Exploring Customer Service Management

Learn how the Customer Service Management (CSM) application can help your organization resolve customer issues and requests for your customers. By adopting a proactive customer service approach, you can increase your customer satisfaction and retention.

Overview of Customer Service Management

With the Customer Service Management application, you can automate your processes and give your service agents visibility into the customer systems and tools that they need to deliver proactive services to your customers. Key benefits of the Customer Service Management application include:

Connecting your teams to boost efficiency

You can bring your front, middle, and back offices together so that you can proactively address customer issues and enable more self-service through automation.

Establishing real-time visibility into your customers' products and services

Proactively detect and prevent issues by sending preemptive alerts to your affected customers. You can identify and predict trends to drive the actionable improvements and automate the resolutions for the most often recurring problems.

Identifying and assigning your issues directly

You can connect your teams to track issues to a resolution by directly contacting the customer's department and quickly resolving these issues. You can also maintain a record of the known issues so that future customers don't have to experience the same problems.

Whether starting or expanding your implementation of Customer Service Management, learn more about the available features that you can use to improve your customer service experience and to track your cases from start to finish.

Customer Service Management workflow

The following infographic shows a sample Customer Service Management workflow that describes the different stages handled by an agent, from creating a new case to the case completed.

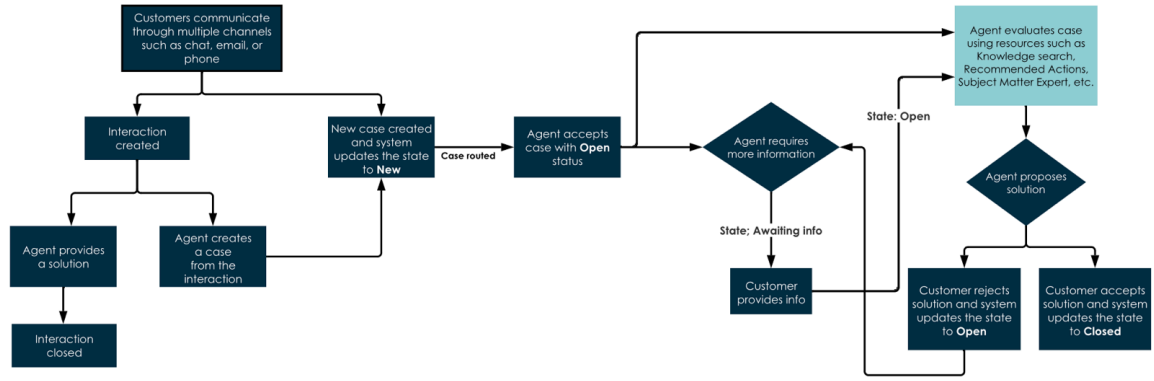
Visual representation of the CSM workflow



Benefits

By utilizing CSM, you can streamline operations throughout the front, middle, and back office, resulting in improved efficiency. Additionally, you can implement self-service features across multiple channels and automate issue resolution. Furthermore, CSM empowers agents with real-time information and intelligent guidance, ultimately enhancing their performance.

Benefits of CSM features

Benefits	Key Features	Role
Learn how to collect, organize, update, and analyze data about your customers.	Customer Data Management	Manager
Drive self-service from a portal that is integrated with knowledge articles, service catalogs, communities, and chatbots.	Self- Service	Administrator
Support your customers across phone, messaging, chat, web, email, in person, and social media.	Omnichannel	Agent
Improve your agent efficiency for faster resolution and a better customer experience.	Agent experience	Manager
Manage the interactions and service level agreements (SLAs), model account relationships, and outsourced service.	Case management	Administrator
Quickly identify the support that a customer needs as well as the opportunities for adoption and selling other add-ons.	Install Base management	Agent
Increase your productivity with automated task creation, triage, and investigation	Intelligence	Manager

Benefits of CSM features (continued)

Benefits	Key Features	Role
so customers get answers fast. Also, learn how to route issues, recommend solutions, and identify trends.		
Get at-a-glance visibility and a deep understanding of the data and identify areas that impact your processes.	Analytics and Insights	Manager
Instantly monitor and analyze your processes, teams, and performance. Also check your conformance to standards, and learn how you can constantly optimize and improve your processes.	Optimization	Manager
Embed a messenger-like pop up inside any website to interact with ServiceNow features, such as browsing knowledge, creating a case, and interacting with Virtual Agent and manage how your customers use your web applications and services from one central location. You can also configure the behavior and styling of the messenger and deploy the configuration on the websites or mobile sites of your choice.	Engagement Messenger for Customer Service Management	Administrator

Focus and purpose of CSM and ITSM

Customer Service Management (CSM) focuses on enhancing customer satisfaction, while IT Service Management optimizes IT services for internal users. Use this topic to explore the distinct roles, the benefits of integration for improved collaboration and communication, and how leveraging both CSM and ITSM can drive success in your organization and elevate your customer experience.

Overview of CSM and ITSM

Customer Service Management (CSM) is centered around external customers, spanning both business-to-business (B2B) and business-to-consumer (B2C). For instance, consider Sarah, a customer service agent at a software company that provides cloud-based solutions. Sarah's primary goal with CSM is to ensure customer satisfaction by resolving technical issues, managing subscription inquiries, and guiding customers through product updates. Ultimately, these efforts help retain clients and enhance the customer experience. See Customer Service Management for more information.

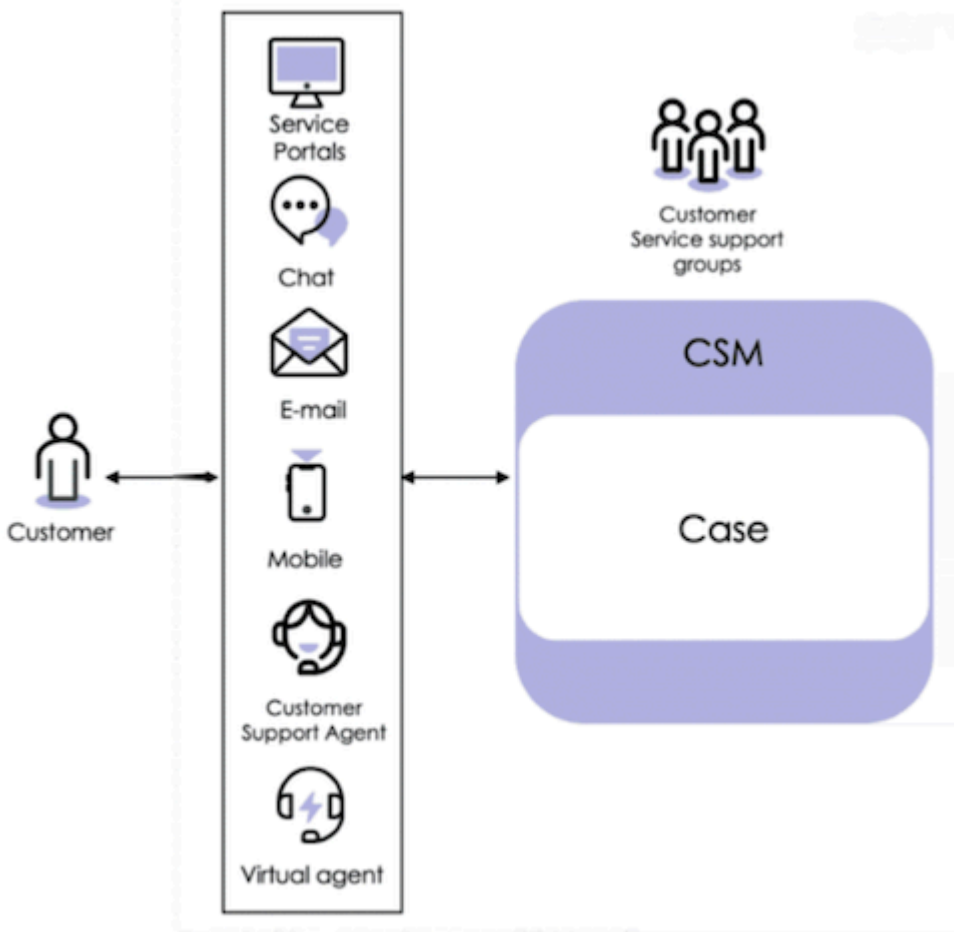
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IT Service Management (ITSM) aims to support internal users of IT services within an organization while empowering teams that depend on these services to deliver value to external customers. Meet Alex, an IT administrator dedicated to maintaining network infrastructure. Alex's role in ITSM entails implementing and managing IT services aligned with the organization's business needs, aiming to support and enable business outcomes through efficient IT operations. See IT Service Management for more information.

Key stakeholders

With CSM, key stakeholders include business professionals such as customer service agents, managers, and executives. Their efforts aim to ensure seamless customer experiences and foster long-term relationships.

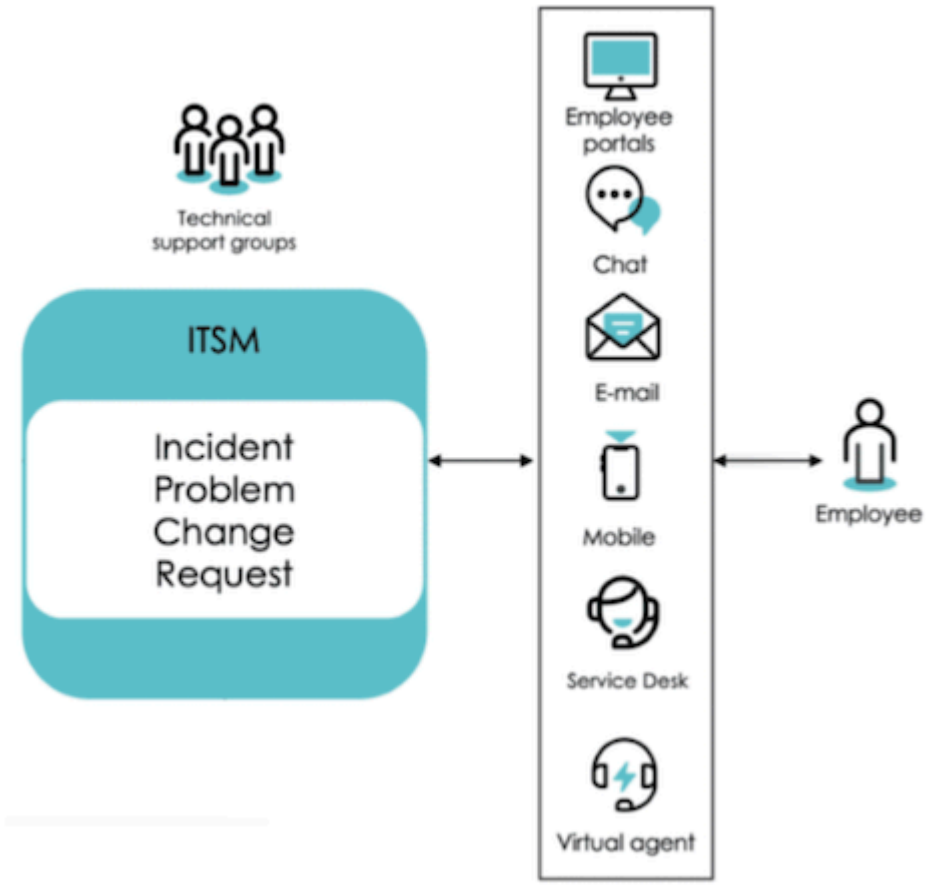
Customer interaction flow in CSM



ITSM engages IT professionals ranging from leadership and management to administrators, technical experts, developers, and support teams orchestrating IT services to meet organizational objectives and drive operational excellence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

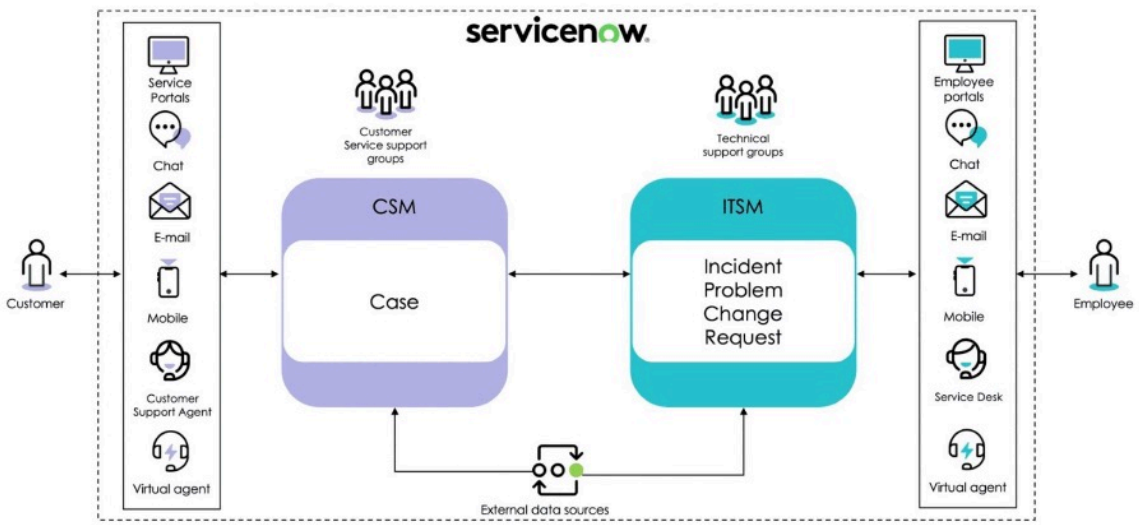
Customer interaction flow in ITSM



Integrating CSM and ITSM

CSM and ITSM don't need to operate independently; they can be integrated to streamline service delivery across the organization. For example, imagine a scenario where Sarah, working at the software company, encounters a technical issue while assisting a client. By integrating CSM with ITSM, Sarah can seamlessly raise an incident ticket within the same workflow, which triggers an ITSM process managed by Alex. This integration enables Sarah and Alex to collaborate efficiently, reducing resolution time and enhancing the overall customer experience.

CSM and ITSM integration



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits of integrating CSM and ITSM

The key benefits include:

- **Efficient Collaboration**: Agents can seamlessly create incident, problem, change, and request records directly from open cases, facilitating collaboration across different parts of the organization to resolve customer issues promptly.
- **Enhanced Customer Communication**: Updates to records associated with a case are automatically reflected in case work notes, enabling agents to provide timely updates to customers and fostering transparency and trust in customer interactions.
- **Unified Service Experience**: Customers can submit requests directly from the customer service portal, where a case is created for each request. A unified experience ensuring consistency and ease of access for customers seeking assistance.
- **Insightful Dashboards**: Agents and managers can gain comprehensive insights by viewing cases with Service Management-related indicators on the Customer Service dashboards. This broad-based view enables informed decision-making and proactive management of customer interactions.

Which one is right for your business

To deliver efficient service and enhance customer satisfaction, it's important to understand the distinct roles of CSM and ITSM. Each module addresses specific needs—CSM focuses on managing customer relationships, while ITSM is centered around optimizing IT service delivery. Knowing when to use each one, and how to integrate them effectively can help organizations streamline operations, improve customer experiences, and achieve better business outcomes.

So, whether you're Sarah, managing customer interactions at the software company, or Alex, focusing on IT processes, leveraging the strengths of both CSM and ITSM is key to driving success in today's evolving business environment.

Data management for Customer Service Management

Organize and manage the data for both your internal users and external customers by using the Customer Service Management application. You can provide your managers and agents with a view of the customer data, including the account and contact or consumer information, products and services, assets, contracts, and entitlements.

Customer service business model

Different business models are available to support your goals and business needs in the Customer Service Management application. The business models vary depending on the products, services, and support that you provide to your customers. With the right model for your business, you can answer queries, solve issues, and provide consistent and high-quality service that focuses on increasing your customer satisfaction.

To learn more about the customer service business model, see Customer service business models.

Customer data

Customer data includes information about the customers who are external to your organization, such as names and addresses, telephone numbers, and email addresses. In the business-to-business (B2B) business model, customer data includes details about accounts and contacts. In the business-to-consumer (B2C) business model, it includes details about consumers and households. Maintaining accurate customer data enables your agents to communicate with customers quickly and easily.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To learn more about the customer data, see Customer data.

Product data

Product data includes information about the products and services that an organization provides to its customers. This data can include information about products and product models, assets, sold products, install base items, and installed products. When assisting customers, your agents can quickly select the correct product data, add the details to case records, and view information related to the product data such as knowledge articles and resolved cases.

To learn more about the product data, see Product data.

Contributor users

Contributor users enable you to engage both internal and external users to assist in resolving customer issues and requests.

To learn more about the contributor users, see Contributor users.

Service Model Foundation

Service Model Foundation refers to a set of pre-designed business and technical data frameworks that meet the business needs of a particular industry. Service Model Foundation provides the core framework, security, and guidance to the model entities in the customer service value chain across the industry verticals. By using these models, you can provide positive experiences for your customers, agents, and middle office workers as they execute the customer service processes.

To learn more about the Service Model Foundation, see Service Model Foundation overview.

Internal user data

Internal user data includes the information about the people within your organization, such as managers, agents, and other employees. Internal users can belong to different user groups and can be assigned roles as customer and consumer service agents and managers.

To learn more about the internal user data, see Internal user data.

Business stakeholders for Customer Service Management

Business stakeholders are users who are directly involved in your customer service processes. They can create, view, and approve cases and requests across your organization.

To learn more about the business stakeholders, see Business Stakeholder for Customer Service Management.

Customer Access Management

Customer access management supports multiple related parties (contacts, consumers, and internal users) in handling cases, sold products, and install bases by providing them with varying levels of access. Additionally, it facilitates tracking and collaboration on specific cases and products for related parties, allowing for the naming of relationships. Related parties associated with a product can not only view the product but also track all of its cases.

To learn more about customer access management, see Configuring customer access management and Using customer access management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Base Management

Use install base management to capture a customer's use or purchase of a product across any industry with the Customer Service Management application. You can track the products and services that are installed at the different customer locations. For example, you could learn how many products are at a location, who has the product, and how it's being used.

Install base supports all the industry verticals across tangible and intangible goods, providing expansion opportunities into post-sales support for any industry vertical. For example, in the banking industry, the install base could be an automated teller machine (ATM). Let's say that an ATM inside a grocery store isn't working. That means, a repair request would have to be created to fix it.

The key benefits of using install base management include:

- Tracking the products and services that have been purchased by a customer.
- Upselling and cross-selling other products from your product catalog. By knowing which products the customer already has installed makes it easier to upsell and cross-sell other products.
- Knowing how the product is being used makes it easier for the field technician to service the product.
- Fixing issues more quickly leads to a great customer experience.
- Keeping a record of the installed base items enables you to maintain and replace the items more quickly.

Self-service for Customer Service Management

With the Customer Service Management application, you can provide service for your customers through self-service portals that are integrated with knowledge articles, community forums, service catalogs, and chatbots.

Customer and consumer self-service portals

By using the Service Portal application, you can create portals that empower your customers to resolve issues and submit cases and requests for themselves. To help direct customers to the right portal resources, you can also activate the Virtual Agent application for Customer Service Management.

Portal types

You can configure three types of portals to support your customers and consumers:

- Customer Service Portal: Supports your business-to-business (B2B) customers
- Business Portal: Supports your business-to-business (B2B) customers and is built using configurable widgets
- Consumer Service Portal: Supports your business-to-consumer (B2C) customers

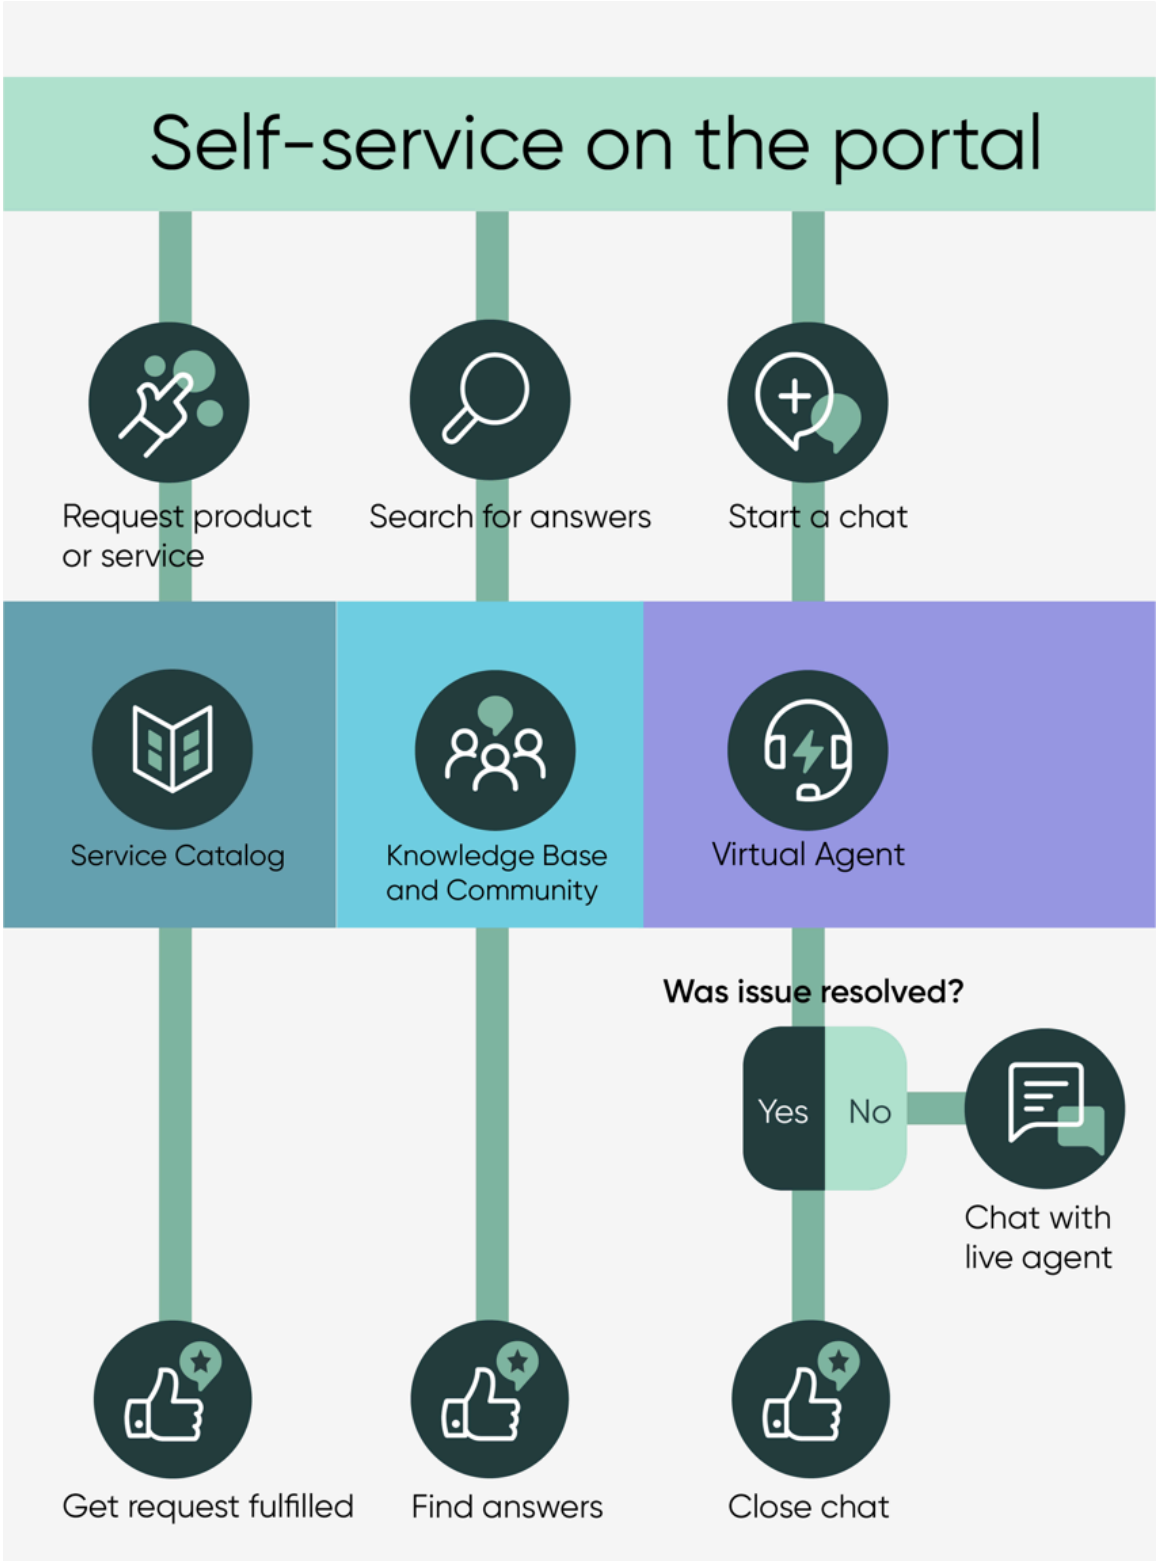
Both portals offer the same self-service and Virtual Agent assistance features.

Self-service on portals

You can configure your Customer Service Portal or Consumer Service Portal with the following self-service features:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Self-service portal



Service catalog

With the Service Catalog application, you can create service catalogs where customers can request items, such as service and product offerings. You can enable customers to request items from the portal by associating one or more service catalogs with the portal. Customers can also track the status of open requests from the portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To learn more about Service catalog, see Service catalog integration with the Customer and Consumer Service Portals.

Knowledge base

With the Knowledge Management application, you can create knowledge bases with articles to share information with customers on the portal. Customers can search the knowledge bases for information, such as troubleshooting or task resolutions, to resolve issues and answer questions.

To learn more about searching the Knowledge base, see Search the knowledge base.

Community

With the Communities application, you can create forums for agents and customers to connect, engage, and collaborate with each other. On the portal, customers can search for community content that could provide the solutions and answers that they need.

To learn more about communities, see Communities.

Chat

With the Virtual Agent platform, you can design and build automated conversations that help your customers get the help that they need.

As customers answer questions and select options presented by Virtual Agent, they're directed to a self-service resource.

If customers want to chat with an agent, Virtual Agent hands them off to a live agent. To provide this resource, use the Connect Support feature.

To learn more about chat, see Configuring the chat channel.

Engagement Messenger

With the Engagement Messenger, your customers can easily access the information or services they need from your third-party web applications, even if they're located outside of the ServiceNow environment.

To learn more about Engagement Messenger, see Set up Engagement Messenger.

To get started with the portals, see Configure the Customer and Consumer Service Portals and Configure Business Portal.

Omnichannels for communicating with customers

Meet customers where they feel most comfortable by providing omnichannel support. Customers can use chat on the Customer Service Management portal, chat via consumer messaging apps, use email, or place a phone call.

Provides an overview of omnichannel support capabilities within the ServiceNow AI Platform.

Customers can use the following consumer messaging apps to message you.

- WhatsApp
- LINE
- Facebook Messenger
- Apple Messages for Business

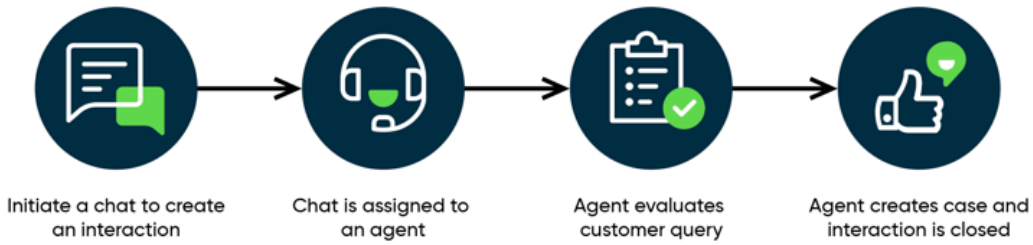
To learn more, see Integrating with consumer messaging apps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chat channel

From the Customer Service Portal and Consumer Service Portal, customers can start a chat with a virtual or live agent for help.

Chatting with an agent



The chat communication channel uses the ServiceNow® Connect Support feature to provide chat capability. You can also enable the ServiceNow® Virtual Agent application to create or use predefined chatbot topics (conversations) for your users.

The chat request from the customer is either routed to a virtual agent or to an available agent with the required skill set. The agent can respond to the customer and, if necessary, create a new case or link the discussion to an existing case.

An agent can also initiate a Zoom meeting from a chat to resolve issues faster. For more information, see Chat Zoom Connector.

If a case is created as the result of a chat, the customer can later find and view the case from the portal for updates. The customer service agent can also link a chat discussion to an existing case. Details from the chat discussion are copied to the case form.

For more information, see Connect Support and Configuring the chat channel.

When a support agent of the assignment group associated with the chat queue ends a chat with a user, a survey is available in the chat window for the users. Users can take the survey to give feedback about the interaction with an agent. The survey is not captured in the transcript in the agent's interactions page.

Email channel

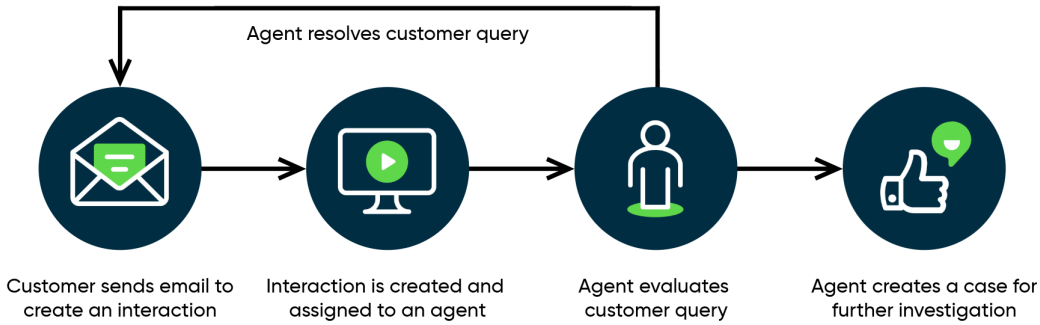
Email queries from customers can be managed either as interactions or cases. Interactions handle simple queries that can be resolved promptly, while cases are for more complex issues requiring investigation. Use interactions for simple questions and as a staging object for case categorization. Use cases for complex issues requiring investigation by the back office to facilitate proper resolution.

Email Interaction

Enables you to create interactions to manage email engagement with customers. Agents can review these interactions and take appropriate actions. The customer query can be

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

resolved by an email response over the interaction, or a case can be created for further



investigation.

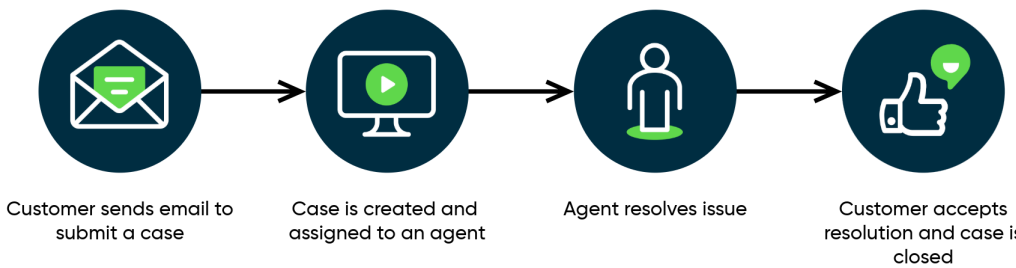
Streamlining case management from intake to resolution

When a customer sends an email, it's automatically created as an interaction in the system. This interaction captures all email communication between agent and customer, providing agents with context for the query. The agent reviews the interaction to determine whether the issue requires further investigation. If the customer's request is clear and needs resolution, a case is created based on the interaction.

Once the case is created, the interaction is marked as closed. This helps prevent unnecessary duplication and keeps the system organized. When the agent replies to the customer's email through the case, an outbound interaction is automatically created. This confirms that all communication is tracked, maintaining a complete record of the conversation.

Email to case

With email to case, customers can send emails to create cases and update current cases. They can also receive email updates from customer service agents as cases progress.



Creating, viewing, and updating cases

Customers can create a new case by sending an email to a designated address. They can also create a case for a specific product by sending an email to a designated address and including the product name in the subject line. Or, if a channel configuration has been created, customers can send an email to a designated address regardless of the information included in the subject line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After submitting a case, the customer receives a confirmation email with the assigned case number and a link to the Case form. When an agent updates a case, the customer receives an email with the details.

Customers can update an existing case in the following ways:

- By replying directly to an email from a customer service agent.
- By creating an email and including the Case: prefix followed by the case number in the subject line. For example, `Case: CS0000011`.

Accepting and rejecting solutions

When an agent proposes a solution to a case, the customer receives an email with instructions for accepting or rejecting the solution. The customer can reply and include **Accept** or **Reject** in the first line of the email, or the customer can select the **Accept** or **Reject** link in the email.

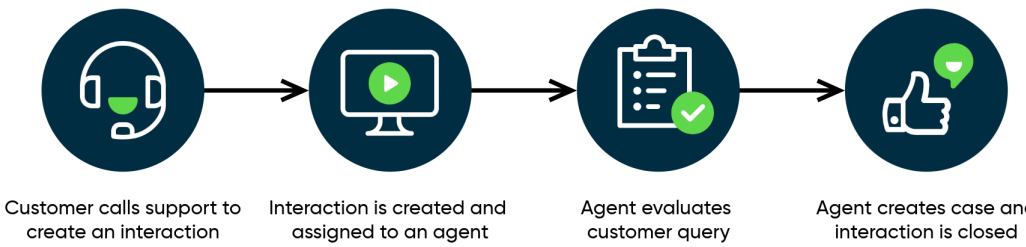
When an agent closes a case, two emails are sent to the customer. The first email states that the case has been closed. The second email provides a link to a customer satisfaction survey.

Note:
If a customer accepts a solution or closes a case from the Customer Service Portal, they're automatically routed to the survey. They don't receive the survey email.

To get started with the email channel, see Configuring the email channel.

Phone channel

External customers can reach out to customer service agents by phone. The Customer Service Management application uses both Computer Telephony Integration (CTI) and OpenFrame to provide phone support for customers.



Computer Telephony Integration (CTI)

CTI provides a way to integrate the ServiceNow AI Platform with telephony providers to support inbound and outbound calls. With this integration, customer service agents can place and accept calls from customers, quickly identify customers and account information, and capture case-related information.

Note:
The CTI integration with the Twilio Voice product requires activation of the Notify plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OpenFrame

OpenFrame is a tool that enables CTI capability with telephony service providers. OpenFrame provides a communication frame that agents use to place and receive customer calls.

Interaction Controls Component (ICC)

Integrate ICC with contact centers to embed a native call control interface within the Agent Workspace. This streamlines the management of all inbound and outbound phone interactions by providing contextual assistance in a single interface.

> **Note:**
> The Interaction Controls Component (ICC) is a framework that includes voice call features. However, these features will not function unless they are implemented by a CCaaS (Contact Center as a Service) solution.
>
> For more information, see: Integrating contact centers with Interaction Controls Component (ICC) for voice calls

To get started with the phone channel, see Configuring the phone channel.

Agent experience

Your agents can assist customers through various interaction channels to resolve their issues and manage their cases, delivering high-quality and efficient customer service with the Customer Service Management application.

CSM Configurable Workspace

Your agents have one desktop for any interaction–phone, chat, messaging, web forms, and so on. Multiple tabs enable agents to efficiently manage several cases at once. Agents have ongoing visibility into the status of issues assigned to middle and back-office teams for resolution. The workspace dynamically displays related contextual information based on the current state. Agents can also set compact mode and dark mode to optimize their experience and productivity.

To learn more about CSM Configurable Workspace, see Explore CSM Configurable Workspace.

Advanced Work Assignment

Define criteria and routing conditions to automatically assign work items (such as chats or cases) to agents based on their availability, capacity, skills, work history, related tasks, or account team.

To learn more about Advanced Work Assignment, see Set up an Advanced Work Assignment service channel for assigning case tasks.

Customer Central

Your agents get a ready-to-use centralized view of customer-specific information. Customer Central combines historical activity from self-service (such as knowledge base article views and Virtual Agent interactions) as well as live interactions (such as chat and SMS). It can be further customized to incorporate data from different sources and use custom components to include customer health scores, churn risk, recent transactions, and so on.

To learn more about Customer Central, see Customer Central.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Assist

With agent assist, your agents can handle cases in the workspace, perform an automatic search that shows possible solutions in other cases, knowledge base articles, and additional information sources.

Playbooks

Your agents can use playbooks to provide your customers with the step-by-step guidance that they need for resolving specific types of customer service cases. For example, your agents can use these playbooks to help your customers resolve onboarding, complaint, and product support issues.

A playbook enables your agents to manage the life cycle of a case. The workflows that are associated with a specific type of case and the activities that must be completed to resolve cases of this type are detailed in the playbook. Playbooks also help your agents to visualize the entire life cycle of a workflow.

To learn more about playbooks, see Playbooks for Customer Service Management.

Mobile

Your agents can manage their customer service cases from a mobile device with the Customer Service Management mobile application. Your agents can stay connected and access information in real time to complete their tasks quickly.

Both your customer service agents and managers can use the Customer Service Management mobile application to review the case details quickly so that they can complete their case tasks. By using a mobile phone with the Customer Service Management application, your agents and customer service managers can perform routine actions and approvals anytime and from anywhere.

To learn more about the Customer Service Management mobile application, see Mobile experience for Customer Service Management.

Case management for Customer Service Management

Manage customer requests and issues by creating cases, routing cases to agents and groups, and working toward resolution. With case management, you can provide your agents with the tools they need to evaluate cases, communicate with customers, answer questions, and resolve issues.

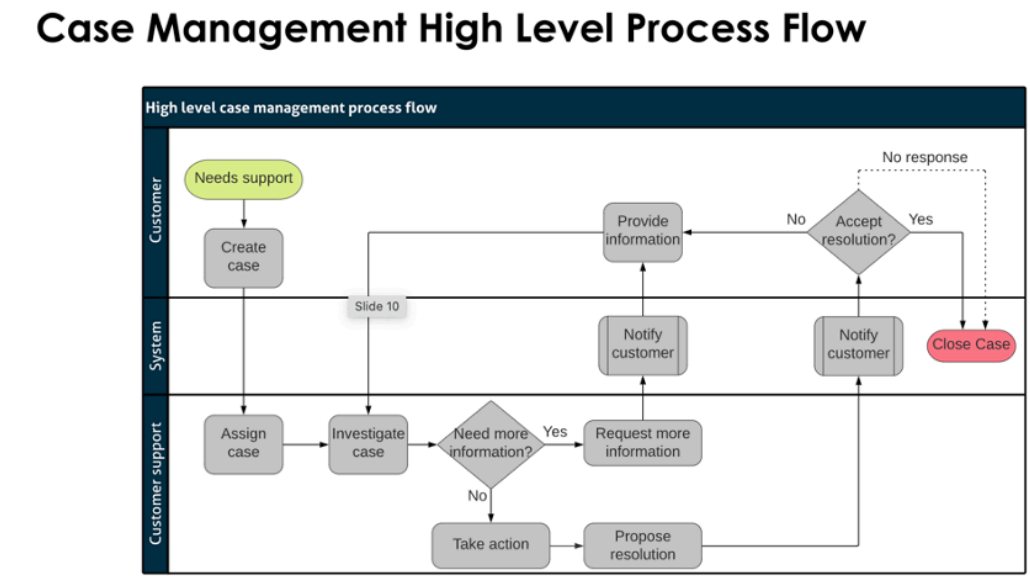
Getting to know the case management process

Case management refers to the business processes and activities designed to evaluate and address customer issues and requests while managing the overall customer experience through effective communication. Case management enables you to engage with customers, categorize and route cases, assign work to agents, and manage cases through resolution and reporting. Case management starts with case creation as customers reach out through a number of communication channels including email, phone, and chat.

The following diagram shows the case management process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

High-level process flow for the case management process



Use the following features with the Customer Service Management application to manage the cases for your customers:

- Case workflows
- Case types
- Service definitions
- Playbooks
- Major issue management
- Customer project management

Case workflows

A case workflow is a series of steps and tasks that are involved in closing a case. By using a case workflow, you can automate systems to simplify your processes, track task completion, and accelerate case resolution.

To learn more about case workflows, see Configure proactive case flows.

Case types

A case type is a collection of data and processes that are needed to resolve a specific type of issue. For example, case types are needed when a company has different processes for supporting customers across multiple departments, business units, or products. By using a case type, you can separate these processes through case applications that support each process.

To learn more about case types, see Customer Service Case Types.

Service definitions

A service definition refers to a specific type of service request that your agents can offer to customers for a case type. Service definitions establish a connection between the products, services, and case types so agents and customers can quickly access the relevant case types by the customer or product.

To learn more about the service definitions, see Service definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbooks

Playbooks provide agents with a visual guide, including step-by-step guidance for the various tasks that the agents can use to resolve the specific type of customer service cases. A playbook helps to improve agent productivity and your customer experience by digitizing and automating complex customer service processes.

To learn more about playbooks, see Playbooks for Customer Service Management.

Major issue management

With major issue management, you can efficiently manage your customer communication and resolution process for a major issue that impacts multiple customers. By identifying other affected customers who haven't reported the issue, you can proactively create cases, notify the affected customers, and manage all the issues until resolution.

To learn more about major issue management, see Major issue management overview.

Customer project management

With customer project management, your company can track and manage long-term complex projects, resolve issues, and track the cost of serving customers on complex projects. Customer project management helps your company to improve the customer experience, reduce inbound calls, and lower costs.

To learn more about customer project management, see Integrate with Customer Project Management.

Intelligence

Use the Intelligence solutions for the Customer Service Management application to access machine learning frameworks, search and automation functions, and natural language processing to automate and enhance your agent and customer experience.

Intelligence solutions

Intelligence solutions use artificial intelligence (AI) to support machine learning and natural language understanding (NLU) capabilities.

Artificial intelligence

Several Customer Service Management applications use an artificial intelligence layer as a framework for machine learning models to interpret language and predict the best resolution for cases. Examples include Predictive Intelligence, Task Intelligence, and Document Intelligence. Artificial intelligence is the foundation of machine learning and natural language understanding frameworks.

Machine learning

Machine learning solutions for Customer Service Management help with case creation, case assignment, and case resolution.

Natural Language Understanding

Natural Language Understanding helps with features such as sentiment analysis, which analyzes customer interactions for positive, negative, or neutral tone. NLU can also interpret customer intent when interacting with a virtual agent to automatically fulfill requests. For example: a customer asks "I need access to the XYZ environment", and NLU interprets "Grant access" as the intent and "XYZ environment" as the entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task Intelligence for Customer Service

The Task Intelligence for Customer Service application offers you several AI capabilities. You can use language detection, record categorization, Sentiment Analysis, and Document Intelligence to automate your routine tasks across a case's life cycle. These capabilities also enable your agents to focus on resolving complex cases.

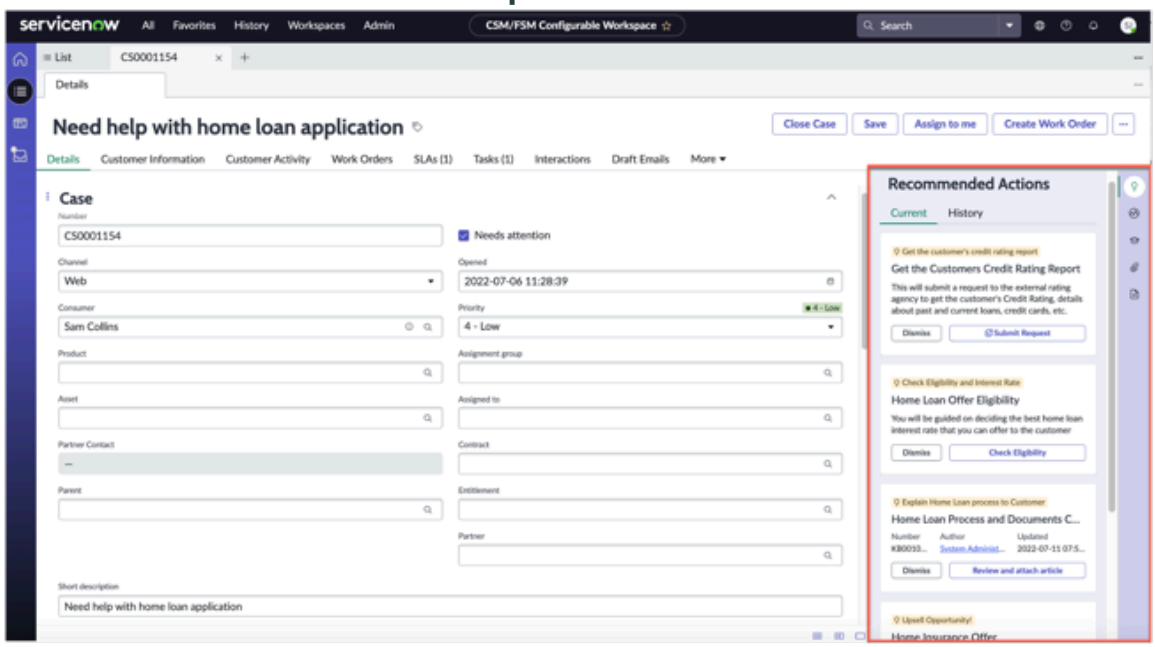
To learn more about Task Intelligence, see Task Intelligence for Customer Service.

Recommended Actions application for Customer Service Management

By using the Recommended Actions application for Customer Service Management, you can configure and display the relevant, recommended actions for your agents. These actions are based on the context of the record. Your agents can quickly follow these recommended actions to assist customers and to resolve issues.

The following example shows the recommended actions on the case record. The panel offers the agent options to assist with a home loan application, such as getting a credit report, determining eligibility, and gathering documents.

Recommended Actions contextual side panel



To learn more about Recommended Actions, see Recommended Actions application.

Predictive Intelligence for case management

You can assist your agents when they are creating cases by limiting the amount of information that they have to enter. For example, an agent only has to enter a short description of the case. Based on the agent's input in the short description field, Predictive Intelligence predicts the category, priority, and assignment group, routing the case to the correct queue.

To learn more about Predictive Intelligence, see Predictive Intelligence for case management.

Guided Decisions for Customer Service Management

You can resolve complex cases faster and more efficiently by guiding your agents through a structured troubleshooting process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guided Decisions is a decision tree authoring and#execution capability in the Customer Service Management application. Use Guided Decisions to guide agents through troubleshooting processes that are based on case context. These processes ask a series of questions and agents provide answers. Based on those answers, agents receive guidance on the next steps to take in the resolution process.

Guided Decisions can help customer service agents by offering step-by-step dynamic guidance as they work to resolve customer issues. This assistance with case resolution can improve agent productivity and customer satisfaction and can help companies in meeting business outcomes. The key benefits include:

- Reduce manual errors by setting up standard processes as decision trees.
- Improve agent productivity by embedding decision trees in recommended actions and playbooks and surfacing relevant actions based on a customer's situation.
- Increase customer satisfaction with consistent agent processes and responses.
- Improve first contact resolution by guiding agents along the optimal path to resolve complex cases.

To learn more about Guided Decisions, see Configuring Guided Decisions.

Analytics and insights

Use the Performance Analytics applications for Customer Service Management to report your customer service performance and effectiveness. You can use the predefined key performance indicators (KPIs) and preconfigured role-based dashboards for monitoring your customer service processes. These analytics enable you to align your organizational goals across all roles, from executive to manager to agent.

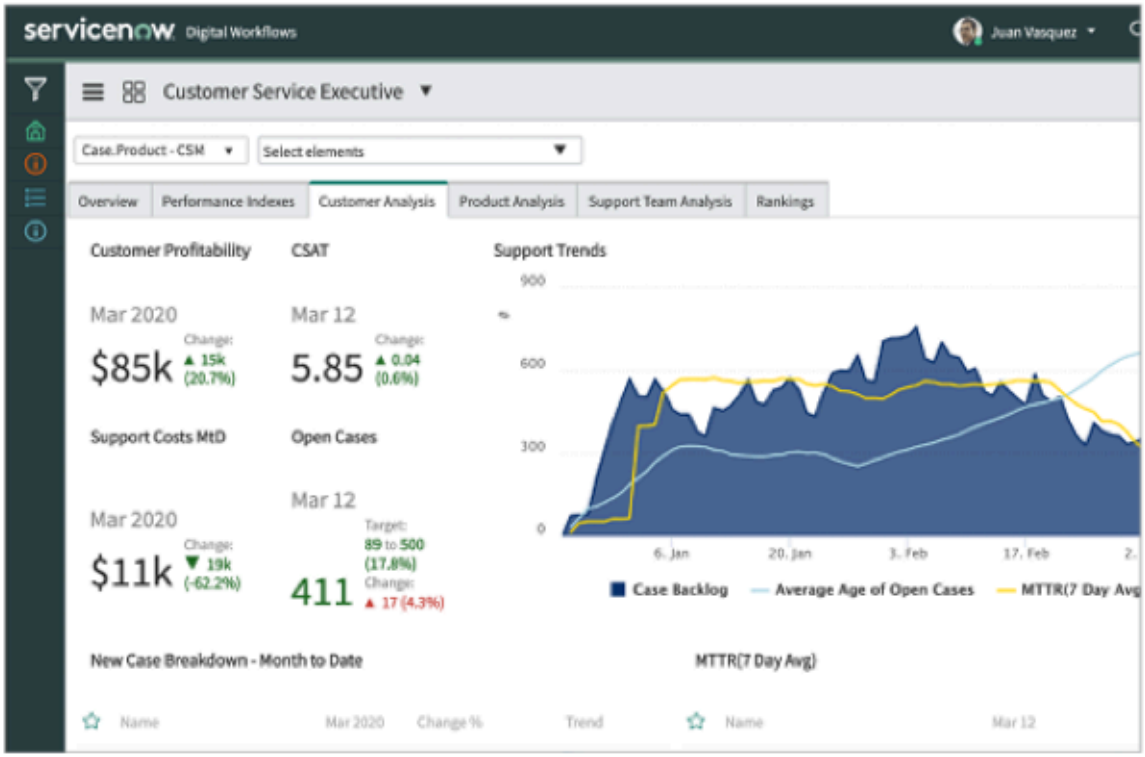
Performance Analytics dashboards

By using the preconfigured Performance Analytics dashboards, you can provide your customer service managers with deep insights into how they can visualize the data over time, analyze the business processes, and identify areas of improvement.

The following example shows a Performance Analytics dashboard with profitability and support trends for the month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Executive dashboard



To learn more about the Performance Analytics solutions, see Customer Service Platform Analytics Solutions.

To learn more about the different Performance Analytics plugins and what they provide, see Additional plugins for Customer Service Management.

Optimization

Optimize your processes by using the Customer Service Management application. You can analyze which processes are relevant to your key performance indicators (KPIs), identify the bottlenecks for your customer service cases, learn how to optimize your workforce, and manage your teams more efficiently.

Process mining

By mining your processes, you can quickly analyze and improve the root cause of the inefficiencies. A process mining content pack has been built exclusively for the Customer Service Management application. This content pack helps you to analyze your cases and create process maps. With a process map, you can review the case records and find the performance issues. After finding some improvement opportunities, you can create initiatives to track the progress to ensure that an issue doesn't happen again in the future. You can also analyze your process maps by using variables like Location, Product, Priority, Category, Resolution code, and Assignment group.

Process mining enables you to do these tasks:

- Visualize your process execution and resolve underlying issues.
- Automatically discover and create process maps for your KPIs and conduct a root cause analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use process maps that were built by using audit log data to identify your bottlenecks, redundancies, and opportunities for automation.
- Replace time-consuming manual analysis and costly consultants with automated data-driven process maps.

The following diagram shows the benefits of Process Mining, including creating process maps, analyzing bottlenecks, and finding new areas of improvement and automation.

Key Features of process mining include:

Dashboard and insights

You can drill down into the process KPIs that are most important to your business. You can get the insights into the process inefficiencies that are discovered by the process model. The top identified case inefficiencies across all organizations are:

- Idling time: The time that it takes for assigned cases to move to Work in progress.
- Resolution rejected: Cases where a solution has been proposed by the agent but for some reason is rejected by the customer.
- Reassignments: Cases where the assignment group change happens at least twice.
- Resolution efficiency: Cases where there's a significant time gap between the Work In Progress and Resolved cases.
- Assignment efficiency: Cases where the time to assign a case is longer than usual.
- Undesirable transition: Cases that go from Work in progress to Work in progress-awaiting info.

Automated root cause analysis and clustering

You can investigate where and why inefficiencies happen in the process. You can get insights on the leading influencers for the analyzed process steps and discover the hidden connections and influencing factors in the process data.

Multi-dimensional mining

You can link the different related processes to visualize in one graph.

Business process flow creation

You can use the case data in audit trails to perform an in-depth analysis and discover the process insights that can improve your business outcomes.

For more information about enabling the Process Mining content pack, see the following topics:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activate Process Mining Content Packs.
- Integrating with Process Mining.

Workforce Optimization

The Workforce Optimization for Customer Service application manages and maintains the productivity of your workforce. With the Workforce Optimization for Customer Service application, you can efficiently route work to your team, manage your team's skills and schedules, and monitor your team's performance.

The Workforce Optimization for Customer Service application is configurable and can be customized to fit your service objectives.

The advantages of Workforce Optimization for Customer Service include:

- Improve the quality, efficiency, and satisfaction of your teams.
- Support skill growth and smart scheduling for your team.
- Get real-time and historical snapshots of your team's performance.
- Onboard, coach, and train workflows to develop and grow your team members.
- Focus on all engagement channels and provide real-time help to your team members so that they can provide a better customer experience.
- Capture all the relevant data and apply these insights and guidance to your team.

To learn more about the Workforce Optimization for Customer Service application, see Workforce Optimization for Customer Service.

Customer Contracts and Entitlements

The Customer Contracts and Entitlements application for Customer Service Management (CSM) provides solution to standardize, organize, manage, and use service contracts and entitlements.

You can use the Customer Contracts and Entitlements application to manage contracts from the initial offer to contract finalization, directly within the CSM Configurable Workspace. You can also manage service contracts and entitlements life cycle changes, scope modifications, and cancellations. The application enables tracking of entitlements and improve contract compliance.

A service contract acts as an agreement between the customer and the organization. A contract includes the consumer or account details, the products covered, and the period for contract activation. Service contract lines store information related to a service or contract offer that is purchased or owned.

Within each contract, entitlements can be defined to detail the specific commitments related to the contract. You can also create independent entitlements that define the type and level of support that a customer receives after a product is purchased. Sold Products eligible to be serviced under a service contract or entitlement can be added as covered products.

Key features of Customer Contracts and Entitlements

Customer Contracts and Entitlements is built on these key features that helps maintain the after-sales services provided to customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View, utilize, and manage contracts and entitlements in the Agent Workspace.
- Manage the life cycle of customer service contracts and entitlements from offer creation to contract generation.
- Establish relationships with existing customer data, such as sold products and install base items, by adding the contract and entitlement data to the common data model.
- Support customer needs by implementing capabilities ranging from account-based support entitlements to contracts that include service plans with complex entitlement coverage.

Contracts and Entitlement Workflows

Manage the life cycle of customer service contracts and entitlements from offer creation to contract generation.

Contracts and entitlement workflows help in efficiently managing the complete life cycle of customer service contracts and entitlements from offer creation to contract generation. After the customer has specified their catalog items for service contracts and entitlements, these workflows facilitate the creation of orders for those items through order orchestration and the generation of transactional customer contracts.

The workflows in this application enable you to modify contracts, contract lines, and entitlements. Contract offers are subscription plans or service plans detailing the precise services that a customer is entitled to as specified in a contract. These offers include details like scope of services, time lines, pricing, and other special terms. Contract offers can be offered independently or combined with other services or products. Entitlement offers are specific terms and service levels that customers are entitled to under a contract.

Key features

- Generating new customer contracts and entitlements: Enables the complete end-to-end sales and order management process to generate new customer contracts and entitlements.
- Create and manage subscription contracts: Customers can create contracts to manage subscription, support, and maintenance contracts. Customers can create these contracts from product inventory records and also manage these contracts by modifying, renewing, or canceling them.
- Integration with Customer Service Management modules: Integrates product catalog management, order management, and contract management to deliver a seamless capability to support selling of service contracts and entitlements.
- Customizable workflows: Provides the flexibility to accommodate changes in the data model, such as the addition of custom fields.
- Modifying Contracts and Entitlements: Manage changes in contracts and entitlements. If the customer wants to modify service contracts such as changes in coverage or other specific terms, these changes can be managed using order management. You can also suspend, resume, and cancel them based on your requirement.
- Renewing services: You can renew sold product service contracts and other entities based on your requirement.
- Covered products: Covered products are specific sold products or order line items that are included in a service contract. Covered products can be directly tracked through the contract records, facilitating changes and visibility of what is covered.

Configuring Customer Service Management

Set up the features, components, and integrations that you need to provide service and support to your customers.

Set up your environment Plan and configure your CSM environment, import foundational data, and set up access management.	**Organize agent workspaces** Configure intuitive workspaces with advanced routing and management features and case management capabilities.	**Enable communication channels** Set up customer communication channels, including voice, email, web, and messaging.
Implement intelligence Set up Intelligence features to automate routine tasks and provide recommended content to agents.	**Set up self-service** Create self-service portals for customers that are integrated with knowledge, communities, service catalogs, and chatbots.	**Extend capabilities** Add additional features to further extend the capabilities of your Customer Service Management environment.

Set up your environment

Begin your customer journey by setting up your Customer Service Management environment. This setup involves planning and configuring your system with essential components such as data models, customer data, product data, and user management tools. Additionally, import your foundation data, set up access controls, and configure case management tools to go live.

Organize agent workspaces

Configuring your agent workspaces is crucial for improving the efficiency and effectiveness of your customer service team. To get started, set up and optimize your agent workspaces by configuring interfaces, landing pages, and record pages. This process involves setting up case routing, implementing advanced case management features. It also includes integrating agent tools for smooth case handling and streamlined workflow management.

Enable communication channels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To facilitate seamless customer interactions across various platforms, it's essential to set up and configure multiple communication channels. This approach ensures that customers can reach your service through their preferred methods, enhancing their overall experience. Set up and configure a variety of communication channels to facilitate customer interactions. Such methods include voice, email, chat, web, messaging, phone, engagement messenger, and omnichannels.

Implement Intelligence

Implementing intelligence features in Customer Service Management helps you achieve a quicker and more personalized customer experience. Set up these features to automate routine tasks and deliver relevant content to you, helping you to focus on more complex case resolutions.

Set Up Self-Service

Creating and enabling a self-service portal equips you to resolve issues independently and access information. Set up self-service portals by integrating features such as knowledge bases, communities, service catalogs, chatbots, walk-up experiences, and appointment booking.

Extend Capabilities

To extend your Customer Service Management environment, integrate additional applications and features. This expansion broadens your system's functionality, enhances process management, and improves support tasks. As a result, you experience more efficient interactions and better overall support.

Set up your environment

Begin your customer journey by preparing your Customer Service Management environment with data models, customer data, product data, user management, and case management tools to go live.

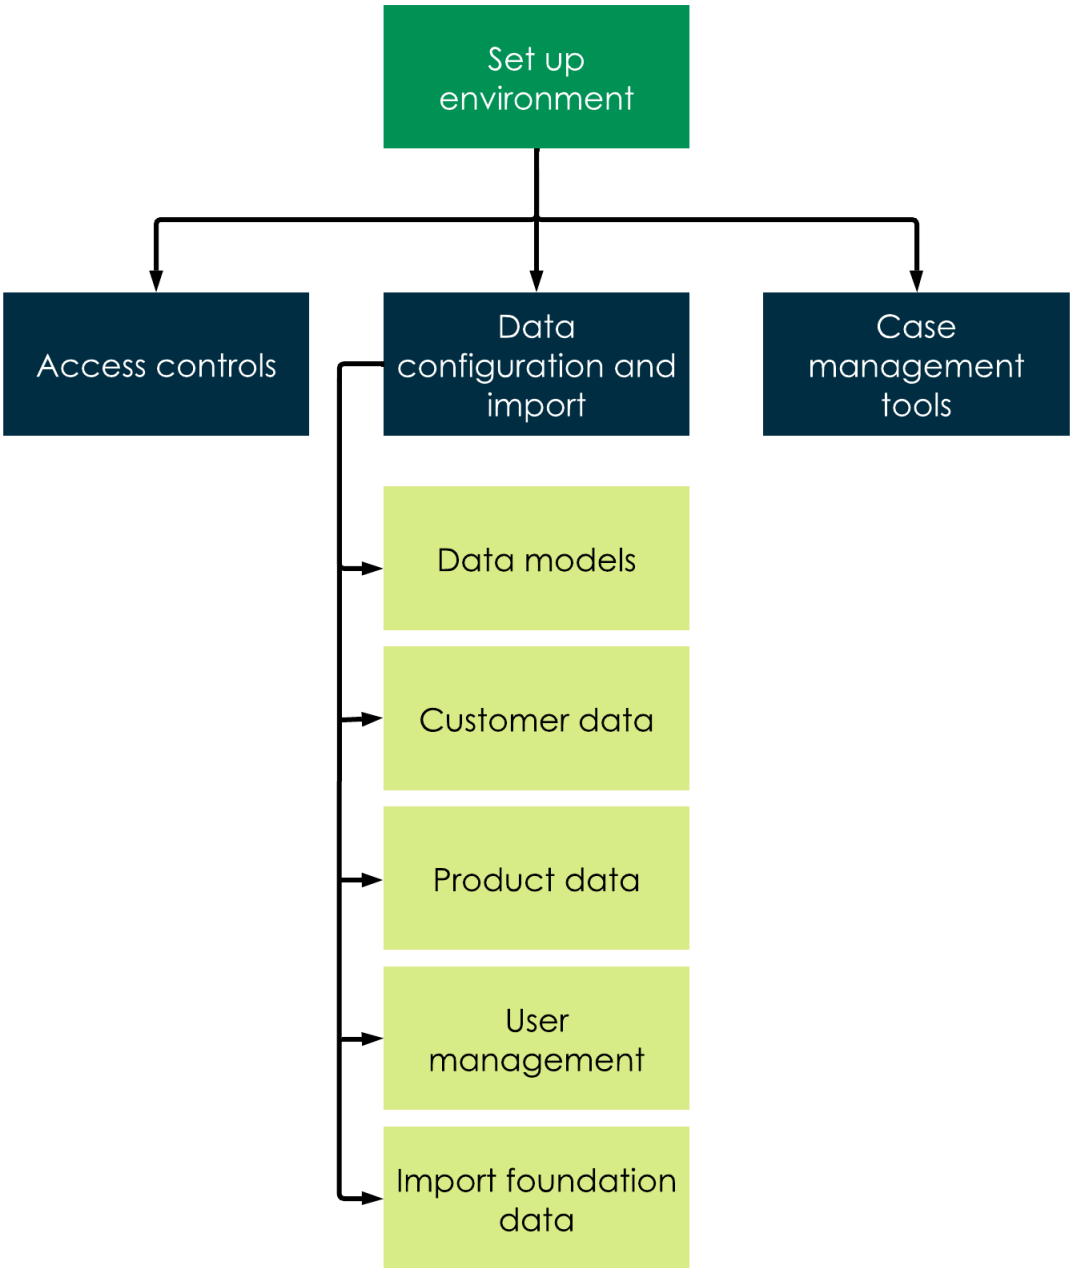
Getting started	Customer data	User management
Activate Customer Service Management, and import your foundation data.	Configure customer data, such as accounts, contacts, and consumers.	Create and manage data for internal users, such as managers, agents, and support groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product data	Data models	
Configure product data including product models, sold products, install base items, and installed products.	Create and manage data models for Customer Service Management.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up your environment overview



Getting started

Start by activating the Customer Service Management plugin and importing your foundation data to establish a solid framework. This approach helps you to plan and install any additional plugins you need, securing a well-integrated and effective system for optimal performance. Activate the CSM plugin and foundation data to establish a robust framework. This facilitates efficient plugin planning and installation, promoting a well-integrated system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer data

Configure customer data in Customer Service Management, including details about accounts, contacts, and consumers to promote comprehensive information capture. This setup confirms that all the relevant customer and account information is captured.

User management

Create and manage user data for internal users such as managers, agents, and support groups, as well as external users. Configure their access to features, capabilities, and case data in Customer Service Management features and case data. This setup helps establish relationships that streamline case management and enhance support roles for accounts, leading to better efficiency and effectiveness in handling customer interactions.

Product data

Configure product data to streamline Customer Service Management including product models, sold products, install base items, and installed products. This setup helps you quickly access relevant details, resolve issues more effectively, and improve overall service by providing a clear view of product status and history.

Data models

Create and manage structured and flexible data models in Customer Service Management to meet industry needs, with organized data, accurate interactions, and seamless adaptability.

Getting started with Customer Service Management

Activate the Customer Service plugin and plan your Customer Service Management implementation by installing additional plugins.

Activating plugins and foundation data

Task	Description
Activate Customer Service Management	As an admin, activate the Customer Service plugin (com.sn_customerservice). This plugin includes demo data and activates related plugins.
Plugins activated with Customer Service Management	Refer the list of related CSM plugins that are activated after activating the Customer Service plugin.
Additional plugins for Customer Service Management	Refer the list of additional CSM plugins that you can activate after activating the Customer Service plugin.
Customer Service properties	Customize settings for several different features, including email communication, asset contact relationships, and the Consumer Service Portal.
Configure foundation data	Import customer information including names, addresses, and phone numbers; accounts, contacts, consumers, users, groups, group members, product models and assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activating plugins and foundation data (continued)

Task	Description
	Assign roles to groups or to individual users. Create service contracts and entitlements. Create customer relationships, asset relationships, and account teams.

Activate Customer Service Management

You can activate the Customer Service plugin (com.sn_customerservice) if you have the admin role. This plugin includes demo data and activates related plugins if they aren't already active.

Before you begin

Role required: admin

About this task

The Customer Service Management plugin activates several related plugins if they aren't already active. For more information, see Plugins activated with Customer Service Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next

You can activate several related plugins after activating the Customer Service Management plugin (com.sn_customerservice). For details, see Additional plugins for Customer Service Management.

Plugins activated with Customer Service Management

The Customer Service plugin activates several related plugins if they are not already active.

Plugins automatically activated with Customer Service

Plugin	Description
Assessment [com.snc_assessment_core]	Enables you to create surveys, send surveys, collect responses, and analyze and share survey results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins automatically activated with Customer Service (continued)

Plugin	Description
Asset Management [com.snc.asset_management]	Manage your assets, consumables, and software licenses.
Assignment Workbench [com.snc.assignment_workbench]	Customer service managers can use the workbench to evaluate agents based on configurable criteria, such as skills and availability, and then assign tasks to the desired agents.
CSM Workspace [com.snc.agent_workspace.csm]	Supports various functions required by customer service agents in the workspace user interface.
Customer Service Base Entities [com.snc.cs_base]	Provides granular access control through relationships, user profile attributes, and roles.
Customer Service Portal Classic [com.glide.service-portal.customer-portal]	This plugin enables the Customer Service Portal, a version of the web portal based on the Service Portal application.
Customer Service Social Integration [com.sn_cs_social]	Adds the appropriate data schema changes for social integration scenarios.
Customer Service Spoke [com.snc.customer_service.spoke]	Provides actions for flow designers to use when creating Customer Service Management business processes.
Glide Conversation Server [com.glide.cs]	Enables the Virtual Agent web clients, Connect Support, conversation branding settings, and Live Agent conversation settings.
Many to many task relations [com.snc.task_relations]	Enables the definition of relationships between different tasks.
OpenFrame [com.sn_openframe]	An interface used to integrate external communication systems with the ServiceNow AI Platform. This plugin provides a UI frame that is accessible and available anywhere within ServiceNow application screens. The Customer Service Management application uses a combination of Computer Telephony Integration (CTI) and OpenFrame to provide phone support for customers.
Process Flow Formatter [com.snc.process_flow_formatter]	Displays a diagram of the process flow for a form.
Resolution Shaper [com.sn_resolutionshaper]	Provides a visual display of activities and state changes of any task based entity, such as a customer service case, at the top of the form view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins automatically activated with Customer Service (continued)

Plugin	Description
Resource Matching Engine [com.snc.matching_rule]	A general rule-based matching engine to match an input record to an output record using a condition builder and/or a script for advanced users.
Skills Management [com.snc.skills_management]	Enables you to organize skills data of service agents and employees in a centralized location. You can use this data to assign tasks based on skills, analyze skill gaps to identify coaching and training needs, optimize your workforce, create career growth plans, and perform skill-based hiring.
Special Handling Notes [com.sn_shn]	Activates the Special Handling Notes application, which enables users to quickly view brief messages about records. These notes can be displayed in an embedded list or related list on a record form or in a pop-up window.
State Flows [com.snc.state_flows]	Customize transitions from one state to another in tables derived from the Task [task] table and configure the system to perform work during transitions to specific states.
Subscriptions and Activity Feed Framework [com.snc.activity_subscriptions]	Provides a generic set of artifacts to handle subscriptions for any defined subscribable object. Any entity can be defined as a subscribable object and a set of subscribers can subscribe to the objects. When an event occurs related to the subscribable object, activities can be tracked and subscribers can be notified.
Task Activities [com.snc.task_activity]	Enables support for activities on task tables.
Virtual Agent Service Portal Widgets [com.glide.va.sp_widgets]	Activates the Service Portal for use as a Virtual Agent web client.

Additional plugins for Customer Service Management

After Customer Service Management is activated, you can activate additional plugins that provide demo data and enable various features.

You must have the admin role to activate these additional plugins. For details, see Activate a plugin.

Customer Service Management plugins and descriptions

Plugin	Description
Agent Schedule [com.snc.agent_schedule]	Enables customer service agents and field service technicians to see work schedules and assignments and also add personal events such as meetings or appointments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Management plugins and descriptions (continued)

Plugin	Description
Case Assignment Workbench Demo [com.snc.case_assignment_workbench_demo]	Provides demo data, such as sample cases and users, so that the Assignment Workbench product features can be demonstrated on a non-production instance.
Case Digests [com.sn_csm_case_digest]	Enables users to send case status updates and root cause analysis to customers and key internal stakeholders.
Consumer Service Portal [com.glide.service-portal.consumer-portal]	This plugin enables the Consumer Service Portal, a web-based portal based on the Service Portal application that you can use to provide information and support to consumers.
CSM Configurable Workspace [sn_csm_wrkspc]	Enables CSM Configurable Workspace, the UI Builder version of the configurable service desk application, that provides agents with an integrated and intuitive user experience.
CSM Contributor User [com.snc.csm_contributor_user]	With the CSM Contributor User plugin, you can enable contributors to report and collaborate on cases created for customers, service organizations, or themselves.
CSM Extension for Proxy Contacts [com.snc.csm_proxy_contacts]	Enables users who are internal to an organization to be the proxy case contact on behalf of customers.
CTI Softphone [com.snc.cti]	This plugin is a demo application that enables Twilio integration using the Notify application and OpenFrame to provide soft phone functions and call center capabilities. The application includes the capabilities to make, receive, transfer, hold, and mute calls. The Customer Service Management and Incident Management applications provide Computer Telephony Integration (CTI) demo workflows. Activate the respective applications to run the workflows. The CTI Softphone plugin activates these related plugins if they are not already active: • **Resource Matching Engine (com.snc.matching_rule):** Provides a tool for rule-based task-to-resource matching. • **Notify (com.snc.notify)**: Provides platform features for workflow-driven voice calls, conference calls, and SMS messages. • **Notify - Twilio Driver (com.snc.notify.twilio)**: Provides Notify support for the Twilio product. Requires a separate contract with Twilio for SMS/ Voice capabilities.

Customer Service Management plugins and descriptions (continued)

Plugin	Description
	• **Openframe (com.sn_openframe)**: Provides an interface that can be used to integrate external communication systems with the ServiceNow AI Platform.
Customer Central [com.sn_csm_customer_central]	Enables customer service agents to access all customer information and activity in a single, centralized view on Agent Workspace.
Customer Communities [com.sn_customer_communities]	Enables users to connect, engage, and collaborate with employees, customers, partners, and prospects. Available to customers who are licensed for Customer Service Management.
Customer Project Management [com.snc.csm_ppm]	Provides the ability to create and manage projects for a customer account and gives end users visibility into their projects via the portal. This plugin requires the Customer Service plugin and the PPM Standard plugin.
Customer Service Case Action Status [com.snc.csm_action_status]	Provides a Customer Service-specific application of the Action Status Automation feature. Use this plugin to display and track blocking tasks for customer service cases.
Customer Service Case Types [com.snc.csm_case_types]	Enables customers to manage complex case processes by defining new case types. A case type represents an individual business process and is a collection of diverse inputs and tasks that an agent performs to resolve customer requests.
Customer Service CTI Demo Data [com.snc.customerservice_cti_demo]	Provides demo data for the CTI Softphone application. **Note:** Starting with the Yokohama release, Customer Service CTI Demo Data is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported. ServiceNow Voice with Amazon Connect provides the latest experience for this functionality. For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.
Customer Service Document Template [com.sn_csm_doc_template]	Enables you to configure the fields from a table record that are included in an output document.
Customer Service Household [com.snc.household]	Enables managing customer service for consumers belonging to the same household. Provides the ability

Customer Service Management plugins and descriptions (continued)

Plugin	Description
	to define the members of a household and relationships between them.
Customer Service Install Base Management [com.snc.install_base]	Enables customers to capture the current state of a customer's install base and establish the relationship to any downstream entities that might impact their functioning.
Customer Service Management Demo Data [com.snc.customerservice.demo]	Provides demo data for the Customer Service Management application.
Customer Service Mobile [com.sn_csm_mobile]	Enables the mobile user interface for Customer Service Management.
Customer Service NLU Model for Virtual Agent Conversations [com.sn_csm.nlu]	This plugin contains NLU models used in the VA topics for Customer Service related use cases.
Customer Service Virtual Agent Conversations [com.sn_csm.virtualagent]	This plugin contains prebuilt template conversation topics for CSM related use cases. They are intended to be copied and configured.
Customer Service with Field Service Management [com.snc.csm_fsm_integration]	This plugin provides an integration between the Customer Service Management and Field Service Management applications. Customers and consumers can view case-related work orders from the Customer Service and Consumer Service Portals. In the Field Service Management application, users can view account and contact information on work orders and work order tasks.
Customer Service with Request Management [com.sn_cs_sm_request]	Provides an integration between Customer Service Management and the Request Management application. Enables users to create request records from a Customer Service case.
Customer Service with Service Management [com.sn_cs_sm]	Provides an integration between Customer Service Management and the Incident, Problem and Change Management applications. Enables users to create incident, problem, and change records from a Customer Service case.
Customer Service with Service Portfolio Management [sn_csm_spm]	Provides an integration between the Customer Service Management and the Service Portfolio Management (SPM) application. This integration gives customer service managers, customer service agents, and service owners visibility into sold products and their service offerings.
Incident Assignment Workbench Demo	Intelligent agent recommendation through dynamic matching rules/criteria.

Customer Service Management plugins and descriptions (continued)

Plugin	Description
(com.snc.incident_assignment_workbench_demo)	
Guided Decisions [com.snc.guided_decisions]	Enables the framework and execution engine for creating guided decisions.
Guided Decisions - Guidance [com.snc.guided_decisions_guidance]	Enables the framework for creating a guidance for guided decisions.
Guided Decisions for Playbook in Workspace [com.snc.guided_decisions_playbook_experience]	Enables activity types, definitions, and UI components for the display of guided decisions in a playbook on Workspace.
Knowledge Product Entitlements [com.snc.kb_product_entitlements]	This plugin enables customer service administrators to restrict customer access to designated knowledge bases and knowledge articles on the customer self-service portal. This plugin adds the Knowledge Product Entitlements menu to the application navigator.
Major Issue Management [com.sn_majorissue_mgt]	A set of capabilities used to manage customer-facing communications and resolution processes for common issues.
Outsourced Customer Service (com.snc.csm_ocs)	Enables organizations to outsource customer service to external service providers.
Performance Analytics - Content Pack - Customer Service [com.snc.pa.customer_service]	Performance Analytics content pack that includes Customer Service base system KPIs.
Performance Analytics - Content Pack - Customer Service Management - Advanced [com.snc.pa.customer_service_advanced]	Updates the Customer Service dashboard and incorporates indicators for the following plugins: • Major Issue Management • Customer Service Case Action Status • Customer Service with Request Management • Customer Service with Service Management • Agent Chat • Advanced Work Assignment for CSM • Performance Analytics - Content Pack - Advanced Work Assignment Activate these plugins to view the related indicators. Without these plugins, indicators may not display correctly.

Customer Service Management plugins and descriptions (continued)

Plugin	Description
Performance Analytics - Context Sensitive Analytics for Customer Service [com.snc.pa.cs.context_sensitive_anal	This plugin enables you to open context-sensitive dashboards in customer service forms based on UI actions. **Note:** You can activate Performance Analytics solutions on instances that do not have Performance Analytics to evaluate the functionality. However, to collect scores for indicators you must license Performance Analytics.
Performance Analytics Premium for Customer Service [com.snc.pa.premium.cs]	Installing this plugin removes the limitations of the out of box Performance Analytics.
Playbooks for Customer Service Management [sn_csm_playbook]	Provides step-by-step guidance for customer service cases.
Predictive Intelligence for Customer Service Management [com.snc.csm_ml]	Enables customers to leverage machine learning algorithms for searching related cases in Customer Service Management. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details. The Predictive Intelligence for Customer Service Management plugin activates these related plugins if they are not already active: • Customer Service plugin (com.sn_customerservice) • Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) • Email Notification Script for Contextual Search Results plugin (com.snc.adv_cxs_results_email_script)
Self-Service Analytics for Customer Service [com.snc.pa.self_service_analytics_csm]	Tracks case reduction (deflection) metrics and self-service KPIs using performance analytics dashboards. Activation of this plugin on production instances may require a separate Performance Analytics license. Contact ServiceNow for details. The Self-Service Analytics for Customer Service plugin activates these related plugins if they are not already active:

Customer Service Management plugins and descriptions (continued)

Plugin	Description
	• Customer Service plugin (com.sn_customerservice) • Self-Service Analytics Core plugin (com.snc.self_service_analytics_core) • Self-Service Analytics PA plugin (com.snc.pa.self_service_analytics)
Self Service Password Reset [com.snc.password_reset]	This plugin enables locally authenticated users to request a temporary password if they forget their current one. Customer contacts can request a new password from the customer self-service portal. The Self Service Password Reset plugin activates the Password Reset plugin (com.glideapp.password_reset) if it is not already active.
Special Handling Notes Demo Data [com.snc.shn_demo]	Provides demo data for the Special Handling Notes application.
Targeted Communications [com.sn_publications]	Provides a tool for publishing and distributing content and articles to both internal and external customers.
Targeted Communications Demo Data [com.snc.publications_demo]	Provides demo data for the Targeted Communications application.
Time Recording for Customer Service [com.snc.csm_time_recording]	Extends the functionality of the Time Card Management and Cost Management applications to Customer Service Management.
Walk-Up for CSM [com.snc.walkup_for_csm]	Walk-up experience for Customer Service enables in-store support to assist onsite check-ins, managing queues, and customer interactions.
UI Components for Customer Portals [sn_ciwf_ui_cmpnt]	This plugin enables you to configure the behavior, content, and layout of a portal using a Configurable Portal Widgets.

Customer Service properties

Use system properties to customize the Customer Service Management application.

These properties control settings for several different features, including email communication, asset contact relationships, and the Consumer Service Portal.

To access these properties, navigate to **Customer Service** > **Administration** > **Properties**.

You can also access Customer Service Management properties in the System Property [sys_properties] table by entering **sys_properties.list** in the application navigator and pressing Enter. Then you can filter the list of properties by application.

Configure foundation data

With Customer Service Management, you can import or create customer information including names, addresses, and phone numbers; account details; products and assets; and service contracts. You can also assign roles to users and create customer relationships.

Before you begin

Role required: admin

About this task

Foundation data includes all of the data that you need to configure in order to support your customers. This includes information about:

- Customers (external users)
- Customer relationships
- Users (internal users such as agents and employees)
- Customer and user roles
- Products and assets
- Service contracts and entitlements

You can import and configure most of this foundation data using the Customer Service Management guided setup. This feature takes you through the entire setup and configuration process.

To create new data, such as adding new accounts and contacts, you can use the Customer Service Management application.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.

   The guided setup reopens with a page of different categories of Customer Service Management features that you can configure.

3. In the Foundation Data category, click **Get Started**.

   The Foundation Data page opens with a list of tasks to configure the different types of customer information.

4. To perform a task, click **Configure**.

Foundation Data configuration tasks

Task	Description
Import Accounts	In the business-to-business (B2B) model, an account is a supported external customer. Import and verify existing account data. For more information, see Import accounts and contacts with guided setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
	Note: After importing customer account data, you must also set the account code system property.
Import Contacts (B2B)	A contact is a user who is an employee of an account. Import and verify existing contact data. For more information, see Import accounts and contacts with guided setup.
Import Consumers (B2C)	A consumer is a customer in the business-to-consumer (B2C) business model. Import and verify existing consumer data. For more information, see Import consumers with guided setup.
Import Users	A user is an individual who can access your instance. Import and verify existing user data. For more information, see Configure users and groups.
Import Groups	A group is a set of users who share a common purpose. Import and verify existing group data. For more information, see Configure users and groups.
Import Group Members	The users associated with a group are listed as group members. Import and verify existing group member data.
Assign Roles	Roles control access to features and capabilities. The Customer Service Management application provides two types of roles: ○ Internal roles for agents and managers ○ External roles for customers, customer partners, and consumers Assign the necessary roles to internal and external users. For more information, see .
Create Customer Relationships	Create relationships between partners, contacts, and customers to make account and asset management easy and flexible. For more information, see Create customer relationships. You can create the following types of relationships: ○ Bi-directional account relationships ○ Account hierarchy ○ Contact relationships

Task	Description
Import Product Models	A product is a type of good or service that your company sells and supports. Product models identify different types of products, such as service, hardware, software, or consumables. For more information, see Import product models with guided setup.
Import Sold Products	Sold products are products and components that have been sold to an account or a consumer. Importing sold products provides an overview of the complete product sold to an account or consumer. For more information, see Import sold products with guided setup.
Create product model and catalog items relationships	Enable self-service for customers to request services on products by creating relationships between product models and catalog items. For more information, see Configure product model and catalog item relationships.
Import Install Base Items	Install base items represent the instances that have been configured for a customer. Each install base item references the configuration item record for the customer. For more information, see Import install base items with guided setup.
Import Installed Products	Installed products create an association between sold products and install base items. Installed products also provide information on the sold products and how they are deployed or installed. For more information, see Import installed products with guided setup.
Import Assets	An asset is a specific product or instance that is supported for a customer. There are different types of assets and Information for each type of asset is stored in a different table. For more information, see Import assets with guided setup.
Create Asset Contact Relationships	Assign assets to the customer contacts who are responsible for managing those assets. If desired, enable a property that limits access to asset information to just the assigned contacts. For more information, see Create asset contact relationships.
Create Service Contracts	A service contract contains information about the type of support that is provided to a customer and can include coverage for specific assets. It can also include multiple service entitlements and SLAs. For more information, see Create service contracts.

Task	Description
Create Entitlements	An entitlement defines the type of support that a customer receives as well as the supported communication channels. Entitlements are counted and tracked using two types of units: cases and hours. For more information, see Configure entitlements.
Create Account Teams	Account teams are made up of employees who fulfill specific jobs or roles for a particular account. Create these roles, or responsibility definitions, and then assign them to employees and contacts. For more information, see Creating an account team.

Customer Service Management and the CSDM guidelines

CSM enables you to provide service and support for your external customers through communication channels such as the web, email, chat, telephone, and social media. The goal of this use case is to understand how CSM key entities work with the core CSDM framework.

CSM use case

CSM provides proactive customer service, decreases cost of service, and provides end-to-end visibility to both customer service and service delivery groups. For more information, see Integrating with Service Portfolio Management.

For information on setting up the data, see Configure foundation data.

Results of the CSM use case

Understand the tables within the CSDM framework that are needed to support the following CSM functionality:

- Service-aware Install Base
- Proactive Customer Service Operations
- Real Time Service Health and Outage Tracking
- Contextual Service Catalog

The following sections include details of the activities needed for the use case.

See Applying CSDM guidelines to your product — product views for more information on Common Service Data Model use cases.

CSM data model

CSM uses the following key entities to resolve complex end-to-end issues.

- A **case** is the primary entity of CSM. CSM uses cases to track and resolve customer questions or issues.
- Customer information is linked to a case using associated entities such as Accounts, Contacts, Consumers, Household, Products, and Service Contracts. This information provides the customer service agent the information necessary to resolve customer issues.
- An **account** can be a customer account, a partner account, or both.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

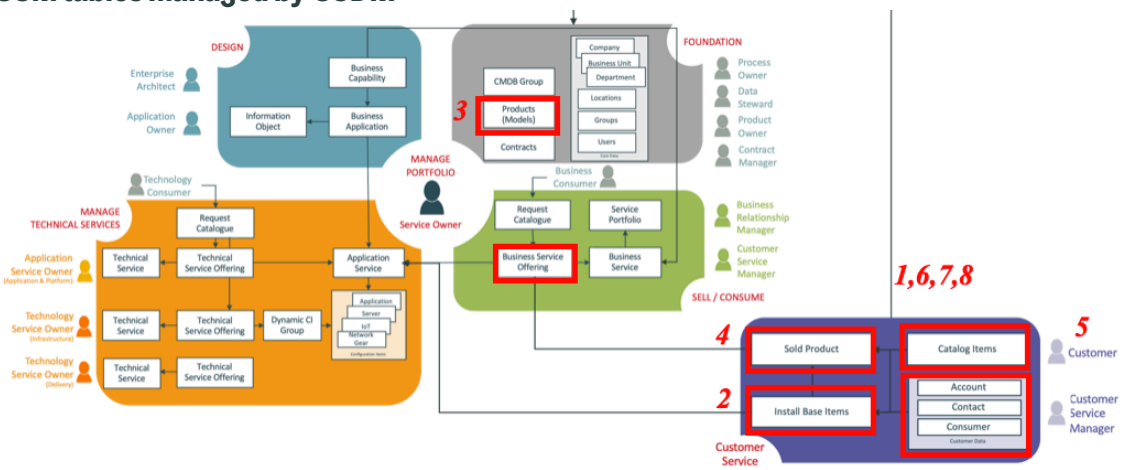
- The **contact** is an employee of an account. A contact record stores information about a contact, such as the name, phone number, and email address. A contact can also have a user ID and can log in to the customer portal.
- A **consumer** is a customer in the business-to-consumer (B2C) business model.
- Household defines the consumers who constitute a household, and the relationships between household members.
- Sold Product tracks the products or services sold to an account or consumer.
- Install Base Items represent the instance of the product that has been configured for a customer.
- Service Contract defines the type of support that customers receive. A contract can include an account and contact or a consumer and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs.
- Entitlement specifies the type of support that a customer receives as well as the supported communication channels.

Customer Service Management and CSDM tables

Customer Service Management manages and uses CSDM tables. Several ServiceNow products benefit from and add value to Customer Service Management.

CSM tables managed by CSDM

CSM tables managed by CSDM



CSM references the following CSDM tables:

1. Sold Product table [sn_install_base_sold_product in CSM

   Represents the product purchased by an Account or Consumer, and references the Product Model table [cmdb_model] or Service Model table [cmdb_service_product_model] for a Customer (Account or Consumer).

2. Install Base Item table [sn_install_base_item] in CSM

   Represents the products installed or in use by an account or consumer. Install Base Items are CIs consumed by the customer and generally reference the Application Services table [cmdb_ci_service_discovered] for SaaS products.

   Multiple sold products can be used on a given Install Base Item by using the Installed Products table [sn_install_base_m2m_installed_product].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. A Service Model references the Service Offerings table [service_offering]. Multiple Service Offerings can be associated with a single Service Model.
4. After the product is sold to a customer, the Sold Product table references the Service Offering table [service_offering]. This reference helps to identify the customers subscribed to an offering.
5. Customers can request services related to the products they have purchased by linking the Catalog Items table [sc_cat_item] to the Product Model or Service Model by using the Product-to-Catalog Items Relationships table [sn_prod_cat_rel_m2m_product_catalog_item].
6. Account table [customer_account] in CSM

   Extends the Company table. The Account table can be a customer account, a partner account, or both.

7. Contact table [customer_contact] in CSM

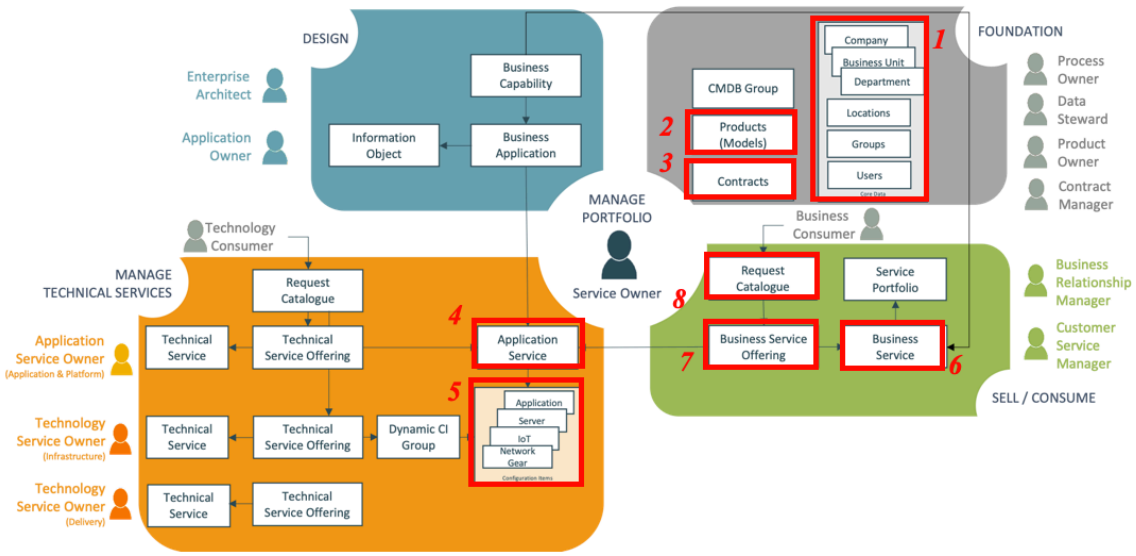
   Extends the User table. A user is an employee of an account. A contact record stores information about a contact, such as the name, phone number, and email address. A contact can also have a user ID and can log in to the customer portal.

8. Consumer table [csm_consumer] in CSM

   A consumer is a customer in the business-to-consumer (B2C) business model.

CSDM tables used by CSM

CSDM tables used by CSM



1. Company [core_company], Business Unit [business_unit], Department [cmn_department], Location [cmn_location], Groups [sys_user_group], Users [sys_user]
2. Product Model tables [cmdb_model], and [cmdb_service_product_model]
3. Contract table [ast_contract]
4. Mapped Application Service table [cmdb_ci_service_discovered]
5. Configuration Item table [cmdb_ci_*]
6. Business Service table [cmdb_ci_service_business]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Business Service Offering table [service_offering]
8. Request Catalog table [sc_cat_item]

Products that add value to CSM

When you use CSM with other ServiceNow products, you increase the value you get from CSM. These other ServiceNow products include:

IT Service Management (ITSM)

Services have the context of the business, applications, information, and technologies layered beneath them.

Event Management

Enables organizations to identify service health-related issues on a single management console. Event Management provides alert aggregation and root cause analysis (RCA) for discovered services, application services, and automated alert groups.

Service Portfolio Management (Service Portfolio Management)

Enables organizations to document and manage services using a standardized, structured format.

Products that benefit from CSM

IT Service Management (ITSM)

Enables organizations to link incidents, problems, changes, and requests to cases, and have the context of the customer (consumer or account) reporting the issue.

IT Operations Management (ITOM)

Enables organizations to identify the Install Base Items and the customers affected by service issues. Helps organizations to provide proactive customer service.

Service Portfolio Management (Service Portfolio Management)

Enables customers that have subscribed to the Service Offering to see who owns the service.

Customer Service Management examples

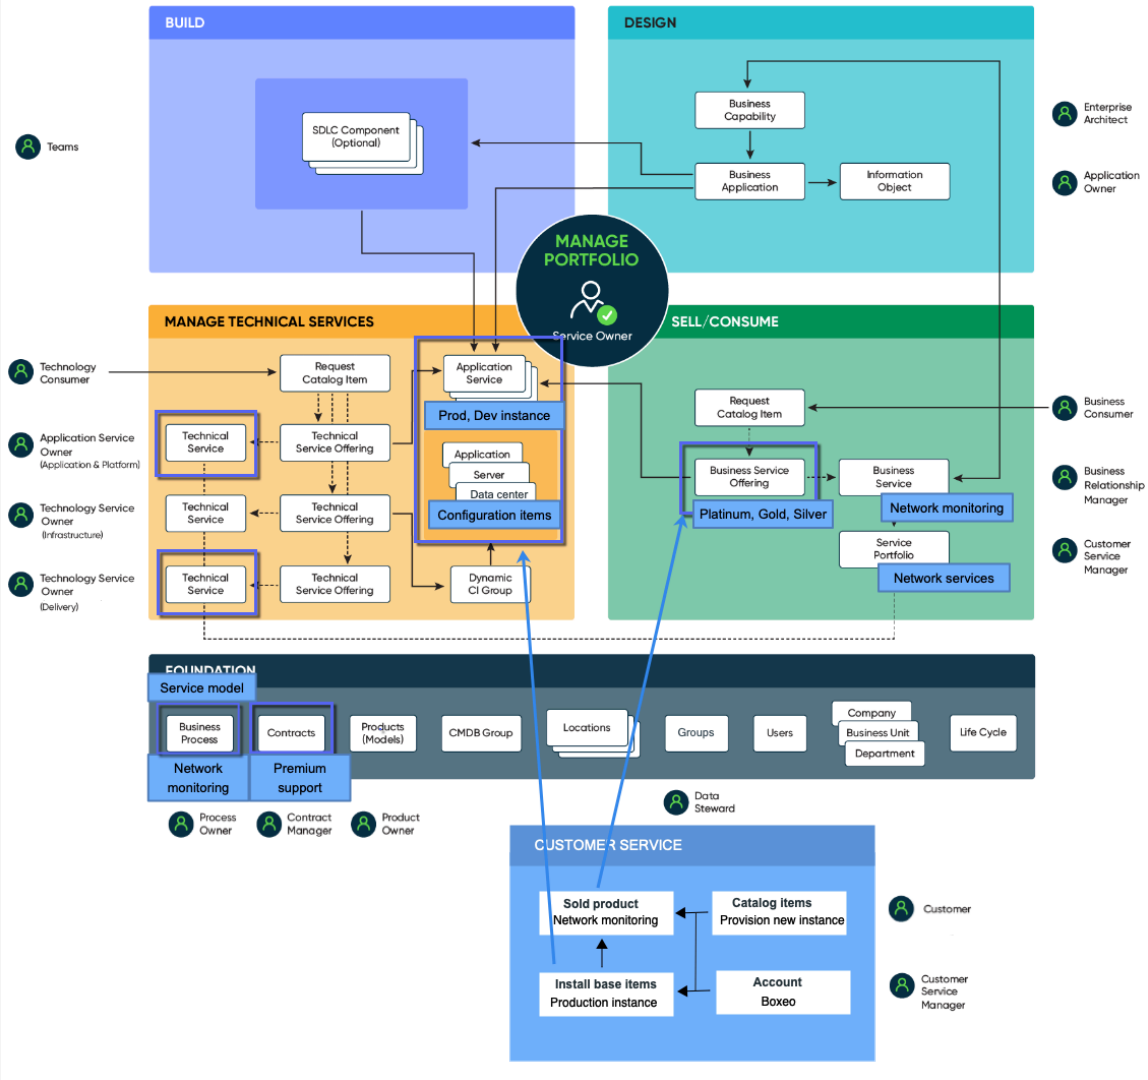
In this example, the CSDM helps the fictitious ACME technology company use CSM to manage network monitoring services for customers.

Example scenario: Key personas and how they benefit

ACME offers a network monitoring service to its enterprise customers who can purchase either the Platinum, Gold, or Silver offering. A customer, Boxeo, has purchased the network monitoring Platinum offering (Sold Product) and is using it in development and production environments (Install Base Item).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM data model example

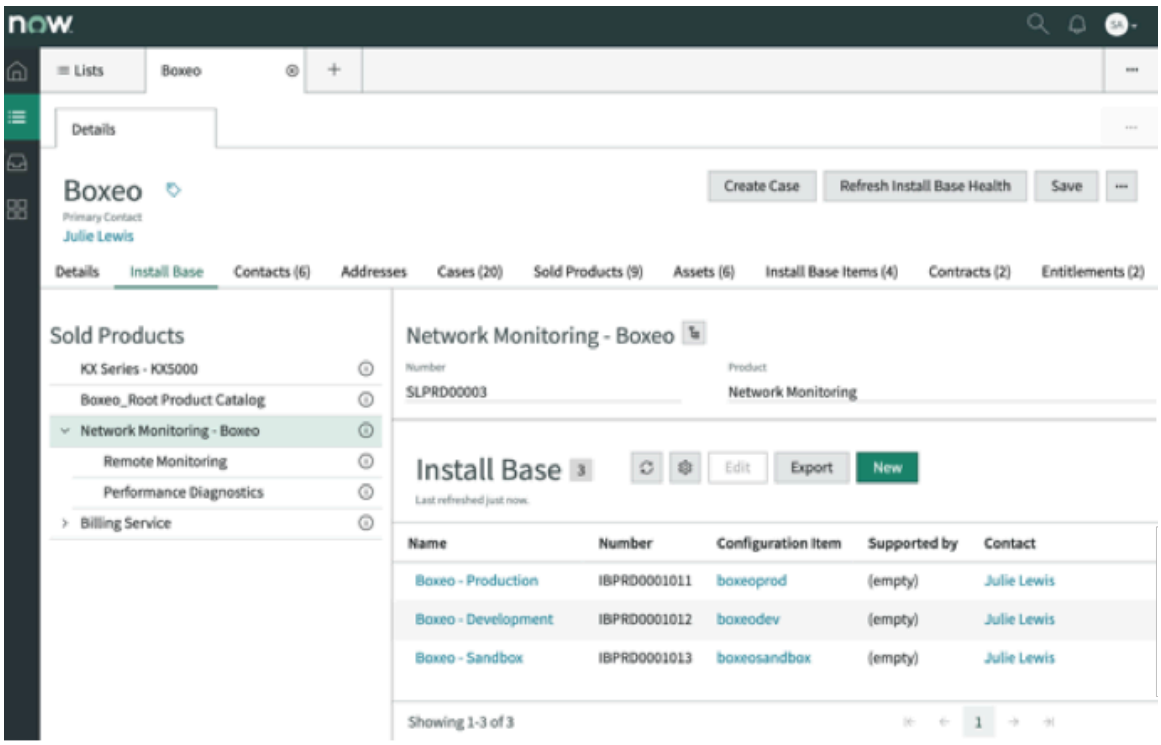


The key personas (customer service agents, network operations center (NOC) engineers, service owners, and customers) can complete the following tasks:

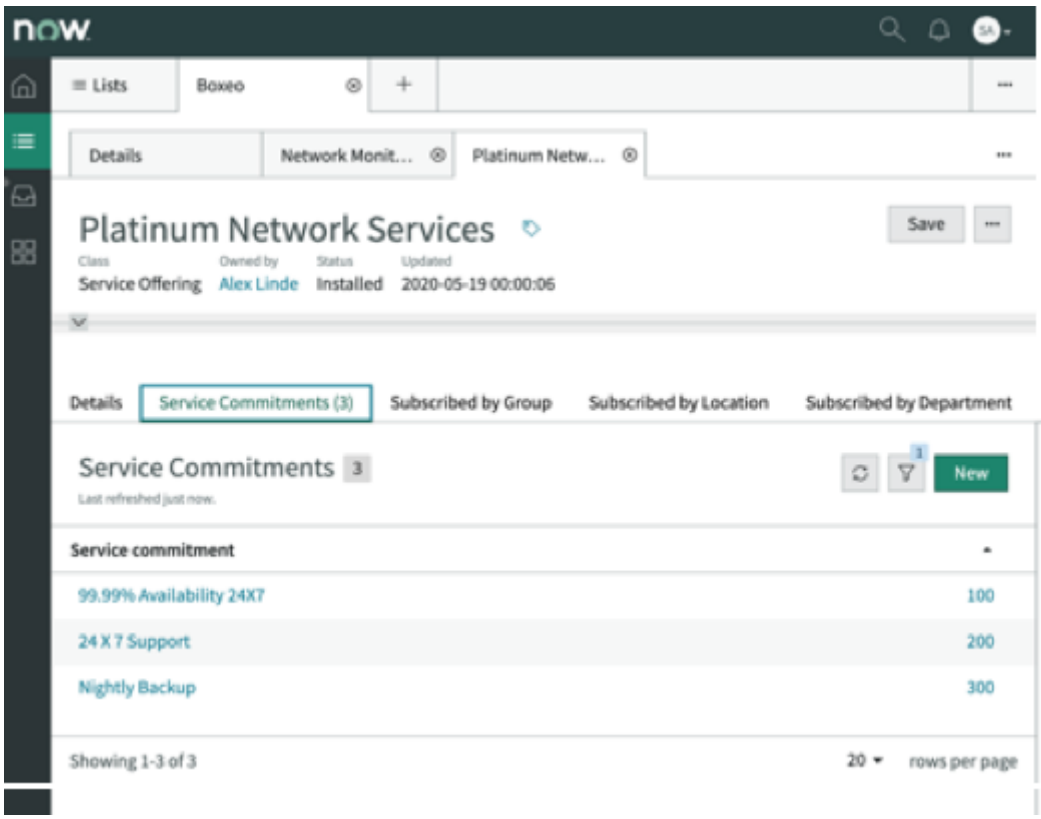
Customer service agents can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the products and services that the customer has purchased (Sold Product) and installed (Install Base).

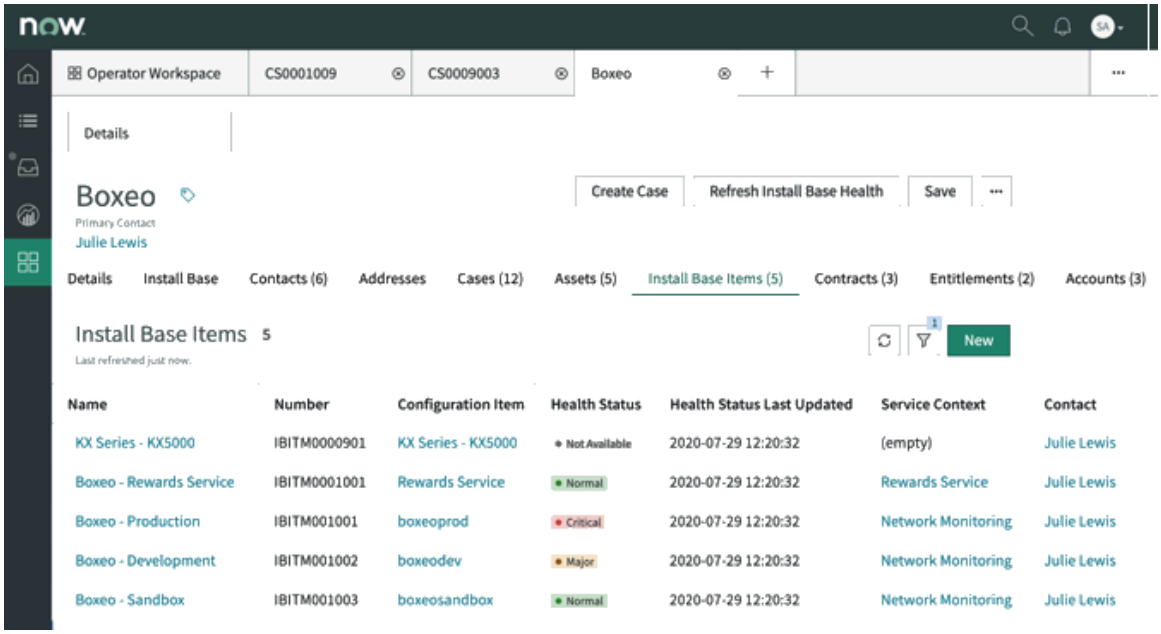


- View the service offering associated with the sold product. The sold product references the service offering.



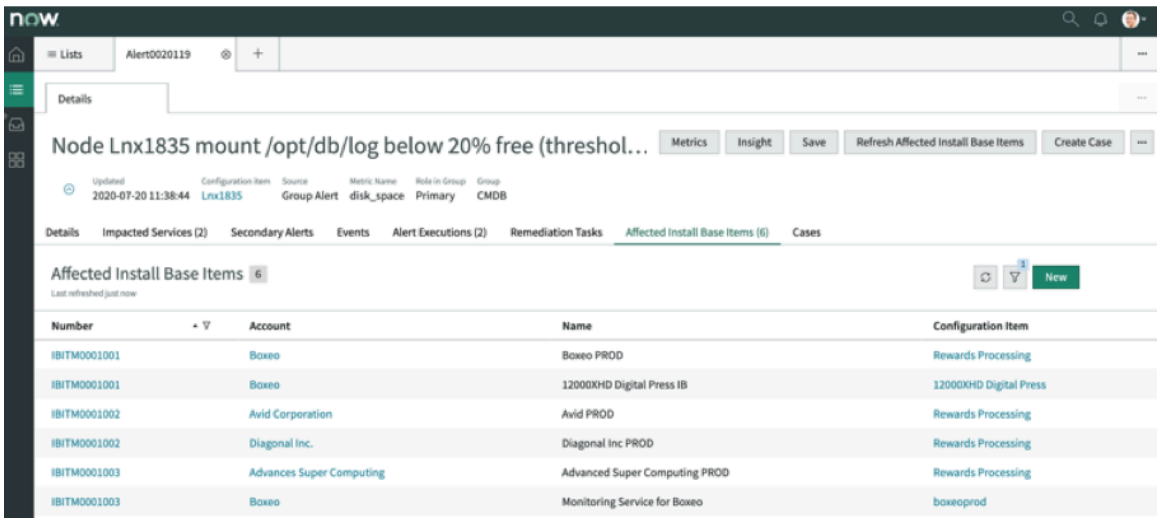
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the health status of Install Base Items



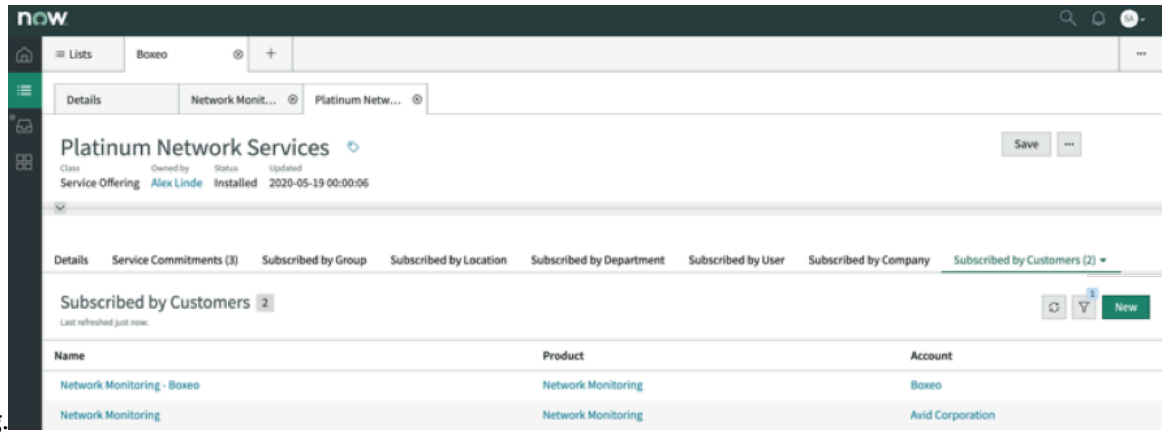
NOC engineers can: View customers affected by a service issue and inform customer service. Specifically, they can perform the following operations:

- View the affected Install Base Items and add it to or remove it from an Account. The Install Base item references the application service (CI). The CI it depends on should be one of the CIs affected. The CI should also be referenced in the Alert to show that Install Base Item (and therefore the Account or Consumer) as affected.
- Create a proactive case from an alert and inform the customer service team of the service issue or outage.



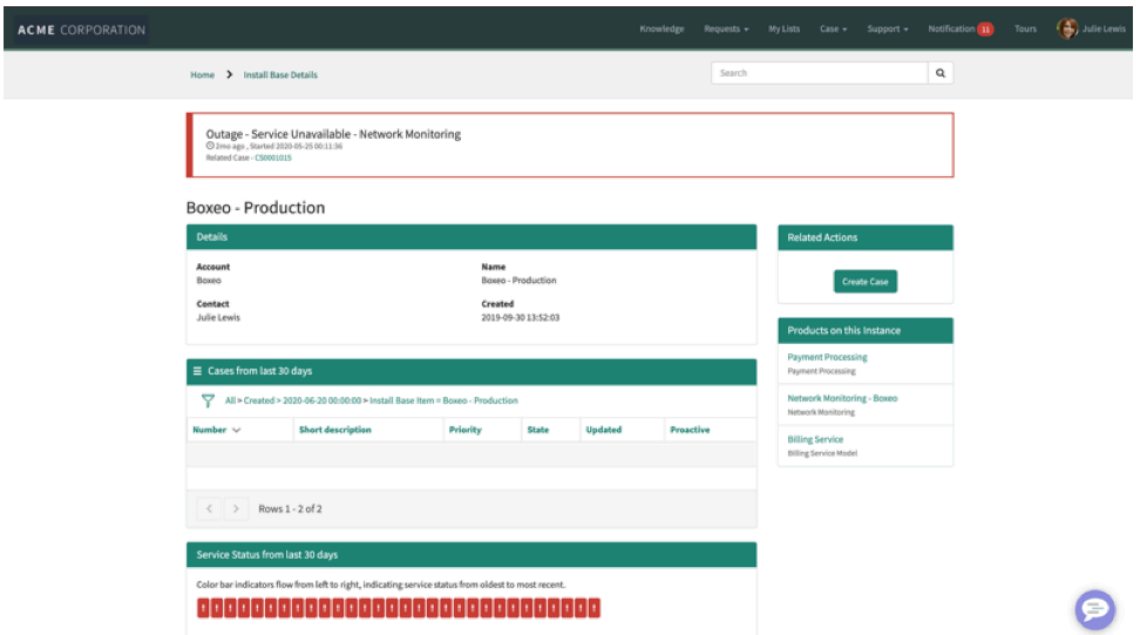
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service owners can: View the customers that are subscribed to a service offering.



Customers can:

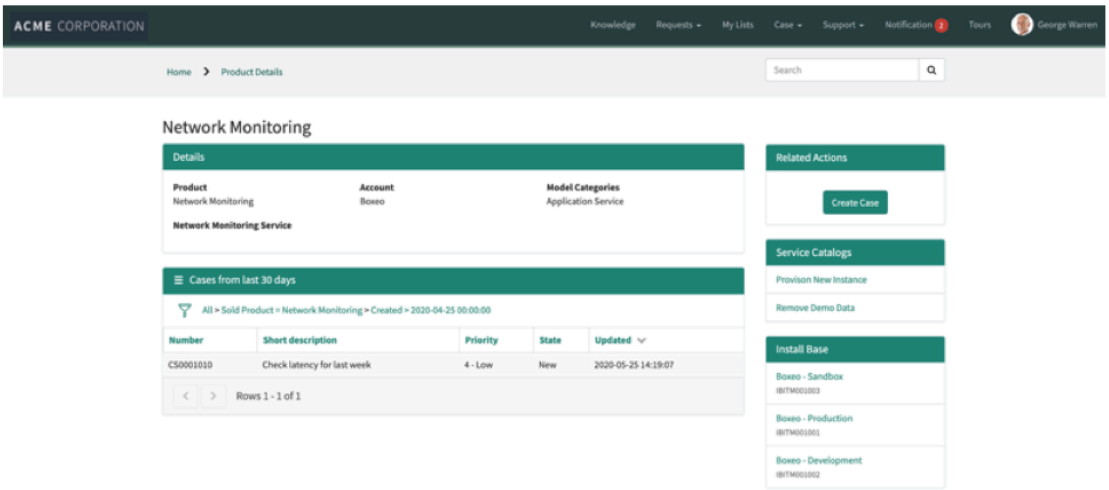
- View the install base items and details.
- View outages and service issues.



- View products they have purchased.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

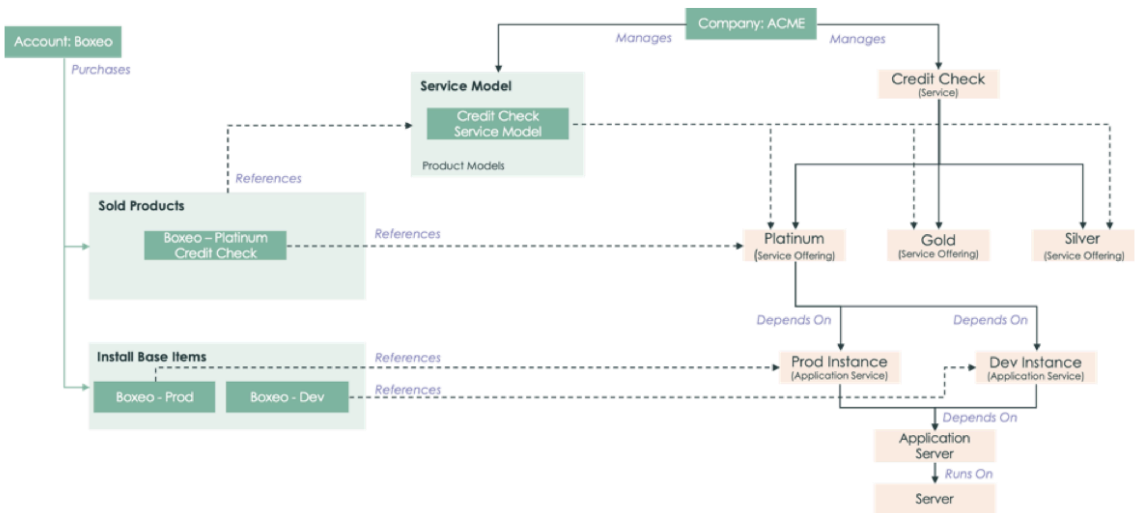
- Request services related to the products they've purchased.



Example CSM and CSDM use cases

Service with multiple packages

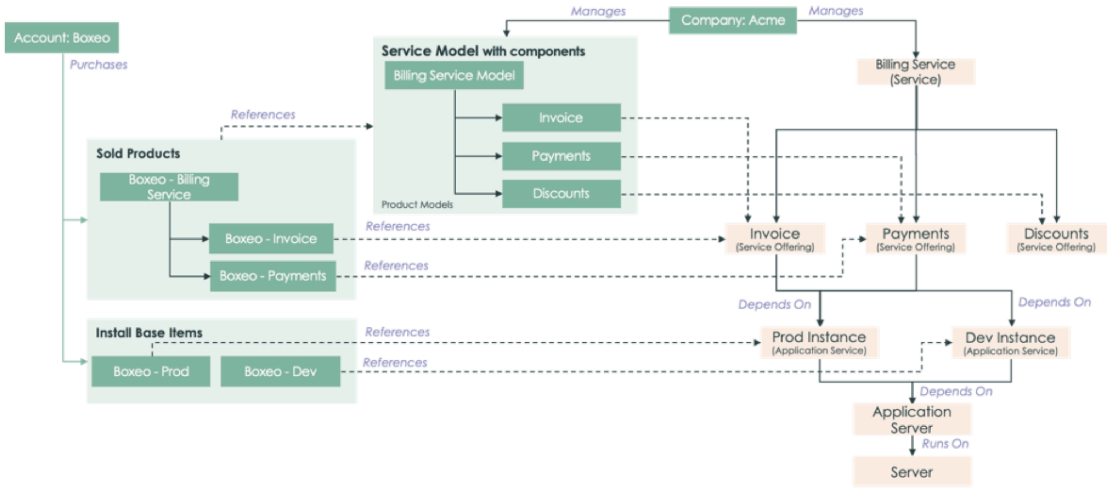
ACME offers a Credit Check Service to its enterprise customers. They can purchase the Platinum, Gold, or Silver offering.



Service with optional components

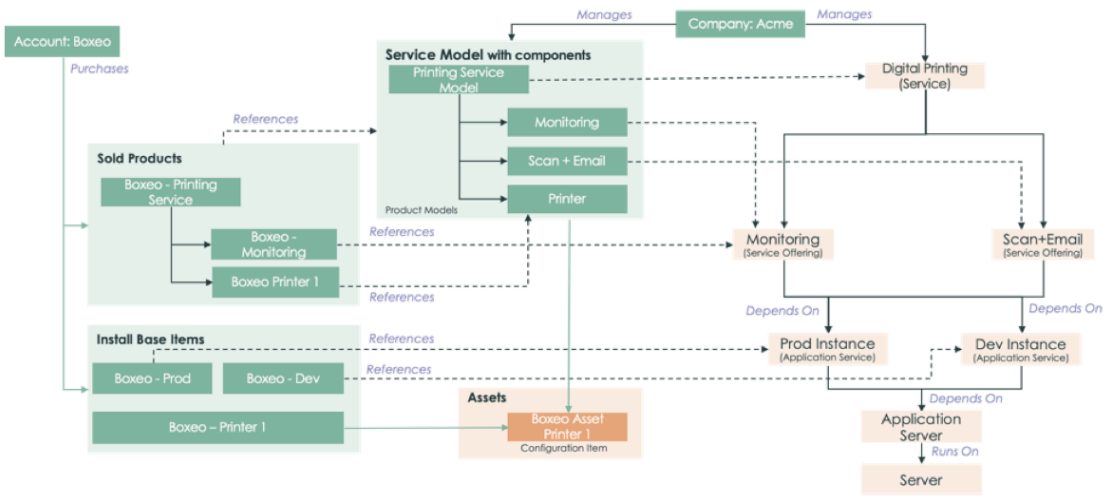
ACME offers a Billing Service to its enterprise customers. They can purchase the bundle or one or more of the component offerings (for example, invoices, payments, or discounts).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



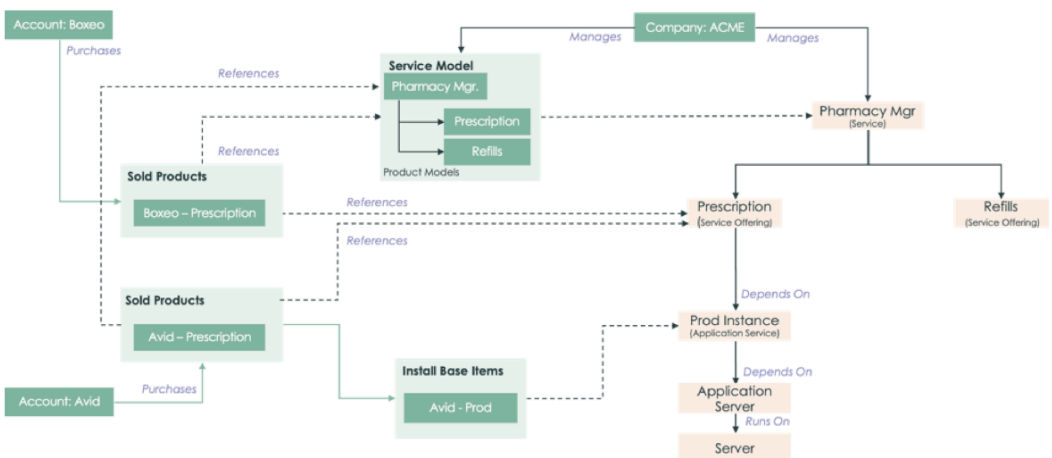
Service with a physical product

ACME offers a Digital Printing Solution. Customers can purchase either the bundle or the printer along with one more service offering (for example, Scan and Email Monitoring).



Service sold to multiple customers

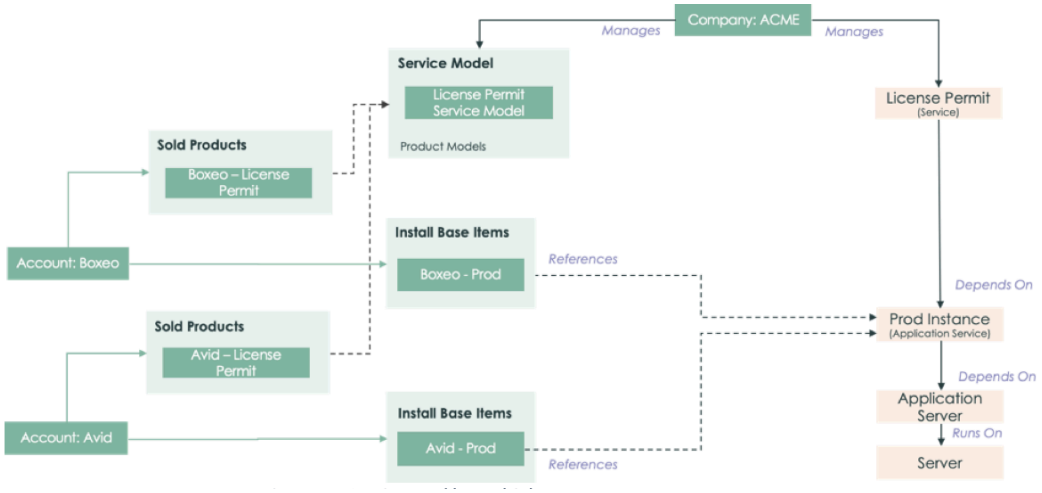
ACME sells a Pharmacy Manager Service to two customers: Boxeo and Avid Inc.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service used by multiple customers

ACME deploys both Boxeo and Avid on the same production instance (multi-tenant model).



Service used on-premises

ACME offers an Order Management service. This purchase is tracked in the ServiceNow AI Platform but is used on-premises.

Customer Service Management considerations

Consider these points while implementing the CSDM framework.

Considerations

- What is a Service-aware Install Base?

  A Service-aware Install Base enables companies to track the digital products and services in use. A Service-aware Install Base also tracks the relationships of the products and services to dependent services and CIs that affect their health.

- What are Proactive Customer Service Operations?

  Proactive Customer Service Operations bring CSM and Event Management together to enable companies to proactively trigger case workflows and notify the affected customers.

- Do I must purchase CSM Professional package to use the Service-aware Install Base?

  No. The Service-aware Install Base is included in the CSM base system.

- Can multiple sold products reference the same service offering?

  Yes. Multiple sold products (that is, Service Models) purchased by different companies can reference the same service offering. For example, multiple customers can purchase the same SaaS offering with the same service commitments.

- Can multiple Install Base Items reference the same application service?

  Yes. Multiple Install Base Items (either for the same account or for different accounts) can reference the same application service. For example, a multi-tenant SaaS offering where multiple customers (each with their own Install Base Item) are used on the same production instance (application service).

- When do I create an incident rather than a proactive case from an alert?

  Typically, some companies create an incident so that their NOC engineers can resolving the issue. After they determine that the issue impacts multiple customers, they also proactively create a major case and related child cases (one for each impacted customer) to notify the affected customers. Thus, the alert, incident, and case are all linked.

  Updates made by the resolving teams to the incident status or additional comments are reflected in the case. The customer service teams use these updates to keep customers informed.

  To meet the customer notification time requirements of the SLAs, companies may also automate creating incidents and cases from the alert. In addition, companies can also create a proactive case from the alert while the issue is being resolved.

- What is the difference between entitlements managed at the CSDM Service Offering and the CSM Contracts and Entitlements?

  Service Commitments in CSDM define the expected level of a service. A service offering consists of a set of service commitments which uniquely define the service offerings. For example, a service offering may include a service commitment to perform a data backup each night.

  Service contracts in CSM store information about the type of support that is provided to a customer. A contract can include an account or consumer, a contact, and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs. An entitlement defines the type of support that a customer receives, as well as the supported communication channels. For example, a customer may sign a service contract to receive support from 6:00 a.m. to 9:00 p.m. on weekdays.

- How can I request additional services based on the product that I've purchased?

  The relationship between the product model and the catalog items enables you to use the customer portal to request additional services for the products you've purchased. Multiple catalog items can be associated with a product model.

- Do I need elements from all the CSDM domains to set up CSM?

  No. The approach mentioned in this use case is based on the recommended guidelines and assumes you are in the Run or Fly stage of the CSDM implementation. See Implementing the CSDM framework in stages for more information.

  When you're implementing CSM, start with the tables in the CSDM Foundation domain and the CSM Customer Service domain. Using these domains enables you to leverage the capabilities included in CSM.

  To enable the proactive customer service operations, use tables from the CSDM Manage Technical Services domain for monitoring the application services tied to the customers' install base. Using this domain enables you to leverage the CSM and ITOM integration.

  Service-centric organizations can leverage the tables from the CSDM Sell/Consume domain to connect the product model to the service offerings and then to sold product. These connections enable you to track the service portfolio and see a complete view of how customers are consuming services.

Customer data

Customer data for Customer Service Management (CSM) consists of information about people who are not part of your organization, including accounts, contacts, consumers, and households.

Accounts

An account is a customer or a partner who sells to and supports other customers. Accounts can be customer accounts, partner accounts, or both, and their information is stored in the Account [customer_account] table.

There are two types of accounts: customer accounts and partner accounts.

- A partner is a supported external customer that sells to and supports other customers. A partner can report and manage cases on behalf of customers. A partner can also be a customer.
- An account can be a customer account, a partner account, or both. The **Customer** and **Partner** fields on the Account form denote the account type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contacts

A contact is an employee of an account and can be associated with only one account. Contacts can have multiple assets and service contracts and can log in to the Customer Service Portal.

Contact information is stored in the Contact [customer_contact] table.

Consumers

A consumer is a customer in the business-to-consumer (B2C) business model and their information is stored in the Consumer [csm_consumer] table.

Households

A household is a group of consumers who live at the same address and share products and services. A household can have a designated head of household and multiple current members. The head of household has access to all of the cases and information for the other household members.

Household information is stored in the Household [csm_household] table.

Configure accounts and contacts

An account is a supported external customer and a contact is a user who is an employee of an account.

Before you begin

Role required: admin

About this task

There are two types of accounts: customer accounts and partner accounts. The **Customer** and **Partner** fields on the Account form denote the account type. An account can be a customer account, a partner account, or both.

A partner is a supported external customer that sells to and supports other customers. A partner can report and manage cases on behalf of customers. A partner can also be a customer.

Note:
After importing customer account data, you must also set the account code system property.

An account can have multiple contacts but a contact can be associated with only one account. A contact can have one or more associated assets and service contracts. A contact can also have a user ID and can log in to the customer portal.

Note:
A contact is a user in the system. If you create a contact, that person is also added to the User table (sys_user).

Procedure

- You can import existing accounts and contacts using guided setup.
- You can create new accounts and contacts using the Customer Service Management application.

Import accounts and contacts with guided setup

Use Customer Service Management guided setup to import existing accounts and contacts.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

After importing customer account data, you must also set the account code system property.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Foundation Data category, click **Get Started**.
3. Click one of the following:
   - **Import Accounts**
   - **Import Contacts**
4. Upload data from an external data source into an import set.
5. Create a transform map.
6. Execute the transform map to transfer the data.
7. Verify that the data records are imported into the target table.

Account codes and account paths

An account code is a unique identifier for an account, while an account path establishes the account hierarchy.

Account codes

An account code is a unique key that identifies an account in a ServiceNow instance. This code is stored in the **Account Code** field on the Account form.

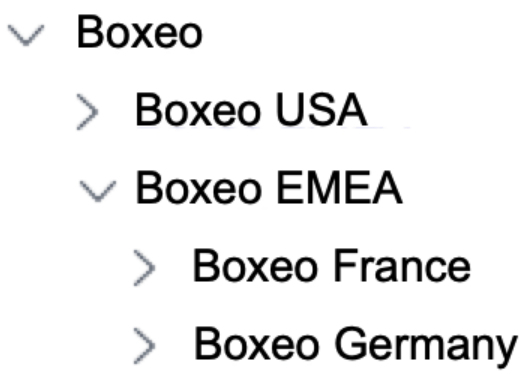
An account code must be unique. Attempting to insert a new record with previously existing account code in the Account [customer_account] table, the value for the code results in the following error:

```
java.sql.BatchUpdateException: Duplicate entry for key
account_path
```

Account paths

An account path establishes the hierarchy among different accounts. This path is stored in the **Account Path** on the Account form.

An account path is a combination of the account codes for each account in the hierarchy. For example, let's use the following accounts to demonstrate account



paths.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of accounts to demonstrate account paths

Account	Account Code	Account Path
Boxeo	~~~~1	~~~~1 Boxeo is the parent company. The account path for Boxeo is the same as the account code, which indicates that it's the first element in the hierarchy.
Boxeo USA	~~~~2	~~~~1/~~~~2 Boxeo USA is a child company of Boxeo. The structure of the account path is interpreted as Boxeo/Boxeo USA.
Boxeo EMEA	~~~~3	~~~~1/~~~~3 Boxeo EMEA is also a child company of Boxeo and the structure of the account path is interpreted as Boxeo/Boxeo EMEA.
Boxeo France	~~~~5	~~~~1/~~~~3/~~~~5 Boxeo France is a child company of Boxeo EMEA. The structure of this account path is interpreted as Boxeo/Boxeo EMEA/Boxeo France.

Importing account records

If you create your account records by importing the data from some source system through a transform map, make sure you execute the business rules. The Account Path is added, updated, and deleted based on the insertion, updating, and deletion of records in the Account [customer_account] table through the business rules. If the business rules are not executed, it can result in empty account paths, which can then result in data access issues.

Note:
If you do not execute the business rules during import, run the script in the **Update account path** business rule for the newly imported records to set the account paths correctly.

Set the account code property

After importing customer account information, update the *com.snc.cs_base.last.generated.code.tree.path* property with the correct account code value.

Before you begin

Role required: admin

About this task

The *com.snc.cs_base.last.generated.code.tree.path* system property stores the **Account Code** value for the most recently created customer account in the Account (customer_account) table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you create a new customer account record, the system uses this property to determine a unique account code value for the account. The property is then updated with this latest assigned value so that the next account code value can be set as a unique value for the next account record insert.

The value of the *com.snc.cs_base.last.generated.code.tree.path* property must match the value of the Account Code field for the last inserted customer account record. When you create customer account records by importing data from other sources or instances, these values can get out of sync. If these values do not match, the system generates an error upon creation of the next new record in the Account table:

```
java.sql.BatchUpdateException: Duplicate entry for key
account_path
```

Use the steps below to fix this error.

Procedure

1. Determine the account code for the last created account.
2. Navigate to the System Property [sys_properties] table.
3. Set the *com.snc.cs_base.last.generated.code.tree.path* property to the value determined in step 1.

Create customer accounts

An account is a supported external customer. Use the Customer Service Management application to create account records.

Before you begin

Role required: sn_customerservice_manager or admin

About this task

There are two types of accounts: customer accounts and partner accounts. The **Customer** and **Partner** fields on the Account form denote the account type. An account can be a customer account, a partner account, or both.

A partner is a supported external customer that sells to and supports other customers. A partner can report and manage cases on behalf of customers. A partner can also be a customer.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** and click one of the following actions:
   - To create a customer account, click **Accounts**.
   - To create a partner account, click **Partners**.
2. Click **New** and fill in the fields on the Account form.
   When a new customer account record is created, the system uses the *com.snc.cs_base.last.generated.code.tree.path* system property to determine a unique account code value for the account. The property is then updated with this latest assigned value so that the next account code value can be set as a unique value for the next account record insert.

   Note:
   If this property is reset to the original value, the system attempts to create new accounts with account codes that are already in use, which can result in an invalid insert.

3. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create additional account addresses

An account can have multiple addresses, such as a main address as well as shipping and billing addresses.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
The main address for an account is stored in fields on the Account form. Shipping and billing addresses for an account are created and stored in the **Addresses** related list. An account can have multiple shipping and billing addresses.

Procedure
1. Navigate to **All** > **Customer Service** > **Customer** > **Accounts**.
2. Click the number of the desired account.
3. In the **Addresses** related list, click **New**.
4. Fill in the fields on the Location form.
5. Select an address type, either **Billing** or **Shipping**.
6. **Optional:** Enable the **Primary** field.
   If you have multiple billing or shipping addresses, use this field to designate one as the primary address.
7. Click **Submit**.

Create customer contacts

A contact is a user who is an employee of an account. Use the Customer Service Management application to create contact records.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
An account can have multiple contacts but a contact can be associated with only one account. A contact can have one or more associated assets and service contracts. A contact can also have a user ID and can log in to the customer portal.

Note:
A contact is a user in the system. If you create a contact, that person is also added to the User table (sys_user).

Procedure
1. Navigate to **All** > **Customer Service** > **Customer** > **Contacts**.
2. Click **New** and fill in the fields on the Contact form.
3. Enter the contact information, such as the name, email address, and phone number.
4. Enter the name of the contact's company in the **Account** field.
5. Select the **Timezone**.
6. Select a **Language**.
7. Select a **Notification** setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Submit**.
   After a registration request is approved, the customer contact receives an email with a user ID and temporary password. When logging in for the first time, the contact is asked to change the password.

Create customer relationships

The Customer Service Management application provides the ability to establish different types of relationships between partners, customers, and contacts.

These relationships make account and asset management easy and flexible. The table below describes the available customer relationships.

Customer relationships

Relationship	Description	Benefit
Bi-directional account relationship	Create a relationship between: • A partner account and a customer account. • Two customer accounts. A bi-directional account relationship is created using a defined account relationship type.	An account relationship allows partner account contacts with the partner role or the partner administrator role to create and manage cases for their partner account.
Account hierarchy	Create a parent-child relationship between accounts.	An account hierarchy allows an account contact with the customer administrator role to manage the child accounts.
Contact relationship	Add a contact from a third account to either of the accounts in an account relationship.	A contact relationship allows a contact with the customer role or customer administrator role to manage the account for which the contact relationship has been established.

Account hierarchy

Use the account hierarchy feature to create a parent-child relationship between accounts.

An account hierarchy represents the legal entity structure of the accounts and their relationships. It also represents an account's customers, assets, and service entitlements.

Customer administrators can do the following for all of the accounts in the hierarchy:

- View and create cases.
- View assets and users.
- View and manage contacts.

The system administrator defines the hierarchy between accounts on the Account form. From the Account form for the child account, select the parent in the **Parent Account** field. If this field is not filled in, the account is a top-level account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the account hierarchy has been defined, it is displayed on the Account form for the parent account. If a parent account is updated or deleted, the hierarchy for any child accounts is also updated.

View the account hierarchy

The account hierarchy uses a tree structure to show the parent, child, and sibling accounts. Two different views of the account hierarchy are available. In both views, the current account is highlighted in the account structure.

- The parent view displays the current account, the parent account (if applicable), and any child or sibling accounts.
- The full view displays the entire structure of the organization from the root account.

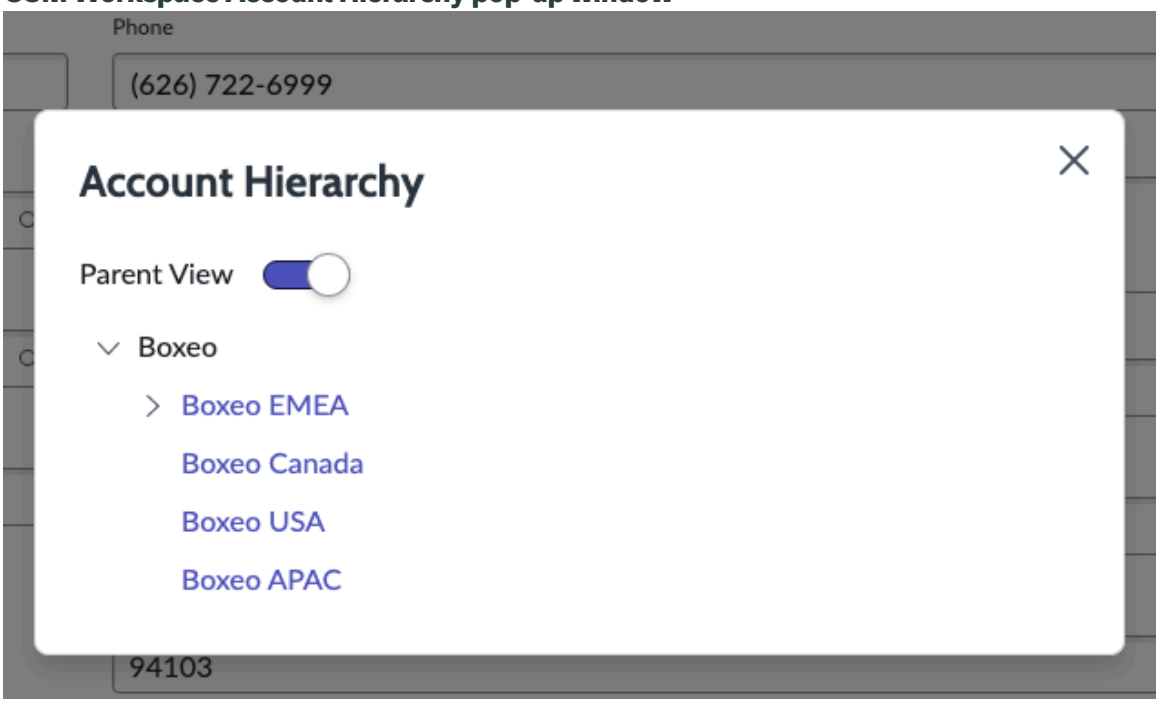
Customer service agents can:

- Expand and collapse the tree structure.
- Switch between the parent view and the full view.
- Click an account to open the related Account form.

Account hierarchy in CSM Agent Workspace

From the Account form, customer service agents can click the open hierarchy icon ( ) in the **Name** field to see the parent-child account relationships in the Account Hierarchy pop-up window. The account hierarchy is available for accounts that have a parent or child account.

CSM Workspace Account Hierarchy pop-up window

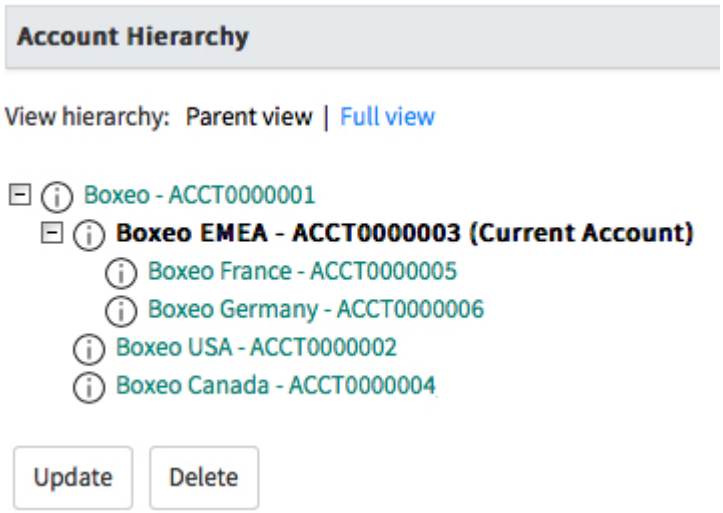


Account hierarchy in the platform interface

Customer service agents can view account information in the Account Hierarchy section on the Account form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Account hierarchy (platform interface)



Create an account hierarchy

Create a parent-child relationship between two accounts.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Accounts**.
2. Select the desired child account.
3. Select the parent for this account in the **Parent Account** field.
4. Click **Update**.
   The account hierarchy is displayed in a tree map on the Account form for the parent account.

Bi-directional account relationships

A bi-directional account relationship is a relationship that exists between two accounts. You can create account relationships between two customer accounts or between a partner account and a customer account.

A bi-directional account relationship is based on a defined account relationship type. Creating a bi-directional account relationship is a two-step process that involves:

- Defining the types of relationships that exist between your partners and customers.
- Using these relationship types to create relationship records between selected accounts.

You can view relationship records on the Account form for either account in the relationship. These records are stored in the **Account Relationships** related list.

For relationships between a partner account and a customer account, partner account contacts with the partner role or the partner administrator role can create and manage cases for their customer accounts.

Account relationship types

An account relationship type defines a relationship that can exist between accounts. Users with the system administrator role can define the following account relationship types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Account to account
- Partner to account

When creating an account relationship type, you define the following information on the Account Relationship Type form:

- The type of **source** account (account or partner).
- The type of **target** account (account or partner).
- The relationship between the source account and the target account.
- The reverse relationship between the source account and the target account.

Account Relationship Type form

Note:
One default account relationship type is provided for partner accounts.

Account relationship records

Once an account relationship type has been defined, users with the customer service manager role can use it to create relationship between specific accounts or partners. An account relationship record includes the following information:

- A source account, selected in the **Account From** field.
- A target account, selected in the **Account To** field.
- The account relationship type that this relationship record is based on.
- The relationship and the reverse relationship of the selected accounts.

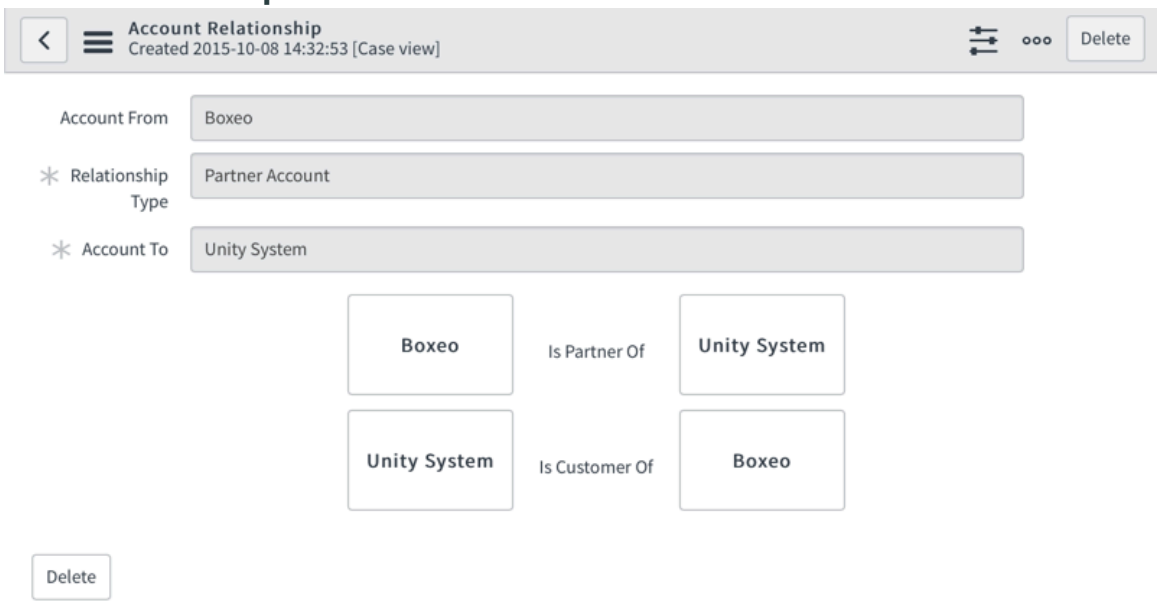
View a relationship record from either account:

- The relationship (**Account From** > **Account To**) appears in the **Account Relationships** related list on the source account record.
- The reverse relationship (**Account To** > **Account From**) appears in the **Account Relationships** related list on the target account record.

Select the account relationship record from either account to see the Account Relationship form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Account Relationship form



You can also view account relationship records that use a specific account relationship type. This information appears as a related list on the Account Relationship Type form. This list shows the source account (**Account From** field) and the target account (**Account To** field) for each account relationship record.

Create an account relationship type

Create an account relationship type by defining the types of source and target accounts and providing a name for the relationship between these accounts.

Before you begin

Role required: admin

About this task

Use the steps below to create an account relationship type.

You can edit an existing account relationship type by changing the types of source and target accounts and the name of the relationship that exists between these accounts. If that account relationship type is currently being used by any account relationship records, the **Relationship** and **Reverse relationship** fields in those records are automatically updated.

You can also delete an existing account relationship type.

- If there are no account relationship records that use the account relationship type, then it is simply deleted.
- If there are active account relationship records that use the account relationship type, an attempt to delete that relationship type results in a warning message. Deleting an account relationship type also deletes the relationship records based on that type.

Account relationship types can be set to inactive at any time.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Account Relationship Types**.
2. Click **New**.
3. Fill in the fields on the Account Relationship Type form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Account Relationship Type form fields

Field	Definition
Relationship type	A unique name that identifies the type of relationship. For example, Service Provider.
From	The type of source account for this relationship type; can be either an account or a partner.
Relationship	A text field where you can name the relationship from the source account to the target account. For example, Service provider for.
To	The type of target account for this relationship type; can be either an account or a partner.
Reverse relationship	A text field where you can name the reverse relationship from the target account to the source account. For example, Customer of.
Active	Sets the account relationship type as active or inactive. Active account relationship types can be used to create account relationship records. An account relationship type can be set to inactive at any time.

4. Click **Submit**.
   The new account relationship type appears on the Account Relationship Types list.

Create an account relationship record

Create an account relationship record by selecting the account relationship type and then selecting the accounts involved in the relationship.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
The system administrator can create a relationship record for an account from the **Account Relationships** related list on the Account Relationship Type form.

The customer service manager and the system administrator can create a relationship record for an account from the **Account Relationships** related list on the account or partner record.

Deleting a relationship record for an account also deletes the reverse relationship record.

Note:
Deleting a relationship record does not have any impact on customer service cases that refer to the relationship record.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Accounts** or **Partners**.
2. Select an account.
3. From the **Account Relationships** related list, select **New**.
4. Fill in the fields on the Account Relationship form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Account Relationship form fields

Field	Definition
Account From	The source account for this relationship. If you are creating the relationship from an account or partner record, this field is automatically filled in; otherwise, make a selection from the Accounts list.
Relationship Type	Select the account relationship type for this record. If you are creating the record from an Account Relationship Type form, this field is automatically filled in. Otherwise, make a selection from the Account Relationship Types list, which shows all active account relationship types.
Account To	The target account for this relationship.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.

   Once a relationship record has been created, it appears in two places:

   - The relationship appears in the **Account Relationships** related list on the source account record.
   - The reverse relationship appears in the **Account Relationships** related list on the target account record.

Contact relationships

You can add a contact from one account to another account by using a contact relationship in the Customer Service Management (CSM) application. By using contact relationships, you can perform actions on behalf of the accounts that you established a contact relationship with.

Overview of contact relationship

A contact is a user who serves as an employee of an account. To associate a contact with additional accounts, contact relationships are used. These contact relationships enable a contact with the customer role or customer administrator role to manage the account that you established a contact relationship with. These contacts can view the information and perform actions on behalf of the accounts, such as creating or updating cases from the customer portal.

Related topics

Configuring a contact relationship

Create a contact relationship for an account

Contact Relationship form

Configuring a contact relationship

You can configure a contact relationship to establish a relationship between an account and a contact in the Customer Service Management (CSM) application.

Configuring the contacts to be associated with an account

When you create a contact relationship, you select a user from the **Contact** field. This field displays the contacts from:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All accounts in the account relationship
- All accounts in the account hierarchy
- All accounts, if the *sn_customerservice.contact_relationship.restrict_within_account_hierarchy* system property is set to **false**. However, when the *sn_customerservice.contact_relationship.restrict_within_account_hierarchy* system property is set to **true**, only the contacts within the account hierarchy and account relationship are displayed.

Note:
By default, the *sn_customerservice.contact_relationship.restrict_within_account_hierarch* system property is set to **true**.

If you're a customer service manager (sn_customerservice_manager), you can create, update, delete, and view the list of contact relationships for an account. If you're a customer service manager (sn_customerservice_manager) or a customer service agent (sn_customerservice_agent), you can view a list of the contact relationships for an account.

When you select a responsibility for the contact, the responsibilities that are available are those responsibility definitions that are created with a type of **Contact**.

Note:
A contact can only be assigned with one responsibility per account.

Configuring multiple contact relationships per account for a contact

Before the Vancouver release, configuring multiple contact relationships for a contact with an account wasn't enabled. The database-level unique index `company_contact` can be turned off only by the administrators.

Starting with the Vancouver release, the Customer Service Management (CSM) application replaced the unique index and introduced the **Prevent duplicate for account-contact** business rule. This business rule enables administrators to disable the restriction of a unique index combination in the contact relationship by setting the **Active** flag to **False**. As a result, an administrator can assign multiple responsibilities per account for a contact.

Create a contact relationship for an account

Create a contact relationship for an account by selecting a contact and then assigning a responsibility to that contact in the Customer Service Management (CSM) application. Through this relationship, a contact can effectively manage the accounts and can execute actions on behalf of the associated accounts.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
Starting with the Yokohama release, Customer Service Management (CSM) introduced the `Prevent duplicate for account-contact`business rule. By using this business rule, an administrator can assign multiple responsibilities per account for a contact.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Accounts** or **Partners**.
2. Select an account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Contact Relationships related list, select **New**.
4. On the form, fill in the fields.

Contact Relationship form fields

Field	Definition
Account	The account to which the contact is assigned. This field is automatically filled in.
Contact	The customer contact selected to fulfill the role or responsibility. The Contacts list includes contacts from any related partner or account as well as contacts from the account hierarchy.
Type	Defines the label for the relationship with the selected user. You can select the type from the list of related party configurations. **Note:** Starting with the Yokohama release, the **Type** field is added to the Contact Relationship form. For more information on how to populate the **Type** field for existing data, see Populate the Type field in relationship tables using the fix script.
Responsibility	Role or responsibility selected for this customer contact. **Note:** As part of creating a responsibility definition, the admin can specify if the responsibility is unique. If so, the responsibility can only be assigned to one contact per account. For more information, see Create account teams.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.
   The contact name, account, and responsibility are added to the Contact Relationships related list.

Creating an account team

Create an account team that is made up of both employees and customer contacts who fulfill the jobs or roles for a particular account in the Customer Service Management (CSM) application. By defining the responsibilities or roles for your team and customer contacts, you make sure that your account team has the roles and functions to support your customer accounts.

If you have the admin role, you can create an account team by using a responsibility definition. By defining the responsibilities that you need for this account team, you create the relationships between the different entities like the accounts, contacts, and more.

You can create two types of responsibility definitions. You can create a definition for an employee and a definition for a contact.

Note:
If you have the admin role, you can also delete the definitions that are no longer used. A definition can only be deleted if it has no entries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After these definitions or roles, are created, the sn_customerservice_manager can use these roles to do the following tasks:

- Build an account team by selecting an account, selecting a role, and then assigning a role to an employee.
- Add a contact relationship to an account by selecting an account, selecting a role, and then assigning a role to a contact.

The users who have been assigned to this role are displayed in the Account Team Members related list on the Responsibility Definition form. For more information, see the following topics:

- Create a responsibility definition
- Configure access through the responsibility access configuration

Assign a team member to an account

Assign a team member to an account by selecting an employee and their role or responsibility in the Customer Service Management (CSM) application. When you assign a team member to an account with account manager responsibility, they can view the information and perform actions on behalf of the accounts, such as creating or updating cases from the customer portal.

Before you begin

Role required: sn_customerservice_manager or admin

Note:
CSM Contributor User (com.snc.csm_contributor_user) plugin must be installed.

About this task

If you're the system administrator, you can assign a team member to an account from the Account Team Members related list on the Responsibility Definition form.

If you're the customer service manager, you can assign a team member to an account from the Account Team Members related list on the account or partner record.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Accounts** or **Partners**.
2. Select an account.
3. From the Account Team Members related list, select **New**.
   The account team member must have sn_customerservice.relationship_contributor role.
4. On the form, fill in the fields.

Account Team Member form fields

Field	Definition
Account	Account that the user is assigned to. If you're assigning a user from an account or partner record, this field is automatically filled in. If not, you can select an account from the Accounts list.
User	Employee selected to fulfill the role or responsibility.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	Note: Starting with the Vancouver release, the Service Organization External Staff [sn_csm_service_organization_external_staff] can be added as Account Relationship Managers through Account Team Members (Account Staff Relationships).
Type	Defines the label for the relationship with the selected user. You can select the type from the list of related party configurations. **Note:** Starting with the Yokohama release, the **Type** field is added to the Account Team Member form. For more information on how to populate the **Type** field for existing data, see Populate the Type field in relationship tables using the fix script.
Responsibility	Role or responsibility selected for this employee.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.

Enhanced address data model for accounts

Define addresses once and reuse them within an account hierarchy, or across account hierarchies.

Businesses often must share addresses between accounts, within an account hierarchy, or across hierarchies. An enhanced address data model makes it possible to link a location with multiple accounts without creating multiple location records.

The enhanced address data model maintains the relationship between accounts and addresses in a new table. By default, this feature is enabled for the new customer service management (CSM) customers. However, it is optional for upgrade customers.

Related topics

- Account Address table
- Enable enhanced address model for accounts
- Associate an address to an account
- Reusing addresses between multiple accounts

Account Address table

Avoid duplication of address records by using the Account Address table.

The Account Address [account_address_relationship] table maintains the relationship between an address and the accounts that use that address.

The Account Address table eliminates the need to duplicate address records that need to be reused across multiple accounts. The Account Address table provides details like the name and the location of the account. The table also provides information on the type of account address, and whether the account is primary or not.

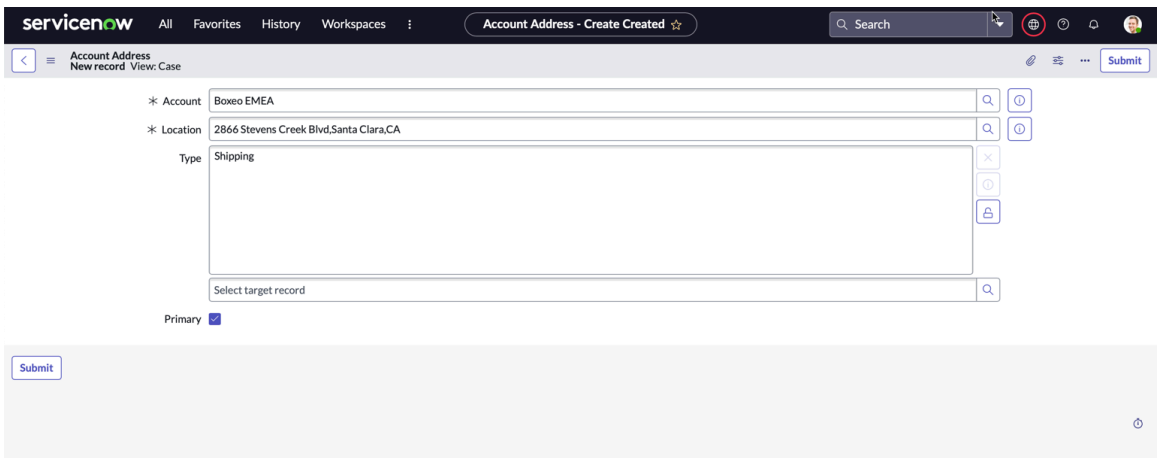
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Account Address table is available for use when the Enhanced address data model for accounts feature is enabled. For more information on enabling the feature and configuring the Account Address table, see Enable enhanced address model for accounts. When address sharing is enabled, Account address related list is visible on the account and location forms.

Account address table

Field	Description
Location	The location or address associated with the account. **Note:** Starting with the Tokyo release, the location form is a two-column layout, as opposed to the single column layout in previous releases.
Account	The name associated with the account.
Primary	An account can only have one primary address.
Type	The type of account address, whether Billing, Shipping or Mailing.

Account Address form



Related topics

Associate an address to an account

Enable enhanced address model for accounts

Use the Account Address table in the enhanced address data model feature to link a location with multiple accounts without creating duplicate location records.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Take a backup of the location data associated with accounts from the Location [cmn_location] table.
2. Create the custom relationship fields in the Account Address [account_address_relationship] table if they have already been created in the Location table.
   The newly created fields in the Account Address table must have the same name and type as the fields in the Location table. The base system provides two relationship fields.
   - **Type**
   - **primary**

   These relationship fields are created in the Account Address [account_address_relationship] table. For more information on creating fields within a table, see Add and customize a field in a table.
3. Update the custom code that references the Account Address table.
   The custom code can include elements that fetch the address of accounts in the Account Address table. Such elements can be reference qualifiers, script includes, business rules, and ACLs referencing to the Location table.
4. Move the account-related data from the Location table to the Account Address table.
5. Run the following migration script.

```
var customRelationshipFields = []; //Add custom relationship
 fields (if any).
var account = ""; //You must specify the sys_id of the account
 if you wish to migrate location data for that account (mostly
 to be used during re-run).
var migrateChildAccountLocations = false; // This value must be
 set to true if you wish to migrate the locations of the child
 accounts associated with the specified account (mostly to be
 used during re-run).
new
 sn_cs_base.CSDataFix().migrateLocationDataToAccountAddress(cus
tomRelationshipFields, account, migrateChildAccountLocations);
```

   Performing a rerun of the script if there's a difference between the number of records that must be migrated and the number of records already migrated. In the event of a rerun, already migrated locations won't be migrated again. To rerun migration for already migrated locations, delete the corresponding records in the account address table.
6. Avoid accidental data entry by deactivating the Account and Custom Relationship fields from the Location table.

   Note:
   You must not deactivate Type and Primary attributes.

   This deactivation removes the Account and the Custom Relationship fields from the location-related forms, lists, and related lists.
7. Set the system property *enable_account_address_sharing* to true.
   This property enables the enhanced address data models for accounts. The Account Addresses related list is displayed on the account and location form.

Associate an address to an account

Users can associate addresses to an account using the Account address related list on the account form or the location form.

Before you begin
Role required: admin

Procedure

1. Associate an address to an account from either the account form or the location form.
   - To associate an address to an account from the account form, navigate to **All** > **Customer Service** > **Accounts**.
   - To associate an address to an account from the location form, select **All** > **Customer Service** > **Locations**.
2. Select an account from the list of existing accounts.
3. Navigate to **Related List** > **Account addresses** and click **New**.
4. Fill the details in account address form and select **Submit**.
   For more information about the table fields, see Account Address table.

Reusing addresses between multiple accounts

Users can reuse the same addresses between multiple account records.

Users can reuse the same address between multiple accounts within the account hierarchy or between non-related accounts. Use the account hierarchy feature to create a parent-child relationship between accounts.

To allow address sharing between accounts in the account hierarchy, see Address sharing through account hierarchy.

To share addresses between non-related accounts, see Share an address through non-related accounts.

Address sharing through account hierarchy

Users can reuse the same address between multiple accounts within the account hierarchy.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Accounts**.
2. Select an account and navigate to **Related List**> **Account Addresses**.
3. Select **New**.
4. See all the locations associated with the selected account in the account hierarchy by selecting the search icon next to the **Location** field.

   Note:
   The **Account** field is already populated with the name of the account.

5. In the Locations pop up, select the location that you want to reuse.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To delete an address in the location table, select **Delete** from the location form or from the location list.

To edit a location form, select **Edit**.

Data migration from Location to Account Address table

Migrate your data from the Location table to the Account Address table.

Migrate data by following the steps provided in the Customer Service Guided Setup.

To access the Guided Setup, navigate to **Customer Service** > **Administration** > **Guided Setup** > **Foundation Data** > **Enable Enhanced Address Data Model for Accounts**.

Note:
Review step 4 within the Enable enhanced address model for accounts to get details on how to migrate data.

Domain separation for the Account Address table

Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

All account address table records are present in the domain of the associated account.

Note:
Any location record is originally created in the global domain. However, when the location record is associated with an account, the location record is automatically added to the account's domain. Associating the same location to multiple accounts does not change the domain of the location.

Configure consumers

A consumer is a customer in the business-to-consumer (B2C) business model.

Before you begin
Role required: admin

About this task
Consumers can have multiple addresses, one of which is the primary address.

Procedure

- You can import existing consumers using a guided setup.
- You can create consumers using the Customer Service Management application.

Import consumers with guided setup

Use Customer Service Management guided setup to import existing consumers.

Before you begin
Role required: admin

About this task
Consumers can have multiple addresses, one of which is the primary address.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**
2. In the Foundation Data category, click **Get Started** and then click **Import Consumers (B2C)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Upload data from an external data source into an import set.
4. Create a transform map.
5. Execute the transform map to transfer the data.
6. Verify that the data records are imported into the target table.

Create consumers

A consumer is a customer in the business-to-consumer (B2C) business model. Use the Customer Service Management application to create consumer records.

Before you begin

Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

About this task

Consumers can have multiple addresses, one of which is the primary address.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Click **New** and fill in the fields on the Consumer form.
3. Enter the consumer information, such as the name, email address, and phone numbers.
4. Fill in the fields on the Primary Address tab.
   A consumer can have multiple addresses but only one primary address. The primary address is stored in the Primary Address tab on the Consumer form and in the **Addresses** related list.
5. **Optional:** Set the desired fields on the Preferences tab.
6. Click **Submit**.
   The record is added to the Consumers table (csm_consumer). The primary address is added to the **Addresses** related list and the **Primary** field is set to **true**.

Create additional consumer addresses

Consumers can have multiple addresses, including one primary address.

Before you begin

Role required: sn_customerservice.consumer_agent, sn_customerservice_manager, or admin

About this task

The primary address is stored in the Primary Address tab on the Consumer form and in the **Addresses** related list. When you fill in the fields in the Primary Address tab and click **Submit**, this information is added to the **Addresses** related list as the primary address, with the **Primary** field set to true. Any changes made to the **Primary Address** fields are also updated in the related list. A consumer can have only one primary address.

Other addresses, such as billing or shipping addresses, can be created and stored in the **Addresses** related list. For these other addresses, the **Primary** field is set to **false**.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Click the number of the desired consumer.
3. In the **Addresses** related list, click **New**.
4. Fill in the fields on the Location form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To denote this address as the primary address for the consumer, enable the **Primary** check box.
   A consumer can have multiple addresses but only one primary address.
6. Click **Submit**.

Create a relationship between two consumers

Create a relationship between two consumers, regardless of household.

Before you begin
Role required: sn_customerservice.svc_location_manager, sn_customerservice_manager, admin

About this task
Relationships are based on responsibilities. A responsibility definition describes a role or a function that supports a customer or consumer. To create a relationship between two consumers, use the Authorized Representative responsibility.

Procedure
1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Select a consumer.
3. In the Consumer Relationships related list, select **New**.
   This related list shows the current relationships that exist for the selected consumer. When you select **New**, a new Consumer to Consumer Relationship form is displayed with the **Consumer is** field filled in.
4. In the **Responsibility** field, select the **Authorized Representative** responsibility.
5. In the **of Consumer** field, select the consumer who is being represented by the consumer in the **Consumer is** field.
6. In the **Type** field, select the type from the list of related party configurations and the **Order** field specifies the sequence in which records are displayed, organized according to business preferences.

   Note:
   Starting with the Yokohama release, the **Type** field is added to the Consumer Relationships form. For more information on how to populate the **Type** field for existing data, see Populate the Type field in relationship tables using the fix script.

7. Select **Submit**.
   The relationship is added to the Consumer Relationships related list.

Assign a team member to a consumer

Assign a team member to a consumer by selecting an employee and their role or responsibility in the Customer Service Management (CSM) application.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
If you're the system administrator or a customer service manager, you can assign a team member to a consumer from the Consumer Team related list on the Consumer form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Select a consumer.
3. From the Consumer Team related list, select **New**.
4. On the form, fill in the fields.

Consumer Team Member form fields

Field	Definition
Consumer	Consumer that the user is assigned to.
User	Employee selected to fulfill the role or responsibility.
Responsibility	Role or responsibility selected for this user.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.

Creating multiple consumer profiles for a user

The concept of consumer profiles refers to the idea that an individual can have multiple profiles associated with them. For example, a consumer might have a patient profile in Healthcare and Life Sciences and simultaneously have a constituent profile in Public Sector Digital Services.

Starting with the Utah release, Customer Service Management (CSM) introduced the consumer profile (sn_csm_consumer_profile) table with a reference to the consumer (csm_consumer) table to define and support consumer profiles. When creating multiple profiles for a user within Customer Service Management (CSM), each profile can have its own set of fields and relational data like sold products, cases, interactions, and installed bases. By creating and defining consumer profiles, you can identify and differentiate profile-specific data.

Industries must use the consumer_profile column on case (sn_customerservice_case), sold product (sn_install_base_sold_product), install base item (sn_install_base_item), interaction (interaction), or child tables for any transactional data. Industries can extend the consumer profile (sn_csm_consumer_profile) table for any industry-specific use case.

Tables used by consumer profiles

Customer Service Management (CSM) introduced consumer profile (sn_csm_consumer_profile) column on Case, Sold Product, Install Base Item, and Interaction tables to identify and differentiate profile-specific data to be used by industries for different use-cases.

Tables and plugins

Plugin	Tables	Column added
Customer Service Base Entities [com.snc.cs_base]	Case [sn_customerservice_case]	Consumer Profile [consumer_profile]
	Sold Product [sn_install_base_sold_product]	Consumer Profile [consumer_profile]
	Install Base Item	Consumer Profile

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables and plugins (continued)

Plugin	Tables	Column added
	[sn_install_base_item]	[consumer_profile]
	Interaction [interaction]	Consumer Profile [consumer_profile]
	Task [sn_customerservice_task]	Consumer Profile [consumer_profile]

Note:
Consumer Profile (sn_csm_consumer_profile) table is an extension-only table to be used for supporting multiple profiles for consumer both within and across different industries.

Consumer Profile Location table

The Consumer Profile Location [sn_csm_consumer_profile_location] table stores the relationship between the consumer profiles and locations.

Starting with the Vancouver release, the Consumer Profile Location [sn_csm_consumer_profile_location] table was introduced. By using this table, you can enhance your consumer profiles to support multiple addresses. Adding this functionality enables the relationship between the consumer profiles and locations, which enables various industries to manage multiple addresses for the individual profiles.

Consumer Profile Location table fields

Field	Data type	Description
Consumer profile	Reference	Profile that is associated with a consumer.
Location	Reference	Locations detail that is associated with the consumer.
Location type	List	Type of location that this record represents such as billing, shipping, and mailing. **Note:** You can associate a consumer profile location record with one or multiple location types.
Active	True/False	Status of the consumer profile-address mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consumer Profile Location table fields (continued)

Field	Data type	Description
		Note: By default, the active field is set to **True**, but you can disable the Consumer Profile Location linkage by setting it to **False**.

Associating locations to consumer profiles

By enabling relationships between consumer profiles and locations across industries such as Financial Services Operations, Healthcare and Life Sciences, and Public Sector Digital Services Core, multiple consumer profiles can be associated with their corresponding addresses in the Customer Service Management (CSM) application.

Overview

Individual consumer profiles can be associated with multiple locations, or multiple consumer profiles can be linked to the same location by using consumer profile locations. That means that different industries can associate consumer profiles with multiple locations and location types. The Customer Service Management (CSM) application supports the consumer profile (sn_csm_consumer_profile) table with a reference to the consumer (csm_consumer) table that helps to define and support consumer profiles.

Use case

For example, in the Healthcare and Life Sciences industry, clinicians must be able to store multiple addresses for patients, like mailing addresses for sending reports and home addresses for sample collections. Similarly, in the Financial Services Operations industry, financial institutions must store multiple addresses, such as mailing addresses for important documents and work addresses for billing purposes, for their customers.

In some scenarios, business-to-consumer (B2C) customers may have multiple addresses that can be used across their profiles for various purposes, serving as distinct addresses. For example, a customer's address could function as a shipping address for a Financial Services Operations profile, while simultaneously serving as a billing address for a Healthcare and Life Sciences profile.

Related topics

- Associate an existing consumer location with a consumer profile
- Create and associate a location to a consumer profile

Associate an existing consumer location with a consumer profile

Associate an existing consumer location with a consumer profile by using the Consumer Profile Location [sn_csm_consumer_profile_location] table in the Customer Service Management (CSM) application. By connecting consumer profiles and locations, industries can handle multiple addresses that are associated with individual profiles.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
By using the Consumer Profile Location [sn_csm_consumer_profile_location] table, you can store the relationship between the consumer profile and location.

Procedure
1. In the navigation filter, enter `sn_csm_consumer_profile_location_list.do`.
2. In the Consumer Profile Locations record, select **New**.
3. In the **Location** field, select the lookup icon to open the list of locations.
4. Select the location to be associated with the consumer profile.
5. On the form, fill in the fields.
   For a description of the field values, see Consumer Profile Location table.
6. Select **Submit**.

Result
A location has been added to the consumer profile. Additionally, you can include different addresses, like a mailing address or a shipping address, and associate them with the same consumer profile, depending on the use case.

Related topics
Create and associate a location to a consumer profile

Create and associate a location to a consumer profile

Create a location and associate it with the consumer profile in the Customer Service Management (CSM) application. With this functionality, you can create and associate multiple addresses to a consumer profile that serve other purposes.

Before you begin
Role required: admin

About this task
Here's an example of why a user created and associated a location to the consumer profile. In the Healthcare and Life Sciences industry, clinicians can store multiple addresses for a patient profile, like mailing addresses for sending reports and home addresses for sample collections.

Procedure
1. In the navigation filter, enter `sn_csm_consumer_profile_location_list.do`.
2. In the Consumer Profile Locations record, select a consumer profile.
3. In the **Location** field, select the lookup icon to open the list of locations.
4. In the Consumer Profile Locations record, select **New**.
5. On the form, fill in the fields.

   Note:
   Ensure that you fill in the **Consumer** field in the Location form. If the **Consumer** field is empty, you get an error.

6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If multiple consumer profile location records are associated with the location, you can't delete a location record.

A new address is created and added to the **Location** field. You can associate this location to the consumer profile. For a description of the field values, see Consumer Profile Location table.

7. Select **Update**.

Related topics

Associate an existing consumer location with a consumer profile

Configuring households

The household entity represents a group of consumers that usually share a common address and use services as a group.

A household is made up of consumers who have been added as members of that household.

Note:
A household has an address and consumers have their own addresses. These addresses do not need to be the same in order to add a consumer as a member to a household.

With the household entity, you can:

- Create households and add consumers as household members.
- Create cases for households and household members.
- Create relationships between household members. These relationships authorize one household member to manage cases on behalf of another member.
- Create relationships between staff members and households or household members that enable the staff members to manage cases for those households and members.
- Track information for households, including sold products, contracts, and entitlements.

Head of household

A household can have one member designated as the head of household. A consumer who is added as the head of household is automatically added as a member of the household.

The head of household has access to all of the cases and information for the household and the other household members. The head of household can also see:

- The sold products for the household.
- The sold products and install base items for household members.

Household information

Households can have multiple members. These members can be either consumers or consumer users. Consumers can also belong to multiple households.

Membership in a household is defined by the **Start Date** and **End Date** on the Household Member form. A household member is considered to be a current member if:

- The **Start Date** field is empty or is filled in with today's date.
- The **Start Date** field is filled in with a past date and the **End Date** field is empty or is filled in with today's date or a future date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only one record with current membership dates is allowed for each consumer in a household. A consumer can leave and rejoin a household multiple times. This information is recorded using the start and end dates.

As members are added or removed from a household, the member history is retained. You can find this information in the following related lists on the Household form.

- **Current Members**: the consumers currently in the household.
- **All Members**: current and past members of a household. This list provides a history of the household. Members can appear multiple times in this list.

On the Household form, you can also find information about household cases and products in the following related lists:

- **Cases**: the cases that have been created for all of the members within a household
- **Sold Products**: the products owned by the household. These products can be owned or shared by multiple household members.

Household member relationships

The following types of relationships can be created for households and household members. These relationships are included in the following related lists on the Household form:

- **Member Relationships**: relationships that have been established between household members. These relationships are created using the Authorized Representative responsibility. Household members that have an Authorized Representative relationship with another household member can act on behalf of that member and can manage cases and information for that member.
- **Household Team**: relationships that have been established between an agent and a household. These relationships are created using the Relationship Manager responsibility. Agents that have a Relationship Manager relationship with a household can manage all of the cases for that household.

Consumer relationships

The following types of relationships can be created for consumers.

- **Consumer Relationships**: relationships that have been established between two consumers, regardless of household. These relationships are created using the Authorized Representative responsibility. Consumers that have an Authorized Representative relationship with another consumer can manage cases for that consumer.
- **Consumer Team**: relationships that have been established between an agent and a consumer. These relationships are created using the Relationship Manager responsibility. Agents that have a Relationship manager relationship with a consumer can access all of the cases for that consumer.

Create or update a household

Create or update a household.

Before you begin

Role required: sn_customerservice_manager, admin

About this task

A household is made up of a group of consumers who live at a common address and share products and services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A household can have a designated head of household and multiple current members. The head of household has access to all of the cases and information for the other household members.

A user with the system administrator role can create a household. This user can also delete a household. When a household is deleted, the system clears the references and associations to the household, including members, sold products, cases, and work orders, but does not delete these associated entities.

Procedure

1. Navigate to **All** > **Customer Service** > **Customers** > **Households**.
2. Click **New** on the Households list.
3. Fill in the fields on the Household form.
4. Click **Submit**.
   The household is added to the Households list.

Add consumers to a household

Add consumers as members of a household.

Before you begin
Role required: sn_customerservice_manager, admin

About this task
You can add existing consumers from the Consumer table to a household.

- A household can have multiple consumers.
- A consumer can belong to multiple households. One household can be designated as the primary household for that consumer.

Household member records are added to the Household Member table. When a consumer is added to a household, the consumer is assigned a unique household member number that begins with the prefix HM.

The Household form includes the following related lists for household members:

- Current Members: consumers that belong to the household as of the current date.
- All Members: current members and past members. The customer service manager or admin can indicate that a consumer no longer belongs to the household by adding a date to the **End Date** field. A consumer that has left a household can be added back to that household.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Households**.
2. Select a household.
3. In the Current Members related list, click **New**.
4. Add a user from the Consumer table in the **Consumer** field.
   The **Household** field is automatically updated with the household selected in step 2.
5. **Optional:** If desired, add the date that the consumer was added to the household in the **Start Date** field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **End Date** field can be added if the consumer is removed from the household.

6. Click **Submit**.
   The consumer is added to the Current Members related list.

   On the Consumer form for this consumer, the household is added to the following related lists:

   - Current Households
   - All Households

   Note:
   You may need to configure the Consumer form to display these related lists. For more information, see Configure Service Model Foundation.

Create a relationship between household members

Create a relationship between two consumers who are current members of the same household.

Before you begin

Role required: sn_customerservice_manager, admin

About this task

Relationships are based on responsibilities. A responsibility definition describes a role or a function that supports a customer or consumer. To create a relationship between two consumers in a household, use the Authorized Representative responsibility.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Households**.
2. Select a household.
3. In the Member Relationships related list, click **New**.
   This related list shows the current relationships that exist between consumers in this household. When you click **New**, a new Household Member Relationship is displayed with the **Household** field already filled in.
4. In the **Consumer is** field, select the consumer in the household to fulfill the responsibility on behalf of another consumer within the same household.
5. In the **Responsibility** field, select the **Authorized Representative** responsibility.
6. In the **of Consumer** field, select the consumer who is being represented by the consumer in the **Consumer is** field.
7. In the **Type** field, select the type from the list of related party configurations and the **Order** field specifies the sequence in which records are displayed, organized according to business preferences.

   Note:
   Starting with the Yokohama release, the **Type** field is added to the Consumer Relationships form. For more information on how to populate the **Type** field for existing data, see Populate the Type field in relationship tables using the fix script.

8. Click **Submit**.
   The relationship is added to the Member Relationships related list.

Assign a team member to a household

Assign a team member to a household by selecting an employee and their role or responsibility in the Customer Service Management (CSM) application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
If you're the system administrator or a customer service manager, you can assign a team member to a household from the Current Members related list on the Household form.

Procedure
1. Navigate to **All** > **Customer Service** > **Customer** > **Households**.
2. Select a household.
3. From the Household Team related list, select **New**.
4. On the form, fill in the fields.

Household Team Member form fields

Field	Definition
Household	Household that the user is assigned to.
User	Employee selected to fulfill the role or responsibility.
Responsibility	Role or responsibility selected for this user.
Order	Specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.

Create and manage cases for a consumer or household

Staff members with the location agent role can create and manage cases for consumers and households.

Before you begin
Role required: sn_customerservice.svc_location_agent, sn_customerservice.svc_location_consumer_agent, sn_customerservice.svc_location_manager

About this task
Staff members at a business location who have either the location agent or consumer location agent role can create cases for households and consumers.

Staff members or internal users who have a relationship with a household (based on the Relationship Manager responsibility) can create cases for that household and its members. Users with relationships to a household are listed in the following locations:

- The Household Team related list on the Household form.
- The Household Team Members list.

Relationship managers can perform the following actions on the cases that they can access:

- Add comments and work notes.
- Add attachments.
- Close cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a consumer case is created or updated, the consumer receives an email notification. If a household is added to a case, the head of household is also notified when the case is created or updated.

Procedure

1. Navigate to **All** > **Customer Service** > **Cases** and click **Create New**.
2. **Optional:** Select the type of case that you want to create.
3. Perform one of the following actions.

Option	Description
Add a consumer.	Select a consumer in the **Consumer** field. ○ If the consumer belongs to only one house hold, the **Household** field is automatically updated. ○ If the consumer belongs to more than one household, select a household from the households that a consumer belongs to in the **Household** field. ○ If the consumer does not belong to a house hold, you can leave the **Household** field empty.
Add a household.	Select a household in the **Household** field. ○ If the household only has only one current member, the **Consumer** field is automatical ly updated. ○ If the household has multiple current mem bers, select a consumer from the house hold members in the **Consumer** field.

4. Fill in the remaining fields on the Case form.
5. If desired, add other members of the household to the watch list.
   If a user with a Relationship Manager relationship is creating a case for a household or household member, this user is automatically added to the watch list.
6. Click **Submit**.
   The case is added to the Cases related list on the Household form.

Create entitlements for a household

Create entitlements for a household so that all household members are covered under the same terms and conditions.

Before you begin

Role required: sn_customerservice_manager, admin

About this task

System administrators and customer service managers can create entitlements for a household. These entitlements apply to the current members of that household.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a case is created for a household or a consumer, the **Entitlement** field on the Case form lists the available entitlements:

Entitlements listed based on field types

If these fields are filled in	The Entitlement field lists these entitlements
Household and Consumer	Entitlements for both the consumer and household.
Household	Entitlements for the household.
Consumer	Entitlements for the consumer

Procedure

1. Navigate to **All** > **Customer Service** > **Contracts** > **Entitlements**.
2. Click **New**.
3. Select a household in the **Household** field.
   When you select a household, the head of household is automatically added to the **Consumer** field.

   Note:
   You may need to configure the form layout and add the **Household** field.

4. **Optional:** If desired, select a different household member in the **Consumer** field.
5. Fill in the remaining fields on the Entitlement form.
   For more information, see Create entitlements for CSM entities.
6. Click **Submit**.
   The entitlement is added to the Entitlements related list on the Household form.

Create service contracts for a household

Create service contracts for a household so that all household members are covered under the same terms and conditions.

Before you begin

Role required: sn_customerservice_manager, admin

About this task

System administrators and customer service managers can create contracts for a household. These contracts apply to the current members of that household.

When a case is created for a household or a consumer, the **Contract** field on the Case form lists the available contracts:

- If the **Household** and **Consumer** fields are filled in, the **Contract** field lists the contracts for both the consumer and household.
- If only the **Household** field is filled in, the **Contract** field lists the contracts for the household.
- If only the **Consumer** field is filled in, **contracts** field lists the contracts for the consumer

Procedure

1. Navigate to **All** > **Customer Service** > **Contracts** > **Service Contracts**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a household in the **Household** field.
   When you select a household, the head of household is automatically added to the **Consumer** field.

   Note:
   You may need to configure the form layout and add the **Household** field.

4. **Optional:** If desired, select a different household member in the **Consumer** field.
5. Fill in the remaining fields on the Contract form.
   For more information, see Create service contracts.
6. Click **Submit**.
   The contract is added to the Contracts related list on the Household form.

Consumer Service Portal changes

Activating the Customer Service Household plugin enables you to view households and household members on the Consumer Service Portal as well as view and create cases for household members.

Viewing multiple households on the portal

Consumers can belong to multiple households and can have one primary household. When the Customer Service Household plugin is activated, consumers who are logged in to the Consumer Service Portal can see the following information on their user profile page:

- The consumer's primary household in the **Primary Household** field.
- The households that the consumer belongs to in the Households list.

Viewing household members on the portal

For consumers who are the head of household, the Support menu includes the **Household Members** menu item, which lists all current members of the household.

Selecting this menu item displays a page that lists the members of the households where the logged-in consumer is the head of household.

Creating cases for other members of a household or other consumers

A consumer can create cases for another consumer in the following instances:

- A consumer who is the head of a household can create cases for other members of the household.
- A consumer who is an authorized representative for another consumer can create cases on behalf of that consumer.

When creating a case, the head of household or authorized representative can select the household member in the **Consumer** field on the record producer.

- If the logged-in consumer belongs to only one household, the household is automatically added to the case when it is submitted.
- If the logged-in consumer belongs to more than one household, the correct household can be selected in the **Household** field on the record producer.
- If the household is selected first, the consumers listed in the **Consumer** field are restricted to the current members of the household.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The default selections for the **Household** and **Consumer** fields on the record producer include the primary household and the logged-in consumer.

Viewing and updating cases on the portal

The logged-in consumer can see the following cases on the portal:

- All Cases: all of the cases that belong to their household or that belong to consumers with which they are an authorized representative.
- My Cases: the cases created by the logged-in consumer.

The head of household or authorized representative can perform the following actions for the cases that belong to their household:

- Add comments and attachments.
- Accept or reject a solution.
- Close a case.

Consumer case information

When the Customer Service Household plugin is activated, the Ticket Fields details tab includes the **Consumer** field.

Configuring billing accounts

Billing Account Core provides a foundational data model for managing billing accounts across organizations and users. It enables businesses to define, organize, and maintain billing relationships, supporting accurate billing, payments, and scalable financial operations.

Billing account overview

A billing account is a centralized record that manages payment and invoicing for services. Use billing accounts to organize billing schedules, payment terms, addresses, currency settings, and links to customers—including individuals, organizations, or sub-accounts.

Unlike a customer account, which represents the organizational relationship, a billing account is a financial entity specifically for managing billing and payments. A single customer can have multiple billing accounts for different billing arrangements, while multiple customers can share a consolidated billing account.

Billing accounts support both B2B and B2C scenarios and provide flexibility for complex billing structures through parent-child hierarchies.

Key capabilities

- Billing schedule: Define billing frequency (monthly, quarterly, annual) and billing cycles
- Payment terms: Configure payment terms (net 30, net 60) and accepted payment methods
- Bill-to address and currency: Specify invoice delivery address and billing currency
- Customer associations: Link billing accounts to customers, contacts, and households
- Hierarchy support: Create parent-child structures for consolidated billing

When to use billing account

Use billing accounts when your organization needs to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Separate billing from customer relationship management
- Support multiple billing arrangements for a single customer
- Consolidate charges from multiple business units, geographies, or product lines
- Manage payment responsibility separately from service consumption
- Track billing-related cases and interactions distinct from general customer cases

Billing account versus cost centers

Aspect	Billing Account	Cost Center
Purpose	Manages external payment and invoicing for services	Tracks and allocates internal costs within the organization
Focus	Customer-facing financial transactions	Internal budget management and expense allocation
Typical users	Finance, billing, customer service teams	Finance, department managers, internal operations
Examples	Customer invoice account, corporate billing account	Marketing department budget, IT operations budget

User management

Configure the internal and external users for Customer Service Management to provide the right access to features, capabilities, and case data. Create relationships that facilitate case management and fulfill support roles for specific accounts.

Setting up users, user groups, and customer relationships

Task	Description
Configure users and groups	Configure the individual users and the user groups who can access your instance.
	Assign roles to individual users and user groups to control access to features, capabilities, and data.
Create multiple consumer profiles for a user	Individual consumers can have multiple profiles for different needs. You can create these profiles to identify and differentiate profile-specific data.
Configure a unified user	Enable users to maintain multiple profiles within the Customer Service Management (CSM) application and other ServiceNow applications with one login.
Create customer relationships	Establish different types of relationships between partners, customers, and contacts, to make case and account management easy and flexible:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up users, user groups, and customer relationships (continued)

Task	Description
	• Bi-directional account relationships • Contact relationships • Account hierarchies
Create account teams	Create teams made up of employees and customer contacts who fulfill the roles and functions to support specific accounts.
Configure Contributor Users	Configure contributor users to engage middle office teams in resolving customer issues and requests.
Configuring customer access management	Configure customer access management to support multiple contacts and consumers on cases and sold products, providing them with varying levels of access to the case.
Fix external user role assignments	Fix the issue with external users assigned with internal user roles.

Configure users and groups

A user is an individual who can access your instance and a group is a set of users who share a common purpose. The users associated with a group are listed as group members.

Before you begin

Role required: admin

About this task

Group information is used across most processes in the *ServiceNow AI Platform* for assigning work to teams and requesting approvals.

Any rule that is applied to a group is automatically assigned to group members; for example, roles and assignment rules.

Procedure

- You can import existing users and groups using guided setup.
- You can create new users and groups using the *ServiceNow AI Platform* user administration feature.
  - Create a user
  - Create a user group
  - Add a user to a group

Configuring a Unified User

By unifying multiple profiles for a single user in the Customer Service Management (CSM) application, you don't need to create and manage multiple user accounts for that user.

A user can maintain multiple profiles within the Customer Service Management (CSM) application and other ServiceNow applications with one login.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

In the past, customers had to create multiple user records for a user who had different roles on different applications. For example, let's say that you have a CSM user who is both an internal employee and an external consumer. With a unified profile, your user can switch between different user records and seamlessly transition between roles.

By using multiple profiles within the CSM application, your organization can have these different profiles:

- Internal and external CSM profiles for the same user where that user has both internal and external accounts. For example, in a financial institution, a consumer might be an employee of a bank and at the same time hold a personal account in the same bank.
- Multiple external profiles for a CSM user where a user has multiple external accounts. For example, a consumer might have a patient profile in Healthcare and Life Sciences and also have a constituent profile in Public Sector Digital Services.
- Multiple profiles with the CSM and other ServiceNow® applications where a user has multiple accounts within CSM and other ServiceNow applications. For example, a user might have a CSM account for vendor support and a VRM account for vendor risk management.

Key benefits

- Improved user experience. A unified user can navigate between internal and external roles without switching profiles.
- Enhanced admin efficiency. Your organization can streamline the administrative processes so that you don't have to manage multiple user accounts for individuals with various profiles or roles.
- Increased customer satisfaction. Your organization can offer a consistent service to your customers across different roles, which could lead to increased customer loyalty and positive feedback.

Related topics

Configuring a user as a Unified Consumer

Configuring a user as a Unified Consumer

By creating a unified profile, you can integrate both internal and external personas or consumers in your organization. A user who has a unified profile has synchronized user's login interactions across the Customer Service Management (CSM) application.

Overview

Before a unified profile was available, a platform user could only hold either an snc_internal or an snc_external role, but not both roles due to role collision issues. Modeling a user as both an employee and a consumer wasn't possible in the past because the sn_customerservice.consumer role inherited the snc_external role. The role inheritance that was combined with the platform's behavior to help prevent role collision restricted a user from performing internal duties while that user was also a consumer.

With this new unified user functionality, a single user who is an employee (snc_internal) can also be a business-to-consumer (B2C) customer. With a unified profile, your user can switch between different user records and seamlessly transition between roles.

For example, in a financial institution, an individual could be both an employee and a personal account holder. Similarly, in the telecommunications industry, an internal employee might also use company voice services for personal use.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

You can activate this functionality by enabling the Customer Service (com.sn_customerservice) plugin.

Using a query rules framework

You can use the Unified Consumer feature only within the query rules framework. For example, when you update a consumer record, the associated user records synchronize through a business rule *sync_consumer* to *csm_consumer_user* through a business rule. This synchronization occurs only if the associated user class has the *csm_consumer_user* record and not any other user record. When you modify the following fields for the consumer user, the associated records also automatically update:

- First name
- Middle name
- Last name
- Email
- Mobile phone
- Business phone
- Home phone

You can synchronize all types of user records by customizing the business rule to the *sys_user* record instead of the *csm_consumer_user* record.

Roles installed with Employee as a Consumer

Supported and unsupported roles and features

Setting up a user as a Unified Consumer

Roles installed with Employee as a Consumer

Use different roles to establish the relationships between your users and entities. By using the Employee as a Consumer functionality within the Customer Service Management (CSM) application, your organization can support both requesters and supporters.

Overview

The Unified Consumer (sn_customerservice.unified_consumer) role enables a user to have both the snc_internal and snc_external roles, which means that roles have greater control over consumer behavior, whether it's internal or external.

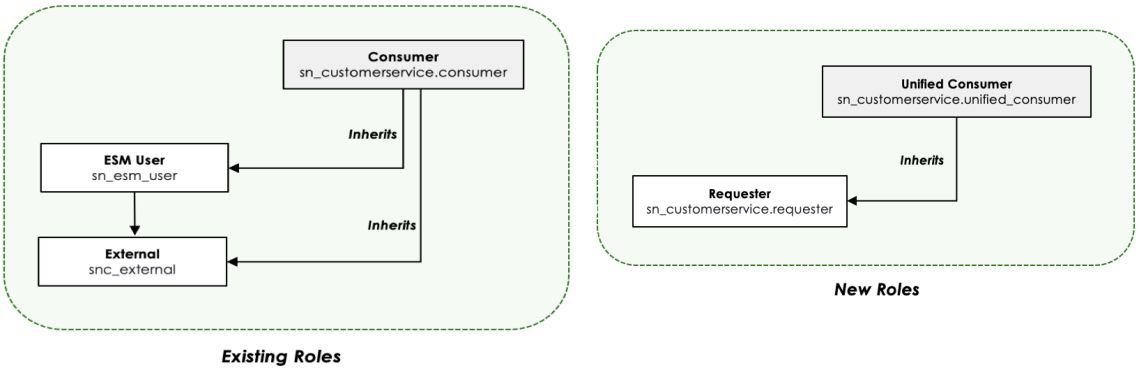
Earlier, the Consumer (sn_customerservice.consumer) role automatically included the snc_external role, which created a limitation. This limitation helped to prevent an organization from assigning the snc_internal role to a user and restricted the simultaneous use of both the snc_internal and snc_external roles. To address these limitations, a new role, independent of the snc_external role, was introduced to complement the sn_customerservice.consumer role. This additional role can be associated with both the snc_internal and snc_external roles, which means that your organization now has increased flexibility in managing a user's behavior.

Employee as a Consumer existing and new roles

The following diagram shows the existing roles and the new roles that enable the Employee as a Consumer functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Existing and new roles



Note:
With the Employee as a Consumer functionality, the Requester (sn_customerservice.requester) and the Unified Consumer (sn_customerservice.unified_consumer) roles were introduced. Both these roles are independent of the snc_internal and snc_external roles.

Requester and Unified Consumer roles and descriptions

Role [name]	Description
Requester [sn_customerservice.requester]	Supports requesters and implements the base functionality. It serves as a base role, running in parallel with the Enterprise Service Management (ESM) User (sn_esm_user) role.
Unified Consumer [sn_customerservice.unified_consumer]	Supports consumers and runs parallel to the Consumer (sn_customerservice.consumer) role. It inherits the Requester (sn_customerservice.requester) role.

Setting up a user as a Unified Consumer

Set up a user as a Unified Consumer by creating a single, unified profile that supports both the internal and external personas in the Customer Service Management (CSM) application.

Overview

You can model a single user both as an employee (snc_internal) and a business-to-consumer (B2C customer) by creating a unified profile. By unifying multiple profiles for a single user in the Customer Service Management (CSM) application, you don't need to create and manage multiple user accounts for that user.

Note:
You can also configure an external Unified Consumer, who lacks an internal (snc_internal) role and isn't an employee, by using similar setup tasks.

The following table describes how to set up the tasks for activating a Unified Consumer.

Set up the tasks for activating a Unified Consumer

Task	Description
Activate a Unified Consumer	Activate a Unified Consumer by updating the *ConsumerImpl* script include to display other sys_user records in the reference list for the csm_consumer table. For more information, see Activate a Unified Consumer.
Create a user	Establish an internal user or designate an existing user as a consumer. For more information, see Create a user.
Assign a role to a user	Assign the Unified Consumer (sn_customerservice.unified_consumer) role to the user. For more information, see Assign a role to a user.
Create a consumer record	Create a consumer record with the user, designating that user as a consumer. For more information, see Create a consumer record.
Associate an existing user with a consumer record	Associate a Unified Consumer user with a consumer record by creating a consumer user and then linking the user with a consumer record. For more information, see Associate an existing user to a consumer record.

Role required: admin

About this task
To enable access to sys_users (internal users), add the sys_user to the user extension in the *Consumer* script include.

Procedure
1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Open the *Consumer* script include and modify the script as follows:

   Add the **initialize** method to the *Consumer* script include and set **this.userExtensions** value.

```
var Consumer = Class.create();

Consumer.prototype = Object.extendsObject(ConsumerImpl, {
    initialize: function() {
        ConsumerImpl.prototype.initialize.call(this);
        this.userExtensions = ["csm_consumer_user",
 "sys_user"];
    },

    type: 'Consumer',

});
```

3. Select **Update**.

What to do next
Add a user to your instance. For more information, see Create a user.

Create a user

You can add a user to your instance to enable them to log in and use designated application features.

Before you begin
Role required: user_admin

Procedure
1. Navigate to **All** > **User Administration** > **Users**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
User ID	Create a unique identifier for this user's ServiceNow login user name. Typical examples of user IDs are `cwitherspoon` and `charlie.witherspoon`. You can't create a user whose User ID duplicates an existing user. If you do import duplicates from an update set, the more recently created name takes the duplicate User ID.
Given name	Enter the user's given (often their first) name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Family name	Enter the user's family name (often their last name). **Note:** You can clear the **First Name** field, or the **Last Name** field in an existing user record, but you can't clear both at the same time.
Title	Enter a title or job description, or select one from the list.
Department	Select the user's department from the list.
Password	Assign a password to the user. To set up the user's password, fill in the fields on the form and **save** the record. Then, select **Set Password**. This password can be permanent or temporary.
Password needs reset	Select this check box to require the user to change the password during the first login.
Locked out	Select this check box to lock the user out of the instance and terminate all their active sessions. The system helps prevent users with the admin role from locking themselves out.
Active	Select this check box to make this user active. Only the administrator sees an inactive user in: ○ Lists of users ○ The selection list on reference fields (magnifying glass icon) ○ The auto-complete list that appears when you type into a reference field
Web service access only	It designates a user as a non-interactive user. This field is available with Non-Interactive Sessions. **Note:** The Web service access only check box is automatically enabled when you select **Machine** in the Identity type field. The Web service access only check box is automatically disabled when you select **Human** or **AI**.
Internal Integration User	Select this check box to Mark service accounts as internal integration users.
Email	Enter the user's email address. To enter a non-standard email address that doesn't pass field validation, you must deactivate the validation script first: **a.** Navigate to **System Definition** > **Validation Scripts**. **b.** Select the **email** record. **c.** Clear the **Active** check box and save the change. **d.** Complete the user profile, including the email address, and update or submit the record. **e.** Reactivate the email validation script.
Identity type	Select the user identity type based on the user:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Human - Select this for a real person, such as an employee, customer, or admin. ○ Machine - Select this for a non-human system or device, such as a server, application, or service account that makes automated requests. ○ AI - Select this for an autonomous AI-driven system. AI users should be used when an AI agent or agentic workflow needs permissions greater than that of the invoking user. See Security for AI agents for more information on using AI Agent type users. **Note:** The Web service access only check box is automatically enabled when you select **Machine** in the Identity type field. The Web service access only check box is automatically disabled when you select **Human** or **AI**.
Language	Select your preferred language from the list.
Calendar integration	Select **Outlook** to have this user receive meeting notifications via email directly to the calendar. Otherwise, select **None**.
Time zone	Select the user's time zone.
Date format	Select the user's preferred format for dates.
Business phone	Enter the user's business phone number.
Mobile phone	Enter the user's mobile phone number.
Photo	Attach a photo of the user, if appropriate.

The minimum fields required to create a user record are: **User ID** and either **First name** or **Last name**.

You can select the **Personalize Form** icon to remove fields.

4. **Optional:** Add **Roles**, **Groups**, **Delegates**, **Skills**, and **Subscriptions** to the user.
   For more information, see Managing roles, Creating groups, and Delegating roles.
5. Select **Submit**.
   The new user record appears in the list.

Assign the Unified Consumer role to a user

Assign the Unified Consumer (sn_customerservice.unified_consumer) role to the sys_user to designate them as a consumer in the Customer Service Management (CSM) application.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select the user from the user record.
3. In the Roles related list, select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Collection list, select the Unified Consumer (sn_customerservice.unified_consumer) role and move it to the Roles list.
5. Select **Save**.

Result
The sys_user is assigned to a unified consumer role (sn_customerservice.unified_consumer).

What to do next
Create and associate a Unified Consumer user to a consumer record. For more information, see Creating and associating a Unified Consumer user to a consumer record.

Creating and associating a Unified Consumer user to a consumer record

Create and associate a Unified Consumer user with a consumer record so that your user can access the Customer Service Portal (CSP). This process involves creating a Unified Consumer user through a consumer form and then associating the user to a consumer record.

Create a Consumer User through a consumer form

Create a Consumer User through the User lookup list on the consumer form in the Customer Service Management (CSM) application.

Before you begin
Role required: admin

About this task
You can create both the internal (snc_internal) and external (snc_external) users.

Note:
Only administrators can associate a sys_user with a consumer, and each user can be associated with only one consumer.

Procedure
1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Select the consumer from the consumer record.
3. In the Login Details related list, select the User lookup icon to open the list of sys_users.
4. On the Users form, select **New**.
5. On the form, fill in the fields.

   For a description of the field values, see Create a user.
6. Select **Submit**.

What to do next
Associate an existing user with a consumer record. For more information, see Associate an existing user with a consumer record.

Associate an existing user with a consumer record

Associate a user with a consumer record in the Customer Service Management (CSM) application. After the association is done, the user can access the Consumer Service Portal (CSP) as a consumer to search for information, create cases, and more.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Consumers**.
2. Select the consumer from the consumer record.
3. In the Login Details related list, select the User lookup icon to open the list of sys_users.
4. On the Users form, select the user to associate with the consumer record.
5. Select **Save**.

Result

The sys_user is associated with the consumer record. The user can now access the Consumer Service Portal (CSP) as a consumer.

Configure Contributor Users

The CSM Contributor User plugin enables you to engage middle office teams in resolving customer issues and requests.

Before you begin

Role required: admin

About this task

With the provided roles, relationships, and user profile attributes, contributors can report and collaborate on cases created for customers, service organizations, or themselves.

The CSM Query Rules plugin is automatically activated by CSM Contributor User plugin (com.snc.csm_contributor_user). For more information, see CSM Query Rules.

Procedure

1. Activate the CSM Contributor User plugin (com.snc.csm_contributor_user).
2. Assign the contributor user roles to middle office users.
3. Create relationships.
4. Ensure the **sn_cs_queryrules.use_query_rules** property is set to true.

Contributor users

With contributor user role, you can engage both internal and external users to resolve the customer issues and requests. This functionality is applicable to the users, recorded within the User (sys_user) table who possess either the snc_internal or snc_external role and external users, recorded within the Service Organization External Staff (sn_csm_service_organization_external_staff) table who possess snc_external role.

Note:
The contributor user role don't extend to the users belonging to the Contacts (customer_contact) class who are snc_external role.

The contributor users feature provides unified customer support for internal and external customers. With this feature, you can serve internal and external customers through shared service teams and service organizations:

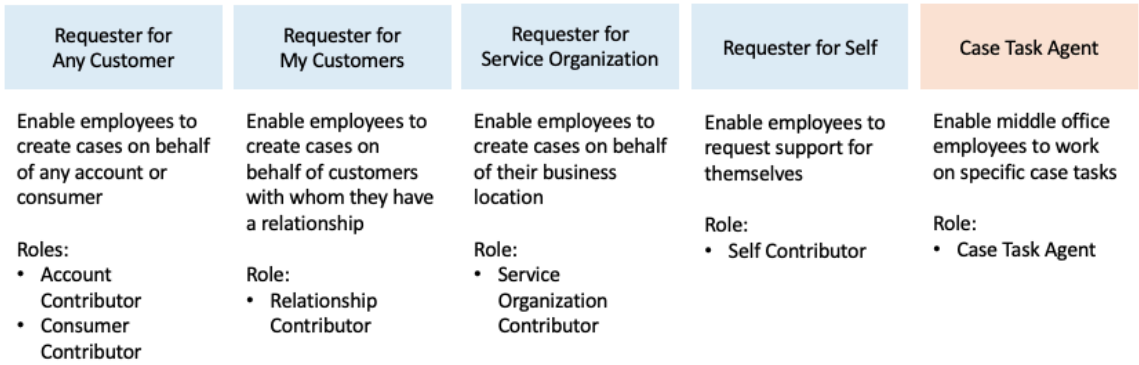
- Enable service organizations to serve one another and external customers.
- Enable employees to request support for themselves and for external customers.
- Enable middle office agents to work on specific tasks that are required to resolve cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of contributor user roles

The contributor users feature includes several roles that you can assign to users to control access to cases, case tasks, and case-related information. These roles can be assigned to users based on different business needs. In some cases, these roles also provide access to the parent cases and associated customer information.

Contributor user roles



The contributor users feature also includes viewer roles that enable employees to view cases, cases tasks, or core customer data. These roles include:

- Case Viewer
- Case Task Viewer
- Customer Data Viewer

Contributor user role description and capabilities

Requester type	Description	Capabilities
Requester for any customer	A requester who can create cases on behalf of any customer. This user: • Works with accounts and contacts or consumers. • Uses the Customer or Consumer Service Portal to assist customers. Roles: • Account contributor (sn_customerservice.account_contributor) • Consumer contributor (sn_customerservice.consumer_contributor)	This user can: • Search knowledge articles and catalog items. • Create cases for customers who visit a business location, including cases for catalog items (requests). • Create cases from communication channels available to customers including phone, web, chat, Virtual Agent, and messaging. If also an internal user on a case, this user can: • Add additional comments and attachments • Accept or reject a solution • Close a case • Receive notifications of case updates • Read work notes
Requester for my customers	A requester who can create cases on behalf of customers	This user can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contributor user role description and capabilities (continued)

Requester type	Description	Capabilities

	with whom they have an established relationship.
	
	This user:
	• Works with accounts and contacts or consumers.
	• Uses the Customer or Consumer Service Portal to assist customers.
	• Manages customer relationships and assists with customer cases.
	
	Role: Relationship contributor (sn_customerservice.relationship_contributor)
		• Search knowledge articles and catalog items.
		• Create cases on behalf of customers with whom they have a relationship.
		• Create cases from communication channels available to customers including phone, web, chat, Virtual Agent, and messaging.
		• View and follow up on all cases created for customers with whom they have a relationship.
		• Update customer data such as adding contacts and addresses.
		• Update cases:
		  ○ Add additional comments and attachments
		  ○ Accept or reject a solution
		  ○ Close a case
		  ○ Receive notifications of case updates
		  ○ Read work notes

Requester for service organization	A requester who can create cases on behalf of their business location. This user: • Works with accounts and contacts, consumers, and households. • Uses the Customer or Consumer Service Portal to assist customers. Role: Service organization contributor (sn_customerservice.service_organization_contributor)	This user can: • Search knowledge articles and catalog items. • Create cases on behalf of their business location, including cases for catalog items (requests), and follow up on those cases. • Create cases from communication channels available to customers including phone, web, chat, Virtual Agent, and messaging. • View and follow up on other cases created for the user's business location. If also an internal user on a case, this user can: • Add additional comments and attachments • Accept or reject a solution • Close a case • Receive notifications of case updates • Read work notes
Requester for self	A requester who can create cases for themselves.	This user can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contributor user role description and capabilities (continued)

Requester type	Description	Capabilities

	This requester accesses cases through a unified employee portal, if provided by their organization.
	
	Role: Self contributor (sn_customerservice.self_contributor)
		• Search knowledge articles and catalog items.
		• Create cases on behalf of themselves, including cases for catalog items (requests).
		• Create cases from communication channels available to customers including phone, web, chat, Virtual Agent, and messaging.
		• View and follow up on the cases that they have created from themselves:
		  ○ Add additional comments and attachments
		  ○ Accept or reject a solution
		  ○ Close a case
		  ○ Receive notifications of case updates
		  ○ Read work notes

Case task agent	A fulfiller, such as a middle office agent, who works on a specific set of tasks required to resolve a case. These case tasks: • Are assigned to the agent or to their department or group. • Focus on a specific function or expertise of the department or group. This agent typically uses a workspace to complete these tasks. Role: Case task agent (sn_customerservice.case_task_agent)	This user can: • View and work on the case tasks assigned to them or to their group or department. • View the parent cases for the case tasks that they can access. • Communicate with agents on the parent case through work notes and additional comments. • Communicate with agents on other case tasks for the parent case through work notes and additional comments. • Access customer information needed to complete a case task. • Make changes to a case task that causes an update to the state or stage of the parent case. • Search for knowledge articles to assist with the case task.

The contributor user roles are available with different CSM plugins. For a more detailed description of these user roles, see Contributor user roles.

Fields added to the Case form

The contributor users feature adds two fields to the Case form that are used to identify the customer for a case. These fields are used in addition to the **Account** and **Consumer** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer fields added to Case form

Field	Description
Requesting Service Organization	This field displays the name of a service organization. If this field is filled in, and the **Account** and **Consumer** fields are empty, the customer for the case is a service organization. This field is included with the Service Organization plugin (com.snc.service_organization).
Requested By	This field displays the name of the requester. If this field is filled in and the **Account**, **Consumer**, and **Requesting Service Organization** fields are empty, the customer for the case is an employee. This field is included with the Customer Service plugin (com.sn_customerservice).

The Customer Service plugin adds two fields to the Notes section of the Case form for contributor users.

Contributor fields added to Case form

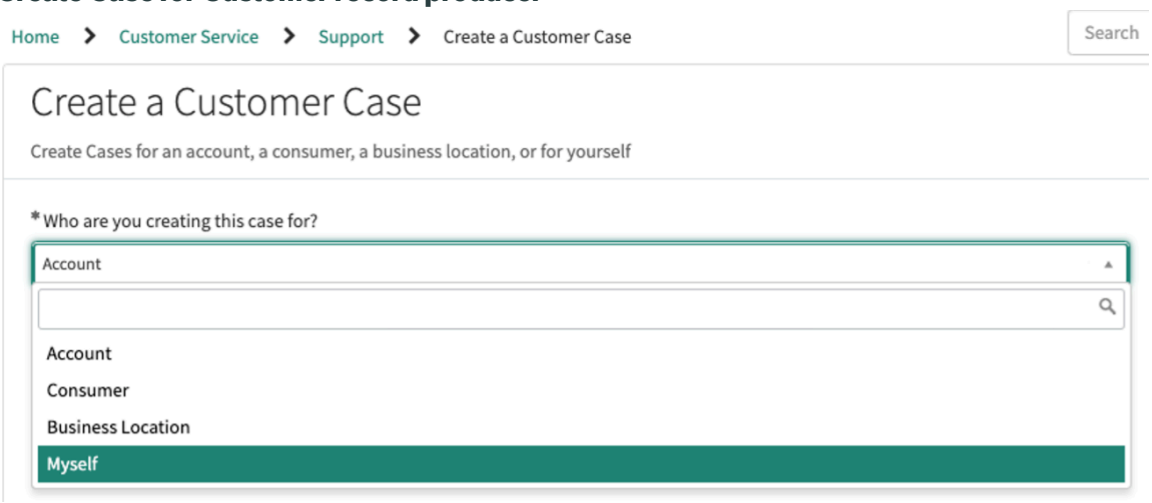
Field	Description
Contributor Users	When a user with the case task agent role is assigned to a case task, the user is added to the **Contributor Users** field. If a user is removed from the **Assigned to** field on the Case Task form, and they are not assigned to any other tasks for the case, they are also removed from the **Contributor Users** field.
Contributor Groups	When a user with the case task agent role is assigned to a case task, the user's assignment group is added to the **Contributor Groups** field. If a user is removed from the **Assigned to** field on the Case Task form, and no other member of their assignment group is assigned to any other tasks for the case, the assignment group is removed from the **Contributor Groups** field. If a group is removed from the **Assignment group** field on the Case Task form, and the group is not assigned to any other tasks for the case, the assignment group is removed from the **Contributor Groups** field.

Create Case for Customer record producer

The contributor users feature adds a record producer that contributor users can access from the Customer and Consumer Service Portals and use to create cases. When creating a case, this record producer presents different options for the customer in the **Who are you creating this case for?** field, depending on the roles assigned to the logged-in user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Case for Customer record producer



When the contributor user selects an option, additional fields related to that customer type are displayed.

Customer type fields added to Create a Customer Case record producer

Customer option	Additional fields
Account	• **Reported by**: the logged-in user with the account contributor role. • **Account**: the name of the account. • **Contact**: the contact for the account.
Consumer	• **Reported by**: the logged-in user with the consumer contributor role. • **Consumer**: the name of the consumer. • **Household**: the household that the consumer belongs to.
Business Location	• **Reported by**: the logged-in user with the service organization contributor role. • **Requesting Business Location**: the name of the service organization requesting assistance. • **Requesting support from Business Location**: the name of the service organization from which the **Requesting Business Location** is asking assistance.
Myself	**Reported By**: the logged-in user with the self contributor role.

Additional fields on the record producer that are common to all customer options include **Priority**, **Channel**, **Subject**, and **Description**.

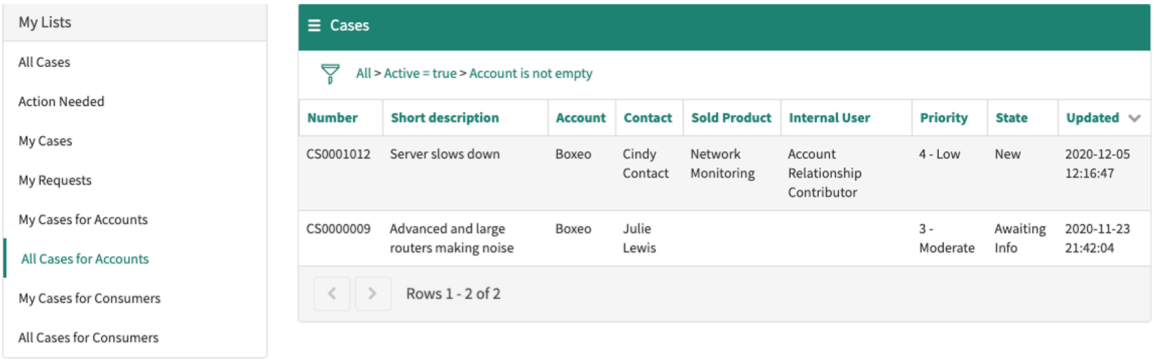
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing record lists on the Customer and Consumer Service Portals

The My Lists widget on the Customer and Consumer Service Portals includes different filters for viewing records.

My Lists widget on the Customer Service Portal



Depending on the roles assigned to the logged-in user, this widget displays the following filters.

My Lists filters

Contributor user	My Lists filters
Account contributor	**Cases for Accounts**
Consumer contributor	**Cases for Consumers**
Service organization contributor	• **My Cases for Business Locations**: cases created by the contributor user on behalf of their business locations. • **All Cases for Business Locations**: all cases created on behalf of the contributor's business locations, independent of who created the case.
Self contributor	**Cases for myself**
Relationship contributor	Displays filters depending on the relationships established for this user. • **My Cases for Accounts**: cases created by the contributor user on behalf of accounts where the user is an Account Manager. • **All Cases for Accounts**: all cases created on behalf of accounts where the user is an Account Manager, independent of who created the case. • **My Cases for Consumers**: cases created by the contributor user on behalf of consumers or households where the user is a Relationship Manager. • **All Cases for Consumers**: all cases created on behalf of consumers or households where the user is a Relationship Manager, independent of who created the case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

My Lists filters (continued)

Contributor user	My Lists filters
	For more information, see Service Model Foundation relationships.

Access to case tasks

Users with the case task agent role can view and access case tasks in lists, on dashboards, and on landing pages.

Use widgets to display case tasks on dashboards and landing pages.

Widgets for displaying case tasks

Widget	Task information displayed
My Case Tasks	This widget includes the following information for each case task: • Task number • Status • Subject • Priority • Case number • Case short description
My Group's Case Tasks	This widget includes the following information for each case task: • Task number • Status • Subject • Priority • Assigned to • Case number • Case short description

Note:
If a playbook is available, the system opens the case task within in the playbook. If no playbook is available, the system opens the Case Task form.

Depending on assigned roles, contributor users can see different modules in CSM Agent Workspace and CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module access by role

Role	Modules

Case task agent
 	
[sn_customerservice.case_task_agent]
	Users with the case task agent role have access to these modules:
	• **Case Task**: includes the case tasks that the user has access to.
	  ○ My Case Tasks
	  ○ My Open
	  ○ Unassigned for my groups
	  ○ My Accessible Tasks
	• **Customers**: Includes read-only access to customer information.
	  ○ Accounts
	  ○ Partners
	  ○ Contacts
	  ○ Consumers
	  ○ Households
	  ○ Household members

Case task viewer [sn_customerservice.case_task_viewer]	Users with the case task viewer role have access to All tasks in the **Case Task** module.
Case contributor viewer [sn_customerservice.case_contributor_viewer]	Users with the case contributor viewer role have access to My Contributing Tasks in the **Case Task** module.
Case viewer [sn_customerservice.case_viewer]	Users with the case viewer role can see the cases that they have access to in the **Cases** module.

Case task agent access to customer information

Users with the case task agent role have read-only access to some of the customer information for the parent case.

- For B2B cases: Account and contact records, including addresses, sold products, and install base.
- For B2C cases: Consumer and household records, including addresses, sold products, install base, and head of household.
- For business location cases: Service organization records, including internal contact information.

Contributor user roles

The contributor user data model uses several roles that can be assigned to users to control case access, case tasks, and case-related information based on different business needs.

These roles are included with several different plugins:

- Customer Service (com.sn_customerservice)
- CSM Contributor User (com.snc.csm_contributor_user)
- Business Location (com.snc.business_location)
- CSM Base Extension Entities (com.snc.cs_base_extension)

See the following tables for detailed role descriptions.

Roles included with the Customer Service plugin

The following table lists the contributor roles that are included with the Customer Service (com.sn_customerservice) plugin along with their descriptions and associated roles.

Customer service roles

Role	Description	Contains roles

Case task agent
 	
[sn_customerservice.case_task_agent]
	This role provides access to case tasks and related case information.
	
	A user with this role can work on the following case tasks:
	• Tasks that are assigned to the user or to the user's assignment groups.
	• Tasks that have been created by the user.
	
	With this role, the user can:
	• View and update case tasks.
	  ○ Add work notes, comments, and attachments.
	  ○ Update the status.
	  ○ Perform additional actions from a case task such as sending email.
	• Create case tasks and assign them to other users.
	
	With this role, users have read-only access to customer information for the case:
		• sn_customerservice.csm_workspace_user
		• sn_customerservice.customer_data_viewer
		• sn_customerservice.case_contributor_editor

Customer service roles (continued)

Role	Description	Contains roles
	The user can access the **All tasks I participate in** module in CSM Agent Workspace.	

Roles included with the CSM Contributor User plugin

The following table lists the contributor roles that are included with the CSM Contributor User (com.snc.csm_contributor_user) plugin along with their descriptions and associated roles.

Roles for the contributor user plugin

Role	Description	Contains roles
Account contributor [sn_customerservice.account_contributor]	This role enables users to create cases for any account.	sn_customerservice.case_contributor_creator
Consumer contributor [sn_customerservice.consumer_contributor]	This role enables users to create cases for any consumer.	sn_customerservice.case_contributor_creator
Self contributor [sn_customerservice.self_contributor]	This role enables users with snc_internal role to create cases for themselves.	sn_customerservice.case_contributor_creator
Case contributor creator [case_contributor_creator]	This role enables users to create cases and is included in the top-level contributor roles.	

Roles included with the Business Location plugin

The following contributor roles are included with the Business Location plugin (com.snc.business_location).

Roles for the business location plugin

Role	Description	Contains roles
Service organization contributor [sn_customerservice.service_organization_contributor]	This role enables users to create cases for their service organization (business location). **Note:** A service organization contributor must be a member of a service organization to create cases on its behalf.	sn_customerservice.case_contributor_creator

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles included with the CS Base Extension Entities plugin

The following contributor roles are included with the CSM Base Extension Entities plugin (com.snc.cs_base_extension).

Roles for the CS base extension entities plugin

Role	Description	Contains roles
Relationship contributor [sn_customerservice.relationship_contributor]	This role enables users to create cases for customers with which they have an established relationship. **Note:** • The CSM Contributor User (com.snc.csm_contributor_user) plugin must be activated. • A relationship contributor must be a member of an account, contact, or household team to create cases on their behalf.	sn_customerservice.case_contributor_creator

Additional roles

Additional contributor roles

Role	Description	Contains roles
Customer data viewer [sn_customerservice.customer_data_viewer]	This role provides read access to customer data, including account, consumer, and household data, and the information included in the related lists.	
Workspace user [sn_customerservice.csm_workspace_user]	This role provides access to case tasks from the following modules in the CSM workspaces: • My Case Tasks • My Group's Case Tasks Users can also: • Use Agent Assist to search for knowledge articles (if the User Criteria is set to provide access to knowledge).	• agent_workspace_user • canvas_user • sn_templated_snip.template_snippet_reader • email_composer

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional contributor roles (continued)

Role	Description	Contains roles
	• Create email (if the user has write access to the record and the email_composer role). • View response templates (if response templates have been configured for the record. **Note:** By default, this role is added to the case task agent role (sn_customerservice.case_task_agent).	

Configuring customer access management

Ensure that the customer access management is set up correctly for the user by completing all configuration tasks using the Customer Service Management (CSM) application.

Overview of customer access management

Customer access management enables you to support multiple contacts and consumers on cases and sold products, providing them with varying levels of access to the case. You can also add additional internal users to a case.

As the needs of industry verticals grow, enterprises encounter complex use cases. There are use case scenarios where case management can be handled by more than one customer contact. For example, in a B2C scenario, let's assume that a loan applicant wants to add a co-borrower, guarantor, and an attorney to a housing loan application where everyone has the same level of access to respond to the loan application-related case. While in other cases, products purchased by a customer can have multiple departments tracking the product, like the finance team tracking the renewals of the product or the operations team tracking the maintenance of the product.

Customer access management enables enterprises across industry verticals such as hi-tech, telecommunications, financial services, government, and manufacturing to meet these complex use cases.

Customer access management helps customer service agents add multiple related parties and provides them with varying levels of access to a case. While adding related parties to a case, customer service agents can select the relationship type. The relationship type defaults the responsibility that drives the access level for the related parties, such as contacts or consumers on a case.

Key benefits

Customer access management:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Improves the customer experience by enabling related parties to track and collaborate on cases
- Improves operational efficiency by enabling customers to track cases for products and services
- Increases automation by automatically granting access to cases based on access to the sold product

Configuration tasks for customer access management

Listed are the following key configuration tasks required to set up and manage customer access.

Task	Description
Customer access management tables and plugins.	Add new tables or modify existing tables to enable customer access management.
Install roles with customer access management.	Use different predefined functional and granular roles to establish relationships between users and entities.
Create a responsibility definition	Define a role or responsibility that can support your organization and users in the Customer Service Management (CSM) application.
Configure access through the responsibility access configuration	Streamline how you create and update your responsibility definitions and access configurations by using the declarative responsibility framework in the Customer Service Management (CSM) application.
Create related party configurations.	Link related party entity responsibilities to responsibility definitions by adding related party configurations to a case.

Roles installed with customer access management

Customer access management uses different predefined functional and granular roles to establish relationships between users and entities. The granular and functional roles help provide user access to information and maintain data security.

Functional and granular roles overview

Functional and granular roles help provide authorized related parties access to the case, and provide additional contacts or additional consumers access to the sold product.

Granular roles provide access to cases, sold product, and related entities. One or more granular roles can be bundled together as a functional role to perform a meaningful action. Linking multiple granular roles to a functional role enables you to build your own access rules by applying the functional and granular roles for various Customer Service Management (CSM) entities.

A granular model helps to protect data by granting the required level of access to the relevant CSM entities. With this functionality, each role is associated with a set of privileges or responsibilities that determine users' access to certain information. You can set granular policies that authorize individuals to do their jobs efficiently and effectively, which helps to improve the customer experience.

Roles and descriptions

Functional roles are a set of granular roles that are required to perform a function that requires access on multiple entities. The following table lists the functional roles for customer access management.

Functional roles

Role title [name]	Plugins required	Description	Contains roles
Case Authorized Contact [sn_customerservice.case_authorized_contact]	Customer Service [com.sn_customerservice]	This role provides access to add additional comments and attachments, accept or reject a solution, receive notifications on case updates, close a case, and update case tasks.	sn_customerservice.case_write_granular
Case Authorized Consumer	Customer Service	This role provides access to add additional	sn_customerservice.case_write_granular

Assign granular roles to a functional role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assign granular roles to a functional role

Assign granular roles to a functional role to help provide authorized related parties with access to the case, and provide additional contacts and additional consumers with access to the sold product.

Before you begin
Role required: admin

Procedure

1. In the navigation filter, enter `sys_user_role.list`.
2. In the **Search** field, enter `*authorized`.
   You can see the list of functional roles that are provided in the base system.
3. Select the functional role that you want to customize.
4. From the Contains Roles related list, select **Edit** and add the desired granular role to the functional role.
5. Select **Save**.
   The granular role is added to the functional role.

Create a responsibility definition

A responsibility, or responsibility definition, specifies the role or function a user has within an entity, determining access through relationships. When creating a relationship, users are assigned specific responsibilities that grant access to the entity and its related entities.

Before you begin
Role required: admin

About this task
If you're using the Service Model Foundation feature, you can also create the responsibility definitions to use in customer and consumer relationships. For more information about configuring Service Model Foundation, see Configure Service Model Foundation.

The Responsibility Definition [sn_customerservice_responsibility_def] table supports domain separation. For more information on domain separation, see Domain separation and Customer Service Management.

Note:
Starting with the Vancouver release, the Responsibility Definition [sn_customerservice_responsibility_def] table is reparented to the Application file [sys_metadata] table.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Responsibility Definitions**.
2. Select **New**.
3. On the form, fill in the fields.

Responsibility Definition form fields

Field	Definition
Name	Name of the responsibility.
Applicable to	Persona type that the responsibility applies to, such as the customer service managers or agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Type	Type of users to whom the responsibility can be assigned to: ○ User: Select **User** if this responsibility should be assigned to an employee. When assigning this type, the list of available users comes from the Users [sys_users] table. ○ Contact: Select **Contact** if this responsibility should be assigned to a customer contact. When assigning this role, the list of available users comes from the Contacts [customer_contact] table. ○ None: Select **None** if this responsibility definition is to be used when creating relationships between consumers. **Note:** Only the responsibility definitions with **Type** set to **User** can be used in the following Service Model Foundation relationships: ○ Account Team Member ○ Consumer Team Member ○ Household Team Member
Unique	Option that you can select to disable the duplicate entries for the responsibility definition.

4. Select **Submit**.

Configure access through the responsibility access configuration

Streamline how you create and update your responsibility definitions and access configurations by using the declarative responsibility framework in the Customer Service Management (CSM) application. This framework enables you to select the level of access for each responsibility by leveraging low-code or no-code capabilities, which reduces the time required for scripting.

Before you begin

Role required: admin

About this task

The Responsibility Access Configuration [sn_customerservice_responsibility_access_config] table is used to store the metadata of the responsibility access configuration. This configuration specifies the level of access and the entities that can be accessed by a particular responsibility. For more information about creating a responsibility definition, see Create a responsibility

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

definition. The need for domain separation in configuring access records is determined by the domain of the referenced responsibility.

Note:
Starting with the Yokohama release, creating and updating responsibility definitions and access configurations using the declarative responsibility framework is deactivated.

Granular roles and supported entities for responsibility framework

Starting with the Yokohama release, multiple module-level granular roles are introduced to simplify defining and configuring the responsibility framework. These new granular roles simplify tasks by removing the need to create custom access control lists (ACLs) on the target table when a responsibility ACL is already in place. This change promotes a more straightforward and declarative migration process.

Granular roles for access through entities

The granular roles provides Create, Read, and Update (CRU) access across entities, based on the access permissions defined for each responsibility within the declarative responsibility framework.

Granular roles	Description
sn_customerservice.cust_data_resp_granular	Provides granular access to customer-related foundational entities (including accounts, contacts, consumers, and households) through the responsibility framework.
sn_customerservice.case_mgmt_resp_granular	Provides granular access to case and related entities through the responsibility framework.
sn_install_base.resp_granular	Provides granular access to installed base items, sold products, and related entities through the responsibility framework.
sn_customerservice.contract_entitlement_resp_granular	Provides granular access to contracts, entitlements, and related entities through the responsibility framework.

Granular roles and supported entities

Granular roles are designed based on feature sets and can be used to provide access to supported tables or entities though the responsibility framework.

Feature Set	Granular Role	Supported Tables/Entities
Customer Data	sn_customerservice.cust_data_resp_granular	• Account [customer_account] • Account Team Member [sn_customerservice_team_member] • Account Address [account_address_relationship] • Account Access [sn_csm_account_access] • Account Relationship [account_relationship]

Create related party configurations

Related party configurations define the title of a relationship between an entity and an organization or user. These configurations also enable linking related party types with responsibility definitions to grant access as needed.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Related Party Configuration**.
2. To create a related party configuration, select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Party Configuration record form

Field	Description
Name	Related party configuration type.
Applies To	Table assigned with the related party configuration.
Entity Type	Entity type such as an account, a consumer, or a product.
Reference Condition	Filter condition for defining the related party configuration. In the **Reference Condition** field, you can select **Add Filter Condition** or **Add "Or" Clause**.
Default Responsibility	Access level to different entities and the related information. **Note:** Whenever a related party record is created, the **Responsibility** field gets auto-populated from the default responsibility associated with the selected party type.
Default Order	Numerical value given to establish the priority of the relationship. **Note:** Whenever a related party record is created, the **Order** field gets auto-populated from the default order associated with the selected party type.

4. Select **Submit**.

List of related party configurations provided with the base system

Related party configurations for different entities that are provided with the base system are listed in the following tables.

Related party configurations for cases

Types and responsibilities for cases are listed in the following table.

Cases

Type	Default Responsibility
Authorized Contact	Authorized Representative
Authorized Consumer	Authorized Representative
Authorized Contributor	Authorized Representative
Listed Contact	Not applicable
Listed Consumer	Not applicable

Related party configurations for sold products

Types and responsibilities for sold products are listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sold Products

Type	Default Responsibility
Authorized Account	Authorized Account
Authorized Contact	Authorized Representative
Authorized Consumer	Authorized Representative
Listed Account	Not applicable
Listed Contact	Not applicable
Listed Consumer	Not applicable

Related party configurations for install bases

Types and responsibilities for install bases are listed in the following table.

Install Bases

Type	Default Responsibility
Authorized Account	Authorized Account
Authorized Contact	Authorized Representative
Authorized Consumer	Authorized Representative
Authorized Contributor	Authorized Representative
Authorized Member	Authorized Representative
Authorized Service Organization	Authorized Service Organization
Listed Account	Not applicable
Listed Contact	Not applicable
Listed Consumer	Not applicable
Listed Contributor	Not applicable
Listed Member	Not applicable
Listed Service Organization	Not applicable

For more information on install base related parties, see Add related parties to an install base item.

Related party configurations for account team members

Types and responsibilities for account team member are listed in the following table.

Account Team Members

Type	Default Responsibility
Account Manager	Account Manager
Preferred Technician	Preferred Technician
Primary Support Agent	Primary Support Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Account Team Members (continued)

Type	Default Responsibility
Support Manager	Support Manager

Related party configurations for contact relationships

Types and responsibilities for contact relationship are listed in the following table.

Contact Relationships

Type	Default Responsibility
Asset Contact	Asset Contact

Related party configurations for consumer relationships

Types and responsibilities for consumer relationship are listed in the following table.

Consumer Relationships

Type	Default Responsibility
Authorized Representative	Authorized Representative

Related party configurations for household member relationships

Types and responsibilities for household member relationship are listed in the following table.

Household Member Relationships

Type	Default Responsibility
Authorized Representative	Authorized Representative

Related party configurations for service organizations

Types and responsibilities for service organizations are listed in the following table.

Service Organizations

Type	Default Responsibility
Location Agent	Location Agent
Location Consumer Agent	Location Consumer Agent
Location Contributor	Location Contributor
Location Manager Contributor	Location Manager Contributor
Location Manager Fulfiller	Location Manager Fulfiller
Location Support Agent	Location Support Agent
Listed Member	Not applicable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Whenever a related party record is created, the **Responsibility** field gets auto-populated from the default responsibility associated with the selected party type. Similarly, the **Order** field gets auto-populated from the default order associated with the selected party type.
- Listed role types don't have any responsibility. Since the correct role and responsibility determine access, related parties are not granted access if the **Responsibility** field is left empty.

Populate the Type field in relationship tables using the fix script

Leverage the fix script to add and manage the **Type** field in relationship tables. This script simplifies data mapping and enhances record consistency across the base system.

Before you begin

Role required: admin

About this task

Starting with the Yokohama release, a new optional **Type** field is added to the account team member [sn_customerservice_team_member] table, which previously included the fields **Account**, **User**, and **Responsibility**. This fix script applies to all relationship tables in the base system.

The **Type** field references the related party configuration [sn_customerservice_related_party_configuration] table, a metadata table that enables administrators to define a **Type Configuration** for each responsibility. This field enables administrators to assign meaningful business names to responsibilities, reducing duplication. By internally referencing the same responsibility, the **Type** field simplifies data management and improves record consistency.

You can use the following procedure to populate the **Type** field using the fix script.

Procedure

1. Identify distinct Responsibility values in the relationship table that you want to update.
2. Create corresponding Type Configuration records in the related party configuration [sn_customerservice_related_party_configuration] table.
3. Run the following fix script to populate the **Type** field.

```
fixRelatedPartyTypeField(String tableName, String
 appliesTo, String entityType, String typeField, String
 responsibilityField)
/**
  * Fixes the related party type field in the specified table.
  *
  * @param tableName  The name of the table to update.
  * @param appliesTo  The value for the applies_to field.
  * @param entityType The value for the entity_type field.
  * @param typeField  The name of the type field to update. If
 null, defaults to FIELD_TYPE.
  * @param responsibilityField The name of the responsibility
 field to update. If null, defaults to FIELD_RESPONSIBILITY.
  */
```

Result

The fix script:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Automatically populates the **Type** field for matching records in the selected relationship table.
- Maps existing responsibilities to their corresponding Type Configuration records.
- Processes updates in batches for optimized performance.
- Logs updates for reference.

Note:
For large record volumes, run the fix script during system downtime to avoid performance impacts.

You can manually populate the **Type** field by navigating to the related party configuration [sn_customerservice_related_party_configuration] table and creating Type Configuration records for each distinct responsibility.

Example:
Suppose you want to populate the **Type** field in the account team member [sn_customerservice_team_member] table, where the table uses the following responsibilities:

- Account Manager 1
- Account Manager 2
- Account Manager 3

1. Navigate to the related party configuration [sn_customerservice_related_party_configuration] table.
2. Create three Type Configuration records, one for each responsibility.
3. Run the fix script that automatically:
   - Maps each responsibility to its corresponding **Type**.
   - Populates the **Type** field for all records in the account team member [sn_customerservice_team_member] table.

Fix external user role assignments

You may have external users (contacts or consumers) on your instance that have been assigned internal roles. If so, you can use the Customer Service Management guided setup to evaluate and correct these role assignments as needed.

Because external users with internal roles can result in access issues, it is recommended that external users only be assigned external roles.

Use the tasks in the Fix External User Role Assignment category guided setup category to evaluate the contacts and consumers with the following role assignments:

- The snc_internal role only.
- The snc_internal role and one or more external roles.
- The snc_internal role and one or more additional internal roles.
- The snc_internal role and one or more additional internal and external roles.

Review the list of users in each group and tag those users with incorrect role assignments. Then run the scheduled job to fix the role assignments.

Note:
You can also review and update external user roles using a query-based list. For more information, see KB0829930.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using guided setup to fix external user role assignments

With the system administrator role, you can use guided setup to fix external user role assignments.

1. Navigate to **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Fix External User Role Assignment category, click **Get Started**.

   The Fix External User Role Assignment page opens with a list of tasks to evaluate groups of external users.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Fix External User Role Assignment tasks

The following table describes the different configuration tasks in the Fix External User Role Assignment category.

Fix External User Role Assignment tasks

Task	Description
External users with possible non-intentional internal role assignment	This is a set of contacts and consumers with the following role assignments: • The snc_internal role only. • The snc_internal role and one or more external roles. It is recommended that you do not assign internal roles to external users. Review the contacts in this list and fix the role assignment as needed.
External users with possible intentional internal role assignments	This is a set of contacts and consumers that have the following role assignments: • The snc_internal role and one or more additional internal roles. • The snc_internal role and one or more additional internal and external roles. It is recommended that you do not assign both internal and external roles to the same user. Review the users in this list and fix the role assignment as needed.
External users with intentional internal role assignments	This is a set of contacts and consumers that have the snc_internal role that is contained by another role. It is recommended that you do not assign internal roles to external users. Review the

Fix External User Role Assignment tasks (continued)

Task	Description
	users in this list and fix the role assignments as needed.
Avoid such role assignments in future	To prevent external users from being assigned the snc_internal role in the future, enable the following property: *glide.security.explicit_roles.enable_intern* Click **Configure** to navigate to the property and verify that the value is true. If false, set the value to true.

Fix roles for external users with possible non-intentional internal role assignments

Review and fix roles for external users that may have non-intentional internal role assignments.

Before you begin

Role required: admin

About this task

It is recommended that you do not assign internal roles to external users. Use this procedure to review and fix the contacts and consumers that may have the following role assignments:

- snc_internal role only
- snc_internal role and one or more external roles

Note:
This guided setup task uses scheduled jobs to identify and fix role assignments. When fixing role assignments, the scheduled job fixes 3000 users at a time. If there are more than 3000 users in this group, change the configuration of the job so that it runs periodically.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Fix External User Role Assignment category, click **Get Started** and then click **External users with possible non-intentional internal role assignment**.
3. Run the scheduled job to tag users that may have non-intentional user role assignments.
   Users are tagged with the **Ext-user-non-intentional** tag.
4. Review the list of tagged users and remove the tag from any users for which you do not need to fix role assignments.
   If necessary, configure the list to display the Tag column.
5. Run the scheduled job to fix the role assignments for the users with the **Ext-user-non-intentional** tag.
   This scheduled job makes the following changes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For users with the snc_internal role only, it removes the snc_internal role and adds the snc_external role.
- For users with the snc_internal role and one or more external roles, it removes the snc_internal role.

This scheduled job runs all of the insert/delete business rules on the User Role [sys_user_has_role] table.

Fix roles for external users with possible intentional internal role assignments

Review and fix roles for external users that might have intentional internal role assignments.

Before you begin

Role required: admin

About this task

It is recommended that you don't assign internal roles to external users. Use this procedure to review and fix the contacts and consumers that may have the following role assignments:

- snc_internal role and one or more additional internal roles
- snc_internal role and one or more additional internal and external roles

Note:
This guided setup task uses scheduled jobs to identify and fix role assignments. When fixing role assignments, the scheduled job fixes 3000 users at a time. If there are more than 3000 users in this group, change the configuration of the job so that it runs periodically.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and select **Get Started**.
2. In the Fix External User Role Assignment category, select **Get Started** and then select **External users with possible intentional internal role assignments**.
3. Run the scheduled job to tag users that may have intentional user role assignments.
   Users are tagged with the **Ext-user-intentional** tag.
4. Review the list of tagged users and remove the tag from any users for which you don't need to fix role assignments.
   If necessary, configure the list to display the Tag column.
5. Run the scheduled job to fix the role assignments for the users with the **Ext-user-intentional** tag.
   This scheduled job makes the following changes:
   - For users with the snc_internal role and one or more additional internal roles, it removes the snc_internal role and all other internal roles, and adds the snc_external role.
   - For users with the snc_internal role and one or more additional internal and external roles, it removes the snc_internal role and all other internal roles.

   This scheduled job runs all of the delete business rules on the User Role [sys_user_has_role] table.

Fix roles for external users with intentional internal role assignments

Review and fix roles for external users that have intentional internal role assignments.

Before you begin

Role required: admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

It is recommended that you do not assign internal roles to external users. Use this procedure to review and fix the contacts and consumers that have the following role assignments:

snc_internal role that is contained by another role.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Fix External User Role Assignment category, click **Get Started** and then click **External users with intentional internal role assignments**.
3. Run the scheduled job to tag users that have intentional user role assignments.
   Users are tagged with the **Ext-user-contained-role** tag.
4. Review the list of tagged users.
5. Manually fix the role assignments for the desired users.

Prevent future internal role assignments for external users

Enable a property to prevent external users from being assigned the snc_internal role.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Fix External User Role Assignment category, click **Get Started** and then click **Avoid such role assignments in future**.
3. Set the
   `glide.security.explicit_roles.enable_internal_user_blacklist`
   property to true.

Product data

Configure product data for Customer Service Management including product models, sold products, install base items, and installed products.

Setting up users, user groups, and customer relationships

Task	Description
Configure product data	Configure the product data for your company, including: • Product models: Goods or services that your company sells and supports. • Sold products: The products and components that have been sold to an account or a consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up users, user groups, and customer relationships (continued)

Task	Description
	• Install base items: Items that represent the instances that have been installed or provisioned for a customer. • Installed products: Information about sold products and how they are deployed or installed.
Configure assets	An asset is a specific product or instance that is supported for an account or consumer.
Create asset contact relationships	Assign an asset to a customer contact who is responsible for managing that asset.
Create service contracts	Service contracts define the type of support that accounts and consumers receive for their products.
Configure entitlements	Entitlements define the type of support that an account or consumer receives as well as the supported communication channels.
Configure Customer Contracts and Entitlements	Use the Post-Sales Support application to configure and display customer service contracts and entitlements.
Use Customer Life Cycle Management Workflows to manage the life cycle of your sold products	This application enables you to update the existing configurations and to modify, suspend, resume, or disconnect the sold products and their complete hierarchy.
Create Lead to Cash for products and services	Use these workflows to analyze business opportunities and customer leads as well as the billing, support, and maintenance requirements after a sale is complete.

Configure product data

Configure product data including product models, sold products, install base items and installed products.

Before you begin

Role required: admin

About this task

- **Product models:** A product is a type of good or service that your company sells and supports. Product models identify different types of products, such as service, hardware, software, or consumables.

  Note:
  Product models require the Model Management plugin (com.snc.model).

- **Sold products:** The products and components that have been sold to an account or a consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Install base items:** Items that represent the instances that have been installed or provisioned for a customer.
- **Installed products:** Provide information on the sold products and how they are deployed or installed. Use installed products to create an association between sold products and install base items.

Procedure

- You can import the following product data using guided setup.
  - Import product models with guided setup
  - Import sold products with guided setup
  - Import install base items with guided setup
  - Import installed products with guided setup
- You can create product data using the Customer Service Management application.
  - Create a product model
  - Create sold products
  - Create install base items
  - Create installed products
- You can configure the following relationships and associations after importing or creating product data:
  - Product models
    - Associate service offerings to product models
    - Configure product model and catalog item relationships
  - Sold products
    - Associate service offerings with sold products
    - Associate sold products with contracts

Product models

Configure product models, such as service, hardware, software, or consumables that your company sells and supports.

Task	Description
Import product models with guided setup	Prepare and import data for each type of product model in a different table.
Create a product model	Create a record for a specific version or configuration of a product type that your company sells and supports.
Associate services with product models	Associate one or more service offerings to a product model to enable customers to choose service offerings for products.
Configure product model and catalog item relationships	Create relationships between product models and catalog items so that your customers can request services for products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import product models with guided setup

A product is a type of good or service that your company sells and supports. Product models identify different types of products, such as service, hardware, software, or consumables.

Before you begin
Role required: admin

About this task
Information for each type of product model is stored in a different table. For example, service product models are stored in the Service Model [cmdb_service_product_model] table.

Note:
Product models require the Model Management plugin (com.snc.model).

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Foundation Data category, click **Get Started** and then click **Import Product Models**.
3. Upload data from an external data source into an import set.
4. Create a transform map.
5. Execute the transform map to transfer the data.
6. Verify that the data records are imported into the target table.

Create a product model

Create a record for a type of product that your company sells and supports.

Before you begin
Role required: model_manager

Confirm that the Model Management plugin (com.snc.model) is installed.

About this task
A product model is a specific version or configuration of a product. Build hierarchical product models that represent the set of products that your organization offers to its customers and define relationships between different product models. Define whether a product is tracked as an asset, a CI, or both. Additionally, identify or create the CI and asset classes to capture configuration information for product models.
Product models provide customer service agents and customers with a common understanding of the products being used by a particular customer. Customers can view the products purchased on the Customer Service Portal and can open cases for any issues they are facing.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Product Models**.
2. Select **New**.
3. Select the type of product model to create:
   - **Application Model**
   - **Consumable Model**
   - **Contract Model**
   - **Facility**
   - **Hardware**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Service**
- **Software**

4. Fill in the fields for the selected product model as appropriate.
   See Model form fields for field descriptions.
5. Select **Submit**.

> **Note:**
> In the **Sold Product** related list, you can see all the accounts and consumers that the product model has been sold to.

Associate services with product models

Enable customers to select services for products by associating services with product models.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
One product model can have multiple associated services.

Procedure
1. Navigate to **All** > **Customer Service** > **Product Models**.
2. Select a product model.
3. Configure the form to display the Services related list.
   For more information, see Add a related list to a form.
4. On the Services related list, click **New** or **Edit** to add an existing service offering to the product model.

Configure product model and catalog item relationships

Enable customers to request services for the products that they own. Create definitions for the services that support your products and then configure service definitions to associate them with the appropriate products and catalog items.

Before you begin
Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task
Use the Service definitions feature to create definitions for the services that are offered to support your products. This feature is available with the Customer service case types plugin.

From the Customer and Consumer Portals, end users can select available services from the Services portal widget. Selecting a service displays the record producer associated with the service definition. Submitting the record producer creates a case of the correct case type.

Procedure
1. Create a service definition.
2. Associate a product with a service definition.
3. Associate one or more catalog items with a service definition.

Configure install base

Track which products and services have been purchased by a customer, how they've been installed or provisioned, along with the detailed configuration for each installed item.

Before you begin

Role required: admin

About this task

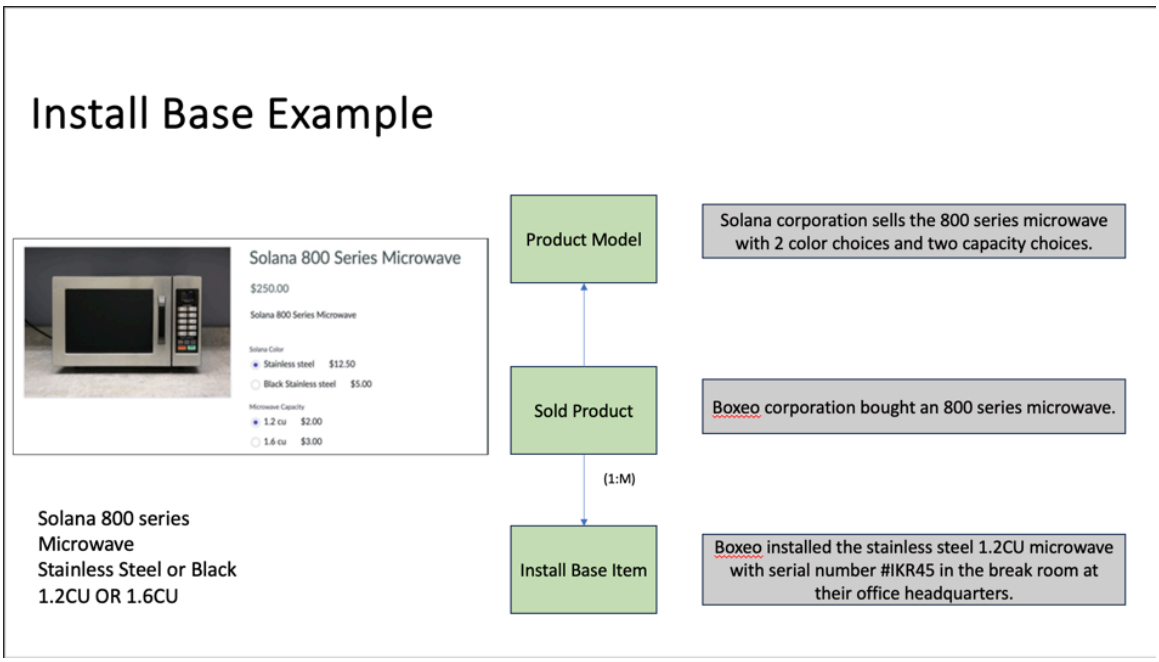
Install the Customer Service Install Base Management plugin (com.snc.install_base) from the ServiceNow Store.

Capture the install base for a customer by creating sold products, install base items, and installed products. This would enable the customer service agents to trace issues back to the relevant product, instances of that product, and other entities impacting their functioning.

Before setting up your install base, create your product data by creating or importing product models. For more information, see Configure product data.

Using install base management

This example shows the summary of the customer's purchase on the Solana microwave.



There are three parts to setting up your install base.

Customer service install base management plugin description

Sold Products	Create a sold product to provide customers, consumers, and customer service agents visibility into the products and services sold to an account or a consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer service install base management plugin description (continued)

Install Base Items	Create an install base item to track instances that have been provisioned for an account or consumer. An install base item can be any configuration item that has been made accessible to customers. For Software as a Service (SaaS) products, an install base item refers to an application service configuration item.
Installed Products	Create an installed product to track information on the instances that a sold product is deployed on at an account or consumer. A sold product can have multiple installed product records depending on the number of instances of the product in use.

You can create sold products, install base items, and installed products as individual records, import them in bulk, or create them from an Account or Consumer record.

Customer service agents can view install base information in Agent Workspace. Customers can view install base information on the Customer Service Portal.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**
3. In the Foundation Data category, view the list of tasks to configure the feature.

Install base description

Task	Description
Import Sold Products	Import sold products to track the products or services sold to an account or consumer.
Import Install Base Items	Import install base items that represent the items installed or provisioned for a customer.
Import Installed Products	Import installed products to create an association between sold products and install base items.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Sold products

Create or import sold products to provide customers, consumers, and customer service agents with a view into the products and services that have been sold to an account or a consumer. A sold product can have child and parent sold items in a hierarchical structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sold products are products and components that have been sold to an account or a consumer. By looking at which products and components have been sold to an account or consumer, you can get an overview of all the products that have been sold to that account or consumer. A sold product can have child and parent sold products in a hierarchical structure. For example, if issues arise with a configuration item, customer service agents can trace which sold product is affected on the Case form.

From the Sold Products form, you can edit install base items, create entitlements and cases, and add contracts. To learn more about creating entitlements, see Create an entitlement.

Setup sold products

Task	Description
Import sold products with guided setup	Use guided setup to import sold products so that you can track the products or services sold to an account or consumer.
Create a sold product	Create a sold product to track the products or services that are sold to an account or consumer.
Associate service offerings with sold products	Associate a service offering with a sold product to provide customer service agents visibility into sold products and their service offerings.
Associate sold products with contracts	Associate sold products to contracts to capture complete information on a customer's install base.

Import sold products with guided setup

Sold products are products and components that have been sold to an account or a consumer. Use guided setup to import sold products so that you can track the products or services sold to an account or consumer.

Before you begin
Role required: admin

About this task
This provides an overview of the complete product sold to an account or consumer. A sold product can have child and parent sold items in a hierarchical structure.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Foundation Data category, click **Get Started** and then click **Import Sold Products**.
3. Upload data from an external data source into an import set.
4. Create a transform map.
5. Execute the transform map to transfer the data.
6. Verify that the data records are imported into the target table.

Create a sold product

Create a sold product to track the products or services that are sold to an account or consumer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Verify that the Customer Service Install Base Management (com.snc.install_base), Customer Service with Service Portfolio Management (SPM) (com.snc.csm_spm), and the Product Catalog Management Core (sn_prd_pm) plugins are installed.

Role required: sn_customerservice_manager or admin

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Sold Products**.
2. Select **New**.
3. On the Sold Product form, fill in the fields.
   To learn more about the descriptions, see Sold product form.
4. Right-click the form header and select **Save**.
   The Child Sold Products, Install Base Items, Cases, Entitlements, Contracts, Additional Contacts, and Additional Consumers related lists are displayed.
5. Fill in the related lists as required.

Sold product related lists

Related list	Description
Child Sold Products	Create a child sold product by selecting **New**.
Install Base Items	Edit an install base item by selecting **Edit**.
Cases	Add a case to the sold product by selecting **New**. The system displays any open cases that are related to the sold product automatically.
Entitlements	Add an entitlement for the sold product by selecting **Select**. **Note:** Customer service managers create entitlements. Customer service agents can view entitlements.
Contracts	Associate a contract with the sold product by selecting **Edit**. **Note:** You can also associate a contract with a sold product from the Service Contracts form. Customer service managers associate the contracts to the sold products. Customer service agents can view the contract information.
Additional Contacts	Add additional contacts to the sold product by selecting **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related list	Description
	You can associate a contact with a sold product by defining its name and responsibility. The additional contacts added can be from the same account, partner account, or contact relationship. You can see the Additional Contacts related list for the sold products that are associated with the B2B account. **Note:** Starting with the Utah release, the sn_install_base_rel_soldproduct_to_contact table has been deprecated for new customers. For upgrade customers, the table continues to be supported and extends the sold product related parties table [sn_install_base_sold_product_related_party].
Additional Consumers	Add additional consumers to the sold product by selecting **New**. You can associate a consumer with a sold product by defining its name and responsibility. You can see the Additional Consumers related list for the sold products that are associated with the B2C account. **Note:** Starting with the Utah release, the sn_install_base_rel_soldproduct_to_contact table has been deprecated for new customers. For upgrade customers, the table continues to be supported and extends the Sold Product Related Parties table [sn_install_base_sold_product_related_party].
Sold Product Related Parties	Add contacts, accounts, and consumers as related parties by selecting **New**.

Note:
For business-to-business and business-to-consumer, you can see both the additional contacts and additional consumers in the sold product related lists and you can also add new records.

6. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The sold product is added to the account or consumer that you selected. Select an account or consumer to see a list of all sold products that are related to the account or consumer. You can also view a list of sold products according to the product model.

Note:
You can also create sold products directly from an account or a consumer.

a. Navigate to **Customer Service** > **Customer** > **Accounts** or **Customer Service** > **Customer** > **Consumer**.

b. Select an account or a consumer.

c. Select the Sold Products related list.

d. Select **New**.

Associate service offerings with sold products

Associate a service offering with a sold product giving customer service agents visibility into sold products and their service offerings.

Before you begin
Role required: sn_customerservice_manager or admin

Ensure that the Customer Service with Service Portfolio Management (SPM) plugin (com.snc.csm_spm) is installed.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Sold Products**.
2. Select the desired record where you want to associate service offerings.
3. In the **Service Offering** field, select an existing service offering.

Note:
The **Service Offering** field may not appear by default in the user interface. If this happens, add **Service Offering** field using the form layout.

4. Click **Update**.

Related topics

Create a service offering

Associate sold products with contracts

Capture complete information on a customer's install base by associating sold products to contracts.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
Associate sold products to contracts so that your customer service agents working on cases can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Check a sold product and view any contracts that exist for the sold product.
- View which products have been sold to the customer under the contract.
- Track when sold products were added to the contract, and how long they are covered for.

You can also associate a sold product with a contract from the Sold Product form.

A sold product can be part of multiple contracts. If a sold product is deleted, it is also deleted from any associated contracts. If a contract is deleted, the sold product remains.

Procedure

1. Navigate to **All** > **Customer Service** > **Contracts** > **Service Contracts**.
2. Click a contract you want to add a sold product to.
3. On the **Products Covered** related list, click **New** to associate sold products to the contract. The list of sold products is filtered based on the account.

   Click **Run filter** to see a list of all sold products. You can only add the sold products that belong to the account selected or to the account hierarchy.
4. Click **Save**.
5. On the **Products Covered** related list, click the **Add All Child Sold Products** related list action to add all child sold products to the contract without having to select each item individually.
6. Click **Update**.

Install base items

Create an install base item to track instances that have been provisioned for an account or consumer. An install base item can be any configuration item that has been made accessible to customers. For Software as a Service (SaaS) products, an install base item refers to an application service configuration item.

Task	Description
Import install base items with guided setup	Use guided setup to import install base items so that you can track instances that have been provisioned for an account or consumer.
Create an install base item	Create an install base item that represents the instance of the product that has been configured for a customer. The install base item enables you to track all the purchases that were made by a customer.
Associate multiple install base items to a case	Associate one or more related install base items to a case to access all the install base items that are associated to the parent install base item.
Install base characteristics	Configure characteristics of install base items to provide information about the service requirements and ensure timely maintenance services for the install base item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import install base items with guided setup

Install base items represent the instances of the product that have been configured for a customer.

Before you begin
Role required: admin

About this task
Each install base item references the configuration item record for the customer.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Foundation Data category, click **Get Started** and then click **Import Install Base Items**.
3. Upload data from an external data source into an import set.
4. Create a transform map.
5. Execute the transform map to transfer the data.
6. Verify that the data records are imported into the target table.

Create an install base item

Create an install base item in the Customer Service Management application that represents the instance of the product that has been configured for a customer. The install base item enables you to track all the purchases that were made by a customer.

Before you begin
Ensure that the Customer Service Install Base Management plugin (com.snc.install_base) is installed.

Role required: sn_customerservice_manager or admin

About this task
An install base item is any configuration item (CI) that has been made accessible to customers. For Software as a Service (SaaS) products, an install base item refers to an application service configuration item. Each install base item references the configuration item record for the customer. If issues arise with a configuration item, customer service agents can trace which install base items that the case is affecting.

https://player.vimeo.com/video/1073309365?h=79d5721672&badge=0&autopause=0&player_id=0&app_id=58479

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Install Base Items**.
2. Select **New**.
3. On the form, fill in the fields.

Install Base Item form

Field	Description
Number	Unique ID of the install base item. This field is automatically filled in, but you can change it.
Name	Name of the install base item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Configuration Item	Configuration item that is associated with the install base item. The sn_customerservice_manager role must also have the app_service_user role to create the install base items for the Application Service configuration item class. For more information, see Application services. Service models have a model category called the Application Service, which links a service model to the Application Service CI class. For more information, see Models and Model categories.
Service Organization	Internal or external entity that is involved in providing service to the customer. **Note:** If you select a service organization, the **Account**, **Contact**, and **Consumer** fields are hidden. The **Service Organization** field is active only when the Service Organization (com.snc.service_organization) plugin is installed.
Account	Account that is associated with the install base item. **Note:** If you enter an account, the **Consumer** field is hidden. The Consumer field is active only when the B2B2C plugin is installed.
Contact	Account contact that is primarily responsible for the install base item.
Consumer	Consumer that is associated with the install base item. **Note:** The Account field is hidden if the **Consumer** field is entered first.
Owned by	Business manager of the install base item. If the business manager is entered in the configuration item, this field is automatically filled in with the information from the configuration item.
Supported by	If the CI contains this information, this field is automatically filled in with the information from the configuration item.
Service Context	Service that is associated to the underlying CI for calculating the impact severity from Event Management. For more information, see Service health status for install base. **Note:** This field is only available if you have the Proactive Customer Service Operations with Event Management plugin installed. The health status of an install base item appears only if an install base item has a CI and a service context that is associated to it. Configure the form layout to add this field.
Parent install base item	Install base item that is the parent of the current install base item.
Root install base item	Install base item that is used to fetch the entire install base hierarchy in a single query.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Household	Household that is associated with the install base item. **Note:** This field is available only when the Customer Service Household (com.snc.household) plugin is installed.
Product	Product model that is associated with an install base and is used to identify the services that are associated with any product model. **Note:** A product model must have a single specification. The specification that is associated to the product model appears only on the install base form.
Location	Location that is associated with the product.
State	Current state of the Install base item and represents the various phases of the life cycle. **Note:** The state of the install base item determines the **Active** field and the **Uninstall date** field on the install base form.
Status	Option that determines whether the product is original or a replacement.
Life cycle stage	CSDM life cycle stage of an install base item.
Life cycle stage status	CSDM life cycle stage status of an install base item.
Active	Option that represents whether the install base is active or inactive. If the state is active, related cases for a product can be created. **Note:** A sync between the active state, install date, and uninstall date is always present. On the install base form, if the **State** is **In Use**, it means that the **Active** option is selected. The **Active** option remains unselected if the **State** is set to **Inactive**.
Install date	Date on which the install base becomes active.
Uninstall date	Date on which the install base becomes inactive.
Asset	Asset that is associated with an install base.
Specification	Specification that is associated with an install base item. Option that helps in fulfilling orders to create an install base item and its hierarchy. **Note:** The **Specification** field appears only to CSM agents, managers, and contributor persona.
Install base identifier	Identify finished goods in the system using their unique identifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Provider service organization	The service organization that sells and supports the products or services owned by the customer.

Note:
In the List view of the install base item, you can filter the data by Condition, Active, Uninstall Date, and Asset.

4. Right-click the form header and select **Save**.
The Sold Products, Entitlements, and Cases related lists are displayed.
5. Fill out the related lists as described in the following table.

Install base item related lists

Related list	Description
Child Install Base items	List of all child install bases that are related to the parent install base item.
Sold Products	List of the sold products that are associated with an install base Item. Edit a sold product by selecting **Edit**.
Cases	List of cases that are associated with an install base item.
All Cases	List of all cases that are related to an install base in the install base hierarchy. **Note:** The All Cases related list appears only when an install base hierarchy is added to the Install base item.
Entitlements	List of entitlements that are associated with an install base item. Add an entitlement for the install base item by selecting **New**. **Note:** Customer service managers can create entitlements. Customer service agents can view entitlements.
Contracts	List of contracts that are related to an install base. Edit a contract by selecting **Edit**.
Install Base Related Parties	List of contacts, consumers, accounts, members, contributors, and service organizations that have access to an install base. For more information on Install Base Related Parties, see Create related party configurations.

For more information on related lists, see Related list for an install base item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Update**.
   The install base item is added to the account or consumer that you selected. You can select an account or consumer to see a list of all the install base items that are related to the account or consumer.

   Note:
   You can also create install base items directly from an account or a consumer.

   a. Navigate to **Customer Service** > **Customer** > **Accounts** or **Customer Service** > **Customer** > **Consumer**.

   b. Select an account or a consumer.

   c. Select the Install Base Items related list.

   d. Select **New**.

Create and manage install base items for a business location

Related list for an install base item

In the Customer Service Management application, you can use the Install base related list to track information that is related to the install base hierarchy, cases, entitlements, and other entities. By using these tables, you can understand your customers' purchases and provide efficient post-sales support.

Related list for install base item

Related list	Description
Create a child install base item	List of all the child install base items associated to the parent install base item.
Sold Products	List of all the products or services sold to a customer. For more information on how to create a sold product, see Create a sold product.
Cases	List of all the cases associated to the current install base item. The list of cases enables customer service agents to access all the cases and issues that are related to an install base in one place. For more information on cases and case access, see Service Model Foundation cases.
All Cases	List of all the child cases associated to the parent install base item. **Note:** You cannot see the parent cases that are associated with a child install base item.
Create an entitlement	List of the existing cases for an account, product, or service contract that defines the type of support that a customer receives. For more information on entitlements, see Configure entitlements.

Related list for install base item (continued)

Related list	Description
Edit a contract	List of all the contracts associated to the current install base item.
Install Base Related Parties	List of all the additional parties that have access to an install base item. You can add related parties only to the root install base item. For more information to the list of related parties and default responsibilities, see Create related party configurations. To add a related party to an install base, see Add related parties to an install base item.

Create a child install base item

Create a child install base item in the Customer Service Management application to view a list of all the cases and issues of the parent install base item.

Before you begin
Role required: admin and sn_customerservice_manager

About this task
A child install base related list provides the information about all the child install bases of the current install base item.

Procedure

1. Navigate to **All** > **Customer Service** > **Product** > **Install Base Item**.
2. In the related list section of the Install base form, select an install base item and open **Child Install Base Items**.
3. Select **New.**
   The **Parent install base item** field on the new install base form is automatically filled or defaulted to the current install base selection. The **Account** and **Contact** fields are automatically filled in on the child install base form.
4. Select **Submit**.

Create an entitlement

Create an entitlement in the Customer Service Management application to view the existing cases for an account, product, or service contract. Creating an entitlement helps you to understand the level of support and the communication channels that an agent can use.

Before you begin
Role required: admin or sn_customerservice_manager

About this task
Create an entitlement to define the type of support that a customer receives.

Procedure

1. Open an install base item and from the related list, select **Entitlements**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.
   For more information, see Configure entitlements and Create entitlements for CSM entities.
4. Select **Submit**.

Edit a contract

Enable an agent or manager to edit an open contract that is related to the parent install base item in the Customer Service Management application.

Before you begin
Role required: admin or sn_customerservice_manager

About this task
The Contracts related list provides a list of all the contracts that are related to the current install base item.

Procedure
1. Open an install base item and from the related list, select **Contracts**.
2. To edit a contract, select **Edit**.
3. From the list of contracts, select the contract that you want to link to the install base item.

   Note:
   The list of contracts that are displayed are related to the **Account** option that you selected in the Install Base form.

4. Select **Save**.

Associate multiple install base items to a case

In the Customer Service Management application, you can associate one or more related install base items to a case to access all items associated with the parent install base item.

Before you begin
Role required: sn_customerservice_manager and admin

Procedure
1. Navigate to **All** > **Customer Service** > **Cases** > **All**.
2. Open the case that you want to associate the multiple install base items to.
3. Open the Affected Install Base Items related list.
4. Select **Edit**.
5. From the existing list of install base items in the **Collection** box, select the install base that you want to add by selecting the right arrow.
   The install base that you select is displayed in the **Affected Install Base Items List** box.
6. Select **Save**.

Install base characteristics

Customer service managers can create the characteristics of the install base items, while administrators can capture and track the characteristics of the install base items by using the Customer Service Management application. These characteristics can provide information about the service requirements and verify timely maintenance services for the install base item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview

Install base characteristics enable flows like case management, field service management, planned maintenance, and reactive service requirements to occur on a schedule. Some install base characteristics are configurable and vary from product to product. The product model characteristics are non-configurable and are directly taken from the product model that is associated with the install base item.

Only users with the sn_customerservice_manager role can create the characteristics for the install base items. Users with the administrator role can activate the Install base characteristics plugin [com.snc.install_base_characteristics] to capture and view all the install base characteristics on the Install base form. To activate the plugin, see Activate a plugin.

The Install base characteristics data model represents how the characteristics of an install base item are stored. To learn about the different fields and tables that they're stored in, see Data model for the Install base item characteristics.

Roles

With the admin role, you can track the characteristics to provide the required product information to administrators, agents, business stakeholders, and customers. You can also track the services that are associated with an install base item at the time of purchase. With this role, you can capture the configurable and non-configurable characteristics to view the configuration specifications for an install base item.

With the sn_customerservice_manager role, you can create a set of configurable characteristics for an install base item on the Customer Service Management (CSM) application. It enables you to view the install base item details and its associated services. After you create an install base characteristic, the characteristic appears in the related list on the install base item form. For more information, see Create the install base characteristics for an install base item.

There are different functional and granular roles to provide varying levels of permissions to users. For information on the different access levels, see Security roles for the install base characteristics.

Install Base characteristics

The install base characteristics are stored in the Install Base Characteristics table [sn_install_base_item_characteristic]. However, both the install base and product model characteristics are displayed in the Install base characteristics and product model related lists on the install base form. You can use the text search option on the Customer Service platform and portals to search for the characteristics on the Install Base characteristics table.

You can view the install base characteristics on the Customer Service, Consumer Service, and Business Location Service Portal (BLSP).

Under the **Support** header on the portals home page, you can view the information about the install base characteristics that are associated with the parent install base item. The characteristics that are associated with the child items aren't visible on the portals. For more information about the install base items from the Customer Service Portal, see View install base information from the Customer Service Portal.

Data model for the Install base item characteristics

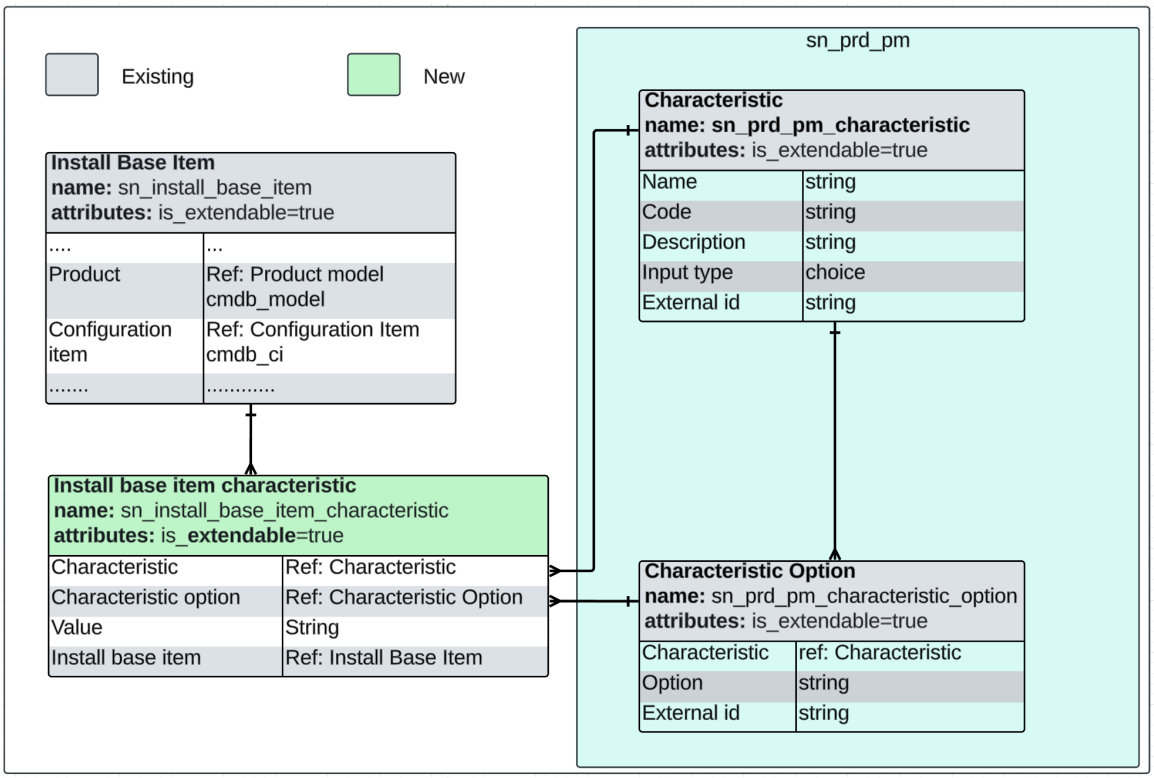
The data model for the install base item characteristics represents how the characteristics of an install base item are stored in the Customer Service Management application. The data model refers to the characteristic values and options and provides a view of how to store a set of characteristics associated to an install base item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Customer Service Management application has several functional and granular roles that provide access levels to create, read, and update characteristics for an install base item. The install base item characteristics table [sn_install_base_item_characteristic] comes with different security roles and plugins. For more information on security roles, see Security roles for the install base characteristics.

The following diagram shows the data model for the Install base characteristics. The data model represents the new and existing install base item and install base item characteristics tables.

Data model for Install base characteristics



The following table describes the different fields on the Install base characteristics form.

Install base item characteristics table

Field	Description
Characteristic	Characteristic that is associated with the install base item.
Characteristic option	Characteristic option that you chose from a list of options for the selected characteristic. **Note:** This field is available when the characteristic that you select is a choice, Boolean, or check box type of option.
Value	String value for the selected characteristic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install base item characteristics table (continued)

Field	Description
	Note: This field is available when the characteristic that you select expects a string input and isn't a choice, Boolean, or check box type of option.
Install base item	Install base item that the characteristics are added to.

Security roles for the install base characteristics

You can assign functional and granular roles to Customer Service Management (CSM) users and administrators so that they can access the different capabilities and features of the install base characteristics.

Functional and granular roles come with varying levels of permissions for the configuration of install base characteristics on the Customer Service Management (CSM) application.

The following tables describe the different functional and granular roles and their descriptions.

Functional roles for the install base characteristics

Role title	Required Plugin	Description	Contains roles	Added to roles
sn_install_base.install_base_viewer	Customer Service Install Base Management [com.snc.install_base_chars] and Product Catalog Management Core] [sn_prd_pm plugin	This role provides read access to an install base characteristics, and all the product model characteristics. This role is intended for internal users only.	• sn_ib_chars.install_base_item_characteristics_read • sn_prd_pm.product_model_characteristic_viewer • sn_install_base.install_base_read_granular	sn_install_base.install_base_mana
sn_install_base.customer_install_base_viewer	Customer Service Install Base Management [com.snc.install_base_chars] and Product Catalog Management Core [sn_prd_pm plugin]	This role provides read access to an install base characteristics, and only the customer visible product model characteristics. This role is intended for external users only.	• sn_ib_chars.install_base_item_characteristics_read • sn_prd_pm.product_model_characteristic_granular • sn_install_base.install_base_read_granular	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Functional roles for the install base characteristics (continued)

Role title	Required Plugin	Description	Contains roles	Added to roles
sn_install_base.install_base_item_characteristics_manager	Customer Service Install Base Management [com.snc.install_base_item_characteristics]	This role provides access to manage the install base item characteristics. This role is intended for internal users only.	• sn_ib_chars.install_base_item_characteristics_write • sn_ib_chars.install_base_item_characteristics_crea • sn_install_base.install_base_viewer	None

Granular roles for the install base characteristics

Role title	Required Plugin	Description	Contains roles	Added to role
sn_ib_chars.install_base_item_characteristics_reader	Customer Service Install Base Characteristics [com.snc.install_base_item_characteristics]	This role provides granular read access to install base characteristics.	sn_prd_pm.characteristics_viewer	• sn_ib_chars.install_base_item_c • sn_ib_chars.install_base_item_c • sn_install_base.install_base_vie • sn_install_base.customer_instal
sn_ib_chars.install_base_item_characteristics_creator	Customer Service Install Base Characteristics [com.snc.install_base_item_characteristics]	This role provides granular create access to install base characteristics.	sn_ib_chars.install_base_item_characteristics_reader	
sn_ib_chars.install_base_item_characteristics_writer	Customer Service Install Base Characteristics [com.snc.install_base_item_characteristics]	This role provides granular write access to install base characteristics.	sn_ib_chars.install_base_item_characteristics_reader	

Create the install base characteristics for an install base item

Create a set of configurable characteristics for an install base item on the Customer Service Management (CSM) application. You can then view the details about the install base item and the services that are associated with it.

Before you begin

Role required: sn_customerservice_manager

About this task

Each product has its own set of attributes, some of which are configurable by the user and some that are non-configurable. Configurable characteristics are a set of characteristics related to an install base item that the user can choose or customize at the time of purchase. These characteristics differ from user to user and product to product. However, non-configurable characteristics are fixed characteristics related to an install base item and can't be chosen or customized by the user at the time of purchase. To learn more about characteristics, see Install base characteristics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

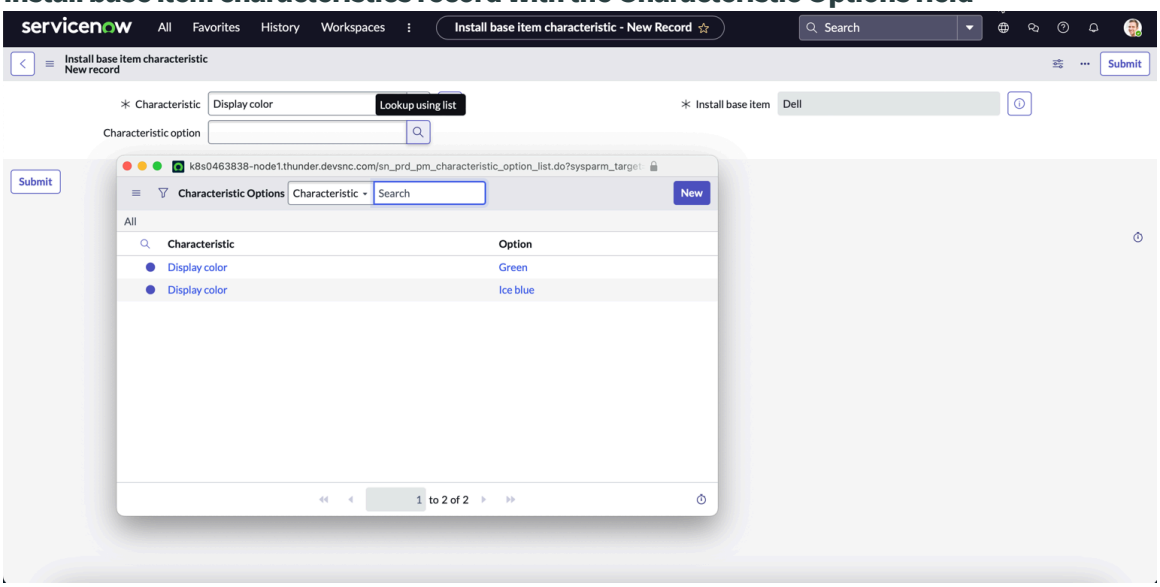
1. Navigate to **All** > **Customer Service** > **Products** > **Install Base Items**.
2. Open an install base item from the list.
3. Navigate to the Install Base Characteristics related list.
4. Select **New**.
5. In the **Characteristic** field, select a characteristic.

   Choose a string type or value for the **Characteristic** field. If the characteristic field has a string type, then the **Value** field appears as shown in the following example.

   Install base item characteristics record with the Value field

   If the characteristic field has an option, then the **Characteristic option** field appears as shown in the following example.

   Install base item characteristics record with the Characteristic Options field



6. Select **Submit**.

Result

After creating an install base characteristic, the characteristic appears in the related list on the install base item form.

Synchronizing an asset class with a configuration item class and install base class

You can synchronize the asset class, configuration item (CI) class, and the install base class by mapping the model categories in the Customer Service Management (CSM) application. With this synchronization, the data can flow between the different entities because the same information is replicated on both entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview

By mapping the install base class, configuration item class, and asset class fields, you can synchronize the information on both the install base item and the asset form. This mapping creates a bidirectional synchronization. For example, you can update any one of the **Location**, **Install date**, **Consumer**, **Account**, **State**, and **Contact** fields on the install base item form to create a synchronization between the install base item and the asset form. For more information on the different fields on the install base form, see Create an install base item.

Note:
You must update the **Consumer** and **Account** fields from the install base item to synchronize the updates to the asset form. Updating the fields on the asset form doesn't synchronize the updates to the install base item.

Install Base item class

The Install Base item class on the model category form only displays the tables that extend from the install base table [sn_install_base_item]. If the install base table has no extensions, no options are displayed in the Install Base Class list. You can create a synchronization between an install base record and an existing associated record by using the following sample migration script.

```
var ibClasses = []; //If the list is empty, system will fetch
 model categories for all Install base item classes
var assetIBIntegrationUtil = new
 sn_install_base.AssetIBIntegrationUtils();
assetIBIntegrationUtil.syncExistingInstallBaseRecordsToAsset(ibC
lasses)
```

Product instance identifier

The product instance identifier helps to avoid creating duplicate records by tracking install base items and their corresponding assets. The product instance identifier applies to all the extensions of the install base [sn_install_base_item] table.

Note:
The **Is product instance** flag on the Model Category form is read-only by default and is marked true for selective model categories only. The product instance identifier is a hash value and not a user-friendly field.

Product instance hierarchy for Install Base Management

Adopt the product instance hierarchy into Install Base Management to maintain a synchronization between an asset and an install base item in the Customer Service Management application.

Enable the product instance to create a synchronization for all changes that occur in the asset hierarchy to automatically reflect in the install base hierarchy. An install base item hierarchy depends on the hierarchy of its associated assets. The Install base hierarchy mirrors its corresponding asset model hierarchy for both the parent and child install base items.

Note:
All the instances in the hierarchy must belong to the same model category.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Synchronizing the install base life cycle fields with the state and status fields

You can synchronize the **Life cycle stage** field and the **Life cycle stage status** fields with the **State** and **Status** fields on the install base form so that you can track the lifecycle of an install base entity.

Overview

Track the lifecycle of an install base entity by migrating to the Common Service Data Model. To learn more about the CSDM framework, see Common Service Data Model framework for Install Base Management.

Life Cycle Mapping table

The Life Cycle Mapping [life_cycle_mapping] table is already populated with the lifecycle mapping values and choices that you must begin your synchronization of the **Life cycle stage** field and the **Life cycle stage status** fields with the **State** and **Status** fields on the install base form. The mapping record maps the **State** fields with their corresponding lifecycle fields on the install base form. The **In Use** and **InActive** options are available in the **State** field and their corresponding mappings are available in the Life Cycle Mapping [life_cycle_mapping] table. With these default options, you can initiate a synchronization with the life cycle fields.

You can create custom choices for the **State** and **Status** field by adding a mapping record in the Life Cycle Mapping [life_cycle_mapping] table. Each custom value has related records on the Life Cycle Mapping [life_cycle_mapping] table. You must activate the mapping records for the synchronization to begin.

For information on how to create the custom choices and then map the **Life cycle stage** and **Life cycle stage status** fields with the legacy **State** field, see Enabling CSDM life-cycle sync between legacy fields and related assets.

Note:
If the custom choices have no lifecycle mappings, then the **Life cycle stage** and the **Life cycle stage status** fields remain in the **To Be Determined** state.

Migration of the Install Base table

If you don't want to activate all the tables and records in the CSDM framework, you can migrate only the Install Base table (sn_install_base_item) as a part of your CSDM migration process. Use the following script to migrate the existing records to synchronize the legacy **State** field with the install base lifecycle fields.

```
var tableNames = [];//list of tablenames ex:
 ['sn_install_base_item'];
new sn_install_base.IBProductInstanceUtil().
 syncLifeCycleFields(tableNames);
```

Install base hierarchy visualization

Use the **Install Base Hierarchy** tab on the CSM Configurable Workspace to view the parent-child hierarchy structure of an install base item.

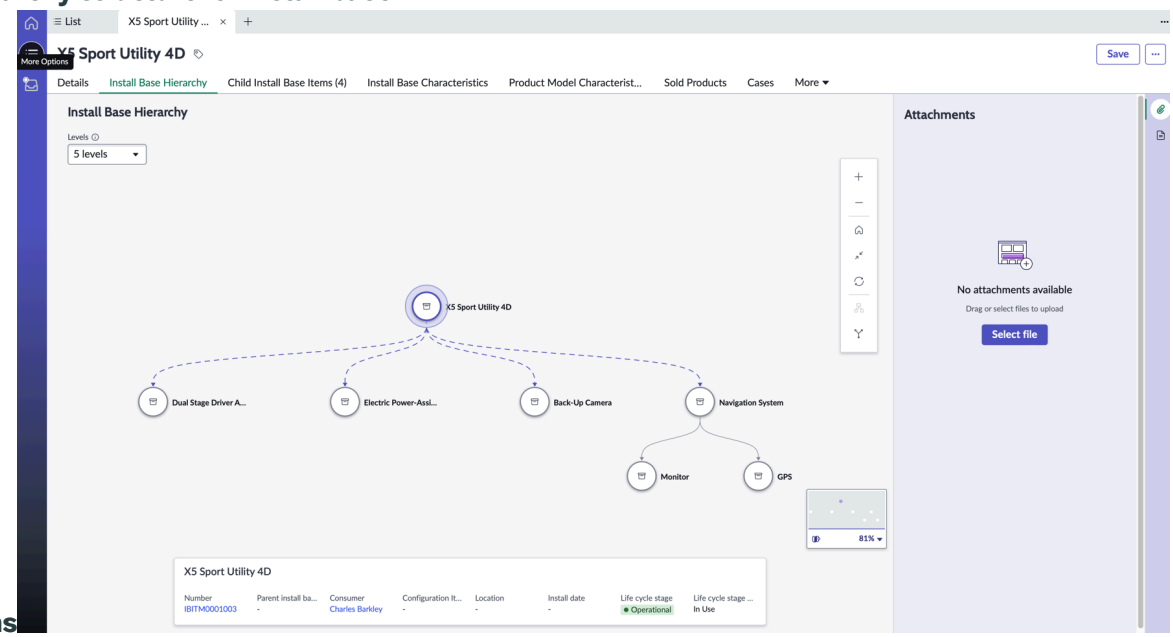
The install base hierarchy provides a node map of both parent and child items associated with an install base item. The hierarchy node begins with the install base item that is currently open. The node map extends toward both the root install base item and the child install base item up to seven levels of hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The first level of the install base hierarchy node map always displays the child items associated with the current install base item. Select the levels from the level selector to view the number if install base levels associated with the current install base item.

For example, select Level 1 with the current install base item as the home node, to view all the child items associated with it. Subsequently, at Level 2, set one of the child install base items as a home node to have further insight into its own child items. The number of child items are denoted by a number badge next to the install base node. You can continue to expand the hierarchy structure up to the seventh level or to 250 nodes, whichever comes first.

Hierarchy structure for install base items



Note:
Badges against child items aren't displayed beyond the seventh level of hierarchy. To view the hierarchy beyond the seven levels, set any one of the install base items in the hierarchy as the home node.

You can use the hierarchy structure of an install base item to perform the following contextual actions on individual nodes.

- Set any node as a home node.
- Create a case from the node.

  To learn about different case types and how to create a case from an install base node, see Customer service case types.

- View details of a node. This opens up the entire record of the install base item.

View the details of any install base that is selected in the hierarchy structure on the record card.

Note:
Select the **Number**, **Parent install base item**, **Account**, **Configuration item**, and **Location** fields on the record card to navigate to the install base record.

Installed products

Create an installed product to track information on the instances that a sold product is deployed on at an account or consumer. A sold product can have multiple installed product records depending on the number of instances of the product in use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Import installed products with guided setup	Import installed products to provide information on the sold products and how they are deployed or installed. Import installed products to create an association between sold products and install base items.
Create installed products	Create an installed product to create an association between sold products and install base items.

Import installed products with guided setup

Installed products provide information on the sold products and how they are deployed or installed. Import installed products to create an association between sold products and install base items.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Foundation Data category, click **Get Started** and then click **Import Installed Products**.
3. Upload data from an external data source into an import set.
4. Create a transform map.
5. Execute the transform map to transfer the data.
6. Verify that the data records are imported into the target table.

Create installed products

Create an installed product to create an association between sold products and install base items. Installed products provide information on the instances that a sold product is deployed on.

Before you begin

Role required: sn_customerservice_manager or admin

Ensure that the Customer Service Install Base Management plugin (com.snc.install_base) is installed.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Installed Products**.
2. Click **New**.
3. Fill out the fields on the form.

Installed Product form

Field	Description
Install Base Item	Instance the sold item is deployed on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sold Product	Sold product deployed to the customer.

4. Click **Submit**.

Common Service Data Model framework for Install Base Management

The Common Service Data Model (CSDM) framework is a standard set of terms and definitions that you can adopt across all ServiceNow® products on the ServiceNow AI Platform. By using this framework, you can effectively track assets through their lifecycle transitions.

The CSDM is the data framework that you follow when you set up ServiceNow products and applications. You adhere to the CSDM guidelines when you define the configuration items (CIs) and the relationships between CIs in the CMDB. This process helps to ensure that your data resides in the appropriate CMDB tables so that you get the maximum value from your ServiceNow AI Platform applications. To learn about CSDM, see Common Service Data Model.

To set up a CSDM environment for Install Base Management, see Activate the CSDM plugin.

Note:
It's optional to adopt CSDM. You can either adopt the CSDM framework or continue using the existing model.

You can use a migration script to update the CSDM life-cycle values in the existing install base records. To learn about the migration script, see Synchronizing the install base life cycle fields with the state and status fields.

Configure assets

An asset is a specific product or instance that is supported for a customer.

Role required: admin

Assets can have serial numbers or asset tag numbers and can be allocated to individual accounts or to a contact within an account. Assets can also have associated support contracts.

Note:
Customer Service Management leverages the Asset Management application to create and maintain assets. Ensure that the Asset Management plugin (com.snc.asset_management) is activated.

You can either import your existing assets using guided setup or create new assets using the Customer Service Management.

Related topics

Configure install base

Import assets with guided setup

Use Customer Service Management guided setup to import existing assets.

Before you begin

Role required: admin

About this task

There are different types of assets and information for each type of asset is stored in a different table. For example, hardware assets are stored in the Hardware [alm_hardware] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Foundation Data category, click **Get Started** and then click **Import Assets**.
3. Upload data from an external data source into an import set.
4. Create a transform map.
5. Execute the transform map to transfer the data.
6. Verify that the data records are imported into the target table.

Create an asset

Create a record for a specific instance of a product.

Before you begin

Role required: sn_customerservice_manager or admin

Customer Service Management leverages the Asset Management application to create and maintain assets. Ensure that the Asset Management plugin (com.snc.asset_management) is activated.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Assets**.
2. Click **New**.
3. Select the type of asset to create:
   - Hardware
   - Software License
   - Consumable
   - License
   - Facility
4. Fill in the fields for the selected asset type on the Asset form, as appropriate.
5. Click **Submit**.

Create asset contact relationships

Assign an asset to a customer contact who is responsible for managing that asset.

Account and partner contacts can see all of the assets related to an account. To limit access to an asset, you can create an asset contact relationship and assign the asset to one or more contacts. Then you can enable the associated property to restrict access to the asset information to the assigned contacts.

The system administrator can add a primary contact to an asset by selecting a user in the **Primary Contact** field on the Asset form. This field references the Contacts table and is filtered by the asset's account.

The system administrator can also create relationships with additional contacts from the **Asset Contacts** related list on the Asset form. When you create an asset contact relationship, you can select contacts from:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The account that the asset belongs to.
- The partner of the account that the asset belongs to.
- Any contacts added to these accounts using contact relationships.

After adding contacts to an asset, enable the related property to limit access. When enabled, the following access is limited from the customer portal:

- When a user clicks **My Assets**, the list shows only those assets for which the user is a contact.
- When a user clicks **Create Case**, the **Asset** field on the Create Case form shows only those assets for which the user is a contact.

Assign a primary contact to an asset

Users with the system administrator role can assign a primary contact to an asset.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Assets**.
2. Click the desired asset.
3. Select a **Primary Contact**.
   This field references the Contacts [customer_contact] table and is filtered by the account selected in the **Account** field.
4. Click **Update**.
   The contact is added to the **Asset Contacts** related list on the asset form.

Assign a contact to an asset

Users with the system administrator role can assign a contact to an asset.

Before you begin
Role required: admin

About this task
Users with the sn_customerservice.customer_admin can also assign a contact to an asset from the Customer Service Portal.

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Assets**.
2. Select the desired asset.
3. From the **Asset Contacts** related list, select **New**.
   When you select **New**, a new Asset Contact form is displayed with the **Asset** field filled in.
4. Select a **Contact** from the list of available contacts within the asset's account.
5. Select the **Order** field to specify the sequence in which records are displayed, organized according to business preferences.
6. Select **Submit**.
   The contact is added to the **Asset Contacts** related list.

Enable the asset contact relationship property

Limit access to asset information to the assigned contacts by enabling the associated property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Properties**.
2. Set the *Restrict Assets based on Contacts assigned to the assets* property to **true**.
3. Click **Save**.

Create service contracts

Service contracts define the type of support that customers receive.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
A contract can include an account and contact or a consumer and the specific assets that are covered. A contract can also include multiple service entitlements and SLAs.

Procedure

1. Navigate to **All** > **Customer Service** > **Contracts** > **Service Contracts**.
2. Click **New**.
3. Fill in the fields on the Contract form, as appropriate.

Contract form

Field	Definition
Number	The automatically created contract number.
Account	The name of the account associated with this contract.
Consumer	The name of the consumer associated with this contract.
Contract administrator	The individual who is responsible for managing the contract.
Approver	The user who approves or rejects the contract.
Contract number	The number assigned to the contract by the customer.
State	The current state of the contract: ○ Draft ○ Active ○ Expired ○ Canceled
Starts	The date that the contract starts.
Ends	The date that the contract ends.
Name	A name for the contract.

4. Right-click the form header and select **Save**.
   The **Entitlements**, **Assets Covered**, **Terms and Conditions**, **Contracts**, **Cases**, and **Products Covered** related lists are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the **Products Covered** related list, click **Edit** to associate sold products to the contract. The list of sold products displayed is filtered based on the account. Click **Run filter** to see a list of all sold products, but you can only add the sold products that belong to the account selected or to the account hierarchy.
6. Click **Submit**.
   You can also click **Submit For Review** to place the contract in the **Draft** state and send an email to the **Approver** to review the contract.
   Customer service agents can view contract information in Agent Workspace and customers can view contract information on the Customer and Consumer Service Portals.

Associate an install base to a service contract

Associate install base items with a service contract to see the list of all the different service contracts that are associated to an install base item in the Customer Service Management application. By associating an install base, you can set a relationship between an install base and a contract.

Before you begin
Role required: sn_customerservice_manager and admin

About this task
Associate install bases to service contracts to access all the contracts that are related to the parent install base item.

Procedure
1. Navigate to **All** > **Customer Service**> **Contracts**> **Service Contracts**.
2. Open the contract that you want to associate the install base to.
3. Select **New**.
4. Create an association by selecting a value for the **Install base Item** field.
5. Select **Submit**.

Configure entitlements

An entitlement defines the type of support that a customer receives as well as the supported communication channels.

Before you begin
Role required: sn_customerservice_manager or admin

About this task
You can associate an entitlement with a product, an asset, an account, or a contract. An entitlement check is performed when a case is opened. This check considers the existing cases for the specific account, product, asset, and service contract. Entitlements can also have associated workflows that drive recommended activities for a case.

Entitlements are counted on a per-unit basis. The **Unit** field on the Service Entitlement form defines the unit type, either cases or hours.

The **Total Units** field defines the total number of cases or hours available for this entitlement and the **Remaining Units** field tracks the number of units remaining. These counters are active if the **Per Unit** field is enabled.

The **Remaining Units** field is updated using business rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When using cases as the unit type, the **Update case entitlement on Close** business rule updates this field when a case for a product, asset, company, or contract that has an associated entitlement is closed.
- To use hours as the unit type, customers must create a separate business rule. For example, create a rule that is applied to the amount of time an agent spends on a case. When a case is resolved, deduct the hours spent from the total service hours available in the entitlement.

Keep these guidelines in mind as you create entitlements.

- Product entitlements: When creating an entitlement for a product, select the product from the **Product** field and then select an account or a consumer.
- Asset entitlements: When creating an entitlement for an asset, first select a company. The only assets then shown belong to that company.
- Contract entitlements: When creating an entitlement for a contract, select the contract and then the assets that are covered as a contract line item. The resulting contract entitlement is valid for the assets listed within that contract.

Procedure

- Create entitlements for customer service entities
- Associate entitlements with customer service entities

Create entitlements for CSM entities

Create an entitlement for a Customer Service Management entity such as an account, a consumer, or a product.

Before you begin

Role required: sn_customerservice_manager or admin

Procedure

1. Navigate to **All** > **Customer Service** > **Contracts** > **Entitlements**.
   You can also create an entitlement from the **Entitlements** related list on the Account and Contract forms.
2. Click **New** at the top of the Entitlements list.
3. Fill in the fields on the Entitlement form.

Service Entitlement form

Field	Definition
Name	The name of the entitlement.
Product	The product model associated with this entitlement.
Account	The name of the account associated with this entitlement.
Consumer	The name of the consumer associated with this entitlement.
Contract	The contract number associated with this entitlement .
Asset	The asset tag number or the serial number of the asset associated with this entitlement.
Active	Check this box to enable the entitlement. Active entitlements are available for selection when creating a new case.
Channel	One or more communication channels associated with this entitlement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	○ Email ○ Web ○ Phone ○ Chat
Install Base Item	The install base item associated with the entitlement. Configure the form layout to add the **Install Base Item** field. **Note:** This field is only available if the Customer Service Install Base Management plugin (com.snc.install_base) is installed.
Sold Product	The sold product associated with the entitlement. Configure the form layout to add the **Sold Product** field. **Note:** This field is only available if the Customer Service Install Base Management plugin (com.snc.install_base) is installed.
Business hours	The schedule associated with this entitlement.
Start date	The start date for this entitlement.
End date	The end date for this entitlement.
Total Units	The total number of units designated for this entitlement. This field is active if the **Per unit** check box is enabled.
Remaining Units	The number of available units that are remaining for this entitlement. This field is active if the **Per unit** check box is enabled. This field is updated using business rules. ○ When using cases as the unit type, the **Update case entitlement on Close** business rule updates this field when a case for a product, asset, company, or contract that has an associated entitlement is closed. ○ To use hours as the unit type, customers must create a separate business rule. For example, create a rule that is applied to the amount of time an agent spends on a case. When a case is resolved, deduct the hours spent from the total service hours available in the entitlement.
Unit	The type of unit being measured for this entitlement: **Cases** or **Hours**.
Per unit	Select this check box to enable unit counters. If enabled, the **Total Units** and **Remaining Units** fields are activated.

4. Click **Submit**.

Associate an entitlement with a Customer Service Management entity

Associate an entitlement with a CSM entity such as an account, contract, asset, product, or install base item, to determine the type of support that a customer needs to receive.

Before you begin

Role required: sn_customerservice_manager or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Contracts** > **Entitlements**.
2. From the Entitlements list, select an entitlement.
3. Select the lookup icon to the right of one of the **Product**, **Account**, **Contract**, **Asset**, or **Install Base Item** fields.
4. From the list, select the entity that you want.

   Note:
   If you select an entity in more than one of the listed fields, the selections that are available in subsequent fields are filtered by the selections already made.

5. To associate an entitlement with an install base, right-click the Configuring Entitlement Form and navigate to **Form Layout** > **Configure** .
6. From the **Available** box, select **Install Base Item**.

   Your selection is automatically moved into the **Selected** box.

7. Select **Save**.
8. In the Entitlement form that reappears, select the **Install Base Item** field and add the install base item that you want to associate with the entitlement.

Customer service case entitlement calculation

When a customer service agent creates a case, the system uses a configurable method to derive the entitlement based on several fields related to the case record.

These fields include:

- Account
- Consumer
- Product
- Asset
- Contract
- Case Channel

If the Proactive Customer Service Operations plugin (com.snc.proactive_cs_ops) is active, the system also considers these fields:

- Sold Product
- Install Base

Relative weights are assigned to each field. Entitlements are calculated based on the weight and precedence. The entitlement with the highest score is assigned to the case.

Weights assigned to different fields

Field	Weight/Precedence Assigned
Account / Consumer	1
Product	2
Asset / Sold Product / Install Base item	3

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Weights assigned to different fields (continued)

Field	Weight/Precedence Assigned
Contract	4

The entitlement calculation uses the **global.CSManagementUtils** script and the **getFirstEntitlement** method.

Customer Life Cycle Management Workflows

Manage the life cycle of your sold products by activating the Customer Life Cycle Management Workflows (com.snc.customer_lifecycle_mgmt_workflows) application.

Overview of workflows

The Customer Life Cycle Management Workflows (com.snc.customer_lifecycle_mgmt_workflows) application enables you to update the existing configurations, and to modify, suspend, resume, or disconnect the sold products and their complete hierarchy. The workflows are built and composed by using the lead-to-cash transactional operations like Effect, Create Instance, Delta, and Commit Instance. To learn more about the transactional operations of the Lead to Cash Core (com.snc.l2c_core) plugin, see Lead to Cash.

Plugins for the Customer Life Cycle Management Workflows

The following table lists the required plugins for the Life Cycle Management Workflows plugin.

Required plugins for the Life Cycle Management Workflows plugin

Plugin	Description
Customer Service Install Base Management (com.snc.install_base)	Enables customers to capture the current state of a customer's install base and establish the relationship to any downstream entities that might impact their functioning. To learn more about install base management, see Configure install base.
Product Catalog Management Core (com.sn_prd_pm)	Enables companies to define the products and services they market, sell, and deliver to customers. To learn more about product catalogs, see Product Catalog Management.
Lead to Cash Core (com.snc.l2c_core)	Enables customers to compose and build the workflows for various entities. To learn more about the Lead to Cash Core plugin, see Lead to Cash.

Life Cycle workflows and configurations

Perform the **Modify**, **Suspend**, **Resume**, and **Disconnect** declarative actions on the complete hierarchy of the sold products. These actions will transform and maintain their state and characteristics. You can perform these actions on the sold product entities to update the existing products or services. The declarative actions are available on the sold product related list on the account detail page on Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The declarative actions with the sold product to order flow are available only if the Order Management (com.sn_ind_tmt_orm) plugin is installed.

The Sold Product related list on the Accounts page displays all the sold products regardless of the product offer having a product specification. You can also select a sold product with a product specification associated with the product offering and perform any of the MACD flows. Be sure to upgrade to Xanadu to perform the modify, suspend, resume, and disconnect actions on product offerings that have a specification associated with it.

Note:
If Product Inventory records are selected, the **Modify**, **Suspend**, **Resume**, and **Disconnect** actions are deactivated.

Workflows

Multiple sub-flows are based on the modify, suspend, resume, and disconnect actions that help to update the sold products and their configurations. The flows are based on a set of entity configurations that are shipped when you activate the Customer Life Cycle Management Workflow plugin.

The following table lists the flows for the declarative actions.

Flow Designers for declarative actions

Flow	Description
Sold product to Suspend order	This flow is responsible for creating a suspend order when the **Suspend** action is triggered on a sold product.
Sold product to Resume order	This flow is responsible for creating a resume order when the **Resume** action is triggered on a sold product.
Sold product to Disconnect order	This flow is responsible for creating a disconnect order when the **Disconnect** action is triggered on a sold product.
Add order to sold product	This flow is responsible for creating a sold product order when order is moved to completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow Designers for declarative actions (continued)

Flow	Description
	Note: The sn_ind_tmt_orm.enable_prod_invt_for_order_management property is set to **False** by default with the Order Management (com.sn_ind_tmt_orm) plugin. However, if the Order Management for Telecom, Media and Tech (com.sn_om_tmt) plugin is installed, the property value is set to **True**. If the property value is false, a record is created in the sold product (sn_install_base_sold_product) table. If the property value is true, a record is created in the Product inventory (sn_prd_invt_product_inventory) table.
Change order to sold product	The sn_ind_tmt_orm.enable_prod_invt_for_order_management property is set to **False** by default with the Order Management (com.sn_ind_tmt_orm) plugin. However, if the Order Management for Telecom, Media and Tech (com.sn_om_tmt) plugin is installed, the property value is set to **True**. If the property value is false, a record is created or updated in the sold product (sn_install_base_sold_product) table. If the property value is true, a record is created or updated in the Product inventory (sn_prd_invt_product_inventory) table.
Suspend order to sold product	This flow is responsible for suspending a sold product on completion of an order.
Resume order to sold product	This flow is responsible for resuming a sold product on completion of an order.
Disconnect order to sold product	This flow is responsible for disconnecting a sold product on completion of an order.

Note:
If the 'sn_ind_tmt_orm.enable_prod_invt_for_order_management' property is set to true, the last five flows in the displayed table are disabled.

Note:
The back and forth flow of the data (from a sold product to an order, an order to a sold product) happens with the help of a set of entity configurations.

Configurations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configurations are a set of end-to-end flows that enable the data to flow from one entity to the other. The subflows that are triggered with each declarative action are based on the configurations that are listed in the following table.

Configurations for declarative actions

Configuration	Configuration ID	Source Entity	Target Entity
Sold product to Order	sn_l2c-cust_flows_sp_to_order	Sold product	Order
Order to Sold Product	sn_l2c_cust_flows_order_to_sp	Order	Sold product

To learn more about the configurations, see Entity configuration and mapping.

- Suspend a single sold product
- Suspend multiple sold products

Modify a sold product and hierarchy

Modify a sold product and its complete hierarchy on the CSM Configurable Workspace so that you can update its existing configurations. For example, you may want to modify a sold product's characteristics and the line items (hierarchy) that are associated with it.

About this task

After an order is created, the fulfillment process for the order begins. After the order is fulfilled and marked **Complete**, the order to sold product flow is triggered. This flow applies the changes to the sold products. The changes are based on the updates that are specified on the order.

Before you begin

Required plugins: Product Configurator UI (app-prd-config-ui)

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. In the Sold Products related list, select the product that you want to modify the characteristics and line items for.

Note:
You can do a **Modify** action on either the root or the child sold products only if the sold product is in the **Active** state. The sold product must have a product offering without a specification that is associated with it. If you select two sold products at the same time, you can't do the **Modify** action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Modify**.
6. On the Configurator UI, modify the existing configurations for the sold product.
   To learn more about the Configurator UI, see Exploring Sales Customer Relationship Management.
7. Select **Update**.
   An order to modify the sold product is created. You can select the order number from the confirmation message on the sold products page to open the order and see the order line items. Alternatively, you can find the order in the Customer Orders list.

Modify a sold product to create a quote

Modify a sold product and its complete hierarchy on the CSM Configurable Workspace to generate a quote for any updated characteristics or configurations. For example, a customer may want to find the price to modify a sold product's characteristics and the line items (hierarchy) that are associated with it.

About this task

Change a sold product or its characteristics. When you modify a sold product's characteristics, a sold product to quote flow is triggered. This flow applies changes to the existing sold product characteristics and presents customers with a quotation based on their selected changes.

Required plugins: Product Configurator UI (com.sn_prd_config_ui), Quote Management (app-l2c-quote-mgmt), and Customer Lifecycle Management workflows (com.snc.customer_lifecycle_mgmt_workflows) (

Role required: Sales Agent (sn_sales_common.sales_agent) and Sales Manager (sn_sales_common.sales_manager)

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. In the Sold products related list, select the product that you want to modify the characteristics and line items for.
5. Select **Modify** to update the characteristics of the sold product.

   Note:
   If you have both the Order Management (com.sn_ind_tmt_orm) and Quote Management (app-l2c-quote-mgmt)) plugins the order agent, order admin, sales agent, and sales manager can perform the **Modify** action that results in an order. To specifically create a quote, customers must configure the decision table to modify existing sold product according to their business needs. Users performing the modify flow must have both the sales agenda and the order agent roles. To learn more about the decision table, see Modify decision table rules in Workflow Studio.

6. On the Configurator UI, modify the existing configurations for the sold product.
   To learn more about the Configurator UI, see Exploring Sales Customer Relationship Management.
7. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A quote to modify the sold product and its hierarchy is created. You can select the quote number from the confirmation message on the sold products page to open the quote and see the quote line items.

In the Sold product to Quote flow, the data from **Account**, **Contact**, **Name**,**Product Offering**, **Quantity**, **Sys_id**, **Characteristic**, **Characteristic Option**, and **Characteristic Value** fields are transferred from the Sold Product to Quote Line Item records.

Resuming sold products

Resume sold products to create a resume order on the CSM Configurable Workspace.

Resume single or multiple root sold products and create combined orders for suspension and resumption of products and services at the same time, to improve agent efficiency.

Resume sold products

Task	Description
Resume a single sold product	Resume a single sold product
Resume multiple sold products	Resume multiple sold products

Resume a single sold product

Create an order to resume a sold product and its hierarchy on the CSM Configurable Workspace. By resuming a sold product, you can restart a product or service.

About this task

After an order is created and marked **Complete**, the order to sold product flow is triggered after fulfillment. This flow enables you to resume a sold product.

Before you begin

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. In the Sold Products related list, select the sold product that you want to resume.

   Note:
   You can do a **Resume** action on the root sold product only if it is in the **Active** state. The sold product must not have a specification that is associated with it. The **Resume** option isn't visible if you select a child sold product.

5. Select **Resume**.

   The **Resume** action is enabled on sold products that are in **Inactive** or **Suspended** states only.

6. In the Resume sold product window, in the **Start date and time** field, enter when you want to resume the sold product.
7. Select **Resume**.

Result

An order for resuming the sold product is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resume multiple sold products

Create an order to resume multiple sold products and their hierarchy on the CSM Configurable Workspace.

About this task

After an order is created and marked **Complete**, the order to sold product flow is triggered after fulfillment. This flow creates sold products on the sold product table (sn_install_base_sold_product).

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace.**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. In the Sold Products related list, select the sold products that you want to resume.

> **Note:**
> You can do a **Resume** action only on the root sold product with a product offering and if it is in the **Inactive** or **Suspended** state. The **Resume** option is disabled if you select a child-sold product.

5. Select **Resume**.
6. In the Resume sold products window, in the **Start date and time** field, enter when you want to resume the sold products.
7. Add a reason for a resumption in the **Reason for resumption** field.
8. Select **Resume**.

Result

An order for resuming the sold products is created, while order line items are created in an asynchronized manner.

Suspending sold products

Suspend sold products to create a suspend order or quote on the CSM Configurable Workspace.

Suspend single or multiple root-sold products, and create combined suspension and resumption orders of products and services at the same time to improve agent efficiency.

Suspend sold products

Task	Description
Suspend a single sold product	Suspend a single sold product
Suspend multiple sold products	Suspend multiple sold products

Suspend a single sold product

Create an order to suspend a sold product and its hierarchy on the CSM Configurable Workspace. By suspending a sold product, you can reduce the number of canceled products or services and take the time to fix that product or service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

After an order is created and marked **Complete**, the order to sold product flow is triggered after fulfillment. This flow enables you to suspend a sold product.

Note:
You can also indefinitely suspend a sold product without creating a resume order.

Before you begin

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. In the Sold Products related list, select the sold product that you want to suspend.

   Note:
   You can do a **Suspend** action on the root sold product only if it is in the **Active** state. The sold product must not have a specification that is associated with it. The **Suspend** option isn't visible if you select a child sold product.

5. Select **Suspend**.
6. In the Suspend sold product window, in the **Start date and time** field, enter the start date and time that you want to start the suspension.

   Note:
   If you fill in only the **Start date and time** field, a suspend order line item is created. A resume order line item is created within the same order header if the **End date and time** field is also filled in.

7. Add a reason for a suspension in the **Reason for suspension** field.
   For example, a disturbance due to a renovation can be a reason for suspension.
8. Select **Suspend**.

Result

An order with the suspend action is created for the suspend order line items. If you specify an end date and time, a resume order line item is created as a part of the same order. When you update the suspend action line item to **Complete**, the sold product state automatically updates to **Suspended**. When you move the state of the resume action line item to **Completed**, the sold product state updates to the **Active** state. The **Resume** action is enabled only if you set the state of the sold product as **Inactive**.

Suspend multiple sold products

Create an order to suspend multiple sold product and their hierarchy on the CSM Configurable Workspace. By suspending a sold product, you can reduce the number of canceled products or services and take the time to fix that product or service.

Before you begin

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

After an order is created and marked **Complete**, the order to sold product flow is triggered after fulfillment. This flow creates sold products on the sold product table (sn_install_base_sold_product).

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. In the Sold Products related list, select the sold products that you want to suspend.

   Note:
   You can do a **Suspend** action only on root sold products with a product offering and if it is in the **Active** state. The **Suspend** option is inactive if you select a child sold product.

5. Select **Suspend**.
6. In the Suspend sold products window, in the **Start date and time** field, enter the start date and time that you want to start the suspension.
   You can see the selected sold products in the account.

   Note:
   If you fill in only the **Start date and time** field, a suspend order line item is created. If you fill in the **End date and time** field, a resume order line item is also created within the same order header.

7. Add a reason for a suspension in the **Reason for suspension** field.
   For example, a disturbance due to a renovation can be a reason for suspension.
8. Select **Suspend**.

Result

An order with the suspend action is created. Suspend order line items are created in an synchronized process. If you specify an end date and time, a resume order line item is also created as a part of the same order.

When you update the suspend order line item to **Complete**, the sold product state automatically updates to **Suspended**.

When you update the state of the resume order line item to **Completed**, the sold product state updates to the **Active** state.

Disconnecting sold products

Disconnect sold products to create a disconnect order on the CSM Configurable Workspace.

Disconnect single or multiple root sold products at the same time, to improve agent efficiency.

Disconnect sold products

Task	Description
Disconnect a single sold product	Disconnect a single sold product
Disconnect multiple sold products	Disconnect multiple sold products

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disconnect a single sold product

Disconnect a sold product in the CSM Configurable Workspace so that you can permanently disconnect a product and its services.

About this task

After an order is created on the order form and is marked **Complete**, a flow is triggered. This flow enables you to disconnect a sold product and its services after fulfillment.

Before you begin

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. From the Sold Products related list, select the sold product that you want to disconnect.

   Note:
   You can do the **Disconnect** action only on one root sold product whose state is **Active** and has a product offering without a specification that is associated with it. The option isn't visible if you select a child sold product.

5. Select **Disconnect**.
6. In the Disconnect sold product pop-up window, enter when you want the disconnection to start in the **Start date and time** field and the reason why you want to disconnect the product in the **Reason for disconnection** field.
7. Select **Submit**.

Result

An order for a disconnection is created. After the order is fulfilled, the sold product is moved to the **Inactive** state.

Disconnect multiple sold products

Create an order to disconnect multiple sold products and their hierarchy on the CSM Configurable Workspace.

About this task

After an order is created and marked **Complete**, the order to sold product flow is triggered after fulfillment. This flow creates sold products on the sold product table (sn_install_base_sold_product).

Role required: sn_ind_tmt_orm.order_admin or sn_ind_tmt_orm.order_agent

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace.**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold products belong to.
4. In the Sold Products related list, select the sold products that you want to disconnect.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can do a **Disconnect** action only on the root sold product with a product offering only if it is in the **Active** state. The **Disconnect** option is inactive if you select a child-sold product.

5. Select **Disconnect**.
6. In the disconnect sold products window, in the **Start date and time** field, enter when you want to disconnect the sold products.
7. Add a reason for a suspension in the **Reason for disconnection** field.
8. Select **Disconnect**.

Result
An order for disconnecting the sold products is created, while order line items are created in a synchronized manner.

Extension points for workflows

Override existing scripts or call custom scripts for the workflows by using extension points on the ServiceNow AI Platform®.

You can access the available extension points for the customer life cycle management workflows in the ServiceNow AI Platform®. Start by entering **sys_extension_point.list** in the application navigator and pressing **Enter**. Then, you can select the extension point that you want to view the record details of. If you want to override an existing script, you can select **Create implementation**.

You can create extension points so that you can create a workflow for a sold product extension that is not already configured. You can also override extension points in order to create configurations. To learn more about the existing extensions and configurations of the Customer Life Cycle Management Workflows, see Customer Life Cycle Management Workflows.

You can create several implementations for each extension point and provide an order number for each implementation. The implementation that has the lowest order number is the one that is executed.

The following table lists the extension points of the Customer Life Cycle Management Workflows.

Extension points for the Customer Life Cycle Management Workflows application

Extension points	Description
CustomerWorflowsEP sn_l2c_cust.flows.CustomerWorkflowEP	Overrides the existing flows and configurations. This extension can be used for any one of these two reasons: • If you want to execute custom flows that are extensions of the current sold product (sn_install_base_sold_product) table. To learn more about existing flows, see Customer Life Cycle Management Workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension points for the Customer Life Cycle Management Workflows application (continued)

Extension points	Description
	• If you want to execute custom Lead to Cash Core configurations. To learn more about existing Lead to Cash configurations, see Entity configuration and mapping.
GetSoldProductClassEP sn_l2c_cust_flows.GetSoldProductClassEP	Returns the correct sold product and product inventory class. The extension can be used to create custom flows in the **Add** and **Modify** flows.
CustomerWorkflowCompleteEP sn_l2c_cust_flows.CustomerWorkflowCompleteEP	Overrides existing methods to perform any custom post-processing actions after an order to sold product flow is complete.

Product inventory configurations

You can select one or more product inventory records to update their configurations and perform the **Modify**,**Suspend**, **Resume**, and **Disconnect** operations.

Create orders or quotes from product inventory records on the CSM Configurable Workspace.

Configurations for product inventory records

Action	Description
Modify product inventory records	Perform the **Modify** operation on a single product inventory record that results in the creation of an order.
Modify product inventory records to create a quote	Perform the **Modify** operation on a single product inventory record that results in the creation of a quote.
Resume product inventory records	Perform the **Resume** operation on single or multiple product inventory records that result in the creation of resume orders.
Suspend product inventory records	Perform the **Suspend** operation on single or multiple product inventory records that result in the creation of suspend orders.
Disconnect product inventory records	Perform the **Disconnect** operation on single or multiple product inventory records that result in the creation of disconnect orders.

Modify product inventory records

Perform the **Modify** operation on a single product inventory record that results in the creation of an order on the CSM Configurable Workspace to update its existing configurations. For example, you may want to add or delete an optional product inventory or update its configurations.

Before you begin

Role required: Sales Agent (sn_sales_common.sales_agent) or Sales Manager (sn_sales_common.sales_manager)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When a **Modify** action is performed and an order is created, the fulfillment process for the order begins. After the fulfillment flow is complete, the order is marked as **Complete** and the product inventory record is updated.

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the product inventory belongs to.
4. Navigate to the Product Inventories related list.

   Note:
   The Product Inventories related list will be available out of the box starting from the Yokohama release. Customers using the Washington or Xanadu versions must add the related list manually.

   You can retain either the sold product or the product inventories related list. If you want to retain both the lists, filter out the product inventory records from the sold product related list and perform the **Modify** flow from the product inventory record.

5. Select a product inventory record in **Active** state and select **Modify**.

   Note:
   The **Modify** flow can be triggered only on a root product inventory record.

6. On the Configurator UI, modify the existing configurations for the product inventory record. To learn more about the Configurator UI, see Exploring Sales Customer Relationship Management.
7. Select **Update**.
   An order to modify the product inventory is created. You can select the order number from the confirmation message on the account page to open the order and see the order line items. Alternatively, you can find the order in the Customer Orders list.

Modify product inventory records to create a quote

Perform the **Modify** operation on a single product inventory record that results in the creation of a quote on the CSM Configurable Workspace. For example, you might want to add or delete an optional product inventory or update its configurations.

Before you begin

Role required: Order admin (sn_ind_tmt_orm.order_admin) or Order agent (sn_ind_tmt_orm.order_agent)

About this task

The **Modify** flow generates a quote. After the quote is marked as **Complete**, an order is created. On fulfillment of the order, the product inventory record is updated.

Required plugins: Product Configurator UI (com.sn_prd_config_ui), Quote Management (app-l2c-quote-mgmt), and Customer Lifecycle Management workflows (com.snc.customer_lifecycle_mgmt_workflows)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the product inventory belongs to.
4. Navigate to the **Product Inventories** related list.
5. Select a single product inventory record in **Active** state and select **Modify**.

   Note:
   The **Modify** flow can be triggered only on a root product inventory record.

   If you have both the Order Management (com.sn_ind_tmt_orm) and Quote Management (app-l2c-quote-mgmt)) plugins the order agent, order admin, sales agent, and sales manager can perform the Modify action that results in an order. Users performing the modify flow must have both the sales agent and the order agent roles. To specifically create a quote, customers must configure the decision table to modify existing sold product according to their business needs. Update the configurations on the Customer Life Cycle Workflows policy decision table. To learn more about the decision table, see Modify decision table rules in Workflow Studio.

6. On the Configurator UI, modify the existing configurations for the product inventory.
   To learn more about the Configurator UI, see Exploring Sales Customer Relationship Management.
   A quote to modify the product inventory is created. You can select the quote number from the confirmation message on the account page to open the quote and see the quote line items. Alternatively, you can find the quote from **All Menu** > **Quote** in the Quote list.

Suspend product inventory records

Perform the **Suspend** operation on single or multiple product inventory records that result in the creation of orders or quotes on the CSM Configurable Workspace. By suspending a product inventory, you can pause your services for a period of time.

Before you begin

Role required: Order admin (sn_ind_tmt_orm.order_admin) or Order agent (sn_ind_tmt_orm.order_agent)

About this task

After performing the **Suspend** action, a suspend order is created and the fulfillment process for the order begins. This fulfillment flow marks the order as **Complete** and updates the product inventory records.

Procedure

1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the product inventory belongs to.
4. Navigate to the **Product Inventories** related list and select one or more root product inventory records.

   Note:
   You can do a **Suspend** action on a single or multiple root sold products only if it is in the **Active** state and is disabled for any other state.

5. Select **Suspend**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Suspend window, in the **Start date and time** field, enter the start date and time that you want to start the suspension.

   Note:
   If you fill in only the **Start date and time** field, suspend order line items are created. Resume order line items are created within the same order header if the **End date and time** field is also filled in. You can also indefinitely suspend a product inventory without creating a resume order by not entering an end date.

7. If you know when you want to end the suspension, enter the **End date and time** field.
8. Add a reason for a suspension in the **Reason for suspension** field.
   For example, a disturbance due to a renovation can be a reason for suspension.
9. Select **Suspend**.

Result
An order to suspend the product inventory record is created.

Resume product inventory records

Perform the **Resume** operation on single or multiple product inventory records that result in the creation of orders or quotes on the CSM Configurable Workspace. By resuming a product inventory, you can restart a product or service.

Before you begin
Role required: Order admin (sn_ind_tmt_orm.order_admin) or Order agent (sn_ind_tmt_orm.order_agent)

About this task
After performing the **Resume** action, a resume order is created and the fulfillment process for the order begins. This fulfillment flow marks the order as **Complete** and updates the product inventory records.

Procedure
1. Navigate to **All** > **CSM/FSM Configurable Workspace.**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the sold product belongs to.
4. Navigate to the **Product Inventories** related list and select one or more root product inventory records.

   Note:
   You can do a **Resume** action on the root product inventory only if it is in the **Suspended** state.

   The **Resume** option is enabled only if the root product inventory with **Suspended** state is selected and is inactive for any other state.

   If you select a child sold product, the option is inactive.

5. Select **Resume**.
6. In the Resume window, in the **Start date and time** field, enter when you want to resume the product inventory.
7. Select **Resume**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
An order for resuming the product inventory records is created.

Disconnect product inventory records

Perform the **Disconnect** operation on single or multiple product inventory records that result in the creation of orders or quotes on the CSM Configurable Workspace so that you can permanently disconnect a product and its services.

Before you begin
Role required: Order admin (sn_ind_tmt_orm.order_admin) or Order agent (sn_ind_tmt_orm.order_agent)

About this task
After performing the **Disconnect** action, a disconnect order is created and the fulfillment process for the order begins. This fulfillment flow marks the order as **Complete** and updates the product inventory records.

Procedure
1. Navigate to **All** > **CSM/FSM Configurable Workspace**.
2. In the list view, select **Customer** > **Accounts**.
3. Open the account that the product inventory belongs to.
4. Navigate to the **Product Inventories** related list and select one or more root product inventory records.

   Note:
   You can do the **Disconnect** action only on one root sold product whose state is **Active** or **Suspended**, and the option is enabled only if the root product inventory with **Active** or **Suspended** states are selected and is disabled for any other state.

5. Select **Disconnect**.
6. In the Disconnect window, enter when you want the disconnection to start in the **Start date and time** field.
7. Add a reason for a disconnection in the **Reason for disconnection** field.
8. Select **Disconnect**.

Result
An order to disconnect the product inventory record is created.

Activate Customer Life Cycle Management Self-Service

If you have the admin role, you can install the Customer Life Cycle Management Self Service plugin.

Before you begin
- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Customer Life Cycle Management Self Service plugin (sn_clm_selfservice) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.
   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install the Customer Life Cycle Management Self Service plugin (sn_clm_selfservice).
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Configure Customer Contracts and Entitlements

Use the Customer Contracts and Entitlements application to configure and display customer service contracts and entitlements.

Activate Customer Contracts and Entitlements

As an admin, you can activate the following plugins to enable users to create and manage Customer Contracts and Entitlements. For more information, see Activate a plugin.

Customer Contracts and Entitlements plugins

Plugin	Description	Dependency
Customer Contracts and Entitlements [com.sn_pss_core]	Provides foundational objects to manage Customer Contracts and Entitlements and APIs for integration.	• Customer Service Install Base Management [com.snc.install_base] • Product Catalog Management Core [com.sn.prd_pm]
Entitlements Verification	Provides APIs to verify entitlement.	Customer Contracts and Entitlements

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Contracts and Entitlements plugins (continued)

Plugin	Description	Dependency
[com.sn_ent_verify]		[com.sn_pss_core]
Contracts and Entitlement Workflows [com.sn_contract_ent_wf]	Provides workflows to manage changes on Customer Contracts and Entitlements.	• Customer Contracts and Entitlements Foundation [com.sn_pss_core] • Lead to Cash Primitives [com.sn_l2c_core] • Customer Life Cycle Management Workflows [com.sn_l2c_cust_flows]

With the activation of Customer Contracts and Entitlements, the existing contracts are available for viewing only.

For more information on the installed roles and tables, see Components installed with Customer Contracts and Entitlements.

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Components installed with Customer Contracts and Entitlements

Several types of components are installed with the Customer Contracts and Entitlements application, including tables and roles.

The following roles are added with the activation of the Customer Contracts and Entitlements plugins.

Roles installed

Role	Description	Contains role	Targeted per
sn_pss_core.service_contract_viewer Service contract viewer	Performs read operation on: • Service contracts • Contract lines • Entitlements	• sn_prd_pm.characteristics_viewer Characteristic viewer • sn_prd_pm.product_catalog_viewer Product catalog viewer	• sn_custor Consume • sn_custor Customer

- Assign a role to a user
- Assign a role to a group

The default view on service contracts and entitlements in Customer Service Management workspace is Service Contract Workspace view. It can be changed by an administrator.

Configuring Contracts and Entitlement Workflows

Configure the Contracts and Entitlement Workflows plugin (com.sn_contract_ent_wf) to generate and modify contracts using order management.

As an admin, you can activate the Contracts and Entitlement Workflows plugin (com.sn_contract_ent_wf). For more information, see Activate a plugin.

The following plugins are prerequisites for activating the Contracts and Entitlement Workflows plugin (com.sn_contract_ent_wf):

Required plugins

Plugin	Description
Product Configuration UI (com.sn_prd_config_ui)	Graphical interface that enables to configure complex products or services according to specific needs and requirements.
Order Management (com.sn_ind_tmt_orm)	Captures, enhances, and oversees the complete life cycle of the product and service orders. With this plugin, you can efficiently handle the order orchestration, data enrichment, and composition to ensure an accurate and timely fulfilment.

After installing the Contracts and Entitlement Workflows plugin (com.sn_contract_ent_wf), the following plugins are automatically installed:

Dependent plugins

Plugin	Description
Customer Contracts and Entitlements (com.sn_pss_core)	Provides foundational objects to manage customer contracts and entitlements.
Lead to Cash Core (com.snc.l2c_core)	Enables customers to compose Sales CRM flows.
Customer Life Cycle Management Workflows (com.snc.l2c_cust_flows)	Provides workflows to manage the life cycles of sold products and install base items.

Creating contracts and entitlements using workflows

After a product offer is selected by the customer and the product is sold to the customer, this workflow creates contracts and entitlements based on the services associated with that sold product and the extra services that the customer has purchased.

There are the product offering scenarios and their configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Offering types and workflows

Offering types	Description
Offers for entitlements	The workflow creates entitlement records for such offerings. These entitlements can be associated with existing sold products, install base items, product inventory records, or the customer.
Offers for services (contract lines)	The workflow enables automatic creation of a service contract, service contract lines, and the entitlements for those contract lines.
Implicit offerings	Implicit entitlements and service contract lines are not shown on order lines. These offers can be marked as implicit when they do not need to be configured while capturing the order and are available as part of a package. These entitlements and service contract lines are automatically created as a part of this workflow.

Creating a contract from an order

For every order with multiple product offerings, a single contract with multiple contract lines is created. You can add multiple product offerings from an order to an existing contract. To add a product offering to an existing contract, add the contract reference in the **Existing Contract** field of the order line item. As part of the order processing, a sold product is generated for every order line.

Creating contracts from product inventory records

If the system property sn_ind_tmt_orm.enable_prod_invt_for_order_management is set to true, order fulfillment workflows create product inventories based on customer orders, product offerings and specifications. On creation of a product inventory, contract lines and entitlements will be created. When a product inventory undergoes a state change, the associated contract lines and entitlements are synced. For more information, see Product inventory configurations. Product inventory records trigger updates to contracts and entitlements under the following conditions:

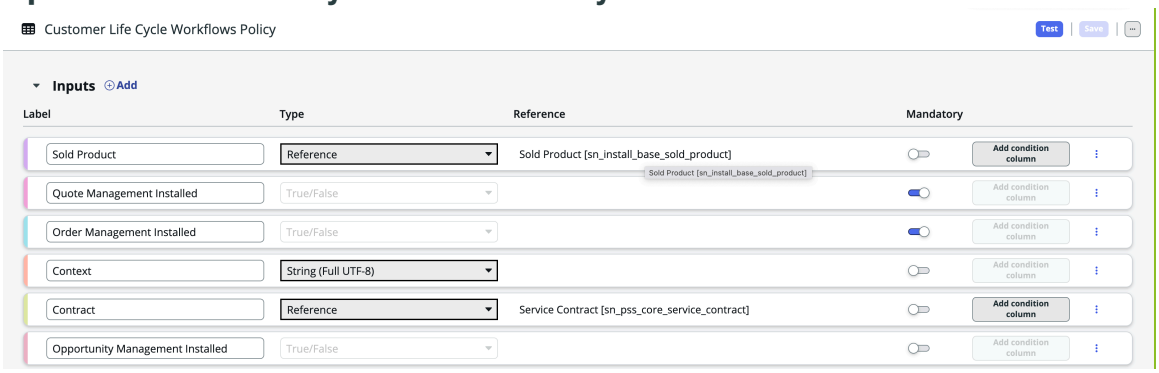
- Process Telecom Order Line flow: The ADD flow creates contract and entitlement records from the product inventory. The MODIFY flow updates the states of the contract line items and entitlements.
- Post Process Telecom Top Domain Order flow: The MODIFY flow updates the states, fields, and characteristics for contract line items and entitlements.
- Product Inventory Operations record: Depending on the scheduled date and time, the DISCONNECT, RESUME, and SUSPEND flows cancels, activates, or suspends the contract line items and entitlements.

Configuring Customer Life Cycle Workflows Policy decision table

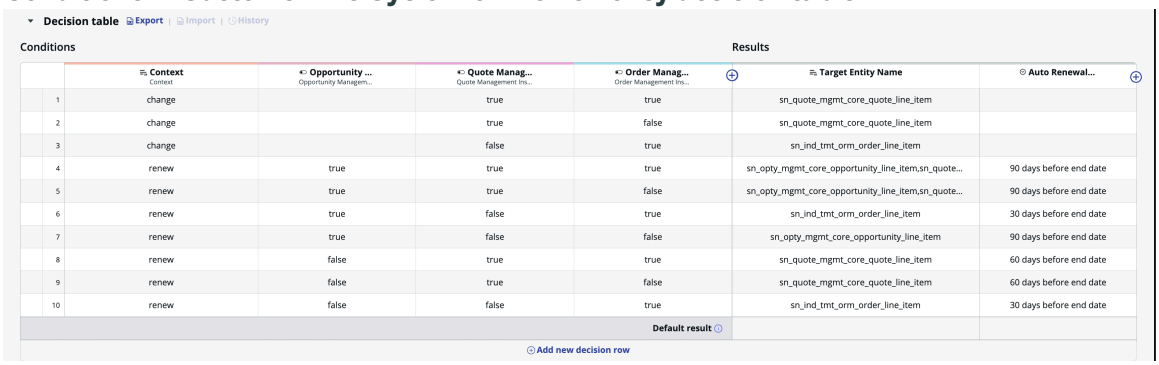
Customer Life Cycle Workflows Policy decision table decides the target entity while renewing and modifying service contracts, service contract lines, and entitlements. Based on this decision table, you can create a quote, an order, an opportunity, or an opportunity and a quote together while renewing or modifying a service contract. For a target entity, you can also select when you want to initiate the renewal of the service contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inputs in Customer Life Cycle Workflows Policy decision table



Conditions in Customer Life Cycle Workflows Policy decision table



You can configure rules based on the six available input parameters to a required target entity while renewing and modifying contracts. Select the following values in the Target Entity Name column to create the corresponding target entities.

Values of target entities

Value	Target Entity
`sn_ind_tmt_orm_order_line_item`	Order
`sn_quote_mgmt_core_quote_line_item`	Quote
`sn_opty_mgmt_core_opportunity_line_item`	Opportunity **Note:** You cannot create opportunities for modifying process.
`sn_quote_mgmt_core_quote_line_item,sn_opty_mgmt_core_opportunity_line_item`	Opportunity and quote together **Note:** You cannot create opportunities and quotes for modifying process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To create an opportunity or opportunity and quote together during renewal, the admin needs to set up the following records:

- Sales Cycle Type: In the Code field, enter **RENEW** and set the Active option to **True**. For more info, see Create a sales cycle for an opportunity.
- Opportunity Stage: In the Name field, enter **Develop** and set the Active option to **True**. For more info, see Create opportunity stages.

If the user selects an opportunity and a quote as target entities, a renewal opportunity and a quote is created. The opportunity and the quote are associated to each other.

Select one of the following options in the Auto Renewal Initiation column to indicate when you want to automatically renew the contract: 90, 60, 30 days before contract end date or on the contract creation date.

Setting up the Customer Contracts and Entitlements application

Configure the features and components of Customer Contracts and Entitlements to enable a seamless, end-to-end service experience including after sales services for your customers.

As a user with the admin role, you can set up the Customer Contracts and Entitlements application to enable users to create entitlements and service contracts for users.

Task	Description
Create a characteristic	Create a characteristic to add to an entitlement. A characteristic refers to the specific attributes or properties that define the entitlement.
Create a user	Add a user to your instance to enable them to log in and use designated application features. After adding the user, you make them approver to review service contracts.
Assign a role to a user	Assign roles to users. Use this feature to grant the sn_customerservice_manager (CSM manager) role to a newly added user and authorize them to make an informed judgment to review a service contract.
Create customer accounts **Note:** On the Accounts form, to view the service contracts, remove the contract-related lists and configure the Service contracts related list.	Create an account and associate it to a service contract.
Create a consumer record	Create a consumer record in Customer Service Management. A consumer can be associated with a service contract in the Customer Contracts and Entitlements application.
Create a sold product	Create a record for a product that is sold to an account or a consumer. A sold product can be associated with multiple contracts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Create an install base item	Create a record for an install base item that is sold to an account or a consumer. An install base item can be associated with multiple contracts.

Create a characteristic

Create a characteristic that can be associated with an entitlement or service contract line.

Before you begin

Role required: sn_customerservice_manager

About this task

A characteristic is used for defining the service coverage that is provided to customers. These characteristics might include the scope of the service, the time period, and any limitations or exclusions such as geographical location and other attributes.

Procedure

1. Navigate to **All** > **Product Catalog Management** > **Characteristics** > **Characteristics**.
2. Select **New**.
3. On the form, fill in the fields.

Characteristic form

Field	Description
Name	The name of the characteristic for the entitlement.
Input type	The type of input for the coverage value related to this characteristic. For example, Choice and CheckBox.
Description	The short overview of the entitlement characteristic.

4. Select **Submit**.

Lead to Cash

Create the Lead to Cash workflows for a product and service through entity configurations and mappings. By creating this workflow, your organization can analyze lucrative business opportunities, customer leads, and the billing, support, and maintenance requirements after a sale is complete.

Overview of the Lead to Cash workflows

A product goes through multiple phases and workflows from the time that a product is identified to the time that it's purchased by the customer. The workflow includes the creation of a quote for a product or services, the creation of orders, the sold products, the install base items, and the contracts and entitlements.

If you're an administrator, you create the workflows for your organization and configure the metadata for your various lead-to-cash entities by activating the foundational Lead to Cash Core (com.snc.l2c_core) application. With the Lead to Cash Core (com.snc.l2c_core) plugin, you can compose and build the workflows that your organization maintains for the life cycle of a sold product. For example, on the Lead to Cash Entities Mapping form on the ServiceNow AI Platform®, you select the sold product entity as a source entity and the order as a target entity. You then map these entities and configurations to create a source to the target flow that is a

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

sold product to order flow. This mapping provides your users with a unified workflow experience across the different entities.

Note:
An entity is defined as a collection of tables that have information about an order. The information can come from multiple tables.

Entity configurations

You can configure the definition of a lead-to-cash entity by defining a name and configuration ID on the Lead to Cash Entity form. The definition creates a back and forth flow of the information between the various entities.

To learn how to create entity configurations, see Create an entity configuration. To learn how to create entity mappings, see Create an entity mapping.

Reconfiguration

You can reconfigure an order or a quote that is in the **Draft** state to make customizations in the Configurator UI. After the configuration is complete, all the order line items associated with the order are also updated. To learn more about reconfiguration, see LeadtoCashCore - Scoped.

Entity configuration and mapping

Use the Entity Configuration tables and forms to configure and map an entity that defines a structure and transfers the data from the source entity to the target entity.

Mapping and configuration

Create the configurations and mappings for the entities by using the Entity Configuration tables.

Entity Configuration tables

The entity configuration tables provide you with the information for the fields on the entity configuration form.

Entity Configuration tables

Table	Name	Description
Lead to Cash Entity	sn_l2c_core_entity	Defines and manages the lead-to-cash entities.
Lead to Cash Entity Definition	sn_l2c_core_entity_definition	Defines and manages the definitions that are associated with the lead-to-cash entities.
Lead to Cash Entity Attribute	sn_l2c_core_entity_attribute	Defines and manages the attributes that are associated with the lead-to-cash entities. The lead-to-cash attributes are based on the definitions that are set for the entities.

Each field on the entity configuration form gathers the information from one entity configuration table. The following table has the information about the fields, their descriptions, and the entity tables that the data is populated from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Lead to Cash Entity Definition and Lead to Cash Entity Attributes are related lists on the Entity Configuration form.

Entity Configuration form

Table	Field	Description
Lead to Cash Entity	Name	Name of the lead-to-cash entity.
Lead to Cash Entity	Config ID	Unique configuration ID for the entity.
Lead to Cash Entity	Active	Status of the entity, whether active or inactive for the configuration.
Lead to Cash Entity Definition	Entity	Reference to the lead-to-cash entity definition.
Lead to Cash Entity Definition	Type	Type of the entity definition.
Lead to Cash Entity Definition	Table	Table that is associated with a lead to cash entity.
Lead to Cash Entity Definition	Label	Label for the entity definition.
Lead to Cash Entity Definition	Parent definition	Parent of the current entity definition.
Lead to Cash Entity Definition	Relationship field	Query field that is associated with the parent entity definition record.
Lead to Cash Entity Definition	Parent field	Query field that is associated with the current entity definition record.
Lead to cash Entity Definition	Inherit parent definition	Parent definition that is also used by the current entity definition. **Note:** To make the current entity definition record follow the same definition that is associated to the parent record, select **Inherit parent definition**.
Lead to Cash Entity Definition	Order	Numerical order to process and visualize the hierarchy of configurations.
Lead to Cash Entity Attribute	Field	Name of the field.
Lead to Cash Entity Attribute	Entity	Reference to the lead-to-cash entity attribute.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity Configuration form (continued)

Table	Field	Description
Lead to Cash Entity Attribute	Table	Table that is associated with the lead-to-cash attribute.
Lead to Cash Entity Attribute	Key	Unique key for the entity attribute.
Lead to Cash Entity Attribute	Advanced	Option for advanced configurations. **Note:** To modify the script according to your requirements, select **Advanced**.
Lead to Cash Entity Attribute	Script	Script for the advanced attributes.

Entity mappings

With entity mappings, you can map the source and target tables to transfer the data between the entities that depend on the available entity configurations. The entity mapping tables provide the information for the fields on the entity mapping forms.

Entity Mapping table

Table	Name	Description
Lead to Cash Entity Mapping	sn_l2c_core_entity_mapping	Defines and maps the lead-to-cash entity mappings.
Lead to Cash Entity Table Mapping	sn_l2c_core_entity_table_mapping	Defines and manages the mappings for the different tables that are associated with the lead-to-cash entities.
Lead to Cash Entity Attribute Mapping	sn_l2c_core_entity_attribute_mapping	Defines and manages the attributes and their mappings with the corresponding lead-to-cash entity.

The entity mapping form enables you to map the entities with their corresponding tables and attributes.

Note:
The Lead to Cash Entity Table Mapping and Lead to Cash Entity Attribute Mapping are related lists on the Entity Mapping form.

Entity Mapping form

Table	Field	Description
Lead to Cash Entity Mapping	Mapping name	Name of the mapping.

Create an entity configuration

Create an entity configuration to compose a workflow between two entities so that you can update their existing configurations and perform actions like suspend, resume, or disconnect a sold product.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Lead to Cash** > **Entity Configurations**.
2. On the Lead to Cash Entities form, create an entity by selecting **New**.
3. On the form, in the **Name** field, enter the entity name and in the **Config ID** field, enter the entity ID.

   For a description of the field values, see Entity configuration and mapping.
4. Select **Submit**.
   You've created an entity configuration. You must now create lead-to-cash entity definitions and attributes.
5. On the Lead to Cash Entity form, in the Lead To Cash Entity Definitions related list, create an entity definition by selecting **New**.
6. On the form, fill in the fields.

   For a description of the field values, see Entity configuration and mapping.
7. Select **Submit**.
8. On the Lead to Cash Entity form, in the Lead To Cash Entity Attributes related list, create an entity attribute by selecting **New**.
9. On the form, fill in the fields.

   For a description of the field values, see Entity configuration and mapping.
10. Select **Submit**.

Result
You've created an entity configuration and defined its definition and attributes. You must now create a custom entity mapping. To learn how to create a mapping, see Create an entity mapping.

Create an entity mapping

Create an entity mapping to compose a workflow between two entities so that you can update their existing configurations and perform a set of declarative actions like suspend, resume, or disconnect a sold product.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Lead To Cash** > **Entity Mappings**.
2. On the Lead to Cash Entity Mappings form, create a mapping by selecting **New**.
3. On the form, fill in the fields.

   For a description of the field values, see Entity configuration and mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.
   You've created an entity mapping. You must now create an entity table mapping and an entity attribute mapping.
5. On the lead to cash entity mapping form, in the Lead To Cash Entity Table Mappings related list, create an entity table mapping by selecting **New**.
6. On the form, fill in the fields.

   For a description of the field values, see Entity configuration and mapping.
7. Select **Submit**.
8. On the lead to cash entity mapping form, in the Lead To Cash Entity Table Mappings related list, create an attribute mapping by selecting **New**.
9. On the form, fill in the fields.

   For a description of the field values, see Entity configuration and mapping.
10. Select **Submit**.

Sales and Order Management Request Tracker

Track the status of Sales CRM workflows and enable agents to track the status of any synchronous and asynchronous flows. It also supports processing dependent records sequentially to make sure that the data stays accurate and consistent.

Inbound request table

Add a record to the modified Inbound Request table [sn_tmt_core_inbound_queue].

The following fields have been added to enhance the Inbound Request table:

- Requested flow
- Account
- Contact
- Consumer
- Response payload
- Source record ids
- Status
- Run in the background
- Initiated by
- Domain
- Execute after
- Request configuration

Inbound Request table fields and descriptions

Fields	Description	Field type
Requested flow	The reference to the Lead to Cash Entity mapping, for example Sold Product to Order mapping.	Reference: sn_l2c_core_entity_mapping

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inbound Request table fields and descriptions (continued)

Fields	Description	Field type
Run in background	Determines whether the flow is synchronous or asynchronous.	True/False Default value: True
Resource	The name of the flow that creates the record in the Inbound Request table.	String
Source record ids	System-generated id of the source records.	List
Source table	Primary Lead to Cash Entity table on which the request is triggered.	Table name
Record id	System-generated id of the target record.	String
Reference table	Name of the target entity table for the request.	Table name
Payload	Request received as input to trigger the flow.	String
Response payload	Response of the request that contains the result of the flow and captures the record-level action and transaction status.	JSON
State	Current state of the transaction.	String (choice) New, In progress, Completed, Error, Pending
Status	The status of completion of the flow, for example success, partial success, failure	String (choice) Success, partial success, failure
Error message	Error message that is returned for an exception.	String
Account	The account associated with the source or target record.	Reference: customer_account
Contact	The contact associated with the source or target record.	Reference: customer_contact
Consumer	The consumer associated with the source or target record.	Reference: csm_consumer
Initiated by	The user id from the current user session.	Reference: sys_user
Domain	The current domain scope of the record, for example global	Domain id
Request Configuration	The reference to the Inbound Request Configuration table.	Reference: sn_tmt_core_inbound_queue_config

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inbound Request table fields and descriptions (continued)

Fields	Description	Field type
Execute After	Inbound request that must be processed before the current request.	Reference: Inbound Request

Note:
The **requested_flow** and **response_payload** fields aren't visible to agents.

Use the **Requested flow <is not empty>** to filter out records using the Lead to Cash core APIs. The Inbound Request table [sn_tmt_core_inbound_queue] provides the status and other details related to the request. For example, while creating an order through a quote record, a confirmation message with the order header number and a link to check the request status appears.

Select the links in the confirmation message to view the status of the **Inbound Request** record and other details related to the request.

Note:
The flow designer **SOM Request Processor** is deprecated. Requests are directed to the flow designer IBQ Request Processor.

Security roles

Security roles and access for the Inbound Request table

Role	Permission
Inbound Queue Admin [sn_tmt_core.inbound_queue_admin]	This user can create, read, and update actions on the requests in the inbound request table. **Note:** For Sales and Order management requests, the user doesn't have access to the **requested_flow** field.
Inbound Queues Create User [sn_tmt_core.inbound_queue_create_user]	Create **Note:** For Sales and Order management requests, the user doesn't have access to the **response_payload**, **payload**, or **requested_flow** fields.
Inbound Queues Write User [sn_tmt_core.inbound_queue_writer]	Write access for non Sales and Order management (SOM) requests Read only access for Sales and Order management (SOM) requests

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security roles and access for the Inbound Request table (continued)

Role	Permission
	Note: For sales and order management requests, the user doesn't have access to the **response_payload**, **payload**, or **requested_flow** fields.
Inbound Queue Read User [sn_tmt_core.inbound_queue_read]	Read access to all Sales and Order Management requests **Note:** For sales and order management requests, the user doesn't have access to the **response_payload**, **payload**, or **requested_flow** fields.

Archival policies

Archive the records in the Inbound Request table and determine when to clean up records on the table after a certain number of days. You can implement a different retention period for successful and failed requests.

Archival rule	Time period
Successful requests	10 days
Failed requests	30 days

Related topics

Inbound Request Configuration table

Inbound Request Configuration table

The Inbound Request Configuration table enables users to define the configurations to determine how each flow is processed and tracked within an Inbound Request.

Overview of the Inbound Request Configuration table

The Sales and Service Core API (app-tmt-core) plugin is required to use the Inbound Request Configuration table (sn_tmt_core_inbound_queue_config).

The Inbound Request Configuration table is a metadata table that must be configured to decide how a particular flow is executed, whether synchronous or asynchronous.

The table can be used to perform the following tasks.

- Enable admins to configure synchronous vs asynchronous processing of requests.
- Adapt the Sales and Order Management Request Tracker across all CRM flows.
- Enable configuration of notification types, whether default, custom, or no notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Request Configuration** field on the existing Inbound Request Table [sn_tmt_core_inbound_queue] is a reference to the new Inbound Request Configuration table (sn_tmt_core_inbound_queue_config).

Any workflow that requires the tracking of a completion status, can use the Inbound Request Configuration table and configure whether a flow is synchronous or asynchronous.

Fields on the Inbound Request Configuration Table

An admin creates a record in the table and specifies the configuration using the **run_mode**, **trigger_notification**, and **configuration_api** fields.

Field and descriptions

List of fields on the inbound request configuration table, their descriptions, and the type of fields.

Field	Description	Type
Config ID	Unique configuration ID for the metadata configuration.	String
Label	Unique label name for the metadata configuration.	Translated text
Active	Specifies whether the Inbound request configuration record is active or not.	True/False Default value is **False**
Run Mode	Specifies whether a request runs synchronously or asynchronously.	String (choices): **Sync**, **Async**, **Advanced**. • Synchronous: Synchronous processing. • Asynchronous: Asynchronous processing • Advanced: Use custom script to determine if the flow has to be synchronous or asynchronous.
Trigger Notification	Specifies how a user wants to receive notifications. A notification is triggered in one of the following situations. • **Trigger notification** field is set to **Default**. • State of a request is **Complete** and the status is either **Success** or **Partial success**. The notifications for the record in the Inbound table	String (choices): None, Default, Custom • None: No notifications • Default: Notifications only for asynchronous requests. • Custom: Custom notification for asynchronous requests based on requirements. Configure custom notifications by using the existing event (sn_tmt_core.ibq.custom.notification)

Setting up service and data models (continued)

Task	Description
	creating cases and tracking the services for products and services consumers use.

Configure Service Model Foundation

Configure the Service Model Foundation feature to enable a foundational data model framework. You can use this framework to create structured and flexible data models that represent your business needs.

Before you begin

Role required: admin

About this task

Service Model Foundation provides the core framework and guidance for building and modeling the entities that are involved in the customer service value chain. This framework introduces new entities, such as service organizations, internal and external business locations, and households. It also introduces roles and relationships that provide both flexibility and control in granting access to customer cases and information.

With the Service Model Foundation plugins, you can support:

- Internal business locations and staff members
- External business locations and staff members
- Households and household members

For more information about this feature, see Service Model Foundation overview.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Service Model Foundation category, view the list of tasks to configure the feature.

Customer central configuration tasks

Task	Description
Activate plugins	Activate the plugins: ○ Business Location (com.snc.business_location) ○ Customer Service Household (com.snc.household)
Activate query rules	Activate the query rules by setting the system property [sn_cs_queryrules.use_query_rules] value to **true**.
Configure forms and lists	Configure forms to add the fields and related lists that support the business location and household models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Assign responsibilities	Assign responsibilities to the service organization (SO) member using the responsibility data model.
Assign roles	Roles control access to features, capabilities, and data. The Service Model Foundation plugins add roles that you can assign to internal and external users in your organization.
Create relationships	Use relationships to provide internal and external users with additional access to customer data. Relationships are based on responsibility definitions. When you create a relationship, you select the users involved in the relationship and the responsibility that one user performs on behalf of another. The Service Model Foundation plugins provide both relationships and responsibility definitions that you can use to create relationships between users.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Service Model Foundation overview

Service Model Foundation provides a framework enabling customers to model and manage their operational hierarchy of the entities involved in offering CRM functions likes sales and customer service in alignment with their business needs.

The Service Model Foundation framework expands the Customer Service Management data model, including the install base model. It provides the flexibility and security needed to support business organizations with internal and external locations, households, customers and consumers, and the relationships that exist between these entities.

https://player.vimeo.com/video/1096272118?h=581e0655db&badge=0&autopause=0&player_id=0&app_id=58479

Use the Service Model Foundation framework to model the service organization structure that is involved in supporting your end customers. With this framework, you can:

- Create a service organization structure that includes both internal and external business locations.
- Assign customer service agents to business locations and provide access to the cases and customer information in their business location hierarchy.
- Establish relationships between agents and specific customers that enable agents to manage cases and information for those customers.
- Establish relationships between consumers, including consumers who are members of the same household.

Entities included with Service Model Foundation

The Service Model Foundation feature includes the following entities.

Industry data models entities

Entity	Definition	Examples
Service organizations	The internal and external entities that are involved in providing a service to customers. A service organization provides the base framework that supports the customer service value chain. This includes internal and external service organizations. You can extend the service organization to create new entities as needed.	• Financial service organizations with multiple branches • Automobile manufacturers with multiple dealerships • Government agencies with multiple office locations
Internal business locations	The internal entities that belong to a service organization and are involved in providing goods and services.	• Stores • Branches • Centers
External business locations	The external entities that belong to a service organization and are involved in providing goods and services.	• Franchises • Dealerships
Customers (B2B)	The external customers in the business-to-business model who use goods and services.	• Accounts • Contacts
Configuring households	The external customers in the business-to-consumer model who use goods and services.	• Consumers • Households
Employees and staff members	The people who work at internal and external service organizations and assist customers.	• Internal employees • External agents • External staff
Roles	Job functions that are performed by various users in the service organization.	• Location managers • Location agents • Location consumer agents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Industry data models entities (continued)

Entity	Definition	Examples
		• Location relationship managers • Location manager contributors
Responsibility definitions	Definitions of the responsibilities that an agent can perform for a customer or that a consumer can perform for another consumer. Use these responsibilities to create relationships between agents and customers or between consumers.	• Location agents • Location consumer agents • Location contributors • Location manager contributors • Location manager fulfiller • Location relationship manager
Relationships	Relationships that are created between agents and customers or between two consumers, are based on specific responsibilities. Use these relationships to provide additional access to data.	• Relationships between an employee or staff member and a customer • Relationships between two consumers

Plugins for Service Model Foundation

Users with the system administrator role can activate the following plugins to enable Service Model Foundation features.

Business Location

Activate the Business Location plugin (com.snc.business_location) to enable support for businesses that interact with customers through physical channels such as stores, branches, franchises, and dealerships. This plugin automatically activates the Service Organization plugin (com.snc.service_organization).

Customer Service Household

Activate the Customer Service Household plugin (com.snc.household) to manage customer service for households. This plugin enables you to create households, define the members of a household, and identify relationships between household members. This plugin automatically activates the Customer Service Base Extension Entities plugin (com.snc.cs_base_extension).

Configure Service Model Foundation

Service Model Foundation responsibilities

A responsibility, or responsibility definition, describes a role or a function that supports a customer. Use responsibility definitions to create relationships between an agent and a customer or between two consumers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you create a relationship, you select the users involved in the relationship and the responsibility that one user performs on behalf of another. The responsibility that is assigned to a relationship provides access to customer cases and information.

Service Model Foundation includes responsibility definitions that you can use to create relationships:

- Between agents and accounts, households, or consumers.
- Between two consumers.

The following responsibilities are provided with the Service Model Foundation plugins.

Note:
Responsibilities are stored in the Responsibility Definition [sn_customerservice_responsibility_def] table.

Responsibilities included with Service Model Foundation plugin

Responsibility	Used in relationship	Description
Account Manager	Account Team Member	Use the Account Manager responsibility to create a relationship between an agent and an account. With this relationship, the agent can: • Create and manage cases for their accounts. • View account information, including the related entities for an account. • Create and manage contacts and additional addresses for their accounts.
Relationship Manager	• Consumer Team Member • Household Team Member	Use the Relationship Manager responsibility to create a relationship between: • An agent and a consumer. • An agent and a household. With this relationship, the agent can do the following: • For a consumer: ◦ Create and manage cases for the consumer. ◦ View household information, including the related entities for that consumer. • For a household: ◦ Create and manage cases for the household. ◦ View household information, including the related entities for that household. ◦ Create and manage household members.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Responsibilities included with Service Model Foundation plugin (continued)

Responsibility	Used in relationship	Description
Authorized Representative	• Consumer to Consumer Relationship • Household Member Relationship	Use the Authorized Representative responsibility to create a relationship between two consumers, regardless of household, or between two consumers within the same household. With this relationship, a consumer can: • Create and manage cases for another consumer. • View the information of another consumer. • View the install base information of another consumer and create cases for: ○ Sold products ○ Install base items

Customizing responsibility definitions

You can use the responsibility definitions provided with Service Model Foundation plugins. You can also modify these definitions or create your own definitions to meet your business requirements.

Note:
If you modify the existing definitions or create new definitions, you may also need to update ACLs to reflect the changes.

If you have an existing account manager responsibility definition, you may need to evaluate the functionality of the account manager responsibility definition provided with the Service Model Foundation plugins.

Note:
Creating and using responsibility definitions is a feature available in releases prior to Paris. Customers can create responsibility definitions using the Responsibility Definition (sn_customerservice_responsibility_def) table and use those definitions to create account teams using the Account Team Member (sn_customerservice_team_member) table. For more information, see Create account teams.

Create a responsibility definition

Users with the system administrator role can create responsibility definitions.

1. Navigate to **Customer Service** > **Administration** > **Responsibility Definitions**.
2. Select **New** and fill in the fields on the Responsibility Definition form.
3. In the **Type** field, select **User** if this responsibility is to be used in the following relationships:
   - Account Team Member
   - Consumer Team Member
   - Household Team Member
4. If this responsibility is to be used in the following consumer relationships, set the **Type** field to **None**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Consumer to Consumer
- Household Member

For more information, see Create a responsibility definition.

Create a unique responsibility definition

A responsibility definition can be unique, meaning that the responsibility can only be assigned to one user. To make a responsibility definition unique:

1. Navigate to **Customer Service** > **Administration** > **Responsibility Definitions**.
2. Select a responsibility definition.
3. Enable the **Unique** check box on the Responsibility Definition form.
4. Select **Update**.

When creating or updating records in the following tables, the system checks for and enforces unique responsibilities.

- Household Team Member [sn_customer_rel_household_to_user]
- Consumer Team Member [sn_customer_rel_consumer_to_user]
- Account Team Member [sn_customerservice_team_member]

For example, the following table describes the table type, an associated responsibility and the applied unique behavior.

Unique responsibility definition

Table	Responsibility Example	Unique behavior
Account Team Member	Account Manager	An account can have only one account manager but a user with the Account Manager responsibility can manage multiple accounts.
Consumer Team Member	Relationship Manager	A consumer can have only one Relationship Manager but a user with the Relationship Manager responsibility can manage multiple consumers.
Household Team Member	Relationship Manager	A household can have only one Relationship Manager but a user with the Relationship Manager responsibility can manage multiple households.

Note:
The unique behavior of a responsibility definition is not enforced when the responsibility is used for relationships between consumers or household members.

Service Model Foundation relationships

Create relationships between an agent and a customer or between two consumers that provide additional access to customer data.

With the Service Model Foundation feature, you can create relationships between the following users:

- Between an internal user and an account, household, or consumer.
- Between two consumers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships are based on responsibilities, or responsibility definitions. When you create a relationship, you select the users involved in the relationship and the responsibility that one user performs on behalf of another. The responsibility that is assigned to a relationship provides access to customer cases and information.

The following relationships are provided with the Service Model Foundation plugins.

Relationships and Responsibilities for Service Model Foundation plugin

Relationship	Responsibility used in the relationship	Description
Account Team Member [sn_customerservice_team_member]	Account Manager	Create a relationship between an internal user and an account. **Note:** The internal user in this relationship must also be assigned the relationship agent role (sn_customerservice.relationship_agent).
Consumer Team Member [sn_customer_rel_consumer_to_user]	Relationship Manager	Create a relationship between an internal user and a consumer. **Note:** The internal user in this relationship must also be assigned the relationship agent role (sn_customerservice.relationship_agent).
Household Team Member [sn_customer_rel_household_to_user]	Relationship Manager	Create a relationship between an internal user and a household. **Note:** The internal user in this relationship must also be assigned the relationship agent role (sn_customerservice.relationship_agent).
Consumer to Consumer [sn_customer_rel_consumer_to_consumer]	Authorized Representative	Create a relationship between two consumers, regardless of household.
Household Member Relationships [sn_customer_rel_household_member_relationship]	Authorized Representative	Create a relationship between two consumers within a household.

Relationships between internal users and customers

Internal users can have relationships with accounts, consumers, and households. These relationships provide internal users with additional access to customer cases and information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An internal user with a relationship to a customer can create and manage cases on behalf of that customer.

Relationships are created using responsibilities. Use the following responsibilities to create relationships between internal users and customers:

- Account Manager: use this responsibility to create a relationship between a staff member and an account.
- Relationship Manager: use this responsibility to create a relationship between a staff member and a household or a consumer.

Relationships that you create are added to the following related lists:

- Account Staff Relationships on the Business Location form
- Consumer Staff Relationships on the Business Location form
- Household Staff Relationships on the Business Location form
- Account Team on the Consumer form
- Consumer Team on the Consumer form
- Household Team on the Household form

Relationships between consumers

Consumers can have relationships with other consumers. These relationships enable consumers to view and manage cases and information on behalf of other consumers.

Relationships are created using responsibilities. Use the Authorized Representative responsibility to create relationships between consumers. With this responsibility, you can:

- Create a relationship between two consumers, regardless of household.
- Create a relationship between two consumers within a household.

Relationships that you create are added to the following related lists:

- Member Relationships on the Household form
- Consumer Relationships on the Consumer form

Deleting relationships

When a relationship definition is deleted, all of the relationships that use the definition are also deleted.

When a consumer is deleted, all of the relationships to which the consumer belonged are also deleted.

When a household is deleted, all of the relationships created for the household are also deleted.

When a consumer stops being a current member of a household, all of the relationships created for the consumer within the household are also deleted. .

Service Model Foundation tables

Tables that are included with or modified by the plugins that enable the Service Model Foundation feature.

The Service Model Foundation feature adds new tables or modifies existing tables when you activate the following plugins:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business Location (com.snc.business_location)
- Customer Service Household (com.snc.household)
- Service Organization (com.snc.service_organization)
- Customer Service Base Extension Entities (com.snc.cs_base_extension)
- Customer Service Install Base Management (com.snc.install_base)

Business Location plugin

The Business Location plugin adds the following tables.

Different table names for the Business Location plugin

Table	Description
Business Location [sn_csm_business_location]	Extends the Service Organization [sn_customer_service_organization] table. A business location is one type of service organization. This table stores business location records.
Internal Business Location [sn_csm_business_location_internal]	Extends the Business Location [sn_csm_business_location] table. This table stores internal business location records. **Note:** An internal business location is a business location with the **Internal** field set to **true**.
External Business Location [sn_csm_business_location_external]	Extends the Business Location [sn_csm_business_location] table. This table stores external business location records. **Note:** An external business location is a business location with the **Internal** field set to **false**.

Customer Service Household plugin

The Customer Service Household plugin adds or modifies the following tables.

Table names for the Customer Service Household plugin

Table	Description
Household	Stores consumer household records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table names for the Customer Service Household plugin (continued)

Table	Description
[csm_household]	For the Service Model Foundation feature, this table is updated to support the head of household.
Household Member [csm_household_member]	Stores records of the consumers who have been added to households.
Household Team Member [sn_customer_rel_household_to_user]	Stores records for each of the household team member relationships that have been created between an internal user and a household.
Household Member Relationship [sn_customer_rel_household_member_relationship]	Extends the Consumer to Consumer Relationship [sn_customer_rel_consumer_to_consumer] table. This table stores records for each of the relationships that have been created between two consumers who belong to the same household.

Service Organization plugin

The Service Organization plugin adds the following tables.

Table names added by the Service Organization plugin

Table	Description
Service Organization [sn_customer_service_organization]	A unidirectional relationship between a company and a service organization, with a reference to the company record added from the service organization. Stores records for service organizations, including business locations and internal business locations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table names added by the Service Organization plugin (continued)

Table	Description
	Note: The following new columns are replicated from the company [core_company] table to the service organization [sn_customer_service_organization] table: • Active: Track the operational status of the service organization. • Domain: Enable domain separation. • Company: Reference to the core_company table.
Service Organization Member [sn_csm_service_organization_member]	Stores records for the users who belong to internal service organizations.
Service Organization External Staff [sn_csm_service_organization_external_staff]	Extends the User [sys_user] table. Stores records for the users who belong to external service organizations. **Note:** If the **Company** field is populated, the **Service Organization** field displays only those service organizations that are associated with the company record. Similarly, if the **Service Organization** field is populated, the **Company** field displays only those companies that are associated with the service organization.
Service Organization Member Responsibility [sn_csm_svc_org_member_responsibility]	Configure the responsibilities of the staff working at service organizations or its extended entities.

Customer Service Base Extension Entities plugin

The Customer Service Base Extension Entities plugin adds the following tables.

Table names added by the Customer Service Base Extension Entities plugin

Table	Description
Consumer to Consumer Relationship [sn_customer_rel_consumer_to_consumer]	Stores records for each of the relationships that have been created between two consumers, regardless of household.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table names added by the Customer Service Base Extension Entities plugin (continued)

Table	Description
Consumer Team Member [sn_customer_rel_consumer_to_user]	Stores records for each of the consumer team member relationships that have been created between an internal user and a consumer.

Customer Service Install Base Management plugin

The Customer Service Install Base Management plugin adds the Consumer Sold Product [sn_install_base_m2m_consumer_sold_product] table. This table stores records for each sold product (products and components) that have been sold to a consumer.

Tables used by Service Model Foundation

Tables from existing plugins that are used by the Service Model Foundation feature to support customers.

Existing plugins and tables used by the Service Model Foundation feature

Plugin	Table	New columns
Customer Service (com.sn_customerservice)	Responsibility Definition [sn_customerservice_responsibility]	
	Account Team Member [sn_customerservice_team_member]	
	Related Party Configuration [sn_customerservice_related_party_configuration]	
	Case [sn_customersrevice_case]	Household Service Organization Consumer Profile
Customer Service Install Base Management (com.snc.install_base)	Sold Product [sn_install_base_sold_product]	Household Consumer Profile
	Install Base Item [sn_install_base_item]	Consumer Profile
Customer Service Management for Orders (com.snc.csm.order)	Order [csm_order]	Household Service Organization

Service Model Foundation roles

Roles that are included with the plugins that enable the Service Model Foundation feature.

The following table describes the roles that the administrator can assign to the internal users.

Service Model Foundation roles

Role	Description	Contains roles
Location agent [sn_customerservice.svc_location_agent]	Create and fulfill cases for the accounts and contacts in the agent's business location.	• sn_fsm_servicedesk_agent • sn_esm_location_agent
Location consumer agent [sn_customerservice.svc_location_consumer_agent]	Create and fulfill cases for the consumers and households in the agent's business location.	• sn_fsm_servicedesk_agent • sn_esm_location_agent
Location manager [sn_customerservice.svc_location_manager]	Create and update cases for accounts, contacts, consumers, and households that work with the business locations within their location hierarchy.	• sn_fsm_servicedesk_agent • sn_customerservice.svc_location_agent • sn_customerservice.svc_location_consumer_ • email_client_quick_message_author • sn_templated_snip.template_snippet_writer • sn_shn.admin • approver_user • sn_publication.approver
Location Project Member [sn_bus_loc.location_project_stakeholder]	Views project details and project tasks of their respective business location. Marks customer visible project tasks as complete.	None
Location Project Manager Contributor [sn_bus_loc.location_manager_project_stakeholder]	Views project details and project tasks of their respective business location and child business locations. Marks customer visible project tasks as complete.	None
EBL Viewer [sn_bus_loc.ebl_viewer]	Views all external business location details and location staff	None
IBL viewer [sn_bus_loc.ibl_viewer]	Views all internal business location details and location staff.	None

Service Model Foundation modules

The Service Model Foundation plugins add several modules to the application navigator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business Location modules

Service Organizations > Internal/External Business Locations: This module lists the internal and external business locations that have been created.

Note:
This module is available in Agent Workspace and in the platform interface.

Users with the following roles have access to these modules.

- sn_customerservice_manager
- sn_customerservice_agent
- sn_customerservice.consumer_agent
- sn_customerservice.svc_location_agent
- sn_customerservice.svc_location_consumer_agent

Service Organization External Staffs module

Service Organizations > Service Organization External Staffs: This module lists the external staff members created and added to the external business location.

Note:
This module is available in Agent Workspace and in the platform interface.

Users with the following roles have access to these modules.

- sn_customerservice_manager
- sn_customerservice_agent
- sn_customerservice.consumer_agent
- sn_customerservice.svc_location_agent
- sn_customerservice.svc_location_consumer_agent

Household modules

- Customer > Households: lists the households that a user has access to.
- Customer > Household Members: lists the consumers that have been added to households.

Note:
These modules are available in Agent Workspace and in the platform interface.

Users with the following roles have access to these modules.

- sn_customerservice_manager
- sn_customerservice.consumer_agent
- sn_customerservice.svc_location_consumer_agent
- sn_customerservice.relationship_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Relationship modules

- Customer Relationships > Consumer Team Members: lists the relationships that have been created between an internal user and a consumer.
- Customer Relationships > Household Team Members: lists the relationships that have been created between an internal user and a household.
- Customer Relationships > Consumer Relationships: lists the relationships that have been created between two consumers, regardless of household.
- Customer Relationships > Household Relationships: lists the relationships that have been created between two consumers who are members of the same household.

Note:
These modules are only available in the platform interface. You can view relationships in Agent Workspace in related lists. Customer service managers and location managers can also modify account, consumer, and household team member relationships in Agent Workspace.

Users with the following roles have access to these modules.

- sn_customerservice_manager
- sn_customerservice.consumer_agent
- sn_customerservice.svc_location_manager
- sn_customerservice.svc_location_consumer_agent

Service Model Foundation cases

Location agents and location consumer agents at a business location can create cases for accounts, contacts, consumers, and households.

Staff members with the location agent or location consumer agent role can do the following:

- View information for the customers at their location.
- Create cases for accounts, contacts, households, and consumers.
- Update cases created at their location.
- Create consumers.

Case location

A case belongs to a business location. When a case is created by a location agent or manager, the **Service Organization** field on the Case form is automatically updated with the business location to which the agent or manager belongs. If the case is reassigned, this field is updated to that of the new agent or manager.

If the location agent or manager belongs to multiple locations, the **Service Organization** field can be kept empty. When you fill in this field, select carefully as the service organization controls a location agent's access to cases.

Note:
A case can belong to only one business location.

The **Service Organization** can be set manually for a new case or changed for an existing case. Changing the **Service Organization** doesn't change the assigned agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case access

Case access is controlled by the business location in the **Service Organization** field on the Case form. The following users can access cases:

- Staff members at the business location with the location agent or location consumer agent role.
- Managers at the business location with the location manager role.

Cases for a business location are added to the Cases related list on the internal or external business location form.

- When a case is created, the service organization on the case is the service organization of the user who creates the case.
- When a case is assigned to an agent, the service organization on the case is updated to the service organization of the assigned agent.

Note:
Only external staff with the location agent can act as fulfillers. For more information, see External business location (EBL) as a fulfiller.

Case access for consumers

Consumer type	Case access
Consumer	Can manage their own cases.
Head of household	Can manage cases for all household members.
Authorized representative, regardless of household	Can manage cases for the consumer they represent.
Authorized representative, inside of household	Can manage cases for the consumer they represent as long as both are current members of the household.

Case access for users

User	Required role	Case access
Location manager	Location manager	Can manage the cases in their location hierarchy.
Location staff member	Location agent Location consumer agent	Can manage the cases in their locations.
Account manager	Relationship agent	Can manage cases for their accounts.
Consumer relationship manager	Relationship agent	Can manage cases for their consumers.
Household relationship manager	Relationship agent	Can manage cases for their households.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

External business location (EBL) as a fulfiller

External business location (EBL) as a fulfiller enables partners, external agencies, and franchises to fulfill customer cases. You can use this capability to maintain consistent customer experiences across both internal and external business locations.

EBL as fulfiller

In the past, only location staff at internal business locations (IBL) could resolve customer-related cases through both platform and workspace. External staff could only create cases from the business location service portal (BLSP) but couldn't resolve them for the business locations. By using EBL as a fulfiller, external location agents having svc_location_agent and snc_external roles can access the platform to create and resolve cases, similar to internal location agents. To learn more, see Service Model Foundation roles and refer to the location agent role.

You can activate this functionality by enabling the business location (com.snc.business_location) plugin.

Note:
Only external location agents can serve as a fulfiller for an external business location.

Use case

For example, the financial institution agencies perform various activities, from policy issuance to claims processing. These activities include underwriting, reviewing claims, and helping customers in claims submission. As most of these tasks are fulfillment activities currently performed by external members or third parties. Now, by using EBL as a fulfiller capability, external location agents in these agencies can efficiently manage and resolve cases.

Other notable limitations:

- The Launch Interactive Analysis option in the Case list form context menu isn't functional.
- Related cases can't be accessed from the related search results on the Case.

However, with an external business location as a fulfiller, the external location agents can:

- Access Service Model Foundation data, such as internal business location, external business location, service organization members, and responsibilities, on the platform.
- Access customer foundation data, including accounts, contacts, sold products, and install base items on the platform.
- Access the case form on the platform.
- Self-assign and start working on a case.
- View related search results.
- Add comments or work notes.
- View the activity stream, work notes, and case timelines.
- Add resolution notes, propose a solution, and close the case.
- Create and update case tasks.
- View service definitions.

Service Model Foundation business locations

Use the business location entity to create an organizational structure that includes internal and external business locations such as stores, branches, franchises, and dealerships.

A business location is an extension of a service organization. The business location entity enables you to model the internal and external organizational structure involved in supporting customers. It also enables you to give agents the right level of visibility into customer data.

With the business location entity you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create internal and external business locations using a hierarchy, with parent and child locations.
- Associate users within a business location, which makes them staff members of that location.
- Provide staff members at a business location with access to the customer cases and information for that location.
- Create teams of staff members to support accounts, consumers, and households.
- Provide the staff members on those teams with access that enables them to manage cases for their accounts, consumers, and households.

Creating a business location

Maintain an organizational structure by creating internal and external business locations. To create a business location, see Create a business location.

Accessing business locations

Managers have access to their business location and to the business locations that are designated as child locations in the hierarchy.

- When a user is added to the **Manager** field, the sn_customerservice.svc_location_manager role is automatically added to that user.
- You can add a user as the manager for multiple business locations.

Staff members with the location agent role or location consumer agent role can perform the following actions:

- Create cases for customers in their business locations.
- Access cases where the location in the **Service Organization** field on the Case form matches their business locations.

Create and manage cases for a business location

As a staff member with the location agent role, create and manage cases for your business locations.

Before you begin

Role required: admin, sn_customerservice.svc_location_agent, and sn_customerservice.svc_location_manager

About this task

Staff members with the location agent role can do the following:

- View information for the customers at their location.
- Create cases for the accounts, contacts, households, and consumers at their location.
- Create consumers.
- Update cases created at their location.

A case belongs to one business location. When a case is created by a location agent or manager, the **Service Organization** field on the Case form is automatically updated with the business location that the agent or manager belongs to. If the case is reassigned, this field is updated to show the new agent or manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the location agent or manager belongs to multiple locations, the **Service Organization** field may be left empty. When you fill in this field, make your selection carefully because the service organization controls a location agent's access to cases.

The **Service Organization** can be set manually for a new case or changed for an existing case. Changing the **Service Organization** does not change the assigned agent.

Location agents and managers can create cases for business locations without adding an account, contact, or consumer. The location agent or manager who creates the case is added to the **Opened by** field.

Procedure

1. Navigate to **All** > **Customer Service** > **Cases** and click **Create New**.
2. **Optional:** Select the type of case that you want to create.
3. On the form, fill in the fields.
   For a description of the field values, see Case form.
4. Click **Submit**.

Related topics

Service Model Foundation cases

Assign responsibilities

Assign roles

Create a customer service case

Create an account staff relationship

Create a relationship between a staff member at a business location and an account.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

About this task

You can assign users who have been added as staff members to a business location to an account relationship.

- Administrators and customer service managers can assign a staff member from any location.
- Location managers can assign staff members from the locations that they have access to.

Relationships are based on responsibilities. A responsibility definition describes a role or a function that supports a customer or consumer. To create an account team member relationship, use the Account Manager responsibility.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Select either an internal or an external business location.
3. In the Account Staff Relationships related list, click **New**.
   This related list shows the accounts that have a relationship with any staff member at that location.
4. In the **Account** field, select the account to which the staff member is assigned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Responsibility** field, select **Account Manager**.
6. In the **User** field, select the staff member to fulfill the responsibility.
7. Click **Submit**.
   The relationship is added to the Account Staff Relationships related list.

Create a consumer staff relationship

Create a relationship between a staff member at a business location and a consumer.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

About this task

Users who have been added as staff members to a business location can be assigned a consumer relationship.

- Administrators and customer service managers can assign a staff member from any location.
- Location managers can assign staff members from the locations that they have access to.

Relationships are based on responsibilities. A responsibility definition describes a role or a function that supports a customer or consumer. To create a consumer relationship, use the Relationship Manager responsibility.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Select either an internal or an external business location.
3. In the Consumer Staff Relationships related list, click **New**.
   This related list shows the consumers that have a relationship to any staff member for the location.
4. In the **Consumer** field, select the consumer to which the user is assigned.
5. In the **Responsibility** field, select the **Relationship Manager** responsibility.
6. In the **User** field, select the staff member to fulfill the responsibility.
7. Click **Submit**.
   The relationship is added to the Consumer Staff Relationships related list.

Create a household staff relationship

Create a relationship between a staff member at a business location and a household.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

About this task

Users who have been added as staff members to a business location can be assigned a household relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationships are based on responsibilities. A responsibility definition describes a role or a function that supports a customer or consumer. To create a household relationship, use the Relationship Manager responsibility.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Select either an internal or an external business location.
3. In the Household Staff Relationships related list, click **New**.
   This related list shows the households that have a relationship to any staff member for the location.
4. In the **Household** field, select the consumer to which the user is assigned.
5. In the **Responsibility** field, select the **Relationship Manager** responsibility.
6. In the **User** field, select the staff member to fulfill the responsibility.
7. Click **Submit**.
   The relationship is added to the Household Staff Relationships related list.

Create and manage sold products for a business location

Staff members with the location agent role can manage sold products for their business locations.

Before you begin
Role required: sn_customerservice_manager, sn_customerservice.svc_location_agent, or admin

About this task
Staff members with the sn_customerservice_manager role can create sold products by choosing the appropriate product model. In contrast, staff members with the sn_customerservice.svc_location_agent role can only view the list of sold products installed at any service organization.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Select either an internal or an external business location.
3. In the Sold Products related lists, click **New**.
4. On the form, fill in the fields.

Sold Product form

Field	Description
Name	Name of the sold product.
Product	Product model sold to the customer.
Parent Sold Product	If the sold product contains child components, reference to another sold product.
Service Organization	Internal or external entity that is involved in providing service to the customer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The sold products are closely tied to the service organization. As an example, if you select a service organization, all the parent sold products come from the same service organization.

5. Click **Submit**.
   A sold product record is created for the selected business location.

Create and manage install base items for a business location

As a staff member with the location agent role, create and manage install base items for your business locations.

Before you begin

Role required: sn_customerservice_manager, sn_customerservice.svc_location_agent, or admin

About this task

Staff members with the sn_customerservice_manager role create install base items by choosing the correct configuration item, whereas the staff members with the sn_customerservice.svc_location_agent role can view the list of install base items installed at any service organization.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Select either an internal or an external business location.
3. In the Install Base Item related lists, click **New**.
4. On the form, fill in the fields.

Install Base Item form

Field	Description
Number	Unique ID of the install base item. The system automatically sets this field value, but you can change it.
Name	Name of the install base item.
Configuration Item	Reference to another sold product if the sold product contains child components.
Service Organization	Internal or external entity that is involved in providing service to the customer.
Owned by	Business manager of the install base item.
Supported by	Configuration item supported by.

Service organization install base

Extend proactive customer support to the Service Model Foundation by tracking products and services at service organizations.

Business locations are extensions of a service organization and are critical to delivering customer service. They enable support for businesses that interact with customers through physical channels such as stores and branches, franchises, and dealerships. Business locations are often considered the face of a business, where consumers engage for information and purchase, as well as post-sales and ongoing support.

Businesses have multiple products installed at these locations to serve their customers. In the past, there was no easy way for companies to track and manage these products and services. It was only possible to track products and services for accounts and consumers, often resulting in broken equipment, delayed service, and lower customer satisfaction.

By extending proactive customer support to the Service Model Foundation, you can track sold products and install base items installed at service organizations.

Starting with the Yokohama release, service organizations can:

- Track and manage products and services installed at a business location.
- Enable contributors at a business location to submit cases and request help.
- Create and resolve cases for sold products and install base items deployed at a business location.

Activate business locations

Activate the Business Location plugin to manage customer service for business locations.

Before you begin

Role required: admin

About this task

The Business Location plugin (com.snc.business_location) enables support for businesses that interact with customers through physical channels such as stores, branches, franchises, and dealerships. Activating the Business Location plugin (com.snc.business_location) automatically activates the Service Organization plugin (com.snc.service_organization). It enables support for internal and external entities in your customer service structure, such as branches, stores, franchises, and dealerships.

Note:
Starting with the Yokohama release, activating the Business Location (com.snc.business_location) plugin automatically activates the Case types (com.snc.csm_case_types) plugin.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the Business Location plugin (com.snc.business_location).
3. Click **Activate**.

Create business locations

Task	Description
Create an internal business location	Create an internal business location.
Create an external business location	Create an external business location.

Create an internal business location

Create an internal business location to enable users and consumers to create accounts, contacts, consumers, and households.

Before you begin
Role required: admin

About this task
A business location has a manager. When you create an internal business location, you add a user to the **Manager** field on the Internal Business Location form. Users then added as internal business location managers are automatically assigned the sn_customerservice.svc_location_manager_contributor role.

However, to assign the sn_customerservice.svc_location_manager role to the internal business location managers, the *sn_bus_loc.int_bus_loc.onboard_location_manager_as_contributor* system property must be set to **false**.

Note:
Only internal users can be added as managers for internal business locations.

The manager of an internal business location can access all the cases for account, household, or consumer in the location hierarchy, including cases for child business locations. The manager can also:

- Add staff members to business locations in the location hierarchy.
- Create account team or consumer team relationships with staff members from the location hierarchy.
- View customer information.
- Update cases created in the location hierarchy.
- Create cases for customers in the location hierarchy.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal Business Locations**.
2. Click **New** on the Internal Business Locations list.
3. Fill in the fields on the Internal Business Location form.
4. Click **Submit**.
   The location is added to the Internal Business Locations list.

   After creating an internal business location, you can add staff members to the location, create relationships between staff members and accounts, households, and consumers, and track the list of customers serviced by a business location.

Related topics

Create an external business location

Create an external business location

Create an external business location to enable users and consumers to create accounts, contacts, consumers, and households.

Before you begin
Role required: admin

About this task
Both internal and external users can be added as managers for external business locations.

The manager of an external business location can access all the cases for an account, household, or consumer in the location hierarchy, including cases for child business locations. The manager can also:

- Create staff members for internal and external business location.
- Assign roles and responsibilities to the staff members.
- Assign staff members to the location.
- View and manage cases created in the location hierarchy.
- Submit a case on behalf of the location.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **External Business Locations**.
2. In the External Business Locations list, click **New**.
3. On the form, fill in the fields.
   For a description of the field values, see External Business Location form.
4. Click **Submit**.
   The location is added to the External Business Locations list.

   After creating an external business location, you can add staff members to the location and create relationships between staff members and accounts, households, and consumers, and track the list of customers serviced by a business location.

Tracking the location details for a service organization

By tracking and capturing the location details for a service organization, you can provide Field Service Management, Walk-up Experience and appointment booking capabilities.

Location tracking details

You can provide Field Service Management, Walk-up Experience, and appointment booking capabilities through the service organization data model by capturing the Location (cmn_location) table details.

Note:
You must activate the service organization (com.snc.service_organization) plugin before you can track the location details for a service organization.

Location field

By going to the service organization form, you can see that there's a **Location** field, where you can add the information about your geographical location, that is, the cmn_location of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

service organization. The address fields on the cmn_location table is synchronized with the service organization but not the vice versa.

Note:
Changes to the cmn_location record don't update the address fields on the service organization.

The address fields on the service organization record that are synchronized with the location (cmn_location) include:

- Street
- City
- State
- Country
- Zip / Postal Code
- Latitude
- Longitude

Note:
With the base system, the Location fields don't appear on the form or list views. If the location field on the service organization isn't defined, an on-demand script is shipped with the base system. The script generates the cmn_location record from the address fields.

Common attributes of service organizations

By using common attributes to establish a unified reference architecture and data model, you can extend the Customer Service Management data model to support your service organizations.

You can get use cases from industries like Financial Services Operations, Healthcare and Life Sciences, and Public Sector Digital Services, to capture common attributes for your architecture and data model. For example, a service organization may want to capture attributes for bank branches, hospitals, and agencies. By capturing these common attributes across industries, you can create a unified reference architecture and data model that avoids implementing the same attribute across different industries.

The following table lists the common attributes that have been identified across industries for the service organization [sn_customer_service_organization] table.

List of common attributes

Field Name	Description
Email	Primary email address for the service organization.
Identification number	ID that is used to identify the service organization.
Type	Type of primary service organization by industry. For example, branches, agencies, providers, stores, and so on.
Subtype	Organization types within the industry. For example, by using the **Type** and **Subtype** fields, you can select the multiple types to be used for your service organizations.

Adding and associating company records with a business location

Create a company record and associate it to an internal or an external business location.

Configuration tasks for associating company records with a business location

Task	Description
Add a new company	Create a company record that represents vendors, manufacturers, or customers with whom you do business.
Associate company records with a business location	Associate company records with a business location to indicate that a business location is a company.

Associate company records with a business location

Associate your company records with a business location to enhance service organization data model adoption across different industry verticals.

Before you begin

Add the **Company** field to an internal or an external business location form using the form layout. For more information, see Add fields to a form layout in Table Builder.

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Select the internal or external business location from the list that you want to associate a company record to.
3. Select the company record previously created from the Company field.
4. Select and hold (or right-click) in the header and select **Save**.

Result

The company record is successfully associated with a business location.

Virtual Agent support for business locations

Customer service agents receive chat requests from your business location staff members on the CSM Agent Workspace. These agents can assist your staff members to resolve issues and manage the cases more efficiently if your staff members fill out a pre-chat survey first.

Overview

Before your staff members can use a pre-chat survey to initiate a chat, your administrator must activate the pre-chat configuration for the Business Location Service Portal. The preconfigured surveys are activated by default in the base system. If your business location has upgraded the system to manually activate the pre-chat configuration, then staff members can fill in the pre-survey before the chat. To learn more about the pre-chat survey, see Pre-chat surveys.

You must also assign the service organization contributor (sn_customerservice.service_organization_contributor) and location manager (sn_customerservice.svc_location_manager_core) roles to the staff members who will be using the pre-survey chat feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Let's say that a staff member with the correct role fills out a pre-chat survey on the Business Location Service Portal (BLSP). The chat is then assigned to a customer service agent or Virtual Agent via the advanced work assignment (AWA) routing. To learn more about AWA, see Exploring Advanced Work Assignment.

Before entering into a chat conversation with the staff member, the assigned agent reviews the context of the case so that the agent has a better understanding on how to handle the case.

Pre-chat survey

The pre-chat survey helps your staff members to fill in the details of the location and support requirements before a chat so that an agent has context about the case and can better assist your staff members. The pre-chat survey makes the chat more efficient and helpful to your staff. To learn more about how a chat is initiated from the BLSP, see Chat with Virtual Agent from the Business Location Service Portal.

The pre-chat survey isn't displayed for service organization contributors who are associated to a single business location. The location is picked by default.

The business locations that are listed in the pre-chat configuration are limited to the locations that are assigned to the business location manager. You can't select a child business location.

To learn more about the configuration of the pre-chat surveys, see Define pre-chat survey configurations.

Chat with Virtual Agent from the Business Location Service Portal

Chat with Virtual Agent from the Business Location Service Portal

Get the information that you need about a case and a case resolution by filling out a pre-survey on the Business Location Service Portal. The pre-survey lets the customer service agent or Virtual Agent know your location and some details about your case so that you don't have to spend more time repeating this information.

Before you begin

Role required: Service Organization Contributor (sn_customerservice.service_organization_contributor) or Location Manager (sn_customerservice.svc_location_manager_core)

Procedure

1. In the Business Location Service Portal, select the Chat icon ( ) to start a conversation.

   Note:
   The agent chat configuration (sp_agent_chat_config) must be active for the Business Location Service Portal.

2. From the list of locations in the pre-chat survey, select the business location that you're directly associated to and select **Submit**.
   A virtual agent or a customer service agent responds to your chat request.
3. When you're finished with the chat, select **End Conversation**.

What to do next

If the agent creates a case or links the discussion to an existing case, you can view these cases from the Business Location Service Portal by selecting **Cases**.

Create customer projects

Create customer projects at internal or external business locations to manage location openings, renovations, closings, or other location-specific initiatives.

Before you begin

To access customer projects and to enable required roles, make sure you enable the Customer Project Management (com.snc.csm_ppm) plugin.

Role required: admin, it_project_manager, sn_service_org.project_manager

About this task

A customer project can be initiated by applying templates, or by importing and exporting projects. Furthermore, cases can be created to address issues either at the project or project task level.

Procedure

1. Navigate to **Workspaces** > **Project Workspace**.
2. Initiate a project by selecting **New**.
   Under **My projects**, a list of projects associated with your role is displayed. Under **All projects**, a list of all projects is displayed.
3. On the form, fill in the fields.
   The following table outlines the unique fields of the form. To learn more about other fields, refer Starting a project.

Create Project form

Field	Description
Project class	Class of the project. Select **Customer Project**.
Project template	Template of a project. To create a project from template, select a template from the list displayed. Based on the template, project tasks are created.
Project name	Name for the project.

4. Select **Confirm**.
5. Select a project to see all the related tabs.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

About this task

You can add internal users with the snc_internal role as staff members to an internal business location.

- Administrators and customer service managers can add staff members to any business location.
- Location managers can add staff members to the business locations that they have access to.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Business Locations** > **Internal Business Locations**.
2. Select the desired internal business locations record.
3. Click the **Register Member** related link to open the Register Member at Internal Business Location record.
   You can use the record to register new location staff or move existing internal or external staff between locations managed by the Location manager, and assign responsibilities to staff accordingly.
4. On the form, fill in the fields.

Register Member at Internal Business Location form

Field	Description
Internal Business Location	The automatically generated internal business location.
Member	Field used to select an internal staff member from the list of service organization internal staff record.
Member Type	Field used to assign responsibility for the member selected at the business location. To learn more about responsibilities, see Assign responsibilities.

5. Select **Submit**.

   A member record with the selected member, member type, and business location is created. After a member type is selected, the member is assigned a responsibility automatically.

Add staff members to an external business location

Add users as staff members to an external business location to support accounts, contacts, consumers, and households.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

© 2026 ServiceNow, Inc. All rights reserved.

About this task

You can add both internal users with the snc_internal role and external users with the snc_external role as staff members to an external business location.

- Administrators and customer service managers can add staff members to any business location.
- Location managers can add staff members to the business locations that they have access to.

Note:
Adding new external staff members to the external business locations must be done using the service organization external staff module.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Business Locations** > **External Business Locations**.
2. Select the desired external business locations record.
3. Click the **Register Member** related link to open the Register Member at External Business Location record.
   You can use the record to register new location staff or move existing staff between locations managed by the Location manager, and assign responsibilities to staff accordingly.
4. On the form, fill in the fields.

Register Member at External Business Location form

Field	Description
External Business Location	The automatically generated external business locations.
Register Staff	Field used to register new location staff or move existing staff from external business location hierarchy between locations. ○ **New Staff**: Create a user in Service Organization External Staff (sn_csm_service_organization_external_staff) table with (snc_external) role. ○ **Existing Staff**: List of staff members already working under the service organization hierarchy.
First Name	First name of the staff member.
Last Name	Last name of the staff member.
User ID	User ID of the staff member.
Email	Email address of the staff member.
Member	Field used to select an external staff member from the list of service organization external staff record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field appears only when **Existing Staff** is selected from the **Register** staff field.
Member Type	Field used to assign responsibility for the selected business location. ○ **None**: Creates a member record. ○ **Listed Member**: Creates a member record. With the member record, a responsibility record is created with the type as Listed Member and the responsibility is empty. ○ **Location Contributor**: Creates a member record and along with the member record, a responsibility record is created with the type as Location Contributor and the responsibility as Location Contributor. **Note:** Assigning responsibility is applicable to both existing and new staff members.

5. Click **Submit**.
   A new external staff member record is created for the selected external business location. The admin must assign responsibilities to the staff members. However, if you've selected **None** as a member type, then you must not create a responsibility record.

Assign responsibilities

Use the responsibility data model to assign responsibilities to a service organization (SO) member.

Before you begin

Role required: admin

About this task

Businesses often need staff to work at more than one business location, and they can have different responsibilities at different locations. Using the responsibility data model, an SO member can be assigned multiple responsibilities.

The responsibility data model maintains the relationship between the SO member and the type of responsibility within the Service Organization Member Responsibilities [sn_csm_svc_org_member_responsibility] table.

Note:
If the business location plugin is active, this feature is enabled by default. However, for upgrade customers, the data in the [sn_csm_svc_org_member_responsibility] table will be auto-populated for existing SO members to ensure that they retain as much access after the upgrade. Any new records created after the Yokohama release must be created using the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Internal/External Business Locations**.
2. Open the business location (internal or external) record.
3. Open the SO Member record from the Members related list.
4. Select **New** to create a record in the SO Member Responsibilities [sn_csm_svc_org_member_responsibility] table.
   The Service Organization Member Responsibility record shows the following fields: **Member**, **Type**, and **Order**.

Note:
The **Member** field refers to the [sn_csm_service_organization_member] table. This field is auto-populated if the record is initiated from the SO Member related list, the **Type** field refers to the [sn_customerservice_related_party_configuration] table, and the **Order** field specifies the sequence in which records are displayed, organized according to business preferences.

With the base system, users with a specific role can be assigned a particular type.

User roles and associated types

Role	Description
sn_customerservice.svc_location_agent	Location Agent **Note:** This role only applies to the internal business location.
sn_customerservice.svc_location_consumer_agent	Location Consumer Agent **Note:** This role only applies to the internal business location.
sn_customerservice.service_organization_contributor	Location Contributor
sn_customerservice.svc_location_manager_contributor	Location Manager Contributor
sn_customerservice.svc_location_manager	Location Manager Fulfiller **Note:** This role only applies to the internal business location.
sn_bus_loc.location_relationship_manager	Location Relationship Manager **Note:** This role only applies to the external business location.
sn_bus_loc.svc_location_support_agent	Location Support Agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. After you assign the required related party type, select **Submit**.
   A new responsibility is added to the SO member.

Assign roles

Assign roles to internal and external users to facilitate proper access to service organizations, business locations, and households. By assigning required roles, you can enable each user to have the necessary permissions to perform their tasks effectively.

Before you begin

Role required: admin

About this task

The Service Model Foundation plugins add the following roles to Customer Service Management.

Service Model Foundation roles

Role	Description	Contains roles
Location manager contributor [sn_customerservice.svc_location_manager_contributor]	A location manager contributor is employed at the business location and manages a business location in the location hierarchy along with all its child business locations. A location manager contributor performs the following tasks: • Manage service organization. • Manages staff at the business locations. • Track products and services at the business locations. • Report cases for any account, household, or consumer created at the parent or any child business locations.	• sn_customerservice.consumer_contributor • sn_customerservice.svc_location_manager_c • sn_customerservice.service_organization_co • sn_customerservice.account_contributor
Location relationship manager [sn_bus_loc.location_relationship_manager] **Note:** This role only applies to the external business locations.	A location relationship manager is employed by the parent business and acts as a point of contact for one or more external business locations. A location relationship manager performs the following tasks:	sn_customerservice.svc_location_manager_co

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Model Foundation roles (continued)

Role	Description	Contains roles
	• Manage and monitor all activities related to products and services at an external business location. • Monitor the performance of external business locations. • Respond to queries on case status from external business location stakeholders.	
Location agent [sn_customerservice.svc_location_agent] **Note:** This role only applies to the internal business location.	A location agent performs the following tasks: • View all customer service management (CSM) entities. • Create cases for any account, household, consumer, or service organization. • Fulfill cases for any account, household, consumer, or service organization created at the agent's location.	• sn_fsm_servicedesk_agent • sn_esm_location_agent
Location consumer agent [sn_customerservice.svc_location_consumer_agent] **Note:** This role only applies to the internal business location.	A location consumer agent performs the following tasks: • View all CSM entities. • Create cases for any account, household, consumer, or service organization. • Fulfill cases for any account, household, consumer, or service organization created at the service organization or any child service organization. • Assign related staff to any account, household, or consumer.	• sn_fsm_servicedesk_agent • sn_esm_location_agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Model Foundation roles (continued)

Role	Description	Contains roles
Location manager [sn_customerservice.svc_location_manager] **Note:** This role only applies to the internal business locations.	A location manager performs the following tasks: • View all CSM entities for a related account, household, consumer, or service organization. • Create, update, and close cases for any related account, household, consumer, or service organization created at the consumer's location.	• sn_fsm_servicedesk_agent • sn_customerservice.svc_location_agent • email_client_quick_message_author • sn_templated_snip.template_snippet_writer • sn_customerservice.svc_location_manager_c • sn_shn.admin • approver_user • sn_customerservice.svc_location_consumer_
Relationship agent [sn_customerservice.relationship_agent]	Manage cases for the accounts, contacts, consumers, and households that the agent has relationships with. It includes the following relationships that are provided with the Service Model Foundation plugins: • Account Manager: Creates a relationship between an internal user and an account. • Relationship Manager: Creates a relationship between an internal user and a consumer or a household.	• agent_workspace_user • sn_fsm_servicedesk_agent • snc_internal • sn_templated_snip.template_snippet_reader • sn_customerservice.csm_workspace_user • sn_shn.editor • email_composer
Service Management location agent [sn_esm_location_agent]	A service management location agent is an agent for a business location.	• sn_lookup_verify_user • assignment_workbench • knowledge • agent_workspace_user • actsub_user • template_editor • chat_admin • cmdb_read • agent_schedule_user • interaction_agent • sn_templated_snip.template_snippet_reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Model Foundation roles (continued)

Role	Description	Contains roles
		• sn_customerservice.csm_workspace_user • sn_shn.editor • email_composer • template_editor_global
Location support agent [sn_bus_loc.svc_location_support_agent]	A location support agent is a service organization member who acts as a fulfiller and can perform the following tasks: • View all CSM entities. • Create and resolve cases. • Access the CSM Configurable Workspace. • Use business location 360 to view details of internal and external business locations that they support, sold products, location members, install base items, and available services. **Note:** The role of location support agent is not supported for external business locations since case fulfillment isn't enabled for these locations.	• sn_esm_location_agent • sn_csm_case_types.service_definition_viewe

Note: If contributor users, like relationship contributors, account contributors, or consumer contributors associated with business locations, have a location contributor (sn_customerservice.service_organization_contributor) role, they can access the business locations.

Procedure

- You can assign roles to users using the Service Model Foundation guided setup.
- You can also assign roles to users using the *ServiceNow AI Platform* user administration feature: Assign a role to a user.

Setting up assignment groups

Associate your assignment groups with an internal or an external business location. This association forms a one-to-many (1:M) relationship, which means, one or more groups can be associated with a service organization. This process makes it easier to route cases to the appropriate team member using the inter-organization support capability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Lets look at the following example to understand the one-to-many relationship.

When you're assigned to a group within your organization, you get access to specific roles and features associated with that group. The Admin sets up these groups and assigns roles via Access Control Lists (ACLs) that control what you can do. You can belong to multiple groups based on your function, and each group can have subgroups with additional roles. For example, if you join Group A, which has subgroups A-1 and A-2, you get the roles from Group A and its subgroups. If you join the Service Desk group as well, you get additional permissions from that group.

For details on creating groups, see Creating groups.

The following table outlines some typical configuration tasks required for setting up assignment groups at your business organization.

Configuration tasks for setting up assignment groups at a business location

Task	Description
Create a group	Create a group to associate it with a service organization.
Configuring a group	Configure a group that includes adding group members and assigning them required roles.
Associate a group to a business location	Establish a one-to-many (1:M) relationship between a group and a business location.
Add group members to a business location	Enroll group members to a business location and have a dedicated group working on cases.

Create a group

Create groups to assign work to team members based on specific requirements such as skills, location, and product models. This approach enables you to route cases to the appropriate team members.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Groups**.
2. Select **New**.
3. On the Group form, fill in the fields.

Group form

Field	Description
Name	The name of the group.
Group email	The group email address or the distribution list for the point of contact, such as the group manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: By default, the group email address overrides the individual email addresses of the members.
Manager	The group manager or lead associated with the group.
Parent	The larger group to which this group belongs. If a group has a parent, the child group inherits the roles of the parent group. The members of the child group aren't members of the parent group.
Hourly rate	The amount charged per hour to calculate costs for the tasks assigned to the group.
Description	The detailed information about the group.

4. Select **Submit**.

What to do next
Configure a group by adding members and assigning them appropriate roles. For more information, see Configuring a group.

Configuring a group

Set up the group by adding members and assigning them the necessary roles. The group members inherit the roles of the group, so you don't have to assign roles to each member separately. This setup enables members within a group to perform specific field service tasks, filtered by location, skills, product models, and so on.

Add members to a group

Add a member to a group so that the member inherits all the roles assigned to the group.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **User Administration** > **Groups**.
2. Select the group from the list that you want to add members to.
3. In the Group Members related list, select **Edit**.
4. Select and add one or more names to the Group Members List.
5. Select **Save**.

What to do next
Assign the required roles to the members of the group. For more information, see Assign required roles.

Assign required roles

You can assign one or more roles to a group to grant required access to the group members.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **User Administration** > **Groups**.
2. Select the group from the list that you want to add roles to.
3. In the Roles related list, select **Edit**.
4. Select and add the required roles to the Roles List.
5. Select **Save**.

Result
The roles are successfully added to the assignment group. You can now start associating these groups to a business location. For more information, see Associate a group to a business location.

Associate a group to a business location

Associate a group with the desired business location by establishing a one-to-many (1:M) relationship. This association helps you assign cases directly to the appropriate assignment groups.

Before you begin
Note:
A group can only be associated with a single business location, but a business location can have multiple groups.

Role required: admin

Procedure
1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Business Locations** > **Internal/ External Business Locations**.
2. Select the internal or external business location from the list that you want to associate an assignment group to.
3. In the Assignment Groups related list, select **New**.
4. On the Service Organization Assignment Group form, fill in the fields.

Service Organization Assignment Group form

Field	Description
Service organization	Auto-populated with the name of the business location to which you're adding an assignment group.
Assignment group	Name of the assignment group that is to be added.

5. Select **Submit**.

What to do next
Add group members to a business location. For more information, see Add group members to a business location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add group members to a business location

Enroll or add group members to a business location to create a dedicated group or team focused on specific cases.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Business Locations** > **Internal Business Locations**.
2. Select the internal business location from the list that you want to add group members to.
3. In the Members related list, select **Edit**.
4. Add the users from the associated group to the Members List.
5. Select **Save**.

Result

The member is successfully added to the assignment group. Based on your requirement, you can keep adding more members to the group and assign them a dedicated task.

Setting up products and available services at a business location

By setting up the relationships between organizations and users in the Customer Service Management (CSM) application, your organization can associate the products and services with the service organization (SO). The SO staff can then address the customer queries about the products and services at a business location and even raise a case on the behalf of their customers.

Configuration tasks for setting up the products and available services at a business location

Task	Description
Create a service definition	Create a service definition record.
Service Definition form	Specify how a service organization provides its services by configuring the **Service Organizations offering Service** field in the sn_case_type_selection table.
Associate a product with a service definition	Associate one or more products with a service definition.
Associate service organizations with a service	Establish an association between products and available services to service organizations by defining the service organization criteria.

© 2026 ServiceNow, Inc. All rights reserved.

Setting up inter-organization support

Provide your agents at a business location with the visibility into other business locations that they support using the inter-organization support capability. This way, you can enable location support agents to resolve cases raised by other business location.

Overview

The Service Model Foundation enables business locations to request help from others and fulfill such requests. Besides supporting customers, business locations can also support other service organizations.

Currently, there is no easy way for agents who are assigned to a specific business location to access the details they need about other business locations they support, such as contact information, install base items, or existing cases.

With the inter-organization support capabilities, you can enable your business location agents to access additional details about the other business locations they serve, facilitating quicker and more efficient support for the requesting service organization.

Note:
You can activate this capability by enabling the business location (com.snc.business_location) plugin.

Use case

Streamlined support for national retail chains: In the retail segment, store and central support teams assist with day-to-day store operations at the market, country, or segment level. The retailers aim to structure these teams to support only the stores or franchises within their countries. For effective customer support, store agents need full access to the stores, but currently, regional support agents lack full access to the service organizations, limiting their effectiveness.

For example, the ABC retail operates with more than 150 stores nationwide. Each store has its own dedicated support team for daily operations, while regional support teams provide additional assistance. However, the regional location support agents currently lack full access to the service organizations, resulting in delays and inefficiencies in addressing store issues.

With the inter-organization capability, ABC retail can:

- Set up inter-organization support for their stores by associating each store with its regional service organization.
- Enable regional location support agents to view context about the stores they support, including contact information, install base, and existing cases.

This way, the regional support agents can quickly access necessary information and other details, coordinate efficiently with store agents, and resolve issues more effectively. This improves overall store performance and customer satisfaction.

Key benefits

Inter-organization support offers the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Improve agent experience: Provide agents at a business location with visibility into the other business locations that they support.
- Reduce resolution time: Minimize back-and-forth communication by providing key context alongside cases for service organizations.
- Increase operational efficiency: Define support structures for service organizations through hierarchy or relationship-based criteria.

Configuring business locations serviced by a business location

You can track the relationship between requesting and fulfilling service organizations. You can set hierarchy or relationship-based support criteria for your business locations.

Configuration tasks for setting up business locations serviced by a business location

Task	Description
Define the configuration type for customers or business locations	Define the configuration type for the business location served to provide access to the location support agents.
Associate customers or business locations to a service organization	Associate business locations to service organizations using the service organization customer criteria [service_organization_customer_criteria] table.

Define the configuration type for customers or business locations

Define the configuration type to provide service to customers or business locations within any service organization (SO) using the Customer Service Management (CSM) application.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Business Locations** > **Internal or External Business Locations**.
2. Select the desired internal or external business locations record and go to the **Configurations** tab.
3. Select the configuration type based on whether you intend to provide service to customers or business locations within any service organization.
4. Select **Update**.

What to do next

Once the configuration is defined, you can associate your customers or business locations to a service organization. For more information, see Associate customers or business locations to a service organization.

Associate customers or business locations to a service organization

Associate your customers or business locations with a service organization (SO) using the Customer Service Management (CSM) application. By establishing a relationship between your

customers or business locations and the SO, your service organization staff can create or resolve cases for the customers and business locations raised by other business location.

Before you begin

Role required: admin, sn_customerservice_manager, sn_customerservice.svc_location_manager, sn_customerservice.svc_location_manager_contributor, and sn_bus_loc.location_relationship_manager

About this task

You can associate customers (accounts, consumers, and households) and business locations (both internal and external) by using the service organization criteria [service_organization_criteria] table. This association helps your organization to gain access to all customers and business locations associated with a service organization.

For more information about defining service organization criteria, see Create the criteria for a service organization.

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Business Locations** > **Internal or External Business Locations**.
2. Select the desired internal or external business locations record.
3. From the Service Organization Customer Criteria related list, select **New**.
4. On the form, fill in the fields.

Service Organization Customer Criteria form

Field	Description
Service Organization Criteria	Criteria that define the customers at a service organization.
Service Organization	Service organization that serves the customers that match the criteria.
Active	Check box to activate or deactivate the service organization customer criteria. By default, the active field is set to **True**. **Note:** Only one active criterion is enabled per table to be associated with a service organization.

5. Select **Submit**.

Result

A service organization criterion is successfully defined for a business location.

Tracking the customers serviced by a business location

You can track the customers that are serviced by the business location in the Customer Service Management (CSM) application. Your organization can associate your customers, accounts,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and households with business locations and even create or resolve cases on the behalf of customers.

Configuration tasks for tracking the customers that are serviced by a business location

Task	Description
Create the criteria for a service organization	Create the records for the service organization criteria that define the list of matching customers to be associated with service organizations.
Define the configuration type for customers or business locations	Define the configuration type for the customers served to provide your service organization staff with the access needed to help resolve cases.
Associate customers or business locations to a service organization	Associate customers to service organizations through the service organization customer criteria [service_organization_customer_criteria] table.

Create the criteria for a service organization

Define the criteria in the service organization criteria [service_organization_criteria] table so that you can later associate your service organizations to a service or your customers to a service organization. You do this task in the Customer Service Management (CSM) application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Service Organizations** > **Administration** > **Service Organization Criteria**.
2. Select **New**.
3. On the form, fill in the fields.

Service Organization Criteria form

Field	Data type	Description
Name	String	Name of the criteria.
Table	Table Name	Table where you must define the criteria. To establish customer associations, you must select **Account**, **Consumer**, or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Data type	Description
		Household from the drop-down list in the **Table** field. Similarly, for associating products and services, you must choose **Internal Business Location** from the drop-down list in the **Table** field. Selecting **Business Location** or **Service Organization** from the drop-down list in the **Table** field leads to an error because the system currently doesn't support fulfillment capabilities for external business locations when resolving a case. **Note:** Support can be extended to other tables by configuring them in the `SOCriteriaTableScript` script include.
Criteria	Conditions	Condition or query filter that matches a list of records in the table.

4. Select **Submit**.

Create relationships

Use relationships to provide internal and external users with additional access to customer data.

Before you begin

Role required: admin

About this task

With the Service Model Foundation feature, you can create relationships between the following users:

- Between an internal user and an account, household, or consumer.
- Between two consumers.

Relationships are based on responsibility definitions. These definitions describe a role or a function that supports a customer. When you create a relationship, you select the users involved in the relationship and the responsibility that one user performs on behalf of another.

The Service Model Foundation plugins provide:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Relationships that you can create between users.
- Responsibility definitions that you can assign to a user in a relationship.

Responsibility and relationship description

Responsibility	Used in relationship	Description
Account Manager	Account Team Member	Use the Account Manager responsibility to create a relationship between an internal user and an account. With this relationship, the internal user can: • Create and manage cases for their accounts. • View account information, including the related entities for an account. • Create and manage contacts and additional addresses for their accounts.

Relationship Manager	• Consumer Team Member
	• Household Team Member
		Use the Relationship Manager responsibility to create a relationship between:
		• An internal user and a consumer.
		• An internal user and a household.
		With this relationship, the internal user can do the following:
		• For a consumer:
		  ○ Create and manage cases for the consumer.
		  ○ View household information, including the related entities for that consumer.
		• For a household:
		  ○ Create and manage cases for the household.
		  ○ View household information, including the related entities for that household.
		  ○ Create and manage household members.

Authorized Representative	• Consumer to Consumer Relationship
	• Household Member Relationship
		Use the Authorized Representative responsibility to create a relationship between two consumers, regardless of household, or between two consumers within the same household.
		With this relationship, a consumer can:
		• Create and manage cases for another consumer.
		• View the information of another consumer.
		• View the install base information of another consumer and create cases for:
		  ○ Sold products
		  ○ Install base items

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Customer Relationships**.
2. Select the desired relationship.

Option	Description
Account Team Members	Create a relationship between an internal user and an account.
Consumer Team Members	Create a relationship between an internal user and a consumer.
Household Team Members	Create a relationship between an internal user and a household.
Consumer Relationships	Create a relationship between two con sumers, regardless of household.
Household Relationships	Create a relationship between two con sumers within a household.

3. From the selected relationship list, select **New**.
4. Fill in the following fields for the selected relationship.

Relationship list form descriptions

Form	Fields
Account Team Member	○ **Account**: Select the account to which the internal user is assigned. ○ **Responsibility**: Select the **Account Manager** responsibility. ○ **User**: Select the internal user to fulfill the responsibility. ○ **Type**: Select the type from the list of related party configurations. ○ **Order**: Select the order that specifies the sequence in which records are displayed, organized according to business preferences.
Consumer Team Member	○ **Consumer**: Select the consumer to which the internal user is assigned. ○ **Responsibility**: Select the **Relationship Manager** responsibility. ○ **User**: Select the internal user to fulfill the responsibility. ○ **Order**: Select the order that specifies the sequence in which records are displayed, organized according to business preferences.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Form	Fields
Household Team Member	○ **Household**: Select the household to which the internal user is assigned. ○ **Responsibility**: Select the **Relationship Manager** responsibility. ○ **User**: Select the internal user to fulfill the responsibility. ○ **Order**: Select the order that specifies the sequence in which records are displayed, organized according to business preferences.
Consumer to Consumer Relationship	○ **Consumer is**: Select the consumer to fulfill the responsibility on behalf of another consumer. ○ **Responsibility**: Select the **Authorized Representative** responsibility. ○ **of Consumer**: Select the consumer who is being represented by the consumer in the **Consumer is** field.
Household Member Relationship	○ **Household**; select the desired household. ○ **Consumer is**: Select the consumer in the household to fulfill the responsibility on behalf of another consumer within the same household. ○ **Responsibility**: Select the **Authorized Representative** responsibility. ○ **of Consumer**: Select the consumer who is being represented by the consumer in the **Consumer is** field. ○ **Type**: Select the type from the list of related party configurations. ○ **Order**: Select the order that specifies the sequence in which records are displayed, organized according to business preferences.

5. Select **Submit**.
   The relationship is added to the relationship list.

   Account, Consumer, and Household Team Member relationships are also added to the corresponding related lists on the Business Location form.

   - Account Staff Relationships
   - Consumer Staff Relationships
   - Household Staff Relationships

   Consumer to Consumer and Household Member relationships are added to the following related lists:

   - Household form > Member Relationships
   - Consumer form > Consumer Relationships

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service Model Foundation responsibilities
- Create a responsibility definition

Household-member relationship for an install base item

Your customer service managers can set up a household-member relationship among the members of one household by using the Customer Service Management application. The established relationship between the consumers in that household means that only the household members can access the install base items.

The household relationship can be used to assign responsibilities between two consumers within the same household with the Household Member Relationship table [sn_customer_rel_household_member_relationship]. This relationship gives household members additional access to edit and update an install base item. To learn more about how to create a household relationship, see Create a relationship between household members.

Setting up a household-member relationship limits the access to the household members. Only the household members can access the household install bases.

After a household-member relationship is established between two consumers, the consumer with the authorized representative responsibility gains access to all the household install bases only when the primary consumer is the other member in the established household-member relationship.

Note:
The authorized representative gains access to the household install bases of the consumer that belongs to the same household.

Consumer relationship for an install base item

Your customer service managers can set up a relationship between two consumers, even if the consumers belong to different households. This relationship can be set up with the Customer Service Management application. An authorized representative can access all the consumer install base items that don't belong to any particular household.

A relationship can be established between two consumers by using the Consumer relationship table [sn_customer_rel_consumer_to_consumer]. To create a relationship, see Create a relationship between two consumers.

Authorized contacts, consumers, accounts, and members all have the Authorized Representative responsibility and can access all the details associated to an install base item. For information on authorized roles and responsibilities, see Create related party configurations.

After a relationship is created, all the install base items with a consumer-to-consumer relationship are visible to the consumer on the Consumer Service Portal. This relationship between the two consumers restricts all access to the household install base items to only those two consumers. This relationship also gives consumers additional access to edit and update the information that is related to an install base item.

Configure Customer Data Models for B2B2C

Configure the Customer Data Models for B2B2C application to enable business customers to support their end consumers by creating cases and tracking the services for products and services consumers use.

Role required: admin

The business-to-business (B2B) model supports customer accounts and the contacts within those accounts. The business-to-consumer (B2C) model supports individual consumers.

With the business-to-business-to-consumer (B2B2C) model, you can support business customers and third-party channel partners who, in turn, support the end consumers. This model can be used to support:

- Employees of a business customer.
- End consumers of a business customer.

Related topics

Customer service business models

Customer service business models

Customer Service Management provides different business models that you can use to support your business needs. Select a business model based on the type of services and support that you provide to your customers.

Business-to-business (B2B) model

In the business-to-business (B2B) model, an account is a supported external customer and a contact is an employee of that account. With the B2B model, you can support accounts and contacts and also set up:

- Customer relationships
- Account teams

Business-to-consumer (B2C) model

With the business-to-consumer (B2C) model, you can support individual consumers.

Service Model Foundation

The Service Model Foundation framework expands the business-to-business (B2B) and business-to-consumer (B2C) models and provides the flexibility and security needed to support:

- Business organizations with internal and external locations
- Households and consumers
- The relationships that exist between these entities

Contributor users

The contributor user model provides unified customer support for internal and external customers. With this model, you can engage middle office teams resolve customer issues and requests.

- Enable employees to request support for themselves and external customers.
- Enable service organizations to serve one another and external customers.
- Assign tasks to middle office agents who work on specific tasks that are required to resolve a case.

Customer Data Models for B2B2C

The Customer Data Models for B2B2C supports complex business models with multi-level customer relationships. This model can be used to support employees of a business customer or end consumers of a business customer.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Overview

Organizations have complex business models with multi-level relationships. These complex structures often exist between an organization and the end consumers. In the B2B model, while organizations do business directly with other organizations (business customers), the users of the service provided can be different. A user can be a direct customer (B2C), or a business customers' customer (B2B2C), or a business customer's employee (B2B2E).

With the business-to-business-to-consumer (B2B2C) model, you can support business customers and third-party channel partners who, in turn, support the end consumers. This model can be used to support:

- Employees of a business customer.
- End consumers of a business customer.

The business-to-business-to-consumer (B2B2C) data model supports different multi-level relationships between a company and the following types of customers:

- Direct customer: B2C
- Business customer: B2B
  - Business customer's customer: B2B2C
  - Business customer's employee: B2B2E

For details on the advantages of using the B2B2C Data Model application, see the text that follows in the Benefits section.

Benefits

- Enable service providers to manage all interactions and cases when the end consumer needs customer service.
- Enable service provider to have a complete view of the end consumers where they hold the relationship as direct customers (B2C) or through a business customer (B2B2C).
- Reduce costs by enabling self-service for various relationships (B2C, B2B2C, B2B2E).

To get started with this application, see Configure Customer Data Models for B2B2C.

To use this application, see Using Customer Data Models for B2B2C.

Activate Customer Data Models for B2B2C

You can activate the Customer Data Models for B2B2C plugin (com.sn_csm_b2b_consumers) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

Role required: admin

You must activate the Customer Service Install Base Management (com.snc.install_base) plugin before installing Customer Data Models for B2B2C.

The Customer Data Models for B2B2C plugin provides the following roles:

- Account consumer (sn_acct_consumer.consumer)
- Account consumer agent (sn_acct_consumer.agent)

When the plugin is activated, customer service agents inherit the account consumer agent role. Consumers who are added as account consumers are given the account consumer role.

About this task

The following items are installed with Customer Data Models for B2B2C:

- Business rules: Required account or consumer
- UI policies
  - Table: Case
  - Table: Interaction
  - Table: Sold Product
  - Table: Install Base Items
- Reference qualifiers
  - Table: Case
  - Table: Interaction
  - Table: Sold Produce
  - Table: Install Base Items

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Customer Data Models for B2B2C plugin (com.sn_csm_b2b_consumers) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configure the Account and Consumer forms for B2B2C

Enable account consumers to view the Account Consumers related list for the Case and Workspace views.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Customer** > **Accounts** and click an account.
2. Add the **Account Consumer>Account** related list to the Account form for the Case and Workspace views.
   a. Select **View** > **Case** from the Additional actions menu ⋮.
   b. Select **Configure** > **Related Lists** from the Additional actions menu ⋮.
   c. Select **Account Consumer>Account** in the **Available** column and move it to the **Selected** column.
   d. Click **Save**.
   e. Select **View** > **Workspace** from the Additional actions menu ⋮.
   f. Repeat steps 2b–2d.
3. Navigate to **Customer Service** > **Consumers** and click a consumer.
4. Add the **Account Consumer>Account** related list to the Consumer form for the Case and Workspace views.
   a. Select **View** > **Case** from the Additional actions menu ⋮.
   b. Select **Configure** > **Related Lists** from the Additional actions menu ⋮.
   c. Select **Account Consumer>Account** in the Available column and move it to the Selected column.
   d. Click **Save**.
   e. Select **View** > **Workspace** from the Additional actions menu ⋮.
   f. Repeat steps 4b–4d.

Configure the Install Base Items and Sold Products lists

Enable account consumers to view the **Account**, **Contact**, and **Consumer** fields for the Self-Service view.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Products** > **Install Base Items**.
2. Select **View** > **Self-Service** from the Additional Actions menu ⋮.
3. Click the gear icon (⚙).
4. Select the Account, Contact, and Consumer fields in the **Available** column and move them to the **Selected** column.

5. Click **OK**.
6. Navigate to **Customer Service** > **Products** > **Sold Products**.
7. Repeat steps 2–5.

Configure the Case list for B2B2C

Enable account consumers to view the **Account**, **Contact**, and **Consumer** fields for the Customer Self Service view.

Before you begin
Role required: admin

Procedure

1. Navigate to **Customer Service** > **Cases** > **All**.
2. Select **View** > **Customer Self Service** from the Additional Actions menu ⋮.
3. Click the gear icon (⚙).
4. Select the Account, Contact, and Consumer fields in the **Available** column and move them to the **Selected** column.
5. Click **OK**.

CSM Configurable Workspace

Set up the CSM Configurable Workspace and expand the Workspace UI to optimize agent customer service processes. This user interface provides agents with the tools they need to answer customer questions and resolve issues efficiently.

Case routing and assignment

Set up Advanced Work Assignment in the CSM Configurable Workspace to route and assign cases automatically to the appropriate agents based on their availability, capacity, and skills. This setup helps to improve efficiency and response times.

Agent tools

Configure organizational tools for agents such as Customer Central, dynamic related records, mobile application, Guided Decisions, and playbooks. These tools enable agents to resolve cases quickly and efficiently.

Case management

Set up case management features to enable agents and customers to create cases as needed and work to resolve those cases. Create the necessary case types to handle specific types of customer issues. Configure service definitions to create connections between products, services, and case types.

Setting up case management, case types, and service definitions

Task	Description
Configure case management	Configure the case management features that enable agents and customers to create cases for issues and questions, track the activities related to resolving issues, and provide communication between the agent and customer. Some of the case management features include the following: • Configure a Case form view to display the desired fields and related lists. • Configure SLA definitions for customer service cases to specify the time within which service must be provided. • Configure major issue management to manage the communication and resolution process for issues that impact multiple customers. • Configure special handling notes to bring important case information to an agent's attention.
Customer service case types	Configure case types to handle different types of customer issues. When creating cases, agents can select the case type that corresponds to the customer issue.

Setting up case management, case types, and service definitions (continued)

Task	Description
Service definitions	Configure service definitions that agents can use to create cases of the right type to support those service requests.

Configure case management

Configure the Customer Service Management features and components that agents and managers use to create and resolve cases.

Before you begin

Role required: admin

About this task

The customer service case is the primary entity of the customer service application. An agent creates a case to identify a customer's question or issue and to track the activities related to resolving the issue. An agent also uses a case to track all of the communication to and from the customer, including the communication channels being used.

Case activities include any action that is taken to resolve an issue. This can include phone calls or emails, knowledge base research, conversations with subject matter experts, and dispatch requests to field service agents, as well as other activities.

From the Case form, an agent can associate and store the related information, such as the customer's name, phone number, and company; account information; product and asset information; service contract and entitlement details, and any associated service level agreements (SLAs).

Note:
These steps may also apply to case type configuration.

To configure case management, use the Customer Service guided setup. The guided setup takes you through the entire setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**.
3. In the Case Management category, view the list of tasks to configure the feature.

Case Management configuration tasks

Task	Description
Create the Case Form View	The Case form displays detailed information about a customer issue or problem. Create a Case form view to display the desired fields.
Create SLA Definitions	Customer Service Management uses service level agreements (SLAs) with customer service cases. An SLA can be attached to a service contract, to a company, and to a product and can be configured to start,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
	pause, and stop based on any customer service case attributes. After creating the necessary SLAs, associate them with customer service cases from the SLAs related list on the Case form.
Case Routing and Assignment	The case routing feature uses matching rules and assignment rules to identify cases that meet certain conditions and then route those cases to customer service agents. Create matching rules to identify cases and then create assignment rules to route cases to agents.
Assignment Workbench	The assignment workbench uses configurable criteria, such as skills and availability, to evaluate the agents in a selected group and provide an overall ranking. Managers can view these results and click one button to assign a task. To configure the assignment workbench: ○ Create matching criteria. ○ Create an assignment workbench configuration.
Special Handling Notes	Use special handling notes to bring important case information to an agent's attention. Create a configuration for the Case [sn_customerservice_case] table and then configure the form layout to display the notes in a pop-up window or a related list.
Escalation Management	Escalating a case or account raises awareness about important customer issues, facilitates communication, and enables users to track progress toward a resolution. Create escalation templates and severity definitions to control the escalation process.
Major Issue Management	Major issue management enables customer communication for issues that impact a wider audience. Use this feature to proactively identify impacted customers, create cases for these customers, provide information, and manage the resolution process.
Case Action Status	The case action status feature enables customer service agents to easily identify cases that need attention and quickly prioritize their work. Visual indicators in the **Action Status** column on the case list highlight case status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Auto Close Resolved Cases	Automatically close cases in the Resolved state if customers do not take any action.
Case Digests	Case digests enable agents to proactively communicate with customers and internal stakeholders about cases. ○ Summaries: while a case is in progress, agents can send periodic case summaries that describe actions taken, next steps, and other case-related information. ○ Post case reviews: when the work on a case has been completed, agents can create a post case review that includes information such as the root cause, mitigation plan, and preventive actions.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Cases and case tasks

Customer service cases store information about customers, their questions and issues, and related information. Case tasks are created and assigned to users to complete the work necessary to resolve cases.

Cases

A case record is the main type of record used by the Customer Service Management application. Case records include detailed information about customers, their reported questions or issues, and the work performed to answer questions and resolve issues. The system stores case records in the Case [sn_customerservice_case] table.

Customer service agents create cases to identify questions or issues, gather information, and track the activities related to resolution. Agents also use cases to communicate with customers and other users.

Key features of a customer service case

Feature	Description
Case details	The Details tab includes the following information: • Customer information such as the customer's name, phone number, and email address. • Product information such as the products, assets, and services owned by the customer. • Case information, such as the priority, assignment group, and assigned agent. • Service contracts, entitlements, and associated service level agreements (SLAs).
Case activities	The Activity pane enables communication between:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key features of a customer service case (continued)

Feature	Description
	• Agents and customers. • Agents and other employees within the organization. The Activity pane also shows the communication history, case notes and updates, and attachments.
Related tasks	Related tasks include tasks that result from the case, such as case tasks, work orders, and requests. These tasks may be internal to the organization or they may involve the customer.
Information	Information that is gathered as part of resolving a case can be included in the knowledge base and used to help resolve similar cases. Agents can also search knowledge bases and attach useful articles.

For more information about cases and case records, see the following topics:

- Create a customer service case
- Create a customer service case of a specific type
- Customer service case form

Case tasks

Case tasks are created for additional work that must be completed as part of resolving a customer service case. These tasks are frequently assigned to users such as middle or back-office agents. Case tasks are stored in the Case Task [sn_customerservice_task] table.

Case tasks can be manually created from cases or automatically from case playbooks. When a case task is created, the system uses information from the case to automatically fill in some of the fields on the case task record. This includes the case number in the **Parent case** field. It also includes customer information in the **Account**, **Contact**, or **Consumer** fields, if this information is present in the case record.

Note:
Case tasks can also be created from other records. If a task is created from a non-case record, such as an incident, problem, change, or request, the **Parent** field is updated with the number of the parent record. The **Account**, **Contact**, or **Consumer** fields aren't updated.

If the value in the **Parent case** or **Parent** fields is updated, the customer information in the **Account**, **Contact**, or **Consumer** fields is also updated.

Depending on a user's assigned roles, case tasks appear in a number of different Case Task list in the application navigator in CSM Configurable Workspace, including:

- My Case Task
- My Open
- Unassigned for my groups
- All

For more information about case tasks and case task records, see the following topics:

- Create a task for a customer service case
- Case task form

Cases, case tasks and related parties

The Customer Service Management application enables you to support multiple contacts and consumers on cases and sold products and provide these contacts with varying levels of case access. These additional contacts and consumers are called related parties. Related parties are added to the Related Parties related list on the case record.

Customer service agents can also add related parties to case tasks. Customers that can be added to a case task are limited to the following:

- Customers that are related parties on the parent case.
- Customers that the agent has access to.

Users with the admin role can remove related parties from cases. When an admin attempts to remove a related party from a case, the system checks to see if that related party is associated with any open case tasks.

- If no, the related party is removed from the case.
- If yes, the related party isn't removed from the case and the system displays a message that lists the associated case tasks.

Case task integration with Service Definitions

The service definitions feature enables you to create connections between products, services, and case types.

- Agents can use configured service definitions to quickly create cases of the right type based on the selected product or service.
- Customers can use configured service definitions to quickly discover and request the services they need.

Case task integration with Service Definitions roles

Role	Description
Admin [admin]	When creating and updating case tasks, users with the admin role can select service definitions in the **Service definition** field on case task records.
Case task agent [case_task_agent]	• Contains the service definition viewer role (sn_csm_case_types.service_definition_viewer). This role gives users access to the service definitions that are mapped to case task tables. • Can create case tasks and update the **Service definition** field on the case task record.

© 2026 ServiceNow, Inc. All rights reserved.

Case task integration with Service Definitions roles (continued)

Role	Description
Case task viewer [case_task_viewer]	• Contains the service definition viewer role (sn_csm_case_types.service_definition_viewer). • Can view case tasks and service definitions.

Case tasks and user roles

User roles and how they interact with case tasks

Role	Description
Admin role	
Admin [admin]	This user can: • Create and assign case tasks. • Update the **Account**, **Contact**, and **Consumer** fields after the case task is created. **Note:** The admin can change the values of these fields to one of the related parties associated with the parent case. • Delete case tasks.
Agent roles	
Customer service agent [sn_customerservice_agent]	This user can do the following for account cases: • Create and assign case tasks. • Update all case task fields. • Delete case tasks.
Consumer service agent [sn_customerservice.consumer_agent]	This user can do the following for consumer and household cases: • Create and assign case tasks. • Update all case task fields. • Delete case tasks.
Case task agent [sn_customerservice.case_task_agent]	This user can work on case tasks that they've created and that are assigned to them or to their assignment groups. Case task agents have read access to the **Account**, **Contact**, **Consumer**, and **Parent case** fields for case tasks that are assigned to them or to their assignment groups. This user can:

User roles and how they interact with case tasks (continued)

Role	Description
	• View and update assigned tasks. • View and update created case tasks. • Create case tasks and assign those tasks to other users. • Add work notes, comments, and attachments to case tasks. • Update the status of case tasks. • Perform additional actions from case tasks such as sending email.
Relationship agent [sn_customerservice.relationship_agent]	This user can view, create, update, and delete case tasks for the customers they have relationships with.
Location agent [sn_customerservice.svc_location_agent]	This user can view, create, update, and delete case tasks for the business locations they have access to.
Consumer location agent [sn_customerservice.svc_location_consumer_agent]	This user can view, create, update, and delete case tasks for the business locations they have access to.
Outsourced agent [sn_csm_ocs.ext_agent]	This user can view, create, update, and delete case tasks based on the outsourcing criteria for the cases they have access to.
Account consumer [sn_acct_consumer.consumer]	Can view the **Account**, **Contact** and **Consumer** fields for the case tasks they have access to. A user with this role can work on the following case tasks: • Tasks that have been created by the user and tasks that are visible to them based on their access to the case. • Tasks that are assigned to the user or to the user's assignment groups. This user can: • View and update assigned tasks. • Create case tasks and assign those tasks to other users. • View and updated created case tasks. • Add work notes, comments, and attachments to case tasks. • Update the status of case tasks. • Perform additional actions from case tasks such as sending email. **Note:** Available with the Customer Data Models for B2B2C plugin (com.sn_csm_b2b_consumers).
Contributor roles

User roles and how they interact with case tasks (continued)

Role	Description
Account contributor [sn_customerservice.account_contributor]	This user can: • View and update case tasks and the fields on the case task record that they have access to. • View the **Parent case**, **Account**, **Contact** and **Consumer** fields on the case task record
Consumer contributor[sn_customerservice.consumer_contributor]	This user can: • View and update case tasks and the fields on the case task record that they have access to. • View the **Parent case**, **Account**, **Contact** and **Consumer** fields on the case task record
Service organization contributor [sn_customerservice.service_organization_contributor]	This user can: • View and update case tasks and the fields on the case task record that they have access to. • View the **Parent case**, **Account**, **Contact** and **Consumer** fields on the case task record
Self contributor [sn_customerservice.self_contributor]	This user can: • View and update case tasks and the fields on the case task record that they have access to. • View the **Parent case**, **Account**, **Contact** and **Consumer** fields on the case task record
Related parties roles	
Case authorized contact [sn_customerservice.case_authorized_contact]	This user can: • View and update case tasks and the fields that they have access to. • View the **Parent case**, **Account**, **Contact** and **Consumer** fields.
Case authorized consumer [sn_customerservice.case_authorized_consumer]	This user can: • View and update case tasks and the fields that they have access to. • View the **Parent case**, **Account**, **Contact** and **Consumer** fields.

Case tasks and external user roles

End users and requesters can access case tasks from the Customer and Consumer Service Portals by selecting **My Lists** > **My Case Tasks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End users and requesters can view and update case tasks and the fields that they have access to (case tasks that have the **Visible to customer** field enabled). You get read access to the **Parent case**, **Account**, **Contact** and **Consumer** fields.

- sn_customerservice.customer
- sn_customerservice.consumer
- customer_case_manager
- sn_customerservice.partner
- sn_customerservice.consumer

The users can see the following fields on the Case Task lists and forms: **Account**, **Contact** and **Consumer**. If an end user is viewing a case task from a list of case tasks, the Case Task form also displays the **Parent case** field.

Scheduled job for case tasks

Case task enhancements in the Yokohama release add several fields to the case task record. After upgrading to the Yokohama release, you can run a scheduled job that populates these fields for active case tasks.

Note:
It is recommended that you run the scheduled job during planned downtime.

If the parent case is an active record in the Case table (sn_customerservice_case) or a table that extends the Case table, the **Update case task fields** scheduled job does the following:

- Copies the parent case number to the **Parent case** field.
- Copies the account and contact or consumer information to the **Account** and **Contact** or **Consumer** fields, if this information is present in the case record.

To run this scheduled job:

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Select **Update case task fields** in the **Name** field.
3. Select **Execute Now**.

Configure a Case form view

The Case form contains detailed information about a customer issue or problem. Configure a Case form view to display the desired fields and related lists.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Cases** > **Create New**.
2. Configure the form layout to add the fields you require.
   For more information about adding fields to a form, see Configuring the form layout.

   Note:
   If you are using Customer Service Install Base Management and Proactive Customer Service Operations, add the **Sold Product** field.

3. Configure the form layout to add the related lists you require.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about adding a related list to a form, see Configuring the form layout.

Note:
If you are using Customer Service Install Base Management and Proactive Customer Service Operations, add the **Affected Install Base Items** related list.

4. Click **Submit**.

Add the Internal User field to the Case form

Add the **Internal user** field to the Case form for the Case view and the Workspace view.

Before you begin
Role required: admin

About this task
The **Internal User** field displays the name of an internal user. When an agent is creating a case on behalf of someone else, they can use this field to identify the person requesting assistance. This user can be an internal employee asking for help for an account, consumer, or service organization, or for themselves.

With the Customer Service Management plugin (com.sn_customerservice), agents can create cases for internal employees or on behalf of their accounts and consumers. Additional plugins provide additional functionality for the **Internal User** field. For more information, see Contributor users.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup** and click **Get Started**.
2. In the Case Management category, click **Get Started**.
3. Click **Add Internal User Field to the Case Form View**.
4. Add the **Internal user** field to the Case form for these views: Case and Workspace.

Configure SLA definitions for customer service cases

A service level agreement (SLA) specifies the time within which service must be provided. Configure SLA definitions that include the necessary information to create and progress SLAs for customer service cases.

Before you begin
Role required: admin

About this task
The Customer Service Management application uses service level agreements with customer service cases. An SLA can be attached to a service contract, to a company, and to a product and can be configured to start, pause, and stop based on any customer service case attributes.

An SLA is automatically associated to a case when the case is created or updated based on the conditions that have been set up in the SLA definition. The specific record that gets attached to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a case is the Task SLA record, which tracks the SLAs for that particular case. The Task SLA table [task_sla] stores Task SLA records.

Procedure

- For more information about SLAs, see Service Level Management concepts.
- To create an SLA, see Create an SLA definition.

Configure case routing and assignment

The case routing feature uses matching rules and assignment rules to identify cases that meet certain conditions and then route those cases to customer service agents.

Before you begin

Role required: admin

About this task

Matching rules are based on two defined sets of conditions: one that identifies specific case attributes and another that identifies the agent resources best suited to handle cases with these attributes.

Assignment rules automatically assign tasks to users and groups when the conditions in a matching rule are met. Create an assignment rule for a matching rule using the **Create assignment rule** related link on the Matching Rule form.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Case Management category, view the list of tasks to configure the feature.

Case Routing and Assignment

Task	Description
Create matching rules for case routing	Matching rules are based on two defined sets of conditions, one that identifies specific case attributes and another that identifies the agent resources best suited to handle cases with these attributes.
Create assignment rules for case routing	Assignment rules automatically assign tasks to users and groups when the conditions in a matching rule are met.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Routing and assigning customer service cases

Create a matching rule for case routing

Create a matching rule for a customer service case that identifies the case attributes as well as the agent resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Routing and Assignment** > **Matching Rules**.
2. Click **New**.
3. Fill in the fields on the Matching Rule form.
   This form contains the following sections:
   - Basic rule information
   - Applies to: use this section to create rule conditions
   - Resource: use this section to create agent and agent group conditions

Matching Rule form

Field	Description
Name	The name of the matching rule.
Execution order	The order in which this matching rule is to be executed. Similar to business rules, matching rules are processed based on execution order, from the lowest to the highest.
Active	Enable this check box to activate the matching rule.
Applies To	
Table	The table that stores the task for which the matching rule is being created. The default is the Case [sn_customerservice_case] table.
Conditions	Use the buttons in this field to build one or more conditions on the selected table. A condition is made up of a selected field, an operator, and a value. Add conditions using the **AND** and **OR** buttons. Delete conditions by clicking the **X** to the right of a condition.
Resource	

Matching	The type of resource matching method to use for this rule: Simple, Advanced, Scripted, Selection Criteria.
	
	Select **Simple** to assign a task to a specific user.
	a. Click the lookup icon next to the **Resource** field.
	b. Select a **Table name**.
	c. Select a **Document** from the table.
	d. Click **OK**.
	
	Select **Advanced** to create a specific set of resource conditions. Then use the condition builder in the **Resource** field to identify these conditions.
	
	Select **Scripted** to create a customized script for identifying resources, with the goal of returning a list of users that have the same skills as the task. The task under consideration is set in the context of the script. For example:
	
	`//current has the task record for which the rule is being executed.`
	`var task = current;`
	`var skills = task.getValue("skills");`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	`var skillUtil = new global.SkillsUtils();`
	`var skilledUsers =`
	`skillUtil.getAllSkilledUserIds(skills);`
	`return skilledUsers;`

Resource	This field changes depending on the resource matching type selected in the **Matching** field. For **Simple** matching, use this field to select a table and a user. For **Advanced** matching, use the condition builder in this field to build one or more conditions to identify a resource. These conditions can be based on user role, agent group, specific skills, work load, or agent availability.
Schedule based filtering	This field applies to **Advanced** matching. Enable this check box to filter resources that are in schedule (work hours) at the time of routing.
Script	For **Scripted** matching. use this field to create a customized script for identifying resources. An example script is included. The expected return from a customized script is an array of resource sys_ids.

4. Click **Submit**.
   The rule appears in the Matching Rules list.
5. Open the newly created rule from the Matching Rules list and add the desired matching criteria.
6. From the **Select Criteria** related list, click **New**.
7. Select a **Criterion**.
8. In the **Use for** field, specify how you want the matching criterion to be used.

Option	Description
Ranking and display	Use the criterion to determine agent ranking and displays it in a column on the workbench.
Display only	Displays the criterion in a column on the work bench but does not use it to determine agent ranking.
Ranking only	Uses the criterion to determine agent ranking but does not display it on the workbench.

9. Select a **Ranking Method**.

Option	Description
More is better	For example, more availability is better when determining the agent ranking.
Less is better	For example, fewer assigned cases are better when determining agent ranking.

10. Click **Submit**.
    The criterion appears on the Matching Rule form in the **Select Criteria** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. **Optional:** From the **Select Criteria** related list, set a **Threshold** for the criterion.
    A threshold sets a minimum requirement for a criterion. If necessary, personalize the list and add the **Threshold** field.

Create an assignment rule for case routing

Create a rule that assigns those cases that meet the matching rule criteria to a customer service agent.

Before you begin

Role required: admin

Procedure

1. Open the desired matching rule.
2. Select the **Create assignment rule** related link.
   You can also create an assignment rule by navigating to **Routing and Assignment** > **Assignment Rule** and selecting **New**.
3. Fill in the fields on the Assignment Rule form.

Assignment Rule form

Field	Description
Name	The name of the assignment rule.
Application	The name of the application to which this assignment rule belongs. The default application is **Global**.
Order	The order in which this assignment rule is executed. Similar to business rules, assignment rules are processed based on execution order, from the lowest to the highest.
Active	Enable this check box to activate the matching rule. Only active assignment rules take effect.
Applies To	
Table	The table that stores the task for which the assignment rule is being created. This list shows only those tables and database views that are in the same scope as the assignment rule. If you select a custom table that extends the task table, you must clear the instance cache by navigating to `https://<instance_name>.service-now.com/cache.do` in order for the assignment rule to work. **⚠ Warning:** Clearing the system cache can affect overall performance, and degrade system response times. Don't run cache flushes during business hours, and don't trigger cache flushes automatically.
Conditions	The conditions in which the assignment rule will apply. Use the buttons in this field to build one or more conditions on the selected table. A condition is made up of a selected field, an operator, and a value. Add conditions using the **AND** and **OR** buttons. Delete conditions by selecting the **X** to the right of a condition.
Assign To

Define assignment rules

Configure Skills Management

Manage skill data in a central location for customer service agents and work items.

Before you begin

Role required: admin

About this task

To configure skills management, use the Customer Service guided setup. The guided setup takes you through the entire setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Skills Management category, view the list of tasks to configure the feature.

Skills Management configuration tasks

Task	Description
Manage skills	Organize skills data of agents and work items in a centralized location.
Assign skills to work items	Create rules to identify skills and automatically associate them with work items.
Assign skills to customer service agents	Identify skills each agent has to work on tasks and assign it to the agent.

Mandatory skills

Use the mandatory skills feature to identify any skills that are required for agents and technicians to work on customer service cases and field service work orders and tasks. Then assign cases and tasks to agents and technicians who have those required skills.

When assigning cases, work orders, and work order tasks, the assignment tools consider the mandatory skills, filter out agents and technicians who don't have these skills, and then rank the remaining agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If agents with the mandatory skills are available, the cases and tasks are assigned to these agents.
- If agents with the mandatory skills aren't available, then agents with any other, non-mandatory skills identified in the cases and tasks are ranked and assigned.

Field service dispatchers (wm_dispatcher), field service technicians (wm_agent), customer service managers (sn_customerservice_manager), and customer service agents (sn_customerservice_agent) can specify both skills and mandatory skills for cases and tasks.

Mandatory skills are an optional feature. Mandatory skills can be identified on the assignment workbench. In addition to the **Skills** list, the assignment workbench includes a **Mandatory Skills Added** list. Agents are ranked in the workbench based on the number of skills that match the skills identified in the Skills list. If the mandatory skills feature is being used, then the agents displayed are filtered by the skills listed in the Mandatory Skills Added list and then ranked by the other matching criteria.

Related topics

Use the assignment workbench

Configuring the mandatory skills feature

Configure the mandatory skills feature for use with the Customer Service Management and Field Service Management applications.

Mandatory skills is an optional feature included with the Customer Service Management and Field Service Management plugins. Use the steps below to configure this feature with the desired application.

Customer Service Management configuration

To configure the mandatory skills feature for use with Customer Service Management:

- In the Case form:
  - Configure the form layout to use the Task Skills [task_m2m_skill] table.
  - In the Task Skills table, set the **Mandatory** field to **True** to identify skills that are mandatory to complete a task.

    Note:
    The Case form should use either the **Skills** field or the Task Skills table, but not both.

- [Optional] For existing cases that have data populated in the **Skills** field on the Case form, run the **Migrate Skills to Task Skill M2M** script to move this data to the Task Skills table. By default, this fix script migrates the skills from existing entries in the Case, Work Order, and Work Order Task tables to the Task Skills table. For more information, see Migrate skills to the Task Skill table.
- If you are using the assignment workbench, replace the **Matching Skills** matching criteria with the **Matching Skills - Mandatory Skills Support** matching criteria. For more information, see Matching rules for case assignment.

Field Service Management configuration

To configure the mandatory skills feature for use with Field Service Management:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Enable the *work.management.use.mandatory.skills* system property.
2. Configure the Work Order form and the Work Order Task form to use the Task Skills [task_m2m_skill] table.
3. [Optional] For existing work orders and tasks that have data populated in the **Skills** field on the Work Order and Work Order Task forms, run the **Migrate Skills to Task Skill M2M** script to move this data to the Task Skills table. By default, this fix script migrates the skills from existing entries in the Case, Work Order, and Work Order Task tables to the Task Skills table and configures them as optional skills. For more information, see Migrate skills to the Task Skill table.
4. If you are using dynamic scheduling, update the task filter for the dynamic scheduling configuration and replace the **Matching Skills for Dynamic Scheduling** matching criteria with the **Matching Mandatory Skills for Dynamic Scheduling** matching criteria. For more information, see Create a task filter.

For configuring optional skills, navigate to **Field Service** > **Administration** > **Configuration**, click the **Assignment** tab and set **Auto-selection of agents for tasks requires them to have skills** to one of the following:

- All - indicates that the agent must have all optional skills listed in the task for task assignment.
- Some - indicates that the agent must have at least one optional skill listed in the task for task assignment.
- None - indicates that the agent is not required to have any optional skill.

Mandatory Skills system properties

The **Migrate Skills to Task Skill M2M** script migrates skills from existing tasks to the Task Skills [task_m2m_skill] table. Configure the task tables included in the migration using the *skills_management.migration* system property.

The mandatory skills feature adds the following system properties.

Note:
To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties installed with Mandatory skills feature

Property name	Description
work.management.use.mandatory.skills	Enables the mandatory skills feature and indicates that the Task Skills [task_m2m_skill] table is being used for work orders and work order tasks. • **Type**: true/false • **Default value**: false
skills_management.migration	Lists the task tables to migrate to the Task Skills [task_m2m_skill] table when an admin runs the **Migrate Skills to Task Skill M2M** script. • **Type**: choice list • **Default value**: wm_task,customerservice_case,wm_order

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Mandatory skills feature (continued)

Property name	Description
com.snc.skills_management.task_skill_migrated_tables	Comma-separated list of tables for which the **Skills** field has already been migrated to the Task Skills [task_m2m_skill] table. If the table name is listed in this property, the data has been migrated and will not be migrated again. • **Type**: choice list • **Default value**: none

Migrate skills to the Task Skill table

Migrate data from the **Skills** field to the Task Skills table to utilize mandatory skills support for executing tasks in a case or work order.

Before you begin

Role required: wm_admin, admin

About this task

The Task Skills [task_m2m_skill] table stores skills and mandatory skills.

In the Customer Service Management application, the assignment workbench uses the Task Skills table instead of the **Skills** field in the Case table to display agents based on the evaluation criteria for task assignments.

In the Field Service Management application, the work order task assignments done using auto-assignment, dynamic scheduling, and Dispatcher Workspace use the Task Skills table instead of the **Skills** field in the Work Order and Work Order Task tables to assign agents for task assignments.

Procedure

1. Add a system property with the following settings.
2. In the **Type** field, set the value to **true**.
3. Click **Update**.
4. Navigate to **System Definition** > **Fix Scripts** and run the **Migrate Skills to Task Skill M2M** fix script.
   The skills are copied to the task_m2m_skill table. The name of the table from which the skills are copied gets appended to the *com.snc.skills_management.task_skill_migrated_tables* system property. When the script is run again, it ignores all tables from which skills have already been migrated.

Configure assignment workbench

The assignment workbench uses configurable criteria, such as skills and availability, to evaluate the agents in a selected group and provide an overall ranking. Managers can view these results and click one button to assign a task.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

There are three types of matching criteria available for selection:

- Simple match
- Aggregate
- Scripted

After creating matching criteria, create a configuration for the assignment workbench by creating a matching rule of the type **Selection criteria** and selecting the desired matching criteria.

If necessary, set the assignment workbench properties.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Case Management category, view the list of tasks to configure the feature.

Configure Assignment Workbench

Task	Description
Create assignment workbench matching criteria	The assignment workbench uses configurable matching criteria, such as skills and availability, to evaluate agents in a selected group and provide an overall ranking. To create matching criteria, select the type and then use the fields related to that type to build the query.
Create an assignment workbench configuration	After creating matching criteria, create a configuration for the assignment workbench by creating a matching rule of the type **Selection criteria** and selecting the desired matching criteria.
Configure assignment workbench properties	Configure the properties related to the assignment workbench display.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Create assignment workbench matching criteria

Create one or more matching criteria that can be used in an assignment workbench configuration.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The assignment workbench uses configurable matching criteria, such as skills and availability, to evaluate agents in a selected group and provide an overall ranking. The Matching Criteria [matching_dimension] table stores the individual criterion that can be added to a matching rule to create an assignment workbench configuration.

Procedure

1. Navigate to **All** > **Routing and Assignment** > **Criteria**.
2. Click **New**.
3. Enter a **Name** and a **Description** for the criterion.
4. Select the **Type** of matching criterion.

Option	Description
Simple Match	Creates a one-to-one match. For example, match the time zone of an agent with the time zone of a task location.
Aggregate	Takes a simple query as an input and pro vides aggregate results. The query returns a set of users.
Scripted	Includes a scripted query which returns a list of users.

5. To create a **Simple Match** criterion, fill in the following fields.

Simple match criterion fields

Field	Description
Applies to	The type of task that this criterion applies to.
Field	The field from the selected task table that you want to match.
Resource Table	The table that stores the resource to use for this matching criterion.
Resource Matching Field	The field from the resource table that you want to match.
Resource Field	The resource field to be displayed for the task records that match the resource records.

6. To create an **Aggregate** criterion, fill in the following fields.

Aggregate criterion fields

Field	Description
Aggregate Table	The type of task that this criterion applies to.
Aggregate Filter	Use the condition builder to create a query that returns a set of users from the selected task table. For example, create a query that returns customer service cases with the following states: New, Open, Awaiting info.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Aggregate Field	The field from the selected task table to be displayed for the task records that match the query conditions.

7. To create a **Scripted** criterion, fill in the following fields.

Scripted criterion fields

Field	Description
Script	Create a customized script which returns a list of users. An example script is included. The expected return from a customized script is an array of resource sys_ids.
Aggregate Field	The field from the selected task table to be displayed for the task records that match the query conditions.

8. **Optional:** Enter a **Display Name**.
9. **Optional:** Enable the **Use Reference** field.
   If you use a reference field, fill in the following fields.

Reference fields

Field	Description
Reference Table	The table that stores the referenced information.
Reference Filter	Add filter conditions to return the desired reference information.
Reference Field	The field from the selected reference table to be displayed for the records that match the filter conditions.
UI Filter Label	The label for this field that appears on the assignment workbench

10. Click **Submit**.

Related topics

Matching criteria for case assignment

Create an assignment workbench configuration

Use a matching rule to create a configuration for the assignment workbench.

Before you begin

Role required: admin

About this task

The assignment workbench configuration is stored in a matching rule that is based on the **Selection criteria** matching type. The default configuration uses the **Recommendation for Case Assignment** matching rule, which includes three of the four default matching criteria:

- Availability Today
- Matching Skills
- Assigned Cases

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can modify or create matching criteria and then modify the **Recommendation for Case Assignment** matching rule as needed or you can create your own configuration.

Procedure

1. Navigate to **All** > **Routing and Assignment** > **Matching Rules** to access the Matching Rules list.
2. Click **New**.
3. Enter a **Name** for the matching rule.
4. If desired, enter an **Execution Order** for the matching rule.
   This is the order in which this matching rule is to be executed. Similar to business rules, matching rules are processed based on execution order, from the lowest to the highest.
5. In the **Applies To** tab, select the **Table** that stores the task for which the matching rule is being created.
6. Use the **Conditions** field to build one or more conditions on the selected table.
   A condition is made up of a selected field, an operator, and a value. Add conditions using the **AND** and **OR** buttons. Delete conditions by clicking the **X** to the right of a condition.
7. In the **Resource** tab, select **Selection Criteria** in the **Matching** field.
8. Click **Submit**.
9. From the Matching Rules list, open the matching rule that you just created.
10. In the **Select Criteria** related list, click **New**.
    This opens the Select Criterion form.
11. Select a **Criterion** from the Matching Criteria list.
12. Select how the criterion is to be used in the **Use for** field.

Option	Description
Ranking and Display	Uses the criterion to determine agent ranking and displays it in a column on the workbench.
Display Only	Displays the criterion in a column on the work bench but does not use it to determine agent ranking.
Ranking and No Display	Uses the criterion to determine agent ranking but does not display it on the workbench.

13. Select a **Ranking Method**.

Option	Description
More is better	A higher value is better. For example, more availability is better when determining the agent ranking.
Less is better	A lower value is better. For example, fewer cases are better when determining the agent ranking.

14. Click **Submit**.
15. Repeat steps 10 through 14 for each criterion to add to the matching rule.
16. If desired, change the weight of a criterion by double-clicking the **Weight** field in the **Select Criteria** related list and entering a new weight.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each matching criterion has an assigned weight. By default, the matching criteria in the Recommendation for Case Assignment matching rule have an assigned weight of 10. You can assign a higher weight to the criteria that are more important.

17. If desired, set the threshold for a criterion by double-clicking the **Threshold** field in the **Select Criteria** related list and entering a threshold number.
A threshold sets a minimum requirement for a criterion. It may be necessary to personalize the list and add the **Threshold** column.

18. If desired, set a criterion active or inactive by double-clicking the **Active** field in the **Select Criteria** related list and selecting **true** or **false**.
Changing this setting has an immediate impact on the agent ranking. It may be necessary to personalize the list and add the **Active** column.

Configure assignment workbench properties

Configure the properties related to the assignment workbench display.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Routing and Assignment** > **Properties**.
2. Set the following properties, as needed.

Option	Description
Title for the macro button *assignment_workbench.find.agents.title*	Creates the title for the macro button on the task form. The default is **Find Agents**.
When enabled opens the assign ment workbench in a new window *assignment_workbench.new.window*	Opens the assignment workbench in a new window. The default is **False**.
Number of agents per page *assignment_workbench_no_of_agents*	Set this property to 20, 30, or 50 agents. To get better performance, do not use more than 50 agents per page. The default is **30**.

3. Click **Save**.

Configure major issue management

Major issue management enables customer communication for issues that impact a wider audience. Use this feature to proactively identify impacted customers, provide information to these customers, and manage the resolution process.

Before you begin
Role required: admin

About this task
This feature enables you to efficiently manage the communication and resolution process for issues that impact multiple customers. With major issue management, you can identify impacted customers who have not yet reported an issue and proactively create cases for these customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Case Management category, view the list of tasks to configure the feature.

Major Issue Management

Task	Description
Activate Major Issue Management	Activate the Major Issue Management (com.sn_majorissue_mgt) plugin.
Configure Customer Service Properties	Enable a system property to synchronize data between parent and child cases.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Major issue management overview

Activate Major Issue Management

Activate the Major Issue Management plugin to use the major issue management feature.

Before you begin
Role required: admin

About this task
This plugin requires:

- Customer Service [com.sn_customerservice]
- Targeted Communications [com.sn_publications]
- Task Communications Management [com.snc.task_communication_management]

Major issue management uses the Targeted Communications recipients lists feature to identify impacted customers.

Note:
If you have installed the Proactive Customer Service Operations plugin, the Major Issue Management plugin is activated by default.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the plugin com.sn_majorissue_mgt.
3. Click **Activate**.

Configure case synchronization

Configure the major issue management system properties to enable synchronization between major cases and associated child cases.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Properties**.
2. Enable the **Synchronize fields from parent to child case** property.
3. In the **Comma separated list of fields that synchronize from parent to child cases** property, add a comma-separated list of fields that synchronize from the major case to each of the associated child cases.
4. **Optional:** Set the **Processes SLA asynchronously during parent to child case creation and synchronization** property to false to process the SLA synchronously.
   This property is enabled by default.
5. Click **Save**.

Targeted communications

The Targeted Communications application provides the ability to create and send articles and emails to internal and external customers.

Users with the publications author (sn_publications.author) and publications administrator (sn_publications.admin) roles can use the Targeted Communications application to author publication articles and emails for employees, customer contacts and accounts, and consumers. Articles are available for viewing from the self-service portals and can also be sent out as email notifications.

Each publication article includes content and a specified list of recipients. Articles can also include optional email notification. Recipients lists can be created dynamically by using a condition builder to identify the desired conditions, by running scripts, or by manual file upload. Recipients can be added to or removed from a list manually and lists can have both dynamically generated and manually added records of the same type.

When creating an article, publication authors specify a publish date and an expiration date. The system uses these dates to automatically publish and expire the article. Authors can also request a review prior to publishing an article. Articles can include an optional email notification that is sent to all recipients in the recipients list when the article is published. In this email notification, all of the recipients are included in a **bcc** list to maintain privacy.

Note:
Delegates of recipient list users do not receive published email notifications.

The process of publishing articles is based on workflows and two default workflows are provided: one to publish articles instantly and one that requires approval prior to publishing. Publication administrators can update workflows and add users with the publications approver (sn_publications.approver) role to perform reviews. Both authors and administrators can monitor publications and see which users have received and viewed the information.

Customer contacts and consumers can view publications by logging in to the Customer Service Portal or the Consumer Service Portal and selecting the **Publications** link in the portal header. Employees can view these publications by navigating to **Targeted Communications** > **Publications** in the application navigator.

Note:
For more info see, Components installed with additional plugins for Customer Service Management

Publication article stages

Publication articles progress through several stages which are displayed in a process flow formatter on the Publication form.

Publication stages

Stage	Definition
Author	The initial state of the publication creation process.
Review	Publications that are waiting for review. A publication cannot be updated when it is in the **Review** stage.
Ready To Publish	Publications that have been reviewed and are ready to be published.
Published	Publications that have reached their **Publish Date**.
Expired	Publications that have reached their **Expiry Date** or that have been manually expired.
Canceled	Pending publications that have been canceled.

States are shown in a process flow formatter at the top of the Publication form. The current state is indicated by a blue underline. States that have been completed are indicated by a blue check mark.

Publication lists

The Targeted Communications application menu includes several views of publication records.

Publications lists

State	Definition
Active Publications	Includes publications in the following stages: • Author • Review • Ready to Publish • Published
Draft Publications	Includes publications that have been created and sent for review.
Expired Publications	Includes publications that have reached their **Expiry Date** or have been set to **Expired**.

Recipients lists

Create the recipients list for a targeted communications that can include internal users, customer, accounts, contacts, and consumers. You can create the recipient list using the methods of user import, dynamic lists, or scripting.

When an article is published, the recipients on this list can view the article on the Customer or Consumer Service Portal. Recipients can also receive optional email notifications.

Recipients lists are also used by the Major Issue Management application to create child cases for a major case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recipients lists are created in the following ways:

- By creating a list of imported users.
- By creating a dynamic list based on selected conditions.
- By creating a script.

Recipients lists can have both dynamically generated and manually added records of the same type.

The system administrator can manage a scheduled job to refresh recipient lists. This scheduled job, *Targeted Communications Refresh recipient list*, adds new recipients to each of the active published articles. The new recipients receive email notification of the article and are granted access to view the article on the portal.

Create a recipient list by importing contact information

Create a recipient list by importing contact information. For contacts, supported file types include xls and csv.

Multiple files can be imported into the same recipient list, with new recipients appended to the recipient list file. The system checks that the accounts and contacts exist in the system and only imports those that exist. Duplicate entries are not created. At the end of the import process, the system displays a status with the number of records imported and rejected.

The system uses the sys_id and the email address attributes to match contacts. It first looks for a matching sys_id match. If not found, it then looks for a matching email address. If neither are found, the record is rejected.

Create a recipient list by importing account, consumer, or internal user information

Create a recipient list by importing account, consumer, or internal user information. The supported file type is xls.

The system uses the following attributes to match the imported records:

- Account: Uses the sys_id and the account number. Attempts to match the sys_id. If not found, then attempts to match using the account number. If neither are found, the record is rejected.
- Consumer and User: Uses the sys_id or the email address. Attempts to match the sys_id. If not found, then attempts to match the email address. If neither are found, the record is rejected.

Note:
Column names are case sensitive. For example, use **sys_id** and **number** for accounts and **email** for consumers and users.

Create a recipient list using a script

Create a recipient list using a script with these supported entities: contact, company/account, consumer, and internal user. The output of the script is an array of sys_ids of the corresponding entity. After creating the recipient list, the system shows the total number of records identified, added to the list, and rejected.

To create a recipient list using a script, select Dynamic Condition in the **Method** field on the Recipients List form and enable the **Show Script** check box. Then create your script in the **Script** field.

Add or remove an approver

Facilitate approval process by adding or removing approvers from your publication workflow.

Before you begin

Role required: sn_publications.admin

Procedure

1. Navigate to **All** > **Targeted Communications** > **Publication Workflow**.
2. Select a workflow.
   The approvers assigned to the workflow are displayed in the **Approvers** field.
3. To add an approver, click **Edit Approvers** next to the **Approvers** field and select an approver from the Users list.
   This list includes users with the sn_publications.approver role. The selected user is added to the **Approvers** field. Approvals on workflows is a platform functionality. For more information, see Approval and rollback workflow activities.
4. To remove an approver, click **Edit Approvers** next to the **Approvers** field, select the approver's name, and then click **Remove**.
   The approver's name is removed from the **Approvers** field.
5. Click **Update**.

Create a recipients list

Create and save a list of users to receive targeted communications.

Before you begin

Role required: sn_publications.author, sn_publications.admin, sn_customerservice_agent, sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task

A recipient list can include internal users, accounts, contacts, or consumers. Create a recipient list using any of the following methods:

- By importing a list of users.
- By creating a dynamic list based on selected conditions.
- By creating a script.

Recipients lists can have both dynamically generated and manually added records of the same type.

Note:
You must create at least one recipient list before creating a publication.

Procedure

1. Navigate to **All** > **Targeted Communications** > **Recipients Lists**.
2. Select **New**.
3. Fill in the fields on the Recipients List form.

Recipients List form

Field	Description
Name	The name of the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	The type of recipients to include in the list. ○ Contacts (customer_contacts) ○ Internal Users (sys_user) ○ Consumers (csm_consumer) ○ Accounts (customer_account)
State	The state of the recipient list. ○ **New**: The list has not yet been generated. Select **Refresh Recipient List**. ○ **In Progress**: The list is being generated. (You may only see this state when generating a large list of recipients.) ○ **Complete**: The list has been generated.
Method	The method used to generate the recipient list. ○ **Upload File**: Create a list by uploading user information from a selected Excel .xlsx file. ○ **Dynamic Condition**: Create a list by selecting conditions in the condition builder or by adding a script. **Note:** To exclude inactive users from receiving emails, use the condition builder to exclude inactive users from the recipients list.
Choose File	If the **Method** is **Upload file**, download an Excel template and then select an .xlsx file that contains the user information. The templates vary based on the entity selected in the **Type** field. For accounts, the template includes columns for sys_id and account number values. For contacts, consumers, and internal users, the template includes columns for sys_id and email values.
Show Script	If the **Method** is **Dynamic Condition**, enable this check box to create a recipients list using a script. Enabling this check box displays the **Script** field.
Script	The script used to create a recipients list.
Table	The table that stores the user information. Depending on the selection in the **Type** field, this field displays: ○ Contact [customer_contact] ○ User [sys_user] ○ Consumer [csm_consumer] ○ Account [customer_account]
User Field	The field that references the user record in the User (sys_user) table. Outlined are the sys_id's for the following types of recipient lists: ○ Contacts (customer_contacts) ○ Internal Users (sys_user) ○ Consumers (csm_consumer)
Account Field	The field in the selected table that stores the account information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is displayed for the following types of recipients lists: **Accounts**.
Conditions	Use the buttons in this field to build one or more conditions on the selected table. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by selecting the Delete button next to the condition.

4. Select **Submit**.
   For recipients lists created by file upload, selecting **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

Edit a recipients list

Modify targeted communication recipient lists using Dynamically Added column in Recipients related list.

Before you begin

Role required: sn_publications.author, sn_publications.admin, sn_customerservice_agent, sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager

About this task

The **Recipients** related list includes the **Dynamically Added** column which displays either True or False, depending on how a record was added:

- True for records that are dynamically generated, either by using the condition builder or by running a script.
- False for records that are added manually, either by using the **Edit** button on the **Recipients** related list or by file upload.

The **Active Communication** column is set to True by default for both dynamically and manually added records. This field indicates whether or not the recipient requires active communication.

Procedure

1. Navigate to **All** > **Targeted Communications** > **Recipients Lists**.
2. Select the desired list.
3. In the **Recipients** related list, click **Edit**.
4. Use the arrows to add or remove records.
5. Click **Save**.

Create a publication

Create a publication to send articles or emails to internal or external customers. You can specify the content type and include an optional email.

Before you begin

Role required: sn_publications.author or sn_publications.admin

About this task

Two options to consider when creating a publication:

- Include the optional email notification (default)
- Select the type of content: HTML or Wiki

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After creating an article, there are two publishing options:

- **Submit:** sets the stage to **Author** and saves the publication record.
- **Send for review:** sets the stage to **Review** and sends the publication to the approver.

Procedure

1. Navigate to **All** > **Targeted Communications** > **Create New Publication**.
2. Fill in the fields on the Publication form.

Publication form

Field	Description
Number	The automatically generated publication number.
Content Type	The type of data included in the publication. Select one of the following: ○ HTML: this content can include Rich Text formatted (RTF) text, images, attachments, and links. Enter the publication data in the **Content** field. ○ Wiki: this content can include plain text. Enter the publication data in the **Wiki** field. The default selection is HTML.
Category	If desired, select a category for the publication. The following categories are available: ○ Defect ○ Outage ○ Information
Recipient Lists	Select a predefined list to target specific customers. Recipient lists are created by the publication author or administrator.
Short Description	A brief description or title of the publication.
Publish Date	Select the publication date as any future date. Publications are sent automatically when the publish date and time are reached.
Expiry Date	Select the expiration date. This date must be at least one day after the **Publish Date**. Publications are automatically expired when the expiry date and time are reached.
Include Attach Links	Include links to any attachments in the email notification preview.
Content	This field appears when you select **HTML** as the **Content Type**. Enter the text of the publication in this field. HTML content can include Rich Text formatted (RTF) text, images, attachments, and links.
Wiki	This field appears when you select **Wiki** as the **Content Type**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Click the Wikitext button and enter the text of the publication in this field. Wiki content can include plain text.

3. Click one of the following options.

Option	Description
Submit	The stage is set to **Author** and the publication record is saved.
Send for Review	The stage is set to **Review** and the publication is sent to the approver for review. Approvers can navigate to **Self-Service** > **My Approvals** to see a list of review requests.

Publish a publication

Automatically publish a publication with an optional email notification to send to customers.

Before you begin

Role required: sn_publications.author or sn_publications.admin

About this task

Publications are automatically published at the date and time selected in the **Publish Date** field on the Publication form. When creating a publication, set the **Publish Date** and the **Expiry Date** fields to control when the publication is automatically published and expired.

Note:
A UI action to manually publish a publication is not available out of box. If needed, the system administrator can Create a UI action and add it to the Publication form.

When creating a publication, you can also include an optional email notification that is sent to all recipients in the recipients list when the publication is published. In this email notification, all recipients are included in a **bcc** list to maintain privacy.

Note:
To exclude inactive users from receiving emails, use the condition builder to exclude inactive users from the recipients list.

Procedure

1. Navigate to **All** > **Targeted Communications** > **Active Publications**.
2. Select the desired publication.
3. View the date in the **Publish Date** field.
   The system automatically publishes the publication on this date and time and sends an email notification to the recipients in the recipients list.

Note:

- If the system administrator has configured a UI action, you can use this UI action for manually publishing the publication.
- For more info, see Email templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a recurring publication

Review publications to either accept or reject them. You must have the publication's approval role to review the publication. If the publication is not reviewed before the Publish Date, the publication is rejected.

Before you begin

Role required: sn_publications.author or sn_publications.admin

About this task

You can specify the recurrence interval and the recurrence start and end date. The number of copies that are created are based on these settings and appear in the **Publications** related list on the original publication form. Each copy has a different publish date, which is based on the interval. Each copy gets reset to the **Author** state and each one goes through its own workflow.

Procedure

1. Do one of the following:
   - Navigate to **Targeted Communications** > **Active Publications**, open the desired publication, and click the **Setup Recurrence** related link.
   - Navigate to **Targeted Communications** > **Recurrences** and click **New**.
2. Fill in the fields on the Recurrence form.

Recurrence form

Field	Description
Short Description	A brief description or title of the publication.
Publication Template	The number of the publication being used as a template. ○ If you clicked the **Setup Recurrence** related link, this field displays the original publication number. ○ If you clicked **Recurrences** in the Targeted Communications menu, select a publication from the Publications list.
Recurrence Start	Select a date for the first occurrence of the recurring publications.
Recurrence End	Select a date for the last occurrence of the recurring publications.
Recurrence Interval	Select an interval for the recurring publications: ○ Daily ○ Weekly ○ Biweekly ○ Monthly ○ Custom
Custom Interval in Days	This field appears when you select **Custom** as the **Recurrence Interval**. Enter the number of days for the interval.

3. Click **Submit**.
   The recurring publications are created based on the selected dates and the recurrence interval and the stage for each copy is set to **Author**. The copies appear on the **Publications**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

related list on the original publication form, as well as on the Active Publications and the Draft Publications lists. From any of these lists you can open each publication and change the information as necessary. Each copy lists the publication template number in the **Recurrence** field.

A record of the recurrence appears on the Recurrences list.

Preview an email notification

Before sending a publication, authors or administrators can preview the email notifications, reviewing the recipient list, subject information, and publication content.

Before you begin

Role required: sn_publications.author or sn_publications.admin

About this task

Users can preview the following information for an email notification when the Customer Service plugin (com.sn_customerservice) is installed:

- The recipient list
- The subject of the publication
- The text of the publication and any attachments.

Procedure

1. Navigate to one of the following modules:
   - **Targeted Communications** > **Active Publications**
   - **Targeted Communications** > **Draft Publications**
2. Select the desired publication.
3. Click the **Preview Target Email** related link.
4. View the email notification in the Notification Preview window.
5. If desired, view the publication on the customer portal by clicking the link in the body of the email.
6. Close the Notification Preview window.
   Once the publication has been published, the customers in the recipient list should receive the email.

Update a publication

You can make changes to a publication that is in the **Author** or **Review** stages.

Before you begin

Role required: sn_publications.author or sn_publications.admin

Procedure

1. Navigate to one of the following modules:
   - **Targeted Communications** > **Active Publications**
   - **Targeted Communications** > **Draft Publications**
2. Open the desired publication.
   The stage of the publication must be either **Author** or **Review**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Make the desired changes.
4. Click **Update**.

Send a publication for review

Send publications for review, either the author or administrators, from the Author stage, triggering a transition to the Review stage. Approvers are automatically added to the Approvers related list.

Before you begin
Role required: sn_publications.author or sn_publications.admin

Procedure

1. Navigate to one of the following modules:
   - **Targeted Communications** > **Active Publications**
   - **Targeted Communications** > **Draft Publications**
2. Select a publication in the **Author** stage.
3. Click **Send For Review**.
   The publication stage is set to **Review** and the approvers are added to the **Approvers** related list on the Publication form.

   Approvers can navigate to **Self-Service** > **My Approvals** to see a list of review requests.

Review a publication

Users with the publications approver role that have been added as approvers to the publication workflow can review a publication.

Before you begin
Role required: sn_publications.approver or sn_customerservice_manager

About this task
After reviewing, an approver can either accept or reject a publication. If an approver does not review a publication before the **Publish Date**, the publication cannot be approved. The **Approve** button is not displayed and the approver sees a message that the publish date and time has passed. The approver can only reject the publication, which returns it to the **Author** stage.

The **Approvers** related list displays a list of approval tasks and includes most recent comment from each approver.

Note:
Delegate approval is not available in the Targeted Communications application.

Procedure

1. Navigate to **All** > **Self-Service** > **My Approvals**.
2. Select a publication for review from the Approvals list that has a state of **Requested**.
3. Review the publication summary at the bottom of the approval form.
4. Add review comments to the **Comments** field.
5. Click one of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Approve	The review state changes to **Approved** on the Approvals list and the publication stage is set to **Ready To Publish**. For other approvers of this article, the review state changes to **No Longer Required**.
Reject	The review state changes to **Rejected** on the Approvals list and the publication stage is set to **Author**.

View the list of approvers for a publication

Access and review the assigned approvers for a publication sent for review in Targeted Communications.

Before you begin

Role required: sn_publications.author or sn_publications.admin

Procedure

1. Navigate to one of the following modules:
   - **Targeted Communications** > **Active Publications**
   - **Targeted Communications** > **Draft Publications**
2. Open the desired publication.
3. Click the tab for the **Approvers** related list.
   The Approvers list includes the users with the publications approver role that have been added as approvers to the publication workflow.

Track a publication

Access a list of recipients for a publication and see which recipients have viewed the content.

Before you begin

Role required: sn_publications.author or sn_publications.admin

Procedure

1. Navigate to **All** > **Targeted Communications** > **Active Publications**.
2. Open the desired publication.
3. Click the **Publication Recipients** related list.
   For each recipient on this list, you can see if the customer has viewed the article.

Expire a publication

Expire a published article before it reaches the **Expiry Date**.

Before you begin

Role required: sn_publications.author or sn_publications.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Targeted Communications** > **Active Publications**.
2. Select an article that has been published.
3. Click **Expire**.
   The publication **Expiry Date** is set to the current date. The publication is removed from the Active Publications list and appears on the Expired Publications list.

Cancel a publication

Cancel a pending publication before it reaches the publish date.

Before you begin
Role required: sn_publications.author or sn_publications.admin

About this task
You can cancel a publication in any of the following stages: **Author**, **Review**, or **Ready to Publish**.

Procedure

1. Navigate to one of the following:
   - **Targeted Communications** > **Active Publications**
   - **Targeted Communications** > **Draft Publications**
2. Select the desired publication.
3. Click **Cancel**.
   The stage of the publication changes to **Cancelled**.

View a publication

Access the details of a publication and review them using the Targeted Communications menu.

Before you begin
Role required: sn_customerservice.customer

Note:
To view a published publication, see View a publication on the Customer Service Portal

Procedure

1. Navigate to **All** > **Targeted Communications** > **Publications**.
2. Select a publication from the Publications list.

Configure special handling notes

Use special handling notes to bring important case information to an agent's attention.

Before you begin
Role required: admin

About this task
Configure the desired entity tables to use special handling notes and then configure the corresponding forms to display either the Special Handling Notes list or pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**.
3. In the Case Management category, select the Special Handling Notes task.
   Configuring special handling notes includes the following steps.

Special Handling Notes configuration steps

Task	Description
Configure an entity table to use special handling notes	Configuring an entity to use special handling notes adds the **Create Special Handling Notes** related link to the corresponding entity form.
Configure a form to show special handling notes in a list or pop-up window	Configure a form to display special handling notes in either a list or a pop-up window.
Configure the necessary properties to display special handling notes	Configure properties that determine the frequency and the number of special handling notes that are displayed.

4. To perform the task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Related topics

Special handling notes

Configure an entity table to use special handling notes

Configure an entity table to use special handling notes.

Before you begin
Role required: sn_shn.admin

About this task
Configuring an entity to use special handling notes adds the **Create Special Handling Notes** related link to the corresponding form.

Procedure

1. Navigate to **All** > **Special Handling Notes** > **Configuration**.
2. Click **New**.
3. Select a table in the **Table name** field.
4. If desired, select one or more **Related Fields**.
   You can also display notes from related entities by including those fields in the configuration. For example, you can display notes for the account and contact associated with a customer service case by selecting the **Account** and **Contact** fields on the Case form.
5. Click **Submit**.
   The configuration is added to the Special Handling Configuration list.

Configure a form to show special handling notes

Display special handling notes on a form, such as the Case form, in either a form list or a pop-up window.

Before you begin

Role required: sn_shn.admin

Procedure

1. Navigate to a form such as the Case form.
2. Right-click the form header and select **Configure** > **Form Layout**.
   The system displays a pop-up window that gives you the choice to use Form Builder or continue with the following steps. Selecting **Try Form Builder** opens the Form Builder tool in a new window. For more information, see Accessing Form Builder.
3. Select **Not Now** on the pop-up window.
4. Select one or both of the following choices from the **Available** column and move it to the **Selected** column.
   - **Special Handling Notes List**
   - **Special Handling Notes Pop Up**
5. Select **Save**.

Related topics

Special handling notes

Configure special handling notes properties

Configure the necessary properties to display special handling notes.

Before you begin

Role required: sn_shn.admin

Procedure

1. Navigate to **All** > **Special Handling Notes** > **Properties**.
2. Configure the following properties.

Option	Description
Display special handling notes only once per session	Special handling notes are displayed each time you access a record. Enable this property to display special handling notes only once per session.
Maximum number of notes displayed in the Special Handling Notes pop-up window	Increase or decrease this number as desired. The default is 20 alerts.
Width of the Special Handling Notes pop-up window in pixels	The width of the pop-up window in pixels. The default width is 500. If you specify less that 300, the window automatically uses the default width.

3. Click **Save**.

Configure case action status

The case action status feature displays the status of cases in the Cases list. Customer service agents can use this feature to easily identify cases that need attention and quickly prioritize their work.

Before you begin
Role required: admin

About this task
Visual indicators in the Action Status column on the case list highlight case status:

- **Needs attention**: A blue indicator highlights cases that require attention, such as cases that have been updated by customers or internal users and are waiting for input or review. A blue indicator highlights cases that need attention.
- **Blocked**: A red indicator highlights cases that are blocked, such as cases that have open related task records or are waiting for customer feedback.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**
3. In the Case Management category, view the list of tasks to configure the feature.

Case Action Status

Task	Description
Activate Case Action Status	Activate the Case Action Status plugin (com.snc.csm_action_status) plugin to enable the case action status feature.
Configure actionable case flows	Enable or disable the actionable case flows that are provided with the Case Action Status plugin.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Case action status

Configure actionable case flows

The Case Action Status plugin provides several actionable case flows that create and resolve blocking tasks for different case-related actions.

Before you begin
Role required: admin

About this task
The actionable case flows included with the Case Action Status plugin are enabled by default. If you do not want to create blocking tasks for a specific action, you need to disable the associated flow. For more information about the case flows included with the plugin, see Actionable case flows.

Note:
The Case Action Status plugin provides case flows that create and resolve blocking tasks for problems associated with cases. To get complete functionality, you must also activate the Customer Service with Service Management plugin (com.sn_cs_sm). For more information, see Integrate with Service Management.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Actionable Case Flows**.
2. Review the list of case flows.
3. Set the **Active** field to false for the desired case flows.

Create cases as a proxy contact

The proxy contact role enables employees to create cases for customer accounts and contacts. Employees can also be proxy case contacts on behalf of customers.

Assign the proxy contact role (sn_customerservice.proxy_contact) to employees in your company who are not fulfillers or do not have other CSM-specific roles.

Note:
This role requires licensing for access to CSM applications. The proxy contact cannot co-exist with the contributor roles.

Employees with the proxy contact role can do the following:

- Create cases on behalf of customers by email, phone, chat, Virtual Agent, and from the Customer Service Portal.
- Create requests on behalf of customers from the Customer Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When creating a case, the employee can select a customer contact or a partner contact as the case contact. The employee is also added to the case as the internal contact.

From the Customer Service Portal, employees can do the following for the cases where they are the internal contact:

- View a list of cases.
- View case details.
- Add comments or attachments to a case.
- Accept or reject a case resolution.
- View a list of related work orders.
- Check the status of a case using Virtual Agent.

Customer service agents can create cases and designate an employee with the proxy contact role as the internal contact.

- From Agent Workspace, agents can create cases for employees from interaction records.
- From connect chat sessions with employees, agents can create cases that add the employee to the **Internal contact** field on the Case form.

Plugin information

Activate the CSM Extension for Proxy Contacts (com.snc.csm_proxy_contacts) plugin to enable this feature. This plugin adds the following to Customer Service Management:

- The sn_customerservice.proxy_contact role.
- The ProxyContactHelper script include.
- The **Internal contact** field on the Case form.
- The **Opened for** field on the Interaction form.

Note:
You need to configure the Interaction form to display the **Opened for** field and the Case form to display the **Internal contact** field.

Configure the Customer 360 ribbon component in Agent Workspace

With the workspace administrator role (workspace_admin), you can configure the Customer 360 ribbon component to display the internal contact for a case.

- If the **Contact** field (the primary field) is populated on the Case form, the Customer 360 component displays the contact information.
- If the **Consumer** field (the secondary field) is populated on the Case form, the Customer 360 component displays the consumer information.
- If the **Internal contact** field (the tertiary field) is populated on the Case form, and the **Contact** and **Consumer** fields do not contain any data, the Customer 360 component displays the internal contact (employee) information.

Internal contact field on Case form

When an employee with the sn_customerservice.proxy_contact role creates a case for a customer account, the **Internal contact** field on the Case form is populated with the employee's name. This field determines case visibility for the employee. From the Customer Service Portal, employees can see cases that they have created and are identified as the internal contact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This field appears on the Case form in both the platform interface and Agent Workspace.

When an agent creates a case, they can select an employee with the sn_customerservice.proxy_contact role in the **Internal contact** field.

Creating a case from the Customer Service Portal

An employee with the proxy contact role can create a case for a customer from the Customer Service Portal. As part of creating a case, the employee:

- Selects an account.
- Selects a contact from the available contacts for the account.
- Selects an asset or product for the account.
- Enters a subject and description for the case.

When the case is created, the employee is added to the **Internal contact** on the Case form.

Creating a case from an interaction record

An agent can create a case for an employee by clicking **Create Case** on the Interaction form. On the resulting Case form, the **Internal contact** field:

- Is set to the value from the **Opened for** field if the employee has the proxy contact role.
- Remains blank if the user in the **Opened for** field does not have the proxy contact role.

Creating a case via email

Employees can create a case by sending an email to the inbound email address. When the email is received, the system checks to see if the user has the proxy contact role.

- If yes, the case is created and the employee is added to the **Internal contact** field. The content of the email is logged in the case activity stream.
- If no, the case is not created.

Initiating a chat from the Customer Service Portal

Employees with the proxy contact role can initiate a chat with an agent directly from the Customer Service Portal or using Virtual Agent. This creates a chat request card with the employee's name in the agent's inbox.

- **Agent Workspace**: when the agent accepts the chat, the interaction record displays the employee name in the **Opened for** field.
- **Platform**: when the agent accepts the chat and creates a case a case from the chat session, the employee name is added to the Case form in the **Internal contact** field.

Check the status of a case using Virtual Agent

Employees with the proxy contact role can use Virtual Agent to check the status of a case where they are the internal contact.

After logging in to the Customer Service Portal and initiating Virtual Agent, use the options available with the **Check Case Status** topic.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing work orders

From the Customer Service Portal, employees with the sn_customerservice.proxy_contact role can see work orders for the cases where they are the internal contact. Employees can also add attachments to the work orders.

In the portal header, click **Support** > **Work Orders**.

Employee notifications

The system sends an email notification to the employee in the **Internal contact** field on the Case form when:

- The case is opened or closed.
- Comments are added to the case.

Configure auto close resolved cases

Use the auto close resolved cases feature to close cases automatically in the Resolved state if customers choose not to take action.

Before you begin
Role required: admin

About this task
Enable this feature by activating the **Auto Close Resolved Cases** Flow Designer flow. You can also create a configuration that enables both the system and agents to exclude cases from auto closure.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**
3. In the Case Management category, view the list of tasks to configure the feature.

Auto Close Resolved Cases

Task	Description
Activate Auto Close Resolved Case Flow	Activate the Auto Close Resolved Cases Flow Designer Flow, which identifies cases in the Resolved state that are waiting for a customer response and takes the following actions: ○ Sends a reminder notification to the customer after 5 days with no response that the case is pending solution acceptance. ○ Closes the case and sends a reminder notification to the customer after 10 days that the case has been auto closed.
Configure Business Rules for Auto Close Field	Configure the following business rules to enable or disable the **Auto Close** field on the Case form: ○ Mark for Auto Close ○ Clear Auto Close

Configure escalation management

Escalating a case or account raises awareness about important customer issues, facilitates communication, and enables users to track progress towards a resolution.

Before you begin

Role required: admin

About this task

An escalation provides increased attention to a customer issue and provides a way to track the progress made in resolving the issue. Create escalation templates and severity definitions to control the escalation process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**.
3. In the Case Management category, view the list of tasks to configure the feature.

Escalation Management

Task	Description
Create escalation templates	An escalation template determines how an escalation request is processed and includes the type of escalation (case or account), an approval list or workflow (if approval is required), and an escalation watch list.
Create escalation severity definitions	The escalation severity defines the type of escalation and the color used to represent the cases and accounts of this escalation severity in the user interface.

4. To perform a task, click **Configure**.

   The page in your instance where the configuration is completed is opened.

Case and account escalation

Use the case and account escalation feature to highlight specific cases or accounts and raise awareness of important customer issues.

Escalating cases or accounts facilitates communication about an issue and enables users to track progress toward a resolution. An escalation provides increased attention to a customer issue and provides a way to track the progress made in resolving the issue. Escalation is an internal process that is not exposed to customers. For more information, see Case and account escalation overview.

Users with the escalation requester role can request and manage case and account escalations. Users with the de-escalator role can de-escalate cases and accounts.

Case and account escalation

Escalate a case or an account

Users with the escalation requester role can escalate a case or account.

Before you begin

Role required: sn_customerservice.escalation_requester or sn_customerservice.deescalation_requester

Procedure

1. Navigate to the desired case or account.
2. Click the **Escalate Case** or the **Escalate Account** related link.
3. Fill in the fields on the Escalation form, as needed.

Escalation form fields

Field	Description
Number	The number automatically assigned to the escalation request.
Source Record	The case or account for which escalation is requested.
Request Source	The source of the case escalation request: ○ **Customer** ○ **Internal**
Reason	The reason for requesting the case escalation: ○ **Inactivity** ○ **Lack of Progress** ○ **Customer Imposed Deadline**
Escalation Severity	The escalation severity associated with this escalation, which defines the severity level for the escalation and the color used to highlight the escalated record in the user interface. ○ **High Severity**: escalated records are highlighted in red. ○ **Medium Severity**: escalated records are highlighted in orange.
Escalation Template	The escalation template selected by the user who requested the escalation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Watch List	The watch list for this escalation record. The watch list includes users on the escalation template and any users that you add for this record. For account escalations, you can **Add account team members to watch list**.
Assignment group	For account escalations, the assignment group for this account escalation.
Assigned to	For account escalations, the customer service agent assigned to this account.
Request By	The user who requested the escalation.
Escalation Justification	Additional information that explains why this escalation is needed.

4. Click **Submit**.
   If the escalation template includes an approval workflow, the approvers review the escalation request and either approve or deny the request (provide a reason). Once the escalation request is approved, the customer is notified.

Manage an escalated case or account

Manage and document the progress for an escalation using the case or account escalation record.

Before you begin

Role required: sn_customerservice_agent or sn_customerservice.consumer_agent

About this task

Perform tasks such as changing the escalation severity (which may trigger a different SLA), update the escalation trend, add or remove users from the watch list, and add comments.

- **Case escalations**: When managing a case escalation, the customer service agent typically performs most of the problem resolution work directly in the case record and the escalation record is primarily used for status reporting purposes. For example, updating the escalation trend and comments to escalation stakeholders. All updates to the case escalation record are automatically replicated to the case record as work notes. The escalation SLA is also associated with the case record rather than the escalation record because that is where the agent provides regular updates.
- **Account escalations**: For account escalations, the escalation record takes on a more important role because account escalations are more serious and are often associated with multiple underlying cases. An account escalation is typically assigned to an account escalation manager who works closely with multiple case owners to resolve the customer escalation. The account escalation manager can consolidate the status across the underlying cases and provide regular updates using the escalation record. Therefore, the SLA is associated with the escalation record.

Procedure

1. Navigate to the list of case and account escalation records by selecting **All** > **Customer Service** > **Escalations** > **All**.
2. Select the desired case or account escalation record.
   The **Source Record** field provides information about the related case or account.
3. Update the fields on the escalation form as needed.
   For example, you can change the escalation severity, which may trigger a different SLA, and update the escalation trend. You can also add users to the watch list and add comments about

the progress of the escalation. For more information about these fields, see Case and account escalation form.

4. Click **Update**.

De-escalate a case or an account

The de-escalation requester can de-escalate cases or accounts when the cause of the escalation is resolved.

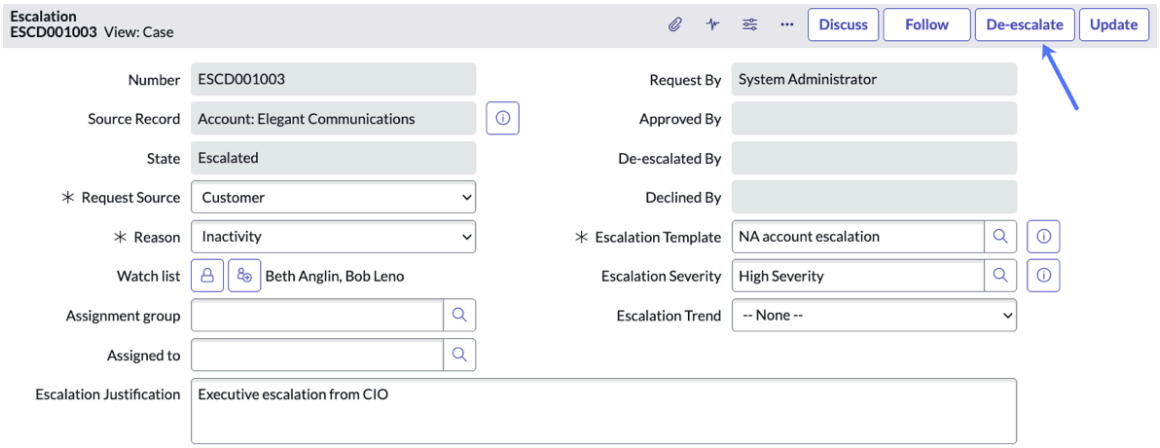
Before you begin

Role required: sn_customerservice.deescalation_requester

About this task

Procedure

1. Navigate to the desired escalation record.
2. Select **De-escalate** in the form header.
   This opens the De-escalate Case pop-up window.



3. Enter the necessary information in the **De-escalation Justification** field.
4. Select **De-escalate** on the window.
   The state of the escalation record changes to **Closed**.

Create a case or account escalation template

Create a template for each type of case or account escalation.

Before you begin

Role required: admin

About this task

An escalation template determines how an escalation request is processed and includes the type of escalation (case or account); an approval list or workflow (if approval is required), and an escalation watch list.

Procedure

1. Navigate to **All** > **Customer Service** > **Escalation Templates**.
2. Click **New**.
3. Fill in the fields on the Escalation Template form, as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Escalation Template form fields

Field	Description
Name	The name of the escalation template.
Skip Escalation Approval	Enable this check box to skip the need for approval. If skipped, escalations are automatically approved.
Use Default Approval Workflow	Enable this check box to use the default approval workflow (**Escalation - Approval**) provided with the escalation feature. If using the default approval workflow, select an **Approval Group**.
Add Case Assignment Group Manager to Approvers	For case escalation, enable this check box to add the manager of the case assignment group to the list of approvers.
Approval Group	If the **Use Default Approval Workflow** check box is enabled: ○ For the **Case Escalation** type, you can select an additional approval group. ○ For the **Account Escalation** type, you must select an approval group. **Note:** If there are no approvers, escalation requests are automatically approved.
Escalation Approval Workflow	The workflow used to approve escalation requests. Use the default **Escalation-Approval** workflow or select a different workflow.
Type	The type of escalation: ○ Case Escalation ○ Account Escalation
Escalation Watch List	Add users to the escalation template watch list. These users receive notifications for all escalations that use this escalation template. For an account escalation, the account team is automatically added to the watch list. **Note:** Users can also be added to the watch list on the escalation record.

4. Click **Submit**.

Create a case or account escalation severity

The escalation severity defines the type of escalation and the color used to represent the cases and accounts of this escalation severity in the user interface.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The assigned severity allows agents to easily identify escalated cases and accounts on lists and forms. The escalation feature provides two escalation severity definitions:

- **High Severity**: escalated records are highlighted in red.
- **Medium Severity**: escalated records are highlighted in orange.

The user interface determines which fields are highlighted for escalated cases and accounts:

- **Agent Workspace**: Field indicators and field highlights appear on the **Short description** field for escalated cases and on the **Name** field for escalated accounts.

  Note:
  You can move indicators and highlights to any field that is not a hyperlinked field.

- **Platform interface**: Escalated case and account numbers are indicated with a colored dot on a list and a colored background on a form.

Procedure

1. Navigate to **All** > **Customer Service** > **Escalation Severity**.
2. Click **New**.
3. Enter a **Name** for the severity.
4. In the **Style** field, enter a color.
   To configure additional escalation severity records, the system administrator must configure a new style with the desired color. For more information, see Highlight list fields.
5. Click **Submit**.

Configure case digests

The case digests feature enables you to provide periodic updates and resolution information about high priority customer service cases to customers and internal stakeholders.

Before you begin

Role required: admin

About this task

The case digests feature includes two types of case communication:

- **Case action summary**: While a case is in progress, agents can send periodic case updates that describe actions taken, next steps, and other case-related information.
- **Post case review**: When the work on a case has been completed, agents can a post a case review document that captures details about the issue, such as the root cause, mitigation plan, and preventive actions.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**
3. In the Case Management category, view the list of tasks to configure the feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Digests

Task	Description
Activate Case Digests	Activate the Case Digests (com.sn_csm_case_digest) plugin.
Create Assignment Rules	Assignment rules automatically assign tasks to users and groups when the rule conditions are met. Two rules are provided with the case digests feature that assigns the post case review and case action summary records to the case agent: ○ Auto- assign the CAS to case agent ○ Auto- assign the PCR to case agent For more information, see Case action summary and post case review assignment rules.
Create Approval Workflows	The case digests feature includes one approval workflow that triggers the approval process for post case reviews. This workflow provides a one-step process that obtains a list of approvers from the **Approval group** and **Approval users** fields on the Post Case Review form.
Create Document Templates	Document templates identify, organize, and format the content from the case digest record that is included in generated documents. Two document templates are provided with the case digests feature, one for post case reviews and one for case action summaries.
Create a Case Digest Configuration	Case digest configurations handle different types of case review processes based on business needs.
Create Mapping for Case Types	Create the mapping that identifies the case type fields that are copied to post case reviews and case action summaries.

4. To perform a task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Related topics

Customer Service case digests

Customer Service case digests

Use the case digests feature to provide periodic updates and resolution information about high priority customer service cases to customers and internal stakeholders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With this feature, you can send periodic case updates while a case is in progress using a case action summary. Once a case has been resolved, you can provide a post case review document that captures details about the issue, root cause, resolution, and preventive measures.

The case digests feature uses a configuration for case action summaries and post case reviews. The configuration determines the information from a customer service case that is captured as part of the case action summary or the post case review document. The configuration also identifies the template that is used to create the summaries and review documents.

Case action summaries

Use a case action summary to provide updates to customers and internal stakeholders while a case is in progress.

Customer service agents typically use case action summaries to communicate information about high priority cases and mass outage cases. Case action summaries can include both internal content and customer-visible information. The summaries available to customers include only the customer-visible information. The summaries available to internal users include both customer-visible information and internal content.

Customer service agents can:

- Create case action summaries for cases that are in progress.
- Preview summaries prior to publishing.
- Publish summaries to customers and internal stakeholders or publish to customers and send email notifications to internal stakeholders.
- Update and re-send summaries as needed.

Customer service agents use the **Send Case Action Summary** UI action to create a case action summary. This action creates a case action summary record and adds the record to the Related Records section on the Case form in the **Case Action Summary** field.

Customer service agents can preview a case action summary before publishing it to a case. In the preview, internal content appears after the customer-visible information and is identified with a message: **The following content is not visible to customers.**

When publishing a case action summary, agents have two options.

- When an agent clicks **Publish to Case**, the system takes the following actions:
  - Adds the information from the customer-visible fields to the **Additional comments** field.
  - Adds the information from all fields to the **Work notes** field.
- When an agent clicks **Publish to Case & Notify**, the system also sends an email notification with the case action summary to the internal users included in the recipient list selected in the **Additional internal recipients** field.

> **Note:**
> The **Publish to Case & Notify** UI action is available when a list has been selected in the **Additional internal recipients** field.

Closing a case automatically closes the corresponding case action summary.

Related topics

Create a case action summary

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Post case reviews

Use a post case review document to capture details about a resolved case, including a summary of the issue, affected assets, root cause, resolution, and any preventive measures.

Customer service agents use the **Create Post Case Review** UI action to create a post case review document. This action creates a case action summary record and adds the record to the Related Records section on the Case form in the **Post Case Review** field.

The configuration selected for post case review documents identifies the information from the customer service case that is captured and populated in post case review record. The configuration also specifies the template that the system uses to create the post case review document.

Before publishing a post case review document to a case, agents can preview the document and, if necessary, have it reviewed and approved. Agents can add an approval group or approval users to the Post Case Review record and then request approval. The system sends an email notification to the approvers with a link to the post case review document. The approvers can either approve the document or suggest changes by adding them to the **Work notes** field on the Post Case Review record.

When an agent publishes a post case review document, the system adds a link to a PDF of the document in the **Additional comments** field on the Case form. The system also adds the record to the Related Records section on the Case form in the **Post Case Review** field. If the document is available to customers, the link is visible from the Customer and Consumer Service Portals.

If a case is closed while the post case review document is in progress, agents can still update the **Additional comments** on the Case form with the post case review document link. Once a case is closed, the Post Case Review form displays a message that the associated case has been closed.

Customer service roles can perform the following actions for post case review documents.

Post case review actions by the Customer service roles

Role	Action
Customer service agent	• Create and preview one post case review document for a resolved case. • Request approval using an optional approval workflow. • Publish a post case review document to a case. • Reopen and edit a published post case review document.
Customer service manager	Review, approve, and suggest changes to post case review documents.
Major issue manager	• Create and publish post case review documents for resolved major cases. • Copy the documents to the associated child cases.

Post case review actions by the Customer service roles (continued)

Role	Action
Customer	View post case review documents from the Customer and Consumer Service Portals.

Post case reviews for major cases

Customer service managers and major issue managers can create and publish post case review documents for resolved major cases. These documents capture the case data specified in the configuration but do not include account-specific information. The customer service manager can also copy a post case review document to the associated child cases. The system adds the account-specific information when it generates the document for each child case.

The system administrator can enable post case review documents for major cases by setting the **sn_customerservice.parent_child_case_sync** system property to true.

Note:
Setting this property to true disables the **Create Post Case Review** UI action for child cases.

Create a post case review

Create a post case review for a major case

Post case review record states

Post case review records can be in a number of different states as they are created, approved, and published.

Different states of post case review records

State	Description
New	A case review record has been created but is not yet assigned to an agent.
In Progress	A case review record has been created and is assigned to an agent.
Awaiting Approval	An agent created a case review document from the case review record and sent it to one or more approvers.
Approved	The case review document has been approved by one or more approvers.
Closed	The case review record has been closed.

Post case review approvals

Enable an optional approval process for post case review documents.

In the case digest configuration, the system administrator can:

- Enable the approval process by selecting an approval workflow.
- Use a condition builder to define the conditions that determine the post case review documents that require approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

One approval workflow, **Post Case Review - Default Approval**, is provided with the Case Digests plugin. This workflow reads the approvers from the **Approval group** and **Approval Users** fields on the Post Case Review form and sends an approval request notification to each user.

Approvers receive an email notification with a link to the post case review document. Approvers can either approve the document or suggest changes by adding them to the **Work notes** field on the Post Case Review form. The agent receives a notification when an approver approves the case review document or suggests changes.

- If the approver suggests changes, the agent can see the changes in the **Work notes** field.
- If the approver approves the document, the status of the post case review record changes to **Approved**.

Case action summary and post case review assignment rules

Use assignment rules to assign case action summaries and post case review documents to customer service agents.

The Case Digests plugin includes two assignment rules:

- **Auto assign the CAS to case agent**
- **Auto assign the PCR to case agent**

When an agent clicks either **Send Case Action Summary** or **Create Post Case Review** on a case record, the system creates the corresponding record and automatically assigns it to that agent.

The system administrator can modify these assignment rules or define different rules to assign case action summary and post case review records. The system populates the **Assigned to** field on the Case Action Summary or Post Case Review form with the user determined by the assignment rule. If there are no active assignment rules, the **Assigned to** field remains blank and the record can be assigned manually.

If using the provided assignment rules that auto assign the records to the same agent:

- The agent clicks **Send Case Action Summary** or **Create Post Case Review** on the Case form.
- The corresponding record opens with the agent's name in the **Assigned to** field.
- The record state is **In Progress**.

If using assignment rules that do not auto-assign the records to the same agent:

- The agent clicks **Send Case Action Summary** or **Create Post Case Review** on the Case form.
- The corresponding records are created but are not displayed.
- If assigned to another agent, the **Assigned to** field displays the agent's name and the state updates to **In Progress**.
- If unassigned, the record remains in the **New** state.

Create a case action summary

Create a case action summary for a customer service case.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task

You can send case action summaries for customer service cases that are in any states other than **New** or **Closed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After creating a case action summary, the record is added to the Case form in the Related Records form section. Closing a case automatically closes the corresponding case action summary.

Procedure

1. Open a customer service case.
2. To create a case action summary, do one of the following.
   - Agent Workspace: Click the More UI Actions icon (•••) and select **Send Case Action Summary**.
   - Platform interface: Click the form context menu icon and select **Send Case Action Summary**.

   This opens a new Case Action Summary form with a status of **In progress**. Depending on the table map configuration defined for the case action summary, some of the information from the case is copied to the Case Action Summary form. With the CAS Configuration, this includes the information from the **Short description** field.

   Note:
   The **Short description** field on the Case Action Summary form can be edited in the platform interface but cannot be edited in Agent Workspace.

3. In the Case Action Summary form, enter any necessary information in the following fields.

Case action summary form

Field	Description
Additional internal recipients	Select a recipient list. When an agent clicks **Publish to Case & Notify**, the system sends an email notification to the internal users in the selected list.
Short description	The short description from the case.
Case summary	A brief summary of the case.
Actions taken	Details about actions taken so far to resolve the case.
Next steps	The steps that the agent is planning to take in order to resolve the case. This field is not customer visible.
Internal notes	Other internal information that the agent wants to share regarding the case. This field is not customer visible.

4. Click **Preview** to generate the case action summary and view it in the Preview Document pop-up window.
5. **Optional:** Make any desired changes to the fields on the Case Action Summary form and click **Preview** again.
6. Click **Update** to save the changes to the case action summary.
7. Publish the case action summary using one of the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a post case review

Create a post case review document for a resolved case that captures the configured case information.

Before you begin

Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task

You can create post case review documents for customer service product cases that are in the **Resolved** state. Creating a review document is a multi-step process that involves:

- Creating a post case review record from a case.
- Previewing the generated review document and making any corrections.
- Requesting approval, if necessary.
- Publishing the review document so that it is available to customers, internal stake holders, or both.

You can create one post case review document per case. If this document has already been created, the **Create Post Case Review** menu option is not available. You can view and edit the post case review document from the Related Records form section.

If a case is closed while the post case review is in progress, you can still update the **Additional comments** field on the Case form with the Post Case Review document link. When the case is closed, the system displays a message about the case closure on the Post Case Review form.

Procedure

1. Open a customer service case in the **Resolved** state.
2. To create a post case review record, do one of the following:
   - Agent Workspace: Click the More UI Actions icon (•••) and select **Create Post Case Review**.
   - Platform interface: Click the form context menu icon and select **Create Post Case Review**.
3. In the Post Case Review form, enter any necessary information in the following fields.

   Some information is copied from the Case form to the Post Case Review form, such as the short description and the resolution information.

Post Case Review form

Field	Description
Number	The automatically assigned post case review record number.
Case number	The case number from which this post case review record was created.
Assigned to	The agent assigned to the post case review record.
Commitment Date	The expected completion date of the post case review.
Assignment group	The group assigned to the post case review record.
Approval group	The group assigned to review and approve the post case review record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is visible if an approval workflow is selected in the case digest configuration.
Approval users	The users assigned to review and approve the post case review record. This field is visible if an approval workflow is selected in the case digest configuration.
Short description	Copied from the **Short description** field on the Case form.
Summary	A summary of the issue.
Symptoms	Specific symptoms or problems created by the issue.
Root Cause Analysis	Copied from the **Cause** field in the Resolution Information section on the Case form.
Solution Provided	Copied from the **Resolution notes** field in the Resolution Information section on the Case form.
Preventive Measures Taken	Any measures taken to prevent the issue from happening.
Work notes list	Internal users who receive a notification about this case when work notes are added.
Work notes	Information about how to resolve a customer service case, or steps taken to resolve it, if applicable.
Activities	Records all activity associated with this record.

4. Click **Preview** to generate the review document and view it in the Preview Document pop-up window.
5. **Optional:** Make any desired changes to the fields on the Post Case Review record and click **Preview** again.
   You can edit the content in the Post Case Review record if the state is **New** or **In Progress**. Clicking **Preview** creates a preview of the document with the latest record information.
6. **Optional:** If approval is required, complete the following steps:
   a. Add an **Approval group**.
   b. Add one or more **Approval users**.
   c. Click **Request Approval**.

   (Optional) You can request approval for a post case review document before sharing it with customers or internal stake holders. When approval is requested, the status of the post case review moves to **Awaiting Approval** and the record is locked for edits.

   An email is sent to the approvers with a link to the post case review document. The approvers can either approve the document or suggest changes by adding them to the **Work notes** field on the Post Case Review record. The agent receives a notification when an approver approves the case review document or suggests changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the approver suggests changes, the agent can see the changes in the **Work notes** field.
- If the approver approves the document, the status of the post case review record changes to **Approved**.

7. Click **Save**.
8. Click **Publish to Case** to update the case with the Post Case Review document.
   The document is included as a link in the **Additional comments** field on the Case form. If the document is available to customers, the link is visible from the Customer and Consumer Service Portals.

Create a post case review for a major case

Create a post case review document for a resolved major case that captures the configured case information.

Before you begin

Role required: sn_customerservice_manager, sn_majorissue_mgt.major_issue_manager, or admin

About this task

You can create a post case review document for a resolved major case if the **sn_customerservice.parent_child_case_sync** is set to true.

> **Note:**
> Setting this property to true disables the **Create Post Case Review** UI action for child cases.

Procedure

1. Open a major case in the **Resolved** state.
2. Complete steps 2 through 7 in the Create a post case review topic.
3. Select one of the following options.

Review and approve a post case review document

Review and approve a post case review document for a resolved case.

Before you begin

Role required: sn_customerservice_manager or admin

About this task

When a customer service agent creates a post case review document that requires an approval, the system sends an email notification to the list of approvers. This email contains the following information:

- A short description of the case and the agent assigned to the case.
- Links to the post case review and case records.
- A link to download the post case review document.
- Links to approve the document or suggest changes.

When a post case review record is in the **Awaiting Approval** state, approvers can access the **Approve** and **Suggest Changes** UI actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Click the link in the email to download the post case review document.
2. Review the document.
3. To suggest changes to the document:

   a. Click the link in the email to suggest changes.
   Alternately, click the link to open the post case review record and then click **Suggest Changes**.

   b. Add the information in the **Work notes** field on the Post Case Review record.

4. To approve the document:
   - Click the link in the email to approve the document.
   - Click the link to open the post case review record and then click **Approve**.

   The state of the post case review record changes to **Approved**.

Re-open a post case review document

Re-open an approved post case review document if you need to make changes or update information.

Before you begin
Role required: sn_customerservice_agent, sn_customerservice_manager, or admin

About this task

Procedure

1. Open a customer service case.
2. In the Related Records form section, access the record in the **Post Case Review** field.
3. Click **Re-open** on the Post Case Review form.
   The status of the record reverts to **In Progress**.
4. Make the necessary changes to the fields on the Post Case Review form.
5. Click **Preview** to generate the review document and view it in the Preview Document pop-up window.
6. **Optional:** Click **Request Approval**.
7. Click **Publish to Case**.

Withdraw post case review approval

Withdraw a post case review document after sending it for approval.

Before you begin
Role required: sn_customerservice_manager or admin

Procedure

1. Navigate to **All** > **Case Digest** > **My Post Case Reviews**.
2. Click and open a post case review which is in **Awaiting Approval** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Withdraw**.
   The post case review document is now in **In Progress** state and approvers are notified by email that the request for approval is no longer required. You can edit the post case review document and resend it for approval.

Cancel post case review

Cancel a post case review that hasn't been approved, rejected, or no longer requested state.

Before you begin

Role required: sn_customerservice_manager or admin

Procedure

1. Navigate to **All** > **Case Digest** > **My Post Case Reviews**.
2. Select and open a post case review that you want to cancel.
3. Select **Cancel**.

Note:
If the post case review state was awaiting approval, approvers are notified by email that the post case review has been canceled and approval is no longer required.

The post case review document is now in **Canceled** state.

Re-open a post case review document

Components installed with case digests

Several types of components are installed with the Case Digests plugin.

Tables

The Case Digests plugin adds the following tables:

- Case Digest Configuration (sn_csm_case_digest_config)
- Case Digest (sn_csm_case_digest_task)
- Post Case Review (sn_csm_case_digest_pcr)
- Case Action Summary (sn_csm_case_digest_cas)

The Customer Service Document Template plugin adds the CS Document Template (sn_csm_doctemplate_template) table.

Extension points

The Case Digests plugin includes the following extension points. Customers can use these extension points to customize the publish action.

Case digests extension points

Extension point	Description
sn_csm_case_digest.CASPublish	Use this extension point to alter the functionality of publishing a case action summary to a case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case digests extension points (continued)

Extension point	Description
sn_csm_case_digest.PCRPublish	Use this extension point to alter the functionality of publishing a post case review document to a case.
sn_csm_case_digest.MajorPCRPublish	Use this extension point to alter the functionality of publishing a post case review document to a major case.

Activate Case Digests

Activate the Case Digests plugin to use the case digests feature.

Before you begin
Role required: admin

About this task
The Case Digests plugin automatically activates the following plugins:

- Customer Service (com.sn_customerservice)
- Customer Service Document Template (com.sn_csm_doc_template)
- ServiceNow Document Viewer (com.snc.documentviewer)
- Targeted Communications (com.sn_publications)

The Case Digests feature uses the recipient lists feature from the Targeted Communications plugin (sn_publications).

When creating a case action summary record, users with the sn_esm_agent role can select a recipient list of the type Internal Users. Selecting the **Publish to Case & Notify** UI action on the Case Action Summary form sends an email notification to the users included in the selected recipient list.

Note:
The **Publish to Case & Notify** UI action is available when a list has been selected in the **Additional internal recipients** field.

For more information, see Recipient lists.

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the plugin com.sn_csm_case_digest.
3. Click **Activate**.

Create a document template

Create a template to use for generating case action summaries or post case review documents.

Before you begin
Role required: admin

About this task
Document templates identify the information to be included in case action summaries and post case review documents. Create a document template to select, organize, and format the content

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

included in the generated documents. You can create a new template or modify an existing template. Two document templates, **CAS Template** and **PCR Template**, are included with the Case Digests plugin.

Procedure

1. Navigate to **All** > **Case Digest** > **Administration** > **Document Templates**.
2. Click **New** to create a template.
   You can also modify an existing template by clicking the template name and opening the template form.
3. Fill in the following fields on the CS Document Template form.

CS Document Template field description

Field	Description
Name	The template name.
Table Name	The table that contains the fields to include in the document template. ○ Case Action Summary [sn_csm_case_digest_cas] ○ Post Case Review [sn_csm_case_digest_pcr]
Header Image	Click to add an image file to use in the document header.
Footer Text	Text to include in the document footer.
Header Position	The position of the image within the header: ○ Left ○ Center ○ Right
Body	The content to include in the generated case action summary or post case review document. Add content by selecting fields from the table identified in the **Table Name** field. Selected fields are added to the text editor.
Internal content	The content in the case action summary that is for internal users only. This field is available if the Case Action Summary table is selected in the **Table name** field.

4. Click **Submit** or **Update**.

Create a case digest configuration

Create case digest configurations to handle different types of case review processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
As part of creating a case digest configuration, you can define the specific information from a customer service case that needs to be captured as part of the review. Two configurations are included with the Case Digests plugin:

- CAS Configuration
- PCR Configuration

Procedure
1. Navigate to **All** > **Case Digest** > **Administration** > **Configuration**.
2. Click **New** to create a new configuration.
   You can also modify an existing configuration by clicking the configuration name and opening the configuration form.
3. Fill in the following fields on the Case Digest Configuration form.

Case Digest Configuration form fields

Field	Description
Name	The configuration name.
Table name	The table that contains the fields to include in the configuration. ○ Case Action Summary [sn_csm_case_digest_cas] ○ Post Case Review [sn_csm_case_digest_pcr]
Order	Determine the order for the configuration. When multiple configurations match for a case, the configuration with the lowest order number is used.
Document template	Select a template to use when creating a case action summary from the Case Action Summary form or a post case review document from the Post Case Review form. You can select from a list of templates that have been defined for the table selected in the **Table name** field.
Case table	A read-only field that displays the Case [sn_customerservice_case] table.
Approval workflow	If using an optional approval workflow, select the workflow from the Workflow list.
Case condition	Use the condition builder to select the case conditions to which this configuration applies.

4. Click **Submit** or **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a case digest table map

Create a table map to configure the fields that are copied from the case record to the post case review or the case action summary records.

Before you begin

Role required: admin

About this task

Two table maps are included with the Case Digests plugin. The **PCR Map** uses the Case (sn_customerservice_case) table as the source table and the Post Case Review (sn_csm_case_digest_pcr) table as the target table. The **PCR Map** maps the following fields.

Case fields and Post Case Review fields on the PCR Map

Case field	Post Case Review field
sys_id	Case number
Short description	Short description
Cause	Root Cause Analysis
Close notes	Solution provided

The **CAS Map** uses the Case (sn_customerservice_case) table as the source table and the Case Action Summary (sn_csm_case_digest_cas) table as the target table. The **CAS Map** maps the following fields.

CAS MAP case fields

Case field	Case Action Summary field
sys_id	Case number
Short description	Short description

Procedure

1. To access the CSM Table Map list, navigate to **csm_table_map_list.do**.
2. Click **New** to create a new table map.
   You can also modify an existing table map by clicking the map name to open the map form.
3. Fill in the following fields on the CSM Table Map form.

CSM Table Map form fields

Field	Description
Mapping name	The table map name.
Application	Read only. The application for this table map.
API Name	Read only. The API for this table map.
Advanced Field Mapping	Enables advanced field mapping.
Source Table	The source table for the map.
Target Table	The target table for the map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Enables the mapping from the source to the target tables.
Use Advanced Condition	Enables advanced condition mapping, which uses a script. If enabled, add a script in the **Advanced Condition** field.
Advanced Condition	The script to use if the **Use Advanced Condition** field is enabled.
Conditions	Use the condition builder to select the conditions that apply to the table map.
Order	Order of priority for processing multiple matching map definitions simultaneously to resolve dependencies. ○ If there is only one matching table map, the system uses that map. ○ If there are multiple matching table maps with the same order, the system uses the map with the older created date. ○ If there are multiple matching table maps with different orders, the system uses the map with the highest order.

4. Click **Submit**.
5. From the CSM Table Map list, select the table map created in step 2.
6. In the Basic Field Mapping form section, click **New**.
7. Select a **Source Field** and a **Target Field**.
8. Enable the **Active** check box.
9. Enter a number in the **Order** field
10. Click **Submit**.
11. Repeat steps 7 through10 for each field to be mapped.
12. Click **Update** on the CSM Table Map form.

Create a table map for case types

Create table maps to configure the case type fields that are copied from a case record to the post case review or the case action summary records.

Before you begin
Role required: admin

About this task
Case Type tables extend from the Case table but do not inherit the table mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Access the CSM Table Map list by navigating to **csm_table_map_list.do**.
2. Create two new table map records in the Case Digest scope, one for the post case review mapping and one for the case action summary mapping.
3. In the first record:
   a. Select the desired Case Type table in the **Source Table** field.
   b. Select the Post Case Review (sn_csm_case_digest_pcr) table in the **Target Table** field.
   c. Click **Submit**.
4. In the second record:
   a. Select the desired Case Type table in the **Source Table** field.
   b. Select the Case Action Summary (sn_csm_case_digest_cas) table in the **Target Table** field.
   c. Click **Submit**.
5. For the two new case type table map records, map the fields from the source table to the target table in the Basic Field Mapping form section.
   For details, see Create a case digest table map.
6. Click **Update**.

Customer service case types

A case type represents the processes and the data that are needed to resolve a specific type of customer issue. Use the case types feature to create and configure the different types of customer service cases that your organization needs.

Customers can use case types to support a wide variety of end user needs, including:

- Diverse industries and products
- Complex processes, events, and systems
- Collaboration with multiple users

A good example of an industry that benefits from multiple case types is the banking industry. Within a bank, customer service agents can use this feature to create case types for different customer needs such as loan processing, credit card processing, or managing complaints.

Case types overview

Configuring case types

System administrators configure the case types feature by creating a table for the new case type that extends the Case table and then setting up a number of different processes and components for the case type.

- The Case Types Guided Setup section below provides an overview of these setup steps.
- For details about the case type guided setup tasks, see Configure customer service case types.

Managing case types

After a case type has been created, system administrators can view the case types, manage settings, and update the configuration. For more information, see Manage customer service case types.

Using case types

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agents can use the case types feature when creating cases for customers by selecting from a list of configured case types. For more information, see the Using case types to create cases section below.

Customer service case types plugin

Users with the system administrator role can activate the Customer Service Case Types plugin (com.snc.csm_case_types).

Activating this plugin adds the **Customer Service** > **Case Types** module to the application navigator. The system administrator can use this module to create and manage case types.

Product Model and Catalog Items Relationship plugin deprecation

The Customer Service Case Types plugin replaces the Product Model and Catalog Items Relationship plugin (com.snc.product_catalog_relationship), which is being prepared for future deprecation. Use the Service definitions feature, available with the Customer Service Case Types plugin, to create definitions for the services that are offered to support your products. Then configure the service definitions to associate them with the appropriate products and catalog items.

For details, see the Deprecation Process [KB0867184] article in the Now Support knowledge base.

Customer service case types applications

The following applications for specific case types are available from the ServiceNow® Store.

Application	Description
Case Playbook for Onboarding (sn_csm_onboarding)	Provides an onboarding case type to capture the details when onboarding customers for a product or service and a playbook that provides step-by-step guidance through the lifecycle of the onboarding process.
Case Playbook for Complaints (sn_csm_complaint)	Provides a complaint case type to capture the details for a customer complaint and a playbook that provides step-by-step guidance through the lifecycle of the complaint.

For more information, see Install a ServiceNow Store application.

Note:
These applications have dependencies on the following plugins:

- Customer Service Case Types (com.snc.csm_case_types)
- Customer Service Case Action Status (com.snc.csm_action_status)

Case Types Guided Setup

Activating the Customer Service Case Types plugin adds the Case Types section to the Customer Service Management Guided Setup. Navigate to **Customer Service** > **Administration** > **Guided Setup** > **Case Types** and use the tasks in this section to create and configure a case type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure a number of different processes and components for a customer service case type, including client scripts and business rules; views, roles, and ACLs; and notifications and record producers.

To create and configure a new case type:

- Create a table for the new case type that extends the Case table (sn_customerservice_case).
- Configure UI actions, UI policies, and client scripts for the new case type.
- Configure views and view rules, roles and ACLs, and business rules for the new case type.
- Set up processes for the case type, including record producers, state flows, and special handling notes.
- Create a case type definition record for the new case type and add it to the Case Type table (sn_case_type).
- Configure the **Get Case Types** flow and modify the conditions that determine visibility for a case type.

For more information, see Configure customer service case types.

Using case types to create cases

Customers can extend the Case table to handle different types of cases. Each extended case type can support multiple types of requests. For example, if a customer creates a case type for Credit Card Services, this case type can support requests such as applying for a new card and reporting a lost or stolen card.

When creating cases, customer service agents select the case type that corresponds to the customer issue.

- In CSM Configurable Workspace and CSM Agent Workspace, agents select a case type from the case type selector.
- In the platform interface, agents select a case type from an interceptor.

In CSM Configurable Workspace, there are several versions of the case type selector that can be configured for agents to use when creating cases of a specific type. These versions include multi-select, single-select, and Product Service Select. The multi-select version is the default functionality. In CSM Agent Workspace, agents can use the multi-select version of the case type selector.

- Create a customer service case of a specific type
- Create a case task of a specific type for a customer service case

Configuring customer service case types

Configure case types to handle different types of customer issues. A case type identifies the processes and the data needed to resolve a specific type of issue.

Before you begin

Role required: admin

About this task

For each case type, you create a table that extends the Case table and configure a number of items, such as business rules and client scripts, that drive customer issues of this type from creation to resolution. When creating cases, agents can select the case type that corresponds to the customer issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There are a sequence of tasks that enable you to configure case types for Customer Service Management. To configure Proactive Customer Service Operations, use the Customer Service guided setup. The guided setup takes you through the entire setup and configuration process.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, click **Get Started**
3. In the Case Types category, view the list of tasks to configure the feature.

Case types configuration tasks

Task	Description
Create Case Types	The first step in creating a case type is to create a table for the case type that extends the Case table (sn_customerservice_case). **Note:** This table should be created in a scope other than global. You can create a table for the case type using one of these methods: ○ Guided Application Creator ○ Platform table creation feature (navigate to **System Definition** > **Table** and click **New**) The extended table for the case type inherits most of the functionality of the Case table.
Set Up View Rules	View rules determine the form views that are available to users. Create view rules that determine the conditions for when the system displays the Case Type table in a specified view.
Set Up States for State Flows	State flows enable you to customize transitions from one state to another in tables derived from the Task [task] table, including the Case [sn_customerservice_case] table and tables extended from Case. You can configure the system to perform work during transitions to specific states. Create choice records for each of the states to be used in state flows for the case type. When creating your desired states, set the **Table** field to the table for the case type and the **Element** field to State.
Set Up UI Policies	UI policies dynamically change the behavior of information on a form, such as setting a field to read-only or making a field mandatory. The case type inherits the following UI policies from the Case table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
	○ Show or hide major case information section ○ Make Partner Contact Read only If Partner is empty You can configure additional UI policies for the Case Type form.
Set Up Client Scripts	Client scripts allow the system to run JavaScript on the client when client-based events occur, such as when a form loads or when a field changes value. The case type inherits the following client scripts from the Case table: ○ Empty Partner Contact on Partner Change ○ Empty Case Form on Account Change ○ Hide Request Related List ○ Hide SM section and list if no plugin ○ Hide Related Records Section You can configure additional client scripts for the case type.
Set Up Business Rules	A business rule is a server-side script that runs when a record is displayed, inserted, updated, or deleted, or when a table is queried. Use business rules to accomplish tasks like automatically changing values in form fields when certain conditions are met, or to create events for email notifications and script actions. You can set up the desired business rules for the Case Type table.
Set Up Case Type UI Actions	UI actions include the buttons, links, and context menu items that appear on lists and forms. A case type inherits the UI actions from the Case table. You have the following options when setting up UI actions for a case type: ○ Create new UI actions for the case type. If you create a new UI action, select the Case Type table in the **Table** field on the UI Action form. ○ Use any of the inherited case UI actions. ○ Use a combination of the two. You can also block any inherited case UI actions that you do not want. To block an action, update the **CSUIActionsimpl** script include.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Enable the **Create Case** UI action for case type selection	This procedure adds the **Create Case** UI action to records in the configured table. Selecting this UI action displays the case type selector. **Note:** For CSM Configurable Workspace, the **Create Case** UI action for case type selection is disabled out of box.
Set Up Case Types	Register a newly created case type by creating a case type definition record. This record is stored in the Case Type table (sn_case_type) and includes the following information: ○ The name of the case type ○ The table created for the case type ○ An optional category ○ An optional subtype ○ A short description ○ A field for setting the case type to active The Case Type table extends the Application File table (sys_metadata). This table includes a **Domain** column that customers can use to add their own logic. To create a case type definition record, navigate to **Customer Service** > **Manage Case Types** and click **New**. After creating and saving the case type definition record, you can configure the following process information for the case type using the related lists on the Case Type form: ○ State flows ○ Special handling notes ○ SLAs ○ Email templates ○ Quick messages ○ Reports For more information, see Manage customer service case types. **Note:** These related lists only display information for the new case type. They do not include information for the base case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Set Up Notifications	Notifications keep users informed about different activities and events. You can determine the conditions when a notification appears by creating a record in the Notification table.
Set Up Roles	Create one or more roles to control access to the case type features and capabilities. Then grant these roles access to the desired applications and modules. For agents to work on a case type, configure the case type role to contain the sn_customerservice_agent role.
Set Up ACLs	Use Access Control List rules (ACLs) to restrict access to data. These rules require users to pass a set of requirements before they can interact with data. For external customers to see a case type, add ACLs that provide read or create access for external users.
Set Up Case Type Selection Conditions	When creating a case of a specific type, an agent clicks **Create Case** and then selects from a list of available case types. The system presents the case types that have been configured for the agent's role. To set up case type selection conditions, use Flow Designer to configure the **Get Case Types** flow and modify the conditions that determine visibility for a case type. There are two different implementations of the **Create Case** UI action: ○ The Customer Service plugin provides a **Create Case** UI action that agents can use as follows: ▪ To create a base case. ▪ To create a case for one specific case type. For example, if your organization always creates the same type of case and you have created only one extension of the Case table, you can modify this UI action to create a case of that specific case type. ○ The Customer Service Case Types plugin also provides a **Create Case** UI action that agents can use to create a case based on a selected case type. After clicking this UI action to create a case, the agent selects the desired case type from a list of multiple available case types.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
	Note: It is recommended that you configure one of the **Create Case** UI actions but not both to avoid confusion.
Set Up Record Producers	A record producer is a specific type of catalog item that enables users to create task-based records, such as case records, from the service catalog. Create a record producer that exposes the new case type on the Customer Service Portal.
Set Up Case Digest for Case Types	The case digest feature enables agents to proactively communicate with customers and internal stakeholders about cases. While a case is in progress, agents can send periodic case summaries that describe actions taken, next steps, and other case-related information. When the work on a case has been completed, agents can create a post case review that includes information such as the root cause, mitigation plan, and preventive actions. **Note:** Using case types with the case digest feature requires the Customer Service Case Types plugin (com.snc.csm_case_types) and the Case Digests plugin (com.sn_csm_case_digest). Cases that are created from a selected case type can use Case Action Summaries and Post Case Reviews. To create the mapping that identifies the case type fields that are copied to Post Case Review and Case Action Summary records: ○ Create a configuration for the desired case type. Navigate to **Case Digests** > **Configuration** and click **New**. ○ Create new records in the CSM Table Map table (csm_table_map) to map the **Send Case Action Summary** and **Create Post Case Review** UI actions. The Case Digests related list on the Case Type form shows the case action summaries and post case review configurations for a case type.
Set Up Contextual Search for Case Types	Navigate to **Contextual Search** > **Table Configuration** and create a table configuration record to add contextual search

Task	Description
	to the case type. In this record, configure the **Table** field as the case type and the **Search Context** field as Case Knowledge Base Search.
Set Up Agent Workspace for Case Types	To configure Agent Workspace differently for each case type, follow the Agent Workspace Guided Setup. You can configure the following features specific to each case type: ○ Workspace lists ○ Notifications ○ Highlighted values ○ Ribbon settings ○ Form headers ○ Action assignments
Set Up Portal View for Case Types	Configure the fields that a customer can see when they view a case on the Customer or Consumer Service Portals. Create a new record to configure the fields for each case type. For more information about the Ticket Configuration form, see Configure the standard ticket page.

4. To perform a task, click **Configure**.

   This button opens the page in your instance where the configuration is completed.

Related topics

Enable the case type single select property

Create a configuration for case type single-select

Configure ribbon settings for case types

Create a ribbon configuration for a case type or enable ribbon configurations to be inherited by the case type.

Before you begin

Role required: admin

About this task

In the Customer Service Management application, a case type represents the data and processes that are needed to resolve a specific type of customer issue. The administrator can create a table for a new case type that extends the Case table (sn_customerservice_case). The extended table for the case type inherits most of the functionality of the Case table.

As part of configuring forms, you can configure ribbon settings for case types. The ribbon appears at the top of the form and includes components that display customer and case information, such as Customer 360, Timeline, and Active SLA. Each component has a ribbon setting that stores configuration information about that component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case types that are extended from the Case table can display these components in the ribbon on the Case form. For case types, you can do the following:

- Create ribbon settings for case extensions, or
- Modify existing ribbon settings so that the case extensions inherit the ribbon component behavior.

To create ribbon settings, see Set up ribbons in workspace.

To modify ribbon component behavior, use the following procedure.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Forms** > **Ribbon Settings**.
2. Select the component name in the Ribbon Settings list.
   For example, you can select Customer 360.
3. On the Ribbon Setting form for the selected component, enable the **Inherit** check box.
4. Select **Update**.
5. Repeat steps 2–4 for each component to be displayed in the ribbon.

Configure case type and case task type declarative actions

Configure declarative actions that enable agents to create cases and case tasks from different locations within CSM Configurable Workspace.

Before you begin
Role required: admin

About this task
The Customer Service Case Types plugin includes declarative actions that enable agents to create cases and case tasks using the case type selector and case task type selector. These declarative actions are disabled by default.

Declarative actions, locations, and actions

Action label	Location	Action
Create Case	Appears on the Case Task list views.	Displays the case task type selector.
Create Case	Appears on the Tasks related list tab on case and case type records.	Displays the case task type selector.
Create Case	Appears on the Case and Case Type list views.	Displays the case type selector.

Declarative actions are stored in the Action Assignment [sys_declarative_action_assignment] table.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Form Actions**.
   The system displays the Action Assignments list.
2. Filter the list to display the actions for the CSM Case Types application.
   If necessary, configure the list to display the **Application** column.
3. For each of the desired declarative actions, set the **Active** field to true.

Enable the case type single select property

Enable the case type single select property so that customer service agents can use the case type single select version of the case type selector and create cases of a specific type with one click.

Before you begin
Role required: admin

About this task
In CSM Configurable Workspace, there are three versions of the case type selector available to agents when creating cases of a specific type.

- With the multi-select version, the agent selects a case type and optionally selects a category and subtype to narrow the available choices before creating a case. This is the default functionality.
- With the single-select version, the agent selects a case type and creates a case. The system populates some of the fields on the Case form with values that have been predefined in the selection configuration.
- With the Product Service Select version, the agent selects a product and a service to create a case. For more information, see Product Service select version of the case type selector.

To use the single-select version, enable the *sn_csm_case_types.case_type_single_field_select* property. You must also create a configuration.

Procedure

1. Navigate to **sys_properties.list**.
2. Click the *sn_csm_case_types.case_type_single_field_select* property in the **Name** field.
3. Set the **Value** to true.
4. Click **Update**.

Create a configuration for case type single-select

Create a configuration for the single-select version of the case type selector and define the fields and values that the system uses to auto-populate the Case form.

Before you begin
Role required: admin

About this task
In CSM Configurable Workspace, there are three versions of the case type selector available to agents when creating cases of a specific type.

- With the multi-select version, the agent selects a case type and optionally selects a category and subtype to narrow the available choices before creating a case. This is the default functionality.
- With the single-select version, the agent selects a case type and creates a case. The system populates some of the fields on the Case form with values that have been predefined in the selection configuration.
- With the Product Service Select version, the agent selects a product and a service to create a case. For more information, see Product Service select version of the case type selector.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To use the single-select version, follow the procedure below to configure one or more selections that are available to agents when creating a case. You must also enable the case type single select property.

Procedure

1. Navigate to **All** > **Customer Service** > **Case Types** > **Manage Case Types**.
2. Select a case type.
3. In the Case Type Selections related list, click **New**.
4. In the **Name** field, enter a descriptive name for the case type selection.
   This is the name that agents see in the **Case Type** field on the Select Case Type pop-up window.
5. In the **Default case type field values** fields, select the desired fields and the corresponding values.
   The system uses this field and value configuration to auto-populate those fields on the Case form when an agent creates a case of this type.
6. Click **Submit**.
   The system saves the configuration in the Service Definition (sn_case_type_selection) table and adds it to the Case Type Selections related list.

Manage customer service case types

Manage the settings and the configuration for a case type from the Case Type form.

After using the Customer Service Management Guided Setup to create and configure a case type, you can view and manage the settings and configuration for the case type from the Case Type form. To access a Case Type form, navigate to **Customer Service** > **Case Types** > **Manage Case Types** and select a case type from the list.

Case Type form related links

The Case Type form includes the following related links.

Case Type form related links

Related link	Description
View Case Type Configuration	Displays the current configuration for this case type, including: • Business rules • Client scripts • Dictionary entries and overrides • Notifications • UI actions • Access controls • UI policies • Data policies • Styles

Related link	Description
	• View rules • Flows
Launch Guided Setup for Case Types	Goes to the Case Types setup tasks in Customer Service Management Guided Setup.
Launch Guided Setup for AWA	Goes to the Advanced Work Assignment (AWA) setup tasks in Agent Workspace Guided Setup.
Launch Guided Setup for Agent Workspace	Goes to the Agent Workspace for CSM setup tasks in Customer Service Management Guided Setup.

Case Type form related lists

The Case Type form related lists display items configured for the case type table. Use the related lists to create additional configurations.

- Record Producers
- State Flows
- Special Handling Notes
- SLAs
- Email Templates
- Quick Messages
- Reports
- Case Type Selections

Select a category and subtype for a case type

The system administrator can assign an optional category and a subtype to a case type. When creating a case, agents can filter the available case types by category and subtype in the case type selector. If an agent selects a category, the list of case types displayed is filtered by that category. If an agent selects a subtype, the list is further filtered by that subtype.

The Customer Service Case Types plugin includes several categories that the system administrator can select for a case type. These categories include:

- Onboarding
- Complaint
- Orders
- General

The **Subtype** field displays fields from the Case Type table that are of the following type:

- Choice list
- Reference

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To select a category and a subtype for a case type:

1. Navigate to **Customer Service** > **Case Types** > **Manage Case Types** and select a case type.
2. Select a category in the **Category** field.
3. Select a field in the **Subtype** field.
4. Select **Update**.

Case types and major cases

The system administrator can enable the **Propose Major Case** UI action for different case types. If this UI action is available, an agent can propose a major case from the selected case type record. If the major case candidate is accepted, a major case is created and the case type record is added as a child case on the major case.

The major case is created on the base Case table. Updates to the major case are synchronized to the child case types. Multiple case type records can be added to the same major case.

Case type selector

The case type selector enables customer service agents to quickly and easily create the right kind of case for a contact or consumer by selecting from a list of available case types or services.

Overview

The case type selector is a component that provides agents with the ability to select the appropriate case type or service when creating a case. For example, an agent can use the case type selector to do the following:

- Select a case type and create a case of that type.
- Select a product from a list of products owned by the customer and create a case for that product.
- Select a service and create a case for that specific service.

The selections that an agent can make is determined by the case type selector configuration. The system administrator can configure different versions of the case type selector by setting properties. The different versions include:

- Multi-select (default)
- single-select
- Product Service select

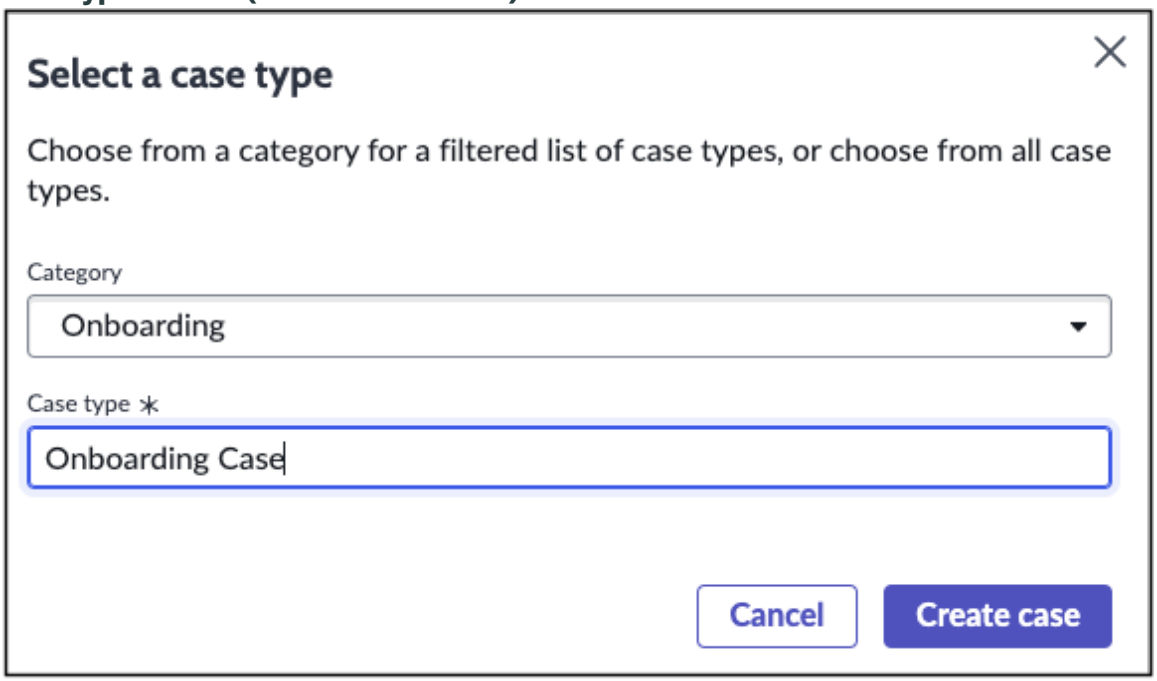
Case type selector (multi-select version)



Using the case type selector

The system displays the case type selector when an agent creates a case from a list or a record.

Agent actions that display the case type selector

Agent action	Description
Select **New**	Select this action from case lists and case type lists such as My Cases or My Complaint Cases.
Select **Create Case**	Select this action from the following records: • Interaction • Account • Contact • Consumer • Sold Product • Install Base Item • Case • Child Case

Some declarative actions available with the Customer Service Case Types plugin are disabled by default. For more information, see Configure case type and case task type declarative actions.

Case type selector versions

Different versions of the case type selector are available for agents to use. The system administrator can configure system properties to determine the version of the case type selector that is presented to agents.

Versions of the case type selector component

Version	Description
Multi-select	With the multi-select version, the agent selects a case type and optionally selects a category to narrow the available choices before creating a case. A category subtype field can also be configured. This field can be a choice list field or a reference field from the Case Type table. **Note:** If a subtype has not been configured for a case type, the subtype field is not displayed. The multi-select version of the case type selector is the default functionality. For more information, see Select a category and subtype for a case type.
Single-select	With the single-select version, the agent selects a case type from a list of available case types and creates a case with one click. The system uses configured field mapping to fill in some of the fields on the Case form. The display of the single-select version is controlled by the *sn_csm_case_types.case_type_single_field_select* system property. • When enabled, the system displays the single-select version. • When disabled, the system displays the multi-select version. **Note:** The single-select version is only available in CSM Configurable Workspace. For more information, see the following topics: • Enable the case type single select property • Create a configuration for case type single-select
Product Service Select	With the Product Service Select version, the agent selects a product and/or a service to create a case. For more information, see Product Service select version of the case type selector. The display of the Product Service Select version is controlled by the *sn_csm_case_types.service_definition_select* system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Versions of the case type selector component (continued)

Version	Description
	• When enabled, the system displays the Product Service Select version of the case type selector. • When disabled, the system uses the value of the *sn_csm_case_types.case_type_single_field_select* property.

Case type select properties

The following properties determine which version of the case type selector is presented to agents.

Version properties of a case type selector

Property	Description
sn_csm_case_types.case_type_single_field_select	Set this property to true to enable the case type single select feature in CSM Configurable Workspace. When enabled, an agent can use this feature to create a case of a specific type with a single selection in the case type selector. • **Type:** true | false • **Default value:** false • **Location:** System Property [sys_properties] table
sn_csm_case_types.service_definition_select	Set this property to true to enable the Product Service Select version of the case type selector in CSM Configurable Workspace. When enabled, an agent can use this version to create a record based on the selected product or service. • **Type:** true | false • **Default value:** true • **Location:** System Property [sys_properties] table This property overrides the *sn_csm_case_types.case_type_single_field_se* property. • When set to true, the system displays the Product Service Select version of the case type selector. • When set to false, the system uses the value of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Version properties of a case type selector (continued)

Property	Description
	sn_csm_case_types.case_type_single_field_s property. • If both properties are set to true, the *sn_csm_case_types.service_definition_selec* property takes precedence. • If both properties are set to false, the system displays the multi-select version of the case type selector.
sn_csm_case_types.service_definition_select_count	Determines the number of the products and services displayed in the Product Service Select version of the case type selector. • **Type:** integer • **Default value:** 25 • **Location:** System Property [sys_properties] table

Configuring service definitions for cases and case tasks

The system administrator creates the service definitions for cases and case tasks, along with their relationships. The service definition manager and service definition admin can also create these service definitions and relationships.

For case task service definitions, the system administrator can include logic and default field values that the system uses when creating the case tasks. For more information, see Configuring service definitions.

Product Service select version of the case type selector

With the Product Service select version of the case type selector, agents can create cases of the correct type based on the selected product or service.

The Product Service select version of the case type selector supports services as well as case types. This version of the case type selector makes it easier for agents to find the available services for a product. This version of the case type selector enables the agent to do the following:

- Select a product from a list of products owned by the account or consumer and see the available services for that product. This list includes sold products and install base items.
- Select a category of services and see the available services within that category.
- Search for a service by entering keywords in the search box.
- Browse the available services using scroll bars and pagination.
- Select a service and create a case based on the service or case type.

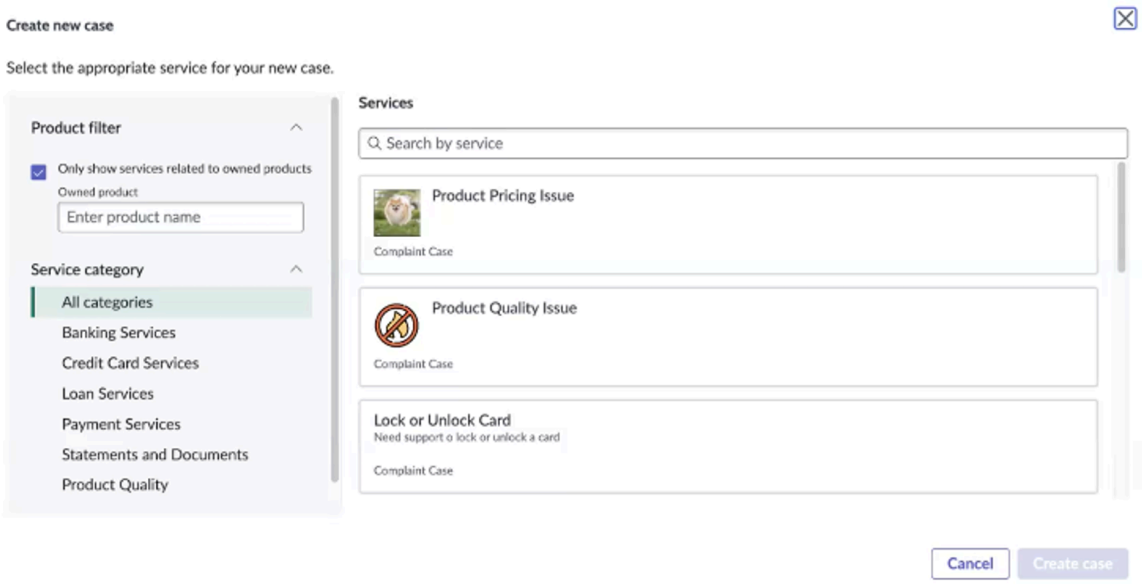
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case type selector (Product Service select version)



Creating cases using the Product Service select version

The system displays the case type selector when an agent creates a case from a list or a record. The fields that are available in the Product Service select version of the case type selector are context-driven based on how an agent creates a case.

Agent actions that display the case type selector

Agent action	Description
Select **New**	Select this action from case lists and case type lists such as My Cases or My Complaint Cases.
Select **Create Case**	Select this action from the following records: • Interaction • Account • Contact • Consumer • Sold Product • Install Base Item • Case • Child Case

Creating cases from a record

When creating a case from a record, the Product Service select version of the case type selector includes the following sections and fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product Service Select fields

Field	Description
Product filter	Use the fields in this section to select a product
Only show services related to owned products	This check box controls the display of the **Owned product** field and determines the services included in the Services section. • If checked, the system lists the services categorized as post-sales that are relevant to the product selected in the **Owned product** field. • If cleared, the system lists the services categorized as pre-sales and general.
Owned product	Use the **Owned product** field to select a product. This field uses typeahead search. Place the cursor in the field and start typing to display a list of products. Selecting a product filters the available services in the Services section. For sold products and install base items, the first line of an entry in the **Product** drop-down list displays the name of the product from the Product Model record. The second line displays the name of the sold product or install base item associated with the product model.
Service category	Select a category to see the available services within that category or select **All categories** to see all available services.
Services	Select a service in the Services section. • Services are displayed in a card format that show the service name, description, and image or icon. • Use a keyword search to narrow the list of available services. • Use the scroll bars and pagination to view the available services.

Agents can select **Create Case** from the following records, which provide context about their owned products and services.

Record types with the Create Case action

Record	Description
Interaction	Applicable services are based on products owned by the contact or consumer.
Account	Applicable services are based on products owned by the account.
Contact	Applicable services are based on products owned by the contact and products that the contact has access to based on related party access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record types with the Create Case action (continued)

Record	Description
Consumer	Applicable services are based on products owned by the consumer.
Sold Product	The **Owned product** field is auto-filled with the product model from the Sold Product record.
Install Base Item	The **Owned product** field is auto-filled with the product model if the install base item is mapped to the product model. If there's no product model associated with the install base item, the **Owed product** field lists the products for the account and contact.
Case	
Child Case	

Creating cases from a list

Agents can select **New** from a case list or case type. Because there's no customer context, the services listed include all available services (pre-sale, post-sale, and general).

Service categories

The administrator can group services into categories so that it's easier for agents to find the services the need. Categories are displayed in the Service categories section. Agents can select a specific category to see the available services within that group or **All categories** to see all available services.

Service cards

The Product Service select version of the case type selector displays the available services in a card view. Each card can include the following information for a service, depending on the configuration:

- Name
- Description
- Image

When an administrator creates a service definition, they can provide a name for the service. They can also provide a description of the service and add an image to represent the service. For more information, see Create a service definition.

Browsing services in the case type selector

Agents can browse the available services for a selected category or for all categories. These services are displayed in a card view.

The Product Service select version of the case type selector can display multiple pages of services. It can display 24 services at a time and a total of 200 services.

The agent can perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the scroll bars to view all the displayed services.
- Select **Show more** to see the next set of services (up to a maximum of 200) if more than 24 services are available.
- Filter the displayed services by selecting a category.
- View a count of the available services after applying a filter.

Note:
The system displays the services that the logged-in agent has access to.

When the agent reaches the limit of 200 services, the system directs the agent to refine the results.

Searching for a service

Agents can search for a service by entering keywords in the search box.

- A list of recent searches appears below the search box
- Search results include the services with names or descriptions that contain the keywords.
- Results are displayed in a card view.

Creating a case for a service

Agents can create cases from lists and from records.

Agents can create cases by selecting a service from the Product Service select version of the case type selector and then selecting **Create Case**.

Agents see the Product Service select version with the Product filter when they create a case from the following records.

- Interaction
- Account
- Contact
- Consumer
- Sold Product
- Install Base
- Case
- Child Case

The **Only show services related to owned products** check box is selected by default.

- When selected, the agent can see Post-sales services.
- When cleared, the agent can see Pre-sales, Post-sales, and General services.

If the agent is on a Sold Product or Install Base record, the **Owned product** field is auto-populated.

If a customer hasn't activated the install base:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Product Service Select version displays the **Service** and **Case type** fields.
- The **Service** field lists all services, including pre-sales and post-sales.
- Agents can select **Create Case** from an interaction, account, contact, or consumer record and select a case type in the **Case type** field.

Case type selector configuration

The Product Service select version of the case type selector includes a product filter. If you have the administrator role, you can configure the case type selector to hide this filter.

By default, this configuration setting is false. The case type selector displays the product filter, the **Only show services related to owned products** check box is empty, and the case type selector shows all available service definitions.

To hide the filter:

1. In the application navigator, **sys_declarative_action_payload_definition.list** and press **Enter**.
2. In the Key column, select **CREATE_CASE_TYPE**.
3. In the **Payload** field, locate the **hideProductFilter** setting.
4. Change the value of the setting from false to true and select **Update**.

When this configuration setting is true, the case type selector doesn't display the product filter. The case type selector shows all available service definitions.

Case task type selector

The case task type selector is a component that provides customer service agents with a way to create the right types of tasks while working on cases.

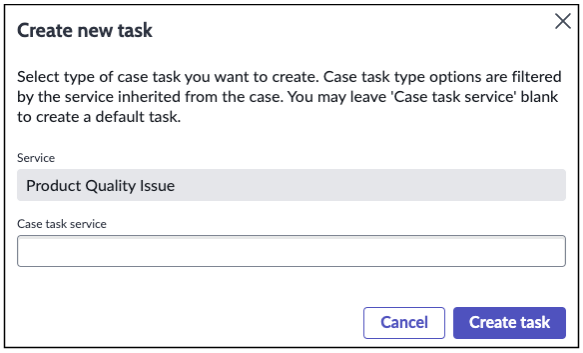
Using the case task type selector, agents can select services and create case tasks specifically for those services. The selections that an agent can make within the case task type selector depends on where they create a case task from.

Case Type Task Selector Options	
When an agent creates a case task from a case task list, they can select a service in the case task type selector.	**Case task type selector (case task list view)** 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Type Task Selector Options (continued)

When an agent creates a case task from a case record, the case task type selector shows related services based on the case type.

Case task type selector (case record view)



An agent working on a case or a case type can create case tasks in the following ways.

How to create case tasks

Select **New** from a case task list	The **Service task** field on the case task type selector shows all of the related services where the target table is Case Task [sn_customerservice_task] and extensions of Case Task.
Select **New** from the Tasks related list tab on a case record	The **Service** field is auto-filled with the case service. The **Case task service** field lists the task services related to the case service. If the case has no service, the **Service task** field shows all of the related services where the target table is Case Task [sn_customerservice_task] and extensions of Case Task.
Select the **+** icon on the related records task list in the Dynamic Related Records component	The **Case task service** field on the case task type selector shows the following services: • The task services related to the case service. • The related services where the service target table is Case Task and extensions of Case Task.
Select **Create Task** in a case playbook stage	The **Service** field is auto-filled with the case service. The **Case task service** field lists the task services related to the case service.
Select **Create Task** in the activity viewer	The **Service** field is auto-filled with the case service. The **Case task service** field lists the task services related to the case service.

Some declarative actions available with the Customer Service Case Types plugin are disabled by default. For more information, see Configure case type and case task type declarative actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring service definitions for cases and case tasks

The system administrator creates the service definitions for cases and case tasks, along with their relationships. The service definition manager and service definition admin can also create these service definitions and relationships.

For case task service definitions, the system administrator can include logic and default field values that the system uses when creating the case tasks. For more information, see Configuring service definitions.

Onboarding case type

Agents can use the onboarding case type to capture the details when onboarding customers for a product or service.

The onboarding case type includes a playbook that provides step-by-step guidance through the lifecycle of the onboarding process.

Onboarding cases use the ONB prefix in the case number. For example, ONB0001007. Onboarding cases appear in the Onboarding Cases module in the following lists:

- My Onboarding Cases
- All Onboarding Cases
- Unassigned Onboarding Cases
- Escalated Onboarding Cases

When creating a case, agents can select **Customer Onboarding** from the list of available case types.

Creating onboarding cases for new or existing customers

Customer service agents can create cases to onboard new customers or to onboard existing customers for new products.

The onboarding case form includes the **New customer** check box. Agents can enable this check box to display the New Customer Information section on the Case form. This form section includes fields that you can use to collect information and create a customer record.

Note:
A new customer doesn't have an existing account, contact, or consumer record.

If an existing case already has the **Account** and **Contact** or **Consumer** fields populated, then the **New customer** check box is turned off.

When saving an onboarding case:

- If the **New customer** check box is enabled, the **Account** and **Contact** or **Consumer** fields aren't required to save the case.
- If the **New customer** check box is inactive, the **Account** and **Contact** or **Consumer** fields are required to save the case.

New Customer Information form section

The New Customer Information form section includes fields that agents can use to collect information. This information is then used to create a customer record. These fields include:

- Customer Type: either Business or Individual
- Business Name: Required when the customer type is Business

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- User Name: Required when the customer type is Individual
- Phone number
- Email

Additional members

The onboarding case type includes the **Additional Members** related list on the Case form. Agents can use this related list to create the users or business entities that should be included in the onboarding case.

Additional members can be any of the following:

- Accounts
- Contacts
- Consumers

Agents select information from the following fields when adding a member to an onboarding case:

- Type: the type of user to be added. For example, a joint owner or a beneficiary or a sub-account.
- Name: the name of the contact or consumer or account.

Note:
If using the onboarding playbook, the user is also added to the Member Information card in the Add additional members step of the Initiate stage.

Onboarding case type stages and states

An onboarding case moves through several stages and states as the agent works to case resolution.

An onboarding case has six stages:

- Initiate
- Pre approval
- Data capture
- Due diligence
- Resolve
- Close

As an onboarding case moves through the stages listed earlier and toward a resolution, the case status is updated. Stage and status are related to each other as described in the following table.

Onboarding case stages and status

Stage	Status	Description
Initiate	New	An onboarding case is created in the **Initiate** stage with a status of **New**. An onboarding case can only be in the **New** state during the Initiate stage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Onboarding case stages and status (continued)

Stage	Status	Description
Initiate	Open	The state of an onboarding case state changes to **Open** when the case is assigned to an agent.
Pre approval	• Open • Awaiting Info	In the Pre-Approval stage, an onboarding case can be in either the **Open** or **Awaiting Info** states. The case moves to the **Awaiting Info** state when an agent selects **Request Info**.
Data capture	• Open • Awaiting Info	In the Data Capture stage, an onboarding case can be in either the **Open** or **Awaiting Info** states. The case moves to the **Awaiting Info** state when an agent clicks **Request Info**.
Due diligence	• Awaiting Info • Under Review	In the Due Diligence stage, an onboarding case can be in the **Awaiting Info** or **Under Review** states. The case moves to the **Awaiting Info** state when an agent selects **Request Info**. The case moves to the **Under Review** state when an agent selects **Submit for Review**.
Resolve	• Review Complete • Resolved	In the Resolve stage, an onboarding case can be in either the **Review Complete** or **Resolved** states. The case moves to the **Review Complete** state when an agent clicks **Review Complete**. The case moves to the **Resolved** state when an agent selects **Propose Solution**.
Close	Closed	The case is closed.

Components installed with case types

Several types of components are installed with the Customer Service Case Types plugin (com.snc.csm_case_types), including components that support the service definitions feature.

Tables installed with case types

The following tables are installed with the Customer Service Case Types (com.snc.csm_case_types) plugin.

Tables added with case types

Table	Description
Case Type [sn_case_type]	This table stores the defined case types. For more information, see Customer Service case types.
Service Definition	This table stores the defined service definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables added with case types (continued)

Table	Description
[sn_case_type_selection]	The service definition feature adds the following fields to the Service Definition table: • Domain Path • Playbook Record Generator • Active • Number For more information, see Service definitions.
Service Definition Category [sn_csm_case_types_service_category]	This table stores the categories that are created for service definitions.
Service Definition Category Relationships [sn_csm_case_types_service_category_rel]	This table stores the service definitions that are associated with a service definition category.
Product Service Relationship [sn_csm_case_types_product_service_rel]	This table stores the products that are linked to a service definition. For more information about these relationships, see Associate a product with a service definition.
Service to Service Relationship [sn_csm_case_types_service_to_service_rel]	This table stores relationships that have been configured between services. For example, related services that have been added to a service definition. For more information about these relationships, see .
Catalog Service Relationship [sn_csm_case_types_catalog_service_rel]	This table stores the catalog items that are linked to a service definition. For more information, see Configure catalog items for a service definition.

Roles installed with case types

The following service definition roles are installed with the Customer Service Case Types (com.snc.csm_case_types) plugin.

Roles installed with case types

Role	Description	Contains roles
Service definition admin [sn_csm_case_types.service_definition_admin]	Administrator role for the Customer Service case types tables. Users with this role can view, create, update, and delete service definitions, service definition categories,	• sn_csm_case_types.service_definition_mana • sn_service_org.service_criteria_delete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with case types (continued)

Role	Description	Contains roles
	and service definition category relationships.	
Service definition manager [sn_csm_case_types.service_definition_manager]	Manager role for the Customer Service case types tables. Users with this role can view, create, and update service definitions, service definition categories, and service definition category relationships.	• sn_csm_case_types.service_definition_repor • sn_csm_case_types.service_definition_all_ta • sn_service_org.service_criteria_write • sn_service_org.service_criteria_create • sn_service_org.service_criteria_read
Service definition viewer [sn_csm_case_types.service_definition_viewer]	Users with this role can view service definitions, service definition categories, and service definition category relationships.	sn_service_org.service_criteria_read
Service definition report viewer [sn_csm_case_types.service_definition_report_view]	Provides report view access to service definition related tables.	None
Service definition all table viewer [sn_csm_case_types.service_definition_all_table_viewer]	Provides view access to the service definition tables. Users with this role can view service definitions, service definition categories, and service definition category relationships.	None

Properties installed with case types

The following properties are added with the Customer Service Case Types plugin. These properties control the version of the case type selector screen that is displayed to agents. For more information, see Case type selector screen.

Properties installed with case types

Property	Description
sn_csm_case_types.case_type_single_field_select	Set this property to true to enable the case type single select feature in CSM Configurable Workspace. When enabled, an agent can use this feature to create a case of a specific type with a single selection in the case type selector screen. • **Type:** true | false • **Default value:** false • **Location:** System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with case types (continued)

Property	Description
sn_csm_case_types.service_definition_select	Set this property to true to enable the Product Service Select version of the case type selector screen. When enabled, an agent can use this screen to create a record based on the selected product or service. • **Type:** true | false • **Default value:** true • **Location:** System Property [sys_properties] table This property overrides the *sn_csm_case_types.case_type_single_field_se* property. • When set to true, the system displays the Product Service Select screen. • When set to false, the system uses the value of the *sn_csm_case_types.case_type_single_field_s* property. • If both properties are set to true, the *sn_csm_case_types.service_definition_selec* property takes precedence. • If both properties are set to false, the system displays the multi-select screen.
sn_csm_case_types.service_definition_select_count	Determines the number of the products and services displayed in the Product Service Select screen. • **Type:** integer • **Default value:** 25 • **Location:** System Property [sys_properties] table
sn_csm_case_types.get_case_types_roles	Stores the admin and agent roles that can access the Case Type Selector and getCaseTypes API. Roles are listed in the **Value** field in a comma-separated list. To add a role, append the role at the end of the list. • **Type:** string • **Default value:** itil,admin,sn_customerservice_agent,sn_customerservice.cor • **Location:** System Property [sys_properties] table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension points installed with case types

Extension points enable you to extend the functionality of an application and integrate customizations without altering the application code. Extension points are stored in the Extension Point [sys_extension_point] table.

The CSMServiceDefinitionIntegrations extension point returns a list of products that is available to agents in the **Product** field on Product Service Select version of the case type selector screen. Out of box, this list is based on customer context and displays the sold products and install base items owned by the customer.

To access this extension point, navigate to **All** > **System Extension Points** > **Scripted Extension Points** and select **CSMServiceDefinitionIntegrations**.

To modify this extension point:

1. Select the **Create implementation** related link on the extension point record.
2. Modify the **Script** field and add an API to return product information.
3. Select **Update**.

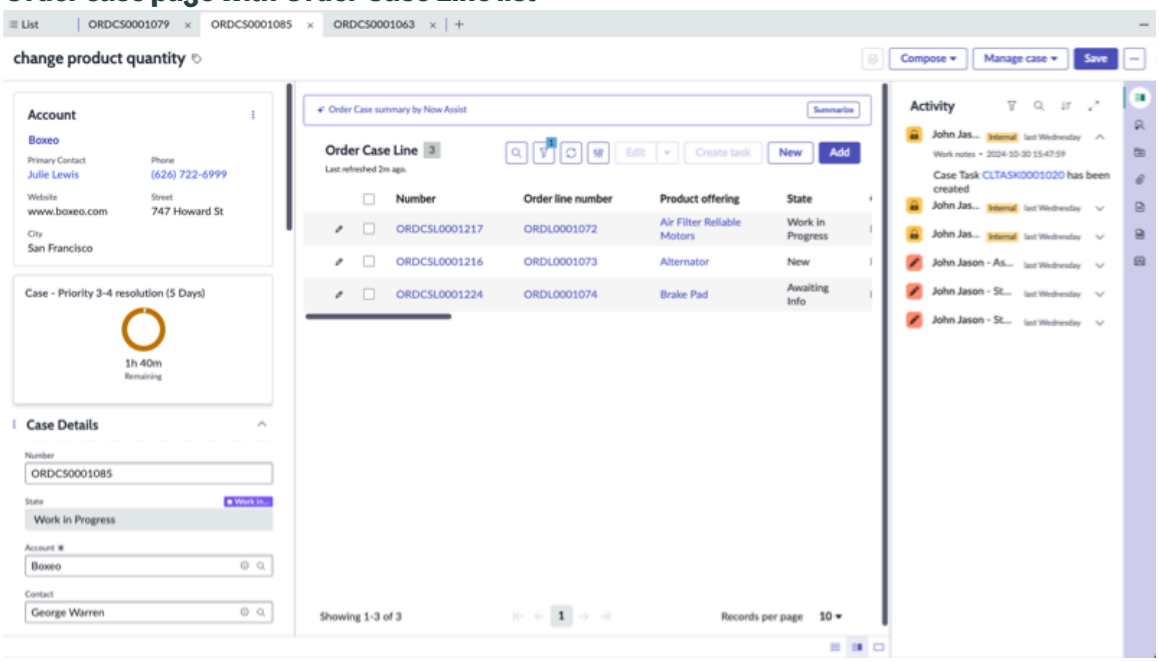
   The system adds the implementation to the Implementations related list on the extension point record.

Note:
The implementation with the lowest **Order** number is used to return the list of products.

Order Operations Case Management

The Order Operations Case Management application enables customer service agents to create cases for multiple customer orders or for specific products within an order.

Order case page with Order Case Line list



The Order Operations Case Management application includes the Orders case type. This case type provides the ability to reference multiple orders or order lines as case line items on an order case record. By using case line items, agents can track multiple issues for the same order case and resolve the issues in each case line item independently before resolving and closing the order case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use order cases to handle issues such as change order requests, including changes in ordered quantities or expedited shipping requests, or other order-related issues. With this application, agents can:

- Create new order cases and add the requested orders or order lines to the case as case line items.
- Add or remove orders or order lines from existing order cases.
- Edit existing case line items or create new case line items for order cases.
- Review the changes that have been requested on case line items.
- Create tasks for case line items and assign them to other agents or team members.
- Manage and track the requests and the actions taken to fulfill orders.
- Resolve the individual case line items before resolving the case.

Benefits of using order cases

Businesses can encounter order issues for many reasons such as inventory discrepancies, payment processing problems, or shipping and delivery errors. Order issues can also result from customer input mistakes or changes in customer needs, such as faster shipping or quantity changes. The following table provides some examples of these issues and the resulting order cases.

Order case examples

Reason	Request/Issue	Order case example
Change in quantity	A customer wants to increase or decrease the quantity of an item in their order.	An order case is created to document the request and confirm stock availability.
Change in delivery date	A customer requests to change the delivery date for their order.	An order case is created to coordinate with logistics and confirm the new delivery schedule.
Change in address	A customer needs to update the shipping address after placing the order.	An order case is created to ensure the change is processed before shipping.
Price discrepancy	A customer notices that the price charged differs from the agreed price.	An order case is created to investigate and correct the billing.
Incorrect item ordered	A customer received the wrong product.	An order case is created to initiate the return process and ensure the correct item is sent.
Cancellation of order lines	A customer wants to cancel specific items in their order.	An order case is created to confirm which items can be canceled and update the order accordingly.

Overview of creating an order case

The following table provides an overview of the process for creating an order case. For detailed steps, see Create an order case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps for creating an order case

Step	Description
Creating an order case	An agent can create an order case in the following ways: • Selecting **Create case** from a customer order. • Selecting **Create case** from the Order Line Items list on a customer order (after selecting one or more order lines). • Selecting **Create case** from an interaction record. • Selecting **New** from the Order Cases list view.
Selecting a service	After initiating an order case, the agent selects an order-related service from the case type selector modal. This modal displays the services that are available for order cases, such as Sales Order Change Request or Sales Order Dispute.
Filling in details on the Create New Order Case intake form	Selecting **Create case** from the case type selector modal displays the intake form where the agent can enter the following order case details: • **Account**: the account for the order. • **Scope of request**: the agent can create a case for order lines from a single order or for multiple complete orders. • **Order number**: the order number associated with the order case. • **Short description**: a brief description of the order case. Depending on where the agent creates the order case from, some of these fields are auto filled.
Viewing the order case record	Selecting **Save** on the intake form creates the Order case record in Draft state. From this record, agents can: • Add orders or order lines to the order case. • Delete orders or order lines from the order case. • Create new order case line items. • Edit the details of order case line items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Steps for creating an order case (continued)

Step	Description
	• Assign order case line items to themselves. • Create tasks for order case line items.
Submitting the order case record	Selecting **Submit** on the Order case record moves the order case and the order case line items to the New state. Once in the New state, agents can begin working to resolve the order case. This includes creating tasks for order case line items, assigning them to other agents or team members, and monitoring case progress.

Order Operations Case Management plugin

Order Operations Case Management (com.sn_order_case) is a case management application for handling support requests on orders or order lines. This application enables customers to process order-related services such as inflight order changes, order inquiries, and order dispute requests. It provides an order case type that includes order line items that need changes, workflows, and agent and customer experiences.

The Order Operations Case Management application includes list views for CSM Configurable Workspace and Core UI.

- In CSM Configurable Workspace, expand the **Order Cases** list category in the Lists tab.
- In Core UI, navigate to **All** > **Customer Order Management** > **Order Cases**.

The Order Operations Case Management application also includes tables, roles, service definitions and other components. For more information, see Components installed with Order Operations Case Management.

The Order Operations Case Management application is available from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Related topics

Case lines and workflows

Order case pages

The Order Operations Case Management application includes record pages that display order cases and order case line items in CSM Configurable Workspace.

The Order Operations Case Management application enables agents to create order cases that reference customer orders and order lines. Using order cases, agents can manage and track customer requests and the actions taken to fulfill these requests.

Order cases contain order case line items, which represent either multiple complete orders or multiple order lines from a single order. The Order Operations Case Management application includes the following record pages to display this information in the workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case record pages

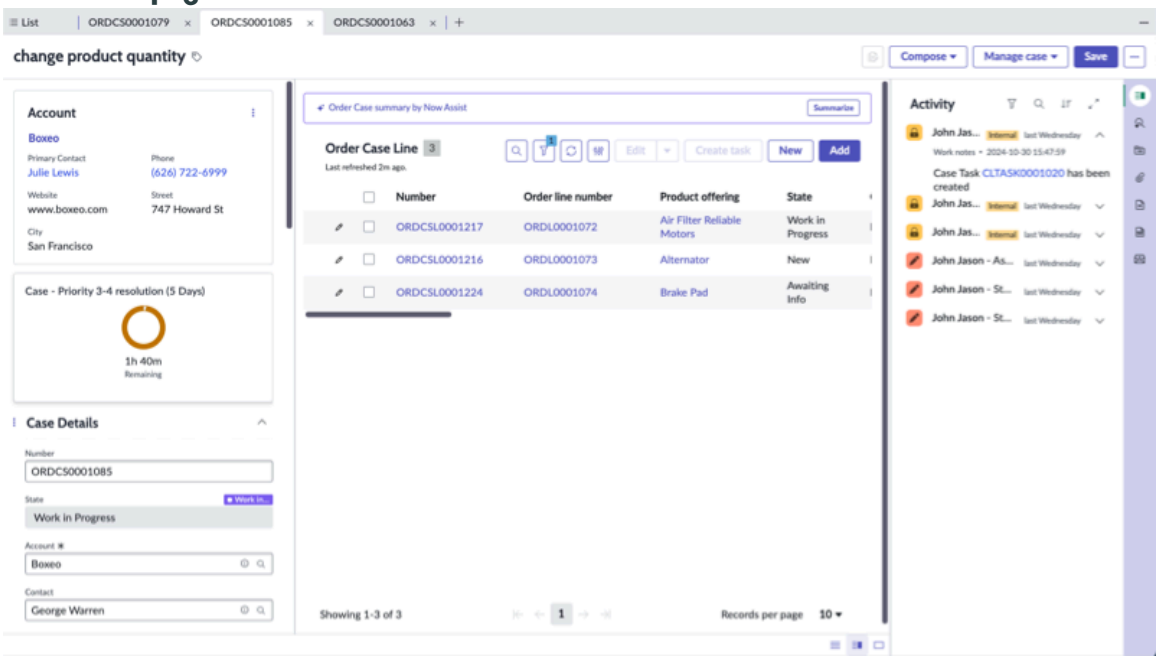
Page	Description
Create New Order Case intake page	When an agent initiates an order case and selects a service from the case type selector modal, the system displays the Create New Order Case intake page. The agent uses this page to enter basic information about the order case, such as the account, order number, and scope of request, and then create the case.
Order case record page	The Order case record page displays the order case and a list of the order case line items. The agent uses this page to do the following: • View details about the order case and the order case line items. • Add or remove orders or order lines to the order case as order case line items. • Create new order case line items. • Edit order case line item details. • Create tasks for order case line items.
Order case line item record page	The Order case line item record page displays information about an order case line item. The agent uses this page to view and edit information about the order case line item, including case line item details, ordered and requested quantities, and shipping information.

Order case record page

The Order case record page displays information about order cases and the associated list of order case line items in CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case page with Order Case Line list



Customer service agents use this page to do the following:

- View details about the order case and the order case line items.
- Add or remove orders or order lines to the order case as order case line items.
- Create new order case line items.
- Edit order case line item details.
- Create tasks for order case line items.

Order case record page components

The Order case record page includes the following components:

Component	Description
Order case form heading	The form heading displays the order case short description. If there's no short description, it displays the order case number. The form heading also includes the action bar and record tags.
Order case action bar	The action bar contains the actions available to users while working on order case records. The specific actions are determined by factors such as the user role, order case state, and other attributes. • **In-progress Actions**: This icon provides a list of minimized modeless dialogs. It includes a badge that displays the number of items in the list. From this list, an agent can select an item to open the minimized comment, work note, or email. • **Compose**: Compose comments, work notes, and emails in modeless dialogs. • **Manage case**: Perform case management actions such as requesting information or proposing a solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	• **Save**: Save changes to the order case record. • **More Actions**: Perform additional actions such as proposing a major case or reporting a knowledge gap.
Account lookup	Agents can use the account lookup component to do the following: • Search for an account. • Link or unlink an account. • Select a reference field on a lookup card, such as a contact name, to open the reference in a subtab. • Select a phone number on a lookup card to call. The account lookup component displays information in record cards. These cards display contact information and provide quick access to customer details such name, address, and phone.
SLA	Displays active SLAs for the order case, including time remaining, the SLA state, and any breaches.
Case details	The case details component includes collapsible sections for: • Case Details • Notes • Closure Information • Related Records This component also includes a menu with additional form actions, such as personalizing the form, exporting data, and copying the URL.
Case summarization	The case summarization component appears above the Order Case Line list. When an agent opens an order case, the component is collapsed and in the default state. Agents can use this component to do the following: • Summarize order case details. • Generate order case resolution notes. • Generate knowledge articles. • Generate email reply recommendation. **Note:** The case summarization component requires the Now Assist for Customer Service Management (CSM) application to be activated and configured.
Order Case Line list	The Order Case Line list component displays the order case line items associated with the order case. Order case line items can be created for orders or order lines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	• If an order case is created for one or more orders, the system converts each customer order's header into a case line item. • If an order case is created for one or more order lines from a single order, the system converts the selected order lines from the customer order to case line items on that order case.

Order Case Line action bar	The Order Case Line action bar contains the actions available to users while working on order case line records.
	• **New**: Opens a Create New Order Case Line record in a separate tab. Fill in the fields and select **Save** to add the order case line item to the list.
	• **Add**: Displays one of the following modals depending on the origin of the order case:
	  ○ Add order lines to case
	  ○ Add orders to case
	Select one or more orders or order lines and then select **Add** to add the selected orders or order lines to the Order Case Line list.
	• **Create task**: Creates a task for the selected order case line item in a separate tab. Fill in the fields on the Create New Case Line Task record and select **Save**.
	
	After selecting an order case line item, agents can edit its details, assign it to themselves, or delete the line item.
	• **Edit**: Displays the details for the selected order case line item in a panel. Make the necessary changes and select **Update** at the bottom of the panel.
	• **Assign to me**: Assigns the selected order case line item to the current user.
	• **Delete**: Deletes the selected order case line item. Select **Delete all** in the confirmation pop-up window.

Activity stream	The activity stream component displays a list of activities occurring on an order case record. This list can be collapsed to provide a quick view of case activities or expanded to provide more detail about individual activities. The Order case record page uses modeless dialogs for composing comments, work notes, and emails. For more information, see the Composing emails, comments, and work notes section.
Contextual side panel	The contextual side panel component includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the Order case record page includes the following tabs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	• Activity stream • Attachments • Recommended Actions search • Related Lists • Email Templates • Response Templates • Form Templates For more information about related lists, see the Order case record page related lists section. **Note:** The Order Operations Case Management application does not include response templates. To configure a response template, see Create or modify a response template.

Order case record page settings

The Order case record page includes the following settings.

Order case record page settings

Setting	Description
Active	Enabling the **Active** check box makes the page available to the selected audience. The Order case record page is active by default. The active setting combined with the page order determines the page that CSM Configurable Workspace uses to display record information. For more information, see Set record page order.
Order	Each record page has an order which indicates the page priority. The lower the number, the higher the priority. The default order for the Order case record page is -1000.
Conditions	Conditions determine when a page variant is displayed. The Order case record page has the following condition: **table=sn_order_case** This condition limits the use of the Order case record page to records from the Order Case [sn_order_case] table and tables that extend the Order Case table.
Audience	The audience determines who can see a record page. The Order case record page does not have a specified audience. For more information, see Learn about audiences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access the settings for this page variant:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the Record section of the Pages and variants list, select **Front-line case page**.
4. Select **Settings** at the top of the page.

Order case record page related lists

Related lists appear in the Related Lists tab in the contextual side panel.

The related lists component provides access to the order case related lists. This component uses an expandable accordion format. Agents can expand the desired lists to see the related items. This component also displays an icon with the number of items in a list.

1. Case Tasks
2. Order Case Lines
3. Order Tasks
4. SLAs
5. Emails
6. Draft Emails
7. Knowledge
8. Knowledge Gaps
9. Child Cases

The items in an expanded list are displayed as cards. An expanded list shows one card for each item in the list, up to a maximum of 8 cards.

- Agents can open an item in a subtab.
- If a list has more than five items, it includes a Show more option.

Related lists include the following actions:

- **Refresh**: refreshes the items in the list.
- **Create**: opens a blank record in a subtab that the agent can use to create a new item.
- **View all**: opens a list of records in a subtab.
- **Show more**: is displayed for lists that have more than five items.

Composing emails, comments, and work notes

The Order case record page uses modeless dialogs to create and post comments and work notes to the activity stream and to compose and send emails.

A modeless dialog is a window that appears in a workspace as an overlay on top of the main window content. This overlay enables users to interact with the window content and the overlay content at the same time.

The Compose group of actions on the Order case record page includes:

- Compose Comments
- Compose Email
- Compose Work Notes(Private)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These actions launch the corresponding modeless dialogs (the behavior is the same as the Front-line case page).

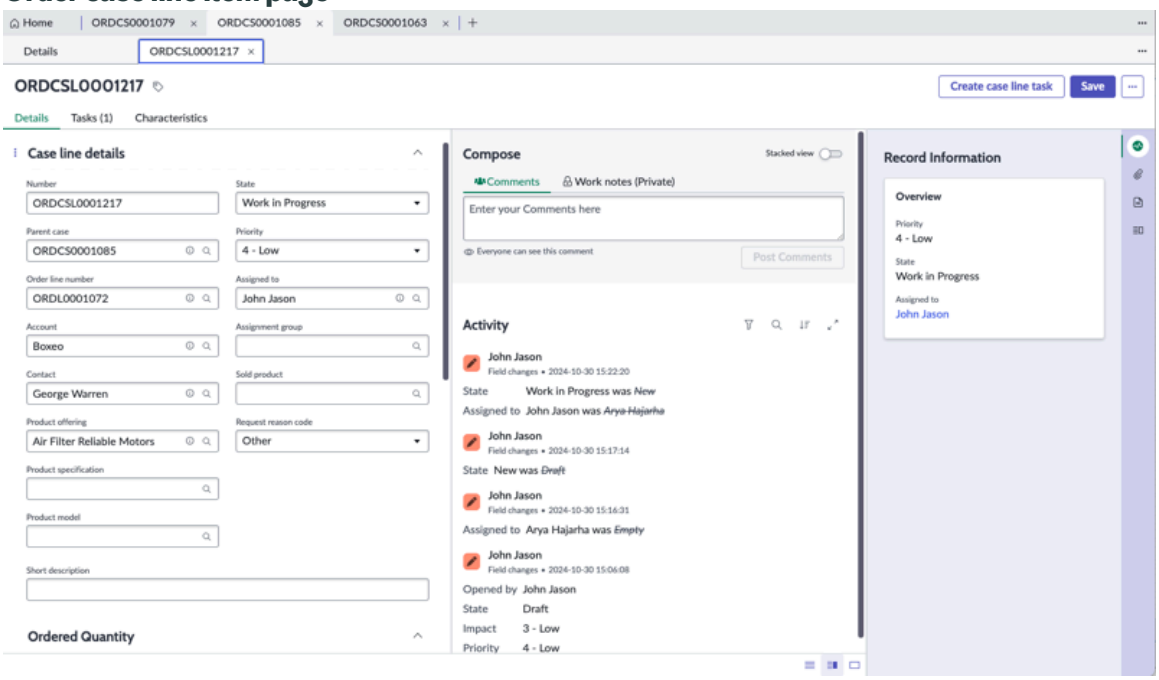
The email templates should be accessed from email dialog.

For more information about composing emails, comments, and work notes, see Modeless dialogs.

Order case line item page

The Order case line item page displays information about an order case line item associated with an order case in CSM Configurable Workspace.

Order case line item page



The order case line item record shows the details of an order case line item, including customer and product information, the requested change to the ordered quantity, the shipping location, and estimated dates. This record also includes the following components:

- Details tab: Displays the case line item details, including order and account information, ordered and requested quantities, and shipping information.
- Tasks tab: Displays the tasks created for the case line item.
- Characteristics tab: Displays the specific characteristics of the case line item.
- Contextual side panel: The contextual side panel includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the Order case line record page includes the following tabs.
  - Record Information
  - Attachments
  - Templates

Order case intake page

Customer service agents use the Order case intake page to capture the initial information when creating a new order case.

The agent initiates an order case in one of the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Selecting **Create case** from a customer order.
- Selecting **Create case** from the Order Line Items list on a customer order.
- Selecting **Create case** from an interaction record.
- Selecting **New** from the Order Cases list view.

The system displays the Order case intake page after the agent selects an order-related service from the case type selector modal. The agent can enter the following order case details:

- **Account**: the account for the order.
- **Scope of request**: the agent can create a case for order lines from a single order or for multiple complete orders.
- **Order number**: the order number associated with the order case. This field is mandatory for cases created from the Order Line Items list on a customer order.
- **Short description**: a brief description of the order case.

Depending on where the agent creates the order case from, some of these fields are auto filled. For example, the **Scope of request** displays the following:

- **Specific line items, Single order**: If the agent selects **Create case** from the Order Line Items list on a customer order.
- **Multiple orders**: If the agent selects **Create case** from a customer order.

After saving the intake record, the agent can see the Order case record page with the case line items created either from customer orders or customer order lines.

Order case and order case line item states

Order cases and order case line items move through several different states as agents work to resolve the individual case lines in order cases.

Order case states

Order cases can be in the states listed in the following table. Actions available on the order case record enable agents to move cases from one state to another.

Order case states

State	Description
Draft	The order case is in the Draft state. Select **Submit** on the order case record page to move the order case and all of the order case line items that are currently in the Draft state to New.
New	The order case has been submitted and is in the New state. Select **Assign to me** on the record page to assign the case to the logged-in user and move the order case and all of the order case line items currently in the New state to Work in Progress.
Work in Progress	The assigned agent is working on the order case. Select the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case states (continued)

State	Description
	• **Request Information**: use this action to request additional information from the contact or consumer. The state moves to Awaiting Information. • **Resolve Case**: use this action to propose a resolution to the contact or consumer. The state moves from Work in Progress to Resolved.
Awaiting Info	The agent is waiting for the contact to provide the requested information for the order case. Select **Information Received** to move the order case back to Work in Progress.
Resolved	The agent has proposed a resolution for the order case to the contact. Select **Close Case** on the record page to move the order case to Closed.
Closed	The order case has been resolved and the resolution has been accepted by the contact. When all of the case line items for an order case are in a terminal state, the case can be set to Closed. Terminal states include: • Resolved - Accepted • Resolved - Denied • Canceled
Canceled	The order case has been canceled. Select **Cancel** to cancel an order case. **Note:** You can only cancel order cases in the Draft state.

Order case line item states

Order case line items can be in the states listed in the following table. The case line items in an order case can be in different states as the agent works to resolve each issue.

Order case line item states

State	Description
Draft	The order case line item is in the Draft state. When an order case is created and is in the Draft state, the associated order case line items are also in the Draft state.
New	The order case line item is in the New state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case line item states (continued)

State	Description
	When an order case is submitted and moved to the New state, the associated order case line items that are currently in Draft state are also moved to the New state.
Work in Progress	The assigned agent is working on the order case line item.
Awaiting Info	The assigned agent has requested additional information about the order case line item and is waiting for a response.
Resolved - Accepted	The change to the order case line item has been accepted.
Resolved - Denied	The change to the order case line item has been denied.
Canceled	The order case line item has been canceled.

Syncing the state of an order case with the order case line items

State changes for an order case can result in state changes for the associated order case line items. These changes are detailed in the following table.

Order case and order case line item states

Order case state	Order case line item tate
Draft	Saving a new order case creates the case in the Draft state. Order case line items for the order case are also created in the Draft state.
New	When an agent submits an order case, the state is updated from Draft to New. The states of the associated order case line items that are currently in Draft state are also set to New.
Work in Progress	When an agent selects **Assign to me** on an order case in the New state, the state is updated from New to Work in Progress. The states of the associated order case line items are also set to Work in Progress. If any of the case line items are set to Work in Progress, then the case is also set to Work in Progress.
Resolved	If a case is set to Resolved, the status of each of the case line items is also set to Resolved. If all of the case line items are Resolved, then the case is set to Resolved.
Closed	When all of the case line items for an order case are in a terminal state, the case can be set to Closed. Terminal states include: • Resolved - Accepted • Resolved - Denied • Canceled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case and order case line item states (continued)

Order case state	Order case line item tate
	When an agent selects **Close Case** on an order case in the Solution Proposed state, the system updates the state to Closed.
Canceled	When a user selects **Cancel** on an order case in the Draft state, the system updates the state to canceled. States for the order case line items associated with the order case are also set to canceled. **Note:** You can only cancel order cases in the Draft state.

Creating an order case

Agents can create order cases from a customer order, from an interaction record, or from the Order Cases list view in CSM Configurable Workspace.

Agents can create order cases in the following ways:

- Selecting **Create case** from a customer order.
- Selecting **Create case** from the Order Line Items list on a customer order. (This action is enabled if one or more order lines are selected.)
- Selecting **Create case** from an interaction record.
- Selecting **New** from the Order Cases list view.

After initiating an order case, the agent can select an order-related service from the case type selector modal. This modal displays the services that are available for order cases, such as Sales Order Change Request or Sales Order Dispute.

Selecting **Create case** from the case type selector modal displays the Create New Order Case intake form where the agent can enter the following order case details:

- **Account**: the account for the order.
- **Scope of request**: the agent can create a case for order lines from a single order or for multiple complete orders.
- **Order number**: the order number associated with the order case.
- **Short description**: a brief description of the order case.

Note:
Depending on where the agent creates the order case from, some of these fields are auto filled.

Selecting **Save** on the intake form displays the Order case record page. From this record, agents can:

- Add order lines to the order case.
- Delete order lines from the order case.
- Create new order case line items.
- Edit the details of order case line items.
- Assign order case line items to themselves.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting **Submit** on the Order case record moves the order case and the order case line items currently in the Draft state to the New state. Once in the New state, agents can begin working to resolve the order case. This can include creating tasks for order case line items and assigning them to team members.

Scope of request

An agent can create the following types of order cases:

- Cases that reference one or more order lines from a single customer order.
- Cases that reference multiple complete customer orders.

The Order case record includes the **Scope of request** field. Depending on where the agent initiates the creation of an order case, this field is auto-filled with one of the following values:

- **Specific line items, Single order**: The system creates an order case and converts the selected order lines from the customer order to case line items on that order case.
- **Multiple orders**: The system creates an order case and converts the order header from each customer order to a case line item on that order case.

For example, if an agent creates an order case by selecting **Create case** on a customer order, the scope of request is **Multiple orders**. If an agent selects one or more order lines and then selects **Create case** from the Order Line Items list on a customer order, the scope of request is **Specific line items, Single order**.

Add orders and order line items to an order case

Order cases include a list of order case line items. Depending on how the order case is created, these case line items represent either customer orders or order lines from a single order.

Once an order case has been created, agents can add additional orders or order lines to that case by selecting **Add** on the Order Case Line action bar. Selecting this action displays a modal that shows information based on the values in the **Origin table** field and **Order number** field on the case record.

- If the **Origin table** is set to Customer Order and the **Order number** field is empty, the case type selector modal shows a list of orders associated with the account selected in the **Account** field. The case type selector modal displays "Add orders to case".
- If the **Origin table** is set to Customer Order and the **Order number** field includes an order, the case type selector modal shows a list of order lines associated with that order. The case type selector modal header is "Add order lines to case".

The agent can select a line item from the modal and then select **Add** to add it to the order case as an order case line item.

Create an order case

Create an order case for a customer order or for selected order lines.

Before you begin
Role required: sn_order_case.creator, sn_order_case.agent, sn_customerservice_agent, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In CSM Configurable Workspace, create an order case in one of the following ways.
   - Select **Create case** from a customer order.
   - Select **Create case** from the Order Line Items list on a customer order. (This UI action is enabled if one or more order lines are selected.)
   - Select **Create case** from an interaction record.
   - Select **New** from the Order Cases list view.
2. Select an order-related service from the case type selector modal and then select **Create case**. This modal displays the services that are available for order cases, such as Sales Order Change Request or Sales Order Dispute.
3. Fill in the following details on the Create New Order Case intake form.
   - **Account**: the account for the order.
   - **Scope of request**: the agent can create a case for order lines from a single order or for multiple complete orders.
   - **Order number**: the order number associated with the order case.
   - **Short description**: a brief description of the order case.

   Depending on where you create the order case from, some of these fields are auto filled with information from the customer order or interaction records.

   Note:
   Default values that have been configured for a service definition record can auto populate fields on the order case record. If the **Account**, **Contact**, or **Contract** field values are also defined in the selected service definition record, those values take priority over the values from the customer order record.

4. Select **Save**.
   Saving the Create New Order Case intake form creates the order case record in Draft state.
5. View the order case record details and the order case line items and make any necessary changes.

   You can perform the following tasks while the order case is in Draft state:
   - Add orders or order lines to the order case.
   - Delete orders or order lines from the order case.
   - Create new order case line items.
   - Edit the details of order case line items.
   - Assign order case line items to yourself.
6. Select **Submit**.
   Submitting the order case record moves the order case and the order case line items currently in the Draft state to the New state and enables you to begin working to resolve the order case.

What to do next

After submitting an order case, you can:

- Add or delete orders or order lines to an order case
- Create new order case lines for an order case

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Edit the information in order case line records
- Create tasks for order case lines and assign them to other users

Add orders or order lines to an order case

Add orders or order lines to an existing order case. You can also delete orders or order lines from an existing order case.

About this task

Adding orders or order lines to an existing case is determined by the value in the **Scope of request** field on the order case record.

- If the value is **Specific line items, Single order**, you can add order lines to the case.
- If the value is **Multiple orders**, you can add orders to the case.

Before you begin

Role required: sn_order_case.creator, sn_order_case.agent, sn_customerservice_agent, admin

Procedure

1. Open an order case record in CSM Configurable Workspace.
2. Select **Add** in the Order Case Line list.
3. Select the desired orders or order lines in the resulting modal.
   - **Add orders to case**: displays the available orders.
   - **Add order lines to case**: displays the available order lines.
4. Select **Add** in the modal.
   The system adds the selected orders or order lines to the Order Case Line list.

Create a new order case line item for an order case

Create a new order case line item for an existing order case.

Before you begin

Role required: sn_order_case.creator, sn_order_case.agent, sn_customerservice_agent, admin

Procedure

1. Open an order case record in CSM Configurable Workspace.
2. Select **New** in the Order Case Line list.
   This opens a Create New Order Case Line record in a separate sub tab.
3. Fill in the details for the new order case line item.
4. Select **Save**.
   The system adds the new order case line to the Order Case Line list.

Edit an order case line item

Edit one or more order case line items for an order case.

Before you begin

Role required: sn_order_case.creator, sn_order_case.agent, sn_customerservice_agent, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open an order case record in CSM Configurable Workspace.
2. Select an order case line item in the Order Case Line list.
3. Select **Edit** to display the Edit item panel.
4. Edit the desired fields.

> **Note:**
> For cases created for multiple complete orders, agents can only make changes to the order header, such as changes to shipping dates and locations.

5. Select **Update** at the bottom of the Edit item panel.

Create a task for an order case line item

Create a task for an order case line item.

Before you begin

Role required: sn_order_case.creator, sn_order_case.agent, sn_customerservice_agent, admin

Procedure

1. Open an order case record in CSM Configurable Workspace.
2. Select an order case line item in the Order Case Line list.
3. Select **Create task** to display the Create New Case Line Task form.
4. Enter information in the fields on the form.
5. Select **Save**.
   The system displays the new case line task record.

Order case form

The order case form displays details about an order case.

Order case form fields

Field	Description
Number	The automatically generated record number. The prefix for numbers from the Order Case table is ORDCS.
Account	The name of the company that the order case is opened for.
Contact	The name of the customer contact for the order case.
Scope of request	Identifies the scope of the change for an order case Agents can use this field to select the type of change for an order case. • **Specific line items, Single order**: Sets one or more order line items as the source for case line items. • **Multiple orders**: Sets one or more complete orders as the source for case line items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case form fields (continued)

Field	Description
	Selecting **Specific line items, Single order** sets the **Origin table** field to "Order Line Item" and makes the **Order number** field mandatory. When the user selects the order number in the **Order number** field and selects **Add** on the Order Case form, the system displays the Add order lines to case modal. This modal lists the order lines for the specified order number. Selecting **Multiple orders** sets the **Origin table** field to "Customer Order".
Order number	Reference to the customer order. If the **Scope of request** field is set to "Specific Line Items, Single Order" then this field becomes mandatory.
Channel	The method by which the customer initiated contact and the case was opened. • Web (default) • Phone • Email • Chat • Social
Service	The service that was selected from the service selector when the order case was created.
Product	The product model of the asset. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). If you select an asset in the **Asset** field and the asset has an associated product, the **Product** field is automatically updated. A product can be associated with multiple assets.
Asset	The asset tag number or the serial number of the asset involved in this case.
Install Base	The Install base field helps you track which products and services have been purchased by a customer, how they have been installed or provisioned, along with the detailed configuration for each installed item.
Origin table	Displays the table where the order case was initiated.
Short description	A brief description of the issue or request.
Needs attention	When checked, the system sends a notification to the agent in the **Assigned to** field. The notification includes the case number, state, priority, and short description.
Opened	The date and time that the case was opened.
Priority	The assigned priority:

Order case form fields (continued)

Field	Description
	• 1 — Critical • 2 — High • 3 — Moderate • 4 — Low (default)
Assignment group	The assigned customer service agent group.
Assigned to	The assigned agent. If a group is selected in the **Assignment group** field, the assigned agent must belong to this group.
Contract	The contract number associated with the order case.
Entitlement	The entitlement associated with this case. The entitlements available for selection in the reference list channel matches the case creation channel. The available entitlements are filtered by the settings in the **Account**, **Contract**, **Product**, and **Asset** fields. If only one entitlement is available for this case, it is automatically added to the **Entitlement** field.
Partner contact	The name of the partner contact.
Partner	The name of the partner company.
Parent	The parent record for the order case.
Resolution code	Choice list indicating the resolution states for the case. This field is mandatory when an agent proposes a solution for a case. The Order Operations Case Management application adds the following resolution codes to the **Resolution code** field: • Change approved • Added replacement product
Request reason code	• Increase Demand • Change in Contract • Initial input incorrect • Other

Order case line item form

Order case line item form fields

Field	Description
Number	The automatically generated record number. The prefix for numbers from the Order Case Line table is ORDCSL.
Parent case	Displays the related order line.
Order line number	The parent case for the order line item record.
Account	The name of the company that the order case is opened for.
Contact	The name of the customer contact for the order case.
Product offering	The product offering for the order case line item.
Product specification	The product specification for the order case line item.
Product model	
Short description	A brief description of the order case line item record.
State	The state of the order case line item record: • Draft • New • Work in Progress • Awaiting Info • Resolved - Accepted • Resolved - Denied • Canceled
Priority	The priority of the order case line item record: • 1 - Critical • 2 - High • 3 - Moderate • 4 - Low • 5 - Planning
Assigned to	The assigned agent. If a group is selected in the **Assignment group** field, the assigned agent must belong to this group.
Assignment group	The assigned customer service agent group.
Sold product	A product, component, or service that has been sold to an account or a consumer.
Request reason code	The reason that the customer is requesting a change to the order case line item. • Increase Demand • Change in Contract

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order case line item form fields (continued)

Field	Description
	• Initial input incorrect • Other
Ordered quantity	Stores the original ordered quantity.
Requested quantity	Stores the quantity change requested.
Approved quantity	Stores the quantity change approved by the agent.
Expected start date	
Requested expected date	
Approved expected date	
Current shipping location	Stores the original shipping location.
Requested shipping location	Stores the requested change in shipping location.
Resolution code	Choice list indicating the resolution states for the case.
Close notes	Details about how the case was closed.
Additional comments	Customer-viewable comments added to the activity stream.
Work notes	Comments and information added to the activity stream that are available only to internal users.

Components installed with Order Operations Case Management

Several types of components are installed with the Order Operations Case Management application, including tables, roles, and service definitions.

Tables

The Order Operations Case Management application adds the following tables.

Order Operations Case Management tables

Table	Description
Order Case [sn_order_case]	Stores order case records. This table extends the Case [sn_customerservice_case] table. Records in the Order Case table use the prefix **ORDCS**.
Order Case Line [sn_order_case_line]	Stores the case line items created for order cases. This table extends the Case Line [sn_case_line] table. Requesters and fulfillers can use this table to capture the orders and order lines as line items on an order case for which they want to request order changes, resolve disputes, or make inquiries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order Operations Case Management tables (continued)

Table	Description
	Records in the Order Case Line table use the prefix **ORDCSL**.

The Order Operations Case Management application also uses the following tables from the Case lines and workflows application.

Case lines and workflows tables

Table	Description
Case Line [sn_case_line]	The Case Line table stores case line item records. This table extends the Task table. The prefix for case line records is **CSL**.
Case Line Characteristic [sn_case_line_characteristic]	The Case Line Characteristic form displays details about a case line item on a case record. The prefix for case line characteristic records is **CSLC**.
Case Line Task [sn_case_line_task]	The Case Line Task table stores the tasks related to case line items. This table extends the Case Task table. The prefix for case line task records is **CSLTASK**.

Roles

The Order Operations Case Management application includes roles that provide access to order cases and order case line items. It also updates some existing roles to provide this same access.

Order Operations Case Management roles

Role	Description	Includes roles
Order case agent [sn_order_case.agent]	Provides create, read, and update access to: • Order cases • Order case line items • Case line characteristics • Order case tasks • Order case line tasks Provides read access to:	• sn_customerservice_agent • sn_order_case.creator • sn_order_case.writer • sn_order.navigation_menu • sn_order_case.delete

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order Operations Case Management roles (continued)

Role	Description	Includes roles
	• Orders • Order line items • Order line characteristics	
Order case agent manager [sn_order_case.agent_manager]	Provides create, read, and update access to: • Order cases • Order case line items • Case line characteristics • Order case tasks • Order case line tasks This role can also override agent actions.	• sn_customerservice_manager • sn_order_case.agent • sn_order_case.report_viewer
Order case viewer [sn_order_case.viewer]	Provides read access to the following records: • Order cases • Order case line item s • Case line characteristics	sn_case_line.characteristic_viewer
Order case creator [sn_order_case.creator]	Provides create access to the following records: • Order cases • Order case line items • Case line characteristics	• sn_order_case.viewer • sn_case_line.characteristic_creator
Order case writer [sn_order_case.writer]	Provides write access to the following records: • Order cases • Order case line items • Case line characteristics	• sn_order_case.viewer • sn_case_line.characteristic_writer
sn_order_case.delete	Provides delete access to order cases and case line items.	• sn_order_case.viewer • sn_case_line.characteristic_delete

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order Operations Case Management roles (continued)

Role	Description	Includes roles
	Note: Once a case has been submitted, only users with the admin role can delete an order case or case line items.	
Order case report viewer [sn_order_case.report_viewer]	Report viewer role for the Order Case and Order Case Line tables. This role can view reports for order cases.	
sn_order_case.navigation_menu	Provides access to Order case navigation menus.	
sn_caseline_characteristic.viewer	Provides read access to case line characteristic records if the user has access to the case line items.	
sn_caseline_characteristic.creator	Provides create access to case line characteristic records if the user has access to the case line items.	sn_caseline_characteristic.viewer
sn_caseline_characteristic.writer	Provides update access to case line characteristic records if the user has access to the case line items.	sn_caseline_characteristic.viewer
sn_caseline_characteristic.delete	Provides delete access to case line characteristic records if the user has access to the case line items.	sn_caseline_characteristic.viewer
sn_caseline_characteristic.report_viewer	Report viewer role for the Case Line Characteristic table.	
Case task agent [sn_customerservice.case_task_agent]	This role provides access to case tasks and related case information. For the Order Operations Case Management application, when a case line task is assigned to a case task agent, that agent has read access to the following records: • Order case • Order case line item • Case line characteristic	• sn_customerservice.customer_data_viewer • sn_customerservice.csm_workspace_user • sn_customerservice.case_contributor_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order Operations Case Management roles (continued)

Role	Description	Includes roles
	When a case line task is assigned to a case task agent, the agent's name and assignment group are added to the **Contributor Users** and **Contributor Groups** fields on the Order case record. If the **Assigned to** field on the case line task record changes, these fields are updated.	

Service definitions and service definition categories

The Order Operations Case Management application provides the following order case service definitions. These service definitions belong to the Orders service definition category, which stores services for order-related issues. When creating a case, agents can select the desired service definition in the case type selector.

Note:
The system administrator needs to activate these service definitions. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions** and filter the list to show service definitions from the Order Case [sn_order_case] table.

For more information about service definitions and categories, see the following topics:

- Service definitions
- Service definition categories

Order case service definitions

Service definition	Description
Sales Order Change Request	Request a change to sales order lines on a single order or multiple sales orders. • Type: Post Sales • Table: Order Case [sn_order_case] • Products: All • Service definition category: Orders
Sales Order Dispute	Dispute an entire order or specific order lines on an order. • Type: Post Sales • Table: Order Case [sn_order_case] • Products: All • Service Definition Category: Orders

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Special handling notes configuration

The Order Operations Case Management application includes a configuration for special handling notes on the Order Case table [sn_order_case]. To view this record, navigate to **Special Handling Notes** > **Configuration**.

The configuration for the Order Case table includes the following related fields:

- Account
- Contact
- Product Model
- Sold Product
- Install Base
- Assigned to

This configuration includes a condition that creates special handling notes for order cases that have a priority of P1 - Critical. It also includes the following information:

- **Short description**: Urgent issue reported.
- **Message**: This case is set as critical. Follow up immediately.

For more information, see Special handling notes.

Order case archive rules

The Order Operations Case Management application includes archive rules that archive older order cases.

Order Operations Case Management archive rules

Archive rule	Description
Archive Order Case	This rule archives order case records that have been closed for more than 2 years. Archiving these order case records also archives the following records: • Order case tasks • Order case lines • Case line characteristics • Order case line tasks
Archive Order Case Line	This rule archives order case line records that have been closed for more than 2 years. Archiving these order case records also archives the following records: • Case line characteristics • Order case line tasks

Order case records that have been archived for more than 5 years are deleted. Deleting these records also deletes the following records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Order case tasks
- Order case line items
- Case line characteristics
- Order case line tasks

Order case workflows

The Order Operations Case Management application includes subflows that provide the mapping between a customer order and an order case. These subflows are used when an agent creates an order case from a customer order.

These subflows create the data mapping between two different entities: 1) the customer order and 2) the order case. For example, when mapping a customer order to order case line items, the entities share some fields such as **Account**, **Contact**, and **Contract**. The data mapping copies these field values from the customer order to the order case line items on the order case.

- If an order case is created by selecting **Create case** from a customer order:
  - The **Scope of request** is set to **Multiple orders**.
  - The mapping copies the data from the selected order headers to create order case line items.
- If an order case is created by selecting **Create case** from the Order Line Items list on a customer order.
  - The **Scope of request** is set to **Specific line items, Single order**.
  - The mapping copies the data from selected order lines to create case line items as well as copies the order line characteristics to case line item characteristics.

Subflows:

- **Primitives - Order to order case for multiple request**
  - Inputs: Order IDs, Order Case ID
  - Action: Create Case Line Item - Multiple Request

    Creates an order case line item on the order case based on the customer order.
- **Primitives - Order to order case for single request**
  - Inputs: Order ID, Order Case ID, Selected IDs
  - Action: Create Case Line Item - Single Request

    Creates order case line items based on the selected order line items from the customer order.

To view these subflows, navigate to **All** > **Process Automation** > **Workflow Studio** and select **Subflows** on the Workflow Studio homepage.

Case lines and workflows

The Case lines and workflows application provides the ability to reference multiple line items on a case record. Agents can use these line items to capture, track, and resolve multiple related issues in a single case.

The Case lines and workflows application provides the framework for a case type to handle multiple related issues. One example is the Orders case type available with the Order

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operations Case Management application. This case type enables agents to create cases with case line items for multiple orders or for multiple order lines within a single order.

Case line items enable agents to track multiple issues for the same case. Agents can resolve these different issues, represented by case line items, independently before resolving and closing the case. Agents can take different actions on different case line items depending on the need.

This application supports different types of line items based on the source of the case. These line items can include entities such as orders or order lines, invoices or invoices lines, contracts, and sold products. Each case line item maps to an entity line (for example, an order line) and has its own resolution process.

Benefits of using case line items

Using the Case lines and workflows application provides the following benefits:

- Identify when an order cannot be filled completely and recommend alternative items.
- Process inflight order changes and customer-initiated changes, such as changes to items, quantities, or requested ship dates.
- Process order exceptions and manage the approval and fulfillment process.
- Manage suppliers by creating supplier cases for order-related questions, such as increasing or decreasing quantity, quality issues, or status tracking.

Case lines and workflows plugin

The Case lines and workflows application (com.sn_case_line) enables the Case table to store multiple line items on a case record. These line items are product instances and can be extended for various entities such as orders, order lines, invoices, invoice lines, and contracts.

The case lines and workflows application includes a Case Line Items list view in the Core UI. To access the Case Line Items list, navigate to **All** > **Customer Service** > **Cases** > **All Line Items**.

The Case lines and workflows application application also includes tables and roles. For more information, see Components installed with Case lines and workflows.

The Case lines and workflows application is available from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Case line record pages

Case line item page	The case line item page shows the details of a case line item, including customer and product information, the requested change to the ordered quantity, the shipping location, and estimated dates.
Case line task page	The case line task page displays information about a task created for a case line item.
Case line characteristic page	The case line characteristic record page displays details about the product offering included in a case line item.

Case line item page

The case line item page displays information about a case line item associated with a case.

The case line item page shows the details of a case line item, including customer and product information, the requested change to the ordered quantity, the shipping location, and estimated dates.

Case line item page tabs

The case line item page includes the following tabs:

- Details: Displays the case line item details, including order and account information, ordered and requested quantities, and shipping information.
- Tasks: Displays the tasks created for the case line item.
- Characteristics: Displays the specific characteristics of the case line item.

Contextual side panel

The contextual side panel on the case line item page includes different tools that agents can use to research and resolve customer issues. The contextual side panel on the case line item page includes the following tabs.

- Record Information
- Attachments
- Templates

Case line item page UI actions

The case line page includes the following actions.

Case line page actions

Action	Description
Create case line task	Appears in the case line item action bar. To create a case line task:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case line page actions (continued)

Action	Description
	1. Select **Create case line task** to display a Create New Case Line Task record in a separate tab. 2. Enter information in this record and select **Save** to create the case line task record. Case line tasks are added to the Tasks tab on the case line record.
Save	Appears in the case line item action bar. Selecting this action saves changes to the case line item record.
Delete	Appears in the More actions menu. Selecting this action displays a confirmation pop-up window. Select **OK** to complete the delete action. • Agent role: can delete case line item records in Draft state. • Admin role: can delete case line item records in any state.

Case line task page

The case line task page displays information about a task created for a case line item.

Agents can use the case line task page to view information about a case line task and to assign the task to other users.

Case line task page tabs

The case line task page includes the following tabs:

- Details: Displays the case line task details, including the parent case and case line item, account and contact, and assigned group and user.
- SLAs: Displays the SLAs for the case line task.
- Time Worked: Displays time worked on the case line task.

Contextual side panel

The contextual side panel on the case line page includes different tools that agents can use to research and resolve customer issues. The contextual side panel on the case line task page includes the following tabs.

- Record Information
- Attachments
- Templates

Activity stream

The activity stream on the case line task page displays a list of activities occurring on the case line task record.

The activity stream can be collapsed to provide a quick view of case activities or expanded to provide more detail about individual activities.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agents can use the activity stream to post work notes and comments about the case line task and to view a list of the task activities.

Case line item states

A case line item can be in one of several different states as agents work to resolve a case and the associated case line items. The case line items in a case can be in different states as the agent works to resolve each issue.

Case line item states

State	Description
Draft	The case line item is in the Draft state. When a case is created and is in the Draft state, the associated case line items are also created in the Draft state.
New	The case line item is in the New state. When a case is submitted and moved to the New state, the associated case line items that are currently in the Draft state are also moved to the New state.
Work in Progress	The assigned agent is working on the case line item.
Awaiting Info	The assigned agent has requested additional information about the case line item and is waiting for a response.
Resolved - Accepted	The change to the case line item has been accepted.
Resolved - Denied	The change to the case line item has been denied.
Canceled	The case line item has been canceled.

Syncing the state of a case with the case line items

The Case lines and workflows application syncs the state of the case line items with the parent case.

Case and case line item states

State	Description
Draft	When a case is created for an item with multiple lines, such as an order, new case line items are also created. The case and case line items are created in the Draft state.
New	When a case is submitted, the state is updated from Draft to New. The states of the associated case line items that are currently in the Draft state are also set to New.
Work in Progress	When an agent selects **Assign to me** on a case in the New state, the state is updated from New to Work in Progress. The states of the associated order case line items that are currently in the New state are also set to Work in Progress. If any of the associated case line items are set to Work in Progress, the case is set to Work in Progress.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case and case line item states (continued)

State	Description
Resolved	When a case is set to Resolved, the status of each associated case line item is also set to Resolved. If all of the case line items are Resolved, the case is set to Resolved.
Closed	If all of the case line items are in a terminal state, the case can be set to Closed. Terminal states include: • Resolved - Accepted • Resolved - Denied • Canceled
Canceled	When a case in the Draft state is set to canceled, the status of each associated case line item is also set to canceled. **Note:** Agents can only cancel cases in the Draft state.

Creating case line items and case line tasks

Agents can create case line items for cases and create tasks for case line items.

Creating case lines

To create a case line record:

1. Select **New**.
   - CSM Configurable Workspace: Open a case and select **New** on the Case Line list action bar to open a new case line record in the Draft state.
   - Core UI: Open a case and select **New** on the Case Lines related list on the case record to open a new case line record in the Draft state.

   The information in the following fields is copied from the parent case to the Case Line Item form:
   - Account
   - Contact
   - Parent case
   - Priority
   - Assignment group
   - Assigned to
2. Fill in the fields on the Case Line Item form.

   For field descriptions, see Case line item form.
3. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a bundled product is added to a case line item record, the system creates a case line item for each component in the bundle after the agent saves the new case line item record. The case line characteristics are also created for each component.

Create a case line task

The case line item record includes a **Create case line task** action that agents can use to create tasks for a case line item.

1. Open a case line item record.
2. Select **Create case line task** to open a Create new case line task form.

   Some fields on this form are auto populated with details from the Case line record.
3. Enter additional information as needed.

   For field descriptions, see Case line task form.
4. Select **Save** to create the case line task record.

   Case line tasks appear in the Tasks tab on the case line item record.

Case Line list action bar

In CSM Configurable Workspace, the Case Line list action bar appears at the top of the Case Line list component on a case record.

Agents can add case lines from existing entities, such as orders or invoices, or create new case lines.

- **New**: Opens a Create New Case Line record in a separate tab. Fill in the fields and select **Save** to add the case line to the list.
- **Add**: Displays the Add lines to case modal. Select one or more lines and then select **Add** to add the selected case lines to the list.

After selecting a case line, users can edit the case line details, assign a case line to themselves, or delete a case line.

- **Edit**: Displays the details for the selected case line in a panel. Make the necessary changes and select **Update** at the bottom of the panel.
- **Assign to me**: Assigns the selected case line to the current user.
- **Delete**: Deletes the selected case line. Select **Delete all** in the confirmation pop-up window.

Case line item form

The case line item form displays details about a case line item on a case record.

Agents can use the case line item form to create a new case line item record and to view and edit an existing case line item record. When editing, agents can:

- Change the reason code
- Change the Priority, Assigned to, and Contact

To access a case line item record, navigate to **All** > **Customer Service** > **Cases** > **All Line Items** and select a record. Users with the following roles can access this list: system administrator, customer service agent, and customer service manager.

The case line item form includes the following related lists:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Case Line Tasks
- Case Line Characteristics

Case line item form fields

Field	Description
Number	The automatically generated record number. The prefix for numbers from the Case Line table is **CSL**.
Parent case	The parent case for the case line item record. This field is mandatory.
Parent case line	The parent case line for the case line item record. This field supports the case lines hierarchy.
Top case line	The top case line for the case line item record. This field supports the case lines hierarchy.
Account	The name of the company that the case is opened for.
Contact	The name of the customer contact for the case.
Product offering	This field is a reference to the Product Offering table [sn_prd_pm_product_offering].
Product specification	This field is a reference to the Product Specification table [sn_prd_pm_product_specification].
Product model	This field is a reference to the Product Model table [cmdb_model].
Short description	A brief description of the case line item record.
State	A case line item record can be in any of the following states: • Draft • New • Work in Progress • Awaiting Info • Resolved - Accepted • Resolved - Denied • Canceled If all of the case line items on a record are in one of the following terminal states, the system syncs the record state to the case line item state: • Resolved - Accepted • Resolved - Denied • Canceled Actions such as **Submit Case** and **Assign to me** change the state of the case and the case lines.
Priority	The priority of the case line record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case line item form fields (continued)

Field	Description
	• 1 - Critical • 2 - High • 3 - Moderate • 4 - Low • 5 - Planning
Assigned to	The agent assigned to the case line item record.
Request reason code	The reason for the requested change. Can be different for each case line item. • Increase Demand • Change in Contract • Initial input incorrect • None
Sold product	This field is a reference to the Sold Product table [sn_install_base_sold_product].
Install base	This field is a reference to the Install Base Item table [sn_install_base_item]. If the **Account** field is populated, this field displays the install base items for the selected account.
Asset	This field is a reference to the Asset table [asset]. If the **Account** field is populated, this field displays the assets for the selected account. If the **Product model** field is populated, this field displays the assets associated to the selected product model. If both the **Account** and **Product model** fields are populated, this field displays the assets associated with selected account and product model.
Resolution code	A code that indicates the resolution state of the case line item record. • Change approved • Added replacement product
Resolution Notes	The agent can use this field to specify how they reached the decision to either accept or deny a change to a case line item.
Contributor Users	This field is populated when a case line task is assigned to a case task agent.

Case line item form fields (continued)

Field	Description
Contributor Groups	This field is populated when a case line task is assigned to a case task agent.
Work notes	Enables users to post work notes to the record.

Case line task form

The case line task form displays details about a case line task associated with a case line item on a case record.

Case line task form fields

Field	Description
Number	The automatically generated record number. The prefix for numbers from the Case Line Task table is CSLTASK.
Parent case	The parent case of the case line item.
Account	The name of the company that the parent case is opened for.
Contact	The name of the customer contact for the parent case.
Case line	The number of the case line item that the task is created for.
State	The state of the case line task: • Open • Closed
Priority	The priority of the case line task: • 1 - Critical • 2 - High • 3 - Moderate • 4 - Low
Assignment group	The assigned customer service agent group.
Assigned to	The agent assigned to the case line task.
Subject	The subject of the case line task.
Description	A longer, more detailed description of the case line task.
Work notes list	A list of users who are interested in the case task. These users receive a notification when work notes are added to the case task.
Work notes	Information about the case task and the steps taken to resolve it. Work notes are posted to the activity stream and are visible only to internal users.

Case line task form fields (continued)

Field	Description
Additional comments	Customer-viewable comments and information about the case task. Additional comments are posted to the activity stream.

Case line characteristic form

The case line characteristic form displays details about the product offering included in a case line item.

Case line characteristic form fields

Field	Description
Number	The automatically generated record number. The prefix for numbers from the Case Line Characteristics table is **CSLC**.
Case line	The case line item that this characteristic belongs to. This field is a reference to the Case Line table.
Characteristic	This field is a reference to the Characteristic table [sn_prd_pm_characteristic].
Characteristic option	This field is a reference to the Characteristic Option table [sn_prd_pm_characteristic_option].
Characteristic value	The value of a characteristic.

Components installed with Case lines and workflows

Several types of components are installed with the Case lines and workflows application, including tables and roles.

Tables installed with Case lines and workflows

Case Lines and workflows tables

Case Line [sn_case_line]	The Case Line table stores case line item records that are created for parent cases. This table extends the Case table. The prefix for case line records is **CSL**.
Case Line Task [sn_case_line_task]	The Case Line Task table stores the tasks related to case line items. This table extends the Case Task table. The prefix for case line task records is **CSLTASK**.
Case Line Characteristic [sn_case_line_characteristic]	The Case Line Characteristic form displays details about the product offering included in a case line. The prefix for case line characteristic records is **CSLC**.

Roles

The Case Lines and workflows application includes roles that provide access to case line item and case line characteristic records. It also updates some existing roles to provide this same access.

Case lines and workflows roles

Role	Description	Includes roles
sn_case_line.characteristic_creator	This user can create case line characteristic records if they have access to the parent case line item record.	sn_case_characteristic_viewer
sn_case_line.characteristic_writer	This user can update case line characteristic records if they have access to the parent case line item record.	sn_case_characteristic_viewer
sn_case_line.characteristic_deleter	This user can delete case line characteristic records if they have access to the parent case line item record.	sn_case_characteristic_viewer
sn_case_line.characteristic_viewer	This user can view case line characteristic records if they have access to the parent case line item record.	
sn_case_line.characteristic_report_viewer	This user can view reports for the case line characteristic table if they have access to the parent case line item record.	
Case task agent [sn_customerservice.case_task_agent]	This is an existing role. The case task agent has read, write, and create access for case line tasks: • If the case task agent is the assigned user on the case task (assigned_to). • If the case task agent belongs to the same assignment group as the assigned user. The case task agent has read access to the following: • The parent order case and the case line items. • The case line characteristic if they have read access to	• sn_customerservice.csm_workspace_user • sn_customerservice.customer_data_viewer • sn_customerservice.case_contributor_editor • sn_csm_case_types.service_definition_viewe

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

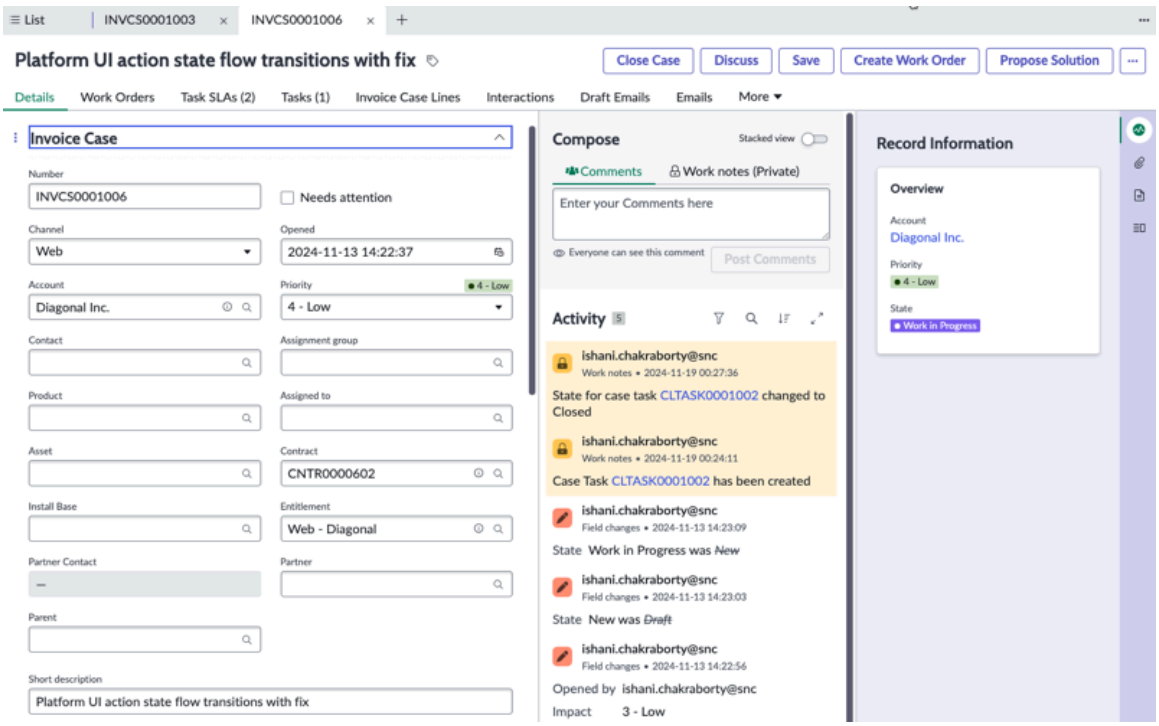
Case lines and workflows roles (continued)

Role	Description	Includes roles
	the associated case line item. • Account and contact records for the parent order case. The case task agent can update the work notes, comments, attachments, and watch list of the parent order case and the case line items.	
Customer service agent [sn_customerservice_agent]	This is an existing role. The customer service agent role has read, write, and update permissions for the following tables: • Case Line • Case Line Task • Case Line Characteristic	For more information, see Roles installed with Customer Service Management.

Case Management for Invoice Operations

The Case Management for Invoice Operations application enables customer service agents to create cases for specific lines from a single invoice or for multiple invoices.

Invoice case record



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Case Management for Invoice Operations application includes the Invoice case type. This case type provides the ability to reference multiple invoices or invoice lines as case lines on an invoice case record. By using case lines, agents can track multiple issues for the same invoice case and resolve the issues in each case line independently before resolving and closing the invoice case.

Use invoice cases to handle issues such as invoice disputes or requested corrections. With this application, agents can create an invoice case and add the invoices or invoice lines that are being disputed or that must be corrected. Agents can work through the case, create case tasks for other team members as needed, or assign case lines to other agents.

Benefits of using invoice cases

Businesses can encounter invoice issues for many reasons including price or quantity discrepancies or incorrect products or services. Invoice issues can also result from incorrect customer details such as incorrect billing or shipping locations. The following table provides some examples of these issues and the resulting invoice cases.

Invoice case examples

Reason	Case example
Price adjustments	The quantity of items invoiced does not match what was ordered or delivered, leading to either underbilling or overbilling.
Price discrepancies	The amount billed does not match the agreed-upon price or contract terms, such as incorrect discounts, tax calculations, or unit prices.
Incorrect customer information	The invoice contains errors in the customer's name, address, or billing information, which can affect payment processing.
Missing or incorrect items	An invoice includes products or services that were not delivered, or omits items that were delivered but not invoiced.
Part number or SKU errors	The part numbers or SKUs listed on the invoice do not match the products that were ordered or delivered, causing confusion or errors in inventory and payment processing.
Currency issues	An invoice is issued in the wrong currency or without proper conversion rates, creating discrepancies in the payment amount.
Incorrect unit of measure (UOM)	The unit of measure (for example, quantity per box, per meter, per kilogram) on the invoice is incorrect, causing confusion or errors in pricing and quantity calculations.
Dispute on negotiated price, discounts, or promotions	The invoice reflects a different price than what was negotiated, or discounts and promotions are not applied, leading to a dispute over the final amount due.
Incorrect invoice number	The invoice number does not follow the correct sequence, leading to accounting or tracking problems.

Overview of creating an invoice case

The following table provides an overview of the process for creating an invoice case. For detailed steps, see Create an invoice case.

Steps for creating an invoice case

Step	Description
Creating an invoice case	An agent can create an invoice case from CSM Configurable Workspace or from the Core UI by selecting **New** from the Invoice Cases list view.
Viewing the invoice case record	After creating an invoice case record, agents can: • Add invoices or invoice lines to the case. • Delete invoices or invoice lines from the case. • Create new invoice case lines. • Edit the details of invoice case lines. • Assign invoice case lines to themselves. • Create tasks for invoice case lines.
Submitting the invoice case record	Selecting **Save** on the Invoice case record moves the invoice case to the Draft state. After reviewing the record details, the agent can select **Submit** on the Invoice case record to move the invoice case and the invoice case lines to the New state. Once in the New state, agents can begin working to resolve the invoice case. This includes creating tasks for invoice case lines, assigning them to other agents or team members, and monitoring case progress.

Case Management for Invoice Operations plugin

Case Management for Invoice Operations (com.sn_csm_invoice) is a case management application for handling support requests on invoices or invoice lines. This application enables customers to process invoice service requests such as invoice disputes or invoice inquiries.

Note:
The Case Management for Invoice Operations application has a dependency on the Case lines and workflows application (com.sn_case_line).

The Case Management for Invoice Operations application includes list views for CSM Configurable Workspace and Core UI.

- In CSM Configurable Workspace, expand the **Invoice Cases** list category in the Lists tab.
- In Core UI, navigate to **All** > **Invoice Case**.

The Case Management for Invoice Operations application also includes tables, roles, service definitions, the Invoice case type, and other components. For more information, see Components installed with Case Management for Invoice Operations.

The Case Management for Invoice Operations application is available from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Invoice case pages

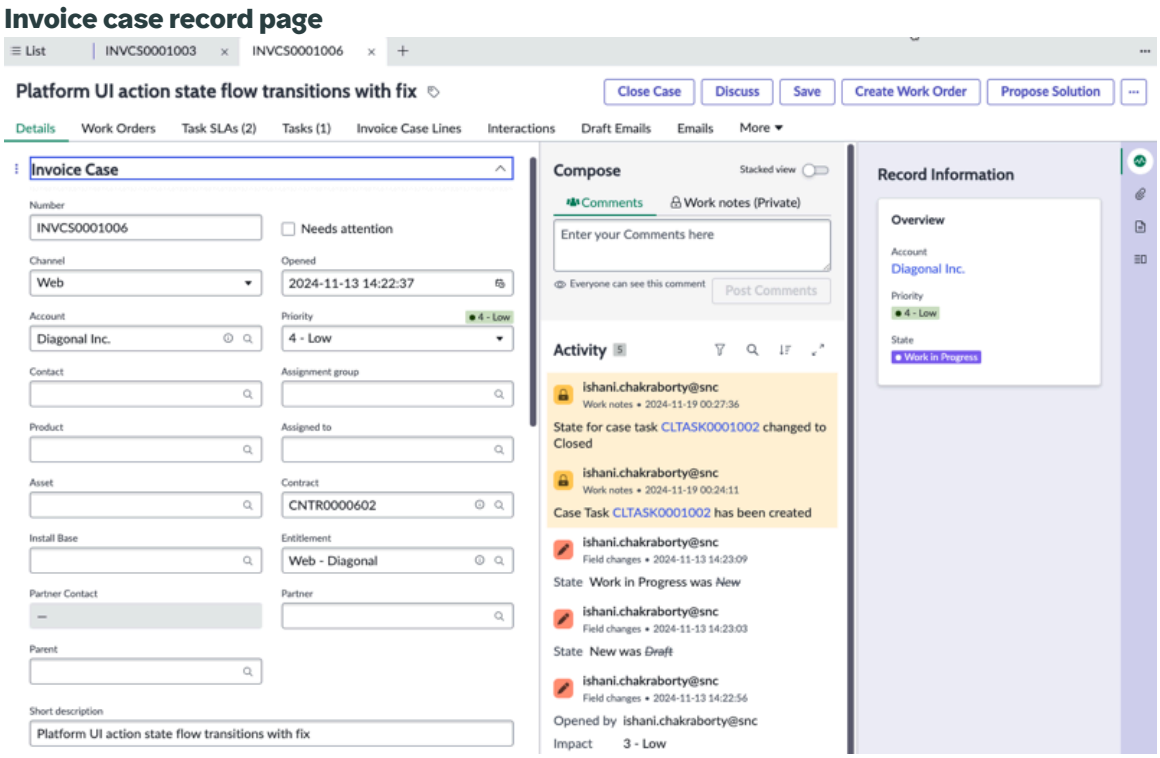
The Case Management for Invoice Operations application includes record pages that display invoice cases and invoice case lines in CSM Configurable Workspace.

The Case Management for Invoice Operations application enables agents to create invoice cases that reference customer invoices and invoice lines. Using invoice cases, agents can manage and track customer requests and the actions taken to fulfill these requests.

Invoice cases contain invoice case lines, which represent either invoice lines from a single invoice or multiple invoices. The Case Management for Invoice Operations application includes the following record pages to display this information in CSM Configurable Workspace.

Invoice case record page

The Invoice case record page displays information about invoice cases and the associated list of invoice case lines.



Customer service agents use this page to do the following:

- Add invoices or invoice lines to the invoice case.
- Delete invoices or invoice lines from the invoice case.
- Create new invoice case lines.
- Edit the details of invoice case lines.
- Assign invoice case lines to themselves.

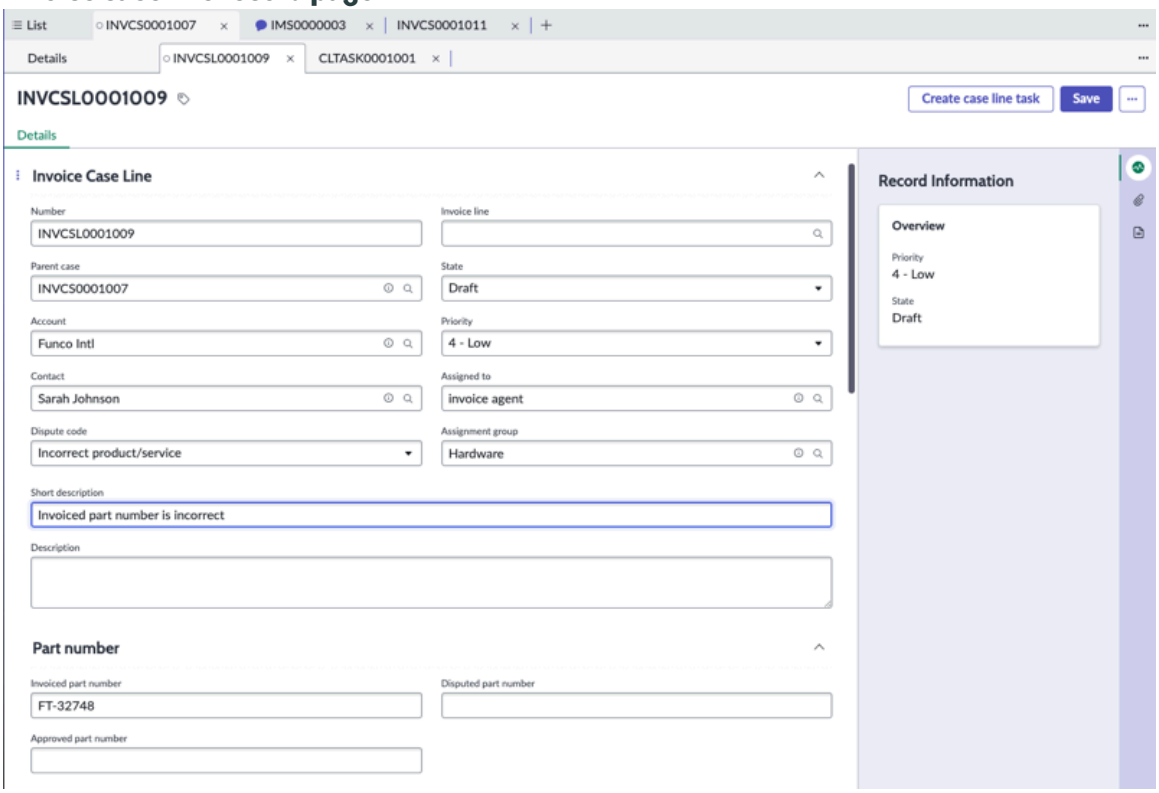
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Case Management for Invoice Operations application uses the CSM default record page to display Invoice case records in CSM Configurable Workspace.

Invoice case line record page

The Invoice case line record page displays information about an invoice case line associated with an invoice case.

Invoice case line record page



The Invoice case line record shows the details of an invoice case line, including customer and product information, the invoiced quantity, invoice discounts, and the billing and shipping locations. From this page, agents can select **Create case line task** to create tasks for invoice case lines.

Invoice case and invoice case line states

Invoice cases and invoice case lines move through several different states as agents work to resolve the individual case lines in invoice cases.

Invoice case states

Invoice cases can be in the states listed in the following table. Actions available on the invoice case record enable agents to move cases from one state to another.

Invoice case states

State	Description
Draft	The invoice case is in the Draft state. Select **Submit Case** on the invoice case record page to move the invoice case and all of the invoice case lines that are currently in the Draft state to New.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case states (continued)

State	Description
New	The invoice case has been submitted and is in the New state. Select **Assign to me** on the record page to assign the case to the logged-in user and move the invoice case and all of the invoice case lines currently in the New state to Work in Progress.
Work in Progress	The assigned agent is working on the invoice case. Select the following actions: • **Request Information**: Use this action to request additional information from the contact or consumer. The state moves to Awaiting Information. • **Propose solution**: Use this action to propose a resolution to the contact or consumer. The state moves from Work in Progress to Resolved.
Awaiting Info	The agent is waiting for the contact to provide the requested information for the invoice case. Select **Information Received** to move the invoice case back to Work in Progress.
Resolved	The agent has proposed a resolution for the invoice case to the contact. Select **Close Case** on the record page to move the invoice case to Closed.
Closed	The invoice case has been resolved and the resolution has been accepted by the contact. When all of the case lines for an invoice case are in a Final state, the case can be set to Closed. Final states include: • Resolved - Accepted • Resolved - Denied • Canceled
Canceled	The invoice case has been canceled. Select **Cancel** to cancel an invoice case. **Note:** You can only cancel invoice cases in the Draft state.

Invoice case line states

Invoice case lines can be in the states listed in the following table. The case lines in an invoice case can be in different states as the agent works to resolve each issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case line states

State	Description
Draft	The invoice case line is in the Draft state. When an invoice case is created and is in the Draft state, the associated invoice case lines are also in the Draft state.
New	The invoice case line is in the New state. When an invoice case is submitted and moved to the New state, the associated invoice case lines that are currently in Draft state are also moved to the New state.
Work in Progress	The assigned agent is working on the invoice case line.
Awaiting Info	The assigned agent has requested additional information about the invoice case line and is waiting for a response.
Resolved - Accepted	The change to the invoice case line has been accepted.
Resolved - Denied	The change to the invoice case line has been denied.
Canceled	The invoice case line has been canceled.

Note:
An agent can manually change the state of each invoice case line to Resolved - Accepted, Resolved - Denied, or Canceled. When all of the invoice case lines are in one of these states, the state of the invoice case changes to Resolved.

Syncing the state of an invoice case with the invoice case lines

State changes for an invoice case can result in state changes for the associated invoice case lines. These changes are detailed in the following table.

Invoice case and invoice case line states

Invoice case state	Invoice case line state
Draft	Saving a new invoice case creates the case in the Draft state. Invoice case lines for the invoice case are also created in the Draft state.
New	When an agent submits an invoice case, the state is updated from Draft to New. The states of the associated invoice case lines that are currently in Draft state are also set to New.
Work in Progress	When an agent selects **Assign to me** on an invoice case in the New state, the state is updated from New to Work in Progress. The states of the associated invoice case lines are also set to Work in Progress. If any of the case lines are set to Work in Progress, then the case is also set to Work in Progress.
Resolved	If a case is set to Resolved, the status of each of the case lines is also set to Resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case and invoice case line states (continued)

Invoice case state	Invoice case line state
	If all of the case lines are Resolved, then the case is set to Resolved.
Closed	When all of the case lines for an invoice case are in a final state, the case can be set to Closed. Final states include: • Resolved - Accepted • Resolved - Denied • Canceled When an agent selects **Close Case** on an invoice case in the Solution Proposed state, the system updates the state to Closed.
Canceled	When a user selects **Cancel** on an invoice case in the Draft state, the system updates the state to canceled. States for the invoice case lines associated with the invoice case are also set to canceled. **Note:** You can only cancel invoice cases in the Draft state.

Components installed with Case Management for Invoice Operations

Several types of components are installed with the Case Management for Invoice Operations application, including tables, roles, and service definitions.

Tables

The Case Management for Invoice Operations application adds the following tables.

Case Management for Invoice Operations tables

Table	Description
Invoice Case [sn_csm_invoice_case]	Stores invoice case records. This table extends the Case [sn_customerservice_case] table. Records in the Invoice Case table use the prefix **INVCS**.
Invoice Case Line [sn_csm_invoice_case_line]	Stores the case line items created for invoice cases. This table extends the Case Line [sn_case_line] table. Requesters and fulfillers can use this table to capture the invoices and invoice lines as line items on an invoice case for which they want to resolve disputes, or make inquiries.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Management for Invoice Operations tables (continued)

Table	Description
	Records in the Order Case Line table use the prefix **INVCSL**.

The Case Management for Invoice Operations application also uses the following tables from the Case lines and workflows application.

Case lines and workflows tables

Table	Description
Case Line [sn_case_line]	The Case Line table stores case line item records. This table extends the Task table. The prefix for case line records is **CSL**.
Case Line Characteristic [sn_case_line_characteristic]	The Case Line Characteristic form displays details about a case line item on a case record. The prefix for case line characteristic records is **CSLC**.
Case Line Task [sn_case_line_task]	The Case Line Task table stores the tasks related to case line items. This table extends the Case Task table. The prefix for case line task records is **CSLTASK**.

Roles

The Case Management for Invoice Operations application includes roles that provide access to invoice cases and invoice case line items. It also updates some existing roles to provide this same access.

Invoice Operations roles

Role	Description	Includes roles
Invoice case agent [sn_csm_invoice.agent]	The invoice case agent should have CRUD access to the invoice case header, invoice case line items, read-only access to invoices and invoice lines, products and product characteristics, accounts and contacts and assignment of invoice cases	• sn_customerservice_agent • sn_case_line.characteristic_delete • sn_csm_invoice.creator • sn_csm_invoice.writer • sn_otc.ar_invoice_viewer • sn_csm_invoice.navigation_menu
Invoice case manager [sn_csm_invoice.manager]	The invoice case manager should have all the access that invoice case agent has +	• sn_csm_invoice.agent • sn_csm_invoice.report_viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice Operations roles (continued)

Role	Description	Includes roles
	manages agents + manager reports	• sn_customerservice_manager • sn_case_line.characteristic_report_viewer
Invoice case task agent [sn_csm_invoice.invoice_case_task_agent]	The invoice case task should have all the access to the case tasks assigned to the agent as well as read-only access to view the invoice case/invoice case lines, invoices/invoice lines that case task is associated with and also be able to update worknotes and comments	• sn_otc.ar_invoice_viewer • sn_customerservice.case_task_agent

In addition to the persona roles, granular roles on invoice case header and invoice case lines are also needed.

Invoice Operations granular roles

Role	Description	Includes roles
Invoice case viewer [sn_csm_invoice.viewer]	Read only access to invoice case, invoice case lines if access to invoice case, invoice case line characteristics if access to case line. Read access to invoice cases.	sn_case_line.characteristic_viewer
Invoice case creator [sn_csm_invoice.creator]	Creating an invoice case with invoice case lines and invoice case line characteristics. Create access to invoice cases.	• sn_case_line.characteristic_creator • sn_csm_invoice.viewer
Invoice case writer [sn_csm_invoice.writer]	Editing an invoice case with invoice case lines if access to invoice case and invoice case line characteristics if access to case line. Write access to invoice cases.	• sn_case_line.characteristic_writer • sn_csm_invoice.viewer
Invoice case navigation menu [sn_csm_invoice.navigation_menu]	Access the invoice case navigation menu item. Role to access the invoice case navigation menus.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice Operations granular roles (continued)

Role	Description	Includes roles
Invoice case report viewer [sn_csm_invoice.report_viewer]	Access to invoice case reports. Report viewer access to invoice cases.	

Service definitions and service definition categories

The Case Management for Invoice Operations application provides the following invoice case service definition: **Invoice Disputes**.

- Type: Post-Sale
- Table: Invoice Case [sn_csm_invoice_case]
- Products: All
- Service definition category: Invoice

Agents can use this service definition to raise a dispute for one or more invoices or for specific lines on a single invoice.

This service definition belongs to the Invoice service definition category, which stores services for invoice-related issues. When creating an invoice case, agents can select this service definition in the case type selector.

Note:
The **Invoice Disputes** service definition is not active by default. To activate this service definition, the system administrator can:

1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Filter the list to show service definitions from the Invoice Case [sn_invoice_case] table.
3. Select **Invoice Disputes**.
4. Enable the **Active** check box.

For more information about service definitions and categories, see the following topics:

- Service definitions
- Service definition categories

Service level agreements (SLAs)

The Case Management for Invoice Operations application includes the following SLAs for the Invoice Case table (sn_csm_invoice_case).

SLA	Description
Initial Response Time for P1 and P2 cases	• Start condition: State of the case is New and Priority is P1 or P2. • Stop condition: State is not New or Draft.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA	Description
	• Schedule: None (24x7). • Duration: 4 hours.
Initial Response Time for P3 and P4 cases	• Start condition: State of the case is New and Priority is P3 or P4. • Stop condition: State is not New or Draft. • Schedule: 8am-5pm weekdays excluding holidays. • Duration: 8 hours. Duration: 8 hours.
Resolution SLA for P1 and P2 cases	• Start condition: State of the case is New and Priority is P1 or P2. • Pause condition: State of the case is Awaiting information. • Resume condition: State of the case is not Awaiting information. • Stop condition: State of the case is Resolved. • Schedule: None (24x7) • Duration: 2 days.
Resolution SLA for P3 and P4 cases	• Start condition: State of the case is New and Priority is P3 or P4. • Pause condition: State of the case is Awaiting information. • Resume condition: State of the case is not Awaiting information. • Stop condition: State of the case is Resolved. • Schedule: 8am-5pm weekdays excluding holidays. • Duration: ???.

Invoice case type

The Case Management for Invoice Operations application includes the **Invoice** case type. This case type captures the case information for invoice-related issues.

In addition to the fields on the customer service case record, the Invoice Case table [sn_csm_invoice_case] includes the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Invoice number**: The invoice number that the invoice case has been opened for.
- **Request source**: The source of the invoice case. Invoice cases can be created from the following sources:
  - Specific invoice lines, single invoice
  - Invoice header details, multiple invoices

For more information about case types, see Customer service case types.

To view the Invoice case type, navigate to **All** > **Customer Service** > **Case Types** > **Manage Case Types** and select **Invoice**.

Invoice case form views

The Case Management for Invoice Operations application includes form views to display invoice cases in CSM Configurable Workspace and in the Core UI.

This application uses the CSM default record page to display Invoice case records in CSM Configurable Workspace.

Invoice cases include the following related lists:

- Invoice Case Lines: Includes the individual case line records for this invoice case.
- Tasks: Includes tasks that have been created for this invoice case.
- Case Line Tasks: Includes tasks that have been created for individual case lines.

For more information, see the following topics:

- Invoice case form
- Invoice case line form

Invoice case archive rules

The Case Management for Invoice Operations application includes archive rules that archive older invoice cases.

Case Management for Invoice Operations archive rules

Archive rule	Description
Archive Invoice Case	This rule archives invoice case records that have been closed for more than 2 years. Archiving these invoice case records also archives the following records: • Invoice case tasks • Invoice case lines • Case line characteristics • Invoice case line tasks
Archive Invoice Case Line	This rule archives invoice case line records that have been closed for more than 2 years. Archiving these invoice case line records also archives the following records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Management for Invoice Operations archive rules (continued)

Archive rule	Description
	• Case line characteristics • Invoice case line tasks

Invoice case records that have been archived for more than five years are deleted. Deleting these records also deletes the following records:

- Invoice case tasks
- Invoice case line items
- Case line characteristics
- Invoice case line tasks

Invoice case workflows

The Case Management for Invoice Operations application includes a subflow that provides the mapping between a customer invoice and an invoice case. The subflow **Primitives - AR Invoice to CSM Invoice case request** creates the data mapping between two different entities: 1) the customer invoice and 2) the invoice case.

For example, when mapping a customer invoice to an invoice case, the entities share some fields such as **Account** and **Contact**. The data mapping copies these field values from the customer invoice to the invoice case record.

To view this subflow, navigate to **All** > **Process Automation** > **Workflow Studio** and select **Subflows** on the Workflow Studio homepage.

Invoice case form

The invoice case form displays details about an invoice case.

Invoice case form fields

Field	Description
Invoice Case	
Number	The automatically generated record number. The prefix for numbers from the Invoice Case table is **INVCS**.
Channel	The method by which the customer initiated contact and the case was opened. • Web (default) • Phone • Email • Chat • Social • Community

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case form fields (continued)

Field	Description
	• Alert • Virtual Agent
Account	The name of the company that the invoice case is opened for.
Contact	The name of the customer contact for the invoice case.
Product	The product model of the asset. A model is a specific version or configuration of an asset (for example, Apple Mac Book Pro). If you select an asset in the **Asset** field and the asset has an associated product, the **Product** field is automatically updated. A product can be associated with multiple assets.
Asset	The asset tag number or the serial number of the asset involved in this case.
Install Base	The Install base field helps you track which products and services have been purchased by a customer, how they have been installed or provisioned, along with the detailed configuration for each installed item.
Partner Contact	The name of the partner contact for this invoice case.
Parent	The parent record for the invoice case.
Short description	A brief description of the issue or request.
Needs attention	When checked, the system sends a notification to the agent in the **Assigned to** field. The notification includes the case number, state, priority, and short description.
Opened	The date and time that the invoice case was opened.
Priority	The assigned priority: • 1 — Critical • 2 — High • 3 — Moderate • 4 — Low (default)
Assignment group	The assigned customer service agent group.
Assigned to	The assigned agent. If a group is selected in the **Assignment group** field, the assigned agent must belong to this group.
Contract	The contract number associated with the invoice case.
Entitlement	The entitlement associated with the invoice case. The entitlements available for selection in the reference list channel matches the case creation channel. The available entitlements are filtered by the settings in the **Account**, **Contract**, **Product**, and **Asset** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case form fields (continued)

Field	Description
	If only one entitlement is available for this case, it is automatically added to the **Entitlement** field.
Partner	The name of the partner company.
Request source	The source of the invoice case. Invoice cases can be created from the following sources: • Specific invoice lines, single invoice • Invoice header details, multiple invoices
Invoice	The invoice that the invoice case is created for.
Notes	
Watch list	Users who receive notifications about this case when additional comments are added or if the state of a case is changed to Resolved or Closed.
Work notes list	Internal users who receive a notification about this case when work notes are added. You can only add internal users to the work notes list.
Additional comments (Customer visible)	Customer-viewable comments. Each comment is inserted into the Activity field when the user saves the record.
Work notes (Private)	Information about how to resolve the case, or steps taken to resolve it, if applicable. Internal users who have been added to the Work notes list receive notifications when work notes are added to the invoice case.
Closure Information	
Closed by	The name of the user who closed the case.
Closed	
Resolution code	The resolution provided for the invoice case:
Cause	Details about the cause of the issue or problem.
Resolution notes	Details about how the case was resolved.
Add resolution notes to comments	A check box to determine if the resolution notes are added to customer-viewable comments when the case is resolved. If selected, the resolution notes are added to the **Additional comments** (customer-visible) field. By default, the check box is cleared.
Related Records	
Incident	Displays the number of the incident record associated with this invoice record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case form fields (continued)

Field	Description
Problem	Displays the number of the problem record associated with this invoice record.
Change Request	Displays the number of the change request record associated with this invoice record.
Caused by Change	If a case is the result of a change, this field displays the associated change request record.

Invoice case line form

The invoice case line form displays details about an invoice case line.

Invoice case line form fields

Field	Description
Invoice Case Line	
Number	The automatically generated record number. The prefix for numbers from the Invoice Case Line table is **INVCSL**.
Parent case	The parent invoice case for this invoice case line record.
Account	The name of the company that the invoice case is opened for.
Contact	The name of the customer contact for the invoice case.
Dispute code	Indicates the type of dispute for which the invoice case line has been created. • Incorrect product/service • Pricing discrepancy • Incorrect quantity • Incorrect customer details • Other
Short description	A brief description of the issue or request.
Description	A more detailed description of the issue or request.
Invoice line	A reference field that displays the invoice line that is being disputed.
State	The current state of the invoice case line record: • Draft • New • Work in Progress • Awaiting Info • Resolved - Accepted

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoice case line form fields (continued)

Field	Description
	• Resolved - Denied • Canceled
Priority	The assigned priority: • 1 — Critical • 2 — High • 3 — Moderate • 4 — Low (default)
Assigned to	The agent assigned to the invoice case.
Assignment group	The group assigned to the invoice case.
Part number	
Invoiced part number	The original part number of the invoiced good or service.
Disputed part number	The disputed part number of the invoiced good or service.
Approved part number	The approved part number of the invoiced good or service.
Quantity	
Invoiced quantity	The original invoiced quantity of the invoiced good or service billed.
Disputed quantity	The disputed quantity of the invoiced good or service billed.
Approved quantity	The approved quantity of the invoiced good or service billed.
Amount	
Invoiced amount	The amount of the invoiced good or service.
Disputed amount	The disputed amount of the invoiced good or service.
Approved amount	The approved amount of the invoiced good or service.
Discount amount	
Invoiced discount amount	The invoiced discount amount of the invoiced good or service.
Disputed discount amount	The disputed discount amount of the invoiced good or service.
Approved discount amount	The approved discount amount of the invoiced good or service.
Billing location	
Invoiced billing location	The invoiced billing location of the invoice.
Requested billing location	The requested billing location of the invoice.
Shipping location	
Invoiced shipping location	The original shipping location of the invoiced good or service.
Requested shipping location	The requested shipping location of the invoiced good or service.

Invoice case line form fields (continued)

Field	Description
Resolution	
Resolution code	The resolution provided for the disputed invoice line item. • None • Solved - Credit • Solved - Write Off • Solved - Settlement • Solved - Invalid Dispute
Close notes	Additional notes made by the user who closes the case.
Notes	
Additional comments (Customer visible)	Customer-viewable comments. Each comment is inserted into the Activity field when the user saves the record.
Work notes (Private)	Information about how to resolve the case, or steps taken to resolve it, if applicable.

Accounts Receivable (AR) invoice table

The AR invoice (sn_otc_invoice) table stores the invoice data.

Accounts Receivable invoice table

The following table lists the fields for AR invoice [sn_otc_invoice] table.

Accounts Receivable invoice table

Field	Data type	Description
Account	Reference to Account	Customer in the business-to-business (B2B) business model.
Amount invoiced with tax (Reporting currency)	FX Currency	Total amount to be paid to the supplier including tax and shipping charges. This amount is displayed in reporting currency.
Amount invoiced with tax (Transaction currency)	FX Currency	Total amount to be paid to the supplier including tax and shipping charges. This amount is displayed in transactional currency.
Amount invoiced without tax (Reporting currency)	FX Currency	Total amount to be paid to the supplier excluding tax and shipping charges. This amount is displayed in reporting currency.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accounts Receivable invoice table (continued)

Field	Data type	Description
Amount invoiced without tax (Transaction currency)	FX Currency	Total amount to be paid to the supplier excluding tax and shipping charges. This amount is displayed in transactional currency.
Billing Contact	Reference to Account Contact	The account contact to which the invoice is sent.
Billing Location	Reference Location	Reference to the location to which the invoice is sent.
Bill to city	String	The city to which the invoice is sent.
Bill to country	Reference to Country	The country to which the invoice is sent.
Bill to state/ province	String	The state to which the invoice is sent.
Bill to street	String	The street address to which the invoice is sent.
Bill to ZIP/postal code	String	The zip code to which this invoice is sent.
Business owner	Reference to User	A group who owns the invoice.
Consumer	Reference to Consumer	Customer in the business-to-consumer (B2C) business model.
Created	Date/Time	Date on which this invoice is created.
Created by	String	Person who created the invoice.
Tax Code	Reference to Tax Code	The tax code levied on the total invoice amount.
Tax Jurisdiction Code	String	The tax code jurisdiction to which you must pay the tax.
Discount (%)	Decimal	Discount % for the discounts amount.
Discount due date	Date	Date by which you must make payment for the discounts to be applicable.
Discounts Amount	FX Currency	The discount applied on the invoice amount.
Due date	Date	Date by when you must make the payment.
Early payment discount amount	FX Currency	The discount applied on the total invoice amount on early payment.
ERP number	String	Unique number generated within the ERP system for the invoice.This field is applicable when there's an ERP integration. The value is populated after the invoice is posted in the ERP system through the integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accounts Receivable invoice table (continued)

Field	Data type	Description
ERP posting date	Date	Date on which the invoice is posted in the ERP system.
Has changed	True/ False	Denotes if the invoice has changed.
Invoice date	Date	Date on which this invoice is created.
Invoice source	String	Name of the application associated with the invoice from where it is sourced.
Number	String	An auto-generated number that uniquely identifies the invoice.
Other charges	FX Currency	Additional charges incurred on the invoice.
Parent invoice	Reference to AR Invoice	Original invoice
Payment date	Date	The date by when you must make the payment.
Payment terms	Reference to payment terms	Conditions applied on the payment
Remit to Contact	Reference to Account Contact	The account contacted to which the payment is made.
Remit to Location	Reference to Location	Reference to the location to which the payment is made.
Remit to city	String	The city to which the payment is made.
Remit to country	Reference to Country	The country to which the payment is made.
Remit to state/ province	String	The state to which the payment is made.
Remit to street	String	The street address to which the payment is made.
Remit to zip/ postal code	String	The zip code to which this payment is made.
Requires acknowledgment	True/ False	Invoice requires acknowledgment of receipt from recipient
Sales Order	Reference to Order	Sales order associated with the invoice.
Sales order number	String	Sales order associated with the invoice.
Customer tax id	String	The tax ID of the customer
Customer Contact	Reference to	The account contact of the customer for the invoice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accounts Receivable invoice table (continued)

Field	Data type	Description
	Account Contact	
Customer Location	Reference to Location	Reference to the customer location for the invoice.
Customer city	String	The city of the customer for the invoice.
Customer country	Reference to Country	The country of the customer for the invoice.
Customer state/ province	String	The country of the customer for the invoice.
Customer street	String	The street address of the customer for the invoice.
Customer zip/ postal code	String	The zip code of the customer for the invoice.
Shipping from Location	Reference to Location	Reference to the location from which the order on the invoice is shipped.
Ship from city	String	The city from which the order on the invoice is shipped.
Ship from country	Reference to Country	The country from which the order on the invoice is shipped.
Ship from state/ province	String	The state from which the order on the invoice is shipped.
Ship from street	String	The street address from which the order on the invoice is shipped.
Ship from zip/ postal code	String	The zip code from which this order is shipped.
Shipping to Contact	Reference to Account Contact	The account contacted to which the order on the invoice is shipped.
Shipping to Location	Reference to Location	Reference to the location to which the order on the invoice is shipped.
Ship to city	String	The city to which the order on the invoice is shipped.
Ship to country	Reference to Country	The country to which the order on the invoice is shipped.
Ship to state/ province	String	The state to which the order on the invoice is shipped.
Ship to street	String	The street address to which the order on the invoice is shipped.
Ship to zip/ postal code	String	The zip code to which this order is shipped.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accounts Receivable invoice table (continued)

Field	Data type	Description
Shipping Charges	FX Currency	Shipping charges incurred for the invoice.
Short description	String	Brief description about the invoice.
Status	String	Current state of the invoice.
Submitted by	Reference to User	Person who submitted the invoice.
Subtotal	FX Currency	The total amount from all the invoice lines without tax and shipping charges.
Supplier	Reference to Supplier	Supplier who delivers the product or service.
Supplier tax id	String	The tax ID of the supplier.
Tax amount	FX Currency	Tax applied on the invoice amount.
Tax rate decimal	Decimal	Tax rate % applied on the invoice - Tax rate in decimal if tax code is not used.
Tax Rate String	String	Tax rate % applied on the invoice - Tax rate in string if tax code and decimal is not used
Type	String	The type of invoice debit or credit.

Accounts Receivable (AR) invoice line table

The AR invoice line (sn_otc_invoice_line) table stores the invoice line data.

Accounts Receivable invoice line table

The following table lists the fields for AR invoice line [sn_otc_invoice_line] table.

Accounts Receivable invoice line table

Field	Data type	Description
Invoice Number	Reference to AR Invoice	Parent invoice number containing the invoice lines.
Invoice line quantity	Decimal	The number of items that have been invoiced in the line.
Line item invoice with tax	FX Currency	The total cost which is being billed for this good or service with tax.
Line item invoice without tax	FX Currency	The total cost which is being billed for this good or service without tax.
Description	String	Brief description of the invoice line.
Line unit price	Decimal	Unit price of the line item in the invoice.
Part Number	String	SKU number from the product catalog

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accounts Receivable invoice line table (continued)

Field	Data type	Description
Line Item Number	String	Invoice line number
Sales Order	Reference to Order	Sales order associated with the invoice
Sales Order Number	String	Sales order associated with the invoice
Sales Order line	Reference to Order Line Item	Sales order line associated with the invoice line.
Sales Order line Number	String	Sales order line associated with the invoice line
Shipping to Contact	Reference to Account Contact	The account contact to which the order on the invoice is shipped.
Shipping to Location	Reference to Location	Reference to the location to which the order on the invoice is shipped.
Ship to city	String	The city to which the order on the invoice is shipped.
Ship to country	Reference to Country	The country to which the order on the invoice is shipped.
Ship to state/ province	String	The state to which the order on the invoice is shipped.
Ship to street	String	The street address to which the order on the invoice is shipped.
Ship to zip/ postal code	String	The zip code to which this order is shipped.
Status	String	Status of the invoice line.
Tax amount	FX Currency	Tax amount for the invoice line item.
Tax code	Reference to Tax Code	Tax code of the invoice line.
Tax jurisdiction code	String	Tax jurisdiction code of the invoice line.
Tax rate decimal	Decimal	Tax rate % applied on the invoice line - Tax rate in decimal if tax code is not used.
Tax rate string	String	Tax rate % applied on the invoice line - Tax rate in string if tax code and decimal is not used.
Unit of Measure	Reference to Unit	Unit of Measure for the invoice line item quantity.

Creating an invoice case

Agents can create invoice cases from the Invoice Cases list view in CSM Configurable Workspace or the Core UI.

Agents can create invoice cases by selecting **New** from the Invoice Cases list view. From the Invoice case record, agents can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add invoices or invoice lines to the invoice case.
- Delete invoices or invoice lines from the invoice case.
- Create new invoice case lines.
- Edit the details of invoice case lines.
- Assign invoice case lines to themselves.
- Create tasks for invoice case lines.

Selecting **Save** on the Invoice case record moves the invoice case and the invoice case lines currently in the Draft state to the New state. Once in the New state, agents can begin working to resolve the invoice case. This can include creating tasks for invoice case lines, assigning them to other agents or team members, and monitoring case progress.

Request source

An agent can create the following types of invoice cases:

- Cases that reference one or more invoice lines from a single customer invoice.
- Cases that reference multiple customer invoices.

The Invoice case record includes the **Request source** field. An agent can select the following values in this field:

- **Specific invoice lines, single invoice**: The invoice case is for a single customer invoice. The agent can select the invoice in the **Invoice** field.
- **Invoice header details, multiple invoices**: The invoice case is for multiple customer invoices.

Add invoices and invoice lines to an invoice case

Invoice cases can include a list of invoice case lines. These case lines represent either customer invoices or invoice lines from a single customer invoice.

Once an invoice case has been created, agents can add invoices or invoice lines to the case by selecting **New** from the Invoice Case Lines related list. Selecting this action displays a new Invoice Case Line record.

The agent can select an invoice line or invoice for the Invoice Case Line record and then select **Save** to add it to the invoice case as an invoice case line.

Create an invoice case

Create an invoice case for a customer invoice or for selected invoice lines.

Before you begin

Role required: sn_csm_invoice.agent, sn_csm_invoice.manager, admin

Procedure

1. In CSM Configurable Workspace, select **New** from the Invoice Cases list view.
2. Add information to the Invoice Case form, such as **Account** and **Contact** and **Short description**.
3. Select an invoice number in the **Invoice** field.
   This field is displayed if the **Request source** field is set to Specific invoice lines, single invoice.
4. Select **Save**.
   Saving the Invoice Case form to creates the invoice case record in the Draft state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. View the invoice case record details and make any necessary changes.

   You can perform the following tasks while the order case is in Draft state:

   - Add invoices or invoice lines to the invoice case.
   - Delete invoices or invoice lines from the invoice case.
   - Create new invoice case lines.
   - Edit the details of invoice case lines.
   - Assign invoice case lines to yourself.

6. Select **Submit**.
   Submitting the invoice case record moves the invoice case and the invoice case lines currently in the Draft state to the New state and enables you to begin working to resolve the invoice case.

What to do next

After submitting an invoice case, you can:

- Add an invoice case line to an invoice case
- Create a task for an invoice case line

Add an invoice case line to an invoice case

Add an invoice case line to an invoice case.

Before you begin

Role required: sn_csm_invoice.agent, sn_csm_invoice.manager, admin

Procedure

1. Open an invoice case In CSM Configurable Workspace.
2. Select the Invoice Case Lines tab and then select **New**.
   This opens a new Invoice Case Line form in a separate sub tab.
3. Add information to the Invoice Case Line form.
4. Select **Save**.

   The system adds the new record to the Invoice Case Lines tab on the invoice case record.

Create a task for an invoice case line

Create a case line task for an invoice case line.

Before you begin

Role required: sn_csm_invoice.agent, sn_csm_invoice.manager, admin

Procedure

1. Open an invoice case In CSM Configurable Workspace.
2. Select the Invoice Case Lines tab and then select an invoice case line.
3. Select **Create case line task**.
   The system opens a Create New Case Line Task form in a separate sub tab.
4. Add information to the Create New Case Line Task form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Save**.

   The system adds the new task record to the Tasks tab on the Invoice Case Line record.

Service definitions

Use service definitions to create connections between products, services, and case types. Customers can use these definitions to quickly discover and request the services they need. Agents can use these definitions to create cases of the right type to support those service requests.

Overview

The service definitions feature is available with the Customer Service Case Types plugin (com.snc.csm_case_types). Case types enable you to address specific types of customer requests. A case type extends the base customer service case and includes the processes, attributes, and data required to resolve a specific type of case, such as onboarding a customer or resolving a complaint.

A service definition describes a service that a business or organization offers to support a product or service that they sell. Service definitions work with case types to provide different types of service requests.

- You can create connections between products and services and the case types that support those services. These connections streamline the case management process for requesting and executing services and simplify service requests based on the customer's context.
- You can also create service definitions for case task types and then create parent-child relationships between case type definitions and case task type definitions. This enables agents to easily create case tasks of the right type.
- You can create categories of services and then organize service definitions into logical groupings. Agents can use these categories to quickly find the services they need.

Service definition benefits

When you create service definitions for each of the services that you offer, agents can use the defined services to create cases and cases tasks of the right type for customer issues and requests. When creating these cases and case tasks, agents can do the following:

- Select from a list of available services.
- Select a category and view the available services within that category.
- Filter the applicable services based on the products owned by a customer.
- Create a case of the right type based on the service requested or for the products owned by a customer.

Customers can use service definitions to discover and request services to support their products from the Customer and Consumer Service Portals.

Service definition categories

Service definition categories enable you to organize service definitions into logical groupings. A category can have multiple service definitions and a service definition can belong to one or more categories.

These categories appear on the case service selector and case task service selector. When an agent is creating a case or case task, they can select a category and then view and select from the available services within that category to create a case or case task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The service definition ID field

In the Washington DC release, the **ID** field replaces the **Number** field.

- For upgrade customers, the **Number** field is relabeled to show that it is deprecated.
- For new customers, the **Number** field is not present.

For customers upgrading from Utah or Vancouver, a fix script runs automatically that adds the ID field to records in the Service Definition [sn_case_type_selection] table. The fix script copies the value from the **Name** field and adds it to the **ID** field, replacing white space characters with underscores. This field has a maximum length of 40 characters.

System administrator experience

The system administrator defines the services that are offered to customers for the products and services in the product catalog. For each service definition, the admin can complete the following configuration tasks.

Service definition configuration tasks

Task	Description
Create a service definition	The service definition record stores details about a service that is provided to customers. This information includes a name for the service definition, the target table, and the service category.
Associate one or more products	Services can be product-specific or general services can be created and made available for all products.
Associate a case type	A case type provides the processes and data that an agent needs to resolve a case for a specific type of service.
Associate a playbook	A playbook provides agents with step-by-step guidance for resolving a specific type of case.
Configure default field values	Configure default values for fields in a service definition's target table. When a record is created for this table, the system uses these values to auto-populate record fields.
Associate a record producer	Record producers enable end users to request services from the Customer and Consumer Portals.
Configure related services for a service definition	Associate one or more related services with a service definition to create parent-child relationships between service definitions. For example, you can create service definitions for case tasks and associate them with a service definition for a case type.
Create a service definition category	Create a category for service definitions. You can use these categories to create logical groupings of service definitions.
Associate service definitions with a category	Add service definitions to a category. A category can have one or more associated service definitions and a service definition can belong to multiple categories.
Add a case type to the Case interceptor	To configure this feature for use in the Core UI, add case types to the Case interceptor.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent experience

Associating a case type with a service definition automates the case type selection process for agents. From CSM Configurable Workspace, agents can quickly create cases of the right case type based on customer context.

When creating cases, agents can select the appropriate service for a customer based on the products that the customer owns. The Product Service Select version of the case type selector enables agents to do the following:

- Create cases from case and case type list views.
- Create cases from several types of records:
- Select a product. The case type selector includes a **This case is for an owned product** check box.
  - If checked: Lists services relevant to the selected product.
  - If cleared: Lists all available services.
- Select a category of services and view the services within that category.
- Select a service from the list of available services.
- Select **Create Case** to create a case of the case type associated with the service.

The system automatically determines the case type based on the selected service and creates a case of that type. If the service definition has an associated playbook, the agent can use the playbook in a tab on the case record.

Note:
From the Core UI, the Case interceptor enables agents to select a service definition for case type creation.

Associating a case task type with a service definition enables agents to create case tasks of the right type based on the case context. The Product Service Select version of the case task type selector enables agents to create tasks from case task lists, case records, playbook stages, and the Dynamic Related Records tab in the contextual side panel.

Customer experience

End users can use the service definitions feature to request available services from the Customer and Consumer Service Portals based on the products they have purchased.

- Use the portal to view the sold products or the install base items that they own.
- Select a product or an install base item and see the available services in the Services portal widget. This widget can display product-specific services, requests for new products, and general services.
- Select a service and launch a record producer to create a service request. When submitted, the system automatically creates a case of the correct type.
- View a case that was created for a service request and see the **Service definition** field on the case record.

Services portal widget

End users can view a list of available services for their sold products and install base items from the Customer and Consumer Service Portals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From the portal, an end user can navigate to a list of their sold products or install base items. After selecting a product, the Services portal widget lists the available services. These can include:

- Services based on a sold product or install base item
- General services
- Services for requesting new products

Selecting a service from the widget displays the record producer associated with the service definition. Depending on the record producer configuration, some of the fields are auto-filled such as the product model or install base item and the selected service. Submitting the record producer creates a case of the correct case type.

Note:
Cases that have been created from a case type associated with a service definition display the service definition in the **Service definition** field. End users can see this information on the case records that they can access from the portal.

Service definition roles

Service definition roles included with the Customer Service Case Types plugin enable users to view, create, and update service definitions, service definition categories, and service definition category relationships. Agents and end users can use these definitions and categories to view and create cases based on the selected service.

Service definition roles

The following service definition roles are installed with the Customer Service Case Types (com.snc.csm_case_types) plugin.

Roles installed with case types

Role	Description	Contains roles
Service definition admin [sn_csm_case_types.service_definition_admin]	Administrator role for the Customer Service case types tables. Users with this role can view, create, update, and delete service definitions, service definition categories, and service definition category relationships.	• sn_csm_case_types.service_definition_mana • sn_service_org.service_criteria_delete
Service definition manager [sn_csm_case_types.service_definition_manager]	Manager role for the Customer Service case types tables. Users with this role can view, create, and update service definitions, service	• sn_csm_case_types.service_definition_repor • sn_csm_case_types.service_definition_all_ta • sn_service_org.service_criteria_write

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with case types (continued)

Role	Description	Contains roles
	definition categories, and service definition category relationships.	• sn_service_org.service_criteria_create • sn_service_org.service_criteria_read
Service definition viewer [sn_csm_case_types.service_definition_viewer]	Users with this role can view service definitions, service definition categories, and service definition category relationships.	sn_service_org.service_criteria_read
Service definition report viewer [sn_csm_case_types.service_definition_report_view]	Provides report view access to service definition related tables.	None
Service definition all table viewer [sn_csm_case_types.service_definition_all_table_viewer]	Provides view access to the service definition tables. Users with this role can view service definitions, service definition categories, and service definition category relationships.	None

How users can use service definitions

In CSM Configurable Workspace, users with the admin role or one of the following agent roles can access the **Service** field for cases and case tasks.

- Customer service agent (sn_customerservice_agent)
- Consumer service agent (sn_customerservice.consumer_agent)
- Customer service manager (sn_customerservice_manager)

The admin and agent roles can do the following:

- See the **Service** column on Case Task lists. For example, My Case Task and My Contributing Tasks.
- See the **Service** field on the Case Task form.
- Select a service in the **Service** field and save the Case Task form.
- Create a case task and see the **Service** field on the Case Task form.

In the Core UI, users with the admin role or one of the agent roles listed above can do the following:

- See the **Service** column on Task list.
- See the **Service** field on the Task form.
- Select a service in the **Service** field and save the Case Task form.

From the Customer and Consumer Service Portals, users with the admin role or an end user role can see the **Service** field on case tasks that the user has access to. See the following table for the end user roles that can see this field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End users and roles that can see the Service field on case tasks

Users and Roles	Description
B2B user roles	
Customer service agent [sn_customerservice.customer]	An agent who assists customers and partners with questions, issues, and problems.
Customer administrator [sn_customerservice.customer_admin]	An administrator role for a customer account. This user has access to all of the data within the account.
Customer case manager [sn_customerservice.customer_case_manager]	A customer role for managing the cases in an account and any related child accounts.
Partner [sn_customerservice.partner]	A partner who is serving customer accounts.
Partner administrator [sn_customerservice.partner_admin]	An administrator role for a partner account.
Case task agent [sn_customerservice.case_task_agent]	A role that provides access to case tasks and related case information.
Case task viewer [sn_customerservice.case_task_viewer]	A role that provides read-only access to all case task records.
Customer contacts with configured contact relationships	For more information, see Contact Relationships.
B2C user roles	
Consumer service agent [sn_customerservice.consumer_agent]	An agent who assists consumers with questions, issues, and problems.
Consumers with configured consumer relationships	Use relationships to provide internal and external users with additional access to customer data. For more information, see Create relationships.
Consumers who are designated as head of household	A household is made up of a group of consumers who live at a common address and share products and services. A household can have a designated head of household and multiple current members. For more information, see Create or update a household.
Contributor roles	
Account contributor [sn_customerservice.account_contributor]	This role enables users to create cases and case tasks for any account.

End users and roles that can see the Service field on case tasks (continued)

Users and Roles	Description
Consumer contributor [sn_customerservice.consumer_contributor]	This role enables users to create cases and case tasks for any consumer.
Self contributor [sn_customerservice.self_contributor]	This role enables users with snc_internal role to create cases and case tasks for themselves.
Location manager contributor [sn_customerservice.svc_location_manager_contributor]	A location manager contributor is employed at the business location and manages a business location in the location hierarchy along with all its child business locations.
Location agent [sn_customerservice.svc_location_agent]	• View all CSM entities. • Create cases for any account, household, consumer, or service organization. • Fulfill cases for any account, household, consumer, or service organization created at the agent's location.
Location consumer agent [sn_customerservice.svc_location_consumer_agent]	• View all CSM entities. • Create cases for any household or consumer. • Fulfill cases for any household or consumer created at the agent's location. • Assign related staff to any account, household, or consumer.
Relationship contributor [sn_customerservice.relationship_contributor]	This role enables users to create cases for customers with which they have an established relationship.
Relationship agent [sn_customerservice.relationship_agent]	Manage cases for the accounts, contacts, consumers, and households that the agent has relationships with. This includes the following relationships that are provided with the Service Model Foundation plugins: • Account Manager: Creates a relationship between an internal user and an account. • Relationship Manager: Creates a relationship between an internal user and a consumer or a household.
Location relationship manager [sn_bus_loc.location_relationship_manager]	A location relationship manager is employed by the parent business and acts as a point of contact for one or more external business locations.

Configuring service definitions

Customer service case types

Manage customer service case types

Create a customer service case of a specific type

Configuring service definitions

Create service definitions for the types of services required to support your products. Associate different features such as case types, playbooks, and record producers with service definitions so that customers can request the services they need and agents can create cases of the right type to support those services.

System administrators can use the service definitions feature to define the services that are offered to customers and connect those services to products, case types, playbooks, and catalog items.

Service definition configuration tasks

Task	Description
Create a service definition	Create a definition for a service that's offered to support a product.
Associate a product with a service definition	Configure the relationship between a product and service.
Associate a case type with a service definition	A case type defines the case resolution process for a service definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service definition configuration tasks (continued)

Task	Description
Associate a playbook with a service definition	A playbook provides step-by-step guidance for resolving a specific type of case. Defining a playbook record generator view enables case creation for a requested service.
Configure default field values for a service definition	Configure default values for fields in a service definition's target table. When a record is created for this table, the system uses these values to auto populate record fields.
Configure catalog items for a service definition	End users can select a catalog item from the service portal and use the record producer to create the service request.
Configure related services for a service definition	Associate one or more related services with a service definition to create parent-child relationships between service definitions. For example, you can create service definitions for case tasks and associate them with a service definition for a case type.
Associate service organizations with a service	After creating a service definition, you can associate service organizations offering service with a service organization.
Create a service definition category	Create a category for service definitions. You can use these categories to create logical groupings of service definitions.
Associate service definitions with a category	Add service definitions to a category. A category can have one or more associated service definitions and a service definition can belong to multiple categories.
Add a case type to the Case interceptor	In the Core UI, the Case interceptor lists the types of customer service cases that an agent can create. If you create a case type and you want that case type to appear in the Case interceptor, you need to add it to the Case interceptor configuration.

Create a service definition

Create a service definition record in the Customer Service Management (CSM) application to establish connections between products, services, and case types.

Before you begin

Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task

A service definition record stores the details about a service that is provided to customers. You can create service definitions for the types of services that are required to support your products and for cases, case types, and case tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After creating a service definition, you can associate the service definition with a product. By associating one or more related services with a service definition, you can create parent-child relationships between the service definitions.

You can also create relationships between the service definition and other related services. For example, you can create a service definition for a case and then create one or more service definitions for your case tasks. Afterward, you can establish a relationship between the case service definition and the case task service definitions.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select **New**.
3. In the **Name** field, enter a name for the service definition.
4. If necessary, modify the information in the **ID** field.
   The system auto-populates the **ID** field with the name of the service definition and replaces the spaces with underscores. The ID can contain alphanumeric characters and underscores and can be up to 40 characters in length.

   Note:
   The value in this field must be unique.

5. In the **Table** field, select the table that the service definition is available for.
   For example, if the service is available for the onboarding case type, select the Onboarding Case [sn_onboarding_case] table.
6. **Optional:** In the **Customer service type** field, select a service type for the service definition.

   A service type enables the system to show the following type of services based on the context:

   - Pre-sale
   - Post-sale
   - General

7. **Optional:** In the **Playbook record generator** field, select a playbook record generator.
   If a service definition has an associated playbook, the agent can use the playbook in a tab on the case record. For more information, see Associate a playbook with a service definition.
8. **Optional:** In the **Image** field, select an image for the service definition.
   Service definitions appear in the case type selector in a card view. The image appears in the card for a service definition along with the name and description.
9. **Optional:** In the **Default table field values** field, select one or more fields and values.
   Configure the default values for the fields in the target table for service definitions. When a record is created for this table, the system uses these values to automatically fill in the record fields. For more information, see Configure default field values for a service definition.
10. **Optional:** In the **Order** field, add an order value for the service definition.
    This value determines the order in which the services are displayed in the case type selector or other workflows. Service definitions with the lowest order value are displayed first. The default value is 100.

    - Service definitions with no order value appear after the ordered service definitions. These service definitions have the lowest priority.
    - If one or more service definitions have the same order value, the system displays the service definitions in alphabetical order.

11. **Optional:** Enable the **Active** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. **Optional:** In the **Description** field, add a description of the service definition.
    Service definitions appear in the case type selector in a card view. The card includes the name, description, and image for a service definition. Customer service agents can search for services by entering keywords found in the service definition name and description.
13. Select **Submit**.
    The service definition is added to the Service Definitions list.

    Upon save, the service definition record includes the following related lists:

    - Product Service Relationships
    - Catalog Service Relationships
    - Service to Service Relationships
    - Service Definition Category Relationships
    - Reports

Result

After creating a service definition, you can perform the following configuration tasks:

- Associate one or more products with a service definition
- Create a service definition category
- Associate a product with a service definition
- Associate a case type with a service definition
- Associate a playbook record generator with a service definition
- Associate a service definitions to a service definition category
- Configure default field values for a service definition
- Configure catalog items for a service definition
- Configure related services for a service definition.
- Associate service organizations with a service.
- Add a case type to the Case interceptor.

Create a service definition category

Create a service definition category record in the Customer Service Management (CSM) application. Then use the category to create logical groupings of service definitions.

Before you begin

Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task

A category can have one or more associated service definitions and a service definition can belong to multiple categories.

When an agent is using the case type selector to create a case, they can select a category before selecting a service. The category acts as a filtering mechanism and reduces the number of available services.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definition Categories**.
2. From the Service Definition Categories list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Name** field, enter a name for the category.
   The category name can be up to 60 characters in length.
4. **Optional:** In the **Description** field, add a description of the category.
   The description can be up to 4000 characters in length.
5. **Optional:** In the **Order** field, add an order number for the category.
   The order value determines the order in which the categories are displayed in the case type selector and case task type selector. The category with the lowest value is displayed first.

   (Optional) The default value is 100. You do not have to set an order value for a category. If a category does not have a value, the system displays the category in the case type selector in alphabetical order.
6. **Optional:** Enable the **Active** check box.
   This field is enabled by default.
7. Select **Submit**.
   The category is added to the Service Definition Categories list.

   Upon save, the new category record includes the Service Definition Category Relationships related list, which shows the service definitions associated with the category.

Result

After creating a service definition category, you can associate service definitions with the category. These associated service definitions are stored in the Service Definition Category Relationships related list.

Associate a product with a service definition

After creating a service definition, you can associate one or more product models or sold products with the definition.

Before you begin

Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task

A product model or a sold product can have multiple services associated with it.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. In the Product Service Relationships related list, select **New**.
   The system displays a new Product Service Relationship record. The **Service definition** field is auto-filled with the name of the selected service definition.
4. Determine if this service definition is available for all products or for a specific product.

   - If it is available for all products, enable the **All products** check box and go to step 6.
   - If it is available for a specific product, leave the check box empty and go to the next step.
5. Select the product in the **Product** field.
6. Select **Submit**.
   The relationship record is added to the Product Service Relationships related list. If the relationship is for a specific product, the name is displayed in the **Product** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate a case type with a service definition

After creating a service definition, you can associate a case type with the definition.

Before you begin

Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task

A case type can be associated with one or more service definitions.

To see the service definitions associated with a case type, navigate to **All** > **Customer Service** > **Case Types** > **Manage Case Types** and select a case type from the list. This information is displayed in the Service Definitions related list.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. In the **Table** field, select the table for the case type that extends the Case table (sn_customerservice_case).
   For example, to associate the service definition with the complaint case type, select the Complaint Case table (sn_complaint_case).
4. Select **Update**.

Associate a playbook with a service definition

After creating a service definition, you can associate a playbook with the definition.

Before you begin

Role required: (playbook_experience.admin + sn_csm_case_types.service_definition_manager) or admin

About this task

Note:
To see the playbook record generator field and values on the list and form view, the service def manager needs the playbook_experience.admin role in addition to sn_csm_case_types.service_definition_manager. Please add this role to associate a playbook with a service definition.

A playbook provides agents with step-by-step guidance for resolving a specific type of case. If a service definition has an associated playbook, the agent can use the playbook in a tab on the case record.

When the agent selects **Create Case** on the case type selector screen, the system displays the new case record and launches the playbook associated with the service in a tab on the record page.

Note:
This is an optional task.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. Select a playbook record generator in the **Playbook record generator** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This field is a reference to the Playbook Experience Record Generator table (sys_playbook_experience_record_generator). For more information, see Playbook record generator

4. Select **Update**.

Associate a service definition with a service definition category

After creating a service definition category, you can associate one or more service definitions with the category.

Before you begin
Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task
Service definition categories enable you to organize service definitions into logical groupings. A category can have multiple service definitions and a service definition can belong to one or more categories.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definition Categories**.
2. Select a category from the Service Definition Categories list.
3. In the Service Definition Category Relationships related list, select **New**.
4. Select a service definition in the **Service Definition** field.
5. Select **Submit**.
   The service definition is added to the Service Definition Category Relationships related list.

Configure default field values for a service definition

Configure default values for fields in a service definition's target table. When a record is created for this table, the system uses these values to auto populate record fields.

Before you begin
Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task
The target table for a service definition is stored in the **Table** field. The table selected in this field is the Case table or a table that extends the Case table. When a record is created for the target table, the system auto populates fields with the default values.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. In the **Default table field values** field, select a field and a value.
   Each time you select a field, an additional selection option becomes available.
4. **Optional:** To remove a field, select the Delete button next to the field value.
5. When you are finished selecting fields and values, select **Update**.

Configure catalog items for a service definition

After creating a service definition, you can associate one or more catalog items with the definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task
A catalog item is a product or service that is available within a service catalog. A record producer is a specific type of catalog item that enables users to create task-based records.

From the Customer and Consumer Portals, end users can select available services from the Services portal widget. Selecting a service displays the record producer associated with the service definition. Submitting the record producer creates a case of the correct case type.

A variable set for service definitions is available with the Customer Service Case Types plugin (com.snc.csm_case_types). This variable set populates the service definition based on the product and/or service selected on the record producer.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. In the Catalog Service Relationships related list, select **New**.
   The system displays a new Catalog Service Relationship record. The **Service definition** field is auto-filled with the name of the selected service definition.
4. Select a catalog item in the **Catalog Item** field.
5. Select **Submit**.
   The catalog item is added to the to the Catalog Service Relationships related list.

Related topics
Service Catalog items

Create or edit a catalog item

Configure related services for a service definition

After creating a service definition, you can associate one or more related services with the service definition. This creates a parent-child relationship between service definitions.

Before you begin
Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task
When creating relationships between services on the Service to Service Relationship record, only one relationship between the related service definition and the service definition can exist.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. In the Service to Service Relationships related list, select **New**.
   The system displays a new Service to Service Relationship record. The **Service definition** field is auto-filled with the name of the selected service definition.
4. Select a related service in the **Related service definition** field.
   From the Service Definitions pop-up window, you can select the target table in the **Table** field and then select from the list of related services for that table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You cannot relate the same service to a parent service more than once.

5. Select **Submit**.
   The related service is added to the to the Service to Service Relationships related list. The **Table** column displays the name of the target table for the related service.

Associate service organizations with a service

Associate your service organizations with a service by using the Customer Service Management (CSM) application. With this association, your service organization (SO) staff can address customer queries for products and services offered at the business location and can raise a case on the behalf of the customer.

Before you begin
Role required: sn_csm_case_types.service_definition_manager, sn_csm_case_types.service_definition_admin, or admin

About this task
An SO can have multiple services associated with it. A service-to-service organization criteria association is contained in the Service Organizations offering Service [service_organizations_offering_service] table.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Service Definitions**.
2. Select a service definition.
3. In the Service Organizations offering Service related list, select **New**.
4. On the form, fill in the fields.

Service Organizations offering Service form

Field	Data type	Description
Service organization criteria	Reference	Criteria to define the service organizations that provide the service. **Note:** For more information about the criteria for the service organization, see Create the criteria for a service organization.
Service definition	Reference	Service that the service organizations provide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Data type	Description
		Note: The **Service definition** field is automatically filled in with the name of the selected service definition.
Active	True/False	Check box to activate or deactivate the service organization criteria. By default, the active field is set to **True**. **Note:** Only one active criterion is enabled per table to be associated to a service definition.

5. Select **Submit**.
   The service organization criteria are added to the Service Organizations offering Service related list.

Add a case type to the Case interceptor

In the Core UI, the Case interceptor lists the types of customer service cases that an agent can create. If you create a case type and you want that case type to appear in the Case interceptor, you need to add it to the Case interceptor configuration.

Before you begin
Role required: sn_csm_case_types.service_definition_admin or admin

About this task
When an agent creates a case, they can select the case type from the Case interceptor.

Procedure
1. Navigate to **All** > **System Definition** > **Interceptors**.
2. Select the Case interceptor from the Interceptors list.
3. In the Answers related list, select **New**.
4. Select **Simple questions to redirect the URL**.
5. Fill in the fields on the Answer form.

Answer form fields and descriptions

Field	Description
Name	Enter a unique name for the case type. For example, Complaint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User Prompt	The description that the agent sees in the interceptor when they create a case.
Target URL	The target URL of the form view that should open for the selected case type.
Order	The order in which the case type appears in the interceptor.

6. Select **Submit**.

CSM Configurable Workspace

CSM Configurable Workspace is a user interface that provides agents with the tools they need to answer customer questions and resolve customer issues.

Workspace UI

The Workspace UI is built to improve agent efficiency and facilitate resolutions. From a single view, agents can:

- Work on multiple issues concurrently in an optimized, intuitive layout.
- Resolve issues faster with automated suggestions powered by machine learning.
- Get notified of potential major incidents based on issue frequency and impact.
- Keep informed of updates and surface important insights with a live activity feed and analytics.

CSM Configurable Workspace overview

A workspace is a suite of tools in a single focused work area that enables a user to efficiently complete an entire job. It provides users such as customer service agents, managers, and help desk professionals with tools to help answer customer questions and resolve issues.

A workspace also includes features that enable a user to be more efficient, including a multi-tab interface for managing multiple cases and a contextual display that provides quick orientation to the current task. For more information about the key features that make up a workspace, see Exploring Workspace.

Workspaces use pages and page variants to display table and record information. Some pages are provided with the CSM Configurable Workspace application. For more information, see CSM Configurable Workspace record pages.

You can also create pages, either from a template or from scratch, or you can duplicate and customize an existing page variant. You can create and customize pages and variants using UI Builder, a web user interface builder. For more information, see Creating pages and page variants.

UI Builder

UI Builder is a web user interface builder that enables you to build pages for workspaces. With UI Builder, you can:

- Configure page layouts and components.
- Extend and deploy custom components in a workspace.
- Leverage UI Builder components to build additional solutions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about working with pages and components, see the following topics:

- For more information about working with components in UI Builder, see Work with components.
- For more information about available components, see Next Experience Components documentation.

Workspace tutorials

The following tutorials describe the different parts of a workspace and give you an overview of how a workspace works.

- Workspace tutorial for agents starting with a record
- Workspace tutorial for agents starting with a chat

Application information

The CSM Configurable Workspace application (com.snc.uib.csm_agent_workspace) is activated with the Customer Service plugin (com.sn_customerservice).

Starting with the Yokohama release, CSM Configurable Workspace has a dependency on the Customer Central plugin. For more information, see Customer Central plugin.

The CSM Configurable Workspace application is available from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

CSM Configurable Workspace features

Agents can use several different features available in CSM Configurable Workspace to assist customers and resolve cases.

CSM Configurable Workspace interface features

Use these topics to get an overview of the CSM Configurable Workspace interface, landing pages, and forms.

Overview of CSM Configurable Workspace features

Feature overview	Description
CSM workspace landing pages	Provides customer service agents with an overview of their new, assigned, and high priority cases, plus the cases assigned to their groups.
CSM workspace form headers	Provides an overview of configurable form headers, the primary and secondary values included in the headers, and where this information appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of CSM Configurable Workspace features (continued)

Feature overview	Description
CSM workspace form features	Provides an overview of agent actions, account hierarchy, special handling notes, related lists, and Agent Assist.
CSM workspace form ribbon and components	Provides agents with a quick overview of the case details. Components in the form ribbon display relevant information about the case, including a contact or consumer summary, a timeline, and SLA details.

Additional features

A number of additional features are available for use with CSM Configurable Workspace.

Additional features for CSM Configurable Workspace

Feature	Description
AWA for CSM	Use Advanced Work Assignment (AWA) to automatically assign work items to agents based on their availability, capacity, and skills.
Chat summarization	Use chat summarization to automatically create summaries of chat conversations.
Workforce Optimization for Customer Service	Use Workforce Optimization to manage and maintain the productivity of your workforce. Efficiently route work to your team, manage your team's skills and schedules, and monitor their performance.
Customer Central	Use Customer Central to provide agents with all of the information about a customer in one central location. This feature enables agents to quickly zoom in on the customer issue and provide efficient and supportive service.
Customer Service Case Types	Use case types to handle different types of customer issues. A case type identifies the processes and the data needed to resolve a specific type of issue, such as a lost or missing credit card.
Proactive Customer Service Operations	Use this feature to track the digital services used by your customers and to proactively create cases for service disruptions.
Playbooks for Customer Service Management	Use playbooks to provide step-by-step guidance for completing the tasks needed to resolve specific types of customer service cases.
Guided Decisions for Customer Service Management	Use guided decisions to resolve complex cases faster and more efficiently by guiding customer service agents through a structured troubleshooting process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional features for CSM Configurable Workspace (continued)

Feature	Description
Lookup and verify	Use this feature to enable agents to quickly look up contacts or consumers using information such as the name, phone number, or record number.
Case action status	Use the case action status feature so that agents can easily identify cases that need attention.
Estimated time to resolve a case	Use machine learning to predict the estimated time to resolve a case (ETTR) based on case attributes such as the short description, category, priority, and assignment group.

CSM Configurable Workspace landing pages

A landing page is an initial view of your workspace. Landing pages present content tailored to a user's assigned role and provide the information they must get started with their work.

Landing pages can include filtered lists, KPIs, and other features that enables you to access information from one location. CSM workspace landing pages provide customer service agents and managers with lists of assigned cases and case tasks as well as agent, group, and organization metrics.

Agents use landing pages as a starting point to get into their work, where they can quickly scan and prioritize cases and case tasks, access records, and track their performance.

CSM Configurable Workspace landing pages

Several landing pages are available for CSM Configurable Workspace.

CSM Landing Page and CSM Landing Page - Premium

These landing pages use components to display lists and metrics. The admin configures this information in UI Builder and can create different landing pages for different audiences.

Two versions of the landing page are available based on plugin activation. For more information, see CSM workspace landing page plugins.

CSM Dashboards

This landing page uses dashboards to display information. You can duplicate the provided dashboards and modify them as desired or create dashboards and then share these dashboards with other users.

CSM workspace landing page plugins

The following table describes the plugin requirements for the CSM workspace landing pages.

CSM landing page plugin requirements

Landing Page	Plugin requirements
CSM Landing Page	Available with the CSM Configurable Workspace plugin (sn_csm_wrkspc).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM landing page plugin requirements (continued)

Landing Page	Plugin requirements
CSM Landing Page - Premium	Available with the following plugins: • CSM Configurable Workspace (sn_csm_wrkspc) • Performance Analytics - Content Pack - Customer Service Management - Advanced (com.snc.pa.customer_service_advanced)
CSM Dashboards	Available with the CSM Configurable Workspace plugin (sn_csm_wrkspc).

CSM Landing Page

The CSM Landing Page provides users with lists of assigned cases and case tasks as well as agent, group, and organization metrics.

Customer service agents and managers can use the CSM Landing Page to quickly scan and prioritize work, access records, and track performance. Administrators can customize landing pages in UI Builder to meet their unique business needs.

The CSM Landing Page includes components that display case information, plus visualizations that further break down the component data. Each of the visualizations is connected to a data source. For example, the **High priority cases** component includes visualizations for P1 and escalated cases, plus cases that need attention.

Note:
To ensure the High priority cases component filters correctly, install the Customer Service Case Action Status (com.snc.csm_action_status) plugin. This plugin adds the missing **action_status** field, which isn't included with the CSM plugin by default. Also, ensure your instance is on Xanadu Patch 7 or later.

The CSM Landing Page is available with the CSM Configurable Workspace (sn_csm_wrkspc) plugin. This landing page is the default landing page for CSM Configurable Workspace.

Note:
Upgrade customers who haven't customized the existing CSM Configurable Workspace landing page are automatically upgraded to the landing page available with the Yokohama release. Upgrade customers who have customized the existing CSM Configurable Workspace landing page must manually accept the Yokohama landing page.

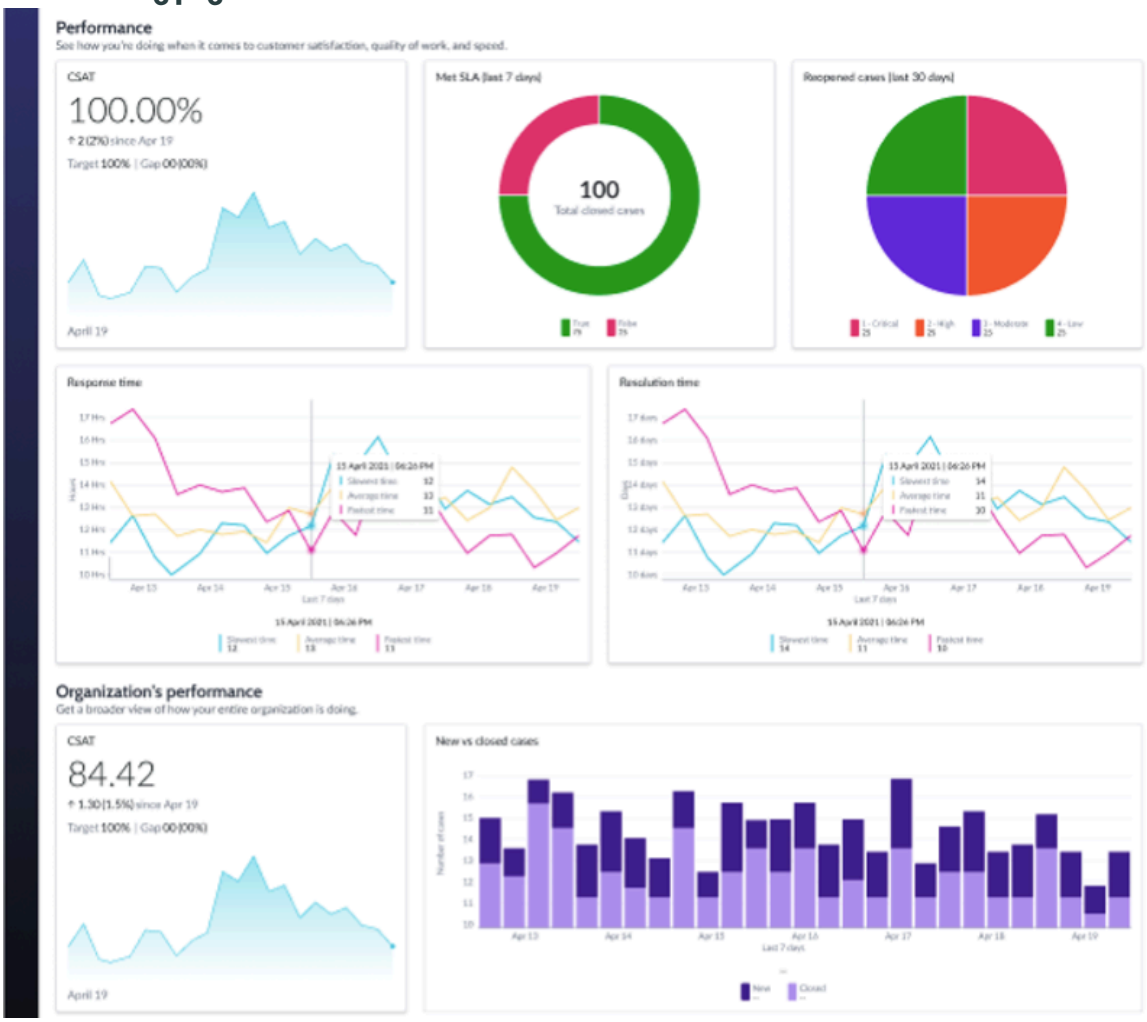
CSM landing page - Performance metrics



CSM Landing Page sections and components

The CSM Landing Page includes different sections and components that display important items, record lists, and performance data.

CSM Landing Page and CSM Landing Page - Premium sections and components

Section	Description
Important Items	This section includes single score cards that display an agent's most important items to work on. • **High priority cases**: Includes P1 cases, escalated cases, and cases that need attention. • **SLA breached or due today** • **Cases not updated in >3d** • **Case tasks** • **Unassigned cases**: Cases that are unassigned and belong to one of the agent's assignment groups. Selecting a score card displays a list of records with the appropriate filter conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Landing Page and CSM Landing Page - Premium sections and components (continued)

Section	Description
Cases	This section includes two lists of records: • **My active cases** • **My team's cases** Selecting a case number opens a new tab and displays the case record.
Performance	This section includes indicators that track the agent's performance. • **Met SLA (last 7 days)** • **Reopened cases (last 30 days)** The following indicators are available in the Performance section with activation of the Performance Analytics - Content Pack - Customer Service Management - Advanced plugin: • **CSAT**: Customer satisfaction score based on cases assigned to the agent for the last 7 days. • **Response time** • **Resolution time** Select an indicator to display either a filtered list of records or a KPI details page.
Organization's Performance	This section includes indicators that track the organization's performance. • **CSAT**: Customer satisfaction score for the last 7 days. • **New vs closed cases**: Daily aggregation of new and closed cases for the last 7 days. Select an indicator to view a KPI details page. **Note:** This section is available for the CSM Landing Page - Premium, which requires activation of the Performance Analytics - Content Pack - Customer Service Management - Advanced plugin.

Create a landing page for CSM Configurable Workspace

Use UI Builder to create landing pages for your agents. For more information, see the following topics:

- Create a CSM Configurable Workspace landing page
- Creating custom landing pages for workspaces
- Create a custom landing page in UI Builder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create multiple landing pages

You can create multiple landing pages. However, only a single landing page is displayed for a user. The landing page that is displayed depends on the following settings:

- The setting of the **Active** field. This field must be set to true for a landing page to be displayed.
- The **Order** of the landing page. Pages with a lower-order value take precedence over pages with a higher-order value. The active page with the lowest order number is displayed.
- If permissions are defined, users can see a landing page if they have the required role or are a member of the required assignment group. Multiple roles and assignment group conditions are treated as OR conditions.

CSM Landing Page - Premium

The CSM Landing Page - Premium provides users with lists of assigned cases and case tasks as well as agent, group, and organization metrics.

Customer service agents and managers can use the CSM Landing Page - Premium to quickly scan and prioritize work, access records, and track performance. Administrators can customize landing pages in UI Builder to meet their unique business needs.

The CSM Landing Page - Premium includes components that display case information, plus visualizations that further break down the component data. For example, the **High priority cases** component includes visualizations for P1 and escalated cases, plus cases that need attention. It also includes additional indicators and visualizations in the **Performance** and **Organization's Performance** sections. Each of the visualizations is connected to a data source.

The CSM Landing Page - Premium is available with the following plugins:

- CSM Configurable Workspace (sn_csm_wrkspc)
- Performance Analytics - Content Pack - Customer Service Management - Advanced (com.snc.pa.customer_service_advanced)

Note:
Upgrade customers who haven't customized the existing CSM Configurable Workspace landing page are automatically upgraded to the landing page available with the Yokohama release. Upgrade customers who have customized the existing CSM Configurable Workspace landing page must manually accept the Yokohama landing page.

Create a landing page for CSM Configurable Workspace

Use UI Builder to create landing pages for your agents. For more information, see the following topics:

- Create a CSM Configurable Workspace landing page
- Creating custom landing pages for workspaces
- Create a custom landing page in UI Builder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create multiple landing pages

You can create multiple landing pages. However, only a single landing page is displayed for a user. The landing page that is displayed for you depends on the following settings:

- The setting of the **Active** field. This field must be set to true for a landing page to be displayed.
- The **Order** of the landing page. Pages with a lower-order value take precedence over pages with a higher-order value.
- If permissions are defined, you can see a landing page if you have the required role or are a member of the required assignment group. Multiple roles and assignment group conditions are treated as OR conditions.

Dashboard landing pages

Enable your users to display, customize, and share dashboards in CSM Configurable Workspace and use these dashboards as landing pages.

Workspace dashboards enable users such as agents and managers to configure and customize their own metrics. These users can switch between available dashboards and modify dashboard lists and metrics to track important information. They can also share dashboards with coworkers and across teams.

To display workspace dashboards, system administrators activate the CSM Dashboards landing page variant and configure user privileges. When configured, users included in the page audience see the Dashboard Overview landing page in CSM Configurable Workspace and the default dashboards included with that page.

The dashboards are represented by tiles on the Dashboard Overview landing page. The individual tiles show the title, the creator, whether the dashboard is certified, and an indication that the logged in user has bookmarked the dashboard.

Benefits of dashboard landing pages

Using a dashboard as a landing page gives your users more flexibility. Being able to easily customize a dashboard makes the page much more usable. Users can create their own lists and metrics to display the information they need and then share these dashboards with other users. As an example, teams can share a single dashboard or new agents can modify a shared dashboard to create their own. It is much faster to create dashboards because they do not require configuration by a system administrator.

Application information

The **CSM Dashboards** landing page variant is included with the CSM and FSM Configurable Workspace Foundation plugin (com.snc.uib.cwf_workspace).

The CSM Configurable Workspace application, which includes the CSM and FSM Configurable Workspace plugin, is available from the ServiceNow® Store.

The default dashboards available with this landing page variant are available depending on user role. Some of these dashboards require additional plugins to see all of the dashboard information. These plugins include:

- Performance Analytics - Content Pack - Customer Service (com.snc.pa.customer_service)
- Performance Analytics – Content Pack – Customer Service Management – Advanced (com.snc.pa.customer_service_advanced)
- Performance Analytics Premium for Customer Service (com.snc.pa.premium.cs)
- Performance Analytics - Content Pack – Advanced Work Assignment (com.snc.pa.awa)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Activating the CSM Dashboards landing page variant

The **CSM Dashboards** landing page variant is an optional page variant for the **CSM/FSM Configurable Workspace experience**. By default, this page variant is marked as inactive and has an order value of 0. When activated and set to the lowest order number, the system uses the **CSM Dashboards** landing page in place of the default CSM Landing Page for the users included in the page audience.

Note:
The default landing page, Dashboard Overview, and the default dashboards included with that page are available in read-only mode and are provided as examples. It is recommended that you create and customize duplicates of the landing page and dashboards.

For more information about activating a page variant and setting the order, see Set record page order.

User roles for the Dashboard Overview landing page

By default, the Dashboard Overview landing page is available to users with the following roles:

- admin
- sn_customerservice_agent
- sn_customerservice.consumer_agent
- sn_customerservice_manager

Note:
Users with other roles, such as location agents or relationship agents, continue to see the **CSM Landing Page**.

The system administrator can change these default roles by configuring the page audience. For more information, see the following topics:

- Learn about audiences
- Add an audience to your UI Builder page

Roles determine view access for the dashboards available with the Dashboard Overview landing page. For details, see Default dashboards.

The service management agent role (sn_esm_agent) contains the data visualizations creator role (viz_creator), which is a role associated with the Visualization Designer and Visualization Library. Users with the viz_creator role can create visualizations. The customer service agent (sn_customerservice_agent) and consumer service agent (sn_customerservice.consumer_agent) roles contain the sn_esm_agent role. For more information, see Data visualizations in Platform Analytics.

Dashboard Overview landing page default dashboards

Four dashboards are available with the Dashboard Overview landing page. These dashboards are available in read-only mode for all users, including the admin role. Users can duplicate these dashboards and make the desired changes to the duplicate dashboards.

Note:
These dashboards are also available from Platform Analytics experience.

The Dashboard Overview landing page includes the following dashboards for agents.

- Customer Service Agent
- Customer Service Agent – Advanced

The Dashboard Overview landing page includes the following dashboards for managers and admins.

- Customer Service Agent
- Customer Service Agent – Advanced
- Customer Service Manager
- Customer Service Manager – Advanced

CSM Configurable Workspace landing page dashboards

Landing page	Details
Customer Service Agent	Available with the CSM Configurable Workspace (com.snc.uib.csm_agent_workspace) plugin. Out of box, the Customer Service Agent dashboard includes the widgets on the **My Work** tab. **Note:** The tab is not visible because it is the only tab on the dashboard. Activating the Performance Analytics - Content Pack - Customer Service (com.snc.pa.customer_service) plugin provides the complete Customer Service Agent dashboard with all tabs.
Customer Service Agent - Advanced	Available with the following plugins: • CSM Configurable Workspace (com.snc.uib.csm_agent_workspace) • Performance Analytics – Content Pack – Customer Service Management – Advanced (com.snc.pa.customer_service_advanced) Activating the Performance Analytics - Content Pack – Advanced Work Assignment (com.snc.pa.awa) plugin adds two additional widgets to the Organizational Trends tab:

CSM Configurable Workspace landing page dashboards (continued)

Landing page	Details
	• My Cases with Problems • My KBs Created
Customer Service Manager	Available with the following plugins: • CSM Configurable Workspace (com.snc.uib.csm_agent_workspace) • Performance Analytics - Content Pack - Customer Service (com.snc.pa.customer_service) Activating the Performance Analytics - Content Pack - Customer Service (com.snc.pa.customer_service) plugin provides the complete Customer Service Manager dashboard with all tabs.
Customer Service Manager - Advanced	Available with the following plugins: • CSM Configurable Workspace (com.snc.uib.csm_agent_workspace) • Performance Analytics – Content Pack – Customer Service Management – Advanced (com.snc.pa.customer_service_advanced) Activating the Performance Analytics - Content Pack – Advanced Work Assignment (com.snc.pa.awa) plugin adds the Work Assignment Analytics tab to the Customer Service Manager - Advanced dashboard.

Certifying a dashboard

Users with the admin role can certify a dashboard to indicate that it is company-approved and recommended for use. The default dashboards available from the Dashboard Overview landing page are certified and admins cannot change this setting. Admins can only certify new dashboards. For more information, see Certify a Platform Analytics dashboard.

Working with dashboards

Agents can create their own dashboards and share those dashboards with other agents or assignment groups. For example, agents can create dashboards with metrics and lists that support specific assignments, such as a temporary weekend assignment.

From the Dashboard Overview landing page, managers and agents can do the following:

- View the default dashboards available for their role.
- Filter the available dashboards.
- Select a dashboard tile to display the dashboard in a new tab. If more than one dashboard is available, the user can switch between the available dashboards by making a selection from the dashboard picker.
- Duplicate and customize the default dashboards.
- View dashboard details such as the dashboard name, description, and visibility.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Edit dashboards using a configuration panel.
- Share dashboards with other users or groups and grant edit or view-only rights.
- Create new dashboards.
- Create and share visualization elements from the Platform Analytics Workspace.

See the task descriptions in the following table for more information.

Dashboard landing page user tasks

Task	Description
View the default dashboards available for your role	1. Select **Workspaces** > **CSM/FSM Configurable Workspace**. The Dashboard Overview landing page displays the available dashboards. 2. Select a dashboard tile to display the dashboard in a new tab.
View dashboard details	1. Select a dashboard. 2. Select the info icon ( ) to open the Details panel.
Filter dashboards	Several filter options are available on the Dashboard Overview landing page. Users can filter the available dashboards in the following ways: • By name or owner (in the search bar) • Recent: shows recently created dashboards • Bookmarked: shows only your bookmarked dashboards. • Certified: shows only the dashboards that have been certified by an administrator. • Created by me: shows only the dashboards that you have created. • Shared with me: shows only the dashboards that have been shared with you. • All: shows all dashboards that you have access to.
Duplicate a dashboard	1. Select the More actions menu ( ). 2. Select **Duplicate**. 3. In the Duplicating dashboard pop-up window, enter a **New name** and a **Description**. 4. Select **Duplicate** on the pop-up window. 5. To access the duplicated dashboard:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard landing page user tasks (continued)

Task	Description
	○ Select **Open it** in the information message. ○ Select the dashboard tile on the Dashboard Overview landing page. For more information, see Duplicate a Platform Analytics dashboard.
Edit a dashboard	**1.** Select **Edit**. **2.** Select the desired dashboard tab. **3.** Edit an existing element or add a new element. For more information about these tasks, see Edit Platform Analytics dashboards.
Share a dashboard	**1.** Select the More actions menu ( ). **2.** Select **Share**. **3.** In the Share Dashboard pop-up window, add users, groups, or roles in the **Grant access to** field. **4.** If desired, enable the check box that enables permissions for the dashboard. **5.** Select either **Add as viewer** or **Add as editor**. **6.** The selected users, groups, or roles are added to the Manage Access section. From here, you can change the permissions. **7.** Click **Confirm**. For more information, see Share a Platform Analytics dashboard.
Create a dashboard	**1.** From the Dashboard Overview landing page, select **Create new dashboard**. **2.** From the New dashboard pop-up window, select **In-line editor**. **3.** Provide a **Name** and a **Description** and select **Create new dashboard**. The new dashboard opens in the editing mode. **4.** Add new elements to the dashboard. For more information about this step, see see Create a dashboard with the in-line editor. When you create a dashboard with the in-line editor, several elements are available to help you organize and populate the information on your dashboard. For more information, see Exploring Platform Analytics dashboards.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard landing page user tasks (continued)

Task	Description
Print a dashboard	**1.** Select the More actions menu ( ). **2.** Select **Printer friendly**. For more information, see Print a Platform Analytics dashboard.
Bookmark a dashboard	**1.** Select the More actions menu ( ). **2.** Select **Add to bookmarks**. For more information, see Bookmark a Platform Analytics dashboard.

CSM Configurable Workspace form headers

Form headers in CSM Configurable Workspace provide a quick glance of case, account, or contact information.

Form headers include a primary value and several secondary values. You can configure the information included in the form header for the Case, Account, and Contact forms.

Form header values

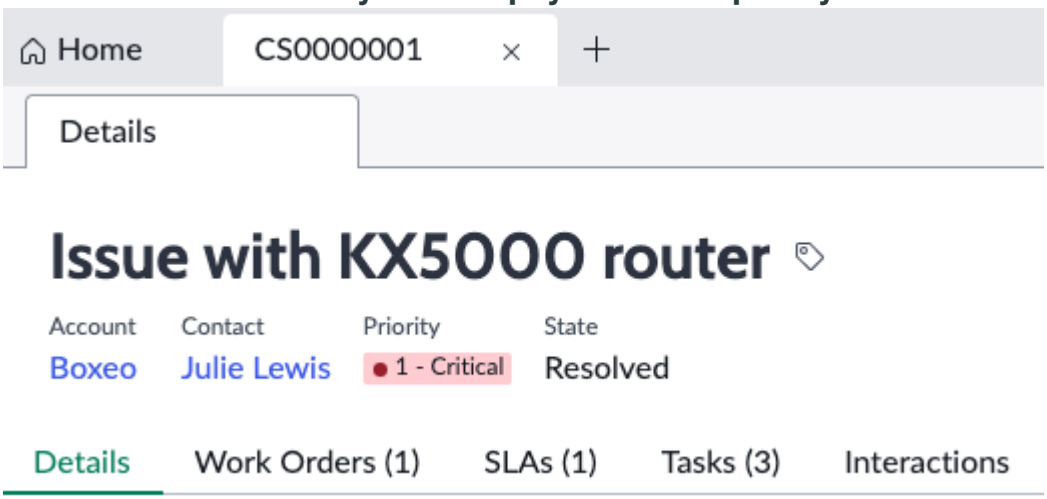
Form	Primary Value	Secondary Values
Case	Short description	• Account and contact (B2B) • Consumer (B2C) • Priority • State
Account	Account	Primary contact
Contact	Contact	Account

Displaying form header secondary values

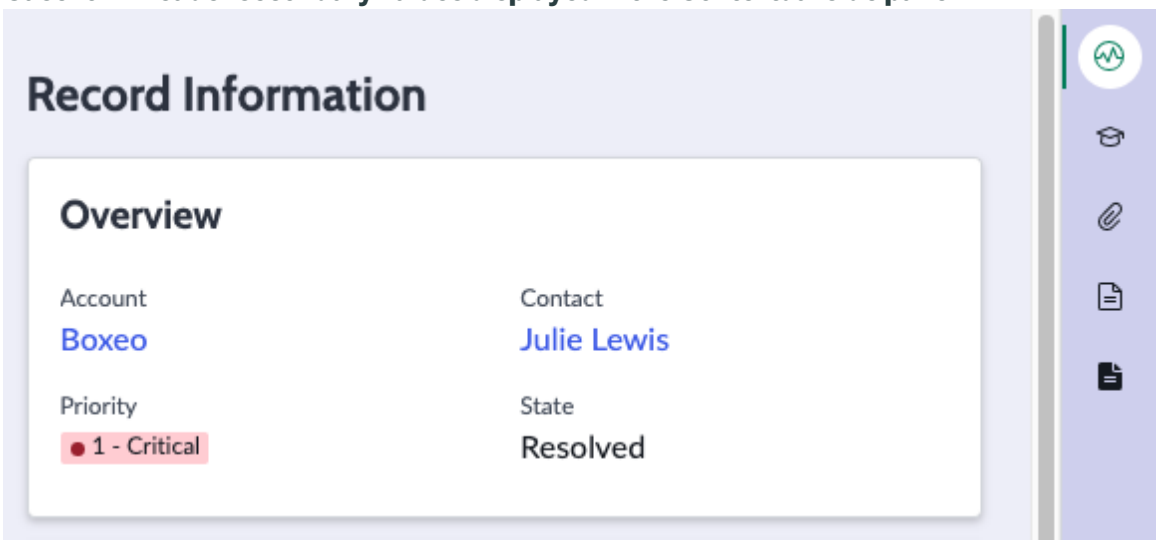
You can configure the form header to display secondary values either below the primary value or in the Contextual side panel. The *record_secondary_values_location* property controls this setting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case form header secondary values displayed below the primary value



Case form header secondary values displayed in the Contextual side panel



See the following topics for more information about configuring form headers in CSM Configurable Workspace:

- Set up a form header in CSM Configurable Workspace
- Display the form ribbon and form header secondary values in the Contextual side panel

Note:
One form header configuration, **CSM/FSM Configurable Workspace Header Config**, is included with CSM Configurable Workspace.

Form header components

For CSM Configurable Workspace, the form header is made up of individual components that can be configured with UI Builder.

Individual components provide customers with flexible and granular configuration options. Customers can control the placement, size and spacing of these components, giving them the ability to show additional information that agents may need.

The Data Value Block component is used to display secondary values in the form header and the Contextual side panel. .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Configurable Workspace form ribbon and components

The form ribbon provides includes components that display relevant information about a case and provide agents with a quick overview of the case details. These components can include a contact or consumer summary, a timeline, and SLA details.

In addition to viewing case information, agents can use links in the ribbon components to place phone calls or create email messages. Agents can also show or hide the ribbon as needed by clicking a button at the top of the ribbon.

Customer Service Management ribbon components

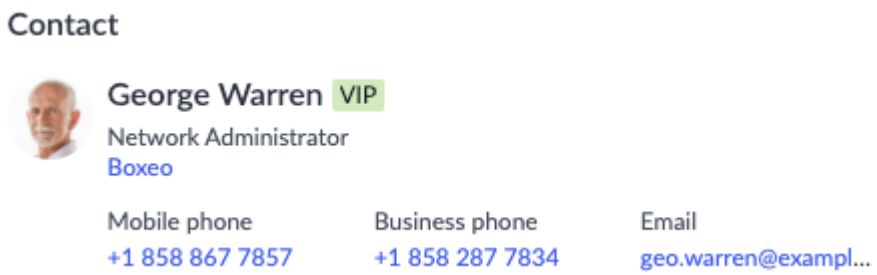
For Customer Service Management, you can configure the ribbon for the Case form to include one or more of the available ribbon components:

- Customer 360
- Timeline
- Active SLAs
- Time to resolve component

Customer 360 ribbon component

The Customer 360 component displays customer information such as the contact or consumer name, email address, and phone numbers.

Customer 360 ribbon component



You can configure the Customer 360 component to display different fields, such as the fields described in the following table.

Field	Description
Header	The header includes customer information. • For B2B customers: Displays either the **Primary Contact** or **Contact**. • For B2C customers: Displays the **Consumer**. • For internal contacts with the proxy contact role (sn_customerservice.proxy_contact): Displays the **Internal contact**. **Note:** Requires the CSM Extension for Proxy Contacts (com.snc.csm_proxy_contacts) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Avatar	A graphic representation of the customer's identity, such as an image or icon.
Name	The customer's name.
Title	The customer's title.
Account	For B2B customers, the account associated with the contact.
Phone numbers	• For contacts: **Mobile phone** and **Business phone** • For consumers: **Mobile phone** and **Home phone**
Email address	The customer's email address.

The Customer 360 component supports dot walking on selected reference tables. You can display fields from these tables:

- User [sys_user]
- Contact [customer_contact]
- Consumer [csm_consumer]

If you configure the Customer 360 component to display information from a dot-walked field, the label for that field shows the `Column` name instead of the `Table.Column` name.

Note:
For B2B customers, the Customer 360 component can also include colored tags that indicate Very Important Person (VIP) accounts and escalated accounts.

From the Customer 360 component, agents can perform the following actions.

Action	Description
Email a contact or consumer	Agents click the address in the **Email** field to send an email to the contact or consumer. This action opens a new email in the email editor with the following fields auto-populated: • **To**: the contact or consumer email address • **Subject**: the case number and short description
Call a contact or consumer	If phone integration is enabled, agents click a number in one of the phone number fields to call the contact or consumer. The OpenFrame window displays information about the contact or consumer name and the account.
View the account record	Agents click the **Account** link to open the account record.

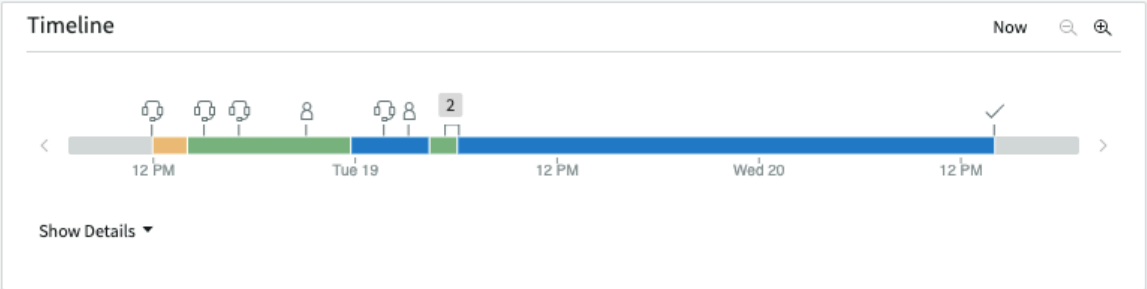
Timeline ribbon component

The timeline component displays a chronological summary of case activities, including case state changes and interactions between the agent and the requester (typically the customer). It also shows how much time that the fulfiller and requester spent on the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The workspace administrator can select the agent role when configuring the timeline component attributes.

Timeline ribbon component



The timeline uses icons to display events and colors to show ranges of time, such as when the case is with the agent or the customer. Agents can point to event icons in the timeline to display tooltips with additional information.

Note:
The timeline component uses the resolution shaper configuration for the selected entity table, for example, the Case table.

The timeline includes the following features:

Timeline features

Timeline feature	Description
Global start and end dates	The global start date is the date that the case was created. The global end date is the date that the case was closed.
Start and end dates	The start and end dates that identify a specific window of time on the timeline. The default window is one week. • The default end date is the current date. • The default start date is the current date minus 7 days.
Header	A configurable title for the timeline. With the system administrator role, you can add a title in the **Name** field on the Ribbon Setting form.
Legend	Click **Show Details** to display event and range summary information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Timeline features (continued)

Timeline feature	Description
	Legend summary information Events	Events are represented on the timeline using icons. Each type of event has a corresponding unique icon. The time that an event occurred is also captured so that events are displayed on the timeline in chronological order.
Grouped events	Events that occur close together can be grouped and represented using a group icon. When events are grouped, the timeline displays a badge icon with the number of events in the group.
Event summaries	Event summaries appear in the timeline legend. Each summary lists the event and the number of times it occurred. **Note:** An event summary includes occurrences of the event over the life of the object visualized on the timeline.
Time ranges	Time ranges are represented on the timeline using colors. Each range has a corresponding unique color and a start and end time. The following default ranges include: • Green: with the agent • Blue: with the customer
Time range summaries	Time range summaries appear in the timeline legend. Each summary lists the range, the corresponding color, and the total duration.

Timeline features (continued)

Timeline feature	Description
	Note: A range summary includes occurrences of the range over the life of the object visualized on the timeline.
Tooltips	Point to event icons to display additional information.
Zoom	Zoom in on the timeline to see more details in a smaller time window or zoom out to see more events in a larger time window. • Click the zoom in or zoom out icons on the timeline. • Use the zoom in and zoom out features on the keyboard (**Ctrl** + **+** and **Ctrl** + **-**). • Use the zoom in and zoom out features on the cursor.
Pan	Pan left and right to view newer or older events. • Pan left in the timeline to view older events by clicking the left caret icon (**<**). Panning to the left stops when the timeline reaches the specified global start date. • Pan right in the timeline to view newer events by clicking the right caret icon (**>**). Panning to the right stops when the timeline reaches the specified global end date.
Reset the timeline	Click **Now** to reset the timeline to the default view after panning or zooming. The timeline resets using the time that the button was clicked as the end date and time.
Messages	The timeline displays messages for the following events: • There is no data to be displayed. • The timeline experiences a loading error.

Active SLA component

The Active SLA component displays active SLAs for the case, including time remaining, the SLA state, and any breaches. If a case has multiple SLAs, the SLA with the most imminent deadline is shown first. Pointing to the SLA component displays left and right navigation arrows that agents can use to view the other SLAs.

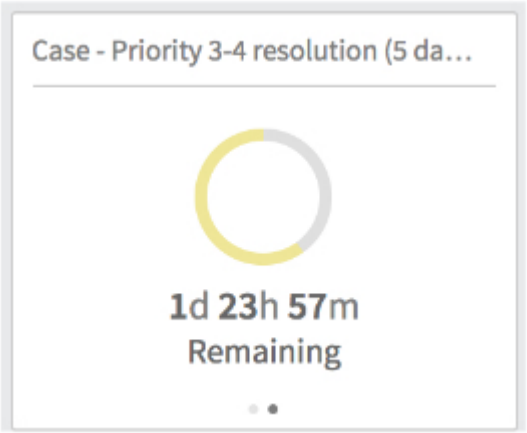
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA ribbon component



Color coding within the component indicates the time remaining for the SLA:

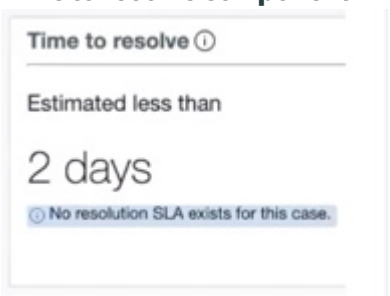
- Green: 0–50%
- Yellow: 50–75%
- Orange: 75–99%
- Red: 100% or breached

Time to resolve component

The time to resolve component displays the estimated time required for an agent to resolve the case.

Note:
The time to resolve component requires the Predictive Intelligence for Customer Service Management plugin (com.snc.csm_ml). For more information, see Estimated time to resolve a case.

Time to resolve component



In this image, the estimated time that the agent will need to resolve the opened case is 0 to 2 days. Hence, the upper bound value is displayed. The estimated time is calculated from the time the case was created. If the range for example, is between 2 to 4 days, both the lower and upper bound values are displayed.

The **Time to resolve** component also displays the prediction for SLA breach if the case is attached to an SLA.

Following are a list of SLA messages displayed and the action required when they appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA messages	Task
No resolution SLA exists for this case	Set the value in the **Target** field to **Resolution** in the **SLA Definition** form.
Repair resolution SLA to add breach time	Click **Repair** on the Task SLA form.
Highly likely to breach resolution SLA	None
Highly unlikely to breach resolution SLA	None
Likely to breach resolution SLA	None
Unlikely to breach resolution SLA	None

Configuring ribbon components

You can configure ribbon components as follows:

- For CSM Agent Workspace, you can configure the ribbon layout if you have the workspace administrator role (workspace_admin). This includes the components to display in the ribbon, the order in which the components appear, and the component width. You can also configure display attributes for some of the components. For more information about ribbon configuration, see Set up ribbons in workspace.

  For some of the components, you can also configure attributes, such as the fields to include in the Customer 360 component.

- For CSM Configurable Workspace, you can create a ribbon setting and add that setting to a ribbon configuration. For more information, see Set up a ribbon configuration in CSM Configurable Workspace.

  Note:
  One ribbon configuration, **CSM/FSM Configurable Workspace Ribbon Config**, is included with CSM Configurable Workspace.

You can also display the form ribbon in the Contextual side panel. For more information, see Display the form ribbon and form header secondary values in the Contextual side panel.

Ribbon configurations in CSM workspaces support domain separation.

CSM Configurable Workspace form features

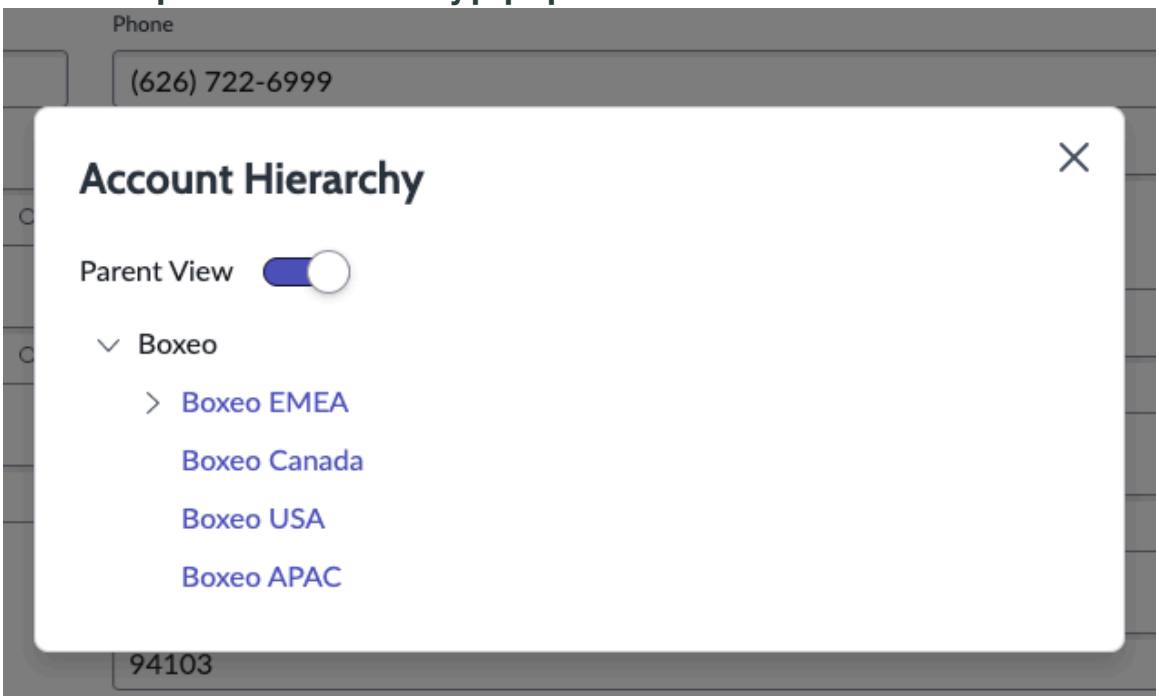
CSM Configurable Workspace form features include account hierarchy, special handling notes, and agent actions.

Account hierarchy

From the Account form, customer service agents can click the open hierarchy icon ( ) in the **Name** field to see the parent-child account relationships in the Account Hierarchy pop-up window. The account hierarchy is available for accounts that have a parent or child account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Workspace Account Hierarchy pop-up window



The account hierarchy uses a tree structure to show the parent, child, and sibling accounts. The parent view displays the current account, the parent account (if applicable), and any child or sibling accounts. The full view displays the entire structure of the organization from the root account. The current account is highlighted in the account structure.

Customer service agents can:

- Expand and collapse the tree structure.
- Switch between the parent view and the full view of the account hierarchy.
- Click an account to open the Account form in a sub tab.

For information about creating an account hierarchy, see Account hierarchy.

Special handling notes

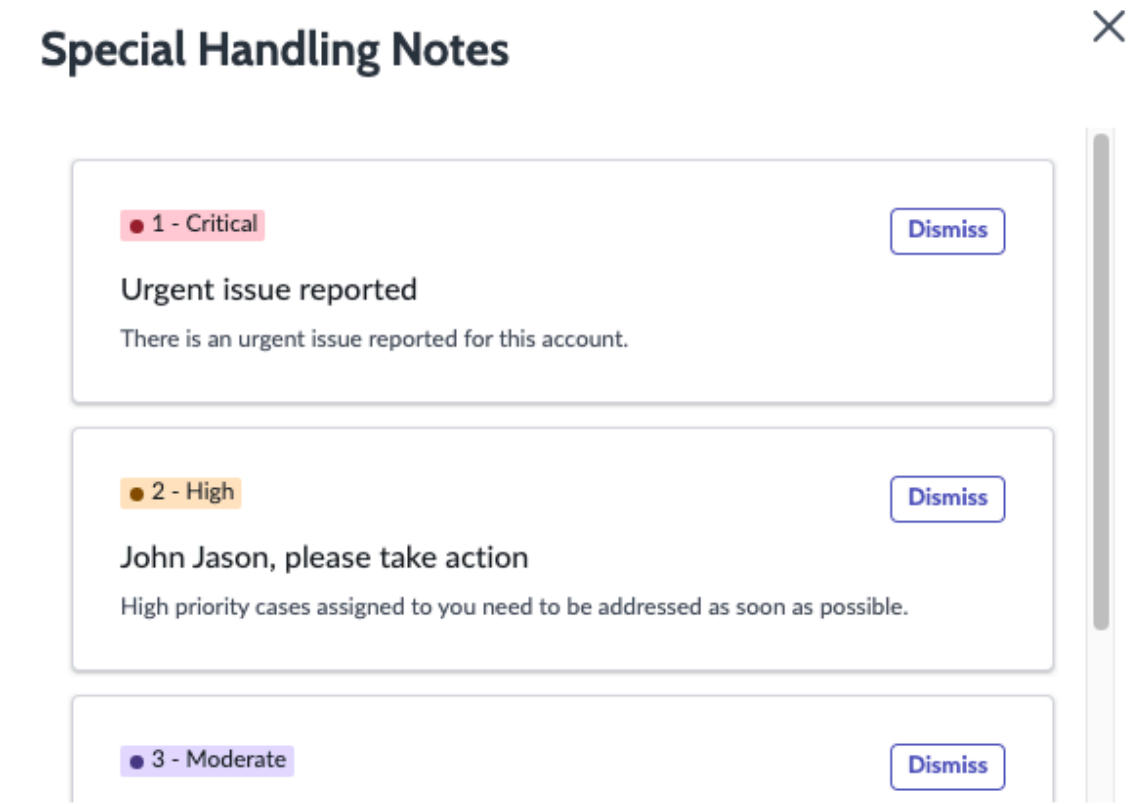
Special handling notes bring important information about individual records to the attention of the customer service agent. If special handling notes are available for a record, these notes are displayed in a pop-up window when the record is opened in a CSM workspace. Notes can also be displayed in an embedded list or a related list on a record form. Notes are ordered by priority in the pop-up window and in lists.

Agents can see the priority, short description, and message for each note. A note can be assigned one of the following priorities, which also have associated colors.

- Priority 1 — red
- Priority 2 — orange
- Priority 3 — purple
- Priority 4 — gray

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Special handling notes pop-up window



Agents can:

- Dismiss individual notes. When all notes are dismissed, the pop-up window closes.
- Close the window.

In the Special Handling Notes module on the platform interface:

- Users with the sn_shn.admin role can configure special handling notes and specify properties.
- Users with the sn_shn.admin or sn_customerservice_manager roles can create special handling notes.

For more information about configuring the special handling notes feature, see Special handling notes overview.

Agent actions

Actions available to customer service agents appear in the form header as buttons or menu items.

- For CSM Agent Workspace, actions must be enabled for each form by the workspace administrator. For more information, see Set up custom UI actions in legacy workspace.
- For CSM Configurable Workspace, you can link UI actions to form actions. For more information, see Set up a form action in CSM Configurable Workspace.

The **Create Knowledge** action requires the following setup:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activate the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer).
- Set the **sn_customerservice.enable_knowledge_kcs** property to true.
- Set the KCS Article template to true (navigate to **Knowledge** > **Administration** > **Article Templates**).

Agent assist

Agent assist is available on the Interaction form in CSM Configurable Workspace. Users with the customer service agent role (sn_customerservice_agent) can use Agent assist to search for information from an interaction. By default, the available search sources include Knowledge articles, Service Catalog, and ServiceNow Community blogs and posts. For more information, see Set up Agent assist.

For more information on how to enable Recommended Actions - AI search and disable Agent Assist, see Enable AI search in Recommended Actions.

CSM Configurable Workspace chat session tabs

Use visual indicators on chat session tabs, such as colors and icons, to alert agents to unread chat messages and SLA threshold timers.

The chat session tabs feature helps agents to manage multiple interactions efficiently. Agents can use visual indicators to reduce the risk of threshold timer breaches, improve chat prioritization, and optimize response times. This feature enables agents to multitask effectively while maintaining service level commitments.

The chat session tabs feature introduces a color-coded system for chat session tabs in CSM Configurable Workspace based on configured Service Level Agreement (SLA) thresholds. Additional visual indicators alert agents about unread messages, chat status, and unsaved changes. These visual cues help agents to prioritize their interactions by tracking chat duration and alerting them when conversations require immediate attention.

Benefits

The chat session tabs feature provides customers with the following benefits.

- Improved prioritization: Agents can visually track the SLA status of each chat by glancing at the tab color and use that information to prioritize customer responses.
- Agent multitasking: Tab color changes and real time notifications help agents to handle multiple interactions simultaneously, minimizing the risk of missing crucial chats.
- Agent productivity: The system helps agents respond more efficiently by highlighting conversations based on urgency, improving customer engagement and satisfaction.

Key features

Chat session tabs provide the following key features.

Chat session tab features

Feature	Description
Real-time duration tracking for chat sessions	This feature actively tracks the duration of a chat and alerts the agent when predefined SLA thresholds are reached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chat session tab features (continued)

Feature	Description
	• The timer begins when a customer sends a message to an agent and the tab for that chat interaction is inactive. • The inactive tab cycles through different colors to alert the agent to the unread message and the approaching SLA thresholds. • The timer resets once the agent engages with the tab.
SLA threshold timers	System administrators can configure a minimum of one and a maximum of three levels of SLA threshold timers. When the admin selects a workspace and enables the **Session Tab Enabled** button, the system adds the first level automatically. Then they can add one or two additional levels if desired. For each level, the admin can select a timer value and tab color.
Tab colors	Tab colors indicate the status of a chat with one or more unread messages. Inactive tabs with unread messages change color to highlight critical wait times. System administrators can select a different color for each configured SLA threshold level.
Unread message counters	Inactive tabs display a counter that shows the number of unread chat messages. The counter uses a background color that is a darker shade of the configured tab color.
Tab messages	Messages on the chat session tabs appear below the customer name and notify the agent of the following chat conditions: • Chat is in wrap-up • Chat has ended Agents see the appropriate message on the tab depending on the condition of the chat.
Unsaved changes indicator	A gray circle on a chat session tab indicates that there are unsaved changes on the tab. The circle disappears once the changes are saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA threshold timers

System administrators can configure up to three levels of SLA threshold timers for inactive chat session tabs. For each level, admins can set a timer and select a unique tab color.

These timers alert agents to unread messages in inactive chats by changing the tab color. If an agent leaves a customer's chat unanswered beyond the length of time defined in these threshold timers, the system changes the tab color.

Chat session tab SLA threshold levels

Level	Description
Level 1: warning	This timer alerts the agent to an SLA breach by changing the color of an inactive tab when it reaches the selected duration. Default setting: 30 seconds after the first new message is received.
Level 2: critical	This timer alerts the agent to a critical SLA breach by changing the color of an inactive tab when it reaches the selected duration. The default setting is 1 minute after the first new message is received. **Note:** The length of time for the Level 2 timer must be greater than the Level 1 timer.
Level 3: severe	This timer alerts the agent to a severe SLA breach by changing the color of an inactive tab when it reaches the selected duration. The default setting is 2 minutes after the first new message is received. **Note:** The length of time for the Level 3 timer must be greater than the Level 2 timer.

For more information, see Configure chat session tabs.

Tab colors

The chat session tabs feature uses tab background colors to provide information at a glance. Colors indicate tab status such as the active tab and inactive tabs that have one or more unread messages.

- **Active tab**: A white background indicates the active tab. This is the tab where the agent is currently working.
- **Inactive tabs**: A colored background indicates an inactive tab that has one or more unread messages. Tabs transition to different colors to highlight chats that have reached the configured SLA thresholds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System administrators can configure up to three SLA threshold levels for chat session tabs. For each level, the admin can set a timer for the threshold level and select a background tab color. Agents see different colors in the chat session tabs based on the threshold timer value.

The background tab color changes when an inactive tab with unread messages reaches the first SLA threshold level. The tab maintains the current color until the timer reaches the next configured SLA threshold level.

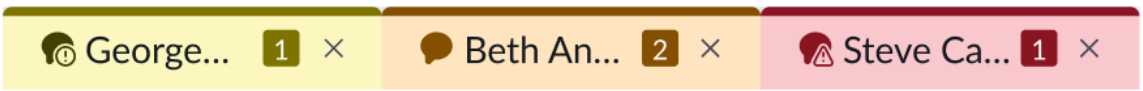
For more information, see Configure chat session tabs.

Unread message counters

Each inactive tab includes a counter that displays the number of unread chat messages.

The counter uses a background color that is a darker shade of the configured tab color.

Chat session tab unread message counters



When a chat message is received, the counter updates to display the total number of unread messages. After selecting the tab, an agent can see the unread messages in the chat window.

Selecting an inactive tab clears the tab color and resets the unread messages counter. The threshold timer and counter restart when the agent navigates away from the tab.

When a customer ends a conversation or a chat session times out, the tab color changes to blue and the unread messages counter disappears.

Viewing unread messages

When an agent selects an inactive tab and returns to a chat conversation, they can see the unread messages in the chat window. This window uses a separator between the older messages and the unread messages and displays the time when the first unread message was sent. This separator appears if there is a time difference greater than 30 seconds between the first new message and the last previous message.

Maximum number of tabs

An agent can have a maximum of 10 tabs open at one time. If an agent attempts to open additional tabs, the system displays a message that advises to close one or more tabs before opening a new tab.

Transferring chats

There are two ways to transfer a chat from one agent to another: manual transfer and automatic transfer.

Chat session tabs for transferred chats

Transfer type	Description
Manual transfer	When an agent manually transfers a chat to another agent and the new agent accepts the chat:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Chat session tabs for transferred chats (continued)

Transfer type	Description
	• The unread messages counter is not displayed on the chat session tab. • The separator is not displayed between new and older messages. The interaction is treated as new for the receiving agent. • The new agent experiences the tab color changes as configured by the admin when new messages arrive from the customer. • The new agent sees the unread messages counter update when new messages arrive.
Automatic transfer	When a chat is automatically transferred to another agent or to a queue: • The unread messages counter is not displayed on the chat session tab. All messages in the chat are in an unread state for the new agent. • The separator is not displayed between new and older messages. The interaction is treated as new for the receiving agent. • The new agent experiences the tab color changes as configured by the admin when new messages arrive from the customer. • The new agent sees the unread messages counter update when new messages arrive.

If a chat is transferred to a queue, SLA threshold timers and tab colors are applicable to the next agent who picks up the case.

When an agent seeks help from a colleague or manager using the Agent Whisper feature, the SLA threshold timers and tab behavior are applicable only for the owner agent and not for anyone else participating in the interaction.

Configuring the chat session tabs feature

Users with the system administrator role can enable the chat sessions tab feature and configure SLA threshold timers for chat sessions from the Conversational Interfaces (CI) Admin console.

When this feature is enabled, chat session tabs display colors to indicate the chat status. These colors are determined by SLA threshold timers that alert agents to impending SLA breaches.

For more information, see Configure chat session tabs.

Configure chat session tabs

Configure settings such as duration and color for the chat SLA threshold timers for a selected workspace in the Conversational interfaces (CI) Admin Console. These timers alert agents to unread messages in inactive chats.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Enable the chat session tabs feature and select the workspace that the feature applies to.

You can configure a minimum of one and a maximum of three chat SLA threshold timers for a workspace. These timers alert agents to unread messages by changing the tab colors of the inactive chats.

Procedure
1. Navigate to **All** > **Conversational Interfaces** > **Settings**.
   This displays the CI Admin console with the Settings tab selected.
2. Select **Agent Chat** on the left side of the CI Admin console.
   This displays the Agent Chat settings screen.
3. In the Session Tab Settings section, enable the **Activate** button in the upper right corner and select **Save**.
   This is a global switch that enables the feature for an instance.
4. Select **CSM/FSM Configurable Workspace** in the **Select a workspace for tab settings** field.
   This is the workspace for which you want to enable the chat session tabs feature.
5. Enable the **Session Tab Enabled** button and select **Save**.

   This enables the chat session tabs feature for the selected workspace and adds the Level 1 timer automatically.

   When enabled, inactive tab colors change color to alert agents to unread messages. You can configure a minimum of one and a maximum of three SLA threshold timers that alert agents to impending SLA breaches.
6. Configure up to three SLA threshold breach warnings.

   a. Select the length of the timer for the **SLA breach warning (Level 1)**.
   This timer alerts the agent to an SLA breach by changing the color of an inactive tab when it reaches the selected duration. The default setting is 30 seconds after the first new message is received.

   b. To configure a second SLA breach warning, select **Add Level**.

   c. Select the length of the timer for the **SLA breach warning (Level 2)**.
   This timer alerts the agent to a critical SLA breach by changing the color of an inactive tab when it reaches the selected duration. The default setting is 1 minute after the first new message is received.

   Note:
   The length of time for the Level 2 timer must be greater than the Level 1 timer.

   d. To configure a third SLA breach warning, select **Add Level**.

   e. Select the length of the timer for the **SLA breach warning (Level 3)**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This timer alerts the agent to a severe SLA breach by changing the color of an inactive tab when it reaches the selected duration. The default setting is 2 minutes after the first new message is received.

Note:
The length of time for the Level 3 timer must be greater than the Level 2 timer.

7. Select the tab color for each of the configured SLA threshold breach warnings in the **Tab color** field and then select **Apply**.
   You must select a unique tab color for each warning level. After applying your selection, you can see a preview of the tab with the selected color.
8. Select **Save**.
   The workspace is added to the Configured workspaces list in the Session Tab Settings section.

Edit or remove chat session tabs

Edit the settings for configured SLA threshold levels, add or remove SLA threshold levels, or remove workspaces from the Configured workspaces list in the Conversational interfaces (CI) Admin Console.

Before you begin
Role required: admin

About this task
The Session Tabs Settings section of the Agent Chat settings screen lists the workspaces that have configured SLA threshold levels. Under the Configured workspaces heading, you can see a list of the configured workspaces and the SLA threshold levels that have been configured for each workspace.

From this section, you can do the following:

- Remove a workspace from the Configured workspaces list.
- Edit the SLA threshold levels for a workspace:
  - Update the timer value and tab color for an SLA threshold level.
  - Add or remove an SLA threshold level.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Settings**.
   This displays the CI Admin console with the Settings tab selected.
2. Select **Agent Chat** on the left side of the CI Admin console.
   This displays the Agent Chat settings screen.
3. Scroll to the Session Tab Settings section to view a list of configured workspaces.
   This list displays the workspaces that have been configured for the instance. It also displays the SLA threshold levels that have been configured for each workspace.
4. To edit a workspace, select **Edit**.
   The details of the configured SLA threshold timers are displayed in the Set SLA Levels section.

   a. From Set SLA Levels section, you can perform the following tasks:
      - Update the timer value for an SLA threshold level.
      - Update the tab color for an SLA threshold level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add an SLA threshold level.
- Remove an SLA threshold level.

b. Select **Save** on the Agent Chat settings screen to save your changes.

5. To remove a workspace from the Configured workspaces list:

a. Select **Remove** for the desired workspace.

b. In the confirmation pop-up window, select **Remove workspace**.
The workspace is removed from the Configured workspaces list in the Session Tab Settings section.

Organize records tabs with ServiceNow Link Manager

Use the ServiceNow Link Manager feature to manage and organize browser tabs within a ServiceNow instance.

The ServiceNow Link Manager feature is designed to enhance user productivity by managing and organizing browser tabs within a ServiceNow instance. This feature ensures that links opened within an instance are consolidated into a single workspace. It is supported on the latest versions of Google Chrome, Microsoft Edge, and Mozilla Firefox. ServiceNow Link Manager is useful for users who need to keep track of numerous open tabs during their workday.

Key features

ServiceNow Link Manager includes the following features:

- **Tab consolidation**: Automatically consolidates new ServiceNow-related tabs into an existing open ServiceNow tab, preventing browser clutter.
- **Cross-platform support**: Supports opening shared record links across environments such as Gmail, Microsoft Teams, Microsoft Outlook, and other web platforms linked to ServiceNow.
- **User-friendly interface**: Easy to enable and disable directly from the Chrome extension settings in the browser.

Frequently Asked Questions

FAQs for ServiceNow Link Manager

Question	Answer
What happens if I turn off ServiceNow Link Manager?	Turning off ServiceNow Link Manager reverts to the default behavior, where each clicked link opens a new tab.
Is the extension available on other browsers?	The extension is currently supported across multiple browsers - Google Chrome, Mozilla Firefox, and Microsoft Edge.
If I have several tabs open and then enable the ServiceNow Link Manager, what will happen?	The existing tabs remain unchanged. Any new links open within the most recent tab in your current workspace.
Can I choose which tabs to consolidate or does ServiceNow Link Manager	ServiceNow Link Manager automatically consolidates all ServiceNow-related tabs. There is currently

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

FAQs for ServiceNow Link Manager (continued)

Question	Answer
automatically consolidate all ServiceNow tabs?	no option available to select specific tabs for consolidation.
Does ServiceNow Link Manager affect my non-ServiceNow tabs?	No. ServiceNow Link Manager only affects ServiceNow-related tabs. Non-ServiceNow tabs continue to function as usual.
Will ServiceNow Link Manager slow down my browser performance?	ServiceNow Link Manager is designed to operate efficiently without significantly impacting your browser's performance. However, if you experience any slowdowns, consider limiting the number of active extensions or tabs.
Can I temporarily disable ServiceNow Link Manager without uninstalling the extension?	Yes, you can easily toggle ServiceNow Link Manager on or off from the extension settings without uninstalling the entire extension.
If I am working with multiple ServiceNow instances, can I customize which instance ServiceNow Link Manager consolidates tabs into?	Currently, ServiceNow Link Manager consolidates tabs within each ServiceNow instance independently. If you have multiple instances open, the link will open in the most recently used instance.

Does the extension work with customized URLs or older browser versions?	ServiceNow Link Manager extension works only with base system workspace URL patterns and doesn't support customized URLs. It currently supports the following patterns:
	CSM workspaces:
	`"patterns": [ { "name": "cwf", "match": "https://*/now/cwf/*" },`
	ITSM workspace:
	`"patterns": [ { "name": "sow", "match": "https://*/now/sow/*" }`
	Note: The extension doesn't work on older browser versions that don't support Manifest V3. Make sure you're using the latest version of Google Chrome, Microsoft Edge, or Mozilla Firefox.

What happens to filters when opening a filtered list URL through ServiceNow Link Manager?	When a filtered list URL redirects to an existing workspace tab, the applied filters are not preserved. The list displays all records, and you must manually reapply filters after the page loads. For more details,

FAQs for ServiceNow Link Manager (continued)

Question	Answer
	see [Now Link Browser Extension] - List Configuration are not working as expected with NowLink Manager

Open new cases in the same tab with ServiceNow Link Manager for Google Chrome

Follow the steps below to install, activate, and use ServiceNow Link Manager in Google Chrome.

Before you begin
Role required: admin

Installing ServiceNow Link Manager

Procedure

1. Select the **Extensions** icon in Chrome browser and select **Manage Extensions**.
2. In the left panel, select **Chrome Web Store** to open it in a new tab.
3. In the search bar, type `ServiceNow Link Manager`.
4. Select the extension in the results and select **Add to Chrome**.
5. Once installed, the extension appears in your extensions list. It is enabled by default. You can toggle it to on or off as needed.

Activating ServiceNow Link Manager

Procedure

1. Select the ServiceNow Settings icon in the top-right corner of your Chrome browser.
2. From the drop down menu, locate the ServiceNow Link Manager toggle switch and turn it on.

Note:
The ServiceNow Link Manager extension turns on automatically in CSM and ITSM Workspace. It doesn't run in other ServiceNow workspaces.

Using ServiceNow Link Manager

Links typically open in a new browser tab. When ServiceNow Link Manager is activated, links consolidate into an already open ServiceNow workspace tab. This consolidation applies whether the link is clicked within ServiceNow itself or from an external site such as Gmail, Microsoft Teams, or Microsoft Outlook.

Open new cases in the same tab with ServiceNow Link Manager for Mozilla Firefox

Follow the steps below to install and activate ServiceNow Link Manager in Mozilla Firefox.

Before you begin
Role required: admin

Installing ServiceNow Link Manager

Procedure

1. Select the **Menu** icon in Mozilla Firefox and select **Add-ons and themes**.
2. Open the **Add-ons for Firefox** site, search for `ServiceNow Link Manager`, and select **Add to Firefox**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the pop-up that appears, select **Add** to confirm installation.
4. Once installed, the extension appears in your add-ons list. It is enabled by default. You can toggle it to on or off as needed.
5. You can pin the extension to the toolbar for quick access.

Activating ServiceNow Link Manager

Procedure

1. Select the **Menu** > **Add-ons and themes** > **Extensions**.
2. Locate the **ServiceNow Link Manager** toggle switch and turn it on.

Note:
The ServiceNow Link Manager extension turns on automatically in CSM and ITSM Workspace. It doesn't run in other ServiceNow workspaces.

Using ServiceNow Link Manager

Links typically open in a new browser tab. When ServiceNow Link Manager is activated, links consolidate into an already open ServiceNow workspace tab. This consolidation applies whether the link is clicked within ServiceNow itself or from an external site such as Gmail, Microsoft Teams, or Microsoft Outlook.

Open new cases in the same tab with ServiceNow Link Manager for Microsoft Edge

Follow the steps below to install and activate ServiceNow Link Manager in Microsoft Edge.

Before you begin
Role required: admin

Installing ServiceNow Link Manager

Procedure

1. Select the **Extensions** icon in Microsoft Edge and select **Manage Extensions**.
2. Open the **Edge Add-ons** site, search for `ServiceNow Link Manager`, and select **Get**
3. In the pop-up that appears, select **Add** to confirm.
4. Once installed, the extension appears in your extensions list. It is enabled by default. You can toggle it to on or off as needed.
5. You can pin the extension next to the address bar for quick access.

Activating ServiceNow Link Manager

Procedure

1. Select **Settings and more** icon in the top-right corner and then **Extensions**.
2. Locate the **ServiceNow Link Manager** toggle switch and turn it on.

Note:
The ServiceNow Link Manager extension turns on automatically in CSM and ITSM Workspace. It doesn't run in other ServiceNow workspaces.

Using ServiceNow Link Manager

Links typically open in a new browser tab. When ServiceNow Link Manager is activated, links consolidate into an already open ServiceNow workspace tab. This consolidation applies whether the link is clicked within ServiceNow itself or from an external site such as Gmail, Microsoft Teams, or Microsoft Outlook.

CSM Configurable Workspace form templates

Create and edit form templates for use in CSM Configurable Workspace and then use the templates to automatically populate fields on records.

Form templates simplify the process of creating and submitting new records by populating fields with selected values. In CSM Configurable Workspace, form templates are available in the Templates tab in the contextual side panel. From the Templates tab, you can do the following:

- View template cards that display information including the template name, description, and when the template was last used.
- View different lists of templates, including Favorites, My Templates, and All.
- Mark templates as Favorites by selecting the star icon on the template card.
- Sort the available templates alphabetically or by last used.
- Create a new template by selecting the Create icon (**+**) at the top of the Templates tab.
- Edit an existing template by selecting the More actions icon on the template card and then selecting **Edit**.

Templates tab

The Templates tab in the contextual side panel includes form templates that are available to the current user. This tab includes three lists of templates:

- **Favorites**: Templates that the user has marked as a favorite by selecting the star icon on the template card. The templates that are added to this list are accessible across different records.
- **My Templates**: Templates created by the user.
- **All**: All templates available to the user.

Within each list of templates, users can do the following:

- Search for templates by entering a keyword in the search box.
- Sort the available templates, either last used or alphabetically, by making a selection from the drop-down menu.

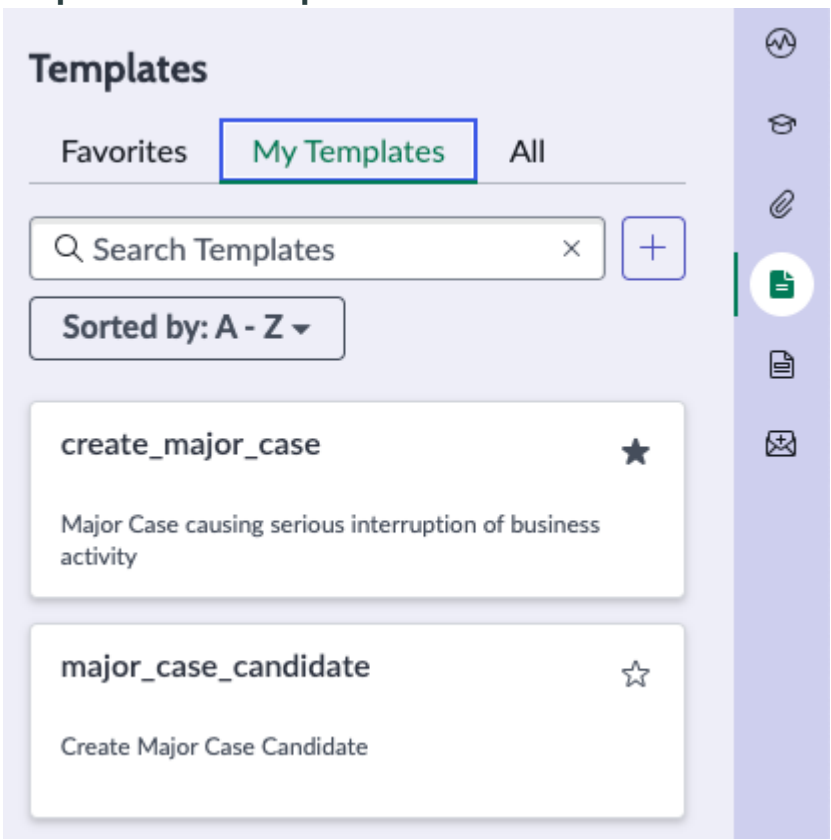
Templates tab with template cards



Template cards

The Templates tab displays a card for each template in a list. These cards provide information about the templates, including:

- A multi-line description of the template.
- A timestamp that shows when the template was last used.
- A star icon that you can use to mark a template as a favorite.

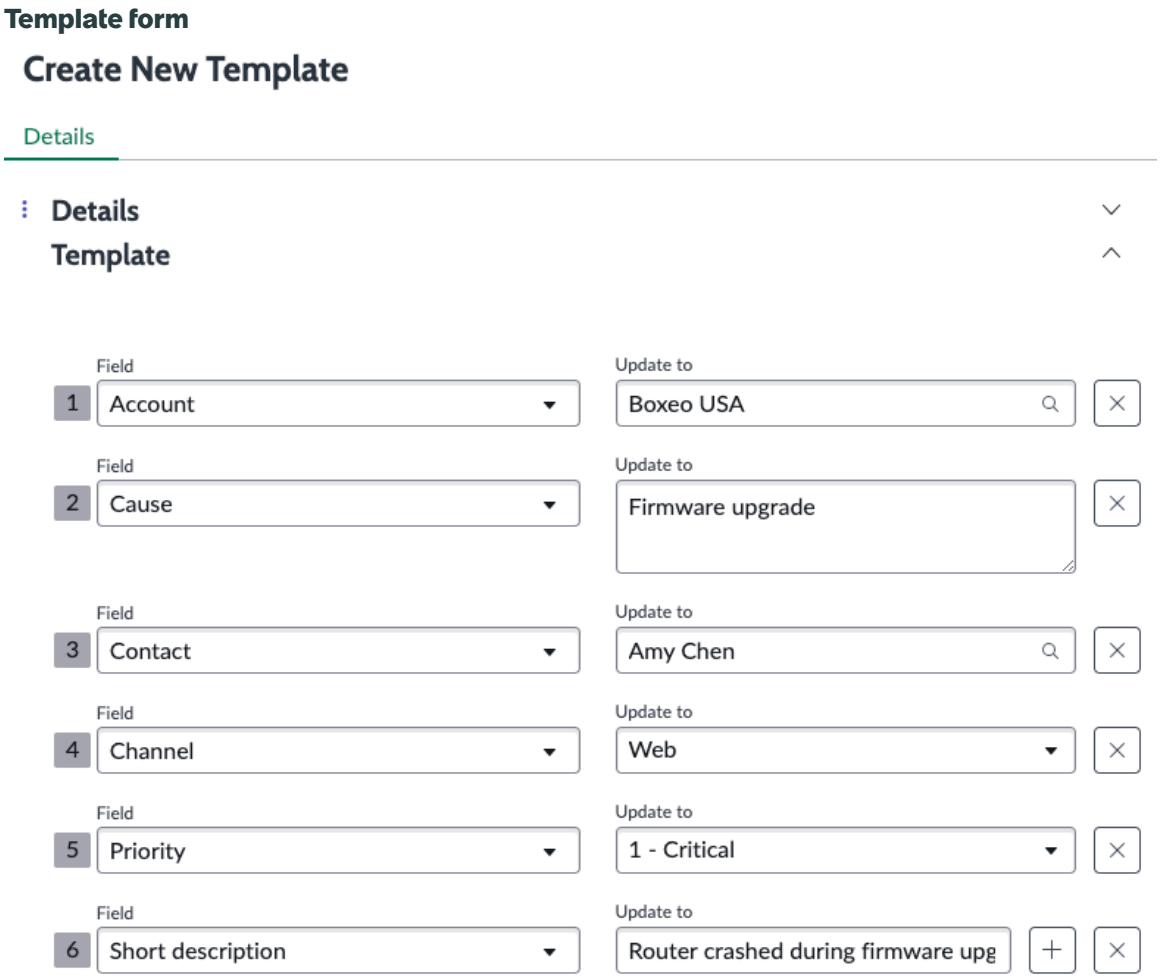
Template form

The template form is used to create and edit templates. This form includes two collapsible form sections:

- **Details**: Includes information about the template, such as the template name and the table that the template applies to.
- **Template**: Includes the selected fields and the configured values for those fields which are applied to a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Template form



The Template section includes a row for each field that has been added to the template. These rows are numbered for readability and easy reference. The fields and configured values in each row are also labeled for readability.

- **Field**: The field to update on the record.
- **Update to**: The value to use for that field.

The template form is available when creating a new template from a case or interaction or editing an existing template. The template form tab header displays a description of the current action:

- **Create new template**: The system displays this tab header when you create a template.
- **Edit template**: The system displays this tab header when you save the changes to a new template or when you edit a template.

Using form templates to create comments and work notes

You can create and use form templates that add content to the **Additional comments** and **Work notes** fields on a case record and then post that content to the activity stream. Selecting a template displays a modeless dialog with the template content. For more information, see Modeless dialogs.

Chat summarization

Use the chat summarization feature to automatically create summaries of chat conversations. The chat summary enables an agent to quickly gain an understanding of the interaction without reading the entire transcript of the conversation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

At the completion of a chat conversation, the system automatically generates a chat summary and adds it to the **Chat summary** field on the Interaction record. This summary is created from the transcript of the chat conversation.

The system calls the chat summary prediction, which generates the summary from predicted values and updates the **Chat summary** field. It also displays the summary as a top recommendation for this field.

An agent can modify and save the information in the **Chat summary** field. To revert the summary to the predicted value, the agent can select the value in the top recommendation.

The chat summarization feature works with or without chat wrap-up enabled. For more information, see Interaction wrap up.

AI indicators

When the system generates a summary and automatically populates the **Chat summary** field, it also does the following:

- Displays an AI icon above the field which indicates that the summary is generated by AI.
- Displays a banner at the top of the Interaction record. The message in the banner advises the agent to check the summary and update the information if it is not accurate.

The agent can dismiss the banner. If the agent manually updates the **Chat summary** field, the AI icon is no longer displayed.

Interaction wrap up with modeless dialog

Interaction wrap up provides agents with dedicated time after each call or chat to finalize interaction details. Agents can use this time to wrap up their work before starting a new conversation.

When interaction wrap up is enabled, an interaction record moves from the Work In Progress state to the Wrap Up state at the end of a customer conversation. This configurable period of time enables agents to complete tasks such as posting work notes and updating record information before moving on to assist other customers.

While in the Wrap Up state, an agent's capacity is not reduced until the state of the interaction moves to Closed Complete.

Interaction wrap up features

Interaction wrap up includes several configurable features:

- Wrap-up codes: Agents can select from a list of codes that provide information about how the interaction was resolved.
- Wrap-up notes: Agents can provide additional information about the interaction resolution.
- Wrap-up timer: Displays the duration of the wrap-up period. When the end of the duration is reached, the system automatically ends the wrap-up period and saves the wrap-up data with the default code and notes field blank.
- Wrap-up modeless dialog: Displays when the agent ends an interaction. Includes the wrap-up timer and fields for the wrap-up code and notes.

Interaction wrap up also includes wrap-up segments, which store interaction wrap-up data. Wrap up segments enable multiple wrap ups per interaction. For example, when one agent transfers an interaction to another agent and each agent completes a wrap up for the same record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Interaction wrap-up benefits

Interaction wrap up provides agents with dedicated time to complete their work on an interaction. If enabled, a wrap-up timer displays the remaining time in the wrap-up period. Agents can complete and submit the wrap-up data within the wrap-up period or allow the system to automatically complete the wrap-up period when the time expires.

Managers can configure the length of the wrap-up period for their agents. Managers can also access reports on wrap-up time usage and effectiveness and use analytics to track data accuracy and agent productivity improvements.

Admins can set and manage wrap-up time limits for voice and chat interactions and create wrap-up codes. Agents can quickly select from a list of available codes during wrap-up.

Wrap-up codes

Wrap-up codes provide information about how an interaction was resolved. Agents can select a wrap-up code when wrapping up an interaction in CSM Configurable Workspace. When wrap-up codes are enabled, agents can select a code from the configured list in the wrap-up modeless dialog.

System administrators can create wrap-up codes. From the Interaction Wrap Up Configuration record, system administrators can also do the following:

- Enable wrap-up codes.
- Select the wrap-up codes that are available to agents in the wrap-up modeless dialog.
- Select a default wrap-up code.

For more information, see the following topics:

- Create an interaction wrap-up configuration
- Create interaction wrap up codes
- Enable interaction wrap up codes

Wrap-up timer

The interaction wrap up timer displays a countdown of the wrap-up period. The wrap-up timer starts when the wrap up period begins.

Agents can complete their work within the wrap-up period and submit the wrap-up data. If agents do not complete their work, the system automatically ends the wrap-up period and saves the wrap-up data with the default code and notes field blank.

Depending on the settings in the Interaction Wrap Up Configuration record, the wrap-up timer appears on an interaction record in one of two locations:

- In the wrap-up modeless dialog: The timer is displayed in the modeless dialog if wrap-up codes are enabled.
- In the interaction record header secondary values. The timer is displayed in the secondary values if wrap-up codes are not enabled.

The system administrator can configure the display of the wrap-up timer by enabling the **Show duration to agent** field on the Interaction Wrap Up Configuration record.

The timer counts down the amount of time specified in the **Duration in seconds** field. The background color of the wrap-up timer changes as it counts down the duration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Background color	Description
Green	Time remaining is between 100% to 50% of duration.
Yellow	Time remaining is between 50% and 25% of duration.
Orange	Time remaining is between 25% and 0% of duration.
Red	When the timer reaches 0.00, the display turns red and then disappears. The system updates the state of the interaction record to Closed Complete.

Wrap-up notes

Agents can provide additional information about the interaction resolution in the wrap-up notes. After selecting a code in the wrap-up modeless dialog, agents can add this information in the **Notes** field.

Wrap-up modeless dialog

When wrap-up codes are enabled in the Interaction Wrap Up Configuration record, the system displays the wrap-up modeless dialog during the wrap-up period.

The wrap-up modeless dialog includes the following fields:

- Wrap up timer (when configured)
- Wrap up code
- Notes

The agent can select a code and add wrap-up notes and then select **Submit & close** to complete the interaction. The wrap-up data is saved in a segment record and the state of the interaction changes to Closed Complete.

If the wrap-up time expires before the agent selects **Submit & close**, the system closes the modeless dialog and saves the wrap-up data with the default code and no notes.

Agent actions that impact the wrap-up modeless dialog:

Action	Result
Initiating an outbound conversation during the wrap-up period	The system ends the countdown and closes the modeless dialog.
Changing the agent status during the wrap-up period	The system ends the countdown and closes the modeless dialog.
Logging out during the wrap-up period	If an agent logs out during the wrap-up period without selecting **Submit & close**, the wrap-up time continues. If the agent does not log back in, the system closes the wrap-up.
Closing the interaction while in wrap up mode	The system displays a warning message. If the agent still wants to close the interaction, the system submits the wrap-up using the default wrap-up code.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Result
Transferring a call to another agent	Each agent's wrap-up period begins the moment they exit the call. This behavior applies to both warm and cold transfers. When a call is transferred from one agent to another, each agent's wrap-up period begins the moment they exit the call.
Cancelling an inbound or outbound call	When a caller cancels an inbound call that hasn't been connected to an agent or agent cancels an outbound call, wrap-up is not initiated.

Wrap-up segments

The system stores interaction wrap-up data in wrap-up segments. Storing the data in segments enables multiple wrap-ups per interaction. For example, when one agent transfers an interaction to another agent, each agent can complete a wrap-up for the same interaction record.

Interaction wrap-up segment records are stored in the Interaction Wrap Up Segment table [interaction_wrap_up_segment]. Customer and consumer agents have read access to this table.

My Wrap Ups list

The My Wrap Ups list displays a list of all wrap-up records for the current user. To access this list in the Lists tab, navigate to **Interactions** > **My Wrap Ups**. This list view includes a link to the interaction record, the wrap-up state (In progress or Complete, and the wrap-up code and notes.

The following roles have access to the My Wrap Ups list:

- Customer service agent (sn_customerservice_agent)
- Consumer service agent (sn_customerservice.consumer_agent)
- System administrator (admin)

Wrap up controller

There are two different controllers for interaction wrap up:

- Interaction UI controller: Original controller; includes legacy wrap-up functionality.
- Wrap up controller: New controller introduced in Yokohama; includes wrap-up codes and the wrap-up modeless dialog.

The Wrap up controller includes output properties that determine where the wrap-up timer is displayed: in the modeless dialog or in the interaction header secondary values. The Wrap up controller also controls how the timer is updated.

The CSM Interaction record page and the CSM voice interaction record page include an input property that determines the wrap-up functionality: **disableLegacyWrapUpLogic**.

- If set to false: the wrap-up functionality remains the same. For upgrade customers, this prevents conflicts with the current or custom wrap-up functionality. The default value of this property is false.
- If set to true: the interaction record page uses the new wrap-up functionality.

To edit this property:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In UI Builder, select the CSM/FSM Configurable Workspace experience.
2. Select the CSM Interaction record page.
3. In the Data and scripts section on the left side, select CSM Interaction Record to open the Edit CSM Interaction Record modal.
4. In the Configure tab of the modal, enable or disable the **disableLegacyWrapUpLogic** property.

Interaction record pages

The wrap-up controller, wrap-up codes, and wrap-up modeless dialog are available on the following record pages in CSM Configurable Workspace:

- CSM Interaction record page
- CSM Voice interaction record page

Customer Central

Customer Central provides customer service agents with all the information about the customer in one central place. It enables them to quickly zoom in on the customer issues and provide efficient and supportive service to their customers.

Customer service agents or location agents can view customer central on the interaction, case, account, contact, or consumer records in CSM Configurable Workspace in the form of two views: Customer Information and Customer Activity.

Starting with the Yokohama release, the Customer History component displays customer activity information on some record pages in CSM Configurable Workspace.

Customer Information view

The Customer Information view displays key information about the customer and a view of all recent customer touch points with the service organization. It contains a number of predefined lists, records, reports, and report groups that are highly configurable, or you can create your own. You can also configure the number of days to display the data for.

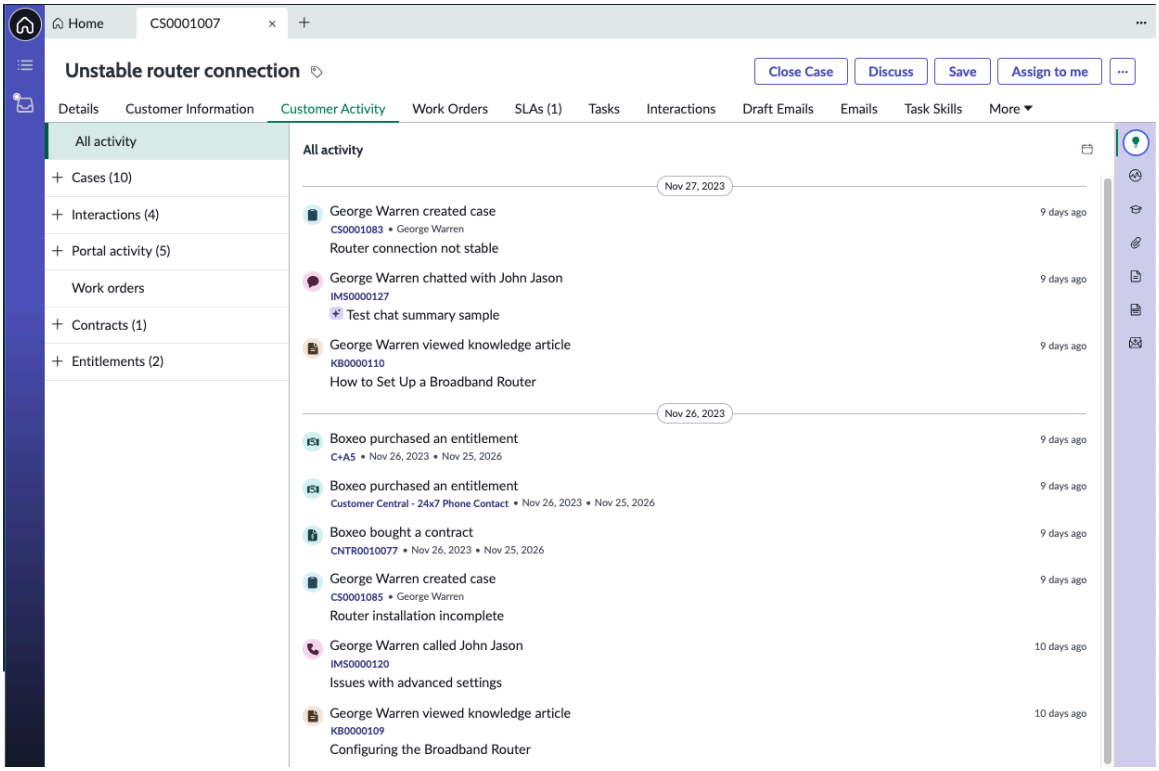
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Activity view

The Customer Activity view displays all the recent customer touch points with the service organization in the form of an activity feed. On the left-hand side, there are facets, or categories of information. The data in the activity feed is displayed based on the facet you select. It contains a number of predefined facets and activities that are highly configurable, or you can create your own. You can also select a date range to display the data for.



Chat summarization

Agents can see an AI-generated chat summary instead of a full transcript so that they can quickly understand the past interaction and resolve a customer issue. An interaction chat summary in the Customer Activity tab provides the context about the chat conversation between the agents and customers.

An AI icon and tooltip are displayed before the summary which indicate that the summary is generated by Now Assist.

This feature has the following dependencies:

- Now Assist for CSM (sn_csm_gen_ai)
- UXC Generative AI (sn_uxc_gen_ai)

When these plugins are not installed or the chat summary is unavailable, agents can see the entire conversation transcript to access the chat history.

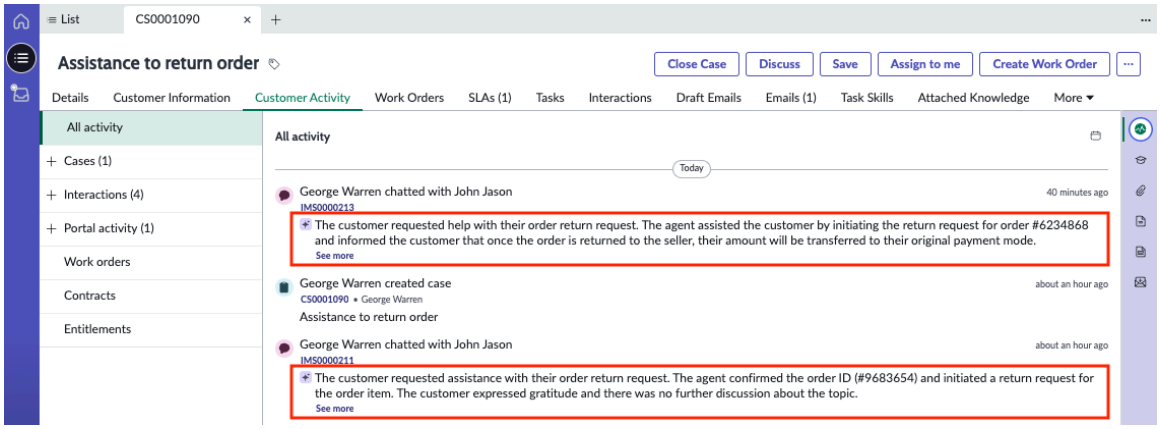
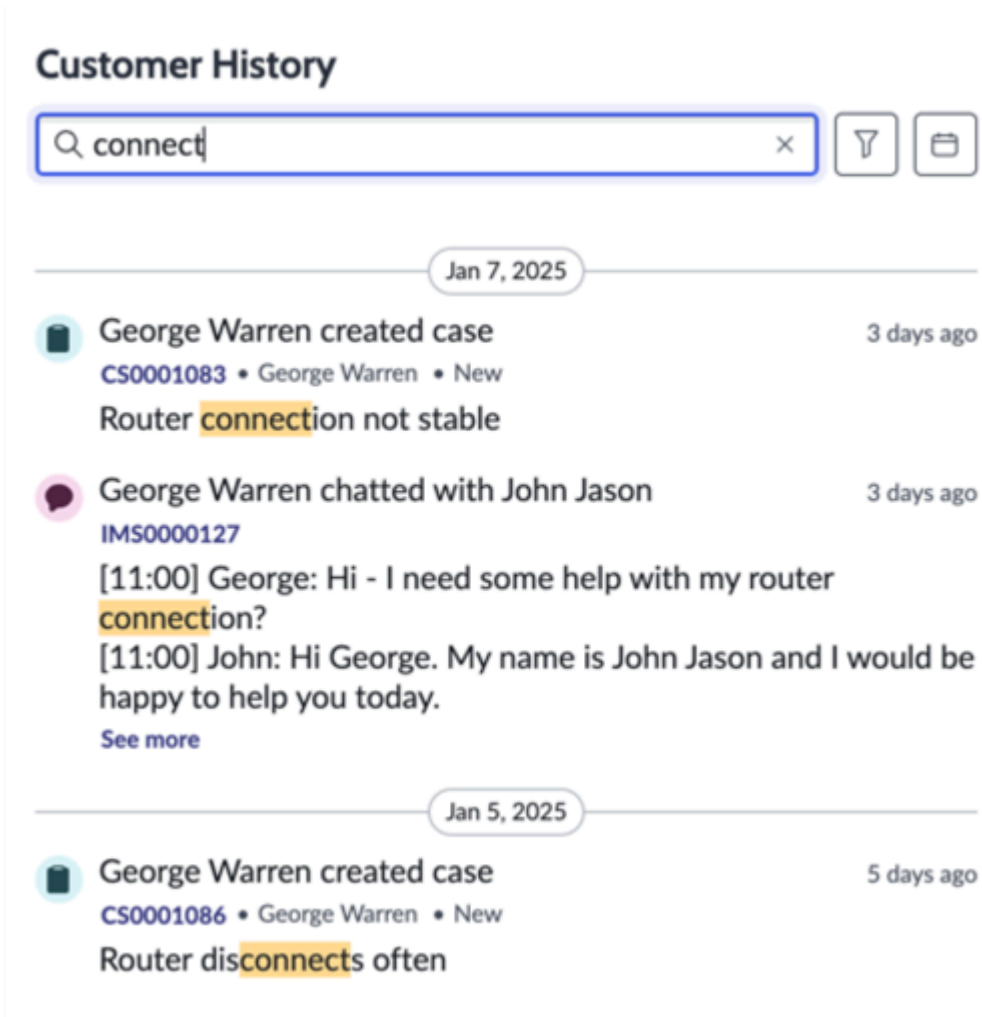
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Customer History component

The Customer History component displays customer, consumer, or account history information, depending on the field selections on the interaction record. This component displays the information previously displayed in the Customer Activity tab.



The Customer History component includes the Customer tab. This tab displays customer, consumer, or account history information, depending on the customer information provided on the interaction record. This tab includes a search field, filter, and date range selector that agents can use to find specific information in the history.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Customer History component is available on the following record pages in CSM Configurable Workspace:

- Front-line case page: Appears in the contextual side panel.
- CSM voice interaction record page: Appears in the left pane.

Users with the system administrator role can add this component to a record page in UI Builder and configure the component properties.

The Customer History component can be configured to display a **Call Transcript** tab. This tab displays the text of the live call transcript when a conversation record is present for the interaction.

Note:
The Call transcript tab is visible to users if configured in the provider application associated with the interaction.

- This tab displays the text of the call transcript when a conversation record is present for the interaction.
- This tab displays the following text when a conversation record is not present for the interaction record: Call transcript not available yet.

The Call transcript tab is visible to users if configured in the provider application associated with the interaction.

For more information about the Customer history component, see the following topics:

- Customer History component features
- Configuring the Customer History component
- Next Experience Components documentation

Customer Central plugin

The Customer Central application (com.sn_csm_customer_central) is activated with the CSM Configurable Workspace application (com.snc.uib.csm_agent_workspace). The CSM Configurable Workspace application is activated with the Customer Service plugin (com.sn_customerservice).

Starting with the Yokohama release, the Customer Central application (com.sn_csm_customer_central) has moved to the ServiceNow Store. Any new enhancements to this application are delivered through the Customer Central store app.

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Related topics

Configure Customer Central

Use Customer Central

Customer History component features

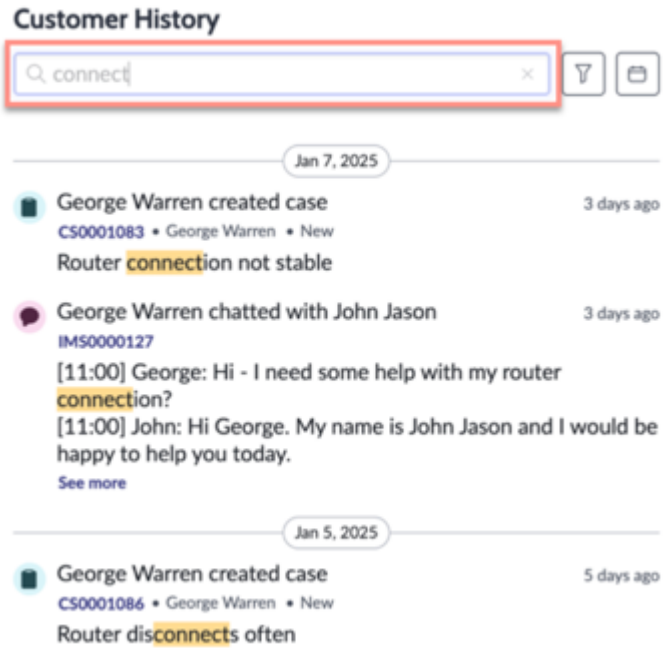
Customer service agents can use several features in the Customer History component to view customer, consumer, or account history information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search

The Search field introduces keyword-based search functionality allowing agents to retrieve activities such as interactions, cases, and work orders by typing keywords or partial matches.

Agents can type a keyword or partial matches to find relevant results. For example, typing **connect** displays cases with terms like connect, connected, or connection.



Filter

Agents can use the filter icon next to the search bar to quickly filter and view relevant case data. Selecting the filter icon displays the results in the Customer History component.

Facets have been replaced by a filter icon. If the **Enable facets** check box is selected in UI builder, the system displays facets on the left of the CSM voice interaction record page. If this check box is not selected, the system displays a filter icon. Selecting the filter icon displays the selectable facets.

When an agent selects a facet:

- The selected facet name appears below the search bar and the system displays the current results.
- Selecting a new facet replaces the current results with the new facet's results.
- Only one facet can be selected at a time.

Note:

- For new customers: Filter icons are displayed by default.
- For existing customers: Facets or filters appear based on screen size.

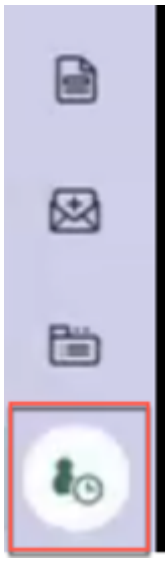
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer History access

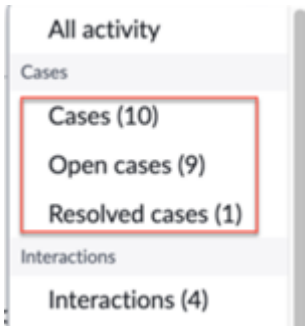
Starting with the Yokohama release, the Front-line case page includes the Customer History component. This component ensures agents can easily view customer details without navigating away from the case page.

Select the **Customer History** tab in the contextual side panel to access customer history.



Cases facet

The Cases facet has been updated to improve case categorization for agents. This helps agents quickly filter the cases based on their status directly within the Customer History component.



The facet is divided into two subcategories:

- Open Cases
- Resolved Cases

Resizable layout blocks

The **Resizable Layout Blocks** feature allows agents to adjust the size of page panel for better visibility. Agents can resize any block (left, center, or right) by following these steps:

1. Click the edges of the block.
2. Drag to adjust the size as needed.

This feature is available across record pages in CSM Configurable Workspace and allows agents to optimize their workspace based on their needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring the Customer History component

Users with admin role can configure several properties for the Customer History component.

Refresh requested

The Customer History component refreshes automatically when the account, contact, or consumer is updated on a record, eliminating the need for manual page refreshes.

The **Refresh requested** property captures the last refresh timestamp and triggers events such as Context Refresh Requested whenever the value changes. Admins can configure custom event handlers to adjust the refresh behavior as needed. 
This property can be set for the following record pages:

- Front-line case page
- CSM default record page

To configure this property on the Front-line case page:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. Open the **Front-line case page**, click the **Customer History** component.
4. Navigate to the **Properties** panel.
5. Enable the **Refresh Requested** property to capture the last refresh timestamp.
6. Add or modify event handlers under the Events tab to customize the refresh behavior.

To configure this property on the CSM Default Record page:

1. Select **Customer Central**.
2. Open the **Customer Activity** section.
3. Navigate to the **Properties** panel.
4. Enable the **Refresh Requested** property to capture the last refresh timestamp.
5. Add or modify event handlers under the Events tab to customize the refresh behavior.

Header title

The Customizable Customer Activity Title feature allows admins to rename the **Customer Activity** title directly from the interface.

To change the title:

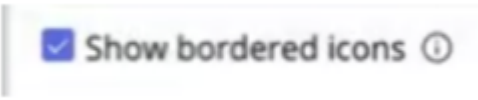
1. Navigate to the **Component visibility** settings in the right navigation pane.
2. Edit the **Header title** property to change the title according to user preferences.

This customization option is available on all pages where the Customer History component is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Show bordered icons

The **Show bordered icons** check box allows admins to customize icon borders in the



interface.

- Set to true: Enables bordered icons
- Set to false: Disables bordered icons

Admins can adjust this setting based on their preferences.

Page design

The Page Design feature introduces a drag-and-drop interface for easier customization of page layouts. Admins can add, position, and resize components directly on the page without using tabs.

To use this feature:

1. Click **+Add Content** on the left navigation pane.
2. In the toolbox window that appears, type Customer activity component and then select and drag it.

The Customer History component is now available in the toolbox.

Presets

Admins can choose from two new presets for the Customer History component on the Front-line case page to better manage how customer data is displayed.

- Customer activity for record page with lazy load
- Customer activity for record page

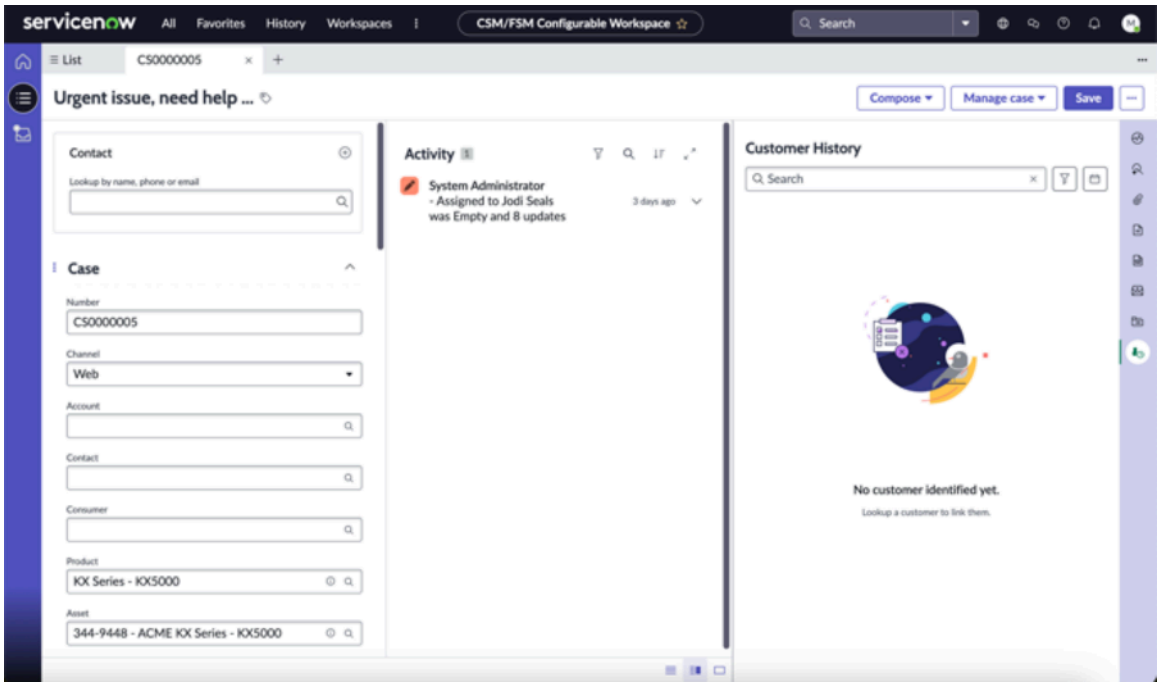
To apply a preset:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. Open the **Front-line case page** and select the **Customer History** component.
4. Select the existing preset in the configuration panel.
5. In the **Select a preset** window, choose **All** under **Controller** to view available presets.
6. Select one of the new presets to update how customer activity is displayed.

Default values are set for all fields to prevent errors by ensuring that fields are never left null or empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New empty state for context fields



On the agent side, when viewing a case, customer history or activity data loads automatically if available. If there's no activity, the system shows "No activities found". If no account, contact, or consumer is selected, it displays "No customer identified yet". This behavior is part of the empty state feature, guiding users to select or add context (account, contact, or consumer) to proceed.

Admins can now configure cases to handle scenarios where customer contact or name fields are empty. Instead of leaving the fields blank, the system prompts users to add the relevant account or contact information.

Lookup and verify

The lookup and verify feature enables customer service agents to quickly look up contacts or consumers using information such as the name, phone number, or record number.

This feature simplifies the process of looking up and verifying contact or consumer information. Agents can use it as follows:

- If an interaction record is already populated with contact or consumer information from a chat or phone call, the agent can review the information and confirm that it is correct.
- If no customer or consumer information is available, the agent can search for this information, select and confirm the information. and populate the interaction record.

Note:
If this information has already been verified, such as through a customer portal login or authentication by Virtual Agent or by an IVR, the **Verified** check box on the interaction record is checked.

Agents can access the search window on the interaction record as follows:

- CSM Configurable Workspace: By clicking the Verify Contact icon ( ) or the Verify Consumer icon ( ) in the contextual side panel.
- CSM Agent Workspace: By clicking the **Lookup Contact** and **Lookup Consumer** buttons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agents can perform a type-ahead search across multiple configurable fields such as name, phone number, email address, and record number. From the search results list, agents can select a result to display detailed information for the contact or consumer in a verification card. Once verified, the system adds the information to the interaction record and checks the **Verified** check box.

Plugins

The lookup and verify feature is included with the Customer Service (com.sn_customerservice) plugin. This plugin provides the configuration for contact and consumer lookup as well as **Lookup Contact** and **Lookup Consumer** UI actions that can be added to the interaction record in CSM Configurable Workspace.

Note:
These actions are not enabled by default. The workspace admin can enable these actions as part of the lookup and verify feature configuration.

Contact and consumer configurations

Two lookup and verify configurations are provided with the feature, one for contacts and one for consumers. Navigate to **Workspace Experience** > **Lookup and Verify** > **Configuration** to access the Lookup and Verify Configurations list.

Note:
To see the contact and consumer lookup and verify configurations, you must activate the CSM Lookup and Verify plugin (com.snc.sn_csm_lookup_verify).

For each configuration, the workspace administrator can:

- Enable the configuration and display the related UI action on the interaction record.
- Enter the minimum number of characters to start the type-ahead search.
- Enter the maximum number of search results returned.
- Select the primary and secondary fields to include in the search results.
- Select the fields to display on the verification card.
- View the lookup tables.

Note:
Customers can contact ServiceNow to make changes to the search fields.

Using Lookup and verify in CSM workspaces

Agents can use the lookup and verify feature in CSM workspaces.

- CSM Configurable Workspace: agents search for contact or consumer information using the contextual side panel.
- CSM Agent Workspace: agents search for contact or consumer information using the Verify Contact or Verify Consumer pop-up windows on the interaction form.

The search field provides type ahead search that displays results in a list and narrows the results as more characters are entered. Selecting a result from the list displays more detailed information about the contact or consumer in a verification card.

The search feature searches multiple configured fields such as name, account, phone number, and record number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For phone numbers and record numbers, it uses an "exact match" search.
- For other fields, it uses a "starts with" search.

Verification cards

After selecting a search result, detailed information about the contact or consumer is displayed in a verification card. From this card, the customer service agent can review and confirm the information by clicking **Verified**.

Tables

The lookup and verify feature uses the following tables:

- Lookup and Verify Configurations (sn_lookup_verify_config)
- Lookup Tables (sn_lookup_verify_search_on_table)

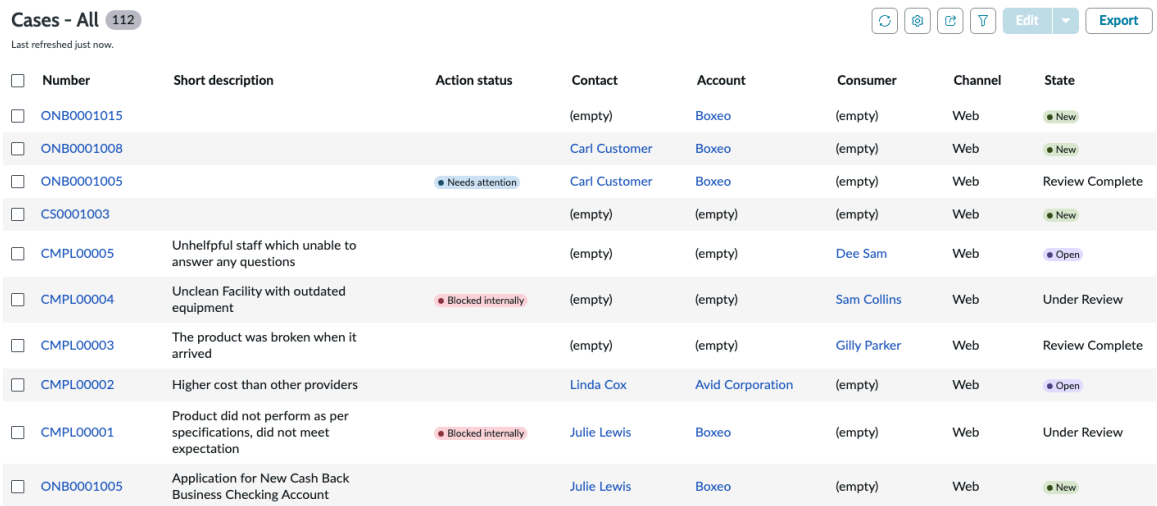
Look up and verify a contact or consumer

Case action status

The case action status feature displays the status of cases in the Case list. With this feature, customer service agents can easily identify cases that need attention.

Action status column on the Case list



Action status column

The case action status feature provides visual indicators in the **Action status** column on the My Cases and My Open lists to highlight case status. In addition to the colored indicators, the **Action status** column also displays a brief status message.

Action status column indicators and messages

Indicator	Status message	Description
Blue	Needs attention	A blue indicator highlights cases that need attention, such as cases that have been updated by customers or internal users and are waiting for input or review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action status column indicators and messages (continued)

Indicator	Status message	Description
Red	• Blocked internally • Blocked by customer • Blocked internally and by customer	A red indicator highlights cases that are blocked, such as cases that have open related task records or are waiting for customer feedback.

Actionable case flows

The case action status feature uses actionable case flows to automatically determine the action status for customer service cases. These flows create and resolve blocking tasks for different case-related actions and update the action status indicators. Certain agent actions trigger these case flows, which in turn create and resolve the blocking tasks. Customer service agents and managers can also manually set the action status for cases by enabling the **Needs Attention** field on the Case form.

For more information, see the following topics:

- Actionable case flows
- Configure actionable case flows

Blocking tasks

A blocking task is something that prevents an agent from making progress toward case resolution. For example, a case might have one or more open related case task records or be waiting for customer feedback.

Certain agent actions trigger case flows that create and resolve blocking tasks for customer service cases. These tasks determine the case action status. Additionally, there are actions that resolve these blocking tasks, such as the customer responding to an agent's question or an internal user resolving a problem task. For more information, see Blocking tasks.

Blocked by related list

The case action status feature adds the **Blocked by** related list to the workspace view of the Case form. Blocking tasks for a case appear in this list. When the system adds a blocking task to a case, it also adds one of the following blocking reasons:

- Need information from the customer
- Need task resolution
- Need PRB workaround
- Other

Note:
When a problem is associated with a case, the blocking reason is set to **Needs task resolution**. The agent can update this reason to **Need PRB workaround** if necessary.

When a blocking task is resolved:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Unblocked By** field displays the user who performed the unblocking action.
- The **Unblocked On** field displays the date that the blocking task was resolved.
- The **Needs Attention** field for the case is enabled.

Notifications

Agents can receive notifications on their preferred channel when a blocking task for an assigned case is resolved. Agents can also receive notifications when the **Needs Attention** field for an assigned case is enabled.

Note:
Notifications are not sent to the user who updated the record.

Users with the admin role can configure notification triggers by navigating to **Agent Workspace** > **Notification Triggers** > **Case Action Status Trigger**.

Administering case action status

Third-party data integration for CSM

The third-party data integration feature enables you to retrieve data from third-party applications and display the data in Agent Workspace for CSM without having to store it in your ServiceNow instance.

Many enterprise customers use ServiceNow applications as part of their IT ecosystems. In these environments, ServiceNow applications coexist with other applications and exchange data through different types of integrations. For customer service agents who typically use a wide variety of applications, this can create a fragmented experience that impacts agent productivity and increases customer wait time.

A frequent integration takes place between ServiceNow and Salesforce applications. In this integration, customers use Salesforce to manage pre-sales activities and ServiceNow to manage post-sales activities. These post-sales activities represent service assurance.

To provide high quality service, agents using the Customer Service Management (CSM) application need a complete understanding of the customer's context, and this includes access to customer data maintained in other systems. A common example of this integration is enriching a CSM customer profile by providing a list of opportunities related to the customer's account. These opportunities are retrieved from Salesforce in real time and are presented in Agent Workspace for CSM.

Using the third-party data integration feature, data from third-party applications can be retrieved as needed. Agents can view the data in lists and forms. This feature uses remote tables to store the third-party data in memory on the application server. Remote tables are useful for data that changes frequently because the data is retrieved in real-time when a user accesses the data from the ServiceNow AI Platform.

Activating third-party data integration

The following plugins are required to implement third-party data integration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Remote Tables (com.glide.script.vtable): Adds the Remote Table Script Definition table (sys_script_vtable) and adds the **Remote Table** flag to the Tables (sys_db_object) table. Active on the base instance.
- OAuth 2.0 (com.snc.platform.security.oauth): Adds the OAuth-related tables and extension points needed to support **OAuth 2.0 –JWT Bearer grant type**. Active on the base instance.
- IntegrationHub (com.glide.hub.integrations): Provides the ability to build reusable integrations with third-party systems and call them from anywhere in the platform. IntegrationHub requires subscription and is available in several subscription packages. Different packages allow for different levels of automation and provide different subsets of predefined third-party integrations, or spokes. For more information, see Request IntegrationHub and IntegrationHub available spokes.
- Customer Service (com.sn_customerservice)

Configuring third-party data integration

Users with the system administrator role can configure the necessary components to enable third-party data integration for Agent Workspace for CSM. At a high level, the configuration steps include:

- Setting up the **OAuth 2.0 – JWT Bearer grant type**, which provides the connection between the ServiceNow instance and the third-party application.
- Setting up aliases to manage connection information and credentials when integrating with external systems and providing alias reference to the IntegrationHub action.
- Creating a remote table to store the third-party data.
- Creating a remote table script definition that maps the data from the third-party application table to the remote table.
- Configuring ACLs for the remote table to provide user access to the third-party data.
- Configuring the lists and forms that display data from the remote table.

For more information, see Configure third-party data integration for CSM.

Using third-party data integration

Within Agent Workspace for CSM, agents can use this feature to:

- View read-only data from third-party applications in lists and forms.
- View data from multiple third-party applications in one browser tab.
- View data from third-party applications in pop-up windows, sub tabs, and related items using iframes.
- Open links to third-party application records from forms.

Domain separation

Remote table script definitions are domain separated. If users do not have access to the same domain as the remote table script definition record, they cannot access records from the remote table specified in the script definition.

The data within the remote table is not domain separated.

For more information, see Domain separation and remote tables.

Third-party data integration solution overview

A typical enterprise ecosystem includes enterprise resource planning (ERP), sales management, and service management systems. There are multiple options for implementing the integrations between these systems.

In this example, the ERP system manages customer data (for example, Accounts).

When a new account is acquired, it is created first in the ERP system and then account data is transferred to Salesforce and ServiceNow (1).

During this process, new accounts are created in Salesforce and ServiceNow. The ServiceNow account record is updated with the Salesforce account ID attribute that holds the reference to the Salesforce account record. The Salesforce account ID is later used to match account records between ServiceNow and Salesforce and also to retrieve opportunity data from Salesforce.

When an agent accesses an account in Agent Workspace for CSM, a list of related opportunities for this account is retrieved from Salesforce in real-time and presented to the agent.

This example assumes that the flow has been implemented and executed and that the ServiceNow account records contain valid Salesforce account IDs. This example also uses the following configuration:

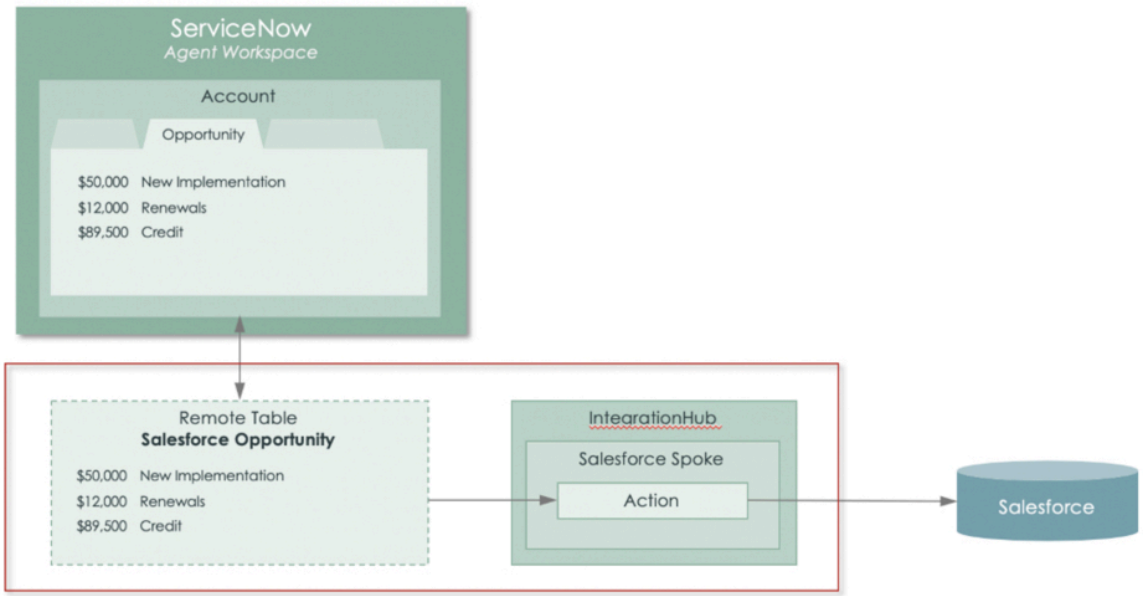
- Connectivity between a ServiceNow and Salesforce.
- Integration using Integration Hub and remote tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration architecture

ServiceNow integrates with Salesforce through the OAuth 2.0 Bearer Token Flow.

Integration architecture



Remote tables and IntegrationHub architecture

Third-party data integration components

These components require configuration by the system administrator to use third-party data integration with Agent Workspace for CSM.

OAuth 2.0 –JWT Bearer grant type

JWT Bearer is the OAuth 2.0 grant type supported for the third-party data integration feature. It allows server-to-server API interactions between the ServiceNow instance and external API providers without requiring any user intervention.

The third-party application admin is used as the subject claim of the JWT that the ServiceNow instance creates and passes to the third-party application instance. This is done to get the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

access token which is used to make the REST API call to fetch records from the third-party application table.

Credentials and connections

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime.

For more information, see the following topics:

- Introduction to credentials, connections, and aliases
- Create connection attributes for IntegrationHub

Remote tables

The Tables (sys_db_object) table contains a record for each table in the database, including remote tables. For remote table records, the **Remote Table** flag is checked on the record form.

The columns in a remote table are mapped to the columns in a third-party application table from which the data is being pulled. The remote table script definition stores this information. Table definitions for remote tables reside on the ServiceNow AI Platform. The table rows, or external records, are stored in memory while a user views the data in a list or form.

For more information about remote tables, see Create a remote table.

When creating a remote table for use with IntegrationHub, pay special attention to the caching interval and choose an interval based on your workflow and the volatility of the third-party data. If the caching interval is too short, this can result in unnecessary connections to the third-party application. If the caching interval is too long, this can result in out-of-date third-party data being presented in Agent Workspace for CSM.

Remote table script definitions

Use a script definition to retrieve and cache data for a remote table by running the script against an external data source. Remote table script definitions store the following information:

- Name
- Active
- Table
- Script
- Cache TTL
- Domain
- Domain path

For more information about script definitions, see Create a script definition for a remote table.

Third-party data integration sample script

The remote table script can be designed to pull records from a third-party application. This script is called when a query to access data in the remote table is made.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In order to use a remote table with IntegrationHub, you need to identify the IntegrationHub spoke that works with the third-party application. The spoke consists of the Flow Designer actions that were created to bring various subsets of the data from that application.

For example, if you need to bring account information from the Salesforce application, you would use the Salesforce spoke and the **Get All Accounts** action. See below for an example of the remote table script that accesses this action.

```
(function executeQuery(v_table, v_query) {
  try {
    // prepare inputs for the spoke actions
    // Get All Accounts action does not have any inputs).
    var inputs = {};

    // call spoke action
    var outputs = sn_fd.FlowAPI.executeAction(

 "sn_salesforce_spok.get_all_accounts", inputs);

    // check if Action was completed successfully
    if (outputs.status != "Success") {
      throw new Error(outputs.errorMessage);
    }

    // extract payload from the action outputs
    var accounts = outputs.accounts.data;

    // map action output data to the remote table columns and
 Sys Id
    for (var i = 0; i < accounts.length; i++) {
      v_table.addRow({
        "u_sf_account_id": accounts[i].name,
        "u_sf_account_name": accounts[i].label,
        // assign remote table Sys Id to the primary key of the
 third-party
        // record
        "sys_id": accounts[i].name,
      });
    }

  // process errors
  } catch (error) {
     gs.addErrorMessage("Error trying to retrieve  Salesforce
 Accounts." +
                        "Please contact System Administrator.");
     gs.addErrorMessage("System Error: " + error.message);
  }

})(v_table, v_query);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Not all IntegrationHub actions can be invoked from the remote table scripts. Specifically, Data Stream Actions cannot be called from the scripts. If the action you would like to use is a Data Stream Action, you might need to create your own action based on the REST step. An easy way to create an action is to copy an existing action and then modify it to accomplish your goal. You can find an example of custom spoke actions in this topic: Create Salesforce spoke actions to retrieve Opportunities for use in the remote table definition.

Configure third-party data integration for CSM

Configure the required components to enable the third-party data integration feature for Agent Workspace for CSM.

Before you begin
Role required: admin

Procedure

1. Identify the third-party application.
   a. Verify that it has the corresponding IntegrationHub spoke and that it is activated on your instance.
   b. Follow the setup instructions specific to the spoke.
   For example, for the Salesforce spoke, follow the instructions in the Set up Salesforce spoke topic.
2. Identify the spoke action that retrieves the desired third-party data.
   You can find the list of available actions in the spoke documentation. If an action that performs the desired task does not exist, you can create your own action by copying an existing action and modifying it to suit your needs. You can find an example of the custom spoke actions in Create Salesforce spoke actions to retrieve Opportunities for use in the remote table definition.

   Note:
   Data Stream Actions cannot be used with the remote table.
3. Create the remote table on your ServiceNow instance to expose the data from the application through the GlideRecord interface.
4. Create the remote table script definition to map the data from the third-party table to the remote table.
   a. Configure error messages if the spoke action call results in an error.
   This error is picked up by the form, list, and field elements and is displayed for the end user when an error occurs. These error messages distinguish between cases where the response from the third-party application has no data and an error while fetching data from the third-party application.
   b. Configure ACLs on the remote table to provide users and roles with read access to the third-party data.
   c. Configure ACLs to revoke CREATE, WRITE, and DELETE access on the remote table for all users.
5. Configure the lists, forms, and fields that pull data from the remote table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once the remote table is set up, you can access data using the GlideRecord interface.

a. Use Agent Workspace components to embed third-party pages and reports in iframes as popups or related items.

b. Configure UI actions on forms to create deep links to the records in the third-party application.

6. Perform some lightweight data synchronization prior to using the feature.
For example, pull in account data from a third-party application using an import set. In the example provided, the Account (customer_account) table has an Account Id column, which is populated with the Id of the account in the third-party application instance. This column is used as the foreign key to pull opportunities for the corresponding account on the third-party application instance.

Reference Salesforce integration using remote tables

In this example, the Customer Account table is extended to include an associated Salesforce Account ID which, in turn, is used to retrieve Salesforce opportunities associated with this account. The remote table is used to hold the retrieved opportunity data.

Use the steps and the examples in the following topics to create a reference Salesforce integration using remote tables.

- Using the IntegrationHub Salesforce spoke.
- Using remote tables and the Salesforce spoke. Identify or create an IntegrationHub action that you can use to test the third-party data integration. Then use this action in the remote table definition.
- Using a related list to create the connection between the customer account and the Salesforce opportunities.

Using remote tables and the Salesforce spoke

Create Salesforce spoke actions that you can use to test the third-party data integration. Then use these actions in the remote table definition.

Using the IntegrationHub Salesforce spoke

Use the Salesforce spoke to integrate a Salesforce account with your ServiceNow instance.

Before you begin

Role required: admin

Procedure

To configure the Salesforce spoke, follow the instructions in Set up the Salesforce spoke.

Related topics

Using remote tables and the Salesforce spoke

Connect Customer Account and Salesforce Opportunities using a related list

Create Salesforce spoke actions to retrieve opportunities for use in the remote table definition

The Salesforce spoke provides actions to retrieve metadata of the opportunity record and create a new opportunity.

Other than Data Stream Actions, there is no action to get a set of the opportunity records based on a given search criteria. You must create your own actions to accomplish the stated goal of the reference example. See Reference Salesforce integration using remote tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To create a new action, copy an existing action and modify it to suit your needs. For example, you can copy the **Get All Accounts** action and modify it to retrieve opportunity records.

For this example, you will create three new Salesforce spoke actions:

- Get All Opportunities
- Get Opportunities for Account Id
- Get Opportunity Details

Each action includes three steps:

1. A pre-processing script step that creates a query.
2. A REST step that executes the query.
3. A post-processing script step that evaluates the response from the query.

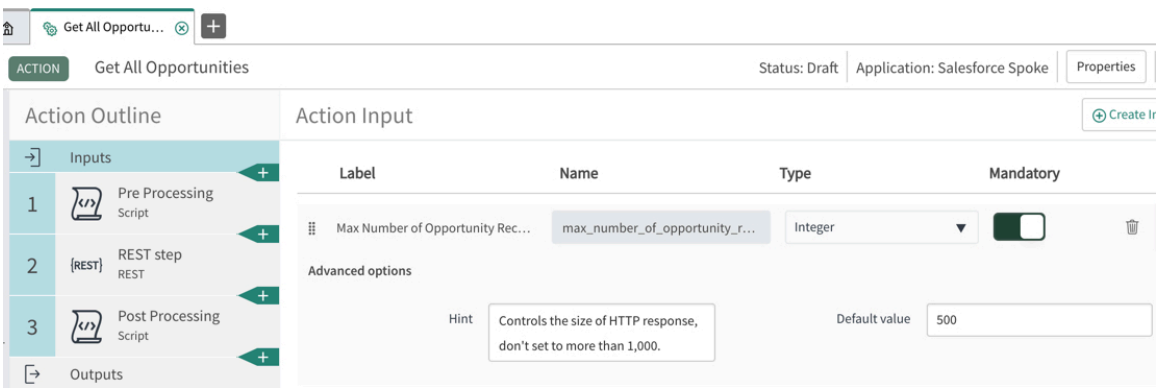
Note:
You can test all actions from the Flow Designer before you attempt to connect them to the remote table.

Get All Opportunities custom action

The **Get All Opportunities** action retrieves opportunity records from the Salesforce application. This action is invoked when you view the remote Opportunity table.

Action inputs

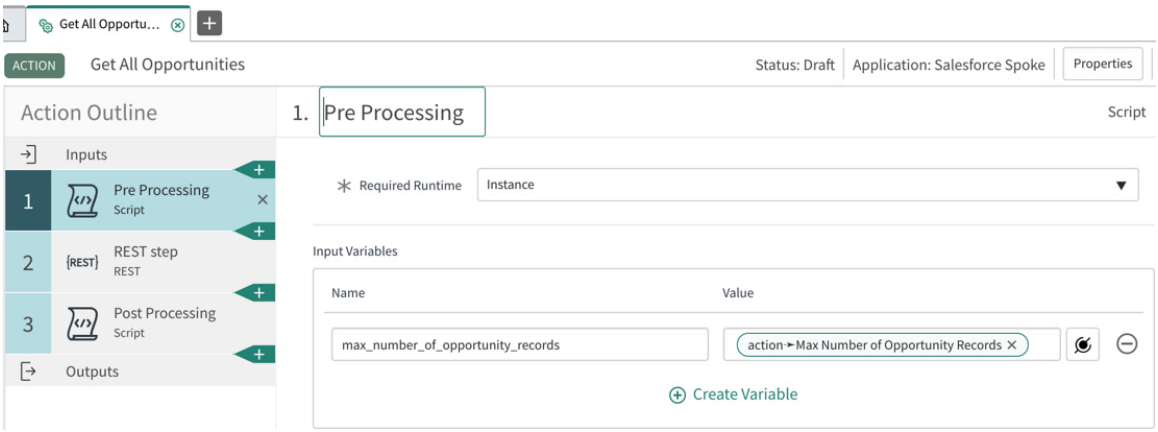
The **Get All Opportunities** action takes a single integer parameter that identifies the maximum number of records to be returned by the query. The REST-based actions can't accommodate pagination and, for this reason, it's important to limit the number of records returned from the third-party application. It isn't recommended to place more than 1,000 records in the remote table. The default number of records is 500.



Pre-processing step

The pre-processing script step takes the action input as its own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The pre-processing script creates a SELECT query for all opportunities limited by the maximum number of records allowed. This query is based on the Salesforce Object Query Language (SOQL).

```
(function execute(inputs, outputs) {

 outputs.query =
"query/?q=SELECT+Name,Id,AccountId,CloseDate,Amount," +
                "StageName,Probability,Type+FROM+Opportunity";

 outputs.query = outputs.query +
                "+LIMIT+" +
inputs.max_number_of_opportunity_records;

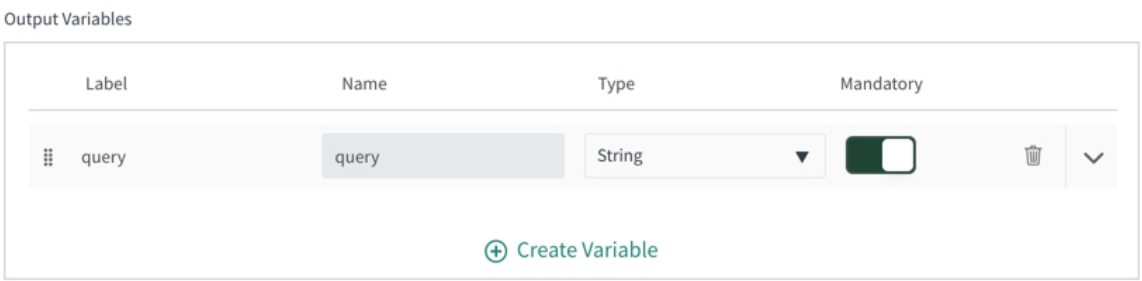
})(inputs, outputs);
```

You must specify the fields from the opportunity records that you're interested in. This example uses the following fields: Name, Id, Account Id, Close Date, Amount, Stage Name, and Probability. To see the full list of available fields, use the **Get Opportunity Fields** action.

You can also control the ordering of the query search by adding the ORDERED BY keyword and value for ASC or DESC order direction. For example, you can add the following line to the script before the line specifying the LIMIT. It makes the query return the first 500 records with the most recent Close Date.

```
outputs.query = outputs.query + "+ORDERED+BY+CloseDate+DESC";
```

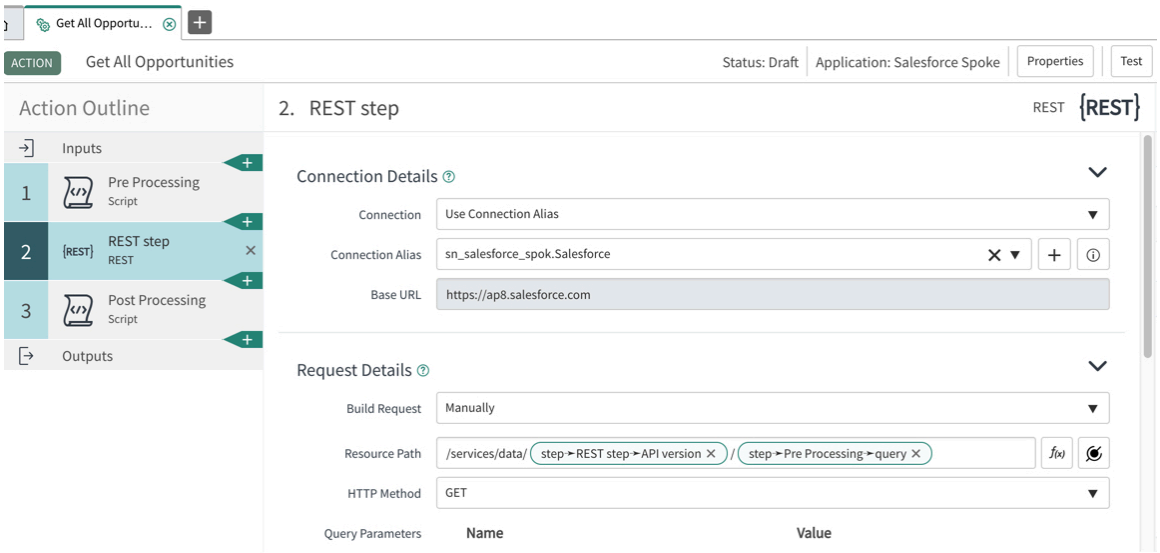
The pre-processing output is a query.



REST step

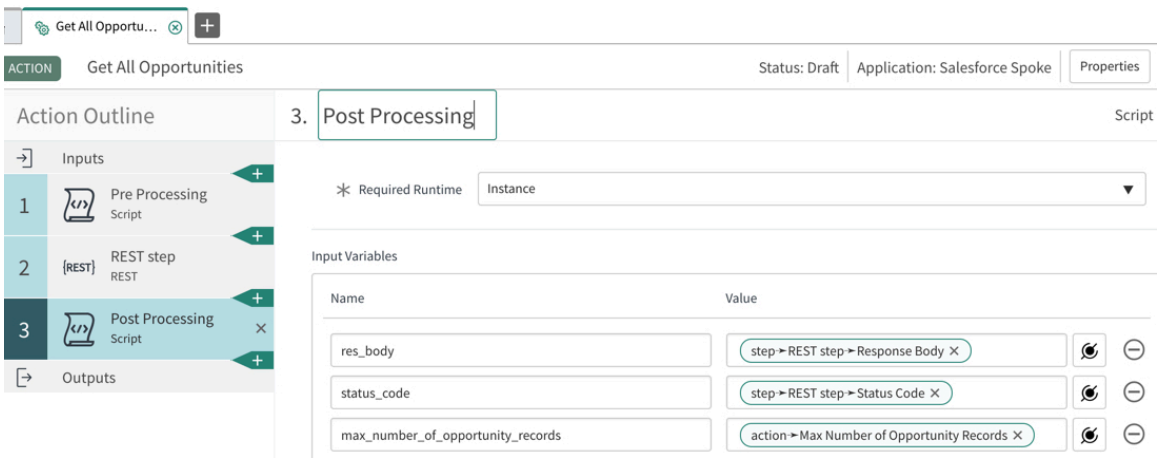
The REST step is a standard REST step from the Salesforce spoke REST-based actions. You don't need to make any changes. Make sure that it points to the correct Connection Alias.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Post-processing step

The post-processing script step takes the action input and REST step output as its inputs.



The post-processing script checks the query response for errors, sets the error message if needed, extracts opportunity data from the response body, and creates an information message to indicate that not all data was retrieved from the Salesforce due to the number of records limitation.

```
(function execute(inputs, outputs) {

  try{
    var response = JSON.parse(inputs.res_body);
  } catch(e) {
    outputs = errorHandler(inputs, outputs);
  }

  function createOutputJson(inputs, outputs) {
    try{
      outputs.records = { data: response.records };
      outputs.status = "Success";

      if ( outputs.records.data.length ==
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
          inputs.max_number_of_opportunity_records ) {
        outputs.info_message = "Opportunity retrieve operation
was " +
                                "limited to" +

inputs.max_number_of_opportunity_records +
                                " records.";
      }
    } catch(e) {
      outputs = errorHandler(inputs, outputs);
    }
    return outputs;
  }

  function errorHandler(inputs, outputs) {
    outputs.status = "Error";
    outputs.error_message = "Unknown Error. " +
                            "Please check error log for more
information";

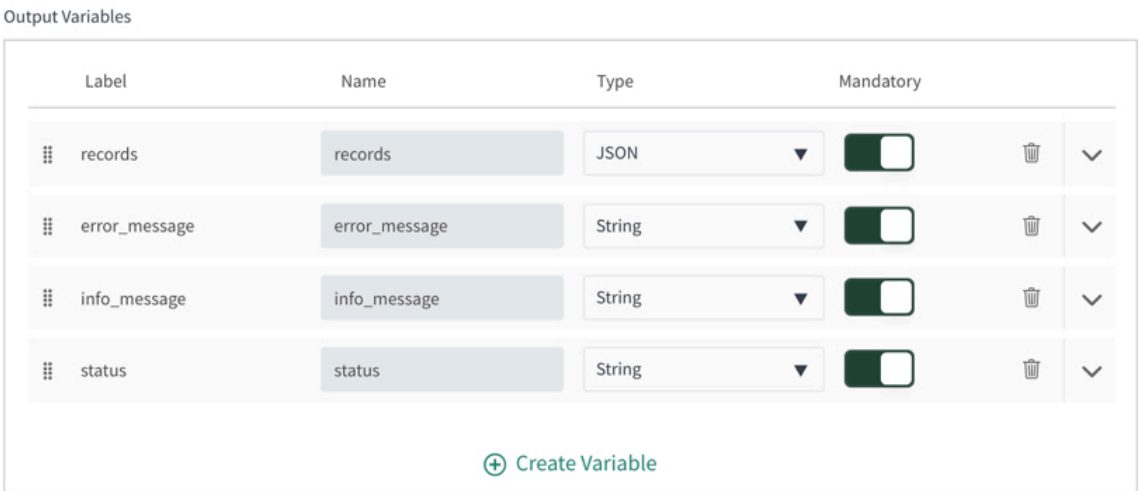
    if(inputs.res_body.contains("message"))
      outputs.error_message = response[0].message;

    return outputs;
  }

  if(inputs.status_code == "200")
    outputs = createOutputJson(inputs, outputs);
  else
    outputs = errorHandler(inputs, outputs);

})(inputs, outputs);
```

The following are outputs of the post-processing step.



Action outputs

Action outputs consist of the query status, error and information messages, and opportunity records. See the preceding screenshot for the action outputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Opportunities for Account Id custom action

The **Get Opportunities for Account Id** action retrieves opportunity records for the specific Salesforce account. This action is invoked when the agent views a Salesforce opportunity available for the customer account based on the Salesforce account associated with it.

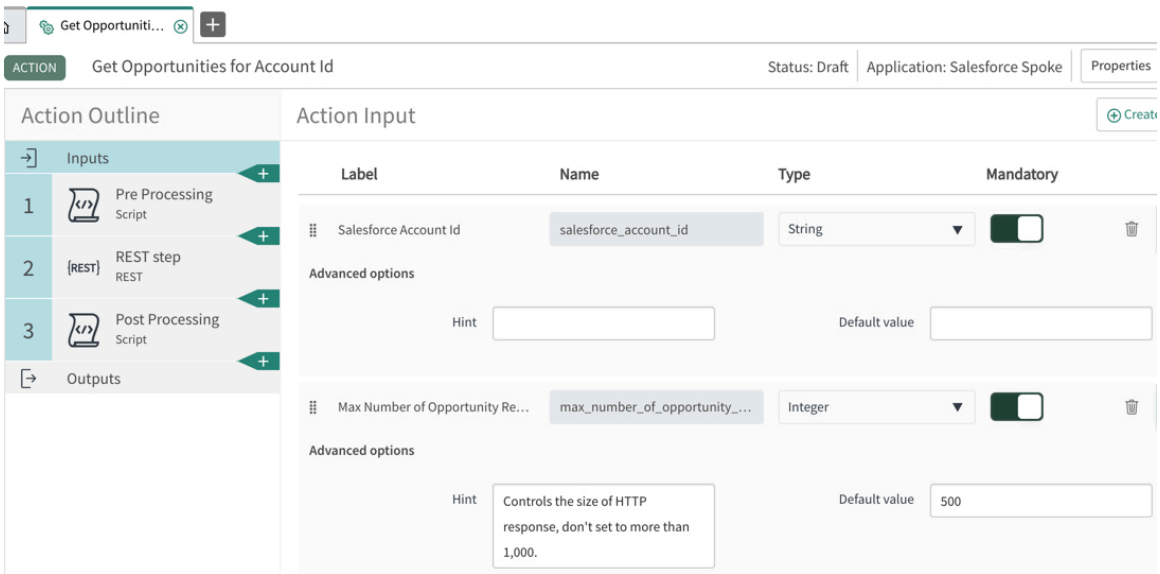
This action is similar to the **Get All Opportunities** action.

Action inputs

In addition to the maximum number of records to be returned by the query, this action also takes a Salesforce Account Id as input to be used as a query parameter. The value of this parameter is provided by the relationship that links the customer account and the Salesforce opportunity through the associated Salesforce Account Id. For more information, see Create defined related lists.

The specific relationship needed for the reference example is also described in the Using a related list to create the connection between the Customer Account and Salesforce Opportunities topic.

The Salesforce Account Id action input parameter has no default value.

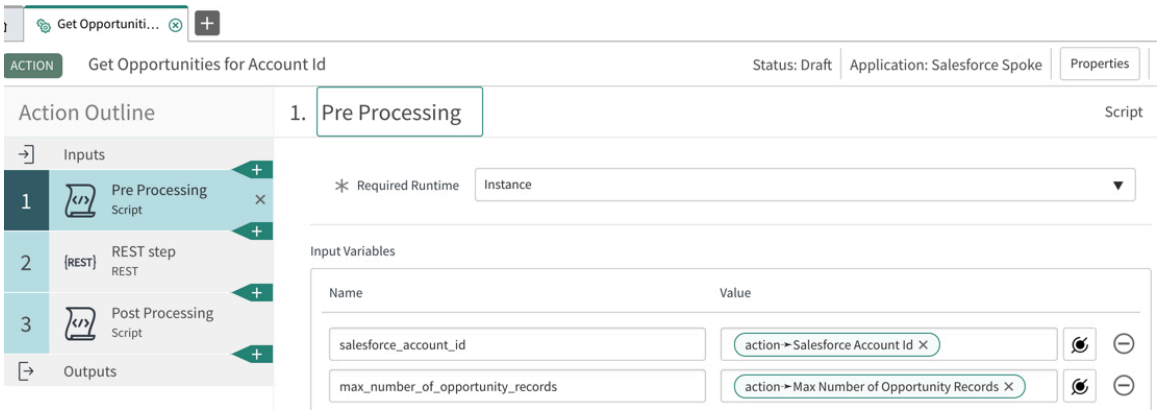


Action Outline with Inputs: Pre Processing script, REST step, Post Processing script. Action Input showing Label, Name, Type, and a toggle for Mandatory.

Pre-processing step

The pre-processing script step takes the action input as its own.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Pre-Processing step script creates a SELECT query similar to the one created for the **Get All Opportunities** action with the addition of the check against the Salesforce Account Id.

```
(function execute(inputs, outputs) {

 outputs.query =
"query/?q=SELECT+Name,Id,AccountId,CloseDate,Amount," +
                 "StageName,Probability,Type+FROM+Opportunity"
       +

                 "+WHERE+AccountId='" +
inputs.salesforce_account_id + "

                 "+LIMIT+" +
inputs.max_number_of_opportunity_records;

})(inputs, outputs);
```

The pre-processing output is a query, similar to the **Get All Opportunities** action.

REST step, post-processing step, and action outputs

These steps and outputs are the same as for the **Get All Opportunities** action.

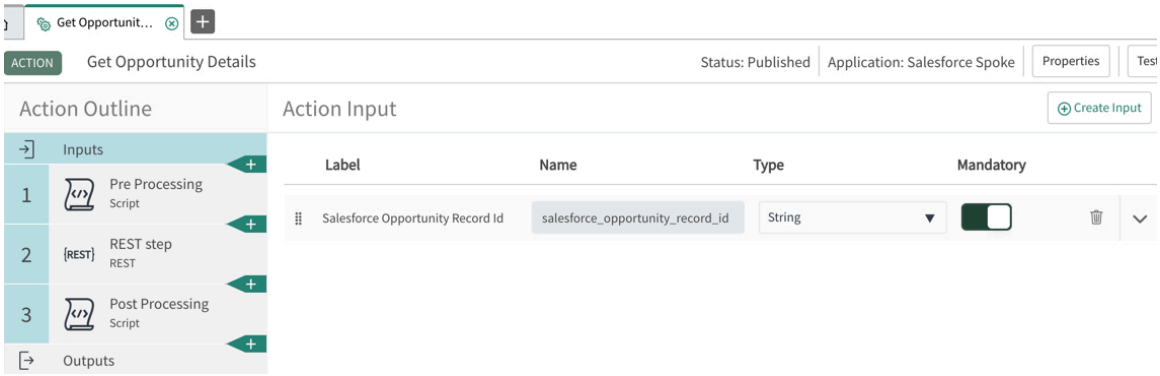
Get Opportunities Details custom action

The **Get Opportunities Details** action retrieves a single Opportunity record from the Salesforce application based on the record Id. This action is invoked when the user opens the form for the Opportunity record in the remote table.

Action inputs

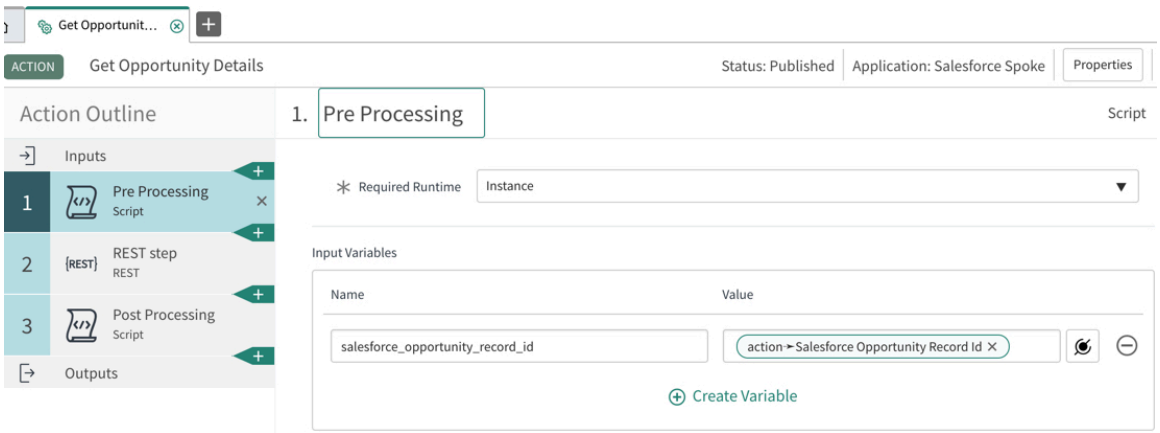
The **Get Opportunities Details** action takes a single integer parameter that identifies the Salesforce Account ID. This parameter is set by the form based on the sys_id that was provided to the remote table in the remote table script. For more information, see Example script that queries the Opportunity table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Pre-processing step

The pre-processing script step takes the action inputs as its own.



As with other actions, the pre-processing step creates an opportunity query for the specific parameter. In this case, the match is done against the opportunity record Id. Do not worry about the LIMIT in this query because it returns at maximum a single record.

```
(function execute(inputs, outputs) {

 outputs.query =
"query/?q=SELECT+Name,Id,AccountId,CloseDate,Amount," +
                "StageName,Probability,Type+FROM+Opportunity"
      +

              "+WHERE+Id='" +
inputs.salesforce_opportunity_record_id + "'";

})(inputs, outputs);
```

The pre-processing output is a query similar to the other custom actions.

REST step, post-processing step, and action outputs

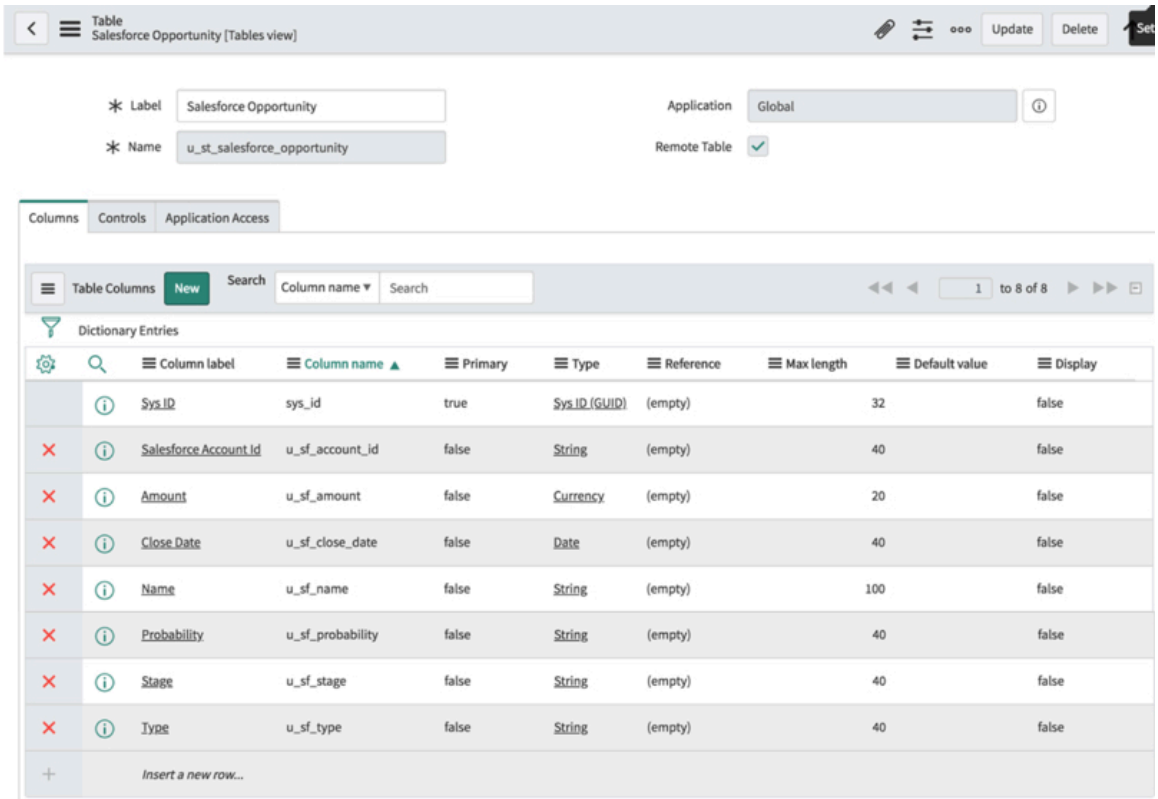
These steps and outputs are the same as for the other custom actions except there is no maximum number of records parameter and no information message.

Remote tables and definition

Once you have the spoke custom actions working, you need to create a remote table that describes the schema for the data to be retrieved from the Salesforce Opportunity table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a remote table as shown in the following example.



Create the script definition for the remote table (u_st_salesforce_opportunity), which does the following:

- Uses the spoke custom actions to pull data from the Opportunity table in the Salesforce instance.
- Maps the response from Salesforce into the remote table columns.

Example script that queries the Opportunity table

This example script queries the opportunity table using the **Get All Opportunities**, **Get Opportunities for Account Id**, and **Get Opportunity Details** custom actions.

The example script consists of three distinct parts:

1. The first part selects the correct custom action and prepares inputs for it.
2. The second part makes a call to the action.
3. The third part processes the outputs of the action.

Selecting a spoke action and preparing the inputs

In this section of the script, select one of the three custom actions that you are prepared to get opportunities from the Salesforce application:

- **Get All Opportunities**
- **Get Opportunities for Account Id**
- **Get Opportunity Details**

You can decide which action to call based on the parameters included in the `v_query` function argument.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
/****** Choose action and prepare action inputs *****/
var action = null;
var inputs = {};

// look up opportunity by salesforce record id
if (v_query.isGet()) {

  action = "get_opportunity_details";
  inputs.salesforce_opportunity_record_id = v_query.getSysId();

// look up opportunities by salesforce account id
} else if (v_query.getParameter("u_sf_account_id")) {

    if (v_query.getParameter("u_sf_account_id") == "undefined")
 {
      gs.addInfoMessage(“Opportunities cannot be retrieved
 because “ +
                        “this “Account does not have associated
 “    +
                        “Salesforce Account. Please contact
 System “ +
                         “Administrator.");
      return;

    } else {
      action = "get_opportunities_for_account_id";
      inputs.salesforce_account_id =
 v_query.getParameter("u_sf_account_id");
    }

// look up all opportunities
} else {
  action = "get_all_opportunities";
}
```

Note that this script configures an information message if the Salesforce account is undefined when it’s required by the action. The undefined value comes from the relationship that is described in Using a related list to create the connection between the Customer Account and the Salesforce Opportunities.

When the Salesforce account is undefined, there’s nothing to query for in this case and the function returns without calling the spoke action.

Calling the spoke action

In this section of the script, call the action using the names of the Salesforce spoke and the selected action and store the outputs of the call.

```
/***** Call action *****/
var outputs =
        sn_fd.FlowAPI.executeAction("sn_salesforce_spok." +
 action, inputs);
```

Processing the action output

In this section of the script, process the outputs starting with the check for errors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
/***** Process action outputs *****/
if (outputs.status != "Success") {
throw new Error(outputs.error_message);
}
```

If the query doesn't return any errors, the script must process the returned records and add them as rows into the remote table. Map the Salesforce Opportunity fields into the remote table columns.

```
var opportunities = outputs.opportunities.data;

 for (var i = 0; i < opportunities.length; i++) {
  var opportunity = opportunities[i];
  v_table.addRow({
    "u_sf_amount": opportunity.Amount,
    "u_sf_close_date": opportunity.CloseDate,
    "u_sf_name": opportunity.Name,
    "u_sf_probability": opportunity.Probability + "%",
    "u_sf_account_id": opportunity.AccountId,
    "u_sf_stage": opportunity.StageName,
    "u_sf_type": opportunity.Type,
    "sys_id": opportunity.Id,
  });
}
```

Note that the Salesforce opportunity record Id is assigned to the remote table sys_id. This verifies that lists and forms for the remote table function properly and that we are able to extract the record Id using `v_query.getSysId()` the next time that the remote table script is invoked.

Then display the information message if it was passed by the query.

```
if (outputs.info_message) {
  gs.addInfoMessage(outputs.info_message);
}
```

Putting the remote table script sections together

The three sections of the script are included in the try-catch block to provide for error handling.

```
(function executeQuery(v_table, v_query) {

  try {

    // place code here from: <Selecting a spoke action and
 preparing the inputs>

    // place code here from: <Calling the spoke action>

    // place code here from: <Processing the action output>

  } catch (error) {
    gs.addErrorMessage("Error retrieving  Salesforce
 Opportunities. " +
                       "Please contact System Administrator.");
    gs.addErrorMessage("System Error: " + error.message);
  }
```

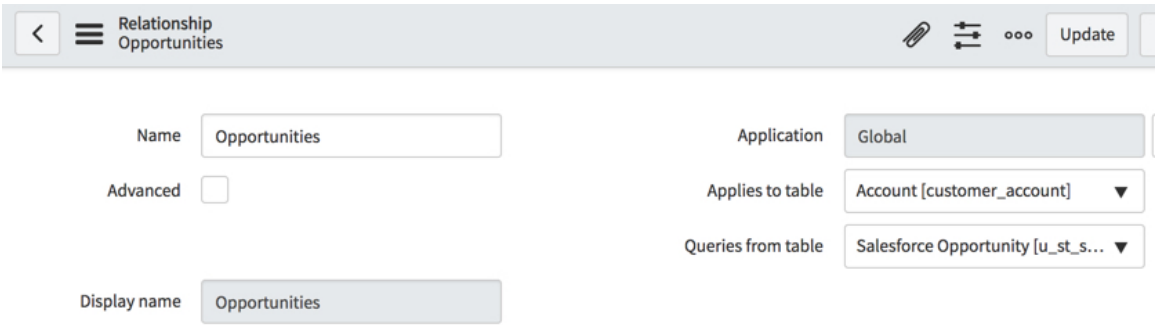
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
})(v_table, v_query);
```

Connect Customer Account and Salesforce Opportunities using a related list

Use a related list to link the Customer Account table with Salesforce Account Id, and the Salesforce Opportunity remote table with the same Account Id.

In this example, create a relationship called Opportunities. Choose the Account table in the **Applies to table** field and the remote opportunity table in the **Queries from table** field. For more information, see Create defined related lists.



Add the following code in the **Query with** field:

```
(function refineQuery(current, parent) {

  var sf_account_id = new
 String(parent.u_salesforce_account_id);

  if (sf_account_id.length == 0)
    sf_account_id = "undefined";

  current.addQuery("u_sf_account_id", sf_account_id);

})(current, parent);
```

This code checks for the presence of the Salesforce Account Id in the Account table and, if it's missing in the record, sets it to `undefined`. The code also includes a query for the Opportunity table column that holds the Salesforce Account Id for the value of this Id from the Account table. This query is invoked when the user opens the list of opportunities associated with the customer account. To see how it is used in the remote table script, see Selecting a spoke action and preparing the inputs.

Set up CSM Configurable Workspace

Set up CSM Configurable Workspace for your agents so they can engage with customers, answer questions, create cases, and resolve issues.

Complete the following tasks to set up CSM Configurable Workspace:

1. Activate the Customer Service plugin (com.sn_customerservice).
2. Set up CSM Configurable Workspace using guided setup.
3. Set up communication channels and routing.
4. Set up additional components specific to CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the plugin

Activating the Customer Service plugin (com.sn_customerservice) provides the CSM Configurable Workspace functionality. For more information, see the following topics:

- Activate Customer Service Management
- Plugins activated with Customer Service Management

Set up CSM Configurable Workspace using guided setup

You can set up CSM Configurable Workspace by using the Customer Service Management Guided Setup. To use the guided setup:

1. Navigate to **Customer Service** > **Administration** > **Guided Setup**.
2. Select **Get Started** on the Welcome page.
3. Scroll through the list of guided setup categories until you reach the CSM Configurable Workspace category.
4. Select **Get Started** in the CSM Configurable Workspace category.

   The CSM Configurable Workspace category includes one task for the Configurable Workspace Guided Setup.
5. Select **Configure** to go to the Configurable Workspace Guided Setup.
6. Select **Get Started**.

The Configurable Workspace Guided Setup includes a sequence of workspace configuration tasks.

Configurable Workspace configuration tasks

Task	Description
Branding and theming	A theme sets the visual style of a configurable workspace experience and provides a consistent look and feel across all pages. • View the brand and theme setting in your workspace experience • Working with themes in Next Experience
Tab Settings	Configure the following in the Tab Settings category: • Configure a New Record menu by adding a table that agents can select to create new records in a configurable workspace. • Select a Service Catalog for your agents to use with a configurable workspace.
Lists	Configure list categories, filtered lists, and tailor lists to show specific items by user role in a configurable workspace. • Create list categories • Create filtered lists

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configurable Workspace configuration tasks (continued)

Task	Description
Forms	Configure the way forms appear for your agents or workers in a configurable workspace. You can also configure the fields that appear on the form to be different depending on the record type and user roles. For more information, see Administering forms for Configurable Workspace.
Additional Forms Configuration	Configure templates that agents can use to pre-populate fields and UI actions to make a configurable workspace more interactive. For more information, see Administering forms for Configurable Workspace.
Search	Define search sources that your agents can query in a configurable workspace. Agents can use these keywords to search for specific records or knowledge articles. • Configuring search in Next Experience • AI search in Recommended Actions
Configurable Workspace Notifications	Determine the conditions when notifications display in a configurable workspace, such as when a record updates or a record assigns to a user.
Advanced Work Assignment (AWA)	Set up Advanced Work Assignment to automatically route tasks and interactions to the right agents.
Configurable Workspace Agent Chat	Configure Agent Chat to enable live agents to chat with customers and manage various conversation features for agents and end users. For more information, see Setting up Agent Chat.
Playbook	Playbooks display business process workflows in a simple task-oriented view. These step-by-step procedures guide users through workflows that address commonly encountered situations. For more information, see Building Playbooks.

Configuring workspace pages in UI Builder

You can use UI Builder to configure the pages and components that display information in CSM Configurable Workspace including the following:

- Landing pages
- Record pages
- Customer Central – Customer Information tab

For more information, see the Manage UI Builder pages and page variants topic in the UI Builder documentation.

Set up communication channels and routing

Enable agents to chat with customers or to receive and place customer calls. You can also set up routing that automatically directs chats to the appropriate agents. For more information, see Setting up Agent Chat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up additional CSM Configurable Workspace components

Complete these tasks to set up the components that are specific to CSM Configurable Workspace.

Additional CSM Configurable Workspace configuration tasks

Task	Description
Create or modify a landing page	The landing page is an agent's initial view of the workspace. The **CSM Landing Page** is included with the Customer Service plugin. You can modify this landing page or you can create and modify a page variant in UI Builder.
Set up a ribbon configuration in CSM Configurable Workspace	The form ribbon includes components that display information about a record. You can add the Customer 360, Timeline, and SLA components to the Case form ribbon. You can also configure attributes for the Customer 360 and Timeline components.
Set up a form header in CSM Configurable Workspace	Configure form headers that provide a quick summary of case, account, or contact information.
Set up a highlighted value in a form header in CSM Configurable Workspace	Configure fields that appear as highlighted values in form headers in CSM Configurable Workspace.
Set up a form action in CSM Configurable Workspace	Create form actions that link to UI actions so that you can use the UI actions in CSM Configurable Workspace.
Display the form ribbon and form header secondary values in the Contextual side panel	Configure the form ribbon and the secondary values that appear in a form header to display in the Contextual side panel in CSM Configurable Workspace.
Display field values as interaction record tab titles	Display field values, such as contact or consumer names, as titles on interaction record tabs in CSM Configurable Workspace.
Enable the Create Case UI action for case type selection	Enable the **Create Case** UI action for case type selection for one or more selected tables.
Configure tabs in the contextual side panel	Use the *`inlineTabExclusion`* UX page property to prevent tabs from appearing in the configurable side panel in CSM Configurable Workspace.
Configure service catalogs for CSM workspaces	Customer service agents use service catalogs to fulfill catalog item requests. You can configure the Service Workspace Portal to use the catalogs that contain the desired items.

CSM Configurable Workspace record pages

A record page provides the base structure for how a record is displayed in CSM Configurable Workspace. This includes records such as cases, incidents, and tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record page overview

Record pages include elements such as layouts, containers, and components to display record information. Some record pages, including the **CSM default record page** and **CSM Interaction record page**, leverage additional logic using presets, controllers, and extension points. Pages with preset and controller logic benefit from reusability because they automatically inherit styling, events, and data binding. This reusability makes simplifies configuration and makes the pages upgrade friendly.

Several record pages are included with CSM Configurable Workspace. You can use these record pages as is or you can customize them to suit your needs. For more information about customizing record pages, see Manage UI Builder pages and page variants.

Each record page has an order value. The system uses the pages with the lowest order values as the default record pages. When the system displays information in CSM Configurable Workspace, such as interaction and case records, it uses the elements in the default pages to determine the page appearance.

Available record pages

Several record pages are included with CSM Configurable Workspace.

CSM Configurable Workspace record pages

Page	Description
CSM default record page	This page builds on the Record default page and includes specific features for case management. **Note:** Use this page to display generative AI elements and functionality available with Now Assist for Customer Service Management (CSM).
CSM Interaction record page	This page builds on the interaction record page and includes CSM-specific features for interaction management. **Note:** Use this page to display generative AI elements and functionality available with Now Assist for Customer Service Management (CSM).
Front-line case page	This page is designed for front-line agents. It provides a simplified case view that enables agents to quickly gather context, categorize cases, and provide prompt responses to customers.
CSM voice interaction record page	This page provides a component that customers can use for integration with Contact Center as a Service (CCaaS) providers and

CSM Configurable Workspace record pages (continued)

Page	Description
	an interface that agents can use to handle customer phone calls.
Record default	This page provides the basic structure for a record page, including record information, a communication interface, and suggestions for issue resolution. This page is also known as the standard record page. **Note:** The Record default page is no longer supported with patches and fixes.
Interaction record page	This page provides the basic structure for an interaction record, including interaction information and related search results. **Note:** The Interaction record page is no longer supported with patches and fixes.

Record page elements

Record pages are made up of different elements that determine how record information is displayed in CSM Configurable Workspace.

Record page elements

Element	Description
Layouts	The metadata that determines how components are positioned on a page and what CSS rules apply. Layouts enable you to create useful and visually appealing pages.
Containers	Hold one or more components on a page.
Components	Components are the building blocks that you use to create pages. End users, such as agents, use components to view and interact with data. Commonly used components include Heading, Image, List, Form, and Button. For more information about components and component configuration, see the ServiceNow® Developer site.
Presets	A preset is a set of instructions that define configuration values for a specific component. A preset also specifies how a component connects to a controller. Using presets can simplify component configuration and enable you to avoid manual data binding.
Controllers	A controller combines the complex business logic, including data brokers, state parameters, scripting, and event

Record page elements (continued)

Element	Description
	management, into a single entity. Presets use the data in a controller to auto-configure a component.
Extension points	An extension point enables subpages, such as viewports and page collections, to inherit controllers from the parent page. Extension points also improve the ability to upgrade.

Default record pages

Each record page has an order number and the page with the lowest order number is the default page. When the system displays a record in CSM Configurable Workspace, it uses this default page to display the record information.

New Z-boot customers see the following pages by default:

- CSM default record page
- CSM Interaction record page

Upgrade customers retain their custom record pages. However, the following pages are no longer supported with patches and fixes:

- Record default
- Interaction record page

For more information about setting the default record pages, see Set record page order.

Front-line case page

The Front-line case page provides a simplified case view that enables front-line agents to quickly gather context, categorize cases, and provide prompt responses to customers.

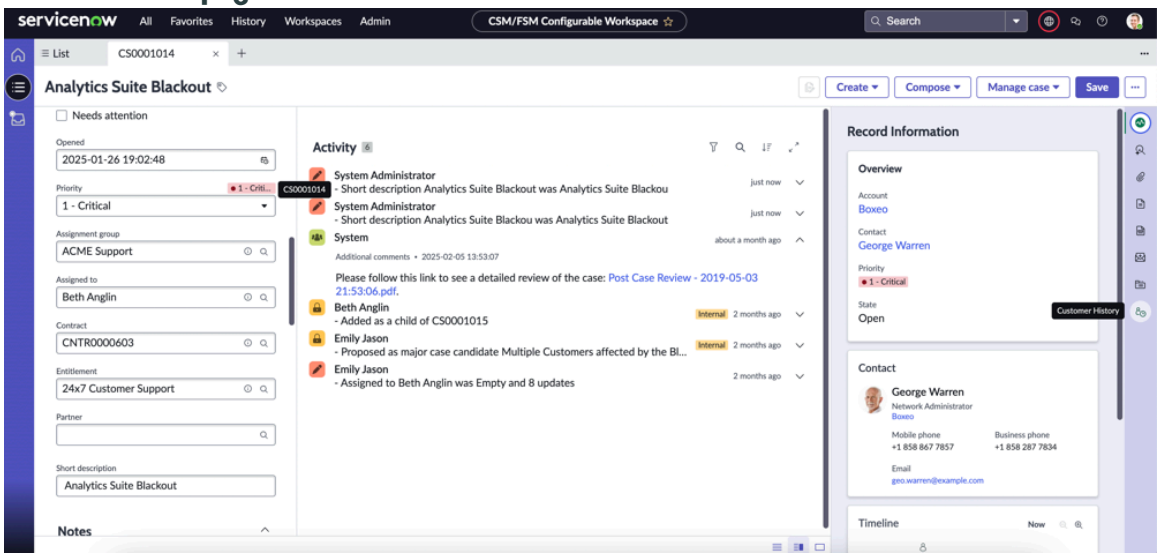
The Front-line case page focuses on the essential functionality that front-line or tier 1 agents need:

- Looking up and verifying customer information
- Scanning the activity stream
- Viewing related information
- Searching for knowledge articles

The Front-line case page is included with the CSM Configurable Workspace application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Front-line case page



Front-line case page variant

The Front-line case page variant is included with the CSM Configurable Workspace application. This variant includes the following settings.

Front-line case page variant settings

Setting	Description
Active	Enabling the **Active** check box makes the page variant available to the selected audience. The Front-line case page variant is active for new and upgrade customers. The active setting combined with the page order determines the page that CSM Configurable Workspace uses to display record information. For more information, see Set record page order.
Order	Each record page has an order which indicates the page priority. The lower the number, the higher the priority. The default order for the Front-line case page variant is 1000.
Conditions	Conditions determine when a page variant is displayed. The Front-line case page has the following condition: **table=sn_customerservice_case** This condition limits the use of the Front-line case page variant to records from the Case [sn_customerservice_case] table and tables that extend the Case table.
Audience	The audience determines who can see the page variant. The Front-line case page has the following audience: **CSM - Front-line Agent** This audience includes the sn_cwf_wrkspc.frontline_agent role. For more information, see Learn about audiences.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access the settings for this page variant:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the Record section of the Pages and variants list, select **Front-line case page**.
4. Select **Settings** at the top of the page.

Roles

The CSM Configurable Workspace application includes the following role: Front-line agent role (sn_cwf_wrkspc.frontline_agent). Agents with this role have access to the Front-line case page in CSM Configurable Workspace.

The Front-line case page variant includes the CSM - Front-line Agent audience, which includes the sn_cwf_wrkspc.frontline_agent role.

Note:
To make the Front-line case the default page, the system administrator can set the page to active and set it to the lowest page order.

Front-line case page components

The Front-line case page includes the following components.

Component	Description
Form heading	The form heading displays the case short description and also includes the action bar and record tags.
Record tags	Agents can create multiple tags for a record and then use the tags to group and organize records. For more information, see Group and find records using tags in workspace.
Action bar	The action bar contains the actions available to users while working on case records. The specific actions are determined by factors such as the user role, case state, and other attributes. • **In-progress Actions**: Provides a list of minimized modeless dialogs and includes a badge that displays the number of items in the list. From this list, an agent can select an item to open the minimized comment, work note, or email. • **Create**: Create records such as work orders, incidents, and requests. • **Compose**: Compose comments, work notes, and emails in modeless dialogs. • **Manage case**: Perform case management actions such as accepting a case or requesting information. • **Save**: Save changes to the case record. • **More Actions**: Perform additional actions such as proposing a major case or reporting a knowledge gap.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
Contact lookup	Agents can use the contact lookup component to do the following: • Search for a contact. • Link or unlink a contact. • Edit and save a linked contact record. • Select a reference field on a lookup card, such as a contact name, to open the reference in a sub-tab. • Select an email address on a lookup card to open a draft email in the email composer in a sub-tab. • Select a phone number on a lookup card to make a call. The contact lookup component displays information in record cards. These cards display contact information and provide quick access to details such name, email, and phone. For more information, see the Contact and consumer lookup components section below.
Consumer lookup	Agents can use the consumer lookup component to do the following: • Search for a consumer. • Link or unlink a consumer. • Edit and save a linked consumer record. • Select a reference field on a lookup card, such as a consumer name, to open the reference in a sub-tab. • Select an email address on a lookup card to open a draft email in the email composer in a sub-tab. • Select a phone number on a lookup card to make a call. The consumer lookup component displays information in record cards. These cards display consumer information and provide quick access to details such name, email, and phone. For more information, see the Contact and consumer lookup components section below.
Case details	The case details component includes collapsible sections for: • Case • Notes • Closure Information • Related Records This component also includes a menu with additional form actions, such as personalizing the form, exporting data, and copying the URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
Case summarization	The case summarization component appears above the activity stream. When an agent opens a case record, the component is collapsed and in the default state. Agents can use this component to do the following: • Summarize case details. • Post the summary to the activity stream. • Refresh the summary. The case summarization component requires the Now Assist for Customer Service Management (CSM) application to be activated and configured. For more information, see the Case summarization component section below.
Activity stream	The activity stream component displays a list of activities occurring on a case record. This list can be collapsed to provide a quick view of case activities or expanded to provide more detail about individual activities. For more information, see the Activity stream component section below. **Note:** The Front-line case page uses modeless dialogs for composing comments, work notes, and emails.
Contextual side panel	The contextual side panel component includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the Front-line case page includes the following tabs. • Record information • Recommended Actions search • Attachments • Form Templates • Response Templates • Email Templates • Related Lists For more information, see the following sections: • Contextual side panel component • Related lists component

Action bar component

The Front-line case page supports actions from the following Customer Service Management and CSM Configurable workspace plugins:

- Customer Service (com.sn_customerservice)
- CSM/FSM Configurable WS Foundation (com.snc.uib.cwf_workspace)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CSM Configurable Workspace (com.snc.uib.csm_agent_workspace)
- CSM Workspace (com.snc.agent_workspace.csm)
- Major Issue Management (com.sn_majorissue_mgt)
- Customer Service with Service Management (com.sn_cs_sm)
- Customer Service with Request Management plugin (com.sn_cs_sm_request)
- Time Recording for Customer Service (com.snc.csm_time_recording)
- Omni-Experience Standard Feature Set

If you are using any additional plugins, you must add the actions from those plugins to the Front-line case page action bar. For more information, see Configure the Front-line case page action bar.

Contact and consumer lookup components

The contact and consumer lookup components enable users to do the following:

- Look up a contact or consumer by name, phone number, or email address. As you type characters in the search box, matching information appears in record cards below the search box.
- Select a contact or consumer after searching by selecting the desired record card. The selected record card replaces the lookup component.

User roles determine which lookup component appears on the Front-line case page.

- Front-line case agents can see the Contact lookup component.
- Consumer agents with the Front-line case agent role can see the Consumer lookup component.
- Some users, such as managers, can have both B2B (account and contact) and B2C (consumer) roles. When a user has both roles, they can see both the Contact and Consumer lookup components.

When using the Contact lookup component to look up and select a contact, the system hides the Consumer lookup component. When using the Consumer lookup component to look up and select a consumer, the system hides the Contact lookup component.

When using the Contact component, the system displays the contacts for the selected account. If the agent selects a different contact, the system updates the account.

After selecting a contact or consumer, users can perform the following actions from the contact or consumer record card:

- Remove a linked contact or consumer from a case record by selecting the more actions icon and then selecting **Unlink**.
- Edit and save a linked contact or consumer record by selecting the pencil icon, editing the information for the contact, and selecting **Save**.
- Select a reference field on a lookup card to open the referenced record in a subtab.
- Select an email address on a lookup card to open to open the email composer in a subtab.
- Select a phone number on a lookup card to make a phone call.
- Collapse the card to display more record content. When collapsed, users can see a link to the contact or consumer name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Contact and Consumer lookup components include advanced search capabilities that enable agents to perform a type-ahead search across multiple tables and fields. This includes the following types of matching:

- Exact match: phone number and record number
- Starts with match: name and email address

Case summarization component

The case summarization component provides agents with a summary of a customer service case, including the issue and the actions taken. Agents can generate summaries to understand case context and post summaries to the case work notes.

The case summarization component appears above the activity stream on the Front-line case page variant. Upon first opening a case, the component is collapsed and in the default state.

Using this component, agents can:

- Select **Summarize** to create a summary of the case details.
- Select **Share to work notes** to copy the summary text to the activity stream.
  - Review the summary text in the Share to work notes pop-up window and modify the text as needed.
  - Select **Save to work notes** on the pop-up window to add the text to the activity stream.
- Select the refresh icon in the component footer to refresh the text and get the latest summary.

Note:
If the case does not contain enough text to summarize, the system displays the following message: "This case doesn't have the minimum number of words required for summarization yet."

To use the case summarization component with the Front-line case page, activate the Now Assist for Customer Service Management (CSM) application and configure the case summarization skill in the Now Assist Admin console. For more information, see:

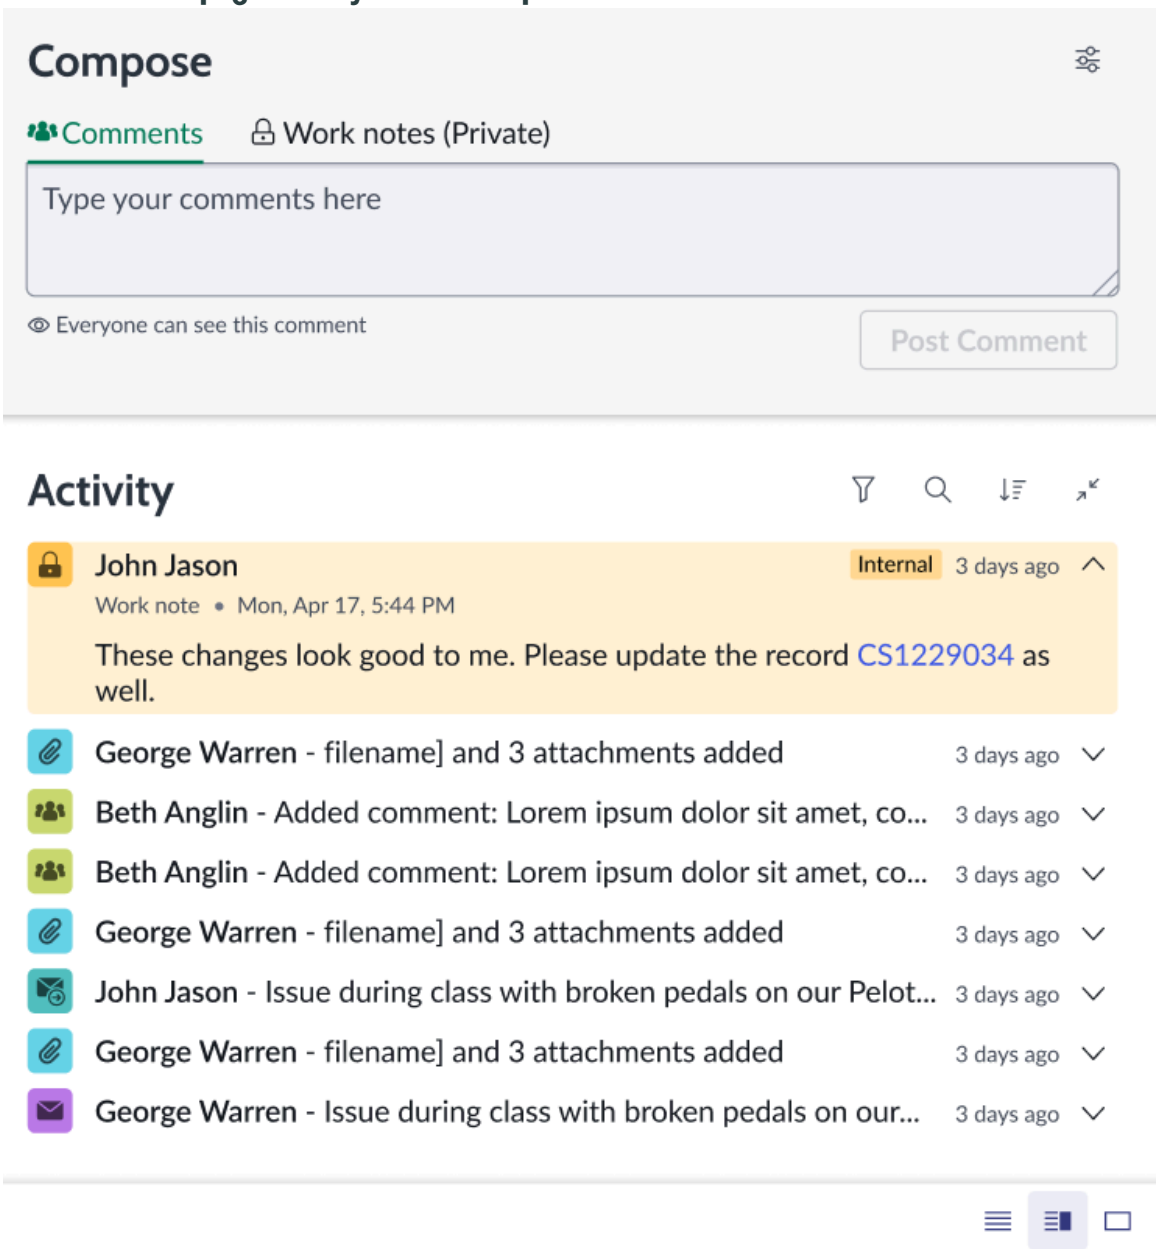
- Activate Now Assist for Customer Service Management (CSM)
- Configure the case summarization skill in the Now Assist Admin console.

Activity stream component

The activity stream component displays a list of the activities occurring on a case record. The activities in the list can be collapsed or expanded. When collapsed, the agent can quickly scan the list to get an overview of case activities. When expanded, the agent can see detailed information on individual activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Front-line case page activity stream component



The activities in the activity stream are represented by tiles that use icons and colors to indicate the activity type.

- Comment
- Work note
- Attachment
- Field change
- Email sent or email received
- Chat discussion
- Custom icon

When collapsed, each activity in the list includes:

- A tile that represents the activity type.
- The name of the user responsible for the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A brief one-line summary of the activity.
- A badge that indicates if an activity is internal or external.
- A relative timestamp.
- An expand button that the agent can use to see a detailed summary of the activity.

When expanded, each activity also includes:

- A full date and time stamp.
- An action label that describes the type of activity.
- For comments and work notes, the full text of the comment or work note.
- For field updates, the field name and the updated field value.
- For emails, detailed message information.
- For attachments, a small preview of the attached file.
- For chats, a sidebar chat card.

The activity stream uses Modeless dialogs for composing comments, work notes, and emails.

Contextual side panel component

The Front-line case page includes the contextual side panel component, which provides agents with the following functionality.

Front-line case page tabs in the contextual side panel

Tab	Description
Record Information	The Record Information tab includes the following cards: • **Overview**: Displays relevant information about the case including the account and contact, the case priority, and the state. • **Active SLA**: Displays active SLAs for the case, including time remaining, the SLA state, and any breaches. The cards that appear in the Record Information tab can be configured in the **Front-line Case Page Ribbon Config** ribbon configuration. For more information, see Set up a ribbon configuration in CSM Configurable Workspace.
Recommended Actions	The Recommended Actions tab includes AI search functionality. Agents can use AI search to find relevant resources or resolutions for customer issues. The search feature displays an initial set of search results based on the text in the case short description. This initial set of results includes knowledge articles. Agents can also enter different search keywords and repeat the search. From the list of search results, agents can do the following: • Select a source to see search results of that type. • Filter the list of search results. • Sort the list of search results.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Front-line case page tabs in the contextual side panel (continued)

Tab	Description

	• Open the search results in full view in a record sub-tab.
	• Take the following actions:
	  ○ View and attach article
	  ○ Perform other actions such as reading articles in full view, flagging articles, or marking articles as helpful or unhelpful.
	• View successful actions by selecting the Actions history icon.
	
	For more information, see Use AI search in Recommended Actions to resolve cases.
	
	Note: Using Recommended Actions in the contextual side panel requires the Recommended Actions application (sn_cs_nb_action) which is included with the CSM Configurable Workspace application.

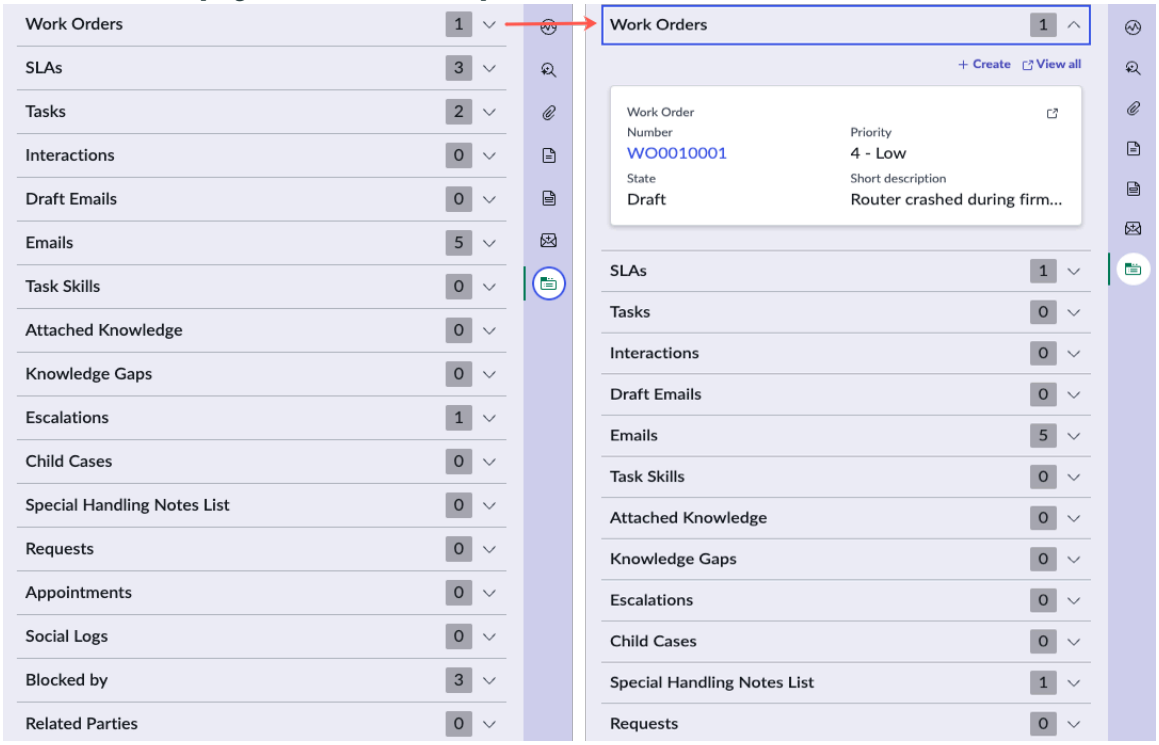
Attachments	The Attachments tab provides access to case-related attachments. From this tab, agents can view and download attachments.
Templates	The Templates tab provides access to available form templates which enable agents to automatically populate fields on new records. Agents can manually apply a template when creating a new record such as an incident or change.
Response Templates	The Response Templates tab provides access to available response templates. These templates contain reusable messages that agents can copy to provide quick and consistent messages to customers.
Email Templates	The Email Templates tab provides access to available email templates. These templates contain default values for fields that agents can add to email messages. These default values can include the recipients (email addresses in the To, Cc, and Bcc fields), the sender, the subject of the email, and text to include in the message body.
Related Lists	The Related Lists tab provides access the case-related lists. The Front-line case page incorporates related list functionality into the contextual side panel. These lists appear in an accordion format that agents can expand and collapse as needed. An indicator displays the number of records available in a related list. When expanded, the records in a related list are displayed in card format. For more information, see the Related lists component section below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related lists component

The related lists component provides access to the case related lists. This component uses an expandable accordion format. Agents can expand the desired lists to see the related items. This component also displays an icon with the number of items in a list.

Front-line case page related lists component



Related lists include the following actions:

- **Create**: Opens a blank record in a sub tab that the agent can use to create a new item.
- **View all**: Opens a list of records in a sub tab.
- **Show more**: is displayed for lists that have more than five items.

The items in an expanded list are displayed as cards. An expanded list shows one card for each item in the list.

- Agents can open an item in a sub-tab.
- If a list has more than five items, it includes a **Show more** option.

Customer History component

The Customer History component displays customer, consumer, or account history information, depending on the field selections on the interaction record. This component displays the information previously displayed in the Customer Activity tab. For more information, see Customer History component in the Customer Central documentation.

Record presence feature

The Front-line case page includes the record presence feature. This feature allows agents to see other users who are viewing the same record and enables easy collaboration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The user presence component displays an icon in the form header that shows the user who is currently viewing the record. For three or more users, the component displays two icons plus a number that represents additional users.

- Hover over an icon to see more information about a user.
- Select the number icon to see more information about the additional users.

For more information about this feature, see User presence.

Requesting information from customers

The Front-line case page includes a **Request Info** UI action that agents can use to request information from customers. This action provides agents with the option to send a comment to the customer when requesting information.

Note:
The **Request Info** UI action is available to users with the sn_cwf_wrkspc.frontline_agent role and for cases in the Open state.

The **Request Info** UI action on the Front-line case page behaves differently than the same action on the CSM default record page. On the Front-line case page, this action moves a case to the Awaiting Info state but does not require the agent to add a comment.

To request information:

1. Select **Manage Case** in the action bar.
2. Select **Request Info**.

The system sets the case **State** field to Awaiting Info and displays the following message to the agent: *Send a comment to request info if you haven't already. The case is awaiting info.*

If the agent has not sent a comment, they can select **Compose** > **Compose Comments** and use the Compose Activity modeless dialog to create and post a comment.

If the agent has already composed a comment and then selects **Request Info**, the system saves the record and automatically posts the comment to the activity stream.

Attaching and sharing knowledge articles

Agents can share articles with customers by using the **Attach and share article** knowledge guidance. This guidance recommends relevant knowledge articles to customer service agents and enables them to share the selected articles with customers in comments, work notes, or emails.

From the Recommendations tab in the contextual side panel, agents can use modeless dialogs to do the following:

- Attach and add a link to a comment.
- Attach and add a link to an email.
- Add a link to a work note.

Selecting these actions displays the comment, work note, or email modeless dialog. Once the guidance is executed, it is marked as Complete. After an action is completed, an entry is posted in the case record activity stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To display the knowledge article links that are added to the modeless dialogs with the **Attach and share article** guidance, the system administrator needs to manually enable the rich text editor:

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *glide.ui.journal.use_html* system property.
3. Set the **Value** to true.

When the *glide.ui.journal.use_html* is set to true, the Rich Text Editor is enabled by default for comments and work notes in the Activity Stream. A **Rich Text Editor** toggle appears in the upper-right corner of the message box, allowing users to switch between rich text and plain text as needed.

The editor provides options such as bold, italics, lists, hyperlinks, and text alignment to help create structured, readable content. This setting does not affect email composition, which is managed
separately via *sys_email_client_confguration*. The rich text editor and formatting options are available by default in email messages, but the toggle does not appear.

For more information about the knowledge guidance, see Attach and share article guidance.

Modeless dialogs

Modeless dialogs are windows that overlay the main window content. Modeless dialogs enable for creating and posting comments and work notes to the activity stream, as well as composing and sending emails.

A modeless dialog is a window that appears in a workspace as an overlay on top of the main window content. This overlay enables users to interact with the window content and the overlay content at the same time. Agents can use modeless dialogs to do the following:

- Create comments and work notes to post to the activity stream.
- Create and send emails and reply to or forward emails.

After opening a modeless dialog, agents can move it around the screen and put it where they need it. This feature enables agents to reference information from the main window while drafting text in the overlay window.

The Front-line case page includes the following modeless dialogs:

- Compose Activity - for creating and posting comments and work notes
- Compose Email - for creating and sending emails

Create comments and work notes

Agents can use the Compose Activity modeless dialog to create comments and work notes and post them to the activity stream. See the following table for more information about creating these activities.

Note:
This feature is available with the Front-line case page in CSM Configurable Workspace.

Using the Compose Activity modeless dialog to create comments and work notes

Task	Description
Create a comment or work note	To create a comment or a work note:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Activity modeless dialog to create comments and work notes (continued)

Task	Description
	1. Select one of the following actions from the action bar to open a Compose window: ○ **Compose** > **Compose Comments** ○ **Compose** > **Compose Work notes (Private)** 2. Add the text to the Compose window. When creating comments and work notes: • Agents can create one draft comment and one draft work note at a time before posting the text to the activity stream. • Agents can open one Compose window at a time. If an agent opens a second window, the previously opened window is minimized.
Post a comment or work note to the activity stream	To post a comment or work note, select one of the following actions from the Compose window: • **Post Comment** • **Post Work Notes (Private)** The Compose window automatically closes after the text is posted to the activity stream. Saving the case record also posts the comment or work note to the activity stream and closes the Compose window.
Minimize a Compose window	Composed windows can be minimized and moved to the In-process Actions menu in the action bar. Minimized comments and work notes appear in a list in the In-process Actions menu. Compose windows can be minimized in the following ways. • Select the Minimize button in the Compose window header. • One Compose window can be open at a time. If an agent opens another Compose window, the first window is minimized.
Open a minimized Compose window	Select the In-progress Actions menu in the action bar and then select an item from the list to open the window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Activity modeless dialog to create comments and work notes (continued)

Task	Description
	Items in the In-process Actions menu appear in a list with the action type (email, comment, or work note) and an abbreviated title. • For email, the title is the email subject. • For comments and work notes, the title is the first line of text.
Discard a comment or work note	To discard a comment or work note: 1. Select the Close button in the Compose window header. 2. Confirm the Discard action by selecting **Discard** in the confirmation pop-up window. The system closes the Compose window and discards the comment or work note.

The following guidelines apply to Compose windows:

- Draft comments and work notes are local to the browser. If the browser page is reloaded, they are cleared.
- Comments and work notes stay synchronized on the form and in the modeless dialogs.
- The Compose window can be resized.

Create emails

Agents can use the Compose Email modeless dialog to create and save email drafts and to send emails. This feature increases the speed of drafting emails while referencing record information.

Emails that are sent from a Compose Email window are posted to the activity stream. Agents can reply to and forward emails from the activity stream. See the following table for more information about creating and sending emails.

Note:
This feature is available with the Front-line case page in CSM Configurable Workspace.

Using the Compose Email modeless dialog to create and send emails

Task	Description
Create and send an email	To create and send an email: 1. Select **Compose** > **Compose Email** from the action bar to open a Compose Email window. 2. Fill out the fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
	a. To, Cc, Bcc **b.** Subject **c.** Email body **3.** Select **Send email**. When creating emails and sending emails: • The Compose Email window automatically closes after the email is sent. • The email is posted to the activity stream.
Reply to or forward an email	To reply to or forward an email: **1.** Expand an email in the activity stream. **2.** Select one of the following buttons to open the Compose Email window: ○ **Reply** ○ **Reply all** ○ **Forward** **3.** Add the desired text. **4.** Select **Send email**. The Compose Email window automatically closes after the email is posted to the activity stream.
Add a link to a knowledge article	To add a link to a knowledge article: **1.** Select the Agent Assist tab in the contextual side panel. **2.** View the list of knowledge articles or search for an article. **3.** Select the More Actions menu on the knowledge article card. **4.** Select **Add link in email**. The system adds the title of the article with a link in the body of the email.
Apply a template to an email	To apply a template to an email: **1.** Select the Apply templates icon ( ) in the Compose email modeless dialog footer to display a list of available templates. The Template preview modal displays the available email templates. It does

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
	not display quick messages or response templates. 2. Select a template from the list. You can also search for a specific template. The system adds the contents of the template to the body of the email. **Note:** If no templates are available, the icon does not appear in the footer.
Minimize a Compose Email window	Minimized emails appear in a list in the In-process Actions menu in the action bar. Select the Minimize icon ( ) in the Compose Email window header to move the email draft to the In-progress Actions menu.
Open a minimized Compose Email window	Select an item from the In-progress Actions menu to open the Compose Email window. Items in the In-process Actions menu appear in a list with the action type (email, comment, or work note) and an abbreviated title. • For email, the title is the email subject. • For comments and work notes, the title is the first line of text.
Maximize a Compose Email window	Select the Maximize icon ( ) in the Compose Email window header to expand the Compose Email window to the full screen. Select the Maximize icon again to exit the Maximize mode.
Open a draft email in a subtab	Select the Pop out icon ( ) in the Compose Email window header to open the draft email in a subtab. The Compose Email window closes when the email opens in the subtab.
Close a Compose Email window	Select the Close icon ( ) in the Compose Email window header. The system saves the text as a draft email and closes the Compose Email window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
View a list of draft emails	Select the View drafts icon ( ) in the Compose Email window footer. Selecting this icon displays a list that includes the most recent email drafts. The list also includes the following actions: • **Manage drafts**: Displays the Manage drafts pop-up window. From this window, you can view a list of all draft emails. You can also delete email drafts from this window. • **Create new email**: Creates a new email in the Compose email window.
Select an email draft	Select the View drafts icon ( ) in the Compose Email window footer. Selecting this icon displays a list that includes the most recent email drafts. You can select a recent draft from this list. To view a list of all email drafts: 1. Select the View drafts icon and then select **Manage drafts**. 2. Select a draft from the list in the Manage drafts pop-up window. The system saves the current draft email and opens the selected draft email in the Compose Email window.
Select an email draft from the Draft Emails related list	1. Select the Related Lists tab in the contextual side panel. 2. Expand the Draft Emails related list. 3. Select the Open draft icon on the desired draft email card. The system opens the selected draft email in a subtab.
Discard the current draft email	1. Select the Discard draft icon ( ) in the Compose Email window footer. 2. Confirm the Discard action by selecting **Discard** in the confirmation pop-up window. The system displays a message that the draft email has been discarded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
Delete an email draft from the Manage drafts pop-up window	1. Select the View drafts icon ( ) in the Compose Email window footer. 2. Select **Manage drafts** to display the Manage drafts pop-up window. 3. Select an email to delete by enabling the check box. 4. Select **Delete** in the pop-up window. 5. Confirm the action by selecting **Delete** again.

The following guidelines apply to the Compose Email window:

- An agent can create multiple email drafts.
- An agent can have one Compose Email window open at a time. The system displays a message if an agent tries to open another Compose Email window while the first Compose Email window is still open.
- An agent must manually close a Compose Email window before opening a new window.
- The Compose Email window can be resized.

Collapsing and expanding the email header

The email header includes the following fields:

- **To**
- **Cc**
- **Bcc**
- **Subject**

You can expand and collapse the email header as needed by selecting the expand header ( ) and collapse header ( ) icons.

When the email header is expanded, you can edit the information in these fields. When the email header is collapsed:

- The names in the **To**, **Cc**, and **Bcc** fields are combined into one line. If there is a long list of recipients, some of the names are replaced with "and more".
- The subject is displayed in a second line.
- The fields are not editable.

When you create a new email or forward an email, the header is expanded by default and displays the **To** and **Subject** fields. If you expand the **Cc** and **Bcc** fields, the collapse header icon is displayed.

When you reply to an email, the header is collapsed by default. Expanding the header shows all the fields that contain information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compose Email modeless dialog footer icons

Several icons appear in the Compose Email modeless dialog footer that you can use when creating email drafts.

Footer icons

Icon	Description
Discard draft ( )	Select this icon to delete the current draft. Then confirm the delete action in the resulting confirmation message.
Apply template ( )	Select this icon to display a list of available templates. You can select a template from the list or search for a specific template. The list can display up to 10 templates. Selecting a template applies that template to the draft email. **Note:** If no templates are available, the icon does not appear in the footer.
View drafts ( )	Select this icon to display a list with recent draft emails as well as email-related actions. You can select an email draft from the list to display that draft in the Compose Email window. Email-related actions include: • **Manage drafts**: Displays the Draft Management pop-up window which includes a list of email drafts. Select a draft to display the contents in the Compose Email window. You can also delete email drafts from this pop-up window. • **Create new email**: Creates a new email draft in the Compose Email window.
Attach file ( )	Select this icon to attach files to an email draft **From computer** or **From record**. After attaching one or more files, you can hide or show the attachments.

Auto-loading the latest email draft

The Compose Email modeless dialog opens with the last saved email draft. When a user selects **Compose** > **Compose Email**, the Compose Email modeless dialog opens and displays this latest draft. If there are no recent drafts for the current case, the system loads a new draft. This feature is enabled by default.

Note:
This feature is controlled by component properties in UI Builder. These properties are located in the Configure tab in the Advanced section:

- **Load latest draft**: When enabled, the system loads the latest email draft.
- **sys ID**: Set this property to -1.

When the property is enabled and a specific sys_id is passed to the email client, the system can load the email draft in the Email Compose modeless dialog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using form templates to create comments and work notes

You can create and use form templates that add content to the **Additional comments** and **Work notes** fields on a case record and then post that content to the activity stream.

Content to add	Description
Comment	If a template includes content to add to the **Additional comments** field on the case record, the system does the following: • Displays a modeless dialog for composing a comment. • Adds the content to the **Comments** field in the modeless dialog. Selecting **Post Comments** adds the content to the **Additional comments** field on the case record and to the activity stream.
Work note	If a template includes content to add to the **Work notes** field on the case record, the system does the following: • Displays a modeless dialog for composing a work note. • Adds the content to the **Work notes** field in the modeless dialog. Selecting **Post Work Notes** adds the content to the **Work notes** field on the case record and to the activity stream.
Comment and work note	If a template includes content to add to both the **Additional comments** and **Work notes** fields on the case record, the system does the following: • Displays two modeless dialogs, one for composing a comment and one for composing a work note. • Adds the content for the comment to the **Comments** field in the comment modeless dialog. • Adds the content for the work note to the **Work notes** field in the work note modeless dialog. Selecting **Post Comments** adds the content to the **Additional comments** field on the case record and to the activity stream. Selecting **Post Work Notes** adds the content to the **Work notes** field on the case record and to the activity stream.

If text already exists in the **Additional comments** or **Work notes** fields, applying a template opens a modeless dialog and adds the template content. Selecting **Undo** removes the template content from the modeless dialog and replaces it with the existing text from the fields on the Case record.

Front-line case page keyboard shortcuts

Use keyboard shortcuts to create comments, work notes, and emails quickly, when using the Front-line case page in CSM Configurable Workspace.

When composing an email, using the shortcut key enables you to compose an email in a subtab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When composing a comment or work note:

- If you have a work note in progress, using the keyboard shortcut displays the existing work note.
- If you have a comment in progress, using the keyboard shortcut displays the existing comment.

Keyboard shortcuts

Action	Windows keyboard shortcut	Mac keyboard shortcut
Compose an email	Control+Alt+e	Command+Option+e
Compose a comment	Shift+Alt+c	Shift+Option+c
Compose a work note	Shift+Alt+w	Shift+Option+w

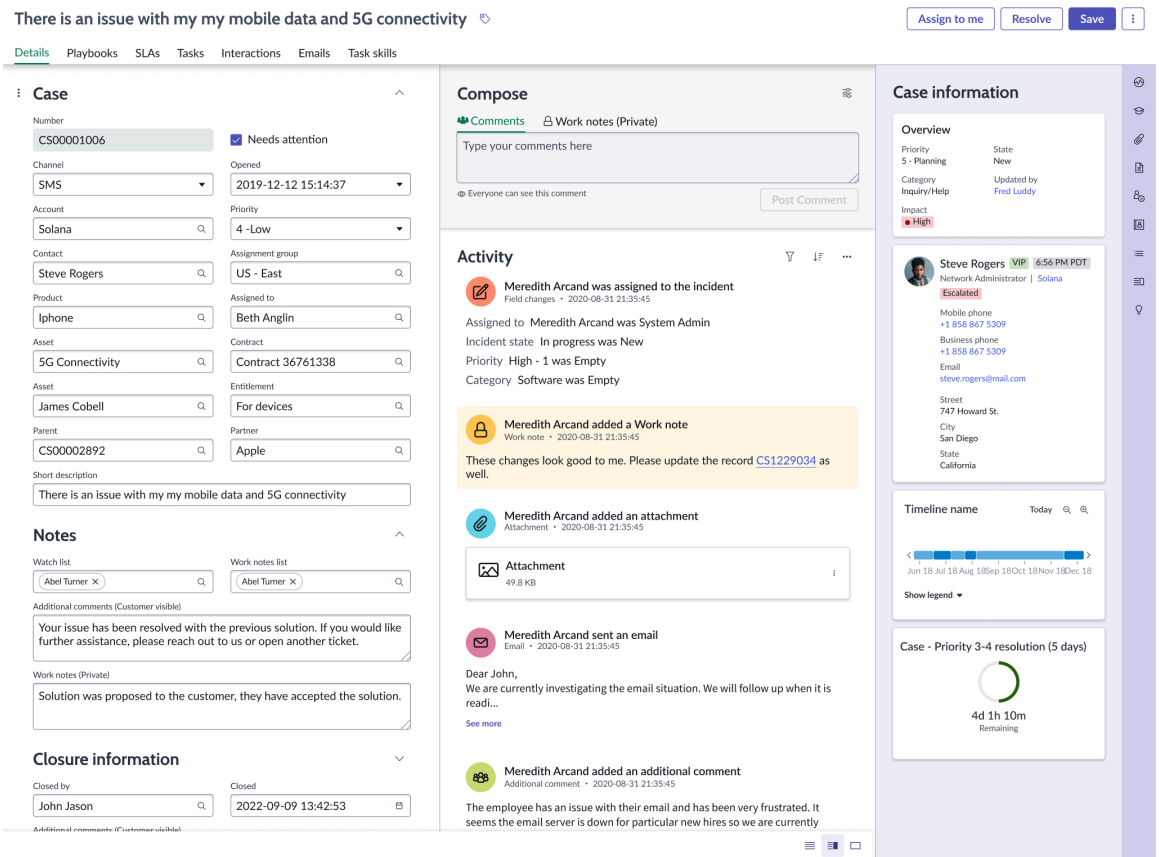
For more information, see Next Experience keyboard shortcuts.

CSM default record page

The CSM default record page provides CSM case management features and functionality and enables agents to create, monitor, and resolve cases.

The CSM default record page includes the basic structure for a record page, including record information, a communication interface, and suggestions for issue resolution. This page is also known as the standard record page.

CSM default record page



The CSM default record page is included with the CSM/FSM Configurable Workspace experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record presence feature

The CSM default record page and the CSM Interaction record page include the record presence feature. This feature allows agents to see other users who are viewing the same record and enables easy collaboration.

The user presence component displays an icon in the form header that shows the user who is currently viewing the record. For three or more users, the component displays two icons plus a number that represents additional users.

- Hover over an icon to see more information about a user.
- Click the number icon to see more information about the additional users.

For more information about this feature, see User presence.

Email templates feature

The CSM default record page includes the Email Templates feature. CSM Configurable Workspace pages that use the CSM default record page include the Email Templates tab in the contextual side panel.

These templates contain default values for fields that agents can easily add to email messages in the Compose panel on case records. These default values can include the recipients (email addresses in the To, Cc, and Bcc fields), the sender, the subject of the email, and text to include in the message body.

Users with the system administrator role can configure email templates by navigating to **All** > **Email Client** > **Email Client Templates** and selecting **New**. For more information, see Create an email client template.

Agents can use this feature to do the following:

- View available email templates.
- Select an email template to display the template details.
- Apply the selected template to an email in the Compose panel.

For more information, see Compose an email from an email template.

Creating emails and applying email templates

Customer service agents can create emails from case records in the following ways:

- By selecting **Email** at the top of the activity stream to open the Compose Email component.
- By selecting the More actions (•••) menu in the case activity bar and then selecting **Compose email** to open a draft email in a new tab.

When creating emails, agents can apply templates to add content to the draft emails, such as the subject line and message body. To apply a template:

1. Select the Apply email templates icon ( ) in the Compose email footer.

   The system displays a list of available templates. It does not display quick messages or response templates.

2. Select a template from the list. You can also search for a specific template.

   The system adds the contents of the template to the body of the email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If no templates are available, the icon does not appear in the footer.

Recommended Actions feature

The Recommended Actions tab includes AI search functionality and Suggested Actions.

- AI search tab: Agents can use AI search to find relevant resources or resolutions for customer issues. The search feature displays an initial set of search results based on the text in the case short description. This initial set of results includes knowledge articles. Agents can also enter different search keywords and repeat the search. From the list of search results, agents can select a source to see search results of that type.

  The following table shows the actions that an agent can perform on search results:

  Source type and guidance actions on the CSM default record page

Source type	Guidance actions
Knowledge base articles	○ Attach and add a link in email. ○ Attach and add a link in comment. ○ Add a link in work note. ○ Copy a link. ○ Read an article. ○ Mark an article as helpful.
Cases	○ Show or copy a resolution for resolved cases. ○ Link or open a case.
Incidents	○ Link an incident. ○ Open an incident.
Problems	○ Link a problem. ○ Open a problem.
Requests	○ Link a change request. ○ Open a change request.

  For all the other source types, default guidance is supported. The Default guidance for search results is a guidance that can be used for any search sources that don't have mapped guidances. For more information on default guidance, see Default guidance for search results.

  For more information on how to avail the AI search feature in Recommended Actions, see Enable AI search in Recommended Actions.

  For more information, see Use AI search in Recommended Actions to resolve cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Using Recommended Actions in the contextual side panel requires the Recommended Actions application (sn_cs_nb_action) which is included with the CSM Configurable Workspace application.

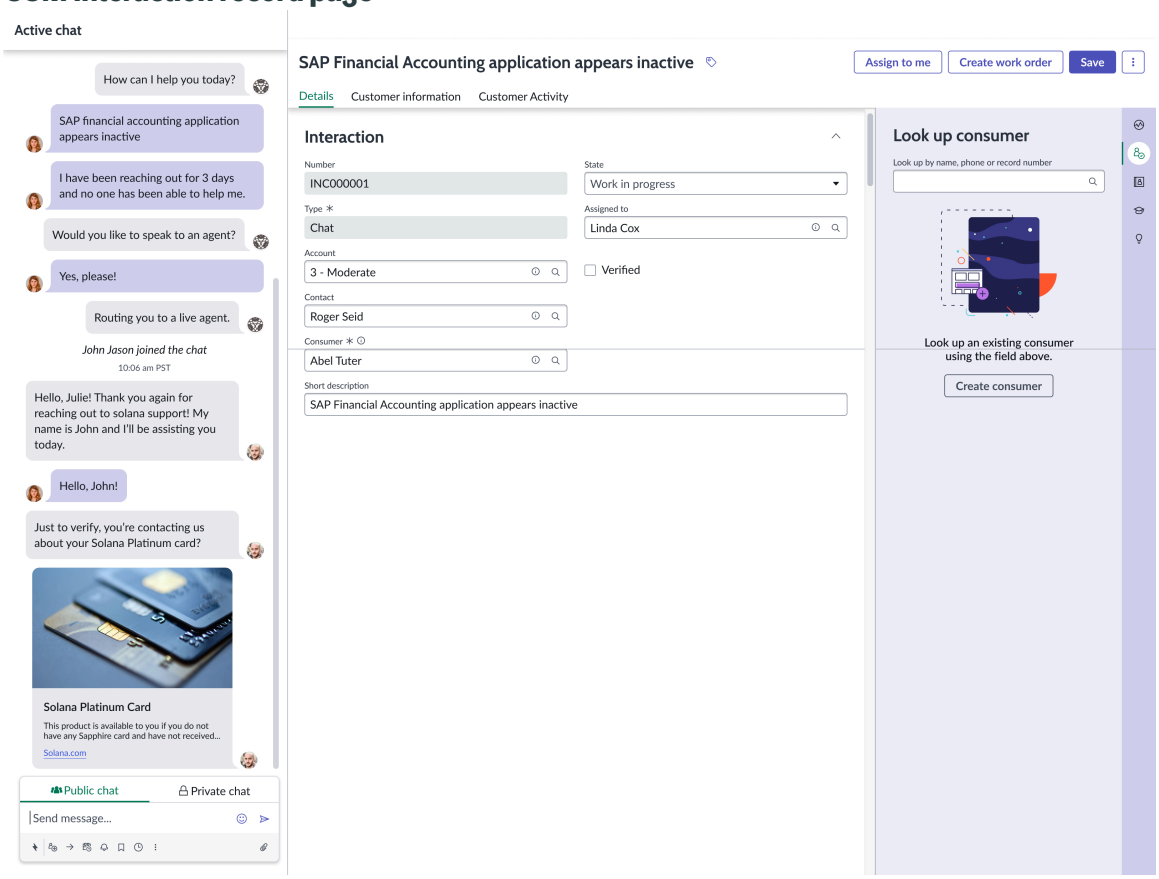
- Suggested Actions tab: This tab displays relevant actions to agents based on a context of a record or recommend a value for a field. For more information on how to configure contexts to display relevant actions for the agent, see Recommended Actions.

CSM Interaction record page

The CSM Interaction record page provides CSM interaction management features and functionality and enables agents to accept and respond to live chats, calls, email and SMS messages.

The CSM Interaction record page provides the basic structure for an interaction record, including interaction information and related search results.

CSM Interaction record page



The CSM Interaction record page is included with the CSM/FSM Configurable Workspace experience.

Record presence feature

The CSM default record page and the CSM Interaction record page include the record presence feature. This feature allows agents to see other users who are viewing the same record and enables easy collaboration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The user presence component displays an icon in the form header that shows the user who is currently viewing the record. For three or more users, the component displays two icons plus a number that represents additional users.

- Hover over an icon to see more information about a user.
- Click the number icon to see more information about the additional users.

For more information about this feature, see User presence.

Recommended Actions feature

The Recommended Actions tab includes AI search functionality and Suggested Actions for the chat, video, email, and walk-up channels on the CSM Interaction record page.

- AI search tab: Agents can use AI search to find relevant resources or resolutions for customer issues. The search feature displays an initial set of search results based on the text in the interaction short description. This initial set of results includes knowledge articles. Agents can also enter different search keywords and repeat the search. From the list of search results, agents can select a source to see search results of that type.

  For the Knowledge source type, agents can do the following:

  - Share an article link in chat, and email.
  - Copy link to an article.
  - Read an article.
  - Flag an article.
  - Mark an article as helpful.

  For all the other source types, default guidance is supported. The default guidance for search results is a guidance that can be used for any search sources that don't have mapped guidances. For more information on default guidance, see Default guidance for search results.

  For more information on how to avail the AI search feature in Recommended Actions, see Enable AI search in Recommended Actions.

  For more information, see Use AI search in Recommended Actions to resolve cases.

  Note:
  Using Recommended Actions in the contextual side panel requires the Recommended Actions application (sn_cs_nb_action) which is included with the CSM Configurable Workspace application.

- Suggested Actions tab: This tab displays relevant actions to agents based on a context of a record or recommend a value for a field. For more information on how to configure contexts so that relevant actions are displayed for the agents, see Recommended Actions.

Related topics

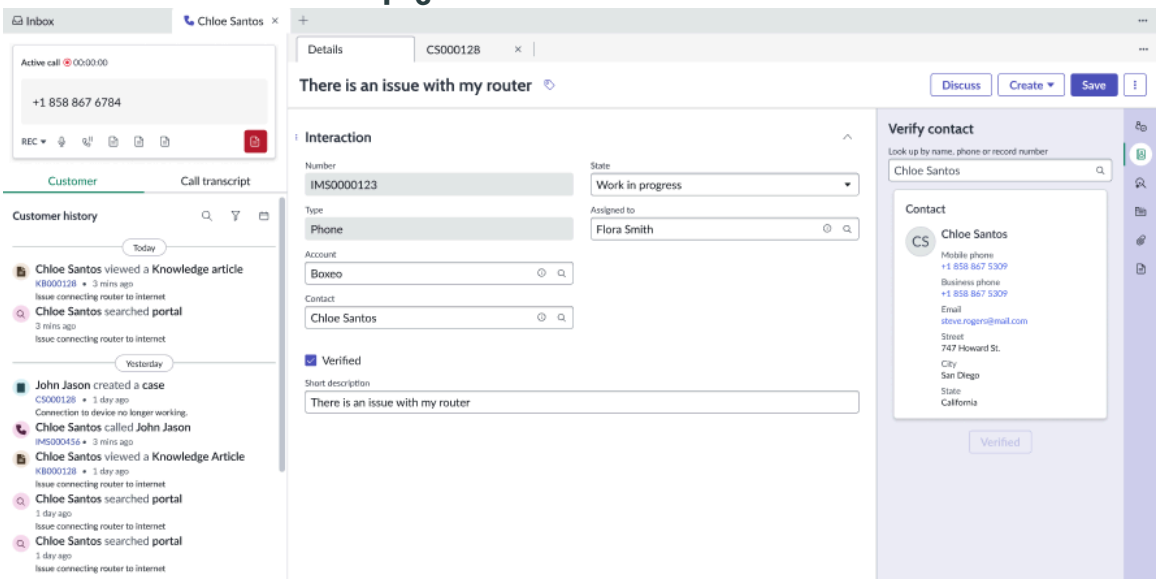
CSM voice interaction record page

CSM voice interaction record page

The CSM voice interaction record page provides a component that customers can use for integration with Contact Center as a Service (CCaaS) providers and an interface that agents can use to handle customer phone calls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM voice interaction record page



The CSM voice interaction record page enables CCaaS providers to display native voice integrations in CSM Configurable Workspace. Using CCaaS call controls integrated in the page, agents can do the following:

- Accept calls directly from the agent inbox.
- Manage call transfers and conferences.
- Place calls on hold and on mute.

For more information about the integration with CCaaS providers, see the following topics:

- Interaction Controls Component
- OpenFrame configuration

Page structure

The CSM voice interaction record page is made up of two different pages:

- CSM voice interaction record page
- Interaction control page

The pages appear together and are visible to agents for phone interactions when the OpenFrame configuration is enabled.

The Interaction control page appears in the left panel and includes the following components:

- Interaction Controls Component (ICC): Enables CCaaS providers to display native voice integrations.
- Customer History component: Displays customer, consumer, or account history information, depending on the customer information provided on the interaction record.
- Live call transcript: Displays the text of the call transcript when a conversation record is present for the interaction.

> **Note:**
> Live call transcript requires additional configuration.

The CSM voice interaction record page includes the following components:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Interaction form
- Action bar
- contextual side panel component

Plugin

The CSM voice interaction record page template and page variant are included with the CSM Configurable Workspace application (com.snc.uib.csm_agent_workspace).

The CSM voice interaction record page template and page variant are available to users when the Interaction Controls Component plugin (com.app_interaction_control) is installed.

The Interaction Controls Component plugin has the following dependencies:

- com.app_openframe_store
- com.sn_component_workspace_openframe

CSM voice interaction record template

The CSM voice interaction record template enables customers to create voice interaction record page variants and customize them as needed. This template includes customizable views for different CCaaS providers as well as real-time updates and notifications.

Record pages and page variants created with this template enable agents to manage phone calls with customers and external users and to display information that helps agents to resolve issues. Use this template to customize and extend CSM functionality around phone interaction management. Additionally, you can configure a CCaaS provider to integrate features such as call transcript.

CSM voice interaction record page variant

The CSM voice interaction record page variant is included with the CSM Configurable Workspace plugin and has a dependency on the Interaction Controls Component plugin. This page variant is available for users with the interaction controls enabled. For more information, see OpenFrame configuration.

This page variant includes the following settings.

CSM voice interaction record page variant settings

Setting	Description
Active	Enabling the **Active** check box makes the page variant available to the selected audience. The CSM voice interaction record page variant is inactive by default. The active setting combined with the page order determines the page that CSM Configurable Workspace uses to display record information. For more information, see Set record page order.
Order	Each record page has an order which indicates the page priority. The lower the number, the higher the priority. The default order for the CSM voice interaction record page variant is -2000.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM voice interaction record page variant settings (continued)

Setting	Description

Conditions	Conditions determine when a page variant is displayed. The CSM voice interaction record page variant has the following conditions:
	• **table = interaction**: Limits the use of the CSM voice interaction page variant to records from the Interaction [interaction] table.
	• **csm.interactionRecordValid = true**: Checks if the interaction record is available in the database.
	• **csm.interactionType = phone**: Checks if the **Type** field on the interaction record is set to phone.
	• **csm.interactiveControlsEnabled = true**: Queries the OpenFrame configuration record and checks the following:
	  ○ The **Enable interaction controls** field is enabled.
	  ○ The user belongs to the group selected in the **User Group** field.
	If all of these conditions are met, the system displays the CSM voice interaction record page variant.

Audience	The audience determines who can see the page variant. The CSM voice interaction record page does not have a defined audience. For more information, see Learn about audiences.

To access the settings for this page variant:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the Record section of the Pages and variants list, select **CSM voice interaction record page**.
4. Select **Settings** at the top of the page.

CSM voice interaction record page components

The CSM voice interaction record page includes the following components.

Component	Description
Form heading	The form heading displays the interaction short description and also includes the action bar and record tags.
Record tags	Agents can create multiple tags for a record and then use the tags to group and organize records. For more information, see Group and find records using tags in workspace.
Action bar	The action bar contains the actions available to users while working on phone interaction records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	• **Discuss**: Open a pop-up window to start a Sidebar discussion. • **Create Incident**: Create an incident record related to the interaction record. • **Create Case**: Create a case record related to the interaction record. • **Save**: Save changes to the interaction record. • **More Actions**: Perform additional actions such as creating a request or associating a related record. **Note:** The specific actions available are determined by factors such as the user role and other attributes.
Interaction Controls Component (ICC)	The Interaction Controls Component enables CCaaS providers to display native voice integrations. Agents can then use the component to manage customer calls directly from their inbox. For more information, see OpenFrame configuration.
Customer History component	The Customer History component displays customer, consumer, or account history information, depending on the field selections on the interaction record. This component can also display live call transcript. **Note:** Live call transcript requires additional configuration.
Interaction details	The interaction details include information about the interaction including the account and contact, short description, and record state.
Contextual side panel component	The contextual side panel component includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the CSM voice interaction record page includes the following tabs. • Recommended Actions search • Related Lists • Attachments • Form Templates

Interaction Controls Component (ICC)

The Interaction Controls Component appears at the top of the left panel of the CSM voice interaction record page. This component enables CCaaS providers to display native voice integrations. Agents can then use the component to manage customer calls directly from their inbox.

The CSM voice interaction record page with the ICC component is displayed when the following conditions are met:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The interaction is of type phone.
- The **Enable interaction controls** field on the OpenFrame Configuration record is enabled.
- The agent belongs to the **User Group** selected on the OpenFrame Configuration record.
  - If a user group is selected on the configuration record, only agents belonging to that group can see the CSM voice interaction record page.
  - If no group is selected, all agents can see the CSM voice interaction record page.

For more information about the integration with CCaaS providers, see the following topics:

- Interaction Controls Component
- OpenFrame configuration

Customer History component

The Customer History component appears below the Interaction Controls Component in the left panel. This component is included with the Customer Central plugin, which is activated as part of the CSM Configurable Workspace application.

The Customer History component includes the **Customer** tab. This tab displays customer, consumer, or account history information, depending on the customer information provided on the interaction record. This tab also includes a search field, filter, and date range selector that agents can use to find specific information in the history.

Customer tab information

Interaction record information	Customer tab information
Customer information is provided	When a customer is selected on the interaction record and customer history is available, the customer history is displayed in the Customer History tab. If customer history is not available, the Customer History tab displays a message that there is no activity yet.
Customer information is not provided	When a customer is not selected on the interaction record, the Customer History tab displays a message suggesting to link to a customer.
Account information is provided	When an account is selected on the interaction record, the account history is displayed in the Customer History tab.

Refreshing the customer history information:

- When an agent selects a different customer on the interaction record and then saves the record, the agent needs to select **Refresh** on the Customer History component to update the information. The agent can also refresh the record page.
- If there is new activity while the page is open, the agent needs to refresh the Customer History component or the record page to display the new activity in the Customer HIstory tab. For example, if the agent selects **Create Case** on the interaction record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Live call transcript

The Customer History component can be configured to display a **Call Transcript** tab, which shows the live call transcript.

- This tab displays the text of the call transcript when a conversation record is present for the interaction.
- This tab displays the following text when a conversation record is not present for the interaction record: Call transcript not available yet.

The Call transcript tab is visible to users if configured in the provider application associated with the interaction.

Action bar component

The action bar component contains the actions available to users while working on phone interaction records.

Note:
The specific actions available are determined by factors such as the user role and other attributes.

- **Discuss**: Open a pop-up window to start a Sidebar discussion.
- **Create Incident**: Create an incident record related to the interaction record.
- **Create Case**: Create a case record related to the interaction record.
- **Save**: Save changes to the interaction record.
- **More Actions**: Perform additional actions such as creating a request or associating a related record.

The CSM voice interaction record page supports actions from the following Customer Service Management and CSM Configurable Workspace plugins:

- Customer Service (com.sn_customerservice)
- CSM/FSM Configurable WS Foundation (com.snc.uib.cwf_workspace)
- CSM Configurable Workspace (com.snc.uib.csm_agent_workspace)
- CSM Workspace (com.snc.agent_workspace.csm)
- Major Issue Management (com.sn_majorissue_mgt)
- Customer Service with Service Management (com.sn_cs_sm)
- Customer Service with Request Management (com.sn_cs_sm_request)
- Time Recording for Customer Service (com.snc.csm_time_recording)
- Omni-Experience Standard Feature Set

If you are using any additional plugins, you need to add the actions from those plugins to the CSM voice interaction record page action bar. For more information, see the configuration steps in this topic: Configure the Front-line case page action bar.

Contextual side panel component

The CSM voice interaction record page includes the contextual side panel component, which provides agents with the following functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM voice interaction record page tabs in the contextual side panel

Tab	Description
Related Lists	The Related Lists tab provides access the interaction related lists. The CSM voice interaction record page incorporates related list functionality into the contextual side panel. These lists appear in an accordion format that agents can expand and collapse as needed. An indicator displays the number of records available in a related list. When expanded, the records in a related list are displayed in card format. The CSM voice interaction record page includes the following related lists: • Related Tasks • Recent Interactions • Open Cases
Attachments	The Attachments tab provides access to case-related attachments. From this tab, agents can view and download attachments.
Templates	The Templates tab provides access to available form templates which enable agents to automatically populate fields on new records. Agents can manually apply a template when creating a new record such as an incident or change.

OpenFrame configuration

The CSM voice interaction record page variant is included with the CSM Configurable Workspace application (com.snc.uib.csm_agent_workspace). This page variant is available to users when:

- The Interaction Controls Component plugin (com.app_interaction_control) is installed.
- Interaction controls in the OpenFrame configuration are enabled.

Complete the following steps to enable interaction controls:

1. Navigate to **All** > **OpenFrame** > **Configurations**.
2. Select a configuration record. For example, select **CTI**.
3. Select the **Enable interaction controls** check box to enable interaction controls for OpenFrame.
4. Select a group from the available **User Group** column and move it to the **Selected** column. This is the group of users to whom the OpenFrame configuration applies.
5. Unlock the URL field, and add a third-party URL.

   You can get this URL from your contact center provider admin.
6. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the following conditions are met, the agent sees the CSM voice interaction record page with the Interaction Controls Component and the Customer History tab component.

- The interaction is of type phone.
- The **Enable interaction controls** field on the OpenFrame Configuration record is enabled.
- The agent belongs to the **User Group** selected on the OpenFrame Configuration record.

The agent can switch between phone interactions and chat interactions. If an interaction is of type chat, the agent sees the CSM default record page.

Creating pages and page variants

You can create new pages or customize existing pages in UI Builder to display table and record information in CSM Configurable Workspace.

When you create a page in UI Builder, you have the option to create a page from scratch, create a page from a template, or you can duplicate and modify a page variant.

UI Builder terminology

The following table describes the UI Builder terminology around workspace experiences, pages and page variants, and page templates. For more information about UI Builder terminology, see the UI Builder glossary.

UI Builder terminology

Term	Description
Workspace experience	A workspace experience in UI Builder is a collection of web pages. Users use these pages to interact with an application. A workspace experience includes experience settings, routes, page variants, and the audience and conditions required for each variant. A workspace experience resides at a specific URL. When an admin creates a workspace experience, they define the web address for the experience and the homepage that the experience uses.
Page collection	A page collection is a group of pages that can be used across multiple workspace experiences within tabs or modals.
Page	A page is a collection of layouts, columns, and components that display information in a workspace. • A page has a unique name. • A page has a unique URL. The page contains content that resides at this URL. • A page includes components that display data from tables and records.
Page variant	A page variant is a version of a page that has unique settings, including audience, conditions, and order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Builder terminology (continued)

Term	Description
	• Admins can create variants of pages to target experiences for different audiences at the same URL. • When a user opens a page URL, the variant that they see is based on these settings. You can create a page variant if you want to use the same page and make minor changes for a different audience. For example, you can create a landing page for customer service agents and a variant of that landing page for customer service managers.
Page template	A page template provides a base structure for a page that you can customize to meet your needs. Using a page template can help you create pages faster and keep pages consistent within an experience. Page templates can include components, data resources, and a layout.

Methods for creating pages and page variants

There are different ways to create pages and page variants in UI Builder.

Methods for creating pages and page variants

Method	Description
Create a page from scratch	When you create a page from scratch, you start with a blank page and select layouts and components that guide a user through an experience. Components are like building blocks that you can add to the page and then customize to build the page functionality.
Create a page from a template	When you create a page from a template, you start with a base structure, including layouts and components. From this starting point, you can customize the page to meet your needs. When you create a page from a template: • The page is automatically active. • The page includes basic settings. • The first variant of the page is also created. You can add settings such as conditions and audience to the variant. For example, when you create a page from the Front-line case page template, the page includes only basic settings. It does not include the same settings as the Front-line case page variant that is provided out of box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Methods for creating pages and page variants (continued)

Method	Description
Create a page variant	When you create a page variant, you create a variation of a page that exists at the same path. When you create a page by duplicating a variant, the new page inherits the variant settings. By creating a page variant, you can target an experience for a specific audience and add conditions that determine when the variant is shown. • The audience determines who uses the page variant. For example, you can limit the audience to a specific user role. • The conditions determine when a page is shown. For example, you can add a condition for records from a specific table, such as the Case table.

For more information about customizing record pages, see Manage UI Builder pages and page variants.

Note:
If a page is modified after page variants have been created, the changes to the page do not sync with the variants. These changes must be made manually.

Determining which page to use

Each record page has an order number. CSM Configurable Workspace uses the active record page with the lowest order number as the default page. When the system displays a record in CSM Configurable Workspace, it uses this default page to display the record information.

Additionally, the system looks at the page settings in this order:

1. Conditions (i.e., table)
2. Audience (the user roles that have access to the page)

If a page variant has no assigned user roles, then every role can access it.

For more information, see Set record page order.

Set record page order

Set the order number of a record page and activate the record page to determine the default page for displaying records in CSM Configurable Workspace.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task
Each record page has an order number and can also be set to active or inactive. The active record page with the lowest order number is the default page. When the system displays a record in CSM Configurable Workspace, it uses this default page to display the record information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record page order values

Record page	Order
Record default	0
Interaction record Page	100
CSM default record page	-1000
CSM Interaction record page	-1000
Front-line case page	1000

To use a different page as the default page, you need to manually switch from the existing pages to the new pages by changing the page order number.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. Select the desired page in the Variants list, for example, **CSM default record page**.
4. Set the page order.
   a. Select the additional actions menu for the page and then select **Edit conditions**.
   b. Enter a value in the **Order** field.
   c. Select **Save**.
5. Activate the page.
   a. Navigate to **All** > **Now Experience Framework** > **Experiences**.
   b. Select the **CSM/FSM Configurable Workspace** experience.
   c. In the **Admin panel** field, open the UX App Configuration: CSM/FSM Configurable Workspace App Config record.
   d. Locate the page in the UX Screens related list.
   e. Set the **Active** field to true.

Customize a record page

To customize a record page, you first create a variant, or copy, of the page and then make changes to the variant.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. Select the desired page in the **Page** list.
   For example, select **Record page**.
4. Select the desired default record page from the Variants list.
   For example, select **CSM default record page**.
5. Select the additional actions menu for this page and then select **Duplicate** to create a copy of the page variant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Rename the copy of the page variant.
   a. Select the copy of the page variant in the Variants list.
   b. Select the additional actions menu for this page and then select **Edit page variant settings**.
   c. Enter a new name in the **Variant name** field.
   d. Select **Save**
7. Now you can customize the page variant.
   For more information, see the following UI Builder topics:
   - Work with pages
   - Work with components
   - Layouts in UI Builder
8. To delete a page variant:
   a. Locate the page variant to be deleted in the **Pages and variants** list.
   b. Select the additional actions menu for this page variant and then select **Delete variant**.
   c. On the confirmation dialog, select **Delete**.
   The system removes the page variant from the **Pages and variants** list.

Configure the Front-line case page action bar

Configure the action bar on the Front-line case page to include actions from other plugins.

Before you begin

Role required: admin

About this task

The Front-line case page supports actions from the following Customer Service Management and CSM Configurable workspace plugins:

- Customer Service (com.sn_customerservice)
- CSM/FSM Configurable WS Foundation (com.snc.uib.cwf_workspace)
- CSM Configurable Workspace (com.snc.uib.csm_agent_workspace)
- CSM Workspace (com.snc.agent_workspace.csm
- Major Issue Management (com.sn_majorissue_mgt)
- Customer Service with Service Management (com.sn_cs_sm)
- Customer Service with Request Management plugin (com.sn_cs_sm_request)
- Time Recording for Customer Service (com.snc.csm_time_recording)
- Omni-Experience Standard Feature Set

If you are using any additional plugins, use the steps in this task to add the actions from those plugins to the Front-line case page action bar. You can add actions in the following ways:

- Add actions to an existing layout group (step 2).
- Create a new layout group and add actions to that group (steps 3 and 4).
- Add actions directly to the action bar (step 5).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Verify that the UI action or declarative action has a corresponding record in the UX Form Actions table (sys_ux_form_action).
   a. Enter **sys_ux_form_action.list** in the application navigator and press Enter.
   b. Search for the desired form action in the UX Form Actions list.
   c. Create a form action record if it does not exist.
2. **Optional:** Add the action to an existing layout group.
   You can create a new layout group and add the action to that group (see step 3). By default, the Front-line case page supports three groups: Compose, Create, and Manage.
   a. Navigate to **All** > **Declarative Actions** > **Form Action Layout Groups** and select a group.
   b. Select the lock icon next to the **Actions** field, add the desired action from the Available UX Form Actions list, and select **Save**.
3. **Optional:** Create a new layout group.
   a. Navigate to **All** > **Declarative Actions** > **Form Action Layout Groups** and select **New**.
   b. Enter a name for the layout group in the **Name** field.
   c. Select the lock icon next to the **Actions** field, add the desired action from the Available UX Form Actions list, and select **Save**.
   Because this is a new group, you need to add it to the Front-line case page layout (see step 4).
4. If you created a new layout group in step 3, add the group to the Front-line case page layout.
   a. Navigate to **All** > **Declarative Actions** > **Form Action Layouts**.
   b. Select the Front-line Case Actions layout.
   c. Select **New** in the UX Form Action Layout Items related list.
   d. On the new record page, set **Item Type** to Group and set **Group** to the group created in step 3.
   e. Fill in the rest of the fields on the form and select **Save**.
5. **Optional:** To add an action directly on the action bar:
   a. Navigate to **All** > **Declarative Actions** > **Form Action Layouts**.
   b. Select the Front-line Case Actions layout.
   c. Select **New** in the UX Form Action Layout Items related list.
   d. On the new record page, set **Item Type** to Action and set **Action** to the desired UX Form Action.
   e. Fill in the rest of the fields on the form and select **Save**.

Configure record pages to hide Customer Central components

Configure the CSM default record page and CSM Interaction record page to hide the Customer Activity and Customer Information tab components.

Before you begin

Role required: admin

About this task

Starting with the Yokohama release, CSM Configurable Workspace has a dependency on the Customer Central plugin. The Customer Central application is installed automatically with CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Customer Central installation can result in the Customer Activity and Customer Information tab components appearing on the following CSM Configurable Workspace record pages:

- CSM default record page
- CSM Interaction record page

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the Page collections tab.
3. Select a page collection.
   - CSM default record post-Details
   - CSM Interaction record post-Details
4. Select **Settings** for one of the following page variants to open the settings panel.
   - Customer Activity default
   - Customer Information default
5. In the Availability section, disable the **Active** check box.
6. Select **Save**.

CSM Configurable Workspace page templates

A page template is a blueprint of a record page that you can use to create a new page or page variant in UI Builder.

A page template can include components, data resources, extension points, and a layout. When you create a page or a page variant from a page template, you start from a base structure that you can customize to meet your needs.

Select one of the CSM Configurable Workspace templates when creating a new page or a new page variant in UI Builder.

CSM Configurable Workspace templates

Template	Description
CSM default record template	The CSM default record template includes CSM case management features and functionality and enables agents to create, monitor, and resolve cases. Use this template if you want to customize and extend CSM functionality around case management.
CSM Interaction record template	The CSM Interaction record template includes the CSM interaction management features and functionality. This view enables agents to accept and respond to live chats, calls, and SMS messages. Use this template if you want to customize and extend CSM functionality around interaction management.
Front-line case page template	The front-line case page template provides a simplified case view that enables agents to quickly gather context, categorize cases, and provide prompt responses to customers. This template focuses on the essential functionality that agents need, including:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM Configurable Workspace templates (continued)

Template	Description
	• Looking up and verifying customer information • Scanning the activity stream • Viewing related information • Searching for knowledge articles

For more information, see Create a page from a template in the UI Builder documentation.

Record presence feature

Pages that you create from the CSM record page template and the CSM Interaction record page templates have the record presence feature available. This feature lets you see the users who are currently viewing a record. For more information, see User presence component.

Using AI Search with CSM Configurable Workspace

Use the ServiceNow® AI Search application with CSM Configurable Workspace.

Starting with the Utah release, the AI Search application replaces the Zing search application for CSM Configurable Workspace. To support this feature, the Zing search configurations have been migrated to AI Search.

Use the Unified Navigation search field in CSM Configurable Workspace to search for information. You can switch between global search results and results from the **CSM/FSM Configurable Workspace** workspace application. The different search configurations are based on different tables.

For more information about using AI Search with CSM Configurable Workspace, see AI Search for Next Experience.

Search application configurations

A search application configuration specifies the search engine and the settings to use for search in a ServiceNow AI Platform application. The **[CSM AIS] Configurable Workspace Search Config** search application configuration is provided with the CSM Configurable Workspace store app.

To access this configuration, navigate to **AI Search** > **Search Experience** > **Search Applications**.

AI Search indexed sources

Indexed sources reflect what content users are able to search on. The CSM Configurable Workspace store app adds AI Search indexed sources for the following tables:

- Account [customer_account]
- Case [sn_customerservice_case]
- Consumer [csm_consumer]
- Contact [customer_contact]
- Order Line Item [csm_order_line_item]
- Order [csm_order]
- Catalog item [sc_cat_item]

Navigation tabs

Navigation tabs appear at the top of the search results page and are static filter options that you can use to filter the results by indexed source. The **[CSM AIS] Configurable Workspace Search Config** search application configuration includes the following navigation tabs:

- All
- Cases
- Accounts
- Contacts
- Consumers
- Orders
- Order Line Items
- Locations

For information about creating navigation tabs, see Configure navigation tabs in an AI Search application configuration.

Facets

Facets are dynamic filter options that you can use to refine the search results by field value. The **[CSM AIS] Configurable Workspace Search Config** search application configuration includes the following facets:

- State
- Priority
- Assignment Group
- Product
- Account
- Contact
- Consumer
- Needs Attention
- Action Status
- Channel
- Active Escalation

For information about creating facets, see Create a facet in an AI Search application configuration.

Guided setup

Guided setup provides a sequence of tasks that helps you configure search application settings. To access guided setup, navigate to **All** > **AI Search** > **AI Search for Next Experience** > **Guided Setup for Zing to AI Search Migration**.

This guided setup tool assists with the migration of Next Experience applications from Zing to AI Search. For more information about using guided setup, see Configuring AI Search for Next Experience.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on your release, you may need to perform only some of the tasks within the guided setup to use AI Search with CSM Configurable Workspace. For Utah zBoot instances, AI Search is the default search application for global search and the CSM Configurable Workspace application.

Migrating Zing search configurations

If you have added, modified, or deleted any search configurations provided out of box, you may need to migrate existing Zing search configurations to AI Search configurations.

- If you have added or modified any search sources in **Agent Workspace Search Config**, you must migrate these sources to AI Search.
- If you have deleted any search sources from **Agent Workspace Search Config**, you must manually delete them from **[Migrated] Agent Workspace Search Config**

Enable fuzzy matching in AI search

Fuzzy matching enables agents to search for records using partial record IDs or incomplete record details and retrieve relevant results. Fuzzy matching identifies similar but not identical elements in data table sets.

AI search in CSM Configurable Workspace supports fuzzy matching with a script. Activating the Customer Service plugin (com.sn_customerservice) automatically runs the script and enables fuzzy match search in both the CSM Configurable Workspace global search and the Recommended Actions AI search component.

When fuzzy matching is enabled:

- AI search returns results based on approximate matching, including partial text or slightly mistyped record IDs.
- The system ranks the search results in order of relevance, prioritizing exact matches but including close matches.

After fuzzy matching is enabled, the system administrator must re-index the tables used in AI search:

1. Make sure that fuzzy matching is enabled by running this command as a background script:

   ```
   gs.info(new sn_ais.AisUtil().isFuzzyNumberMatchEnabled());
   ```

   The result should be 'true'.

2. Make sure that AI search is enabled.
3. Navigate to **All** > **AI Search** > **AI Search Index** > **Indexed Sources**.
4. Select the table to re-index.
5. Select **Index All Tables**.
6. Go to the homepage and enter a search query in the global search field.

   You should see fuzzy matching results for the tables that were re-indexed.

Note:
If a table is not present in the AI Search Index Sources list, you can add the table by selecting **New** on this list.

Configuring AI Search

Open the CSM/FSM Configurable Workspace experience in UI Builder

Access the CSM/FSM Configurable Workspace experience in UI Builder for editing.

Before you begin
Role required: ui_builder_admin, admin

About this task

Procedure

1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **Experiences** tab.
3. Select the **CSM/FSM Configurable Workspace** experience.

Result
The CSM/FSM configurable experience opens in UI Builder.

Create a CSM Configurable Workspace landing page

Create landing pages for different agents and teams by creating a page variant and adding or modifying containers and components.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task
A landing page is the page that an agent sees when they open their workspace. One landing page for CSM Configurable Workspace is included with the Customer Service plugin (com.sn_customerservice). This page, the **CSM Landing Page**, gives agents an overview of their new, assigned and high priority cases, plus the cases assigned to their groups.

You can create a variant of this page in UI Builder, a WYSIWYG web user interface builder, and modify it as needed.

Note:
It is important to create a variant of the CSM Landing Page to prevent issues with upgrades.

For example, you can use UI Builder to perform these tasks:

UI Builder tasks

Task	Description
Change the page layout	The layout governs the slots that are available on a page, how the slots are positioned, and what CSS rules apply to them. For more information about layouts and layout systems, see Work with layouts.
Add components to the page	Components are the base elements of your page. Components range from core elements like buttons and labels to more complex experience components like lists and forms. For more information, see Work with components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Builder tasks (continued)

Task	Description
	Note: You can also find information about UI Builder components on the ServiceNow developer site. For more information, see the component documentation on *www.devportaldocs.service-now.com/*.
Connect data resources to the components	Connect data resources to dynamically expose data from tables, records, or other elements on your page. For more information, see Work with data resources.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. In the **My experiences** section, click **CSM/FSM Configurable Workspace**.
3. In the Page drop-down menu, select **Landing Page**.
4. In the Variants list, select **CSM Landing Page**.
5. Create a landing page variant.

   a. Click the additional actions menu next to the **CSM Landing Page** variant and select **Duplicate**.

   b. In the Create a variant pop-up window, add a **Variant name**.

   c. Click **Create**.

   d. If desired, specify the audience and display conditions for the page variant.
   The audience determines who can see the page. An audience is a collection of user roles. For more information, see Understanding your audiences.

   The **Order** field determines which page is displayed. The page with the lowest order number is displayed first.

   e. Click **Save**.

6. Add or modify containers and components for the landing page variant.
   See the UI Builder documentation for details about adding or modifying containers and components.
   - Add components to a page: Beginning with step 4, use this task to add a component to a container and to configure the component properties and event handlers. This task also contains information about adding additional containers.
   - Add styling to a component: Beginning with step 3, set CSS styles for a component to change its default appearance.
   - Add a modal to a component: Beginning with step 5, add a window that appears when a user clicks a component. For example, if you add a button component that deletes a record, you can add a modal that asks the user to confirm the record deletion.
7. Click **Save** to save the page variant.

Set up a ribbon configuration in CSM Configurable Workspace

Create a ribbon setting and add that setting to a ribbon configuration for CSM Configurable Workspace.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

About this task

Use the steps in this task to set up a ribbon configuration for CSM Configurable Workspace.

- Create a ribbon setting, such as creating another version of the Customer 360 ribbon component.
- Add the ribbon setting to a ribbon configuration.
- Set the width and the order of the ribbon setting within the ribbon configuration.

Note:
You can also use ribbon settings from CSM Agent Workspace in CSM Configurable Workspace if you add the setting to the ribbon configuration.

One ribbon configuration **CSM/FSM Configurable Workspace Ribbon Config**, is included with CSM Configurable Workspace. This configuration includes the Customer 360, Timeline, and Active SLA ribbon components. You can use this configuration in the base system without completing any additional configuration steps.

Procedure

1. Create a ribbon setting.
   a. Navigate to **Now Experience Framework** > **Configuration Settings** > **UX Ribbon Setting**.
   b. Select **New**.
   c. Fill in the fields on the Ribbon Setting form.

Ribbon Setting form

Field	Description
Name	A label that describes this ribbon setting. It often includes the table associated with this ribbon.
Ribbon component	The component to add to the ribbon setting, including Customer360, Timeline, Active SLA, or a custom ribbon component. **Note:** You can only add one component at a time. To make a second component appear in the ribbon, repeat this procedure to create another ribbon setting and add a different component.
Table	The table associated with this ribbon setting. Anytime an agent selects a record from this table, the ribbon setting appears with this component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Width	The number of columns that the component occupies in the ribbon. The width of the page is 12 columns. When using multiple components, the total combined width of all the components must equal 12 or less. **Note:** For CSM Configurable Workspace, set the width of the ribbon component on the Ribbon Configuration Setting form (see step 3).
Application	The scope of this ribbon. Global means the ribbon works with all applications.
Order	The location of this component in the ribbon. Ordering the components goes from left to right. For example, if you associate three components with a table, the component with the lowest order appears on the left and the component with the highest order appears on the right. **Note:** For CSM Configurable Workspace, set the order of the ribbon component on the Ribbon Configuration Setting form (see step 3).
Active	Toggle to turn this component on or off in the ribbon for this table.
Inherit	If set to true, the ribbon configuration can be inherited by child tables. For this to be effective, a child table shouldn't have any configured ribbon settings. The **Inherit** field is false by default.
Experience restricted	If set to true, the ribbon component is restricted to Configurable Workspaces. If set to false, the ribbon component is global and appears in CSM Agent Workspace (legacy). For more information, see Set up ribbons in workspace. This field is set to true by default.

d. Select **Submit**.

2. Create a ribbon configuration as a container for your ribbon setting.

a. Navigate to **Now Experience Framework** > **Configuration Settings** > **UX Ribbon Configurations**.

b. Select **New**.

c. Fill in the fields on the UX Ribbon Configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UX Ribbon Configurations form

Field	Description
Name	Unique name for this ribbon configuration.
Application	The scope of this ribbon configuration. Global means the ribbon works with all applications.
Active	Toggle to turn this component on/off in the ribbon for this table.
Description	Short description of this ribbon configuration that displays in the UX Ribbon Configurations list.

d. Select **Submit**.

3. Add the ribbon setting to the ribbon configuration.

a. Navigate to **Now Experience Framework** > **Configuration Settings** > **Ribbon Configuration Settings**.

b. Select the configuration from the UX Ribbon Configurations list.

c. Fill in the fields on the Ribbon Configuration Setting form.

Ribbon Configurations Settings form

Field	Description
Table	The table associated with this ribbon setting. Anytime an agent selects a record from this table, the ribbon setting appears with this component.
Ribbon	The ribbon setting to add to the ribbon configuration.
Configuration	The desired ribbon configuration.
Application	The scope of this ribbon. Global means the ribbon works with all applications.
Order	The location of this component in the ribbon. Ordering the components goes from left to right. For example, if you associate three components with a table, the component with the lowest order appears on the left and the component with the highest order appears on the right.
Width	The number of columns the component occupies in the ribbon. The width of the page is 12 columns. When using multiple components, the total combined width of all the components must equal 12 or less. **Note:** The width is ignored if the ribbon is configured to display in the contextual side panel.

Field	Description
Active	Toggle to turn this component on/off in the ribbon for this table.

d. Select **Submit**.

What to do next

You can display the form ribbon at the top of the form or in the Contextual side panel. For more information, see the following topics:

- CSM Configurable Workspace form ribbon and components
- Display the form ribbon and form header secondary values in the Contextual side panel

Set up a form header in CSM Configurable Workspace

You can create a form header for use in CSM Configurable Workspace.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

About this task

After creating a form header, you must link it to a form header configuration if you want it to appear in CSM Configurable Workspace.

> **Note:**
> You can also use form headers from CSM Agent Workspace in CSM Configurable Workspace if you link the setting to the form header configuration.

One form header configuration **CSM/FSM Configurable Workspace Header Config**, is included with CSM Configurable Workspace. You can use this configuration out of the box without completing any additional configuration steps.

Procedure

1. Create a form header.

a. Navigate to **Now Experience Framework** > **Configuration Settings** > **UX Form Header**.

b. Select **New** on the Form Headers list.

c. Fill in the fields on the form header form.
For field descriptions, see Set up form headers in workspace.

d. Select **Submit**.

2. Add the form header to the form header configuration.

a. Navigate to **Now Experience Framework** > **Configuration Settings** > **UX Header Configurations**.

b. Select the header configuration.

c. In the Workspace Form Headers related list, select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You might have to configure the form to display the related list.

d. Move the desired form header from the left column to the right column to add it to the header configuration.

e. Select **Save**.

Set up a highlighted value in a form header in CSM Configurable Workspace

You can configure fields that appear as highlighted values in a form header in CSM Configurable Workspace.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task
After creating a highlighted value, you must link it to a highlighted value configuration if you want it to appear in CSM Configurable Workspace.

Note:
You can also use highlighted values from CSM Agent Workspace in CSM Configurable Workspace if you link the value to the highlighted value configuration.

One highlighted value configuration, **CSM/FSM Configurable Workspace Highlighted Value Config**, is included with CSM Configurable Workspace. You can use this configuration out of the box without completing any additional configuration steps.

Procedure

1. Create a highlighted value.
   a. Navigate to **Now Experience Framework** > **Configuration Settings** > **UX Highlighted Values**.
   b. Select **New**.
   c. Fill in the fields on the Highlighted Value form and select **Submit**.
   For field descriptions, see Highlight values in the form header.
   d. In the Highlighted Values list, select the record you created.
   e. In the Highlighted Value Conditions related list, select **New**.
   f. Fill in the fields on the Highlighted Value Condition form.
   For field descriptions, see Highlight values in the form header.
   g. Select **Submit**.
2. Add the highlighted value to the highlighted value configuration.
   a. Navigate to **Now Experience Framework** > **Configuration Settings** > **UX Highlighted Values Configurations**.
   b. Select the configuration.
   c. In the Highlighted Values related list, select **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Move the desired value from the left column to the right column to add it to the selected configuration.

e. Select **Save**.

Set up a form action in CSM Configurable Workspace

Create a form action that links to a UI action so that you can use the UI action in CSM Configurable Workspace.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

About this task

In order to use UI actions in CSM Configurable Workspace, each UI action must have a corresponding form action.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Actions and Events** > **UX Form Actions**.
2. Click **New**.
3. Enter a name for the form action in the **Name** field.
   It is recommended that you give the form action the same name as the UI action.
4. In the **Action Type** field, select UI Action.
5. Select the UI action in the **UI Action** field.
6. Click **Submit**.

Display the form ribbon and form header secondary values in the Contextual side panel

Configure the form ribbon and the secondary values that appear in a form header to display in the Contextual side panel in CSM Configurable Workspace.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

About this task

Note:
This task applies to CSM Configurable Workspace.

The form ribbon includes components that provide agents with an overview of case details, such as a customer summary and a case timeline.

The form header for the Case form can display two levels of field values from the Case table. The primary value is the case short description. The secondary values include the account and contact or consumer, the case priority, and the case state.

You can use properties to determine where the form ribbon and secondary values are displayed: at the top of the record or in the Contextual side panel. Two properties are available for the standard record page and two are available for the interaction record.

These properties can operate independently. For example, you can display the form ribbon in the Contextual side panel and the secondary values in the form header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The form ribbon properties apply to pages that have active ribbon configurations. If a page does not have a ribbon configuration, or has an inactive ribbon configuration, there is no information for the system to display in either location.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences** > **CSM/FSM Configurable Workspace**.
2. In the UX Page Properties list, click the desired property.
3. In the **Value** field for the selected property, enter one of the following values.
4. Click **Update**.

Display field values as interaction record tab titles

Display field values, such as contact or consumer names, as titles on interaction record tabs in CSM Configurable Workspace.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task

Note:
This task applies to CSM Configurable Workspace.

Configure the *`sessionTabTitle`* property to identify the fields that can be used in interaction record tab titles. Enter fields in this property as a comma separated string.

The system evaluates these fields in the order that they appear in the string. The first field that has a value is used as the interaction record tab title. If none of the fields in the string have values, the system displays the record number as the tab title.

Note:
Configured fields must appear on the interaction record.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences** > **CSM/FSM Configurable Workspace**.
2. In the UX Page Properties list, click the *`sessionTabTitle`* property.
3. In the **Value** field, enter the fields to use in interaction record tab titles. Enter the fields as a comma separated string. The default string is *`contact,consumer,number`*.

   Note:
   Configured fields must appear on the interaction record.

4. Click **Update**.

Enable the Create Case UI action for case type selection

Enable the **Create Case** UI action for case type selection for one or more selected tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task
This procedure adds the **Create Case** UI action to records in the configured table. Selecting this UI action displays the Select a case type pop-up window .

> **Note:**
> For the CSM Configurable Workspace, the **Create Case** UI action for case type selection is disabled out of box.

Procedure
1. Navigate to the Action Assignments list by entering **sys_declarative_action_assignment_list.do** in the application navigator.
2. Filter the actions for the table on which you want the **Create Case** UI action to be enabled. For example, to enable the UI action for the Interaction table, use the **Table** column to filter for the Interaction [interaction] table.
3. Select the **Create Case** action with this description: This Creates Case UI action enables the agent to create a case on Agent Workspace by selecting the type of case from a list of available case types.
4. On the Create Case Action Assignment record, enable the **Active** check box and save the record.
5. Navigate to the UI Actions list by entering **sys_ui_action_list.do** in the application navigator.
6. Filter the actions for the same table as selected in step 2.
7. Select the **Create Case** action with no comments.
8. On the Create Case UI Action record, disable the **Active** check box and save the record.
9. Repeat steps 1 through 8 for each table on which you want to enable the **Create Case** UI action for case type selection.

Configure tabs in the contextual side panel

Use the **inlineTabExclusion** UX page property to prevent tabs from appearing in the configurable side panel in CSM Configurable Workspace.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task
You can configure the **inlineTabExclusion** UX page property for specific tables. The following example shows the default value for this property.

```
[{
  "template": [
    "incident","sn_customerservice_case"
  ],
  "attachment": [
    "sn_customerservice_case"
  ]
}]
```

In the mapping for this property, the key represents the tab to be hidden and the value includes the list of tables for which the tab is hidden. In the above example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Response template tab is hidden for the Incident [incident] and Case [sn_customerservice_case] tables.
- The Attachment tab is hidden for the Case [sn_customerservice_case] table.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the UX Page Properties related list, select **inlineTabExclusion**.
4. Make the necessary changes to the **Value** field.
5. Select **Update**.

Configure the Agent Assist and Response Template tabs in the contextual side panel

Add a table configuration for the Agent Assist tab or Response Template tab for custom tables or custom case types in the contextual side panel in CSM Configurable Workspace.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

About this task

The Agent Assist tab and the Response Template tab that appear in the contextual side panel use a UX page property that contains table configurations. To display these tabs for custom tables or case types, create a new UX page property called **contextualTableConfigMapping** and add the table configurations to that property.

The mapping for this property includes the tab name, the table name, and the sys_id of the table configuration. For example:

```
[{“tab_name”:[{“table=custom_table_name”:”the sys id of the
 table config”}]},
{“tab_name”:[{“table=custom_table_name”:”the sys id of table
 config”}]}]
```

```
[{“agent_assist”:[{“table=incident":"e15061a4b30303002bf182c136a
8dc34"}]},["response_template":[{“table=template”:”0a73bc83c3041
300e2fd5cb981d3ae29”}]}]
```

You can map multiple tables in this property. For example:

```
[{"agent_assist":[{"table=custom_table_name":"the sys id of
 table config"}, {"table=custom_table_name_2":"the sys id of
 table config"}]}]
```

You can also use operators to match multiple tables in the property configuration. The operators in the following example include:

- STARTSWITH
- ENDSWITH
- LIKE: This operator is used to match table names with a pattern. In the following example, the LIKE operator would match with all tables that include the word "case".
- IN: This operator enables you to set a list of values that must match values in your tables.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
[
  {
    "agent_assist": [
      {
        "tableSTARTSWITHkb_template":
 "5cb4030e73e2330021741c86fbf6a7e1"
      },
      {
        "tableENDSWITHu_kb_template":
 "5cb4030e73e2330021741c86fbf6a7e1"
      }
    ],
    "response_template": [
      {
        "tableLIKEcase": "5f0a5f7e77840010ec75945caa1061a5"
      },
      {
        "tableINagent_file, sn_customerservice_case":
 "82d52b55a300021033d6441d041e61bd"
      }
    ]
  }
]
```

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the UX Page Properties related list, select **New**.
4. Fill in the following fields on the UX Page Property form.

Field	Description
Page	CSM/FSM Configurable Workspace
Name	Use this name for the property: **contextualTableConfigMapping**
Type	json

Value	Include an entry for Agent Assist or for Response Template or both.
	
	Agent Assist example:
	`[{"agent_assist":[{"table=custom_table_name":"the sys id of table config"}]}]`
	
	Response Template example:
	`[{"response_template":[{"table=custom_table_name":"the sys id of table config"}]}]`
	
	Agent Assist and Response Template example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`[{"agent_assist":[{"table=custom_table_name":"the sys id of table config"}]},{"response_template":[{"table=custom_table_name":"the sys id of table config"}]}]`

5. Select **Save**.
   After adding the property, you can open the record page that uses the configured table and test the results in the contextual side panel.

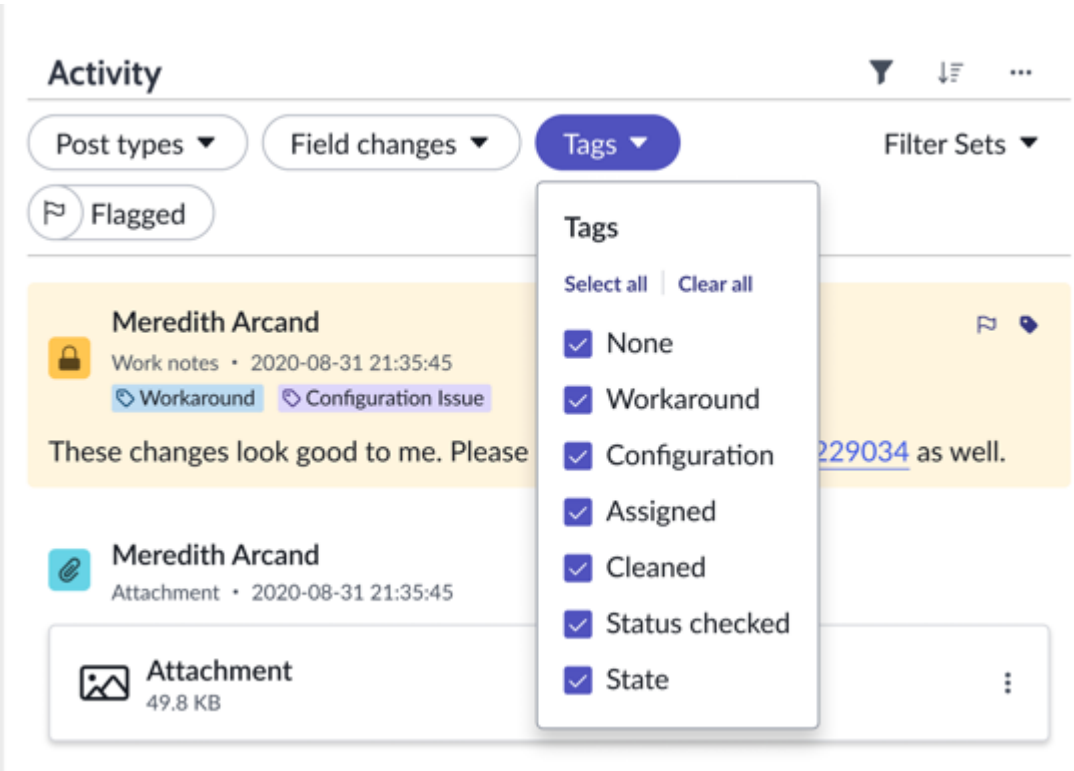
Configuring contextual search

Filter activities in the activity stream

Use tags to filter the items that appear in the activity stream.

Tags enable you to filter your activities in the activity stream by dynamic and static states not offered in filter lists. For example, these states can include Workaround or Status checked.



Tags are enabled and created by your system administrator. To enable and add tags for agents as a system administrator, see Create tags for the activity stream.

To use tags to filter activities in the activity stream, see Filter activities with tags.

Set up additional CSM workspace features

You can set up additional features for use in CSM workspaces. These features typically require plugin activation and some configuration.

You can set up the following features for use in CSM workspaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CSM workspace features

Feature	Description
Customer Central	Customer Central provides customer service agents with all the information about the customer in one central place. • The Customer Information view displays key information about the customer. • The Customer Activity view displays recent customer touch points in an activity feed. Use Customer Service guided setup to Configure Customer Central.
Customer Service Case Types	Configure case types to handle different types of customer issues. A case type identifies the processes and the data needed to resolve a specific type of issue, such as a lost or missing credit card. Use Customer Service guided setup to Configure customer service case types.
Proactive Customer Service Operations	Use this feature to track the digital services used by your customers and to proactively create cases for service disruptions. Use Customer Service guided setup to Configure Proactive Customer Service Operations.
Playbooks for Customer Service Management	Playbooks provide step-by-step guidance for completing the tasks needed to resolve specific types of customer service cases. The following playbooks are available for Customer Service Management from the ServiceNow Store: • Case Playbook for Onboarding • Case Playbook for Complaints • Case Playbook for Product Support
Guided decisions	Resolve complex cases faster and more efficiently by guiding customer service agents through a structured troubleshooting process. For details, see Configuring Guided Decisions.
Lookup and verify	This feature enables customer service agents to quickly look up contacts or consumers using information such as the name, phone number, or record number. For details, see Set up lookup and verify in Workspace.
Estimated time to resolve a case	Use machine learning to predict the estimated time to resolve a case (ETTR) based on case attributes such as the short description, category, priority, and assignment group.

CSM workspace features (continued)

Feature	Description
	For details, see Configure estimated time to resolve a case.

Migrating to Configurable Workspace

If you are currently using CSM Agent Workspace, you can implement CSM Configurable Workspace and continue using some of your existing CSM Agent Workspace configurations.

Some configurations can be used by both CSM workspaces while others need to be configured specifically for CSM Configurable Workspace. Of these configurations that are specific to CSM Configurable Workspace, some are accomplished in the platform interface using lists and forms, while others are accomplished using the UI Builder.

Use the topics in the following table to explore CSM Configurable Workspace features. Then follow the steps to implement CSM Configurable Workspace and migrate your existing CSM Agent Workspace configurations.

Explore	Migrate
• Explore CSM Configurable Workspace • Workspaces in Customer Service Management	1. Set up CSM Configurable Workspace 2. Migrate to CSM Configurable Workspace

Explore CSM Configurable Workspace

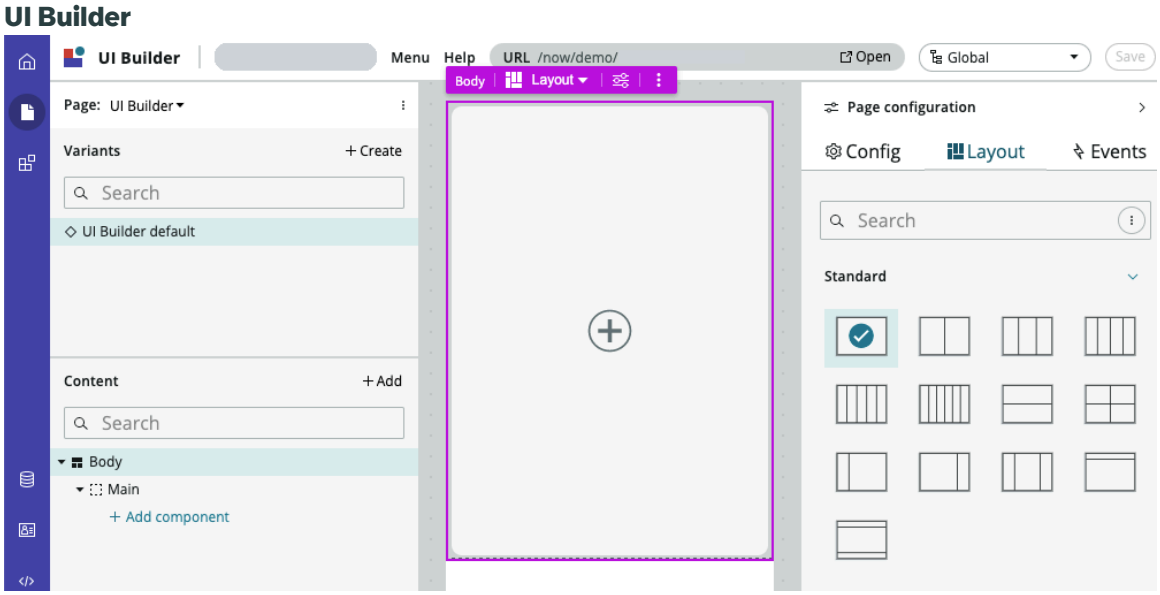
CSM Configurable Workspace is a workspace that can easily be configured and extended using UI Builder.

UI Builder is a drag-and-drop web user interface builder that you can use to build and configure CSM Configurable Workspace pages and components.

UI Builder

Working in UI Builder enables you to preview the final interface of the workspace you're building and to see the effects of different configurations. For CSM Configurable Workspace, some configurations are also performed in lists and forms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Working in UI Builder

A page in a workspace is made up of components that enable your users to accomplish one or more tasks. For example, you can create a page to solve employee software issues at your company.

You build out the functionality within the page by adding the components that you need for your user experience. Components are elements like buttons and data visualizations. UI Builder comes with a library of components you can add to the page.

After the components are on your page, you can change the layout any way you want. For example, you can use themes to make a page match your company's styles and standards. For more information, see Manage the visual style of UI Builder experiences.

Add an event mapping to a component. Event mapping is an important process within UI Builder. When you build pages with components, you need those pages to actually perform actions for users. For example, you can map a button to an event handler to perform a button action when a user selects that button. Another example may be adding a data resource such as a form. You could set up an event handler to notify a user when the page succeeds in loading the form.

UI Builder is as powerful as you need it. You can build simple web experiences, or you can create complex data-driven experiences.

Setting up CSM Configurable Workspace

For more information about configuring different features in CSM Configurable Workspace, such as ribbon configurations, form headers, and UI actions, see Set up CSM Configurable Workspace.

Migrate to CSM Configurable Workspace

Follow the instructions in this topic to migrate from CSM Agent Workspace to CSM Configurable Workspace.

If you are currently using CSM Agent Workspace and want to migrate to CSM Configurable Workspace, you can continue using most of your existing configurations. Some features,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

however, need to be configured specifically for CSM Configurable Workspace. You can migrate some of the configurations using lists and forms and others using the UI Builder tool.

Workspace configuration examples

Workspace configurations	Examples
Configurations that work in both CSM Agent Workspace and CSM Configurable Workspace without modification.	• Ribbons • Forms
Configurations that are different for CSM Configurable Workspace.	• Lists • List categories

Also, be aware that some configuration changes made for one workspace can also affect the other. For example, changes to the CSM Agent Workspace configuration may impact CSM Configurable Workspace. The same applies to changes to the CSM Configurable Workspace configuration, which may impact CSM Agent Workspace.

Note:
For customers who are **not** currently using CSM Agent Workspace and want to implement CSM Configurable Workspace:

- Use the CSM Configurable Workspace guided setup by navigating to **Customer Service** > **Administration** > **Guided Setup** > **CSM Configurable Workspace**. Clicking **Configure** in this category takes you to the Configurable Workspace guided setup. The information and instructions in the different guided setup categories can help you set up a new implementation of CSM Configurable Workspace.
- For additional information, see Setting up Workspace.

Workspace features

This section provides information, parameters, and steps to complete the migration of CSM Agent Workspace configurations to CSM Configurable Workspace. Select the feature that you want to migrate from the following list.

Workspace features and descriptions

Feature	Description
Activity stream	Activity Stream enables agents to communicate with requesters and make internal notes about the work done on a record.
Agent assist	Agent assist provides agents with automatic search results that show possible solutions for records they open.
Agent Chat for Customer Service Management Configurable Workspace	Agent Chat enables agents to interact with customers, create incident or case records, or transfer chats to another agent or queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workspace features and descriptions (continued)

Feature	Description
Branding and theming	Branding and theming enables you to customize your Configurable Workspace to your company branding and theming.
Email Composer and Email Viewer	The Email Composer enables requestors and fulfillers to use email to communicate.
Customer Central	Customer Central displays all the touch points that a customer has had with a contact center in the form of information cards.
Declarative actions	Declarative actions add custom functionality to your Workspace forms, fields, lists, and related lists without writing custom scripts or learning APIs.
Forms	The form is the user interface where agents do most of their work.
Form headers	Form headers provide an overview of the record.
Global Search in configurable workspaces	Global Search provides users with the ability to search for information within the defined search sources.
Highlights	Highlights provide background color that visually expresses the status of a highlighted value.
Lists	The list view displays filtered lists of records, such as All tasks, Open tasks, and My tasks.
Ribbons	Ribbons help agents quickly scan relevant information about a record, such as a timeline, a user, or a customer summary.
UI Action Bar	UI actions include custom buttons, menu items, and limiting access to forms based on user role.

Activity stream

Learn about how the Workspace Activity stream functions in Configurable Workspace.

Activity stream enables agents to communicate with requesters and make internal notes about the work done on a record. Configure the Activity stream and Activity stream Compose components in UI Builder to set up Activity stream in Configurable Workspace.

For more information about the Activity Stream component, see Next Experience Components documentation and select Activity Stream from the list of Next Experience Components.

Activity Stream corresponding parameters

Workspace Activity stream matched with Configurable Workspace parameters.

Note:
Not every Configurable Workspace component parameter has a corresponding Workspace (legacy) parameter.

Agent assist

Learn about how the Workspace Agent assist functions with Configurable Workspace.

Agent assist provides agents with automatic search results that show possible solutions for records they open. Configure Agent assist in Configurable Workspace by configuring a record page with a Glide form data source and a Contextual Sidebar. For more information, see Agent assist Overview on the ServiceNow Developer Site.

Note:
You may need to log in to the Developer Site to see the content.

For more information about using contextual search for Agent Assist, see the following topics:

- Contextual search
-

Agent Chat for Customer Service Management Configurable Workspace

Learn how the CSM Agent Workspace Agent Chat functions with CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Chat enables agents to interact with customers, create incident or case records, or transfer chats to another agent or queue. CSM Agent Workspace Agent Chat configurations work with CSM Configurable Workspace.

For more information about the Agent Chat component, see Next Experience Components documentation and select Agent Chat from the list of Next Experience Components.

Agent Chat corresponding parameters

Parameters that are hidden in UI Builder (UIB) aren't configurable in UIB. These parameters are used for specific customer workflow use cases.

Component parameters for Agent Chat

Component	Legacy component name	Legacy component parameter name	UIB component parameter name
Agent Chat	sn-chat	Interaction - Active	• Interaction Sys ID - Active (Hidden in UIB) • User isUxf (Hidden in UIB)

Branding and theming

Learn about branding and theming for your Configurable Workspace.

Branding and theming enables you to customize your Configurable Workspace to your company branding and theming. Configure your Configurable Workspace branding and theming in UI Builder to brand and theme your Configurable Workspace.

For more information about branding and theming, see the following topics:

- View the brand and theme setting in your workspace experience
- Configuring Next Experience with Theme Builder
- Configuring Next Experience themes and preferences

Email Composer and Email Viewer

Learn about how the Email Composer and Email Viewer function with Configurable Workspace.

Email Composer

The Email Composer component enables requestors and fulfillers to use email to communicate. The component is associated with a record to include conversations as part of the record. For example, an agent can compose an email to a customer to gather information about the customer's case.

Email Composer corresponding tables

Legacy table name	UIB table name
No corresponding table	sys_ux_screen

Configure the Email Composer in UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about the Email Composer component, see Next Experience Components documentation.

Email Viewer

The Email Viewer component enables customer service agents to preview emails in CSM Configurable Workspace before sending them to customers. The component is associated with a record to include emails as part of the record.

Email Viewer corresponding tables

Legacy table name	UIB table name
No corresponding table	sys_ux_screen

Configure the Email Viewer in UI Builder.

For more information about the Email Viewer component, see Next Experience Components documentation.

Customer Central

Learn about how CSM Agent Workspace Customer Central functions with CSM Configurable Workspace.

Customer Central displays all the touch points that a customer has had with a contact center in the form of information cards. CSM Agent Workspace Customer Central configurations function in CSM Configurable Workspace. Configuration changes at the sn_customercentral_cust_info_config and sys_declarative_action_assignment and their related lists, however, can be configured in CSM Configurable Workspace.

- Set up the Customer Information view in CSM Configurable Workspace using Guided Setup.
- Set up the Customer Information view in CSM Agent Workspace using Guided Setup.

Customer Central corresponding tables

Legacy table name	UIB table name
sys_declarative_action_assignment	sys_ux_screen

Declarative actions

Learn how the Workspace declarative actions function with configurable workspace.

Declarative actions add custom functionality to your Workspace forms, fields, lists, and related lists without writing custom scripts or learning APIs. Declarative actions include: form and list actions, related list actions, and field decorators.

Declarative actions corresponding tables

Legacy table name	UIB table name
Action Assignment [sys_declarative_action_assignment]	Action Assignment [sys_declarative_action_assignment] UX Add-on Event Mapping [sys_ux_addon_event_mapping]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To migrate a declarative action, convert your custom declarative actions to new UXF Client Action type, and then define the corresponding add-on event mapping. For more information, see the following topics:

- Customizing your workspace with declarative actions
- Create a UXF client action for forms
- Declarative actions glossary
- Custom Playbook actions

Related topics

Manage actions in UI Builder pages

Bind an event to a declarative action

Forms

Learn how the Workspace form functions with Configurable Workspace.

The form is the user interface where agents do most of their work. Workspace form configurations work without modification in Configurable Workspace, but the configurations may affect the functioning of your Configurable Workspace.

Form parameters

Form mapping doesn't directly correspond between Workspace form components and Configurable Workspace form components. Workspace components are hard-coded with the form and incorporate everything on the form including the form header, UI action bar, Activity stream, the sidebar, etc. In Configurable Workspace, these features are separate components.

Form headers

Learn how Workspace form headers function with Configurable Workspace.

Form headers provide an overview of the record.

Form header corresponding tables

Legacy table name	UIB table name
sys_aw_form_header	sys_aw_form_header sys_ux_header_config sys_ux_m2m_workspace_header_ux_header_config

To migrate your Workspace form header to Configurable Workspace, add an additional step in custom form headers to the Configurable Workspace form header setup.

- An additional form header configuration is provided out of box, CSM/FSM Configurable Workspace Header Config.
- Legacy form headers function without modification, but may affect the functionality of Configurable Workspace.
- Add the Form header component to your Configurable Workspace for additional functionality.

For additional information, see Set up a form header in Configurable Workspace.

Global Search in configurable workspaces

Learn about how the CSM Agent Workspace Global Search functions with CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Global Search provides users with the ability to search for information within the defined search sources.

Global Search corresponding tables

Legacy table name	UIB table name
sys_aw_global_search_config	sys_ux_page_property

For more information, see Using AI Search with CSM Configurable Workspace.

Highlights

Learn how Workspace highlights function with Configurable Workspace.

Highlights provide background color that visually expresses the status of a highlighted value. The status you choose determines the color highlight.

Highlight corresponding tables

Legacy table name	UIB table name
sys_highlighted_value	sys_highlighted_value sys_ux_highlighted_value_config sys_ux_m2m_highlighted_value_config

To migrate your highlights, add an extra step in the custom highlighted values to Configurable Workspace.

An additional highlighted value configuration is provided out of box, CSM/FSM Configurable Workspace Highlighted Value Config.

- Legacy highlighted values in form headers work without modification, but may affect the functionality of Configurable Workspace.
- Highlighted values must be added to a highlighted value configuration to appear in Configurable Workspace.

For more information, see Set up a highlighted value.

Lists

Learn about how Workspace lists function with Configurable Workspace.

The list view displays filtered lists of records, such as All tasks, Open tasks, and My tasks. By setting up list categories and filtered lists, you help your agents quickly find the records they need to work on. Configure your Workspace lists setups in Configurable Workspace.

List Menu Configuration

The Menu Configuration is a container that houses the default configurations of the list menu which consists of categories and filters.

List Menu corresponding tables

Legacy table name	UIB table name
No corresponding table	sys_ux_list_menu_config

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The List Menu setup is added by default to Configurable Workspace. Associate your list and list categories with this configuration.

List categories

List categories enable you to group records so that agents can find the records they need to work on.

List category corresponding tables

Legacy table name	UIB table name
sys_aw_list_category	sys_ux_list_category

List category data lives in a new UIB table. For more information about setting up list categories, see List categories.

Filtered lists

Filtered lists enable you to group records that help agents do their work more efficiently.

Filtered list corresponding tables

Legacy table name	UIB table name
sys_aw_list	sys_ux_list

List filter data lives in a new UIB table. For more information about setting up list filters, see List filters.

Note:
Roles and groups are defined in the UIB table and are not applicable.

Role and Access

Roles and access enable you to define the audience of each of the lists defined in the list filters.

Role and Access corresponding tables

Legacy table name	UIB table name
sys_aw_list	sys_ux_applicability_m2m_list

To migrate roles and access, select a filtered list and choose the audience.

Ribbons

Learn how CSM Agent Workspace ribbons function with CSM Configurable Workspace.

Ribbons help agents quickly scan relevant information about a record, such as a timeline, a user, or a customer summary.

Ribbon corresponding tables

Legacy table name	UIB table name
sys_aw_ribbon_setting	sys_aw_ribbon_setting sys_ux_ribbon_config sys_ux_ribbon_config_setting

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy ribbon widgets work in CSM Configurable Workspace, but not the legacy ribbon configurations. Add ribbon settings to a ribbon configuration to appear in CSM Configurable Workspace.

For more information, see Set up a ribbon configuration in Configurable Workspace.

UI Action Bar

Learn how the Workspace UI Actions component functions with Configurable Workspace.

UI actions include custom buttons, menu items, and limiting access to forms based on user role. The UI Action Bar component replaces the UI Actions component in Workspace.

UI Action Bar corresponding tables

Legacy table name	UIB table name
sys_ui_action	sys_ux_form_action

To migrate UI actions, each UI action must have a corresponding form action to use UI actions in Configurable Workspace.

For more information, see Set up a form action in Configurable Workspace.

Case routing and assignment

Set up Advanced Work Assignment (AWA) to automatically route cases to the appropriate customer service agents in CSM Configurable Workspace.

Setting up Advanced Work Assignment for CSM Configurable Workspace

Topic	Description
Exploring Advanced Work Assignment	Learn more about the AWA tool, including concepts such as work assignment and assignment rules, service channels, work items and work item queues, and agent capacity.
AWA for CSM	Use AWA to automatically assign work to your agents based on availability, capacity, and skills. AWA pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Agents see their assignments in their CSM Configurable Workspace inbox.
Set up an Advanced Work Assignment service channel for assigning case tasks	Set up an Advanced Work Assignment (AWA) service channel that you can use to assign case tasks to available users.
Configure the AWA queues for the proxy contact role	Modify the Advanced Work Assignment queues and add routing conditions that support the proxy contact role. This role enables employees to create cases for customer accounts and contacts. Employees can also be proxy case contacts on behalf of customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AWA for CSM

Use the ServiceNow® Advanced Work Assignment (AWA) for Customer Service Management feature to automatically assign work items to agents based on their availability, capacity, and skills. AWA for CSM pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Agents see their assignments in their Agent Workspace inbox.

Plugins

The Advanced Work Assignment for CSM feature is available with the Customer Service plugin (com.sn_customerservice).

To use the shift-based assignment feature for customer service cases, you must enable the Workforce Optimization for Customer Service plugin (com.snc.wfo.csm) in addition to the Advanced Work Assignment plugin (com.glide.awa). For more information, see Activate Workforce Optimization for Customer Service.

To use the chat feature with Advanced Work Assignment for CSM, you must also activate the Agent Chat plugin (com.glide.interaction.awa).

For more information, see Activate related plugins for Advanced Work Assignment.

Inbox layouts

Three chat inbox layouts are included with the Chat service channel.

Chat Layouts and fields on the Chat Service channel

Chat Layout	Included Fields
Default Chat Layout	Short description
Contact Chat Layout	Short description, Contact, Account
Consumer Chat Layout	Short description, Consumer

Two case inbox layouts are included with the Case service channel.

Case Layouts and fields on the Case service channel

Case Layout	Included Fields
Default Case Layout	Short description, Contact, Account, Priority, Category
Consumer Case Layout	Short description, Consumer, Priority, Category

Variable work item sizing

Organizations may like to size cases based on the complexity of the case, time and effort required to complete work. This helps in estimating agent utilization accurately. Advance work assignment currently treats every case as one unit of work. However, sometimes, certain cases may require more work than others. These cases may account for a greater share of an agent's capacity. Work item sizing allows to size the case differently based on the case attributes. For more information, see Service channel capacity and utilization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent affinity

Agent Affinity is an Advanced Work Assignment enhancement that enables you to streamline the routing of work items. Advanced Work Assignment automatically assigns work items based on historical, task-based, or account team affinity. For more information about agent affinity, see Using Agent Affinity.

Related topics

Advanced Work Assignment

Set up an Advanced Work Assignment service channel for assigning case tasks

Set up an Advanced Work Assignment (AWA) service channel that you can use to assign case tasks to available users.

Before you begin

Role required: admin

You can use the Advanced Work Assignment (AWA) feature to automatically assign work items to users based on their availability and capacity.

AWA assigns work items using assignment groups so it's important that your users and groups are set up correctly.

- Determine the assignment group to use in the AWA service channel configuration and add users to this group.
- Add the **Assignment Group** field to the Case Task form view and make the field mandatory.
- Ensure that the users in the assignment group have access to case tasks.

> **Note:**
> By default, CSM uses assignment groups to control visibility to case tasks. Therefore the logic to assign a case task to the correct assignment group is triggered when a case task is created.

About this task

Setting up a service channel involves multiple steps, which are detailed in the following procedure. Once the service channel setup is complete, you can use AWA to assign newly created case tasks that:

- Are unassigned.
- Satisfy the conditions specified in the service channel.
- Have the configured AWA assignment group selected in the **Assignment Group** field on the Case Task form.

Procedure

1. Create the case task service channel.

   a. Navigate to **Advanced Work Assignment** > **Service Channels** and click **New**.

   b. Fill in the fields on the Service Channel form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New service channel field description

Field	Description
Name	Name of the service channel that you are configuring. For example, Case Task.
Inbox order	Order in which channel items appear in the user inbox. The **Inbox Order** field is an integer field type. This field can store whole numbers.
Application	Name of the application. For the Case Task channel, select Customer Service.
Active	Option for activating the service channel. When you select this option, the associated queues for the service channel can start accepting work items.
Short description	Brief description of the service channel.
Table	Table that stores the service channel records. To route case tasks, select the Task (sn_customerservice_task) table.
Assign to field	Field that references the user that the item is assigned to. For the Task table, this field is the **Assigned to** (assigned_to) field.
Assignment group field	Field that references the assignment group that the item is assigned to. For the Task table, this field is the **Assignment group** field.
Advanced condition	If enabled, the advanced conditions that apply to the channel. For case tasks, the parent case is active: **[Active] [is] [true]**.
Default work item size	Amount of a user's capacity that is used if this work item is assigned. The default is 1.
Default capacity	Number of items automatically assigned to agents (pending overrides). The default for this field depends on the type of work item.
Utilization condition	Condition that determines what constitutes an active item that counts toward user workload/capacity. For case tasks: **[State] [is not] [Closed]**.

c. Click **Submit**.
The system adds the Case Task channel to the Service Channels list.

For more information about creating an AWA service channel, see Create a service channel.

2. Configure the layout for the case task inbox card.

a. Click **Case Task** in the Service Channel list to open the record.

b. In the Inbox Layout related list, click **Default Case Task layout**.

c. Add the following fields to the card layout.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Field 1**: Number
- **Field 2**: Subject
- **Field 3**: Parent Number

d. Click **Update**.

For more information about configuring the card layout, see Create or modify an inbox layout.

3. Create a queue for the case task service channel.

a. In the Queue related list, click **New**.

b. Fill in the following fields on the Queue form.

Queue related list field description

Field	Description
Name	Name of the queue. For example, Case Task Assignment.
Short description	Brief explanation of the queue. For example, Assign case tasks to middle office users.

c. Click **Submit**.

For more information about configuring a queue, see Create a work item queue.

4. Create an assignment rule for the Case Task Assignment queue.

a. Navigate to **Advanced Work Assignment** > **Assignment Rules** and click **New**.

b. Fill in the fields on the Assignment Rule form.

New assignment rules field description

Field	Description
Name	Name of the assignment rule.
Short description	Brief description of the assignment rule. For example, Assign the case tasks based off this configuration.
Assign by	Type of assignment. Select **Most Capacity**, which routes a work item to the user who has the greatest availability for handling the work.
Allow agents to reject	In the Rejection handling form section, enable this check box to enable users to reject work items in their inbox.

c. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about creating an assignment rule, see Configure agent assignment rules.

5. Create a group for the Case Task Assignment queue.

   a. Navigate to **Advanced Work Assignment** > **Management** > **Groups** and click **New**.

   b. Fill in the fields on the Group form and click **Submit**.

   c. Click the group to display the Group form.

   d. In the Group Members related list, add users to the group.
   The users that you add to the group for the Case Task Assignment queue require the following roles:

   - Case task agent (sn_customerservice.case_task_agent)
   - AWA agent (awa_agent)

   For more information about creating a group, see Create or modify groups for Advanced Work Assignment queues

6. Associate the assignment rule with the Case Task Assignment queue.

   a. Navigate to **Advanced Work Assignment** > **Settings** > **Queues** and click the Case Task Assignment queue.

   b. In the Assignment Eligibility related list on the Queue form, click **New**.

   c. Select the case task assignment rule in the **Agent assignment rule** field.

   d. Select the case task assignment group in the **Groups** field.

   e. Click **Submit**.

7. Activate the service channel.

   a. Navigate to **Advanced Work Assignment** > **Settings** > **Presence States**.

   b. Click the **Available** presence state and add the case task service channel to the **Selected** column.

   c. Click **Update**.
   Once the service channel is activated, you can use it to assign work items. For more information, see Service channels.

Configure the AWA queues for the proxy contact role

Modify the Advanced Work Assignment queues and add routing conditions that support the proxy contact role and the **Internal contact** field on the Case form.

Before you begin

Role required: admin

About this task

Modify the following AWA queues:

- For the Case service channel: Customer Service Cases
- For the Chat service channel: Customer Service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Queues**.
2. Select the **Customer Service Cases** queue.
3. In the **Work item routing condition** field, add the following OR condition: **Internal Contact is not empty**.
4. Click **Update**.
5. Select the **Customer Service** queue.
6. In the **Work item routing condition** field, add the following OR condition: **Roles is sn_customerservice.proxy_contact**.
7. Click **Update**.

Agent tools

Enable agents to resolve cases quickly and efficiently by providing them with tools, such as Guided Decisions, playbooks, dynamic related records, and Customer Central.

Setting up agent tools

Tool	Description
Guided Decisions	Set up structured troubleshooting processes to help agents resolve complex issues in a consistent way.
Playbooks	Set up playbooks to provide agents with step-by-step guidance for resolving specific types of customer service cases, including onboarding, complaint, and product support cases.
Dynamic related records	Configure the dynamic related records feature to display related records in the contextual side panel in CSM Configurable Workspace. These records dynamically change based on the context of the current record or playbook activity.
Customer Central	Configure the Customer Information and Customer Activity views in Customer Central to provide agents with all the information about a customer in one central place.
Customer Service mobile application	Configure and customize the Customer Service mobile application for agents who use the application instance on their mobile devices.

Configuring Guided Decisions

Create structured troubleshooting processes for your agents through the ServiceNow® Guided Decisions Experience application. Help your agents solve complex issues in a consistent way.

The Guided Decisions Experience application is a tool for authoring and running decision tree flows. A decision tree walks an agent through a troubleshooting process based on a record context. The process asks a series of questions and the agent provides the answers. Based on those answers, the agent receives guidance on the next steps to take in the resolution

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

process. Agents can resolve complex issues faster and more efficiently. For more information, see Decision trees in Guided decision.

Scenarios for using decision trees

Decision trees can help agents resolve the following types of customer issues:

- Troubleshoot a faulty device, such as a laptop that doesn't work. Use a decision tree to find the cause and provide a fix for the customer.
- Review a refund request. Use a decision tree to determine whether the customer is eligible for a refund, which can include checking for exceptions and creating tasks.
- Reset a customer's password. Use a decision tree to walk the agent through the process, such as verifying the customer's identity, trying other options, and, if needed, resetting the password.

For an example of end-to-end configuration of a decision tree for a specific scenario, see Example configuration of a decision tree.

Guided Decisions features

- Reuse values in a decision tree by linking inputs in question and guidance nodes. You can also link inputs of a child tree to a parent tree.
- Link an activated decision tree to your current decision tree to reuse other decision trees and reduce effort in creating new ones. The linked decision tree acts as a child tree to the current decision tree.
- Enable users to edit their responses in the previous question nodes or a guidance node.

  In a nested decision tree, users can navigate back to the previous node of a parent tree from a child tree.

Guided Decisions experiences

The Guided Decisions Experience application provides two different experiences for creating and editing decision trees: through the Decision Tree Builder or the Core UI.

- Create a graphical diagrammatic representation of nodes and their paths in a troubleshooting process through the Decision Tree Builder. For more information, see Decision trees in Decision Tree Builder.
- Use forms and lists and edit existing decision trees through the Core UI. For more information, see Decision trees in Core UI.

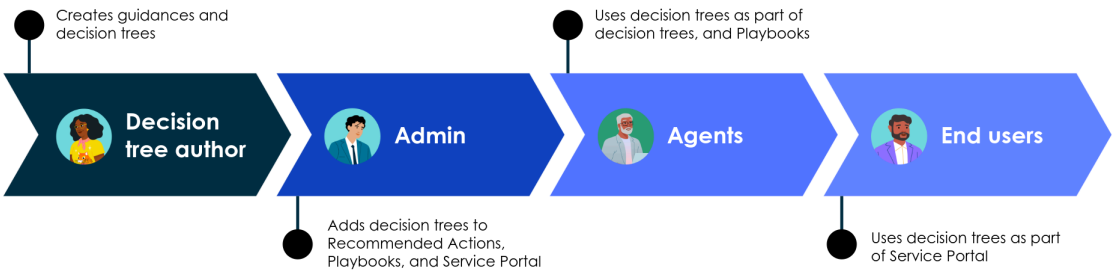
Setting up the Guided Decisions Experience application

As an admin, set up the Guided Decisions Experience application to enable users to create and run decision trees by completing the following setup tasks:

- Install the Guided Decisions Experience application.
- Assign roles to Guided Decisions users - Use roles to control access to Guided Decisions features and information.
- Install the Recommended Actions application - Enables decision trees to be run as recommended actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating and using decision trees



Users with the decision tree author role (decision_tree_author) create decision trees. After creating a decision tree, the decision tree is implemented by adding it to a recommended action, playbook, or Service Portal. For more information, see the following topics:

- Create a decision tree in Decision Tree Builder
- Edit a decision tree in Core UI
- Add Guided Decisions to playbooks
- Add Guided Decisions to Recommended Actions
- Add Guided Decisions to Service Portal

Agents interact with decision trees as part of a recommended action or as part of a playbook within a record, such as a case.

Customers and end-users interact with decision trees on Service Portal.

For guided decisions that are added to playbooks, agents can work through the decision trees and complete actions suggested in the guidance as part of a playbook stage or activity. How the agent interacts with the decision tree depends on the playbook configuration. For more information, see the following topics:

- Use Guided Decisions in playbooks to resolve cases
- Use Guided Decisions in recommended actions to resolve cases

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Decision trees in Guided decision

Decision trees and guidances enable agents to work through a structured troubleshooting process to resolve customer issues faster and provide standardized resolution.

Decision trees

A decision tree is a multi-step process that includes a series of questions, answers, and a guidance for an agent to follow. This process is made up of different decision tree elements, including nodes, inputs, and paths. For more information, see Decision tree elements.

Decision trees contain different types of nodes. Decision nodes represent one or more questions. Guidance nodes provide recommendations to agents. Each decision tree has a root node called the start node. Each node includes a path to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the next node. Based on the answers to the questions, each decision node leads to an outcome, which can be a guidance, a follow-up question, or another decision tree.

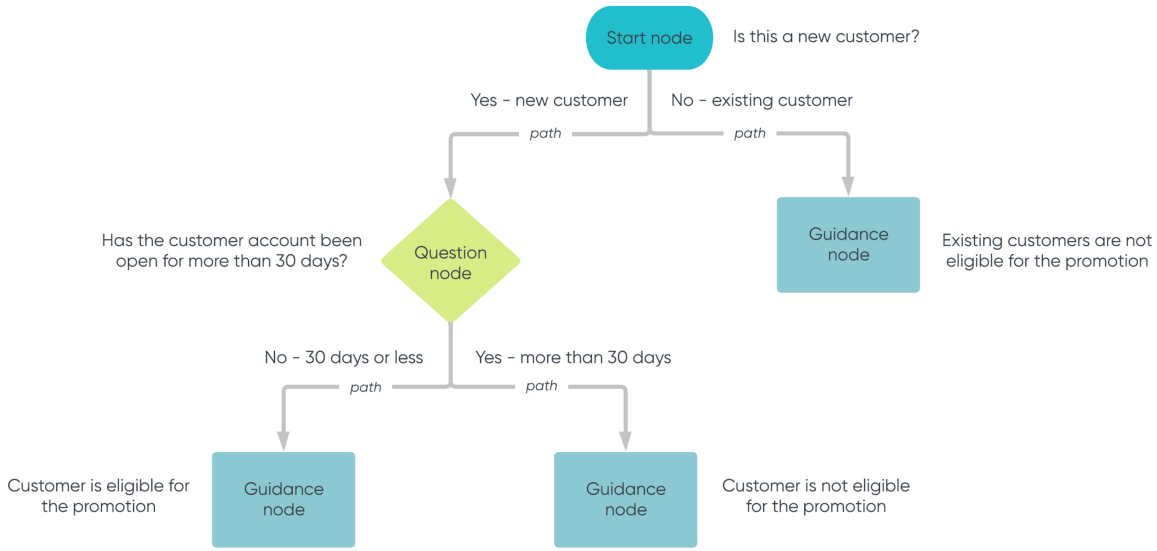
Guidances

A guidance is an action that an agent can take or information that an agent can share. For example, a guidance can recommend that the agent can share a knowledge article or create a work order. Agents can perform the action by clicking a button on the card.

Decision tree example

The following example uses a flowchart to show the structure of a decision tree that determines customer eligibility for a promotion. This promotion is available to customers who opened their accounts within the last 30 days.

Decision tree for evaluating customer eligibility



The agent can select one of two paths to answer the question "Is this a new customer?"

- The **No** path indicates that the customer isn't eligible for the promotion.
- The **Yes** path asks an additional question to determine if the account has been open for more than 30 days.
  - If **Yes**, the customer isn't eligible for the promotion.
  - If **No**, the customer is eligible to receive the promotion.

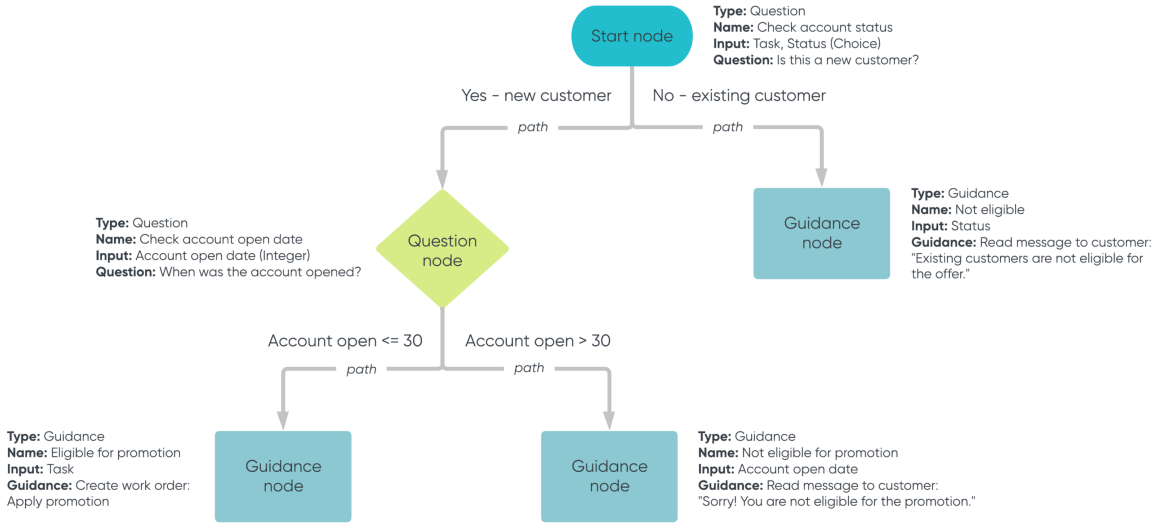
Decision tree configuration details



For more information about creating a decision tree, see the following topics:

- Configuring decision trees in Decision Tree Builder
- Create a decision tree in Core UI

Decision tree elements

Decision trees are made up of several types of elements including nodes, inputs, and paths.

Decision trees are built using different elements, which are described in the following table. The terminology for these elements differs slightly between Decision Tree Builder and Core UI but the definitions remain the same. For more information decision tree nodes and paths, see Decision tree nodes and Decision tree paths.

Core UI terms, decision tree builder terms, and definitions

Core UI term	Decision Tree Builder term	Definition
Decision tree	Decision tree	A multi-step process that includes a series of questions and answers. Based on the answers, each question in a decision tree leads to another question, a guidance for the agent to follow, or another decision tree.
Node	Node	A node is a point in a decision tree. You can create different types of nodes depending on what is happening at that point in the tree. Node types include the following: • Start node • Question node • Guidance node • Linking node
Start node	Start node	The first node in a decision tree. When you create a decision tree, the system

© 2026 ServiceNow, Inc. All rights reserved.

Core UI terms, decision tree builder terms, and definitions (continued)

Core UI term	Decision Tree Builder term	Definition
		automatically creates the start node. The start node can be a question or a task.
Decision node	Question node (When adding a node and selecting **Ask users at least one question** in the pop-up window)	This type of node represents one or more questions. The answers to the questions lead to an outcome, which can be another question, a guidance, or another decision tree.
Guidance node	Guidance node (When adding a node and selecting **Propose a guidance as an outcome** in the pop-up window)	This type of node has a reference to a guidance, which provides a recommendation to an agent.
Linking node	Linking node (When adding a node and selecting **Link decision tree** in the pop-up window)	A linking node includes a reference to another decision tree. This linking connects the execution of the primary decision tree to another decision tree when a specific condition is met.
Guidance	Guidance	An action that an agent can take or information that an agent can share. You can select guidances included with the Guided Decisions Experience plugin or you can Create a guidance in the Core UI.
Decision input	Question or instruction	A question or instruction with a configured answer type. When working through a decision tree, an agent can provide an answer to the question in the format of answer type that you configure.
Input type	Type of answer	The type of data that the question in a question node can accept as an answer, such as string, integer, or choice. For a list of supported input types, see Answer types for questions.
Decision input mapping	Link input	Linking inputs from one decision tree node to another to reuse input values in prior decision tree nodes.
Label (for a node)	Node name	The name for a question, guidance, or linking node. In Decision Tree Builder, this name appears on the node in the canvas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Core UI terms, decision tree builder terms, and definitions (continued)

Core UI term	Decision Tree Builder term	Definition
Type (for a node)	Node purpose	The type of a node in the Decision Tree Node record in Core UI. The purpose of a node in the right panel in Decision Tree Builder. • Question node: Ask users at least one question • Guidance node: Propose a guidance as an outcome
Not applicable	Path	A path connects two nodes in a decision tree or question node to the start node of the next decision tree. A path is created and associated with a node and represents the potential outcome of that node.
Decision path	Not applicable	A path that provides possible outcomes of a decision node. A decision path links a decision node to the next node of type decision.
Guidance path	Not applicable	A path that links a decision node to the next node of type guidance.
Linking path	Not applicable	A path that links a decision node to the start node of the next decision tree.
Order	Path priority	The priority in which the path is executed.

Decision tree nodes

Decision trees include several types of nodes, including start nodes, question nodes, guidance nodes, and linking nodes.

A decision tree begins with a start node, which presents the first set of questions to an agent. The start node is typically followed by a question node, which asks another set of questions. A question node can be followed by another question node, a guidance node, which provides a recommendation to an agent, or by a linking node, which includes a reference to another decision tree.

You can enable agents to modify their responses in previous nodes:

- Agents can go back to the previous node by selecting the **Back** button.
- Agents can jump to any previous node by selecting the Edit icon) in the View my responses tab.

For more information, see Create a decision tree in Core UI and Add questions or instructions to a decision tree.

Start nodes

A start node is the first node in a decision tree. When you create a decision tree, you provide internal and external names, a title and short description, and a name for the action label. After

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

saving the record, the system creates the decision tree and the start node. You can use this start node to build the rest of the decision tree.

A start node includes a minimum of one question. A start node always has a task input of reference type so you can reuse the task input in other decision or guidance nodes via linking inputs. The task input includes a reference to the table that stores the record type that the agent is working on.

Decision or question nodes

A question node asks one or more questions. The answer to the question leads to an outcome, which can be another question, a guidance for the user to follow, or another decision tree.

A question node presents the agent with a question or instructions to follow to evaluate the customer's situation and provide the right solution. You can add HTML formatting, such as images, links, or text formatting to the question node. Examples of typical questions or instructions include:

- For resetting a password: "What is the customer's account ID?"
- For troubleshooting a faulty device: "What is the device type or model number?"

The answers to the questions are used to create path conditions.

For more information about the available answer types, see Answer types for questions.

Note:
Using unsupported input types can cause errors in the runtime experience.

Guidance nodes

A guidance node proposes a solution to a customer’s issue through a reference to a guidance, which provides a recommendation to an agent. Examples of a guidance include recommending a knowledge article, creating a work order, or escalating a case.

A guidance node can be followed only by a question node. The execution of the decision tree continues after the agent performs the guidance, and the guidance history is marked as complete. You can use a question node to connect two guidance nodes.

A guidance can have outputs, which drive further decision making. With a guidance, you can do the following:

- Define output variables.
- Define values for the output variables, which are mapped in the Automation Plan flow for the guidance by the Assign Guidance Outputs flow action.
- Connect the guidance to the guidance node's next node.
- Map the outputs of the guidance to inputs for the guidance node's next node.

For descriptions of the available guidances, see Guidances included with Guided Decisions Experience application.

Users with the Decision tree author role can also create guidances to reuse in decision trees or recommended actions. For more information, see Create a guidance in the Core UI.

Linking nodes

A linking node includes a reference to another decision tree. This type of node connects the execution of the primary decision tree to another decision tree when a defined condition is met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linking to another decision tree is useful for complex troubleshooting or for troubleshooting that requires multiple stages.

A linking node includes the following elements:

- A linked decision tree, where the execution of the primary decision tree continues after this node is reached.
- Input mapping, which maps the inputs from the nodes preceding the linking node to the start node of the linked decision tree.
- A path, which connects the previous question node to the start node of the child tree.

For more information, see the following topics:

- For Decision Tree Builder: Link an activated decision tree to this decision tree.
- For Core UI: Link another decision tree to this decision tree

Linking inputs in decision tree nodes

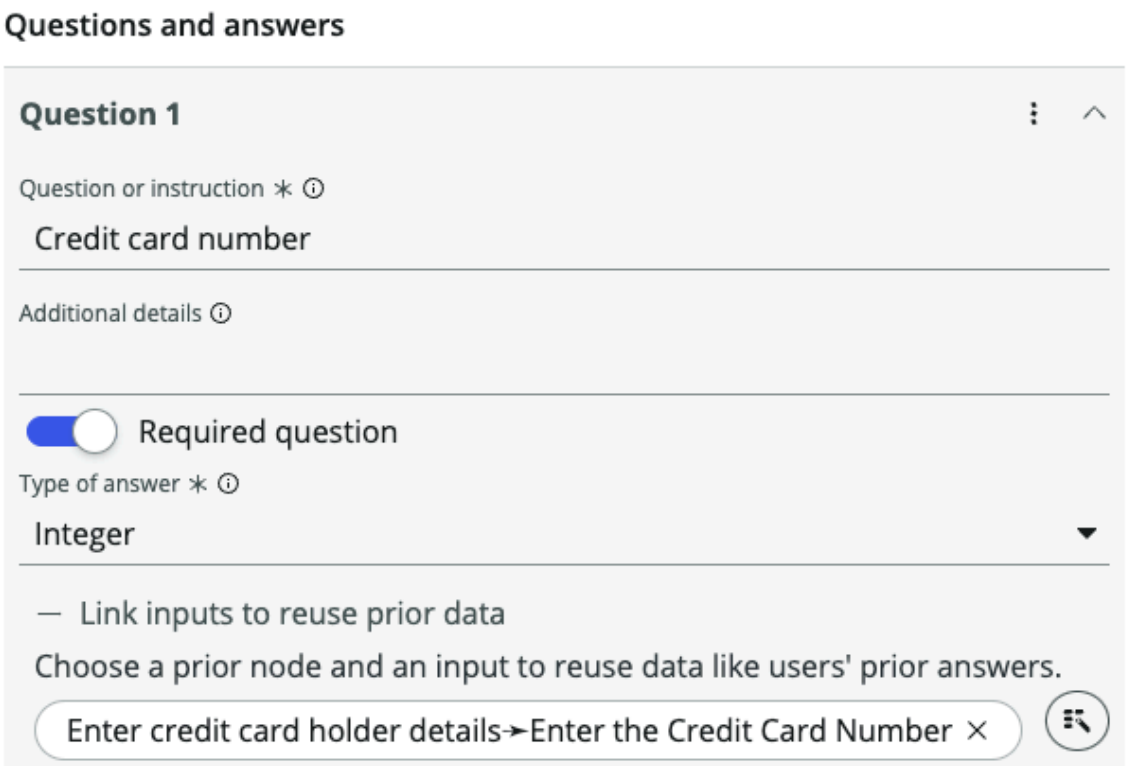
Linking of inputs enables decision tree authors to reuse input values (answers) from prior nodes.

Linking inputs in question and linking nodes

Most questions are presented to an agent to provide answers. When you link an input to another input, the question is not displayed to the agent. Because the input reuses values from the input it is linked to, the agent does not need to provide any answer.

Similar to other inputs, you can use linked inputs to create path conditions.

Example of linking inputs in a question node



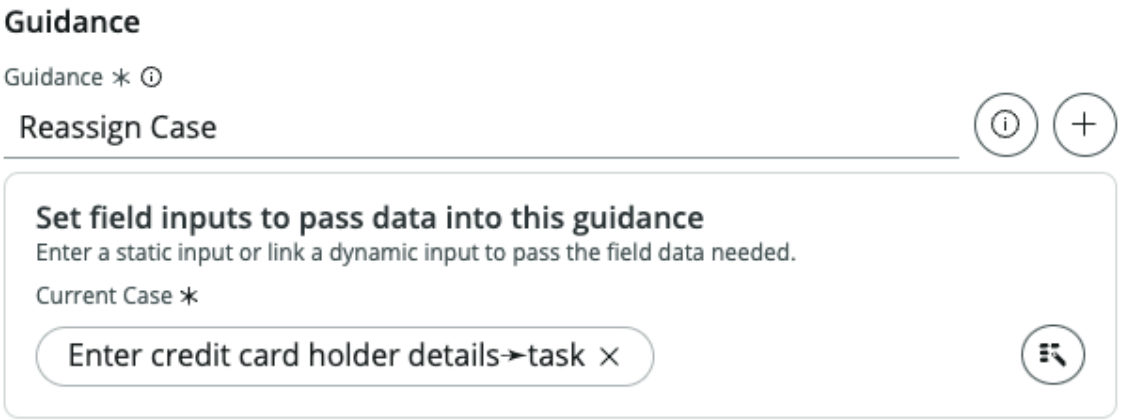
For example, if you have already asked the credit card number in the start node, you can reuse that input in the following question node. This question is not presented to the agent again and the value is automatically filled out during run time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Linking inputs in guidance nodes

With linking inputs, you can reuse the answers that customer provided to supply input values to the guidance inputs. You can link the task input in the start node to the guidance inputs to pass the information about the record that the agent is working on.

Example of linking inputs in a guidance node



For example, you can connect the start node's task input to the following guidance. The task input holds a reference of the record the agent is working on in a workspace. You need a case number, which is provided by the task input, for reassigning the case to someone else.

Special cases for linking inputs

In most cases, you can only link inputs to other prior node's inputs of the same type. For example, you can link a string input field type to another string input field type.

The Guided Decisions Experience application supports the following special cases.

Cases supported in the Guided Decisions

Input type	Description
String input field type	Accepts any type of field to be linked. For example, string accepts integer, decimal, choice, and others. String is a text field which accepts any characters.
Reference input field type	Accepts only reference type of field. You can link reference input types only if the current question node's input table matches the prior node's input table at the same level or at the child level. For example, the Task table can be linked to the Task table or the Task table can be linked to the Case table, which is a child of the Task table.
Choice input field type	Accepts choice type and string type because a choice in a choice list is a string.
Date and Date/Time input field types	Accepts the following types: • `glide_date_time` • `glide_date`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cases supported in the Guided Decisions (continued)

Input type	Description
	• `date` • `datetime` • `due_date` • `calendar`

Note:
The Guided Decisions Experience application does not support `glide_var` type fields to map to any inputs.

Decision tree paths

A path is created and associated with a node and represents the potential outcome of that node.

When you create a path, you provide a name, a priority, and the path conditions.

Field	Description
Path name	The path name appears in the decision tree.
Path priority	The priority determines which path and its conditions get checked first when there are multiple paths. A node can have more than one path but only one path from a node can be executed at a time. For example, a path with a priority of 100 has a lower priority value than a path with a priority of 200, so only path with priority 100 is executed.
Path conditions	Path conditions represent the potential answers or outcomes from a node. You create path conditions using a condition builder, which has access to its direct parent node's inputs. It uses these inputs to create informative path conditions that represent potential answers or outcomes for the node. Path conditions must be met in order to go to the path's destination node.

- Decision Tree Builder: Determine the next node displayed in a decision tree
- Core UI: Determine the next node in a decision tree

Example configuration of a decision tree

This example demonstrates an end-to-end configuration of a decision tree to help you get started with Guided Decisions. After you configure the decision tree, you can either embed it in a playbook or use it as a recommendation in Recommended Actions.

For more information about decision trees, see Decision trees in Guided decision and Configuring guidances and decision trees.

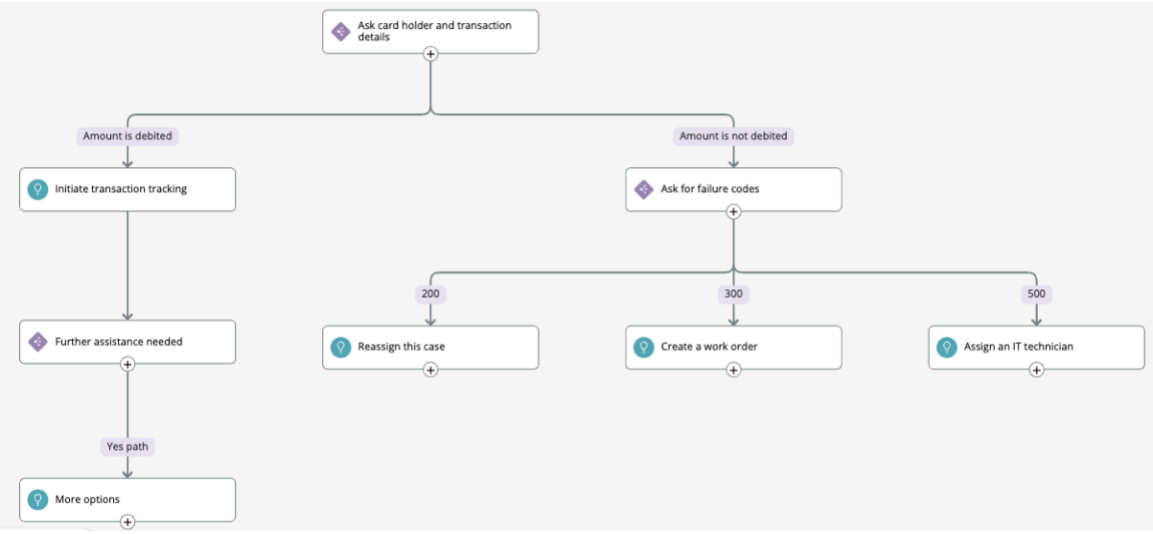
Troubleshooting a failed credit card transaction

Paul, who holds an account with the StellarVest bank is trying to purchase a smart watch using their credit card. But the transaction failed at the time of payment. Paul created a case in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

StellarVest bank portal seeking assistance. Agents from the StellarVest bank work on the cases created by customers to resolve their issues.

In this scenario, the agent assigned to the Paul's case uses a decision tree to troubleshoot the failed credit card transaction. The decision tree collects user, credit card, and transaction details. If money was debited, transaction tracking is initiated. However, if no money was debited, the agent provides a failure code which determines what guidance is provided. Examples of potential guidances include: reassigning the case, creating a work order, or assigning the case to an IT technician.



Creating the decision tree to troubleshoot the failed transaction

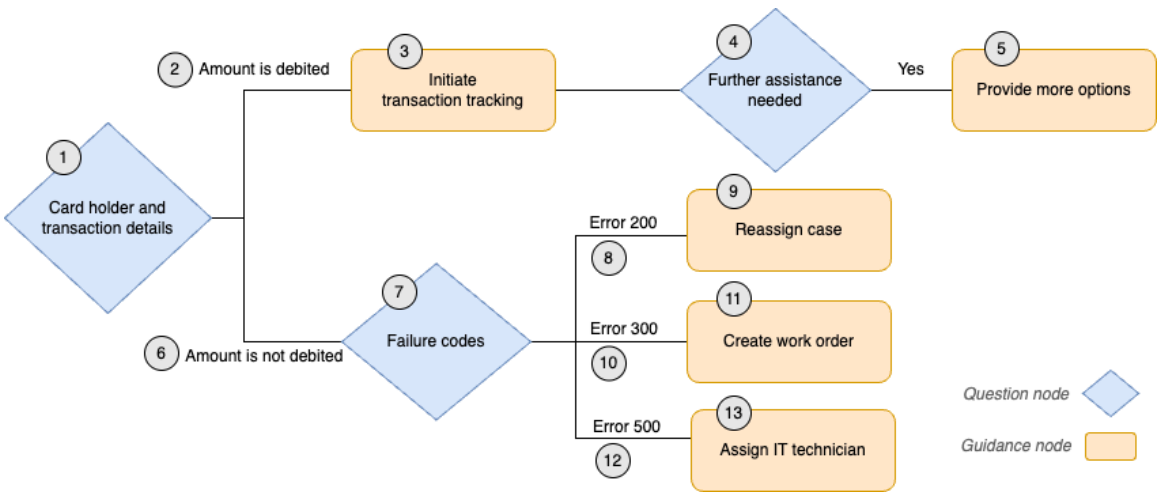
Learn how process analysts or business owners create a decision tree, and configure various decision tree nodes in the next pages.

Preparation for creating a decision tree

Before configuring a decision tree, process analysts should document the flow of the decision tree using a flow chart including the questions, answers, associated paths, and guidance.

Anita, who is a process analyst at the StellarVest bank wants to create a decision tree that enables agents to troubleshoot a failed credit card transaction.

Anita first creates a flowchart to document the flow of a decision tree to determine the questions, answers, and possible guidance to configure.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow chart for decision tree

No.	Element	Name	Description
1	Start node	Card holder and transaction details	Start node that collects customer, credit card, and transaction details.
2	Path	Amount is debited	Path with condition: Amount is debited.
3	Guidance node	Initiate transaction tracking	Guidance to initiate transaction tracking when amount is debited.
4	Question node	Further assistance needed	Ask whether the customer needs further assistance.
5	Guidance node	Provide more options	Guidance to provide more options such as talk to an agent or request a new card.
6	Path	Amount is not debited	Path with condition: amount isn't debited.
7	Question node	Failure codes	Collect transaction failure codes when amount isn't debited.
8	Path	Error 200	Error code received is 200.
9	Guidance node	Reassign case	Guidance to reassign the case to someone else.
10	Path	Error 300	Error code received is 300.
11	Guidance node	Create work order	Guidance to create a work order for dispatching a new credit card.
12	Path	Error 500	Error code received is 500.
13	Guidance node	Assign IT technician	Guidance to assign an IT technician to resolve the issue.

Create a decision tree for troubleshooting a failed transaction

Help Anita create a decision tree that agents can use to troubleshoot a failed credit card transaction. After this step, the decision tree can be configured in Decision Tree Builder.

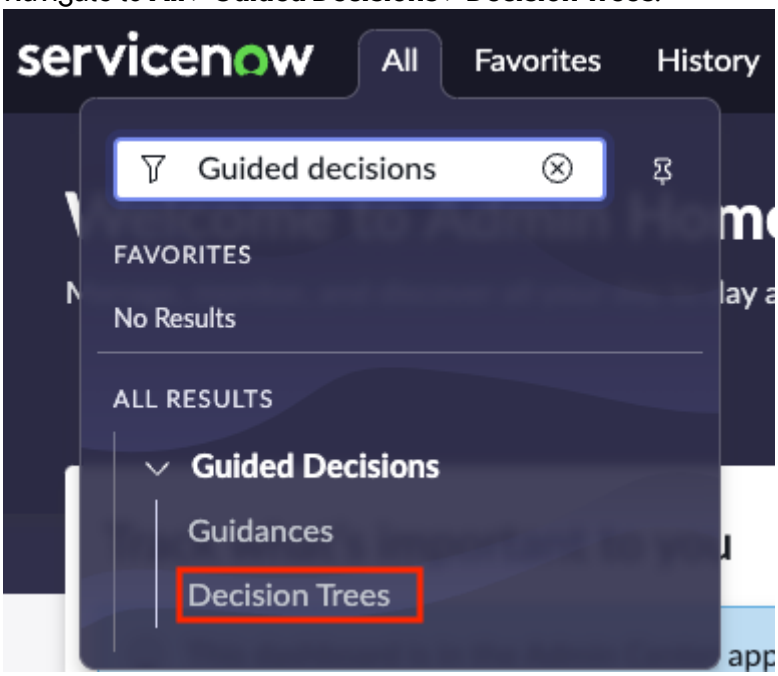
Before you begin

Role required: admin, sn_gd_core.decision_tree_author

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

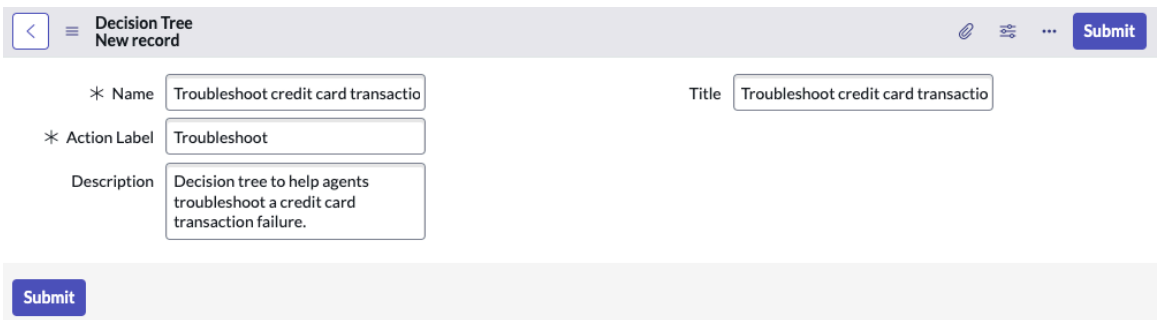
1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.



2. Select **New** on the Decision Trees list.
3. On the form, fill in the fields.

Decision tree form for troubleshooting a failed transaction

Field	Description
Name	Type `Troubleshoot credit card transaction failure`.
Action Label	Type `Troubleshoot`.
Description	Type `Decision tree to help agents troubleshoot a credit card transaction failure`.
Title	Type `Troubleshoot credit card transaction failure`.
Question font size	Enter the desired font size for the questions in the guided decision tree. Example: `14`
Show a dismiss button	Select this check box if you want the Dismiss button to appear on recommendation for the agent.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.
   The **Open in Builder** button is shown.

What to do next

Configure the start node to ask for the user, card, and transaction details and determine if any amount was debited.

Create the Initiate transaction tracking guidance

Create the Initiate transaction tracking guidance by configuring inputs, outputs, preview experience and detail experience.

Before you begin

Role required: sn_gd_guidance.guidance_manager

Procedure

1. Navigate to **All** > **Guided Decisions** > **Guidances**.
2. Create a guidance.
   a. Select **New** in the Guidances list.
   b. In the **Name** field, enter `Initiate transaction tracking`.
   c. In the **Description** field, enter `Guidance for tracking the failed credit card transaction`.
3. Create the following inputs for the guidance.
   Inputs are the variables or information that the system needs to perform the guidance. You can use inputs in multiple places such as the guidance preview experience and the guidance actions.

   a. In the Guidance Input tab, select **New** for each input.

   b. Create the following inputs and select **Submit**.

Guidance inputs

Label	Type	Reference	Order	Is form field
Cardholder name	String	-	100	true
Task	Reference	Case	200	false
Credit card number	Integer	-	300	true
Transaction ID	Integer	-	400	true
Date and time of transaction	Date/time	-	500	true

4. **Optional:** Create an output for the guidance.
   Outputs are the desired result of the guidance action. For example, if a guidance action creates a case task, the output of that action can return a reference to the case task that was created.
   a. In the Guidance Output tab, select **New**.
   b. In the **Label** field, enter `Case number for transaction tracking`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Type** field, select Reference.

d. In the **Reference** field, select the Case table.

e. Select **Submit**.

5. Configure the preview and detail experiences.
   For more information, see Configure guidance detail experience.
6. Select **Submit**.

What to do next

Configure a guidance action that an agent can take while initiating transaction tracking.

Create a guidance action for the Initiate transaction tracking guidance

Configure the actions that agents can take to initiate a transaction tracking.

Before you begin

Role required: sn_gd_guidance.guidance_manager

Procedure

1. Navigate to **All** > **Guided Decisions** > **Guidances**.
2. Select the Initiate transaction tracking guidance from the Guidances list.
3. In the Guidance Actions form section, select **New**.
4. On the Guidance Action form, fill in the fields.

Field	Description	Value
Guidance	The guidance that this action is associated with. This field is read only.	Initiate transaction tracking
Action label	A name for this guidance action.	Initiate
Call to Action Label	The label for the action button that appears on the recommendation card in the contextual side panel. For example, **Review and attach article** or **Propose Solution**.	Initiate
Action Behavior	The selected behavior for the guidance action: ○ **Single click**: The action is initiated and completed with one click and the card moves to the **History** tab in the side panel. Useful for simple actions such as escalating a case. ○ **Open in Contextual Side Panel**: The action opens in a detailed view within the side panel. The agent can review the details in the side panel, such as reviewing	Single click

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

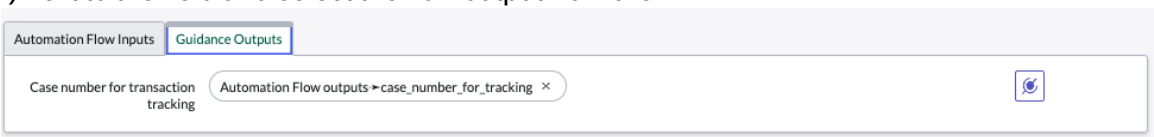
Field	Description	Value
	the content of a knowledge base article. ○ **Open in Sub Tab**: The action opens in a separate tab. You can configure the preview experience for all the action behavior types and configure the detail view for the actions that open in the subtab or contextual side panel. For more information, see Configure guidance detail experience. **Note:** Actions that open in the contextual side panel or in the subtab don't move to the in-progress state. The action moves to the in-progress or completed state only when the agent selects the action button in the detail view.	
Primary	Denotes the guidance action as a primary action. This field is enabled by default. A primary action highlights the action that the agent should take and makes that action available as a button on the recommendation card. **Note:** A guidance can have only one primary guidance action. If this field is not selected, the guidance action is a secondary action available through the more actions menu on the recommendation card.	Select the field
Application	The application that this guidance action is associated with. This field is read only.	Global
Guidance Action Automation	The flow associated with this guidance action.	Initiate transaction tracking subflow
Order	The order of the action.	100
Completion Message	The message that appears at the top of the recommendation	The transaction tracking is initiated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Value
	card when the guidance action is complete.	

5. Right-click the form header and select **Save**.
   Depending on the selected flow in the **Guidance Action Automation** field, the flow inputs and outputs are shown.
6. Configure the flow inputs and guidance outputs.
   - In the **Automation Flow Inputs** tab, select the Pill-picker icon ( ) next to the field and select the flow input from the list.

   - In the **Guidance Outputs** tab, select the Pill-picker icon ( ) next to the field and select the flow output from the list.



7. Select **Submit**.

Configure the start node to ask for cardholder and transaction details

Add questions to ask for credit cardholder details and transaction details and configure answer types in a start node in Decision Tree Builder.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

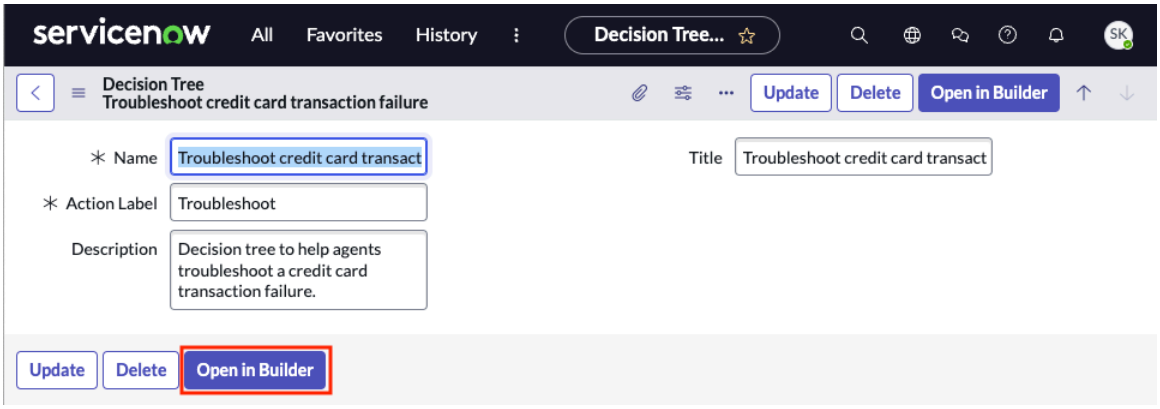
In the question node, you can add the questions that you want to ask customers or details that you want to collect. For example, you can ask for the type of credit card or whether any amount is debited. Based on the answers provided, the path to a next question or guidance node is taken.

Procedure

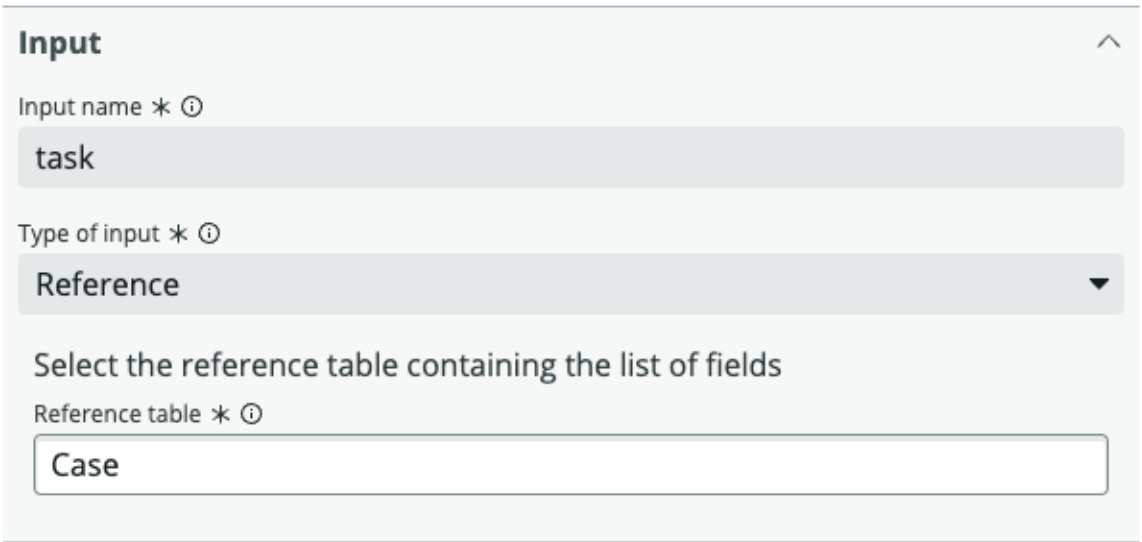
1. Select **Open in Builder**.

   The new decision tree opens in Decision Tree Builder in a new tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select **New node**, which is a start node of your decision tree.
3. In the **Node name** field, enter `Ask card holder and transaction details`.
4. In the Input section, in the **Reference table** field, select the Case table.

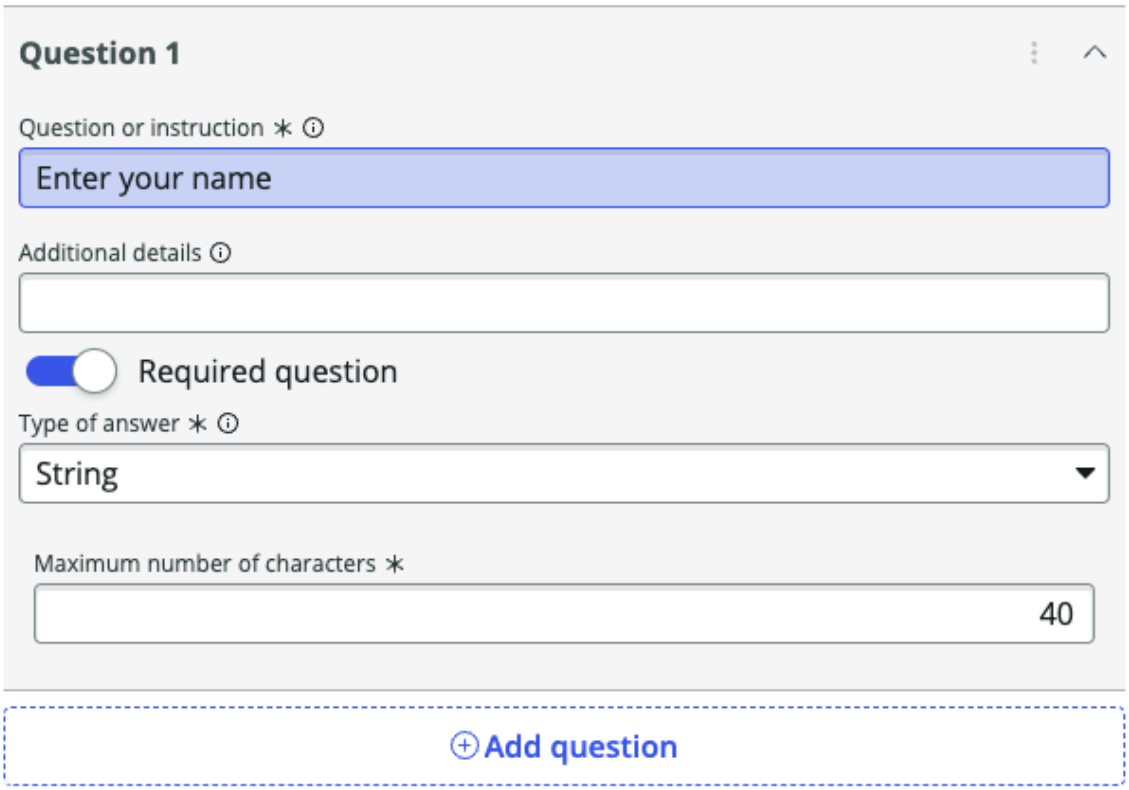


The reference table doesn't necessarily have to be a task table. For example, you can select a case, incident, or interaction table for the record context to recommend this decision tree in a workspace.

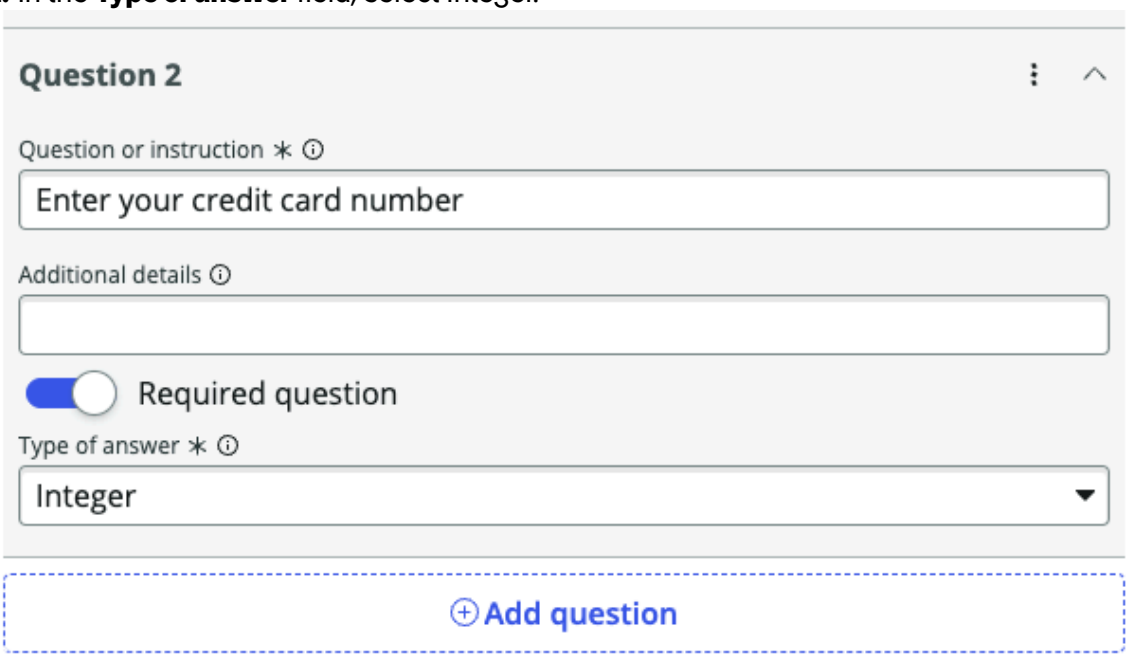
Note:
You must select the same table as the reference table for the context record in Recommended Actions.

5. Configure question 1.
   a. In the **Question or instruction** field, type `Enter your name`.
   b. Make this question a required question by selecting the **Required question** field.
   c. In the **Type of answer** field, select String.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Configure question 2.
   a. Select the **Add question** button.
   b. In the **Question or instruction** field, type `Enter your credit card number`.
   c. Make this question a required question by selecting the **Required question** field.
   d. In the **Type of answer** field, select Integer.

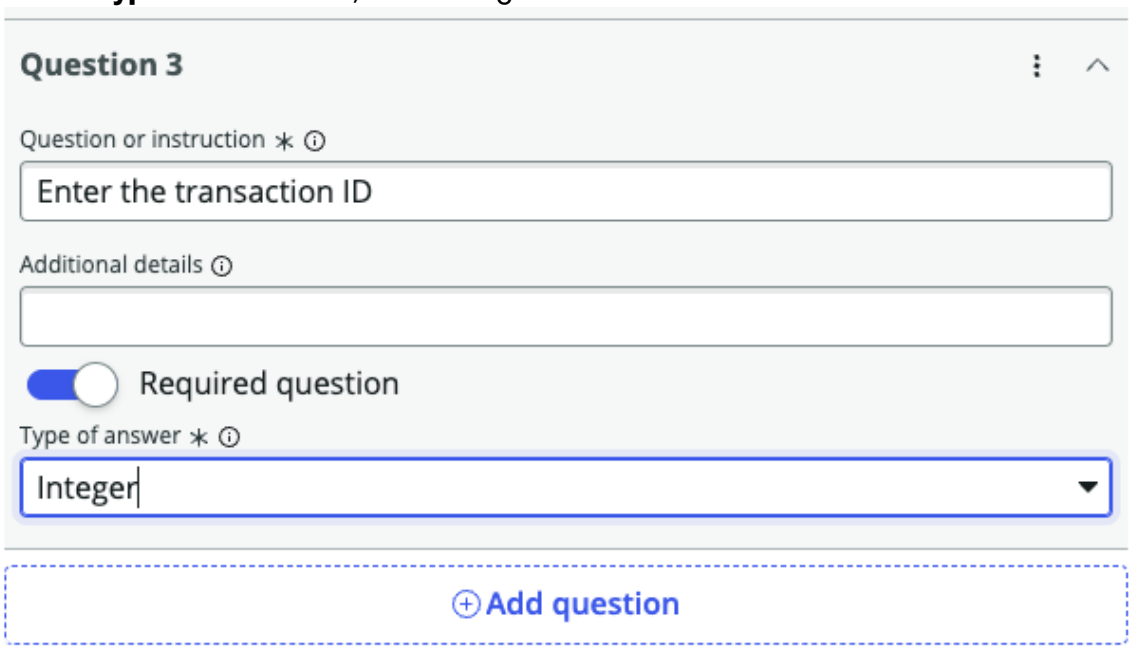


7. Configure question 3.
   a. Select the **Add question** button.
   b. In the **Question or instruction** field, type `Enter the transaction ID`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Make this question a required question by selecting the **Required question** field.

d. In the **Type of answer** field, select Integer.



8. Configure question 4.

a. Select the **Add question** button.

b. In the **Question or instruction** field, type `Select the card type`.

c. Make this question a required question by selecting the **Required question** field.

d. In the **Type of answer** field, select Choice.

e. In the **Label** field, enter `Visa` for the first option in the list.

f. Select **Add choice**.

g. In the **Label** field, enter `MasterCard` for the second option in the list.

h. Select **Add choice**.

i. In the **Label** field, enter `Meestro` for the third option in the list.

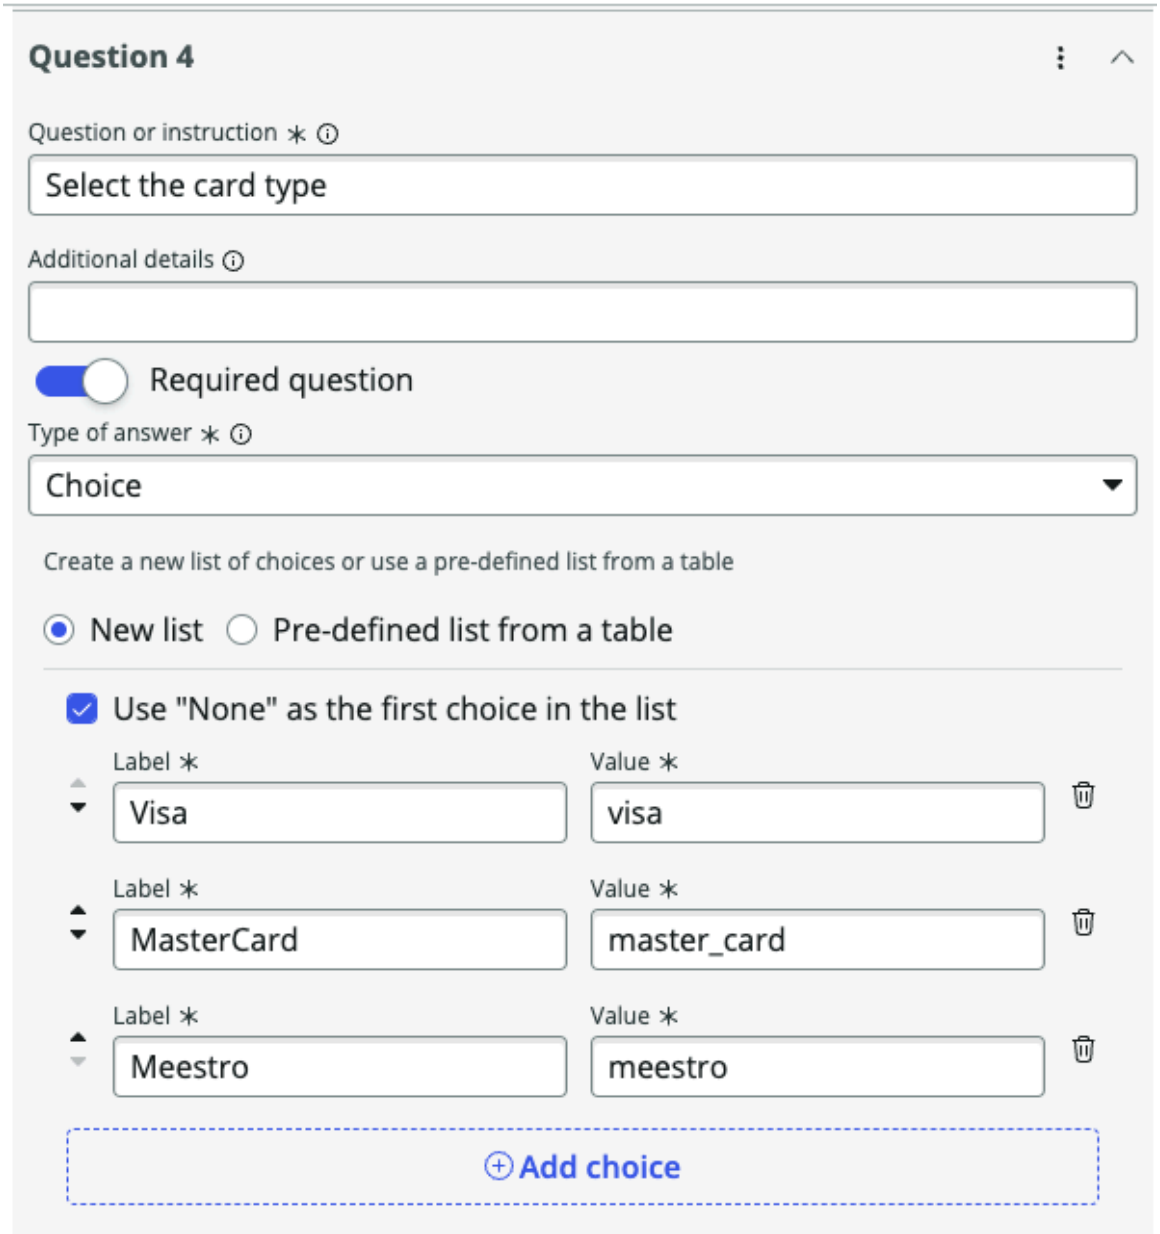
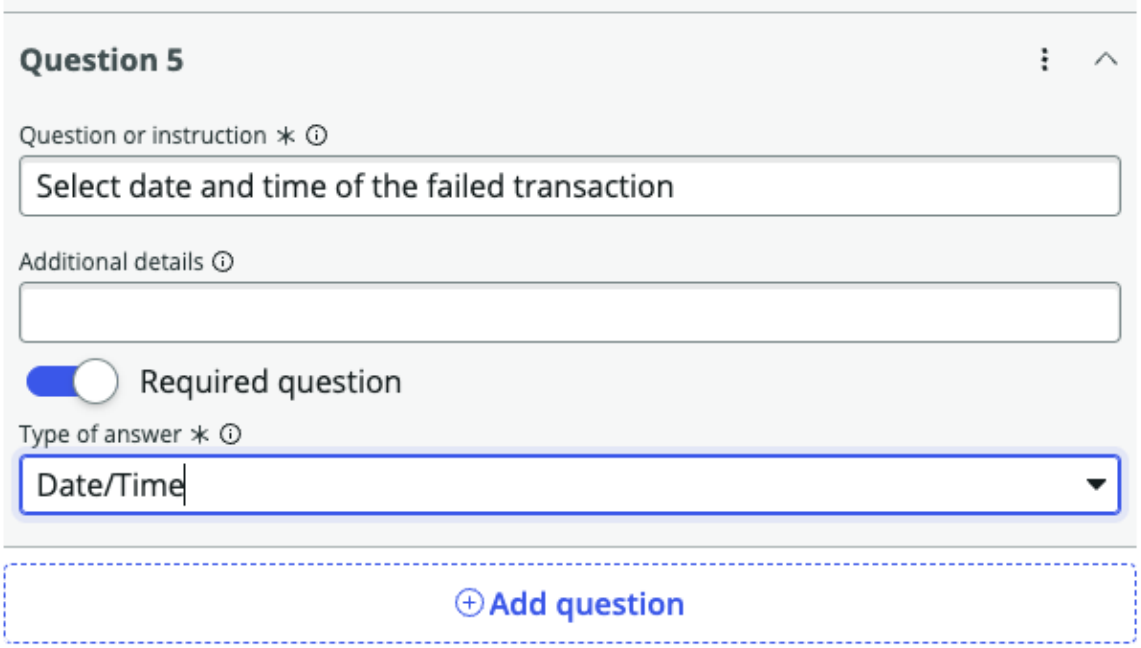
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

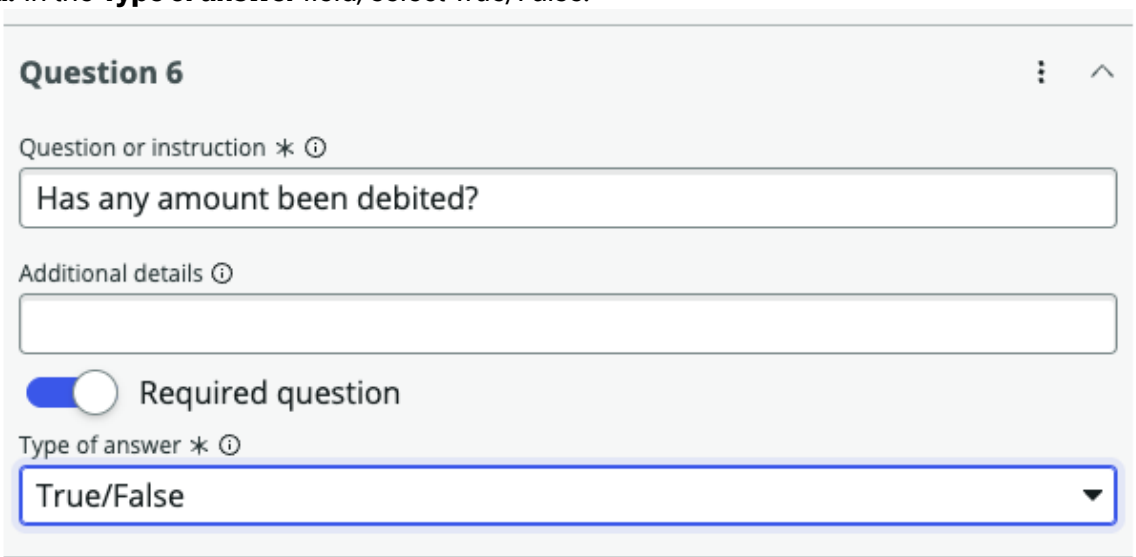


9. Configure question 5.
   a. Select the **Add question** button.
   b. In the **Question or instruction** field, type `Select date and time of the failed transaction`.
   c. Make this question a required question by selecting the **Required question** field.
   d. In the **Type of answer** field, select Date/time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. Configure question 6.
    a. Select the **Add question** button.
    b. In the **Question or instruction** field, type `Has any amount been debited?`.
    c. Make this question a required question by selecting the **Required question** field.
    d. In the **Type of answer** field, select True/False.



11. Select **Save and close**.

What to do next

Add paths and configure conditions for transactions when the next question or guidance node is displayed in a decision tree.

Configuring paths with conditions whether the amount is debited or not

Configure paths with conditions to determine the next question or guidance node that is displayed in a decision tree.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If any amount is debited during a failed transaction, the path that leads to the Initiate transaction tracking guidance is taken.
- If no amount is debited during a failed transaction, the path that leads to the next question node is taken.

Configure the path for the amount-debited condition

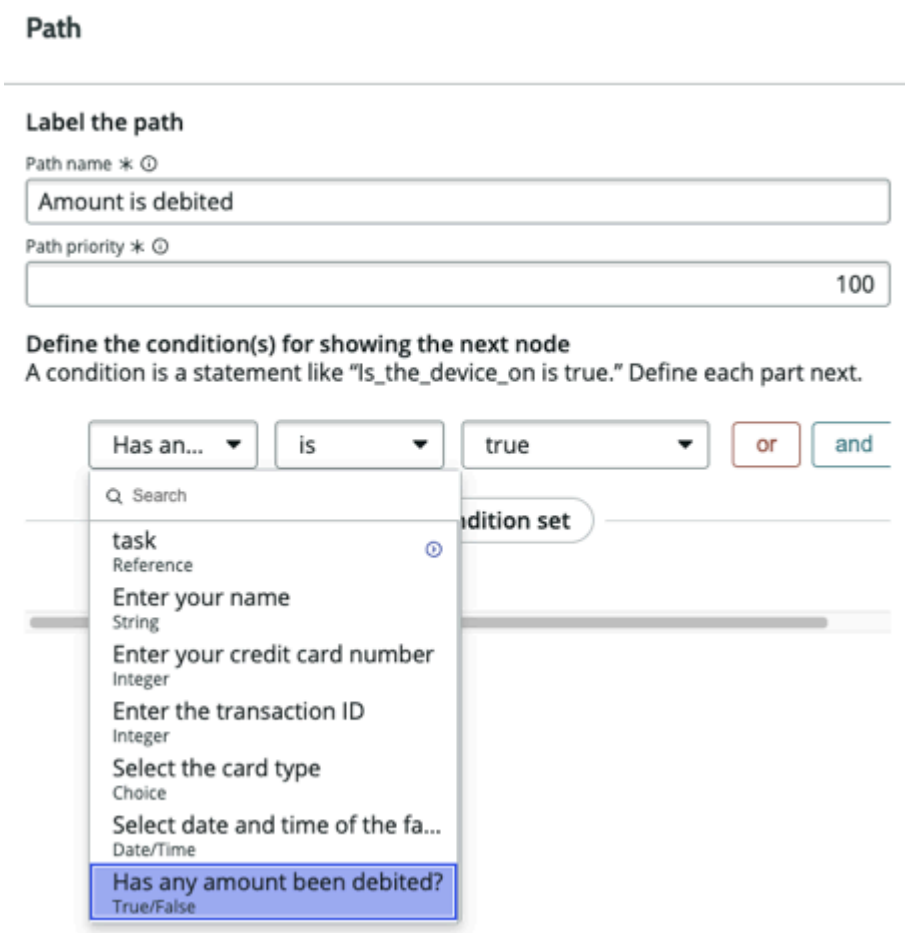
Configure a path for the amount-debited condition for the next guidance node.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

When a customer answers that the amount is debited from the credit card, the path that leads to the Initiate transaction tracking guidance is taken.



Procedure

1. In Decision Tree Builder, select the Add path icon (⊕) on the start node.
   A new path and a new node are added to the canvas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select the new path.
3. In the **Path name** field, enter `Amount is debited`.
4. In the **Path priority** field, enter `100`.
5. Select the appropriate fields to set the condition "Has any amount been debited? | is | true".
6. Select **Save and close**.

What to do next

Configure a guidance node that allows agents to initiate the transaction tracking for a failed transaction.

Configure the path for the amount-not-debited condition

Configure a path for the amount-not-debited condition for the next question node.

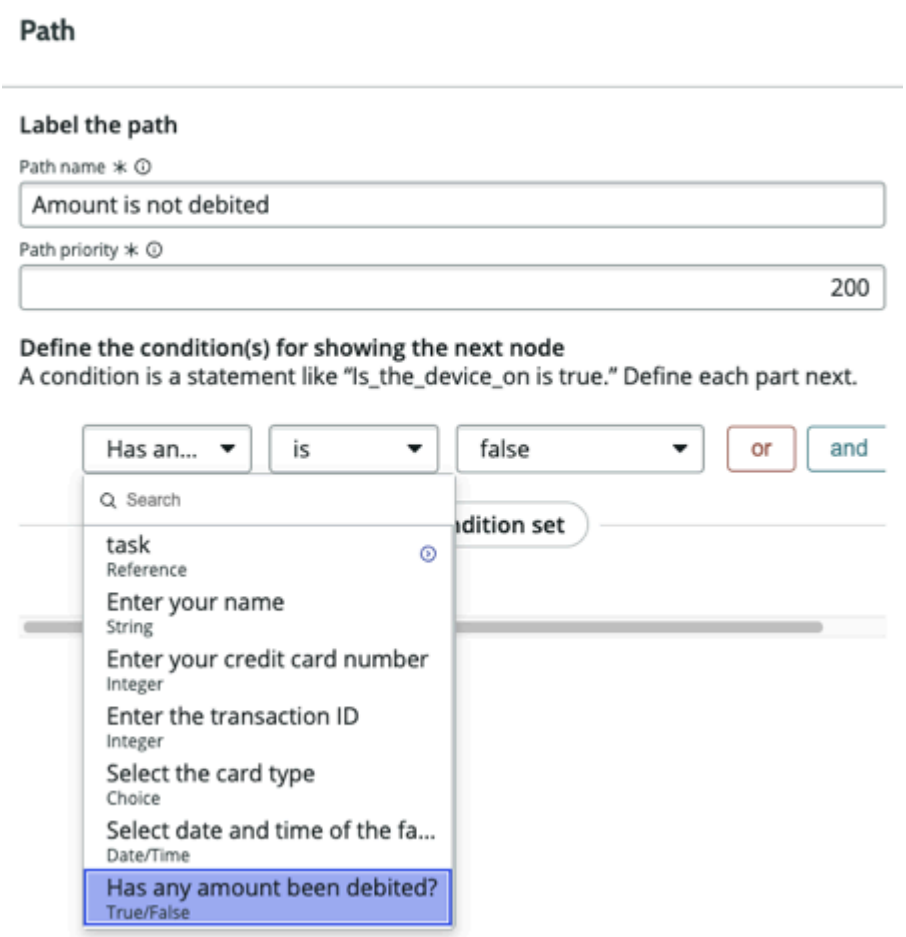
Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

When a customer answers that the amount isn't debited from the credit card, the path that leads to the next question node is taken. The question node asks for failure codes that the user received.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. In Decision Tree Builder, select the Add path icon (⊕) on the start node.
   A new path and a new node are added to the canvas.

2. Select the new path.
3. In the **Path name** field, enter `Amount is not debited`.
4. In the **Path priority** field, enter 200.
5. Select the appropriate fields to set the condition "Has any amount been debited? | is | false".
6. Select **Save and close**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Configure a question node to ask for the failure codes that customer received after the failed transaction.

Configure a guidance node to initiate the transaction tracking

Configure a guidance node in Decision Tree Builder so that agents can initiate the transaction tracking.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

When the customer answers that money is debited after a failed transaction, agents can create a case to initiate the transaction tracking.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

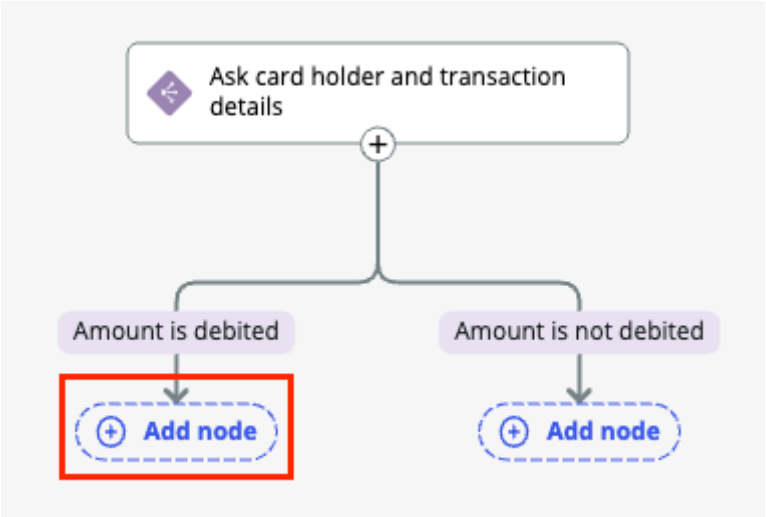
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

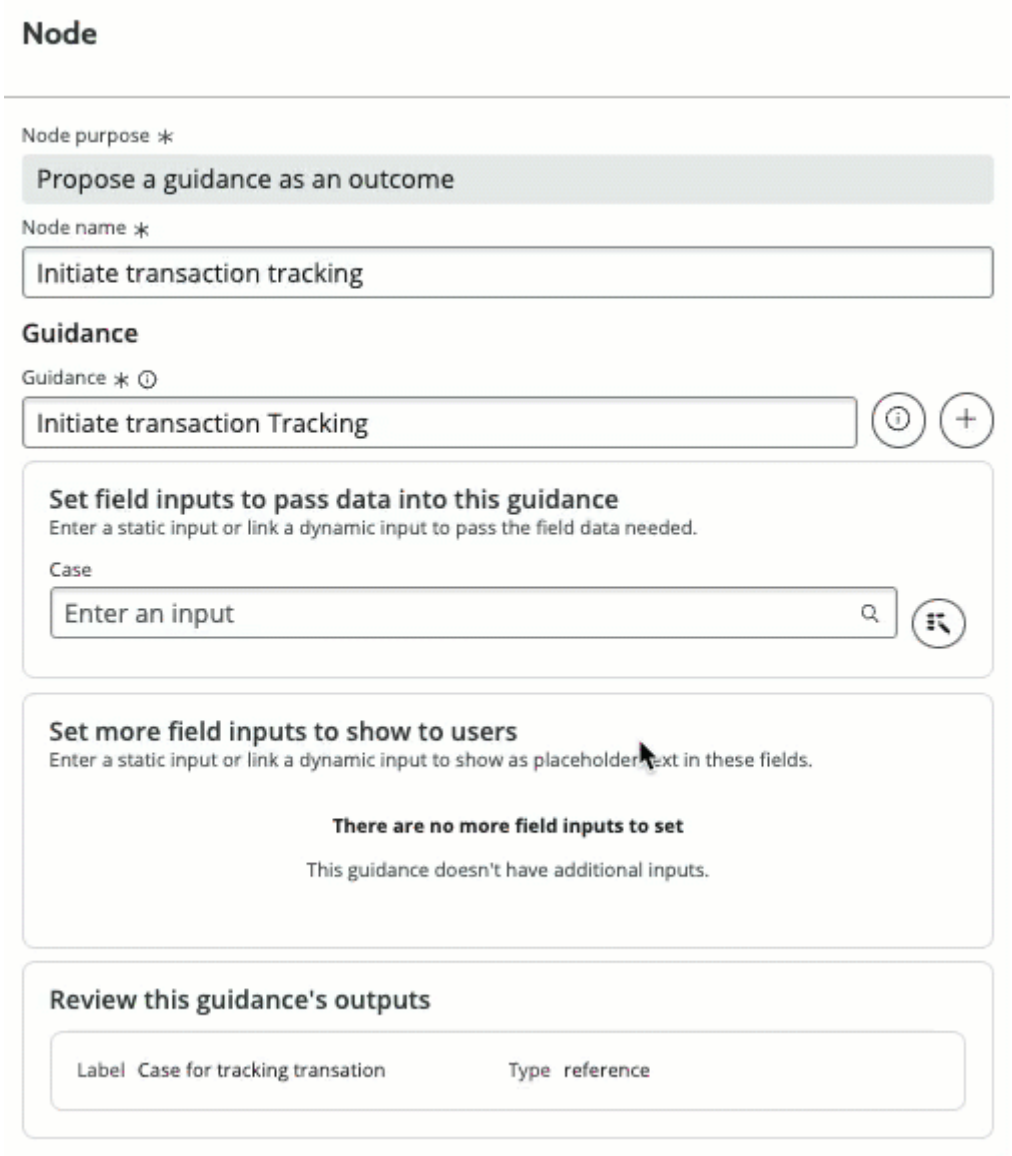
Procedure

1. Select **Add node** on the Amount-is-debited path.



2. In the pop-up window, select **Propose a guidance as an outcome** to configure a guidance node.
   A guidance is an outcome of a decision tree.
3. In the **Node name** field, enter `Initiate transaction tracking`.
4. In the **Guidance** field, select Initiate transaction tracking guidance.
5. In the **Set field inputs to pass data into this guidance** section, link the task input from the previous question node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the **Set more field inputs to show to users** section, link guidance inputs to the inputs from the previous question node.

   a. Select the Link input icon ( ) next to the field.

   b. Select the previous question node and the question from the list.
   The provided answer to the question is mapped to the guidance input during runtime.

7. Select **Save and close**.

What to do next

Do the following steps to add the next question node:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Add a new path by selecting the Add path icon (⊕) on the Initiate transaction tracking guidance node.

   You can add a question node only after a guidance node. The execution of the decision tree continues after the guidance is performed. The path configuration isn't required because there can only be one question node after a guidance node.

2. Configure a question node for further assistance.

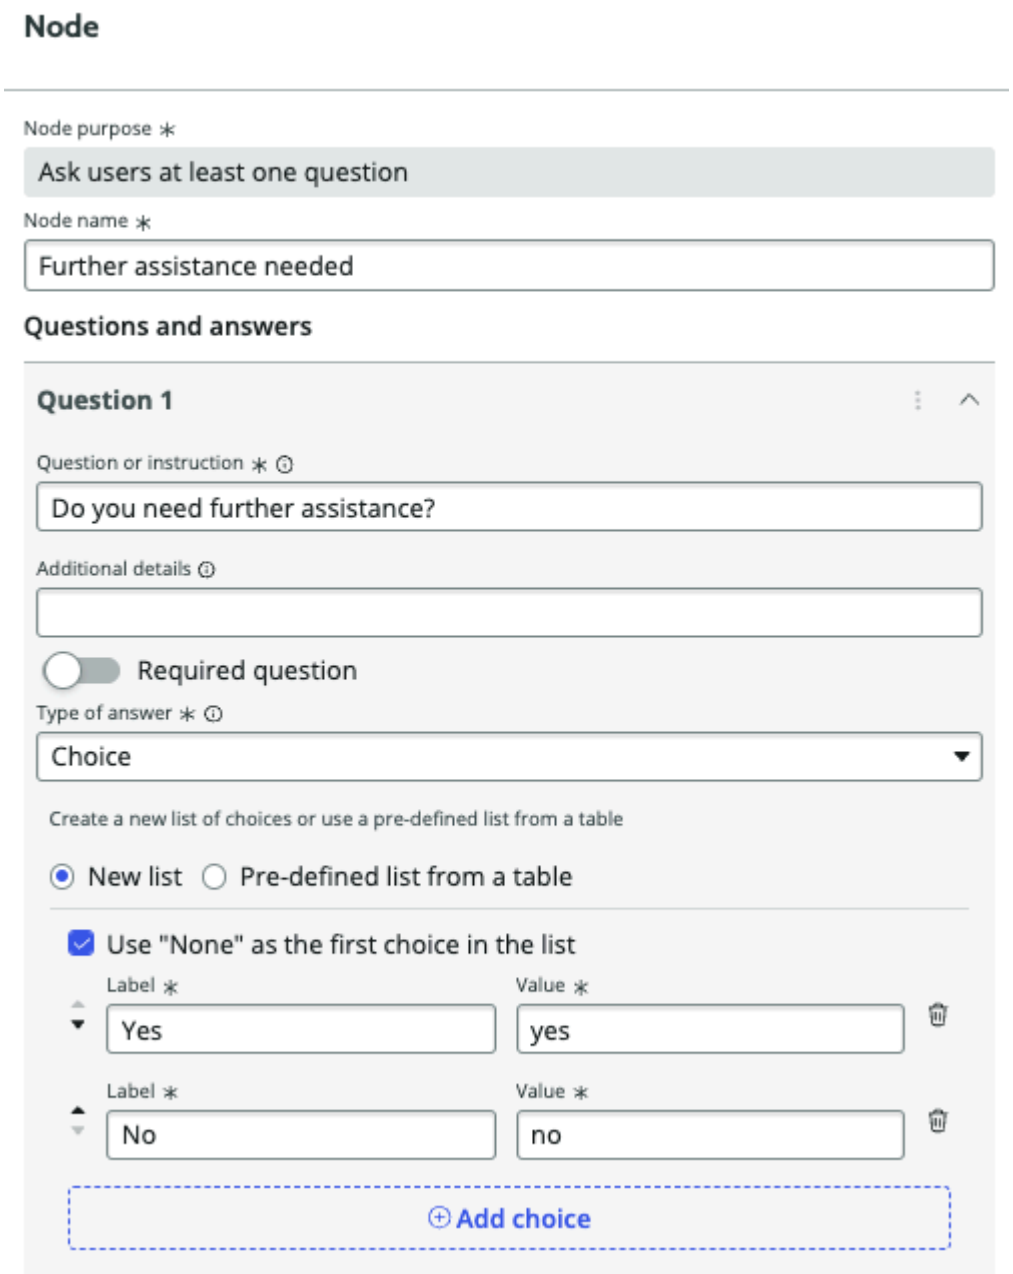
Configure a question node for further assistance

Add a question node to ask users whether they need further assistance.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **New node** on the path that comes from the Initiate transaction tracking guidance.
2. In the **Node name** field, enter `Further assistance needed`.
3. In the **Question or instruction** field, type `Do you need further assistance?`.
4. Make this question a required question by selecting the **Required question** field.
5. In the **Type of answer** field, select Choice.
6. In the **Label** field, enter `Yes` for the first option in the list.
7. Select **Add choice**.
8. In the **Label** field, enter `No` for the second option in the list.
9. Select **Save and close**.

What to do next

Do the following steps to add the next guidance node:

1. Configure a path with the condition "Do you need further assistance? | is | Yes". For more information and example, see Determine the next node displayed in a decision tree and Configuring paths with conditions whether the amount is debited or not.
2. Add a guidance node and associate the More options guidance to the Yes path. For more information and example, see Provide actions to agents in a decision tree and Configure a guidance node to initiate the transaction tracking.

Configure a question node to ask failure codes

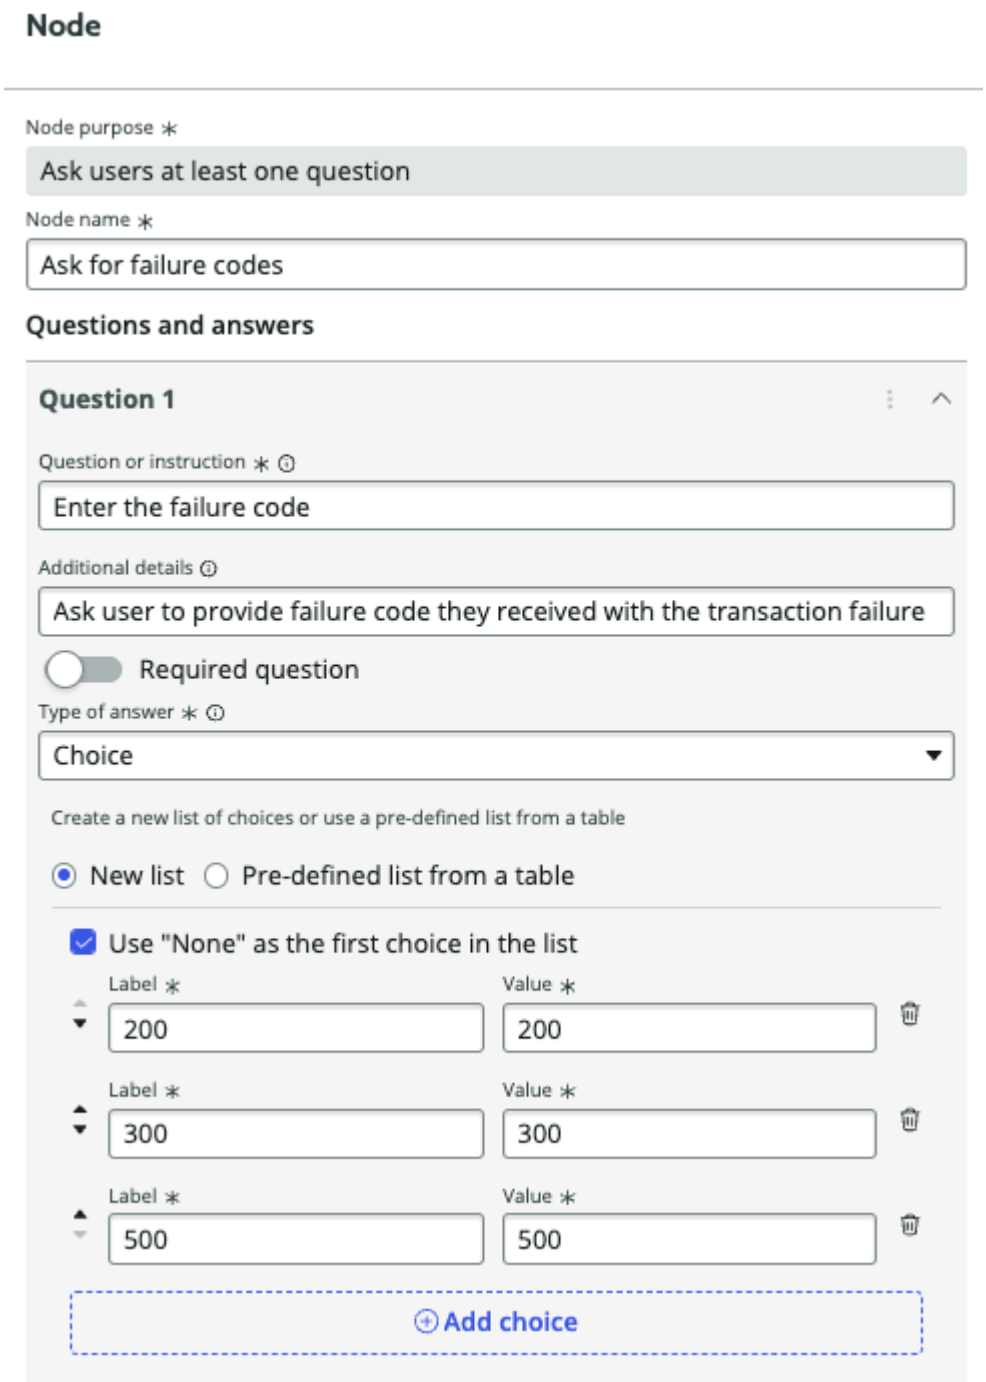
Add a question to ask for the failure code that the customer received after a failed credit card transaction.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

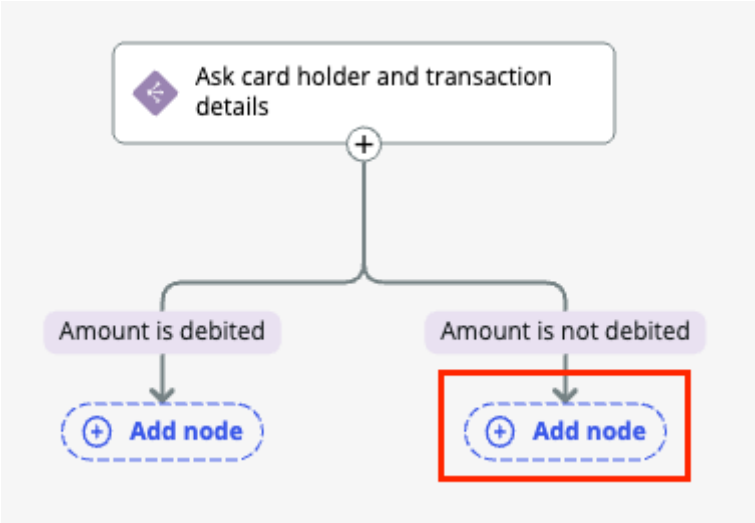
About this task



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **Add node** on the Amount-not-debited path.



2. In the pop-up window, select **Ask users at least one question** to configure a question node.
3. In the **Node name** field, enter `Ask for failure codes`.
4. In the **Question or instruction** field, type `Enter the failure code`.
5. Make this question a required question by selecting the **Required question** field.
6. In the **Type of answer** field, select Choice.
7. In the **Label** field, enter `Failure code 200` for the first option in the list.
8. Select **Add choice**.
9. In the **Label** field, enter `Failure code 300` for the second option in the list.
10. Select **Add choice**.
11. In the **Label** field, enter `Failure code 500` for the third option in the list.
12. Select **Save and close**.

What to do next

Configure a path for each failure code the customer can receive after a failed credit card transaction.

Configure paths for different failure code conditions

Configure a path for each failure code condition to provide appropriate guidance to agents.

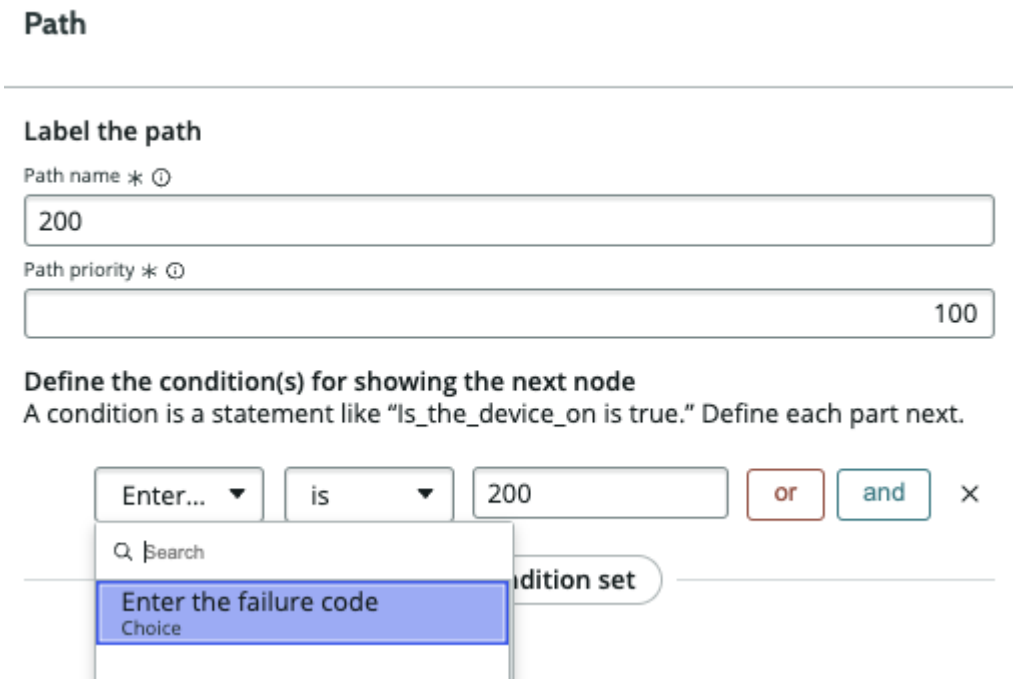
Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

When the failure code received by the customer is 200, the path that leads to the Reassign case guidance is taken.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information about how to configure a path, see Determine the next node displayed in a decision tree.

Procedure

1. In Decision Tree Builder, select the Add path icon (⊕) on the Ask for failure codes question node.
   A new path and a new node are added to the canvas.
2. Select the new path.
3. In the **Path name** field, enter `200`.
4. In the **Path priority** field, enter `100`.
5. Select the appropriate fields to set the condition "Enter the failure code | is | true".
6. Select **Save and close**.

What to do next

Configure paths for other failure codes:

- 300 failure code - This path leads to the Create work order guidance.
- 500 failure code - This path leads to the Assign IT technician guidance.

Associate guidances for different failure codes

Associate guidances to paths with different failure code conditions.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

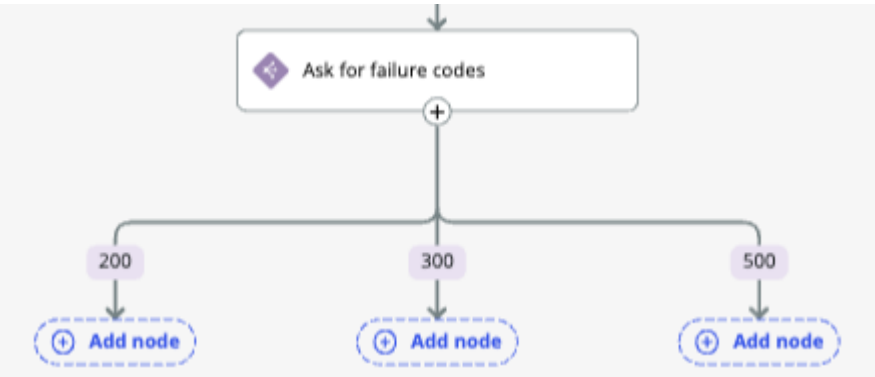
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task



Procedure

1. Associate a guidance to the 200 path.
   a. Select **Add node** in the 200 path.
   b. In the pop-up window, select **Propose a guidance as an outcome** to configure a guidance node.
   A guidance is an outcome of a decision tree.
   c. In the **Node name** field, enter `Reassign this case`.
   d. In the **Guidance** field, select the Reassign case guidance.
   e. In the **Set more field inputs to show to users** section, map inputs by selecting the Link input icon ( ) next to the field and selecting a guidance input from the list.
   f. Select **Save and close**.
2. Associate a guidance to the 300 path.
   a. Select **Add node** in the 300 path.
   b. In the pop-up window, select **Propose a guidance as an outcome** to configure a guidance node.
   A guidance is an outcome of a decision tree.
   c. In the **Node name** field, enter `Create a work order`.
   d. In the **Guidance** field, select the Create work order guidance.
   e. In the **Set more field inputs to show to users** section, map inputs by selecting the Link input icon ( ) next to the field and selecting a guidance input from the list.
   f. Select **Save and close**.
3. Associate a guidance to the 500 path.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Add node** in the 500 path.

b. In the pop-up window, select **Propose a guidance as an outcome** to configure a guidance node.
A guidance is an outcome of a decision tree.

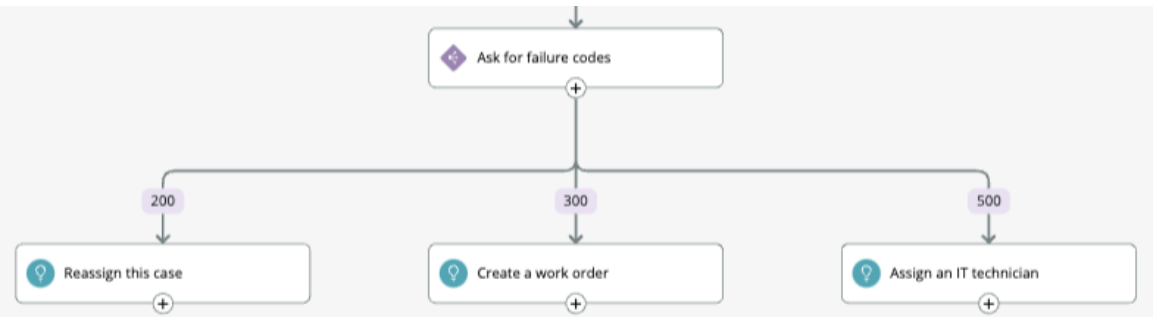
c. In the **Node name** field, enter `Assign an IT technician`.

d. In the **Guidance** field, select the Assign IT technician guidance.

e. In the **Set more field inputs to show to users** section, map inputs by selecting the Link input icon ( ) next to the field and selecting a guidance input from the list.

f. Select **Save and close**.

Result



Activate the Troubleshoot credit card transaction failure decision tree

Validate and activate the completed decision tree so you can use it in playbooks in case records or as recommendations in Recommended Actions.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

About this task
When you activate the completed decision tree, Decision Tree Builder checks for errors such as missing information, invalid input mappings due to changes in prior node inputs, or missing guidance inputs. After all the errors are resolved, you can validate and activate the decision tree.

If you change an activated decision tree, remember to activate the decision tree again to display the updated decision tree in a workspace.

Procedure

1. In Decision Tree Builder, select **Activate**.
   - If there are errors in your decision tree, error icons and alert messages are displayed. You must resolve the errors before you can activate the decision tree. For more information, see Validation error notifications in Decision Tree Builder.
   - If there are no errors, a confirmation dialog box displays.
2. In the confirmation dialog box, select **Activate now**.
   A success message with instructions on the next action to take is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The status of the decision tree is changed from **Not Active** to **Active**.
- The **Activate** button is disabled.

What to do next

- Configure recommended actions to use the activated decision tree as a recommendation. The recommendations appear as cards in the contextual side panel of a workspace. For more information, see Add Guided Decisions to Recommended Actions.
- Configure Playbooks to use the activated decision tree as part of a playbook in a record tab. For more information, see Add Guided Decisions to playbooks.

Install the Guided Decisions Experience application

You can install the Guided Decisions Experience application (sn_ga_exp) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Guided Decisions Experience application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Guided Decisions Experience:

- Plugins
- Tables
- Roles
- Guidances

For more information, see Components installed with Guided Decisions Experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Guided Decisions Experience application (sn_ga_exp) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Components installed with Guided Decisions Experience

Several types of components are installed with the Guided Decisions Experience application, including tables, roles, and guidances.

Tables

The following tables are added to your instance with the activation of Guided Decisions Experience.

Tables added with Guided Decisions Experience activation

Table	Description
Decision Tree [ga_decision_tree]	Stores details of all decision trees.
Decision Tree Node [ga_decision_tree_node]	Stores details of all decision tree nodes in each decision tree.
Decision Input Mapping [ga_decision_input_mapping]	Stores input-mapping details such as source node, source input, destination node, and destination input.
Decision Tree Version [ga_decision_tree_version]	Stores decision tree versions with states.

Roles

The following roles are added to your instance with the activation of the Guided Decisions, Guided Decisions Experience, and Recommended Actions plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles added with Guided Decisions and Recommended Actions

Role	Description	Contains roles
Decision tree author [decision_tree_author]	Creates, views, updates, and deletes decision trees. **Note:** This role is automatically given to customer service managers.	• decision_table_admin • sn_gd_guidance.guidance_manager • decision_tree_user **Note:** Included with the Guided Decisions plugin.
Decision tree user [decision_tree_user]	Views decision trees. **Note:** This role is automatically given to customer service agents.	• decision_table_reader • sn_gd_guidance.guidance_user **Note:** Included with the Guided Decisions plugin.
Guidance manager [sn_gd_guidance.guidance_manager]	Creates, views, updates, and deletes guidances, which are outcome of a decision tree. **Note:** This role is automatically given to customer service managers.	sn_gd_guidance.guidance_user **Note:** Included with the Guided Decisions - Guidance plugin.
Guidance user [sn_gd_guidance.guidance_use	Views guidances. **Note:** This role is automatically given to customer service agents.	uxframework_user **Note:** Included with the Guided Decisions - Guidance plugin.
Playbook author [pd_content_author]	Adds decision trees and guidances to a new or existing playbook for service agents to access on their workspace.	• sn_gd_core.decision_tree_user • pd_shared.user • pd_trigger_author
Resource Generator author [sn_nb_action.resource_generator_author]	Configures resource generators.	• flow_operator • decision_table_reader • platform_ml_read • sn_nb_action.trend_definition_author **Note:** Included with the Recommended Actions plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles added with Guided Decisions and Recommended Actions (continued)

Role	Description	Contains roles
Trend Definition author [sn_nb_action.trend_definition_author]	Configures trend definitions.	**Note:** Included with the Recommended Actions plugin.

Guidances

The Guided Decisions Experience application includes the guidances described in the following table.

Guidance involved in Guided Decisions

Guidance	Description
Apply resolution from a solved case	Enables agents apply a resolution from recommended solved cases by clicking the **Resolve case** button on a card. The action copies the resolution notes and a resolution code from the solved case into the Closure Information section of the current case. The state of the current case changes to resolved.
Communicate Workaround	Enables agents to communicate a workaround from a recommended problem record by clicking a **Communicate workaround** button on a card. The action opens the guidance in the side panel. The guidance shows the workaround from the problem record and provides a note field for the agent to add additional notes. The workaround and notes are added in the work notes and the problem record is linked to the current case.
Create case task	Enables agents to create a case task for the current case by clicking a **Create** button on a card, which opens the guidance in the side panel where the agent can enter a subject for a new case task and submit it.
Create Work Order	Enables agents to create a work order for a case by clicking a **Create** button on a card. Creates a work order task and opens the task in a subtab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidance involved in Guided Decisions (continued)

Guidance	Description
Link to existing defect	Enables agents to link an existing defect to the current case by clicking a **Link to defect** button on a card, which links the defect to the case and updates the work notes.
Link to existing open case	Enables agents to link the current case to an existing open case by clicking the **Link to this case** button on a card. The action sets the open case as the parent of the current case.
Offer Recommendation	Enables agents to recommend upgrade of a product to provided product model.
Propose Resolution	Enables agents to enter resolution notes and a resolution code for a case by clicking a **Propose Solution** button on a card.
Read message to customer	Enables an agent to indicate that a message was read to the customer during a call by clicking the **Mark as read** button on a card, and adding the message to the work notes.
Reassign case	Enables agents to reassign the current case to a recommended assignment group by clicking a **Reassign** button on a card, which opens the guidance in a side panel where the agent can enter notes. The current case is reassigned to a different assignment group and the work notes are updated.
Review and attach article	Enables agents to review a recommended knowledge article in the contextual side panel. They can do this by clicking the **Review and attach article** button on a card, which opens the article in the side panel. In the side panel, agents can do the following: • Review the article. • Attach the article to the case. • Mark the article as helpful. • Open the article in a subtab.

Configuring guidances and decision trees

Configure guidances and decision trees to resolve customer issues faster and provide standardized resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A decision tree is a structured troubleshooting process for service agents to work through. For more information, see Setting up Guided Decisions.

The configuration process consists of the tasks listed in the following table.

Guidance and decision tree configuration tasks

Step	Description
Create a guidance in the Core UI	Configure guidances to provide actions to your agents.
Configuring decision trees in Decision Tree Builder	Configure decision trees that agents can use to troubleshoot solutions for customer issues. You can create decision trees in Decision Tree Builder only.
Editing decision trees in Core UI	Edit the decision trees that you created using Core UI to improve or extend the troubleshooting process. Only editing of existing decision trees is supported in Core UI. You can create decision trees in Decision Tree Builder only.
Add Guided Decisions to Recommended Actions	Add decision trees to recommended actions, so that agents can take relevant actions in a troubleshooting process based on a record context.
Add Guided Decisions to playbooks	Add decision trees to playbooks, so that agents can provide resolution in a troubleshooting process for their cases.
Add Guided Decisions to Service Portal	Add decision trees to Service Portal, so that internal users can leverage self-service or troubleshoot their issues.

Create a guidance in the Core UI

Create a guidance in the Core UI so that you can link the guidance to the guidance node of a decision tree. For example, your agent may attach a knowledge article or propose a solution to a customer to help resolve an issue.

Before you begin

Role required: sn_gd_guidance.guidance_manager

About this task

The preview information appears on the Recommended Actions card in the contextual side panel. The preview experience is applicable only for Recommended Actions, where agents can see previews of recommendations before launching them.

Playbooks don't have a preview experience because decision trees are embedded and considered launched already in playbooks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Guidances**.
2. Create a guidance.
   a. Select **New** in the Guidances list.
   b. On the form, fill in the fields.

Guidance form

Field	Description
Name	Name for the guidance.
Description	Brief description of the guidance.
Action available to multiple users	Makes the guidance available to multiple agents working on the case. When this option isn't selected, only one agent can work on any guidance. When the first agent works on the guidance and the state is In-progress, Completed, or Error, the other agents can't see this guidance.
Allow users to re-run the guidance	Enables agents to go back to the previous node, edit the previous nodes, or re-execute the guidance in the runtime experience of a decision tree.
Hide completed guidance	Hides the guidance recommended for a case resolution. In other words, the completed guidance in the View my response section of a Decision Tree is not displayed for the agent. **Note:** This field is visible only when the Guided Decision Experience plugin is installed. You may need to configure the form to add this field.

   c. Select **Submit**.
3. Open the guidance that you want to update.
4. Create one or more inputs for the guidance.
   Inputs are the variables or information that the system needs to perform the guidance. You can use inputs in multiple places such as the guidance preview experience and the guidance actions.
   a. In the Guidance Input tab, select **New**.
   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidance Input form

Field	Description
Type	Field type of the input. Depending on the field type that you select, you might need to configure additional settings. For example, if you select Reference as the field type, you need to select a reference table.
Label	Name for the guidance input.
Column name	
Is form field	If the guidance input requires an action by the agent, such as adding information to a field, select the **Is form field** check box.
Order	Sequence in which the guidance input is displayed when more than one guidance input is defined.
Choice List Specification	Choices are: ▪ Dropdown without --None-- (must specify a default value) ▪ None ▪ Dropdown with --None-- None is the default value. ▪ Suggestion This tab appears when you select a value in the **Type** field.
Default value	Specifies the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field uses a default value of 2 but cannot use a default value of two.

c. Select **Submit**.

5. **Optional:** Create one or more outputs for the guidance.
   Outputs are the desired result of the guidance action. For example, if a guidance action creates a case task, the output of that action can return a reference to the case task that was created.

   a. In the Guidance Output tab, select **New**.

   b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidance Output form

Field	Description
Type	Field type of the output. (Optional) Depending on the field type that you select, you might need to configure additional settings. For example, if you select Reference as the field type, you need to select a reference table.
Label	Defines a unique label for the guidance output. The label appears on list headers and form fields for the output.
Column name	Defines the field name of the column. When you create a new field, this name is populated automatically based on the label.
Order	Sequence in which the guidance output is displayed when more than one guidance outputs is defined.
Default value	Specifies the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field uses a default value of 2 but cannot use a default value of two.

c. Select **Submit**.

6. Configure the preview experience.

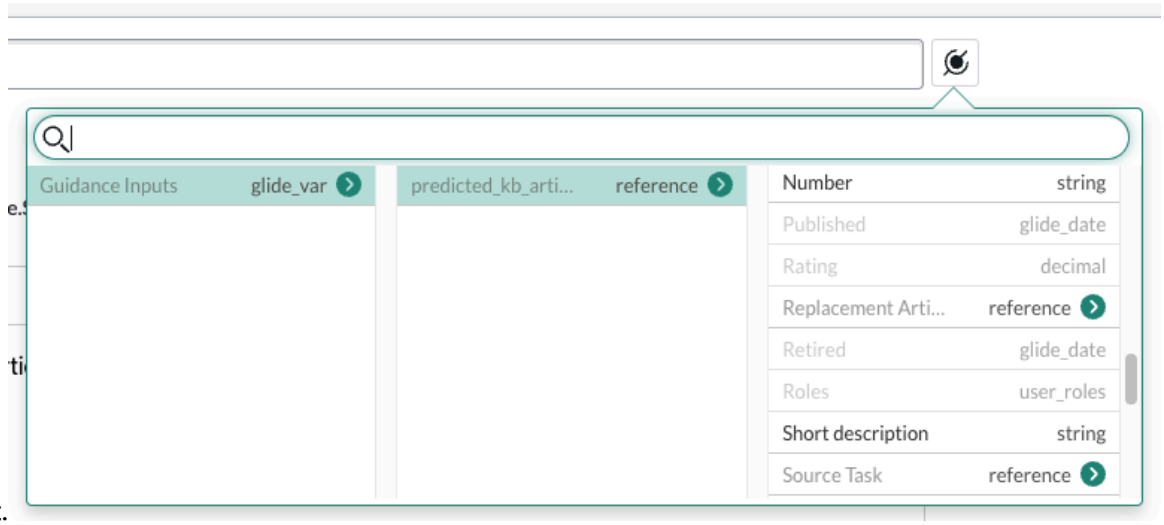
a. Select the **Preview Experience** tab.

b. In the **Preview Title** field, add a title for the guidance preview as either static text, dynamic content (field values from guidance inputs), or a combination of static text and dynamic content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To enter static text, type the text into the field.
- To enter dynamic content, select the Pill-picker icon ( ) next to the field and select a guidance input from the list.

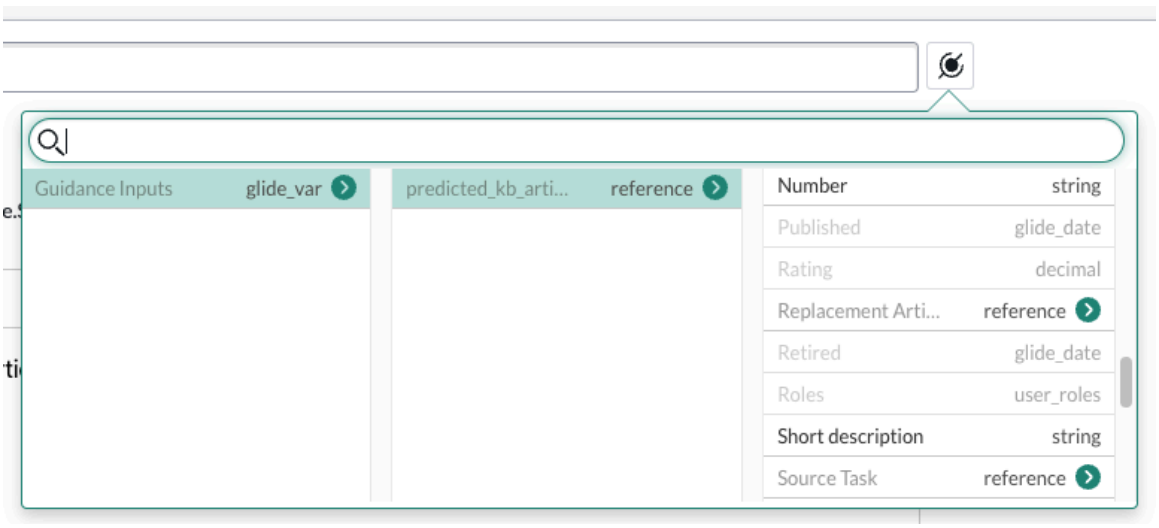
  You can drill down to find the specific input you want.



This field can contain static text, dynamic content, or a combination of static text and dynamic content. To select dynamic content as a field value:

i. Select the Pill-picker icon ( ) next to the **Preview Title** field.

ii. Select a guidance input from the list. You can drill down to another level to find the input you want.



c. In the **Fields To Display** field, select fields to display in the guidance preview.

d. In the **Message** field, create a message for the guidance preview.
You can use the tools available in the rich text editor to create and format the message. This field can include text and HTML content like images, videos, and links.

7. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Configure guidance detail experience for Recommended Actions cards.

Configure guidance detail experience

Configure a guidance title and description that are displayed to users in recommended actions or playbooks.

Before you begin

Role required: sn_gd_guidance.guidance_manager

About this task

The detail information appears in playbooks, or in a contextual side panel or in a subtab for Recommended Actions for Customer Service.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Guidances**.
2. Select a guidance from the Guidances list.
3. Configure the detail experience for the guidance in the Detail Experience tab.
   The detail experience is a message that is displayed for guidances that opens in the contextual side panel or in a subtab.
   a. In the **Title** field, add a title for the guidance in the detailed view.
   b. In the **Guidance Message** field, provide a message for the detail view.
4. Select **Submit**.

What to do next

- Customize a guidance preview experience in the UI Builder
- Customize a guidance detail experience in the UI Builder

The process for configuring a guidance is the same in the Guided Decisions Experience application and the Recommended Actions for Customer Service application.

Create a guidance action for a guidance

Configure the actions that agents can take to resolve cases or issues.

Before you begin

Role required: sn_gd_guidance.guidance_manager

Procedure

1. Navigate to **All** > **Guided Decisions** > **Guidances**.
2. Select a guidance from the Guidances list.
3. In the Guidance Actions form section, select **New**.
4. On the Guidance Action form, fill in the fields.

Field	Description
Guidance	The guidance that this action is associated with. This field is read only.
Action label	A name for this guidance action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Call to Action Label	The label for the action button that appears on the recommendation card in the contextual side panel. For example, **Review and attach article** or **Propose Solution**.
Action Behavior	The selected behavior for the guidance action: ○ **Single click**: The action is initiated and completed with one selection and the card moves to the **History** tab in the side panel. Useful for simple actions such as escalating a case. ○ **Open in Contextual Side Panel**: The action opens in a detailed view within the side panel. The agent can review the details in the side panel, such as reviewing the content of a knowledge base article. ○ **Open in Sub Tab**: The action opens in a separate tab. You can configure the preview experience for all the action behavior types and configure the detail view for the actions that open in the sub tab or contextual side panel. For more information, see Configure guidance detail experience. **Note:** Actions that open in the contextual side panel or in the subtab don't move to the in-progress state. The action moves to the in-progress or completed state only when the agent selects the action button in the detail view.
Primary	Denotes the guidance action as a primary action. This field is enabled by default. A primary action highlights the action that the agent should take and makes that action available as a button on the recommendation card. **Note:** A guidance can have only one primary guidance action. If this field is not selected, the guidance action is a secondary action available through the more actions menu on the recommendation card.
Application	The application that this guidance action is associated with. This field is read only.
Guidance Action Automation	The flow associated with this guidance action.
Order	The order of the action.
Completion Message	The message that appears at the top of the recommendation card when the guidance action is complete. For example, **KB article was shared**.

5. Depending on the selected flow in the **Guidance Action Automation** field, you can configure flow inputs and guidance outputs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure flow inputs in the **Automation Flow Inputs** tab.
- Configure outputs in the **Guidance Outputs** tab.

  These fields can contain static text, dynamic content (field values from guidance inputs), or a combination of static text and dynamic content. To use dynamic content, select the Pill-picker icon ( ) next to the field and select a guidance input from the list.

6. Select **Submit**.

What to do next
Configure a guidance node and link the created guidance to this node to provide actions to agents.

Create a decision tree in Core UI

Create a decision tree that agents can use to troubleshoot solutions to customer issues.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

About this task
Decision trees are first created in Core UI. You then use Decision Tree Builder to configure the start node and add nodes and paths to build a decision tree.

Procedure
1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. On the Decision Trees page, select **New**.
3. On the form, fill in the fields.

Decision Tree form

Field	Description
Name	The internal name of the decision tree.
Action Label	The label of the call-to-action button on the Recommended Actions card.
Description	The description of the decision tree to show on the Recommended Actions card.
Title	The external name of the decision tree that end-users or agents see in a workspace. If the **Title** field is empty, the internal name is shown as the external name on the Recommended Actions card.
Question font size	The font size of the questions in the guided decision tree. It reflects in the workspace and service portal. The font size defined in the parent decision tree is inherited by the child decision tree even though the Question font size for the child decision tree has its own Question font size defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	You may need to configure the form to add this field.
Show a dismiss button	Shows or hides the **Dismiss** button that cancels the flow of a decision tree. This field is turned on by default.

4. Select **Submit**.

Result
A decision tree record and a start node are created.

What to do next
Configure a start node to add initial set of questions or instructions to a decision tree in Decision Tree Builder.

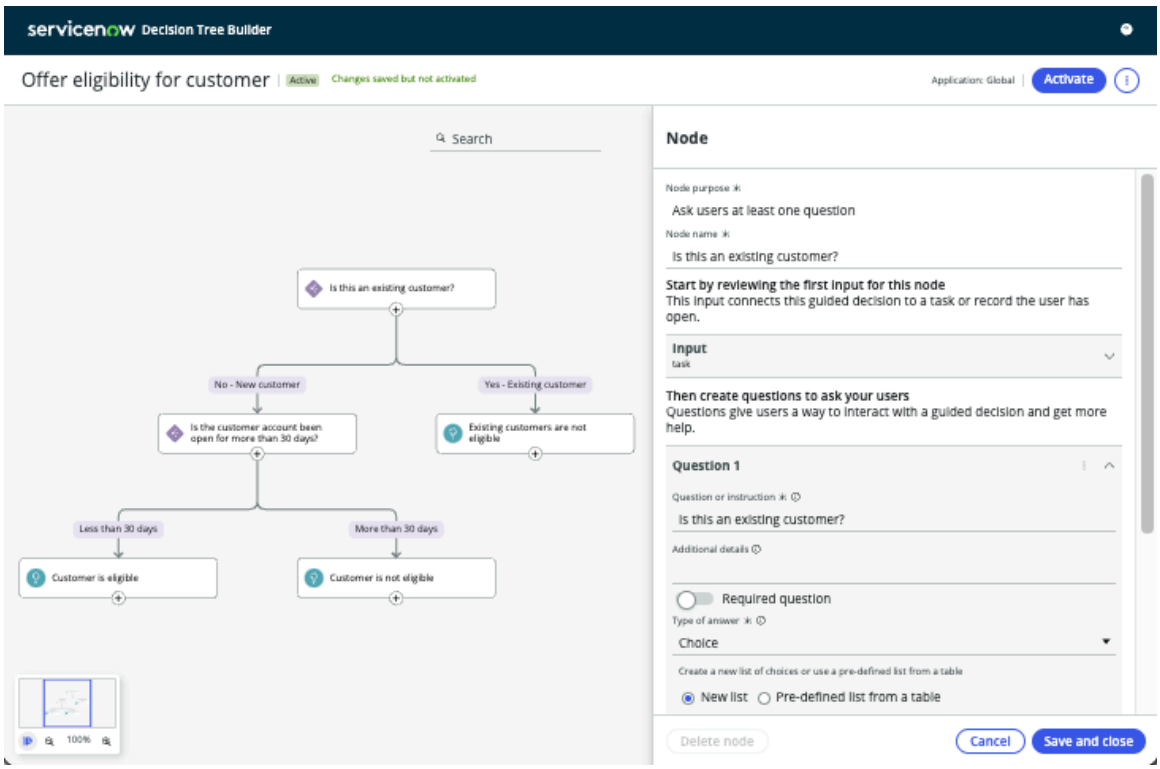
Configuring decision trees in Decision Tree Builder

Configure decision trees using the no-code visual Decision Tree Builder, which provides a canvas for a diagrammatic representation of nodes and their paths in a troubleshooting process.

As a process owner or business analyst, you can configure decision tree by adding nodes, defining paths, and attaching guidances through Decision Tree Builder. For more information, see Decision tree nodes.

You can validate and activate a decision tree with a single action. For more information, see Activate a decision tree.

Decision Tree Builder canvas



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing Decision Tree Builder

You can access the Decision Tree Builder by selecting the **Open in Builder** button on the decision tree record.

Configuring question and guidance nodes

You can configure a new node as a question node or a guidance node. When there are multiple questions in a start node or a question node, you can delete a question or change the order of the questions. For more information, see Add questions or instructions to a decision tree.

Guidance nodes provide actions to agents to resolve or escalate a customer issue. You can either select a guidance from the list of available guidances or create a guidance in Core UI. You can then configure guidance inputs by entering static values or reuse inputs from prior nodes. For more information, see Provide actions to agents in a decision tree.

Linking node

You can configure a new node as a linking node to link a child decision tree to the current decision tree. This linking connects the execution of the primary decision tree to another decision tree when a specific condition is met. For more information, see Link an activated decision tree to this decision tree.

Creating paths for the next nodes

A path in a decision tree connects one node to another. You can configure a condition to define when the path must be taken. Selecting certain answers can be a condition for the path. The priority order for a path sets the precedence of one path over another.

For more information, see Determine the next node displayed in a decision tree.

Editing a node or a path

When you edit the inputs of nodes and their paths, make sure to update the following nodes as well because they might be reusing data from these inputs.

Deleting a node or a path

Note the following information about deleting a node or path:

- You can delete a leaf node if it isn't connected to any path or a node.
- Deleting a leaf node removes the node from the decision tree but the configuration of the path before the deleted node remains intact.
- You can't delete an intermediate node or path.
- When you delete the question node after a guidance node, both the question node and the path are deleted.

Linking inputs

You can link inputs from one node to another to reuse input values from prior nodes. You can use linked inputs to create path conditions. For more information about input mapping in the question node or guidance node, see Linking inputs in decision tree nodes.

For more information, see Reuse answers at decision points.

Related topics

Validation error notifications in Decision Tree Builder

Activate a decision tree

Revert to the previous activated decision tree version

Add questions or instructions to a decision tree

Add questions you want to ask your customers or instructions you want to provide to them and configure answer types in a start node in Decision Tree Builder.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

The start node is the first node in a decision tree. It contains a task input and a minimum of one question or instruction. You can configure one or more questions to ask customers or instructions to provide to them.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.
4. In Decision Tree Builder, select **New node**.
5. In the **Node name** field, enter a name for the start node.
6. **Optional:** In the **Reference table** field, select a table for the record type.

   (Optional) The table that you select for the task input does not necessarily have to be a task table. For example, you can select a case, incident, or interaction table for the record context to recommend this decision tree in a workspace.

   Note:
   You must select the same table as the reference table for the context record in Recommended Actions.

7. In the Question 1 section, enter a question or instruction for customers.
   You can add text formatting, images, or links using the controls at the top of the Question 1 section.
8. **Optional:** Make this question a required question by selecting the **Required question** field.
9. Select the type of answer for your question.

   For a description of the answer types, see Answer types for questions.

   The answer the customer provides to a question can be passed to other nodes and paths via input mapping.

10. **Optional:** Link inputs to reuse answers from prior nodes.
    For more information, see Reuse answers at decision points.
11. **Optional:** Add more questions or instructions.
12. Select **Save and close**.

What to do next

Determine the next node displayed in a decision tree

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Answer types for questions

Several answer types are available for agents to provide answers to questions in a decision tree.

Type of answer

Choice	Description
Choice	A list of choices. The list types are: • **New list**: New choice list • **Pre-defined list from a table**: Existing choice list from a selected table **Use "None" as the first choice in the list**: Option to add **None** as the default value in the list.
Date	Date in the format of YYYY-MM-DD
Date/time	Date and time in the format of YYYY-MM-DD HH:MM:SS
Decimal	A number including decimal points.
Integer	A number that does not include decimal points.
Reference	Reference to a field from another table. When this answer type is selected, the following fields appear: • **Reference table**: Table for selecting a field from. • **Apply a filter**: Condition to filter the search results. For example, the Caller field on the Incident table is a reference to the User [sys_user] table.
String	A line of text. When this answer type is selected, the following field appears: **Maximum number of characters**: Length limit of the text string.
True/ False	Check box that enables the user to indicate whether the condition is true or false. If selected, it returns a value of true.

Determine the next node displayed in a decision tree

Configure a path in Decision Tree Builder to set the conditions for when the next question or a guidance is displayed in a decision tree.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

You can create two or more paths from any question node.

Because you can add a question node only after a guidance node, the path configuration isn't required.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In Decision Tree Builder, select the Add path icon (⊕) on a node.
   A new path and a new node are added to the canvas.
5. Select the new path.
6. Enter a name for the path.
7. In the **Path priority** field, enter a priority order for this path.
   The path with the lowest priority order is executed first.
8. Configure one or more conditions by selecting a question from the previous node, an operator, and an input's value.
   For example, if the answer type is an integer, you can set a condition that when a value that a customer provides is more than the value you specify in the condition, this path must be taken.

   You can access the direct parent node's inputs only while configuring a condition for the path.
9. **Optional:** If there are multiple questions in a question node, select **New condition set** to define a complex condition for a combination of answers.
10. Select **Save and close**.

What to do next

Continue building your decision tree.

- Add a next set of questions. For more information, see Add a follow-up set of questions or instructions in a decision tree.
- Provide guidance to agents. For more information, see Provide actions to agents in a decision tree

Add a follow-up set of questions or instructions in a decision tree

Configure a question node in Decision Tree Builder to add follow-up questions or instructions. Answer to these questions either lead to a guidance or a further set of questions.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.
4. In Decision Tree Builder, add a new node by selecting the Add path icon (⊕) on a node.
5. Select **Add node**.
6. In the pop-up window, select **Ask users at least one question** to configure a question node.
7. Enter a name for the node.
8. In the Question 1 section, enter a question or instruction for customers.
9. **Optional:** Make this question a required question by enabling the **Required question** field.
10. **Optional:** Enter more details related to your question or instruction in the **Additional details** field.
11. Select the type of answer.

    For a description of the answer types, see Answer types for questions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The answer the customer provides is passed to other nodes and paths via input mapping.

12. **Optional:** Link inputs to reuse answers from prior nodes.
    For more information, see Reuse answers at decision points.
13. **Optional:** Add more questions or instructions.
14. Select **Save and close**.

What to do next
Continue building your decision tree.

- Add a next set of questions. For more information, see Add a follow-up set of questions or instructions in a decision tree
- Provide guidance to agents. For more information, see Provide actions to agents in a decision tree

Provide actions to agents in a decision tree

Configure a guidance node in Decision Tree Builder so agents can view a recommendation on what to do next.

Before you begin
Verify that the guidances you want to use exist or create them. For more information, see Create a guidance in the Core UI.

Role required: admin, sn_gd_core.decision_tree_author

About this task
Note:
If the **Allow users to re-run the guidance** field is selected when creating a guidance, users can re-execute the guidance or go back and modify responses in the previous question nodes in the run-time experience.

You can link guidance inputs and outputs to the next question node.

You can select a guidance from the list of available guidances to link to your guidance node or create a new one in Core UI.

Procedure
1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.
4. In Decision Tree Builder, add a new node by selecting the Add path icon (⊕) on a node.
5. Select **Add node**.
6. In the pop-up window, configure a guidance node by selecting **Propose a guidance as an outcome**.
   A guidance is an outcome of a decision tree.
7. Enter a name for the node.
8. In the **Guidance** field, select the guidance by starting to type the guidance name and selecting it from the list.
9. Enter specific values for guidance inputs in the **Set field inputs to pass data into this guidance** section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These fields can contain static text, dynamic content such as field values from guidance inputs, or a combination of static text and dynamic content. To use dynamic content, select the Link input icon ( ) next to the field and select a guidance input from the list.

10. **Optional:** Enter placeholder values for guidance inputs in the **Set more field inputs to show to users** section.
    Agents can substitute their own information for the placeholder values. These fields can contain static text, dynamic content such as field values from guidance inputs, or a combination of static text and dynamic content. To use dynamic content, select the Link input icon ( ) next to the field and select a guidance input from the list.
11. Select **Save and close**.

What to do next

Add a next node that is a question node after a guidance node.

Link an activated decision tree to this decision tree

Nest and invoke a decision tree from a linking node when specific conditions are met in Decision Tree Builder. Use nested trees to execute complex troubleshooting and reuse existing decision trees.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.
4. In Decision Tree Builder, add a new node by selecting the Add path icon ( ) on a node.
5. Select **Add node**.
6. In the pop-up window, select **Link decision tree** to configure a linking node.
7. Enter a name for the node.
8. In the **Child decision tree** field, select an activated decision tree.
9. Enter values or link inputs to reuse answers from prior nodes.
   For more information, see Reuse answers at decision points.
10. Select **Save and close**.

Reuse answers at decision points

Link inputs to reuse answers from prior nodes in Decision Tree Builder. For example, in a decision tree that deals with a loan application, you could reuse the input related to the customer's salary at multiple decision points to determine the loan eligibility.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

Linked inputs can be used to create path conditions.

For more information about input mapping and exceptions related to input mapping, see Linking inputs in decision tree nodes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.
4. In Decision Tree Builder, select the node you want to map inputs to.

Different nodes and actions

Node type	Action
Question node	**a.** Enter a question and select the type of answer. **b.** Select **Link inputs to reuse prior data**. **c.** Use the Link input icon () to select a prior node and an input that you want to reuse in this question. **Note:** The question with a reused answer is answered automatically during runtime.
Guidance node	**a.** Select a guidance from the list. **b.** Select the Link input icon () to select a prior node and the input that you want to reuse in the guidance input.
Linking node	**a.** Select a child tree from the list. **b.** Select the Link input icon () to select a prior node and the input that you want to reuse in the start node of the child tree.

5. Select **Save and close**.

Activate a decision tree

Activate a completed decision tree so you can use it in playbooks created using Playbooks, in recommendations created using Recommended Actions for Customer Service, or in Service Portal.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

When you activate a decision tree, Decision Tree Builder checks for errors such as missing information, invalid input mappings due to changes in prior node inputs, or missing guidance inputs. After all the errors are resolved, you can activate the decision tree.

If you make changes to an activated decision tree, remember to activate the decision tree again to display the updated decision tree in a workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree that you want to activate.
3. Select **Open in Builder**.
4. In Decision Tree Builder, select **Activate**.
   - If there are errors in your decision tree, error icons and alert messages are displayed. You must resolve the errors before you can activate the decision tree. For more information, see Validation error notifications in Decision Tree Builder.
   - If there are no errors, the confirmation dialog box to activate the decision tree displays.
5. In the confirmation dialog box, select **Activate now**.
   A success message with instructions on the next action to take is displayed.

Result

- The decision tree status changes from **Not active** to **Active**.
- The **Activate** button is disabled.

What to do next

- Configure recommended actions to use the activated decision tree as a recommendation. The recommendations appear as cards in the contextual side panel of a workspace. For more information, see Add Guided Decisions to Recommended Actions.
- Configure Playbooks to use the activated decision tree as part of a playbook in a record tab. For more information, see Add Guided Decisions to playbooks.
- Configure a Service Portal page to use the activated decision tree for providing troubleshooting process to internal users. For more information, see Add Guided Decisions to Service Portal.

Revert to the previous activated decision tree version

Discard any changes in a non-activated decision tree and revert the decision tree to the last activated version.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Open in Builder**.
4. Select the More options icon (⋮) and select **Discard latest version**.

Result

The decision tree reverts to the last activated version.

Validation error notifications in Decision Tree Builder

Notifications of errors that you might encounter while building and activating a decision tree in Decision Tree Builder enable you to recover easily from errors.

© 2026 ServiceNow, Inc. All rights reserved.

Error display

If there are missing values or incorrect configurations in a node or path, errors may appear during validation when saving or activating a decision tree.

The errors are indicated in the following ways:

- Error icons on nodes and paths that have errors
- A label for a count of nodes and paths that have errors in the top-right corner
- An alert message in the side panel showing a list of errors in the selected node or path

For more information on errors and recovery across various nodes and paths, see Validation errors.

Validation errors

Several types of errors are displayed for missing or incorrect information in the nodes and paths while saving an element or activating a decision tree.

Question node errors

Resolving errors in question nodes

Error message	Resolution
This node needs a unique name	Enter a name in the **Node name** field.
The questions in this node need to be unique	Enter a unique question or instruction in the **Question or instruction** field.
This node needs a question to ask users	Enter a unique question or instruction in the **Question or instruction** field.
The task input needs a reference table to pass data about records	Select a table in the **Reference table** field for the task input to pass data about the record on which this decision tree is run.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolving errors in question nodes (continued)

Error message	Resolution
Question {number} needs a question or instruction	Enter a question or instruction in the **Question or instruction** field.
Question {number} needs an answer type	Select an input type for the expected answer in the **Type of answer** field.
Question {number} needs answer choices	The Choice answer type requires a choice list. Enter values in the **Label** and **Value** fields to configure a list. You can add as many choices as you want.
Question {number} needs an answer-string character limit	Enter a character limit in the **Maximum number of characters** field.
Type of answer in Question {number} doesn't exist	The answer type that you entered in the **Type of answer** field isn't valid. Select the answer type from the list. For more information, see Answer types for questions.
Question {number} needs a choice table and choice fields for the answer(s)	The **Pre-defined list from a table** option for the choice answer type requires you to specify the choice table and choice field to reuse choices. Select a table and list field in the **Choice table** and **Choice field** fields respectively.
Choice table in Question {number} doesn't exist	Enter a valid table name in the **Choice table** field.
Question {number} needs a reference table for the answer(s)	The reference input type requires a reference table to be selected. Select a table in the **Reference table** field to add a reference field, which stores a reference to a field on another table, as an answer type.
Reference table in Question {number} doesn't exist	Enter a valid table name in the **Reference table** field.
You need to add a path after this node	Question nodes require paths to add the next question or guidance nodes. Select the Add path icon ⊕ on the question node in the canvas to add a new path.
The input you linked in Question {number} isn't valid because of mismatched answer types. You can unlink this input, link a new one, or change this question's answer type.	After you change a question's answer type in a prior node, the input mapping from the question in the current node is no longer valid. **1.** Unlink the input by deleting the link. **2.** Either change this question's answer type to match the changed answer type in the prior node or add a question that matches it. **3.** Select the Link input icon (⛓) to link the inputs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolving errors in question nodes (continued)

Error message	Resolution
The input you linked to Question {number} no longer exists after recent node changes. Unlink this input to fix this error.	Unlink the input by deleting the link.
The input you linked in Question {number} isn't valid because of mismatched reference tables with a prior node. Tables need to match at the same or child level.	You can link reference input types only if the current question node's input table matches the prior node's input table at the same level or at the child level. For example, the Task table can be linked to the Task table or the Task table can be linked to the Case table, which is a child of the Task table. 1. Unlink the input by deleting the link. 2. If necessary, select the reference table that matches at the same level or at the child level. 3. Select the Link input icon ( ) to link the reference inputs again.

Guidance node errors

Resolving errors in guidance nodes

Error message	Resolution
This node needs a unique name	Enter a name in the **Node name** field.
This node needs a guidance	Guidance nodes must be linked to a guidance. Either select an existing guidance or create one. • Select an available guidance from the list in the **Guidance** field. • Create a guidance in Core UI by selecting the Create a guidance icon in the **Guidance** field. For more information, see Create a guidance in the Core UI.
You need to set inputs for this guidance	Configure the guidance inputs for the guidance that you selected. For more information, see Provide actions to agents in a decision tree.
{Guidance input name} input isn't valid because of mismatched reference tables with a prior node. Tables need to match at the same or child level.	You can link reference input types only if the current guidance node's input table matches the prior node's input table at the same level or at the child level. For example, the Task table can be linked to the Task table or the Task table can be linked to the Case table, which is a child of the Task table.

Resolving errors in guidance nodes (continued)

Error message	Resolution
	1. Unlink the input by deleting the link. 2. Select the ( ) icon to link the inputs again or enter a static value.
The input you linked to {Guidance input name} no longer exists after recent node changes. Unlink this input to fix this error.	1. Unlink the input by deleting the link. 2. Select the Link input icon ( ) to link the inputs again or enter a static value.
You need to reset the input(s) for this guidance because of changes in prior nodes	1. Unlink the input by deleting the link. 2. If necessary, select the Link input icon ( ) to link the new answer type from the prior node or enter a static value.

Linking node errors and warnings

Resolving errors in linking nodes

Error message	Resolution
This node needs a unique name	Enter a name in the **Node name** field.
This node needs a child tree	Linking nodes must be linked to a child tree. Either select an activated decision tree or create one. • Select an activated decision tree from the list in the **Child decision tree** field. • Create a decision tree in Core UI by selecting the Create a decision tree icon ⊕ in the **Child decision tree** field. For more information, see Create a decision tree in Core UI.
You need to map the inputs of the child decision tree to this decision tree correctly.	Configure the start node inputs of the child decision tree or select the Link input icon ( ) to link the inputs.
{Input name} input isn't valid because of mismatched reference tables with a prior node. Tables need to match at the same or child level.	You can link reference input types only if the current guidance node's input table matches the prior node's input table at the same level or at the child level. For example, the Task table can be linked to the Task table or the Task table can be linked to the Case table, which is a child of the Task table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolving errors in linking nodes (continued)

Error message	Resolution
	1. Unlink the input by deleting the link. 2. Select the ( ) icon to link the inputs again or enter a static value.

Resolving warnings in linking nodes

Warning message	Resolution
The child decision tree you linked earlier changed. Double-check the mapped inputs.	1. Unlink the input by deleting the link. 2. If necessary, select the Link input icon () to link the input from the prior node or enter a static value.
Make sure these linked decision trees can still use {child decision tree}: • {Name of parent tree 1} • {Name of parent tree 2} • {Name of parent tree 3}	When you update and activate a decision tree, the parent decision trees that use this decision tree as a child tree must also be updated. 1. Select the parent decision tree. 2. Select the link node that references the child decision tree that has changed. 3. Unlink the input by deleting the link. 4. If necessary, select the Link input icon () to link the input from the prior node or enter a static value.

Path errors

Resolving errors in paths

Error message	Resolution
This path needs a name	Enter a name in the **Path name** field.
This path needs a unique path priority	Enter a unique value in the **Path priority** field.
This path needs conditions for showing the next node	Configure one or more conditions by selecting an input from the previous node, an operator, and an input value.
Every condition in this path needs to be complete	Complete a condition in the path by selecting an input from the previous node, an operator, and an input value.
You need to add a node after this path	A path must lead to a node. Select **Add node** to configure the placeholder node as a question node or a guidance node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolving errors in paths (continued)

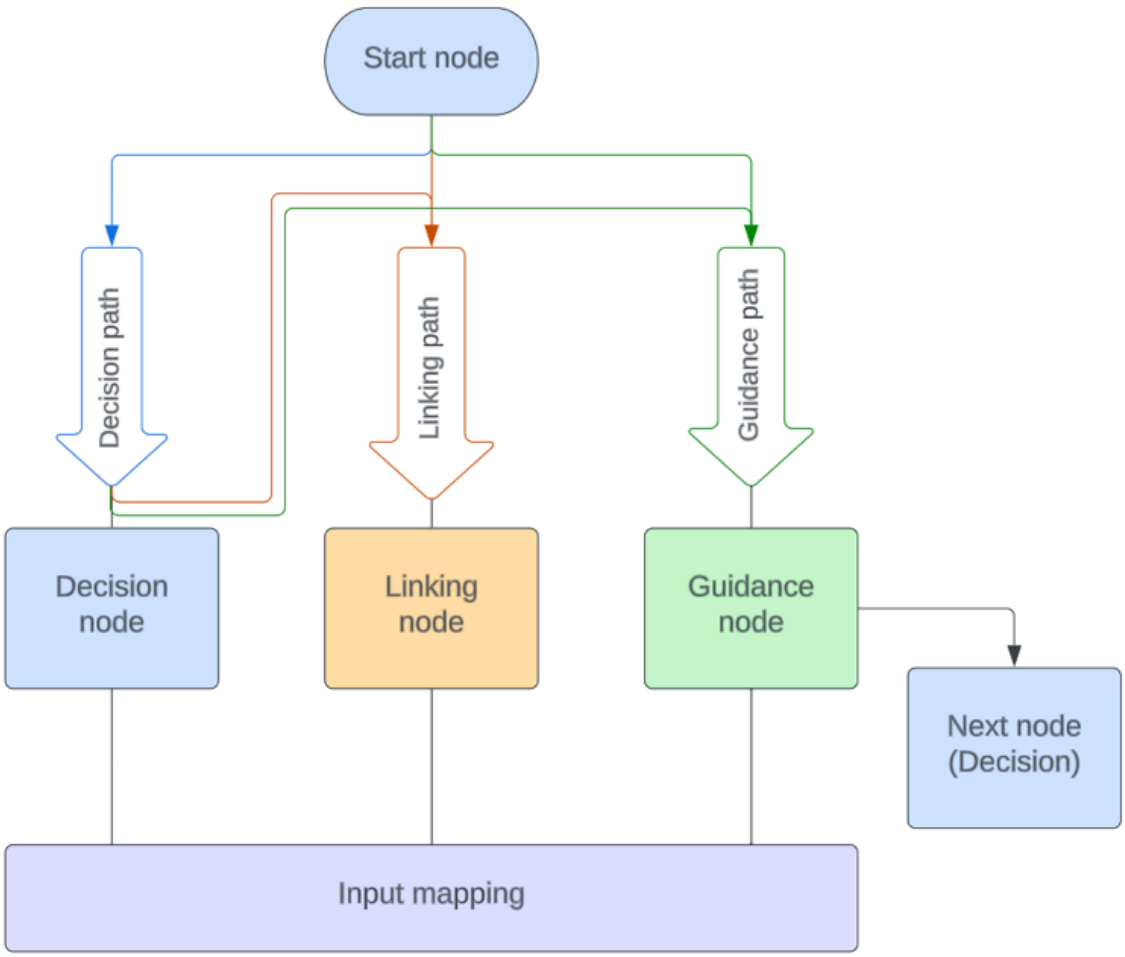
Error message	Resolution
The path condition needs new values because of changes in prior nodes	Reconfigure the path condition by selecting the new input from the previous node, an operator, and the new input value.
The path conditions can't be defined until the prior node has a question and answer	Configure questions and answer types in the path's parent node.

Editing decision trees in Core UI

You can edit decision trees created in Core UI to improve or extend a troubleshooting process.

Note:
You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

Decision tree configuration flow in Core UI



The following table provides high-level information for editing a decision tree in the Core UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Decision tree configuration steps

Decision tree step	Description
Configure a start node and a task input	Each decision tree includes a start node of type decision and a task input. The task input stores a reference of the record that the agent is working on. For more information, see Edit a decision tree. Select the start node from the Decision Tree Nodes related list. Create inputs to add initial questions you want to ask customers. Select the input type for the expected answer and configure the answers in the related list. For more information, see Add questions or instructions to a decision input.
Create a decision path	Create a decision path and configure conditions for the next decision node. For example, you can set up a condition to select an answer for the question in the start node. When a user selects this answer, this path that leads to a decision node is taken. For more information, see Determine the next node in a decision tree. A decision node is automatically created.
Create inputs to add follow-up questions in the decision node	Select the input type for the expected answer and configure the answers in the related list. For more information, see Add questions or instructions to a decision input.
Create a guidance path	Create a guidance path and configure conditions for the next guidance node. For example, you can set up a condition to select an answer for the question in the start node or decision node. When a user selects that answer, this path leads to a guidance node. For more information, see Determine the next node in a decision tree. A guidance node is automatically created.
Configure the created guidance node	Configure the guidance node to provide resolution to a customer. Associate a guidance to the guidance node and configure the guidance inputs. For more information, see Provide actions to agents in a decision tree.
Create a linking path	Create a linking path and configure conditions for the next decision tree. For example, you can set up a condition to select an answer for the question in the decision node. When a user selects that answer, this path leads to the next decision tree. For more information, see Determine the next node in a decision tree.

Decision tree configuration steps (continued)

Decision tree step	Description
	A linking node is automatically created.
Configure the created linking node	Configure the linking node to link another decision tree to this decision tree. For more information, see Link another decision tree to this decision tree.
Configure a next node	Configure a next node that is a decision node. **Note:** You can't add another guidance node after a guidance node. • You can add an intermediate decision node to add another guidance node. • You can configure a linking node after this decision node to link another decision tree. For more information, see Add a next node after a guidance node.
Map inputs from one node to another	Map inputs from one node to another to reuse answers by selecting a source node and a source input and a destination input. In the guidance node, you can pass inputs from the prior nodes to the guidance inputs by using the Pill-picker icon ( ) to reuse answers. For more information, see Reuse answers at decision points.

Note:
To go back to your decision tree from any node, select the Preview this record icon (ⓘ) next to the **Decision Tree** field and then select **Open Record**. You can see all the nodes that you created in the related list.

Edit a decision tree

Edit a decision tree that you created using Core UI to improve or extend a troubleshooting process.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. On the form, edit the fields, as necessary.

Decision Tree form

Field	Description
Name	The internal name of the decision tree. **Note:** A start node is created for the decision tree with this name.
Action Label	The label of the call-to-action button on the Recommended Actions card.
Description	The description of the decision tree to show on the Recommended Actions card.
Start Node	The reference of the start node.
Title	The external name of the decision tree that end-users or agents can see in a workspace. If the **Title** field is empty, the internal name is shown as the external name on the Recommended Actions card.
Show a dismiss button	Shows or hides the **Dismiss** button that cancels the flow of a decision tree. This field is turned on by default.

4. Select **Update**.

What to do next
Add questions or instructions to a decision input

Add questions or instructions to a decision input

Create decision inputs for each decision node. Decision inputs appear in the form of questions in a workspace for service agents to answer.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

Create a decision path first. A decision node is automatically created with the same name as the decision path.

About this task
Decision nodes can have one or multiple questions with different answer types.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select the start node or any decision node.
4. Select **Create Input**.
5. In the **Type** field, select the type of a decision input.

> **Note:**
> In the **Type** field, you have access to many input types. Select only one of the recommended input types listed the following table.

Input type

Field	Description
Choice	A list of choices **Choice list specification**: Type of choice list. You can create a choice list by clicking **New** in the Choices related list.
Date	Date in the format of YYYY-MM-DD
Date/time	Date and time in the format of YYYY-MM-DD HH:MM:SS
Decimal	A number with the decimal points
Integer	A number with no decimal points
Reference	Reference to a field from another table ○ **Reference**: Reference table for selecting a field. ○ **Reference qual condition**: Condition to filter the search results. For example, the Caller field on the Incident table is a reference to the User [sys_user] table.
String	A line of text **Maximum number of characters**: Option to specify the length of the string
True/ False	A check box field

6. In the **Label** field, enter a question or instruction for customers.
7. Select **Submit**.

What to do next

Determine the next node in a decision tree

Determine the next node in a decision tree

Create a path to set conditions and priority order for the next node in a decision tree.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Based on the answer a service agent provides to a question, a decision path guides the agent to the next decision node, a guidance path guides the agent to the next guidance node, and a linking path guides the agent to the next linking node.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select the start node or decision node.
4. Select one of the following actions.

5. In the **Label** field, enter a label for the path.
6. In the **Order** field, enter a priority order for this path.
   The path with the lowest priority order is executed first.
7. Configure a condition for this path to display the next node.

Path types and descriptions

Path	Description
Decision path	Decision paths include conditions when the next question is displayed to an agent.
Guidance path	Guidance paths include conditions when a guidance that provides resolution for an issue is displayed to an agent.
Linking path	Linking paths include conditions when a next decision tree is executed.

You can only access the direct parent node's inputs while configuring a condition for the path.

8. Select **Update**.

Note:
You can create as many decision, guidance, or linking paths as required.

What to do next

Continue building the decision tree.

- Add questions or instructions to a decision input
- Provide actions to agents in a decision tree
- Link another decision tree to this decision tree

Provide actions to agents in a decision tree

Associate a guidance to a guidance node so that service agents can act to resolve or escalate a customer issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

Create a guidance path first. A guidance node is automatically created with the same name as the guidance path.

About this task
A guidance is an outcome of a decision tree.

You can either create a guidance or select a guidance from a list. For a complete list of guidances that are available by default, see Components installed with Guided Decisions Experience. You can then enter guidance inputs, as required.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

Procedure
1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select the guidance node created.
4. In the **Guidance** field, select a guidance to associate with the guidance node.
5. Depending on the guidance you selected, enter guidance inputs, as required.

   Note:
   If you selected the Attach Knowledge Article guidance, enter the knowledge article to link to.

   If you selected the Provide Resolution guidance, enter the case, resolution notes, and a resolution code.

   If you selected the Create Work Order guidance, enter the task to link to.

6. Select **Update**.

What to do next
Link task input in the start node to the guidance

Link task input in the start node to the guidance

Link the task input in the start node to the task input in the guidance to pass record information.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

About this task
The task input in the start node holds a reference of the record that an agent is working on in a workspace. For example, if you want to attach a KB article to a case, you would need the case number.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select the guidance node created.
4. Select **Create Input Mapping**.
5. In the **Source Node** field, select the start node of your decision tree.
6. In the **Source Input** field, select the task input.
7. In the **Destination Input** field, select the task input associated with the guidance.

> **Note:**
> The **Destination Node** is automatically filled with the value of the decision node that you're creating the input mapping from.

8. Select **Submit**.

Link another decision tree to this decision tree

Nest and invoke decision trees from linking nodes when specific conditions are met. Use guidance output and nested trees to execute complex troubleshooting.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

Create a linking path first. A linking node is automatically created with the same name as the linking path.

About this task
The execution of the linked decision tree begins when a specific condition specified in the linking path is met. The linking node holds a reference of the start node in the next decision tree.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select the linking node.
4. In the **Linked Decision Tree** field, select an available decision tree from the list.
5. Select **Update**.

Add a next node after a guidance node

Add a next node that is a decision node after a guidance node. If a next node is configured, the execution of the decision tree continues after the agent performs the guidance and the guidance history is marked as complete.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

About this task
You can only add a decision node after a guidance node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can add an intermediate decision node to add another guidance node.
- You can configure a linking node after this decision node to link another decision tree.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select the guidance node.
4. Select **Set Next Node**.
5. In the **Label** field, enter a name for the next decision node.
6. Select **Update**.

What to do next

Continue building the decision tree.

- Add questions or instructions to a decision input
- Determine the next node in a decision tree

Reuse answers at decision points

Create input mapping to reuse answers from prior nodes. For example, in a decision tree that deals with loan application, you can reuse the input related to the customer's salary at multiple decision points to determine the loan eligibility.

Before you begin

Role required: admin, sn_gd_core.decision_tree_author

About this task

For more information about input mapping in a decision node or a guidance node, see Linking inputs in decision tree nodes.

Mapped inputs can be used to create path conditions.

You can edit or extend existing decision trees in the Core UI but you can no longer create them. Use Decision Tree Builder to create new decision trees. For more information, see Configuring decision trees in Decision Tree Builder.

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision node or the guidance node that must reuse inputs.
3. Click **Create Input Mapping**.
4. In the **Source Node** field, select the node you want to copy from.
5. In the **Source Input** field, select the node input to copy.
6. In the **Destination Input** field, select the node input you want to copy the values to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Destination Node** is automatically filled with the value of the node that you're creating the input mapping for.

7. Select **Submit**.

Delete a decision tree

Delete a decision tree and all the related version records. All related records such as decision tree versions, nodes, and paths are deleted.

Before you begin
Role required: admin, sn_gd_core.decision_tree_author

Procedure

1. Navigate to **All** > **Guided Decisions** > **Decision Trees**.
2. Select the decision tree from the list.
3. Select **Delete**.

Add Guided Decisions to Recommended Actions

Add decision trees created using the Guided Decisions Experience application to Recommended Actions, so customer service agents can work through it to resolve cases more efficiently.

Before you begin
Ensure that you have Recommended Actions application (sn_nb_action) installed.

Role required: sn_nb_action.next_best_action_author, admin

Procedure

1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Create a context for a table.
   A context enables agents to see recommended actions for a record in that table.
3. Create a rule for the context.
   A rule is a set of conditions that applies to a context and determines when a recommended action appears for records in the context table.
4. Create a recommendation of type decision tree.
   A recommendation is a way to suggest an action to an agent.

Related topics

Configuring Guided Decisions

Configuring guidances and decision trees

Add Guided Decisions to playbooks

Add decision trees created using the Guided Decisions Experience application to a playbook, so customer service agents can work through it to resolve cases more efficiently.

Before you begin
Role required: admin, pd_content_author

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A playbook is set of steps that defines a process. A decision tree can be added as one of the steps within a playbook.

Playbooks are displayed in cases on Agent Workspace based on trigger definitions defined for each playbook in the Process Automation Designer. For more details, see Process Automation Designer. Based on the context of the case the customer service agent is working on, the playbook and any associated decision trees are displayed.

For more details on playbooks for Customer Service Management, see Playbooks for Customer Service Management.

Procedure

1. Navigate to **All** > **Process Automation** > **Process Automation Designer**.
   Playbooks opens in a new tab.
2. Select the process you want to add the decision tree to.
3. Select **Add activity**.
4. Select **Guided Decisions Experience** > **Guided Decisions**.
5. In the Details tab, fill in the basic details of your activity.

Option	Description
Label	Unique name for your activity. This name ap pears in user-facing views of your playbook.
Description	Description of your activity.
Run condition	After the activity starts, the activity runs only if specific conditions are met.
When to start	Options when your activity must start: ○ **After Previous**: This activity starts when the preceding activity has a state of Skipped or Complete. ○ **Immediately**: This activity starts when its stage starts running. Your activity doesn't depend on the state of any preceding activi ties. ○ **With Previous**: This activity starts when the immediately preceding activity starts run ning.

6. Select **View all properties**.
7. In the Automation tab, in the **Decision tree** field, select the decision tree you want to add to the guided decision.
8. Select **Done**.
9. In the main header, select **Activate**.
   Activating your process publishes it so that it runs when triggered.

Result

The decision tree is added to the playbook. Depending on the context of the case, customer service agents can access the decision trees from cases on Agent Workspace.

Configuring guidances and decision trees

Add Guided Decisions to Service Portal

Create or edit a page to add decision trees to Service Portal so internal users can troubleshoot their issues.

Before you begin

The decision tree that you want to add to the Service Portal page must exist. For more information, see Configuring decision trees in Decision Tree Builder.

Role required: sp_admin or admin

About this task

These steps are intended for users with little to no coding experience.

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. Select **Designer**.
3. From the Service Portal Designer, either select an existing page or add a new page.
4. Under Layouts, create the area to add widgets by selecting **Container** and dragging it onto the page.
5. In the **Widgets** tab, in the **Filter Widget** field, search for the Decision tree - Visualizer widget, then drag the widget to the layout.
6. Select the Edit icon ( ).
7. Provide the decision tree ID.
   a. On the decision tree record, select the Additional actions icon ( ).
   b. Select **Copy sys_id** from the menu.
8. Select **Save**.

What to do next

If you want the decision tree theme to match the Service Portal, you can apply a UX theme to change your existing theme. For more information, see Match the theme of the decision tree component with the Service Portal page.

Related topics

Configuring Guided Decisions

Configuring guidances and decision trees

Match the theme of the decision tree component with the Service Portal page

Customize the theme of the decision tree component to match the Service Portal theme.

Before you begin

A variant UX theme to match the theme of the decision tree component with the Service Portal theme must exist. For more information, see Manage the visual style of UI Builder experiences .

Role required: sp_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. In the **Search** field, enter `ux_portal_theme_to_uib_theme_mapping` and select the record.
3. Copy the value of the **Name** field from the ux_portal_theme_to_uib_theme_mapping record. The **Name** field contains the system property name appended with the existing portal theme ID, for example, `ux_portal_theme_to_uib_theme_mapping.f548bd34845a1110f87767389929c667`.
4. Select **New** to create a system property.
5. In the **Suffix** field, paste the copied value.
6. Provide the UX theme ID of the theme that you want to apply in the **Value** field.
   a. On the UX theme record, select the Additional actions icon ( ).
   b. Select **Copy sys_id** from the menu.
7. Select **Update**.

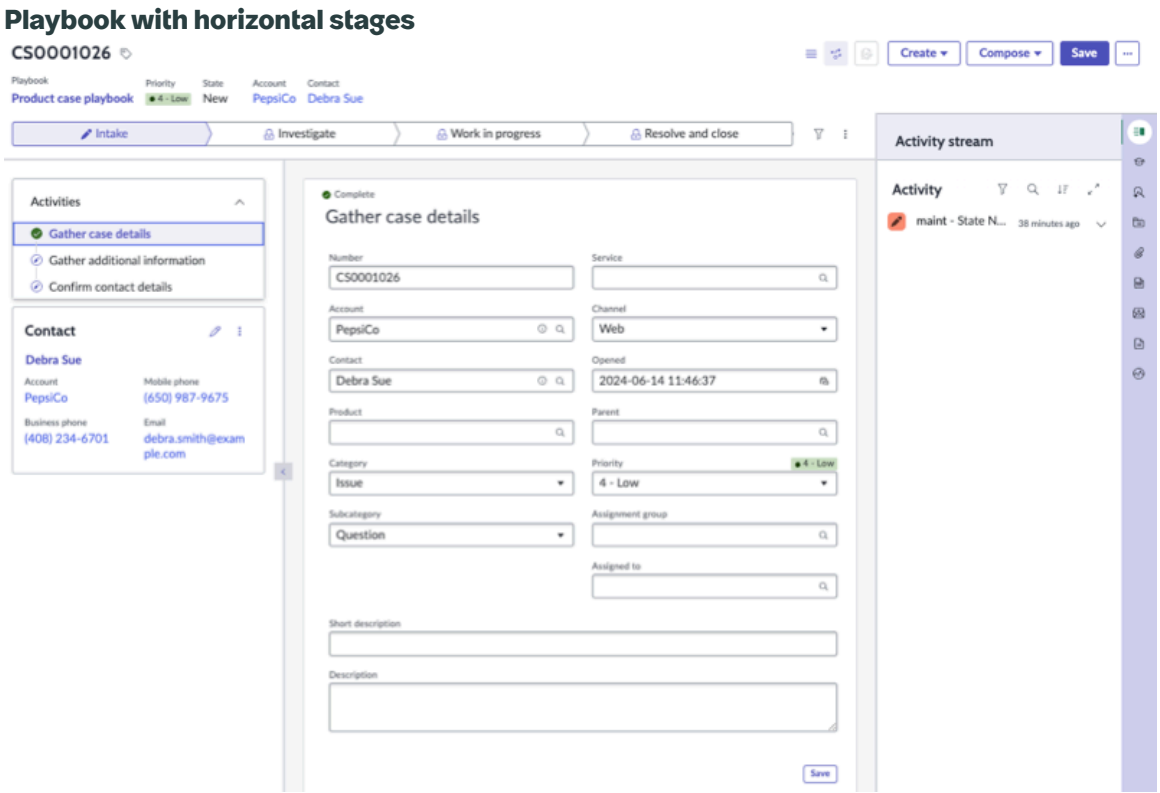
Result

The Service Portal theme is applied to the decision tree component.

Playbooks in Customer Service Management

Playbooks provide customer service agents with step-by-step guidance for resolving specific types of cases. Agents can follow a playbook in CSM Configurable Workspace and complete guided activities to resolve customer issues.

Playbook with horizontal stages



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook overview

A playbook is an end-to-end workflow that includes the stages, steps, and guidance to lead users through a business process. A playbook visualizes a workflow in a task-oriented view and guides users through sequences of tasks.

A playbook takes a workflow and breaks it into multiple stages. Each stage in a playbook includes a logical group of sequential activities for an agent to complete. Stages can also include automated activities, such as sending an email to a customer when a stage or activity is complete.

Playbooks include:

- A series of steps that a user must complete in order to achieve a particular goal and the necessary guidance for completing those steps.
- One or more stages, or groups of tasks, and sequences of activities within each stage.

Playbooks are created in the Workflow Studio application. Pages that display playbooks in a workspace are created in the UI Builder application. Agents use playbooks in CSM Configurable Workspace to complete activities. End users can also use playbooks from service portals to create requests and provide information. For more information, see the following sections in this topic:

- Playbook users and tools
- Configuring and configuring playbooks

Playbook users and tools

The following table describes the different user roles that are involved in the creation, configuration, and use of playbooks. It also describes the tools and applications used by each of those roles.

Playbook user roles and tools

User role	Tool / application
Playbook admin [playbook.admin]	Uses the Workflow Studio application to author, configure, and monitor playbooks. Workflow Studio is the design environment where playbook owners build playbooks.
Playbook experience admin [playbook_experience.admin]	Uses the Playbook Experience application to create playbook experience records. These records define how playbook activities appear within a playbook.
UI Builder admin [ui_builder_admin]	Uses the UI Builder application to create or customize pages that display playbooks in CSM Configurable Workspace. UI Builder is a web user interface builder. Users with the UI Builder admin role use the tool to create pages, which are collections of components that make up a workspace user interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook user roles and tools (continued)

User role	Tool / application
	Note: Playbook page templates are available for UI Builder admins to use as a starting point for creating playbook pages.
Customer service agent [sn_customerservice_agent]	Uses playbooks in CSM Configurable Workspace to complete activities and resolve cases. The playbook runtime experience is where end users, such as agents, follow the playbook to complete a business process.
End user [sn_customerservice.customer]	Uses playbooks create cases, provide requested information, and complete assigned tasks. For more information, see Playbooks for portals.

Creating and configuring playbooks

Creating and configuring a playbook involves different tools and applications. Playbooks are created using the Workflow Studio application. Some of the configuration for a playbook is performed in UI Builder as part of the playbook component configuration. Additional settings can be configured in the playbook experience record in the Core UI. These settings include selecting the playbook activity view and configuring playbook stage and activity visibility. For more information, see Configure Playbooks for Customer Service Management.

Configuration tasks and tools

Tools	Tasks
Workflow Studio	Workflow Studio is the design environment where playbook owners (users with the playbook.admin role) build playbooks. For more information, see the following topics: • Exploring Workflow Studio • Getting started with Playbooks
Playbook Experience	Playbook experience records define how playbook activities appear within a playbook. • Users with the playbook_experience.admin role can create playbook experience records. • Users with the ui_builder_admin role can select a playbook experience when adding a playbook to a page in UI Builder. The playbook experience record includes settings for the playbook stage and activity visibility, such as hiding or displaying playbook activities based on user role or activity state.
UI Builder	Users with the ui_builder_admin role can use UI Builder to create or customize pages, which are collections of components that make up a workspace user interface. Some of the playbook configuration tasks in UI Builder include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration tasks and tools (continued)

Tools	Tasks
	• **Selecting a playbook activity view**: The activity view determines how the stages and activities are displayed in the playbook. Select a playbook activity view in the playbook component configuration in UI Builder. • **Selecting a playbook experience**: The playbook experience determines how the system renders a playbook in a workspace. You can use playbook experiences to customize the look and feel of a playbook, map user actions, and override activities. Select a playbook experience when adding a playbook to a page in UI Builder. • **Configuring a playbook to use compact mode**: Compact mode moves the playbook to the contextual side panel. Agents can complete playbook activities in the side panel while viewing other information in the record page. Configure a playbook to use compact mode in the playbook component configuration in UI Builder.

Using playbooks

Customer service agents can use the guidance available with playbooks to complete the tasks and activities that are needed to resolve specific types of cases.

A playbook includes multiple stages and each stage includes one or more activities for an agent to complete. When using a playbook, agents can:

- View the stages and activities.
- Select an activity and perform the work necessary to complete that activity.
- Mark an activity as complete and move to the next activity or stage.
- Complete the stages and activities necessary to resolve the case.

For more information, see Using Playbooks for Customer Service Management.

Playbook applications

Several applications are available that enable you to create and use playbooks with Customer Service Management. See Playbook plugins for detailed plugin and dependency information.

Customer Service Management playbook applications

Application	Description
Playbooks for Customer Service Management	Use this application to create or customize playbooks based on your individual business needs. Create playbooks that support case types or the base customer service case.
Case Playbook for Onboarding	Use this application to manage the process for taking on new customers or enrolling customers in new products. An onboarding case captures the details of the new customer,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Management playbook applications (continued)

Application	Description
	including their selection of products and services.
Case Playbook for Complaints	Use this application to manage the process for handling customer complaints. A complaint case captures the details of the problem reported by the customer and the expected resolution.
Case Playbook for Product Support	Use this application to guide agents through the steps that are needed to resolve product issues. A product support case captures information about the customer, the product, and the reported issue.

Playbook plugins

The Playbooks for Customer Service Management plugin (sn_csm_playbook) is available from the ServiceNow Store. This plugin requires the following plugins:

- Customer Service (com.sn_customerservice)
- Dynamic Related Records (com.snc.uib.sn_dyn_rel_rec)
- Playbook Experience (com.playbook_experience)

The following playbook applications are available for use with Customer Service Management and are available from the ServiceNow Store:

- Case Playbook for Onboarding
- Case Playbook for Complaints
- Case Playbook for Product Support

These playbooks require the following plugins:

- Playbooks for Customer Service Management (com.sn_csm_playbook)
- Customer Service Case Types (com.snc.csm_case_types)

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Playbook layout and features

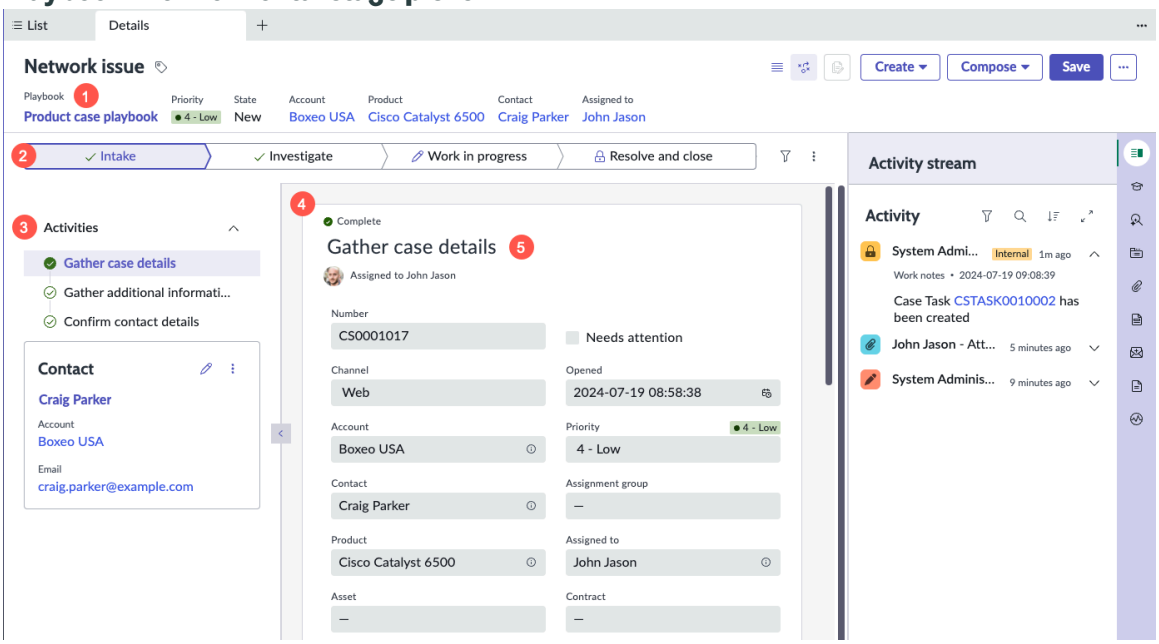
A playbook includes several features that agents use to complete activities and resolve cases, including the playbook stage picker, activity picker, and activity viewer. Record pages created in UI Builder determine how these playbook features are displayed in CSM Configurable Workspace.

UI Builder page templates and record pages that include horizontally and vertically oriented playbooks are available with the Playbooks for Customer Service Management application [com.sn_csm_playbook].

For more information about using these record pages, see the following topics:

- Case playbook: horizontal stages record page
- Case playbook: vertical stages record page

Playbook with horizontal stage picker



Playbook layout and features

Callout	Playbook feature	Description
1	Playbook name	The name of the playbook appears in the page header.
2	Stage picker	Playbooks include either a horizontal or vertical stage picker, which gives the agent a complete view of the playbook and where they are within the playbook. • The horizontal stage picker displays the playbook stages across the top of the record page below the page header. Select a stage to see the activities in the activity picker. • The vertical stage picker displays the playbook stages and activities on the side of the record page. Select a stage to expand the stage and display the included activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook layout and features (continued)

Callout	Playbook feature	Description
3	Activity picker	The activity picker displays the activities for the current stage. Each activity has an indicator that shows the activity state: • Completed • In progress • Remaining With the horizontal stage picker, you can expand or collapse the list of activities for the current stage. With the vertical stage picker, you can expand each stage to see the activities within that stage. Selecting an activity displays the details in the activity viewer.
4	Activity viewer	The activity viewer displays the selected activity. This is the main work area where an agent performs the work necessary to complete the current activity.
5	Activity cards	Activity cards display the details about the current activity in the activity viewer. Depending on the type of activity, the activity cards can display information such as form data, task status, SLA timers, or attachments. Agents use the cards to complete the work for each activity, such as filling in forms, completing checklists, completing tasks, or adding attachments.

Playbook activity view

The activity view determines how the stages and activities are displayed in the playbook.

- **Focused**: Displays the stages and activities in the playbook lifecycle panel and the current activity in the playbook work area.
- **Stacked**: Displays the stages in the playbook lifecycle panel and cards for each of the activities in the current stage in the playbook work area.

The system administrator can configure the playbook activity view in UI Builder. For more information, see Select a playbook activity view.

Playbook stages

Playbooks contain one or more stages and stages contain one or more activities. The current stage in a playbook is highlighted and the activities in that stage appear in the activity picker.

The stages in the stage picker include icons that indicate the stage status:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A check mark indicates that the stage is complete.
- A pen icon indicates the current stage.
- A lock icon indicates that a stage is locked and can't be started until the previous stage is complete.

There are two versions of stage picker: horizontal and vertical.

- The horizontal stage picker displays across the top of the UI and shows persistent information in the left panel. With the horizontal stage picker, you can expand or collapse the list of activities for the current stage.
- The vertical stage picker displays in the left panel. With the vertical stage picker, you can expand each stage to see the activities within that stage.

Playbook activities

Activities are the individual tasks that an agent needs to complete in order to complete a playbook stage. The activity picker displays the activities for the current playbook stage. Each activity in the activity picker has an indicator that shows the activity state:

- Complete ( )
- In Progress ( )
- Pending ( )
- Skipped

Selecting an activity displays the details of that activity in the activity viewer.

Navigating playbook stages and activities

Agents can use the stage picker and activity picker to navigate between stages and activities as assigned roles or activity security configurations permit. For example, activities such as case tasks can be assigned to different users. A user with the case task agent role can only see the case tasks that are assigned to them.

When an agent opens a record that uses a playbook, it opens to the current stage and highlights the current activity. For stages with multiple activities, the current activity is the first available activity. An available activity is an activity that has a state other than Complete.

When an agent selects an available activity, it becomes the current activity. An agent can navigate stages and activities in any order as long as there is at least one available activity to select.

Note:
The playbook configuration determines the visibility and accessibility of pending stages and activities. For more information, see Configure playbook stage and activity visibility.

Using keyboard navigation in a playbook

Use the following keyboard keys to navigate playbook stages and activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Tab** key: Use the **Tab** key to initiate navigation and move between stages, activities, and the playbook work area.
- **Arrow** keys: Use the left, right, up, and down arrow keys to navigate the fields on a playbook activity card.
- **Enter** key: Press the **Enter** key to select buttons on a playbook activity card.

Filtering playbook activities

Agents can filter playbook activities and see those activities that match the filter conditions.

- To filter playbook activities, select the filter icon ( ) and select one or more of the following states:
  - Complete
  - In Progress
  - Pending
  - Skipped
- To clear the filter, select the filter icon again and remove the selections.

Configuring stage and activity visibility

Users with the admin role can configure the visibility of playbook stages and activities, including:

- Showing or hiding stages and activities that are pending.
- Showing or hiding stages and activities where a user does not have access.

The administrator configures these settings in the Playbook Experience record. For more information, see Configure playbook stage and activity visibility.

Playbook capabilities

The capabilities provided by playbooks enable agents to quickly resolve customer issues. These capabilities work together to provide agents with a better overall experience when using playbooks to resolve customer issues.

Playbook capabilities

Capability	Description
Create a record using a playbook	Customer service agents can create a record using a playbook instead of a record form. Creating a record using a playbook opens the playbook and initiates the first activity. The agent completes this activity as part of the record creation. For example, an agent can create a case and gather the necessary information about the customer and the issue as the first activity in the playbook. For more information about configuring this feature, see Playbook record generator in the Workspace Playbook setup documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook capabilities (continued)

Capability	Description
See the entire end-to-end workflow using the stage picker and activity picker	The stage picker and activity picker enable agents to see the following information: • The end-to-end workflow. • The stages in the playbook. • The activities in the current stage. • Stage and activity progress indicators. • Details of the current activity displayed in the activity viewer.
Use the contextual side panel to view additional information	Playbooks can display the following information in the contextual side panel: • Activity stream • Ribbon information such as the case overview, customer details, timeline, and SLAs • Dynamic related records (see below for more information) • Related Items tab For more information, see: • Using the activity stream in the contextual side panel • Viewing ribbon information in the contextual side panel • Viewing related records in the contextual side panel • Related Items
Use the contextual side panel to display dynamic related records	Display records in the contextual side panel that dynamically change based on the context of the current record or playbook activity. For more information, see Dynamic related records.
Use a playbook in compact mode	Compact mode displays the playbook in the contextual side panel. Agents can complete playbook activities in the contextual side panel while viewing other information on the record page. For more information about configuring this feature, see Integrate Playbook with Workspace.
View the SLA widget on playbook activity cards	Activity cards in the playbook activity viewer can display an SLA widget in the upper right corner. The widget appears on the activity card when the playbook activity has an SLA. This includes activities in the following stages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook capabilities (continued)

Capability	Description
	• Triage • Research • Respond The color of the widget indicates the time remaining for the SLA: • Green: 0–50% • Yellow: 50–75% • Orange: 75–99% • Red: 100% or breached

Playbook terminology

Use the following list of terms to gain an understanding of playbook structure, tools, and configuration.

A playbook is an end-to-end workflow that includes the steps, strategies, and guidance to lead users through a business process. A playbook:

- VISUALIZES a workflow in a task-oriented view and guides users through sequences of tasks.
- INCLUDES a series of steps that a user must complete to achieve a particular goal.
- PROVIDES guidance for completing those steps.

Playbook structure

A playbook contains one or more stages, or groups of tasks, and sequences of activities within each stage. A playbook also includes a trigger. The structure of a playbook is created in Workflow Studio.

Playbook structure

Term	Definition
Trigger	A trigger determines when a playbook starts running. Each trigger has a type and conditions that, when met, start running an activated playbook. The trigger type represent a record operation, such as when a record is created or updated. Trigger conditions determine when and how a trigger is fired. Triggers are created in Workflow Studio.
Stage	A stage is a sequence of activities in a playbook that are grouped in a logical way. A playbook can contain one or more stages and each stage includes one or more activities for a user to complete. Stages can also include automated activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook structure (continued)

Term	Definition
	Stages are added to a playbook in Workflow Studio.
Activity	An activity is one step in the overall business process represented in a playbook. Activities are the tasks, steps, or actions that a user takes to complete a playbook. Activities are grouped in stages and are sequenced in a logical order. Users can complete or skip manual activities. Activities can also be completed automatically. Activities are added to playbook stages in Workflow Studio.

Playbook UI components

Customer service agents interact with playbooks in CSM Configurable Workspace. The record pages that display playbooks in a workspace are created or customized in UI Builder. Different components make up the playbook record pages.

Playbook UI components

Term	Definition
Playbook picker	A playbook picker can be used to select a playbook in the user interface. A playbook picker is available if there are multiple playbooks on a record.
Stage picker	A stage picker displays the stages in a playbook. It gives the user a complete view of the playbook and where they are within the playbook. A stage picker can be oriented horizontally or vertically and includes icons that indicate the stage status.
Horizontal stage picker	A horizontal stage picker displays the playbook stages horizontally at the top of the record page and highlights the current stage. It displays activities within the current stage in the activity picker.
Vertical stage picker	A vertical stage picker displays the playbook stages and activities vertically on the side of the record page. It highlights and expands the current stage to display the activities within that stage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook UI components (continued)

Term	Definition
	Activity picker	The activity picker displays the activities in the current stage. It includes indicators that show the activity state. Activity viewer	The activity viewer displays the details of the current activity. This is where a user performs the work necessary to complete the current activity.
Activity card	An activity card displays the details of the current activity. Users use the cards to complete the work for each activity.

Playbook page templates

Use playbook page templates to create pages and page variants for use in CSM Configurable Workspace. These pages and page variants provide agents with either horizontal or vertical playbooks that they can use to complete tasks and resolve cases.

The following page templates are available with the Playbooks for Customer Service Management application [com.sn_csm_playbook]. For more information, see Playbook plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook page templates

Page template	Description
Case playbook: horizontal stages	Includes a horizontal stage picker that displays across the top of the UI and shows persistent information in the left panel.
Case playbook: vertical stages	Includes a vertical stage picker that displays in the left panel. This stage picker can track overall progress on the UI in a vertical view.

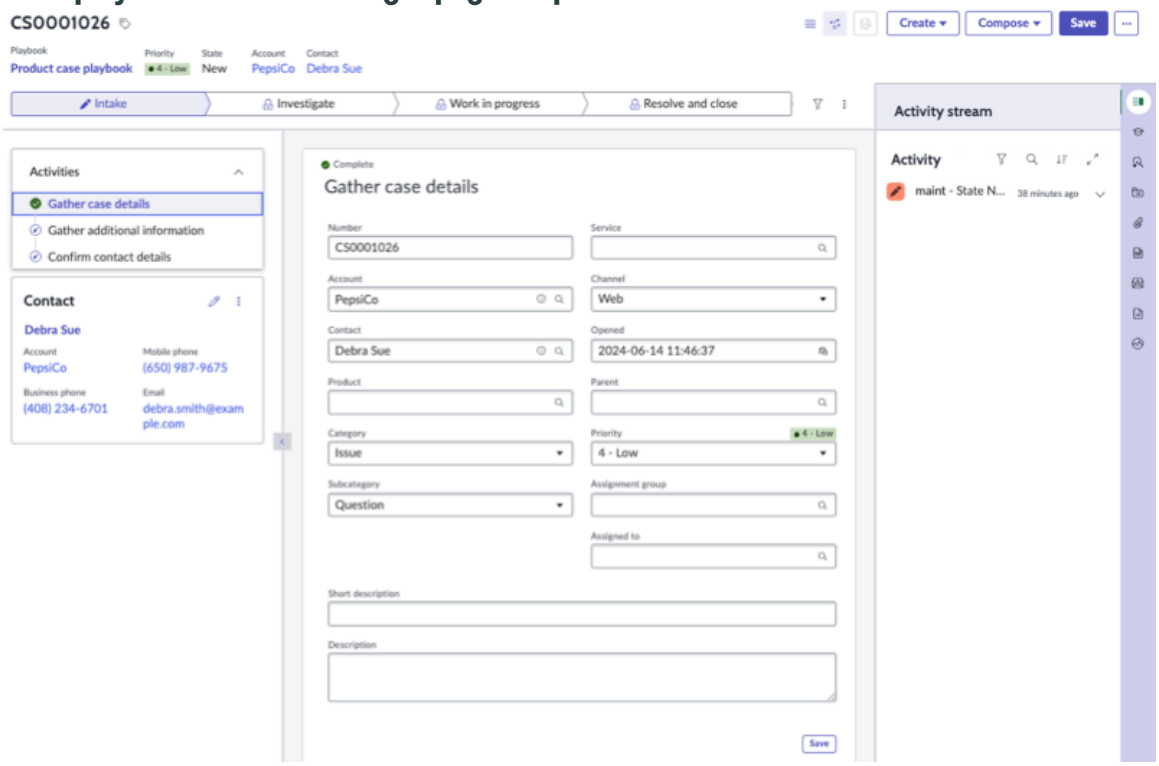
Considerations for using these page templates include the number of stages that appear in the picker and the length of the stage names. For example, longer stage names in the horizontal playbook can be truncated.

Note:
By default, the playbook page templates aren't active. To activate a page template, see Activate a playbook page or page variant.

Case playbook: horizontal stages page template

The Case playbook: Horizontal stages page template includes a horizontal stage picker across the top of the page and an activity picker on the left side. For details about the components included in this template, see Playbook template components.

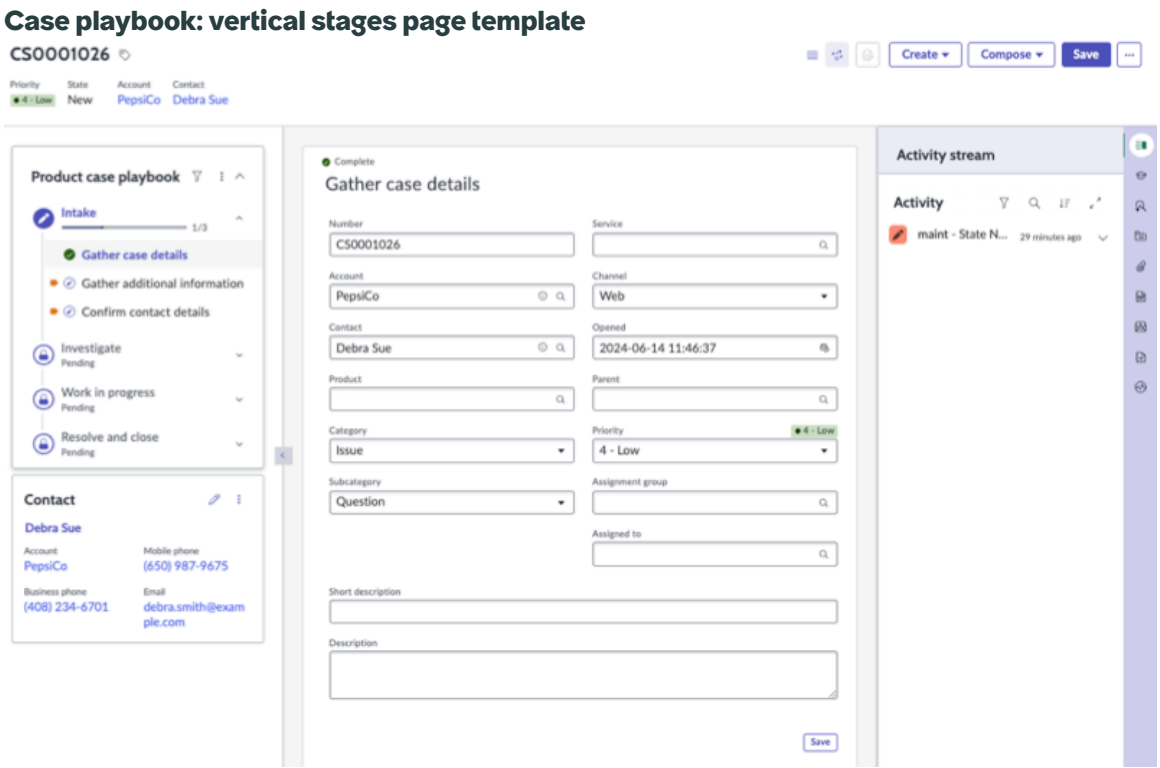
Case playbook: horizontal stages page template



Case playbook: vertical stages page template

The Case playbook: Vertical stages page template includes a vertical stage picker on the left side of the page. For details about the components included in this template, see Playbook template components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Playbook page template components

The playbook page templates include modular components that enable you to quickly build playbook pages in UI Builder.

Case playbook page template components

Component	Description
Page header	The page header includes record information that is displayed in the primary and secondary fields: • The primary field displays the short description of the record. • The secondary fields display the additional record information such as the priority, state, and contact or consumer details. You can configure the fields that appear in the page header. For more information, see Customize the page header for a playbook page.
Action bar	The action bar contains the actions that are available to users while working on case records. The available actions are determined by factors such as the user role, case state, and other attributes. • **Record Details**: Displays the record details. • **Playbook Details**: Displays the playbook details. • **In-progress actions**: Provides a list of minimized modeless dialogs and includes a badge that displays the number of

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case playbook page template components (continued)

Component	Description
	items in the list. From this list, an agent can select an item to open the minimized comment, work note, or email. • **Create**: Create records such as requests, incidents, and work orders. • **Compose**: Compose comments, work notes, and emails in modeless dialogs. • **Save**: Save changes to the case record. • **More Actions**: Perform additional actions such as proposing a major case or reporting a knowledge gap. You can configure the actions that are included in the action bar. For more information, see Customize UI actions for a playbook page.
Playbook name	In the Case playbook: horizontal stages template, the playbook name appears in the form header above the horizontal stage picker. In the Case playbook: vertical stages template, the playbook name appears at the top of the vertical stage picker.
Stage picker	The playbook templates include either a horizontal or vertical stage picker, which gives the agent a complete view of the playbook and where they are within the playbook. • The horizontal stage picker displays the playbook stages across the top of the record page below the page header. Select a stage to see the activities in the activity picker. • The vertical stage picker displays the playbook stages and activities on the side of the record page. Select a stage to expand the stage and display the included activities. The stages in the stage picker include icons that indicate the stage status: • A check mark indicates that the stage is complete. • A pen icon indicates the current stage. • A lock icon indicates that a stage is locked and can't be started until the previous stage is complete.
Activity picker	The activity picker displays the activities for the current stage. Each activity has an indicator that shows the activity state: • Completed • In progress • Remaining With the horizontal stage picker, you can expand or collapse the list of activities for the current stage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case playbook page template components (continued)

Component	Description
	With the vertical stage picker, you can expand each stage to see the activities within that stage. Selecting an activity displays the details in the activity viewer.
Activity viewer	The activity viewer displays the selected activity. This is the main work area where an agent performs the work necessary to complete the current activity.
Activity cards	Activity cards display the details about the current activity in the activity viewer. Depending on the type of activity, the activity cards can display information such as form data, task status, SLA timers, or attachments. Agents use the cards to complete the work for each activity, such as filling in forms, completing checklists, completing tasks, or adding attachments.
Contact or consumer lookup	The lookup component enables agents to look up contact or consumer information and display that information in a record card. These cards display customer information and provide quick access to details such name, email, and phone. The contact record card also includes account information. Agents can use the lookup component to do the following: • Search for a contact or consumer. • Link or unlink a contact or consumer record. • Edit and save the information in a linked contact or consumer record. • Select a reference field on a record card, such as a contact or consumer name, to open the reference in a sub-tab. • Select an email address on a lookup card to open a draft email in the email composer in a sub-tab. • Select a phone number on a lookup card to make a call. For more information, see Playbook lookup component.
Case summarization	The case summarization component appears below the lookup component. When an agent opens a case record, the component is collapsed and in the default state. Agents can use this component to do the following: • Summarize case details. • Post the summary to the activity stream. • Refresh the summary. The case summarization component requires the Now Assist for Customer Service Management (CSM) application to be activated and configured. For more information, see Playbook case summarization component.

Case playbook page template components (continued)

Component	Description
Record details	The case details component includes collapsible sections for: • Case • Notes • Closure Information • Related Records This component also includes a menu with additional form actions, such as personalizing the form, exporting data, and copying the URL. Agents can view case details by selecting the **Record Details** button in the action bar.
Contextual side panel	The contextual side panel component includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the Case playbook: horizontal stages page includes the following tabs. • Activity Stream • Agent Assist • Search • Related Items • Attachments • Response Templates • Email Templates • Templates • Record Information For more information about the tabs in the contextual side panel, see Playbook contextual side panel component.
Activity stream	The activity stream component displays a list of activities occurring on a case record. This list can be collapsed to provide a quick view of case activities or expanded to provide more detail about individual activities. For more information, see Playbook activity stream component. **Note:** The Case playbook: horizontal stages page uses modeless dialogs for composing comments, work notes, and emails.
Compose email and Compose comments modeless dialogs	A modeless dialog is a window that overlays the main window content. You can use modeless dialogs to create and post comments and work notes to the activity stream and to compose and send emails as you work through the stages and

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case playbook page template components (continued)

Component	Description
	activities in a playbook. For more information, see Playbook modeless dialogs.

Using multiple form controllers

The multiple form controller feature enables page authors to add multiple form components to UI Builder templates. This feature is available with the following playbook page templates:

- Case playbook: horizontal stages
- Case playbook: vertical stages

With this feature, page authors can:

- Integrate inline tabs with forms that use dedicated form controller instances, eliminating the need for page collections and enhancing UI Builder usability and runtime performance.
- Enhance record pages with custom component bundles that include a form controller.
- Incorporate modals containing forms into record pages, facilitating the transmission of notifications and form updates back to the main page.

For more information about using multiple form controllers, see Add forms to UI Builder pages.

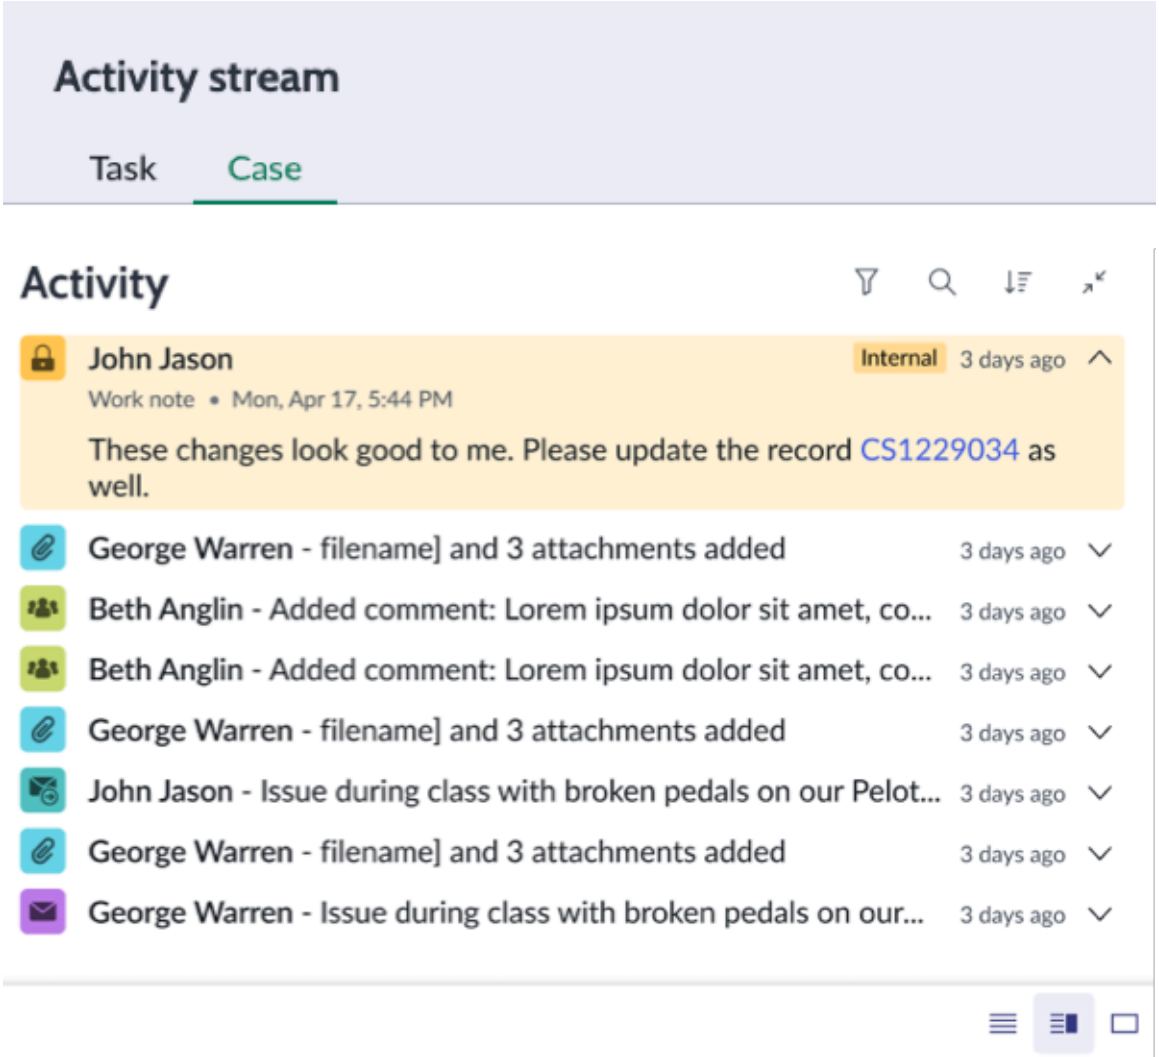
Playbook activity stream component

The activity stream component displays a list of activities occurring on a case record.

The activities in the list can be collapsed or expanded. When collapsed, the agent can quickly scan the list to get an overview of case activities. When expanded, the agent can see detailed information on individual activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook activity stream component



Note:
The activity stream uses Modeless dialogs for composing comments, work notes, and emails.

Activity stream Case and Task tabs

The activity stream component includes tabs for tasks and cases. The Task tab appears when an agent is working on a playbook activity whose associated record is a case task.

Activity stream tiles

The activities in the activity stream are represented by tiles that use icons and colors to indicate the activity type. These activity types include:

- Comment
- Work note
- Attachment
- Field change
- Email sent or email received
- Chat discussion
- Custom icon

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When collapsed, each activity in the list includes:

- A tile that represents the activity type.
- The name of the user responsible for the activity.
- A brief one-line summary of the activity.
- A badge that indicates if an activity is internal or external.
- A relative timestamp.
- An expand button that the agent can use to see a detailed summary of the activity.

When expanded, each activity also includes:

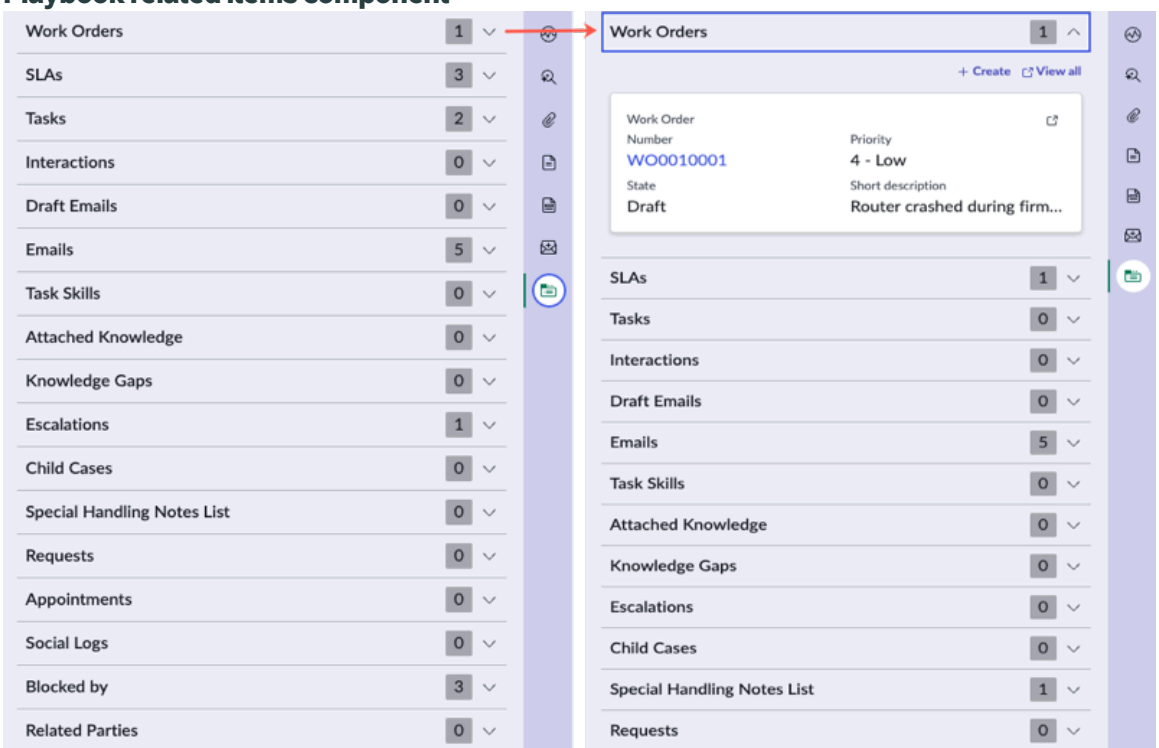
- A full date and timestamp.
- An action label that describes the type of activity.
- For comments and work notes, the full text of the comment or work note.
- For field updates, the field name and the updated field value.
- For emails, detailed message information.
- For attachments, a small preview of the attached file.
- For chats, a sidebar chat card.

Playbook related items component

The related items component provides access to the case-related lists.

The related items component uses an expandable accordion format. Agents can expand the desired lists to see the related items. This component also displays an icon with the number of items in a list.

Playbook related items component



Related lists include the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Create**: Opens an empty record in a subtab that the agent can use to create an item.
- **View all**: Opens a list of records in a subtab.
- **Show more**: Is displayed for lists that have more than five items.

The items in an expanded list are displayed as cards. An expanded list shows one card for each item in the list.

- Agents can open an item in a subtab.
- If a list has more than five items, it includes a **Show more** option.

Playbook lookup component

The playbook lookup component enables agents to look up contact and consumer records.

Using the lookup component, agents can do the following:

- Look up a contact or consumer by name, phone number, or email address. As the agent types characters in the search box, matching information appears in record cards below the search box.
- Select a contact or consumer after searching by selecting the link icon on the desired record card. The selected record card replaces the lookup component.

Agents can perform the following actions from a record card:

- Remove a linked contact or consumer from a case record by selecting the more actions icon and then selecting **Unlink**.
- Edit and save a linked contact record by selecting the pencil icon, editing the information for the contact, and selecting **Save**.
- Select a reference field on a lookup card to open the referenced record in a sub-tab.
- Select an email address on a lookup card to open to open the email composer in a sub-tab.
- Select a phone number on a lookup card to make a phone call.

Note:
An account lookup component is also available. To display this component, turn off the **Hide component** setting for this component in UI Builder. This setting is located in the Component visibility section of the Configure tab.

Playbook contextual side panel component

The playbook contextual side panel component provides agents with access to tools and information such as the activity stream, templates, and attachments.

The contextual side panel component provides agents with the following functionality.

Tabs in the contextual side panel

Tab	Description
Activity Stream	The activity stream displays a list of activities occurring on a case record. For more information, see Playbook activity stream component.
Agent Assist	Agent assist provides agents with a list of resources that show possible solutions for the current record. This list is based on the record short description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tabs in the contextual side panel (continued)

Tab	Description

Search	The Search tab includes AI search functionality. Agents can use AI search to find relevant resources or resolutions for customer issues.
	
	The search feature displays an initial set of search results based on the text in the case short description. This initial set of results includes knowledge articles. Agents can also enter different search keywords and repeat the search.
	
	From the list of search results, agents can do the following:
	• Select a source to see search results of that type.
	• Filter the list of search results.
	• Sort the list of search results.
	• Open the search results in full view in a record sub-tab.
	• Take the following actions:
	  ○ View and attach article
	  ○ Perform other actions such as reading articles in full view, flagging articles, or marking articles as helpful or unhelpful.
	• View successful actions by selecting the Actions history icon.
	
	For more information, see Use AI search in Recommended Actions to resolve cases.
	
	Note: Using Recommended Actions in the contextual side panel requires the Recommended Actions application (sn_cs_nb_action) which is included with the CSM Configurable Workspace application.

Related Items	The Related Items tab provides access to the case-related lists. The Case playbook: horizontal stages page incorporates related list functionality into the contextual side panel. These lists appear in an accordion format that agents can expand and collapse as needed. An indicator displays the number of records available in a related list. When expanded, the records in a related list are displayed in card format. For more information, see Playbook related items component.
Attachments	The Attachments tab provides access to case-related attachments. From this tab, agents can view and download attachments.
Response Templates	The Response Templates tab provides access to available response templates. These templates contain reusable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tabs in the contextual side panel (continued)

Tab	Description
	messages that agents can copy to provide quick and consistent messages to customers.
Email Templates	The Email Templates tab provides access to available email templates. These templates contain default values for fields that agents can add to email messages. These default values can include recipients (email addresses in To, Cc, and Bcc), sender, subject, and text for the message body. For more information, see Email Templates.
Templates	The Templates tab provides access to available form templates which enable agents to automatically populate fields on new records. Agents can manually apply a template when creating a new record such as an incident or change.
Record Information	The Record Information tab includes the following cards: • **Overview**: Displays relevant information about the case including the account and contact, the case priority, and the state. • **Contact**: Displays customer information including the name, title, phone numbers, and email address. • **Timeline**: Displays a chronological summary of case activities, including case state changes and interactions between the agent and the requester. • **Active SLA**: Displays active SLAs for the case, including time remaining, the SLA state, and any breaches.

Playbook modeless dialogs

Use modeless dialogs, windows that overlay the main window content, to create and post comments and work notes to the activity stream and to compose and send emails.

A modeless dialog is a window that appears in a workspace as an overlay on top of the main window content. This overlay enables users to interact with the window content and the overlay content at the same time. Agents can use modeless dialogs to do the following while working in a playbook:

- Create comments and work notes to post to the activity stream.
- Create and send emails and reply to or forward emails.

After opening a modeless dialog, agents can move it around the screen and put it where they need it. This feature enables agents to reference information from the main window while drafting text in the overlay window.

The playbook page templates include the following modeless dialogs:

- Compose Activity - for creating and posting comments and work notes
- Compose Email - for creating and sending emails

You can access the modeless dialogs by selecting the **Compose** button in the action bar and then selecting one of the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Compose Comments
- Compose Email
- Compose Work notes (Private)

Create comments and work notes

Agents can use the Compose Activity modeless dialog to create comments and work notes and post them to the activity stream. See the following table for more information about creating these activities.

Using the Compose Activity modeless dialog to create comments and work notes

Task	Description
Create a comment or work note	To create a comment or a work note: 1. Select one of the following actions from the action bar to open a Compose window: ○ **Compose** > **Compose Comments** ○ **Compose** > **Compose Work notes (Private)** 2. Add the text to the Compose window. When creating comments and work notes: • Agents can create one draft comment and one draft work note at a time before posting the text to the activity stream. • Agents can open one Compose window at a time. If an agent opens a second window, the previously opened window is minimized.
Post a comment or work note to the activity stream	To post a comment or work note, select one of the following actions from the Compose window: • **Post Comment** • **Post Work Notes (Private)** The Compose window automatically closes after the text is posted to the activity stream. Saving the case record also posts the comment or work note to the activity stream and closes the Compose window.
Minimize a Compose window	Composed windows can be minimized and moved to the In-process Actions menu in the action bar. Minimized comments and work notes appear in a list in the In-process Actions menu. Compose windows can be minimized in the following ways.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Activity modeless dialog to create comments and work notes (continued)

Task	Description
	• Select the Minimize button in the Compose window header. • One Compose window can be open at a time. If an agent opens another Compose window, the first window is minimized.
Open a minimized Compose window	Select the In-progress Actions menu in the action bar and then select an item from the list to open the window. Items in the In-process Actions menu appear in a list with the action type (email, comment, or work note) and an abbreviated title. • For email, the title is the email subject. • For comments and work notes, the title is the first line of text.
Discard a comment or work note	To discard a comment or work note: 1. Select the Close button in the Compose window header. 2. Confirm the Discard action by selecting **Discard** in the confirmation pop-up window. The system closes the Compose window and discards the comment or work note.

The following guidelines apply to Compose windows:

- Draft comments and work notes are local to the browser and are cleared if the browser page is reloaded.
- Comments and work notes stay in sync on the form and in the modeless dialogs.
- The Compose window has a fixed size.

Create emails

Agents can use the Compose Email modeless dialog to create and save email drafts and to send emails. This feature increases the speed of drafting emails while referencing record information.

Emails that are sent from a Compose Email window are posted to the activity stream. Agents can reply to and forward emails from the activity stream. See the following table for more information about creating and sending emails.

Using the Compose Email modeless dialog to create and send emails

Task	Description
Create and send an email	To create and send an email:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
	1. Select **Compose** > **Compose Email** from the action bar to open a Compose Email window. The system automatically applies the email template with the lowest order to the new email. 2. Fill out the fields: **a.** To, Cc, Bcc **b.** Subject **c.** Email body 3. Select **Send email**. When creating emails and sending emails: • The Compose Email window automatically closes after the email is sent. • The email is posted to the activity stream.
Reply to or forward an email	To reply to or forward an email: 1. Expand an email in the activity stream. 2. Select one of the following buttons to open the Compose Email window: ○ **Reply** ○ **Reply all** ○ **Forward** 3. Add the desired text. 4. Select **Send email**. The Compose Email window automatically closes after the email is posted to the activity stream.
Add a link to a knowledge article	To add a link to a knowledge article: 1. Select the Agent Assist tab in the contextual side panel. 2. View the list of knowledge articles or search for an article. 3. Select the More Actions menu on the knowledge article card. 4. Select **Add link in email**. The system adds the title of the article with a link in the body of the email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
Apply a template to an email	To apply a template to an email: **1.** Open the Email Templates tab in the contextual side panel. **2.** Select the More Actions menu on the desired email template. **3.** Select **Apply template**. The system adds the contents of the template to the body of the email. **Note:** When you create a new email, the system automatically applies the email template with the lowest order.
Minimize a Compose Email window	Minimized emails appear in a list in the In-process Actions menu in the action bar. Select the Minimize icon ( ) in the Compose Email window header to move the email draft to the In-progress Actions menu.
Open a minimized Compose Email window	Select an item from the In-progress Actions menu to open the Compose Email window. Items in the In-process Actions menu appear in a list with the action type (email, comment, or work note) and an abbreviated title. • For email, the title is the email subject. • For comments and work notes, the title is the first line of text.
Maximize a Compose Email window	Select the Maximize icon ( ) in the Compose Email window header to expand the Compose Email window to the full screen. Select the Maximize icon again to exit the Maximize mode.
Open a draft email in a sub-tab	Select the Pop out icon ( ) in the Compose Email window header to open the draft email in a sub-tab. The Compose Email window closes when the email opens in the sub-tab.
Close a Compose Email window	Select the Close icon ( ) in the Compose Email window header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Compose Email modeless dialog to create and send emails (continued)

Task	Description
	The system saves the text as a draft email and closes the Compose Email window.
Select an email draft from the Draft Emails related list	1. Select the Related Lists tab in the contextual side panel. 2. Expand the Draft Emails related list. 3. Select the Open draft icon on the desired draft email card. The system opens the selected draft email in a sub-tab.

Modeless dialog guidelines

The following guidelines apply to the Compose Email window:

- An agent can create multiple email drafts.
- An agent can have one Compose Email window open at a time. The system displays a message if an agent tries to open another Compose Email window while the first Compose Email window is still open.
- An agent has to manually close a Compose Email window before opening a new window.
- The Compose Email window can be resized.

Playbook case summarization component

The playbook case summary component provides agents with a summary of a customer service case, including the issue and the actions taken. Agents can generate summaries to understand case context and post summaries to the case work notes.

The case summarization component appears below the lookup component on the playbook page templates. Upon first opening a case, agents see that the component is collapsed and in the default state.

Using this component, agents can:

- Select **Summarize** to create a summary of the case details.
- Select **Share to work notes** to copy the summary text to the activity stream.
  - Review the summary text in the Share to work notes popup window and modify the text as needed.
  - Select **Save to work notes** on the popup window to add the text to the activity stream.
- Select the refresh icon in the component footer to refresh the text and get the latest summary.

Note:
If the case does not contain enough text to summarize, the system displays the following message: "This case doesn't have the minimum number of words required for summarization yet."

To use the case summarization component with the playbook page templates, activate the Now Assist for Customer Service Management (CSM) application and configure the case summarization skill in the Now Assist Admin console. For more information, see:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activate Now Assist for Customer Service Management (CSM)
- Configure the case summarization skill in the Now Assist Admin console.

Playbook pages

Use playbook pages in CSM Configurable Workspace so that your agents can view the stages and activities in a playbook, work on activities, and have quick access to in-context information.

Overview of templates, pages, and page variants

Pages provide the base structure for how the system displays record information in CSM Configurable Workspace. You can create and customize pages with UI Builder, a web user interface builder.

A page template is a pre-defined page configuration. When you create a page in UI Builder, you can select a page template as a starting point. You can also create a page from scratch or by copying another page and then customizing the page to meet your needs.

A page variant is a version of a page that includes unique settings such as the audience, conditions, and page order. For more information about templates, pages, and page variants, see Creating pages and page variants.

Pages and page variants can also include playbooks, which are created in Workflow Studio. A playbook provides step-by-step guidance for resolving a specific type of case. The workflows that are associated with a specific type of case and the activities that need to be completed to resolve cases of this type are detailed in the playbook.

Playbook pages

The Playbooks for Customer Service Management plugin provides the following playbook pages:

- Case playbook: horizontal stages page
- Case playbook: vertical stages page

Additional CSM playbook applications provide playbook pages that you can activate and use with case types in CSM Configurable Workspace.

Playbook applications and playbook pages

Application	Page variant	Description
Case Playbook for Complaints v5.0	Complaint case process page	Includes a horizontal stage picker that provides an end-to-end view of the complaint process.
Case Playbook for Onboarding v5.0	Onboarding case process page	This playbook page includes a horizontal stage picker at the top of the record that provides an end-to-end view of the onboarding process.
Case Playbook for Product Support v4.0	Product Support process page	This playbook page includes a horizontal stage picker at the top of the record that provides an end-to-end view of the product support process.

For more information, see Playbook plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
By default, playbook pages are read-only. To use a playbook page, activate the page and set the page order.

Benefits of using playbook pages

Resolving customer issues or requests often involves the execution of tasks across multiple users, departments, and systems. Different users are responsible for different tasks within the overall resolution process. Using playbooks provides the following benefits:

- An experience that is tailored to customer service agents and other users.
- Visibility into the overall resolution process, the current stage in the process, and the activities that need to be completed within that stage.
- Access to in-context information.

Configuring playbook pages

The following table includes configuration tasks for playbook pages.

Playbook page configuration tasks

Task	Description
Activate a playbook page or page variant	Activate a playbook page or page variant and set the page order. **Note:** Some playbook pages and page variants are not active by default.
Customize the page header for a playbook page	Configure the page header for a playbook page. The page header includes a primary value and several secondary values. These fields can provide case, account, and contact information at a glance.
Customize UI actions for a playbook page	Configure the UI actions to display in the action bar for a playbook page.
Customize content in the left side panel for a playbook page	Add custom components in the side panel. By default, this panel includes the Customer 360, Timeline, and Active SLA components.
Customize tabs in the contextual side panel for a playbook page	Add or remove the tabs from the contextual side panel. Agents can use these tabs to perform tasks such as adding attachments and viewing recommendations.
Customize the dynamic related records for a playbook page	Configure the Dynamic Related Records feature to display the related records in the contextual side panel.
Configure the app route to use an existing subpage	Create an app route to make an existing page a part of the page collection.
Configure an optional activity for a playbook	Configure an optional activity in#Workflow Studio at various stages in a playbook so that

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook page configuration tasks (continued)

Task	Description
	agents and fulfillers can insert an activity when they are using the playbook.
Set up a record generator for case type	Create a record for a case type as the first step in a playbook by using a playbook record generator.
Set up email templates in Configurable Workspace	Configure new email templates to enable agents to create emails for common issues.

Using playbook pages

Playbooks enable your agents to view and complete their tasks more efficiently.

Playbook user tasks

User task	Description
Create a record using a playbook	If a playbook is configured to use the feature, an agent can create a record by using a playbook activity. Creating a record opens the playbook and initiates the first activity, which is to guide an agent through the record creation process. After saving the case, an agent moves to the next activity in the current stage or to the first activity in the next stage.
Resolve a case using a playbook	Opening a case takes the agent to the first open assigned activity. An agent can do the following actions while working on the activities in a playbook: • View the entire playbook process in the horizontal stage picker. • View the activities for each stage in the stacked playbook activity view. • Use the activity stream in the contextual side panel • Filter activity cards. • Select an activity and perform the work required in the main work area. • View and update the case details by using the **View Details** button. • View the persistent contextual information in the left side panel, such as the account and contact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook user tasks (continued)

User task	Description
	• View the related list tabs in the Dynamic related records component in the contextual side panel. • Access information in the contextual side panel, including the activity stream, form ribbon, Agent Assist, Dynamic related records, attachments, and templates. • Create tasks, compose email, and add worknotes. • Open reference fields in subtabs under the session tab.
Add an activity to a playbook	Add optional activities to a playbook stage as needed.
Summarize case details	Use the Now Assist for CSM case summarization skill to summarize the case details and display this information on the case record.
Compose an email from an email template	Quickly compose emails for common issues by selecting an email template in the Compose Email page instead of manually drafting an email.

Note:
For tasks that an agent completes outside of a playbook, the system automatically updates the playbook activities.

Case playbook: horizontal stages record page

The Case playbook: horizontal stages page is a record page that you can use in CSM Configurable Workspace. This page includes a playbook with a horizontal stage picker that displays across the top of the user interface and persistent information in the left panel.

The Case playbook: horizontal stages record page is created from the Case playbook: horizontal stages template.

The Case playbook: horizontal stages record page is available with the Playbooks for Customer Service Management v6.0 store application. For more information, see Playbook plugins.

Case playbook: horizontal stages page variant

The Case playbook: horizontal stages page variant is included with the Playbooks for Customer Service Management v6.0 store application. This variant includes the following settings.

Case playbook: horizontal stages page variant settings

Setting	Description
Active	The Case playbook: horizontal stages page variant is not active by default. Enabling the **Active** check box makes the page variant available to the selected audience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case playbook: horizontal stages page variant settings (continued)

Setting	Description
	The **Active** setting combined with the page order determines the page that CSM Configurable Workspace uses to display record information. For more information, see Set record page order.
Order	Each record page has an order which indicates the page priority. The lower the number, the higher the priority. The default order for the Case playbook: horizontal stages page variant is -1.
Conditions	Conditions determine when a page variant is displayed. The Case playbook: horizontal stages page variant has the following condition: **table=sn_customerservice_case** This condition limits the use of the Case playbook: horizontal stages page variant to records from the Case [sn_customerservice_case] table and tables that extend the Case table.
Audience	The audience determines who can see the page variant. The Case playbook: horizontal stages page variant does not have an audience. This means everyone with access to the experience can see this page variant. For more information, see Learn about audiences.

To access the settings for this page variant:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the Record section of the Pages and variants list, select **Case playbook: horizontal stages**.
4. Select **Settings** at the top of the page.

Case playbook: horizontal stages page components

The Case playbook: horizontal stages page includes the following components.

Component	Description
Page header	The page header includes record information that is displayed in the primary and secondary fields: • The primary field displays the short description of the record. • The secondary fields display the additional record information such as the priority, state, and contact or consumer details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	You can configure the fields that appear in the page header. For more information, see Customize the page header for a playbook page.
Record tags	Agents can create multiple tags for a record and then use the tags to group and organize records. For more information, see Group and find records using tags in workspace.
Action bar	The action bar contains the actions available to users while working on case records. The specific actions are determined by factors such as the user role, case state, and other attributes. • **Record details**: Displays the record details. • **Playbook details**: Displays the playbook details. • **In-progress Actions**: Provides a list of minimized modeless dialogs and includes a badge that displays the number of items in the list. From this list, an agent can select an item to open the minimized comment, work note, or email. • **Create**: Create records such as work orders, incidents, and requests. • **Compose**: Compose comments, work notes, and emails in modeless dialogs. • **Save**: Save changes to the case record. • **More Actions**: Perform additional actions such as proposing a major case or reporting a knowledge gap. You can configure the actions that are included in the action bar. For more information, see Customize UI actions for a playbook page.
Playbook name	In the Case playbook: horizontal stages page variant, the playbook name appears in the form header above the horizontal stage picker.
Stage picker	The Case playbook: horizontal stages page variant includes a horizontal stage picker, which gives the agent a complete view of the playbook and where they are within the playbook. The horizontal stage picker displays the playbook stages across the top of the record page below the page header. Select a stage to see the activities in the activity picker. The stages in the stage picker include icons that indicate the stage status: • A check mark indicates that the stage is complete. • A pen icon indicates the current stage. • A lock icon indicates that a stage is locked and can't be started until the previous stage is complete.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
Activity picker	The activity picker displays the activities for the current stage. Each activity has an indicator that shows the activity state: • Completed • In progress • Remaining With the horizontal stage picker, you can expand or collapse the list of activities for the current stage. Selecting an activity in a stage displays the details in the activity viewer.
Activity viewer	The activity viewer displays the selected activity. This is the main work area where an agent performs the work necessary to complete the current activity. Activity cards display the details about the current activity in the activity viewer. Depending on the type of activity, the activity cards can display information such as form data, task status, SLA timers, or attachments. Agents use the cards to complete the work for each activity, such as filling in forms, completing checklists, completing tasks, or adding attachments.
Contact or consumer lookup	The lookup component enables agents to look up contact or consumer information and display that information in a record card. These cards display customer information and provide quick access to details such name, email, and phone. The contact record card also includes account information. Agents can use the contact lookup component to do the following: • Search for a contact or consumer. • Link or unlink a contact or consumer record. • Edit and save the information in a linked contact or consumer record. • Select a reference field on a record card, such as a contact or consumer name, to open the reference in a sub-tab. • Select an email address on a lookup card to open a draft email in the email composer in a sub-tab. • Select a phone number on a lookup card to make a call. For more information, see Playbook lookup component.
Case summarization	The case summarization component appears below the lookup component. When an agent opens a case record, the component is collapsed and in the default state. Agents can use this component to do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	• Summarize case details. • Post the summary to the activity stream. • Refresh the summary. The case summarization component requires the Now Assist for Customer Service Management (CSM) application to be activated and configured. For more information, see Playbook case summarization component.
Record details	The case details component includes collapsible sections for: • Case • Notes • Closure Information • Related Records This component also includes a menu with additional form actions, such as personalizing the form, exporting data, and copying the URL. Agents can view case details by selecting the **Record Details** button in the action bar.
Contextual side panel	The contextual side panel component includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the Case playbook: horizontal stages page includes the following tabs. • Activity Stream • Agent Assist • Recommended Actions • Related Items • Attachments • Response Templates • Email Templates • Templates • Record Information For more information about the tabs in the contextual side panel, see Playbook contextual side panel component.
Activity stream	The activity stream component displays a list of activities occurring on a case record. This list can be collapsed to provide a quick view of case activities or expanded to provide more detail about individual activities. For more information, see Playbook activity stream component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	Note: The Case playbook: horizontal stages page uses modeless dialogs for composing comments, work notes, and emails.
Compose email and Compose comments modeless dialogs	A modeless dialog is a window that overlays the main window content. You can use modeless dialogs to create and post comments and work notes to the activity stream and to compose and send emails as you work through the stages and activities in a playbook. For more information, see Playbook modeless dialogs.

Case playbook: vertical stages record page

The Case playbook: vertical stages page is a record page that you can use in CSM Configurable Workspace. This page includes a playbook with a vertical stage picker that displays in the left panel and can track overall progress on the UI in a vertical view.

The Case playbook: vertical stages record page is created from the Case playbook: vertical stages template.

The Case playbook: vertical stages record page is available with the Playbooks for Customer Service Management v6.0 store application. For more information, see Playbook plugins.

Case playbook: vertical stages page variant

The Case playbook: vertical stages page variant is included with the Playbooks for Customer Service Management v6.0 store application. This variant includes the following settings.

Case playbook: vertical stages page variant settings

Setting	Description
Active	The Case playbook: vertical stages page variant is not active by default. Enabling the **Active** check box makes the page variant available to the selected audience. The **Active** setting combined with the page order determines the page that CSM Configurable Workspace uses to display record information. For more information, see Set record page order.
Order	Each record page has an order which indicates the page priority. The lower the number, the higher the priority. The default order for the Case playbook: vertical stages page variant is -1.
Conditions	Conditions determine when a page variant is displayed. The Case playbook: vertical stages page variant has the following condition: **table=sn_customerservice_case** This condition limits the use of the Case playbook: vertical stages page variant to records from the Case [sn_customerservice_case] table and tables that extend the Case table.

© 2026 ServiceNow, Inc. All rights reserved.

Case playbook: vertical stages page variant settings (continued)

Setting	Description
Audience	The audience determines who can see the page variant. The Case playbook: vertical stages page variant doesn't have an audience. This means everyone with access to the experience can see this page variant. For more information, see Learn about audiences.

To access the settings for this page variant:

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **CSM/FSM Configurable Workspace** experience.
3. In the Record section of the Pages and variants list, select **Case playbook: vertical stages**.
4. Select **Settings** at the top of the page.

Case playbook: vertical stages page components

The Case playbook: vertical stages page includes the following components.

Component	Description
Form heading	The page header includes record information that is displayed in the primary and secondary fields: • The primary field displays the short description of the record. • The secondary fields display the additional record information such as the priority, state, and contact or consumer details. You can configure the fields that appear in the page header. For more information, see Customize the page header for a playbook page.
Record tags	Agents can create multiple tags for a record and then use the tags to group and organize records. For more information, see Group and find records using tags in workspace.
Action bar	The action bar contains the actions available to users while working on case records. The specific actions are determined by factors such as the user role, case state, and other attributes. • **Record details**: Displays the record details. • **Playbook details**: Displays the playbook details. • **In-progress Actions**: Provides a list of minimized modeless dialogs and includes a badge that displays the number of items in the list. From this list, an agent can select an item to open the minimized comment, work note, or email.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	• **Create**: Create records such as work orders, incidents, and requests. • **Compose**: Compose comments, work notes, and emails in modeless dialogs. • **Save**: Save changes to the case record. • **More Actions**: Perform additional actions such as proposing a major case or reporting a knowledge gap.
Playbook name	In the Case playbook: vertical stages page variant, the playbook name appears at the top of the vertical stage picker.
Stage picker	The Case playbook: vertical stages page variant includes a vertical stage picker, which gives the agent a complete view of the playbook and where they are within the playbook. The vertical stage picker displays the playbook stages and activities on the side of the record page. Select a stage to expand the stage and display the included activities. The stages in the stage picker include icons that indicate the stage status: • A check mark indicates that the stage is complete. • A pen icon indicates the current stage. • A lock icon indicates that a stage is locked and can't be started until the previous stage is complete.
Activity picker	The activity picker displays the activities for the current stage. Each activity has an indicator that shows the activity state: • Completed • In progress • Remaining With the vertical stage picker, you can expand each stage to see the activities within that stage. Selecting an activity in a stage displays the details in the activity viewer.
Activity viewer	The activity viewer displays the selected activity, which is the main work area where an agent performs the work necessary to complete the current activity. Activity cards display the details about the current activity in the activity viewer. Depending on the type of activity, the activity cards can display information such as form data, task status, SLA timers, or attachments.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	Agents use the cards for completing the work for each activity, such as filling in forms, completing checklists, completing tasks, or adding attachments.
Contact or consumer lookup	The lookup component enables agents to look up contact or consumer information and display that information in a record card. These cards display customer information and provide quick access to details such name, email, and phone. The contact record card also includes account information. Agents can use the contact lookup component to do the following: • Search for a contact or consumer. • Link or unlink a contact or consumer record. • Edit and save the information in a linked contact or consumer record. • Select a reference field on a record card, such as a contact or consumer name, to open the reference in a subtab. • Select an email address on a lookup card to open a draft email in the email composer in a sub-tab. • Select a phone number on a lookup card to make a call. For more information, see Playbook lookup component.
Case summarization	The case summarization component appears below the lookup component. When an agent opens a case record, the component is collapsed and in the default state. Agents can use this component to do the following: • Summarize case details. • Post the summary to the activity stream. • Refresh the summary. The case summarization component requires the Now Assist for Customer Service Management (CSM) application to be activated and configured. For more information, see Playbook case summarization component.
Record details	The case details component includes collapsible sections for: • Case • Notes • Closure Information • Related Records This component also includes a menu with additional form actions, such as personalizing the form, exporting data, and copying the URL.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	Agents can view case details by selecting the **Record Details** button in the action bar.
Contextual side panel	The contextual side panel component includes different tools that agents can use to research and resolve customer issues. The contextual side panel in the Case playbook: horizontal stages page includes the following tabs. • Activity Stream • Agent Assist • Recommended Actions • Related Items • Attachments • Response Templates • Email Templates • Templates • Record Information For more information about the tabs in the contextual side panel, see Playbook contextual side panel component.
Activity stream	The activity stream component displays a list of activities occurring on a case record. This list can be collapsed to provide a quick view of case activities or expanded to provide more detail about individual activities. For more information, For more information, see Playbook activity stream component. **Note:** The Case playbook: vertical stages page uses modeless dialogs for composing comments, work notes, and emails.
Compose email and Compose comments modeless dialogs	A modeless dialog is a window that overlays the main window content. You can use modeless dialogs to create and post comments and work notes to the activity stream. You can also compose and send emails as you work through the stages and activities in a playbook. For more information, see Playbook modeless dialogs.

Activate a playbook page or page variant

Activate a playbook page or page variant and set the page order. The system uses the active page with the lowest order number to display records in CSM Configurable Workspace.

Before you begin

Role required: ui_builder_admin, admin

Some playbook pages and page variants are not active by default. You need to activate the pages and set the page order before using the pages in CSM Configurable Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. In the Experiences list, select **CSM/FSM Configurable Workspace**.
3. Find one of the following pages by scrolling through the Pages and variants list to the Record section:
   - Case playbook: horizontal stages
   - Case playbook: vertical stages
   - Complaint case process page
   - Onboarding case process page
   - Product Support process page

   Note:
   These pages may be marked as **Inactive**.
4. Display the page settings by selecting **Settings** for the desired page or page variant.
5. Activate the page by selecting the **Active** check box.
6. In the **Order** field, set the order number for the page.
   Each page has an order number. The page with the lowest order number is the default page. When the system displays a record in CSM Configurable Workspace, it uses this default page to display the record information. For more information, see Set record page order.
7. In the **Variant conditions** field, specify the table value.
   Add the table values for the case types where you want to see this page variant.
8. Select **Save**.

Customize the page header for a playbook page

Customize the page header by defining the primary and secondary fields that are displayed in CSM Configurable Workspace.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

About this task
Overview information for a record is available in the page header.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Configuration Settings** > **UX Header Configurations**.
2. Select the **CSM/FSM Configurable Workspace Header Config** header configuration.
3. Select a table from the UX Form Headers list.
   You can also create a UX Form Header record. For more information, see Set up a form header in CSM Configurable Workspace.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the **Primary field** to display in the form header.
5. In the Secondary values related list, select the secondary values to display in the form header.
   a. In the **Order** field, set the sequential order in which to display the secondary values.
   b. Select **Update** to save the form header record.
6. In the **Order** field, set the sequential order in which to display the secondary values.
7. Select **Update** to save the UX header configuration record.

Related topics

Customize UI actions for a playbook page

You can customize the UI actions that appear in the action bar for a playbook page or page variant.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

Note:
Any changes made to the configuration will affect other record pages and page variants where the action bar component is used.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Form Actions**.
2. Select an **Action label** to display the Action Assignment form.
3. Click **Edit** to include or exclude a particular action on the UI.
4. Click **Update**.

Set up a form action in CSM Configurable Workspace

Customize content in the left side panel for a playbook page

Components that can be added to the left side panel include Customer360, Timeline, Active SLA, or a custom ribbon component. You can update the ribbon component attributes based on the fields you want to display in the left side panel on the playbook page.

Before you begin
Role required: workspace_admin, ui_builder_admin, admin

Note:

Any changes made to the configuration will affect other record pages and page variants where this ribbon setting is used.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Configuration Settings** > **UX Ribbon Setting**.
2. Select a ribbon setting for your table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a ribbon setting doesn't exist for your table, you can create one. For more information, see Set up a ribbon configuration in CSM Configurable Workspace.

3. Select values for the **Ribbon component** and the **Ribbon Component Attributes**.
4. Select **Update**.

Related topics

Set up a ribbon configuration in CSM Configurable Workspace

Customize tabs in the contextual side panel for a playbook page

Add customized tabs in the contextual side panel. Agents can use these tabs to view case information, add attachments, view recommendations, and perform other case-related actions.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. On the UI Builder home page, select the **Page collections** tab.
3. Select the desired page collection.
   A page collection is a group of pages that you can use in multiple experiences.
4. In the Pages and variants section, select the Create new page icon (**+**) to create a new page or add a variant to a page.
5. In the Set up your page details pop-up window, enter a name for the page and then select **Continue**.
6. Create a default page by entering a name for the variant and selecting **Create**.
   The new page appears under the Pages and variants list.
7. Select the newly created page name.
8. Add a component to the page collection by selecting **+Add component**.
   You can create a subpage that gets displayed in the contextual side panel.

Result

The added component gets displayed on the UI. The location depends on where you want to create the custom content on the page.

Customize the dynamic related records for a playbook page

Customize the dynamic related records for a playbook page to display in the contextual side panel in CSM Configurable Workspace. These records dynamically change depending on the context of the current record or playbook activity.

Before you begin

Role required: workspace_admin, ui_builder_admin, admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The definitions for the related records aren't active by default. You must activate these definitions if you want them to appear in the related records.

Any change made to the customer service case dynamic related record context applies to all extensions of the customer service case. For creating custom context, see Configure related record contexts.

You must define an EVAM (Entity View Action Mapper) view configuration for the tables in addition to setting up Dynamic Related Records. For more information, see Define an EVAM view configuration.

Procedure

1. Navigate to **All** > **Dynamic Related Records** > **Related Record Contexts**.
2. Select **Related Record Contexts** for either the Onboarding, Complaint, or Product Support table.
3. Activate all the related record definitions for the Onboarding, Complaint, or Product Support case.
   For more information, see Dynamic related records.
4. Select **Update**.

The following table shows the Dynamic Related Record list for each case type.

Dynamic Related Record list for different case types

Case type	Dynamic related record
Customer service case	○ Blocked By ○ Related Parties ○ Social Logs ○ Appointments ○ Requests ○ Special Handling Notes ○ Child Cases ○ Knowledge Gaps ○ Attached Knowledge ○ Task Skills ○ Emails ○ Draft Emails ○ Interactions ○ Tasks ○ Work Orders ○ Install base ○ Escalations ○ Service Level Agreement (SLA)

Configure dynamic related records

Configure related record definitions

Define an EVAM view configuration

Create a view configuration to combine conditions, database fields, and declarative actions with an associated view template.

Before you begin

Role required: admin or evam_admin

About this task

Entity View Action Mapper (EVAM) is an application that standardizes how different data sources display in cards and lists.

A view configuration combines conditions, database fields, and declarative actions with an associated view template. For more information, see View configurations, view templates, and configuration bundles for EVAM.

Procedure

1. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **EVAM Definitions** > **Configuration Bundles**.
2. Select **dynamic_related_records_bundle** and then select **New**.
3. Fill in the fields on the EVAM view configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the EVAM view configuration.
Active	Option to activate the EVAM view configuration.
View Template	Template to associate with the EVAM view configuration. You can create a template or use an existing template.
Application	Application scope of the EVAM view configuration.
Order	Priority that the EVAM view configuration takes over other view configurations. To give higher priority to a view configuration, enter a lower number.
Table	Table to associate with the EVAM view configuration.
Condition	Conditions for when to use the EVAM view configuration.
Table Fields	Table fields to display on the EVAM view configuration. For example: `name,supplier,description,product_category`
Custom Fields	Custom fields to display on the EVAM view configuration. This is a comma-separated list of non-table fields that are required for the template. For example: `price,image_url,delivery_label,delivery_date,product_url`

4. Select **Save**.
5. Create an M2M action assignment or select **Link Existing** and then select the Declarative Action **navigation**.
   For more details, see, View configurations, view templates, and configuration bundles for EVAM.

Related topics

Configure dynamic related records

Configure related record definitions

Configure the app route to use an existing subpage

Create an app route to make an existing page a part of the page collection. For example, the dynamic related record is a global subpage that you can use at any application level.

Before you begin

Role required: admin

About this task

Configuring an app route enables you to utilize an existing page in a page collection. This is applicable to both page templates and page variants.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select the **Page collection** tab and then select **CSM default record pre-tabs** from the Page Collections list.

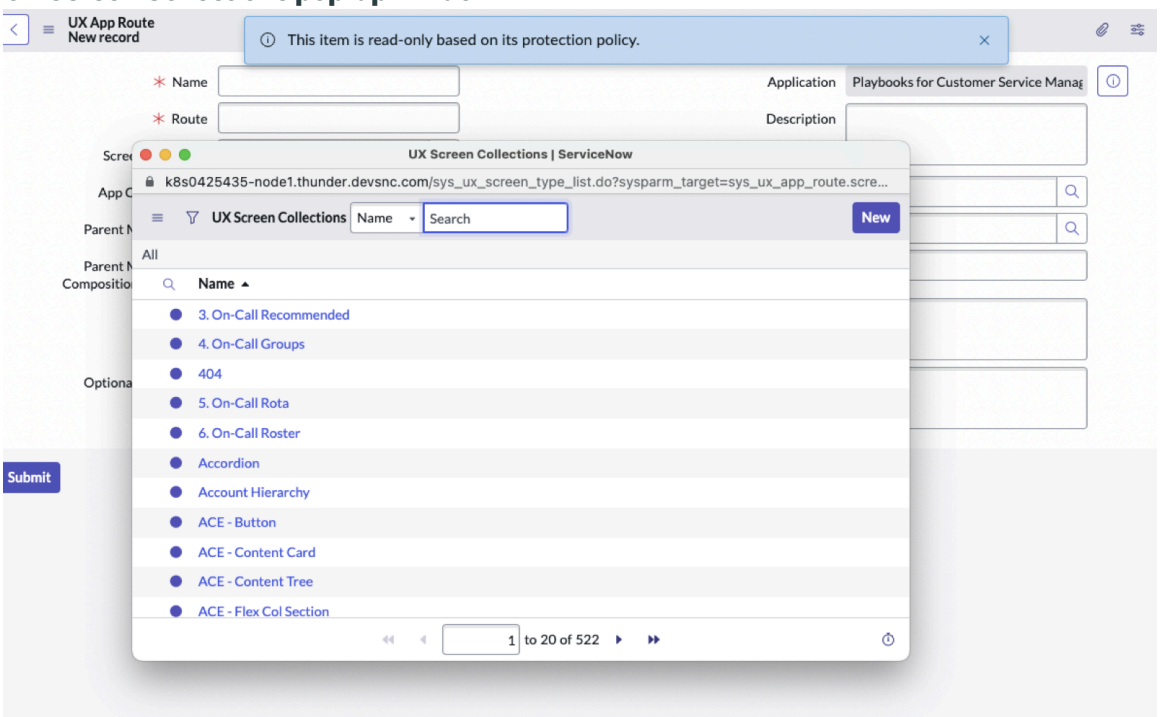
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the CSM default record pre-tabs page, select **View page collection settings** in the upper right corner.
4. In the General section, select **Open page collection**.
   The system opens the UX Extension Point page for CSM default record pre-tabs.
5. Navigate to the **UX App Routes** related list.
6. Select **New** to create an app route.
7. Enter a name In the **Name** field, a route in the **Route** field, and then select the **Screen Collection** that you want to reuse.

   The route is the path that the system uses to reach the page collection. For example, some common routes in CSM Configurable Workspace include record, list, and create_case_type for the Create Case modal.

   You can also create a screen collection by selecting **New** on the UX Screen Collections pop-up window and entering the name, route, and screen collection.

UX Screen Collections pop-up window



8. Select **Submit** to create the app route.

Result

The system adds the subpage to the page collection.

Playbook applications

Several playbook applications are available that provide playbooks to onboard customers, manage customer complaints, and resolve issues.

Customer Service Management playbook applications

Application	Description
Case Playbook for Onboarding	Use this application to manage the process for taking on new customers or enrolling

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Management playbook applications (continued)

Application	Description
	customers in new products. An onboarding case captures the details of the new customer, including their selection of products and services.
Case Playbook for Complaints	Use this application to manage the process for handling customer complaints. A complaint case captures the details of the problem reported by the customer and the expected resolution.
Case Playbook for Product Support	Use this application to guide agents through the steps that are needed to resolve product issues. A product support case captures information about the customer, the product, and the reported issue.

Case Playbook for Onboarding

Use the Case Playbook for Onboarding to manage the process for taking on new customers or enrolling customers for new products.

The onboarding playbook provides the activities and tasks that agents can perform during the onboarding process. Agents can also create and assign tasks as needed and use the playbook to communicate with the customer.

Use the Case Playbook for Onboarding for cases that were created by using the onboarding case type. This playbook is available for both CSM Configurable Workspace and CSM Agent Workspace. In the CSM Workspaces, the playbook appears in the **Playbook** tab on the case record.

Note:
If you have the admin role, you can configure a playbook to use compact mode in CSM Configurable Workspace. Use the compact mode to move the playbook from a tab in the Workspace to a tab in the contextual side panel.

Case Playbook for Onboarding application

The Case Playbook for Onboarding application (com.sn_csm_onboarding_caseflow) is available from the ServiceNow® Store. For more information, see Playbook plugins.

Case Playbook for onboarding a PAD process definition

The Case Playbook for Onboarding 3.0 includes a new Process Automation Designer (PAD) process definition called **onboarding_playbook_v1**. This process definition contains the optimized stages and activities for the onboarding playbook.

Process definitions are stored in the Process Definitions table (sys_pd_process_definition). As an admin, you can view a list of processes by doing the following task:

1. In the application navigator, enter **sys_pd_process_definition.list**.
2. Configure the list to show the **Name** field.

Only one PAD process per playbook can be active at a time. For more information, see Process definitions.

Case Playbook for Onboarding features

The Case Playbook for Onboarding 3.0 includes the case features and workspace enhancements that are listed in the following table.

Onboarding Case Playbook 3.0 features

Feature	Description
Create an onboarding case using the Case Playbook for Onboarding	Feature that opens the onboarding playbook and initiates the first activity in the Initiate stage, which is gathering the customer information. The agent can complete and save this activity to create the record. For more information, see Create a record using a playbook.
Focused activity view	Feature that determines how the stages and activities appear in the playbook. The Case Playbook for Onboarding uses the Focused activity view, which enables agents to see • The end-to-end life cycle of the onboarding workflow in the playbook life-cycle panel. • The current stage is expanded and the current activity is highlighted within the playbook life-cycle panel. • The current activity that is displayed in the playbook work area.
Contextual side panel	Feature that displays the following information: • Activity stream • Ribbon information, such as the case overview, customer details, timeline, and SLAs • Dynamic related records The activity stream and ribbon information are available in CSM Configurable Workspace only. For more information about using the contextual side panel, see the following topics: • Using activity stream in the contextual side panel • Viewing the ribbon information in the contextual side panel • Viewing dynamic related records in the contextual side panel

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Onboarding Case Playbook 3.0 features (continued)

Feature	Description
Activity visibility	Feature that enables you to control the activity visibility: • Hide the activities in a stage that the logged-in user can't access. • Hide the pending activities in a stage. For more information about configuring this feature, see Configure playbook stage and activity visibility.
Compact mode	Mode that moves the playbook from a tab in the Workspace to the contextual side panel. Agents can complete the playbook activities in the side panel while they are viewing the other tabs in the record page. This mode is available in CSM Configurable Workspace only. Users with the admin role can configure a playbook to use compact mode in the playbook component configuration in UI Builder. For more information about configuring this feature, see Integrate Playbook with Workspace.
Dynamic related records	Feature that displays the records in the contextual side panel. These records dynamically change based on the context of the current record or playbook activity. From the **Related Records** tab in the contextual side panel, agents can • Filter the list of related records • Open the list in a new tab • Create new records The dynamic related records feature is available in CSM Configurable Workspace only. For more information, see Viewing related records in the contextual side panel.
SLA widget	Activity cards in the playbook work area that can display an SLA widget. The widget appears on the activity card when the playbook activity has an SLA. The widget includes the activities in the following stages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Onboarding Case Playbook 3.0 features (continued)

Feature	Description
	• Pre-approval (duration is 3 days) • Data capture (duration is 5 days) • Due diligence (duration is 15 days) • Resolution (duration is 20 days) The color of the widget indicates the time remaining for the SLA: • Green: 0–50% • Yellow: 50–75% • Orange: 75–99% • Red: 100% or breached

Using the playbook stage and activity pickers to navigate the stages and activities

The playbook stage picker enables agents to see the entire onboarding workflow. Agents can navigate the playbook stages and activities by doing the following tasks:

- Expand and collapse the stages to show or hide the activities.
- Use the filter in the stage picker to filter activities by the assigned user or the activity state.
- Click an activity to display the details in the playbook work area.

Using the Playbook Actions menu

The Playbook Actions menu in the playbook header includes the actions that agents can perform at the playbook and activity levels. The agents can select the Playbook Actions icon (⋮) to access this menu.

The Playbook Actions menu includes the following playbook-level actions:

- **Expand All Stages**: Expands all the stages in the playbook.
- **Collapse All Stages**: Collapses all the stages in the playbook.
- **Request Info**: Displays a pop-up window that the agent can use to communicate with the customer and to request information about a case or case task. This action also saves the details to the case or case task activity stream. By using this action, the state of the case or case task changes to Awaiting Info and pauses the SLAs and any timers.
- **Info Received**: Returns the case or case task to the previous state and restarts the SLAs and any timers.

Note:
The **Request Info** and **Info Received** actions can also be configured to appear on the case task activity cards.

The activity-level actions can vary depending on the type of activity and in which stage it appears. For example, actions are available to accept cases, create related cases, create case tasks, and propose solutions.

Onboarding playbook stages and activities

The following table lists the Case Playbook for Onboarding stages and activities that agents can use to onboard new customers or products.

Playbook activities by onboarding stage

Stage	Activity	Activity Details
Initiate Guides the agent in collecting customer and case information and sending a case for pre-approval.	Collect customer information	When an agent creates an onboarding case, the workspace opens the Create New Onboarding Case form, launches the onboarding playbook, and uses the first activity to gather customer information. The agent enters the information about the channel, account, contact, consumer, product, and service. For more information about the products and services, see Service definitions. Agent actions: **Continue**: Creates the onboarding case and adds the case number to the record tab. It also marks the first activity as complete and moves to the second activity.
	Add additional members	Activity that agents can use to add additional members to the onboarding case: 1. Select **Add new** to open the Create New Related Party form in a new tab. 2. In the **Type** field, select the related party with the correct entity type, such as a beneficiary who is a customer contact. 3. Select the **User**. 4. Select **Save** to add the user to the Member Information list on the activity card. Agent actions: • **Assign to me**: Available if the case is not yet assigned. Assigns the case to the logged-in user. • **Add new**: Adds a user to the Member Information list. • **Send for Pre Approval**: Completes the Initiate stage and moves to the Pre-approval stage.
	Notify customer	Activity that displays the details of the email that was automatically sent to the customer at the completion of the Initiate stage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook activities by onboarding stage (continued)

Stage	Activity	Activity Details
Pre approval Automates the pre-approval process for the customer.	Check approval status	Activity that includes a list of approvals and approvers. **Note:** This activity shows the list of approvals if an approval workflow is manually configured for an onboarding case. The approval workflow configuration is not provided in the base system. If no approval workflow is configured, this activity completes automatically.
	Update customer information	Agents can use this activity to verify the account, contact, or consumer information for the onboarding case. Agent actions: **Save**: Saves any changes made to the customer information.
	Complete pre approval	Agents can use this activity to provide additional information and add notes or attachments. Agent actions: • **Request info**: Requests additional information from the customer. This action changes the state of the case task to Awaiting Info. • **Post**: Posts the comment or the work note to the case task record activity stream. • **Initiate Data Capture**: Marks the activity and the Pre approval stage as complete.
	Notify customer	This activity displays the details of the email that was automatically sent to the customer at the completion of the Pre approval stage.
Data capture Organizes the collection of customer information.	Verify document checklist	This activity displays a document checklist. Agents can check off the necessary documents and provide comments or work notes. If the customer type changes after the case is created, a new checklist of the appropriate type replaces the original checklist. Agent actions:

Playbook activities by onboarding stage (continued)

Stage	Activity	Activity Details
		• **Request info**: Request additional information from the customer. This action changes the state of the case task to Awaiting Info. • **Post**: Posts the comment or the work note to the case task record activity stream. • **Submit for Review**: Marks the activity and the Data capture stage as complete.
	Notify customer	This activity displays the details of the email that was automatically sent to the customer at the completion of the Data capture stage.
Due diligence Displays case tasks for completing due diligence.	Perform background check	Agents can use this activity to perform background checks on the customer. Agent actions: • **Request info**: Request additional information from the customer. This action changes the state of the case task to Awaiting Info. • **Post**: Posts the comment or the work note to the case task record activity stream. • **Review Complete**: Marks the activity as complete.
	Initiate legal verification	Agents can use this activity to initiate the legal verification process for a customer. Agent actions: • **Request info**: Request additional information from the customer. This action changes the state of the case task to Awaiting Info. • **Post**: Posts the comment or the work note to the case task record activity stream. • **Review Complete**: Marks the activity as complete.
	Review credit history	Activity that the agents can use to review a customer's credit history. Agent actions: • **Request info**: Request additional information from the customer. This action changes the state of the case task to Awaiting Info.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Playbook activities by onboarding stage (continued)

Stage	Activity	Activity Details
		• **Post**: Posts the comment or the work note to the case task record activity stream. • **Review Complete**: Marks the activity and the Due Diligence stage as complete.
	Notify customer	This activity displays the details of the email that was automatically sent to the customer at the completion of the Due Diligence stage.
Resolve Manages the case resolution activities.	Propose resolution	Activity that displays the fields from the Resolution Notes section on the Case form. Agents can add the resolution details and select **Propose solution**. If the customer rejects the resolution, the agent can return to the Resolve stage and propose another solution. Agent actions: • **Propose solution**: Propose the solution to the customer and mark the Resolve stage as complete. • **Change solution**: This action appears after the agent proposes a solution.
	Notify customer	This activity displays the details of the email that was automatically sent to the customer at the completion of the Resolve stage.
Close Manages the case close activities.	Notify customer	Activity that displays the details of the email that was automatically sent to the customer at the completion of the Close stage.
	Close case	When the customer accepts the resolution, the Resolve stage completes and the Close stage is also marked as complete.

Process-based page variant for onboarding case type

The Case Playbook for Onboarding v5.0 application includes a process-based page variant that you can activate and use with the onboarding case type in CSM Configurable Workspace. This page includes the following features:

- Horizontal stage picker in the record that provides an end-to-end view of the onboarding process.
- Related list tabs that are displayed in the Dynamic Related Records component in the contextual side panel.
- Persistent account and contact information that display in the panel.
- Displays **Email** tab in the **Activity Stream**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Email templates that are displayed in the contextual side panel.
- Customization of the start and end states of the approval flow as fields in the Approval request activity.

Agents can create tasks as needed and view and update the case details. For more information, see Playbook pages.

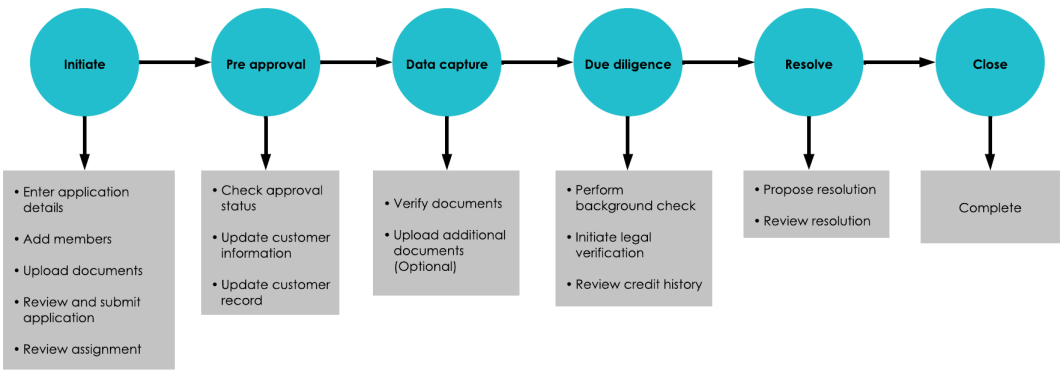
Guided Playbook for Onboarding Request

The Case Playbook for onboarding has undergone modifications in Playbooks for Portals to expose the initiate stage for self-service. This change will provide the guided playbook intake process to end customers as well, previously available only to agents. The experience is initially shipped as inactive to customers.

End customers now have visibility into the entire lifecycle of the onboarding application when viewing the case application. They can perform various tasks based on the specific stage of the case lifecycle. This includes submitting new cases, checking the status of existing cases, and taking actions on tasks that require customer input as the case progresses.

Contributor users, on the other hand, have the ability to submit cases and act on tasks on behalf of the customer. During the initiate stage of the onboarding case type, end customers have the option to save their progress. Additionally, they can view the case process on the case ticket page specifically designed for onboarding cases. The flows within the system guide users through the step-by-step completion of both simple and complex processes, ensuring a smooth and efficient experience.

Guided Playbook for Onboarding Request



As customer, you can:

- Locate the catalog content item 'New Guided Onboarding Request' under the 'Support' category in the service catalog.
- Launch the playbook record generator associated with the selected content item.
- Monitor your progress in the submission process, including the number of remaining steps and the ability to navigate back to previous steps when viewing a playbook.
- Easily populate the required fields with the options provided and input controls.
- Save an application or form before it is ready for submission and resume working on it at a later time.
- Locate the draft case from the case list view to continue where you left off.
- Click **Submit** to complete the initiation stage during the **Review Application**step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Receive a notification if there are any pending tasks due to missing documents.
- Access the case ticket page directly from the email notification, with the process tab open, displaying the **Data Capture** stage and the **Upload Documents** activity.

Known limitations:

- If you switch to the new Process Automation Designer (PAD) with the existing service definition and the old record generator, you may encounter a configuration error page when attempting to create onboarding from the case type selector. You need to update the service definition's references as well to the new record generator.
- The Portal playbook experience only supports the New PAD. Customers may encounter issues if they attempt to use the old PAD, so it is recommended not to use it. Ensure that only one PAD is active at a given time.

Case Playbook for Complaints

Use the Case Playbook for Complaints to guide agents through the steps that are needed to resolve customer complaints.

A complaint case captures the information about the customer, the product, and the details about the complaint. The complaint playbook provides the activities and tasks that agents can perform to research and resolve the complaint. Agents can also create and assign tasks as needed and use the playbook to communicate with the customer.

The Case Playbook for Complaints can be used with cases that are created using the complaint case type. This playbook is available for both CSM Configurable Workspace and CSM Agent Workspace. In the CSM Workspaces, the playbook appears in the **Playbook** tab on the case record.

Note:
If you have the admin role, you can configure a playbook to use the compact mode in CSM Configurable Workspace. Use the compact mode to move the playbook from a tab in the Workspace to a tab in the contextual side panel.

Case Playbook for Complaints application

The Case Playbook for Complaints 3.0 application (com.sn_csm_complaint_caseflow) is available from the ServiceNow® Store. For more information, see Playbook plugins.

Case Playbook for Complaints PAD process definition

The Case Playbook for Complaints 3.0 includes a new Process Automation Designer (PAD) process definition called **complaint_playbook_v1**. This process definition contains the optimized stages and activities for the complaint playbook.

The process definitions are stored in the Process Definitions table (sys_pd_process_definition). To view a list of processes, do the following task:

1. In the application navigator, enter **sys_pd_process_definition.list** in the application navigator.
2. Configure the list to show the **Name** field.

Only one PAD process per playbook can be active at a time. For more information, see Process definitions.

Case Playbook for Complaints features

The Case Playbook for Complaints 3.0 includes the case features and enhancements that are listed in the following table.

Case Playbook for Complaints 3.0 features

Feature	Description
Create a complaint case using the Case Playbook for Complaints	Feature that opens the complaint playbook and initiates the first activity in the Intake stage, which is gathering complaint details. The agent can complete and save this activity to create the record. For more information, see Create a record using a playbook.
Focused activity view	Feature that determines how the stages and activities appear in the playbook. The Case Playbook for Complaints uses the Focused activity view, which enables agents to see • The end-to-end life cycle of the complaint workflow in the playbook life-cycle panel. • The current stage is expanded and the current activity is highlighted within the playbook life-cycle panel. • The details of the current activity that is displayed in the playbook work area.
Contextual side panel	Feature that displays the following information in the contextual side panel: • Activity stream • Ribbon information, such as the case overview, customer details, timeline, and SLAs • Dynamic related records **Note:** The activity stream and ribbon information are available in CSM Configurable Workspace only. For more information about using the contextual side panel, see

Case Playbook for Complaints 3.0 features (continued)

Feature	Description
	• Using activity stream in the contextual side panel • Viewing the ribbon information in the contextual side panel • Viewing dynamic related records in the contextual side panel
Activity visibility	Feature that uses the following settings to control activity visibility: • Hide the activities in a stage that the logged-in user can't access. • Hide the pending activities in a stage. For more information about configuring this feature, see Configure playbook stage and activity visibility.
Compact mode	Mode that moves the playbook from a tab in the Workspace to the contextual side panel. Agents can complete the playbook activities in the side panel while they're viewing the other tabs in the record page. **Note:** This mode is available in CSM Configurable Workspace only. Users with the admin role can configure a playbook to use the compact mode in the playbook component configuration in UI Builder. For more information about configuring this feature, see Integrate Playbook with Workspace.
Dynamic related records	Feature that displays the records in the contextual side panel. These records dynamically change based on the context of the current record or playbook activity. From the **Related Records** tab in the contextual side panel, agents can • Filter the list of related records • Open the list in a new tab • Create records

© 2026 ServiceNow, Inc. All rights reserved.

Case Playbook for Complaints 3.0 features (continued)

Feature	Description
	Note: The dynamic related records feature is available in CSM Configurable Workspace only. For more information, see Viewing related records in the contextual side panel.
SLA widget	Activity cards in the playbook work area that can display an SLA widget. The widget appears on the activity card when the playbook activity has an SLA. This widget includes the activities in the following stages: • Triage • Research • Respond The color of the widget indicates the time remaining for the SLA: • Green: 0–50% • Yellow: 50–75% • Orange: 75–99% • Red: 100% or breached

Using the playbook stage and activity pickers to navigate stages and activities

The playbook stage picker enables agents to see the entire complaint workflow. Agents can navigate the playbook stages and activities by doing the following tasks:

- Expand and collapse stages to show or hide activities.
- Use the filter in the stage picker to filter activities by the assigned user or the activity state.
- Select an activity to display the details in the activity viewer.

Using the Playbook Actions menu

The Playbook Actions menu in the playbook header includes the actions that agents can perform at the playbook and activity levels. The agents can select the Playbook Actions icon (⋮) to access this menu.

The Playbook Actions menu includes the following playbook-level actions:

- **Expand All Stages**: Expands all the stages in the playbook.
- **Collapse All Stages**: Collapses all the stages in the playbook.
- **Request Info**: Displays a pop-up window that the agent can use to communicate with the customer and to request information about a case or case task. This action also saves the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

details to the case or case task activity stream. By using this action, the state of the case or case task changes to Awaiting Info and pauses the SLAs and any timers.

- **Info Received**: Returns the case or case task to the previous state and restarts the SLAs and any timers.

Note:
The **Request Info** and **Info Received** actions can also be configured to appear on case task activity cards.

The activity-level actions can vary depending on the type of activity and in which stage it appears. For example, actions are available to accept cases, create related cases, create case tasks, and propose solutions.

Complaint playbook stages and activities

The following table lists the Case Playbook for Complaints stages and activities that agents can use to resolve customer issues.

Case Playbook for Complaints stages and activities

Stage	Activity	Activity Details
Intake Guides the agent to collect the information needed to create the complaint case.	Gather complaint details	When an agent creates a complaint case, the workspace opens the Create New Complaint Case form, launches the complaint playbook, and uses the first activity to gather complaint details. The agent can enter the information about the customer, the service, the complaint, and the expected outcome for the case. As the agent enters the complaint details, additional fields appear on the activity card such as the **Category** and **Subcategory** fields. **Note:** For more information about the service, see Service definitions. Agent actions: **Continue**: Creates the complaint case and adds the case number to the **Record** tab. It also marks the first activity as complete and moves to the second activity.
	Add involved parties	Activity that the agent can use to add involved parties to the complaint case: 1. Select **Add new** to open the Create New Related Party form in a new tab. 2. In the **Type** field, select the related party with the correct entity type, such as a co-complainant who is a customer contact.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Playbook for Complaints stages and activities (continued)

Stage	Activity	Activity Details
		3. Select **User**. 4. Select **Save** to add the user to the Involved Parties list on the activity card. Agent actions: • **Assign to me**: Available if the case isn't yet assigned. Assigns the case to the logged-in user. • **Add new**: Adds a user to the Involved Parties list (see the previous steps).
	Verify primary address	Activity that shows the fields from the Primary Correspondence Address form section on the **Details** tab. Agents can accept this address or select a different address. Agent actions: • **Save**: Saves the updates to the Primary Correspondence Address fields. • **Move to triage**: Completes the Intake stage, marks the activities in the stage as complete, and moves to the next stage in the complaint playbook.
	Notify customer	Activity that displays the details of the email that was automatically sent to the customer at the completion of the Intake stage.
Triage Enables the agent to do the initial troubleshooting on the case.	Verify complaint	Case task that agents can use to review any available related search results in the contextual side panel and add notes or attachments. Agent actions: • **Request info**: Requests additional information from the customer. This action changes the state of the case task to Awaiting Info. • **Post**: Posts the comment or the work note to the case task record activity stream. • **Submit for review**: Marks the case task and the Triage stage as complete.
	Notify customer	Activity that displays the details of the email that was automatically sent to the customer at the completion of the Triage stage.
Research Orchestrates sending the case to different	Review legal implications	Case task that agents can assign to a different user for legal review.

Case Playbook for Complaints stages and activities (continued)

Stage	Activity	Activity Details
		• **Request info**: Requests additional information from the customer. This action changes the state of the case task to Awaiting Info. • **Post**: Posts the comment or the work note to the case task record activity stream. • **Review complete**: Marks the case task and the Respond stage as complete.
Resolve Manages the activities for case resolution.	Propose resolution	Activity that shows the fields from the Resolution Notes section on the Case form. An agent can add the resolution details and select **Propose solution**. If the customer rejects the solution, the agent can return to the Resolve stage and propose another solution. Agent actions: • **Propose solution**: Proposes the solution to the customer and marks the Resolve stage as complete. • **Change solution**: This action appears after the agent proposes a solution.
	Notify customer	Activity that displays the details of the email that was automatically sent to the customer at the completion of the Resolve stage.
Close Manages the activities for closing the case and sending a survey to the customer.	Close case	When the customer accepts the resolution, the Resolve stage completes and the Close stage is also marked as complete.
	Notify customer	Activity that displays the details of the email that was automatically sent to the customer at the completion of the Close stage.

Process-based page variant for complaint case type

The Case Playbook for Complaints v5.0 application includes a process-based page variant that you can activate and use with the complaint case type in CSM Configurable Workspace. This page includes the following features:

- Horizontal stage picker in the record that provides an end-to-end view of the complaint process.
- Related list tabs that are displayed in the Dynamic Related Records component in the contextual side panel.
- Persistent account and contact information that is displayed in the panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Email** tab that is displayed in the **Activity Stream**.
- Email templates that are displayed in the contextual side panel.
- Customization of the start and end states of the approval flow as fields in the Approval request activity.

Agents can create tasks as needed as well as view and update case details. For more information, see Playbook pages.

Case Playbook for Product Support

Use the Case Playbook for Product Support to guide agents through the steps that are needed to resolve product issues.

A product support case captures the information about the customer, the product, and the reported issue. The product support playbook provides the activities and tasks that agents can perform to research and resolve the issue. Agents can also create and assign tasks as needed and use the playbook to communicate with the customer.

The Case Playbook for Product Support is available for both CSM Configurable Workspace and CSM Agent Workspace. In the CSM Workspaces, the playbook appears in the **Playbook** tab on the case record.

Note:
If you have the admin role, you can configure a playbook to use the compact mode in CSM Configurable Workspace. Use the compact mode to move the playbook from a tab in the Workspace to a tab in the contextual side panel.

Case Playbook for Product Support application

The Case Playbook for Product Support 3.0 application (com.sn_csm_product_caseflow) is available from the ServiceNow® Store. For more information, see Playbook plugins.

Case Playbook for Product Support PAD process definition

The Case Playbook for Product Support 3.0 includes a new Process Automation Designer (PAD) process definition called **product_playbook_v1**. This process definition contains the optimized stages and activities for the product support playbook.

The process definitions are stored in the Process Definitions table (sys_pd_process_definition). To view a list of processes, you can do the following task:

1. In the application navigator, enter **sys_pd_process_definition.list**.
2. Configure the list to show the **Name** field.

Only one PAD process per playbook can be active at a time. For more information, see Process definitions.

Case Playbook for Product Support features

The Case Playbook for Product Support 3.0 includes the case features and enhancements that are listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Playbook for Product Support features

Feature	Description
Focused activity view	Feature that determines how the stages and activities appear in the playbook. The Case Playbook for Product Support uses the Focused activity view, which enables agents to see • The end-to-end life cycle of the product support workflow in the playbook life-cycle panel. • The current stage is expanded and the current activity is highlighted within the playbook life-cycle panel. • Details of the current activity that is displayed in the playbook work area.
Contextual side panel	Feature that displays the following information in the contextual side panel: • Activity stream • Ribbon information, such as the case overview, customer details, timeline, and SLAs • Dynamic related records **Note:** The activity stream and ribbon information are available in CSM Configurable Workspace only. For more information about using the contextual side panel, see • Using activity stream in the contextual side panel • Viewing the ribbon information in the contextual side panel • Viewing dynamic related records in the contextual side panel For more information about configuring this feature, see Configure playbook stage and activity visibility.
Activity visibility	Feature that uses the following settings to control the activity visibility:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Playbook for Product Support features (continued)

Feature	Description
	• Hide the activities in a stage that the logged-in user can't access. • Hide the pending activities in a stage.
Compact mode	Mode that moves the playbook from a tab in the Workspace to the contextual side panel. Agents can complete the playbook activities in the side panel while they're viewing the other tabs in the record page. **Note:** This mode is available in CSM Configurable Workspace only. Users with the admin role can configure a playbook to use the compact mode in the playbook component configuration in UI Builder. For more information about configuring this feature, see Integrate Playbook with Workspace.
Dynamic related records	Feature that displays the records in the contextual side panel. These records dynamically change based on the context of the current record or playbook activity. From the **Related Records** tab in the contextual side panel, agents can • Filter the list of related records • Open the list in a new tab • Create new records **Note:** The dynamic related records feature is available in CSM Configurable Workspace only. For more information, see Viewing related records in the contextual side panel.
SLA widget	Activity cards in the playbook work area can display an SLA widget. The widget appears on the activity card when the playbook activity has an SLA. The color of the widget indicates the time remaining for the SLA: • Green: 0–50% • Yellow: 50–75%

Case Playbook for Product Support features (continued)

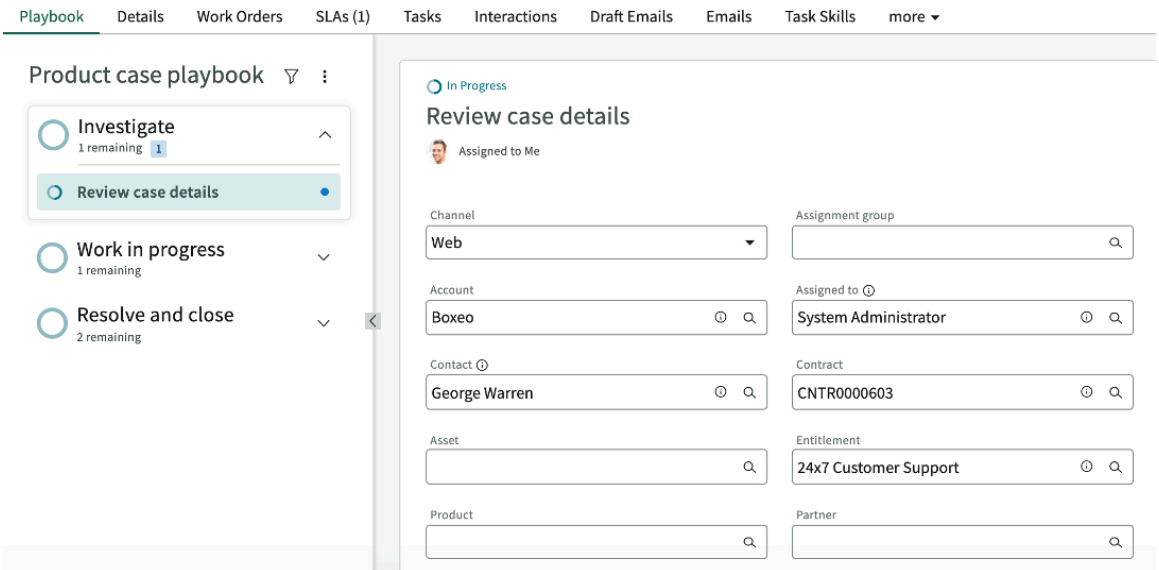
Feature	Description
	• Orange: 75–99% • Red: 100% or breached

Using the playbook stage and activity pickers to navigate stages and activities

The playbook stage picker enables agents to see the entire product support workflow. Agents can navigate the playbook stages and activities by doing the following tasks:

- Expand and collapse the stages to show or hide activities.
- Use the filter in the stage picker to filter activities by the assigned user or the activity state.
- Select an activity to display the details in the playbook work area.

The following example shows the different stages and activities in a playbook.



Using the Playbook Actions menu

The Playbook Actions menu in the playbook header includes the actions that agents can perform at the playbook level. The agents can select the Playbook Actions icon (⋮) to access this menu.

The Playbook Actions menu includes the following playbook-level actions:

- **Expand All Stages**: Expands all the stages in the playbook.
- **Collapse All Stages**: Collapses all the stages in the playbook.
- **Request Info**: Displays a pop-up window that the agent can use to communicate with the customer. This action also saves the details to the case activity stream. By using this action, the state of the case changes to Awaiting Info and pauses the SLAs and any timers on the case.
- **Info Received**: Returns the case to the previous state and restarts the SLAs and any timers on the case.

The activity-level actions can also appear in the Playbook Actions menu. These actions vary depending on the type of activity and in which stage it appears. For example, actions are available to accept cases, create related cases, create case tasks, and propose solutions.

Case Playbook for Product Support stages and activities

The following table lists the Case Playbook for Product Support stages and activities that agents can use to resolve customer issues.

Case Playbook for Product Support stages and activities

Stage	Activity	Details
Investigate Guides the agent in collecting customer information and performing some initial research about the product issue.	Review case details	A case is in the Investigate stage when the case state is New or Open. This activity displays information about the case, including the customer and product details and any contracts or entitlements. The agent can add details about the issue and review the information and related search results, such as knowledge articles or similar cases. Agent actions: • **Assign to me**: Assigns the case to the current agent. • **Accept**: Enables the agent to accept the case. • **Save**: Saves any changes made to the case details. • **Mark Complete**: Saves the information, marks the activity as complete, and moves to the next activity or stage.
Work in progress Create case tasks as needed and assign tasks to users.	Create case tasks	A case is in the Work in progress stage when the agent completes the initial research and begins working on the issue. This activity includes a list of case tasks. Agents can create tasks as needed to complete the work for a case. Agent actions: • **Add New**: Creates a case task. Add information to the task and select **Save** to add the task to the Case Tasks list. • **Mark Complete**: Marks the activity as complete and moves to the next activity or stage.
Resolve and close Case tasks are complete and the agent is ready to	Resolve	Add details to the **Resolution code** and **Resolution notes** fields on the activity card and select **Save**. This information is added to the case record. Agent actions:

© 2026 ServiceNow, Inc. All rights reserved.

Case Playbook for Product Support stages and activities (continued)

Stage	Activity	Details
propose a solution to the customer.		• **Propose Solution**: Notifies the customer of the proposed solution. • **Change Solution**: Appears after the agent proposes a solution. Use this action to add information to the case resolution fields.
	Close case	This activity shows the following read-only fields: • **Closed by**: the agent who closed the case. • **Closed**: the date and time that the case was closed. The system closes the case when the customer accepts the resolution or when the agent selects **Close Case**.

Process-based page variant for cases

The Case Playbook for Product Support v5.0 application includes a process-based page variant that you can activate and use with cases in CSM Configurable Workspace. This page includes the following features:

- A horizontal stage picker at the top of the record that provides an end-to-end view of the complaint process. Activities within each stage are stacked in the activity viewer.
- Displays the related list tabs in the Dynamic Related Records component in the contextual side panel.
- Displays persistent account and contact information in the left side panel.
- Displays **Email** tab in the **Activity Stream**.
- Displays the email templates in the contextual side panel.
- Supports case summarization card on the left panel.

Agents can create tasks as needed as well as view and update case details. For more information, see Playbook pages.

Configure Playbooks for Customer Service Management

Configure different playbook settings, such as selecting the activity view and determining activity visibility.

Some of the configuration for a playbook is performed in UI Builder as part of the playbook component configuration. Additional settings can be configured in the playbook experience configuration record. These settings include selecting the playbook activity view and configuring playbook stage and activity visibility.

Playbook configuration tasks

Configuration task	Description
Create or customize a playbook record page	A record page provides the base structure for how a record is displayed in CSM Configurable Workspace. The

Playbook configuration tasks (continued)

Configuration task	Description
	following playbook record pages are available with the Playbooks for Customer Service Management application [com.sn_csm_playbook]: • Case playbook: horizontal stages page • Case playbook: vertical stages page For more information, see Manage UI Builder pages and page variants.
Configure the playbook record page settings	Each UI Builder record page includes the following settings: • **Active**: Enabling this check box makes the page available to the selected audience. • **Order**: This value indicates the page priority. The page with the lowest order value is the default page. • **Conditions**: Determine when a page variant is displayed. • **Audience**: Determines who can see the page. For more information, see the following topics: • Case playbook: horizontal stages page variant settings • Case playbook: vertical stages page variant settings
Select a playbook activity view	The activity view determines how the stages and activities are displayed in the playbook. • **Stacked**: <add description> • **Focused**: <add description> Users with the system administrator role can select a playbook activity view in the playbook component configuration in UI Builder.
Configure playbook stage and activity visibility	The following fields control the visibility of playbook stages and activities. • **Hide Inaccessible Activity**: Accessibility is determined by user permissions. When enabled, the user cannot see an activity if they do not have permissions to view the data associated with the activity. If all activities in a stage are inaccessible to the user, the stage is also hidden. • **Control Activity Display**: Pending activities are those activities that have not yet been triggered. Select one of the options in this field to show or hide pending activities. Users with the system administrator role can in the playbook experience configuration record.

Playbook configuration tasks (continued)

Configuration task	Description
Configure a playbook to use compact mode	Compact mode moves the playbook from a tab in the Workspace to the contextual side panel. Agents can complete playbook activities in the side panel while viewing other tabs in the record page. Users with the system administrator role can configure a playbook to use compact mode in the playbook component configuration in UI Builder. For more information about configuring this feature, see Integrate Playbook with Workspace.
Preview a playbook	Users with the playbook experience admin role [playbook_experience.admin] can preview a playbook in real time within a non-production environment. With this feature, playbook experience administrators can easily see and test different playbook settings.
Select a playbook experience	A playbook experience is a defined set of configurations that determines how the system renders a playbook in Workspace. You can use playbook experiences to customize the look and feel of a playbook, map user actions, and override activities. The Playbook Experience plugin (com.playbook_experience) includes the Global Playbook Experience record, which defines a default playbook configuration. The Playbooks for Customer Service Management plugin (com.sn_csm_playbook) includes the following additional playbook experience records: • CSM Configurable Workspace Playbook • CSM Agent Workspace Playbook Users with the system administrator role can select a playbook experience when adding a playbook to a page in UI Builder. Different playbooks for the same record type can use different playbook experiences. For example, if a complaint case uses two playbooks, each playbook can use a different playbook experience. For more information, see the following topics in the Workspace administrator documentation: • Create Playbook experience configurations • Preview a playbook
Set up a record generator for a case type	Create a record for a case type by using a playbook record generator. With a record generator, the system creates a record as the first step in the playbook.
Confgure an optional activity for a playbook	Configure optional playbook activities so that agents and fulfillers can insert activities during a playbook run. For example, a customer may want to schedule an optional activity such as making an appointment to visit a location.

Playbook experiences

Playbook experiences are used to customize the look and feel of a playbook. Settings in a playbook experience control how UI Builder renders a playbook in the CSM workspaces. System administrators can configure settings in the playbook experience record that determine the playbook stage and activity visibility.

Within UI Builder, system administrators can configure playbook component settings such as:

- Selecting a playbook experience
- Selecting an activity view
- Enabling compact mode

For more information, see Configuring playbooks for Customer Service Management.

Select a playbook activity view

The activity view determines how the stages and activities are displayed in the playbook.

Before you begin

Role required: admin

About this task

Users with the system administrator role can select the playbook activity view in the playbook component configuration in UI Builder.

Procedure

1. Navigate to UI Builder and open the playbook component.
2. Select the playbook component.
3. In the Config tab, select a view in the **Activity View** field.
4. Select **Save**.

Configure playbook stage and activity visibility

Configure the visibility of playbook stages and activities that are pending or that a user cannot access.

Before you begin

Role required: admin

About this task

Use the following fields in the playbook experience configuration record to control the visibility of playbook stages and activities.

- **Inaccessible Data Visibility**: Accessibility is determined by user permissions. When enabled, the user cannot see an activity if they do not have permissions to view the data associated with the activity. If all activities in a stage are inaccessible to the user, the stage is also hidden.
- **Pending Item Visibility**: Pending activities are those activities that have not yet been triggered. Select one of the options in this field to show or hide pending activities.

Procedure

1. Navigate to **All** > **Playbook Experience** > **Playbook Experiences**.
2. Select a Playbook experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Configurations related list, click the desired configuration.
4. Select **Hide Inaccessible Activity** from the **Inaccessible Data Visibility** field drop-down list to hide the activities in a stage that the logged-in user cannot access.

   The default value for this field is false.
5. In the **Pending Item Visibility** field, select one of the following options.
6. Click **Update**.

Related topics

Create Playbook experience configurations

Configure an optional activity for a playbook

Set up a record generator for case type

Create a record for a case type by using a playbook record generator. With a record generator, the system creates a record as the first step in the playbook.

Before you begin

Role required: playbook_experience.admin

About this task

A record generator is set up for a specific table. You can specify the name of the record generator activity, the form view, and the playbook that a user sees before a record is created. You can also configure the declarative action that are used to submit the form. For more information on declarative actions, see Declarative actions.

Procedure

1. Navigate to **All** > **Playbook Experience** > **Record Generators**.
2. Select **New**.
3. Fill in the fields on the form.

Playbook Experience Record Generator form fields

Field	Description
Table	Table that the new record page should use for the record generator entry.
Process Definition	Process definition that you want to display before a record is created. All activities are marked pending. If no process is running after the record is created, a playbook manually triggers this process definition.
Create Record Activity Name	Name to display on the record generator activity that is inserted as the first step within the specified process definition.
Active	Option to activate the record generator.
Order	Integer that determines the precedence of this configuration in relation to other activities in a Playbook experience. The lower the number

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	means that it's more likely a user selects it over another configuration. Use numbers that are in the hundreds. For example, 100, 200, 300, or 400.
Create Record Form View	Form view for the new record form embedded within the inserted activity.
Template Fields	Optional field values that can be pre-filled in the new record form.

4. Select **Submit**.

Configure an optional activity for a playbook

Configure optional playbook activities so that agents and fulfillers can insert activities during a playbook run. For example, a customer may want to schedule an optional activity such as making an appointment to visit a location.

Before you begin
Role required: playbook_experience.admin

About this task
Configure optional playbook activities in Process Automation Designer (PAD).

Although you can insert global optional activities anywhere in the playbook, you can only insert stage-specific optional activities when a specified stage is active in the playbook. You can also add other global optional activities such as similar records, similar documents, and managed documents.

Note:
Some optional activities may require additional plugins. For example, for the Approval Request activity, if the approval action needs to be exposed to the customer via the service portal, you must install the plugin portal store app (com.snc:app-customer-service-portal) release version 23.2.4. To display the activities for the similar and managed documents in PAD, you must install the document management plugin (com.snc.platform_document_management).

Procedure
1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Select the Playbooks tab at the top of the page.
3. Select a playbook from the Label column.
4. See the optional activities under all the stages by turning on the toggle for **Optional activities**.
5. Under **Add activity**, select **Playbook for Customer Service Management** > **Approval Request**.
   A new approval request optional activity is created.
6. Select the **Approval Request** optional activity.
7. Under **Edit activity properties**, in the **Details** tab, add a **Label**, **Description**, **Activity Definition**, and set **Start Rule** to **Manual**.
   This setting is the Optional Activity indicator.
8. Save the new activity record.
9. Select **View all properties**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Navigate to **Automation tab** > **parent records** and select the parent record.
11. **Optional:** Go to the **Automation** tab and set the values of the starting state and ending state. The values for the starting and ending states are derived from the value field of the sys_choice table.

    (Optional) To create a custom state flow, see Create a state flow. Ensure that the class of the state flow is “Customer Service Case Flow." You can also configure more declarative actions for the optional activity. For more information, see Creating new declarative action assignments.
12. Select **Done**.
13. Select **Activate**.

Playbooks for Portals

With Customer Service Management (CSM) playbooks on service portals, you get the step-by-step guidance for the case flow process and the contextual information that you need to successfully complete each stage of the flow and its associated activities.

Guided intake with playbooks makes it effortless to fill out a form or provide information for a case. Playbooks offer a clear roadmap that indicates your progress in the submission process and the remaining steps that you need to complete. If needed, you can navigate back to a previous step. You’re also presented with the options and input controls that enable you to quickly and accurately input information. Additionally, you can save an application or form that is not yet ready for submission and resume work on it later.

Get started

1. Set up predefined Playbooks for Portals
2. Set up custom Playbooks for Portals
3. Using Playbooks for Portals
4. Activate a new onboarding playbook with self-service
5. Enable a reflow for your UI Builder pages

Set up predefined Playbooks for Portals

Set up predefined Playbooks for Portals to provide end users with the playbook experience on your service portal.

Overview of Playbooks

Playbooks guide users through complex processes and enable them to save their progress and resume their work when convenient. They can also get the information that they need for each stage of the flow and its associated activities with the Customer Service Management (CSM) playbooks on service portals.

You can activate Playbooks for Portals if you have the admin role. The base system is delivered in an inactive state. You must activate it in the Playbooks (PAD) for the user to see it.

Plugins required:

- Playbooks for Customer Service Management: sn_csm_playbook
- Playbook Experience: sn_playbook_exp

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Case Playbook for Onboarding: sn_onboarding (required if you need the predefined playbook experience)
- Case Playbook for Product Support: sn_product (required if you want to use the product case playbook and record generator)

Plugins are available from the ServiceNow® Store. For more information, see Playbook plugins.

Summary of steps for setting up predefined Playbooks for Portals

You can set up Playbooks for Portals using the following high level steps.

1. Activate the draft state in the onboarding case type state. For more information, see Activate the draft state in the onboarding case type state.
2. Activate the Record Generator
3. Activate a new onboarding playbook with self-service
4. Activate guided onboarding in the playbook content items. For more information, see Activate guided onboarding in Playbook content items.
5. Add a **Process** tab to the Portal so that users can see where they are in the Playbook process. See Add the Process tab to the Portal for more information.

Activate the draft state in the onboarding case type state

A portal user can save a case during the intake process and continue later with the draft state.

About this task

Activate a draft state for the onboarding case type so that the case remains in the draft state during the intake stage until the case is submitted.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **sys_choice.list**.
2. Select the record with **Table name** - **sn_onboarding_case** with the **Element** field value as **state**, and the **Label** field name as **Draft**.
3. Select **Edit**.
4. Clear the **Inactive** check box.
5. Select **Update**.
6. Navigate to **System Definition** > **Scheduled Job** and search for **sys_id** - **ba5ba3d8944e7110f87759453e4c7084** or **Name** - **Update My Lists URL for draft cases**.
7. Select **Execute Now**.
   This action excludes the Draft cases from the list filter on the **My List** tab on the initial page load.
8. **Optional:** If you're using a custom case type table and you do not see the relevant state upon filtering, you might have to assign requisite ACLs for the state field and its associated values.

Activate the Record Generator

Activate the record generator to the portal case and display the new guided playbook to the user. Portal users can navigate through the playbook steps to complete the case intake.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Playbook Experience** > **Record Generators**.
2. In the list, select the **Table name** - **sn_onboarding_case** with **Process Definition** name - **Onboarding with Self-Service**.
3. Select **Edit**.
4. Select the **Active** check box.
5. Select **Update**.

Activate a new onboarding playbook with self-service

Activate a new onboarding playbook with self-service in Playbooks (PAD) to ensure that the new playbook is visible.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Process Automation Designer**.
2. On the Processes tab, select the label **Onboarding with Self-Service**.
3. From the More actions menu, select **Activate**.
   Verify that the previous PAD process is deactivated.

Activate guided onboarding in Playbook content items

Activate guided onboarding in playbook content items and verify that the new content item launches the playbook record generator that is associated with it.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Playbook Experience** > **Playbook Content Items**.
2. Select **New Guided Onboarding Request**.
3. Select **Edit**.
4. Select the **Active** check box.
5. Select **Update**.

Add the Process tab to the Portal

Add a **Process** tab to the CSM ticket page so that users can track the playbook process.

Before you begin
Role required: admin

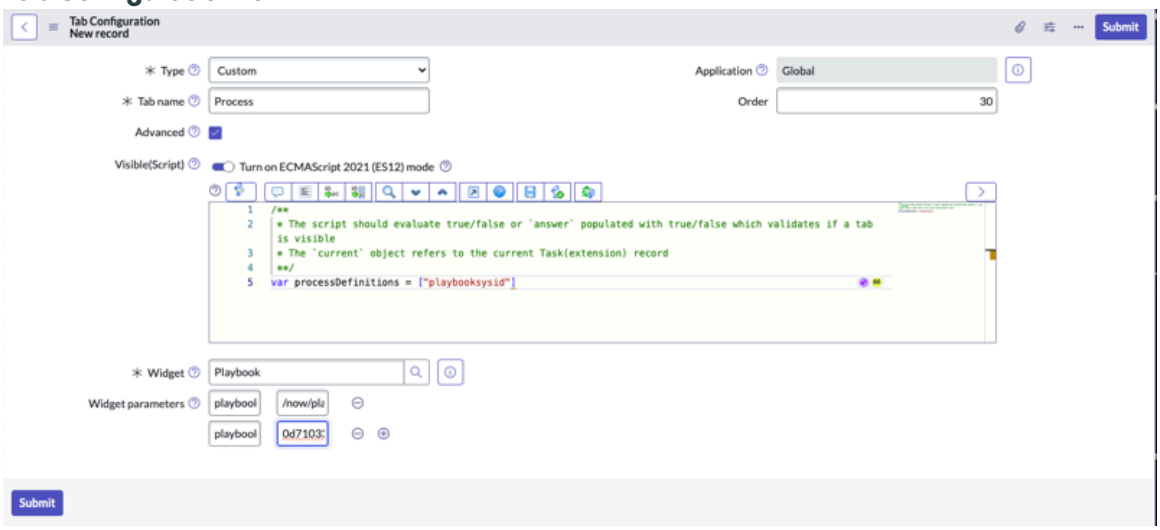
Procedure

1. Navigate to **All** > **Standard Ticket** > **Standard Ticket Configuration**.
2. Open the configuration for your table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Tabs** related list, click **New**.
4. In the **Tab Configuration** form, fill in the fields as follows.

Tab Configuration form



Tab configuration form fields

Field	Data
Type	Custom
Tab name	Process
Advanced	Toggle to active
Visible script	Add one or more playbook sysIds
Widget	Playbook
Widget parameters	Widget 1: Name: playbook_uib_page_url Value: /now/playbook-portal/csm_case_process Widget 2: Name: playbook_experience_id Value: 0d71033773f220109edbc1f52ff6a741

5. Select **Submit**.

Note:

For the user to view the process tabs in the portal, ensure you have assigned the requisite ACLs.

Set up custom Playbooks for Portals

Create custom Playbooks for Portals to provide end users with the playbook experience on your service portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Overview of Playbooks

Playbooks guide users through complex processes and enable them to save their progress and resume their work when convenient. They can also get the information that they need for each stage of the flow and its associated activities with the Customer Service Management (CSM) playbooks on service portals.

You can activate Playbooks for Portals if you have the admin role. The base system is delivered in an inactive state. You must activate it in the Playbooks (PAD) for the user to see it.

Plugins required:

- Playbooks for Customer Service Management: sn_csm_playbook
- Playbook Experience: sn_playbook_exp
- Case Playbook for Onboarding: sn_onboarding (required if you need the predefined playbook experience)
- Case Playbook for Product Support: sn_product (required if you want to use the product case playbook and record generator)

Plugins are available from the ServiceNow® Store. For more information, see Playbook plugins.

Summary of steps for setting up Playbooks for Portals

You can set up Playbooks for Portals using the following high level steps.

1. Define your process using Workflow Studio. See Create a playbook for more information.
2. Activate the record generator. For more information, see Activate the Record Generator.
3. Set up ACLs (Access Control Lists) to provide the appropriate read, write, and create permissions for users. See Explicit Roles in CSM for more information.

   Note:
   Add write and create roles with a condition based on "State=draft" so that users can only edit the fields in the draft state.

4. Create a Playbook Content Item so that users can navigate to the Playbook experience. See Create a Playbook Content Item for more information.
5. Set up a redirection widget so that users are redirected to the playbook intake experience once the state changes from "draft" to "new." See Set up a redirection widget for more information.

Create a Playbook Content Item

Create a content item of Playbook type on portal so that users can navigate to the playbook experience. These content items are specifically configured to enable the playbook experience on portals.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Playbook Content Items** > **New**.

   Content item form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In the form, fill out the fields.

Relevant Content Item form fields

Field	Definition
Name	The name of the content item you are creating
Table	Map your table here
Record ID	Always enter -1
Playbook experience	The name of your playbook experience
Playbook experience record generator	Map your record generator
Portal page	`csm_intake` standard with the Playbooks for Customer Service Management application. **Note:** You can clone the `csm_intake` page and modify it per your requirements.
Title	Title that appears at the top of the page.

3. Select **Submit**.

What to do next
After completing this step, you can navigate to the portal where the catalog is mapped and execute the content item. The playbook intake experience opens, with the record generator mapped as the first activity.

Set up a redirection widget

You can set up a widget to reroute the user to the `csm_ticket` page once the record state changes from draft to new, indicating that the user has completed the intake process.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Service Portal** > **Widgets**.
2. Open the widget **CSM Intake Redirect**.
3. Add the following code the in the client controller section.

Note:
As a best practice, clone the **CSM Intake Redirect** widget to modify and replace it on the `csm_intake` page, or on your custom page.

```
spUtil.recordWatch($scope, 'sn_customerservice_case',
 c.data.filter, function(response) { //replace
 sn_customerservice_case with your table.

        if (response.data.operation ==
 "update" && response.data.record.state &&
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
response.data.record.state.value != "0") { //checking if the
state is not draft

            if
(($window.location.href).indexOf('?id=csm_ticket&') == -1);
            $window.location = "?id=csm_ticket&table=" +
c.data.table + "&sys_id=" + c.data.sys_id;
        }
    });
```

4. Select **Update**.

Enable a reflow for your UI Builder pages

Enable a reflow for your UI Builder pages. This way, when you're resizing a window, you don't have to scroll horizontally.

Before you begin

Role required: admin

About this task

The reflow feature adjusts the properties of the components when you're resizing a window. It accommodates smaller screen sizes and changes the component's properties for the different screen sizes.

Procedure

1. Navigate to **All** > *UI Builder*.
2. Under **Experiences**, select **Playbook Experience Portal**.
3. Open a specific page or variant: Either **CSM Create Case Process** or **CSM Case Process**, for which you want to adjust the reflow.
4. Edit the **Playbook Activity Viewer** component settings.
5. On the **Styles** tab in the UI Builder, set the height of the activity viewer to 100vh.
6. Navigate to the component **Resizeable Panes** > **Panes configuration** and copy the code in the default displayed pane by editing the scripted property value.

```
// Resizable Panes default displayed pane scripted value
// when in left/right pane position
function evaluateProperty({api, helpers}) {
    if(!api.data.playbook_custom_layout.compactMode) return
 "both";
  return (api.data.playbook_custom_layout.selectedItem ||
 {}).stageContextId ? "right" : "left";
}
// when in top/bottom pane position
function evaluateProperty({api, helpers}) {
    if (!api.data.playbook_custom_layout.compactMode) return
 "both";

  return (api.data.playbook_custom_layout.selectedItem ||
 {}).stageContextId ? "bottom" : "top";
}
```

7. Select **Done**.
   For more details, see Reflow for playbook components.

Configure dynamic related records

System administrators can configure the dynamic related records feature to display related records in the contextual side panel in CSM Configurable Workspace. These records dynamically change based on the context of the current record or playbook activity.

Configuring the dynamic related records feature involves several types of records. See the following table for details about these record types.

- Related record contexts
- Related record definitions
- Context related record definitions

Dynamic related record types

Record type	Description
Related record context	Defines the context in which related records appear in the Related Records tab. You can create a related record context for the following types of records: • A source record, such as a customer service case • A playbook activity, such as adding additional members to an onboarding case A context record identifies the following information: • The table that contains the type of record for which related records are being configured. • Additional conditions that apply to the selected table. These conditions determine if the related record definitions for the selected table are executed at runtime. • The types of related records to display, such as SLAs or emails.
Related record definition	Identifies one specific type of data to be retrieved, such as SLAs or active contracts. You can create a related record definition for each type of data to include in the Related Records tab and then associate one or more definitions with a context record.
Context related record definition	Defines the relationship between a context record and its associated definition records. When you open a context record, you can see the associated definition records in the Context Related Record Definitions related list.

For more information about these tables, including field descriptions, see Dynamic related record tables.

How the context and definition records work

The context record defines the context in which related records appear in the Related Records tab. This includes conditions to apply to the selected record type. For example, to create a context record for an onboarding playbook activity:

1. Select the table that stores the activity: **Activity Execution [sys_pd_activity_context]**.
2. Define additional conditions that apply to the selected table:
   - **[Activity.Process definition] [is] [Onboarding playbook]**
   - **[Activity] [is] [Add additional members]**
   These conditions determine if the related record definitions for the selected table are executed at runtime. If the conditions evaluate to true, the definitions are executed. If false, the definitions are ignored. If a context has no conditions, this evaluates to true.
3. Select the related record definitions to execute: **Additional Members**

At runtime, the system checks to see if there are related record contexts that match the current record or playbook activity.

- When it finds a match, the system evaluates the conditions defined in the context.
- If the conditions evaluate to true, the system executes the related record definitions for the context.

To continue with the example above, an agent using the Case Playbook for Onboarding is currently working on the activity to add additional members. The system performs the following actions to display the correct related records:

- Checks the active contexts and finds **Onboarding Additional Members**.
- Evaluates the conditions in the context and determines that they evaluate to true.
- Executes the **Additional Members** related record definition.
- Retrieves and displays the correct set of records from the table identified in the **Additional Members** related record definition. In this case, the Related Party [sn_customerservice_related_party] table.

The definition record uses a script to define which related records are retrieved based on the context. This record also includes the table where the related record data is stored. At runtime, the script evaluates the context of the current record or playbook activity, along with any conditions, and dynamically displays the related record data.

Dynamic related record configuration tasks

Configuring the dynamic related records feature includes the following tasks:

- Configure the related record contexts and definitions to identify which related records to display in the Related Records tab.
- Configure the card layout for the records displayed in the Related Records tab.
- Configure the maximum number of related records to display.

© 2026 ServiceNow, Inc. All rights reserved.

Related Records list card layout

Records appear in the Related Records tab in a card format. This format is created with Entity View Action Mapper (EVAM), a ServiceNow AI Platform application that standardizes how different data sources display in cards and lists.

EVAM uses view configurations and view templates to determine how information for each type of related record is displayed.

- EVAM view configuration: Combines conditions, the table and table fields, and declarative actions with an associated view template.
- EVAM view template: Contains the JSON used to give the necessary information for the card display and use.

EVAM view configurations can be grouped together to create configuration bundles. The Dynamic Related Records for Configurable Workspace plugin includes a configuration bundle, *dynamic_related_records_bundle*, which contains view configurations and view templates for the dynamic related records feature.

The system administrator can modify the view configurations in the *dynamic_related_records_bundle* or create new view configurations. This includes selecting the fields that are displayed on the card for each type of record. For more information, see:

- Define an EVAM view configuration
- Define an EVAM view template

Related record definitions included with the plugin

The Dynamic Related Records for Configurable Workspace plugin includes several related record definitions for case records. To view a list of definitions, navigate to **Dynamic Related Record** > **Related Record Definitions**.

The system administrator can make any of these definitions available to agents by adding them to the related records shared page in UI Builder.

Related Record Definitions table

Related record definition	Description
SLAs	Displays SLAs for a case, including information from the following fields: • Stage • SLA definition • Start time • Business time left
Emails	Displays emails for a case, including information from the following fields: • Notification type • Subject

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Record Definitions table (continued)

Related record definition	Description
	• Recipient • Date created
Escalations	Displays escalations for a case or for the account and contact or consumer, including information from the following fields: • State • Number • Escalation severity • Source record
Blocked By	Displays blocking tasks for a case, including information from the following fields: • Blocking task • Blocking reason
Child Cases	Displays child cases related to a case, including information from the following fields: • Number • Short description • Account and contact • Consumer

Dynamic related records

Display related records in the Contextual side panel in CSM Configurable Workspace that dynamically change based on the context of the current record or playbook activity.

The dynamic related records feature provides customer service agents with easy access to the information they need when they need it. Agents can view related records in the Contextual side panel without navigating away from the current tab and searching for information in other related lists. This feature also enables users to display related records without requiring any type of reference or parent-child relationship.

Different types of agents can use dynamic related records to see different information. For example:

- A front-line agent creating a new case can see similar, recently opened cases.
- A middle-office agent reviewing a complaint case can see active contracts for the customer.
- A back-office agent can view emails for a selected playbook activity.

To view related records, click the Related Records tab in the Contextual side panel in CSM Configurable Workspace. Records appear in the Related Records list as read-only cards.

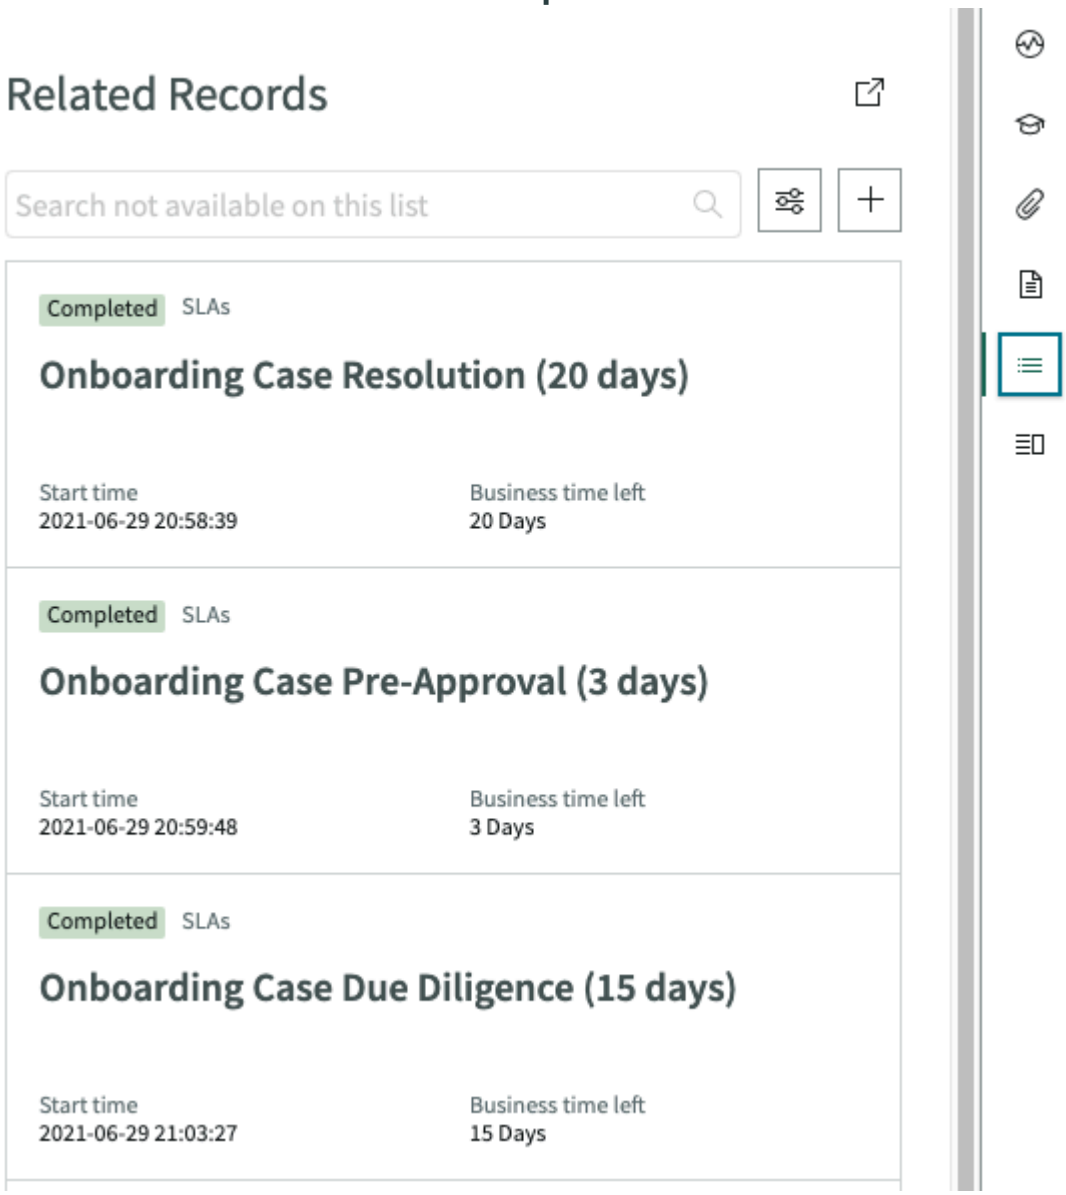
Related Records tab in the Contextual side panel



Configuring dynamic related records

System administrators can configure the dynamic related records feature and define the following information:

- Context records that specify the type of record for which related records are displayed, such as a case record or a playbook activity. A context can also specify any conditions for the record type that must be met in order for related records to be displayed.
- Definitions for each specific type of related record to display, such as SLAs or contracts.
- Relationships between context records and their associated definition records.

System administrators can also configure the related record card format. For more information, see Configuring dynamic related records.

Using dynamic related records

Agents can search the Related Records list by entering text in the search field or filter the list to display records of a specific type, such as SLAs or active customer contracts. Agents can expand

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a card to show more a more detailed view or open the list in a sub-tab. If agents have create permission, they can also create new related records of the selected type.

For more information about these agent actions, see Using the Related Records tab in the contextual side panel.

Dynamic related records plugin

The Dynamic Related Records for Configurable Workspace plugin (com.snc.uib.sn_dyn_rel_rec) is available from the ServiceNow Store.

Install any ServiceNow Store applications by requesting them from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

This plugin provide agents with access to related information based on the context of the current record or playbook activity. System administrators can configure related record definitions that make data available in context to the action that the agent is performing.

This plugin adds the Dynamic Related Record menu and the following modules to the application navigator:

- Related Record Contexts
- Related Record Definitions

This plugin also adds several related record definitions. For more information, see Related record definitions included with the plugin.

Using dynamic related records with Playbooks for Customer Service Management

The Playbooks for Customer Service Management plugin (sn_csm_playbook) adds the dynamic related records feature to CSM Configurable Workspace. It also includes the Case context record and several related record definitions.

The Case Playbook for Onboarding, Case Playbook for Complaints, and Case Playbook for Product Support applications include additional context records and related record definitions.

Related topics

Configure dynamic related records

Using the Related Records tab in the contextual side panel

Using the Related Records tab in the contextual side panel

Agents can view, search, and sort the records in the Related Records tab in the contextual side panel.

The Related Records tab displays related records that dynamically change based on the context of the current record or playbook activity. The records that are displayed in the Related Records tab depend on the following settings:

- The related record contexts and definitions that have been configured for a record or playbook activity.
- The agent's access permissions to data.

Related Records tab in the contextual side panel

Task	Steps
View related records in the contextual side panel	Click the Related Records tab (☰) to view the Related Records list. Related records appear in the list in a card format. The initial set of records displayed in the list is determined by the record type selected in the filter at the top of the list.
Select the type of related record to view	Use the filter at the top of the Related Records list to select the type of related records to view. Agents can also use the filter to see the current selection. **1.** Click the filter icon ( ). **2.** Select a record type from the dropdown menu. The dropdown menu includes the related lists that have been configured for the parent record.
Search the related records list	Use the search field at the top of the Related Records list to perform a text search. Records that match the search text are highlighted. **1.** Enter the search text in the search field at the top of the Related Records list. **2.** Click the search icon. **Note:** The search field is grayed out if search is not available for the selected type of related records.
Open a related record in a sub-tab	Click a card in the Related Records list to open the record in a sub-tab under the parent record. In the sub-tab, the agent can view the record details and perform available actions.
Open the related record list in a list view in a sub-tab	Click the list view icon ( ) to display the related records in a list view in a sub-tab under the parent record.
Create a new record for the selected related list	Create a new record for the record type currently selected in the Related Records list. This action opens a new record form in a sub-tab under the parent record. **1.** Click the create record icon ( ) at the top of the Related Records list. **2.** Fill in the fields on the record form and click **Save**.

Related records shared page

The Related Records shared page enables you to view records that are related to the current record or playbook activity in the contextual side panel.

The ui_builder_admin role or administrator role can configure a record page in UI Builder and use the Related Records shared page to add a Related Records tab on the contextual side panel. The Related Records tab shows the list of related records in card format.

Use the Related Records shared page to display records from tables that have a configured relationship to the main record. This can include multiple types of related records such as SLAs, active contracts, and emails.

The Related Records shared page:

- is part of the Base Agent Workspace app shell.
- is a public page that is available in the page templates.
- is a generic page that can be embedded in the contextual side panel for any page.

For more information about the Related Records shared page, see the Related Records component information on the ServiceNow Developer Site.

Dynamic related record tables

The dynamic related records feature uses different tables to store context and definition information.

The following tables support the configuration of the dynamic related records feature. These tables extend the sys_metadata table.

Related Record Context table

Records in the Related Record Context [sn_related_record_context] table define the context in which related records appear in the Related Records tab. This includes the following information:

- The selected table. You can create context records for source records (such as customer service cases) or playbook activities (such as adding additional members to an onboarding case).
- Additional conditions that apply to the selected table. These conditions determine when the related record definitions for the selected table are executed.
- The related record definitions to execute. These definitions identify the data to be retrieved, such as SLAs or emails.

Related Record Context table fields

Field	Description
Name	The unique name of the context record.
Applies to table	The table that stores the record type for the context record. To display related records for a source record, select the table that stores the source record. For example, Case [sn_customerservice_case].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Record Context table fields (continued)

Field	Description
	To display related records for a playbook activity, select the table that stores the activities: Activity Execution [sys_pd_activity_context].
Primary reference field	The primary field from the **Applies to table** that is passed to the Context Related Record Definition for evaluation. The value is used by the scripted query in the definition. The following data types are supported: • Sys ID • Doc ID • Reference
Secondary reference field	The secondary field from the **Applies to table** that is passed to the Context Related Record Definition for evaluation. The value is used by the scripted query in the definition. The following data types are supported: • Sys ID • Doc ID • Reference
Application	The application to which the context record applies. This is a read-only field.
Active	Enables the context record.
Inherited	When enabled, the context record also considers tables that extend from the **Applies to table**.
Conditions	Conditions that are applied to the records in the **Applies to table**.

Related Record Definition table

Records in the Related Record Definition [sn_related_record_definition] table identify one type of data to be retrieved, such as active contracts, case tasks, or SLAs. A definition record includes:

- The display label, which appears in the filter dropdown list in the Related Records tab.
- The table to be queried from. For example, the Email [sys_email] table.
- If needed, primary and secondary reference tables.
- Scripted conditions that further specify which fields to query from.

You can create definition records for each type of data to include in the Related Records tab and then associate the definitions with one or more context records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Record Definition table fields

Field	Description
Display label	The unique name of the related record definition. This label appears in the filter list in the Related Records tab.
Primary reference table	The primary table used in the definition script. At runtime, the script expects to get passed a record of this type. If you entered a data type in the **Primary reference field** in the related record context, enter the table for that data type.
Secondary reference table	The secondary table used in the definition script. At runtime, the script expects to get passed a record of this type. If you entered a data type in the **Secondary reference field** in the related record context, enter the table for that data type.
Application	The application to which the definition record applies. This is a read-only field.
Queries from	The table that stores the related record data to be retrieved.
Active	Enables the definition record. A definition must be active for the related records of that type to be displayed in the Related Records tab.
Script	Create a script that defines which records are retrieved based on the context.

Context Related Record Definition table

The Context Related Record Definition [sn_m2m_context_related_record_defn] table defines the relationship between a context record and its associated definition records.

When you open a context record, you can see the associated definition records in the Context Related Record Definitions related list.

Context and associated definition records

Field	Description
Related record context	The context record.
Related record definition	The name of the related record definition associated with the context record. The system uses this definition to determine which records to retrieve.
Application	The application to which the context record applies. This is a read-only field.
Order	The order determines where the related record type appears in the filter list in the Related Records tab. The order for this related record definition is compared with the order of the other definitions associated with the **Related record context** to determine the order of appearance in the filter list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Context and associated definition records (continued)

Field	Description
	If more than one context applies to a record, the system evaluates the order for all of the related record types. If there is a duplicate related record type, the system takes the record type with the lowest order value.
Active	Enables the **Related record definition** for this context record.

Configure related record contexts

This type of configuration record defines the context in which related records appear in the Related Records tab.

Before you begin

Role required: admin

About this task

In a related record context, the system administrator configures the following information:

- The table that stores the record type for the context. You can create a context for a source record, such as a case, or for a playbook activity.
- Conditions to apply to the selected table. These conditions determine if the related record definitions associated with this context are executed at runtime.
  - If the conditions evaluate to true, the system executes the related record definitions.
  - If the conditions evaluate to false, the system ignores these definitions.

  Note:
  If a context has no conditions, this evaluates to true.

- The related record definitions to execute. Associate a definition for each type of related record to display for this context.

Procedure

1. Navigate to **All** > **Dynamic Related Record** > **Related Record Contexts**.
2. Click **New**.
3. Enter a **Name** for the context record.
4. Select the table that stores the record type for the context in the **Applies to table** field.
5. In the **Primary reference field**, select the field from the **Applies to table** that is passed to the Context Related Record Definition for evaluation.
   The following data types are supported:
   - Sys ID
   - Doc ID
   - Reference
6. **Optional:** If desired, select another reference field from the **Applies to table** in the **Secondary reference field**.
7. Enable the **Inherited** field if you want the context record to also consider tables that extend from the **Applies to table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Use the condition builder to select conditions that are applied to the records in the **Applies to table**.
   For example, if you are creating a context for a playbook activity, you can use the condition builder to identify the playbook and then the specific activity within that playbook.
9. Click **Submit**.
   The context is added to the Related Record Contexts list.

Associate related record definitions with a related record context

Associate the desired related record definitions with a context record to determine which related records appear for the selected record type.

Before you begin
Role required: admin

About this task
A related record context includes the following information:

- The table that stores the record type for the context (source record or playbook activity).
- Conditions to apply to the selected table which determine if the associated related record definitions are executed at runtime.
- The related record definitions to execute.

Procedure

1. Navigate to **All** > **Dynamic Related Record** > **Related Record Contexts**.
2. Click the desired context.
3. In the Context Related Record Definitions related list, click **New**.
   You may need to change the application in order to see the **New** button:
   a. Click the system settings icon in the upper right corner.
   b. Click **Developer**.
   c. Select the **Application** and close the pop-up window.
4. Click the lookup icon in the **Related record definition list**.
5. Select a definition from the Related Record Definitions list.
6. Assign an order number to the definition in the **Order** field.
   The order determines where the related record type appears in the filter list in the Related Records tab.
7. Click **Submit**.

Configure related record definitions

Related record definitions identify the types of records that the dynamic related records feature can display in the Related Records tab.

Before you begin
Role required: admin

About this task
The system administrator can create relate definitions and associate the desired definitions with a related record context. For example, the admin can associate SLA and escalation definitions with the Case related record context. Definitions can be associated with multiple contexts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Dynamic Related Records for Configurable Workspace plugin includes several related record definitions for case records. For more information, see Related record definitions included with the plugin.

Procedure

1. Navigate to **All** > **Dynamic Related Record** > **Related Record Definitions**.
2. Click **New**.
3. Enter a name for the definition in the **Display label** field.
   This label appears in the filter dropdown list in the Related Records tab. Agents click the filter icon and select the type of related record to view in the Related Records list.
4. In the **Queries from** field, select the table that stores the related record data to be retrieved.
5. Select a table in the **Primary reference table** field.
   The primary table used in the definition script. At runtime, the script expects to get passed a record of this type. If you entered a data type in the **Primary reference field** in the related record context, enter the table for that data type.
6. **Optional:** If desired, select a table in the **Secondary reference table** field.
   The secondary table used in the definition script. At runtime, the script expects to get passed a record of this type. If you entered a data type in the **Secondary reference field** in the related record context, enter the table for that data type.
7. Use the **Script** field to define which records are retrieved based on the context.

   At runtime, the script evaluates the current record's context, along with any selected conditions, and dynamically displays the related records.
8. Click **Submit**.

Configure the maximum number of related records to display

Configure the maximum number of related records to display in the Related Records tab in the contextual side panel in CSM Configurable Workspace.

Before you begin

Role required: ui_builder_admin, admin

About this task

As part of configuring the Related Records shared page, the administrator can define the maximum number of related records that are displayed in the Related Records tab in the contextual side panel. This is defined as part of the UI Builder data transform configuration. The default value is 100 records.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. In the My experiences list, click the desired workspace.
3. In the Page menu, select **Record**.
   The Page menu is in the upper left corner of the UI Builder interface.
4. Click **Edit in original scope**.
5. In the Content list below the Page menu, click the **Contextual sidebar** component.
6. In the contextual sidebar configuration panel on the right side of the UI Builder interface, click the Config tab.
7. In the Tabs list, click **Related Record**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Edit Content**.
9. Click the Data icon in the bar on the left side of the UI Builder interface.
10. Under Local data resource instances, click **Look Up Related Records**.
11. In the Configuration tab for the data resource, enter a value in the **Max results** field.
12. Click **Save**.

Configure Customer Central

Provide customer service agents with all the information about a customer in one central place by configuring the Customer Information and Customer Activity views for Customer Central.

Before you begin

Role required: admin

About this task

Customer Central provides customer service agents with all the information about the customer in one central place. It enables them to quickly zoom in on the customer issue and provide efficient and empathetic service to their customers.

Customer Central consists of two views, Customer Information and Customer Activity.

Note:
If you are using CSM Agent Workspace, Customer Central is displayed on the Interaction record. If you are using CSM Configurable Workspace, Customer Central is displayed on the interaction, account, contact, or consumer records. Both views are highly configurable and can be adapted to suit the needs of your business.

For more details, see Customer Central.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**.
3. In the Customer Central - Customer Information or Customer Central - Customer Activity category, view the list of tasks to configure the feature.

Customer central configuration tasks

Task	Description
Activate Customer Central	The Customer Central application (com.sn_csm_customer_central) is activated with the CSM Configurable Workspace application (com.snc.uib.csm_agent_workspace). The CSM Configurable Workspace application is activated with the Customer Service plugin (com.sn_customerservice). **Note:** Starting with the Yokohama release, the Customer Central application (com.sn_csm_customer_central) has moved to the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Configure the Customer Information view using the CSM Configurable Workspace	Configure the display of the Customer Information view using CSM Configurable Workspace.
Configure the Customer History view	Configure the display of the customer activity view.
Configure the Customer History component	Starting with the Yokohama release, the Customer History component displays customer activity information on some record pages in CSM Configurable Workspace.

4. To perform a task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Activate Customer Central

Activate the Customer Central plugin to use Customer Central.

About this task

Starting with the Yokohama release, the Customer Central application (com.sn_csm_customer_central) is activated with the CSM Configurable Workspace application (com.snc.uib.csm_agent_workspace). The CSM Configurable Workspace application is activated with the Customer Service plugin (com.sn_customerservice).

Starting with the Yokohama release, the Customer Central application (com.sn_csm_customer_central) has moved to the ServiceNow Store.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Plugins**.
2. Search for the plugin com.sn_csm_customer_central.
3. Select **Activate**.

Note:
To use Customer Central demo data, activate the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin.

Create data for Customer Central

When upgrading from an existing release, customers must run a fix script to create data for Customer Central.

Before you begin

Role required: admin

About this task

This task applies to customers who are upgrading their release version and installing Customer Central for the first time. Running the fix script creates data in the Activities table for Customer Central.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Fix Scripts**.
2. Select the **Create activities for last N days data** fix script.
3. Select **Run Fix Script**.

Configure Customer Central properties

Set how many days you want to display data from in Customer Central.

Before you begin
Role required: admin

About this task
This property applies to both the Customer Information and Customer History views.

Procedure

1. Navigate to **All** > **Customer Central** > **Administration** > **Properties**.
2. Enter the number of days you want to display data from in Customer Central.
   The default is set to 30.

Configure the Customer Information view using CSM Agent Workspace

Configure the display of the Customer Information view using the CSM Agent Workspace.

Before you begin
Role required: admin

About this task
The Customer Information view displays all touch points that a customer has had with a contact center in the form of information cards.

Note:
The following steps can be used to configure the Customer Information view in the CSM Agent Workspace. This is the workspace that is configured using the ServiceNow AI Platform interface.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**
3. In the Customer Central - Customer Information category, view the list of tasks to configure the feature.

Customer Central - Customer Information configuration tasks

Task	Description
Configure your settings for the Customer Information view	Set the Customer Central properties as required.
Configure customer information lists	Configure the lists to display on the Customer Information view. For example, a list can be recent cases or recent chat interactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Configure customer information reports	Configure which reports to display on the Customer Information view.
Configure customer information records	Configure the records to display on the Customer Information view. For example, a record could provide information on the contact or consumer.
Configure customer information report groups	Configure the groups of reports to display in a single section on the Customer Information view.
Configure customer information contexts	Associate each list, record, report, and report group configuration you created with a consumer or contact context, depending on who you want to display the information for.

4. To perform a task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Configure lists for the Customer Information view

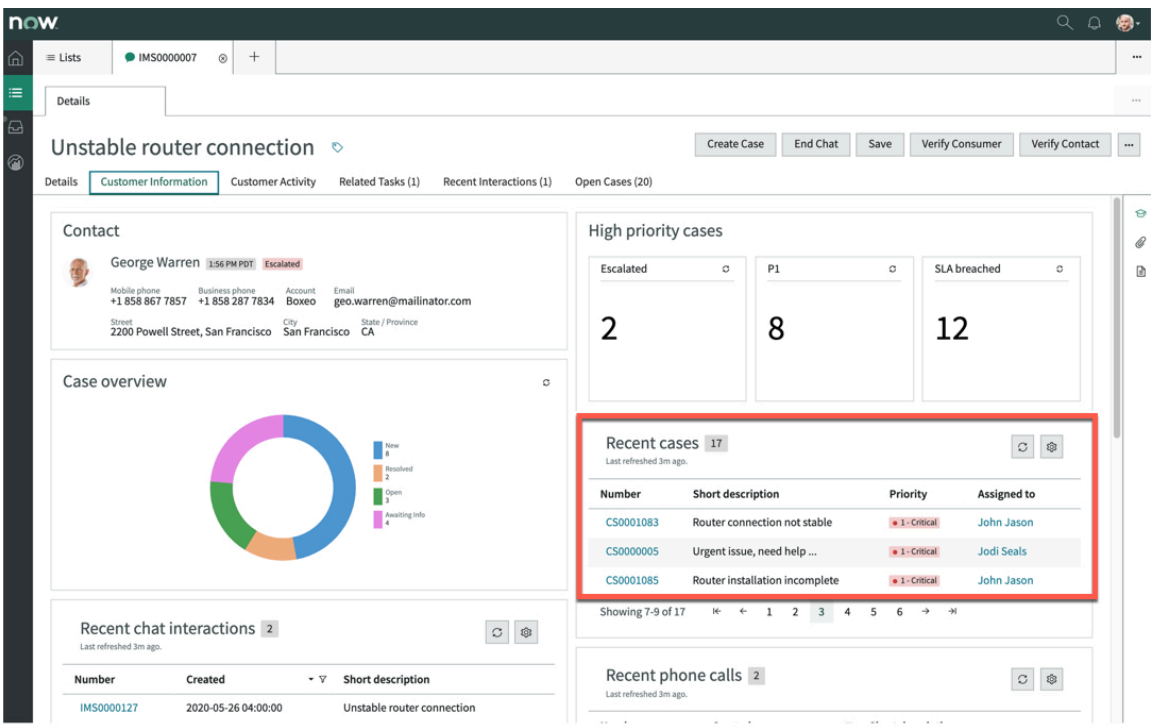
Configure lists for the Customer Information view.

Before you begin

Role required: admin

About this task

Lists are displayed in the Customer Information view in Agent Workspace.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Central** > **Customer Information** > **List Configurations**.
2. Select **New**.
3. Fill out the fields, as required.

New lists configurations field description

Field	Description
Title	Enter a title for the list configuration.
Context table	Select a context table.

Relationship	Enter the relationship between the context and the list.
	a. To create a new relationship, click the Lookup icon and then New.
	b. Enter a name for the relationship.
	c. In the Applies to table, select either the contact or consumer context table.
	d. In the Queries from table select the table from which this list retrieves data.
	e. In **Query with**, type a script to specify the records to include from the table for the relationship queries. For example:
	`current.addQuery("contact", parent.sys_id);`
	`“contact” => is the name of the column in the list table that stores the context ID, for example, contact ID.`
	`“parent.sys_id” => is the unique key in the contact table that holds the contact record.`
	`Note: If building a new relationship, ensure that the exact column name from the list table that stores the context ID is specified here.`

View	Select the name of the view that has the set of columns to display for this list. For information on how to create a view, see Configure the list layout.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
List limit	Enter the number of records to display in the list. You can access the remaining records using pagination.

4. Select **Submit**.

Configure reports for the Customer Information view

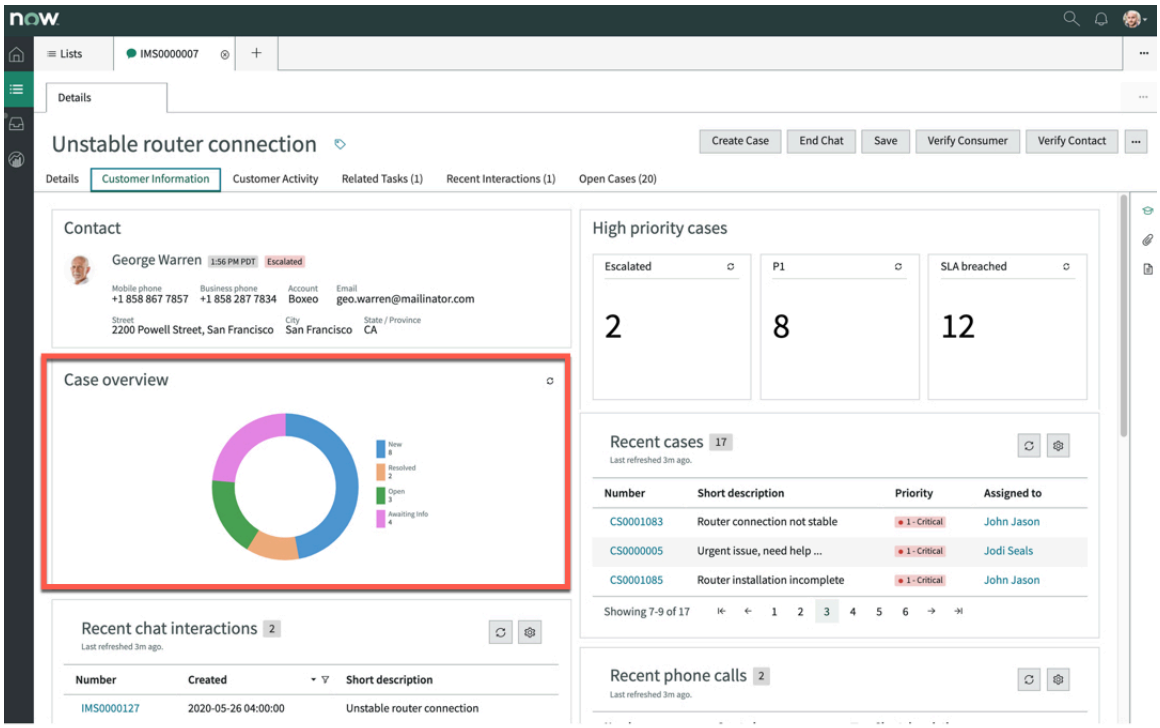
Configure which reports to display on the Customer Information view.

Before you begin

Role required: admin

About this task

Reports are displayed in the Customer Information view in Agent Workspace.



Procedure

1. Navigate to **All** > **Customer Central** > **Customer Information** > **Report Configurations**.
2. Select **New**.
3. Fill out the fields, as required.

Field	Description
Title	Enter a title for the report.
Context table	Select a Context table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: For example, enter Contact if you want to display all the information about a customer contact.
Report	Select a report. **Note:** Only pie charts, doughnuts, and single score charts are supported.

Relationship	Enter the relationship between the context and the report.
	a. To create a new relationship, click the Lookup icon and then New.
	b. Enter a name for the relationship.
	c. In the Applies to table, select either the contact or consumer context table.
	d. In the Queries from table select the table from which this list retrieves data.
	e. In **Query with**, enter a script to build the relationship between the context table and the report table. You can also specify any filter conditions if needed. For example:
	`current.addQuery("contact", parent.sys_id);`
	`“contact” => is the name of the column in the report table that stores the context ID, for example, contact ID.`
	`“parent.sys_id” => is the unique key in the contact table that holds the contact record.`
	`Note: If building a new relationship, ensure that the exact column name from the report table that stores the context ID is specified here.`

4. Select **Submit**.

Configure records for the Customer Information view

Configure the records to display on the Customer Information view. For example, a record could provide information on the contact or consumer.

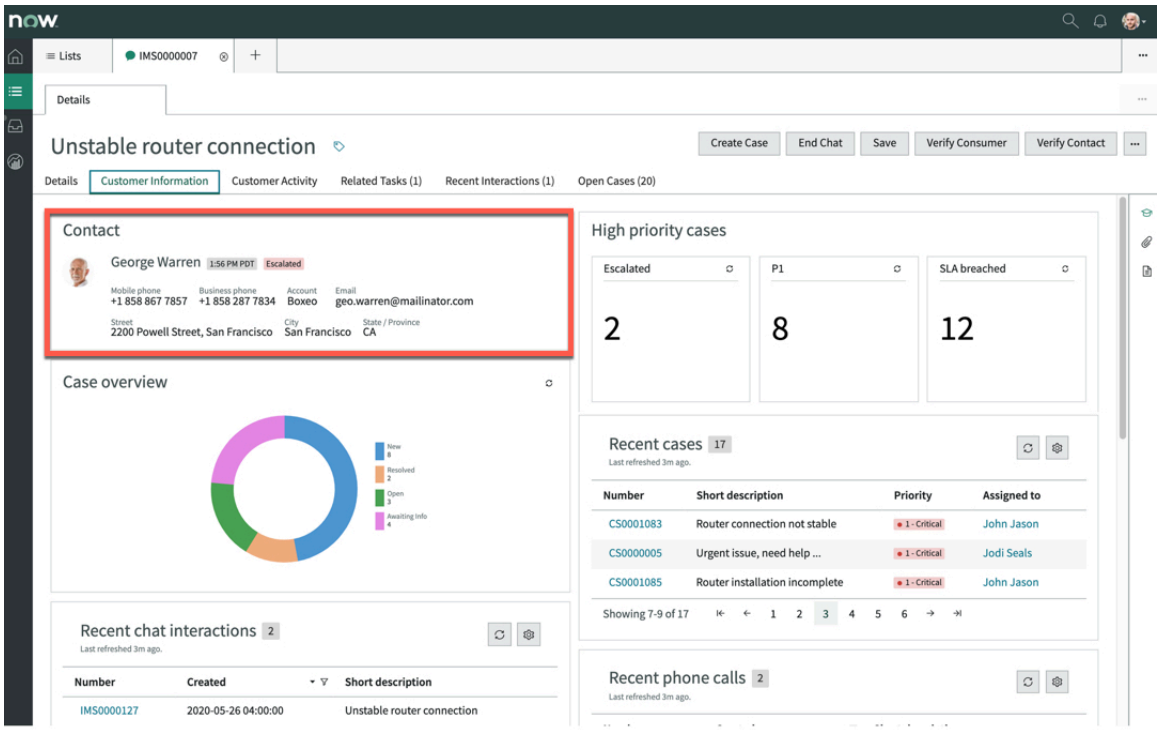
Before you begin

Role required: admin

About this task

Records are displayed in the Customer Information view in Agent Workspace.



Procedure

1. Navigate to **All** > **Customer Central** > **Customer Information** > **Record Configurations**.
2. Select **New**.
3. Fill out the fields, as required.

New record configurations field description

Field	Description
Title	Enter a title for the record.
Context table	Select a Context table. **Note:** For example, enter Contact if you want to display all the information about a customer contact.
Relationship	Enter the relationship between the context and the record. **a.** To create a new relationship, click the Lookup icon and then New. **b.** Enter a name for the relationship. **c.** In the Applies to table, select the table on which the list appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	Note:
	Enter either contact or consumer.
	
	d. In the Queries from table select the table from which this list retrieves data.
	
	e. In **Query with**, enter a script to build the relationship between the context table and the record table. You can also specify any filter conditions if needed. For example:
	
	`current.addQuery('sys_id', parent.sys_id);`
	
	`“sys_id” => is the name of the column in the record table that stores the context ID, for example, contact ID.`
	`“parent.sys_id” => is the unique key in the contact table that holds the contact record.`
	`Note: If building a new relationship, ensure that the exact column name from the record table that stores the context ID is specified here.`

Fields	Select the fields to display on the record.

4. Select **Submit**.

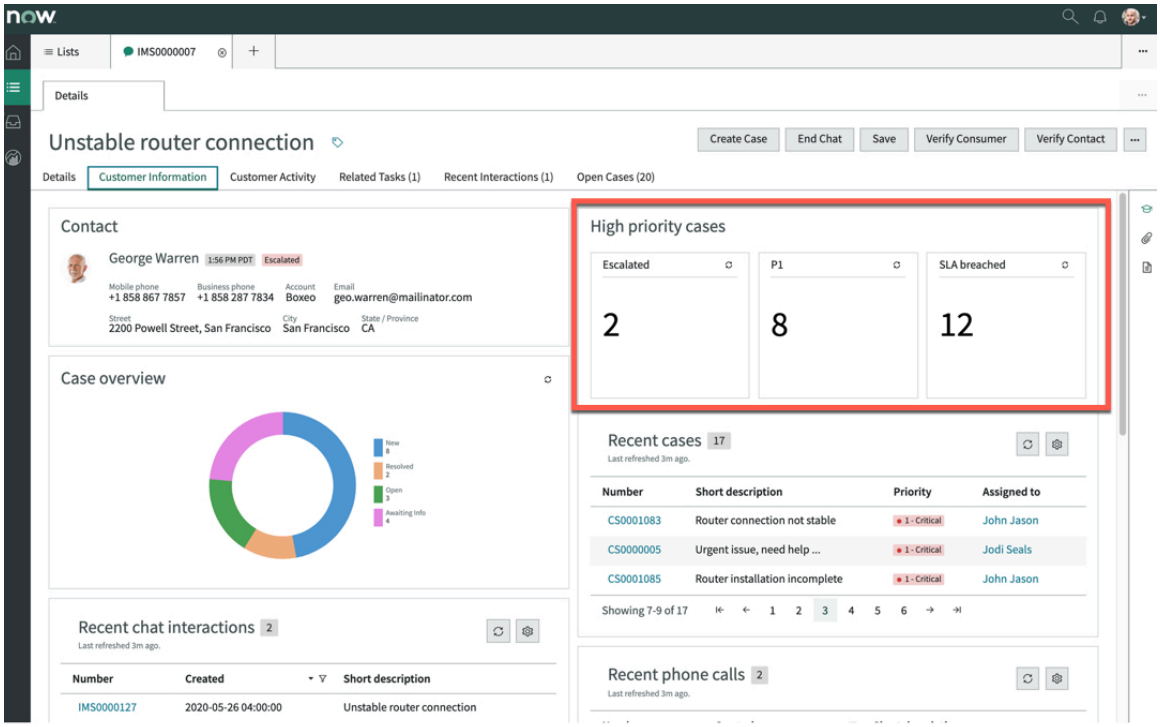
Configure report groups for the Customer Information view

Configure the groups of reports to display in a single section on the Customer Information view.

Before you begin
Role required: admin

About this task
Report groups are displayed in the Customer Information view in Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Customer Central** > **Customer Information** > **Report Group Configurations**.
2. Select **New**.
3. Fill out the fields, as required.

Report Group configurations form fields and descriptions

Field	Description
Title	Enter a title for the report group.
Context table	Select a Context table. **Note:** For example, enter Contact if you want all the information about a customer contact to be displayed.
Report configurations	Select the list of reports to be displayed in the group.

4. Select **Submit**.

Configure customer information contexts for the Customer Information view

Associate each list, record, report, and report group configuration you created with a consumer or contact context, depending on who you want to display the information for.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Configure customer information cards to display each of the list, record, or report configurations for a consumer or contact. Each customer information card corresponds to a card on the Customer Information view.

Procedure
1. Navigate to **All** > **Customer Central** > **Customer Information** > **Customer Information Contexts**.
2. Select the contact or consumer record that you want to add your configuration to.
3. On the Customer Information Cards related list, select **New**.
4. Add your configuration to create a customer information card.
5. Select **Submit**.

Note:
Repeat these steps for every configuration that you want to add to the contact or consumer record. You can also change the layout and order in which to display the cards on the Customer Information view.

Configure the Customer Information view using the CSM Configurable Workspace

Configure the display of the Customer Information view using the CSM Configurable Workspace.

Before you begin
Role required: admin

About this task
The Customer Information view displays all touch points that a customer has had with a contact center in the form of information cards.

Note:
The following steps can be used to configure the Customer Information view in the CSM Configurable Agent Workspace. This is the workspace that is configured using UI Builder, introduced in the Quebec release.

Procedure
1. Navigate to **All** > **Customer Service** > **Administration** > **Guided Setup**.
2. On the Getting Started page of the guided setup, select **Get Started**
3. In the Customer Central - Customer Information for CSM Configurable Workspace category, view the list of tasks to configure the feature.

Customer Central - Customer Information for CSM Configurable Workspace configuration tasks

Task	Description
Configure your settings for the Customer Information view	Set the Customer Central properties as required.
Configure customer information lists	Configure the lists to display on the Customer Information view. For example, a list can be recent cases or recent chat interactions.
Configure customer information reports	Configure which reports to display on the Customer Information view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Configure customer contact cards	Configure the contact card to display contact information on the Customer Information view. For example, a contact card could provide information on the contact,consumer, or account.

4. To perform a task, select **Configure**.

   This button opens the page in your instance where the configuration is completed.

Configure the Customer History view

Configure the display of the Customer History view.

Before you begin

Role required: admin

> **Note:**
> Customer Activity has been renamed to Customer History, with no changes to its functionality. References to the previous name will be updated in a future release.

About this task

The Customer History view provides customer service agents an overview of all interaction that a customer has had with a contact center in the form of an activity feed.

There are two panels on the Customer History view. On the left, the facets categorize the customer touch points and a customer service agent can filter to display the data they want. On the right, the activity feed displays more detailed information on each of the facets in reverse chronological order.

Procedure

1. Navigate to **All** > **Customer Central** > **Customer Activity** > **Guided Setup**.
2. On the Customer History Configuration page of the guided setup, view the list of tasks listed in the following order.

   Select **Get Started** beside each block to configure the features.

   a. Customer History Properties

   b. Activity Feed

   c. Activity Contexts

Customer History configuration tasks

Task	Description
Configure Customer Central properties	Set the Customer History view system properties as required.
Configure activity types	Create an activity type to display in the activity feed on the Customer Activity view.
Configure activity groups	Create an activity group and then add activity types to the activity group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task	Description
Configure activity type templates	Create an activity type template to define how to display the activity type data on each of the activity tiles in the activity feed.
Configure activity contexts	Add the activity groups and activity types you created to an activity context, depending on who you want to display the information for and create facets to group the data.
Create facets for activity contexts	Create facets to group the data and enable customer service agents to filter and display the data they want to see in the activity feed.

3. To perform a task, select **Configure**.

Configure activity types for the Customer History view

Create an activity type to display in the activity feed on the Customer History view.

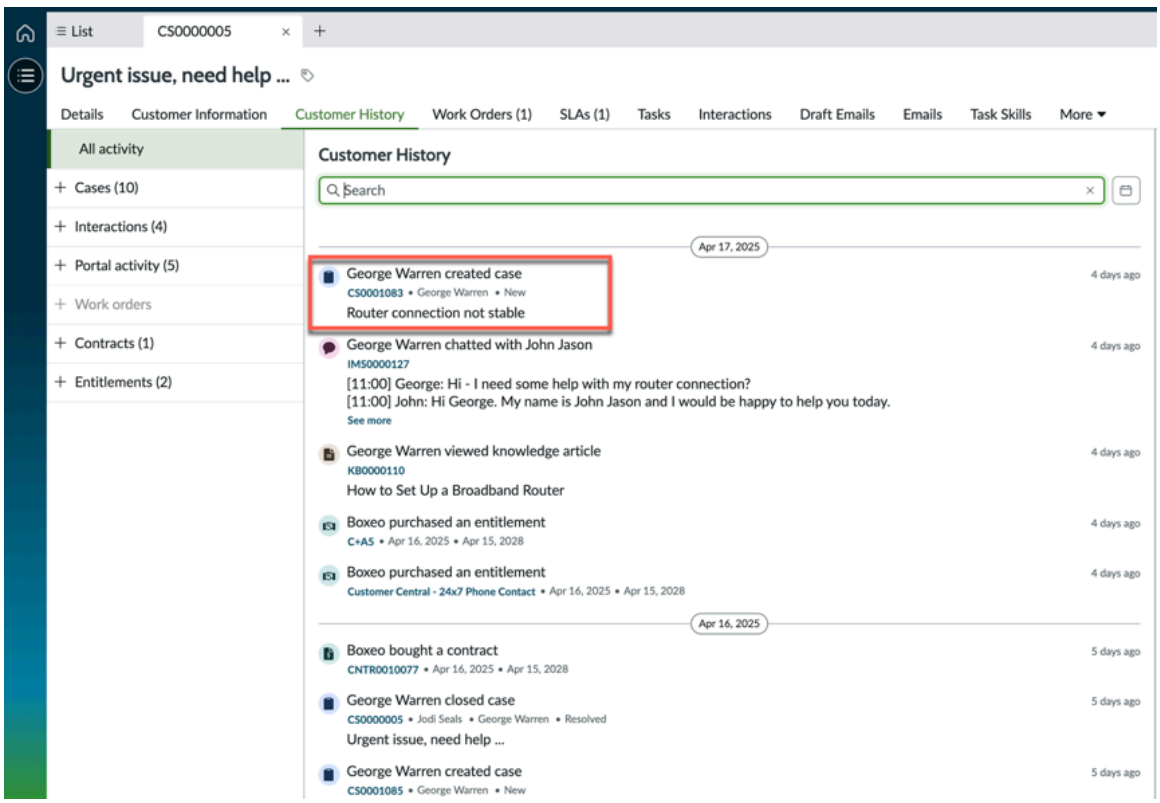
Before you begin

Role required: admin

Note:
Customer Activity has been renamed to Customer History, with no changes to its functionality. References to the previous name will be updated in a future release.

About this task

An activity type is an action that a contact or consumer performs. These actions are displayed in the activity feed on the Customer History view.
Activity types are displayed in the Customer History view in Agent Workspace.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Customer Central** > **Customer Activity** > **Guided Setup**.
2. Select **Get Started** under Activity Feed.
3. Select **Configure** beside Activity Types.
4. Select **New**.
5. Fill out the fields, as required.

New Activity Types field description

Field	Description
Short description	Enter a name for the activity.
Activity message	Enter the message that is displayed on the activity tile in the activity feed. **Note:** If the message is not yet defined, you can create a message. Refer to the video above on how to create a message.
Activity source	Enter the table on which the activity is performed. For example, if creating a case is the activity, the Case table is the Activity Source.
Actor	Enter the person performing the activity.
Object	Select an Object, which is the unique key that identifies the object on which the activity is performed.
Filter conditions	Specify any condition that must be met for the activity to be displayed in the activity feed.
Active	Deselect the **Active** check box to not display the activities corresponding to this type in the activity feed. **Note:** If you deselect this check box, deselect the corresponding facet. If not, the facet displays with no data.
Verb	Select a verb that describes the activity performed. **Note:** If the verb is not yet defined, you can create a verb. Refer to the video above on how to create a verb.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target	Select the second person involved in the activity. Not all activities have a second person.

6. Select **Submit**.

Note:
Once you create a new activity type, a new business rule is created.

7. After submitting, you can configure the business rule in one of two ways:
   - Select the link to the business rule in the notification message.
   - Go to the Activity Feed page and select **Configure** beside the Business Rule section.

Note:
Configuring the business rule is optional. The business rule is required to create a record in a central activity table each time the action is performed. The central activity table improves the performance of rendering the feed during runtime. Create a business rule for each activity type.

8. In the Advanced tab, update the script.
   The following is an example script.

```
var actSubCtx =
 global.ActivitySubscriptionContext.getContext();
if (current.contact) {
    actSubCtx.getActivityService().createActivity(current,
 verb, "", "", "", module);
}
current: current variable in business rules holds the
 GlideRecord of the table on which the business rules is
 triggered. If this business rule is on Case table, current
 will hold the GlideRecord of the case.
verb: verb that is configured in the Verb field of the created
 activity type
module: module that is configured in the Module field of the
 created activity type
Note: If there is already a Create Activity business rule, a
 notification message will also be displayed. You can update
 the script as required.
```

Configure activity groups for the Customer History view

Create an activity group and then add activity types to the activity group.

Before you begin

Role required: admin

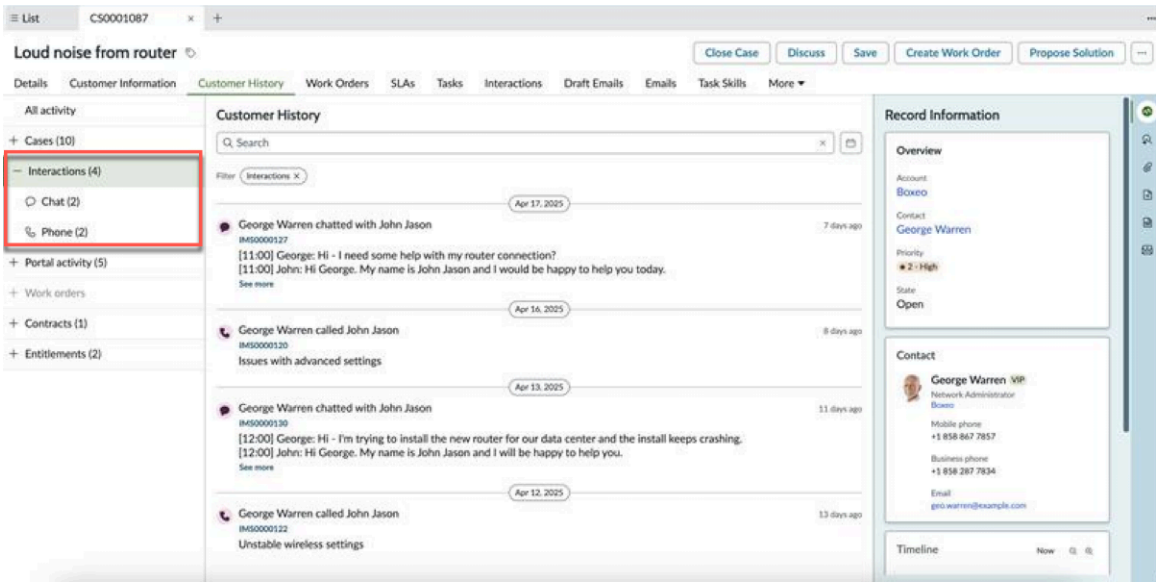
Note:
Customer Activity has been renamed to Customer History, with no changes to its functionality. References to the previous name will be updated in a future release.

About this task

An activity group is a logical grouping of activity types. An activity group is displayed in the activity feed based on the facet selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity groups are displayed in the Customer History view in Agent Workspace.



Learn more about configuring activity groups from the following video tutorial. Configure activity groups

Procedure

1. Navigate to **All** > **Customer Central** > **Customer Activity** > **Guided Setup**.
2. Select **Get Started** under Activity Feed.
3. Select **Configure** beside Activity Groups.
4. Select **New**.
5. Fill out the fields, as required.

New Activity Groups field description

Field	Description
Name	Select a name for the activity group.
Table name	Select the table that stores the object on which the activities in this group are performed. Usually, it is the same as the Activity Source selected in the Activity Type.

6. Once you have created an activity group, select it from the Activity Group list and add the activity types to the group.
7. On the Activity Types related list, select **New**.
8. Fill out the fields, as required.

New Activity Types field description

Field	Description
Activity type	Select the activity type you want to add to the activity group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Activity group field	Select the field from the Activity Source table that identifies the object in the table associated to the Activity Group.

9. Select **Submit**.

Configure activity type templates for the Customer History view

Create an activity type template to define how to display the activity type data on each of the activity tiles in the activity feed.

Learn more about configuring activity type templates from the following video tutorial. Configure activity type templates

Before you begin
Role required: admin

Note:
Customer Activity has been renamed to Customer History, with no changes to its functionality. References to the previous name will be updated in a future release.

About this task
You can define which fields are displayed, where it is displayed on the tile, and the order of the display.

Procedure
1. Navigate to **All** > **Customer Central** > **Customer Activity** > **Guided Setup**.
2. Select **Get Started** under Activity Feed.
3. Select **Configure** beside Activity Type Templates.
4. Select **New**.
5. Fill out the fields, as required.

Activity Type templates field description

Field	Description
Name	Enter a name for the template.
Activity Type	Select the activity type to add the template for.
Icon	Select an icon to use for the activity type.

6. Select **Submit**.
7. Once you have created an activity type template, select it from the Activity Type Template list to configure the fields and order of fields to display.
8. Select New to create template fields for the activity type.
9. Fill out the fields, as required.

Field	Description
	show transcript when the Chat Summary field is empty.

10. Select **Submit**.

Associate activity groups and activity types to activity contexts

Add the activity groups and activity types that you created to an activity context, depending on who you want to display the information for.

Associate an activity group to an activity context

Learn more about associating an activity group to an activity context from the following video tutorial.

Associate an activity type to an activity context

Learn more about associating an activity type to an activity context from the following video tutorial.

Before you begin

Role required: admin

Note:
Customer Activity has been renamed to Customer History, with no changes to its functionality. References to the previous name will be updated in a future release.

About this task

An activity context is the person or user who is interacting with the customer service agent. There are two predefined activity contexts: consumer and contact. Add the activity groups and activity types that you created to the activity context, depending on who you want to display the information for.

Procedure

1. Navigate to **All** > **Customer Central** > **Customer Activity** > **Guided Setup**.
2. Select **Get Started** under Activity Contexts.
3. Select **Configure** beside Activity Context Groups.
4. Open the contact or consumer record that you want to add your configuration to.
5. On the Activity Context Groups related list, select **New**.
6. Add the activity group.
7. On the Activity Context Types related list, select **New**.
8. Fill out the fields, as required.

Activity context types related list field description

Field	Description
Activity type	Add the activity type.
Fetch from activities	Deselect Fetch from Activities if a business rule isn't defined for this activity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Filter conditions	Add filter criteria to apply filter conditions on the source table.
Source mapping field	Select the field in the Source table that is related to the context.
Context mapping field	Select the field in the Context table to map to the field selected in **Source mapping** field.
Advanced mapping	Select Advanced Mapping and write a script in the **Advanced mapping script** field if the source and context mapping isn't sufficient.

9. Select **Submit**.

Create facets for activity contexts

Create facets to group the data and enable customer service agents to filter and display the data they want to see in the activity feed.

Defining and associating facets to contexts

Learn more about configuring facets from the following video tutorial.

Before you begin

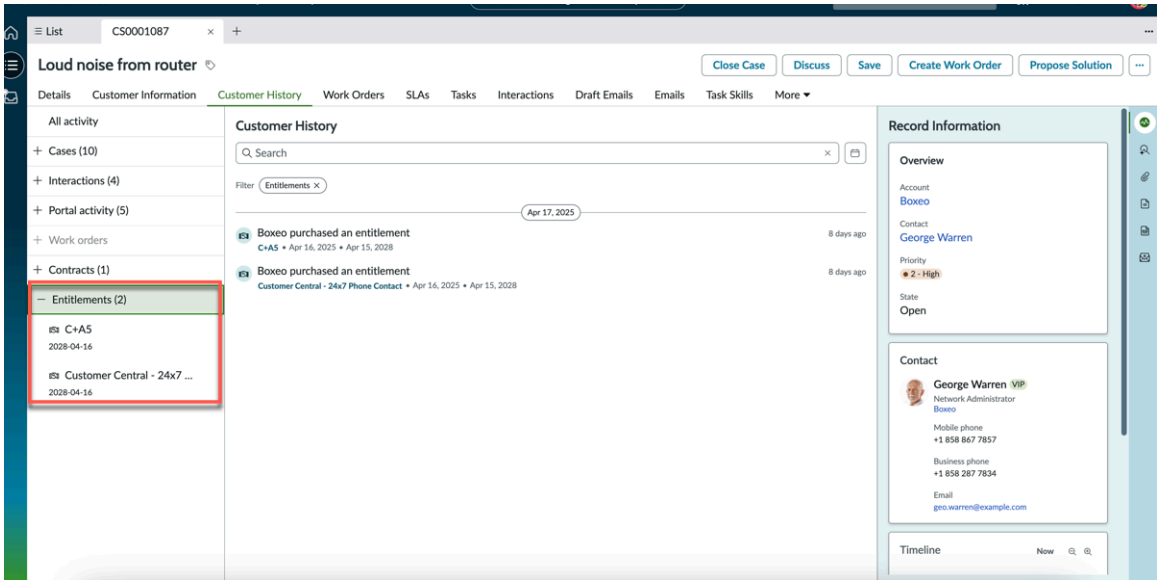
- Role required: admin
- Ensure that the application scope is set to Customer Central.

Note:
Customer Activity has been renamed to Customer History, with no changes to its functionality. References to the previous name will be updated in a future release.

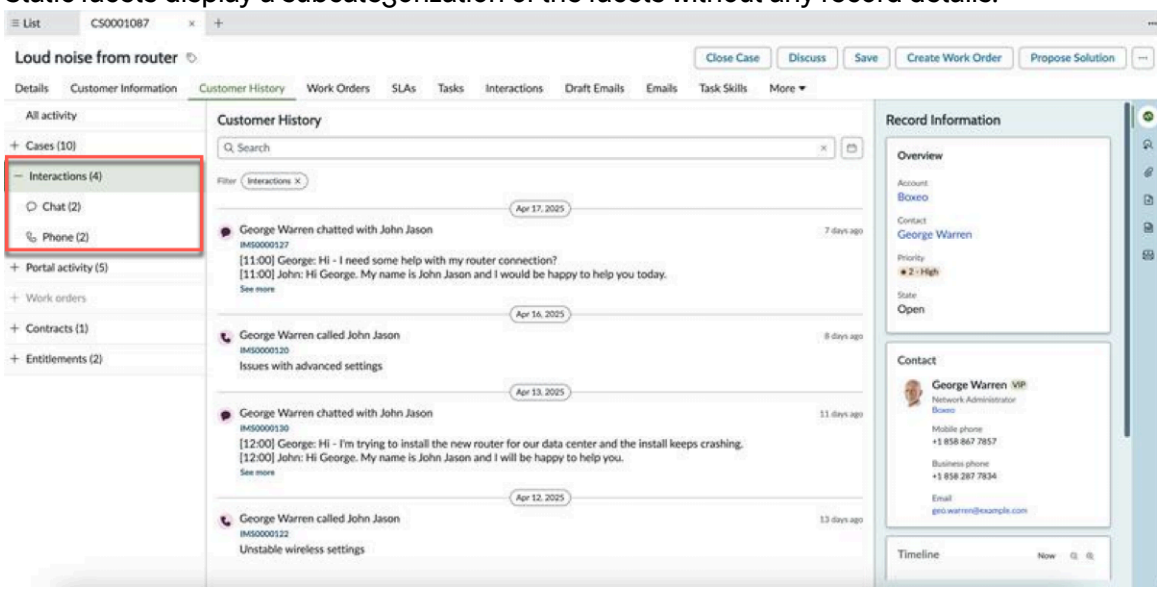
About this task

An activity context is the person or user who is interacting with the customer service agent. There are two predefined activity contexts: consumer and contact. Facets group the data, which enables customer service agents to filter and display the data they want to see in the activity feed. Each facet represents an activity group.
Facets are displayed in the Customer History view in Agent Workspace. Dynamic facets display record details associated with the facet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Static facets display a subcategorization of the facets without any record details.



Procedure

1. Navigate to **All** > **Customer Central** > **Customer Activity** > **Guided Setup**.
2. Select **Get Started** under Activity Contexts.

> **Note:**
> The Get Started button becomes active only after you complete all configurations and select Mark as Complete in the previous sections.

3. Select **Configure** beside Facets.
4. Open the contact or consumer record that you want to create facets for.
5. On the Facets related list, select **New**.

> **Note:**
> Ensure that the application scope is set to Customer Central. The New button only appears under this scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Fill out the fields, as required.

New activity contexts field description

Field	Description
Name	Enter a Name for the facet. This is the name of the facet that appears on the Customer Activity view.
Activity context group	Add an activity context group for the facet.
Facet type	Select whether the facet is dynamic or static. Dynamic displays record details associated with the facet. Static displays a subcategorization of the facets without any record details. Static facets can also be associated to a facet group.
Order	Enter the order the facet should appear in.
Facet group	If you selected facet type Static, associate the facet to a group. If you associate the facet to a facet group, this facet becomes a subcategory of the facet group you selected.
Icon	Select an icon for the facet.
Facet title	If you selected facet type Dynamic, choose the field of the record to display as the facet title.
Facet fields	If you selected facet type Dynamic, select the fields to display for each record.

7. Select **Submit**.

Configure the Customer Service mobile application

Configure the Customer Service mobile application and customize it for agents who use the application instance on their mobile devices.

Before you begin

Role required: admin

About this task

The Customer Service Mobile plugin (com.sn_csm_mobile) enables the Customer Service mobile application.

Procedure

1. Navigate to **All** > **System Applications** > **Studio**.
2. In the **Select Application** pop-up window, click **Customer Service Mobile**.

Before you begin
Role required: admin

About this task
You have the following options for setting up communication channels:

Procedure
- Set up the Customer Service email channel.
  Customers can send emails to create new cases and update current cases as well as receive email updates from agents as cases progress. Customer Service Management uses the ServiceNow email accounts feature to create and maintain email accounts.
  - Configure one or more email addresses.
  - Configure an email address for a product.
  - Configure an email subject line prefix
  - Set email communication channel properties
  - Create an email client template.
  - Create quick messages.
  - Create rules for incoming emails and create and assign cases.
- Set up the Customer Service phone channel.
  External customers can reach out to customer service agents using the phone communication channel. Customer Service Management uses both Computer Telephony Integration (CTI) and OpenFrame to provide phone support for customers, as well as the Notify application and the Twilio Voice product.

  OpenFrame is included with Customer Service Management. The CTI Softphone plugin (com.snc.cti) and the Customer Service CTI Demo Data (com.snc.customerservice_cti_demo) plugin must be activated separately. The Notify plugin (com.snc.notify) is activated as part of the CTI Softphone plugin.
  - Set up the phone communication channel.
  - Associate a phone number with a workflow.
  - Create an OpenFrame configuration.
- Set up the Customer Service chat channel.
  The chat communication channel uses the Connect Support feature to provide chat capability from the Customer Service Portal and Consumer Service Portal. You can also enable Virtual Agent to create or use predefined chatbot topics (conversations) for your users.
  - Configure the customer service chat queue.
  - Add an agent to the chat support assignment group.
  - Activate Virtual Agent for CSM
  - Activate Customer Service Virtual Agent conversations.
  - Integrate Customer Service Virtual Agent with Facebook Messenger.
- Set up the social media integration feature to support case resolution through social media channels.
  - Create a social media profile for an account, contact, or consumer.
  - Create a social media log entry for a case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring the chat channel

Configure the chat channel with the ServiceNow® Connect Support feature. You can also enable Virtual Agent to create or use predefined chatbot topics (conversations) for your users. You can also give users the option of switching to a live agent from a virtual agent.

Agents must be added to the Customer Service chat support assignment group before they can receive chat requests. This assignment group is used by the Customer Service chat queue to route the chat requests.

For more information, see Connect Support and Virtual Agent.

Pre-chat surveys

Use pre-chat surveys to capture preliminary information from a customer. From the responses received, Advanced Work Assignment (AWA) routes chat conversations to appropriate queues and groups. Before entering into a chat conversation, the assigned agent can review the context of the issue.

Pre-chat features

Pre-chat surveys provide the following advantages that help agents efficiently handle chat conversations:

Preconfigured pre-chat surveys

Pre-chat surveys determine the pre-chat questions presented to users. Preconfigured surveys are activated by default in the base system, but in order to avoid conflicts with previous configurations, customers who have upgraded have to manually activate them. These preconfigured surveys are:

- CSP Pre-Chat Survey - Collects preliminary information for logged-in customers.
- CSP Anonymous Pre-Chat Survey – Collects preliminary information for users who are not logged in.

You can define a different survey or modify these predefined surveys. For more information, see Create chat surveys.

Routing chats to the correct queue

Advanced Work Assignment (AWA) leverages information captured through pre-chat surveys to route a chat to the right queue. For more information, see Work item queues.

Identifying topics related to the chat issue

When customers enter a response to the standard pre-chat question "Please briefly describe your issue," Natural Language Understanding can help determine the appropriate Virtual Agent conversation topic. Relevant topics are automatically displayed to end users (requesters) rather than prompting them to choose from a list of conversation topics. For more information, see Define context topic intent configurations.

Configuring Pre-chat if you have upgraded

Some settings need to be configured if you have upgraded your ServiceNow® instance. For more information, see Configure Pre-chat after upgrading.

Plugins

You must activate the Consumer Service Portal (com.glide.service-portal.consumer-portal) and Glide Conversation Server (com.glide.cs) plugins. To activate the plugins, see Activate a plugin.

Pre-chat from the Consumer Service Portal

Configure the customer service chat queue

Define the customer service agents, default chat messages, schedule, and escalation path for the customer service chat queue.

Before you begin

Role required: admin

About this task

The Customer Service Management chat communication channel uses the ServiceNow Connect Support feature.

Procedure

1. Navigate to **All** > **Collaborate** > **Administration** > **Queues**.
2. Select **Customer Service** from the Chat Queues list.
3. Fill in the fields, as appropriate.

Chat Queue form

Field	Description
Name	Name of the queue.
Active	Not used in Connect.
Assignment group	User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.
Average wait time	Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.
Confirm problem	Not used in Connect.
Escalate to	Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the **Escalate** option in conversations.
Initial agent response	Message that users see when an agent accepts their chat. For example, **Thank you for contacting support. We are looking into your question now and will be with you shortly.**
Not available	Message that users see when they attempt to start a chat outside the defined queue **Schedule**. You can use HTML to format the message and include links or media.
Question	Initial phrase that users see when they start a new chat in the queue. For example, **How can I help you?**
Schedule	Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.

4. Click **Submit**.

Connect Support

Activate Virtual Agent for CSM

Activate Virtual Agent for CSM to use the predefined Customer Service Virtual Agent topics (chatbot conversations) designed to help your customers complete common self-service tasks.

Before you begin

The Virtual Agent plugin (com.glide.cs.chatbot) must be activated. If the Virtual Agent isn't currently activated, contact ServiceNow to activate it.

Role required: admin

Procedure

Activate the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent) to access the predefined Customer Service topics.

Customer Service Virtual Agent conversations

Predefined Customer Service Virtual Agent chatbot conversations enable your customers to get help with the product. Integrating Natural Language Understanding (NLU) models with your virtual agent chatbot topics enables chatbots to analyze, understand, and navigate the user to the right topic based on the inferred intent.

A conversation topic defines the dialog between the Virtual Agent (chatbot) and the user to accomplish a specific goal.

Activating Virtual Agent conversations

The system administrator or a virtual agent admin must do the following to enable the chatbot conversations:

- Enable the Glide Virtual Agent plugin (com.glide.cs.chatbot).
- Enable the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent).
- Publish the following read-only pre-defined virtual agent chatbot topics and topic blocks:

  Note:
  You can duplicate a topic and then customize it.

  - Check Case Status (Template)

    Users can search cases and check the status of an existing case.

  - Get Help with a Product (Template)

    Users can get help on an issue with a product, search relevant knowledge articles, or create a case for the issue.

  - Get Help (Template)

    This topic is for users who are not logged in and want to chat anonymously. Users can use keywords and search relevant knowledge articles or choose to be transferred to a live agent. You can integrate this topic with the Virtual agent - Facebook messaging integration to enable chat using your messaging application.

  - Get Help with an Order (Template)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users can get help on an issue with an existing order, search relevant knowledge articles, or create a case for the issue.

- Submit Request (Template)

  Users can submit a request for searching and using one of the catalog items.

- Create Case

  Creates a case from Virtual Agent when no relevant topics for the issue you have are displayed.

- Update Case

  Users can update a case from Virtual agent.

Your users can run the published topics in your chat support client.

Activating Virtual Agent conversations with NLU

- The Customer Service NLU Model for Virtual Agent Conversations (com.sn_csm.nlu) plugin is automatically enabled when you enable the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent).

  After you enable the plugin, you can view the following read-only intents for the Customer Service NLU for VA models in Studio:

  - CheckCaseStatus
  - GetHelp
  - GetHelpWithProduct
  - GetHelpWithOrder
  - SubmitRequest

  Each intent corresponds to a chatbot topic. To customize an intent, you can import an existing intent from the Customer Service NLU for Virtual Agent model and then link the NLU model with the associated intent for the topic.

- Enable ServiceNow NLU in the general settings.

Natural Language Understanding in Virtual Agent

Integrate Customer Service Virtual Agent with Facebook Messenger (Legacy)

Integrate the Customer Service Virtual Agent with Facebook Messenger to enable bot conversations in the messenger.

Before you begin

Role required: virtual_agent_admin or admin

- Install the Customer Service (com.sn_customerservice) plugin.
- Install the Customer Service Virtual Agent Conversations plugin (com.sn_csm.virtualagent).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Make sure Virtual Agent is integrated with Facebook Messenger.
- Make sure you have the token and secret for the messenger.

For information on integrating the Virtual Agent with Facebook Messenger and for retrieving the messenger token and secret, see Set up Virtual Agent integration for consumer messaging apps.

About this task

With this integration, you can get help using Virtual Agent chatbot conversations. For more information on getting help, see Customer Service Virtual Agent conversations .

Procedure

1. In the application navigator, enter `sys_cs_adapter_configuration_page_messenger_list.do`
2. Select **sample-fb-messenger-app**.
   You have to be in the **Customer Service Virtual Agent Conversations** application to edit the record.
3. In the **Messenger Page ID** field, enter your company's Facebook page ID.
4. Right-click and select **Save**.
5. In the **Provider Auth** field, click the information icon and open the **Message Auth** record:
   - Go to the **Outbound message creation** field, click the information icon and open the **Token Verification** record.
   - In the **Token** field, enter the token for the messenger application.
   - Click **Update**.
6. In the **Message Auth** record:
   - Go to the **Inbound message verification** field, click the information icon, and open the **Hash Message Verification** record.
   - In the **Secret** field, enter the app secret for the messenger application.
   - Click **Update**.

Configure Pre-chat after upgrading

If you have upgraded, some settings need to be configured to use Pre-chat effectively.

Before you begin

Role required: admin

About this task

For information about using pre-chat surveys to capture preliminary information from a customer, see Pre-chat surveys. If you have upgraded, you must manually adjust some settings to use Pre-chat most effectively.

Procedure

1. Make the predefined pre-chat surveys active.
   a. Navigate to **Conversational Interfaces** > **Pre-Chat Survey**.
   b. Select the CSP Pre-Chat Survey, which collects preliminary information for logged-in customers.
   c. In the form, select **Active**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click **Submit**.

e. Repeat this process for the CSP Anonymous Pre-Chat Survey, which collects preliminary information for users who are not logged in.

2. Disable the legacy form-based chat widget from appearing in the portal header.

a. Type *sys_properties_list.do* from your instance.

b. Search for the *csp.legacy_chat* property.

c. Set the property value to **true**.

d. Click **Update**.
The **Chat** option from the portal header is disabled.

3. Include the chat widget to appear on the Consumer Service Portal page.

a. Navigate to **Service Portal** > **Agent Chat**.

b. Click **CSP Chat**.

c. Select **Active**.

d. Click **Submit**.
The Open chat window icon that customers can use to initiate the pre-chat survey and connect with an agent will appear in the portal header.

Configuring the email channel

You can configure an email channel to either create interactions or cases from incoming emails. Email Interaction creates interactions from emails. Email to Case automatically creates cases from emails. The setup process involves configuring email properties, defining flows, and setting up notifications.

Email Interaction

Email Interaction creates an interaction from customer email. It associates the email conversation between agent and the customer with the interaction record. If the customer request requires investigation and resolution, a case is created. Subsequently, email communication is tracked through the case record.

Email to case

Email to Case creates cases from incoming customer emails to streamline issue tracking and resolution.

Email Interaction

Like chat and phone channels, Email Interaction enables agents to manage email conversations with customers using interaction records. Agents can create cases when further investigation is needed. This approach reduces unnecessary cases and provides a consistent design for omnichannel interactions.

To enable Email Interaction for Customer Service Management (CSM), configure system properties and define flows for processing incoming emails. These flows determine how emails are converted into interactions and, if necessary, into cases.

Additionally, enabling notifications for interactions helps keep agents informed about email responses received from customer, providing timely responses to customer inquiries.

Activate Email Interaction for CSM

Activate the Email Interaction for CSM plugin (sn_eaai_csm) for new or existing CSM customers. This plugin includes demo data and activates related plugins if they aren't already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The flows are deployed with Email Interaction for CSM and are enabled by default for new CSM customers. The flows aren't enabled by default for existing CSM customers. To manually activate the flows, Activate a flow for Email Interaction for CSM

Procedure
1. Navigate to **All** > **System Definition** > **Plugins**.
   The Review Installation Details dialog is displayed.
2. Find the Email Interaction for CSM using the filter criteria and search bar.
   The app is available in the Store applications section.
3. Start the installation process by selecting **Install**.
   The Review Installation Details dialog box is displayed.
4. Review the details of the installation.
5. Verify that the **Install now** option is selected.
6. **Optional:** If you want to get the demo data, select the **Load demo data** check box.
7. Select **Install**.

Result
The Email Interaction for CSM plugin is successfully installed.

View the service channel configured with Email Interaction for CSM

View the service channel configured during the installation of the Email Interaction for CSM application. This service channel facilitates the routing of email interactions through Advanced Work Assignment.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Service Channels**.
2. View the **Email** service channel.

Configure Advanced Work Assignment route email interactions

Configure Advanced Work Assignment#(AWA) to route email interactions automatically to your agents, based on their availability, capacity, and optionally, skills.

Before you begin
Role required: admin

About this task
The Service channel **Email** is configured during the installation of the Email Interaction for CSM application.#If you want to create service channels for email, follow the procedure.

You can use the#Advanced Work Assignment (AWA) feature to automatically assign work items to users based on their availability and capacity.

AWA assigns work items using assignment groups, so it's important that your users and groups are set up correctly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Determine the assignment group to use in the AWA service channel configuration and add users to this group.
- Confirm that the users have at least one of the roles: sn_customerservice.consumer_agent or sn_customerservice_agent.

Setting up a service channel involves multiple steps, which are detailed in the procedure. Once the service channel setup is complete, you can use AWA to assign newly created email interactions that either unassigned or satisfy the conditions specified in the service channel.

Procedure

1. Create the email service channel.

   a. Navigate to#**All** > **Advanced Work Assignment** > **Settings** > **Service Channels** > **New**

   b. Fill in the fields on the Service Channel form.

Service channel form

Field	Description
Name	Name of the service channel that you're configuring. For example, Custom-Email.
Inbox order	Order in which channel items appear in the user inbox. The#**Inbox Order**# field is an integer#field type. This field can store whole numbers.
Application	Name of the application. For the Email Interaction channel, select Email Interaction for CSM.
Active	Option for activating the service channel. When you select this option, the associated queues for the service channel can start accepting work items.
Short description	Brief description of the service channel.
Table	Table that stores the service channel records. To route email interactions, select the Interaction table.
Assign to field	Field that references the user that the item is assigned to. For the Interaction table, this field is the **#Assigned to#field** (assigned_to) field.
Assignment group field	Field that references the assignment group that the item is assigned to. For the Interaction table, this field is the #**Assignment group#field** field.
Advanced condition	Advanced conditions that apply to the channel.
Default work item size	Amount of a user's capacity that is used if this work item is assigned. The default is 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Default capacity	Number of items automatically assigned to agents (pending overrides). The default for this field depends on the type of work item.
Utilization condition	Condition that determines what constitutes an active item that counts toward user workload/capacity.

c. Select **Submit**.

The system adds the Email Interaction channel to the Service Channels list. For more information, see#Create or configure a service channel.

2. Configure the layout for the email interaction inbox card.

Note:
The Inbox layouts are configured during the installation of the Email Interaction for CSM application.

#If you want to create Inbox layouts follow the procedure in Create or modify an inbox layout for **Email** service channel, available by default, or **Custom-Email** service channel.

3. Create a queue for the email interaction service channel.

a. In the Queue related list of the service channel, select#**New**.

b. On the form, fill in the fields.

Queue form

Field	Description
Name	Name of the queue. For example, Email Queue.
Short description	Brief explanation of the queue. For example, "Assign email interactions to front-office users".

For more information about configuring a queue, see#Create a work item queue.

c. Select **Submit**.

4. Create an assignment rule for the queue.

a. Navigate to#**All** > **Advanced Work Assignment** > **Settings** > **Assignment Rules**.

b. Select **New**.

c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New assignment rules field description

Field	Description
Name	Name of the assignment rule.
Short description	Brief description of the assignment rule. For example, Assign the email interactions based on this configuration.
Assign by	Type of assignment. Select **Most Capacity**, which routes a work item to the user who has the greatest availability for handling the work.
Allow agents to reject	Option to enable agents to reject work items in their inbox.

For more information about creating an assignment rule, see#Configure agent assignment rules .

5. Create a group for the queue.

   a. Navigate to#**All** > **Advanced Work Assignment** > **Management** > **Groups.**

   b. Select **New**.

   c. On the Group form, fill in the fields.
   For more information about creating a group, see Create or change groups for Advanced Work Assignment queues .

   d. Select **Submit**.

   e. Select the group to display the Group form.

   f. In the Group Members related list, add users to the group.

   The users that you add to the group for the Email Interaction Assignment queue require the roles.

   - Customer agent (sn_customerservice_agent)
   - Consumer agent (sn_customerservice.consumer_agent)
   - AWA agent (awa_agent)

6. Associate the assignment rule with the queue.

   a. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Queues**.

   b. Select the queue.
   For example, Email Queue.

   c. In the Assignment Eligibility related list on the Queue form, select **New**.

   d. In the **Agent assignment rule** field, select the assignment rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In the **Groups** field, select the assignment group.

f. Select **Submit**.

7. Activate the service channel.
   a. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Presence States**.
   b. Select the **Available** presence state.
   c. Add the email service channel to the **Selected** column.
   d. Select **Update**.

Result
After the service channel is activated, you can use it to assign work items. For more information, see Service channels.

Creating flows for incoming emails that create and update interactions

The default email flows are available once you activate the Email Interaction for CSM application. Enable the email flows to activate email processing for automatic creation and updating interactions.

- **Create Interaction from Email**: Creates an interaction of type Email for each new inbound email from a customer.
- **Update Interaction from Email**: Updates the interaction with the reply email received from the customer.

  If a reply email is received on a closed interaction, a new interaction of type Email is created. It includes the link to the previous closed interaction.
- **Update Case via Reply for Email**: Updates the case record with the reply email received from Customer on the case.

  This flow creates an interaction of type Email if a reply email is received on the closed case record. The new interaction includes a link to the closed case.

Alternatively, customers can use Inbound Actions to create and update email interactions.

The execution order of the Inbound Flows takes a higher precedence over Inbound Actions meaning that when an email flow executes, it helps prevent execution of Inbound Actions.

Activate a flow for Email Interaction for CSM

Activate flows for customers who have the Email Interaction for CSM application configured, enabling efficient workflow automation.

Before you begin
Role required: admin

About this task
For new CSM customers, the flows are activated by default. Existing CSM customers should activate email interaction related flows and deactivate the case related flows.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Open a flow from the available flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create Interaction from Email
- Update Interaction from Email
- Update Case via Reply for Eaal

3. Activate the selected flow by selecting **Activate**.

Result
All the available flows are activated.

Define a custom flow to create or update email interactions

Define email-related business processes using Workflow Studio. This tool enables you to manage emails along with your customer service processes through a visual interface without having to design or request complex scripts.

Create an interaction

Create an interaction record to capture customer details.

Before you begin
Role required: workspace_admin, awa_agent, sn_customerservice_consumer_agent, or sn_customerservice_agent

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. Create a flow.
   a. Select **Flows**.
   b. Select **New**.
   c. Select **Flow**.
   d. In the **Flow name** field, enter the flow name.
   e. Select the application scope from the Application list.
   f. In the **Description** field, enter the description.
   g. Select **Show additional properties**.
   To know more about additional properties, see Create a flow in Workflow Studio.
   h. Select **Build flow**.
3. Create a trigger.
   a. Select **Add a Trigger**.
   b. Search and select **Application**.
   c. Select **Inbound Email**.
   d. Select Email conditions with **AND** operator.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Type** is **received**.
- Select **Receive type** is **New**.

e. Leave the Reply Record Type as empty.

f. Select **Done**.

4. Select **Add an Action, Flow Logic, or Subflow** and select any of the following.
   - Action
   - Flow Logic
   - Subflow

> **Note:**
> After you have created action entries, you can select multiple actions using **Select multiple**.

5. **Optional:** Add error handler.
   a. To enable the error handling, slide the **ERROR HANDLER** toggle switch.
   b. Select **Add an Action, Flow Logic, or Subflow** and select any of the following.
   - Action
   - Flow Logic
   - Subflow
6. Verify the email flow and modify it if necessary.
7. Select **Save**.
8. Select **Activate**.
9. From the confirmation dialog box, select **Activate**.

System properties for configuring Email Interaction

You can manage certain workflows based on the system properties, such as enabling or disabling the creation of email interactions for guest users. You can set an inactivity period after which email interactions are automatically closed.

Navigate to**All>System Properties>All Properties**#.

Alternatively, in your instance, enter `sys_properties.list` in the filter navigator and customize the Email Interaction system properties.

System Properties for Email Interaction

Property	Description
sn_eaai_csm.create_interaction_for_non_matched_user	Enable or disable interaction creation for a non-matched user. • Type: Boolean (true | false) • Value: true • Location: **All> System Properties> All Properties**.
sn_eaai_csm.period_of_customer_inactivity_to_close_interaction	Set the inactivity period (in days) after which an interaction is closed if no email is received from the customer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Properties for Email Interaction (continued)

Property	Description
	• Type: Integer • Value: 5 • Location: **All> System Properties> All Properties**.

Configure an ongoing notification for email interactions

Configure an ongoing notification for email interactions. Configure the ongoing menu item on the toolbar in the CSM Configurable workspace for agents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Presence States**.
2. From the Service channels section, from the Available list, select **Email** (or a custom email channel) and **Chat – Asynchronous**.
3. Add the selected items to the Selected list.
4. Select **Update**.

Enable agents to respond to customers with email activity history

Enable agents to respond to customers with email activity history, which is created by embedding a mail script in an email client template.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Email Client** > **Email Client Templates**.
2. View **Email response to the customer**.
3. Select **Email response to customer**.
4. In the#**Body HTML** field, enter `<div id="collapsible-content"> ${mail_script:get_email_interaction_activity_history_for_reply}</ div>`.
   This script, get_email_interaction_activity_history_for_reply (available by default), retrieves and formats email activity history, adding it to the email client in the agent workspace. The content is hidden behind ellipses within a DIV tag with the ID “collapsible-content".

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The number of emails in the activity history matches the value set in the system property, number_of_activities_in_notification.

Note:
You can also create a client template and map it to the Interaction table. For more information, see Create an email client template.

Configure email notifications for an interaction

Configure email notification to determine whether they should be sent to the contact, consumer, or guest.

Before you begin
Role required: admin

About this task
Email notifications that are available by default:

- Interaction created for consumer
- Interaction created for guest
- Interaction created for contact

You can customize the existing notification or create a notification. For more information, see Email and SMS notifications.

Procedure

1. Navigate to **All** > **System Notifications** > **Email** > **Notifications**.
2. Select the Show column search row icon ( ).
3. In the#**Name** column, search for any of the following notification.
   - Interaction created for consumer
   - Interaction created for guest
   - Interaction created for contact
4. If you want to disable notifications, update **Active** to False.
   a. Select **here**.
   b. Clear the **Active** check box.
   c. Select **Update**.
5. If you want to include different content, update the email template.
   a. Select **What it will contain**.
   b. From the **Email template** field, remove the existing template.
   c. Search and select the email template.
   Alternatively, in the **Message HTML** field, enter the content for the email template.
   d. Select **Update**.

Result
Email notifications are disabled for contact, consumer, or guest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable recommended actions for an email interaction

Help the agent to find relevant resources based on the context of an email by enabling recommended actions.

Before you begin
Role required: admin

About this task
For more information, see Configuring Recommended Actions.

Procedure
1. Navigate to **All** > **Recommended Actions** > **Contexts**.
2. Select **CSM Interaction context**.
3. Set the **Active** column as true.

Customize the email interaction experience

Customize the Email Interaction record page in UI Builder for agents.

Before you begin
Role required: admin

About this task
For more information on UI Builder, see UI Builder.

Procedure
1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. **CSM/FSM Configurable Workspace** from the list or search for `CSM/FSM Configurable Workspace`
4. Navigate to **Pages and variants** > **Record** > **Email Interaction Page**.
5. Select the Open menu icon ( ).
6. Select **Duplicate variant**.
   For more information, see Create a page variant.
7. On the Tell us about your variant screen, enter `Custom Email Interaction Page` in the **Name** field.

   Note:
   Don't change the **Conditions** field.

8. Select **Create**.
   The Page variant opens.
9. Select the **Settings** tab.
10. Enter a lower value in the **Order** field.
    For example, -1100.
11. Select **Save**.

Result
You can customize the page in the UI builder.

Email to case

Set up email addresses that customers can use to submit cases to your team. To help direct cases to specific teams, you can designate email addresses to specific products. While agents work on the cases, they can also email customers with updates and proposed solutions.

Customer Service Management uses the Email Accounts application to create and maintain email accounts. The system administrator can create multiple incoming email addresses that customers can use to communicate with customer service agents. The system administrator can also create one outgoing email address.

After the incoming and outgoing email addresses are created, the system administrator can set the following properties for the email communication channel:

- Establish one of the incoming email addresses to automatically create a case.
- Enable a prefix to include in the subject line of an email to any of the incoming email addresses that automatically creates a case.
- Create cases for customers who are not currently in the system.

The system administrator can also create a channel configuration to associate any of the incoming email addresses with specific products.

Related topics

Configure an email address for a product

Email accounts

Configure an email address for a product

Configure an email address that creates a case for a specific product.

Before you begin

Role required: admin

About this task

Create a configuration that links a product to a specific email address. This configuration is created in the Channel Configuration (sn_customerservice_channel_config) table.

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Channels**.
2. Select **New**.
3. On the Channel Configurations form, fill in the fields.

Channel Configurations form

Field	Description
Name	Name of the email configuration.
Channel Type	Configuration type. Set this field to **Email**
Product	Product model associated with this email configuration.
Active	Option to activate the email configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Email address	Email address for this configuration. Enter one of the incoming email addresses that the administrator created using the Email Accounts application.

4. Select **Submit**.

Configure an email subject line prefix

Configure a prefix to include in an email subject line that creates a case.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Customer Service** > **Administration** > **Properties**.
2. In the **Email subject prefix format for new case** field, enter the prefix.
   The default prefix is **Case:**.
3. Select **Save**.

Customer service email properties

Users with the system administrator role can set several properties for the Customer Service Management email communication channel.

After creating the incoming and outgoing email addresses that customers use to communicate with customer service agents, the system administrator can set the following email-specific properties.

Navigate to **Customer Service** > **Administration** > **Properties** to access these properties.

Customer Service Management email properties

Property	Definition
Case email address [glide.cs.email.case_queue_address]	One of the incoming email addresses that automatically creates a customer service case. For incoming email, the system checks the address to see if it matches the address in the **Case email address** property. If yes, the system creates a customer service case. If it does not match, or if this property is not set, the system then checks the **Email subject prefix format for new case** property.
Email subject prefix format for new case [glide.cs.email.new_case_prefix]	The prefix included in the subject line of an email to any of the incoming email addresses that automatically creates a customer service case. This field is automatically set to **Case:** as the default prefix.
Create case for non matched user [sn_customerservice.email.create_case_for_non_matched_user]	Enable the creation of new customer service cases when emails are received from users with email addresses that do not currently exist in the system.
Number of activities	Indicates the number of activities (emails and comments) in the activity history that are included in the email notifications and replies. The default value is 3.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customer Service Management email properties (continued)

Property	Definition
[number_of_activities_in_notification]	
Include system emails in email notifications [include_system_emails_in_notification]	Indicates whether system emails are included in email notifications. The default value is false.
Number of activities in reply number_of_activities_in_reply	Number of additional comments and emails included in Reply/Reply-All templates (-1 means all)
Email history notifications	By default, the email history shows the last three messages in the case record. To show all activities on a case record in email replies and email notifications, add this script `${mail_script:get_emails_comments_activity_history` to the email reply system property (reply-received) and the case commented system property (case.commented.for.customer). For more information, refer to Configure email and comment notifications .

Disable email responses from the case activity stream

Disable email responses from the case activity stream. Stop agents from interacting with customers directly.

Before you begin

Role required: admin

About this task

By default, customer service agents can respond to cases using options within a customer email thread instead of having to use another email client. Agents can use the **Reply**, **Reply All**, and **Forward** buttons in the case activity stream to respond to customer emails.

You can disable this feature and hide these buttons from the Agent Workspace or Configurable Workspace application.

Procedure

1. Navigate to **All** and enter `sys_properties.list`.
   The System Properties page opens.
2. Select **New**.
3. Create a system property with the name *`sn_agent_workspace.activity_email_options_enabled`*.
4. Set the value to false.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Users with the role sn_customerservice_agent are now unable to reply to or forward emails.

Creating rules for incoming emails that create and assign cases

Create your email-related business processes using Inbound Email Flows. After you receive an email on a specified support email address, you can define rules to create cases and assign the cases to specific teams.

In previous releases, incoming emails were processed through inbound email actions. Admins created separate email actions to support different business flows using scripts.

Inbound Email Flows provide powerful configuration capabilities to manage emails along with your customer service processes through a visual Flow Designer interface. Business managers can define inbound email flows without having to depend on admins or developers to write complex scripts. Email flows use conditional logic to incorporate multiple business processes in one flow.

Note:
The **Email conditions** under the **Inbound Email** trigger are case-sensitive. Review your flow designer conditions and consider lowercase and uppercase options depending on how the sender puts the email address in the headers.

The following example email flows are available by default after you activate the Customer Service Management plugin. Enable the email flows for activating the email processing rules to automatically create and update cases.

- Create case from email
- Update case using Reply

Note:

- The execution order of the inbound email flows takes a higher precedence than inbound actions (that is if an email flow executes, it avoids execution of inbound actions).
- The user who sends an email should have the necessary roles to perform operations specified in the flow, or else the operation stops while executing.

The following example email flows are installed with the platform. These flows aren't required for any of the CSM email processing rules:

- Handle email replies
- Logging a problem

Define rules to process incoming emails

Define your email-related business processes using Inbound Email Flows. Manage emails along with your customer service processes through a visual **Flow Designer** interface without having to design or request complex scripts.

Before you begin
Role required: admin, sn_customerservice_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Email flows use conditional logic to incorporate multiple business processes in one flow. When designing inbound email flows, note the following:

- The execution order of the inbound email flows takes a higher precedence than inbound actions.That is, if an email flow executes, it prevents the execution of inbound actions.
- The user who sends an email should have the necessary roles to perform operations specified in the flow or the operation will stop.

Procedure

1. Create an inbound email flow.
   a. Navigate to **All** > **Process Automation** > **Flow Designer**.
   b. Select one of the following flows.
      - **Create Case from Email**: Creates a case when a user sends a new email.
      - **Update Case via Reply**: Updates a case when you use the reply option.
   c. Select **Edit Flow**.
   d. Select the **Inbound Email** trigger.
   e. Modify the default email filter conditions or select **New Criteria** to add conditions.
   f. Select a Reply Record Type table.
   g. Select **Done**.
2. Edit the flow.
   a. Select an existing action and expand it.
   b. Provide information for the action or select the add icon (+) to add a new action, flow logic, or subflow.
   c. Select **Done**.
3. Finalize the rule.
   a. Verify the email flow and modify it if necessary.
   b. Select **Save**.
   c. Select **Activate**.
4. Select **Activate**.
   The defined inbound email flow is activated.

Result

The defined inbound email flow is activated.

Configure email and comment notifications

Add a script to the email reply or case comment template to include all activities (emails and comments) on a case record in email replies and in email notifications.

Before you begin
Role required: admin

Procedure

1. Update comment notifications.
   a. Navigate to **All** > **System Notifications** > **Notifications**.
   b. In the **Email template** column, enter `case.commented.for.customer`.
   c. In the *`case.commented.for.customer`* system property, add the following script to the **Message HTML** field: `${mail_script:get_emails_comments_activity_history}`.
   d. Save the field.
2. Update email notifications.
   a. Navigate to **All** > **Email client templates** > **Reply**.
   b. In the *`reply-recieved`* system property, add the following script to the **Body HTML** field: `${mail_script:get_emails_comments_activity_history}`.
   c. Save the field.

Result
All emails and comments are now included in the email replies and notifications.

Configuring the phone channel

Configure phone support for customers with Computer Telephony Integration (CTI) and OpenFrame.

Create an OpenFrame configuration

This configuration specifies the OpenFrame window settings as well as the URL to be launched within OpenFrame.

Configure OpenFrame events

Use OpenFrame events to achieve better integration between Advanced Work Assignment (AWA) and Computer telephony integration (CTI) and aide in improved call routing.

Create an OpenFrame configuration

This configuration specifies the OpenFrame window settings as well as the URL to be launched within OpenFrame.

Before you begin
Role required: admin

About this task
As part of the OpenFrame configuration, users with the admin role can select one or more user groups. Access to the configuration is limited to the users that have the OpenFrame user role and that belong to the selected groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **OpenFrame** > **Configurations** to display the OpenFrame Configurations list.
2. Select **New**.
3. Fill in the fields, as appropriate.

OpenFrame Configuration form

Field	Description
Name	The name of the OpenFrame configuration.
Title	The title that appears in the OpenFrame window header.
Subtitle	The subtitle that appears in the OpenFrame window header.
Order	The order number for the configuration. If users have multiple OpenFrame configurations, they can only access the configuration with the lowest order number. **Note:** When upgrading, the **Order** field for the existing default OpenFrame configuration is set to 1.
Enable collapsed view	Enables the expand and collapse capability for the OpenFrame window. When collapsed, users can still access call control actions. The default setting is **False**.
Show presence indicator	Enables the indicator that displays agent availability.
User Group	The user groups selected for this configuration. Access to this configuration is limited to the users that have the OpenFrame user role and that belong to the selected groups. **Note:** If you do not select any groups, the configuration is available to all users with the OpenFrame user role.
URL	The URL to be launched within OpenFrame. This URL can be an absolute path or a path that is relative to the ServiceNow instance.
Active	Denotes this configuration as active.
Width	The width of the OpenFrame window.
Height	The height of the OpenFrame window, not including the OpenFrame header height.
Icon Class	The class of icons used for the OpenFrame window (retina-icons.css). Only supports icon-phone and icon-video values.
Title Icon	The icon displayed on the OpenFrame window header.
Configuration	Can be used to store any JSON-encoded string.

openFrameAPI - Client

OpenFrame events for work items, agent presence, and interactions

Use OpenFrame events to achieve better integration between Advanced Work Assignment (AWA) and Computer telephony integration (CTI) and aide in improved call routing.

OpenFrame events are enabled by default when your administrator installs the Openframe plugin (com.sn_openframe) and Advanced Work Assignment for CSM plugin (com.sn_csm.awa).

Note:
The Advanced Work Assignment for CSM (com.sn_csm.awa) plugin is automatically installed with the Customer Service plugin (com.sn_customerservice).

As a CTI developer, ensure that you subscribe to the following events by using the subscribe method of the openFrameAPI. For more information, see openFrameAPI - Client.

OpenFrame events

Event	Description
openframe_awa_agent_presence	Events are sent to OpenFrame when an agent's presence state changes.
openframe_awa_workitem_offered	Events are sent to OpenFrame when a work item is offered to an agent.
openframe_awa_workitem_accepted	Events are sent to OpenFrame when a work item is accepted by an agent.
openframe_awa_workitem_rejected	Events are sent to OpenFrame when a work item is rejected by an agent.
openframe_agent_off_interaction	Events are sent to OpenFrame indicating the presence of an agent on chat as off or available.

Add and activate an OpenFrame configuration by navigating to **OpenFrame** > **Configurations**. For more information, see Create an OpenFrame configuration.

Social media integration

Support case resolution through social media communication channels.

When working with customers or consumers to create and resolve cases, agents can select **Social** as the communication channel and add a social profile to the Case form. Any

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

communication with customers or consumers that takes place through social media is recorded on the Case form in the **Social Logs** related list.

Customer service managers can create one or more social profiles for a user by recording a user's social profile information on a specific social media channel such as Twitter or Facebook. Managers can create social profiles for accounts, contacts, and consumers from the **Social Profiles** related list on the entity form. Agents have read-only access to these profiles.

Integration with Customer Service Management

The social media communication channel is integrated with the following Customer Service Management forms: Case, Account, Contact, and Consumer.

On the Case form, the **Channel** field includes the **Social** option. Selecting this option adds the **Social Profile** field to the Case form, in which you can select a specific social media channel. The **Social Logs** related list captures the details of social media conversations.

The Account, Contact, and Consumer forms include the **Social Profiles** related list. Customer service managers can create one or more profiles for each of these entities.

Plugins

The Customer Service Social Integration plugin (com.sn_cs_social) is activated as part of the Customer Service Management plugin.

Tables

The Customer Service Social Media plugin adds the following tables.

Customer Service Management Social Media Plugin Tables

Table	Description
Social Channels [sn_app_cs_social_social_channel]	Stores the social channels, which are brought in by the social integration tool.
Social Profiles [sn_app_cs_social_social_profile]	Stores the social profiles created for each customer contact or consumer.
Social Logs [sn_app_cs_social_social_log]	Stores the details of social media conversations related to cases.

Configure Chat Zoom Connector

Install and set up the Chat Zoom Connector application to interact with customers using Zoom meetings initiated from a chat.

Before you begin

Role required: admin

About this task

This task provides general steps to set up the Chat Zoom Connector application for initiating Zoom meetings from a chat.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Integrate the Zoom account of your company with your ServiceNow instance using the Zoom spoke.
   For more information, see Set up the Zoom spoke.
2. Set up the Notify Zoom connector in Zoom for associating the Notify communication channel with Zoom meetings.
   The conference call details of the Zoom meetings are stored in the Notify Conference Calls [notify_conference_call] table. For more information, see Set up Notify Zoom connector.
3. Install the Chat Zoom Connector application.
   For more information, see Install a ServiceNow Store application.

   Note:
   The Chat Zoom Connector application installs the `CSMZoomInteractionImpl` script include, which is preconfigured for the Customer Service application. It also installs the `sn_chat_zoom.ZoomInteractionExtPoint` extension point, which enables the copying of any application-specific fields from the parent chat interaction record to the Zoom interaction record. For more information, see Configure application-specific field values for Zoom interactions.

4. Activate the Zoom quick action.

Chat Zoom Connector

Using Chat Zoom Connector

Chat Zoom Connector

Resolve issues quickly and engage better with customers with video and screen sharing options in Zoom using the ServiceNow® Chat Zoom Connector application.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Overview

The Chat Zoom Connector application integrates the chat communication channel with the Notify communication channel by managing and initiating a Zoom meeting directly from a chat. An interaction record is created for each Zoom meeting initiated from a chat.

As an agent, you can use the Chat Zoom Connector application to initiate Zoom meetings from a customer chat and optionally record the meeting.

As an agent manager, you can access an interaction record of type Zoom to view the meeting details such as the meeting URL, participants, and recording.

As a customer, you can join a Zoom meeting with an agent regardless of whether you have a Zoom account.

To get started with the Chat Zoom Connector application, see Configure Chat Zoom Connector.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

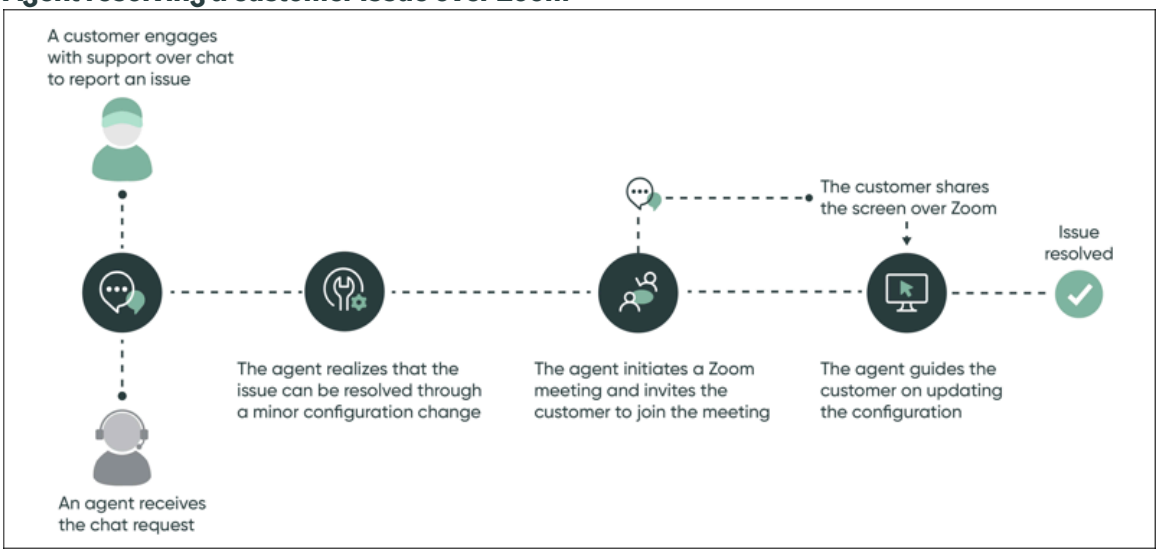
Key features

- Initiate Zoom meetings using the Quick Actions list in chats.
- Track Zoom meetings as interactions on the ServiceNow platform.
- Track participants in Zoom meetings.
- Post the meeting recording to the interaction activity stream.

Example scenario

The following example scenario shows the use of the Chat Zoom Connector application in resolving a configuration issue with an agent initiating a Zoom meeting directly from a customer chat.

Agent resolving a customer issue over Zoom



1. A customer engages with Support over chat to report an issue for a product.
2. An agent receives the chat request and realizes that the issue can be resolved through a minor configuration change.
3. The agent initiates a Zoom meeting using the Quick Actions list in the chat and invites the customer to join the meeting.

   Note:
   The customer does not need a Zoom account to join the meeting.

4. The customer shares the screen over Zoom and the agent guides the customer on updating the configuration and resolves the issue.

Configure application-specific field values for Zoom interactions

Use scripted extension points to enable the copying of application-specific field values to interaction records for Zoom meetings initiated from chats.

Before you begin
Role required: admin

Install the Chat Zoom Connector application. For more information, see Install a ServiceNow Store application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can enable the copying of any application-specific fields from a parent chat interaction record to its Zoom interaction record by using the `sn_chat_zoom.ZoomInteractionExtPoint` extension point. The parent chat is the chat from which the Zoom meeting was initiated.

By using extension points, you can easily integrate customizations without having to alter the base code. You can extend standard base functionality using customized scripts. For more information, see Using extension points to extend application functionality.

An implementation is available in the base system for scripted extension points. You can modify the data and add additional fields.

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. In the **API Name** column, search for and select **sn_chat_zoom.ZoomInteractionExtPoint**.
3. On the Extension Point form, select a script include to use the `sn_chat_zoom.ZoomInteractionExtPoint` extension point.
   - Create and register a custom script include.

     For more information, see Registering custom script includes against the scripted extension points.
   - Modify the existing script include by going to the Implementations related list and selecting a script include in the **Class** column. The script includes are displayed in the **Class** column.

     Note:
     By default, the `ZoomInteractionExtPoint` and `CSMZoomInteractionImpl` script includes that use the `sn_chat_zoom.ZoomInteractionExtPoint` extension point are available for Global and Chat Zoom Connector applications.
     - The `ZoomInteractionExtPoint` script include for the Global application copies the field values from the parent chat interaction record to the Zoom interaction record.
     - If the Customer Service application is installed, the `CSMZoomInteractionImpl` script include for the Chat Zoom Connector application copies the value of the **Consumer**, **Account**, and **Contact** fields from the interaction record of the parent chat to the Zoom interaction record. The `CSMZoomInteractionImpl` script include is available only when the Customer Service application is installed.
4. Include application-specific fields by adding the `sn_chat_zoom.ZoomInteractionExtPoint` extension point in the script include. You can create multiple implementations for an extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed first.
5. On the Extension Point form, select **Update**.

Activate the quick action for Zoom meetings

Activate the Zoom quick action to initiate Zoom meetings using the quick action from a chat.

Before you begin

Install the Chat Zoom Connector application. For more information, see Install a ServiceNow Store application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

By default, the Zoom quick action is inactive. Activate this quick action to enable agents to initiate Zoom meetings from a chat.

Procedure

1. Navigate to **All** > **Quick Actions** > **Actions**.
2. In the **Name** column, search for and select **Zoom**.
3. On the Quick Action form, select the **Active** check box.
4. Click **Update**.

Result

By default, the Zoom quick action is associated with chats when the Chat Zoom Connector application is installed. In addition, if the Conversational SMS service channel application is installed, the quick action is also associated with SMS conversations. For more information, see Conversational SMS service channel and Quick actions .

Set up Engagement Messenger

Understand the stages involved in setting up Engagement Messenger before you add it to your customer service web portal.

After you install the Engagement Messenger application in your instance, you're ready to configure it. You can also watch the academy video to understand the overall functionality of Engagement Messenger.

The configuration process involves the following tasks:

1. Install the Engagement Messenger application from the ServiceNow® Store.
2. Create Engagement Messenger module.
   - Configure the theme and styling of how Engagement Messenger appears to your customers
   - Configure how Engagement Messenger behaves when your customer uses it
   - Configure how Engagement Messenger works for your customers

   For more information, see Configure Engagement Messenger.
3. Create identity providers to enable an authenticated user experience. See Create an identity provider (IdP) for Engagement Messenger.

   If you want to enable only a guest user experience for your customer service portal, you can ignore this step and move on to step 4.
4. Create cross-origin resource sharing (CORS) rules for the REST API. See Configure a CORS rule for Engagement Messenger.
5. Add HTTP response headers for your Engagement Messenger. See Create HTTP response headers for Engagement Messenger.
6. Configure the system properties to enable virtual agent chat, multi-provider SSO, and to set a user session time-out value. For more information, see Engagement Messenger properties.
7. Configure a custom URL to load Engagement Messenger on third-party websites. For more information, see Enable Engagement Messenger on a website when third-party application cookies are blocked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Configure the deep linking feature to launch a specified feature in Engagement Messenger. For more information, see Deep linking feature in Engagement Messenger.
9. Activate an Engagement Messenger module.
10. Embed Engagement Messenger in your web application.
11. Embed messenger in your native iOS mobile app using Now Mobile® SDK. For information, see the Embed Engagement Messenger in a native iOS app using Now Mobile SDK [KB1587276] article in the Now Support Knowledge Base.
12. Embed messenger in your native android mobile app using Now Mobile® SDK. For more information, see the Embed Engagement Messenger in a native android app using Now Mobile SDK [KB1587611] article in the Now Support Knowledge Base.

Engagement Messenger for Customer Service Management

By using the ServiceNow® Engagement Messenger application, your customers use self-service to find the information or service that they need from your third-party web applications that are outside of the ServiceNow environment.

Request apps from the ServiceNow Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Engagement Messenger benefits

With the Engagement Messenger application, you can manage how your customers use your web applications and services from one central location. You can also configure the behavior and styling of the messenger and deploy the configuration on the websites or mobile sites of your choice.

Engagement Messenger provides the following benefits:

- Let your customers access your services from within an integrated messenger in your third-party websites.
- Integrate customer support capabilities via a no or low-code configuration.
- Meet your customer needs faster with these pre-packaged features:
  - Case management including case types
  - Service catalog requests
  - Virtual and live agent chat
  - Field service management
  - Appointment booking for field service
  - Walk-up appointment booking
  - Knowledge article search that is powered by ServiceNow® AI Search

For more information about the Engagement Messenger application, see Features of Engagement Messenger.

To get started with the Engagement Messenger application, see Set up Engagement Messenger.

Features of Engagement Messenger

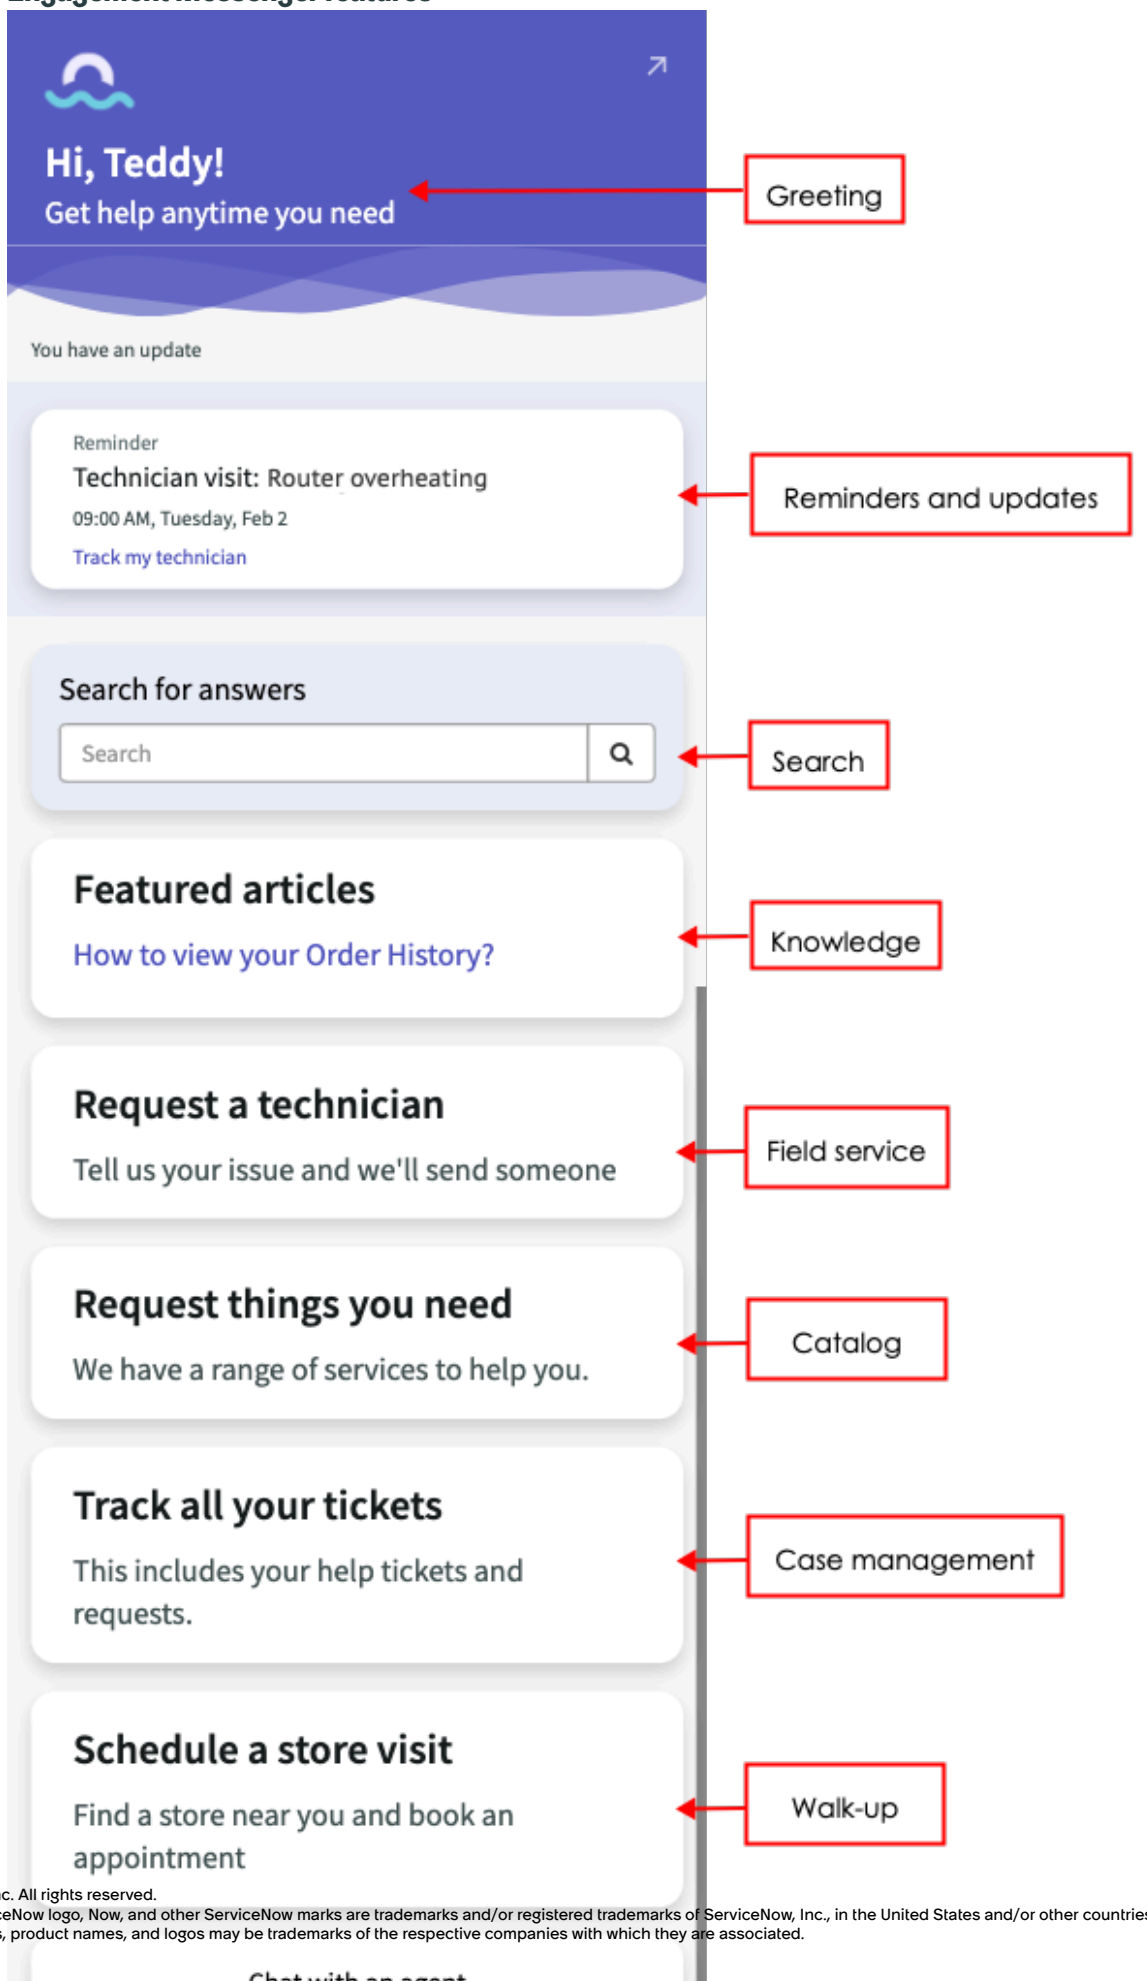
Understand what the Engagement Messenger application can provide to your customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you create and configure the Engagement Messenger module, you can customize it for your customers. For example, you can change the display order of any of these features on the home page of the messenger. Also, you can enable or disable any of these features to suit your customer's needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Engagement Messenger features



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Greeting

You can display the user greeting, which also includes a greeting message, on the header of the messenger. You can customize the way you want to greet your guest users and the users who sign in to your website.

Knowledge

You can select a knowledge base for your search results or choose to display featured articles on the home page of the messenger. You can also add multiple knowledge bases to suit your customer base.

Note:
To add knowledge bases to the Engagement Messenger module, you must manually assign the knowledge_admin role to the Engagement Messenger admin [sn_csm_ec.ec_admin] user.

Search

The ServiceNow® AI Search capability that is used in the Engagement Messenger application uses the knowledge bases that you selected for your messenger.

When a customer searches for information using the Search widget on the messenger, the displayed results are from the articles in the knowledge bases that are associated with your messenger module.

Customers can open the articles from the search results to get the information they need. They can also provide feedback to the article directly from the messenger to indicate whether the article was helpful or not. This feedback helps you to understand which articles are the most helpful so that you can improve those articles that weren't helpful.

Note:

- If the Service Portal - Restricted Pages plugin (com.glide.service-portal.pages.restricted) is activated in your ServiceNow instance, an AI Search functionality will not work in Engagement Messenger for unauthenticated users.

  If this plugin isn't activated, then the AI Search functionality works for both unauthenticated and authenticated users.

- You must configure AI Search in your ServiceNow instance and then enable Typeahead Search and AI Search Assist widgets so that the unauthenticated users can use the AI search feature from Engagement Messenger.

  For more information on enabling Typeahead Search and AI Search Assist widgets for Engagement Messenger, see Enabling AI search in the Customer and Consumer Service Portals for unauthenticated users.

  For more information of AI Search configuration, see Configuring AI Search.

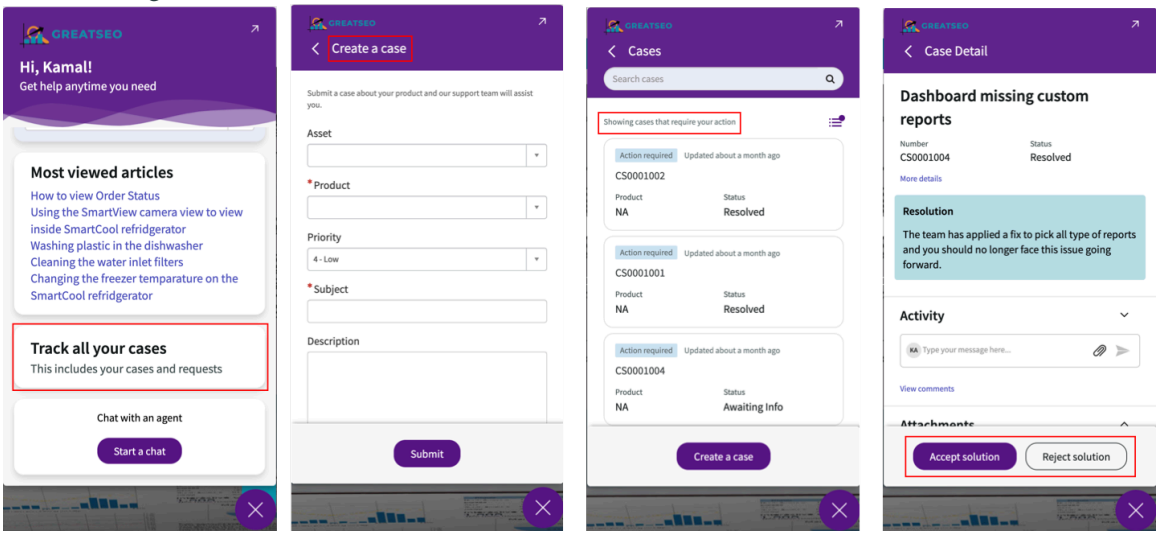
Case management

You can manage your customer cases on the messenger. This feature is available only for authenticated users of your website.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By using the Cases widget on the messenger, your customers can submit a case to request help with something or to report an issue. Submitted cases can be assigned to a customer service agent and tracked to a resolution.

Case management



Whenever your customers return to the customer portal and log in, they're notified of any updates to the cases that they created. They can also view the details of all the cases and requests that they have previously submitted and track their status.

Some cases would require action from the submitted user, asking them to provide more information about the help they need or to review a solution that the support team has provided. Customers can perform all these actions directly from within the messenger.

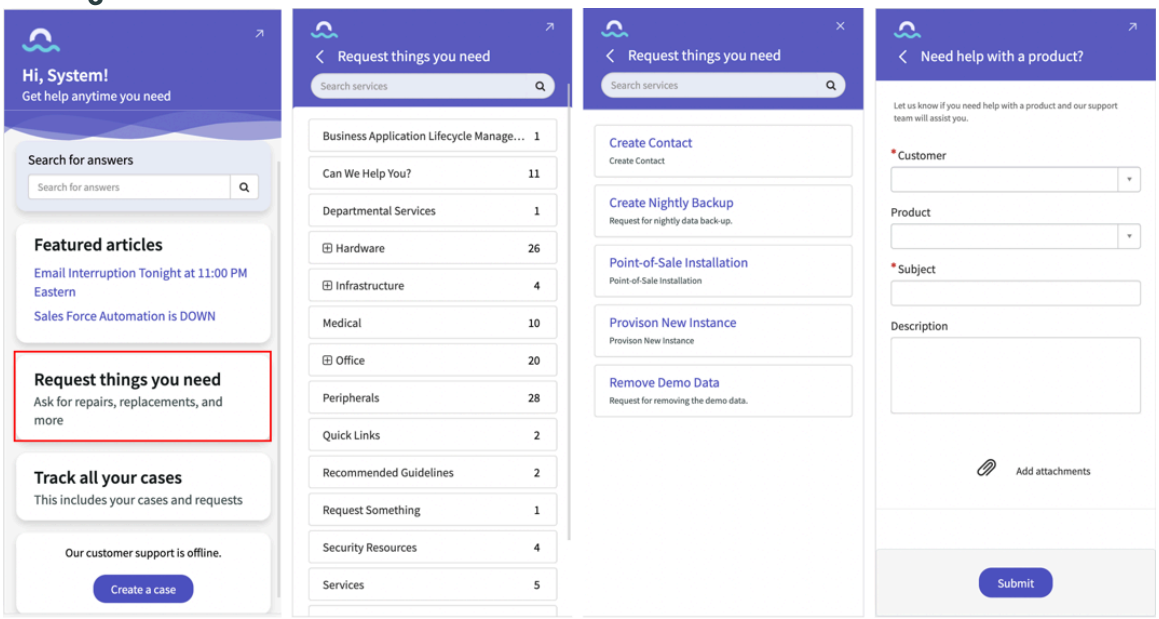
Catalogs

You can associate pre-defined catalogs with your Engagement Messenger. Customers can browse through the list of available catalog items. From this list of catalog items, they can choose to request a service or create a ticket. The requests that the customer makes can be tracked to a resolution using the case management feature.

Whenever your customers return to the customer portal and log in, they are notified of any updates to the requests that they have previously submitted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog feature



Field service management

The field service feature enables your customer to request a technician visit to service their issue. By selecting a product or service that they need help with and their location, customers can submit a request for a technician visit. While submitting the request, customers can also add any supporting attachments that they think might help the support team understand the issue before a technician is allotted for the visit.

All technician requests are stored as work orders in your ServiceNow instance so that they can be tracked to completion.

The Work Order will have the location where the customer has raised a request. Geo-location services must be enabled for the technicians so that customers can track the live location and know the estimated time of arrival (ETA) of their technician. For more information, see Field service feature configuration.

Note:

- Verify that the Field Service Management - Customer Experience plugin (com.snc.fsm_customer_experience) is active in your ServiceNow instance.
- The field service feature is available only for users who log in to the Engagement Messenger and not for guest users.

Walk-up appointments

The walk-up feature enables your customers to book an appointment to visit one of your stores, service centers, and the like. Customers can view the support centers near them and select one to schedule an appointment to visit. Once an appointment is scheduled, customers receive a confirmation email.

Customers who log in into your website can view a list of scheduled appointments directly from this widget on the Engagement Messenger home page. They can modify or cancel existing appointments. They also receive notification emails on the following status of their walk-up appointment:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- They’re ready to be assisted by an associate of the support center
- A walk-up interaction is assigned to an associate of the support center
- A walk-up interaction is closed

Customers who don’t log in can use the confirmation email to view and modify their appointments.

Note:
To enable a walk-up feature for your customers, verify that you activate the following plugins in your ServiceNow instance:

- Walk-up for CSM plugin (com.snc.walkup_for_csm) for authenticated users
- Guest Walk-up Experience for Customer Service plugin (sn_guest_walkup_cs) for unauthenticated users

Virtual and live agent chat

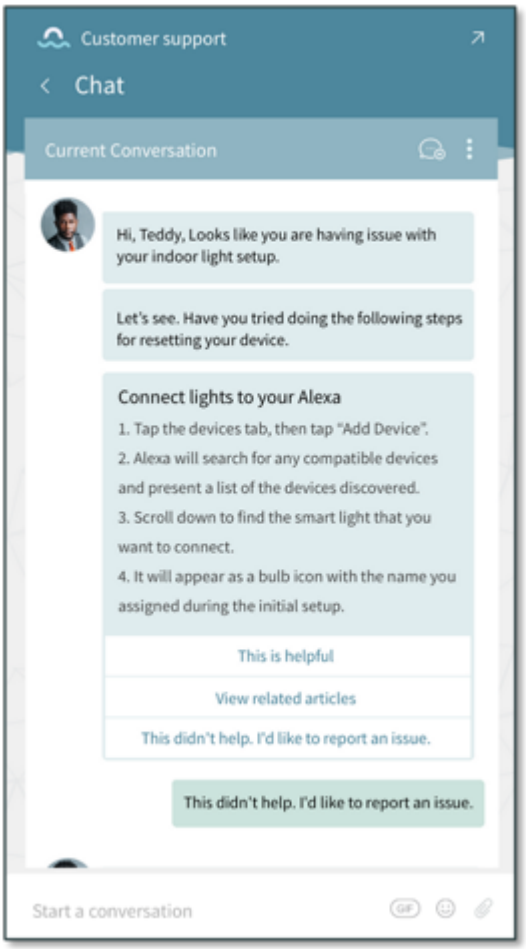
The chat feature enables support agents to interact with customers to resolve their issue by creating incident or case records or to transfer chats to another agent or queue if needed. Chat feature support is enabled for both authenticated and guest (unauthenticated) users.

Virtual and live agent chat

Customers can use the Chat widget on the messenger to interact with a virtual or live customer support agents in your organization. This way, your customers can get immediate responses to their queries or issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Live agent chat



Engagement Messenger also provides contextual chat functionality. From any case details page, your customers can directly start a chat that opens with the context of that specific case.

Note:
Chat is available when you activate the Glide Virtual Agent plugin (com.glide.cs.chatbot) and set the *com.glide.cs.embed.csp_frame_ancestors* system property value to **'self' <your website URL>**.

Now Assist in Virtual Agent with Engagement Messenger

Now Assist in Virtual Agent offers a conversational support experience that improves the chat experience in Engagement Messenger by delivering prompt answers to user questions. When enabled, Now Assist in Virtual Agent provides your users with an interactive generative AI experience. A friendly and natural language conversation that is easier to understand and helps users to be more comfortable with chatting to a bot.

By integrating generative AI chat capabilities, Now Assist in Virtual Agent enhances the user experience in Engagement Messenger. It improves asynchronous messaging, enabling users to resolve issues more quickly and efficiently. These capabilities help speed up issue resolution and increase efficiency by reducing the number of incoming

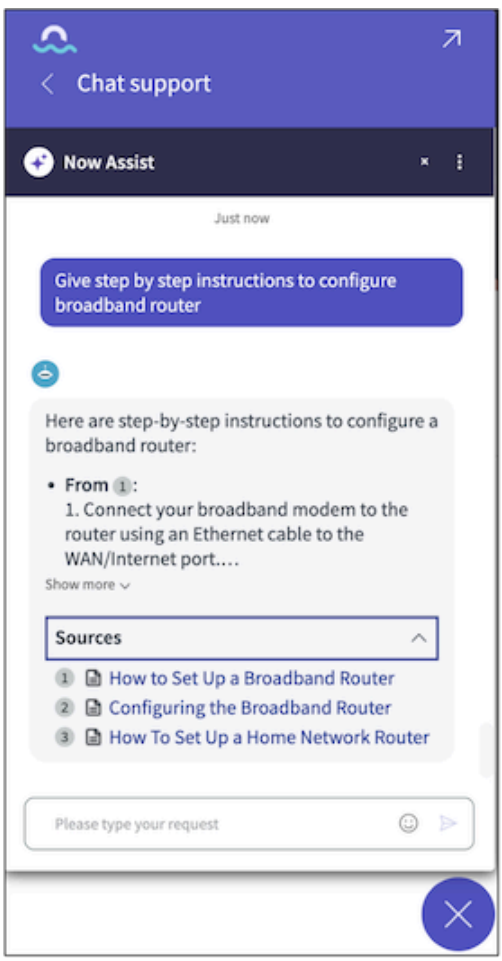
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

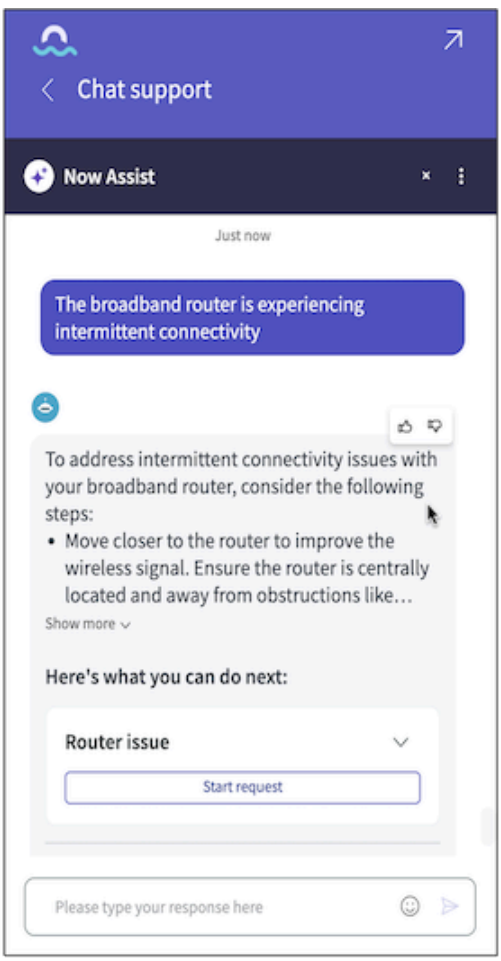
queries that must be diverted to a live agent. To know more about Now Assist in Virtual Agent, see Exploring Now Assist in Virtual Agent.

Getting started with Now Assist in Virtual Agent in Engagement Messenger:

- To enable Now Assist in Virtual Agent chat support in Engagement Messenger, verify that the Now Assist in Virtual Agent experience is configured by virtual_agent_admin or admin. For more information, see Configuring assistants overview.
- You can create or use an existing assistant by navigating to **All** > **Conversational Interfaces** > **Assistants**. For more information, see Create a chat assistant.
- Once you select an assistant navigate to the **Display experience** tab to configure the Engagement Messenger module. In the **Portals** tab, select the Engagement Messenger module from the **Add portal** list and select the **Standard chat** as the experience. For more information, see Display your chat assistant on a portal, channel, or mobile app.

Note:
Each assistant comes with its own search configuration. For a smooth experience, if the assistant appears on a portal or mobile app that already has AI search configured, consider duplicating that setup to maintain consistency.





Asynchronous chat

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

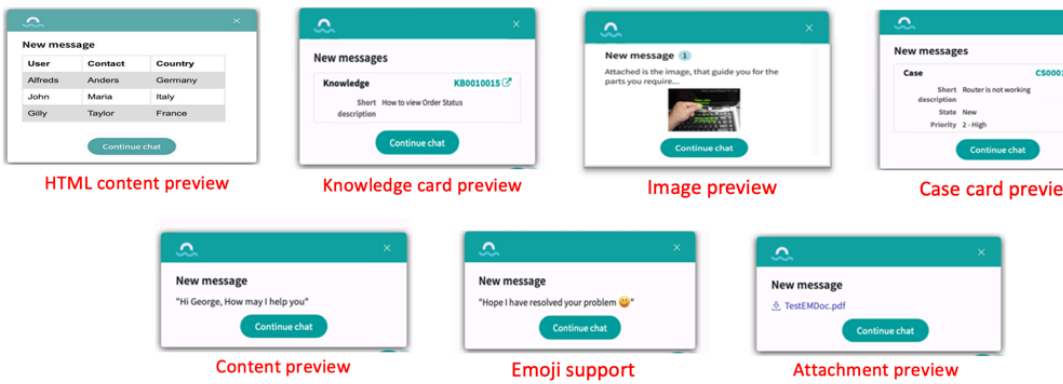
Engagement Messenger supports communication at different time intervals, enabling your support agents and end users to participate in long-running conversations without having to be online at the same time. For more information about asynchronous conversation, see Asynchronous Chat.

Configure asynchronous chat on Engagement Messenger by setting the web client as a messaging channel. For more information, see Configure asynchronous chat for the web channel.

Message preview

- Enable preview to see previews of unread chat message text, tables, links, HTML content, cases, knowledge cards, and images shared by the support agent without opening a message. The complete HTML content or video, and multiple unread messages, can be seen only when the user accesses the message.
- Asynchronous chat supports emojis sent by an agent in the message preview for a more interactive conversation. For more information on how to use emojis in Agent chat, see Using emojis in Agent Chat.

Previews

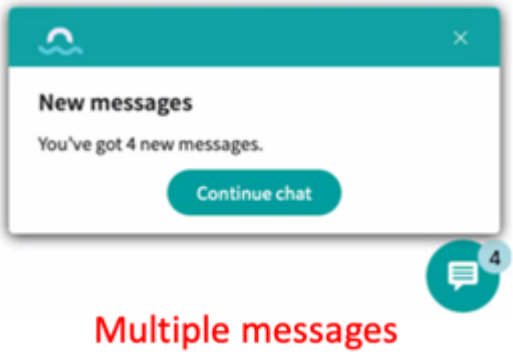


Offline message support

Offline chat support enables users to view messages sent by the support agent while they were offline. The chat widget notification shows the total number of unread messages in real-time when the user revisits the website.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Offline message support



Chat messages history

Users can close and reopen the chat window as needed without losing context or progress so an accidental messenger closure doesn't reset the chat session.

Note:
You can set a specific timeout to manage the idle conversation. By default, if the requester doesn't respond to an agent message within two days, the conversation status changes to Closed Abandoned and the chat session is ended. As an admin, you can override the conversation idle timeout period for a web channel by setting the value in the Conversation Idle Timeout field in the Messaging Channels [sys_cs_channel] table. For details, see Closing Virtual Agent and Live Agent conversations.

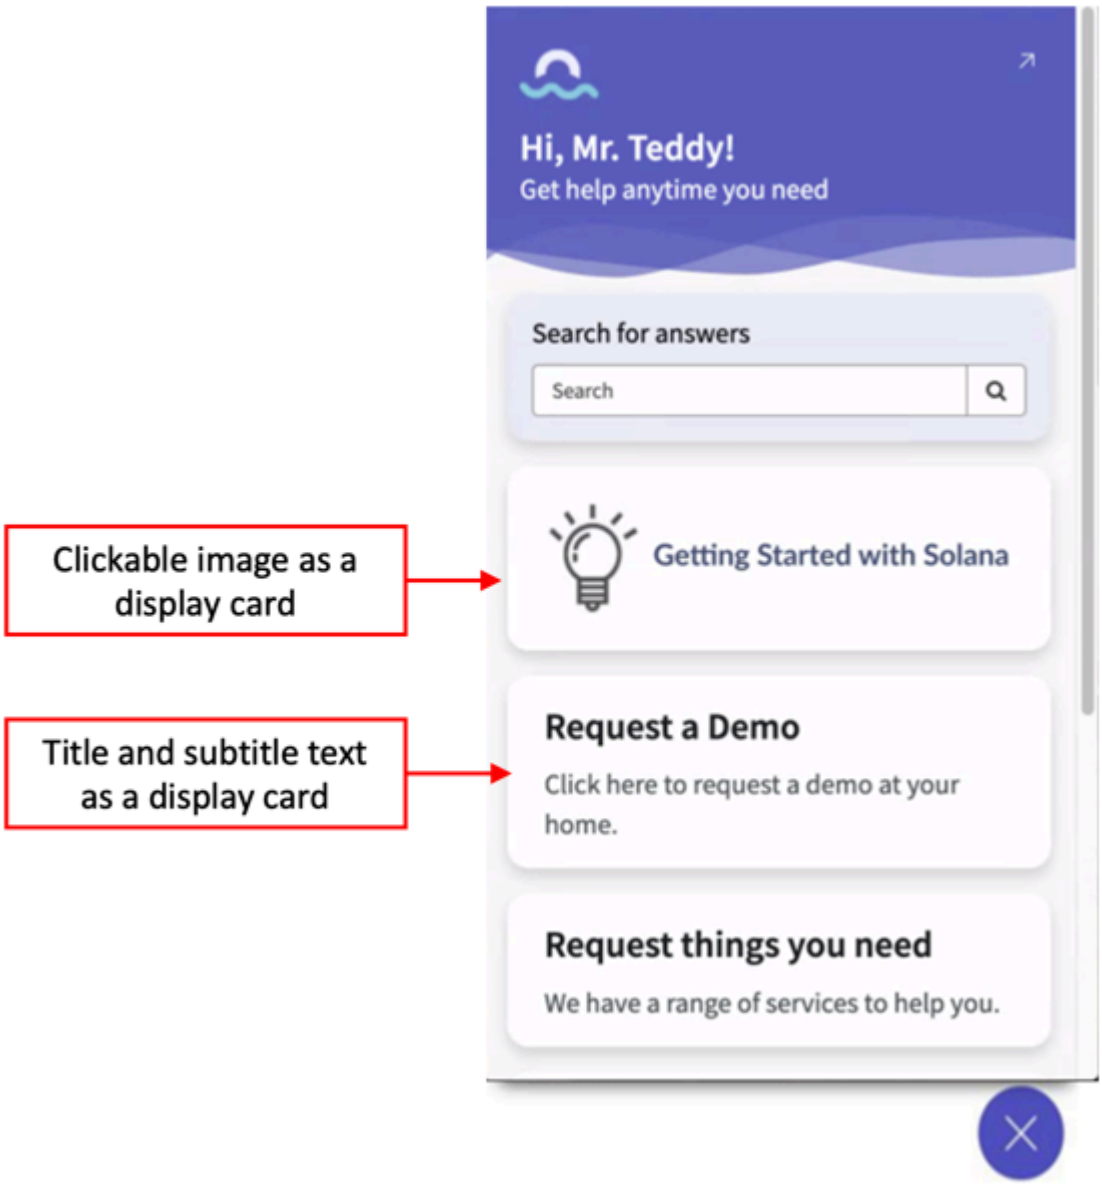
Configurable Cards

The Configurable Cards enables you to add custom features to Engagement Messenger. It enables Engagement Messenger to serve as a one-stop solution for accessing all the information. You can embed portal page, featured links, and data from any table on the messenger using the Configurable Cards.

Portal page feature card

Enables you to embed any portal page or catalog item on Engagement Messenger. The embedded page opens within the messenger when the user selects the feature card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

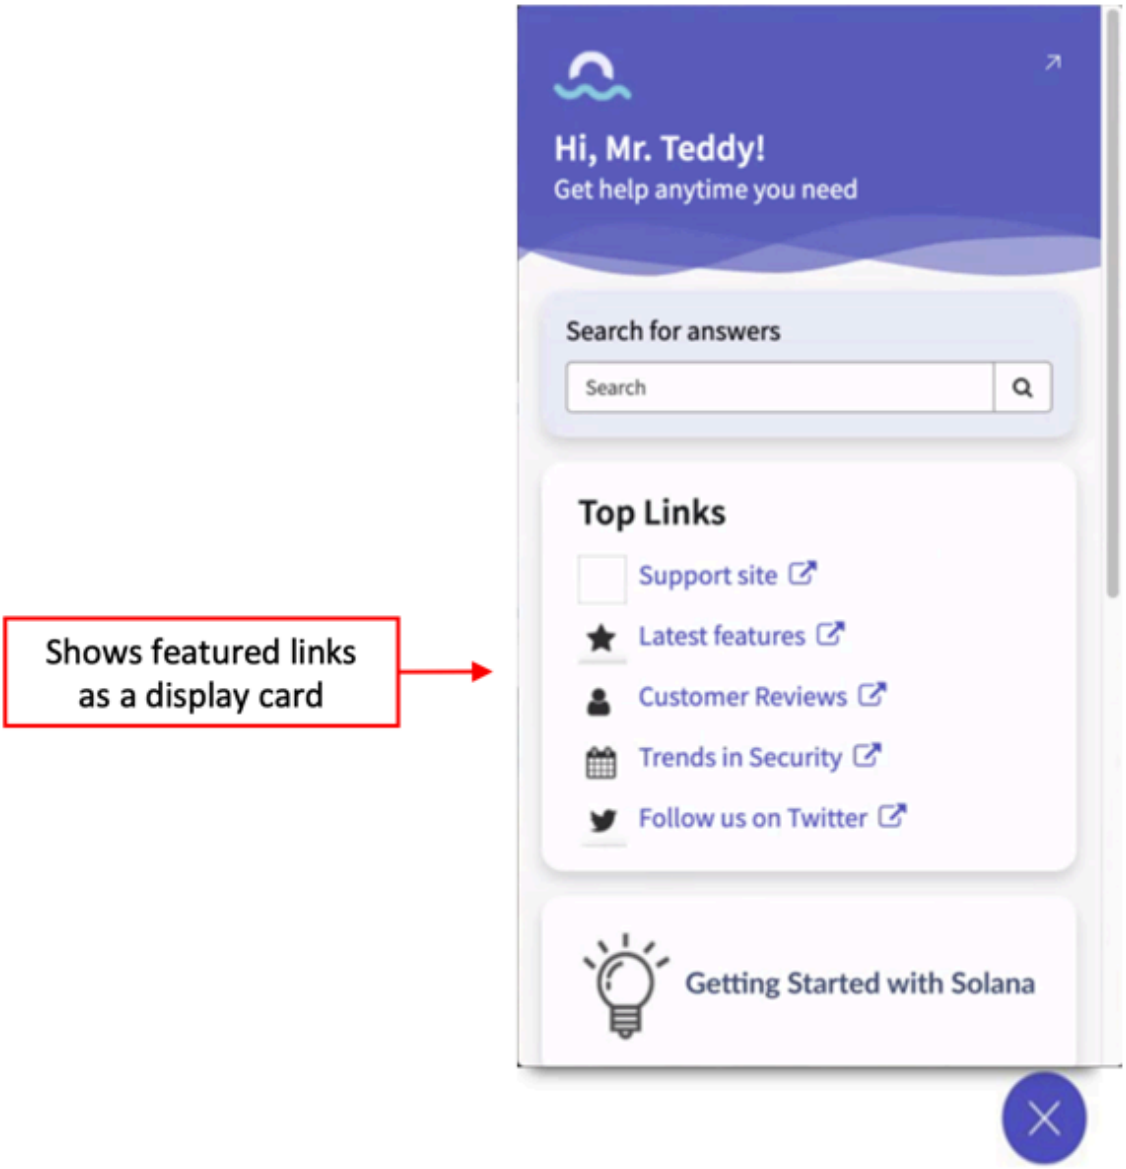


Featured links

Enables you to add a list of links to the website on Engagement Messenger. The link opens in a new browser tab when accessed using the feature card on messenger's home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Featured links



Data from any table feature card

The feature card enables you to embed data from any table on Engagement Messenger. The added records appear as a card with a title or links on a messenger's home page.

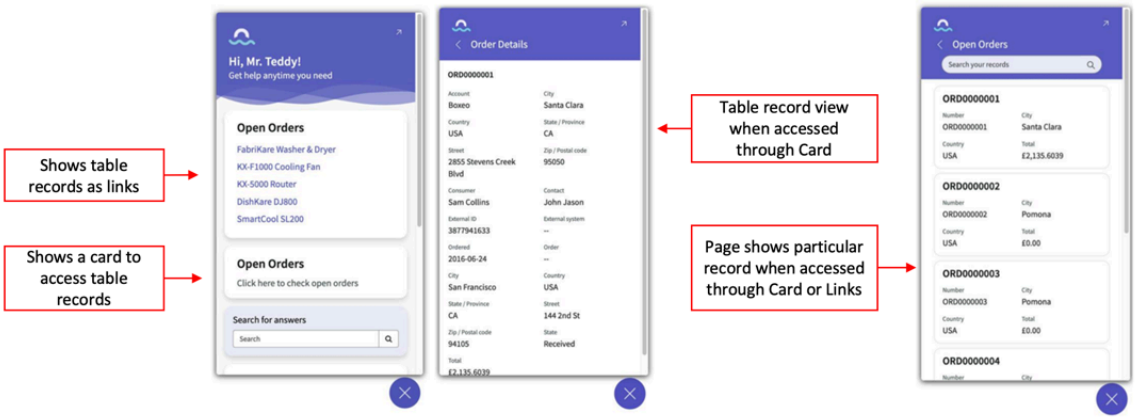
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data from any table



Proactive updates and reminders

Engagement Messenger provides your customers' updates and reminders in the following scenarios so that you can keep your customers updated even if they aren't accessing the messenger directly.

- Reminder for an upcoming walk-up appointment, according to the walk-up feature configuration
- Reminder for an upcoming technician visit
- Updates on a case
- Update on a chat

According to the configuration of Engagement Messenger behavior, the count of the updates is displayed on the messenger widget on your customer support webpage. If the customer navigates away from your website, the count of updates is also displayed on the browser tab.

To learn how to start configuring Engagement Messenger for your third-party website, see Set up Engagement Messenger.

Install the Engagement Messenger application

Install the Engagement Messenger application from the ServiceNow Store if you have the admin role.

Before you begin

Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Engagement Messenger application (sn_csm_ec) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they'll be installed, are currently installed, or must be installed. If any plugins or applications must be installed, you must install them before you can install the Engagement Messenger application.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Result

The following items are installed with Engagement Messenger:

- Plugins
- Roles
- Tables

For more information, see Components installed with Engagement Messenger.

What to do next

- If you want to enable Virtual Agent chat support in the Engagement Messenger, activate the Glide Virtual Agent plugin (com.glide.cs.chatbot).

  For more information, see Activate Virtual Agent.
- Get started with Engagement Messenger. For more information on how to get started, see Set up Engagement Messenger.

Configure Engagement Messenger

Create a Engagement Messenger module and configure its behavior, appearance, and styling. By creating a messenger module, you can customize the appearance and behavior according to your organizational branding and to suit your customer needs.

Before you begin

- Install the Engagement Messenger application.
- Gather or prepare the following items:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Image files for your logo and messenger launcher icon. The images must be in .jpg, .png, .bmp, .gif, .jpeg, .ico, or .svg file format.
- Color names and hex codes for branding to configure the styling of the messenger user interface.

- Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. Choose to create an Engagement Messenger module or edit an existing module.
   - To create a module, select **New**.
   - To edit an existing module, select **Edit** in the Edit module column of your messenger module. The guided configuration view is displayed.
3. In the guided configuration view, navigate through Module, Appearance, Behavior, Features, and Implement.
4. On the form, fill in the fields.

Engagement Messenger module form

Field	Description
Module	
Module name	Unique name for your messenger module.
Short description	Brief description of the messenger module.
Appearance	
Logo	Logo that is displayed in the header of the messenger on your website. The recommended size and dimensions are: ○ Size (in bytes): approximately equal to 2 KB ○ Height (in pixels): 30–55 ○ Width (in pixels): 30–55 **Note:** If no logo is selected, the Home icon ( ) is displayed as a default logo in the header of the messenger.
Launcher icon	Icon that is displayed as the messenger option on your website. On your website, selecting this icon launches the messenger. The recommended size and dimensions are: ○ Size (in bytes): approximately equal to 1 KB ○ Height (in pixels): 24–60

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Width (in pixels): 24–60 ○ Use a circular icon with a transparent background **Note:** The grid size range of a launcher icon is from 24X24 to 60X60. Any deviation from the defined range rescales automatically to fit the launcher icon size.
Launch icon position	Position of the messenger launch icon on your website.
Allow module to expand to full-height	Option for enabling the messenger module to expand to the full height of the browser tab.
Horizontal margin (in pixels)	Distance from the right or left of the browser tab for the placement of the messenger launcher icon. The distance is calculated from right or left based on your input for the field **Launch icon position**. For example, if you set the launch icon position as **Right** and the **Horizontal offset** as **50**, then the launch icon is placed at a distance of 50 px from the right of the browser tab. The maximum value for this field is 70 px.
Vertical margin (in pixels)	Distance from the bottom of the browser tab for the placement of the messenger launch icon. The maximum value for this field is 70 px.
Primary color	Primary color for styling the header or buttons in your messenger. For example, this color is used for user action buttons such as the **Submit**, **Yes**, or **OK**.
Primary font color	Text color that is used on UI elements that use the primary color.
Secondary color	Secondary color for styling your messenger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, this color is used for user action buttons such as **Cancel** or **No**.
Secondary font color	Text color that is used on UI elements that use the secondary color.
Tertiary color	Tertiary color for styling your messenger. For example, this color is used to mark customer cases with tags such as **Action required**.
Tertiary font color	Text color that is used on UI elements that use the tertiary color.
Theme	Theme for other styling options of the messenger. This field is automatically set to **CWF Engagement Messenger Theme**. If you want to select a different theme, ensure that the theme that you select here must match certain criteria. For more information, see Engagement Messenger module theme requirements.
Note: If the value for the **Primary color**, **Secondary color**, or **Tertiary color** fields is set to color names, such as **Pink**, the Engagement Messenger UI doesn't display these colors correctly. As a workaround, you can enter the hexadecimal values of these colors. For example, use #FFC0CB for **Pink**.	
Behavior	
Notification	
Enable notifications on launcher icon	Option to enable in-app pop-up notification alert message when a new message is received.
Enable sounds	Option to get the notification alert sound.
Enable notifications in browser tab	Option to get the notification alert on the browser tab when the concerned web page isn't opened.
Enable user behavior tracking	Option for enabling the collection of user experience analytics from users of your Engagement Messenger. This option is available only if you activate the Service Portal Analytics plugin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	(com.glide.service-portal.analytics) in your ServiceNow instance. **Note:** If you update your Engagement Messenger module name after user behavior tracking is enabled, the User Experience Analytics dashboard would show the original module name, not the updated name.
As an administrator, you can configure the Proactive Recommendations feature for Engagement Messenger. For more information, see Proactive Recommendations configuration for Engagement Messenger.	
Features	
See Configure the feature configuration of Engagement Messenger.	
Implement	
Website URLs	Comma-separated list of URLs of the websites where you want to deploy the messenger. For example, `https://www.example.com, https://www.yourwebsiteurl.com`
Authentication type	Authentication type for this embedded messenger. Select one of the following options: ○ None ○ Security assertion markup language (SAML)-based ○ Open ID connect (OIDC)-based If you want to enable only the guest user experience for the messenger in your website, set this field to **None**. Ensure that you create an identity provider (IdP) for the authentication type you select in this field. For more information, see Create an identity provider (IdP) for Engagement Messenger.
Advanced branding	
Hyperlink text color	Text color used for hyperlinks in messenger.
Navigate-back icon	The icon appears in the messenger header that enables the user to navigate to the previous page. The icon size is 24X24.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Close icon	This icon appears in the messenger header that enables the user to close messenger. The icon size is 16X16.
List search icon	The icon appears in the messenger header that enables searching through a list. The icon size is 16X16.
Expand icon	The icon appears in the header that enables the user to expand the messenger to access information. The icon size is 16X16.
Collapse icon	The icon appears in the messenger header that enables the user to collapse an expanded messenger. The icon size is 16X16.
Start-chat icon	The icon appears in the messenger header that enables the user to start a chat with an agent regarding their ticket or technician visit. The icon size is 16X16.
Filter menu icon	The icon appears at the top of the list page that enables the user to apply filters to get desired result. The icon size is 24X24.
Applied-filters icon	The icon appears at the top of the list page and shows applied filters icon in messenger. The icon size is 24X24.

Note:
The advanced branding configuration is only available in the form view.

5. Select **Save**.
6. Select **Email instructions** to notify your security administrator to complete the following tasks:

   a. Create an identity provider (IdP) for Engagement Messenger.

   b. Configure a CORS rule for Engagement Messenger.

   c. Create HTTP response headers for Engagement Messenger.

Note:
Engagement Messenger extends service portal capabilities that don't support domain separation. For more information, see Domain separation and Service Portal. However, other tables that are used in Engagement Messenger may support domain separation according to the configurations with which they're created.

https://player.vimeo.com/video/1073656709?h=9f18f942f3&badge=0&autopause=0&player_id=0&app_id=58479

Result
A new messenger configuration is created and listed in the Modules module of Engagement Messenger application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

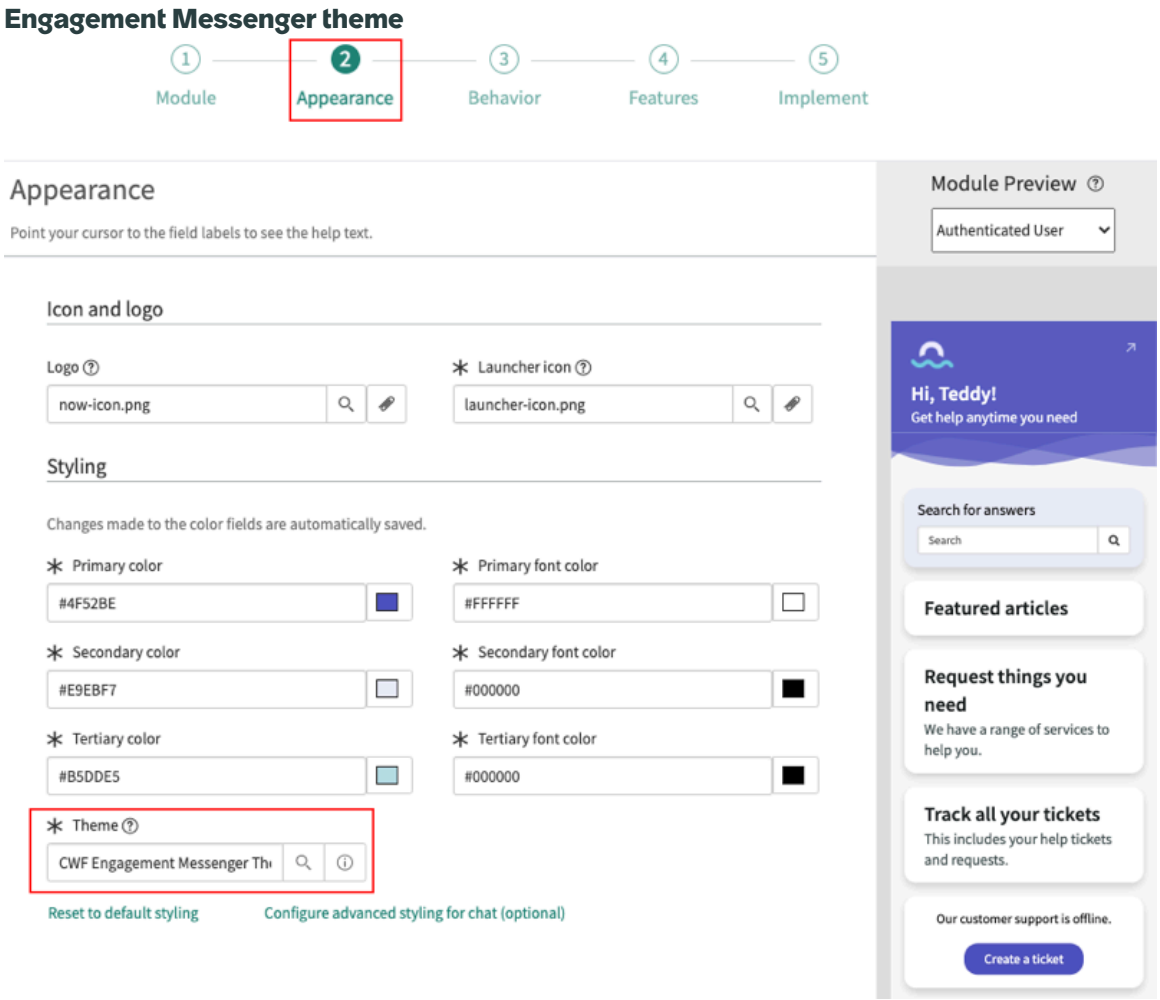
What to do next

1. Engagement Messenger properties.
2. configure the features of Engagement Messenger.
3. Share the messenger module code with your developer using the **Email code** to embed Engagement Messenger in your website.
4. Following are the advanced formatting changes that are available as an optional configuration in Engagement Messenger:
   - Engagement Messenger module theme requirements to reuse Service Portal theme to customize the visual appearance in Engagement Messenger.
   - Default font sizes for search result text in Engagement Messenger.

Engagement Messenger module theme requirements

You can set a theme that you can apply to an Engagement Messenger module. A theme enables you to define additional styling of Engagement Messenger in your website.

You can select the theme for your Engagement Messenger in the Appearance section of the guided configuration.



A theme that you want to use for your messenger module must meet the following criteria:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The header must be set as **CWF EC Header**
- It must contain the JS include */scripts/sn_csm_ec.js*
- It must contain the CSS includes *cwf_ec_theme_inline_css* and *sp-theme-la-jolla.css*

Default font sizes for search result text in Engagement Messenger

Define normal and genius search result font sizes to change text appearance in Engagement Messenger on different devices.

Note:
The ec_admin role is required to change the default configuration.

Search types and default configurations in Engagement Messenger

Search type	Default configuration
Normal search for Knowledge Base and Catalog	The default normal search result font size settings are: • Large for title • Medium for summary **Note:** • This setting for knowledge bases is found in the *em_kb_search_template* template script. • This setting for Catalog is found in the *em_catalog_search_template* template script. The default auto-spell correction text font size is medium. **Note:** The default configuration is set in the Faceted Search widget.
Genius search for Knowledge Base and Catalog	The default genius search result font size settings are: • Small for identifier • Large for heading • Medium for summary

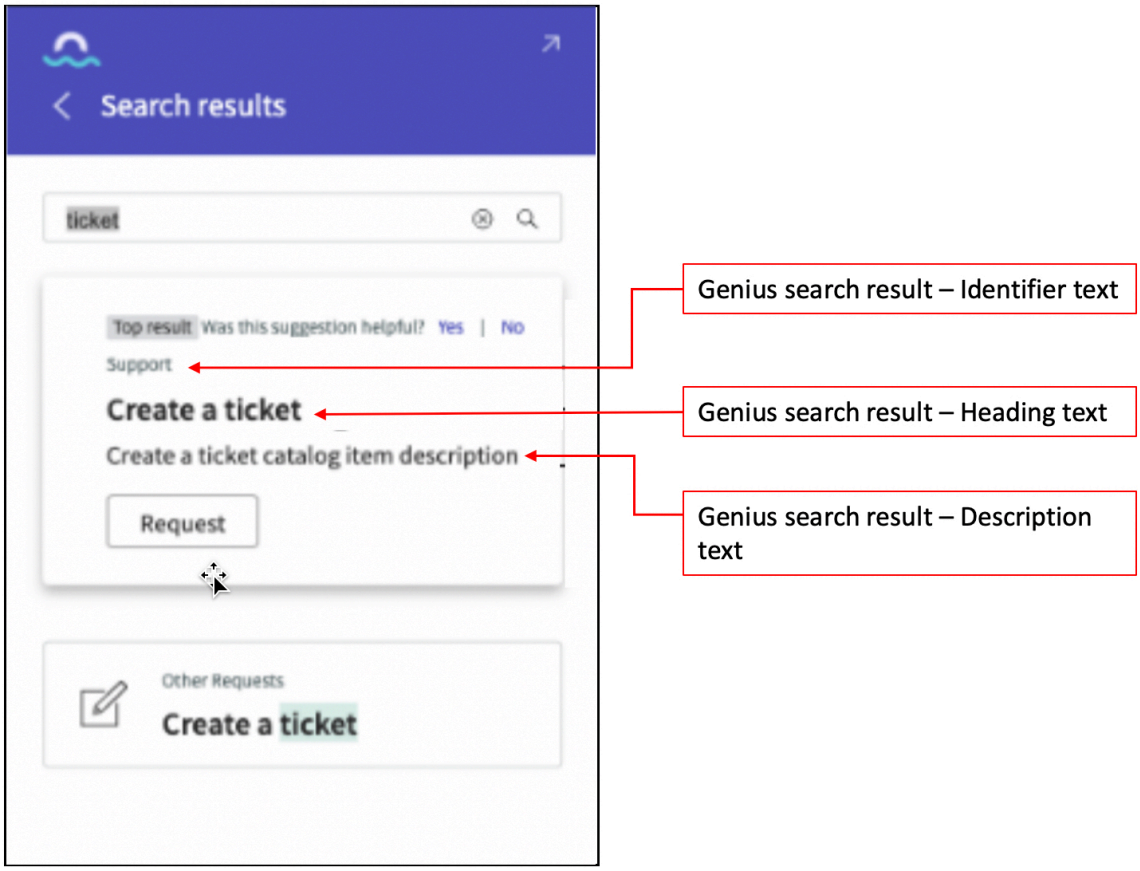
Genius search result text appearance in Engagement Messenger



Change the default chat mode for the Chat feature

Set either asynchronous chatting through a chat window or synchronous mode through messaging as the default chat mode of the Chat feature.

Before you begin

Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. On the Engagement Messenger Modules page, in the **Edit module** column, select **Edit**.
3. On the Configure Engagement Messenger Module page, select **Features**.
4. Enable the Chat feature by turning on **Chat** in the Feature settings pane.
5. On the Chat form, in the **Global chat settings** section, select **Change the default mode for chatting**.
   The Messaging Channel page opens in a new tab.
6. In the Type field, select the default chat mode.
   - To enable synchronous chat to engage in real-time conversation through a chat window, select **Chat**.
   - To enable asynchronous chat to engage in long-running conversations through messaging without being online concurrently, select **Messaging**.

     For more information, see Configure asynchronous chat for the web channel.
7. Select **Update**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure email notifications for unread chat messages

Send email summaries with all unread messages when the user isn't active during a chat conversation for a specified duration.

Before you begin
Role required: sn_csm_ec.ec_admin

About this task
You can send email summaries to an authenticated user or users who are verified by a live agent.

Procedure
1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. On the Engagement Messenger Modules page, in the **Edit module** column, select **Edit**.
3. On the Configure Engagement Messenger Module page, select **Features**.
4. Enable the Chat feature by turning on the **Chat** in the Feature settings pane.
5. On the Chat form, in the **Global chat settings**, select **Email notifications for unread messages**.
   The Missed activity emails page opens in a new tab.
6. Enable the sending of chat email notification by turning on the **Missed activity email** option.
7. In the Offline threshold drop-down list, set the time duration that the user is inactive before sending the email notification.
   - 15 minutes (default)
   - 2 hours
   - 8 hours
   - Custom
8. Select **Save**.

Result
Automatically sends email notifications of missed chat messages at the specified time interval.

Enable Engagement Messenger on a website when third-party application cookies are blocked

Configure a custom URL for the ServiceNow instance that helps prevent web browsers from blocking Engagement Messenger when cross-origin iframes and third-party cookies are blocked.

Before you begin
You must activate the Custom URL (com.snc.customurl) plugin. For more information, see Activate custom URLs.

Role required: admin

About this task
The latest versions of browsers including Safari and Chrome have enhanced browser security features. By default, the browser security features block third-party cookies that help prevent the loading of a third-party application on a website. If you don't use a custom URL, the browser treats the messenger as a third-party application when embedded inside a parent website. To prevent messenger from getting blocked by the browser, you need to set a custom URL for the ServiceNow instance to match the messenger domain with the website domain. Using custom URL, browser treats messenger as a first-party application rather than a third-party application. The web browser's security restrictions block messenger for the following reasons:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Web browser blocks cross-origin iframes when the domain of the URL used in the iframe does not match the domain of the website itself.

  Note:
  Engagement Messenger uses an iframe to load messenger's#nterface on a third–party website.

- Web browser treats messenger's cookies as the third-party cookies and blocks them.

  Note:
  Engagement Messenger uses cookies to enable features like authentication, recommendations, proactive help and so on.

Note:
Custom URL is primarily configured to get a branded URL for the ServiceNow instance, Portals, and EM module that matches with your domain URL.

You must add a CNAME record to your website domain's DNS records where Engagement Messenger is embedded and set it as your ServiceNow instance URL. For example, in the name server for `acme.com`, create an entry

```
support.acme.com 300 IN CNAME acme.servicenow.com
```

where `acme.service-now.com` is the ServiceNow instance and `acme.com` is your website on which Engagement Messenger is integrated.

Procedure

1. Navigate to **All** > **Custom URL** > **Custom URLs**.
2. Select **New**.
3. On the Custom URL form, in the **Domain name** field, enter the CNAME record (your custom URL) that you have set as the ServiceNow instance URL.
4. Select **Create**.

   Note:
   The new custom URL takes approximately six hours for activation.

5. **Optional:** After the custom URL is active, on the Custom URL form, select the **Set instance URL** check box to enable the custom URL as an instance URL.
6. In a text editor, open the HTML file of the web page on your website where you integrate Engagement Messenger.
7. In the code, replace the existing website URL with a custom URL.
8. Save the file.

Result
Engagement Messenger loads on a third-party website.

Example:
The following code includes a sample URL that contains `support.acme.com` as a custom URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom URL in code

```
<script src="https://support.acme.com/scripts/sn_csm_ec.js?v=4.0.1"></script>
<script>
SN_CSM_EC.init({
      moduleID: "https://support.acme.com/#<module_id>,
      loadFeature: chatFeatureContext()
});
</script>
```

Related topics

- Set a custom URL as the instance URL
- Custom URLs association to your instance
- Custom URL errors and fixes

Before you begin
Role required: admin

Procedure

Navigate to **All** > > .

Result

Update Engagement Messenger launch URLs to the latest version

Update the version of Engagement Messenger in the code used to embed Engagement Messenger in your website or to launch features automatically with Engagement Messenger.

Before you begin
Role required: Website administrator

Procedure

1. Open the HTML file of the web page on the website where you integrate Engagement Messenger.
2. Change the existing version number to `v=3.1`.
   For example:

```
<script src="https://example.service-now.com/scripts/sn_csm_ec.js?v=3.1"></script>
<script>
SN_CSM_EC.init({
       moduleID: "https://example.service-now.com/#aeff0547dd393010f87734cef087e2ba",
       loadFeature: SN_CSM_EC.loadEMFeature()
});
</script>
```

3. Save the file.

Engagement Messenger properties

You can configure the system properties for your Engagement Messenger module so that you can enable Virtual Agent chat, multi-provider SSO, and set a user session time-out value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Engagement Messenger

After you configure an Engagement Messenger module, set the following system properties that are based on your configuration of the messenger module.

Tip:
In the navigation filter, enter `sys_properties.list` to view the list of all the system properties and search for the property that you want to update.

Properties and descriptions of the Engagement Messenger module

Property	Description
com.glide.cs.embed.csp_frame_ancestors	After activating the Glide Virtual Agent plugin (com.glide.cs.chatbot), you must use the *com.glide.cs.embed.csp_frame_an* system property to enable the configuration o frame-ancestors policy for the website where to host Engagement Messenger. Set the value of the *com.glide.cs.embed.csp_frame_an* system property 'self' <`your website URI` example, 'self' `https://www.example.c` • Type: string • Value: self • Location: System Properties
glide.authenticate.multisso.enabled	Set the *glide.authenticate.multisso.ena* system property to true to enable multiple pro SSO. • Type: true | false • Value: self • Location: System Properties **Note:** If you want to enable only a guest user ex for your customer service portal, you can this configuration.
User session time-out *glide.ui.session_timeout*	Set a user session timeout value for the *glide.ui.session_timeout* system pr to a value that is greater than or equal to your time-out. • Type: integer • Value: 30 • Location: System Properties

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties and descriptions of the Engagement Messenger module (continued)

Property	Description
	Note: If you want to enable only a guest user ex for your customer service portal, you can this configuration.
sn_customerservice.emails.customportal	Set the URL of your third-party customer supp so that the notification emails that your custor contain URLs that redirect them to the exact re record that they submitted. These notification emails are sent in scenario submitting a case, requesting a service, reque field technician, or booking a walk-up appoint • Type: string • Value: None • Location: System Properties For example, if your customer support portal i `https://www.example.com/support` then set the property value to `https://www.example.com/support`.
sn_csm_ec.proactive_inactivity_time	Set the inactive period (in seconds) to trigger help in Engagement Messenger. • Type: integer • Value: 2 • Location: System Properties
glide.knowman.serviceportal.use_numbered_url	The property contains a comma-separated lis service portal record sys_ids. For any portal re specified in this property, the article link will b displayed with the sysparm_number URL para instead of sys_kb_id. • Type: string • Value: None • Location: System Properties

Configure the feature configuration of Engagement Messenger

Configure the features of Engagement Messenger so that you can change the default settings to suit your customer needs.

Before you begin

Role required: sn_csm_ec.ec_admin

You must configure Engagement Messenger before configuring its features. For more information, see Configure Engagement Messenger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Configure how the features of Engagement Messenger appear to your customers, their display arrangement, and their behavior.

Use the Features section of the guided configuration to customize the messenger configuration. View a live preview of how the Engagement Messenger would look like in your third-party website. You can also watch the academy video to understand the overall functionality of Engagement Messenger.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. In the Edit module column of the messenger module that you want to configure, select **Edit**.
   The guided configuration view is displayed.
3. From the Features section of the guided configuration, enable or disable a feature by using the toggle ( ) on the feature card.
4. Open one of the following features and modify the values:
   - Greeting: See Greeting feature configuration.
   - Knowledge: See Knowledge feature configuration.
   - Search: See Search feature configuration.
   - Case: See Case management feature configuration.
   - Catalog: See Catalog feature configuration.
   - Field service: See Field service feature configuration.
   - Walk-up: See Walk-up feature configuration.
   - Chat with an agent: See Chat feature configuration form fields.

     Note:

     - The knowledge article, catalog item, and case links sent by an agent can be opened within Engagement Messenger. You can configure how links should be open in a messenger. For more information, see Create a smart link preference.
     - You can also enable the Now Assist in Virtual Agent in Engagement Messenger by Configuring assistants overview and then Display your assistant in Engagement Messenger.

   - Configurable Cards: See Configurable Cards feature configuration.
   - Callback: See Callback feature configuration form.
5. **Optional:** You can also add a feature in the **Features** section using Configurable Cards.
   a. Select **Add custom feature**.
   b. Enter the feature name and select the feature type.
   c. Select **Add**.
   For more information, see Configurable Cards feature configuration.
6. Select **Update**.
7. **Optional:** Change the display order of the features by reordering the feature cards.
   You can see the modified home page layout of your Engagement Messenger in the live preview of the module.

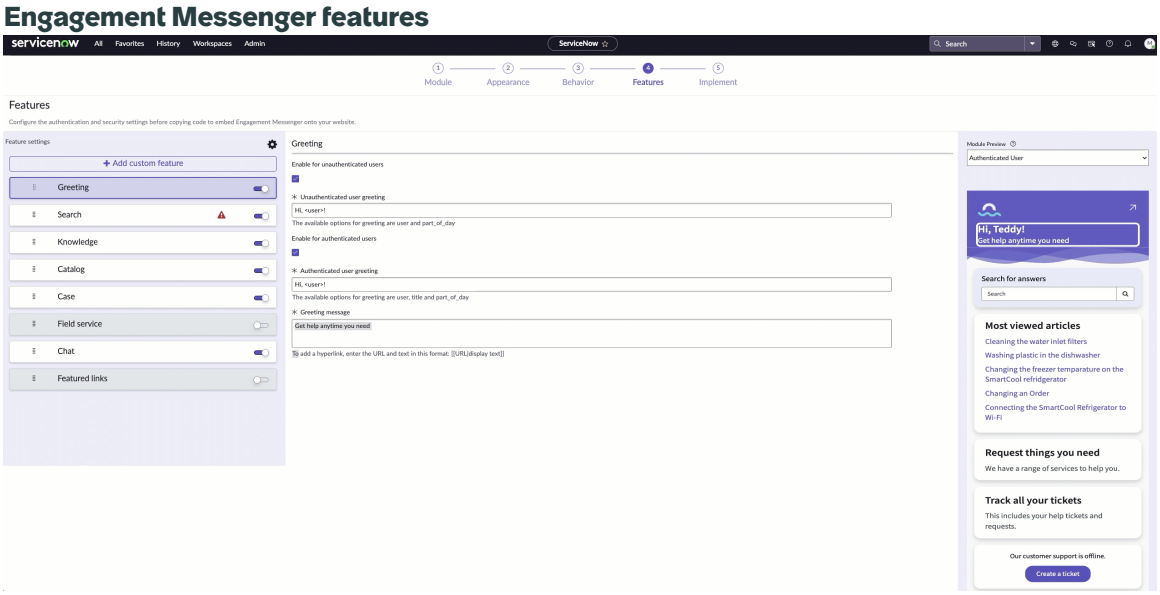
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
Engagement Messenger extends service portal capabilities that don't support domain separation. For more information, see (Domain separation and Service Portal). However, other tables that are used in Engagement Messenger may support domain separation according to the configurations with which they're created.

What to do next
Create an identity provider (IdP) for Engagement Messenger.

Enable AI Search in Engagement Messenger for unauthenticated users

Enable the AI Search experience in Engagement Messenger so unauthenticated users can see the most relevant set of search results.

Before you begin
You must configure AI Search for the Engagement Messenger before enabling AI Search for an unauthenticated user. For more information, see Search feature configuration.

Role required: admin

About this task
As an admin, you must enable the EC AI Homepage Search, Typeahead Search, and AI Search Assist widgets in Engagement Messenger to enable the AI Search capability for unauthenticated users.

Procedure
1. Navigate to **Service Portal** > **Widgets**.
2. Search for and open the **EC AI Homepage Search** widget.
3. Select the **Public** check box.
4. Select **Update**.

What to do next
Enable the Typeahead Search and AI Search Assist widgets. For information, see Enable AI search in the Customer and Consumer Service Portals for unauthenticated users.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the default behavior of Engagement Messenger

Configure the default behavior of Engagement Messenger to set the default settings for Notification, Recommendations, and Proactive.

Before you begin

Configure Engagement Messenger.

Use Engagement Messenger embed Code to integrate proactive recommendations on a web page.

Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. Select the Engagement Messenger module you want to install on your website.
3. In the Edit module column, select **Edit**.
4. In the Configure Engagement Messenger module, select the **Behavior** tab.
5. In the **Behavior** tab, configure the **Recommendations** and **Proactive** settings to define the Engagement Messenger functions.
   For more information, see Proactive Recommendations configuration for Engagement Messenger.

   Note:
   For information about how to customize the Notification behavior, see Configure Engagement Messenger.

6. Select **Save**.

Proactive Recommendations configuration for Engagement Messenger

The Proactive Recommendations feature enables you to show context-based suggestions in real time and to configure the recommendations experience on Engagement Messenger.

Note:
To integrate Proactive Recommendations on a web page, you need to enable recommendations in the embed code of Engagement Messenger.

Recommendations setting configuration form

Field	Description
Enable recommendation	Option to show or hide the recommendations.
Title text	Title of the recommendation screen in the messenger.
Subtitle text	Helpful text about the recommendations that displays at the top of the recommendations screen.
Show the search bar	Option to display the search bar on the Recommendation page that enables you to search content in addition to the provided recommendations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations setting configuration form (continued)

Field	Description
Maximum number of recommendations	The maximum number of recommendations to be shown on the recommendations screen.
Link text for additional recommendations	Text for the link that enables the user to view an additional recommendations.
Link text for Engagement Messenger	Text displayed in the footer of the messenger to enable navigation to the Engagement Messenger home page. Use the `[[display text]]` format to add a clickable link to messenger.
• If AI Search does not return any recommendations, then the Engagement Messenger home page is displayed. • You need to enable AI Search to make Recommendations available to users.	

Proactive setting configuration form

Field	Description
Type	Type of display to show the suggestions proactively on messenger after 30 seconds of inactivity. Select **None** to disable proactive behavior.
Choose an animation type	The type of animation for the launcher icon that activates when the user is inactive. • Ripple (like a wave) • Bounce
Show a tooltip above the icon	Option to show the tooltip message above the launcher icon.
Tooltip text	The message displayed on the tooltip.
Offer search	
Title text	Title of the widget that appears when **Offer search** is selected as the proactive help type.
Subtitle text	Description of the widget that appears on the widget body and appears below the title text.
Placeholder text	Placeholder text that appears in the search box.
Offer chat	
Title text	Title of the widget in the messenger.
Subtitle text	Description of the widget in the messenger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive setting configuration form (continued)

Field	Description
Chat button label	Label of the button that is displayed for the user to start the conversation.
Offer the recommendation you configured	
Select the **Offer the recommendation you configured** option to show the knowledge article and catalog items recommendations proactively as per the configuration in the Recommendations section.	
Note: AI Search needs to be enabled for Offer search and Offer the recommendation you configured options.	

Use Engagement Messenger embed Code to integrate proactive recommendations on a web page

Modify the embed code of Engagement Messenger to enable recommendations and pass the search query for recommendations based on AI Search.

Before you begin

- Embed Engagement Messenger in your web application.
- Activate an Engagement Messenger module.
- Role required: sn_csm_ec.ec_admin

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. Select the Engagement Messenger module that you want to install on your website.
3. In the Edit module column, select **Edit**.
4. In the Configure Engagement Messenger module, select the **Implement** tab.
5. In a text editor, open the HTML file of the web page on your website where you integrate Engagement Messenger.
6. In the **Implement** tab, copy the code from the Embed code section.
7. Paste the code that you copied into the text file before the closing body tag.
8. Enable recommendations for a specific page in messenger by adding the parameter `enableRecommendations: true` in the embed code.

   When a user enters a search term in Engagement Messenger, the website's URL slug (the last part of the URL) is included in the search query by default. The URL slug conditions for the search query entered in the messenger search bar are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a single forward slash is at the end of the URL, then no search term is picked. For example, `https://example.service-now.com/`.
- If a term is surrounded by forward slashes at the end of the URL, the enclosed text is considered to be a search term. For example, in the URL `https://example.service-now.com/product-xyz/`, product xyz is considered a search term.
- If a single forward slash is followed by text, that text is considered to be a search term. For example, in the URL `https://example.service-now.com/search_string` search string is considered as a search term.

The URL slug is used to deduce the search query as follows:

- All the special characters are replaced by a space. For example, in the URL `https://example.service-now.com/product-xyz`, the search term is "product xyz."
- Any file extension is ignored. For example, in the URL `https://example.service-now/product.html`, the search term is "product."

9. Enable recommendations at the module level.
   a. Navigate to **All** > **Engagement Messenger** > **Modules**.
   b. Select your Engagement Messenger module.
   c. Select **Edit**.
   d. In the Configure Engagement Messenger module, select the **Behavior** tab.
   e. Enable the **Enable recommendations** toggle switch.
10. **Optional:** Add custom logic when passing a search query parameter to the AI Search by passing a function callback as the value for a parameter `getAISRecommendationsContext`.
    The following example shows the modified code to generate proactive recommendations with the custom logic for passing a search context query.

```
‹script
 src="https://
example.service-now.com/scripts/sn_csm_ec.js"></script>
  ‹script>
  SN_CSM_EC.init({

 moduleID:"https://instancename.service-now.com/<sys_id>",
              loadFeature: SN CSM EC. loadEMFeature(),
              enableRecommendations: true,
              getAISRecommendationsContext: function
 getSearchQuery(){
              //Insert your code here to fetch the search
 query string return product xyz
}

  };
  </script>
```

11. Save and publish the HTML file.

Result

Engagement Messenger shows recommendations based on the context provided by the third-party website.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:
The following example shows the modified code to generate default proactive recommendations for the default context.

```
‹script
 src="https://
example.service-now.com/scripts/sn_csm_ec.js"></script>
  ‹script>
  SN_CSM_EC.init({

 moduleID:"https://instancename.service-now.com/<sys_id>",
              loadFeature: SN CSM EC. loadEMFeature(),
              enableRecommendations: true
             }

  };
  </script>
```

Create an identity provider (IdP) for Engagement Messenger

Create an IdP for your Engagement Messenger so that you can enable customer authentication. You can create an IdP for either the OpenID Connect (OIDC) or Security Assertion Markup Language (SAML) authentication type.

Before you begin
Role required: admin

About this task
If you previously configured an IdP, you can ignore this task and reuse the existing IdP.

Note:
If you have configured multiple IdPs on your instance and want to select a specific IdP for your Engagement Messenger module, do the following:

- Enable Engagement Messenger on a website when third-party application cookies are blocked
- Custom URL with Identity Provider
- If you have multiple IdPs on your instance:
  - In case of OIDC authentication type, the generated ID token should contain the client ID of a IdP record against which authentication is required.
  - In case of SAML authentication type, set the particular IDP record as Auto-redirect IdP.

Note:
For more information, see Setting up auto login and logout for Engagement Messenger.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Administration** > **Identity Providers**.
2. Select **New**.
3. Select either **OpenID Connect** or **SAML**.
   - If you select **OpenID Connect**, follow the procedure in Create an OpenID Connect (OIDC) configuration for Single Sign-On (SSO).
   - If you select **SAML**, follow the procedure from step 3 in Create and update identity providers.

What to do next

- When customers sign in to your website where the Engagement Messenger module is deployed, they must also be authenticated within the messenger. User authentication is done by using the same IdP that authenticated the customer's login into your website.

  You must verify that the customers of your website are also added in your OIDC or SAML authentication provider for the ServiceNow instance.

- Enable cross-domain requests between Engagement Messenger and your website. For more information, see Configure a CORS rule for Engagement Messenger.

How to set up OIDC provider on ServiceNow instance

Configure a CORS rule for Engagement Messenger

Configure a cross-origin resource sharing (CORS) rule to enable cross-domain requests between Engagement Messenger and your website where you want to deploy the messenger.

Before you begin

Role required: admin

You must complete the following tasks:

- Configure Engagement Messenger.
- Create an identity provider (IdP) for Engagement Messenger.

About this task

Use the Engagement Messenger API and your website URL to create a CORS rule.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Administration** > **CORS Rules**.
2. Click **New**.
3. On the form, fill in the fields.

CORS Rule form

Field	Description
Name	Unique name for the CORS rule.
Application	Application scope for this record.
REST API	Engagement Messenger REST API that this CORS rule applies to. Set this field to **Engagement Center API [sn_csm_ec/engagement_center_api]**.
Domain	Domain that sends the request to this REST API. Set this field value to the URL of the website where you want to deploy the messenger. For example, **https://www.example.com**.

Field	Description
Max age	Number of seconds to cache the client session. After an initial CORS request, further requests from the same client within this time do not require a preflight message. If you do not specify a value, the default value of 0 indicates that all requests require a preflight message.
HTTP Methods	Allowed HTTP methods. Enable the GET and POST methods.
HTTP Headers	Comma-separated list of HTTP headers to send in the response. You can leave this field empty.

4. Select **Submit**.

What to do next
Create HTTP response headers for Engagement Messenger.

Create HTTP response headers for Engagement Messenger

Configure a name-value pair for HTTP response headers for the Engagement Messenger module. The ability to configure and pass response headers enables special handling of the page content by a client, which is most typically a browser.

Before you begin
- Configure Engagement Messenger.
- Create an identity provider (IdP) for Engagement Messenger.
- Configure a CORS rule for Engagement Messenger.
- Role required: admin

About this task
Use the Engagement Messenger API and your website URL to create a CORS rule.

Procedure
1. Navigate to **All** > **Engagement Messenger** > **Administration** > **HTTP Response Headers**.
2. Select **New**.
3. On the form, fill in the fields.

HTTP Response Header form

Field	Description
Active	Option for indicating that this HTTP response header configuration is active.
Application	Application scope for this record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies to	Type of record that the HTTP response header configuration applies to. Select **Specific Type** to indicate that this HTTP response header configuration is for the specific type and record that you select in the **Type** and **Record** fields.
Type	Type of record that the HTTP response header configuration applies to. Select **Service Portal** to indicate that the records are related to the Service Portal.
Record	Engagement Messenger module record that the HTTP response header configuration applies to. Select a record: **a.** Select the Search ( ) icon to access the Select the document pop-up form. **b.** In the **Table name** field, ensure that the value is set to **Service Portal**. **c.** In the **Document** field, select the Search ( ) icon. **d.** From the list of Service Portal records, select the messenger module that you configured. **e.** Select **OK**.
Name	Name for the name-value pair for the HTTP response header. Set this field value to **Content-Security-Policy**.
Value	Value for the name-value pair for the HTTP response header. Set this field value to **frame-ancestors 'self' <enter your website URL>**. For example, **frame-ancestors 'self' https://www.example.com**.
Description	Detailed description for the HTTP response header.

HTTP Response Headers

Activate an Engagement Messenger module

Activate the Engagement Messenger module that you configured so that you can embed it in your website.

Before you begin

Role required: sn_csm_ec.ec_admin

Perform the following tasks:

- Configure Engagement Messenger.
- Create an identity provider (IdP) for Engagement Messenger.
- Configure a CORS rule for Engagement Messenger.
- Create HTTP response headers for Engagement Messenger.

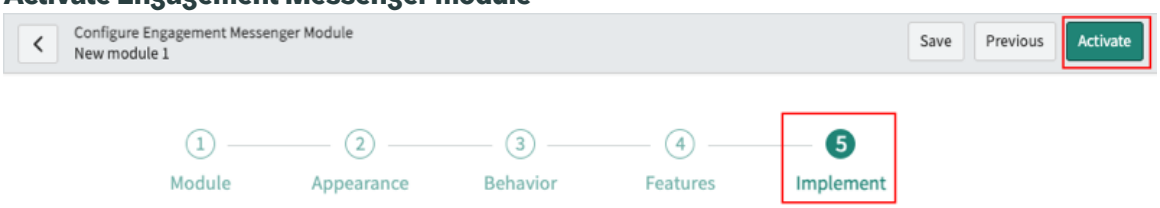
About this task

Unless you activate a messenger module, it would not be available for your customers to use from within your third-party website.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. In the Edit module column of the messenger module that you want to activate, click **Edit**. The guided configuration view is displayed.
3. Select the **Implement** step.
4. Select **Activate**.

Activate Engagement Messenger module



What to do next

Embed Engagement Messenger in your web application.

Embed Engagement Messenger in your web application

Embed the source code of the messenger module that you configured in your website so that you can enable your customers to start using Engagement Messenger in your website.

Before you begin

- Activate an Engagement Messenger module.
- Role required: sn_csm_ec.ec_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Copy the source code of the messenger module that you activated and paste it in the HTML file of the website where you want to deploy the messenger.

Next, depending on the authentication type that you selected for your configured messenger module, you may have to write code for functions to get the ID token and to start and stop the session for a logged-in user in the messenger.

Procedure

1. Navigate to **All** > **Engagement Messenger** > **Modules**.
2. In the Edit module column of the messenger module that you want to install in your website, click **Edit**.
   The guided configuration view is displayed.
3. Click the **Implement** tab.
4. If you have done any changes to the Security settings section, click **Save**.
   The code of the Engagement Messenger module is updated.
5. Scroll down to the Embed code section and click **Copy code**.
