Starting with version 21.0.x, you can create action tasks for a regulatory task when the task is in any of the following states:

- New
- Work in Progress
- Implementation

You can now break down a regulatory task into smaller, manageable components so that you can more efficiently track and execute the required activities. You can plan, assign, and monitor tasks now in a structured manner that supports your compliance objectives and regulatory requirements.

The regulatory action tasks are created as a follow-up to complete the changes that have been identified as part of the impact assessment for regulatory change tasks. Once these specific changes are identified, you can create and manage these action tasks as a manager or user.

You can perform common user-actions like **Enter**, **Choose**, **Select**, **Attach**, **View**, **Add**, **Associate**, and **Unlink**.

Procedure

1. Navigate to **Application** > **Regulatory Change Management** > **Action Tasks** > **All action tasks**.
2. Select a task.
3. On the form, fill in the fields.

Regulatory Action Tasks form

Field	Description
Regulatory Task	Number of the regulatory task.
Category	Category type of the action task, such as compliance or risk.
Assignment Group	Group that is assigned the action task.
Priority	Priority of the action task.
Due date	Due date of the action task. Past dates are not allowed.
Compliance action target	Specific GRC record to be selected. For example, Authority Document, Citation from the list menu, and the associated document.
Assigned to	User who is assigned the task.
Short description	Short description of the action task.
Instructions	Instructions for the action task.
Activity Journal	
Watch list	List of users who receive notifications about the updates.
Work notes	Log of the work notes.
Worknotes list	Users who receive notifications about the work notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can update the following fields:

- **Category**
- **Action target**
- **Short description**
- **Instructions**
- **Work notes**
- **Worknotes list**
- **Watch list**

4. Click **Save**.
   The action task is saved and it is displayed under the Action Tasks tab in the Regulatory Change Tasks page.

Create an issue related to the regulatory tasks

Create an issue as part of the regulatory change tasks and source document tasks workflow to capture any problems or exceptions that are observed during the workflow. You can create and view issues related to regulatory tasks using the issues related list.

Before you begin

Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user

About this task

A new module titled as Issue is introduced in the Regulatory Change Management application.

Procedure

1. Navigate to **Application** > **Regulatory Change Management** > **Issue** to create and view issues related to the regulatory tasks using the issues related list.
2. Use the following modules to get a filtered list of the issues.

Create and view issues related to Regulatory Tasks

Field	Description
My Open Issues	View open issues assigned to a user.
All Open Issues	View all open issues assigned to a user.
All Unassigned Issues	View all unassigned issues assigned to a user.
All Grouped Issues	View all grouped issues assigned to a user.
All Issues	View all issues related to the Regulatory Tasks.

Result

You can view the issues related to the Regulatory tasks in the respective modules.

What to do next

For information about how to enable or disable menu items, see Enable/disable application menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete an issue

Delete any issue if it's a part of a regulatory change task or a source document task if it's no long required.

Before you begin

Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user

About this task

Delete an issue that is no longer required.

Procedure

1. Navigate to **Application** > **List** > **Issues** > **All issues**.
2. Select the issue that you want to delete.
3. Select **Delete** from the **More Actions** menu.
4. Read the warning message in the Confirmation dialog and select **Delete**.
   The selected issue is deleted.

Result

You can no longer view the deleted issue in the issues list.

Regulatory Change Management Core UI

The ServiceNow® Regulatory Change Management application enables you to check upcoming regulatory changes, assess their impact, and implement risk and compliance-related changes. The application ensures overall regulatory compliance.

Use the features and capabilities of the Regulatory Change Management application user interface such as setting up regulatory alerts, performing impact assessment, creating regulatory change tasks, creating action plan, managing action tasks, and closing of the regulatory change tasks to manage the regulatory changes across your organization.

Regulatory alerts

Regulatory alerts are an aggregation of different regulatory events and documents that are sourced from multiple regulatory intelligence providers. Similar to web feeds, a regulatory alert is a record of these regulatory changes. Such changes are frequently updated, and the alerts help you stay informed about the regulatory landscape.

The Regulatory Change Management application transforms and maps the alerts. The application provides the information in regulatory alert tables.

The Regulatory Change Management life cycle starts with the regulatory alert record. Each regulatory alert record contains metadata that helps stakeholders to translate the changes, create an action plan, and implement actions to comply with the regulatory changes.

With the Regulatory Change Management application, you can use the regulatory alerts to inform the users about regulatory updates.

Types of alerts and associated regulatory tasks

Different types of alerts are displayed under the Regulatory Alerts module in the Regulatory Change Management application.

You can use the following types of regulatory alerts:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Regulatory event alerts: Signify alerts, provide updates to news, and provide insights on regulatory changes. Alerts are by default regulatory event alerts. All RSS feeds result in a regulatory alert record.
- Source document alerts: Signify changes to the citations. Citations are like various sections of an authority document. ServiceNow® GRC offers the Network Frontiers Unified Compliance Framework (UCF) integration. The integration creates authority documents after the import, and it creates corresponding citations under each authority document. When an existing citation is updated or a new citation is inserted, it signifies a change in the source document. Source document alerts are only available when integrating with a third-party regulatory intelligence provider; for example, Thomson Reuters.

The difference between a regulatory event alert and a source document alert is scope. Regulatory event alerts signify general alerts for general changes and for upcoming regulatory changes. In contrast, source document alerts signify changes that are specific to the citations. When an existing citation is updated or a new citation is inserted, it signifies a change in the source document.

The different types of alerts each involve a separate set of regulatory tasks. These tasks are created whenever a user with the sn_grc_reg_change.user or sn_grc_reg_change.admin role takes an alert and then marks it as applicable. These tasks are the following:

- Regulatory change task: This task is created for regulatory event alerts. The task is used to evaluate the changes and to update the GRC objects, such as policies, controls, and risk statements in the library.
- Source document import task: This task is created for source document alerts. The task is used to update an existing citation or to insert a new citation that is received from the provider into the regulatory library.

Alerts and user roles

Alerts can have different states. The main property of an alert is whether it's assigned or unassigned. For assigned alerts, the **Coordinator** field has a value. An alert can be assigned either to a user with the sn_grc_reg_change.manager role or the sn_grc_reg_change.user or sn_grc_reg_change.admin role. In contrast, an unassigned alert isn't assigned to anyone.

You can do various actions on unassigned alerts. These actions are the following:

- Update
- Applicable
- Defer
- Initiate Impact Assessment
- Not Applicable
- Cancel Regulatory Alert
- Delete

When an unassigned regulatory event alert is marked as applicable, a regulatory change task is created. When an unassigned source document alert is marked as applicable, a source document import task is created.

When an unassigned alert is marked as not applicable with due comments, its state is updated as Closed in the regulatory alert form.

Assigned alerts can have different states. These states are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- New
- Deferred
- Impact Assessment
- In Progress
- Closed

In terms of user roles, all alerts can be accessed by users with either the sn_grc_reg_change.admin role or the sn_grc_reg_change.manager role. Users with the sn_grc_reg_change.user role can view assigned alerts that are assigned to them, but they can't view unassigned alerts or alerts that are assigned to other people.

Table cleaners for regulatory alerts

The alert records that are marked as not applicable must be cleaned at regular intervals. The Regulatory Change Management application provides table cleaners for cleaning the alert records automatically. Users specify the time and frequency for the cleanup activity. Only users with the sn_grc_reg_change.admin role can perform cleanup activities.

Similarly, registry file records that have been processed can be cleaned at specified time intervals.

Perform actions on regulatory alerts

Perform various actions on unassigned and other types of regulatory alerts. For example, you can assign an unassigned alert, initiate impact assessment on an alert, and mark an alert as applicable, among other actions.

Before you begin

Role required: sn_grc_reg_change.manager or sn_grc_reg_change.user

About this task

A regulatory alert can be either a regulatory event alert or a source document alert. Some actions can be done on either type of alert, but some actions can only be done on regulatory event alerts. Users and managers can do many of the same actions, but there are some actions that can only be done by managers.

Managers can assign fields to the appropriate user. The appropriate user can then assess the applicability of the alert, initiate impact assessments, and complete the assigned regulatory tasks.

In the following procedure, steps 3 and after describe the various actions that you can take as a manager or user.

Procedure

1. Navigate to **All** > **Application** > **Regulatory Change Management** > **Regulatory Alerts**.
2. To assign an unassigned alert, select an alert in the Unassigned Alerts module.
   With the sn_grc_reg_change.manager role, you can set the **Coordinator** field to an appropriate user who has the sn_grc_reg_change.user role.
   This action moves the alert to the All Assigned Alerts module.
3. To save and update the changes to the alert record, select **Update**.
4. To defer an alert to a later date, do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Defer**.

b. Select a future reminder date and add a reason for the deferral.

c. Select **Submit**.
The alert is moved to the **Deferred** state in the application. Assigned users receive an email on the selected deferral date as a reminder to work on the alert. They can also cancel the alert.

5. To initiate an impact assessment on the alert, select **Initiate Impact Assessment**.
This action is available only to managers and users of regulatory event alerts. This action is not available for source document alerts.
6. If the impact of the alert is not applicable to the organization, select **Not Applicable**.
Specify a reason for marking the field as not applicable.
The alert moves to the **Closed** state.
7. To cancel the alert, select **Cancel Regulatory Alert**.
This action is available to managers and users of regulatory event alerts, and to managers of source document alerts; but it is not available to the users of source document alerts.
This action moves the alert to the **Cancelled** state. The alert is moved to the Closed Alerts module.
8. To reassign an assigned alert to another user with the sn_grc_reg_change.user role, select **Reassign**.
9. To delete an alert, select **Delete**.

Add an AI-recommended citation to a regulatory alert

Add an AI-recommended citation to a regulatory alert by using the GRC: Predictive Intelligence application.

Before you begin
Role required: sn_compliance_admin or sn_compliance_manager

About this task
Traditionally, citations were downloaded from a third-party provider but only the users with subscription licenses could download the citations from those third-party-providers or you could create citations from an authority document by using Compliance Workspace.

Procedure
1. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
2. Select the List icon ( ).
3. Select **Regulatory alerts**.
4. Select a regulatory alert to open it.
Regulatory alerts can be either a regulatory event or a source document.
5. Select **Recommended actions**.

Note:
The **Recommended actions** option is available only for a regulatory-event alert that is categorized as a regulatory-event type.

6. Within each AI-recommended citation, select **Associate** to associate the citation to the regulatory alert.
The recommended citation card displays the following details:
   - A score that indicates the confidence level of the generated citation.
   - Name of the citation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Description of the citation.
- The authority document to which the citation belongs.

7. Repeat the previous step for all the citations that you want to associate with the opened regulatory alert.
   The selected citations are associated with the regulatory alert.

Manage and assign regulatory event alerts

Assign regulatory event alerts that are received from the regulatory intelligence provider to an appropriate user. You can review other properties of the regulatory event alert.

Before you begin

Role required: sn_grc_reg_change.manager

About this task

Regulatory alerts are displayed under the Regulatory Alerts module in the Regulatory Change Management application.

As a manager, you can view and assign the regulatory event alerts to users with the sn_grc_reg_change.user role. The user can then perform actions on the regulatory event alerts.

Procedure

1. Navigate to **All** > **Application** > **Regulatory Change Management** > **Regulatory Alerts** > **Unassigned Alerts**.
   All the regulatory alerts in your instance are displayed. You can view the unassigned alerts and assign them to a specific user. An incoming alert is automatically assigned to the New state.
2. In the regulatory alert list, select a regulatory event alert by using the Type column.
   The alert record for the regulatory event alert is displayed.
3. To assign the alert, set the **Coordinator** field to the appropriate user.
   You can review the other properties of the alert to help you determine the appropriate user to assign to.

Regulatory Alert form

Fields	Description
Title	Title of the alert as received from the provider.
Source	Source of the regulatory alert.
Description	Description and a brief summary of the event.
Provider	Name of the regulatory alert provider.
Provider URL	URL of the alert that is received from the provider.
Regulatory body URL	URL of the regulatory body that is associated with the alert.
Coordinator	List of regulatory managers to whom you can assign the alert.
Overall impact	Overall impact of the field. ○ No impact ○ Low ○ Medium

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	○ High ○ Critical
Type	Type of regulatory alert. ○ Regulatory event ○ Source document
Dates	
Source publication date	Date when the particular regulatory event is actually published by the regulatory body.
Comments date	Date until when the comments can be provided for the regulatory event.
Effective date	Date when the particular regulatory event will be applicable.
Compliance date	Date by which the regulatory event will be compliant.
Expiration date	Date when the particular regulatory event will expire.
Series data	
Series name	Name of the series related to the regulatory alert.
Sequence number	Sequence number related to the regulatory alert.
Activity Journal	
Additional comments	Additional comments related to the alert.
Related lists	
Regulatory Tasks	Related tasks for the alert. This field is available only when a alert is assigned to a coordinator and it is in In Progress state.
Related Documents	Details of the documents related to the alert, such as a citation, title, or type.
Impact Assessments	Impact assessment details that are associated with the regulatory event alert.

4. Select **Update**.

Result

The regulatory event alert is assigned to the selected user and it is listed under the **All Assigned Alerts** module in the application.

Train and use the similarity solution to recommend citations on regulatory alerts

Train and use the machine learning solution by activating the Governance, Risk, and Compliance Predictive Intelligence plugin. The solution enables the system to automatically recommend correct citations on regulatory alerts to associate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Make sure that the following plugins are activated.

- GRC Profiles
- Predictive Intelligence

Role required: ml_admin

Procedure
1. Navigate to **Similarity** > **Solution Definitions**.
2. Select the **Recommend citations on regulatory alerts** solution.
3. On the Similarity Definition form, fill in the fields.
   For a description of the fields, see Similarity Definition Form.
4. Select the appropriate button for the solution definition.

Auto-assign configuration for regulatory alerts

Set up an assignment configuration record to enable auto-assignments for regulatory alerts of the type regulatory event.

Before you begin
The GRC: Assignment and Approval Configurations (sn_grc_appr) application for approval and assignment configurations is installed with the GRC: Compliance Case Management application.

Role required: sn_grc_appr.admin, sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager

About this task
You can now route regulatory alerts to domain experts who can promptly address compliance issues within their ares of specialization. This ensures proactive management of regulatory risks and obligations.

Procedure
1. Navigate to **All** > **Assignment and Approval Configurations** > **Assignment Configurations**.
2. Select **New**.

   The Assignment configuration New Record is displayed.
3. On the form, fill in the fields.
   For information on the fields in the form, see Assignment Configuration New Record.

   Note:
   You cannot have more than one approval configuration applying to the table with the same priority.
4. Select **Submit**.

Similarity Definition Form

Use the Similarity Definition Form form in Compliance Workspace to create a similarity definition for regulatory compliance mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Similarity Definition form

For a description of the field values, see the following table.

Similarity Definition form

Field	Description
Label	Unique name for the similarity solution.
Name	Name of the similarity solution. This field is automatically set to the system-assigned name that is the most similar to your value for the **Label** field.
Word Corpus	Existing word corpus that is relevant to your solution. For this use case, select the **Word Corpus for Issue Assignment** word corpus. **Note:** For word corpora in similarity solutions, the number of records according to table is limited to 300,000.
Table	Table that contains the records that you want to train against and to predict for. When you assign a table value, a link appears in the form. The link shows the number of records that match your current conditions. For this use case, the field is automatically set to the [sn_compliance_citation] table. Don't modify this field for this solution definition.
Fields	Field types that are likely to help in recommending the citations. You can select the columns from the table in the **Table** field so that their data helps in predicting the citations more accurately. In this use case, the **Name**, the **Document Name**, **Document Description**, and **Description** fields are selected. These fields are the field types that contain the citation records that you want to recommend. **Note:** You can modify the fields selected here if there are other non-empty important fields on the issue record in your database, such that these fields can help in finding out similar citations for mapping to the regulatory alerts.
Test Table	Table that contains the citations that you want to predict for. For this use case, the field is automatically set to the Issue [sn_grc_reg_change_regulatory_feed] table. **Note:** The number of records which the Similarity window can retrieve is limited to 10. This field must not be modified for this solution definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Similarity Definition form (continued)

Field	Description
Test Fields	Fields which are used as input during prediction. In this use case, select **Title** and **Description**. **Note:** You can modify the fields selected here if there are other non-empty important fields on the issue record in your database, such that these fields can help in finding out similar issues for predicting the issue owners.
Filter	Leave this field empty.
Processing Language	Dominant language of the dataset that you are training on the solution definition. If the dataset language is English, choose **English**. By default, English processing is applied to all datasets. For example, if you select **English**, the system processes the data in both English and Italian. **Note:** The term processing indicates some of the language-specific steps that are used as part of training a solution. These steps include tokenizing words, removing stop words, and stemming.
Stopwords	List of stopwords. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is English, the **Default English Stopwords** option appears. The Default English Stopwords list also appears in your selection. You can add your own custom list of stopwords.
Training Frequency	Frequency of training. The retraining option can range is 180 days.
Update Frequency	Frequency of how often you want to refresh the data that you use to retrieve your similarity results. For example, new citations typically occur frequently throughout the day. If you have new citations, you may want to select an update frequency of **Every 15 minutes**. This frequency can increase the likelihood that new citations are included in the refresh.

Manage and assign source document alerts

Assign source document alerts that are received from the regulatory intelligence provider to an appropriate user. You can review other properties of the source document alert.

Before you begin

Role required: sn_grc_reg_change.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

As a manager, you can view and assign the source document alerts to users with the sn_grc_reg_change.user role. The user can then perform actions on the source document alerts.

Procedure

1. Navigate to **All** > **Application** > **Regulatory Change Management** > **Regulatory Alerts** > **Unassigned Alerts**.
   All the regulatory alerts in your instance are displayed. You can view the unassigned alerts and assign them to a specific user. An incoming alert is automatically assigned to the New state.
2. In the regulatory alert list, select a source document alert by using the Type column.
   The alert record for the source document alert is displayed.
3. To assign the alert, set the **Coordinator** field to the appropriate user.
   You can review the other properties of the alert to help you determine the appropriate user to assign to.

Regulatory Alert form

Fields	Description
Title	Title of the source document type of alert as received from the provider.
Citation	Citation number for the source document that is received from the alert provider.
Provider URL	Provider URL for the alert.
Regulatory body URL	URL of the regulatory body that is associated with the alert.
Provider	Name of the alert provider.
Coordinator	User who is assigned the alert.
State	State of the alert.
Type	Type of the regulatory alert. For example, source document.
Taxonomy	
Regulatory body	Organization that exercises a regulatory function, such as a government agency.
Sector	Different business segments for your organizations, such as banking and insurance.
Theme	Broad topics that you can use to classify your regulatory content. Possible themes are Privacy, Operational Resilience, and Regulatory Filings.
Jurisdiction	Location where a regulatory or legal body can extend the legal authority.
Content type	Different categories of content that a regulatory body can issue, such as legislative materials, regulations, and rules.
Dates	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Source publication date	Date when the particular regulatory event is actually published by the regulatory body.
Effective date	Date when the particular regulatory event will be applicable.
Expiration date	Date when the particular regulatory event will expire.
Comments date	Date until when the comments can be provided for the regulatory event.
Compliance date	Date by which the regulatory event will be compliant.
Activity Journal	
Additional comments	Additional comments related to the alert.
Activities	Log of the activities related to the alert.

4. Select **Update**.

Result

The source document alert is assigned to the selected user and it is listed under the **All Assigned Alerts** module in the application.

Regulatory change tasks

When a manager or user marks an unassigned alert as applicable, a regulatory change task is created. A regulatory change task is used by the stakeholders to analyze and identify the changes that should be performed on the alerts. The stakeholders can then create action tasks.

A regulatory change task serves as the parent for all the action tasks that have been created to complete the identified changes. For example, an action task can involve making updates to the policies, controls, and risk statements in the regulatory library.

A manager with the sn_grc_reg_change.manager role assigns a regulatory change task to an identified user with the sn_grc_reg_change.user role in the system. The regulatory change task displays the details of the task such as the assignment group, the approver, the assignee, and other relevant information.

After a regulatory change task is completed, the associated regulatory alert can be closed.

Users and associated actions for the regulatory change tasks

Managers with the sn_grc_reg_change.manager role and the users with the sn_grc_reg_change.user role can view and perform certain tasks in the Regulatory Change Tasks module.

Views and actions available to managers

Managers with the sn_grc_reg_change.manager role can view the following tasks in the Regulatory Change Tasks module:

- All Assigned Tasks
- Unassigned Tasks
- New Tasks
- Respond Tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Pending Approval Tasks
- Implementation Tasks
- Closed Tasks
- My Approvals

Managers can perform the following actions on a regulatory change task:

- Assign the regulatory change task to a user with the sn_grc_reg_change.user role.
- Add instructions for the assignee on the task.
- Get added to the watchlist.
- Add work notes.
- Add a future due date to complete the work on the regulatory change task.
- Add an approver, typically another manager, to approve the regulatory change task.
- Update the work notes.

Views and actions available to other users

Users with the sn_grc_reg_change.user role can view the following tasks in the Regulatory Change Tasks module:

- New Tasks
- Respond Tasks
- Pending Approval Tasks
- Implementation Tasks
- Closed Tasks

If the user is assigned the regulatory change task, then the user can log in and perform the following actions on the regulatory change task:

- View the regulatory change task under New tasks.
- Update the work notes.
- Select **Respond** to move the task to the Respond state.
- Verify if an action task should be created for the regulatory change task.
- Evaluate if the incoming alert has an impact on the GRC library of the current system.
- View the details of the impact assessment performed by entity owners.
- Create necessary action tasks that are related to the Compliance and Risk areas in the GRC library, and then assign them to an appropriate group.

Manage the regulatory change tasks

Manage the regulatory action tasks in the Regulatory Change Tasks module so that you can use these tasks to identify and comply with the regulatory changes.

Before you begin
Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user, or sn_grc_reg_change.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Regulatory change tasks are automatically created whenever a regulatory event alert is marked as applicable after the applicability assessment. Regulatory Compliance team members craft an action plan to identify the changes that need to be implemented so that your organization complies with the regulatory change.

Procedure

1. Navigate to **All** > **Application** > **Regulatory Change Management** > **Regulatory Change Tasks**.
2. Select a regulatory change task.
3. On the form, fill in the fields.

Regulatory Change Task form

Field	Description
Assignment group	Assignment group of the task. The group is selected from the Group Hierarchy table.
Assigned to	Name of the user who is assigned the task.
Approver type	User or group who approves the task.
Approver	Approver of the regulatory change task. When the approver type is Group, the request is sent to the group members.
Due date	Due date for the regulatory change task.
Approved on	Date when the regulatory change task is approved.
Regulatory alert	Name of the regulatory alert.
Instructions	Instructions for the task.
Watch list	Watch list to add interested users.
Worknotes list	Users interested in the work notes.
Work notes	Log of the work notes.
Activities	Log of the activities.
Related list	
Action Tasks	Regulatory action tasks. Select **New** to create a regulatory action task in response to the regulatory change task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If there are regulatory action tasks that are in progress when the parent regulatory task is closed manually, all the associated regulatory action tasks are moved to the Cancelled state with the following warning message: `Action tasks for this Regulatory Change Task/ Document Import Task are in-progress. Clicking OK will cancel them. Do you want to proceed?` If there are no regulatory action tasks associated or if the regulatory action tasks are closed, the following message is displayed: `Are you sure you want to close this task? Click OK to close the task.`
Issues	Issues observed during the regulatory change workflow or source document workflow.
Approvers	Approval records that get created when an approval is requested.

4. Click **Update**.
5. If you want to add new action tasks that are related to the regulatory change task, click **New** in the Action Tasks related list.
6. To request an approval on the regulatory change task, log in as an approver and click **Request Approval** to request an approval.
   The state of the regulatory change task is updated to the **Awaiting Approval** state. In the Approvers related list of the regulatory change task, the state of the approval is updated to **Requested**. The manager with the sn_grc_reg_change.manager role, the user with the sn_grc_reg_change.user role, or the admin user with the sn_grc_reg_change.admin role can view the request in **My Approvals** of the regulatory change tasks.
7. Select **Approve** to approve the request.

Result

The request is approved. The regulatory change task moves to the Implementation state. When the action task associated with the regulatory change task is completed, the regulatory change task is closed.

Source document import tasks

The Regulatory Change Management application processes the alerts that are externally sourced. Source document import tasks are automatically created whenever a source document alert record is marked as applicable. The source document can refer to the legislative and regulatory materials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a source document type of regulatory alert is received, it provides the citation title and the number of the citation. The citation may already be available in the GRC library or it can be a newly created citation. Each alert record contains metadata about the source document that helps the key stakeholders to import the record into the regulatory library. The metadata includes the citation name and other information.

Source document alerts are used to create source document import tasks. A source document import task is used to ingest a particular source document that is received from the provider into the regulatory library. This task is performed by the Compliance team members. They import a source document into the regulatory library in ServiceNow as a citation object.

A source document import task is created from a regulatory alert record. The task goes through the source document import workflow or life cycle.

1. All the unassigned alert records that are of source document type are assessed for applicability.
2. If a source document alert record is marked as applicable, a source document import task is automatically created.

The source document import life cycle starts from the regulatory alert record. When the manager with the sn_grc_reg_change.manager role marks an unassigned source document alert as applicable, a source document import task gets created.

Users can view the import document task in the Ready to Import state, evaluate the citation associated with the alert, and decide the future course of action for the import document task.

Users, associated actions, and states for the source document import tasks

Managers with the sn_grc_reg_change.manager role and the users with the sn_grc_reg_change.user, or sn_grc_reg_change.admin role can view and perform certain actions on the source document import tasks.

Views and actions available to managers

Managers with the sn_grc_reg_change.manager role can view and sort the following types of source document import tasks:

- All tasks
- Unassigned tasks
- All assigned tasks
- Ready to Import tasks
- In-progress tasks
- Implementation tasks
- Pending approval tasks
- Closed tasks
- My approvals

Managers can view the import document task under the My Approvals module.

Managers can perform the following actions on the source document alert:

- Assign the alert to a user.
- Update the alert with additional details.
- Reassign the alert to another user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Defer the alert to a later date by adding a reason and the comments.
- Mark the alert as applicable or not applicable after performing an initial assessment. This action changes the state of the alert to In Progress.

Views and actions available to other users

Users with the sn_grc_reg_change.user or sn_grc_reg_change.admin role can view the import document task under the Implementation Tasks.

Users can view the new source document alert under the New Alerts module.

Note:
For source document type of alerts, an impact assessment is not needed.

Users can perform the following actions on a new alert:

- Update the details of the alert.
- Mark the alert as applicable.
- Mark the alert as not applicable.

States of the source document import task

The states of the source document import task are the following:

- Ready to Import
- In Progress
- Awaiting Approval
- Implementation
- Deferred
- Closed

If the alert is marked as applicable, and if the source document task created as part of the process moves to the Closed state, then the regulatory alert record is automatically moved to the Closed state.

Manage the source document import tasks

Manage the source document tasks, the associated source document alerts, and other relevant details in the Regulatory Change Tasks module. Use these tasks to identify and comply with the source document changes.

Before you begin

Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user, or sn_grc_reg_change.admin

About this task

A source document import task is used to ingest a particular source document that is received from the provider into the regulatory library.

Procedure

1. Navigate to **All** > **Application** > **Regulatory Change Management** > **Source Document Import Tasks**.
2. Select a source document import task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

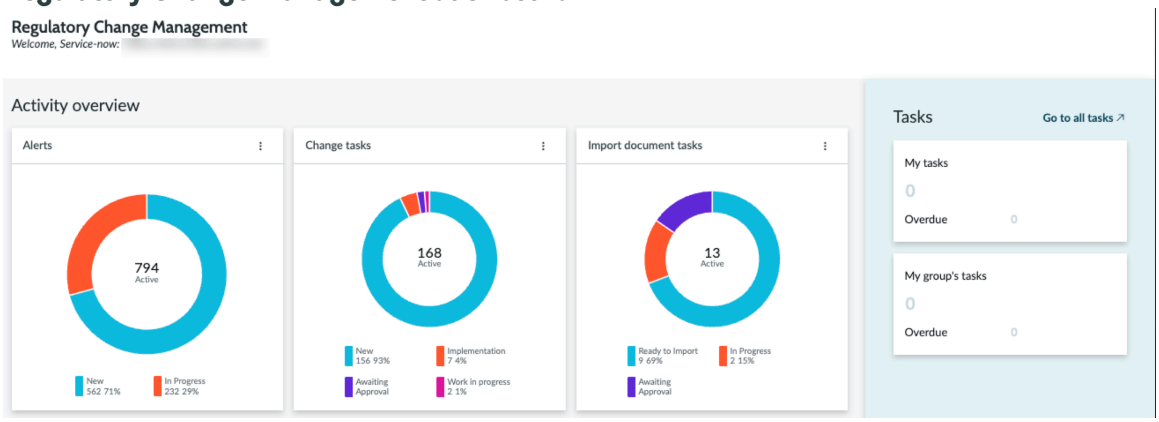
3. On the form, fill in the fields.

Source Document Import Task form

Field	Description
Assignment group	Assignment group for the record. The group is selected from the Group Hierarchy table.
Assigned to	Name of the person who is assigned the task.
Approver type	Approver type for the task. Choices are as follows: ○ **User** ○ **Group**
Approver	Approver of the source document import task. When the **Approver type** field is set to **Group**, the request is sent to the group members.
Due date	Due date for the source document import task.
Approved on	Date when the source document import task is approved.
Regulatory alert	Name of the regulatory alert.
Instructions	Instructions for the task.
Import Task	
Action	Action for the import task. ○ Update- to update an existing citation. ○ Insert- to insert a new citation.
Target citation	Search and look for a citation to update. Select New to insert a citation.
Activity Journal	
Watch list	Users whom you have added as watchers.
Work notes list	List of work notes made by users.
Work notes	Work notes or comments provided.
Related list	
Similar source documents	Records of similar source documents.
Action Tasks	Action tasks related to the import document tasks. Select **New** to add new action tasks.
Issues	Issues observed during the regulatory change workflow or the source document workflow.
Approvers	Approvers of the import document task. This list displays the approval records that get created when an approval is requested.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To apply your changes, do one of the following:
   - To update the selected source document import task, select **Update**.
   - To save the changes, select **Work in Progress**.
5. To request an approval for the source document import task, select **Request Approval**.



Result
A new citation is inserted or an existing citation is updated.

Regulatory Change Management dashboard

The Regulatory Change Management dashboard provides the current view of the regulatory landscape.

Note:
The Overview Dashboard in the Classic UI is no longer available from the Xanadu release.

Regulatory Change Management dashboard

Overview of regulatory changes

For examples of how different people in your organization would use this dashboard, see these use cases.

Dashboard use cases

User	Dashboard use
sn_grc_reg_change.manager	The RCM Manager can view the new regulatory Alerts and understand the state of the alerts and the different regulatory tasks. It also provides a calendar view of the regulatory tasks with their due dates.

The Overview page provides a summary of the regulatory events and tasks, such as the following:

- New Regulatory Alerts
- New Regulatory Change Tasks
- Overdue Regulatory Change Tasks
- Critical Action Tasks

- Regulatory Alert by State: Displays the alerts that are grouped by state, number, and percentage
- Regulatory Change Tasks by State: Displays the tasks that are grouped by state, number, and percentage
- Import Document Tasks by State: Displays the tasks that are grouped by state, number, and percentage
- Action Tasks: Groups and stacks the action tasks by the State and Priority fields
- Regulatory Change Tasks by Due Date: Displays a report of the regulatory change tasks

Managing regulatory tasks in Compliance Workspace

You can perform various regulatory tasks in the Regulatory Change Management application in Compliance Workspace and receive granular information on the tasks and alerts using the data visualization widgets.

The Regulatory Change Management workflow and the Regulatory Change Management process flow provide information on the regulatory tasks that are performed by the Regulatory Change Management application users to comply with the regulatory changes. See the Regulatory Change Management workflow and Regulatory process flow and tasks for more information.

You can perform the following GRC: Regulatory Change Management configuration tasks in Compliance Workspace:

- Assign the regulatory event alert to a Coordinator. For more information, see Assign a regulatory event alert to a coordinator.
- Assess the impact of the regulatory event alert, complete the assessment, and manage the regulatory change tasks associated with the alert. For more information, see Assess the impact of a regulatory event alert and Manage the regulatory change tasks.
- Assign the source document alert to a Coordinator. For more information, see Assign a source document alert to a coordinator.
- Manage the source document import tasks associated with the source document alert. For more information, see Manage a source document import task.
- Manage the action tasks that are associated with the regulatory event alerts and the source document alerts. For more information, see Create a new action task for the alert and Complete the action task associated with the alert.
- Create an issue related to a regulatory task. For more information, see Create or add an issue related to a regulatory task.
- Map the taxonomy. For more information, see Manage the taxonomy.

Regulatory alerts

The List view in the Regulatory Change Management application in the Compliance Workspace displays all the regulatory alerts received under the **Regulatory alerts** option in the menu. The **Unassigned alerts** list displays all the new and unassigned regulatory alerts. The Type column in the **Unassigned alerts** list displays the type of the regulatory alert.

The regulatory alerts are of two types:

Regulatory event alert

A regulatory event alert is a system notification that informs stakeholders about changes in laws or regulations affecting the organization's operations. These alerts

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

are a critical component of a firm's regulatory compliance framework, designed to ensure timely awareness and response to evolving legal and regulatory obligations.

Regulatory event alerts provide early visibility into developments that may necessitate updates to internal policies, procedures, controls, or risk management strategies. They help organizations maintain compliance, mitigate potential regulatory risks, and align internal practices with current legal requirements.

Regulatory event alerts provide real-time or near-real-time notifications to support proactive compliance management. These alerts help designated users such as compliance officers, legal teams, and business leaders take timely action. You can assess the regulatory change's impact and determine the appropriate next steps for the organization.

Source document alert

A source document refers to an official publication or authoritative record that provides essential information pertaining to laws, regulations, or regulatory guidelines. In Regulatory Change Management, source documents serve as the original and credible reference materials that inform an organization's understanding of legal and regulatory obligations.

These documents are issued by regulatory bodies or authorities and may include statutes, guidance notes, policy statements, consultation papers, regulatory updates, and enforcement notices.

Within Regulatory Change Management, source documents curated by Thomson Reuters Regulatory Intelligence (TRRI) are integrated to ensure users have access to reliable, up-to-date, and jurisdiction-specific regulatory content.

By linking regulatory alerts and compliance activities to the relevant source documents, organizations can ensure traceability, strengthen audit readiness, and maintain alignment with the latest regulatory expectations.

Select the title of a regulatory or source document alert in List view to open a new page displaying the alert's details.

Regulatory event alerts page

The regulatory event alerts page displays the following tabs and related lists by default:

- Overview tab
- Details tab
- Impacted areas
- Risk assessments
- Regulatory assessments
- Regulatory tasks

Source document alerts page

The source document alerts page displays the following tabs by default:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Differences between regulatory event alert and source document alert

A regulatory event alert informs you of a regulatory change, while a source document alert signals the release or update of the related official document.

The following table outlines the key differences between a regulatory event alert and a source document alert, highlighting their purpose, content, and usage within the compliance process.

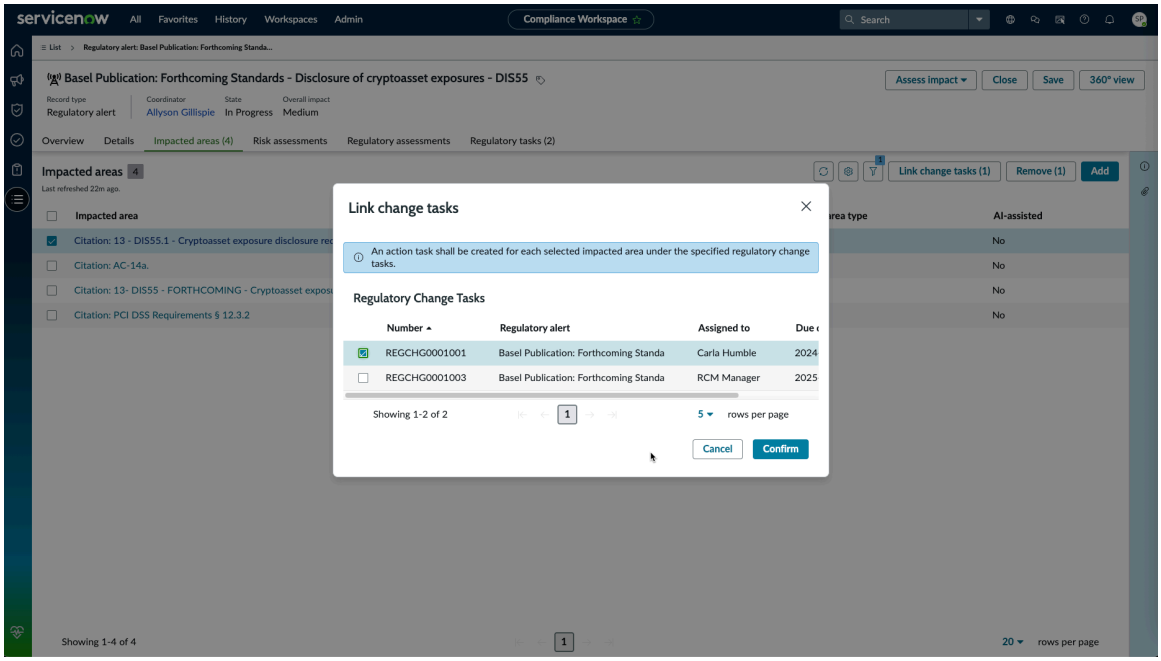
Regulatory event alert vs Source document alert

Aspect	Regulatory event alert	Source document alert
Definition	A notification about changes or developments in laws, regulations, or policies.	A notification about the publication or update of an official regulatory source document.
Purpose	To inform stakeholders of new or amended regulatory requirements that may impact compliance.	To provide access to authoritative documents that support or detail regulatory changes.
Content source	Curated updates based on analysis of regulatory developments (for example, by TRRI).	Derived directly from official documents published by regulators or authoritative bodies.
Nature of information	Summarized and contextual insights about a regulatory event.	Original, unaltered content from official sources such as laws, guidance, or notices.
Use case	Helps assess impact and determine compliance actions or next steps.	Serves as a reference for legal interpretation, policy updates, and audit traceability.
Example	Alert about a change in data privacy regulations in the EU.	Alert linking to the official EU regulation amendment document published by the authority.

Link Change tasks

Link Change tasks directly from the Impacted areas tab of a regulatory alert.

Before you begin



Role required: sn_grc_reg_change.user

Procedure

1. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
2. Go to **List** > **Regulatory alerts** > **All assigned alerts**.
3. Select and open the required regulatory alert.
4. Navigate to the **Impacted areas** tab on a regulatory alert.
5. Select the impacted areas for which you want to link change tasks.
6. Select **Link change tasks**.
7. Select the regulatory change tasks that you want to link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Confirm**.

Result

An action task is created for each selected impacted area and the specific regulatory change task. For example, if you select three impacted areas and two regulatory change tasks, then six action tasks are created.

Linking change tasks enables scalable task automation by generating action tasks for each impacted area and regulatory change task combination, confirming complete coverage and reducing manual effort.

Regulatory change tasks

When a regulatory alert is marked as applicable by the alert coordinator, manager, or administrator, the system initiates the creation of a regulatory change task. This task serves as a central point for stakeholders to determine the necessary modifications to organizational compliance practices.

The regulatory change task provides a structured process for evaluating regulatory updates and initiating corrective actions. Stakeholders use this task to identify what changes are required, which leads to the creation of one or more Action tasks. These action tasks represent the specific activities needed to implement the changes, such as updating relevant policies, controls, or risk statements within the regulatory library.

Each regulatory change task contains related action tasks. The action tasks get created to fulfill the identified requirements. This hierarchical relationship ensures traceability and accountability throughout the change implementation process.

If you have the `sn_grc_reg_change.manager` role, you can assign regulatory change tasks to users with the `sn_grc_reg_change.user` role. The task includes key information such as the assigned group, the designated assignee, the approver, and other essential task details.

You can create multiple regulatory change tasks for a single regulatory alert. Each task can represent a distinct area of regulatory impact or a specific category of required action. This approach enables organizations to break down complex regulatory updates into manageable workstreams.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Organizing work into separate regulatory change tasks enables teams to assign responsibilities more accurately based on specific subject matter expertise. This structure enables clear monitoring of progress on each individual task component. Separate regulatory change tasks help identify and manage dependencies between related activities more effectively.

A structured task distribution improves collaboration across teams and ensures accountability throughout the process. This approach also supports the timely completion of all required compliance actions. Linking multiple regulatory change tasks to a single regulatory alert improves traceability across all related activities. This linking enables stakeholders to view how various aspects of the regulatory alert are being addressed.

A regulatory task gets closed automatically on approval, indicating that all required steps have been successfully completed. Alternatively, you can manually close a regulatory task while it is in the Implementation state when all associated action tasks have been completed and closed.

After completing all regulatory change tasks and their associated action tasks, you can close the related regulatory alert. Closure of the alert confirms that all required compliance obligations have been successfully fulfilled.

Types of regulatory tasks

The following types of regulatory tasks are available in Regulatory Change Management:

- Business Change- for example, implementing a new process to comply with updated anti-money laundering regulations.
- Citation Amendment- for example, updating legal references in internal documentation due to changes in data protection laws like GDPR.
- Control Update- for example, modifying access control procedures to meet new cybersecurity compliance requirements.
- Policy Revision- for example, updating the organization's privacy policy to reflect changes in consent requirements under new regulatory guidance.
- Regulatory Reporting- for example, preparing and submitting revised financial disclosures to a regulatory authority in response to new reporting standards.
- Training Revision- for example, updating employee training modules to include recent changes in workplace harassment laws.
- Others-For example, establishing a new governance framework to manage cross-border data transfers in response to emerging regulatory expectations.
- None- Tasks that don’t fall under any specific predefined category, such as preliminary research or administrative setup tasks.

New workflow of a regulatory task

Upgrade the following applications to get the new workflow:

- GRC: Common Workspace Elements (`sn_grc_workspace`)
- GRC: Regulatory Change Management (`sn_grc_reg_change`)

Starting with version 21.0.x, a regulatory task progresses through the following states:

- New- The action task has been created but hasn’t yet been reviewed or acted upon. This is the initial placeholder for the task. Usually, a compliance analyst or a regulatory coordinator is responsible for reviewing and validating the task.
- Work in Progress- The task is under active assessment. The task owner is analyzing regulatory requirements and identifying impacted areas, business processes, or required changes. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

task assignee performs analysis, coordinates with stakeholders, and prepares the task for implementation.

- Implementation- The necessary changes identified (for example, policy updates, control modifications, or training revisions) are being implemented. Action tasks may be created and assigned to specific impacted areas. Usually, the business process owner executes required changes.
- Awaiting Approval (optional)- The implementation is complete and pending review or formal approval by designated stakeholders. This stage may be skipped if approval isn't required. An approver like compliance manager validates that the task was completed correctly and meets regulatory requirements.
- Closed- The task has been reviewed (if applicable), and all necessary actions are completed. The task is formally closed. A compliance analyst confirms that closure criteria are met and updates task status.

While in the Implementation state, requesting approval is optional. If all associated action tasks are completed, the regulatory task can be closed directly from the Implementation state without requiring additional approval.

Note:
After the upgrade:

- The first approval of a regulatory task in the Awaiting Approval state moves the task into the Implementation state.
- The first rejection of a regulatory task in the Awaiting Approval state moves the task into a Work In Progress state.

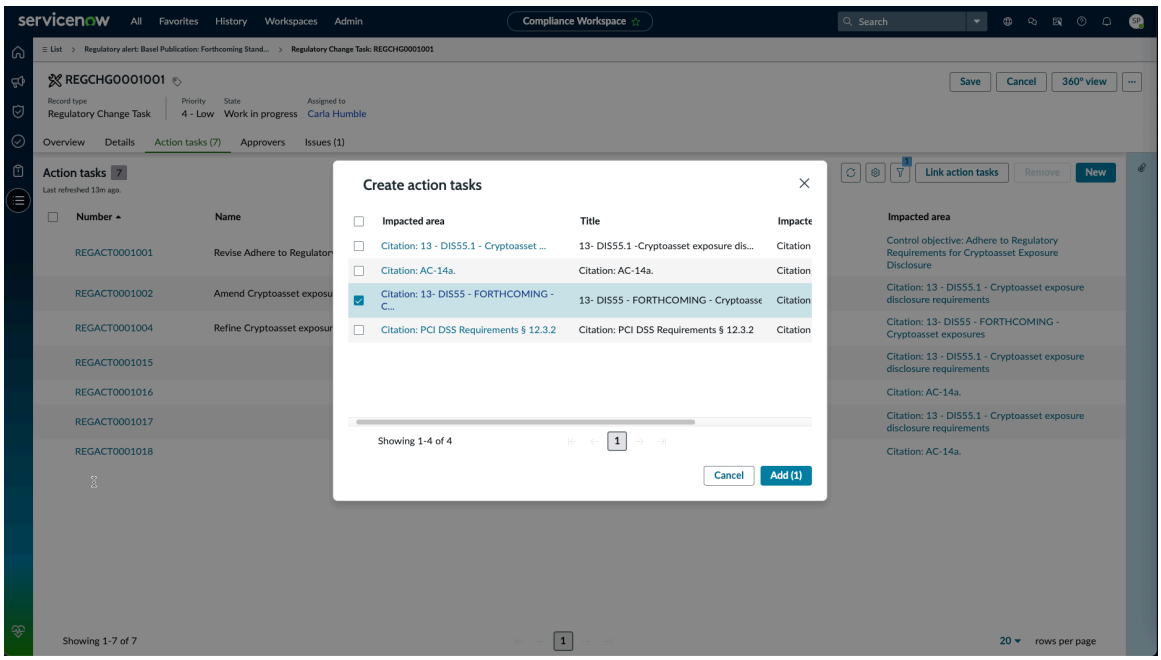
Create action tasks

Starting with version 21.0.x, you can create action tasks for a regulatory task when the task is in any of the following states:

- New- The regulatory action task has been newly created and is pending initial review or planning. You can create action tasks at this stage, for example, predefine tasks for anticipated impacted areas.
- In Progress- The action task is actively being worked on, and it includes analysis, defining impacted areas, and assigning responsibilities. Action tasks can be created and linked during this stage as findings and required actions are identified.
- Closed- The regulatory task has been completed and formally closed. However, retrospective action tasks can still be added, such as documentation updates or follow-up audits. You can still create action tasks at this stage, useful for tracking late or follow-up actions.

You can break down a regulatory task into smaller, manageable components so that you can more efficiently track and execute the required activities. You can plan, assign, and monitor tasks now in a structured manner that supports your compliance objectives and regulatory requirements.

For example, a new data privacy law requires updates across multiple departments. You break down the regulatory task into smaller components such as updating the privacy policy, revising employee training, and implementing new data access controls. This breakdown of tasks enables each team to track and complete their assigned tasks efficiently.



Link Action tasks

Link Action tasks for existing impacted areas from within a regulatory change task or directly through the regulatory alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_grc_reg_change.user

Procedure
1. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
2. Go to **List** > **Regulatory alerts** > **All assigned alerts**.
3. Select and open the required regulatory alert.
4. On the **Regulatory tasks** tab, select and open the required regulatory change task.
5. Navigate to the **Action tasks** tab on a regulatory change task.
6. Select **Link action tasks**.
7. Select the impacted areas for which you want to create action tasks.
8. Select **Add**.

Result
An action task is created for each of the selected impacted areas within the specific regulatory task.

Linking action tasks automates task assignment for each impacted area, ensuring accountability and streamlined execution of regulatory requirements across the organization.

What to do next
After the action tasks are created, the tasks appear in the list for the owners. The owner works on the action tasks and closes them.

Regulatory event alerts view

When you select a regulatory event alert in the List view in the Compliance Workspace, it displays the details of the alert on a new page. The details include the title of the alert, provider of the alert, its state, and other important information in the Overview tab and Details tab.

The regulatory event alerts page also displays the following tabs and related lists associated with the alert:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Overview tab
- Details tab
- Related documents list
- Impact assessments list

The following section provides more information on the tabs and the related lists that are associated with the alert.

Overview tab

Field	Description
Impact assessments	Details about the impact assessment of the alert such as entity, risk assessment, assessor, inherent risk, and state.

Taxonomy side-panel: The taxonomy side-panel displays the following taxonomy classes for the Regulatory event alert:

- Regulatory bodies
- Content types
- Jurisdictions
- Themes
- Sectors

Note:
The taxonomy classes are displayed only if the records have any values associated with them. For example, if the regulatory alert does not have any values for the taxonomy class Jurisdictions, the taxonomy category Jurisdictions is not displayed in the taxonomy side panel.

Impact radius for regulatory alerts of type regulatory event

Adding impacted areas to a regulatory alert of type regulatory event helps to calculate the impact radius of a regulatory alert. Impact radius typically refers to the extent to which a regulatory change affects an organization.

Impacted areas

The regulatory events that could have an impact on the compliance or risk posture of your organization should be assessed. Calculating the impact radius is a method for assessing the impact of the regulatory event on the GRC objects and for suggesting action tasks based on the assessment of the impact. The Regulatory Change Management application supports the impact radius calculation process for a regulatory alert. Calculating the impact radius is a method of automatically creating action tasks for the users.

Regulatory alerts are of two types:

- Regulatory event
- Source document

Prior to the Yokohama release, the Regulatory Change Management users had the option to add only one or more number of citations impacted due to any regulatory change. This led to sole reliance on only citations and omitted taking other business operations such as policies, control objectives, controls, risks, third-parties, and so on, into consideration. To address this problem, a

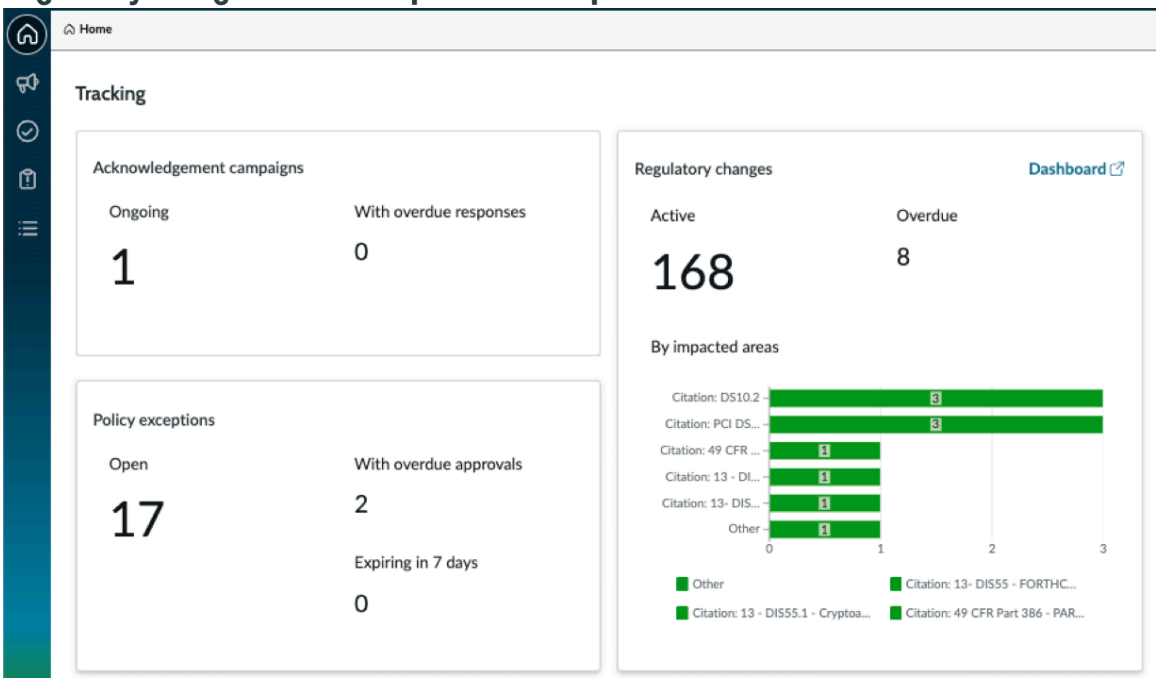
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

new table called impacted area (sn_grc_reg_change_impacted_area) is created and it captures the following items including the previously captured citations:

- Citation
- Control objective
- Policy
- Authority document
- Control
- Acknowledgment campaign
- Policy category
- Policy exception
- Risk statement
- Risk framework
- Risk

Note:
Impacted areas can be added to regulatory alerts that are of type regulatory event.

Impact radius calculation



When you add impacted areas to regulatory alerts of type regulatory event, assign it to a user, and the user marks the alert as applicable, regulatory tasks are automatically generated. The regulatory tasks are then assigned to a user. When the assigned user of the tasks chooses to respond to the tasks, action tasks for each impacted areas are generated. However, you can also manually add more action tasks, other than the ones that are automatically created based on the impacted areas.

Representation of regulatory changes in the Compliance Workspace

The Compliance Workspace is updated to display the regulatory changes by impacted areas. The following figure displays the regulatory changes section under the Tracking widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regulatory changes on the Compliance workspace

Source document alerts view

When you select a source document alert in the List view in the Compliance Workspace, it displays the details of the alert on a new page. The details include the title of the alert, provider of the alert, its state, and other important information in the Overview tab and Details tab.

The source document alerts page also displays the following tabs:

- Overview tab
- Details tab

See more information on the tabs.

Overview tab

Field	Description
Citation	Citation associated with the source document alert.
Stepper component	Process flow stepper component for the source document alert that displays the following stages: • New: When the source document type alert is in the **New** state, the highlighted stage in the stepper component is displayed as **New**. • In progress: When the state of the source document type alert is updated to **In progress**, the highlighted stage in the stepper component is displayed as **In progress**.

assessment, you can reassign the assessment to the correct responder. While performing regulatory assessments on the Tasks page, you can view the following:

- Guidance for each section of the assessment under the Details section
- The completion progress of the assessment

Procedure

1. Navigate to **All** > **Employee Center** > **GRC Tasks** > **My to-dos** > **Open** > **Regulatory assessments**.
2. Select and open the assigned assessment.
3. Respond to the questionnaire.
4. **Optional:** To reassign the assessment to a different assessor, do the following.
   a. Select More options on the top right.
   b. Select **Reassign**.
5. **Optional:** To cancel the assessment while responding, select **Cancel**.
6. Select **Submit**.
7. On the confirmation dialog box, select **Submit**.
8. On the success dialog box, select **OK**.

Result

The requestor responsible for initiating the assessment can monitor the progress activity by accessing the Regulatory Assessment related list of a regulatory alert.

Respond to a regulatory alert risk assessment

Respond to a classic risk assessment on a regulatory alert to determine which entities are impacted and what actions must be taken to mitigate the risks.

Before you begin

Role required: sn_grc.business_user, sn_risk_advanced.ara_assessor

About this task

When you receive an assessment, if you're not the rightful responder of the assessment, you can reassign the assessment to the correct responder. After you finish the assessment, you can also reassess the assessment.

Procedure

1. Navigate to **All** > **Self Service** > **Employee Center** > **GRC tasks** > **My to-dos** > **Risk assessments**.
2. Select and open the assigned assessment.
3. Select **Start assessment**.
4. Under the **Inherent Assessment** tab, rank the risk assessment factors such as Compliance, Legal, Financial, and so on.
   Based on the answers, the computed inherent risk results are calculated and displayed.
5. In the **Provide comments** field, provide any comments as required.
6. To submit the responses, select **Submit**.
   The Assessment summary tab displays the Inherent risk rating result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To send the assessment for approvals, if approvers are defined, or to directly publish the assessment, select **Submit**.
8. Provide your comments as required.
9. Select **OK**.

Result

If approvers are not specified, the assessment moves to the Monitor state. The requestor responsible for initiating the assessment can monitor the progress activity by accessing the Risk Assessment related list of a regulatory alert. If approvers are defined, the assessment moves ahead for review.

Assess the impact of a regulatory alert

Evaluate the risk of a regulatory alert by initiating either a risk assessment or a regulatory assessment.

Before you begin

Role required: sn_grc_reg_change.user

About this task

You can initiate one of the following assessments:

- Regulatory assessment: Uses the Smart Assessment Engine. A regulatory assessment is used to assess the potential effects of new or updated regulations before the regulations are finalized or implemented.
- Risk assessment: Uses the classic risk assessment. A risk-based approach is used to identify and address both direct and indirect impacts.

Procedure

1. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace** > **Lists** > **Regulatory Alerts**.
2. Select the regulatory alert that you want to assess.
3. Select **Assess impact**.
4. Select either **Regulatory assessment** or **Risk assessment** based on your requirement.
5. If you select, Regulatory assessment, do the following in the Evaluate regulatory impact dialog box.

   a. In the **Assessment template** field, specify the template to use for the assessment.

   b. In the **Select a group** field, select the group responsible to perform the assessment.

   c. In the **Assessors** field, specify individual assessors of the group.
   Ensure that the assessors have the sn_grc_reg_change.user or sn_grc.business_user roles granted.

   d. In the **Due date** field, specify the due date for the assessment completion.

   e. Select **Send**.

   In the Regulatory assessments related list in the regulatory alert record, the new regulatory assessments are listed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. If you select, Risk assessment, from the Entities list, select the entities that require an impact assessment.

   a. Select **Send**.
   Ensure that the entity owners who are the risk assessors have the sn_risk_advanced.ara_assessor role.
   In the Risk assessments related list in the regulatory alert record, the new impact assessments are listed.

Create regulatory event alerts manually

Create a manual entry of the regulatory changes or updates so that they can be routed to the correct subject matter experts for further analysis.

Before you begin

Role required: sn_grc_reg_change.manager

About this task

Users with the sn_grc_reg_change.manager role can create the regulatory alerts manually. Creating the regulatory alerts manually provides the following benefits:

- Recognize and fix human instinctive errors accurately.
- Assign an ad-hoc or the submitted regulatory event alert to the subject matter experts for further review and analysis, thus ensuring accountability.
- Ensure that the data entered manually in the system has high quality and a high level of integrity.

Procedure

1. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace** > **Regulatory alerts** > **Unassigned Alerts**.

   The Regulatory Change Management application in the Compliance Workspace is displayed.

2. Select **New**.
   The Create New Regulatory alert form is displayed.
3. On the **Details** tab, fill in the form.

Create New Regulatory alert form

Field	Description
Title	A short summary title of the regulatory alert.
Source	Displays the data source type identified for creating a regulatory event record. The default option for the input source type is Manual. **Note:** This field is locked for editing for the purpose of internal reporting and business configuration management.
Type	Type of regulatory alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description and a summary of the event.
Provider	Name of the alert provider. **Note:** This field is locked for editing for the purpose of internal reporting and business configuration management.
Provider URL	URL of the alert that is received from the provider.
Regulatory body URL	URL of the regulatory body that is associated with the alert.
Coordinator	User that the alert is assigned to.
Overall impact	Overall impact of the alert.
Dates	
Source publication date	Date when the regulatory event is published by the regulatory body.
Comments date	Date until when the comments can be provided for the regulatory event.
Effective date	Date when the regulatory event is going to be applicable.
Compliance date	Date by which the regulatory event is going to be compliant.
Expiration date	Expiry date for the regulatory event.
Activity Journal	
Additional comments	Additional comments related to the alert.

Note:
Beginning with the Xanadu release, the taxonomy section in the form is not available for the new installations.

4. In the **Coordinator** field, assign the regulatory event alert to a coordinator with the sn_grc_reg_change.user role and select **Save**.

Result
The regulatory event alert is assigned to the selected coordinator.

What to do next
Import the regulatory event alerts in bulk and Assess the impact of a regulatory event alert.

Assign a regulatory event alert to a coordinator

Log in to the GRC: Regulatory Change Management application, review the regulatory event alert, update the details, and assign it to a coordinator.

Before you begin
Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

About this task

In the following procedure, step 4 and after describe various actions that users with the sn_grc_reg_change.manager role or sn_grc_reg_change.user role can perform.

Procedure

1. Log in with the sn_grc_reg_change.manager user role.
2. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
   The Regulatory Change Management application in the Compliance Workspace is displayed.
3. Navigate to **Lists** > **Assigned Regulatory Alerts** view.
4. In the Assigned Alerts list, select a regulatory event alert.
   The detailed view for the selected regulatory event alert is displayed.
5. In the Details tab, fill in the form.

Details tab

Fields	Description
Title	Title of the alert as received from the provider. This field is automatically set to display the title.
Description	Description and a summary of the event. This field is automatically set to display the description.
Provider URL	URL of the alert that is received from the provider. This field is automatically set to display the provider URL.
Regulatory body URL	URL of the regulatory body that is associated with the alert. This field is automatically set to display the regulatory body URL.
Provider	Name of the alert provider. This field is automatically set to display the name of the alert provider.
Type	Type of regulatory alert. This field is automatically set to display the type of the alert.
Coordinator	User that the alert is assigned to.
Overall impact	Overall impact of the alert.
Dates	
Source publication date	Date when the regulatory event is published by the regulatory body. This field is automatically set to display the source publication date.
Comments date	Date until when the comments can be provided for the regulatory event. This field is automatically set to display the comments date.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Effective date	Date when the regulatory event is going to be applicable. This field is automatically set to display the effective date.
Compliance date	Date by which the regulatory event is going to be compliant. This field is automatically set to display the compliance date.
Expiration date	Expiry date for the regulatory event. This field is automatically set to display the expiration date.
Series data	
Series name	Series name of the alert. This field is automatically set to display the series name from the provider.
Sequence number	Sequence number of the alert. This field is automatically set to display the sequence number from the provider.
Activity Journal	
Additional comments	Additional comments related to the alert.
Compose	
Compose section	Additional comments related to the alert.
Activities	Log of the activities related to the alert.
Highlighted details	
Taxonomy	Taxonomy details associated with the alert. This field is automatically set to display the taxonomy details of the alert.

Note:
Beginning with the ServiceNow® Xanadu release, the taxonomy section in the form is not available to the new installations.

6. In the **Coordinator** field, assign the regulatory event alert to a coordinator with the sn_grc_reg_change.user user role and select **Save**.

Result
The regulatory event alert is assigned to the selected coordinator.

What to do next
Assess the impact of a regulatory event alert

Assess the impact of a regulatory event alert

Assess the impact of a regulatory event alert by creating an assessment on the regulatory event alert. Assign the impact assessment to the owner of the business entity that is affected by the alert.

Before you begin
Role required: sn_grc_reg_change.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
As a user with the sn_grc_reg_change.user role, you can review the regulatory event alert and initiate an impact assessment on the alert.

Procedure
1. Log in with the sn_grc_reg_change.user role.
2. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
   The Regulatory Change Management application in the Compliance Workspace is displayed.
3. Navigate to **Lists** > **Assigned Regulatory Alerts** view.
4. Select the regulatory event type alert that is assigned to you as the coordinator of the alert.
5. Select **Initiate Impact Assessment**.
6. Select any entity from the Entities list for the impact assessment and select **Create Assessments**.

   Note:
   Perform an impact assessment on the regulatory event alert in the classic user interface as the form is not yet migrated to the Workspace. For more information, see Assess the impact of a regulatory alert.

   If no entities are configured, you can configure new entities.

Result
In the Impact assessments related list, the new impact assessment is listed and it is automatically assigned to the entity owner. The entity owner reviews it and sends feedback on the assessment. After completing the assessment, the calculated inherent risk is displayed under the **Assessment Summary** tab. When the entity owner selects **Mark as complete** on the impact assessment, it saves the assessment details and marks it as Complete.

What to do next
See Manage regulatory change tasks for information on marking the alert as applicable and managing the regulatory change tasks.

Manage regulatory change tasks

Manage the regulatory change tasks that are associated with the regulatory event alert. When a business entity owner completes the impact assessment on the regulatory event alert, the user with the sn_grc_reg_change.user role reviews the assessment summary and marks the alert as applicable.

Before you begin
Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user

About this task
The coordinator of the regulatory event alert identifies the steps to comply with the regulatory change and manages the regulatory change task.

Procedure
1. Navigate to **All** > **Regulatory Change Management application** > **Compliance Workspace**.
   The Regulatory Change Management application in the Compliance Workspace is displayed.
2. Navigate to **Lists** > **Regulatory Alerts** view.
3. Select the regulatory event alert for which a business entity owner has completed the assessment.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Review the impact assessment and mark the alert using one of the following options.

5. For the applicable alert, select the **Regulatory Tasks** related list and select the regulatory change task that is created automatically for the alert.
6. In the Details tab, fill in the form.

Regulatory Change Task form

Field	Description
Regulatory Change Task	
Regulatory alert	Title of the regulatory alert associated with the source document import task. This field is automatically set to display the title of the alert.
Instructions	Instructions related to the source document import task.
Assignment	
Assignment group	Assignment group for the record. The group is selected from the **Group Hierarchy** table.
Approver type	Approver type for the task. Choices are as follows: ○ **User** ○ **Group**
Assigned to	User to whom the regulatory change is assigned.
Approver	If the approver type is a group, the **Approver group** field is displayed.
Approver group	If the approver type is a user, the **Approver** field is displayed.
Schedule	
Due date	Due date for the source document or regulatory event alert import task.
Approved on	Date when the source document import task is approved. This field is automatically set to display the approval date.
Activity Journal	
Watchlist	Users whom you want to add as watchers for this task.
Work notes list	Users who have added the work notes for this task.
Work notes (Private)	Work notes related to the task.
Compose

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Worknotes	Worknotes typed in by the users. These work notes can be posted for reference.
Activity	
Activity	Activity and state of the task.
Attachments	
Attachments	Attachments related to the task.

7. Verify that the mandatory fields such as **Approver**, **Assigned to**, and **Due date** are updated.
8. Select **Respond**.
   The **Respond** action triggers the impact radius calculation in the background. For information on impact radius calculation, see Impact radius for regulatory alerts of type regulatory event. The regulatory change task is updated with the **Responded** state.
9. Add an action task if necessary.
   See Create a new action task for the alert for creating an action task.
10. Add issues if necessary.
    See Create or add an issue related to a regulatory task for more information.
11. After creating necessary action tasks and issues, select **Request Approval**.
    Depending on the state of the approval, the action task is activated. When the action task is closed, the associated source document import task is automatically closed.

Result

Verify that the regulatory change task is updated with the **Responded** state and the Action tasks related list is displayed for the regulatory event alert.

What to do next

Create a new action task for the alert

Regulatory Change Task form

Use the Regulatory Change Task form in Compliance Workspace to create a regulatory change task.

Manage a source document import task

Manage the source document import tasks that are associated with the source document alerts. When a source document alert is marked as applicable, a source import document task is created automatically.

Before you begin

Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user

About this task

A source document import task is used to ingest a particular source document that is received from the provider into the regulatory library.

Procedure

1. Navigate to **All** > **Regulatory Change Management application** > **Compliance Workspace**. The Regulatory Change Management application in the Compliance Workspace is displayed.
2. Navigate to **Lists** > **Regulatory Alerts** view.
3. Select the source document alert that you assessed previously and select the import document task.
4. In the Details tab, fill in the form.

Source document import task form

Field	Description
Import Document Task	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

Attachments	Attachments related to the task.

5. Verify that the **Assigned to**, **Approver**, and **Due date** fields are updated.
6. To save the changes, select **Save**.
7. To update the selected source document import task, select **Work in progress**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Navigate to the Action tasks related list and add an action task if necessary.
   See Create a new action task for the alert for creating a new action task.
9. Navigate to the Issues related list and add an issue if necessary.
   See Create or add an issue related to a regulatory task for adding an issue.
10. In the Import Task section, insert a new citation or update an existing citation as described in the table.
11. Select **Request Approval**.

Result

The state of the source document import task is updated to **Awaiting Approval**. Depending on the state of the approval, the action task is activated.

What to do next

See Create a new action task for the alert and Complete the action task associated with the alert for information on creating a new action task and completing an action task associated with the alert.

Assign a source document alert to a coordinator

Log in to the GRC: Regulatory Change Management application, review the source document alert, and assign it to a coordinator. The coordinator then assesses the applicability of the alert and completes the associated regulatory tasks.

Before you begin

Roles required: sn_grc_reg_change.manager, sn_grc_reg_change.user

About this task

As a manager, you can view and assign the source document alerts to users with the sn_grc_reg_change.user role. The user can then perform actions on the source document alerts.

Procedure

1. Log in with the sn_grc_reg_change.manager user role.
2. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
   The Regulatory Change Management application in the Compliance Workspace is displayed.
3. Navigate to **Lists** > **Assigned Regulatory Alerts** view.
4. Select a source document type alert in the list.
5. In the Details tab, fill in the form.

Details tab in the Source Document alert form

Fields	Description
Title	Title of the source document type of alert as received from the provider. This field is automatically set to display the title.
Citation	Citation number for the source document that is received from the provider. This field is automatically set to display the citation.
Provider URL	URL of the alert provider. This field is automatically set to display the provider URL.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Regulatory body URL	URL of the regulatory body that is associated with the alert. This field is automatically set to display the regulatory body URL.
Provider	Name of the alert provider. This field is automatically set to display the name of the provider.
Type	Type of the regulatory alert. For example, source document alert. This field is automatically set to display the type of the alert.
Coordinator	User that the alert is assigned to.
Dates	
Source publication date	Date when an alert is published by the regulatory body. Auto-populated field. This field is automatically set to display the source publication date.
Comments date	Date until when the comments can be provided for the alert. Auto-populated field. This field is automatically set to display the comments date.
Effective date	Date when the alert is going to be applicable. This field is automatically set to display the effective date.
Compliance date	Date by which the alert is going to be compliant. This field is automatically set to display the compliance date.
Expiration date	Expiry date for the alert. This field is automatically set to display the expiration date.
Activity Journal	
Additional comments	Additional comments related to the alert.
Compose	
Additional comments	Additional comments related to the alert that are added in the Compose section.
Log of the activities	Log of the activities related to the alert. Displays the system generated changes and additional comments.
Highlighted details	
Taxonomy	Taxonomy details associated with the alert. This field is automatically set to display the taxonomy details of the alert.

6. In the **Coordinator** field, assign it to a user with the sn_grc_reg_change.user user role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Log in with the sn_grc_reg_change.manager role, open the selected source document alert, and mark the alert using one of the following options.

Result
After marking the source document alert as **Applicable**, a new source document import task is created under the Import document tasks related list.

Create a new action task for the alert

Create a new action task for the alert so that you can assign the action tasks to the compliance and risk users and mark a due date for the action tasks.

Before you begin
Role required: sn_grc_reg_change.user

About this task
The user with the sn_grc_reg_change.user role assigns the selected action task to the users with the sn_compliance.manager and sn_risk.manager roles depending on the action area of the alert such as compliance or risk. Once the compliance and risk users complete the action tasks associated with the alert, the alert and the parent regulatory change task are closed automatically.

Procedure
1. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
   The Regulatory Change Management application in the Compliance Workspace is displayed.
2. In the List view, navigate to **Lists** > **Regulatory Alerts** > **Assigned Alerts** view.
3. Complete one of the following tasks depending on the type of the alert.

4. Navigate to the Action Tasks related list and select **New**.

Note:
Only when the regulatory task is in **New**, **Work in Progress**, or **Implementation** states, you can create a new action task.

Action tasks form

Field	Description
General	
Name	Name of the action task.
Instructions	Instructions related to the action task.
Classification	
Type	Type of the action task: ○ None ○ Business Impact ○ Change Policies ○ Executive Briefing ○ Legal Review

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Work notes (Private)	Log of the work notes.
Response notes	Displays the response notes.
Attachments	
Attachments	Attachments related to the task.

5. In the action tasks form, verify that the mandatory fields are updated.
   The action task is marked for the sn_compliance.manager or the sn_risk.manager users.
6. To save the changes, select **Save**.

Result
The action task is marked for the users with the sn_compliance.manager or the sn_risk.manager roles.

What to do next
Complete the action task associated with the alert

Complete the action task associated with the alert

Complete the action tasks that are related to the regulatory event alerts and source document alerts. The compliance and risk users complete the action tasks that are assigned to them. The compliance and risk managers track the progress on the action tasks.

Before you begin
Role required: sn_compliance.manager, sn_risk.manager, sn_compliance.user, sn_risk.user, sn_grc_reg_change.manager

About this task
The action tasks are created as a follow-up to complete the changes that have been identified as part of the regulatory change tasks and source document import tasks.
The actions described in the following steps are performed by the users with the sn_compliance.manager, sn_risk.manager, sn_compliance.user, sn_risk.user, and sn_grc_reg_change.manager roles.

Procedure
1. Log in with the sn_compliance.manager or the sn_risk.manager user role.
2. Navigate to **All** > **Regulatory Change Management** > **Compliance Workspace**.
   The Regulatory Change Management application in the Compliance Workspace is displayed.
3. In the List view, navigate to **Lists** > **Regulatory Alerts** > **Assigned Alerts** view.
4. Navigate to the action task that is marked for you.
5. Assign the action task as described in the table.
6. Complete the action task as described in the table.
7. Verify the status of the action task as described in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Once the user with the sn_compliance.user or the sn_risk.user role completes the action task, the regulatory event alert and the parent regulatory change task are closed automatically. Similarly, the source document alert and the parent source document import task are closed when the associated action tasks are completed. This is the final step of the regulatory tasks workflow.

Create or add an issue related to a regulatory task

Create or add an issue related to a regulatory task to document the observations, changes in the citation, discrepancies, or to notify about any problems. You can also identify the source of the issue to analyze and classify the issues.

Before you begin

Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user

Procedure

1. Navigate to **All** > **Regulatory Change Management application** > **Compliance Workspace** > **Regulatory alert**.
   The Regulatory Change Management application in Compliance Workspace is displayed.
2. On the regulatory change task form, navigate to the **Issues** tab.

   You can add an existing issue to a regulatory task or create an issue that you can relate to a regulatory task.

3. Select **Save**.

Create New Issue form

Use the Create New Issue form in Compliance Workspace to create an issue or add an existing issue to a regulatory task.

Create New Issue form

For a description of the field values, see the following table.

Create New Issue form

Field	Description
Issue	
Number	Number of the issue. This field is auto-filled.
Name	Name of the issue.
Issue source	Source of the issue, such as Business service or Scenario analysis. This field is auto-filled.
Issue type	Source from where the issue was created. This field is auto-populated with one of the following options based on how the issue is created: • Control design effectiveness failure • Control operative effectiveness failure • Control does not meet requirement • Control does not exist • Non-compliance to a regulation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
	• Non-compliance to a policy • Improvement or suggestion to an existing policy • Recommendation for a new policy • process optimization or improvement • Observation • Data breach • Fraud • Misstatement • Training • Documentation
Classification	Classification of the issue. This field is auto-populated with one of the following options: • Audit • Compliance • Operational Resilience • Risk • Vendor
Location	Location of the issue.
State	State of the issue. Available options are: • New • Analyze • Respond • Review • Closed Complete • Closed Incomplete
Substate	Substate of the issue. This field is auto-filled.
Priority	Priority of the issue. Available options are: • Critical • High • Moderate • Low • Planning
Issue rating	Rating of the issue. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
	• Very High • High • Moderate • Low • Very Low
Description	Approver of the scenario analysis plan.
Assignment	
Assignment group	Assignment group for the issue. For example, Application Development group.
Assigned to	User that the issue is assigned to.
Issue manager group	Manager group that the issue is assigned to. Available options are: • Compliance Managers • IT Risk Managers • Risk Managers
Issue manager	Manager that the issue is assigned to.
Watchlist	Users who are on the watchlist for the issue.
Schedule	
Due date	Date when the issue is due.
Confirmed date	Confirmation date for the issue. This field is auto-filled.
Planned start date	Planned start date for the issue.
Planned end date	Planned end date for the issue.
Duration	Duration for the issue in days, hours, minutes, and seconds.
Created	Date on which the issue is created. This field is auto-filled.
Closed	Date on which the issue is closed.
Actual start date	Actual start date for the issue.
Actual end date	Actual end date for the issue.
Actual duration	Actual duration for the issue in days, hours, minutes, and seconds.
Issue grouping	
Parent issue	Parent issue that is associated with the issue.
Issue group rule	Group rule for the issue. This field is auto-filled.
Action plan	
Recommendation	Recommendation for the issue.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
Action plan	Action plan for the issue.
Activity	
Work notes	Work notes for the issue.
Additional comments	Additional comments for the issue.
Settings	
Functional domain	Functional domain for the issue.

Associating an AI-recommended citation to an open regulatory alert

Associate a citation to an open regulatory alert by using the GRC: Predictive Intelligence application and a similarity solution model that uses an AI-recommended citation. Your compliance team can check the incoming regulatory alerts to determine if the citations or requirements apply to your organization.

Overview of associating a citation to a regulatory alert

Traditionally, if you had a subscription license, you could download a citation from a third-party provider or create a citation from an authority document by using Compliance Workspace.

Note:
An authority document is a document that contains the external regulations, such as the laws, regulations, and standards, that your organization must comply with.

A citation is a passage or an expression from an authority document that your business must comply with. It's an individual requirement within an authority document.

Now, you can use AI and machine learning (ML) to train a similarity solution model that automatically suggests which citations to add to the regulatory alerts. The citations are based on a confidence score that indicates the level of confidence that a prediction is correct. A higher score means that the match has a higher probability of being correct.

The Governance, Risk, and Compliance: Predictive Intelligence application uses AI and ML to make the GRC application adding citations smarter. These suggestions are based on a confidence score that is based on the recommended citation.

A user with the sn_compliance_admin role must train the solution definition after they install the GRC: Predictive Intelligence application with its dependencies. A user with the ml_admin role can also customize the solution definition. This modification is based on the data in the [sn_complaince_citation] and the [sn_grc_reg_change_reg_feed] table. If you have the sn_compliance_admin role, you can select how frequently you want to refresh the data that you use to retrieve your similarity results. For more information about solution definitions, see https://servicenow.com/docs/bundle/xanadu-customer-service-management/page/product/customer-service-management/reference/similar-cases-solution-definitions.html.

Key benefits of associating a citation to a regulatory alert

By associating an AI-recommended citation to an open regulatory alert, your organization gets the following key benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enhanced regulatory compliance mapping for effective reporting.
- Reduced manual effort by your compliance team to identify and discover citations that are mapped to the incoming regulatory alerts.

What you see when associating an AI-recommended citation card to a regulatory alert

When you use AI to associate a recommended citation card to a regulatory alert, you see the following details:

- The confidence score of the recommended citation.
- The citation name and authority document name that links with the citation and authority. You can open the links in separate windows.
- An option to ignore the recommendation.
- An option to associate the recommendation.
- The history icon that enables you to view the history of actions that were taken on the regulatory alert, including the dates when the recommendations were added or ignored by your users.

Action tasks in Regulatory Change Management

The action tasks facilitating the change management process are associated with Regulatory Change. The ownership of these action tasks is managed by the respective business owners affected due to the regulatory change.

Action tasks are related to regulatory change tasks and to source document import tasks. Users with the `sn_grc_reg_change.manager`, `sn_grc_reg_change.user`, or `sn_grc_reg_change.admin` role create regulatory action tasks and source document import tasks. These tasks are related to the Compliance and Risk areas in the GRC library. The Compliance Manager and Risk Manager assign the tasks to the correct Risk or Compliance group.

There are two categories of action tasks in the Regulatory Change Management application:

- Compliance: Contains all compliance-related action tasks. Compliance users can select a specific Compliance record in the GRC library, such as policies and controls.
- Risk: Contains all risk-related action tasks. Risk users can select a specific Risk record in the GRC library, such as risk statements.

Action tasks are created automatically for potentially impacted risk statements and policies.

Managers with the `sn_grc_reg_change.manager` role can view and sort the action tasks using the following tabs:

- **All assigned tasks**
- **Unassigned compliance tasks**
- **Unassigned risk tasks**
- **Ready tasks**
- **In Progress tasks**
- **Closed tasks**

Starting with version 19.0.x, you can initiate and complete the action tasks independently without requiring prior approval from users who are assigned with the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`sn_grc_reg_change.manager` role. You can execute assigned responsibilities in a timely manner and reduce unnecessary approval bottlenecks. The access to action tasks remains governed by user permissions and role-based access controls to ensure proper accountability and oversight.

Staring with version 21.0.x, you can reopen the action tasks for a regulatory task when it's rejected and transitions back to the Implementation state. You can review and rework the tasks to address the feedback or incorporate the updated requirements. You can also modify and resubmit the reopened action tasks so that the implementation aligns with regulatory expectations before you resubmit the change task.

Types of action tasks

The following types of action tasks are available in Regulatory Change Management:

- Business Impact
- Change Policies
- Executive Briefing
- Legal Review
- Notification
- Others
- None

Import the regulatory event alerts in bulk

Populate the Workspace with your own regulatory event alerts. You can then import multiple alerts in the Regulatory Change Management application.

About this task

Importing the regulatory alerts in bulk offers the following benefits:

- Savings in time and efforts.
- Reduced errors by eliminating the need to manually enter data.
- Improved scalability and data visibility by making the data readily available irrespective of the size.
- Enhanced data analysis and reporting to gain insights.

Before you begin

Role required: sn_grc_reg_change.admin, sn_grc_reg_change.it_admin

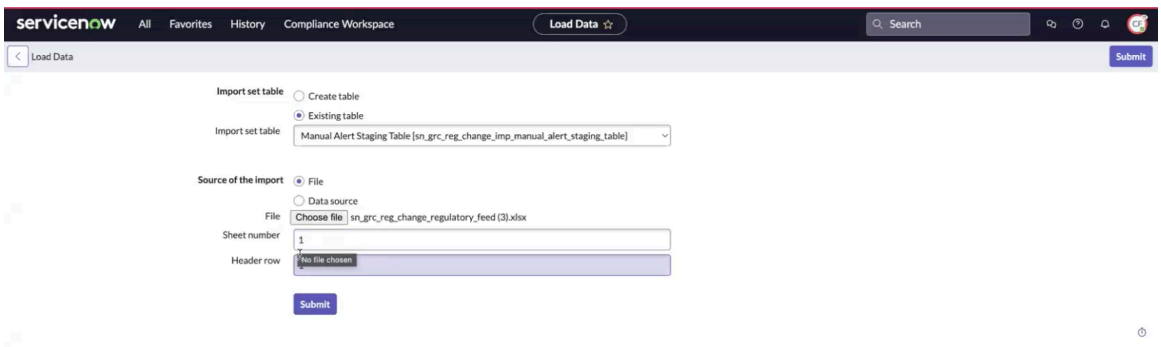
About this task

Before importing the data, you must review the following checklist:

- Ensure that you have access and privilege to import the alerts. If you do not have the right permission, the Import data link is hidden in the UI.
- The supported file formats are#xls and .xlsx. All file attachments should be separated from the data. Unexpected errors may occur if the .xls and .xlsx files contain special controls such as combination filters or images embedded in them.
- Any data for the file to be imported should not be enclosed in the <script> </script> tags.
- Each required (mandatory) field must contain a value. Ensure that you do not leave any mandatory fields blank in the import file. For example, when you are importing information, each record must include a name. You cannot proceed to the next step without mapping the mandatory fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All data values displayed in the drop-down lists must exist in the corresponding fields.
- Ensure that the first row of data (records) in the source file contains the column headings or field names rather than the actual data values. These column headings or field names help you to identify the data when you map new data to the existing fields in the application.



Procedure

1. Log in with the admin role and navigate to the **All** > **Regulatory Change Management** > **Regulatory Alerts** list view.
2. Select **Download Template**.
   It downloads the prebuilt#spreadsheet#or workbook that is already#formatted, organized, and populated with data value. The Data entry sheet of the file shows the mandatory columns to be filled such as Title and Type. The Field description sheet of the template provides detailed information about each of those field attributes. For more information, see Create regulatory event alerts manually.

   Note:
   Before you import your regulatory alerts, you must prepare the downloaded file by filing in mandatory information.

3. Open the downloaded template and enter the title and type in the **Title** and **Type** columns. When you fill in all the data, the file is ready to be imported into the application. After you have #prepared#the external data file for#data import, you can begin the import process.
4. Navigate to the Regulatory Alerts list view and select **Import alerts** to process importing the data.

   The Load Data form is displayed that guides you on how to import the alerts as shown in the example.

5. In the **Import set table** field, select **Existing table**.
   You can select the data file, configure the import options, and map the import data to application fields. You must use the existing table (Manual Alert Staging Table) for data processing and validation.
6. In the **Source of the import** field, select **File**.
   You can select the saved template for importing the data.
7. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data importing request is processed. You can view the import status as shown in the following example.

Result

The imported regulatory event alerts are assigned to the coordinator.

What to do next

Assess the impact of a regulatory event alert

Manage the taxonomy

Manage the taxonomy when you are setting up the Regulatory Change Management application in the Compliance Workspace. Create an internal taxonomy and map the internal taxonomy to the external taxonomy so that the Regulatory Change Management application refers to only one taxonomy.

Before you begin

Role required: sn_grc_reg_change.admin

Procedure

1. Navigate to **All** > **Regulatory Change Management application** > **Compliance Workspace**.
   A new Compliance Management tab is displayed.
2. In the List view, navigate to **Lists** > **Taxonomy** page.
3. Navigate to one of the following modules:
   - **Regulatory bodies**
   - **Content types**
   - **Jurisdictions**
   - **Themes**
   - **Sectors**

   The name and parent body for the selected taxonomy category are displayed.
4. In the Name list, select a taxonomy element.
   Details of the selected taxonomy element are displayed on a separate page with the Details tab and Internal taxonomy related list.
5. To create a new internal taxonomy for the selected taxonomy class, select **New**.

Create new internal taxonomy form

Field	Description
Name	Name of the internal taxonomy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Taxonomy class	Taxonomy class populated by default for the selected category.
Parent	Parent record for which the new internal taxonomy is created.

6. To save the taxonomy, select **Save**.

Compose an email in Compliance Workspace

Compose and send an email for cases and requests by using the Compliance Workspace. This feature helps you to communicate with different stakeholders within or outside your organization.

Before you begin

Role required: sn_grc_case_mgmt.grc_case_analyst

About this task

You can compose and send emails regarding your cases and requests to multiple stakeholders. For example, you can consult the legal team for any obligatory opinions and suggestions on the recorded compliance case. You can manage the emails from the case or request record page.

Procedure

1. Navigate to **Workspaces** > **Compliance Workspace**.
2. Select the list icon and then complete one of the following.
   - Navigate to **Cases** > **All cases** and select the case you want.
   - Navigate to **Requests** > **All requests** and select the request you want.
3. Select the More actions icon.
4. On the form, fill in the fields.

Email Draft form

Field	Description
To	Email ID of the recipient. You can add multiple email IDs separated by commas in this field to send email to more than one recipient.
Subject	Brief summary or title of your email.
Email message	Body of your message that includes any information, requests, or details you want to convey to the recipient. You can format the text, add attachments, and include links in this section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can send emails to both ServiceNow users and external stakeholders who don't have access to the ServiceNow instance. You must provide the basic record details in the subject line or body of the email to make them aware of the record that you're referring to.

5. **Optional:** To add attachments, select **Attach File**.
6. Select **Send Email**.
   The email has been sent to the recipient. You can view emails associated with the regulatory agency record by navigating to the Emails tab of that record.

Regulatory Change Management reference

Reference topics provide additional information such as tables, roles, and properties that are installed with the Regulatory Change Management application.

User roles in Regulatory Change Management

Stakeholders in the Regulatory Change Management (RCM) application have different roles and responsibilities.

The Regulatory Change Management application roles are installed with the activation of the GRC: Regulatory Change Management application. The customization or extension of configuration is not allowed. Only the users with GRC Admin roles can do the configurations setup. The application involves the following types of roles.

Role titles and names	Description	Available roles
RCM Admin [sn_grc_reg_change.admin]	The RCM Admin has access to all the aspects of the Regulatory Change Management application.	• sn_grc_reg_change.it_admin • sn_grc_reg_change.manager
RCM IT (Information Technology) Admin [sn_grc_reg_change.it_admin]	The RCM IT Admin sets up the integrations with third-party regulatory intelligence providers. The RCM IT Admin troubleshoots issues, if any.	• connection_admin • action_designer • import_admin • credential_admin • flow_designer • oauth_admin • sn_grc.developer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role titles and names	Description	Available roles
		Note: The GRC User role (sn_grc.user) contains the GRC Business User role (sn_grc.business_user). For more information, see Common roles in Governance, Risk, and Compliance.
RCM Manager [sn_grc_reg_change.manager]	The RCM Manager assigns regulatory alerts and monitors regulatory change tasks and action tasks. **Note:** A group titled as **RCM Managers** is added under **Groups** in the **User Administration** panel under the Regulatory Change Management application. The RCM Managers group reviews the regulatory tasks workflow, ensuring regulatory compliance. The users who belong to this group must have the sn_grc_reg_change.manager role.	sn_grc_reg_change.user
RCM User [sn_grc_reg_change.user]	The RCM User assesses the applicability of the alerts, initiates impact assessments, responds to impact assessment questionnaires, and completes the assigned regulatory change tasks and action tasks.	• sn_compliance.reader • sn_risk.reader

For information about feature roles, see GRC Feature roles.

Types of alerts, user roles, and states of regulatory alerts

Different users perform various actions on the alert records based on the type of the alert.

You can view the following types of alerts under the Regulatory Alerts module:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All Assigned Alerts: Displays all assigned alerts in the instance where the **Coordinator** field is assigned to an appropriate user.
- Unassigned Alerts: Displays the unassigned alerts in the instance where the **Coordinator** field is empty. Mark the Overall impact as No impact, Low, Medium, High, or Critical.
- New Alerts: Displays new alerts in the instance where the **Coordinator** field is empty.
- Deferred Alerts: Displays the deferred alerts where the **Coordinator** field is assigned to an appropriate user, the state is Deferred, and a reminder date is listed to perform the action post deferral.
- Impact Assessment Alerts: Displays the alerts for regulatory events that are in Impact Assessment state.
- In Progress Alerts: Displays the alerts that are in In Progress state.
- Closed Alerts: Displays the alerts that are in Closed state.

The following table provides information on the user roles, the actions that these users can perform, and the description of these actions.

User roles, actions, and description

User roles	Actions	Description
• sn_grc_reg_change.manager • sn_grc_reg_change.user • sn_grc_reg_change.admin	Update	Updates the details of the alert.
	Reassign	Reassigns the details of the alert.
	Defer	Defers a regulatory alert to a future date.
	Applicable	Marks the alert as applicable.
	Initiate Impact Assessment	Initiates an impact assessment on the alert.
	Not Applicable	Marks the alert as not applicable.
	Cancel	Cancels the alert.

Managers can view all alerts. Users with the sn_grc_reg_change.user role can view assigned alerts that are assigned to them, but they cannot view unassigned alerts or alerts that are assigned to other people.

See the following table for information on the states of regulatory alerts.

States of the alerts and their description

State	Description
New	Each incoming regulatory alert is by default assigned to a new state. Only the sn_grc_reg_change.admin or the sn_grc_reg_change.manager can assign an alert record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States of the alerts and their description (continued)

State	Description
Deferred	Some alerts do not require an immediate action and therefore, they are in the Deferred state and they are assigned to a later date.
Impact Assessment	The alert records that are of type regulatory event are assessed for applicability and are marked for an impact assessment. After an impact assessment, the alerts are marked as applicable or not applicable.
In Progress	Alerts with the In Progress state are being worked on. An sn_grc_reg_change.user is assigned to each alert.
Closed	Alerts that are not relevant to an organization are in the Closed state. Alerts that have associated tasks that have been completed are also in the Closed state.
Cancelled	Alerts that are in Cancelled state.

Note:
The attributes on the alert record are part of the metadata that is given by the third-party regulatory intelligence provider. These attributes help in determining the applicability of the alert to the organization. These records are non-editable in the Regulatory Change Management application.

Tables installed with Governance, Risk, and Compliance

Some tables are added by default with activation of the Governance, Risk, and Compliance plugin.

Tables installed

Table	Description
Control objective to object staging table [sn_grc_pci_control_objective_object_staging]	Stores the staged data of control objective and configuration test mappings.
Control objective mapping import configuration [sn_grc_pci_control_objective_mapping_import_configuration]	Stores the metadata of the configuration information required to ship the records from the staging table to the target table.
Control objective mapping import additional fields configuration [sn_grc_pci_control_objective_mapping_import_additional_fields_configuration]	Stores the metadata of key-value pairs pertaining to any additional columns on the target m2m table.
Content Reference to Authority Document sn_grc_m2m_cont_ref_auth_doc	Many-to-many relationship table that stores the mapped data between the content references and authority documents.
Content Reference to Citation [sn_grc_m2m_cont_ref_citation]	Many-to-many relationship table that stores the mapped data between the content references and citation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed (continued)

Table	Description
Content Reference to Control Objective [sn_grc_m2m_cont_ref_ps]	Many-to-many relationship table that stores the mapped data between the content references and control objectives.
Functional domain [sn_grc_functional_domain]	Stores the metadata of the list of functional domains.
Functional domain configuration [sn_grc_functional_domain_configuration]	Stores the configuration information of all audit and compliance objects that are classified as IT related.
Functional domain configuration m2m relationship registry [sn_grc_functional_domain_config_m2m_relationship_registry]	Stores the m2m mapping of the relationship registries that determine the parent table, child table, and the relationship between the two.
GRC functional domain user action [sn_grc_functional_domain_user_action]	Stores the manually triggered user actions of adding and removing of objects as IT related.
Issue to Content [sn_grc_m2m_issue_content]	Many-to-many relationship table that is used to manage relationships between issue and control objective.
Issue to Document [sn_grc_m2m_issue_document]	Many-to-many relationship table that is used to manage relationships between issue and policy table and between issue and authority document.
Issue to Engagement [sn_grc_m2m_issue_engagement]	Many-to-many relationship table that is used to manage relationships between issue and engagement.
Issue to Item [sn_grc_m2m_issue_item]	Many-to-many relationship table that is used to manage relationships between issue and control.
Item to entity [sn_grc_m2m_item_entity]	Many-to-many relationship table that stores associated reliant entities with common controls.
Item to entity type [sn_grc_m2m_item_entity_type]	Stores entity type ID record for entity type association.
Indicator [sn_grc_indicator]	Stores details of indicators.
Supporting Data [sn_grc_indicator_supporting_data]	Stores the supporting data collected after the indicator job run (GRC indicator nightly run).
Indicator Supporting Data Statistics [sn_grc_indicator_supporting_data_statistics]	Stores statistics of indicators for collecting supporting data, which is leveraged by the supporting data collection job.

Roles and tables installed with Regulatory Agency Library

Several types of components are installed with activation of the Regulatory Agency Library application, including tables and user roles.

© 2026 ServiceNow, Inc. All rights reserved.

Risk Management

Use the Governance, Risk, and Compliance: Risk Management application to continuously monitor to identify high-impact risks, improve your risk-based decision-making, and reduce reaction time effectively. The application also provides structured workflows for the management of risk assessments, risk indicators, and risk issues.

Risk Workspace

Starting with version 13.0.5, the Risk Workspace has been added for Risk Management users. The Risk Workspace offers a simplified user experience for you to perform your daily tasks and activities. For more information on the new workspace, see GRC Risk Workspace.

Benefits of Risk Management

The benefits of Risk Management are:

- Faster risk-based decision-making: Prioritize activities based on automated risk scores to work on the most critical risks first.
- Increased performance: Risk management embedded in automated cross-functional activities eliminates work interruption.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Effectively communicate risk: Real-time insights and role-based dashboards make reporting at all levels easier and faster.
- Stay on top of risks: Mobile interfaces provide the information you need to do your job anytime and anywhere.

Explore  Learn about how risk managers, risk users, and risk administrators use the Risk Management application.	**Configuring Risk Management**  Configure your Risk Management application.	**Integrate Risk Management**  Extend Risk Management capabilities by integrating with other applications.
Using Risk Management  Work on risk assessments, risk events, and so on.	**Analytics and reporting solutions for Risk Management**  Highlight the critical risks with dashboards and reports.	**Risk Management reference**  Get details about components like fields, tables, and properties.

Implement Risk Management

Use the Risk Management implementation to quickly implement the GRC Risk Management and Advanced Risk applications.

Exploring Risk Management

The Risk Management product provides a centralized process to identify, assess, respond to, and continuously monitor Enterprise and IT risks that may negatively impact business operations. The application also provides structured workflows for the management of risk assessments, risk indicators, and risk issues.

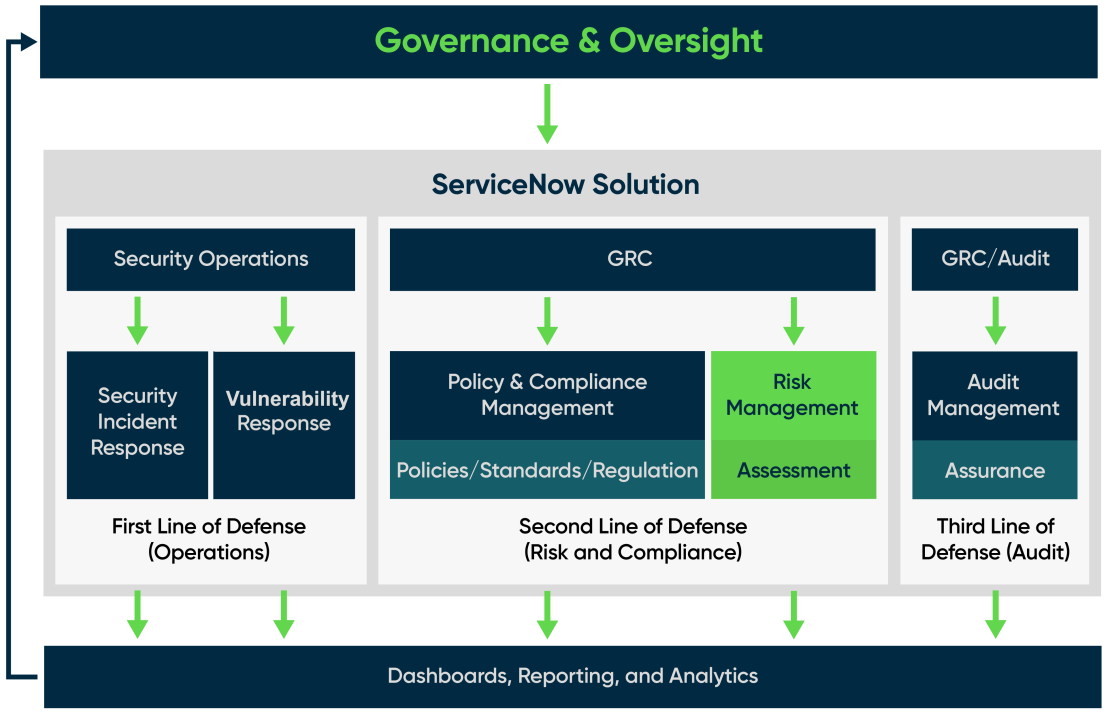
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Who uses Risk Management

The complete risk process involves all areas of your organization working together.

- Audit committee
- IT steering committee
- Risk officers (conduct risk assessment and identify all that can go wrong in business)
- All levels of management (assist the risk officers with the identification of what can go wrong in their processes)



Key activities for Risk Management

Once the key roles are identified, work to identify the following items:

- Determine what level of risk the organization is willing to accept? Get risk data in place and then determine what is acceptable.
- Develop a risk management policy, through risk frameworks and risk statements.
- Develop risk assessment and response procedures.
- Implement controls to reduce your organization's exposure to risk. Repeat on a regular interval.
- Measure your risk exposure and improvements.

Risk Management and the ServiceNow AI Platform

The Risk Management and the Advanced Risk applications enable you to do the following.

- Manage risks, risk statements, and risk frameworks: The risk library contains all risk frameworks and risk statements. Risk frameworks are used to group risk statements into manageable categories, while risk statements group the individual risks. The risk register is the central repository for all potential risks that could occur at any time, anywhere in the organization.
- Manage risk events: Risk events are potential or actual financial and non-financial losses, near-misses, and gains that occur within an organization.
- Risk hierarchy and scoring: Starting with New York, risk managers can create hierarchies that include different types of risk (operational risk, IT risk, or strategic risk). Once the underlying risks are assessed, the risk scores are automatically rolled up across the risk statement hierarchy, providing better tactical and strategic decision-making.
- Manage classic risk assessments: Risk assessments are surveys that gather evidence to determine risk. The Risk Assessment Designer provides a single interface that users can use to create, and edit attestations, as well as change scoring parameters. The question bank offers a library of questions for various categories, so you do not have to build each questionnaire from scratch. Risks start in a **Draft** state then move to **Assess**, which sends a notification to the Assessment respondents.
- Manage Advanced Risk Assessments: With Advanced Risk Assessment, create an integrated risk platform. This integrated platform supports various kinds of risk assessment methodologies and enables you to integrate risk assessment as a part of your overall decision-making process.
- Manage policy exceptions and extensions: Policy exceptions and extensions provide temporary relief for a non-compliant control. The policy exception captures the rationale, comments, and evidence to support the acceptance or rejection of a policy exception request. Also, extension to an approved policy exception can be requested before the policy exception validity period. The control owner, the compliance manager, and the risk manager may be involved in the policy exception and extension workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use entity and risk dependencies using the GRC: Workbench: The GRC: Workbench utilizes CMDB information to show the upstream and downstream relationships across all applications. These relationships enable consistent risk mapping and modeling across the enterprise.
- Risk indicators, control indicators, and indicator templates: Continuous monitoring involves activities related to identifying and creating key risk and control indicators. Supporting information can be collected for those indicators through automatic data collection or manual tasks. Indicator results are then used to create issues for controls, update risk scores, and provide supporting information for audit activities and control testings.
- Manage risk issues and remediation: Issues can be created manually to document audit observations, remediations, or to accept any problems. They are automatically generated from indicator results, attestation results, or control test effectiveness.
- Manage continuous monitoring for risks between Risk Management and Vulnerability Response: Continuous monitoring for risks is a feature integration between the GRC: Risk Management and the Security Operations Vulnerability Response products, which uses indicators to quickly identify high impact vulnerabilities based on business impact.
- Analytics and reporting solutions for Risk Management: Performance Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

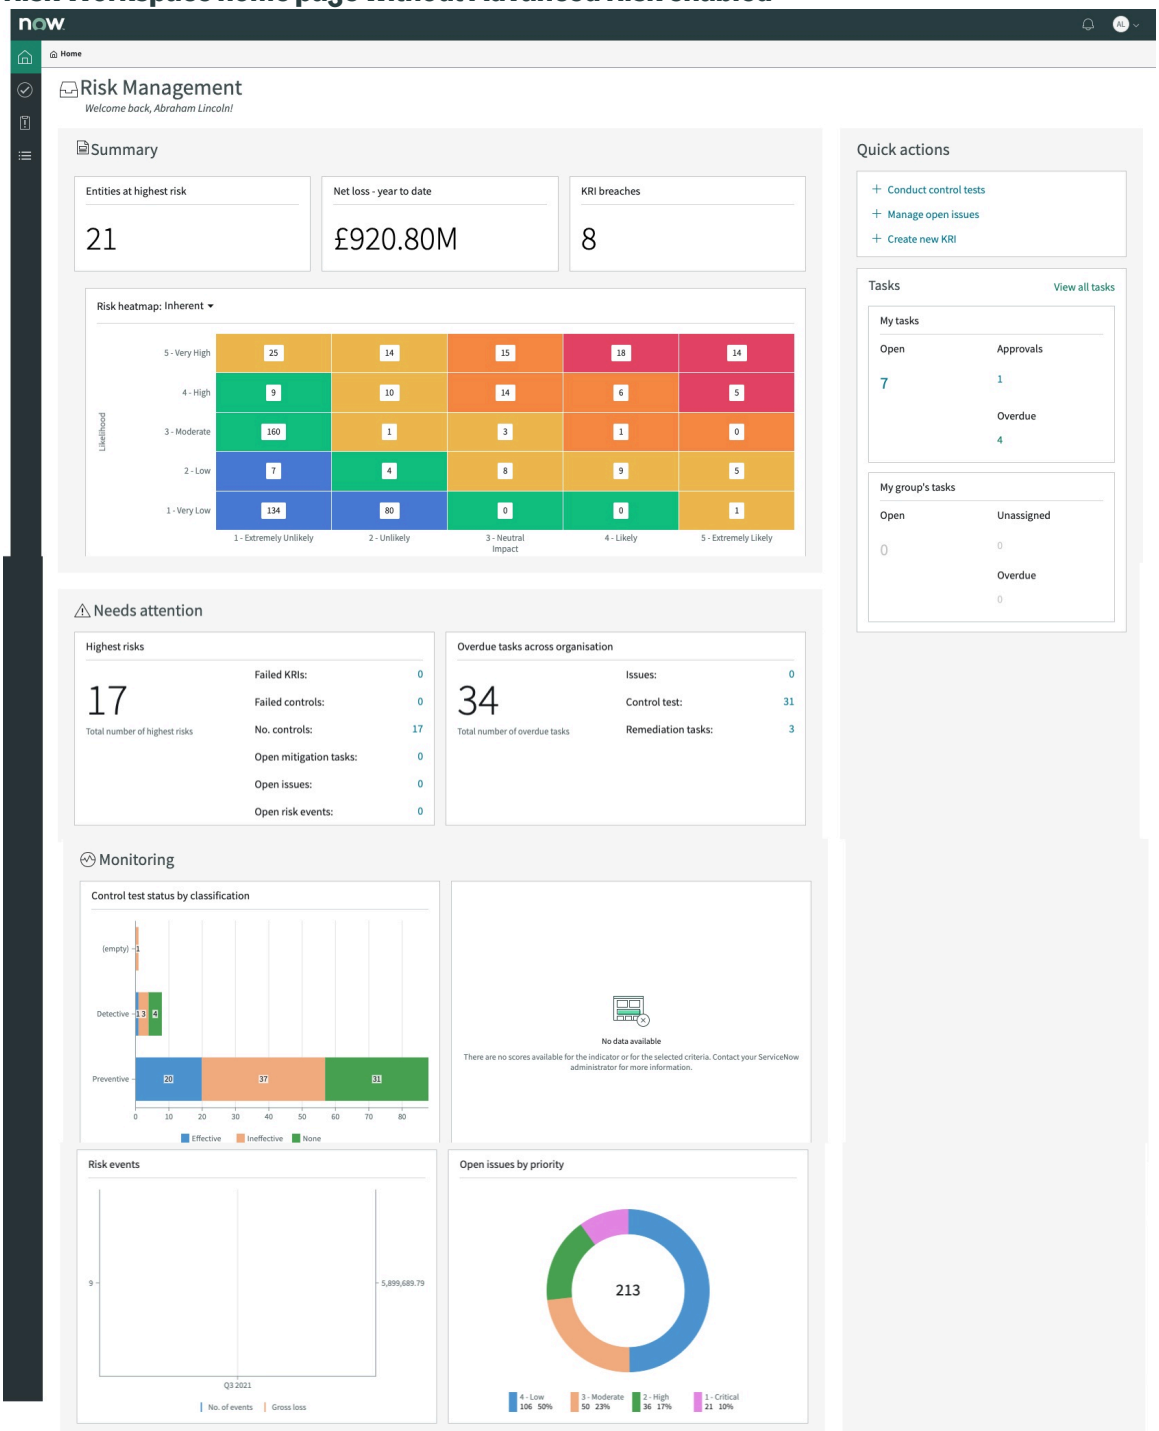
GRC Risk Workspace

Starting with version 13.0.5, the GRC Risk Workspace provides a new and simplified user experience with a single-pane view. In the workspace, you can perform the same functions as the classic environment, but with more intuitive functionality. These functions include risk assessments, risk events processing, and so on.

The Risk Workspace is highly configurable and role-driven. Being role-driven means that the Risk Workspace is customized or unique for each user or role in your organization. In the workspace, different users with specific roles can perform different functions and have views that differ from each other. The workspace also reduces the number of apps that the users must install to utilize the Risk Management application. For example, if you want to manage your IT risks, you must install only one application. The workspace makes the management and installations of apps easier. To use the Risk Workspace, you must install and activate the **GRC: Risk Management workspace** (com.sn_risk_workspace) plugin.

The starting point in the Risk Workspace is the Home page .

The Home pages show you the complete view of the risk status across your organization. Some of the key items that you can see are the key risk indicator (KRI) breaches, the risk heatmaps, the risk classification and breakdown, entities at the highest risk and so on.



The Home page offers the following benefits:

- Provides a different view for each role.
- Is designed for the specific responsibilities of each role.
- Shows the day-to-day tasks for each role depending on the user. For example, the Home page for an Operational Risk Manager differs from that of the Home page of the IT Risk Manager.
- Displays the key tasks assigned to you and your group. This makes it easier to get a complete view of your actionable tasks. For more information on the new user experience for Advanced Risk Assessments, see Advanced Risk Assessments in the Risk Workspace.
- Shows the risk profile for the top entities. This consolidated view enables easier reporting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enables customization to suit your needs. For example, you can configure your own color codes for heatmaps and reports. For more information, see Operational risk heatmap for Advanced Risk Assessment in the Risk Workspace
- Provides quick links for performing key tasks such as scheduling risk assessments, creating new key risk indicators, and so on.
- Provides data in a way that you can click and view the details.
- Shows the classic risk assessment scores if the Advanced Risk application is not enabled.

Risk Workspace home page without Advanced Risk enabled

Roles and user enhancements in the Risk Workspace

The roles for the Risk Workspace are the Operational Risk Manager and IT Risk Manager. See the following sections for the description of each role, its responsibilities, and its tasks.

Note:
Because the roles in your organization might be different from what is presented here, use these roles as references or models.

Multiple enhancements have also been made to the user experience in the Risk Workspace. Each enhancement is described in detail in the subsequent sections.

Risk Workspace for the operational risk manager

Operational risk managers manage operational risks such as losses due to errors, breaches, or damages that are caused by people, internal processes, systems, or external events. Operational risks range from the small, such as the risk of loss due to minor human errors, to the large, such as the risk of bankruptcy due to serious fraud.

Operational risk manager

Operational risk managers are a part of the operational risk team that manages the risk posture of the organization. Risk posture is the current risk profile for a company. As an operational risk manager, you must perform the following tasks.

Define the operational risk framework

Effectively manage the operational risks of an organization by defining a robust risk management framework. This framework helps to identify risks and to define the control framework to mitigate those risks. A risk management framework consists of the following components:

- Risk identification
- Risk measurement or scoring
- Risk mitigation
- Risk reporting and monitoring

Set up libraries

Set up comprehensive libraries by doing the following:

- Creating risk statements: A risk statement is used to record a risk in a way that everyone can reach a common agreement on its severity or relative priority.
- Creating control objectives: A control objective defines the aim or purpose of risk-mitigating controls. These controls need continuous monitoring.
- Defining entity classes, entity types, and entities: For more information on entities, see Understanding entities.
- Defining the upstream and downstream entities.

The first step is to set up risk statements so that your team has a specific idea of the risk. For example, simply calling a risk as a cybersecurity risk is not specific. Cybersecurity risks could mean different things to different people. Therefore, a common statement to define cybersecurity is created as a risk statement. To create risk statements and their hierarchy, clearly define the risk impact, the assets at risk, and the source of risk. By defining the risk statements and creating their hierarchy, you can ensure that the risk scores are aggregated thus giving the complete risk status.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conduct risk assessments on a periodic basis

Perform the annual risk assessments according to your organization's policies. Also, ensure that the risk register is updated and accurate. Create risk assessment scopes and schedule assessments. To learn more about risk registers, see Risk register in the Risk Workspace.

Record and monitor risk events

Risk events are potential or actual financial and non-financial losses, near misses, and gains that occur within an organization. To effectively manage risks, it is essential to monitor risk events, perform a root-cause analysis, and track the remedial tasks. Organizations use risk events to understand their losses and analyze areas of improvement to reduce further losses. You must maintain the loss event register to capture complete event information and to suggest additional controls to mitigate risks in the future.

Define key risk indicators

Monitor the risk posture of your enterprise on a continuous basis. Continuous monitoring of risks and controls involves identifying and creating key risk and control indicators. Supporting information can be collected for those indicators through automatic data collection or manual tasks. Indicator results are then used to create issues for controls, signal a change in the risk posture, and to provide supporting information for audit activities and control testing. If the indicator thresholds are breached, you must escalate to the respective stakeholders.

Manage issues and incidents

An issue is created when there is a change in the environment, process, or system that poses a threat. An issue requires action to prevent an incident or loss. An incident is a successful outcome or event with a negative impact. As the operational risk manager, you can view, create, and manage issues and incidents. Ensure tracking, proper closure, remediation, and monitoring of issues and incidents.

Communicate the operational risk posture

Define dashboards to report data effectively and accurately. You must create the required reports which can be shared with the executives and the head of the operational risk team. The reports and dashboards ensure that the aggregated assessment results across the organization help to identify the top operational risks for the enterprise.

The following table lists the key tasks that you perform in your role as an operational risk manager.

Tasks of an operational risk manager

Activity	Task
Define the operational risk framework	• Create a risk statement • Create a risk framework in the Risk Workspace • Associate a risk statement with a control objective in the Risk Workspace

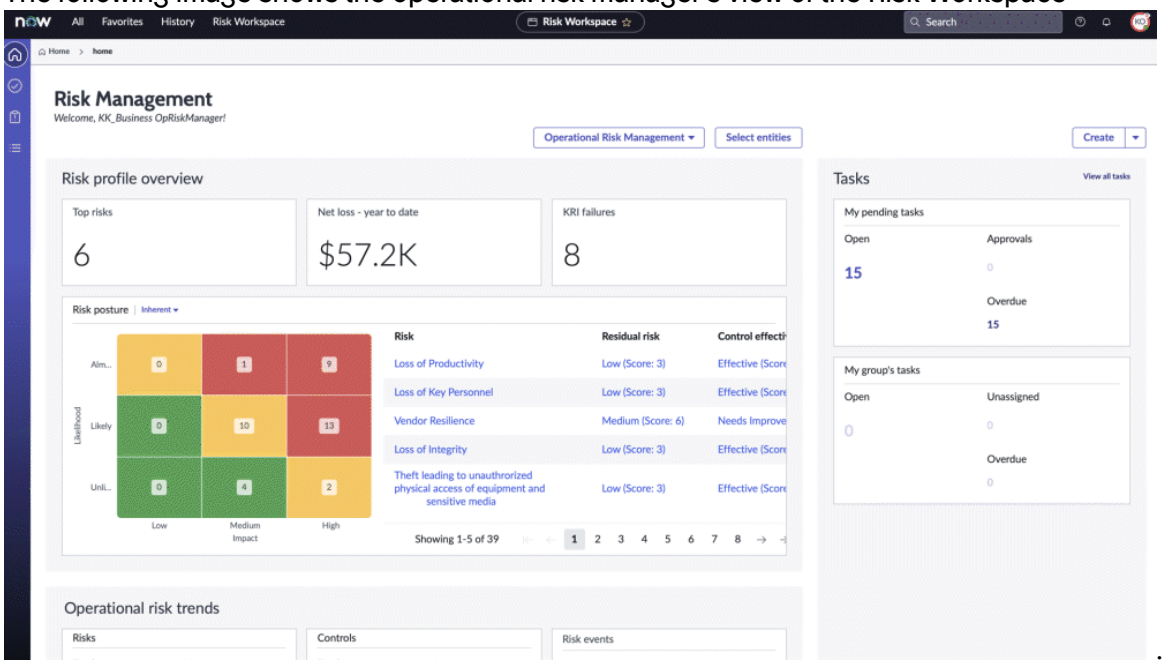
Roles installed with the GRC Risk Workspace

Risk Workspace for the business operational risk manager

Business operational risk managers are the first lines of defense for each individual line of business. They are responsible to manage the risk posture of their specific business units.



A business operational risk manager has the role sn_risk_workspace.business_op_risk_manager. As a business operational risk manager, you can do the following in your workspace.

- Filter the appropriate risk assessment methodology to view the relevant data.
- View the performance of your entity by viewing the number of top risks.
- View the number of key risk indicators that have failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The net loss beginning the first day of the current calendar year or fiscal year up to the current date.
- Create risks, risk events, and indicators.
- View the operational risk trends such as the not assessed risks and new risks identified in the last 30 days.
- View the risks by category.
- View the control status, the number of new controls, and the number of controls not attested.
- View the number of overdue issues and the number of new issues.

The following image shows the operational risk manager's view of the Risk Workspace

To view the risk assessments for the top risks for your entities, click the **Top risks** card.

The heatmap on the workspace gives critical insights into the risks when you select each tile of the heatmap. You can use the filter on the heatmap to view either the inherent risk posture or the residual risk posture. For more information, see Risk heatmap workbench.

Risk Workspace for the IT risk manager

Information technology or IT risk is any threat to your business data and critical systems. It is the risk associated with using and operating IT within an organization. An IT risk manager is the primary person responsible for establishing and maintaining the organization-wide IT risk management program.

IT risks vary in nature. It is important to be aware of all the different types of IT risks potentially affecting your business. An IT risk manager works with various stakeholders to ensure that IT risks are managed within the risk appetite of the organization. To facilitate risk assessments for IT risk managers, a preconfigured risk assessment methodology (RAM) is also provided by default. IT risk managers can use this RAM or make modifications to it according to their requirements.

Home page for the IT risk manager

User experience enhancements in the Risk Workspace

In the new workspace, several enhancements have been made to ease the way you perform your daily tasks. The user experience enhancements are useful for new GRC users or users who do not have the complete experience of GRC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Views of the Risk Workspace

The new workspace offers the following views for the users.

List view

The list view shows a simplified list of all the modules. You can access the list view by clicking the List icon ().

Record view

The record view provides detailed information about any record. For example, in the risk statement form, you can view the complete hierarchy including the parent and children of the risk statement. This view provides the complete details including important information such as open indicator breaches, open issues, open risk events and so on.

Miscellaneous user experience improvements

Overview pages of records

The Overview tab of each record provides you a summary of all the information you need in a single view. For example, for a risk record you can see KRI breaches, the controls failures, the number of issues open, the open indicator tasks, the number of risks assessed and so on.

Contextual side panel for records

The Contextual side panel of a record provides detailed related information for the records. For example, for a risk, you can see the parent and child hierarchy. You can display and close the Contextual side panel by clicking the reference icon ().

Tasks

Tasks is a centralized task inbox that shows your tasks and your group's tasks. You can access your tasks by clicking the Tasks icon ().

360° relationship view

The 360° view feature enables you to view the relationships between a selected record and related objects, such as controls, risks, and entity types. The 360° view also enables you to interact with all records displayed. For more information, refer to 360° Relationship Visualization.

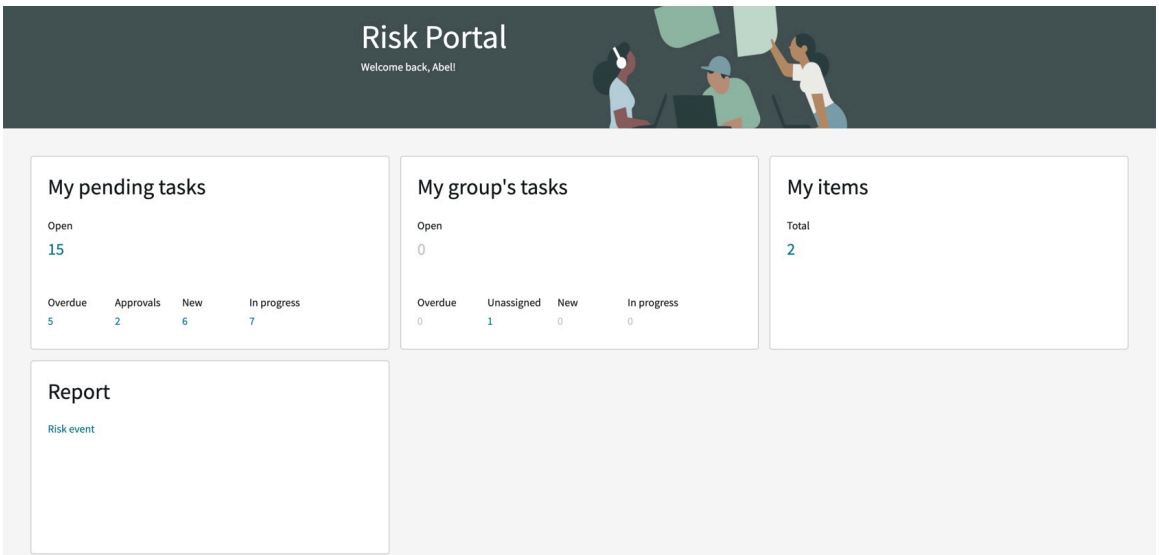
Breadcrumb navigation

The breadcrumb style navigation provides a browser path to navigate a hierarchy of linked pages with related content. The breadcrumb style navigation provides a digital trail from the user's starting point to the current content, with the ability to navigate to each link. For more information, refer to Breadcrumb navigation

Consolidated issues page

The comprehensive issue management page shows you a detailed status of your issues. For example, you can see overdue issues, issues approaching the overdue date, issues by priority and so on. You can also see the issues assigned to you and your group. This feature makes issue tracking easy. You can access your issues by clicking the Issue landing page icon (). For more information, refer to Issue management in the Risk Workspace.

GRC Risk Portal



The GRC Risk Portal is a simplified interface that enables the GRC business users to view their tasks and their group's tasks. The Risk Portal also enables users to report risk events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

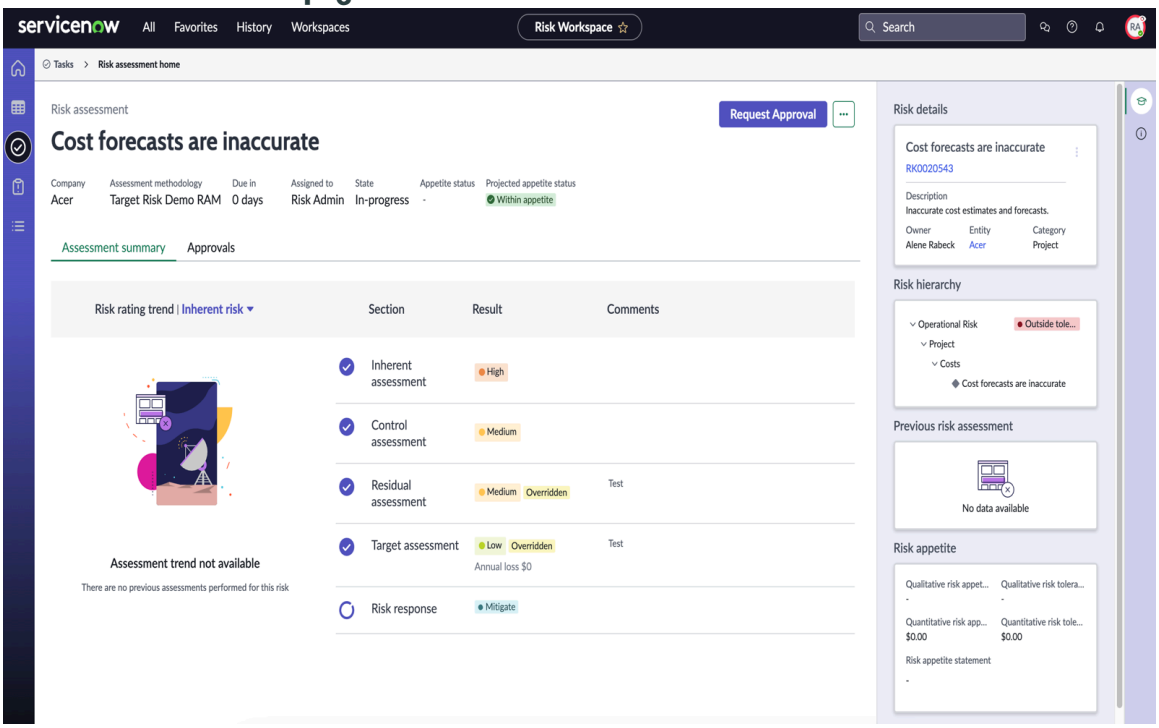
To access the Risk Portal, navigate to **Risk** > **Risk Portal**. To use this portal, you must have the sn_grc.business_user role. On the Risk Portal you can do the following:

- **My pending tasks**: View the tasks that are pending and are assigned to you. For example, if you have a risk assessment assigned to you, you can launch it from the Risk Portal.
- **My group's tasks**: View the tasks assigned to your group.
- **My items**: View the requests you have raised. For example, issues, policy exceptions, remediation tasks and so on.
- **Report**: Report a risk event. To see how you can report a risk event from the Risk Portal see, Report a risk event from the Risk Portal

Risk Portal

Advanced Risk Assessments in the Risk Workspace

The Risk Workspace offers an enhanced and a simplified user experience for users to perform Advanced Risk Assessments. You can quickly access the risk assessments assigned to you or your group from the GRC Risk Portal or the Risk Workspace.



With the new Risk Workspace, your risk assessments are more intuitive with more data readily available for you to refer for every assessment that you perform in the risk assessment instance. As an operational risk manager, when you use Advanced Risk Assessments, on the Home page, in the **Risk Summary** field,you have a filter available to select your risk assessment methodology. For example, you can select the risk assessment methodology that shows you the operational risks assessed. For more information on risk assessment methodologies, see Advanced Risk Assessment.

For a new user to understand risk assessments, a Contextual side panel is provided with an explanation about the assessment sections. While a default explanation and a brief training are provided, you can also configure the system to show your training content related to risk assessments. If you do not want to keep the side panel training information open, you can also close it using the information icon.

At a glance, the risk assessment home page shows you the entity being assessed, the due date for the assessment, the person the assessment is assigned to, the approver, and the risk description. The home page also shows the results of the risk assessment and the selected risk response strategies.

© 2026 ServiceNow, Inc. All rights reserved.

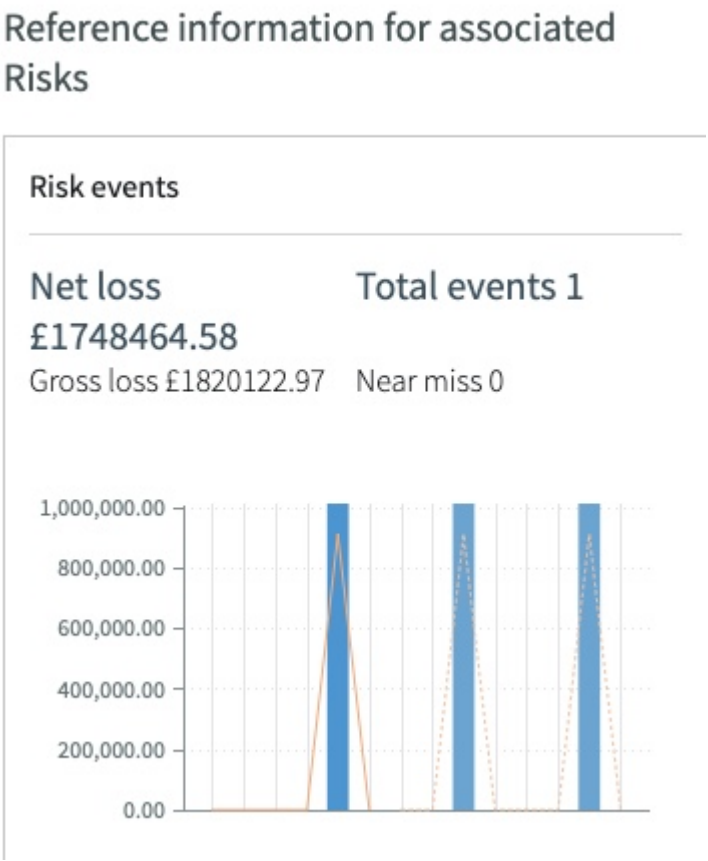
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk assessment home page

Some of the major enhancements for Advanced Risk Assessments in the Risk Workspace are as follows:



View reference information for associated risks and controls

The Contextual side panel shows the reference information for associated risks and controls. The graphical representations can be clicked to get detailed information about the risk events, issues, indicator breaches and so on. The reference information shows the following:

- Risk events graph that displays the gross loss and the net loss of the aggregated risk events for that particular risk. This graph also displays the forecasts of the losses.
- Percentage of key indicator breaches for every quarter.
- Percentage of control indicator failure graph. When performing a control assessment, you can refer to the control test results, indicator failures, and so on
- Number of open issues with their severity. You can also create issues by clicking the plus icon.

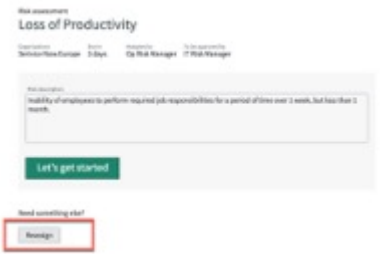
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reference information for Advanced Risk Assessment



View factor guidance

In the workspace, while responding to factors, you can quickly view the guidance by clicking the Show guidance icon . This ability saves your time as you can view the guidance and understand the factor while responding.

Reassign assessments

If you are assigned a risk assessment that must be assessed by another user, you can reassign the assessment from the risk assessment home page. In case there are two users with the same name, you have the ability to view their email addresses while reassigning the assessment. This ability prevents users from assigning the assessment to the wrong users.

View factor weighting information

As a first line risk assessor, you may need to view the qualitative weight, the qualitative score, and the quantitative score of a factor. You can easily access this information by clicking **Overall rating**.

Related topics

Perform advanced risk assessment in the Risk Workspace

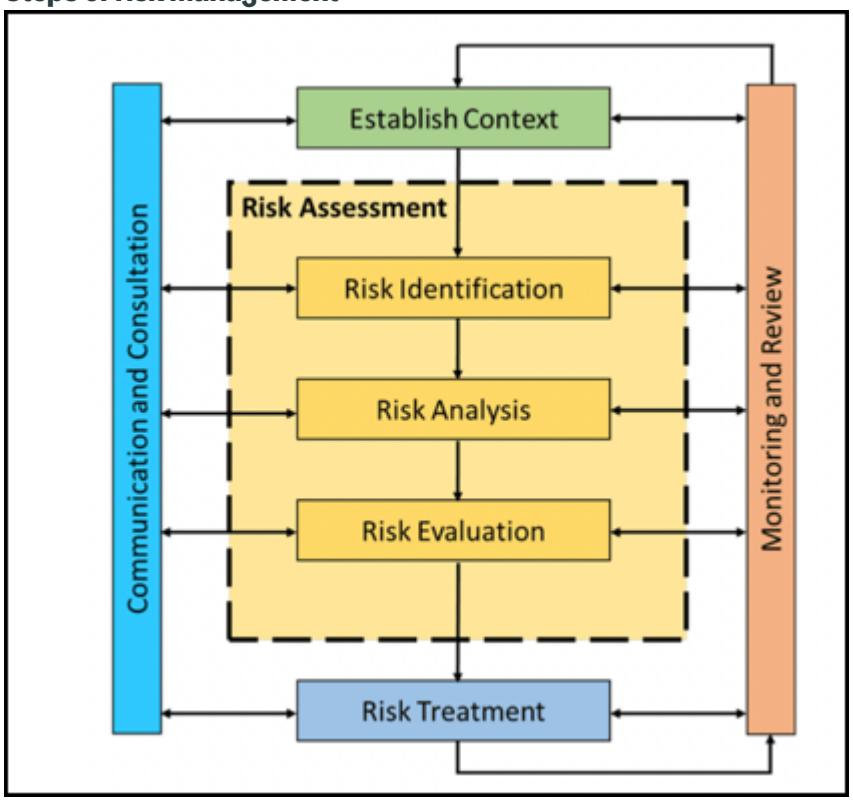
Advanced Risk Assessment

Use the ServiceNow® Governance, Risk, and Compliance (GRC) Advanced Risk Assessment feature to create an integrated risk platform. This integrated platform supports various kinds of risk assessment methodologies. It enables you to integrate risk assessment as part of your overall decision-making process.

Advanced Risk Assessment offers the following benefits:

- Digitizes the complete risk management life cycle, including risk identification, risk analysis, risk evaluation, risk treatment, and monitoring.
- Customizes the risk assessment process based on the unique needs of your organization. This customization includes configuring the assessment criteria, the context, and the overall risk scoring logic.
- Supports both qualitative and quantitative risk assessment methods.
- Automatically aggregates the bottom-up risk assessment scores across the risk.
- Embeds the risk assessment process in the workspace for first-line users. This embedding helps users make informed decisions based on risks that are associated with actions.

Note:
To know if your current license entitles you to Advanced Risk Assessments, contact ServiceNow.



Steps of risk assessment

Before understanding Advanced Risk Assessment in detail, it is important to understand the key steps of risk management:

1. Risk identification: Find an uncertainty or risk that might prevent your organization from achieving its objectives.
2. Risk analysis: Understand the cause and consequence of the risk.
3. Risk evaluation: To determine if additional action is required, compare the results of the risk analysis with the established risk criteria.
4. Risk treatment: Define an action plan to address the risk.
5. Risk monitoring: Track the risk posture of the organization and communicate it to relevant stakeholders.

Steps of risk management

Risk assessment consists of risk identification, risk analysis, and risk evaluation. Advanced risk assessment is performed based on factors or questions and their responses. It can be performed for an entity such as an organization. To use advanced risk assessment, you must enable the **Migrate to Advanced Risk Assessments** property located under the Administration module. The assessor and approver for the risk assessment must have the sn_grc.business_user role. Advanced risk assessment enables you to do a detailed assessment of the risks where the inherent risks, mitigating controls, and residual risks are assessed. If you don't have the complete GRC setup for entities, risk statements, controls, and so on, then you can still assess the risks on any ServiceNow record or object. An example of object assessment is assessing change management. During risk assessment, the following risks are assessed.

- Inherent risks: Inherent risks are risks that don't have controls. For example, driving at a high speed on a highway is inherently more of a risk than driving at a moderate speed. The score of this inherent risk is derived by multiplying the impact of the risk and the likelihood of the risk.
- Control effectiveness: Controls can mitigate the impact or likelihood of a risk. For example, highways have speed limit monitors. If a risk materializes, the controls mitigate the impact. Controls can be preventive, detective, or corrective.
  - Preventive controls are designed to prevent errors, inaccuracies, or fraud before these issues occur.
  - Detective controls are intended to discover the existence of errors, inaccuracies, or fraud.
  - Corrective controls are designed to correct errors or irregularities that have been detected.
- Residual risks: Residual risks are the leftover risks that remain after the implementation of controls. For example, despite the safety measures in place, if there's still an accident, then the damage caused by the accident is a residual risk. A residual risk score can be calculated using any of the following methods:
  - A matrix between inherent and residual effectiveness.
  - A mathematical formula such as the inherent score minus the control score.
  - Answers to factors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Target risks: Target risks are the desired risk an organization want to achieve in the future. By evaluating the desired level of likelihood and impact of identified risks, organizations can establish target risk levels for each risk. For example, when assessing a risk, you consider various aspects such as inherent risk, the effectiveness of controls, and residual risks. However, it's equally important to capture the desired risk level that will be attained after your risk response is implemented. The target risk represents the optimum level of risk that you aim to achieve after your action plan is successfully executed. It enables you to measure the benefits your organization gets in relation to the cost of implementing those actions.

Workflow of Advanced Risk Assessment

To use Advanced Risk Assessment, you must set up the risk assessment methodology (RAM), define the assessment scope, and perform the assessment.

Before using Advanced Risk Assessment, different users must perform different setup tasks. These steps define the workflow of the assessment.

1. Set up the risk assessment methodology (RAM): A risk administrator with the sn_risk.admin role sets up the system. The administrator does the following:
   - Identification: Identifies if a risk or an object is being assessed.
   - Assessment: Determines how to assess the issue, such as with assessment criteria, risk scoring, or reporting preferences.

   For more information, see Configure a risk assessment methodology.
2. Define the risk assessment scope: After the RAM is defined, the entity owner defines and identifies the following:
   - The relevant risks for the entity.
   - The assessors and approvers for those assessments.
   - Periodicity of those risk assessments.

   For more information, see Create a risk assessment scope and initiate assessments or Create a risk assessment scope in the Risk Workspace.
3. Perform risk assessment: The risk assessor with the sn_grc. business_user role performs the following assessment tasks.
   - Assesses the inherent risks and the effectiveness of mitigating controls.
   - Reviews the residual risk and defines the risk treatment plan.
   - Perform a target risk assessment to define your desired future risk level.
   - Triggers the review and approval workflow.

   For more information, see Perform advanced risk assessment in the Risk Workspace.
4. Monitor the assessments: After the risk assessment is approved, the assessment moves to the Monitor state. The risks assessed in the risk assessment must be monitored especially if it contains automated factors. Automated factors or questions that automatically fetch data from any of the data sources have ever-evolving risk ratings. Therefore, a risk which may currently have a low rating might have a higher rating later. This makes it imperative to monitor a completed assessment to reduce threats to your organization.

Factors in Advanced Risk Assessment

Factors are questions that you can use to analyze risks. Factors appear on a risk assessment instance.

Factors are questions that appear during the risk assessment. To use Advanced Risk Assessment, you must first define these factors and configure a risk assessment methodology

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(RAM). For more information on RAMs, see Configure a risk assessment methodology. Each factor or question has a response. There are different types of factors:

- Manual factor: A factor that requires human input. The response is a manual response. An example is your name.
- Automated factor: A factor whose response is automatically calculated. An example is the temperature in your city today. The information is fetched from external sources.
- Scripted automated factors: A factor that is used to write scripts.
- Group factor: A set of factors that are grouped logically.

These factor types are explained more in the following sections. After you define the factors and publish them, you can configure a RAM and associate the factors to the assessment types within the RAM. The RAM forms the basis of the risk assessment. Publish each of the selected assessment types, and then publish the RAM. Users with the sn_risk.user role can select the assessment types for which the assessment must be performed.

Your risk assessment instance is then created. Its properties depend on the assessment types and options that you selected for your RAM. The risk assessment instance is where the risk assessor evaluates the risks. As a question, a factor can be used in multiple assessment types. For example, a question such as "What is the probability of a building getting flooded?" can be a part of either an inherent assessment or a residual assessment after the control effectiveness assessment.

Note:
A factor can be used in multiple assessment types, but it can be used in only one RAM. A factor that is created and used in one RAM cannot be reused in other RAMs.

Types of factor contributions

An assessor provides responses to factors. Risk assessors can contribute to factors in the following ways:

- Qualitative: Losses are in the form of subjective terms such as high, medium, and low. The losses can also be in the form of a numerical score that is converted into a rating.
- Quantitative: Losses are in a numerical form. They can be incurred from a risk in monetary terms. They contribute to the inherent Annual Loss Expectancy (ALE).
- Both: Losses have both a qualitative risk rating and a quantitative dollar value. These ratings are also called semi-quantitative.

For more information on understanding qualitative, quantitative, and semi-quantitative ratings, see Types of risk rating methodologies

Manual factors

In a risk assessment, questions that need human responses from the respondents are called manual factors. In manual factors, the response is subjective and difficult to classify. Some questions require human intelligence and assessment. Therefore, a manual factor is a subjective assessment of a person's view. Examples of manual factors are reputational impact, expected speed of onset, and so on. In manual factors, users can provide the following types of responses:

- Text: A descriptive answer. For example, feedback. This choice does not contribute toward the risk score calculation.
- Choice: User-defined choices to the questions in the assessment. For example, users can select risk ratings from low, medium, or high.
- Number: A numeric value. For example, the number of open issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Currency: An amount in the local currency of the user. For example, the financial impact of a certain risk.
- Percentage: A percentage value for the questions in the assessment. For example, the percentage of employees satisfied with the organization strategies.

Group factors

When factors are grouped logically, they are called group factors. A group factor's score depends on the responses of the corresponding manual factors. For example, organizations are affected from financial risks and non-financial risks. You can create some factors for financial risks, and other factors for non-financial risks. You can combine these two sets of factors into a single group factor called Overall Impact. Like manual factors, group factors can contribute either to a numerical risk score that is converted to a qualitative contribution, or to the ALE values as a quantitative contribution.

Automated factors

Automated factors automatically fetch the latest data, during an assessment, from any of the data sources such as tables or database views. Automated factors help to automate the risk assessment process. They do not rely on manual inputs, and thus reduce subjectivity. For example, a risk assessor wants to perform an assessment for different locations. One of the automated factors is the political condition of a country, and this information is publicly available on a website. Because this data does not reside within ServiceNow, the assessor can use automated factors to fetch the data. Some other examples of automated factors are the following:

- The number of employees on a project.
- The revenue of a business unit.
- The business criticality of a process.

Scripted automated factors

Automated scripted factors are used to write scripts. The scripts fetch the data from either ServiceNow records or from external sources. Scripted automated factors automatically provide the responses for factors during risk assessment.

The following use cases demonstrate an example of how you can model scripted factors. For example, if you want to use the results from the compliance function to assess the mitigation effectiveness of the controls, there are two ways for assessing the controls:

- Individual assessment of controls
- Control environment assessment.

In the individual assessment of controls, each control is separately assessed. To understand control assessment in the context of scripted factors, consider the example of money laundering as a risk. In this example, the control effectiveness is assessed based on the percentage of the failed controls. The values of the failed controls are then transformed into a rating to calculate the control effectiveness of that control. For example, the risk of money laundering has three mitigating controls:

- Employee training
- Internal audit on employees
- Customer due diligence

Assume that you have defined the control effectiveness criteria in the following manner:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control Design Effectiveness Failure	Control Effectiveness
0%-30%	Effective
30%-60%	Needs improvement
> 60%	Ineffective

Now, assume that out of the three controls, one control passed and two controls failed. The failure of two controls translates into a 66.67% failure rate. Based on the transformation and based on the previous table, the control effectiveness rating is ineffective. You can use this defined script to automate the response to the factor to assess the risk of money laundering.

As for control environment assessment, you can assess the complete control environment instead of assessing each control individually. To understand control environment assessment, consider the following example. Assume that you want to assess the control environment based on two aspects: design effectiveness and operating effectiveness. To calculate the design effectiveness, you can fetch the related controls that are related to the risk of money laundering. You can then look at the test results to understand how many of the controls had failed. Assume that you have defined the control effectiveness criteria in the following manner:

Control Design Effectiveness Failure	Control Effectiveness
0%-30%	Effective
30%-60%	Needs improvement
> 60%	Ineffective

Now, assume that two controls failed and one control passed. Thus, the control design effectiveness failure rate is 33.33%. Based on the previous table, this low value of 33.33% means that the control design needs improvement. This response can be automatically scripted in the automated scripted factor because it does not need any human calculation or intervention.

Types of risk rating methodologies

Risks are scored during an assessment and then a rating is derived. Ratings are of three kinds: qualitative, semi-quantitative, and quantitative.

Qualitative rating

Qualitative risk assessments rely on the assessor's perceptions of the probability and impact of a risk. If the method is purely qualitative, then the ratings are based on the list values such as high, medium, or low. In this case, the risk scores do not roll up. Because this method has minimal mathematical dependency, qualitative risk assessment is easy and quick to perform. This method also enables an organization to take advantage of the assessor's experienced knowledge of the process or asset that is being assessed. Users who are new to risk assessments usually use this kind of rating.

The following figure shows an example of qualitative rating.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Qualitative risk assessment

		Impact		
		Low	Medium	High
Probability	Low	Low Risk	Low Risk	Medium Risk
	Medium	Low Risk	Medium Risk	High Risk
	High	Medium Risk	High Risk	High Risk

Semi-quantitative rating

In a semi-quantitative rating, the qualitative ratings also have a corresponding numerical scale. For example, if the quantitative risk score is between 0-10, then the qualitative rating is low. Users who use this type of rating are not new to risk assessments. Most users belong to this category. In this category, the risk scores roll up and the risk appetite is qualitative in nature.

The following figure shows an example of semi-quantitative rating.

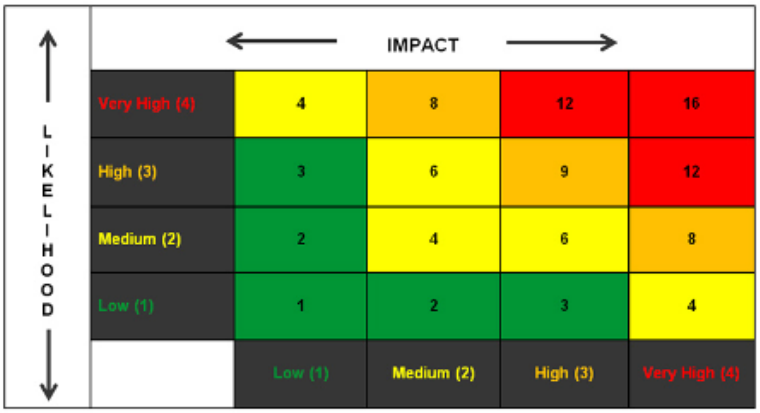
Semi-quantitative risk rating

Risk Score	Rating
0 – 3	Low
4 – 6	Medium
6 – 9	High
10 – 16	Very High

Quantitative rating

A quantitative risk assessment focuses on data that is fact-based, measurable, and highly mathematical. In a quantitative risk rating that uses advanced simulation techniques, the risk is quantified in purely numerical terms. In this category, the risk appetite is quantitative in nature.

Transformation criteria



After the risk scores are calculated, you can transform the scores into a rating and then easily report the ratings to senior management and to other stakeholders.

Scores are transformed into a rating because ratings provide clear meaning and interpretation for the scores. The transformation of risk scores is done using transformation criteria. You can define the transformation criteria based on your requirements. For example, you can define that a risk score between 80-100 is a high risk.

The following figure shows an example of the rating transformation criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rating transformation Criteria

Risk Score	Rating
0 – 3	Low
4 – 6	Medium
6 – 9	High
10 – 16	Very High

Any object assessment using Advanced Risk Assessment

If you don't have the complete GRC setup for entities, risk statements, controls, and so on, even then, you can still assess the risks on any ServiceNow record or object. An example of object assessment is assessing change management or assessing a citation.

Any object assessment is used to perform risk assessment on any ServiceNow record. To perform a risk assessment, a prior knowledge of risk is not necessary. Using the assessment results, risk managers can quickly analyze the risks associated with their project or application.

Any object assessment can be performed in the following ways:

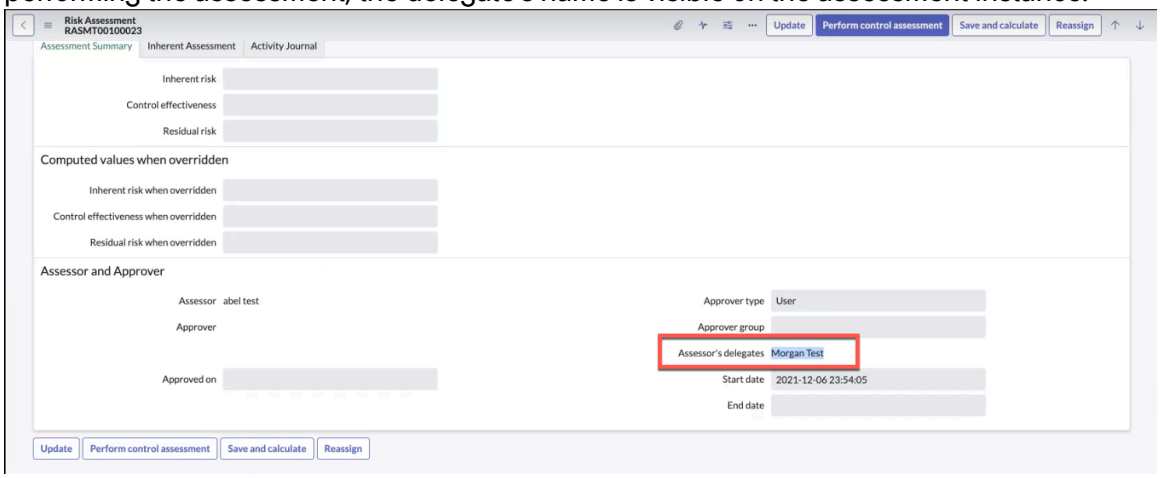
- Ad hoc: In an ad hoc based risk assessment, users can perform the assessment through a UI action.
- Event driven: In an event driven risk assessment, a user can perform the risk assessment based on some event.

To perform any object assessment, you must create a risk assessment methodology with **Object** as the context and then select the relevant table.

Note:
You cannot assess your controls if you perform the risk assessment for an object. The reason for this limitation is that controls are associated to either an entity or a risk. Also, the risk response workflow is not available for the assessment of an object.

After you generate an assessment, you can add a related list in the object in which you can see the list of assessments. For more information on how to configure any object assessment for an object and create the **Assess risk** button, see the Perform any object assessment [KB0826429] article in the Now Support Knowledge Base.

For information on how to configure any object assessment in the Risk Workspace, refer to the Any object integration in workspace [KB0961251] article in the Now Support Knowledge Base.



Note:
You must log in to Now Support to view the articles.

Delegation of risk assessment

If a risk assessor is unavailable to perform a risk assessment, the assessor can appoint a delegate to perform the risk assessment for a specified time period. The ServiceNow AI Platform enables you to appoint your delegates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delegation is the assignment of authority to another person to perform specific activities. It is a process of entrusting work to another person. In the context of risk assessments, at times, it may happen that the assigned assessor for a risk assessment is unavailable to perform their risk assessments. In such a scenario, the assessor can assign another user as a delegate and the delegate can perform the risk assessment on behalf of the original assessor for a specified time period. A delegate can perform the risk assessment from the Risk Workspace and the Risk Portal. A delegate also receives a copy of all the system notifications that are sent to the original assessor. Once the delegate starts performing the assessment, the delegate's name is visible on the assessment instance.

As a risk assessor, to understand how you can assign a delegate, refer to Configure a delegate for your tasks.

To delegate tasks to another user, configure your user profile form to display the Delegates related list. For details, refer to Add the Delegates related list.

It is important to note the following points when you assign a delegate.

- The ability to assign a delegate is only available to perform an assessment. You cannot assign a delegate for approving a risk assessment.
- After a delegate is assigned an assessment, the assessment shows the names of the original assessor as well as the delegate.
- You can only assign an individual user as a delegate and not a group.
- A delegate must have the sn_risk_advanced.ara_assessor role to perform risk-based assessment.
- A delegate must have the sn_risk_advanced.ara_assessor to perform any object assessment.
- All delegates are considered licensed users and are tracked for their GRC usage.
- When the delegate logs in to perform the risk assessment on behalf of the assessor, the original assessor's name remains in the **Assessor** field. The new field **Assessor's delegates** displays the name of the delegate.
- The delegate can reassign the task to another user.
- The delegate can view the on-going assessments for the original assessor under **Tasks** in the Workspace.
- The delegate can create issues.
- The delegate can create risk response tasks and request approval.
- All activity performed by the delegate is captured in the activity stream.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding the risk assessment instance

A risk assessment instance is where a risk assessor can assess risks and objects by responding to questions or factors.

After the risk assessment methodology (RAM) is created and the risk assessment scope is defined, the assessments are initiated by the risk administrator. The assessor receives a notification to assess the risks. To perform the risk assessment, an assessor must have the sn_grc.business_user role. The assessment is used to arrive at a risk score for an entity.

Note:
You must manually assign the advanced risk assessment roles to the sn_grc.business_user role. To understand how you can adjust granting of roles and groups, refer to see the How to adjust granting of roles and groups to use background jobs [KB0963693] article in the Now Support Knowledge Base.

The questions that a risk assessor answers are configured in the RAM. An assessment can contain manual factors and automated factors. Manual factors need human input as responses. For automated factors, the responses are automatically calculated. Automated factors are automatically executed based on the schedule that is defined in their configuration.

After an assessment is completed, then based on the defined reassessment frequency, a reassessment is automatically triggered. A reassessment is triggered only if the existing risk assessment instance is in the Monitor state. If an assessment is in the Monitor state, then whenever automated factors run according to their schedule, the assessment scores will change and the factors will contribute new scores to the rollup.

If the risk assessor determines that an assessment must be reassigned to another relevant assessor, then the assessor can reassign the assessment. The assessor can also modify the responses after responding to the factors.

If an assessment is taken more than once, and if the option to copy the previous assessment responses is enabled in the RAM, then the responses from the previous assessments get automatically copied to the current assessment.

Note:
Automated factor responses and overridden scores aren't copied from previous assessments.

Components of a risk assessment instance

Based on the configurations in the RAM, the risk assessment instance form also displays the following related lists:

- Previous Assessments: The previous five assessments for the risk that is currently being assessed.
- Risk Events: The number of risk events that are associated with the risk.
- Risk Indicators: The number of risk indicators that passed and failed for this risk.
- Open Issues: The number of open issues for the risk and their state and owners.
- Risk Response Tasks: The number of risk response tasks that are created for the assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Related controls: The controls that are related to the risk. This related list appears only when the control environment is being assessed.

Note:
Customers on previous releases might not be able to see the updated count for passed and failed indicators. To resolve this issue, run the *`Update indicator and Controls Count`* fix script.

An assessor has the option to not assess the mitigating controls. The option to opt out of controls is useful in cases where there is a risk but there are no controls to mitigate it. For example, consider a scenario where a pandemic is a risk but there are no vaccines to control it. In such a case, the risk is assessed but the controls can be left out of the assessment. When an assessor decides to opt out of assessing mitigating controls and residual risks, the score is set to **Not applicable**.

If the control assessment is configured to assess individual controls, and the controls are associated with the risk being assessed, then the option to opt out of controls does not appear. This happens because the controls are defaulted.

If the residual assessment is for inherent risks and controls, and if the risk assessor opts out of control assessment, then the residual risks are not applicable. This condition is created because if there are no controls, that automatically means there are only inherent risks and no residual risks.

Stages of risk assessment

The risk assessment life cycle goes through the following states:

1. Ready to assess: A new assessment instance is created.
2. Inherent assessment: The inherent risk assessment is performed.
3. Control assessment: The control assessment is performed.
4. Residual assessment: The residual risk assessment is performed.
5. Target assessment: The target risk assessment is performed.
6. Respond: You respond to the risks.
7. Awaiting approval: The risk assessment is awaiting approval from the approvers if they have been identified.
8. Monitor: The risk assessment is complete and is being monitored.

Managing risk responses

A risk response is the strategy used to deal with risks after the risks are assessed.

After risks are assessed, the assessor determines how to approach those risks. To deal with the risks, the assessor can choose from the following types of risk responses or strategies:

- Accept: Accept the risk as it is.
- Mitigate: Identify and implement additional controls to mitigate the risk.
- Avoid: Change the plan to completely avoid the risk.
- Transfer: Transfer or share the risk with a third party.

After an assessor identifies the appropriate risk response strategy, they can create risk response tasks and assign them to users with any of the following roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sn_grc.business_user
- sn_grc.business_user_lite
- sn_risk.implementation_business_user (feature role)

Each strategy is explained as follows:

Risk acceptance

When risk users accept a risk, they provide a plan for how they want to accept the risk, provide a justification for accepting the risk, and seek additional approval from the risk owner. Closure of the acceptance task implies you are accepting this risk for that time period. The risk then moves to the Monitor state. After the specified time period is over, you can re-initiate the workflow to assess the risk and then you can again respond to the risk. The risk owner can then respond with one of the following options:

- Approve
- Reject
- Cancel
- Request more information
- Decide that it is no longer required

Risk mitigation

When risk users choose to mitigate a risk, a risk mitigation task is created. The risk user must provide a plan for how to mitigate the risk and request a review from the risk manager. When the risk mitigation task is in the Draft or Work In Progress state, you can either create more risk-mitigating controls for the risk or add existing controls from the library. The reviewer with the role sn_risk.manager then reviews the plan and selects one of the following options:

- Close
- Revert to draft state and provide additional comments
- Cancel
- Delete

Risk avoidance

When risk users choose to avoid a risk, they provide a plan for how they want to avoid the risk and request a review from the risk manager. The reviewer then reviews the plan and can select one of the following options:

- Close
- Revert to Draft state and provide additional comments
- Cancel
- Delete

Risk transfer

When risk users choose to transfer a risk, they provide a plan for how they want to transfer the risk and request a review from the risk manager. The reviewer then reviews the plan and can select one of the following options:

- Close
- Revert to Draft state and provide additional comments

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cancel
- Delete

Note:
The risk response workflow is not available for an object assessment.

Risk score rollup in Advanced Risk Assessment

In Advanced Risk Assessment, risk scores are calculated across risk statement hierarchy, entity hierarchy, or a combination of both. These methods enable stakeholders to monitor their risk posture and provide visibility of the overall aggregated risk score.

Before you understand the rollup feature, consider the following points:

- Each entity might have multiple scores based on the different risk assessment methodologies.
- Only the risk assessments in the **Monitor** state contribute to the risk score.
- Each risk assessment methodology might have a different formula to calculate the rollup qualitative score and the rollup quantitative score. The formula is specified in the **Rollup configurations**section in the risk assessment methodology form.
- Whenever the Advanced Risk plugin is activated the risk scores get rolled up.

Risk statement hierarchy

Based on the assessments, the system automatically rolls up the inherent risk scores, the Annual Loss Expectancy (ALE), control effectiveness score, residual risk score, and ALE across the risk statement hierarchy for the selected methodology. This rollup allows the risk managers to monitor their enterprise risk posture.

Entity hierarchy

Like risk statement hierarchy, the system also automatically rolls up the risk scores and ALE values across the entity hierarchy for a risk assessment methodology. This rollup allows the entity owner to monitor the entity's risk posture. The rollups are done using the following formulae:

- Sum
- Average
- Maximum
- Minimum

Entity hierarchy and risk statement

Using the Manage Aggregated Risk report, customers can define additional reporting dimensions on which they want to monitor the risk posture for an entity. For example, if you want to understand an internal fraud related risk for Retail Banking, you can define that reporting dimension and monitor the risk.

Changes in reports and risk rollup method after migrating to Advanced Risk Assessment

To utilize the new rollup score calculation, the risk administrator, with the role sn_risk.admin, must first enable the *`Migrate to Advanced Risk Assessments`* property by navigating to **Advanced Risk Assessment** > **Administration** > **Properties**. This property is not enabled by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
It is crucial to note that when you enable the mentioned property, any customizations in the risk overview dashboard will be hidden. Contact ServiceNow for assistance. Also, the following properties in risk are not hidden when you migrate to advanced risk rollup:

- Compare risk tolerance based on
- Compare calculated risk score with

When customers migrate to Advanced Risk, the following reports are hidden from the user's view:

- Aggregated Risk Report
- Exposure by Entity
- Exposure by Risk Statement

In the Risk Overview dashboard, the following tabs are hidden:

- Entity Tolerance Status
- Risk Tolerance Status
- Aggregated Entity Information
- Aggregated Risk Information

Under the Aggregated Risk Report, the following modules are visible that show the rolled up risk scores:

- Aggregation by Risk Statements
- Aggregation by Entities
- Entity by Risk Statements

When you migrate to advanced risk assessment, individual risk score values do not roll up to give you the risk score. Instead, the values from advanced risk assessment are considered. For example, for an entity, in the Entity form, the Risk Rollup and Tolerance section is not displayed. The same applies to any risk statement. Instead, a related list called Aggregated Risk is displayed. The Aggregated Risk related list contains the following values derived from various risk assessments:

- Risk assessment methodology
- Residual rating
- Inherent rating
- Control effectiveness
- Residual ALE
- Inherent ALE
- Contributing risk assessments
- Risk rollup status

Privacy risk management

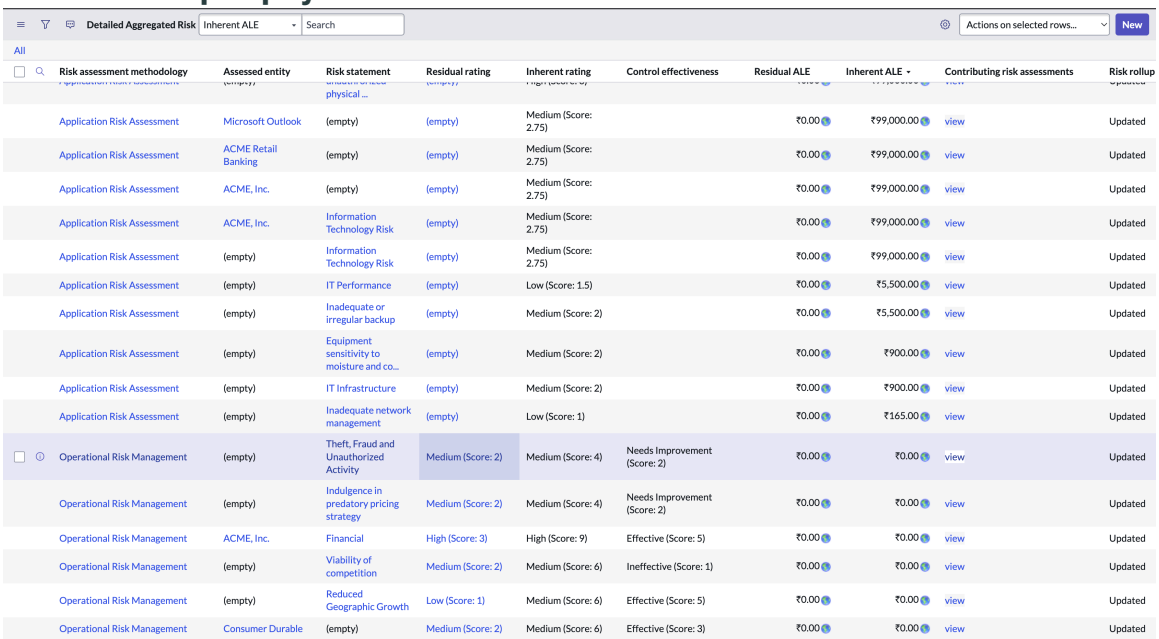
As users of Privacy Management, you can perform advanced risk assessments with a limited set of features even if you do not have the complete license for Integrated Risk Management.

To prioritize the areas that need attention, risk assessment is performed by various stakeholders and is embedded as part of different workflows in an organization. For example, within Privacy Management, users must be able to identify the assets that pose the highest risks and ensure appropriate levels of controls are implemented to mitigate those risks. To address this need of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

risk assessment in other business units, a solution is implemented to enable the users of Privacy Management to use the advanced risk assessment capability, with limited features, without buying the Integrated Risk Management license for their risk management needs.

The following are the key points to consider when users use the limited advanced risk assessment for their risk assessments.



- The lite users of other business units can only have two published risk assessment methodologies.
- Automated factors are available for use.
- Managing risk events and using the risk identification workflow are not available in limited risk assessments.

Risk score rollup in Privacy Management

When users of Privacy Management perform advanced risk assessments, they get the risk scores automatically rolled up.

Starting with version 14.0, users of Privacy Management can perform advanced risk assessments. Risk scores are rolled up when you perform advanced risk assessments. Rolled up scores show the aggregated risk results. The rolled up aggregated scores are displayed on the tables as shown in the following figure.

Risk score rollup display

Risk assessment methodology	Assessed entity	Risk statement	Residual rating	Inherent rating	Control effectiveness	Residual ALE	Inherent ALE	Contributing risk assessments	Risk rollup
Application Risk Assessment	Microsoft Outlook	(empty)	(empty)	Medium (Score: 2.75)		₹0.00	₹99,000.00	view	Updated

For more information to understand the rollup of scores, see Risk score rollup in Advanced Risk Assessment.

Manage risk assessment scheduler

Create a risk assessment scheduler and assign it to the risk manager. A risk manager can then identify the entities and the risks within the entities for bulk initiation of risk assessments.

In most organizations, the second line of risk managers coordinates the risk assessments. This second line of risk managers identifies the entities and the risks within those entities for risk assessment. They also identify who must assess the identified risks. This process is like a risk assessment campaign the risk managers must manage until the first line of risk managers reach the level of maturity where this is no longer required and the first line of risk managers can self-assess and report these risks. Because of this cycle of risk assessment, the risk managers

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

are expected to create individual risk assessment scopes and initiate risk assessments. This repetitive activity results in loss of time for risk managers. To address this issue, a new form called Risk Assessment Scheduler has been introduced in the Quebec release. The risk assessment scheduler enables the risk manager to select the:

- Risk assessment methodology
- Entities that must be assessed
- Assessors of the assessment
- Frequency with which the risks must be reassessed.

Based on this information, the system automatically creates the risk assessment scope and initiates the risk assessments for those entities at the defined frequency. All the risks that are mapped to the entity are considered to be in scope for assessment.

The following figure shows the states, the descriptions, and the expected outcomes of each of the actions for the risk scheduler form:

Workflow and actions of the risk assessment scheduler

State	New	Scope Definition	Complete
Description	This is the state of the record when a new risk scheduler record is created.	This is the state when the risk manager defines the scope of the risk assessments which includes the entities, when they should be assessed, and who should assess it.	This is the state when the system bulk initiates the risk assessments for the selected entities to the respective assessors.
Expected Outcome	The user selects the risk assessment methodology for which they need to bulk initiate assessments.	The user selects the entities that must be assessed, the assessor who should assess these risks, and the frequency of reassessment, if applicable.	The system automatically creates the risk assessment scopes for those entities and bulk initiates risk assessment tasks for the respective risks in those entities.
Available Actions	**Define assessment scope –** This is the only action that the user can take in this state. Once this action is taken, the record moves into scope definition state. The entities selected in the next state are filtered based on the risk assessment methodology selected	**Add –** Using this action, the risk manager can add entities that must perform the risk assessment. The list is filtered based on risk assessment methodology. **Change methodology –** This action takes the record back into the new state where the user can change the risk assessment methodology, if required. **Finalize –** After the entities are selected, the assessors are defined. The user can use this action to initiate the risk assessments.

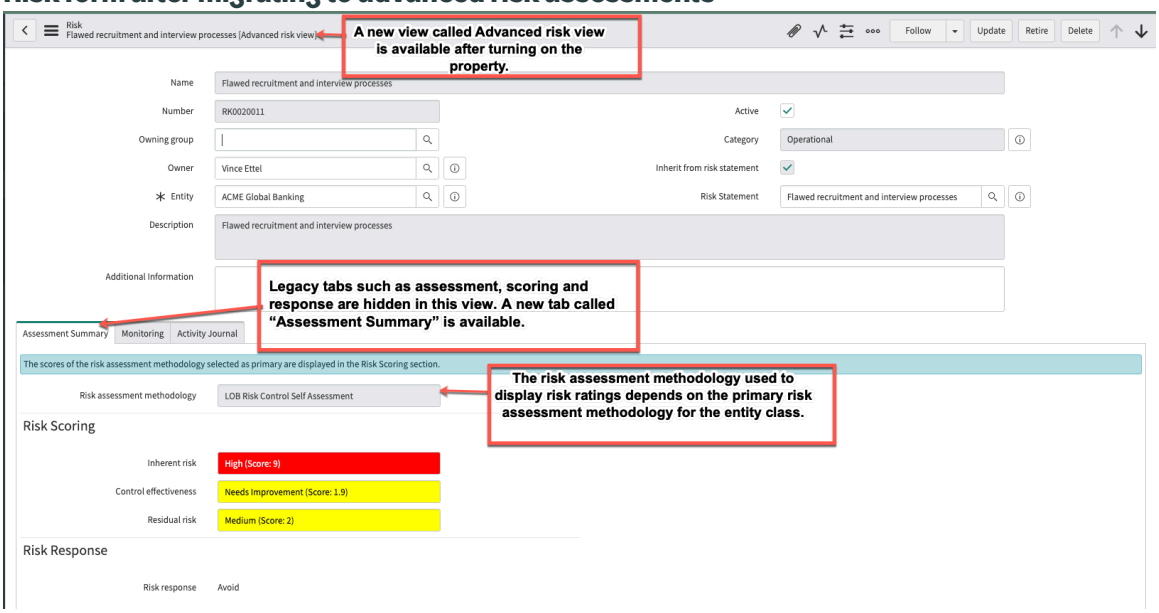
Integration of advanced risk assessments with risks and controls

When customers migrate to advanced risk assessments, the system replaces the legacy risk life cycle and shows a new section called Assessment Summary on the Risk form. This section is useful for the risk managers as it provides the overall visibility of the assessment results.

Migrating to advanced risk assessments is useful for the risk managers as they can view the risks that need immediate attention. To migrate to advanced risk assessment, a new property called *`Migrate to Advanced Risk Assessments`* is introduced in the Quebec

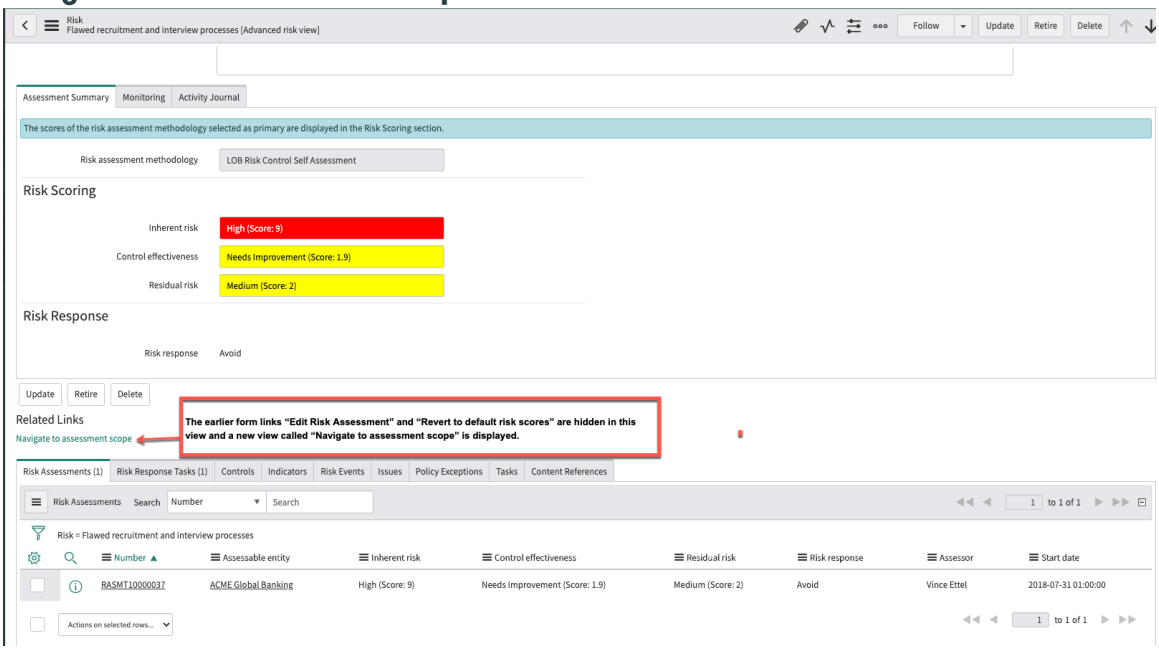
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

release. Users can enable this property under **Advanced Risk Assessment** > **Administration** > **Properties**.



When users enable this property, they completely migrate to the advanced risk assessment and do not use the old risk management. This migration affects the following forms:

- Risk
- Entity
- Risk Statement



When users migrate, the system then removes the legacy risk life cycle, scoring, assessment, and response sections on the risk form. Instead, a new section called Assessment Summary is available where the risk assessment scores are displayed along with the risk response. If there are multiple methodologies used for risk assessment, the system detects the default methodology for the selected entity class and displays those scores in this field. The primary risk assessment methodology can be defined in the risk assessment methodology form.

Risk form after migrating to advanced risk assessments

Navigation to risk assessment scope

Similarly, for controls, the control effectiveness values are updated if individual assessment of controls is performed.

On the Entity form, the aggregated risk scores are displayed from the primary risk assessment methodology. The old tabs displaying the legacy risk scores are hidden from the user's view.

On the risk statement form, fields like assessment, framework, and scoring are hidden. The corresponding old links for pushing risk scores and so on are also hidden from the user's view.

Risk appetite and tolerance in Advanced Risk

You can define a risk appetite and tolerance within your organization by using the Advanced Risk application. A risk appetite and tolerance enable your organization to define the boundaries for acceptable and unacceptable risks.

Overview of a risk appetite

A risk appetite is the amount of risk that an organization is willing to take to achieve its strategic objectives.

A risk appetite can be defined in qualitative (numerical scale and ratings) and quantitative (absolute dollar) terms. For example, let's say that a lending institution provides a loan to some small scale industries. The lending institution has defined 5 percent as their target non-performing asset (NPA) for the current fiscal year.

Note:
A non-performing asset (NPA) is a loan or advance for which the principal or interest payment remained overdue.

Therefore, the risk appetite of the institution is 5 percent.

Benefits of using a risk appetite

The benefits of having a risk appetite for your organization are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Provide better guidance to your first line of employees to implement risk management in specific areas of your business.
- Take risks within your organizational expectations and define and manage actions when there's a breach.
- Assess the risk status that is based on the defined risk appetite and prioritize the risks that require attention.
- Assess all possible risks and define the boundaries for acceptable and unacceptable risks.
- Monitor your risk exposure and ensure that it's consistent with your risk appetite. You can also track any unacceptable risks.
- Initiate a risk mitigation plan based on the risk appetite status.

Overview of risk tolerances

A risk tolerance is the standard deviation from the defined risk appetite that an organization can withstand without risking the organization's objectives and goals.

Setting up a risk appetite and tolerance

A risk administrator can configure and set up a risk appetite for your organization in the Advanced Risk application. For more information, see Risk appetite setup.

Target risk assessment in Advanced Risk

You can perform a target risk assessment to define your desired future risk level using the Advanced Risk application. The target risk assessment enables you to assess your target risk posture and monitor progress toward its achievement.

Overview of a target risk assessment

A target risk assessment is an assessment type to define the desired risk level the organization want to achieve in the future. By evaluating the desired level of likelihood and impact of identified risks, organizations can establish target risk levels for each risk.

For example, when assessing a risk, organizations consider various aspects such as inherent risk, the effectiveness of controls, and residual risks. However, it's equally important to capture the desired risk level that will be attained after the risk response is implemented. The target risk represents the optimum level of risk that you aim to achieve after your action plan is successfully executed. It enables you to measure the benefits your organization gets in relation to the cost of implementing those actions.

Setting up a target assessment

A risk administrator can configure and set up a target risk assessment for your organization in the Advanced Risk application. Risk administrator can enable the option for assessing a target risk on the Risk assessment methodology (RAM) form. For more information, see Configure a target assessment.

Important:
You can enable target risk assessment for existing published RAMs. However, after you enabled, it can't be turned off. Additionally, target risk assessment can only be conducted for new assessments and not for assessments that are already in progress.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessing a target risk

Assessors can analyze the future state of the risk based on the defined factors, scoring logic, and rating criteria in the RAM form. Assessing the future state of risk is a structured process that shares similarities with inherent, control, and residual assessment types. Based on the target risk profile, the system also computes the future risk appetite status. It enables assessors to analyze if the target risk profile is in line with the risk appetite or not. Risk approvers can review the target risk rating and the future appetite status and approve them. Target risk assessment can be performed for both risk and object-based assessments. However, if it's object-based, the future appetite status isn't computed and displayed. For more information, see Perform advanced risk assessment in the Risk Workspace.

Important:
If target risk assessment is enabled for a methodology, the risk or object can only be assessed in the next experience.

Reporting a target risk

On the heatmap, you can view the target risk profile, which provides a comprehensive understanding of the inherent, residual, and target states of the risk. When the risk assessment criteria are shared, you can analyze the risk movement from inherent state to residual state and then to its target state. By using the risk trend capability, you can assess risk changes over the past five periods to determine if it's moving in the desired direction. For more information, see Risk heatmap workbench.

Manage risk events

Risk events are potential or actual financial and non-financial losses, near misses, and gains that occur within an organization. Risk events are also known as loss events or loss entries.

To effectively manage risks, it's essential to monitor risk events. You must relate them to existing risks, perform a root-cause analysis, and track the remedial tasks. Organizations use risk events to understand their losses and to manage their risks more efficiently. Risk events do not only lead to losses. At times, risk events also result in gains for an organization. For example, in the banking industry, if there's an error in a trading algorithm, it might result in a gain for an organization.

Any employee can report a risk event. After a risk event is reported, it is analyzed by the risk manager.

Risk events can be of two types:

Internal risk events

Events that occur within your organization.

External risk events

Events that occur in other organizations but are shared with the industry to ensure that other organizations can prevent them.

You can create a risk event using either the Service Portal or your ServiceNow instance. Risk events provide the following:

- Concrete data that enables you to better quantify and validate existing risks.
- Visibility into new risks because risk events often recur.

You can view the risk events dashboards by navigating to **Risk Events** > **Overview**.

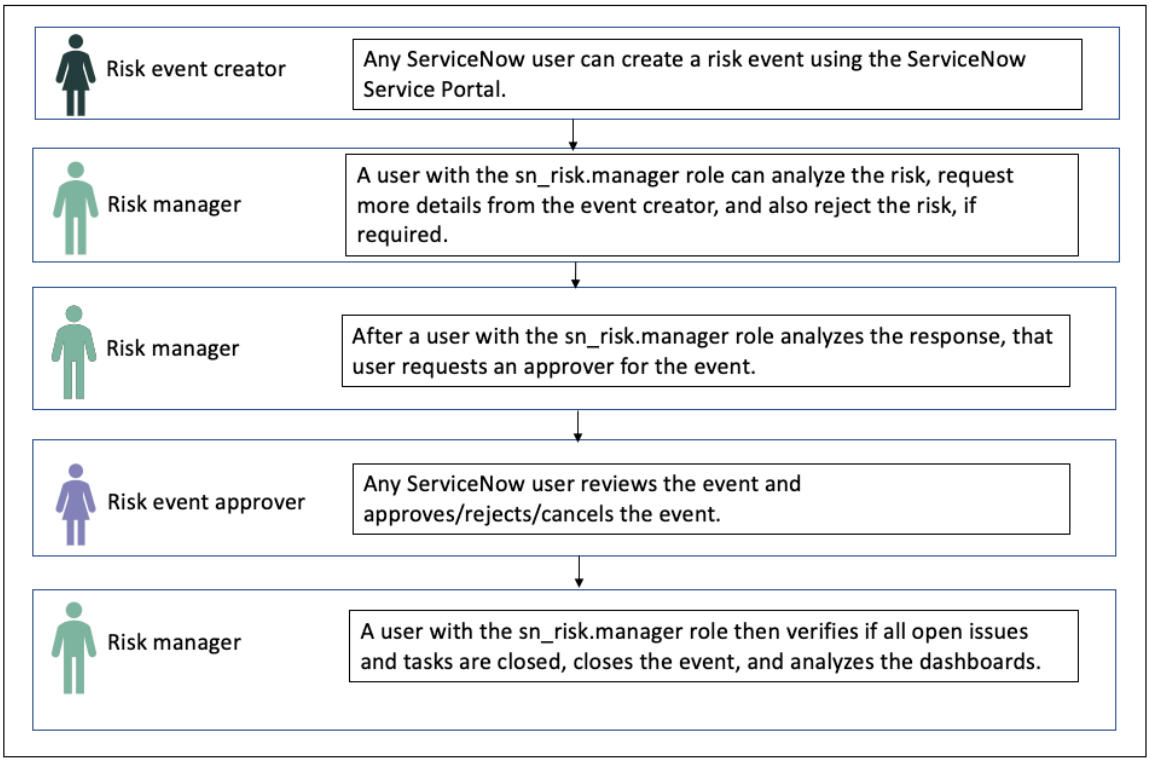
Risk events life cycle

Risk events life cycle

After a risk event is created, the event goes through a life cycle where risk managers analyze it and send it for approval.



The life cycle for risk events goes through the following stages:

1. Creating a risk event: A new event is reported by a business user. The event is pending validation by the event owner or risk manager who has the sn_risk.manager role.
2. Analyzing the risk event: The risk manager analyses if the event is legitimate and adds all the important information such as the event's loss entries, approvers, the root cause of the event, and the preventative and remedial action for the event. In this state, additional information can be requested from the event creator. You can then create an issue to ensure that similar events do not occur in the future. The issues are assigned to the respective issue owners who can then either accept the issue as is or create a remediation task.
3. Awaiting approval for the risk event: After all the data is entered and validated, the risk manager may request that the event be approved. The need for approval is determined by the loss threshold defined by the organization. For example, your organization may decide that if a risk event leads to a loss of $100000, then it must be approved by the senior risk management teams. Each event might go through several rounds of approval.
4. Approving, rejecting, or canceling a risk event: After the event is approved, the risk manager ensures that the issues created for the risk event are closed and that the root-cause analysis (RCA) is complete before the event is closed. At this stage, the approver can also choose to reject or cancel the event with adequate reasons.
5. Closing a risk event: After a user with the sn_risk.manager role is certain that the event has been captured and that the RCA has been completed, the event coordinator can close the risk event. If a risk event has open issues and tasks, then the risk event cannot be closed until the associated issues and tasks are closed.

The risk events workflow is summarized in the following figure:

Relationship between risks, risk events, and risk statements

Relating risk events to risks and relating a risk statement to a risk is important for all organizations that use the Risk Management application. Properties to enable these relationships are provided under *`Risk Event Properties`* and Risk Management properties.

Relationship of risk events to risk

Consider relating risk events to risks if you use the Risk Management application. This relationship provides data for future risk assessment and is also useful for accurate reporting. For example, if the management of an organization wants to know the total loss incurred due to internal fraud, it can only be reported if all the risks are related to the internal fraud risk event. To relate risks events to risk, set the *`Make risk event to risk relationship mandatory`* property to Yes. By default, this property is not turned on.

Relationship of risk statement to risk

Consider relating each risk statement to a risk. Establishing this relationship prevents the creation of orphan risks. An orphan risk is a risk that does not have a corresponding risk statement associated with it. For example, if all the business units within an organization understand the risk of employee attrition in different terms, it is difficult for the organization to maintain comprehensive data on the risk of attrition. It is easier if the risk statement of Employee Attrition is attributed to all events that relate to this risk. Establishing the relationship between a risk statement and a risk is vital for correct reporting and prevention. To relate risks to risk statements, set *`sn_risk.risk_statement_mandatory`* to True.

Add Basel categories to risk statements

The Basel categorization is specific to the banking industry. This categorization helps customers comply with the Basel regulations by automating their loss event reporting. This particular setting enables the users to view the Basel Dashboards. The Basel Dashboard shows the number of loss events and net loss based on the Basel business lines and categories. Enabling this setting enables the users to view the Basel categorization tab where users can select one of the following Basel categories that apply.

- Internal fraud
- External fraud
- Employment practices and workplace safety
- Clients, products, and business practice
- Damage to physical assets
- Business disruption and system failures
- Execution, delivery, and process management

For more information, see Properties installed with Advanced Risk and Properties installed with Risk Management

To enable Basel categorization, set *`Show Basel attributes and reports`* to **Yes**.

Risk event response template

The risk event response template automates the process of adding approvers, issues, and owners to a risk event. This automation is based on the conditions defined in the template.

The risk event response template provides these primary benefits:

- reduces the need for human handling of risk events during risk event creation.
- automatically defines the risk event life cycle and how users respond to that risk event.
- saves time with a predefined template.

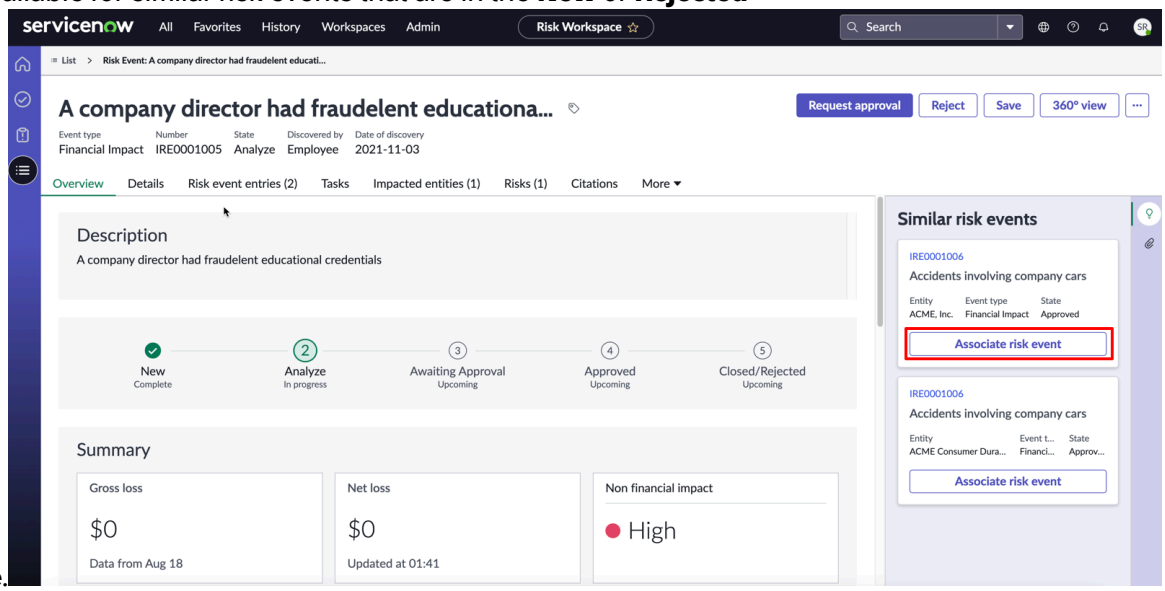
For example, consider that a health and safety risk event has occurred. If the template is defined, the template can be used to assign the event to the person responsible for health and safety. The template facilitates the automatic assignment of risk events by enabling you to choose event types, entities, categories, and so on.

Users can define the threshold amount for risk event approvers. The threshold is defined based on the risk appetite of the customers. For example, an organization decides that a risk event resulting in a loss of $1000, does not need an approver. This threshold of $1000 can be defined in the template. If the organization determines that any amount greater than $1000 dollars needs approval, the template can automatically assign an approver.

You can define the template for any entity. All the child entities of the parent entity inherit the rules defined in the risk event response templates. Defining a template saves the time and effort required to define the rules for each entity separately.

For more information on how to set up risk event ingestion, see KB0780985 article in the Now Support Knowledge Base.

Associate similar risk events



Train a similarity solution definition that uses machine learning by activating the Governance, Risk, and Compliance: Predictive Intelligence plugin. The solution enables the system to display similar risk events automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Governance, Risk, and Compliance: Predictive Intelligence plugin uses Artificial Intelligence (AI) and Machine Learning (ML) to manage the risk events more efficiently. You can identify similar risk events and group them to capture and analyze the actual impact of the risk event.

For example, in an organization with operations in multiple locations, the risk event teams across different locations may be working on similar types of risk events. This challenge results in duplicate efforts to manage the risk events within the organization. This capability reduces the manual effort in managing similar risk events and improves overall organizational efficiency.

You can associate similar risk events only when the main risk event is in the **Analyze** state. Also, the Associate risk event button is unavailable for similar risk events that are in the **New** or **Rejected** state.

The platform machine learning administrator (ml_admin) can create a solution definition and modify an existing one. You can navigate to **Risk Events** > **Administration** > **Properties** to update the risk event property with the new solution definition name.

Business process management

A business process is an activity or a set of activities that can accomplish a specific organizational goal.

A business process is anything that happens within your organization and that has a well-defined start and finish. Examples of business processes in the banking industry are the customer onboarding process and the credit check process. Because each business process is unique, they may have different levels of criticality and impact. Business processes must be managed with a comprehensive life cycle. They may also have different risks and different controls that must be identified. With the Quebec release, the creation of a business process is enhanced. As an enterprise architect or a service owner, you can do the following:

- Define a new business process.
- Manage the life cycle of the process.
- Define the owners of the process.
- Define the relationship of the new process to a specific process, such as if the new process is a parent process or a child process.
- Define the business impact and the criticality of the process.
- Review the process periodically for improving efficiency.

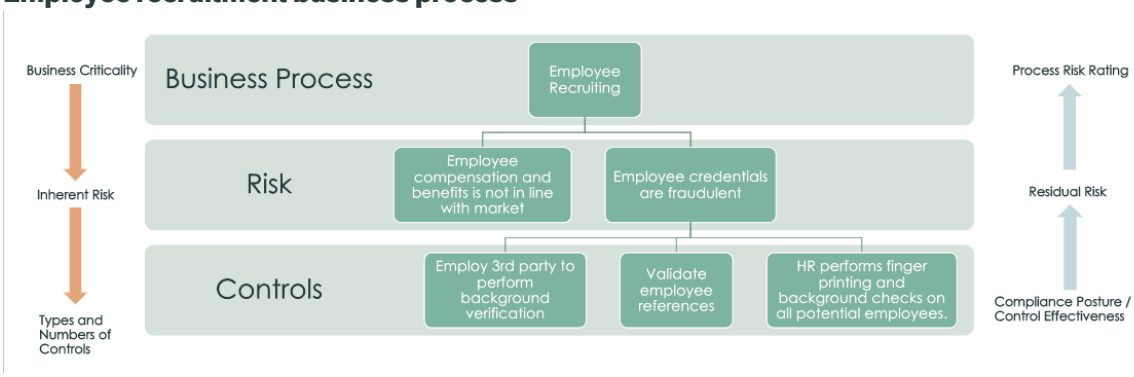
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Life cycle of a business process



The life cycle states of a business process are as follows:

1. **Draft**: This state is the default state when a business process is created and its relationship to various risks and controls is defined. If no reviewers are selected to review the process, then the process is directly published.
2. **Review**: If reviewers are selected, the process is sent to the reviewers before it is published.
3. **Published**: After the review is complete, the process is published.
4. **Retired**: The process is no longer required.

> **Note:**
> Even when a process is Retired, it stays in the system for audit purposes.

The following image shows an example of how to define a business process, such as employee recruitment. You can define the relationship of the process with the associated risks and controls. You can also determine how associating the risks and controls helps to derive the risk rating of the process.

Employee recruitment business process

Create a business process

Exploring the entities

Entities are one of the most fundamental and crucial elements for using Governance, Risk, and Compliance. Entities can be people, processes, departments, applications or objects that are examined for risks.

To effectively maintain the risk universe of your organization, we recommend that you define entity types, entity classes, and entity tiers. A risk universe refers to a list of risks that your organization either faces or might face in the future. The list contains a description of each risk's criticality and frequency. Entities are used within all offerings of GRC such as GRC: Policy and Compliance Management, Audit Management, and GRC: Regulatory Change Management.

Entities in GRC

In Governance, Risk, and Compliance, an entity can be a person, process, department, application, or object, whose exposure must be managed. These entities have controls that are defined to view the status.

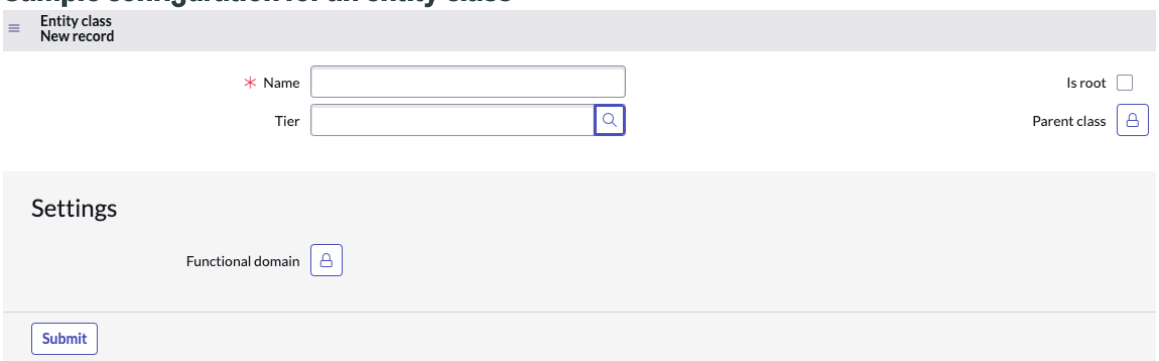
To understand entities, consider the following example. Assume that you're a new GRC user and you want to implement a change management process to all your critical financial systems. All the systems can be considered as individual entities. Map all the systems to an entity class

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

called Financial. Have an entity type filter for critical financial systems to determine the systems that are identified as critical.

The primary benefit of creating entities is that you can maintain accountability because each entity has an owner. To understand this benefit, assume that you want to configure all the servers in a new way. After you finish the configuration, you perform an audit and then discover that only one server failed to comply with the new configuration. If you had not defined all the entities, then the entire audit result would have been deemed as failed. But because you have the entities defined, then only the non-compliant server entity and its identified owner are held accountable instead of all the servers.

Having defined entities ensures that the entity owners can be identified and that appropriate controls can be applied to those entities. It also helps in tracking the entities that are non-compliant. Any entity that has child entities can be said to have downstream entities. Any entity that has parent entities can be said to have upstream entities.



When a source record linked to an entity filter is created, an entity is automatically generated in GRC. If the source record name changes after the entity is created, the entity name updates to match the source record name. This behavior is controlled by the Sync Entity name with source record check box. When selected, the Name field becomes read only and stays in synchronization with the source record. Clearing the check box enables you to manually override the entity name.

After creating entities, you can tag the similar entities by defining the entity class for them individually or you can link them to an existing entity class.

Entity classes

Entity classes are used to add a conceptual information about the entity or tag the entity. To understand the concept of entity class, consider the following example. A company has office branches in three cities. The office space is considered as an entity and the entity class for these entities would be the location. You can create an entity class by associating it with an entity tier as shown in the following example.

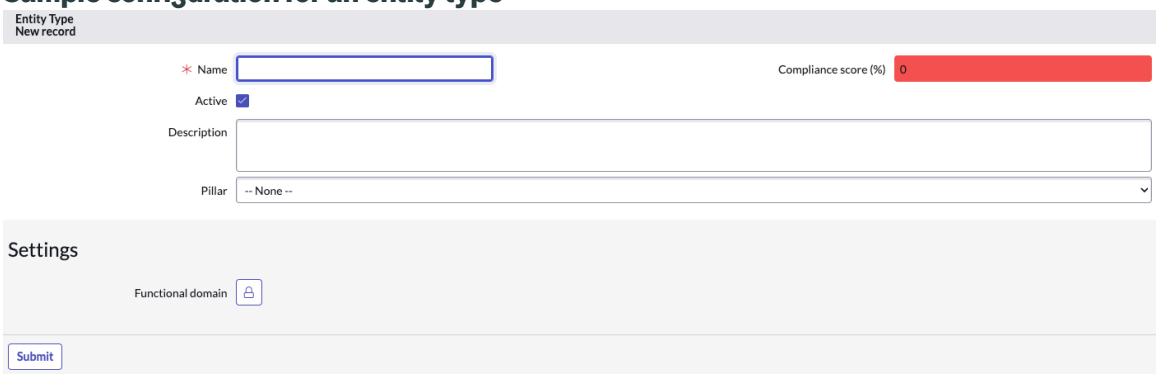
Sample configuration for an entity class

Entity class rules

Entity class rules help to assign classes to the entities at the table level. Any new entity created on the table gets that entity class automatically. Entity classes are used to tag your entities.

When you create an entity over a specific table, the class associated with that table automatically gets assigned to the entity. You can set a new entity class rule for a table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Entity types

An entity type is a grouping of entities that is based on filtering. Entity types enable you to find and create entities that match a set of filter conditions. Hierarchy can be created within the entity classes.

Entity types also enable you to create risks and controls for each entity without spending much time. For example, an organization can have multiple departments, such as finance, HR, or IT. All these departments can be considered as entities and can be grouped under the entity type called Departments.

You can create an entity type by associating it with the core business pillar such as Technologies or Facilities as shown in the following example.

Sample configuration for an entity type

Entity tiers

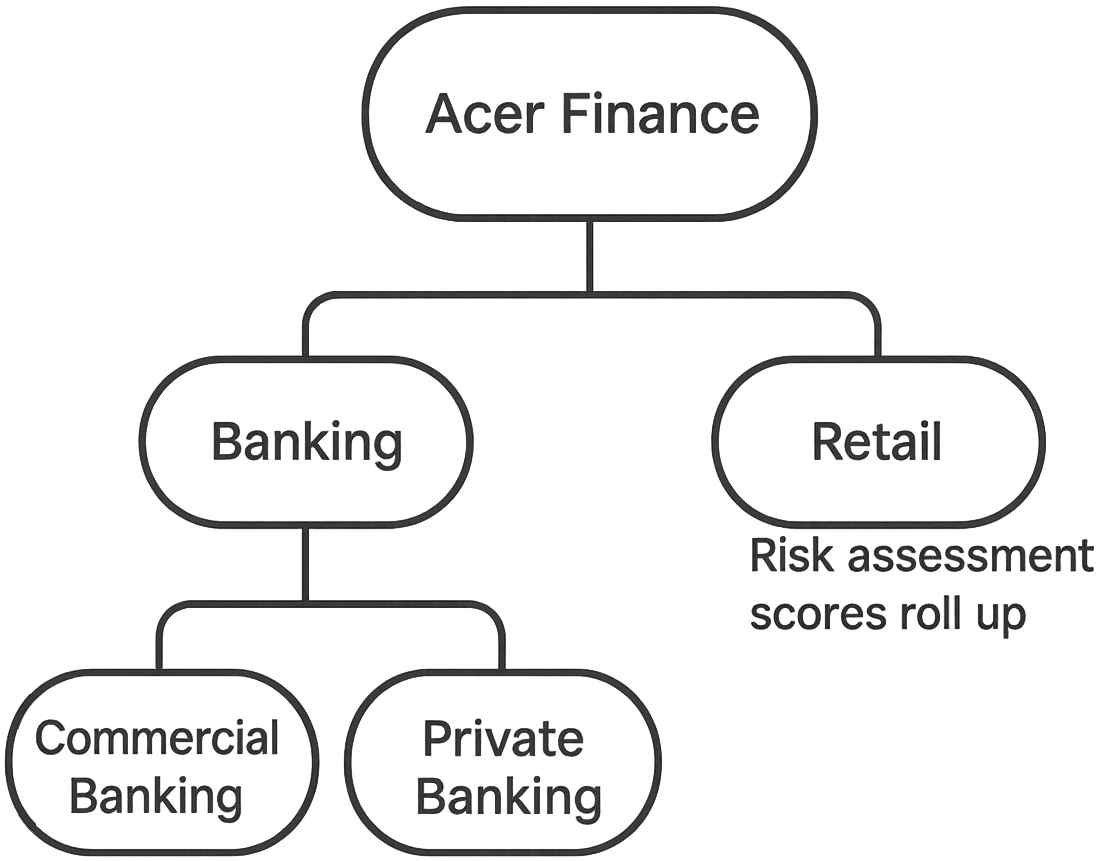
When you create entity tiers, you apply a level or hierarchy to the entity classes. This level applies to all the entities in those entity classes. Entity tiers enable you to select and view the status of the most critical items in the business as shown in the following example.

List view for an entity tier

Name	Label	Domain	Tier level
application	Application	global	20
business	Business	global	10
it_asset	IT Asset	global	30

Entity types in GRC

Entity types enable you to find and create entities that match a set of filter conditions. Entity types also enable you to create risks and controls for each entity without spending much time.



An organization can have multiple entities. Each of those entities can have several risks and controls associated with them. The conventional method for mapping each risk with each entity was by using multiple spreadsheets. This method is not the most accurate or reliable method because the risks and controls exist in silos and a standard risk taxonomy is not created. A risk taxonomy is a comprehensive, common, and stable set of risk categories that are used within an organization. When you create entity types and associate risk statements to them, the risks are automatically created for all the entities. The association is done via your risk taxonomy. The benefit of creating entity types is that it eliminates the need for maintaining multiple spreadsheets with the associated risks and controls for each entity. By applying entity types, you can quickly create entities by using the entity filters that are present within the entity types. Entity types can contain entities associated with different classes.

For example, an organization can have multiple departments, such as finance, HR, or IT. All these departments can be considered as entities and can be grouped under the entity type called Departments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Grouping entities also helps in rolling up and aggregating the risk scores after risk assessments are performed. To understand how grouping entities contribute to rolling up the risk scores, consider the following example. Assume that there's a banking organization called Acer Finance. Acer Finance has two business lines: Banking and Retail. The Banking division has further subdivisions such as Commercial Banking and Private Banking. The risk assessments are generally performed at the bottom-most level. In this example, the assessment is performed at the Commercial Banking and Private Banking levels. The reporting, however, is done at the top-most level. This means that the risk assessment scores of Commercial Banking and Private Banking will roll up and aggregate at the Banking level. Similarly, the scores of the Banking and Investment will roll up to the Acer Finance organization level.

Graphical representation of the example

Related topics

Entity classes in GRC

Entity classes in GRC

Entity classes are used to tag your entities and to provide a complete view of the risk status in your organization.

Entity classes are tags. After tagging the entities, you can gather data based on entity tags. To understand the concept of entity classes, consider the following example. Assume that the Chief Risk Officer (CRO) of your organization wants to see the risk status of all the business applications across all the divisions in the business. As a risk analyst, you can show the CRO the dashboard for the **Business Applications** entity class.

For more information on how to create an entity class, see Create entity class using the GRC: Workbench.

Related topics

Entity tiers in GRC

Entity tiers in GRC

By creating entity tiers, you can prioritize the entity classes.

When you create entity tiers, you apply a level or hierarchy to the entity classes. This level applies to all the entities in those entity classes. Entity tiers enable you to select and view the risk status of the most critical items in the business. Consider the following example. Assume that the Chief Risk Officer (CRO) of your organization wants to see the risk status of only the most critical financial business applications. If you have created a hierarchy or set of tiers for the entities, then you can filter the tier 1 entities and present the required data. Each entity class can belong to only one tier.

By creating entity tiers, you can better understand how your lower tier entities affect your higher tier entities. For example, assume that you created the entity hierarchy where Business is tier 1, Application is tier 2, and IT asset is tier 3. Therefore, the risks of the entities of tier 3 affect the entities of tier 2 and that in turn affects tier 1. This roll-up or aggregation provides accurate risk scores.

Manage risks, risk statements, and risk frameworks

The risk library contains all risk frameworks and risk statements. Risk frameworks are used to group risk statements into manageable categories, while risk statements group the individual risks. The risk register is the central repository for all potential risks that could occur at any time, anywhere in the organization.

Assess risks and develop risk statements

Assessing risk means identifying and analyzing the threats and vulnerabilities that could adversely affect your organization's business objectives. Risk is a function of the likelihood of a given threat exercising a particular potential vulnerability, and the resulting impact of that adverse event on the organization. By identifying your risks and the impact and likelihood of those risks occurring, your organization can prioritize control testing and remediation activities. It also helps you understand the true business impact when a control fails.

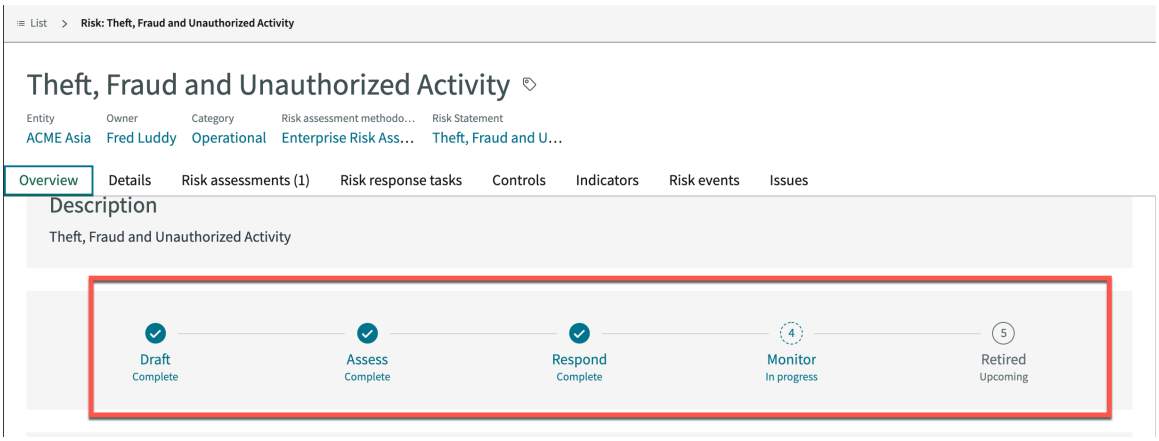
A good risk statement should answer:

- What could happen?
- How could it happen?
- Why do we care?

Workflow of a risk using Advanced Risk

When you migrate to advanced risk assessment, you can view the various states of the risks take the necessary actions. This ability simplifies your view of the risk form.

When your risk administrator enables the *`Migrate to Advanced Risk Assessments`* property located under **Advanced Risk Assessment** > **Administration** > **Properties**, the life cycle of the classic or legacy risks undergo a change. You can also initiate a risk assessment directly from the risk form.



Note:
Once you enable this property, you cannot disable it.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prior to version 14.0, when the *Migrate to Advanced Risk Assessments* property was enabled, the risks were only classified as either active or inactive. Starting with version 14.0, as a risk owner, when you enable Advanced Risk, you can view the following states of your risks.

1. Draft
2. Assess
3. Respond
4. Monitor
5. Retired

States of a risk with advanced risk assessment

All the states and the actions available for each state are explained in the following table.

State	Description	Actions available
Draft	This is the state of a risk when a risk is created by the second line of defense or identified by the first line of defense. The objective in this state is to map and identify the risk pertaining to your organization. If you modify the entity or the primary risk assessment methodology (RAM) for a risk, the state of the risk gets updated based on the primary RAM's latest assessment.	• **Save** • **Assess**: Pushes the workflow and initiates the risk assessment. • **Monitor**: If you do not want to assess the risk but want to monitor the risk. • **Retire**: The risk is retired along with all underlying risk assessment and risk response. • **Navigate to assessment scope**: Shortcut to risk assessment scope. The primary risk assessment methodology is passed. • **360 degree**: View the complete 360-degree relationships for the risk.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Description	Actions available
Assess	This is the state of a risk when advanced risk assessment is initiated and being performed. If there is a response strategy, then the risk moves to the Respond state otherwise it moves to the Monitor state once the assessment is completed.	• **Save** • **View assessment**: Navigates to the actual risk assessment form. • **Cancel assessment**: If you want to cancel the current assessment. The respective risk assessor is notified about the canceled assessment. • **Return to draft**: Cancels the current assessments and returns the risk to the previous state. • **Retire** • **Navigate to assessment scope** • **360 degree**
Respond	This is the state of the risk when the risk response task is in progress. Once the risk response task is closed, the risk is automatically moved into the Monitor state	• **Save** • **Assess**: Pushes the workflow back in the workflow. The in-progress risk response task would be canceled. • **Retire** • **Navigate to assessment scope** • **360 degree** • **Return to draft**
Monitor	This is the state of the risk when the risk has been assessed and the response task is closed. If KRIs are defined (through Metrics), they are executed to monitor the risk.	• **Save** • **Assess**: Moves the risk back to Assess state and initiates the risk assessment. • **Retire** • **Navigate to assessment scope** • **360 degree** • **Return to draft**

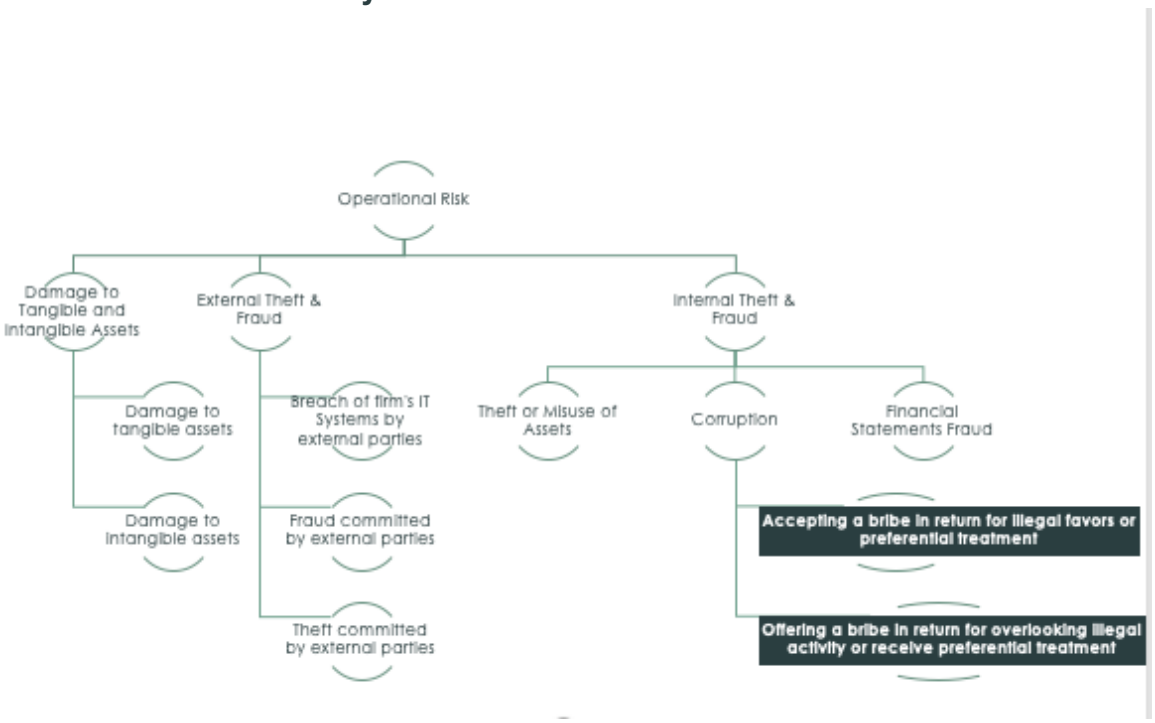
State	Description	Actions available
Retire	This is the state of the risk when the risk is no longer valid but the organization wants to keep a system of record for audit purposes.	• **360 degree** • **Activate**: Reactivates the risk and moves it back to Draft state. • **Navigate to assessment scope**.

Manage risks linked to the same risk statement

You can create and associate multiple risks to the same risk statement and entity combination. This association benefits the risk managers and the entity owners.



Before the latest release, users could only associate one risk for a single entity and risk statement combination. This ability was useful for customers who have a mature risk program with a well-defined and standardized risk taxonomy. However, it did not meet the requirements of customers who do not have a standardized risk taxonomy. Such customers usually have only two or three levels of risk statement hierarchy while their actual risks are still local for each business unit or lines of business. Also, when the first line identifies new risks, they associate those risks to an enterprise risk hierarchy. This allows the new risk scores to aggregate and impact the overall risk hierarchy. With the current release, a new option called **Inherit from risk statement** is introduced on the Risk form. If this option is selected, the risk creation happens in the previous manner. This means that there can be only one instance of risk statement and entity combination. However, if this option is not selected, the system allows the risk statement hierarchy to be used as categorization and sub-categorization hierarchy and associates multiple risks to the same risk statement and entity combination. This option also enables the first line to associate their newly identified risks to the risk hierarchy at a level they want to. When this new option is not selected, the system assumes that the name and description of the risk is overridden and must not be the same as the risk statement name and description.

This feature benefits the risk manager as it allows the risk managers to define the risk taxonomy according to the needs of their organization. It also benefits the entity owners to identify risks for their entity and link them to enterprise risk taxonomy.

To understand this feature, see the following image and consider the example. Most customers have risk statements defined until Corruption. Anything lower than Corruption such as accepting a bribe is defined as a risk as it is difficult to harmonize these risks across the organization. This feature of linking multiple risks to the same risk statement and entity enables customers to prevent the creation of orphan risks with no one acting on them.

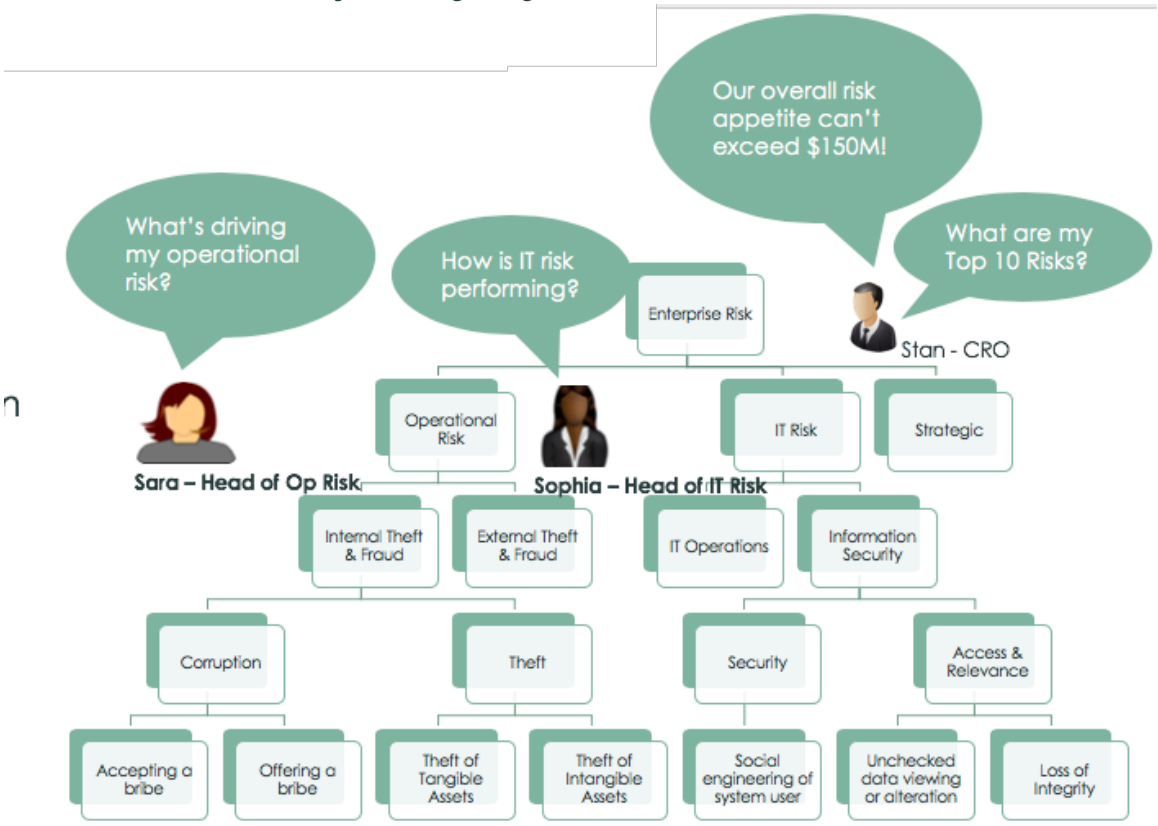
New risk statement hierarchy

Risk hierarchy and scoring

Starting with New York, risk managers can create hierarchies that include different types of risk (operational risk, IT risk, or strategic risk). Once the underlying risks are assessed, the risk scores are automatically rolled up across the risk statement hierarchy, providing better tactical and strategic decision-making.

Risk Hierarchy

Risk managers and administrators create and view hierarchies on the risk statement form:



- Define a parent risk statement using the **Parent** field
- Add children risk statements using the **Risk Statements** related list

Note:
Risk users can view the hierarchies established by the managers and administrators.

Depending on the risk areas, different people in the organization own and manage their own risks. However, top-level risk scores take into account the score of all the risks below it. Therefore, managing all the different risk areas in a central location provides an integrated view of your organizations total risk posture.

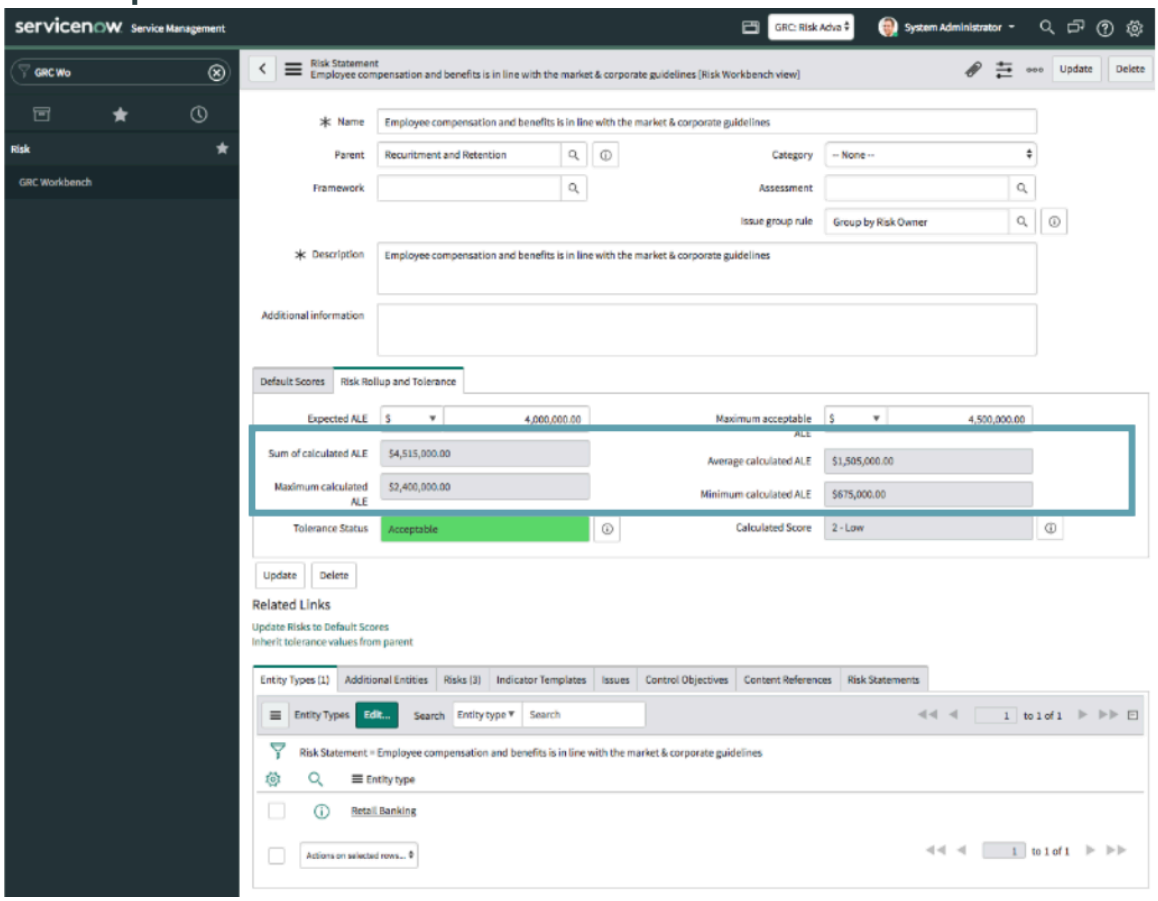
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hierarchical risk taxonomy showing integrated view of risk

Translate quantitative risk scores to qualitative values



The **Tolerance Status** and the **Calculated Score** are based on the Calculated Annual Loss Expectancy (ALE) of the underlying risks:

- Sum of calculated ALE
- Average calculated ALE
- Maximum calculated ALE
- Minimum calculated ALE

Note:
Only risks in the **Monitor** state can contribute to the risk statement scores.

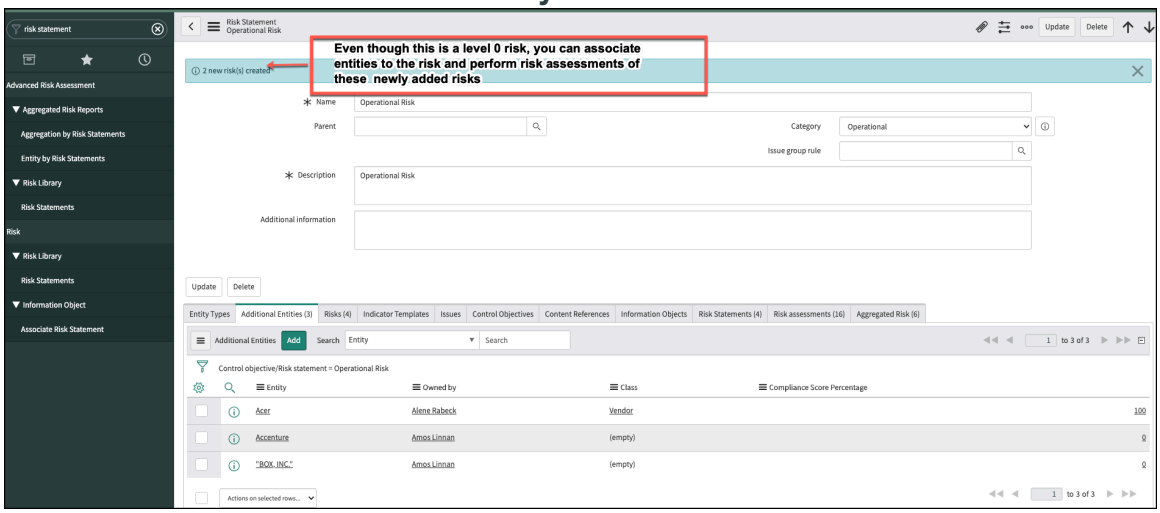
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Rollup and Tolerance tab

Association of entities at any level of a risk statement



You can associate entities, entity types, and indicator templates, at any level of the risk statement hierarchy. Creating this association is useful for risk managers while assessing risks.

All organizations maintain a standardized risk taxonomy. This taxonomy is organized into hierarchies and sub-hierarchies that enable the right level reporting of risk to the appropriate stakeholders. Also, depending on the user who is assessing the risks, the level at which the risk may be assessed is different. For example, enterprise risks are assessed at the top level while detailed risk and control assessments are done at the bottom-most level of the risk hierarchy. With the latest release, users can now associate entity types or entities along with indicator templates at any level of risk statement hierarchy. Therefore, if a customer wants to perform a top-down risk assessment, they can do so by mapping the company to the top-level risk statement hierarchy. They can also perform the traditional bottom-up risk assessment by applying the lowest risk statement to the business units or lines of business. The bottom-most or lowest level is also known as the leaf level. This flexibility to associate entities to risk at any level is useful for enterprise risk managers as it helps them perform the top-down risk assessments.

The following figure shows the risk statement form where users can associate entities to create risks.

Associate entities to risk statements at any level

Manage classic risk assessments

Risk assessments are surveys to determine risk. The Risk Assessment Designer provides a single interface that users can use to create, and edit attestations, as well as change scoring parameters.

The question bank offers a library of questions for various categories, so you do not have to build each questionnaire from scratch. Risks start in a **Draft** state then move to **Assess**, which sends a notification to the Assessment respondents.

My Assessments is contained in the **Risk Register** module and contains active assessments for which you are the respondent. The assessments appear in a list with a single assessments record per risk.

All Assessments is contained in the **Risk Register** module and contains all active assessments. The assessments appear in a list with a single assessments record per risk.

Risk managers can create a new set of questions for each risk statement.

In classic risk assessment, the scores do not automatically roll up. Whenever a risk statement is created, the default scores are manually entered by the risk administrator. All the risks that are created from a risk statement inherit the scores defined in the risk statement.

Risk indicators, control indicators, and indicator templates

Indicators are an important tool used to manage your organization's risks. Indicators collect data to monitor controls and risks, and to collect audit evidence. Indicators monitor a single control or risk. They are used to enhance and facilitate the monitoring, mitigation, and reporting of risks.

Indicators

Indicators are useful when you want to know if your organization is compliant before you do an audit. If certain controls are non-compliant, indicators help you identify them and enable you to correct them. Continuous monitoring involves activities related to identifying and creating key risk and control indicators. Indicators are of the following types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Manual: Manual indicators are used for data that cannot be retrieved from a ServiceNow instance because it comes from an external system, such as customer data from a third-party sales system.
- Basic: Basic indicators are automated indicators based on an indicator source. The indicator source specifies a table and a frequency at which the scores from this table are saved.
- Scripted: Scripted indicators use a custom script to collect the data.

The *GRC indicator nightly run* job executes the indicators. When an indicator is run, you have the option to collect supporting data. Supporting data refers to the evidence that is collected when an indicator is run. Supporting data or information can be collected for the indicators through automatic data collection or manual tasks.

Indicators yield results when the indicator tasks are closed. Those results are then used to create issues for controls, update risk scores, and provide supporting information for audit activities and control testing. Starting with version 10.1, the system displays the actual historical data for the supporting data records from the indicator results or indicator tasks. For more information on how to create the various types of indicators, see:

- Create and run a manual risk indicator in the Risk Workspace
- Create and run a basic risk indicator in the Risk Workspace
- Create and run a scripted risk indicator in the Risk Workspace

Indicator templates

Indicator templates enable you to create multiple indicators for similar controls or risks. You can either use an indicator template to create indicators or you can create independent indicators. Even if you use an indicator template to create an indicator, you can modify or override the details of the indicators.

Manage risk issues and remediation

Issues can be created manually to document audit observations or remediations, or to accept any problems. They are automatically generated from indicator results, attestation results, or control test effectiveness.

Various types of issues are created under the following conditions:

Issue

Created when an indicator fails

Control issue

Created when a control attestation is completed indicating that the control is **Not implemented**

Control test issue

Created when a control test is closed complete with the control effectiveness set to **Ineffective**

Other issue

Created by the user manually

Remediating an issue marks an intention to fix the underlying issue causing the control failure or risk exposure. Accepting an issue marks an intention to create an exception for a known control failure or risk. Controls that are **Accepted** remain in a non-compliant state until the control is reassessed. In this way, the issue can be used to document observations during audits.

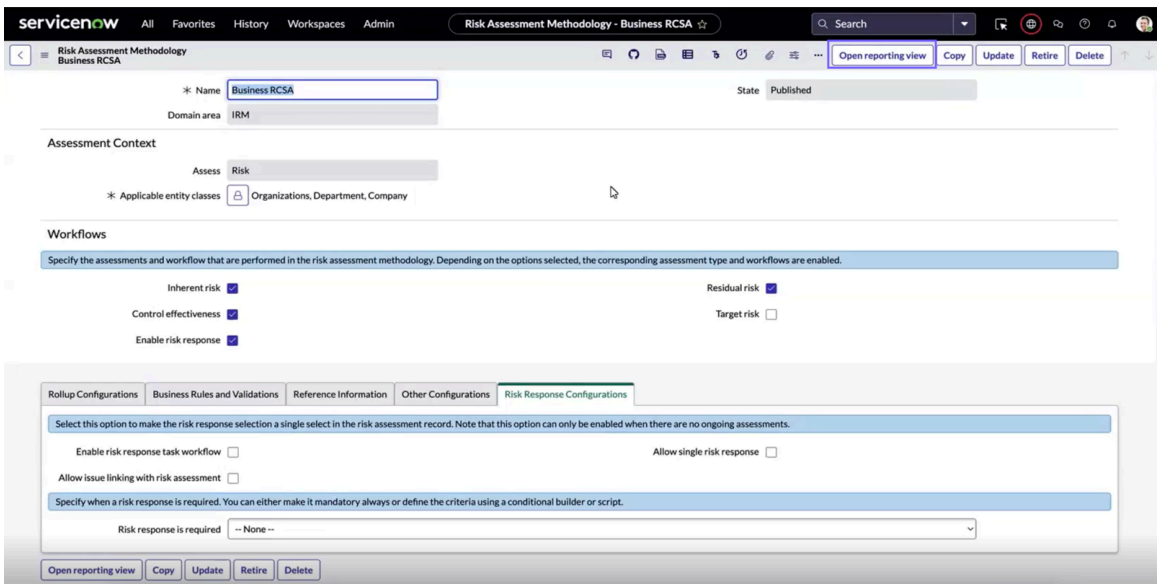
Reporting views from Risk Assessment Methodology

The reporting view provides an overview of all completed assessments under a specific Risk Assessment Methodology (RAM). It consolidates assessment data such as factor responses, scores, issues, controls, and associated risks into a single structure.

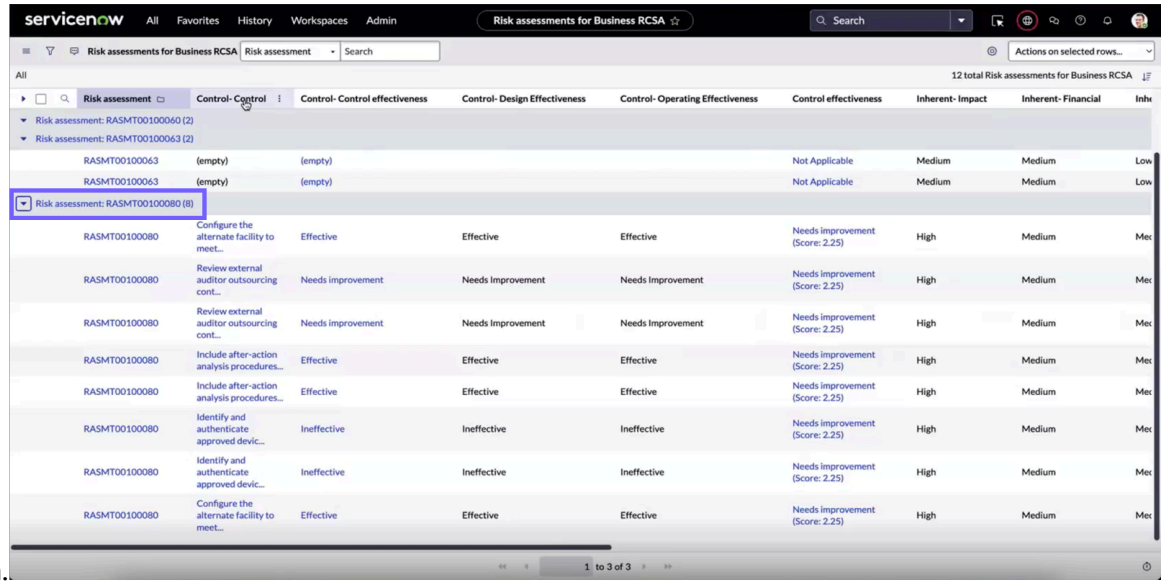
Overview of the reporting view



Reporting views provide a comprehensive, bird's-eye view of all the assessments performed under a specific Risk Assessment Methodology (RAM). This feature consolidates assessment data into a single view to simplify reporting and analysis. Reporting views are automatically created when you publish a RAM. The assessment data populates only when the risk assessment reaches the Monitor state.

The reporting view enables you to:

- Monitor risk assessments for a specific RAM.
- Access consolidated assessment data in one location.
- Generate custom reports and dashboards.



Accessing reporting view

You can navigate to a published RAM and select **Open reporting view** to access the consolidated assessment list, which is grouped by risk assessment.

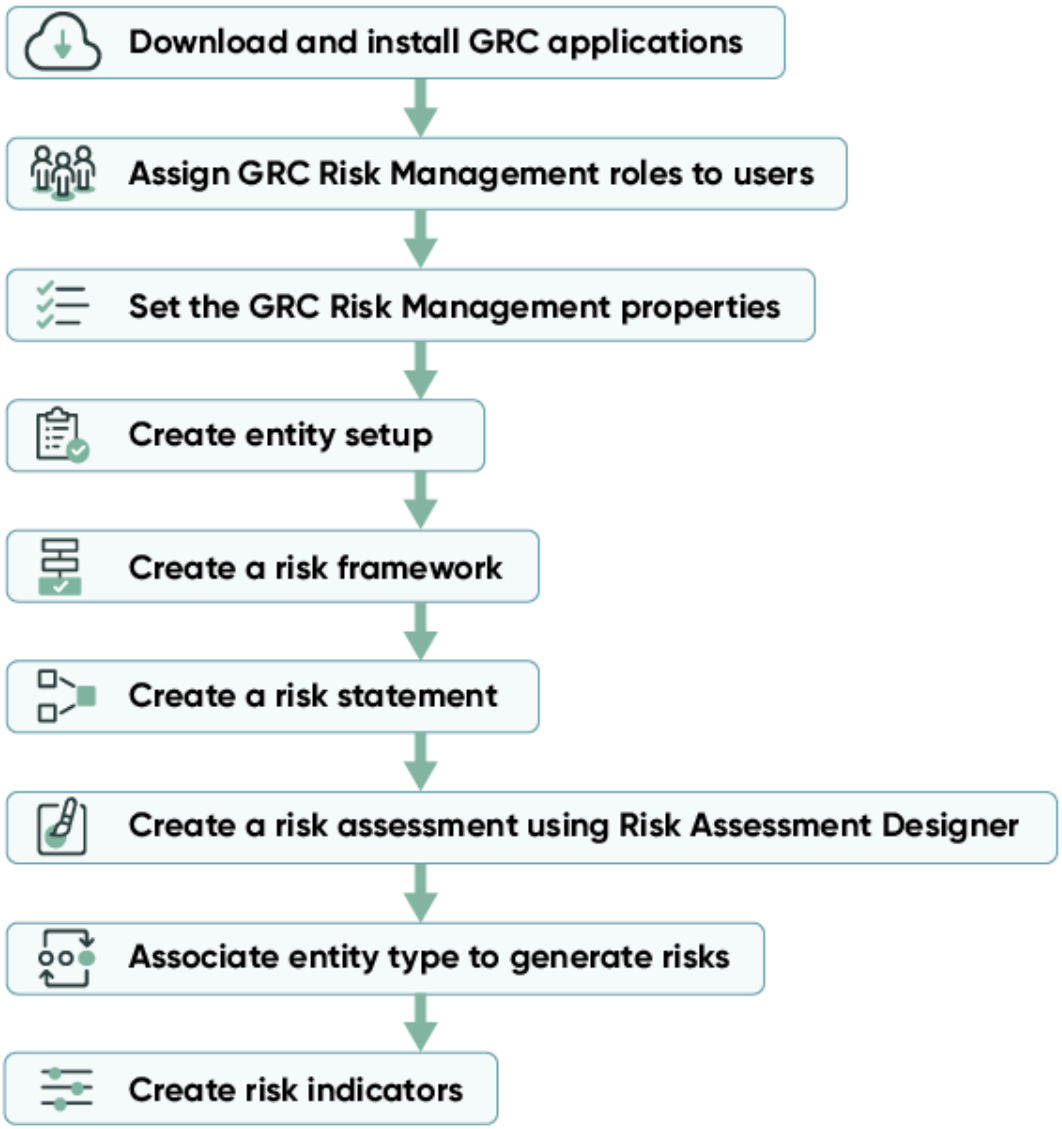
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can expand individual records to review detailed factor responses, scores, and other assessment information.

> **Note:**
> Automatic creation of Reporting views isn't supported on Xanadu. For instructions on creating them manually, refer to KB2547071.

Configuring Risk Management

Configure the Risk Management application to use the features it provides for the complete risk management of your organization.



Risk Management implementation

Use the steps in the Risk Management application checklist to download the Risk Management from the ServiceNow Store, and get it ready for operation. Mandatory and optional setup steps, as well as an implementation checklist are provided to simplify the setup.

The flow of mandatory steps in the checklist is illustrated here.

Risk management implementation checklist

Download Risk Management

Before you run GRC: Risk Management (sn_risk) in your instance, you must download it from the ServiceNow Store.

Before you begin
Role required: admin

Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Install Risk Management

You can install the Risk Management application (com.sn_risk) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Risk Management requires the following plugins. Ensure that these plugins are activated before you install Risk Management .

  Required ServiceNow plugins

  GRC Risk Management dependencies

  Installs all the dependent plugins required to support the GRC Risk Management application.

- Risk Management requires the following ServiceNow Store applications. Ensure that these applications are installed before you install Risk Management .

  Required ServiceNow Store applications

  GRC Profiles

  The GRC: Profiles application is a set of common components shared by the GRC suite of applications. The application includes common architecture, issue management, and indicators.

Role required: admin

About this task

The following items are installed with Risk Management:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Risk Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Risk Management application (com.sn_risk) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install .

4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.

5. Select **Install**.

Setup checklist for the Risk Management application

This checklist includes the set up tasks that you are required to complete in your ServiceNow AI Platform® instance. When you have completed these tasks, the base system is ready for operation.

Before you begin

Role required: sn_risk.admin

Procedure

1. Create and print a PDF of the checklist topic and check off tasks as you complete them.
2. To generate a PDF, select the **Save As PDF** icon and at the top of the topic and select **Selected topic**.

Risk Management application checklist

Item	Checklist
☐	A user with the sn_risk.admin role, can ○ define and modify the risk criteria ○ configure the risk properties ○ create assessments ○ modify the existing assessments ○ assign roles For details, see Risk Management Administration.
☐	A user with the sn_risk.admin role, can also assign roles. For details, see Roles installed with Risk Management
☐	A risk manager, with the sn_risk.manager role, needs to manage numerous risk statements. To achieve this goal, the risk framework must be defined. For details, see Create a risk framework and associate risk statements to it.
☐	A risk manager, with the sn_risk.manager role, must create a risk statement to group risks logically. For details, see Create a risk statement
☐	A risk administrator or a risk manager can create a risk assessments using the Risk Assessment Designer. For details, see Create a risk assessment using the Risk Assessment Designer.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Checklist
☐	Risk administrators and risk managers can create risk indicators. Risk indicators monitor changes in the levels of risk exposure and contribute to the early warning signs that enable organizations to report risks, prevent crises and mitigate them in time. For details, see Create a risk indicator.
☐	Risk administrators and risk managers can create entities manually, rather than generating them from the entity types. For details, see Create independent entities
☐	Risk administrators and risk managers must create and edit entity types and map them to existing ServiceNow® tables for which you must track compliance. Entities are assigned to control objectives and risk statements, which generate controls and risks for every entity type. For details, see Generate risks and controls from entity types

Setup checklist for GRC Advanced Risk

Use the following checklist to get a high-level overview of the basic configurations available with the Advanced Risk application.

Before you begin

Role required: sn_risk.admin

Procedure

1. Create and print a PDF of the checklist topic and check off tasks as you complete them.
2. To generate a PDF, select the **Save As PDF** icon and at the top of the topic and select **Selected topic**.

	see Risk score rollup in Advanced Risk Assessment
☐	Risk events are potential or actual financial and non-financial losses, near misses, and gains that occur within an organization. Risk administrators can integrate risk events with other applications to facilitate reporting of risk events. For details, see Manage risk events
☐	With GRC Advanced Risk Assessment, create an integrated risk platform. Risk administrators can configure detailed risk assessment options. For details, see Advanced Risk Assessment

Download Advanced Risk

Before you run Advanced Risk in your instance, you must download it from the ServiceNow Store.

Before you begin
Role required: admin

About this task
GRC Risk Advanced provides access to the following features:

- Manage risk events
- Risk hierarchy and scoring

Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Risk Management detailed setup

Set up Risk Management so that you can use the features such as risk assessments, risk events, and other capabilities of the GRC Risk Management application.

To setup Risk Management:

1. Download Risk Management: Before you run GRC: Risk Management (com.sn_risk) in your instance, you must download it from the ServiceNow Store.
2. Download Advanced Risk: Before you run Advanced Risk in your instance, you must download it from the ServiceNow Store.
3. Mobile experience for GRC Risk Management: As a risk manager, use your Android or iOS mobile device to manage your work.
4. Quick start tests for Risk Management: Validate that Risk Management still works after you make any configuration change, such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

© 2026 ServiceNow, Inc. All rights reserved.

Configure Risk Management

Administrators in the global domain can set properties to determine how the system defines the Risk Management application.

Before you begin

Role required: sn_risk.admin

Note:
Administrators in domains lower than the global domain can view the Properties screen, but cannot modify the settings.

Procedure

1. Navigate to **All** > **Risk** > **Administration** > **Properties**.
2. Fill in the fields on the Risk Management Properties form.
   See Properties installed with Risk Management for property descriptions.
3. Click **Save**.

Properties installed with Risk Management

Risk Management Administration

Using the Risk Management application, administrators can customize risk categories, risk criteria, risk management properties, and risk assessment types.

Risk criteria

Risk criteria are the scoring values attributed to the likelihood that a risk occurs, and the impact to your organization if the risk does occur.

Risk criteria thresholds define a high/likely or low/unlikely score as shown:

Risk criteria thresholds

Likelihood	Impact	Scores
1 = Extremely Unlikely	1 = Very Low	0-5 = Very Low
2 = Unlikely	2 = Low	6-10 = Low
3 = Neutral	3 = Moderate	11-15 = Moderate
4 = Likely	4 = High	16-20 = High
5 = Extremely Likely	5 = Very High	21-25 = Very High

Risk properties

Name	Description
A list of tables that are available in the **Applies to** field on forms	If this field is blank, all tables are available on the various forms for Entity Types, Entities, and Risks. Defines a comma-separated list of tables that are available in the **Applies to** field on the Entity Type, Entity, and Risk form. Add *.extended* after the table name to include all extended tables.

Set up checklist for the GRC Mobile application

The following checklist includes the set up tasks that you are required to complete in your ServiceNow AI Platform® instance and on your mobile device. Complete these set up tasks prior to using the GRC Mobile application to view the Risk Management application on your mobile device.

Before you begin

As an option, print this checklist and use it to guide you through the set up tasks that are required for the GRC Mobile application. Verify that each item on the list is completed so that you can log in to the GRC Mobile application and add a ServiceNow AI Platform instance.

Time to complete this task: 15-20 minutes.

Roles required: admin, sn_risk.manager

GRC Mobile application checklist

Item	Description
☐	As a user with the admin role, verify that you have the GRC core applications installed on a ServiceNow AI Platform instance. This is the ServiceNow AI Platform instance that you view on your mobile device. **Note:** The GRC core applications and the ServiceNow AI Platform instance should be from the same family release. 1. To verify the GRC: GRC Profile Dependencies core application is installed on your instance, navigate to **Plugins** and search for GRC Profile. 2. If the GRC Profile core application is not already installed, click **Install** to install it. 3. After the GRC Profile application is installed, install either the Policy and Compliance Management core application, or the Risk Management core application, or both the Policy and Compliance Management and Risk Management applications. These are the two GRC applications that you can view with the GRC Mobile application.

GRC Mobile application checklist (continued)

Item	Description
	If not visible in your instance, all of the GRC core applications are available from the ServiceNow Store. For more information about getting entitlement, downloading, and installing the GRC core applications, see GRC and the ServiceNow Store. When you install the GRC core applications, the dependency plugins for the GRC Mobile application, (com.glide.sg and com.glide.sg.agent_native_client) are also automatically installed. To verify that these dependency plugins are installed and activated: **1.** Navigate to **Plugins**. **2.** Search for the plugin IDs (com.glide.sg and com.glide.sg.agent_native_client). **3.** If they are not activated, activate these plugins.
☐	As a user with the admin role, verify that you have the GRC mobile app installed on the ServiceNow AI Platform instance that you want to view on your mobile device. **Note:** The GRC mobile app and the ServiceNow AI Platform instance should be from the same family release. For more information about getting entitlement, downloading, and installing the GRC Mobile application, see GRC and the ServiceNow Store.
☐	As a user with the admin role, in your ServiceNow AI Platform instance verify that you have assigned mobile users with the required ServiceNow AI Platform roles. **1.** To view the roles that are assigned to a user, navigate to **Users and Groups** > **Users**. **2.** Select the user name followed by the roles related list. All roles assigned to this user are displayed. **3.** Verify a user is assigned, or assign a user with the IT Infrastructure Library role (itil). Users with the itil role can create, open, and update records. Only users with the itil role can have tasks assigned to them. **4.** Verify a user is assigned, or assign a user with the risk manager role (sn_risk.manager). This role is automatically added when you assign the itil role. **5.** Verify you have created any required assignment groups and assigned mobile users to these groups. **Note:** If you have multiple users for the mobile application, you alternatively can assign the sn_risk.manager role to a group. Each user you add to the group inherits this role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Mobile application checklist (continued)

Item	Description
	For more information on users and assigning roles to users and groups, see Create a user.
☐	As a mobile user with the sn_risk.manager role, verify that you have installed the most current ServiceNow® Agent application on your mobile device. **Agent mobile app**  The most current Agent app is available on the Apple iOS App Store and the Google Play Store.
☐	As a user with the sn_risk.manager role, verify notifications are enabled on your mobile device and in your ServiceNow AI Platform instance. Notifications inform you when critical pending approval requests are assigned to you or to your assignment group. To assist you with timely remediation, after you enable notifications, click on a notification in the GRC Mobile application and navigate directly to the record. To enable notifications in your ServiceNow AI Platform instance so they are displayed on your mobile device, follow these steps. **1.** Verify you have downloaded and installed the GRC Mobile application on your ServiceNow AI Platform instance. **2.** In System Settings in your ServiceNow AI Platform instance, under Notifications, verify you have enabled the **ServiceNow Mobile Application**. For more information about setting notifications, see "User notification preferences in Core UI" on the Setting notification preferences in Core UI. ServiceNow AI Platform notifications are also displayed on the messages screen on your mobile device. Verify that notifications are also enabled in the settings of your mobile device.

You have successfully set up your mobile device and the ServiceNow AI Platform for the GRC Mobile application. The next step is to log in to your ServiceNow AI Platform instance with the ServiceNow Agent app on your mobile device.

Risk appetite setup

You can configure the risk appetite feature in the Advanced Risk application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Follow the order of the tasks to configure the risk appetite feature in the Advanced Risk application.

Configure a risk appetite and tolerance in Advanced Risk

Set up the advanced risk assessment properties so that you can configure and customize the risk appetite and tolerance in the Advanced Risk application.

Before you begin

Role required: sn_risk.admin

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Properties**.
2. Set the property values that are described in the following table.

Advanced risk assessment properties

Property	Description
Migrate to Advanced Risk Assessments sn_risk_advanced.hide_risk_legacy_lifecycle	Option to migrate to the advanced risk assessments. Select **Yes** to use the risk appetite feature.
Define risk appetite as sn_risk_advanced.risk_appetite_scale	Option to select the risk appetite type: ○ **Risk appetite only (1-point scale)**: Uses only the risk appetite. The risk appetite field is available on the risk statement, risk, and entity form. The risk appetite status is calculated based on this property selection. ○ **Risk appetite and risk tolerance (2-point scale)**:Uses both the risk appetite and tolerance. The risk appetite and risk tolerance fields are available on the risk statement, risk, and entity form. The risk appetite status is calculated based on this property selection. ○ **None**: Don't want to use the risk appetite. **Note:** Only one property between the **Define risk appetite as** and **Express risk appetite in** can be configured at a time. Configure a property first, save it, and then configure the other property.
Express risk appetite limits in sn_risk_advanced.risk_appetite_analysis	Option to select risk appetite scale: ○ **Qualitative terms only**: Defines the risk appetite in qualitative terms only. Your risk appetite is based on the appetite scale such as low, medium, or high. The risk ratings are compared with the qualitative appetite and tolerance to calculate the qualitative appetite status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	○ **Quantitative terms only**: Defines the risk appetite in quantitative terms only. A quantitative risk appetite can be measured and expressed using numerical values. For example, an organization decides to have $1000 (US dollars) as a target non-performing asset (NPA) for this year. The organization can define $1000 (US dollars) as a quantitative risk appetite. The annual loss expectancy values are compared with the quantitative appetite and tolerance to calculate the quantitative appetite status. ○ **Both**: Defines the risk appetite in both qualitative and quantitative terms. **Note:** Only one property between **Define risk appetite as** and **Express risk appetite in** can be configured at a time. Configure a property first, save it, and then configure the other property.
Number of days before which an email should be sent to review risk appetite sn_risk_advanced.risk_appetite_review_notifcation	Notification email scheduler to send an automated email notification to the risk statement owner before the next review date.

3. Select **Save**.

Set up a risk appetite scale

Set up a risk appetite scale in the Advanced Risk application to define the qualitative risk appetite within your organization.

Before you begin
Role required: sn_risk.admin

About this task
Use a risk appetite scales to define the qualitative risk appetite on the risk statement, entity, and risk records. The risk appetite scales that are shipped by default are as follows:

- **1-Averse**
- **2-Minimalist**
- **3-Cautious**
- **4-Open**
- **5-Hungry**

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Appetite Scales**.
2. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Appetite Scale form

Field	Description
Name	Name of the risk appetite scale. For example, Hungry.
Active	Option to enable the appetite scale. You can't delete a risk appetite scale. Instead, you make it as inactive. This option is automatically selected. **Note:** When you make a risk appetite scale active or inactive, it affects multiple records, such as related risk assessments, entities, risk statements, and risks.
Description	Brief description about the appetite scale.
Value	Value of the risk appetite scale. This field defines a numerical value of the risk appetite scales. **Note:** Any change in the risk appetite value affects multiple records, such as related risk assessments, entities, risk statements, and risks.
Display order	Order of the risk appetite scale. This field enables you to set a sequence in which the risk appetite scale appears.

4. Select **Submit**.

Change a risk appetite status

Change the default name, color, and icon that appear for the risk appetite status in the Advanced Risk application.

Before you begin
Role required: sn_risk.admin

About this task
Use the risk appetite status to define the final risk status of the entities, risks, and risk statements that are based on the defined risk appetite. The appetite status helps you to monitor the risk and to define further actions to bring the risk within the appetite.

The risk appetite statuses that are shipped by default are as follows:

- **Outside appetite**
- **Outside tolerance**
- **Within appetite**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A risk appetite status can't be deleted but can be retired or created. When you create a risk appetite status, customization of the application is required to enable it for status computation.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Appetite Status**.
2. Open the risk appetite status that you want to change.
3. On the form, fill in the fields.

Risk Appetite Status form

Field	Description
Name	Name of the risk appetite status. For example, Outside appetite.
Color for risk appetite status	Color that appears for the risk appetite status. **Note:** To make this change on the workspace view for the risk, entity, and risk statement, you must perform some additional steps. For more information about these additional steps, see KB0867184. You must log in to the Now Support to view the Knowledge Base articles.
Icon	Icon that appears for the risk appetite status. **Note:** To make this change on the workspace view for the risk, entity, and risk statement, you must perform some additional steps. For more information about these additional steps, see KB0867184. You must log in to the Now Support to view the Knowledge Base articles.

4. Select **Submit**.

Modify Advanced Risk messages

Modify the messages displayed on the risk assessment form using the Advanced Risk application. Modifying system messages enables personalized and consistent messaging for users, aligning with their preferences and specific requirements.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System UI** > **Messages**.
2. To filter all the advanced risk assessment messages, select the Key column and search for `advanced_risk_assessment_component`.
   Messages related to advanced risk assessment appear.
3. Select the message that you want to modify.
4. **Note:**
   Make sure you are not modifying the **Key** field.

   Modify the message text in the **Message** field.
5. Select **Update**.

Create related list groupings in Advanced Risk

Simplify the groupings of related lists on a record page and customize them to your specific needs, assigning meaningful names in the process. This configuration enhances readability and user experience when interacting with the forms.

Before you begin

Role required: admin or sn_grc_workspace.record_view_admin

About this task

On a form, there can be numerous related lists that can occasionally result in a cluttered view. To streamline the display, you have the option to select and configure the related lists you want to see on the form. By default, the ability to configure the related lists is given for the following tables:

- Calculated Metric Definition table
- Metric Definition table

While you can select any table and configure the related lists for that table, as an example, this procedure describes how you can create groupings for the Metric Definition table. Apart from the related lists, you can also specify a UX page that you want to display under a group.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Record View Configuration**.
2. Select **Risk workspace configuration**.
3. In the Table configurations related list, select **Metric Definition**.
4. In the Group configurations related list, select **New**.
5. On the form, fill in the fields.

Group configuration form

Field	Description
Table configuration	Name of the table for which you're configuring the related list. This field is automatically set.
Name	Name of the group that is displayed on the related list of the form. For example, you can provide a name such as `Risk` for grouping

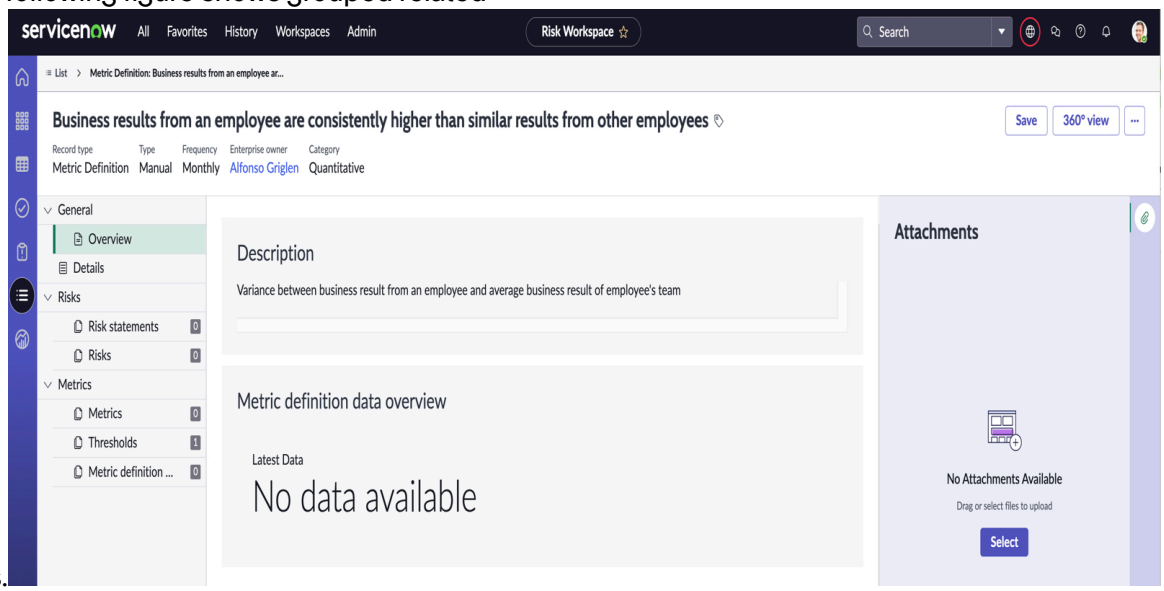
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	risk-related objects, such as risks and risk statements.
Active	Option to indicate if the configuration is active.
Order	Order number of the group on the form. **Note:** If you want to display the order before the Details tab, then the order number must be less than or equal to `100`.
Condition	Conditions that must be met to be displayed on the form. For example, you can specify if a record is active, only then it must be displayed on the form.

6. Select **Submit**.
7. In the Group configurations related list, select the entry you created.
   a. In the Group entries related list, select **New**.
   b. On the form, fill in the fields.

Group entry form

Field	Description
Group configuration	Group for which the related list is created. For example, in this procedure, the group for which you're configuring the entry is **Risks**.
Order	Order of the entry on the UI page.
Application	Application for which the related list is being created. This field is automatically set to **GRC: Risk Management Workspace**.
Active	Option to indicate if the entry is active.
Type	Choice to indicate the type of item the group contains. The choices are as follows: ▪ **UX page** ▪ **Related list**
Related list	Related list that you want must appear under the group. This option appears only when the **Type** field contains **Related list**.
Screen	Specific variation or version of a page. This option appears only when the **Type** field contains **UX page**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Route	The path of the UX screen. This option appears only when the **Type** field contains **UX page**.

c. Select **Submit**.

Result

The following figure shows grouped related lists.

Integrating Risk Management with other applications

Extend the capabilities of Risk Management such as Advanced Risk Assessment and help other applications with risk identification and risk assessments.

Advanced Risk Assessment goes outside of Governance, Risk, and Compliance to help other applications such as APM and Project Portfolio Management identify and assess their risks and manage their life cycle.

Manage your project risks by using the project risk assessment capability. This capability enables the risk administrators, projects managers, and risk owners to manage the complete project risk life cycle such as project risk identification, project risk assessment, project risk mitigation, and project risk monitoring. This feature provides efficient visibility and reporting of the project risks posture through mediums such as aggregated project risk ratings and heatmaps. The integration of with also ensures that when a project risk threatens to affect an enterprise, the risk can be easily reported to the enterprise risk team so that the necessary mitigating actions can be defined. To use this feature, ensure that you have the Project Portfolio Management application installed. You must also enable the Enable Advanced Risk PPM Integration property under Advanced Risk Assessment Administration Properties. The default setting for this property is No. Only users with it_pps_admin or risk_admin roles can enable this property.

Manage your digital risks with business applications by using the application risk management capability. This capability allows the management of the complete risk life cycle of a business application including general data collection about the application, application inherent risk assessment, applicability of the appropriate policies, regulations and controls, and implementation and monitoring of controls. The integration of the GRC workflow with the business application reduces the communication barriers and reduces the information silos

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the two organizations. This reduction of barriers reduces the overall effort in management of business applications. To use this feature, ensure that you have the Application Portfolio Management (APM) application, Application Portfolio Management integration with Policy and Compliance Management and Application Portfolio Management integration with Risk Management installed.

Project Risk Assessment using Advanced Risk Assessment

Manage your project risks by using the Project Risk Assessment capability. Risk administrators, projects managers, and risk owners can manage the complete project risk life cycle by using the Project Risk Assessment capability.

As your organization grows, it is important to perform risk assessments of your projects. Because each project is unique, it is important to customize the project risk management process according to the unique project requirements. Determining the right level of project risk management process constitutes the risk management plan. The project risk life cycle consists of phases such as project risk identification, project risk assessment, project risk mitigation, and project risk monitoring.

With version 11.0.1, you can use Governance, Risk, and Compliance (GRC) Advanced Risk Assessment to assess your project risks. The feature is integrated with a strong risk assessment engine which you can use with strong project risk management requirements. This feature also provides efficient visibility and reporting of the project risks posture by using tools such as aggregated project risk ratings and heatmaps. The integration also ensures that when a project risk threatens to affect the enterprise, the risk can be easily reported to the enterprise risk team. The enterprise risk team can then define the necessary mitigating actions.

Benefits of the GRC and Project Portfolio Management integration for managers

Using this integration, Project Managers can do the following activities:

- Identify the risks from a standard risk taxonomy.
- View the risks for their projects within the Project form.
- Identify and assess the risks from the Project form itself.
- Assess the inherent and residual risks.
- Elevate a project risk to an enterprise risk if the risk impacts the enterprise.
- Calculate the roll-up risk scores across projects, programs, and portfolios so that the stakeholders can view this information.
- Monitor the risk posture of a project through risk aggregation.

> **Note:**
> Only the project risks that are assessed contribute to the final risk scores.

- View the heatmap of the risks as well as understand the mitigating actions.
- View the Project Risk Overview dashboard to get an overall risk posture.

Enterprise Risk Managers also benefit from the integration. They can do the following activities:

- View the project risks that affect the enterprise and take necessary action.
- Get an overall view of the enterprise-level risks and their nature at all levels.

Use case for the GRC and Project Portfolio Management integration

To understand the use case for this integration, consider the following scenario. An organization can have multiple projects. Some projects are complex and some are less complex. Risk management of complex projects may be aligned to ISO 31000 risk assessment standards. Complex projects require various activities such as risk identification, assessment, response, and monitoring. Less complex or simpler projects might require only simple assessments. The integration between Project Portfolio Management and Advanced Risk Assessment supports the risk assessment of project risks.

Related topics

About Project Portfolio Management

Workflow of project risk assessment

To understand the integration of Project Portfolio Management and Governance, Risk, and Compliance risk management capabilities, it is important to understand the workflow of project risk assessment.

Project risk assessment follows a sequence of steps. Sometimes, a risk is elevated to an enterprise risk after the risk is assessed. An enterprise risk is a risk that can cause monetary or reputational losses. It can jeopardize your ability to stay in business.

The workflow of project risk assessment is as follows:

1. A project manager identifies risks and adds those risks to a project. The manager can either create risks or add them from a library. The project manager has the it_project_manager and sn_grc.business_user roles. For more information, see Add risks for a project.
2. The project manager then initiates risk assessment for the newly added risks. In the Project Integration Configuration form, the assessors and approvers are defined for the assessment. They get an email notification to assess the risks.

   Note:
   You can only assess the risks that are in the Pending, Open, or Work in Progress state.

3. If the Project Integration Configuration form has stakeholders selected as assessors, then the project manager must manually assign the risks to the relevant stakeholder.
4. As a risk specialist, the risk assessor is notified about the new risks for assessment.

   The risk assessor can use the link in the email notification to start the assessment. Alternatively, the risk assessor can navigate to **Advanced Risk Assessment** > **Risk Assessment Tasks** > **My Tasks** to perform advanced risk assessment. See Advanced Risk Assessment.

5. In the project risk form, the project manager reviews the Risk Assessment Summary section to view the risk assessment scores.
6. If the project manager determines that the project risk has an impact on the enterprise, then the project manager can elevate the risk to an enterprise risk.

   Note:
   When a project risk is elevated to an enterprise risk, the project risk is copied from the project risk register to the enterprise risk register.

7. If a risk is elevated to an enterprise risk, the enterprise risk manager is requested to assess the risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

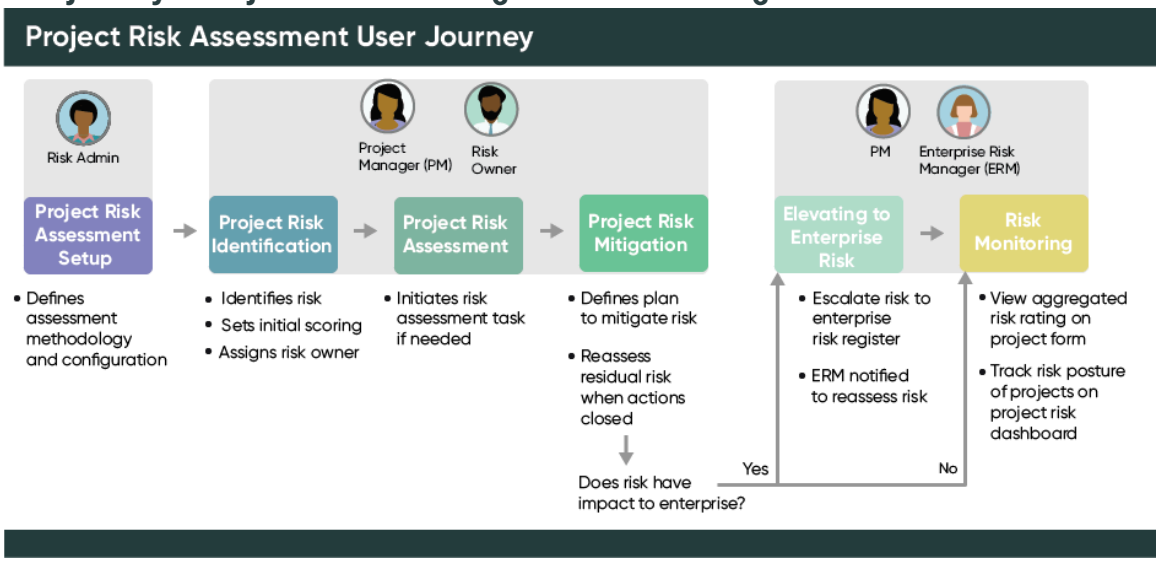
8. The project manager views the enterprise inherent risk score and the enterprise residual risk score in the **Risk Assessment Summary**.
9. As part of the Project Portfolio Management workflow, if a risk materializes and an action must be taken for this risk, then the project manager can convert the risk into an issue. For more information, see RIDAC (Risk, Issue, Decision, Action, and Request Changes) record entries for a project.
10. The project manager can also view the project risk posture through the heatmap in the Risk Overview section on the project form. The heatmap displays high impact risks and high likelihood risks. With the heatmap, you can prioritize the risks that need immediate attention. The risks that are assessed contribute to the aggregated risk score. The aggregated risk score is a single score that can be reported to all the stakeholders. For more information, see Create a project.
11. View the Project Risk Overview dashboard to understand the overall risk posture of project risks and of enterprise risks. For more information, see Project Risk Overview dashboard.

Note:
The assessor and the approver must have risk business user role (sn_grc.business_user) to perform the required tasks. If the project risks are reassessed for any reason and the scores change, then the enterprise risk assessor gets an email notification with the option to reassess the enterprise risk.

The key users and the user journey are shown in the following figures.

Key users of Project Portfolio Management and Risk Integration

Project Managers
- Own the overall project risk and need visibility into project risks
- Use the aggregated risk to understand the overall project risk posture as well as visualize their distribution on the heatmap
- Can elevate risks to enterprise risk register if they have materialistic impact to the enterprise



Project Risk Owners
- Own the specific risk and assess and mitigate it to contain it from materializing
- Use the ARA to assess the inherent risk, define actions to mitigate those risks and assess the leftover (risidual) risk to decide if further mitigating actions are required

Enterprise Risk Managers
- Need visibility into risks from the projects and understanding of which risks may impact the overall organization risk posture
- Can reassess project risk which may have an enterprise impact to analyze such risks and take appropriate action on them

User journey of Project Portfolio Management and risk integration

Configure Project Portfolio Management and Advanced Risk integration

Use the Project Integration Configuration form to set up the risk assessment. You have to select the risk assessment methodology, the right assessors and approvers, and the formula to roll up the risk scores and show the scores at a project level.

Before you begin

To use Advanced Risk Assessment for Project Management, do the following:

- Activate the Project Portfolio Management plugin.
- Activate the Advanced Risk plugin.
- Enable the *Enable Advanced Risk PPM Integration* property under **Advanced Risk Assessment** > **Administration** > **Properties**. This property is automatically set to **No** by default. Only users with the it_pps_admin or sn_ risk.admin roles can enable this property..

Note:
Currently, in the Project Portfolio Management suite, advanced risk assessments are only supported for the Project Management application.

Role required: sn_risk.admin

About this task

As the risk administrator, you can select the following on the Project Integration Configurations form:

- The risk assessment methodology (RAM).
- The approvers and assessors for both enterprise risk assessment and project risk assessment.

Two predefined RAMs are provided for Enterprise Risk Assessment and Project Risk Assessment. You can modify the default methodology or create methodologies. If you select your own risk assessment methodology, then the entity class for that methodology must be Project. For assessing project risks and enterprise risks, you can add the approvers and assessors of your choice. The risk assessment methodology for project risk is automatically selected as the methodology that is associated to the Project Portfolio Management risk table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Project Integration Configuration**.
2. Click the information icon to view the project risk integration configuration record.
3. Click **Open Record**.
4. On the form, fill in the fields.

Project Risk Integration Configuration form

Field	Description
Project Risk Assessment	
Assessment methodology	The assessment methodology for project risk assessment. This field is automatically set to **Enterprise Assessment for Projects**
Assessor type	Assessor for the project risk assessment. The choices are as follows: ○ Project Manager: The user assigned as the project manager of the project. ○ Risk Owner: The user who is identified in the**Assigned to** field of the risk. ○ Stakeholders: Stakeholders for the project. **Note:** If **Stakeholder** is selected, then when the project manager assigns the assessor, all users who are added to the Stakeholders related list in the project are displayed. The project manager can select the required stakeholder.
Risk rollup formula	The formula used to roll up the project risk scores. The choices are as follows: ○ Average ○ Maximum ○ Minimum **Note:** Only the risks that are assessed using Advanced Risk Assessment are aggregated and have their scores rolled up. If a risk is retired, then the score of the retired risk is not aggregated. For details, see Risk score rollup in Advanced Risk Assessment.
Approver type	Approver of the project risk. The approver has to approve the risk assessment. The choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ None: No approver is necessary. ○ Project Manager: The project manager is the approver. ○ Stakeholder: The stakeholders for the project.
Enterprise Risk Assessment	
Assessor type	Assessor for enterprise risk. The choices are as follows: ○ Project Manager: The user assigned as the project manager of the project. ○ Risk Owner: The user who is identified in the**Assigned to** field of the risk. ○ Group: The group to which the risk is assigned. **Note:** This user must have the sn_risk.manager role.
Approver type	Approver for enterprise risk. The choices are as follows: ○ None: When no approver is necessary. ○ Project Manager: The user assigned as the project manager of the project. ○ Group: The group to which the risk is assigned.
Days to overdue	Number of days after which an assessment is considered overdue starting from the date of initiation. The field is automatically set to **5**. **Note:** The assessor gets reminder notifications before the due date approaches. The assessor and the assessor's manager get a notification after the due date passes.
Assessor group	The group which assesses the enterprise risk if the **Assessor type** field has **Group**.

5. Click **Update**.

Result
The assessor and approver details are set.

Assign project risks to stakeholders for assessment

Assign the project risks to the relevant stakeholder for assessment. You must manually assign the risks to the stakeholders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: it_project_manager

About this task
If the Project Risk integration Configuration form has **Stakeholders** selected as an assessor, then the project manager must manually assign the assessment to one of the stakeholders of the project.

Procedure
1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project for risk assessment.
   Ensure that risks for this project are present. See Add risks for a project.
3. Click the Risks related list.
4. Select the risk you want to assess.
5. Click **Assess Risk**.
   The values are shown based on the integration configuration.
6. In the **Approver** field, select an assessor for the project risk.
7. Click **Submit**.

Result
The risk moves to the risk assessor's workflow.

Related topics
Configure Project Portfolio Management and Advanced Risk integration

Assess project risks using Advanced Risk Assessment
Assess the project risks by responding to predefined factors or questions. Arrive at a risk score for the project.

Before you begin
Role required: it_project_manager and sn_grc.business_user

About this task
A risk is assessed for inherent risks and residual risks. An inherent risk is a risk that has no mitigating controls. A residual risk is a risk that remains after the controls are accounted for.
The workflow of the risk assessment is determined by the risk admin on the risk assessment methodology configurations. If the project manager wants to enable approval of the assessment, then the project manager can configure the approval flow in the Project Integration Configuration form. If an assessment for a risk has been taken before, the results of the previous assessments appear in the Previous Assessments related list.
A risk assessor can do the following:

- Assess the risks that were added for a project.
- Decide if the risks must be elevated to enterprise risks.

To understand how to assess risks on a risk assessment instance and how to respond to the questions, refer to Understanding the risk assessment instance.

Procedure
1. Navigate to **All** > **My Tasks** > **Module**.
2. Select the assessment that you want to assess.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Assess**.
4. In the Inherent Assessment section, respond to the factors as appropriate and click **Save and Calculate**.
5. In the Results section, you can override the computed score.
   a. If you think that the computed risk score is not correct, select the **Override computed score** check box to override the computed risk score.
   b. In the **Override inherent risk** field, select a value to override the computed risk rating. This field appears only when the **Override computed score** option is selected.
   c. In the **Comments** field, enter your justification for overriding the computed risk rating.
6. Click **Perform residual assessment**.
   a. In the Residual Assessment section, respond to the factors as appropriate.
   b. Click **Save and Calculate**.
7. Click **Mark as complete**.
8. Click **Request Approval**.
   The option to request approval appears only when the Project Integration Configurations form has the approvers identified. In that case, the workflow moves to the Awaiting Approval state. But if the option to request approval is not selected, then the workflow moves to the Monitor state.

What to do next
Elevate a project risk to enterprise risk.

Elevate a project risk to enterprise risk

Elevate a project risk to an enterprise risk if the project risk has an impact on the enterprise.

Before you begin
Role required: it_project_manager or sn_grc.business_user

About this task
If you find that a project risk has an impact on the enterprise, then you can elevate the project risk to an enterprise risk. After a risk is elevated, the project risk is automatically copied to the enterprise risk register. An elevated risk needs an assessment on the enterprise impact. The enterprise risk is always connected to the project risk. If a project risk is retired, then the enterprise risk also gets retired.

Procedure
1. Navigate to **All** > **Project** > **Projects** > **All**.
2. Select the project for risk assessment.
3. Select the assessed risk that you want to elevate.
4. In the related links, click **Elevate to Enterprise Risk**.

Note:
The assessor is predefined in the **Assessor** field. The value in this field is obtained from the Project Integration Configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Approver** field, select an approver.
6. Click **Submit**.

Result

A new risk assessment is generated for enterprise risk assessment. The assessment is sent to the enterprise risk assessor.

What to do next

Based on the assessors identified as the enterprise assessors in the Project Integration Configuration form, the enterprise risk manager gets a notification to assess the risk from an enterprise risk perspective. The steps to perform the risk assessment are the same as given in Assess project risks using Advanced Risk Assessment.

Application risk assessment using Advanced Risk Assessment

Manage digital risks of business applications easily by integrating GRC with business applications. By integrating, you get real-time insights into the digital risk posture of business applications, have improved communication between application owners and IT risk managers, and can reduce workloads.

Enterprises use Application Portfolio Management (APM) to manage their inventory of business applications. Examples of business applications are Zoom, Workday, Jobvite, and so on. Each business application has two owners:

- IT Application owner: Owns the application from the IT team and is the primary point of contact. The IT application owner is also known as the application product owner or application owner.
- Business owner: Owns the application for its business uses. The business owner is the executive sponsor of the business application. The owner is generally from the business who sponsors the application. For example, finance applications are usually sponsored by the head of finance.

When you integrate GRC with APM, you can simplify the work of IT risk managers by identifying the risks and the necessary controls. You can mitigate the digital risks of business applications. You can also ensure that the controls are effective. The benefits of this integration are the following:

- Reduces the time spent by risk managers and by the application owners of digital risks.
- Provides faster and more efficient communication between the application owners and risk managers.
- Provides an overview of the digital risk posture of business applications.
- Enables continuous monitoring of the applications.

The users who benefit from this integration are shown in the following figure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

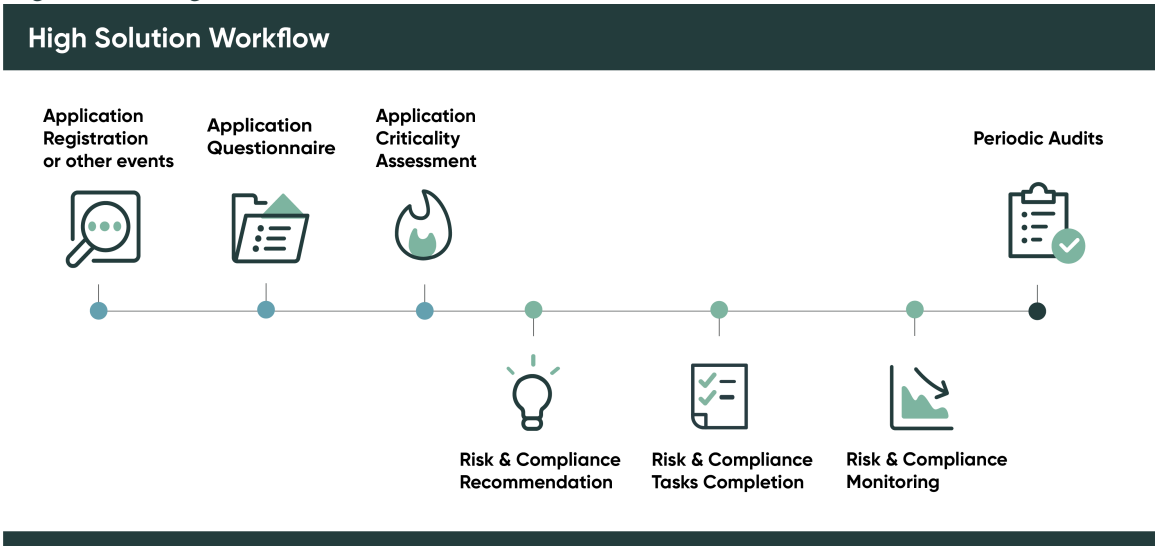
Beneficiaries of APM and Risk integration

Key Personas

IT Risk Manager
- Primary person responsible for application risk
- Decides the Business Impact Analysis (BIA) rating for the application
- Identifies and implements the necessary controls for the application

IT Application Owner / Product Owner
- Maintains the business application and is primary point of contact
- Provides accurate information about the application for:
  - Risk and control identification
  - Business impact computation
- Assists IT Risk manager in implementation of controls

Application Sponsor / Business Owner
- Business sponsor accountable for the application
- Monitors the application status on a periodic basic



IT Governance Team
- People from compliance and audit team acting as a 2nd and 3rd line of defense
- Conduct audits of the business application to ensure compliance
- Create IT Governance framework that all business applications should comply with

The Application Risk Assessment feature is available when you activate the Advanced Risk plugin. But the default configurations for the APM risk identification record are available only when you have the APM integration with Risk Management plugin (com.snc.apm_risk_assessment) enabled.

The following image shows the high-level workflow of the integration:

High-level integration of APM and Advanced Risk Assessment

Related topics

Workflow of risk identification for business applications

Workflow of risk identification for business applications

When assessing an application for risks, the application goes through various stages of risk identification and assessment. You can define the identification and assessment workflow based on your requirements.

Before the risks of an application are assessed, the application must be created in the Business application table and brought to GRC. After the application comes to GRC, a risk identification record is created. The application owner provides information about the application to the IT Risk Manager. The IT Risk Manager then maps the recommended risks, citations, and policies.

Consider the following example to understand the workflow of risk identification and assessment for a business application. A new business application is introduced into your organization. This new application is a part of the Business Application table. The new application has two owners:

- IT application owner
- Business owner: This user must have the sn_grc.business_user role.

Note:
Your organization can use different roles.

At this point, the application is not a part of GRC. It must be brought to GRC as an entity before its risks can be assessed. The new application must also have information objects associated with it.

The workflow and approvers of the application risk assessment are determined by the settings in the Risk Identification Configuration form. Refer to Set up risk identification integration to understand the process of defining the workflow. To reinitiate risk identification, a flow designer action is provided.

When assessing a new business application, the workflow of the risk identification is as follows:

1. A business application is created either automatically or by an application owner in the business application table.
2. GRC detects the new business application. A GRC entity is created for the new application. The detection is handled by the GRC Profile Generation scheduled job that runs in the background.

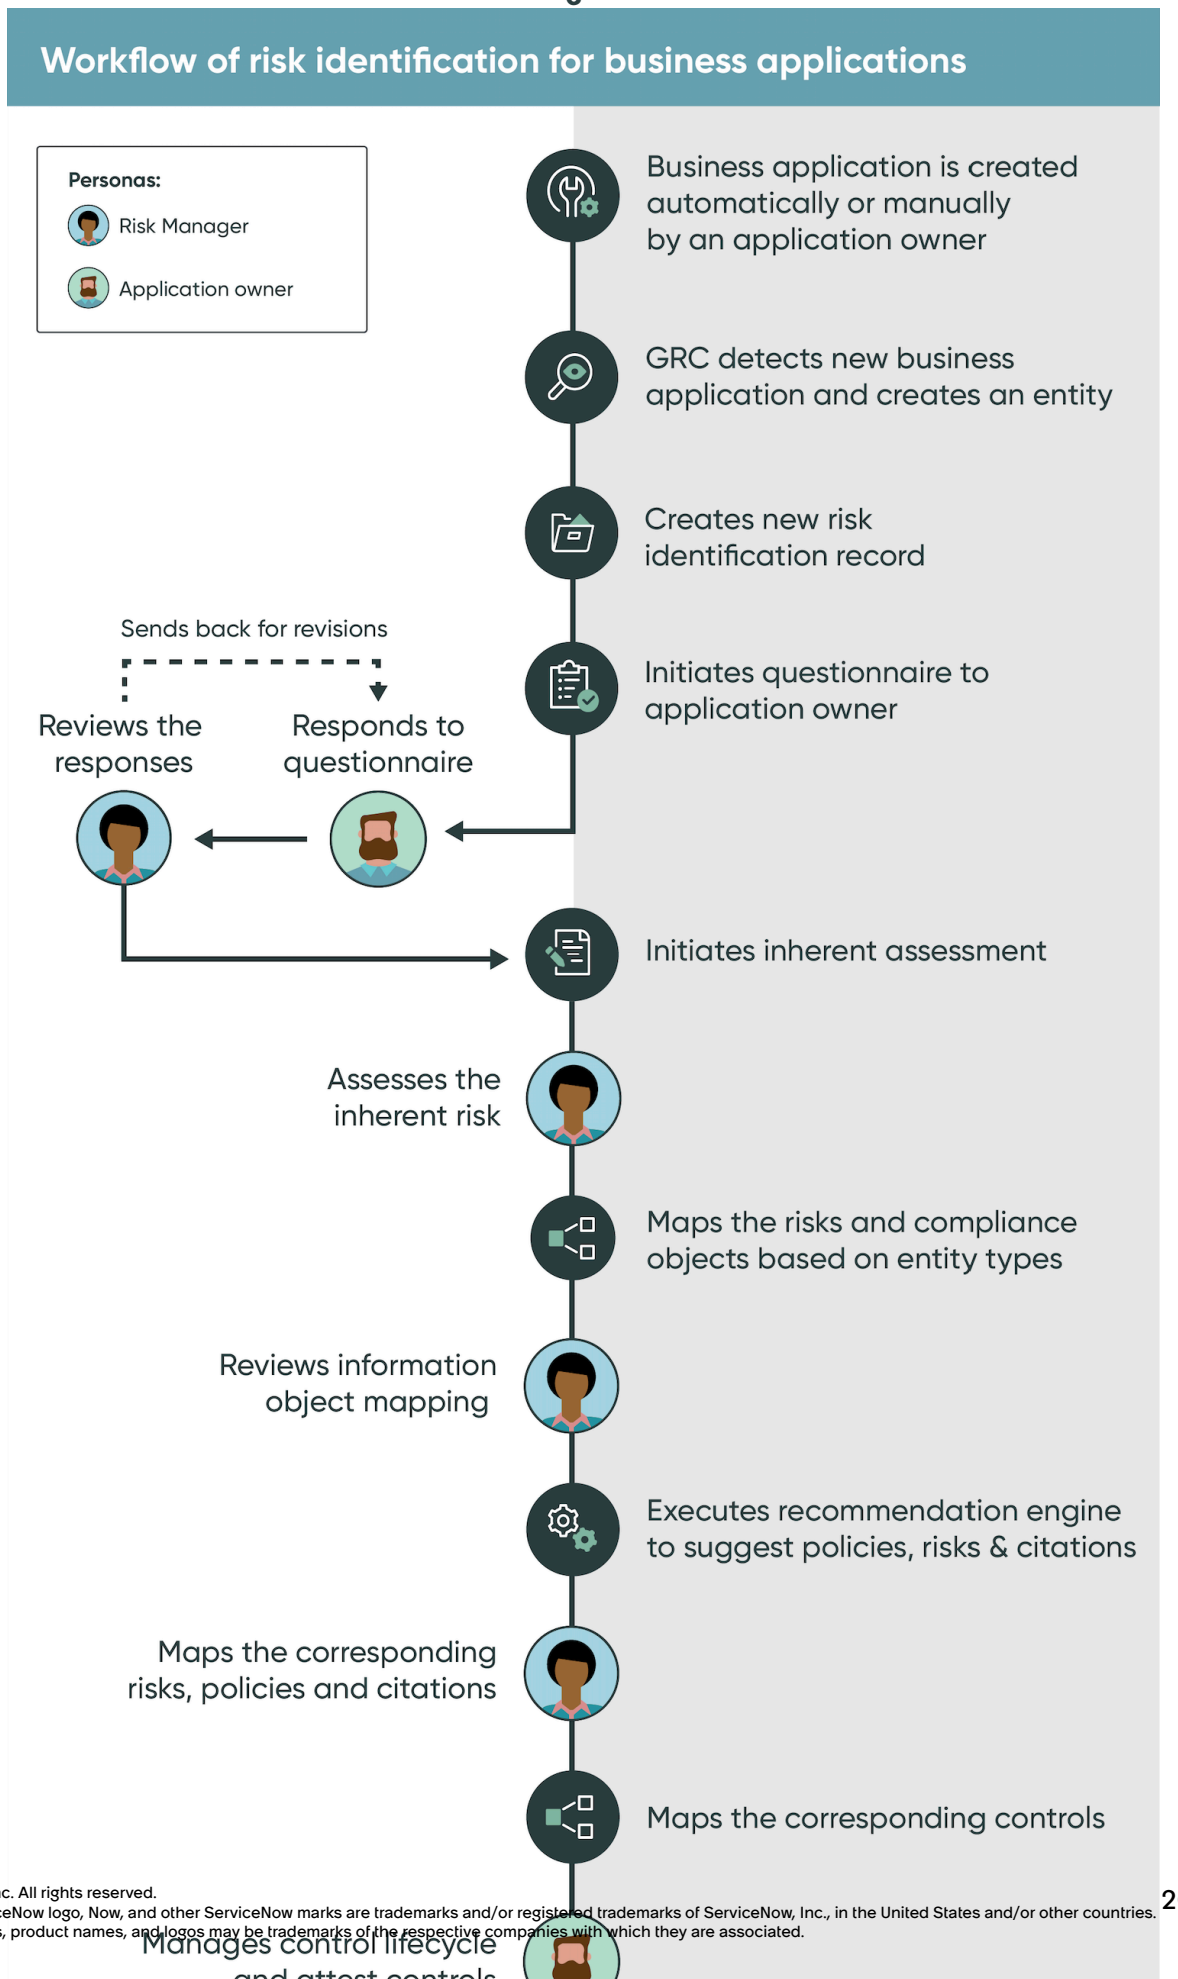
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. A new risk identification record is created for the application.

   Note:
   The Risk Manager can modify the configuration record and determine the workflow of the assessment. After a risk identification configuration is published, the risk manager can modify only some fields in the configuration record.

4. A questionnaire is initiated and sent to the application owner to collect details about the application.
5. The application owner responds to the questionnaire.
6. The IT Risk Manager reviews the responses. If the responses are unsatisfactory, the manager sends the questionnaire back to the application owner.

   Note:
   If the questionnaire is sent back, then the new responses are reverted to their original form.



7. Based on the configuration, after the IT Risk Manager is satisfied with the responses, the system initiates the inherent assessment.
8. GRC maps the risks and compliance objects based on the entity types.
9. The IT Risk Manager reviews the information object mapping.
10. The system executes the recommendation engine based on the algorithm selected in the configuration.
11. The IT Risk Manager reviews and maps the recommended risks, policies, and citations based on the associated information objects.
12. The IT Risk Manager maps the recommended controls based on associated citations, policies, and risks.
13. The application owner manages the control life cycle and attests the controls.

The following figure represents the workflow of the solution.

States of the risk identification record

After the risk identification configuration moves to the Published state, a risk identification record gets created for the related entity.

The risk identification record moves through the following states:

- New: A new record is created
- Information Gathering: The information about the application is collected.
- Review: The Risk Manager reviews the information.
- Inherent Assessment: The Risk Manager performs inherent risk assessment.
- Risk Mapping: The Risk Manager maps the necessary risks, citations, and policies.
- Monitor: The risks are monitored.
- Retired: The risks are retired as necessary.

After the risk identification configuration moves to the Retired state, the configuration becomes invalid and risk identification records are not created for related entities.

In terms of its life cycle, a risk identification record goes through the following states:

1. New
2. Information Gathering
3. Review
4. Inherent Assessment
5. Risk Mapping
6. Monitor
7. Retired

Set up risk identification integration

Before assessing an application, specify the target application where the risk identification must be initiated.

Before you begin

Make sure you have the following applications:

- Application Portfolio Management must be installed if you want the recommendation engine enabled and want to use the integration.
- Application Portfolio Management integration with Risk Management (com.snc.apm_risk_assessment) must be installed. This application is required only if you want to use the integration.
- Smart Assessment Engine and GRC Common Workspace Elements must be installed to use the smart assessment questionnaire during the risk identification. For more information, see Configuring Smart Assessment Engine.

Role required: sn_risk.admin

About this task

The Risk Identification Configuration form contains an entity type and a default identification record for the business application table. As a risk admin, you can either modify the default record or create your own configuration. The steps in this procedure are for creating a record. The Risk Identification Configuration form is used to do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Gather information about the application by using a questionnaire.
- Determine the criticality of the application.
- Determine if an inherent assessment for the application is required.
- Identify risks and map the relevant controls.
- Choose to receive recommendations for risks and controls.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Identification Configuration**.
2. Select **New**.
3. On the form, fill in the fields.

Risk Identification Configuration form

Field	Description
Name	Name of the configuration. An example is `Risk Identification for Business Application`.
Configuration level	The level where the configuration is done. The choices are as follows: ○ Entity class ○ Table
Target entity class	Entity class for which the risk identification questionnaire is initiated. For each entity of this entity class, a risk identification record is automatically created. This field appears only when **Entity class** is selected from **Configuration level**.
Target table	Table that contains the application record. For each entity of this table, a risk identification record is automatically created. This field appears only when **Table** is selected from **Configuration level**.
State	State of the configuration. This field is automatically set to **Draft**.
Risk manager group	Group which reviews the risk identification workflow. The users who belong to this group must have the sn_risk.manager and sn_compliance.manager roles.
Identification questionnaire	Option to initiate a questionnaire for gathering information about the application.
Inherent assessment	Option to perform inherent assessment or business impact analysis (BIA) assessment.
Recommendation engine	Option to recommend risks and controls. This option is available only when the **Target table** field has **Business Application**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Identification Questionnaire	
Use smart assessment	Option enables the use of smart assessment templates. You can select a smart assessment template in the **Questionnaire** field. For more information on how to create a smart assessment template, see Create a smart assessment template for risk identification.
Questionnaire	Questionnaire used for information gathering. **Note:** You can see a list of smart assessment templates only when you select the option **Use smart assessment**. Only published assessment templates with a Risk Identification category and the **Assessment target** field selected as `Entity` are available for selection.
Respondent type	Respondent of the questionnaire. The choices are as follows: ○ Entity owner ○ User on target record
Questionnaire review required	Option to require that the questionnaire is reviewed by a reviewer.
Respondent field	Field on the target table that contains the respondent for the questionnaire. This field appears when the **Respondent type** field has **User on target record**.
Inherent Assessment	
Review for inherent assessment required	Option to choose if the inherent assessment must be reviewed.
Risk assessment methodology	Option to select the risk assessment methodology (RAM) to perform inherent assessment. You can see the list of RAMs associated with the selected Target table. **Note:** Only published object-based RAMs with the inherent assessment option enabled are available for selection.
Approver type	Type of approver for the inherent assessment. The choices are as follows: ○ User on target record ○ Group

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field appears only when **Review for inherent assessment required** option is selected.
Approver	Approver for the inherent assessment. For a business application, the approver is the business owner of the application. **Note:** This field appears only when **User on target record** is selected from **Approver type**.
Approver group	Approver group for inherent assessment. This field appears only when the **Approver type** field has **Group**. **Note:** This field appears only when **Group** is selected from **Approver type**.
Recommendation Engine	
The Recommendation Engine section appears only when the **Target table** field has **Business Application**.	
Recommendation engine algorithm	Specify the recommendation engine. The choices are as follows: ○ None ○ Based on information object mapping For details on information objects, see Information objects.
Frequency	
Frequency	Frequency of the reinitiation of the workflow. **Note:** The next run date of the reinitiation of the workflow is calculated based on the frequency defined in the risk integration configuration record. This frequency ensures continuous evaluation of the application.
Month	Month when the job must run.
Day of month	Day of the month when the job must run.

4. Select **Submit**.
5. To define the RAM mapping for the risk identification configuration, do the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Risk Identification Configuration to RAM Mappings section, select **New**.
The Risk Identification Configuration to RAM Mappings section appears only when **Entity class** is selected from **Configuration level**.

b. On the form, fill in the fields.

Risk Identification Configuration to RAM Mapping form

Field	Description
Risk identification configuration	Risk identification configuration for the RAM mapping. This field is automatically set to Risk identification configuration number.
Table	Table on which you want to define the RAM mapping.
Risk assessment methodology	Option to select the RAM to perform inherent assessment. You can see the list of RAMs associated with the selected table. **Note:** Only published object-based RAMs with the inherent assessment option enabled are available for selection.

c. Select **Submit**.

6. Select **Publish** to publish the record.

Workflow of risk identification for business applications

Respond to an application questionnaire

Respond to a questionnaire about an application for risk assessment.

Before you begin

Role required: sn_grc.business_user or sn_grc.businesss_user_lite

About this task

The Risk Identification form contains multiple stages for the workflow. When an application is created in GRC as an entity, a questionnaire is sent to the IT application owner. The questionnaire is useful for risk managers to identify threats and mitigating controls.

Procedure

1. Navigate to **All** > **Self-Service** > **My Assessments & Surveys**.
Alternatively, you can also navigate to **Risk identification classic questionnaires** or **Risk identification questionnaires** from the My Tasks page to access the questionnaire. Select **Risk identification questionnaires** for the smart assessment questionnaire.
2. Open the record with the assessment that you must respond to.
3. Enter your responses.
4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The state of the risk identification record moves from the Information Gathering state to the Review state.

What to do next
The IT Risk Manager can review the responses and can either send the questionnaire back or accept the responses.

Create a smart assessment template for risk identification

Create a smart assessment template for risk identification using the Smart Assessment Engine application.

Before you begin
Role required: sn_risk.admin

Procedure
1. Navigate to **All** > **Assessment Workspace**.
2. On the Assessment workspace landing page, select **New template** and then fill in the Template details form.

Create assessment template form

Field	Description
Template name	Unique meaningful name for the template.
Assessment name	Option to include alternative name for generated assessments. The respondent sees this name rather than the template name. **Note:** The **Assessment name** field is available when you select the add text T+ icon.
Description	Text that helps others to understand what the template will be used for.
Assessment template categories	Category that the new assessment template should be a member of. You must select `Risk identification category`. Template categories that enforce the data segregation for templates. A category controls which users can view a template. Each assessment template is associated with one or more template categories. To view a template in a category, you must have a category role that is associated with the category. See Create an assessment template category

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can create an assessment only from a published assessment template. You can update a published template only if no active assessment is associated with the template.
Assessment target	The table records selected to be assessed, otherwise known as the assessment scope. Multiple tables can be added as the assessment target making the scope a combination of records from each table. You must select `Entity`.

3. Select **Create**.

Using the template designer

Review responses and perform inherent risk assessment

Compute the overall risk score for an application by performing an advanced risk assessment. After the IT application owner responds to the questionnaire, a risk manager reviews the responses and performs the inherent assessment.

Before you begin

Role required: sn_risk.manager

About this task

After the risk assessor returns the assessment questionnaire, you can review the questionnaire as the risk manager. Based on your review, you can initiate a risk assessment for the application. The risk assessment task is initiated to the group responsible for performing the assessment. The task is available in **My Group Tasks**. Any risk manager who is a part of the group can perform the assessment. The assessors usually don't vary.

You can choose to use either the manual factors or the automated factors. By default, there are three manual factors which are associated to a risk assessment methodology. There are also three automated factors which are not associated to any risk assessment methodology. The names of the factors are:

- Confidentiality Impact
- Integrity Impact
- Availability Impact

Some of the factors or questions on the risk assessment instance might already have an answer or a response. These values are derived from the responses of the application owner. You can view how the value was calculated.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Risk Identification** > **All**.
2. Open the record with the assessment that you must review.
3. In the Questionnaires related list, click **View responses** for the required assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. If you are not satisfied with the responses provided in the questionnaire, click **Reject Questionnaire**.
The respondent receives an email and is asked to resubmit the questionnaire.

b. If you're satisfied with the responses provided by the application owner, then perform the inherent assessment by clicking **Perform Inherent Assessment**.
The risk assessment instance link is created.

To understand the risk assessment process and how to respond to questions, refer to Understanding the risk assessment instance.

4. Click the risk assessment instance link that is generated.
5. Respond to the questions or manual factors.
6. Right-click and save the form.
7. Click **Request Approval**.

Result
The approver selected in the Risk Identification Configuration form can review the inherent assessment. The state on the Risk Identification form is moved to the Risk Mapping state.

What to do next
Associate risks, citations, policies, and controls with a risk identification record.

Associate risks, citations, policies, and controls with a risk identification record

After the inherent assessment is completed, you can associate risks, citations, policies, and controls with the risk identification record. You can identify what methods to use to mitigate the risks.

Before you begin
Role required: sn_risk.manager and sn_compliance.manager

About this task
Risks, citations, and policies can be associated manually or by using the recommendation engine. The recommendation engine provides automatic suggestions for risk, citations, and policies. The choice to enable the recommendation engine is made in the risk identification configuration record. The choice is available only for the business application table. For the recommendations to be enabled, the risks statements, citations, and policies must have information objects.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Risk Identification** > **All**.
2. Open the record for which you want to associate risks, citations, and policies.
This is the record for which you performed the inherent assessments.
3. Click **Associate Risks**.
The Information Objects Mapping related list and the Risks related list appear. At this stage, you can either manually add risks or allow the recommendation engine to recommend risks.
4. To add risks manually, click **Add from library**.
5. To use the recommendation engine, do the following:
   a. Click **Recommend Risks** to use the recommendation engine.
   b. Select the appropriate risk statement and click **Add Risks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To add citations and policies, click **Associate Citations and Policies**.
   The Citations related list and Policies related list appear.
7. Add the required citations and policies either manually from the library or by using the recommended policies and citations.
8. To associate controls, click **Associate Controls**.
9. Add the required controls either manually from the library or by clicking **Recommended Controls**.
   The controls are created based on the control objectives.
10. To move a control to the Attest state, select the control and click **Initiate Attestation**.
11. Click **Monitor** to move the record to Monitor state.

Related topics

Recommendation engine for risk and compliance mapping

Recommendation engine for risk and compliance mapping

A recommendation engine is a system that suggests products, services, and information to users based on data analysis. A recommendation engine boosts revenues and other essential metrics.

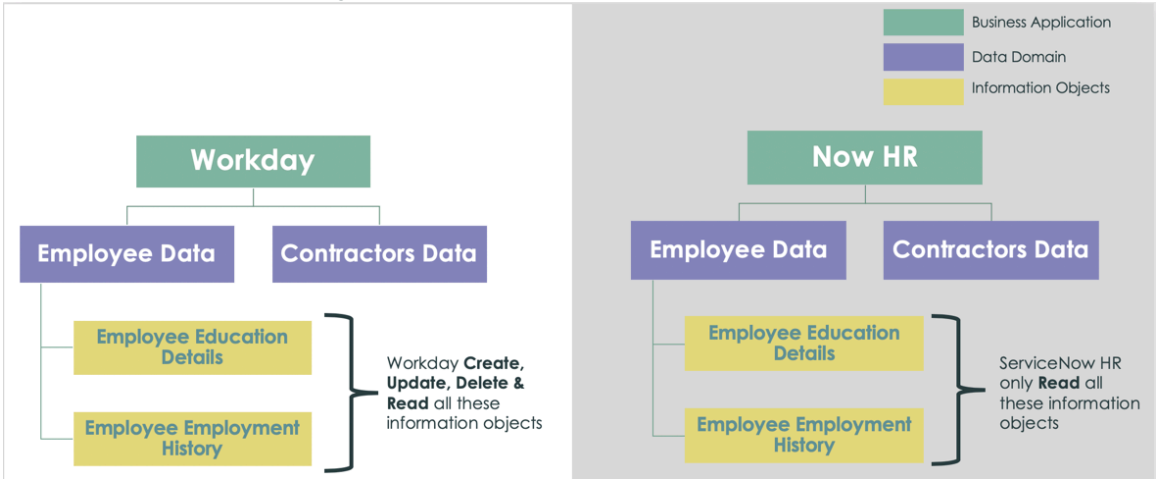
Recommendations derive from various factors, such as the history of the user and the behavior of similar users. An example of a recommendation engine is a video-sharing website. Based on your viewing history and preferences, the website recommends videos. Some recommendation engines are rule-based. Risk and compliance mapping in GRC uses a rule-based recommendation engine.

When using the recommendation engine, the risk manager has to map the information objects with their risk statements, citations, and policies. The key features of the recommendation engine are the following:

- Uses the concept of information objects to recommend the risks and compliances.
- Matches the business applications with the risk and compliance libraries by comparing the information objects of the libraries.
- Allows IT risk managers to define and map risk and compliance libraries based on the information that is contained within the application.
- Reduces the time spent on mapping the risk and compliance libraries.
- Improves the overall time it takes to scope the right applications and assets that must be audited for a particular type of audit.

Information objects

Information objects are a part of the information portfolio management capability in the Application Portfolio Management application.



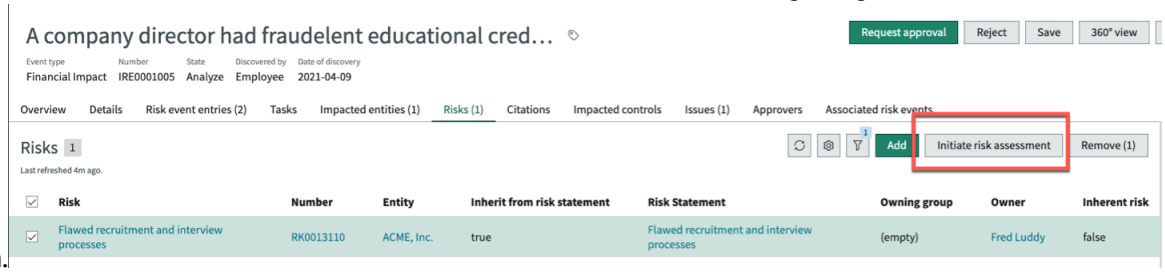
An information object is a configuration item that displays information in an organized form. The purpose of the information object is to logically describe the type of data that is exchanged between the application and the database. After information objects are created, they are mapped to business applications. For a given business application, the information objects determine if information can be created, updated, deleted, or read in that business application. This ability allows application owners to efficiently manage information. From an information security management perspective, this ability enables the risk and compliance function to define the right level of controls that must be applied.

The following figure shows an example of information objects. There are two applications: Workday and Now HR. Both applications store employee information. Employee information is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

an information object. The Now HR application can only read employee information, while the Workday application has more permissions. The risks and controls that apply to the applications are similar. However, Workday not only reads, but also creates, updates, and deletes the employee information. This means that the risks associated with Workday are higher, and so the controls applied to Workday are more stringent.

Example of information objects



Integration of advanced risk assessment with other applications

As an administrator, you can embed risk assessments within other workflows and define rules for when risk assessments must be initiated. The key benefit of embedding risk assessments is the digitization of the workflow so that assessments are initiated automatically without manual effort.

Prior to the San Diego release, you could perform risk assessments in a cyclic manner. This means that earlier risk assessments were performed only few times in a year and thus your risk posture reporting might not be accurate. To address this issue, you can now perform event-driven risk assessments. Event-driven risk assessments mean that when an event occurs, you can perform a risk assessment. Performing event-driven risk assessments help you to get a quick view of the actual risk posture and take the necessary corrective actions. You can integrate advanced risk assessment with any application and perform risk-based assessments in your workspaces. By default, ServiceNow® provides the integration of advanced risk assessment with risk events in the Risk Workspace.

To integrate risk assessment in an application in your workspace, you must perform the configuration steps given in the Risk assessment integration in workspace [KB0999135] article in the Now Support Knowledge Base. After you perform the configuration steps, you can see the **Initiate risk assessment** button on the user interface. The following image shows the new button.

Although you can integrate the Initiate risk assessment feature on any application in your workspace, this article uses risk events as an example. When you analyze a risk event and identify the relevant risks, you can easily initiate risk assessments for those risks by integrating the advanced risk assessment workflow in your risk events. This integration enables you to perform risk assessments without going through the entire process of creating risk assessment scopes. Prior to the San Diego release, for a risk assessor to perform a risk assessment, the risk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

user was required to create a risk assessment scope defining the entity, the assessor, and the approver.

When you initiate an assessment for a risk that is created for a risk event, although the risk assessment methodology (RAM) is set to the primary RAM of the entity class, you can select a different relevant risk assessment methodology. Only those risk assessment methodologies that are associated with the entity class of the selected risk are available for selection. You can then specify the assessor and approver for the risk assessment. Only users with the sn_risk_advanced.ara_assessor role can be the assessors and users with the sn_risk_advanced.ara_approver role can be the approvers. For more information on these roles, see Roles for performing advanced risk assessment. Earlier, the approvers were defined when the risk administrators created the risk assessment scopes. However, when you initiate a risk assessment from an application, you can specify the approvers at the time creating the assessment. You cannot change the approvers once you have specified them. If the approver is set as **Same as assessor's manager**, then the approver is automatically set depending on the assessor. You can also define the number of days after which the assessment will be considered overdue.

Even when you initiate a risk assessment from an application using the API, you can add those risks to the risk assessment scope at any time. After the risk is added to the risk assessment scope, the frequency of the assessment is based on the frequency defined in the risk assessment scope.

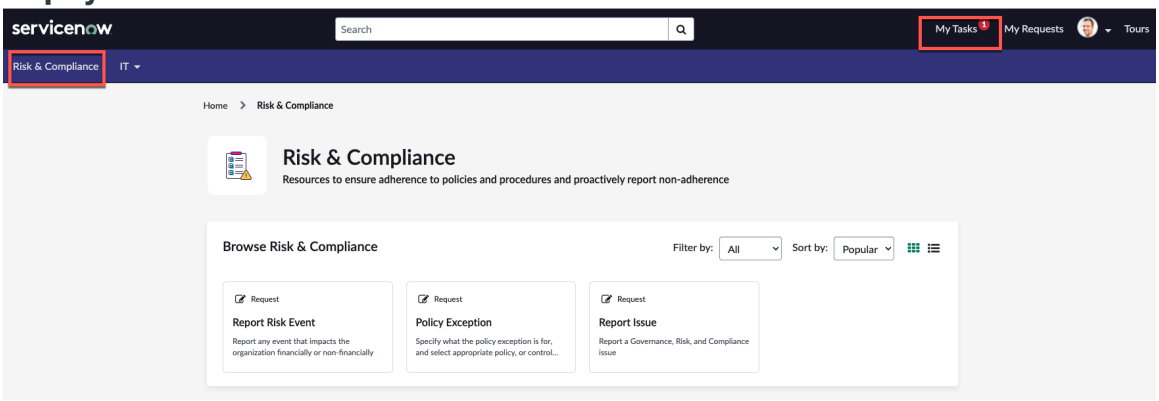
There could be some scenarios when you maybe unable to initiate a risk assessment from an application. Those scenarios are listed as follows.

- If you select multiple risks and try to initiate the assessments at once. The reason for this is that different risks can have different entities and can have different risk assessment methodologies.
- If an in-progress risk assessment exists.
- If a risk assessment methodology is not defined for the entity for which the risk exists.

Integration of Employee Center and GRC

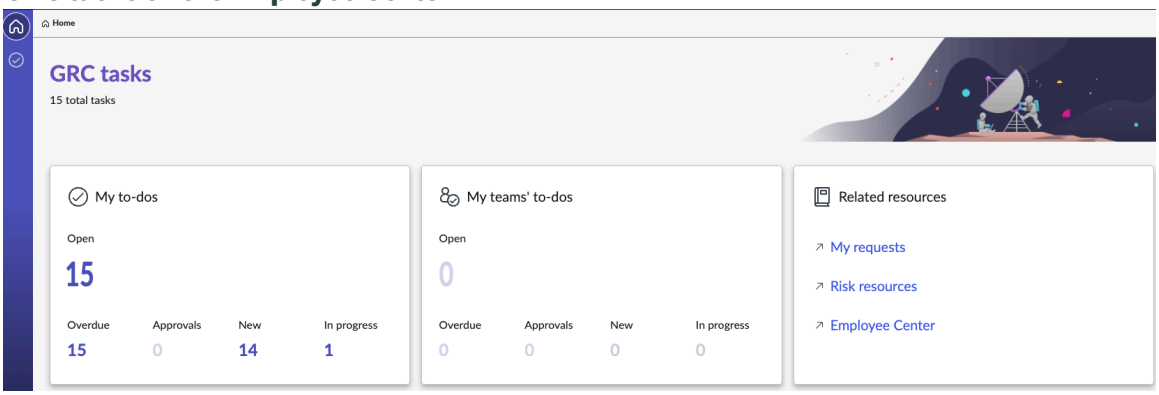
The integration of GRC tasks with the Employee Center makes it easier for employees to complete the GRC tasks easily and effectively. This integration allows them to report risk events or request policy exceptions and makes GRC more useful in the organization.

The Employee Center portal is a unified portal that helps connect systems across the enterprise to one destination site that provides a simple and centralized experience for employees with easy to configure options. To learn more about the Employee Center, refer to Exploring Employee Center.



If you integrate GRC with the Employee Center, you can provide all employees an interface to perform the following tasks:

- Quickly report risk events.
- Report an issue.
- Request a policy exception.
- Use **My tasks** to get a consolidated view of all your tasks and perform them immediately.
- Respond to a risk identification questionnaire.
- Complete other GRC tasks such as control attestation questionnaire, classic risk assessments and so on.



The following images show you the user interface of the Employee Center.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Employee center with GRC

GRC tasks on the Employee Center

Manage continuous monitoring for risks between Risk Management and Vulnerability Response

Continuous monitoring for risks is a feature integration between the GRC: Risk Management and the Security Operations Vulnerability Response products, which uses indicators to quickly identify high impact vulnerabilities based on business impact.

Risk administrators, managers, or users can monitor critical vulnerabilities by viewing the direct effect on risk posture. A new **Business Services** entity type and indicator templates automatically identify impacted services that are critical, represent a loss of availability, and are greater than two weeks old. These high-risk vulnerabilities can result in a breach and possible loss of intellectual property.

Note:
The Entity type called 'Critical Business Services' is set to inactive by default and must be turned on.

Continuous monitoring for risk workflow

1. The system admin activates the Risk Management and Vulnerability Response plugins.
2. The risk administrator creates risk statements and indicator templates.
3. The risk manager associates the **Critical Business Services** entity type to the risk statements and indicator templates.
4. The Vulnerability Response application ingests vulnerability data from scanners related to impacted services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. As risks are identified, issues are generated and assigned to the appropriate business service owners.
6. Dashboards provide an up-to-date view for business stakeholders as risks are identified and remediated.

Integrating Microsoft 365 with Management Reporting of Risk

The Management Reporting of Risk (sn_grc_mgmt_report) integration provides reporting capabilities to Risk reporting managers to report ServiceNow Risk Management system data, list reports, charts, pivot, and multi-pivot reports using Microsoft Word.

The risk managers prepare reports for board members or senior management periodically to provide updates on the risk profile based on the information available in ServiceNow.

This integration enables the risk reporting managers to view the inventory of the ServiceNow Risk Management data links on the report and refresh the inserted data to be in synchronization with the latest ServiceNow Risk Management data. An audit trail is also established between the data imported and the ServiceNow instance. The audit trail provides any auditor the ability to select the links in the document and access the source of the data in the ServiceNow instance.

Note:
This integration is compatible with the desktop version 16.71 (23031200) and the web version 16.0.16412.41005 of Microsoft Word. However, the charts aren't interactive in the web version. This means that you can't modify the chart colors, formats, and so on. The supported Windows Office version is 2303 (Build 16130.20394).

You can also change the format, style, and colors of the imported data. The following chart styles are supported:

Supported chart styles

Chart type	Styles supported
Pie chart	• Chart color • Display data label • Chart title • Show legend

Bar chart	• Chart color
	• Display data label
	• Chart title
	• X-Axis and Y-Axis
	  ○ Title

Workflow of Management Reporting of Risk

The Management Reporting of Risk integration utilizes a workflow that requires participation from multiple user roles such as system administrators, Risk administrators, and Risk managers. By defining a clear workflow, individuals and teams can better understand their roles and responsibilities and generate the necessary reports.

The following figure displays the complete workflow of using the Management Reporting of Risk integration to generate reports in a Microsoft Word document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process flow for Management Reporting of Risk integration

To generate Microsoft Word reports:

1. Download the ServiceNow Reporting add-in: As a system administrator, download and install the Risk manifest file. A manifest file contains information about the files included in a software application or package. It's used by the software installer to ensure that all the necessary files are installed in the correct locations. At this stage, you must also work with your Microsoft 365 administrator to upload the manifest file to the Microsoft Word application. The Microsoft 365 administrator has the necessary access rights.
2. As a Risk administrator, set up the Microsoft 365 reporting configuration records to specify which tables, reports, and charts from your ServiceNow® instance must be used to import data into your Microsoft Word. You can also specify the columns from a table from which you want to import data.
3. As a Risk administrator, you can configure additional reporting filters. These filters specify at a granular level what data must be imported to the disclosure report from a table.
4. As a Risk manager, go to your Microsoft Word document, authenticate yourself with the ServiceNow® credentials, and import the data from your instance to the document. You can alter the formatting of the data according to your preferences.

Install the ServiceNow Reporting add-in for risk reporting

Install the ServiceNow Reporting add-in to your Microsoft Word document. This add-in is required to import reports and data from your ServiceNow® instance to Microsoft Word documents to create risk reports.

Before you begin

Ensure that the following plugins are activated:

- sn_esg_msoff_intg
- sn_outlook_addin
- sn_grc_mgmt_report

Role required: sys_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In Manifests**.
2. From the Office Manifests list, select **ServiceNow Reporting**.
3. Select **Download Manifest**.
4. To enable the add-in, contact your Microsoft 365 account manager who can use the manifest file you downloaded in step 3.

What to do next

For detailed instructions on how to deploy the manifest file, see the Deploy add-ins in the Microsoft 365 admin center [KB1307378] article in the Now Support knowledge base.

To configure the HTTP response headers for the add-in for Microsoft Word in the browser, see the Response header resolution [KB1434453] article in the Now Support knowledge base.

Set up Microsoft 365 reporting configuration in risk

Set up the Microsoft 365 reporting configuration records to specify the data points and reports that you want to import in to a Microsoft Word document for risk reporting purposes.

Before you begin

Role required: sn_risk_advanced.ara_admin

About this task

Data is imported into a Microsoft Word document for risk reporting purposes. You must specify which tables and reports from your ServiceNow instance must be used to import data into the Microsoft Word. You can also specify the columns from a table from which you want to import data. Only those reports that are either created by or shared with the Risk administrator are available for selection.

Procedure

1. Navigate to **All** > **Management Reporting of Risk** > **Microsoft 365 Reporting Integration** > **Reporting Configurations**.
2. From the Microsoft 365 reporting configurations list, select **New**.
3. On the Microsoft 365 reporting configuration form, fill in the fields.

Microsoft 365 reporting configuration form

Field	Description
Business domain	Domain from where the configuration is created. This field is automatically set to **Risk**.
Reporting item	Name of the configuration. For example, if you want to get data about your Risk statement in your word document, you can provide a name such as `Risk statement`.
Source type	Source from which you want to fetch the data. The choices are as follows: ○ **Table**: Select this option when you want to import data from a table. ○ **Report**: Select this option if you want to import data from a predefined report or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	chart. For more information on how to create a report, see Create a report with Analytics Q&A. **Note:** Only list reports, pivot reports, multi-level pivot reports, horizontal and vertical bar charts, and pie charts are available for selection. Stacked bar charts and grouped bar charts aren't supported.
Source table	Source table to fetch data from. This field only appears when **Table** is selected from the **Source type** field.
Filter	Filter conditions to filter the records. This field only appears when **Table** is selected from the **Source type** field.
Columns	Column from the table whose values are to be inserted. This field only appears when **Table** is selected from the **Source type** field.
Source report	Available report to be inserted in the disclosure report. This field only appears when **Report** is selected from the **Source type** field.
Active	Option to indicate if the record is active. Only active records are available for selection in the document.

4. Select **Submit**.

What to do next

Add additional reporting configuration filters to the reporting configuration. These filters help to fetch the data into your Microsoft Word disclosure report. For more information, see Add additional reporting configuration filters for a Microsoft 365 configuration record in risk.

Configure a business domain role in Management Reporting of Risk

Configure the business domain roles so that users of a particular domain can select the domain for which they want to import the data. Only those users who are added during the configuration are able to view the domain on the Microsoft Word document.

Before you begin

Role required: sn_risk_advanced.ara_admin

Procedure

1. Navigate to **All** > **Management Reporting of Risk** > **Microsoft 365 Reporting Integration** > **Business Domains**.
2. Select the default Risk domain name record.
3. Select the **Roles** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add or remove the roles as required.
5. Select **Update**.

Add additional reporting configuration filters for a Microsoft 365 configuration record in risk

Add additional reporting filters to specify at a granular level what data must be imported to the report from a table using the Management Reporting of Risk application.

Before you begin

Role required: sn_risk_advanced.ara_admin

About this task

When you specify that you want to import data from a particular table, you must also specify from which exact record of the table you need the data. For example, assume that you specify that you want to fetch data from the sn_risk_risk table. This table may have multiple records. Therefore, you must specify the exact record from which you want to fetch the data. You can specify as many filters as you require.

Procedure

1. Navigate to **All** > **Management Reporting of Risk** > **Microsoft 365 Reporting Integration** > **Reporting Configurations**.
2. Open the record for which you want to add the additional reporting configuration filters.
3. On the Microsoft 365 reporting configuration filters related list, select **New**.
4. On the form, fill in the fields.

Microsoft 365 reporting configurations filter form

Field	Description
Reporting configuration	Name of the configuration to which you're adding additional filters. This field is automatically set.
Field name	Name of the field from which data must be fetched. For example, for the risks table, you can specify the **Name** field. If you select a name, then all the names of the risks are available for selection during data import.
Order	Order of the field as it would appear on the add-in pane of the document.
Aggregate on time dimension	Option to aggregate the report configuration source table data based on the chosen time dimension. For more information about this option, see the example in the procedure. This field only appears when the **Field name** has **Time dimension**.
Time dimension	Time dimension for which data must be aggregated. The list of time dimensions are: ○ Year ○ Semi-annual ○ Quarter ○ Month

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Week ○ Date Select the dimensions according to your requirement and move them from the Available list to the Selected list. **Note:** This field only appears when the **Aggregate on time dimension** option is selected.

5. Select **Submit**.

Result
The configuration data is ready to be imported in to your add-in.

Add the ServiceNow Reporting add-in into Microsoft Word

Before you can import data into your Microsoft Word document to create your disclosure reports, you must add the ServiceNow Reporting add-in to your Microsoft Word.

Before you begin
Role required: Any user of the Microsoft Word document.

Procedure
1. Open the Microsoft Word application.
2. On the menu bar, select **Home**.
3. Select **Add-ins**.
4. Select **ADMIN MANAGED**.
5. Select the **ServiceNow Reporting** add-in.
6. Select **Add**.

Result
The Microsoft 365 for ServiceNow Reporting integration is activated and the following buttons are available on the Microsoft Word document in the **ServiceNow Reporting** add-in.

- **Insert Link**
- **Manage Links**
- **Create claim**

Import risk data in to a Microsoft Word

Import and insert data such as Risk data points and reports into a Microsoft Word report document from a ServiceNow instance. You can only import and insert the data that is configured in your reporting configurations.

Before you begin
Role required: sn_risk_advanced.ara_reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the Microsoft Word document in which you want to insert data.
2. On the ribbon, select **Insert Link**.
   On the right side pane, the ServiceNow login screen appears.
3. To log in to your ServiceNow instance, select **Log in**.
   a. A message is displayed that states that ServiceNow Reporting will display in a new window, select **Allow**.
   b. On the ServiceNow login screen, provide your credentials.
   c. Select **Allow**.
4. To insert a Risk data point from a table into the document, move the cursor at the point where you want to insert data.
   a. Select the **Data** tab on the right side pane.
   b. The **Business domain** field is set to **Risk**.
   c. In the **Reporting Item** field, select the reporting configuration you want to insert.
      The additional filters dynamically appear based on the configuration record selected.
   d. In the **Name** field, select the name of the configuration record.
   e. In the **Value to insert** field, select the column from which you want to insert data.
   f. Select **Add**.
5. To insert a table into the report, move the cursor at the point where you want to insert data.
   a. Select the **Table** tab on the right side pane.
   b. The **Business domain** field is set to **Risk**.
   c. In the **Reporting item** field, select the reporting configuration that you want to insert.
   d. Select **Add**.
   The data is inserted in to the report document. The inserted text takes the formatting of the document. You can modify the formatting as required.
6. To insert a chart, move the cursor at the point where you want to insert the chart.
   a. Select the **Chart** tab on the right side pane.
   b. The **Business domain** field is set to **Risk**.
   c. In the **Reporting item** field, select the reporting configuration that you want to insert.
   d. Select **Add**.
   The chart is inserted in to the report document. The inserted chart can be modified according to your preferences. For example, you can change the colors, the type of chart and so on.
7. To view the details of any record that is inserted in the document, select the content control, and then select **Open link**.
   It takes you to the ServiceNow instance, where you can access the data.
8. To view the list of all ServiceNow links that you've inserted in the report and obtain the latest data on the document, select **Manage Links**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the check boxes for the links that you want to refresh.

b. Select the refresh icon.
The data is refreshed while displaying the time of refresh and retaining the formatting of the document.

9. To identify and highlight which content control is selected on the report, select the three vertical dots or the more actions icon.
The content control is highlighted in the right pane.

Using Risk Management

You can use the features and capabilities of the Risk Management application perform various activities such as creating issues, reporting risk events, performing risk assessments and so on.

Mobile experience for GRC Risk Management

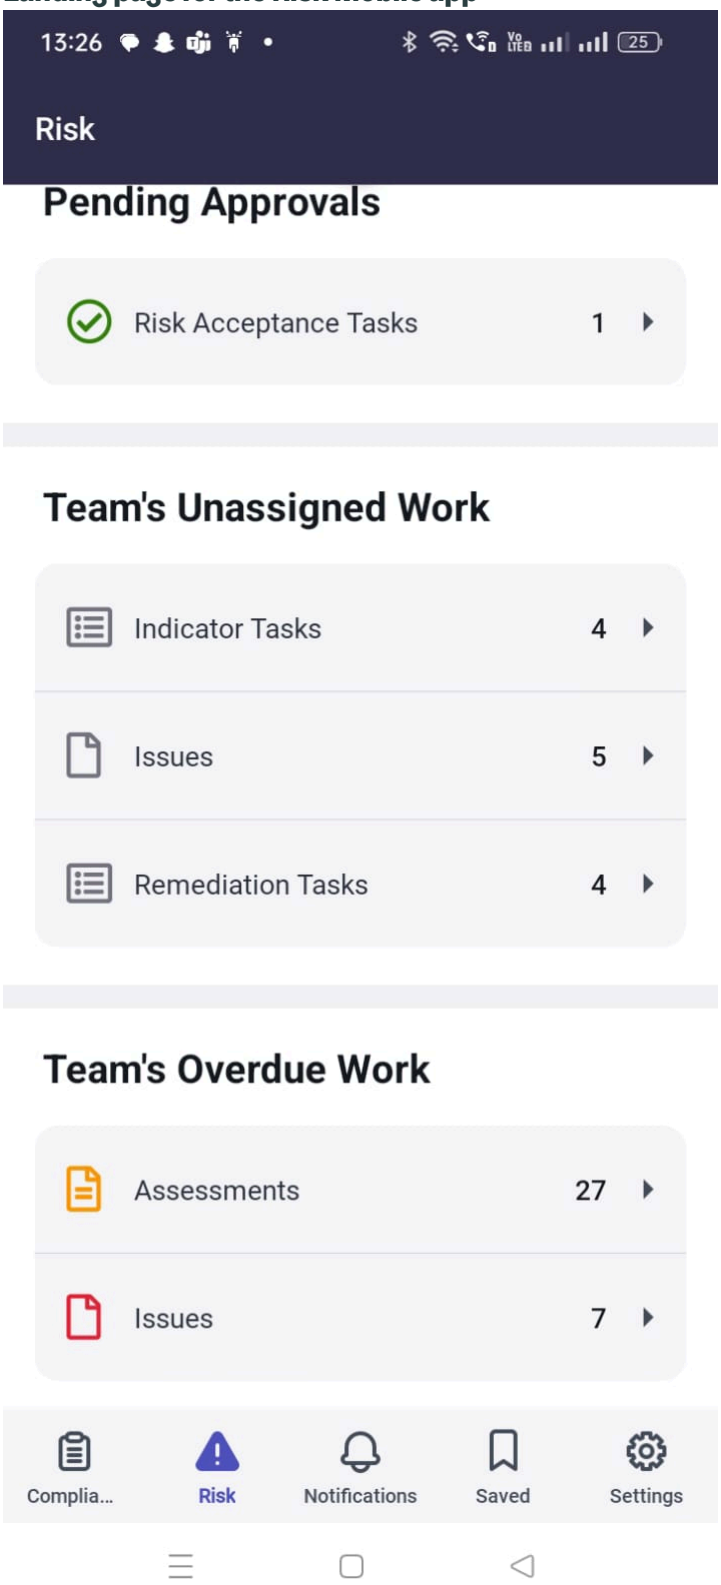
As a risk manager, use your Android or iOS mobile device to manage your work.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Overview of using mobile device to manage risks

As a user with the ServiceNow AI Platform® risk manager (sn_risk.manager) role, manage your tasks, assignments, requests, approvals, and other follow-up actions all from your mobile device. Receive timely notifications for current alerts, as well as risk and compliance status for all your critical assets, vendors, and impacted essential business services.



With the GRC Mobile application, you can perform the following Risk Management activities without being tied to the desktop:

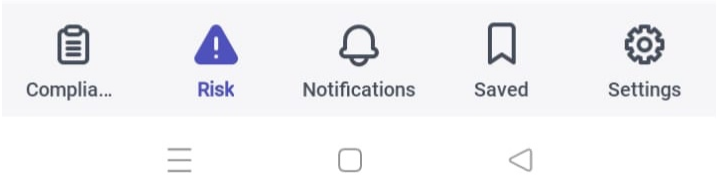
- Approve or reject pending tasks that are assigned to you with the Risk Acceptance Tasks applet.
- Assign unassigned tasks to your team with the Indicator Tasks, Issues, and Remediation Tasks applets.
- Manage and reassign your team's overdue tasks with the Assessments and overdue Issues applets.

The following figure illustrates how you log in to your ServiceNow AI Platform instance from your mobile device and the landing screen that is displayed after you log in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Landing page for the Risk Mobile app

For step-by-step instructions about how to set up your ServiceNow AI Platform instance and install the GRC Mobile application, see Set up checklist for the GRC Mobile application. For instructions about how to log in, see Log in to the GRC Mobile application.



Applications

Applications are the ServiceNow® software components such as Policy and Compliance Management, Risk Management, and Audit Management that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

provide specific features and functionalities within your ServiceNow AI Platform instance. After you install these core applications and the GRC Mobile app on your ServiceNow AI Platform instance, these applications are displayed as icons on the bottom of your Android or iOS mobile device after you log in.

Icons on the bottom of the device screen

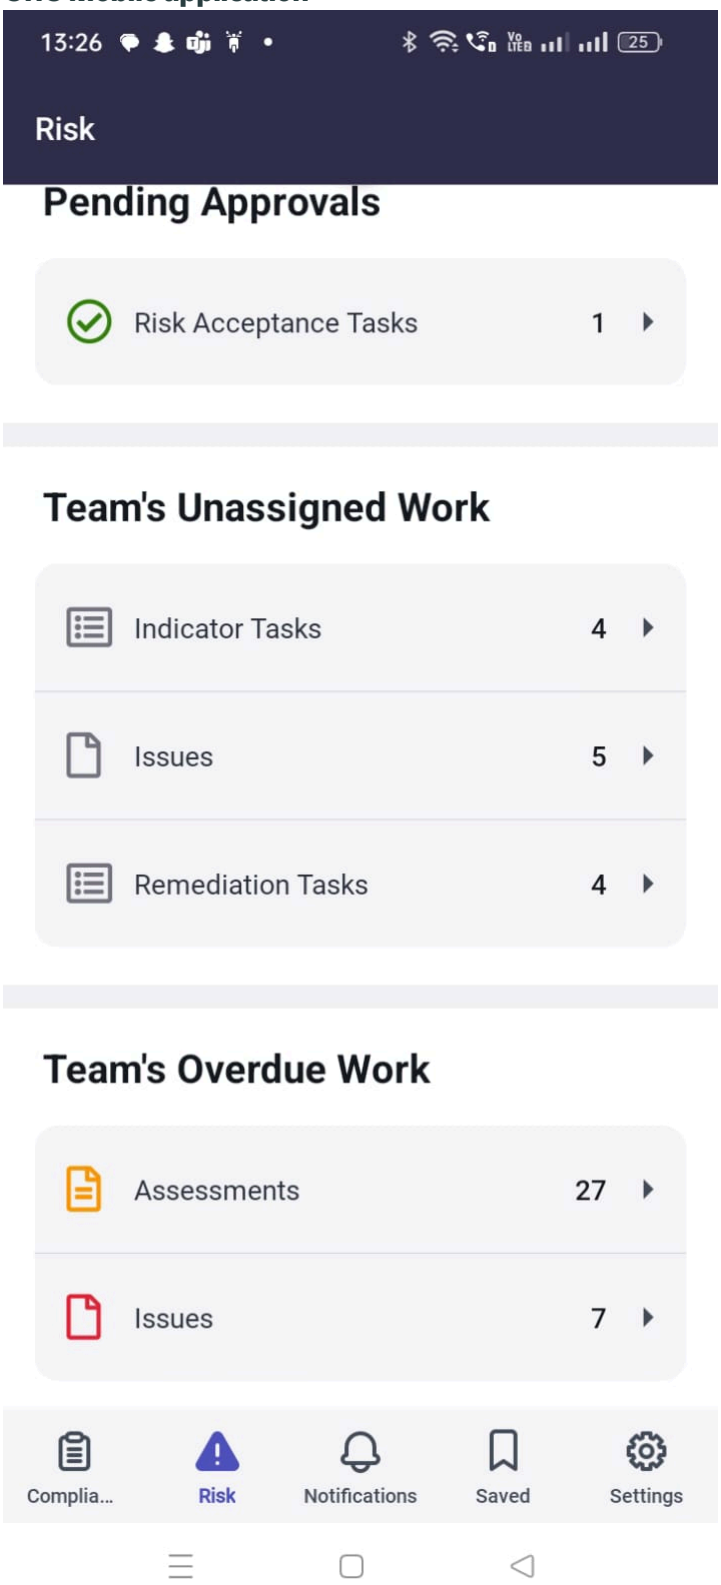
Folders

Each ServiceNow® mobile application contains folders that separate the applets by categories. In the preceding image, Pending Approvals, Team's Unassigned Work, and Team's Overdue Work are the folders of the Risk Mobile app.

Applets

Applets are the different options within the application. In the preceding image, the icons under the Pending Approvals, Team's Unassigned Work, and Team's Overdue Work sections are the available applets for the Risk Mobile app.

Log in to the GRC Mobile application



Open the GRC Mobile application and add a ServiceNow AI Platform® instance with Risk Management to your mobile device.

Before you begin

Verify that you have completed the setup steps described in Set up checklist for the GRC Mobile application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Mobile application

Role required: GRC Risk manager (sn_risk.manager)

About this task

Time to complete this task: 5-7 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On your mobile device, tap the **ServiceNow Agent** app.

   If you are not already logged in to a ServiceNow AI Platform instance, the Instances screen is displayed.

2. If the ServiceNow AI Platform instance with the Risk Management core application is not already added to your mobile device, follow these steps to add it.

   a. On the Instances screen that is displayed, tap the plus icon ().
   A screen is displayed that prompts you to enter and save an address of a ServiceNow AI Platform instance.

   b. Fill in the fields.

Field	Description
Enter the instance address or scan a QR code.	Choose one to continue: ▪ Before the `.service-now.com`, enter the name of your ServiceNow AI Platform instance, for example, `grcmobile`. ▪ Enter an address in this field. This address is the URL of your ServiceNow AI Platform instance that you want to view on your mobile device, for example, `https://grcprkny.service-now.com`. ▪ Scan a QR code. For more information about the mobile app, see Log in to an instance with a mobile app
(Optional) Enter nickname	Enter a nickname for this instance. If you have multiple instances added to the device, nicknames can help you quickly locate a ServiceNow AI Platform instance.

   c. Tap **Save and Login**.

3. On the ServiceNow login screen that is displayed, enter the User name and Password for the ServiceNow AI Platform instance that you want to add and tap **Login**.
   The Risk landing screen is displayed. You have successfully logged in to the GRC Mobile application.

4. After you log in, verify notifications are enabled in the GRC Mobile application.

   a. On the landing screen on the bottom, tap **More**.

   b. On the More screen, tap **Notification**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the Notifications screen, tap **Enable Notifications** if not enabled.
Notifications from the ServiceNow AI Platform are displayed on the Notifications screen in the GRC Mobile application.

5. After you login to an instance on your mobile device, it is the default ServiceNow AI Platform instance on the device.
If you want to view another ServiceNow AI Platform instance on the device, you must log out of the default instance. To log out:

a. Tap the **More**.
The More screen is displayed.

b. Tap **Settings**.

c. On the screen that is displayed, tap **Logout**.
The Instances screen is displayed with any ServiceNow AI Platform instances you have added to the mobile device.

d. **Optional:** Tap another instance to log in to it, or, alternatively, follow the preceding steps to add another instance.

Trouble?

If the instances screen for the GRC Mobile application is not displayed after you tap the **ServiceNow Agent** app on your device, verify that the **ServiceNow Agent** is permitted as a trusted app on your device. To permit access as a trusted app, navigate to the settings or general device management area on your mobile device and tap the option (**Trust app**, etc.) to permit access.

If an error message is displayed after you enter your credentials in the log in screen, verify that your User name and password for the ServiceNow AI Platform instance is correct.

If you have problems viewing the landing screen, verify your network connection.

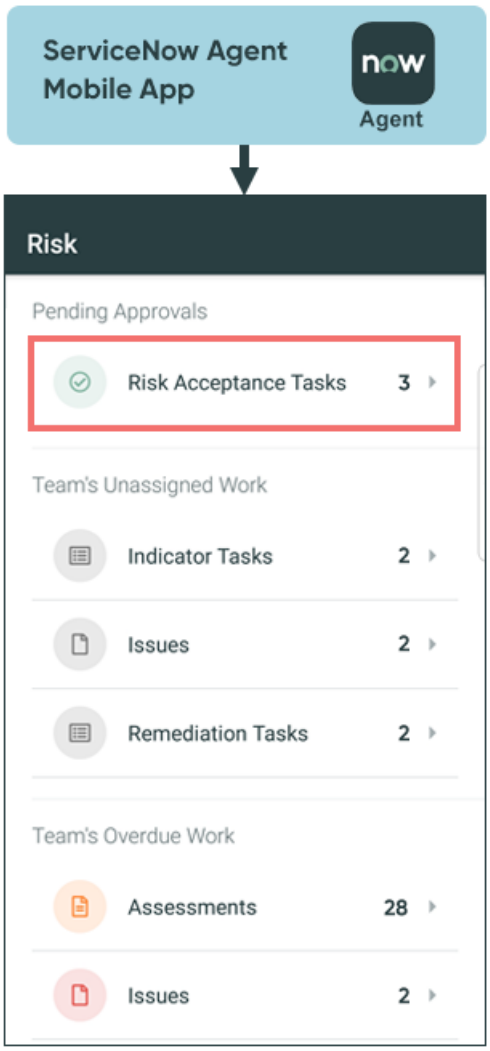
If you cannot view the Instances screen after you tap the **ServiceNow Agent** app, try uninstalling it from your device. Verify you have the most current version of the app from the Apple iOS App Store or the Google Play Store and try reinstalling it.

What to do next
Select one of the following topics for more information about each applet.

Process pending Risk acceptance tasks with the GRC Mobile application

Process pending approval requests for Risk Management acceptance tasks that are submitted to you.

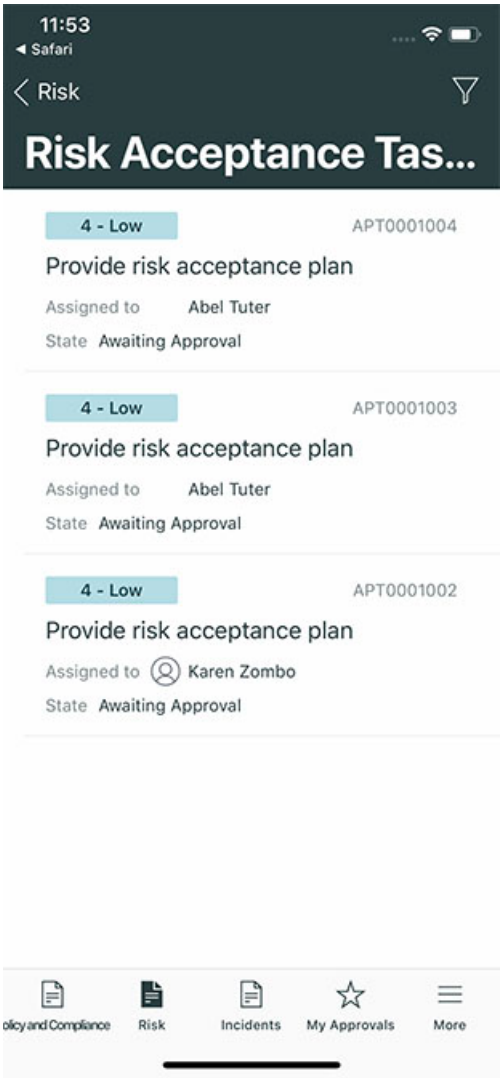
Before you begin
Role required: GRC risk manager (sn_risk.manager)



About this task
Approve or reject a pending request from the list of records. Alternatively, view the details of the record or add a work note prior to processing the request. Time to complete this task: 5-10 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

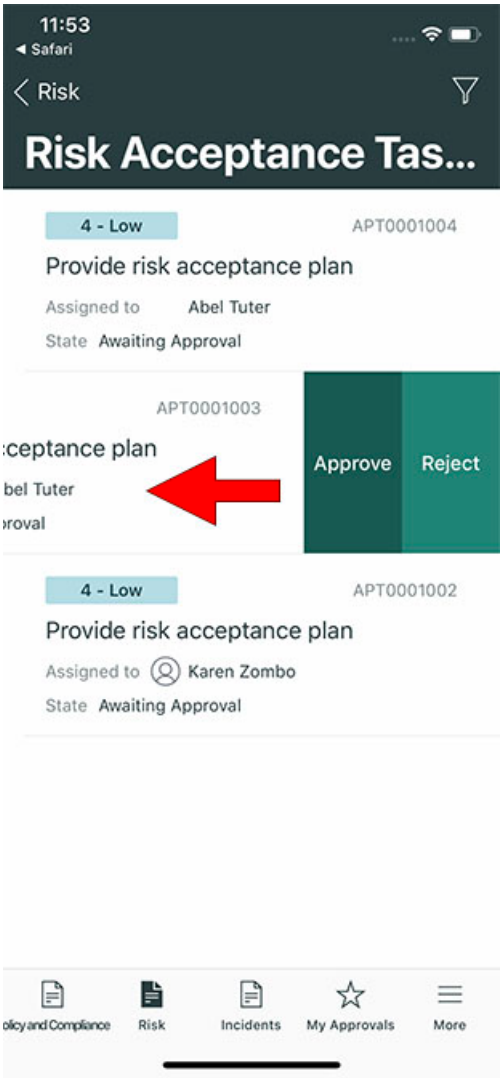


1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Risk landing screen displayed, tap **Risk Acceptance Tasks**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

The Risk Acceptance Tasks screen is displayed with a list of records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

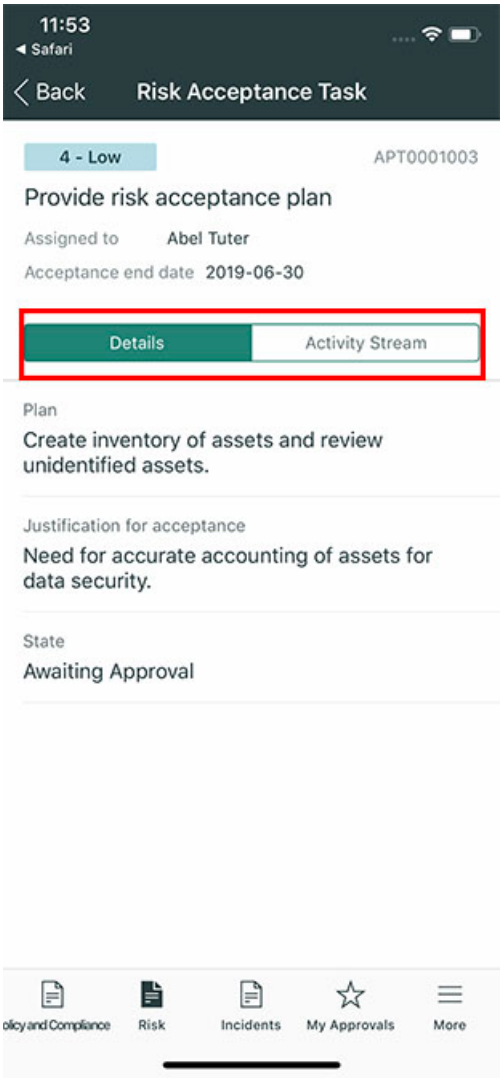


3. **Optional:** If you want to reduce the number of records that are displayed on the screen, see Filter records with the GRC Mobile application to search for records that match specific search criteria.

   (Optional) Filtering records on screens in the mobile app works like filtering with a condition builder on the ServiceNow AI Platform. Setting filters can reduce the number of records that are displayed on screens.

4. To approve or reject a request directly from the list, with the Risk Acceptance Tasks screen displayed, swipe left on a record to open the menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. On the menu that is displayed, choose one to continue.

6. Alternatively, with the Risk Acceptance Tasks screen displayed, follow these steps to view more details or add a work note to a record on the list.
7. With the Risk Acceptance Task screen displayed, tap the record to open it.
8. To view more details, on the record that is displayed, tap **Approval for** to view the Risk Acceptance Task.
9. Tap the task record that is displayed to open it.

   On the record that is displayed, choose one from the following table to continue.

© 2026 ServiceNow, Inc. All rights reserved.

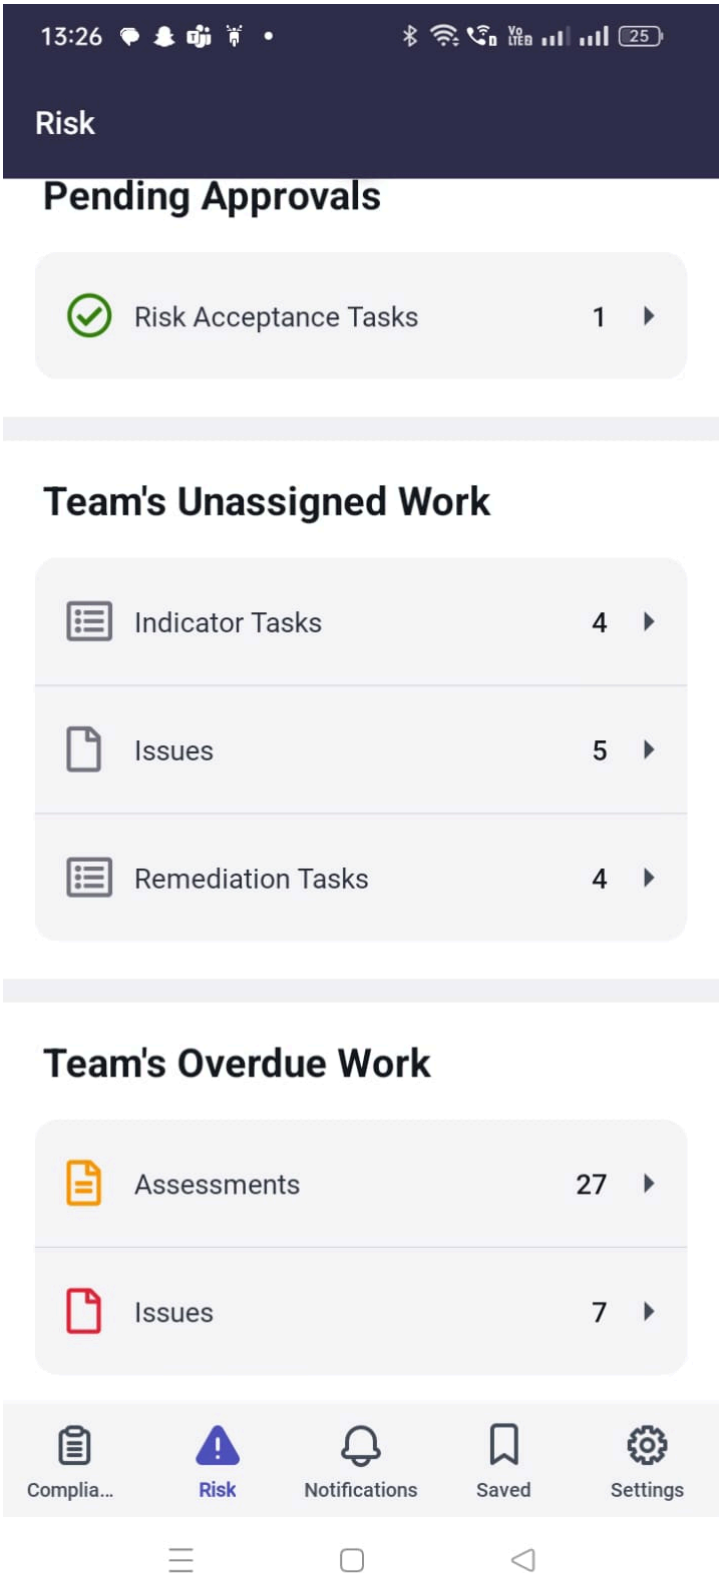
Assign Risk Management indicator tasks with the GRC Mobile application

Assign unassigned indicator tasks to a member of your assignment group. An indicator task is related to a Risk record that is assigned to your compliance group.

Before you begin

Role required: GRC Risk manager (sn_risk.manager)

About this task



Assign an Indicator Task from the list of records. Alternatively, view the details of the record or add a work note prior to assignment. Time to complete this task: 5-10 minutes.

Procedure

1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Risk landing screen displayed, under the `Team's Unassigned Work` section, tap **Indicator Tasks**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

Assign Risk Management issues with the GRC Mobile application

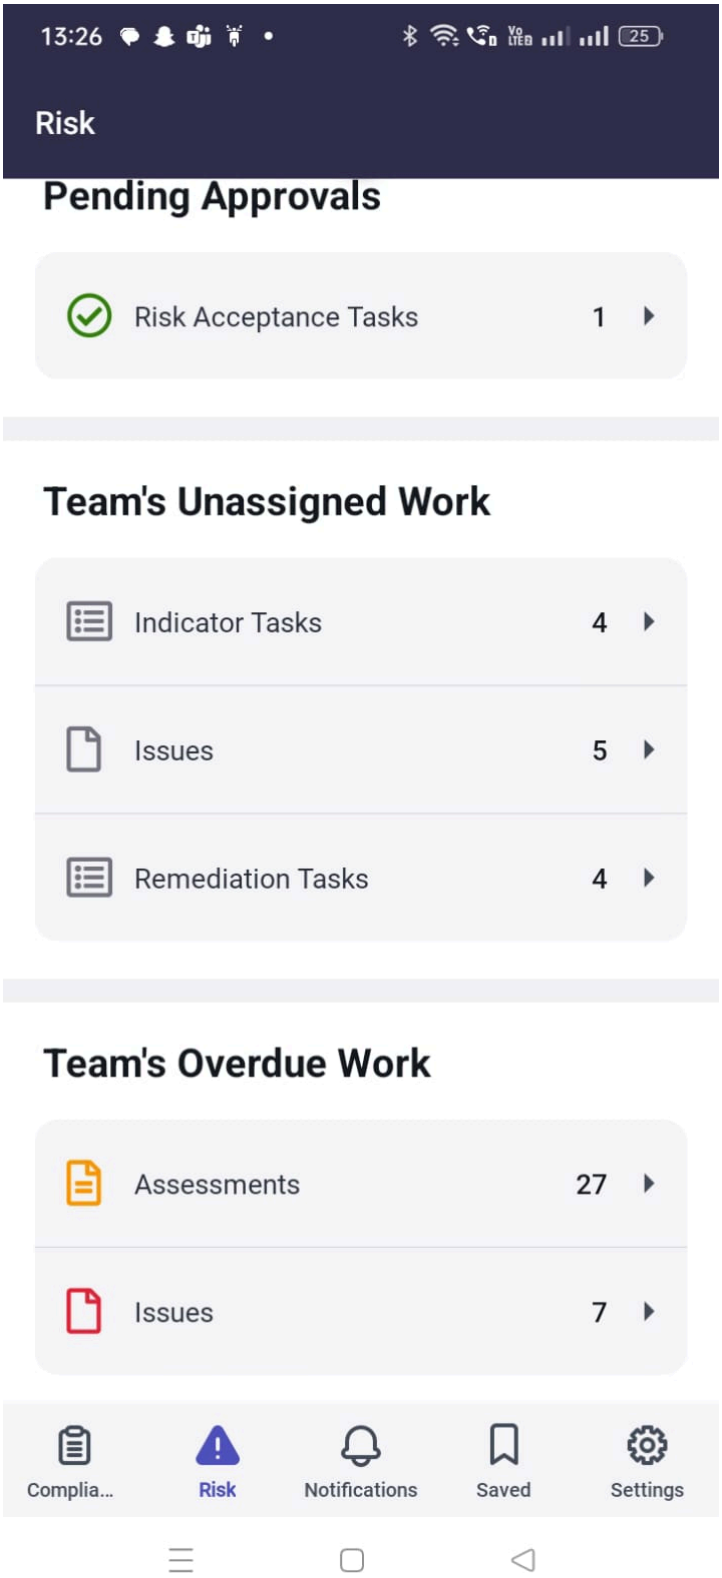
Assign unassigned issues to a member of your assignment group. Navigate through the record to view more details about the Risk Statement, the Risk record, and Remediation Tasks associated with an issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: GRC risk manager (sn_risk.manager)

About this task



Edit or assign an issue from the list of records. Alternatively, add or work note or view the details and related lists of the record prior to assignment. Time to complete this task: 5-10 minutes.

Procedure

1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Risk landing screen displayed, under the `Team's Unassigned Work` section, tap **Issues**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Time to complete this task: 5 minutes.

Procedure
1. To further refine your search results, or to enter additional filter criteria on any list of records that is displayed, tap the filter icon ().
2. With the Filters screen displayed, tap a field to expand it.
3. From the options that are displayed, tap the check box or tap an item for your filter.
   For many of the filters, you can select more than one option.
4. Tap the Back icon () or **DONE** to save your changes to a field.
   The criteria you chose are displayed on the Filters screen. The number of records that match your criteria is also displayed at the top of the screen. Tap **Clear** or **RESET** to remove any filters and restore the default setting.
5. **Optional:** Repeat steps 1 - 4 with the Filters screen displayed to continue setting your filter criteria.
6. Tap the intersection icon after you set all criteria to create AND conditions.).
   Alternatively, tap the union icon () to create OR conditions.
7. After you have added all the criteria you want, with the Filters screen displayed, tap **DONE**.
   On the screen, only the records that match your filter criteria are displayed.

What to do next
View the records that are displayed after your search for more details.

Use Risk Events

Report risk events and monitor their workflow to prevent losses in your organization.

Configure risk event integration

Configure risk event integration with other upstream ServiceNow applications. This integration enables all users in an organization to report and track the risk events.

Before you begin
Role required: sn_risk.admin and user_admin

About this task
When you configure the risk event integration with another upstream application, then users of that application can directly report risk events from the application. For example, if you configure risk event integration in the ServiceNow® IT Service Management (ITSM) application, all users of ITSM can report risk events from the ITSM application. By default, this configuration is provided for the IT Incidents application and the Security incidents application.

The two modes that enable the creation of a risk event are **Simple** and **Advanced**. The **Simple** mode enables you to define filter conditions on the application table so that users of the Incidents application can report a risk event. For example, you can define that a financial event with a high impact must be reported as a risk event. In contrast, the **Advanced** mode enables users with GRC developer role to write scripts.

Incident managers with the incident_manager role are able to see the **Report Risk Event** option in an incident, whereas Security Managers with the sn_si.manager role are able to see the **Report Risk Event** option in a security incident.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Risk Events** > **Administration** > **Integration Configuration**.
2. Click **New**.
3. On the form, fill in the fields.

Risk Event Integration Configuration form

Field	Description
Number	Configuration number. This field is automatically set.
Active	Option to enable the creation of a risk event from the application table.
Integration name	Short and unique title for the integration. For example, to report a risk event from an incident table, you can type `Incident-risk-event-integration`.
Application table	Application table that is used for reporting risk events. The table determines the upstream application that will be used for reporting risk events.
Source for name	How the name of risk events are set. The choices are as follows: ○ **Form field**: Select this option if you want the value from a specific selected field to be used as the risk event name. ○ **Default value**: Enter a custom value. The risk event is created with the name you enter here.
Source for description	How the description of risk events are set.
Source for entity	How the entity of risk events are set.
Source for date of discovery	How the date of discovery for risk events are set.
Name	Field in the application table that is used to set the name of risk events. This field appears only when **Form field** is selected from the **Source of name** field.
Default Name	Default name for risk events. This field appears only when **Default value** is selected from the **Source of name** field.
Description	Field in the application table that is used to set the description of risk events. This field appears only when **Form field** is selected from the **Source of description** field.
Default description	Default description for risk events. This field appears only when the **Default value** is selected from the **Source of description** field.
Entity	Field from the application table that refers to a GRC entity or to a record in a GRC entity. This field appears only when **Form field** is selected from the **Source of entity** field.
Default Entity	Default entity for risk events. Default entities are created from the table in the **Application table** field. This field appears only when **Default value** is selected from the **Source of entity** field.
Date of discovery	Field in the application table that is used to set the date of discovery of risk events. This field is visible only when **Form field** is selected from the **Source of date of discovery** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Default date of discovery	Default date of discovery of risk events.
Default event type	Default event type of risk events. For example, if the event is financial or non-financial.
Event subtype	Subtype of the risk event. For example, if the event is actual or potential.
Source for Non-Financial impact	How the non-financial impact of risk events is set.
Non-Financial impact	Field in the application table that is used to set the non-financial impact of risk events. This field appears only when **Form field** is selected from the **Source of non-financial field** field.
Default non-financial impact	Default severity of risk events. The choices are **Low**, **Medium**, or **High**.
Source for expected loss	How the expected loss of risks events is set.
Expected loss	Field in the application table that is used to set the expected loss of risk events. This field appears only when **Financial impact** is selected from the **Default event type** is field and only when **Form field** is selected from the **Source of expected loss** field.
Default expected loss	Default monetary value of the loss. This field appears only when the **Financial impact** is selected from the **Default event type** field and only when **Default value** is selected from the **Source of expected loss** field.
Display UI Action Based On	
Mode	Mode that is used to create the UI action. The choices are as follows: ○ **Simple**: Mode to set simple filter conditions. For example, if the impact of an incident is **High**, the **Report a Risk Event** UI action must be created. ○ **Advanced**: Mode to write a script to query tables, including the table from the **Application table** field.
Role condition	Roles that can report risk events from the upstream application.
Filter condition	Build the filters as per the requirement.
Script	Field to write a custom script to query any table. **Note:** The option to write a script is only available to users who also have the sn_grc.developer role. This field appears when the **Mode** field has **Advanced**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.
   Any other application table which extends the task table can configure this integration. For details, see the Risk Event Ingestion [KB0780985] article in the Now Support Knowledge Base. You must log in to view the article.

Result
The application that is configured to report risk events displays the **Create Risk Event** button.

Create a risk event response template

Automatically add approvers, issues, and owners to a risk event based on the conditions defined in the risk event response template.

Before you begin
Role required: sn_risk.manager and sn_risk.admin

Procedure
1. Navigate to **All** > **Risk Events** > **Administration** > **Response Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Risk Event Response Templates form

Field	Description
Number	Template number. This number is automatically set.
Entity	Entity that the template is created for.
Category	Category that the risk event applies to if there is an occurrence. You can edit the category to apply one of the following options. ○ **Personal**: For example, any physical harm caused to an employee. ○ **Legal**: For example, an employee conducts a business that is a conflict of interest. ○ **Information Security**: For example, a theft, burglary, or system crash. ○ **Human Resources**: For example, sensitive lawsuits by an employee against another employee. ○ **All**: Any risk event that is reported.
Approval rule based on	Rule used while assigning the event. ○ **Gross Loss** ○ **Net Loss** ○ **Expected Loss** This field depends on the values in the **Event type** and **Sub type** fields. For example, if the event type is **Financia**l, and the sub type is **Actual**, the approval rule is based on gross loss, net loss, or expected loss. If the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Sub type is **Potential**, the approval rule is expected loss, by default. If the Event type is **Non-Financial Impact**, the approval rule is Non-financial, by default.
Event type	Event type. ○ **Financial Impact**: Indicates that the event has an associated financial loss. Enter the amount. You can choose the currency. ○ **Non-Financial Impact**: Indicates that while the event does not have any financial loss, it does have a non-financial impact on the organization. For example, non-financial impact can be negative market news or a decline in employee morale.
Sub type	Event sub type. Select one of the following: ○ **Actual** ○ **Potential**
Auto close event once approved	Option to select if the event must be closed after approval. Selecting this option results in closing of the event after the issue and root cause are closed. If a risk event has open issues or tasks, the risk event is not closed even after approval.
Currency conversion date	Currency conversion dates for the risk event entries. You can select specific dates for currency conversion rather than relying solely on the date of impact to calculate the net loss. The options are as follows: ○ **Risk event entry date** ○ **First loss entry date** ○ **Last loss entry date** ○ **First recovery entry date** ○ **Last recovery entry date** ○ **Custom date**

4. In the Risk Event Owner Assignment section, select the assignment type and the owner or owning group.
5. To automatically create an issue, select the **Automatically create issue** check box in the Issue Creation and Assignment section.
6. In the Root Cause Analysis Task section, fill in the fields.

Risk Event Response Templates form

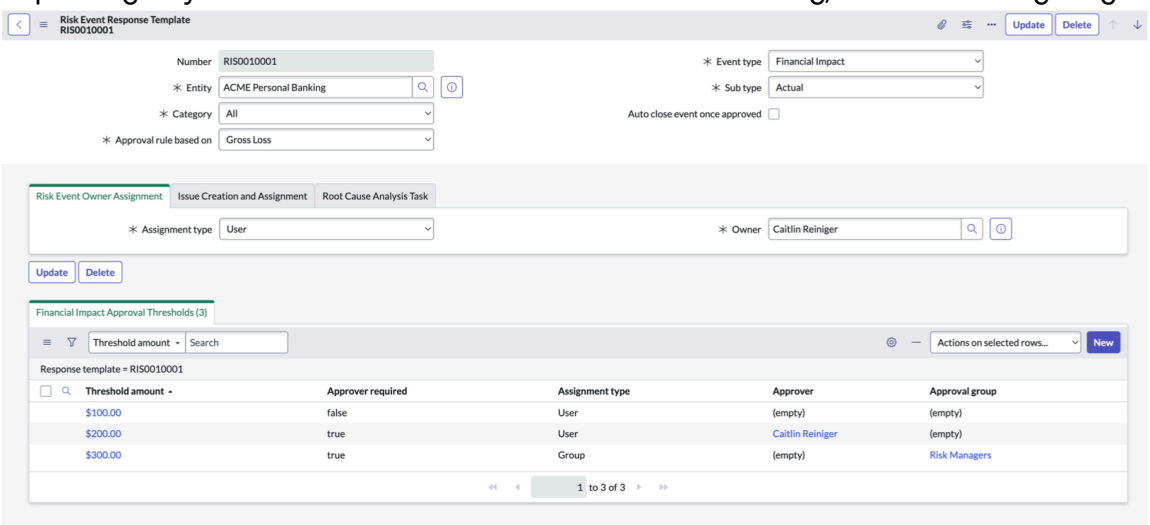
Field	Description
Automatically create RCA task	Task creation for root cause analysis (RCA). Automatically create a Root Cause Analysis

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	(RCA) task based on the amount entered in the **Threshold for task creation** field.
Assigned to	Person that the RCA task is assigned to.
Threshold for task creation	Option to specify the threshold amount after which an RCA task is created. For example, users can specify that after an event crosses loss worth $1000, an RCA task must be created.
Priority	Priority of the event. Select from: ○ **Critical** ○ **High** ○ **Moderate** ○ **Low** ○ **Minor**

7. Select **Submit**.
   A new risk event response template is created.

Define a threshold amount for the risk event response template



Define a threshold limit for assigning risk event approvers. A threshold limit is defined to determine if a risk event needs an approver.

Before you begin

Role required: sn_risk.manager and sn_risk.admin

About this task

Based on the risk loss amount, you can decide whether approvers are required for the risk events losses. For example, for any risk event that results in a loss of $1000 or less, an approver is not needed. But for any amount beyond $1000, the risk event must be evaluated and an approver is automatically assigned. There can be multiple levels of approvals depending on your defined thresholds. For a better understanding, see the following image.

In the previous example, the following rules are applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the loss is between $0-$100, approval is not required.
- If the loss is between $101 – $200, approval is required and approval goes to Caitlin.
- If the loss is over $201 approval will be required from both Caitlin and the Risk manager.

Procedure

1. Navigate to **All** > **Risk Events** > **Administration** > **Response Templates**.
2. Select and open the risk event response template for which you want to add the financial threshold limit.
3. In the Financial Impact Approval Thresholds related list, click **New**.
4. From the **Threshold amount** list, select the currency type and enter the amount that needs an approval.
5. Select the **Approver required** check box.
6. From the **Assignment type** list, select either **User** or **Group**.
7. In the **Approver** field, select the approver to approve the risk event if the threshold amount is exceeded.
8. Click **Submit**.

Result

The response template is updated with the threshold limit and approver details.

Report risk events from the Service Portal

When you identify any event that might have a financial or non financial impact on your organization, report it from the ServiceNow, Inc. Service Portal. You can also report any event that has already occurred with a financial or non financial impact.

Before you begin

Role required: ServiceNow user

About this task

You can log your risk event under any of the following event types:

- Risk event with financial impact
- Risk event with non-financial impact

Procedure

1. In the Service Portal, click **Catalog** > **Browse by Categories**.
2. Click **Governance Risk and Compliance** and then click **Report Risk Event**.
3. On the form, fill in the following fields:

Report risk event

Field	Description
Title	Enter the title of the risk event reported.
Description	Enter the description of the risk event reported.
Show my entities only	When selected, only the entities owned by you are displayed. This value is taken from the **Owner** field on the **Entity** form. By default, this option is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Entity where the event occurred	Select the entity that will absorb or report the loss. Select only one entity from the list.
Other entities affected	Select other related entities that are affected by the event. **Note:** You can select more than one entity.
Event type	Select one of the following: ○ Financial Impact- This indicates that the event has an associated financial loss. Enter the amount in your local currency. ○ Non-financial Impact- This indicates that while the event does not have any financial loss, it does have a non-financial impact on the organization. For example, a non-financial impact can be negative market news or a decline in employee morale.
Currency	Select the currency for the loss. This field appears only when the event type is Financial.
Date of discovery	Select the date when the risk event was discovered.
How was the event discovered	Select how the event was discovered. For example, if the risk event was reported by a customer, select **Customer Feedback/Complaint**.
Root cause	Enter your analysis for the cause of the event. For example, if a fire occurs in a server room, the root cause may be an increase in temperature or an electrical short circuit.
Action taken	Enter what was done to reduce the impact of this risk event. For example, if the fire in the server room was caused by an electrical short circuit, then the action taken is a replacement of the defective equipment.

4. Click **Submit**.
5. To view all the risk events you have reported, navigate to **GRC > My Risk Events**.

Result
The risk event is created in the system and is ready to be analyzed by the risk manager. When an action is taken on the event, you will receive notifications on the status. You can respond to queries or track the status of the event during its life cycle.

Report a risk event from Employee Center

When you identify any event that might have a financial or non financial impact on your organization, report it from the ServiceNow, Inc. Employee Center. You can also report any event that has already occurred with a financial or non financial impact.

Before you begin
Role required: sn_grc.business_user, or sn_grc.business_user_lite

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select **Risk & Compliance**.
3. Select **Report Risk Event**.
4. On the form, fill in the fields.

Report risk event form

Field	Description
What was the event?	Brief description of the event.
Describe in detail what happened	Detailed description of the event.
Show my entities only	When selected, only the entities owned by you are displayed. This value is taken from the **Owner** field on the **Entity** form. By default, this option is selected.
Which entity is impacted by this event?	The entity that will absorb or report the loss.
Other entities affected	Select other related entities that are affected by the event. **Note:** You can select more than one entity.
What kind of impact will this event have?	Type of impact. The choices areas follows: ○ Financial Impact- This indicates that the event has an associated financial loss. ○ Non-financial Impact- This indicates that while the event does not have any financial loss, it does have a non-financial impact on the organization. For example, a non-financial impact can be negative market news or a decline in employee morale.
Currency	Currency for the loss. This field appears only when the event type is set to **Financial Impact**.
How much financial loss this event may cause?	Loss amount due to the event. This field appears only when the event type is set to **Financial Impact**.
How would you rate the non-financial impact of this event?	Non-monetary impact of the event. The choices are as follows: ○ **Low** ○ **Medium** ○ **High**
When did you discover the event?	Date the event was discovered.
How was the event discovered?	How the event was discovered. For example, if the risk event was reported by a customer, select **Customer Feedback/Complaint**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
What do you think caused this event?	Provide your analysis for the cause of the event. For example, if a fire occurs in a server room, the root cause may be an increase in temperature or an electrical short circuit.
What actions have been taken so far to contain this event?	Provide the actions taken to reduce the impact of this risk event. For example, if the fire in the server room was caused by an electrical short circuit, then the action taken is a replacement of the defective equipment.

5. Select **Submit**.

Result
The risk event is submitted for review.

Report a risk event from an incident

If risk event integration is configured, users can report risk events from any upstream application such as IT Incidents. This ability to report risk events saves the time of users and helps to prevent losses for organizations.

Before you begin
Role required: sn_risk.user

Procedure
1. Navigate to **All** > **Incident** > **All**.
2. Open the incident for which you want to report a risk event.
3. Select **Report Risk Event**.

   The availability of the **Report Risk Event** button on the incident record is determined by the filter conditions specified in the Risk Event Integration Configuration record. For more information, see Configure risk event integration.

4. On the form, fill in the fields.

Report Risk Event form

Field	Description
Name	Name of the incident.
Date of discovery	The date the incident was created.
Entity	The entity to which the incident belongs.
Event type	Type of event. The choices are: ○ Financial impact ○ Non financial impact
Currency	Currency in which the amount of loss is reported. This field appears if **Financial impact** is selected from **Event type**.
Expected Loss	Expected amount of monetary loss. This field appears if **Financial impact** is selected from **Event type**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Non Financial Impact	Impact of the incident. The choices are: ○ Low ○ Medium ○ High
Description	A brief description of the incident.

5. Select **Submit**.

Result
The risk event is created.

Create a risk event task

A risk event might require associated tasks. Unless these tasks are created and eventually closed, the risk event cannot be closed.

Before you begin
Role required: sn_risk.manager

Procedure
1. Navigate to **All** > **Risk Events** > **All Events**.
2. Select the record for which a task must be created.
3. Select the Tasks related list and then select **New**.
4. On the form, fill the fields.

Risk event task form

Field	Description
Assigned to	Person that the task is assigned to.
Priority	Level of importance given to a task, which indicates how readily a task or assignment can be delayed.
Short description	Brief description of the task.
Description	Detailed description of the task.
Work notes	Any relevant information for your reference.
Additional comments	Any additional information that might be necessary.

5. Select **Submit**.

What to do next
Review the associated issues of a risk event or create a new issue during approval. For more information, see Manually create GRC issues.

Analyze a risk event

Analyze user-submitted risk events to determine if the risk event is valid and needs further processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_risk.manager

About this task
When you analyse a risk event, you add more relevant details to the risk event that is submitted. During analysis, you can either reject the event if the risk event doesn't appear to be an actual risk event, or request more information if the information is insufficient.

Procedure
1. Navigate to **All** > **Risk Events** > **All Events** and open the risk event that you want to analyze. Alternatively, you can also navigate to **Risk Events** > **New Events**.
2. On the form, review the fields and edit them as necessary.

Risk event form

Field	Description
Name	Name of the risk event. Edit the name of the risk, if necessary, to provide a more intuitive name.
Number	Number of the risk event. This field is automatically set.
Discovered by	The person who discovered the risk event. Edit the **Discovered by** field, if necessary.
Opened by	Person who created the event.
Primary entity	Entity that bears the loss. This entity is visible to management for reporting.
Owning group	Group responsible for monitoring the event to closure.
Owner	The person who owns the risk event. A risk manager can be an event owner. If the owning group is specified, the owners are filtered from the owning group.
State	State of the risk event. This field is automatically set.
Substate	Substate of the event. This field is automatically set.
Event type	Type of event. You can edit the event type, if necessary. For example, if during analysis you observe that the event type isn't a financial impact, you can edit the entry.
Sub type	Event sub type. You can edit the sub type, if necessary. For example, if during analysis you observe that the event type isn't an actual event but a potential event, you can edit the entry.
Category	Event category. You can edit the category to apply one of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Personal**: For example, any physical harm caused to an employee. ○ **Legal**: For example, an employee is found conducting business that is a conflict of interest. ○ **Information Security**: For example, a theft, burglary, or system crash. ○ **Human Resources**: For example, sensitive lawsuits by an employee against another employee.
Approvers	The person who approves the risk event. Any user with the sn_risk.user role can approve the risk event.
Cost center	Corresponding account number of the entity.
Description	Detailed description of the event in this field.
Dates	
Date of occurrence	Exact day, month, and year when the event occurred. For example, a mortgage was lent against a property that didn't comply with the building regulations on August 12, 2019.
Date of discovery	Date that the event was first discovered or noticed. For example, the mortgage was discovered on August 24, 2019.
Date of first recognition	Date that the event was first recognized and entered in the book of accounts. For example, the loss entries were entered in the firm's book of accounts on August 26, 2019.
Loss/Gain Estimates	
Expected loss	Amount of loss expected. Expected loss is the probability weighted average of all possible losses. This amount is based on the user's judgment of the expected amount that the organization might lose.
Potential loss	Amount expected to be a potential loss due to the risk event. This amount is the maximum loss an entity can incur due to the loss from the risk event.
Event Analysis	
Cause	Primary reason why the risk event occurred.
Cause description	Brief description about why the risk event occurred.
Consequence	Consequence of the risk event. For example: Regulatory fines can be imposed as a result of the risk event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actions taken	Remedial actions that were taken to address the issue. This is the initial record of the event.
Credit/Market Risk	
Boundary event	Option for a boundary event. A boundary event is an operational risk event which leads to a consequence, such as a financial loss in another risk category.
External risk type	○ **Credit**: Credit risk is the possibility of a loss resulting from a borrower's failure to repay a loan or meet contractual obligations. For example, when lenders offer credit cards, or loans, there's a risk that the borrower might not repay the loan. ○ **Market**: Market risk is the possibility of an investor incurring losses due to factors that affect the performance of the financial markets in which the investor is involved. For example, a recession might impact the entire market.
External risk reference	ID for reconciliation in the book of accounts. Specify the IDs for reconciliation purposes. The credit and market risk systems are different.
Additional Classification	
Used in modeling	Option to share these risk event records with external systems where they want to perform advanced analysis using simulation techniques such as Monte Carlo simulation.
Full rapid recovery	Total loss recovered. Select if the total loss is recovered within a short duration and doesn't impact the organization. **Note:** Generally, a short duration refers to five working days, but this value can be configured according to your requirements.
Financial gain	This option is automatically selected if the risk event meets one of the following conditions. ○ Risk event is a potential event and the **Expected loss** field or the **Potential loss** field has a negative value because of the gain. ○ Risk event is an actual event and the **Net loss** field has a negative value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Near miss	This option can either be modified or can be automatically set based on the event type. If the event sub type is **Actual**, and the **Full rapid recovery** option is selected, the **Near miss** option is automatically selected.
Reason for near miss	Reason which prevented the risk event from incurring the loss. If the event type is Potential, select the **Near miss** option and in the **Reason for near miss** field, enter the reason why the event was a near miss
Confidentiality	
Note: This section only appears when: ○ The *sn_grc.enable_record_confidentiality* property is enabled under GRC properties. ○ The risk event is in New or Analyze state	
Confidential	Option to mark the risk event record as confidential.
Allowed users	Users who can view the risk event. **Note:** By default, the risk event owner and the logged in user are added to the list of confidential users.
Allowed groups	Groups that can view the risk event.
Summary	
To understand how the values in this section appear, refer to the example given after this step.	
Direct amount	The aggregated sum of all direct losses. This field is automatically set.
Additional cost	The aggregated sum of all additional costs. This field is automatically set.
Gross loss	Sum of all direct losses, indirect amounts, and additional costs. This field is automatically set.
Net loss	The net amount of the loss. This field is automatically set.
Indirect amount	The aggregated sum of all indirect losses. This field is automatically set.
Rapid recovery amount	The aggregated sum of the amount that was recovered rapidly. This field is automatically set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Recovered amount	The amount to be recovered for the risk event. This field is automatically set.
Non financial impact	Impact of the event when it does not have a monetary loss. The choices are as follows: ○ **None** ○ **Low** ○ **Medium** ○ **High**
Activity	
Additional comments	Provide additional comments that you may have about the risk event.
Work notes	Option to provide work notes for reference. Work notes are not visible to the risk event creator.

Example

The values in the Summary section, the values in the fields are calculated in the Event Impacts related list. For example, consider that a firm has a fire outbreak. This event can result in multiple direct and indirect impacts such as loss of information and business.

If you enter the value of a direct impact as **$2000**, then the **Direct amount** field reflects the same value. If you enter two indirect amounts, each with a value of **$300** and **$500** respectively, then the **Indirect amount** field reflects a value of **$800**.

If an external agency is hired to address the root cause of the fire outbreak, the cost incurred reflects an additional cost.

If the firm was able to recover a part of the cost of the event in five working days, then the **Rapid recovery amount** field reflects the same amount.

The **Gross loss** field reflects the total loss incurred by the event.

The currency conversion rates impact the values displayed in the Summary related list. For example, if you enter a value of **300** Japanese Yen as the recovery amount, you see the amount in the concurrent USD value of **2756** in the Summary related list. This conversion occurs because the currency conversion rates are applied from the Exchange Rate table. For more information on how the values in the exchange rate table are calculated, see Use your own currency-conversion rates.

3. To send the risk event for approval, click **Request Approval**.

Create a risk event entry

Create a risk event entry to determine the monetary or non-monetary impact of the risk event. A risk event can have multiple risk event entries.

Before you begin

Role required: sn_risk.manager

About this task

Risk event entries capture the direct and indirect losses reported due to the risk event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk Events** > **All Events** and select the event to be analyzed.
2. Click the Risk Event Entries related list.
3. Click **New**.
4. On the form, fill in the fields.

Event Entry form

Field	Description
Number	Number for the event entry. This field value is automatically set.
Risk event	Title of the risk event. This field value is automatically set.
Date of impact	Date that the impact was recorded. **Note:** The date of discovery and the date of first recognition can be different. This date cannot be a future date.
Amount	Amount that the impact costs. The amount entered is reflected in the Summary related list.
Rapid recovery	Loss amount for this entry if it's recovered in a short time, which is generally five working days.
Impact type	Type of financial impact for the event. Select from the following types: ○ **Direct/Indirect Impact**: Direct or indirect financial impact of the event on the entity. ○ **Recovery**: Amount recovered from the total financial impact. ○ **Additional Cost**: The additional cost incurred due to the impact. ○ **Non-Financial Impact**: The event has no financial impact.
Category	**Direct** or **Indirect**. For example, if the impact is direct, is it external?
Sub category	Sub category of the event impact. Select one of the following categories: ○ **External Cost**: The cost that's incurred for external agencies. For example, if a loss is incurred due to erroneous accounting and an external auditor was hired to assess the event, the cost incurred in employing the auditor is an external cost.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **General Ledger**: The book of accounts in which this event is entered. ○ **Booked Provision**: Refers to the amount that you set aside in your accounts to cover a future event. For example, if a firm sets aside an amount to cover a risk event that might occur in the future. ○ **Revenue Reversal/Timing Losses**: When you reverse revenue, a reverse entry is created that backs out the original entry. Don't enter any new accounting information into the system.
GL account reference	Account number in which this entry is captured in the ERP system.
Short description	Brief description of the impact.

5. Click **Submit**.

What to do next

Create or edit a new risk

Creating or editing a new risk for an event is useful for future prediction of risks. The information obtained from the risks is useful for scoring and reporting. For more information, see Create a risk manually.

Link new control to risks

A control is used to prevent a risk from occurring. Linking the controls to risks lets users know which controls failed and why the risk event occurred. This information can be used for future predictions and reporting.

> **Note:**
> Only those risks and controls that are tagged to the impacted entity can be related to this risk event.

For more information, see Create a control.

Approve a risk event

A user with the sn_risk.manager role must approve a valid risk event. If any risk approver rejects the event, the state of the risk event changes to rejected.

Before you begin

Role required: sn_risk.manager

Procedure

1. Navigate to **All** > **My Approvals**.
2. Click the record in the list with your name as the approver.
3. Click **Approve**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Close a risk event

Close a risk event to complete the risk events life cycle. A user with the sn_risk.manager role must close the risk event after verifying that all associated open issues and remedial tasks are closed.

Before you begin
Role required: sn_risk.manager

Procedure

1. Navigate to **All** > **Risk Events** > **Assigned to Me**.
2. Open the record that you want to close and verify if all the associated tasks and issues are closed.
3. Click **Close**.

Reopen a closed risk event

Reopen closed risk events to identify and address overlooked or underestimated risks, updating existing risk events instead of creating another risk event.

Before you begin
Role required: sn_risk_advanced.risk_event_admin

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list icon  and navigate to the closed risk events.
3. Open the risk event that you want to reopen.
4. Select **Reopen**.
5. Select a reason and provide justification in the **Additional Comments** field.
6. Select **Confirm**.
   The risk event moves to the Analyze state.

Add a risk event cause to the cause library

A cause library is a centralized library of the possible causes that can lead to a risk event. Adding causes helps to identify the reason for a risk event and prevent future events.

Before you begin
Role required: sn_risk.manager and sn_risk.admin

About this task
Add a risk event cause to the cause library to help with risk analysis, risk prediction, and risk prevention.

Procedure

1. Navigate to **All** > **Risk Events** > **Administration** > **Causes**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause form

Field	Description
Name	Name of the cause. For example, `Inadequate IT security`.
Parent	Parent of the cause. The parent refers to the group under which the cause is categorized. For example, for Inadequate IT security, the parent cause can be Process.
Description	Brief description of the cause.

4. Click **Submit**.

Result
The risk event cause is added to the library.

Related topics

Add a risk event consequence to the consequence library

Add a risk event consequence to the consequence library

A consequences library is a centralized library of the possible consequences of a risk event.

Before you begin
Role required: sn_risk.manager and sn_risk.admin

About this task
Add a risk event consequence to the consequence library to help with risk analysis, risk prediction, and risk prevention.

Procedure

1. Navigate to **All** > **Risk Events** > **Administration** > **Consequences**.
2. Click **New**.
3. On the form, fill in the fields.

Consequence form

Field	Description
Name	Consequence name. For example, `Asset loss`.
Parent	Parent of the consequence. The parent refers to the group under which the consequence is categorized. For example, for Asset loss, the parent consequence can be Damage to Physical Assets.
Description	Brief description of the consequence.

4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The risk event consequence is added to the library.

Related topics
Add a risk event cause to the cause library

Set up GRC Virtual Agent to report risk events

Use a Virtual Agent chatbot to report risk events from the Service Portal. A virtual agent chatbot helps customers to quickly report a risk event. The chatbot assists the customers by saving their time. The information exchanged during the conversation flow enables the chatbot to fulfill a user request or assist the user in completing a task.

Before you begin
Customers must have the following plugins activated for setting up the GRC Virtual Agent

- Glide Virtual agent (com.glide.cs.chatbot) activated with a valid license.
- GRC Advanced Risk.

Role required: sn_risk.admin.

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. Click **Page Editor**.
3. In the search field, enter `Index`.
4. Click **Service Portal index**.
5. At the top of the page, click **Edit Service Portal (index) page in Designer**.
6. In the Filter Widget search field, type `Virtual Agent Service Portal Widget` , drag the widget, and drop it anywhere on the screen.

   You can see the chat icon at the bottom-right of the screen.

Perform Advanced Risk Assessment

Use the ServiceNow® Governance, Risk, and Compliance (GRC) Advanced Risk Assessment feature to create an integrated risk platform.

To see the roles required for performing and approving the assessment, refer to Roles for performing advanced risk assessment.

Create a manual factor

Create manual factors to evaluate and assess risks on a risk assessment instance.

Before you begin
Role required: sn_risk.admin

About this task
Manual factors need human responses. You can create manual factors and associate them with various assessment types, such as an inherent assessment, control assessment, or residual assessment.

Note:
You can only delete a factor if there are no Risk assessment methodologies (RAMs) associated with the factor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Manual Factors**.
2. Select **New**.
3. On the form, fill in the fields.

Manual Factor form

Field	Description
Name	Name of the factor such as `Reputational impact`.
State	State of the factor. This field is automatically set to **Draft**.
Factor contribution	Type of factor contribution. Choices are the following: ○ **Qualitative**: Provides a numerical score and then converts the score into a rating. ○ **Quantitative**: Provides the losses that can be incurred in monetary terms. The losses contribute to the annual loss expectancy (ALE). ○ **Both**: Assessment type is both qualitative and quantitative.
Display order	Order of questions in the assessment form. This field enables you to set a specific sequence in which the questions must appear.
User response	Option for users to respond to the factors. Choices are the following: ○ **Choice**: Users can create choices such as low, medium, and high alongside their respective scores. **Note:** Selecting this option displays the Choices related list. Save the form to see the Choices related list. ○ **Number**: Users can enter a number in response to a factor. ○ **Text**: Users can enter text in response to a factor. This option does not contribute to the score, and it is used as guidance or as a data collection method. ○ **Currency**: Users can enter currency in response to a factor. ○ **Percentage**: Users can enter a percentage in response to a factor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Control type	Option to modify the layout of factor choices on the risk assessment form. Choices are as follows: ○ **Radio**: Displays the factor choices in radio buttons. ○ **Drop-down**: Displays the factor choices in a drop-down list. This field appears only when **Choice** is selected from the **User response** field.
Control layout	Option to display the factor choices in vertical or horizontal layout. This field appears only when **Radio** is selected from the **Control type** field.
Transform qualitative score	Option to transform the overall group qualitative score based on an interval scale. For example, assume the **User response** field is set to **Percentage**. As the admin, you can transform the percentage value into a qualitative score, such that 0% to 30% is low, 30% to 60% is medium, and 60% and higher is high. In this case, the ratings 1, 2, and 3 can be assigned to low, medium, and high. This field appears only when **Qualitative** is selected from the **Factor contribution** field.
Qualitative weighting (%)	Score contribution or qualitative weight that is given to the factor. This value determines the actual contribution of this factor to the final score. This value is a percentage. This field appears only when **Qualitative** is selected from the **Factor contribution** field.
Mandatory response	Option for making the responses mandatory.
Description	Brief description about the purpose of the factor and where to use the factor. This description is for the administrator to understand the factor.
Guidance text	Guidance on how to respond to the factor. If the risk assessor does not understand the factor's question, then this field can help explain the question. For example, if the assessor wants to understand a question about the financial impact of losing a high value asset, the assessor can get guidance from this field.

4. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the Qualitative Transformation Criteria related list.

> **Note:**
> This related list appears only when you select the **Transform qualitative score** option.

6. On the form, fill in the fields.

Qualitative Transformation Criteria form

Field	Description
Lower limit of range	Value that is the lower limit of a range of values. For example, for the first range of 0% to 30%, the lower limit is 0. For the second range of 31% to 60%, the lower range is 31.
Score	Value that must be used as the score if the value is within the range defined in the **Lower limit of range** field. For example, for the lower limit 0, the score can be 1. For the lower limit 31, the score can be 2.

7. Click **Submit**.
8. Open the factor that you created.
9. Click **Publish**.

Result
The factor is published and is ready for use in a Risk Assessment Methodology.

Create a group factor

Create group factors to evaluate and assess risks on a risk assessment instance.

Before you begin
Role required: sn_risk.admin

About this task
Group factors contribute to either a numerical risk score or to the Annual Loss Expectancy (ALE). You can group multiple factor responses into one group factor that can be used for reporting. The score of a group factor is computed based on the scores of its associated factors.

Procedure
1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Group Factors**.
2. Select **New**.
3. On the form, fill in the fields.

Group Factor form

Field	Description
Name	Name of the factor such as `Organizational impact`.
Factor contribution	Type of factor contribution. Choices are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Qualitative**: Provides a numerical score and then converts the score into a rating. ○ **Quantitative**: Provides the losses that are incurred from a risk in monetary terms. The losses contribute to the ALE. ○ **Both**: Assessment type is both qualitative and quantitative.
Display order	Order of questions in the assessment form. This field enables you to set a specific sequence in which the questions must appear.
State	State of the factor. This field is automatically set to **Default**.
Qualitative weighting (%)	Score contribution or qualitative weight that is given to the factor. This value determines the actual contribution of this factor to the final score. This value is a percentage. This field appears only when **Qualitative** is selected from the **Factor contribution** field.
Description	Brief description about the purpose of the factor and where to use the factor. This description is for the administrator to understand the factor.
Qualitative Score	
This section appears only when **Qualitative** is selected from the **Factor contribution** field.	
Formula for qualitative score	Formula for calculating the overall qualitative risk score. Choices are the following: ○ **Sum**: Sum of the factor responses. ○ **Minimum**: Minimum value of the factor responses. ○ **Maximum**: Maximum value of the factor responses. ○ **Average**: Average value of the factor responses. ○ **Product**: Value derived by multiplying the factor responses. ○ **Weighted average**: Average value of the weighting of factors. ○ **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.
Transform qualitative score	Option to transform the overall group qualitative score based on an interval scale.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, assume the **User response** field is set to **Percentage**. As the admin, you can transform the percentage value into a qualitative score, such that 0% to 30% is low, 30% to 60% is medium, and 60% and higher is high. In this case, the ratings 1, 2, and 3 can be assigned to low, medium, and high. This field appears only when **Qualitative** is selected from the **Factor contribution** field.
Quantitative Score	
This section appears only when **Quantitative** is selected from **Factor contribution** field.	
Formula for quantitative score	Formula for calculating the overall qualitative risk score. Choices are the following: ○ **Sum**: Sum of the factor responses. ○ **Minimum**: Minimum value of the factor responses. ○ **Maximum**: Maximum value of the factor responses. ○ **Average**: Average value of the factor responses. ○ **Product**: Value derived by multiplying the factor responses. ○ **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.

4. Select **Save**.
5. In the Factors related list, click **Edit** and add the required factors.
6. Select **Save**.
7. Select the Qualitative Transformation Criteria related list.
8. On the form, fill in the fields:

Qualitative Transformation Criteria form

Field	Description
Lower limit of range	Value that is the lower limit of a range of values. For example, for the first range of 0% to 30%, the lower limit is 0. For the second range of 31% to 60%, the lower range is 31.
Score	Value that must be used as the score if the value is within the range defined in the **Lower limit of range** field. For example, for the lower limit 0, the score can be 1. For the lower limit 31, the score can be 2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Submit.**
10. Open the factor that you created.
11. Select **Publish**.

Result

The factor is published and is ready for use in a Risk Assessment Methodology.

Scoring logic for predefined formulas for group factors

Group factors have multiple predefined formulae and each of them has a specific contribution to the scoring logic.

Predefined formulae scoring logic

Users can select one of the following predefined formulae to calculate the scoring for group factors. The scores are contributed by scores of manual factors that comprise a group factor and have factor contribution as Qualitative or Quantitative, or Both.

The qualitative scores calculated using the predefined formulae are transformed using the transformation criteria if the **Transform qualitative score** option is selected for the group factor.

The qualitative scores calculated after transformation will be derived using the Qualitative weighting of the group factor. For example, if the calculated score is 10 and the Qualitative weighting is 50%, then the final score for group factor will be calculated as 10 x 0.5 = 5.

Sum

For Qualitative, this formula adds up the qualitative scores in an assessment instance. The scores are contributed by scores of manual factors that comprise a group factor and have factor contribution as either Quantitative or Both.

For Quantitative, this formula adds up the quantitative scores in an assessment instance. The scores are contributed by scores of manual factors that comprise a group factor and have factor contribution as either Quantitative or Both.

Minimum

For Qualitative, this formula takes the minimum of qualitative scores in an assessment instance. The scores are contributed by scores of manual factors that comprise a group factor and have factor contribution as either Quantitative or Both.

For Quantitative, this formula takes the minimum of quantitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Quantitative or Both.

Maximum

For Qualitative, this formula takes the maximum of qualitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Qualitative or Both.

For Quantitative, this formula takes the maximum of quantitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Quantitative or Both.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Average

For Qualitative, this formula takes the average of qualitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Qualitative or Both.

For Quantitative, this formula takes the average of quantitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Quantitative or Both.

Product

For Qualitative, this formula multiplies qualitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Qualitative or Both.

For Quantitative, this formula multiplies quantitative scores in an assessment instance. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Quantitative or Both.

Weighted average

For Qualitative, this formula divides the sum of qualitative scores in an assessment instance by the sum of weights. The scores are contributed by scores corresponding to the factors that a comprise a group factor and have factor contribution of either Qualitative or Both.

Create an automated factor

Create automated factors to automatically fetch data from other data sources such as tables or database views.

Before you begin

You must have the Governance, Risk, and Compliance Enterprise license.

Role required: sn_risk.admin

About this task

Automated factors help automate the risk assessment process. They do not to rely on manual inputs, and they thus reduce subjectivity. All the responses to automated factors are automatically calculated during the assessment.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Automated Factors**.
2. Click **New**.
3. On the form, fill in the fields.

Automated Query Factor form

Field	Description
Name	Name of the factor such as `Regulatory Impact`.
Factor contribution	Type of factor contribution. Choices are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Qualitative**: Provides a numerical score and then converts the score into a rating. ○ **Quantitative**: Provides the losses that can be incurred in monetary terms. The losses contribute to the annual loss expectancy (ALE). ○ **Both**: Assessment type is both qualitative and quantitative.
Display order	Order of questions in the assessment form. This field enables you to set a specific sequence in which the questions must appear.
Response type	Options for users to respond to the factors. Choices are the following: ○ **Number**: The factor response after automatic calculation will be a number. ○ **Currency**: The factor response after automatic calculation will be in currency. ○ **Percentage**: The factor response after automatic calculation will be a percentage.
Assessment context	Context where the assessment must be performed. Choices are the following: ○ **Risk**: Select this option to perform the assessment for an entity and for an associated risk. ○ **Object**: Select this option to perform an assessment on any ServiceNow record. For example, users can perform Exception Risk Assessment or Change Risk Assessment directly on an object.
State	State of the factor. This field is automatically set to **Draft**.
Qualitative weighting (%)	Score contribution or qualitative weight that is given to the factor. This value determines the actual contribution of this factor to the final score. This field appears only when **Qualitative** is selected from the **Factor contribution** field.
Transform qualitative score	Option to transform the overall group qualitative score based on an interval scale. For example, assume the **User response** field is set to **Percentage**. As the admin, you can transform the percentage value into a qualitative score, such that 0% to 30% is low, 30% to 60% is medium, and 60% and higher is high. In this case, the ratings 1, 2, and 3 can be assigned to low, medium, and high.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only when **Qualitative** is selected from the**Factor contribution** field.
Collect supporting data	Option for collecting supporting data. If this option is selected, the Supporting Data section appears.
Description	Brief description about the purpose of the factor and where to use the factor. This description is for the administrator to understand the factor.
Data Source	
Source	Table or view that is used as the source of the factor.
Filter Criteria	
Filter by entity	Option for filtering the source by the risk assessment instance entity.
Entity-mapping field	Field that refers to the Entity table. This field appears only when the **Filter by entity** option is selected.
Filter by risk	Option for filtering the source by the risk of the risk assessment instance.
Risk mapping field	Field that refers to the Risk table. This field appears only when the **Filter by risk** option is selected.
Filter by control	Option for filtering the source by the risk assessment instance control. This option applies only to the individual assessment of controls in the control assessment.
Control mapping field	Field that refers to the Control table. This field appears only when the **Filter by control** option is selected.
Filter by object	Option for filtering the source by the object of the risk assessment instance. This field appears only when you are performing the risk assessment on an object.
Object mapping field	Field that refers to an object in the assessment instance. This field appears only when **Object** is selected from the **Assessment context** field, and when the **Filter by object** option is selected.
Aggregation.	
Aggregation type	Formula for aggregating the records that are selected from the table in the **Source** field. Choices are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Sum**: Sum of the aggregation column. ○ **Average**: Average value of the aggregation column. ○ **Maximum**: Maximum value of the aggregation column. ○ **Minimum**: Minimum value the aggregation column. ○ **Count**: Count of number of records of the aggregation column. ○ **Count distinct**: Number of unique records of the aggregation column.
Aggregation column	Column that is used for aggregation based on the table selected in the **Source** field.
Schedule	
Frequency	Frequency of when the factor is run.
Day of the week	Day of the week when the factor is run. This field appears only when **Weekly** is selected from the **Frequency** field.
Day of month	Day of the month when the factor is run. This field appears only when **Monthly** is selected from the **Frequency** field.
Month	Month when the factor is run. This field appears only when the **Frequency** field has the values **Quarterly**, **Semi-annually**, or **Annually**.
Next run date	Date when the factor runs again. This field is automatically set based on the selections made on the form.

4. Click the Supporting Data section.
5. For the data that you want to collect, move the corresponding fields from the Available list to the Selected list.
6. Click **Submit**.
7. Open the factor that you created.
8. Click **Publish**.

Result

The factor is published and is ready for use in a Risk Assessment Methodology.

4. Click **Submit**.
5. Open the factor that you created.
6. Click **Publish**.

Result
The factor is published and is ready for use in a Risk Assessment Methodology.

Related topics
Create an automated factor

Copy a factor

Create a copy of a published factor to make minor modifications and then reuse the factor.

Before you begin
Role required: sn_risk.admin

Procedure
1. Navigate to **All** > **Advanced Risk Assessment** > **Administration**
2. Open the factor you want to copy.
3. Click **Copy**.

Result
A copy of the factor is created.

Configure a risk assessment methodology

Configure a risk assessment methodology (RAM) in the Advanced Risk application so that you can assess the risks or objects in your organization.

Before you begin
Role required: sn_risk_advanced.ara_admin

About this task
A RAM is a configuration or record in the new risk assessment engine in the Advanced Risk application.

You can use a RAM to assess either the risks or objects in your organization. For example, you can configure a RAM to specify the types of risk assessments and the entities on which a risk assessment is performed. By using a RAM, your organization can have different methodologies for assessing risks.

After you move a RAM to the **Retired** state, you can also move it back to the **Draft** state if you want to make some changes later. You can only move a RAM to the **Draft** state if it doesn't have any assessments in the **Monitor** state or the **Closed** state. When you move a RAM back to the **Draft**, the on-going assessments and the associated scopes are deleted.

Procedure
1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Assessment Methodologies**.
2. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values on the risk assessment methodology form, see Risk Assessment Methodology form.

4. Right-click and save the form.
5. To configure the various assessments, select one of the following options.

6. Select **Publish**.

Note:
After a new assessment is created on the same risk and the assessment is in the **Monitor** state, the other assessments automatically move to the **Completed** state. When an assessment instance is in the **Monitor** state, you can't move the RAM back to the **Draft** state. A RAM can only be moved back to the **Draft** state if there are no assessment instances.

Risk Assessment Methodology form

Use the Risk Assessment Methodology form in the Advanced Risk application to specify the types of risk assessments and the entities on which the risk assessment is performed.

See the following table for a description of the field values.

Risk Assessment Methodology form

Field	Description
Name	Name of the risk assessment methodology (RAM). For example, Organizational risk assessment.
Domain area	Domain area of the RAM. This field is automatically set to **IRM**.
State	State of the RAM. This field is automatically set to **Draft**.
Assessment Context	
Assess	Assessment context that you can select: • **Risk**: Performs the assessment for an entity and the risk statement that is related to it. • **Object**: Performs an assessment on any ServiceNow record. For example, users can perform an Exception Risk Assessment or a Change Risk Assessment directly on those respective tables.
Applicable entity classes	All entity classes that the RAM applies to, such as the business services, assets, or business applications. This field appears only when **Risk** is selected from **Assess**.
Applicable Record Types	Tables on which you want to perform the assessment. You can select multiple tables and associate them to the RAM. This field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Assessment Methodology form (continued)

Field	Description
	appears only when **Object** is selected from **Assess**. **Note:** You can add multiple objects or tables to a published RAM, but can't remove them after the RAM is published.
Workflows	
Inherent risk	Option for assessing an inherent risk.
Control effectiveness	Option for assessing the control effectiveness.
Enable risk response	Option to enable the **Risk Response** tab on the risk assessment. This option appears only when **Risk** is selected from **Assess**.
Residual risk	Option for assessing a residual risk.
Target risk	Option for assessing a target risk.
Rollup Configurations	
This section appears only when **Risk** is selected from **Assess**.	
Calculate ALE based on	Formula that you can select for calculating the annual loss expectancy (ALE): • **Sum** • **Average** • **Maximum** • **Minimum**
Calculate score based on	Formula that you can select for calculating the score: • **Average** • **Maximum** • **Minimum**
Risk Response Configurations	
This section appears only when **Risk** is selected from **Assess**.	
Enable risk response task workflow	Option to enable users to create, delete, remove, edit, and link risk response tasks within an assessment.
Allow single risk response	Option to make the risk response selection a single select in the risk assessment form. For example, the options could be "Accept," "Avoid," "Mitigate," or "Transfer." With a single select, assessors can choose only one of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Assessment Methodology form (continued)

Field	Description
	these options to indicate the risk response strategy. **Note:** This option can only be enabled when there are no ongoing assessments.
Allow issue linking with risk assessment	Option to create an issue or link an existing open issue with the risk assessment.
Risk response is required	Option to make a risk response as required: • **None**: No risk response is required. • **Always**: Mandate a risk response always. • **On specific conditions**: Mandate a risk response based on specific conditions using the condition builder. • **On specific conditions defined using script**: Mandate a risk response under specific conditions using a predefined script or set of instructions.
Business Rules and Validations	
Final comment is required	Option to make the final comments as required. Final comments provide better transparency and enable risk owners to communicate the action plan if there's a breach of appetite or tolerance. The options are as follows: • **None**: No final comment is required. • **Always**: Mandate final comments always. • **On breach of appetite**: Mandate final comments on the breach of appetite. • **On breach of tolerance**: Mandate final comments on the breach of tolerance. This field appears only when **Risk** is selected from **Assess**.
Automatically create issue	Option to create issues automatically. This field appears only when **Risk** is selected from **Assess**. • **None**: Enables you not to create issues automatically. • **On breach of appetite**: Creates issues automatically on the breach of appetite. • **On breach of tolerance**: Creates issues automatically on the breach of tolerance.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Assessment Methodology form (continued)

Field	Description
	Note: The issues are created only after the risk assessment is approved and moved to the published state.
Residual score is lower than inherent	Option to validate that the qualitative residual score is lower than the inherent score. **Note:** This option appears only when the residual risk assessment is enabled.
Reference Information	
This section appears only when **Risk** is selected from **Assess**. Enabling these options shows the reference information in the risk assessment instance.	
Show related risk events	Option for showing the related risk events on the risk assessment.
Show related risk indicators	Option for showing the related risk indicators on the risk assessment.
Show open issues	Option for showing the open issues on the risk assessment.
Show previous assessment	Option for showing the previous assessment on the risk assessment. This option helps the risk assessor to refer to the previous assessment and analyze the details of that assessment before taking another assessment.
Other Configurations	
Advanced reminder (days)	Based on the due date of the risk assessment, this field is the number of days before a notification is sent to the assessor. For example, if you enter 3 in this field, then the assessor gets a reminder notification three days before the due date.
Overdue reminder (days)	Based on the due date of the risk assessment, this field is the number of days after this date that reminder emails are sent. For example, assume you enter 5 in this field. Then for five days after the due date is over, the assessor keeps receiving reminder emails that the due date is over. On the sixth day, an email notification is sent to the assessor and to the assessor's manager.
Risk identification	Method to identify risks in the risk assessment scope:

© 2026 ServiceNow, Inc. All rights reserved.

Risk Assessment Methodology form (continued)

Field	Description
	• **None** • **From Library**: Identifies risks from the library on the risk assessment. • **Ad-hoc**: Identifies a risk that is not in the library. • **From Library and Ad-hoc**: Creates risks as well as adds risks from the library.
Group factor comments	Option to enable group factor comments in the risk assessment form.
Copy previous responses	Option to copy the factor responses and comments whenever a reassessment is performed.
Allow override of results	Option to override the computed scores and the ALE during risk assessment.
Configure section terminology	Option to configure section labels for inherent, control, residual, and target assessments. After you select this option, you can configure the title, score label, and annual loss expectancy label for each assessment type. **Note:** Section label renaming applies only to the advanced risk assessment interface while leaving the terminology used in reports, dashboards, heatmaps, and other areas unchanged.
Update assessment results to source record	Option to copy the assessment results to the source record on which the assessment is performed. You can define the assessment result mapping for the applicable record types in the individual assessment types. This field appears only when **Object** is selected from **Assess**.
Schedule	
This section appears only when **Object** is selected from **Assess**.	
Reassessment frequency	Option of how often the reassessment is performed: • **None** • **Weekly** • **Monthly** • **Quarterly**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Assessment Methodology form (continued)

Field	Description
	• **Semi-annually** • **Annually**
Days to overdue	Based on the due date of the risk assessment, this field is the number of days after which an assessment is considered overdue.

Copy a risk assessment methodology

Modify your risk assessment methodology (RAM) and factors by creating a copy of the record. The option to copy allows the system to create a true copy of the underlying record including all the related lists. This action saves the time of risk administrators as they do not have to create the records from the beginning each time.

Before you begin

Role required: sn_risk.admin

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Assessment Methodologies**
2. Open the RAM you want to copy.
3. Select **Copy**.

Retire a risk assessment methodology

Retire a risk assessment methodology (RAM) that is no longer used. Retiring unused RAMs makes it easier to manage the active RAMs for the risk administrator.

Before you begin

Role required: sn_risk.admin

About this task

When you retire a risk assessment methodology, it is important to note that you cannot make a retired RAM active again. You must also note that:

- all the factors associated with this methodology retire.
- the risk assessment scope retires.
- all open associated assessments retire.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Assessment Methodologies**.
2. Select and open the risk assessment methodology that you want to retire.
3. Click **Retire**.
   The state changes to **Retired**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure an inherent assessment

Configure and publish an inherent assessment in the Advanced Risk application to assess the inherent risks in your organization.

Before you begin

Role required: sn_risk.admin

About this task

Configure the criteria for an inherent risk assessment by adding the factors, scoring logic, and rating criteria to the Inherent Assessment form. Each risk assessment methodology (RAM) has its own inherent assessment criteria. For example, you can assess the inherent risk for such factors as the financial impact, regulatory impact, and client impact. To get the inherent assessment score, the impact of these factors is multiplied by the likelihood that a risk would occur.

Procedure

1. Navigate to the RAM form that has the inherent risk as an assessment type.
2. In the Assessment Types related list, select **Inherent Assessment**.
3. On the form, fill in the fields.

   For a description of the field values on the inherent assessment form, see Inherent Assessment form.

4. To add factors, select the Factors related list.
   This related list is available only when **Factor responses** is selected from the **Calculate based on** field.
5. Select **Edit** and add the factors.
6. Select **Save**.
7. Select the Qualitative Rating Criteria related list and select **New**.
8. On the form, fill in the fields.

Qualitative Rating Criteria form

Field	Description
Lower rating interval	Range for qualitative risk ratings. For example, for a range of 0–10, you can enter 0 as the lower range. For a range of 11– 20, the value can be 11 as the lower range.
Rating	Severity of the risk. You can enter ratings such as high, medium, or low. For example, assume that the lower rating interval for the Low rating is 0, and that the lower rating interval for the Medium rating is 11. If the risk score is 15, then the rating criterion is Medium because 15 is in the range of 11-20.
Overridden score	Score that is used when the assessor overrides the risk rating.
Risk color style	Color code style for the background color on the risk rating value and for the text color on the risk assessment instance. For example, for a high risk, you can select the Red color

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	style with the background color as red and the text as black.
Risk appetite scale	Risk appetite scale for the risk rating criteria. The appetite scales must be mapped to the qualitative risk rating criteria in the risk assessment methodology. You can compute the qualitative appetite status that is based on the latest assessment or aggregated rating to provide the qualitative appetite status. For example, you can select a risk appetite scale of **Hungry** for the risk rating of **Very High**. This field appears only when the risk appetite feature is configured in the advanced risk assessment properties. **Important:** In a qualitative risk assessment, map the risk appetite scale to the risk rating criteria for the final assessment type. For example, if you have both residual and inherent assessments, map the risk appetite scale to the risk rating criteria in the residual assessment.

Note:
Don't enter negative values in the Qualitative Rating Criteria form.

9. **Optional:** If you select the **Enable heatmap** option, then do the following actions:
   a. Select the Heatmap Colors related list.
   b. In the Risk color style column, specify the risk color style.
10. To define the assessment result mapping for the applicable record types, do the following actions:

    These steps apply when conducting the inherent assessment on an object.

    a. Select the Assessment Result Mapping related list.
    The Assessment Result Mapping related list appears only when the **Update assessment results to source record** option is selected in the RAM.

    b. Select the record type.

    c. On the form, fill in the fields.

Applicable Record Type form

Field	Description
Risk assessment methodology	Name of the RAM. This field is automatically set based on the selected RAM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Record Type	Name of the applicable record type. This field is automatically set based on the selected record type.
Inherent risk rating	Column where the inherent risk rating value is stored in the source record. After the assessment, the inherent risk rating result is copied to the column that is selected in this field. This field appears only when the **Assessment contribution** field has **Qualitative** or **Both**.
Inherent ALE	Column where the inherent annual loss expectancy (ALE) value is stored in the source record. After the assessment, the inherent ALE result is copied to the column that is selected in this field. This field appears only when the **Assessment contribution** field is set to is **Quantitative** or **Both**.

Note:
If the same record type is used in another risk assessment methodology, the source record will update based on the field defined in the RAM of the latest advanced risk assessment.

d. Select **Update**.

11. Select **Submit**.

12. Select **Publish**.

Result
The assessment type is published.

Inherent Assessment form

Use the Inherent Assessment form in the Advanced Risk application to assess the inherent risks in your organization.

See the following table for a description of the field values.

Inherent Assessment form

Field	Description
Risk assessment methodology	Selected RAM. This field is automatically set based on your RAM.
State	State of the RAM. This field is automatically set to **Draft**.
Calculate based on	Option for calculating the assessment score that is based on factor responses.
Assessment contribution	Type of factor contribution:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inherent Assessment form (continued)

Field	Description
	• **Qualitative**: Provides a numerical score and then converts the score into a rating. Selecting this option ensures that only qualitative factors are available for adding. • **Quantitative**: Provides the losses that can be incurred in monetary terms. The losses contribute to the annual loss expectancy (ALE). Selecting this option ensures that only quantitative factors are available for adding. • **Both**: Provides both the qualitative and quantitative assessment type.
Enable heatmap	Option to enable the heatmap report on the Advanced Risk dashboard. **Note:** You can select this option only if a minimum of two factors are added to the assessment type. Selecting this option makes the Heatmap Configuration section and the Heatmap Colors related list appear on the form.
Qualitative Score	
This section appears only when **Qualitative** is selected from the **Assessment contribution** field.	
Qualitative scoring logic	Formula that you can use to calculate the scoring logic: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses. • **Product**: Value that is derived by multiplying the factor responses. • **Weighted average**: Average value of the weighting of factors. This value is then classified as low, medium, or high. • **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inherent Assessment form (continued)

Field	Description
Quantitative Score	
This section appears only when **Quantitative** is selected from the **Assessment contribution** field.	
Quantitative scoring logic	Formula that you can use to calculate the scoring logic: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses. • **Product**: Value that is derived by multiplying the factor responses. • **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.
Section Labels	
This section appears only when **Configure section terminology** is selected in the RAM form. **Note:** Section label renaming applies only to the advanced risk assessment interface while leaving the terminology used in reports, dashboards, heatmaps, and other areas unchanged.	
Title	Option to rename the section title of the assessment type. For example, if you rename Inherent assessment as Gross assessment, the new title will be displayed in all sections where the Inherent assessment was previously referred.
Score label	Option to rename the qualitative score label in the Scoring section of the assessment form. For example, if you rename Inherent risk as Gross risk, the new score label will be displayed in the scoring section where Inherent risk was previously referred.
Annual loss expectancy label	Option to rename the quantitative score label in the Scoring section of the assessment form. For example, if you rename Inherent ALE as Gross ALE, the new score label will be displayed in the scoring section where Inherent ALE was previously referred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inherent Assessment form (continued)

Field	Description
Heatmap Configuration	
This section appears only when the **Enable heatmap** option is selected.	
Factor for X-axis	Factor that appears on the X-axis of the heatmap. **Note:** Only qualitative factors of the type **Choice** or factors with the transformation criteria can be selected. For more information, see Transformation criteria.
Factor for Y-axis	Factor that appears on the Y-axis of the heatmap. **Note:** Only qualitative factors of the type **Choice** or with the transformation criteria can be selected. For more information, see Transformation criteria.

Configure a control effectiveness assessment

Configure and publish a control effectiveness assessment to assess the effectiveness of controls in mitigating risks.

Before you begin

Role required: sn_risk.admin

About this task

Configure the control assessment criteria with details such as factors, the scoring logic, and the rating criteria. You can also specify if you would like to assess the complete control environment or if you would like to assess controls individually. These details are the aspects on which the risk assessment is performed. You can also enable the options to add existing controls or new controls during an assessment. This exercise ensures that each risk assessment methodology (RAM) has its own control assessment criteria.

Procedure

1. Navigate to the RAM form that has inherent risk as an assessment type.
2. Under the Assessment Types related list, select **Control Assessment**.
3. On the form, fill in the fields.

   For a description of the field values on the control assessment form, see Control Assessment form.

4. Select the Factors section and select **Edit**.
   The Factors related list appears only when **Control environment assessment** is selected from the **Calculate based on** field.
5. Add the necessary factors from the Collection list to the Factors list, and select **Save**.
6. Select the Qualitative Rating Criteria related list and select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the form, fill in the fields.

Qualitative Rating Criteria form

Field	Description
Lower rating interval	Range for qualitative risk ratings. For example, for a range of 0–10, you can enter 0 as the lower range. And for a range of 11– 20, the value can be 11 as the lower range.
Risk rating	Severity of the risk. You can enter ratings such as high, medium, or low. For example, assume that the lower rating interval for the Low rating is 0, and that the lower rating interval for the Medium rating is 11. If the risk score is 15, then the rating criterion is Medium because 15 is in the range of 11–20.
Overridden score	Score that the risk assessor can use to override the computed score.
Risk color style	Color code style for the background color on the risk rating value and for the text color on the risk assessment instance. For example, for a high risk, you can select the Red color style with the background color as red and the text as black.

Note:
Don't enter negative values in the Qualitative Rating Criteria form.

8. To define the assessment result mapping for the applicable record types, do the following actions:

   These steps apply when conducting the control assessment on an object.

   a. Select the Assessment Result Mapping related list.
   The Assessment Result Mapping related list appears only when the **Update assessment results to source record** option is selected in the RAM.

   b. Select the record type.

   c. On the form, fill in the fields.

Applicable Record Type form

Field	Description
Risk assessment methodology	Name of the RAM. This field is automatically set based on the selected RAM.
Record Type	Name of the applicable record type. This field is automatically set based on the selected record type.
Control effectiveness	Column where the control effectiveness rating value is stored in the source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	record. After the assessment, the control effectiveness result is copied to the column selected in this field.

Note:
If the same record type is used in another risk assessment methodology, the source record will update based on the field defined in the RAM of the latest advanced risk assessment.

d. Select **Update**.

9. Select **Submit**.

10. Select **Publish**.

Result
The control assessment type is published.

Control Assessment form

Use the Control Assessment form in the Advanced Risk application to assess the effectiveness of controls in mitigating risks.

See the following table for a description of the field values.

Control Assessment form

Field	Description
Risk assessment methodology	Name of the risk assessment methodology used for control assessment. This field is automatically set based on your RAM.
State	State of the RAM. This field is automatically set to **Draft**.
Assessment contribution	Type of factor contribution. This field is automatically set to **Qualitative contribution**.
Calculate based on	Option to assess the types of control. Choices are the following: • **Control environment assessment**: Select this option if you don't want to assess individual controls, but instead want to assess the overall effectiveness of the control environment. • **Individual assessment of controls**: Select this option if you want to perform assessment for individual controls. For example, you can select the risk of employees accepting bribes and then assess each existing control to mitigate the risk of bribery. This option is available

Control Assessment form (continued)

Field	Description
	only when the Policy and Compliance Management (com.sn_compliance) plugin is activated.
Control identification	Option to decide how to identify the controls in the risk assessment instance. The choices are the following: • **None** • **From Library**: Use this option when you want to identify controls from the library on the risk assessment instance. • **Ad-hoc**: Use this option when you want to identify new controls on the risk assessment instance. • **From Library and Ad-hoc**: Use this option when you want to identify controls from the library as well as identify new controls. This field appears only when the **Calculate based on** field has the value **Individual assessment of controls**.
Factor for overall effectiveness	Manual, automated, or group factors to assess controls. This field appears only when the option **Individual assessment of controls** is selected from the **Calculate based on** field. Only qualitative factors or factors with the option to transform the qualitative score will be displayed in this field.
Qualitative scoring logic	Formula for calculating the scoring logic. Choices are the following: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses. • **Product**: Value derived by multiplying the factor responses. • **Weighted average**: Average value of the weighting of factors. This value is then classified as low, medium, or high. When

Control Assessment form (continued)

Field	Description
	this option is selected, the control weight is fetched from the control form. • **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.
Qualitative script variables	Format of the script and the variables used in the script. This field is available only when **Script** is selected from the **Qualitative scoring logic** field.
Qualitative script	User-defined script to compute the scoring logic. This field enables you to have more control over the score computation.
Section Labels	
This section appears only when **Configure section terminology** is selected in the RAM form. **Note:** Section label renaming applies only to the advanced risk assessment interface while leaving the terminology used in reports, dashboards, heatmaps, and other areas unchanged.	
Title	Option to rename the section title of the assessment type. For example, if you rename Control assessment as Preventive assessment, the new title will be displayed in all sections where the Control assessment was previously referred.
Score label	Option to rename the qualitative score label in the Scoring section of the assessment form. For example, if you rename Control risk as Preventive risk, the new score label will be displayed in the scoring section where Control risk was previously referred.

Configure a residual assessment

Configure and publish a residual assessment in the Advanced Risk application to assess the residual risks in your organization.

Before you begin

Role required: sn_risk.admin

About this task

Use a residual assessment to identify and assess the risks that exist after any controls are implemented. If no controls are identified, then the residual risk is the same as an inherent risk. If the factors for an inherent assessment are used a residual assessment, then you can copy the assessment contribution, qualitative scoring logic, factors, and qualitative rating criteria from the inherent assessment. You can also choose how you want to derive the score of the residual assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the risk assessment methodology (RAM) form that has the residual risk as an assessment type.
2. In the Assessment Types related list, select **Residual Assessment**.
3. On the form, fill in the fields.

   For a description of the field values on the residual assessment form, see Residual Assessment form.
4. **Optional:** If you selected **Factor responses** in the **Calculate based on** field, then select the Factors related list so that you can add factors to the residual assessment.
5. Select **Edit**, add the necessary factors, and then select **Save**.
6. **Optional:** If the **Calculate based on** field has **Inherent risk and control effectiveness** and if the **Qualitative scoring logic** field has **Lookup matrix between inherent assessment and control effectiveness**, then do the following actions:
   a. Select the Matrix related list.
   b. In the respective columns, enter the score, risk rating, risk color style, and overridden score.
7. Select the Qualitative Rating Criteria related list and select **New**.
8. On the form, fill in the fields.

Qualitative Rating Criteria form

Field	Description
Lower rating interval	Range for the qualitative risk ratings. For example, for a range of 0–10, you can enter 0 as the lower range. For a range of 11– 20, the value can be 11 as the lower range.
Risk rating	Severity of the risk. You can enter ratings such as high, medium, or low. For example, assume that the lower rating interval for the Low rating is 0, and that the lower rating interval for the Medium rating is 11. If the risk score is 15, then the rating criterion is Medium because 15 is in the range of 11–20.
Overridden score	Score that the risk assessor can use to override the computed score.
Risk color style	Color code style for the background color on the risk rating value and for the text color on the risk assessment instance. For example, for a high risk, you can select the Red color style with the background color as red and the text as black.
Risk appetite scale	Risk appetite scale for the risk rating criteria. Appetite scales must be mapped to the qualitative risk rating criteria in the risk assessment methodology. Compute the qualitative appetite status that is based on the latest assessment or aggregated rating to provide the qualitative appetite status. For example, you can select a risk appetite scale

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	of **Hungry** for the risk rating of **Very High**. This field appears only when the risk appetite feature is configured in the advanced risk assessment properties. **Important:** In a qualitative risk assessment, map the risk appetite scale to the risk rating criteria for the final assessment type. For example, if you have both residual and inherent assessments, map the risk appetite scale to the risk rating criteria in the residual assessment.

Note: Don't enter negative values in the Qualitative Rating Criteria form.

9. Select the Heatmap Colors related list.
   This related list appears only when all of the following are true:
   - The **Enable heatmap** option is selected.
   - The **Calculate based on** field has **Factor responses**.
   - The residual assessment is based on a matrix between the inherent assessment and control effectiveness.
10. In the Risk color style column, select the background color and text color combination.
11. To define the assessment result mapping for the applicable record types, do the following actions:

    These steps apply when conducting the residual assessment on an object.

    a. Select the Assessment Result Mapping related list.
    The Assessment Result Mapping related list appears only when the **Update assessment results to source record** option is selected in the RAM.

    b. Select the record type.

    c. On the form, fill in the fields.

Applicable Record Type form

Field	Description
Risk assessment methodology	Name of the RAM. This field is automatically set based on the selected RAM.
Record Type	Name of the applicable record type. This field is automatically set based on the selected record type.
Residual risk rating	Column where the residual risk rating value is stored in the source record. After the assessment, the residual risk rating result is copied to the column that is selected

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	in this field. This field appears only when the **Assessment contribution** field has **Qualitative** or **Both**.
Residual ALE	Column where the residual annual loss expectancy (ALE) value is stored in the source record. After the assessment, the residual ALE result is copied to the column that is selected in this field. This field appears only when the **Assessment contribution** field is set to is **Quantitative** or **Both**.

Note:
If the same record type is used in another risk assessment methodology, the source record will update based on the field defined in the RAM of the latest advanced risk assessment.

d. Select **Update**.

12. Select **Submit** and then select **Publish**.

Result
The assessment type is published.

Residual Assessment form

Use the Residual Assessment form in the Advanced Risk application to assess the residual risks in your organization.

See the following table for a description of the field values.

Residual Assessment form

Field	Description
Risk assessment methodology	Name of the RAM. This field is automatically set based on the selected RAM.
Calculate based on	Options for calculating the assessment score: • **Inherent risk and control effectiveness**: Makes the assessment qualitative. The comparison between inherent and control effectiveness is always qualitative. • **Factor responses**: Bases the residual factors' calculation on responses to manual factors.
Assessment contribution	Type of factor contribution: • **Quantitative** • **Qualitative** • **Both**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Residual Assessment form (continued)

Field	Description
	If **Inherent risk and control effectiveness** is selected in the **Calculate based on** field, then this field is automatically set to **Qualitative**. The field can't be modified.
Factors same as inherent	Option to automatically copy the assessment contribution, qualitative scoring logic, factors, and qualitative rating criteria from the inherent assessment. **Note:** This option appears only when the **Calculate based on field** field has the **Factor responses** value.
Enable heatmap	Option to enable you to view the heatmap report on the Advanced Risk dashboard. **Note:** This option can be selected only if a minimum of two factors are added to the assessment type.
Qualitative score	
Qualitative scoring logic	Scoring logic to be used. The options for this field change based on the option that is selected in the **Calculate based on** field. When the **Calculate based on** field has **Inherent risk and control effectiveness**, the options are as follows: • **Lookup matrix between inherent assessment and control effectiveness**: Generates a matrix between the inherent assessment and control effectiveness assessment. It performs a Cartesian product to generate scores. You can view the matrix in the Matrix related list. For example, if the inherent risk is high and the control effectiveness is low, then the residual risk is also high. • **Inherent score-control effectiveness score**: Provides the difference between the inherent score and the control effectiveness score. • **Inherent score/control effectiveness score**: Provides the value that is derived by dividing the inherent score by the control effectiveness score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Residual Assessment form (continued)

Field	Description
	• **Script**: Use a custom script to calculate the qualitative score. The Script option enables you to create a customized calculation method that aligns with your organization's unique requirements and risk assessment approach. **Note:** You can write or modify scripts only for assessment types that aren't published. When the **Calculate based on** field has **Factor responses**, the options are as follows: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses. • **Product**: Value derived by multiplying the factor responses. • **Weighted average**: Average value of the weighting of factors. This value is then classified as low, medium, or high. • **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.
Quantitative score	
This section appears only when the value **Quantitative** is selected from the **Factor contribution** field.	
Quantitative scoring logic	Scoring logic to be used: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Residual Assessment form (continued)

Field	Description
	• **Product**: Value that is derived by multiplying the factor responses. • **Script**: User-defined formula to calculate the score. This option is available only to users with the sn_grc.developer role.
Section Labels	
This section appears only when **Configure section terminology** is selected in the RAM form. **Note:** Section label renaming applies only to the advanced risk assessment interface while leaving the terminology used in reports, dashboards, heatmaps, and other areas unchanged.	
Title	Option to rename the section title of the assessment type. For example, if you rename Residual assessment as Net assessment, the new title will be displayed in all sections where the Residual assessment was previously referred.
Score label	Option to rename the qualitative score label in the Scoring section of the assessment form. For example, if you rename Residual risk as Net risk, the new score label will be displayed in the scoring section where Residual risk was previously referred.
Annual loss expectancy label	Option to rename the quantitative score label in the Scoring section of the assessment form. For example, if you rename Residual ALE as Net ALE, the new score label will be displayed in the scoring section where Residual ALE was previously referred.
Heatmap Configuration	
This section appears only when the **Enable heatmap** option is selected.	
Factor for X-axis	Factor that appears on the X-axis of the heatmap. **Note:** Only the qualitative factors of type **Choice** or factors with the transformation criteria can be selected. For more information, see Transformation criteria.
Factor for Y-axis	Factor that appears on the Y-axis of the heatmap.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Residual Assessment form (continued)

Field	Description
	Note: Only the qualitative factors of type **Choice** or with the transformation criteria can be selected. For more information, see Transformation criteria.

Configure a target assessment

Configure and publish a target assessment in the Advanced Risk application to assess your desired future risk level. By configuring a target assessment, you enable the assessors and approvers to perform a target risk assessment in the Next Experience.

Before you begin

Role required: sn_risk.admin

About this task

Configure a target assessment to assess the future risks levels. Similar to inherent and residual assessments, you can define the criteria for conducting target assessments. Configuration includes specifying factors, scoring logic, rating criteria, and heatmap configuration.

Procedure

1. Navigate to the Risk assessment methodology (RAM) form that has the target risk as an assessment type.
2. In the Assessment Types related list, select **Target Assessment**.
3. On the form, fill in the fields.

   For a description of the field values on the Target assessment form, see Target assessment form.

4. **Note:** If you selected **Factor responses** in the **Calculate based on** field, then you have to add factors to the assessment manually.

   To add factors, select the Factors related list and then do the following steps:

   a. Select **Edit**.

   b. Select the factors and add them to the Factors List.

   c. Select **Save**.

5. **Optional:** To add qualitative rating criteria, select the Qualitative Rating Criteria related list and select **New**.
6. On the form, fill in the fields.

Qualitative Rating Criteria form

Field	Description
Lower rating interval	Range for the qualitative risk ratings. For example, for a range of 0–10, you can enter 0

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	as the lower range. For a range of 11– 20, the value can be 11 as the lower range.
Risk rating	Severity of the risk. You can enter ratings such as high, medium, or low. For example, assume that the lower rating interval for the Low rating is 0, and that the lower rating interval for the Medium rating is 11. If the risk score is 15, then the rating criterion is Medium because 15 is in the range of 11–20.
Overridden score	Score that the risk assessor can use to override the computed score. This score is associated with the risk when the rating is overridden.
Risk color style	Color code style for the background color on the risk rating value and for the text color on the risk assessment instance. For example, for a high risk, you can select the Red color style with the background color as red and the text as black.
Risk appetite scale	Risk appetite scale for the risk rating criteria. Appetite scales must be separately mapped to the qualitative risk rating criteria for Target Assessment in the RAM form. For example, you can select a risk appetite scale of **Hungry** for the risk rating of **Very High**. This field appears only when the risk appetite feature is configured in the advanced risk assessment properties. Future appetite status is calculated based on the defined risk appetite and the target risk profile. **Note:** The future appetite status can't be aggregated or rolled up to any specific entities, risk statements, or individual risks.

Note:
Avoid entering negative values in the Qualitative Rating Criteria form.

7. Select **Submit**.
8. **Optional:** If you select the **Enable heatmap** option, you can do the following actions:
   a. To specify the risk color style, select the Heatmap Colors related list.
   b. In the Risk color style column, specify the risk color style.
   c. Select **Submit**.
9. To define the assessment result mapping for the applicable record types, do the following actions:

   These steps apply when conducting the target assessment on an object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the Assessment Result Mapping related list.
The Assessment Result Mapping related list appears only when the **Update assessment results to source record** option is selected in the RAM.

b. Select the record type.

c. On the form, fill in the fields.

Applicable Record Type form

Field	Description
Risk assessment methodology	Name of the RAM. This field is automatically set based on the selected RAM.
Record Type	Name of the applicable record type. This field is automatically set based on the selected record type.
Target risk rating	Column where the target risk rating value is stored in the source record. After the assessment, the target risk rating result is copied to the column that is selected in this field. This field appears only when the **Assessment contribution** field has **Qualitative** or **Both**.
Target ALE	Column where the target annual loss expectancy (ALE) value is stored in the source record. After the assessment, the target ALE result is copied to the column that is selected in this field. This field appears only when the **Assessment contribution** field is set to is **Quantitative** or **Both**.

Note:
If the same record type is used in another risk assessment methodology, the source record will update based on the field defined in the RAM of the latest advanced risk assessment.

d. Select **Update**.

10. Select **Publish.**

Target assessment form

Use the Target Assessment form in the Advanced Risk application to assess the desired future risk level in your organization.

See the following table for a description of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target Assessment form

Field	Description
Risk assessment methodology	Name of the RAM to which this target assessment belongs. This field is automatically set based on the selected RAM.
State	Current state of the assessment type. This field is automatically set to **Draft**.
Calculate based on	Options for calculating the assessment score: • **Factor responses**: Option to select individual factors for the target assessment. • **Factors same as inherent**: Option to copy the assessment contribution, scoring logic, and factors from the inherent assessment. • **Factors same as residual**: Option to copy the assessment contribution, scoring logic, and factors from the residual assessment. • **Overall assessment**: Option to continue without any factors selection. Assessors can directly provide rating or Annual loss expectancy (ALE) for the assessment.
Assessment contribution	Type of factor contribution: • **Quantitative** • **Qualitative** • **Both** **Note:** If **Factors same as inherent** or **Factors same as residual** is selected in the **Calculate based on** field, then **Assessment contribution** field is automatically set to a value defined in the inherent and residual assessment types. The field can't be modified.
Enable heatmap	Option to enable you to view the heatmap report on the Advanced Risk dashboard. **Note:** This option can be selected only if a minimum of two factors are added to the assessment type.
Copy rating criteria from inherent	Option to copy the qualitative rating criteria from the inherent assessment. This option appears only when the value **Factors same as inherent** is selected from the **Calculate based on** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target Assessment form (continued)

Field	Description
Copy rating criteria from residual	Option to copy the qualitative rating criteria from the residual assessment. This option appears only when the value **Factors same as residual** is selected from the **Calculate based on** field.
Qualitative score	
This section appears only when the value **Qualitative** or **Both** is selected from the **Assessment contribution** field.	
Qualitative scoring logic	Formulae to calculate the qualitative scoring. You can modify the **Qualitative scoring logic** field only when the value **Factor responses** is selected from the **Calculate based on** field. The options are as follows: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses. • **Product**: Value derived by multiplying the factor responses. • **Weighted average**: Average value of the weighting of factors. This value is then classified as low, medium, or high. • **Script**: Use a custom script to calculate the qualitative score. The Script option enables you to create a customized calculation method that aligns with your organization's unique requirements and risk assessment approach. This option is available only to users with the sn_grc.developer role. **Note:** Only users with the sn_grc.developer role can write or modify scripts for assessment types that aren't published.
Quantitative score	
This section appears only when the value **Quantitative** or **Both** is selected from the **Assessment contribution** field.	
Quantitative scoring logic	Formulae to calculate the quantitative scoring. You can modify the **Quantitative scoring logic** field only when the value **Factor responses**

© 2026 ServiceNow, Inc. All rights reserved.

Target Assessment form (continued)

Field	Description
	is selected from the **Calculate based on** field. The options are as follows: • **Sum**: Sum of the factor responses. • **Minimum**: Minimum value of the factor responses. • **Maximum**: Maximum value of the factor responses. • **Average**: Average value of the factor responses. • **Product**: Value that is derived by multiplying the factor responses. • **Script**: Use a custom script to calculate the quantitative score. The Script option enables you to create a customized calculation method that aligns with your organization's unique requirements and risk assessment approach. **Note:** Only users with the sn_grc.developer role can write or modify scripts for assessment types that aren't published.
Section Labels	
This section appears only when the **Configure section terminology** option is selected in the RAM form. **Note:** Section label renaming applies only to the advanced risk assessment interface while leaving the terminology used in reports, dashboards, heatmaps, and other areas unchanged.	
Title	Option to rename the section title of the assessment type. For example, if you rename Target assessment as Future assessment, the new title will be displayed in all sections where the Target assessment was previously referred.
Score label	Option to rename the qualitative score label in the Scoring section of the assessment form. For example, if you rename Target risk as Future risk, the new score label will be displayed in the scoring section where Target risk was previously referred.
Annual loss expectancy label	Option to rename the quantitative score label in the Scoring section of the assessment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target Assessment form (continued)

Field	Description
	form. For example, if you rename Target ALE as Future ALE, the new score label will be displayed in the scoring section where Target ALE was previously referred.
Other Configurations	
Assessment is required	Option to make the target assessment either always required or conditionally required based on specific conditions. The options are as follows: • **Always**: Option to make the target assessment required regardless of any specific conditions. • **On specific conditions**: Option to make the target assessment required based on specific conditions using the condition builder. • **On specific conditions specified through script**: Option to make the target assessment required using a predefined script or set of instructions. The Script option enables you to create a customized condition that align with your organization's unique requirements and risk assessment approach. **Note:** Only users with the sn_grc.developer role can write or modify scripts.
Heatmap Configuration	
This section appears only when the **Enable heatmap** option is selected.	
Factor for X-axis	Factor that appears on the X-axis of the heatmap. **Note:** Only the qualitative factors of type **Choice** or factors with the transformation criteria can be selected. For more information, see Transformation criteria.
Factor for Y-axis	Factor that appears on the Y-axis of the heatmap.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Target Assessment form (continued)

Field	Description
	Note: Only the qualitative factors of type **Choice** or with the transformation criteria can be selected. For more information, see Transformation criteria.

Create risk color styles

Create a library of risk color styles to use for different assessment types and matrixes. A risk color style is a combination of a background color and a text color. The color styles help maintain consistency when you configure risk assessments.

Before you begin

Role required: sn_risk.admin

About this task

ServiceNow® provides preconfigured color styles. You can either modify the preconfigured colors or create your own color styles.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Color Styles**.
2. Select **New**.
3. On the form, fill in the fields.

Risk Color Style form

Field	Description
Color style	Name of the text and color code combination. For example, `High Risk`.
Next experience color styles	
Note: The default color for the customized risk color style is set to Critical, with the variant set to Primary. You can manually change the color and variant based on the requirement.	
Color	Color that appears as the background color. It's the fundamental hue from which different shades variants are derived.
Variant	Variant refers to different shades or tints of the base color. The options are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Primary**: Standard or base shade of the color. It's typically the most pure or neutral version of the color. ○ **Secondary**: Lighter shade of the primary color. ○ **Tertiary**: Lightest shade of the primary color.
Preview	Visual representation of how the selected color and its variants appear in the interface.
Classic color styles	
Rating color	Color that appears as the background color.
Text color	Color that appears as the text color.

4. Select **Submit**.

Result
The risk color style is ready to use.

Configure risk heatmaps

Within a risk assessment methodology (RAM), configure the heatmap visualization for inherent and residual assessments. Use different heatmaps for different risk assessment methodologies.

Before you begin
Role required: sn_risk.admin

About this task
Configure the heatmap using the prepackaged heatmap widgets. Map the configured heatmaps to a dashboard to monitor the risk posture of the RAM.

Procedure
1. Navigate to the dashboard where you want to add the heatmap.
2. In the upper-right corner, change the selected application from Global to GRC: Advanced Risk.
3. To add widgets, select the plus + icon in the upper right.
4. From the Add Widgets list, select one of the following.
   - **Advanced inherent heatmap**.
   - **Advanced residual heatmap** to configure the inherent heatmap or the residual heatmap respectively.
5. If you want to reuse an existing filter for the RAM, then do the following:
   a. Select **Interactive Filters** from the **Add Widgets** list
   b. Select **Reference**
   c. Select **Risk Assessment Methodologies**.
   Alternatively, you can create your own filter on the RAM table and add it on the dashboard tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The selected heatmap appears on the dashboard.

Create a risk assessment scope and initiate assessments

Create a risk assessment scope to define and identify risks for an entity. Identify assessors and approvers for assessments, and define the frequency of assessments.

Before you begin
Role required: sn_risk.admin

About this task
You can initiate assessments after you create the scope. This process provides visibility and accurate reporting for the management team.

Procedure
1. Navigate to **All** > **Advanced Risk Assessment** > **Risk Assessment Scope** > **Create**.
2. On form, fill in the fields.

Risk Assessment Scope form

Field	Description
Risk assessment methodology	Risk assessment methodology (RAM) that you use to assess risks.
Assessable Entity	Entities that are related to the entity classes that are selected in the **Applicable entity classes** field on the RAM. The value of this field changes based on the entity classes specified in your selected RAM. Only those entities that belong to the selected classes are displayed in this field.
Owner	Owner of the entity. This field is automatically set based on the entity owner.

3. Right-click and save the form.
4. **Optional:** To view a summary of assessments, click the Summary section.
   The Summary section has the following fields. These fields are populated only when you add risks to the assessment scope and when you initiate assessments:
   - **No. of risk assessments closed**
   - **No. of risks not assessed**
   - **No. of ongoing risk assessments**
5. Right-click to save the form.
6. If you want to add existing risks, then do the following:
   a. In the Risks related list, click **Add** to add existing risks.
   b. From the Choose Risks window, select the risks that you want to add.
   c. Click **Add Risks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. To select control objectives that do not have a control for the entity, click **Create from library**.

e. From the Choose Risk Statements window, select what risk statements to apply and click **Create From Library**.

f. Click **Initiate Assessments** either for all the risk records or for the selected risk records. Ensure that the selected records are in either the Draft or Closed state.

g. To add new risks, click **New**, fill in the details, and click **Submit**.
The newly added risks appear in the Risks related list.

7. To apply the new settings, click **Settings**.
8. On the form, fill in the fields.

Assessor, approver, and frequency form

Field	Description
Assessor type	User or group who is responsible for assessing the risk. Choices are the following: ○ **Same as risk owner** ○ **Specify users** ○ **Specify groups** ○ **Same as entity owner**
Assessor	User who is responsible for assessing the risk. This field appears only when **Specify users** is selected from the **Assessor type** field.
Assessor group	Group that is responsible for assessing the risk. This field appears only when **Specify groups** is selected from the **Assessor type** field.
Reassessment frequency	Frequency of assessment. Choices are the following: ○ **None** ○ **Weekly** ○ **Monthly** ○ **Quarterly** ○ **Semi-annually** ○ **Annually**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you need to perform an unplanned risk assessment before the next reassessment date, then the next assessment date will be based on the frequency set in the previous assessment. For example, if your frequency is set as monthly and you perform your first assessment on January1, and then you perform an unplanned assessment on January 15, then the next assessment will still be based on the previous assessment date.
Days to overdue	Number that is used to calculate the due date of the assessment starting from the date the assessment is initiated. For example, if the value in this field is 10, then the due date of the assessment will be 10 days after the date the assessment is initiated. The default value is 5.
Approver type	User or group who is responsible for approving the assessment. Choices are the following: ○ **Same as entity owner** ○ **Same as assessor's manager** ○ **Specify users** ○ **Specify groups** ○ **None**
Approver	User who is responsible for approving the assessment. This field appears only when **Specify users** is selected from the **Approver type** field.
Approver group	Group that is responsible for approving the assessment. This field appears only when **Specify groups** is selected from the **Approver type** field.

The settings that you select in this step apply to all the new risks that are added to this scope.

9. To save the form, click **Submit**.
10. To generate the assessments, click **Initiate all assessments**.
    When you generate an assessment, the assessor receives an email notification stating that the assessment is assigned to the assessor or to the assessor's group.

What to do next

If you want to cancel an assessment for risks that no longer need to be assessed, select the assessment and click **Cancel Assessments**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When a risk assessment is canceled, the risk assessors are notified about the cancellation and the tasks are removed from their queue.

Simulate a risk assessment

Simulate a risk assessment to verify the associated risk assessment methodology (RAM) configuration when it is in the draft state.

Before you begin
Role required: sn_risk.admin

About this task
To modify the configuration of a published RAM, you need to delete all its assessments manually and change the RAM state to Draft. The simulation of risk assessment enables you to verify the RAM configuration when the RAM is in the draft state. This feature helps you to validate a factor, scoring logic, and the workflow and make necessary changes to the RAM before it is published. The simulated risk assessments are not used for risk aggregation and are deleted after the RAM is modified or published.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Administration** > **Risk Assessment Methodologies**.
2. Select and open the RAM for which you want to verify the configuration.

   Important:
   You should select a RAM that is in the draft state.

3. Click **Simulate**.

   Important:
   This button appears only when all the assessment types for the selected RAM are published.

   A dialog box appears for the risk or object selection.

4. Select a risk or object that you want to simulate.

   Important:
   You can select risks and objects that belong to the entity classes and tables specified in the RAM.

5. Click **Submit**.
   A simulated risk assessment is created, and a success message appears with the risk assessment number. You can click and open the risk assessment number to perform the assessment.
6. **Optional:** To view all the simulated assessments for the selected RAM, click **View simulated assessments**.

Assess risks and objects on an assessment instance

Assess the risks that you have configured and reassign the risks to relevant approvers.

Before you begin
Role required: sn_grc.business_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must manually assign the advanced risk assessment roles to the sn_grc.business_user role. To understand how you can adjust granting of roles and groups, see the How to adjust granting of roles and groups to use background jobs [KB0963693] article in the Now Support Knowledge Base.

Procedure

1. Navigate to **All** > **Advanced Risk Assessment** > **Risk Assessment Tasks** > **My Tasks**.
   The assessment is in the **Ready to assess** state.
2. To begin the assessment, click **Assess**.
   The work flow moves to the first risk assessment type. If a particular assessment type is not configured, then that section does not appear on the form.
3. **Optional:** To reassign an assessment, click **Reassign** and enter the name of the person who you want to reassign the assessment to.
4. Click the Inherent Assessment section and answer the questions on the form.
   a. Right-click and save the form.
   b. To move to the next assessment, click **Inherent Assessment** and fill in the fields.

Inherent Assessment section

Field	Description
Results	
Computed inherent risk	Inherent risk score.
Override computed score	Option to override the computed inherent score.
Computed inherent ALE	Computed inherent ALE of the risk. The ALE is calculated based on the inherent assessment factors.
Override inherent risk	Value that was configured in the RAM form to override the computed inherent risk score. This field is available only when the **Override computed score** option is selected.
Override inherent ALE	Value that overrides the computed inherent risk score. The value is used for rollup.
Comments	Additional information that provides more details for the risk assessment approver. Users must enter a reason for overriding the computed score. This field is required when the **Override computed score** option is selected.

   c. If necessary, add comments in the **Comments** column.
   d. Click **Save and calculate**.
5. To perform control assessment, click **Perform control assessment** and do the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the form, fill in the fields.

Control Assessment section

Field	Description
Results	
Computed control effectiveness	Control effectiveness score.
Override computed score	Option for overriding the computed control effectiveness score.
Comments	Additional information that provides more details for the risk assessment approver. This field is required when the **Override computed score** option is selected.

Note:
If you have selected **Individual assessment of controls** in the **Calculate based on** field in the Control Assessment form, then you can create controls from the library, add existing controls, add new controls, or remove existing controls. Use guidance text for assistance in answering the factors. To determine if the control is compliant, see the Status column.

b. To create, add, or remove controls, perform one of the following actions:

Choice	Action
To create controls from the library	**i.** Click **Create From Library** from the Choose Controls window. **ii.** Select the necessary control objectives. **iii.** Click **Add controls**.
To add an existing control	**i.** Click **Add**. **ii.** Select the controls. **iii.** Click **Add controls**.
To create a new control	**i.** Fill in the fields in the New Control window. **ii.** Click **Submit**.
To remove any control	**i.** Click **Remove** from the Choose Controls window. **ii.** Select the controls that you want to remove. **iii.** Click **Remove controls**.

If the risk has default controls, then those controls are automatically added to the control assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. If you do not have any controls that are associated with the risk or object that you must assess, then select the **No mitigating controls to assess** option.
If you choose not to assess the mitigating controls, then the residual risks are by default marked as not applicable in the residual assessment stage. However, if a risk has associated mitigating controls, then the users do not see the **No mitigating controls to assess** option.

d. If you opt out of assessing controls, enter a justification in the **Comments** field.

e. Click **Save and calculate**.

6. To move to the next assessment, click **Perform residual assessment** and do the following.

a. On the form, fill in the fields.

Residual Assessment section

Field	Description
Results	
Computed residual risk	Residual risk score.
Comments	Additional information that provides more details for the risk assessment approver. This field is required when the **Override computed score** option is selected.

Note:
You can add existing controls and new controls during this stage. You can also remove controls that you might have wrongly added. The factors that appear for residual assessment are the factors that you have configured in the factor form. The answers that you provide for these factors determine the control assessment score. The score is based on the qualitative weight, qualitative score, and quantitative score.

b. If you want to assess a residual risk but you have opted not to assess mitigating controls, then clear the **Residual risk not applicable** field.
If you do not want to assess a residual risk, then do not change the field.

c. Right-click and save the form.

7. To move to the next state and respond to the risks that you have assessed, click **Respond**.

a. In the **Risk Response** tab, click **Risk response** and select one or more risk responses from the following options:

- **None**: Do not select any response for the risk.
- **Accept**: Accept and acknowledge the risk.
- **Avoid**: Eliminate the risk or its impact.
- **Mitigate**: Lessen the impact or probability of the risk.
- **Transfer**: Transfer the responsibility to a third party.

b. Right-click and save the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If multiple risk responses are selected, risk response tasks are created.

8. Click the Risk Response task related list, assign the task to an appropriate user, and right-click to save the form.
   This related list only appears when the **Enable risk response** option is selected by the risk administrator during the RAM configuration.
9. In the **Comments** field, enter comments.
10. To view the activities for this assessment, click **Activity Journal**.
11. To finish your assessment and send it for approval, click **Save** and then click **Request Approval**.
    The approver that you have selected in the risk assessment scope gets an email notification to approve or reject the risk assessment instance. If there are no approvers, the risk assessment instance moves to the Monitor state.

What to do next

To view the summary of the assessment, click **Assessment Summary**.

Assess risks

Use the classic risk assessment and assess the risks in your organization.

Create a risk assessment using the Risk Assessment Designer

Use the Risk Assessment Designer to create and edit metric types, use different metric types for different risks, select multiple respondents for a risk assessment, as well as change scoring parameters. The Question Bank offers a library of questions for various categories, so you do not have to build each questionnaire from scratch.

Before you begin

Role required: sn_risk.asmt_creator, sn_risk.manager

Procedure

1. Navigate to **All** > **Risk** > **Administration** > **Assessment Types**.
2. Click **Risk Assessment Designer**.
   The designer contains the following elements:

Element	Description
Controls	Supported question data types are available in the Controls palette. Drag a control onto the designer canvas to create a question of that type.
Questions	A library of questions for various categories, so you do not have to build each questionnaire from scratch.
Categories	New assessment open in the **Design** view. The questionnaire **Name** field appears above the first category in the canvas. A blank question field appears in the category container.

3. Enter a name in the **Name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Drag a control onto the designer canvas to create a question of that type.

Question controls

Data type	Description	Scored
Attachment	Question with a Manage Attachments icon that allows users to attach one or more files.	Y
Boolean	Question with a check box or a **Yes/No** list for user responses.	
Choice	List of predefined options. For more information, see the definition for **Choices**.	Y
Date	Date field.	N
Date/Time	Date and time field.	N
Number	Number field with predefined minimum and maximum values. The default is 1-10.	N
Percentage	Percentage field with a prescribed range.	N
Scale	Predefined Likert scale. Answer options appear as radio buttons.	Y
Numeric Scale	Selectable number scale. The default is 1-5. Answer options appear as radio buttons.	Y
String	Single or multi-line text field.	N
Template	Choice list of templates that provide a predefined scale of options.	Y
Reference	Choice list of fields from a specified reference table. This data type does not support reference qualifiers.	

Note:
Set the correct answer for the metric that you want to be scored. Scored metrics determine the compliance status of the risk.

5. Click one of the following tabs to change the view in the canvas.

Option	Description
Design	Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
Configuration	Create introductions and end notes for attes tations, and select a signature.
Availability	Select the recipients for each category in the attestation.

6. Point to the menu icon in the upper right of the designer to select one of the following options.

Note:
The availability of each option depends on the status of the assessment that is opened in the designer.

Option	Description
Save	Save the current assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Preview	Display a preview to the selected recipients.
Publish	Distributes the assessment to the selected re cipients.
Save and Publish	Saves and distributes the assessment in one step.
New Attestation	Opens a fresh canvas for a new assessment.
Load Attestation	Opens a list of existing assessment that you can select and edit.

Unlike other types of assessments, risk assessments do not appear in the **Self-Service** > **My assessments & surveys** module, because hundreds of control attestations could be generated at once. Instead,risk assessments are shown as a list in the **Risk** > **Risk Register** > **My Assessments** and **Risk** > **Risk Register** > **All Assessments** module.

Create an assessment type

The risk manager can create a set of questions for each risk assessment.

Before you begin

Role required: sn_risk.asmt_creator or sn_risk.manager or sn_risk.administrator

Procedure

1. Navigate to **All** > **Risk** > **Administration** > **Assessment Types**.
2. Select **New**.
3. On the form, fill in the fields.

Assessment Metric Type form

Field	Description
Name	Name of the assessment type.
Assessment duration	Number of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated.
Table	Table that contains the records you want to evaluate. The system creates assessable records for records on this table that meet the conditions you specify, if any. The number of matching records appears as a link by the **Condition** field. If you change the table selection, the link dynamically updates. Select the link to open the list of matching records in a new tab or window. **Note:** More roles are required to view the records on certain tables. If you select a table that you don't have access to, a warning message appears by the Condition field where the number of matching records would be. You can't generate assessable records for tables you don't have sufficient roles for.
Scale factor	Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you're satisfied with before you save the metric type.
Condition	Condition builder that defines specific records to assess from the selected table. If you don't specify any conditions, the system creates assessable records for all records on the selected table. Select the refresh icon to update the adjacent record count. **Note:** If you change the table or conditions, you must select **Generate Assessable Records** to create new assessable records.
Description	Helpful information about this type. Enter a clear description of the type and its purpose.
State	Status of the assessment: **Draft** or **Published**.
Enforce condition	Option that determines what happens to assessable records when you change the selected table or conditions.
Roles	Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record and to the associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrixes. **Note:** Users with these roles don't have access to Assessments modules unless they're assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to grant user access to specific assessment data in special cases. For example, the Vendor metric type provides access to users with the vendor_manager role to view results and compare assessable records when they open scorecards or decision matrixes in the Vendor Performance application.

4. Select **Submit**.

Assess risk for a policy exception

After the review of a policy exception request and before deciding to approve or reject a request, the compliance manager may choose to request a risk assessment by the risk manager.

Before you begin
Role required: compliance manager

About this task
For more information, see Manage policy exceptions and extensions.

Procedure
1. Navigate to **All** > **Policy and Compliance** > **My Policy Exceptions**.
2. Select the policy exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Review the form details, as necessary.
4. Click the Business Impact Analysis tab and update the following fields:

Policy exception request Business Impact Analysis tab

Field	Value
Risk description	Description of the risk.
Residual likelihood	Likelihood of the risk occurring. If it is not **None**, select the likelihood of this risk occurring: ○ **5 — Extremely Likely** ○ **4 — Likely** ○ **3 — Neutral** ○ **2 — Unlikely** ○ **1 — Extremely Unlikely**
Residual impact	Residual impact of the risk. If it is not **None**, select the residual impact of this risk: ○ **5 — Very High** ○ **4 — High** ○ **3 — Moderate** ○ **2 — Low** ○ **1 — Very Low**
Residual score	Value calculated after you select a residual likelihood and residual impact rating: ○ **5 — Very High** ○ **4 — High** ○ **3 — Moderate** ○ **2 — Low** ○ **1 — Very Low**

5. Perform one of the following actions.

6. Click **Update**.

Assess a risk

Risks start in a **Draft** state then move to the **Assess** state.

Before you begin

Role required: sn_grc.user

About this task

Risk assessments do not appear in the **Self-Service** > **My assessments & surveys** module, because hundreds of GRC assessment records could be generated at once. Instead, risk assessments are shown in a separate list view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Risk Register** > **My Assessments**.
2. Open the assessment and review the details.

Option	Description
If you are unable to answer the questions	**a.** Reassign the assessment to another user in the **Assigned to** field. **b.** Click **Update** and close the record. **Note:** Only a user with the sn_grc.user role can be re-assigned the assessment. The list of assessments refreshes when you reassign an assessment to another user.
If you are able to answer the questions	**a.** Click **Take assessment**. **b.** Answer the questions and attach informa tion, as required. **c.** Click **Submit**. The list of assessments refreshes when you close the **Take Assessment** pop-up window.

Manage a business process

Create and manage business processes in your organization.

Create a business process

Create a business process and define the owners, approvers, business criticality, and review frequency for the process.

Before you begin

Role required: business_process_admin

Procedure

1. Navigate to **All** > **CSDM** > **Design** > **Business Process**.
2. Click **New**.
3. On the form, fill in the fields.

Business Process form

Field	Description
Name	Name of the business process.
Parent	Parent business process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If a parent process exists, it creates a hierarchy of business processes.
Life cycle stage	Stage of the business process in the business life cycle. The stage determines the status and displays the actions. **Note:** This field is automatically set to **Ideation** when you save the form for a process in the Draft state.
Review frequency	Frequency for reviewing the business process.
Life cycle stage status	Status of the business process within the life-cycle stages. **Note:** This field is automatically set to **Under Evaluation** when you save the form for a process in the Draft state.
Next review date	Planned date on which the business process must be reviewed. The value in this field is automatically set only after the business process is approved.
Description	Short description of the business process. The description can include the background, the actual steps, and the interaction of the process.
Ownership	
Managed by group	Group that maintains the business process.
Approval group	Group that must review and approve the business process.
Owned by	User responsible for the business process. This user is a member of the Managed by group.
Business Impact	
Business criticality declared	Criticality of the business process based on your subjective assessment. The choices are: ○ **1- most critical** ○ **2- somewhat critical** ○ **3- less critical** ○ **4- not critical**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Impact to confidentiality	Risk rating for the risk of loss of confidentiality. Confidentiality loss leads to leakage of confidential information. The choices are the following: ○ **High** ○ **Medium** ○ **Low**
Impact to availability	Risk rating for the risk of loss of availability. Unavailability of the system may cause delays in decision making, business interruptions, loss of revenue, and customer dissatisfaction. The choices are the following: ○ **High** ○ **Medium** ○ **Low**
Business criticality determined	Computed criticality of the business process based on the assessment of the subprocesses. The choices are the following: ○ **1- most critical** ○ **2- somewhat critical** ○ **3- less critical** ○ **4- not critical**
Impact to integrity	Risk rating for the risk of impact to integrity. Impact to integrity has consequences for businesses and employees, including fines and damage to your brand, reputation, and people. The choices are the following: ○ **High** ○ **Medium** ○ **Low**

4. Right-click on the form header and click **Save**.
   The record moves to the Draft state.
5. To send the record for review and approval, click **Review**.
   The values in the **Life cycle stage** field and the **Life cycle stage status** field change. The Approvals related list appears, and the members of the Approval list can view the record in their list of approvals.

Approve, reject, or delete a business process

If a new business process has identified approvers, then the approvers must review and approve the process before it can be published. The approvers can also reject or delete the process as necessary.

Before you begin

Role required: business_process_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Service Desk** > **My Approvals**.
2. Open the record that you want to approve.
3. In the **State** field, select one of the following options:
   - Not Yet Requested
   - Requested
   - Approved
   - Rejected
   - Canceled
   - No Longer Required
4. In the **Comments** field, enter your comments as required.
   If the reviewer rejects the record, then the reviewer must enter comments.
5. Select one of the following options.

Create a risk framework and associate risk statements to it

Risk managers create risk frameworks to group risk statements into manageable categories.

Before you begin

Role required: sn_risk.manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Library** > **Frameworks**.
2. Click **New**.
3. On the form, fill in the fields.

Risk Framework form

Field	Description
Number	Read-only field that is automatically populated with a unique identification number.
Active	Option that indicates whether the risk framework is active.
Name	The name of the risk framework.
Description	A description of the risk framework.
Additional information	Additional information for this risk framework.

4. Click **Submit**.
5. Select the risk framework from the list to reopen it.
6. In the **Risk Statements** related list, select **Edit** to add the risk statements to the risk framework.
7. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define risk statement hierarchy

Risk managers establish parent and child relationships on the risk statement form.

Before you begin

Role required: sn_risk.manager

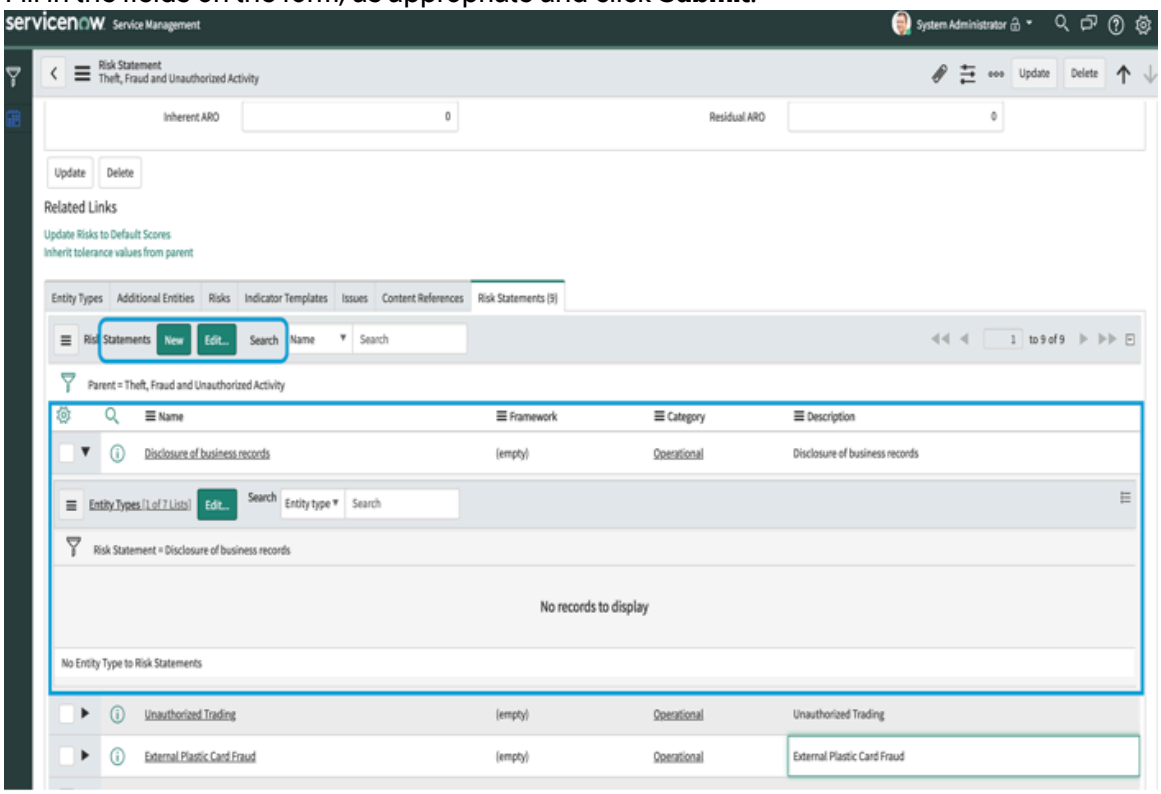
Procedure

1. Navigate to **All** > **Risk** > **Risk Library** > **Risk Statements**.
2. Click **New**.
3. On the form, fill in the fields.

> **Note:**
> When any of the following statement fields changes: Name, Description, Reference, Category, Type, Classification, and Attestation, all the associated controls and risks are updated, and their state is set back to Draft.

Risk Statement from

Field	Description
Name	Name of the risk statement.
Parent * this field is visible only when Advanced Risk has been downloaded.	Parent risk statement to this risk statement. ○ Users select the appropriate parent from the taxonomy structure. ○ If no parent is specified, the risk statement becomes the root of the tree. ○ It is possible to have several of these root-type risk statements within the organization. ○ A risk statement cannot be both a parent and a child of another risk statement.
Framework	Framework this risk statement is associated with.
Category	Choose a category. ○ Legal ○ Financial ○ Operational ○ Reputational ○ Legal/Regulatory ○ Credit ○ Market ○ IT
Assessment	Assessment associated with this risk statement.
Issue group rule	Issue group rule assigned to this risk statement for reporting and dashboard.
Description	Description of the risk statement.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional information	Additional information for this risk statement.
Default Scores	
Inherent SLE	Monetary value of a risk if it occurs before any mitigation strategies are in place.
Residual SLE	Monetary value of a risk if it occurs after all mitigation strategies are in place.
Inherent ARO	Probability that a risk occurs in any given year before any mitigation strategies are in place.
Residual ARO	Probability that a risk will occur in any given year after all mitigation strategies are in place.
Risk Rollup and Tolerance * this tab is visible only when Advanced Risk has been downloaded.	
Expected ALE	Enter currency and amount for the expected ALE. **Note:** This value must be less than or equal to the **Maximum acceptable ALE**.
Maximum acceptable ALE	Enter currency and amount for the maximum acceptable ALE. **Note:** This value must be greater than or equal to the**Expected ALE**.
Sum of calculated ALE	This is a calculation based on all the underlying risks or risk statements.
Average calculated ALE	This is a calculation based on all the underlying risks or risk statements.
Maximum calculated ALE	This is a calculation based on all the underlying risks or risk statements.
Minimum calculated ALE	This is a calculation based on all the underlying risks or risk statements.
Tolerance Status	Automatically calculated based on tolerance values. ○ If the **Calculated ALE** is less than or equal to the **Expected ALE** = Acceptable in green ○ If the **Calculated ALE** is greater than the **Expected ALE**, but less than or equal to the **Max acceptable ALE** = Needs Attention in orange ○ If the **Calculated ALE** is greater than the **Maximum acceptable ALE** = Unacceptable in red
Calculated Score	The corresponding score for the calculated ALE:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Low ○ Med ○ High

4. Click **Submit**.
5. To add children risk statements, click the **Risk Statements** related list, and click **New**.
6. Fill in the fields on the form, as appropriate and click **Submit**.

7. Repeat until you have added all the children risk statements related to this risk statement.

Create a risk statement

Risk managers create risk statements to group risks into manageable categories.

Before you begin

Role required: sn_risk.manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Library** > **Risk Statements**.
2. Click **New**.
3. On the form, fill in the fields.

> **Note:**
> When any of the following statement fields changes: Name, Description, Reference, Category, Type, Classification, and Attestation, all the associated controls and risks are updated, and their state is set back to Draft.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Statement form

Field	Description
Name	Name of the risk statement.
Parent	Parent risk statement.
Framework	Framework this risk statement is associated with.
Category	Choose a category. ○ Legal ○ Financial ○ Operational ○ Reputational ○ Legal/Regulatory ○ Credit ○ Market ○ IT
Assessment	Risk assessment template to be assigned to this risk statement. An assessment template is a questionnaire that is used for assessing a risk.
Description	Description of the risk statement.
Additional information	Additional information for this risk statement.

Note:
Accurate default scoring selections are important for normalizing risk across the organization.

4. To fill in the fields for the risk appetite section, see Define the risk appetite for a risk statement.
5. Click the **Default Scores** related list and fill in the fields on the form, as appropriate.

Default Scores form

Field	Description
Inherent SLE	Impact that the event has on the organization if there are no controls to check the event.
Residual SLE	Impact that the event has on the organization if there are controls to check the event.
Inherent ARO	Likelihood of the event occurring if there are no controls to check the event.
Residual ARO	Likelihood of the event occurring if there are controls to check the event.

6. Click the **Risk Rollup and Tolerance** related list and on the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Rollup and Tolerance form

Field	Description
Expected ALE	Annual Loss of Expectancy (ALE) refers to the product of the annual rate of occurrence (ARO) and the single loss expectancy (SLE). Expected ALE is the expected value of the ALE for the risk statement. Enter currency and amount for the expected ALE. **Note:** This value must be less than or equal to the **Maximum acceptable ALE**.
Sum of calculated ALE	This calculation is based on the sum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Maximum calculated ALE	This calculation is based on the maximum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Maximum acceptable ALE	Threshold value for the ALE for the risk statement. **Note:** This value must be greater than or equal to the**Expected ALE**. This value has an impact on the Tolerance status field.
Average calculated ALE	This calculation is based on the average of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Minimum calculated ALE	This calculation is based on the minimum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Calculated Score	The corresponding score for the calculated ALE: ○ Low ○ Med ○ High

7. Click the **Basel Categorization** related list and select the Basel Categories Hierarchy.
   The Basel categories are as follows:
   - Internal Fraud: misappropriation of assets, tax evasion, intentional mismarking of positions, bribery.
   - External Fraud: theft of information, hacking damage, third-party theft and forgery.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Employment Practices and Workplace Safety: discrimination, workers compensation, employee health and safety.
- Clients, Products, and Business Practice: market manipulation, antitrust, improper trade, product defects, breaches, account churning.
- Damage to Physical Assets: natural disasters, terrorism, vandalism.
- Business Disruption and Systems Failures: utility disruptions, software failures, hardware failures.
- Execution, Delivery, and Process Management: data entry errors, accounting errors, failed mandatory reporting, negligent loss of client assets.

8. Click **Submit**.

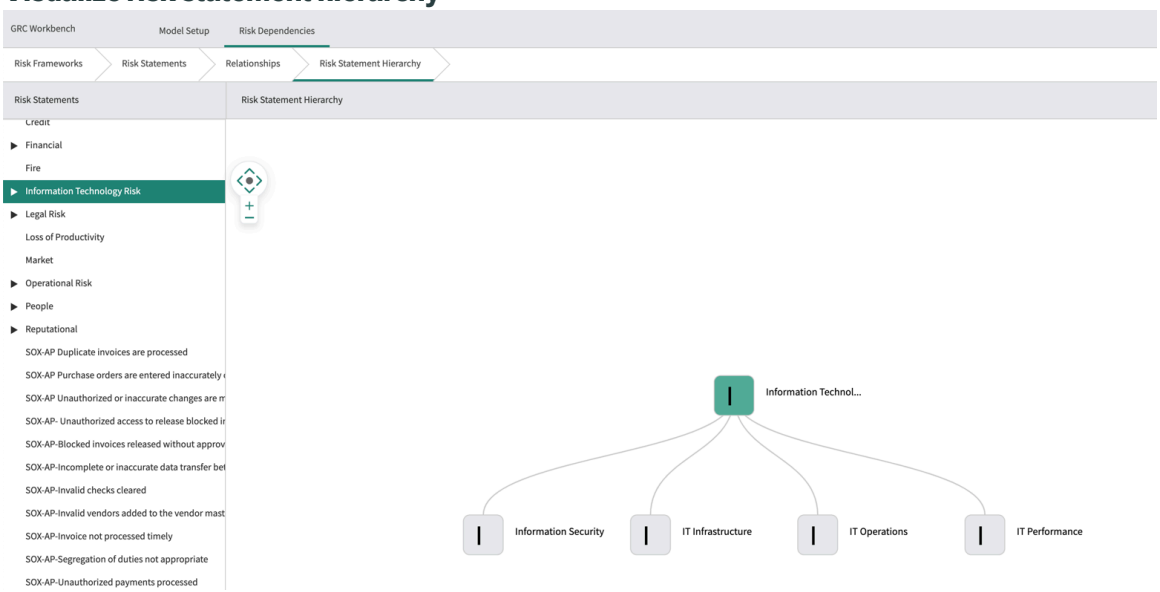
Visualize risk hierarchies using the GRC: Workbench

Risk users can see the hierarchy of risk statements using the GRC: Workbench.

Before you begin

Activate the GRC: Workbench (app-grc-workbench) plugin.

Role required: sn_risk.reader



Procedure

1. Navigate to **All** > **Risk** > **GRC Workbench**.
2. Click **Risk Dependencies**.
3. Click **Risk Statement Hierarchy**.
4. On the left pane, click the risk statement for which you want to visualize the risk statement hierarchy.

   Example

   For example, if you want to see the hierarchy of the Information Technology risk statement, click Information Technology Risk and you can see the parent risk statement and the child risk statements such as information security, IT infrastructure, IT operations, and IT performance. The risk statement hierarchy is displayed.

Visualize risk statement hierarchy

Generate a risk from a risk framework

Making associations with risk frameworks automatically creates risks.

Before you begin

Role required: sn_risk.admin and sn_risk.manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Library** > **Risk Framework**.
2. Open the risk framework record.
3. In the **Entity Type** related list, click **Edit**.
4. Select the entity types to associate to the risk framework, and click **Save**.
   All risk statements are associated to the entity type and a risk is created for every risk statement against every entity in the entity type.

Generate a risk from a risk statement

Making associations with risk statements automatically creates risks.

Before you begin

Role required: sn_risk.admin and sn_risk.manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Library** > **Risk Statement**.
2. Open the risk statement record.
3. In the **Entity Type** related list, click **Edit**.
4. Select the entity types to associate to the risk statement, and click **Save**.
   One risk is generated for each entity in the entity type based on the risk statement.

Relate risks to each other

Create relationships between risks to better understand how risks affect each other and how they affect the enterprise.

Before you begin

Role required: sn_risk.manager or sn_risk.admin

Procedure

1. Navigate to **All** > **Risk** > **Risk Register** > **All Risks**.
2. Open a risk.
3. Perform one of the following actions.

Option	Description
To specify that the current risk is down stream of another risk	Click the **Add** button in the **Upstream Risks** related list.
To specify that the current risk is upstream of another risk	Click the **Add** button in the **Downstream Risks** related list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the desired risks to relate to the current risk and click **Create Relationship**.
5. In the pop-up window, check all the desired risks to relate to the current risk, and click **Create Relationship**.

Create a risk manually

Risk administrators can create risk records when they see a potential for a gain or loss of value.

Before you begin

Role required: sn_risk.user

Procedure

1. Navigate to **All** > **Risk** > **Risk Register** > **Create New**.
2. On the form, fill in the fields.

Risk form

Field	Description
Number	Unique identification number. This field automatically populated.
Inherit from risk statement	Option to create a risk independent of risk statement.
Active	Option to indicate if the risk is active.
Name	Name for the risk. Field is auto-populated if the risk is generated from a risk statement, but can be changed without affecting the relationship between the risk and risk statement.
Description	Description of the risk and how it is a threat to the organization.
Risk Statement	Risk statement this risk is associated with.
Category	Category of risk which applies to the profile. ○ Legal ○ Financial ○ Operational ○ Reputational ○ Legal/Regulatory ○ Credit ○ Market ○ IT If the risk is generated from a risk statement, the field is automatically populated/
Entity	Entity related to the risk. **Note:** Only active entities are shown.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Sync with entity owner	Option to assign the entity owner as the owner of this risk record. When selected, if the entity owner changes, the risk owner is updated automatically. This option is set to **True** by default.
Owning group	Owning group for the risk.
Risk relevance	Explanation of how this risk applies to you. **Note:** This field only appears when the **Inherit from risk statement** option is selected.
Owner	Owner for the risk. **Note:** The owner is always added as a respondent.

3. Select the **Assessment Summary** tab.
   This tab is only visible if you have the Advanced Risk plugin activated. The scores of the risk assessment methodology selected as the primary are displayed in the risk scoring section. If the Advanced Risk plugin is not activated, then the following sections for classic risk appear.
4. To fill in the fields for the risk appetite section, see Define the risk appetite for a risk.
5. On the form, fill in the fields.

Risk Scoring Form

Field	Description
Note: These fields appear for classic risk.	
Assessment	Assessment to attach to this risk.
Assessment respondents	Users assigned to the assessment of this risk. **Note:** Only a user with the sn_grc.user role can be added as a respondent.

When both the **Assessment** and **Assessment respondents** fields are set, assessments are created when you select **Assess**.

6. Select the **Scoring** tab.
7. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Scoring form

Field	Description
Note: These fields appear for classic risk.	
Inherent SLE	Monetary value of a risk if it occurs before any mitigation strategies are in place.
Residual SLE	Monetary value of a risk if it occurs after all mitigation strategies are in place.
Inherent ARO	Probability that a risk occurs in any given year before any mitigation strategies are in place.
Residual ARO	Probability that a risk will occur in any given year after all mitigation strategies are in place.
Inherent ALE	Annualized loss expectancy `ALE = SLE x ARO` before any mitigation strategies are in place.
Residual ALE	Annualized loss expectancy `ALE = SLE x ARO` after all mitigation strategies are in place.
Inherent score	The score of the risk before any mitigation strategies are in place.
Residual score	The score of the risk after all mitigation strategies are in place.
Calculated ALE	Annualized loss expectancy based off all calculations.
Calculated score	The corresponding score for the calculated ALE.

8. Select the **Response** tab.
9. On the form, fill in the fields.

Risk Response form

Field	Description
Response	○ Accept ○ Avoid ○ Mitigate ○ Transfer
Justification	Enter a reasonable justification for the selected response

10. Select the **Monitoring** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Monitoring form

Field	Description
Control compliance percentage	Percentage of compliant controls
Control non-compliance percentage	Percentage of non-compliant controls
Control failure factor	Sum of failed controls weighting divided by total controls weighting
Indicator failure factor	Uses the last result of each associated indicator. Number of last results failed divided by total number of indicators associated.
Calculated risk factor	This value is calculated from `(Indicator failure factor + Control failure factor) / 2`.

11. Select the **Activity Journal** tab.
12. Enter additional comments, as necessary.
13. Select **Submit**.

Follow a risk

Connect integrates with Risk Management providing an overlay to the standard interface, allowing users to participate in conversations while they work and collaborate on the risk record.

Before you begin

Role required: sn_risk.user
For more information about Connect, see Connect.

Procedure

1. Navigate to **All** > **Risk** > **Risk Register** > **All Risks**.
2. Open the risk record from the list.
3. Click the **Follow** tab and perform one of the following actions.

Add a control to a risk

Controls are added to the risks for the on-going review of processes.

Before you begin

Role required: sn_risk.manager and sn_compliance.manager

About this task

Procedure

1. Navigate to **All** > **Risk** > **Risk Register** > **All Risks**
2. Open the risk record from the list.
3. Continue with one of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When a control objective and risk statement are associated and the control entity matches the risk entity, the risk-control association is created.
- The risks and controls that are created after associating a control objective to the risk statement aren't associated with the risk statement immediately. They get associated when the *GRC Profile Generation* scheduled job runs.
- If you manually delete a control from a risk, the control won't be re-created by the scheduled job. You must manually create it again if necessary.

Related topics

Associate a risk statement with a control objective in the Risk Workspace

Manually create GRC issues

As a GRC user, you can manually create issues to document policy, risk, or audit observations, or to accept any GRC problems. You can also identify the source of the issue to help analyze and classify the issues.

Before you begin

Role required: (per product)

- In Policy and Compliance Management: sn_grc.business_user, sn_grc.business_user_lite
- In Risk Management: sn_grc.business_user, sn_grc.business_user_lite
- In Audit Management: sn_grc.business_usersn_grc.business_user_lite

Note:
Starting with Version 12.0.1 of the products mentioned above, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

For more information on the access control limitations to issues, see GRC business user role to control access and track usage of compliance tables.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.

   Note:
   Starting with Version 12.0.1 of the products mentioned above, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

2. On the Issue form, fill in the fields.

   The due date under the **Dates** tab is automatically calculated based on the issue rating. You can manually override the calculated due date. The Task SLAs related list creates and displays SLAs based on the **Due date**.

3. Save the issue record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The tabs at the bottom of the screen enable you to perform various tasks for remediating the issue. You can add policy exceptions and create remediation tasks. Additionally, you can view other issues, indicator results, and task SLAs related to the issue.

Note:
Starting with Version 12.0.1, the **Task SLA** tab creates and displays SLAs based on the **Due date**. Notifications are sent to the issue owner and issue manager when the issue **Due date** reaches 50%, then 75%, then when it breaches. If the **Assigned to** and **Due date** fields are not empty and the issue is not in the **New** state, an SLA is created for the issue.

If the due date for the SLA changes, a new SLA is created. The SLA is completed when the issue transitions to **Closed Complete** or **Closed Incomplete**. Also, the SLA is cancelled if the **Due date** or **Assigned to** fields are empty, or the state is New.

Also starting with Version 12.0.1, remediation tasks can be created with the Assigned to user and issue manager user roles, as well as any user with the GRC Business User role.

Report issues from the Service Portal

When you identify any deficiencies in the controls or improvements that can be made in the organization policies, report an issue from the ServiceNow, Inc. Service Portal.

Before you begin
Role required: ServiceNow user

Procedure

1. In the Service Portal, click **Catalog** > **Browse by Categories**.
2. Click **Governance Risk and Compliance** and then click **Report Issue**.
3. On the form, fill in the following fields:

Report Issue form

Field	Description
Enter a brief description of the issue	Brief description of the issue.
Enter a detailed description of the issue	Detailed description of the issue.
Enter possible suggestions to address the issue	Potential suggestions to address the issue.
Which entity is the issue related to?	Entity related to the issue.
Which control objective is the issue related to?	Control objective related to the issue. **Note:** This field appears only if Policy and Compliance Management is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Which control is the issue related to?	Control inherited from item generation process. The control objective is read-only field. When you select the control, the control objective is auto-populated.

4. Click **Submit**.
5. To view all the issues you have reported, navigate to **GRC > My Reported Issues**.

Issue assignment using the Governance, Risk, and Compliance Predictive Intelligence plugin

Train a similarity solution model that uses machine learning so that the system can automatically suggest how to route issues to the correct assignee. Automatic routing suggestion reduces the time spent on deciding who should own the issue.

The Governance, Risk, and Compliance: Predictive Intelligence plugin utilizes Artificial Intelligence (AI) and Machine Learning (ML) to make GRC issue management smarter. On the GRC issue form, users are given suggestions for the assignment of issues to appropriate candidates. These suggestions are based on the platform similarity solution model.

Users must train the solution definition after they install the GRC: Predictive Intelligence plugin along with its dependencies. The Platform Machine Learning Administrator (ml_admin) can also customize the solution definition. This modification is based on the data in tables. Some of the critical fields, such as the filter condition **Assigned to [is] [not empty]**, must not be modified because modification may impact how the UI shows the prediction results.

Train and use the similarity solution definition for issue assignment prediction

Train and use the machine learning solution by activating the Governance, Risk, and Compliance Predictive Intelligence plugin. The solution enables the system to automatically suggest correct assignees to route issues. These suggestions reduce the time spent on deciding who should own the issue.

Before you begin

Make sure that the following plugins are activated.

- The Policy and Compliance Management plugin
- The Risk Management plugin
- GRC Profiles plugin must be activated
- The Predictive Intelligence plugin

Modify the following Governance, Risk, and Compliance properties with the sn_grc.admin role.

- **Issue assignee suggestion based on** property (*`Similarity Analysis`*).
- **Machine Learning Solution for prediction of issue assignee** property (*`ml_x_snc_sn_grc_pred_intel_global_similarity_solution_definition_for_assig`*

Role required: ml_admin

Procedure

1. Navigate to **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click the **Similarity Solution Definition for Assigned To for Issue** solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Similarity Definition form

Field	Value
Label	Unique name for the similarity solution.
Name	Name of the similarity solution. This field is automatically set to the system-assigned name that is the most similar to your value for the **Label** field.
Word Corpus	Existing word corpus that is relevant to your solution. For this use case, select the **Word Corpus for Issue Assignment** word corpus. **Note:** For word corpora in similarity solutions, the number of records per table is limited to 300,000.
Table	Table that contains the records that you want to train against and to predict for. When you assign a table value, a link appears in the form. The link shows the number of records that match your current conditions. For this use case, the field is automatically set to the Issue [sn_grc_issue] table. Do not modify this field for this solution definition.
Fields	Field types that are likely to help in identifying the owner. You can select the columns from the table in the **Table** field so that their data helps in predicting the issue more accurately. In this use case, the **Short description** and the **Description** fields are selected. These fields are the field types that contain the text of the issue records whose owner you're trying to identify. **Note:** You can modify the fields selected here if there are other non-empty important fields on the issue record in your database, such that these fields can help in finding out similar issues for predicting the issue owners.
Test Table	Table that contains the record that you want to predict for. For this use case, the field is automatically set to the Issue [sn_grc_issue] table. **Note:** The number of records which the Similarity window can retrieve is limited to 10. This field must not be modified for this solution definition.
Test Fields	Fields which are used as input during prediction. In this use case, select **Short description** and **Description**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	Note: You can modify the fields selected here if there are other non-empty important fields on the issue record in your database, such that these fields can help in finding out similar issues for predicting the issue owners.
Filter	Filter that applies conditions to the field records that you're using as a base to retrieve your similarity results. For example in this use case, you can set an **Assigned to [is] [not empty]** condition because leaving the field empty will not provide a suggestion.
Processing Language	Dominant language of the dataset that you are training on the solution definition. If the dataset language is English, choose **English**. By default, English processing is applied to all datasets. For example, if you select **Italian**, the system processes the data in both English and Italian. **Note:** The term processing indicates some of the language-specific steps that are used as part of training a solution. These steps include tokenizing words, removing stop words, and stemming.
Stopwords	List of stopwords. When you select your processing language, the system automatically adds a Stopwords list that uses the same language. For example, if your processing language is English, the **Default English Stopwords** option appears. The Default English Stopwords list also appears in your selection. You can add your own custom list of stopwords.
Training Frequency	Frequency of training. The retraining option can range from once a day to every 30 days in 3 month increments up to 180 days.
Update Frequency	Frequency of how often you want to refresh the data that you use to retrieve your similarity results. For example, new issues typically occur frequently throughout the day. If you have issue records that are open, you may want to select an update frequency of **Every 15 minutes**. This frequency can increase the likelihood that newly opened records are included in the refresh.

3. Click the appropriate button for the solution definition.

Use entity and risk dependencies using the GRC: Workbench

The GRC: Workbench utilizes CMDB information to show the upstream and downstream relationships across all applications. CMDB information is one of the sources. These relationships enable consistent risk mapping and modeling across the enterprise.

The GRC Manager [sn_grc.manager] uses the GRC Workbench to:

- Create entity classes.
- Define the upstream/downstream relationships between entity classes. These relationships make up the dependency model and ensure that risks are defined and evaluated consistently across the enterprise.
- Create entity types, create entities, and classify entities

Note:
The GRC Manager cannot view the GRC: Workbench from **Risk** > **GRC Workbench**. The GRC Manager [sn_grc.manager] enters `/$grc_workbench.do` after their instance name in the url to access the GRC: Workbench.

The Risk Manager [sn_risk.manager] uses the GRC: Workbench to:

- Perform all the same tasks as the GRC Manager
- Create risk frameworks, risk statements, and risks
- Define risk relationships

Model Setup tab

The Model Setup tab contains links to perform the following tasks.

Link	Action
Dependency Model	Create entity classes and develop the organizational relationship model
Entity Types	Create and edit entity types
Dependency Map	Create and visualize entity relationships

Risk Dependencies tab

The Risk Dependencies tab contains links to perform the following tasks.

Link	Action
Risk Frameworks	Create and edit risk frameworks
Risk Statements	Create and edit risk statements
Relationships	Create and visualize risk relationships

Activate GRC: Workbench

The GRC: Workbench plugin is not activated by default, it is available as a separate subscription within the GRC Suite.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
To create entity classes, entity dependencies, and risk dependencies activate the GRC: Workbench, and the GRC: Risk Management plugin [com.sn_risk].

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins

Create entity class using the GRC: Workbench
GRC managers create entity classes representing the types of things that are part of the dependency model. Reports can be filtered to define relationships between the different enity classes. An entity class defines what a entity actually is.

Before you begin
Role required: sn_grc_manager

Procedure
1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. On the left, in the Entity classes section, click **Add Class**.
3. Enter an entity class name and click the plus (+) icon

   The newly created entity class is added to the list on the left.

What to do next
Create relationships between entity classes using the GRC: Workbench.

Create relationships between entity classes using the GRC: Workbench
Managers create relationships between entity classes using the GRC: Workbench to build out the dependency map and better understand how entities relate to one another.

Before you begin
Role required: sn_grc.manager

Create profile classes using the GRC: Workbench, before creating relationships between entity classes.

Entity classes can roll up to each other, leading to the development of the dependency model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Model Setup** tab at the top, and select the **Dependency Model** tab.
3. If needed, create entity classes.
4. Do one of the following actions.

Option	Description
If there are no relationships between entity classes	Drag an entity class from the left to the center and drop it.
If there are relationships between entity classes	Drag additional entity classes from the list on the left and drop them on the top or bottom of any entity class in the tree. **Note:** Dragging to the top of an entity class makes the target entity class roll up to the class that is dropped. Dragging to the bottom of an entity class makes the class that is being dropped roll up to the target class.

Note: As long as you remain on the GRC: Workbench, click **Undo** after creating a relationship between entity classes to roll back the change. Leaving the GRC: Workbench causes the undo history to be lost.

What to do next

After modeling out entities, define the risks in your organization:

- Generate a risk from a risk framework
- Generate a risk from a risk statement
- Associate a risk framework or risk statement with an entity type to generate risks

After generating risks, Relate risks to each other.

Associate a risk framework or risk statement with an entity type to generate risks

Risks are automatically generated when you make associations between risk frameworks or risk statements and entity types.

Before you begin

Role required: sn_risk.admin and sn_risk.manager

Procedure

1. Navigate to **Risk** > **Scoping** > **Entity types**.
2. Open the entity type record.
3. In the **Risk Framework** or **Risk Statement** related list, click **Edit**.
4. Select the risk frameworks or risk statements to associate to the entity, and click **Save**.
   All risk frameworks or statements are associated to the entity type and a risk is created for every risk statement against every entity in the entity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visualize and edit entity dependencies using the GRC: Workbench

The GRC: Workbench gives GRC administrators a graphical interface to create entity dependencies. These relationships enable consistent entity and risk mapping and modeling across the enterprise.

Before you begin

Role required: sn_grc.manager

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Model Setup** tab at the top, then select the **Dependency** tab below it.
3. Search for and select an entity from the list on the left.
   Entities are organized hierarchically by entity class, then by entity types.
4. After selecting an entity from the left, the entity is displayed in the center with its direct upstream and downstream dependencies.
   On the right, eligible entities that can be added as upstream or downstream dependencies are listed.
5. Perform one of the following actions.

Option	Description
To add an upstream entity dependency	Drag an eligible upstream entity from the list of eligible entities on the right and drop it on the top half of the entity in the center of the page.
To add a downstream entity dependency	Drag an eligible downstream entity from the list of eligible entities on the right and drop it on the bottom half of the entity in the center of the page.

The entities are removed from the right menu when moved to the center of the page.

Delete entity dependencies using the GRC: Workbench

When deleting entity dependencies, only the relationship between the entities is deleted. The entities themselves remain unmodified.

Before you begin

Role required: admin

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Model Setup** tab at the top, then select the **Dependency Map** tab below it.
3. Search for and select the desired entity from the list on the left.
   After selecting an entity from the left, the entity is displayed in the center with its direct upstream and downstream dependencies.
4. In the center tree, point to the upstream or downstream risk that should be disassociated from the selected center risk.
   As you point to the risk, a delete icon appears, click the delete icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Delete** in the confirmation dialog to confirm the deletion of the relationship.

Note:
Only the relationship between the entities is deleted. The entities themselves remain unmodified.

Delete an entity class using the GRC: Workbench

Deleting an entioty class, deletes all relationships below it.

Before you begin
Role required: admin

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Model Setup** tab at the top, and select the **Dependency Model** tab.
3. Select the desired entity class from the list on the left.
   After selecting an entity from the left, the entity is displayed in the center with its direct upstream and downstream dependencies.
4. Click the delete icon to the right of the entity class name.
5. In the deletion confirmation pop-up, click **Delete**.
   Deleting the entity class deletes all relationships below it.

Create a risk using the GRC: Workbench

Risk managers can create risks directly from the GRC: Workbench.

Before you begin
Role required: sn._risk.admin or sn.risk.manager

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Risk Dependencies** tab at the top, then select the **Relationships** tab below it.
3. On the left, in the Risks section, click **Create Risk**.
4. On the form, fill in the fields.

Risk form

Field	Description
Name	Name for the risk. Field is auto-populated if the risk is generated from a risk statement, but can be changed without affecting the relationship between the risk and risk statement.
Number	Unique identification number. This field is automatically populated.
State	Risk state. Possible choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Draft** In this state, all risk users can modify the risk. Only available when creating a one-off control. One-off controls are possible but not recommended. ○ **Attest** When the risk is created from a risk statement, controls are in this state. **Note:** When a risk is set back to draft, the assessment is canceled. ○ **Review** Risks are automatically moved to review from the assessment phase. ○ **Monitor** In this state, all risk managers can move the risk from review to monitor. ○ **Retired** Risk managers or administrators can move a risk from Monitor to Retired. Indicators do not run when the risk is in this state. **Note:** When a risk is retired, any assessment associated with it is canceled.
Owning group	Owning group for the risk.
Category	Category of risk which applies to the profile. ○ Legal ○ Financial ○ Operational ○ Reputational ○ Legal/Regulatory ○ Credit ○ Market ○ IT Field is auto-populated if risk is generated from a risk statement.
Owner	Owner for the risk. **Note:** The owner is always added as a respondent.
Statement	Statement this risk is associated with.
Entity	Entity related to the risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Only active entities are shown.
Description	Description of the risk and how it is a threat to the organization.
Additional Information	More details that help others understand the risk record.

5. Click the **Assessment** tab.
6. On the form, fill in the fields.

Risk Scoring form

Field	Description
Assessment	Assessment to attach to this risk.
Assessment respondents	Users assigned to the assessment of this risk. **Note:** Only a user with the sn_grc.user role can be added as a respondent.

When both the **Assessment** and **Assessment respondents** fields are set, assessments are created when you click **Assess**.

7. Click the **Scoring** tab.
8. On the form, fill in the fields.

Risk Scoring form

Field	Description
Inherent SLE	Monetary value of a risk if it occurs before any mitigation strategies are in place.
Residual SLE	Monetary value of a risk if it occurs after all mitigation strategies are in place.
Inherent ARO	Probability that a risk occurs in any given year before any mitigation strategies are in place.
Residual ARO	Probability that a risk will occur in any given year after all mitigation strategies are in place.
Inherent ALE	Annualized loss expectancy ALE = SLE x ARO before any mitigation strategies are in place.
Residual ALE	Annualized loss expectancy ALE = SLE x ARO after all mitigation strategies are in place.
Inherent score	The score of the risk before any mitigation strategies are in place.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Residual score	The score of the risk after all mitigation strategies are in place.
Calculated ALE	Annualized loss expectancy based off all calculations.
Calculated score	The corresponding score for the calculated ALE.

9. Click the **Response** tab.
10. On the form, fill in the fields.

Risk Response form

Field	Description
Response	○ Accept ○ Avoid ○ Mitigate ○ Transfer
Justification	Enter a reasonable justification for the selected response

11. Click the **Monitoring** tab.

Risk Monitoring form

Field	Description
Control compliance	Percentage of compliant controls
Control non-compliance	Percentage of non-compliant controls
Control failure factor	Sum of failed controls weighting divided by total controls weighting
Indicator failure factor	Uses the last result of each associated indicator. Number of last results failed divided by total number of indicators associated.
Calculated risk factor	This value is calculated from `(Indicator failure factor + Control failure factor) / 2`.

12. Click the **Activity Journal** tab.
13. Enter additional comments, as necessary.
14. Click **Submit**.
    The risk is created and centered in the middle of the page. Also, the risk is selected on the right.

© 2026 ServiceNow, Inc. All rights reserved.

Visualize and edit risk dependencies using the GRC: Workbench

The GRC: Workbench gives GRC administrators a graphical interface to create risk dependencies. These relationships enable consistent entity and risk mapping and modeling across the enterprise.

Before you begin

Role required: sn_risk.manager

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Risk Dependencies** tab at the top, then select the **Relationships** tab below it.
3. Search for and select a risk from the list on the left.
   Risks are organized hierarchically by entity class, then by entity.
4. After selecting a risk from the left, the risk is displayed in the center with its direct upstream and downstream dependencies.
   On the right, eligible risks that can be added as upstream or downstream dependencies are listed.
5. Perform one of the following actions.

Option	Description
To add an upstream risk dependency	Drag an eligible upstream risk from the list of eligible risks on the right and drop it on the top half of the risk in the center of the page.
To add a downstream risk dependency	Drag an eligible downstream risk from the list of eligible risks on the right and drop it on the bottom half of the risk in the center of the page.

Delete risk dependencies using the GRC: Workbench

When deleting risk dependencies, only the relationship between the risks is deleted. The risks themselves remain unmodified.

Before you begin

Role required: sn_risk.manager

Procedure

1. Navigate to `https://myCompany.service-now.com/$grc_workbench.do`.
2. Select the **Risk Dependencies** tab at the top, then select the **Relationships** tab below it.
3. Search for and select a risk from the list on the left.
   Risks are organized hierarchically by entity class, then by entity.
4. In the center tree, point to the upstream or downstream risk that should be disassociated from the selected center risk.
   As you point to the risk, a delete icon appears, click the delete icon.
5. Click **Delete** in the confirmation dialog to confirm the deletion of the relationship.

Note:
Only the relationship between the risks is deleted. The risks themselves remain unmodified.

Monitor risks using GRC Performance Analytics Indicators

You can link Risk Management risk statement and risks to Performance Analytics indicators, breakdowns and thresholds. You can associate Performance Analytics indicators with risk statements, and risks to view scorecards and trends and analyze current conditions and trends.

The risks and controls associated with a PA indicator or PA indicator/breakdown/element automatically monitor any PA threshold with the same PA indicator or PA indicator, breakdown, or element relationship. Any PA threshold breach is reported at the risk or control and Performance Analytics indicators relationship level within a breach counter.

PA threshold breach impact

When a risk or control and Performance Analytics indicators relationship breach counter is different than zero (for example, a PA threshold with the same PA indicator or PA indicator, breakdown, or element relationship has breached), and if no opened issue exists, then an issue is created which is associated to the risk or control. Also for risks, the **Indicator failure factor** represents the number of risk and Performance Analytics indicators relationships with a breach counter different than zero.

Reset all PA Indicator breach counters

Reset breach counters associated to a risk or control by clicking **Reset all PA Indicator breach counters** or opening the specific relationship and clicking **Reset Breach Counter**.

GRC PA indicator breach reports

There are two reports for the reporting of breaches:

- Risk PA Indicator Breaches
- Control PA Indicator Breaches

Activate GRC: Performance Analytics Integration

The GRC: Performance Analytics Integration plugin provides an integration between Performance Analytics and the Risk Management and Policy and Compliance Management applications. This plugin provides more insight into organizational risk and compliance performance.

Before you begin

Role required: admin

About this task

This plugin includes demo data and activates related plugins if they are not already active.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next
After activating the GRC: Performance Analytics Integration plugin on an instance with customized related lists on content (risk or control objective) or items (risk or control), you may have to manually add the PA Indicator to content relationships and/or the PA indicator to item relationships.

Related topics
List of plugins

Associate a PA indicator with a risk statement or control objective

You can associate Performance Analytics indicators with risk statements and policy statements to analyze trends related to the risk or policy.

Before you begin
Role required: sn_risk.manager or sn_compliance.manager

Procedure
1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Policies and Procedures** > **Control objectives**.
   - **All** > **Risk** > **Risk Library** > **Risk Statements**.
2. Open a risk statement or control objective.
3. In the **PA Indicators** related list, click **New**.
4. On the form, fill in the fields.

PA Indicators form

Field	Description
PA Indicator	The performance analytics indicator to associate the Risk Statement or control objective with.

5. Click **Submit**.
   On the risk statement or control objective form, in the **PA Indicators** related list, you see the associated indicator. You can optionally click **View Indicator** on the desired indicator to see the Performance Analytics scorecard of the indicator. The PA Indicator associations are carried over to all risks or controls associated to the original risk statement or control objective. Also, if the indicator has a breakdown that matches the risk or entity of the control (for example a Business Service breakdown), the **Breakdown** and **Element** fields for the relationship are automatically filled in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate a PA indicator with risks and controls

You can associate Performance Analytics indicators with risks and controls to analyze trends related to the entity that risk or control belongs to.

Before you begin

Role required: sn_risk.manager or sn_compliance.manager

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Controls** > **All Controls**.
   - **Risk** > **Risk Register** > **All Risks**.
2. Open a risk or control.
3. In the **PA Indicators** related list, click **New**.
4. On the form, fill in the fields.

PA Indicators form

Field	Description
PA Indicator	Performance analytics indicator to associate the Risk or Control with.
Breakdown	Break down to view a specific trend based on the breakdown element.
Element	Break down element to view a particular trend and scorecard. **Note:** This field depends on the **Breakdown** field being populated. When visible, it is mandatory.

5. Click **Submit**.
   On the Risk or Control form, in the **PA Indicators** related list, you see the associated indicator. You can optionally click **View Indicator** on the desired indicator to see the Performance Analytics scorecard of the indicator.

Update associated GRC indicators for a set of items

You can update all the items belonging to a GRC content record so each item is individually related to the PA indicator.

Before you begin

Role required: sn_risk.manager or sn_compliance.manager

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Policies and Procedures** > **Control Objectives**.
   - **All** > **Risk** > **Risk Library** > **Risk Statements**.
2. Open a Risk Statement or Control Objective that has an associated Performance Analytics Indicator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the **Update PA Relationships** related link.
   All the risks or controls related to the risk statement or policy statement are automatically associated with all the risk statement or policy indicators of the statement. Also, if the indicator has a breakdown that matches the risk or entity of the control (for example a Business Service breakdown), the **Breakdown** and **Element** fields for the relationship are automatically filled in.

Create a GRC indicator template

Compliance or risk managers create indicator templates from which many indicators can be created.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager
- sn_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager
- sn_grc.user

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Indicators** > **Indicator Templates**.
   - **All** > **Risk** > **Indicators** > **Indicator Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Indicator template form

Field	Description
Name	Name of the indicator.
Description	Description of the indicator.
Category	Category for which you're creating an indicator template. For example, select **Risk Indicator Template** to create a risk indicator template.
Active	Option that determines whether the indicator template is active.
Method	
Type	The method used to determine the type of indicator template. The choices are as follows: ○ **Manual**: Manual indicators are used for data that cannot be retrieved from a ServiceNow instance because it comes from an external system, such as customer data from a third-party sales system. ○ **Basic**: Basic indicators are automated indicators based on an indicator source. The indicator source specifies a table and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a frequency at which the scores from this table are saved. ○ **Script**: Scripted indicators use a custom script to collect the data.
Result if the value meets or exceeds the target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed** For example, assume you enter `100` in this field. If the indicator result output is more than 100, then the indicator status will pass or fail based on the value configured in this field.
Target Type	Type of the target value. The choices are as follows: ○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Target	The value that determines if the indicator should pass or fail.
Instructions	Additional instructions for the template.
Value mandatory	Option to decide if a value must be compulsory in the indicator task for a manual indicator. **Note:** This option appears only if **Manual** is selected from the **Type** field. This option is automatically selected if **Count** or the **Percentage** is selected from the **Target type** field.
Supporting Data	
Note: Starting with version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks are displayed. Earlier, only the real-time state of the records collected could be viewed.	
Collect supporting data	Option to enable collecting supporting data or evidence every time the indicator runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Table used for collecting supporting data.
Supporting data fields	Fields of the source table to be used for collecting the supporting data.
Sample collection type	Type of supporting data collection, such as count or percentage.
Sample size	Minimum number of records that must be used for collecting supporting data. For example, a basic indicator could query a large table, returning thousands of records with each indicator execution. You do not need to save all of them; just a sample of those records. If you enter a sample size of 100, only 100 records are saved, even though the query returned thousands.
Basic Criteria	
Criteria	Criteria to filter the data from the source table.
Use reference field	Option to enable the use of the **Reference field**.
Reference field	Connection between the supporting data table and the **Applies to record** field of the entity.
Additional Criteria	
To create indicators with targets, use the advanced filter criteria. This section appears only when you select **Basic** from the **Type** field. This section is used to provide more filter criteria.	
Additional criteria	More criteria to filter the data to calculate the target value. This section only appears when **Percentage** is selected from the **Target type** field.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
First run date	First collection time for indicator results. This field is automatically set based on when an indicator or an indicator template runs for the first time. The value in this field can't be modified.
Next run date	Next run time to collect indicator results of all downstream indicators for this indicator template.
Due date duration (days)	Due date duration in days between the creation and due date of the indicator task and generation of its results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The due date duration added to the creation date reflects as the **Due date** of the indicator task. This field appears only when **Manual** is selected from the **Type** field. For more information, see Performance enhancements for Indicator nightly job.

4. When you have completed these entries, you can also view information on the following related lists:
   - Control Objectives/Risk Statements
   - Content References

   Note:
   The **Control Objectives/Risk Statements** tab enables you to reuse the same template for multiple control objectives or risk statements, or both of them.

5. Select **Submit**.

Create a risk indicator

Create a risk indicator to identify the possibility of a future adverse impact on your organization. Indicators are an early warning system, and they enable you to take preventative action on the risks.

Before you begin

Role required: sn_risk.manager or sn_risk.admin

About this task

Generally, indicators are automatically created using the normal process of indicator templates. You can also manually create new indicators. You can also create an indicator by using an indicator template. When you relate an indicator template to a risk statement, the risk indicators are automatically generated.

Procedure

1. Navigate to **All** > **Risk** > **Indicators** > **Indicators**.
2. Click **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	Category of the indicator. For example, select **Risk Indicator** to create a risk indicator.
Inherit from template	Option to create the indicator from an existing template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Template	Template used to create the indicator. This field appears only if the **Inherit from template** option is selected.
Override template	Option to override the template's properties such as the name of the indicator.
Name	Name of the indicator. If you select a template in the **Template** field, then this field is automatically set to the template name.
Description	Brief description of the indicator. This field is automatically set if you select a template in the **Template** field.
Entity	Entity used to filter risks.
Applies to record	Record that the entity applies to.
Risk	Filtered risk that is related to the indicator. **Note:** If you have selected an indicator template, then the risk is also filtered based on the template.
Owning group	Group that owns the indicator.
Owner	Owner of the indicator. This field is automatically set to the owner's name based on the risk.
Method	
Type	Method used to determine the type of indicator. The choices are as follows: ○ **Manual**: Manual indicators are used for data that cannot be retrieved from a ServiceNow instance because it comes from an external system, such as customer data from a third-party sales system. ○ **Basic**: Basic indicators are automated indicators based on an indicator source. The indicator source specifies a table and a frequency at which the scores from this table are saved. ○ **Script**: Scripted indicators use a custom script to collect the data.
Target type	Type of the target value. The choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Value mandatory	Option to decide if a value must be compulsory in the indicator task for a manual indicator. **Note:** This option appears only if **Manual** is selected from the **Type** field. This option is automatically selected when **Count** or **Percentage** is selected from the **Target type** field.
Target	Value to determine if the indicator will pass or fail.
Result based on target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed** For example, assume you enter `100` in this field. If the indicator result output is more than 100, then the indicator status will pass or fail based on the value configured in this field.
Instructions for collecting data	More instructions on how to collect data.
Supporting Data	
Note: Starting with version 10.1, the system displays the actual historical data for the supporting data records from the indicator results or indicator tasks.	
Collect supporting data	Option to enable collecting supporting data or evidence every time the indicator runs.
Source table	Table used for collecting supporting data.
Supporting data fields	Fields of the source table that are used for collecting the supporting data.
Sample size	Minimum number of records that must be used for collecting supporting data.
Basic Criteria	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
To filter the data on the source table, use the basic criteria. This section appears only when **Manual** or **Basic** is selected from the **Type** field.	
Criteria	Criteria to filter the data from the source table.
Use reference field	Option to enable the use of the **Reference field**.
Reference field	Connection between the supporting data table and the **Applies to record** field of the entity.
Additional Criteria	
To create indicators with targets, use the advanced filter criteria. This section appears only when you select **Basic** from the **Type** field. This section is used to provide more filter criteria.	
Additional criteria	More criteria to filter the data to calculate the target value. This section only appears when **Percentage** is selected from the **Target type** field.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
Next run time	Next collection time for indicator results. This field is automatically set based on the value in the **Collection frequency** field.
Results	
Status	Status of the indicator to show whether the indicator passed or failed.
Previous status	Previous status of the indicator to show whether the indicator passed or failed.

4. Click **Submit**.

Result
The risk indicator is created and is ready to be executed.

View the Risk Overview

The Risk Overview is contained in the Risk Management application and provides an executive view, allowing risk managers to quickly identify areas of concern by pinpointing entities with known high risk.

The Risk Overview contains the following reports in the base system.

Risk Overview

Name	Visual	Description
Inherent Risk		

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Overview (continued)

Name	Visual	Description
Residual Risk		
Inherent Annual Loss Exposures		
Residual Annual Loss Exposures		
Risk Issues by Framework (Opened Date)		
Risks by Response		
Risk Expectations		
Profile	Drop down list	Select one or many profiles to view and compare their risks.
GRC - Risk States	Check boxes	Select one or many risk states to view and compare.
Risks by Category		
Very High Risk	Single Score	Displays the number of very high risks.
High Risk	Single Score	Displays the number of high risks.
Moderate Risk	Single Score	Displays the number of moderate risks.
Low Risk	Single Score	Displays the number of low risks.
Very Low Risk	Single Score	Displays the number of very low risks.
Inherent Risk Heatmap		
Residual Risk Heatmap		

Using the Risk Workspace

Starting with Version 13.0.5, a new workspace has been introduced for the Risk Management application. The new workspace provides you with an improved User Experience (UX) and a simplified user journey.

Create a risk framework in the Risk Workspace

Create risk frameworks to group risk statements into manageable categories and generate risks. After the risks are generated, you can identify methods to mitigate them.

Before you begin

Role required: sn_risk.manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Library** > **Risk frameworks**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Risk Framework form

Field	Description
Number	Unique identification number.
Active	Option to indicate whether the risk framework is active. **Note:** If a risk framework is made inactive or retired, all the associate risk statements and risk records are also deactivated.
Name	Name of the risk framework.
Description	Description of the risk framework.
Additional information	Additional information for this risk framework.

4. Click **Save**.
5. To add entities from entity types, click the Entity types related list.
   a. Click **Add**.
   b. Select the entity types.
   c. Click **Add**.
6. To add risk statements, click the Risk Statements related list and do one of the following.

Result
The new risk framework is created.

Create a risk statement in the Risk Workspace

Create risk statements to group risks into manageable categories.

Before you begin
Role required: sn_risk.admin

About this task
When you create a risk statement, you can associate entity types or add additional entities to generate risks.

Note:
When any of the following risk statement fields changes: Name, Description, Reference, Category, Type, Classification, and Attestation, all the associated controls and risks are updated, and their state is set back to Draft. All the associated risk assessments also get canceled.

Procedure
1. Navigate to **All** > **Risk Workspace** > **Library** > **Risk statements**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Statement form

Field	Description
Name	Name of the risk statement.
Description	Description of the risk statement.
Parent	Parent risk statement. You can define the hierarchy using this field.
Framework	Framework this risk statement is associated with. **Note:** This field only appears if the *Migrate to Advanced Risk Assessment* property is enabled. For more information, see Risk score rollup in Advanced Risk Assessment
Category	Category of the risk statement. The choices are as follows: ○ Legal ○ Financial ○ Operational ○ Reputational ○ Legal/Regulatory ○ Credit ○ Market ○ IT ○ Project
Level	Level at which the risk statement is created. For example, if the risk statement has a parent and a grandparent, then the level of this new risk statement will be 3.
Assessment	Risk assessment template to be assigned to this risk statement. An assessment template is a questionnaire that is used for assessing a risk. **Note:** This field appears when you use classic risk with enabling the advanced risk property.
Issue group rule	Issue group rule assigned to this risk statement for reporting. The purpose of the issue group rule is to group similar issues together into a parent issue based on conditions defined in the rule. This feature enables you to work on the similar issues at once and close out the parent issue once resolved, which will close out all the child issues.
Additional information	Additional information for this risk statement.

4. To fill in the fields for the risk appetite section, see Define the risk appetite for a risk statement.
5. If you're using classic risk, in the Default Scores section, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Inherent SLE	Single-loss expectancy (SLE) is the monetary value expected from the occurrence of a risk on an asset if there are no controls to check the event.
Residual SLE	Monetary value expected from the occurrence of a risk on an asset if there are controls to check the event.
Inherent ARO	Annualized rate of occurrence (ARO) is an estimated frequency of the threat occurring in one year. ARO is used to calculate annualized loss expectancy (ALE). The value in this field indicates the likelihood of the event occurring if there are no controls to check the event.
Residual ARO	The value in this field indicates the likelihood of the event occurring if there are controls to check the event.

6. If you're using classic risk with the advanced risk plugin activated, in the **Risk Rollup and Tolerance** section, fill in the fields.

Field	Description
Expected ALE	ALE refers to the product of the ARO and the SLE. Expected ALE is the expected value of the ALE for the risk statement. Enter currency and amount for the expected ALE. **Note:** This value must be less than or equal to the **Maximum acceptable ALE**.
Sum of calculated ALE	This calculation is based on the sum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Maximum calculated ALE	This calculation is based on the maximum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Maximum acceptable ALE	Threshold value for the ALE for the risk statement. **Note:** This value must be greater than or equal to the **Expected ALE**. This value has an impact on the **Tolerance status** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Average calculated ALE	This calculation is based on the average of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Minimum calculated ALE	This calculation is based on the minimum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Tolerance Status	Overall risk status. This field appears when the other ALE fields are populated.
Calculated Score	The corresponding score for the calculated ALE: ○ Low ○ Med ○ High

7. In the Basel Categorization section, select the Basel Categories Hierarchy.
   The Basel categories are as follows:
   - Internal Fraud: misappropriation of assets, tax evasion, intentional mismarking of positions, bribery.
   - External Fraud: theft of information, hacking damage, third-party theft, and forgery.
   - Employment Practices and Workplace Safety: discrimination, workers' compensation, employee health, and safety.
   - Clients, Products, and Business Practice: market manipulation, antitrust, improper trade, product defects, breaches, account churning.
   - Damage to Physical Assets: natural disasters, terrorism, vandalism.
   - Business Disruption and Systems Failures: utility disruptions, software failures, hardware failures.
   - Execution, Delivery, and Process Management: data entry errors, accounting errors, failed required reporting, negligent loss of client assets.
8. Click **Save**.
9. To add entity types, click the Entity types related list.
   a. Click **Add**.
   b. Select the entity types to add.
   c. Click **Add**.
10. To add additional entities, click the **Additional entities** related list.
    a. Click **Add**.
    b. Select the entities to add.
    c. Click **Add**.
11. Click **Save**.

Result
The risk statement is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
You can continue to add control objectives, indicator templates, and information objects to the risk statement. You can also now assess the risks that are generated in the Risks tab. You can also view the hierarchy of the risks statement on the risk statement side bar. To view the complete risk profile at a glance, click the **Overview** tab.

Associate a risk statement with a control objective in the Risk Workspace

Associate risk statements to control objectives in the Risk Workspace. This association helps you to manage your risks by ensuring that the risks have mitigating controls.

Before you begin
Role required: sn_risk.manager or sn_compliance.manager

About this task
When a control objective and risk statement are associated and the control entity matches the risk entity, the risk-control association is created. This association helps in mitigating the risks and threats.

Procedure
1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. In the Risk Workspace, select the list  icon.
3. Navigate to **Library** > **Control objectives**.
4. Select and open the required control objective.
5. Select the Risk statements related list.
   a. Select **Add**.
   b. Select the risk statements that you want to add.
   c. Select **Add**.
   d. Select **Save**.

Result
The risks associated with the risk statement automatically inherit the controls associated with the control objectives with matching entities.

Common controls in Risk Management

By linking the risks to a common control in the Risk Management application, you can reduce the time and effort that is needed to manage and apply these centralized controls to your reliant entities. For example, a fire sprinkler system can be a common control for multiple business units (BUs), such as finance, security, and human resources (HR).

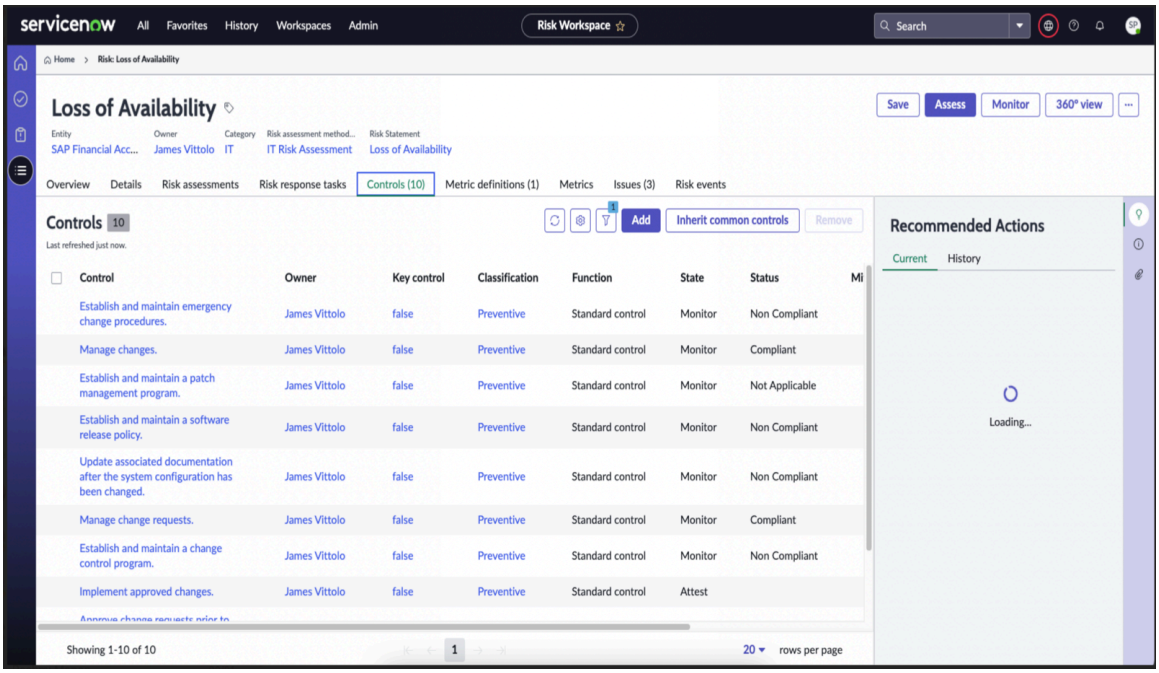
Overview of common controls

Every organization has multiple (BUs) and shared functions, such as information technology (IT), HR, and finance. These shared functions define the policies and controls that the BUs can use to meet the regulatory requirements or to manage the risks in their BUs. Multiple BUs can use common controls that are owned and managed by a different department or team. This process enables an organization to maintain centralized control over certain processes while each BU can take advantage of these common controls. For more information on common controls, see Common Controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To mitigate the risks in the reliant entities, a risk owner can link their risks to the common controls. By linking the risk, a risk owner can reduce the effort that is required to attest and test these common controls for the reliant entities.

Benefits of common controls



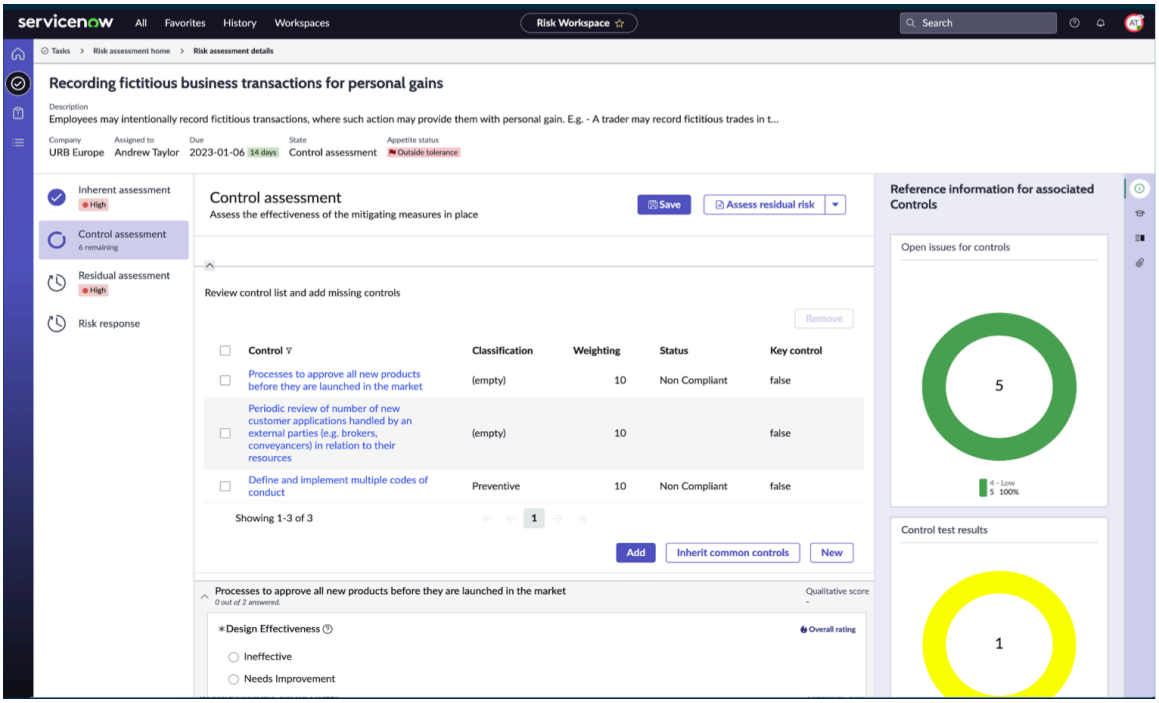
A common control has the following benefits:

- You spend less time and effort to manage a common control because you can test and apply a common control to all your reliant entities.
- You only need to manage the active controls, so the overall reporting of the controls is improved.

Common controls in a risk

If a control objective and risk statement are associated and the reliant entity of the control matches the risk entity, the risk-control association is established automatically. You can also inherit common controls to a risk when the risk entity is marked as a reliant entity in a common control. Any changes to the risk statement and the control's objective relationship can impact the risk-control association as well. The following example shows the inherit common controls option on the risk form:

Inherit common controls

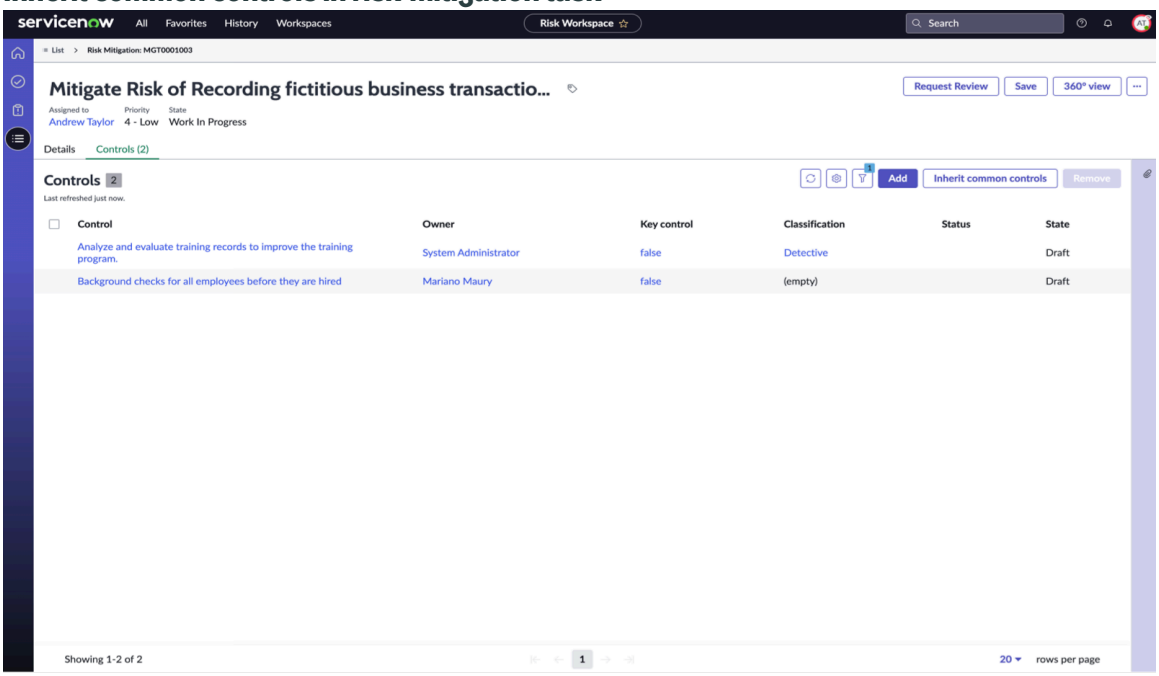


Note:
Only active relationships between risks and controls are maintained and any historic relationships are automatically deleted.

Common controls in a risk assessment

You can inherit common controls in the risk assessment when the entity is marked as a reliant entity in the common control. The following example shows the inherit common controls option on the risk assessment form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

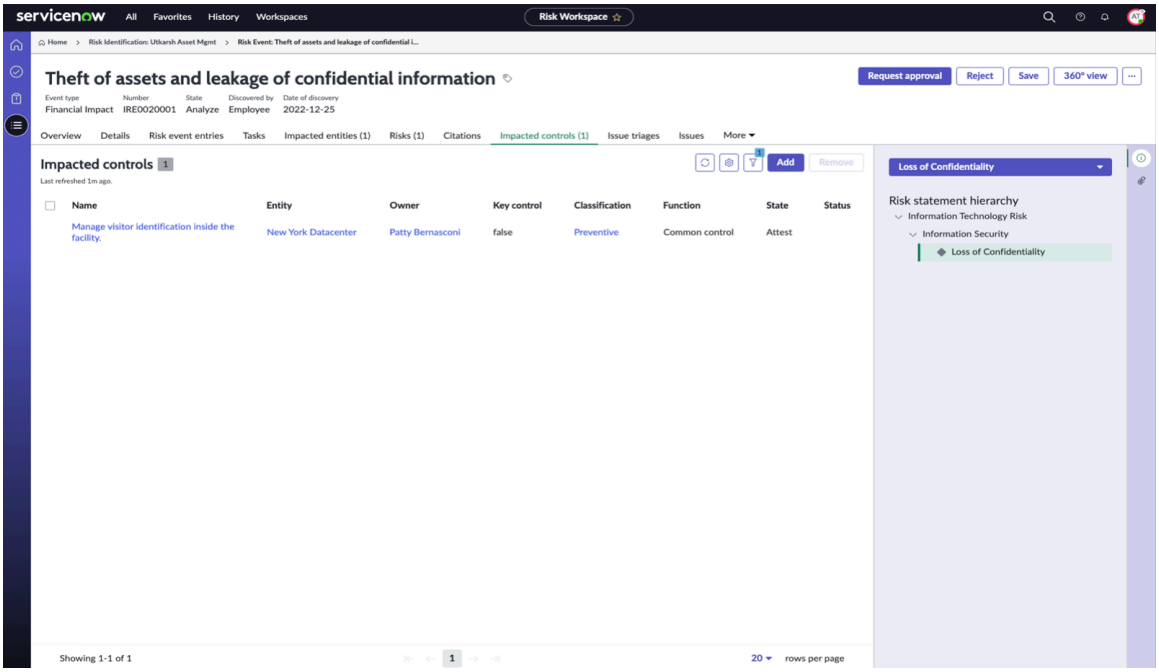


Inherit common controls in risk assessment

Common controls in a risk-mitigation task

You can inherit the common controls to a risk-mitigating task when the entity is marked as a reliant entity in the common control. You can inherit the common controls to a risk-mitigating task when it is in the Draft or Work In Progress state. The following example shows the inherit common controls option on the risk-mitigation task form.

Inherit common controls in risk-mitigation task



Common controls in a risk event

A common control is automatically linked to a risk event when the underlying risk has materialized for the risk event. It enables the control owner to identify when the common control

fails and to take immediate action if a common control does fail. The following example shows the inherit common controls option on the risk event form:

Common controls in risk event

Create and run a manual risk indicator in the Risk Workspace

Create and run a manual risk indicator to identify the possibility of a future adverse impact on your organization. Indicators are an early warning system and they enable you to take preventative actions on risks. In a manual indicator, the results are manually gathered using task assignments.

Before you begin

Role required: sn_risk.manager or sn_risk.admin

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Indicators** > **Risk indicators**.
2. Click **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	Category of the indicator. For example, select **Risk Indicator** to create a risk indicator.
Inherit from template	Option to create the indicator from an existing template.
Template	Template used to create the indicator. This field appears only if the **Inherit from template** option is selected.
Override template	Option to override the template's properties such as the name of the indicator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name of the indicator. If you select a template in the **Template** field, then this field is automatically set to the template name.
Description	Brief description of the indicator. This field is automatically set if you select a template in the **Template** field.
Entity	Entity used to filter risks.
Applies to record	Record that the entity applies to. This field is automatically set.
Risk	Filtered risk that is related to the indicator. **Note:** If you have selected an indicator template, then the risk is also filtered based on the template.
Owning group	Group that owns the indicator. This field is automatically set based on the owning group of the risk.
Owner	Owner of the indicator. This field is automatically set to the owner's name based on the risk.
Method	
Type	Method used to determine the type of indicator. Select **Manual**.
Target type	Type of the target value. Choices are as follows: ○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Value mandatory	Option to decide if a value is required in the indicator task for a manual indicator. **Note:** This option is automatically selected when **Count** or **Percentage** is selected from the **Target type** field.
Target	Numerical value that is your goal for the indicator. This value determines if the indicator succeeded (passed) or failed. For example, if your goal for employee retention is 80%, you can enter the goal as the value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Any result less than 80% would mean the indicator failed.
Result if the value meets or exceeds the target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed** For example, assume you enter 80 in the **Target** field. If the indicator result output is more than 80, then the **Indicator status** field is set to **Passed** or **Failed** based on the value configured in the **Result based on target value** field.
Instructions for collecting data	More instructions on how to collect data.
Reference field	Connection between the supporting data table and the **Applies to record** field of the entity.
Basic Criteria	
Note: This section appears only after you specify supporting data.	
Criteria	Criteria to filter the data from the source table. Click **Set conditions** inside the field and create filters for the conditions.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
First run date	Date the indicator was first run.
Next run date	Next collection time for indicator results. This field is automatically set based on the value in the **Collection frequency** field. You can also edit this field and change the date. **Note:** This field only gets updated based on the scheduled runs and not when the indicators are manually executed.
Results	
Status	Status of the indicator to show whether the indicator passed or failed.
Previous status	Previous status of the indicator to show whether the indicator passed or failed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Save**.
5. To collect supporting data, click **Specify supporting data** and do the following:
   a. In the **Source table** field, select the table used for collecting supporting data.
   b. In the **Supporting data fields** field, select the fields of the source table that are used for collecting the supporting data.
      While specifying the supporting data fields, you cannot dot-walk in the Risk Workspace.
   c. In the **Sample size** field, specify the minimum number of records that must be used for collecting supporting data.
   d. Click **Save** and reload the form.
6. Click **Execute**.
   An indicator task is created and assigned to the risk owner. After the risk owner closes the indicator task, the Indicator Results related list appears.
7. To see the results of the indicator task, click the Indicator Results related list and do the following:
   a. Click the result that you want to view.
   b. To view the snapshot of the supporting data, click **View supporting data**.
   c. To view a particular live record, click **View** for that record.
      Live records always open in the classic user interface and not in the Risk Workspace user interface.

Create and run a basic risk indicator in the Risk Workspace

Create and run a basic risk indicator to identify the possibility of a future adverse impact on your organization. Indicators are an early warning system and they enable you to take preventative action on the risks. Basic indicators are automated indicators based on an indicator source.

Before you begin

Role required: sn_risk.manager or sn_risk.admin

About this task

In a basic indicator, the data is automatically collected from the source you specify. You must specify the supporting data before adding the criteria to filter data.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Indicators** > **Risk indicators**.
2. Click **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	Category of the indicator. For example, select **Risk Indicator** to create a risk indicator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Inherit from template	Option to create the indicator from an existing template.
Template	Template used to create the indicator. This field appears only if the **Inherit from template** option is selected.
Override template	Option to override the template's properties such as the name of the indicator.
Name	Name of the indicator. If you select a template in the **Template** field, then this field is automatically set to the template name.
Description	Brief description of the indicator. This field is automatically set if you select a template in the **Template** field.
Entity	Entity used to filter risks.
Applies to record	Record that the entity applies to.
Risk	Filtered risk that is related to the indicator. **Note:** If you have selected an indicator template, then the risk is also filtered based on the template.
Owning group	Group that owns the indicator.
Owner	Owner of the indicator. This field is automatically set to the owner's name based on the risk.
Method	
Type	Method used to determine the type of indicator. Select **Basic**.
Target type	Type of the target value. The choices are as follows: ○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Target	Value that determines if the indicator succeeded (passed) or failed.
Result based on target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, assume you enter 100 in the **Target** field. If the indicator result output is more than 100, then the indicator status is **Passed** or **Failed** based on the value configured in this field.
Basic Criteria	
Note: This section appears only after you specify supporting data.	
Criteria	Criteria to filter the data from the source table. Click **Set conditions** inside the field and create filters for the conditions.
Additional Criteria	
Additional criteria	More criteria to filter the data to calculate the target value. This section only appears when **Percentage** is selected from the **Target type** field. Click **Set conditions** inside the field and create filters for the conditions.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
First run date	Date the indicator was first run.
Next run date	Next collection time for indicator results. This field is automatically set based on the value in the **Collection frequency** field. You can also edit this field and change the date. **Note:** This field only gets updated based on the scheduled runs and not when the indicators are manually executed.
Results	
Status	Status of the indicator to show whether the indicator passed or failed.
Previous status	Previous status of the indicator to show whether the indicator passed or failed.

4. Click **Save**.
5. To collect supporting data, click **Specify supporting data** and do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Source table** field, select the table used for collecting supporting data.

b. In the **Supporting data fields** field, select the fields of the source table that are used for collecting the supporting data.
While specifying the supporting data fields, you cannot dot-walk in the Risk Workspace.

c. In the **Sample size** field, specify the minimum number of records that must be used for collecting supporting data.

d. Click **Save** and reload the form.

6. Click **Execute**.
The Indicator Results related list appears.
7. To see the results of the indicator, click the Indicator Results related list and do the following:

a. Click the result that you want to view.

b. To view the snapshot of the supporting data, click **View supporting data**.

c. To view a particular live record, click **View** for that record.
Live records always open in the classic user interface and not in the Risk Workspace user interface.

Create and run a scripted risk indicator in the Risk Workspace

Create and run a scripted risk indicator to identify the possibility of a future adverse impact on your organization. A scripted indicator enables you to write your own script to run the indicators. Indicators are an early warning system and they enable you to take preventative action on the risks.

Before you begin

Role required: sn_risk.manager or sn_risk.admin

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Indicators** > **Risk indicators**.
2. Click **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	Category of the indicator. For example, select **Risk Indicator** to create a risk indicator.
Inherit from template	Option to create the indicator from an existing template.
Template	Template used to create the indicator. This field appears only if the **Inherit from template** option is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Override template	Option to override the template's properties such as the name of the indicator.
Name	Name of the indicator. If you select a template in the **Template** field, then this field is automatically set to the template name.
Description	Brief description of the indicator. This field is automatically set if you select a template in the **Template** field.
Entity	Entity used to filter risks.
Applies to record	Record that the entity applies to.
Risk	Filtered risk that is related to the indicator. **Note:** If you have selected an indicator template, then the risk is also filtered based on the template.
Owning group	Group that owns the indicator.
Owner	Owner of the indicator. This field is automatically set to the owner's name based on the risk.
Method	
Type	Method used to determine the type of indicator. Select **Script**. **a.** To add your script, save the form and click **Add script**. **b.** Click **Save**.
Target type	Type of the target value. The choices are as follows: ○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Target	Value that determines if the indicator succeeded (passed) or failed.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
First run date	Date the indicator was first run.
Next run date	Next collection time for indicator results. This field is automatically set based on the value in the **Collection frequency** field. You can also edit this field and change the date. **Note:** This field only gets updated based on the scheduled runs and not when the indicators are manually executed.
Results	
Status	Status of the indicator to show whether the indicator passed or failed.
Previous status	Previous status of the indicator to show whether the indicator passed or failed.

4. To collect supporting data, save the form and click **Specify supporting data** and do the following:
   a. In the **Source table** field, select the table used for collecting supporting data.
   b. In the **Supporting data fields** field, select the fields of the source table that are used for collecting the supporting data.
   While specifying the supporting data fields, you cannot dot-walk in the Risk Workspace.
   c. Click **Save** and reload the form.
5. Click **Execute**.
   The Indicator Results related list appears.
6. To see the results of the indicator, click the Indicator Results related list and do the following:
   a. Click the result that you want to view.
   b. To view the snapshot of the supporting data, click **View supporting data**.
   c. To view a particular live record, click **View** for that record.
   Live records always open in the classic user interface and not in the Risk Workspace user interface.

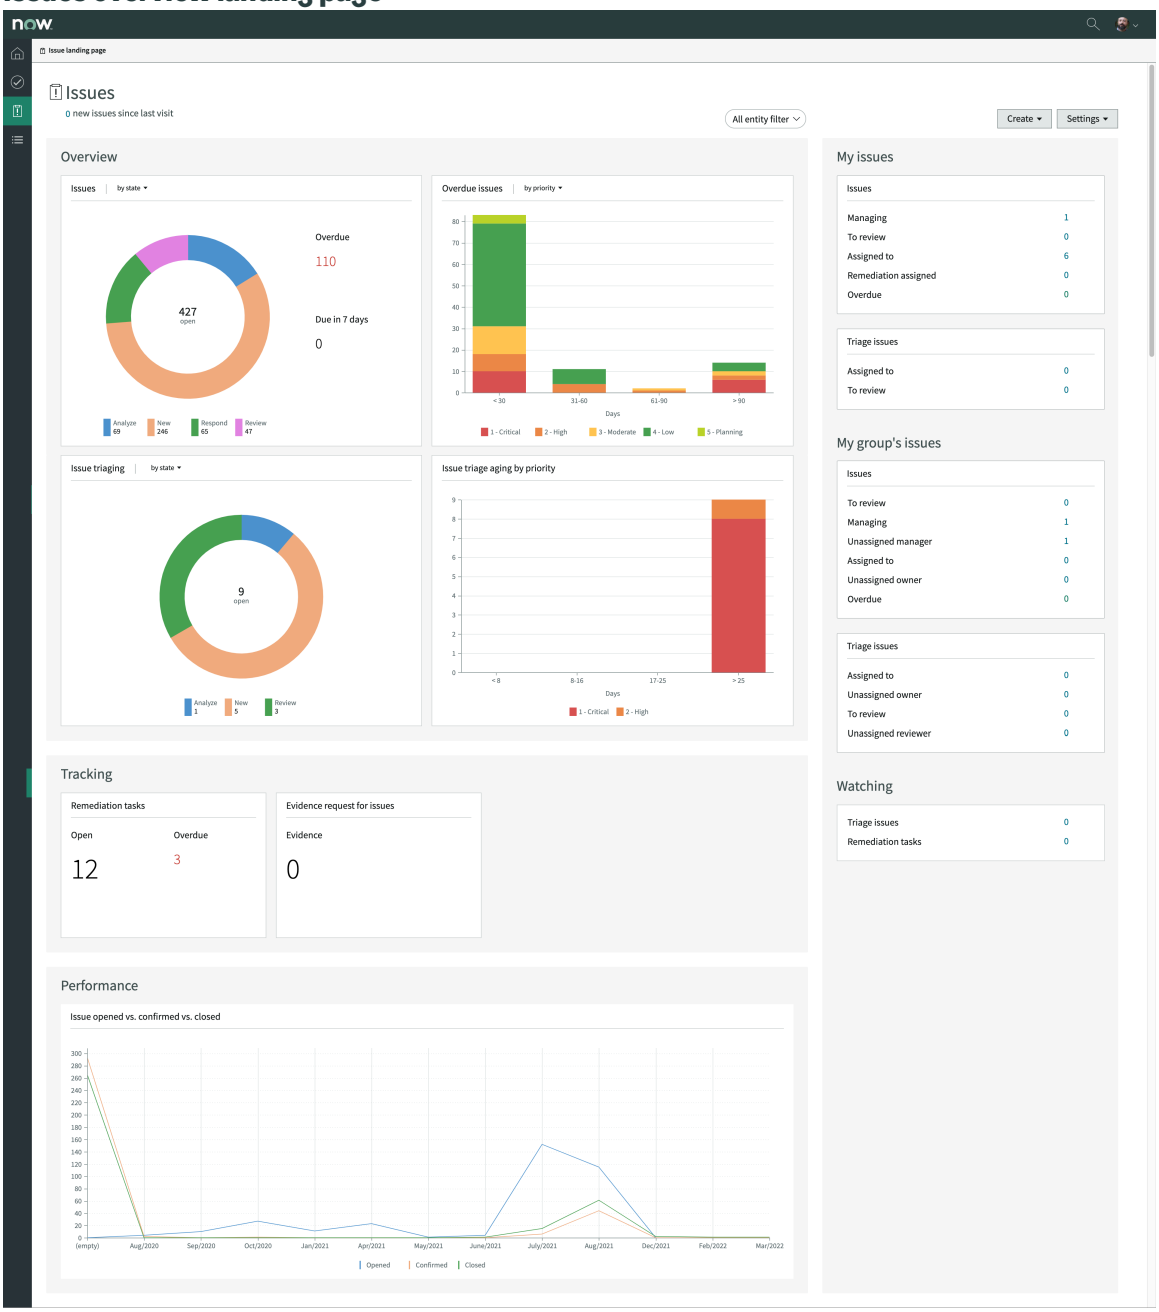
Issue management in the Risk Workspace

The issues landing page in the Risk Workspace provides logged-in managers and users with all the information they need to manage issues on a single page. The landing page features actionable insights, quick action buttons, filters, and access to open issue triages.

The issues landing page is available in the following workspaces:

- Compliance Workspace
- Audit Workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Privacy Workspace
- Risk Workspace

Open the Issues overview landing page

On each of the listed workspaces, you can access the issues by clicking the Issue overview icon ( ).

Click this icon to open the Issues overview landing page.

Issues overview landing page

Sections of the Issues overview landing page

Charts and graphs on the Issues overview landing page

Overview	
Issues	This chart shows issues broken down by state, issue type, issue rating, or priority. The number of overdue issues and issues due in seven days are also shown.
Overdue issues	This aging chart shows issues overdue by different ranges of time. For example, you can determine, at a glance, issues that are between 61 and 90 days overdue. The chart can be filtered by priority and issue rating.
Issue triaging	This chart shows issue triages by state, issue type, or priority. It can aid issue managers identify how issues are being triaged and prioritized.
Issue triage aging by priority	This aging chart provides an overview of how long issues have been open.
Tracking	
Remediation tasks	This widget shows the status of open and overdue remediation tasks associated with issues.
Evidence request for issues	This widget shows the number evidence requests that have been opened for issues.
Performance	
Issue opened vs. confirmed vs. closed	This chart shows trend data for open, confirmed, and closed issues over time.
My issues	
Issues	The section shows issues assigned to the logged-in user that can be reviewed, re-assigned, assigned for remediation, and that are overdue.
Triage issues	The section shows triage issues assigned to the logged-in user that can re-assigned and reviewed.
My group's issues	
Issues	The section shows issues assigned to member of the logged-in user's group.
Triage issues	The section shows triage issues assigned to the logged-in user's group.
Watching	
Triage issues	This section shows the number of triage issues for which the logged-in user is on the watch list.
Remediation tasks	This section shows the number of remediation tasks for which the logged-in user is on the watch list.

Create a risk assessment scope in the Risk Workspace

Create a risk assessment scope to identify risks for an entity, define assessors and approvers, set assessment frequency, and initiate assessments using the Risk Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_risk_workspace.IT_risk_manager, sn_risk_workspace.operational_risk_manager, or sn_risk_workspace.business_op_risk_manager

About this task

Creating a risk assessment scope ensures that assessments are effectively carried out, resulting in valuable insights for the risk management team and enabling informed decision-making.
You can create a risk assessment scope with a guided experience using the playbook. Each stage within the playbook includes one or more activities that must be completed, providing a structured approach to the risk assessment scope. The playbook guides you through each stage, recommending necessary activities, and ensuring comprehensive coverage of the workflow. Stages can also include automated activities, such as auto-sending an email to the Assessor when you initiate an assessment.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list  icon.
3. From the list, navigate to **Risk assessment planning** select **Scoped entities**.
4. Select **New**.
   The Risk assessment scope playbook opens and initiates the first activity for defining the risk assessment methodology (RAM) and assessable entity, which is the Scope definition stage.
5. On the Scope definition activity card, fill in the fields.

Scope definition card

Field	Description
Risk assessment methodology	Risk assessment methodology (RAM) that you use to assess risks.
Assessable entity	Entities associated with the selected entity classes defined in the **Applicable entity classes** field on the RAM. The value of this field changes based on the entity classes specified in your selected RAM. Only those entities that belong to the selected classes are displayed in this field.
Owner	Owner of the entity. This field is automatically set based on the assessable entity.

6. Select **Continue**.
   The Risks selection activity card opens that enables you to select and assess the risks related with the entity using the selected RAM.
7. To add existing risks, select **Add** and do the following:
   a. Select the risks to add.
   b. Select **Add**.
8. **Optional:** To create risks, select **Create risk** and do the following:
   a. Fill in the details of the new risk.
   b. Select **Save**.
9. **Optional:** To create risks from the risk taxonomy, select the down arrow icon next to the **Create risk** button, select **Create from risk statements**, and do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the risk statements to add.

b. Select **Add**.

10. Select **Mark as complete**.
    The Assignment stage in the Risk assessment scope playbook opens.
11. On the Assignment activity card, fill in the fields.

Assignment card

Field	Description
Assessor type	User or group who is responsible for assessing the risk. Choices are as follows: ○ **Same as entity owner** ○ **Same as risk owner** ○ **Specify users** ○ **Specify groups**
Assessor	User who is responsible for assessing the risk. This field appears only when **Specify users** is selected from the **Assessor type** field.
Assessor group	Group that is responsible for assessing the risk. This field appears only when **Specify groups** is selected from the **Assessor type** field.
Approver type	User or group who is responsible for approving the assessment. Choices are as follows: ○ Same as entity owner ○ Same as assessor's manager ○ Specify users ○ Specify groups ○ None
Approver	User who is responsible for approving the assessment. This field appears only when **Specify users** is selected from the **Approver type** field.
Approver group	Group that is responsible for approving the assessment. This field appears only when **Specify groups** is selected from the **Approver type** field.

12. Select **Mark as complete**.
    The Reassessment frequency stage in the Risk assessment scope playbook opens.
13. On the Reassessment frequency activity card, fill in the fields.

Reassessment frequency card

Field	Description
Reassessment frequency	How often you want to assess risks. Choices are as follows: ○ None ○ Weekly ○ Monthly ○ Quarterly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Semi-annually ○ Annually **Note:** If you conduct an unplanned risk assessment before the next scheduled reassessment date, the subsequent assessment date is determined by the frequency established in the last assessment. For example, if your frequency is set as monthly and you conduct the initial assessment on January 1. Then, if you perform an unplanned assessment on January 15, the next assessment will still be based on the last assessment date.
Days to overdue	Number of days within which the assessment should be completed after it is initiated. For example, if you define a value of 10 in this field, the due date of the assessment will be set to 10 days after the date the assessment is initiated. The default value is 5.

14. Select **Mark as complete**.
    The Initiate assessments stage in the Risk assessment scope playbook opens.
15. To initiate the assessments, select **Initiate all assessments**.
    When you generate an assessment, the assessor or the assessor's group gets an email notification indicating that the assessment has been assigned to them.
16. **Optional:** To go back in the workflow and change the scope, assignment, or frequency, select the menu ⋮ icon, and then select **Redefine scope**.

Schedule risk assessments in the Risk Workspace

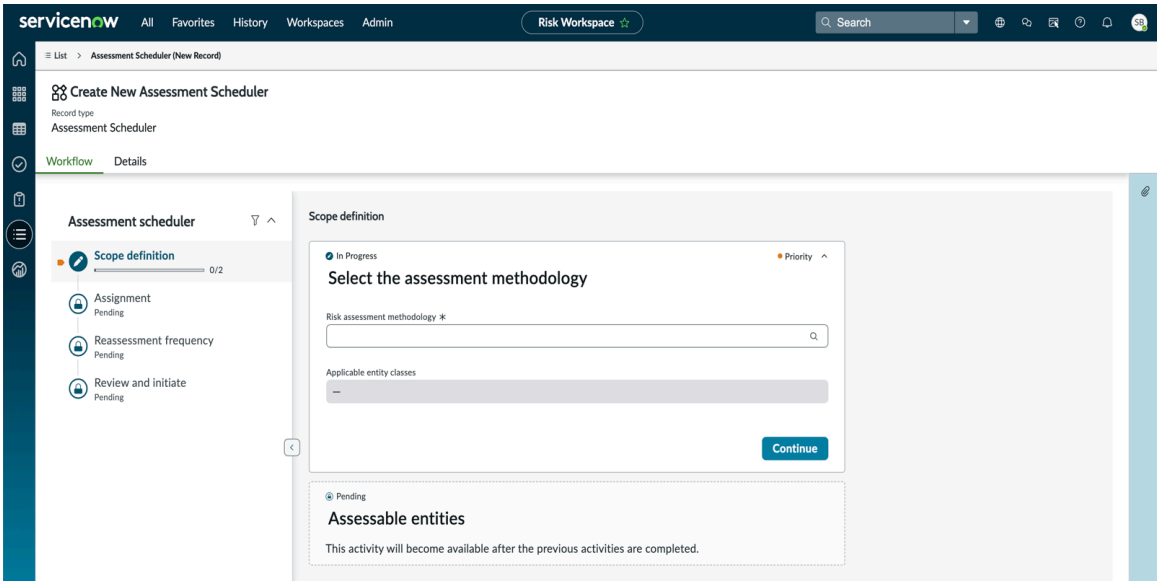
Schedule risk assessments automatically for multiple entities. The risk assessment scheduler helps the risk managers save time by automatically initiating the assessments based on the defined frequency.

Before you begin

Role required: sn_risk_workspace.IT_risk_manager and sn_risk_workspace.operational_risk_manager

About this task

In most organizations, the second line of risk managers is responsible for coordinating risk assessments. This group identifies the entities and associated risks that require assessment. They also determine the individuals responsible for assessing these risks. However, this continuous cycle of risk assessment demands that risk managers create individual risk assessment scopes and initiate assessments, leading to a significant loss of their time. To address this issue, the risk assessment scheduler can be used. By using the scheduler, you can schedule assessments and specify their frequency. The system initiates the assessments automatically based on the defined frequency. Additionally, you can designate the assessors and approvers for each assessment.



Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list .
3. Navigate to **Risk assessment planning** > **Scheduled assessments**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **New**.

   The Assessment Scheduler playbook opens the Scope definition stage, where you define the risk assessment methodology (RAM) and assessable entity.

5. On the Scope definition activity card, fill in the fields.

Scope definition card

Field	Description
Risk assessment methodology	Risk assessment methodology (RAM) that you use to assess risks.
Applicable entity classes	Entity classes related to the selected RAM. The value of this field changes based on the entity classes specified in your selected RAM. This field is automatically set based on the applicable entity classes for the selected RAM.

6. Select **Continue**.
   The Assessable entity selection activity card opens up, enabling you to add the assessable entities that belong to the applicable entity classes.
7. To add entities, select **Add** and do the following:
   a. Select the entities to add.
   b. Select **Add**.
8. Select **Mark as complete**.
   The Assignment stage in the Assessment scheduler playbook opens.
9. On the Assignment activity card, fill in the fields.

Assignment card

Field	Description
Assessor type	Individual or group who is responsible for assessing the risk. Choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Entity owners ○ Risk owners ○ Group
Assessor group	Group that is responsible for assessing the risk. This field appears only when **Group** is selected from the **Assessor type** field.
Approver type	Individual or group who is responsible for approving the assessment. Choices are as follows: ○ Entity owners ○ Assessor's manager ○ Group ○ None
Approver group	Group that is responsible for approving the assessment. This field appears only when **Group** is selected from the **Approver type** field.

10. Select **Mark as complete**.
    The Reassessment frequency stage in the Assessment scheduler playbook opens.
11. On the Reassessment frequency activity card, fill in the fields.

Reassessment frequency card

Field	Description
Initiate later	Option to initiate the assessments on a future date.
Initiate assessments on	Date on which you want to schedule an assessment. This field appears only when the **Initiate later** option is selected.
Reassessment frequency	How often you want to assess risks. Choices are as follows: ○ None ○ Weekly ○ Monthly ○ Quarterly ○ Semi-annually ○ Annually **Note:** If you conduct an unplanned risk assessment before the next scheduled reassessment date, the subsequent assessment date is determined by the frequency established in the last assessment. For example, if your frequency is set as monthly and you conduct the initial assessment on January 1. Then, if you perform an unplanned assessment on January 15, the next assessment will still be based on the last assessment date.
Days to overdue	Number of days within which the assessment should be completed after it's initiated. For example, if you define 10 in this field, the due date of the

Field	Description
	assessment will be set to 10 days after the date the assessment is initiated. The default value is 30.

12. Select **Mark as complete**.
    The Review and initiate stage in the Assessment scheduler playbook opens.
13. To initiate the assessments, select **Initiate assessments**.
    When you generate an assessment, the assessor or the assessor's group gets an email notification indicating that the assessment has been assigned to them.
14. **Optional:** To go back in the workflow and change the scope, assignment, or frequency, select **Redefine scope**.

Result

The assessments are initiated. You can view all the scheduled assessments under **Risk assessment planning** > **Scheduled assessments**.

Perform advanced risk assessment in the Risk Workspace

Conduct risk assessments to assess inherent risks, effectiveness of controls, residual risks, and target risks in the Risk Workspace application. You can define risk responses that enable you to manage and mitigate the risks identified during the risk assessment process.

Before you begin

Role required: sn_grc.business_user

Note:
You must manually assign the advanced risk assessment roles to the sn_grc.business_user role. To understand how you can adjust the granting of roles and groups, see the How to adjust granting of roles and groups to use background jobs [KB0963693] article in the Now Support Knowledge Base. You must log in to Now Support to view the article.

About this task

A risk assessment is performed for the following:

- Inherent risks
- Effectiveness of controls
- Residual risks
- Target risks

The risk assessments yield risk scores that are automatically calculated based on the configurations made in the risk assessment methodology (RAM). If you want to change the automatically calculated scores, you can overwrite the calculated scores and provide a justification. If you have no controls to assess, then the residual risk score is the same as the inherent risk score.

After performing the assessment, you can define the risk response. Risk response refers to the process of managing identified risks. It's a planning and decision-making process where the risk managers decide how to deal with each risk. While performing the assessment, you can view detailed reference information on the Contextual side panel. This panel provides information for the risk events, open issues, key indicator breaches, control test results, and control indicator failures.

If the risk assessment in being performed by an assessor's delegate, the **Assessor's delegates** field shows the delegate's name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A risk assessment record progresses through the following statuses:

- **New**: The risk assessment is created but not yet initiated or is in a ready-to-assess state.
- **In progress**: The risk assessment is currently being evaluated. This status applies when the assessment is in any of the following states: Inherent Assessment, Control Assessment, Residual Assessment, Target Assessment, or Respond.
- **Awaiting approval**: The risk assessment is complete and awaiting review or approval from the designated approvers.
- **Completed**: The risk assessment has been fully approved, finalized, and requires no further actions.
- **Archived**: The risk assessment is no longer active. When an assessment is in the Completed status and a reassessment begins for the same risk, the old assessment is moved to the Archived status.
- **Cancelled**: The risk assessment has been terminated or withdrawn.

For more information on statuses, see Risk Assessment workflow changes from 19.1.x version article in the Now Support Knowledge Base. You must log in to Now Support to view the article.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **My tasks**.
2. Open the risk assessment that you want to assess and do one of the following.
   - If you want to start the assessment, select **Let's get started**.
   - If you think that the risk assessment must be assigned to someone else, select **Reassign** and fill in the necessary details.
   - If this risk was previously assessed, to view the previous assessment, select **Review last assessment**.
   - If the risk assessment is in progress and you want to continue the assessment, select **Resume**.
3. To perform inherent assessment, respond to the all inherent assessment questions.

   a. Optional: To view the guidance for a factor, select the question mark icon (.

   b. Optional: To view the qualitative and quantitative weightage, select overall rating icon.
   The application automatically saves your responses and calculates the overall risk score.
4. **Optional:** To change the computed inherent risk results, do the following:

   a. Select the **I would like to change the computed score** option.

   b. From the **Override inherent risk** field, select the appropriate value.

   c. Enter comments that explain the reasons for the change in the computed score.
5. Select **Next**.
6. For the Control assessment, do one of the following:
   - To assess the effectiveness of the controls, respond to all the control assessment factors.
   - To proceed without assessing the mitigating controls, select the **Control assessment not applicable** option.
   - To assess the control environment without adding controls, select **I would like to change the computed score** option and refer to step 8.

   You can also change the computed control effectiveness results by providing a justification for changing the score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To add or create controls for the control assessment, do one of the following:
   - To add existing controls, select **Add**.
   - To inherit common controls, select **Inherit common controls**.
   - To create a control, select the down-arrow next to the **Inherit common controls** button, and select **Create control**.
   - To add controls from control taxonomy, select the down-arrow next to the **Inherit common controls** button, and select **Create from control objectives**.
8. **Optional:** To assess the control environment without adding controls, do the following:
   a. Select the **I would like to change the computed score** option.
   b. From the **Override control effectiveness** field, select the appropriate value.
   c. Enter comments that explain the reasons for the change in the computed score.
9. To assess the leftover risks after the implementation of mitigating controls, select **Next** and respond to the factors in the residual assessment.
   You can also change the computed residual score by providing a justification for changing the score.
10. **Note:**
    The availability of the target risk assessment on the assessment form depends on the conditions outlined in the RAM.

    To assess the desired risk level that you want to achieve in the future, select **Next** and respond to the factors in the target assessment.
    You can also change the computed target score by providing a justification for changing the score.
11. To select an appropriate strategy and to define the plan of action for the risks assessed, select **Next**, and do the following.
    a. Select the appropriate risk responses.
    b. **Optional:** To create a risk response task, select the **Create task** button, and select the appropriate values.
    For more information, see Create a risk response task in the Risk Workspace.
    c. **Optional:** To link existing risk response tasks or copy the tasks along with the risk response strategies from the previous assessment while reassessing a risk, select **Yes, continue with existing**.
    The **Yes, continue with existing** button appears only when you are reassessing a risk. To continue with another response, select **Change response**.
    d. Select **Save task** and review your responses.
    The risk response tasks are created and assigned to the assignee. You can edit the task and modify it to change the owner.
12. To link existing issues to the risk assessment, do the following:
    You must enable the **Allow issue linking with risk assessment** option on the Risk Assessment Methodology (RAM) form to use this feature.
    a. Select **Add existing issues**.
    b. Select the issues from the list and select **Add**.
13. To create issues for the risk assessment, do the following:

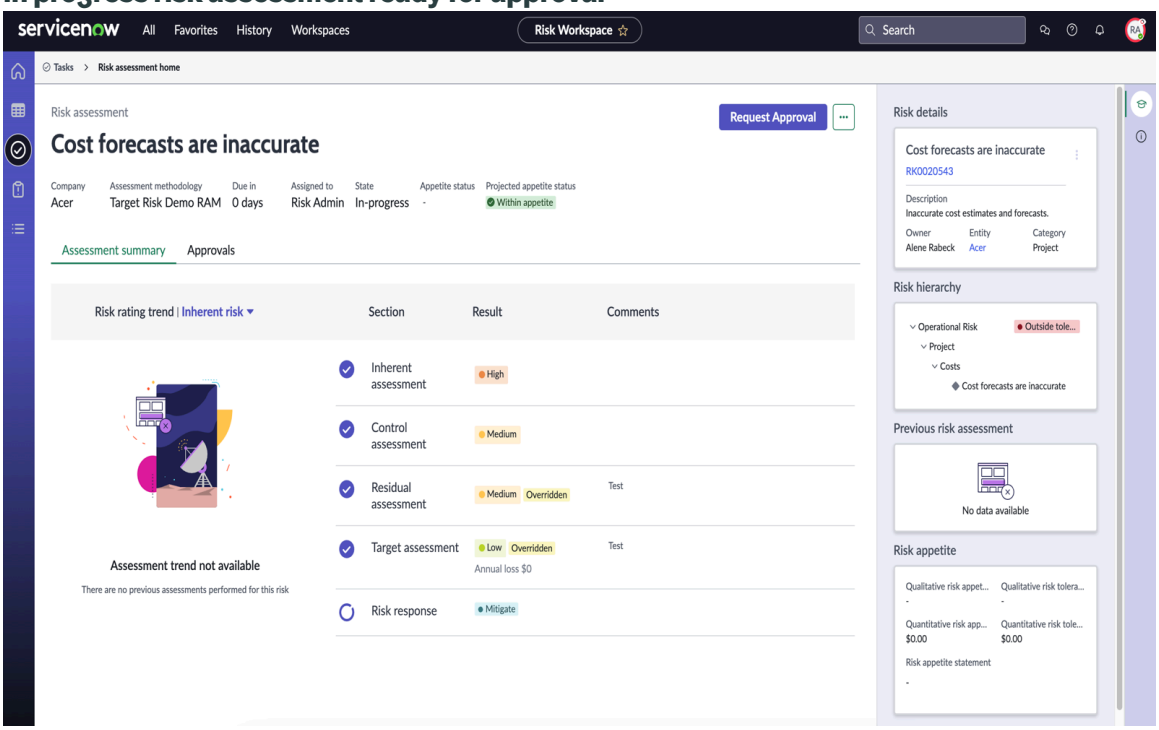
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must enable the **Allow issue linking with risk assessment** option on the Risk Assessment Methodology (RAM) form to use this feature.

a. Select **Create issue**.

b. On the Create an issue form, fill in the required details.

c. Select **Save**.



14. Select **Submit**.
    If there are no validation errors, the assessment homepage is displayed.
15. **Optional:** If you want to modify the assessment, select **Edit**.
16. **Optional:** To view the activities taking place for the assessment, select the Activity log icon .
17. If you have defined approvers, then select **Submit**.
    The assessment home page is displayed. You can review the summary of your assessment.
18. To request approval, edit assignment, or reassign, select one of the following.

Result

The assessment is sent to the approver and the approval workflow starts.

Example:

In progress risk assessment ready for approval

Generate a risk assessment summary

Generate a risk assessment summary

Generate a risk assessment summary that is based on your inherent risks, residual risks, target risks, and control effectiveness data by using the Now Assist for IRM application. Your approvers get the key insights to understand the context quickly, and you reduce the time involved in creating summaries manually.

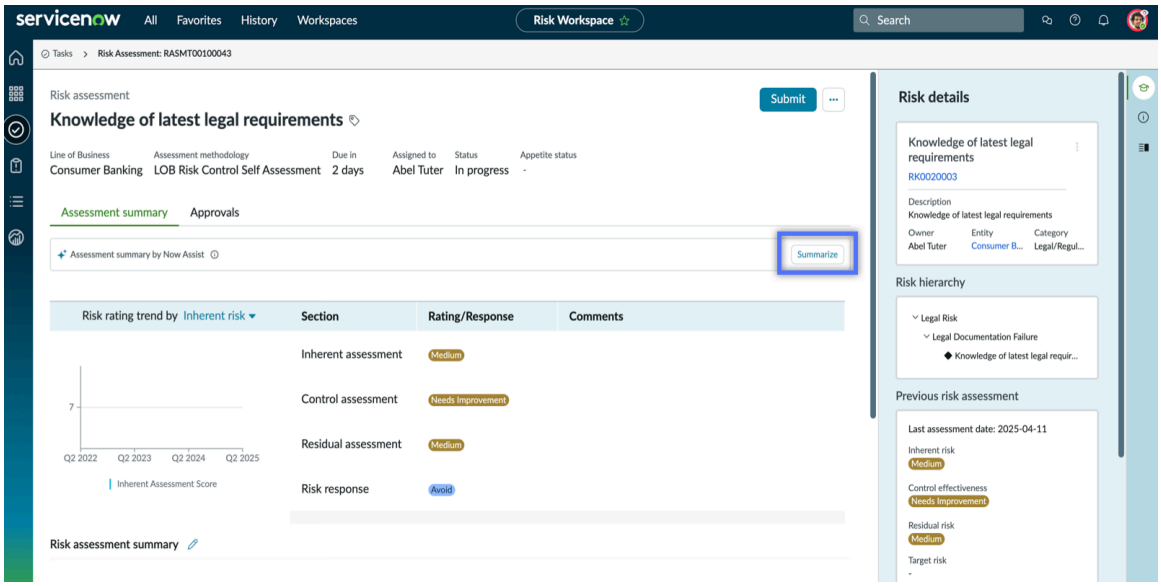
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Install the Now Assist for IRM application to generate a risk assessment summary.

Activate the Risk Assessment Summarization skill from the Now Assist Admin console to enable assessors and approvers to generate risk assessment summary.

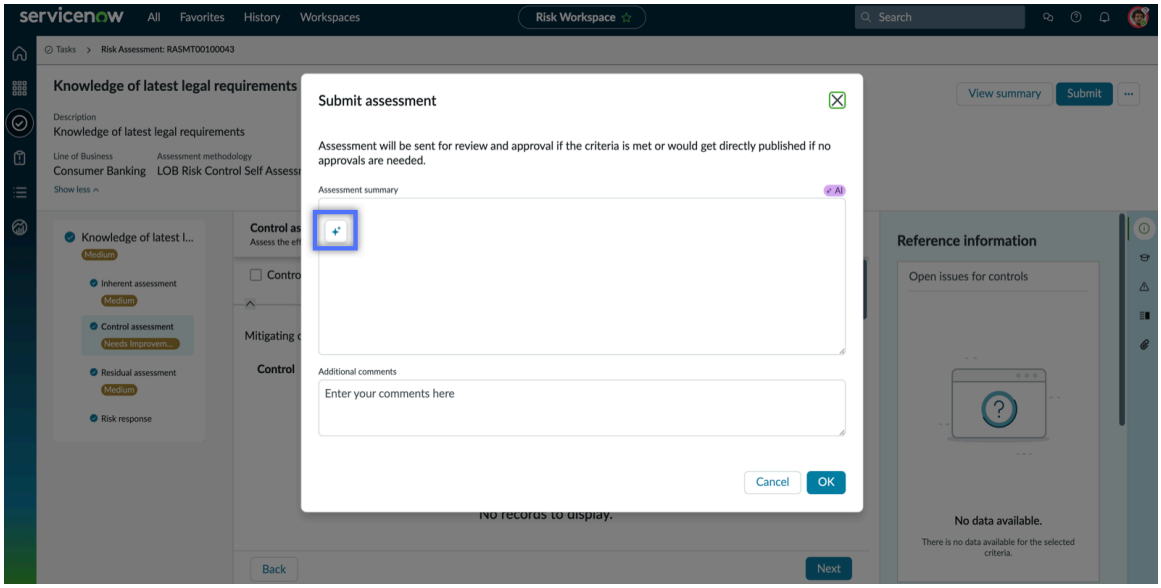
Role required: The sn_grc_sharegenai.risk_asmt_user role must be assigned manually to the assessor (sn_risk_advanced.ara_assessor) and approver (sn_risk_advanced.ara_approver) roles to generate the risk assessment summary.



About this task

Assessor can generate the risk assessment summary and save the summary in the **Risk assessment summary field** only when they are submitting the assessment. After submission, both assessors and approvers can generate the summary and share it in the work notes. You can also summarize the assessment for object based assessments.

Note:
This feature is available only on the Risk Workspace.



Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **My tasks**.
2. Open the risk assessment that you want to create the risk assessment summary for.
3. Generate a risk assessment summary from the risk assessment landing page by selecting **Summarize**.

4. Generate a risk assessment summary while submitting the assessment by selecting the generate summary icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A summary is generated; you can edit it and save it for reference and reporting purposes. After submission of the risk assessment, the **Assessment summary** field becomes read only.

Perform any object assessment in the Risk Workspace

Assess the risks on any object or record in ServiceNow®. An example of object assessment is assessing change management or assessing a citation.

Before you begin

Role required: sn_grc.business_user

About this task

To perform an object risk assessment, a prior knowledge of risk is not necessary. When you perform any object assessment in the Risk Workspace, you do not see the description of the risk and any reference information because the entire context of risk is not required. You can configure the risk assessment button in the object record and start the assessment. For more information, see Any object assessment using Advanced Risk Assessment.

Procedure

1. Navigate to my **All** > **Risk** > **Risk Workspace**.
2. Click the Work queue ( )
3. Under **My pending tasks**, under Advanced risk assessments, open the object risk assessment assigned to you.
4. If you select **Start assessment**, respond to the assessment questions.
   For more information, see Perform advanced risk assessment in the Risk Workspace.
5. Click **Save**.
6. If you have configured risk response in your risk assessment methodology, select the appropriate risk response strategy and click **Define risk response**.
7. To send the assessment for review, click **Review and submit**.
   The assessment home page is displayed. You can review the summary of your assessment.
8. To request approval, edit assignment, or reassign, select one of the following. **Request approval**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow of risk response task

The risk response task workflow is a structured process to manage assessed risks by defining plans of action to either accept, mitigate, avoid, or transfer those risks.

Exploring the user journey for Risk response task

The states of a risk response task are as follows:

1. **Draft**: The default state when a risk response task is created.
2. **Work in progress**: The state when the risk response task owner starts working on it and sends it to the approver for review.
3. **Awaiting approval**: The state when the approver reviews the risk response task and either approves or rejects it.
4. **Closed**: The state when the approver approves the risk response task, moving it to the Closed state.

The risk response task workflow consists of the following stages:

Create a risk response task

After an assessor identifies the risk response plans, the assessor then creates risk response tasks. The user with the sn_risk_advanced.ara_assessor role can create a risk response task and assigns them to the risk user with the role sn_risk.user. After creation, the risk response task moves to the Draft state. For more information, see Create a risk response task in the Risk Workspace.

Create action items

The risk assessor can create multiple strategies with various action items for each risk response task. Action items are specific, granular tasks defined within a risk response task to address and manage risks effectively. Action items can be created and defined when the risk response task is in either the Draft state or the Work in progress state. For more information, see Create an action item in the risk response task.

Action items have their own independent workflow. For more information, see Workflow of action item in risk response task.

Note:
You can create risk response action items for all types of risk response tasks except for Risk acceptance tasks.

Respond to the risk response tasks

After the risk response task is assigned, the risk response task owner moves the risk response task to the Work in progress state. In this stage, the risk response task owner defines a plan of action for the risk response task. After defining the plan of action, the task owner can request for approval from the approvers defined in the approval configurator. By default, a single level of approval is enabled for all types of risk response tasks, where the risk owner can approve the tasks. These approvals can be configured based on requirements. After the task owner request for approval, the risk response task moves to the Awaiting approval state.

Important:
All action items associated with the risk response task must be closed to move the risk response task from Work in progress to Awaiting approval state.

Approve or reject the risk response task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Awaiting approval state, the approvers defined in the approval configurator can review the plan of action and either approve or reject the risk response task. The risk response task moves to the Closed state, if the all the approvers approve the task. If any of the approvers reject the task, then the risk response task moves back to the Work in progress state.

Workflow of action item in risk response task

The action item workflow is a structured process for managing the granular tasks associated with risk response tasks, which are assigned to multiple stakeholders.

Exploring the user journey for an Action item

The states of an action item are as follows:

1. **Draft**: The default state when an action item is created.
2. **Assigned**: The state when the action item is assigned to a user.
3. **Work in progress**: The state when the action item owner starts working on it and sends it to the risk response task owner for review.
4. **Review**: The state when the risk response task owner reviews the action item and either approves or rejects it.
5. **Closed**: The state when the risk response task owner approves the action item, moving it to the Closed state.

The action item workflow consists of the following stages:

Create action items

The risk assessor or risk response task owner can create multiple strategies with various action items for each risk response task. Action items are specific, granular tasks defined within a risk response task to address and manage risks effectively. The risk response task owner defines a plan of action for the action item. Action items can be created when the risk response task is in either the Draft state or the Work in progress state. For more information, see Create an action item in the risk response task.

Note:
You can create risk response action items for all types of risk response tasks except for Risk acceptance tasks.

Respond to the action item

The assignee of the risk response action item moves the action item to the Work in progress state. In this stage, the action item owner specifies the action taken in the **Assignee comments** field, along with any other required steps. The action item owner then sends the action item to the risk response task owner for approval. After the action item owner request for approval, the action item moves to the Review state.

Approve or reject the action item

In the Review state, the risk response task owner can review the assignee comments and either approve or reject the action item. If the approver approves the action item, it moves to the Closed state. If approver rejects the action item, then the action item moves back to the Work in progress state.

Important:
All action items associated with the risk response task must be closed to move the risk response task from Work in progress to Awaiting approval state.

Create a risk response task in the Risk Workspace

Create a risk response task to define plan of actions, assign responsibilities, set priorities, and establish deadlines to ensure effective management of the assessed risks.

Before you begin

Role required: sn_risk_advanced.ara_assessor

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the task  icon.
3. Open a risk assessment for which you want to add a risk response task and navigate to the Risk response section.
4. To create a risk response task, select **Create task** next to the selected risk response plan.
5. On the form, fill in the fields.

Risk response task form

Field	Description
Name	Unique name of the risk response task.
Plan	Actions that are implemented to manage the identified risk. Actions include steps, methods, and resources required to manage the risk.
Assigned to	Person responsible for managing the risk response task.
Priority	Importance or urgency of the risk response task.
Due date	Date by which the risk response task must be completed.

6. Select **Save task**.

Create an action item in the risk response task

Create multiple strategies with various action items for each risk response task. Action items help you to understand and focus on specific steps needed to manage risks.

Before you begin

Role required: sn_risk_advanced.ara_assessor

About this task

Action items are specific, granular tasks defined within a risk response task to address and manage risks effectively. They're elevated from the broader risk response task and can be assigned to different users to ensure that the required response plan is executed.

Note:
You can create action items for:

- Risk responses except Risk Acceptance tasks
- Risk responses that are in Draft or Work in Progress

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the task  icon.
3. Open a risk response task for which you want to add an Action item.
4. Select the **Action items** related list.
5. Select **New**.
6. On the form, fill in the fields.

   For a description of the field values on the Create New Action Item form, see Create New Action Item form.
7. Select **Save**.
8. To send the action item to the assignee, select **Send to Assignee**.
   The action item moves to the Assigned state.

Create New Action Item form

Use the Create New Action Item form to define the plan of action, assign responsibilities, set priorities, and establish milestones for the action item.

See the following table for a description of the field values.

Create New Action Item form

Field	Description
Title	Unique name of the action item.
Plan of action	Actions that are implemented to manage the identified risk. The actions include steps, methods, and resources required to manage the risk.
Reviewer	Person responsible for reviewing the action item. This field is automatically set to the name of the person creating the action item.
Priority	Importance or urgency of the action item.
Start date	Date on which the action item is scheduled to begin.
Assigned to	Person responsible for completing the action item.
State	Status of the action item. This field is automatically set to **Draft**.
End date	Date by which the action item is expected to be completed.
Watchlist	List of individuals who can view and receive notifications about the action item.
Details	
The Details section is a read-only section.	

© 2026 ServiceNow, Inc. All rights reserved.

Create New Action Item form (continued)

Field	Description
Risk response task	Name of the risk response task that includes this action item.
Risk	Name of the risk for which this action item is created.
Priority	Importance or urgency of the risk response task.
State	Status of the risk response task.
Entity	Name of the associated entity.
Due date	Date by which the risk response task is expected to be completed.
Actions taken	
Assignee comment	Comments or actions taken by the assignee responsible for implementing the action item. This field is read only for risk response task owner.
Additional comments	Additional information or details about the action item.

Workflow for risk identification in the Risk Workspace

Workflows provide step-by-step guidance for completing the risk identification process in the GRC Risk Workspace.

In the Risk Workspace, a risk manager can use the risk identification workflow to identify risks. The workflow has multiple stages. The stage progress gets updated as activities are completed. The risk identification workflow is broken it into multiple lanes. Each lane in the workflow includes one or more activities for a task owner to complete.

The benefit of using the risk identification workflow is that you can get a detailed view on a single interface. You can also easily go back to any stage and restart an activity.

For risk identification, after a risk identification record is created, the information gathering questionnaire is sent to the assigned user. You can also send email reminders to the users to respond to the questionnaire. After the responses are received, the risk manager can do the following activities:

1. View the responses.
2. Approve or reject the responses.

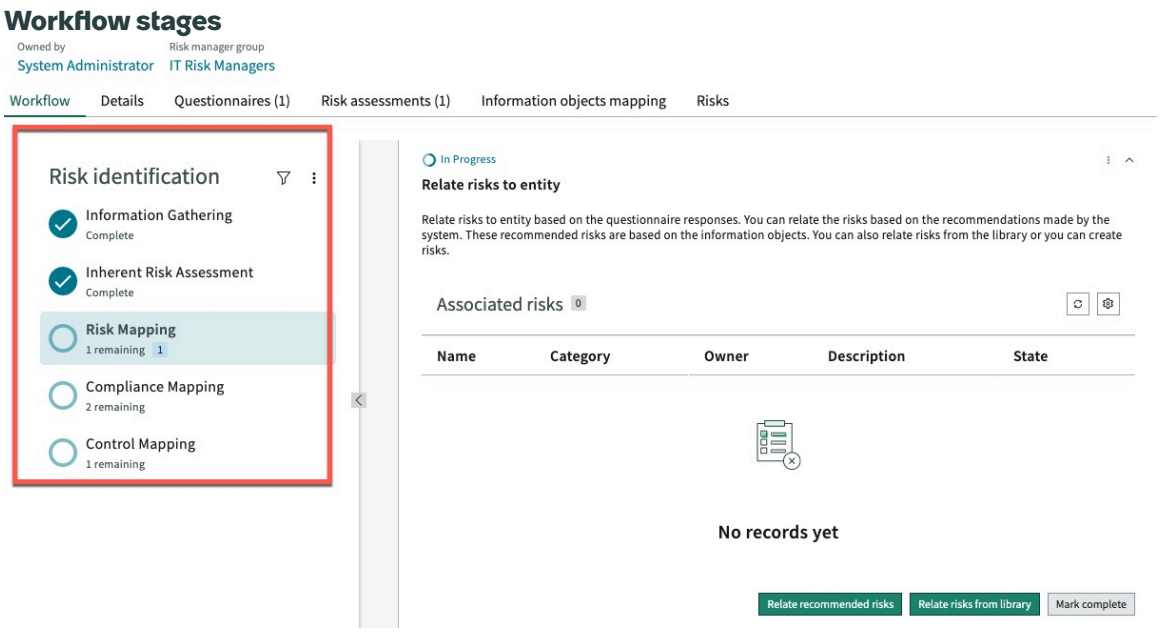
> **Note:**
> If there is rejection, the risk manager can provide a reason for rejection and resend the questionnaire.

3. Initiate inherent assessment.
4. Perform the risk assessment.
5. View the assessment scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Relate either the recommended risks or relate them from the library. Alternatively, the risk manager can also create risks.

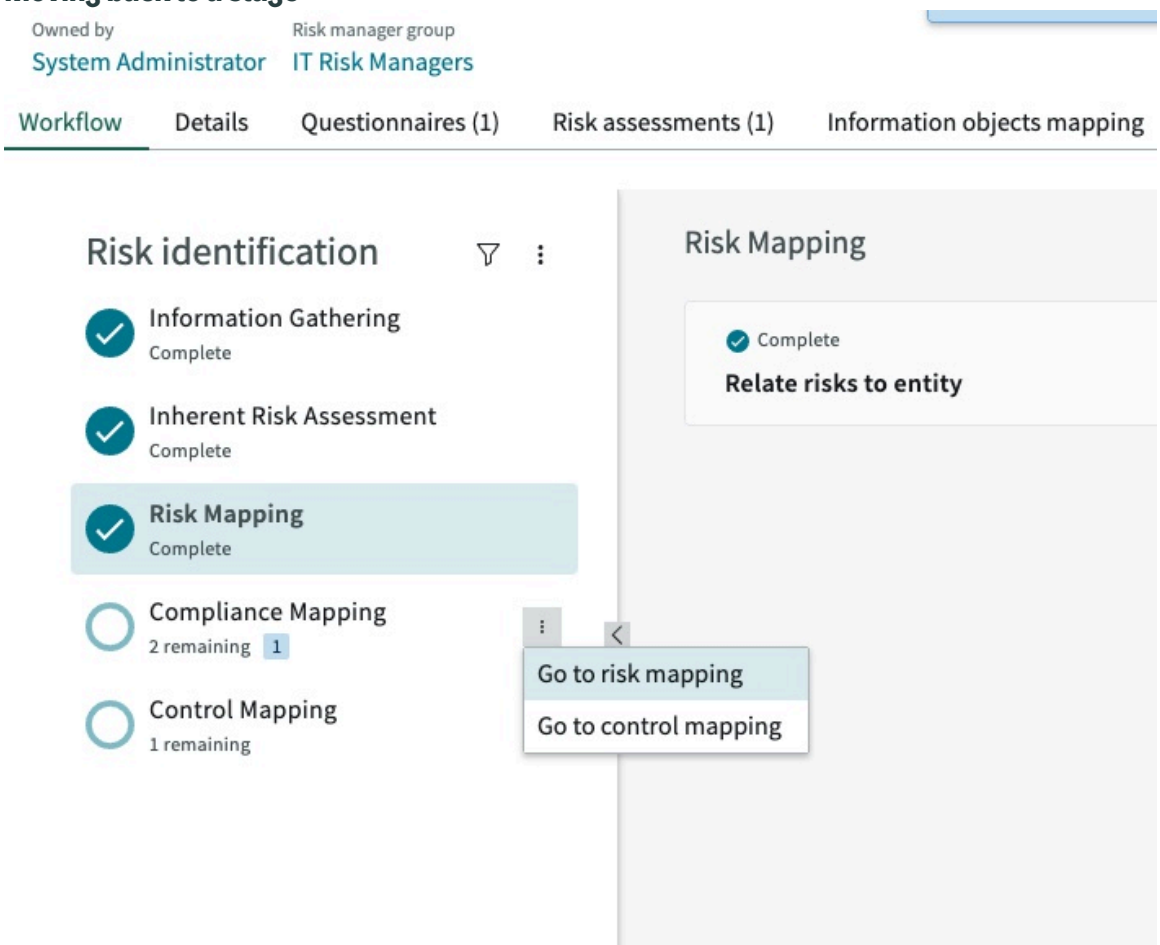
   Note:
   Recommended risks are risks that are generated from information objects.



7. Mark the activity as complete.
8. Relate either the recommended policies or relate them from the library.
9. Relate or create additional controls after the controls for various risks and policies are automatically generated.
10. Request attestations for either all the controls or selective controls.

It is important to remember the following points:

- In a workflow, the stage progression is automatic, however, if you restart any activity after completing it, you have to manually move to the next stage.
- If you finish relating the controls and then again move to risk mapping, the control-mapping stage moves to pending state.
- When you reinitiate a workflow, a new workflow instance is created.



For more information, see Application risk assessment using advanced risk assessment

The following figures show the workflow stages and actions:

Create a risk event in the Risk Workspace

Create a risk event in the Risk Workspace. Risk events are potential or actual financial and non-financial losses, near misses, and gains that occur within an organization.

Before you begin

Role required: sn_risk.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you create a risk event, the risk event goes through the defined lifecycle of analysis, approval, and closure. Creating or recording risk events enables your organization to prevent similar events from occurring.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Risk events** > **All events**.
2. Click **New**.
3. On the form, fill in the following fields:

Create New Risk Event form

Field	Description
Name	Name of the risk event such as `ATM Theft`.
Description	Description of the risk event reported.
Classification	
Event type	Type of event. The options are as follows: ○ **Financial Impact**: Select this option when the event leads to monetary losses. ○ **Non-Financial Impact**: Select this option when the event does not have monetary losses.
Category	Event category. You can edit the category to apply one of the following options: ○ **Personal**: For example, any physical harm caused to an employee. ○ **Legal**: For example, an employee is found conducting business that is a conflict of interest. ○ **Information Security**: For example, a theft, burglary, or system crash. ○ **Human Resources**: For example, sensitive lawsuits by an employee against another employee.
Sub type	Event sub type. The choices are as follows: ○ **Actual**: Select this option if the event has actually occurred. ○ **Potential**: Select this option if the event has the potential to occur.
Discovered by	Person who discovered the risk event.
Opened	Date of risk event creation.
Opened by	Person creating the risk event.
Near miss	Option to specify if the risk event had the potential to incur losses but did not result in losses. This field is available when **Potential** is selected from the **Sub type** field.
Financial gain	Option to show if the risk event resulted in a gain instead of a loss. This option is automatically selected if the risk event meets one of the following conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ If **Potential** is selected from **Sub type** field and the **Expected loss** field or the **Potential loss** field has a negative value because of the gain. ○ If **Actual** is selected from **Sub type** field and the **Net loss** field has a negative value.
Used in modeling	Option to share the risk event records with external systems where advanced analysis is performed using simulation techniques such as the Monte Carlo simulation. The Monte Carlo simulation is a mathematical technique used to estimate the possible outcomes of an uncertain event.
Ownership	
Primary entity	Entity that bears the loss. This entity is visible to management for reporting.
Owning group	Group responsible for monitoring the event to closure.
Cost center	Account number of the entity.
Owner	Person who owns the risk event. A risk manager can be an event owner. If the owning group is specified, the owners are filtered from the owning group.
Key Dates	
Date of occurrence	Date when the event occurred.
Date of discovery	Date that the event was first discovered or noticed.
Loss/Gain Estimates	
Expected loss	Amount of loss expected. Expected loss is the probability weighted average of all possible losses. This amount is based on the user's judgment of the expected amount that the organization might lose.
Non financial impact	Rating for the non-financial impact associated with the event.
Potential loss	Amount expected to be a potential loss due to the risk event. This amount is the maximum loss an entity can incur due to the loss from the risk event.
Credit/Market Risk Overlap	
Boundary event	Option to mark the event as a boundary event. A boundary event is an operational risk event which leads to a consequence, such as a financial loss, in another risk category.
External risk type	Type of external risk the risk event can have. The choices are as the following: ○ **Credit**: Credit risk is the possibility of a loss resulting from a borrower's failure to repay a loan or meet contractual obligations. For example, when lenders offer credit cards, or loans, there's a risk that the borrower might not repay the loan. ○ **Market**: Market risk is the possibility of an investor incurring losses due to factors that affect the performance of the financial markets in which the investor is involved. For example, a recession might impact the entire market. This option appears when **Boundary event** is selected.

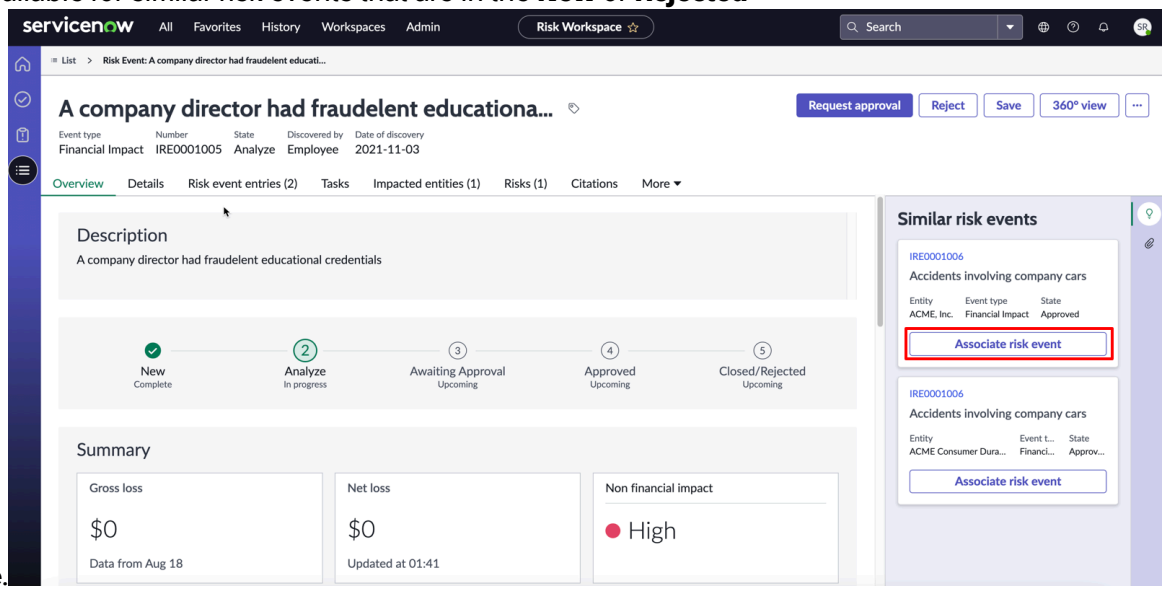
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
External risk reference	ID for reconciliation in the book of accounts. This value is automatically set. This option appears when **Boundary event** is selected.
Root Cause Analysis	
Cause	Primary reason why the risk event occurred.
Cause description	Brief description about why the risk event occurred.
Consequence	Consequence of the risk event. For example, regulatory fines can be imposed as a result of the risk event.
Actions taken	Remedial actions that were taken to address the issue. This is the initial record of the event.
Activity	
Work notes	Notes about the risk event. These notes are not visible to external users.
Additional comments	Additional comments about the risk event. These notes are visible to the external users.

4. Click **Save**.

Associate similar risk events

Train a similarity solution definition that uses machine learning by activating the Governance, Risk, and Compliance: Predictive Intelligence plugin. The solution enables the system to display similar risk events automatically.



The Governance, Risk, and Compliance: Predictive Intelligence plugin uses Artificial Intelligence (AI) and Machine Learning (ML) to manage the risk events more efficiently. You can identify similar risk events and group them to capture and analyze the actual impact of the risk event.

For example, in an organization with operations in multiple locations, the risk event teams across different locations may be working on similar types of risk events. This challenge results in duplicate efforts to manage the risk events within the organization. This capability reduces the manual effort in managing similar risk events and improves overall organizational efficiency.

You can associate similar risk events only when the main risk event is in the **Analyze** state. Also, the Associate risk event button is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

unavailable for similar risk events that are in the **New** or **Rejected** state.

The platform machine learning administrator (ml_admin) can create a solution definition and modify an existing one. You can navigate to **Risk Events** > **Administration** > **Properties** to update the risk event property with the new solution definition name.

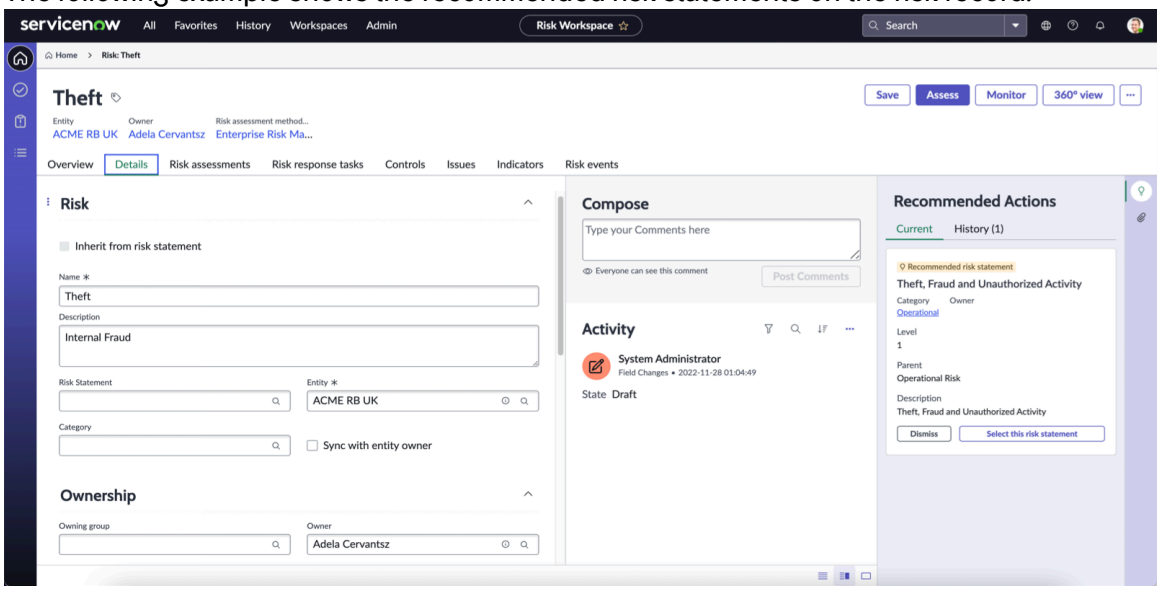
Categorizing risks with the Governance, Risk, and Compliance: Predictive Intelligence plugin

By using the Governance, Risk, and Compliance: Predictive Intelligence plugin, you can predict the risk statements for your orphan risks (the risks that don't have risk statements) on the risk records for your organization. You can then identify the correct risk statement for the risks and then aggregate them into manageable categories.

Usually, the first line of employees or the risk champions within an organization identify the risks for the business.

> **Note:**
> A risk champion is an executive who is in charge of identifying and reporting risks within an organization.

As the risk champions identify these risks, they manually associate the risks with the correct risk statement. The organization's senior management gets visibility into the organization's risk profile because these operational risks are aggregated into the enterprise risks.



However, your risk champions must manually search the complete risk library to identify the correct risk statement for the identified risks. This activity is time-consuming and is an inefficient use of resources. When the risk champions search for risk statements manually, they tend to select whatever is the earliest match rather than search for the entire library, which results in the incorrect categorization of risks with risk statements.

Predicting risk statements on risk records

The Governance, Risk, and Compliance: Predictive Intelligence plugin uses artificial intelligence (AI) and machine learning (ML) to predict the related risk statements on the risk records. The Predictive Intelligence plugin uses the similarity capability in the Predictive Intelligence engine to compare the risk name and description with the risk statements. With this plugin, your organization can reduce the effort that is required to search and identify the risk statements to associate with the identified risks. Your organization also gets higher accuracy in risk aggregation and reporting and visibility into the organization's risk profile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows the recommended risk statements on the risk record.

Note:
A risk user (sn_risk.user) can only see the risk statement recommendations when the risk statement isn't defined on the risk record. Based on the recommendations, a risk user can associate the risk with a related risk statement.

Benefits of risk categorization with risk statements

By categorizing your organization's risks with the risk statement, the following benefits are provided to different users:

- Risk owners: Identify the correct risk statement for the orphan risks to group risks into manageable categories.
- Risk managers: Reduce the number of orphan risks that were created by the first line of employees or risk champions. The risk managers get visibility into the organization's risk profile and can analyze the impact due to the similar type of risks.
- Risk administrator: Configure the solution definition to predict the risk statements that are based on the organizational needs.

Setting up the feature

A risk administrator with the ml_admin role can set up the risk categorization in the Risk Workspace application. Before your organization can use this feature, the risk administrator must install and activate the following applications and plugins:

- Risk Management
- Risk Workspace
- Predictive Intelligence
- Recommended Actions - Advanced

A risk administrator can train a default similarity solution for the risks in your organization by using the Predictive Intelligence plugin.

Note:
A similarity solution is a machine-learning solution to collect and compare your existing records to new similar records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Create and train a similarity solution.

Note:
You must have at least 1000 risk records for the similarity algorithm to work.

A risk administrator with the ml_admin role can review the default similarity solution definition for risk and modify it based on your organizational needs.

Analyze a risk event in the Risk Workspace

Analyze user-submitted risk events. You can add additional details to the risk event, request more information from the submitter, or reject the risk event if the event is not valid.

Before you begin
Role required: sn_risk.manager

About this task
When you a risk event is submitted, it contains basic or little information. As a risk manager, you must add additional details to it when the event is in the **Analyze** state. These additional details consist of the following:

- Approvers of the risk event.
- Root cause of the event.
- Preventative and remedial action for the event.
- Additional entries for the event to break up the event losses.
- Citations
- Tasks
- Impacted controls
- Issues

If you need more information about the risk event, you can ask the submitter to provide you additional information. If you think that the event does not merit attention or is invalid, then you can reject the event.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Risk events** > **All events**.
2. Open the event to analyze and click **Analyze**.
3. Click the Details related list and modify any information that you may need.
   If the risk event occurred but the losses were quickly recovered, the**Full rapid recovery** option is selected. If the risk event resulted in a gain, instead of a loss, the **Financial gain** option is selected. To understand how a risk event can result in a gain, see Manage risk events
4. Click **Save**
5. At this stage, you can do one of the following.

6. To add more information to the risk event, click the appropriate related list and add the necessary details.

What to do next
If the risk event is of subtype **Actual**, create risk event entries. For more information see Create a risk event entry in the Risk Workspace.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a risk event entry in the Risk Workspace

Create a risk event entry to determine the monetary or non-monetary impact of the risk event. A risk event can have multiple risk event entries.

Before you begin

Role required: sn_risk.manager

About this task

Risk event entries capture the direct and indirect losses reported due to the risk event. For example, if a risk event of a fire outbreak in an organization is reported, the direct and indirect losses associated with it could be replacing furniture, replacing hardware, losing important data and so on. All these associated losses must be captured individually. You can add risk event entries only for actual events. Potential Risk event entries cannot have risk event entries. You can select any currency while reporting the losses and the currency conversion system will convert the currency to USD.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Risk events** > **All events**.
2. Open the event for which you want to add risk event entries.
3. Click the Risk Event Entries related list.
4. To create direct and indirect losses, new loss recovery, new additional cost, or new non-financial impact, perform the following actions as necessary.
5. Click **Save** and refresh the page.
   The loss amounts get updated on the page.

Create an ORX external event

Create an Operational Riskdata eXchange (ORX) external risk event to share the risk event of your company with other organizations. This exchange of risk events information acts as a learning for other organizations in the industry and prevents them from making the same errors.

Before you begin

Role required: sn_risk_workspace.operational_risk_manager

About this task

The ORX association enables operational and non-financial risk professionals to collect, measure and analyse data in an effective way that is consistent with industry. To view and create an ORX event, you must enable the *Show ORX External Events* property.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **External risk events** > **ORX events**.
2. Click **New**.
3. On the form, fill in the fields.

New ORX external event form

Field	Description
Name	Name of the risk event
Description	Brief description of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Company details	
Company	Company in which the event occurred.
Region	Region in which the event occurred.
Role of the firm	Role the firm had in relation to the transaction.
Business line level 2	Business line of the event.
Country	Country in which the event occurred.
Counterparty	Type of counterparty or claimant that is involved in the event.
ORX member	Option to show if the company is an existing ORX member.
Loss details	
Loss event id	ID of the loss event.
Loss category	Category of the loss.
Event type level 2	Level 2 of the event such as corporate finance, merchant banking and so on.
Process code	Code of the process.
Product code	Code of the product.
Open	Option to denote if the risk event is open.
Sources	Source of the event.
Classification	
Boundary risk	Operational risk event which triggers a consequence for example, financial loss in another risk category.
AMA status	Advanced measurement approach (AMA) is one of three possible operational risk methods that can be used under Basel II by a bank or other financial institution.
Financial amounts	
Gross loss amount	Gross loss amount.
Direct recovery	Any payment other than an indirect recovery received by the firm which offsets the loss.
Indirect recovery	Recovery made through insurance.
Net Loss (in Local Currency)	Net loss incurred in the local currency.
Net Loss (in Euro)	Net loss incurred converted to Euros.
Key dates	
Date of discovery	Date the event was discovered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Date of event start	Date the event started
Date of settlement	Date the event was settled.
Date of publication	Date the even was published.
Date of event finish	Date the event finished.
Cause	
Cause level 3	Third cause level of the event.
Additional details	
Jurisdiction	Jurisdiction of the event.
Scenario category	Category of the scenario such as conduct, external fraud, technology and so on.
Environmental volatility	Aspect of the environment or circumstances in which the bank was operating at the time of the event.
Activity	
Work notes	Notes that are visible to any responder to this event, their manager, or an administrator.
Additional comments	Additional comments about this event.

Report a risk event from the Risk Portal

Report a risk event from the Risk Portal. The Risk Portal provides an easy method to quickly report risk events.

Before you begin

Role required: sn_grc.business_user role

Procedure

1. Navigate to **Risk Portal**.
2. Under Report, click **Risk event**
   The Report Risk Event form is displayed.
3. On the form, fill in the fields.
4. Click **Submit for review**.

Result

The risk event is created and submitted for the risk team's review.

Chart colors for risk data

You can view your risk data visualizations in different colors for a quick overview of your risks.

Various risk reports appear on the Risk home page. Some examples of these reports are pie charts, bar graphs and so on. These reports show the risk ratings in different colors. By

© 2026 ServiceNow, Inc. All rights reserved.

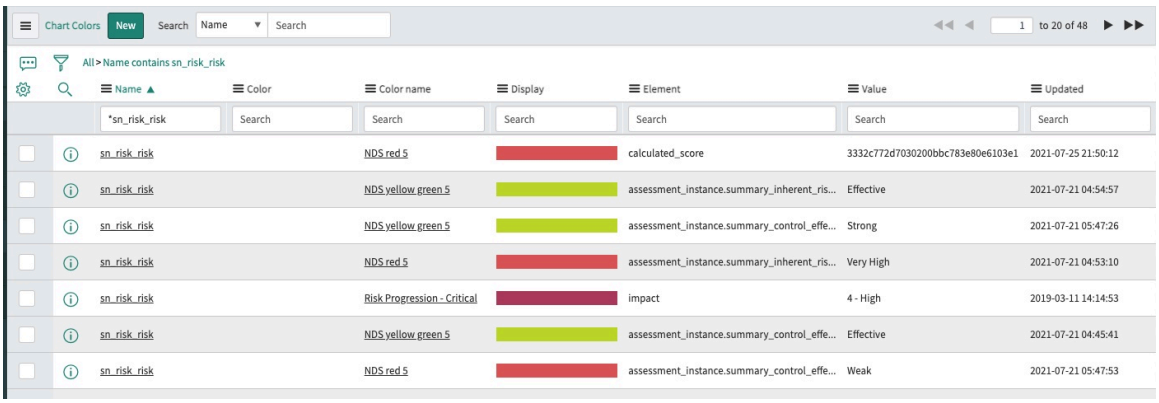
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

default, ServiceNow® provides the chart colors for the following risk ratings for Advanced Risk Assessments.



- Very high
- Critical
- Ineffective
- High
- Medium
- Moderate
- Needs improvement
- Low
- Effective
- Very low

For classic risk, the following risk criteria are defined with the respective colors:

- Very low
- Low
- Moderate
- High
- Very high

If you want to add or modify a risk criteria or a risk rating, a report administrator with the role, report_admin, can configure your chart colors. For more information on configuring chart colors, see Using chart colors.

Chart colors

Create a business process in the Risk Workspace

Create a business process in the Risk Workspace and define the owners, approvers, business criticality, and review frequency for the process.

Before you begin

Role required: Enterprise architect or service owner or itil

About this task

When you create a business process, it is important to ascertain the CIA triad. CIA triad refers to confidentiality, integrity, and availability. The CIA triad is a common model that forms the basis

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

for the development of security systems and policies. These are used for the identification of vulnerabilities and methods for addressing problems and creating solutions.

Procedure

1. Navigate to **All** > **Risk Workspace** > **Lists** > **Business Processes**.
2. Click **Create New**.
3. On the form, fill in the fields.

Business Process form

Field	Description
Name	Name of the business process.
Description	Description of the business process.
Parent	Parent business process, if it exists, to create a hierarchy of business processes.
Review frequency	Frequency for reviewing the business process.
Ownership	
Life cycle stage	Stage of record in the business life cycle. The stage determines the status and displays the actions. This field is automatically set to **Ideation** when you save the form for a process in **Draft** state.
Managed by group	Group that maintains the business process.
Approval group	Group that must review and approve the business process.
Owned by	User responsible for the business process. This user is a member of the Managed by group.
Life cycle stage status	Status of business process within the life cycle stage. This field is automatically set to **Under Evaluation** when you save the form for a process in **Draft** state.
Next review date	Planned date on which the business process must be reviewed. The value in this field is automatically set only after the business process is approved.
Description	Short description of the business process. The description can include the background, the actual steps, and the interaction of the process.
Business Impact	
Business criticality declared	Criticality of the business process based on your subjective assessment. The choices are: ○ **1- most critical** ○ **2- somewhat critical**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **3- less critical** ○ **4- not critical**
Business criticality determined	Computed criticality of the business process based on the assessment of the sub-processes. The choices are: ○ **1- most critical** ○ **2- somewhat critical** ○ **3- less critical** ○ **4- not critical**
CIA triad	
Impact to confidentiality	Risk rating for the risk of loss of confidentiality for the process. The choices are: ○ **High** ○ **Medium** ○ **Low**
Impact to integrity	Risk rating for the risk of impact to integrity for the process. The choices are: ○ **High** ○ **Medium** ○ **Low**
Impact to availability	Risk rating for the risk of loss of availability for the process. The choices are: ○ **High** ○ **Medium** ○ **Low**

4. Right-click and save the form.
   The record moves to the **Draft** state.

Related topics

Add related assets to a business process

Add related assets to a business process

Add related business assets to a business process to gain visibility into the IT assets and their performance.

Before you begin

Role required: Enterprise architect or service owner or itil

About this task

A business process is supported by various assets such as business applications, network servers, application servers and their services and so on. It is important that a process owner is able to establish that relationship and then have visibility into these IT assets and their performance. For example, assume that employee leave management is a business process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This business process depends on an application to automate it. The application, in turn, depends on servers to run it. Thus, if you relate the assets to a process, you can track the overall performance of your processes.

Procedure

1. Navigate to **All** > **Risk Workspace** > **Lists** > **Business Processes**.
2. Open the business process to which you want to add assets and click the Related assets related list.
3. Click **Add**.
   The Related Assets pop up appears.
4. Select the related assets you want to add to the business process.
5. Click **Add**.
6. Click **Save**.

Create a test plan in Risk Workspace

Create a test plan to document the control testing procedure. You can create a test plan from scratch or based on a test template to describe how a feature is to be tested.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Control testing** > **Control test plans**.
2. Click **New**.
3. On the form, fill in the fields.

Create New Test plan form

Field	Description
Number	Unique identification number.
Name	Name of the test plan.
Control	The control that this test plan covers.
Entity	Entity is auto-populated based on the value selected in the **Control** field.
Test template	Related test template. If you select a test template, all the fields in the **Design test** and **Operational test** sections are populated with the test template values.
Duration	Expected duration of the test.
Design test	
Design expectations	Basic requirement that should be met for a control to be effective.
Design assessment procedures	Procedure or steps to be followed to conclude whether the design of the control is

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	effective to achieve the control objective or not. This is based on the design expectation.
Operational test	
Operational expectations	Expectations that should be met to ensure that the control is operating effectively to achieve the control objective.
Operational assessment procedures	Detailed steps, to carry out the operational expectations, which need to be performed to conclude that the control is operating successfully.

4. Click **Save**.
5. To visually explore the relationships between the different types of critical audit data that affect your business, click **360° view** button.

Filter data in the risk heatmap workbench

As a risk user, filter data in the risk heatmap workbench to get a granular view of your risks.

Before you begin

Role required: sn_risk_workspace.operational_risk_manager, sn_risk_workspace.business_op_risk_manager

About this task

Using the condition builder feature, the risk heatmap workbench enables you to further filter the risks that need your attention. For example, you can filter risks with high rating. If you have an important filter that you use frequently, you can also save the filter.

Procedure

1. Navigate to **All** > **Risk Management** > **Risk Workspace**.
2. From the Home page, select the launch workbench icon ( ).
3. Select the filter icon.
4. In the Advanced view dialog box, provide the values for field, operator, and value.
5. Select **Submit**.
   The heatmap is refreshed with the filtered results.
6. To view the filter conditions that you have built and applied, select **Filter Overview**.
7. To clear the filter condition results, select **Clear results**.
8. To save the filter, select the save filter button ( ) in the Contextual side panel.
   a. In the **Title** field, provide a title for the filter.
   b. Select **Save**.
   The saved filter appears in the My saved filters related list.
9. To delete a filter condition that you have built, open the Filter dialog box, and select the delete condition button ( ) and click **Submit**.

Define the risk appetite for an entity

Define the risk appetite on the entity records in the Risk Management application to evaluate all the possible risks and to set the boundaries for the acceptable and unacceptable risks for your business.

Before you begin

Role required: sn_risk.user

About this task

Entity owners can define the risk appetite and tolerance and then copy the qualitative risk appetite to the downstream entities. By doing this task, a business can define and manage an action plan when there's a breach. By defining the qualitative (numerical scale and ratings) and quantitative (monetary value) appetite, a risk user can understand the risk appetite and take decisions. For more information on the risk appetite and tolerance, see Risk appetite and tolerance in Advanced Risk.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list icon and navigate to the entity.
3. Define the risk appetite for a new or an existing entity:
   - To define the risk appetite for a new entity, select **New**.
   - To define the risk appetite for an existing entity, select and open the required entity record.
4. On the entity form, select the **Risk Appetite** section and fill in the fields.

   For a description of the field values, see Risk appetite fields on the Entity form.
5. Select **Save**.
6. **Optional:** To copy the qualitative appetite to the downstream entities, select the more actions icon on the form and select **Copy qualitative appetite**.

Important:
You can only copy the qualitative appetite and tolerance to downstream entities when the risk appetite of the downstream entity isn't overridden. You must define the quantitative appetite and tolerance for each level in the hierarchy.

Risk appetite fields on the Entity form

Learn about the risk appetite fields on the Entity form. Use these fields to define the risk appetite, evaluate all the possible risks, and set the boundaries for the acceptable and unacceptable risks in the Risk Management application.

See the following table for a description of the field values.

Note:
The risk appetite fields that appear on the entity form depends on the advanced risk assessment properties set by the risk administrator.

Risk appetite fields on the Entity form

Field	Description
Override qualitative risk appetite	Option to override the qualitative risk appetite of the parent entity. By default, all entities

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Entity form (continued)

Field	Description
	inherit the risk appetite of the upstream entity in the entity form. When you select this option, you can define the risk appetite values for the current entity separately. **Note:** This field appears only when there's an upstream entity available for the current entity.
Qualitative appetite	Risk appetite in numerical scale and rating terms. The qualitative appetite is compared with the qualitative risk rating to compute the qualitative appetite status. You can define the qualitative appetite based on the appetite scale set by the risk administrator. The default options are as follows: • 1 - Averse • 2 - Minimalist • 3 - Cautious • 4 - Open • 5 - Hungry A risk administrator can change or create the risk appetite scales based on the organization's requirement. For more information, see Set up a risk appetite scale. After you define the qualitative appetite, you can copy it to the downstream entities. **Note:** A risk user and risk reader with the sn_risk_advanced.qualitative_risk_appetite_reader role can only view the qualitative appetite and qualitative tolerance values on the form and in other places.
Quantitative appetite	Risk appetite in quantitative terms. The quantitative risk appetite can be measured and expressed in monetary values. The quantitative appetite is the amount of loss that an organization is willing to risk. For example, an organization decides to have $10,000 (US dollars) as a target non-performing asset (NPA) for this year, which means that the organization defines $10,000 (US dollars) as the quantitative risk appetite.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Entity form (continued)

Field	Description
	The quantitative appetite is compared with the annual loss expectancy (ALE) to compute the quantitative appetite status. **Note:** A risk user and risk reader with the sn_risk_advanced.quantitative_risk_appetite_reader role can only view the quantitative appetite and the quantitative tolerance values on the form and in other places.
Qualitative tolerance	Risk tolerance in numerical scale and rating terms. The risk tolerance is the standard deviation from the defined risk appetite. The qualitative tolerance is compared with the qualitative risk rating to compute the qualitative appetite status. The qualitative tolerance should be greater than the defined qualitative appetite. You can define the qualitative tolerance based on the appetite scale that is set by the risk administrator. The default options are as follows: • 1 - Averse • 2 - Minimalist • 3 - Cautious • 4 - Open • 5 - Hungry A risk administrator can modify or create the risk appetite scales based on the organization's requirement. For more information, see Set up a risk appetite scale.
Quantitative tolerance	Risk tolerance in quantitative terms. The risk tolerance is the standard deviation from the defined risk appetite. The quantitative risk tolerance can be measured and expressed in monetary values. For example, an organization decides to have $15,000 (US dollars) as a target non-performing asset (NPA) for this year, which means that the organization defines $15,000 as the quantitative risk tolerance. The quantitative tolerance is compared with the annual loss expectancy (ALE) to compute the quantitative appetite status.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Entity form (continued)

Field	Description
	Note: The quantitative tolerance should be greater than the defined quantitative appetite.
Risk appetite status	
Qualitative appetite status	Qualitative appetite status of the entity. The qualitative appetite status is calculated by comparing the defined qualitative appetite with the qualitative appetite that is mapped to the final risk rating. A risk administrator can map the appetite scales to the risk rating criteria for the final assessment type in the risk assessment methodology (RAM). **Note:** The primary RAM that is associated with the entity class is considered for status calculation. For example, if you define the qualitative appetite as 2-Minimalist and the qualitative tolerance as 4-Open, then the following statuses appear: • For a qualitative risk rating of 1- Averse or 2-Minimalist, the appetite status is within appetite. • For a qualitative risk rating of 3-Cautious or 4-Open, the appetite status is outside the appetite. • For a qualitative risk rating of 5-Hungry, the appetite status is outside the tolerance.
Quantitative appetite status	Quantitative appetite status of the entity. The annual loss expectancy (ALE) values are compared with the defined quantitative appetite to calculate this appetite status. **Note:** The aggregated ALE value from the primary RAM that is associated with the entity class are considered for the status calculation. For example, if you define the quantitative appetite as $1000 (US dollars) and the quantitative tolerance as $1500, then the following statuses appear:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Entity form (continued)

Field	Description
	• For ALE equal to or less than $1000, the appetite status is within the appetite. • For ALE ranges from $1001 to $1500, the appetite status is outside the appetite. • For ALE more than $1500, the appetite status is outside the tolerance.
Appetite status	Overall appetite status. The overall appetite status considers the worst-case scenario between the qualitative and quantitative status. For example, if the qualitative appetite status is within the appetite and the quantitative appetite status is outside the appetite, then the overall appetite status is outside the appetite.

Define the risk appetite for a risk

Define the risk appetite on the risk records in the Risk Management application to evaluate all possible risks and to set the boundaries for acceptable and unacceptable risks.

Before you begin

Role required: sn_risk.user

About this task

Risks inherit the appetite value from the associated risk statement. Risk owners can also define the risk appetite and tolerance on the risk form when there's a business requirement to override the parent value. For more information on the risk appetite and tolerance, see Risk appetite and tolerance in Advanced Risk.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list icon and navigate to the risk.
3. Define the risk appetite for a new or an existing risk:
   - To define the risk appetite for a new risk, select **New**.
   - To define the risk appetite for an existing risk, select and open the required risk record.
4. On the risk form, select the **Risk Appetite** section and fill in the fields.

   For a description of the field values, see Risk appetite fields on the Risk form.
5. Select **Save**.

Field	Description
	organization's requirement. For more information, see Set up a risk appetite scale.
Quantitative tolerance	Risk tolerance in quantitative terms. The risk tolerance is the standard deviation from the defined risk appetite. The quantitative risk tolerance can be measured and expressed in monetary values. For example, an organization decides to have $15,000 (US dollars) as a target non-performing asset (NPA) for this year, which means that the organization defines $15,000 (US dollars) as the quantitative risk tolerance. The quantitative tolerance is compared with the annual loss expectancy (ALE) to compute the quantitative appetite status. **Note:** The quantitative tolerance should be greater than the defined quantitative appetite.
Risk appetite statement	Risk appetite statement that defines the amount and types of risk an organization is willing to accept to achieve its objectives. It documents what the organization considers as threats and its response strategies. These statements give additional context to understand the risk appetite and help the business to make risk-informed decisions. For example, "ACME Inc. has no appetite for unauthorized access to systems and confidential data and will maintain strong controls to mitigate external threats against its technology infrastructure. ACME Inc. has a low appetite for losing the continuity of business operations stemming from unreliable telecommunications or system availability. Business resiliency planning and execution must be aligned with strategic objectives. ACME Inc. has a moderate appetite for innovative technology solutions to meet user demands in a rapidly changing environment. The agency will exercise appropriate governance

Risk appetite fields on the Risk form (continued)

Field	Description
	• For ALE that is equal to or less than $1000 (US dollars), the appetite status is within the appetite. • For ALE ranges from $1001 to $1500 (US dollars), the appetite status is outside the appetite. • For ALE more than $1500 (US dollars), the appetite status is outside the tolerance.
Appetite status	Overall appetite status. The overall appetite status considers the worst-case scenario between the qualitative and quantitative status. For example, if the qualitative appetite status is within the appetite and the quantitative appetite status is outside the appetite, then the overall appetite status is outside the appetite.

Define the risk appetite for a risk statement

Define the risk appetite on the risk statement records in the Risk Management application to evaluate all the possible risks and set the boundaries for the acceptable and unacceptable risks.

Before you begin

Role required: sn_risk.manager

About this task

A risk manager can define the risk appetite and tolerance for the risk statement and then copy the qualitative risk appetite to the downstream risk statements and risks. It helps businesses to take risks within their organizational capabilities and define and manage an action plan when there's a breach. By defining the qualitative (numerical scale and ratings) and quantitative (monetary value) appetite, a risk user can understand the risk appetite and take decisions.
For more information on the risk appetite and tolerance, see Risk appetite and tolerance in Advanced Risk.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list icon and navigate to the risk statement.
3. Define the risk appetite for a new or an existing risk statement:
   - To define the risk appetite for a new risk statement, select **New**.
   - To define the risk appetite for an existing risk statement, select and open the required risk statement record.
4. On the form, select the **Risk Appetite** section and fill in the fields.

   For a description of the field values, see Risk appetite fields on the Risk Statement form.
5. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** To copy the qualitative appetite to the downstream risk statement and risks, select the more actions icon on the form and select **Copy qualitative appetite**.

> **Important:**
> You can only copy the qualitative appetite and tolerance to the downstream risks and risk statements when the risk appetite isn't overridden. You need to define quantitative appetite and tolerance for each level in the hierarchy.

Risk appetite fields on the Risk Statement form

Learn about the risk appetite fields on the Risk Statement form. Use these fields to define the risk appetite, evaluate all the possible risks, and set the boundaries for the acceptable and unacceptable risks in the Risk Management application.

See the following table for a description of the field values.

> **Note:**
> The risk appetite fields that appear on the entity form depends on the advanced risk assessment properties that are set by the risk administrator.

Risk appetite fields on the Risk Statement form

Field	Description
Override qualitative risk appetite	Option to override the qualitative risk appetite of the parent risk statement. By default, all risk statements inherit the risk appetite of the parent risk statement. When you select this option, you can define the risk appetite values for the current risk statement separately. **Note:** This field appears only when there's a parent risk statement available for the current risk statement.
Qualitative appetite	Risk appetite in numerical scale and rating terms. The qualitative appetite is compared with the qualitative risk rating to compute the qualitative appetite status. You can define the qualitative appetite based on the appetite scale that is set by the risk administrator. The default options are as follows: • 1 - Averse • 2 - Minimalist • 3 - Cautious • 4 - Open • 5 - Hungry A risk administrator can change or create the risk appetite scales based on the organization's requirement. For more information, see Set up a risk appetite scale.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Risk Statement form (continued)

Field	Description
	After you define the qualitative appetite, you can copy it to the downstream risks and risk statements. **Note:** A risk manager with the sn_risk_advanced.qualitative_risk_appetite_reader role can only view the qualitative appetite and qualitative tolerance values on the form and in other places.
Quantitative appetite	Risk appetite in quantitative terms. The quantitative risk appetite can be measured and expressed in monetary values. The Quantitative appetite is the amount of loss that an organization is willing to risk. For example, an organization decides to have $10,000 (US dollars) as a target non-performing asset (NPA) for this year, which means that the organization defines $10,000 (US dollars) as the quantitative risk appetite. The quantitative appetite is compared with the annual loss expectancy (ALE) to compute the quantitative appetite status. **Note:** A risk manager with the sn_risk_advanced.quantitative_risk_appetite_reader role can only view the quantitative appetite and quantitative tolerance values on the form and in other places.
Qualitative tolerance	Risk tolerance in numerical scale and rating terms. The risk tolerance is the standard deviation from the defined risk appetite. The qualitative tolerance is compared with the qualitative risk rating to compute the qualitative appetite status. The qualitative tolerance should be greater than the defined qualitative appetite. You can define the qualitative tolerance based on the appetite scale set by the risk administrator. The default options are as follows: • 1 - Averse • 2 - Minimalist • 3 - Cautious • 4 - Open • 5 - Hungry

Risk appetite fields on the Risk Statement form (continued)

Field	Description
	A risk administrator can change or create the risk appetite scales based on the organization's requirement. For more information, see Set up a risk appetite scale.
Quantitative tolerance	Risk tolerance in quantitative terms. The risk tolerance is the standard deviation from the defined risk appetite. The quantitative risk tolerance can be measured and expressed in monetary values. For example, an organization decides to have $15,000 (US dollars) as the target non-performing assets (NPAs) for this year. This means that the organization defines $15000 (US dollars) as the quantitative risk tolerance. The quantitative tolerance is compared with the annual loss expectancy (ALE) to compute the quantitative appetite status. **Note:** The quantitative tolerance should be greater than the defined quantitative appetite.
Risk appetite statement	Risk appetite statement that defines the amount and types of risk that an organization is willing to accept to achieve its objectives. It documents what the organization considers threats and its response strategies. These statements give additional context to understand the risk appetite and help the business to make risk-informed decisions. For example, `"ACME Inc. has no appetite for unauthorized access to systems and confidential data and will maintain strong controls to mitigate external threats against its technology infrastructure. ACME Inc. has a low appetite for losing the continuity of business operations stemming from unreliable telecommunications or system availability. Business resiliency planning and execution must be aligned with strategic objectives. ACME Inc. has a moderate appetite for innovative technology solutions to meet user demands in a rapidly changing`

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Risk Statement form (continued)

Field	Description
	`environment. The agency will exercise appropriate governance and discipline when considering and adopting new technology."`
Next review date	Date to update the risk appetite fields and review the risk appetite statement. An email notification is sent to the risk statement owner before the next review date. A risk administrator can schedule the email notification in the advanced risk assessment properties. For more information, see Configure a risk appetite and tolerance in Advanced Risk.
Risk appetite status	
Methodology for status calculation	Risk assessment methodology (RAM) whose aggregated results are used to calculate the risk appetite status of the risk statement.
Qualitative appetite status	Qualitative appetite status of the risk statement. The qualitative appetite status is calculated by comparing the defined qualitative appetite with the qualitative appetite that is mapped to the final risk rating. A risk administrator can map the appetite scales to the risk rating criteria for the final assessment type in RAM. **Note:** The RAM selected from the **Methodology for status calculation** field is considered for the status calculation. For example, if you define the qualitative appetite as 2-Minimalist and qualitative tolerance as 4-Open, then the following statuses appear: • For a qualitative risk rating of 1- Averse or 2-Minimalist, the appetite status is within appetite. • For a qualitative risk rating of 3-Cautious or 4-Open, the appetite status is outside appetite. • For a qualitative risk rating of 5-Hungry, the appetite status is outside the tolerance.
Quantitative appetite status	Quantitative appetite status of the risk statement. The annual loss expectancy (ALE) values are compared with the defined quantitative appetite to calculate this appetite status.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk appetite fields on the Risk Statement form (continued)

Field	Description
	Note: The aggregated ALE value from the RAM that are selected from the **Methodology for status calculation** field are considered for the status calculation. For example, if you define the quantitative appetite as $1000 (US dollars) and the quantitative tolerance as $1500 (US dollars), then the following statuses appear: • For ALE equal to or less than $1000, the appetite status is within appetite. • For ALE ranges from $1001 to $1500, the appetite status is outside the appetite. • For ALE more than $1500, the appetite status is outside the tolerance.
Appetite status	Overall appetite status. The overall appetite status considers the worst-case scenario between the qualitative and quantitative status. For example, if the qualitative appetite status is within the appetite and the quantitative appetite status is outside the appetite, then the overall appetite status is outside the appetite.

Parallel Review and Feedback in Advanced Risk

Learn how to use the Review and feedback workflow to enable the 2nd and 3rd line managers to review records, capture feedback, and track the closure of feedback.

Overview of Parallel Review and Feedback

The Parallel Review and Feedback in the Advanced Risk application helps in collaboration and engagement across different lines of management within an organization. The workflow enables the 2nd and 3rd line managers, such as Operational, IT, and Business Risk Managers, to provide feedback on records or fields in the records. For example, a risk manager can provide feedback by requesting a root cause analysis at the field level of the risk event. Alternatively, they may request the risk event owner to provide details of additional loss entries at the record level for the same risk event. Risk managers can create feedback on records available on the ServiceNow table and external records.

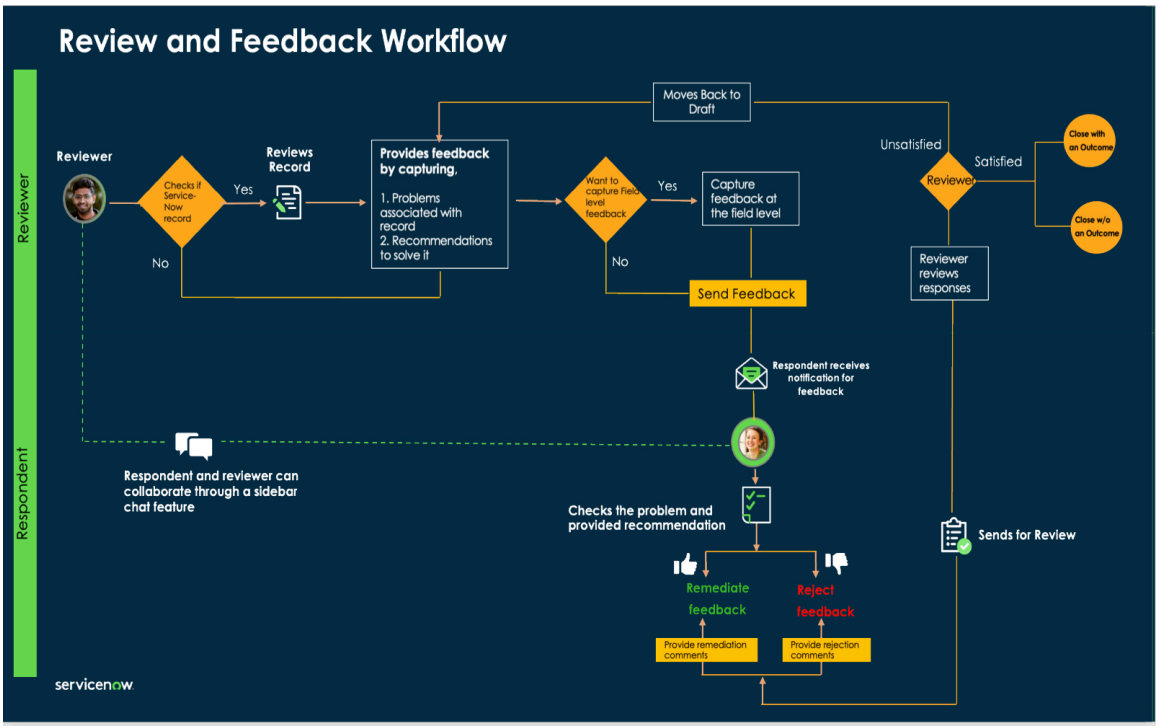
Benefits of Parallel Review and Feedback

The Parallel Review and Feedback application enables you to do the following:

- Provide feedback at any stage of the workflow.
- Update the feedback responses directly from the source record by using the side-panel feature.
- View and manage the feedback workflows that are raised against the records from a centralized dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the change history, which enables a quick comparison of pre-feedback and post-feedback.
- Reopen the feedback if the responses are deemed unsatisfactory.
- Monitor the feedback and follow up with the record owners through an intuitive dashboard.
- Collaborate effectively with the reviewer, respondent, and other stakeholders through a sidebar discussion chat.
- Initiate and link further actions as outcomes of the feedback, such as creating an issue or linking to an existing one.
- Configure a feedback integration setup for any record type, including custom tables where you can define the table or record type to create feedback from.



Parallel Review and Feedback workflow

The Parallel Review and Feedback workflow outlines the systematic process by which the solution facilitates the submission of feedback on a record or specific fields within a record. Feedback could be related to any improvement or recommendation at a record level, such as data integrity, compliance, and operational procedures.

Exploring the user journey for Parallel Review and Feedback

The following diagram shows the workflow of Review and Feedback.

Parallel Review and Feedback workflow

The steps for how each user uses the Review and Feedback application according to their organization's requirements are explained as follows.

Configure a feedback integration

Configure a feedback integration setup in the Advanced Risk application to define the table on which you want to use Parallel Review and Feedback. This setup enables you to define the workspace, reviewer, and respondent for creating feedback on the table records. A user with the sn_rvw_feedback.admin role can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

configure a feedback integration. For more details, see Configure a feedback integration.

Create the feedback

A user with the sn_rvw_feedback.reviewer role can create feedback on a record they're reviewing, suggesting overall improvements, or changes to specific fields in the record. You can create feedback on both ServiceNow® and external records. For more information, see Create feedback in the Risk Workspace and Create Feedback from the record side panel.

Respond to the feedback

A user with the sn_rvw_feedback.respondent role can take necessary actions and provide comments or explanations regarding the submitted feedback. The respondent can either remediate or reject the feedback, provided that there's proper justification. After closing all the open items, the respondent can send the feedback to the reviewer. For more information, see Respond to the feedback.

Collaborate through sidebar chat feature

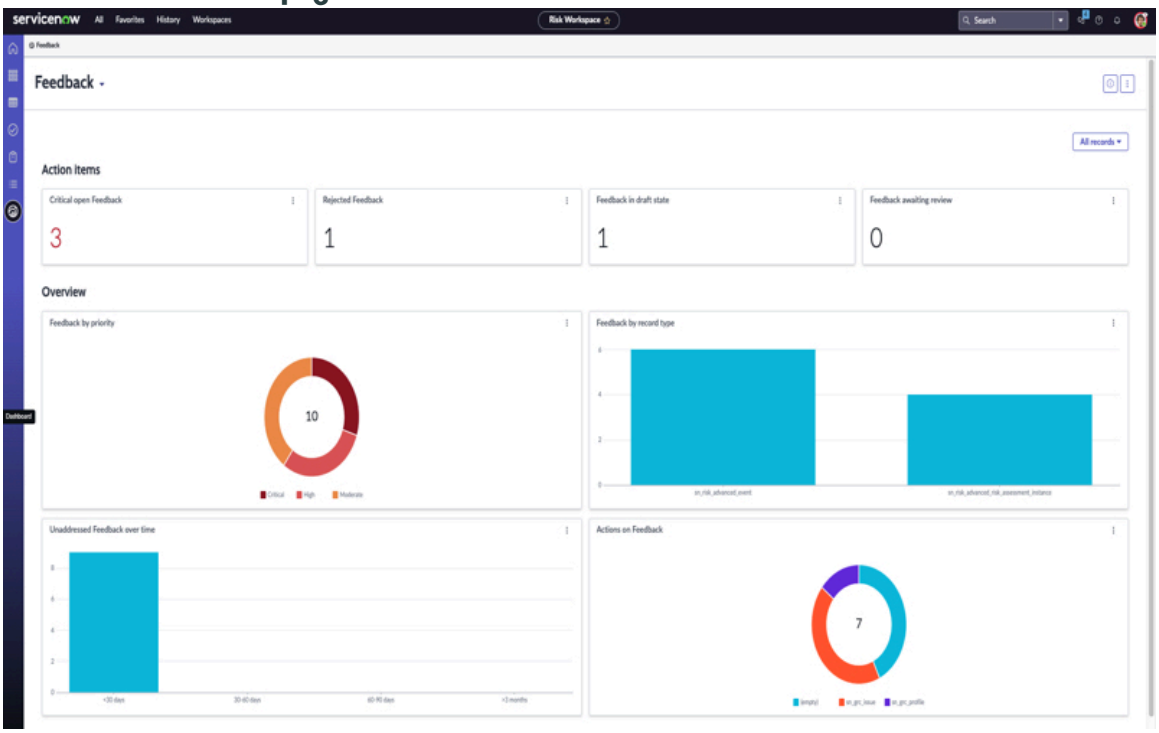
The Sidebar chat feature enabling the first and second line risk users to discuss feedback in real-time. The chat feature enables better collaboration among different stakeholders to brainstorm solutions, clarify details, or coordinate actions regarding the feedback received. For more information, see Initiate a chat from Sidebar in Parallel Review and Feedback.

Review and close the feedback

When the reviewer is content with the respondent's comments, they have a couple of options. They can choose to close the feedback either with or without an action. If an action is selected, they can take further actions based on the feedback received. It involves initiating new actions or tasks, such as creating an issue or linking it to an existing record, to facilitate follow-up and resolution. For example, an organization conducted an RCSA (Risk and control self-assessment) concerning fraud-related risks and suggested they have 3 controls in place. Subsequently, the second line of defense reviewed the assessment and raised a feedback, recommending the addition of a new control as it aligns with global best practices to mitigate that risk. Implementing this new control requires budget allocation and an estimated timeline of 1-2 years. The organization may decide to close the feedback by creating an issue to track and manage the progress.

When the reviewer isn't satisfied with the respondent comments, the reviewer can move the feedback to the Draft state and reinitiate the workflow. For more information, see Review and close the feedback.

Feedback dashboard



Use the Feedback dashboard to track and manage feedback using the Risk Workspace. The Feedback dashboard organizes feedback according to its status, importance, type, and other specific factors.

Launching Feedback dashboard

You can launch the Feedback dashboard by using the launcher  icon. The following example shows the cards that are available on the Feedback dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feedback dashboard page

You can analyze and monitor only relevant information by filtering the dashboard based on different record types. You can navigate to **All records** and select the respective record type to visualize related information on the dashboard. The available record types are based on the active feedback configurations.

The following table describes the cards that are available on the Feedback dashboard landing page.

Feedback dashboard

Section	Card	Description
Action items	Critical open Feedback	Shows the feedback with priority as **Critical**.
	Rejected Feedback	Shows the feedback with response as **Rejected**.
	Feedback in draft state	Shows the feedback that hasn't yet been sent to the respondent.
	Feedback awaiting review	Shows the feedback that hasn't yet been reviewed by the reviewer following the respondent's comments.
Overview	Feedback by priority	Shows the active feedback based on their assigned priorities. This helps in understanding the proportion of feedback categorized by urgency levels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feedback dashboard (continued)

Section	Card	Description
	Feedback by record type	Shows the feedback based on their record types. This helps in understanding the proportion of feedback categorized by the source records.
	Unaddressed Feedback over time	Shows the unaddressed feedback over time. The bar chart displays the trend of unresolved feedback, enabling teams to measure their responsiveness and workload distribution.
	Actions on Feedback	Shows the closed feedback with initiated actions and feedback with no actions taken. It facilitates the analysis of what further actions are generally taken as an outcome of the feedback.

Configure a feedback integration

Configure a feedback integration setup in the Advanced Risk application to define the table on which you want to use Parallel Review and Feedback. This setup enables you to define the workspace, reviewer, and respondent for creating feedback on the table records.

Before you begin

Role required: sn_rvw_feedback.admin

Procedure

1. Navigate to **All** > **Parallel Review and Feedback** > **Feedback** > **Administration** > **Feedback Integration Configuration**.
2. Select **New**.
3. On the form, fill in the fields.

   For a description of the field values on the Feedback Integration Configuration form, see Feedback integration configuration form.
4. Select **Submit**.

Feedback integration configuration form

Use the Feedback integration configuration form to define a setup for the Parallel Review and Feedback.

See the following table for a description of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feedback integration configuration form

Field	Description
Table	Name of the table to integrate review and feedback. For example, if you want to provide feedback on the risk event records, you must select the sn_risk_advanced_event table.
Reviewer group	Reviewer group who can provide feedback on the selected table records.
Active	State of the feedback integration configuration. Only active configurations can be considered to provide feedback on the selected table records.
Workspace URL path	Workspace URL path to send feedback-related notifications to a particular workspace. For example, to use it on the Risk Workspace, select `risk/risk`.
Respondent	
Respondent type	Respondent who can respond to the raised feedback on the selected table records. The options are as follows: • **User on target record**: Individual who can respond to the feedback. • **Group on target record**: Group of users who can respond to the feedback. • **Specific group**: Specific group who can respond to the feedback when the target record doesn't have a user or group. You can see only those groups that are assigned with the sn_rvw_feedback.respondent role.
Respondent field	User or group field on the target record. For example, if you want the record owner to respond to the raised feedback, select `Owner` in this field.

Create feedback in Advanced Risk

Create feedback on a record or fields in a record in the Advanced Risk application. The feedback enables you to recommend improvements related to data integrity, compliance, operational procedures, and other pertinent areas.

You can create feedback by using one of the following options:

- Create feedback in the Risk Workspace
- Create Feedback from the record side panel

Create feedback in the Risk Workspace

Create feedback on a record or fields in a record, to recommend improvements related to data integrity, compliance, operational procedures, and other pertinent areas, such as disposition and accountability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_rvw_feedback.reviewer

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list  icon.
3. From the list, navigate to **Parallel Review and Feedback** and select **Feedback**.
4. Select **New**.
5. On the form, fill in the fields.

   For a description of the field values on the Create New Feedback form, see Create New Feedback form.
6. Select **Save**.
   The feedback is moved to the Draft state.
7. To add feedback items, select the **Items** related list.
8. Select **New**.
9. On the form, fill in the fields.

Create New Feedback Item form

Field	Description
State	State of the feedback item. This field is automatically set to **Open**.
Context	Fields on the record on which you want to provide feedback.
Reviewer comments	Observations or feedback on the selected context.
Respondent comments	Comments or explanations provided by the respondent for the feedback. This is a read-only field for a reviewer.

10. Select **Save**.
11. Select **Send feedback**.
    The feedback is raised and assigned to the respondent. The feedback is moved to the Assigned state.

Create New Feedback form

Use the Create new feedback form to provide feedback on a record or fields in a record.

See the following table for a description of the field values.

Create new feedback form

Field	Description
Name	Name of the feedback.
Description	A brief description of the feedback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new feedback form (continued)

Field	Description
Refers to ServiceNow record	Option to select a ServiceNow table record on which you want to provide feedback. Clear this option to select an external record.
Record type	Feedback integration configuration on which you want to provide feedback. This enables you to select the table defined in the configuration. **Note:** This field appears only when the **Refers to ServiceNow record** option is selected.
Priority	Priority of the feedback.
Record	Record on which you want to provide feedback. This enables you to select the records associated in the table defined in the configuration.
Watch list	Individuals to be notified regarding the feedback.
Reviewers	
Reviewer group	Group that is providing the feedback.
Reviewer	Individual providing the feedback. This field is automatically set to your name. You can also provide feedback on behalf of someone.
Respondents	
Respondent group	Group that is responding to the feedback.
Respondent	Individual responding to the feedback.
Response	
Response	State of the response. This is a read-only field for a reviewer.
Respondent comments	Comments or explanations provided by the respondent for the feedback. This is a read-only field for a reviewer.
Activity	
Work notes	Notes or information about the feedback. For example, problems associated with the record and its possible solution.
Additional comments (Customer visible)	Additional information about the feedback that you want to share with the customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Feedback from the record side panel

Create feedback on a record or fields in a record from the record side panel using the Advanced Risk application. The feedback enables you to recommend improvements related to data integrity, compliance, operational procedures, and other pertinent areas.

Before you begin

Role required: sn_rvw_feedback.reviewer

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list  icon.
3. Open the record on which you want to create a Feedback.
4. In the side-panel, select the list  icon.
5. Select **New**.
6. On the form, fill in the fields.

   For a description of the field values on the Create New Feedback form, see Feedback Details form.

7. Select **Save**.
   The feedback is moved to the Draft state.
8. **Optional:** To initiate a Sidebar discussion, select the More actions icon on the feedback, and select **Discuss**.
9. To add feedback items, select the **Add Item**.
10. On the form, fill in the fields.

Feedback item form

Field	Description
Record context	Fields on the record on which you want to provide feedback.
Comments	Observations or feedback on the selected context.

11. Select **Save**.
12. Select **Send feedback**.
    The feedback is raised and assigned to the respondent. The feedback is moved to the Assigned state.

Feedback Details form

Use the Feedback Details form to provide feedback on a record or fields in a record from the record side panel.

See the following table for a description of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feedback Details form

Field	Description
Name	Name of the feedback.
Description	A brief description of the feedback.
Reviewer group	Group that is providing the feedback.
Reviewer	Individual providing the feedback. This field is automatically set to your name. You can also provide feedback on behalf of someone.
Respondent group	Group that is responding to the feedback.
Respondent	Individual responding to the feedback.
Priority	Priority of the feedback.

Initiate a chat from Sidebar in Parallel Review and Feedback

Initiate a Sidebar chat to collaborate among different stakeholders to brainstorm solutions, clarify details, or coordinate actions regarding the feedback received.

Before you begin

Role required: sn_rvw_feedback.reader

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list  icon.
3. From the list, navigate to **Parallel Review and Feedback** and select **Feedback**.
4. Open the Feedback that you want to discuss.
5. Select **Discuss**.
   The Start a Sidebar discussion dialog box appears.
6. To initiate Sidebar discussion from the record side-panel, open the record that you want to discuss and do the following:
   a. In the side-panel, select the list  icon.
   b. Select the feedback.
   c. Select the More actions icon on the feedback, and select **Discuss**.
7. In the Start a Sidebar discussion dialog box, fill in the fields as appropriate.

Start a Sidebar discussion

Field	Description
Subject	Option to provide a title for the sidebar discussion.
Add participants	Options to add participants for the sidebar discussion.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: You can include any users with access to this record in this discussion.
Include a brief message for participants	Brief summary about the feedback to be discussed in the sidebar discussion.

8. Select **Start discussion**.

Respond to the feedback

Provide comments or explanations regarding the submitted feedback using the Advanced Risk application. You can either remediate or reject the feedback, provided that there's proper justification.

Before you begin

Role required: sn_rvw_feedback.respondent

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **My tasks**.
2. Open the Feedback that you want to respond.
3. To respond to the feedback from the record side panel, select the list  icon on the record and do the following:
   a. Provide comments or explanations regarding the feedback submitted in the **Response** field. **Response** field is required to reject a feedback item.
   b. Select **Remediate** or **Reject**.
4. To respond to the feedback on the record, navigate to the **Response** section and do the following:
   a. Select the response in the **Response** field.
   b. Provide comments or explanations regarding the feedback submitted in the **Respondent comments**.
   The **Respondent comments** field becomes required when you select the response as **Rejected**.
   c. Select **Save**.
5. To respond to the feedback items, select the **Items** related list and do the following:
   The **Items** related list appears only when the reviewer adds feedback items while providing the feedback.
   a. Select the feedback items.
   b. Select the response in the **State** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Provide comments or explanations regarding the feedback submitted in the **Respondent comments**.
The **Respondent comments** field becomes required when you select the response as **Rejected**.

d. Select **Save**.

6. Select **Send for review**.
You must close all the open items to send the feedback to the reviewer.

Review and close the feedback

Review the feedback response and take further actions using the Advanced Risk application.

Before you begin

Role required: sn_rvw_feedback.reviewer

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **My tasks**.
2. Open the Feedback that you want to review and assess the respondent's comments and response.
3. If you are satisfied with the response, you have the following choices:
   - To close the feedback, select **Close**.
   - To close the feedback with an action, select **Close and initiate an action**.

   Note:
   You can create an issue or link the feedback to an existing record to facilitate follow-up and resolution.

4. **Optional:** If you're unsatisfied with the response, select the more actions ••• icon and do the following:

   a. Select **Move to draft**.
   This action clears previous responses from the respondent.

   b. Select **Ok**.

Roles for Parallel Review and Feedback

When you integrate Parallel Review and Feedback with other applications, users must have the necessary roles to review records, capture feedback, and track the closure of feedback.

The following roles have been introduced to enable users of other applications to use the Parallel Review and Feedback:

Roles installed

Role title [name]	Contained under	Description
sn_rvw_feedback.admin	sn_risk.admin	Users with this role can configure a feedback integration setup to define

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed (continued)

Role title [name]	Contained under	Description
		the table on which you want to use parallel review and feedback.
sn_rvw_feedback.reviewer	sn_risk_workspace.IT_risk_manager sn_risk_workspace.operational_risk_manager	Users with this role can create feedback on a record they're reviewing, suggesting overall improvements, or changes to specific fields in the record.
sn_rvw_feedback.respondent	sn_risk_workspace.business_ops_risk_manager	Users with this role can take necessary actions and provide comments or explanations regarding the submitted feedback.
sn_rvw_feedback.reader	sn_risk.reader	Users with this role have read-access to feedback.

Risk assessment project

You can perform assessments on multiple risks and controls simultaneously by creating a risk assessment project. Risk assessment project enables assessors to review multiple risks and controls to understand their potential impact, likelihood, and associated mitigation strategies.

Overview of a risk assessment project

A Risk assessment project is a structured process designed to assess multiple risks and controls simultaneously, particularly within workshop-based RCSA (Risk and Control Self-Assessment) environments. It replaces manual data entry and fragmented workflows by enabling efficient data collection, collaborative input from stakeholders, and automated reporting. A Risk assessment project simplifies coordination, speeds up processes, and improves data accuracy by providing a unified workspace for evaluating risks collectively and reliably.

Note:
Assessment of multiple risks and controls is supported only in Risk Workspace.

Benefits of a risk assessment project

The following are the key benefits of a risk assessment project:

- Simplifies the RCSA process by enabling multiple risks and controls to be assessed at the same time, which saves time on manual data collection.
- Reduces the chances of errors and inconsistencies by using automated error handling and providing comprehensive error summaries before finalizing assessments.
- Reduces unnecessary back-and-forth interactions among stakeholders by involving all required participants in the assessment project.
- Enables navigation between different stages of risk assessments and access multiple risks and controls simultaneously, without switching screens.
- Provides detailed summary reports on the assessment results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Simplifies the process of signing off on all the risks together within the project.
- Enables access to reference information related to each risk in the sidebar panel.

Personas involved

The following personas are involved with the risk assessment project:

Project owner

The project Owner creates and manages the risk assessment project. It includes setting up the project context, identifying relevant stakeholders, and defining the scope of risks that must be assessed.

Assessor

The project assessor performs assessment on multiple risks and controls within the risk assessment project. They analyze each risk, evaluate the effectiveness of existing controls, and create risk response strategies.

Approver

The Project Approver reviews the completed risk assessments and provides the final sign-off on the project. They ensure that all scoped risks have been assessed and either approve or reject the risk assessment.

Roles required

The following roles are required for a risk assessment project:

- Risk assessment project reader [sn_risk_advanced.risk_asmt_project_reader]: Provides read-only access to the risk assessment projects.
- Risk assessment project user [sn_risk_advanced.risk_asmt_project_user]: Provides the ability to create risk assessment projects and update or delete only the projects created by the user.
- Risk assessment project manager [sn_risk_advanced.risk_asmt_project_manager]: Provides the ability to create, update, and delete any risk assessment projects.

For more information, see Roles installed with the GRC Risk Workspace.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk assessment project workflow

The stages of a risk assessment project are as follows:

1. **Define**: In this stage, the risk assessment project is created. A risk assessment project user ([sn_risk_advanced.risk_asmt_project_user]) or a risk assessment project manager ([sn_risk_advanced.risk_asmt_project_manager]) can create a risk assessment project and complete the following tasks:
   a. Define the context by including the assessable entity and the risk assessment methodology (RAM).
   b. Specify the project name and description.
   c. Identify and add the relevant stakeholders, including the project owner, assessors, and watchlist users.
2. **Risk scoping**: In this stage, the risk assessment project owner is responsible for defining the risks to be assessed. The following options are available to map risks for the selected composite or single entity:

   Create risks from upstream entities

   Option to add risks based on underlying relationships with selected entities. Risks are automatically mapped from the underlying entities. You can remove them without deleting them from the underlying entities. This option is specific to composite entities.

   Create ad-hoc risk

   Option to add a risk that is not in the library.

   Create risk from risk statements

   Option to add risks from the risk statement.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Assessment**: In this stage, the assessor evaluates each scoped risk using the defined RAM. Throughout the assessment, the assessor can access a summary of the assessment. Automated error handling enables assessors to validate risk assessment projects, reducing the likelihood of errors and inconsistencies. After the assessment is completed, the assessor submits the assessment for approval.

   Note:
   Assessors can also add risks and controls during the assessment stage.

4. **Approval**: In this stage, the approvers configured in the approval configurator review the assessment summary. Based on the approvers' satisfaction with the assessment, the approver can do one of the following:

   Approve

   The project moves to the Completed stage.

   Reject

   The project moves to the Assessment stage for the assessor to address identified issues and make necessary revisions.

Note:
After the project reaches the Completed state, you can create a new project with the same RAM and entity. When the new project reaches the Completed state, the old project moves to the Archived state.

Create a risk assessment project

Create a risk assessment project to perform assessments on multiple risks and controls simultaneously using Risk Workspace. You can define the project context, including the assessable entity, Risk assessment methodology (RAM), project name, description, and identify and add stakeholders.

Before you begin

Role required: sn_risk_advanced.project_user or sn_risk_workspace.operational_risk_manager or sn_risk_workspace.IT_risk_manager, or sn_risk_workspace.business_op_risk_manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list  icon.
3. From the list, navigate to **Risk assessment projects** and select **New**.
4. Select **New**.
5. In the Define stage, do the following.

   a. In the Context section, fill in the fields.

Context

Field	Description
Assessable entity	Single or composite entity that needs to be assessed.
Risk assessment methodology	Risk assessment methodology (RAM) that you use to assess risks within the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Next**.

c. In the Details section, fill in the fields.

Details

Field	Description
Name	Name of the risk assessment project. The name is automatically generated based on the selected assessable entity, followed by the current month and year, with a separator between them. You can modify the name if necessary.
Description	Description about the risk assessment project. It helps the assessors to understand the project in detail.

d. Select **Next**.

e. In the Stakeholders section, fill in the fields.

Stakeholders

Field	Description
Owner	Name of the project owner. This field is automatically set to the user who created the project, but you can modify it if needed.
Assessor type	User or group who is responsible for assessing the project. Choices are as follows: ▪ **Users**: Option to select users responsible for assessing the project. ▪ **Group**: Option to select group of users responsible for assessing the project. ▪ **Entity owner**: Option to select the assessable entity owner as assessor. ▪ **Entity stakeholder**: Option to select assessor from the assessable entity stakeholders list.
Assessors	User who is responsible for assessing the project. This field appears only when **Users** is selected from **Assessor type**.
Assessor group	Group that is responsible for assessing the risk. This field appears only when **Group** is selected from **Assessor type**.
Assessors from entity	Assessors from the assessable entity stakeholders list. This field appears only when **Entity stakeholder** is selected from **Assessor type**.
Watchlist type	Users or group who can view and receive notifications about the project. Choices are as follows: ▪ **Users**: Option to select users who can view and receive notifications about the project. ▪ **Group**: Option to select group of users who can view and receive notifications about the project. ▪ **Entity stakeholder**: Option to select watchlist users from the assessable entity stakeholders list.
Watchlist users	Users who can view and receive notifications about the project. This field appears only when **Users** is selected from **Watchlist type**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Watchlist group	Group who can view and receive notifications about the project. This field appears only when **Group** is selected from **Watchlist type**.
Watchlist users from entity	Watchlist users from the assessable entity stakeholders list. This field appears only when **Entity stakeholder** is selected from **Watchlist type**.

The project moves to the Scope risk stage and you can see a list of risks mapped from the underlying entities.

6. To add risks in the Scope risk stage, you can do the following:
   a. **Optional:** To create risks from the risk statement, select **Create from risk statements**.
   b. **Optional:** To add a risk that is not in the library, select **Create ad-hoc risk**.
   c. **Optional:** To remove risks from the assessment without deleting them from the underlying entities, select the risks, and select **Remove**.
   d. **Optional:** To add any risks that have been removed, select **Add risk**.
7. Select **Next**.
   The project moves to the Assess stage, and a notification goes to the assessor.

Perform assessment on a risk assessment project in stacked view

Perform assessments on multiple risks and controls simultaneously in a risk assessment project using Risk Workspace. You can assess inherent risks, effectiveness of controls, residual risks, and target risks. You can define risk responses that enable you to manage and mitigate the risks identified during the risk assessment process.

Before you begin

Role required: sn_grc.business_user, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

Note:
You must manually add the sn_risk_advanced.risk_asmt_project_reader and sn_risk_advanced.ara_assessor roles to sn_grc.business_user to perform assessments on the risk assessment project.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **My tasks**.
2. Open the risk assessment project that you want to assess.
3. Select **Stacked view** to assess the risk assessment project.
4. Select **Open assessment**.
5. To start the assessment, select **Let's get started**.
   If you're performing reassessment, Copy risk assessments dialog box appears. Select **Yes** to copy responses from the previous risk assessment.
6. **Optional:** To reassign the project, select the ⋮, and select **Reassign**.
7. **Optional:** To add risks to the project, you can do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To create risks from the risk statement, select the icon, and select **Create from risk statements**.

b. To add a risk that is not in the library, select the icon, and select **Create ad hoc risk**.

c. To add any underlying risks that have been removed, select the icon, and select **Add risk**.

The risks with an in-progress assessment can't be added as part of the risk assessment project.

8. **Optional:** To remove risks from the project, you can do the following:
   Removed scoped risks remain part of the project but are marked as not applicable for reporting purposes. However, removed ad hoc risks are completely deleted.

   a. Select **Actions**.

   b. Select **Remove risk**.
   Remove risk dialog box appears.

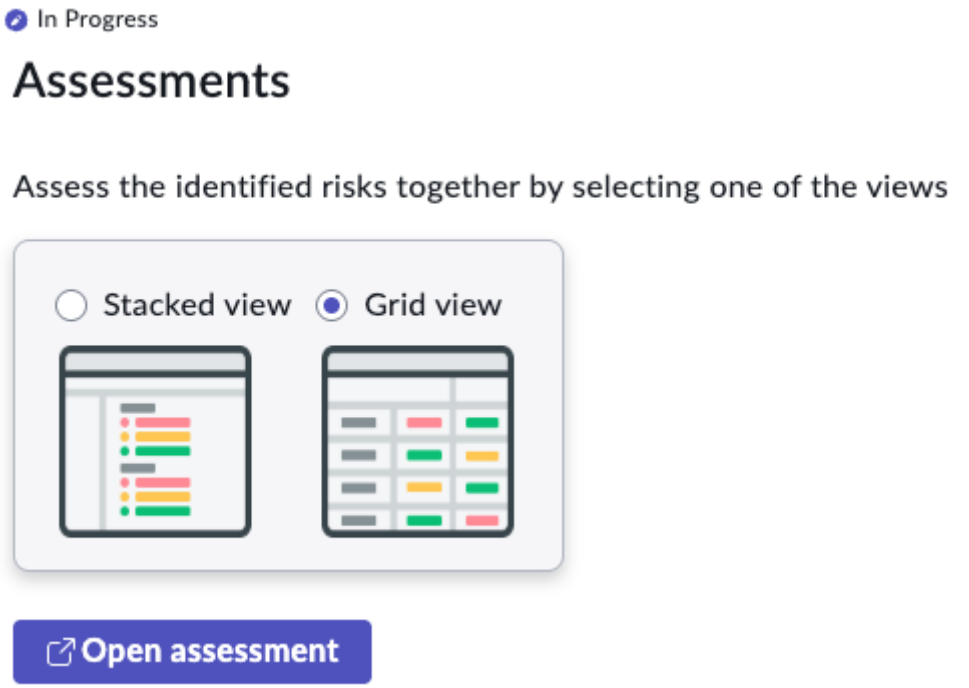
   c. In the remove risk dialog box, provide justification and select **Remove**.
   The selected risk is deleted, along with all associated responses.

9. Respond to all the factors in Inherent, Control, and Residual assessments, and define a risk response strategy for each risk within the project.
   The application automatically saves your responses and calculates the overall risk score.
10. To view the complete summary of the assessment, select **View summary**.
11. To check for any errors in the assessment before you submit the assessment, select the icon, and select **Validate**.
    You can see the list of errors, if any, that must be resolved in the side panel for the selected risk.
12. Identify the errors and resolve them.
13. Select **Validate** to check if the errors have been resolved.
14. To submit the risk assessment project for approval, select **Submit**, and select **Confirm Submission**.
    Assessments are validated again in this stage. Review the assessment summary before you submit. You can't make any changes after submission.

Perform assessment on a risk assessment project in grid view

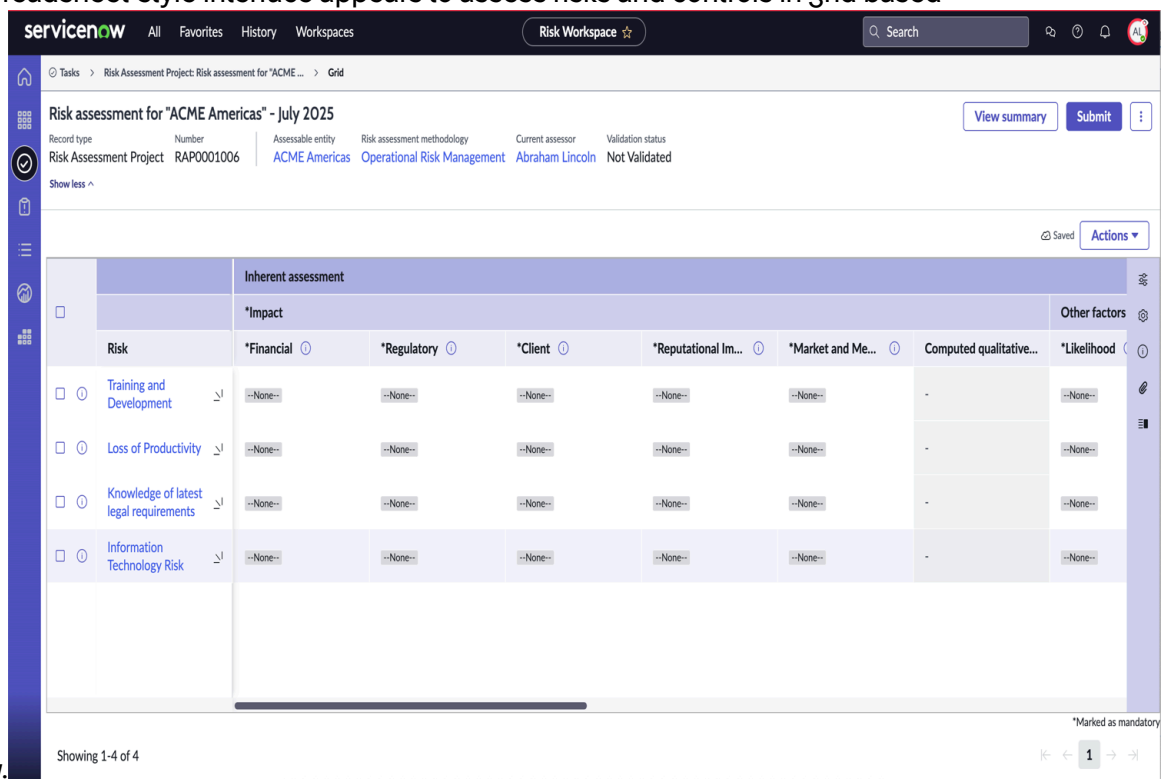
Perform assessments on multiple risks and controls simultaneously in a risk assessment project using the grid view. You can assess inherent risks, effectiveness of controls, residual risks, and target risks. You can define risk responses that enable you to manage and mitigate the risks identified during the risk assessment process.

Before you begin



Role required: sn_grc.business_user, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

Note:
You must manually add the sn_risk_advanced.risk_asmt_project_reader and sn_risk_advanced.ara_assessor roles to sn_grc.business_user to perform assessments on the risk assessment project.



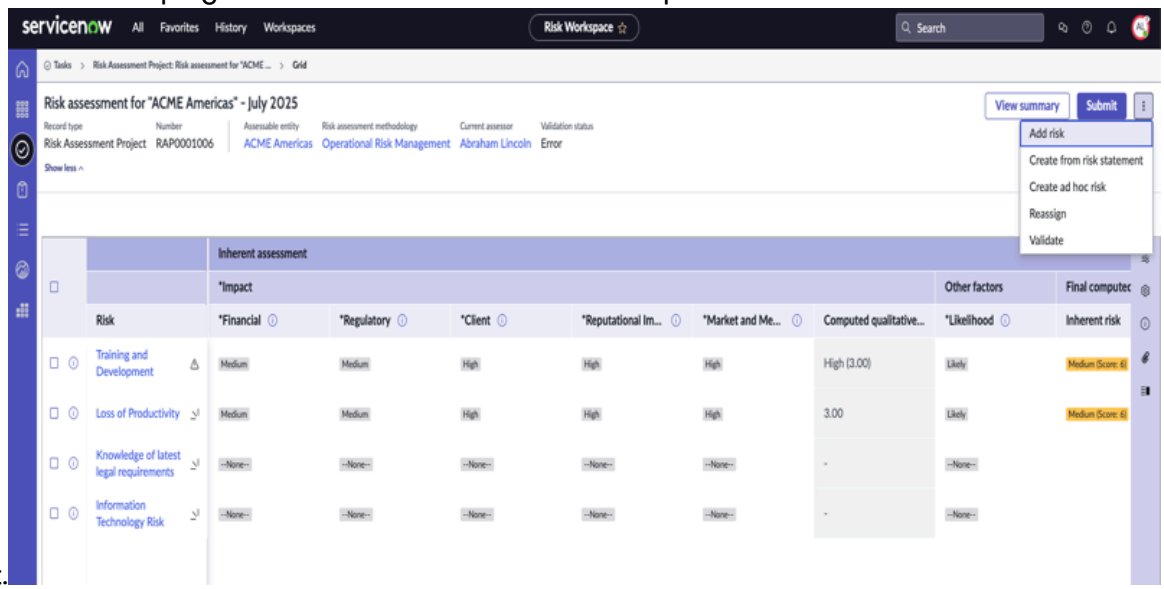
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **My tasks**.
2. Open the risk assessment project that you want to assess and do one of the following.
3. Select **Grid view** to assess the risk assessment project.

4. Select **Open assessment**.
   A spreadsheet-style interface appears to assess risks and controls in grid based view.

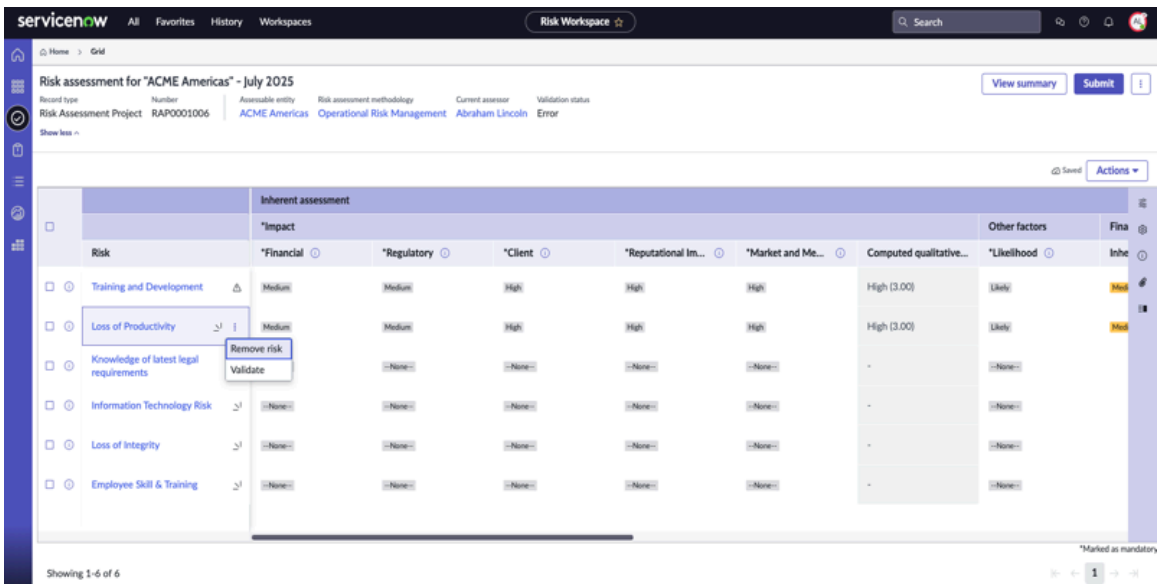
5. **Optional:** To reassign the project, select the ⋮, and select **Reassign**.
6. **Optional:** To add risks to the project, you can do the following:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To create risks from the risk statement, select the ⋮ icon, and select **Create from risk statements**.

b. To add a risk that is not in the library, select the ⋮ icon, and select **Create ad hoc risk**.

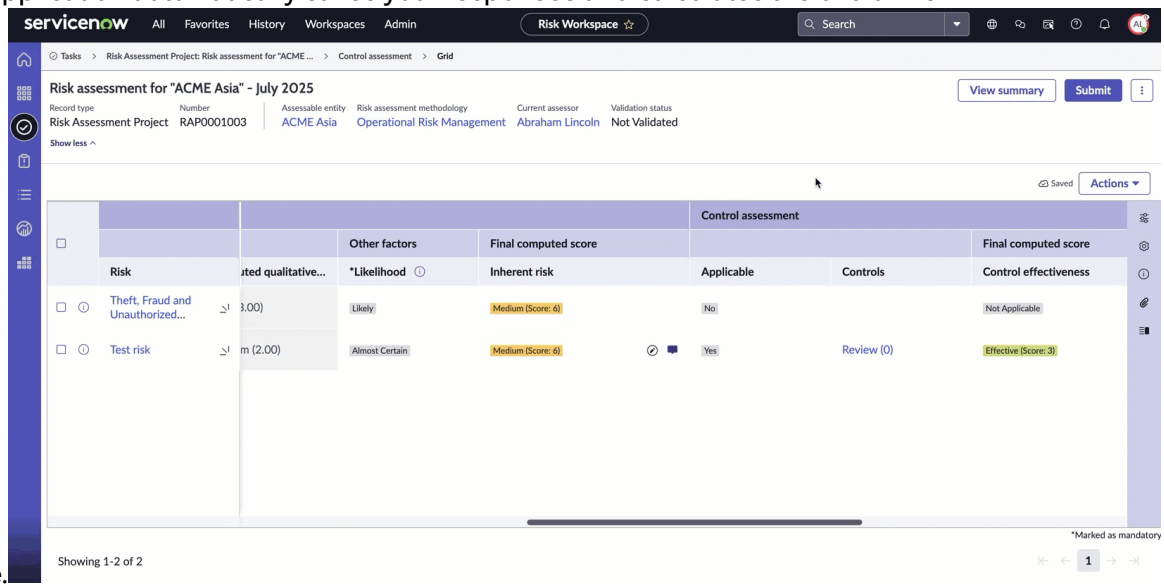


c. To add any underlying risks that have been removed, select the ⋮ icon, and select **Add risk**.

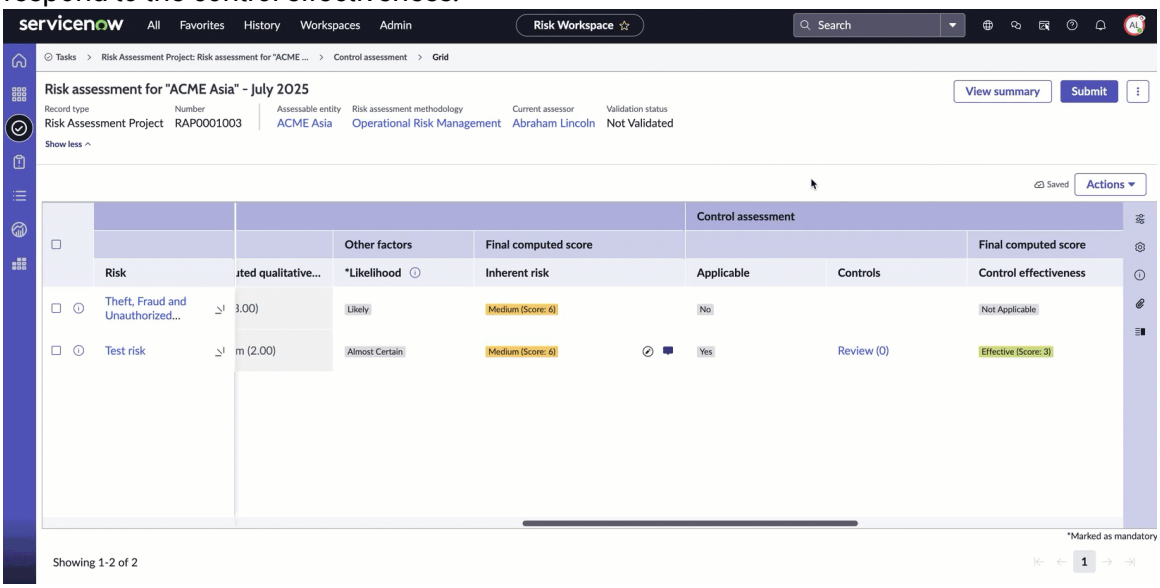
The risks with an in-progress assessment can't be added as part of the risk assessment project.

7. **Optional:** To remove risks from the project, you can do the following:
Removed scoped risks remain part of the project but are marked as not applicable for reporting purposes. However, removed ad hoc risks are completely deleted.

a. Select **Actions**.



b. Select **Remove risk**.
Remove risk dialog box appears.



c. In the remove risk dialog box, provide justification and select **Remove**.
The selected risk is deleted, along with all associated responses.

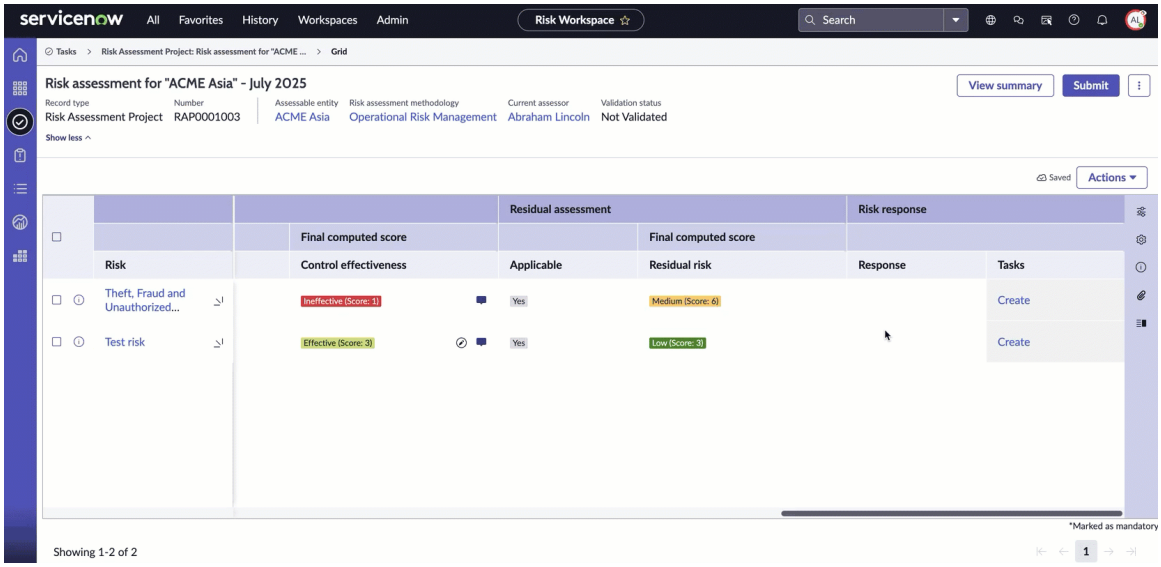
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Respond to all the factors in Inherent assessment for each risk within the project.
   The application automatically saves your responses and calculates the overall risk score.



9. To assess controls, select **Yes** in the Applicable column under Control assessment, and then respond to the control effectiveness.

10. To assess residual and target assessment, select **Yes** in the Applicable column.
    The application automatically calculates the final computed scores for individual assessments.
11. Select a risk response strategy and create a risk response task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. To view the complete summary of the assessment, select **View summary**.
13. To check for any errors in the assessment before you submit the assessment, select the icon, and select **Validate**.
    You can see the list of errors, if any, that must be resolved in the side panel for the selected risk.
14. Identify the errors and resolve them.
15. Select **Validate** to check if the errors have been resolved.
16. To submit the risk assessment project for approval, select **Submit**, and select **Confirm Submission**.
    Assessments are validated again in this stage. Review the assessment summary before you submit. You can't make any changes after submission.

Reassess a risk assessment project

Reassess a risk assessment project to assess any completed risk assessment project. It verifies that risks are reviewed and updated to reflect new insights or changing conditions, maintaining alignment with organizational goals.

Before you begin

Role required: sn_grc.business_user, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

Note:
You must manually add the sn_risk_advanced.risk_asmt_project_reader and sn_risk_advanced.ara_assessor roles to sn_grc.business_user to perform assessments on the risk assessment project.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list icon.
3. From the list, navigate to **Risk assessment projects**, and select **Completed**.
4. Open the Risk assessment project that you want to reassess.
5. Select **Reassess**.
   A Reassess project dialog box appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the reason for reassessment and provide additional context in the Reassess project dialog box.
7. Select **Confirm**.
   The risk assessment project is created and moves to the Scope Risk stage, with the details in the Define stage pre-filled from the previous assessment.
8. **Optional:** To change the risk assessment project details, select **Redefine**.

What to do next

Perform assessment on a risk assessment project in stacked view

Reassign assessor for a risk assessment project

Reassign assessors for multiple in-progress risk assessment projects simultaneously to minimize disruptions during stakeholder transitions.

Before you begin

Role required: sn_risk_advanced.risk_asmt_project_manager

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the list  icon.
3. From the list, navigate to **Risk assessment projects**, and select **In progress**.
4. Select the Risk Assessment projects for which you want to reassign assessors.
   Reassign project dialog box appears.
5. In the Reassign project dialog box, select the assessor in the **Select assessor** field.
6. Select **Confirm**.

Matrix report in Risk Workspace

Matrix report is a structured report that you can configure to view in a grid or table format in the Risk Workspace. You can use the matrix report to access and analyze the risk posture of your organization using entity-related data, such as risks, controls, KRIs, and events.

The Matrix Report offers a configurable, grid-based view within the Risk Workspace, designed to centralize and simplify access to entity-related risk data, including risks, controls, KRIs, and events. By consolidating fragmented information into a single interface, the Matrix Report provides risk managers with a clear, comprehensive picture of an entity's risk posture.

The Matrix report is accessible from both the Entity Risk Profile Matrix landing page and the individual entity record page. The Matrix Report helps reduce the need to switch between different views, making it easier to assess an entity’s overall risk profile. It supports faster identification of data gaps and enables more efficient risk analysis and decision-making.

Benefits of Matrix report

The benefits of the Matrix report are as follows:

- Displays risks, controls, KRIs, and events linked to an entity in one place, reducing the need to navigate across multiple records or pages.
- Offers a grid-based layout that helps you to understand the relationships between data elements more easily.
- Enables admins to configure columns based on their requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Minimizes time spent switching between different sections of the application by bringing key data together.
- Helps risk managers to assess the risk posture of an entity and identify gaps or issues that need attention.

Configure Matrix report registry

Configure the Matrix report registry to select the base table. You can create a relationship of the base with the target table to configure the details of the report for an entity-related record or a landing page.

Before you begin

Role required: sn_matrix_report.admin

Procedure

1. Navigate to **All** > **Matrix report** > **Matrix report registry**.
2. Select **New**.
3. Enter the name of the Matrix report registry in the **Name** field.
4. Select **Entity [sn_grc_profile]** in the **Base table** field.
5. Select **Submit**.
   The Matrix report registry is created and appears in a list view.
6. Select the Matrix report registry that you created.
   The base level of the configuration is auto-populated, which contains the base target table and you can select any filter conditions. For the next level configuration, add new relationships between the base table and a target table for the matrix report.
7. In the Matrix relationships related list, select **New**.
8. On the form, fill in the fields.
   For a description of the field values, see Matrix relationship form.
9. Select **Submit**.
   You have configured the base table, which is the level 0 of the matrix report configuration. You can add new configurations as well. For example, if you have selected the base table as Entity, then you can add configurations such as risk related to that entity, which would be level 1. For level 2, you can configure a relationship between controls and issues. Parent record as source helps to identify the record from which the data is taken.

Note:
The Source table and the Relationship can't be the same in the Matrix report registry.

What to do next

After the matrix relationship is complete, you can Configure target table fields as columns for matrix report.

Create Matrix report configuration for Risk Workspace

Create the Matrix report configuration by naming the report, choosing a display type (Landing page or Record page), and setting filter conditions on the base table.

Before you begin

Role required: sn_matrix_report.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Matrix report** > **Matrix report configurations**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Matrix report configuration form.
4. Select **Submit**.

Matrix report configuration form

Use the Matrix report configuration form to configure the Matrix report in the Risk Workspace.

Matrix report configuration form

Field	Description
Name	Title of the matrix displayed in the report. For example, `Entity Risk Profile Matrix`.
Matrix report	Matrix report registry reference.
Base table	Base table of the Matrix report registry.
Workspace	Workspace to which this report configuration applies. You must select **Risk Workspace**.
Display type	Type of display. The options are as follows: • **Landing page**: Option to select if you want this configuration to apply to the Entity Risk Profile Matrix page. • **Record page**: Option to select if you want this configuration to apply to an individual entity record.
Is default	Option for default display type. The field appears only when **Landing page** is selected from **Display type**.
Matrix configuration	
Filter on	Additional filter conditions applied to the base table. Record or table where this configuration or report is displayed. The field appears only when **Landing page** is selected from **Display type**.
Configured for	Record or table where this configuration or report is displayed. The field appears only when **Record page** is selected from **Display type**.
Filter condition	Filter conditions on the configured table.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

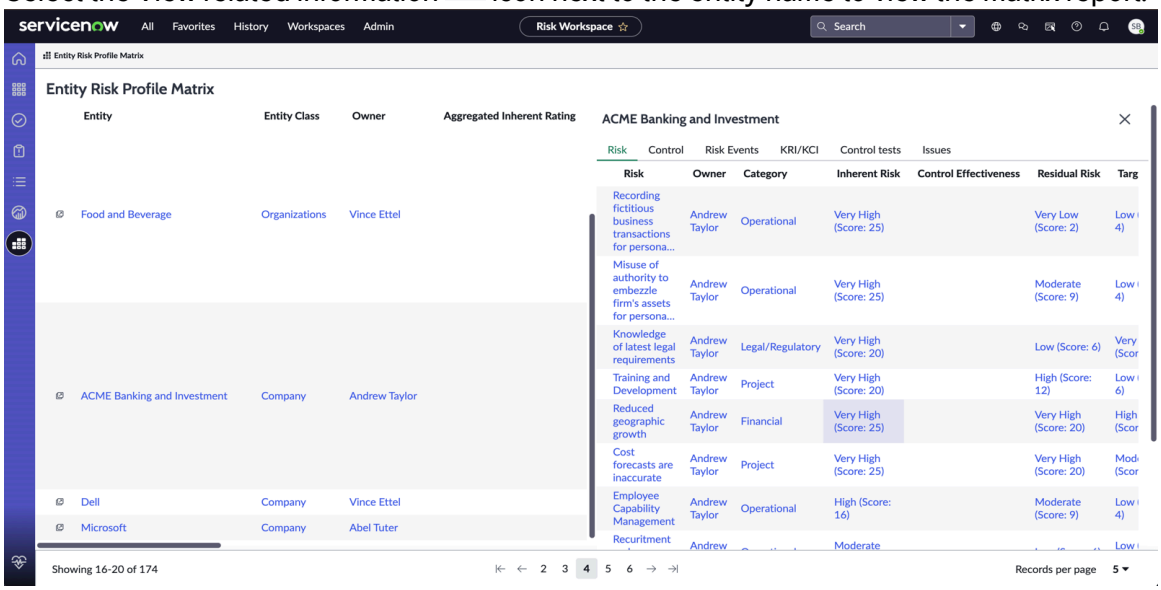
Matrix report configuration form (continued)

Field	Description
Base table relation	Relationship between the configured table and the base table.

View matrix report in the landing page and record page of Risk Workspace

Access and analyze the risk posture of your organization using entity-related data, such as risks, controls, KRIs, and events in a centralized, configurable grid-based view. The Matrix report reduces time spent switching views and helps risk managers assess data more easily, leading to more proactive and streamlined risk management.

Before you begin

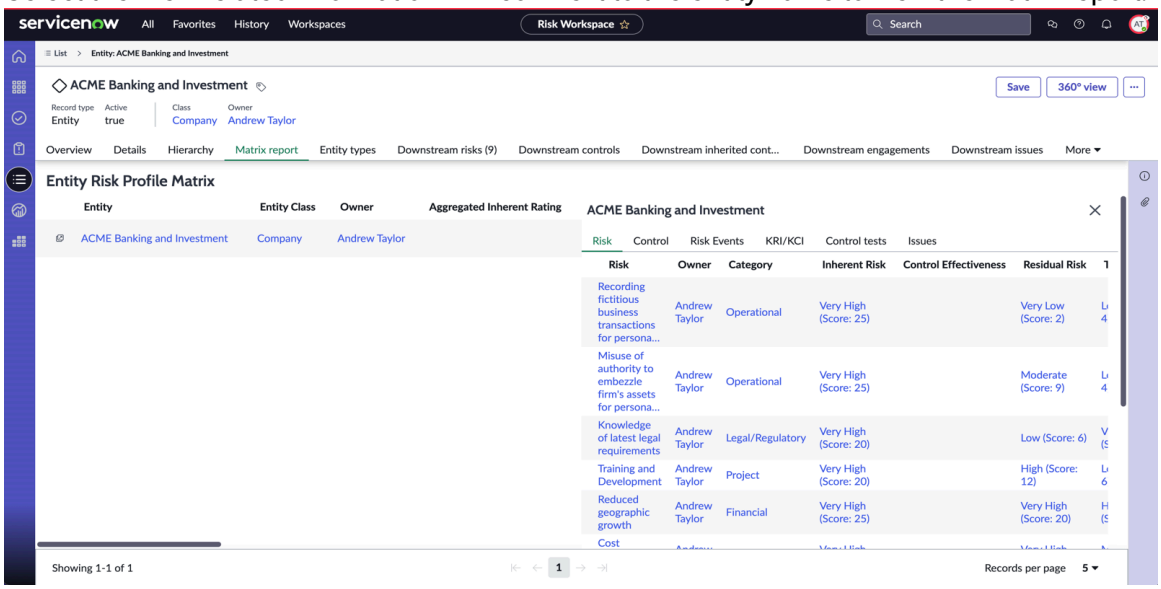


Role required: sn_risk_workspace.operational_risk_manager or sn_risk_workspace.IT_risk_manager or sn_risk_workspace.business_op_risk_manager

Risk Workspace and Matrix report plugin should be installed to use the feature.

About this task

Procedure



1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the Entity risk profile matrix icon.
   For the landing page display type matrix configuration, you can view the Matrix report in the Risk Workspace.
3. Select the View related information icon next to the entity name to view the matrix report.

4. To view the matrix report on the entity record page, select the list .
5. Open the entity record for which you want to view the matrix report and select the **Matrix report** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the View related information icon next to the entity name to view the matrix report.

GRC: Metrics in Integrated Risk Management

Risk metrics are defined as a quantifiable measure that is used to track and assess the status of a specific risk. Metrics help in tracking the exposure of a risk over time.

Risk indicators are an important tool within operational risk management. Indicators facilitate the monitoring and control of risk. Therefore, they may be used to support a range of operational risk management activities and processes, such as risk identification, risk and control assessments, the implementation of effective risk appetite, and the risk management and governance frameworks. Indicators only support one type of results called Pass or Fail and do not support data types such as number, percentage, or monetary amount. Metrics provide better escalation and notification mechanism for indicators, allow specific definition of data owners, and the classification of the indicators.

The key benefits of metrics are as follows.

- Provides continuous visibility into risk and control performance.
- Alerts respective owners about change of risk and control performance.
- Automates metric data collection tasks saving time for organization.
- Efficiently monitors and sharing of risk information across the organization.

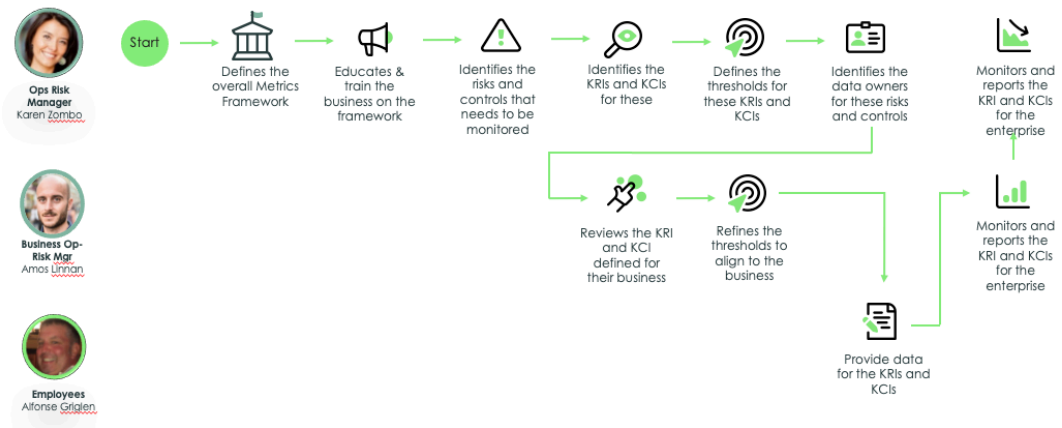
Uses of the GRC: Metrics in ESG Management and IRM

The GRC: Metrics application is used by various applications such as Integrated Risk Management and ESG Management.

Risk management and Environmental, Social, and Governance (ESG) are concepts that intersect in several ways, with ESG referring to the criteria used by investors to evaluate a company's sustainability. ESG factors consider issues such as climate change, human rights, diversity and inclusion, corporate governance, and supply chain management, among others. Risk management involves identifying, assessing, and mitigating risks that may affect an organization's ability to achieve its objectives, including financial, operational, and reputational risks, among others. The relationship between risk management and ESG is strong since poorly managed ESG factors can create significant risks for companies. For example, a company with poor environmental practices may face legal and regulatory, reputational, and operational risks. Similarly, a company with weak governance practices may face legal and reputational risks, as

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

well as risks related to conflicts of interest and poor decision-making. By integrating ESG factors into their risk management processes, companies can identify and mitigate these risks, leading to more sustainable and resilient business models. For example, a company that identifies and mitigates its environmental risks may reduce its exposure to future environmental regulations, while a company that improves its governance practices may reduce its exposure to reputational and legal risks. Therefore, companies that effectively manage their ESG risks can improve their overall risk management capabilities, create long-term value, and ensure the sustainability of their business models.



Types of metrics

The following are the types of metrics.

- Key risk indicators (KRIs): These indicators identify the amount of exposure to a given risk or set of risks. Examples of KRIs are: Staff morale determined through employee surveys, number of hacks attempted on IT, number of negative social media posts following a loss event and so on.
- Key control indicators (KCIs): These indicators identify the effectiveness of the controls that have been implemented to reduce or mitigate a given risk exposure.
- Key performance indicators (KPIs): These indicators show how effectively the risk exposure is managed. These indicators show the achievement against objectives.

The following image shows the metrics workflow.

Workflow of metrics

Difference between indicators and metrics

Indicators are used as automated control tests or assessments while metrics are used as KRIs and KCIs monitoring tool. The following table lists the differences between an indicator and a metric.

Indicators versus metrics

GRC Indicators	Metrics
Used for continuous monitoring of risks and controls and for collecting supporting data.	Used to measure the degree to which a system, component, or process, possesses a given attribute.
Can be used to monitor a risk or control.	Can be used to measure any GRC object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicators versus metrics (continued)

GRC Indicators	Metrics
Can have only binary values such as pass or fail.	Can have any value: Quantitative (numbers) or Qualitative (text).

Exploring GRC: Metrics

A metric is used to measure and evaluate the effectiveness of your organizational processes. A metric or a combination of metrics can provide an insight into a system, component, or process. The GRC: Metrics application enables other applications to assess, compare, and track the performance of the processes.

Metrics

The GRC: Metrics application is installed automatically with the ESG Management application from the ServiceNow® Store. The user role that is responsible to read, create, and update the metric definitions and metrics is the ESG Management metrics manager (sn_esg.metrics_manager).

With the GRC: Metrics application, you can define metrics by using the metrics form. Metrics are a combination of a metric definition and an entity. Applying the metric definition to an entity creates a metric. Once the metrics are defined, data is gathered to track the effectiveness and performance of your processes. For example, consider a metric that measures the effectiveness of an incident resolution process by calculating the time it takes to resolve an incident.

Every organization has a range of data sources for building and structuring their own metric analysis. To establish a useful metric, the metrics manager must first assess and set the goals. Next, the manager sets the targets for the metrics that are integrated with their business decisions.

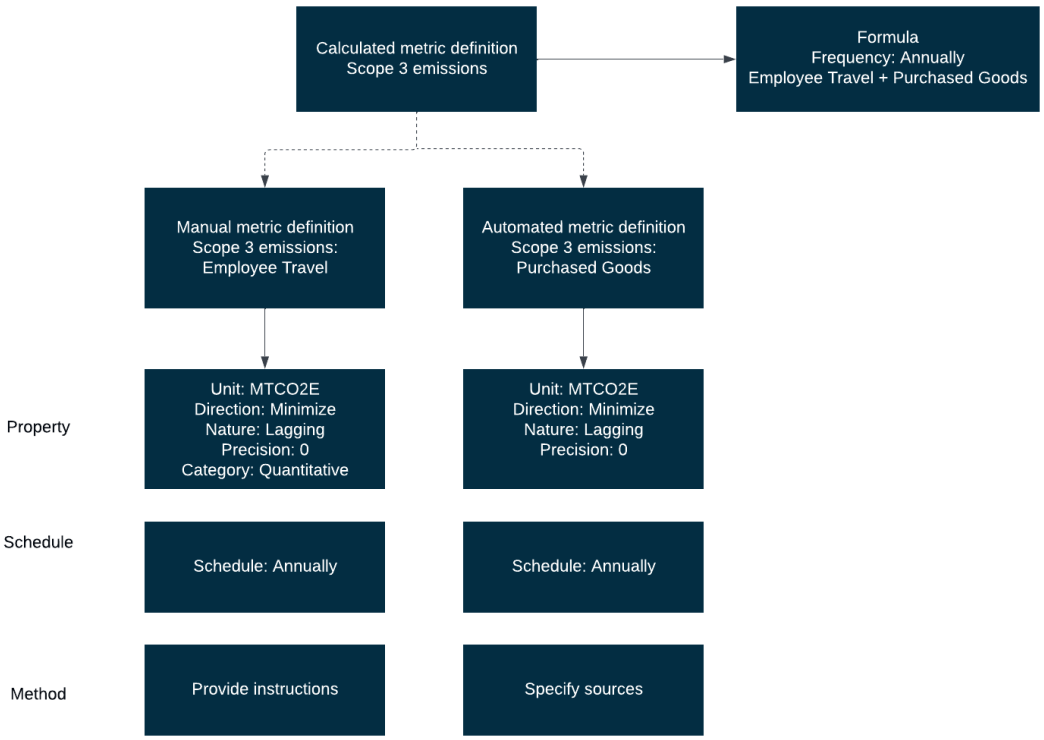
Qualitative and quantitative metrics

You can classify your metrics into qualitative and quantitative measurements.

Qualitative metrics in ESG Management are derived from the subjective opinion that you form based on other information. Some examples of qualitative metrics in the ESG Management sectors are brand credibility, corporate value, and so on.

Quantitative metrics in ESG Management are the metrics that you can measure in a specific number through certain formulas. Some examples of quantitative metrics for an organization include reporting total energy use, energy use by region, and so on.

Examples of metrics



Consider the example of measuring greenhouse gas emissions for business entities in your organization. Greenhouse gas emissions are categorized into three groups called Scopes by the international Greenhouse Gas (GHG) Protocol.

You want to measure the metrics for Scope 3 Emissions for the following categories: employee travel and purchased goods. The employee travel policy applies to all the employees in the organization. You can collect the metrics for the employee travel policy manually by providing instructions in the metric definition.

On the other hand, the metrics for the purchased goods are collected automatically based on the specified conditions method, schedule, and core property in the metric definition. The metric collection process is illustrated in the following image.

© 2026 ServiceNow, Inc. All rights reserved.

Define a metric

Metric data by entity

The metric data by entity table (sn_grc_metric_data_by_entity) includes metric definition data and metric data for entities and the aggregated data for parent entities defined in the entity hierarchy. For example, if an ESG reporting disclosure manager wants to understand the total emissions for an entire year for a particular location and if the location has sub-locations, you can also aggregate the data and use it for reporting purposes. For example, consider that your organization has a location Japan. Japan, in turn, has two sub locations, Tokyo and Kyoto. Assume that you want to find your total yearly Scope 1 emissions for the year 2022 for Japan. Using the time dimensions feature, you can aggregate your data and get a view of your total emissions for a year. You can also aggregate the data for a quarter, week, or a month depending on your reporting requirements. The data in this table is collected according to the calendar of metric or entity.

Components of GRC: Metrics

A metric consists of several components such metric definition, metric data, metric definition data, metric data tasks. All of these elements or parts contribute to the metric collection process in various ways.

Metric definitions

A metric definition is a template-level record that helps set the core properties of a metric. These properties include the unit, direction, nature, precision, frequency of data collection, and category of the metric. The metric itself collects scores, which are then aggregated into the defined metric template. The advantage of creating and using a metric definition lies in its ability to streamline the process of creating metrics using these metric definition templates. For instance, imagine you have several business units, and you need to collect revenue data for each of them. Without a metric definition, you would have to create separate templates for every business unit and repeatedly specify the metric properties. However, by using a metric definition, you simplify this task. Once you've created the metric definition, you can easily attach your entities (business units in this case) and collect the metrics without duplicating efforts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The GRC: Metrics application provides the following types of metric definitions:

- Automated metric definition: Data is collected automatically.
- Manual metric definition: Data is collected manually.
- Calculated metric definition: Data is collected by aggregating data from other child metrics.

Metric data

When you execute a metric, the metric data gets created. In the case of manual metric definitions, the values of metric data are copied from the metric data tasks when the metric data tasks are closed. To address off-cycle requests for the most up-to-date information on existing metric definitions and metrics, you can create ad hoc metric data tasks on manual metrics. On the metric data form, the option **Ad hoc** denotes if the metric data task was created as an ad hoc task. It is important to note that these ad hoc tasks do not contribute to the aggregated metric definition data, are not considered for entity hierarchy rollup, and are not evaluated for threshold rating, Variance(%). However, in a calculated metric definition, if the **Calculation level** is set to **Entity**, and there are ad hoc tasks from the manual metric definitions, then these tasks are aggregated to derive the calculated metric definition data.

For a scripted automated metric definition, the values are updated when you execute the script. For a basic automated metric definition, the values are updated from the selected table. The field **Variance (%)** shows the variation in between current period and the previous period metric data. This difference is displayed in percentage. The field **Last period data** refers to the previous period's metric data.

Metric definition data

Metric definition data gets automatically created when the metric definition gets executed and aggregated. On the metric definition data page, the field **Variance (%)** shows the variation in between the current period and the previous period's metric definition data. This difference is displayed in percentage. The field **Last period data** refers to the previous period's metric definition data.

Metric data tasks

Metric data tasks only apply to manual metric definitions. These tasks are generated whenever manual metrics are executed and the data owners provide responses for these tasks manually. You can provide responses to multiple metric data tasks using the metric data table. For more information, see Metric data table.

A metrics manager has the authority to determine whether a metric data task needs approval. If approval is necessary, you can choose between two methods: Simple Approval or Advanced Approval by using the *`Metric approval`* property. For more information about this property, see Components installed with ESG Management.

Metric definition types

A metrics manager defines the metrics by creating a metric definition. A metric definition is a template-level record. In the metric definition, you set the core properties of the metric, such as unit, direction, nature, precision, and category. The metrics collect the scores, and these scores get rolled up into the metric definition.

The GRC: Metrics application provides the following types of metric definitions:

- Automated metric definition: Data is collected automatically.
- Manual metric definition: Data is collected manually.
- Calculated metric definition: Data is collected by aggregating scores from other child metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These types of metric definitions are further explained in the following sections.

Automated metric definition

In automated metric definitions, the data is collected automatically based on the conditions defined in the metric definition, such as metric properties, method, and schedule. For the method, the metrics manager specifies the source table or the script that is used for collecting the metric data and the filtering criteria to filter the metric data. See Create an automated metric definition for more information.

Manual metric definition

In manual metric definitions, the mode of data collection is manual. The data owner for a particular metric provides the metric data by going through the instructions. As the metrics manager, you have to define the metric properties, method, and schedule for the metric definition. In the method, specify the instructions for the metric definition as the metrics manager. Also, specify the data collection details such as data owner type, data owner, and approval details.

In a manual metric definition, a metric data task is generated depending upon the frequency defined in the metric definition. As a metrics manager, you can assign the task to a data owner who provides the data for the task. See Create a manual metric definition for more information. When a metric data task is created, a system generated email notification is sent to the task owner. As a metric data owner, you can provide the data for multiple metrics using the Metrics tasks module (). For more information, refer to Provide data for multiple metrics.

Each metric data task has a due date defined in the manual metric definition form. By default, the due date follows the schedule of 8-5. However, a risk administrator can also modify the schedule. For more information, refer to Create a new schedule. If the risk administrator wants to overwrite the schedule, then the risk administrator can modify the *sn_grc_metric.metric_data_task_schedule* property.

Both quantitative and qualitative category of metrics can be created using the manual metric definition.

It is possible to convert a manual metric definition to an automated metric definition and an automated metric definition to a manual metric definition. In the event that a manual metric definition has open tasks, it is necessary to first close them prior to converting the manual metric definition.

Calculated metric definition

A calculated metric definition calculates the scores from its children. It can include the automated and manual metric definitions, metrics (quantitative), and other calculated metric definitions of identical frequency. As the metrics manager, you have to specify how you want to calculate the metric definitions score and how frequently you want to calculate them.

The calculated metric definition rolls up the scores from its children. The rollup property defined in the calculated metric definition consists of a rollup formula and schedule for the rollup frequency. A calculated metric definition can include those automated and manual metric definitions, and metrics as its children which are of the same frequency as that of the parent calculated metric definition. See Create a calculated metric definition for more information.

Applying the metric definition to the entities

You can apply the metric definitions to the entities in your organization. Instead of defining the metric for each entity, you can define the metric definition once and then apply that metric definition to your entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, assume you want to measure the greenhouse gas emissions for the entities in your organization. Defining the metric for each entity is a time-consuming process. By creating a metric definition, you can define the metric once and then apply that metric definition to your entities.

The following illustration shows how you can apply the metric data definition to an entity. If you have an automated metric definition for the purchased goods metric category, the metric can be applied to the Products entity and IT entity in your organization. If you have a manual metric definition such as Employee Travel, the metric can be applied to the Enterprise entity in your organization as the travel policy applies to everyone across the enterprise.

Apply the metric data definition to an entity

Thresholds in Integrated Risk Management

In the context of metrics, thresholds refer to predetermined values or limits used to assess the performance of a metric. These thresholds are typically defined based on specific criteria or objectives and serve as reference points to determine whether the measured value or performance meets, exceeds, or falls below the desired level.

The three colors of thresholds—red, amber, and green—are commonly used to indicate different levels of performance or status. These colors indicate the status where green signifies the metric is performing well according to expectation, amber signals caution or warning, and red signifies a critical situation. For instance, consider a scenario where you have established a metric definition aimed at reducing credit risk, with the metric direction set to Minimize. In this case, the metric values should be lower than the specified threshold value. This requirement arises from the intention to prevent pollution from increasing and instead promote its reduction. If the metric value is higher than the defined limit, the value would appear in red or amber. Thresholds only apply to quantitative metric definitions.

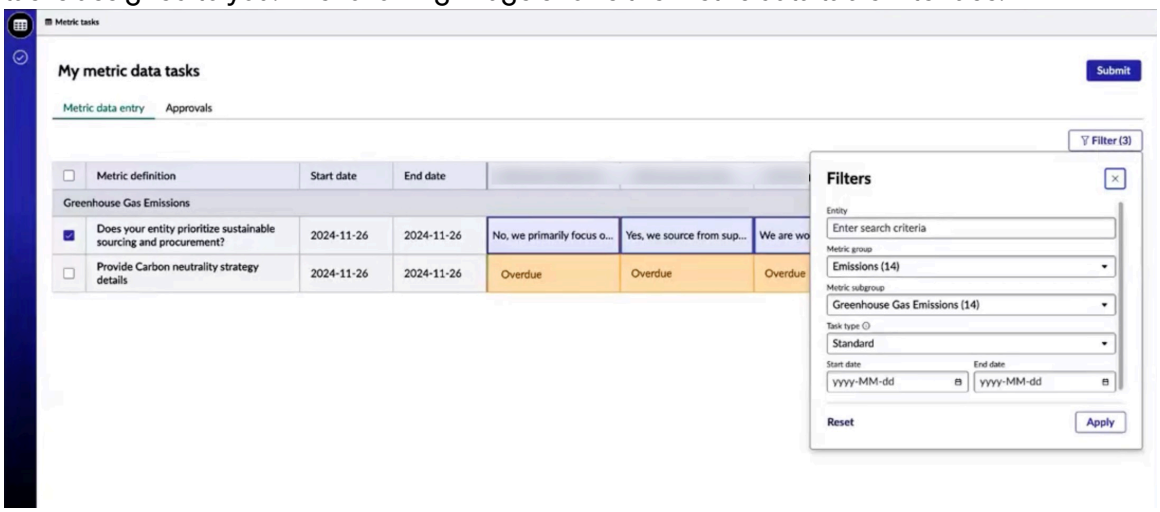
Types of threshold

There are two types of threshold for a metric.

- Static: A static threshold for a metric or a metric definition refers to a fixed value used as a limit for tracking a metric.
- Dynamic: Dynamic thresholds are specified in percentages. This means that the percentage variance is calculated based on two factors: direction and the previous data.

  For example, in June 2023, the attrition rate is 12% based on the industry average, indicating a relatively low level of risk. The objective is to minimize attrition risk, so any increase in the metric value is considered undesirable. In July 2023, new metric data is collected, and it shows that the attrition risk metric has deviated by 5%. To evaluate the significance of this increase, you can define different thresholds representing various levels of change. These thresholds are expressed as percentage differences from the previous period's data, in this case, from June 2023. For example, the organization sets a threshold range of 5% to 10%. If the percentage change in the attrition risk metric between June and July falls within this range, the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



threshold status is classified as "amber." This indicates a moderate level of change, signaling that the metric has deviated from the desired target value but is not yet critical. However, if the percentage change in the attrition risk metric exceeds or reaches 15%, the threshold status is classified as "red." This signifies a significant change that demands immediate attention or corrective action since it deviates greatly from the desired target value. By monitoring these threshold levels, the organization can identify and address the increasing attrition risks promptly, enabling effective risk management.

For more information, refer to Create a threshold for a metric definition.

Metric data table

The metric data table enables data collection for metrics across the organization using an easy-to-use interface like a spreadsheet with multiple filters and a task management workflow.

As a data owner, you can access the metric data table ( ) and complete the tasks assigned to you. The following image shows the metric data table interface.

The metric data table offers the following benefits:

- Simplifies data collection across the entire organization.
- Enables you to view all the metrics that the data owner must respond to in a single place instead of navigating across multiple tasks.
- Displays a maximum of 700 tasks at a time.
- Simplifies the process of providing data by enabling you to filter metric data tasks by entity, metric groups, metric subgroups, start date, end date, and approval level.
- Displays the open tasks with the number of open tasks in parentheses.
- Maintains an audit trail of all changes to the data and the users who made the changes.
- Enables you to view the metrics segregated by entities.
- Gives additional information to the data owner for reference such as instructions to follow while providing the data.
- Provides the ability for the users to attach files in the Contextual side panel and attach the relevant documents and links.
- Enables ESG program managers and metrics managers to view the data submitted by the data owners and approve or reject multiple data tasks with comments.
- Enables data owners to view the rejection comments in the Activity tab.
- Helps you to view how the past three data for quantitative metrics is trending.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enables you to see the approvers of your task and the approval status.
- Displays the percentage variance of data when compared to the data of the previous period.
- Displays the threshold status if the metric exceeds the threshold.
- Enables you to view the last period's data.

Configuring metrics

You can configure GRC: Metrics to meet the needs of your organization.

As a metrics administrator, you can do the following:

- Create a manual metric definition
- Create a calculated metric definition
- Create an automated metric definition
- Update a metric
- Create a metric unit
- Create a metric
- Create a threshold for a metric definition

Create a manual metric definition

Create a manual metric definition to collect the data manually for a metric.

Before you begin

Role required: sn_grc_metric.manager, sn_risk.user, and sn_compliance.user

About this task

In the manual metric definition, the mode of data collection is manual. An option is available to set up the qualitative and quantitative metrics.

Note:
The forms for creating an automated metric definition or a manual metric definition point to the same sn_grc_metric_definition table. The difference between the two forms is the method of the collection.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Lists** > **Metrics** > **Manual metric definitions**.
2. Click **New**.
3. On the form, fill in the fields.
   For information about the fields, refer to Manual metric definition fields.
4. Click **Save**.

Result

The metric definition is saved in the Metric definitions list.

What to do next

You can associate an entity type, create metrics, and add citations to the metric definition. See Update a metric definition for more information.

Manual metric definition fields

Detailed explanation of the fields on the manual metric definition form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New manual metric definition form

Field	Description
Basic details	
Name	Name of the manual metric definition. For example, `Number of incidents`.
Active	Option to mark the manual metric definition as active.
Description	Brief description of the manual metric definition.
Category	Category of the metrics data. The choices are as follows: • **Qualitative**: Qualitative data is intangible and non-numerical in nature. It's defined by the characteristics of a process or business activity. • **Quantitative**: Quantitative data is tangible and numerical in nature. It's defined by the numbers or key performance indicators. **Note:** This fields **Nature**, **Direction**, **Precision**, and **Unit** are only displayed only when the category of the manual metric definition is **Quantitative**.
Calendar	Calendar to use for metric aggregation. Only the configured calendar options are available for selection. This field is automatically set to **Standard Calendar**. **Note:** Standard calendar refers to the Gregorian calendar.
Aggregation method	Method used to calculate the metric data for all the entities. For example, if you have a metric that you want to measure for multiple entities such as people, departments, or regions, you might want to know how to calculate the scores for each entity into a single score that represents the overall performance. Your choice of aggregation method depends on your goal of metric collection. For example, if you're interested in overall performance and want to account for differences in scale or size between entities, the sum or average may be more appropriate. If you're interested in identifying the best-performing entity, the maximum may be more appropriate, while if you're interested

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New manual metric definition form (continued)

Field	Description
	in identifying the worst-performing entity, the minimum may be more appropriate. The aggregation happens across time periods based on the frequency defined in the metric definition. If the frequency is monthly, the calculation takes place every month. The four choices for aggregation methods are as follows: • **Sum**: The metric data for all entities are added together to create a single score. • **Average**: The metric data for all entities are averaged to create a single score. • **Maximum**: The highest metric data among all entities is used as the single score. • **Minimum**: The lowest metric data among all entities is used as the single score.
Unit	Unit for the manual metric definition.
Precision	Number of decimal places after the decimal point on a score. This field is automatically set to **0**. When the Precision is set to 0, the result is rounded to the nearest whole number. For example, if a metric definition with Precision 0 calculates the values 7 + (5 / 2), the result rounds up to 10. When the Precision is set to greater than 0, the result is rounded to the nearest decimal point for the given precision. For example, Precision 1 rounds a result of 4.45 as 4.5.
Frequency	Frequency at which the metric definition should collect the scores. The choices are as follows: • **Daily** • **Weekly** • **Monthly** • **Quarterly** • **Semi-annually** • **Annually**
First run date	Start date of the metric definition execution for the collection of data according to the frequency.

New manual metric definition form (continued)

Field	Description
Data collection	
Data owner assignment type	Type of the data owner assignment for the metrics within the metric definition. The choices are as follows: • **Simple** The system assigns the specified Data owner or Data owner group to the Metric. • **Advanced** The system assigns a Data owner based on the assignment configuration. ESG admins [sn_esg.admin] or Risk admins [sn_risk.admin] can set assignment configurations to dynamically assign data owners. For more information on creating assignment configurations see, Create an assignment configuration and Assignment Configuration New Record. **Note:** This is available if you have the GRC: Approver Configurator application installed. For more information see, Using Approver Configurator for setting up approvals.
Data owner type	Type of the data owner responsible for the manual metric definition. The choices are as follows: • **User** • **User group** **Note:** Only groups that include at least one member with the ESG Metrics Manager role or higher can be selected for this field.
Data owner	Data owner responsible for the manual metric definition. Select a data owner from the list. **Note:** If you selected the advanced option for **Data owner assignment type**, this will be the assigned data owner if the assignment configuration doesn't return any results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New manual metric definition form (continued)

Field	Description
Result type	The format that you want to be available for responses in assigned metric data tasks. This applies to responses and overridden responses. • Text: Users can enter a plain text response. • HTML: Users can enter HTML code as a response. • Choice: Users can select a choice from a list. This field appears when the **Category** field is set to **Qualitative**.
Choice table	Table the choices are being populated from. This field appears when the **Category** field is set to **Qualitative**.
Choice field	Field and its values from the selected table that are displayed for each choice. This field appears when the **Category** field is set to **Qualitative**.
Choice condition	Option to only show certain fields or certain values within the Choice field under set conditions. Select **Set conditions** to open the condition builder. This field appears when the **Category** field is set to **Qualitative**.
Instructions	Instructions for the data owner. Method of collection for the manual metric definition.
Approval required	Option to indicate if an approval is required for the manual metric definition. **Note:** When the **Approval required** option is enabled, the **Approver type** and **Approver** fields are displayed.
Approver type	Type of the approver of the metric definition. The choices are as follows: • **User** • **User group** **Note:** This field appears only when the Metric approval property is set to **Simple**. For more information see, Components installed with ESG Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New manual metric definition form (continued)

Field	Description
	Note: Only groups that include at least one member with the ESG Metrics Manager role or higher can be selected the User Group.
Approver	Approver user or approver group that is responsible to approve the metric definition. The choices are as follows: • **Approver**: Displayed when the User option is selected. • **Approver group**: Displayed when the User option is selected. **Note:** This field appears only when the Metric approval property is set to **Simple**. For more information see, Components installed with ESG Management. **Note:** Only users with the ESG Program Manager role or higher can be selected.
Metric Properties	
Type	Method used to determine if the score is collected manually or in an automated manner. The choices are as follows: • **Automated** • **Manual** Select **Manual**.
Enterprise Owner Type	Type of enterprise owner responsible for the manual metric definition. The choices are as follows: • **User** • **User group** **Note:** Only groups with at least one member with the ESG Metrics Manager role or higher can be selected in this field.
Direction	Direction that you want to see the metric in. The choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New manual metric definition form (continued)

Field	Description
	• **None**: If you don't want any change in the metric direction, select this option. • **Minimize**: If the desired metric direction is downward, select this option. • **Maximize**: If the desired metric direction is upward, select this option. • **Milestone**: When the metric direction isn't applicable, but the metric is tracked against a milestone, select this option. **Note:** Thresholds can be set for all directions excluding **Milestone**. For more information on creating thresholds, see Create a threshold for a metric
Group	Area that the metric relates to.
Reporting classification	Tag used to categorize the metric.
Due date offset	Number of business days after the schedule end date when the metric data task becomes overdue. For example, if the frequency of a metric definition is monthly and if you enter `15` in this field, then the due date for metric data task will be overdue 15 business days after the month ends. If set to 0, the due date is set to one day after the end date. **Note:** The offset is based on the applied schedule.
Enterprise owner	Enterprise owner of the manual metric definition. **Note:** Only users with the ESG Metrics Manager role or higher can be selected in this field.
Nature	Nature of the manual metric definition. The choices are as follows: • **None**: If you don't want any change in the metric direction, select this option. • **Leading** (Predictive) Metric: Is predictive and helps anticipate future outcomes. In this case, the company may use a leading metric related to GHG emissions, such as the amount of energy consumed per production

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New manual metric definition form (continued)

Field	Description
	unit. By tracking energy consumption, the company can predict its future GHG emissions based on the energy sources used and the efficiency of its production processes. This leading metric enables the company to proactively identify areas for improvement and make informed decisions to reduce emissions. • **Lagging** (Measures Impact) Metric: Measures the impact of past actions or events. In the example, a lagging metric related to GHG emissions could be the total emissions produced by the company in a given year. This metric provides an assessment of the company's historical environmental impact. By monitoring this metric over time, the company can evaluate the effectiveness of its emission reduction efforts and identify areas where further improvements are needed. Lagging metrics help measure the outcomes of past actions and inform future strategies. • **Current** metric: Monitors ongoing processes and identifies real-time improvement areas. For GHG emissions, a current metric could be the emissions intensity, which measures the emissions generated per unit of production. By tracking emissions intensity, the company can identify specific areas within its operations that contribute to higher emissions. This metric helps the company identify real-time improvement opportunities, such as optimizing energy usage, implementing energy-efficient technologies, or adopting renewable energy sources.
Subgroup	Subgroup that the metric relates to
Key metric	Option to indicate if it's a key metric for your business.
Confidentiality	

Note:
This section only appears when:

- The *sn_grc.enable_record_confidentiality* property is enabled under GRC properties.
- The record is in **Draft** state.

© 2026 ServiceNow, Inc. All rights reserved.

New manual metric definition form (continued)

Field	Description
Confidential	Option to mark the record as confidential.
Allowed users	Users who can view the record. **Note:** By default, the logged-in user is added to the list of confidential users.
Allowed groups	Groups that can view the record.

Create an assignment configuration

Create an assignment configuration for a manual metric definition to have data owners dynamically assigned to metrics.

Before you begin
Role required: admin, sn_esg.admin, or sn_risk.admin

About this task
In the manual metric definition, you can choose between a simple or advanced option for the assignment of data owners. For the advanced option, you must configure how the data owner is assigned by creating a new assignment configuration record. For more information, on the manual metric definition form and fields, see Manual metric definition fields.

Procedure
1. Navigate to **All** > **Assignment and Approval Configurations** > **Assignment configurations**.
2. Click **New**.
3. On the form, fill in the fields.
   For information about the fields, refer to Assignment Configuration New Record.

   Note:
   You cannot have more than one approval configuration applying to the table with the same priority.

4. Select **Save**.

Result
Data owners will be assigned to metrics based on the parameters set in your assignment configuration.

Note:
If the assignment configuration does not return any results the user defined in the **Data owner** field of the metric definition record will be the assigned as the data owner.

Create an automated metric definition

Create an automated metric definition to collect the data for a metric. A metric definition specifies the method and key properties of the metric, such as the unit, direction, or nature of the metric.

Before you begin
Role required: sn_grc_metric.manager, sn_risk.user, and sn_compliance.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In automated metric definitions, the data is collected automatically based on the conditions that you define in the metric definition. In the condition, specify the tables that are used for collecting the metric data. For example, if you want to obtain data for all the incidents logged in a particular month, you can specify the Incidents table as a source for data collection.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Lists** > **Metrics** > **Automated metric definitions**.
2. Click **New**.
3. On the form, fill in the fields.
   For a detailed explanation of the fields, refer to Automated metric definition fields.
4. Click **Save**.

> **Note:**
> In the new automated metric definition form, only the **Details** tab is displayed. After a new automated metric definition is created, additional related lists are displayed with the **Details** tab in the form.

Result

The automated metric definition is saved in the Metric definitions list.

What to do next

You can associate an entity type, create metrics, and add citations to the metric definition. See Update a metric definition for more information.

Automated metric definition fields

The fields of the automated metric definition form are explained in this topic.

New automated metric definition form

Field	Description
Basic details	
Name	Name of the automated metric definition. For example, `Number of incidents`.
Active	Option to mark the automated metric definition as active. When enabled, the metric definition becomes active and ready for use.
Description	Brief description of the automated metric definition.
Unit	Unit for the automated metric definition. You can define the units in which the data is shown.
Aggregation method	The Aggregation method refers to the method used to calculate the metric data for all the entities. For example, if you have a metric that you want to measure for multiple entities such as people, departments, or regions, you might want to know how to calculate the data for each entity into a single score that represents the overall performance. Your choice of aggregation method depends on

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
	your goal of metric collection. For example, if you are interested in overall performance and want to account for differences in scale or size between entities, the sum or average may be more appropriate. If you are interested in identifying the best-performing entity, the maximum may be more appropriate, while if you are interested in identifying the worst-performing entity, the minimum may be more appropriate. The aggregation happens across time periods based on the frequency defined in the metric definition. If the frequency is monthly, the calculation will take place every month. The four choices for aggregation methods are as follows: • **Sum**: The metric data for all entities are added together to create a single score. • **Average**: The metric data for all entities are averaged to create a single score. • **Maximum**: The highest metric data among all entities is used as the single score. • **Minimum**: The lowest metric data among all entities is used as the single score.
Class	Class to which the metric definition belongs. The choices are as follows: • **KPI**: Indicates how well the risk exposure is managed against objectives. Use this option to add entities and additional entities to the metric definition. • **KRI**: Indicates the amount of exposure to a given risk or set of risks. Use this option to add risks and risk statements to the metric definition. This option is available if the Advanced Risk plugin is activated. • **KCI**: Indicates the effectiveness of any controls that have been implemented to reduce or mitigate a given risk exposure. Use this option to add controls and control objectives to the metric definition. This option is available if the Policy and Compliance Management plugin is activated.

© 2026 ServiceNow, Inc. All rights reserved.

New automated metric definition form (continued)

Field	Description
	Important: This field appears only when the metric definition is created from the IRM suite of applications. It does not appear for Environmental, Social, and Governance Management.
Precision	Number of decimal places after the decimal point on a score. When an indicator has a Precision of 0, the indicator rounds the result to the nearest whole number. For example, if an indicator with Precision 0 calculates the values 7 + (5 / 2), the indicator rounds the result up to 10. When an indicator has a Precision greater than 0, the indicator rounds to the nearest decimal point for the given precision. For example, an indicator with Precision 1 rounds a result of 4.45 as 4.5.
Calendar	Calendar to use for metric aggregation. Only the configured calendar options are available for selection. This field is automatically set to **Standard Calendar**. **Note:** Standard calendar refers to the Gregorian calendar.
Frequency	Collection frequency with which the metric is executed. Indicates how often the metric definition should collect the data. The choices are as follows: • **Daily** • **Weekly** • **Monthly** • **Quarterly** • **Semi-annually** • **Annually**
First run date	Start date for the collection frequency schedule for the automated metric definition.
Data collection	
Method Type	Type of automated metric. The choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
	• **Basic**: Indicates using aggregation methods such as sum, average, maximum, minimum, and count distinct. • **Scripted**: Indicates using a script to collect the data. This option can be used when, for example, you want to collect data from multiple tables. • **External Source**: Indicates that the data will be collected from external sources. For example, if you want to source data about the number of employees in your organization and their gender ratio, you can obtain the information from an external source such as Workday which is an application that stores human resources data. **Note:** If you select **Scripted**, you must save the form and select **Add script** to add your script. Only users with the sn_grc_metric.developer role can add scripts.
Table	Table from which data is obtained for the metrics. This field only appears if the **Method Type** field is set to **Basic**.
Criteria	Condition for the record from which data is collected. Build a filter by adding conditions that contain a field, operator, and values and then click **Set**. For example, you can build a condition that you want to collect data for only those incidents the due date for which is in the current month. **Note:** Select a value for the **Table** field before modifying this field.
Aggregate	Method or the calculation used to aggregate the data from the chosen table. When an option is selected in the **Aggregate** field, a new **Aggregation Field** is displayed next to the **Aggregate** field. The **Aggregation Field** displays the selected record. The choices for the **Aggregate** field are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
	• **Count**: Count of the number of records that are obtained from the chosen table. For example, if you want a count of the incidents, you can select this option. **Note:** The **Aggregation Field** is not displayed when **Count** is selected. • **Sum**: Sum of the column that is selected in the **Aggregation Field**. • **Average**: Average of the values of the column that is selected in the **Aggregation Field**. • **Maximum**: Maximum of the values of column that is selected in the **Aggregation Field**. • **Minimum**: Minimum of the values of the column that is selected in the **Aggregation Field**. • **Count Distinct**: Number of groups in the result set that is grouped by the **Aggregation Field**.
Table field	Column or field of the table that is selected in the **Table** field. For example, you can select the **Caller** column in the Incident table. This selection enables you to understand that which callers are associated with the Incident table and compare them with the callers of your entities. **Note:** Select a table before modifying this field.
Aggregation field	Column or field from the table that is selected in the **Table** field on which the aggregation must be performed. **Note:** This field does not appear if **Count** is selected in the **Aggregate** field.
Entity field	Column or field from the entity table. The entities are matched based on the field selected in the **Table field** and the field selected in the **Entity field**. This field is automatically set to **Applies to record**. In the context of the Incident table in this procedure,

New automated metric definition form (continued)

Field	Description
	this field enables you to compare, for example, which particular incident has been logged by which caller.
Create metric data task	Option to mark the creation of metric data task.
Data owner assignment type	Type of the data owner assignment for the metrics within the metric definition. The choices are as follows: • **Simple** The system assigns the specified Data owner or Data owner group to the Metric. • **Advanced** The system assigns a Data owner based on the assignment configuration. ESG admins [sn_esg.admin] or Risk admins [sn_risk.admin] can set assignment configurations to dynamically assign data owners. For more information on creating assignment configurations see, Create an assignment configuration and Assignment Configuration New Record. **Note:** This is available if you have the GRC: Approver Configurator application installed. For more information see, Using Approver Configurator for setting up approvals.
Data owner type	Type of the data owner responsible for the metric definition. The choices are as follows: • **User** • **User group**
Data owner	Data owner responsible for the metric definition. Select a data owner from the list. **Note:** If you selected the advanced option for **Data owner assignment type**, this will be the assigned data owner if the assignment configuration doesn't return any results.
Instructions	Instructions for the data owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
Collect supporting data	Option to enable collection for supporting data. **Note:** Collected supporting data is automatically deleted after a certain period, with the retention time varying according to the data frequency. • Daily: After 30 days • Weekly: After 30 days • Monthly: After 3 months • Quarterly: After 3 quarters • Semiannually: After 3 semi-annual periods • Yearly: After 3 years
Supporting data fields	Specifies the data fields to be shown in the supporting data. **Note:** For optimal performance, please limit your selection to 4-5 fields if your data is extensive. Selecting more fields may result in performance issues.
Approval required	Option to indicate if an approval is required for the metric definition. **Note:** When the **Approval required** option is enabled, the **Approver type** and **Approver** fields are displayed.
Approver type	Specifies the type of approver for the metric definition. The choices are as follows: • **User** • **User group** **Note:** This field appears only when the Metric approval property is set to **Simple**. For more information see, Components installed with ESG Management.
Approver	Approver user or approver group that is responsible to approve the metric definition. The choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
	• **Approver**: Displayed when the User option is selected. • **Approver group**: Displayed when the User option is selected. **Note:** This field appears only when the Metric approval property is set to **Simple**. For more information see, Components installed with ESG Management.
Metric Properties	
Type	Method used to determine if the data is collected manually or in an automated manner. The choices are as follows: • **Automated** • **Manual** Select **Automated** because the procedure is to create an automated metric definition.
Enterprise Owner Type	Type of enterprise owner who is responsible for the automated metric definition. The choices are as follows: • **User** • **User group**
Direction	Direction that you want to see the metric in. The choices are as follows: • **None**: If you don't want any change in the metric direction, select this option. • **Minimize**: If the desired metric direction is downward or descending, select this option. For example, you want to minimize the fuel consumption. • **Maximize**: If the desired metric direction is upward or ascending, select this option. For example, you want to maximize the use of natural resources in your organization. • **Milestone**: When the metric direction isn't applicable, but the metric is tracked against a milestone, select this option. For example, if your organization is going to launch a new

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
	renewable energy product in the market, the upcoming launch date is considered as a milestone.
Group	Area that the metric relates to. For example, the metric may be related to the area of gender diversity, energy, water consumption, or may be related to Scope 3 emissions, and so on.
Reporting classification	Tag used to categorise the metric.
Enterprise owner	User who is the owner of the metric and is responsible for the metric. For example, for a metric such as revenue collection, the vice president or the general manager of the business unit could be the enterprise owner.
Nature	Nature of the automated metric definition. The choices are as follows: • **None**: If you don't want any change in the metric direction, select this option. • **Leading** (Predictive) Metric: Is predictive and helps anticipate future outcomes. In this case, the company may use a leading metric related to GHG emissions, such as the amount of energy consumed per production unit. By tracking energy consumption, the company can predict its future GHG emissions based on the energy sources used and the efficiency of its production processes. This leading metric enables the company to proactively identify areas for improvement and make informed decisions to reduce emissions. • **Lagging** (Measures Impact) Metric: Measures the impact of past actions or events. In our example, a lagging metric related to GHG emissions could be the total emissions produced by the company in a given year. This metric provides an assessment of the company's historical environmental impact. By monitoring this metric over time, the company can evaluate the effectiveness of its emission reduction efforts and identify areas where further improvements are needed. Lagging metrics help measure the outcomes of past actions and inform future strategies. • **Current** metric: Monitors ongoing processes and identifies real-time improvement areas. For GHG emissions, a current metric

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New automated metric definition form (continued)

Field	Description
	could be the emissions intensity, which measures the emissions generated per unit of production. By tracking emissions intensity, the company can identify specific areas within its operations that contribute to higher emissions. This metric helps the company identify real-time improvement opportunities, such as optimizing energy usage, implementing energy-efficient technologies, or adopting renewable energy sources.
Subgroup	Subgroup that the metric relates to.
Key metric	Option to indicate if the metric is a key metric for your business.
Confidentiality	
Note: This section only appears when: • The *sn_grc.enable_record_confidentiality* property is enabled under GRC properties. • The record is in **Draft** state.	
Confidential	Option to mark the record as confidential.
Allowed users	Users who can view the record. **Note:** By default, the logged in user is added to the list of confidential users.
Allowed groups	Groups that can view the record.

Create a calculated metric definition

Create a calculated metric definition by aggregating the automatic metric definition and the manual metric definition.

Before you begin

Role required: sn_grc_metric.manager, sn_risk.user, and sn_compliance.user

About this task

Add the automatic metric definition and the manual metric definition as children to the parent calculated metric definition. Specify the frequency and the method to aggregate the two metric definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Lists** > **Metrics** > **Calculated metric definitions**.
2. Click **New**.
3. On the form, fill in the fields.
   For information about the fields, refer to Calculated metric definition form.
4. Click **Save**.

Result

The metric definition is saved in the Metric definitions list.

What to do next

You can associate an entity type, create metrics, and add citations to the metric definition. See Update a metric definition for more information.

Calculated metric definition form

The fields of the calculated metric definition form are explained in this topic.

New calculated metric definition form

Field	Description
Basic details	
Name	Name of the calculated metric definition. For example, `Number of employees`.
Active	Option to mark the calculated metric definition as active.
Description	Brief description of the calculated metric definition.
Unit	Unit for the metric definition. You can define the units in which the scores are shown. The most commonly used units are provided by default.
Precision	Number of decimal places after the decimal point on a score. This field is automatically set to **0**. When the Precision is set to 0, the result is rounded to the nearest whole number. For example, if a metric definition with Precision 0 calculates the values 7 + (5 / 2), the result rounds up to 10. When the Precision is set to greater than 0, the result is rounded to the nearest decimal point for the given precision. For example, Precision 1 rounds a result of 4.45 as 4.5.
Calendar	Calendar to use for metric aggregation. Only the configured calendar options are available for selection. This field is automatically set to **Standard Calendar**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New calculated metric definition form (continued)

Field	Description
	Note: Standard calendar refers to the Gregorian calendar.
Frequency	Frequency for the calculated metric definition. This field indicates how often the metric definition should roll up the scores. The choices are as follows: • **Daily** • **Weekly** • **Monthly** • **Quarterly** • **Semi-annually** • **Annually**
Calculation	
Calculation level	Level at which the calculation is performed. The choices are as follows: • **Metric definition**: If you calculate the data at the metric definition level, then the data across all child metric definitions or child metrics is used for calculation. • **Entity**: If you calculate data at the entity level and specify the calculation method using the formula builder, then the common entities across all the child metric definitions are matched and the data is calculated for each entity. To aggregate the data to get an overall score at the metric definition level, select **Entity**.
Aggregation method	Method to aggregate the metric score at the entity level. The choices are as follows: • **None** • **Sum** • **Average** • **Maximum** • **Minimum** This field only appears when the **Calculation level** field is set to **Entity**.
Metric Properties

New calculated metric definition form (continued)

Field	Description
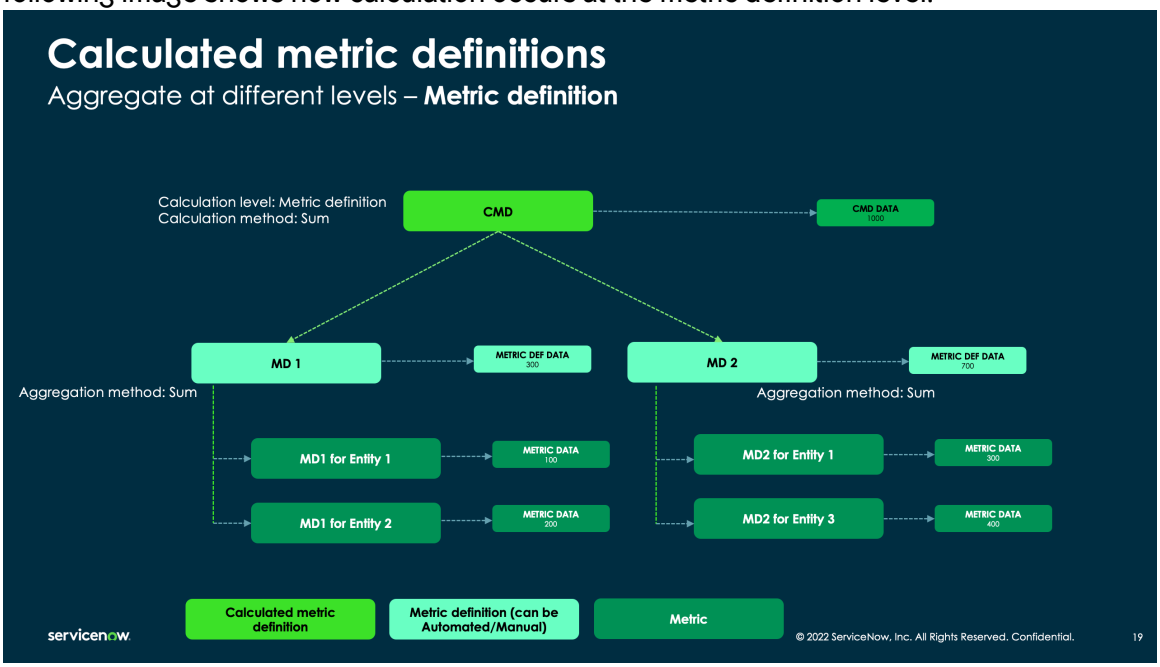
Allowed groups	Groups that can view the record.

Formula building in a calculated metric definition

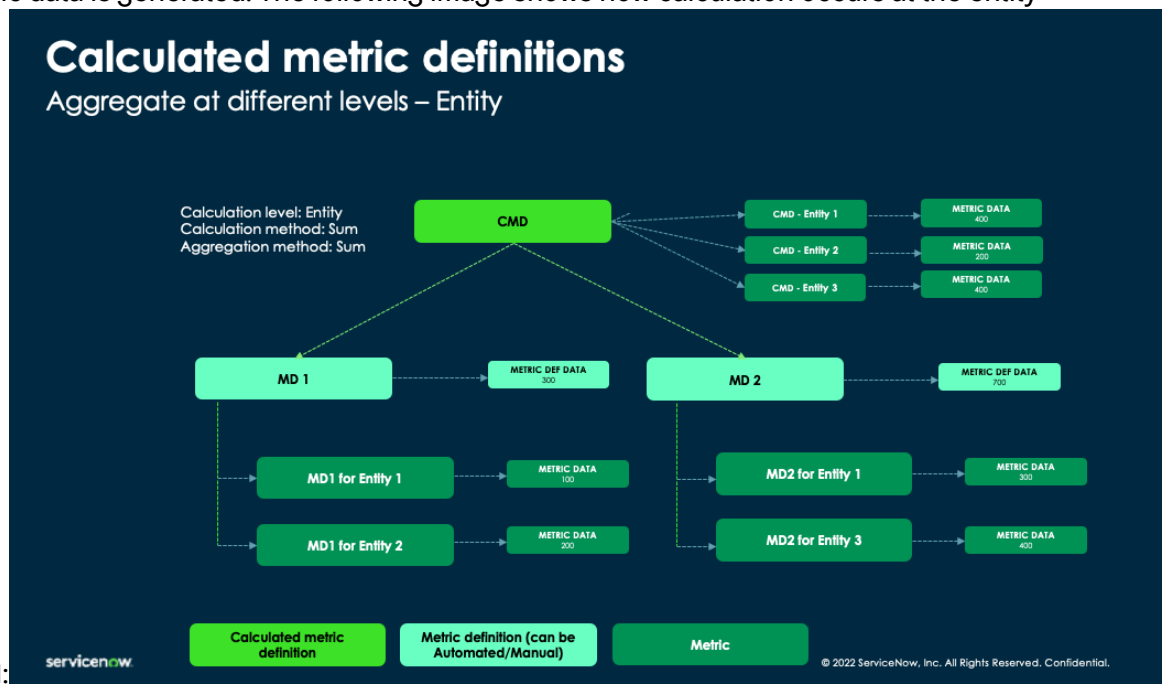


In a calculated metric definition, you can create formulas to perform calculations for any data that you may require.

A formula consists of operands, operators, and functions. For example, if you want to calculate the total employee count from two metric definitions namely number of male employees and number of female employees, then the selected metric definitions are the operands and the operator is the symbol or function that performs a specific operation on the operands to obtain a result. Examples of operators include addition (+), subtraction (-), multiplication (*), and division (/).

You can set default values for operands in the Calculated Metric Definition Settings table to ensure metric calculations continue smoothly even when data is missing or undefined. When a formula encounters an empty operand, the system automatically applies the configured default value from this table, allowing the calculation to proceed without interruption. Users can activate the shipped default record or create custom entries with preferred values for specific operands. This setup enhances the reliability and flexibility of metric logic, reduces manual intervention, and supports consistent results across varying data conditions.

When you build a formula in a calculated metric definition, you can choose to build it at either the metric definition level or at the entity level. Before you save the calculated metric definition form and build the formula for metric definition score calculation, you must specify the calculation level in the calculated metric definition form. The two levels are as follows:



- **Metric definition**: If you select **Metric definition** in the **Calculation level** field, then the data across all child metric definitions or child metrics is used for calculation. When you select **Execute**, the formula is applied and the calculated metric definition data is generated. For more information, see Configure the formula builder. The following image shows how calculation occurs at the metric definition level:

- **Entity**: If you select **Entity** in the **Calculation level** field and specify the calculation method using the formula builder, then the child metrics are created for the calculated metric

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

definition. These metrics are created for each distinct entity that is associated with the metric definitions that have been used as operands in the formula. When you Execute the metric definition, the formula is applied and the metric data is generated. When you Aggregate the metric definition, the metric data is aggregated and the calculated metric data is generated. The following image shows how calculation occurs at the entity level:

Activate default values for CMD calculations

Activate default values for missing operands in CMD formulas using the Calculated Metric Definition Settings table, or configure new records as needed. This ensures uninterrupted calculations and allows customization for specific operand requirements.

Before you begin

Role required: sn_esg.program_manager

Procedure

1. Navigate to **All** > **Environmental, Social, and Governance** > **Administration** > **Metric Definition Settings**.
2. To setup default values you can do one of the following:
   - Select the default record on the list and activate the record.

     Note:
     If required you can make updates to the default record.

   - Select **New**.
3. On the form, fill in the fields.
   For information on the fields of the form, see Metric definition setting record fields.
4. Select **Submit**.

Metric definition setting record fields

The fields of the metric definition setting record form are explained in this topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric definition setting record

Field	Description
Name	Name for the record. For example, `Default record for CMD calculations`.
Active	Option to mark the default values record as active.
One for null record	You can select relevant operators in the field. If a metric operand is null or undefined during formula execution, and the adjacent operator matches the one selected, the system assigns a default value of 1 to that operand—ensuring the calculation proceeds without error.
Order	Determines the priority of the record when multiple records are available. The record which has the highest number is selected
Skip null record	You can select relevant operators in the field. If a metric operand is null or undefined during formula execution and the adjacent operator matches the one selected, the system will skip that operand from the calculation. This prevents errors and ensures the formula continues without interruption.
Zero for null record	You can select relevant operators in the field.If a metric operand is null or undefined during formula execution and the adjacent operator matches the one selected in this field, the system assigns a value of 0 to that operand. This ensures the calculation proceeds without error and maintains consistency in results.
Type	Displays the type of metric definition. This field is automatically set to **Calculated metric definition**.
Table name	Specifies the name of the table where the default values are stored. This field is auto-populated.
Filter	Specifies the condition under which the default values defined in this record should be applied during CMD formula execution. You can setup multiple criteria conditions.

Configure the formula builder

Specify the formula context, the tables, and the identifiers before you can build a formula.

Before you begin

Role required: admin

About this task

It's necessary to configure the formula builder before a formula can be built in a calculated metric definition. During configuring, you can specify the formula context, the tables to use, and their conditions. In the context of ESG Management, if you build the formula at the metric definition

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

level, you must select the metric definition table and the metric table during configuration. To build the formula at the entity level, you must select the metric definition and the emission factor table. Other applications can use the tables that are required for their use. You can configure the columns and their labels that you want to display along with the emission factor during building the formula. These labels help in easily identifying the emission factors.

Procedure

1. Navigate to **All** > **Formula builder** > **Configuration**.
2. Select **New**.
3. On the form, fill in the fields.

Formula builder configuration form

Field	Description
Formula context	Configuration available to create the formula for a specific option. The choices for ESG are as follows: ○ **Calculation level - entity** ○ **Calculation level - metric definition** **Note:** Users of other applications can select different context options.
Application	Scope of the application. This field is automatically set.
Table	Tables that you want to use while building the formula.
Condition	Criteria using which the records are filtered from the selected table when building the formula. For example, you can build a condition that **Domain is ESG**.
Display field	Unique display name for the operands such as the **Name** field or the **ID** field.
Identifier	An abbreviated two-letter combination of lowercase letters that is associated with a specific table name. For example, if your table name is Hardware accessories, your identifier can be `ha`. **Note:** Using `fn` as an identifier isn't permitted as fn refers to function.
Show additional columns	Option to decide if you want additional columns to be displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This option is useful in cases where there are duplicate emission factor names. Showing additional details can help metric managers to select the right emission factor.
Primary column	Primary column that you 'd like displayed for the emission factor during formula building. For example, if you select **From unit**, then the emission factor's From unit will be displayed along with the factor name.
Secondary column	Secondary column that you'd like displayed for the emission factor during formula building. For example, if you select **To unit**, then the emission factor's To unit will be displayed along with the factor name. **Note:** When defining calculated metric definitions, you can use emission factors with different units than the collected data.
Primary column label	Preferred label of the primary column selected. For example, if you selected **Short Description** in the **Primary column** field, you can provide the preferred label as `Short Desc`.
Secondary column label	Preferred label of the secondary column selected.

4. Select **Submit**.

Create a formula

Build your own formula using either entities or metric definitions.

Before you begin

Role required: sn_esg.program_manager

sn_risk.user (for Risk users).

About this task

When creating a formula, you can utilize functions like maximum, minimum, or average, as well as operators such as +, -, /, or * to define the method of computation. To build a formula successfully, it’s important that at least one metric definition operand or an entity operand is present.

Note: The formula can be built using all browsers except Safari.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to one of the following locations depending on which application you're using for creating the formula.
   - **All** > **Environmental, Social, and Governance** > **ESG Workspace** > **Metrics** > **Calculated metric definitions**.
   - **All** > **Risk Management** > **Risk Workspace** > **Metrics** > **Calculated metric definitions**.
2. Open the metric definition for which you want to build a formula and select **Build formula** > **Formula builder**.
3. In the formula text field, type \ to start building your formula.
4. To build the formula either at the metric definition level or the entity level, perform the following steps.

   a. To build a formula at the metric definition level, select two metric definitions or metrics, and an operator between them.

      Example
      For example, you can select GHG emissions from employee commuting + Data Center emissions (market-based) to calculate a sum.

   b. To build a formula at the entity level, select two metric definitions or emission factors, and an operator between them.

5. To copy, reset, or preview the formula, do the following.
   a. To copy the formula, select **Copy**.
   b. To reset the formula to its initial state, select **Reset**.
   c. To view the formula without any identifiers in a neat format, select **Preview**.
6. To save the formula, select **Save formula**.
7. To execute the formula, select **Execute**.
   It's important to save the formula before you execute it.
8. On the formula builder page, select **Need help?** to receive guidance on the necessary steps to build the formula.

Update a metric definition

Update an existing metric definition to collect the new metrics. You can associate new goals, targets, and entities with the metric definition.

Before you begin
Role required: sn_grc.metric_manager, sn_risk.user and sn_compliance.user

About this task
You can use the same form for updating the automated metric definition, manual metric definition, and composite metric definition.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Metrics**.
2. Select a metric definition from the list.
3. On the form, update the fields as necessary.

© 2026 ServiceNow, Inc. All rights reserved.

Update metric definitions tabs and related lists

Field	Description
Tabs and related lists	
Details tab	Details of the metric, such as metric definition, metric properties, method, and schedule in the automated metric definition. Details of the metric, such as collection method, schedule, data collection details, approval in the manual metric definition. Details of the metric, metric properties, and roll up properties in the calculated metric definition. The fields on the Details tab are explained in the Metric definition forms.
Entity type	Details of the entity type to be associated with the metric. For example, provides the name, description, and conditions, such as active, need update, and processing entities. To add a new entity type, click **Add**. **Note:** The Entity type related list is displayed only for an automated metric definition and a manual metric definition. It isn't displayed for the calculated metric definition.
Additional entities	Additional entities that can be associated with the metric definition. Provides details, such as name, owned by, class, and compliance score in percentage (%). To add new entities, click **Add**. **Note:** This related list is displayed only for an automated metric definition and a manual metric definition. It isn't displayed for the calculated metric definition.
Child Metric Definition	Child metric definition associated with the parent metric definition. Displays the details such as name, frequency, and description of the child metric definition. To add a new child metric definition, click **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This related list is displayed only for the calculated metric definition. It isn't displayed for the automated metric definition and the manual metric definition.
Metrics	Details of the metrics, such as name, associated entity, and active state of the metric. To add a new metric, click **New**.
Citations	Details of the citations such as reference, name, authority document, description, and compliance score in percentage (%). To add a new citation, click **Add**.
Goals	Details of the goals, such as name, state, category, start date, end date, owner, and status. To add a new goal, click **Add**.
Targets	Details of the target, such as name, owner, state, status, progress, actual value, target value, and end date. To add a new target, click **Add**.
Metric definition data	Details of the metric definition data, such as collection frequency, collection definition, interval end date, value, and state. **Note:** This related list is displayed only for an automated metric definition and a manual metric definition. It isn't displayed for the calculated metric definition.
Calculated metric data	Details of the calculated metric data, such as interval end date, roll up frequency, and value. **Note:** This related list is displayed only for the calculated metric definition. It isn't displayed for the automated metric definition and the manual metric definition.

4. To save the metric definition, click **Save**.
5. To calculate the composite metric data for the composite metric definition, click **Aggregate**. The **Aggregate** action calculates the composite metric data for the current interval end date and roll-up frequency to its parent metric definition. The composite metric data record is displayed under the Composite metric data related list. A composite metric definition score is created if it doesn't exist for the current interval.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To delete the metric definition, click **Delete**.
7. To visually explore the 360° relationship view of the metric definition, click **360° view**.

Create a metric

Create a metric to perform calculations on your data.

Before you begin

Role required:
sn_grc_metric.manager, sn_risk.user, and sn_compliance.user.

About this task

To create a metric, you need a metric definition and an entity. A metric definition defines the method for collecting the score for an entity. When a metric definition gets associated with an entity, it creates a metric.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Lists** > **Metrics** > **Metrics**.
2. Click **New**.
3. On the form, fill in the fields.

New automated metric definition form

Field	Description
Name	Name of the automated metric definition. For example, `Number of incidents`.
Description	Brief description of the automated metric definition.
Active	Option to mark the automated metric definition as active.
Class	Class to which the metric definition belongs. The choices are as follows: ○ **KPI**: Indicates how well the risk exposure is managed against objectives. Use this option to add entities and additional entities to the metric definition. ○ **KRI**: Indicates the amount of exposure to a given risk or set of risks. Use this option to add risks and risk statements to the metric definition. This option is available if the Advanced Risk plugin is activated. ○ **KCI**: Indicates the effectiveness of any controls that have been implemented to reduce or mitigate a given risk exposure. Use this option to add controls and control objectives to the metric definition. This option is available if the Policy and Compliance Management plugin is activated.
Type	Method used to determine if the score is collected manually or in an automated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	manner. This field is automatically set to **Automated** but the value changes when you select the metric definition and gets updated to the type of the metric definition.
Key metric	Option to indicate if the metric is a key metric for your business.
Domain area	The workspace from where the metric definition is created. This field is automatically set. For example, if you create a metric definition from the Risk Workspace, then this field is set to **Risk**.
Enterprise Owner Type	Type of enterprise owner who is responsible for the automated metric definition. The choices are as follows: ○ **User** ○ **User group**
Metric Score Aggregation	Method used to summarize the score at the metric definition level. The choices are as follows: ○ **Sum**: Sum of all active metrics. ○ **Average**: Average of all active metrics. ○ **Maximum**: Maximum value of all active metrics. ○ **Minimum**: Minimum value of all active metrics.
Value	Value obtained after the metrics are executed.
Enterprise owner	Enterprise owner of the automated metric definition.
Metric Properties	
Direction	Direction of the automated metric definition. The choices are as follows: ○ **None**: If you don't want any change in the metric direction, select this option. ○ **Minimize**: If the desired metric direction is downward or descending, select this option. For example, you want to minimize the fuel consumption. ○ **Maximize**: If the desired metric direction is upward or ascending, select this option. For example, you want to maximize the use of natural resources in your organization. ○ **Milestone**: When the metric direction isn't applicable, but the metric is tracked against a milestone, select this option. For example, if your organization is going to

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	launch a new renewable energy product in the market, the upcoming launch date is considered as a milestone.
Precision	Number of decimal places after the decimal point on a score. When an indicator has a Precision of 0, the indicator rounds the result to the nearest even, whole number. For example, if an indicator with Precision 0 calculates the values 7 + (5 / 2), the indicator rounds the result up to 10. However, if the formula calculates 2 + (5 / 2), the indicator rounds the result down to 4. When an indicator has a Precision greater than 0, the indicator rounds to the nearest decimal point for the given precision. For example, an indicator with Precision 1 rounds a result of 4.45 as 4.5.
Unit	Unit for the automated metric definition. You can define the units in which the scores are shown. The most commonly used units are provided by default.
Nature	Nature of the automated metric definition. The choices are as follows: ○ **None** ○ **Leading**: If the metric is an indicator of future events, select this option. For example, consider the number of sales that a store makes on new solar batteries. This number is a leading indicator for the support requests that the store may receive in the future. ○ **Lagging**: If the metric is an indicator of past events, select this option. For example, consider the number of sales that a store has made in the previous year. This number is a lagging indicator for the support requests that the store has received in the past year. ○ **Current**: If the metric is an indicator of the current state of the events, select this option. For example, consider the number of sales that a store has made in the current year. This number is an indicator of the current support requests received by the store.
Method

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Method Type	Type of automated metric. The choices are as follows: ○ **Basic** ○ **Scripted** **Note:** If you select **Scripted**, you must save the form and select **Add script** to add your script. Only users with the sn_grc.developer role can add scripts.
Table	Table that is queried for creating the automated metric definition.
Criteria	Condition for the record from which a score is obtained. Build a filter by adding conditions that contain a field, operator, and values and then click **Set**. **Note:** Select a value for the **Table** field before modifying this field.
Aggregate	Method to aggregate the automated metric definition score. When an option is selected in the **Aggregate** field, a new **Aggregation Field** is displayed next to the **Aggregate** field. The **Aggregation Field** displays the selected record. The choices for the **Aggregate** field are as follows: ○ **Count**: Count of the number of records that are rendered by the table query that is set in the filter criteria. ○ **Sum**: Sum of the values of the parameters based on the selected value in the **Aggregation Field**. ○ **Average**: Average of the values of the parameters based on the selected value in the **Aggregation Field**. ○ **Maximum**: Maximum of the values of the parameters based on the selected value in the **Aggregation Field**. ○ **Minimum**: Minimum of the values of the parameters based on the selected value in the **Aggregation Field**. ○ **Count Distinct**: Number of groups in the result set that is grouped by the **Aggregation Field**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The **Aggregation Field** is displayed for all the options except **Count**.
Reference field	Field based on which the metric data can be segregated. This field connects the entity to the selected scoring table and it calculates a score that is specific to an entity. **Note:** Ensure that the table that the reference field points to matches with the table of the records that the associated entities point to, through the **Applies to** field in the entity form. **Note:** It is the user's responsibility to validate the criteria mentioned in the note as the system doesn't validate it. Select a table before modifying this field.
Schedule	
Calendar	Calendar to use for metric collection. Only the configured calendar options are available. This field is automatically set to **Standard Calendar**. Standard calendar refers to the Gregorian calendar. This field can be modified only if the metric definition for this metric doesn't use the standard calendar.
Frequency	Collection frequency for the metric definition. This field is automatically set based on the frequency of the selected metric definition.
First run date	Date the metric is run the first time.
Due date offset	Number of days after the schedule end date when the metric data task becomes overdue. For example, if the frequency of a metric definition is monthly and if the you enter `15` in this field, then the due date for metric data task will be overdue 15 days after the month ends. This field only appears when the metric definition associated with the metric is of type Manual.
Next run date	Date when the metric going to be executed.
Period date	Date used to specify the start and end dates for the data collection period.
Data Collection Details	
Data owner type	Data owner type, such as User.
Data owner	Name of the user as the data owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Approval **Note:** This section appears only when the Metric approval property is set to Simple. For more information see, Properties installed with Advanced Risk.	
Approval required	Option to indicate if an approval is required.
Approver type	Type of the approver of the metric definition. The choices are as follows: ○ **User** ○ **User group**
User	Approver user or approver group that is responsible to approve the metric definition. The choices are as follows: ○ **Approver**: Displayed when the User option is selected. ○ **Approver group**: Displayed when the User group option is selected. **Note:** By default, the approver is the user specified in the metric definition, but this can be overridden at the metric level.
Classification	
Group	Area that the metric relates to.
Reporting classification	Tag used to categorise the metric.
Subgroup	Subgroup that the metric relates to.
Confidentiality **Note:** This section only appears when: ○ The *sn_grc.enable_record_confidentiality* property is enabled under GRC properties. ○ The record is in **Draft** state.	
Confidential	Option to mark the record as confidential.
Allowed users	Users who can view the record. **Note:** By default, the logged in user is added to the list of confidential users.
Allowed groups	Groups that can view the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Save**.

> **Note:**
> After a new metric is created, the related lists along with the **Details** tab are displayed on the form. You can view the metric data overview in the **Overview** tab. The Metrics overview page displays the metrics data details when you execute a metric along with the duration for which the data is collected.

Result
The metric is saved in the Metrics list.

Create a metric unit

Define the units in which the metric scores are displayed. The units can be numbers, percentages, currencies, quantities of time, or any other unit that you define. The commonly used units are provided by default.

Before you begin
Role required: sn_grc_metric.manager, sn_risk.user and sn_compliance.user.

Procedure
1. Navigate to **All** > **Risk** > **Risk Workspace** > **Metrics** > **Units**.
2. Click **New**.
3. On the form, fill in the fields.

New metric unit form

Field	Description
Name	Name of the unit. For example, $.
Format	Format of the unit. For example, `{0} MWh` gives you the number of Megawatt-hours with the abbreviation MWh.

4. To save the metric unit, click **Save**.

Result
The metric unit is saved in the Units list.

Create a unit family

Create a unit family to group similar units together. For example, the various units of distance such as miles and kilometers can be grouped. Unit families help you to organize units during unit conversion.

Before you begin
Role required: admin

About this task
Creating unit families also supports conversion of units. Sometimes, the unit in which metric data is entered may be different from the reporting unit of the metric definition. In such cases, the units must be converted. For example, the metric data may be entered in US gallons and the reporting unit in the metric definition is Liters. If US gallon and liters belong to the same unit family such as Volume, you can convert the units.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Various formulas are used to convert different units. If the reporting unit of a metric definition belongs to a unit family that has the conversion factor as **Calculated**, then the metric data tasks for that metric must be provided in the same unit as the metric definition. For example, if the reporting unit for temperature in a metric definition is Celsius, and if the conversion factor of temperature is set to **Calculated**, then all the metric data tasks for that metric definition can only be provided in Celsius. In such cases, users can specify the formula that must be used for the conversion. For more information see, Formula building in a calculated metric definition.

Procedure

1. Navigate to **All** > **Risk** > **Administration** > **Unit family**
2. Select **New**.
3. On the form, fill in the fields.

Unit family form

Field	Description
Name	Name of the unit family. For example, `Temperature`.
Conversion factor	Conversion factor that must be applied when converting units from the family. The choices are as follows: ○ **Direct**: Use this option if the conversion of the units in the family can be done directly. For example, you can convert kilometers to miles using direct conversion. ○ **Calculated**: Use this option if the conversion formulas are complex. For example, to convert temperatures in degrees Celsius to Fahrenheit, the formula is °F = °C × (9/5) + 32.

4. Select **Submit**.

Convert metric data to a different unit

Convert any metric data into a preferred reporting unit.

Before you begin

Role required: admin

About this task

The preferred reporting unit for any data is specified in a metric definition. When users enter the data in a metric data task, they may do so in a unit that is different from the unit set in the metric definition. For example, a user may enter data about water usage in liters but the organization needs the report in US gallons. And therefore, the metric definition is also set to gallons. In this case, liters must be converted to US gallons.

Note:
In the metric data task, only those units that belong to the same unit family are available for the data. Unit conversion only applies to units that have the unit family conversion factor set to **Direct**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Administration** > **Unit Conversions**.
2. Select **New**.
3. On the form, fill in the fields.

Unit conversion form

Field	Description
Name	Name of the unit conversion. For example, `Litres to gallons`.
From unit	Unit to convert.
To unit	Unit to convert to.
Unit family	Unit family to which the unit belongs. For example, **Volume**.
Value	Conversion value. For example, the conversion value from liters to gallons is `0.264172`.

4. Select **Submit**.

Update a metric

Update a metric to add goals, metric data, and targets. Associate citations to the metric.

Before you begin

Role required: sn_grc_metric.manager, sn_risk.user, and sn_compliance.user

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Lists** > **Metrics** > **Metrics**.
2. Select a metric from the list.
3. On the form, update the fields as necessary.

Update metric tabs and related lists

Field	Description
Tabs	
Name	Name for the metric. For example, `Number of incidents- ACME Asia`.
Description	Brief description of the metric.
Metric definition	Metric definition associated with the metric.
Entity	Entity associated with the metric.
Enterprise Owner Type	Enterprise owner type who is responsible for the metric. This field is automatically set to display the enterprise owner type.
Type	Type of the automated metric definition. This field is automatically set.

© 2026 ServiceNow, Inc. All rights reserved.

Field	Description
Goals	Details of the goals associated with the metric, such as name, state, category, start date, end date, owner, and status. To add a new goal, click **Add**.
Metric data	Details of the metric data such as start date, end date, value, collector metric data, collection frequency, and type. Start date: The start date is the date the data collection begins. End date: The end date is the end of the period date that determines the interval for which the score is calculated. The end date depends on the frequency of the metric definition. The end date is used for tracking the scores. Every score is time-dependent and it has a reference to the interval end date. Collection frequency: The options in the collection frequency field are: ○ **Daily**: Score that gets created for each day. ○ **Weekly**: Score that gets created by the end of the week date (Sunday). Monday is the start of the week and Sunday is the end of the week. ○ **Monthly**: Score that gets created by the end of the month. ○ **Quarterly**: Score that gets created by the end of the quarter. For example, Q1 ends on March 31, Q2 ends on June 30, Q3 ends on September 30, and Q4 ends on December 31 in a year. ○ **Semi-annually**: Score that gets created by the end of the 6-month period. The end date for the semester is June 30 and December 31 in a year. ○ **Annually**: Score that gets created by the end of the year. The end date for the year is December 31.
Targets	Details of the targets associated with the metric, such as name, state, owner, start date, end date, type, and measure. To add a new target, click **Add**.
Citations	Details of the citations, such as reference, name, authority document, description, and compliance score percentage (%). To add a new citation, click **Add**.

4. To save the metric, click **Save**.
5. To delete the metric definition, click **Delete**.
6. To execute the metric, click **Execute**.
   A metric data score is created if it doesn't exist for the current interval. Re-executing a metric or a metric definition for the current interval only updates the score.
7. To visually explore the 360° relationship view of the metric definition, click **360° view**.

Update a manually created metric

Update a manually created manual metric to add goals, metric data, and targets. Associate citations to the metric.

Before you begin

Role required: sn_grc.metric_manager, sn_risk.user and sn_compliance.user

About this task

You can use the same form for updating the automated metric definition, manual metric definition, and composite metric definition.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Metrics**.
2. Select a metric definition from the list.
3. On the form, update the fields as necessary.

Update metric tabs and related lists

Field	Description
Tabs	
Name	Name for the metric. For example, `Number of incidents- ACME Asia`.
Description	Brief description of the metric.
Metric definition	Metric definition associated with the metric.
Entity	Entity associated with the metric.

Create a threshold for a metric definition

Evaluate the performance of your quantitative metric definition by defining threshold for your metric definitions.

Before you begin

Role required: admin

About this task

After you create a metric definition, you can define threshold limits for a metric and a metric definition to determine the performance of the metric. When the threshold value is breached or crossed, the system notifies the relevant owners. For example, you can create a metric definition to monitor employee attrition and define your target value for the metric, the amber threshold value and the red threshold value for a specified period. Now, consider that you defined your threshold value as 5, and your amber value as 8, and your red value as 10. This means that when there is an attrition of 8 people, the system will notify you about the metric performance as Amber. If your attrition reaches 10, the system will notify you about the metric performance as Red. This notification will enable you to take appropriate actions. You can create more than one threshold for a metric. If a threshold is defined before the metric is created, then the metrics inherit the rules of the threshold. You can create thresholds for all types of metric definitions. In this procedure, automated metric definition is used as an example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the threshold is created after the metric definition is created, you can copy the thresholds to the metrics.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Metrics** > **Metrics**.
2. Select and open the metric for which you want to define the threshold.
3. Select the Thresholds related list.
4. Select **New**.
5. On the form, fill in the fields.

Metric Definition Threshold form

Field	Description
Threshold type	Type of threshold. The choices are the following. ○ Static: A static threshold for a metric or a metric definition refers to a fixed value used as a limit for tracking a metric. ○ Dynamic: Dynamic thresholds are specified in percentages. This means that the percentage variance is calculated based on two factors: direction and the previous data For more information, see Thresholds for metrics.
Amber threshold	Percentage value that signifies moderate change in the variance of target value.
Valid from	Date the data is valid from.
Target value	Previous data against which the percentage variance is compared.
Red threshold	Percentage value that signifies critical change in the variance of target value.
Valid until	Date the data is valid until.

6. Select **Submit**.
7. To copy the thresholds to the metrics, select **Copy threshold**.

Using GRC: Metrics to provide data

Using the GRC: Metrics application you can track your business goals, define your key risk indicators (KRIs) and key performance indicators (KPIs), and generate reports for the management to provide insights into the progress.

Provide data for a metric data task

Use the metric data task to provide data for a manual metric.

Before you begin

Role required: sn_grc_metric.user, sn_risk.reader, and sn_compliance.reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Metrics** > **My metric data tasks**.
2. Open the task for which you want to provide the data.
3. Select **Move to In Progress**.
4. On the Metric information form, under the Metric input section, fill in the following fields.

Field	Description
Metric data	Value for the metric. This field appears only when **Quantitative** is selected in the **Category** field in the metric form.
Unit	Unit of the data. For example, US gallon. **Note:** You can provide the data in any unit and it gets converted to the reporting unit specified in the metric definition.
Response	Response for the metric. This field appears only when **Qualitative** is selected in the **Category** field in the metric form.
I certify and acknowledge that the response I have submitted is accurate.	Option to certify data accuracy.
Additional comments (Customer visible)	Additional information for the metric data.

5. Select **Save**.
6. To provide evidence or supporting information, in the Related documents, related list, select **New**.
7. On the Related Document form, fill in the fields.

Related Document form

Field	Description
Name	Provide a name for the supporting information.
Url	Select the lock icon to add a supporting URL.
Metric data task	This field is automatically set to the name of the metric data task for which you are providing information.

8. Select **Submit**.

Provide responses for multiple metrics

Use the metric tasks module to provide responses for multiple metrics in an easy-to-use format.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

As a data owner, you have to provide data or responses for multiple metric data tasks. The data that you provide comes from multiple sources and there can be multiple data owners. In such a scenario, it's hard to maintain the audit trail for data input. The metric tasks module enables you to provide data for multiple metric data tasks. Use the filters such as metric data tasks by entity, metric groups, metric subgroups, start date, and end date to select the metrics for which you want to provide data. You can view the responses that you've entered, submitted, and also if the dates for data or for response submission are overdue. You can only provide metric data responses for tasks that aren't in the Closed state.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the Metric data table icon ( )
3. Select the filter icon and set the Entity, Metric group, Metric subgroup, Task type, Start date, and End date filters to show the tasks for which you want to provide data.

   Only those Groups which have open metric data tasks appear in the filter.
4. Select **Apply.**
5. Double-click the cell for the entity in which you want to provide data.
6. Enter the information needed for your response and select **Save**.
   Perform this step for each cell for which you want to provide data. You can scroll the cells to provide responses for all the tasks.

   Note:
   You have the option to select a choice or enter HTML depending on how the related metric definition has been set up. These formats are available when the manual metric definition **Category** field is set to **Qualitative**. For more information, see Create a manual metric definition and Manual metric definition fields.
7. Select the tasks for which you want to submit the responses.
8. To provide any evidence for the data that you've entered, select the **Attachments and links** tab on the Contextual side panel and add the links and attachments as required.
9. Select **Submit**.
   To select all cells for each individual metric definition for submission, select the check box in the corresponding row. To select all cells for submission, select the check box in the header row of the Metric data tasks table.
10. **Optional:** Select the check boxes that you want and then select **Submit**.

Review a metric data task

Review a metric data task and then either approve or reject the task based on your review.

Before you begin

Role required: sn_grc_metric.admin, sn_grc_metric.manager, and sn_grc_metric.reader

About this task

If you have been assigned as an approver as part of a metric definition record, your approval task appears in the approvals tab of a metric data task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Select the Metric data table icon ( ).
3. Review the metric data tasks and perform one of the following actions.
   You can approve or reject cells in bulk at the individual metric definition level or for all cells by selecting the check box for each row or the check box in the header row of the Metric data tasks table.
4. **Optional:** Select the check boxes that you want and then select **Reject** or **Approve**.

Override metric data task response

As a metrics manager, if you think that the response provided for a quantitative or qualitative metric must be modified, you can edit the data and provide a justification for the modification.

Before you begin

Role required: sn_grc_metric.admin, sn_risk.admin, and sn_compliance.admin

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **Metrics** > **Metric data tasks**.
2. Open the task for which you want to edit the data.
3. Under the Metric input section, select the **Override Response** option.
4. In the **Overridden response** field, provide the new response.
5. In the **Justification** field, provide a justification for overriding the previous data.
6. In the **Additional comments** field, provide any additional comments that you have.
7. Select **Save**.

Override metric data

If the metric data provided by the data owner is inaccurate, then you can modify or override the metric data provided by the data owner.

Before you begin

Role required: sn_grc_metric.admin, sn_risk.admin, and sn_compliance.admin

About this task

After a metric data task is closed, the risk administrator can modify the metric data as needed. The risk administrator must provide a valid justification for modifying the data.

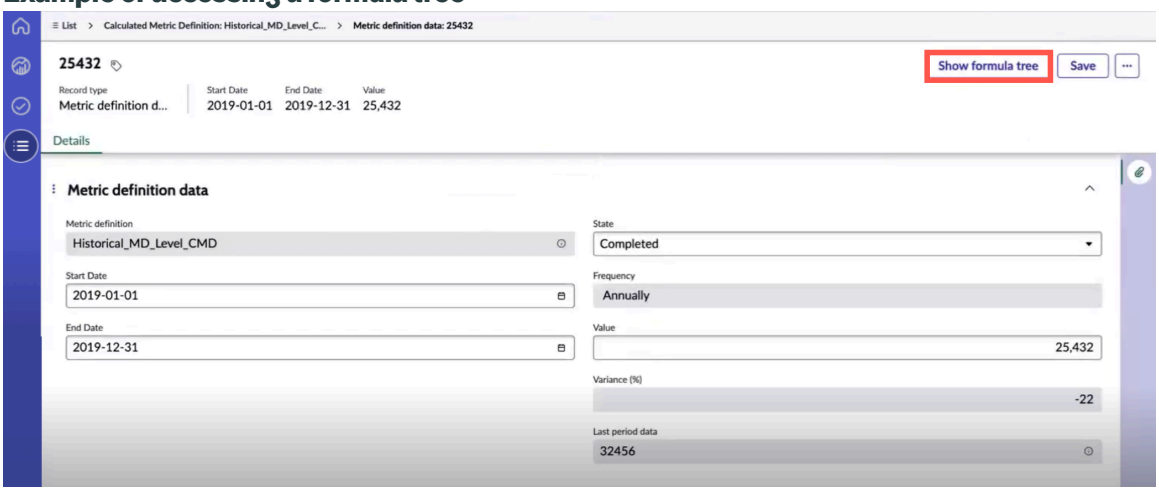
Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace** > **List** > **Metrics** > **My metric data tasks**.
2. Open the record you want to modify.
3. On the Metric information form, under the Metric input section, select the **Override Metric Data** option.
4. In the **Overridden metric data** field, provide a new value.
5. In the **Justification** field, provide a valid justification for overriding the data.
6. In the **Additional comments** field, provide additional comments, if any.
7. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The metric data task value is overridden and the same value is updated in the metric data.

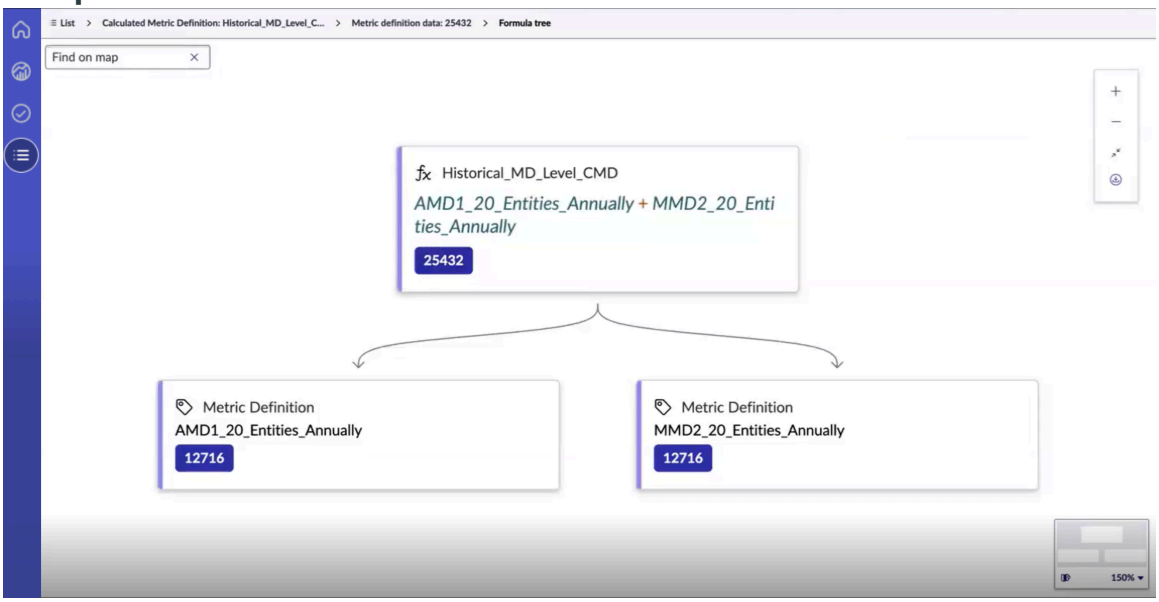
Reviewing calculation details with formula trees



Review calculated metric definitions by viewing a structured and visual representation of the entire calculation chain. By using a formula tree, you can access the calculation details and view how the different metrics and emission factors are interconnected.

The formula tree is a tool that enhances transparency in calculated metric values. Navigate to the calculated metric data record you want and view the formula tree, which shows a detailed breakdown of the calculation. It displays the values of the operands and how they're combined to produce the final result. This feature helps users and auditors understand and verify the accuracy of complex calculations.

Note:
Formula trees are available for the generated Calculated metric data when the **Calculation level** is set to Metric Definition and for the generated metrics when the **Calculation level** is set to Entity. For more information on Formula building, see Formula building in a calculated metric definition.



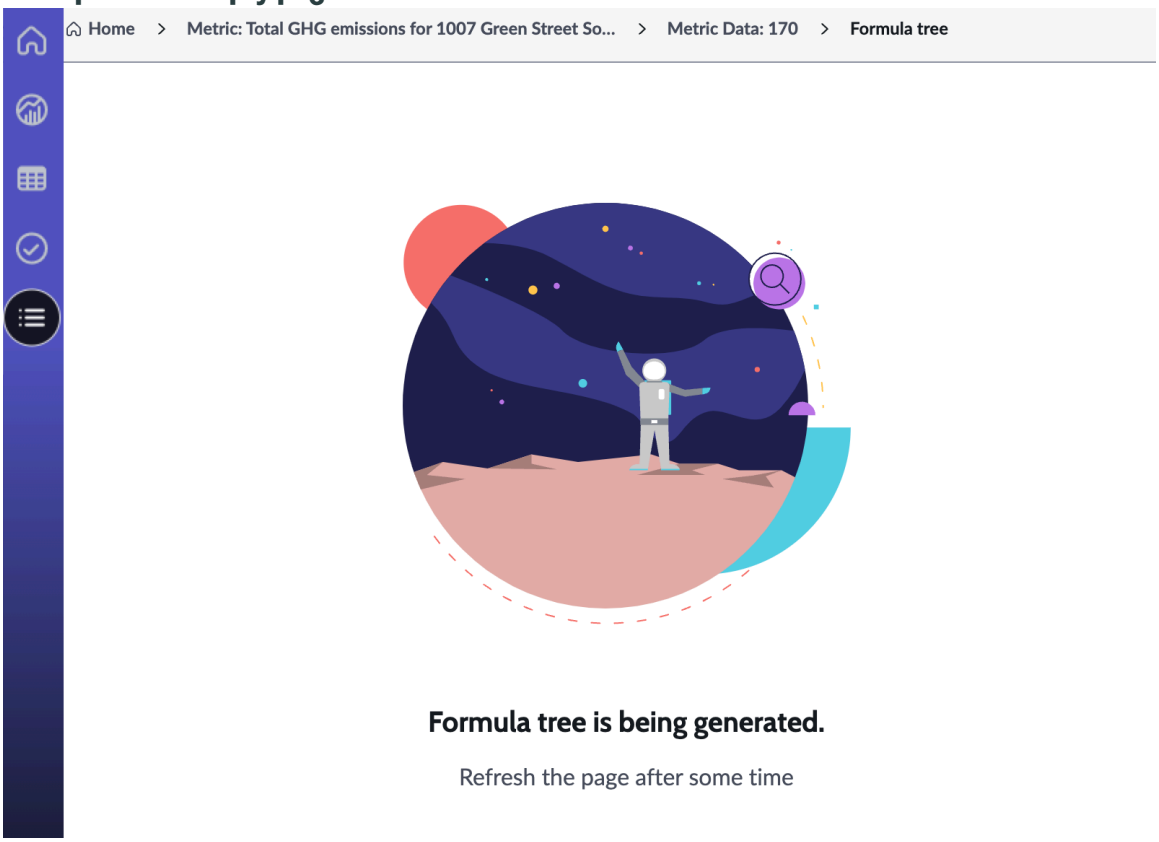
As shown in the following examples, you can navigate to the calculated metric data record and select **Show formula tree** to view the associated formula tree.

Example of accessing a formula tree

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

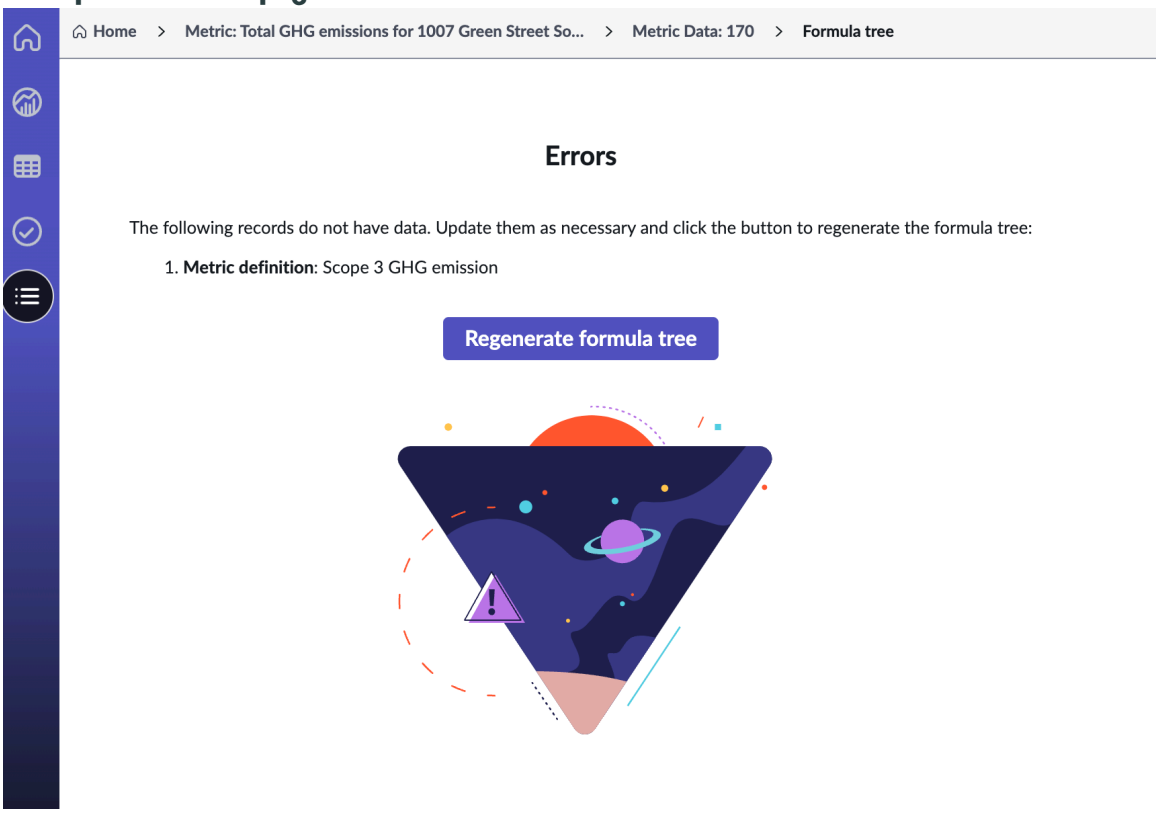
Example of a formula tree

Note:
A formula tree displays the values of operands by applying the level of precision provided in the CMD.



For example, if the CMD specifies a precision of 2 decimal places, the formula tree displays all operand values with two decimal places, even if the actual values have more or fewer decimal places.

As shown in the following examples, if you're seeing an empty page, it's because the formula tree or formula operands are currently empty and are being updated asynchronously. If you're seeing an error page, it's due to errors in the formula operands that need to be corrected.



Note:
If a value is missing for any operand in a CMD formula, you can use the Calculated Metric Definition Settings table to define a default value for that operand. The system will automatically retrieve and apply the specified default value, ensuring the formula executes without interruption. Users can customize these default values or add new records as needed to suit their calculation requirements. For more information, refer to Activate default values for CMD calculations.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of an empty page

Example of an error page

To learn more about formula trees, see:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View the calculation breakdown in a formula tree

View a structured and visual representation of the entire calculation chain.

Before you begin

Role required: sn_esg.admin, sn_esg.metric_manager, sn_esg.program_manager, sn_esg.reporting_disclosure_manager

sn_risk.user (for Risk users).

About this task

A formula tree provides transparency by displaying the detailed breakdown of how values are calculated, including all the operands and operations. This is especially helpful for auditing data and debugging.

Procedure

1. Navigate to one of the following locations depending on which application you're using.
   - **All** > **Environmental, Social, and Governance** > **ESG Workspace** > **Metrics** > **Calculated metric definitions**.
   - **All** > **Risk Management** > **Risk Workspace** > **Metrics** > **Calculated metric definitions**.
2. Open the metric definition for which you want to view formula tree data for and select **Calculated Metric Data**.
3. Select the calculated metric data record that you want and then select **Show formula tree**. You can view a visual representation of the entire calculation chain. The formula, associated metric definitions, sub formulas, functions, and so on, are shown.

Note:
If you're seeing an empty page, it's because the formula tree or formula operands are currently empty and are being updated asynchronously. If you're seeing an error page, it's due to errors in the formula operands that need to be corrected.

GRC: Metrics reference

Several properties, tables, and roles are installed with the GRC: Metrics application.

Components installed with the GRC: Metrics application

When the Risk Management application is activated, the GRC: Metrics application is automatically installed. The GRC: Metrics application adds roles that are listed here.

Roles installed

The following roles are installed with the GRC: Metrics application.

Roles installed with the GRC: Metrics application

Role	Description	Contains
sn_grc_metric.admin	This role serves as the Administrator within the application, and contains the responsibilities of the Metric Manager role. The role possesses the ability to override metric data results in metric data tasks and	sn_grc_metric.manager, schedule_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with the GRC: Metrics application (continued)

Role	Description	Contains
	has the authority to delete metric definitions and metrics. Typically, this role is assigned to individuals holding positions as product owners or application administrators.	
sn_grc_metric.manager	This role possesses the ability read, create, and update metric definitions and metrics. It is primarily assigned to risk managers, compliance managers, or business managers, who require the authority to define metrics within their respective areas of responsibility.	sn_grc_metric.user
sn_grc_metric.reader	This role is restricted to read-only access. It does not possess the privileges to create, edit, or update any metric definitions or metrics. However, as a metric reader, this role is authorized to review and approve metric data tasks where they have been designated as an approver. This role can be assigned to managers and executives if they want to access dashboards with metrics data to monitor the performance of the metrics.	None
sn_grc_metric.user	This role is primarily assigned to data owners, enabling them to respond to manual metric data entry tasks. Typically, these users are from the business and hold ownership responsibilities within the organization.	sn_grc.reader, sn_grc_metric.reader
sn_grc_metric.developer	Users with this role possess the privilege to write and edit the script for data collection automated metric definition.	None

Analytics and reporting solutions for Risk Management

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This Platform Analytics Solution is available on the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

To enable the Analytics and Reporting solution for GRC: Risk Management, perform these steps.

1. Visit the ServiceNow Store and obtain an entitlement to the Performance Analytics - GRC: Risk Management application and associated applications. See Install a ServiceNow Product on the ServiceNow Store.
2. On the instance, navigate to **System Applications** > **All Applications** > **All**.
3. Locate and install the Performance Analytics - GRC: Risk Management application.

The following reports and dashboards are available in the Risk Management application.

Important:

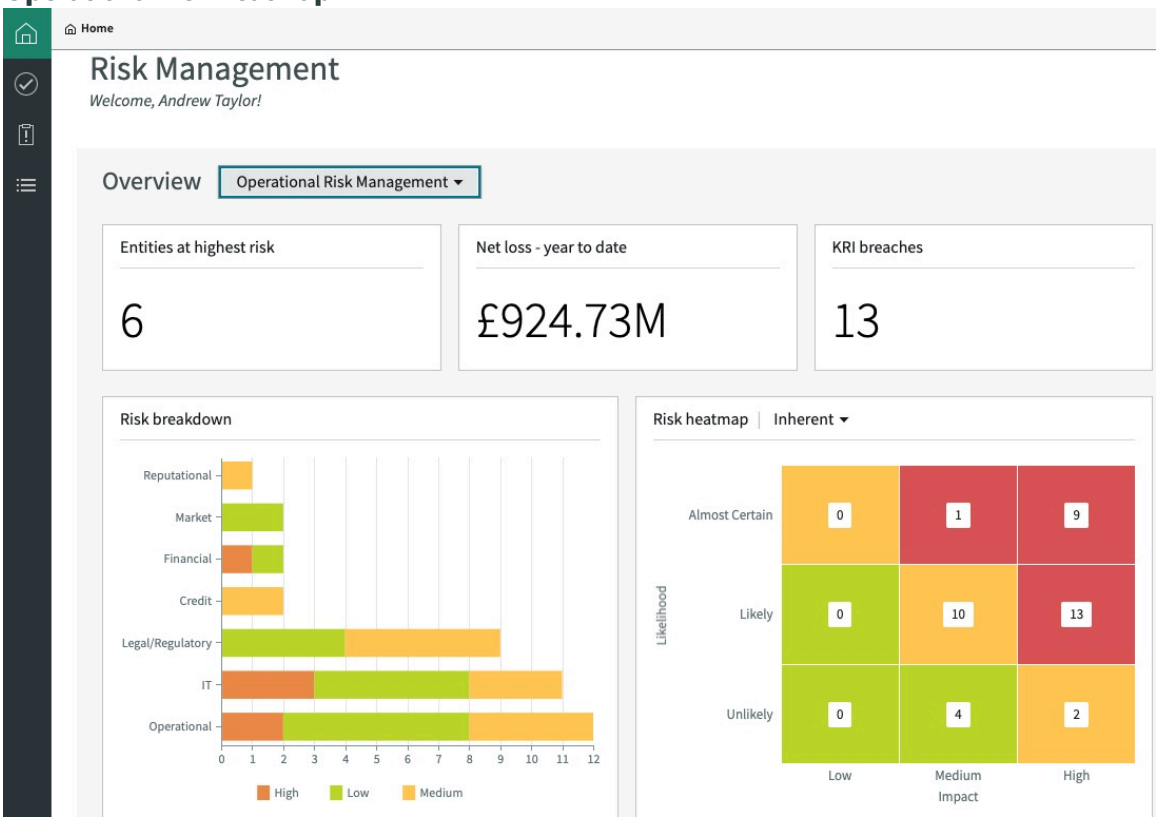
Starting with version 18.1.0 of the Risk Management application, the Analytics and Reporting solutions for Risk Management are available in the Next Experience UI Framework.

Operational risk heatmap for Advanced Risk Assessment in the Risk Workspace

As an operational risk manager, you can configure and manage your risk heatmaps in the Risk Workspace.

A risk heatmap is a data visualization tool that is used for communicating the specific risks that threaten an organization. Heatmaps are considered a critical component of enterprise risk management because it helps to identify risks that need more attention. In the Risk Workspace, you can configure your Advanced risk assessment heatmaps using the UI Builder. The heatmaps provide detailed information about your inherent and residual risks. The axes of the heatmaps can be configured in the inherent risk and residual risk configurations. To see how you can configure the axes details for the heatmap, see Configure an inherent assessment and Configure a residual assessment.

To view the operational risk heatmaps, ensure the following:



- Activate the **GRC: Risk Management workspace** (com.sn_risk_workspace) plugin.
- Activate the **GRC: Advanced Risk** (com.sn_risk_advanced) plugin.
- Enable the *`Migrate to Advanced Risk Assessments`* property.

In the **Summary** field, you can select the risk assessment methodology for which you want to view the heatmap. When you click any tile of the heatmap, you can view all the risks and their scores assessed for that particular risk assessment methodology. You can view the risk response

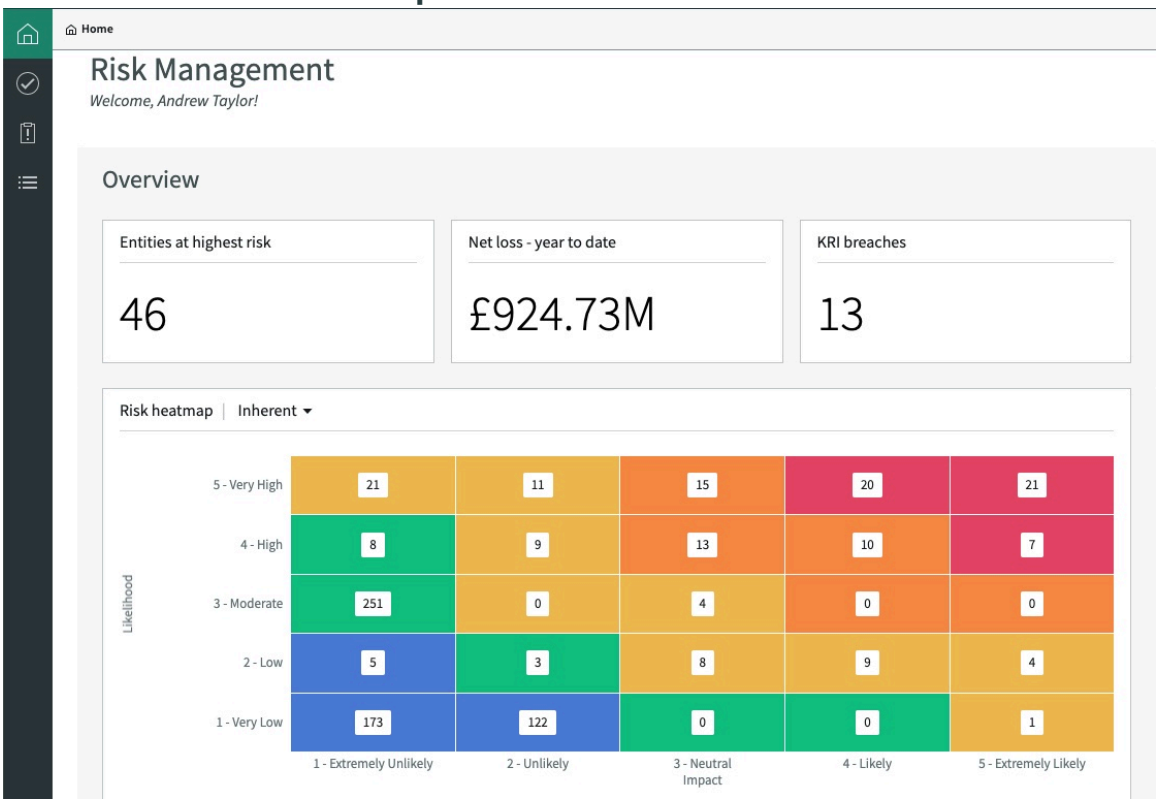
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

strategy selected for those risks. If you want to define colors for your heatmaps, you can define the colors according to your preferences. For more information, see Create risk color styles.

Operational risk heatmap

To add or configure the heatmap in other pages or workspaces, see the Risk Heatmap Documentation [KB0994328] article in the Now Support Knowledge Base

Risk heatmap for classic risk assessment



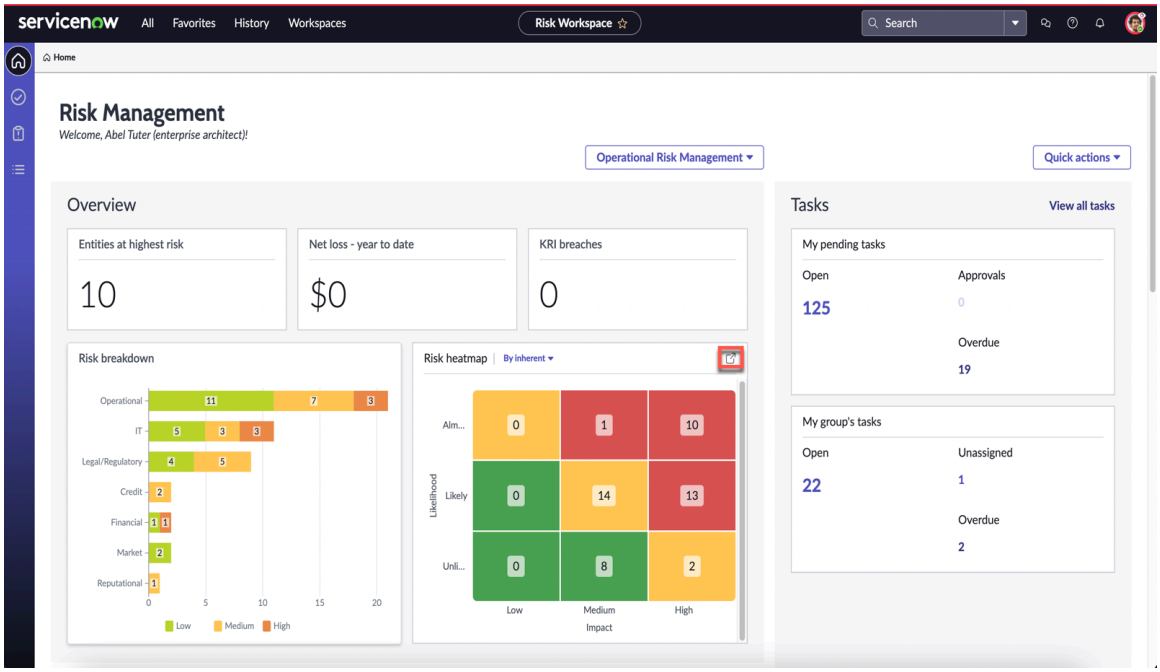
As an operational risk manager, if you opt to use the classic risk assessment to assess the risks in your organization, you can view the risk heatmap to get an overview of the risk posture for your organization.

A risk heatmap is a data visualization tool that is used for communicating the specific risks that threaten an organization. A risk heatmap is considered a critical component of enterprise risk management because it helps to identify risks that need more attention.

To view the operational risk heatmaps, ensure that you activate the GRC Risk Management (sn_risk) plugin. When you click any tile of the heatmap, you can view the risk records and see the entity, the risk statement, the owning group, the owner and the calculated scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classic risk assessment heatmap



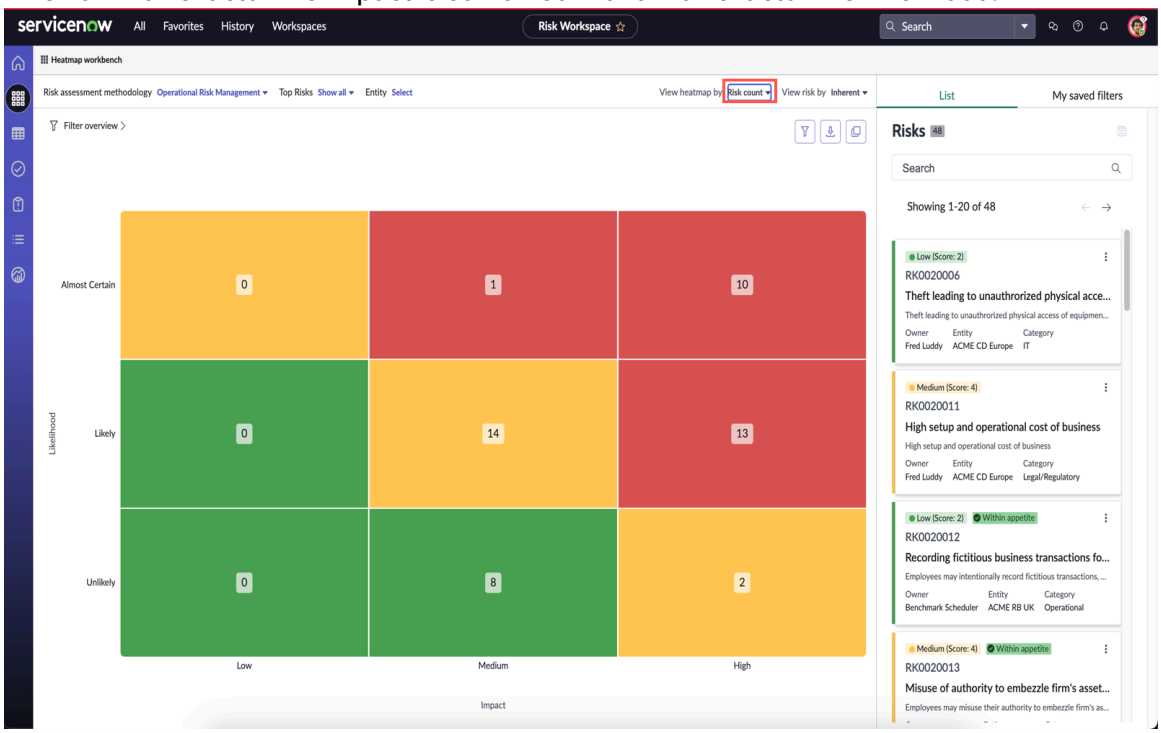
Risk heatmap workbench

As an operational risk manager, you can visualize the risk details and better understand the risk posture of your entity by using the risk heatmap workbench in the Advanced Risk application.

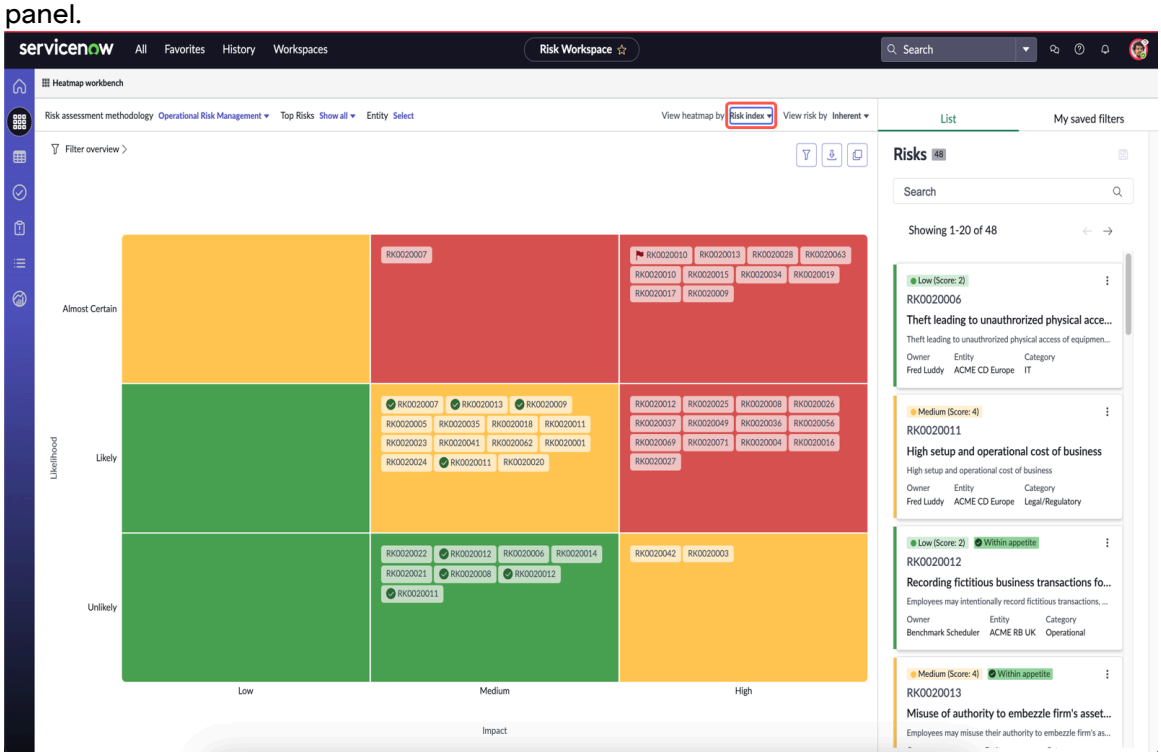
Overview of the heatmap workbench

A risk heatmap is a graphical representation of your risk data where the individual values that are contained in a matrix are represented in colors that denote a meaning. You can use risk heatmaps to see your risk assessment results in a convenient, visually attractive, and succinct format. Starting in version 14.0, you can launch the risk heatmap workbench with the launch workbench icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



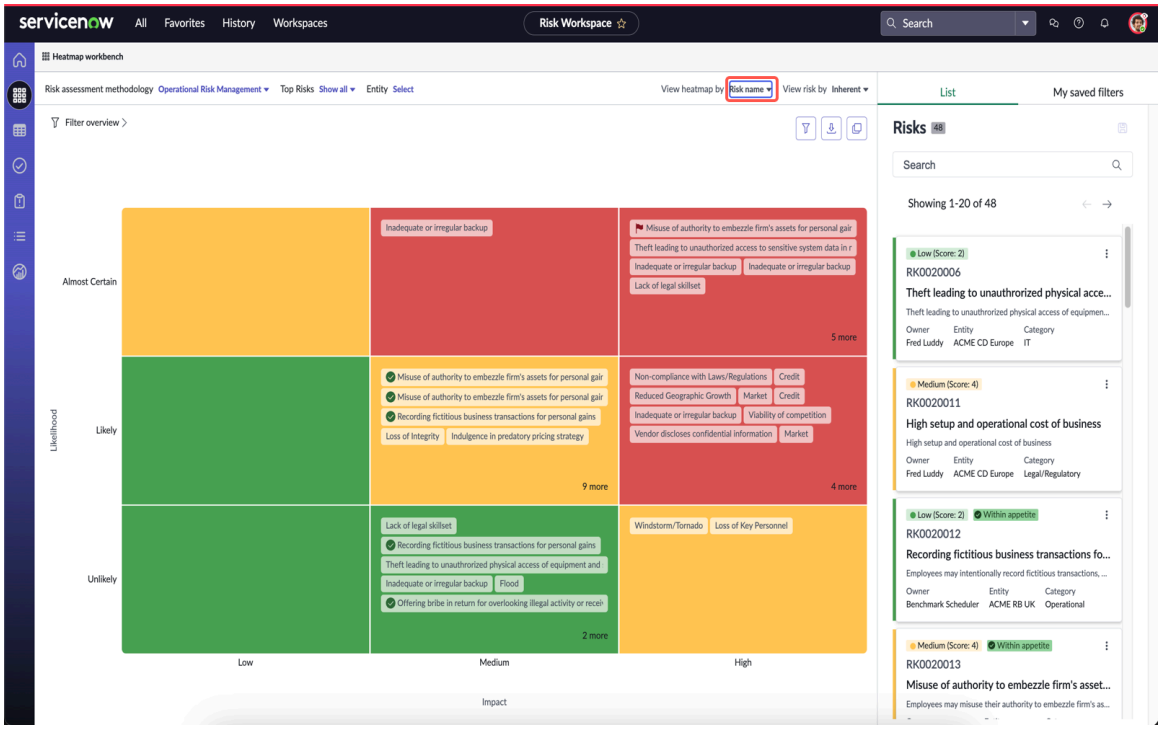
Features of the heatmap workbench



By using the risk heatmap workbench, you can view the following aspects for risks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Risk count: Shows the number of risks that are in each cell on a heatmap such as when an X-axis factor like Impact is combined with a Y-axis factor like Likelihood.

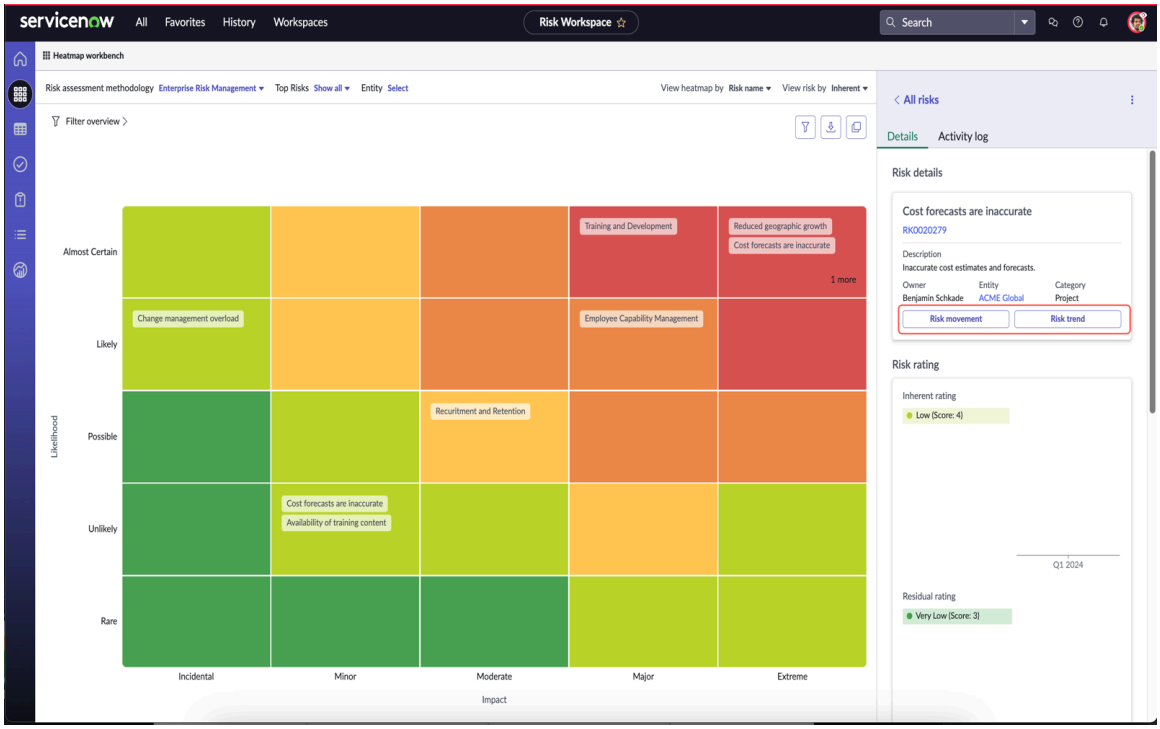


- Risk index: Shows the risk IDs in each cell and the details of each risk on the contextual side panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Risk name: Shows the names of all the risks in each cell.

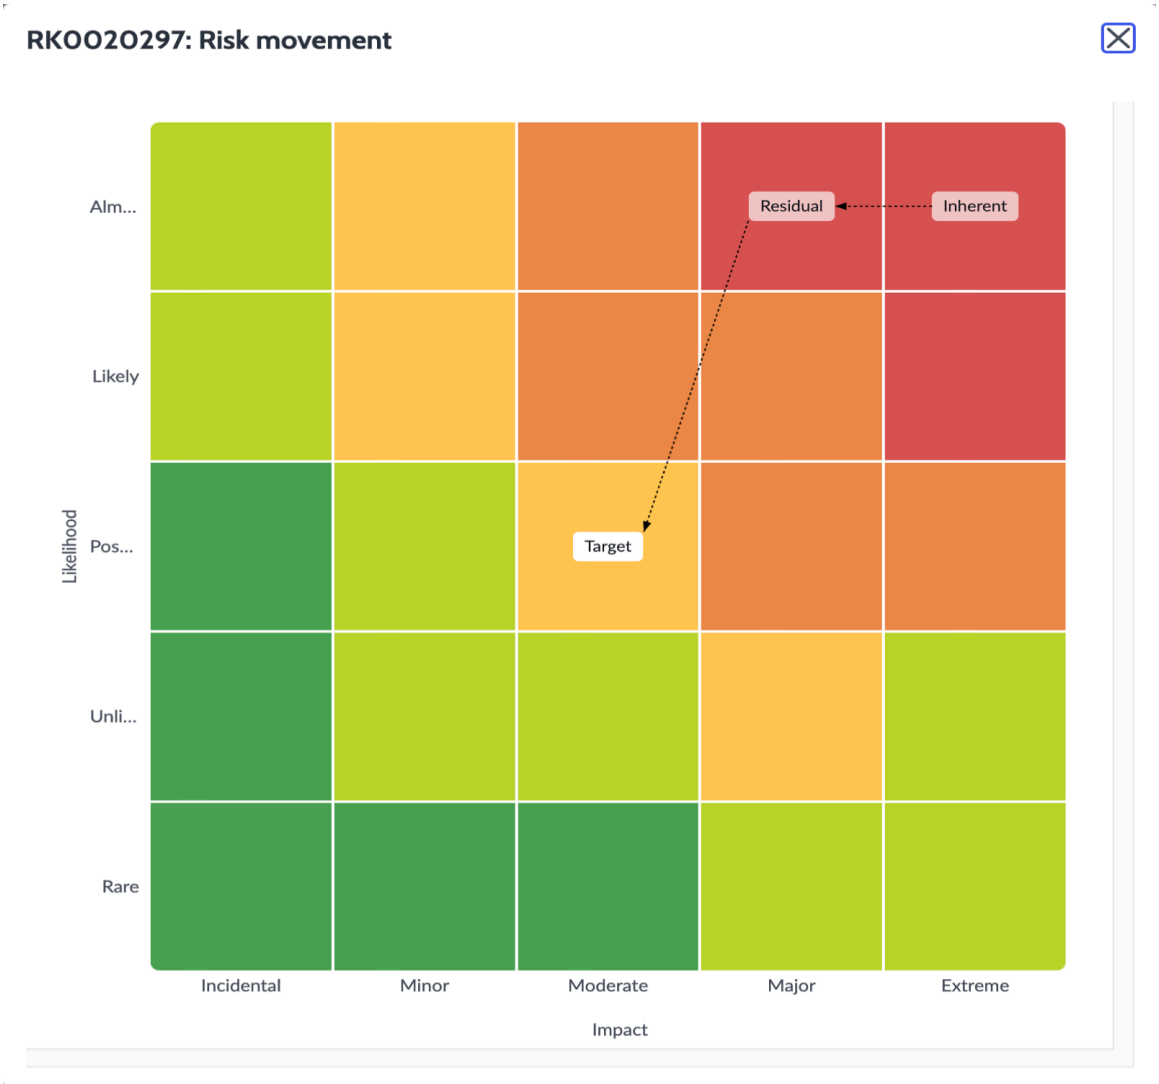
- Top Risks: Shows the top risks on the heatmap workbench. For example, if you select 10 from the Top Risks filter selection list, you can see all the top 10 risks that are associated with the selected Risk Assessment Methodology (RAM) on the heatmap.
- Entity: Shows the risks that are associated with the specific entities and their downstream entities on the heatmap workbench. You can filter the risks that are associated with the specific entities that are defined in the RAM.



By pointing to each risk, you can quickly get details about the risk. For example, you can see who the risk owner is, the entity to which the risk belongs, and the category of the risk. The contextual side panel shows 20 entries at a time on a page. You can configure the total number of entries that you want to see. You can either view all the risks as cards or select a single risk and view its details. After you select a risk from the heatmap cell, you can see the details of that risk on the side panel. For example, you can see the risk rating, the risk response, the risk tracking, and the risk hierarchy. The activity log captures all the activities that are performed on a risk. If you click the more actions icon ⋮, you can see the following options:

- **Open**: Provides the risk record.
- **360° view**: Provides an overview of the associated entities, controls, risk statements, risk assessments, and risk response tasks.
- **View assessment**: Provides an assessment summary of the risk.

Reporting in the heatmap workbench



The heatmap workbench is the primary tool that you use for risk reporting and analysis. By looking at the Risk movement and Risk trend, you can visualize your organization's risk profile and share that information with your stakeholders.

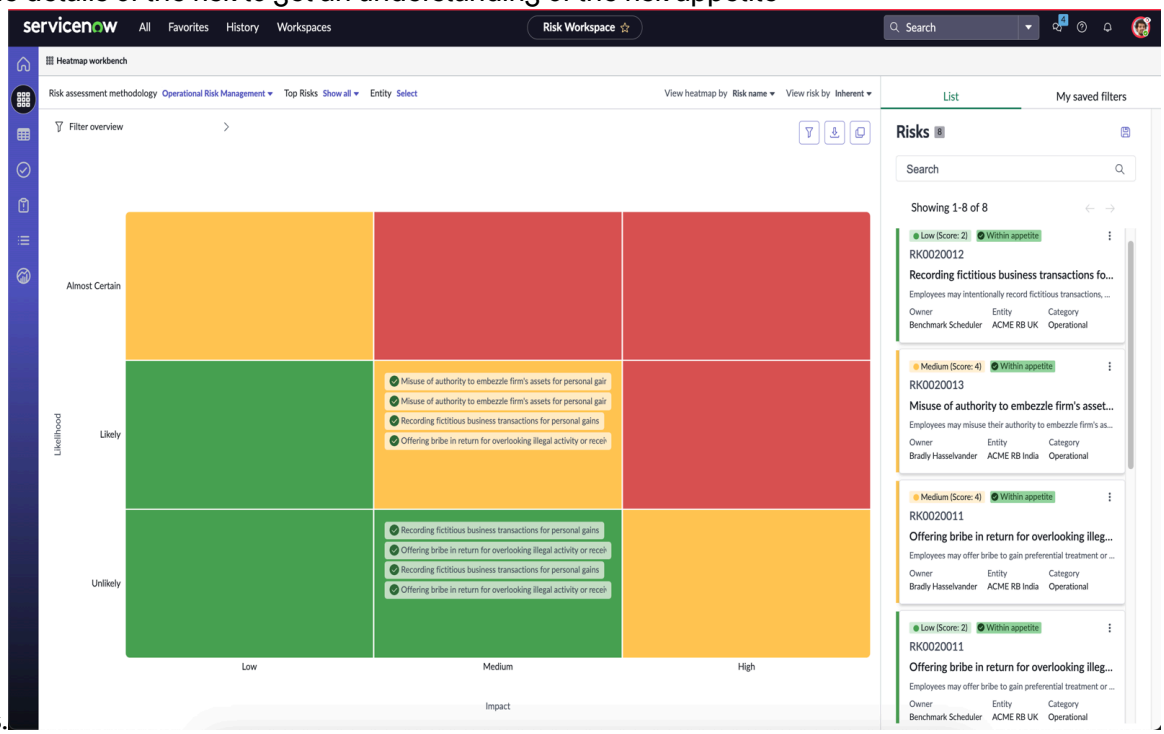
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the risk movement from inherent (risk level without controls or mitigating actions), to residual risk (leftover risk after the implementation of controls), finally to target risk (risk level that you want to achieve in future) on the heatmap workbench. This information helps you to analyze the assigned controls to mitigate if the risks are effective or not. The risk movement is available only for RAMs where the residual risk has the same factors as an inherent risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the risk score movement across multiple assessments on the heatmap workbench. The risk trend shows how the risk has changed and analyzes how you have been managing the risk. The risk trend is available for the last five risk assessments. You can also disable the trend line on the heatmap for a clear and less cluttered view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Risk appetite in the heatmap workbench

You can view the status of the risk appetite on the heatmap workbench. The risk appetite trend is also available on the heatmap. You can also

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

see the details of the risk to get an understanding of the risk appetite status.

Filtering in the heatmap workbench

You can filter the data that you see on the heatmap workbench. For example, let's say that you see 40 entries on the heatmap and you'd like to filter those risks where the entity is ACME Global. You can use the condition builder and apply your filters. After the filters are applied, the heatmap is refreshed and displays the data based on the filter conditions that you have applied. For more information on how to filter the data, see Filter data in the risk heatmap workbench. The ability to filter is only available in the workbench view. You can save the frequently used filters in the My saved filters section.

Downloading and copying in the heatmap workbench

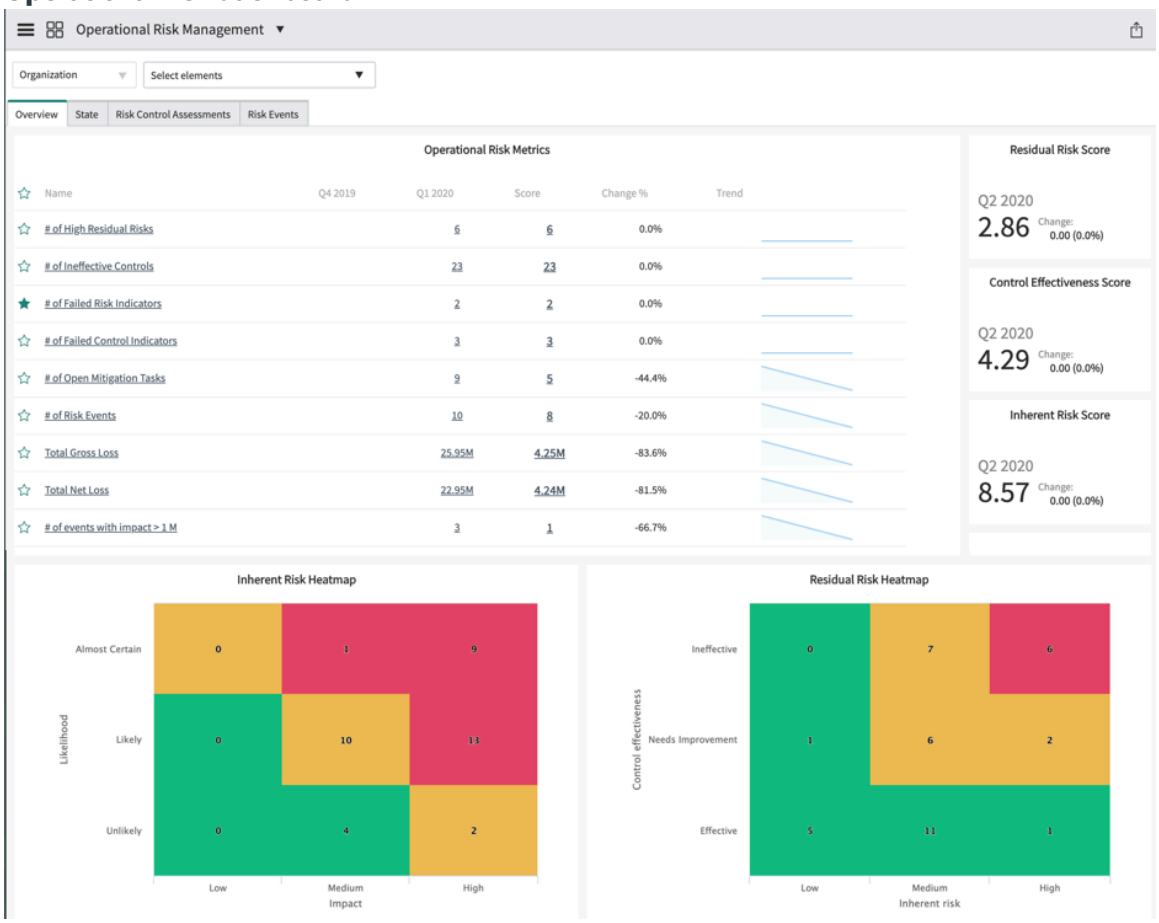
You can download or copy the risk heatmap information to include in reports or share with relevant stakeholders as needed. The download icon enables you to download the heatmap as an image. The copy icon enables you to copy the heatmap information in your clipboard. You can then paste it into emails, reports, presentations, or other documents to share the visual data representation as needed.

Searching in the heatmap workbench

As a risk user, while looking for a particular risk, you can quickly search a risk by the name, owner, or any of the other information that is shown in the card. You can also filter the data by searching the risks. In the contextual side panel, you can enter your keyword in the search field and the filtered results are visible.

Note:
The search feature considers the risk name, risk description, and fields that are shown in the card. For example, if you search for the word Operational, then all risks that have the word operational will appear in the search result.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



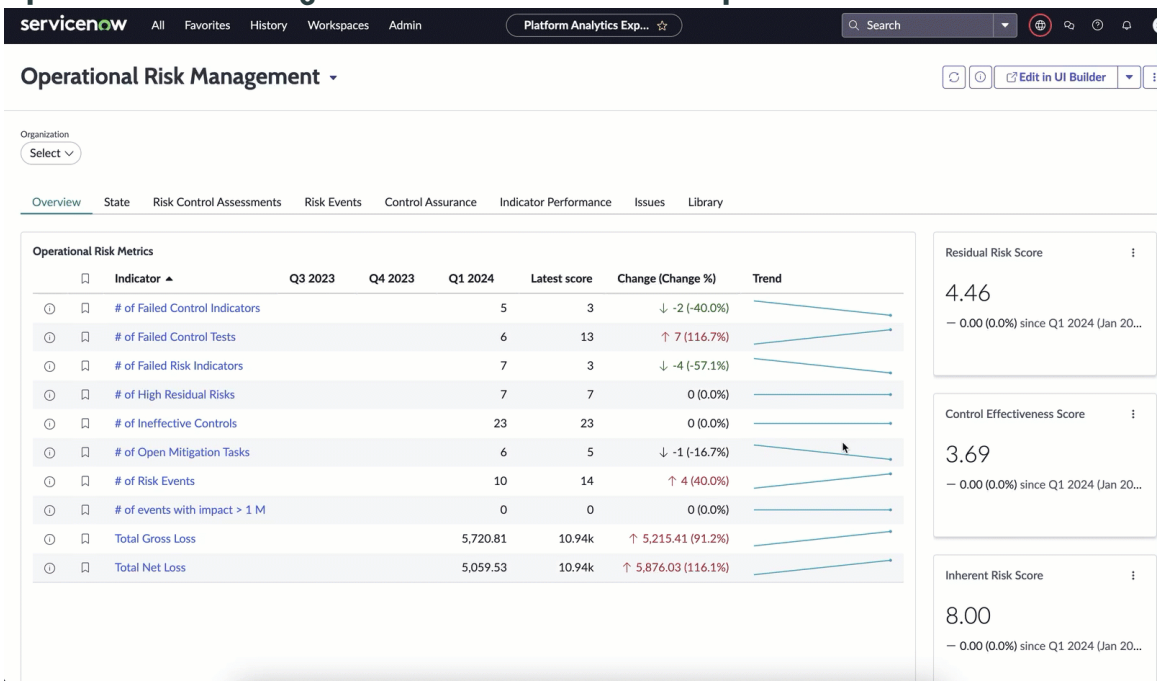
Immersive view of the heatmap workbench

With the immersive view of the heatmap, you can view the expanded form of the heatmap where the X-axis and the Y-axis values are highlighted. The benefit of this view is that if you have too much information in one zone, you can focus on that zone and analyze each risk. The pagination enables you to see all records. You can point to a risk to quickly understand more details about the risk. You can also view the different values of both the axes by clicking the value. For example, let's say that in the heatmap, the X-axis has the values low, medium, and high and the Y-axis has the values unlikely, likely, and almost certain. You can click any value in both the axes to see the risks for that combination.

Operational Risk Management dashboard

The Operational Risk Management dashboard enables an entity owner, with the role sn_risk.user, to view the complete risk posture for the enterprise in a single consolidated report. This dashboard makes it easy to analyze the risk posture efficiently and take necessary corrective actions to ensure that there are no losses.

Operational risk dashboard



Important:
Starting with version 18.1.0 of the Advanced Risk application, the Operational Risk Management dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

To open the dashboard, navigate to **All** > **Advanced Risk Assessment** > **Analytics Operational Risk Dashboard**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operational Risk Management dashboard in the Next Experience

End user and roles

End user and goal	Required role	Benefits
Risk user: Operational risk captures business continuity plans, environmental risk, process systems, operations risk, and people-related risks.	sn_risk.user	• Improves the reliability of business operations. • Improves the effectiveness of risk management operations. • Strengthens the decision-making process. • Reduces losses caused by unidentified or poorly-identified risks. • Detects unlawful activities early. • Lowers compliance costs. • Reduces potential damage from future risks.

Operational risk is the risk of loss that is incurred from inadequate or inefficient internal processes, people, and systems, or from external events. Operational risk captures the following to provide the complete risk posture of an organization:

- Risk identification and assessment
- Risk events data
- Identifying and assessing internal controls
- Monitoring and reporting of risks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicators

Indicators define a performance measurement taken at regular intervals of a business service, an activity, or organizational behavior. These performance measurements result in a series of indicator scores over time. To view this dashboard, users must have Advanced Risk and Policy and Compliance Management plugins activated

To view the list of all indicators for all the associated plugins, see the following:

- GRC Advanced Risk plugin indicators
- GRC Policy and Compliance Management plugin indicators
- GRC Audit Management plugin indicators
- GRC Risk Management plugin Performance Analytics indicators
- GRC Profiles plugin indicators

Note:
There are two jobs that you must run to collect data for this dashboard.

- **Daily Data Collector job**: This job is used to collect data for the Indicators. This jobs runs daily. To run this job, you must fill the **Run as** field with an appropriate value. This job is preconfigured.
- **Historical Data Collector job**: This job is used to collect data over a period of time. This job is generally preconfigured with the demo data. Therefore, if you enable demo data, while activating the plugin, then you can view this job. To run this job, you must fill the **Run as** field with an appropriate value.

Breakdowns

Organization (Entity)

Data visualizations

Title	Type	Description
Risk Response by Residual Risk Rating	Heatmap	Heatmap which shows the number of different risk response tasks for each residual risks.
Controls by owner	Horizontal bar	Controls distributed on the basis of their owners.
Risks by owner	Horizontal bar	Risks distributed on the basis of their owners.
Inherent risks by category	Horizontal bar	Number of risk assessments with different inherent risk levels grouped by risk statement categories such as credit, market and so on.
Residual risks by category	Horizontal bar	Number of risk assessments with different residual risk levels grouped by risk statement categories such as credit, market, and so on.

Title	Type	Description
Control Test	List	List of all controls.
Control Indicators	List	Indicators associated with each control.
Risk Indicators	List	Indicators associated with each risk.
Controls by classifications	Pie chart	Controls distribution on the basis of its classification like preventive or detective.
Controls by attestation frequency	Pie chart	Controls distributed on the basis of attestation frequency.
Risks by category	Pie chart	Risk distribution on the basis of category.
Overdue issues	Single score	Number of open issues that are past their planned end date.
Active risk events	Single score	Number of active risk events.
Pending attestations	Single score	Number of controls awaiting attestation.
Overdue assessment task	Single score	Number of risk assessments with the substate as Overdue.
Upcoming acceptance expiry	Single score	Number of risk acceptance tasks with acceptance end date in next 10 days.
Open mitigation tasks	Single score	Number of open mitigation tasks.
Open indicator tasks	Single score	Number of open indicator tasks.
Overdue control tests	Single score	Number of open control tests that are past their planned end date.

GRC Advanced Risk plugin indicators

The GRC Advanced Risk plugin contains various indicators.

The Advanced Risk plugin includes the following indicators:

# of high residual risks

Number of high residual risks per quarter.

# of ineffective controls

Number of ineffective controls per quarter.

Maximum of maximum calculated ALE for this quarter

Maximum of maximum calculated ALE for this quarter.

Maximum of maximum acceptable loss expectancy for this quarter

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All active risk statements updated within the current quarter and calculates the average of maximum_acceptable_loss_expectancy

Number of open mitigation tasks

Number of risk mitigation tasks in open state in this quarter.

# of risk events

Number of risk events that were reported in this quarter.

Total gross loss

Total gross loss from financial risk events per quarter.

Total net loss

Total net loss from financial risk events per quarter.

Active Events

Number of active risk events per quarter.

# of events with impact > 1 M

Number of risk events with financial impact greater than one million USD.

Average residual risk

Average residual risk score per quarter.

Average control effectiveness

Average control effectiveness per quarter.

Average Inherent Risk

Average inherent risk score per quarter.

Risk Assessments (Open)

Open risk assessments.

Issues (created this quarter)

Issues created per quarter.

Indicator task (created this quarter)

Indicator tasks per quarter.

Control tests (created this quarter)

Control tests per quarter.

Risk assessments in Monitor state

Risk assessments in monitor state.

Non-financial risk events

Number of non-financial risk events per quarter.

Total potential loss

Total potential loss from financial risk events per quarter.

Total expected loss

Total expected loss from financial risk events per quarter.

# of events with high non-financial impact

Number of risk events with high non financial impact per quarter.

Average gross loss per event

Average of the gross loss incurred for each active risk event.

Average net loss per event

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Average net loss per event. Net loss = Gross loss minus recovery loss.

Average recovery made per loss event

Average recovery made per loss event per quarter.

Average additional cost per event

Average additional cost per financial risk event per quarter.

Annual Loss Expectancy

Average ALE monthly is measured monthly as unit.

Number of entity

Number of entities which are in active state and updated during or before this quarter.

Near Miss

Number of near miss risk events per quarter.

Number of risk statements

Number of risk statement which are in active state and updated during or before this quarter.

Total control indicators

Number of control indicators running per quarter

High risks with failed indicators

Number of risks with high rating and failed indicators in the quarter.

Overdue indicator tasks

Number of indicator tasks due in the quarter.

Percentage of risk indicators failed

Percentage of failed risk indicators.

Total Failed Indicators Quarterly

Number of failed indicators in the quarter.

High Risk with Failed Control

Number of High Risk with Failed Control Test

Total Risk Indicators

Number of risk indicators running per quarter.

# of ineffective controls

Number of ineffective controls per quarter.

# of failed risk indicators

Number of failed risk indicators per quarter.

# of Failed Control Tests

Number of failed control tests per quarter.

Failed Control Test Quarterly

Number of Failed Control Test Quarterly

By this quarter

Total number of remediation task that needs to be completed by this quarter.

Key Controls with Failed indicators

Key Controls with Failed indicators is measured quarterly

GRC Audit Management plugin indicators

The GRC Audit Management plugin contains various indicators.

The Audit Management plugin includes the following indicators:

Key controls not tested

Number of key controls that are not tested.

Failed Controls

Number of controls whose control tests are ineffective.

Open Audit Issue

Number of open audit issues

Passed controls

Number of controls whose control tests are effective.

Ongoing Control Test

Number of Ongoing Control Tests

Failed control test quarterly

Number of failed control tests in a quarter.

New controls

Number of new controls.

GRC Policy and Compliance Management plugin indicators

The GRC Policy and Compliance Management plugin contains various indicators.

The Policy and Compliance Management plugin includes the following indicators:

# of failed control indicators

Number of failed control indicators per quarter.

Controls (not retired)

Number of non-retired controls.

Control not Attested

Number of controls whose state is in draft or attest.

Orphan controls

Number of controls without control objective

Mandated Controls

Number of controls whose enforcement is mandatory.

Key Controls

Number of key controls

Controls without Test Plans

Number of controls without test plans.

Exempted controls

Number of exempted controls.

Controls without KCI's

Number of controls without indicators.

Active Controls

Number of active controls.

GRC Risk Management plugin Performance Analytics indicators

The GRC Risk Management plugin contains various Performance Analytics indicators.

The GRC: Risk Management plugin includes the following Performance Analytics indicators:

Risk without mitigating control

Number of risks without mitigating control.

Active Risk

Number of Active Risks

New risk

Number of risks which are in draft state.

Risk without KRI's

Number of Risk's without KRI's.

Orphan risks

Number of risks without risk statement.

Risk not assessed

Number of risks which are not assessed.

GRC Profiles plugin indicators

The GRC Profiles plugin contains various indicators.

The GRC: Profiles plugin includes the following indicators:

Open remediation tasks

Number of open remediation tasks

Today

Number of issues closed today.

Today

Number of issues created today.

By this year

Total number of issues that need to be resolved by this year.

By this quarter

Total number of issues that needs to be resolved by this quarter.

By this month

Total number of issues that need to be resolved by this month.

All open issues

Number of open issues

All Unassigned Issues

Number of unassigned issues.

Remediation Task Aging Indicator

Remediation Task Age Distribution on the basis of state.

All Open Issues QoQ

All Open Issues Quarter to Quarter

Issues Aging Indicator

Issue Age Distribution on the basis of state.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By this week

Total number of issues that needs to be resolved by this week.

This quarter

Number of issues closed on this quarter.

New issues

Number of new issues

This month

Number of issues created this Month.

By today

Total number of remediation task that needs to be completed by today.

This week

Number of issues closed on this week.

This week

Number of issues created this week

By today

Total number of issues that need to be resolved by today.

This quarter

Number of issues created in this quarter.

By this year

Total number of remediation tasks that need to be completed by this year.

By this month

Total number of remediation task that needs to be completed this month.

By this week

Total number of remediation tasks that needs to be completed by this week.

This month

Number of issues closed on this month

Risk register in the Risk Workspace

The risk register contains the information about identified risks, results of risk analysis such as risk scores, and risk response plans. The risk register enables you to monitor and control the risks of your organization.

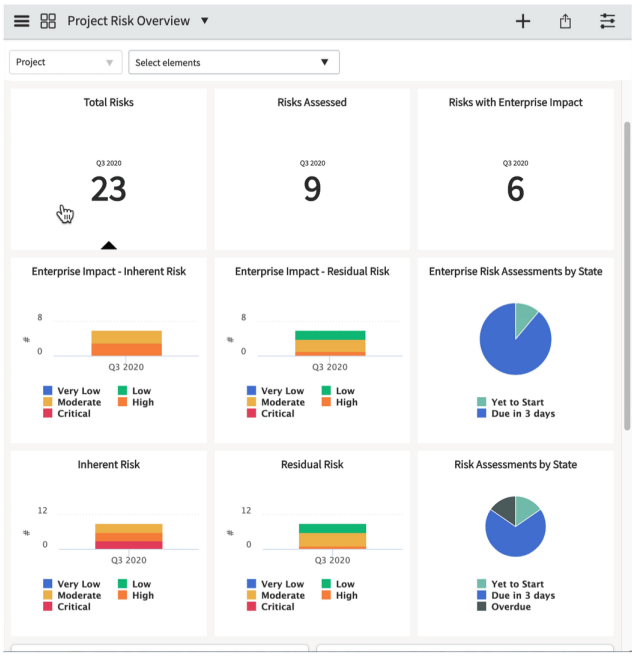
A risk register is a crucial risk analysis tool used in enterprise risk management. It is a record of information of identified risks. A risk register is used for regulatory compliance and keeps risk managers updated about the enterprise risks. It is important to regularly monitor risks and responses. A risk register simplifies this task by showing at a glance:

- Which risks exist?
- Which risks are the most threatening?
- How must the enterprise deal with those risks?
- Should some risks be accepted?
- What is the mitigation plan?

To view the Risk Register, navigate to **Risk Workspace** > **Risk assessments** > **Risk Register**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The components of the Risk Register are the following:



- Entities that are assessed for risks.
- The risk assessment methodology that is used for risk assessment.
- The assessor of the risk assessment
- The risk assessment scores for:
  - Inherent risks
  - Control effectiveness
  - Residual risk
- The risk responses for each risk.

Project Risk Overview dashboard

The project risk dashboard is useful for project managers and the enterprise risk managers. Using this dashboard, the project managers and enterprise risk managers can view the risk performance and the overall risk posture. This dashboard helps risk managers to reduce the overall risks in an organization.

Important:
Starting with version 18.1.0 of the Advanced Risk and Risk Management applications, the Project Risk Overview dashboard is deprecated. If you're on a legacy release or already using the dashboard, you can continue to use it.

Project Risk Overview dashboard

Required roles

- To edit the dashboard, users must have it_pps_admin or sn_risk.admin roles.
- To view the dashboard, users must have sn_risk.reader role or it_project_manager, or sn_ppm.read roles.
- To view the details of the records, users must have the sn_grc.business_user role.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
Enterprise risk manager	The enterprise risk manager can view the different enterprise risks and understand how many risks are critical, high, moderate, low, and very low. This dashboard provides an understanding of the overall enterprise risk posture.
Project manager	The project manager can select the project for which they want to view the risks. They can view the trend of the risks on a quarter-by-quarter basis, the number of risks assessed, the number of risks that affect the enterprise, and so on. The heatmap aggregates all the project risks that are assessed. It helps to keep a track of the bad risks and helps to manage them. This reduces the overall risk exposure for an organization.

Indicators

PPM-Total Risks

Count of all risks with a parent project.

PPM-Enterprise Risk Assessments

Count of all risk assessments with risk assessment methodology as Enterprise Assessment for Projects and the entity class as Project.

PPM- Project Risk Enterprise

Count of all risk assessments with risk assessment methodology as Project Risk Assessment and with table as risk.

PPM-Risks Assessed

Count of all risks with project risk assessment in the Monitor state.

PPM-Risks with Enterprise Impact

Count of all risks with enterprise risk assessment in the Monitor state.

Breakdowns

- Project
- Project and Enterprise Risk Assessment States
- Qualitative Rating Criteria - Enterprise Inherent Assessment
- Qualitative Rating Criteria - Enterprise Residual Assessment
- Qualitative Rating Criteria - Project Inherent Assessment
- Qualitative Rating Criteria - Project Residual Assessment

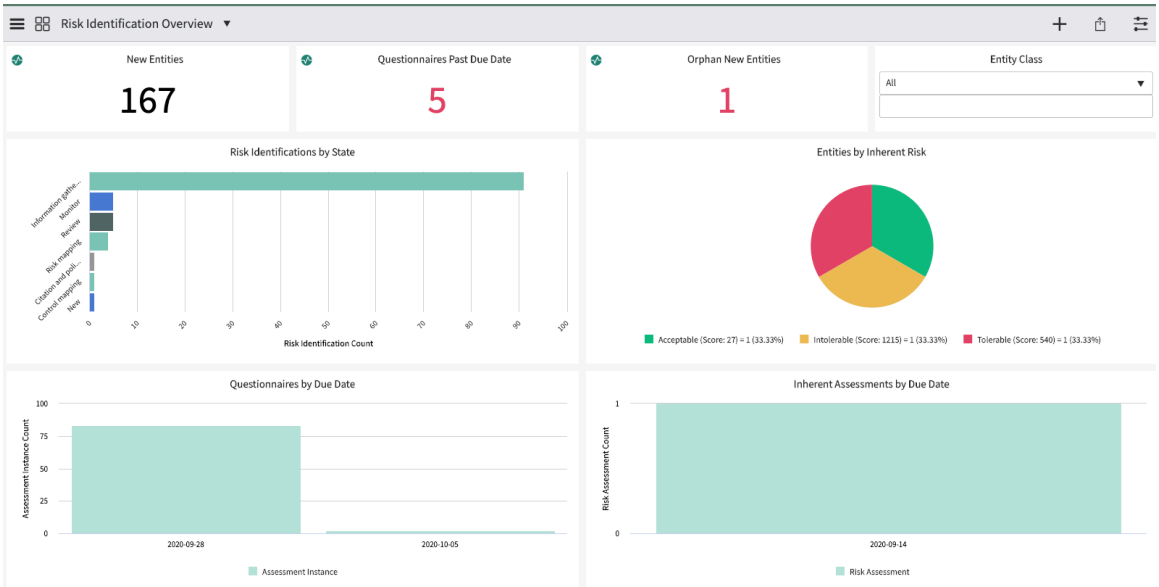
Data visualizations

This dashboard displays the following visualizations:

Title	Type	Description
Total risks	Single score	Total number of project risks identified.
Risks assessed	Single score	Total number of project risks assessed.
Risks with enterprise impact	Single score	Total number of risks with enterprise impact.
Enterprise impact- inherent risk	Bar graph	Number of inherent risks with enterprise impact.
Enterprise impact- residual risk	Bar graph	Number of residual risks with enterprise impact.
Enterprise risk assessments by state	Pie chart	Number of enterprise risk assessments by states.
Inherent risk	Bar graph	Number of inherent project risks.
Residual risk	Bar graph	Number of residual project risks.
Risk assessment by state	Pie chart	Number of project risk assessments by states.
Inherent risk by likelihood and impact	Heatmap	Aggregation of all the inherent project risks and their impact.
Residual risk by likelihood and impact	Heatmap	Aggregation of all the residual project risks and their impact.



Risk Identification Overview dashboard

The risk identification dashboard is useful for risk managers and helps them to keep a track of various records or objects which are in transit in the risk identification workflow.

This dashboard offers various insights for the users. These insights enable risk managers to decide the required action and helps them to prioritize the risk identification records that need attention. For example, if there are questionnaires past their due date, the risk managers may want to follow up with the person who was assigned the questionnaire.

Reports

This dashboard displays the following reports:

Title	Type	Description
New Entities	Single score	The number of new entities created in GRC in the last week. This report notifies the risk manager of the new entities. The risk manager can map the risks and controls for the new entities and check if the risk identification workflow is initiated or not.
Questionnaires Past Due Date	Single score	The number of questionnaires that have past their due date. This allows the risk manager to track the number of overdue questionnaires and take necessary actions.
Orphan New Entities	Single score	The number of new entities created weekly that do not have an owner. Orphan entities have risks and controls with no one acting upon those risks. This report allows the risk manager to track entities for which an owner is missing and identify an owner to respond to the survey.
Risk Identifications by State	Horizontal bar	The number of risk identification records grouped by state such as: • New • Information gathering • Control mapping • Citations and Policies • Risk Mapping • Review • Monitor
Entities by Inherent Risk	Pie chart	The number of risk identifications grouped by inherent risk ratings. This report allows the risk manager to track risk identification based on inherent risk ratings and highlight the critical

Title	Type	Description
		entities that need immediate attention.
Inherent Assessments by Due Date	Bar graph	The number of upcoming inherent assessments assigned to a user based on the due date. This is a weekly report.
Questionnaires by Due Date	Bar graph	The number of upcoming questionnaires assigned to a user based on the due dates. This is a weekly report.

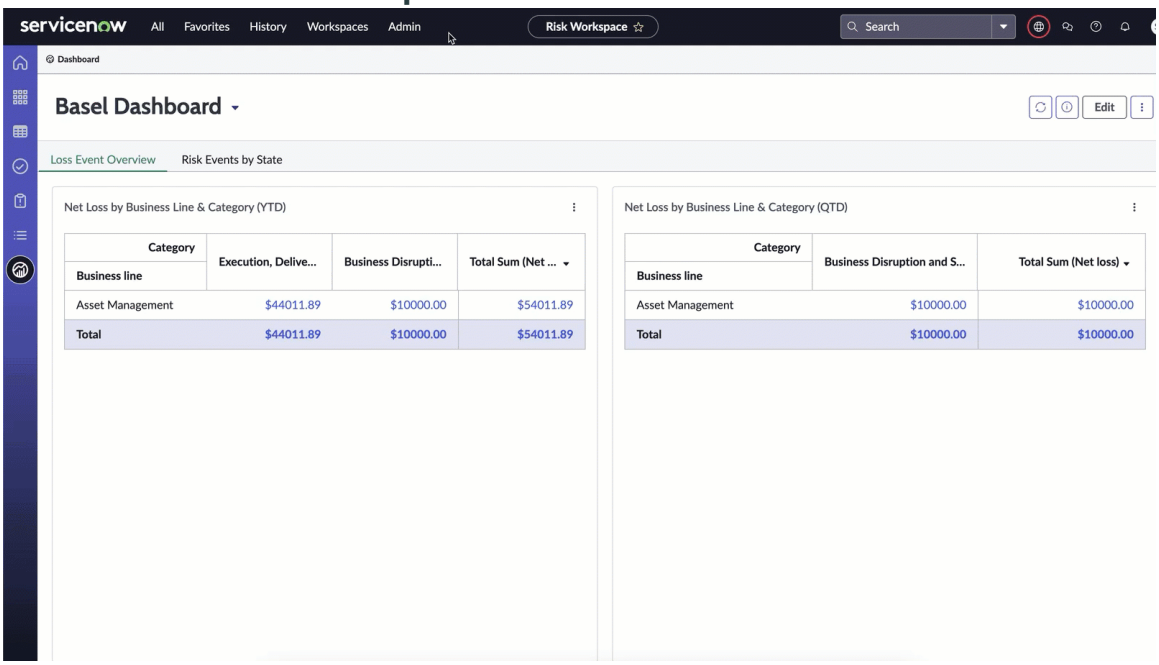
Basel dashboard

The Basel dashboard is a medium to share the Basel reports with external regulators for Basel regulations. This dashboard is useful for banking and financial domains where it is compulsory to share the Basel reports.

As a business user, you can choose to enable or disable displaying this dashboard by configuring the *`Show Basel attributes and properties`* property under *`Risk Event Properties`*.

This dashboard has two tabs:

- LOB to Category Mapping reports:
  - Net loss by Business Line & Category (YTD)
  - Net loss by Business Line & Category (QTD)
  - Number of Events by Business Line & Category (YTD)
  - Number of Events by Business Line & Category (QTD)
- Risk Events by Open & Closed State reports:
  - Open Risk Events by Basel Category
  - Closed Risk Events by Basel Category
  - Open Risk Events by Line of Business
  - Closed Risk Events by Line of Business



Important:
Starting with version 18.1.0 of the Risk Management and Advanced Risk applications, the Basel dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

To open the dashboard, navigate to **All** > **Risk Events** > **Analytics Basel Dashboard**.

Risk Overview dashboard in the Next Experience

End users

End user and goal	Required role
Audit Manager: Needs clear visibility into the overall state and volume of vulnerabilities within the organization.	sn_risk.manager
Audit Administrator: Needs to pinpoint areas of concern quickly	sn_risk.admin
Audit Analyst: Needs to quickly prioritize which risks/tasks to focus on based upon criticality to the organization.	sn_risk.user

Data visualizations

The Risk Overview dashboard contains the following visualizations:

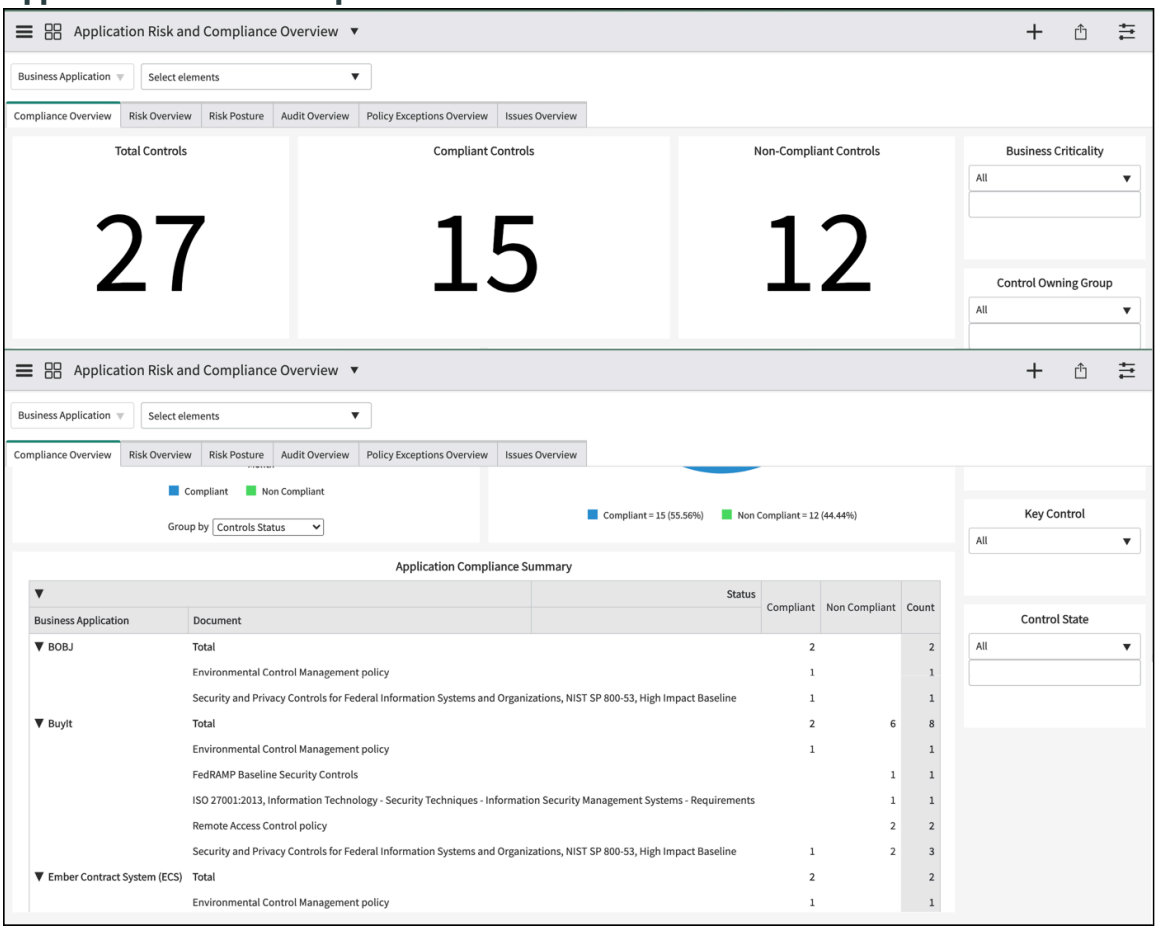
Name	Type	Description
High Inherent Risk	Single Score	Number of risks with High Inherent Risk status
High Residual Risk	Single Score	Number of risks with High Residual Risk status
Inherent Annual Loss Exposures	Box	Calculation of the inherent Annualized Loss Expectancy (ALE)
Inherent Risk	Bubble	Calculation of the inherent risk score from the likelihood and significance of a risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Type	Description
Inherent Risk Heatmap	Heatmap	Inherent risk heatmap providing total number of risks by very high risk, high risk, moderate risk, low risk and very low risk
Low Inherent Risk	Single Score	Displays the number (count) of low inherent risks.
Low Residual Risk	Single Score	Displays the number (count) of low residual risks.
Moderate Inherent Risk	Single Score	Displays the number (count) of moderate inherent risks.
Moderate Residual Risk	Single Score	Displays the number (count) of moderate residual risks.
Residual Annual Loss Exposures	Box	Calculation of the residual Annualized Loss Expectancy (ALE)
Residual Risk	Bubble	Calculation of the residual risk score from the likelihood and significance of a risk.
Residual Risk Heatmap	Heatmap	Total number of residual risks by very high risk, high risk, moderate risk, low risk, very low risk
Risk by Entity	Bar	Number of total active risks broken down by profile.
Risk Exceptions	List	Listing of all risk exceptions
Risk Issues by Framework (Opened Date)	Line	Total number of open risks over time broken down by framework
Risks by Category	Horizontal bar	Total number of open risks broken down by category
Risks by Response	Horizontal bar	Total number of open risks broken down by response
Very High Inherent Risk	Single Score	Displays the number (count) of very high inherent risks.
Very High Residual Risk	Single Score	Displays the number (count) of very high residual risks.
Very Low Inherent Risk	Single Score	Displays the number (count) of very low inherent risks.
Very Low Residual Risk	Single Score	Displays the number of very low residual risks.

Advanced Governance, Risk, and Compliance Application Risk dashboard

The GRC **Application Risk and Compliance Overview Dashboard** provides the latest view of risk and compliance aspects for the business applications that are used in an enterprise.



The Application Risk Dashboard is useful for the Chief Information Officer (CIO) and application owners. Both these users must have the sn_compliance.reader, sn_risk.reader, and sn_audit.user roles to view the dashboard. Navigate to **Advanced GRC Dashboard** > **Application Risk Dashboard**. The **Application Risk and Compliance Overview Dashboard** is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To be able to view this dashboard, you must activate the GRC: Advanced Dashboards (com.sn_grc_pa_advanced) plugin and the GRC: Policy and Compliance Management (sn_compliance) plugin.

The Application Risk and Compliance Overview dashboard provides you a detailed report of the risk and compliance posture of all the business applications in an organization.

Application Risk and Compliance Dashboard

This dashboard highlights the following:

- The compliance impact of applications in use.
- The risk posture of applications.
- The state of remediation and exceptions activity of the issues.
- The audit activity around applications and status.

This dashboard provides answers to the following questions that are of interest to the CIO and the application owner:

1. What are the key applications, and are they all operational and delivering the required services optimally?
2. What are the policies and authority documents that the applications must be compliant to? Are the applications compliant to them?
3. What are the risks faced by the applications? Are any of them high to raise a concern? Are there enough mitigations in place? Are there adequate controls in place and are they working effectively?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. For applications that need remediation, are the remediations being done on time according to the Service Level Agreements (SLAs)? Which are the applications that generate the maximum number of issues?
5. Are exceptions being sought often on the applications and why? Are they within manageable limits?
6. Are the applications due for audit any time? How have the applications performed on these audits?

The dashboard offers various representations such as bar graphs, donut charts, and trend charts. Application owners can use various filters on the dashboard to view reports related to the business applications they own such as, critical business applications, mandated controls related to specific business application, or high priority issues and so on.

Compliance Overview

The Compliance Overview tab appears when you activate the Policy and Compliance plugin. The Compliance Overview tab provides an overview of the compliance posture of the business applications and displays the following reports:

- Total Controls: This report provides the total number of active controls.
- Compliant Controls: This report provides the total number of compliant controls which are not in draft or retired state.
- Non-Compliant Controls: This report provides the total number of non-compliant controls which are not in draft or retired state.
- Compliance Status By Month: This report provides the number of active controls by month.

> **Note:**
> This bar chart shows the compliance status for the current month and can be grouped by either Control Status or Business Application.

- Compliance %: This report provides the percentage of different statuses of active controls such as Compliant, Non Compliant, and Not Applicable.
- Application Compliance Summary: This report provides the summary of policies, authority documents, and the controls associated with business applications.

The following filters can be used to filter data on the reports:

- Business Application
- Business Criticality
- Entity Owner
- Enforcement such as mandatory or voluntary controls
- Key Control
- Control State
- Control Owning Group

Risk Overview

The Risk Overview tab appears when you activate the Advanced Risk plugin. The Risk Overview tab provides an overview of the risks associated with business applications and displays the following reports:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Risk Heatmap by Application Criticality: This report displays the heatmap of the application risks based on criticality of applications versus the risk rating of the application.
- Risk Response Tasks Overview: This report displays the response tasks created for a risk and different states of those tasks.

  Note:
  This bar chart can be grouped by and stacked by risk response, risk response state, risk calculated score, risk response assigned to, or business application.

- Application Risk Summary: This report displays the summary of risks directly associated with the applications that contribute to the overall risk rating of the application. Other downstream risks that contribute to the application risk rating are not represented in this report. The risks considered for this report are very high, high, and moderate.
- Application Risk Mitigating Controls Status: This report provides the information for an application's risks and the associated controls. The risks considered for this report are very high, high, and moderate. The state of controls must not be in draft or retired. The risks for only one year are displayed.

The following filters can be used to filter data on the reports:

- Business Application
- Criticality
- Risk Rating
- Application Owner
- Business Owner

Risk Posture

The Risk Posture tab appears when you activate the Risk plugin. The Risk Posture tab provides information about the risk exposure of business applications. The reports in this tab can also be filtered using the Business Application filter. The Risk Posture tab displays the following:

- Very High Risks: This report displays the very high risks of an application.
- High Risks: This report displays the high risks of an application.
- Moderate Risks: This report displays the moderate risks of an application.
- Acceptance Task Expirations: This report displays the risk response acceptance tasks that have an expiration on the current day, the current week, the current month, the current quarter, and the current year.
- Contributing Risks Trend: This report displays the trend of risks directly associated with business applications and how they are performing over a period. Other downstream risks that contribute to the application risk rating are not represented in this report.

Audit Overview

The Audit Overview tab appears when you activate the Audit plugin. The Audit Overview tab provides an overview of audit and audit activities related to business applications and displays the following reports:

- Open Audit Engagements: This report displays the number of audit engagements in open state.
- Ineffective Controls: This report displays the number of ineffective controls for an audit engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Open Issues: This report displays the number of open issues for an audit engagement.
- Past Due Issues: This report displays the number of past due audit issues for an application.
- Upcoming Audit Engagements: This report displays the monthly count for the upcoming audit engagements.
- Open Issues by Audit Engagements: This report displays the monthly count for the open audit issues.
- Past Due Issues by Audit Engagements: This report displays the past due audit issues over a period.
- Ineffective Controls by Audit Engagements: This report displays the information regarding audit engagements and the associated ineffective controls.

The following filters can be used to filter data on the reports:

- Business Application
- Audit Engagement
- Criticality

Policy Exceptions Overview

The Policy Exceptions Overview tab appears when you activate the Policy and Compliance plugin. The Policy Exception Overview tab provides information about policy exceptions requested for business applications. The data displayed in the Policy Exceptions Overview tab can be filtered using the Business Application filter. This tab displays the following reports:

- New Exceptions: This report provides information about the new exceptions requested.
- Approved Exceptions: This report provides information about the number of approved exceptions.
- Rejected Exceptions: This report provides information about the number of rejected exceptions.
- Expired Exceptions: This report provides information about the number of expired exceptions.
- Exceptions Awaiting Approval: This report provides information about the exceptions that are awaiting approval and are due on the current date, the current week, the current month, and the current quarter.
- Extensions Awaiting Approval: This report provides information about the extensions that are awaiting approval and are due on the current date, the current week, the current month, and the current quarter
- Upcoming Exceptions Expirations: This report provides information about the exceptions that are about to expire and which are due on the current date, the day after the current date, the current week, the week after the current week, and the current month.
- Exceptions Requested vs. Approved: This report provides information about the exceptions requested versus the number of exceptions approved per month.

Issues Overview

The Issues Overview tab appears when you activate either the Risk Management plugin or the Policy and Compliance Management plugin. The Issues Overview tab provides information about the various compliance and risk issues associated with business applications. The data displayed in the Issues Overview tab can be filtered using the Business Application filter. This tab displays the following reports:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Open Issues: This report displays the number of issues in open state.
- Critical Priority Issues: This report displays the number of critical priority issues.
- High Priority Issues: This report displays the number of high priority issues.
- Accepted Issues: This report displays the number of issues that are accepted.
- Past Due Issues: This report displays the number of past due issues.
- Issues to be Resolved: This report displays the number of issues that must be resolved on the current date, the current week, current month, current quarter, and current year.
- Remediation Tasks to be Completed: This report displays the number of remediation tasks that must be completed on the current date, the current week, current month, current quarter, and current year.
- Past Due Issues: This report displays the number of past due issues over a time period.
- Past Due Remediation Tasks: This report displays the number of past due remediation tasks over a time period.
- Issue Creation Trend: This report displays the trend of how issues are created over a time period.
- Issue Closure Trend: This report displays the trend of how issues are closed over a time period.
- Remediation Task Creation Trend: This report displays the trend of how remediation tasks are created over a period.
- Remediation Task Closure Trend: This report displays the trend of how remediation tasks are closed over a period.

Performance Analytics dashboards for risk events and risk hierarchy

Use the Performance Analytics (PA) dashboards to view the comprehensive data for risk events and risk hierarchy. Use the Analytics Hub to view data for any time period.

By default, users with the sn_risk.manager role can view data for six months. To view the data for different time periods, purchase and activate the Performance Analytics Premium plugin. Users with the sn_risk.manager role can collate historical data for one year by running the ServiceNow® Governance, Risk, and Compliance (GRC) *`Entity and risk statement historical data collection`* job.

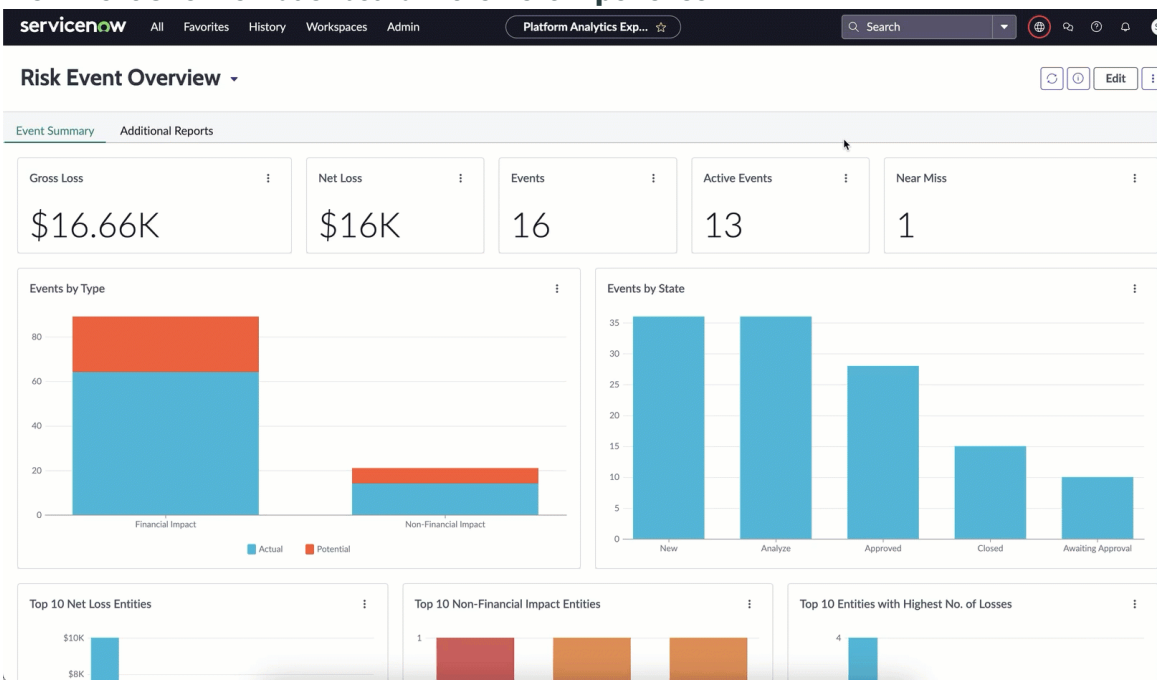
Note:
Run the historical data collection job only once. Running this job more than once leads to inconsistent data collection and might result in a loss of previous data.

Risk Events dashboards

The Risk Events dashboards present the following data:

- Risk Event Overview: This dashboard shows the following trends:
  - Gross Loss
  - Net Loss
  - Events
  - Active Events
  - Near Miss
  - Events by Type
  - Events by State

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Top 10 Net Loss Entities
- Top 10 Non-Financial Impact Entities
- Top 10 Entities with Highest No. of Losses

Important:
Starting with version 18.1.0 of the Risk Management and Advanced Risk applications, the Risk Event Overview dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

To open the dashboard, navigate to **All** > **Risk Events** > **Analytics Overview**.

Risk Event Overview dashboard in the Next Experience

- Risk Event Overview by Entity dashboard: Entity owners with the sn.risk_user role can view the aggregated information for gross loss, net loss, and the number of events on a monthly basis. The dashboard also shows the average gross loss per event, average net loss per event, average recovery made per event, and average additional cost per event. Entity owners with the sn.risk_user role can also view the following risk events trends for a particular entity. Administrators with the sn.risk_admin role can edit this dashboard.
  - Gross Loss
  - Net Loss
  - Events
  - Active Events
  - Near Miss
  - Risk Events
  - Risk Events by Non-Financial Impact
  - Annual Loss Expectancy vs Net Loss
  - Risk Event Metrics

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Starting with version 18.1.0 of the Risk Management and Advanced Risk applications, the Risk Event Overview by Entity dashboard is available in the Next Experience UI Framework.

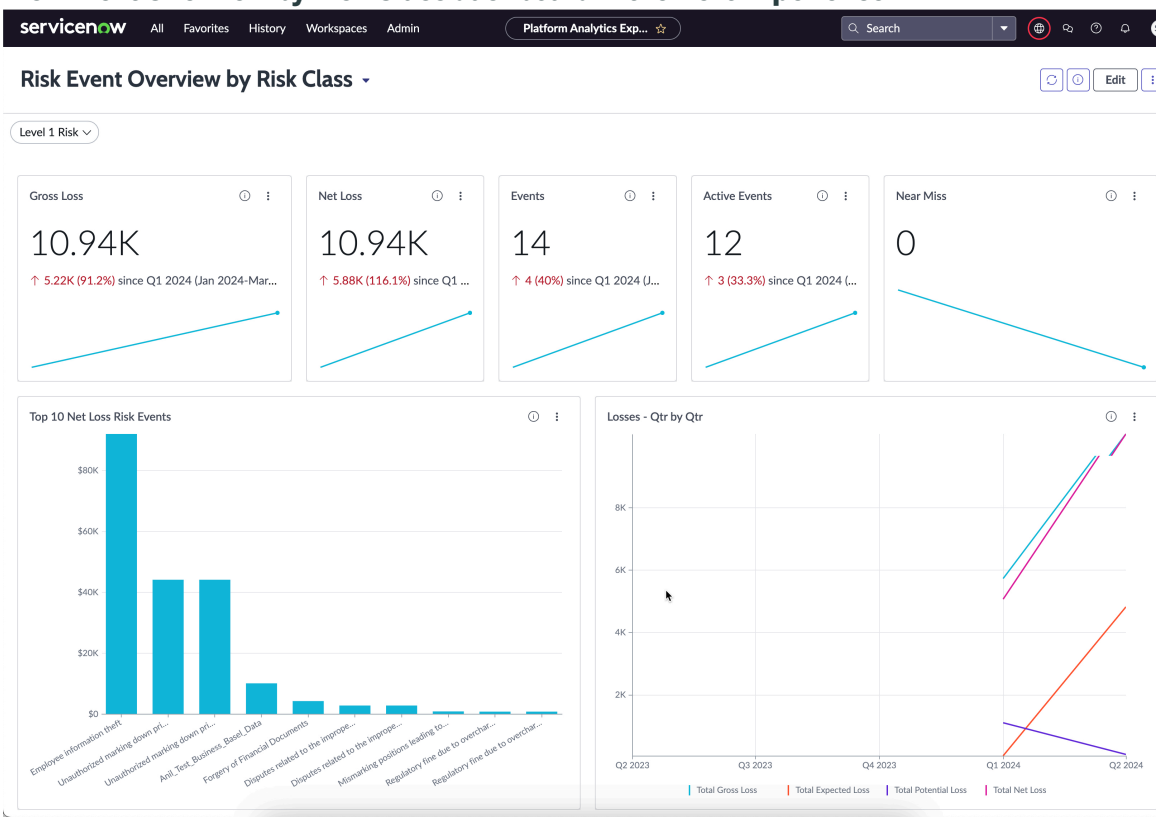
If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

To open the dashboard, navigate to **All** > **Risk Events** > **Analytics Overview by Entity**.

Risk Event Overview by Entity dashboard in the Next Experience

- Risk Event Overview by Risk Class dashboard: Users with the sn_risk.manager role can view level 1 risk event trends. Users can understand the aggregated gross losses, net loss, number of events created, number of active events, and the total number of near-miss events. This dashboard also shows the following trends:
  - Gross Loss
  - Net Loss
  - Events
  - Active Events

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Near Miss
- Top 10 Net Loss Risk Events
- Annual Loss expectancy vs Net Loss

Important:
Starting with version 18.1.0 of the Risk Management and Advanced Risk applications, the Risk Event Overview by Risk Class dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

To open the dashboard, navigate to **All** > **Risk Events** > **Analytics Overview by Risk Class**.

Risk Event Overview by Risk Class dashboard in the Next Experience

Exposure by Risk Statements dashboard

To view the Exposure by Risk Statements dashboard, navigate to **Risk** > **Exposure by Risk Statements**. This dashboard is useful for users with the sn_risk.manager role. This dashboard is similar to the Exposure by Entity dashboard, except that the dashboard also displays the risks by risk statement. This dashboard provides the distribution of entities based on tolerance status and calculated scores, as well as annual loss expectancy trends. A heatmap of the risk ratings by tolerance status is included. The Exposure by Risk Statements dashboard displays the following trends:

- Risk Statements per Tolerance Status
- Risk Statements per Rating
- Annual Loss Expectancy
- Risk Ratings by Tolerance Status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Starting with version 18.1.0 of the Advanced Risk and Risk Management applications, the Exposure by Risk Statements dashboard is deprecated. If you're on a legacy release or already using the dashboard, you can continue to use it.

Exposure by Entity dashboard

To view the Exposure by Risk Statements dashboard, navigate to **Risk** > **Exposure by Entity**. This dashboard is useful for entity owners responsible for a particular entity class. The dashboard also shows the entity health by displaying the statuses: Unacceptable, needs attention, and acceptable. Use this dashboard to compare trends across quarters based on annual loss expectancy (ALE). This dashboard displays risk ratings by tolerance status in the form of a heatmap. The heatmap helps you identify the entities that need attention. Annual loss expectancy trends and a heatmap of the risk ratings by tolerance status are also shown. The Exposure by Risk Statements dashboard displays the following trends:

- Entities per Tolerance Status
- Entities per Rating
- Entity Annual Loss Expectancy
- Risk Ratings by Tolerance Status

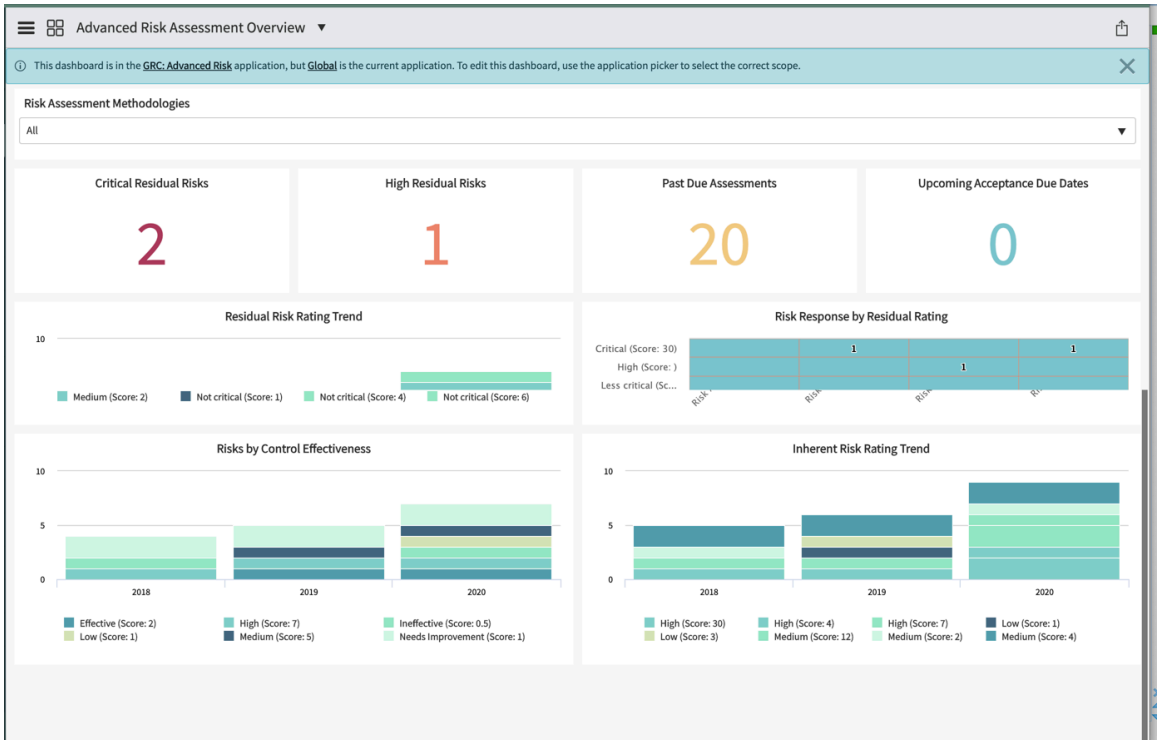
Important:
Starting with version 18.1.0 of the Advanced Risk and Risk Management applications, the Exposure by Entity dashboard is deprecated. If you're on a legacy release or already using the dashboard, you can continue to use it.

Advanced risk assessment dashboard

Use the Advanced Risk Assessment Overview dashboard for an overview of the performance of any risk assessment methodology based on the risk assessment instances.

Advanced Risk Assessment Overview

Important:
Starting with version 18.1.0 of the Advanced Risk application, the Advanced Risk Assessment Overview dashboard is deprecated. If you're on a legacy release or already using the dashboard, you can continue to use it.



Navigate to **Advanced Risk Assessment** > **Overview**. The Advanced Risk Assessment Overview dashboard displays the following:

- Critical Residual Risks:
- High Residual Risks
- Past Due Assessments
- Upcoming Acceptance Due Dates
- Residual Risk Rating Trend
- Risk Response by Residual Rating
- Risks by Control Effectiveness
- Inherent Risk Rating Trend
- Upcoming acceptance due dates: This number indicates the count of the tasks for which the acceptance due date is within the next 30 days.

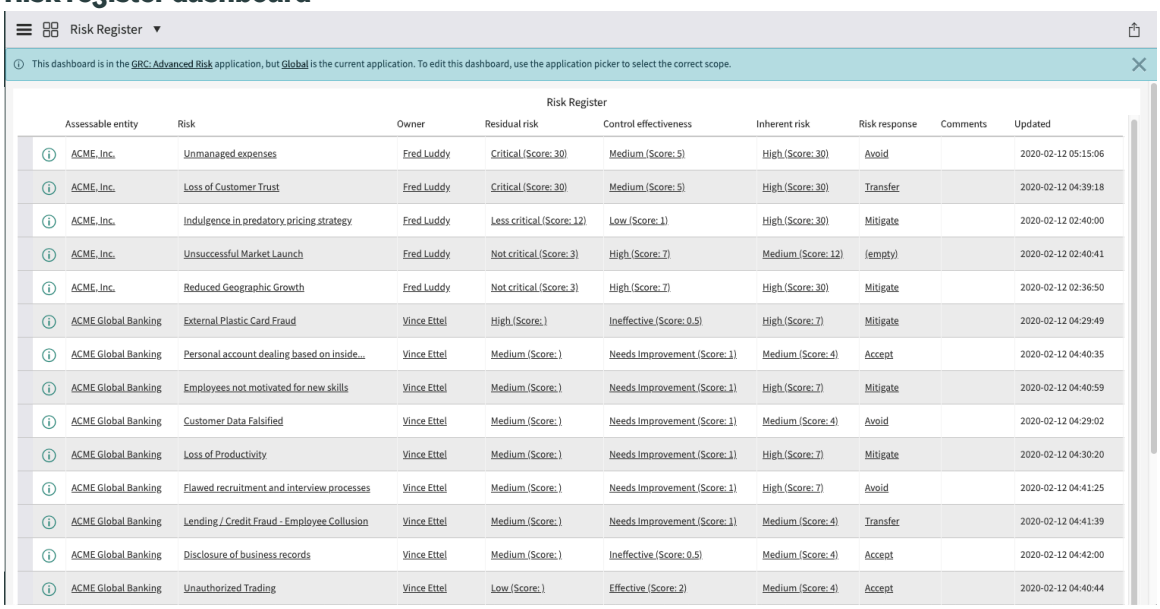
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This dashboard is visible only to users with the sn_risk.manager role.

Advanced risk dashboard



Advanced Risk Assessment Risk Register

> **Important:**
> Starting with version 18.1.0 of the Advanced Risk application, the Risk register dashboard is deprecated. If you're on a legacy release or already using the dashboard, you can continue to use it.

The Risk Register dashboard displays the risk assessments instances in the list view sorted by residual risks.

This dashboard is visible to users with the sn_risk.user role.

Risk Management reference

Reference topics provide additional information such as tables, roles, and properties that are installed with the Risk Management application.

Components installed with Risk Management

Several types of components are installed with activation of the Risk Management plugin, including tables, user roles, and scheduled jobs.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed with Risk Management

Roles are added with activation of GRC: Risk Management.

Roles installed

Role title [name]	Description	Contains roles
Risk Reader [sn_risk.reader]	In addition to the inherited permissions, the risk reader has read-only access rights to the Risk application and modules. The risk reader can do the following in the GRC scope: • Act on issues assigned to him. • Have read access to all Indicator templates. • Can act on indicator tasks assigned to them. • Have read-access to indicators. • Have read-access to entities. The risk reader can do the following in the Risk Management application: • Act on the Remediation tasks assigned to them. • Have read-access to risks. • Take old risk assessment. • Have read-access to risk statement and risk framework.	• sn_grc.reader • survey_reader • sn_rvw_feedback.reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed (continued)

Role title [name]	Description	Contains roles
	• Perform advanced risk assessment. • Create risk events. • Work on risk event tasks and issues. • Access all risk events and risk dashboards. • Have read-access to feedback.	
Risk User [sn_risk.user]	Contains the reader and business user roles in sn_grc scope, and the reader role in the Risk Management application and business user role in the sn_grc scope. In addition to the inherited permissions, the risk user can view: • entity types • entities • risks • remediation tasks • control • control objectives • policy exceptions The risk user can also create risks. The risk user can be assigned risks and has read-only access to the Policy and Compliance Management application and modules. Risk user can do everything that the risk reader can do. The risk reader can do the following in the Risk Management application: • Work on risk acceptance tasks and remediation tasks. • Create risks. • Access the Advanced Risk related dashboards.	• sn_grc.user • sn_compliance.reader • sn_risk.reader • survey_reader • sn_grc.business_user • sn_risk_advanced.ara_creator

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed (continued)

Role title [name]	Description	Contains roles

	• Take risk assessment.
	• Create risk response tasks.
	• View risk statements.
	• View risk assessment scope.
	• View and report risk events.
	• Work on assigned risk event tasks.
	• View indicator supporting data.
	• Respond to indicator tasks.
	• Respond to risk identification questionnaire.
	• Respond to metrics data tasks.
	• Report issues.
	• Submit issue triage requests.
	• Work on assigned remediation tasks.
	• Work on assigned issues.
	• If there is an integration with Project Portfolio Management:
	  ○ View the Project Risk Overview dashboard
	  ○ Create risks from library.
	  ○ Elevate enterprise risks.
	  ○ Initiate any object assessment.	

Roles installed with the GRC Risk Workspace

The GRC: Risk Workspace application installs the roles for Operational risk manager and IT risk manager for the users to perform their respective tasks.

Roles and their descriptions

Role title [name]	Description	Contains roles
Operational risk manager (sn_risk_workspace.operational_risk_manager)	Operational Risk Managers are a part of the operational risk team that manages	• sn_risk.manager • sn_compliance.manager

Properties installed (continued)

Name	Description
Auto close issue created by indicator sn_grc.auto_indicator_issue_closure	• **Type**: yes or no • **Default value**: no. • **Location**: **Risk** > **Administration** > **Properties**
A list of tables that are available in the 'Applies to' field on the Risk form. sn_risk.risk_applies_to_tables	• **Type**: string • **Default value**: Risk Assessment • **Location**: **Risk** > **Administration** > **Properties**

Tables installed with Risk Management

Tables are added with activation of GRC: Risk Management.

Tables installed

Table	Description
Risk [sn_risk_risk]	Extends Item table [sn_grc_item] and stores specific risks associated with entities
Risk Statement [sn_risk_definition]	Extends Content table [sn_grc_content] and stores definitions of risks.
Risk Framework [sn_risk_framework]	Extends Document table [sn_grc_document] and stores all risk frameworks, a collection of risk statements
Risk Framework to Entity Type [sn_risk_m2m_framework_profile_type]	Extends Document to Entity Type table [sn_grc_m2m_document_profile_type] and is a many-to-many relationship table that is used to manage the relationships between risk frameworks and entity types
Entity Type to Risk Statement [sn_risk_m2m_risk_definition_profile_type]	Extends Content to Entity Type table [sn_grc_m2m_content_profile_type] and is a many-to-many relationship table that is used to manage the relationships between entity types and risk statements
Risk Tasks [sn_risk_m2m_risk_task]	Stores many-to-many relationships between risks and tasks
Risk Transfer [sn_risk_transfer_task]	When a risk is analyzed, there are four ways to respond to it. This table provides a way for a risk manager to transfer a risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed (continued)

Table	Description
Color Setting [sn_risk_color_setting]	This table is used for the reports to relate impact/likelihood with palette colors.
Risk Avoidance [sn_risk_avoidance_task]	When a risk is analyzed, there are four ways to respond to it. This table provides a way for a risk manager to avoid a risk. For example, by having a building in California, you are exposed to earthquake risk. You can avoid this risk by choosing not to have buildings in California.
Risk Acceptance [sn_risk_acceptance_task]	When a risk is analyzed, there are four ways to respond to it. This table provides a way with an approval process that allows a risk manager to approve (accept) or reject the risk.
Risk Mitigation [sn_risk_mitigation_task]	When a risk is analyzed, there are four ways to respond to it. This table provides a way for a risk manager to mitigate a risk.
Risk to Control sn_risk_m2m_risk_control	Contains relationships of risks to controls.
Risk Statement to Control Objective sn_risk_m2m_risk_definition_policy_statement	Contains relationships of Risk statements to Control objectives. On addition of entry to this, related risks to controls relationships get created in Risk to Control table with matching entity.
Risk Mitigation to Control sn_risk_m2m_risk_mitigation_control	Controls added to Risk mitigation task as part of the task's flow to mitigate risk are added to this table.
Risk Relationship sn_risk_m2m_risk_risk	Contains upstream-downstream/parent-child relationship between two risks.
Risk Response Task sn_risk_response_task	Base table to Risk Acceptance, Risk Avoidance, Risk Mitigation, Risk Transfer tasks.

Note:
All additional tables installed by the dependent plugins are also needed for GRC: Risk Management.

Components installed with Advanced Risk

Activating the GRC: Advanced Risk (sn_risk_advanced) plugin adds or modifies several tables, user roles, and other components. The Advanced Risk plugin enables you to perform advanced risk assessments and manage risk events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Note:
Demo data is available for this feature.

Tables installed with Advanced Risk

Tables are added with activation of GRC: Advanced Risk.

Table	Description
Risk Event Task [sn_risk_advanced_mitigation]	Track the mitigation tasks associated with the risk event reported.
Aggregated Risk Report [sn_risk_advanced_risk_report_definition]	Create this definition where the customer can choose entities and associate some risk statements with these entities to report aggregated risk scores.
Risk Report [sn_risk_advanced_risk_report]	Based on the aggregated risk report definition, a record for each combination of entity and risk statement is created. The tolerance status and calculated score is also displayed.
Event Entry [sn_risk_advanced_event_impact]	Impact entries for the risk event to be added by the Risk Manager during the Analyze state.
Risk Event to Risk [sn_risk_advanced_m2m_event_risk]	Each risk event can be associated to applicable risks. This table enables tracking the risk event to risk relationships.
Risk Event [sn_risk_advanced_event]	Tracks the loss or gain events reported by different users.
Associated Risk Events [sn_risk_advanced_m2m_event_event]	A risk event can be linked to multiple other risk events. This table contains those associations.
Risk Event to Entity [sn_risk_advanced_m2m_event_profile]	A Risk Manager can relate multiple entities that are impacted by the risk event. This table tracks the impacted entities linked to the risk event.
Risk Event to Control [sn_risk_advanced_m2m_event_control]	A Risk Manager can relate multiple controls related to the entities that are linked to the risk event. This table tracks the impacted entities linked to the risk event.
Risk Event to Citation [sn_risk_advanced_m2m_event_citation]	A risk manager can relate risk events to regulatory obligations and citations. This association facilitates breach reporting and compliance with regulations.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
All additional tables installed by the dependent plugins are also needed for GRC: Advanced Risk.

Roles for performing advanced risk assessment

When you integrate advanced risk assessment with other applications, you must ensure the users have the necessary roles to perform and approve the assessments.

Starting with version 14.1.2, several new roles have been introduced to enable users of other applications to successfully use the advanced risk assessments feature. These independent roles have been created to provide the users the required ability to perform advanced risk assessment without requiring the Integrated Risk Management specific roles such as Risk Admin, GRC Business User.

Note:
You must manually assign the advanced risk assessment roles to the sn_grc.business_user role. To understand how you can adjust granting of roles and groups, see the How to adjust granting of roles and groups to use background jobs [KB0963693] article in the Now Support Knowledge Base. To understand more about the GRC business user role, see the GRC Business User [KB0864247] article in the Now Support Knowledge Base article in the Now Support Knowledge Base. You must log in to Now Support to view the article.

Role title [name]	Contained under	Description	Contains roles
		as approving the assessment.	
sn_risk_advanced.ara_reader	sn_risk.reader	Users with role can read all the information on a risk assessment instance. Users with this role have read access to all tables within advanced risk assessment. If there are users who only need to have access to reports, they can use this role.	
sn_risk_advanced.qualitative_risk_appetite_reader	sn_risk.user sn_risk.reader	Users can view the qualitative risk appetite fields.	
sn_risk_advanced.quantitative_risk_appetite_reader	sn_risk.user sn_risk.reader	Users can view the quantitative risk appetite fields.	

Properties installed with Advanced Risk

Properties are added with activation of GRC: Advanced Risk. There are also properties that are available for the various capabilities such as risk events and advanced risk assessments.

Properties for Advanced Risk

All the properties for Advanced Risk, are listed on the System Properties page. To access the System Properties page, in the filter navigator, type *`sys_properties.list`*.

Advanced risk plugin properties

Property	Description
Maximum number of levels for risk hierarchy [sn_risk_advanced.risk_hierarchy_max_levels]	Set the maximum number of levels of risk hierarchy. • **Type**: Integer • **Default value**: 5
Configure risk rating [sn_risk_advanced.risk_rating_config]	Compare calculated risk score with either of choices Maximum calculated ALE, Minimum calculated ALE, Average calculated ALE.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced risk plugin properties (continued)

Property	Description
	• **Type**: choice list • **Default value**: avg **Note:** This property works with classic risk scoring.
Compare risk tolerance [sn_risk_advanced.risk_tolerance]	Compare risk tolerance based on either of the choice Average, Maximum, Minimum, Sum. • **Type**: choice list • **Default value**: sum
Enable the GRC enterprise risk licensing features [sn_risk_advanced.enable_irm_advanced_risk_enterprise]	This property enables the GRC enterprise risk licensing features. • **Type**: true or false • **Default value**: false

Properties for Risk Events

To access the risk event properties, navigate to **All** > **Risk Events** > **Administration** > **Properties**.

Risk event properties

Property	Description
Machine learning solution for predicting similar risk events [ml_sn_sn_grc_pred_intel_global_similar_risk_events]	Solution definition for predicting similar risk events.
Show Basel attributes and reports [sn_risk_advanced.show_basel_attr_reports]	Set this property to true if you want to enable the Basel categorization of risk events. This property is useful for customers in the banking domain. • **Type**: True or false • **Default value**: false
Define risk event currency conversion configuration [sn_risk_advanced.risk_event_currency_conversion_date_config]	Property to define currency conversion dates for the risk event entries. You can select specific dates for currency conversion rather than relying solely on the date of impact to calculate

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk event properties (continued)

Property	Description
	the net loss. The options are as follows: • **Risk event entry date** • **First loss entry date** • **Last loss entry date** • **First recovery entry date** • **Last recovery entry date** • **Custom date** **Note:** You can also override the defined currency conversion dates in the risk response template configuration. These changes apply to both new and ongoing risk event workflows.
Make risk event to risk relationship mandatory [sn_risk_advanced.make_riskevent_to_risk_relation_mandatory]	Set this property to true if you want to ensure that each risk event has corresponding risks. • **Type**: True or false • **Default value**: false
No. of days for Rapid Recovery Classification [sn_risk_advanced.no_of_days_for_rapid_recovery_classification]	Customize the number of days that users can set as their rapid recovery threshold. • **Type**: Integer • **Default value**: 5
Show ORX External events [sn_risk_advanced.show_orx_events]	Users can choose to see the ORX External Events. ORX provides a platform for the secure exchange of high-quality operational risk loss data from around the world. This property is useful for customers in the banking domain. Customers import the ORX information as shared by

Risk event properties (continued)

Property	Description
	the ORX organization. This information can be related to risk statement or control objectives. This information can be modified by users. • **Type**: True or false • **Default value**: false
How many years of risk event data to be shown on the report [sn_risk_advanced.number_of_years_report_data]	Select how many years of risk event data must be shown on the report. • **Type**: Integer • **Default value**: 2 **Note:** This property is visible on the System Properties page.

Properties for advanced risk assessment

To access the advanced risk assessment properties, navigate to **All** > **Advanced Risk Assessments** > **Administration** > **Properties**.

Properties for Advanced Risk Assessment

Property	Description
Migrate to Advanced Risk Assessments [sn_risk_advanced.hide_risk_legacy_lifecycle]	Migrate to Advanced Risk Assessments. • **Type**: yes or no • **Default value**: no
Enable Advanced Risk PPM Integration [sn_risk_advanced.enable_advanced_risk_ppm_integration]	Perform project risk assessments. Only users with the it_pps_admin or sn_risk.admin roles can enable this property. • **Type**: yes or no • **Default value**: no For more information, see Configure Project Portfolio Management and Advanced Risk integration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Advanced Risk Assessment (continued)

Property	Description
	Note: This property is only available when Project Portfolio Management is installed.
sn_risk_advanced.metric_approval	Enables Risk administrators to define either the simple approval flow or the advanced approval flow for all the metrics and metric definitions. **Note:** This property is available only when the sn_grc_appr plugin is activated and must be set while configuring the ESG Management application. The choices are as follows: • **Simple**: By choosing this option, the Approval section will be enabled both on the manual metric definition form and within the metrics. Using this section, you can designate approvers directly on the metric definition form. • **Advanced**: When you choose this option, the Approval section will be unavailable on the manual metric definition form and the metric form. Instead, approval can be configured by setting the approval conditions, tables, and approvers in the GRC: Approver Configurator application. This application also allows you to define multiple levels of approvals. For more information see, Using Approver Configurator for setting up approvals.

Business process roles

Various roles are available for business process users and managers.

The following table lists the roles that you must use for managing your business processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles used for managing business processes

Role title	Description
Business process administrator business_process_admin	This role provides create, read, update, and delete (CRUD) access to all records and their relationships in the business process. This role is assigned to users who are administrators and have thorough information and training on business processes. In the context of GRC, users with the sn_grc.admin role who manage GRC applications and their setup automatically gain access to this role. This access enables the GRC administrators to administer business process and its records similar to other GRC tables.
Business process manager business_process_manager	This role is assigned to business process managers who are usually specialists and manage multiple business processes in the organisation. They can create, read and update any business process and manage the relationship of business process with other records. Such users generally work with other employees and are experts around business processes. In the context of GRC, users with the sn_grc.manager role automatically inherit this role that enables them to manage the business processes for the entire organization.
Business process user business_process_user	This role must be assigned to the respective process owners who manage the business process that they own. With this role, they can update the business processes that they own and can also read any business process. This role can also be provided to users who are required to view the business processes in the organization and understand them better. In the context of GRC, users with the sn_risk.user role are automatically assigned this role as this role enables them to manage the business processes they own as well as read all business processes.

Domain separation in Risk Management

Domain separation is supported for Risk Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.

These users can choose to expand or collapse the domain scope to show or hide data from other domains.

Note:
Users always have access to data from domains that have been explicitly granted to them by domain visibility.

How domain separation works in GRC

- While GRC supports separation of data, separation of logic and process is not fully supported.

- Many types of records in GRC are automatically generated through user processes. Entities, controls, risks, indicators, and control tests are all fields that can be generated automatically. For records that are automatically generated, the domain of the record is determined by the domain iterator configured for the job. Otherwise, it defaults to the default domain (if defined) or to the Global domain. For records that are manually generated, the domain is derived from the domain of the user creating the record.

  Automatic generation should be kept in mind when working in a domain-separated GRC implementation. Users should be sure that they are creating / generating records at the right domain level so that they are visible to the right set of users.

  For example, suppose you have domains that look like:

  - Global
  - TOP
    - Domain A
    - Domain B

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have a risk or control that you want to be assessed by users in domains A and B, the risk or control should be generated or manually created at the global level. If the risk or control is created in Domain B, you will not be able to recreate the risk or control in Domain A due to indexing.
- If you have a risk or control that you want to be assessed by users in TOP and Domain A, you can create the risk or control in Domain A.

Unless the risks and controls are in the Global domain, users should not assign risks or controls in a higher domain to users in a lower domain. In the example above, if you have a control in the TOP domain, you should not assign it for attestation to users in Domains A or B since those users would not have access to the control; thus the attestation or assessment questionnaire would not be generated.

Similarly, users should not assign control objectives and risk statements in a higher domain to attestations and assessments in a lower domain. Otherwise the attestation or assessment questionnaire would not be generated.

Use case

GRC data for IT can be separated from the GRC data of other departments. Each business area using the GRC application can have separate data that cannot be shared with other departments. Therefore each department can have its own entities, policies, controls, risks, and so on.

When looking at a control from the IT domain, the user can choose to expand the domain scope to show values from the Finance domain or collapse the domain scope to show only controls that match the IT domain.

By default, domain separation adds a domain field to the Task `[task]` and Configuration Items `[cmdb_ci]` tables and their extensions.

You can extend domain separation to any new tables you create by adding `sys_domain` and `sys_domain_path` fields to the table's dictionary definition. By default, the system only domain-separates platform and baseline application tables where appropriate.

Warning:
ServiceNow does not recommend domain separating platform tables (any table with the sys_ prefix such as the Dictionary Entry `[sys_dictionary]` and Dictionary Entry Override `[sys_dictionary_override]` tables) because it can produce unexpected results.

In this use case, client scripts, business rules, workflows, processes, and so on can be domain-separated.

While the behavior offered with domain separation provides multi-tenancy support, multi-tenancy is still contained within a single instance. This means that some global properties, some global data, and some global processes are shared across all domains. For example, the system's "Remember me" option on the login page is global and cannot be specified per domain.

If you need complete and total separation of all system properties and do not require global reporting or global processes, separate instances are the best option.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain values are allocated to GRC objects

Records that are automatically generated, the domain of the record is determined by the domain iterator configured for the job. The following table shows how domain values are allocated to different GRC objects:

GRC objects	Domain source
Risk	Gets domain value from Entity.
Risk assessment	Gets domain value from Risk.
Object assessment	Gets domain value from Object.
Risk assessment response	Gets domain value from Risk Assessment instance.
Risk identification	Gets domain value from Entity.
Aggregated risk	Gets domain value from Entity and Risk statement.
Basel reports	Gets domain value from Risk events.
Risk to control	Gets domain value from Risk.

Note:
When the domain source is global or nil, then that object's domain will be set to Default.

Smart Assessment Engine

The ServiceNow® Smart Assessment Engine (SAE) application helps you to reduce the manual burden and costs of your assessment processes through automation.

Exploring Smart Assessment Engine

The ServiceNow® Smart Assessment Engine (SAE) helps you reduce the manual burden and costs of your assessment processes through automation.

Smart Assessment Engine

In Governance, Risk, and Compliance (GRC) workflows such as compliance management, vendor risk management, privacy management, audit management, business continuity, and operational risk management, organizations face challenges in gathering input from employees and making informed decisions. Manual processes can be inefficient, time-consuming, and prone to errors, leading to increased operational costs and compliance risks.

SAE is designed to automate and optimize assessment processes, reducing manual efforts and costs. It provides an intuitive, configurable, and access-controlled assessment experience, enabling organizations to design and execute assessments seamlessly while ensuring compliance and efficiency. SAE is a versatile and business-friendly assessment engine that simplifies data collection, risk analysis, and compliance management. It supports a drag-and-drop template designer for effortless assessment creation and includes predefined roles to align with standard user personas. SAE ensures end-to-end workflow automation, post-assessment actions, and seamless collaboration.

By implementing SAE, organizations can streamline assessments, enhance accountability, and ensure regulatory compliance while optimizing overall efficiency. It enables organizations to track risks, maintain compliance, and improve decision-making through standardized evaluation processes.

Smart Assessment Engine benefits

The following table shows the benefits of the Smart Assessment Engine application.

Roles of SAE users

Assessment actor

A user with the assessment actor [sn_smart_asmt.actor] role can respond to the assessments that are assigned to them. They can also reassign these assessments.

Assessment reader

A user with the assessment reader [sn_smart_asmt.assessment_reader] role can read the assessments within the categories that they're assigned to. Additionally, they can read and comment on the assessments they created, and view and comment on the assessments that are generated from those templates.

> **Note:**
> The Assessment reader role field in the template determines the minimum user role that is required to view and comment on assessments. Only users with the specified role and the Assessment reader [sn_smart_asmt.assessment_reader] role can access the assessments that are generated from this template.

Assessment Admin

A user with the assessment admin [sn_smart_asmt.assessment_admin] role can create, view, update, and delete both template categories and assessment templates. Additionally, the user with this role can view all the assessments, modify their states, reassign the assessments, and migrate the existing metric types to new assessment templates.

Template reader

A user with the template reader [sn_smart_asmt.template_reader] role can read specific assessment templates that are based on the categories mapped to the templates.

> **Note:**
> Each template must be mapped to one or more template category. A template reader must have this role to view the templates that are mapped with that category. A template reader must be able to access a template category to view the template.

Template Manager

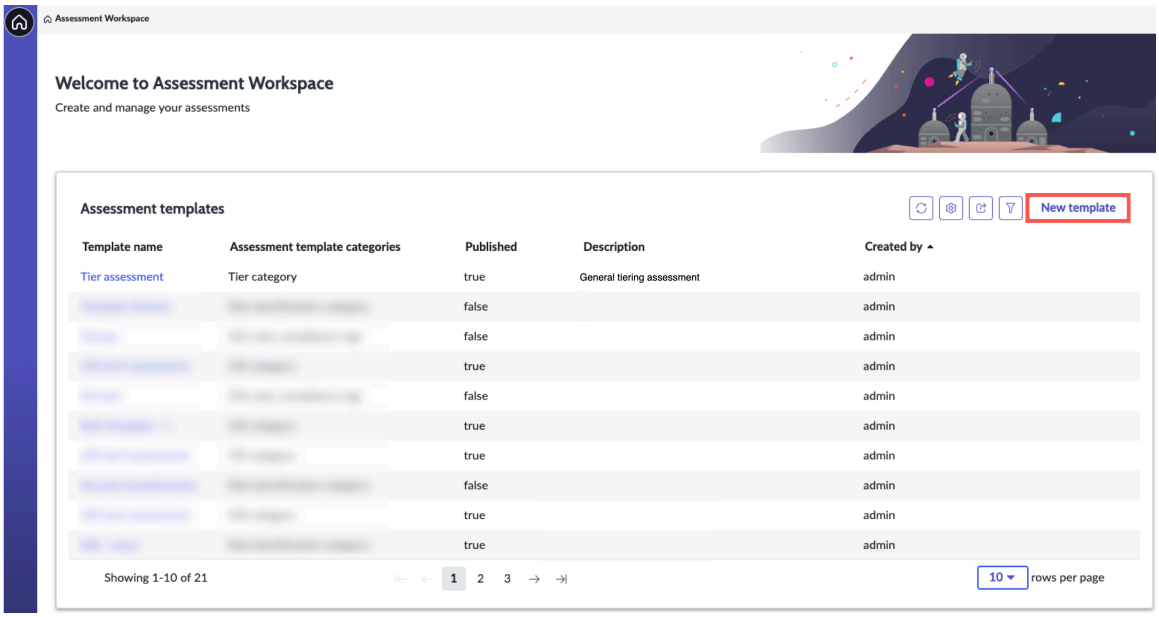
A user with the template manager [sn_smart_asmt.template_manager] role can read, write, or create specific assessment templates that are based on the categories that are mapped to these templates. Their access to the template categories during the creation process is governed by the same rules that apply to the template readers.

Template Developer

A user with the template admin or template manager role and template [sn_smart_asmt.developer] role can read, write, and create the script for response automation in assessment questions.

For more information, see Roles in Smart Assessment Engine.

Accessing templates in the Assessment Workspace



You can see all your assessment template-related information on the Assessment Workspace landing page. You can review the published and unpublished assessment templates and create assessment templates by using the Smart Assessment Engine application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Smart assessment workspace

You can view all your assessment template-related information by navigating to **Workspaces** > **Assessment Workspace**. If you have the sn_smart_asmt.assessment_admin or sn_smart_asmt.template_manager roles, you can create the assessment templates or update the unpublished assessment templates in the Assessment Workspace. A template manager's ability to create or update the assessment templates is determined by their category role. Any team member with the Template reader [sn_smart_asmt.template_reader] role can view the specific templates for their category role. For more information on the assessment categories, see Create an assessment template category. You can also access the Assessment Workspace landing page by selecting the home icon .

As shown in the following example, you can view all of your published and unpublished assessment templates with their names, categories, and descriptions.

Creating assessment templates

You can create a template by selecting **New template** and filling out the Template details form. For more information, see Create an assessment template and Using the template designer.

Domain separation and Smart Assessment Engine (SAE)

Domain separation is supported for Smart Assessment Engine. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Smart Assessment Overview

The ServiceNow® Smart Assessment Engine (SAE) application helps you to reduce the manual burden and costs of your assessment processes through automation.

You can use the Smart Assessment Engine application to create and distribute assessments to employees for evaluating various situations, aspects, or records.

How domain separation works in Smart Assessment Engine

- To use a domain-separated model, the platform version must be in at least the Xanadu release.
- Templates in SAE are process-separated.
- Assessments are data-separated.
- All actors including the assessment group should belong to the same domain or global domain.
- The assessment template should be accessible in the common domain where the assessment is created.
- Domain overrides aren't supported.

Note:
The Smart assessment connected plugin [com.sn_smart_asmt_connect] must be installed for domain separation to be available.

The table displays different scenarios within the assessment domain, illustrating the relationship between the domain of the scope item and the domain of the assessment actors. Each row represents a different scenario, indicating whether the assessment actor has access the assessment template.

Scope item	Assessment actor	Assessment
Domain A	Domain B	Not possible
Domain A	Domain A	Domain A
Not applicable	Domain A	Domain A
Global	Domain A	Domain A
Domain A	Global	Domain A

Domain separation for service providers

Configuring Smart Assessment Engine

You can activate or upgrade the Smart Assessment Engine application by downloading it from the ServiceNow Store and then configuring the settings in the initial setup checklist to meet your needs.

Configuration overview

Install or upgrade ServiceNow® Smart Assessment Engine (SAE) by completing the task on the initial setup checklist.

Initial setup checklist for SAE

Consider printing the following checklist so that you can check off the tasks as you complete them. To generate a PDF, select **Save As PDF** ( ) and then select **Selected topic**.

Setup tasks for standard SAE application

Task	Description
☐	Activate the **Smart Assessment Core** plugin (com.sn_smart_asmt). Role required: admin
☐	Activate the **Smart Assessment Designer** plugin (com.sn_smart_asmt_desg). Role required: admin
☐	Activate the **Smart Assessment Connected** plugin (com.sn_smart_asmt_conn). Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time.

Setup tasks for advanced SAE features

Task	Description
☐	Activate the **Smart Assessment Migration Tools** plugin (com.sn_smart_asmt_mig). Role required: admin **Note:** The migration plugin is necessary only if you have existing assessment designs. This plugin migrates your existing metric types to the new assessment templates. For more information on migrating metric types to assessment templates, see Creating an assessment template from legacy assessment metric types.
☐	Activate the **Smart Assessment Dependencies** plugin (com.sn_smart_asmt_dep). Role required: admin **Note:** This plugin is necessary if you want to use the features domain separation and post-assessment actions.
☐	Activate the **Smart Assessment Post-Assessment Actions** plugins (com.sn_impact_fwk) and (com.sn_smart_imp_auto). Role required: admin **Note:** The Smart Assessment Dependencies plugin must be activated before activating the Smart Assessment Post-Assessment Actions plugins.
☐	Activate the **Advanced Response Automation for Smart Assessment** plugin (com.sn_smart_resp_auto). Role required: admin
☐	Activate the **Basic Scoring for Smart Assessment** plugin (com.sn_smart_scoring). Role required: admin
☐	Activate the **Smart Assessment Collaboration** plugin (com.sn_smart_collab). Role required: admin

To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
After installing the required plugins, you can do the following:

- Assign SAE roles to users and user groups. Roles determine the permissions and access in the Smart Assessment Engine application. For more information, see Roles in Smart Assessment Engine.
- Activate a language. The ServiceNow AI Platform uses American English by default. You can configure SAE to use a different language. For more information, see Activate a language.
- Refer to the upstream application documentation for further steps. For example, after installing the plugins from the setup checklist, you can refer to the Policy and Compliance Management documentation to enable smart assessments in Policy and Compliance Management.

Triggering assessments

You can trigger a Smart Assessment Engine assessment from the Workflow Studio or from a script. With either method, you specify a published assessment template, the assessors who respond, and other optional inputs.

Important:
You can create an assessment only from a published assessment template. You can update a published template only if no active assessment is associated with the template.

Trigger an assessment from Workflow Studio

Configure the Trigger Smart Assessment flow action to initiate the Smart Assessment Engine assessments and send them to the specified assessors. You then add the action to your flow.

For more information, see Configure the Trigger Smart Assessment Flow action.

Trigger an assessment from a script

Use a script to execute the Trigger Smart Assessment flow action to generate Smart Assessment Engine assessments and assign them to the assessors.

An example trigger condition might be that the state in the control table changes to **Attest**.

For more information, see Trigger assessments from a script.

Related topics

Flow Designer

Building flows

Create a flow in Workflow Studio

Configure the Trigger Smart Assessment Flow action

Configure the Trigger Smart Assessment flow action to initiate the Smart Assessment Engine assessments and send them to the specified assessors. You then add the action to your flow.

Before you begin
Role required: flow_designer

About this task
The flow includes both a trigger condition and the Trigger Smart Assessment flow action.

An example trigger condition might be that the state in the control table changes to **Attest**.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. On the **Action** tab, select **Trigger Smart Assessment**.
3. Fill in the Trigger Smart Assessment action form to design the action.
   The settings on the form are described in Trigger Smart Assessment action form.
4. Test the action as described in Building flows.
   For descriptions of all these settings, see Settings in the Test action pop-up window.
5. Select **Save**.

> **Note:**
> After you save the configuration, select **Activate** to trigger the assessment.

Result
Assessments are triggered.

Trigger assessments from a script

Use a script to execute the Trigger Smart Assessment flow action to generate Smart Assessment Engine assessments and assign them to the assessors.

Before you begin
Role required: flow_designer

About this task
In the script, you specify the assessment template for the generated assessments and the conditions that trigger the assessments.

Procedure

1. Navigate to **All** > **Process Automation** > **Workflow Studio**.
2. On the **Actions** tab, select **Trigger Smart Assessment**.
3. In the More actions icon (...), select **Create code snippet**, and then copy and paste the snippet into your script.

Result

> **Note:**
> In the snippet, you have the option to specify whether the action should execute synchronously or asynchronously. Select the asynchronous option to help avoid stalling, especially when processing large templates.

The call to the Trigger Smart Assessment action is now part of the script.

Creating an assessment template from legacy assessment metric types

You can use the assessment designs that you have already created by migrating the metric types to the Smart Assessment Engine assessment templates. You can leverage the existing assessment designs to support SAE assessment automation, analysis, and reporting.

Overview of the migration process

The sets of questions that are defined in the ServiceNow® Assessments and Surveys application are saved as metric types and are what you are migrating into SAE. When you migrate a legacy metric type to an SAE assessment template, the original metrics are saved as question types. For more information on which metric types are supported and how they are mapped to SAE, see How legacy metric types are migrated to sections in templates.

The migration process does not support all metric types in the ServiceNow® Assessments and Surveys application. The following table lists the metric types that are not supported.

Metric types not supported for migration

Metric Type	Description
Custom	Metric type used to create a nonstandard question.
Duration	Metric type used to create a question related to the time duration. For example, a question about the planned duration or actual duration in an assessment.
Image scale	Metric type used to create a question where users select an image to use for scales.
Percentage	Metric type used to create a question where users enter a percentage.
Rankings	Metric type used to create a question where users select a different order number for each option to rank them.
Ratings	Metric type used to create a question where users can enter a rating.

Note:
Migrating metrics in a data-type template that enables the image flag to be selected aren't supported.

Migration Process

Generate an assessment template from an existing metric type by following this process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Fill in a form:
   - Specify which metric type to migrate.
   - Specify the assessment template category that you want the template to be associated with. An assessment template category specifies the group of users that can access the template.
2. Start the migration process. The following activities then transform the metric type data into an SAE assessment template:
   - Metric categories become sections in the template.
   - Metrics become questions in the template.
   - Metric definitions become response options in the template.
   - The template is given the name of the original metric type.
   - The template is mapped to the template categories that you specified on the form.

   Note:
   The template definitions are migrated as response options if the metric data type is a template.

   For more information, see How legacy metric types are migrated to sections in templates.
3. On the Assessment Workspace, validate the assessment template and update it as needed. After the template is published, you can use it to generate assessments.

   Note:
   The migrated assessment templates are in the draft state after migration. You must review and publish the template before you can use it for assessments.

For more information about migrating the legacy metric types, see Migrate a legacy metric type to an assessment template.

Results of migrating a metric category to an assessment template

Migrate a legacy metric type to an assessment template

Migrate an existing metric type to an SAE assessment template. You can leverage the existing assessment designs while using Smart Assessment Engine.

Before you begin
Role required: sn_smart_asmt.assessment_admin

About this task
SAE must be running on the same instance as the metric data to migrate.

Procedure
1. Navigate to **All** > **Smart Assessment Engine** > **Administration** > **Template Migrations**.
2. On the Assessment template migrations list, select **New** and then fill in the Assessment template migration form.

   You specify the metric type to migrate and the template category that the assessment template should be associated with. The system automatically fills in the other settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment template migration form

Field	Description
Number	Unique number, starting with the text ATMIG, that the system assigned to the migration record for the metric type. You can use the number to search for the record.
Source metric type	Metric type to migrate to the assessment template format.
Purpose	Purpose that the new assessment template should be a member of. For example, Risk, Performance, Security, Personal data, and so on. Template categories that enforce the data segregation for templates. A category controls which users can view a template. Each assessment template is associated with one or more template categories. To view a template in a category, you must have a category role that is associated with the category. By default, newly defined template categories are active. **Note:** You can only select one purpose.
Migration status	Value that changes as the template migration process proceeds. ○ New: Status of a template migration definition before you start migration. ○ In progress: Status for after you start the migration process, the process is in progress until it finishes. ○ Completed: Status of a template migration if all items (metric type, metric categories, and metrics) migrate, which means that the template is ready for you to review, update, and eventually publish. ○ Partially completed: Status when any of the downstream elements like the questions, sections, or metric category haven't migrated successfully. In this case, you must address the errors and restart the migration process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Errored: Status when an error occurs during the migration. In this case, you must address the errors and restart the migration process.
Target assessment template	New template that the existing metric type is migrated to. **Important:** If the migration status is **Errored**, the field shows no value.

3. Select **Migrate**.

Result
The Section migration related list is updated as migration proceeds. You can view the data that was migrated from the metric type to the Smart Assessment Engine assessment template in the related lists on the Assessment template migration form. See Results of migrating a metric category to an assessment template.

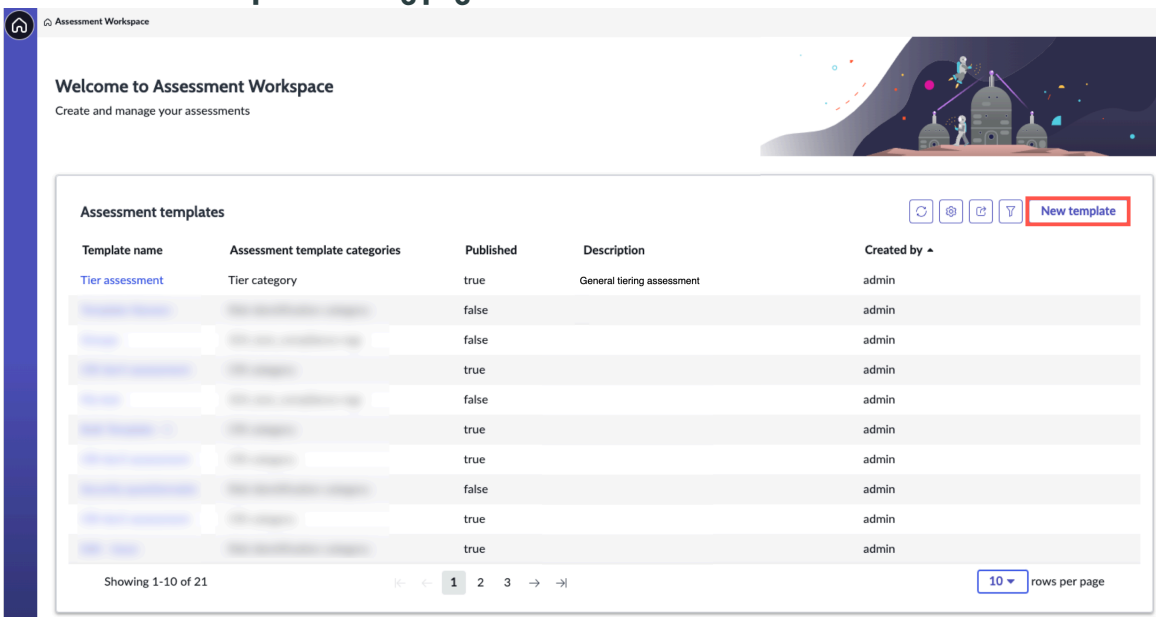
Manage smart assessment lifecycle

Use template designer to create assessment templates. After the templates are published, assessors can respond to assigned assessments, track progress, and save their input automatically.

Use this section to manage the full lifecycle of smart assessments, from designing templates to submitting responses.Using the template designer, template managers and administrators can create structured assessment templates with instructions, questions, reference information, and configure automations. After the templates are published, assessors can respond to assigned assessments, track progress, and save their input automatically.

Using the template designer

You can create assessment templates and add instructions, questions, and reference information by using the template designer in the Smart Assessment Engine application. Smart assessments can help you to evaluate various situations, aspects, or records.



Overview of using the template designer

If you have the template manager [sn_smart_asmt.template_manager] or assessment admin [sn_smart_asmt.assessment_admin] role, you can create and update assessment templates by navigating to the Assessment Workspace landing page. You can create a template by selecting the **New template** button and update an assessment template by selecting an existing unpublished assessment template from the Assessment templates list.

The following example shows the Assessment Workspace landing page, where you can view all templates and open the template designer.

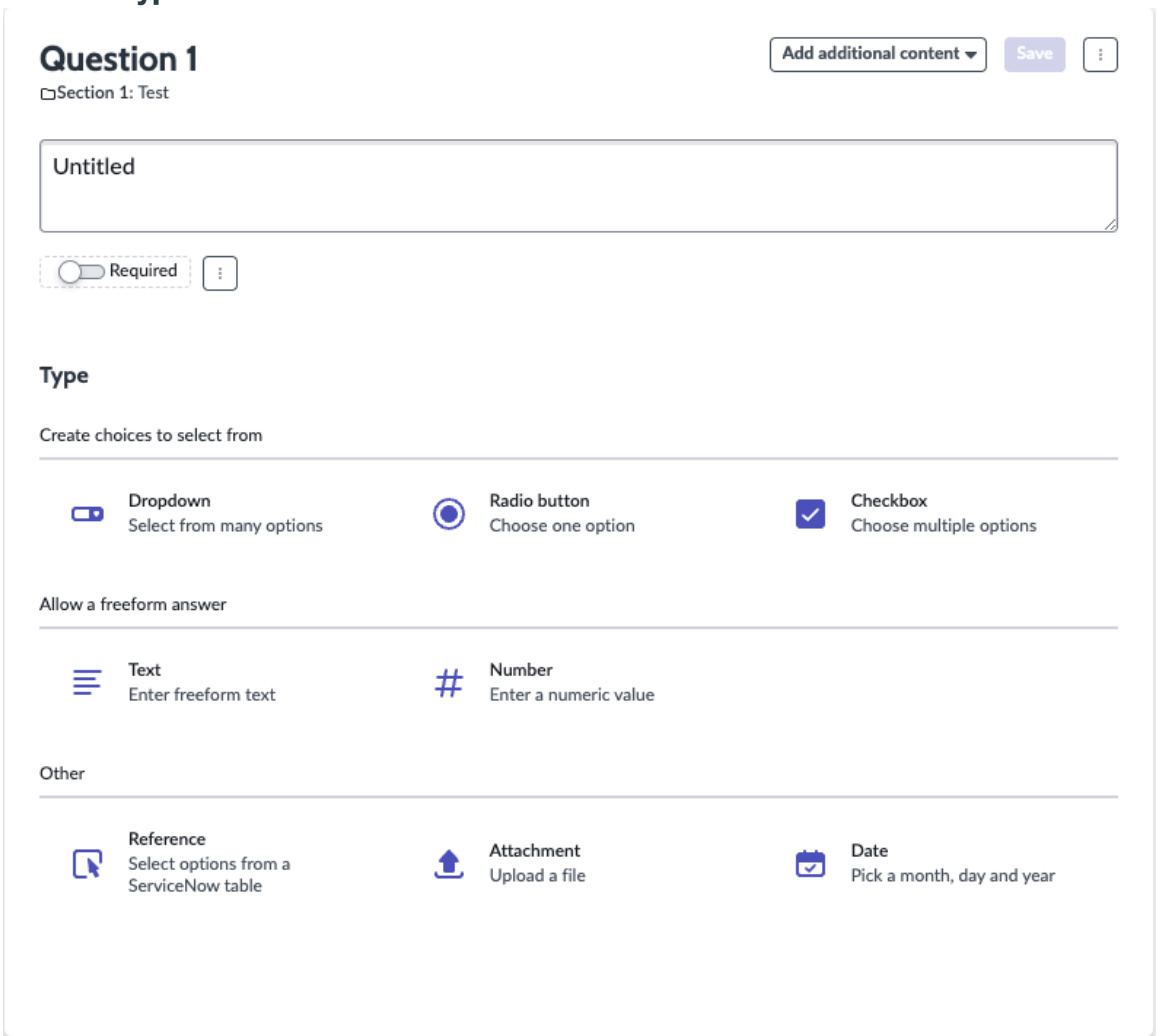
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Workspace landing page

In the template designer, you can view and edit the assessment template details on the **General** tab. From this tab, you can access the Settings page to configure the key settings. For example, configuring the assessment duration sets the time frame for your responders to complete the assessment.

Adding instructions and questions to a template

Instructions help you set clear expectations for your responders, and questions help you gather precise and relevant information from your responders. You can add instructions and questions to a new assessment template or an existing assessment template. You can add sections to categorize your questions by different areas. Each section requires a name and specific questions.



You can choose from the following question types:

- Text question
- Drop-down list question
- Radio button question
- Check box question
- Number question
- Reference question
- Attachment question
- Date question

You can also customize the attributes of the question, such as its visibility conditions, setting up default automated response, and justification requirements to ensure well-supported answers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question types

You can use instructions and questions to help gather precise and relevant information from your responders. For more information, see Add instructions and questions to an assessment template.

Adding reference information to a template

You can add reference information that assessors can see while they complete the assessment. The reference information can include any live data from the assessment scope. For example, you can include information on any of the associated incidents, work notes, or domain. Adding necessary reference information to assessments can help minimize the need for external references. For information on how to add reference information, see Add reference information to an assessment template.

Creating categories for an assessment template

Template categories determine who can access the template. Before you can add an assessment template category to a new or existing unpublished assessment template, you must make a template category. You can't create a template category within the template designer, and after a template is associated with a template category, you can't update it. For information on how to create assessment template categories, see Create an assessment template category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Searching within assessment templates

Search for text within the assessment template sections, subsections, or questions. The search results appear in place of the content tree, and the first match is highlighted. If no matches are found, a `No results found` message is displayed. You can select the search icon in the navigation pane to display the search box.

Triggering assessments

After you finalize and publish these templates, you can use them to trigger the assessments. For more information on triggering the assessments, see Triggering assessments.

Note:
You can create an assessment template only from a published assessment. If there isn't an associated active assessment, you can modify and publish these published templates again.For more information, see Accessing templates in the Assessment Workspace and Create an assessment template.

Create an assessment template

Create an assessment template by using the Smart Assessment Engine application by naming it, specifying its categories, and optionally, specifying the tables that have the records as the assessment target or scope. You can then add questions and other attributes to the template. Alternatively, you can also copy an existing template including all questions, sections, instructions and existing configurations.

Before you begin
Role required: sn_smart_asmt.template_manager

About this task

Important:
You can create an assessment only from a published assessment template. You can update a published template only if no active assessment is associated with the template.

Procedure

1. Navigate to **Workspaces** > *Assessment Workspace* to access the Assessment Workspace landing page.
2. Create a template by selecting **New template**, and then fill in the template details form.

   Note:
   You can also copy an existing template including all questions, sections, instructions, and existing configurations. For more information on how to copy an existing template refer to Copy an assessment template.

3. On the Create assessment template form, fill in the fields.
   For a description of the field values, see Create assessment template form.
4. Select **Save**.

What to do next
You can fill in the template with instructions, questions, and optional guidance for responding to a question, as well as sections that group the related questions. See Add instructions and questions to an assessment template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Create an assessment template category

Copy an assessment template

Add instructions and questions to an assessment template

Add instructions and questions to an assessment template by using the Smart Assessment Engine application. You can use instructions and questions to help gather precise and relevant information from designated responders.

Before you begin

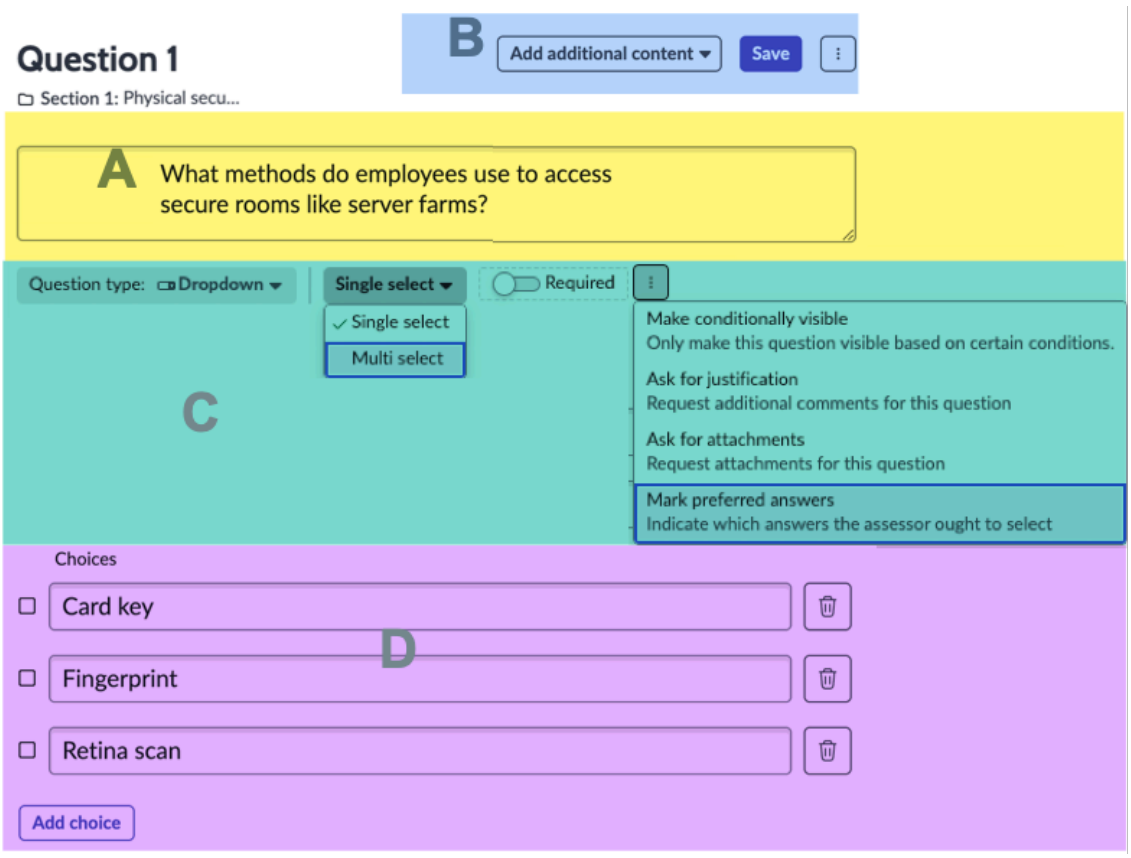
Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure

1. Open an assessment template for updates by either going to the landing page or when you create a template and save it.
   The Details page on the **General** tab displays the information that you provided to create the template.
2. Select the Settings page and then fill in the values.

Settings page

Field	Description
Duration	Default time period in days between when the assessment is sent and when the responders are expected to return a completed assessment. This setting is used to calculate the **Due date** value for assessments that are generated from this template.
Assessment reader role	Role that is required to view an assessment that is generated from this template.



3. Add instructions to the assessment.
   a. On the **Questions** tab, select **Add instructions**.
   b. Enter the information that a responder might find useful in the Instructions text box.
      This information could include the purpose of the assessment, the ways that the responses are used or analyzed, and so on.
   c. Select **Save**.
4. On the **Questions** tab, select **Add instructions**.
5. Enter the information that a responder might find useful in the Instructions text box.
   This information could include the purpose of the assessment, the ways that the responses are used or analyzed, and so on.
6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Add a section that can hold questions by selecting **Add section**.
   The sections organize the questions into manageable groups. For example, an assessor who is knowledgeable about a subject can answer all questions in one section and an assessor with a different area of expertise can respond to questions in another section. The sections can contain either the subsections or questions, but not both. The subsections can only contain questions but no other subsections.

   Note:
   At any time, you can select a section in the list and then select **Delete** to delete that section.

8. Enter a name and description for the section and then select **Save**.
9. Select a section in the list and then select **Add question**.

For each question type, you configure the following settings:

A: Enter the text of the question

Enter the question text that the assessor reads.

B: Add additional content (optional)

Add a plain text description that appears after the question and Guidance text that could contain HTML or images by selecting **Question description**. You can provide descriptive text that appears in addition to the question text and provide guidance on how best to answer the question.

C: Specify the question type and set the attributes for the type

Configure any one of several question types (check box, text, date, and so on).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can customize each type of question with attributes like whether a response is required or visible only when specified conditions are met, whether particular responses are correct or preferred, whether a justification is required, and so on.

Note:
The option to have one or multiple records selected as answers to one question is available only for the drop-down list, check box, and reference question types.

D: Specify possible responses

Configure a specified set of possible responses to some question types.

For more information on configuring a question, see one of the following topics.

Description	Location
Create and configure text type questions.	Create a text question
Create and configure drop-down list type questions.	Create a drop-down list question
Create and configure radio button type questions.	Create a radio button question
Create and configure check box type questions.	Create a check box question
Create and configure number type questions.	Create a number question
Create and configure reference type questions.	Create a reference question
Create and configure attachment type questions.	Create an attachment question
Create and configure date type questions.	Create a date question
Create and configure code type questions.	Create a code question

Create a text question

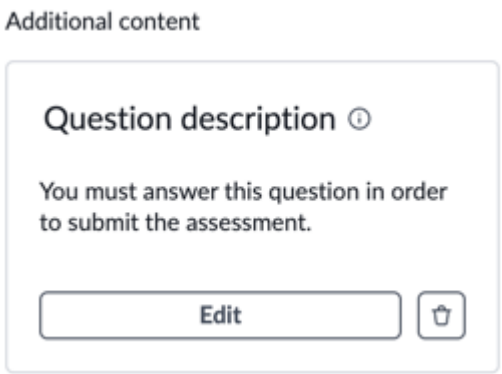
Enable the assessors to respond to a question by using simple text in an assessment. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.

Before you begin

Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

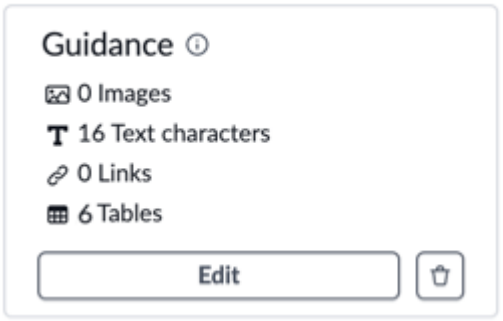
Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.
2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Text** and then enter the question in the text box.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Preview section displays an example of the text box that the assessor uses for the response.



4. Specify any number of attributes for the question.

5. Select **Save**.

6. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**. 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. The content appears in a pop-up win dow when the assessor accesses the ques tion. A confirmation box displays the list of items that are provided to an assessor. Update the content by selecting **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

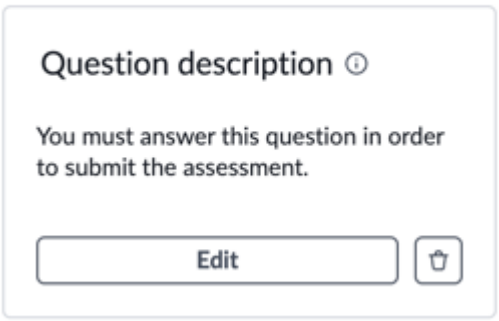
Option	Description
	Additional content 

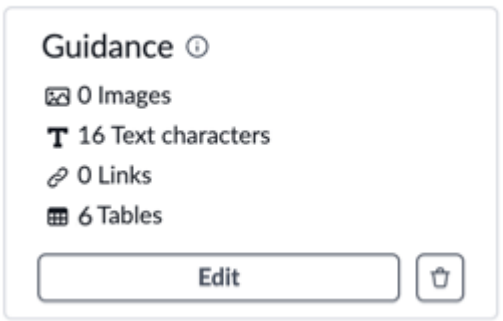
7. Select **Save**.

Create a drop-down list question

Enable the assessors to respond to a drop-down list question by making one or more selections from a list. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.

Before you begin





Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.
2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Drop-down list** and then enter the question in the text box.
   The system adds two **Choice** text fields.
4. In the Choices section, enter the text for the response choices that appear to the assessors in the assessments.
   Create additional choices by selecting **Add choice**.
5. Specify any number of attributes for the question and select **Save** after every change.
6. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Additional content 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. The content appears in a pop-up win dow when the assessor accesses the ques tion. A confirmation box displays the list of items that are provided to an assessor. Update the content by selecting **Edit**. Additional content 

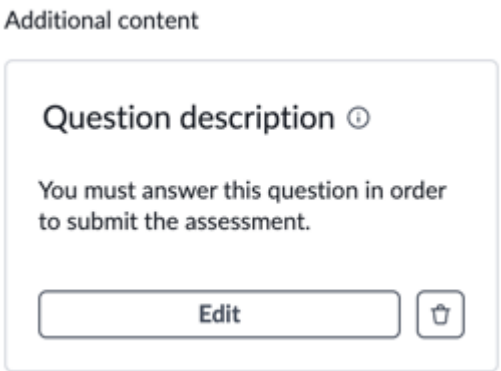
7. Select **Save**.

Create a radio button question

Enable the assessors to respond to a radio button question by making a selection from a limited list of options. Only one selection is allowed for this question type. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.

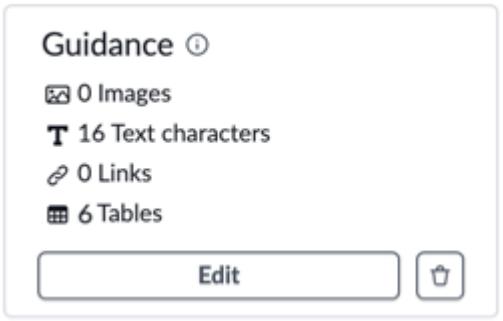
Before you begin

Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin



Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Radio button** and then enter the question in the text box.
   The system adds two **Choice** text fields.
4. In the Choices section, enter the text for the response choices that appear to the assessors in the assessments.
   Create additional choices by selecting **Add choice**.
5. Specify any number of attributes for the question and select **Save** after every change.

6. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**. 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. The content appears in a pop-up win dow when the assessor accesses the ques tion. A confirmation box displays the list of items that are provided to an assessor. Update the content by selecting **Edit**.

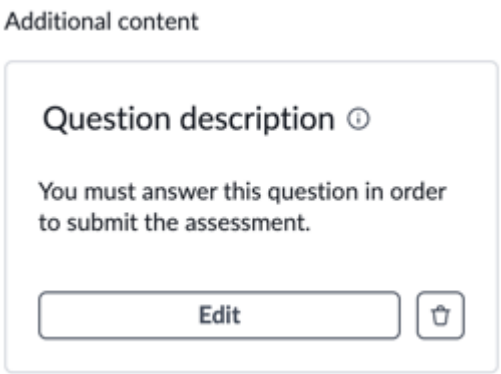
Update the content by selecting **Edit**. Additional content 

7. Select **Save**.

Create a number question

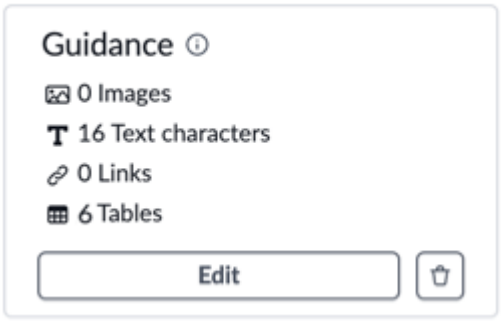
Enable the assessors to respond to a number question with a numerical value. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.

Before you begin



Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure



1. Open the assessment template to add questions on the landing page or create a template to add questions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Number** and then enter the question in the text box.
   The Preview section displays an example of the text box that the assessor uses for the response.
4. Specify any number of attributes for the question and select **Save** after every change.
5. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**. 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. The content appears in a pop-up win dow when the assessor accesses the ques tion. A confirmation box displays the list of items that are provided to an assessor. Update the content by selecting **Edit**.

Option	Description
	Additional content 

6. Select **Save**.

Create a reference question

Enable the assessors to respond to a reference question by selecting an item from a list. The list is generated dynamically from the data in the table that you specify. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.

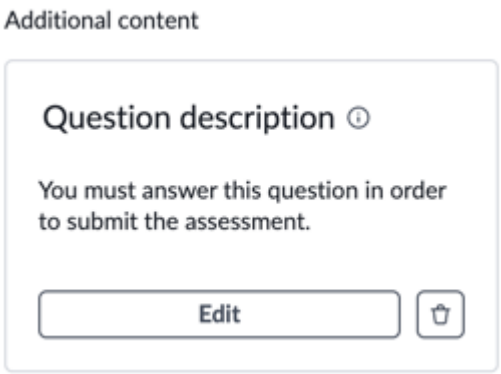
Before you begin

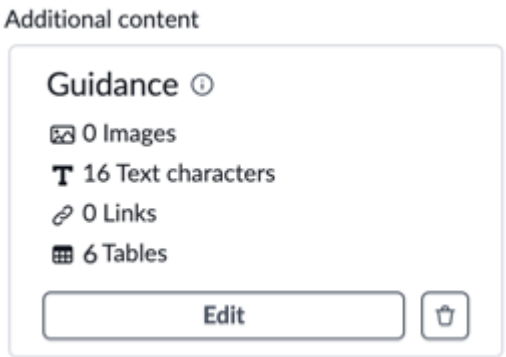
Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.

2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Reference** and then enter the question in the text box.
   The system adds two fields that enable you to configure the source and content of the possible responses.





Configure the reference type question

Table	Source of the data that becomes available dynamically as possible responses.
Field to display in drop-down list	Field in the specified table whose data is presented as potential responses.

4. Specify any number of attributes for the question and select **Save** after every change.

5. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

© 2026 ServiceNow, Inc. All rights reserved.

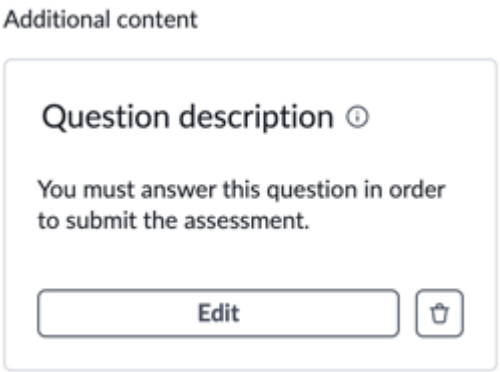
Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**. 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. The content appears in a pop-up win dow when the assessor accesses the ques tion. A confirmation box displays the list of items that are provided to an assessor. Update the content by selecting **Edit**. 

6. Select **Save**.

Create an attachment question

Enable the assessors to respond to an attachment question by adding one or more files as a response. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.



© 2026 ServiceNow, Inc. All rights reserved.

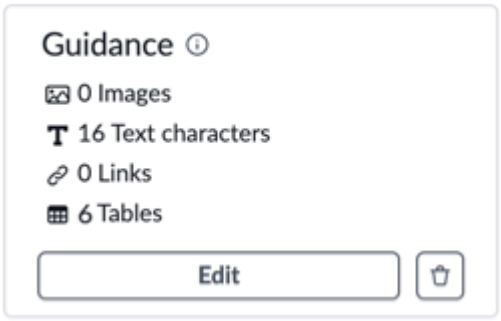
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin



Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.
2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Attachment** and then enter the question in the text box.
   The Preview section displays an example of how the attached file appears to the assessor.
4. Specify any number of attributes for the question and select **Save** after every change.
5. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**. 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. The content appears in a pop-up win dow when the assessor accesses the ques tion. A confirmation box displays the list of items that are provided to an assessor. Update the content by selecting **Edit**.

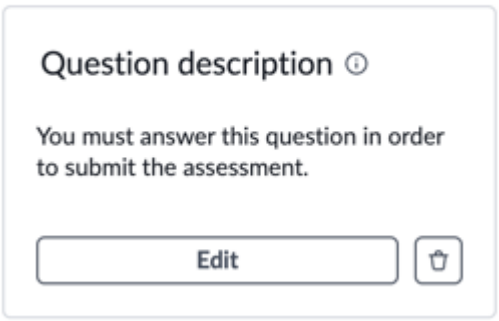
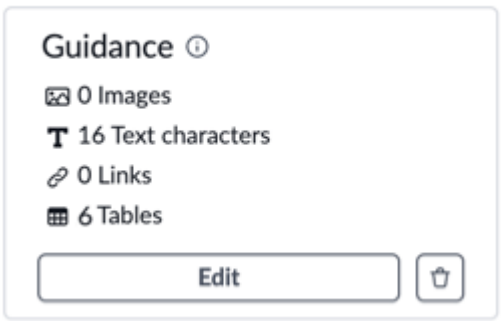
6. Select **Save**.

Create a date question

Enable the assessors to respond to a date question by specifying a date or a date and time. Specify any of several attributes to qualify the question, for example, whether a response is required or an attachment is requested as part of your assessment template by using the Smart Assessment Engine application.

Before you begin





Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.
2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the Type section, select **Date** and then enter the question in the text box.
   The Preview section displays an example of how the date or date/time field appears to the assessor.
4. Specify any number of attributes for the question and select **Save** after every change.
5. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**.

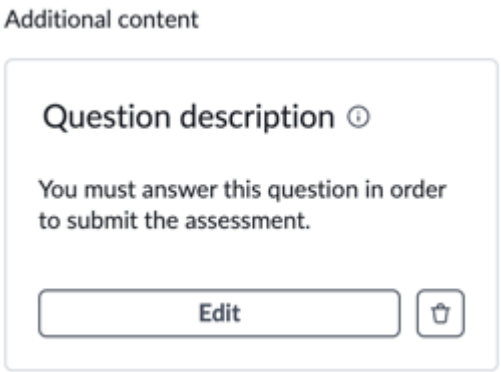
6. Select **Save**.

Create a code question

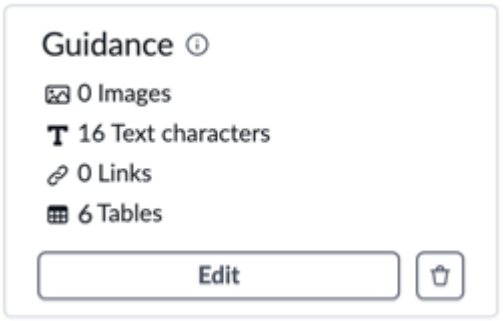
Enable the assessors to respond to a question by using entering a barcode number or scanning a QR code in an assessment.

Before you begin



Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Note:
Users with the sn_smart_asmt.template_manager role must also have the appropriate template category role assigned.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the assessment template to add questions on the landing page or create a template to add questions.
2. On the **Questions** tab for the template, select the section that you want to add the question to and then select **Add question**.
3. In the **Type** section, select **Code**.
4. Enter the barcode manually or select scanner and scan the QR code.
   The Preview section displays an example of the text box with the code or scanned QR code that the assessor uses for the response.
5. Specify any number of attributes for the question.
6. Select **Save**.
7. **Optional:** If you want to add content that helps the assessor answer this question, select **Add additional content**.

Option	Description
Question description	(Optional) Enter the descriptive text that fol lows the question when the assessor access es the question. A confirmation box displays the text as an as sessor sees it. Update the text by selecting **Edit**. 
Guidance	(Optional) Enter the content that explains how best to answer the question. Add the for matted text, table, images, links, and attach ments. 8. Select **Save**.

Add reference information to an assessment template

Add reference information to an assessment template to help ensure that assessors can access to the information they need while responding to assessments by using the Smart Assessment Engine. With an assessment template, you can minimize the need for external references and can improve the efficiency of the assessment process.

Before you begin

You must select one or more assessment targets as part of the assessment template. The assessment targets are the table records that are selected to be assessed, otherwise known as the assessment scope. Multiple tables can be added as the assessment target, which makes the scope a combination of records from each table. For more information, see Create an assessment template.

Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

Procedure

1. Open an assessment template for updates by either going to the landing page or when you create a template and save it.
   The Details page on the **General** tab displays the information that you provided to create the template.
2. Select the **Questions** tab and then select **Add assessment reference**.
3. In the **Card description** field, enter the text describing what information is being provided in the reference card.
4. Select the **Assessment target** for the reference card.
   This table is referenced when populating the reference card with information. You can select fields that are available within the current assessment target (application scope) or dot walk to access fields from the assessment target's related tables. The **Assessment target** field is automatically filled in if only one **Assessment target** was selected for the template.
5. In the Available columns section, select the fields that you want to be used to fill in the reference card.
   You can drag the field selections into any order in the Select columns section. The information appears in the same order in the reference card.
6. Select **Add** and then **Save**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an assessment template category

Create an assessment template category in the Smart Assessment Engine application so that you can organize and grant access to the assessment templates that are related.

Before you begin

Role required: sn_smart_asmt.assessment_admin

About this task

Template categories that enforce the data segregation for templates. A category controls which users can view a template. Each assessment template is associated with one or more template categories. To view a template in a category, you must have a category role that is associated with the category.

Procedure

1. Navigate to **All** > **Smart Assessment Engine** > **Administration** > **Template Categories**.
2. On the Assessment template categories list, select **New** and then fill in the form.

Assessment template category form

Field	Description
Name	Unique meaningful name for the template category. For example, `Food storage compliance`.
Category role	Minimum role that you must have to view any template that is a member of this category. To view a template in a particular category, you must have one of the category roles that is associated with the category. Each category has one category role.
Description	Text that helps others to understand the purpose of including templates in this category.
Active	Option to activate the category. By default, newly defined template categories are active.
Set defaults for templates	
Enable normalization	Automatically enables normalization when this category is assigned to an assessment template.
Normalization strategies	Normalization strategies available. This field appears only when **Enable normalization** field is selected.
Default normalization strategy	Default normalization strategy for an assessment assigned with this category. This field appears only when **Enable normalization** field is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Submit**.
   The system generates the assessment template category and adds it to the list of categories that can be specified when designing an assessment template. Active categories are only available for use while categorizing templates.

Copy an assessment template

Make a copy of an existing assessment template in the Smart Assessment Engine to help reduce the amount of manual input needed. The copied template includes all questions, sections, instructions, and existing configurations from the original template, which you can then customize to meet new requirements or scenarios.

Before you begin
Role required: sn_smart_asmt.template_manager and sn_smart_asmt.assessment_admin

About this task
You can copy an assessment template that is in the Draft or Published state. The user who copies the template is marked as the creator and the duplication time is added as the creation time.

Procedure
1. Navigate to **Workspaces** > *Assessment Workspace* to access the Assessment Workspace landing page.
2. Open the existing assessment template that you want to copy.
3. Select the  icon.
   - The user is navigated to the copied template, and the copying process begins, which may take some time.
   - While the copy is in progress, both the source and copy template are locked for editing.
   - After the copying is completed, you can update the assessment template details as needed.

Result
The system generates a copied template in the Draft state. When you open the template, you can see the all questions, sections, instructions, and existing configurations from the original template. You can update it as required.

Scoring assessments

Scoring in Smart Assessment Engine is a systematic way to evaluate responses to various questions within an assessment. By attributing scores to answers, you can translate qualitative responses into quantitative data, offering a measurable and comparable outcome for each assessment.

Exploring scoring

In Smart Assessment Engine, scoring involves assigning numerical values to responses based on predefined criteria. You can apply scores to individual questions or to entire sections or subsections of questions. Scoring can be done for various question types, like radio buttons, check boxes, drop-down lists, and number fields. Each possible answer can be preassigned with a score, or scores can be calculated based on ranges or combinations of responses. Scoring provides a clear, objective measurement of the responses given in an assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Scoring logic varies by question type:

- For multiselect question types, you can assign scores to options, apply functions, and set question weights.
- For radio question types, you can assign scores to choices and set question weights.
- For number question types, the assessor's numeric response is used as the score.

You can also normalize the scores in which raw scores (the actual score earned on questions) are transformed into a standardized range or distribution. For more information, refer to Normalization in assessment.

Scoring levels

Scores can be calculated using predefined functions at various levels within an assessment:

Assessment level

Aggregates the scores from all sections and questions within that assessment.

Section level

Aggregates the scores from all subsections and questions within that section.

Subsection level

Aggregates the scores from all questions within that subsection.

Question level

Calculates the scores for each individual question.

Functions, such as *Sum*, *Min*, *Max*, *Average*, and *Weighted average*, are available at the assessment, section, and subsection levels. At the question level, all functions except *Weighted average* are available. However, only one function can be defined at all levels.

The following function can be used:

Average

The sum of all scores is divided by the number of sections or questions.

Maximum

The maximum score among all sections or questions is selected.

Minimum

The minimum score among all sections or questions is selected.

Sum

Scores for all sections or questions are added.

Weighted average

A weighted average assigns greater importance to values based on their weight. To calculate it, multiply each question, section or subsections score by its weight, sum up the results, and divide by the total weight.

Scoring results

The final scores are displayed based on the upstream application requirement. They determine how and where the scores are shown to the end user, providing flexibility for score visualization and presentation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each section or assessment level has a metric record connected to it through a metric_mapping record. To identify the scores, metric_mapping can be used to check the metric associated with each section, and from the associated metric record, the metric_instance can be located.

Once the scoring is completed, the final scores are available as follows:

- Question level scores are stored in the question instance (sn_smart_asmt_question_instance) table for individual questions.
- Section, subsection, and assessment level scores are stored in the (sn_smart_scoring_metric_instance) table.

Benefits of scoring

id="ul_m4c_r4q_wdc">

Scoring in Smart Assessment Engine transforms subjective responses into objective data. This data enables you to understand and use assessment results effectively, such as for identifying areas of improvement, evaluating progress, or tracking outcomes. Benefits of scoring include the following:

- Aids in analyzing complex data and making informed decisions by providing clear, objective metrics.
- Aligns assessments with your specific goals and needs because scores can be assigned and calculated in various ways.
- Simplifies the process of interpreting results. Instead of sifting through qualitative data, you can quickly glance at numerical scores to analyze performance.
- Confirms that all responses are evaluated consistently, reducing the likelihood of bias.

Configure scoring for an assessment

Set up scoring for your assessment responses to calculate meaningful scores at the assessment, section, or subsection level.

Before you begin

- Confirm that the smart assessment scoring plugin [com.sn_smart_scoring] is installed.
- Role required: sn_smart_asmt.template_manager or sn_smart_asmt.assessment_admin

About this task

- Scoring can only be configured on a draft template. Once the template is published, you can no longer configure scoring for it.
- If questions are skipped and not answered, they’re excluded from the score calculation.

Procedure

1. Navigate to **Workspaces** > **Assessment Workspace** to access the assessment workspace landing page.
2. Create an assessment or open an existing assessment template, which is in a draft state to configure scoring.
3. Select the **Scoring** tab.
4. Under **Scoring settings**, select the **Enable scoring for this template** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Enable scoring for this template** option enables you to apply scoring at the assessment, section, subsection, and question levels.
- Once scoring is enabled, you can enable normalization and configure its default settings. For more information, refer to Configure normalization in assessment

5. **Optional:** To activate scoring at assessment level, select the **Assessment score** option. Enabling the **Assessment Score** option initiates the calculation of the assessment-level score, which can be grouped by sections or questions.
6. On the form, fill in the fields.

Assessment scoring form

Field	Description
Group By	Option to select how the assessment score is calculated. **All sections together** Score is calculated by combining the scores from all sections. **All questions together** Score is calculated by combining the scores of all individual questions.
Apply function	Function used to calculate the assessment score. For example if you select sum, scores for questions are added and that is the final score. The following function can be used: **Average** The sum of all scores is divided by the number of sections or questions. **Maximum** The maximum score among all sections or questions is selected. **Minimum** The minimum score among all sections or questions is selected. **Sum** Scores for all sections or questions are added. **Weighted average** A weighted average assigns greater importance to values based on their weight. To calculate it, multiply each

Field	Description
	question, section or subsections score by its weight, sum up the results, and divide by the total weight.

7. Select **Save**.
8. Select the **Questions** tab.
9. Turn on the toggle switch on the question for which you want to configure scoring.
10. On the form, fill in the fields.

Question scoring form

Field	Description
Scores	Relevant score for the option. For number question types, the assessor's numeric response is used as the score.
Question Weight	Question weight shows how important a question is within the section or subsection, affecting its impact on the section or subsection's score. By default, the weight is added as 1. You can update it as necessary.
Scoring when unanswered	If questions are unanswered, this setting determines how they're scored. **Note:** By default, the option **Skip scoring if question is unanswered** is checked. If you cleared this option, the **Default score** field is displayed.
Default score	Default score for the question, which is used in case the question goes unanswered.

Note:
Scoring logic varies by question type.

- For multi-select, you can assign scores to options, apply functions, and set question weights.
- For radio options, you can assign scores to choices and set question weights.
- For number-type questions, the assessor's numeric response is directly used as the score.

11. Select **Save**.
12. **Optional:** Turn on the toggle switch on the subsection for which you want to configure scoring.
13. On the form, fill in the fields.

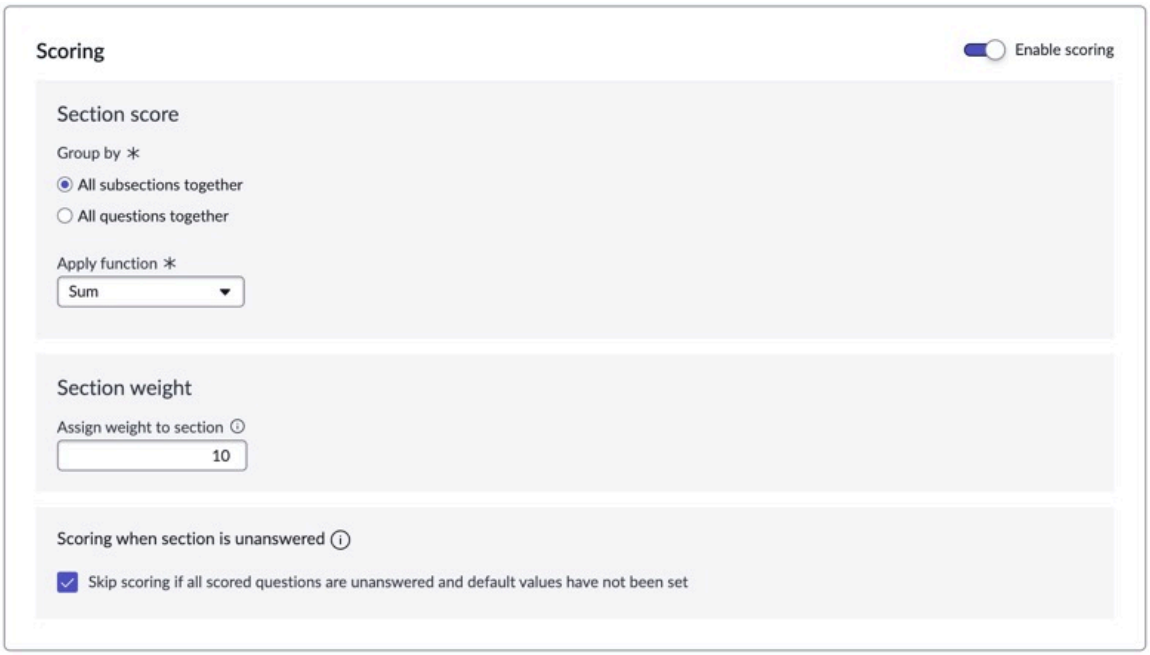
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subsection scoring form



Field	Description
Apply function	Function used to calculate the subsection score. For example if you select sum, scores for questions are added and that is the final score. The following function can be used: **Average** The sum of all scores is divided by the number of sections or questions. **Maximum** The maximum score among all sections or questions is selected. **Minimum** The minimum score among all sections or questions is selected. **Sum** Scores for all sections or questions are added. **Weighted average** A weighted average assigns greater importance to values based on their weight. To calculate it, multiply each question, section or subsections score by its weight, sum up the results, and divide by the total weight.
Subsection weight	Subsection weight shows how important a subsection is within a section, affecting its contribution to the section's score. By default, the weight is added as 1. You can update it as necessary.
Scoring when subsection is unanswered	If all questions within a subsection remain unanswered, this setting determines how they're scored. **Note:** By default, the option **Skip scoring if all scored questions are unanswered and default values have not been set** is checked. If you cleared this option, the **Set default score for subsection** field is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Set default score for subsection	Default score for the subsection, which is used in case the all questions within the subsection are unanswered.

Note:
The subsection scores are calculated by grouping question scores based on the defined criteria.

14. Select **Save**.
15. **Optional:** Turn on the toggle switch on the section for which you want to configure scoring.

16. On the form, fill in the fields.

Section scoring form

Field	Description
Group By	Option to select how the section score is calculated. **All subsections together** Score is calculated by combining the scores from all subsections. **All questions together** Score is calculated by combining the scores of all individual questions.
Apply function	Function used to calculate the Section score. For example if you select sum, scores for questions are added and that is the final score. The following function can be used:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Average The sum of all scores is divided by the number of sections or questions. **Maximum** The maximum score among all sections or questions is selected. **Minimum** The minimum score among all sections or questions is selected. **Sum** Scores for all sections or questions are added. **Weighted average** A weighted average assigns greater importance to values based on their weight. To calculate it, multiply each question, section or subsections score by its weight, sum up the results, and divide by the total weight.
Section weight	Section weight shows how important a section is within an assessment, affecting its contribution to the assessment's score. By default, the weight is added as 1. You can update it as necessary.
Scoring when section is unanswered	If all questions within a section remain unanswered, this setting determines how they're scored. **Note:** By default, the option **Skip scoring if all scored questions are unanswered and default values have not been set** is checked. If you cleared this option, the **Set default score for section** field is displayed.
Set default score for section	Default score for the section, which is used in case all questions within the section are unanswered.

17. Select **Save**.

Result

The scoring is now configured at all required levels.

Normalization in assessment

Normalization in Smart Assessment Engine refers to adjusting assessment question scores to a common scale to promote fair comparison and prioritization.

Exploring normalization

Scoring in Smart Assessment Engine enables you to translate qualitative responses into quantitative data, which provides a measurable and comparable outcome for each assessment. For more information on scoring, refer to Scoring assessments. Normalization in scoring addresses the issue of inconsistent scoring scales across different assessments, promoting fairness and comparability. It enables for accurate aggregation and analysis of scores, regardless of varying question difficulty or formats. Without normalization, scores from different assessments or sections can be misleading, leading to unfair evaluations and inaccurate insights. Normalization is supported for number, drop-down, radio button, and check box type questions.

Normalization is the process by which raw scores (the actual score earned) are transformed into a standardized range or distribution. This transformation facilitates comparison across different questions, sections, subsections, or entire assessments. The normalization feature confirms that scores from various components, which may differ in structure, difficulty, or scoring methods, are adjusted to a common scale. This is essential for providing fair comparisons, accurate analytics, and consistent insights. Normalization helps standardize these measurements, enabling different metrics or scores to be evaluated on the same scale.

The assessment admin defines the default normalization strategy for template categories, confirming consistent scoring logic across assessments. They can also configure the normalization formula or create custom formulas.

The template manager can do the following:

- Enables or disables normalization after scoring and aggregation details are set up.
- Defines normalization parameters at various aggregation levels (assessment, section, subsection or questions)
- Overrides default normalization parameters to determine the best strategy for their assessment.

Learn how normalization adjusts individual assessment scores to a common scale, enabling comparison across different assessments. For more information, refer to Score normalization.

Default Normalization

A template's purpose determines its default normalization settings, including whether normalization is enabled and which normalization strategy is used. Changing the purpose resets normalization settings, but reassigning the purpose is required to update template values. You can define a default normalization configuration and apply it automatically at various levels within an assessment, including the assessment itself, sections, subsections, and individual questions. The Linear normalization strategy is available by default. You can also create a custom normalization strategy. For more information, refer to Create a normalization strategy.

Normalization configuration behavior

Normalization behaves differently depending on whether it's overridden at a specific level. An override happens when you manually change the normalization settings at a level, for example, turning it on when it's off by default, turning it off when it's on by default, or modifying the strategy or input values while it's enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you don't override the configuration, enabling scoring at a level will automatically apply normalization using default values, and any changes to those defaults will be reflected across levels. Disabling scoring will also disable normalization.

However, if you override the configuration, any changes made to the default settings won't affect that level, it will retain the customized behavior you've set.

States of normalization

The normalization state can vary at all levels based on the normalization strategy used or any updates made to it.

Default strategy from template settings

This state is displayed when default normalization is enabled and no configurations are overridden.

Default strategy with some overrides

This state is displayed when default normalization is enabled and only input values are changed, with the same strategy as default.

Custom strategy

This state is displayed when the normalization strategy differs from the default or when normalization is enabled explicitly at the level despite being turned off by default.

Set up normalization

This state is displayed when normalization is turned off at the level, either due to default settings or explicit user action.

Benefits of normalization

Normalization in Smart Assessment Engine offers numerous benefits, confirms that all scores are on the same scale, making it easier to aggregate and analyze data.

- Normalization provides transparency in the assessment process, as scores are adjusted to a common scale, making it easier to understand the results.
- Normalization simplifies aggregation by removing the complexity of aggregating scores across different scoring scales and methodologies.
- Normalization creates a uniform scoring model, enabling consistent and fair comparisons, and facilitating apples-to-apples comparisons.
- Normalization makes it easier to understand and interpret scores, as they're all on the same scale.
- Normalization enables decision-makers to make more informed decisions, as they're based on a consistent and fair comparison of scores.

Score normalization

In Smart Assessment Engine normalization maps the actual scores to a standardized scale, typically from 0 through 100, enabling for a unified evaluation framework.

Normalization approach overview

In Smart Assessment Engine normalization adjusts individual assessment scores to a common scale, enabling comparison across different assessments. Normalization of assessment scores can be achieved through two approaches: Maximizing values, where higher scores are desirable, and minimizing values, where lower scores are preferred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To maximize the value	Maximize the value when higher values are better. The following formula is used to get the normalized score: `Normalized Score (High) = ((raw score - minimum Score) / (maximum score - minimum score)) * (scale factor maximum - scale factor minimum) + scale factor minimum`
To minimize the value	Minimize the value when lower values are better. The following formula is used to get the normalized score: `Normalized Score (High) = (1 - (raw score - minimum Score) / (maximum score - minimum score)) * (scale factor maximum - scale factor minimum) + scale factor minimum`

Where,

- Raw score = Actual score calculated
- Minimum score = The minimum value of the current scale.
- Maximum score = The maximum value of the current scale.
- Scale factor maximum = The minimum value of the target scale.
- Scale factor minimum = The maximum value of the target scale.
- Scale definition = Specifies the scoring direction: 'high' for higher scores being better or 'low' for lower scores being better.
- Relative Scaling = When enabled the normalized score is calculated relative to the maximum value.

Note:
This approach is applicable only when the linear normalization strategy is used. The formulas may vary if a different strategy is selected.

Configure normalization in assessment

Set up normalization for your assessment responses to adjust individual scores to a common scale at the assessment, section, or subsection level.

Before you begin

- Confirm that the smart assessment scoring plugin [com.sn_smart_scoring] is installed.
- Role required: sn_smart_asmt.template_manager and sn_smart_asmt.assessment_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

- To configure normalization, first set up scoring. For more information, refer to Configure scoring for an assessment.
- Normalization is supported for questions with number, drop-down, radio button, and check box types.

Procedure

1. Navigate to **Workspaces** > **Assessment Workspace** to access the assessment workspace landing page.
2. Create an assessment or open an existing assessment template, which is in a draft state to configure normalization.
3. Select the **Scoring** tab.
4. Select the **Enable normalization for this template** option.
   - To enable normalization on a template, normalization and its defaults must be enabled in the purpose assigned to that template. For more information, refer to Create an assessment template category.
   - The **Enable normalization for this template** option enables you to apply normalization rules at the section, subsection, and question levels.
5. **Optional:** To define default normalization values to be applied at section, subsection, and question levels automatically, select **Define default normalization to apply at different levels automatically** option and on the form, fill in the fields.

Note:
The input fields shown below are specific to the default Linear normalization strategy. The fields may differ when using alternative normalization strategies.

Set up defaults

Field	Description
Normalization Strategy	The default normalization strategy to be used.
Minimum	The minimum value of the current scale.
Maximum	The maximum value of the current scale.
New scale minimum	The minimum value of the target scale.
New scale maximum	The maximum value of the target scale.
Scale definition	Specifies the scoring direction: 'high' for higher scores being better or 'low' for lower scores being better.
Relative scaling	When enabled the normalized score is calculated relative to the maximum value.
Choose where to apply these defaults	
Assessment level	Default normalization values are applied for assessment level scores.
All sections	Default normalization values are applied for all section level scores.
All subsections	Default normalization values are applied for all subsection level scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
All questions	Default normalization values are applied for all question level scores.

6. **Optional:** If the **Assessment score** option is selected, to use aggregate score at the assessment level, you can select **Use normalized score for aggregation**.
   a. To edit the normalization values for the assessment score, select edit icon and update normalization values.
   b. To delete the normalization values for the assessment score, select delete icon and select **Remove normalization**.
7. Select **Save**.
8. Select the **Questions** tab.
9. **Optional:** To customize normalization values, select the specific section, subsection, or question you wish to update.
   a. To edit the normalization values for the assessment score, select edit icon and update normalization values.
   b. To delete the normalization values for the assessment score, select delete icon and select **Remove normalization**.
   Default normalization is automatically applied at multiple levels sections, subsections, and individual questions.
10. Select **Save**.

Create a normalization strategy

You can create a custom normalization strategy as required.

Before you begin

- Confirm that the Basic Scoring for Smart Assessments plugin [com.sn_smart_scoring] is installed.
- Role required: sn_smart_asmt.assessment_admin and sn_smart_asmt.developer

Procedure

1. Navigate to **All** > **Smart Assessment Engine** > **Administration** > **Normalization Strategies**.
2. On the Scoring normalization strategies list, select **New** and then fill in the form.

Scoring normalization strategy form

Field	Description
Name	Unique meaningful name for the normalization strategy.
Published	Displays checked when the normalization strategy is published.
Retired	Displays checked when the normalization strategy is retired.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Text that helps others to understand the purpose of this normalization strategy.
Strategy	Enables the script for the normalization strategy. **Note:** When ECMAScript 2021 (ES12) mode is enabled, you can use the latest supported JavaScript features in your script. If this mode is turned off, your script will be limited to the JavaScript features supported by the application's default environment.

3. Select **Save**.
   A new related list **Scoring normalization strategy inputs** appears.
4. On the Scoring normalization strategies inputs list, select **New** and then fill in the form.

Scoring normalization strategy input form

Field	Description
Normalization strategy	The name of the normalization strategy in which inputs are to be created.
Order	Order of the input.
Type	Type of the input. For example: Number or Choice.
Label	Label of the input.
Name	Name of the input. **Note:** Strategy input names must start with a letter, underscore (_), or dollar sign ($), and may only contain ASCII letters, digits, underscores, or dollar signs. Avoid using spaces, special characters, or reserved keywords, as these are not permitted.
Description	Text that helps others to understand the purpose of this input.

5. Select **Submit**.
   Continue adding inputs as needed by repeating these steps.
   If the input is **Choice**, then a choice related list appears
6. To add choices select the corresponding choice label from the Scoring normalization strategy inputs list.
7. On the related list Scoring normalization strategy input choices list, select **New** and then fill in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoring normalization strategy input form

Field	Description
Normalization strategy input	The name of the normalization strategy input in which choices are to be created.
Order	Order of the input choice.
Label	Label of the choice.
Value	Value of the choice.

8. Select **Update**.
   Continue adding input choices as needed by repeating these steps.
9. Update the strategy script to incorporate the newly created input values for normalizing raw scores.
   - You can create scripts to define the transformation logic or formula needed to normalize the raw score effectively.
   - You can also set up conditions within the script.
   - You can confirm that the input in **result.value** must always be floating-point number for all question types.
10. Select **Publish**.
    After creating a custom strategy, you can manage it further by moving it back to draft to make edits, retiring it when it's no longer needed, or deleting it permanently.

Edit a normalization strategy

You can edit a normalization strategy only if it is in a draft state and not being used by any category.

Before you begin

- Confirm that the smart assessment scoring plugin [com.sn_smart_scoring] is installed.
- Role required: sn_smart_asmt.template_manager and sn_smart_asmt.assessment_admin

Procedure

1. Navigate to **All** > **Smart Assessment Engine** > **Administration** > **Normalization Strategies**.
2. On the Scoring normalization strategies list, select the normalization strategy you want to update.
3. On the top panel select **Move to draft**.
   To update a normalization strategy, it must be in a draft state. If the strategy is currently published, you must first move it back to a draft state before making any edits.
4. Make the required updates and select **Save**.
5. Select **Publish**.

Retire a normalization strategy

You can retire a normalization strategy to confirm it is no longer active. Once retired, it cannot be reactivated or changed back to draft or published. However, any purposes currently using this strategy will continue to do so.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Confirm that the smart assessment scoring plugin [com.sn_smart_scoring] is installed.
- Role required: sn_smart_asmt.template_manager and sn_smart_asmt.assessment_admin

Procedure

1. Navigate to **All** > **Smart Assessment Engine** > **Administration** > **Normalization Strategies**.
2. On the Scoring normalization strategies list, select the normalization strategy you want to retire.
3. On the top panel select **Retire**.
   The normalization strategy is retired and moved to an inactive state.

Delete a normalization strategy

You can delete a normalization strategy only if it is in draft state. Deleting a strategy removes it permanently, so confirm it is no longer in use before proceeding.

Before you begin

- Confirm that the smart assessment scoring plugin [com.sn_smart_scoring] is installed.
- Role required: sn_smart_asmt.template_manager and sn_smart_asmt.assessment_admin

Procedure

1. Navigate to **All** > **Smart Assessment Engine** > **Administration** > **Normalization Strategies**.
2. On the Scoring normalization strategies list, select the normalization strategy you want to delete.
3. On the top panel select **Move to draft**.
   To delete a normalization strategy, it must be in a draft state. If the strategy is currently published, you must first move it back to a draft state.
4. On the top panel select **Delete**.
   A confirmation message with a warning is displayed, review it carefully.
5. Select **Delete**.

Automate response

Set up default responses for questions so that assessors can complete assessments quickly and provide quality results.

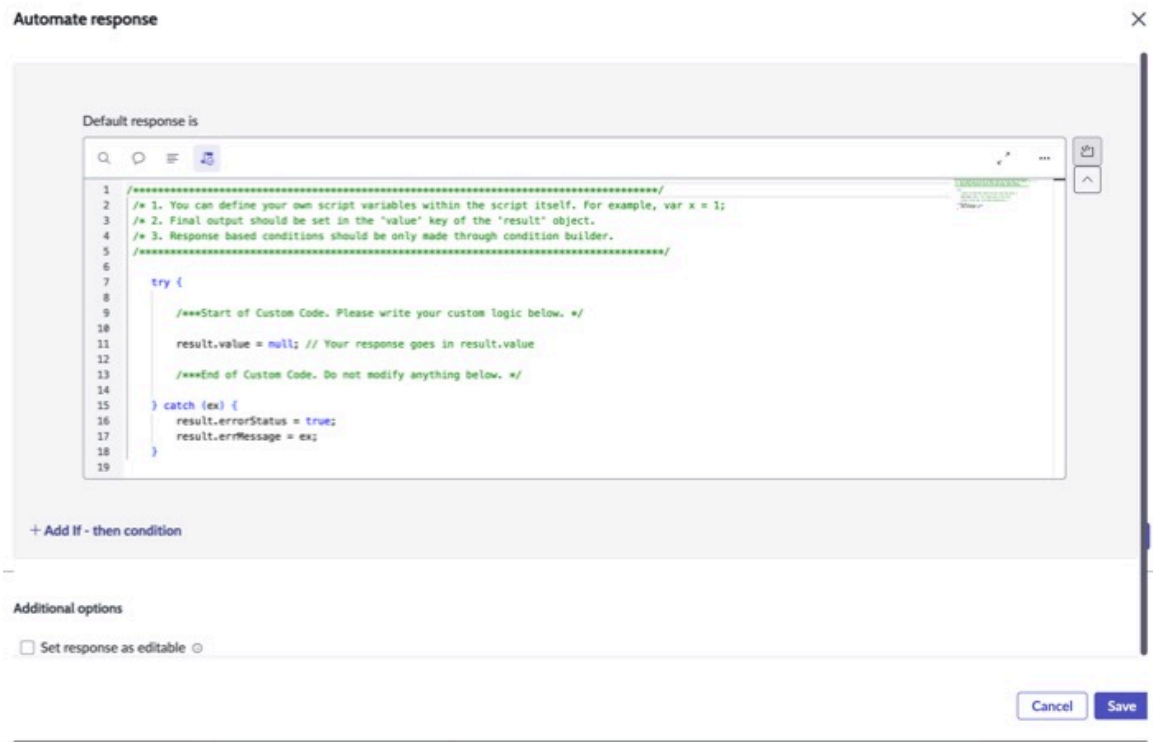
Response automation aims to make the assessment process efficient by reducing manual data entry and providing a static response or script-based approach to automate responses. A template manager can make the responses read-only or editable. You can set up the automated responses with the following:

Default Response field

Enables you to set default answers for the following question types:

- Text
- Drop-down lists
- Radio buttons
- Check boxes
- Date

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Date & time
- Number

You can select a default response that doesn't have a condition or one that is dependent on multiple conditions. Assessors can then verify, adjust, or keep these default responses.

Scripts

Enables you to create dynamic automated responses. You can create scripts that retrieve, transform, and map data from various sources, such as other questions, tables, or templates. You can then integrate this data into the response. With these scripts, you can:

- Generate dynamic default responses based on other questions, creating real-time adaptability.
- Query tables to fetch specific data and incorporate it into the response, confirming relevant information is included.
- Set up conditions within the script to handle different scenarios, enabling complex and dynamic automation workflows.

When setting up the automated response, you can use if-then conditions to build the required criteria for the response. For more information, see Configure an automatic response for a question.

Configure an automatic response for a question

Set up automatic responses for assessment questions using either static responses or script-based responses based on specific conditions. You can configure default responses for text, drop-down list, radio button, check box, date, and number question types. This feature helps save assessors time and effort by reducing the number of questions that require answers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

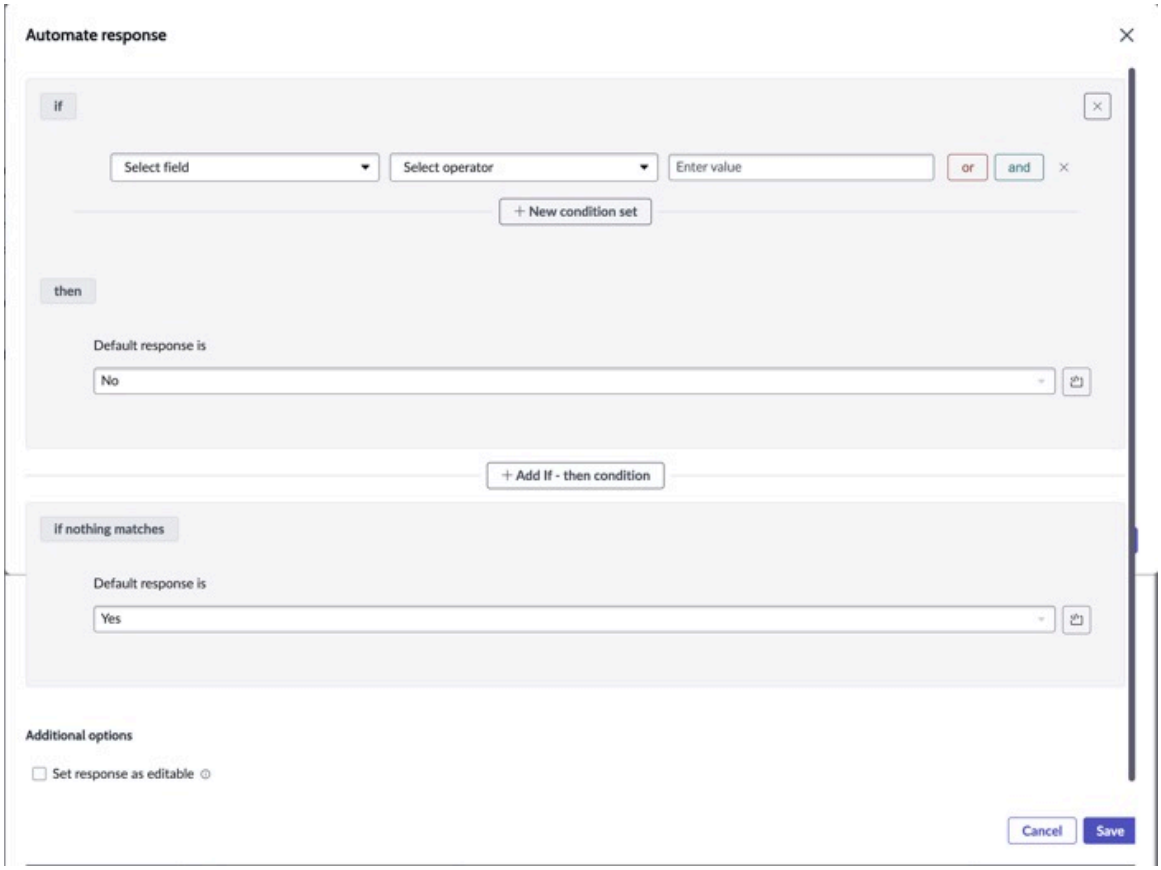
Before you begin

The Advanced Response Automation for Smart assessment plugin (com.sn_smart_resp_auto) must be installed.

> **Note:**
> If you have the assessment admin or template manager role, you can configure a default or conditional default response for a question. To create scripts, you need the developer role in addition to the assessment admin or template manager role.

Role required: sn_smart_asmt.assessment_admin or sn_smart_asmt.template_manager and sn_smart_asmt.developer

Procedure



1. Navigate to **Workspaces** > **Assessment Workspace** to access the Assessment Workspace landing page.
2. Create an assessment template or open an existing assessment template that is in the Draft state.
   For more information on creating a template, see Create an assessment template.
3. Select a question for which you want to configure an automatic response.
4. Select the ⋮ **Configuration options**, then select **Automated response**.
5. In the **Default response is** field of the **Automated response** pop-up window, select a default response for the question based on the question type or create a script.

   a. **Optional:** Create a script for a dynamic response by selecting the script icon .

   b. Update the `result.value = <null>` with the required input.
   In the script, **result.value** holds the response. The input in **result.value** must match the corresponding question type. For example, a text-type question should have a string value and while a number-type question should have an integer value.

6. **Optional:** Set up a condition by selecting **Add If-then condition**.
7. Select **+ New condition set** under **If** condition to set the condition.
   - Add details to **If** and **Then** conditions using the condition builder. For more information, refer to Condition builder.
   - You can set up multiple conditions within a single **If** condition by selecting **+ New condition set**. Within a single condition row, you can combine multiple conditions using **and** or **or** logical operators.
8. **Optional:** Set up one or more subsequent if-then conditions by selecting **Add If-then condition**.
   - Add details to **Otherwise if** and **Then** conditions using the condition builder. For more information, refer to Condition builder.
   - The first condition that meets the criteria triggers the default response. Priority is determined by the order of the conditions. For instance, if you have three conditions and the first one is true, the system doesn't check the remaining two.
9. **Optional:** In the **Default response is** field in the **If nothing matches** section, set the default response for situations where none of the condition sets meet the set criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** Create a script for a dynamic response by selecting the script icon .
11. Update the **result.value** field with the required input.
    In the script, **result.value** holds the response. The input in **result.value** must match the corresponding question type. For example, a text-type question should have a string value and while a number-type question should have an integer value.
12. **Optional:** Under **Additional options**, select the **Set response as editable** option.
    - Selecting the **Set response as editable** option enables the assessors to edit the response. If cleared, the response becomes read-only.
    - For a question to be marked as required, the **Set response as editable** option must be selected. If **Set response as editable** is cleared, the **Required** option is automatically turned off.
13. Select **Save**.

Post-assessment automations

Post-assessment automations, also known as post-assessment actions, in Smart Assessment Engine are actions that happen automatically after an assessment is complete. These actions use the responses from an assessment to automate tasks. Using action sets, automated actions, trigger conditions, and evaluation criteria, post-assessment actions can help your assessments be efficient, consistent, accurate, and scalable.

Post-assessment actions overview

Post-assessment actions help automate decision-making processes. You can configure them to execute rules based on specific conditions or to run automatically without any conditions. It provides a structured and user-friendly interface to set up these rules without requiring technical expertise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using post-assessment actions, the template designer can complete actions like updating fields, creating follow-up assessments, or generating other records automatically after an assessment is submitted. Post-assessment automation involves the following key components:

- Action sets
- Automated actions
- Trigger conditions
- Evaluation criteria

Action sets

Action sets help you automate tasks by setting conditions and corresponding actions. By using action sets, you can confirm that the most important criteria are checked first. You can add multiple action sets in a single automation. You can also edit or delete an action set that is no longer needed. There are the following types of action sets:

Conditional action set

Checks conditions from the **If** field in order and stops when it finds the first true condition. Then, it executes the corresponding action from the **Then** field and doesn't check the rest of the conditions.

Standalone action set

Executes actions that happen without any specific conditions. You can add multiple actions in a single standalone action set.

Automated actions

Automated actions, also known as subflows, are predefined sequences of actions or processes that can be executed automatically based on certain conditions. The subflows are mapped to an action category, and the action category is mapped to a template assessment category. During the runtime of the subflow, the conditions are evaluated, and the corresponding subflows are executed. For example, if a response to a question meets a defined condition, a subflow can be triggered to create or update records, send notifications, or perform other automated tasks.

Trigger conditions

Trigger conditions are user-defined condition sets based on the assessment responses. When the condition sets are met, the automated actions are triggered. For example, if a response to a question meets a set condition defined as high risk, it might trigger an action.

Evaluation criteria

The configured post-assessment actions are executed when the assessment is submitted.

Benefits of post-assessment actions

Efficiency

Post-assessment actions automate routine tasks, enabling you to focus on more strategic activities.

Consistency

Predefined rules help ensure that actions are carried out uniformly across all assessments, maintaining standardization.

Accuracy

Automation reduces the risk of errors that can occur during manual processing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scalability

The system can handle a large volume of assessments and actions without manual intervention.

Configure post-assessment actions

The post-assessment actions feature in Smart Assessment Engine enables you to automate actions based on assessment responses. The template designers can predefine actions using a rule engine, such as updating fields, creating follow-up assessments, or generating other records.

Before you begin

- A subflow must be available and mapped to the assessment template category for which you want to configure post-assessment actions. For more information about how to create and build subflows, refer to Create a subflow in Workflow Studio and Building subflows.
- The Reusable Impact Framework plugin (sn_impact_fwk) and Post Assessment Actions for Smart Assessments plugin (sn_smart_imp_auto) must be installed.

Role required: sn_smart_asmt.assessment_admin or sn_smart_asmt.template_manager and sn_smart_imp_auto.automation_creator

Procedure

1. Navigate to **Workspaces** > **Assessment Workspace** to access the Assessment Workspace landing page.
2. Create an assessment template or open an existing assessment template for which you want to configure post-assessment actions.
   Post-assessment actions can only be set on a published assessment template and remains in the Draft state until manually activated. After activated, post-assessment actions can't be moved back to the Draft state while the template remains published. They can only be deactivated.
3. Select the **Automations** tab.
4. Select **Create Automation**.
5. Provide a unique name and a description for the automation.
6. Add either a conditional action set or a standalone action set.
7. If the conditional action set is selected, to set condition select **If**.
8. In the **Set actions** dialog box, fill in the fields as appropriate.
9. If a standalone action set is selected, to set an action by selecting **then**.
10. Select an option for the **Action type** list.
    Based on the selected action type, new fields appear requiring additional details.

    The options displayed in the **Action type** field are subflows linked to the chosen template's categories. For more information on automated actions, see Post-assessment automations.
11. Select **Activate**.
12. Acknowledge the **I understand the automation will no longer be editable** informational check box and then select **Activate**.
    The automation is now activated, and a confirmation message is displayed. When the assessor submits the assessment, the automation you set up is executed.

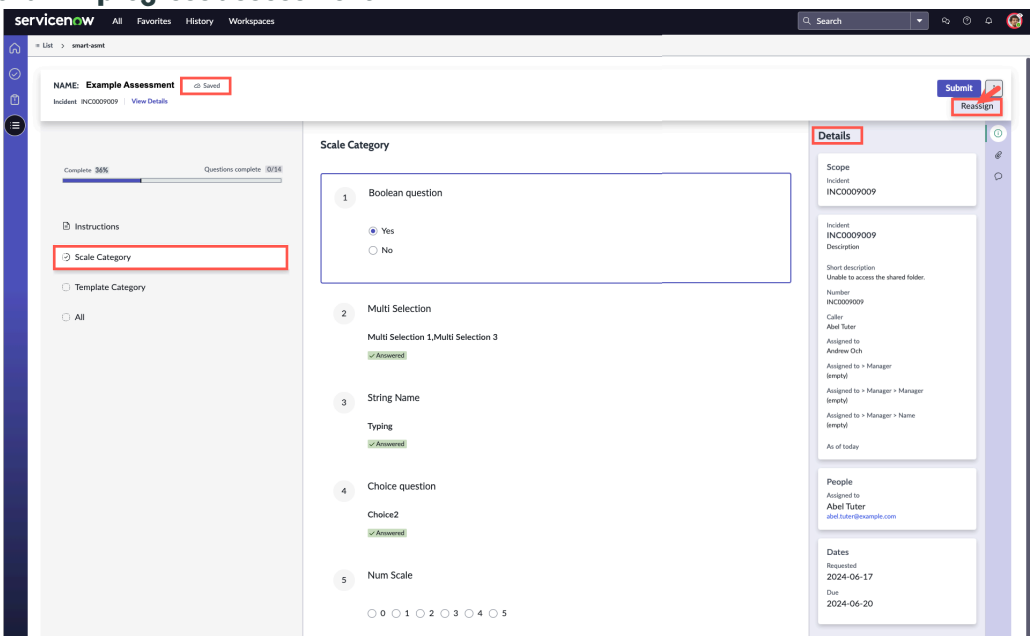
Responding to assessments

Use the Smart Assessment Engine application to help assessors complete survey requests. Track your progress and let the system automatically save your information. Administrators and template managers manage the assessment process.



If you have the Assessment actor [sn_smart_asmt.actor] role, you can submit responses to an assigned assessment. Here are some more key functionalities:

- A progress indicator displays how much of the assessment you have completed.
- Questions are paginated, making it easier to navigate through the assessment.
- Your work is automatically saved, eliminating the risk of potential data loss.
- An assessment administrator [sn_smart_asmt.assessment_admin] can cancel assessments that are no longer needed.

If you have the assessment reassign [sn_smart_asmt.reassign] role, you can reassign in-progress assessments to another user. If your template manager or administrator has added reference information, such as scope-related information, you can view it in the Details section of your assessment. If relevant to the state of the assessment, the scope, requester, assignee, the requested and due dates are listed in the Details section by default.

The following example shows how your progress, save status, assessment status, reference information, actions, and more are indicated in the assessment view.

Example of an in-progress assessment

Assessment response features

Navigating assessments

Assessment actors can navigate through an assessment by selecting the section of questions they're ready to answer.

Saving assessments

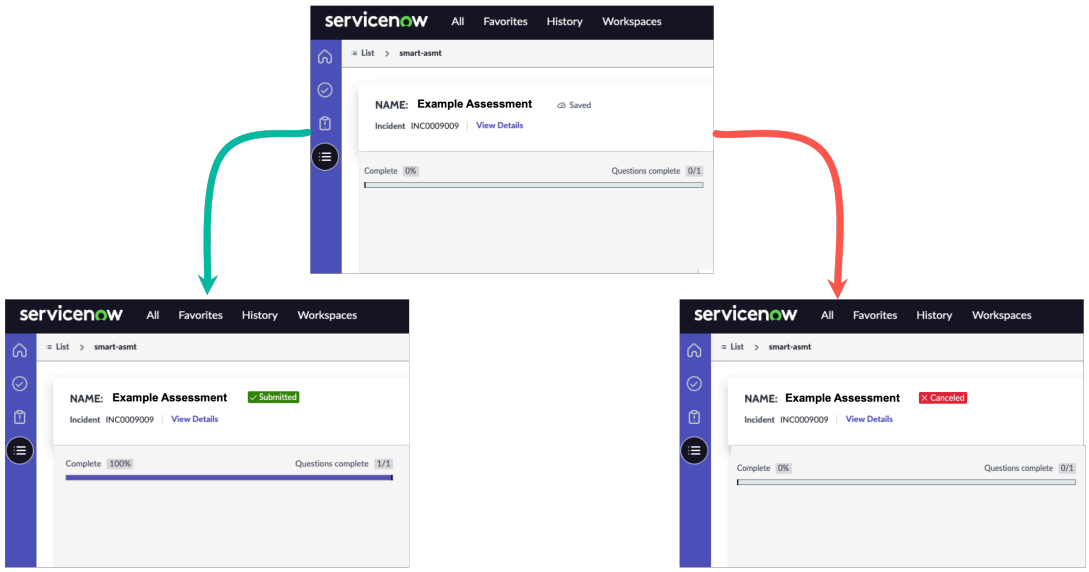
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Your assessment progress is automatically saved and your save status is indicated by the saved badge Saved.

Progress tracking in assessments

The progress bar indicates how many questions remain in the assessment including required and optional questions.

The following example shows how the progress bar and state badges are updated when you complete an assessment and submit it or cancel it.

Example of progress bar and state badges

Respond to an assessment

Respond to an assessment that has been assigned to your queue. Your responses to the assessment help with making informed decisions and taking targeted actions by using the Smart Assessment Engine application.

Before you begin

Role required: sn_smart_asmt.actor

About this task

When you're assigned a task to respond to an assessment, you submit your responses to the assessment within the relevant workspace. Smart assessments are available for use with Control attestation and Risk identification. Your responses can help with gathering evidence to prove that a control is implemented or help identify gaps that can lead to potential risk.

Procedure

1. Navigate to your workspace.
2. Navigate to your list of assigned assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the task icon ( ) and then navigate to **My pending tasks** > **Control attestations** > **Smart Assessments**.
3. Review any instructions or reference information.
   You may see additional question guidance text for your review as you complete the questions.
4. Answer all relevant questions in the questionnaire.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your responses are automatically saved.

5. Select **Submit**.

Submit an assessment

You must have the assessment actor role to complete and submit the assessment. The submit button becomes enabled once all required questions are answered.

Before you begin
Role required: sn_smart_asmt.reassign

About this task
A lock icon next to the submit button indicates the number of required questions remaining. Hovering over the lock icon displays the exact count, helping you track your progress.

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments that you want to submit.
3. To submit the assessment, on the top pane select **Submit**.
   The submit dialog box appears.
4. Read the confirmation message and select the check box.
5. Select **Submit**.

Reassign an assessment

Reassign assessment to redirect them to different users, enabling for flexible task management.

Before you begin
Role required: sn_smart_asmt.reassign

About this task
You can reassign an assessment to anyone if you have the assessment reassign [sn_smart_asmt.reassign] and the template category role that is associated with the assessment template.

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments that you want to reassign.
3. To reassign the assessment, on the top pane select more action icon ⋮ and select **Reassign**.
   A reassign dialog box appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Reassign dialog box, select the assessor name in the **Reassign to** field.
5. Select **Reassign**.

Filter unanswered questions

Filter your assessments to show only unanswered questions, making it faster to complete them. It enables you to identify unanswered questions efficiently at a glance, eliminating the need to review them individually.

Before you begin

Role required: sn_smart_asmt.actor

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments in which you want to filter the questions.
3. To see only unanswered questions, on the top pane change the filter to **Unanswered Questions** from **All questions**.
   To see all questions, change the filter back to **All Questions**.

Adding attachments to assessment

You may have documents or image files that provide additional information for the assessment, you can attach these documents to assessments in the open state. These documents and image files can be added as attachments to the assessment for reference.

Before you begin

Role required: sn_smart_asmt.actor

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments in which you want to add the attachments.
3. From the contextual sidebar, select the **Attachment** icon .
   The **Attachments** sidebar appears.
4. Select the **Select file** button.
5. Select a file from your local computer and select **Open**.
   The selected file appears in the Attachments list.
6. Repeat the process to add multiple attachments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adding comments to assessments

Comments can be added to an assessment at any time by the owner or contributors, regardless of its current state. This feature enables for clarification on questions or other aspects of the assessment.

Before you begin
Role required: sn_smart_asmt.actor

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments in which you want to add a comment.
3. From the contextual sidebar, select the **Comment** icon .
4. Provide your comment in the **Comment** field.
5. Select **Post Comments**.
   The comment appears in the comment list.

Cancel assessment

If an assessment is no longer needed, you can cancel it to terminate its progress. Once canceled, the assessment becomes read only.

Before you begin
Role required: admin

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments that you want to cancel.
3. To cancel the assessment, on the top pane select more action icon and select **Cancel**.
4. In the **Confirmation** dialog box, select **Confirm**.

Copying responses from previous assessments

You can copy responses from previous assessments to save time and reduce repetition.

Copy smart assessment responses action

If you have the flow designer [flow_designer] or system admin privileges, you can add the Copy smart assessment responses Workflow Studio action to your flows and subflows. This flow action enables you to reuse responses from a previous assessment.

The following table shows the Copy smart assessment responses action form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

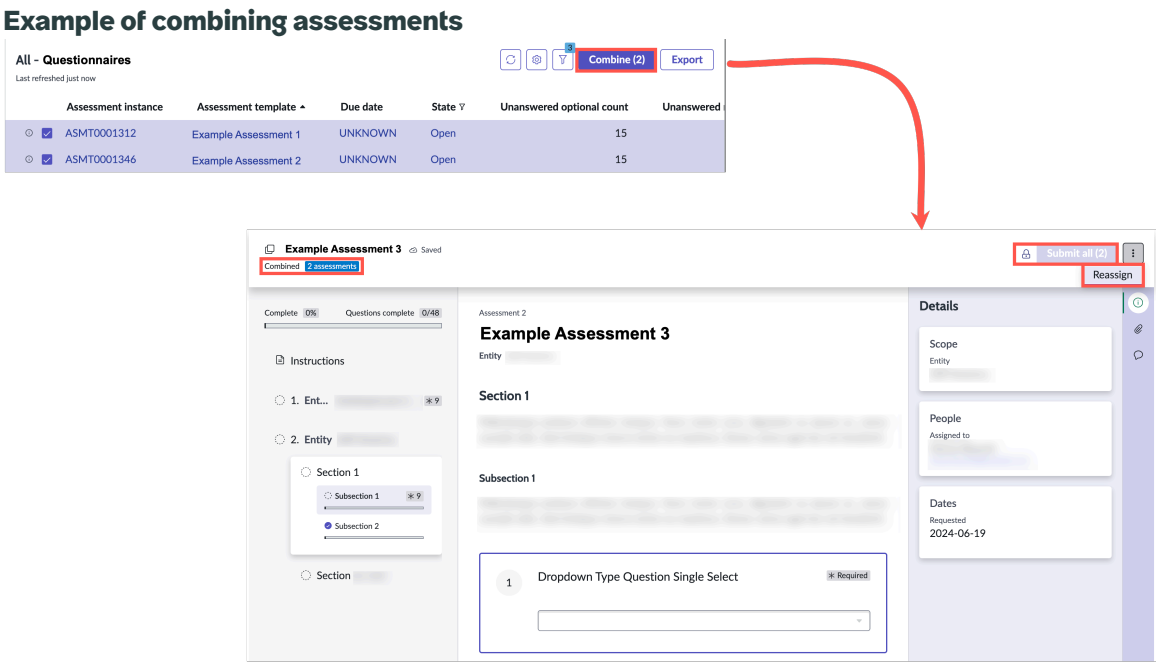
Copy smart assessment responses action form

Field	Description
Source Assessment [Smart assessment instance]	Assessment that you're copying responses from for reuse. You must use the assessment instance record reference for this selection.
Target assessment [Smart assessment instance]	Assessment that you're copying responses into. You must use the assessment instance record reference for this selection.

Both the source assessment that you're copying from and the target assessment for reusing responses must be based on the same template. The target assessment must be in an Open state. After this flow action is implemented, the answers from the source assessment are automatically available as answers for the assessor's responses.

For more information on adding actions to flows in Workflow Studio, see Create a flow in Workflow Studio.

Combining assessments and copying responses



You can combine multiple assessments assigned to you into a single, streamlined view, enabling you to submit or reassign them all at once. You can also copy your response from one assessment and apply it to the other assessments. This feature enables you to work on all the assessments together more efficiently.

When you combine assessments, you can submit or reassign them in bulk, streamlining your workflow. To further simplify the process, you can enable the auto-copy feature. This feature automatically replicates your responses across all applicable assessments, eliminating the need for manual entry. The auto-copy feature is available when all combined assessments originate from the same template. If the assessments are based on different templates, the auto-copy feature remains inactive and cannot be enabled.

You can answer questions in any assessment within the combined group, and the corresponding questions in other assessments are updated with the response. The attachments and comments in the side panel remain specific to each individual assessment.

When you select multiple assessments, the number of selected assessments appears on the **Combine** button. After combining the assessments, a new assessment opens. From that assessment, you can see how many assessments have been combined by viewing both the header of the assessment and the **Submit all** button.

Benefits of combining assessments

Combining assessments in Smart Assessment Engine enables multiple benefits to assessment responders such as:

- Unified experience for the responders, allowing them to answer multiple assessments from the same or different templates within a single interface, which eliminates the need to open and respond to each assessment separately.
- Users retain context across related questions, making it easier to compare and contrast information from different templates.
- By consolidating fragmented and repetitive assessment requests, combined assessments help prevent cognitive overload for assessors, making the process smoother and less stressful.
- Submission and auditability of combined assessments remain consistent with existing procedures, ensuring changes are traceable and compliance with audit requirements is maintained.

For more information on how to combine assessments, see Submit combined assessments.

Submit combined assessments

Combine your Smart Assessment Engine assessments so you can respond to all of them together. You can also configure your responses to replicate automatically across all applicable assessments so you don't need to fill them in manually.

Before you begin

Role required: sn_smart_asmt.actor

Procedure

1. In your workspace, navigate to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Workspaces** > **Compliance Workspace**

b. Select the list icon ().

c. Navigate to **Control attestations** > **Smart Assessments**.

2. Select the assessments that you want to combine.
   To combine assessments, they must be created from the same template. Assessments from different templates can't be combined.
3. Select **Combine**.
4. On the **Combine Assessments** pop-up window, complete the following:

   a. In the **Combined assessment name** field, enter a name for the combination of assessments.

   b. Copy your responses across all combined assessments by turning on the **Enable auto copy** toggle switch.

      - The auto-copy feature is activated when the combined assessment is created and can't be changed later. For more details, refer to Combining assessments and copying responses.
      - The auto-copy feature is available only when combined assessments originate from the same template. If the assessments are from different templates, the auto-copy feature remains disabled and cannot be activated.

5. Select **Continue**.
   A combined assessment instance opens that shows all the selected assessments within one assessment view. The scope, reference information, and instructions for each original assessment are preserved.
6. Respond to the questions in the combined assessment.
7. Select **Submit all**.

Collaboration in assessments

Collaboration in Smart Assessment Engine allows you to add multiple contributors to an assessment and support live collaboration with real-time updates. It also displays presence indicators to show who is currently active on the assessment.

Exploring Collaboration

The Collaboration feature in the Smart Assessment Engine aims to enhance the efficiency and effectiveness of team-based assessments by allowing multiple users to work together in real-time. It enables assessments to be assigned and reassigned to contributors, with simultaneous editing supported, each user's changes appear instantly to others. Presence indicators also show who is currently active on the assessment.

The Owner has the authority to assign or reassign the assessment to multiple individuals or groups, determine who will collaborate on it, and add or remove Contributors. Only the Owner can submit the assessment for review or completion and has access to a full suite of collaboration features, including managing comments and attachments made by Contributors. Contributors can view the assessments assigned to them and see all collaborators involved in the sidepanel, but they cannot reassign or submit the assessment. Instead, Contributors can also add comments and attachments to the assessment.

Benefits of Collaboration

Collaboration in Smart Assessment Engine enables multiple stakeholders to contribute, review, and refine content in real-time. It introduces flexibility, accountability, and improved quality into the process.

- Tasks can be distributed and completed in parallel, significantly reducing turnaround time.
- Every change is tracked, ensuring accountability and offering a transparent view of who contributed what and when.
- Leveraging the knowledge of multiple experts ensures more thorough and reliable assessments.
- Large and complex assessments become manageable by dividing work among contributors

Collaboration transforms assessments from isolated, siloed activities into dynamic, team-driven processes. By enabling structured collaboration, organizations can not only increase the quality and speed of assessments but also foster greater alignment, transparency, and decision-making confidence across teams.

Add contributors to assessments

The assessment owner can add contributors to an assessment as needed, allowing multiple individuals to collaborate effectively. Contributors can work simultaneously on the assessment, enabling real-time collaboration and efficient progress.

Before you begin

Role required: sn_smart_asmt.actor

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.
   a. Navigate to **Workspaces** > **Compliance Workspace**
   b. Select the list icon ( ).
   c. Navigate to **Control attestations** > **Smart Assessments**.
2. Select the assessments in which you want to add contributors.
   The assessment owner and admin can add additional contributors to the assessment.
3. From the contextual sidebar, select the **Contributors** icon .
4. Select the **+ Add** button.
5. On the **Add contributors** pop up, add the names of the users in **Select users to add to this assessment** field.
6. Select **Add contributors**.

Remove assessment contributors

The assessment owner can remove contributors from an assessment as needed.

Before you begin

Role required: admin

Procedure

1. Navigate to your workspace and then to your list of assessments.
   Here's an example of how to navigate to this list in the Compliance Workspace.

SAE roles

SAE roles

Role	Permissions
Assessment actor [sn_smart_asmt.actor]	• Respond to the assessments that are assigned to them. • Reassign the assessments that are assigned to them.
Assessment reader [sn_smart_asmt.assessment_reader]	• Read assessments that are within the categories that have the assessment reader role assigned. • Read, reassign, and comment on the assessments that you have requested. • View and comment on the assessments generated from any templates that have the assessment reader role configured.
Assessment admin [sn_smart_asmt.assessment_admin]	Includes the assessment_admin role. Administrator for the SAE application. • Access the Assessment Workspace. • Create, view, update, or delete a template category. **Note:** A template category can't be deleted until any attached templates are removed. • Create, view, update, or delete an assessment template. • View, cancel, or reassign assessments. • Migrate the existing metric types to the assessment templates.
Assessment reassign [sn_smart_asmt.reassign]	Reassign assessments.
Template reader [sn_smart_asmt.template_reader]	• Access the Assessment Workspace with all details displayed in read-only mode. • Read the assessment template if you have a template category role that is associated with that template.
Template manager [sn_smart_asmt.template_manager]	Includes the template_reader role.

SAE roles (continued)

Role	Permissions
	• Read, write, and create the specific assessment templates that are based on the categories that are mapped to the templates. • Access the template categories if you have a template category role that is associated with that template.
Template developer [sn_smart_asmt.developer]	Read, write, and create the script for response automation in assessment questions. **Note:** In addition to this role, you must also have either the assessment admin or template manager role to read, write, and create scripts.
Automation reader [sn_smart_imp.auto.automation_reader]	• Read the automation created for the assessment template. • Access the Assessment Workspace. • Reads an assessment template if you have a template category role that is associated with that template.
Automation creator [sn_smart_imp.auto.automation_creator]	• Read, write, and create the automatons for the assessment template. • Access the Assessment Workspace. • Read an assessment template if you have a template category role that is associated with that template.

Flow actions for fulfillment subflow definitions

If you define your own fulfillment subflows for the Smart Assessment Engine application in Workflow Studio, you can use the standard flow actions that are available in the ServiceNow AI Platform. Each action deals with the different aspects of the fulfillment or inventory maintenance, which can help bring some consistency in how data is retrieved and updated.

The fulfillment flows in the demo data that was shipped with the ServiceNow AI Platform use the flow actions in the following table.

Flow actions available as part of the base system

Action name	Description
Trigger Smart Assessment action	Flow action to create and assign an assessment. The flow action takes the customer order line, configuration item (CI), and sold product as input, and creates the install base item and installed product.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow actions available as part of the base system (continued)

Action name	Description
Update Configuration Item	Flow action that includes a prescriptive way to update the configuration items order fulfillment subflow. The flow action takes the sold product, product model ID, and comments as input, and updates the corresponding configuration item that is based on the install base Item.
Get Child Sold Product	Flow action that includes a prescriptive way to retrieve the sold products that are relevant to a specification in a customer order. The flow action takes the specification and the parent sold product as input and retrieves the child sold product from the respective hierarchy. Using this flow action helps with the product inventory updates that occur at the end of the fulfillment process.
Get Customer Order Characteristic Value	Flow action that takes the customer order line Item and characteristic as input and returns a characteristic value from the customer order line item. If the characteristic isn't present in the customer order line item, it returns the default value for the characteristic from the respective order line item offering.

Setting	Description
	assign it to another user. One assessment instance is assigned to each assessor. Assessors have the Assessment actor [sn_smart_asmt.actor] role. See Roles in Smart Assessment Engine.
Requester	Contact for questions from the assessor. Each generated assessment includes the contact information.
Description	Text that helps others to understand the intent of the generated assessments.
Template category	Category that the assessment template should be a member of. For example, Risk, Performance, Security, Personal data, and so on. Template categories that enforce the data segregation for templates. A category controls which users can view a template. Each assessment template is associated with one or more template categories. To view a template in a category, you must have a category role that is associated with the category. For more information, see Create an assessment template category. **Note:** You can create an assessment only from a published assessment template. You can update a published template only if no active assessment is associated with the template.
Assessment target	Table records that are selected to be assessed, otherwise known as the assessment scope. Multiple tables can be added as the assessment target, which makes the scope a combination of records from each table.

Trigger Smart Assessment action form

Use the Trigger smart assessment action form to add assessment actions to a flow or to obtain a code snippet for a script as part of the process for triggering Smart Assessment Engine assessments.

Trigger Smart assessment action form

Trigger Smart assessment action form

Field	Description
Assessment template	Smart assessment template record to use to generate the assessment.
Assessors	Persons who are notified of the assessment and typically respond to the assessment or assign it to another user. One assessment instance is assigned to each assessor. Assessors have the Assessment actor [sn_smart_asmt.actor] role. See Roles in Smart Assessment Engine.
Collaborative assessment	Assessment which can have multiple contributors. **Note:** The 'Collaboration features for Smart Assessment' plugin must be installed for this to work.
Primary assessor (Required for collaborative)	Assessment owner for the collaborative assessment.
Requester	User that is the contact for questions from the assessor. Each generated assessment includes the contact information.
Due date	Due date that appears in the assessment. This setting overrides the **Duration** setting and the **Duration** setting in the template.
Duration	Time period that is used to calculate the due date of the assessment, starting from when the assessment is triggered. This setting overrides the **Duration** setting in the template.
Duplicate handling	Action to take when a duplicate assessment exists. **Note:** An assessment is considered as a duplicate if there's another open assessment with the same template, scope items, group, or assessors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trigger Smart assessment action form (continued)

Field	Description
	• **Do not create duplicate assessments** • **Create duplicate assessments** • **Create new and cancel existing assessments** Create an assessment to change the state of the existing assessment to **Cancelled**.
Assessment group	Assessment group that the generated assessments are associated with. **Note:** The assessment group that you select should be in an open state and contain the assessments that are linked to the same assessment template as the one you are using. If you select an assessment group, the system checks whether the group is open or closed: • Open: The system first validates that the existing group contains at least one assessment that is linked to the same assessment template. If so, then generated assessments are added to the existing group. • Closed: Assessments can't be added to the existing group. **Note:** If you don't select an assessment group, all generated assessments are grouped under a newly created group.
Scope	List of all scope items that the generated assessments are applied to. Each scope item contains two keys: `table` and `record`. For each context item that is configured at the template level, a corresponding scope item must be set up. For example, if the context items for a template include tables such as Controls [sn_compliance_control] and Entity [sn_grc_profile], then at least two scope items should be configured in the scope: one with `table: Entity [sn_grc_profile], record: [profile_record_id]` and another with `table: Controls`

Tracking assessment template migration

After you have filled out the Assessment template migration form and started the migration process, you can view the progress and confirm if it completed successfully or if there were any errors. For more information on the migration process, see Creating an assessment template from legacy assessment metric types, Migrate a legacy metric type to an assessment template, and How legacy metric types are migrated to sections in templates.

Viewing the migration results

To view your migration results, navigate to **All** > **Smart Assessment Engine** > **Administration** > **Template Migrations**. In the Assessment template migrations list, select the migration number. Each migration record for a metric type is assigned a unique number that starts with the text ATMIG. The form displays the values that were used to generate the template. The related lists display the status and content of the migrated data. The Section migrations table provides a description of the fields in the related lists.

Results of the migration

The following table describes the fields in the Section migrations related list.

Section migrations related list

Field	Description
Number	Unique number that starts with the text ATSMIG in the migration record for the section. You can use the number to search for the record.
Source metric category	Metric category that is created from the section after the metric types are migrated.
Target section	Section that was populated during the migration.
Migration status	Migration status: • **Completed**: The migration is completed successfully. • **Errored**: An error occurred during the migration.
Error details	Description of an error that occurred during the unsuccessful migration.

Select the down arrow for a section to view the list of questions in the section. The following table describes the fields in the Question migrations related list.

Question migrations related list

Field	Description
Number	Unique number, starting with the text ATQMIG, that the system assigned to the migration

Exploring Third-party Risk Management

The Third-party Risk Management application centralizes and standardizes the processes, source materials, responsible persons, and methods of your third-party risk management program. You can improve your operations by managing your portfolio of third parties and by identifying, tracking, and mitigating the issues that arise with third parties.

© 2026 ServiceNow, Inc. All rights reserved.

Third-party Risk Management overview

To protect your organization's assets, reputation, and operations, your third-party risk management program must identify, assess, and mitigate the risks that are associated with external parties. The TPRM application helps you to prevent your outsourced providers, partners, and suppliers from creating a business disruption or a negative impact on your business performance. By using the TPRM application, you can reduce the manual burden and costs of your risk assessment process through automation.

TPRM brings all third-party risk information into one environment.

The following key capabilities can help you to assess risk more effectively:

- Onboarding, Offboarding, Renewals, and additional due diligence workflows
- Assessment management
- Continuous risk monitoring
- Risk performance management

Third-party Risk Management Users

Users

User	Description
Due diligence requesters	Requesters can be any employee at your organization interested in onboarding, reassessing, or offboarding an engagement. For more information on the different types of due diligence requests, see Requesting third-party risk due diligence.
TPRM Assessors	TPRM Assessors are members of the Risk manager's team that help with mitigating the risk of a potential engagement by reviewing information collected through the due diligence process. They could be potentially assigned as owners of due diligence requests based on their expertise or knowledge of the engagement. Here are some examples of different types of assessors and how they would impact the due diligence process for TPRM:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users (continued)

User	Description
	• **Compliance Risk Assessor**: Confirms that engagements comply with industry standards, legal requirements, and contractual obligations. They regularly review engagement processes and activities to help ensure compliance. • **Cybersecurity Risk Assessor**: Evaluates the cybersecurity practices and infrastructures of engagements to protect against data breaches and cyber threats. They regularly review the engagement's security measures and suggest necessary enhancements. • **Operational Risk Assessor**: Analyzes the existing operational practices of engagements, focusing on aspects such as business continuity, supply chain logistics, and quality of service. They regularly review the engagement's operational practices to help ensure they are in alignment with the organization's standards and that appropriate contingencies are in place for potential disruptions.
TPRM Approvers	TPRM approvers are typically a senior member within the organization. They're responsible for the final review and approval of the due diligence findings. They help confirm that all risk management requirements have been satisfactorily addressed before proceeding

	organization's specific risk management needs and compliance requirements.

For more information on TPRM roles, see Roles in Third-party Risk Management.

Third-party Risk Management workflow

The following infographic shows the workflow of the most important processes that you can use to manage risk.

Request due diligence for an engagement

An employee at your organization requests due diligence for a third-party engagement. The due diligence request is reviewed and approved by the Third-party risk (TPR) manager [sn_vdr_risk_asmt.vendor_risk_manager].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Requesting third-party risk due diligence.

Assess risk using an internal assessment containing an Inherent Risk Questionnaire (IRQ)

An IRQ is a set of questions that scores and scopes the required due diligence on the third parties or engagements. After the due diligence request is approved by the TPR manager or TPR assessor [sn_vdr_risk_asmt.vendor_assessor] that has been assigned as the owner of the due diligence request, they select an IRQ and attach it to an internal assessment.

Note:
After the IRQ process enters the IRQ in progress state, you can request risk intelligence reports associated with your due diligence request. For more information, see Using risk intelligence reports and scores and Request a risk intelligence report associated with a due diligence request.

For more information, see Assessing your third-party risk.

Create third-party elements and their entities

After your due diligence request has completed the IRQ process, if TP elements are needed, the TPR manager or due diligence request owner selects **Start collection** and a collection task is created. A third-party element questionnaire is sent to the engagement contact. The TPR manager or owner manually creates third-party element records based on the responses. Entity records are automatically generated for each element. The TPR manager or owner then manually adds these elements as entities.

For more information, see Assessing your third-party risk and Monitoring third-party elements.

Assess risk using an external assessment

After the IRQ process or TP element collection process is completed, the TPR manager or owner selects questionnaires and requests for documentation to attach to external assessments for sending to the third party or engagement. For more information on creating assessments, see Create an external assessment and Third-party risk assessment form.

For more information on this process, see Assessing your third-party risk and Monitoring third-party elements.

Note:
If you have any integrated risk intelligence, relevant information is pulled at this time.

Integrate scores using risk intelligence providers

Your organization can purchase services from providers that return data that is analogous to personal credit scores. The scores provide insight on how trustworthy and safe a particular third party can be.

For more information, see Integrating scores from risk intelligence providers.

Request risk intelligence reports and scores

If you are the TPR assessor and are the due diligence request owner or have the TPR manager role, you can use the TPRM application to request scores or reports for third parties by using the risk intelligence request form. After the reports and scores are generated by the risk intelligence provider, the links to these reports are delivered and associated with that risk intelligence report record. If you have

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

any integrated risk intelligence, relevant information is pulled at this time. For more information, see Using risk intelligence reports and scores.

View scores and related information

The information gathered is scored and combined into a single view of the due diligence process to display all scores, completed questionnaires, issues, approvals, and comments.

For more information on scoring, see Scoring calculations using the classic assessment engine and Verifying scoring calculations using the classic assessment engine. See Classic assessment configuration for information on how scoring can be configured at the assessment and questionnaire level.

Approve due diligence requests

All approvers can review due diligence and see the detailed information before making an approval. After all approvers approve the due diligence request, all the due diligence information can be made available for the person that is negotiating the contract. The contract risk process only applies if a contract is required.

For more information, see Approving or rejecting requests for due diligence.

Negotiate a contract

The contract negotiator can see the detailed information of all the scores and questionnaires. If additional due diligence is required, they can request it. If the contract negotiator successfully executes a contract with the third party, they can upload it and specify that the contract is executed. This action automatically notifies all key stakeholders of the contract's status. The contract negotiator can also skip the contract risk process, reject the due diligence request, or specify that the contract isn't executed and that the third party isn't engaged for business.

Note:
If the third-party risk manager or owner selects the **Skip contract risk process** option during the due diligence process, the assigned contract negotiator isn't notified and the Contract risk process state is skipped. An approver and owner can update the **Skip contract risk process** selection up until the approval process is completed. For more information about this process, see Due diligence request process management.

For more information on this process, see Managing the contract risk process.

Monitor third-party risk

TPR managers, TPR assessors, and Third-party assessment reviewers [sn_vdr_risk_asmt.vendor_assessment_reviewer] can monitor and review the performance of third parties with Vendor Management Workspace.

For more information, see Monitoring your third-party risk.

Manage the Third-party portal

TPR managers can manage third-party contacts, including creating logins, assigning roles, and tracking progress on questionnaires and tasks through the Third-party portal. Third-party contacts can use the portal to respond to assessments, delegate tasks, and manage their information, with options to use Microsoft Excel templates or the SIG questionnaire for responses.

For more information, see Managing the contract risk process.

For an in-depth description of the TPRM Due diligence workflow, see Due diligence workflow.

Smart assessments with Third-party Risk Management

Risk profile

A risk profile is a comprehensive assessment of the potential risks that are associated with a particular third party. To generate a risk profile, you evaluate and document several aspects of the third party's operations, practices, and relationships. The aim is to understand the level of risk they may pose to your organization.

A risk profile enables you to make informed decisions about engaging, monitoring, and mitigating risks associated with third parties. Identify areas of concern, implement risk mitigation strategies, and establish ongoing monitoring processes to help you align third-party relationships with your risk tolerance and strategic objectives.

To prioritize and manage risks effectively, you assign scores or ratings to many risk factors and aggregate them to generate an overall risk assessment for the third party. TPRM displays risk profile information on the Home page.

- Financial stability: An assessment of the third party's financial health to gauge their ability to fulfill their contractual obligations. This includes factors like revenue, profitability, and debt levels.
- Operational risk: An evaluation of the third party's business operations and processes, including their ability to deliver products or services consistently and reliably.
- Compliance and legal risk: A review of the third party's adherence to relevant laws, regulations, and industry standards. This may include assessments of their compliance with data protection, security, and ethical standards.
- Cybersecurity risk: An assessment of the third party's cybersecurity measures and data protection practices to determine their ability to safeguard sensitive information.
- Geopolitical risk: An analysis of geopolitical factors that could impact the third party's operations, such as political stability and regulatory changes in their home country.
- Reputation risk: Consideration of the third party's reputation in the industry, including any past incidents or controversies that could affect the organization's brand.
- Business continuity risk: An evaluation of the third party's plans and capabilities for maintaining operations if there are disruptions or disasters.

Risk intelligence

Risk intelligence providers generate risk scores for a variety of third-party risk domains. Your organization can purchase services from providers that return data that is analogous to personal credit scores. The scores provide insight on how trustworthy and safe a particular third party can be.

Why you conduct due diligence

Conducting due diligence on third parties is a crucial component of your comprehensive third-party risk program. You conduct due diligence to become aware of the risks that are associated with a third party so that you can confidently decide how to form your relationship.

Third-party risk management concentrates on evaluating and managing the risks introduced by external parties. This includes assessing factors such as cybersecurity risks, data privacy compliance, financial stability, regulatory compliance, and operational resilience associated with the engagements. You conduct due diligence (an investigation or examination of business relationship risk), to make informed decisions, establish appropriate controls, and mitigate the potential negative impact of engaging with third parties.

Goals of due diligence

Comply with regulations

Companies are often subject to various regulations and legal requirements that mandate conducting due diligence on third parties. These regulations aim to prevent illegal activities, such as money laundering, corruption, fraud, and other forms of financial misconduct. By performing due diligence, you demonstrate your commitment to compliance and risk mitigation. See Regulations that affect third-party risk.

Protect your reputation

Engaging with a third party can directly impact a company's reputation. By conducting due diligence, you can uncover any potential negative associations or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

activities that could harm your brand image or public perception. This enables you to make informed decisions about whether to proceed with the engagement or to take appropriate mitigating actions.

Safeguard against operational disruptions

Third parties such as suppliers, service providers, or partners play critical roles in your organization's operations. Poor performance, financial instability, or other issues with third parties can disrupt your operations and supply chain, leading to delays, quality issues, or other problems. Due diligence helps assess the reliability and capability of third parties, reducing the risk of operational disruptions.

Protect sensitive information

You might share sensitive information with third parties, such as customer data, intellectual property, or trade secrets. Due diligence helps evaluate a third party's data security measures, privacy practices, and overall commitment to protecting confidential information. This is crucial for maintaining data integrity and helping to prevent breaches or unauthorized disclosures.

Mitigate financial risks

Engaging with financially unstable third parties can pose significant financial risks. Due diligence helps assess the financial health, creditworthiness, and payment history of potential partners or third parties. It enables you to evaluate the financial risks associated with a third party and to make informed decisions based on their financial stability and track record.

Comply with internal policies

You might have internal policies and standards that dictate the criteria for engaging with third parties. Due diligence helps ensure that potential third parties align with the policies, such as sustainability practices, diversity and inclusion requirements, or ethical guidelines.

Related topics

Types of due diligence

Types of due diligence

In the due diligence process, you typically conduct several types of due diligence to gather relevant information and assess various aspects of the third party. The particular types of due diligence that you conduct vary depending on the nature and criticality of the engagement and the risks involved.

Information Security due diligence

Information security due diligence is critical. It involves evaluating the third party's data protection practices, cybersecurity measures, and information handling processes. This includes assessing their data security policies, incident response capabilities, encryption practices, and employee training on data protection. The objective is to safeguard sensitive information and mitigate the risk of data breaches or unauthorized access.

Financial due diligence

Financial due diligence involves assessing the financial health and stability of the third party. It includes reviewing financial statements, analyzing profitability, liquidity, debt levels, cash flow, and other financial indicators. The goal is to understand the financial viability of the third party and help ensure that they have the capacity to fulfill their obligations.

Legal due diligence

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legal due diligence involves examining the legal and regulatory compliance of the third party. It includes reviewing contracts, agreements, licenses, permits, and legal documents. The purpose is to identify any legal risks, liabilities, ongoing litigation, or regulatory non-compliance that could impact your organization's interests.

Operational due diligence

Operational due diligence focuses on assessing the operational capabilities and processes of the third party. It involves evaluating their infrastructure, facilities, supply chain, production processes, quality controls, and capacity to meet your organization's requirements. The goal is to help ensure that the third party can effectively deliver the desired products or services.

Compliance due diligence

Compliance due diligence involves verifying the third party's adherence to applicable laws, regulations, and industry standards. It includes assessing their compliance programs, policies, and procedures related to areas such as anti-corruption, data privacy, information security, environmental practices, and labor standards. The objective is to identify any compliance gaps or risks that could result in legal or reputational issues for your organization.

Reputation due diligence

Reputation due diligence focuses on evaluating the third party's reputation, integrity, and past performance. It involves conducting background checks, reviewing references, searching for news or media coverage, and assessing any past controversies or ethical issues. The purpose is to help ensure that the third party has a positive reputation and aligns with your organization's values and expectations.

Financial due diligence example

Financial due diligence evaluates a third party or engagement's financial health and stability. Third-party Risk Management supports this process by providing:

- Questionnaire templates with financial questions and document requests that you can send to the third party or engagement using an assessment through the third-party portal.

  For more information see, Sample questionnaires and Create an external assessment.

- Due Diligence Request (DDR) workflows that orchestrate internal review, external assessment, approvals, and contract risk checks.

  For more information see, Due diligence workflow.

- Reports and dashboards to track active requests, aging items, and completion timelines.

  For more information see, Monitoring the due diligence request process.

Access these features by navigating to the **Vendor Management Workspace**:

1. Go to **Workspaces** > **Vendor Management Workspace**. On the **Risk** tab, select the due diligence management icon .
2. On the Due diligence management page, select a stage (IRQ, Due diligence, Approvals, Contract risk, Final review, Closed) to view actionable lists.
3. Open a Due diligence request record to manage the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To send financial questionnaires or document requests from a DDR or an Assessment record, create an assessment.
5. Use the Due Diligence Management page to monitor status and aging.

For more information see, Monitoring the due diligence request process and Create an external assessment.

Note:
Activate the Third#party Risk Due Diligence plugin (com.sn_tprm_dd) to enable preconfigured workflows and the Risk Concentration Map. For more information, see Configuring Third-party Risk Management and Enable the TPRM Risk concentration map.

Why you might have several engagements with a single third party

While onboarding a particular third party, you might conduct a separate engagement for each distinct type of relationship that you have with the third party. One engagement is to assess the risk involved in the third party's development of software for your organization and a separate engagement is for the facilities management service that they provide.

Different engagements of the same third party might require varying levels of risk assessment

Note:
The first internal step after an engagement request is approved is to start the IRQ process to scope the risk by determining the third party's risk score. An engagement starts in the inactive state. An engagement moves to the active state when a contract is in place or you take part in an active relationship with the third party.

Different engagements of the same third party can require different levels of risk assessment due to variations in the nature of the services provided, the level of access to sensitive data or critical systems, and the potential impact on your organization's infrastructure. By conducting a separate risk assessment for each engagement, you can tailor your risk management strategies and controls to address the risks associated with each engagement effectively.

Example — the third party will provide two distinct services

In this example, Your organization engages with a third party for two distinct services:

Service: Software Development Engagement

The third party is responsible for developing a custom software application for the financial institution. This engagement involves the third party accessing and processing sensitive customer data, integrating with critical systems, and potentially introducing changes to the organization's infrastructure.

Service: Facilities Management

The third party is also responsible for managing the physical security and maintenance of the financial institution's office buildings. This engagement involves providing security personnel, managing access control systems, and confirming the overall safety and maintenance of the facilities.

The services present different risk profiles and require separate risk assessment engagements:

Engagement for the software development service

This engagement involves a higher level of risk due to the following factors:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Access to sensitive data: The third party has access to customer data, which requires strict data protection and privacy controls to help prevent unauthorized access or data breaches.
- System integration: The third party's software must integrate with critical systems, potentially impacting the stability, availability, or security of those systems. Proper testing and quality assurance procedures are crucial to minimize the risk of system failures or vulnerabilities.
- Change management: The introduction of new software or changes to existing systems can introduce risks, such as compatibility issues, system disruptions, or software vulnerabilities. Robust change management practices and code review processes are necessary to mitigate these risks.

Engagement for the facilities management service

Even though this engagement also involves the same third party, the risk profile is lower when compared to the software development engagement:

- Physical security: The focus here is on managing physical security measures, such as access control and surveillance systems. While still important, the risks associated with physical security are typically more straightforward and easier to manage compared to cybersecurity risks.
- Maintenance and safety: The third party's responsibility is primarily related to general maintenance and promoting a safe working environment. While there are still risks associated with building maintenance (for example, safety hazards), they might be more predictable and manageable compared to the complex cybersecurity risks in the software development engagement.

Types of engagement with third parties

The particular third-party engagements that you might have depend on your industry, size, and operational requirements. Each engagement brings its own set of risks and requires appropriate risk management measures (due diligence) to protect your interests.

Types of engagement

All third parties must be categorized as "Vendors" in the Company [core_company] table.

For more information of how this categorization is structured, see Third-party risk management data model.

Type of third party	Description	Possible types of engagement
Advertising Agencies	Companies that create and execute advertising campaigns on behalf of organizations.	Developing marketing strategies, creating ad campaigns, managing media placements.
Affiliates/Subsidiaries	Related companies or subsidiaries that are part of the organization's corporate structure.	Depends on the type of organization
Auditors	Independent firms that conduct financial audits and provide assurance services to	Conducting financial audits, providing internal control assessments, offering risk management advice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type of third party	Description	Possible types of engagement
	verify the accuracy of financial statements.	
Business Partners	Companies or organizations that collaborate with the organization on joint ventures, partnerships, or strategic alliances.	Joint marketing initiatives, co-developing products, sharing resources.
Business Process Outsourcers (BPOs)	Third-party providers that assume responsibility for specific business processes or functions.	Customer support, payroll processing, IT helpdesk support.
Call Centers	Service providers that handle customer inquiries, support, and telemarketing activities.	Customer service hotline, technical support, sales calls.
Clients	Entities or individuals who engage the organization's services or purchase its products.	Client Services
Cloud Service Providers (CSPs)	Companies that offer cloud-based infrastructure, platforms, or software solutions.	Data storage and backup, cloud computing, software-as-a-service (SaaS) solutions.
Collection Agencies	Third parties engaged to recover outstanding debts or delinquent payments on behalf of organizations.	Debt collection services, skip tracing, negotiation with debtors.
Consultants	Individuals or firms that provide expert advice, guidance, and solutions in specific areas.	Management consulting, IT consulting, process improvement, strategy development.
Contractors	Individuals or companies hired to perform specific tasks, services, or projects.	Construction projects, software development, marketing campaigns, event planning.
Counterparties	Entities or individuals with whom the organization has contractual agreements or business relationships.	Supplier contracts, partnership agreements, licensing agreements.
Credit Card Processors	Entities that facilitate payment processing and manage credit card transactions.	Credit card payment processing, fraud prevention, merchant services.
Customers	Individuals or entities that purchase goods or services from the organization.	Product sales, service subscriptions, client contracts.
Datacenters	Facilities that provide secure hosting, storage, and management of digital data and IT infrastructure.	Server colocation, data backup and recovery, network management.

Type of third party	Description	Possible types of engagement
Data Processors	Third parties that process or handle sensitive data on behalf of the organization	cloud storage providers.
Digital Marketing Agencies	Agencies specializing in digital marketing strategies and tactics.	Search engine optimization (SEO), social media marketing, content creation, online advertising.
Distributors	Third parties responsible for distributing or selling products or services on behalf of manufacturers or suppliers.	Product distribution agreements, supply chain management, sales partnerships.
E-commerce Platforms	Online platforms that enable businesses to sell products or services directly to customers over the internet.	Online storefront setup, payment processing integration, order fulfillment.
Employee Benefits Providers	Companies that offer employee benefits administration services.	Health insurance coverage, retirement plans, employee wellness programs.
Energy Providers	Entities that supply electricity, gas, or other forms of energy required for organizational operations.	Energy supply contracts, utility services, energy management consulting.
Environmental Consultants	Experts who assess and provide guidance on environmental impact, compliance, and sustainability matters.	Environmental impact assessments, regulatory compliance consulting, sustainability planning.
Event Management Companies	Service providers that plan, organize, and execute corporate events, conferences, trade shows, or promotional activities.	Event planning, venue coordination, logistics management.
Facilities Management Companies	Third parties responsible for managing and maintaining physical facilities.	Security services, cleaning and maintenance, repairs and renovations.
Financial Advisors	Professionals who provide advice and guidance on financial planning, investment strategies, and wealth management.	Financial planning, investment portfolio management, retirement planning.
Freight Forwarders	Entities that manage and coordinate the transportation of goods.	Freight logistics, customs clearance, supply chain management.
Franchises	Entities or individuals granted the right to operate a business under the organization's brand and business model.	Franchise agreements, brand licensing, franchise support services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type of third party	Description	Possible types of engagement
Government Agencies	Government bodies or entities with which the organization interacts.	Regulatory compliance, permits and licenses, government contracts.
Human Resources Outsourcers	Service providers that handle various HR functions.	Payroll processing, employee benefits administration, recruitment outsourcing.
Insurance Providers/Brokers	Companies or brokers that provide insurance coverage or risk management services.	Insurance policies, risk assessments, claims management.
Joint Venture Partners	Companies or organizations that enter into a joint venture with the organization.	Joint business development, shared marketing campaigns, co-production agreements.
Legal Services Providers	Law firms or legal service providers engaged to address legal matters.	Contract drafting, litigation support, regulatory compliance advice.
Marketing and Advertising Agencies	External agencies or consultants engaged for marketing, advertising, or public relations activities.	Marketing strategy development, ad campaign execution, brand positioning.
Outsourcing Providers	Third parties that handle specific business functions or processes.	IT outsourcing, finance and accounting services, manufacturing outsourcing.
Regulatory/Compliance Entities	Government agencies, regulatory bodies, or compliance consultants.	Compliance audits, regulatory reporting, industry certifications.
Resellers/Distributors	Third parties that distribute or resell the organization's products or services.	Retail partnerships, distribution agreements, reseller networks.
Research and Development Partners	Universities, research institutions, or specialized R&D companies.	Collaborative research projects, technology licensing, innovation partnerships.
Service Providers	External entities that offer various services to support the organization's operations.	IT support, facility maintenance, consulting services.
Software Providers	Companies that supply software solutions to support the organization's operations.	Enterprise software licensing, software maintenance and support, customized software development.
Subcontractors	Third parties engaged by contractors or vendors to perform specific tasks.	Subcontracted construction work, specialized service subcontracting, project-specific outsourcing.
Suppliers	External entities that provide goods or materials necessary for the organization's operations.	Procurement agreements, supply contracts, and third-party partnerships.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type of third party	Description	Possible types of engagement
Technology Providers	Companies that supply technology solutions, software, or hardware.	IT infrastructure deployment, software integration, network setup and management.
Telecommunications Providers	Companies that provide communication services, such as voice, data, and internet connectivity.	Phone and internet services, virtual private networks (VPNs), network security solutions.
Testing and Quality Assurance Providers	Companies that offer software testing and quality assurance services.	Software testing, quality assurance assessments, user experience testing.
Training and Development Providers	Entities that offer training and development programs, courses, or workshops.	Employee training, leadership development, skills workshops.
Transportation Providers	Entities that provide transportation services for goods or people.	Freight transportation, passenger transportation, logistics coordination.
Travel Agencies	Companies that assist with travel arrangements, bookings, and itinerary planning.	Corporate travel management, travel booking services, group travel coordination.
Utility Providers	Companies that supply essential utilities, such as water, gas, or electricity.	Water supply, gas services, electricity distribution.
Vendors	External entities that supply goods or services required for organizational operations.	Supply chain management, procurement contracts, and third-party partnerships.
Warehousing and Logistics Providers	Companies that offer warehousing, storage, and logistics services.	Inventory management, order fulfillment, distribution network management.
Web Development and Design Agencies	Agencies specializing in web development, design, and digital experiences.	Website development, user interface design, e-commerce platform integration.
Wholesalers	Entities that buy goods in bulk and resell them to retailers or distributors.	Wholesale distribution agreements, supply chain management, bulk purchasing.
Workforce Agencies	Agencies that provide temporary or contingent workforce solutions.	Temporary staffing, contract workers, on-demand labor.

Regulations that affect third-party risk

When implementing your third-party risk management program, you must carefully consider the regulations. Applicable regulations vary depending on your industry, geographic location, jurisdiction, and nature of your operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regulations that typically affect third-party risk management programs

You should consult legal and compliance experts to determine the specific regulatory landscape relevant to your third-party relationships. Here's a list of regulations that are typically considered when assessing third-party risk:

Anti-Money Laundering (AML) and Counter-Terrorism Financing (CTF) regulations

These regulations aim to prevent money laundering, terrorist financing, and other illicit financial activities. They require companies to verify the identity of their third parties, assess their sources of funds, and ensure compliance with applicable AML and CTF laws.

Anti-Corruption and Bribery laws

Regulations such as the U.S. Foreign Corrupt Practices Act (FCPA) and the UK Bribery Act impose strict requirements on companies to prevent bribery and corruption. Due diligence helps identify any potential risks related to bribery or corruption in the third party's operations and relationships.

Data Protection and Privacy regulations

With the increasing focus on data protection and privacy, regulations like the European Union's General Data Protection Regulation (GDPR) and the California Consumer Privacy Act (CCPA) require companies to safeguard personal data. Due diligence includes assessing a third party's data protection and privacy practices to ensure compliance with these regulations.

Sanctions and Embargoes

Governments impose sanctions and embargoes on certain countries, individuals, or entities to restrict trade and prevent support for illegal activities. Companies need to ensure that their third parties aren’t subject to any sanctions or embargoes and aren’t engaged in activities that violate these restrictions.

Financial Regulations

Depending on the industry, companies might need to consider financial regulations such as the Sarbanes-Oxley Act (SOX) for publicly traded companies or sector-specific regulations like the Dodd-Frank Act for financial institutions. These regulations often require companies to assess the financial stability, reporting accuracy, and internal controls of their third parties.

Labor and Employment Laws

Companies need to ensure that their third parties comply with labor and employment laws, including regulations related to minimum wage, working hours, health and safety, and equal employment opportunities. This helps mitigate risks associated with labor violations and potential reputational harm.

Environmental Regulations

Companies might need to evaluate a third party's compliance with environmental regulations, particularly if the third party engages in activities that have an environmental impact. This includes assessing their environmental practices, waste management, pollution control measures, and adherence to sustainability standards.

Benefits of your third-party risk management program

A third-party risk management program can help you to proactively identify, assess, and mitigate the risks that are associated with your relationships with third parties. By effectively managing third-party risks, you can enhance your overall resilience, protect your interests, and create sustainable and trustworthy business relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Here are some key benefits and value propositions of implementing a robust third-party risk management program:

Risk reduction and mitigation

A third-party risk management program enables you to identify and assess potential risks associated with your third-party relationships. By conducting due diligence, monitoring activities, and implementing risk mitigation strategies, you can reduce the likelihood and impact of risks such as compliance violations, financial instability, data breaches, reputation damage, operational disruptions, and legal liabilities.

Compliance and regulatory adherence

A comprehensive third-party risk management program helps you comply with applicable laws, regulations, and industry standards. By verifying the compliance of your third parties with various regulatory requirements, you can avoid legal penalties, reputational damage, and potential business disruptions resulting from non-compliance.

Enhanced reputation and brand protection

Engaging with third parties introduces risks to your reputation and brand. By proactively managing these risks through a third-party risk management program, you can safeguard their reputation, maintain stakeholder trust, and demonstrate a commitment to ethical business practices and responsible supply chain management.

Operational efficiency and continuity

Third parties such as suppliers, vendors, or service providers play critical roles in your operations. By effectively managing third-party risks, you can validate the reliability, performance, and continuity of your supply chain. This reduces the likelihood of disruptions, delays, or quality issues that can impact operational efficiency and customer satisfaction.

Cost savings and financial protection

Implementing a third-party risk management program can lead to cost savings and financial protection. By evaluating the financial stability of third parties, you can avoid engaging with financially vulnerable entities that might default on payments or fail to deliver goods or services. Additionally, by helping to prevent legal and regulatory non-compliance issues, you can avoid costly fines, penalties, legal disputes, and associated expenses.

Enhanced decision-making and informed partnerships

A well-structured third-party risk management program provides you with comprehensive information and insights about your third parties. This enables better decision making when selecting and engaging with third parties, enabling you to choose partners that align with your values, standards, and business objectives. It also helps foster stronger and more reliable relationships based on trust and shared risk awareness.

Strengthened cybersecurity and data protection

Third-party relationships can introduce significant cybersecurity and data protection risks. A third-party risk management program helps assess the cybersecurity practices and data protection measures of third parties, reducing the chances of data breaches, unauthorized access, or data leakage. This helps you protect sensitive information and maintain compliance with data protection regulations.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example — Onboarding a third party

Acme, a large manufacturing company, is in the process of onboarding a new third party to supply critical components for their production line. To help ensure the third party's reliability and to mitigate potential risks, Acme starts a thorough third-party risk management onboarding process.

Onboarding process example

Request process

Any employee (typically a user who wants to do business with a third party) makes the business case to start the due diligence process for a risk assessment.

A Third-party Risk (TPR) manager reviews the request for due diligence for the engagement and approves it.

Inherent Risk Questionnaire (IRQ) process

After the request is approved, the IRQ assessor completes the internal assessment by responding to the IRQ.

Based on the information gathered, Acme assesses the potential risks associated with the third party. They evaluate factors such as financial stability, operational capacity, adherence to quality standards, compliance with regulations, and the third party's ability to meet delivery timelines. This assessment helps Acme understand the third party's risk profile and determine the appropriate risk mitigation strategies.

Due diligence process: Compliance verification and data security and privacy assessment

When the IRQ process is complete, Acme's TPRM application sends questionnaires and requests for documentation to the third party. As part of an assessment, you might send multiple questionnaires and document requests. Acme might request documents: the third party's certifications, licenses, or audit reports to validate compliance.

> **Note:**
> To simplify and automate the process of determining which questionnaires and document requests to send to a third party of this type, Acme's staff has developed assessment templates. They defined questionnaire templates, document request templates, or both and then grouped them into an assessment template. Acme can reuse the template to send the appropriate questionnaires, document requests, or both to similar third parties in future assessments.

Acme uses the third party's responses and internal analysis to determine whether the third party meets all necessary compliance requirements. This includes verifying the third party's compliance with applicable laws and regulations, such as environmental regulations, labor laws, and anti-corruption policies.

Given the sensitive nature of the components involved, Acme evaluates the third party's data security and privacy practices. They assess the third party's information security measures, data protection policies, access controls, and vulnerability management processes. If the third party will have access to Acme's proprietary information or customer data, they might require the third party to undergo a cybersecurity audit or provide evidence of their data protection measures.

Contractual Agreements and Risk Mitigation

To protect their interests, the TPR contract negotiator at Acme (often corporate counsel) incorporates specific contractual provisions to address identified

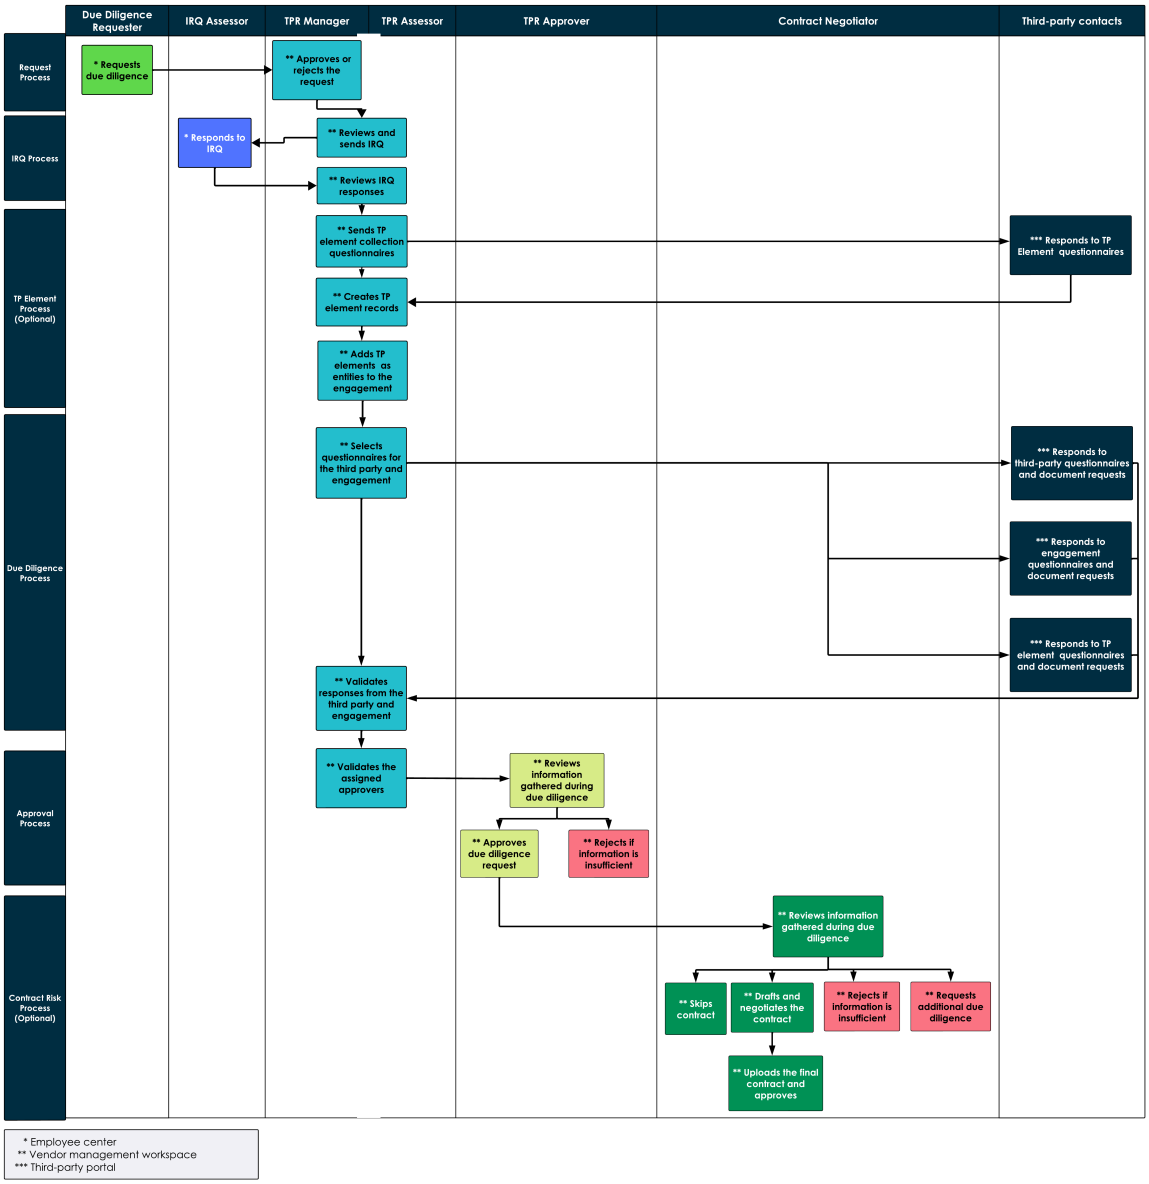
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

risks. The contract negotiator uses the information gained in the IRQ and due diligence processes to include clauses related to compliance, quality standards, confidentiality, data protection, business continuity, and dispute resolution mechanisms. The contract can also outline performance metrics, expectations, and termination clauses if there’s a non-compliance or breach.

Ongoing Monitoring and Review

Acme establishes an ongoing monitoring process to regularly assess the third party's performance and adherence to agreed-upon terms. Persons at your organization might manually perform periodic financial reviews, quality audits, site visits, or surveys. They also establish communication channels to address any concerns or changes in the third party's risk profile.

Due diligence workflow



The Third-party risk management (TPRM) processes provide a consistent framework for your third-party risk management program. You can customize the workflow processes to meet your organization's needs.

Processes in the due diligence workflow

Each task in a process must be completed before the next task can be started. The roles of the users that perform the various tasks are described in Roles in Third-party Risk Management. The following diagram describes the due diligence workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Due diligence workflow

Request process: Ask to start a new engagement, reassess, or offboard an existing one

1. An employee at your organization requests due diligence for a third-party engagement.
   a. The employee logs in to Employee Center on their instance. They open the due diligence request form and specify the name of the third party and the reason for the request:
      - Onboard a new engagement
      - Reassess a risk for an existing engagement
      - Reassess an existing engagement to prepare for a contract renewal
      - Offboard an engagement with due diligence
      - Offboard an engagement with no due diligence

> **Note:**
> When offboarding an engagement with no due diligence the TP element collection and Due diligence process are not applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. The employee provides details about the third party and engagement. The information includes the product or service that should be assessed in this engagement, the user who will respond to the Inherent Risk Questionnaire assessor (IRQ), and the third-party (TP) contact or engagement contact who will respond to the external questionnaires.

c. At any time, an external risk intelligence provider might update the risk data for the third party because a Third-party risk (TPR) manager might have integrated the services of a risk intelligence provider while configuring the application.

d. The employee submits the form.

e. The system sends out an email notification to the employee who made the request.

f. The system sends out an email notification to the Due diligence request assignment group. A member of the group can assign a TPR manager or TPR assessor to act as the owner of the request. This action triggers a task for the TPR manager.

2. The TPR manager scopes the request, updates it as needed, and then approves or rejects it.

a. The TPR manager logs in to the Vendor Management Workspace and navigates to the due diligence management page, where they review and update the request:

- The TPR manager reviews the person who was suggested as the IRQ assessor. If needed, they can specify a different person as the IRQ assessor.
- The TPR manager can start a discussion with the requester and other users by selecting **Discuss**. The message is recorded in the Activity section of the **Details** tab.

b. The TPR manager either rejects or approves the request. If the TPR manager accepts the request, the IRQ process starts.

Note:
TPR assessors can create recurring third-party assessments to reassess a risk on a regular schedule. For more information, see Configure a risk assessment to recur on a schedule and Event-driven management — automate assessment processes.

IRQ process: Scope the risk

1. The TPR manager reviews and approves the IRQ.

a. In the Vendor Management Workspace, the TPR manager reviews and approves the IRQ by from a list on the system.

The TPR administrator can create custom IRQs for an organization. The content of each IRQ is created and maintained by the person who is responsible for the business area, the geography, or third party that the questions are intended for. To define an IRQ, the TPR administrator adds sample questions to a questionnaire template and modifies the questions as needed. The sample questions are provided in the base system. Defining an IRQ is a no-code process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
The TPR manager can use the answer to a question in an IRQ to determine the questionnaires that are sent to the third party that is being assessed. This feature is available only if the Third-party Risk Management application has been activated.

For more information, see Set up internal questionnaire responses to automatically attach external questionnaires to assessments.

b. The TPR manager either rejects the due diligence request or approves it. When the request is approved, the system sends the IRQ to the IRQ assessor, which is an internal stakeholder at an organization.

c. The IRQ assessor is notified of the IRQ both by email and by a new task in their queue.

Note:
The system can also auto-send third-party risk assessments when changes to a risk score occur.

2. Internal users respond to the IRQ:

a. In the Employee Center, any user that is interested in the engagement opens and responds to the IRQ.

Several answers generate further clarifying questions. The answers can determine which external questionnaires are auto-generated and added to the sets that goes to the TP and engagement contact.

For example, if an IRQ assessor responds that the third party interacts with government officials as part of the engagement, then an anti-bribery questionnaire that is appropriate to the third party's country (ABAC in the USA or FCBA in the EU, and so on) is included.

b. The IRQ assessor submits the completed IRQ. This action triggers a task for the TPR manager.

3. The internal stakeholders (third-party assessment reviewer, TPR assessor, TPR approver, TPR manager, or TPR administrator) review the IRQ responses:

a. In the Vendor Management Workspace, the users review the IRQ responses.

b. The TPR manager might ask the IRQ assessor for clarification and then either rejects or approves the IRQ responses.

c. If an internal stakeholder user approves the IRQ responses, they move to the next process by closing the engagement request.

Note:
After the IRQ process has entered the IRQ in progress state, you can request risk intelligence reports associated with your due diligence request. For more information, see Using risk intelligence reports and scores and Request a risk intelligence report associated with a due diligence request.

TP element collection process: Collect third-party element information (Optional)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The TPR manager or due diligence request owner starts the third-party element collection.
   a. In the Vendor Management Workspace, if third-party elements are needed the TPR manager or owner selects **Start collection** and a collection task is created.
   b. The TPR manager or owner navigates to the collection task tab and assigns the relevant third-party element collection questionnaires to the external assessment for collecting elements.

      Note:
      As part of the base system, sample questionnaires for collection and assessment are available for third-party elements classified as a Facility, Principal, Products, or Other.

   c. The TPR manager or owner reviews and approves the questionnaires and they're sent to the engagement.
2. The system sends out an email notification to persons at the engagement. The messages notify the engagement contact to respond to the third-party element collection questionnaires.
3. In the Third-party portal, the engagement contacts either respond to the questionnaires directly or assign the tasks to other contacts at the organization.
4. The engagement contact returns the completed questionnaires.
5. The system changes the state of the assessment to **Responses received** and sends alerts to the TPR manager and owner.
6. In the Vendor Management Workspace, the TPR manager or owner opens the questionnaires and verifies all the required information was provided.
7. The TPR manager or owner then navigates to the list of Third-party elements and manually creates a third-party element record for each set of responses in the questionnaire.
8. After all third-party elements are created, the TPR manager or owner closes the assessment.
9. The system changes the state of the request to **Collection in review**.
10. The internal stakeholders (TPR assessor, TPR approver, TPR manager, or TPR administrator) review and approve the element records.
11. In the Vendor Management Workspace, the TPR manager or owner opens the engagement and manually adds elements as entities on the Entities tab.
12. After all third-party element entities are assigned to an engagement, you can start the due diligence process.

Due diligence process: Collect information to generate a risk score

1. Either one of the following processes results in the selection of external due diligence questionnaires:
   - In the Vendor Management Workspace, the TPR manager selects the questionnaires that the TP and engagement contacts respond to.
   - The system auto-selects the questionnaires according to the configurations set to make the selections. For more information on how to configure external questionnaires to be selected based on internal questionnaire responses,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

see Set up internal questionnaire responses to automatically attach external questionnaires to assessments.

- The system auto-selects the questionnaires according to the business rules that were defined to make the selections.

2. Regardless of the selection method that you used in step 1, two external due diligence questionnaires are selected:
   - One set collects information on the third-party organization. The TP contact responds to that questionnaire.
   - The other set collects information on the business unit within the third-party organization that is the subject of the engagement. The engagement contact (as specified in the due diligence request) responds to that questionnaire.

   Note:
   If you completed the optional TP element collection process, a questionnaire must be selected and assigned as part of an assessment for each third-party element you created. The third-party element questionnaires are completed by the engagement contact.

3. In the Vendor Management Workspace, the TPR manager reviews the auto-selected questionnaires that the TP and engagement contacts respond to. The TPR manager validates or modifies the selections and then approves the set of questionnaires. For more information on creating external assessments, see Create an external assessment.
4. The system sends out an email notification to persons at the third party. The messages notify the TP contact and engagement contact to respond to the external questionnaires.

   Note:
   Do not make any changes to a questionnaire template after it's already in use, you can duplicate the template instead by making a copy. If you make any changes to a questionnaire after it's been sent out as part of an external assessment, those updates won't show up in the questionnaire displayed in the third-party portal. For more information, see Create a questionnaire or document request template and Create a questionnaire or document request template using the Designer.

5. In the Third-party portal, the TP and engagement contacts either respond to the questionnaires directly or assign the tasks to other contacts at the third-party organization.

   Note:
   The Third-party portal is fully isolated from your organization's instance.

   In an iterative process, before the TPR manager closes an assessment, the TPR manager can generate non-compliance issues and tasks. The TPR manager communicates with the TP contacts and engagement contacts by using comments to close the issues and tasks. The TPR manager can also assign different contacts as needed. For more information, see Manage issues.

6. The TP contact and engagement contact return the completed questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. The system changes the state of the request to **Ready for TPRM approval** and sends alerts to the TPR managers.
8. In the Vendor Management Workspace, the TPR manager validates that the questionnaires are received, complete, and signed if necessary, and then closes the assessment phase to start the approval process.

Note:
If the third-party risk manager or owner selects the **Skip contract risk process** option during the due diligence process, the assigned contract negotiator isn't notified and the Contract risk process state is skipped. An approver and owner can update the **Skip contract risk process** selection up until the approval process is completed. For more information about this process, see Due diligence request process management.

Approval process: Internal stakeholder analyzes each aspect of risk

All internal stakeholders (approvers) review the questionnaire responses and supporting documents from the third-party and engagement contacts. If the responses are good, one or more approvers approves and then closes the DD request. If a contract will be prepared, the approved request moves to the Contract Risk process.

- Approvers can approve or reject the request and then close it.
- Closing the request moves it either to the contract risk process, or if no contract is involved, the engagement starts.

Contract Risk process

After approval, all due diligence information can be made available for the contract negotiator. By using the Vendor Management Workspace, the contract negotiator accesses all the data that is generated during the preceding processes to design and settle the contract:

- The contract negotiator can skip the contract risk process if a contract is no longer required.
- The contract negotiator can request additional due diligence if it's required.
- If the contract negotiator successfully executes a contract with the third party, they can upload it and specify the contract is executed to automatically notify all the key stakeholders.
- The contract negotiator can specify that the contract isn't executed, and the third party won't be engaged for business.
- The contract negotiator can specify that the contract is terminated, and the third party won't be engaged for business.

Note:
Starting with version 19.1.x of the Third-party Risk Management application, the tiering questionnaire and external assessment reminders workflows are deprecated and migrated to Workflow Studio. If you have customized these workflows, they won't be deprecated or migrated as part of this change.

Smart assessments with Third-party Risk Management

With the integration of Smart Assessment Engine (SAE), TPRM now supports both the Classic assessment engine and SAE. You can create questionnaire templates and add

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

instructions, questions, and reference information by creating templates using SAE in the Vendor Management Workspace.

SAE overview

The Smart Assessment Engine in Vendor Management Workspace enables you to create both internal and external questionnaires using configurable templates, logical grouping of questions, inline guidance, and automations.

For more information about the Smart Assessment Engine application, refer to Exploring Smart Assessment Engine.

Note:
To use Smart Assessment Engine, you must enable the Smart Assessment Engine enabled [sn_vdr_risk_asmt.sae_enabled] property. After setting this property, you can't create new assessments and questionnaire templates using the Classic assessment engine.

Benefits of using the Smart Assessment Engine experience

The new assessment experience offers the following benefits.

- Enhanced navigation: Use the improved navigation for a better user experience.
- Assessment support: Conduct assessments for both internal and external parties in one standard UI. TPRM SAE questionnaire templates are extended to include additional attributes such as the risk area and the option to include previous responses, which aren't available in the base SAE templates. TPRM SAE templates must be created directly within the Vendor Management Workspace to ensure that they include the necessary attributes and can be used for TPRM assessments.
- Organize questions: Group questions into subsections and sections for better organization.
- Add attachments: Attach the files directly to the individual questions.
- Add reference information: Add reference information to a questionnaire template to help ensure that assessors and respondents can access the necessary information they need while completing a questionnaire.
- Filter questions: Quickly identify and filter unanswered questions.
- Auto-save for questionnaires: Save your work automatically as you complete each question within a questionnaire.
- Standardized risk rating scale definition: Override the default risk rating scales at the template level for both internal and external assessments.
- Assessment duration: Define the duration of an assessment when creating a questionnaire template.
- Combine assessments: Respond to questionnaires by using the same SAE template in a single, streamlined view.
- Risk scoring and score normalization: Standardize the risk scores for a consistent evaluation using the more flexible scoring settings available in SAE.
- Support for the GRC and third-party portals: Internal assessment responders can use the GRC portal to access and complete internal assessments and external assessment responders can use third-party portal to complete external assessments.

Smart Assessment Engine limitations

SAE with TPRM has the following limitations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All new assessments must use SAE questionnaire templates.
- Third-party risk assessors can no longer create issues from the View responses page. Issues generation rules can be used to create issues automatically.
- Third-party risk assessors can no longer create comments on individual questions. They can only use the comment section at the questionnaire level.
- The signature feature isn't supported.
- Automatic attachment of questionnaires to external assessments based on inherent risk questionnaire (IRQ) responses or IRQ-calculated risk tiers is currently not supported in Smart Assessment Engine.
- The following question types aren't supported: Percentage, ranking, image scale, and custom metric aren't supported. You must either convert these question types to supported formats before migration or create new questions in the template designer after migration.

  Note:
  For the percentage and image scale question types, customers can use the Number type and Radio button type, respectively. Ranking and custom metric question types aren't supported.

- If a section in the classic template contains only unsupported questions, an empty section is created in the TPRM SAE template. TPRM SAE templates with empty sections can't be published; therefore, you must either add replacement questions to these sections or delete the empty sections before publishing.

  For more information on migration results, migration limitations, and creating TPRM SAE questionnaires, see Results of migrating a template to a TPRM SAE template and Create a TPRM SAE questionnaire or document request template.

- Repeating assessments aren't supported. You can use Event-driven management rules.
- When transferring TPRM SAE questionnaire templates between instances, the update set won't include the duration information. Users must export the duration information manually from the `sn_smart_asmt_duration` table and import it into the target instances.
- If an assessment template isn't updated to support SAE assessments, the related tier-based, provider-based, and event-driven management rules won't run as expected.
- The TPRM scoring migration proceeds only if there were no errors during the template migration. If there were errors, the TPRM scoring migration doesn't occur.

Note:
For more information on migration results and migration limitations, see Results of migrating a template to a TPRM SAE template.

What to explore next

Configuring Third-party Risk Management

You can activate or upgrade TPRM, by downloading the applications from the ServiceNow Store and then configuring the settings to meet your needs.

Configuration overview

By performing the tasks in the Setup tasks for TPRM checklist, you can upgrade or install the TPRM application. After you've completed the tasks, you can perform additional configuration as described in Classic assessment configuration.

Note:

For any custom messages you create, it is your responsibility to generate the corresponding `sys_ui_message` records. This step is crucial if you want the custom messages to be extracted and translated.

Initial setup and upgrade checklist for TPRM

Setup tasks for TPRM

Task	Description
Activate the Third-party Risk Management app [com.sn_vdr_risk_asmt].	To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time. **Important:** The base system includes many sample questions that you can use in your question bank. To include sample questionnaires, select **Load demo data** while installing the app. Role required: admin
Activate the Due diligence request workflow application [com.sn_tprm_dd].	To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time. Role required: admin
Activate the Vendor Risk Management Workspace application [sn_vrm_ws].	To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time. Role required: admin
Add an authentication policy to enable secure access for external third parties.	For more information, see Add an authentication policy to enable secure access for external third parties. Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for TPRM (continued)

Task	Description
	Use the platform post-authentication policies to enable third parties to secure access to your instance. For background information on this feature, see Post-authentication context.
Assign TPRM roles to users and user groups.	Assign roles to users before you implement or use the Third-party Risk Management application. Assigning roles in a well-organized manner simplifies and improves process management and helps to ensure that users are promptly notified of tasks in their areas of responsibility. For more information, see Assign TPRM roles to users and user groups. Role required: admin
Add users to groups based on their responsibilities.	Assign users to groups before you implement or use the Third-party Risk Management application. Each group contains users with particular roles. Well-organized user groups simplify and improve process management and help to ensure that users are promptly notified of tasks in their areas of responsibility. For more information, see Add users to groups based on responsibilities. Role required: admin
Configure TPRM properties.	Configure property settings for a variety of TPRM operations. For more information, see Configure TPRM properties. Role required: admin
Enable the TPRM Risk concentration map.	This task is optional. For more information, see Enable the TPRM Risk concentration map. Role required: admin After you install the Risk concentration map feature, you must install a Google license to enable the feature.
Enable your emails with third-party contacts.	Configure email communication with third-party contacts to enable email notification of assessments and issues. For more information, see Enable email with third-party contacts. Role required: admin
Import the existing data from other systems.	This task is optional. Import existing data (third parties, engagements, assessments, questionnaires, issues, and so on) from other systems (like the Aravo platform, the ProcessUnity platform, and so on). You aren't charged for importing the data.

Setup tasks for TPRM (continued)

Task	Description
	For more information, see Import existing data from other systems. Role required: admin
Set up third-party contacts.	Third-party contacts are external users at the third-party organization. They use the Third-party portal to securely organize, prioritize, and perform tasks like responding to questionnaires for assessments, performing tasks, and communicating with your risk-assessment staff regarding issues. You grant access to the Third-party portal and specify the permissions for third-party contacts. For more information, see Set up third-party contacts. Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Activate a language.	This task is optional. The ServiceNow AI Platform uses American English by default. You can configure TPRM to use a different language. For more information, see Activate a language. Role required: admin
Run the quick-start tests for third-party risk management.	This task is optional. Verify that TPRM still works after you make configuration changes such as applying an upgrade or developing an application. Copy and customize the quick-start tests to pass when using your instance-specific data. For more information, see Run the Quick Start tests for Third-party Risk Management.

Assign TPRM roles to users and user groups

Assign roles to users before you implement or use the Third-party Risk Management application. Assigning roles in a well-organized manner simplifies and improves process management and helps to ensure that users are promptly notified of tasks in their areas of responsibility.

Before you begin

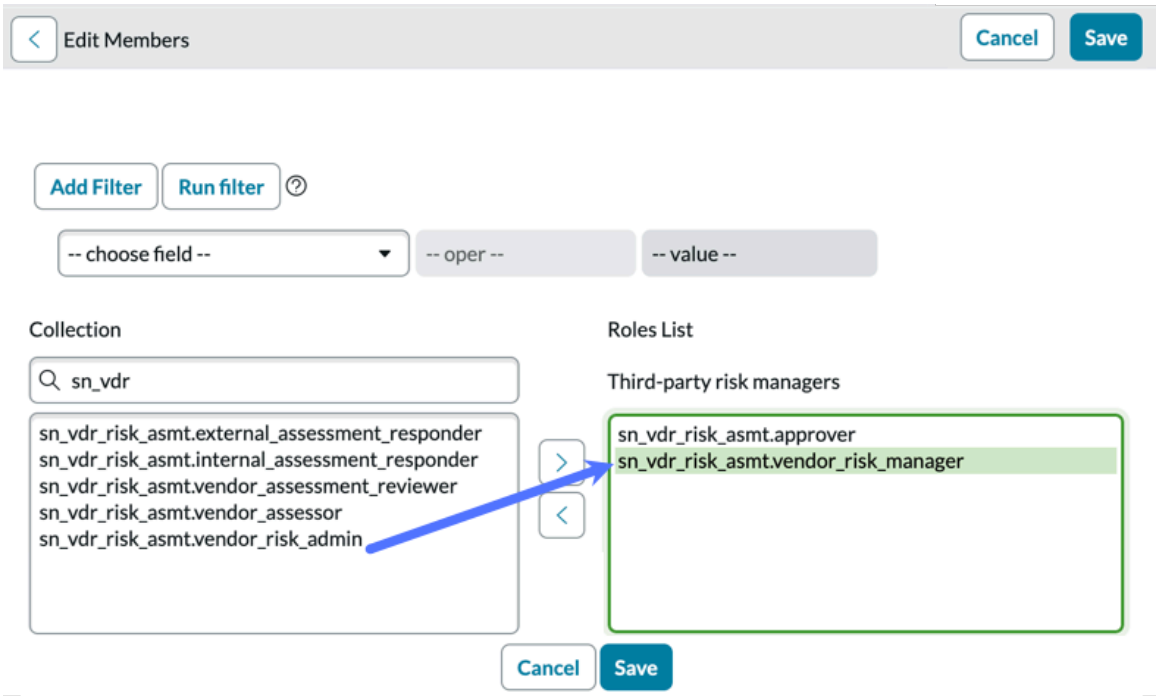
Role required: admin

About this task

The roles discussed in this procedure are described in Roles in Third-party Risk Management.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Administration** > **User Groups**.
2. Select the Roles related list to assign roles to the group.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the search field for the **Collection** list, enter `sn_vdr` to view the list of roles that relate to the TPRM application.

   TPRM roles are described in Roles in Third-party Risk Management.

b. Move the roles that are appropriate for the group from the **Collection** list to the **Roles** list and then select **Save**.

   In this example, the **sn_vdr_risk_asmt.vendor_risk_manager** role is assigned to the group that the user has named `Third-party Risk Managers`.

3. On the Group Members related list, select **Edit**.
4. Move all appropriate users from the **Collection** list to the **Group Members List** and then select **Save**.
5. **Optional:** Use the Groups related list to add subgroups to the group that you are defining.

Add users to groups based on responsibilities

Assign users to groups before you implement or use the Third-party Risk Management application. Each group contains users with particular roles. Well-organized user groups simplify and improve process management and help to ensure that users are promptly notified of tasks in their areas of responsibility.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Several user groups are created when you activate the TPRM app. In this procedure, you add users to each group. The roles mentioned in this procedure are described in Roles in Third-party Risk Management.

There's an important practical result of including all users with a particular role in a group: Your risk management process isn't affected when one or more members of the group are unavailable due to vacation, for example.

Important:
Consider this to be an ongoing process, where the user who is assigned as the group manager is responsible for continuously updating group membership.

Due diligence request assigners

Group members have the Third-party risk (TPR) assessor [sn_vdr_risk_asmt.vendor_assessor] role.

Each member receives email notification of new requests for due diligence. For requests in the **New** or **Unassigned** state, no one has been specified in the **Assigned to** field. Any group member can assign or be assigned to a request.

The individual who owns an assessment for audit purposes and monitors and manages overall assessment processes. The owner is responsible for confirming that the assessment is completed in a timely fashion by the third party, reviewing their responses, and creating and resolving issues. To drive the assessment to its completion, they are notified when an assessment reaches a particular milestone. They must have the TPR manager or TPR assessor role.

Third-party Risk Managers

Group members have both the TPR approver role [sn_vdr_risk_asmt.approver] and the TPR manager role [sn_vdr_risk_asmt.vendor_risk_manager].

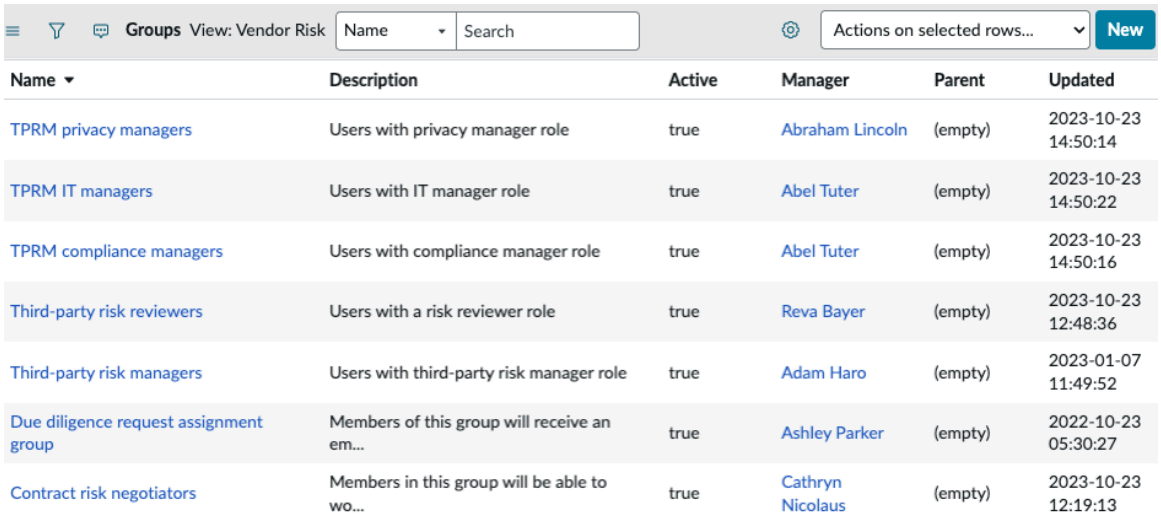
Members can monitor and manage overall due diligence processes and approve new requests for due diligence.

Third-party Risk Reviewers (External assessment reviewers)

Group members have the Third-party assessment reviewer role [sn_vdr_risk_asmt.vendor_assessment_reviewer].

Members can monitor and manage interactions with third-party contacts during external due diligence processes.

Contract risk negotiators



Group members have the Contract risk negotiator [sn_vdr_risk_asmt.contract_negotiator] role.

Members work in the contract risk process.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Administration** > **User Groups**.
   The list of user groups appears.

© 2026 ServiceNow, Inc. All rights reserved.

2. Select the name of the group to update.
3. **Optional:** Specify a manager for the group.
   The group manager is responsible for continuously updating group membership. The group manager typically has the same role (or higher) as the members.
4. **Optional:** Specify an email alias for the group.
   - If you don't specify an alias, then a separate email notification is sent to each member.
   - If you specify an alias, then a single email notification is sent with all members in the **To:** list.
5. On the Group Members related list, select **Edit**.
6. Move all appropriate users from the **Collection** list to the **Group Members** list and then select **Save**.
7. **Optional:** Use the Groups related list to add subgroups to the group that you're defining.
   This option enables you to organize users into practical subsets.
8. Repeat the process for each group.

Roles in Third-party Risk Management

TPRM and the Explicit Roles plugin

Configure TPRM properties

Configure property settings for a variety of TPRM operations.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_admin

About this task

You can specify the following property settings:

Organization name [`sn_vdr_risk_asmt.company.name`]

Third-party contacts see this name in all references on the Third-party portal.

Excel cell text delimiter [`sn_vdr_risk_asmt.excel_choice_delimiter`]

Character string that separates response text in questions of type 'Choice' and 'Multiple Selection'.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common delimiters: \r, \n, \t, \r\n, and the comma character.

Maximum Excel file size [sn_vdr_risk_asmt.excel_file_max_size]

Maximum file size in MB that can be imported.

Maximum age for reusing responses [sn_tprm_dd.max_age_for_questionnaire_reuse]

Maximum age in days for a questionnaire to be used to pre-populate responses in a new questionnaire. The questionnaire from the most recent closed assessment is used. This setting applies when a user selects the **Include previous responses** option when configuring a questionnaire or questionnaire template.

Allow assessors to answer/edit questionnaires for third-party contacts [sn_svdp.allow_assessor_edit]

You can set the following options:

- Enter `answer` to enable TPR assessors [sn_vdr_risk_asmt.vendor_assessor] to answer questions or modify responses (default).
- Enter `edit` to enable TPR assessors to modify responses.
- Enter `false` to not enable TPR assessors to answer questions or modify responses.

Smart Assessment Engine enabled [sn_vdr_risk_asmt.sae_enabled]

The option to use Smart Assessment Engine or Assessment Engine.

- Select the check box to enable Smart Assessment Engine for TPRM.
- When the check box isn't selected Smart Assessment Engine isn't enabled for TPRM.

> **Warning:**
> You won't be able to change this setting back once it's set to be "true." After this property is enabled, this selection can't be reversed.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Administration** > **Properties**
2. For each property, enter the value that meets your need.
   - Each property entry describes the value to enter.
   - To view the name of a property, select the help icon.

Enable the TPRM Risk concentration map

After you install the Risk concentration map feature, you must install a Google license to enable the feature.

Before you begin

Role required: admin

Procedure

Follow the instructions in Set up Google Maps API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on the Google Maps APIs in the Geo-map component, see the KB article: KB1588661

Enable email with third-party contacts

Configure email communication with third-party contacts to enable email notification of assessments and issues.

Before you begin

Role required: admin

About this task

Note:
Third-party contacts see your organization's name in all references on the Third-party portal. You specify the name in the `sn_vdr_risk_asmt.company.name` property setting. See Configure TPRM properties.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. Select both the **Email sending enabled** and **Email receiving enabled** check boxes and then select **Save**.

Import existing data from other systems

Import existing data (third parties, engagements, assessments, questionnaires, issues, and so on) from other systems (like the Aravo platform, the ProcessUnity platform, and so on). You aren't charged for importing the data.

Before you begin

Role required: admin

About this task

The overall process of importing data into your instance is discussed at Import sets.

You will find a learning module that takes you through the process of importing data at https://developer.servicenow.com/dev.do#!/learn/courses/sandiego/app_store_learnv2_importingdata_sandiego_importing_data_into_servicenow.

An article on running transform maps appears at https://developer.servicenow.com/dev.do#!/learn/courses/sandiego/app_store_learnv2_importingdata_sandiego_importing_data_into_servicenow/app_store_learnv2_importingdata_sandiego_importing_data/app_store_learnv2_importingdata_sandiego_run_a_transform_map.

Important:
To import the data without being charged, you must turn off the "Run business rules" option before running the transform map to import the data. If you do not turn off business rules, then the imported data records are marked as activity and you will be charged for a license.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a transform map.
   See Create a transform map for instructions.

   Important:
   Clear the **Run business rules** check box before you run the transform map.

2. Run the transform map and repeat the process for each data set.

Assessment setup overview

By performing the tasks in the Assessment setup checklist for TPRM, you're setting up and configuring the TPRM application to address your unique requirements for scoring and assessing risk for third parties, engagements, and other entities using the classic assessment engine.

Note:

For any custom messages you create, it is your responsibility to generate the corresponding `sys_ui_message` records. This step is crucial if you want the custom messages to be extracted and translated.

Assessment setup checklist for TPRM

Setup tasks for assessments and questionnaires

Task	Description
Set up risk rating scales for scoring assessments and questionnaires.	You can configure the risk rating scale that is selected by default for all questionnaires. For more information, see Set up risk rating scales for scoring. Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Set up third-party risk domains or areas.	You can configure the scoring method and weight that is selected by default for all third parties associated with a specific risk area. For more information, see Define a third-party risk domain. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Set up third-party risk area criteria, which are the group of risk domains or areas that apply to a type of third party.	You can adjust the weight and scoring method of each risk area within a criteria definition. For more information, see Define third-party risk area criteria. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Set up third party and engagement component criteria.	Components are entities that can be assessed for risk. Component criteria are groups of components that are related to a particular type of third party or engagement. You can't add new components or modify existing ones. You can, however, define the criteria (in terms of scoring method and weight) to be used to assess the components.

Setup tasks for assessments and questionnaires (continued)

Task	Description

	You can update the **Default scoring method** to specify how multiple scores for each risk area are calculated. You can use the **Default weight** to adjust the weight of third-party provider scores in the third party's overall risk rating.
	
	The following component classifications are available.
	• Third-party components
	  ○ Third-party risk assessments (External risk assessments)
	  ○ Subsidiaries
	  ○ Engagements
	  ○ Risk intelligence rating
	• Engagement components
	  ○ Engagement risk assessments
	  ○ Product
	  ○ Principal
	  ○ Facility
	  ○ Other
	
	For more information on setting up component criteria, see Define component criteria.
	
	For more information on how engagement components impact third-party elements, see Monitoring third-party elements.
	
	Role required: sn_vdr_risk_asmt.vendor_risk_manager

Set up third-party and engagement risk scoring rules.	Define the criteria, based on risk scores, that determine which third parties or engagements require assessments. Third-party risk scoring rules apply to subsidiaries, engagements, and third-party risk areas. Engagement risk scoring rules only apply to engagements. For more information, see Define third-party risk scoring rules and Define engagement risk scoring rules. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Create questionnaire or document request templates.	You can reuse questionnaire templates and document-request templates to streamline the

Setup tasks for assessments and questionnaires (continued)

Task	Description
	creation of new questionnaires and document requests. The following template classifications are available. • Questionnaire template • Document request template • Tiering questionnaire template • Fourth-party template • IRQ template • Collection template For more information, see Create a questionnaire or document request template and Create a questionnaire or document request template using the Designer. Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin
Import questionnaires using an excel spreadsheet.	This task is optional. After preparing your excel spreadsheet, you can import your data and then create questionnaires automatically from templates. For more information, see Import a questionnaire from a spreadsheet. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Set up a metric category (question bank), which is a group of questions related to a type of an assessment.	Add questions to a question bank so that you can reuse sets of questions in a questionnaire template. You can add new questions and questions from existing questionnaires. For more information, see Set up and maintain a question bank. Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin
Create questions to meet your assessment requirements.	You can create custom questions, add existing questions, or add and customize the sample questions that are included with the base system. For more information, see Define a question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for assessments and questionnaires (continued)

Task	Description
	Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Set up option to use normalized values for scoring.	You can use the **Maximum normalization input** setting to use normalized values to calculate assessment scores for Choice or Multiple Selection questions with the scored check box not selected. Normalization of values can help ensure consistent comparisons across different entities. For more information on how this setting impacts scoring, see Normalize the scores for metrics. **Note:** This option is available under the question type tab of an assessment metric (question) record. For more information on setting up questions, see Define a question. Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Create assessment templates for external questionnaires.	You can create an assessment template with set duration requirements and questionnaires attached by default to help streamline the assessment process for different types of third parties and engagements. For more information, see Create an external assessment template. Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Create issue generation rules.	This task is optional. Set up rules that auto-generate issues for external assessments. Specify a Third-party risk assessment, a Questionnaire template, and the Questions to apply the rule to, as well as an Issue template and a Task template to use while generating it. For more information on setting up these rules, see Create an issue generation rule. Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin
Schedule recurring assessments.	This task is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for assessments and questionnaires (continued)

Task	Description
	Recurring assessments can be scheduled for third parties or engagements. You can use an assessment template you created or manually attach questionnaire and document requests as needed. For more information, see Configure a risk assessment to recur on a schedule. Role required: sn_vdr_risk_asmt.vendor_assessor
Set up an internal questionnaire's responses to automatically attach questionnaires to external assessments that are based on the responses, the calculated risk tier, or both.	This task is optional. For more information, see Set up internal questionnaire responses to automatically attach external questionnaires to assessments. Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin
Set up event-driven management rules.	This task is optional. Set up rules that auto-generate and send questionnaires and doc requests to engagements and third parties. For engagements and third parties that meet the criteria you define, you specify the schedule and the assessment templates. You can automate all request types except onboarding. For more information on setting up these rules, see Event-driven management — automate assessment processes. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Verify risk ratings and scoring calculations.	This task is optional. Review scores and risk ratings in your questionnaires and help ensure the accuracy and consistency of risk scoring by verifying the correct application of weights, normalized values, scoring methods, and risk rating scales. For more information, see Verifying scoring calculations using the classic assessment engine.

For more information on calculations for risk ratings and scoring, see Scoring calculations using the classic assessment engine.

For more information on assessment and score-related automation, see Set up internal questionnaire responses to automatically attach external questionnaires to assessments, Assessing your third-party risk, Create a VRM automated risk assessment when the assigned risk tier changes, Event-driven management — automate assessment processes, and Automate actions upon risk intelligence updates.

Set up risk rating scales for scoring

The risk rating scale helps business users better understand risk assessment results. For example, in the default settings, risk scores in the 20 through 39 range indicate high risk, while scores in the 60 through 79 range indicate low risk.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager

About this task

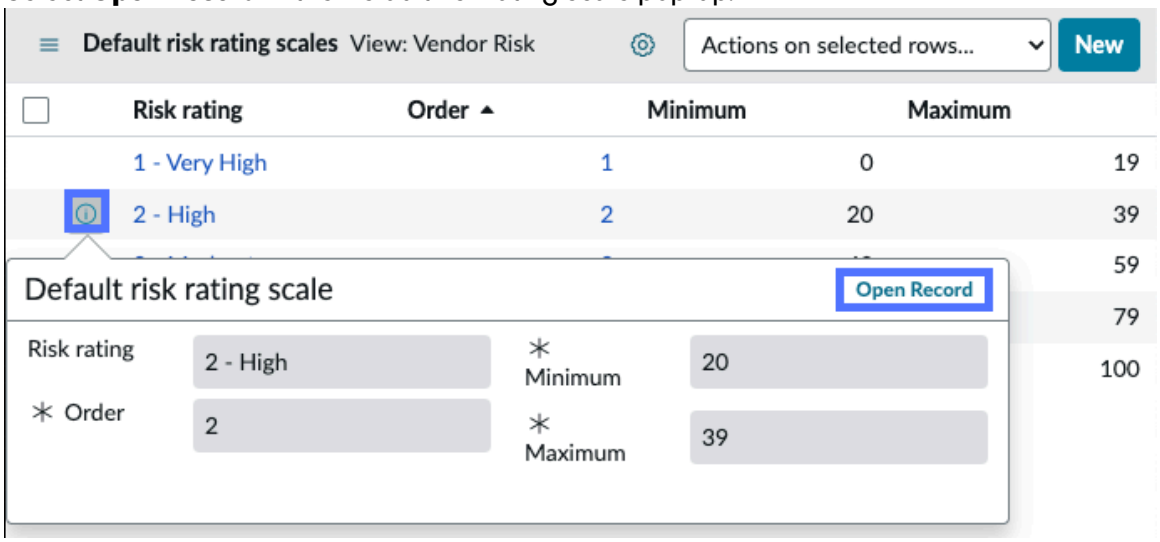
Note:
Many organizations find that the default settings represent their needs appropriately and don't change the settings.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Risk Rating Scale** to modify or refine the Risk Rating Scale.

   The base system includes five ratings. You can customize their maximum and minimum values.

   Default risk rating scales View: Vendor Risk | Actions on selected rows... | New



Risk rating	Order ▲	Minimum	Maximum
1 - Very High	1	0	19
2 - High	2	20	39
3 - Moderate	3	40	59
4 - Low	4	60	79
5 - Very Low	5	80	100

2. Refine the existing values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Hover over the risk rating you want to update and select the information icon to preview the **Risk Rating Scale** record.

b. Select **Open Record** in the Default risk rating scale pop-up.

3. Customize the **Minimum** and **Maximum** to adjust the lowest and highest value that falls in the risk rating scale range.
4. Select **Update**.

Define a third-party risk domain

A risk domain defines the type of risk to assess for a third party. For example, you might want to assess a data-management third party in terms of security risk and a bank in terms of financial risk. Security risk and financial risk are risk domains. Some platform applications refer to risk domains as "risk areas."

Before you begin

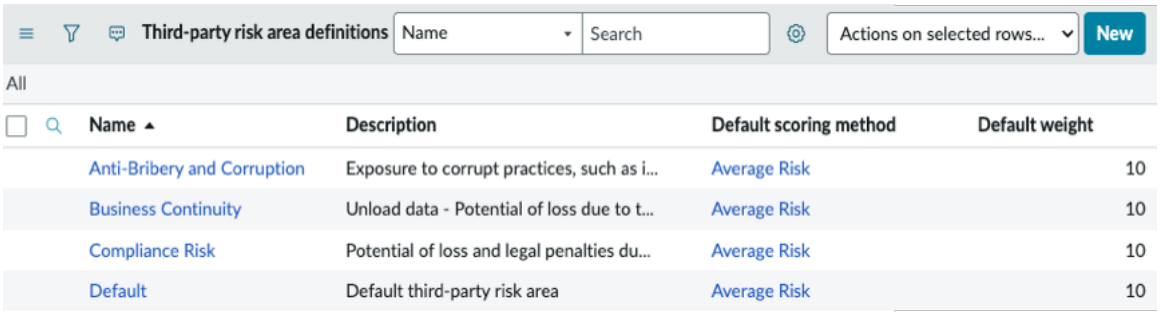
Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task

Note:
Risk domains are called "risk areas" in some platform applications.

You can better understand and mitigate the risks that a third party poses to your organization by identifying the domains of their business to assess for risk and quantifying the importance (weight) of each domain.

- Security risk domain: A third party that handles sensitive personal data in their infrastructure might need to be assessed against their security posture.
- Reputational risk domain: If that personal data were breached, it could cause damage to your reputation due to negative media attention.
- Financial risk domain: If a third party fails to deliver on time, you might have to pay fines, settlements, or both resulting in financial loss.

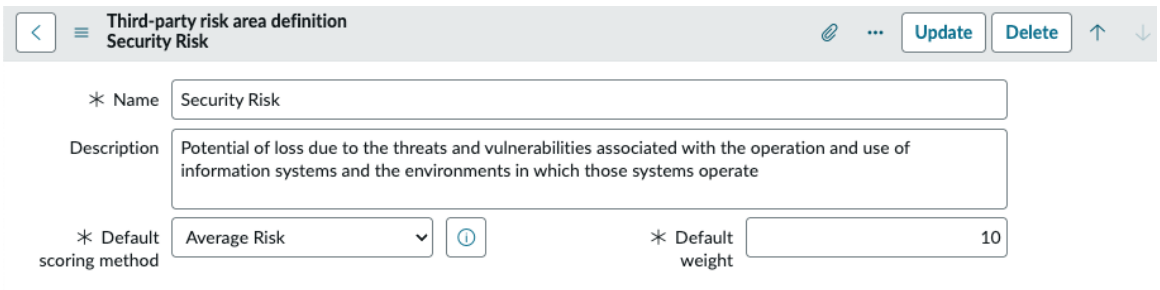


In this procedure, you create a Risk domain definition. In each definition, you specify the criteria that determine which organizations should be assessed for a particular type of risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Risk domain definitions are called Risk area definitions on the forms.

Procedure



1. Navigate to **All** > **Third-party Risk Management** > **Scoring Setup** > **Risk Domains**.

2. Select **New**, fill in the form, and then select **Submit**.

Third-party Risk Area Definition form

Field	Description
Name	Name of the risk domain.
Description	A description of the risk domain that helps colleagues to understand the intent of the definition. See the example.
Default scoring method	The default scoring method for third parties in this risk domain. The scoring methods are based on how well a third-party contact answers 100 questions: ○ Average Risk: A rounded average of the ratings earns an Average Risk (Moderate) for the third party. ○ Max Risk: A score of 0 indicates that all questions were answered incorrectly and the risk for that third party would be Max Risk (Critical). ○ Min Risk: A score of 100 indicates that all questions were answered correctly and the risk for that third party would be Min Risk (Minor). **Note:** Each organization in a particular risk domain inherits the scoring method and weight of the risk area definition. Third-party risk managers can override the values when needed.
Default weight	The default weight for third parties in this risk domain.

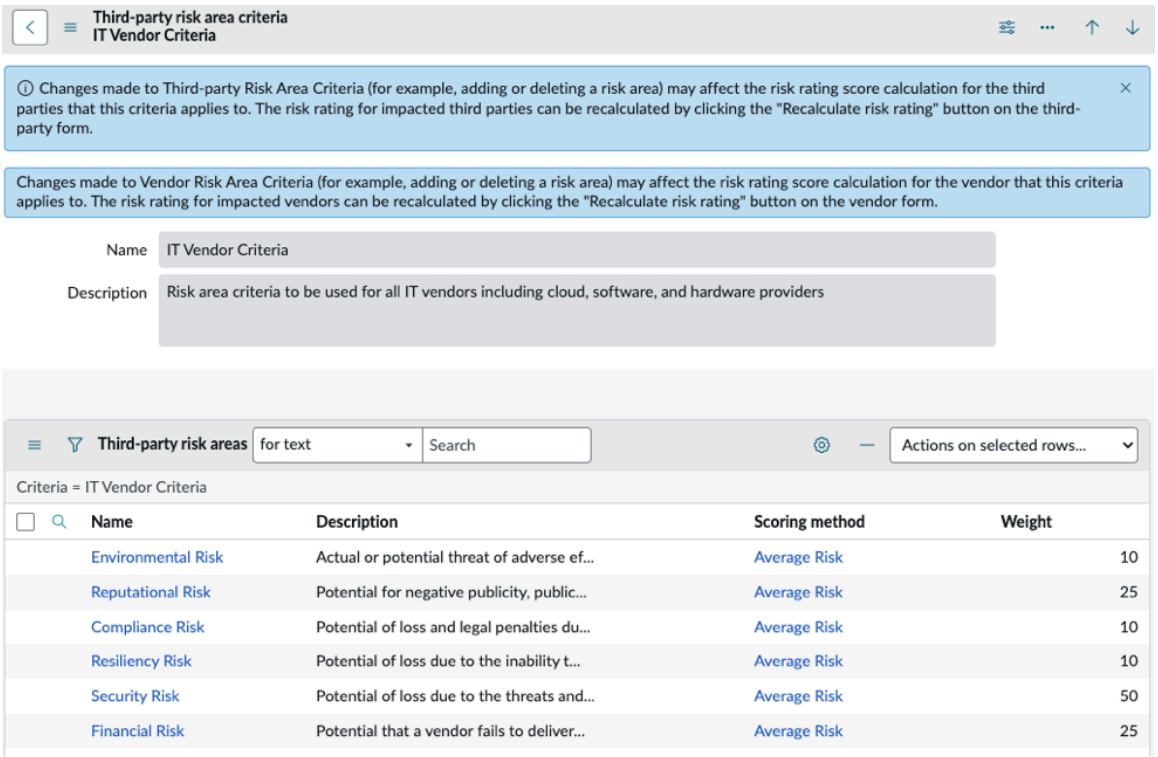
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define third-party risk area criteria

A third-party risk area criteria is a group of risk domains (sometimes called risk areas in other platform features) that applies to a particular type of third party.



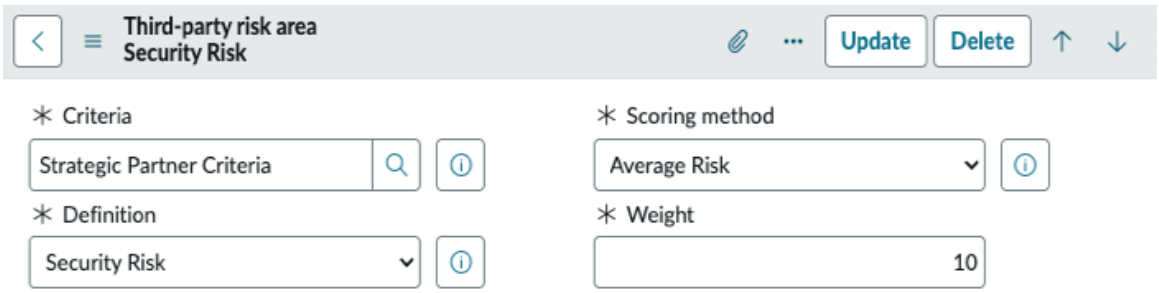
Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task

This is an example of the group of risk domains that you include in a risk area criteria that you might apply to IT service providers.

Note:
Risk domains are called "risk areas" in some platform applications.



Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Scoring Setup** > **Risk Domain Criteria**.
2. Select **New**, enter a **Name** and **Description**, and then save the record.
   The Third-party Risk Areas related list appears. In the following steps, you specify the risk areas to include in the risk area criteria.
3. On the Third-party Risk Areas related list, select **Edit**.
4. On the Edit Members page, select the third-party risk areas to add to the third-party risk area criteria record and then select **Save**.
   - The selected third-party risk areas appear in the Third-party Risk Areas related list.
   - Scoring method and weight are copied from the risk areas.
   - You can adjust the weight of each risk area within a criteria definition.
   - You can override the values when needed.
5. **Optional:** To edit **Scoring method** and **Weight**, select the name of a third-party risk area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Changes to the scoring method and weight are used for the third-party risk area criteria record but aren't saved in the individual risk area definition records.

Example:
Assume you're creating a third-party risk area criteria with two risk areas: Financial and Security. Financial has a scoring method of Min Risk and a weight of 10.

- Your company is more concerned with security-related criteria, so the Security risk area has a scoring method of Average Risk and a weight of 20.
- The weights for both risk areas add up to 30. Resulting in the risk area with a weight of 10 calculating as 10/30 or roughly 33%.
- The risk area with a weight of 20 calculates as 20/30 or roughly 66%.
- If both risk areas had a weight of 10, they would each carry a weight of 50%.

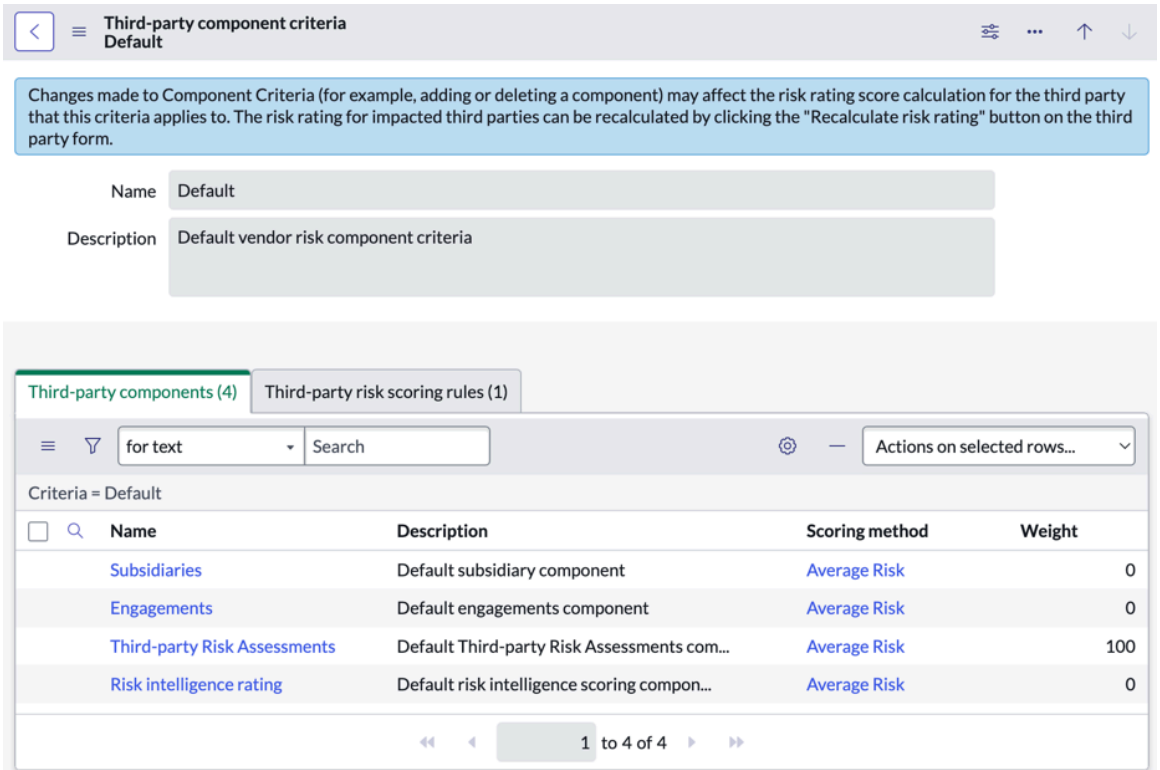
Define component criteria

Components are the entities for which you can assess risk (for example, subsidiaries or engagements). A component criteria is a group of components that should apply to a particular type of third party or engagement.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task
Components are the entities for which you can assess risk. The base system comes with the following types of components:

- Third-party components
  - Third-party risk assessments (External risk assessments)
  - Subsidiaries
  - Engagements
  - Risk intelligence rating
- Engagement components
  - Engagement risk assessments
  - Product
  - Principal
  - Facility
  - Other



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the third party or engagement components by navigating to **Third-party Risk Management** > **Scoring Setup** > **Third-party Components** or **Third-party Risk Management** > **Scoring Setup** > **Engagement Components**.

Note:
You can't add new components or modify existing ones. You can, however, define the criteria (in terms of scoring method and weight) to be used to assess the components. You can update the **Default scoring method** to specify how multiple scores for each risk area are calculated. You can use the **Default weight** to adjust the weight of third-party provider scores in the third party's overall risk rating.

Procedure

1. Navigate to **Third-party Risk Management** > **Scoring Setup** > **Third-party Component Criteria** or **Third-party Risk Management** > **Scoring Setup** > **Engagement Component Criteria**.
2. Select the **Default** entry to open the default criteria.

3. Based on the amount of emphasis your company places on each of the component types, open each component and assign a weight.

   For example, you could create component criteria for all IT third parties that care most about third-party risk assessments, as follows:

Example: Assigning weight to component for IT third parties

Component	Weight
Subsidiaries	5
Engagements	5

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Weight
External Risk Assessments	90

4. When you have finished assigning weights, select **Update**.

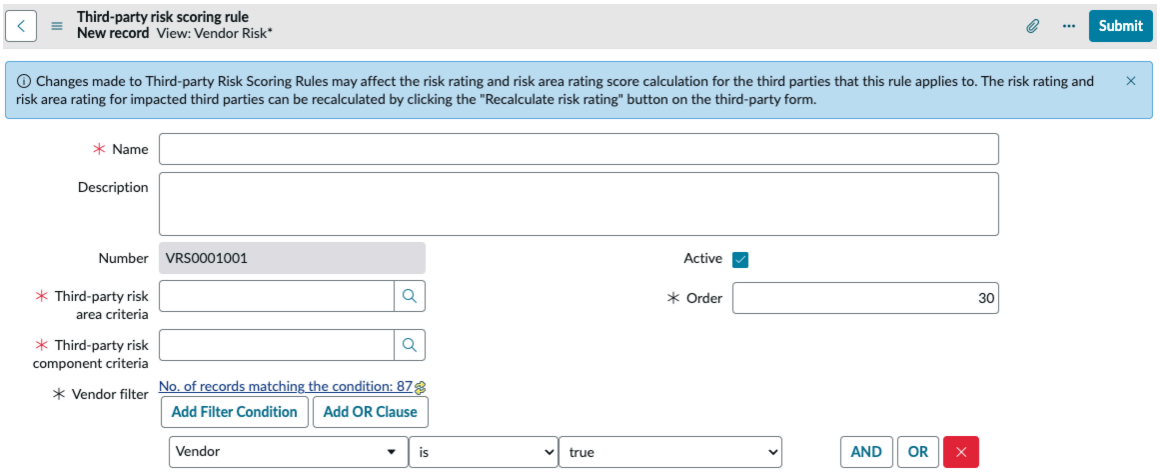
Define third-party risk scoring rules

Define criteria, based on risk scores, that determine which third parties require assessments. Third-party risk scoring rules apply to subsidiaries and engagements and to third-party risk areas.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

Procedure



1. Navigate to **All** > **Third-party Risk Management** > **Scoring Setup** > **Third-party Risk Scoring Rules**.
2. Select **New**, fill in the form, and then select **Submit**.

Third-party Risk Scoring Rule form

Field	Description
Name	Name of the scoring rule.
Description	Description of the scoring rule that will help other users understand its intent.
Number	For each third-party risk scoring rule, the system auto-assigns a unique ID number that starts with the text VRS. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Third-party risk area criteria	The risk area criteria that applies to this engagement risk scoring rule. A third-party risk area criteria is a group of risk domains (sometimes called risk areas in other platform features) that applies to a particular type of third party. See Define third-party risk area criteria for details on how the criteria are defined.
Third-party risk component criteria	Criteria for third-party risk assessments, engagements, and subsidiaries that applies to this risk scoring rule. Components are the entities for which you can assess risk (for example, subsidiaries or engagements). A component criteria is a group of components that should apply to a particular type of third party or engagement. See Define component criteria.
Active	Option to activate the rule. Only active rules are applied.
Order	Select the order to indicate the rule's precedence. If multiple rules apply to the same third-party risk area, engagement, or subsidiary, the one with the higher-order value is applied.

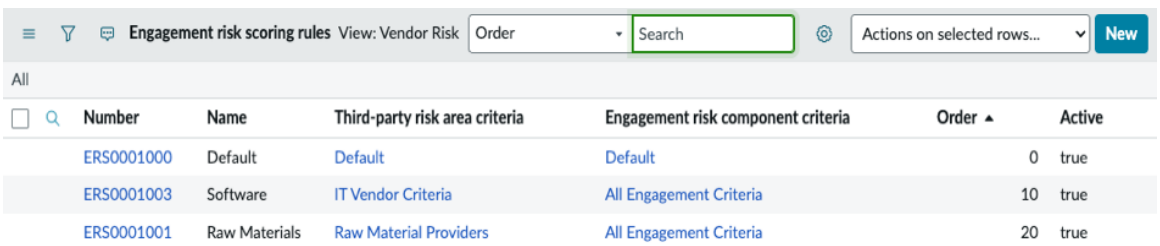
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Vendor filter	Use the condition builder to define the rules for selecting third parties. For example, you can filter on third parties with whom you do considerable business (Size is $1,000,000) or third parties within a specific category (Category is software).

Define engagement risk scoring rules

An engagement risk-scoring rule specifies component criteria that determine which engagements are selected for assessment. For example, a rule could enable assessments for engagements that involve more than $40,000 annual business. Engagement scoring rules apply only to engagements.

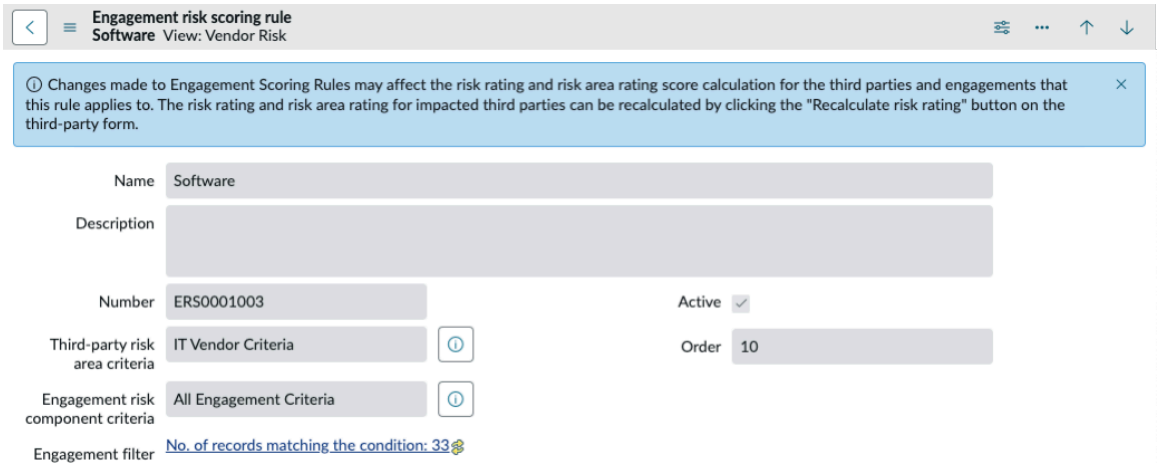
Before you begin



Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task

Important:
Engagement risk scoring rules apply only to engagements and not to parent third parties. Engagement risk rating scores, therefore, apply only to risk assessments for the engagement.



Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Scoring Setup** > **Engagement Risk Scoring Rules**.

2. Select **New**, fill in the form, and then select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Engagement Risk Scoring Rules form

Field	Description
Name	Name of the scoring rule.
Description	Description of the scoring rule.
Number	For each engagement risk scoring rule, the system auto-assigns a unique ID number that starts with the text ERS. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Third-party risk area criteria	The third-party risk area criteria that applies to this engagement risk scoring rule. A third-party risk area criteria is a group of risk domains (sometimes called risk areas in other platform features) that applies to a particular type of third party. See Define third-party risk area criteria for details on how criteria are defined.
Engagement risk component criteria	The engagement risk component criteria that applies to this engagement risk scoring rule. Components are the entities for which you can assess risk (for example, subsidiaries or engagements). A component criteria is a group of components that should apply to a particular type of third party or engagement.
Active	Option to activate the rule. Only active rules are applied to engagements.
Order	Specify the order to indicate the rule's precedence. If multiple rules apply to the same engagement, the one with the higher-order value is applied.
Engagement Filter	Criteria for selecting engagements. Use the condition builder to define the criteria. For example, you can perform assessments for third parties with whom you do considerable business: `Annual spend is greater than $40,000` or third parties within a particular category: `Category is software`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event-driven management — automate assessment processes

Use the Event-driven management feature to configure rules that auto-generate and send questionnaires and doc requests to engagements and third parties. For engagements and third parties that meet the criteria you define, you specify the schedule and the assessment templates. You can automate all assessment types except onboarding.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

Procedure

1. Use either of the following methods to start the process:
   - Workspace: Select **Workspaces** > **Vendor Management Workspace** and on the **Risk** tab, select the list icon . In the **Event-driven management** list, select any option: **Active**, **Inactive**, or **All**.
   - Legacy: Navigate to **All** > **Third-party Risk Management** > **Event-driven management** and then select any option: **Active**, **Inactive**, or **All**.
2. Select **New** and then fill in the form.

   The following settings appear in sections on the workspace page and as related lists on the legacy form.

Event-driven management rule form

Field	Description
Name	Meaningful name for the rule that helps others understand its intent and operation.
Number	For each Event-driven management rule, the system auto-assigns a unique ID number that starts with the text EMR. In the history table of rule runs (executions), the system auto-assigns a unique ID number for each run that starts with the text EMH. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Business justification	The business reason for defining the automated process.
Technical description	The conditions that trigger the run and the kinds of third parties that are affected.
Scope: Specify the kind of assessment to generate and the template to use.	
Category	○ External assessment: Send questionnaires and doc requests. In the **Applies to** field, you specify whether to send the materials to third parties or to engagements. ○ Reassess engagement: Reassess an existing engagement when the conditions change. For example, let's say that you hear adverse news or have changes in your

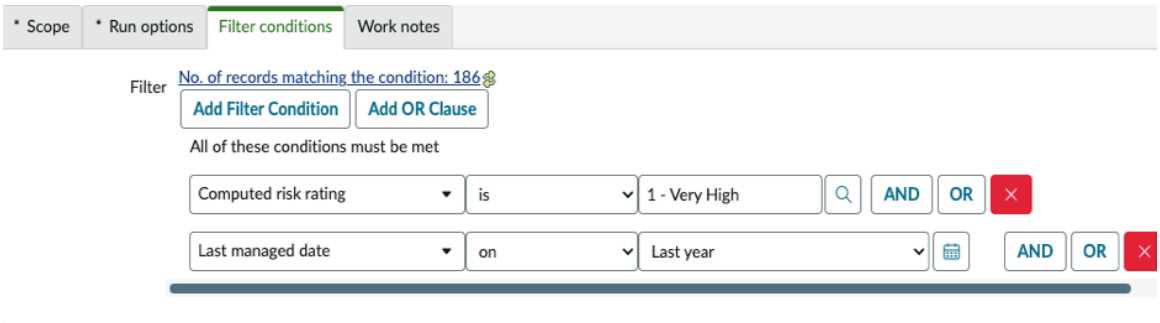
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	third-party's supply lines. You might want to reassess the risk by conducting additional due diligence. ○ Reassess engagement for contract renewal: Reassess the risk before your organization renews the contract with a current third party or engagement by conducting due diligence. ○ Offboard engagement with due diligence: Determine if offboarding (terminating the relationship) with an engagement is the optimal course of action by conducting due diligence. For example, it might be too risky to switch third parties or engagements even if their current performance doesn't meet expectations. ○ Offboard engagement with NO due diligence: Request that an engagement be permanently terminated when an engagement ends or you want to switch to a different third party for other reasons. In this case, you typically don't need to conduct additional due diligence. The process does, however, include the normal Inherent Risk Questionnaire (IRQ) process to confirm that the services provided by the engagement will no longer continue. For important details, see Offboarding an engagement without conducting due diligence.
Applies to	This field is editable only if you set the category as **External assessment**. Specify whether the questionnaires and doc requests should be sent to third parties or to engagements.
Internal questionnaire template	This field appears if you select any category other than **External assessment**. Template that specifies the contents of the Inherent Risk Questionnaire (IRQ). **Note:** If the rule is related to Due Diligence requests and the Smart Assessment Engine is not enabled, the IRQ template will refer to the classic template table (asmt_metric_type). If the Smart Assessment Engine is enabled, it will refer to the TPRM template table (sn_vdr_risk_asmt_sae_questionnaire_template).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assessment template	This field appears only if you set the category as **External assessment**. Template that specifies the questionnaires and doc requests to send.
Run options: Define the trigger and the schedule for generating the assessments.	
Run type	Specify how the rule should be triggered. ○ **One-time**: Send the third-party risk assessment on the date that you specify in the **Start date** field. ○ **Recurring**: Send the third-party risk assessment on the schedule that you specify with the **Frequency** setting. ○ **On-demand**: The rule runs only when a user selects **Run now**. **Note:** Regardless of the **Run type** setting, you can select **Run now** at any time to run the rule immediately. Such an on-demand run doesn't affect future scheduled runs. In the run history, the **Trigger action** for the run is recorded as **Manual**.
Frequency	This field appears only if you select the **Recurring** run type. Specify how often the rule should run.
Start date	This field appears only if you select the **Recurring** or **One-time** run type. First date that an active rule is available to run (depending on the specified filter conditions). A one-time rule runs on the start date.
End date	This field appears only if you select the **Recurring** run type. Last date that an active rule is available to run (depending on the specified filter conditions). A rule becomes inactive after the end date. If you don't specify an end date, then the rule continues until you delete or update it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Specify the filter conditions.
   Use the filter editor to specify the conditions that determine which third parties or engagements should receive the questionnaires and doc requests.

   When you select **Set**, the system applies the filter and displays a link to enable you to view the list of engagements or third parties that match the filter conditions.

4. Specify how the Third-party Risk (TPR) assessor [sn_vdr_risk_asmt.vendor_assessor], owner, and contract risk negotiator [sn_vdr_risk_asmt.contract_negotiator] are selected for the engagements or third parties that match the filter conditions.

Option	Description
Use last	Assign the user that most recently performed the function for the engagement.
Use onboarding	Assign the user that most recently performed the function during onboarding for the en gagement.
Specify now	When you select this option, a selection box opens to enable you to specify the user.
Specify later	When you select this option, after the rule is saved, you or another user can specify the ap propriate TPR assessor or contract risk nego tiator later during the workflow. This option doesn't appear for owner selection.

5. Select **Save** in the workspace or **Submit** in the form.
   - The system saves the rule.
   - Regardless of the **Run type** setting, you can select **Run now** at any time to run the rule immediately. Such an on-demand run doesn't affect future scheduled runs. In the run history, the **Trigger action** for the run is recorded as **Manual**.
   - The system displays the following additional read-only values on the workspace **Details** tab and on the form.

Additional values

Field	Description
Active	Option to activate the rule. By default, newly defined rules aren't active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Only active rules with a **Run status** value of **Ready** can run when the specified conditions are met. ○ You can, however, run a rule configured as **On-demand** whether it's active or not.
Run status	○ **Ready**: The rule is defined and can run as determined by the filter conditions and schedule. **Note:** Only active rules with a **Run status** value of **Ready** can run when the specified conditions are met. ○ **Running**: The rule is currently running (questionnaires and document requests are being sent). For rules that are currently running: The duration between the **Run start** timestamp and the current time indicates how long the rule has been running. **Note:** Regardless of the **Run type** setting, you can select **Run now** at any time to run the rule immediately. Such an on-demand run doesn't affect future scheduled runs. In the run history, the **Trigger action** for the run is recorded as **Manual**. If a rule seems to be stuck running for an excessive time: **a.** Go to **Process automation** > **Flow Administration** > **Event Queue**. **b.** Find the platform background task with a name that starts with `sn_vdr` or `sn_tprm` that is in the **error** state.
Next scheduled run	For rules with a recurring **Run type**, the read-only date of the next scheduled run is calculated based on the specified filter conditions and the **Frequency** setting.
Last successful run	Timestamp of the most recent run that is in the **Successful** state.

View the run history for event-driven management rules

When an event-driven management rule runs, it auto-generates and sends questionnaires and doc requests to third parties. You can view the current state (running, successful, or recalled) of all runs of rules. Select a record number to view details and to view the set of assessments generated by the rule.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

Procedure

1. Use either of the following methods to start the process:
   - Workspace: Select **Workspaces** > **Vendor Management Workspace** and on the **Risk** tab, select the list icon . In the **Event-driven management** list, select any option: **Active**, **Inactive**, or **All**.
   - Legacy: Navigate to **All** > **Third-party Risk Management** > **Event-driven management** and then select any option: **Active**, **Inactive**, or **All**.
2. Select the **Event-driven management history** tab in the workspace or view the Event-driven management history related list on the form.

   Each record of a run includes the following read-only values:

Event-driven management history

Field	Description
Number	Select a number to view the **Details** tab for the run. For each Event-driven management rule, the system auto-assigns a unique ID number that starts with the text EMR. In the history table of rule runs (executions), the system auto-assigns a unique ID number for each run that starts with the text EMH. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Trigger action	○ **Scheduled job**: The rule ran on the schedule specified for the **Frequency** setting. ○ **Manual**: The rule ran when a user selected **Run now**.
Run start	Date and time that the rule started to run. For rules that are currently running: The duration between the **Run start** timestamp and the current time indicates how long the rule has been running.
Run complete	Date and time that the rule ended a run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	○ **Running**: The rule is currently running (questionnaires and document requests are being sent). For rules that are currently running: The duration between the **Run start** timestamp and the current time indicates how long the rule has been running. ○ **Successful**: The rule ran to completion and sent all questionnaires and doc requests to third parties. ○ **Recall in progress**: The rule was recalled and is currently removing questionnaires and document requests from Third-party portals. ○ **Recalled**: After the rule completed the run, a user recalled the third-party risk assessments. See Recall event-driven questionnaires and doc requests.

View the assessments generated by event-driven management rules

When an event-driven management rule runs, it auto-generates and sends questionnaires and doc requests to third parties. You can view the current state (running, successful, or recalled) of all runs of rules. Select a record number to view details and to view the set of assessments generated by the rule.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

Procedure

1. On the Vendor Management Workspace, use either of the following methods to start the process:

   ○ To view all DD requests and assessments for a particular rule:

   a. Select the list icon .
   b. In the **Event-driven management rules** list, select any option: **Active**, **Inactive**, or **All**.
   c. In the **Event-driven management** list, select any option: **Active**, **Inactive**, or **All**.
   d. Select a rule.
   e. On the **Event-driven management history** tab, select a run.
   f. Select the appropriate tab to view the DD requests or assessments that the rule sent.

   ○ To view the DD requests and assessments for a particular run of a rule:

   a. Select the list icon .
   b. In the **Event-driven management** list, select either option: **Successful runs** or **Recalled runs**.

c. Select a run.

d. Select the appropriate tab to view the DD requests or assessments that the rule sent.

2. On the legacy interface, use the following method:

   - To view the DD requests and assessments for a particular run of a rule:

     a. Navigate to **All** > **Third-party Risk Management** > **Event-driven management** and then select either option: **Successful runs**, **Recalled runs**.

     b. Select a run.

     c. Select the appropriate tab to view the DD requests or assessments that the rule sent.

3. Select the **Details** tab to view the record of a run.

   Each record includes the following read-only values:

Event-driven management history

Field	Description
Number	For each Event-driven management rule, the system auto-assigns a unique ID number that starts with the text EMR. In the history table of rule runs (executions), the system auto-assigns a unique ID number for each run that starts with the text EMH. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Trigger action	○ **Scheduled job**: The rule ran on the schedule specified for the **Frequency** setting. ○ **Manual**: The rule ran when a user selected **Run now**.
Run start	Date and time that the rule started to run. For rules that are currently running: The duration between the **Run start** timestamp and the current time indicates how long the rule has been running. If a rule seems to be stuck running for an excessive time: **a.** Go to **Process automation** > **Flow Administration** > **Event Queue**. **b.** Find the platform background task with a name that starts with `sn_vdr` or `sn_tprm` that is in the **error** state.
Run complete	The date and time that the rule ended a run.

Field	Description
State	○ **Running**: The rule is currently running (questionnaires and document requests are being sent). For rules that are currently running: The duration between the **Run start** timestamp and the current time indicates how long the rule has been running. ○ **Successful**: The rule ran to completion and sent all questionnaires and doc requests to third parties. ○ **Recalled**: After the rule completed the run, a user recalled the questionnaires and document requests. See Recall event-driven questionnaires and doc requests.

Recall event-driven questionnaires and doc requests

You can recall third-party risk assessments (questionnaires and document requests) that were sent by an event-driven management rule. The items are removed from the Third-party portal for all third parties or engagements that haven't yet responded.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task

Important:
The questionnaires and document requests are removed from the Third-party portal only for third parties where no item had yet been returned.

Procedure

1. Use either of the following methods to start the process:
   - Workspace: Select **Workspaces** > **Vendor Management Workspace** and on the **Risk** tab, select the list icon. In the **Event-driven management** list, select any option: **Active**, **Inactive**, or **All**.
   - Legacy: Navigate to **All** > **Third-party Risk Management** > **Event-driven management** and then select any option: **Active**, **Inactive**, or **All**.
2. Enter text that explains the reason for recalling the items in the **Recall justification** field and then select **Recall**.

   The third-party risk assessments are removed from the affected Third-party portals and the **State** value of the rule is set to **Recalled**.

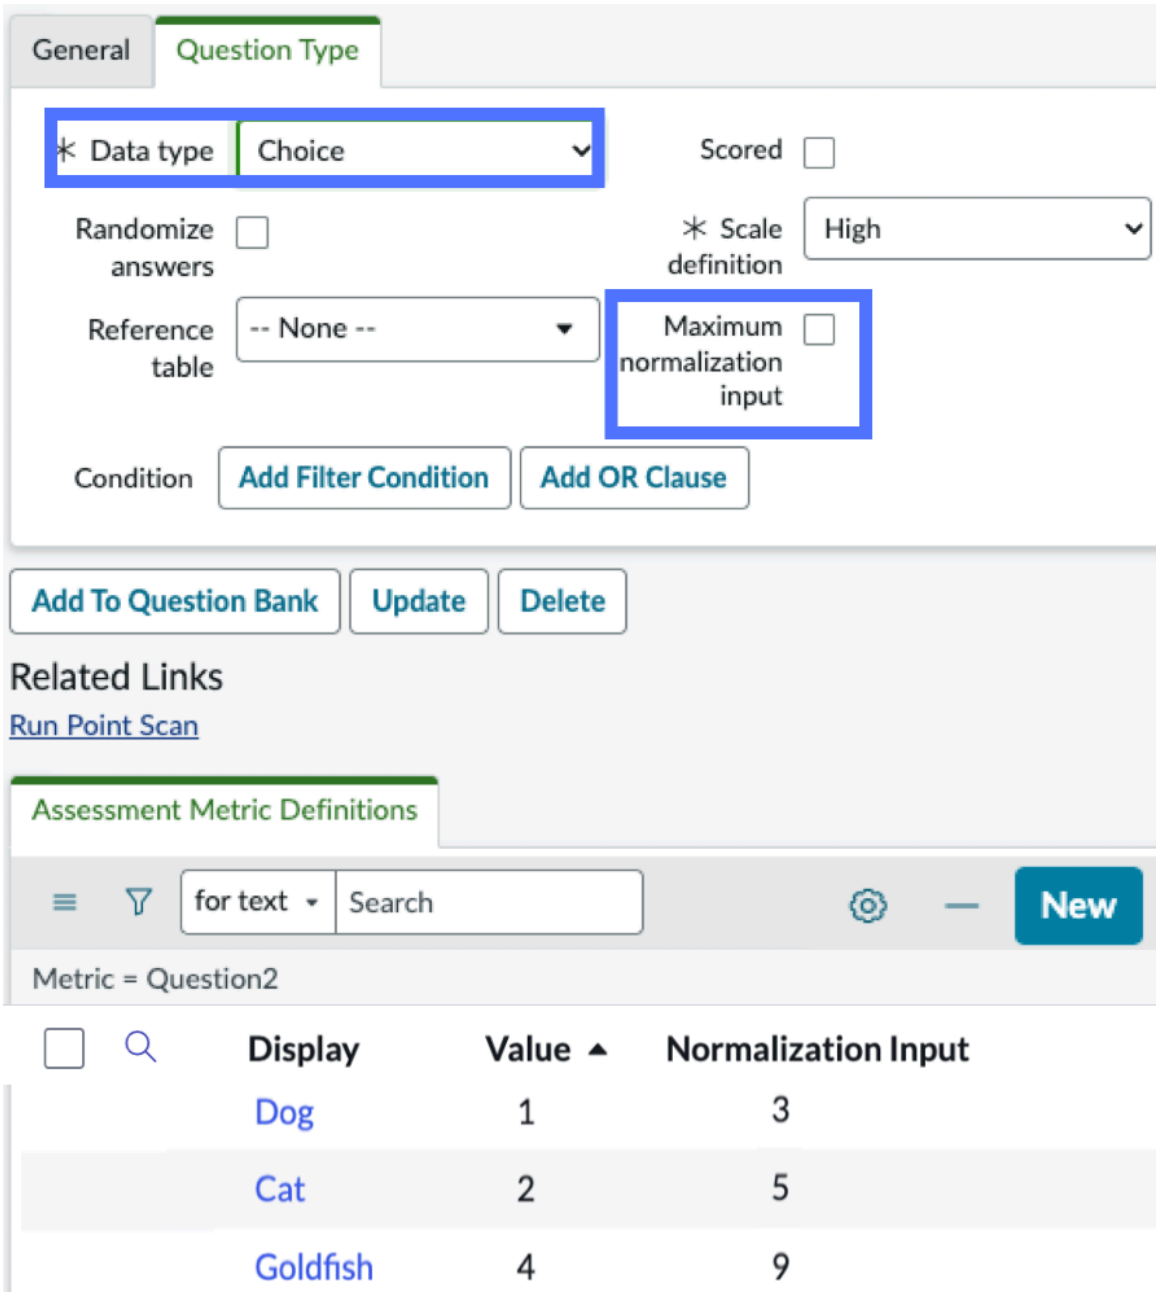
Normalize the scores for metrics

You can use the **Maximum normalization input** setting to use normalized values to calculate assessment scores for questions (metrics).

When Maximum normalization input applies

The **Maximum normalization input** field appears only when:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- The data type of the question is either **Choice** or **Multiple Selection**.
- The **Scored** check box is not selected.

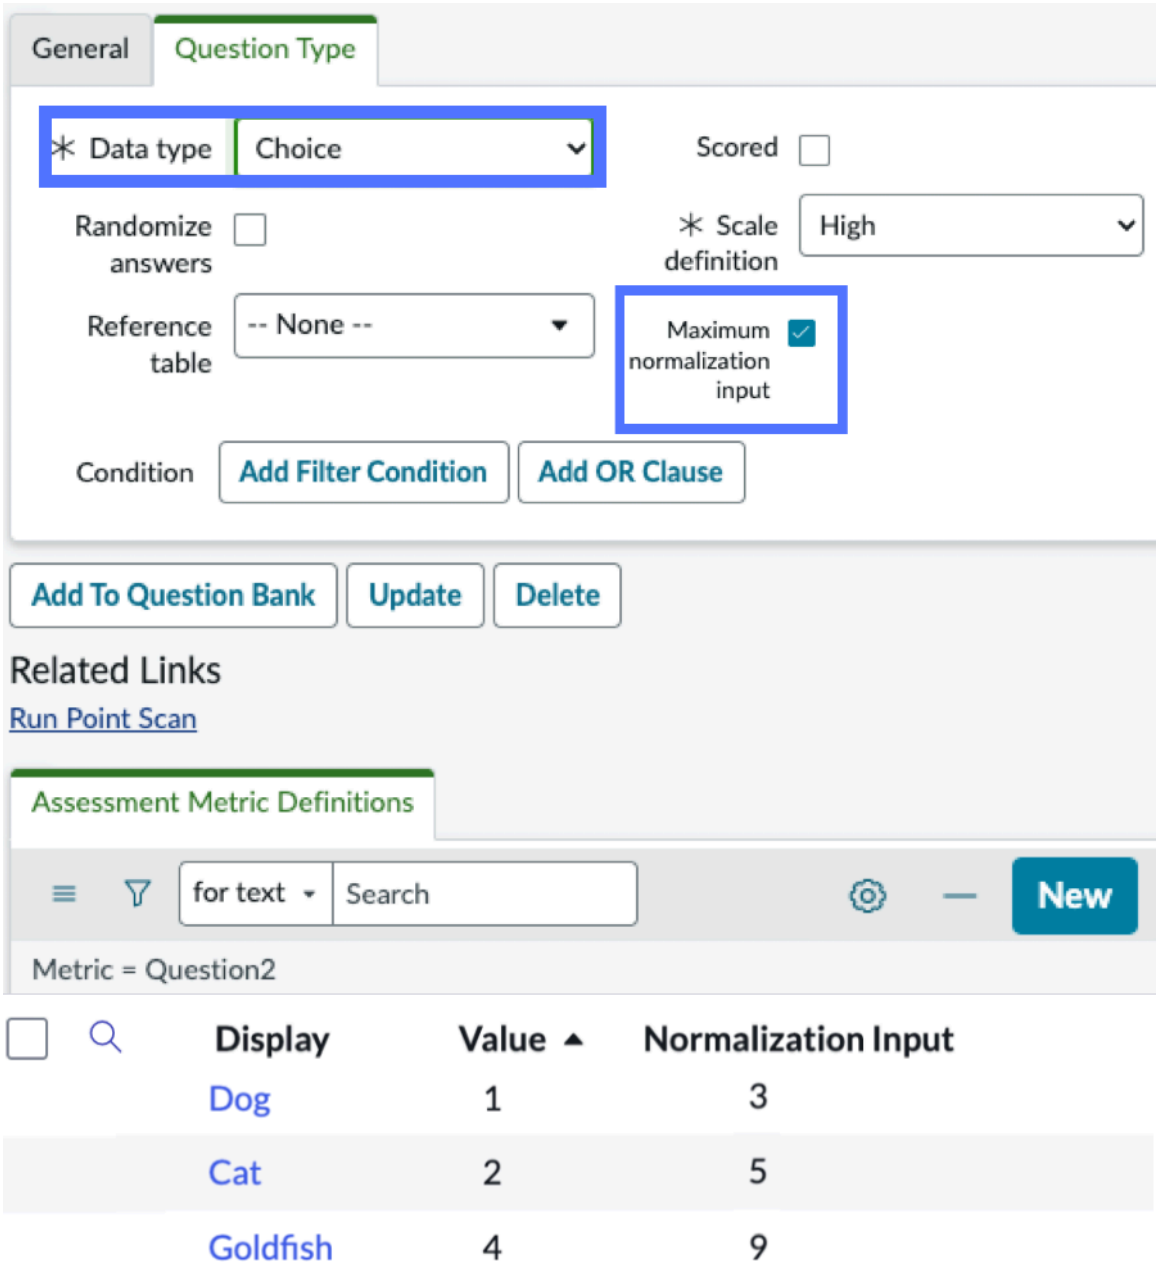
To use normalized scoring, the value assigned to each metric definition (possible answer) for each metric (question) must be unique.

In the following examples, the **Scale definition** is **High** (larger numerical values are good).

Choice type questions

When Maximum normalization input is not selected

Formula: ([Value of the response] – [Lowest value]) / ([Highest value] – [Lowest value]) * 100.



In this example, the question allows a choice among answers with values of 1, 2, and 4.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scores

Response	Calculation	Score
Dog	[(1-1)/(4-1)] * 100	0
Cat	[(2-1)/(4-1)] * 100	33
Goldfish	[(4-1)/(4-1)] * 100	100

When Maximum normalization input is selected

Formula: `([Value of the response]/ [Highest value]) * 100`.

In this example, the question allows a choice among answers with values of `1`, `2`, and `4` and normalization input values of `3`, `5`, and `9` respectively.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

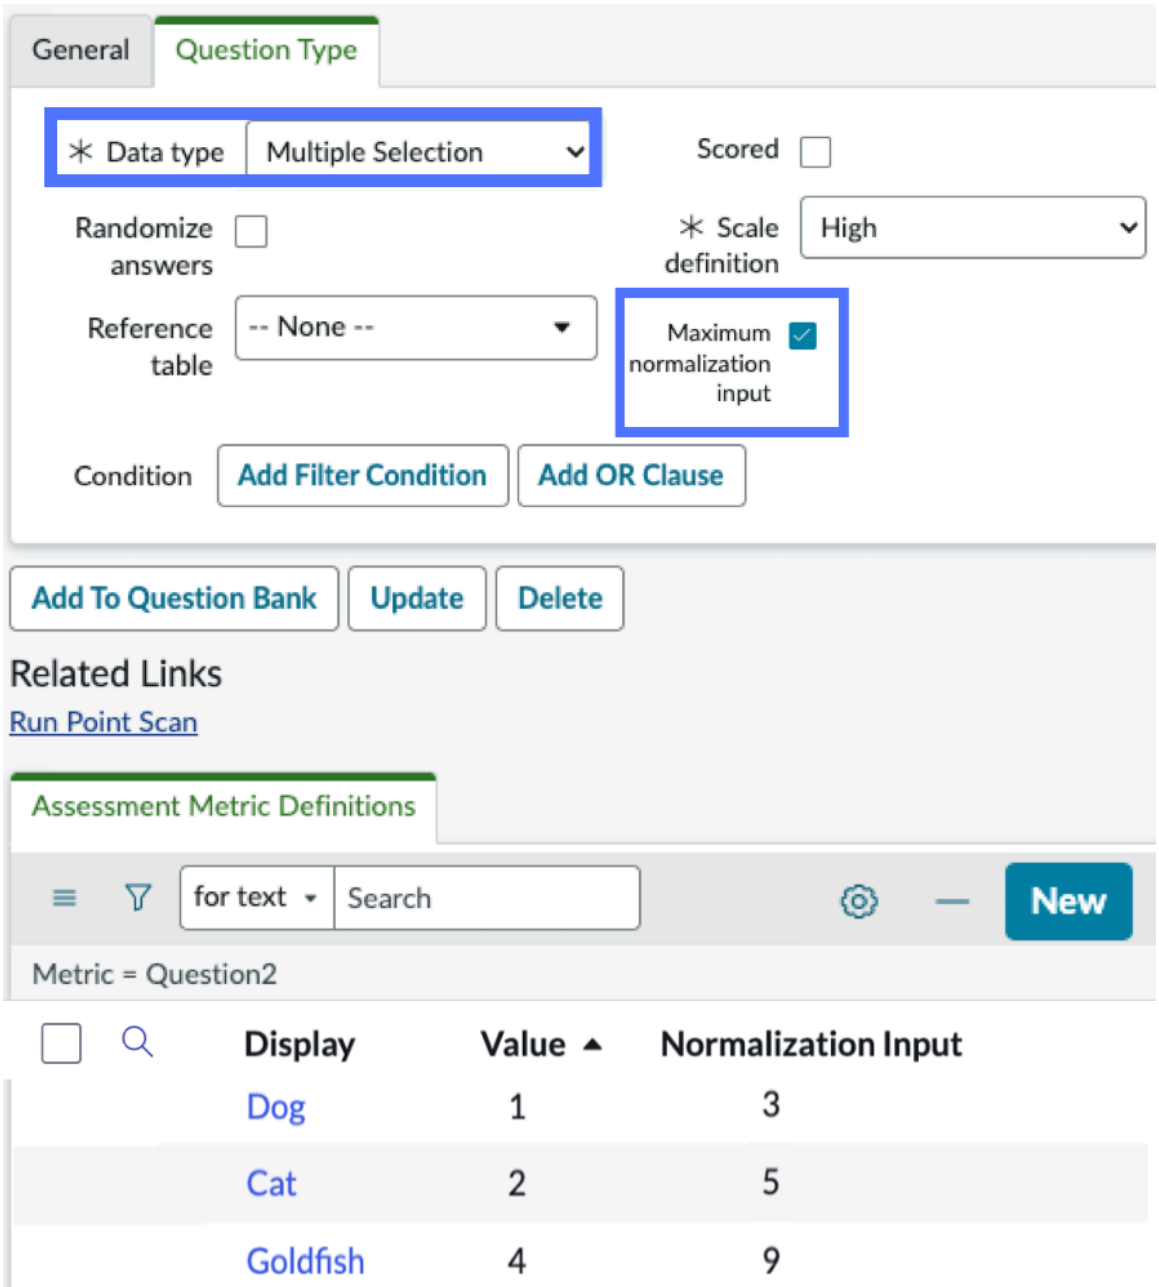
Scores

Response	Calculation	Score
Dog	(1 / 4) * 100	25
Cat	(2 / 4) * 100	50
Goldfish	(4 / 4) * 100	100

Multiple selection type questions

When Maximum normalization input is not selected

Formula: `([Sum of the normalization input values for the selected responses] / [Sum of all the normalization input values]) * 100`.



In this example, the question allows for multiple selections among answers with values of `1`, `2`, and `4` and normalization input values of `3`, `5`, and `9` respectively.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scores

Response	Calculation	Score
Dog and Cat	([3+5] / 17) * 100	47
Cat	(5 / 17) * 100	29
Cat and Goldfish	([5+9] / 17) * 100	82
Goldfish	(9 / 17) * 100	53

When Maximum normalization input is selected

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The system uses the value `0` for the response that has the lowest value. In this example, the **Dog** response is assigned the value `0`.
- Formula for each selection: `([Highest normalization input value for the selected responses] / [Maximum of the normalization input values]) * 100`.
- The score for the metric (question) is the maximum calculated score among all responses.

In this example, the user selects **Dog** and **Cat**.

- The score for the **Dog** response is `(0 / 9) * 100 = 0`.
- The score for the **Cat** response is `(5 / 9) * 100 = 55.5`.
- The score for the overall metric is `55.5`.

Formula: `(Highest of the normalization input values for the selected responses / Highest of all the normalization input values) * 100`.

In this example, the question allows for multiple selections among answers with values of `1`, `2`, and `4` and normalization input values of `3`, `5`, and `9` respectively.

Scores

Response	Calculation	Score
Dog and Cat	(5 / 9) * 100	56
Cat	(5 / 9) * 100	56
Cat and Goldfish	(9 / 9) * 100	100
Goldfish	(9 / 9) * 100	100

Set up and maintain a question bank

After you add a question to a question bank, you can reuse it in any assessment by dropping it into the assessment. You can create custom questions, add existing questions, or add and customize the sample questions that are included with the base system.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

Procedure

1. Define an assessment category by navigating to **All** > **Third-party Risk Management** > **Administration** > **Question Bank**, and then select **New**.
2. Enter a descriptive name and description for the assessment category and then select **Save**.
3. Open the record by selecting the name of the new assessment category.
4. Add an assessment metric (a question) to the category using one of the following methods.
5. Select **Update** to save the questions to the question bank in the current assessment category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define a question

After you add a question to a question bank, you can reuse it in any assessment by dropping it into the assessment. You can create custom questions, add existing questions, or add and customize the sample questions that are included with the base system.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager

About this task

Terminology in TPRM

Term	Description
Metric or Assessment metric	A single question within a questionnaire template.
Metric type or Assessment metric type	A questionnaire template.
Category or Assessment category	A set of related questions within a questionnaire template. **Note:** There can be multiple categories within a metric type.

Selecting the scored option (**Scored** check box) is optional. All question responses unless otherwise stated are scored. The scored option changes the scoring behavior. When the 'Scored' option is selected, the score is always 0 or 100 reflecting whether the answer is correct or incorrect, and the questionRating and questionPercentContribution formulae are not used; the Normalized Value is directly set to 0 or 100. When the 'Scored' check box is not selected, the score is calculated using the questionRating and questionPercentContribution formulae to determine the Normalized Value. Selecting the Maximum normalization input field only applies when the 'Scored' check box is not selected, as it is used to define the maximum value for normalization, and the score can vary based on the input values and weights. If the 'Scored' check box is selected, the Maximum normalization input field does not apply, and the Normalized Value is simply 0 or 100. For more information on scoring and normalized scores, see Scoring calculations using the classic assessment engine and Normalize the scores for metrics.

Procedure

1. Define or select the assessment category that is appropriate for the question that you plan to add.
   - To select an existing assessment category, navigate to **All** > **Third-party Risk Management** > **Administration** > **Question Bank**, and then select it in the list.
   - For instructions on defining an assessment category, see Set up and maintain a question bank.
2. Create an assessment metric (a question).

   In the Assessment Metrics related list for the assessment category, select **New** and then fill in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric form

Field	Description
Name	A name for the assessment metric.
Mandatory	Indicates whether the question must be answered.
Weight	A numerical value used to compare the importance of this metric to other metrics. **Note:** Weight values must be whole integers. Using decimals results in incorrect scores. For example, use 56 and not 0.56.
Category	The category to which the metric is associated.
Question	The question to be displayed on the questionnaire.
Description	Tooltip text to help the third-party contact better understand the question.
Details	An expanded description for the question that is displayed to the assessment taker. The details can include text, images, video, and links to external websites or other content. **Note:** You can define the details at the assessment level or at the category level.

3. Select the **General** tab and then fill in the values.

Assessment Metric form — General tab

Field	Description
Method	The method used for gathering data for the metric. ○ Assessment ○ Default answer from field ○ Default answer from script ○ Script
Order	Order that the question will be displayed in the questionnaire. Questions with lower values for **Order** appear earlier in the questionnaire.
Active	Activates the metric for assessments and results calculations.
Depends on	The identifier for a separate metric (question). The answer to the question that is specified in this field determines whether the question that you're currently defining is displayed to the user. This field appears only if you select **Assessment** in the **Method** field.
Default answer	The field from which the default answer for the question comes. This field appears only if you select **Default answer from field** in the **Method** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Ask question	Specifies whether the question requires an answer when a default value is provided. This field appears only if you select **Default answer from field** or **Default answer from script** in the **Method** field.
Script	The scripts used to produce performance indicators for the associated metric when the assessment is generated. This field appears only if you select **Default answer from script** or **Script** in the **Method** field. **Note:** To enter a tab character in your script, use the **Tab** key. For tab actions, press **Esc** to tab forward and **Shift+Esc** to tab backward.

4. Select the **Question Type** tab and then fill in the form.

Note:
The fields that appear depend on the **Data type** that you select.

Assessment Metric form — Question Type tab

Data type	Description and additional fields
Attachment	On questionnaires, users attach one or more files to a question. This question type is not scored by default.
Check box	On questionnaires, users select a check box for a statement or leave it cleared. To define a single metric to be scored for the data type, select **Scored** and select a **Correct answer** for the question. If you didn't select the **Scored** check box, set the **Scale definition**. If a selected check box equates to a good score, set the field to **High**. If a small numerical value should be interpreted as a positive score, set the field to **Low**.
Choice	On questionnaires, users select a value from a list of custom answer options. Create a metric definition for each answer option. **Note:** If you use a comma in one of the answer options, they will appear as a hyphen when the questionnaire is exported as a spreadsheet. For example, if "Yes, add more info" is one of your answer options, it appears as "Yes- add more info" in an exported spreadsheet. Select the **Randomize answers** check box to randomize the order of answer options for a question. Select the **Reference table** to use for reference data type questions. Define conditions to restrict choices to those that meet the selection criteria.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description and additional fields
	To define a single metric to be scored for the data type, select **Scored** and then select a correct answer for the question. If you didn't select the **Scored** check box, set the **Scale definition** value. ○ If a selected check box is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**. You can select the **Maximum Normalization input** check box to calculate assessment scores for questions using a normalization input value. For more information, see Normalize the scores for metrics.
Date	On questionnaires, users select a date. This question type is not scored by default.
Date/Time	On questionnaires, users select a date and time. This question type is not scored by default.
Duration	On questionnaires, users specify an answer that falls within the **Min**/**Max** range. Select the **Dependent plugin** that the duration depends upon: ○ Asset Management ○ CMDB ○ Core ○ Cost Management ○ Procurement ○ Software Asset Management To define a single metric to be scored for the data type, select **Scored** and select a **Correct answer** for the question. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set the field to **High**. ○ If a small numerical value is a positive score, set the field to **Low**.
Image Scale	On questionnaires, users select an image scale. To define a single metric to be scored for the data type, select **Scored** and select a **Correct answer** for the question. You must unlock the **Correct answer** field to make changes. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**.
Likert Scale	On questionnaires, users select a value from a custom scale of answer options. Create a metric definition for each answer option, which is represented by a selection button on the scale. A Likert scale metric that evaluates an

Data type	Description and additional fields
	application's ease of use might have **Easy**, **Average**, and **Difficult** metric definitions. Select **Randomize answers** to randomize the order of answer options for the question. To define a single metric to be scored for the data type, select **Scored** and select a **Correct answer** for the question. You must unlock the **Correct answer** field to make changes. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**.
Multiple Selection	On questionnaires, users select one or more values from a list of custom answer options. For the **Multiple Selection** data type, you have the option to specify a **Reference table** and conditions that filter, which values from the table are displayed in the list. For example, if you select **Country [core_country]** as the reference table and set the conditions as **Name** + **starts with** + **B**, the query returns only the 19 countries that start with the letter B, instead of the full list of 231 countries. To define a single metric to be scored for this data type, select **Scored** and select a **Correct answer** for the question. You must unlock the **Correct answer** field to make changes. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**. You can select the **Maximum Normalization input** check box to calculate assessment scores for questions using a normalization input value. For more information, see Normalize the scores for metrics.
Number	On questionnaires, users enter a number that falls within the **Min**/**Max** range. To define a single metric to be scored for this data type, select **Scored** and select a **Correct answer** for the question. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**.
Numeric Scale	On questionnaires, users enter a number that falls within the **Min**/**Max** range. To define a single metric to be scored for this data type, select **Scored** and select a **Correct answer** for the question. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**.
Percentage	On questionnaires, users enter a percentage number that falls within the **Min**/**Max** range.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description and additional fields
	To define a single metric to be scored for this data type, select **Scored** and select a **Correct answer** for the question. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**.
Ranking	On questionnaires, users can select a different order number for each option to rank them. A user can either fill in the number or drag an option. Select **Randomize answers** to randomize the order of answer options for the question. Set the **Scale definition**. ○ If a large numerical value equates to a good score, set the field to **High**. ○ If a small numerical value should be interpreted as a positive score, set the field to **Low**.
Reference	On questionnaires, users select a value from a list that is generated from a specified **Reference table**. For example, a user could select a user name in response to a question if you specify User [sys_user] as the reference table. You also have the option of defining conditions for limiting the information pulled from the reference table into manageable chunks.
String	On questionnaires, users enter text. The size of the string field depends on the **String option** you select: ○ Single line ○ Single line wide ○ Multiline This question type is not scored by default.
Template	On questionnaires, users select a value from a predefined series of answer options. There must be at least one template defined to use this data type. For a template, there's a template definition for each answer option, which is represented by a radio button. To define a single metric to be scored for this data type, select **Scored** and select a **Correct answer** for the question. You must unlock the **Correct answer** field to make changes. If you didn't select the **Scored** check box, set the **Scale definition**. ○ If a large numerical value is a good score, set to **High**. ○ If a small numerical value is a good score, set to **Low**.
Yes/No	On questionnaires, users select **Yes** or **No** from a list. To define a single metric to be scored for this data type, select **Scored** and select a **Correct answer** for the question. If you didn't select the **Scored** check box, set the **Scale definition**.

Data type	Description and additional fields
	○ If a **Yes** answer is a good score, set to **High**. ○ If a **No** answer is a good score, set to **Low**.

5. Select **Update** to save the questions to the question bank.

View the sample questions in the base system

TPRM includes sample questionnaires that you can use to define questionnaire templates for your organization.

Before you begin

To include sample questionnaires, you select **Load demo data** while installing TPRM. See Configuring Third-party Risk Management for installation instructions.

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

About this task

- Sample questions don't include scoring or right/wrong answers — you define those attributes.
- Sample questions aren't updated to support regulatory changes — you manage changes.

Procedure

Navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Questionnaire Templates**.

Terminology in TPRM

Term	Description
Metric or Assessment metric	A single question within a questionnaire template.
Metric type or Assessment metric type	A questionnaire template.
Category or Assessment category	A set of related questions within a questionnaire template. **Note:** There can be multiple categories within a metric type.

The Assessment Metric Types list displays the list of metric types. Each metric type includes one or more metric categories. Each metric category includes multiple sample questions.

Related topics

Create an external assessment template

When defining an assessment template, the third-party risk manager provides scheduling information for the third-party risk assessment.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

As part of an assessment, the TPR manager can send multiple questionnaires and document requests by using assessment templates. The TPR admin first defines the required questionnaire templates and document request templates and then the TPR managers groups them into an assessment template. The TPR manager can use the resulting assessment template to send the appropriate questionnaires, document requests, or both in future assessments.

Note:

When you create a new assessment template and have the Smart Assessment Engine property enabled, the Supports smart assessment option is selected by default after saving the template.

For existing assessments, the Supports smart assessment option is set automatically when all Classic engine templates have been removed. You can add associated questionnaire and document request templates that have been migrated to and published in the Smart Assessment Engine.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Third-party Risk Management** > **Assessment setup** > **External Assessment Templates**.
   - **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Assessment setup** > **External assessment templates**.
2. Select **New**.
3. On the form, fill in the fields.

   For more information about the field descriptions, see Create new external assessment template form.
4. Select **Submit**.
5. Add a questionnaire or document request template to the assessment template using one of the following methods.
   The assessment template is ready to be used.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Engine. For more information, see Configure a risk assessment to recur on a schedule and Event-driven management — automate assessment processes.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **External Risk Assessments** > **Assessment scheduling**.
2. Select **New**, fill in the form, and then select **Submit**.

Repeating Assessment form

Field	Description
Number	For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Description	Detailed description of the recurring assessment.
Name	Name of the recurring assessment.
Assessment template	Template used to create the current assessment.
Applies to	The entity to which the assessment applies: **Third party** or **Engagement**.
Third party	Select the third party being assessed.
Engagement	Select the engagement being assessed. The field is visible only if you selected **Engagement** in the **Applies to** field.
Active	Option to enable the current recurring assessment to run when scheduled.
Next assessment creation (months)	The next assessment will be created in the specified number of months after the previous assessment is closed.
Next assessment end date (months)	The end date for the new assessment after the previous assessment is closed.
Assessment results valid duration (days)	The number of days that the assessment results are valid.

The Assessment occurrences related list displays the status of each time the assessment took place and the risk rating that resulted from the assessment.

Import a questionnaire from a spreadsheet

If you maintain questionnaires using Microsoft Excel spreadsheets, you can save time and effort by importing your spreadsheet data directly into TPRM tables. You can then create questionnaires automatically from templates.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

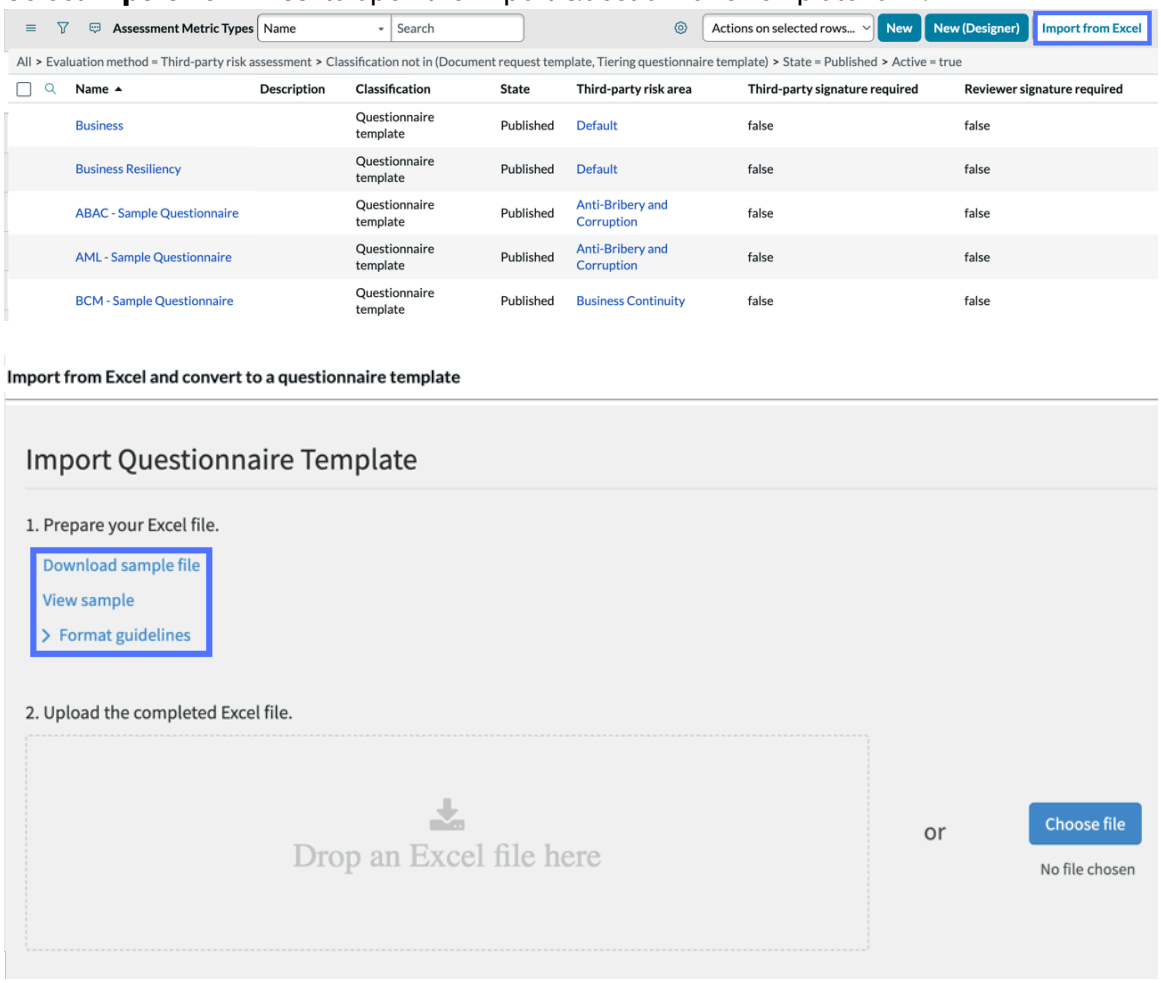
Before you import questionnaires, you must validate that the data in the spreadsheet meets certain requirements. To assist you before you import the spreadsheet, you can review the formatting requirements and view or download a sample spreadsheet to use as a guide. See Guidelines for importing spreadsheet data.

You can specify the following property settings:

Text delimiter in spreadsheets [`sn_vdr_risk_asmt.excel_choice_delimiter`]

Character string that separates response text in questions of type 'Choice' and 'Multiple Selection'.

Common delimiters: \r, \n, \t, \r\n, and the comma character.



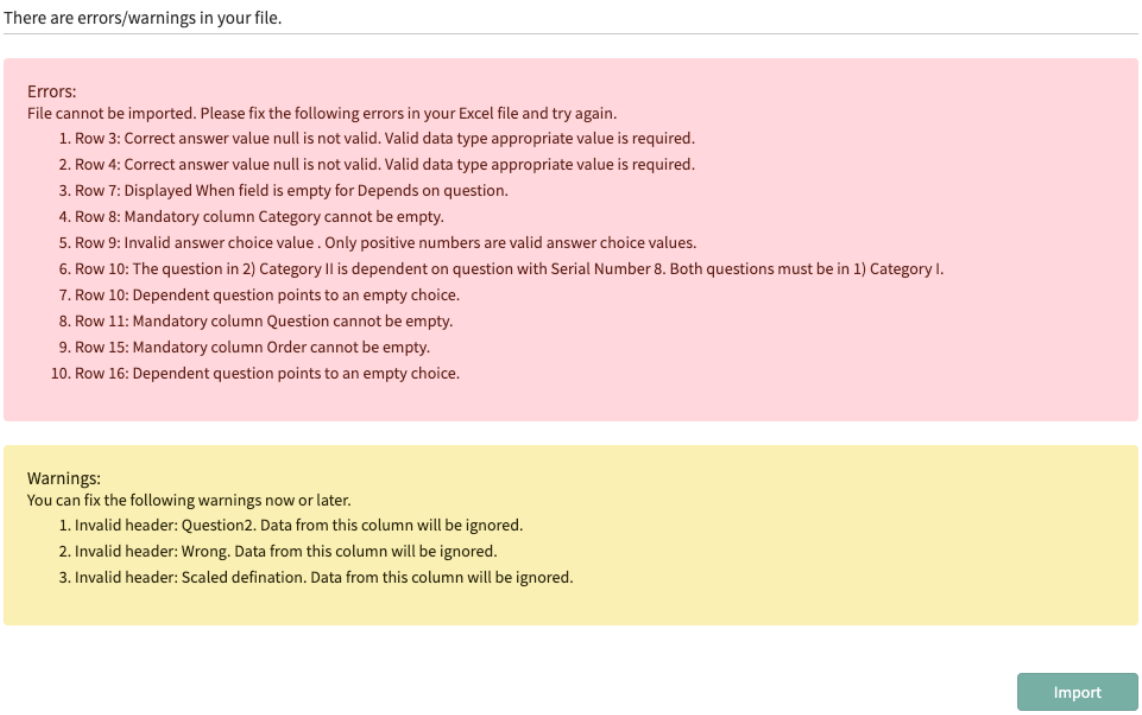
Maximum spreadsheet file size [`sn_vdr_risk_asmt.excel_file_max_size`]

Maximum file size in MB that can be imported.

See Configure TPRM properties.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Questionnaire Templates** or to **Third-party Risk Management** > **Tiering Setup** > **Tiering Questionnaire Templates**.
2. Select **Import from Excel** to open the Import Questionnaire Template form.

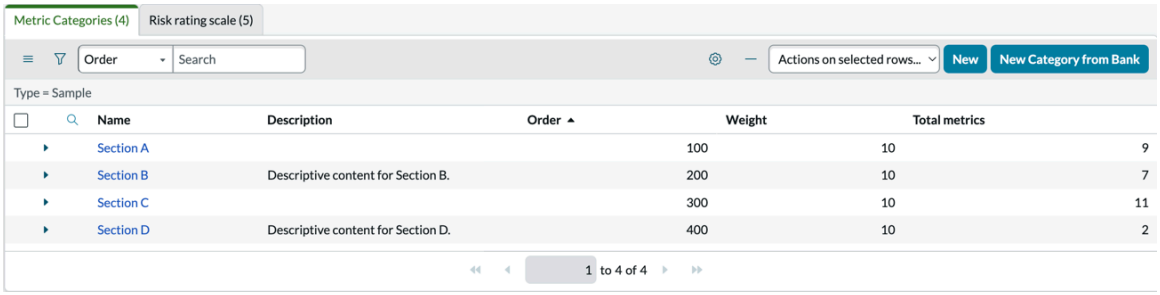


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can review the formatting requirements and view or download a sample spreadsheet to use as an example. Referencing a sample file can help you ensure that you are using values in the expected format.

3. Perform any or all of the steps in the **Prepare your Excel file** section:
   - Select **Download sample file** to download an active worksheet that is properly formatted for import into Third-party Risk Management. You can use the sample as a guide for reformatting your own spreadsheet, or you can copy data from your spreadsheet directly into the sample.
   - Select **View sample** to open an image of a properly-formatted worksheet. You can compare this with your existing worksheet to validate that it contains the same columns and question formats.
   - Select **Format guidelines** to view Guidelines for importing spreadsheet data.
4. When your spreadsheet is ready for import, either drag it into the **Drop an Excel file here** box, or select **Choose File**, navigate to your Excel file, and then select **Open**.

   Errors and warning appear if the file is formatted incorrectly. You must fix all errors before the questionnaires can be imported. You can import a file that has only warnings, but there might be issues in the resulting question data.



Note:
If there are warnings, you can continue with the import, but issues might arise. Consider fixing all errors and warnings before you import questionnaires.

5. After you have fixed errors and warnings, enter a name for the template, and then select **Import**.

   The name must be unique. The name defaults to the worksheet name in your spreadsheet.

   A confirmation pop-up displays the imported questionnaire.

Create a questionnaire or document request template

You can reuse questionnaire templates and document-request templates to speed up the creation of new questionnaires and document requests.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

About this task

When defining a template, you specify whether questionnaires or document requests should require electronic signatures for the third party, the reviewer, or both as mandated by your organization's rules or federal regulations. See the following optional steps for information about copying existing questionnaire templates.

Terminology in TPRM

Term	Description
Metric or Assessment metric	A single question within a questionnaire template.
Metric type or Assessment metric type	A questionnaire template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminology in TPRM (continued)

Term	Description
Category or Assessment category	A set of related questions within a questionnaire template. **Note:** There can be multiple categories within a metric type.

Note:
A questionnaire template must have at least one category. Each category must contain at least one question.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Third-party Risk Management** > **Assessment setup** > **Questionnaire Templates** or **Third-party Risk Management** > **Assessment Setup** > **Document Request Templates**.
   - **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Assessment setup** > **Questionnaire Templates**.
2. Complete one of the following options to create a new template or copy an existing template.

Create an issue generation rule

Create a questionnaire or document request template using the Designer

Use the Questionnaire Template Designer to create and edit questionnaire or document request templates that you can use as the basis for other templates.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

Terminology in TPRM

Term	Description
Metric or Assessment metric	A single question within a questionnaire template.
Metric type or Assessment metric type	A questionnaire template.
Category or Assessment category	A set of related questions within a questionnaire template. **Note:** There can be multiple categories within a metric type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A questionnaire template must have at least one category. Each category must contain at least one question.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Third-party Risk Management** > **Assessment setup** > **Questionnaire Templates** or **Third-party Risk Management** > **Assessment Setup** > **Document Request Templates**.
   - **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Assessment setup** > **Questionnaire Templates**.
2. Select **New (Designer)**.

Tabs on the designer

Tab	Description
Controls	Supported question data types are available in the Controls palette. Drag a control onto the designer canvas to create a question of that type.
Questions	A library of questions for various categories, so you don't have to build each questionnaire from scratch.
Categories	Assessment open in the **Design** view. The questionnaire **Name** field appears above the first category in the canvas. An empty question field appears in the category container.

3. Enter a name and then drag a control onto the designer canvas to create a question of that type.

Note:
Selecting the scored option (**Scored** check box) is optional. All question responses unless otherwise stated are scored. The scored option changes the scoring behavior. If selected, the score is based on a binary system (0 or 100) reflecting whether the answer is correct or incorrect. If not selected, the score is calculated using a scale definition, involving the questionRating, questionPercentContribution, and questionNormalizedValue formulae, and the MaximumNormalizationInput field can influence the normalized value. For more information, see Scoring calculations using the classic assessment engine and Normalize the scores for metrics.

Question controls

Data type	Description	Scored
Attachment	Question with a manage attachments icon for users to attach one or more files.	Y
Boolean	Question with a check box or a **Yes/No** list for user responses.	N
Choice	List of predefined options. For more information, select the definition for **Choices**.	Y

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description	Scored
Date	Date field.	N
Date/Time	Date and time field.	N
Number	Number field with predefined minimum and maximum values. The default is 1–10.	N
Percentage	Percentage field with a prescribed range.	N
Scale	Predefined Likert scale. Answer options appear as radio buttons.	Y
Numeric Scale	Selectable number scale. The default is 1–5. Answer options appear as radio buttons.	Y
String	Single or multi-line text field.	N
Template	Choice list of templates that provide a predefined scale of options.	Y
Reference	Choice list of fields from a specified reference table. This data type doesn't support reference qualifiers.	N
Image Scale	Choice list of images you can use for scales.	N
Multiple Selection	List of selectable choices. Multiple choices are allowed.	N
Ranking	Selectable scale for ranking choices.	N

4. Select the form context menu to select one of the following options.

Option	Description
Save	Save the current questionnaire or document request.
Preview	Display a preview of the questionnaire or doc ument request with its current settings.
New Assessment	Open a fresh canvas for a new questionnaire or document request.
Load Assessment	Open the list of existing questionnaires or document requests that are available for use.
Copy Assessment	Create a copy of the questionnaire or docu ment request that you can edit.

Create an issue generation rule

Create an issue generation rule that will automatically create an issue based on question responses to external assessments. Issues help ensure that your concerns about a third party or engagement are remediated.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

About this task

In an iterative process, before the TPR manager closes an assessment, the TPR manager can generate non-compliance issues and tasks. The TPR manager communicates with the TP contacts and engagement contacts by using comments to close the issues and tasks. The TPR manager can also assign different contacts as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Issues** > **Issue Generation Rules** or **Workspaces** > **Vendor Management Workspace**, select the list icon, and then navigate to **Assessment setup** > **Issue Generation Rules**.
2. Create an issue generation rule by selecting **New** and fill in the form.

Issue generation rules form

Field	Description
Name	Name or short description of the rule.
Issue template	Issue template that is used when generating the issue.
Task template	Task template that is used after generating the issue.
Active	Option that activates the issue generation rule for assessments and questions.
Supports smart assessment	Option that indicates that the Issue generation rule can be used with the Smart Assessment Engine. **Note:** For existing rules, this option isn't set when there are classic questionnaire and document request templates that haven't been migrated and published. This option is set automatically when an SAE questionnaire or document request template has been added manually. When you create a new rule template and have the Smart Assessment Engine property enabled, this field is selected by default after saving the template.
Questions	
Questionnaire template	Questionnaire template that the rule applies to.
Questions	Questions that generate issues based on their responses.
***SAE* Questions**	
Questionnaire template	Questionnaire template that the rule applies to.
Questions	Questions that generate issues based on their responses.

3. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

After the TPR assessor moves the state of the assessment to the Generating Observations state, issues will generate based on these rules.
The TPR assessor can navigate to the Issues tab of the External assessment in the Vendor Management Workspace to view generated issues.

Set up internal questionnaire responses to automatically attach external questionnaires to assessments

Set up an internal questionnaire's responses to automatically attach questionnaires to external assessments that are based on the responses, the calculated risk tier, or both by using Third-party Risk Management. By setting up this configuration, you can help to improve your ability to respond to risk tier changes and internal questionnaire responses.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

Note:
Automatic attachment of questionnaires to external assessments based on inherent risk questionnaire (IRQ) responses or IRQ-calculated risk tiers is currently not supported in Smart Assessment Engine.

About this task

You can set up questionnaires to be automatically added to external assessments based on responses to an internal questionnaire, calculated risk tiers, or both. Risk tiers are determined based on the responses collected after an internal assessment is completed. You can configure whether the risk tier that is used to automatically attach a questionnaire is calculated after the IRQ is completed or for the engagement as part of its internal assessment. For more information on risk tiers, see VRM third-party risk tiering assessments.

Procedure

1. Navigate to **All** > **Third Party Risk Management** > **Assessment Setup** > **Questionnaire Templates**.
2. Select the internal questionnaire template that you want to use.

   Note:
   The questionnaire must have the IRQ template classification.

3. Select the Metric Categories related list, the category name, and then select the question from the Assessments Metrics related list that you want to configure.
   For more information on the different types of questions and how to define them, see Define a question.
4. Add a configuration to the Questionnaires templates related list by selecting **New**.
5. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question to Questionnaire Form

Field	Description
Question	Type of question in the questionnaire that you're configuring. For example, it could be a choice or string question.
Answer	Answer that results in the questionnaire to be attached to the external assessment.
Tier	Risk tier that results in the questionnaire to be attached to the external assessment.
Tier from level	Level at which the referenced risk tier is calculated: IRQ assessment or Engagement. For example, if the risk tier that is calculated during the inherent risk questionnaire assessment matches what you selected for the **Tier** field, the questionnaire is attached to the external assessment.
Questionnaire	Questionnaire that is attached if the requirements that are defined by this form are met.
Applies to	Type of external assessment that the questionnaire is attached to.

6. Select **Submit**.

Smart assessment configuration

The TPR manager and TPR admin roles involve a broad variety of responsibilities. After the TPRM base system is set up, you configure Smart Assessment Engine specific settings as well as other assessment settings that enable and enhance everyday risk-assessment tasks. TPRM admins can enable SAE and work with SAE templates.

Assessment setup overview

By performing the tasks in the Assessment setup checklist for TPRM, you're setting up and configuring the TPRM application to address your unique requirements for scoring and assessing risk for third parties, engagements, and other entities using the Smart Assessment Engine for TPRM assessments.

Note:

For any custom messages you create, it is your responsibility to generate the corresponding `sys_ui_message` records. This step is crucial if you want the custom messages to be extracted and translated.

Assessment setup checklist for Smart Assessment Engine integration with TPRM

Setup tasks for assessments and questionnaires

Task	Description
Set Smart Assessment Engine enabled [sn_vdr_risk_asmt.sae_enabled] property.	After setting this property, SAE becomes the default assessment engine and replaces the legacy experience. **Warning:** After this option is enabled, this selection can't be reversed. For more information, see Configure TPRM properties and Migrating from Classic Assessment Engine to Smart Assessment Engine. Role required: sn_vdr_risk_asmt.vendor_risk_admin
Migrate questionnaire templates.	This task is optional. You can migrate existing questionnaire or document request templates to an SAE template. **Note:** If you're setting up assessments for TPRM for the first time, you don't need to complete this task. For more information, see Migrating from Classic Assessment Engine to Smart Assessment Engine, Migrate a template to an SAE template, Results of migrating a template to a TPRM SAE template, and How legacy metric types are migrated to sections in templates. Role required: sn_vdr_risk_asmt.vendor_risk_admin
Update assessment templates and issue generation rules.	This task is optional. Add published SAE questionnaire templates to all related assessment templates and Issue generation rules. For more information, see Create an external assessment template and Create an issue generation rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for assessments and questionnaires (continued)

Task	Description
	Note: If assessment templates aren't updated to be compatible with SAE templates, tier-based, provider-based, issue generation, and event-driven management rules won't run as expected. Role required: sn_vdr_risk_asmt.vendor_risk_admin
Create post assessment impact automation rules.	This task is optional. Configure automation rules that trigger impact actions after an assessment is completed. These rules can initiate workflows such as risk mitigation, notifications, or updates to related records based on assessment outcomes. Plugin Dependency: Smart Assessment Post-assessment Actions (com.sn_impact_fwk and com.sn_smart_imp_auto). Access vendor risk assessment configurations, including automation rule setup and impact framework integration. Rules are asynchronous and can be tailored to specific assessment types or risk thresholds. Role required: sn_vdr_risk_asmt.vendor_risk_admin
Create response automation rules.	This task is optional. Enable automatic responses for assessments based on predefined conditions. For example, if a vendor scores below a certain threshold, the system can auto-generate follow-up actions or flag the record for review. Plugin Dependency: Smart Response Automation (com.sn_smart_resp_auto) Configure response logic and manage automation settings within the Smart Assessment Engine. Rules can be configured using templates and conditions based on scoring, risk levels, or assessment responses. Role required: sn_vdr_risk_asmt.vendor_risk_admin
Set up risk rating scales for scoring assessments and questionnaires.	This task is required for the initial setup of TPRM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for assessments and questionnaires (continued)

Task	Description
	You can configure the risk rating scale that is selected by default for all questionnaires. For more information, see Set up risk rating scales for scoring. Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Set up third-party risk domains or areas.	This task is required for the initial setup of TPRM. You can configure the scoring method and weight that is selected by default for all third parties associated with a specific risk area. For more information, see Define a third-party risk domain. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Set up third-party risk area criteria, which are the group of risk domains or areas that apply to a type of third party.	This task is required for the initial setup of TPRM. You can adjust the weight and scoring method of each risk area within a criteria definition. For more information, see Define third-party risk area criteria. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Set up third party and engagement component criteria.	This task is required for the initial setup of TPRM. Components are entities that can be assessed for risk. Component criteria are groups of components that are related to a particular type of third party or engagement. You can't add new components or modify existing ones. You can, however, define the criteria (in terms of scoring method and weight) to be used to assess the components. You can update the **Default scoring method** to specify how multiple scores for each risk area are calculated. You can use the **Default weight** to adjust the weight of third-party provider scores in the third party's overall risk rating. The following component classifications are available.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for assessments and questionnaires (continued)

Task	Description

	• Third-party components
	  ○ Third-party risk assessments (External risk assessments)
	  ○ Subsidiaries
	  ○ Engagements
	  ○ Risk intelligence rating
	• Engagement components
	  ○ Engagement risk assessments
	  ○ Product
	  ○ Principal
	  ○ Facility
	  ○ Other
	
	For more information on setting up component criteria, see Define component criteria.
	
	For more information on how engagement components impact third-party elements, see Monitoring third-party elements.
	
	Role required: sn_vdr_risk_asmt.vendor_risk_manager

Set up third-party and engagement risk scoring rules.	This task is required for the initial setup of TPRM. Define the criteria, based on risk scores, that determine which third parties or engagements require assessments. Third-party risk scoring rules apply to subsidiaries, engagements, and third-party risk areas. Engagement risk scoring rules only apply to engagements. For more information, see Define third-party risk scoring rules and Define engagement risk scoring rules. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Create questionnaire or document request templates.	This task is required for the initial setup of TPRM. You can reuse questionnaire templates and document-request templates to streamline the creation of new questionnaires and document requests. The following template purposes (classifications) are available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup tasks for assessments and questionnaires (continued)

Task	Description
	• TPRM external 3rd-party element questionnaire • TPRM external 4th-party questionnaire • TPRM external document request • TPRM external questionnaire • TPRM internal IRQ • TPRM internal tiering questionnaire For more information, see Create a TPRM SAE questionnaire or document request template. Role required: sn_vdr_risk_asmt.vendor_risk_admin
Create assessment templates for external questionnaires.	This task is required for the initial setup of TPRM. You can create an assessment template with set duration requirements and questionnaires attached by default to help streamline the assessment process for different types of third parties and engagements. For more information, see Create an external assessment template. Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager
Create issue generation rules.	This task is optional. Set up rules that auto-generate issues for external assessments. Specify a Third-party risk assessment, a Questionnaire template, and the Questions to apply the rule to, as well as an Issue template and a Task template to use while generating it. For more information on setting up these rules, see Create an issue generation rule. Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin
Set up event-driven management rules.	This task is optional. Set up rules that auto-generate and send questionnaires and doc requests to engagements and third parties. For engagements and third parties that meet the criteria you define, you specify the schedule

Setup tasks for assessments and questionnaires (continued)

Task	Description
	and the assessment templates. You can automate all request types except onboarding. For more information on setting up these rules, see Event-driven management — automate assessment processes. **Note:** The Event-driven management rules feature is the default option for scheduling assessments and replaces Recurring assessments. Role required: sn_vdr_risk_asmt.vendor_risk_manager
Set up scoring for questionnaires.	This task is required for the initial setup of TPRM. You can configure how questionnaires and document requests are scored. For more information, see Configure scoring for an assessment and Normalization in assessment. Role required: sn_vdr_risk_asmt.vendor_risk_admin

Migrating from Classic Assessment Engine to Smart Assessment Engine

Learn what changes when you migrate from the Classic Assessment Engine to the Smart Assessment Engine, including feature differences, limitations, and setup requirements. This overview can help you and your team evaluate the impact before enabling the new engine.

Enabling SAE in TPRM

Starting with version 21.0.x of the Third-party Risk Management application, you can enable the Smart Assessment Engine (SAE) by setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property. After setting this property, SAE becomes the default assessment engine and replaces the legacy experience. The transition isn't reversible.

Warning:

Set this property in your non-production instances and conduct thorough testing before changing your production instances. Failure to do so may result in unexpected issues.

Smart Assessment Engine limitations

The TPRM SAE questionnaire template has the following limitations.

- All new assessments must use SAE questionnaire templates.
- Third-party risk assessors can no longer create issues from the View responses page. Issues generation rules can be used to create issues automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Third-party risk assessors can no longer create comments on individual questions. They can only use the comment section at the questionnaire level.
- The signature feature isn't supported.
- Automatic attachment of questionnaires to external assessments based on inherent risk questionnaire (IRQ) responses or IRQ-calculated risk tiers is currently not supported in Smart Assessment Engine.
- The following question types aren't supported: percentage, ranking, image scale, and custom metric. You must either convert these question types to supported formats before migration or create new questions in the template designer after migration.

  Note:
  For the percentage and image scale question types, customers can use the Number type and Radio button type, respectively. Ranking and custom metric question types aren't supported. You must either convert these question types to supported formats before migration or create new questions in the template designer after migration.

- If a section in the classic template contains only unsupported questions, an empty section is created in the TPRM SAE template. TPRM SAE templates with empty sections can't be published; therefore, you must either add replacement questions to these sections or delete the empty sections before publishing.

  For more information on migration results, migration limitations, and creating TPRM SAE questionnaires, see Results of migrating a template to a TPRM SAE template and Create a TPRM SAE questionnaire or document request template.

- The TPRM scoring migration proceeds only if there were no errors during the template migration. If there were errors, the TPRM scoring migration doesn't occur.

  For more information, see Configure scoring for an assessment and Normalization in assessment.

- Event-driven management rules are the default option for scheduling assessments and replaces Repeating assessments.

Plugin dependencies

After setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property, the following applications and plugins are installed automatically:

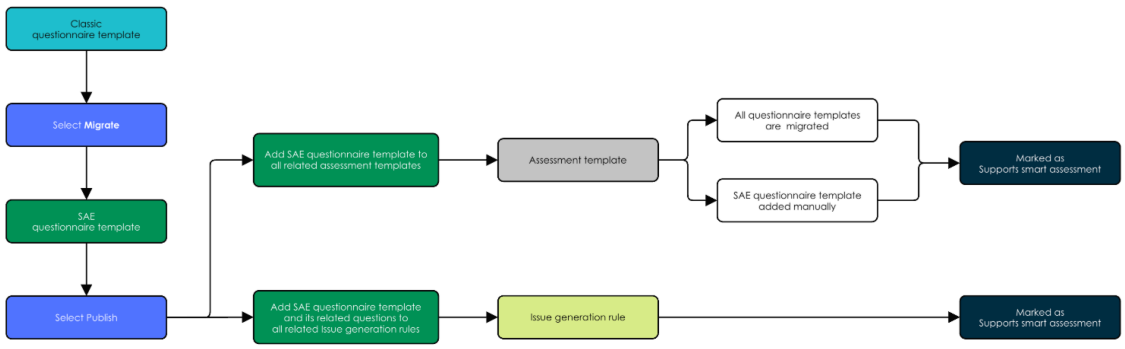
- The Vendor Risk Management Workspace application [sn_vrm_ws] is automatically installed so you can use the Vendor Risk Management workspace where you can access SAE questionnaires and features.
- The Smart Assessment Engine application and plugins are automatically installed enabling you to use the features of the Smart Assessment Engine for your assessments.

  Smart Assessment Engine application package that includes the following:

  - Smart Assessment Core plugin [com.sn_smart_asmt]
  - Smart Assessment Designer plugin [com.sn_smart_asmt_desg]
  - Smart Assessment Connected plugin [com.sn_smart_asmt_conn]
  - Smart Assessment Migration Tools plugin [com.sn_smart_asmt_mig]
  - Smart Assessment Dependencies plugin [com.sn_smart_asmt_dep]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Smart Assessment Post-assessment Actions plugin [com.sn_impact_fwk] and [com.sn_smart_imp_auto]
- Smart Assessment Response Automation plugin [com.sn_smart_resp_auto]
- Smart Assessment Scoring plugin [com.sn_smart_scoring]



Note:
For more information on these plugins, see Configuring Smart Assessment Engine and Smart assessment configuration.

Migration Overview

After setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property, all TPRM assessments will automatically use SAE templates and automation rules (tier-based rules, provider-based rules, event-driven rules and issue generation rules) that support SAE only. You will be able to continue any in-flight assessment until they are completed. You will not be able to create any new assessments with classic questionnaire templates.

The following diagram shows the questionnaire to TPRM SAE template migration workflow.

SAE migration workflow

1. Migrate templates either one by one or in bulk. After migration, all templates are in the Draft state by default.
2. Review each migrated questionnaire template individually to confirm that they're accurate and complete.
3. Publish TPRM SAE questionnaire templates. After publishing, the following actions occur automatically:
   - All the related assessment templates are updated to use the migrated questionnaire template. If all the questionnaire templates in an assessment template are published, the assessment template is automatically marked as Support smart assessment.
   - All issue generation rules are automatically marked as Support smart assessment if their related questionnaire template is published.
   - All automation rules (tier-based rules, provider-based rules, event-driven rules and issue generation rules) are automatically marked as Support smart assessment after their related assessment template is marked as Support smart assessment.

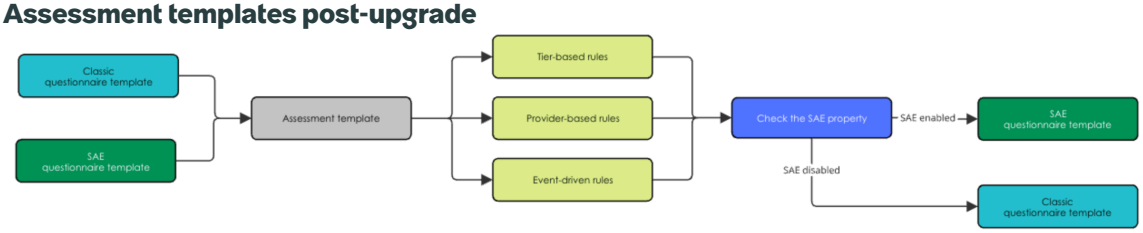
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For Issue-generation rules to work as expected when applied to an TPRM SAE questionnaire template, at least one question must have the option, Enable preferred response, set to true.

4. Review each assessment template to confirm it's marked as Supports smart assessment. If an assessment template isn't marked as Supports smart assessment, manually adding a new TPRM SAE questionnaire template to it updates its status.

For more information, see Migrate a template to an SAE template, Create a TPRM SAE questionnaire or document request template, Create an external assessment template, and Create an issue generation rule.

Classic assessment engine to Smart Assessment Engine comparison



The following table shows the comparable features between the Classic assessment engine and Smart Assessment Engine.

Comparable features

Classic assessment engine features	Smart assessment engine features
Metric Type	Template
Metric Category	Section
Metrics	Questions
Additional Information	Justification
Assessable Record	Scope
Multiple Assessable Records in one Assessment	Combined Assessments
Schedule and Trigger Assessments	Trigger Assessment Flow Action
Domain Separation	Domain Separation
Question Dependency	Conditional Visibility
Correct Answer	Preferred Answer
Scoring	Scoring
Automated response	Response Automation

The following diagram shows the relationship between assessment templates and questionnaires after enabling SAE.

Assessment templates post-upgrade

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Before setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property, the following are used by default.
  - Existing questionnaire templates
  - Existing assessments
- After setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property, the following are used by default.
  - SAE questionnaire templates (New or migrated).
  - Assessments marked as Supports smart assessment.
  - Tier-based, Provider-based, and Event-driven management rules only work with assessments marked as Supports smart assessment.

Note:
All questionnaire templates must be reviewed and published. All assessment templates and automation rules must be reviewed to confirm they're marked as Supports smart assessment.

Scoring assessments

Normalization in assessment

Migrate a template to an SAE template

Migrate an existing questionnaire or document request template to a TPRM SAE questionnaire template. You must migrate all classic templates to TPRM SAE templates or create new ones before you can use SAE in TPRM.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_admin

Before beginning the migration process, take note of the following and plan accordingly.

- You must set the Smart Assessment Engine enabled [sn_vdr_risk_asmt.sae_enabled] property. After setting this property, SAE becomes the default assessment engine and replaces the legacy experience.

  Warning:
  After this option is enabled, this selection can't be reversed.

  For more information, see Configure TPRM properties and Migrating from Classic Assessment Engine to Smart Assessment Engine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The following question types aren't supported: percentage, ranking, image scale, and custom metric. You must either convert these question types to supported formats before migration or create new questions in the template designer after migration.
- If a section in the classic template contains only unsupported questions, an empty section is created in the TPRM SAE template. TPRM SAE templates with empty sections can't be published; therefore, you must either add replacement questions to these sections or delete the empty sections before publishing.
- When transferring TPRM SAE questionnaire templates between instances, the update set won't include the duration information. Users must export the duration information manually from the `sn_smart_asmt_duration` table and import it into the target instances.
- If an assessment template isn't updated to support SAE assessments, the related tier-based, provider-based, and event-driven management rules won't run as expected.
- The TPRM scoring migration proceeds only if there were no errors during the template migration. If there were errors, the TPRM scoring migration doesn't occur.
- Responses from previous assessments aren't migrated.
- Event-driven management rules are the default option for scheduling assessments and replace Recurring assessments.

Note:

For more information on migration results and migration limitations, see Results of migrating a template to a TPRM SAE template.

For more information on creating SAE questionnaires, see Create a TPRM SAE questionnaire or document request template.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Questionnaire Templates** or **Document Request Templates**.

   You must set the Smart Assessment Engine enabled [sn_vdr_risk_asmt.sae_enabled] property before migrating templates.

2. To migrate one questionnaire, select the questionnaire template you want and then select **Migrate**.
   You can migrate multiple questionnaires in bulk, by selecting the check box next to each questionnaire you want and then select **Migrate**.
3. View the generated Assessment template migration record by selecting the link in the info message.
   You can view all Assessment template migration records by navigating to **All** > **Third-party Risk Management** > **Assessment Setup** > **Classic Template Migration**. For more information about the Classic Template Migration table and migration results, see Results of migrating a template to a TPRM SAE template.
   The **Migration Status** field will update with one of the following after the migration job runs:
   - **Completed**: The migration is completed successfully.
   - **Partially completed**: Only some elements were successfully migrated.
   - **Errored**: An error occurred during the migration.
4. Navigate to the **Migration Status** of the Classic Template Migration Table to view templates that were migrated successfully or resulted in errors and correct any errors in the questionnaire template that you want to migrate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Repeat the steps until all errors are resolved and the questionnaire migrated successfully.
6. Navigate to **Workspaces** > **Vendor Management Workspace** and review the migrated questionnaire.
7. Review and confirm all questions, sections, and scoring appear as expected by completing the following.

   a. Identify unsupported question types.
      - Percentage
      - Ranking
      - Image scale
      - Custom metric

   b. Convert unsupported question types.
      - For percentage questions, use the Number type.
      - For image scale questions, use the Radio button type.
      - Ranking and custom metric question types aren't supported.

   c. Remove empty sections.
   If a section in the classic template contains only unsupported questions, an empty section is created in the new template. Templates with empty sections can't be published.

   d. Navigate to the **Scoring** tab and confirm that all settings appear as expected.
   For more information, see Configure scoring for an assessment and Normalization in assessment.

8. Select **Publish**.
   TPR admins can edit the questionnaire and publish it with changes.

Result
The SAE Questionnaire Templates and SAE Document Templates related list of the original questionnaire template record is updated to include the migrated templates. For more information, see Results of migrating a template to a TPRM SAE template.

What to do next
If you have Assessment templates, add the published SAE questionnaire template to all related assessment templates. If you have Issue generation rules, add the published SAE questionnaire template and its related questions to each related generation rule. For more information, see Create an external assessment template and Create an issue generation rule.

Create a TPRM SAE questionnaire or document request template

Create a TPRM SAE questionnaire or document request template that supports SAE for risk identification. After integrating SAE, new users must create SAE templates, and existing users can create additional templates after migrating their existing ones.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_risk_admin

You must set the Smart Assessment Engine enabled [sn_vdr_risk_asmt.sae_enabled] property. After setting this property, SAE becomes the default assessment engine and replaces the legacy experience.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:
After this option is enabled, this selection can't be reversed.

For more information, see Configure TPRM properties and Migrating from Classic Assessment Engine to Smart Assessment Engine.

About this task

To add Third-party Risk Management (TPRM) specific information such as third-party risk areas, the include previous responses option, and enable scoring option to your questionnaire template, you must create a template using the Vendor Management Workspace. After saving the questionnaire, the questionnaire template opens in the Assessment Workspace where you can make edits using the Smart Assessment template designer.

Important:
You must publish your questionnaire template after completing all of your customizations and review for it to be available for use in the Vendor Management Workspace. TPR admins can edit the questionnaire and republish it with changes. However, editing templates that have already been sent out is not recommended, as this can disrupt scoring for questionnaires completed using the previous version.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Assessment setup** > **Questionnaire templates**.
2. Complete one of the following options to create a new template or copy an existing template and customize.

What to do next

- If you chose to create a new template the system generates an empty template. Navigate to each corresponding tab to define the overall instructions, questions, optional guidance for responding to a question, sections that group the related questions, and scoring. For more information, see Add instructions and questions to an assessment template, Add reference information to an assessment template, Configure scoring for an assessment, and Normalization in assessment.
- If you chose to copy an existing template, the system generates a template including all questions, sections, instructions, and configurations of the existing template. You can now customize it as necessary.

Note:
Not all question types are supported. Percentage, ranking, image scale, and custom metric aren't supported. For the percentage and image scale question types, customers can use the Number type and Radio button type, respectively. Ranking and custom metric question types aren't supported. You must either convert these question types to supported formats before migration or create questions in the template designer after migration.

Integrating Third-party Risk Management with GRC: Policy and Compliance Management

The GRC: Policy and Compliance Management integration updates the compliance status of controls and control objectives based on the questionnaire responses from a third party or engagement. Third-party risk (TPR) managers with the Compliance Manager [sn_compliance.manager] role can associate controls with specific questions, third parties, and engagements.

If you have the Policy and Compliance Management application installed, TPR managers with the Compliance Manager role can perform several key tasks that help manage and assess Third-party compliance.

- You can associate third parties and engagements to specific control objectives. This association creates controls for the third party or engagement, establishing a direct connection between them and the compliance management process.

  For more information, see Manually add a control to a third party or engagement.

- You can individually link the question to multiple control objectives for each question in a questionnaire template. This enables for a granular and detailed assessment of compliance.

  For more information, see Manually add a control objective to a question.

- When third parties and engagements respond to questionnaires, the system automatically updates the compliance status of the linked controls. If they provide an incorrect answer, the associated controls are marked as non-compliant. Conversely, correct answers keep the controls compliant.

Note:
Although it is not possible to directly map control objectives to questions in SAE questionnaires, SAE provides the capability to flag controls as compliant or non-compliant through post-assessment actions.

All third parties are automatically categorized into an entity type called Vendors. This helps ensure that each third party and engagement is represented as an entity.

When an entity, such as a third party or engagement, is associated with a control objective a corresponding control is created for that entity. This association links the third party or engagement with the control, which can influence the compliance status of the control.

In the context of Third-party Risk Management, each question in a questionnaire template can be individually linked to multiple control objectives through a related list. When a questionnaire is sent to a third party and the third party responds with an incorrect answer, the controls associated with the linked control objectives are marked as non-compliant. Conversely, if the third party provides the correct answer, the controls remain compliant.

This feature helps ensure that the compliance status of controls is dynamically updated based on the third party or engagements responses, providing a real-time and accurate assessment of

Manually add a control to a third party or engagement

If you're using both Policy and Compliance Management and Third-party Risk Management, you can associate controls with third parties and engagements. Controls can be marked as compliant or non-compliant.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager and sn_compliance.manager

About this task

Controls are automatically generated when you associate a policy with an entity type or an entity type with a control objective. A control is created for each entity listed in the entity type for the control objective. Controls can also be manually created.

For more information on creating policies in Policy and Compliance Management, see Create a policy.

To understand the difference between a control objective and a control, see Structural overview of Policy and Compliance Management.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the list icon and then navigate to **Third parties** > **All third parties** or **Engagements** > **All engagements**
3. Select the third party or engagement that you want.
4. Navigate to the **Controls** tab of the third party or engagement.
5. Assign a control to the engagement by selecting **New**.
6. On the form, fill in the fields.
   For descriptions of all these fields, see Create new control form.
7. Select **Submit**.
   For more information on managing controls, see Manage controls.
   The control is created and all related lists are visible.

Create new control form

Use the create new control form to capture all the information that you need to associate a control with a third party or engagement using the Third-party Risk Management application. As a third-party risk admin, you can create a control.

Control form

Field	Description
Name	Name of the control.
Number	Unique identification number.
Entity	Related entity. **Note:** If you change the state of the entity to Active from Retired state, then the manually created control on the entity also moves to the Draft state.
Inherit from control objective	Option to indicate whether the control is created through item generation process. For more information, see Multiple controls for a unique entity–control objective combination.
Control Objective	Related control objective.
Owning group	Group that owns the policy.
Owner	User that owns the policy. **Note:** The owner is always added as a respondent. The control owner that you select belongs to the owning group.
Sync with entity owner	Option to sync control with entity owner.
Key control	Indicator that the control is a key control.
Weighting	Value used to calculate the control score effectiveness. Based on the control weighting, in the control score effectiveness value is calculated
Status	Control status. Possible choices are: • **Compliant** • **Non-compliant** • **Not applicable**
State	Control state. Possible choices are: • **Draft** In this state, all compliance users can modify the control. Only available when creating a one-off control. One-off controls are possible but not recommended. • **Attest** When the control is created from a control objective, controls are in this state.

Control form (continued)

Field	Description
	Note: When a control is set back to draft, the attestation is canceled. • **Review** Controls are automatically moved to review from the attestation phase. • **Monitor** In this state, all compliance managers can move the control from review to monitor. • **Retired** Compliance managers or administrators can move a control from Monitor to Retired. **Note:** When a control is retired: ○ Associated indicators do not run ○ Associated attestations are canceled ○ Changes to associated control objectives do not update the control
Exempt	Mark the control as exempted.
Function	List of options: • Standard control • Common control **Note:** All existing controls are termed as standard controls. You can convert a standard control to common and reverse its function as standard if you so require. However, by default all controls whether existing or created are standard. For more information, see Convert standard control to common control and add reliant entities.
Enforcement	List of options: • Mandated • Voluntary
Category	List of options: • Acquisition or sale of facilities, technology, and services • Audits and risk management • Compliance and Governance Manual of Style • Human Resources management • Leadership and high-level objectives • Monitoring and measurement

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control form (continued)

Field	Description
	• Operational management • Physical and environmental protection • Privacy protection for information and data • Records management • System hardening through configuration management • Systems continuity • Systems design, build, and implementation • Technical security • Third Party and supply chain oversight • Root • Deprecated
Type	List of options: • Acquisition/Sale of Assets or Services • Actionable Reports or Measurements • Audits and Risk Management • Behavior • Business Processes • Communicate • Configuration • Data and Information Management • Duplicate • Establish Roles • Establish/Maintain Documentation • Human Resources Management • Investigate • IT Impact Zone • Log Management • Maintenance • Monitor and Evaluate Occurrences • Physical and Environmental Protection • Process or Activity • Records Management • Systems Continuity • Systems Design, Build, and Implementation • Technical Security

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control form (continued)

Field	Description
	• Testing • Training
Classification	List of options: • Preventive • Corrective • Detective • IT Impact Zone
Frequency	Frequency at which the control is tested. This field is for the control's testing and reporting purpose. List of options: • Event Driven • Daily • Weekly • Monthly • Quarterly • Semi-Annually • Annually **Note:** For information on the difference between the **Frequency** field for a control and the **Attestation Frequency** field in an entity, see KB0694607.
Description	Description of the control.
Additional Information	Additional information about the control.
Attestation	
Attestation	Select from a list of options. • Other attestation types can be configured. • If this field is populated, then the **Attestation Respondents** field automatically becomes mandatory, and the owner is made the respondent. **Note:** If the user changes the attestation type in the control objective, all the related controls are changed also.
Attestation respondents	• Users assigned to the attestation of this control. • Only a user with the sn_grc.user role can be added as a respondent.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control form (continued)

Field	Description
	Note: When both the **Attestation** and **Attestation respondents** fields are set, attestations are created when you select **Attest**.
Attestation frequency	Frequency at which attestations on the control are triggered. If the field has no value selected, then the associated entity's **Attestation frequency** value defaults to this field. Option for attestation frequency. • Daily • Weekly • Monthly • Quarterly • Semi-Annually • Annually **Note:** After the attestation is complete, the control moves to Review and Monitor states. The control is then monitored for its next due date of attestation. You have the option to trigger the control's attestation frequency based on the attestation's **Created date** or the last completed attestation's **Updated date**. This option is based on the value in *`Trigger control attestations based on the created or updated date of the last completed attestation`* system property.
Activity Journal	
Additional comments	Public information about the control.

Manually add a control objective to a question

If you're using both Policy and Compliance Management and Third-party Risk Management, you can associate control objectives and controls with questions. Controls can be marked as compliant or non-compliant based on the response to the question.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager and sn_compliance.manager

About this task

A control objective is an objective, direction, or standard that acts as guidance for company interactions and operations. Control objectives can be categorized, classified, and related to policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on creating policies in Policy and Compliance Management, see Create a policy.

To understand the difference between a control objective and a control, see Structural overview of Policy and Compliance Management.

Note:
Although it is not possible to directly map control objectives to questions in SAE questionnaires, SAE provides the capability to flag controls as compliant or non-compliant through post-assessment actions.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Questionnaire Templates** and select the questionnaire template you want.
2. Select the metric categories that you want from the related list and then select the question you want.
3. Navigate to the Control Objectives related list and then create a control objective by selecting **New**.
4. On the form, fill in the fields.
   For descriptions of all these fields, see Control objectives form.
5. Select **Submit**.
   For more information on managing controls, see Manage controls.
   The control objective is created and all related lists are visible.

Integrating scores from risk intelligence providers

Risk intelligence providers generate risk scores for a variety of third-party risk domains. Your organization can purchase services from providers that return data that is analogous to personal credit scores. The scores provide insight on how trustworthy and safe a particular third party can be.

Working with data from risk intelligence providers

Note:
You can request risk data for third parties but not for engagements.

- After you register a risk intelligence provider, you specify which of the provider's scoring or rating services you'll use. You also specify how their scores or ratings map to your TPRM ratings. For more information, see Register a risk intelligence provider, Set up a risk intelligence provider service, and Set up a request type for a provider.
- You add a raw score from a provider to the provider service record for a third party. The system uses the mapping that you specified to normalize the value to the appropriate TPRM rating. For more information, see Add a risk intelligence score to risk data for a third party.
- A provider-based submission rule is a set of conditions and actions. In a rule, you can specify that an update to a rating from a risk intelligence provider is the condition that triggers the action that is specified in the rule. The action might be to create and send a third-party risk assessment, issue, task, or email. For more information, see Automate actions upon risk intelligence updates.

Integration types

Here are some examples of the types of integrations supported by ServiceNow and ServiceNow partners:

- Independent software vendor (ISV) integration types involve integrating ISV services such as EcoVadis or Black Kite.
- Content integration types involve integrating external content sources such as regulatory databases or industry standards.
- Data integration types involve integrating external data sources to gather and analyze relevant data such as data from financial systems, security tools, or vendor management systems.
- Environmental, social, and governance (ESG) integration types involve incorporating ESG factors into the TPRM process.

Integrations supported by ServiceNow

Note:
You can find the integration apps on the ServiceNow Store.

Set up a risk intelligence provider service

Set up a request type for a provider

Register a risk intelligence provider

Create a record for each risk intelligence provider from which you'll request reports. The risk scores and ratings that risk intelligence providers generate are analogous to personal credit scores. The scores provide insight on how trustworthy and safe a particular third party can be.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessment_reviewer

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Providers**.
2. Select **New**, fill in the form, and then select **Submit**.

Risk intelligence providers form

Field	Description
Name	Unique name of the risk intelligence provider.
Short description	Description of the provider and possibly of the services provided.
Is multi-factor	Option to specify that the provider can return multiple different score types, for example, Financial risk or Security risk.
Order reports	Option to specify that the provider can be selected for risk intelligence report requests.
URL	Provider's website URL. This enables colleagues to visit and review the provider.
Note	Text comments that provide additional information for your colleagues, for example, descriptions of the available scoring services or why your organization has decided to use the provider.
Provider logo	Image of the provider's logo. This image appears on TPRM reports for the provider.

Result

You can now specify the services and levels of service that you might later request from the provider.

Services that you have associated with the provider appear in the Risk intelligence provider services related list. To add a service, select **New** in the related list and then follow the instructions in Set up a risk intelligence provider service.

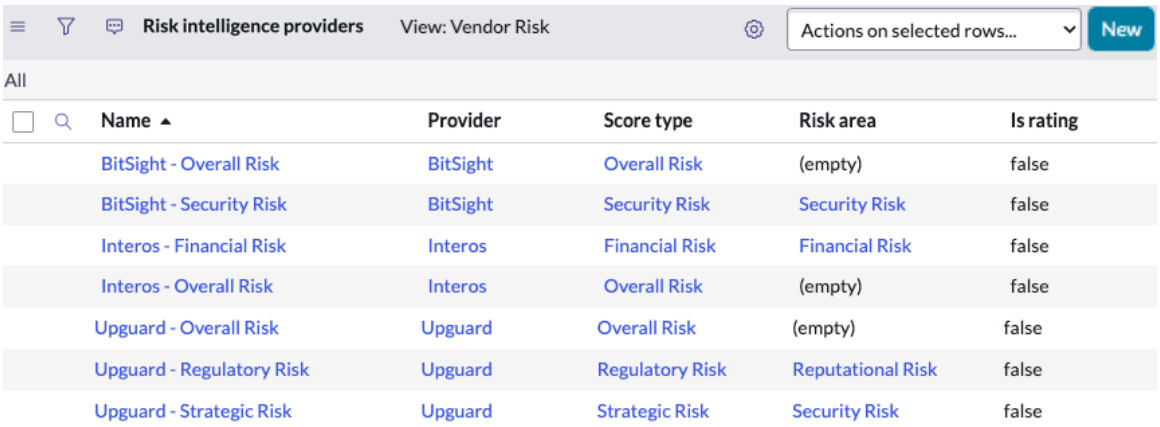
Important:
The **Order reports** option on the Risk intelligence provider form must be selected for providers to be available for risk intelligence report requests.

Set up a risk intelligence provider service

After you register a risk intelligence provider, you specify which of the provider's scoring or rating services you'll use. You also specify how their scores or ratings map to your TPRM ratings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin



Role required: sn_vdr_risk_asmt.vendor_assessment_reviewer

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Provider Services**.

   Current risk intelligence provider services appear in the Third-party Provider Services related list.

   Note:
   The list of provider services also appears as a related list while you're registering a provider. The system auto-generates a unique name for the service by concatenating the **Provider** name and **Score type**.

Risk intelligence providers View: Vendor Risk Actions on selected rows... New

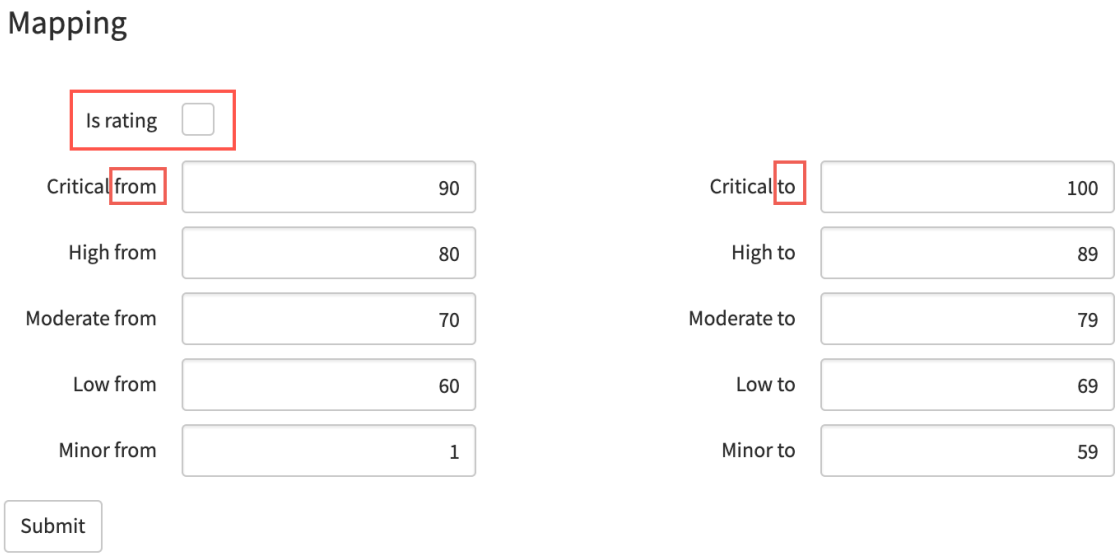
BitSight - Overall Risk	BitSight	Overall Risk	(empty)	false
BitSight - Security Risk	BitSight	Security Risk	Security Risk	false
Interos - Financial Risk	Interos	Financial Risk	Financial Risk	false
Interos - Overall Risk	Interos	Overall Risk	(empty)	false
Upguard - Overall Risk	Upguard	Overall Risk	(empty)	false
Upguard - Regulatory Risk	Upguard	Regulatory Risk	Reputational Risk	false
Upguard - Strategic Risk	Upguard	Strategic Risk	Security Risk	false

2. Select **New** and then fill in the fields on the form.

Risk Intelligence Provider Service form

Field	Description
Provider	Name of the risk intelligence provider for this scoring service.
Score type	Each service offered by the provider returns a particular type of risk rating or score, for example, Financial risk or Security risk. For each provider, you define at least two services. ○ Define a service that returns the overall risk score for the third party. ○ Define a service for each additional type of score that the provider can return.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	Important: ○ The **Is multi-factor** setting for a provider indicates that the provider can return multiple different score types. For providers that you configure as multi-factor, you must define a service with **Score type** = **Overall Score** before you can create other services for the provider. When the provider returns an overall score, you add the data. The normalized value appears as the "Overall" value on the provider's card on the **Risk intelligence scores** tab. ○ For providers that you configure as not multi-factor, you specify only one score type. The score or rating returned by the provider is converted to the normalized TPRM score. The normalized value is also displayed as the "Overall" value on the provider's card on the **Risk intelligence scores** tab.
Name	Name of the provider service being set up. The system auto-generates a unique name for the service by concatenating the **Provider** name and **Score type**.
Risk area	Select the third-party risk domain associated with the score type. For more information, see Define a third-party risk domain. **Note:** Risk domains are called "risk areas" in some platform applications.
Copy mapping from	If applicable, specify an existing service with this provider that uses identical mapping as the service that you're configuring. ○ The mappings are copied to the current record. ○ The mappings become read-only.

3. Scroll to the **Mapping** area and perform one of the following actions.
   - To map the provider ratings to the ratings used by TPRM, select the **Is rating** check box and then enter each provider rating next to its corresponding platform rating.
   - To associate a range of provider scores with each TPRM rating, don't select **Is rating**. Each row identifies the lowest and highest values in a rating. Enter the lowest value in the **from** column and the highest value in the **to** column.

   You must fill in at least three rows.

   - All rows must be either ratings or ranges. A mix of the two types isn't allowed.
   - If there are more returned values than rows, group values in the appropriate row and separate with commas.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.

   You can now specify the types of requests that you might later request from the provider.

   A request type is the name of the report available for the provider. For more information, Set up a request type for a provider.

Set up a request type for a provider

After you register a risk intelligence provider and service, you specify the available request types that you and your organization will use.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessment_reviewer

About this task

A request type is the name of the report available for the provider. Request types can be defined as ranging from Level 1 (general risk intelligence) to Level 3 (granular risk investigation, such as hiring a private investigator). There's no limit to the level or description of the request as long as it makes sense to both you and the risk intelligence provider. For example, a risk intelligence report ordered from Black Kite that provides a high-level summary of cyber risk information could be classified as a Level 1 - General Cyber Risk Report request type.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Request Types** and then select **New**.
2. Select the provider, enter a request type, select **Submit**, and then repeat the process for each request type.
3. Repeat the overall process to define a service for each additional type of score that the provider can return.

Result

You can now request different types of risk scores from the risk intelligence provider.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

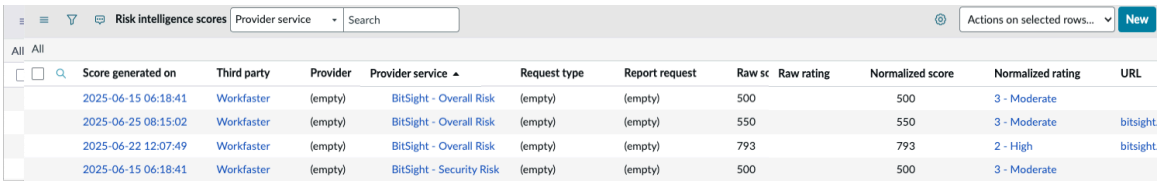
Add a risk intelligence score to risk data for a third party

You add a raw score from a provider to the provider service record for a third party. The system uses the mapping that you specified to normalize the value to the appropriate TPRM rating.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessment_reviewer

About this task



You typically populate the risk intelligence scores table using an integration that you created or installed from the ServiceNow Store. This procedure describes the process of updating risk intelligence scores manually.

When you request a risk score for a third party, risk intelligence providers return the score at a URL that they specify. Follow this procedure to manually add the score and URL to your risk data for the third party.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Scores**.

   The Risk intelligence scores related list displays the list of current provider services and associated scores.

2. Select **New**, fill in the fields on the Risk intelligence score form, and then select **Submit**.

   This step adds the score and the URL where the provider returned the score to the data for the third party or engagement.

   When you enter a rating from a risk intelligence provider, the system normalizes the value to convert it to the appropriate TPRM rating. When you enter a score from a risk intelligence provider, the TPRM generates both a normalized rating and a normalized numerical score.

Risk intelligence score form

Field	Description
Provider	Unique name of the risk intelligence provider. The choice list is populated with the providers that you registered.
Provider service	A name that is the concatenation of the risk intelligence provider name and the particular service that returned the risk data. You configured the service using the process specified in Set up a risk intelligence provider service.
Third party	Third party that was scored by the provider.
Request type	Level of analysis for the **Score type** that you defined for the service. For example, a provider might offer three request types for the Financial Risk score type: Level 1, Level 2, and Level 3. A "Level 3" report might return significantly more detailed information and might cost significantly more than a "Level 1" report.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL	URL of the site that the provider returned for the request. The site provides the rating or score and additional information from the provider.
Raw rating / Raw score	Raw value returned by the provider in the specified URL.
Normalized score	If you entered a numerical raw score from the provider, then this is the computed normalized TPRM score.
Normalized rating	If you entered a numerical raw score or raw rating from the provider, then this is the computed normalized TPRM rating.
Score generated on	Date and time that the score was added to this record. **Note:** This is not the date/time when the data was generated by the provider.

3. **Optional:** Add subfactor data to the risk data for the third party.
   Subfactor data is not validated or mapped to TPRM score/rating data, but is stored directly as you enter it.

   a. Navigate to **All** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Subfactors** and then select **New**.

   b. Fill in the form in the same way as you filled in the data for a score/rating.

Risk intelligence subfactors form

Field	Description
Provider	Unique name of the risk intelligence provider. The choice list is populated with the providers that you registered.
Provider service	A name that is the concatenation of the risk intelligence provider name and the particular service that returned the risk data. You configured the service using the process specified in Set up a risk intelligence provider service.
Name	Name of the subfactor.
Third party	Third party that was scored by the provider.
Score	Raw value returned by the provider. **Note:** You can enter numerical or alphabetic text in this field. The value is not validated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Created	(Optional) Date and time that the score was added to this record. **Note:** This is not the date and time when the data was generated by the provider.

Result
The data that you have associated with the third party now appears in reports. See Viewing risk intelligence scores for details. The data appears in the following locations:

- Risk intelligence scores related list as described in this procedure.
- **Risk overview** tab in the workspace.
- **Risk intelligence scores** tab in the workspace.

Automate actions upon risk intelligence updates

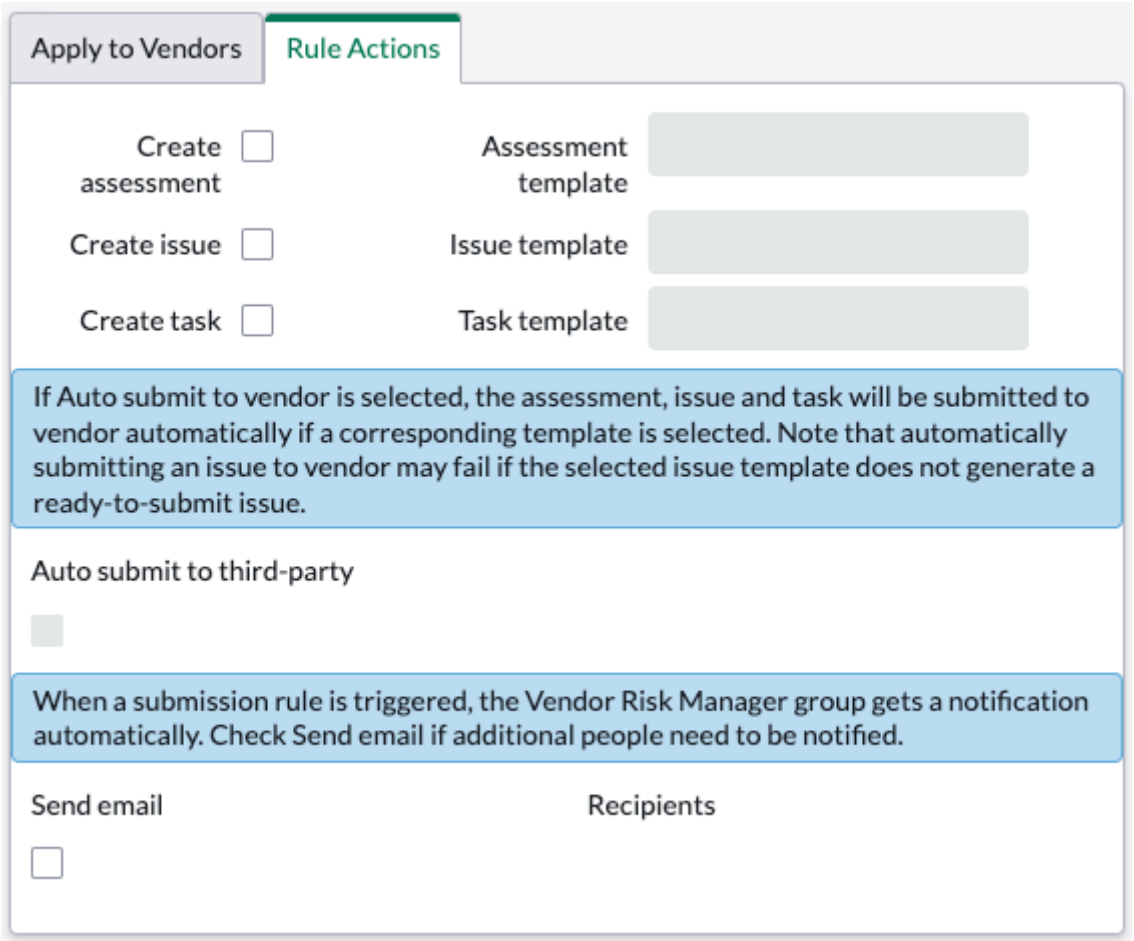
A provider-based submission rule is a set of conditions and actions. In a rule, you can specify that an update to a rating from a risk intelligence provider is the condition that triggers the action that is specified in the rule. The action might be to create and send a third-party risk assessment, issue, task, or email.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessment_reviewer

About this task
When you enter a rating from a risk intelligence provider, the system normalizes the value to convert it to the appropriate TPRM rating. When you enter a score from a risk intelligence provider, the TPRM generates both a normalized rating and a normalized numerical score.

Follow this procedure to define a rule to perform an action when a provider sends an updated rating or score.

Procedure
1. Navigate to **All** > **Third-party Risk Management** > **Assessment Submission Rules** > **Provider-based Submission**.
2. Select **New** and then fill in the form.



Provider-based submission rule form

Field	Description
Provider service	Select the scoring service from the risk intelligence provider that is associated with the rule.
Order	Enter the execution order for the rule. If multiple rules are defined for the same risk intelligence provider, only the rule with the lowest **Order** value is executed.
Name	Auto-generated name of the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
○ Change type ○ Extent of change ○ Normalized percentage/ Normalized score/ Normalized risk rating	Select the basis for the external score change that should trigger the rule and the extent of change, as follows: ○ If Change type = Normalized percentage, select **Increased risk by** or **Decreased risk by**, and the percentage in the **Normalized percentage** field. ○ If Change type = Normalized score, select **Increased risk by**, **Decreased risk by**, or **Threshold**, and a score in the **Normalized score** field. ○ If Change type = Normalized rating, enter a risk rating threshold that will trigger the rule in the **Normalized risk rating** field.

3. Select the **Apply to third parties** tab.
   a. Use the condition builder to define conditions for identifying the third parties to be affected by the rule.
   b. Select **Submit**.
4. Select the **Rule Actions** tab, fill in the fields, and then select **Submit**.

Provider-based submission rule form — Rule Actions tab

Field	Description
Create assessment	Select this check box to create an assessment for the third parties identified on the **Apply to third parties** tab. If you also select the **Auto submit to third party** check box, the assessment is automatically sent to the third parties when the rule is triggered.
Create issue	Select this check box to create an issue for the third parties identified on the **Apply to third parties** tab. If you also select the **Auto submit to third party** check box, and you have selected a template from the **Issue template** field, the issues are auto-generated for the third parties when the rule is triggered. **Note:** To enable to auto-generation, you must verify that the following three fields are completed when the issue is created: ○ **Vendor** ○ **Recommendation** (on the **Recommendations** tab) ○ **Explanation** (on the **Recommendations** tab)
Create task	Select this check box to create a task for the third parties identified on the **Apply to third parties** tab. If you also select the **Auto submit to third party** check box, and you have selected a template from the **Task template** field, the tasks are automatically created for the third parties when the rule is triggered.
Assessment template	If you selected the **Create assessment** check box, select the assessment template to be used to create the assessments.
Issue template	If you selected the **Create issue** check box, you can optionally select an issue template to be used to create an issue for the third parties identified on the **Apply to Vendors** tab. If you also select the **Auto submit to third party** check box, you must select an issue template in order to automatically create an issue when the rule is triggered.
Task template	If you selected the **Create task** check box, you can optionally select a task template to be used to create a task for the third parties identified on the **Apply to Vendors** tab. If you also select the **Auto submit to third party** check box, you must select a task template in order to automatically create a task when the rule is triggered.
Auto submit to third party	Automatically submit assessments, issues, and/or tasks to the third parties identified on the **Apply to third parties** tab as described in the preceding field descriptions.
Send email/ Recipients	When the rule is triggered, users with the TPR manager role receive an email notification. Select **Send email** and specify **Recipients** to send the email notification to other individuals.

Integrating EcoVadis with Third-party Risk Management

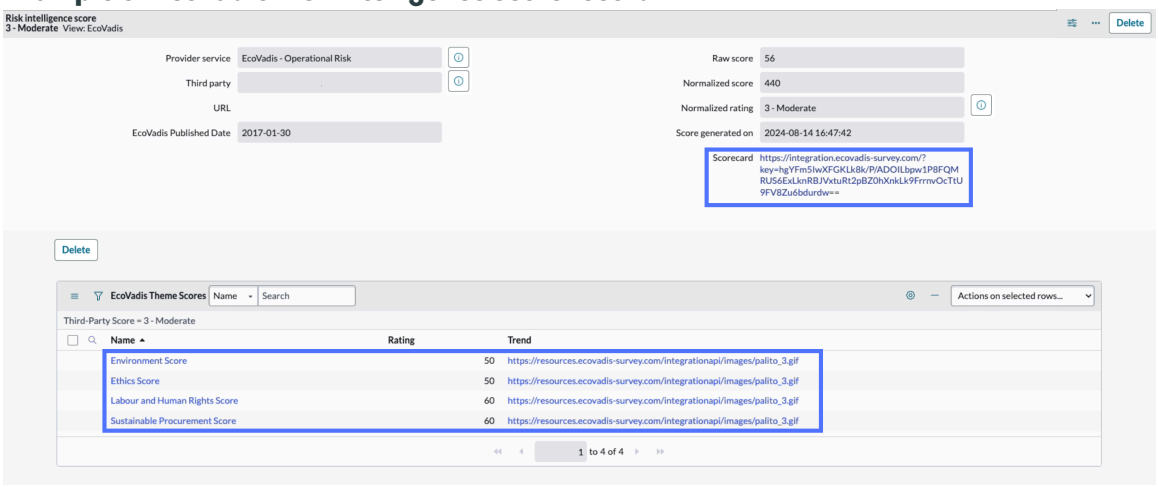
Integrating EcoVadis into your third-party risk management program can enhance your ability to assess and mitigate risks associated with sustainability and corporate social responsibility (CSR). By leveraging EcoVadis' comprehensive sustainability ratings, you can gain detailed insights into the environmental, ethical, and social practices of your third parties.

Configuring the Vendor Risk Management integration with the EcoVadis application

The following pre-requisite configurations are required to use the Vendor Risk Management integration with the EcoVadis application.

- Activate the Vendor Risk Management integration with EcoVadis application [com.sn_app_grc_ecovadis]. To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time.
- Create a connection and authenticate your credentials with EcoVadis for more information, see Create an EcoVadis connection and configuration.
- Request EcoVadis ratings using the EcoVadis website. After the request is accepted, scores will become available in TPRM. For more information on the EcoVadis website, see https://support.ecovadis.com/hc/en-us.

Note:
You can customize the system properties for EcoVadis. For more information, see Customize system properties for EcoVadis integration.



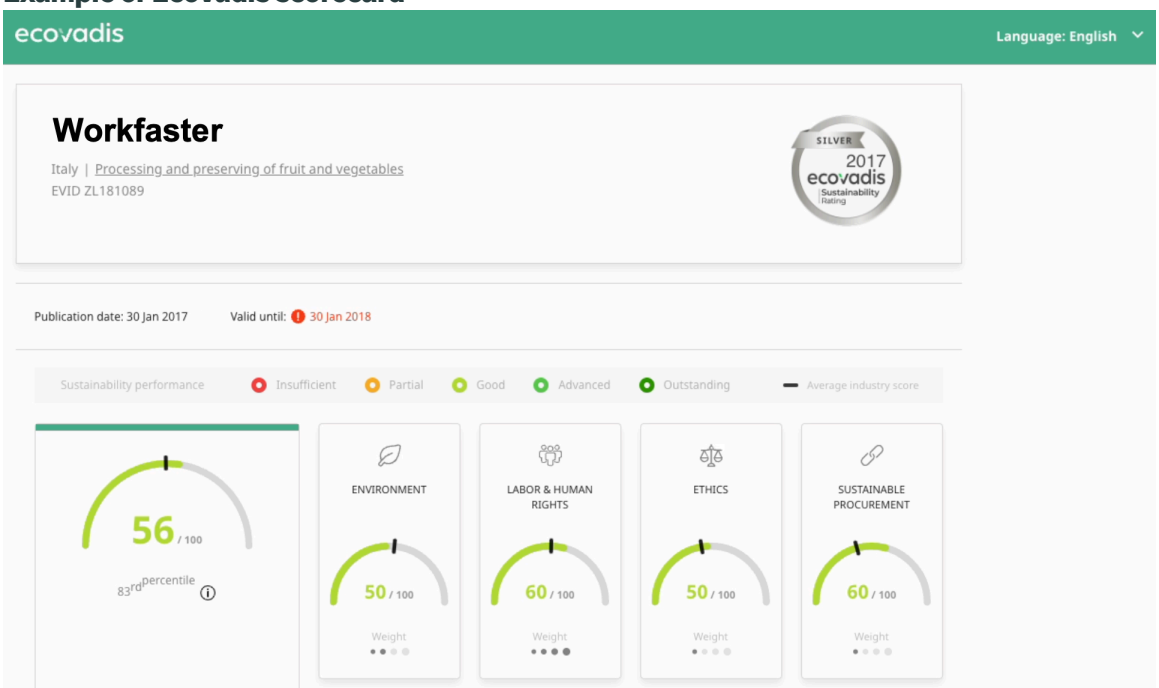
EcoVadis integration actions

As part of the EcoVadis integration with TPRM, you can Fetch and view risk intelligence scores including theme scores and scorecards from EcoVadis.

For more information, see Fetch and view EcoVadis scores.

The following example shows the theme scores and scorecard link that you can view after fetching scores.

Example of EcoVadis Risk intelligence score record



The following example shows a company's sustainability performance across four key areas: environment, labor practices, ethics, and sustainable procurement. It provides a detailed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

breakdown of the company's strengths and areas for improvement, along with a final overall score out of 100.

Example of EcoVadis scorecard

Note:
Confirm that all third parties that you want to assess using EcoVadis has a website listed as part of their third-party record. EcoVadis confirms that a third party is registered by referencing the website URL.

Create an EcoVadis connection and configuration

Create a connection to fetch and update scores from EcoVadis to help ensure that your risk and theme scores remain current when using Third-party Risk Management.

Before you begin

Activate the Vendor Risk Management integration with EcoVadis application [com.sn_app_grc_ecovadis]. To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time.

Role required: admin

Procedure

1. Navigate to **All** > **EcoVadis for third-party Risk Management** > **Connections & Credential Aliases** and select **EcoVadis Connection Alias**.
2. Select the Create new connection & credential related link.
3. Fill out the form.

Create Connection and Credential form

Field	Description
Connection Name	Name of the connection.
Connection URL	EcoVadis API base address.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential Name	Name of the EcoVadis credential.
User Name	Username of the user in EcoVadis.
Password	Password of the user in EcoVadis.

4. Select **Create**.
5. After creating a connection, set up a configuration by navigating to **All** > **EcoVadis for third-party Risk Management** > **Configuration**.
6. Select **New**.
7. Enter a name and select the EcoVadis Config connection that you created.

Note:
You can only create one configuration.

Customize system properties for EcoVadis integration

You can optionally customize the default values of the sn_ecovadis.token_uri and sn_ecovadis.score_uri system properties. These properties manage tokens and access risk scores from EcoVadis when using Third-party Risk Management.

Before you begin

Create an EcoVadis connection and configuration. For more information, see Create an EcoVadis connection and configuration.

Role required: admin

Procedure

1. Select **All** and in the navigation filter enter `sys_properties.list`.
2. Navigate to the sn_ecovadis.token_uri or sn_ecovadis.score_uri properties.
3. Select the property that you want and update the **Value**.
   Additional properties that can be customized include:
   - sn_ecovadis.app_scope_sys_id: The sys id of EcoVadis for Third-party Risk Management Application.
   - sn_ecovadis.connection_credential_alias_sys_id: The sys id of connection and credentials alias configured in EcoVadis.
   - sn_ecovadis.ecovadis_provider_service: The sys id of the EcoVadis provider service.
4. Select **Update**.
   The Vendor Risk Management integration with EcoVadis application [com.sn_app_grc_ecovadis] is updated and ready for use.

Fetch and view EcoVadis scores

Retrieve current scores and scorecards from EcoVadis on demand or at a set frequency of time using Third-party Risk Management. Customizing settings for the EcoVadis Fetch Score Scheduler can help you get the latest scores when you need them.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

EcoVadis ratings can help you can gain detailed insights into the environmental, ethical, and social practices of your third parties. Fetching these scores regularly helps you stay updated on their compliance and performance.

Note:
Confirm that all third parties that you would like to assess are using EcoVadis has a website listed as part of their third-party record. EcoVadis confirms that a third party is registered by referencing the website URL.

Procedure

1. **All** > **Ecovadis for third-party Risk Management** > **Scheduled Job**
2. Select **EcoVadis fetch Score Scheduler**.
3. Fetch a score on demand or at a scheduled time.
   - Select **Execute Now** to get the latest scores.
   - Select the Active option, set the following fields, and select **Update** to fetch scores at a specific frequency.

Field	Description
Run	The frequency or set dates EcoVadis scores are fetched. ▪ Daily ▪ Weekly ▪ Monthly ▪ Periodically ▪ Once ▪ On Demand ▪ Business Calendar: Entry Start/Finish
Time zone	Time zone that applies to the time selected to fetch the scores.
Time	Time the scores are fetched.

Note:
A scheduled job will run once per day.

4. Navigate to **All** > **Third-party Risk Management** > **Third Parties** > **All Third Parties** and select the third party you want.
5. Select the Risk intelligence scores related list.
6. View a score by selecting the date and time from the **Score generated on** column.

Note:
You can view all scores including EcoVadis theme scores and scorecards when your score record is in the EcoVadis view.

Result

You can view EcoVadis third-party theme scores in the EcoVadis Theme Scores related list and access the EcoVadis scorecard by selecting the URL in the **Scorecard** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

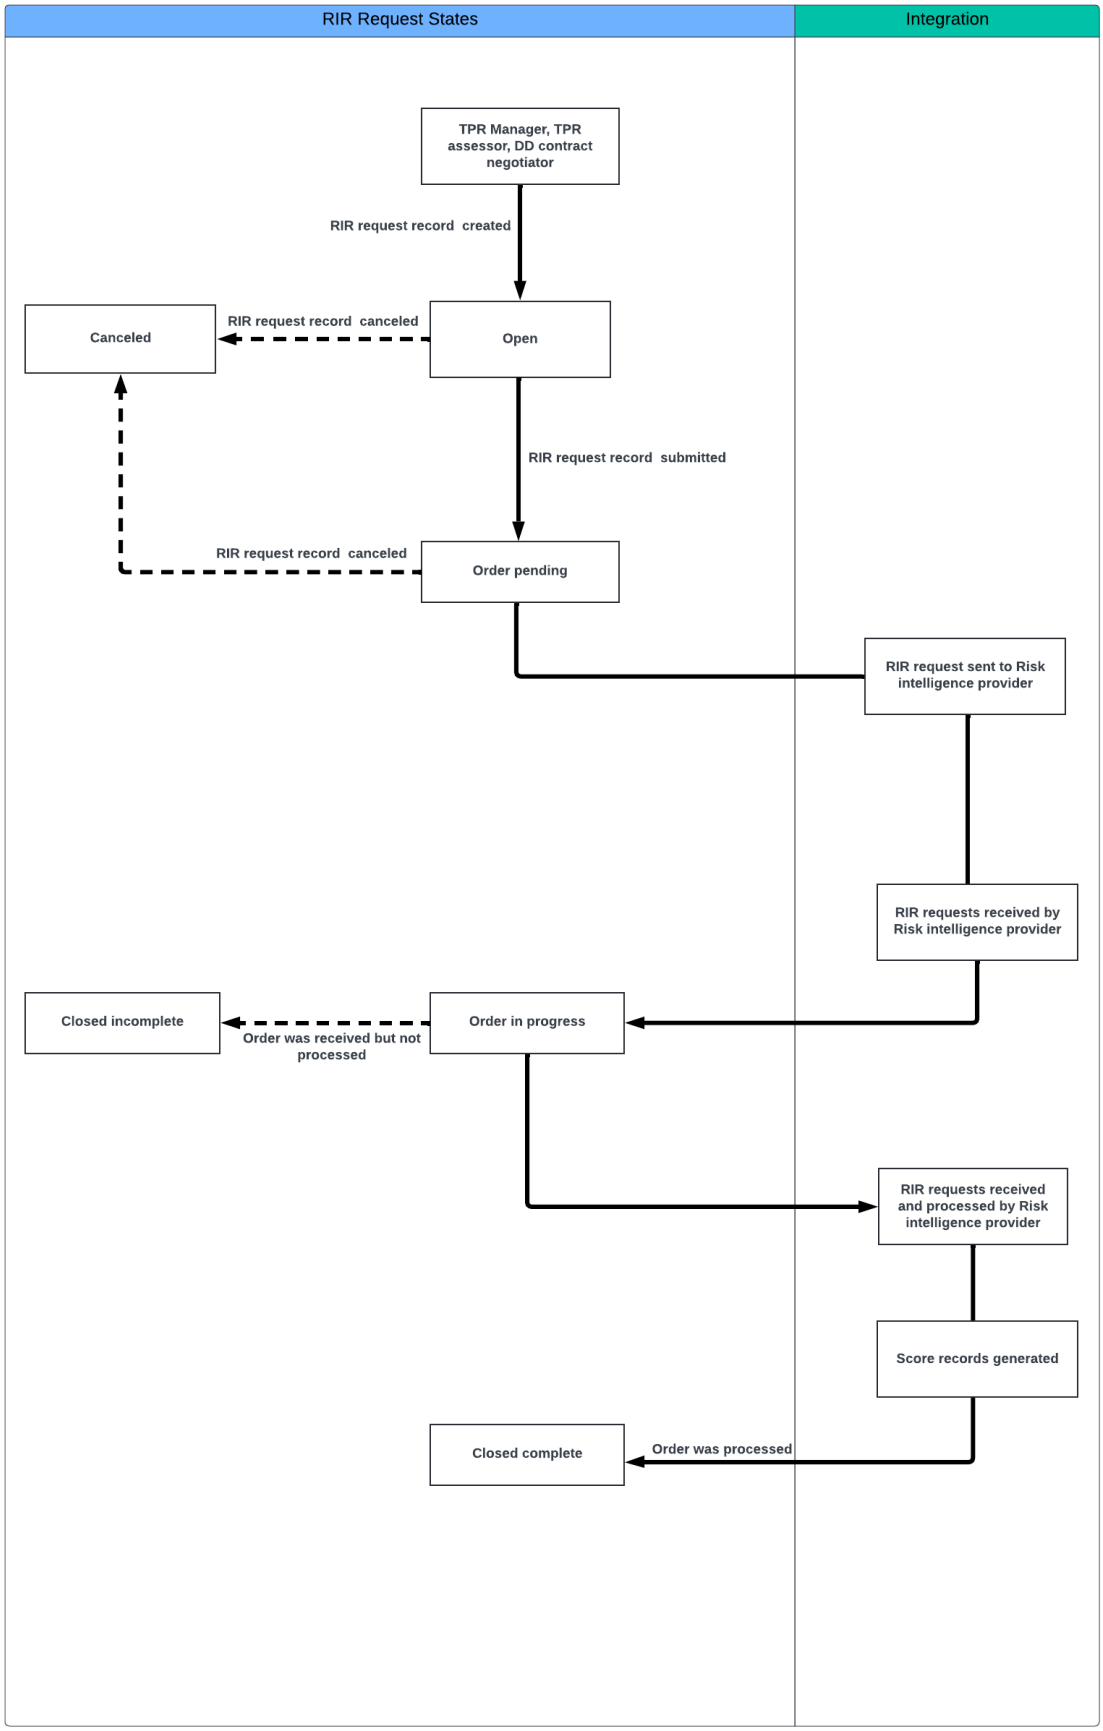
Scores are mapped to the Risk Intelligence Provider and Provider Service for EcoVadis.

Note:
You can verify that scores are being fetched by navigating to **All** > **EcoVadis for third-party Risk Management** > **Application Logs**.

Risk intelligence provider integrations

The Third-party Risk Management application includes support for risk intelligence provider integrations. These guidelines can help your organization to develop a risk intelligence provider integration for Risk intelligence report (RIR) requests for third parties and due diligence requests.

Integration requirements



The TPRM application enables your organization to integrate with external risk intelligence content providers. If you have the Third-party risk (TPR) assessor [sn_vdr_risk_asmt.vendor_risk_assessor] or TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] role, you can request the scores or reports for third parties by using the risk intelligence request form. After the reports are generated by the provider, the links to the reports are uploaded to the Third-party Risk Management application and associated with the relevant third party.

Note:
Before requesting reports and scores, a team member with the TPR assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role must register the providers and set up both the providers and request types in the Third-party Risk Management application. For more information, see Register a risk intelligence provider, Set up a risk intelligence provider service, and Set up a request type for a provider.

The following diagram shows the RIR request flow states and their relationship with the integration requirements for risk intelligence providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RIR requests integration

Integration process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. All RIR requests in the Order pending state are ready to be sent to the risk intelligence provider.
2. A nightly job is set up by the integration API to check for the report request records that are in the Order pending state.
3. The integration API updates the RIR request record state to Order in progress,
4. The integration API sends a packet to the provider that includes the names of the records and their corresponding source tables:
   - rir_sysid [sn_tprm_dd_risk_intel_request]
   - provider_sysid [sn_vdr_risk_asmt_tpss_provider_basic]
   - third_party_sysid [core_company]
   - third_party_name [core_company]
   - request_type_sysid [sn_tprm_dd_risk_intel_request_type]
   - request_type_name [sn_tprm_dd_risk_intel_request_type]
   - provider_service_sysid [sn_vdr_risk_asmt_tpss_provider]
5. If the packet isn't sent successfully, the integration API updates the RIR request state to Closed incomplete.
6. After receiving the RIR request, the risk intelligence provider processes it and gathers information including the URL, score, and content.
7. The risk intelligence provider returns a packet for upload to the Third-party Risk Management application.

   The packet contains the following names of the records, their corresponding source tables, and content:
   - rir_sysid [sn_tprm_dd_risk_intel_request]
   - provider_sysid [sn_vdr_risk_asmt_tpss_provider_basic]
   - third_party_sysid [core_company]
   - request_type_sysid [sn_tprm_dd_risk_intel_request_type]
   - provider_service_sysid [sn_vdr_risk_asmt_tpss_provider]
   - URL
   - score
   - rating
   - content

   Note:
   The score or rating should be the provider's score or rating. The provider should have set up a mapping to convert the provider's score to a ServiceNow score through a Provider Service record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Using the packet information, the integration API creates a risk intelligence score record [sn_vdr_risk_asmt_security_score] and populates the URL field. This URL is used to download and attach the reports to the associated RIR request record [sn_tprm_dd_risk_intel_request].

9. The integration API updates the state of the RIR request from Order in progress to Closed complete or Closed incomplete, depending on whether the risk intelligence provider completes the report or fails to send it and decides to close the order.

Limitations

The integration API doesn't update the score record in the Score table. If the API fails to populate a field when it creates a score record, a new score record is created instead of updating the existing record. For example, if the API didn't associate a score with an RIR request, it has to call the API again to create a new score and associate it with the RIR request.

Risk intelligence report request states

The risk intelligence report requests have the following potential states:

Open

An RIR request enters this state after the record has been created and saved by the Third-party Risk (TPR) manager, TPR assessor, or contract negotiator that is assigned to the due diligence request. For each risk intelligence request, the system auto-assigns a unique ID number that starts with the text RIR.

Order pending

An RIR request enters this state after the record has been submitted by the Third-party Risk (TPR) manager, TPR assessor, or contract negotiator that is assigned to the due diligence request.

The following changes take place:

- The order has been submitted to the provider.
- The **Request date** field has been populated with the date that this record was submitted on.
- All fields in the Risk intelligence report request section are read-only.

Order in progress

An RIR request enters this state after the order has been received by the provider.

The following changes take place:

- The score records are generated with the report request.
- The **Score generated on** field is updated.

Closed incomplete

An RIR request enters this state after the order was received by the provider but couldn't be processed due to an error so the order was closed.

Closed complete

An RIR request enters this state after the order was received and processed by the provider.

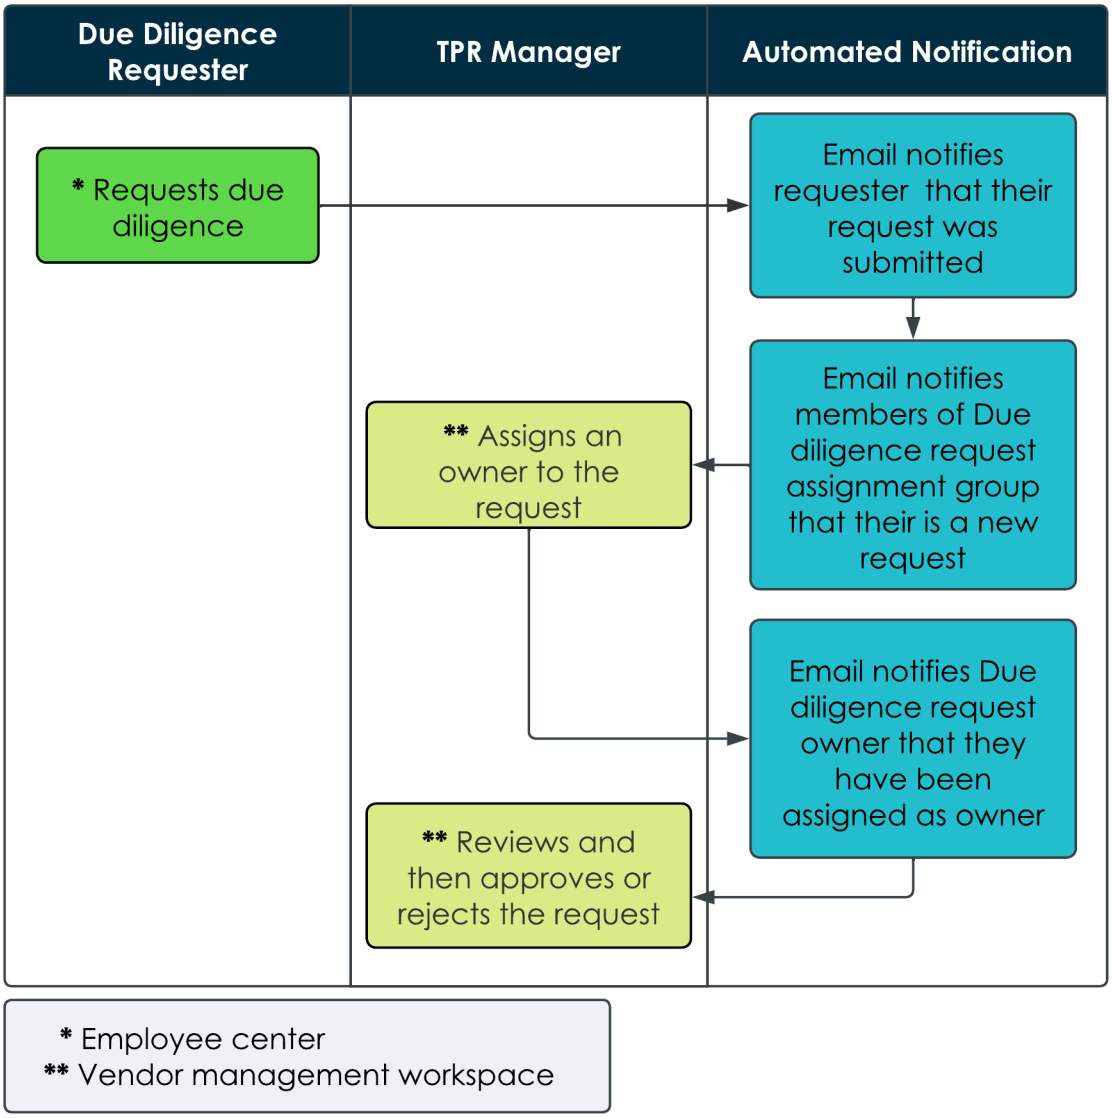
Canceled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An RIR request enters this state after a TPR manager, TPR assessor, or contract negotiator cancels the report request. If a TPR manager, TPR assessor, or contract negotiator must cancel a request, it can be done while the request is in the **Open** or **Order pending** state. After an RIR request is canceled, that record can't be edited. You must create a record.

Requesting third-party risk due diligence

Request third-party risk due diligence to determine the level of risk for interactions with a third party, engagement, or fourth party by using Third-party Risk Management. You conduct due diligence to become aware of the associated risks so that you can make informed decisions, establish appropriate controls, and mitigate the potential negative impact when working with external parties.



Any employee at your organization can request due diligence, which is an investigation or examination of business relationship risk, for an engagement.

- An engagement is the informal or contracted relationship that you intend to form with a third party that could potentially expose your organization to risk. The engagement outlines the services or products to be provided by the third party and other details of the relationship.
- A third party is any organization or individual that you've interacted or entered into a business relationship with. Third parties can have subsidiaries and can contract with fourth parties. For example, departments are subsidiaries.
- A fourth party can contract with further parties. All downstream parties, such as the fourth through the nth parties, carry risk in the same ways as third parties.

For more information about the terms that are used in these sections or why you might conduct due diligence, see Terminology and Why you conduct due diligence.

The following infographic shows the due diligence request process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following are the steps of the due diligence request process.

1. An employee at your organization requests due diligence for a third-party engagement.
2. The system sends out an email notification to the employee who made the request.
3. The system sends out an email notification to the Due diligence request assignment group.
4. A member of the group can assign a Third-party risk (TPR) manager [sn_vdr_risk_asmt.vendor_risk_manager] or TPR assessor [sn_vdr_risk_asmt.vendor_assessor] to act as the owner of the request.
5. The system sends out an email notification to the assigned owner of the due diligence request.
6. The TPR manager reviews the request for due diligence for the engagement and approves it. If the information provided by the requester was insufficient or the engagement isn't possible for your organization, the TPR manager rejects it.
7. The IRQ process starts after the TPR manager approves the request for due diligence.

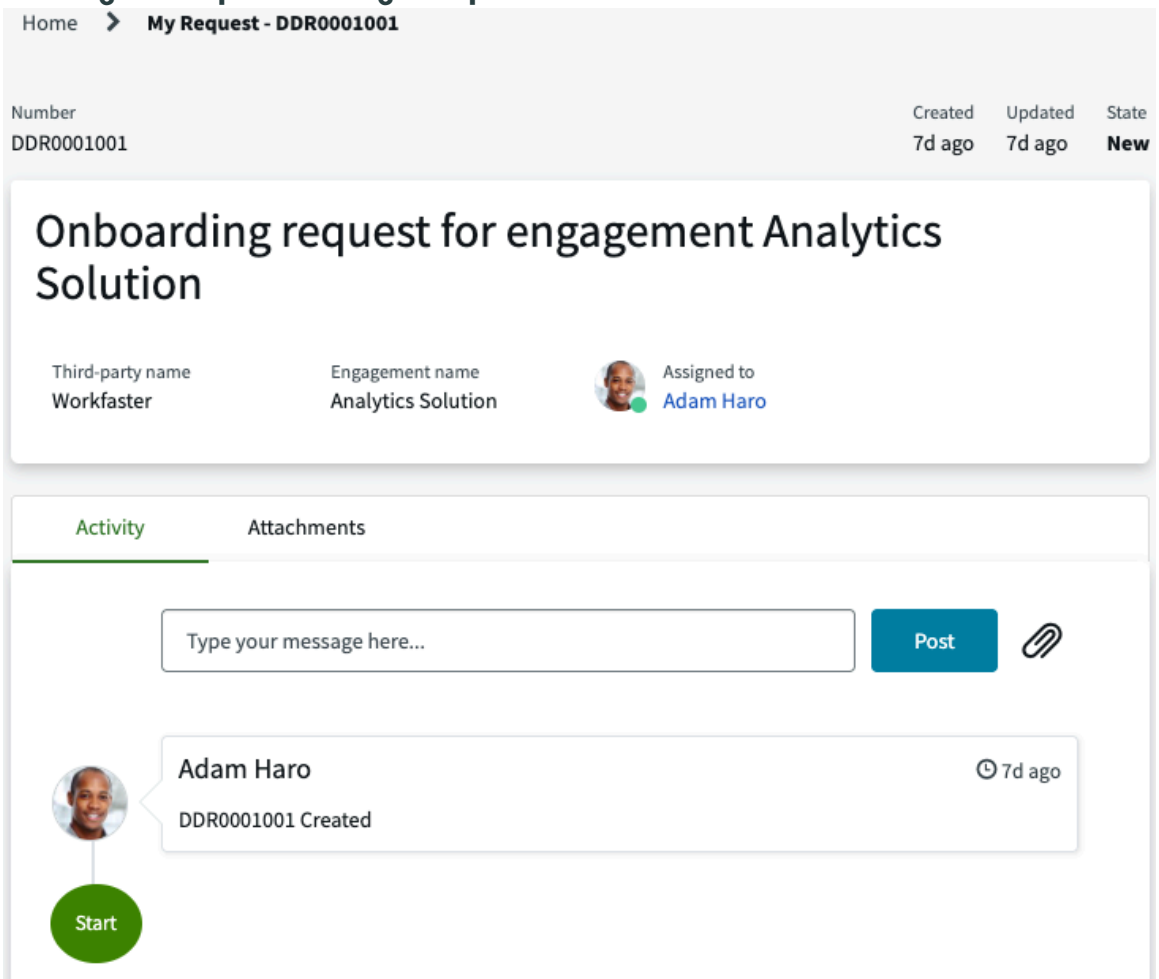
To learn more about creating or monitoring a due diligence request, see Request due diligence for a third-party engagement and Monitoring the due diligence request process.

When creating a due diligence request, the following options are available:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Onboard a new engagement** Start the onboarding process for a new engagement with an existing third party. For more information about this type of onboarding, see Example — Onboarding a third party.
- **Reassess an existing engagement** Reassess an existing engagement when the conditions change. For example, let's say that you hear adverse news or have changes in your third-party's supply lines. You might want to reassess the risk by conducting additional due diligence.
- **Reassess an existing engagement for contract renewal** Reassess the risk before your organization renews the contract with a current third party or engagement by conducting due diligence.
- **Offboard an engagement with due diligence** Determine if offboarding (terminating the relationship) with an engagement is the optimal course of action by conducting due diligence. For example, it might be too risky to switch third parties or engagements even if their current performance doesn’t meet expectations.

  Extenuating circumstances can contribute to the decision. For example, if the third party is sourcing materials that are difficult to obtain, switching providers might be costly and introduce additional risks. In such cases, continuing with the existing third party, with whom a long-term relationship exists, might be preferable to mitigate potential disruptions and higher risks.



- **Offboard an engagement with no due diligence** Request that an engagement be permanently terminated when an engagement ends or you want to switch to a different third party for other reasons. In this case, you typically don't need to conduct additional due diligence. The process does, however, include the normal Inherent Risk Questionnaire (IRQ) process to confirm that the services provided by the engagement will no longer continue. For more information about this type of offboarding, see Offboarding an engagement without conducting due diligence.

For each due diligence request, the system auto-assigns a unique ID number that starts with the text DDR. Use the ID to track your request. You can post a message to reviewers and add attachments from the page.

The following example shows how a new due diligence request appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Due diligence request tracking example

For more information on the different processes that make up the overall due diligence workflow, see Due diligence workflow and Assessing your third-party risk.

Request due diligence for a third-party engagement

Request due diligence to assess the risk that is associated with doing business with an engagement. By conducting due diligence, you gain access to the most up-to-date, comprehensive, and accurate information before making a decision on entering into a business relationship.

Before you begin

Role required: snc_internal

About this task

Because your organization assesses the risk that is associated with doing business with third parties, it performs due diligence for any engagement with a third party. When you request due diligence, you specify the third party's name and the reason for your request. For example, start a new engagement with a third party that you have already engaged or perform due diligence in preparation to renew a contract. You then specify the details that help the Third-party Risk (TPR) managers and TPR assessors at your organization proceed with the due diligence processes. If a request is accepted, it initially goes through the IRQ process. After the IRQ process, as part of the Due diligence process, two third-party risk assessments begin. One assessment is for the third party and another assessment is for the engagement. For more information, see Due diligence workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This feature is available only if the Third-party Risk Management application has been activated. After you install the Risk concentration map feature, you must install a Google license to enable the feature. To enable the risk concentration map feature, see Enable the TPRM Risk concentration map.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center** to open your Employee Center and then select **Risk & Compliance**.
2. Select the **Request due diligence for third-party risk** card.
3. On the request form, specify the purpose of your request.
   - **Onboard a new engagement**
   - **Reassess an existing engagement**
   - **Reassess an existing engagement for contract renewal**
   - **Offboard an engagement with due diligence**
   - **Offboard an engagement with no due diligence**

     For more information, see Offboarding an engagement without conducting due diligence.

   For descriptions of each type of due diligence request, see Requesting third-party risk due diligence.
4. **Optional:** Select **Add attachments** to include a document with the request.
5. Specify the third party for the engagement.

   You can request due diligence either for an engagement with a third party that you're already engaged with or for an engagement with a new third party.

   Note:
   You can reactivate a third party that is in the **Terminated** status. Terminated third parties appear in the list for requests of the **Onboard a new engagement** type. If such a request is accepted and closed, the third party's status is changed to **Active**.

   - For an engagement with an existing third party or with a department, partner, subsidiary, or fourth party of the third party:
     a. Select the third party from the list.
     b. The form expands and the system auto-populates the key information for the third party including the address and contact details.
     c. In the next step, enter the key information like the address and contact details for the engagement.
   - For a new third party:
     a. Select the **Third party is not listed** check box.
     b. Enter the name of the new third party.
     c. The form expands. In the next step, you enter the key information like the address and contact details for the third party and for the engagement.

   If you selected an existing third party, much of the information is automatically filled in. For descriptions of these fields, see Request third-party risk due diligence request form.
6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The system opens to the **Activity** tab on the My request page. For each due diligence request, the system auto-assigns a unique ID number that starts with the text DDR. Use the ID to track your request. You can post a message to reviewers and add attachments from the page.
- The system sends you an email confirmation that your request was submitted. The message includes a link to the request details on the Third-party Risk Management application.
- The system sends an email notification to all users in the group that is specified in the **Assignment group**. The message states that the request was received and is in the **New** state. The message also includes a link to the details page for the request.

Note:
For new due diligence requests, the **Assignment group** is set to Due diligence request assigners. The TPR manager or owner can specify which group is the **Assignment group** on the **Details** tab for a due diligence request. For more information, see Due diligence request process management and Add users to groups based on responsibilities.

Related topics

Offboarding an engagement without conducting due diligence

Offboarding an engagement without conducting due diligence

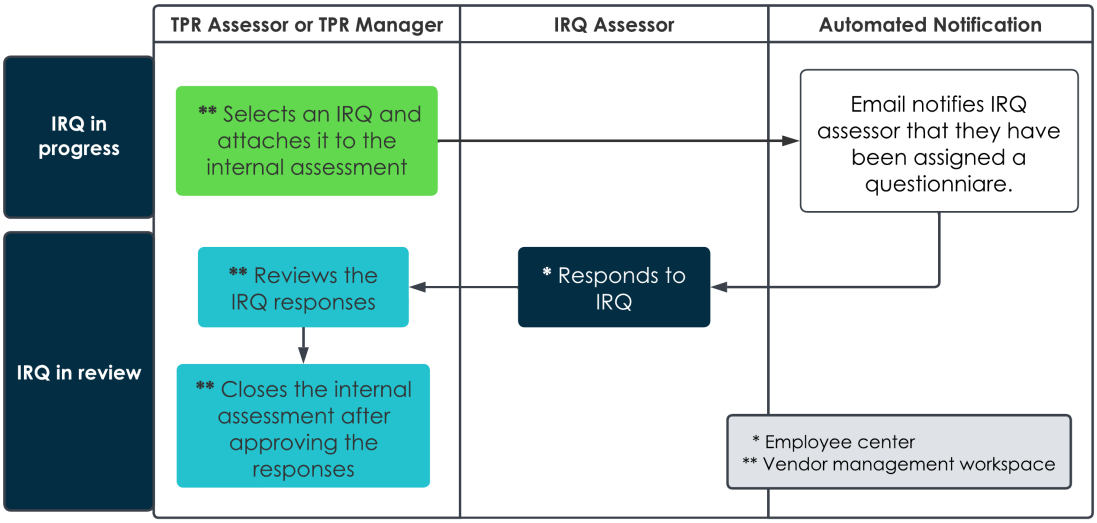
Request that an engagement be permanently terminated when an engagement ends or you want to switch to a different third party for other reasons. In this case, you typically don't need to conduct additional due diligence. The process does, however, include the normal Inherent Risk Questionnaire (IRQ) process to confirm that the services provided by the engagement will no longer continue.

The user who is assigned as **IRQ assessor** is responsible for completing the questionnaire specifying why the engagement is no longer required. After the IRQ is completed, the approval process formally offboards the engagement and sets it to the inactive state.

When the engagement is set as inactive, future auto-scheduled due diligence or information requests aren’t sent to the engagement contacts.

Assessing your third-party risk

Use Third-party Risk Management to identify and assess potential risks that are associated with your third-party relationships. The information gathered from internal questionnaires, external questionnaires, and documentation requests helps you to understand the third party's risk profile, determine the appropriate risk mitigation strategies, and determine whether the third party or engagement meets all necessary compliance requirements.



Responding to questionnaires

The following processes outline the timing and methods for responding to internal and external questionnaires:

Inherent Risk Questionnaire (IRQ) process

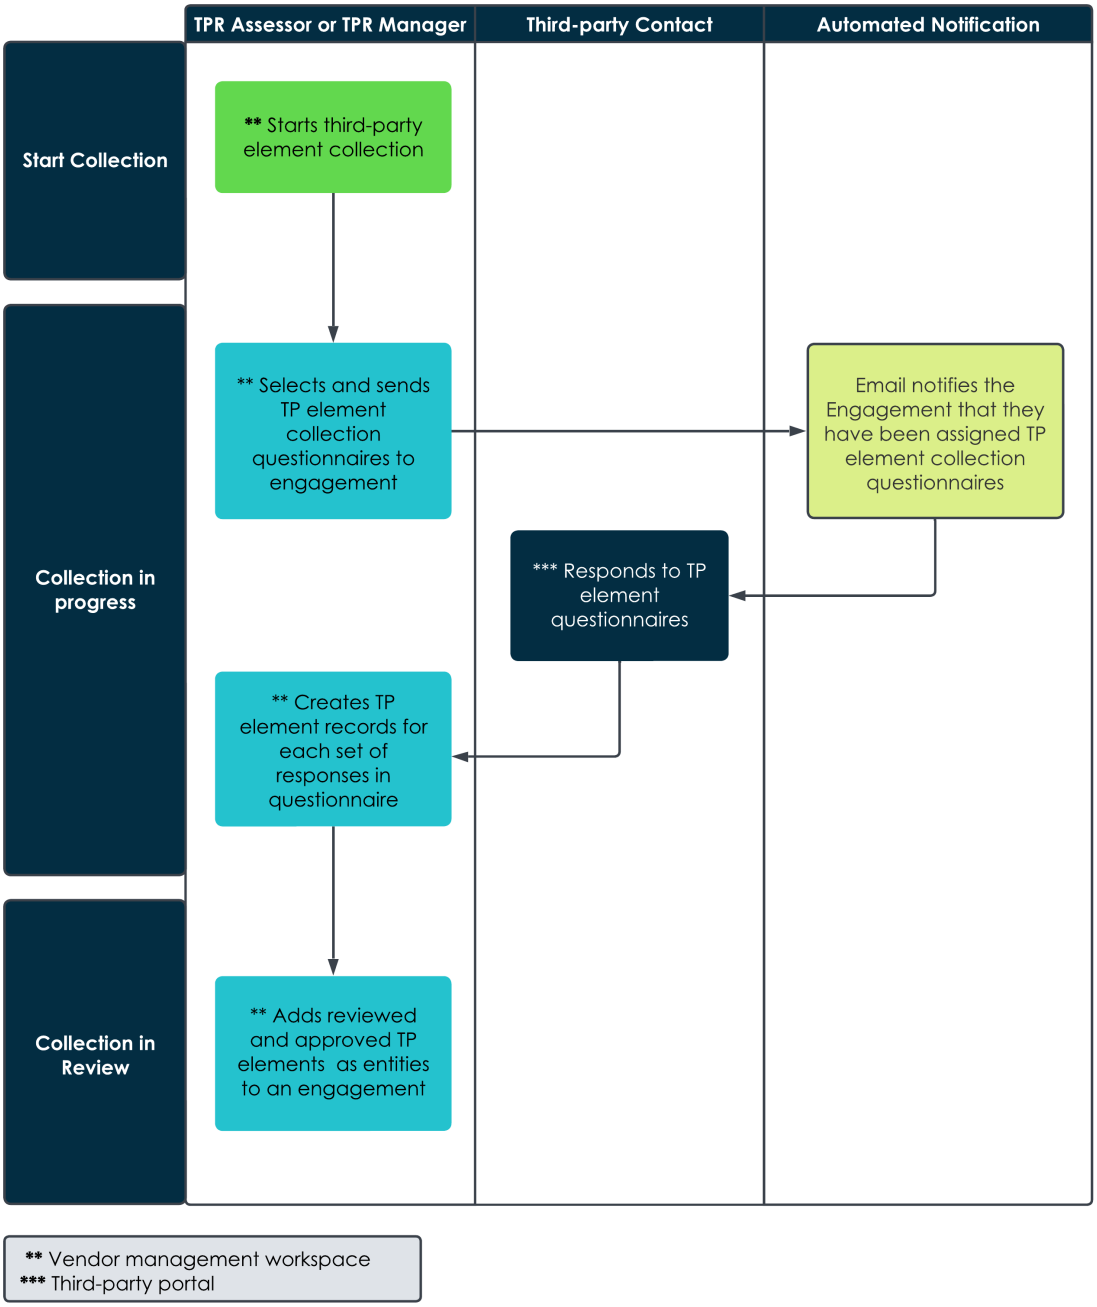
The following infographic shows the IRQ process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following are the steps of the IRQ process.

1. After the due diligence request is approved by the Third-party risk (TPR) manager [sn_vdr_risk_asmt.vendor_risk_manager] or TPR assessor [sn_vdr_risk_asmt.vendor_assessor] that has been assigned as the owner of the due diligence request, they select an IRQ and attach it to an internal assessment.
2. The system sends out an email notification to the employee that has been assigned as the IRQ assessor [snc_internal].
3. The IRQ assessor completes the internal assessment by responding to the IRQ.
4. After the IRQ assessor submits their responses and the TPR manager or owner reviews and closes the IRQ, the due diligence request state updates from IRQ in progress to IRQ in review.

Note:
Don't change a questionnaire template after it has been sent out as part of an internal assessment. Instead, duplicate the template by making a copy and make your changes in the new copy. If you update a questionnaire after it has been sent out, the changes won't appear in the version shown to the IRQ assessor. To send an updated version, you must cancel the existing questionnaire by deassociating it from the internal assessment and then add the questionnaire using the updated template. For more information, see Create a questionnaire or document request template, Create a questionnaire or document request template using the Designer, Create a TPRM SAE questionnaire or document request template.



Based on the information gathered, the TPR manager and their team assess the potential risks that are associated with the engagement. They evaluate factors such as the financial stability, the operational capacity, the adherence to quality standards, the compliance with regulations, and the third party's ability to meet delivery timelines. This assessment helps the team to understand the third party's risk profile and to determine the appropriate risk mitigation strategies.

For more information about IRQs or internal assessments, see Create an internal assessment and Respond to an internal assessment.

Third-party (TP) element collection process: Collect TP element information

The following infographic shows the TP element collection process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

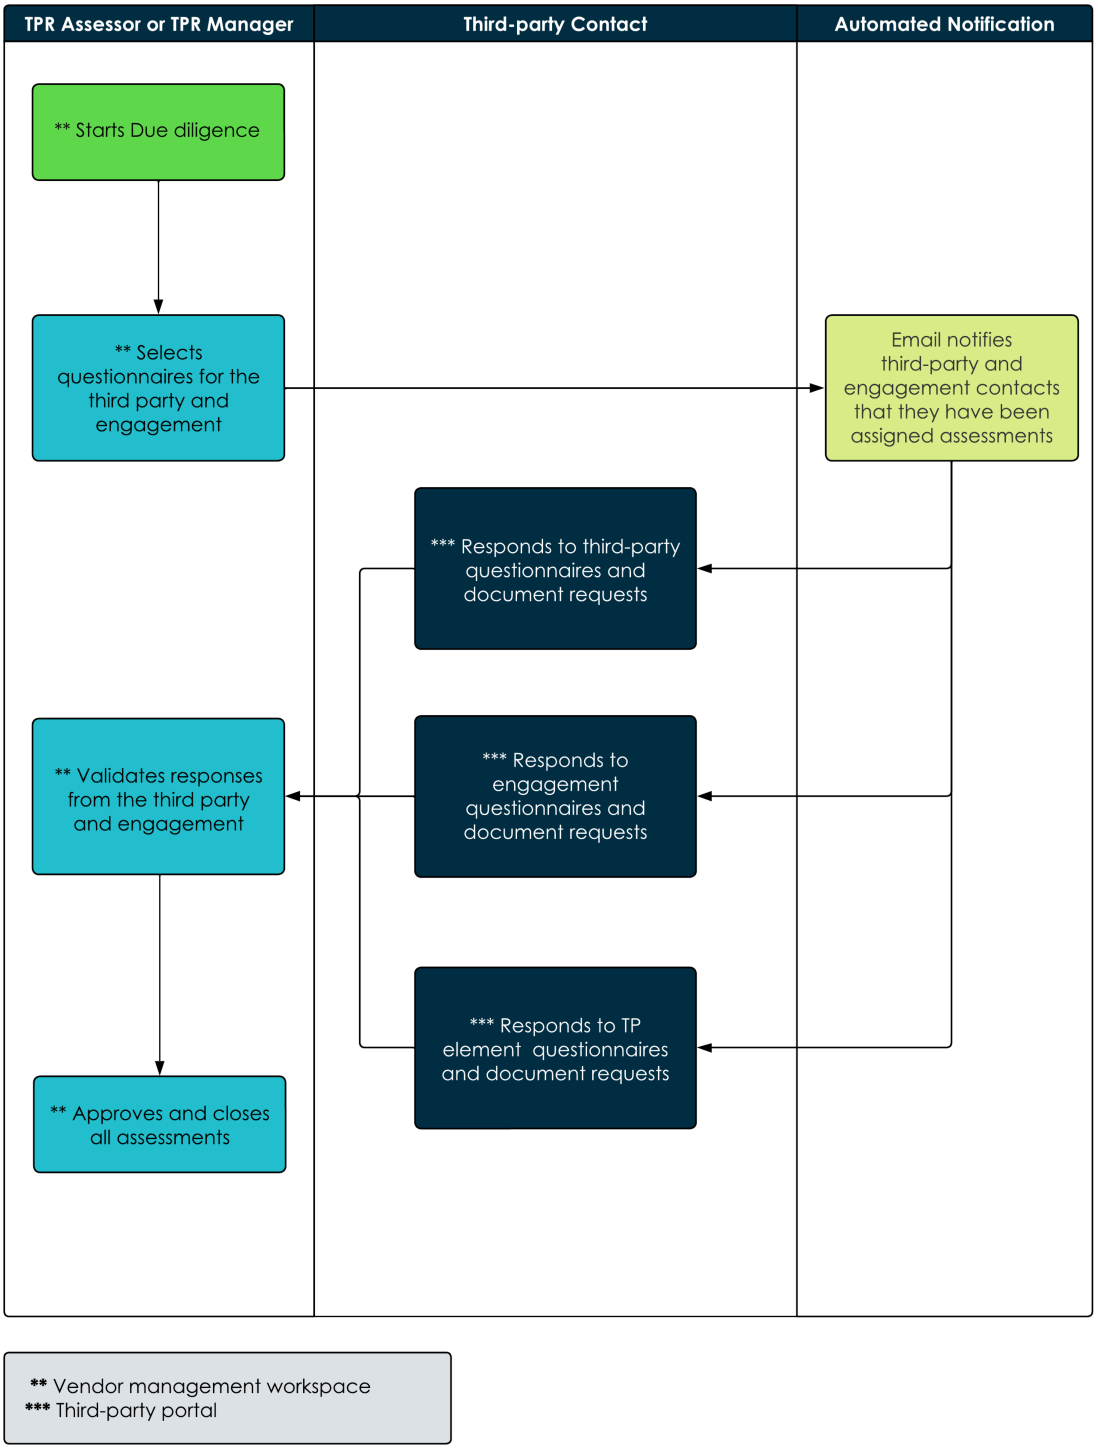
The following are the steps of the TP element collection process.

1. After your due diligence request has completed the IRQ process, if TP elements are needed, the TPR manager or due diligence request owner selects **Start collection** and a collection task is created.
2. The TPR manager or owner assigns TP element questionnaires to an external assessment for collecting elements and sends that assessment to an engagement to collect required information for TP elements.
3. The system sends out an email notification to the third-party engagement contact that has been assigned the TP element questionnaire.
4. After the third-party engagement contact submits their responses, the TPR manager or owner reviews and verifies all the required information was provided in the questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. The TPR manager or owner then navigates to the list of third-party elements and manually creates a third-party element record for each set of responses in each questionnaire.

   For more information, see Create a third-party element record.



6. After all TP elements are created, the TPR manager or owner closes the collection task assessment. The system changes the state of the request from Collection in progress to Collection in review.
7. The internal stakeholders (TPR assessor, TPR approver, TPR manager, or TPR administrator) review and approve the element records.

This is an optional process for collecting TP elements and assigning them to engagements so that they can be assessed as part of the overall due diligence workflow. For more information on TP elements, see Monitoring third-party elements.

Due diligence process: Compliance verification

The following infographic shows the due diligence process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following are the steps of the Due diligence process.

1. After the IRQ process or TP element collection process is completed, the TPR manager or owner selects questionnaires and requests for documentation to attach to external assessments for sending to the third party or engagement. For more information on creating assessments, see Create an external assessment and Third-party risk assessment form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you completed the optional TP element collection process, a questionnaire must be selected and assigned as part of an assessment for each third-party element you created. The TP element questionnaires are completed by the engagement contact.

2. The system sends out an email notification to the third-party and engagement contact that has been assigned each assessment.

Note:
Don't change a questionnaire template after it has been sent out as part of an external assessment. Instead, duplicate the template by making a copy and make your changes in the new copy. If you update a questionnaire after it has been sent out, the changes won't appear in the version shown in the third-party portal. To send an updated version, you must cancel the existing questionnaire by deassociating it from the external assessment and then add the questionnaire using the updated template. For more information, see Create a questionnaire or document request template, Create a questionnaire or document request template using the Designer, Create a TPRM SAE questionnaire or document request template.

3. After the third-party and engagement contacts submit their responses, the TPR manager or owner reviews and verifies all the required information was provided in the assessments. Issues and tasks are created if remediation or additional information is required.
4. The TPR manager or owner approves and closes each assessment.

The TPR manager can develop assessment templates to simplify and automate the process of determining which questionnaires and document requests to send to a third party of this type. The TPR administrator can define questionnaire templates, document request templates, and then the TPR manager can group them into an assessment template. Your organization can reuse the template to send the questionnaires and document requests to similar third parties in future assessments. For more information about templates, see Create an external assessment template, Create a questionnaire or document request template, and Create a questionnaire or document request template using the Designer.

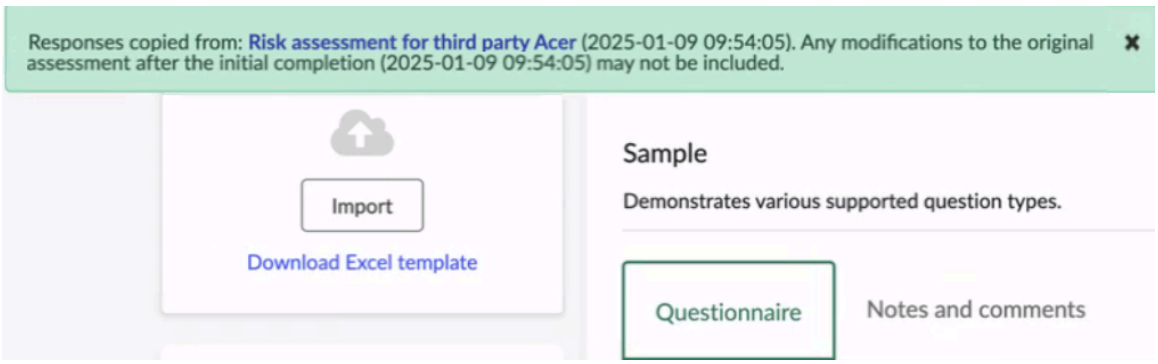
The TPR manager and their team use the third party's responses and internal analysis to determine whether the third party meets all the necessary compliance requirements. These requirements could include verifying the third party's compliance with applicable laws and regulations, such as environmental regulations, labor laws, and anti-corruption policies.

Note:
The third-party risk assessor, manager, or admin can answer questions, modify responses, and submit external questionnaires on behalf of third parties or engagements. For more information, see Respond to a questionnaire for a third party or engagement.

Due to the sensitive nature of the items involved, the TPR manager and their team evaluate the third party's data security and privacy practices. They assess the third party's information security measures, data protection policies, access controls, and vulnerability management processes. If the third party has access to proprietary information or customer data, they might require the third party to undergo a cybersecurity audit or provide evidence of their data protection measures.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about reviewing responses, see Review responses to external questionnaires.



Note:
Your TPR assessor can export received or returned questionnaires to Microsoft Excel spreadsheets. This option enables your organization to use the spreadsheet environment to review the questions and answers. For more information about exporting questionnaire responses, see Export questionnaire responses to a spreadsheet.

Pre-populate questionnaires with responses

The TPR manager or TPR assessor can pre-populate questionnaires for third parties, engagements, and entities with responses from complete questionnaires associated with the same third party. After sending out the assessment, the questionnaire is pre-populated with all responses from the most recent completed version of that questionnaire, regardless of whether the original associated assessment is completed. This is helpful for questionnaires where responses are expected to remain consistent, expediting the process and enabling third-party contacts to review and update responses only if necessary. For more information on creating assessments, see Create an external assessment.

Important:
When the TPR manager or TPR assessor adds a questionnaire to an assessment, they have the option to select or deselect the Include previous responses option on the questionnaire page. The option can't be changed after the questionnaire is sent to the third party. For more information, see Create a questionnaire or document request template and Assessment metric type form.

When a third-party or engagement contact opens a pre-populated questionnaire in the Third-party portal, they receive a notification that the responses were copied from an earlier questionnaire. The notification includes a link to the assessment that supplied the responses and its last updated date as shown in the following example.

Limitations:

- Some question types and their responses can't be pre-populated such as the attachment, duration, and signature question types. These question responses remain blank and previous responses aren't included.
- Responses are copied from the original assessment (Assessment A) to the newer assessment (Assessment B) one time. This copying occurs when Assessment B is submitted to a third party or an engagement. Any changes you make to Assessment A afterward won't be reflected in Assessment B. Both assessments remain separate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issues and tasks

The role of TPR assessor [sn_vdr_risk_asmt.vendor_assessor] is required to create and manage both tasks and issues.

The TPR manager, TPR assessor, or contract negotiator can create tasks to help ensure that a team member or the third-party contact responds to concerns about the questionnaire responses or requested documents. They can manage existing tasks to verify that the assigned team member or third-party contact responds to a task and updates it as needed. For more information about creating and managing issues, see Create a task for a third party or engagement and Manage a task for a third party or engagement.

The TPR manager, TPR assessor, or contract negotiator can create an issue to help ensure the teams concerns about a third party or engagement are remediated. They can also manage the existing issues to verify that they're understood, shared with the correct persons, and are acted on as needed. For more information about creating and managing tasks, see Create an issue for a third party or engagement and Manage issues.

Additional assessment actions

The TPR manager, due-diligence request owner, or contract negotiator may need to reopen an assessment because there's new information available that impacts the engagement or some other change has occurred. For more information, see Why you conduct due diligence.

If the TPR manager, due-diligence request owner, or contract negotiator must gather more information from an engagement, they can send out an additional questionnaire or document request by reopening an assessment and doing the following actions:

1. Navigate to the Due diligence request record page by selecting the relevant **DDR** number.
2. View the related third-party risk assessment by selecting the **VRA** number on the **External assessments** tab.
3. Select **Re-open**.

The due diligence request state updates from Ready for TPRM approval to Due diligence. The TPR manager, owner, or contract negotiator can request questionnaires and document requests as needed. For more information, see Reopen an assessment.

If the TPR manager, due-diligence request owner, or contract negotiator doesn't require an assessment for an ongoing engagement or requires a quick close for onboarding or renewing an engagement, they can cancel an assessment by doing the following actions:

1. Navigate to the Due diligence request record page by selecting the relevant **DDR** number.
2. View the related third-party risk assessment by selecting the **VRA** number on the **External assessments** tab.
3. Select **Cancel**.

Even if one or all assessments are canceled, the due diligence request proceeds to the Approval process.

Create an internal assessment

Create an internal assessment as part of a due diligence request or ongoing risk monitoring using Third-party Risk Management. An internal assessment can affect which questionnaires are later sent to the third party or engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
The third-party risk (TPR) assessors must contact a team member with the TPR manager role to complete step 5.

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor

About this task
When creating an on-demand internal assessment, TPR managers or TPR assessors can create the assessment and add the questionnaires. TPR managers can submit the assessment and the assigned respondents complete the assessment. You can select multiple respondents at a time and automatically trigger assessments.

Important:
Smart assessments must be viewed in the Vendor Management Workspace.

Procedure
1. Navigate to one of the following locations:
   - **All** > **Third-party Risk Management** > **Internal Risk Assessments** > **All Assessments**.
   - **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Internal Risk Assessments** > **All Assessments**.
2. Create an internal assessment by selecting **New** and fill in the form.
   For descriptions of all these fields, see Create new internal assessment form.
3. Select **Submit**.
4. Associate existing questionnaires with the assessment by performing one of the following.
   TPR administrators can create questionnaires and associate them with the assessment. For more information, see Create a questionnaire or document request template and Create a TPRM SAE questionnaire or document request template.
5. Select **Submit**.
   This step can be completed by TPR managers.
   - The state of the assessment changes to Awaiting response.
   - The Respondents receive an email notification that includes a link to the assessment.

What to do next
The owner assigned to the internal assessment works with the respondents to close the assessment. For information on how to respond to Internal assessments, see Respond to an internal assessment.

Assessing your third-party risk

Respond to an internal assessment

IRQ process management

Respond to an internal assessment

Respond to an Inherent Risk Questionnaire (IRQ) or internal assessment that has been assigned to your queue. Your responses to the questionnaire help determine if the process moves forward and can affect which questionnaires are sent to the third party or engagement.

Before you begin
Role required: snc_internal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When someone in your organization creates a due diligence request, the owner of the overall due diligence process specifies who should respond to that initial IRQ. Internal assessments can also be created on demand and the owner assigns questionnaires to IRQ assessors or respondents. As an IRQ assessor or respondent, you receive an email that contains the links to the assigned questionnaires, the name of the related assessment, and the deadline. This information is also provided as part of the questionnaire in Employee Center. For more information, see Assessing your third-party risk, Create an internal assessment, Requesting third-party risk due diligence, and Due diligence workflow.

Note:
When a request is created, the system alerts the initial due diligence requester and all users in the Due diligence request assignment group. A member of the group can assign a Third-party risk (TPR) manager or TPR assessor to act as the owner of the request.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center** to open your Employee Center.
2. Respond to an internal assessment by performing one of the following.
3. Answer all relevant questions in the questionnaire and then select **Submit**.

Related topics

Assessing your third-party risk

Create an internal assessment

Why you conduct due diligence

Create an external assessment

Create an assessment and initiate the third-party risk assessment life cycle using Third-party Risk Management. An external assessment specifies the details for the third party or engagement and defines the plan for completing the assessment.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor

About this task

Assessments can be created on-demand or can recur on a specified schedule. When creating an on-demand external assessment, Third-party risk (TPR) managers or TPR assessors select the questionnaire template or document request template and the third party. You can select multiple third parties at a time and automatically trigger assessments.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Third-party Risk Management** > **External Risk Assessments** > **All Assessments**.
   - **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **External Risk Assessments** > **All Assessments**.

   Important:
   Smart assessments must be viewed in the Vendor Management Workspace.
2. Create an external assessment by selecting **New** and fill in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For descriptions of all these fields, see Third-party risk assessment form.

3. Select **Submit**.

   Additional related lists appear. If you left the **Assessment template** field empty and want to use assessment templates to associate multiple questionnaires or document requests with this assessment, use the Questionnaires or Document Requests related lists.

4. Associate existing questionnaires or document requests with the assessment, by performing the following steps.

   a. Open the Questionnaires or Document Requests related list.

   b. Select Edit, select the questionnaires or document requests to use, and then select Save.

   c. Repeat for the other type of questions, if needed.
   TPR administrators can create questionnaire or document request templates and associate them with the assessment. For more information, see Create a questionnaire or document request template.

5. Select **Submit to third party**.

   Important:
   When the TPR manager or TPR assessor adds a questionnaire to an assessment, they have the option to select or deselect the Include previous responses option on the questionnaire page. The option can't be changed after the questionnaire is sent to the third party. For more information, see Create a questionnaire or document request template and Assessment metric type form.

   - The state of the assessment changes to Submitted to third party.
   - The templates that you selected generate questionnaires or document requests.
   - If the Include previous responses option is selected for a questionnaire, then previous responses are copied and added to the outgoing questionnaire. The notification in the Third-party portal includes the number, name, and last updated date of the previous assessment that supplied the responses. The notification also includes a link to the assessment.
   - The primary third-party contact receives an email notification that includes a link to the assessment in the Third-party portal.

     Note:
     When you use the Include previous responses option, responses are copied from the original assessment (Assessment A) to the newer assessment (Assessment B) one time. Any changes you make to Assessment A afterward won't be reflected in Assessment B. Both assessments remain separate.

6. When the third-party contact is ready to respond to the assessment, they open the assessment in the Third-party portal.

   Note:
   If your questionnaire is set up to require a signature, the third party or reviewer must save and e-sign the questionnaire or document request before it can be submitted. The signature feature isn't supported for SAE questionnaires. For more information, see E-signatures on questionnaires or document requests.

7. The TPR assessor moves the state of the assessment to Generating Observations.

   During this time, the TPR assessor can navigate to the Risk overview tab, in the Questionnaires and document requests section, select the **Name** or **Questionnaire instance** to view the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

responses. In the classic engine they can provide comments or change responses, as necessary.

For any problems that arise, the TPR assessor creates an issue to track the remediation process (Finalizing with third party).

8. The TPR assessor moves the assessment to the Closed state.

What to do next

The TPR assessor works through the third-party portal with the third party to close the assessment.

Related topics

Assessing your third-party risk

Review responses to external questionnaires

Respond to a questionnaire for a third party or engagement

Answer questions, modify responses, or submit external questionnaires for a third party or engagement by using Third-party Risk Management. You can save valuable time by responding for a third party or engagement when they have already provided the required information for a previous questionnaire.

Before you begin

The **Allow assessors to answer/edit questionnaires for third-party contacts** property (*sn_svdp.allow_assessor_edit*) must be active. For more information on configuring this property, see Configure TPRM properties.

Role required: sn_vdr_risk_asmt.vendor_assessor, sn_vdr_risk_asmt.vendor_risk_manager, sn_vdr_risk_asmt.vendor_risk_admin

Procedure

1. Navigate to **All** > **Self-Service** > **Third-party risk management** > **External risk assessments** > **All open**.
2. Select the External assessment (VRA) number of an assessment that is in the **Draft** or **Submitted to third party** state.
3. On the Risk overview tab, in the Questionnaires and document requests section, select the **Name** or **Questionnaire instance** to open the questionnaire that you want and then fill in the questions.

   Note:
   To respond to a questionnaire using a questionnaire template, see Using a Microsoft Excel spreadsheet template for external questionnaires and Respond using a Microsoft Excel template.

4. Select **Submit**.

Review responses to external questionnaires

Third-party contacts use the Third-party portal to complete assessments and collaborate with the TPR manager in the comments section for each question. When assessments reveal gaps, the TPR manager or the TPR assessor can generate an issue or task. In addition, the Vendor Management Workspace application can auto-generate issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessor

About this task
If the TPR manager or TPR assessor decides that an assessment response is unsatisfactory, they can return some of the questions or document requests in the assessment. Incorrect answers to questions can automatically generate issues, or issues can be generated manually from the question. The comments identify the issues to the third-party contact.

To enable TPR assessors to modify responses, configure the **Allow TPR assessors to modify responses in third-party questionnaires** [`sn_svdp.allow_assessor_edit`] system property. You can set the following options:

- Enable TPR assessors to answer questions or modify responses (default)
- Enable TPR assessors to modify responses
- Do not enable TPR assessors to answer questions or modify responses

See Configure TPRM properties.

Procedure
1. Navigate to **All** > **Self-Service** > **Third-party risk management** > **External risk assessments** > **All open**.
2. Select the External assessment (VRA) number of an assessment that is in the **Responses received** state.
3. On the Risk overview tab, in the Questionnaires and document requests section select the templates related list, select the **Name** or **Questionnaire instance** to open the questionnaire that you want.
4. If you're using the Classic assessment engine, you can fill in the following fields.

Third party's responses

Field	Description
Reviewer comment	Text that provides internal information about the state of responses.
Show follow-up only	Select the check box to display only questions that were flagged as needing a follow-up (the **Follow up** check box was selected when the assessment was returned to the third-party for updates).
Show incorrect or un-scored responses only	Select the check box to display only questions with an incorrect answer or for which no response was given.
Show unanswered questions only	Select the check box to display only questions for which no response was given.
Hide comments	Select the check box to hide all **Comment** text boxes.
Include this question when	Select the check box to indicate that you want to create an issue dealing with this question. You can add an **Internal comment**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
creating an issue	**Note:** If you have already created an issue for a question, the field is inactive to help prevent you from creating an additional issue for the question.
Follow up	Select the check box to make the external comment visible to the third party.
Comment for third party	Select the check box to add an **External comment** for the third party.

5. After you review the assessment and add comments, perform one of the following steps.

Reopen an assessment

Reopen an assessment to send out more questionnaires and document requests to collect required additional information from the third party or engagement.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor or sn_vdr_risk_asmt.vendor_risk_manager

About this task

As the TPR manager, TPR assessor, or owner of the due diligence request, you may reopen an assessment due to an internal stakeholder request or if new information impacts the engagement. You can reopen an assessment after the due diligence request has gone through any of the following processes: due diligence, approval, or contract. The due diligence request must be in the Closed state before you can reopen an assessment. After reopening the assessment, you can select additional questionnaires and document requests to send from the Questionnaire templates and Document templates tabs.

Procedure

1. In the Vendor Management Workspace, select the list icon and then navigate to **Due diligence requests** > **All requests**.
2. Select the relevant **DDR** number.
3. View the related Third-party risk assessments by selecting the **VRA** number on the **External assessments** tab.
4. Select **Re-open**.

Create an issue for a third party or engagement

Create an issue to help ensure that your concerns about a third party or engagement are remediated.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

In an iterative process, before the TPR manager closes an assessment, the TPR manager can generate non-compliance issues and tasks. The TPR manager communicates with the TP contacts and engagement contacts by using comments to close the issues and tasks. The TPR manager can also assign different contacts as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the **Quick actions** box on the TPRM home page , select **Create issue**.
2. **Optional:** Select a template to fill in several fields on the form.
   You can filter the template list and add templates to your custom **My templates** list.
3. Fill in the form and then select **Save**.

Third-party risk issue form

Field	Description
Name	Helpful tag for the template. The field might be filled in by a template.
Description	Text that helps others to understand the issue.
Number	For each issue, the system auto-assigns a unique ID number that starts with the text VRI. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Applies to	○ **Third party**: The issue applies to the parent third-party organization. ○ **Engagement**: The issue applies to the engagement. ○ **Entity**: The issue applies to the third-party element entity.
Third party	Third party with which the issue is associated.
Assessment	Assessment with which the issue is associated.
State	The state of an issue is updated as you perform actions that are associated with the issue. The workflow chain along the top of the **Risk overview** tab identifies the current state of the issue. See Manage issues.
Priority	Specify the priority. The value appears in all reports that include the issue.
Assignment group	Qualified group of individuals available to work on the request.
Assigned to	User that is responsible for managing and closing the issue.
Third-party contact	Contact at the third party with which the issue is associated.
Watch list	Add other users to help ensure that they see updates in the issue state and other values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Visible in third-party portal	Option to display the issue to the third-party contacts in the Third-party portal.
Recommendations section	
Recommendation	○ Third party to remediate: You expect that the TP contact will remediate the issue so you can close it. ○ Accept issue: You determine that the risk associated with issue is acceptable and requires no further action. ○ Request additional information: You will request additional information from the TP contact. The field might be filled in by a template.
Explanation	The field might be filled in by a template.

If **Visible in third-party portal** is selected, then the third-party contact is alerted to the issue.

Result

The highest priority issues are listed in the Issues by priority section of the Home page. The **Assigned to** user can manage the issue on the tabs of the Issue management page. See Manage issues.

Manage issues

Manage issues

Verify that an issue that is associated with a risk assessment is understood, communicated to the appropriate persons, and is acted on as needed.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

Procedure

1. Use either of the following methods to start the process:
   - On the TPRM **Home** page, the highest priority issues are listed in the **Issues by priority** section. Select an issue name to view the **Risk overview** tab on the Issue page.
   - On the **List** page, select the issue name from one of the lists in the **Issues** section to view the **Risk overview** tab on the Issue page.

   Note:
   For each issue, the system auto-assigns a unique ID number that starts with the text VRI. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.

2. **Optional:** Select an action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select **Discuss** to send a message to other users. The message is recorded in the **Activity** section of the **Details** tab.
- Select **Create task** to create a task. See Create a task for a third party or engagement.
- Select **Save** to save any change you made to a value on any tab.
- Select **Delete** to delete the issue record.

3. Open the appropriate tab.

On each tab, the Third-party overview section displays general details for the third party.

Risk overview tab for an issue

- The workflow chain along the top identifies the current state of the issue. The state is updated as you perform actions that are associated with the issue.
- Tasks section: Lists associated tasks and displays the count and status of tasks. For each issue, the system auto-assigns a unique ID number that starts with the text VRI. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
- Tasks by planned end date section: Helps you to identify tasks that need urgent attention.
- Third-party overview section: General details for the third party.

Details tab for an issue

- Third-party risk issue section: General information on the third party and recommended actions for the issue.
- The **Compose section** on the **Details** tab enables you to permanently add text to the record. The Activity section is updated with any actions on issues and tasks, submissions to TP contacts, and also with work notes and comments that users add to the record. Add text in the following fields as needed:
  - **Work notes (Private)**: Information about the third-party risk assessment. Work notes are visible only to internal users who are assigned to the process.
  - **Comments**: Comments about the third-party risk assessment are visible both to internal users and to third-party contacts.

Tasks tab for an issue

The tab displays information for tabs that are associated with the issue. Select a task number to open the task in the task management page. Select **New** to create a task. See Create a task for a third party or engagement.

Questions tab for an issue

The tab displays a list of the questions that are associated with the issue. Select a question to view the question definition and current response.

Create a task for a third party or engagement

Create a task to help ensure that a user at your organization or the third-party contact responds to your concerns about questionnaire responses or requested documents during the due diligence process.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In an iterative process, before the TPR manager closes an assessment, the TPR manager can generate non-compliance issues and tasks. The TPR manager communicates with the TP contacts and engagement contacts by using comments to close the issues and tasks. The TPR manager can also assign different contacts as needed.

Procedure

1. In the **Quick actions** box on the TPRM home page , select **Create task**.
2. Fill in the form and then select **Save**.

Third-party risk task form

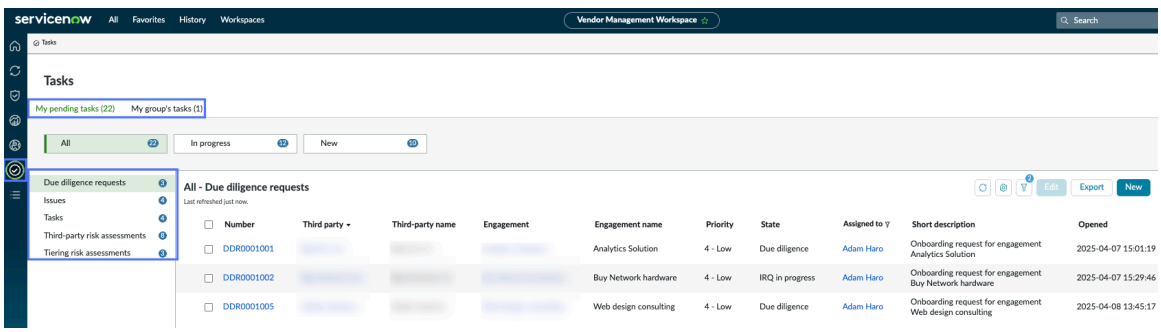
Field	Description
Short description / Description	High-level and detailed information about the issue that needs to be resolved and the method for resolving it.
Number	For each task, the system auto-assigns a unique ID number that starts with the text VRT. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Applies to	○ **Third party**: The task applies to the parent third-party organization. ○ **Engagement**: The task applies to the engagement. ○ **Entity**: The task applies to the third-party element entity.
Third party	Third party with which the task is associated.
Assessment	Assessment with which the task is associated.
Issue	Issue with which the task is associated.
State	State of progress for the task. ○ Open ○ Submitted to third party ○ Review ○ Closed complete ○ Closed incomplete ○ Closed cancelled
Priority	Specify the priority. The value appears in all reports that include the task.
Assigned to	User that is responsible for managing and closing the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Third-party contact	Contact at the third party with which the task is associated.
Watch list	Add other users to help ensure that they see updates in the task state and other values.
Visible in third-party portal	Option to display the task to the third-party contacts in the third-party portal.
Task schedule section	
Planned duration / Actual duration	The time period that you expect the task to require and the actual duration that is calculated from the actual start and actual end dates.
Planned start date / Planned end date	Expected start and end dates for the task.
Actual start date / Actual end date	Actual start and end dates for the task based on the first action and the date the task was closed.
Closed by	User who closed the task (typically the owner — the **Assigned to** user).
Created / Updated	Dates that the task was saved and date of the latest change.

Manage a task for a third party or engagement

Verify that the **Assigned to** user at your organization or the third-party contact responds to a task and update the state of the task as needed.



Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

Procedure

1. Select **Workspaces** > **Vendor Management Workspace** and then select the **Risk** tab to open the workspace to the home page and then select the task icon .
2. On either the **My pending tasks** or **My group's tasks** tab, select **Tasks**, and then select the task number.

Note:
The other options in the list (**Due diligence requests**, **Issues**, and so on) also enable you to select a task to work on.

Closed by	User who closed the task (typically the **Assigned to** user).
Created / Updated	Dates that the task was saved and date of the latest change.

Export questionnaire responses to a spreadsheet

Export received or returned questionnaires to Microsoft Excel spreadsheets. This option enables you to use the spreadsheet environment to review questions and answers.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

You can export only questionnaires in the received or returned state.

Note:
This is available when you're using the Classic assessment engine.

Procedure

1. Navigate to **All** > **Self-Service** > **Third-party risk management** > **External risk assessments** > **All open**.
2. Select the External assessment (VRA) number of an assessment that is in the **Responses received** state.
3. On the Risk overview tab, in the Questionnaires and document requests section, select the **Name** to open the questionnaire that you want and then fill in the questions.

   - To export a single questionnaire:

     Select **View Responses** and then select **Export Responses**.

   - To export more than one questionnaire:

     a. Select the check boxes for the questionnaires that you want, then select **Export Questionnaire** from the **Actions on selected rows** list.

     b. Select **Export**.

   - To export all listed questionnaires:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Export All**.

b. A pop-up lists the questionnaires to be exported.

c. Select **Export**.

Note:
Questionnaires in the received or returned state are available for exporting.

The system generates a compressed file that contains a separate Excel file for each questionnaire. Exported files use the following file naming convention: `<assessmentName> - <questionnaireName>.xlsx`.

The **Assessment details** tab in a spreadsheet shows the name and state of the assessment, the planned and completion dates, and signatory details. Each **Section** tab displays the question data for the assessment categories.

Monitoring your third-party risk

You can monitor the potential risks that are associated with your third-party relationships by using the Third-party Risk Management application. An ongoing monitoring process can help you regularly assess the third party's performance and adherence to the agreed-upon terms.

Ongoing monitoring and review

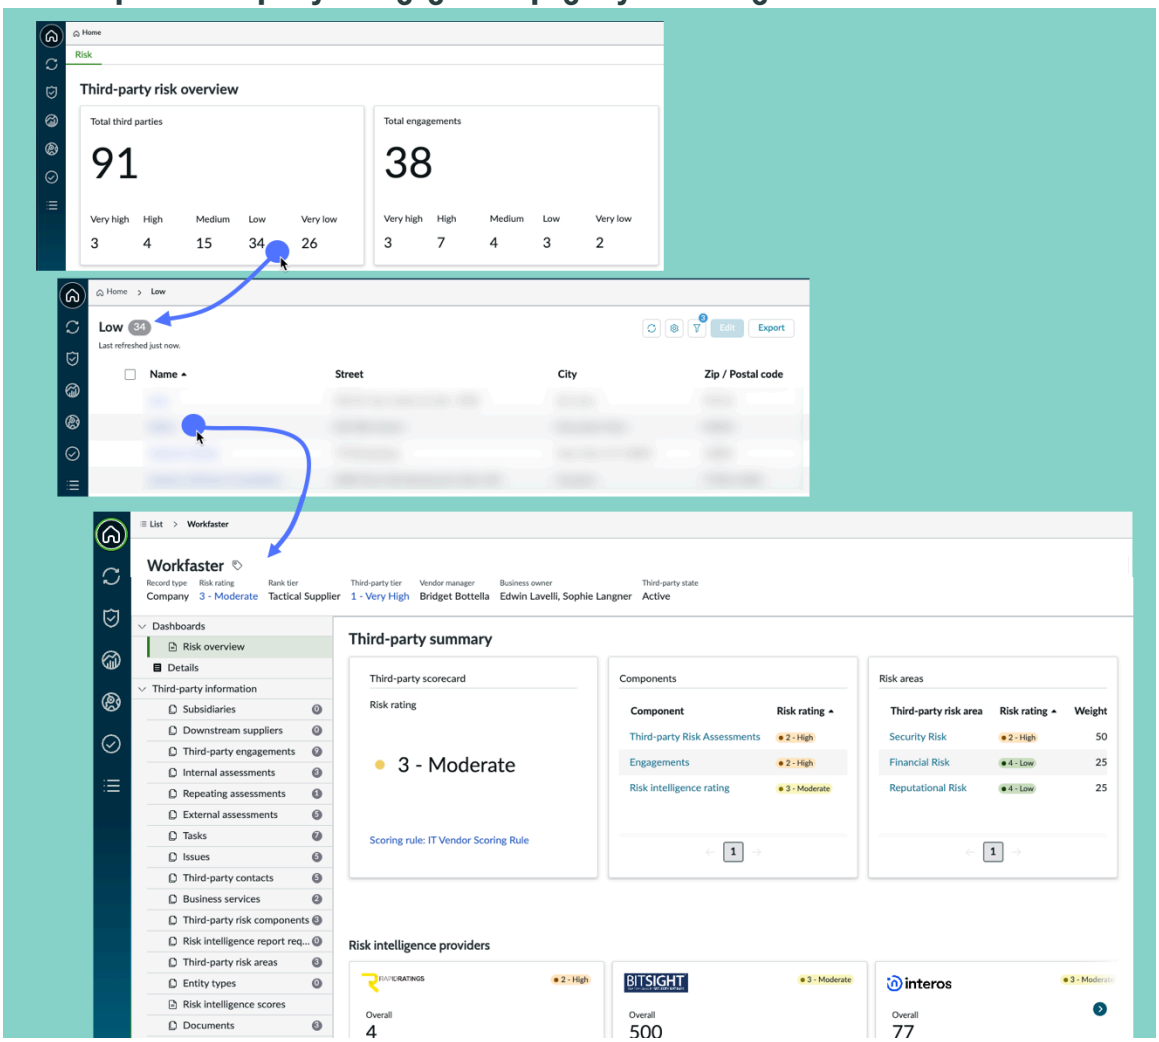
You can monitor and review the performance of your third parties with Vendor Management Workspace. For example, you can regularly assess whether the third party is adhering to the agreed-upon terms.

Note:
The Vendor Management Workspace is designed for users with the Third-party risk (TPR) manager [sn_vdr_risk_asmt.vendor_risk_manager], TPR assessor [sn_vdr_risk_asmt.vendor_assessor], and Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] roles.

Viewing risk reports and other information

Starting with version 21.1.x, the legacy horizontal tab-based layout in the Vendor Management Workspace has been replaced by a structured vertical navigation panel. This design introduces:

- Grouped Related Lists: Organizes access to third-party records, assessments, and dashboards into logical sections.
- Clearer Workflows: Navigation is streamlined to support risk management processes and dependency tracking for third parties and engagements.
- Consistent Availability: The vertical panel is accessible across all internal user roles, ensuring a unified experience for managing vendor risk and resilience.



You can view the risk reports for all third parties and engagements by navigating to **Workspaces** > **Vendor Management Workspace** and then selecting the **Risk** tab to open the workspace to the home page. For more information, see Viewing third-party risk reports.

You can also view the status and all current information for a third party or engagement by navigating to **Workspaces** > **Vendor Management Workspace**. On the **Risk** tab, select the home page icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As shown in the following example, you can select any number in the Third-party risk overview section to open a list of third parties or engagements with that risk rating value. You can then select a third party or engagement.

How to open a third party or engagement page by risk rating

For more information, see Get an overview of a third party.

TPRM personalized dashboards

Monitor and analyze your assessment data at various levels using the Third-party insights dashboard and TPRM custom analytics dashboard. If you have the TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] or TPR assessor [sn_vdr_risk_asmt.vendor_assessor] role, you can create and share your own dashboards and reports. TPR managers can also customize report layouts, widgets, and data views to prioritize key metrics and workflows that align with your individual roles and risk programs. These dashboards provide you and your team with tailored insights and deliver relevant information at a glance, improving your decision-making process. You can view TPRM personalized dashboards by navigating to **Workspaces** > **Vendor Management Workspace** and selecting the dashboard page icon . For more information, see Monitoring assessment data using TPRM dashboards.

Due diligence processes

You can view the status of the following due diligence processes from the Due diligence request record page:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Request process
- Inherent Risk Questionnaire (IRQ) process
- Third-party risk assessment process
- Approval process
- Contract risk process

To access the Due diligence request record page, you can select the DDR number for any due diligence request. For more information about the due diligence process, see Monitoring the due diligence request process.

Managing fourth-nth parties

You can use Third-party Risk Management to help identify, understand, and manage risks that are related to third parties dependent on the services of fourth-nth parties. Monitoring fourth-nth parties can help ensure that they adhere to the same security and compliance standards as the primary third party. For more information about fourth-nth parties, see Monitoring your fourth-nth parties.

Managing third-party elements

You can monitor third-party elements through scalable scoring models, relationship analysis, and due diligence workflow integration as part of the third-party element collection process. Monitoring third-party elements and leveraging that information can help with conducting more informed risk assessments as part of your third-party risk program. For more information about third-party elements, Monitoring third-party elements.

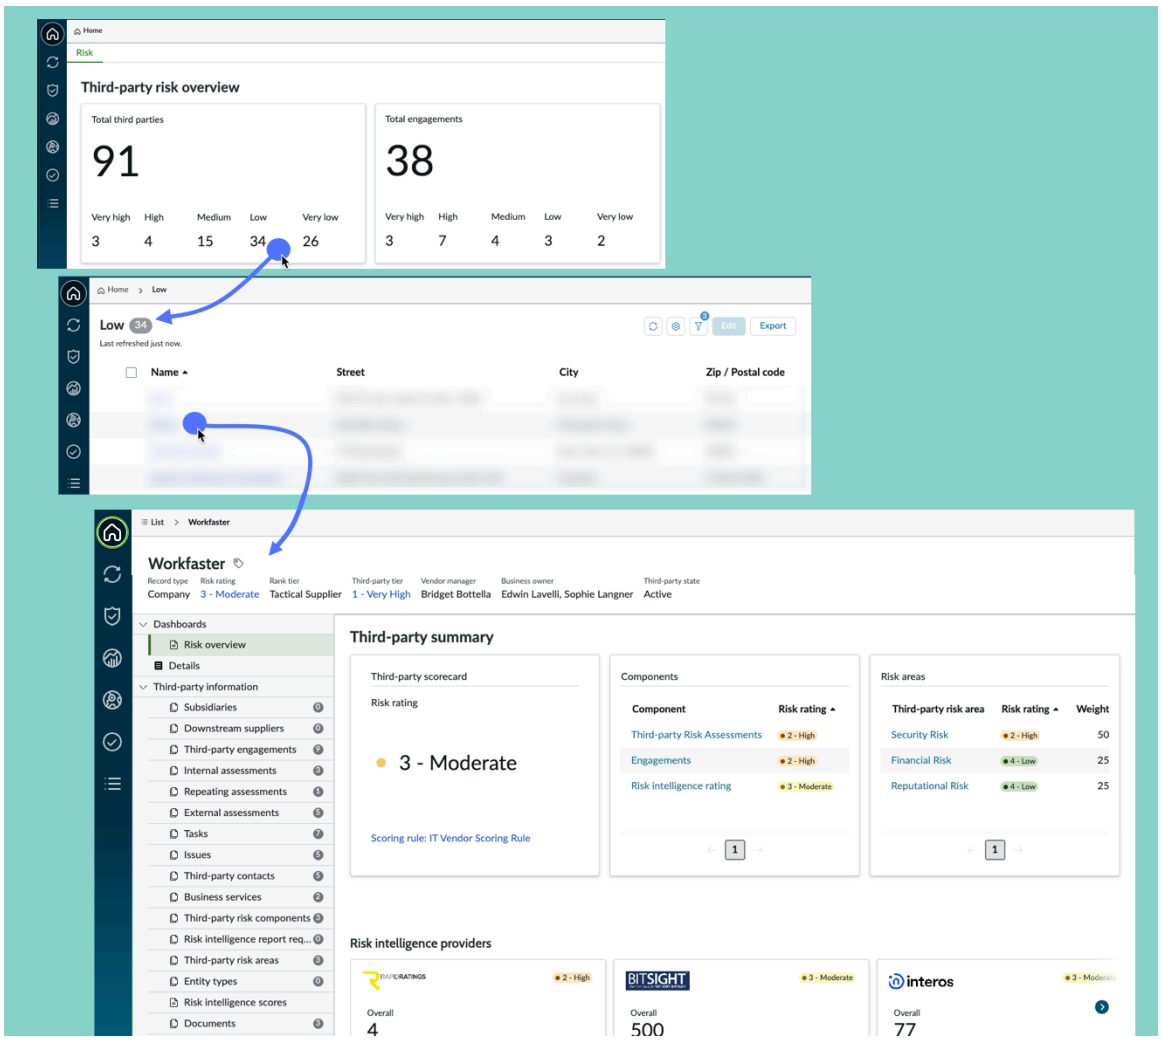
Viewing managed activities

An engagement only consumes one license, regardless of whether there's one managed activity or many managed activities per contract year. Managed activity usage is triggered only when an activity is initiated. You can view your managed activities for verification purposes with the Usage analytics activities [sn_vdr_risk_asmt_ua_activity] table. This read-only table stores a record whenever a managed activity occurs. You must have the Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role to view this table. You can access the Usage analytics activities table by navigating to **All** > **Third Party Risk Management** > **Administration** > **Managed Activity Analytics**. For more information, see Tracking a managed activity.

Note:
The Usage analytics activities [sn_vdr_risk_asmt_ua_activity] table is only available to those users that have purchased the Third-party Risk Management application and have access to the Due diligence management application. To see the instructions for downloading a GRC application from the ServiceNow® Store, see Download a GRC application from the ServiceNow Store for the first time.

Get an overview of a third party

Use the third party page to access all current information and status for a third party.



Accessing third-party information

1. Select **Workspaces** > **Vendor Management Workspace**.
2. On the **Risk** tab, select .

- **Discuss**: Select **Discuss** to send a message to other users. The message is recorded in the **Activity** section of the **Details** tab.
- **Create**: Generate an issue or task. See Create an issue for a third party or engagement and Create a task for a third party or engagement.
- **360° view**: Visually explore the relationships between existing assessments, issues, tasks, product models, upstream, and downstream contacts that affect the selected third party. See 360° Relationship Visualization.
- **Save**: Save changes that you have made on the page.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing third-party risk reports

Use the **Risk** tab on the Vendor Management Workspace to access and prioritize activities such as managing your portfolio of third parties, assessing third-party risk, and completing the remediation life cycle. The workspace enables automation that reduces the manual burden and costs of risk assessment.

Navigating the Vendor Management Workspace

Select **Workspaces** > **Vendor Management Workspace** and then select the **Risk** tab to open the workspace to the home page. Each icon in the navigation panel opens a specialized page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page

The home page displays reports of important risk information and provides quick access to actions for TPR managers and TPR assessors. See TPRM Home page.

Due diligence management page

TPR managers and assessors use the due diligence management reports to track, prioritize, and manage their responsibilities. See TPRM Due diligence management reports.

Risk activity page

The Risk activity page enables you to quickly identify assessments, issues, and tasks that need attention. See TPRM Risk activity page.

Dashboards page

The Dashboards page shows the Third-party insights dashboard and TPRM custom analytics dashboard. You can use these dashboards to provide tailored insights, improve decision-making, and create dashboards to meet any additional requirements. For more information, see TPRM Dashboards page and Monitoring assessment data using TPRM dashboards.

Risk concentration map page

The Risk concentration map page pinpoints the geographical locations of active third parties and engagements. You can configure filters to view particular risk ratings and engagement types. See TPRM Risk concentration map.

Task page

The task page gives you access to tasks that are assigned to you and to members of your group. You can further filter the lists of tasks by due diligence requests, type of third-party action, and by risk or tiering assessment. See TPRM Task page.

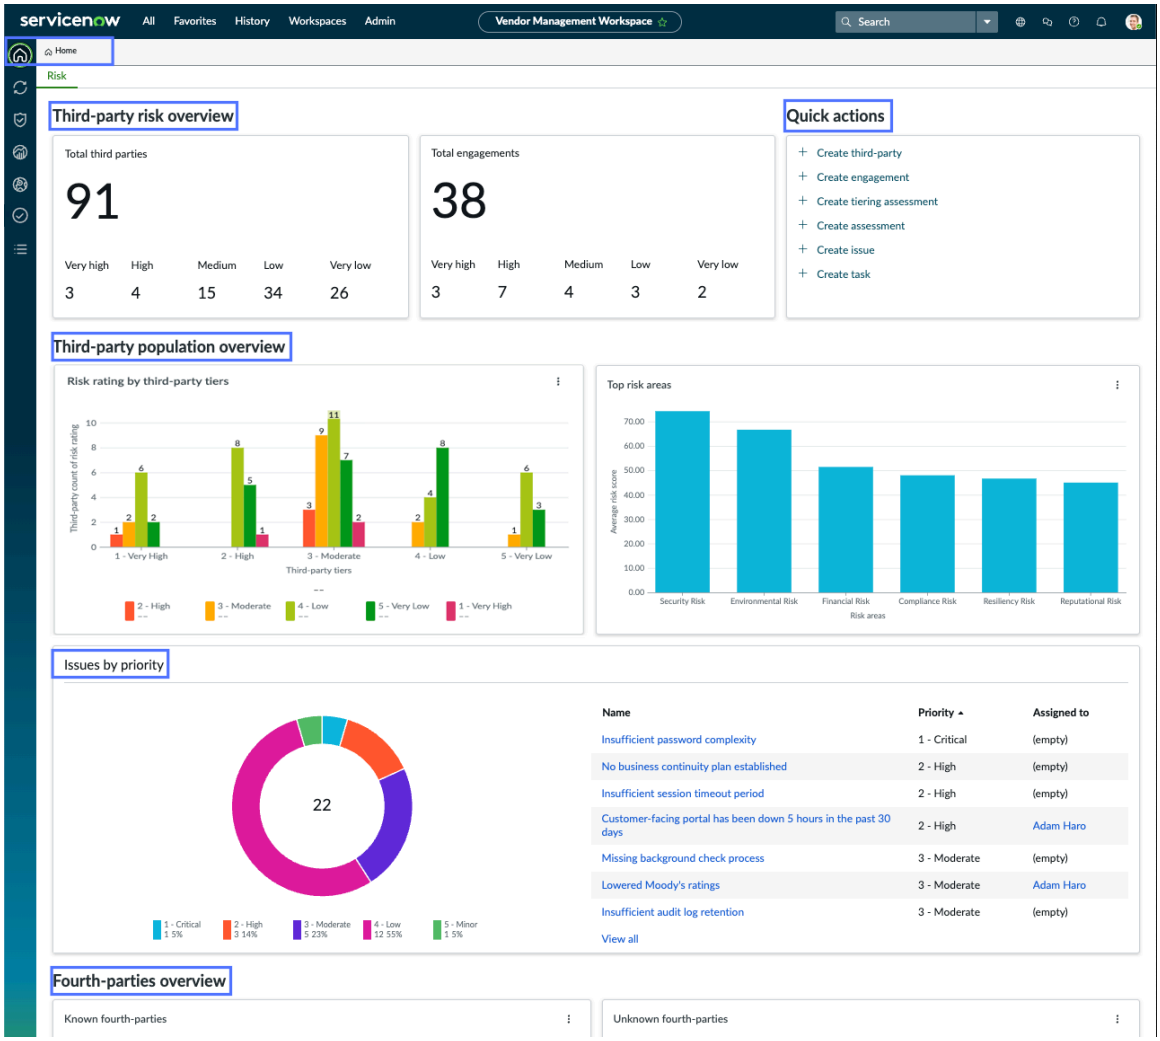
List page

The List page is a general-purpose page that enables access to all items that you can view or act on in TPRM. See TPRM List page.

Who can use the Vendor Management Workspace

The Vendor Management Workspace is designed for users with the following roles:

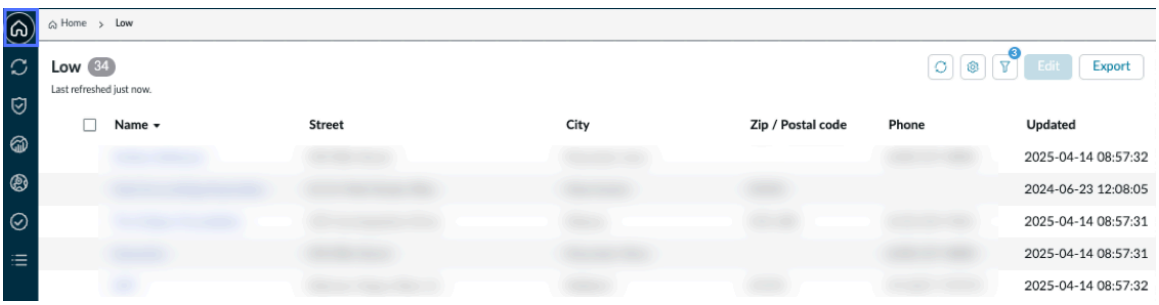
- TPR manager (Third-party risk manager) [sn_vdr_risk_asmt.vendor_risk_manager]
- TPR assessor (Third-party risk assessor) [sn_vdr_risk_asmt.vendor_assessor]
- Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer]



TPRM Home page

The home page displays reports of important risk information and provides quick access to actions for TPR managers and TPR assessors.

Accessing the page



To open the Home page in the Vendor Management Workspace, select **Workspaces** > **Vendor Management Workspace** and on the **Risk** tab select the home page icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party risk overview

Select any number in a box to open the associated list of third parties or engagements.

After you open a list, you can select **Export** to export the data or select **New** to create a new engagement request.

Quick actions

- Create a third party record. Set up the key data and contact information for a third party that your organization will possibly engage. See Create a VRM third party record.
- Define an engagement. Define an engagement so that you can assess the risks that are associated with the services or products offered by a third party. Engagements can also represent the products or services that are provided to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

parent third party, either directly or from departments, partners, or subsidiaries that you can also assess for risk. Define a VRM engagement.

- Create a tiering assessment. Organizations use risk tiering to classify their third parties into categories of potential risk posed at the time of onboarding. The standard predefined risk tiers are None, Low, Minor, Moderate, High, and Critical. Each risk tier has associated assessment questions and document requests. See VRM third-party risk tiering assessments.
- Create an assessment and initiate the third-party risk assessment life cycle. See Create an external assessment — Legacy process.
- Create an issue to help ensure that your concerns about a third party or engagement are remediated. See Create an issue for a third party or engagement.
- Create a task to help ensure that a user at your organization or the third-party contact responds to your concerns about questionnaire responses or requested documents during the due diligence process. See Create a task for a third party or engagement.

Third-party population overview

- **Risk rating by risk tiers**: The number of engagements at each risk rating for each third-party risk tier. See Set up risk rating scales for scoring.
- **Top risk areas**:

  The average risk score for engagements that are associated with each risk domain that you've defined.

  Note:
  Risk domains are called "risk areas" in some platform applications.

  A risk domain defines the type of risk to assess for a third party. For example, you might want to assess a data-management third party in terms of security risk and a bank in terms of financial risk. Security risk and financial risk are risk domains. Some platform applications refer to risk domains as "risk areas." See Define a third-party risk domain.

Issues by priority

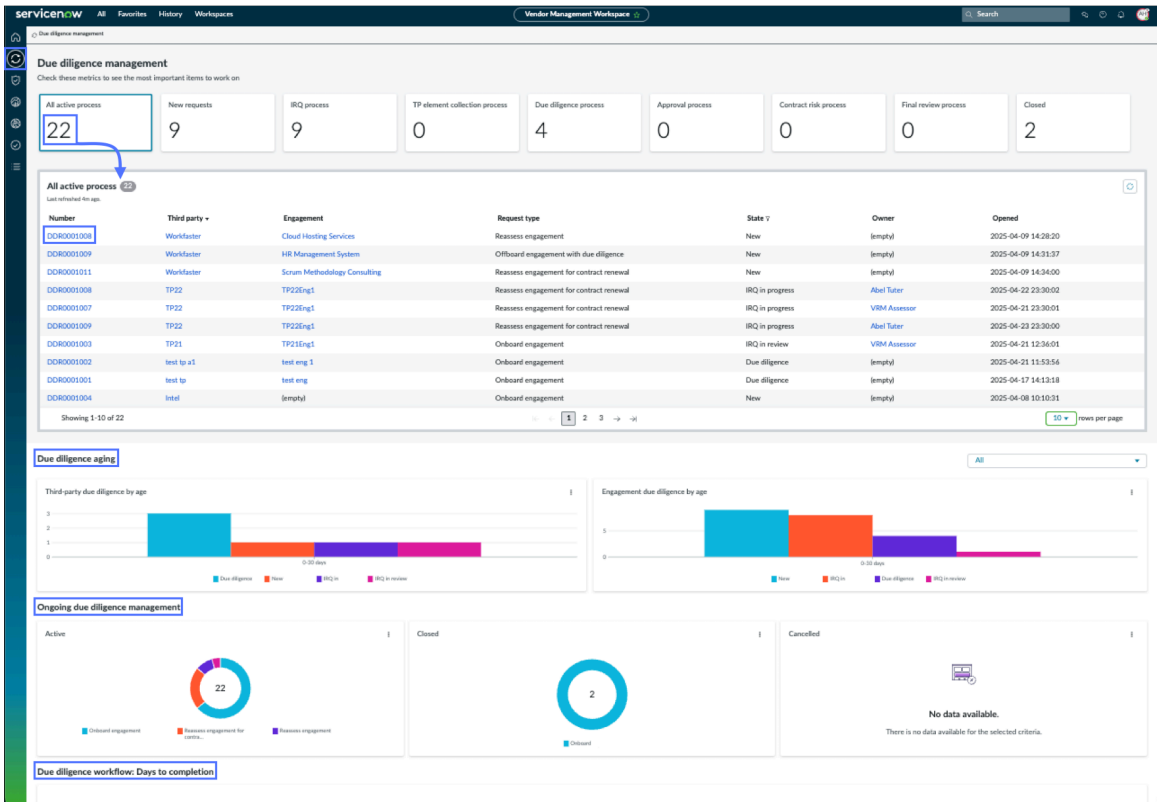
Count and priority of the highest priority open issues. Select an issue name to view the **Risk overview** tab of the issue page. See Manage issues.

Fourth-nth party overview

Counts of fourth parties and their sub-parties that are associated with third parties or engagements and unknown fourth parties. Select a segment of the corresponding graph to view a list of known or unknown fourth-parties.

Note:
Known fourth parties are organizations that have already been utilized as third parties in your risk management program and unknown fourth parties are only categorized as fourth parties and haven't been utilized or identified as third parties.

TPRM Due diligence management reports



TPR managers and assessors use the due diligence management reports to track, prioritize, and manage their responsibilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing the reports

To view the due diligence management reports, select **Workspaces** > **Vendor Management Workspace**. On the **Risk** tab, select due diligence management icon .

Tip:
TPR managers and TPR admins can perform a wide variety of tasks from the due diligence management dashboard. They can work on all processes in the workflow for a due diligence request: IRQs, external due diligence, approval, contract risk, and closed requests.

Select items in the list view to work on engagement requests

By default, the page lists all active processes: IRQ, due diligence, approval, contract risk, and closed processes. Select the number on any card to view a list of actionable items for the process.

- Select the number on the **All active processes** card to view the list of active processes.
- Select the number on the **New requests** card to view the list of new requests.
- Select the number on the **IRQ process** card to view the list of active IRQs. See IRQ process management for details.
- Select the number on the **Due diligence process** card to view the list of active third-party risk assessments. See Third-party (external) risk assessment management for details.
- Select the number on the **Approval process** card to view the list of requests in the approval process. See Approval process management for details.
- Select the number on the **Contract risk process** card to view the list of requests in the contract process. See Managing the contract risk process for details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the number on the **Final review process** card to view the list of requests in the final review process.
- Select the number on the **Closed** card to view the list of closed requests for due diligence.

For each due diligence request, the system auto-assigns a unique ID number that starts with the text DDR. In any list, select the DDR number to view the request.

Due diligence aging section

The Due diligence aging section displays the current duration of requests for due diligence for a third-party engagement: due diligence for third parties and for engagements. Use the list box to specify the type of due diligence request to display in the charts.

Ongoing due diligence management

The Ongoing due diligence management section displays the current breakdown of **Active**, **Closed**, and **Cancelled** requests for due diligence.

Due diligence workflow: Days to completion

The Due diligence workflow: Days to completion section displays the average completion time of each workflow over time.

TPRM Risk concentration map

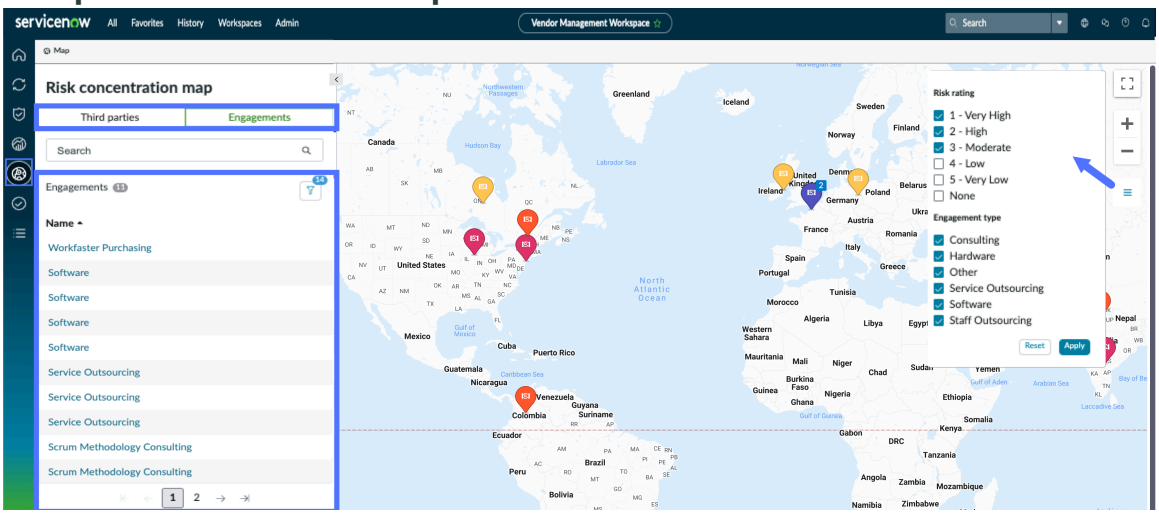
The Risk concentration map page pinpoints the geographical locations of active third parties and engagements. You can configure filters to view particular risk ratings and engagement types.

Accessing the page

Note:
This feature is available only if the Third-party Risk Management application has been activated. After you install the Risk concentration map feature, you must install a Google license to enable the feature. To enable the risk concentration map feature, see Enable the TPRM Risk concentration map.

To view the Risk concentration map, select **Workspaces** > **Vendor Management Workspace** and on the **Risk** tab, select the risk map icon .

Risk concentration map actions



- Select an engagement from the **Engagements** tab to view its high-level information and specific location on the map.
- Select a third party from the **Third parties** tab to view the third party's high-level information, a list of their associated engagements, and those engagements on the map. This is helpful for viewing the locations of each engagement, which can differ from the associated third party.
- Select the menu icon to open the list of filters that you can apply to the map.

Note:
The Risk concentration map only shows engagement locations.

The following example shows the risk concentration map view when the **Engagements** tab is selected and filters are applied.

Each of the lists provides links to risk information and to action pages for your day-to-day tasks.

Monitoring assessment data using TPRM dashboards

You can monitor and analyze assessment data at various levels in the Third-party Risk Management application using the Third-party insights dashboard and TPRM custom analytics dashboard. These dashboards provide you and your team with tailored insights and deliver relevant information at a glance, improving your decision-making process.

Dashboards in Vendor Management Workspace

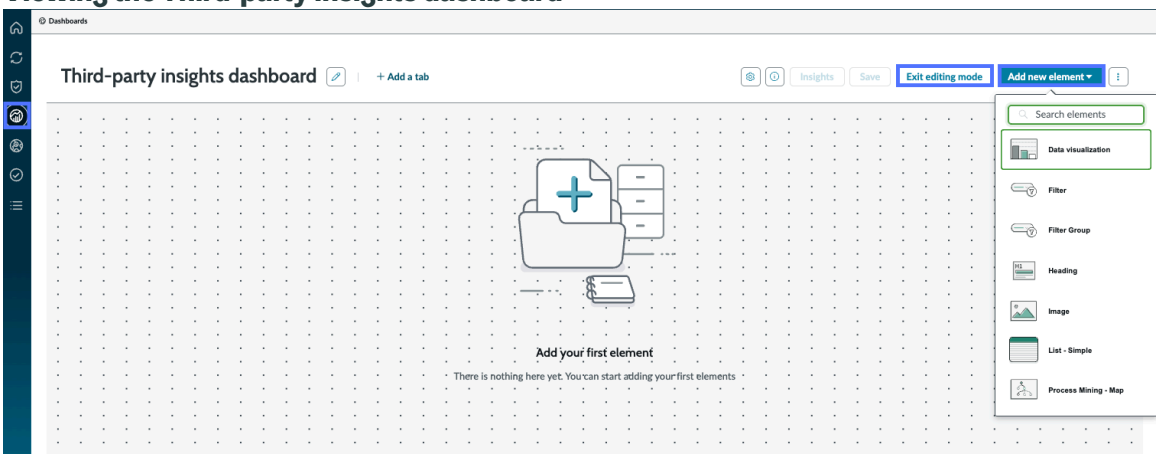
You can view the Dashboards page by navigating to **Workspaces** > **Vendor Management Workspace** and selecting the dashboard page icon . From the dashboards page, you can view the Third-party insights and TPRM Custom Analytics dashboards, which are included as part of the base system. You also have the option to create more dashboards, customize them, and share them with others.

Dashboard access

Role	Description
Third-party risk (TPR) manager [sn_vdr_risk_asmt.vendor_risk_manager]	Edit the Third-party Insights and TPRM Custom Analytics dashboard. View all questionnaire responses, including responses from tiering assessments, internal assessments, and third-party risk assessments.
TPR admin [sn_vdr_risk_asmt.vendor_risk_admin]	Edit the Third-party Insights and TPRM Custom Analytics dashboard. View all questionnaire responses, including responses from tiering assessments, internal assessments, and third-party risk assessments.
TPR assessor [sn_vdr_risk_asmt.vendor_assessor]	View assigned questionnaire responses assigned in the Third-party Insights and TPRM Custom Analytics dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard access (continued)



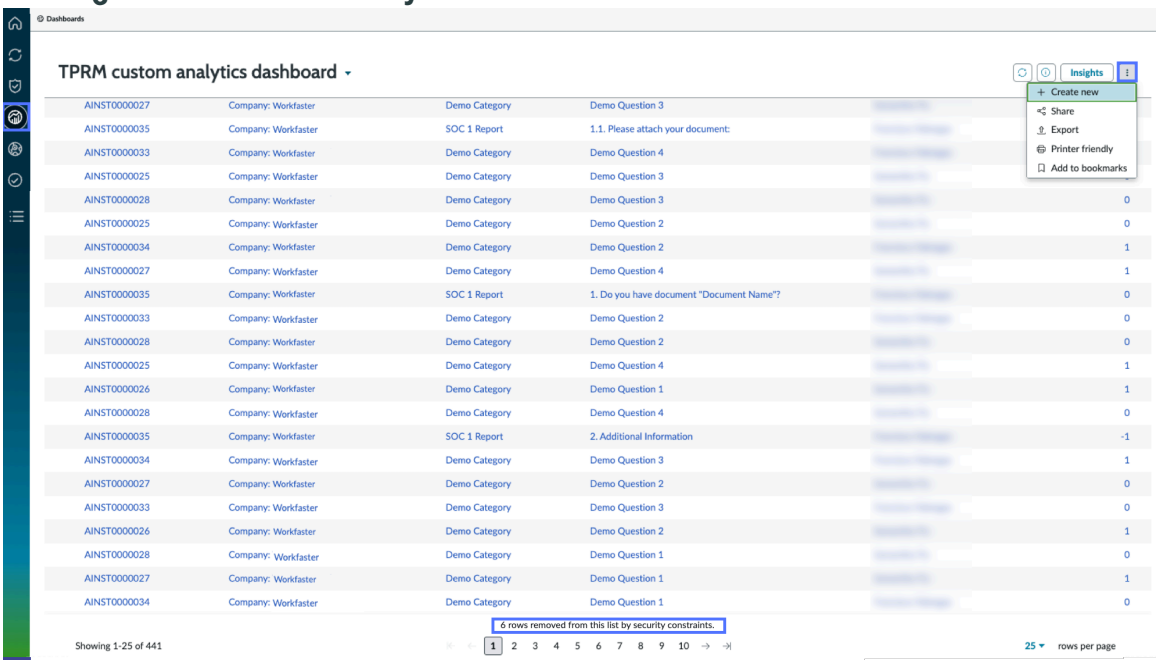
Role	Description
Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer]	View assigned questionnaire responses in the Third-party Insights and TPRM Custom Analytics dashboard.

Note:
All roles can create and customize personal dashboards, add data visualizations, and share their dashboards with others as viewers or editors. If you have the admin role, you must be in the same application scope as the dashboard and then you can delete any dashboard. For more information, see Delete a TPRM dashboard.

Third-party insights dashboard

This dashboard is a versatile, blank template that includes instructions to help you customize it to your specific needs. You can add various elements such as data visualizations, bar charts, trend analyses, and score reports to create custom sections and data visualizations. TPR managers, TPR assessors, and third-party assessment reviewers can view this dashboard, while TPR managers have the additional ability to edit and share it.

Viewing the Third-party insights dashboard



TPRM custom analytics dashboard

This dashboard is pre-configured with a default list showing all active questionnaire instances relevant to your role. The list has customizable columns, enabling you to filter and group data according to your preferences. TPR managers have full edit access to this dashboard, while TPR assessors and third-party assessment reviewers have read access only. This dashboard serves as a centralized hub for efficiently tracking and comparing assessment responses, making it easier for you to manage assessments.

Viewing the TPRM custom analytics dashboard

To learn more about creating and using TPRM dashboards, see:

- Create a TPRM dashboard with the In-line editor
- Edit TPRM dashboard details
- Edit TPRM dashboards
- Edit TPRM dashboard elements
- Share a TPRM dashboard
- Delete a TPRM dashboard
- TPRM Dashboards page

For more information on dashboards, see Dashboards in Platform Analytics.

Create a TPRM dashboard with the In-line editor

You can create dashboards with data visualizations, filters, and other elements that you can share with others. You can create elements and add existing elements from the in-line editor.

Before you begin

Save your work regularly.

Role required: Any user with an internal role can create dashboards.

> **Note:**
> Data visualizations based on table data are automatically shared with users that you share a dashboard with.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**
2. Select the dashboards page icon .
3. Select the more actions menu icon and select **Create new**.
4. Select the **In-line editor** tile and give the dashboard a name and a description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to use scripting, data binding, and other advanced capabilities, select the **Technical editor** tile to continue in UI Builder. This editor is available only to users who can access UI Builder (users with either the admin or the ui_builder_admin role. If you have any other role, go to step 6. For more information about the technical editor, see Technical dashboards.

5. Select **Create new dashboard**.
6. Choose **In-line editor**.
   The Technical editor option opens a page in UI Builder that is treated as a dashboard, with a list of available components. For more information, see UI Builder and Create a technical dashboard in UI Builder.
7. Select **Add new element** to add content to the dashboard.
   See Platform Analytics dashboard overview for information about what you can add to a dashboard.

   When you add a data visualization, select **New data visualization** to create a new visualization or **Saved data visualization** to choose one from the library. When you add a filter, select **New filter** to create the filter without pre-configured data or **Saved filter** to reuse an existing filter.
8. Select the dashboard details icon to open the Details panel and provide a name and description for your dashboard.
   For more information, see Edit TPRM dashboard details.
9. Arrange the data on the canvas to make it useful.
   You can select and drag from the corners of the elements to resize them on the canvas.
10. Select **Add a tab** to create room for more information on additional tabs.
11. Select **Save** early and often.
    The dashboard in-line editor doesn't automatically save your dashboard when you're creating it. Be sure to save your work regularly.

What to do next

- Edit TPRM dashboard details
- Edit TPRM dashboard elements

Edit TPRM dashboard details

You can change a dashboard name, add a description, certify it, configure visibility, and specify the requester, the owner, the owner group.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_admin or sn_vdr_risk_asmt.vendor_risk_manager can edit the Third-party Insights and TPRM Custom Analytics dashboards.

Any role for dashboards that you own or ones that you have been given permission to edit.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**
2. Select the dashboard page icon and then select the dashboard you want to edit.
3. Select the dashboard details icon to open the **Details** panel.
   On the **Details** panel, you can edit several aspects of the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Edit the **Name** field to change how the dashboard appears in the Dashboard Overview.

b. Fill in the **Description** to provide further context about the purpose of the dashboard.

c. Mark the dashboard as **Certified** to inform the user that the dashboard is for use across your organization.

> **Note:**
> You must have an admin role to mark a dashboard as **Certified**. For more information, see Certify a Platform Analytics dashboard.

d. In **Dashboard Visibility**, view, add, or remove workspaces in which the dashboard can be viewed.
If you have the admin role, you can change the workspaces for any dashboard. Other users can change workspaces only for dashboards they create. For more information, see Edit TPRM dashboards.

e. Specify one or more dashboard categories.

f. Specify who requested the dashboard.
This user is considered a responsible user. The data visualization is shared with them, with editing permissions.

g. Specify the owner of the dashboard.
By default, the owner is the creator of the dashboard, but the creator or owner can assign ownership to another user.

h. Specify an owner group.
The owner of a dashboard can be an entire group rather than a single person.

i. See who created the dashboard.

j. See who the dashboard has been shared with.

Edit TPRM dashboards

You can edit dashboard and dashboard tab information in the in-line editor. If the dashboard has been shared, any changes you make are applied globally.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_admin or sn_vdr_risk_asmt.vendor_risk_manager can edit the Third-party Insights and TPRM Custom Analytics dashboards.

Any role for dashboards that you own or ones that you have been given permission to edit.

About this task

You can edit the details of the dashboards you have created. When you edit the content of dashboards created in the technical editor, you're redirected to UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
By default, dashboards are subject to edit lock. Only one person at a time can have the same dashboard in edit mode. If you're viewing a locked dashboard, you aren't able to make edits even with edit permissions. You'll see the locking user's initials next to the **Refresh** and **View dashboard details** icons. Hover on the initials to see the user's name, company, and roles.

The **More actions** menu includes the option to clear the edit lock. Use this option with caution.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the dashboard page icon and then select the dashboard you want to edit.
3. Select the dashboard that you want to edit.
4. Perform any of the following actions.

Note:
If you aren't able to edit, either you don't have permission to edit the dashboard, or it is in edit lock.

Edit TPRM dashboard elements

You can edit the contents of a dashboard or dashboard tab, including data visualizations and filters. Because dashboards are shared, any changes you make are applied globally.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_risk_admin or sn_vdr_risk_asmt.vendor_risk_manager can edit the Third-party Insights and TPRM Custom Analytics dashboards.

Any role for dashboards that you own or ones that you have been given permission to edit.

About this task
You can edit the details of dashboards created in the in-line editor and in the technical editor in the Vendor Management Workspace. When you edit the content of dashboards created in the technical editor, you're redirected to UI Builder.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**
2. Select the dashboard page icon and then select the dashboard you want to edit.
3. Perform any of the following actions.

Note:
If you're unable to edit the dashboard, you don't have permissions to edit the dashboard.

Related topics

Create a TPRM dashboard with the In-line editor

Share a TPRM dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Share a TPRM dashboard

Share a dashboard with other users, groups, or roles to create a shared view of data that you can use to collaborate. You can grant viewing permissions or both viewing and editing permissions.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_admin or sn_vdr_risk_asmt.vendor_risk_manager can share the Third-party Insights and TPRM Custom Analytics dashboards.

Any role for dashboards that you own or ones that you have been given permission to share.

About this task

You can share dashboards that have been shared with you, if sharing is enabled. If you have permissions to edit a dashboard that has been shared with you, you can pass that ability along to whomever you share it with. Users with the administrator role can share all dashboards.

Edit permissions granted by sharing a dashboard don't apply to the underlying data visualizations on the dashboard. View permissions granted don't apply to that dashboard's visualizations outside of the dashboard itself.

Only admins can see roles in the Sharing panel.

Note:
Data visualizations based on table data are automatically shared with users that you share a dashboard with.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**
2. Select the dashboard page icon  and then select the dashboard you want to share.
3. Select the more actions menu icon  and select **Share**.
4. Enter the names of one or more users, groups, or roles you want to share the dashboard with.
5. To enable the people you share the dashboard with to share the dashboard as well, select **Allow recipients to add, edit, or delete sharing permissions associated with this dashboard**. When you add a user, group, or role as a viewer, they can only share the dashboard as a viewer. When you add a user, group, or role as an editor, they can share the dashboard as a viewer or as an editor.

   Important:
   Granting permission to share a dashboard or data visualization includes the ability to add, edit, and delete sharing permissions for any user, group, or role on that dashboard or data visualization. A user can't use this ability to give themselves or others edit permissions if they weren't originally given edit permissions.

6. Select one of the following options.

Option	Description
Add as viewer	Grant only viewing permissions to the users, groups, or roles you're sharing the dashboard with. They can't edit it.
Add as editor	Grant editing permissions to the users, groups, or roles you're sharing the dashboard with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	You must be in the same application scope as the dashboard to add a user as an editor.

7. **Optional:** Select **Copy link with filter** or **Copy link** to copy the dashboard's URL to the clipboard.
   The URL points to the tab that was open when you opened the **Share dashboard** dialogue. **Copy link with filter** also applies the filters as they're configured on the dashboard or dashboard tab.
8. Select **Confirm**.
9. **Optional:** Select the dashboard details icon to view who the dashboard has been shared with and where it's visible.

Delete a TPRM dashboard

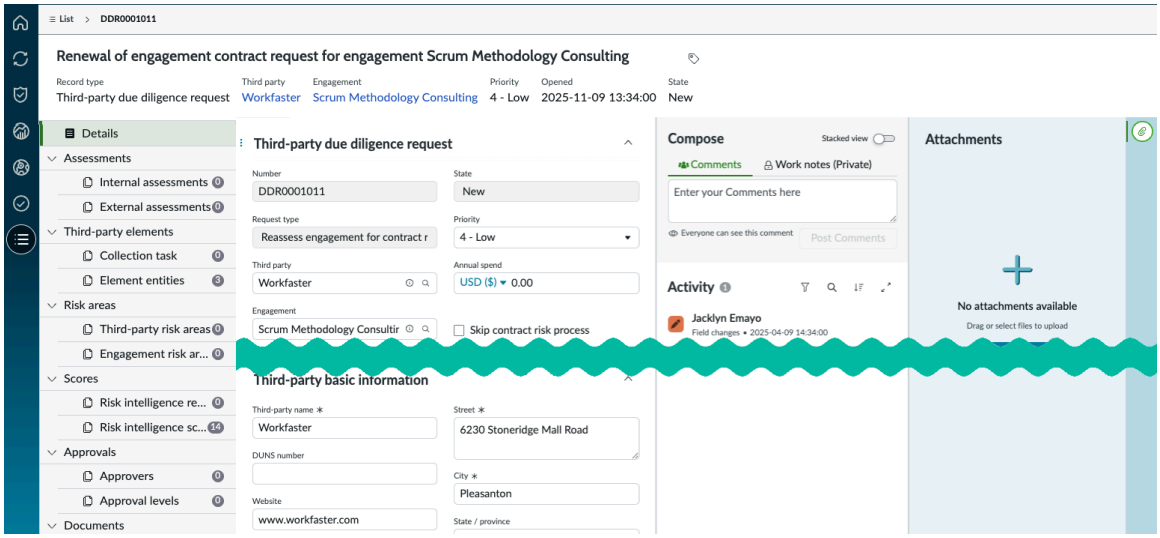
You can delete a dashboard that is no longer useful. The Analytics Center invokes the Workflow Studio to remove the dashboard from your instance.

Before you begin

Inform any users who can view the dashboard that you're deleting it. Users who have bookmarked a deleted dashboard see an error when they try to access it.

Role required: You can delete any dashboard that you created. If you have the admin role, you must be in the same application scope as the dashboard and then you can delete any dashboard.

Procedure



1. Navigate to **Workspaces** > **Vendor Management Workspace**
2. Select the dashboard page icon and then select the dashboard that you want to delete.
3. From the more actions menu select, **Delete**.
4. Confirm the deletion.
   You can't undo this action. If you accidentally delete a dashboard associated with a plugin, an admin can restore the original version of the dashboard.
   a. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
   b. Find the plugin using the filter criteria and search bar.
   c. Select the more actions menu button and choose **Repair**.
   d. Select **Repair** in the Activate Plugin window.

Monitoring the due diligence request process

TPR managers and TPR admins can perform a wide variety of tasks from the due diligence management dashboard. They can work on all processes in the workflow for a due diligence request: IRQs, external due diligence, approval, contract risk, and closed requests.

For each due diligence request, the system auto-assigns a unique ID number that starts with the text DDR. You can access the Due diligence management page from many locations by selecting the **DDR** number for any due diligence request. The page opens to the **Details** tab. Typically, you start from the TPRM Home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring processes from the request management page

Viewing basic information about a request on the Details tab

From the Details tab, you can view and adjust the due diligence request information for a third party. You can also log external-facing comments and private work notes, attach files, and track request updates in the activity stream. See Due diligence request process management.

Monitoring the IRQ process

The first internal step after an engagement request is approved is to start the IRQ process to scope the risk by determining the third party's risk score. You can access the Due diligence management page from many locations by selecting the **DDR** number for any due diligence request. See IRQ process management.

Monitoring the external due diligence process

Select a VRA **Number** to open the external assessments page in the Due diligence management page. See Third-party (external) risk assessment management.

Monitoring the approval process

You can view the list of users who can approve or reject a DD request and also view the details of their approval actions. In addition, you can view the approval levels for a request. See Approval process management.

View the risk intelligence scores for a third party

The information on the **Risk intelligence scores** tab comes from risk intelligence provider services. Select any link to drill into the settings and scores. See Viewing risk intelligence scores.

Monitoring the Contract risk process

Protect your organization's interests, as the Third-party risk contract negotiator, often the corporate counsel, by incorporating specific contractual provisions so that you can address the risks identified using the Third-party Risk Management application. See Accessing DD requests that are in the contract risk process.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions on the Due diligence management pages

Tip:
When you create (or the system generates) a new record (for example, a request for due diligence or a task), the system auto-assigns a unique ID number that helps to identify the type of data in the record. You can use the ID number to search for or filter the item you want to work on. See Unique ID numbers for TPRM records.

Actions

Action	Description
Start onboarding	For requests in the New state, this button enables the TPR manager to start the process.
Discuss	Select **Discuss** to send a message to other users. The message is recorded in the **Activity** section of the **Details** tab.
Save	Select **Save** to save any change you made to a value on any tab.
... Delete	Select **Delete** to delete the record of the engagement request.
Working in the Compose section	The **Compose section** on the **Details** tab enables you to permanently add text to the record. The Activity section is updated with any actions on issues and tasks, submissions to TP contacts, and also with work notes and comments that users add to the record. Add text in the following fields as needed: • **Work notes (Private)**: Information about the third-party risk assessment. Work notes are visible only to internal users who are assigned to the process. • **Comments**: Comments about the third-party risk assessment are visible both to internal users and to third-party contacts.
Adding an attachment	Select **Browse** in the **Attachments** section to select and add an attachment.

Monitoring your fourth-nth parties

You can identify and manage the third-party risks that depend on the services of the fourth-nth parties by using the Third-party Risk Management application. By monitoring your fourth-nth parties, you can help to ensure that they adhere to the same security and compliance standards as the primary third party.

Fourth-nth parties

Fourth-nth parties can include various entities, such as sub-suppliers, service providers, consultants, or any other organization that the third party relies on to deliver its products or services. These parties could have access to your sensitive data, systems, or processes, which makes them potential sources of risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Let's look at some fourth-nth party risk examples:

Parts

A company regularly uses an item from a third party that relies on a hardware part from another organization. In this case, the organization that provides the additional part is a fourth party that can potentially create a downstream risk for the item that is provided by the third party.

Services

A company stores its payroll application by using the Automatic Data Processing (ADP) service. The ADP service is a third-party service that relies on Amazon Web Services (AWS) to store its data. The ADP service depends on AWS to have security measures and processes in place to safeguard their data and maintain its safety. Although AWS is often a third party of primary services, the AWS service is a fourth party to the third party ADP in this case.

You can link two fourth parties to each other. For example, a link can occur when an organization that provides an additional part relies on another fourth party to deliver the hardware part. However, you can't create a loop when you link two fourth parties. The starting point can be either a third or fourth party. For example, let's consider Fourth party A, which has a child Fourth party B. Fourth party B, in turn, has a child Fourth party C. However, Fourth party C can’t have a child that leads back to Fourth party A. This restriction ensures that a circular dependency isn’t formed among the fourth parties.

Fourth-nth party actions

As part of your risk management program, you can add fourth-nth party information manually or by collecting responses from a third party by using a fourth-party registration questionnaire. You can manually create a fourth-nth party record if you don't have time to send a questionnaire to a third party or only need to create one record. After reviewing and registering, or manually creating these fourth-nth party records, they’re available for monitoring by using Vendor Management Workspace. As your business relationships change, you can keep relevant information current by promoting a fourth-nth party record to a third-party record. This third-party record incorporates all existing information and then designates the existing fourth-nth party as a known fourth party.

Here are the different actions that you can take to manage and monitor fourth-nth parties:

Register the fourth-nth parties

If you're a third-party risk (TPR) assessor or manager, you can register fourth-nth parties after collecting responses from a third party by using the fourth-party registration questionnaire. You can send the fourth-party registration questionnaire only to the third parties and not engagements. For more information, see Register a fourth-nth party.

View the fourth-nth parties that are associated with a third party

You can view all the related fourth-nth parties by navigating to the **Downstream suppliers** tab of the third-party page in Vendor Management Workspace. Viewing all the fourth parties that are linked to a third party can help you make informed decisions about initiating or continuing a relationship with an engagement. For instance, if a fourth party that is associated with a third party is known for higher risks in the automotive industry, it might still be acceptable to pursue an engagement in a different industry. However, if an engagement with the same third party involves the automotive industry, the risk could be considered too high.

For more information on how to view all the related fourth-nth parties, see Viewing information on fourth parties.

View the fourth-parties overview section

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the known fourth parties, the sub-parties that are associated with the third parties, and the unknown fourth parties by navigating to the Vendor Management Workspace home page. Having this high-level view is helpful in understanding how much information is available for a fourth party and how it relates with the other third parties and engagements. For example, if it's a known fourth party, you can leverage all the existing due diligence information that was gathered while it was assessed as a third party.

Note:
The known fourth parties are organizations that have already been used as third parties in your risk management program. The unknown fourth parties are only categorized as fourth parties that haven't been used or identified as third parties.

For more information on viewing the known fourth parties, the sub-parties that are associated with the third parties, and the unknown fourth parties, see TPRM Home page.

Manually create a fourth-nth party record

If you're a TPR assessor or manager, you can manually create a fourth-nth party record.

For more information on how to create a fourth-nth party record, see Create a fourth-nth party record.

Note:
You can add an existing third party as a fourth-nth party to another third party by navigating to the **Downstream suppliers** tab of a third-party page in the Vendor Management Workspace and selecting **Add**. After it's added the existing third party is now categorized as both a third party and fourth-nth party for the chosen third party and includes all collected information.

Promote a fourth-nth party to a third party

If you're a TPR assessor or manager, you can promote a fourth-nth party record to a third party. After you promote a fourth-nth party to a third party, a third-party record is created and the existing fourth-nth party is identified as a known fourth party.

For more information on how to promote a fourth-nth party record to a third-party record, see Promote a fourth-nth party to a third party.

Viewing information on fourth parties

TPRM Home page

Register a fourth-nth party

Register fourth-nth parties after collecting responses from a third party by using the fourth-party registration questionnaire in the Third-party Risk Management application. With the fourth-party registration questionnaire, you can create multiple fourth-nth party records at a time.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_assessor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the **Fourth-party templates** tab of a new or active external assessment.
2. Assign a Fourth-party registration questionnaire to the external assessment by selecting **Add** and then selecting a questionnaire.

   The questionnaire you are using for fourth-party registration can only be sent to third parties.

   You can use the fourth-party registration questionnaire that is included as part of the base system or a custom questionnaire that has the Fourth-party template classification and has a Fourth-party information metric category added.

   The third party must answer the first two questions in each Fourth-party information section. Don't alter the first eight questions of each section because they're used for mapping the responses to the new fourth-party record.

   For more information on assessments, see Assessing your third-party risk.
3. When you receive responses from the third-party contact, navigate to the **Downstream Suppliers** tab of the assessment and review the fourth-nth party information that was collected.
4. Review each fourth-nth party in the list and confirm if that party exists and select **Create new fourth-party** if it doesn't.

Downstream suppliers list

Field	Description
Name	Name of the fourth-nth party that is associated with the record.
URL	URL for the fourth-nth party.
Downstream supplier	Fourth party record that is used after the fourth-nth party is approved and becomes active. You can enter an existing fourth-nth party by double-clicking (or using the keyboard shortcut) the downstream supplier field and selecting the magnifying glass icon . This action helps you view existing records to avoid creating duplicate records.
DUNS number	Unique numeric identifier for the single business entity. A DUNS number isn't legally required for a business.
Status	Current state in the registration process: **In review**, **Active**, or **Ignored**.

5. Select **Approve** to make each fourth-party record active or select **Ignore** to keep the record inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once a fourth-nth party record is active, it's fully registered and available for use in your risk management program.

For more information on fourth-nth parties, see Monitoring your fourth-nth parties.

Create a fourth-nth party record

Create a fourth-nth party record by using the Third-party Risk Management application. You can create fourth-nth party records manually as an alternative to using a fourth-party registration questionnaire.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_assessor

About this task

If you only need to create one fourth-nth party record or don't have time to send a questionnaire to a third party, you can create a fourth-nth party record manually. To create and register multiple fourth-nth party records, see Register a fourth-nth party.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the list icon and then navigate to **Third parties** > **All fourth parties**.
3. Select **New**.
4. On the form, fill in the fields.

Create New Company form

Field	Description
Company section	
Name	Name of the fourth-nth party that is associated with the record.
Status	Status of the fourth-nth party: ○ Active ○ Onboarding ○ Prospect ○ Active unauthorized ○ Terminated ○ Onboarding rejected **Note:** After a fourth-nth party record is active, it's available for use in your risk management program.
Website	URL for the fourth-nth party.
DUNS number	Unique numeric identifier for the single business entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	A DUNS number isn't legally required for a business.
Notes	Additional information about the fourth-nth party.
Contact section	
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax	Standard contact information for the third-party organization.

5. Select **Save**.
6. Associate the active fourth-nth party record with a third party by navigating to the **Downstream Suppliers** tab of the desired third party and selecting **Add**.
   The fourth-nth party record is active and associated with a third party.

   For more information on fourth-nth parties, see Monitoring your fourth-nth parties.

Promote a fourth-nth party to a third party

Promote a fourth-nth party record to a third party by using the Third-party Risk Management application. If you're now working with a fourth-nth party at the third-party level, you can keep relevant information current by promoting a fourth-nth party record to a third-party record.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_risk_assessor

About this task
When preparing to request due diligence for a new engagement, you can upgrade an existing fourth-nth party record to a third-party record, rather than creating a record. This third-party record is automatically populated with the existing fourth-nth party information, while the original fourth-nth party record and its relationships remain intact.

For example, Company A is pursuing a new project and needs to conduct due diligence on an engagement with a supplier, Supplier B. Previously, Supplier B was considered a fourth party because they were a subcontractor managed through a different third party, Supplier A. However, for this new project, Company A decides to work directly with Supplier B for their new project. Company A promotes Supplier B from a fourth party to a third party in their records. This scenario means that Supplier B is now directly associated with Company A. Company A can now conduct due diligence on their new engagement with Supplier B. Supplier B is a third party for Company A and still a fourth party for Supplier A.

Procedure
1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the list icon and then navigate to **Third parties** > **All fourth parties**.
3. Select the desired fourth-nth party.
4. Select **Add as a third-party**.
   A third-party record is created that incorporates all the existing fourth-nth party record information and then designates that fourth-nth party as a known fourth party. Known fourth parties have been or are in the process of being assessed for risk as part of the due diligence

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

workflow. You can access all available due diligence information at the fourth-nth party and its corresponding third-party level.

For more information on fourth-nth parties, see Monitoring your fourth-nth parties.

Monitoring third-party elements

You can monitor third-party elements through scalable scoring models, relationship analysis, and due diligence workflow integration by using the Third-party Risk Management application. Monitoring third-party elements and leveraging that information can help with conducting more informed risk assessments as part of your third-party risk program.

Third-party elements overview

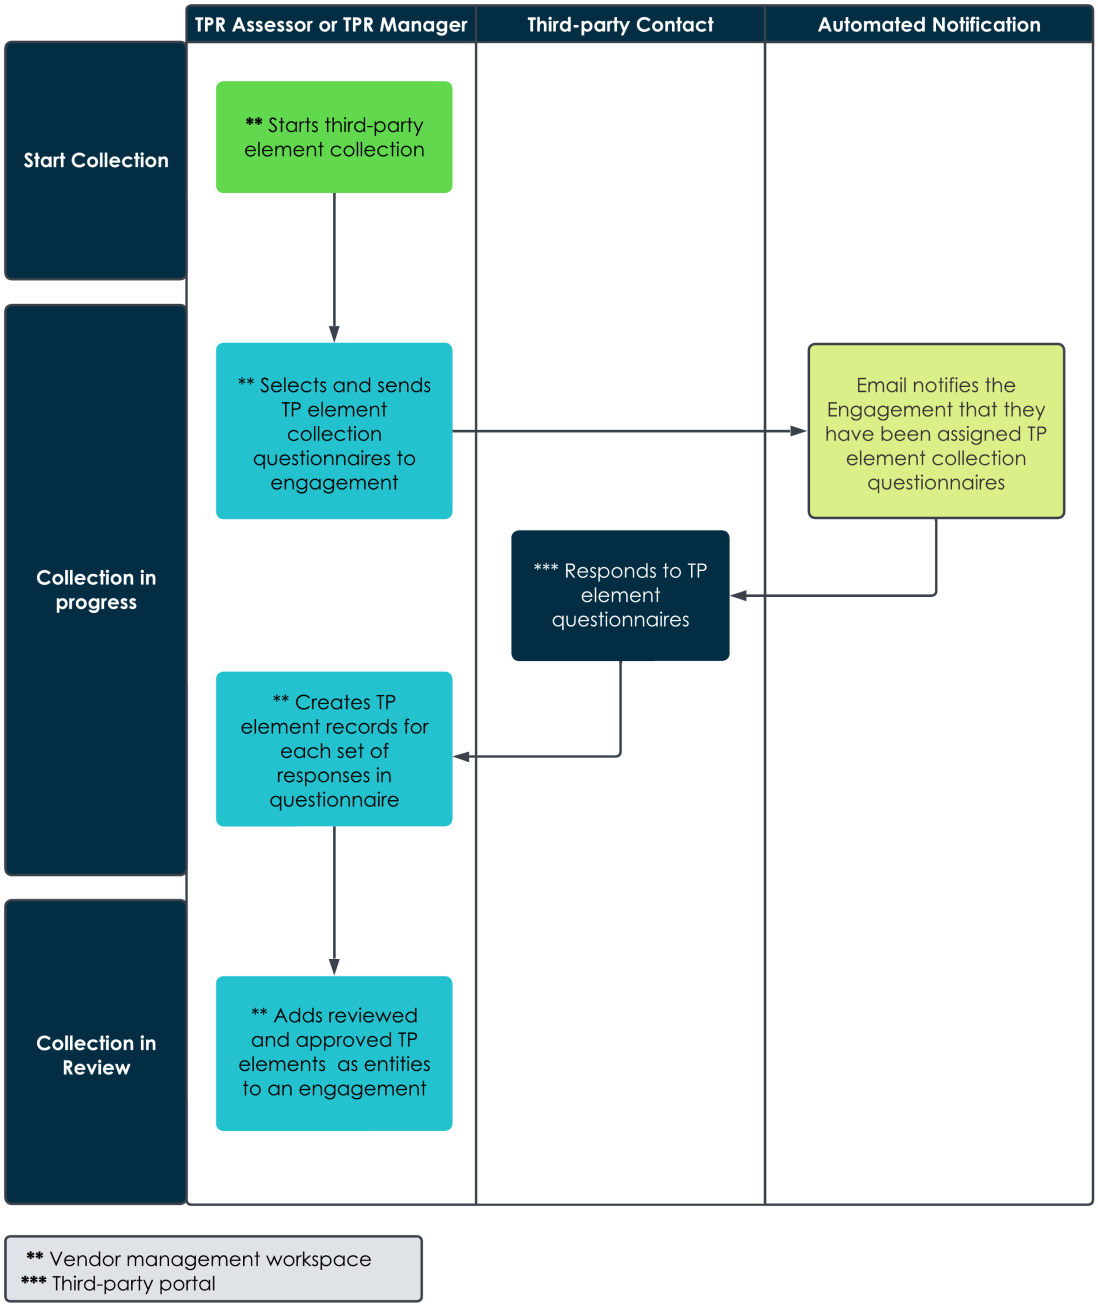
Third-party elements (TP elements) are the external organizations that an engagement relies on to provide goods, services, or support. These organizations can include the suppliers, contractors, facilities, individuals, or any other external organization that can access the engagement's systems, data, or facilities.

Let's look at some TP element class and risk examples:

Datacenter

A facility or location where an engagement or third party outsources the storage, processing, and management of their data and IT infrastructure. A datacenter could potentially experience a data breach, downtime, or compliance violation that exposes their engagements to unexpected risk. This example would be classified as a Facility TP element.

Manufacturing facility



A facility or location where an engagement or third party outsources the production or assembly of their products. A manufacturing facility could potentially experience a supply chain disruption, a counterfeit part, or regulatory compliance issue that exposes their engagements to unexpected risk. This example would be classified as a Facility TP element.

Beneficial owner

An individual who owns or controls an organization that is involved in a business relationship or transaction. These individuals may not be the registered or legal owners of the organization but have significant influence or control over its operations, decision-making, or financial affairs. This example would be classified as a Principal TP element.

The following infographic shows the TP element collection process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on Third-party (TP) elements and examples of their associated controls and potential risks, see Terminology.

Collecting and reviewing third-party elements

Collecting and reviewing third-party elements is optional. If you have the Third-party risk (TPR) assessor [sn_vdr_risk_asmt.vendor_assessor] role and are the due diligence request owner or TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] role, you can start this process after your due diligence request has completed the Inherent Risk Questionnaire (IRQ) process.

You would follow this process to collect and review TP elements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In the Vendor Management Workspace, if TP elements are needed, the Third-party risk (TPR) manager or due diligence request owner selects **Start collection** and a collection task is created.
2. The TPR manager or owner opens the external assessment for collecting elements and adds the relevant TP element collection questionnaires.
3. The TPR manager or owner reviews and approves the questionnaires and they're sent to the engagement. For more information on assessments, see Assessing your third-party risk.
4. In Vendor Management Workspace, the TPR manager or owner opens the questionnaires and verifies that all the required information was provided.
5. The TPR manager or owner then navigates to the list of TP elements and manually creates a TP element record for each set of responses in each questionnaire.
6. After all TP elements are created, the TPR manager or owner closes the collection task assessment. The system changes the state of the request from **Collection in progress** to **Collection in review**.
7. The internal stakeholders (TPR assessor, TPR approver, TPR manager, or TPR administrator) review and approve the element records.

For more information, see Create a third-party element record.

Adding third-party elements to engagements

After the TP elements are reviewed and approved by the TPR manager and internal stakeholders in Vendor Management Workspace, the TPR manager or owner opens the engagement and manually adds the reviewed and approved TP elements as entities on the **Entities** tab of the engagement. For more information, see Add a third-party element record to an engagement. After you add all TP element entities to an engagement, you can start the due diligence process. During the due diligence process, you must select and assign a questionnaire as part of an external assessment for each TP element that you created. The third-party contact completes the TP element questionnaires. For more information, see Assessing your third-party risk.

Third-party element scoring

You can categorize each TP element into one of the following types: Facility, Product, Principal, or Other. This classification helps you with organizing the assessment criteria and subsequent scoring. Scoring on a TP element is determined by averaging the risk ratings from its associated third-party risk assessments. If you conduct multiple assessments for the same TP element, the system considers only the latest assessment for each engagement for scoring, disregarding duplicates. This process helps to ensure that the TP element's risk rating reflects the most current evaluation. For example, if a TP element has assessments with risk ratings of very high and very low, the average of these ratings leads to the overall risk being moderate.

After an element is assessed and a risk rating is determined, this rating is first aggregated into a component score that is based on its classification, such as Facility. For example, all Facility-type elements are aggregated into a single component score, which contributes to the overall score of the engagement. The engagement score is then compiled by aggregating the scores from all relevant component scores within that engagement. If multiple assessments or TP elements are within an engagement, each is scored individually and then combined to form the overall engagement score. The engagement score is then rolled up to the third-party level by aggregating the scores from all the engagements that are associated with a particular third party. The aggregation at this level could be based on different rules, such as averaging, taking the minimum, or maximum scores, depending on the scoring rules set within the system. This rolled-up score represents the overall risk or performance score of the third party and reflects all the engagements and elements that are associated with it.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can create your own TP element classifications to meet your specific risk program requirements. For more information on creating classifications and assigning weights for scoring, see Third-party element form and Define component criteria.

Create a third-party element record

Create a third-party element record after you collect the responses from a third party by using a collection template questionnaire in the Third-party Risk Management application. After a third-party element record is created, an element entity is available to be assigned to an engagement.

Before you begin

Make sure your due diligence request has completed the Inherent Risk Questionnaire (IRQ) process so that you can start the Third-party (TP) element collection process.

Role required: sn_vdr_risk_asmt.vendor_assessor that is the due diligence request owner or sn_vdr_risk_asmt.vendor_risk_manager

About this task

In the Vendor Management Workspace, the Third-party risk (TPR) manager or due diligence request owner selects **Start collection** for the due diligence request and a collection task is created. A collection task is an external assessment for collecting elements. After receiving and verifying responses to the collection template questionnaire, a Third-party risk (TPR) manager or due diligence request owner creates third-party element records. Corresponding entity records are created after a third-party element record is created.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the list icon and then navigate to **Due diligence requests** > **All requests**.
3. Select the due diligence request that you want.
4. On the **Collection task** tab of the due diligence request, select the External assessment (VRA) number to open the external assessment for collecting elements.
5. On the **Questionnaire templates** tab, select **Add** to assign a third-party element questionnaire to the external assessment and then select the collection template questionnaire.

   You can send the third-party element questionnaire only to third parties.

   For more information on assessments, see Assessing your third-party risk.
6. After you receive responses from the engagement contact, navigate to the **Risk overview** tab of the assessment.
7. In the Questionnaires and document requests section, select the collection template questionnaire and review the responses.
8. After confirming that you received all the required information, select the list icon and then navigate to **Third-party Elements** > **All third-party elements**.
9. Create a third-party element record by selecting **New** and fill in the form by using the information that was collected from each set of responses in the third-party element questionnaire.
   For descriptions of all these fields, see Third-party element form.

   Note:
   The TP element classification determines which scoring model is applied to the third-party element. You can create new third-party element classifications by navigating to **All** > **Third-party Risk Management** > **Third-party Elements** > **Classifications**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Select **Submit**.
    A third-party element and an associated entity have been created. You can view the associated entity record by selecting **Go to entity**.

What to do next

Close the external assessment for collecting elements and then manually add elements as entities on the entities tab of an engagement. After all third-party elements are assigned to an engagement, you can start the due diligence process. For more information, see Add a third-party element record to an engagement and Monitoring third-party elements.

Add a third-party element record to an engagement

Assign a third-party element record to an engagement by using the Third-party Risk Management application. After you assign the element entity to an engagement, the third-party risk manager and internal stakeholders can assess it as part of the due diligence process.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor that is the due diligence request owner or sn_vdr_risk_asmt.vendor_risk_manager

About this task

You can assign third-party elements to an engagement after they've been reviewed and approved by the third-party risk manager and internal stakeholders. For more information, see Monitoring third-party elements and Create a third-party element record.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the list icon and then navigate to **Third parties** > **All engagements**.
3. Select the engagement that you want.
4. Navigate to the **Entities** tab of the engagement.
5. Assign a third-party element to the engagement by selecting **Add**.
   The third-party element is active and available for assessment.

Tracking a managed activity

View managed activities in the usage analytics activities table for tracking and verification purposes in the Third-party Risk Management application.

Overview of managed activities

You can track and verify managed activities in the Usage analytics activities [sn_vdr_risk_asmt_ua_activity] table.

An engagement only consumes one license, regardless of whether there's one managed activity or many managed activities per contract year. Managed activity usage is triggered only when an activity is initiated.

Activities that are associated with a new third party going through the due diligence onboarding workflow aren't counted as managed activities. In this context, a new third party is defined as a company that is not in the Company [core_company] table.

If any of the following activities aren't related to a new third party going through the due diligence onboarding workflow, they're counted as managed activities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An Inherent risk questionnaire (IRQ) that is sent by the system has a status of **Awaiting response**. For more information, see Assessing your third-party risk.
- A tiering assessment with a questionnaire that is sent by the system has a status of **Awaiting response**. For more information, see Create a VRM tiering assessment.
- A third-party risk assessment with a questionnaire that is sent by the system has a status of **Submitted to third party**. For more information, see Life cycle states of a external assessment.
- The creation of a task or issue for a third-party risk assessment. For more information, see Create a task for a third party or engagement and Create an issue for a third party or engagement.

If a third-party risk assessment or due diligence request is automatically created by an event-driven management rule and later recalled, it isn't counted as a managed activity. An assessment that is related to an event-driven management rule can be recalled up until the time that it's submitted to the third party. For more information, see Event-driven management — automate assessment processes.

Note:
If an assessment isn't related to an event-driven management rule, you can't recall it and it's counted as a managed activity. If an assessment is canceled, it's still considered as a managed activity.

Using the usage analytics activities table for verification

The usage analytics activities table stores a record every time a managed activity occurs. This table is read only. Records that are two years or older are automatically archived. You must have the Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role to view this table.

You can access the Usage analytics activities table by navigating to **All** > **Third Party Risk Management** > **Administration** > **Managed Activity Analytics**.

The following example and table show the Usage analytics activities [sn_vdr_risk_asmt_ua_activity] table.

Usage analytics activities table

Usage analytics activities View: Vendor Risk | Created | Search | Actions on selected rows...

Usage analytics activities

Field	Description
Created	Date and time that the activity occurred.
Activity	Record that is related to the activity.
Activity type	Managed activities that can be associated with tiering assessments, internal assessments, third-party risk assessments (TPRA), issues, and tasks.
Applies to	• **Third party**: The activity applies to the parent third-party organization. • **Engagement**: The activity applies to the engagement.
Third party	Third party that is related to the activity.
Engagement	Engagement that is related to the activity.
Status	State of the activity: • **Tracked**: The activity is logged. • **Recalled**: The activity was recalled by a user after it occurred.

Note:
The calculated risk scores that are updated by assessments are managed activities. However, they aren't logged in the Usage analytics activities [sn_vdr_risk_asmt_ua_activity] table. The score updates from the risk intelligence score providers aren't managed activities. For more information on the risk intelligence scores, see Viewing risk intelligence scores.

Approving or rejecting requests for due diligence

Set up the approval levels and rules for due diligence requests in the Third-party Risk Management application to use while approving or rejecting requests after reviewing questionnaire responses and due diligence process results.

Approval process overview

Approval levels and rules are used to determine which team members are assigned as approvers to the due diligence request. During the approval process, approvers review the external questionnaire responses and supporting documents that were provided by the third-party contact. They also consider any other information that was gathered during the due diligence process. Approvers can approve or reject due diligence requests depending on their interpretation of the information reviewed.

For more information on managing approvals, approval levels, and approval rules, see Approval process management.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Any multi-level approvals related to a workflow require updates to be made using Workflow Studio. For more information on creating flows using Workflow Studio, see Create a flow in Workflow Studio.

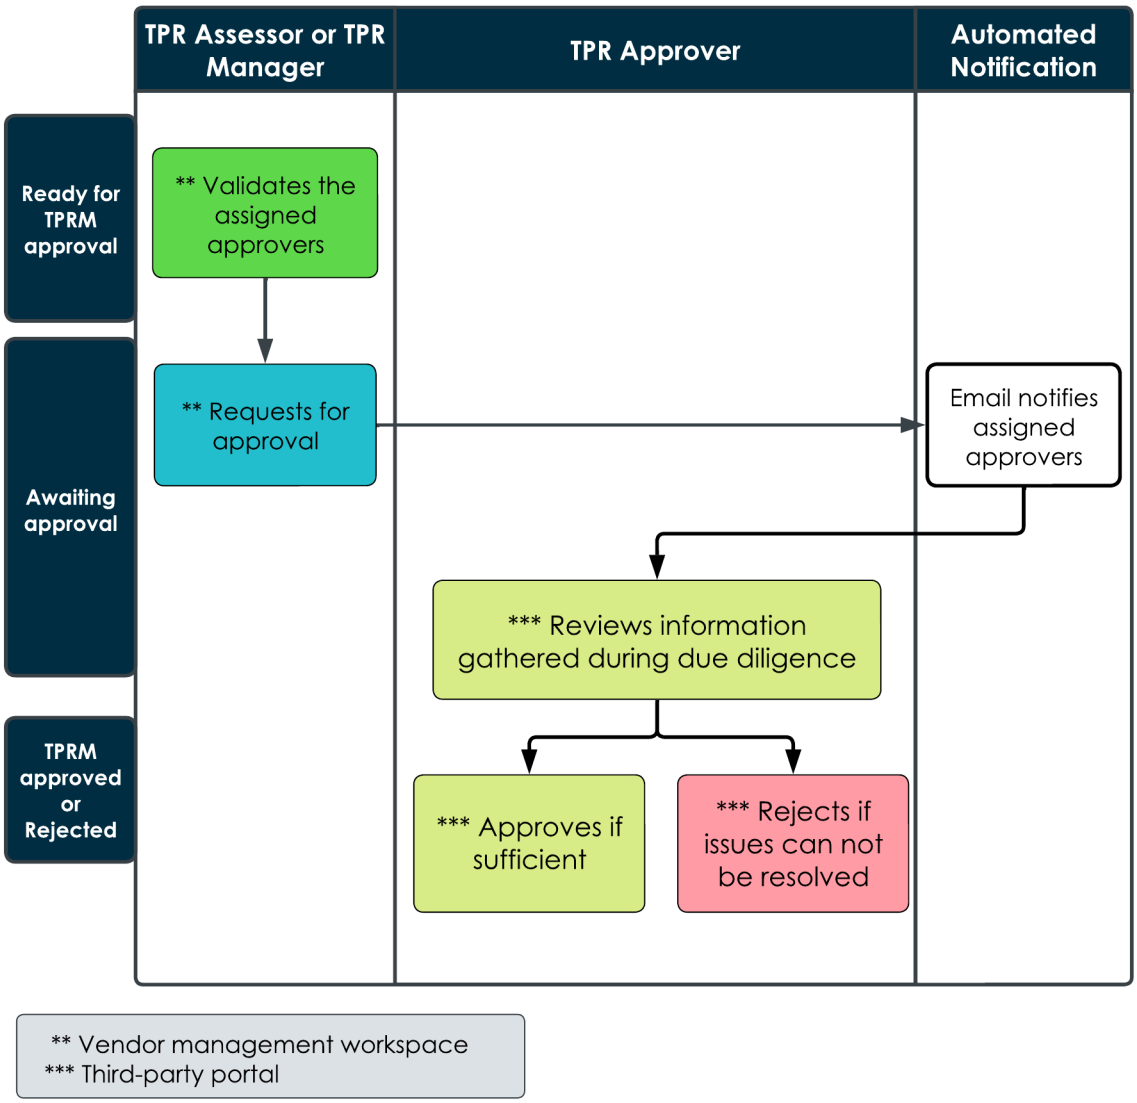
Setting up approval levels and rules

You must have the admin or Third-party risk (TPR) admin [sn_vdr_risk_asmt.vendor_risk_admin] role to make the approval levels and rules for due diligence requests. You can create up to 10 different approval levels that each contain different approval rules. Within each approval level, you can assign one or more rules with different filter conditions that apply to the assigned approvers. For example, you might want different approvers to be assigned to the due diligence request depending on the engagement's risk rating and location.

With the Third-party due diligence default configuration, you can create three records with approval levels 1, 2, and 3. Level 1 has three rules, level 2 has two rules, and level 3 has two rules. The following example shows how you would assign these rules with filter conditions:

- Level 1
  - Rule 1: User A and User B are assigned to approve the engagement's low risk rating.
  - Rule 2: User C and User D are assigned to approve the engagement's medium risk rating.
  - Rule 3: User E and User F are assigned to approve the engagement's high-risk rating.
- Level 2
  - Rule 1: TPR manager is assigned to approve the engagement in Asia/Pacific.
  - Rule 2: TPR manager is assigned to approve the engagement in Europe/North America.
- Level 3
  - Rule 1: All TPR administrators are assigned to approve an engagement in a specific region that has a high-risk rating.
  - Rule 2: All TPR administrators are assigned to approve an engagement in a specific region that has a very high-risk rating.

During the approval process, level 1 is triggered first. If all assigned users approve the conditions in level 1, then level 2 is triggered and so on. If any assigned user in level 1 has rejected the due diligence request, level 2 isn't triggered and the due diligence request is rejected. For more information on possible rating definitions, see Set up risk rating scales for scoring.



Note:
You can use the Third-party due diligence default configuration included as part of the base system or deactivate the default configuration and create an approval configuration that applies to a different table. For more information, see Set up an approval configuration record.

For more information on setting up approval levels and rules, see Set up the approval levels for due diligence requests and Set up the approval rules for due diligence requests.

Approving due diligence requests

The following infographic shows the approval process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The due diligence request enters the Ready for TPRM approval state after all assessments have been closed. The TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] or TPR assessor [sn_vdr_risk_asmt.vendor_assessor] that has been assigned as the owner of the due diligence request confirm approvers have been assigned to the due diligence request. After validating the assigned approvers, the TPR manager or owner requests approval. The due diligence request enters the Awaiting approval state and the system sends an email notification to all assigned approvers.

All internal stakeholders (approvers) review the external questionnaire responses and supporting documents that were provided by the third-party contact. You must be part of the Third-party risk (TPR) manager user group to make approvals. Approvers perform all actions by using Vendor Management Workspace or VRM Classic user interface. Approvers can view all of their pending **My approvals**, **Tasks**, and **Issues** by navigating to the Task page.

To view the Task page in the Vendor Management Workspace, select **Workspaces** > **Vendor Management Workspace**. Then, select the task icon .

To view your assigned approvals, select **My approvals**.

To view **My approvals** in the VRM Classic user interface, navigate to **All** > **Self-Service** > **Third-party Risk Management** > **Due Diligence Requests** > **My Approvals**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From this view, you can accomplish the following tasks:

- Review the internal questionnaire responses.

  Navigate to the Due diligence request record page by selecting the Due Diligence Request (DDR) number and then selecting the Internal assessment (INA) number on the **Internal assessments** tab. For more information, see IRQ process management.

- Review the risk intelligence scores.

  Navigate to the Due diligence request record page by selecting the DDR number and then selecting the **Risk intelligence scores** tab. For more information, see Viewing risk intelligence scores.

- Review the external questionnaire responses and supporting documents.

  Navigate to the Due diligence request record page by selecting the DDR number and then selecting the External assessment (VRA) number on the **External assessments** tab. For more information, see Third-party (external) risk assessment management.

- Access the approval request record page.

  Select one of the Requested states from the list to open the approval request record page. From this page, you can select **Approve** or **Reject**. For more information, see Approval process management.

If the responses meet your requirements, one or more approvers approves the request, and the owner (TPR manager or TPR assessor) closes the due diligence request and the engagement. The third party or engagement state is now **Active**. If a contract is going to be prepared, an approver, TPR manager, or owner selects **Send to contract negotiator** and assigns a contract negotiator. The approved due diligence request's state is updated to the Contract Risk Process state and the contract risk negotiator is notified through an automated email.

For more information, see Managing the contract risk process.

Rejecting due diligence requests

If an issue can't be resolved or the due diligence request is canceled, the approver can enter comments and reject the due diligence request. To view your **My approvals**, navigate to the task page, select **My approvals**, and then select a Requested state from the list to open the approval request record page. From this page, you can select **Reject** to reject the request.

After the due diligence request is rejected, the following actions occur:

1. The due-diligence request's state is updated from Awaiting approval to Rejected.
2. You must enter an explanation for rejecting the due diligence request in the **Comments** field.
3. The Due diligence process state is updated to Rejected and all stakeholders are notified that the engagement has been rejected.

> **Note:**
> The owner can reopen the approval process by selecting the due diligence request from the All request list. The owner is required to provide a justification for restarting the approval process.

Set up the approval levels for due diligence requests

Assign one or more approval levels to the users or groups that approve your due diligence requests in the Third-party Risk Management application. Because the approval levels are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

applied iteratively and each level contains different rules, you can help to ensure that the correct user or group is assigned as an approver.

Before you begin

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

Procedure

1. Navigate to **All** > **Approval Configurator** > **Approval Configurations**.
2. Select **Third-party due diligence default configuration**.
3. Create an approval level by selecting **New**.
   A **Third-party due diligence default level** is included as part of the base system.
4. On the form, fill in the fields.

Approval Level form

Field	Description
Name	Name for the approval level.
Level	Stage of approval.

Note:
In an approval configuration, you can't have multiple approval levels with the same level number. The rules of each level are applied sequentially, one after the other.

5. Select **Submit**.

For information on setting up rules to assign to levels, see Set up the approval rules for due diligence requests.

For more information on approval levels and rules, see Approving or rejecting requests for due diligence.

Related topics

Set up the approval rules for due diligence requests

Set up the approval rules for due diligence requests

Set up the rules at each approval level for your due diligence requests by selecting an approver type and the number of approvals that you require in the Third-party Risk Management application. You can also filter the table conditions that apply to each rule so that you can help ensure that the correct user or group is assigned as an approver.

Before you begin

Set up the approval levels. For more information, see Set up the approval levels for due diligence requests.

Role required: admin or sn_vdr_risk_asmt.vendor_risk_admin

About this task

For each rule, you can select the individual approvers, approvers from the Third-party due diligence request [sn_tprm_dd_request] table, or dynamic approvers. Dynamic approvers refer to individuals or groups who are assigned as approvers based on the Approver table that is defined in the approval rule form. The approvers can be a Third-party risk (TPR) manager or TPR administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each approval level can contain multiple approval rules. Each approval rule can be created on the table of the approving record or any other related table of the approving table.

Procedure

1. Navigate to **All** > **Approval Configurator** > **Approval Configurations**.
2. Select an approval configuration record.
3. In the Name column of the Approval Levels section, select the approval level record that you want.
4. In the Approval Rules section, select **New**.
5. On the approval rule form, specify the name of the rule.
6. Enter a brief description of the approval rule.
7. Select the source for the request.
   For descriptions of all these fields, see Approval rule form.
8. Select **Submit**.

Managing the contract risk process

Protect your organization's interests, as the Third-party risk contract negotiator, often the corporate counsel, by incorporating specific contractual provisions so that you can address the risks identified using the Third-party Risk Management application.

If a contract is being negotiated with the engagement or third party, the due diligence request enters the Contract risk process state after all approvals have been processed. If you’re the assigned contract negotiator, you're notified through an automated email when all the approvals have been processed.

The following infographic shows the contract risk process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The [sn_vdr_risk_asmt.contract_negotiator] role is required and your contract negotiator performs all actions by using the Vendor Management Workspace or VRM Classic user interface.

You can view all pending **Due diligence requests for Negotiator**, **Tasks**, and **Issues** by navigating to the Task page.

To view the Task page, select **Workspaces** > **Vendor Management Workspace**, and then select the tasks icon .

To view your assigned requests, select **Due diligence requests for Negotiator**.

To view **Due diligence requests for Negotiator** in the VRM Classic user interface, select **All** > **Self-Service** > **Third-party Risk Management** > **Due Diligence Requests** > **My Requests in Contract Process**

From this view, you can accomplish the following tasks:

- Review the internal questionnaire responses.

  Navigate to the Due diligence request record page by selecting the Due Diligence Request (DDR) number. You can view the related internal questionnaire responses by selecting the Internal assessment (INA) number on the **Internal assessments** tab. For more information, see IRQ process management.

- Review the risk intelligence scores.

  Navigate to the Due diligence request record page by selecting the DDR number. You can view the related risk intelligence scores by selecting the **Risk intelligence scores** tab. For more information, see Viewing risk intelligence scores.

- Review the external questionnaire responses and supporting documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to the Due diligence request record page by selecting the DDR number. View the related external questionnaire responses and supporting documents by selecting the Third-party risk assessment (VRA) number on the **External assessments** tab. For more information, see Third-party (external) risk assessment management.

Note:
To learn more about the processes in the due diligence workflow, see Due diligence workflow for more information.

Contract Risk process (Only if the engagement is contracted)

If the engagement includes a contract, as the contract negotiator, you prepare the contract and do the following actions:

1. Access all data that is generated during the Request, IRQ, Due Diligence, and Approval processes to design and settle the contract and assess the following items:
   - Initial Inherent Risk Questionnaire (IRQ) responses and comments by the Third-party risk assessor. For more information, see IRQ process management.
   - Risk data from the risk intelligence providers. For more information, see Viewing risk intelligence scores.
   - Responses to third-party questionnaires and engagement questionnaires. For more information, see Third-party (external) risk assessment management.
   - Issues and tasks for the third-party contacts that were assigned to you by the Third-party risk manager. Assigned issues and tasks are listed on the tasks page.
2. After the contract is fully signed by all parties (executed), attach the contract and activate the engagement by selecting **Contract executed** and then complete the following actions from the **Details** tab on the due diligence request record page:
   a. Set the **Contract start date** for the engagement.
   b. Set the **Contract start date** for the third party if not set previously.
   c. Set the **Contract expiration date** for the engagement to the requested end date.
   d. Update the due diligence request's state from Contract risk process to Engagement contract executed.

After the contract is executed, the **Contract start date** and **Contract expiration date** fields are read-only and available to view from the **Details** tab for the third party and engagement in the Vendor Management Workspace.

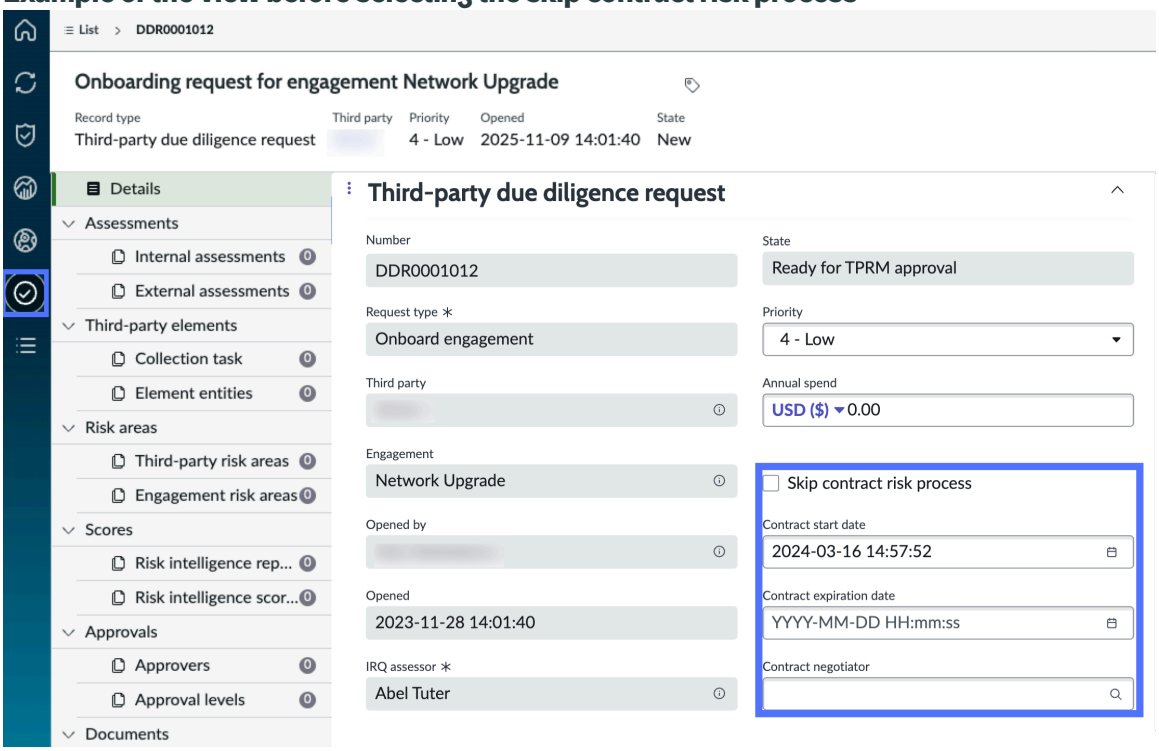
Note:
After opening an assigned task, select **Browse** in the **Attachments** section to select and add a contract. If you want the contract to appear in the Documents related list, select **Documents** and on the Documents page select **New** to add a new contract document or **Link Documents** to attach an existing contract document. For more information about the Document Management system, see Document Management system in Third-party Risk Management.

Follow the same process in step 2 to activate an engagement for due diligence requests, onboard an engagement, and reassess an engagement for contract renewal.

Contract Risk process (contract is skipped)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

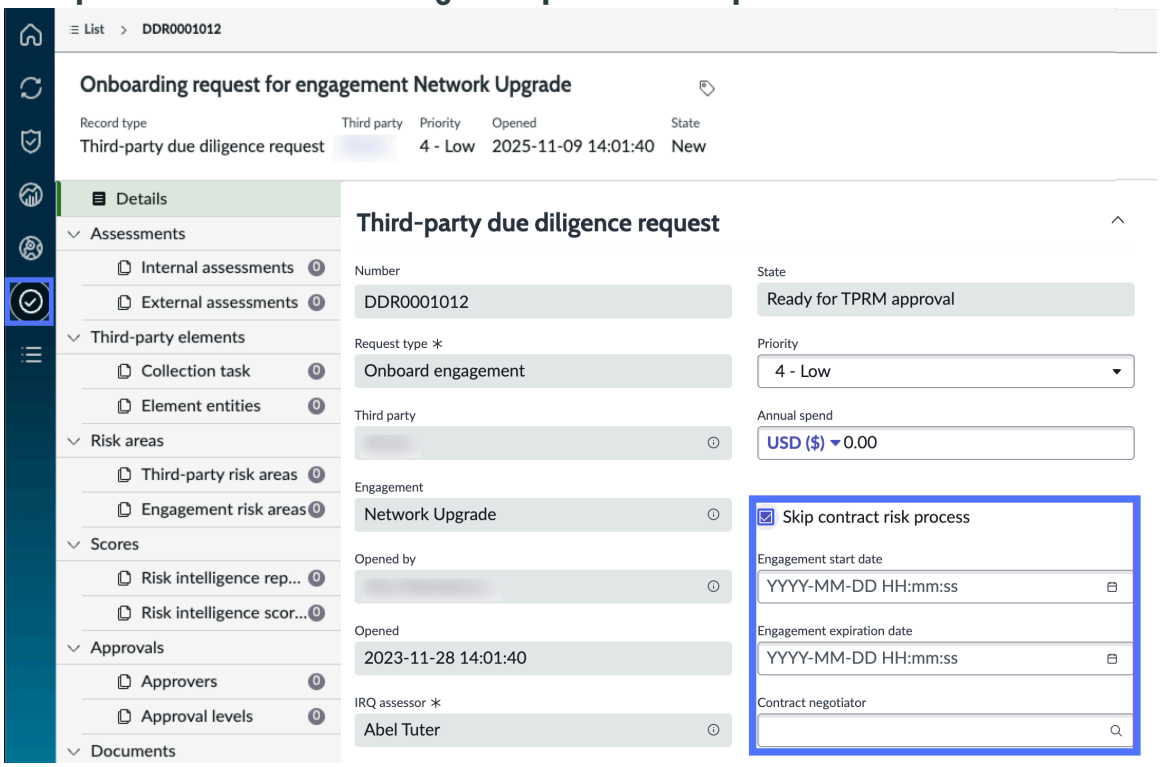
If the engagement doesn't require a contract, you can skip the contract by selecting **Skip contract** from the **Details** tab on the due diligence request record page.



The following changes take place:

1. The **Contract start date** is changed to **Engagement start date**.
2. The **Contract end date** is changed to **Engagement expiration date**.
3. A required **Justification** field appears. Enter an explanation for skipping the contract.
4. The due diligence request's state is updated from Contract risk process to Contract risk process skipped.
5. After the owner closes the request, the engagement is **Active**.

Note:
Skipping in this context is a way of intentionally not participating in the contract risk process that was initially scheduled or expected.

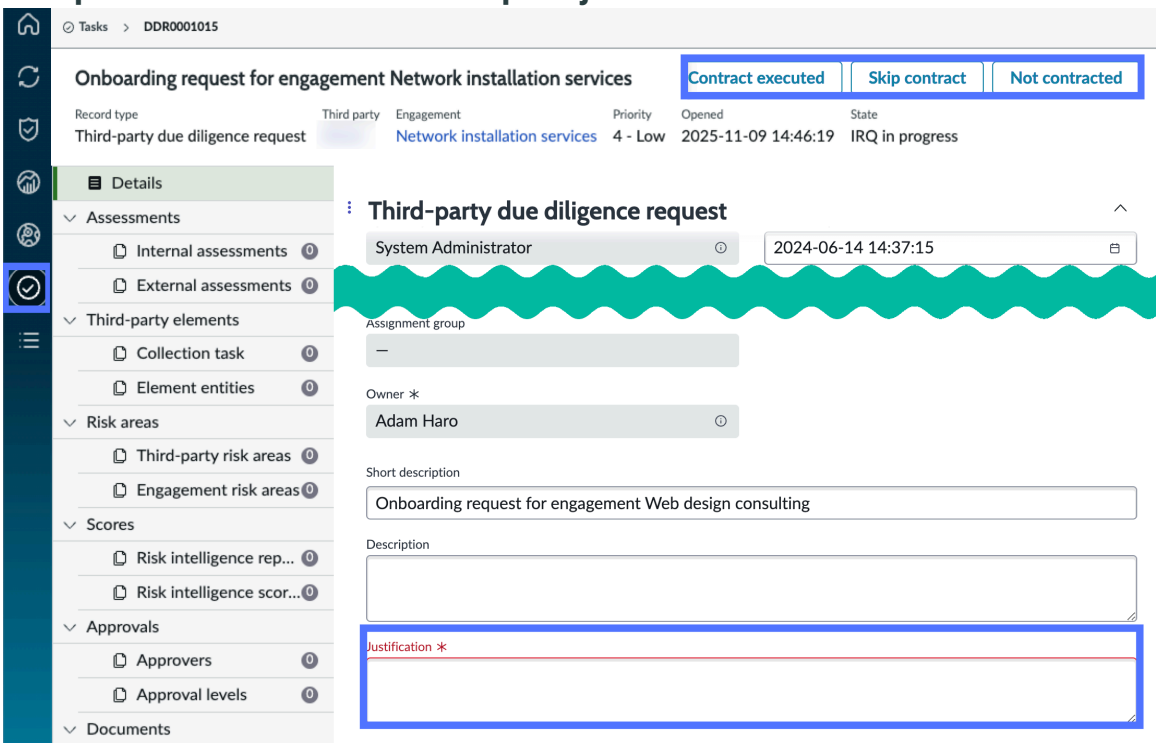


The following examples show the contract start and expiration date before and after you select the skip contract risk process.

Example of the view before selecting the skip contract risk process

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of the view after selecting the skip contract risk process



Note:
If the third-party risk manager or owner selects the **Skip contract risk process** option during the due diligence process, the assigned contract negotiator isn't notified and the Contract risk process state is skipped. An approver and owner can update the **Skip contract risk process** selection up until the approval process is completed. For more information about this process, see Due diligence request process management.

The following example shows the available selections and where the required justification box appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of available selections and required justification

Contract Risk process (Not contracted, onboarding engagement is rejected)

If an issue can't be resolved or the due diligence request is canceled, you can reject the engagement by selecting **Not contracted** from the **Details** tab on the due diligence request record page.

The following actions take place:

1. A required **Justification** field appears. You must enter an explanation for rejecting the engagement.
2. The due diligence request's state is updated from Contract risk process to Not contracted.
3. After the owner closes the request, the due diligence request changes from Not contracted to Rejected.
4. All stakeholders are notified that the engagement isn't contracted and onboarding is rejected.

The owner can reopen the request and the due diligence request's state will update to the Ready for TPRM approval state.

Contract Risk process (Contract terminated)

When the engagement is being offboarded and a contract is no longer required, you can approve the termination of the contract by selecting **Contract terminated**. The following actions then take place:

1. The due diligence request's state is updated from Contract risk process to Contract terminated.
2. The **Termination date** is updated with the current date.

Contract Risk process (Contract not terminated)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the engagement is being offboarded (relationship terminated) and the contract can't be terminated, you can reject the request by selecting **Contract not terminated** from the **Details** tab on the due diligence request record page.

The following actions then take place:

1. A required **Justification** field appears. You must enter an explanation for rejecting the request.
2. The due diligence request's state is updated from Contract risk process to Contract not terminated.
3. After the owner closes the request, the engagement is **Rejected** and all stakeholders are notified that the contract isn't terminated.

Contract Risk process (Contract not renewed)

If the engagement is being reviewed for renewal and the contract can't be renewed, you can reject the engagement by selecting **Contract not renewed**.

The following actions then take place:

1. A required **Justification** field appears. You enter an explanation for rejecting the engagement.
2. The due diligence request's state is updated from Contract risk process to Contract not renewed.
3. After the owner closes the request, the engagement is **Rejected** and all stakeholders are notified that the contract isn't renewed.

Contract Risk process (Request additional due diligence)

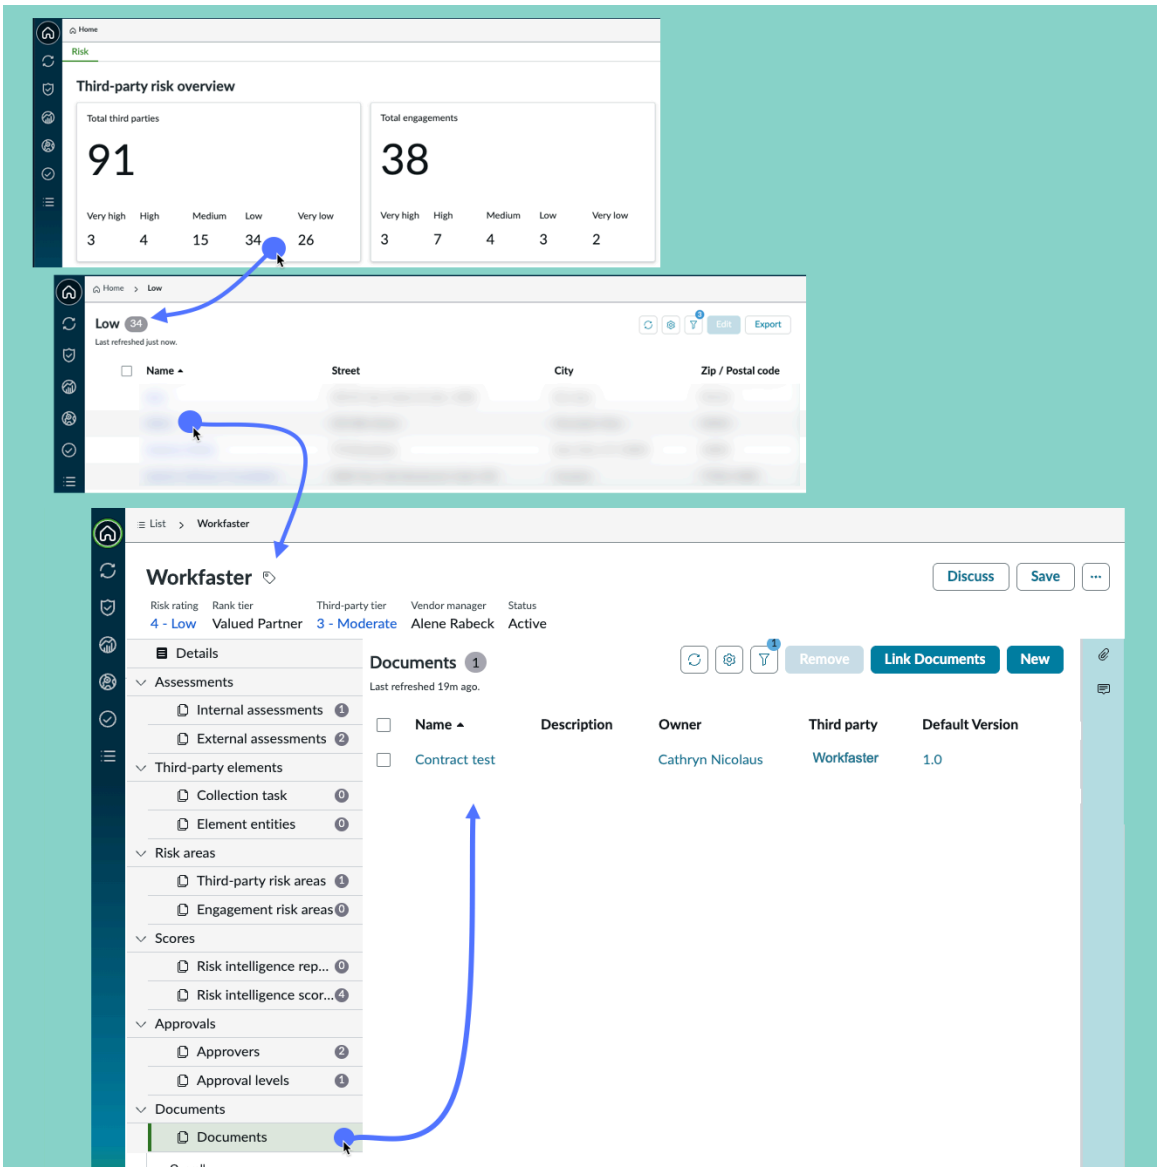
If you require additional due diligence, you can reject the engagement by selecting **Request additional due diligence** from the **Details** tab on the due diligence request record page.

The following actions then take place:

1. A required **Justification** field appears. You must enter an explanation for requesting additional due diligence.
2. The due diligence request's state is updated from Contract risk process to Due diligence.
3. After the owner closes the request, it's updated to the Due diligence process state and all stakeholders are notified that the engagement requires additional due diligence.
4. Either you, as the contract negotiator, or the owner can reopen the assessment and attach a new questionnaire to restart the process.

After the contract risk process is completed, the owner receives an email notification. Only the Third-party risk manager or owner can close a due diligence request.

Note:
For more information on viewing contracts associated with due diligence requests, see Accessing DD requests that are in the contract risk process.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing DD requests that are in the contract risk process

You can view the contracts associated with each engagement or third party and alongside detailed information such as the expiration, start date, end date, and state. You can also manage and update contract processes.

Accessing contract information

1. Select **Workspaces** > **Vendor Management Workspace**.
2. On the **Risk** tab, select the home page icon .
3. In the Third-party risk overview section, select any number in a box to open the list of third parties or engagements with that value.
4. Select a third party or engagement name to open all tabs for the item and then select the **Documents** tab.

5. Select a **Name** to view detailed information.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing contract processes

Viewing basic information about a contract on the Details tab

From the details tab you can view and adjust contract information. You can also attach files.

Contract specific information on the Details tab

Column	Description
Contract Number	Assigned ID for the contract. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Start date, End date	Dates for the beginning and end of interactions with the engagement.
State	Current state of the contract: Draft, Active, Expired, or Cancelled.
Substate	Current substate of the contract: Extension Active, Renewal Active, Awaiting Review, Under Review, Approved, Renewal Approved, Rejected, Renewal Rejected, Extension Approved, Extension Rejected.
Expiration	Current state of expiration: (empty), Expired, Within 30 days.

Related topics

Contract Management

Working in the VRM Classic user interface

While you can continue to use the legacy user interface to perform Vendor Risk Management tasks, the Vendor Management Workspace offers enhanced TPRM features and more useful reports.

Configure a risk assessment to recur on a schedule

Configure a third-party risk assessment to recur on a schedule to regularly update risk results for a third party or an engagement.

Role required: sn_vdr_risk_asmt.vendor_assessor

Create a VRM third party record

Configure a third-party risk assessment to recur on a schedule to regularly update risk results for a third party or an engagement.

Role required: admin or sn_vdr_risk_asmt.vendor_risk_manager.

Setting up VRM third-party hierarchies and engagements

Create third-party hierarchies by defining the parent-child relationships between the parent third party and all of their subsidiaries. You do this task because some organizations work with third parties that have subsidiaries (or subsidiaries of subsidiaries) that can pose a potential risk to your business. You can perform

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

assessments at each subsidiary organization and roll up the results to calculate an overall risk score for the parent third party.

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor.

Define a VRM engagement

Define an engagement so that you can assess the risks that are associated with the services or products offered by a third party. Engagements can also represent the products or services that are provided to the parent third party, either directly or from departments, partners, or subsidiaries that you can also assess for risk.

Tip:
Any person with access to your instance at your organization can request an engagement. That process is typically more streamlined and more effective than the process described here, where a Third-party risk (TPR) manager or TPR assessor defines an engagement. For more information, see Request due diligence for a third-party engagement.

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor.

VRM third-party risk tiering assessments

Organizations use risk tiering to classify their third parties into categories of potential risk posed at the time of onboarding. The standard predefined risk tiers are None, Low, Minor, Moderate, High, and Critical. Each risk tier has associated assessment questions and document requests.

Managing external risk assessments — Legacy process

Before the TPR manager closes an assessment, stakeholders create issues and tasks, usually during the **Generating observations** state. The TPR assessor assigns third parties as needed and communicates using comment streams to achieve closure on non-compliance. The third-party primary contact uses the Third-party portal to view all assessments.

Create an external assessment — Legacy process

Create an assessment and initiate the third-party risk assessment life cycle.

Important:
Starting with version 18.1.3 of Third-party Risk Management the Vendor Risk Overview dashboard is deprecated. If Third-party Risk Management was installed prior to 18.1.3 the Vendor Risk overview dashboard is still available for your use.

Create a VRM third party record

Set up the key data and contact information for a third party that your organization will engage.

Before you begin

Contact your system administrator before you update the portfolio of third parties.
Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_risk_admin

About this task

In addition to adding new records, TPR managers make ongoing updates to third-party information, including risk security scores, risk tiers, critical third-party contacts, and the business services that the third parties fulfill.

You can import third-party data from a spreadsheet, integrate the data from an onboarding system, or import data from the vendor table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use either of the following methods to start the process:
   - In the Vendor Management Workspace, select the list icon and then navigate to **Third parties** > **All Third parties**.
   - Navigate to **All** > **Third-party Risk Management** > **All Third parties**.
2. Select **New** and then fill in the fields.

Third party form

Field	Description
Name	Third party name.
Website	URL for the third party.
DUNS number	Unique numeric identifier for the single business entity. A DUNS number is not legally required for a business.
Industry	Type of industry.
Vendor type	Specify the type of product or service that the third party will provide.
Parent	If you set up third-party hierarchies, and this third party is a subsidiary, select the parent third party.
Total annual spend	Expected amount that you expect to spend annually on this third party.
Security Score	The security score provided by a risk intelligence provider.
Score provider	The risk intelligence provider that provided the normalized security score.
Status	Status of the third party.
Contract start date	Date that the contracted engagement should start.
Risk rating	After third-party risk assessment responses have been received, this weighted average of the components (that is, the risk ratings of assessments, engagements, and subsidiaries) is calculated. For more information, see Setting up VRM third-party hierarchies and engagements.
Rank tier	Type of supplier.
Third-party tier	Risk tier for the third party calculated by mapping the tiering score to a risk tier.
Vendor manager	The employee assigned as the manager to this third party.
Business owner	The employees that use this third party in their daily business.
Notes	Additional information.
Contact tab	
Street	Street address of third party.
City	City of third party.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State / Province	State or Province of the third party.
Zip / Postal code	Zip code or postal code of the third party.
Country	Country of the third party.
Phone	Phone number of the third party.
Fax phone	Fax number of the third party.
Profile tab	
Publicly traded	Is the third party publicly traded?
Stock symbol	Stock symbol of the third party.
Revenue per year	Annual revenue of the third party.
Number of employees	Count of the third party's employees.
Banner image	Banner image for the third party.
Banner text	Banner text for the third party.
Risk Scoring tab	
Computed risk rating	Average of the third-party risk area risk ratings.
Override risk rating	Enables you to override the computer risk rating for the third party.
Assessment risk rating	Calculated risk assessment rating. The risk rating scale helps business users better understand risk assessment results. For example, in the default settings, risk scores in the 20 through 39 range indicate high risk, while scores in the 60 through 79 range indicate low risk.
Engagement risk rating	Calculated engagement rating. The risk rating scale helps business users better understand risk assessment results. For example, in the default settings, risk scores in the 20 through 39 range indicate high risk, while scores in the 60 through 79 range indicate low risk.
Subsidiary risk rating Child third-party risk rating	Calculated risk rating for subsidiaries. The risk rating scale helps business users better understand risk assessment results. For example, in the default settings, risk scores in the 20 through 39 range indicate high risk, while scores in the 60 through 79 range indicate low risk.
Risk intelligence rating	See Integrating scores from risk intelligence providers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

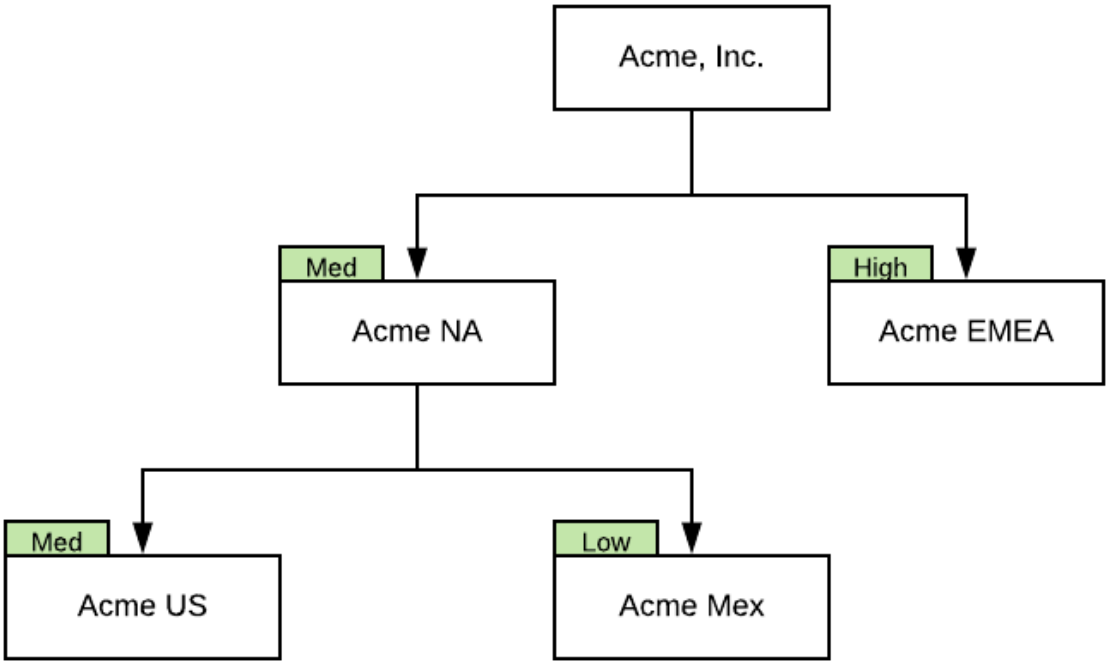
Field	Description
Overridden risk rating	If you selected **Override risk rating**, enter the new risk rating.
Overridden on	If you selected **Override risk rating**, date that the override occurred.
Justification	If you selected **Override risk rating**, you must enter a reason for the override.

3. If Third-party Risk Management is integrated with other GRC applications, or if you set up vendor hierarchies (that is, third-party risk domains, component criteria, and risk scoring rules), the form can include some or all of the following related lists.

   For more information, see Setting up VRM third-party hierarchies and engagements.

   Note:
   Risk domains are called "risk areas" in some platform applications.

   - **Child Vendors:** This table stores all information for subsidiaries. Subsidiary risk ratings are automatically aggregated and displayed on the **Risk Rating** tab on the Third-party form.
   - **Vendor Contacts:** This table stores information for all of the third-party stakeholders. Typically, the customer creates one primary third-party contact and one or more secondary contacts. The primary contact adds other contacts to the list.
   - **Business Services:** The Services table is part of the CMDB. It relates the third parties to the services they provide. For example, assume the IT team has a service called “Video Conference Services” that is used for internal employees to communicate internally and with customers. That business service, they have decided, comes from Zoom rather than building anything in-house.
   - **Vendor Engagements:** This table stores all engagement information for third parties. Engagements risk ratings are automatically aggregated as displayed on the **Risk rating** tab on the Third-party form.
   - **Tiering Assessments:** This table stores the history of tiering assessments.
   - **Repeating Assessments:** This table stores the history of recurring assessments.
   - **Assessments:** This table stores the history of assessments. Assessment risk ratings are automatically aggregated and displayed on the **Risk rating** tab on the Third-party form.
   - **Vendor Risk Components:** This table stores all third-party risk components. If third-party risk components (that is, assessments, engagements, or subsidiaries) are present, their risk ratings are automatically aggregated and displayed on the **Risk rating** tab on the Third-party form.
   - **Issues:** This table stores the history of issues.
   - **Tasks:** This table stores the history of tasks.



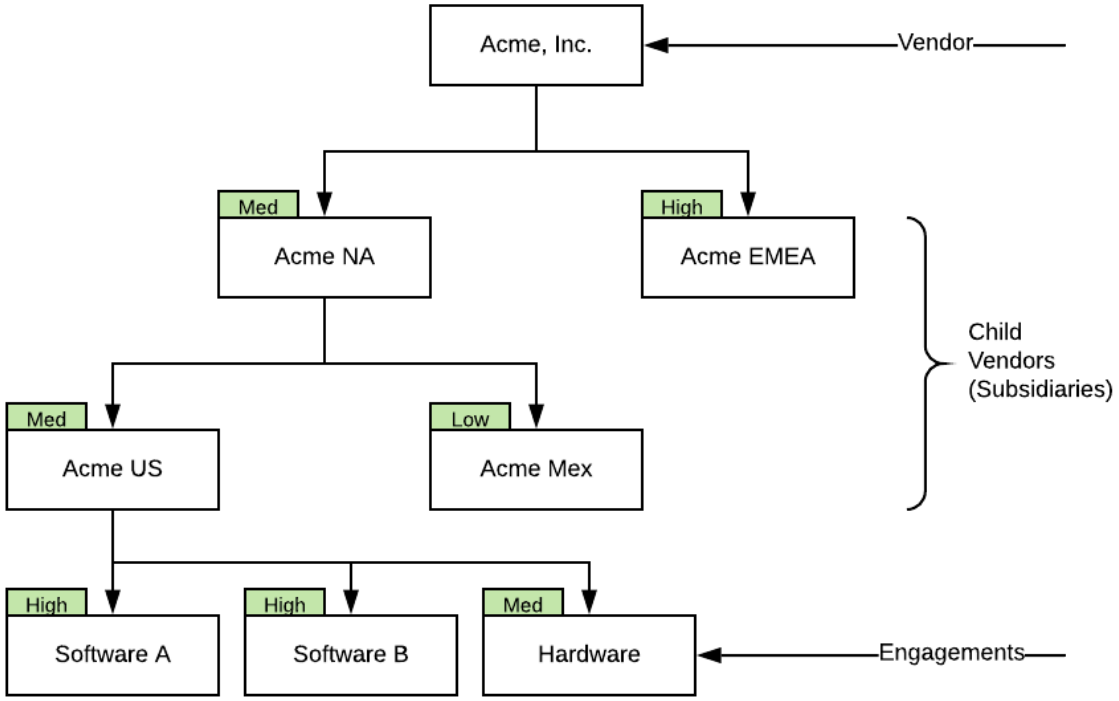
Setting up VRM third-party hierarchies and engagements

Create third-party hierarchies by defining the parent-child relationships between the parent third party and all of their subsidiaries. You do this task because some organizations work with third parties that have subsidiaries (or subsidiaries of subsidiaries) that can pose a potential risk to your business. You can perform assessments at each subsidiary organization and roll up the results to calculate an overall risk score for the parent third party.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party hierarchy

In this example, parent organization Acme has two subsidiaries and Acme NA has two subsidiaries. In this hierarchy, you perform risk assessments for the parent third party and all subsidiaries and calculate risk scores for each entity. You can then aggregate (roll up) the risk scores to calculate the risk score for Acme.



Third-party hierarchy with subsidiaries and engagements

Engagements represent products or services provided to the parent organization—either directly or from subsidiaries—that you can assess for risk. In the case where a subsidiary provides engagements, the risk scores assigned to the engagements are rolled up to calculate the risk score of the subsidiary, which in turn roll up to the parent organization.

In this example, subsidiary Acme US has three engagements. As in the previous example, risk is assessed for the parent, all of its subsidiaries, and all of their engagements. The risk scores are then rolled up to calculate the risk score for the parent.

See Define a VRM engagement.

Overview: Setting up a third-party hierarchy

Note:
The setup procedures in this section apply only if you work with multi-layered third parties; that is, third parties that operate subsidiaries. They also guide you through the setup of engagements offered by subsidiaries. If these are not the types of third parties you do business with, and you do not want to set up third-party hierarchies, these procedures are optional.

Setup procedures for third-party hierarchies

Setup procedure	Description
Define third-party risk areas.	A risk domain defines the type of risk to assess for a third party. For example, you might want to assess a data-management third party in terms of security risk and a bank in terms of financial risk. Security risk and financial risk are risk domains. Some platform applications refer to risk domains as "risk areas." See Define a third-party risk domain.
Define third-party risk area criteria.	A third-party risk area criteria is a group of risk domains (sometimes called risk areas in other platform features) that applies to a particular type of third party. See Define third-party risk area criteria.
Define component criteria.	Components are the entities for which you can assess risk. The base system includes the engagements, external

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup procedures for third-party hierarchies (continued)

Setup procedure	Description
	monitoring, subsidiaries, and third-party risk assessments components. Risk is calculated for each component and then the risk is aggregated and rolled up to calculate a third-party risk rating. See Define component criteria.
Define engagements for a third party	Define an engagement so that you can assess the risks that are associated with the services or products offered by a third party. Engagements can also represent the products or services that are provided to the parent third party, either directly or from departments, partners, or subsidiaries that you can also assess for risk. As engagements are defined, you can define primary and secondary contacts for both third parties and engagements. Each type of contact can perform specific activities in the Third-party portal. See Define a VRM engagement.
Define engagement risk scoring rules.	An engagement risk-scoring rule specifies component criteria that determine which engagements are selected for assessment. For example, a rule could enable assessments for engagements that involve more than $40,000 annual business. Engagement scoring rules apply only to engagements. See Define engagement risk scoring rules.
Define third-party risk scoring rules.	Define criteria, based on risk scores, that determine which third parties require assessments. Third-party risk scoring rules apply to subsidiaries and engagements and to third-party risk areas. See Define third-party risk scoring rules.

Define a VRM engagement

Define an engagement so that you can assess the risks that are associated with the services or products offered by a third party. Engagements can also represent the products or services that are provided to the parent third party, either directly or from departments, partners, or subsidiaries that you can also assess for risk.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor

Procedure

1. On the **Risk** tab of the Vendor Management Workspace, select **Create engagement** in the Quick actions box.
   The Create third-party engagement form opens to the **Details** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. **Optional:** Select **Browse** to select and add an attachment.
3. Fill in the form and then select **Save**.

Create third-party engagement form

Field	Description
Third-party engagement section	
Name	Unique name for the engagement. Ideally, mention the product or service that is the subject of the engagement.
Third party (Vendor)	The third party for whom you are creating this engagement record.
Type	Type of product or service to be provided by the engagement organization.
Start/End date	Enter start and end dates to define how long the engagement is valid.
Contract start date / end date	Preferred dates for the beginning and end of interactions with the third party.
Contract expiration date	The date on which the engagement ends officially and legally.
Status	Select the current status of the engagement. ○ Active ○ Onboarding ○ Prospect ○ Active unauthorized ○ Terminated ○ Onboarding rejected **Note:** An engagement starts in the inactive state. An engagement moves to the active state when a contract is in place or you take part in an active relationship with the third party.
Risk rating	Displays the risk rating assigned to the engagement after an assessment has been performed.
Engagement tier	The tier used for this engagement. See VRM third-party risk tiering assessments for details of how the tier is determined.
Annual spend / Value	The annual monetary spend associated with this engagement's services.
Engagement manager	Specify the person who will monitor, prioritize, and act on responses to external questionnaires, issues, and tasks. Select the lock to lock/unlock the field.
Business owner	Specify the person who is familiar with the engagement organization and the product or services that will be engaged. Select the lock to lock/unlock the field.
Notes	Enter text that describe the engagement to other users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Contact section	
Street, City, State/ Province, ZIP/Postal code, Country, Phone, Fax	Standard contact information for the engagement organization.
Latitude and Longitude	The **Latitude** and **Longitude** values are used to mark the location on the Risk concentration map. See TPRM Risk concentration map.
Risk Ratings section	
Computed risk rating	The calculated **Computed risk rating**. The value is overall risk rating for the third party, calculated after the assessment by rolling up all of the TPR assessors' risk ratings.
Override risk rating	Option to override the computed rating. If you select the check box, then specify the following values: ○ Overridden risk rating. Select the new risk rating. ○ Overridden on: The system auto-populates the date that the override occurred. ○ Justification: Enter the reason that you overrode the value.

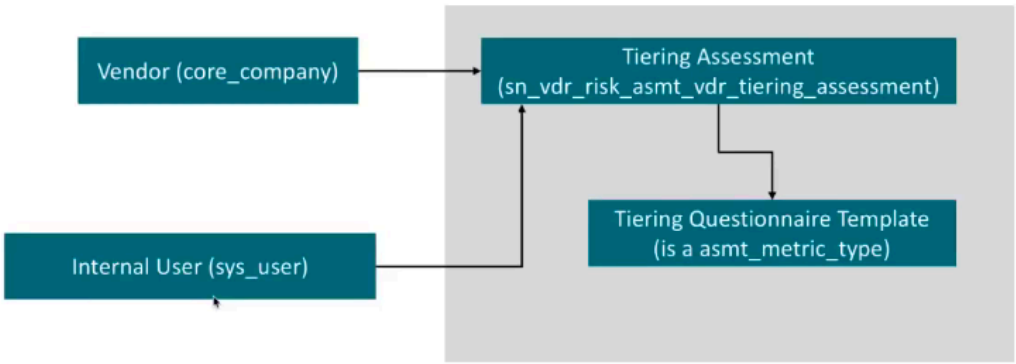
VRM third-party risk tiering assessments

Organizations use risk tiering to classify their third parties into categories of potential risk posed at the time of onboarding. The standard predefined risk tiers are None, Low, Minor, Moderate, High, and Critical. Each risk tier has associated assessment questions and document requests.

The more complete IRQ process replaces tiering

In the TPRM application, the IRQ is an internal questionnaire that improves the original tiering assessment process. IRQs enhance internal risk assessments with increased flexibility, control, and scalability. Unlike a tiering assessment where external questionnaires are determined solely by the risk tier, an IRQ can dynamically trigger external questionnaires based on both respondents' answers and risk tier.

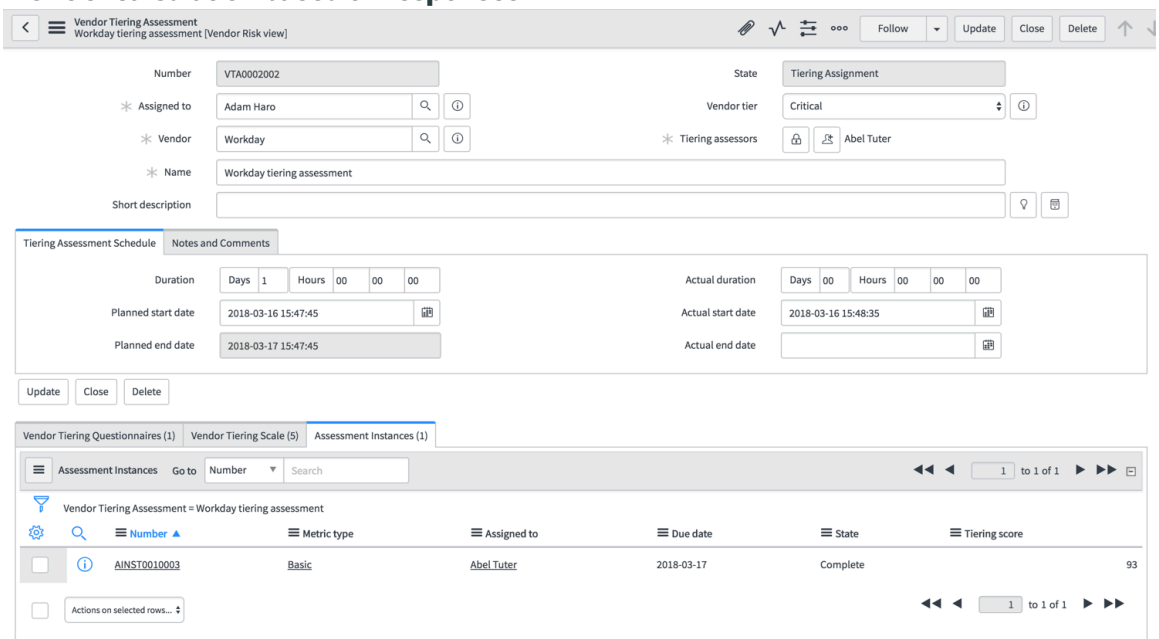
To enable a seamless transition to TPRM, you have the option to duplicate existing tiering assessments and designate them as IRQ internal assessments. Risk tiering is supported as an unchanging legacy process.



Legacy operation

1. Most organizations import their third-party portfolio through a spreadsheet or an integration with another onboarding solution. Third-party risk (TPR) managers make ongoing updates to third-party information, including risk security scores and risk tiers.
2. The TPR manager or TPR assessor determines the risk tier or categories of risk exposure for the third party.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. The TPR manager selects the third party, assigns the tiering questionnaire template, and assigns the internal assessor that is required to complete the assessment.

Risk tiering assessment table relationship

4. Internal stakeholders navigate to **Self-service** > **My Assessments and Surveys** to complete and submit the assessment.
5. After the internal assessor has responded to the questionnaire, the system calculates the tiering score as the average of all scores. The TPR manager can initiate the risk assessment or a configured business rule can auto-send one. When the assessment is closed, the system assigns a risk tier to the third party based on the tiering score.

Risk tier calculation based on responses

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk tiering scale and scoring calculations

Risk tiering process

1. The tiering assessment initiates an assessment instance for the assigned internal assessor.
2. Response scores are averaged to generate the tiering score.
3. The tiering score is mapped to risk tiers.
4. The risk tier is assigned to the third party when the tiering assessment is closed.

Create a VRM tiering assessment

The TPR assessor creates a tiering assessment from the vendor record, initiating the third-party risk tiering assessment life cycle. Also, third-party risk managers can select multiple third parties at a time and trigger multiple third-party risk tiering assessments.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

The more complete IRQ process replaces tiering.

Important:

In the TPRM application, the IRQ is an internal questionnaire that improves the original tiering assessment process. IRQs enhance internal risk assessments with increased flexibility, control, and scalability. Unlike a tiering assessment where external questionnaires are determined solely by the risk tier, an IRQ can dynamically trigger external questionnaires based on both respondents' answers and risk tier.

To enable a seamless transition to TPRM, you have the option to duplicate existing tiering assessments and designate them as IRQ internal assessments. Risk tiering is supported as an unchanging legacy process.

Procedure

1. Use either of the following methods to start the process:
   - On the **Risk** tab of the Vendor Management Workspace, select **Create tiering assessment** in the Quick actions box.
   - Navigate to **All** > **Third-party Risk Management** > **Assessment Submission Rules** > **Tier Based Submission**.
2. Fill in the fields on the **Details** tab and then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tiering Assessment section

Field	Description
Name	Name of the tiering assessment.
Short description	Description of the tiering assessment.
Number	For each risk tiering assessment, the system auto-assigns a unique ID number that starts with the text VTA. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Applies to	The entity to which the assessment applies: ○ **Third party**: The parent organization. ○ **Engagement**: The organization within the third party that will supply the product or service.
Third party	Vendor being assessed.
State	○ Draft: Default value while the assessment is being defined. ○ Awaiting Response ○ Tiering Assignment ○ Closed
Assigned to	TPR manager assigned to manage the tiering assessment process.
Tier level	Risk tier for the third party. ○ Critical ○ High ○ Moderate ○ Low ○ Minor The results of the tiering assessment and risk assessment help to determine the value. The TPR manager can override the value.
Tiering assessors	Internal assessors responsible for completing the tier assessment.

Tiering assessment schedule

Field	Description
Tiering Assessment Schedule	
Planned duration	Estimated duration of the assessment.
Planned start date / Planned end date	Date and time that work on the tiering assessment is expected to begin and end.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actual duration	Amount of time it took to complete the tiering assessment. This value is calculated using the **Actual state date** and **Actual end date**.
Actual start date / Actual end date	Date and time that work on the tiering assessment began and was completed
Notes and Comments	
Work notes	Information about the assessment process. Work notes are visible to users who are assigned to the issue.
Additional comments (Customer visible)	Public information about the third-party risk assessment.

3. Select **Save**.

   The **Compose section** on the **Details** tab enables you to permanently add text to the record. The Activity section is updated with any actions on issues and tasks, submissions to TP contacts, and also with work notes and comments that users add to the record. Add text in the following fields as needed:

   - **Work notes (Private)**: Information about the third-party risk assessment. Work notes are visible only to internal users who are assigned to the process.
   - **Comments**: Comments about the third-party risk assessment are visible both to internal users and to third-party contacts.

4. Select the **Tiering Questionnaires** tab, select the questionnaires to use for the tiering assessment, and then select **Add** and select **Add**.

   Note:
   The base system includes a sample tiering questionnaire called **Basic**. Modify and save the questionnaire to meet your needs.

5. Select **Save**.
6. When all settings are correct, select **Submit Assessment**.

Review VRM tiering assessment responses

Starting with GRC: TPRM version 15.0.0, risk tiering is a legacy process that you do not need to perform. Instead, use the IRQ process in the Vendor Management Workspace.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessor

About this task
The more complete IRQ process replaces tiering.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

In the TPRM application, the IRQ is an internal questionnaire that improves the original tiering assessment process. IRQs enhance internal risk assessments with increased flexibility, control, and scalability. Unlike a tiering assessment where external questionnaires are determined solely by the risk tier, an IRQ can dynamically trigger external questionnaires based on both respondents' answers and risk tier.

To enable a seamless transition to TPRM, you have the option to duplicate existing tiering assessments and designate them as IRQ internal assessments. Risk tiering is supported as an unchanging legacy process.

The TPR assessor can view risk tiering assessment responses after the internal stakeholders have submitted their assessment and adjust the scoring appropriately.

Procedure

1. Use either of the following methods to start the process:
   - In the Vendor Management Workspace, select the list icon and then navigate to **Tiering risk assessments** > **Open assigned to me**.
   - Navigate to **All** > **Third-party Risk Management** > **Tiering Assessments** > **My Open Assessments**.
2. Review, add, or change responses, as necessary.

Create a VRM automated risk assessment when the assigned risk tier changes

Create a risk assessment when the risk changes for a third party by using a tier-based assessment submission rule. With this process, you can start reassessing the risk automatically if the source of the tier change is the engagement or third party.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task
The comprehensive Inherent Risk Questionnaire (IRQ) process replaces tiering.

Important:

In the TPRM application, the IRQ is an internal questionnaire that improves the original tiering assessment process. IRQs enhance internal risk assessments with increased flexibility, control, and scalability. Unlike a tiering assessment where external questionnaires are determined solely by the risk tier, an IRQ can dynamically trigger external questionnaires based on both respondents' answers and risk tier.

To enable a seamless transition to TPRM, you have the option to duplicate existing tiering assessments and designate them as IRQ internal assessments. Risk tiering is supported as an unchanging legacy process.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Assessment Submission Rules** > **Tier Based Submission**.
2. Select a rule record or select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Security Score Providers form

Field	Description
Third party	Name of the third party to apply the rule to. This rule also applies to the selected third party's engagements. **Note:** Leave the field empty to apply the rule to all third parties and engagements.
Active	Option to turn a tier-based assessment submission rule on or off. When you select the check box, the tier-based assessment submission rule is on. When you clear the check box, the rule is turned off. **Note:** When all rules are turned off, the third-party risk assessments aren't automatically generated by tier changes.
Tier	Risk tier that should automatically generate an external assessment: ○ None ○ Critical ○ High ○ Moderate ○ Low ○ Minor
Assessment Template	Template to send when the risk tier scale changes to the tier that is specified in the rule.
Auto submit to third party	Option to automatically submit an external assessment to a third party or engagement after the external assessment is generated. If the option isn't selected, the external assessment stays in the **Draft** state after it's created.

4. Select **Update**.

   When a change to the tier activates the rule, the system generates an external assessment and sends it out to either the third party or engagement. An external assessment is only sent to the source of the tier change. If the third party or engagement caused the tier to change, an external assessment is sent to both the third party and the engagement.

Managing external risk assessments — Legacy process

Before the TPR manager closes an assessment, stakeholders create issues and tasks, usually during the **Generating observations** state. The TPR assessor assigns third parties as needed and communicates using comment streams to achieve closure on non-compliance. The third-party primary contact uses the Third-party portal to view all assessments.

External assessment workflow

1. The TPR admin creates questionnaire and document request templates.
2. The TPR manager creates internal assessment and external assessment templates, and also creates the notifications associated with the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The TPR manager prepares and sends the IRQ to internal stakeholders.
4. Internal stakeholders complete and submit the assessment.
5. After receiving the completed risk tiering assessments, the TPR assessor updates and closes the tiering assessment.
6. The TPR manager sends the assessments to the third party's primary contact. External risk assessments can be sent automatically based on changes to a risk score or risk tier.
7. The third-party contact signs into the Third-party portal to complete the risk assessment.

   The Third-party portal displays a list of assessments and the status of each. From the portal, the primary contact can invite other third-party collaborators to complete portions of the assessments. After other collaborators are identified, the primary contact submits the assessment.
8. The TPR assessor reviews the results of the assessments and closes each third-party assessment, creating issues for remediation as necessary. When an issue is created for a particular question, a visual indicator appears in the Third-party portal for the question.

   Remediating

   Remediating an issue means that the underlying issue causing the control failure or risk exposure will be fixed.

   Accepting

   Accepting an issue means you create an exception for a known control failure or risk. Controls that are **Accepted** remain in a non-compliant state until the control is reassessed. In this way, the issue can be used to document observations during audits.

Related topics

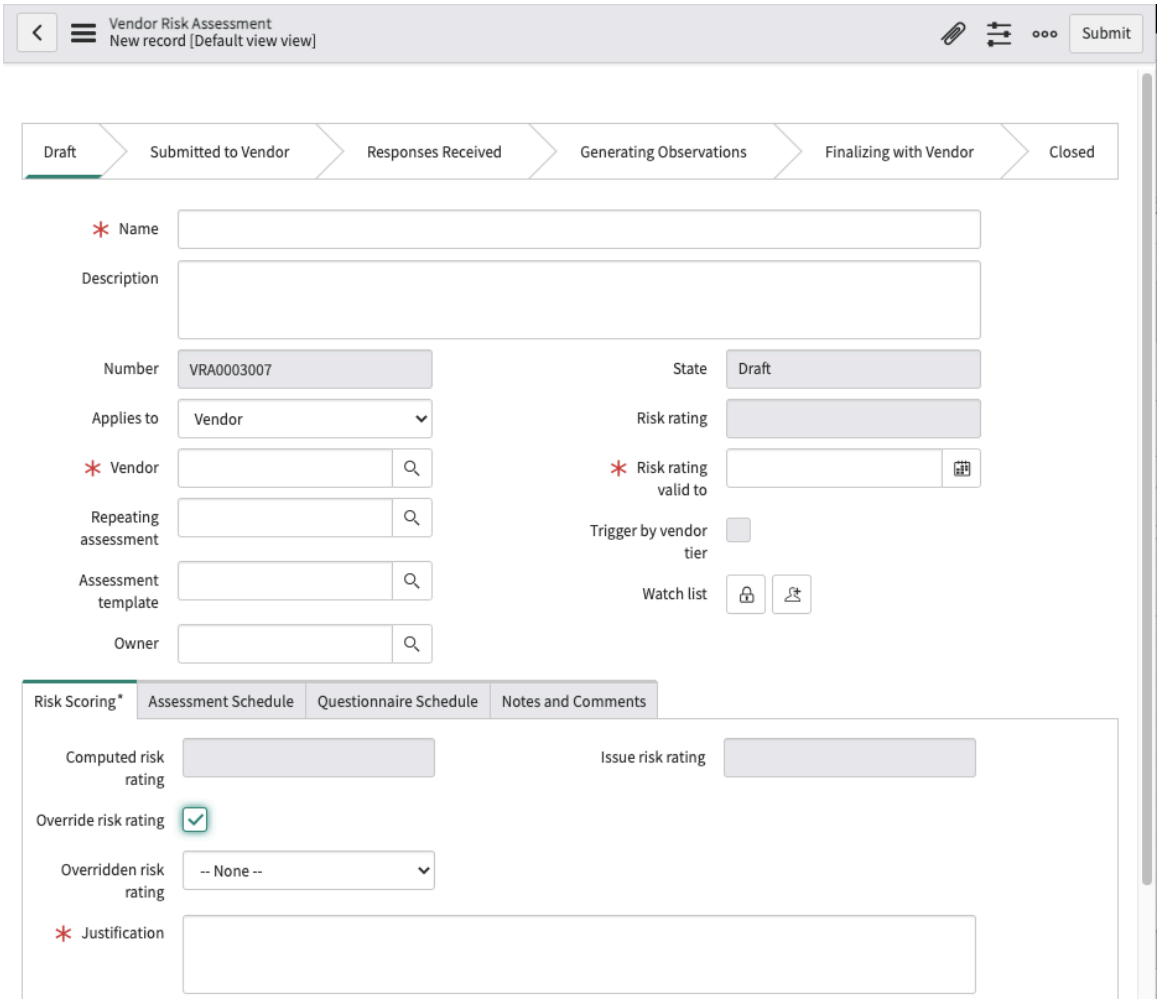
Life cycle states of a external assessment

Create an external assessment — Legacy process

Create an assessment and initiate the third-party risk assessment life cycle. An external assessment specifies the details for the third party or engagement and defines the plan for completing the assessment.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor



About this task

Assessments can be created on-demand or can recur on a specified schedule. When creating an on-demand external assessment, TPR managers select the questionnaire template or document request template and the third party. TPR managers can select multiple third parties at a time and automatically trigger assessments.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **External Risk Assessments** > **All Assessments**.
2. Select **New** and then fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor Risk Assessment form

Field	Description
Name	The name that identifies the third-party risk assessment on all forms and lists.
Description	A more detailed explanation of the issue.
Number	For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Applies to	The entity to which the assessment applies: **Third party** or **Engagement**.
Vendor	The assessed third party. **Note:** You can reactivate a third party that is in **Terminated** status. If such a request is accepted and closed, the third party's status is changed to **Active**.
Engagement	Select the engagement to assess. The field is visible only if you selected **Engagement** from the **Applies to** field.

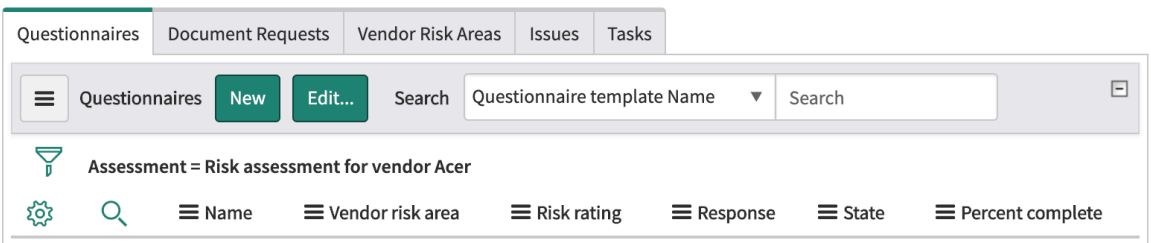
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Repeating assessment	The assessment used to create the current assessment. **Note:** You can create repeating assessments if you are using the classic assessment engine. You can configure rules that auto-generate and send questionnaires and doc requests to engagements and third parties using the Event-driven management feature if you are using the Smart Assessment Engine. For more information, see Configure a risk assessment to recur on a schedule and Event-driven management — automate assessment processes.
Assessment template	Select an assessment template to create questionnaires or document requests for this assessment. To use multiple templates to create multiple questionnaires or document requests for the assessment, leave the field empty.
Owner	The individual who owns an assessment for audit purposes and monitors and manages overall assessment processes. The owner is responsible for confirming that the assessment is completed in a timely fashion by the third party, reviewing their responses, and creating and resolving issues. To drive the assessment to its completion, they are notified when an assessment reaches a particular milestone. They must have the TPR manager or TPR assessor role. For new requests, if the **Owner** field is empty, then the following action happens: The system sends an email notification to all users in the group that is specified in the **Assignment group**. The message states that the request was received and is in the **New** state. The message also includes a link to the details page for the request. See Add users to groups based on responsibilities. **Note:** If the **Owner** field is empty and you select **Start the IRQ process**, then you become the owner.
Assignment group	For new requests, the **Assignment group** is set to **Due diligence request assigners**. The system sends an email notification to all users in the group that is specified in the **Assignment group**. The message states that the request was received and is in the **New** state. The message also includes a link to the details page for the request. On the due diligence request form: ○ Any member of the group can select **Assign to me** or set the **Owner** field to any other member of the group. ○ A TPR manager or TPR assessor can clear the **Assignment group** field or change the value to select from different TPR assessors in the **Owner** selection list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	The process of collecting assessment data from a third party transitions through several states. See Life cycle states of a external assessment for detailed descriptions.
Risk rating	The overall risk rating for the third party. ○ Critical ○ High ○ Moderate ○ Low ○ Minor **Note:** The **Risk rating** is determined by finding a risk rating scale range in which the risk score falls. It defines how a minimum and maximum range of assessment scores maps to a qualitative risk score.
Risk rating valid until	The date the risk rating expires. The date must be later than the **Risk rating valid to** date on any associated questionnaires or document requests.
Trigger by risk tier	Select the check box to initiate the assessment when the risk tier changes for the third party.
Watch list	Add users that should be notified when this record is modified.
Risk Scoring **Note:** Risk ratings are calculated and displayed after assessment responses have been received.	
Computed risk rating	Average of the third-party risk area risk ratings.
Override risk rating	Select the check box to override the computed risk rating for the third party. When selected, future changes to the assessment risk rating will affect only the computed risk rating, not the risk rating. **Note:** If you deselect a selected check box, then the computed risk rating is copied to the assessment.
Overridden risk rating	If you selected **Override risk rating**, enter the new risk rating.
Justification	If you selected **Override risk rating**, you must enter a reason for the override.
Issue risk rating	The risk rating for issues associated with the third parties being assessed. The issue risk rating is based on the priority of closed issues and how they were resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	○ If the issue was **Closed Completed**, it indicates that the issue was resolved. ○ If the issue was **Closed Incomplete**, it indicates that the third party failed to complete the associated questions. ○ If the issue was **Closed Cancelled**, it indicates that the issue didn't need to be resolved. If the issue is closed and the **State** of the assessment isn't closed or cancelled, the **Issue risk rating** is recalculated and displayed. **Note:** The **Computed risk rating** isn't affected by this calculation.
Override risk rating	Option to override the computed risk rating for the third party. When selected, any future changes made to the assessment risk rating will affect only the computed risk rating, not the risk rating. **Note:** If the check box is selected and then deselected, the computed risk rating is used.
Overridden risk rating	If you selected **Override risk rating**, enter the new risk rating.
Justification	If you selected **Override risk rating**, you must enter a reason for the override.
Assessment Schedule	
Planned duration (days)	Estimated duration of the assessment
Planned start date / Planned end date	Planned start and completion dates and times for work on the assessment.
Created by	User who created this record.
Created	Date/time the record was created.
Actual duration	The amount of time it took to complete the third-party risk assessment. This field is calculated using the **Actual state date** and **Actual end date**.
Actual start date	Date and time that work on the assessment began.
Actual end date	Completion date and time for the assessment.
Updated	Date/time when the record was last updated.
Questionnaire Schedule	
Planned duration (days)	The amount of time given to the third party to complete the assessment. The value is calculated using the **Planned state date** and **Planned end date**.

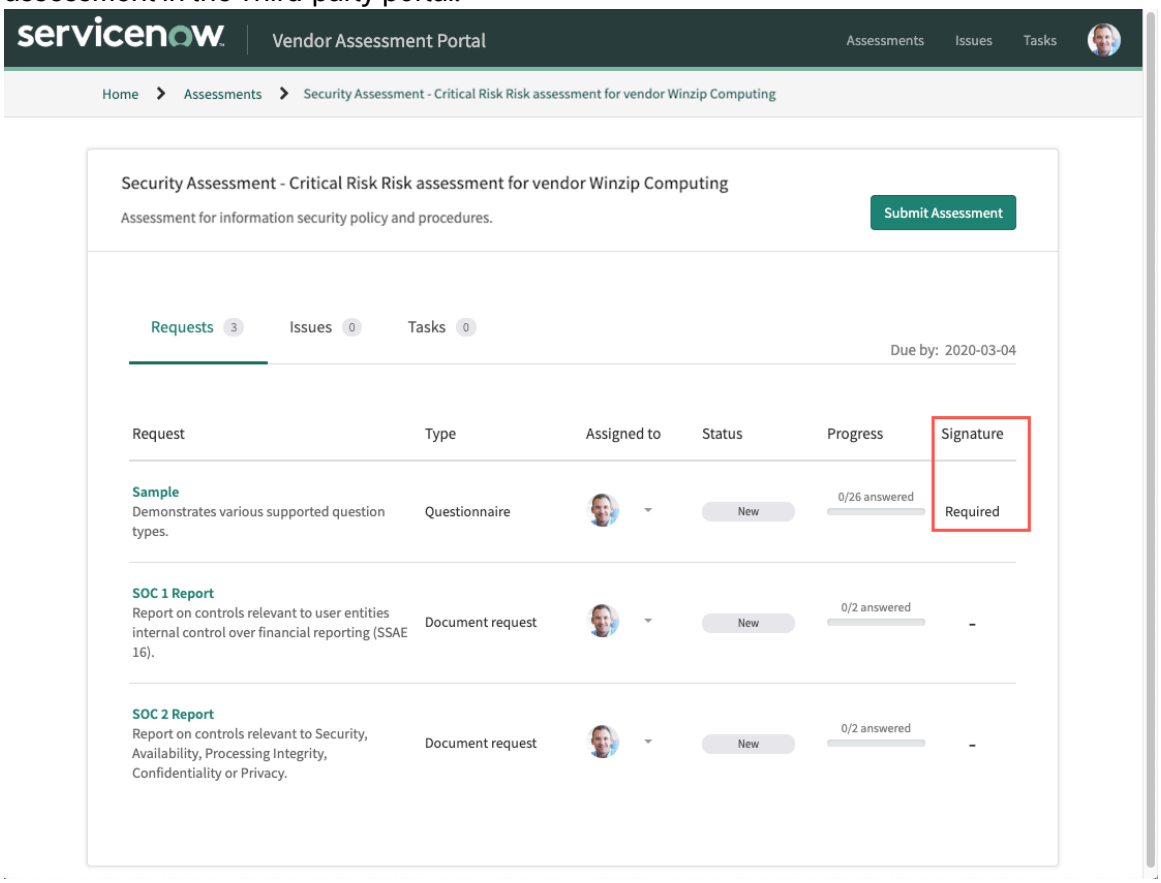
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Review duration (days)	Time allocated for the customer to review all questionnaires.
Due date	Deadline for third party to respond to and return all questionnaires.
Completion date	Actual date when third party completed all questionnaires.
Submitted to third party	Delivery date for third party questionnaires.
Resubmitted to third party	Date that questionnaires are resent to the third party.
Responses expected by	The date that your organization expects the responses to be returned by the third-party contact.
Notes and Comments	
Work notes	Information about the assessment. Work notes are visible to users assigned to the issue.
Additional comments (Customer visible)	Public information about the assessment.

3. Save the record.

   Additional related lists appear. If you left the **Assessment template** field empty and want to use assessment templates to associate multiple questionnaires and/or document requests with this assessment, use the Questionnaires or Document Requests related lists.

4. To associate existing questionnaires and/or document requests with the assessment, perform the following steps.
   a. Open the Questionnaires or Document Requests related list.
   b. Select **Edit**, select the questionnaires or document requests to use, and then select **Save**.
   c. Repeat for the other type of questions, if needed.
5. To create new questionnaire and/or document request templates and associate them with the assessment, see Create a questionnaire or document request template.



Important:
In the next step, you can choose to submit the questionnaire to the third party. To pre-populate the questionnaire with responses from the most recently closed assessment, you must select the **Include previous responses** option before you submit it to the third party. The setting cannot be changed after the questionnaire is sent to the third party. See Create a questionnaire or document request template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Submit to third party**.
   - The state of the assessment changes to **Submitted to third party**.
   - The templates that you selected generate questionnaires and/or document requests.
   - If the **Include previous responses** option is selected for a questionnaire, then previous responses are copied and added to the outgoing questionnaire. The notification in the Third-party portal includes the number, name, and closing date of the assessment that supplied the responses. The notification also includes a link to the assessment.
   - The primary third-party contact receives an email notification that includes a link to the assessment in the Third-party portal.

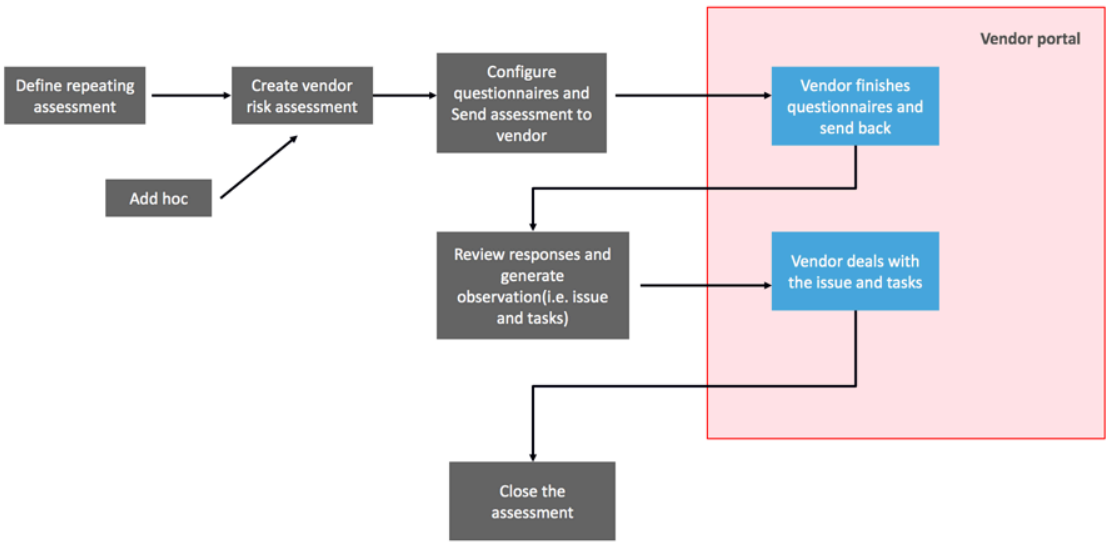
   Note:
   When you use the **Include previous responses** option, responses are copied from Assessment A to Assessment B one time. Any changes you make to Assessment A afterward won't be reflected in Assessment B. Both assessments remain separate.

7. When the third-party contact is ready to respond to the assessment, they open the assessment in the Third-party portal.

Note:
In the example, one of the questionnaires requires a signature. The third party or reviewer must save and e-sign the questionnaire or document request before it can be submitted. For more information, see E-signatures on questionnaires or document requests.

8. The TPR assessor moves the state of the assessment to **Generating Observations**.

   During this time, the TPR assessor can select the **View Response** link in the Document Requests or Questionnaires related list to view the response and provide comments or change responses, as necessary.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For any problems that arise, the TPR assessor creates an issue to track the remediation process (Finalizing with third party).

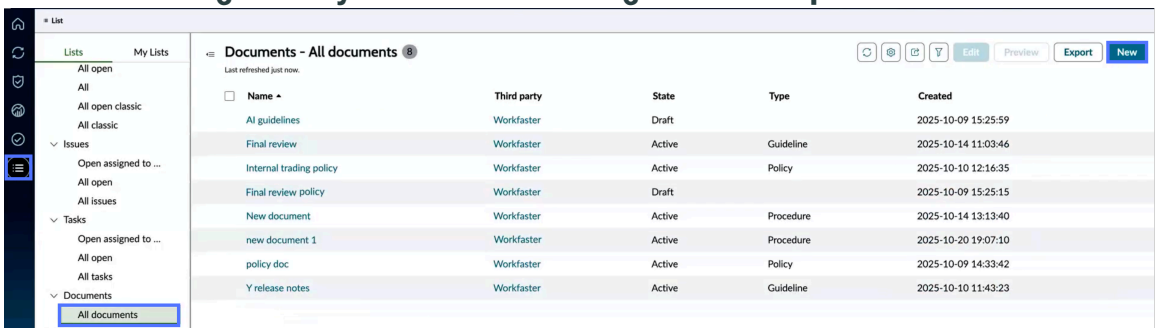
9. The TPR assessor moves the assessment to **Closed** state.

What to do next

The TPR assessor works through the third-party portal with the third party to close the assessment.

Document Management system in Third-party Risk Management

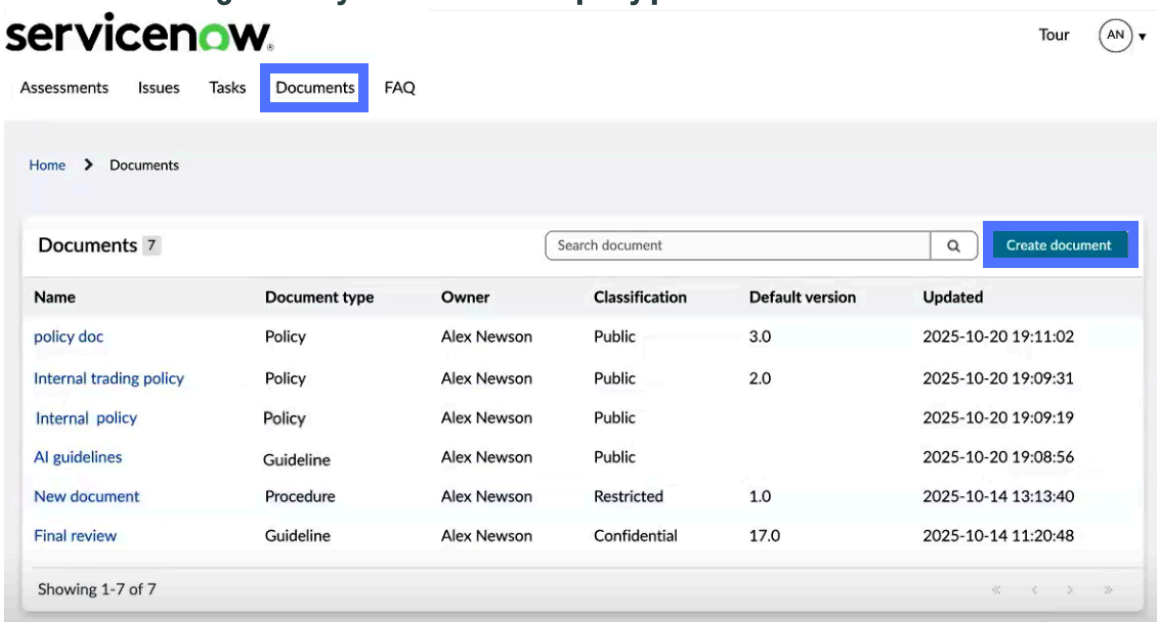
Learn how the enhanced Document Management system supports third-party collaboration and internal workflows in Third-party Risk Management (TPRM).



Document Management Overview

Starting with version 21.1.x, the Document Management System (DMS) in Third-party Risk Management (TPRM) provides a centralized repository for storing, organizing, and managing third-party documents throughout the vendor life cycle. DMS streamlines evidence tracking, reduces duplication, and improves audit readiness by enabling document reuse across assessments, contracts, issues, and tasks. Access DMS in the Vendor Management Workspace or third-party portal to create, manage, and reference documents. Primary contacts manage permissions in the portal. TPR assessors [sn_vdr_risk_asmt.vendor_assessor], TPR managers [sn_vdr_risk_asmt.vendor_risk_manager], and TPR administrators have write access, while third-party assessment reviewers [sn_vdr_risk_asmt.vendor_assessment_reviewer] have read-only access. DMS supports metadata, version control, search, reporting, and audit tracking for all document actions.

The DMS is accessible for internal users through the Documents module in the Vendor Management Workspace as shown in the following example.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Document Management System in Vendor Management Workspace

The DMS is accessible for external users through the Third-party portal as shown in the following example.

Document Management System in the Third-party portal

Key capabilities

- Third-party contacts can upload and manage documents using the third-party portal.

  For more information, see Upload and manage documents in the third-party portal.

- Internal users can create and access document records through the Documents module in the Vendor Management Workspace.

  For more information, see Create a document record.

- Users can manage document versions, download attachments, and track their metadata.

  For more information, see Create a document version.

- Documents can be linked to multiple TPRM record types with auto-rollup:
  - Tasks
  - Issues
  - Engagements
  - Assessments

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Link documents to a TPRM record.

- Internal users can manage role-based permissions for primary contacts and other internal users.

  For more information, see Define document sharing permissions.

- Each document version supports download options, advanced search and reporting for metadata and relationships, and complete audit tracking of actions and version history.

Document life cycle and traceability

Each document captures metadata including creation date, type, description, version, and status. Metadata is used for classification, reporting, and workflow routing.

Each document supports multiple versions. TPR assessors, managers, and administrators can upload new versions, view version history, and download attachments for any version. Versions are sorted by creation date in descending order.

Documents can be linked to assessments, engagements, issues, and tasks. These references automatically roll up to related third-party records. Duplicate references aren't allowed.

Note:
A linked document is a document record associated with another record (assessment, engagement, issue, or task) for traceability and reporting. Linking creates a formal relationship that supports life-cycle tracking. A reference is the entry that represents this link, shown in the document's References tab and the related record's Documents list. Each reference includes metadata like record type and ID. The key difference is that linking is the action and a reference is the result. Multiple references to one document are possible, but duplicate references to the same record aren't allowed.

All document actions including uploads and version updates are tracked for audit purposes. Audit logs are accessible to authorized users.

Collaboration and insights

All actions, including approvals and rejections, are tracked in the audit log for transparency and reporting. You can search documents by metadata fields and generate reports on document usage, status, and relationships. Filters include document type, risk category, expiration date, and third-party association. You can generate reports on document usage, version history, and linked records using the Reports module or Performance Analytics.

Report types can include:

- Document inventory report with metadata and version details.
- Linkage report showing documents associated with assessments, engagements, and tasks.
- Audit report for document actions and life-cycle events.

Limitations

- External users can't preview documents due to restrictions; they must download documents from the portal to view them.
- The third-party field is optional when creating a document. However, if the document is associated with a third party, this field is required. For internal documents with no third-party association, the field can remain empty.
- Document creation and versioning currently require separate steps.

Create a document record

Use the Document Management system to create document records in Third-party Risk Management.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessment_reviewer

- Any user with access to the Vendor Management Workspace can create a document.
- If you have the TPR Assessor [sn_vdr_risk_asmt.vendor_assessor] role, you automatically have write access to all documents.
- If you're the document creator, you also have write access regardless of your role.
- If you aren't the creator and don't have the TPR Assessor [sn_vdr_risk_asmt.vendor_assessor] role you only have read access to the document.

For more information on setting document permissions, see Define document sharing permissions.

About this task

The document management system in TPRM enables you to create, version, and reference documents. This ensures that all relevant parties have access to the necessary documents and that the document life cycle is properly managed.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **All Documents**.
2. Create a document record by selecting **New**.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create new document form.
4. Select **Submit** to save the document record.

What to do next

After submitting the document record, complete the following tasks to finalize the document setup:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add a version by uploading a document file. Only one attachment is allowed per version. For more information, see Create a document version.
- Define who can view, edit, or manage the document using the sharing permissions field. For more information, see Define document sharing permissions.
- Link reference records by associating the document with relevant records such as assessments, engagements, issues, or tasks to enable roll-up and traceability. For more information, see Link documents to a TPRM record.

Create new document form

On the Create new document form, fill in the fields for the document.

Create New Documents

Field	Description
Name	Unique name of the document.
Owner	Individual who owns a document for audit purposes.
Template	Option to determine whether the document is a template. This field isn't available in the third-party portal.
Default version	Document version that is used for document download. By default, the latest version is the default version. This field isn't available in the third-party portal.
Current version	Latest document version that is used for document download. This field isn't available in the Vendor Management Workspace.
Sharing permissions	Option that enables the document creator or owner to configure permission controls for the document. You can specify a user role and one of the following permission types: • Reader • Writer • Owner This field isn't available in the third-party portal.
Third party	Third party with which the document is associated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Documents (continued)

Field	Description
	When a third party is provided, sharing permissions are enabled automatically in TPRM. This field is required only if the document is associated with a third party. For example, internal documents may not need to be associated with a specific third party. **Note:** When a document is created by a third-party contact in the third-party portal, this field is auto- filled and sharing permissions are enabled.
Department	Name of the department that created the document. For example, Customer Support, Development, Finance, HR, or IT. This field isn't available in the third-party portal.
Type	Type of document based on the content. For example, Guideline, Policy, Procedure, or Contract.
Classification	Classification of the document. You can specify one of the following classification types: • Public • Restricted • Confidential • Internal
State	The state the document is in: Draft, Submit, Review, or Complete.
Description	A brief description about the document.

Create a document version

Use the document management system to version documents in Third-Party Risk Management (TPRM).

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A document can have many versions. You can view these versions as a related list within the document record.

The term "document" refers to the container record that holds document information such as its name, description, type and other metadata. While the document record doesn't contain the actual document file, it does contain versions in the record, which you can open, update, and track.

Use the attachment icon  to add documents to a record.

Alternatively, you can provide the link to a document in the URL field. You then access the actual documents by selecting the versions in the related list.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon  and then navigate to **All Documents**.
2. Select the document record that you want and then the **Versions** tab.
3. Select **New** to add a version.
4. On the form, fill in the fields.

Create New Documents

Field	Description
Document	Name of the document.
File type	File type of the document. You can attach a file or include a URL.
Version State	The state the document is in: Draft, Submit, Review, or Complete.
Notes	Any information related to the file.

5. Select **Save** to save the document record.

What to do next

After saving the document record, complete the following tasks to finalize the document setup:

- Define who can view, edit, or manage the document using the sharing permissions field. For more information, see Define document sharing permissions.
- Link references by associating the document with relevant records such as assessments, engagements, issues, or tasks to enable roll-up and traceability. For more information, see Link documents to a TPRM record.

Define document sharing permissions

Controls who can view, edit, or manage a document using the Document Management system in Third-party Risk Management (TPRM).

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Sharing permissions define which users or groups can view, edit, or manage a document. You can apply user criteria, individual users, or groups for granular control.

- If permissions don't apply correctly, review user criteria or group membership.
- If you can't edit permissions, request access from the document owner or administrator.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **All Documents**.
2. Select the document record that you want and then the **Versions** tab.
3. Locate the **Sharing permissions** field.
4. Select the type of permission control:
   - **User Criteria Permissions** – Apply conditions based on roles or attributes.
   - **User Permissions** – Add individual users.
   - **Group Permissions** – Assign access to groups.
5. Specify whether users can **View**, **Edit**, or **Manage** the document.
6. Select **Submit** to save changes.

What to do next
Verify that permissions work as expected by checking access from a user account with restricted rights.

Link documents to a TPRM record

Use the Document Management system to link documents to assessments, engagements, issues, and tasks for traceability in Third-party Risk Management (TPRM).

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessor

About this task
Linking documents ensures reusability and traceability across the TPRM life cycle. A single document can be referenced by multiple records such as assessments, engagements, issues, and tasks. Duplicate references aren't allowed.

If you want to link a document directly to a third-party, engagement, or assessment record instead of the document record, navigate to that specific record and add the document reference to the **Documents** related list. For example, **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Third-parties** > **All Engagements** select the engagement record you want, open the **Documents** related list, and select **Link documents**.

Note:

- If the selected record already has the document linked, the system displays an error and prevents duplicate references.
- If permissions restrict linking, request access from the document owner or administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Documents** > **All Documents**.
2. Select the document record that you want to add a document reference link to.
3. Open the **Document References** tab.
4. Select **New** to add a reference.
5. Choose the record type (Assessment, Engagement, Issue, or Task) and select the specific record.
6. Select **Submit** to save the reference.

What to do next

After linking the document, perform the following tasks:

- Verify that the reference appears in the **Document References** list.
- Confirm that the link rolls up to the associated third-party record for traceability. The linked document should be visible from the **Documents** related list of the Third-party record.
- Confirm permissions enable relevant users to view linked documents.

Using digital resilience third-party registers

Use the Digital Resilience Third-party Information Register application in the Vendor Management Workspace to create, update, and track assessments, branches, legal entities, and so on, and maintain registers of contractual arrangements with ICT third-party service providers.

Digital resilience third-party registers

Beginning with Release 19.1.x, the Digital Resilience Third-party Information Register application is supported for DORA compliance in the Vendor Management Workspace.

The Digital Resilience Third-party Information Register application is used to download the Digital resilience third-party registers. The application contains the Microsoft Excel template that includes all tabs for reporting purposes. It helps the financial entities to maintain a comprehensive register of their contractual arrangements with ICT Third-party service providers at the individual entity, sub-consolidated, and consolidated levels.

You can use Digital resilience third-party registers to create or edit the records in bulk or individually for assessments, branches, contracts, functions, legal entities, supply chains, third parties, or third-party engagements using the Microsoft Excel upload and download feature.

Note:
The IRM Professional license users can access Digital resilience third-party registers in the Operational Resilience Workspace. The TPRM license users can access Digital resilience third-party registers in the TPRM Workspace.

The Digital resilience third-party registers application fulfills multiple functions for the entities:

- Assists the entities in tracking their ICT third-party risks.
- Empowers the competent authorities in European Union to oversee ICT and third-party risk management within financial entities.
- Aids European Supervisory Authorities (ESA) in identifying Critical ICT third-party service providers (CTPP) for EU level supervision.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following applications are used in the background for the Digital resilience third-party registers application:

- Digital Resilience Third-party Information Register: This application is used to download the Digital resilience third-party registers application. It contains the Microsoft Excel template including all tabs for reporting purposes.
- Digital Operational Resilience Management: This application is used for uploading and downloading of all individual DORA tables. It's automatically installed when the Digital Resilience Third-party Information Register is activated.

For more information on configuring Digital resilience third-party registers and its possible use cases, see Configuring Digital resilience third-party registers and Use cases for updating the information registers.

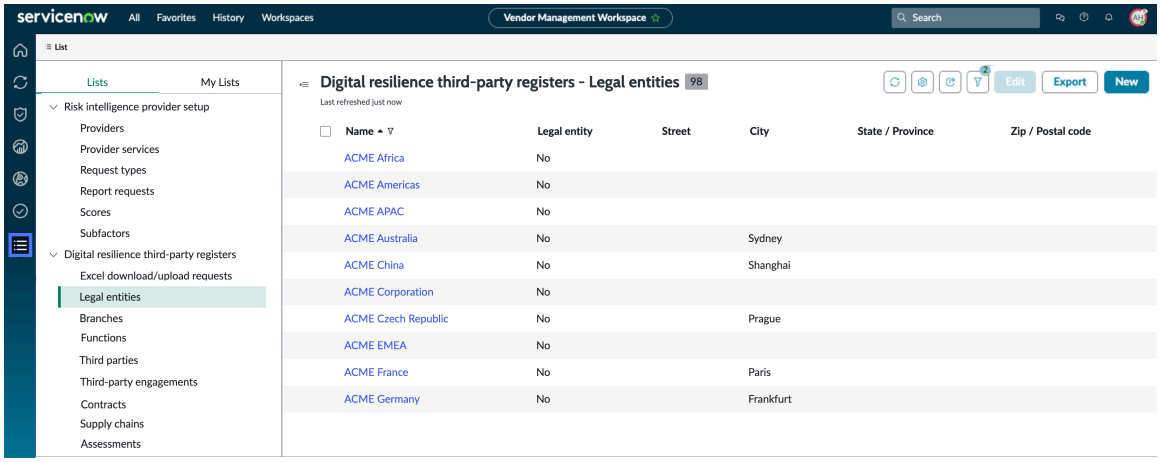
Digital Operational Resilience

Digital Operational Resilience refers to the ability of a financial entity to build, assure, and review its operational integrity and reliability. It ensures that the entity has the full range of ICT related capabilities that are needed to secure its network and information systems. These systems support the continuous provision of financial services and maintain their quality, even during disruptions. The continuity can be achieved directly or indirectly with the services provided by the ICT third-party service providers.

Digital Operational Resilience Act

Digital Operational Resilience aligns with the Digital Operational Resilience Act (DORA). It's a European Union (EU) regulation that came into effect on 16 January 2023 and it will be applicable from January 17, 2025. It enhances the ICT security of financial entities supervised by the European Supervisory Authorities (ESA)s and protects Europe's financial sector from major digital disruptions.

For more information on DORA and the Digital Resilience Third-party Information Register application, see https://www.eba.europa.eu/activities/direct-supervision-and-oversight/digital-operational-resilience-act and Exploring Digital resilience third-party registers.



Creating records for Digital resilience third-party registers

Third-party risk (TPR) assessors [sn_vdr_risk_asmt.vendor_assessor] and TPR managers [sn_vdr_risk_asmt.vendor_manager] can create and update these records by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. You must create or update these records in a specific sequence. For more information on this sequence, see Creating and reviewing the records.

Note:
TPR assessors and TPR managers can delete Third party, Third-party engagement, and Contract records. TPR administrators [sn_vdr_risk_asmt.vendor_risk_admin] can delete all record types by navigating to each individual record and selecting **Delete**.

The following example shows how records appear in the Digital resilience third-party registers in the Vendor Management Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following records can be manually created and updated.

Legal entities

You can create a legal entity record, by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. Here, you can view existing legal entities and enhance their digital resilience information to comply with DORA regulations. After installing the Digital Resilience Third-party Information Register application, a **Legal Entities** related list is added for existing companies that aren't already defined as a third party, enabling you to add their details. The Legal Entity record includes essential fields for regulatory reporting, such as the Legal Entity Identifier (LEI), name, country of registration, and entity type. These fields are offered as choice lists within the system. The system acknowledges the entity hierarchy, with no additional details required for ultimate parents, while subsidiaries must specify their parent entity. The date of registration for each legal entity is also noted. Additionally, specific details like the last update, integration date, removal status, deletion date, currency used, and total asset value are documented for each entity, as required by regulators for entities engaging with external third parties for outsourced technical services. Regulators mandate these specific details for legal entities engaging with external third parties for outsourced technical services.

Note:
Existing third parties aren't shown in the Legal entities list. Company records can only be defined as a Third party or Legal entity. For companies and legal entities, the Vendor option is set to **False**. (The check box isn't selected.)

For more information see, Create a legal entity and enhance digital resilience data, Create New Company form, and Create New Legal entity form.

Branches

You can create a branch record by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. This enables you to enhance the branch's digital resilience information to help ensure compliance with DORA regulations. A legal entity can operate multiple branches across different cities or countries, and all these branches can be documented. When a new branch is established, its information must be included for regulatory reporting. Some common details captured include the branch name and description, owner's details, business units and departments for reporting purposes, whether the branch is a head office or another type, the branch ID, and its originating country. The branch number is auto-generated, and once all details are complete, the information is ready to be captured in the information register.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information see, Create a branch and enhance digital resilience data and Create New Branch form.

Function

You can create a function record, by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. Here, you can add details such as the function identifier, license activity, function name, and criticality or importance assessment. Each function represents a specific service or group of services as defined by the Digital Operational Resilience Act (DORA). The functions record is used to capture detailed information about each function, including descriptive text. Once the function record is created, you can enhance its digital resilience information to help ensure compliance with DORA regulations, effectively documenting the third-party provided ICT service usage.

For more information see, Create a function and enhance digital resilience data and Create New Function form.

Third parties

You can access and view existing third-party records by selecting the Third parties list within the Digital resilience third-party registers in the Vendor Management Workspace. After installing the Digital resilience third-party registers, a **Digital Resilience Information** related list is added on the third party's page, enabling you to set up the digital resilience information details.

Here, you can view the legal entity ID of the third party, which can be captured by the Value Added Tax (VAT) number or Company Registration Number (CRN). You can specify the country of registration and its code, which the system uses to generate the ID. Additionally, you can indicate if the third party is an ultimate or a subsidiary, include the name of the ICT third party and the type of service they provide (for example, Software as a Service), and optionally note if an individual acts on behalf of the organization. You can also select the reporting currency and input the total annual expense for this engagement.

For more information see, Create a third party and enhance digital resilience data, Create New Company form, and Create New ICT third-party service provider form.

Engagements

You can access and view existing third-party engagement records by selecting the Third-party engagements list within the Digital resilience third-party registers in the Vendor Management Workspace. After you install the Digital resilience third-party registers, the **Digital Resilience Information** related list is added on the third-party engagements page, enabling you to set up the digital resilience information details.

Here you can view the third party's name, its type, annual spend, engagement tier, and other relevant information. You can enhance the record's digital resilience information by creating ICT third-party service provider records. Add ICT third-party service provider details such as the name of the service provider, its identification code, type of ICT services, currency, and so on. This enhances the digital resilience information of its associated third-party engagement for compliance with DORA regulation.

For more information see, Create a third-party engagement and enhance digital resilience data, Create New Third-party engagement form, and Add Digital resilience information to third-party engagements.

Contracts

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create a contract record by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. Here, you can add details such as the vendor name, start and end dates, state, substate, and other relevant information. Once the contract record is established, you can enhance its digital resilience information to help ensure compliance with the DORA regulations.

The Digital resilience third-party registers provide details about who within your organization is using externally outsourced ICT services, which functions and branches are using them, and who the third-party providers and their engagements are. Contracts serve as the link between these aspects, binding legal entities, branches, and functions to third parties and their engagements.

You can access these contracts through the Contracts list in the Digital resilience third-party registers. Alternatively, navigate to a specific legal entity's record, open the **Legal Entities** related list, and access all associated contract information. To view contracts for a legal entity, go to the legal entity's record, open the **Legal Entities** related list, and navigate to the different Contracts-related tabs. If the entity signing the contract differs from the one using it, that detail is included in the record, along with the service provider. Details captured in these records can include data storage and processing locations, data sensitivity and service provider reliance, contract and termination details, annual assessments, and contractual reference numbers.

For more information see, Create a contract and enhance digital resilience data, Create New Contract form, and Create New Contractual arrangement form.

Supply chains

You can create a supply chain record by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. Here you can capture details of the supply chain such as the type of the ICT services, Legal Entity Identifier (LEI) of the entity that provides the ICT services, and so on.

For more information see, Create a supply chain and enhance digital resilience data and Create New Contractual arrangement form.

Assessments

You can create an assessment of the ICT service record by navigating to the Digital resilience third-party registers in the Vendor Management Workspace. Here, you can add details such as the contractual arrangement reference number, identification code, and type of code for the ICT third-party service provider. Once the assessment is created, you can enhance its digital resilience information to help ensure compliance with the DORA regulation. It’s required to review your contracts and third parties annually.

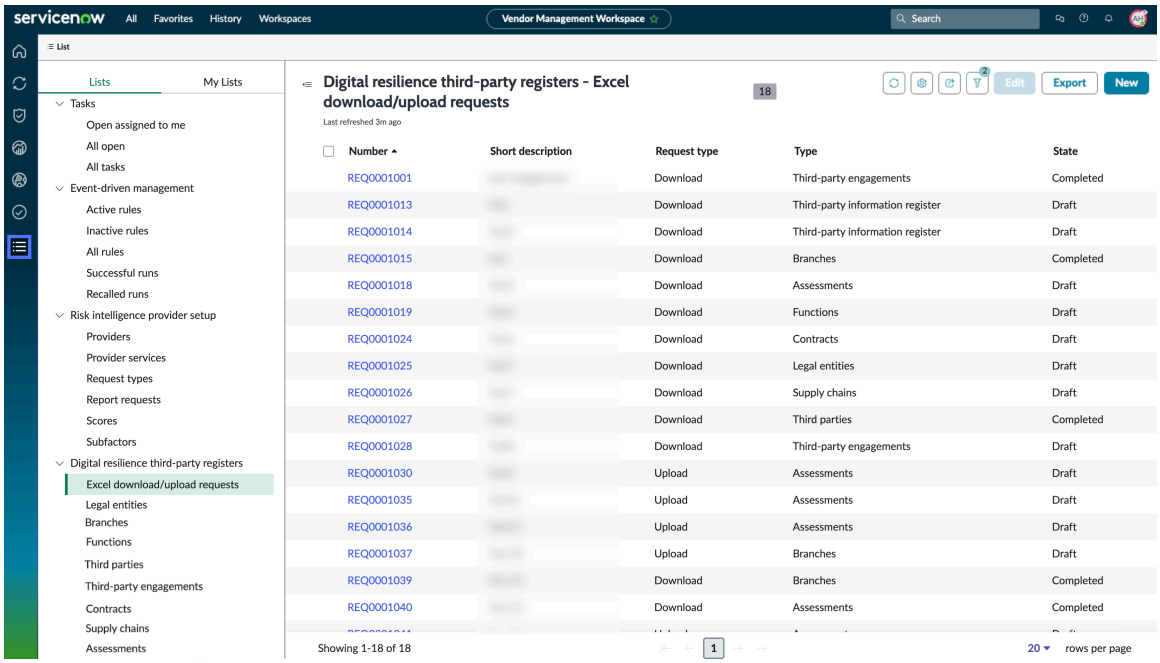
Add details such as the contractual arrangement reference number, identification code, and type of code for the ICT third-party service provider. You can then enhance its digital resilience information for compliance with DORA regulation.

For more information see, Create an assessment and enhance digital resilience data and Create New Contractual arrangement form.

For more information on the roles related to using Digital resilience third-party registers, see Roles in Third-party Risk Management.

Uploading and downloading records

In addition to creating individual records, TPR assessors and TPR managers can request the download of records using the Excel download/upload requests feature. For more information



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

see, Create a Microsoft Excel download request, and Create New Excel download/upload request form.

Note:
You need the TPR administrator role to edit and delete Excel download/upload requests.

TPR administrators can create and update records in bulk using the Excel download/upload requests feature. For more information, see Create records in bulk and Update existing records in bulk.

The following example shows where you can view and create Excel download/upload requests.

Note:
If you have the Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role, you can export a list of each record type by navigating to the list of records you want in the Digital resilience third-party registers in the Vendor Management Workspace.

Register of Information packages

After upgrading the Digital Resilience Third-party Information Register application to version 21.1.x, third-party assessors (sn_vdr_risk_asmt.vendor_assessor) can generate regulator-ready Register of Information (RoI) packages using the Plain-CSV Report Package option on the download page. The resulting ZIP file includes metadata and report folders structured to regulator specifications, with filenames containing the Legal Entity Identifier (LEI), entity ID, and release version. This format ensures EU DORA compliance and supports automated validation workflows. Users can follow the guide provided in the Instructions section on the Download/Upload request page for step-by-step instructions and required permissions. For more information, see Register of information regulatory packages and Generate a register of information package.

Third-party risk managers (sn_vdr_risk_asmt.vendor_manager) can validate downloaded RoI packages using the same Plain-CSV Report Package option. The system performs validation across multiple tables, checking file format, structure, encoding, naming conventions, and field-level data. If validation warnings are detected, a report is automatically attached, including mappings to regulator fields such as Template Code, Row Code, and Column Code. These reports also include real-world field labels, rule expressions, and record identifiers. Validation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

errors can be cross-referenced using a downloadable Excel master template that mirrors the CSV structure, simplifying issue identification and resolution. This template can be generated using the Excel master template option on the download page. Additional enhancements include support for “Not applicable” values, enforcement of file size limits, and clearer error messages for malformed data. For more information, see Validation framework for Register of Information and Validate Register of Information packages.

Create a legal entity and enhance digital resilience data

Create a legal entity record in Digital resilience third-party registers using Third-party Risk Management. You can then configure digital resilience information for the legal entity such as its name, type, country, and hierarchy.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

When you select the Legal entities list within the Digital resilience third-party registers in the Vendor Management Workspace, you can view the existing legal entity records in the system.

Note:
Existing third parties aren’t shown in the Legal entities list. Company records can only be defined as a Third party or Legal entity. For companies and legal entities, the Vendor option is set to **False**. (The check box isn’t selected.)

When you install Digital resilience third-party registers, the **Legal entities** tab gets added to existing company record pages that aren’t already defined as a third party. You can select the tab and configure the details for that Legal entity.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Legal entities** and then create a company record by selecting **New**.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Company form.
4. Select **Save**.

   The company record is set up. Users can set up the legal entity for the company and the digital resilience information on the **Legal entity** tab of the company record.
5. To create a legal entity record and set up its digital resilience information for DORA regulation, navigate to the **Legal entity** tab and select **New**.

   The Legal entity record contains the fields that provide the information required for the regulatory reporting of the legal entity. This includes details such as Legal Entity Identifier (LEI), name, country of registration, entity type (as defined by the regulator), and more. These fields are offered as choice lists within the system for users to select from.

   For information on setting up the digital resilience information for a legal entity, see Create New Legal entity form.
6. Select **Save**.
   The company record is now associated with a legal entity. You can confirm this by reviewing the Legal entity column of the Legal entities list. If the column field shows Yes, a legal entity is associated with the company record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To edit a Legal entity record, navigate to the legal entity tab of a company record, select the legal entity you want and select **Save** after making your edits.
8. To export Legal entity records, select **Export**.

What to do next

Set up branches for a legal entity. For more information, see Create a branch and enhance digital resilience data.

Create New Company form

On the Create New Company form, fill in the fields for the legal entity.

Create New Company form

Field	Description
Name	Unique name of the company.
Website	Website details of the company.
DUNS Number	Unique identification number for the company that is generated by the application. Data Universal Numbering System number, is a unique nine-digit number that identifies a business.
Rank tier	Rank tier for the company. Available options are: • **Strategic Partner** • **Valued Partner** • **Tactical Supplier** • **Excluded Supplier** • **Other**
Third-party tier	Tier assigned for the company. Available options are: • **1 - Very High** • **2 - High** • **3 - Moderate** • **4 - Low** • **5 - Very Low**
Vendor manager	Vendor manager of the company.
Business owner	List of business owners for the company.
Parent	Parent organization that determines the corporate hierarchy.
Status	Current standing of the company. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
	• **Not Selected** • **Selected** • **Onboarding** • **Prospect** • **Active** • **Active unauthorized** • **Terminated** • **Onboarding rejected**
Risk rating	Rating assigned to the company based on risk evaluation. This field is auto-filled.
Total annual spend	Total amount that the company spends annually. This field is auto-filled.
Notes	Further remarks or comments regarding the company.
General	
Industry	Sector or industry classification for the company. Available options are: • **Agriculture** • **Apparel** • **Banking** • **Biotechnology** • **Chemicals** • **Communications** • **Construction** • **Consulting** • **Education** • **Electronics** • **Energy** • **Engineering** • **Entertainment** • **Environmental** • **Finance** • **Food & Beverage** • **Government** • **Healthcare** • **Hospitality**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
	• **Insurance** • **Machinery** • **Manufacturing** • **Media** • **Not For Profit** • **Recreation**
Vendor	Choice to identify the company as a vendor. By default, this option is set to **False** (check box is not selected) for companies and legal entities.
Manufacturer	Manufacturers who produce the items that users procure.
Number of employees	Number of employees that the company has.
Banner image	Banner image for the company with a height between 60 and 70 pixels.
Attach image	Option to attach the banner image.
Banner text	Banner text that is displayed with the banner image.
Location	
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax phone	Standard contact information for the company.
Latitude and Longitude	Values that are used to mark the location of the company on the Risk concentration map.
Financial	
Publicly traded	Option to mark if the company is publicly traded.
Stock symbol	Stock symbol of the company.
Stock price	Stock price of the company.
Revenue per year	Revenue per year for the company.
Market cap	Market cap for the company.
Profits	Profits for the company.
Fiscal year	Fiscal year for the company in YYYY-MM-DD format.
Risk ratings	
Computed risk rating	Calculated risk rating. This field is auto-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
	The value is overall risk rating for the company, calculated after the assessment by rolling up all of the TPR assessors' risk ratings.
Override risk rating	Option to override the computed risk rating. If you select the check box, then specify the following values: • **Overridden risk rating**: Select the new risk rating. • **Overridden on**: Date that overridden risk rating or justification is updated. • **Justification**: Enter the reason for overriding the value.
Overridden risk rating	Rating that has been manually changed by a user, overriding the rating that was calculated by a system. Available options are: • **1 - Very High** • **2 - High** • **3 - Moderate** • **4 - Low** • **5 - Very Low**
Overridden on	Date when the overridden risk rating or its justification was last updated.
Justification	Reason for overriding the risk rating.
Assessment risk rating	Risk level for the assessment. This field is auto-filled.
Engagement risk rating	Risk level for the engagement. This field is auto-filled.
Subsidiary risk rating	Risk level for the subsidiary. This field is auto-filled.
Risk intelligence rating	Score that reflects the probability and impact of a risk event. This field is auto-filled.

Create New Legal entity form

On the Create New Legal entity form, fill in the fields to set up the digital resilience information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Legal entity form

Create New Legal entity form

Field	Description
Digital resilience information	
LEI of the entity	Legal Entity Identifier. A unique global identifier for the entity reported in the register of information. It uses the 20-character, alpha-numeric code based on the ISO 17442 standard.
Name of the entity	Legal name of the entity that maintains and updates the register of information.
Country of the entity	Two-letter country code where the license or the registration of the entity, as listed in the information register, was issued.
Type of entity	Types of the entity. Identify the type of the entity by using one of the following options: • **Credit institutions** • **Investment firms** • **Central counterparties (CCPs)** • **Asset management companies** • **Account information service providers** • **Electronic money institutions** • **Crypto-asset service providers** • **Central security depository** • **Trading venues** • **Trade repositories** • **Payment institution** • **Other financial entity** • **Securitization repository** • **Crowdfunding service providers** • **Administrator of critical benchmarks** • **Credit rating agency** • **Institutions for occupational retirement provision** • **Insurance intermediaries, reinsurance intermediaries and ancillary insurance intermediaries** • **Insurance and reinsurance undertakings** • **Data reporting service providers** • **Managers of alternative investment funds**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Legal entity form (continued)

Field	Description
Value of total assets - of the financial entity	Monetary value of the total assets of the entity using the ICT services, as per the previous year's financial statement.

Create a branch and enhance digital resilience data

Create a branch record in Digital resilience third-party registers using Third-party Risk Management. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

A legal entity can operate multiple branches across various cities or countries, all of which can be documented on the form. If a new branch is launched, its information is also required for regulatory reporting.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Branches** and then create a branch by selecting **New**.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Branch form.

   Users typically fill in the following details of the branch:
   - Branch name and its description
   - Owner's details
   - Tagging of business units and departments for reporting purpose
   - Specifying the branch as a head office or as a different branch other than the head office
   - ID of the branch and its originating country

   The number for the branch is auto-generated. Once the branch details are complete, the information is ready to be captured in the information register.
4. Select **Save**.
5. To edit a Legal entity record, navigate to the legal entity tab of a company record, select the legal entity you want and select **Save** after making your edits.
6. To edit the branch record, select it from the list and select **Save** after making your edits.
7. To export the branch records, select **Export**.

What to do next

Specify the functions that are associated with a branch. For more information, see Create a function and enhance digital resilience data.

Create New Branch form

On the Create New Branch form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Branch form

Field	Description
SysID	Unique 32-character GUID (Globally Unique ID) that identifies each branch record in an instance. Provide this value if you want to update an existing record. Provide a value of -1 if you want to create a new record in the system.
Name	Name of the branch.
Description	Description for the branch.
Number	Unique identification number for the branch that will be generated by the application, for example, BRN0001005. This field is auto-filled.
Department	Department that the branch belongs to, for example, Customer Support, Product Management.
Owner	Name of the owner of the branch.
Business unit	Name of the business unit that is associated with the branch, for example, HR, IT, Legal.
Digital resilience information	
Is Branch different from Financial Entity head office of the branch	Option to confirm if the branch is different from the head office. Available options are: • **Yes**: When you select the **Yes** option, the **Identification code type** and **Identification code of the branch** fields are displayed. • **No**
Identification code type	Type of identification code used for the branch. Available options are: • **LEI** • **Other**
Identification code of the branch	An overseas branch of the financial entity, uniquely identified by a specific code, for example, FB97521. The financial entity uses the branch's Legal Entity Identifier (LEI) or another identification code to distinguish it.
LEI of the financial entity head office of the branch	Legal Entity Identifier (LEI) of the head office of the financial entity to which the branch belongs, for example, LEIACMEGermany001 or LEIACMEAmericas001
Name of the branch	Name of the branch that is used for identification. When the LEI of the financial entity head office of the branch is entered, this field is auto-filled, for example, Frankfurt branch office.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Branch form (continued)

Field	Description
Country of the branch	Two-letter country code where the branch is located. When the LEI of the financial entity head office of the branch is entered, this field is auto-filled, for example, Germany.

Create a function and enhance digital resilience data

Create a function record in Digital resilience third-party registers using Third-party Risk Management where you can configure details of the function such as function identifier, license activity, function name, criticality, or importance assessment details. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

A legal entity can have multiple branches and across these branches, different functions operate. Thus, the legal entities, branches, and functions are the users of the ICT service that is outsourced.

A function can be a service, a service offering, or a process.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Functions** and then create a function by selecting **New**.
3. On the form, fill in the fields.

   For descriptions of all these fields, see Create New Function form.
4. Select **Save**.

   An organization can have various functions, each representing a specific service, service offerings, or group of services and their service offerings, as defined by the Digital Operational Resilience Act (DORA). You can select and view these functions. The functions form is designed to capture the detailed information about each function.

   You can also add descriptive text on the form. Once completed, you have captured details about the third-party provided Information and Communication Technology ICT service usage.
5. To edit the function record, select it from the list and select **Save** after making your edits.
6. To export function records, select **Export**.

Create New Function form

On the Create New Function form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Function form

Field	Description
Name	Name of the function, for example, Financial Accounting.
Description	Description for the function.
Number	Unique identification number for the function that will be generated by the application, for example, FUN0001003. This field is auto-filled.
Department	Department that the function belongs to, for example, Finance.
Owner	Name of the owner for the function.
Business unit	Name of the business unit that is associated with the function, for example, HR, IT, Legal.
Digital resilience information	
Function Identifier	Function identifier that is composed by the letter F (capital letter) followed by a natural number (for example, “F1” for the 1st function identifier and “Fn” for the nth function identifier with “n” being a natural number). For example, when you create newer functions, it will be F1, F2, F3, and so on. This field is auto-filled.
Licensed activity	Licensed activity that is referred to in Annex II for different type of financial entities. List of activities that the function is related to. Licensed activity is a particular drop-down list that's been provided by the user and the set of values that are required by the regulator.
Function name	Function name according to the financial entity’s internal organization, for example, Financial Accounting.
LEI of the financial entity	Financial entity using the LEI, 20-character, alpha-numeric code, for example, LEIACMEGermany001.
Function Type	Type of the function. Available options are: • **Business capability** • **Business service** • **Business process** • **Service offering** • **Is an independent object**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Function form (continued)

Field	Description
	When you select the **Business capability** option the **Select the business capability** field is displayed. When you select the **Business service**, **Business process**, or **Service offering** options, the following fields are displayed: • **Select the business service** • **Select the business process** • **Select the service offering**
Criticality or importance assessment	Criticality or importance of the function according to the financial entity's assessment. Available options are: • **Yes** • **No** • **Assessment not performed**
Reasons for criticality or importance	Brief explanation on the reasons to classify the function as critical or important. Maximum 300 characters are allowed.
Date of the last assessment of criticality or importance	Date of the last assessment of criticality or importance in case the function is supported by ICT services provided by ICT third-party service providers. If you have Operational Resilience, this information is auto -populated. If you do not have Operational Resilience and you are using the application with TPRM, you must fill in this information manually. If the function is service-related and you have Operational Resilience, and you've completed an importance and impact assessment, the default values are copied from that assessment.
Recovery time objective of the function	Recovery time objective of the function in number of hours. If the recovery time objective is less than 1 hour, '1' is reported. In case the recovery time objective of the function is not defined, '0' is reported. If a Business Impact Analysis (BIA) has been conducted for the business process, service, or service offering, and Business Continuity Management (BCM) is also set up in the same

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Function form (continued)

Field	Description
	instance, then the values are copied from the relevant BIA for this function.
Recovery point objective of the function	Recovery point objective of the function in number of hours. If the recovery point objective is less than 1 hour, '1' is reported. In case the recovery point objective of the function is not defined, '0' is reported. If a Business Impact Analysis (BIA) has been conducted for the business process, service, or service offering, and Business Continuity Management (BCM) is also set up in the same instance, then the values are copied from the relevant BIA for this function.
Impact of discontinuing the function	Impact of discontinuing the function according to the financial entity's assessment. One of the options in the corresponding drop-down list is used. Available options are: • **Low** • **Medium** • **High** • **Assessment not performed**

Create a third party and enhance digital resilience data

Create a third-party record in Digital resilience third-party registers using Third-party Risk Management. Add the details of the third-party company such as its name, address, phone number, vendor manager. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

By selecting the Third parties list within the Digital resilience third-party registers from the Vendor Management Workspace, you can access and view the existing third parties in the system.

After installing the Digital resilience third-party registers, the **Digital resilience information** tab is added for third parties. You can open this tab and set up the digital resilience information details.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Third parties** and then create a third party by selecting **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For descriptions of all these fields, see Create New Company form.

4. Select **Save**.
5. To set up the digital resilience information for DORA regulation, navigate to the **Digital resilience information** tab of the third party and select **New**.
6. On the form, fill in the fields.

   For descriptions of all these fields, see Create New ICT third-party service provider form.

7. To edit the third-party company record, select it from the list and select **Save** after making your edits.
8. To export third-party company records, select **Export**.
9. To delete the third-party company record, select it from the list and select **Delete**.

Create New Company form

On the Create New Company form, fill in the fields for the third party.

Create New Company form

Field	Description
Name	Name of the third party.
Phone	Phone number of the third party.
Fax phone	Fax phone number of the third party.
Street, City, State/Province, ZIP/Postal code	Standard contact information for the third party.
Manufacturer	Option to mark the third party as a manufacturer.
Vendor	Option to mark the third party as a vendor.
Stock symbol	Stock symbol of the third party.
Stock price	Stock price of the third party.
Notes	Additional details of the third party.

Create New ICT third-party service provider form

On the Create New ICT third-party service provider form, fill in the fields.

Create New ICT third-party service provider form

Field	Description
Type of code to identify the ICT third-party service provider	Type of code that is used to identify the ICT third-party service provider. Available options are: • **LEI** • **EUID**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New ICT third-party service provider form (continued)

Field	Description
	• **Country Code_CRN**: Company Registration Number • **Country Code_VAT**: Value-added Tax Identification number • **Country Code_PNR**: Passenger Name Record • **Country Code_NIN**: National Identification Number
Identification code of ICT third-party service provider	Identification code of the ICT third-party service provider.
Type of additional identification code to identify the ICT service provider	Type of additional identification code to identify the ICT service provider. Available options are: • **LEI** • **EUID** • **Country Code_CRN**: Company Registration Number • **Country Code_VAT**: Value-added Tax Identification number • **Country Code_PNR**: Passenger Name Record • **Country Code_NIN**: National Identification Number
Additional identification code to identify the ICT third-party service provider	Additional identification code to identify the ICT third-party service provider.
Type of person of the ICT third-party service provider	Type of person of the ICT third-party service provider. Available options are: • **Legal person, excluding individual acting in a business capacity** • **Individual acting in a business capacity**
Country of the ICT third-party service provider's headquarters	Country where the ICT third-party service provider's headquarters is located.
Legal name of the ICT third-party service provider	Legal name of the ICT third-party service provider.
Name of the ICT third-party service provider	Name of the ICT third-party service provider. This field can list a commonly used brand name or trading name that the ICT third-party service provider operates under, which might not exactly match the legal name.

Create New ICT third-party service provider form (continued)

Field	Description
Currency	Currency of the country where the ICT third-party service provider's headquarters is located.
Total annual expense or estimated cost of the ICT third-party service provider	Total annual expense or estimated cost of the ICT third-party service provider.
Is the third party the ultimate third party?	Option to confirm whether the third party is the ultimate third party. Available options are: • **Yes** • **No**
Identification code of the ICT service provider's ultimate parent undertaking	Identification code of the ICT service provider's ultimate parent.
Type of code to identify the ICT service provider's ultimate parent	Type of code that is used to identify the ICT service provider's ultimate parent. Available options are: • **LEI** • **EUID** • **Country Code_CRN**: Company Registration Number • **Country Code_VAT**: Value-added Tax Identification number • **Country Code_PNR**: Passenger Name Record • **Country Code_NIN**: National Identification Number

Create a third-party engagement and enhance digital resilience data

Create a third-party engagement record in Digital resilience third-party registers using Third-party Risk Management. Add details of the third-party engagement such as the name of the third party, its type, annual spend, engagement tier. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

About this task

By selecting the Third-party engagements menu item within the Digital resilience third-party registers from the Vendor Management Workspace, you can access and view the existing third-party engagements in the system.

The **Digital resilience information** tab is also available for the Third-party engagement module, enabling you to report on third-party engagements at a more detailed, granular level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After installing the Digital resilience third-party registers, the **Digital resilience information** tab is added for third-party engagements. You can open this tab and set up the digital resilience information details.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Third-party engagements** and then create a third-party engagement by selecting **New**.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Third-party engagement form.
4. Select **Save**.
5. Add digital resilience information.
   For more information, see Add Digital resilience information to third-party engagements.
6. To edit the third-party engagement records, select it from the list and select **Save** after making your edits.
7. To export the third-party engagement record, select **Export**.

Create New Third-party engagement form

Use the create new third-party engagement form to capture all the information that you need to create a third-party engagement record in Digital resilience third-party registers using Third-party Risk Management. As a third-party risk assessor you can create a third-party engagement record.

Create New Third-party engagement form

Field	Description
Name	Unique name for the engagement. Ideally, mention the product or service that is the subject of the engagement.
Third party	The third party for whom you are creating this engagement record.
Type	Type of product or service to be provided by the engagement organization.
Start date	Enter start and end dates to define how long the engagement is valid.
End date	Preferred dates for the beginning and end of interactions with the third party.
Status	Select the current status of the engagement. Available options are: • **Active** • **Onboarding** • **Prospect** • **Active unauthorized**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Third-party engagement form (continued)

Field	Description
	• **Terminated** • **Onboarding rejected**
Risk rating	Displays the risk rating assigned to the engagement after an assessment has been performed.
Engagement tier	The tier used for this engagement. See VRM third-party risk tiering assessments for details of how the tier is determined.
Annual spend	The annual monetary spend associated with this engagement's services.
Engagement manager	Specify the person who will monitor, prioritize, and act on responses to external questionnaires, issues, and tasks. Select the lock to lock/unlock the field.
Business owner	Specify the person who is familiar with the engagement organization and the product or services that will be engaged. Select the lock to lock/unlock the field.
Notes	Enter text that describes the engagement to other users.
Third-party engagement: Contact	
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax	Standard contact information for the engagement organization.
Latitude and Longitude	The **Latitude** and **Longitude** values are used to mark the location on the Risk concentration map. See TPRM Risk concentration map.
Risk ratings	
Computed risk rating	Calculated **Computed risk rating**. This field is auto-filled. The value is overall risk rating for the third party, calculated after the assessment by rolling up all of the TPR assessors' risk ratings.
Override risk rating	Option to override the computed rating. If you select the check box, then specify the following values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Third-party engagement form (continued)

Field	Description
	• Overridden risk rating: Select the new risk rating. • Overridden on: Date that overridden risk rating or justification is updated. • Justification: Enter the reason for overriding the value.
Overridden risk rating	Rating that has been manually changed by a user, overriding the rating that was calculated by a system. Available options are: • **1 - Very High** • **2 - High** • **3 - Moderate** • **4 - Low** • **5 - Very Low**
Overridden on	Date that overridden risk rating or justification is updated.
Justification	Reason for overriding the value.
Assessment risk rating	Risk rating for the assessment. This field is auto-filled.
Engagement risk rating	Risk rating for the engagement. This field is auto-filled.
Subsidiary risk rating	Risk rating for the subsidiary. This field is auto-filled.
Risk intelligence rating	Score that corresponds to the likelihood and consequence of a risk event. This field is auto-filled.
Related lists on the form	
Engagement contacts	Engagement contacts for the third-party engagement.
Business services	Business services related to the third-party engagement.
Tiering assessments	Tiering assessments for the third-party engagement.
Repeating assessments	Repeating assessments for the third-party engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Third-party engagement form (continued)

Field	Description
	Note: You can create repeating assessments if you are using the classic assessment engine. You can configure rules that auto-generate and send questionnaires and doc requests to engagements and third parties using the Event-driven management feature if you are using the Smart Assessment Engine. For more information, see Configure a risk assessment to recur on a schedule and Event-driven management — automate assessment processes.
Assessments	Assessments for the third-party engagement.
Third-party risk areas	Risk areas related to the third-party engagement.
Issues	Issues related to the third-party engagement.
Tasks	Tasks related to the third-party engagement.
Entity types	Entity types related to the third-party engagement.
Digital resilience information	Digital resilience information for the third-party engagement. You can add the following parameters: • Name • Third party • Identification code of ICT third-party service provider • Type of code to identify the ICT third-party service provider • Name of the ICT third-party service provider

Add Digital resilience information to third-party engagements

Add Digital resilience information to third-party engagements by creating ICT third-party service provider records in Digital resilience third-party registers using Third-party Risk Management. Add details such as name of the service provider, its identification code, type of ICT services, currency, and so on. This enhances the digital resilience information of its associated third-party engagement for compliance with DORA regulation.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Third-party engagements** and select an engagement record you want.
3. Select the **Digital resilience information** tab and then create an ICT third-party service provider by selecting **New**.
4. On the form, fill in the fields.
   For descriptions of all these fields, see Create New ICT third-party service provider form.
5. Select **Save**.
   The ICT third-party service provider record is created and its details are displayed in the **Details** tab of the ICT third-party service provider record. You can confirm which third-party engagements have digital resilience information associated with them by reviewing the Digital resilience information column of the Third-party engagements list. If the column field shows Yes, digital resilience information is associated with the third-party engagement record.

Create a contract and enhance digital resilience data

Create a contract record in Digital resilience third-party registers using Third-party Risk Management where you add details of the contract such as vendor name, start and end dates, state, substate. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessor

About this task
The Digital resilience third-party registers include details about who within your organization is using externally outsourced ICT services, which functions and branches are using them, and who the third-party providers and their engagements are. The contracts link these two aspects together.

The contracts link both parties—those using the information and those providing it. Essentially, they bind legal entities, branches, and functions to third parties and third-party engagements.

You can navigate to the contracts from the Contracts menu item in Digital resilience third-party registers. Alternatively, you can navigate to the legal entities record, open the Legal entities tab, and navigate to the contracts.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Contracts** and then create a contract by selecting **New**.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Contract form.
4. Select **Save**.
5. To submit the contract for review, select **Submit for Review**.
6. To add entities signing the contract to use the ICT services associated with the contract, navigate to the **Entities signing contract to use service** related list of the contract record and select **Add**.
7. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To add entities using the ICT services associated with the contract, navigate to the **Entities making use of services** related list of the contract record and select **Add**.
9. Select **Save**.

> **Note:**
> When creating multiple entities using the ICT services, the combination of LEI and Nature of the entity must be unique. If the nature of the entity is a branch, the combination of the LEI of the entity, Nature of the entity, and the identification code of the branch must be unique.

10. To add entities signing the contract to provide ICT services associated with the contract, navigate to the **Entity providing services** related list of the contract record and select **Add**.
11. Select **Save**.
12. To add third parties signing the contract to provide ICT services associated with the contract, navigate to the **Third party signing contract to provide services** related list of the contract record and select **Add**.
13. Select **Save**.
14. To add third-party engagements signing the contract to provide ICT services associated with the contract, navigate to the **Third-party engagements signing contract** related list of the contract record and select **Add**.
15. Select **Save**.
16. To set up the digital resilience information for DORA regulation, navigate to the **Specific information** related list and create a contractual arrangement by selecting **New**.
17. On the form, fill in the fields.
18. Select **Save**.
19. To add intra-group contractual arrangements, navigate to the **Intra-group contractual arrangements** tab of the contract and select **Add**.
20. Select **Save**.
21. To add ICT service supply chains associated with the contract, navigate to the **ICT service supply chains** tab of the contract and select **New** and fill in the fields.
22. Select **Save**.
23. To add Assessments of the ICT services associated with the contract, navigate to the **Assessments of the ICT services** tab of the contract and select **New** and fill in the fields.
24. Select **Save**.
    For descriptions of all these fields, see Create New Contractual arrangement form.
25. To edit the contract record, select it from the list and select **Save** after making your edits.
26. To export contract records, select **Export**.
27. To delete the contract record, select it from the list and select **Delete**.

Create New Contract form

On the Create New Contract form, fill in the fields.

Create New Contract form

Create a supply chain and enhance digital resilience data

Create an Information and Communication Technology (ICT) service supply chain record in Digital resilience third-party registers using Third-party Risk Management. You can then configure details of the supply chain such as the type of the ICT services, Legal Entity Identifier (LEI) of the entity that provides the ICT services.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Contracts** and then select the contract record you want to associate a supply chain record with.
3. Navigate to the ICT service supply chains related list and select **New**.
4. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Contractual arrangement form.
5. Select **Save**.
6. To edit the supply chain record, complete the following.
   a. Navigate to **Supply chains** and select the check box of the record you want from the list.
   b. Select **Edit** and update the fields as required.
   c. Select **Update**.
7. To export supply chain records, complete the following.
   a. Navigate to **Supply chains** and select the check box of the record you want from the list.
   b. Select **Export**.
   c. Select the **File Type**.
      Available choices are:
      - **Excel**
      - **CSV**
      - **JSON**
      - **PDF**
   d. Select the **Delivery Type**.
      Available choices are:
      - **Download**
      - **Email**

Create an assessment and enhance digital resilience data

Create an assessment of the Information and Communication Technology (ICT) service in Digital resilience third-party registers using Third-party Risk Management. Add details such as the contractual arrangement reference number, identification code, and type of code for the ICT third-party service provider. You can then enhance its digital resilience information for compliance with DORA regulation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessor

About this task
It's required that you review your contracts and third parties annually. You can provide the following assessment details on the assessment form:

- Contractual reference number, which helps identify the following details:
  - Users of the contract
  - Providers of the contract
  - Other relevant details that are automatically pulled in
- Audit information:
  - Has the third-party provider been audited?
  - When was the audit last conducted?
- Exit strategy details:
  - Existence of an exit plan
  - Possibility of integrating with the ICT service provider if terminated
  - Impact assessment of discontinuing the ICT service
  - Identification of any alternatives

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Contracts** and then select the contract record you want to associate an assessment record with.
3. Navigate to the Assessments of the ICT services related list and select **New**.
4. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Contractual arrangement form.
5. Select **Save**.
6. To edit the assessment record, complete the following.
   a. Navigate to **Assessments** and select the check box of the record you want from the list.
   b. Select **Edit** and update the fields as required.
   c. Select **Update**.
7. To export assessment records, complete the following.
   a. Navigate to **Assessments** and select the check box of the record you want from the list.
   b. Select **Export**.
   c. Select the **File Type**.
   Available choices are:
   - **Excel**
   - **CSV**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **JSON**
- **PDF**

d. Select the **Delivery Type**.
Available choices are:

- **Download**
- **Email**

What to do next
Once all details are captured, you can perform the following tasks:

- Download the information using the Microsoft Excel download feature. For more information, see Create a Microsoft Excel download request.
- Upload updated records as needed. For more information, see Update existing records in bulk.

Create a Microsoft Excel download request

Create a Microsoft Excel download request to download the records from the Digital resilience third-party registers using Third-party Risk Management for auditing purposes.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_assessor

About this task
Use the Excel download/upload requests module in Digital resilience third-party registers to export the records in Microsoft Excel format. The European Union auditors and regulators can download these records for audits, reviews, and appropriate actions.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Excel download/upload requests** and then create an Excel download/upload request by selecting **New**.
3. On the form, fill in the fields.
For descriptions of all these fields, see Create New Excel download/upload request form.
4. Select **Save**.
After saving a download request, you can choose which records you want to download by navigating to its corresponding tab. For example, you would navigate to the **Contracts** tab for a Excel master template download request or the **Assessments** tab for an Assessments download request.
5. Select the records that you want from the list and perform one of the following steps.
For information on Register of information regulatory packages, see Register of information regulatory packages, Generate a register of information package, Validation framework for Register of Information, and Validate Register of Information packages.
6. Add the name that you want for the Microsoft Excel file and select **Save**.

   In releases prior to 21.x.x of Digital resilience third-party registers, downloading the contract created a single sheet with all the contract data. Starting with version 21.x.x of Digital resilience third-party registers, when you generate a report on the contracts, it mirrors the UI and provides details, including information on entities, third parties, third-party engagements, and specific contract information in the Microsoft Excel sheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

It generates a Microsoft Excel sheet that you can submit directly to your regulatory authority. The file strictly adheres to the format of the template issued by the regulatory authority and includes all necessary details for reporting your third-party engagements.

Starting with version 20.x.x of Digital resilience third-party registers, you can see choice or reference values in the downloaded Microsoft Excel files. For example, Departments can be created in the system as 'Research and Development'. When the functions are downloaded, department values are displayed as options in the Microsoft Excel template for selection. The template includes drop-down lists for departments, business units, and other yes or no questions (as seen in the Branch template). Additional drop-downs are added for countries, currencies, etc.

The application also handles translations for meta data, including headers and drop-down options.

Ensure that no duplicate records are present after downloading data for Legal entities, Functions, etc. When downloading the template, ensure that there are no duplicate Third party rows. For example, creating one DORA Third party and two DORA entities, then creating DORA contracts for the same vendor using the same entity, result in only one Third party row in the downloaded template and not two duplicate rows. You can add new entities and enter their LEI (even if not in the drop-down list) in the downloaded contract file without needing to download the contract records again. You can upload the modified contract records back to the application.

7. To export Excel download/upload requests, select the requests you want and then **Export**.

Create New Excel download/upload request form

Use the Create New Excel download/upload request form to capture all the information that you need to create a download/upload request for Digital resilience third-party registers using the Third-party Risk Management application. As a third-party risk manager or third-party risk assessor you can create an Excel download/upload request record.

Create New Excel download/upload request form

Field	Description
Short description	Brief description of the request. For example, legal_entity_template.
Type	Types of download request. The choices are as follows: • **Excel master template** • **Plain-csv reporting package** • **Assessments** • **Branches** • **Contracts** • **Functions** • **Legal entities** • **Supply chains**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Excel download/upload request form (continued)

Field	Description
	• **Third parties** • **Third-party engagements**
Number	Number of the request. This field is auto-filled.
Request type	Type of the request. The choices are as follows: • **Upload** • **Download**
State	State of the record. This field is auto-filled to **Draft** state.
Entity maintaining the register of info **Note:** These fields appear when you select **Excel master template** or **Plain-csv reporting package**as the **Type**.	
LEI of the entity maintaining the register of information	Entity maintaining and updating the register of information using the LEI, 20-character, alpha-numeric code based on the ISO 17442 standard.
Name of entity	Legal name of the entity that maintains and updates the register of information.
Country of entity	Country where the license or the registration of the entity, as listed in the information register, was issued.
Type of entity	Types of the entity. The options include the following: • **Credit institutions** • **Investment firms** • **Central counterparties (CCPs)** • **Asset management companies** • **Account information service providers** • **Electronic money institutions** • **Crypto-asset service providers** • **Central security depository** • **Trading venues** • **Trade repositories** • **Payment institution** • **Other financial entity** • **Securitization repository**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Excel download/upload request form (continued)

Field	Description
	• **Crowdfunding service providers** • **Administrator of critical benchmarks** • **Credit rating agency** • **Institutions for occupational retirement provision** • **Insurance intermediaries, reinsurance intermediaries and ancillary insurance intermediaries** • **Insurance and reinsurance undertakings** • **Data reporting service providers** • **Managers of alternative investment funds** • **Non-financial entity: Other than ICT intra-group service provider** • **Non-financial entity: ICT intra-group service provider** • **Issuers of asset-referenced tokens**
Competent authority	The competent authority according to Article 46 of Regulation (EU) 2022/2554 to which the register of information is reported.
Date of reporting	The ISO 8601 (yyyy-mm-dd) code of the date of reporting
Base currency	Currency used for reporting monetary values in the report. For example, US Dollar or Euro.
Report type	Specifies whether the report covers a single entity **Individual** or a **Consolidated** group of entities.

Create records in bulk

Create records in bulk from the Digital resilience third-party registers using Third-party Risk Management rather than creating one record at a time for single or multiple entities. You can save time and effort by working on multiple records at a time.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_admin

About this task

Only DORA administrators can view the **Upload** option and perform this task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Excel download/upload requests** and then create an Excel upload request by selecting **New**.

   Note:
   Only DORA administrators can see the **Upload** option and perform this task.

3. On the form, select **Upload** as the request type and fill in the remaining fields.
   For descriptions of all these fields, see Create New Excel download/upload request form.

   Note:
   You can only upload one type of record for each upload request. For example, if you made an upload request for Assessment records, you can only include Assessment record information in the template.

4. Select **Save**.
   A template file is generated and available for download.
5. Download the default template by selecting **Download template** and fill it out.
   You can view instructions for filling out the template by navigating to the **Instructions** tab of the template file. You can add your record creation information by navigating to the **Digital resilience information** tab and filling out the template.
6. Attach the completed template file by selecting **Attach File** and selecting the file from your local hard drive.
7. Select **Upload**.
8. Navigate to the **Result** section of the upload request to view the records that were uploaded successfully and any errors.
   a. Correct the errors in the Microsoft Excel spreadsheet.
9. Repeat the steps until all errors are resolved and all records are uploaded successfully.
   The records are uploaded in bulk from the Digital resilience third-party registers.

Update existing records in bulk

Update existing records in bulk from the Digital resilience third-party registers using Third-party Risk Management.

Before you begin
Role required: sn_vdr_risk_asmt.vendor_risk_admin

About this task
Only DORA administrators can view the **Upload** option and perform this task.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Excel download/upload requests** and then create an Excel download request by selecting **New**.
3. On the form, select **Download** as the request type and fill in the remaining fields.
   For descriptions of all these fields, see Create New Excel download/upload request form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Save**.
   After saving a download request, you can choose which records you want to download by navigating to its corresponding tab. For example, you would navigate to the **Contracts** tab for a Third-party information register download request or the **Assessments** tab for an Assessments download request.
5. Select the records that you want to update from the list and select **Export to Excel**.
6. Add the name that you want for the Microsoft Excel file and select **Save**.

   It creates a Microsoft Excel sheet that you can use to make bulk updates for the records you selected.

   After downloading the templates to add options on the reference fields, the upload templates are updated to a dynamic format with drop-downs for choice and reference fields, rather than hard-coding the values.

   The dynamic templates automatically handle translations for headers and reference field options. They fetch these elements in real-time, ensuring they remain up-to-date without the need for manual updates. The default template stays up-to-date because the options are generated dynamically.

   You can view instructions for filling out the template by navigating to the **Instructions** tab of the template file. You can add your updated record creation information by navigating to the **Digital resilience information** tab and filling out the template.

   Note:
   You can only upload or download one type of record for each request. For example, if you made an upload request for Assessment records, you can only include Assessment record information in the template.

7. Follow the instructions in the template file and add your updated information.
8. Create an upload request by navigating to **Excel download/upload requests** and selecting **New**.
9. On the form, select **Upload** as the request type and fill in the remaining fields.
   For descriptions of all these fields, see Create New Excel download/upload request form.

   Note:
   Only DORA administrators can view the **Upload** option and perform this task.

10. Select **Save**.
11. Attach the updated template file by selecting **Attach File** and selecting the file from your local hard drive.
12. Select **Upload**.
13. Navigate to the **Result** section of the upload request to view the records that were uploaded successfully and any errors.
    a. Correct the errors in the Microsoft Excel spreadsheet.
14. Repeat the steps until all errors are resolved and all records are uploaded successfully.
    The updated records are uploaded in bulk from the Digital resilience third-party registers.

Register of information regulatory packages

The Register of Information (RoI) is a regulatory reporting requirement under the Digital Operational Resilience Act (DORA) and is supported by the Digital Resilience Third-party Information Register application in the Vendor Management Workspace application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RoI overview

The RoI is a structured data package that financial entities must submit to regulators to demonstrate compliance with DORA. It includes information about legal entities, third-party service providers, contracts, and functions.

Starting with version 21.1.x, third-party assessors (sn_vdr_risk_asmt.vendor_assessor) can generate regulator-ready RoI packages using the Plain-CSV Report Package option on the download page. The ZIP file includes metadata and report folders structured to regulator specifications, with file names containing LEI, entity ID, and release version. This enhancement ensures EU DORA compliance and supports automated validation workflows. You can follow the guide provided in the Instructions section on the Download/Upload request page for step-by-step instructions and required permissions.

Note:
You can use the Excel master template option to download a document to use for data preparation and internal review and the Plain-CSV reporting package option to download a document to use for regulator submission and compliance validation.

The RoI framework in TPRM is designed to align with DORA's five pillars, particularly ICT third-party risk management and incident reporting. RoI packages generated in TPRM follow the European Banking Authority's structure and validation requirements.

Note:
RoI framework includes DPM business validation rules and additional configuration files such as report.json, reportPackage.json, and FrameworkCodeModuleVersion. These components enable third-party risk administrators (sn_vdr_risk_asmt.vendor_admin) to view and maintain validation logic and configuration settings for CSV reporting and automated validation workflows, ensuring consistency and compliance across regulatory submissions. TPR admins can access these properties by navigating to **All** > **Digital Operational Resilience Management** > **Properties** and can access DPM business validation rules by navigating to **All** > **Digital Operational Resilience Management** > **DPM business validation rules**.

Digital Resilience Third-party Information Register support for RoI

The Digital Resilience Third-party Information Register provides the following capabilities to support RoI compliance:

- Data capture for entities, contracts, functions, and third parties
- CSV report generation aligned with regulator specifications
- ZIP packaging with metadata and report folders
- Validation workflows for technical, schema, and business rule checks
- Role-based access for managing RoI requests

Note:

All RoI-related actions are performed in the **Digital resilience third-party registers** section of the Vendor Management Workspace. This workspace provides access to download/upload requests, validation tools, and master templates.

For more information, see Generate a register of information package

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate a register of information package

Use the CSV report option in the download page to generate regulator-ready Register of Information (RoI) packages.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **Digital resilience third-party registers**.
2. Select **Excel download/upload requests** and then create an Excel download request by selecting **New**.
3. On the form, select and fill in the remaining fields.
   The **Excel Master Template** option downloads documents to use for data preparation and internal review. The **Plain-CSV Reporting Package** option downloads documents that you can use for regulator submission and compliance validation.

   For descriptions of all these fields, see Create New Excel download/upload request form.
4. Select **Export info register** to initiate the download process.

   When a Register of Information (RoI) package is uploaded using the Plain-CSV Report Package option, the system automatically generates a ZIP file containing metadata and report folders with CSV files formatted to meet DORA specifications. Real-time validation is performed during the upload process. If any errors or warnings are detected, a validation report is generated and attached to the request record alongside the CSV package. This report includes mappings to regulator fields (such as Template Code, Row Code, and Column Code), rule expressions, field labels, and record identifiers to help you locate and resolve issues. An email notification is sent to whoever initiated the request once the download is complete. If no issues are found, only the CSV package is attached. You can access the report from the attachment area of the request record and cross-reference it with the downloadable Excel master template, which mirrors the CSV structure and assists with error resolution.

   For more information on validation, see Validate Register of Information packages.

Validation framework for Register of Information

The validation framework helps ensure that RoI packages meet regulatory requirements defined by the DORA.

Validation overview

The validation framework for the Digital Resilience Third-party Information Register application helps ensure that downloaded RoI packages comply with the structural, formatting, and data integrity requirements defined by the DORA. It supports a real-time, three-level validation system that automatically checks for technical accuracy, regulatory alignment, and business rule compliance during the upload process.

- Level 1 (Technical checks): 29 rules validating file encoding, structure, and naming.
- Level 2 (Data package mode technical checks): 12 rules ensuring template and schema alignment.
- Level 3 (Data package model business rules): 70 rules verifying regulatory logic and field dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Data Package Model is used to structure and validate RoI packages.

The DPM business validation rules and report.json, reportPackage.json, FrameworkCodeModuleVersion properties enable Third-party risk admins [sn_vdr_risk_asmt.vendor_admin] to view and maintain validation logic and configuration settings for CSV reporting and automated validation. Third-party risk admins can access these properties by navigating to **All** > **Digital Operational Resilience Management** and then selecting **Properties** or **DPM Business Validation Rules**.

Validation process

Validation is now performed automatically during the upload of RoI CSV files. As soon as the ZIP package is uploaded via an Excel download/upload request, the system initiates real-time validation without requiring a separate request type. The system performs checks across multiple dimensions:

- File-level validation: Ensures correct encoding, naming conventions, and file structure.
- Template-level validation: Verifies that required templates are present and formatted correctly.
- Field-level validation: Applies rule expressions to check for missing values, incorrect formats, and invalid references.

Validation results are returned in a downloadable report that includes:

- Mappings to regulator fields such as Template Code, Row Code, and Column Code.
- Rule expressions and descriptions.
- Real-world field labels and record identifiers.
- Row-level error summaries.

Third-party risk managers (sn_vdr_risk_asmt.vendor_manager) can validate downloaded RoI packages using the same Plain-CSV Report Package option. After a validation report is generated for a Register of Information (RoI) package, the system automatically sends an email notification to whoever initiated the download or upload request. This email alerts the user that the process has been completed and provides access to the results. If validation warnings are detected, both the validation report and the CSV package are attached to the request record. If no issues are found, only the CSV package is included. This automated notification ensures timely awareness and facilitates efficient follow-up actions for compliance and data correction workflows.

To assist with error resolution, you can cross-reference the validation report with downloadable master templates that mirror the CSV structure. These templates help identify the location and context of each issue, making it easier to correct data in the ServiceNow instance or source system. Validation reports are only generated when errors or warnings are detected. If no issues are found, only the CSV package is returned.

To improve troubleshooting, the system maps rule expressions to real-world field labels and record identifiers. Even when malformed data is uploaded, the validation API returns meaningful error messages to help you identify and resolve issues efficiently.

Excel master templates are available for download from the **Download/Upload Request** page. These templates mirror the expected CSV structure and provide field definitions, formats, and sample values to assist with validation and error resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Only users with the TPR admin [sn_vdr_risk_asmt.vendor_risk_admin] role can perform validation tasks.

Common validation issues

Refer to the following guidance to troubleshoot common validation issues when submitting RoI packages.

- Validation report is missing: The uploaded package contains no errors or warnings. Check the **Result** section of the request. If no issues are found, only the CSV package is returned and no validation report is generated.
- Missing required fields: One or more required fields are empty or incorrectly formatted. Open the validation report and locate the affected row and column. Use the master template to identify the correct field name and expected format. Update the record in the ServiceNow instance or source system and revalidate.
- Rule expression failures: The data violates one or more business rules defined in the validation framework. Review the rule expression and description in the validation report. Use the record identifier to locate the affected record and correct the data. Common issues include invalid LEI formats, empty currency fields, or missing contract references.
- Invalid use of “Not applicable” values: These values are used in fields that don’t support them. Check the field definition in the master template. Replace “Not applicable” with a valid value or remove it if the field is required. Revalidate the updated package.
- Validation report is difficult to interpret: The report lacks context or field labels are unclear. Download the master template and use it to cross-reference the row number, sheet name, and record identifier. This helps locate the affected record and understand the validation error in context.
- File size or encoding issues: The uploaded ZIP file exceeds the 5-MB limit or uses unsupported encoding. Compress the file to meet the size requirement and verify all CSV files use UTF-8 encoding. Re-upload the corrected package.

Validate Register of Information packages

Run real-time validation on Register of Information (RoI) packages to help ensure compliance with DORA requirements.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager

Generate a Plain-CSV Reporting Package and an Excel Master Template. For more information, see Generate a register of information package.

About this task

Validation is performed automatically when a ZIP file containing RoI CSV templates is uploaded via an Excel download/upload request. The system initiates real-time validation without requiring a separate request type.

Once validation is complete, the system sends an email notification to whoever initiated the request. If validation warnings are detected, both the validation report and the CSV package are attached to the request record. If no issues are found, only the CSV package is included.

The validation report contains mappings to regulator fields such as Template Code, Row Code, and Column Code, along with rule expressions, field labels, and record identifiers. These details help users locate and resolve issues efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To review and resolve validation errors, download the Excel master template from the **Download/ Upload Request** page. The template mirrors the CSV structure and includes field definitions, formats, and sample values. Use it to cross-reference the validation report and identify the location and context of each issue.

Validation reports are only generated when errors or warnings are present. If no issues are found, only the CSV package is returned.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**, select the list icon and then go to **Digital resilience third-party registers**.
2. Select **Excel download/upload requests** and open the request record you want.
3. Download the validation report from the attachment area of the request record.
4. Cross-reference the validation report with the Excel master template to identify and correct issues.
5. Update the affected records in the system or spreadsheet and re-upload the corrected package for re-validation.

Managing the Third-party portal

Third-party contacts respond to questionnaires, requests for documentation, tasks, and issues on the Third-party portal. The portal is the point of interaction between third parties and risk assessors.

Third-party contacts

Third-party contacts are the individuals that represent the third party. By using the third-party portal, they can respond to questionnaires, work on tasks, and address issues that your third-party risk assessment team raises. Third-party contacts are either primary or secondary contacts. The primary contact is the assigned individual who receives the assessment questionnaires. Each third party must have at least one primary contact. The Third-party editor [vendor_editor], Third-party Risk (TPR) manager [sn_vdr_risk_asmt.vendor_risk_manager], TPR assessor [sn_vdr_risk_asmt.vendor_assessor], or the primary contact can create third-party contacts.

You assign the **primary contact** responsibility to the third-party contact who can directly answer assessment questions or assign another contact at the third party to answer the questions. Primary contacts can manage other contacts for the third party.

Third-party contacts are automatically assigned two roles: vendor_contact and snc_external. The vendor_contact role provides third-party contacts with access to the Third-party portal, while the snc_external role is a safeguard that restricts access only to the portal. The snc_external role helps prevent any unauthorized entry into your instance. For more information, see Set up third-party contacts.

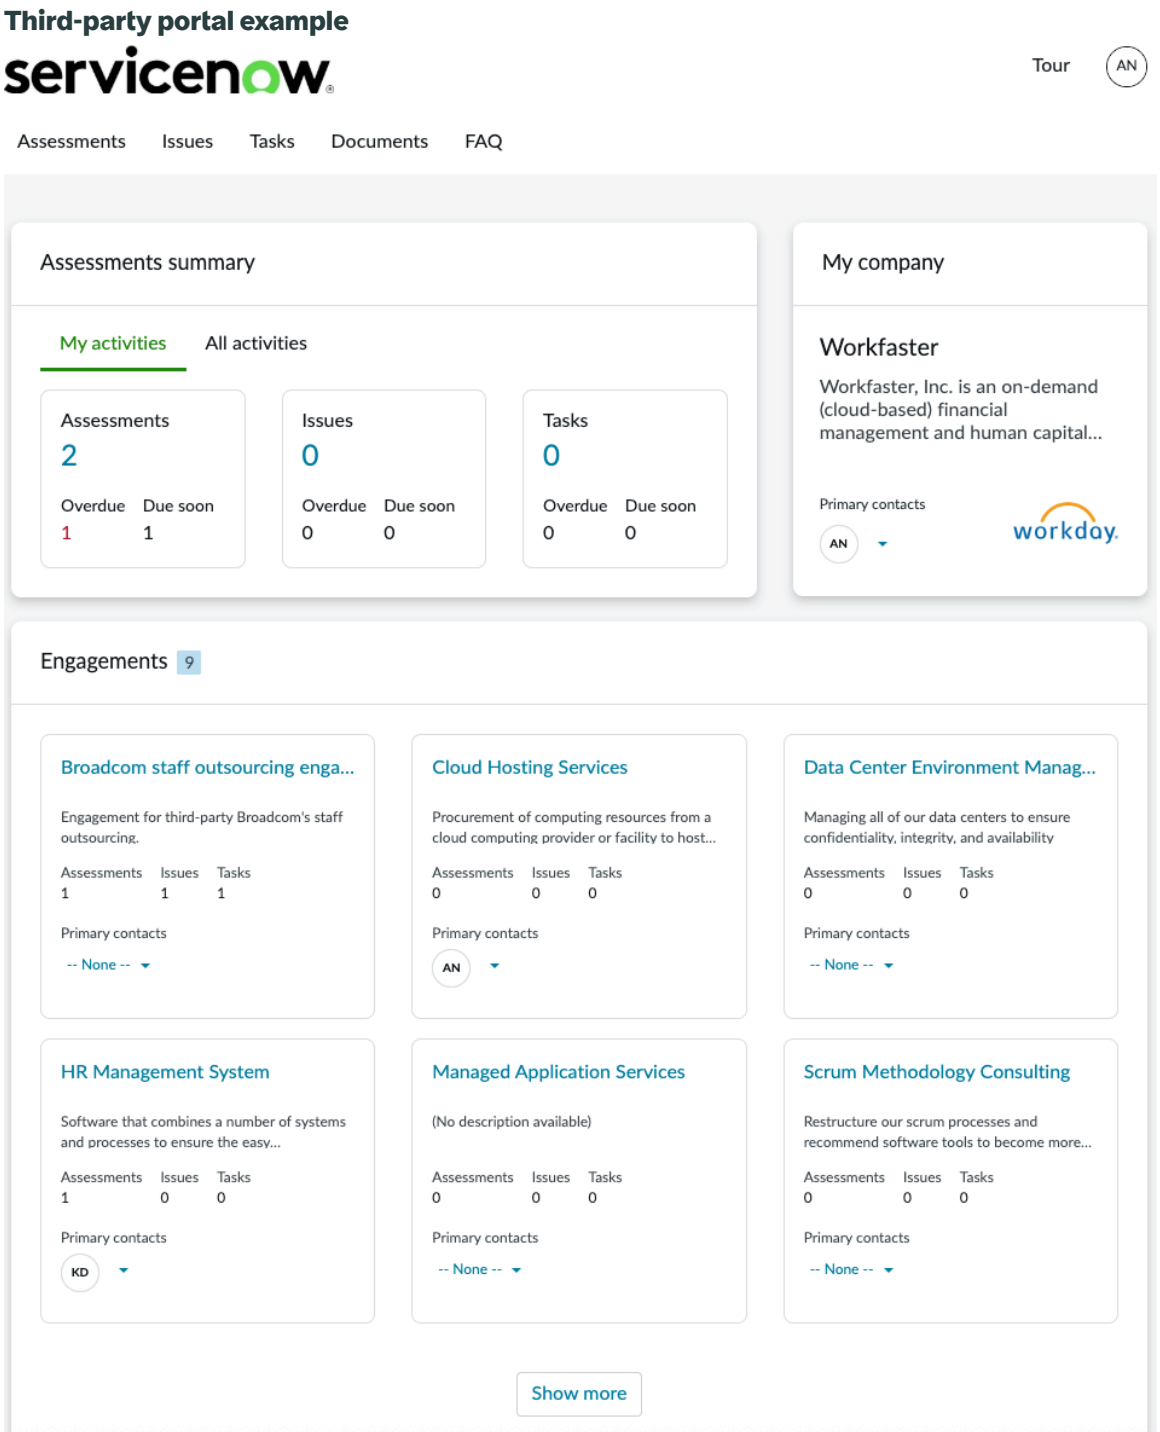
Note:
Third-party contacts see your organization's name in all references on the Third-party portal. You specify the name in the `sn_vdr_risk_asmt.company.name` property setting. See Configure TPRM properties.

Tasks for third-party contacts

The primary third-party contact can perform the following tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Delegate questionnaires, tasks, and issues to other third-party contacts.
- View and update the third-party contact information.
- Update the notification preferences.



Secondary third-party contacts can use the portal to perform the following tasks:

- View and respond to "assigned to me" assessments.
- Change a password or request a new password.

Important:
The third-party contact role should be used only for external contacts. The role prohibits access to the ServiceNow AI Platform and grants access only to the Third-party portal.

Third-party contacts see the portal as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Questionnaire and document request states

Progress is tracked in assessment requests and the progress is indicated by the state of the requests within the questionnaires and document requests. Here are the possible states for requests.

New

After questionnaires and document requests are sent out, they are in the **New** state.

In progress

After the third-party or engagement contact has started providing responses in a questionnaire or document request, the requests is in the **In progress** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed

After the third-party or engagement contact has provided responses for all questions in a questionnaire or document request and saved, the request is in the **Completed** state.

Note:
After all requests have entered the Completed state, you must return to the assessment page and submit the assessment.

Responding to questionnaires using a Microsoft Excel template

Third-party contacts can use a Microsoft Excel template to respond to questionnaires by downloading the template, completing it, and importing the final version into the Third-party portal. The Microsoft Excel questionnaire template contains instructions for filling out the template. This enables third-party contacts to provide information outside the third-party portal, streamlining the due diligence process. For more information, see Using a Microsoft Excel spreadsheet template for external questionnaires and Respond using a Microsoft Excel template.

Responding to assessments using a SIG questionnaire

Third parties can use the Shared Assessments Standardized Information Gathering questionnaire (SIG) to provide assessment documentation in the Third-party Risk Management application. The third-party contact can upload the pre-filled SIG spreadsheet or respond to a form-based questionnaire that is imported to the instance. For more information, see Using the SIG questionnaire for a risk assessment and Respond using the SIG.

Note:
Third-party contacts can reassign a questionnaire to another team member by selecting the more actions menu icon and selecting **Reassign**. After reassigning the questionnaire, they lose access to the questionnaire.

Launching the portal

Third-party contacts launch the portal by using **[your instance URL]/svdp**).

Learning to use the portal—the FAQ page

Third-party contacts can select **FAQ** to view answers to common questions, such as how to invite additional users to the portal and how to assign primary contacts to third-party or engagement records.

Managing third-party contacts

Users in your organization with the TPR assessor role [sn_vdr_risk_asmt.vendor_assessor] use TPRM to manage the following third-party contact activities:

- Create a login for a new third-party contact.
- Enable or disable a third-party contact login.
- Reset a password for a third-party contact.
- Assign a user role to a third-party contact.
- Assign a third-party contact to an assessment.
- View and update the customer contact information.
- Access the completed assessments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Set up third-party contacts and Manage the access for your third-party contacts.

Note:
If necessary, you can respond on behalf of third parties or engagements to questionnaires. See Respond to a questionnaire for a third party or engagement for more information.

The **Allow assessors to answer/edit questionnaires for third-party contacts** property (*sn_svdp.allow_assessor_edit*) must be active. For more information on configuring this property, see Configure TPRM properties.

Set up third-party contacts

Set up your third-party contacts so that you can send assessments, address issues, and communicate any additional required information with these contacts using Third-party Risk Management.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager and admin for steps 4 and 5

About this task

Third-party contacts are external users at the third-party organization. They use the Third-party portal to securely organize, prioritize, and perform tasks like responding to questionnaires for assessments, performing tasks, and communicating with your risk-assessment staff regarding issues. You grant access to the Third-party portal and specify the permissions for third-party contacts. The third-party risk (TPR) manager must contact a team member with the admin role to complete steps 4 and 5.

Important:
The third-party contact role should be used only for external contacts. The role prohibits access to your ServiceNow AI Platform instance and grants access only to the Third-party portal.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Third Parties** > **Third-party Contacts** to determine whether a third-party contact has already been assigned.

   The number of contacts is listed for each third party on the third-party contacts page.

2. On the third-party contacts page, select a third party to view the list of associated contacts.
   - To manage existing contacts:
     - Select each contact to verify that the contact is associated with the appropriate third party, is active, and, if applicable, is specified as the primary contact.

       Note:
       The questionnaires, document requests, and issues that are currently assigned to the contact are listed in the associated tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you don't have the admin role, ask a user who does to verify that the vendor_contact role appears for the user on the Roles related list. If the user with the admin role can't see the Roles related list, they have to go to step 4. If the user with the admin role can't see the vendor_contact role listed for the user, they have to go to step 5.

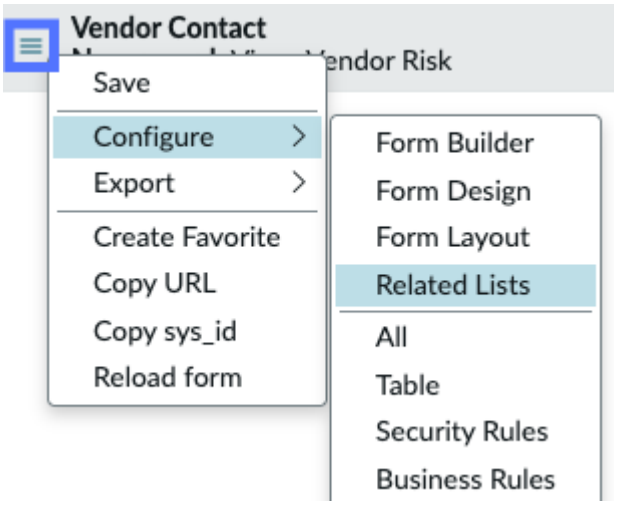
Note:
For more information on managing third-party contacts, see Manage the access for your third-party contacts.

- To add a contact, select **New** and continue with the following steps.

Note:
It's normal for a contact to have the snc_external role because the vendor_contact role includes it.

3. On the form, fill in the fields.

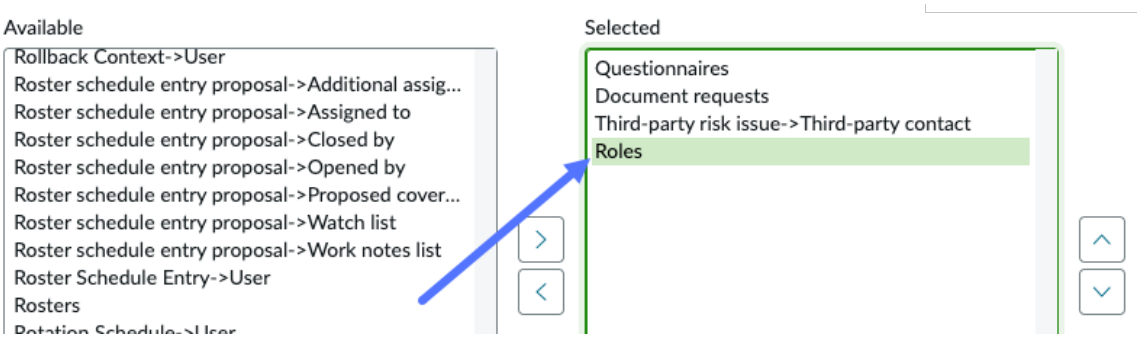
Third-party contact form



Field	Description
First name, Last name, Email, Title, Department	Standard contact information for the user at the third-party organization.
User ID	ID used to log in to the Third-party portal instance.
Third-party	Third-party organization of the contact.
Language, Time Zone	Preferred language and time zone for the user at the third-party organization.
Active	Option to activate the contact to be eligible to work in the Third-party portal.
Primary contact	Third-party contact who can directly answer assessment questions or assign another contact at the third party to answer the questions. They can also manage other contacts for the third party.

Note:
An email notification is sent out to the new third-party contact after the form is submitted. The email contains a link to the third-party portal and login credentials.

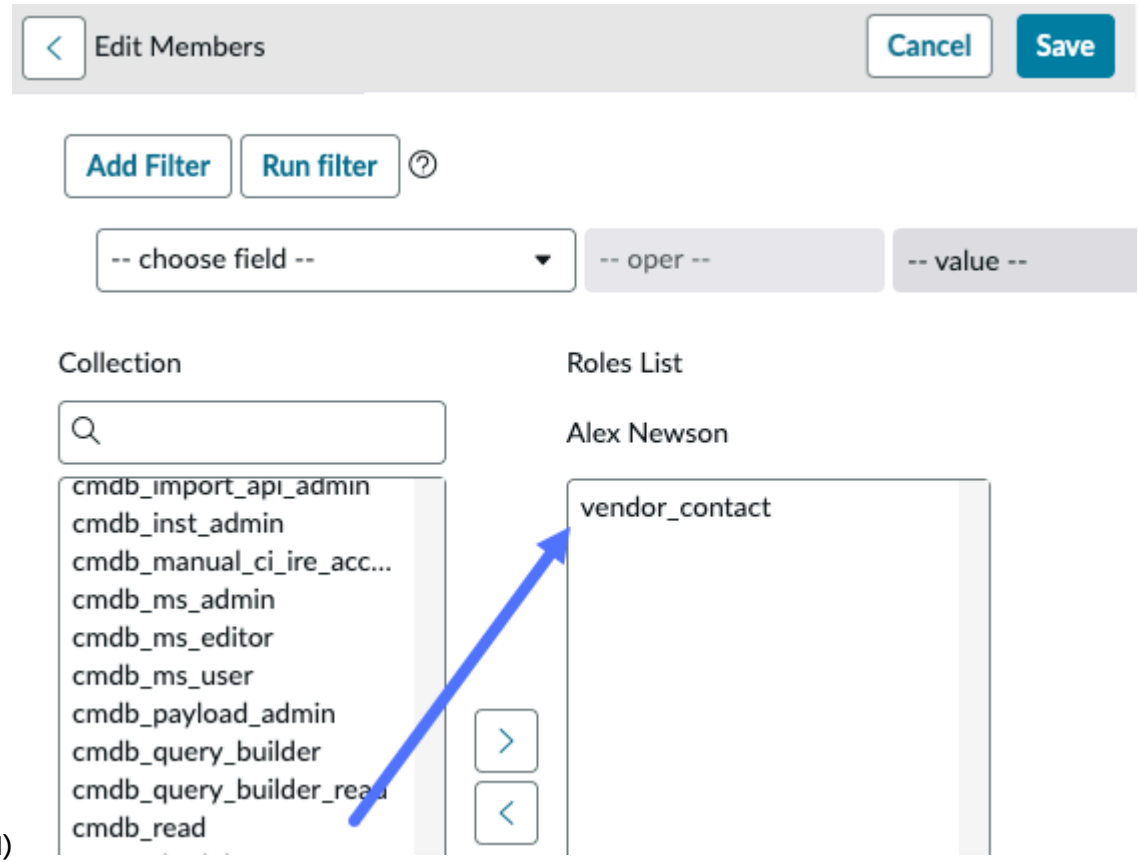
4. **Optional:** Validate that each contact has the vendor_contact role by adding the **Roles** value to the Vendor Contact page.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Add the Roles related list by selecting the actions icon and selecting **Configure** > **Related Lists**.

b. Move the Roles related list to the Selected list and then select **Save**.



(Optional)

5. **Optional:** Grant third-party contacts access to the third-party portal by selecting **Edit** and adding **vendor_contact** to the Roles list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional)

Warning:
If the user has other roles, such as snc_internal, then the user might also be able to log in to your platform and have visibility into critical records.

Manage the access for your third-party contacts

View your existing third-party contacts and adjust their information and access permissions as needed by using Third-party Risk Management. When you keep the contact details up to date, you can help to avoid your third-party contacts from getting unauthorized access or losing authorized access to the third-party portal.

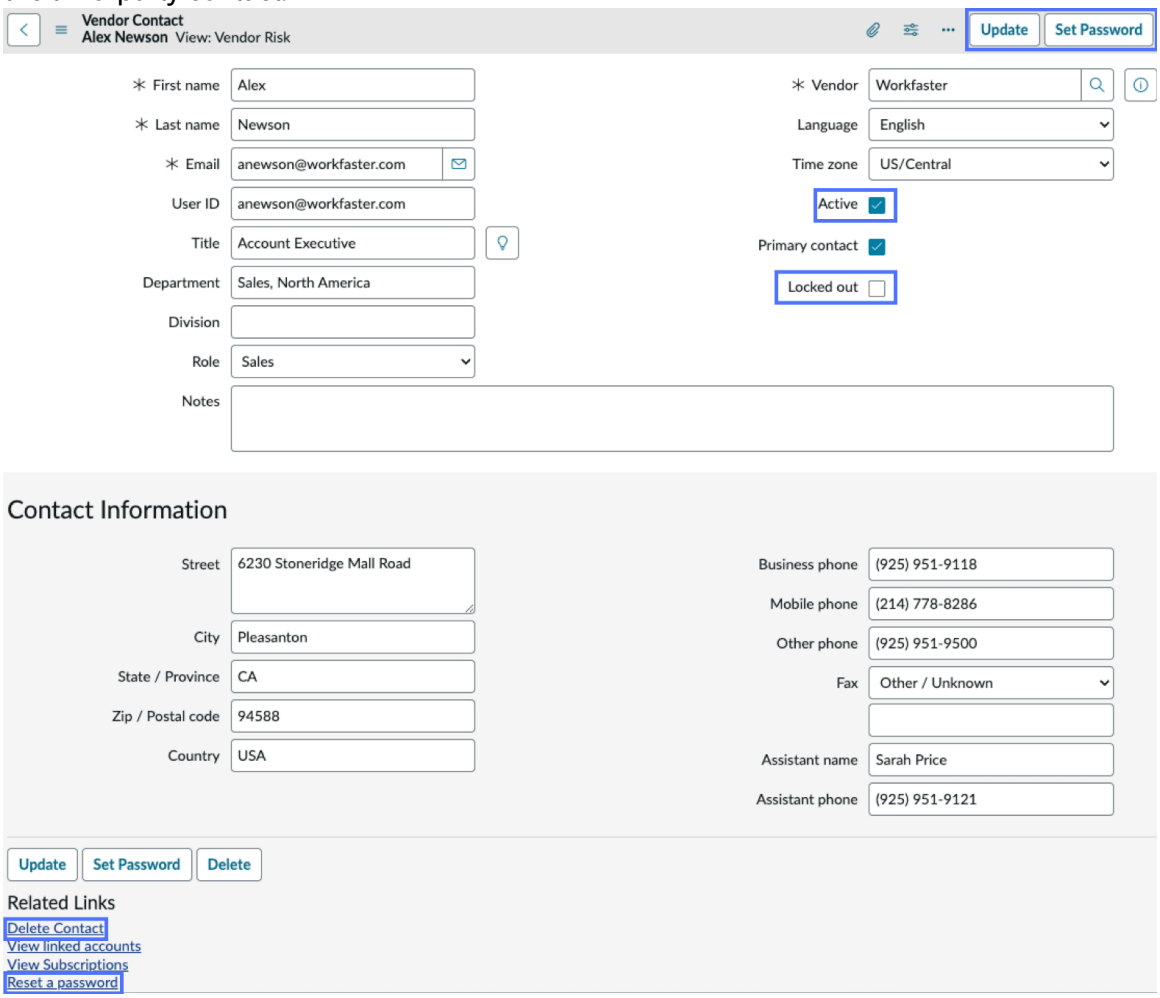
Before you begin

The third-party risk (TPR) manager must contact a team member with the admin role to complete the last 3 options of step 3.

Role required: sn_vdr_risk_asmt.vendor_risk_manager and admin to complete the last 3 options of step 3.

About this task

Your third-party contacts are external users at the third-party organization. They use the third-party portal to securely organize, prioritize, and perform tasks like responding to questionnaires for assessments and communicating with your risk-assessment staff about issues. You can also adjust the access to the third-party portal and permissions for your third-party contacts.



Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Third Parties** > **Third-party Contacts** to view your existing third-party contacts.

   The number of contacts is listed for each third party on the third-party contacts page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select the third party that you want to view the list of associated contacts for and then select the third-party contact.

3. **Optional:** Manage the access to the portal for your third-party contacts.

4. Select **Update**.

Note:
For more information on setting up third-party contacts, see Set up third-party contacts and Enable email with third-party contacts.

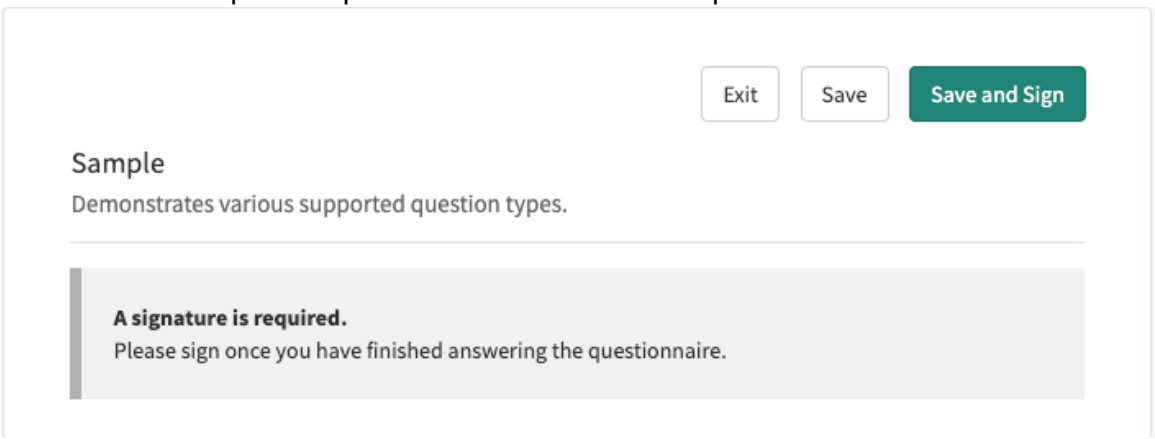
E-signatures on questionnaires or document requests

Questionnaires or document requests might require electronic signatures of third-party contacts and/or reviewers.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_risk_manager or sn_vdr_risk_asmt.vendor_assessor

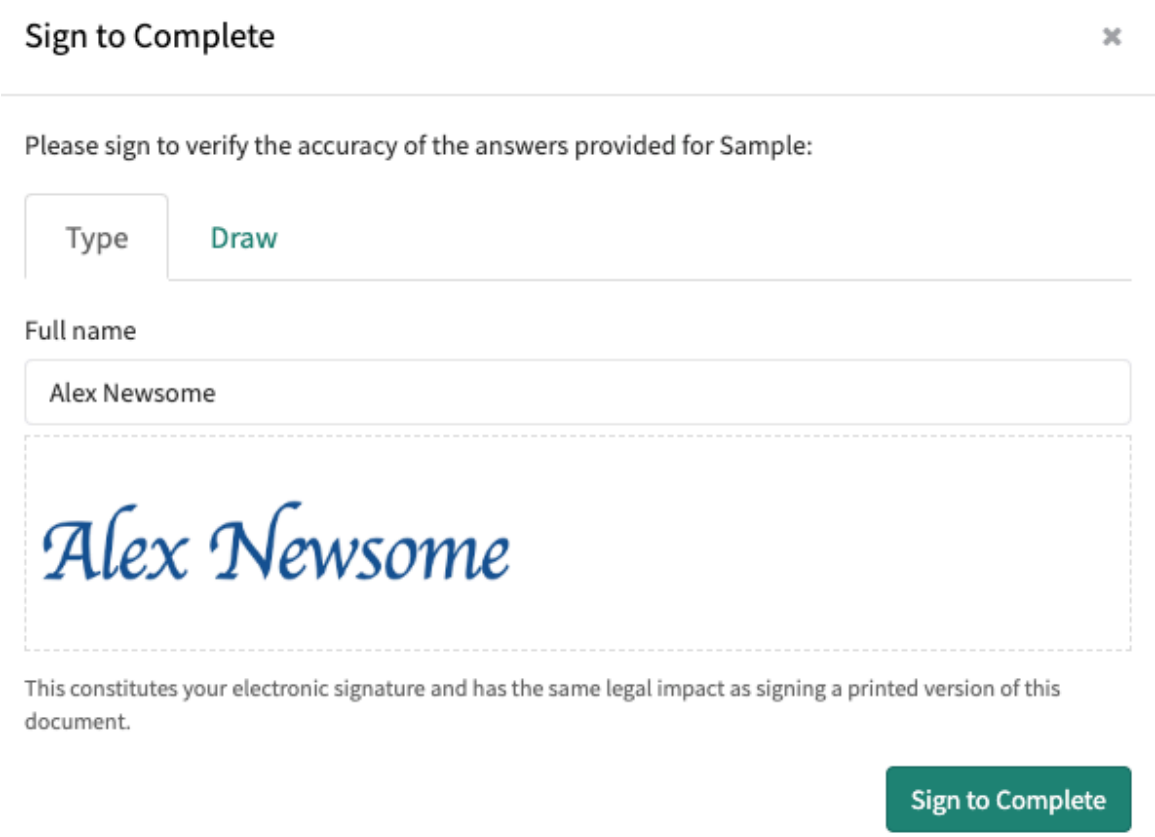
About this task



After a questionnaire or document request has been submitted to the third party, the Third-party Risk (TPR) manager or TPR assessor receives an email notification that includes a link to the record.

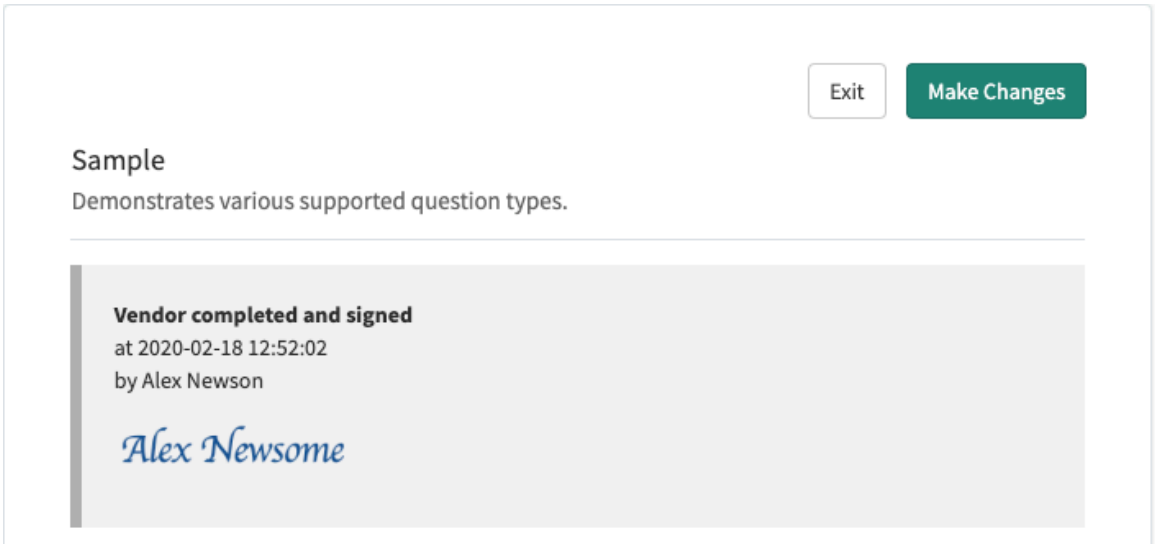
Note:
The signature feature isn't supported for SAE questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Select the link to open the questionnaire or document request.



Note:
Notice that a signature is required for the **Sample** questionnaire. Open the questionnaire that requires a signature.

2. Complete the questionnaire or document request, and, when you have answered the questions, select **Save and Sign**.
3. Use the **Type** tab to enter your name or use the **Draw** tab provide a free-form signature and then select **Sign to Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To update the questionnaire or document request in any way, select **Make Changes**.
   The signature is removed and you must sign again after making the changes.
5. After you have completed and signed the assessment, select **Exit** and then repeat the process for any additional questionnaires or document requests in the assessment.
6. When you have completed all questionnaires or document requests in the assessment, select **Submit Assessment**.

> **Note:**
> You cannot submit an assessment until all items that require e-signatures have been signed.

Result
The state of the assessment changes to **Response Received**, and risk scores are calculated.

Upload and manage documents in the third-party portal

Use the third-party portal to upload and manage documents for assessments, engagements, issues, and tasks in Third-Party Risk Management (TPRM).

Before you begin
Role required: Primary contacts can complete all actions while secondary contacts must be assigned read and write access.

About this task
Third parties and engagement owners can upload and manage documents directly in the portal. Uploaded documents can include contracts, policies, or compliance evidence and can be linked to assessments, engagements, and related tasks.

Procedure
1. Log in to the Third-party portal at `https://<myCompany>.service-now.com/svdp`.
2. Select the **Documents** tab, and then select **Create document** to upload a document.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create new document form.
4. Attach the document file.
5. Select **Submit** to save the document record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the file upload fails, check the file size and format restrictions and retry. If permissions prevent upload, request access from the engagement owner.

6. When managing documents, you have the following actions available.

Document Management system in Third-party Risk Management

Create a document record

Create new document form

TPRM and the Explicit Roles plugin

Activating the Third-party Risk Management plugin also installs the Explicit Roles plugin. Administrators assign the snc_internal and snc_external roles to provide internal and external users access to the instance.

When third-party contacts are created, they are automatically assigned the snc_external role, giving them access to resources related to the Third-party portal.

Various tables provide role-based access to record by setting the **Roles** field. If the **Roles** field is empty, all users have access to that record. For example, if the **Roles** field for a Service Catalog item has an empty **Roles** field, all users have access to that Service Catalog item.

However, when the Explicit Roles plugin is installed, the **Roles** field is updated to **snc_internal**. Also, all users are given the snc_internal role. Continuing with the previous example:

- Before installing the Explicit Roles plugin, if a Service Catalog item had an empty **Roles** field, it was accessible to every user.
- After installing the Explicit roles plugin, the **Roles** field of the Service Catalog item is updated to snc_internal and all existing users are given the snc_internal role, making the catalog item accessible to those users.
- After that, all new users must be assigned the snc_internal role, or they will not have access to that Service Catalog item.

The following table describes the changes to tables affected by the Explicit Roles plugin.

Tables affected by the Explicit Roles plugin

Table	Changes
Access Control [sys_security_acl]	For all existing and newly created ACLs without a role requirement, the snc_internal role is assigned.
Catalog item [sc_cat_item]	For all records where the **Roles** field is empty, the snc_internal role is added. If the glide.sc.use_user_criteria property is set to false, newly created catalog items are automatically assigned the snc_internal role. If the property is set to true, the SNC External user criteria is added to all newly created catalog items, excluding external users from viewing the record.
Page [content_page]	For sites that have a login page, where the **Read roles** field is empty, the snc_internal role is added. For sites that have no login page or that have automatically created content pages, the public role is added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables affected by the Explicit Roles plugin (continued)

Table	Changes
Navigation Menu [sys_app_application]	For all records where the **Roles** field is empty, the snc_internal role is added. Newly created navigation menus with an empty **Roles** field are also automatically assigned the snc_internal role.
Overview Help Panel [sys_ui_overview_help_panel]	For all records where the **Roles** field is empty, the snc_internal role is added. Newly created overview panels with an empty **Roles** field are also assigned the snc_internal role.
Portal Page [sys_portal_page]	For all records where the **Read** roles field is empty, the snc_internal role is added. Newly created portal pages with an empty **Read roles** field are also automatically assigned the snc_internal role.
Processor [sys_processor]	For all records where the **Roles** field is empty, the snc_internal role is added. Newly created processors with an empty **Roles** field are also automatically assigned the snc_internal role.
Report [sys_report]	For all records where the **Roles** field is empty, snc_internal is added. Newly created reports that have an empty **Roles** field when sharing are also automatically assigned the snc_internal role.

Using a Microsoft Excel spreadsheet template for external questionnaires

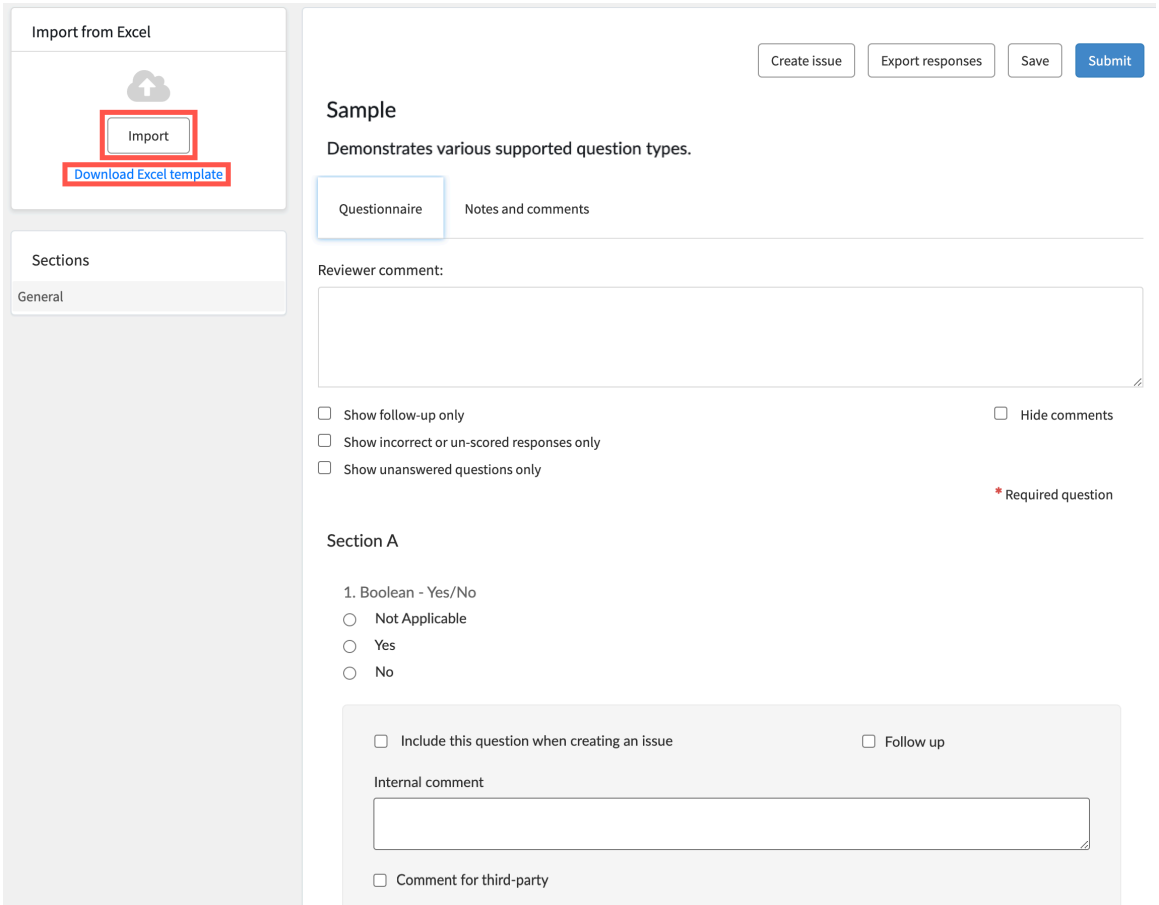
Third parties and engagements can use a Microsoft Excel spreadsheet to respond to questionnaires by downloading the template, completing it, and importing the final version into the Third-party portal. This enables respondents to provide information outside the third-party portal.

Downloading the questionnaire template

You can access the questionnaire template through the Vendor Management Workspace, Classic user interface, or through the third-party portal.

If you have the Third-party risk (TPR) assessor [sn_vdr_risk_asmt.vendor_assessor] or TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] role, you can download the questionnaire template by navigating to the questionnaire you want and selecting **View responses**. For more information on the questionnaire template process, see Respond using a Microsoft Excel template.

To view a questionnaire using the Classic user interface, select **All** > **Self-Service** > **Third-party risk management** > **External risk assessments** > **All open**, select the assessment you want, and then select **View responses** next to the questionnaire you want in the Questionnaire related list. After the questionnaire page has opened, select the Download Excel template link.



To view a questionnaire using the Vendor Management Workspace, select **Workspaces** > **Vendor Management Workspace**, select the list icon and then navigate to **External risk assessments**. After choosing the assessment you want, navigate to the Questionnaires and document requests section of the Risk overview tab and select the questionnaire you want. After the questionnaire page has opened, select the Download Excel template link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
As TPR assessor or TPR manager you can submit a questionnaire after completing this process on behalf of a third party or engagement contact if the **Allow assessors to answer/edit questionnaires for third-party contacts** property (*sn_svdp.allow_assessor_edit*) is active. For more information on configuring this property and responding to questionnaires, see Configure TPRM properties, Respond to a questionnaire for a third party or engagement, and Review responses to external questionnaires.

The following example shows the questionnaire page.

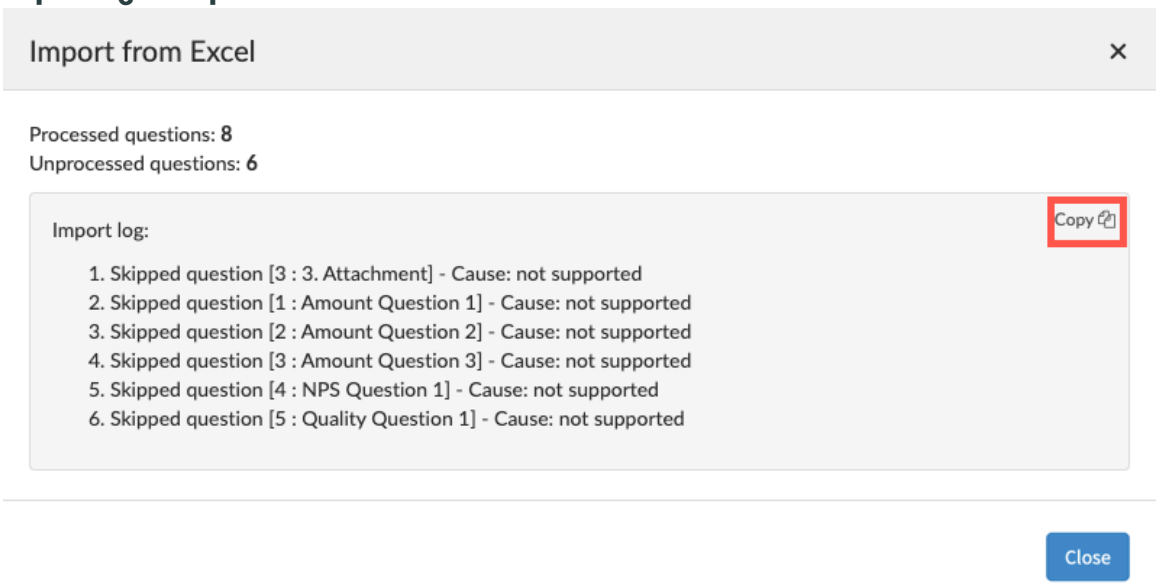
Sample questionnaire example

Important:
The questionnaire template is downloaded in the .xlsx format and after being completed must be uploaded in the same format.

Completing the questionnaire template

You can view the instructions for filling out the template by navigating to the **Instructions** tab in the questionnaire template file. To add question data for each section of the questionnaire, go to the corresponding tab. Each tab is named after its section and contains the relevant question data.

Important:
You must follow the instructions for each question type and column entry. Entries in the Question Details, Depends on, and Required when columns must match the tag, question name, or action being referenced. Validation for the questionnaire template is limited.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Importing the questionnaire template

Import a completed questionnaire by selecting Import and then selecting the file from your file browser. A dialog box shows the progress status for your questionnaire template as answers are imported. After the import is complete, you can review the results and select **Copy** to copy the import log to your clipboard if applicable. Review the import log and correct any errors before attempting to upload the updated template.

The following example shows the dialog box and import log.

Import log example

Limitations

The questionnaire template has the following limitations and requirements.

- Don’t modify the structure or formatting of the document; only make selections or enter content as instructed.
- Not all question types have validation, so some of your responses might not be checked for correctness or completeness.
- Answer all mandatory questions; leaving them unanswered can result in an incomplete submission.
- Complete certain question types, including Attachment, Reference, Image Scale, and Template, in the ServiceNow instance or with the help of a third-party representative, as the template doesn’t support them.
- Follow the additional conditions specified in the Required When column for conditional questions, which depend on your answers to previous questions, as indicated in the Depends On column.
- Review the Question Details column carefully, as it provides additional context or information about the questions.
- Disable any filters in the questionnaire template to help ensure you see and answer all questions, as filters can hide questions.
- Avoid modifying or distributing the document without authorization, as this violates the copyright agreement and can result in penalties for you or your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about questionnaire template requirements, see the **Instructions** tab in the questionnaire template file.

For instructions that you can send to third-party contacts, see Respond using a Microsoft Excel template.

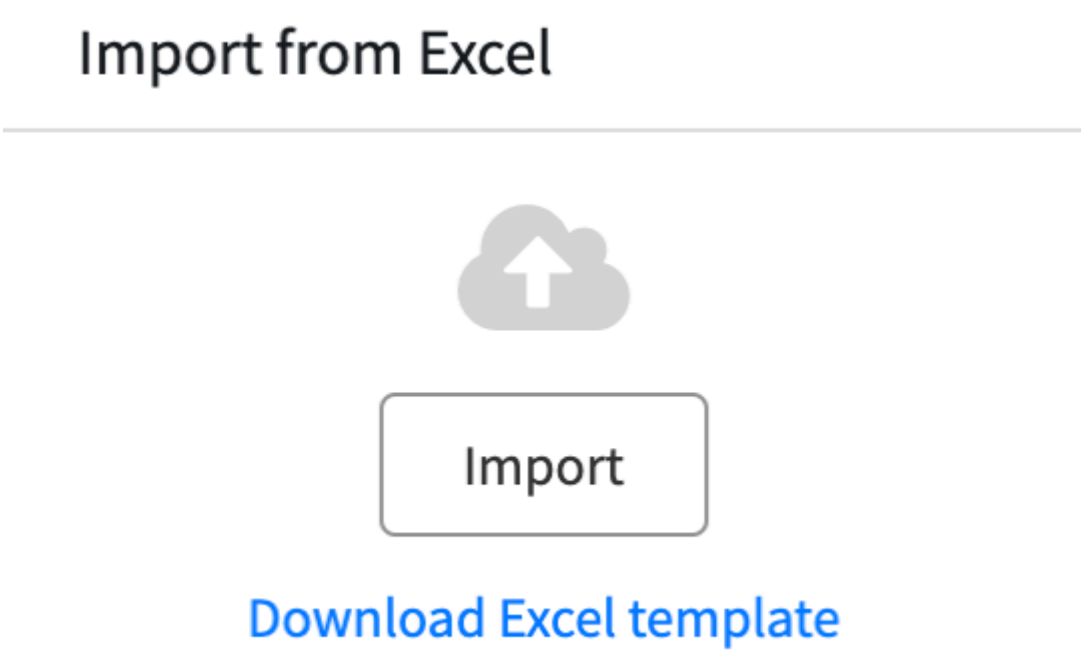
Note:
Due to license restrictions, you can't download Shared Assessments Standardized Information Gathering (SIG) questionnaire templates. For more information about using SIG questionnaires, see Using the SIG questionnaire for a risk assessment.

Respond using a Microsoft Excel template

Use a Microsoft Excel template to respond to questionnaires by downloading the template, completing it, and importing the final version into the Third-party portal. The Microsoft Excel questionnaire template contains instructions for filling out the template.

Before you begin
Role required: vendor_contact

About this task
The Microsoft Excel questionnaire template enables third-party and engagement contacts to provide information outside the third-party portal, streamlining the due diligence process. For more information, see Using a Microsoft Excel spreadsheet template for external questionnaires.



Procedure

1. Log in to the Third-party portal at `https://<myCompany>.service-now.com/svdp`.
2. Select the **Assessments** tab, and then select the assessment and questionnaire you want to respond to.
3. Select the Download Excel template link.
   The system generates a template file and it's automatically downloaded. Downloaded files use the following file naming convention: `<questionnaireName_id>.xlsx`
4. Fill out the template according to the instructions.
   You can view the instructions for filling out the template by navigating to the **Instructions** tab in the template file. To add question data for each section of the questionnaire, go to the corresponding tab. Each tab is named after its section and contains the relevant question data.

   Important:
   You must follow the instructions for each question type and column entry. Entries in the Question Details, Depends on, and Required when columns must match the tag, question name, or action being referenced. Validation for the questionnaire template is limited.

5. Upload a completed questionnaire by selecting **Import** and then select the file from your file browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A dialog box shows the progress status for your questionnaire template upload. After the upload is complete, you can review the results.

6. Review the results and select **Copy** to copy the import log to your clipboard if applicable.
7. Select **Close**.
   a. Review the import log and correct any errors in the Microsoft Excel questionnaire template.
8. Repeat the steps 5 through 7 until all errors are resolved.
   The questionnaire template has been successfully uploaded and the questionnaire is now updated with all the question data from the complete questionnaire template.
9. Select **Submit**.
   The complete questionnaire is now available for review by the requester.

Using the SIG questionnaire for a risk assessment

Third parties can use the Shared Assessments Standardized Information Gathering questionnaire (SIG) to provide assessment documentation in the Third-party Risk Management application. The third-party contact can upload the pre-filled SIG spreadsheet or respond to a form-based questionnaire that is imported to the instance.

Supported SIG versions

TPRM supports the current SIG version and prior versions up to 2021. The following SIG versions are supported:

- SIG Full 2024, 2023, 2022, and 2021
- SIG Core 2024, 2023, 2022, and 2021
- SIG Lite 2024, 2023, 2022, and 2021

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
SIG 2020 versions are available for reactivation. SIG 2020 versions are deactivated by default.

Important:

The base system includes sample SIG questionnaires. These questionnaires don't provide the correct answers. The templates provided by the Shared Assessments service don't include the correct answers. You have to determine the correct and wrong answers.

Yes-or-no questions in the sample SIG questionnaires don't include scoring logic. By default, all Yes answers in the samples are graded as correct. You must configure the logic for your own needs.

SIG Limitations

Your third party might run into the following issues when using a SIG:

- If a third party uploads a version prior to the earliest supported SIG, all responses for matching questions are imported and any non-matching questions are imported with empty responses for the third party to answer later.
- If a third party attempts to load the data from a version of SIG that is older than the current version, some questions might not be mapped or parsed correctly (for example, if you load data for SIG 2021 full on SIG 2022 full).
- Loading a version of SIG prior to 2021 isn't supported.

Note:
For more information about using the GRC: SIG Questionnaire Integration plugin, see Standardized Information Gathering (SIG) Questionnaire Integration, Install the GRC: SIG Questionnaire Integration, and Verify the SIG Questionnaire Integration in Third-party Risk Management.

For instructions that you can send to third-party contacts, see Respond using the SIG.

Respond using the SIG

Use the Shared Assessments Standardized Information Gathering questionnaire (SIG) to provide assessment documentation on the third-party portal. You can upload the pre-filled SIG spreadsheet or import a form-based questionnaire.

Before you begin
Role required: vendor_contact

About this task
TPRM supports the current SIG version and prior versions up to 2021. The following SIG versions are supported:

- SIG Full 2025, 2024, 2023, 2022, and 2021
- SIG Core 2025, 2024, 2023, 2022, and 2021
- SIG Lite 2025, 2024, 2023, 2022, and 2021

Note:
SIG 2020 versions are available for reactivation. SIG 2020 versions are deactivated by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you upload a version prior to the earliest supported SIG, all responses for matching questions are imported and any non-matching questions are imported with blank responses for you to answer later.

Important:
If you attempt to load data from a version of SIG that is older than the current version, some questions might not be mapped or parsed correctly (for example, if you load data for SIG 2022 full on SIG 2023 full). You can't load a version of SIG prior to 2021.

Procedure

1. Log in to the Third-party portal at `https://<myCompany>.service-now.com/svdp`.
2. Upload a completed questionnaire or complete the questionnaire.
3. Submit the SIG questionnaire on the Third-party portal.
   The complete SIG questionnaire is now available for review by the requester.

Using risk intelligence reports and scores

Request risk intelligence reports or scores directly from your external risk intelligence content providers by using the Third-party Risk Management application. This information can be requested and managed based on the importance or risk level of the individual third party.

Risk intelligence overview

Risk intelligence providers are companies that specialize in analyzing and generating risk scores for various third-party risk domains. These providers offer services that are similar to personal credit scoring systems, delivering data that helps organizations assess third parties.

If you have the third-party risk (TPR) assessor [sn_vdr_risk_asmt.vendor_risk_assessor] and are the due diligence request owner or the TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] role, you can use the TPRM application to request scores or reports for third parties by using the risk intelligence request form. After the reports and scores are generated by the risk intelligence provider, the links to these reports are delivered and associated with that risk intelligence report record.

The information in these reports can cover various topics, including the geopolitical risks, economic stability, industry-specific trends, and regulatory changes that could affect your third-party interaction. You can order different types of reports, such as credit risk reports, compliance reports, strategic risk reports, and more, for your specific risk management program requirements.

Setting up risk intelligence providers and request types

If you have the TPR assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role, you must register the providers and set up both the providers and request types in the Third-party Risk Management application before you can request a report. For more information, see Register a risk intelligence provider, Set up a risk intelligence provider service, and Set up a request type for a provider.

Note:
You can request risk reports for third parties but not for engagements.

Requesting risk intelligence

As a TPR manager [sn_vdr_risk_asmt.vendor_risk_manager], TPR assessor [sn_vdr_risk_asmt.vendor_risk_assessor] that is the due diligence request owner, or contract

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

negotiator [sn_vdr_risk_asmt.contract_negotiator] that is assigned to the due diligence request, you can request a Risk Intelligence Report (RIR) or score to gain insight on how trustworthy a particular third party can be. You would follow this process to request risk intelligence reports or scores:

1. Fill out the RIR request form. An RIR request can be associated with a third party or due diligence request. When you associate a RIR request with a due diligence request, reviewers and approvers can more easily access all the related activity, scores, reports, and details through the **Risk Intelligence report request** tab in the Vendor Management Workspace[var.vendor-management-ws]. For more information, see Request a risk intelligence report and Request a risk intelligence report associated with a due diligence request.

   Note:
   If you want to associate an RIR request with a due diligence request, it must be after the inherent risk questionnaire (IRQ) has been completed (that is, when the due diligence request has entered the IRQ in progress state).

2. The TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] and their team reviews the request.
3. The TPR manager [sn_vdr_risk_asmt.vendor_risk_manager], TPR assessor [sn_vdr_risk_asmt.vendor_risk_assessor] that is the due diligence request owner, or contract negotiator [sn_vdr_risk_asmt.contract_negotiator] that is assigned to the due diligence request can submit it if it's approved. After the request has been submitted and has entered the Order pending state, all fields in the Risk intelligence report request section are read-only to help to prevent incorrect orders from being submitted to the provider.

   Note:
   The TPR manager, TPR assessor, or contract negotiator can cancel a RIR request while the request is in the Open or Order pending state. An RIR request can also be canceled if the report is no longer needed due to new information that impacts the third party or some other change.

4. After the reports and scores are generated by the risk intelligence provider, the links to these reports and the scores are delivered and associated with the risk intelligence report request. The RIR request then enters the Closed complete state.

For more information on RIR requests and their process states, see Risk intelligence report requests management.

Note:
You can't have multiple RIR requests with the same provider, request type, or third party. For example, if you have already associated an RIR request with a third party, you can't request the same report from the same provider as part of a due diligence request for an engagement. This process helps with preventing duplicate orders from being submitted to the provider.

You can manually add scores to third parties and use the Risk intelligence scores related list to review the background information on the existing scores for a third party. For more information, see Add a risk intelligence score to risk data for a third party.

Tracking sanctions-related information

By tracking sanction-related information about your third parties, you can check if that third party is involved in any activities that are prohibited or restricted by government sanctions or regulations. Logging and updating sanctions-related information for third parties keeps your team informed as you review and approve a due diligence request as part of your third-party risk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

program. For more information about tracking sanctions-related information, see Track sanctions-related information.

Request a risk intelligence report

Request a risk intelligence report (RIR) or score to gain insight on how trustworthy a particular third party can be using the Third-party Risk Management application.

Before you begin

You must set up and register all risk intelligence providers and set up request types so that they're available as selections in the risk intelligence report form. For more information, see Register a risk intelligence provider, Set up a risk intelligence provider service, and Set up a request type for a provider.

Role required: sn_vdr_risk_asmt.vendor_risk_manager

About this task

You can order different types of risk intelligence reports such as credit risk reports, compliance reports, strategic risk reports, and more for your specific risk management program requirements.

Note:
There can only be one active request of each type for a third party. For example, if Workfaster has already requested a Level 1 report, they can't request another Level 1 report while the first one is still being processed.

Procedure

1. Navigate to **All** > **Self-Service** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Report Requests**.
2. Select **New**.
3. On the form, fill in the fields.

   For descriptions of all these fields, see Risk intelligence report request form. To create a risk intelligence report request that is associated with a due diligence request, see Request a risk intelligence report associated with a due diligence request.
4. **Optional:** In the Sanction section of the form, enter any sanctions-related information. For information on how to track sanctions screening information, see Track sanctions-related information.
5. Select **Save**.

   The system opens to the third-party risk RIR request. For each risk intelligence request, the system auto-assigns a unique ID number that starts with the text RIR. Use this ID to track your request. You can add attachments and start a discussion with your team from this page.
6. Select **Submit request**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The RIR request has been submitted to the provider.

Note:
You can create a risk intelligence request through the third-party record page with the following actions.

a. In Vendor Management Workspace, select the list icon and then navigate to **All third parties**.
b. Select the relevant third party to get to the third-party record page.
c. On the **Risk Intelligence report request** tab, select **New** and specify the **Provider** and **Request type**.
d. Select **Save**.
e. Select **Submit request**.

You have submitted the RIR request to the provider.

Request a risk intelligence report associated with a due diligence request

Request a risk intelligence report (RIR) or score to gain insight on how trustworthy a particular third party can be as part of the due diligence request process by using the Third-party Risk Management application. By associating your RIR request with a due diligence request, all activity, scores, reports, and details are available for you to see.

Before you begin

You must set up and register all risk intelligence providers and set up request types so that they're available as selections in the Risk intelligence report request form. For more information, see Register a risk intelligence provider, Set up a risk intelligence provider service, and Set up a request type for a provider.

Role required: sn_vdr_risk_asmt.vendor_assessor that is the due diligence request owner, sn_vdr_risk_asmt.vendor_risk_manager, or sn_vdr_risk_asmt.contract_negotiator assigned to the due diligence request.

About this task

You can order different types of risk intelligence reports such as credit risk reports, compliance reports, strategic risk reports, and more for your specific risk management program requirements.

Note:
There can only be one active request of each type for a third party. For example, if Workfaster has already requested a Level 1 report, they can't request another Level 1 report while the first one is still being processed.

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the list icon and then navigate to **Due diligence requests** > **All requests**.
3. Navigate to the Due diligence request record page by selecting the relevant **DDR** number.
4. On the **Risk Intelligence report request** tab, select **New** and specify the **Provider** and **Request type**.

   For descriptions of all these fields, see Risk intelligence report request form.

5. **Optional:** In the Sanction section of the form, enter any sanction-related information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on how to track sanctions screening information, see Track sanctions-related information.

6. Select **Save**.

   The system opens to the Third-party risk intelligence request. For each risk intelligence request, the system auto-assigns a unique ID number that starts with the text RIR. Use this ID to track your request. You can add attachments and start a discussion with your team from this page.

7. Select **Submit request**.
   You have submitted the RIR request to the provider.

Track sanctions-related information

Track sanction-related information as part of requesting risk intelligence reports and scores by using the Third-party Risk Management application. Logging and updating sanctions-related information for third parties keeps your team informed as you conduct due diligence as part of your third-party risk program.

Before you begin

Role required: sn_vdr_risk_asmt.vendor_assessor that is the due diligence request owner, sn_vdr_risk_asmt.vendor_risk_manager, or sn_vdr_risk_asmt.contract_negotiator assigned to the due diligence request

Procedure

1. Navigate to **All** > **Self-Service** > **Third-party Risk Management** > **Risk Intelligence Provider Setup** > **Report Requests**.
2. Select the RIR number that you want.
3. On the form, specify if the third party is sanctioned by selecting **Yes** or **No** and fill in the fields. For descriptions of all these fields, see Risk intelligence report request form.
4. Select **Update**.
   The sanctions-related section of the RIR request has been updated.

Third-party Risk Management reference

Reference topics provide detailed descriptions of tables, properties, forms, and roles that are installed with the Third-party Risk Management application.

Terminology

Learn more about the key concepts and terms that are used in the TPRM application.

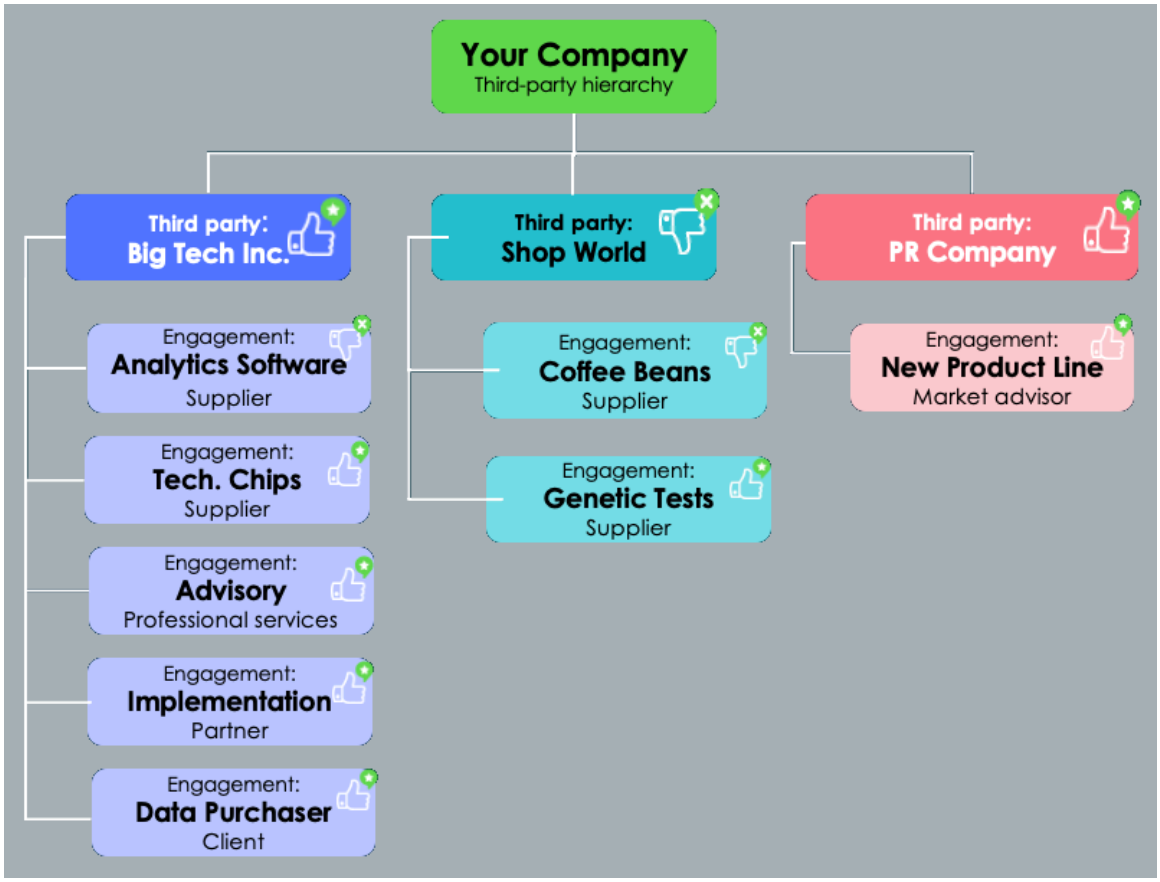
Third, Fourth, and nth parties

A third party is any organization or individual that you've interacted or entered into a business relationship with. Third parties can have subsidiaries and can contract with fourth parties. For example, departments are subsidiaries. A fourth party can contract with further parties (referred to as nth parties—fifth, sixth, and so on). All downstream parties (fourth through nth parties) carry risk in the same ways as third parties.

A vendor provides the goods or services that you use to produce or deliver your own goods or services. All vendors are third parties, but not all third parties are vendors. Here's a list of some other types of third parties:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Suppliers
- Affiliates
- Counterparties
- Consultants
- Partners
- Professional services
- Advisers
- Franchises
- Dealers
- Resellers
- Distributors
- Customers
- Clients
- Outsourced staff



Engagements

An engagement is the informal or contracted relationship that you intend to form with a third party that could potentially expose your organization to risk. The engagement outlines the services or products to be provided by the third party and other details of the relationship. These details can include the terms of payment, confidentiality requirements, and the duration of the relationship.

You can assess each engagement by using internal and external assessments. The issues, tasks, internal assessments, and external assessments are associated with the engagements.

In this example, Your Company interacts with three third parties and manages several engagements among them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The particular third-party engagements that you might have depend on your industry, size, and operational requirements. Each engagement brings its own set of risks and requires appropriate risk management measures (due diligence) to protect your interests.

- For a detailed discussion and an example, see Why you might have several engagements with a single third party.
- For a list of the kinds of engagements that you might perform, see Types of engagement with third parties.

Subsidiaries

A subsidiary is an organization owned or controlled by the third party and is considered part of the third party's organization. They're typically managed as part of the third party's risk profile. They're different from fourth to nth parties which have contracts with a third party and aren't owned or controlled by that third party.

Risk assessment for subsidiaries is the same as for other third parties. The risk ratings of the subsidiaries contribute to their controlling third party's score.

IRQ—the Inherent Risk Questionnaire

During the internal assessment process, internal employees in your organization answer questions in the IRQ. These responses help with assessing the inherent risk that is associated with engaging with a third party. An inherent risk refers to the level of risk before implementing any risk mitigation measures. An IRQ supports the following activities:

Determining risk factors

- The nature of the services provided by the third party.
- The sensitivity of the data involved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The geographic location of the third party.
- The overall security posture of the third party.

Determining scoring or rating

Responses to the questionnaire are often scored or rated to help quantify the inherent risk that is associated with the third party. This scoring system can aid in prioritizing risk management efforts.

Decision making

The results of the IRQ are then used in the decision-making process. Third-party Risk (TPR) administrators and managers can configure IRQs to send out specific external assessment (due diligence) questionnaires to the third parties based on the specific responses to questions.

- Should you engage with the third party?
- What level of due diligence is required?
- What specific risk mitigation measures should you implement?

Ongoing due diligence

The IRQ may also be part of ongoing management, with periodic reassessments to account for changes in the third party's operations, security practices, or other relevant factors.

Due diligence (DD)

Due diligence is the process of conducting a thorough investigation or examination of the integrity, reputation, financial stability, legal compliance, operation capabilities, supply chain, and other relevant factors of a potential business partner, supplier, or vendor. Conducting due diligence on third parties is a crucial component of your comprehensive third-party risk program. You conduct due diligence to become aware of the risks that are associated with a third party so that you can confidently decide how to form your relationship. Use due diligence workflows to onboard new engagements or to reassess or retire any existing engagements. Due diligence workflows include gathering information through internal assessments, external assessments, and risk intelligence. All the scores from these steps are analyzed by the third-party risk managers to decide whether to onboard, reassess, or retire an engagement. Due diligence also has an optional contract negotiation process before closing the due diligence workflow.

See Why you conduct due diligence and Types of due diligence.

Third-party risk assessments

A third-party risk assessment (TPRA) is a set of questionnaires that you can send to third-party contacts or internal users to assess the third-party and engagement risks. An assessment that you send to internal users are categorized as an internal assessment. An assessment that you send to a third-party contact is called an external assessment.

Use an internal assessment to calculate the third party and engagement tiers. The classification that you use to identify the internal questionnaires in the questionnaire templates table is the Inherent Risk Questionnaire template [irq_template]. You can automatically attach the required questionnaires for external assessments according to the responses that you receive from the internal assessments. You can configure this option in a questionnaire to question mapping table [sn_tprm_dd_m2m_question_to_questionnaire].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use an external assessment to assess the risks that are associated with the third party and engagement according to the third-party contact responses that you receive. The risk ratings from an external assessment are calculated at the assessment level by using all the questionnaires that are attached to the assessment. These assessment ratings are aggregated and rolled up to the third parties and engagements. The aggregation is either MIN, MAX or AVG and can be configured in a scoring setup. Third-party contacts (external users) from the third-party portal `https://<myCompany>.service-now.com/svdp` respond to these external assessments.

For more information on scoring, see Scoring calculations using the classic assessment engine.

Risk intelligence providers

Risk intelligence providers generate risk scores for a variety of third-party risk domains. Your organization can purchase services from providers that return data that is analogous to personal credit scores. The scores provide insight on how trustworthy and safe a particular third party can be.

See Integrating scores from risk intelligence providers.

Risk intelligence scores

Risk intelligence scores are numerical assessments that evaluate the level of risk associated with a particular organization. These scores are generated by risk intelligence providers who collect and analyze a wide range of data sources. Scores can come in any form be it ratings or numbers. The system maps the score value to the appropriate TPRM rating. These scores can help your organization make informed decisions about engaging with third parties, managing compliance, and mitigating potential risks. Risk intelligence scores are available for third parties as of the Washington DC release. The risk ratings are calculated by the scoring rules that are associated with the engagement in the scoring setup.

Third-party scores

Third-party scores are numerical assessments that are an aggregate of your risk intelligence scores and scores determined by external assessments (engagement questionnaires, and third-party risk questionnaires).

These scores help organizations make informed decisions about selecting and managing their third-party relationships, enabling alignment with their risk tolerance and compliance requirements. By assessing third-party scores, organizations can identify potential risks, prioritize due diligence efforts, and implement appropriate risk mitigation strategies.

Risk rating components

A component is the entity for which you can assess risk. The base system includes engagements, external monitoring, subsidiaries, and third-party risk assessments. Risk is calculated for each component and then the risk is aggregated and rolled up to calculate a third-party risk rating.

A component criteria is the definition of how a component is going to be used by a third party. A component criteria is a group of components that should apply to a particular type of third party or engagement.

Note:
You can't add new components or modify existing ones. You can, however, define the criteria (in terms of scoring method and weight) to be used to assess the components.

A risk area or domain defines the type of risk to assess for a third party. This is typically aligned to the area/domain in which the third-party operates or for which they provide a product/service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, you might want to assess a data-management third party in terms of security risk and a bank in terms of financial risk.

A risk area criteria is the definition of how risk areas are going to be used by a Third party is defined in the risk area criteria. A third-party risk area criteria is a group (or grouping) of risk domains or areas that may apply to a particular type of third party. For example, security, financial, and reputational risk domains may be grouped into a risk area criteria that should apply for any third party. One can better understand and mitigate the risks that a third party poses to your organization by identifying the domains of their business to assess for risk and quantifying the importance (weight) of each domain.

Scoring rules

A scoring rule provides the mechanism to apply component criteria and risk area criteria to a third-party and a risk area criteria for an engagement.

For a third party, the component criteria determine which specific components are applicable and the relevant scoring method for each component. These components may include geographic location, overall security posture, and results from internal and external assessments. The scoring methods for these components are configured in the scoring setup. For example, internal assessments for geographic location and overall security posture are part of the internal assessment process, while external assessments use methods like MIN, MAX, or AVG to calculate risk ratings. Additionally, risk intelligence scores from external providers are mapped to appropriate ratings and combined with the external assessment scores to form the overall third-party score.

For a third party, the risk area criteria determine which specific risk areas (or domains) are applicable and the relevant scoring method for each risk area.

These risk areas may include:

- Data breaches
- Downtime
- Compliance violations
- Supply chain disruption
- Counterfeit parts
- Regulatory compliance issues
- Hidden ownership
- Reputational risk
- Financial risk

The scoring method for each risk area can be configured in the scoring setup and can be either MIN, MAX, or AVG, depending on the organization's preference and the nature of the risk.

For an engagement, the risk area criteria determine the applicable risk areas or domains, which include:

- Geographic location
- Security posture
- Nature of services
- Data sensitivity
- Third-party elements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The scoring method for a specific risk area can be configured as MIN, MAX, or AVG. This method aggregates the risk ratings from internal and external assessments to determine the overall third-party score.

Note:

For more information on assessment configuration and scoring, see Classic assessment configuration, Scoring calculations using the classic assessment engine, and Verifying scoring calculations using the classic assessment engine.

Third-party elements

Third-party elements are the external organizations that a third party or engagement relies on to provide goods, services, or support. These organizations can include vendors, suppliers, contractors, individuals, or any other external organization that has access to the third party or engagement's systems, data, or facilities. Any vulnerabilities or failures in these third-party elements can have a significant impact on the third party or engagement's operations, reputation, and security. By implementing these controls and addressing associated risks, organizations can enhance their ability to manage and mitigate the potential negative impacts of third parties and their third-party elements. Regularly reassessing and updating these controls is essential to adapting to changes in the business environment and regulatory landscape.

Here are some examples of Third-party elements and their associated controls and potential risks.

Datacenter

Facilities or locations where third parties or engagements outsource the storage, processing, and management of their data and IT infrastructure.

Controls:

- Vendor security assessments: Assess regularly the security measures and practices of third-party vendors providing services such as cloud hosting or data storage.
- Data encryption: Confirm that data stored in the datacenter is encrypted to protect it from unauthorized access.
- Access controls: Implement strict access controls to limit physical and virtual access to the datacenter facilities and servers.
- Incident response plan: Develop and maintain a comprehensive incident response plan to address any security incidents promptly.

Risks:

- Data Breaches: A breach in the third-party datacenter could lead to unauthorized access and compromise of sensitive information.
- Downtime: Reliance on a third-party datacenter puts the organization at risk of downtime if the service provider experiences technical issues.
- Compliance Violations: Failure by the datacenter to adhere to industry or regulatory compliance standards could lead to legal and financial consequences for the organization.

Manufacturing facility

Facilities or locations where third parties or engagements outsource the production or assembly of their products.

Controls:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Supplier Audits: Regularly audit and assess the security practices of suppliers providing critical components or services for the manufacturing process.
- Quality Assurance Standards: Enforce quality assurance standards for third-party suppliers to promote the integrity and safety of raw materials and components.
- Supply Chain Visibility: Maintain visibility into the entire supply chain to identify and address potential vulnerabilities.
- Contractual Agreements: Establish clear contractual agreements with suppliers outlining security requirements and consequences for non-compliance.

Risks:

- Supply Chain Disruption: Dependency on third-party suppliers exposes the organization to the risk of supply chain disruptions, impacting production.
- Counterfeit Parts: Inadequate controls on the supply chain may lead to the use of counterfeit or substandard components, compromising product quality.
- Regulatory Compliance Issues: Failure by suppliers to comply with regulatory standards can result in legal and regulatory consequences for the manufacturing facility.

Beneficial owners

Individuals who ultimately own or control an organization that is involved in a business relationship or transaction. These individuals may not be the registered or legal owners of the organization but have significant influence or control over its operations, decision-making, or financial affairs.

Controls:

- Due Diligence: Incorporate a robust due diligence process to identify and verify beneficial owners, including background checks, document reviews, and interviews where necessary.
- Contractual Obligations: Include clauses in contracts with third parties that require them to disclose any changes in beneficial ownership and confirm compliance with applicable laws and regulations.
- Monitoring and Reporting: Establish a system for ongoing monitoring of beneficial owners to detect any changes or developments that may impact the risk profile of the third party.
- Training and Awareness: Provide training to relevant staff on the importance of understanding and monitoring beneficial ownership, including red flags and reporting procedures.
- Regulatory Compliance Program: Develop and maintain a program that verifies compliance with all relevant laws and regulations related to beneficial ownership, including reporting and disclosure requirements.
- Escalation Procedures: Establish clear escalation procedures for cases where concerns or irregularities related to beneficial ownership are identified, promoting timely and appropriate action.

Risks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Hidden Ownership: Beneficial owners might deliberately conceal their ownership, making it challenging to assess the potential risks associated with their influence on the third party.
- Reputational Risk: If the beneficial owners have a questionable reputation, involvement with them may harm the reputation of your organization.
- Regulatory Compliance: Failure to comply with regulations related to beneficial ownership reporting and transparency can lead to legal and regulatory consequences.
- Financial Risk: Beneficial owners with financial instability or involvement in fraudulent activities may pose financial risks to the third party and, consequently, to your organization.

Roles in Third-party Risk Management

Roles determine permissions and access in TPRM.

TPRM roles

Friendly name [role name]	Description	Contains roles
Third-party reader [vendor_reader]	Read access to third-party contact records.	None
Third-party editor [vendor_editor]	Create/update/delete third-party contact records.	None
Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer]	View assessment and questionnaire data. In addition to viewing, they can leave comments on the following tables: • Tiering assessment • Internal assessment • External assessment • Third-party risk issues • Third-party risk tasks • Third-party risk due diligence request	Contains: • compliance_reader • risk_reader • task_editor • vendor_reader • sn_dora_accel.user • sn_smart_asmt.template_reader • sn_smart_asmt.assessment_reader
TPR assessor (Third-party risk assessor) [sn_vdr_risk_asmt.vendor_assessor]	• Includes all permissions of the Third-party assessment reviewer role plus: Manage third parties, third-party contacts, external risk assessments, and issues. • You can set the following options for the	Contains: • compliance_reader • vendor_assessment_reviewer • vendor_editor • vendor_reader • sn_dora_accel.manager

Roles required for accessing the Digital resilience third-party registers

A user with one of the following roles can access the Digital resilience third-party registers related modules in the Vendor Management Workspace:

- TPRM DORA user [sn_dora_accel.user] role

  Third-party assessment reviewer and TPR approver contain this role.

- TPRM DORA manager [sn_dora_accel.manager] role

  TPR assessor and TPR manager contain this role.

- TPRM DORA admin [sn_dora_accel.admin]

  The TPR admin contains this role.

For more information on DORA related roles, see Roles installed with Digital resilience third-party registers.

Roles required for using Smart Assessment Engine

A user with one of the following roles can view templates in the Assessment Workspace:

- TPRM SAE template reader [sn_smart_asmt.template_reader] role

  Third-party assessment reviewer contains this role.

- TPRM SAE assessment reader [sn_smart_asmt.assessment_reader] role

  Third-party assessment reviewer contains this role.

A user with one of the following roles can respond to questionnaires in the Vendor Management Workspace, GRC portal, or Third-party portal.

- TPRM SAE internal assessment user [sn_vdr_risk_asmt.internal_assessment_responder]

  This is role is automatically assigned to an assigned IRQ assessor or internal assessment respondent.

  This role is required to respond to internal/IRQ assessment questionnaires using the GRC Portal.

  This role contains the following roles: sn_grc_business_user, canvas_user, and sn_smart_asmt.actor.

- TPRMSAE external assessment user [sn_vdr_risk_asmt.external_assessment_responder]

  This is role is automatically assigned to the assigned third-party contact.

  This role is required to respond to external questionnaires using the Third-party portal.

  This contains the role: sn_smart_asmt.actor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A user with the TPRM SAE admin [sn_smart_asmt.assessment_admin] role can create SAE templates in the Configure domain separation for Vendor Management Workspace and Assessment Workspace.

Third-party admin contains this role.

A user with the sn_smart_imp_auto.automation_creator role can create post assessment impact automation rules.

Third-party admin contains this role.

Important:
The Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role is the minimum role that you must have to view any template that is a member of the TPRM external questionnaire, TPRM external document request, TPRM internal tiering questionnaire, and TPRM internal IRQ purposes.

For more information on SAE related roles, see Roles in Smart Assessment Engine.

Unique ID numbers for TPRM records

When you create (or the system generates) a new record (for example, a request for due diligence or a task), the system auto-assigns a unique ID number that helps to identify the type of data in the record. You can use the ID number to search for or filter the item you want to work on.

Unique text prefixes for ID numbers that identify the type of record

- **Questionnaire requests**: When a questionnaire template is added to an assessment and sent out, the system generates assessment instances for each template. Each of these instances is automatically assigned a unique ID number that starts with the text AINST.
- **Contracts**: For each contract, the system auto-assigns a unique ID number that starts with the text C or CNTR.
- **Controls**: For each control, the system auto-assigns a unique ID number that starts with the text CTRL.
- **Due diligence requests**: For each due diligence request, the system auto-assigns a unique ID number that starts with the text DDR.
- **Engagement risk scoring rules**: For each engagement risk scoring rule, the system auto-assigns a unique ID number that starts with the text ERS.
- **Event-driven management**: For each Event-driven management rule, the system auto-assigns a unique ID number that starts with the text EMR. In the history table of rule runs (executions), the system auto-assigns a unique ID number for each run that starts with the text EMH.
- **IRQs**: For each IRQ process, the system auto-assigns a unique ID number that starts with the text INA.
- **Risk Intelligence Requests**: For each risk intelligence request, the system auto-assigns a unique ID number that starts with the text RIR.
- **Issues**: For each issue, the system auto-assigns a unique ID number that starts with the text VRI.
- **Tasks**: For each task, the system auto-assigns a unique ID number that starts with the text VRT.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **External assessments (the external due diligence process where third-party contacts respond to requests for information)**: For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA.
- **Third-party risk scoring rule**: For each third-party risk scoring rule, the system auto-assigns a unique ID number that starts with the text VRS.
- **Risk tiering assessment**: For each risk tiering assessment, the system auto-assigns a unique ID number that starts with the text VTA.

Results of migrating a template to a TPRM SAE template

You can view the templates that were migrated to Smart Assessment format.

Tracking template migration

After you have started the migration process, you can view the progress and confirm if it was completed successfully. For more information on the migration process, see Migrate a template to an SAE template and Creating an assessment template from legacy assessment metric types.

Viewing the migration results

To view your migration results, navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Classic Template Migration**. In the Assessment template migrations list, select the migration number. Each migration record for a metric type is assigned a unique number that starts with the text ATMIG. The form displays the values that were used to generate the template. The related lists display the status and content of the migrated data.

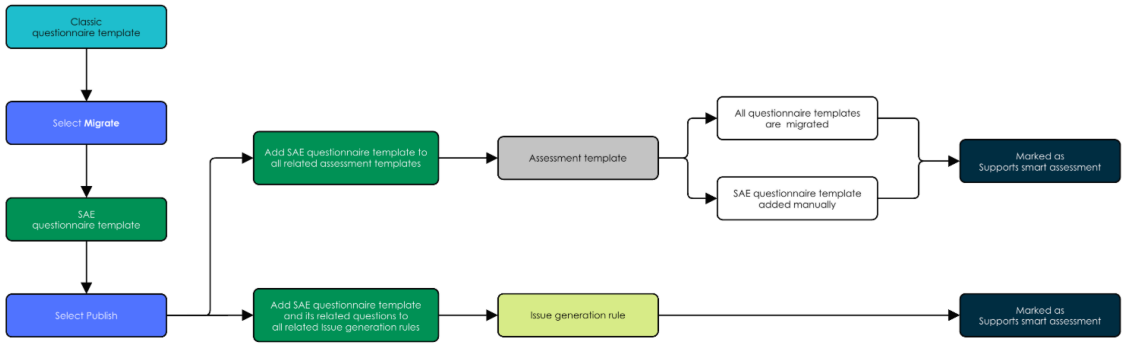
The following table describes the fields in the Assessment template migration list.

Assessment template migration list

Field	Description
Number	Unique number that starts with the text ATSMIG in the migration record for the questionnaire. You can use the number to search for the record.
Source metric type	Classic template that migrated.
Target assessment template	Smart Assessment template that is migrated from the source template.
Purpose	Purpose for the migrated template. **Note:** Known as Template classifications in the Classic assessment engine, TPRM has a **Purpose** for each classic template classification. TPRM purpose options include: • TPRM external 3rd-party element questionnaire • TPRM external 4th-party questionnaire • TPRM external document request

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment template migration list (continued)



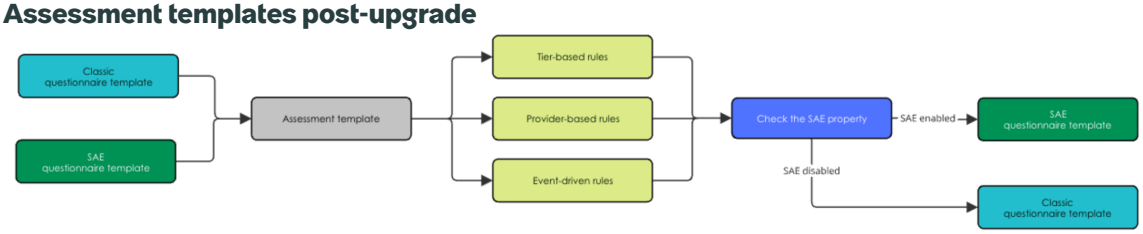
Field	Description
	• TPRM external questionnaire • TPRM internal IRQ • TPRM internal tiering questionnaire To view a TPRM SAE questionnaire template you must have the TPR assessment reviewer role [sn_vdr_risk_asmt.vendor_assessment_reviewer]. For more information on creating assessment template purposes, see Create an assessment template category. **Note:** You can create an assessment only from a published assessment template. You can update a published template only if no active assessment is associated with the template.
Migration status	Value that updates as the template migration process proceeds. • **In progress**: Status for after you start the migration process, the process is in progress until it finishes. • **Completed**: The migration is completed successfully. • **Partially completed**: Only some elements were successfully migrated. • **Errored**: An error occurred during the migration.
Error details	Description of an error that occurred during the unsuccessful migration.
Created	Date and time the migration job was created.

Template migration results

The following diagram shows the questionnaire to TPRM SAE template migration workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAE migration workflow



1. Migrate templates either one by one or in bulk. After migration, all templates are in the Draft state.
2. Review each migrated questionnaire template individually to confirm that they're accurate and complete.
3. Publish TPRM SAE questionnaire templates. After publishing, the following actions occur automatically:
   - TPRM SAE templates are associated with all related Assessment templates.
   - TPRM SAE templates are associated with all related Issue generation rules.

   Note:
   For Issue-generation rules to work as expected when applied to an TPRM SAE assessment template, at least one question must have the option, Enable preferred response, set to true.
4. After all questionnaire templates related to an assessment template have been migrated and published, they should be marked as Supports smart assessment and ready for use.
5. Review each assessment template to confirm it's marked as Supports smart assessment. If an assessment template isn't marked as Supports smart assessment, manually adding a new TPRM SAE questionnaire template to it updates its status.
6. After a questionnaire template has been migrated and published, its related issue generation rule is automatically marked as Supports smart assessment and is ready for use.

For more information, see Migrate a template to an SAE template, Create a TPRM SAE questionnaire or document request template, Create an external assessment template, and Create an issue generation rule.

The following diagram shows the relationship between assessment templates and questionnaires after upgrading.

Assessment templates post-upgrade

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Before setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property, the following are used by default.
  - Existing questionnaire templates
  - Existing assessments
- After setting the Smart Assessment Engine enabled (*sn_vdr_risk_asmt.sae_enabled*) property, the following are used by default.
  - SAE questionnaire templates (New or migrated).
  - Assessments marked as Supports smart assessment.
  - Tier-based, Provider-based, and Event-driven management rules only work with assessments marked as Supports smart assessment.

Note:
Templates and questions must be reviewed to confirm they're marked as Supports smart assessment. After the assessment templates and questions are marked as Supports smart assessment, issue-generation rules can be applied.

Template migration scoring results

The Migrate scores from classic template business rule automates the migration of scores from the Classic template to the TPRM SAE template, helping ensure consistent scoring configuration. If a new template is created, you must manually enable scoring, define the correct options, and set their scores. For more information, see Scoring assessments, Configure scoring for an assessment, and Normalization in assessment.

Migration limitations

The assessment migration process has the following limitations and requirements.

- The following question types aren't supported: percentage, ranking, image scale, and custom metric. You must either convert these question types to supported formats before migration or create new questions in the template designer after migration.
- If a section in the classic template contains only unsupported questions, an empty section is created in the TPRM SAE template. TPRM SAE templates with empty sections can't be published; therefore, you must either add replacement questions to these sections or delete the empty sections before publishing.
- When transferring TPRM SAE questionnaire templates between instances, the update set won't include the duration information. Users must export the duration information manually from the `sn_smart_asmt_duration` table and import it into the target instances.
- If an assessment template isn't updated to support SAE assessments, the related tier-based, provider-based, and event-driven management rules won't run as expected.
- The TPRM scoring migration proceeds only if there were no errors during the template migration. If there were errors, the TPRM scoring migration doesn't occur.
- Responses from previous assessments aren't migrated.

Guidelines for importing spreadsheet data

Before you try to import the questionnaire data from a Microsoft Excel spreadsheet into Third-party Risk Management tables, you must verify that its format meets particular guidelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property settings that affect spreadsheet data

You can specify the following property settings:

Text delimiter in spreadsheets [`sn_vdr_risk_asmt.excel_choice_delimiter`]

Character string that separates response text in questions of type 'Choice' and 'Multiple Selection'.

Common delimiters: \r, \n, \t, \r\n, and the comma character.

Maximum spreadsheet file size [`sn_vdr_risk_asmt.excel_file_max_size`]

Maximum file size in MB that can be imported.

See Configure TPRM properties.

Supported columns

Required columns are marked with *. Column headings must appear in the first row of the spreadsheet.

- Serial number *
- Category *
- Question *
- Order *
- Data type *
- Description
- Scored
- Correct answer
- Scale definition
- Depends on
- Displayed when
- Min
- Max
- Weight
- Mandatory
- Allow additional information
- Allow not applicable
- All other columns of the Assessment Metric [asmt_metric] table

Supported question types

- Check box
- Yes/No
- Choice
- Attachment
- Date
- Date/Time

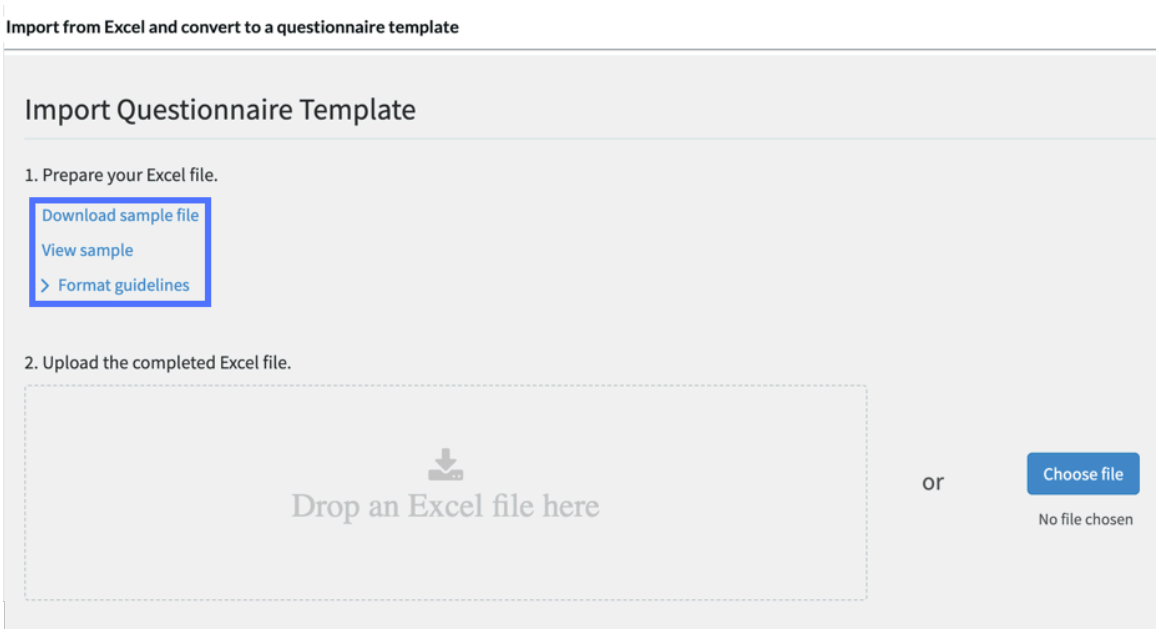
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Percentage
- String
- Multiple Selection
- Number
- Numeric Scale



Supported Excel formats

Requirements:

- Each file can have only one worksheet.
- You can separate multiple choices in a cell with line breaks (Alt/Option + Enter). Other options are available in System Properties.

- .xlsx
- .xls
- .xlm
- .xltx
- .xlt
- .xlw
- .xlsb
- .csv

Note:
You can review the formatting requirements and view or download a sample spreadsheet to use as an example. Referencing a sample file can help you ensure that you are using values in the expected format.

Sample questionnaires

The questionnaire that you use can depend on your industry, geographic area, jurisdiction, or the particular nature of your operations. These questionnaires are provided as part of the base system and are samples that shouldn't be implemented into your risk management program without first being reviewed and approved by your legal team.

Types of Questionnaire template

You can view these questionnaire templates by navigating to **All** > **Third-party Risk Management** > **Assessment Setup** > **Questionnaire Templates**.

Due diligence request process management

From the Details tab, you can view and adjust the due diligence request information for a third party. You can also log external-facing comments and private work notes, attach files, and track request updates in the activity stream.

The **Details** tab for a due diligence request displays information in the following sections:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party due diligence request

Third-party due diligence request

Field	Description
Number	For each due diligence request, the system auto-assigns a unique ID number that starts with the text DDR.
State	Current state in the due diligence process: IRQ, external due diligence, approval, contract risk, or closed.
Request Type	• **Onboard a new engagement.** Start the onboarding process for a new engagement with an existing third party. • **Reassess an existing engagement.** Reassess an existing engagement when the conditions change. For example, let's say that you hear adverse news or have changes in your third-party's supply lines. You might want to reassess the risk by conducting additional due diligence. • **Reassess an existing engagement for contract renewal.** Reassess the risk before your organization renews the contract with a current third party or engagement by conducting due diligence. • **Offboard an engagement with due diligence.** Determine if offboarding (terminating the relationship) with an engagement is the optimal course of action by conducting due diligence. For example, it might be too risky to switch third parties or engagements even if their current performance doesn’t meet expectations. • **Offboard an engagement with NO due diligence.** Request that an engagement be permanently terminated when an engagement ends or you want to switch to a different third party for other reasons. In this case, you typically don't need to conduct additional due diligence. The process does, however, include the normal Inherent Risk Questionnaire (IRQ) process to confirm that the services provided by the engagement will no longer continue.
Priority	Priority of the request. • **1 - Critical** • **2- High**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party due diligence request (continued)

Field	Description
	• **3 - Moderate** • **4 - Low** • **5 - Planning**
Third party	Third party with which the request is associated.
Annual spend	Money that is spent with the third-party organization in one year.
Engagement	Engagement with which the request is associated. **Note:** After the due diligence request is submitted by the requester, the TPR manager or due diligence request owner can update this field to an existing engagement by selecting the magnifying glass icon. This helps avoid onboarding existing engagements.
Skip contract risk process	Option to skip the contract risk process. When you select the check box, you bypass the `contract negotiation` state. The **Contract start date** and **Contract expiration date** fields are replaced with **Engagement start date** and **Engagement expiration date**. See Contract Risk process. **Note:** After the Third-party risk (TPR) manager approves the request, it won't be sent to the contract negotiators, and the request is closed.
Requestor	Creator of the request.
Opened	Date the request was opened.
Contract start date, Expiration date	Preferred dates for the beginning and end of interactions with the engagement.
Engagement start date, Engagement expiration date	Preferred dates for the beginning and end of interactions with the engagement.
IRQ assessor	User at your organization that responds to the IRQ. See IRQ process management.
Contract negotiator	User at your organization that prepares, negotiates, and approves the contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party due diligence request (continued)

Field	Description
Assignment group	Qualified group of individuals available to work on the request. For new requests, the **Assignment group** is set to **Due diligence request assigners**. The system sends an email notification to all users in the group that is specified in the **Assignment group**. The message states that the request was received and is in the **New** state. The message also includes a link to the details page for the request. On the due diligence request form: • Any member of the group can select **Assign to me** or set the **Owner** field to any other member of the group. • A TPR manager or TPR assessor can clear the **Assignment group** field or change the value to select from different TPR assessors in the **Owner** selection list.
Assigned to	The individual assigned to the due diligence request. The owner is responsible for confirming that the assessment is completed in a timely fashion by the third party, reviewing their responses, and creating and resolving issues. To drive the assessment to its completion, owners are notified when an assessment reaches a particular milestone. The owner must have the TPR manager or TPR assessor role.
Short description, Description	Description of the request that helps others to understand the creator's intent and requirements.

Third-party basic information

Third-party basic information

Field	Description
Third-party name	Name of third party with which the request is associated.
DUNS number	Unique numeric identifier for the single business entity. A DUNS number isn't legally required for a business.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party basic information (continued)

Field	Description
	Note: In the Third-party due diligence request [sn_tprm_dd_request] table, there are two DUNs number columns: vdr_duns_number indicates the third party DUNs number and eng_duns_number indicates the engagement DUNs number.
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax	Standard contact information for the third-party organization.
Website	URL for the third party.
Type	Type of third party.
Industry	The industry in which the third party is involved.
First name, Last name, Title, Email, Phone	Standard contact information for the third-party contact.

Engagement basic information

Engagement basic information

Field	Description
Engagement name	Name of engagement with which the request is associated.
Type	Type of product or service for this engagement.
Use the corporation address	Option to use the same corporation address as the third party. When you select the check box, auto-populate the related fields with the third-party organization contact information.
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax	Standard contact information for the engagement organization.
Use the same contact	Option to use the same contact information as the third party. When you select the check box, the related fields are auto-populated with the third-party contact information.
First name, Last name, Title, Email, Phone	Standard contact information for the engagement contact who will respond to the questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk ratings

Fields are auto-populated by the current stage of the IRQ process for the request.

Field	Description
Inherent assessment rating	Rating determined by the IRQ process.
Risk intelligence rating	Rating determined by data from a risk intelligence service provider.
Third-party assessment rating	Rating determined by responses during the external assessment process.
Engagement rating	Rating determined for the engagement.

Progress summary

Status of the due diligence processes. The fields are auto-populated by the current stage of each assessment for the due diligence request.

- Inherent risk assessment
- Third-party risk assessment
- Engagement risk assessment

Compose, Activity, Attachments

The **Compose section** on the **Details** tab enables you to permanently add text to the record. The Activity section is updated with any actions on issues and tasks, submissions to TP contacts, and also with work notes and comments that users add to the record. Add text in the following fields as needed:

- **Work notes (Private)**: Information about the third-party risk assessment. Work notes are visible only to internal users who are assigned to the process.
- **Comments**: Comments about the third-party risk assessment are visible both to internal users and to third-party contacts.

The due diligence request form captures all the initial information that you need to start the due diligence process. Any employee within your organization can request due diligence. If you're selecting an existing third party, a significant portion of the information is automatically filled in.

Request third-party risk due diligence form

Field	Description
Third-party information section	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request third-party risk due diligence form (continued)

Field	Description
Name, DUNS number, Phone, Industry, Website, and Fax	Standard information for the parent organization. A DUNS number isn't legally required for a business. **Note:** • The third party that you identify here might be the target of your request, or it might be the parent of the organization that you engage with. You add the information about the engagement organization in the following Engagement address section. • In the Third-party due diligence request [sn_tprm_dd_request] table, there are two DUNs number columns: vdr_duns_number indicates the third party DUNs number and eng_duns_number indicates the engagement DUNs number.
Engagement information section	
Name	Name that identifies this engagement on all forms and lists.
Type	Type of product or service that the engaged organization provides.
Phone / Fax	Phone and fax numbers of the department or subsidiary organization that the engagement relates to. This number could differ from the number for the parent third party.
Request start date	Date by which you need the engagement to be active so that you can engage with the third party. This information helps the Third-party risk (TPR) manager to prioritize your request.
Request end date	Date at which you expect to end the engagement.
User who will respond to the initial IRQ	Person with the IRQ assessor role who should respond to the IRQ. For more information, see Respond to an internal assessment. **Note:** While reviewing this request for due diligence, the TPR manager or owner can specify a different user.
Third-party address section	
Street, City, State/Province, ZIP/Postal code, Country	Standard address information for the parent organization.
Engagement address section	
Street, City, State/Province, ZIP/Postal code, Country	Standard address information for the engagement organization. Select **Same as third-party address** if the target of your engagement request is the parent third-party organization.

© 2026 ServiceNow, Inc. All rights reserved.

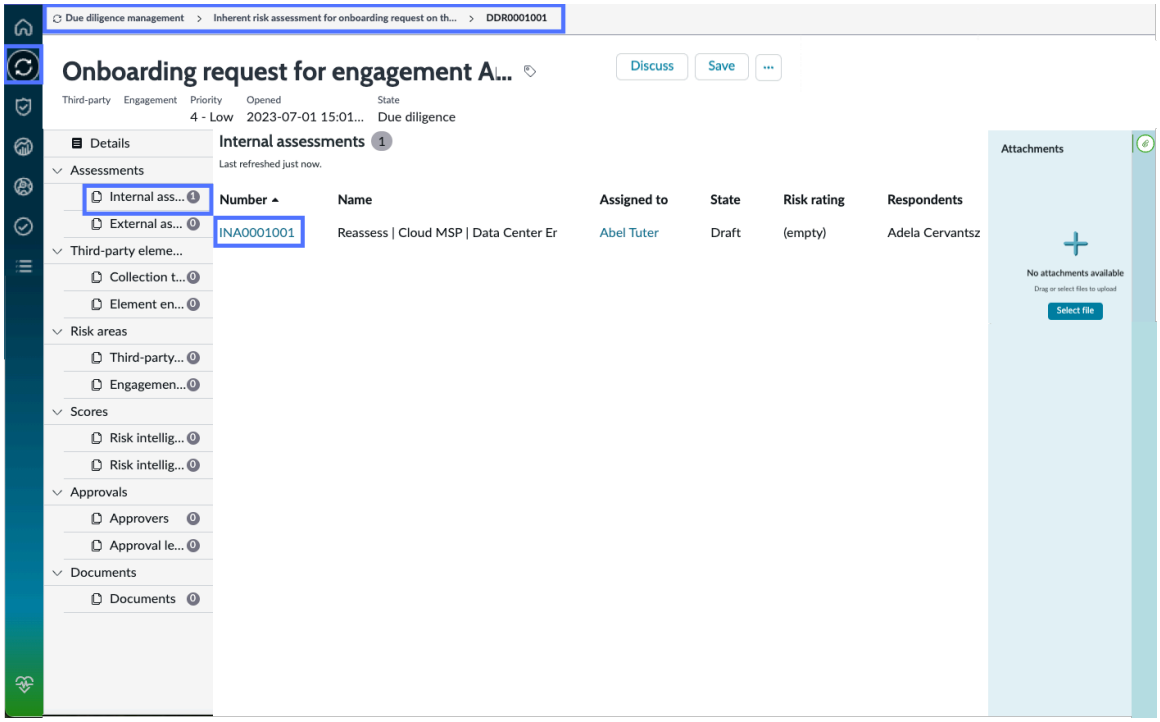
IRQ process management



The first internal step after an engagement request is approved is to start the IRQ process to scope the risk by determining the third party's risk score.

Accessing the IRQ process

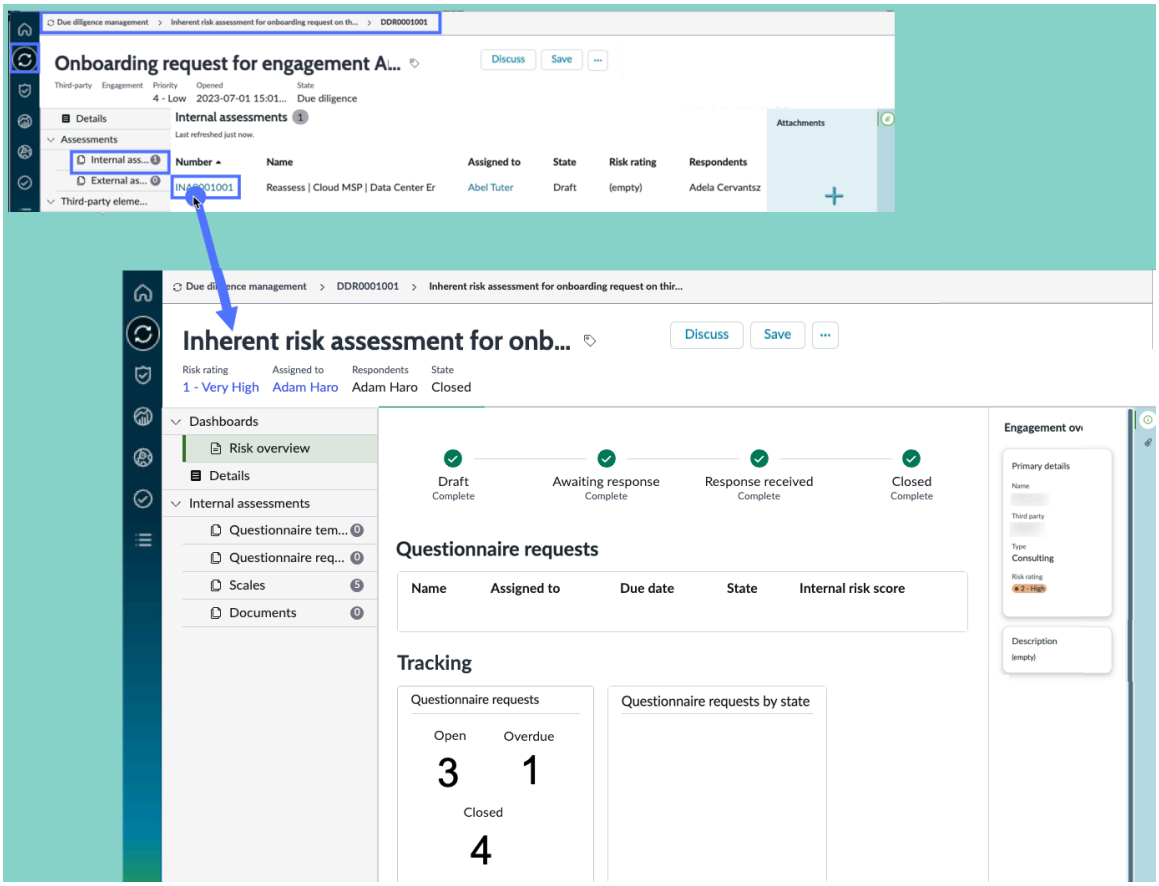
On the Due diligence management page, select the **DDR** number for any due diligence request and then select the **Internal assessments** tab.

The tab displays the list of all IRQ processes for the engagement request. For each IRQ process, the system auto-assigns a unique ID number that starts with the text INA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing the list of internal risk assessments

Internal assessments tab



Internal assessments tab

Column	Description
Number	For each IRQ process, the system auto-assigns a unique ID number that starts with the text INA. Select an INA number to work on the Internal assessments page to the **Risk overview** tab. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Name, Assigned to, Risk rating	Data from the engagement request.
State	The current state of the internal assessment: Draft, Awaiting response, Response received, or Closed.
Respondents	Users who responded to the request.

Risk overview tab on the Internal assessments page

For each IRQ process, the system auto-assigns a unique ID number that starts with the text INA. Select an INA number to work on the IRQ process on the Internal assessments page.

- **Work notes (Private)**: Information about the third-party risk assessment. Work notes are visible only to internal users who are assigned to the process.
- **Comments**: Comments about the third-party risk assessment are visible both to internal users and to third-party contacts.

- The **Third-party overview** section provides key information on the third party that is associated with the engagement request.

Questionnaire templates tab on the Internal assessments page

The tab lists all open IRQs. Select a questionnaire name to view the details.

Scales tab on the Internal assessments page

The tab lists the definitions of the calculated rating and tier values. See Set up risk rating scales for scoring and VRM third-party risk tiering assessments for instructions for defining the settings.

Questionnaire requests tab on the Internal assessments page

All values on the tab come from the internal assessments that have been conducted on the third part in the engagement.

Questionnaire requests tab

Column	Description
Number	When a questionnaire template is added to an assessment and sent out, the system generates assessment instances for each template. Each of these instances is automatically assigned a unique ID number that starts with the text AINST. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Assessment number	For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Metric type	Questionnaire that determined the questionnaires used in the assessment.
Assigned to	User that is responsible for managing and responding to the IRQ.
Due date	Deadline for third party to respond to and return all questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Questionnaire requests tab (continued)

Column	Description
State	Current stage of the IRQ process for the engagement request.
Internal risk score	An engagement risk-scoring rule specifies component criteria that determine which engagements are selected for assessment. For example, a rule could enable assessments for engagements that involve more than $40,000 annual business. Engagement scoring rules apply only to engagements. See Define engagement risk scoring rules.

Create new internal assessment form

Use the internal assessment form to capture all the information that you need to create an internal assessment. As a third-party risk assessor, you can create an assessment template.

Internal assessment form

Field	Description
Name	The name that identifies the third-party risk assessment on all forms and lists.
Short description	A more detailed explanation of the purpose of the assessment.
Number	For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Applies to	The party to which the assessment applies: **Third party** or **Engagement**.
Third party	Select the third party to assess. **Note:** You can reactivate a third party that is in **Terminated** status. If such a request is accepted and closed, the third party's status is changed to **Active**.
Engagement	Select the engagement to assess. The field is visible only if you selected **Engagement** from the **Applies to** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Internal assessment form (continued)

Field	Description
Due diligence request	If there's an existing due diligence request associated with this assessment, it's listed here.
Assessment Engine	The assessment engine used for the Third-party risk assessment. This field is set to **Smart**. This field is only visible if you have enabled the Smart Assessment Engine enabled [`sn_vdr_risk_asmt.sae_enabled`] property. For more information about this property, see Configure TPRM properties. **Note:** When reviewing previous assessments, you can determine which engine was used by checking this field. If the assessment was created using the Classic assessment engine, the field displays **Classic**.
State	Current stage of the internal assessment process.
Assigned to	The individual who owns an assessment for audit purposes and monitors and manages overall assessment processes. The owner is responsible for confirming that the assessment is completed in a timely fashion by the third party, reviewing their responses, and creating and resolving issues. To drive the assessment to its completion, they are notified when an assessment reaches a particular milestone. They must have the TPR manager or TPR assessor role.
Risk rating	The overall risk rating for the third party. • Critical • High • Moderate • Low • Minor **Note:** The **Risk rating** is determined by finding a risk rating scale range in which the risk score falls. It defines how a minimum and maximum range of assessment scores maps to a qualitative risk score.
Respondents	Individual who is assigned to respond to the internal assessment. Multiple respondents can be assigned to an internal assessment.
Assessment Schedule	
Planned duration (days)	Estimated duration of the assessment. **Note:** This estimate includes the amount of time needed to receive responses and for internal and external users to review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Internal assessment form (continued)

Field	Description
Planned start date / Planned end date	Planned start and completion dates and times for work on the assessment. **Note:** The **Planned end date** is automatically set to one month from the **Planned start date**. After the assessment is saved, this date can't be changed.
Actual duration	The amount of time it took to complete the third-party risk assessment. This field is calculated using the **Actual state date** and **Actual end date**.
Actual start date	Date and time that work on the assessment began.
Actual end date	Completion date and time for the assessment.
Notes and Comments	
Work notes	Information about the assessment. Work notes are visible to users assigned to the issue.
Additional comments (Customer visible)	Public information about the assessment.

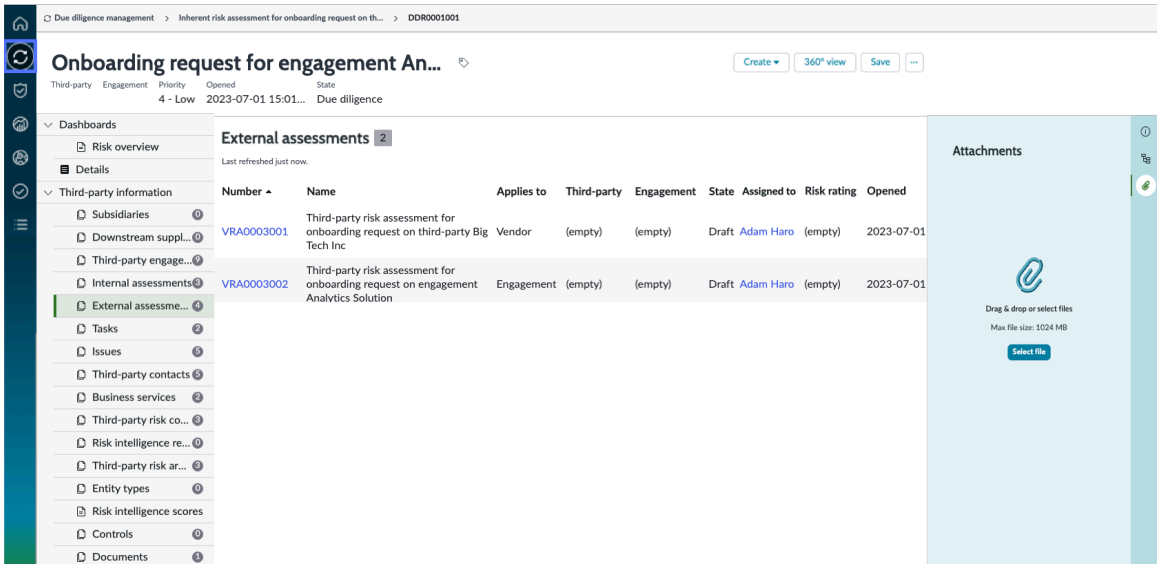
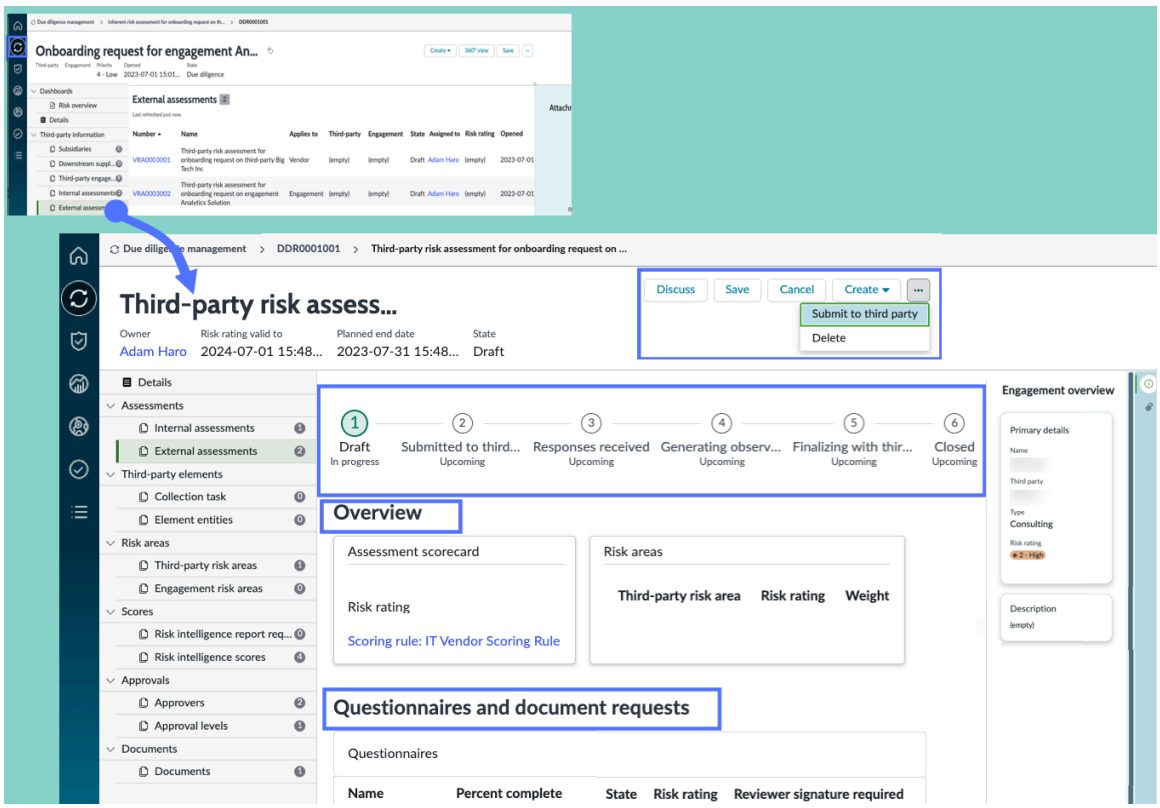
Create an external assessment template



Third-party (external) risk assessment management

After the IRQ process is complete, you send questionnaires and document requests to the third-party contact. You manage the third-party risk assessment by working with the contacts to help ensure that the responses are complete and accurate.

Accessing an external assessment



On the Due diligence management page, select the **DDR** number for any engagement due diligence request and the select the **External assessments** tab. The tab displays the list of all third-party risk assessments (external due diligence processes) for the selected engagement request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Working on a third-party risk assessment

For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA. A risk assessment can represent the work on an engagement request for a third-party organization or an engagement request for a group within the parent organization. Select a VRA number to work on the risk assessment on the **External assessments** tab.

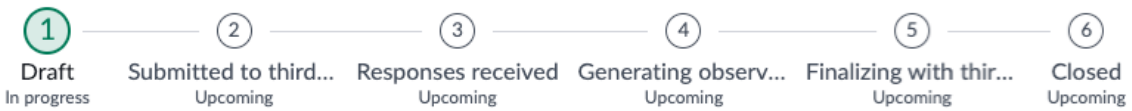
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions on any tab



Actions

Action	Description
Discuss	Select **Discuss** to send a message to other users. The message is recorded in the **Activity** section of the **Details** tab.
Create	Create an issue or task as describe in the following sections.
Save	Select **Save** to save any change you made to a value on any tab.
Submit to third party	Submit all questionnaires and document requests to the TP contact. The action is recorded in the Activity section on the **Details** tab.
… Delete	Select **Delete** to delete the record of the engagement request.
Adding an attachment	Select **Browse** in the **Attachments** section or select the attachment icon to select and add an attachment.

Working on third-party risk assessments

Risk overview tab on the External assessments page

- The symbols indicate the current state of the external assessment process for the engagement request. See Life cycle states of a external assessment for descriptions of the states.

- **Overview** section: List of assessments that are associated with the engagement.
- **Questionnaires and document requests** section: List of questionnaires and document requests for the engagement.
- **Fourth-party questionnaires** section: List of questionnaires and document requests for fourth parties and their sub-parties that are associated with the engagement.
- **Tracking** section: Count of assessments associated with the third party that are in the **Open**, **Overdue**, and **Closed** status.

Details tab on the External assessments page

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Third-party risk assessment section: General information on the third party plus schedules for the overall assessment and questionnaire due dates from the engagement due diligence request.

- The **Compose section** on the **Details** tab enables you to permanently add text to the record. The Activity section is updated with any actions on issues and tasks, submissions to TP contacts, and also with work notes and comments that users add to the record. Add text in the following fields as needed:
  - **Work notes (Private)**: Information about the third-party risk assessment. Work notes are visible only to internal users who are assigned to the process.
  - **Comments**: Comments about the third-party risk assessment are visible both to internal users and to third-party contacts.

Questionnaire templates tab on the External assessments page

The tab lists the questionnaires that the third-party contact will respond to. Select a name to view the details. For more information, see Create a questionnaire or document request template and Create a questionnaire or document request template using the Designer.

To enable TPR assessors to modify responses, configure the **Allow TPR assessors to modify responses in third-party questionnaires** [`sn_svdp.allow_assessor_edit`] system property. You can set the following options:

- Enable TPR assessors to answer questions or modify responses (default)
- Enable TPR assessors to modify responses
- Do not enable TPR assessors to answer questions or modify responses

See Configure TPRM properties.

Document templates tab on the External assessments page

The tab lists the requests for documents that the third-party contact should return. The information in the columns helps you to prioritize your work in following up with third-party contact. In particular, the state and percent complete values are key indicators. Select a name to view the details. For more information, see Create a questionnaire or document request template and Create a questionnaire or document request template using the Designer.

Fourth-party templates tab on the External assessments page

The tab lists the fourth-party questionnaires that the third-party contact will respond to. Select a name to view the details. For more information, see Monitoring your fourth-nth parties.

Third-party risk areas tab on the External assessments page

A risk domain defines the type of risk to assess for a third party. For example, you might want to assess a data-management third party in terms of security risk and a bank in terms of financial risk. Security risk and financial risk are risk domains. Some platform applications refer to risk domains as "risk areas." See Define a third-party risk domain.

Issues tab on the External assessments page

In an iterative process, before the TPR manager closes an assessment, the TPR manager can generate non-compliance issues and tasks. The TPR manager communicates with the TP contacts and engagement contacts by using comments

Life cycle states of a external assessment

The process of collecting assessment data from a third party moves between several states. For example, during the **Submitted to third party** state, the third party responds to tasks, issues, and works to complete the questionnaires.

Third-party assessment states

Third-party assessment states

Draft

An external assessment record is opened in the **Draft** state.

- **Assessment template:** A set of external questionnaires and document requests that are auto-generated based on IRQ responses. Alternatively, an administrator could manually specify the questionnaires and document requests.
- **Risk rating:** The overall risk rating that is auto-generated based on IRQ responses.
- **Owner:** The owner is the person who owns an assessment for audit purposes and monitors and manages overall assessment processes. Owners are responsible for confirming that the assessment is completed in a timely fashion by the third party, reviewing their responses, and creating and resolving issues. To drive the assessment to its completion, owners are notified when an assessment reaches a particular milestone. The owner must have the TPR manager or TPR assessor role.

Submitted to third party

The questionnaires and document requests for the assessment have been sent to the third-party contact. Internal stakeholders await responses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Responses received

After contacts at the third party have completed all questionnaires and document requests, your internal third-party risk team reviews and analyzes the responses. The team might return particular questions for follow-up, clarification, or missing answers.

Generating observations

When all responses are completed, the system can auto-generate issues for incorrect answers.

Third-party contacts respond to issues. Your internal third-party risk team makes a final determination to accept the responses or remediate the issues.

Finalizing with a third party

Your third-party risk team reviews all assessment data. In some cases, the team resets the assessment to the **Draft** state to restart the assessment life cycle.

Closed

When all data is acceptable, the assessment is complete and a member of the team closes the assessment. If the engagement will be contracted, the **Closed** state initiates the contract risk process.

Assessment metric type form

Use the assessment metric type form to capture all the information that you need to create a questionnaire template using the Third-party Risk Management application. As a third-party risk admin, you can create a questionnaire template.

Assessment Metric Type form

Field	Description
Name	The name of the template.
Third-party risk area	Select the third-party risk domain that applies to the type of third party that will receive the questionnaire or document request. For example, if you select the Security risk domain, then only third parties that are assigned that risk domain will receive the questionnaire or document request. For more information, see Define a third-party risk domain.
Third-party signature required	Option to require the third party's primary contact to provide an electronic signature in the Third-party portal. **Note:** You can use electronic signatures to certify that the third-party contact has successfully reviewed and approved the questionnaire responses or document request.
Reviewer signature required	Option to require the reviewer to review the validity of the assessment responses and provide an electronic signature as final approval.
Description	A description for the template.
Include previous responses	Option to pre-populate the questionnaire with responses from a completed questionnaire (state is **Complete**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric Type form (continued)

Field	Description
	Important: If you have the TPR assessor [sn_vdr_risk_asmt.vendor_assessor] role, you can override the option that is specified in the questionnaire template while editing a questionnaire. The entry in the Third-party portal notifies the third-party contact that responses were copied. The notification includes a link to the assessment that supplied the responses and its last updated date. • The responses are populated when the new questionnaire is submitted to the third-party contact. • The source questionnaire must be based on the same template as the current questionnaire. • The responses are populated from the most recently completed questionnaire. • Answers of the attachment, duration, and signature type aren't copied. • The setting can't be changed after the questionnaire is sent to the third party. To specify the maximum age for source questionnaires, configure the **Maximum age for reusing responses** `sn_vdr_risk_asmt.max_age_for_questionnaire_reuse` system property. See Configure TPRM properties.

Assessment Templates form (continued)

Field	Description
Questionnaire review duration (days)	Time allocated for the third-party risk admin to review the responses provided to questionnaire.
Created by	User who created the template.
Created	Time when the template was created.
Updated	Time when the template was last updated.
Supports smart assessment	Option that indicates that the assessment template can be used with the Smart Assessment Engine. **Note:** For existing assessments, this option is not set when there are classic questionnaire and document request templates that have not been migrated and published. This option is set automatically when an SAE questionnaire or document request template has been added manually. When you create a new assessment template and have the Smart Assessment Engine property enabled, this field is selected by default after saving the template.
Description	Description of the assessment.
Questionnaire templates	
Name	Name of the questionnaire template.
Third-party risk area	The third-party risk area that applies to this questionnaire template.
Description	Description of the questionnaire template.
Document request templates	
Name	Name of the document request template.
Third-party risk area	The third-party risk area that applies to this document request template.
Description	Description of the document request template.
***SAE* Questionnaire templates**	
Name	Name of the questionnaire template.
Third-party risk area	The third-party risk area that applies to this questionnaire template.
Description	Description of the questionnaire template.
***SAE* Document templates**	
Name	Name of the document request template.
Third-party risk area	The third-party risk area that applies to this document request template.

Third-party risk assessment form

Use the third-party risk assessment form to capture all the information that you need to create an assessment using the Third-party Risk Management application. As a third-party risk assessor or manager, you can create an external assessment.

Third-party risk assessment form

Field	Description
Name	The name that identifies the third-party risk assessment on all forms and lists.
Description	A more detailed explanation of the purpose of the assessment.
Number	For each external risk assessment, the system auto-assigns a unique ID number that starts with the text VRA. The unique ID is used in all references to the item. You can use the ID to search or filter for the item that you want to work on.
Applies to	The party to which the assessment applies: **Third party**, **Engagement**, **Entity**.
Third party	The assessed third party. **Note:** You can reactivate a third party that is in **Terminated** status. If such a request is accepted and closed, the third party's status is changed to **Active**.
Engagement	Select the engagement to assess. The field is visible only if you selected **Engagement** from the **Applies to** field.
Entity	Select the entity to assess. The field is visible only if you selected **Entity** from the **Applies to** field. **Note:** This is an entity record created as part of the third-party element collection process. For more information, see Monitoring third-party elements.
Repeating assessment	The assessment used to create the current assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party risk assessment form (continued)

Field	Description
	Note: You can create repeating assessments if you're using the classic assessment engine. You can configure rules that auto-generate and send questionnaires and doc requests to engagements and third parties using the Event-driven management feature if you're using the Smart Assessment Engine. For more information, see Configure a risk assessment to recur on a schedule and Event-driven management — automate assessment processes.
Assessment template	Select an assessment template to create questionnaires or document requests for this assessment. To use multiple templates to create multiple questionnaires or document requests for the assessment, leave the field empty.
Due diligence request	If there's an existing due diligence request associated with this assessment, it's listed here.
Assessment Engine	The assessment engine used for the Third-party risk assessment. This field is set to **Smart**. This field is only visible if you have enabled the Smart Assessment Engine enabled [`sn_vdr_risk_asmt.sae_enabled`] property. For more information about this property, see Configure TPRM properties. **Note:** When reviewing previous assessments, you can determine which engine was used by checking this field. If the assessment was created using the Classic assessment engine, the field displays **Classic**.
State	The process of collecting assessment data from a third party transitions through several states. See Life cycle states of a external assessment for detailed descriptions.
Risk rating	The overall risk rating for the third party. • Critical • High • Moderate • Low • Minor **Note:** The **Risk rating** is determined by finding a risk rating scale range in which the risk score falls. It defines how a minimum and maximum range of assessment scores maps to a qualitative risk score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party risk assessment form (continued)

Field	Description
Risk rating valid to	The date the risk rating expires. The date must be later than the **Risk rating valid to** date on any associated questionnaires or document requests.
Trigger by third-party tier	Select the check box to initiate the assessment when the risk tier changes for the third party.
Assigned to	The individual who owns an assessment for audit purposes and monitors and manages overall assessment processes. The owner is responsible for confirming that the assessment is completed in a timely fashion by the third party, reviewing their responses, and creating and resolving issues. To drive the assessment to its completion, they are notified when an assessment reaches a particular milestone. They must have the TPR manager or TPR assessor role.
Watch list	Add users that should be notified when this record is modified.
Risk Scoring **Note:** Risk ratings are calculated and displayed after assessment responses have been received.	
Computed risk rating	Average of the third-party risk area risk ratings.
Issue risk rating	The risk rating for issues associated with the third parties being assessed. The issue risk rating is based on the priority of closed issues and how they were resolved. • If the issue was **Closed Completed**, it indicates that the issue was resolved. • If the issue was **Closed Incomplete**, it indicates that the third party failed to complete the associated questions. • If the issue was **Closed Cancelled**, it indicates that the issue didn't need to be resolved. If the issue is closed and the **State** of the assessment isn't closed or canceled, the **Issue risk rating** is recalculated and displayed. **Note:** The **Computed risk rating** isn't affected by this calculation.
Override risk rating	Option to override the computed risk rating for the third party. When selected, any future changes made to the assessment risk rating affects only the computed risk rating, not the risk rating. **Note:** If the check box is selected and then deselected, the computed risk rating is used.
Overridden risk rating	Risk rating to override the current computed risk rating. If you selected **Override risk rating**, enter the new risk rating.

Third-party risk assessment form (continued)

Field	Description
Justification	Justification for overridden risk rating. If you selected **Override risk rating**, you must enter a reason for the override.
Assessment Schedule	
Planned duration (days)	Estimated duration of the assessment. **Note:** This estimate includes the amount of time needed to receive responses and for internal and external users to review.
Planned start date / Planned end date	Planned start and completion dates and times for work on the assessment. **Note:** The **Planned end date** is automatically set to one month from the **Planned start date**. After the assessment is saved, this date can't be changed.
Actual duration	The amount of time it took to complete the third-party risk assessment. This field is calculated using the **Actual state date** and **Actual end date**.
Actual start date	Date and time that work on the assessment began.
Actual end date	Completion date and time for the assessment.
Questionnaire Schedule	
Planned duration (days)	The amount of time given to the third party or engagement to complete all questionnaires.
Review duration (days)	Time allocated for the Assessment reviewer to review all questionnaires. **Note:** Users with the Third-party assessment reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer] role can review and leave comments for the following: • Tiering assessments • Internal assessments • External assessments • Third-party risk issues • Third-party risk tasks • Third-party risk due diligence requests
Submitted to third party	Delivery date for third party questionnaires.
Due date	Deadline for third party to respond to and return all questionnaires.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party risk assessment form (continued)

Field	Description
	Note: The **Due date** is set to a duration of 10 days by default. You can extend the due date of a questionnaire by increasing the **Planned duration (days)**; however, the **Planned end date** of the assessment won't be updated.
Completion date	Actual date when third party completed all questionnaires.
Responses expected by	The date that your organization expects the responses to be returned by the third-party contact.
Notes and Comments	
Work notes	Information about the assessment. Work notes are visible to users assigned to the issue.
Additional comments (Customer visible)	Public information about the assessment.

Assessing your third-party risk

Third-party element form

Use the third-party element form to capture all the information that you need to create a third-party element record using the Third-party Risk Management application. As a third-party risk manager, third-party risk assessor, or due diligence request owner, you can create a third-party element record.

Third-party element form

Field	Description
Name	Name that identifies this third-party element on all forms and lists.
Classification	Type of third-party element: • Facility • Product • Principal • Other

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Third-party element form (continued)

Field	Description
	Note: This selection determines which scoring model is applied to the third-party element. You can create new third-party element classifications by navigating to **All** > **Third-party Risk Management** > **Third-party Elements** > **Classifications**.
Description	Text that explains and clarifies the background of the third-party element.
Notes	Additional information about the third-party element.
Alternate name	Alternate name to refer to the third-party element. An alternate name could be a simplified, branded, or localized name that differs from the official name that was provided by the third party.
Created by	User who created the third-party element.
Contact details section	
First name, Last name, Contact department, Contact title, Contact phone, and Contact email	Standard contact information for the person at the third-party organization who acts as the primary third-party contact. For a description of the responsibilities of the third-party contact role, see Roles in Third-party Risk Management.
Street, City, State/Province, ZIP/Postal code, Country	Standard address information for third-party organization.
Latitude and Longitude	Values that are used to mark the location on the Risk concentration map. For more information, see TPRM Risk concentration map.

Approval process management

You can view the list of users who can approve or reject a DD request and also view the details of their approval actions. In addition, you can view the approval levels for a request.

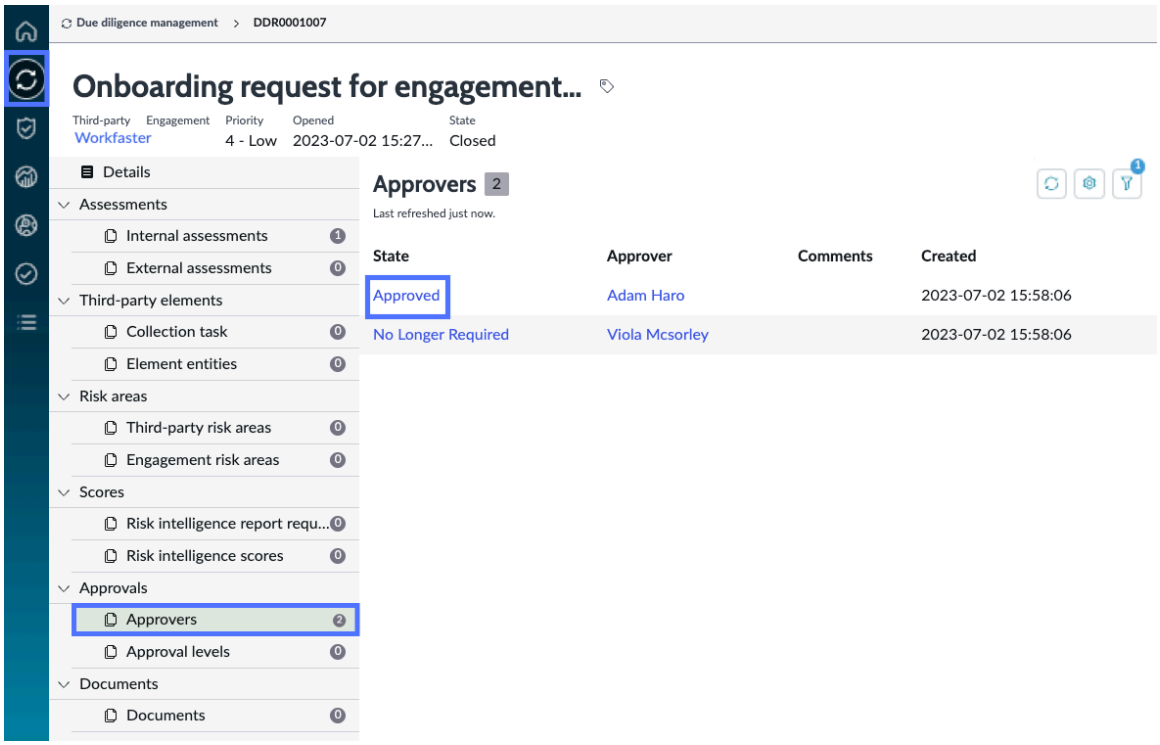
Approval process

During the approval process, each aspect of risk is analyzed by the appropriate internal stakeholders. All internal stakeholders (approvers) review the questionnaire responses and supporting documents from the third-party and engagement contacts. If the responses are good,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

one or more approvers approves and then closes the DD request. If a contract will be prepared, the approved request moves to the Contract Risk process.

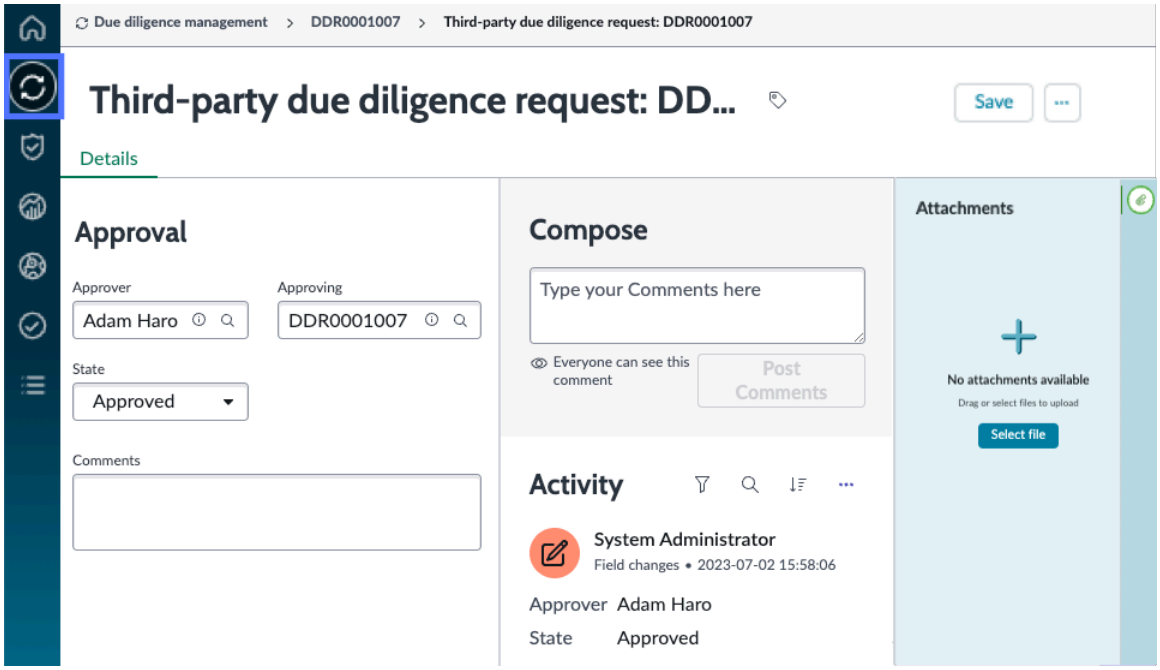
Accessing the Due diligence management page



You can access the Due diligence management page from many locations by selecting the **DDR** number for any DD request. Select either the **Approvers** tab or the **Approval levels** tab.

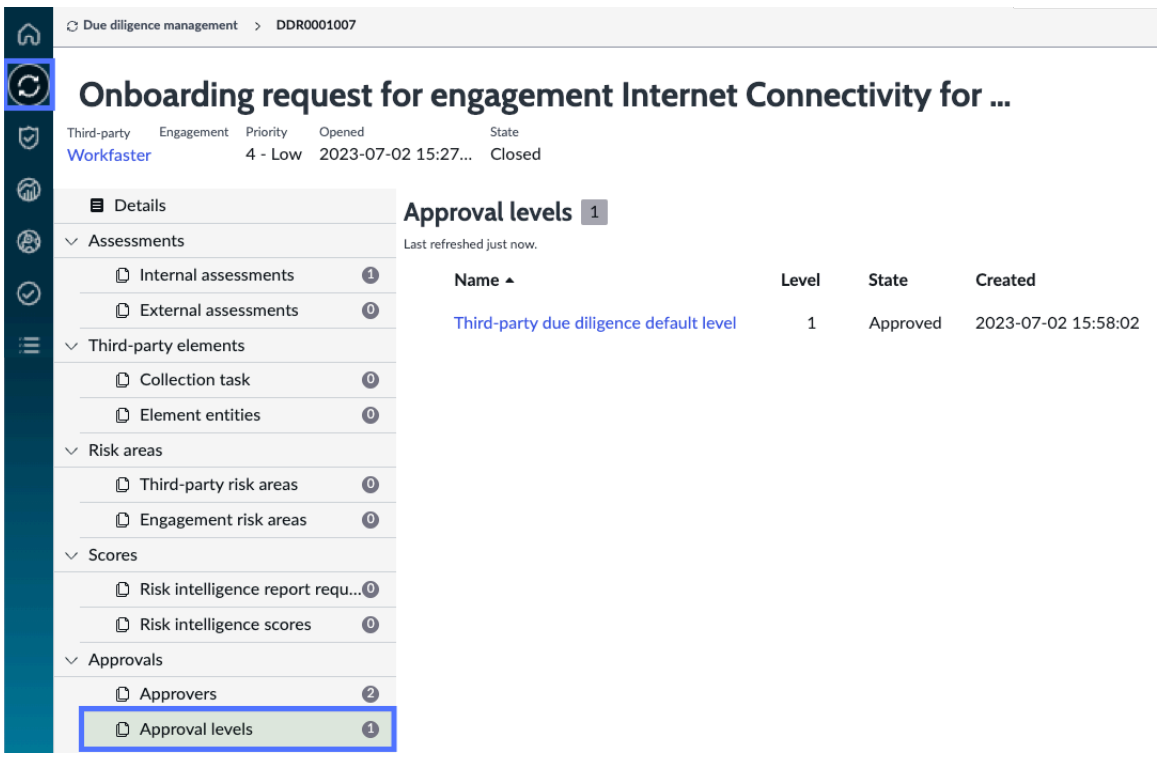
Approvers tab

The tab lists the users that have responded to the engagement request. Select the **State** value to view the details of the approval action that the approver performed.



The state of the approval can be one of the following values:

- Not yet requested
- Requested
- Approved
- Rejected
- Cancelled
- No longer required



Select the **State** value for a request to view the **Details** tab for the request.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval levels tab

Note:
For more information on how Third-party risk (TPR) admins can set approval levels and rules, see Set up the approval levels for due diligence requests and Set up the approval rules for due diligence requests.

Approval business rules

If you have the TPR admin [sn_vdr_risk_asmt.vendor_risk_admin] role, you can view all business rules by navigating to **All** > **System Definition** > **Business Rules**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following business rules are included when the Third-party Risk Due Diligence [sn_tprm_dd] application is activated.

Third-party risk due diligence business rules

Business rule	Source table	Description
Create approval records	Third-party due diligence request [sn_tprm_dd_request]	Creates approval records for the evaluated approvers, setting the first record to **Requested** and subsequent records to **Not yet requested** when the due diligence request state updates to **Awaiting for approval**.
Roll up approval and update DD	Approval [sn_tprm_approval]	Marks next approval record as **Requested** if multiple approvals are required. If all required approval records are approved, then the due diligence record state is updated to **Approved**.
Cancel existing approvals	Third-party due diligence request [sn_tprm_dd_request]	Cancels approval requests if the state of the approval record is updated to **No longer required**.

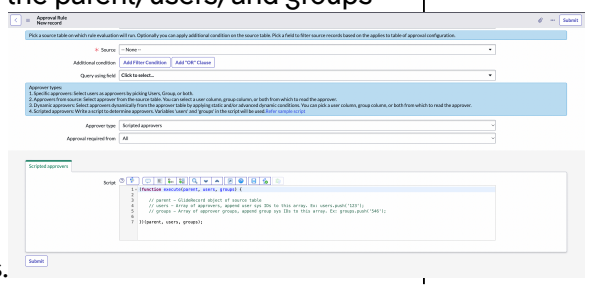
Approval rule form



The approval rule form captures all the information needed to create an approval rule. An admin or third-party risk admin can create an approval rule.

Approval Rule form

Field	Description
Name	Name of the approval rule.
Source	Table to which the approval rule is applied. Third-party due diligence request [sn_tprm_dd_request] table is the source table for due diligence requests.
Query using field	Field that connects the approving table and the source table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Rule form (continued)

Field	Description
	Note: This field is only required if you're not using the Third-party due diligence request [sn_tprm_dd_request] table as a source.
Additional condition	Filter conditions that you can apply on the source table. These filter conditions determine when the rule is applied.
Approver type	Type of approver: • Specific approvers: Your choice of approvers. • Approver from source: Users or groups from the source table. • Dynamic approvers: Approvers that are selected dynamically from any table. • Scripted approvers: Script to determine your approvers. In the following example, a new approval rule record is shown with Scripted approvers as the selected **Approver type**. A script is started where you can update the parent, users, and groups parameters.

Approval Rule form (continued)

Field	Description
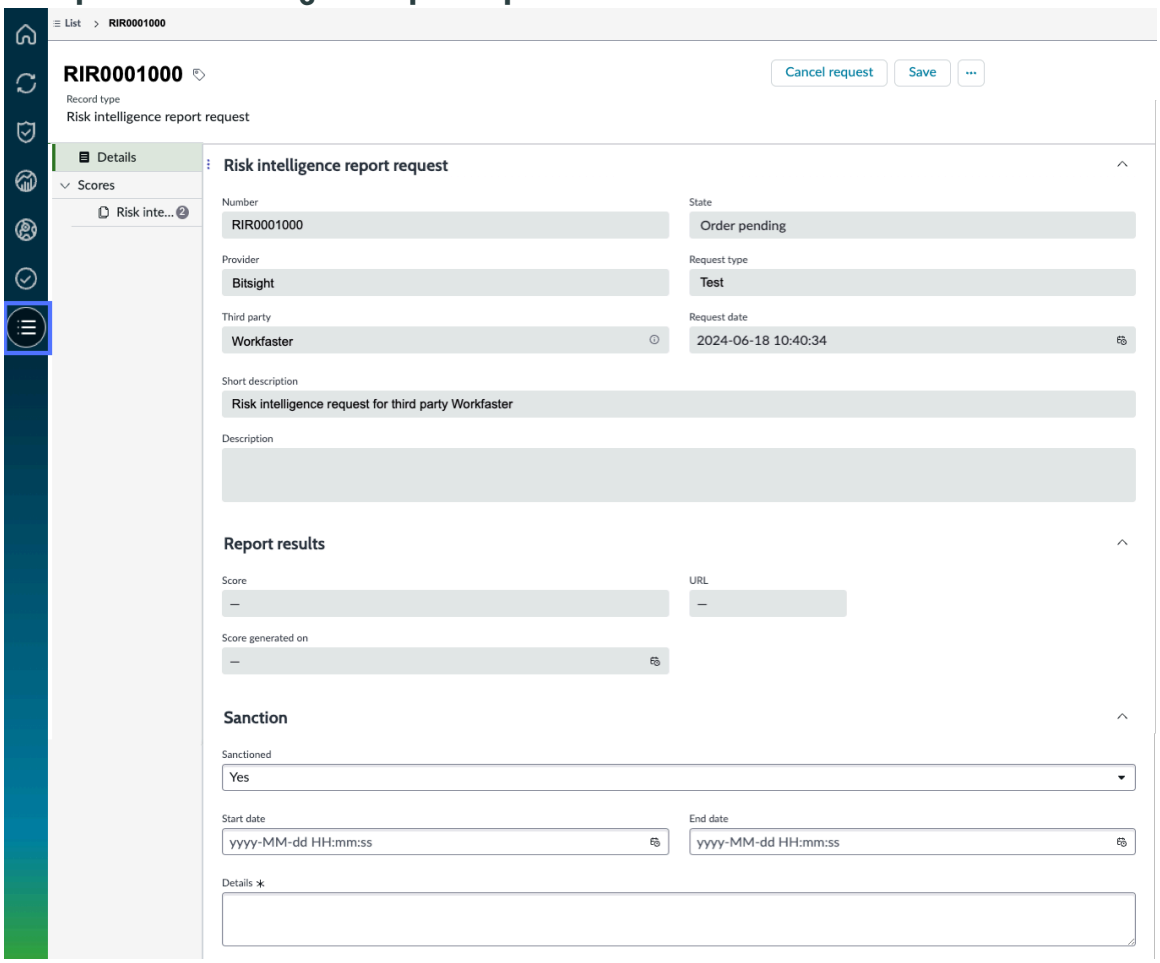
Dynamic condition	Script field to apply an advanced filter on the approver table.
Users	One or more users that are designated as approvers.
Group	Group of approvers.
Scripted approvers	
Script	Script to determine approvers. **users** and **groups** in the script are selected as approvers.

Risk intelligence report requests management

You can view a list of risk intelligence report (RIR) requests, their associated providers, scores, and report URLs. In addition, you can create requests and make updates by using the Third-party Risk Management application.

Risk intelligence report request process



If you have the third-party risk (TPR) assessor [sn_vdr_risk_asmt.vendor_risk_assessor] or TPR manager [sn_vdr_risk_asmt.vendor_risk_manager] role, you can request a RIR or score. You can create a RIR request that is associated with a third party or due diligence request. If you want to associate an RIR request with a due diligence request, it must be after an inherent risk questionnaire (IRQ) has been completed (that is when the due diligence request has entered the IRQ in progress state). You can update the Sanction section at any time.

For more information, see Request a risk intelligence report, Request a risk intelligence report associated with a due diligence request, Risk intelligence report request form, and Track sanctions-related information.

The following example shows how a new risk intelligence report request appears in Vendor Management Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of a risk intelligence report request

The following table shows the information that is captured in an RIR request.

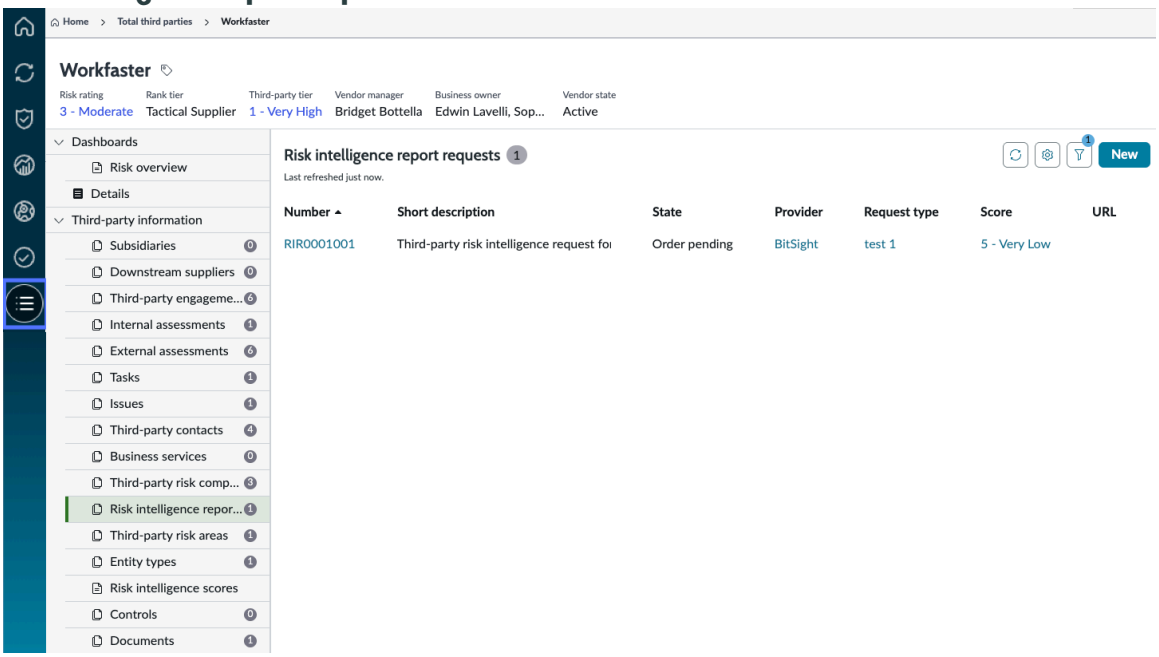
Risk intelligence report request

Field	Description
Risk intelligence report request section	
Number	Unique ID number that is auto-assigned by the system and starts with the text RIR.
Provider	Organization that is responsible for generating the risk intelligence information for the request.
Request type	Type of report or score that is provided. Each service that is offered by the provider returns a particular type of risk rating or score. For example, Financial risk or Security risk. **Note:** The request types that are available are dependent on what has been set up for the provider. For more information, see Set up a request type for a provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk intelligence report request (continued)

Field	Description
Third party	Third party that is to be scored by the provider.
Due diligence request	Due diligence request that is associated with the risk intelligence request. There's an option to request risk intelligence as part of a due diligence request. For more information, see Request a risk intelligence report associated with a due diligence request.
Short description/ Description	Text that explains and clarifies the intent of the request for stakeholders.
State	Current state of the request: • Open • Order pending • Order in progress • Closed complete • Closed incomplete
Request date	Date that the order is pending and ready to be sent to the provider.
Received date	Date that the response from the provider is received.
Report results section	
Score	Overall risk score that is determined by the provider.
URL	Link to additional information about the origin of the generated score.
Score generated on	Date that the score is generated.
Sanction section	
Sanctioned	Option that you can select **Yes** to indicate that the third party is sanctioned. This field is set to **No** by default.
Start date	Start date of the sanctioned enforcement.
End date	End date of the sanctioned enforcement.
Details	Text that explains and clarifies the type of sanction and how it impacts your business relationship with the third party.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk intelligence report requests tab

While viewing the data for a third party, you can select the **Risk intelligence report requests** tab to view the list of report requests.

The following example shows the **Risk intelligence report requests** tab in Vendor Management Workspace.

Risk intelligence report requests tab

For more information on RIR requests, see Using risk intelligence reports and scores.

Risk intelligence report request states

The RIR requests have the following potential states:

Open

An RIR request enters this state after the record has been created and saved by the Third-party Risk (TPR) manager, TPR assessor, or contract negotiator that is assigned to the due diligence request. For each risk intelligence request, the system auto-assigns a unique ID number that starts with the text RIR.

Order pending

An RIR request enters this state after the record has been reviewed and submitted by the Third-party Risk (TPR) manager, TPR assessor, or contract negotiator that is assigned to the due diligence request.

The following changes take place:

- The order has been submitted to the provider.
- The **Request date** field has been populated with the date that this record was submitted on.
- All fields in the Risk intelligence report request section are read-only.

Order in progress

An RIR request enters this state after the order has been received by the provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following changes take place:

- The score records are generated with the report request.
- The **Score generated on** field is updated.

Closed incomplete

An RIR request enters this state after the order was received by the provider but couldn't be processed due to an error, and the order was closed.

Closed complete

An RIR request enters this state after the order was received and processed by the provider.

Canceled

An RIR request enters this state after a TPR manager, TPR assessor, or contract negotiator cancels the report request. If you must cancel a request, it can be done while the request is in the **Open** or **Order pending** state. If you want to create a duplicate of a canceled request, you can't edit that record. You must create a new RIR request.

Scoring calculations using the classic assessment engine

Perform a comprehensive external risk assessment when calculating multiple ratings and scores by using the Third-party Risk Management application. You can gain a deeper understanding of the overall calculation process and learn how user-defined parameters and configurations influence the results of the questionnaires.

Risk rating scale

Every time that you create a questionnaire, the system applies a default risk rating. You can configure the risk rating scale, which includes the categories, minimum, and maximum values, to meet your specific questionnaire needs that can vary for each assessment. For example, you can define risk rating values as colors rather than **1-Very High** through **5-Very Low**.

The following example shows the default risk ratings that are provided as part of the base system.

Default risk rating scale

Score calculation mechanism

The score calculation mechanism for each external assessment uses the ServiceNow AI Platform® assessment score calculation engine. This engine performs these calculations by using a series of related equations that are dynamically recalculated. You define the following parameters that affect the calculated assessment rating:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Questions (metrics)

  For more information on how to define a question, see Define a question.

- Metric scale definition

  For more information on how to define the metric scale definition, see Define a question.

- Categories

  For more information on how to define a category, see Set up and maintain a question bank.

- Weights

  For more information on how to define a weight, see Define component criteria.

- Risk rating scale

  For more information on how to define a risk rating scale, see Set up risk rating scales for scoring.

- Business service rating scale

  At the end of the scoring calculation, if a third party or engagement is associated with a business service that you defined in the Service [cmdb_ci_service] table, that criticality weight is factored into the calculation. Different business services may have varying levels of associated risks. By adjusting the criticality weight, you can use the resulting values to adjust your risk mitigation strategies.

  Note:
  Only answered questions contribute to overall calculations.

  You can define the criticality weights by navigating to **All** > **Self-Service** > **Third-party Risk Management** > **Assessment Setup** > **Business Service Rating Scale**.

  As part of the base system, four ratings are defined:

  - 1 - most critical
  - 2 - somewhat critical
  - 3 - less critical
  - 4 - not critical

  You can associate each third party or engagement with multiple business services.

Note:
A business service is a defined sequence of tasks or activities that contribute to the delivery of a service such as email, IT services, E-commerce.

The following infographic shows the assessment rating calculation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment rating calculation process

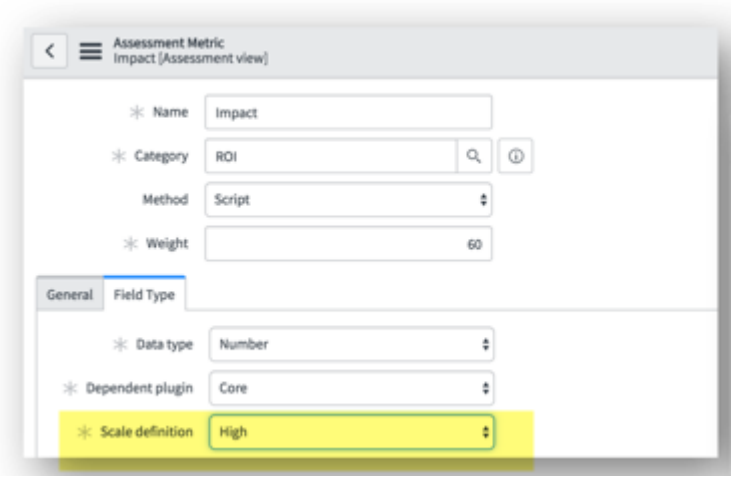
1. Each question on the questionnaire has these values calculated:
   a. questionRatings: The rating for each question is calculated by the responses. The rating is determined by the metric scale definition and the values that are associated with the answers. The questionRating is not a value that is stored in a table.
   b. questionPercentContribution: The percent contribution of each question within its category is determined by this calculation. This value is based on the weight that is assigned by the third-party risk manager to the question and the overall weight of the category. The questionPercentContribution is not a value that is stored in a table.
   c. questionNormalizedValue: The normalized value for each question is calculated by multiplying the question rating, question percent contribution, and a constant value (100). This value enables you to compare questions with different weights and ratings.
2. The categories of each questionnaire have these ratings calculated:
   a. categoryRating: The rating for each category is calculated by summing up the normalized values of all the questions within the category. The category rating is derived from the associated risk rating scale.
   b. categoryNormalizedValue: The category rating is normalized by multiplying it with the category weight to enable you to compare values across all categories.
3. Questionnaire, questionnaireQuantitativeScore: The overall quantitative score for the assessment is calculated by summing up the normalized category scores. This score represents the risk score for the questionnaire.
4. Documents, Qualitative Score: The calculation for the qualitative risk rating for the document requests is based on the answer to the default question “Do you have document ‘document name’? on the document request. This rating can be overridden by the third-party risk assessor if necessary.
5. Assessment, assessmentRating: The final rating for the assessment is calculated by taking the weighted average of the questionnaires and document requests within each third-party risk area. The weights are determined by the risk area scoring method.

Note:
Only answered questions contribute to overall calculations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scored option for questions

Selecting the scored option (**Scored** check box) is optional. All question responses unless otherwise stated are scored. The scored option changes the scoring behavior. When the 'Scored' option is selected, the score is always 0 or 100 reflecting whether the answer is correct or incorrect, and the questionRating and questionPercentContribution formulae are not used; the Normalized Value is directly set to 0 or 100. When the 'Scored' check box is not selected, the score is calculated using the questionRating and questionPercentContribution formulae to determine the Normalized Value. Selecting the Maximum normalization input field only applies when the 'Scored' check box is not selected, as it is used to define the maximum value for normalization, and the score can vary based on the input values and weights. If the 'Scored' check box is selected, the Maximum normalization input field does not apply, and the Normalized Value is simply 0 or 100. For more information on questions and normalized scores, see Set up and maintain a question bank, Define a question and Normalize the scores for metrics.



questionRating calculation

You use the `questionRating` calculation to define the relative degree of significance of each individual assessment metric as compared to other metrics. This key variable helps to calculate the normalized value later in the process.

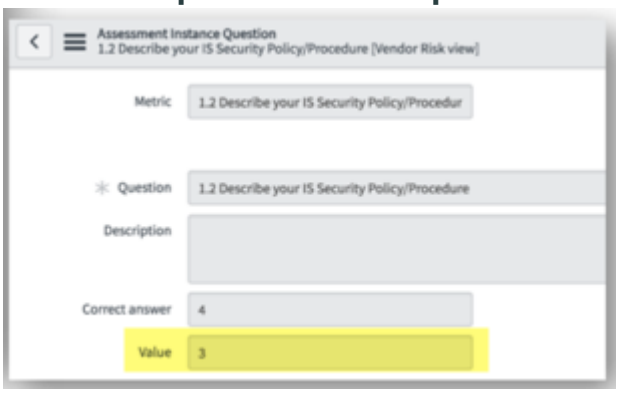
You can define the **Scale definition** for an individual assessment metric by setting it to be **High** or **Low**.

The following example shows how the metric scale definition field was defined in the Assessment Metric form.

Metric scale definition example

- **High** means that large numerical values indicate a positive result. If the metric scale definition is high, the following equation is used:

  ```
  questionRating = (value - minValue) / (maxValue - minValue)
  ```



- **Low** means that small numerical values indicate a positive result. If the metric scale definition is low, the following equation is used:

  ```
  questionRating = 1 - ((value - minValue) / (maxValue - minValue))
  ```

The following example shows the question value field that is defined in the assessment instance question form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment question value example

The **value** used in the equation is taken from the response to the question. The configuration of the metric defines the correct answer, which is the value, and the other values that are associated with the other incorrect or less desirable answers. The questionRating is not a value that is stored in a table.

questionPercentContribution calculation

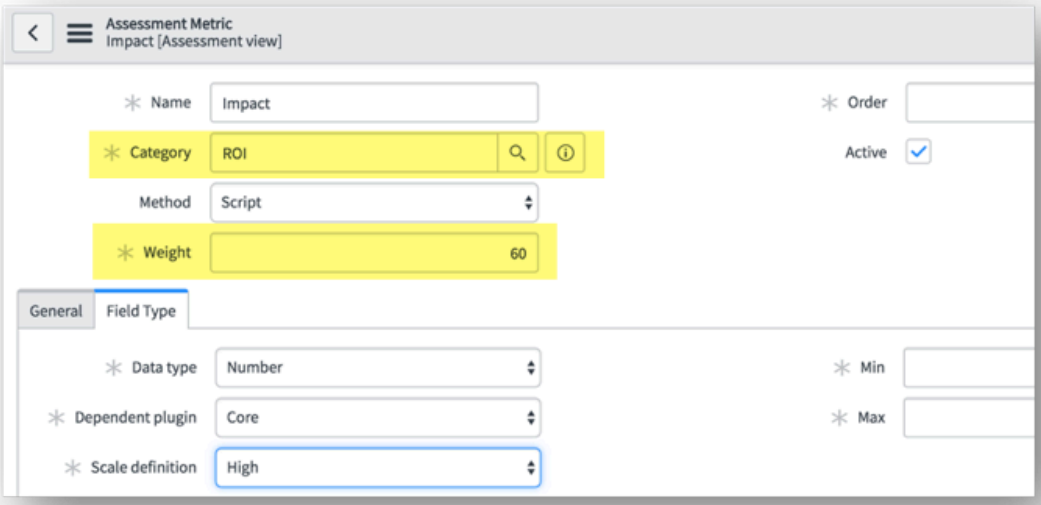
The `questionPercentContribution` defines the degree of significance of the assessment metric within the category where it's included. This key variable is used in calculating the normalized value later in the process.

The following equation is used to calculate the `questionPercentContribution`.

```
questionPercentContribution = (questionWeight /
sumOfAllQuestionWeightsWithinCategory)
```

Note:
sumOfAllQuestionWeightsWithinCategory is the sum of weights in the category for questions that are answered.

The **Category** represents a theme for evaluating the assessable records in a metric type. You can define this category's example with the return on investment (ROI), risk, performance, security, personal data, and so on.



The **Weight** is a numerical value that represents the metric importance that relates to other metrics. A higher weight in proportion to the overall weight of the category has a stronger influence on the final score. You can define the weight, set it to any integer, and apply it to questions and categories.

Note:
The questionPercentContribution is not a value that is stored in a table.

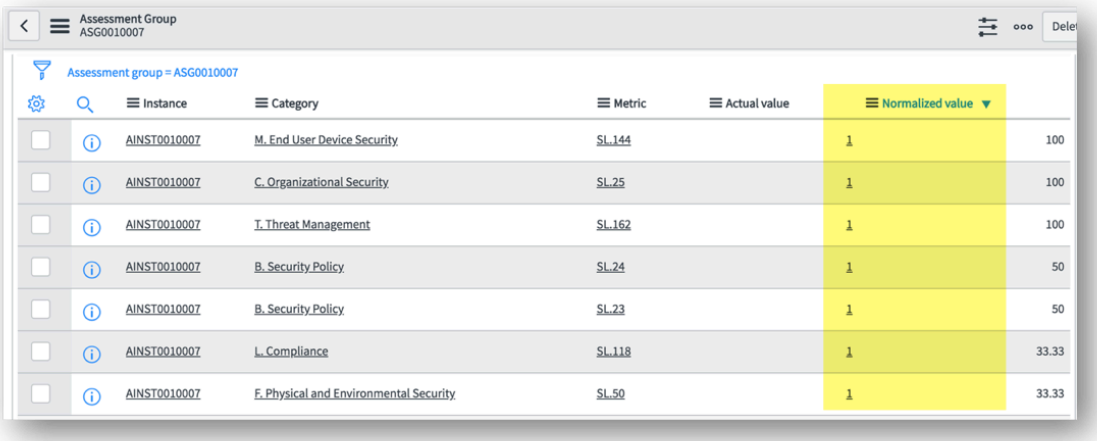
The following example shows the question category and weight field that you can define in the assessment metric form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment question category and weight example

questionNormalizedValue calculation

The `questionNormalizedValue` enables questions with different weights and ratings to be compared equally on the same scale.



The following equation is used to calculate the `questionNormalizedValue`.

```
questionNormalizedValue = 100 * questionRating *
questionPercentContribution
```

Each answer to every question (assessment metric) on the questionnaire has a **normalized value**. This normalized value enables you to make a meaningful comparison that is later rolled up to the category and the overall assessment results.

The following example shows a list of normalized values for an assessment group.

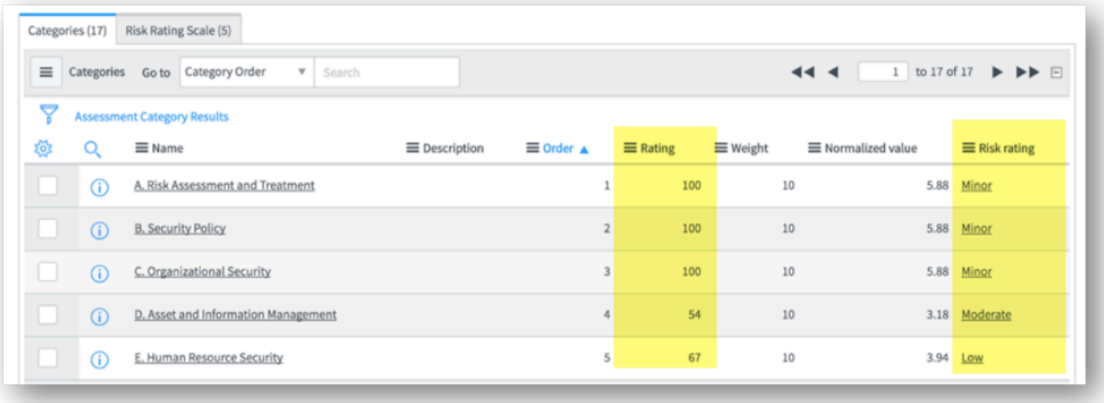
Normalized value list for an assessment group example

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

categoryRating calculation

Now that there are normalized values for each metric within the category, the `categoryRating` calculates a value for the entire category that can then be normalized by using the `categoryNormalizedValue` equation to facilitate inter-category comparisons.

The following equation is used to calculate the `questionPercentContribution`.



```
categoryRating = sumOfAllQuestionNormalizedValuesWithinCategory
```

The category **Rating** is the sum of all normalized values for the metrics within the category.

The stated **Risk Rating** for each category is derived from the associated Risk Rating Scale.

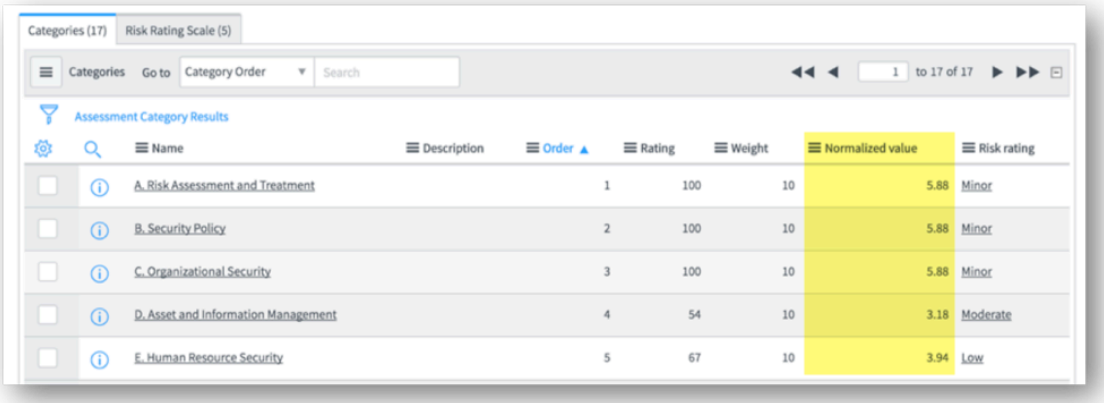
The following example shows the list of category ratings and risk ratings for an assessment category.

Categories rating and risk rating list example

categoryNormalizedValue calculation

With the Category Ratings established, the `categoryNormalizedValue` equation uses this rating and the category weight to normalize the result across all categories.

The following equation is used to calculate the `categoryNormalizedValue`.



```
categoryNormalizedValue = categoryRating * (categoryWeight /
sumOfAllCategoryWeights)
```

This calculated normalized value performs a more meaningful comparison that is later rolled up to the overall assessment results. Higher **categoryWeight** values increase the normalized value of the category.

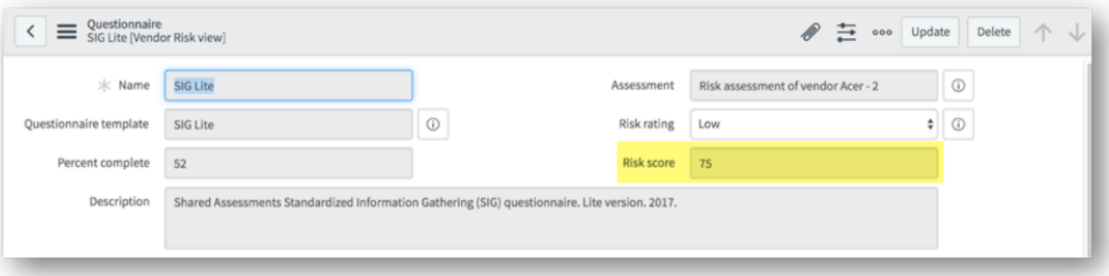
The following example shows the list of normalized values for an assessment category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Categories normalized value list example

questionnaireQuantitativeScore calculation

With all categories normalized, the overall quantitative score for the assessment is calculated.



The following equation is used to calculate the `questionnaireQuantitativeScore`.

```
questionnaireQuantitativeScore = sumOfAllCategoryNormalizedValues
```

The output from the `questionnaireQuantitativeScore` equation is the sum of the normalized category scores. It's presented as the **Risk Score** on the record for the questionnaire.

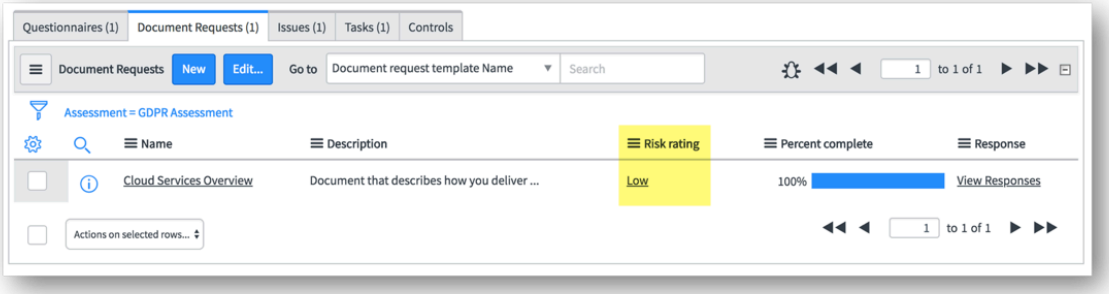
The following example shows a risk score for a questionnaire.

Questionnaire record with risk score example

Qualitative score for documents

Document Requests have a risk rating that is a qualitative score. The preliminary risk rating is based on the answer to the default question "Do you have document 'document name'?".

The document risk rating uses the scale that is shown in the following table.

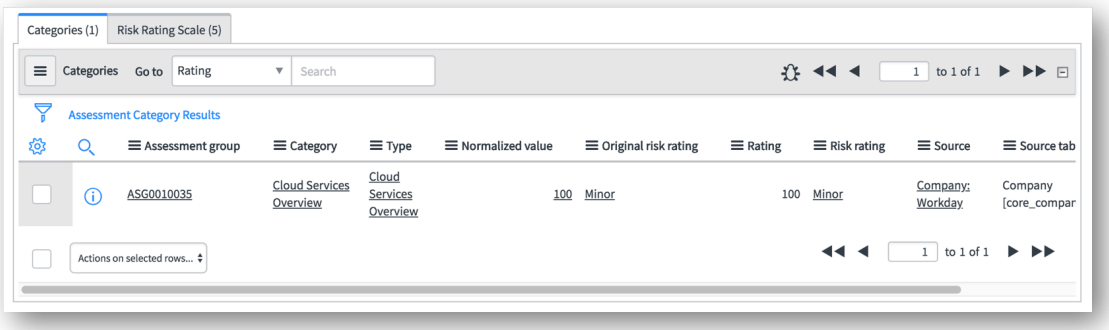


Document risk rating scale

Response	Risk Rating
Yes	Low
No or unanswered	High
N/A	Moderate

The following example shows a risk rating for a document request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Document request risk rating example

After the document is reviewed, it might be found to be deficient, so the Third-party risk assessor can override the default rating. The assessment retains the current **Risk Rating** and the **Original Risk Rating**. The stated **Risk Rating** for each category is derived from the associated Risk Rating Scale.

The following example shows a categories related list that includes the original and current risk rating.

Categories related list example

assessmentRating calculation

For any external assessment, the final rating for the assessment is calculated as the weighted average of the questionnaires and document requests within each third-party risk area.

The following equation is used to calculate the `assessmentRating`.

```
assessmentRating = (AVG (Questionnaire + Document Request for a risk area) * weight assigned to that risk area + (Questionnaire + Document Request for another risk area) * weight assigned to that risk area) / the sum of the weights
```

- Questionnaire 1 = defined in the Security Risk Area
- Questionnaire 2 = defined in the Financial Risk Area
- Questionnaire 3 = defined in the Financial Risk Area
- Document Request 1 = defined in the Security Risk Area

The risk area criteria are set like the example shown in the following table:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk area criteria

Risk Area	Scoring Method	Weight
Security Risk	Average Risk	10
Financial Risk	Max Risk	20

The final rating for the assessment is calculated by using this equation:

```
assessmentRating = (AVG (Questionnaire 1 + Document Request 1) *
10 + MAX (Questionnaire 2 + Questionnaire 3) * 20) / (10 + 20).
```

The final rating is the overall assessment rating that considers the scores and ratings from all assessments conducted for a third-party or engagement. It's calculated by taking the weighted average of the questionnaires and document requests within each risk area. This calculation process ensures that all relevant metrics, categories, and weights are taken into account based on how you defined these parameters and configurations. The calculation process and the factors involved can help you make informed decisions and take appropriate actions based on the final rating.

Note:
For information on verifying risk ratings and scoring calculations, see Verifying scoring calculations using the classic assessment engine.

Related topics

Verifying scoring calculations using the classic assessment engine

Verifying scoring calculations using the classic assessment engine

You can review scores and risk ratings in your questionnaires to help ensure the accuracy and consistency of risk scoring by verifying the correct application of weights, normalized values, scoring methods, and risk rating scales. Based on the different weights you assign, Third-party Risk Management averages these values and produces a composite score for the overall risk.

Verification checklist

The [sn_vdr_risk_asmt.vendor_assessor] or [sn_vdr_risk_asmt.vendor_manager] role is required to perform all related actions by using the Vendor Management Workspace or VRM Classic user interface. For full descriptions of assessment configuration and set up, see Classic assessment configuration.

Here are some of the configurations that you can check while reviewing scores and risk ratings:

Checklist items

Configurations	Description
Scoring method	Verify that the correct scoring method has been selected. You can select or update scoring methods for risk area domains, risk area criteria, and component criteria. For example, confirm that Min Risk is used instead of Average Risk if that aligns better with your assessment goals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

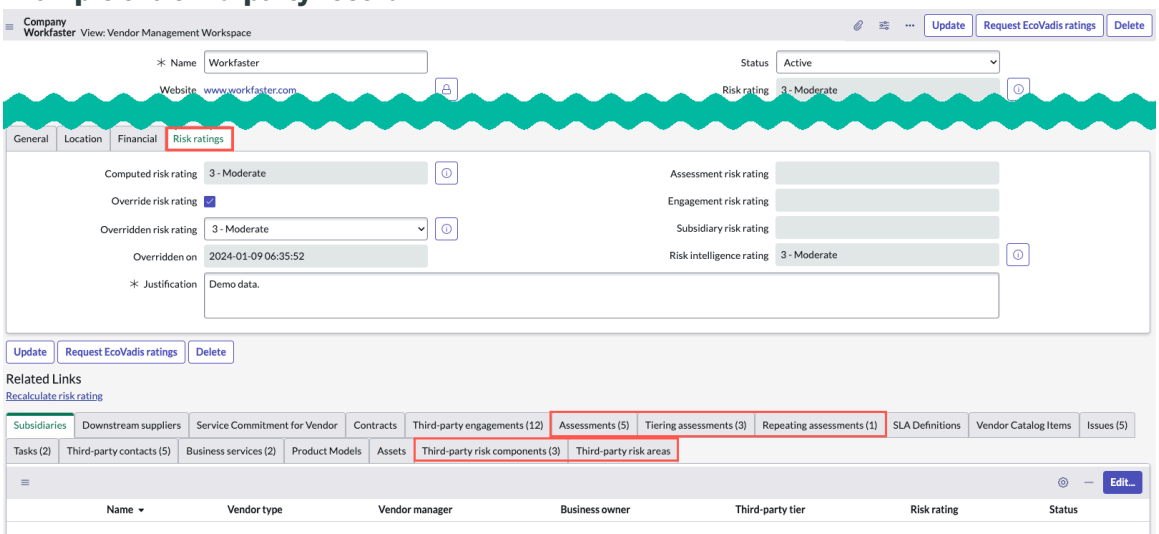
Checklist items (continued)

Configurations	Description
	For more information, see Define a third-party risk domain, Define third-party risk area criteria, and Define component criteria.
Weights	Verify the accuracy of weights applied to risk areas, risk criteria, risk components, and questions. You can apply custom weights to reflect the importance and priority of different types of risk. Weight values for questions must be whole integers. Using decimals results in incorrect scores. For example, use 56 and not 0.56. For more information on how to assign or update weights, see Define a third-party risk domain, Define third-party risk area criteria, Define component criteria, and Define a question.
Scoring calculations	Verify that calculations, normalized values, and unanswered questions are behaving as expected. For example, confirm that you're accounting for unanswered questions not being included as part of the scoring calculation. For information on the different formulas used to calculate scores and ratings, see Scoring calculations using the classic assessment engine. For information on how to use normalized values to calculate assessment scores for Choice or Multiple Selection questions with the scored check box not selected Normalize the scores for metrics.

How to view risk ratings

You can view risk ratings for individual third parties, engagements, assessments, and questionnaires.

The following risk ratings are available to view.



- Computed risk rating: The overall risk rating for the third party, calculated after the assessment.
- Third party rating: An aggregate of all engagement ratings.
- Engagement risk rating: Determined by the component criteria
- Subsidiary risk rating: If company1 has company2 and company3 as subsidiaries, the aggregate of final ratings on company2 and company3 are the subsidiary ratings on company1.
- Risk intelligence rating: Aggregate of all provider ratings.
- Assessment rating: Determined by weights defined by category, calculations, and more.

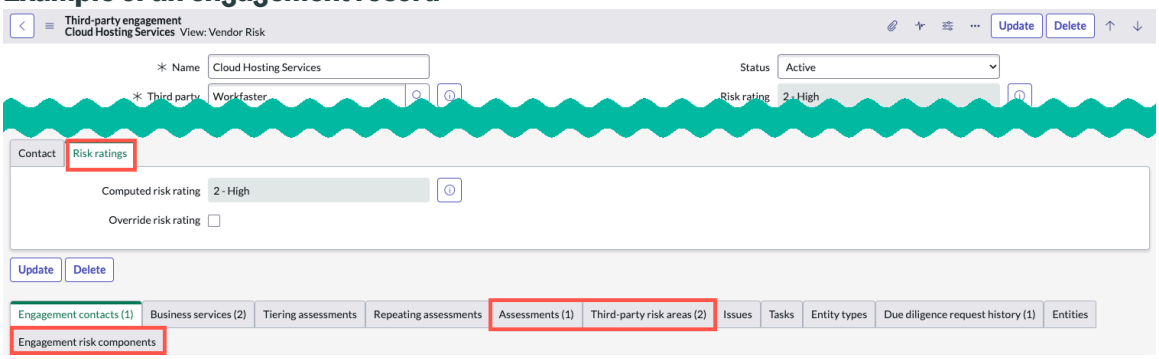
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

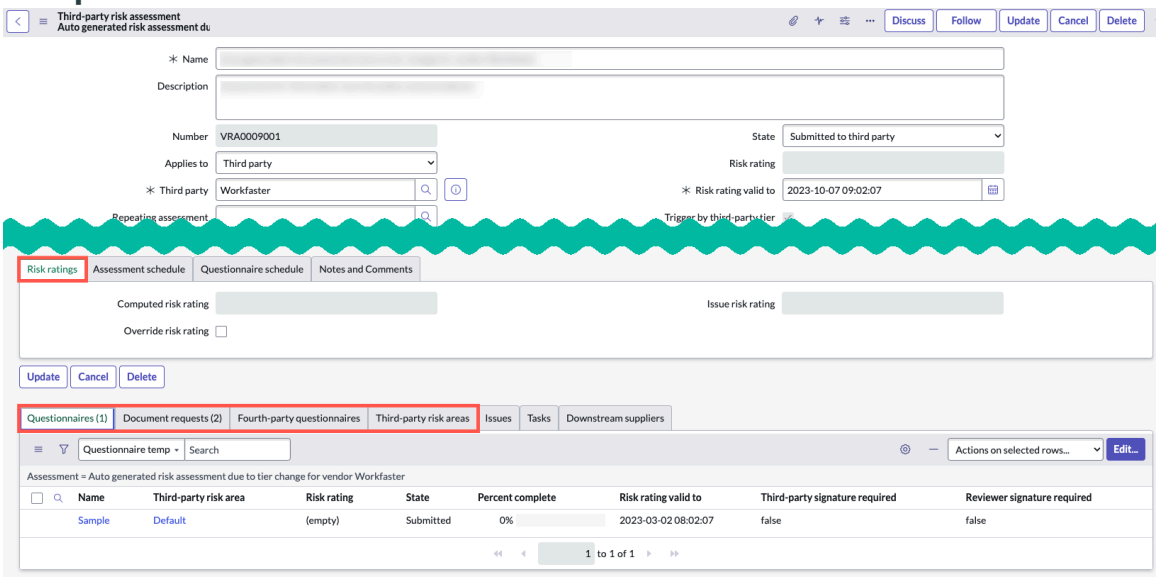
Note:
Risk ratings and scores are only available to view after assessments have been completed and scores have been integrated from a provider.



You can view all associated ratings for a third party by navigating to its Risk ratings related list. Navigate to **All** > **Third-party Risk Management** > **Third Parties** > **All Third Parties** and select the third party you want. The following example shows you can view all available risk ratings as well as the Third-party risk components, Third-party risk areas, Assessments, Tiering assessments, Repeating assessments related lists, and more.

Example of a third-party record

You can view all associated ratings for an engagement by navigating to its Risk ratings related list. Navigate to **All** > **Third-party Risk Management** > **Engagements** > **All Engagements** and select the engagement you want. The following example shows you can view all available risk ratings as well as the Engagement risk components, Third-party risk areas, Assessments, Tiering assessments, Repeating assessments related lists, and more.



Example of an engagement record

You can view all associated ratings for an assessment by navigating to its Risk ratings related list. Navigate to **All** > **Third-party Risk Management** > **External Risk Assessments** > **All Assessments** and then select the assessment you want. The following example shows you can view all available risk ratings as well as the Third-party risk areas, Questionnaires, Document requests, Downstream supplier related lists, and more.

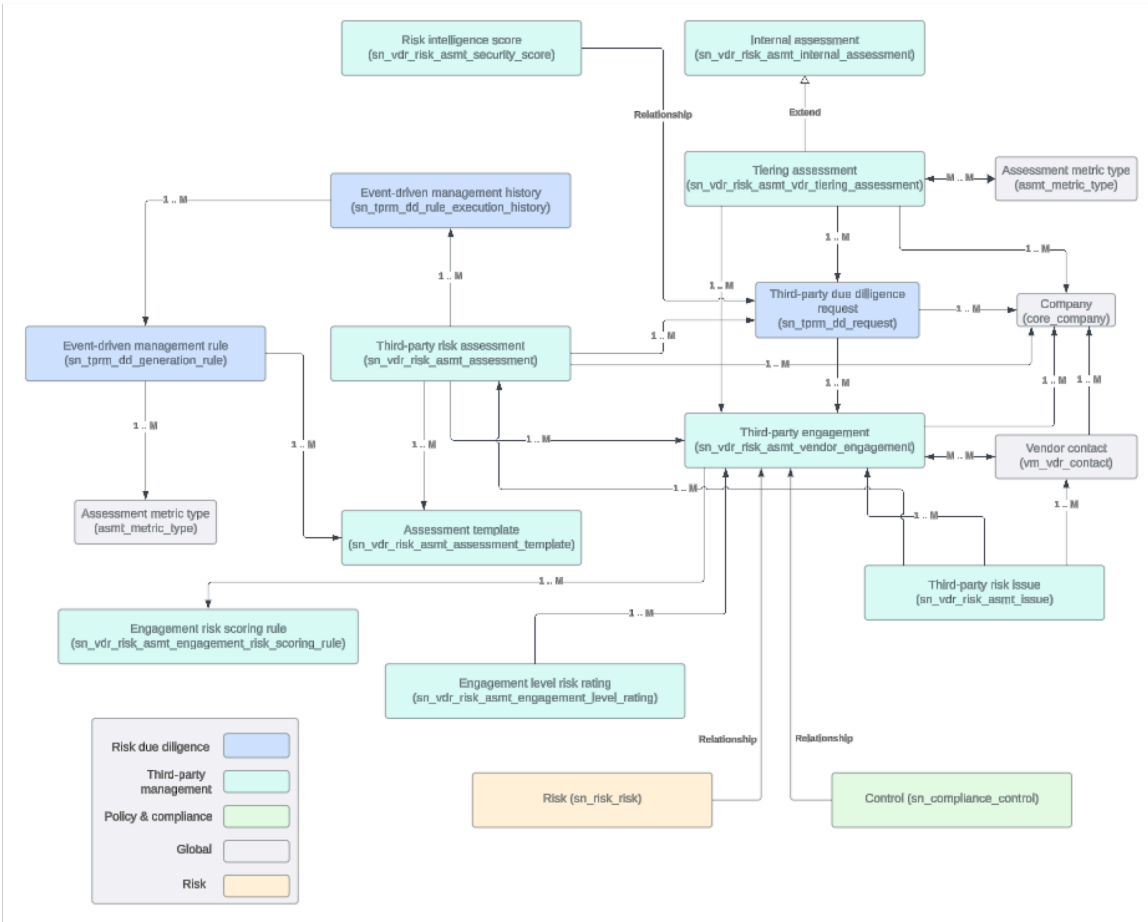
Third-party risk management data model

Use the Third-party Risk Management (TPRM) data model to assess, monitor, and mitigate the risks for your risk management program.



TPRM data model overview

The Third-party Risk Management application is one of the Governance, Risk, and Compliance products.

The following model is used to support TPRM's capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TPRM data model

The third-party risk assessment data model includes various components and relationships:

Components:

- Risk intelligence score [sn_vdr_risk_asmt_security _score]
- Internal assessment [sn_vdr_asmt_internal_assessment]
- Tiering assessment [sn_vdr_risk_asmt_vdr_tiering_assessment]
- Event-driven management history [sn_tprm_dd_rule_execution_history]
- Third-party due diligence request [sn_tprm_dd_request]
- Company [core_company]
- Event-driven management rule [sn_tprm_dd_generation_rule]
- Third-party risk assessment [sn_vdr_risk_asmt_assessment]
- Third-party engagement [sn_vdr_risk_asmt_vendor_engagement]
- Vendor contact [vm_dr_contact]
- Assessment metric type [asmt_metric_type]
- Assessment template [sn_vdr_risk_asmt_assessment_template]
- Third-party risk issue [sn_vdr_risk_asmt_issue]
- Engagement risk scoring rule [sn_vdr_risk_asmt_engagement_risk_scoring_rule]
- Engagement level risk rating [sn_vdr_risk_asmt_engagement_level_rating]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Risk [sn_risk_risk]
- Control [sn_compliance_control]

Relationships:

- The third-party risk assessment component can have a one-to-many relationship with the following components:
  - Event-driven management histories
  - Third-party due diligence requests
  - Company
  - Third-party engagements
  - Third-party risk issues
  - Assessment templates
- The Event-driven management histories component can have a many-to-one relationship with the Event-driven management rules component.
- The Event-driven management rules component can have a one-to-many relationship with the Assessment metric type component and the Assessment template component.
- The third-party engagement component can have a one-to-many relationship with the following components:
  - Company
  - Engagement risk scoring rule
  - Third-party risk issue
- The Third-party engagement component can have a many-to-many relationship with the Vendor contact component.
- The Vendor contact component can have a one-to-many relationship with the Company and a Third-party risk issue component.
- The Engagement level risk rating component can have a one-to-many with the Third-party engagement component.
- The Third-party engagement component is related to the Risk and Control component.
- The Risk intelligence score component is related to the Third-party due diligence component.
- The Tiering assessment component can have a one-to-many relationship with the following components:
  - Third-party due diligence
  - Third-party engagement
  - Company
- The Tiering assessment component can have a many-to-many relationship with the Assessment metric type component.
- The Third-party due diligence component can have one-to-many relationships with the following components:
  - Event-driven management history
  - Third-party risk assessment
  - Company
- The following components are related to Risk due diligence:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event-driven management rule
- Event-driven management history
- Third-party risk due diligence request

- The following components are related to Third-party management:
  - Risk intelligence score
  - Internal assessment
  - Tiering assessment
  - Third-party risk assessment
  - Third-party engagement
  - Assessment template
  - Third-party risk issue
  - Engagement risk scoring rule
  - Engagement level risk rating
- The internal assessment component is an extension of the tiering assessment component.
- The Control component is related to Policy and Compliance Management.
- The Risk component is related to Risk Management.
- The following components are Global:
  - Vendor contact
  - Company
  - Assessment metric type

The following table lists the roles that are required for the components in the TPRM data model.

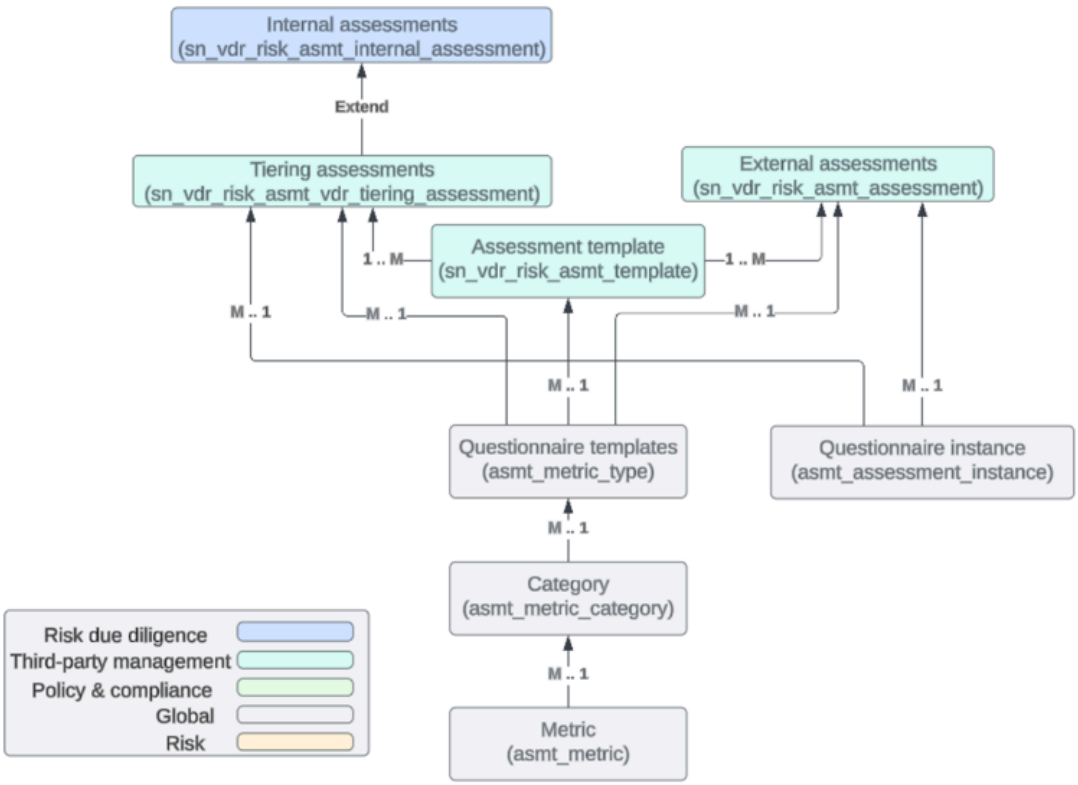
Roles for the TPRM data model

Role	Description
sn_vdr_risk_asmt.approver	Approve due diligence requests in the third-party risk management process.
sn_vdr_risk_asmt.contract_negotiator	Work in the contract risk process stage of the onboarding process.
sn_vdr_risk_asmt.vendor_assessment_reviewer	Edit assessments.
sn_vdr_risk_asmt.vendor_assessor	Manage third parties, third-party contacts, third-party risk assessments, and issues, and complete third-party risk assessment requests.
sn_vdr_risk_asmt.vendor_risk_admin	Have full control over all vendor risk management data and assessment metric types.
sn_vdr_risk_asmt.vendor_risk_manager	Manage third parties, third-party contacts, third-party assessment templates, questionnaire templates, documentation request templates, and scheduled assessments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the roles, see Roles in Third-party Risk Management.

Core components



TPRM is based on sending assessments and calculating scores from the received responses.

You can use these core components to perform assessments:

- Third-party risk assessment
- Third-party engagement
- Third-party due diligence
- Scoring setup
- Risk intelligence

The following diagram shows the main tables and flow for a third-party risk assessment of the TPRM data model.

Third-party risk assessment data model

Here are the components and relationships that make up the Third-party risk assessment data model.

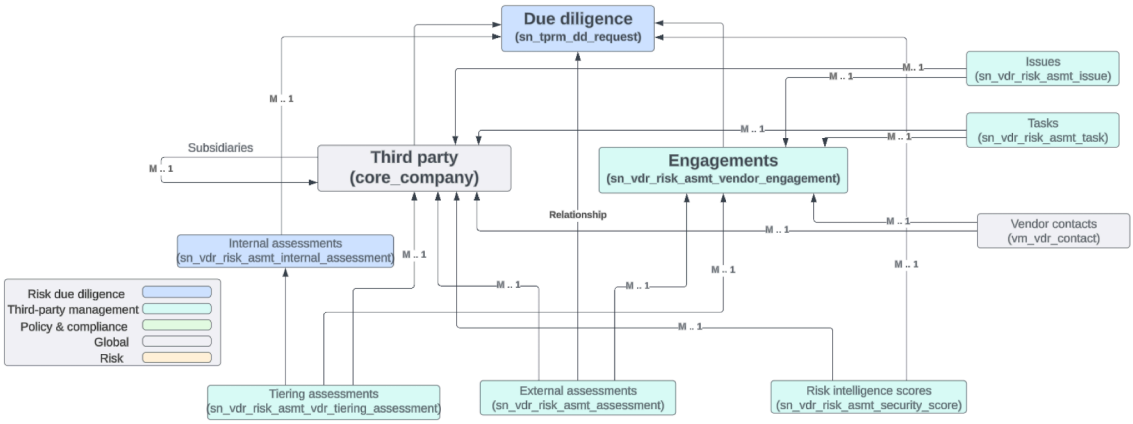
Components:

- Internal assessments [sn_vdr_risk_asmt_internal_assessment]
- Tiering assessments [sn_vdr_risk_asmt_vdr_tiering_assessment]
- External assessments [sn_vdr_risk_asmt_assessment]
- Assessment template [sn_vdr_risk_asmt_template]
- Questionnaire templates [asmt_metric_type]
- Questionnaire instance [asmt_assessment_instance]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Category [asmt_metric_category]
- Metric [asmt_metric]

Relationships:



- The Metric component can have a many-to-one relationship with the Category component.
- The Category component can have a many-to-one relationship with the Questionnaire component.
- The Questionnaire templates component can have a many-to-one relationship with the following components:
  - Assessment template
  - Tiering assessments
  - External assessments
- The Questionnaire instance component can have a many-to-one relationship with the following components:
  - External assessments
  - Tiering assessments
- The Assessment template component can have a one-to-many relationships with the following components:
  - Tiering assessments
  - External assessments
- The Internal assessment component is an extension of the Tiering assessment component.
- The Internal assessment components are related to Risk due diligence.
- The following components are related to Third-party management:
  - Tiering assessments
  - External assessments
  - Assessment templates
- The following components are Global:
  - Questionnaire templates
  - Category
  - Metric
  - Questionnaire instance

For more information on assessments, see Assessing your third-party risk.

The following diagram shows the main tables and flow that are used for the due diligence in the TPRM data model.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Due diligence data model

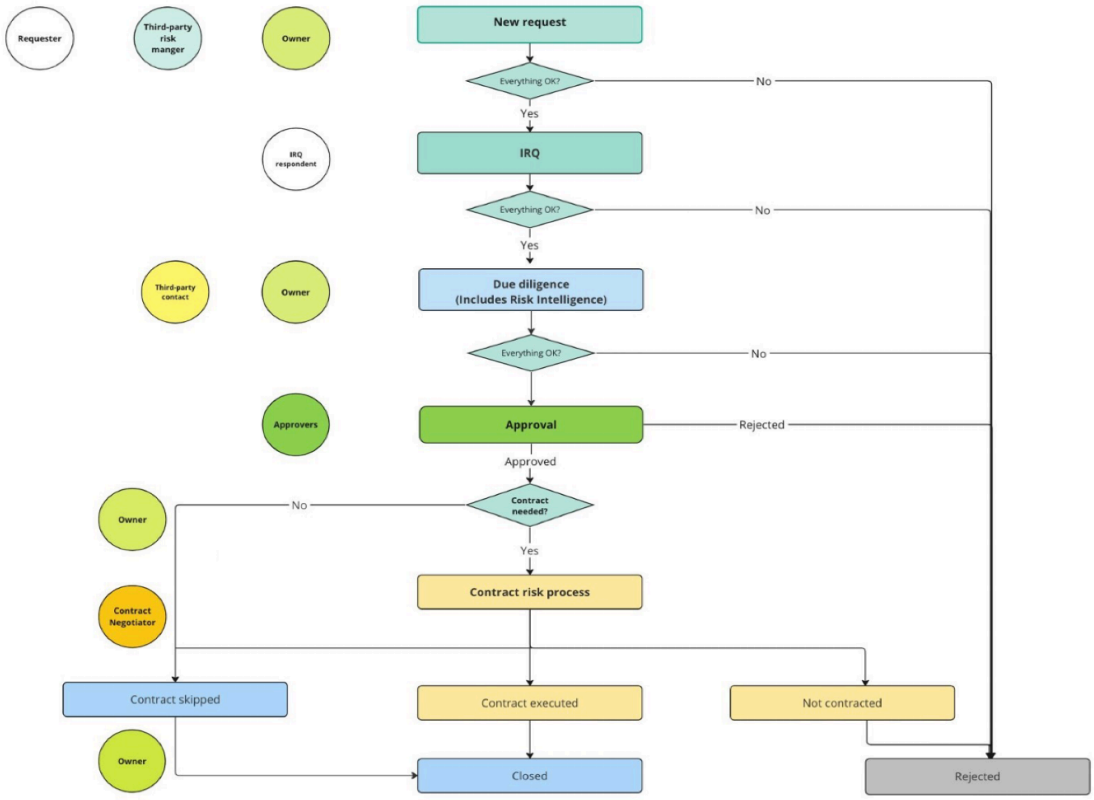
Here are the components and relationships that make up the due diligence data model.

Components:

- Third party [core_company]
- Engagements [sn_vdr_risk_asmt_vendor_engagement]
- Due diligence [sn_tprm_dd_request]
- Issues [sn_vdr_risk_asmt_issue]
- Tasks [sn_vdr_risk_asmt_task]
- Vendor contacts [vm_vdr_contact]
- Risk intelligence scores [sn_vdr_risk_asmt_security_score]
- External assessments [sn_vdr_risk_asmt_assessment]
- Tiering assessments [sn_vdr_risk_asmt_vdr_tiering_assessment]
- Internal assessments [sn_vdr_risk_asmt_vdr_internal_assessment]

Relationships:

- The Third party component has a one-to-many relationship with subsidiaries.
- The Third party component has a one-to-many relationship with the following components:
  - Vendor contacts
  - Internal assessments
  - External assessments
  - Tiering assessments
  - Risk intelligence scores
  - Issues
  - Tasks
- The Due diligence component has a one-to-many relationship with the following components:
  - Vendor contacts
  - Internal assessments
  - Tiering assessments
  - Risk intelligence scores
- The Engagements component has a one-to-many relationship with the following components:

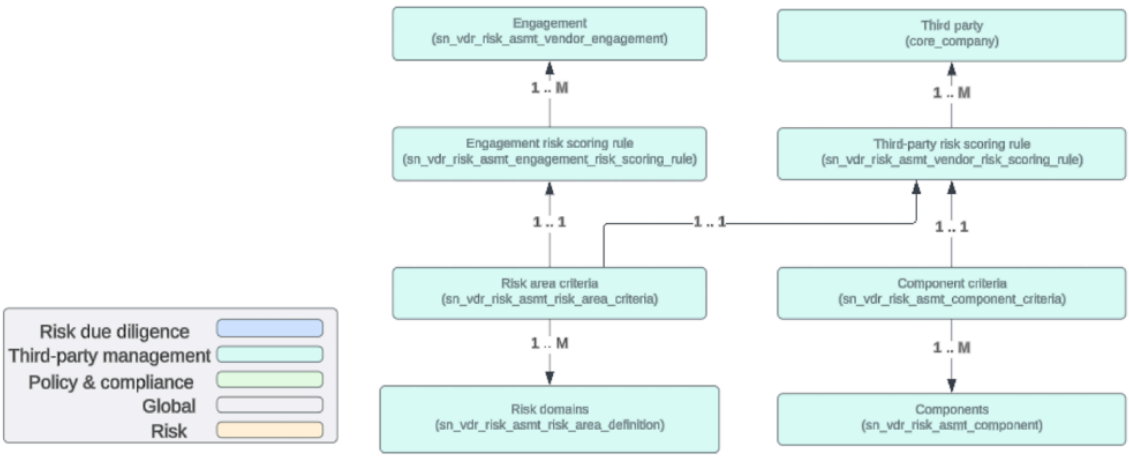


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Vendor contacts
  - Internal assessments
  - External assessments
  - Tiering assessments
  - Issues
  - Tasks
- The Third party component is related to the Due diligence component.
- The Engagements component is related to the Due diligence component.
- The External assessments component is related to the Due diligence component.
- The Internal assessment component is an extension of the Tiering assessment component.
- The following components are related to Risk due diligence:
  - Due diligence
  - Internal assessments
- The following components are related to Third-party management:
  - Engagements
  - Issues
  - Tasks
  - Risk intelligence scores
  - External assessments
  - Tiering assessments
- The following components are Global:
  - Third party
  - Vendor contact

The following diagram shows the required roles, processes, and choices that are part of the due diligence workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Due diligence workflow

For more information on the due diligence workflow, see Due diligence workflow.

The following diagram shows the main tables that are used for scoring the TPRM data model.

Scoring data model

Here are the components and relationships that make up the scoring data model.

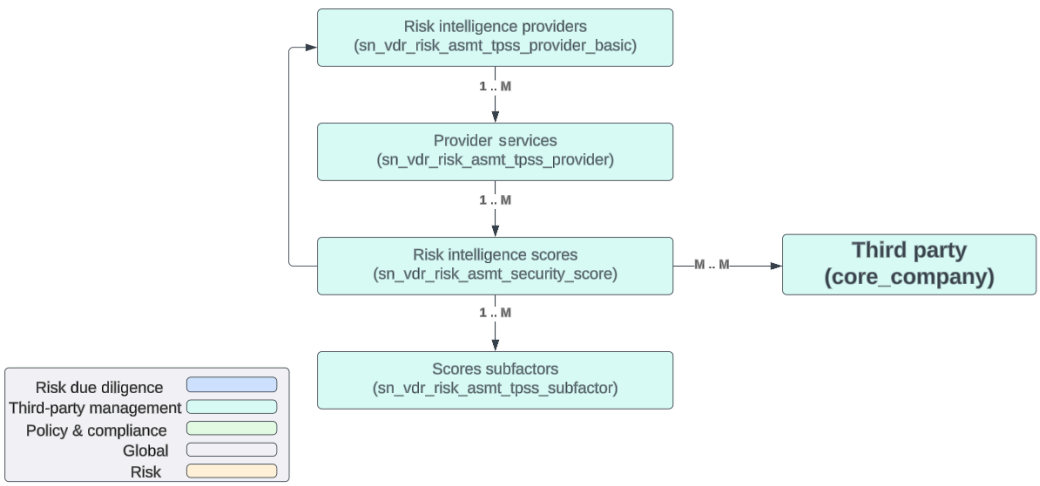
Components:

- Third party [core_company]
- Third-party risk scoring rule [sn_vdr_risk_asmt_vendor_risk_scoring _rule]
- Component criteria [sn_vdr_risk_asmt_component_criteria]
- Components [sn_vdr_risk_asmt_component]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Engagement [sn_vdr_risk_asmt_vendor_engagement]
- Engagement risk scoring rule [sn_vdr_risk_asmt_engagement_risk_scoring_rule]
- Risk area criteria [sn_vdr_risk_asmt__risk_area_criteria]
- Risk domains [sn_vdr_risk_asmt_risk_area_definition]

Relationships:



- The Risk area criteria component has a one-to-many relationship with the Risk domain component.
- The Risk area criteria component has a one-to-one relationship with the Engagement risk scoring rule component and the Third-party risk scoring rule component.
- The Engagement risk scoring rule has a one-to-many relationship with the Engagement component.
- The Component criteria has a one-to-many relationship with Components.
- The Component criteria has a one-to-one relationship with the Third-party risk scoring rule component.
- The Third-party risk scoring rule component has a one-to-many relationship with the Third-party component.
- All of these components are related to Third-party management.

Use the scoring setup in TPRM configure how the scores from the external risk assessments are aggregated to the engagements and third parties. The criteria tables have the information that is related to the aggregation of the scores of multiple records (MIN, MAX, AVG) or from multiple tables (weights for each table). Use the scoring rules to group third parties or engagements and assign criteria. You can configure all the records in these tables without any customization.

For more information on scoring, see Scoring calculations using the classic assessment engine.

The following model diagram shows the main tables that are used for risk intelligence in the TPRM data model.

Risk intelligence model

Here are the components and relationships that make up the Risk intelligence data model.

Components:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Third party [core_company]
- Provider Services [sn_vdr_risk_asmt_tpss_provider]
- Risk intelligence scores [sn_vdr_risk_asmt_security_score]
- Score subfactors [sn_vdr_risk_asmt_tpss_subfactor]

Relationships:

- The Risk intelligence providers component has a one-to-many relationship with the Providers Services component.
- The Providers Services component has a one-to-many relationship with the Risk intelligence scores component.
- The Risk intelligence scores component has a one-to-many relationship with the Scores subfactors component.
- The Risk intelligence scores component is related to the Risk intelligence providers component.
- All of these components are related to Third-party management.

For more information on risk intelligence, see Risk intelligence report requests management.

Domain separation and Third-party Risk Management

Domain separation is supported for TPRM. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation overview

The ServiceNow® GRC: Third-party Risk Management (TPRM) application enables you to proactively identify, assess, and mitigate risks that are associated with your third-party relationships. TPRM provides a centralized process for managing your portfolio of third parties, assessing and scoring risk, and performing remediation. TPRM supports domain separation at the basic level (level 0 or data level). Your Managed Service Provider can configure TPRM at the process level of domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in TPRM

- All TPRM tables support the data level of domain separation. No special setup is needed except for adding the domain-related columns to form views or list views.
- When TPRM is installed to an instance where domain separation is activated, all TPRM data is automatically domain-separated. See the platform domain separation documentation for details.

Use cases

Tenant domains manage their own application data in the same way as data is managed on an instance.

Domain-separated tables

There is no **Domain** column in TPRM application tables.

All TPRM tables support data-level domain separation with sys_domain and sys_domain_path columns.

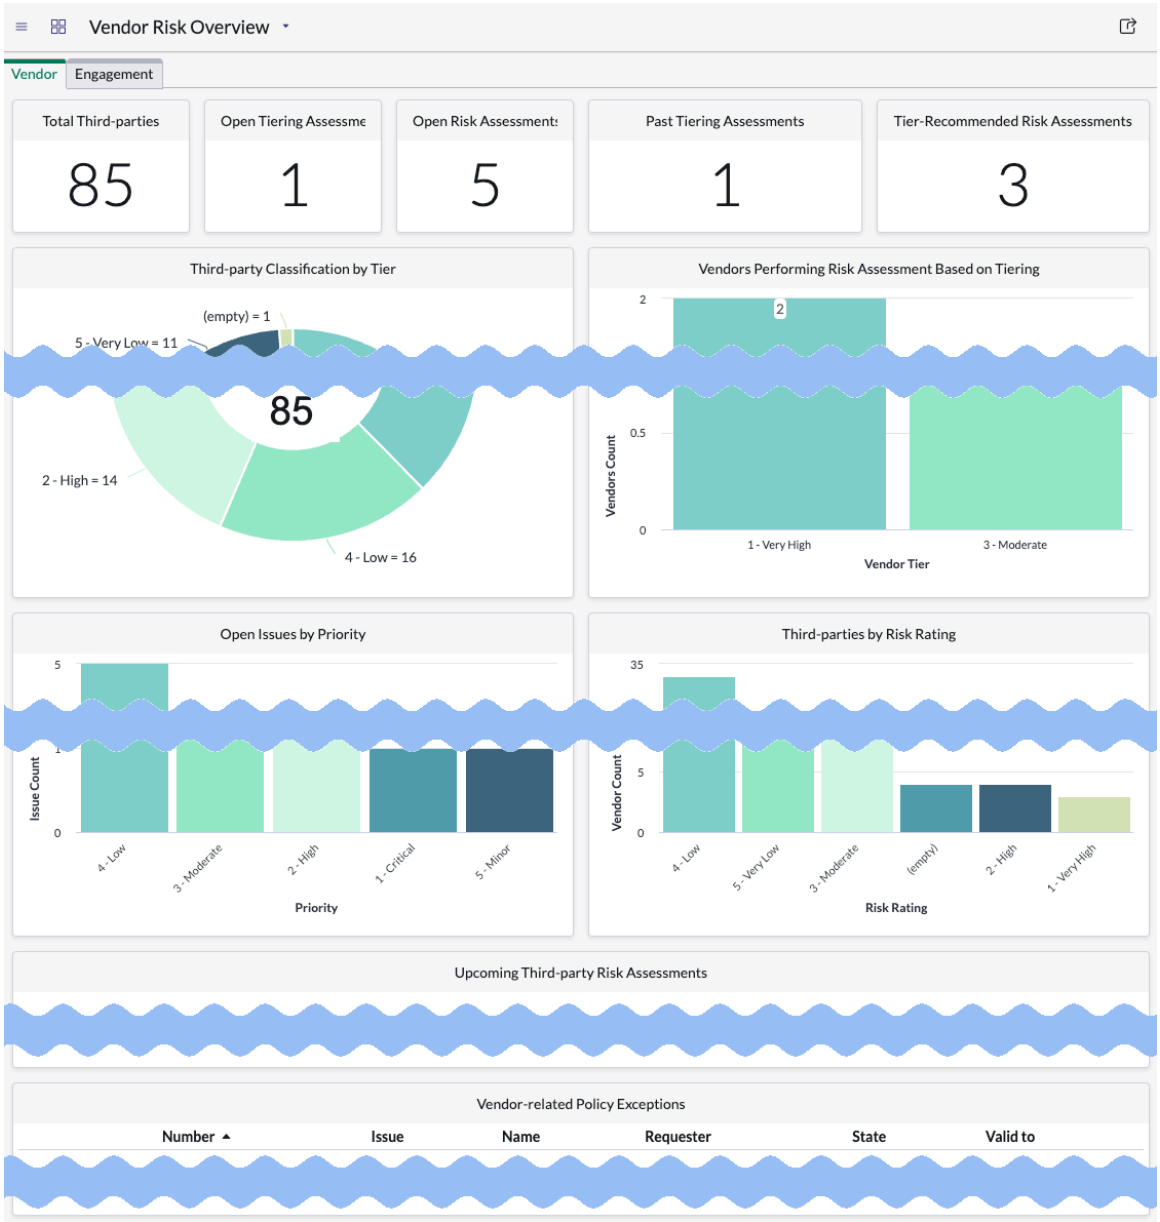
Domain separation for service providers

Vendor Risk Overview reports — Legacy view

The Vendor Risk Overview page is replaced by the third-party risk reports on the Vendor Management Workspace.

Viewing the reports

To open the Vendor Risk Overview, navigate to **All** > **Third-party Risk Management** > **Overview**. The page displays reports that provide insights into your third-party risk management program. The



The more complete IRQ process replaces tiering

In the TPRM application, the IRQ is an internal questionnaire that improves the original tiering assessment process. IRQs enhance internal risk assessments with increased flexibility, control, and scalability. Unlike a tiering assessment where external questionnaires are determined solely by the risk tier, an IRQ can dynamically trigger external questionnaires based on both respondents' answers and risk tier.

To enable a seamless transition to TPRM, you have the option to duplicate existing tiering assessments and designate them as IRQ internal assessments. Risk tiering is supported as an unchanging legacy process.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reports on the Engagement tab (continued)

Report	Description
Open Risk Assessments	Number of engagements with active risk assessments open.
Past Tiering Assessments	Number of engagements that have not completed the tiering assessment within the assessment time frame.
Past Risk Assessments	Number of engagements with active tiering-based risk assessments.
Engagements Classification by Tier	Donut report showing the number of engagements assigned to each tier.
Engagements by Type	Number of engagements of each type.
Open Issues by Priority	All engagement open issues sorted by priority.
Engagements by Risk Rating	Number of engagements sorted by risk rating.

Important:
Starting with version 18.1.3 of Third-party Risk Management the Vendor Risk Overview dashboard is deprecated. If Third-party Risk Management was installed prior to 18.1.3 the Vendor Risk overview dashboard is still available for your use.

Common Governance, Risk, and Compliance features

Each Governance, Risk, and Compliance application has unique features and capabilities. Additionally, there are many features that are common to all GRC applications.

For example, you can run GRC applications by using the ServiceNow® mobile application. Content packs and integrations are available from multiple GRC applications. Information such as domain separation support levels is also included.

Assignment Configurator for non-regulatory alerts

Assignment rules help in automating organization's task records such as action tasks, and non-task records such as issues, incidents, regulatory alerts, and so on.

The Assignment Configurator module allows you to automatically set a value in the assigned_to and assignment_group fields when a set of conditions occurs and applies to Integrated Risk Management record-based tables such as issues, incidents, compliance cases, risks, controls and many more.

An assignment rule must also meet these additional criteria to run:

- The task record has been created or updated. Assignment rules do not apply to unsaved changes on a form.
- The task record must be unassigned. The record cannot have an existing value for either the `assigned_to` or `assignment_group` fields. Assignment rules cannot overwrite existing assignments (including assignments set by a default value or a previously run assignment rule).
- The assignment rule is the first rule that matches the table and conditions. If more than one assignment rule matches the conditions, only the rule with the lowest order value runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure assignments

Assignment configuration rules help in automating organization's task records such as action tasks, and non-task records such as issues, incidents, regulatory alerts, etc.

Before you begin

The GRC: Assignment and Approval Configurations (sn_grc_appr) application for approval and assignment configurations is installed with the GRC: Compliance Case Management application.

Role required: admin

Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Assignment Configurations**.
2. Select **New**.

   The Assignment configuration New Record is displayed.

3. On the form, fill in the fields.
   For information on the fields in the form, see Assignment Configuration New Record.

   Note:
   You cannot have more than one approval configuration applying to the table with the same priority.

4. Select **Submit**.

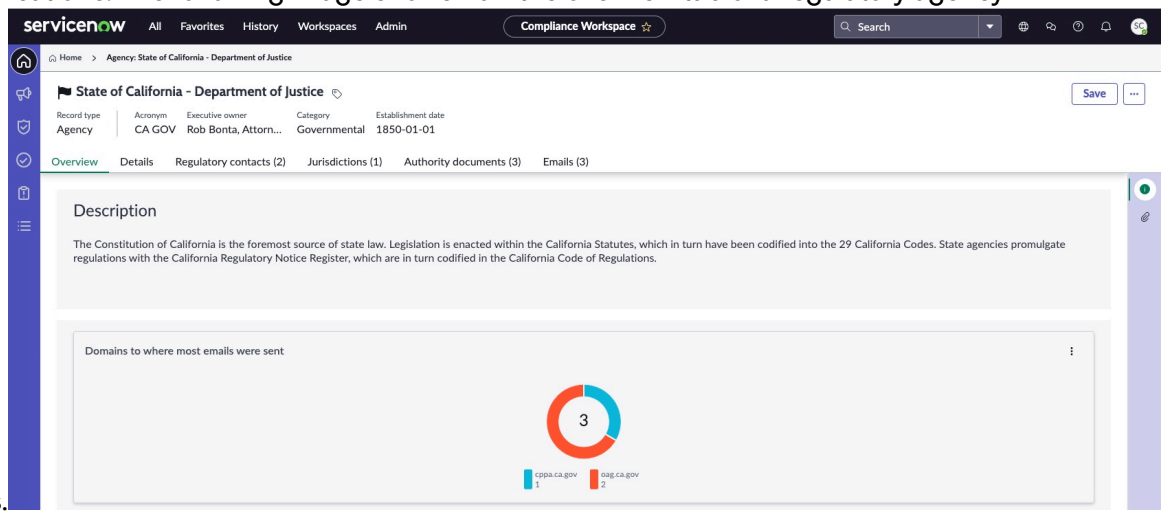
Regulatory Agency Library

Regulatory Agency Library is a new application available in the ServiceNow Store for download and activation.

Persona required: GRC Practitioners.

Regulatory Agency Library is an independent agency responsible for exercising laws or standards or guidelines in a specific field or activity or business operations.

Regulatory Agency Library establishes a centralized library of agencies for identifying relevant regulatory authorities that are responsible for overseeing particular industries or sectors within each jurisdiction. The centralized library consolidates all regulatory communications via emails and implements notification rules for data privacy or security breaches for the reported compliance cases.



- Identify the geographical jurisdictions covered.
- Classify based on regulatory focus or industry-based sector.
- Establish point of communication and interaction between the agency and the entity that it regulates.
- Empowers the compliance team to organize and streamline the connect with regulations to manage the regulations and policies effectively.

Several types of components are installed with activation of the Regulatory Agency Library application, including tables and user roles. For more information, see Roles and tables installed with Regulatory Agency Library.

Overview of an agency record

After a regulatory agency is created, on the overview tab of the agency, you can view the pie charts depicting the total number of emails sent to the various regulator domains. This feature enables you to view the domains where the maximum number of emails were sent. #The ability to drill-down helps you to access the emails tracker page directly from an agency record thus enabling you to filter and display only the relevant emails sent for a specific agency, making it easier to track and manage communications. The following image shows how the overview tab of a regulatory agency appears.

Download and activate the Regulatory Agency Library plugin

You can activate the GRC: Regulatory Agency Library application if you have the admin role. This application includes demo data and provides you access to regulatory body profiles.

Before you begin

In ServiceNow Store, you must confirm that you have entitlements (or licenses) to the application and its dependent applications.

Role required: admin

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All** > .
2. Find the Regulatory Agency Library application by using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. Select **Install**.
4. In the Application installation dialog box, review the application dependencies.

   If your application requires other applications, activate them first if they aren't already installed.

   Installing your application automatically installs the dependent applications if they aren't installed already.

5. If demo data is available and you want to load it, select **Load demo data**.

   Some applications include demo data, which are sample records that describe application features for common use cases. Load demo data when you first activate the application on a development or test instance.

   Note:

   If you don't select the **Load demo data** check box for a store application during installation, demo data isn't available to activate from the **Application Manager** later. For information on how to activate or reactivate demo data after the initial installation, see the Workaround to install demo data if application is already installed [KB0722909] article in the knowledge base.

6. Select **Install**.

Add a regulatory agency

Add a regulatory agency in Compliance Workspace to identify the relevant regulatory authorities that are responsible for overseeing the industries or sectors within each jurisdiction.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

About this task

As a case analyst, you can choose and add the regulatory agency that is related to a compliance case. By default, all the regulatory agencies in the system are displayed. After you add the regulatory agency, you must analyze which regulations have been violated and set their reporting status. The reporting status helps you to determine if the regulation must be reported or not.

In the ServiceNow AI Platform, the regulatory agencies are captured in the Compliance library. Adding the regulatory agencies to the Compliance library helps you to identify which regulations have been breached or violated and prevents your organization from getting penalties or fines.

As a case analyst, you can choose and add the regulatory agency that is related to a compliance case. By default, all the regulatory agencies in the system are displayed. After you add the regulatory agency, you must analyze which regulations have been violated and set their reporting status. The reporting status helps you to determine if the regulation must be reported or not.

Procedure

1. Navigate to **All** > **Compliance Workspace** > **Lists** > **Regulatory information** > **Agencies**.
2. Select **New**.
3. On the Create New Agency form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the fields, see Create New Agency form.

4. Select **Save**.

Create New Agency form

Use the Create New Agency form in Compliance Workspace to create a regulatory agency. The regulatory agency is a new record type that handles regulatory changes or compliance case management.

Create New Agency form

For a description of the form field values, see the following table.

Create New Agency form

Field	Description
Name	Name of the regulatory agency.
Summary	Brief summary of the regulatory agency.
Description	Detailed description of the regulatory agency.
Acronym	Acronym of the regulatory agency, if any.
Logo	Logo of the regulatory agency.
Executive owner	Executive owner of the regulatory agency.
Website link	Website link on which the regulatory agency is listed.
Additional details	
Sector	Sector for classifying the regulatory agency.
Establishment date	Establishment date of the regulatory agency.
Type	Type for classifying the regulatory agency.
Theme	Theme of the regulatory agency.
Category	Category of the regulatory agency such as regulatory, legislative, assembly, or others. The default value is Regulatory as you're adding a new regulatory alert.
Settings	
Functional domain	Functional domain of the regulatory agency.

Add a regulatory contact to an agency

Add a regulatory contact to a specific regulatory agency or within a jurisdiction in Compliance Workspace. By mapping a regulatory contact to a specific agency, this contact is notified about your case reporting, case audit, and case closures as they occur.

Before you begin

Role required: compliance_case_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
As a compliance_case_manager, you can map one contact or multiple contacts to a regulatory agency. By default, all the regulatory contacts in the system are displayed. When you add a regulatory contact, you must analyze which jurisdiction it belongs to.

Procedure
1. Navigate to **All** > **Compliance Workspace** > **Lists** > **Regulatory information** > **Regulatory contacts**.
2. Select **New**.
3. On the Create New Regulatory Contact form, fill in the fields.
   For a description of the fields, see Create New Regulatory Contact form.
4. Select **Save**.

Create New Regulatory Contact form
Use the Create New Regulatory Contact form in Compliance Workspace to create a regulatory contact to either a regulatory agency or a jurisdiction.

Create New Regulatory Contact form
For a description of the form field values, see the following table.

Create New Regulatory Contact form

Field	Description
Name	Name of the regulatory contact.
Regulatory agency	Regulatory agency to which you add the regulatory contact.
Active	Option to select if you want to make the regulatory contact active.
User	User name of the regulatory contact.
Email	Email address of the regulatory contact.
Phone number	Phone number of the regulatory contact.
Address	Contact address of the regulatory contact.
Designation	Designation of the regulatory contact.
Apply to global jurisdiction	Contact that also applies to a global jurisdiction.

Add a jurisdiction to an agency
Add a jurisdiction to a regulatory agency in Compliance Workspace to define the geographical scope for regulatory applicability.

Before you begin
Role required: compliance_case_manager

About this task
As a compliance_case_manager, you can associate one or more jurisdictions with a regulatory agency. This ensures that regulatory changes are correctly mapped to applicable regions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Compliance Workspace** > **Lists** > **Regulatory information** > **Regulatory agencies**.
2. Select the agency record you want to update.
3. In the **Jurisdictions** related list, select **Add**.
4. Choose one or more jurisdictions from the list (for example, North America, EU, APAC). For more information on creating jurisdictions, see Map the taxonomy.
5. Select **Save**.

Add an authority document to an agency

Add an authority document to a regulatory agency in Compliance Workspace to maintain traceability between regulations and their source documents.

Before you begin
Role required: compliance_case_manager

About this task
Authority documents represent official regulatory publications such as rulebooks or guidelines. Linking these documents to agencies helps ensure compliance workflows reference the correct source.

Procedure

1. Navigate to **All** > **Compliance Workspace** > **Lists** > **Regulatory information** > **Regulatory agencies**.
2. Select the agency record you want to update.
3. In the **Authority Documents** related list, select **Add**.
4. Choose one or more authority documents from the list (for example, GDPR Guidelines).
5. Select **Save**.

Compose and send an email about a regulatory agency record

Compose and send an email about a regulatory agency record to multiple stakeholders within or outside your organization by using the Compliance Workspace.

Before you begin
Role required: sn_grc_case_mgmt.grc_case_analyst

About this task
You can compose and send emails regarding regulatory agencies to multiple stakeholders. For example, you can consult the legal team for any required interpretations or guidance on a newly added regulatory agency record. You can manage these emails from the Regulatory Agency record page.

Procedure

1. Navigate to **Workspaces** > **Compliance Workspace**.
2. Select the list icon and then Navigate to **Regulatory information** > **Agencies** and select the agency you want to compose an email for.
3. Select the More actions icon .

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Compose Email**.
5. On the form, fill in the fields.

Email Draft form

Field	Description
To	Email ID of the recipient. You can add multiple email IDs, separated by commas, in this field to send an email to more than one recipient.
Subject	Brief summary or title of your email.
Email message	Body of your message that includes any information, requests, or details that you want to convey to the recipient. You can format the text, add attachments, and include links in this section. **Note:** You can send emails to both internal users and external stakeholders who don't have access to your instance. You must provide the basic record details in the subject line or body of the email to make them aware of the record that you're referring to.

6. **Optional:** To add attachments, select **Attach File**.
7. Select **Send Email**.
   The email has been sent to the recipient. You can view emails associated with the regulatory agency record by navigating to the Emails tab of that record.

Mobile experience for Governance, Risk, and Compliance

Manage your work, task assignments, requests, approvals, and other follow-up actions for GRC applications directly from your mobile device. Receive timely notifications for current alerts, as well as risk and compliance status for your critical assets, vendors, and impacted essential business services.

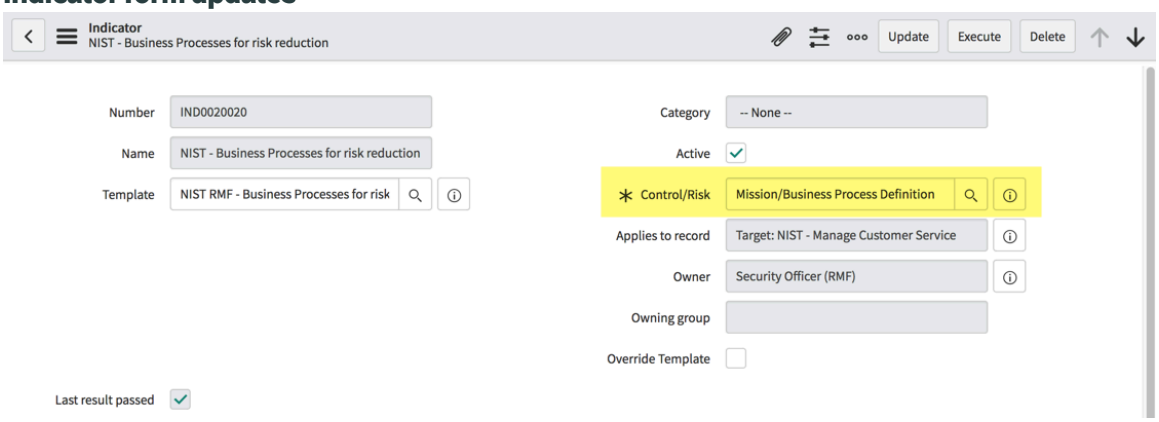
Starting with New York, the following applications provide mobile access:

- Managing mobile experience for GRC Policy and Compliance
- Mobile experience for GRC Risk Management

Governance, Risk, and Compliance application nomenclature updates and industry terminology

The following terms are used within GRC applications and/or within the GRC industry.

GRC nomenclature updates



Starting with previous release, many terms within all the GRC core applications were updated.

Industry acronyms

Term	Definition
Basel III	An international standard for banking that regulators can use when making regulations on how much capital banks must have to offset potential risk. The more risk a bank has, the more capital it should have in place to ensure that it stays solvent. The regulation was the third such standard issued by the Basel Committee on Banking Supervision, and hence the name Basel III.
CISA	Cybersecurity Information Sharing Act
CISM	Certified Information Security Manager
COBIT	Control Objectives for Information and Related Technologies (COBIT) provides an IT governance framework to manage risk and compliance issues based on best practices. Published by the IT Governance Institute and the Information Systems Audit and Control Association (ISACA).
COSO	The Committee of Sponsoring Organizations (COSO) was formed in 1985 to sponsor the National Commission on Fraudulent Financial Reporting. COSO is an independent private sector initiative that studied the causal factors that can lead to fraudulent financial reporting and developed recommendations for public companies, the SEC, and other regulators and educational institutions.
EDPA	European Data Privacy Act
ENISA	European Network & Information Security Agency
EUP	Energy use in products (EUP) is an EU directive that requires companies to design products to use less energy.
European Directive on Data Protection	One of the first and most important pieces of data privacy legislation that specifically addresses internet privacy.
FCA	Financial Conduct Authority
GDPR	General Data Protection Regulation (GDPR) is a regulation, effective May 25, 2018, replacing the Data Protection Directive 95/46/ec to strengthen and harmonize the data protection rights of European Union citizens.
GRI	Global Reporting Initiative (GRI) is an international group that created the G3 framework for sustainability reporting.
ITGI	IT Governance Institute
PII	Personal Identifying Information / Personally Identifiable Information (PII) is the information that permits the identity of an individual to be directly or indirectly inferred.
PCI DSS	Payment Card Industry Data Security Standard (PCI DSS) is a set of security standards designed to ensure that all companies that accept, process, store, or transmit credit card information maintain a secure environment.
SOLVENCY II	SOLVENCY II
SOX	The Sarbanes-Oxley Act (SOX) established the Public Company Accounting Oversight Board and added requirements for publicly

Term	Definition
	traded companies, their officers, boards, and auditors. It increased penalties for corporate financial fraud. This U.S. Legislation was enacted in response to the high profile Enron and WorldCom financial scandals. Its goal is to protect shareholders and the general public from accounting errors and fraudulent practices in the enterprise. SOX applies to companies that trade publicly in the U.S.

Industry terms

Term	Definition
ALE	Annualized loss expectancy (ALE) = Single Loss Expectancy (SLE) x Annualized Rate of Occurrence (ARO). Used in Quantitative risk scoring.
ARO	Annualized rate of occurrence.
Acceptance	A specific risk can be accepted by the management, stopping further investments into deeper controls or higher levels of mitigation, if it is within the level of Tolerance or if further mitigation and control would actually cost much more that the estimated Impact (or significance) of the risk.
Assertion	Any formal declaration or set of declarations about the subject matter made by management.
Assessment	A broad review of the different aspects of a company or function that includes elements not covered by a structured assurance initiative.
Attestation	Process of validating that something is true. For instance, a control effectiveness or compliance can be attested through a questionnaire, electronically signed by its fulfiller.
Audit	Formal inspection and verification to check whether a standard or set of guidelines is being followed, records are accurate, or efficiency and effectiveness targets are being met. In ServiceNow®, an organization identifies all the controls that they want to test at one time and assigns responsibility of the overall audit to a single person. A single task manages the testing of all controls.
Audit activities	One of the tasks within an audit that is assigned to an individual for execution of the audit.
Audit committee	A committee, often including members of the board of directors, responsible for overseeing financial reporting and internal controls.
Audit documentation (working papers)	Records kept by the auditor of procedures applied, tests performed, information obtained, and pertinent conclusions reached in the engagement. The documentation provides the principal support for the auditor's report.
Audit evidence	Facts gathered during the audit procedures that provide a reasonable basis for forming an opinion regarding the financial statements under audit.
Audit objective	When obtaining evidence in support of financial statement assertions, the auditor develops specific audit objectives in light

Industry terms (continued)

Term	Definition
	of those assertions. For example, an objective related to the completeness assertion for inventory balances is that inventory quantities include all products, materials, and supplies on hand.
Audit observations	Used by internal auditors for identifying control gaps or identifying new risks.
Automated controls	Internal controls executed automatically by computer systems. Manual controls are executed by a person charged with that task and are typically performed on a subset of transactions and data. Automated controls can be executed on every relevant transaction or data element, ensuring greater accuracy with less effort.
Authority documents	The regulations, certifications, frameworks, standards, and best practices that an organization chooses or are required for compliance with regulations. Authority Documents are related to controls, risks, and policies.
Business risk	Risks that could adversely affect an entity's ability to achieve its objectives and execute its strategies.
Calculated score	Calculated score is derived from the inherent score and residual score as an overall outcome. Refers to actual exposure of risk based on the quality of implemented control system.
Chain of custody	A legal principle regarding the validity and integrity of evidence. It requires accountability for anything used as evidence in a legal proceeding. This ensures that it can be accounted for from the time it was collected until the time it is presented in a court of law.
Chief Compliance Officer (CCO)	A corporate official in charge of overseeing and managing compliance issues within an organization. This person ensures that a company is complying with regulatory requirements, and that the company is complying with internal policies and procedures.
Chief Operating Officer (COO)	Also called a Chief Operations Officer, an executive in charge of the company’s day-to-day operations.
Chief Risk Officer (CRO)	Also called a Chief Risk Management Officer, an executive in charge of enterprise risk management and the compliance efforts of a company.
Citations	Records with the specific requirements cited by an authority document. The citation record relates authority documents to its applicable control.
Compliance	The act of adhering to and demonstrating adherence with laws, regulations, or policies. Compliance relates to regulations in many areas including finance, the environment, global trade, worker safety, and privacy.
Confidentiality	Preserving authorized restrictions on access and disclosure, including means for protecting privacy and proprietary information.
Containment control	Control designed to limit the impact (or significance) of a risk, if it would occur.
Control	The actual control activities that are performed by an organization. Control records include basic required information about the control

Industry terms (continued)

Term	Definition
	(owner, activity, frequency, and so forth.). Controls can be related to authoritative source contents, policies, and risks. Any action taken by management, the board, and other parties to manage risk. Management plans, organizes, and directs the performance of sufficient actions to provide reasonable assurance that objectives and goals are achieved. Control records include basic required information about the control (owner, activity, frequency, and so forth.). Controls can be related to authoritative source contents, policies, and risks.
Control framework	A set of fundamental controls which perform and preserve the cross mapping of controls to prevent financial loss, information loss, or more generally to prevent risks within an enterprise.
Control instance	The actual run of a Control Test Definition, periodically or on demand, showing the result data sample, the attestation, or the manual result of the test activities.
Control test definitions	Control test definitions specify how and when controls are tested, including testing steps, expected results, the group or individual responsible for the testing, and the test schedule. Control test instances are automatically generated from the test schedule. Remediations are automatically created when control tests fail or when audit observations are noted.
Corrective controls	Internal controls that come into play once a problem is discovered. An example would be removing access from users who have excessive privileges or executing a backup and recovery plan after a physical disaster has occurred.
Corporate Performance Management	Corporate Performance Management (CPM) is a combination of strategy management, planning, reporting and consolidation, and revenue, cost, and profitability modeling that enables companies to measure their performance and improve it.
Detect	Ongoing progress toward objectives as well as actual and potential undesirable conditions and events using management actions and controls.
Detective control	A control designed to discover an unintended event or result. It may also detect if and when a specific risk occurs.
Effect	A measure of the likelihood, timing, and impact of an event on something.
Effective internal control	Reasonable assurance that operational objectives are achieved, that published financial statements are reliably prepared, and that the entity complies with applicable laws and regulations.
Engagement	An audit project that may include audit tasks that accomplish a set of objectives or goals.
Event	An observable action, occurrence, or a change in condition. An event includes change in knowledge about a condition, even if the condition did not change.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Industry terms (continued)

Term	Definition
Entity	Fundamental concept of GRC, entities are used to model any enterprise element for which controls and risks can be associated. For example: business units, servers, laptops.
Entity type	Used to refer to multiple similar entities. For example: Asia/Pacific business unit, Linux servers, MacBook Pro.
Evaluate	To measure something against criteria.
Evidence (evidential matter)	Includes written and electronic information (such as checks, records of electronic fund transfers, invoices, contracts, and other information) that permits the auditor to reach conclusions through reasoning.
Fraud	Any illegal act characterized by deceit, concealment, or violation of trust. These acts are not dependent upon the threat of violence or physical force. Frauds are perpetrated by parties and organizations to obtain money, property, or services and to avoid payment or loss of services or to secure personal or business advantage.
General controls	Policies and procedures to assure proper operation of computer systems, including controls over network operations, software acquisition and maintenance, and access security.
Governance, Risk, and Compliance (GRC)	Governance, risk management, and compliance with regulations have traditionally been separate corporate functions. GRC is the integrated collection of capabilities that enable an organization to reliably achieve objectives while addressing uncertainty and acting with integrity. It encompasses the governance, assurance and management performance, risk, and compliance. GRC is the business of how an organization operates through the management of risk while remaining compliant with external and internal standards to optimize performance. GRC embraces how processes, controls, security, and culture integrate to ensure that the organization has integrity.
Impact	Used to evaluate the severity of a risk, together with the Likelihood. It evaluates the level of consequence a specific risk would have on an organization if/when it would occur.
Indicator	A metric used to collect data to monitor controls and risks, and collect audit evidence.
Inherent likelihood	The likelihood of the identified risk occurring before any response strategy is implemented.
Inherent risk	The level of risk exposure, in terms of Likelihood and Impact (or significance), assuming no related internal controls and no mitigation actions are yet in place.
Inherent score	The score of the risk before any response strategy is implemented.
Inherent significance	How significant the risk is before any response strategy is implemented.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Industry terms (continued)

Term	Definition
Integrity	The property whereby information, an information system, or a component of a system has not been modified or destroyed in an unauthorized manner. A state in which information has remained unaltered from the point it's produced by a source, during transmission, storage, and eventual receipt by the destination.
Internal audit	A department, division, team of consultants, or other practitioners that provides independent, objective assurance and consulting services designed to add value and improve an organization's operations. The internal audit activity helps an organization accomplish its objectives by bringing a systematic, disciplined approach to evaluate and improve the effectiveness of governance, risk management, and control processes.
Internal auditors	Employees of the client responsible for providing analyses, evaluations, assurances, recommendations, and other information to the entity's management and board. An important responsibility of internal auditors is to monitor performance of controls.
Internal controls	The policies, procedures, practices, and organizational structures designed to provide reasonable assurance that business objectives are achieved and undesired events are prevented or detected and corrected.
Issue	A GRC task that allows end users to document Control and Risk issues and track the response to remediate or accept the issue.
IT Governance	The leadership, organizational structures, and processes that ensure that the enterprise's IT sustains and extends the enterprise's strategies and objectives. It is the responsibility of executives and the board of directors.
IT GRC	Encompasses the software and hardware and related policies and procedures used to support compliance and risk management efforts from an IT perspective based on established best practices.
Likelihood	The probability that something happened.
Management	The act of internally directing, controlling, and evaluating an entity, process, or resource.
Manual controls	Controls performed manually, not by computer.
Material (materiality)	A risk is material when it is possible to calculate its financial impact.
Mitigation	Reducing the risk associated with a particular violation of a rule. Before a risk occurs, appropriate mitigation actions are put in place to resolve possible related control failures and/or to reduce the risk exposure.
Objective	Something that an entity intends to attain or accomplish.
Operational audit	An audit designed to evaluate the various internal controls, economy, and efficiency of a function or department.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Industry terms (continued)

Term	Definition
Operational controls	Controls relating to the daily operation of a company or enterprise to ensure that all objectives are achieved.
Operational risks	Risks relating to the people, processes, and systems required to achieve an organization's mission and objectives.
Objectivity	The ability to evaluate client records with no preconceived notions or prejudices.
Obligations	Assertions about obligations deal with whether liabilities are obligations of the entity at a given date. For example, management asserts that amounts capitalized for leases in the balance sheet represent the cost of the entity's rights to leased property and that the corresponding lease liability represents an obligation of the entity.
Owner	The owner of a risk, a control, or a mitigation/remediation task accepts its accountability. They may delegate some tasks related to the ownership, but they stay accountable to the organization.
Peer review	A practice monitoring program in which the audit documentation of one CPA firm periodically reviewed by independent partners of other firms to determine that it conforms to the standards of the profession.
Plan	Audit planning is developing an overall strategy for conduct and scope of the audit. The nature, extent, and timing of planning vary with size and complexity of the entity, experience with the entity, and knowledge of the business. In planning the audit, the auditor considers the entity's business and its industry, its accounting policies and procedures, methods used to process accounting information, the planned assessed level of control risk, and the auditor's preliminary judgment about audit materiality.
Policy	A document that records a high-level principle or course of action that has been decided on. The intended purpose is to influence and guide both present and future decision making to be in line with the philosophy, objectives, and strategic plans established by the enterprise's management teams. In addition to policy content, policies describe the consequences of failing to comply with the policy, the means for handling exceptions, and the manner in which compliance with the policy is checked and measured. In ServiceNow®, approved policies are published in the Knowledge Base. Policies are related to authority documents and control records. Policy statements define specific details that a process follows within a policy.
Preventative control	A control designed to avoid an unintended event.
Procedure	An action, such as a step performed as part of an audit program or as part of the client's internal controls. Provides the "how to" of policies and guides their implementation. Procedures are audience-specific and provide exact instructions that ensures compliance with a given policy. ServiceNow® treats policies and procedures in the same way; therefore, the terms may be used

Industry terms (continued)

Term	Definition
	interchangeably. This may differ from frameworks, such as COBIT 5.1, which defines policies and procedures as two separate items.
Professional skepticism	Approaching an audit with a questioning mind-set.
Qualitative Impact	Includes Impact (refers to significance of a risk) and Likelihood (refers to probability of a risk occurring) ratings. Score is calculated by multiplying Impact by Likelihood. An impact often expressed using an ordinal scale or nominal scale.
Quantitative Impact	A positive/negative effect on financial assets, tangible assets, intangible assets, business continuity, and health & safety. Calculated by Single Loss Expectancy (SLE) x Annualized Rate of Occurrence (ARO) = Annualized loss expectancy (ALE). A quantitative impact is expressed numerically.
Questionnaire	An internal control questionnaire is a list of questions about the internal control system to be answered (with answers such as yes, no, or not applicable) during audit fieldwork. The questionnaire is part of the documentation of the auditor's understanding of the client's internal controls.
Random sample (random-number sampling)	Identical probability of each population item being selected for a sample. Also, the use of random numbers to select a random sample from a population.
Reasonable assurance (an internal control)	An internal control, no matter how well designed and operated, cannot guarantee that an entity’s objectives are met because of inherent limitations in all internal control systems.
Remediation	After a failure is identified and assessed, appropriate remediation can take place to mitigate or eliminate the issue Residual likelihood: The likelihood of the identified risk occurring after any response strategy is implemented.
Requirement	Something that an entity must address as a result of making a promise.
Residual likelihood	The likelihood of the identified risk occurring after any response strategy is implemented.
Residual risk	Level of the risk exposure, in terms of likelihood and impact (or significance), after related internal controls and mitigation actions are in place and effective.
Residual score	The score of the risk after any response strategy is implemented.
Residual significance	How significant the risk is after any response strategy is implemented.
Risk	A risk is any threat or vulnerability that could adversely affect an organization’s business objectives. All risks are contained in one risk repository. Risks can be related to any item, policy, control, and remediation task. Risks requiring immediate or ongoing attention can be mitigated, prevented, or controlled using the defined controls and related control tests. A risk statement is a defined consequence that can occur if a threat exploits a vulnerability.

Industry terms (continued)

Term	Definition
	Risk is measured in terms of Impact (or Significance) and Likelihood. Types of risks include operational risks (fraud, for example), risks of noncompliance (not filing the proper documents to comply with legislation), and strategic risks (such as an incident that affects a brand's reputation). The business risk associated with the use, ownership, operation, involvement, influence, and adoption of IT within an enterprise.
Risk analysis	The systematic examination of available information to determine how often specified events may occur and the magnitude of their consequences.
Risk appetite	The level of risk that an organization is willing to accept in pursuit of its objectives.
Risk assessment	The appraisal of the risks facing an entity, asset, system or network, organizational operations, individuals, geographic area, other organizations, or society, and includes determining the extent to which adverse circumstances or events could result in harmful consequences.
Risk criteria	Are quantitative or qualitative values against which level of risk is evaluated.
Risk management	The objective of risk management is to reduce uncertainty. It's the act of managing processes and resources to address risk while pursuing the organization's objectives. The process of identifying, analyzing, assessing, and communicating risk and accepting, avoiding, transferring or controlling it to an acceptable level considering associated costs and benefits of any actions taken.
Risk management framework	A formalized process for managing risk on an explicit basis. The framework consists of a risk assessment, response, and accountability for the risk and mitigation activities around it.
Risk mitigation	The processes built into the controls environment, such as policies, frameworks, and accountabilities, that reduce a risk.
Risk register	A repository of the key attributes of potential and known IT risk issues. Attributes may include name, description, owner, expected/actual frequency, inherent/residual level, potential/actual business impact, and mitigation/remediation plans.
Risk response	The decision to accept a risk, decline a risk, treat or mitigate a risk, or share a risk with another party.
Risk statement	General statements about potential risks or threats that could occur somewhere in an organization.
Risk tolerance	The level of risk that the organization is unwilling to exceed to achieve objectives. The representation of the risk appetite in terms of threshold, generally financial, given to various management levels in the organization for specific risk categories.
Sample size	The number of population items selected when a sample is drawn from a population.

Industry terms (continued)

Term	Definition
Sampling	Selecting a small but pertinent and representative number of records to represent the entire population of records.
Sampling risk	The possibility that conclusions drawn from the sample may not represent correct conclusions for the entire population.
Segregation of duties (SoD)	Assigning different people the responsibilities of authorizing transactions, recording transactions, and maintaining custody of assets. Segregation of duties reduces the opportunities for one person to both perpetrate and conceal errors or fraud.
Significance	Used to evaluate the severity of a risk, together with the Likelihood. It evaluates the level of consequence a specific risk would have on an organization if/when it would occur.
SLE	Single loss expectancy (SLE) = Single Loss Expectancy = Asset Value x Exposure Factor.
Stakeholder	A person, group, or organization that has direct or indirect stake in an organization because it can affect or be affected by the organization's actions, objectives, and policies.
Standard	A professional pronouncement promulgated by the Internal Audit Standards Board that delineates the requirements for performing a broad range of internal audit activities, and for evaluating internal audit performance.
Strategic risks	Relating to strategic objectives such as political factors, customer priorities, brand, or reputation.
Target	A measurable value that an entity strives to achieve.
Test	A sample from a population to estimate characteristics of the population.
Test plan	A specific audit test of the design and operating effectiveness of a single control.
Threat	An event that has, on balance, an undesirable effect on achieving objectives.
Tolerance	The acceptable level of departure from a target.
Unified Compliance Framework (UCF)	Network Frontiers Unified Compliance Framework (UCF) contains authority documents that can be imported into the ServiceNow® instance. For more information, see Unified Compliance Framework.
Uncertainty	The state of being unable to completely predict, determine, or define something.

Governance, Risk, and Compliance content packs

Content packs may include pre-defined scopes, specific policies, controls, risks, audit, test plans, dashboards, and reports that provides customers an operational head-start when adopting various regulations and frameworks.

Use the following documentation for the installation, verification, and reporting features of the GRC content packs on the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unless otherwise noted, each content pack requires that you have the ServiceNow GRC products installed and activated on your instance.

Sarbanes-Oxley (SOX) Content Pack

The Sarbanes-Oxley (SOX) Content Pack provides basic SOX content for an organization to commence and manage activities towards attaining operational SOX compliance using the ServiceNow® GRC application. A content pack may include pre-defined scope, specific policies, controls, risks, audit, test plans, dashboards, and reports providing users of ServiceNow® GRC a head-start in using the applications towards SOX compliance-related activities.

Users with the GRC Administrator roles of Compliance Admin (sn.compliance.admin), Risk Admin (sn.risk.admin), or Audit Admin (sn.audit.admin) in an organization are responsible for editing the content to suit the SOX requirements of the organization. The SOX Content Pack covers the three ServiceNow® GRC core applications, namely Policy and Compliance Management, Risk Management and Audit Management, and it establishes relationships across the various content elements in those applications.

Install the SOX Content Pack

Install the SOX Content Pack for use with the core GRC applications.

Before you begin

Role required: sn_compliance.admin, sn_risk.admin, or sn_audit_admin, admin

Complete the following setup checklist prior to installation. These setup tasks are required for a smooth installation.

Setup task	Description
Verify that the ServiceNow plugins are activated.	Activate one of the following GRC plugins: • GRC: Policy and Compliance Management (com.sn_compliance) • GRC Risk Management (com.sn_risk) • GRC: Audit Management (com.sn_audit) To verify that this plugin is activated, navigate to **Subscription Management** > **Subscriptions** in your instance. The list displays the subscriptions your organization has purchased.

Procedure

1. Enter info re: Legal Notice.
2. If you have not installed the application, follow the instructions to install it.

   a. Log in to the instance you want to install the application on.

   b. Navigate to **System Applications** > **All Available Applications** > **All**.
   A list of apps available for installation is displayed.

   c. Locate the app, select it, and click **Install**.

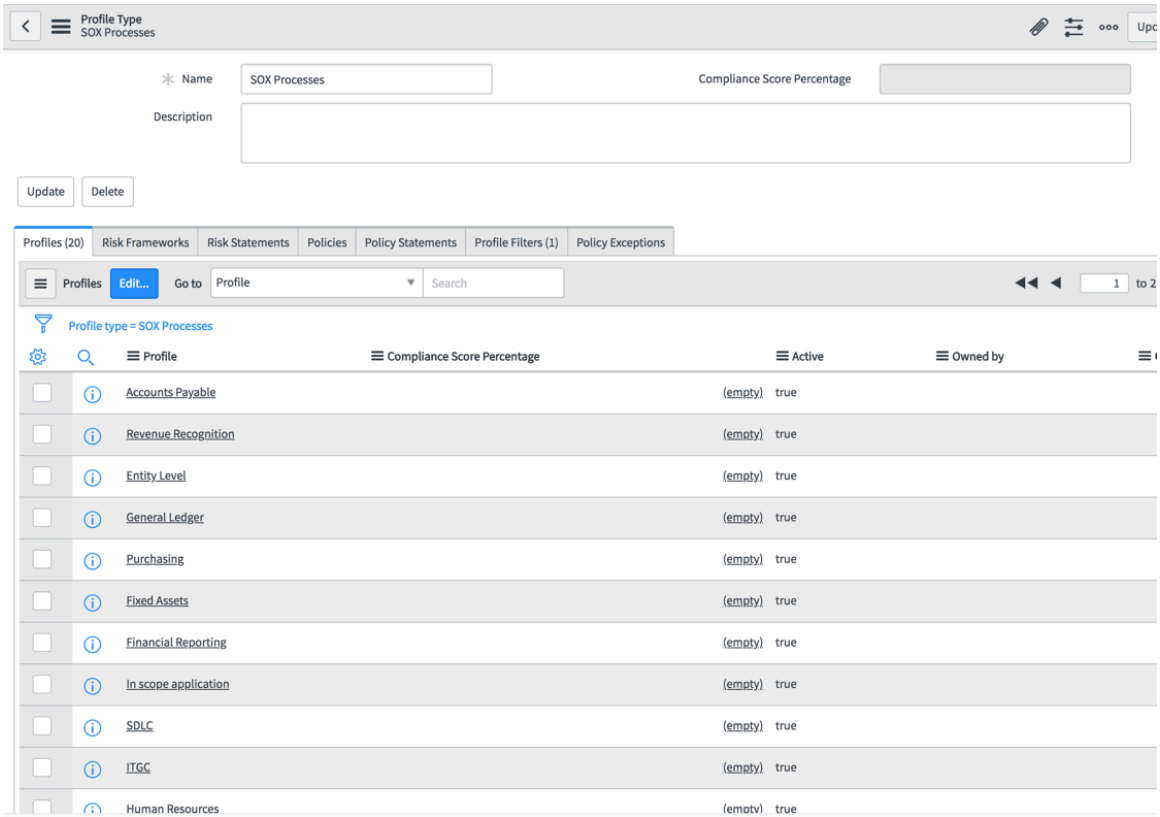
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your app is automatically installed onto your instance.

When uninstalling the app, select the check box to retain the profile types profiles and indicators.

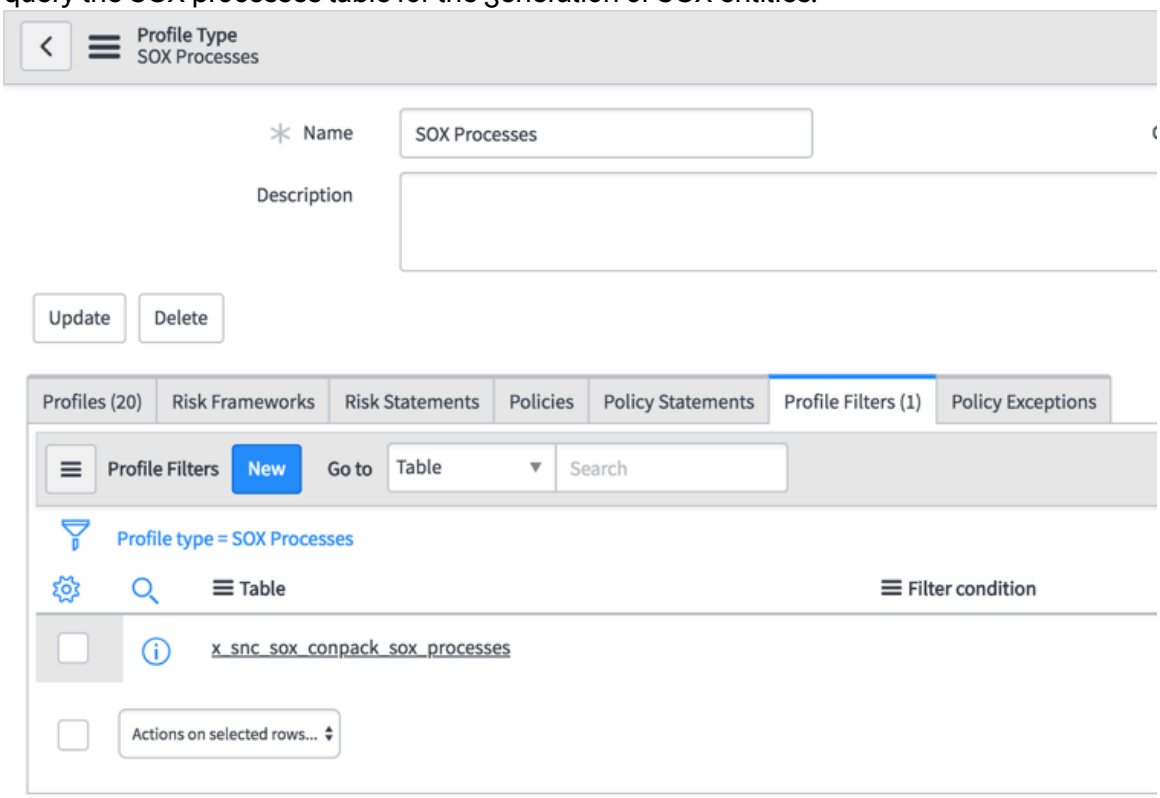
Verify the SOX Content Pack in Policy and Compliance Management

After importing the SOX Content Pack, verify and edit the profile types, profiles, policies, policy statements, controls, policies, indicator templates, and indicators, within the Policy and Compliance Management application.



Before you begin

Role required: Compliance Admin (sn_compliance.admin)



Procedure

1. Navigate to **All** > **Policy and Compliance** > **Scoping** > **Entity Types**.
   A **SOX Processes** entity type is added and is used to generate the SOX profiles:
   - Accounts Receivable
   - Accounts Payable
   - Commissions
   - Equity
   - Entity Level
   - Financial Reporting
   - Fixed Assets
   - General Ledger
   - Human Resources
   - In Scope Application
   - Inventory
   - ITGC
   - Payroll
   - Purchasing
   - Revenue Recognition
   - SAP
   - SDLC
   - Tax
   - Travel and Expense
   - Treasury

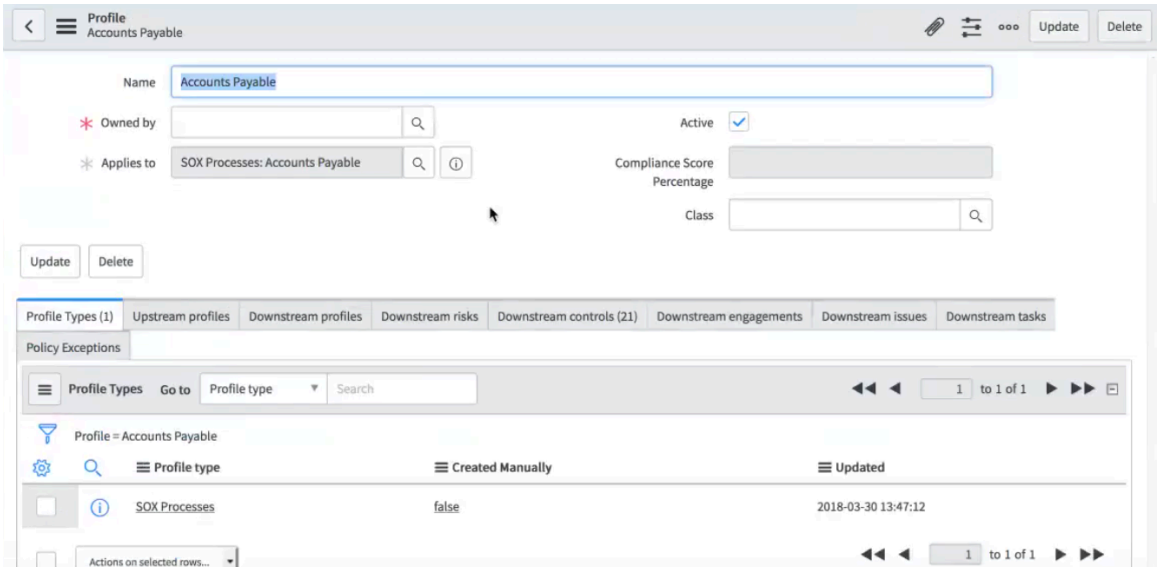
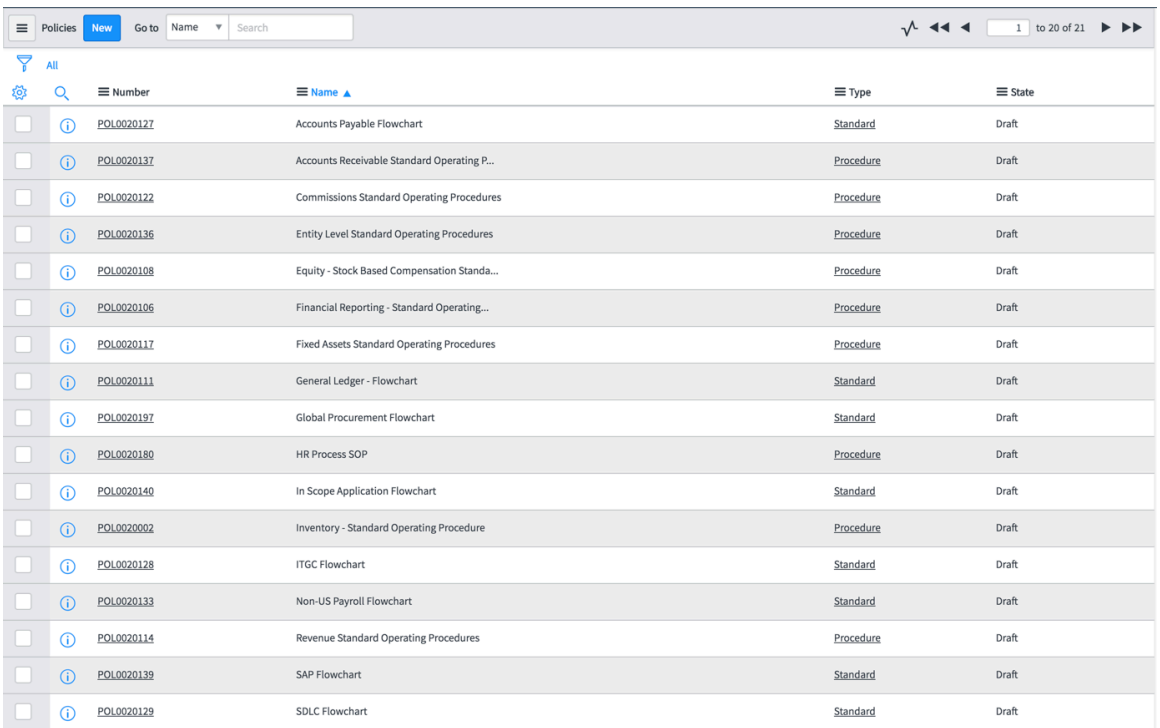
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



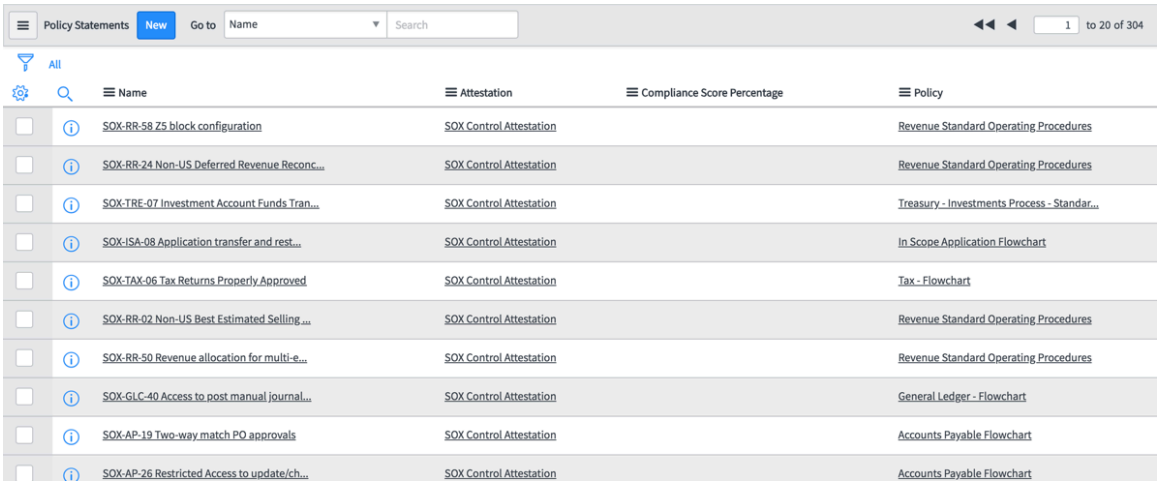
2. If using the Kingston SOX contact pack, under the Entity filters related list, a filter is added to query the SOX processes table for the generation of SOX entities.



3. Open an entity to see all the downstream controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

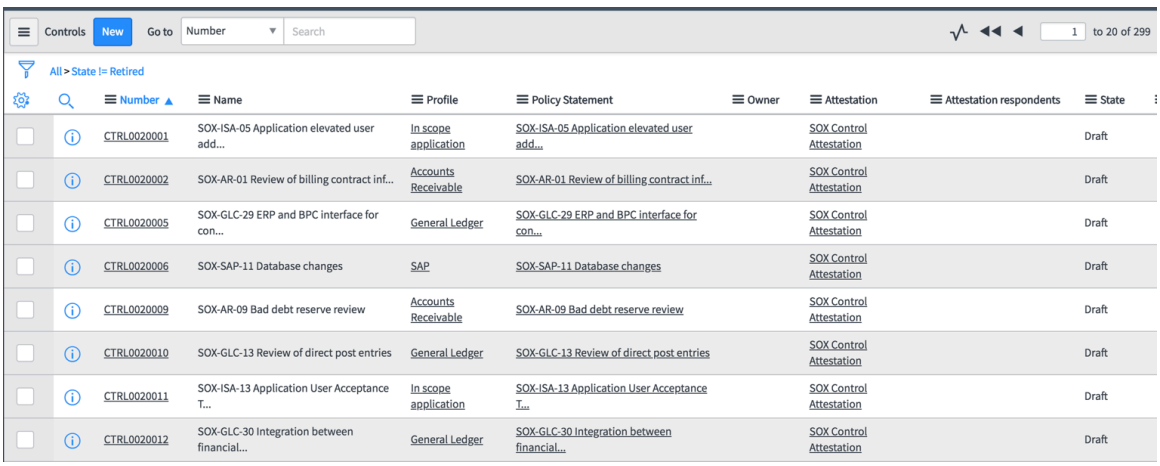
4. Navigate to **Policy and Compliance** > **Policies and Procedures** > **Policies**.
   All SOX policies have been added in the Draft state:
   - Accounts Payable Flowchart
   - Accounts Receivable Standard Operating Procedures
   - Commissions Standard Operating Procedures
   - Entity Level Standard Operating Procedures
   - Equity - Stock Based Compensation Standard Operating Procedures
   - Financial Reporting - Standard Operating Procedure
   - Fixed Assets Standard Operating Procedures
   - General Ledger - Flowchart



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Open a SOX policy record.
   Notice that there is no text in the policy. Create your own policy and initiate the policy lifecycle.
6. Navigate to **Policy and Compliance** > **Policies and Procedures** > **Policy Statements**.
7. In the search bar, enter SOX in the **Name** field.

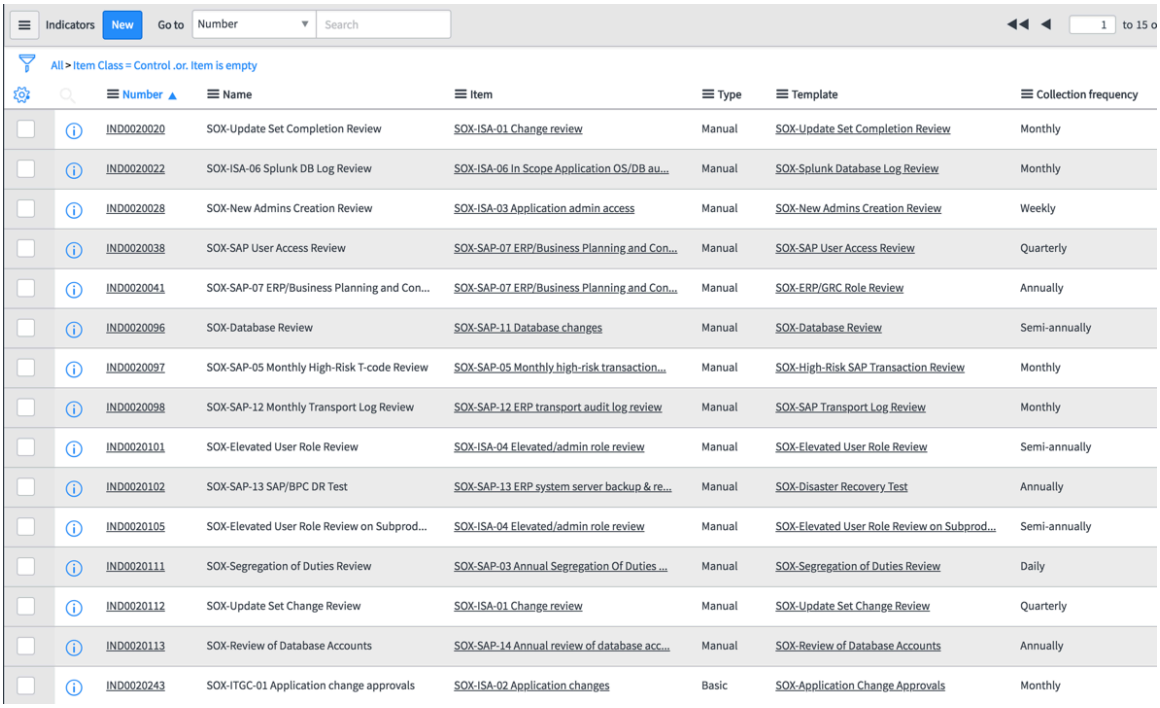
Note:
The names of all SOX-related policy statements begin with **SOX**.



- All the SOX policy statements are created and assigned to SOX policies.
- The SOX Control Attestation is created and added to the policy statement.

8. Navigate to **Policy and Compliance** > **Controls**.
9. In the search bar, enter SOX in the **Name** field.

Note:
The names of all SOX-related controls begin with **SOX**.



- All the SOX controls are created for each entity.
- The SOX Control Attestation is added to all controls with no attestation respondents.

10. Navigate to **Policy and Compliance** > **Indicators**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Under the Profile filters related list, a filter is added to query the SOX processes table for the generation of SOX

profiles.

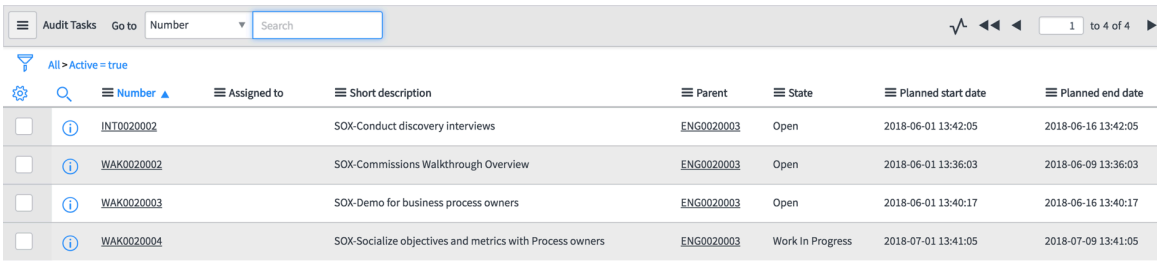
3. Navigate to **Audit** > **All Engagements**.
The **SOX Audit** engagement has been added in the Scope state with the following fields set as empty:
   - **Assigned to**
   - **Auditor**
   - **Approver**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

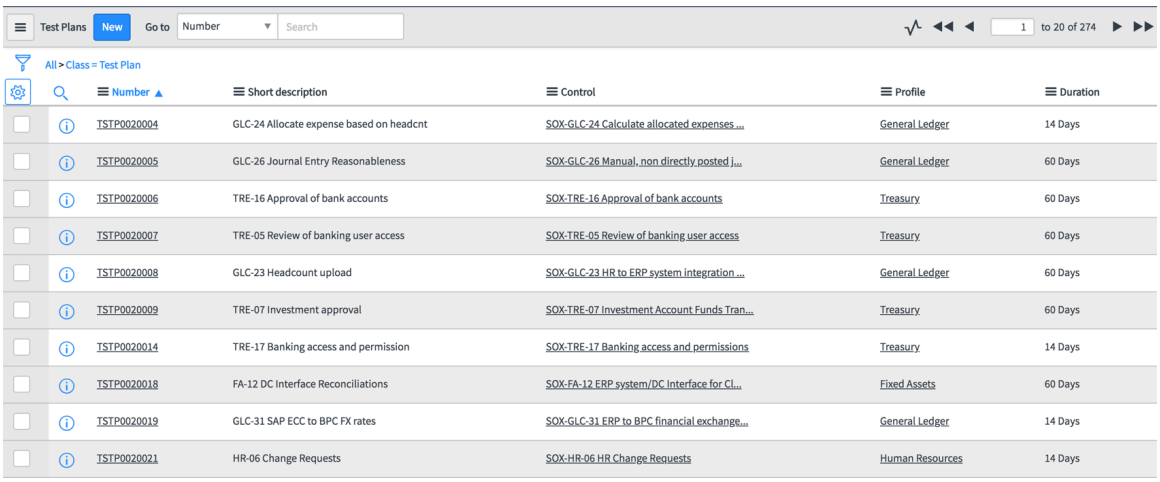


4. Navigate to **Audit** > **All Audit Tasks**.
5. In the search bar, enter SOX in the **Name** field.

   Note:
   The names of all SOX-related audit tasks start with **SOX**.

   The SOX Audit tasks have been added with the following fields:

   - **Type** is interview or walkthrough
   - **Assigned to** is empty
   - **Assigned parent (engagement)** is SOX Audit



6. Navigate to **Audit** > **Audit Testing** > **Test Templates**.
   The SOX test templates have been added and assigned to policy statements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Navigate to **Audit** > **Audit Testing** > **Test Plans**.
   The SOX test plans have been generated for controls based on the test templates.

Result

For information about the SOX Audit Dashboard, see SOX Content Pack dashboard and reports.

SOX Content Pack dashboard and reports

The SOX Content Pack dashboards display multiple SOX reports on a single screen. Various GRC roles have read or edit access to these dashboards.

Policy and Compliance Management roles for SOX

- The Compliance Reader (sn_compliance.reader) can read **SOX Compliance Dashboard** and **SOX Processes**
- Compliance Manager (sn_compliance.manager) can read **SOX Compliance Dashboard**, **SOX Risk Dashboard**, and edit **SOX Processes**
- The Compliance Admin (sn_compliance.admin) can read **SOX Risk Dashboard** and edit **SOX Compliance Dashboard** and **SOX Processes**

- Audit Admin (sn_audit.admin) can read **SOX Compliance Dashboard**, **SOX Risk Dashboard** and edit **SOX Audit Dashboard** and **SOX Processes**

SOX Compliance Dashboard

The SOX Compliance Dashboard displays an overview of all controls, attestations, and control issues. Navigate to **SOX** > **SOX Compliance Dashboard**. The following reports are available:

Compliance Overview

This dashboard shows the compliance overview of SOX policies and controls, and the effect on the entities related to SOX processes. It also shows:

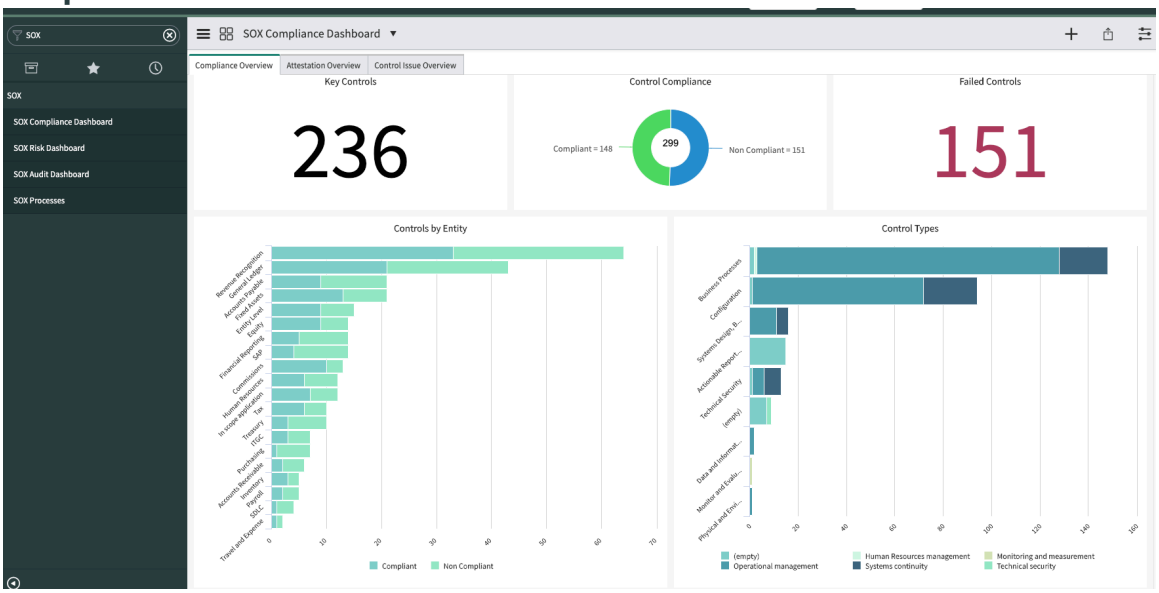
- Key Controls
- Controls by Profile
- Control Compliance
- Controls by type
- Failed Controls
- Control Exceptions

Attestation Overview

This dashboard provides an overview of all the attestations related to SOX controls, and it helps to monitor the status and progress of attestations for the compliance teams to track. It shows:

- Pending Attestations
- Past due Attestations
- Attestations by Profiles
- My Attestations

Issue Overview



This dashboard provides an overview of all issues related to the SOX controls. It shows:

- Issues past due 90 days
- Issues pending 30 to 90 days
- Issues pending 30 days
- Issues due in next 30 days
- Issues by Profile

Governance, Risk, and Compliance integrations

Integrations enhance the ServiceNow® GRC product offering, providing users the ability to integrate with third-party applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the following documentation for the installation, verification, and reporting features of the GRC integrations on the ServiceNow Store.

Unless otherwise noted, each integration requires that you have the ServiceNow GRC products installed and activated on your instance.

GRC integration with Thomson Reuters Regulatory Intelligence

The ServiceNow® Regulatory Change Management application helps you to gather, monitor, and analyze regulatory data and track developments in a complex regulatory environment.

Benefits of integrating with Thomson Reuters Regulatory Intelligence

Use the ServiceNow® GRC integration with Thomson Reuters Regulatory Intelligence application to integrate with the Thomson Reuters platform and to consume the Thomson Reuters Regulatory Intelligence (TRRI) feeds into your ServiceNow instance.

This integration helps you gather, monitor, and analyze regulatory data in a rapidly changing and complex regulatory environment. It enables you to efficiently manage and mitigate risks. GRC integration with Thomson Reuters Regulatory Intelligence involves an additional licensing cost.

Thomson Reuters Regulatory Intelligence Integration (TRRI) delivers regulatory feeds that include various regulatory changes. The Regulatory Change Management application transforms and maps the feeds. The Regulatory Change Management application provides the information in regulatory feed tables.

With the Thomson Reuters guided setup, you can do the following:

- Receive regulatory feeds from the Thomson Reuters platform that are relevant to your organization.
- Transform and map the regulatory taxonomy from the Thomson Reuters platform to your internal regulatory taxonomy.
- Load the transformed data into your ServiceNow instance and manage regulatory changes.

In the guided setup, you can do multiple tasks and subtasks:

- Create a Connection: Create a connection and validate it. The connection is required for integration with the Thomson Reuters platform. Tasks in this step include the following:
  - Create Connection
  - Validate Connection
  - Submit OAuth Credentials
- Activate Integration Flows: Set up a schedule and activate the flows at different times. Run the flows with a time gap, such as a gap of 12 hours between the flows. Tasks in this step include the following:
  - Configure the flow that inserts feed files into the feed registry.
  - Configure the flow that moves processed feeds into the destination directory.
- Create an Internal Taxonomy: Create your taxonomy to categorize and classify the regulatory content. An internal taxonomy can be a multi-hierarchical structure.
- Map an External Taxonomy to an Internal Taxonomy: Map the source taxonomy from the Thomson Reuters platform with the internal taxonomy that you have created.

When setting up the integration, you go through the following stages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Configure feed settings: Configure and set up the feed content, delivery settings, and delivery location in the Thomson Reuters Regulatory Intelligence (TRRI) feeds platform. The delivery location is where the feeds are delivered.
2. Set up a MID Server: The Thomson Reuters platform sends the regulatory feed files to the SFTP server that's configured on the Thomson Reuters portal. An administrator should set up a MID Server with SSH capabilities for the GRC integration with Thomson Reuters Regulatory Intelligence application.

   The MID Server ingests the feed file data from the SFTP server into the ServiceNow instance. The MID Server runs as a Windows service or as a UNIX daemon to facilitate communication between an instance and the external applications.
3. Set up SFTP connection: The Thomson Reuters platform deposits the regulatory feed files at an SFTP location that is configured in the Thomson Reuters platform portal. Create an SFTP connection and import the feed files into your ServiceNow instance. To learn more, see Establish an SFTP or REST API connection.

Import sets enable administrators to import data from various data sources, and then map that data into ServiceNow tables.

Bringing series data from Thomson Reuters into the Regulatory Change Management application

The Documents in Series related list enables you to track the development of a regulatory change from the proposed stage to the final stage. You can see related events in a single place. In the Regulatory Feed form, the series name, and the regulatory events that are part of the Thomson Reuters series are displayed. You can view the Thomson Reuters series data in the Series Data section in the Regulatory Feed form. The series name and the sequence number of the feed are displayed under the Series Data section in the Regulatory Feed form. This section helps you to get more context on the regulatory events and to make decisions regarding the applicability of the events.

The Regulatory Feed table appears in the Series Data section in the Regulatory Feed form. The following new columns are added to the Regulatory Feed table for the Thomson Reuters series data:

- Series Name: Displays the series name of the regulatory event.
- Sequence Number: Displays the sequence number of the regulatory event.
- Series ID: Displays the series identification number of the regulatory event. You can select the series ID from the list view. The series ID is then displayed.

The Documents in Series related list is part of the regulatory feed form. It displays the following details on the feed:

- Number: The number of the regulatory feed as received from Thomson Reuters. For example, REG0001023.
- Title: The title of the regulatory feed as received from Thomson Reuters. For example, CFPB-2019-0021 Home Mortgage Disclosure (Regulation C).
- Sequence Number: The sequence number of the regulatory feed as received from Thomson Reuters. For example, sequence number 7. If you have all the data, then the prior six events are displayed in the related list and the seventh event in the series is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Series Data section and the Documents in Series related list are displayed in the Regulatory Feed form only if the feed type is regulatory event and the source of the regulatory feed is Thomson Reuters.

The regulatory data that is received from the Thomson Reuters platform is processed and brought into the staging tables in a ServiceNow instance.

Actions to automate the integration tasks

The GRC integration with Thomson Reuters Regulatory Intelligence application provides the following actions to automate the Thomson Reuters integration tasks:

- Get the related source documents for the regulatory events.
- Get the Thomson Reuters platform to feed file names from the SFTP source path.
- Move the files processed by the Thomson Reuters platform to the destination path.
- Trigger the scheduled import job in the Thomson Reuters platform after getting the file names from the SFTP server.
- Validate the path and credentials for the new SFTP connection.

The instructions for automation are covered in detail in the guided setup files that are sent with the software.

Install the GRC integration with Thomson Reuters Regulatory Intelligence application

Install the GRC integration with Thomson Reuters Regulatory Intelligence application (com.sn_grc_int_tr). The application includes demo data. It installs related ServiceNow Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

The GRC integration with Thomson Reuters Regulatory Intelligence requires the ServiceNow® Regulatory Change Management application from the ServiceNow Store. Ensure that this application is installed before you install the GRC integration with Thomson Reuters Regulatory Intelligence application.

Role required: sn_grc_reg_change.admin

About this task

The following items are installed with the GRC integration with Thomson Reuters Regulatory Intelligence application:

- Store applications
- Scheduled jobs
- Tables

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the GRC integration with Thomson Reuters Regulatory Intelligence application (com.sn_grc_int_tr) by using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the application by its name or ID. If you cannot find the application, then you might have to request it from the ServiceNow Store.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, then you must install them before you can install the GRC integration with Thomson Reuters Regulatory Intelligence application.

4. Select **Install**.

Establish an SFTP or REST API connection

Establish an SFTP or REST API connection for the GRC integration with Thomson Reuters Regulatory Intelligence application. You can create an SFTP or REST API connection with the SFTP server by using the Connection & Credential aliases that are shipped with the Thomson Reuters platform.

Before you begin

Role required: sn_grc_reg_change.admin

About this task

Thomson Reuters deposits the regulatory feed files at the SFTP location that is configured in Thomson Reuters portal. To import the feed files from the SFTP location into the ServiceNow instance, you can create a connection with this SFTP server.

Procedure

1. Navigate to **All** > **Regulatory Change Management** > **Thomson Reuters** > **Connection & Credential Aliases**.
   The following two Connection & Credential aliases are shipped with the Thomson Reuters platform:
   - The Thomson Reuters platform REST API
   - The Thomson Reuters platform SFTP
2. In either the Thomson Reuters platform REST API alias or the Thomson Reuters platform SFTP alias, select the **Create New Connection & Credential** related link.
   You can create a connection with either the REST alias or the SFTP alias, but not both. The details to be provided in the SFTP alias and the REST alias are different from each other.
   When you enter the details in the Create Connection & Credential alias form, a new connection is created.
3. On the form, fill in the fields.
   - If you selected the Create Connection & Credential SFTP alias form, then fill in the following fields.

Create Connection & Credential SFTP alias form

Field	Description
Connection information	
Name	Name of the SFTP connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Host	Information about the SFTP server host.
Port	Port number of the SFTP server.
Credential information	
Name	Credential name that is used to access the SFTP server.
User Name	User name that is used to access the SFTP server.
Password	Password that is used to access the SFTP server.
Post processing information	
Source path	Location of the directory that contains the regulatory feed files.
Destination path	Location of the directory where the successfully imported files are placed.

- If you selected the Create Connection & Credential REST alias form, then fill in the following fields.

Create Connection & Credential REST alias form

Field	Description
Credential information	
OAuth client ID	Client ID of the application that is registered in the third-party OAuth OIDC server.
OAuth client secret	Client secret ID of the application that is registered in the third-party OAuth OIDC server.

4. Depending on your previous step, select either **Create** in the SFTP alias form or select **Create and Get OAuth Token** in the REST alias form.
   The File Connection Information record is created.

Result

When a new connection is established, a file connection information record is created in the instance. After the file connection information record is created, you can no longer create more file connection information records by selecting **New** in the Connections related list.

Modules in the GRC integration with Thomson Reuters Regulatory Intelligence application

The GRC integration with Thomson Reuters Regulatory Intelligence application includes various modules.

The following modules are displayed under the GRC integration with Thomson Reuters Regulatory Intelligence application:

Modules in the application

Module	Description
Thomson Reuters Guided Setup	Instructions to configure and set up the application.
Connection & Credential Aliases	Connection and credential aliases for SFTP and for OAuth.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Modules in the application (continued)

Module	Description
Connections	File connection information record from the Thomson Reuters platform. Click Validate to validate the connection. In case you encounter any issues in validating the connection, triage it using an integration log. If you do not want to use a connection, you can move it to the Draft state by clicking **Move to draft**. In the integration, the system uses only the file connection information record that has the Validated state.
OAuth Registry Entry	Record of when the OAuth connection and credential are created via the shipped connection and credential alias.
OAuth Credentials	Record of when the OAuth credentials are created.
Feed Registry	Record for each of the feed files that are located in the source directory of the SFTP location.
Integration Logs	Integration logs with integration details. The log contains errors that occurred in the integration flows, such as, errors that were observed while validating a connection.
Data source	Data source that ingests the feed files from the SFTP location and creates a record automatically in the regulatory feed table.
Scheduled Import	Scheduled import job that scans and searches for the oldest entry in the feed registry.
Taxonomy XML Configuration	Record that is shipped as part of the Thomson Reuters platform. Contains the XPaths and attributes that are required to parse the uploaded Thomson Reuters platform taxonomy file in XML format.
TR | Regulatory Bodies	External Regulatory Bodies taxonomy records for the Thomson Reuters platform.
TR | Content Types	External Content Types taxonomy records for the Thomson Reuters platform.
TR | Jurisdictions	External Jurisdictions taxonomy records for the Thomson Reuters platform.
TR | Themes	External Themes taxonomy records for the Thomson Reuters platform.
TR | Sectors	View the external Sectors taxonomy records for the Thomson Reuters platform.
Taxonomy Mapper	Mapping of the Thomson Reuters platform taxonomy to internal taxonomy.

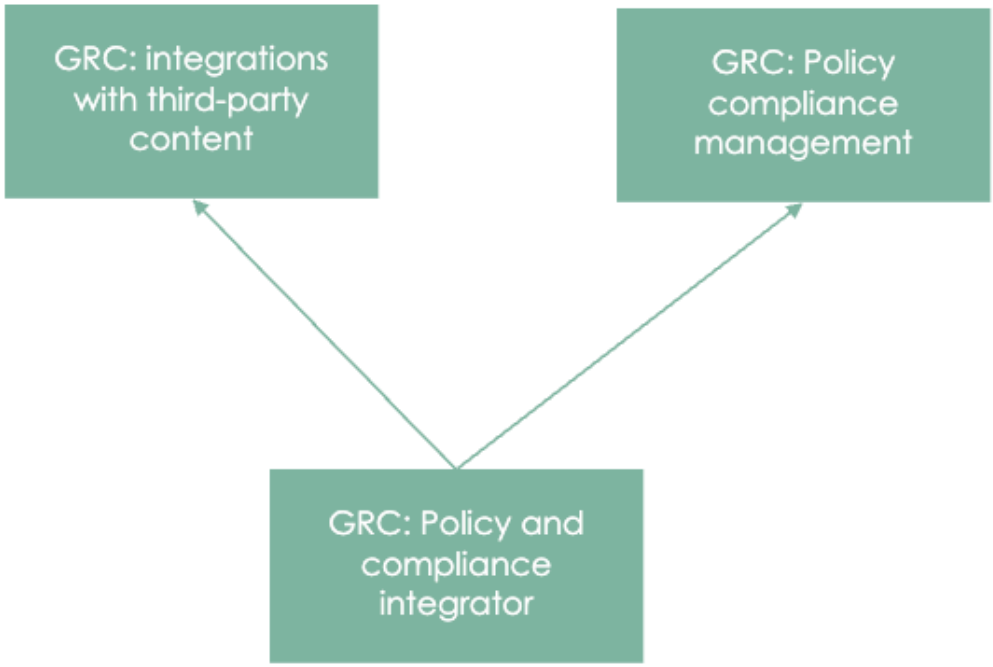
The data that is accessed through the application modules is stored in the following tables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables for storing application data

Table	Field
sn_grc_reg_change_external_theme	External Regulatory Theme
sn_grc_reg_change_external_regulatory_body	External Regulatory Body
sn_grc_reg_change_external_sector	External Regulatory Sector
sn_grc_reg_change_external_content_type	External Regulatory Content Type
sn_grc_reg_change_external_jurisdiction	External Regulatory Jurisdiction
sn_grc_reg_change_ theme	Regulatory Theme
sn_grc_reg_change_ regulatory_body	Regulatory Body
sn_grc_reg_change_sector	Regulatory Sector
sn_grc_reg_change_ content_type	Regulatory Content Type
sn_grc_reg_change_ jurisdiction	Regulatory Jurisdiction

GRC: integrations with third-party content



The GRC: integrations with third-party content application helps you to standardize the content integration process across various GRC applications by providing a common framework for your content providers.

In Xanadu, you can use the GRC: integrations with third-party content application with the GRC: Policy and Compliance integrator application. The GRC: Policy and Compliance integrator application provides the options that enable you to review, approve, and import the data into the Policy and Compliance Management tables.

You can install the GRC: integrations with third-party content application separately from the ServiceNow Store. When you download the GRC: Policy and Compliance integrator application from the ServiceNow Store, the GRC: integrations with third-party content application is downloaded automatically in your instance as shown in the following diagram.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC: Policy and Compliance integrator application download structure

Note:
The GRC: integrations with third-party content application is not visible in the application navigator in an instance.

When the GRC: integrations with third-party content and GRC: Policy and Compliance integrator applications are downloaded in your instance, a user with the sn_grc_cim.admin role can execute the tasks that are related to the application workflow.

For more information on the user roles, see User roles for the integration process and Create a user with the sn_grc_cim.admin role.

User roles for the integration process

You must assign the user roles that are required for the overall integration process that is associated with the GRC: integrations with third-party content and GRC: Policy and Compliance integrator applications.

You can assign the following roles with the GRC: integrations with third-party content and GRC: Policy and Compliance integrator applications.

User roles

Role titles	Description
sn_grc_cim.admin	As a user with the sn_grc_cim.admin role, you can access the APIs and the tables in the GRC: integrations with third-party content application.
sn_grc_cim.manager	As a user with the sn_grc_cim.manager role, you have read and write access to the tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles (continued)

Role titles	Description
	in the GRC: integrations with third-party content application.
sn_compliance.manager	The sn_compliance.manager role inherits the sn_grc_cim.manager role. As a user with the sn_compliance.manager role, you have read and write access to the tables in the GRC: Policy and Compliance Management application.
sn_compliance.admin	The sn_compliance.admin role inherits the sn_grc_cim.admin role. As a user with the sn_compliance.admin role, you can access the tables in the GRC: Policy and Compliance Management application.

Create a user with the sn_grc_cim.admin role

Create a user with the sn_grc_cim.admin role to perform the tasks that are related to the content integration and import process.

Before you begin

Note:
Ensure that you have installed the GRC: integrations with third-party content application in your instance. For more information, see GRC: integrations with third-party content.

Role required: sn_grc_cim.admin, sn_compliance.admin

Procedure

1. Log in to an instance with the sn_compliance.admin role and assign the sn_grc_cim.admin role to a user.

   Note:
   The sn_compliance.manager role inherits the sn_grc_cim.manager role. Similarly, the sn_compliance.admin role inherits the sn_grc_cim.admin role.

   As a user with the sn_grc_cim.admin role, you can access all the APIs that are required to insert the records into the GRC: integrations with third-party content application. As a user with the sn_grc_cim.manager role, you have the write access to the tables of the GRC: integrations with third-party content application.

2. Navigate to the GRC: Policy and Compliance integrator application in an instance to execute the workflow.
   For the next steps that you must do in the GRC: Policy and Compliance integrator application workflow, see Workflow for GRC: Policy and Compliance integrator.

Standardized Information Gathering (SIG) Questionnaire Integration

The Shared Assessments Standardized Information Gathering Questionnaire (SIG) is used to obtain required assessment documentation from a third party. The third party contact can upload a pre-filled SIG spreadsheet or take a form-based questionnaire that gets imported to the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC: SIG Questionnaire Integration version 20.1.x has SIG templates for 2025, 2024, 2023, 2022, and 2021. If a vendor uploads a version prior to the 2021 SIG, all responses for matching questions are imported and any responses for questions that don't match are imported with empty responses for the vendor to answer later.

Install the GRC: SIG Questionnaire Integration

The GRC: SIG Questionnaire Integration plugin installs the SIG questionnaire templates for use with the GRC: Third-party Risk Management application.

Before you begin

Role required: sn_vdr_risk.admin, admin
Complete the following setup checklist prior to installation. These setup tasks are required for a smooth installation.

Setup task	Description
Verify that the ServiceNow plugins are activated.	Activate the Third-party Risk Management (com.sn_vdr_risk_asmt) plugin. To verify that this plugin is activated, navigate to **Subscription Management** > **Subscriptions** in your instance. The list displays the subscriptions that your organization has purchased. For more information, see Configuring Third-party Risk Management and the instructions for activating an entitled GRC application from the ServiceNow® Store: Activate an entitled GRC ServiceNow Store application and Download a GRC application from the ServiceNow Store for the first time.

Procedure

1. Log in to the instance you want to install the application on.
2. Navigate to **System Applications** > **All Available Applications** > **All**.
   A list of apps available for installation is displayed.
3. Locate the app, select it, and select **Install**.
   The app installs GRC: Third-party Risk Management (com.sn_vdr_risk_asmt) plugin and GRC SIG Questionnaire Integration (com.sn_sig_asmt) plugin.

Note:
When uninstalling the app, select the check box to retain the profile types profiles and indicators.

Verify the SIG Questionnaire Integration in Third-party Risk Management

After installing SIG Questionnaire Integration, verify that the SIG questionnaire templates are available within the Third-party Risk Management application.

Before you begin

Role required: Third-party Risk Manager (sn_vdr_risk_asmt.vendor_risk_manager)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Third-party Risk Management** > **Assessment Setup** > **Questionnaire Templates**.
2. Confirm the following questionnaires are available.
   - SIG Full 2025, 2024, 2023, 2022, and 2021
   - SIG Core 2025, 2024, 2023, 2022, and 2021
   - SIG Lite 2025, 2024, 2023, 2022, and 2021

Governance, Risk, and Compliance use case accelerators

Use case accelerators may include pre-defined scopes, specific policies, controls, risks, audit, test plans, dashboards, and reports that provides customers an operational head-start when adopting various regulations and frameworks.

Use the following documentation for the installation, verification, and reporting features of the GRC use case accelerators on the ServiceNow Store.

Unless otherwise noted, each use case accelerator requires that you have the ServiceNow GRC products installed and activated on your instance.

Cyber Risk Institute accelerator

The Cyber Risk Institute (CRI) is focused to collaborate with the financial sectors and regulators to streamline standardization across risk management. For better cyber compliance management, CRI provides a CRI Profile with the financial sector consensus.

The CRI framework profile aligns with NIST CSF v2.0. The CRI profile and assessments assist you in implementing the CRI framework to enhance cyber compliance management. This framework includes detailed diagnostic statements such as control objectives aligned with NIST CSF 2.0 that map to the financial services regulatory references such as financial services citations from FFIEC CAT and others.

As part of the Cyber Risk Institute's (CRI) Accelerator, you can:

- Import a CRI profile containing relevant authority documents, citations, and control objectives based on NIST CSF.
- Streamline the compliance process with automated tiering and selection of CRI assessments, conducted using the smart assessment engine.
- Create controls automatically based on tier and generate a compliance score from the CRI assessment responses, which roll up to the entity level.

For more information, see:

- Perform CRI tiering questionnaire to determine the tier value of entity.
- Verify the NIST CSF Use Case Accelerator.

Cybersecurity Controls Accelerator

The Cybersecurity Controls Accelerator™ enables users to easily adopt the CIS Controls from The Center for internet Security™ to enhance their overall security preparedness and cyber-defense posture.

CIS Control adoption is further enhanced by targeting the leading cybersecurity methodologies to the user's maturity and readiness level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Cybersecurity Controls Accelerator contains the CIS Controls version 7.1 authority document, 191 associated CIS citations, and 191 CIS control objectives that are related to the citations.

The Technology Controls Monitoring Accelerator application (com.sn_grc_infosec), which must also be downloaded to use the Cybersecurity Controls Accelerator, includes 171 (26 basic) predefined indicator templates that are mapped to the CIS Controls. These indicator templates provide automated control validation and continuous monitoring.

Support for CIS Controls™ v8

Beginning with the Xanadu release, Cybersecurity Controls Accelerator supports CIS Controls™ v8 authority documents, citations, and control objectives that are related to the citations.

Content for CSA CCM v4.0

Beginning with the Xanadu release, Cybersecurity Controls Accelerator supports the Cloud Security Alliance Cloud Controls Matrix (CSA CCM v4.0) content such as Authority Document, Citations, and Control Objectives.

Download the Cybersecurity Controls Accelerator

Before you run the GRC: Cybersecurity Controls Accelerator application in your instance, you must download it from the ServiceNow Store.

Before you begin

Prior to running the Cybersecurity Controls Accelerator application, you must download and activate the following GRC applications:

- GRC: Policy and Compliance Management
- GRC: Profiles
- GRC: Technology Controls Monitoring Accelerator

Role required: admin

Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Monitoring cybersecurity controls

After you have accessed the Cybersecurity Controls Accelerator, you can monitor the controls using these modules.

Cybersecurity Controls Accelerator modules

Application/ Module	Description
CIS Controls	
Authority Documents	The **Authority Documents** module provides a list of authority documents, including the CIS Controls v7.1 and v8 authority documents. The authority documents include references to citations and control objectives. The authority documents are stored in the Authority Document table [sn_compliance_authority_document].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cybersecurity Controls Accelerator modules (continued)

Application/ Module	Description
Citations	The **Citations** module provides a list of citations contained in the CIS Controls v7.1 and v8 authority document. Each citation can include one or more control objectives and refers to: • Content references • Information objects The citations are stored in the Citation table [sn_compliance_citation].
Control Objectives	The **Control Objectives** module provides a list of control objectives associated with the citations in the CIS Controls v7.1 and v8 authority document. Each control objective can include one or more of the following items: • Entity types • Additional entities • Policies • Controls • Indicator Templates • Policy Exceptions • Issues • Risk statements • Content references The control objectives are stored in the Control Objective table [sn_compliance_policy_statement]
Indicator Templates	The **Indicator Templates** module provides a list of predefined indicator templates that are mapped to the CIS Controls. The indicator templates automate control validation and provide continuous monitoring. Indicator Template Reference to Content [sn_grc_m2m_ind_temp_cont]

As previously mentioned, the Technology Controls Monitoring Accelerator application (com.sn_grc_infosec) is a dependant application when you download the Cybersecurity Controls Accelerator application. The Technology Controls Monitoring Accelerator application provides predefined indicator templates that are mapped to the CIS Controls.

Note:
Should you decide not to implement the Cybersecurity Controls Accelerator application, you can still use the Technology Controls Monitoring Accelerator to validate compliance with CIS and ISO 27002 via the Unified Compliance Framework (UCF) from the Policy and Compliance Management application. For more information, see Technology Controls Monitoring Accelerator.

UCF controls mapped to indicator templates

If you use the CIS or ISO authority documents imported from UCF, you can still manage compliance activities using the 285 (171 CIS and 114 ISO) automatically monitored indicator templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The 171 indicator templates are mapped to the 171 CIS control objectives provided with the Cybersecurity Controls Accelerator application.

Note:
the information in the 26 basic indicator templates is drawn from various ServiceNow ITx applications, as shown in the following example.

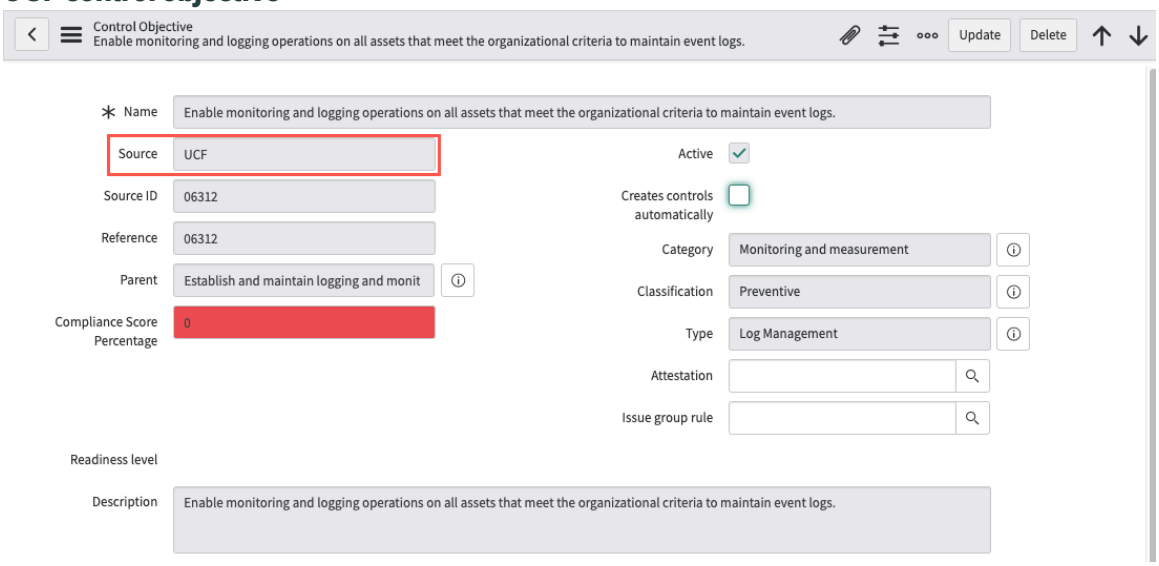
Basic indicator templates for CIS Controls

CIS Control	Description	ITx Source applications
CIS Control 1.1	Utilize an active discovery tool to identify devices connected to the organization's network and update the hardware asset inventory.	Discovery
CIS Control 1.2	Utilize a passive discovery tool to identify devices connected to the organization's network and automatically update the organization's hardware asset inventory.	Discovery
CIS Control 1.4	Maintain an accurate and up-to-date inventory of all technology assets with the potential to store or process information. This inventory shall include all hardware assets, whether connected to the organization's network or not.	Discovery
CIS Control 1.5	Ensure that the hardware asset inventory records the network address, hardware address, machine name, data asset owner, and department for each asset and whether the hardware asset has been approved to connect to the network.	Discovery
CIS Control 1.6	Ensure that unauthorized assets are either removed from the network, quarantined, or the inventory is updated in a timely manner.	Discovery
CIS Control 1.7	Utilize port level access control, following 802.1x standards, to control which devices can authenticate to the network. The authentication system shall be tied into the hardware asset inventory data to ensure only authorized devices can connect to the network.	Discovery
CIS Control 1.8	Use client certificates to authenticate hardware assets connecting to the organization's trusted network.	Discovery
CIS Control 2.1	Maintain an up-to-date list of all authorized software that is required in the enterprise for any business purpose on any business system.	Software Asset Management
CIS Control 2.2	Ensure that only software applications or operating systems currently supported by the software's vendor are added to the organization's authorized software inventory. Unsupported software should be tagged as unsupported in the inventory system.	Software Asset Management
CIS Control 2.3	Utilize software inventory tools throughout the organization to automate the documentation of all software on business systems.	Software Asset Management
CIS Control 2.4	The software inventory system should track the name, version, publisher, and installation date for all software, including operating systems authorized by the organization.	Software Asset Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic indicator templates for CIS Controls (continued)

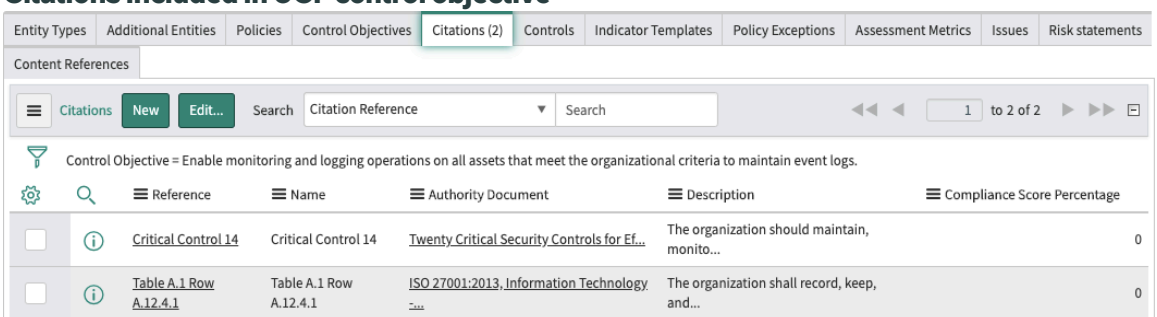
CIS Control	Description	ITx Source applications
CIS Control 2.5	The software inventory system should be tied into the hardware asset inventory so all devices and associated software are tracked from a single location.	CMDB
CIS Control 3.1	Utilize an up-to-date SCAP-compliant vulnerability scanning tool to automatically scan all systems on the network on a weekly or more frequent basis to identify all potential vulnerabilities on the organization's systems.	Vulnerability Response
CIS Control 3.2	Perform authenticated vulnerability scanning with agents running locally on each system or with remote scanners that are configured with elevated rights on the system being tested.	Vulnerability Response
CIS Control 3.6	Regularly compare the results from back-to-back vulnerability scans to verify that vulnerabilities have been remediated in a timely manner.	Vulnerability Response
CIS Control 3.7	Utilize a risk-rating process to prioritize the remediation of discovered vulnerabilities.	Vulnerability Response
CIS Control 15.1	Maintain an inventory of authorized wireless access points connected to the wired network.	CMDB
CIS Control 16.1	Maintain an inventory of each of the organization's authentication systems, including those located onsite or at a remote service provider.	CMDB
CIS Control 18.5	Use only standardized and extensively reviewed encryption algorithms.	Discovery
CIS Control 18.8	Establish a process to accept and address reports of software vulnerabilities, including providing a means for external entities to contact your security group.	Vulnerability Response
CIS Control 19.1	Ensure that there are written incident response plans that defines roles of personnel as well as phases of incident handling/management.	Security Incident Response
CIS Control 19.2	Assign job titles and duties for handling computer and network incidents to specific individuals and ensure tracking and documentation throughout the incident through resolution.	Security Incident Response
CIS Control 19.3	Designate management personnel, as well as backups, who will support the incident handling process by acting in key decision-making roles.	Security Incident Response
CIS Control 19.4	Devise organization-wide standards for the time required for system administrators and other workforce members to report anomalous events to the incident handling team, the mechanisms for such reporting, and the kind of information that should be included in the incident notification.	Security Incident Response



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic indicator templates for CIS Controls (continued)

CIS Control	Description	ITx Source applications
CIS Control 19.6	Publish information for all workforce members, regarding reporting computer anomalies and incidents to the incident handling team. Such information should be included in routine employee awareness activities.	Security Incident Response
CIS Control 19.8	Create an incident scoring and prioritization schema based on known or potential impact to your organization. Utilize score to define frequency of status updates and escalation procedures.	Security Incident Response

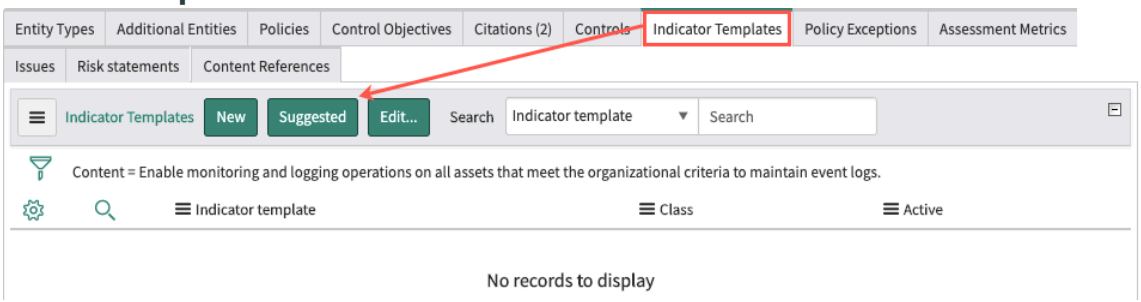


Control objectives that are downloaded from UCF have UCF as the source, as shown below.

UCF control objective

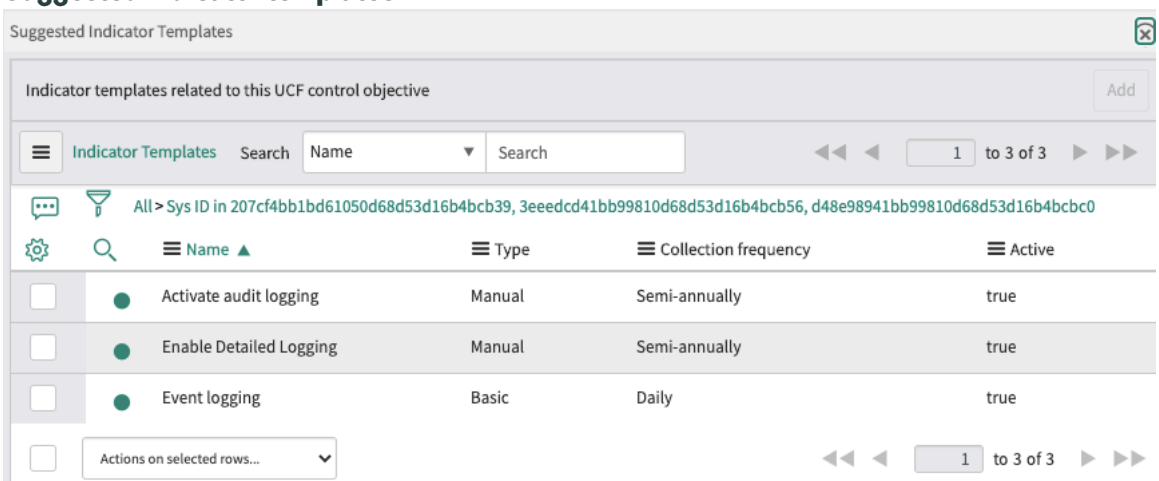
If you click the **Citations** related list, you can see that two citations are present: one obtained from CIS and one from ISO 27001 authority documents from UCF.

Citations included in UCF control objective



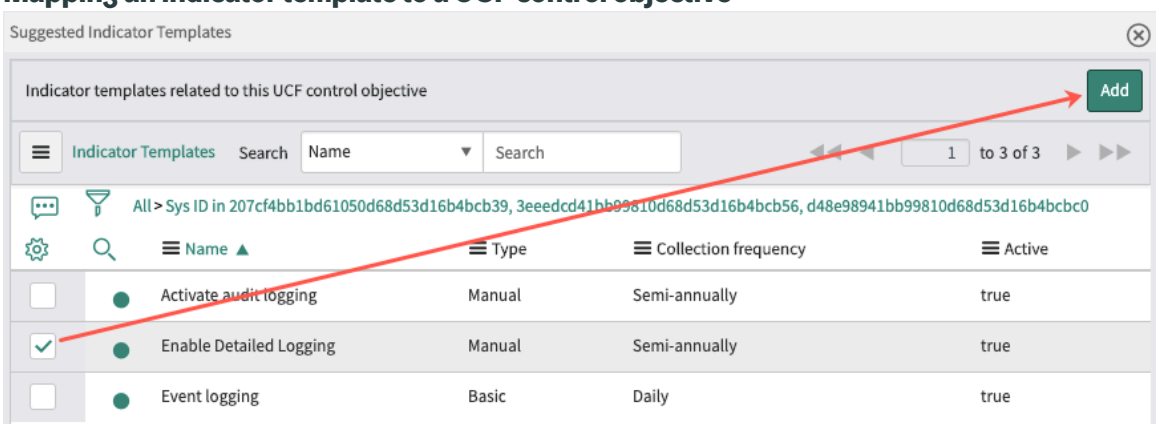
These citations allow you to use the CIS controls downloaded from UCF, instead of the CIS Controls included with the Cybersecurity Controls Accelerator application while still associating the controls with the indicator templates provided.

If you want to associate this UCF control objective to similar indicator templates, you can click the **Indicator Templates** related list and then click the **Suggested** button.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicator Templates related list



A list of indicator templates that may apply to the selected control objective are shown.

Suggested indicator templates

Select the indicator templates you want to map to the UCF control objective and click **Add**.

Mapping an indicator template to a UCF control objective

NIST CSF Use Case Accelerator

The NIST CSF Use Case Accelerator gives customers an operational head-start when adopting the NIST CSF. When the accelerator is downloaded and activated in the GRC applications, pre-configured policies, scopes (profiles, profile type recommendations), indicators, risks, and other GRC elements appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Who uses the NIST CSF Use Case Accelerator

Persona	Description
Risk executive	Ensures that risks are identified and managed consistently across the organization. Defined access to the following sections: • **NIST CSF** > **Overview** • **NIST CSF** > **Framework Core** • **NIST CSF** > **Framework Profiling** • **NIST CSF** > **Content**
Security officer	Addresses gaps, non-compliant controls, risks, issues, failed indicators, and action plans for the organizations cybersecurity. Defined access to the following sections: • **NIST CSF** > **Framework Core** • **NIST CSF** > **Framework Profiling**
Control provider	Helps build a library of cybersecurity controls for the organization. Defined access to the following sections: • **NIST CSF** > **Framework Core** • **NIST CSF** > **Content**
Sys admin	Access to the following sections: **NIST CSF** > **Administration**
GRC admin	Access to the following sections: **NIST CSF** > **Administration**

Install the NIST CSF Use Case Accelerator

The NIST Cybersecurity Framework (CSF) Use Case Accelerator is used with the GRC core applications: Policy and Compliance Management, Risk Management, and Audit Management applications.

Before you begin

Role required: none. Complete the following setup checklist prior to installation. These setup tasks are required for a smooth installation.

Setup task	Description
Verify that the following applications have been installed:	To verify that these applications are activated, navigate to **Subscription Management** >

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup task	Description
• Policy and Compliance Management • Risk Management • Audit Management	**Subscriptions** in your instance. The list displays the subscriptions your organization has purchased.

Verify that you have the required roles.	The System Admin (admin) assigns the following roles:
	• Policy and Compliance Management roles
	  ○ Attestation Creator (sn_compliance.attestation_creator)
	  ○ Compliance Administrator (sn_compliance.admin)
	  ○ Compliance Developer (sn_compliance.developer)
	  ○ Compliance Manager (sn_compliance.manager)
	  ○ Compliance Reader (sn_compliance.reader)
	  ○ Compliance User (sn_compliance.user)
	• Risk Management roles
	  ○ Risk Admin (sn.risk.admin)
	  ○ Risk Reader (sn.risk.reader)
	  ○ Risk Manager (sn.risk.manager)
	  ○ Risk User (sn.risk.reader)
	• Audit Management roles
	  ○ Audit Admin (sn_audit.admin)
	  ○ Audit Developer (sn_audit.developer)
	  ○ Audit Manager (sn_audit.manager)
	  ○ Audit User (sn_audit.user)
	  ○ External Auditor (sn_audit.external_auditor)

Procedure

1. Log in to the instance you want to install the application on.
2. Navigate to **System Applications** > **All Available Applications** > **All**.
3. Locate the **GRC: NIST CSF Accelerator** application.
4. If you want to load demo data, select the **Demo Data** check box.
5. Click **Install**.

Verify the NIST CSF Use Case Accelerator

After installing the GRC: NIST Cybersecurity Framework (CSF) Use Case Accelerator, review the NIST CSF application structure, core content, and demo data, if selected during installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **User Administration** > **Roles** and review the roles installed with the NIST CSF application.

   These roles contain nist_csf in their names; for example, sn_irm_nist_csf.security_officer. The roles are associated with NIST CSF application modules to provide access based on the user's role.

   Note:
   The basic NIST CSF user role is needed to access the application. This role contains the reader or user roles from the ServiceNow® GRC suite of applications.

2. In the Application Navigator, type **NIST CSF**, and verify the application core content.

Navigate to	Verify
NIST CSF > **Content** > **Authority Documents**	Review the Authority Documents installed for NIST CSF.
NIST CSF > **Content** > **Citations**	Review the Citations installed for NIST CSF.
NIST CSF > **Content** > **Control Objectives**	Review the Control objectives installed for NIST CSF.
NIST CSF > **Content** > **Risk Statements**	Review the Risk Frameworks and Risk Statements installed for NIST CSF.
NIST CSF > **Content** > **Test Templates**	Review the Test Templates installed for NIST CSF.
NIST CSF > **Content** > **Indicator Templates**	Review the Indicator Templates installed for NIST CSF.
NIST CSF > **Content** > **Attestation Types**	Review the Control Attestation Types installed for NIST CSF.
NIST CSF > **Content** > **Assessment Types**	Review the Risk Assessment Types installed for NIST CSF.

3. Validate the application demo content, if loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to	Verify
NIST CSF > **Orient Targets**	Review the sample Targets installed in the system for use with the NIST CSF application.
User Administration > **Users**	Review the sample Persona users installed in the system for use with the NIST CSF application. The User IDs for these users end with .CSF and their name contains CSF.
Policy and Compliance > **Scoping** > **Profile Classes**	Perform a search for profile classes with the **Name** field containing **with NIST**. Review their relationships by reviewing their roll up to field in respective profile classes.
Policy and Compliance > **Scoping** > **entity types**	Perform a search for entity types with the **Name** field starting with **NIST CSF**.
Policy and Compliance > **Policies and Procedures** > **All Controls**	Perform a search for all controls referencing **Control Objectives** with a **Source = NIST CSF**.
Risk > **Risk Register** > **All Risks**	Perform a search for all risks referencing **Risk Statements** with a **Source = NIST CSF**.
Audit > **Audit Testing** > **Test Plans**	Perform a search for test plans with **Test Templates** that begin with **NIST CSF**.
Policy and Compliance > **Indicators** > **Indicators**	Perform a search for all indicators where **Item.Content.Source = NIST CSF**.
Risk > **Indicators** > **Indicators**	Perform a search for all indicators where **Item.Content.Source = NIST CSF**.
Policy and Compliance > **Issues** > **All Issues**	Perform a search for all issues where**Item.Content.Source = NIST CSF**.
Risk > **Issues** > **All Issues**	Perform a search for all issues where **Item.Content.Source = NIST CSF**.
Policy and Compliance > **Remediation Tasks** > **All Open Remediation Tasks**	Perform a search for all Remediation tasks where an issue identified on the remediation task has**Item.Content.Source = NIST CSF**.
Risk > **Remediation Tasks** > **All Open Remediation Tasks**	Perform a search for all Remediation tasks where an issue identified on the remediation task has **Item.Content.Source = NIST CSF**.

NIST CSF supporting concepts

Familiarize yourself with these concepts, developed from the NIST CSF guidance.

Concept	Description
Target	The target is the foundation of the NIST Cybersecurity Framework (CSF) Use Case Accelerator and all related concepts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
	The target is a shared table between the ServiceNow® GRC products and several Use Case Accelerators. They are similar to the concept of entities in the core GRC applications. They are optionally linked to profiles, but are used for any attributes that are specific to the Use Case Accelerators.
Critical infrastructure (or critical in NIST CSF application usage)	Vital physical or virtual systems and assets that have a serious impact on cybersecurity, national economic security, and national public health or safety.
Implementation tiers	Helps an organization view cybersecurity risks and the processes they use to manage those risks. Tiers are prioritized for achieving cybereecurity objectives. With the NIST CSF applications, organizations can evaluate targets from the implementation tier view, which uses the Tier attribute on Target table.
Cybersecurity activity	Cybersecurity policies and requirements are found in the ServiceNow® GRC Policy and Compliance Management application. The application provides guidelines for understanding cybersecurity outcomes that need to be achieved to strengthen cybersecurity practices and enhance security compliance. These activities in the NIST CSF application as are a combination of a Target, Function, and Category. NIST CSF activities evaluate cybersecurity requirements for Targets, which provides detailed insights into gaps, non-compliant controls, risks, issues, failed indicators, and action plans and when they are addressed. Also, they help organizations strengthen their security compliance position.
Functions	Functions organize basic cybersecurity activities at their highest level. These Functions are Identify, Protect, Detect, Respond, Recover, and Govern. They help an organization by organizing information, enabling risk management decisions, addressing threats, and learning from previous activities to improve its management of cybersecurity risk. In NIST CSF, functions select relevant cybersecurity outcomes for activities and organize them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
Category	Categories are the subdivisions of functions that are broken into groups of cybersecurity outcomes. Examples of categories include: Asset Management, Identity Management and Access Control, and Detection Processes. Subcategories are used to divide a category into specific outcomes of technical and management activities. They provide a set of results that can help support achievement of the outcomes in each category. Examples of subcategories include: External information systems are cataloged, Data-at-rest is protected, and Notifications from detection systems are investigated. The Framework Core identifies underlying categories and subcategories for each function as cybersecurity policies and their details as policy statements. The NIST CSF categories define the cybersecurity activities for targets and uses the associated subcategories to evaluate cybersecurity requirements to provide additional insight.
Implementation state	State of the cybersecurity activity, whether implemented or planned for the future. It is possible to document the implementation state of a cybersecurity activity.
Gaps	Control objectives of the cybersecurity policy that do not have any controls in-place for the target's profile identified in the cybersecurity activity.
Non-compliant controls	Cybersecurity controls that are considered non-compliant because of implementation issues and have been found for the target's entity, which is identified in the cybersecurity activity.
Risks	Risks associated with the controls implemented for the target's entity, which is identified in the cybersecurity activity.
Issues	Issues with controls and risks for the target's entity, which are identified in the cybersecurity activity.
Failed indicators	Failed indicators of controls and risks implemented for the target's entity, which is identified in the cybersecurity activity.
Action plans	Action plans for issues for the target's entity, which are identified in the cybersecurity activity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

NIST CSF tables

A few tables are impacted by the NIST CSF guidance.

Table	Purpose
Target [sn_grc_target]	Target is a core table of design to be shared component among the ServiceNow GRC application and GRC use-case content packs.Target is like entity in its purpose, but is used to track any attributes specific to use-case content packs. No two target records can reference the same entity at any time.
NIST CSF Activity [sn_irm_nist_csf_nist_csf_activity]	NIST CSF Activity table is used to track cybersecurity activity relevant for a target. The activity also helps in performing gap analysis that identifies the gaps, non-complaint controls, risks, issues, failed indicators and action plans for a cybersecurity activity.
Gaps [sn_irm_nist_csf_m2m_policy_state_nist_csf_act]	Gaps table in NIST CSF is used to track control objectives that aren't yet implemented as gaps. This table comes handy for reporting and drill down purposes. It's an m2m table that associates Gaps to Targets.
Non-compliant Control [sn_irm_nist_csf_m2m_cxontrols_nist_csf_act]	Non-compliant Control table in NIST CSF is used to track controls that are identified as non-compliant. Only cybersecurity control objectives as defined by the framework core which are implemented as controls and non-compliant are tracked. This table comes handy for reporting and drill down purposes. It's an m2m table that associates Non-compliant Controls to Targets.
Risk [sn_irm_nist_csf_m2m_risks_nist_csf_activities]	Risk table in NIST CSF is used to track risks that are associated with controls that have been implemented for cybersecurity control objectives as defined by the framework core. This table comes handy for reporting and drill down purposes. It's an m2m table that associates Risks to Targets.
Issue [sn_irm_nist_csf_m2m_issues_nist_csf_act]	Issue table in NIST CSF is used to track issues that are associated with controls that have been implemented for cybersecurity control objectives as defined by the framework core. Issues of risks associated with these controls are also included in the metric. This table comes handy for reporting and drill down purposes. It's an m2m table that associates Issues to Targets.
Action Plan [sn_irm_nist_csf_m2m_remediation_nist_csf_act]	Action Plan table in NIST CSF is used to track the action plans that are identified for the issues. This table comes handy for reporting and drill down purposes. It's an m2m table that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Purpose
	associates Action Plans (remediation tasks) to Targets.
Failed Indicators [sn_irm_nist_csf_m2m_indicators_nist_csf_act]	Failed indicators table in NIST CSF is used to track the failed indicators of the target and the control or risk. This table comes handy for reporting and drill down purposes. It's an m2m table that associates Failed Indicators to Targets.
Related Control Objectives [sn_compliance_m2m_policy_stmt_policy_stmt]	Related Control Objectives table in NIST CSF is used to track the associations between control objectives. In base implementation, parent and child control objectives are supported, but this table introduces a concept to relate the control objectives at the same level.

NIST CSF Use Case Accelerator dashboards and reports

The contains various reports. The NIST Cybersecurity Framework (CSF) Use Case Accelerator contains a variety of reports displayed on different dashboards, available within each of the sections in the NIST CSF process:

Overview reports

Repots available under NIST CSF > Overview.

Reports	Purpose
Framework Core	Provides an overview of the Cybersecurity policies organized by the NIST CSF functions.
Critical Targets	Provides an overview of critical targets by entity class or tiers.
Critical Targets lacking Cybersecurity activities	Provides an overview of critical targets that lack cybersecurity activities by entity class or tiers.
Current Cybersecurity activities	Provides an overview of currently performed cybersecurity activities by entity class, entities, or cybersecurity functions.
Desired Cybersecurity activities	Provides an overview of desired cybersecurity activities by entity class, entities, or cybersecurity functions.
Gaps Analysis Summary	Provides a summary of gaps, non-compliant controls, risks, issues failed indicators, and action plans for targets grouped by cybersecurity, cybersecurity functions, or the targets themselves.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Framework profiling reports

Reports available under NIST CSF > Framework Profiling > Overview.

Reports	Purpose
Gaps	Displays an overview of the gaps that exist for cybersecurity activities. Gaps are grouped by policies, entity class, profiles, or functions.
Risks	Displays an overview of risks that exist for cybersecurity activities. Risks are grouped by policies, profile class, entities, or functions.
Non-compliant Controls	Displays an overview of non-compliant controls that exist for cybersecurity activities. Non-compliant controls are grouped by policies, entity class, profiles, or functions.
Failed Indicators	Displays an overview of failed indicators that for cybersecurity activities. Indicators are grouped by policies, entity class, entities, or functions.
Issues	Displays an overview of issues for cybersecurity activities. Issues are grouped by policies, entity class, entities, or functions.
Action Plans	Displays an overview of action plans that exist for cybersecurity activities. Action plans are grouped by policies, entity class, entities, or functions.

NIST CSF process overview

The NIST CSF navigation structure facilitates the management of the NIST cybersecurity through activities of identification and prioritization, as described in the NIST Framework for Improving Critical Infrastructure Cybersecurity version 1.1 and version 2.0 special publications.

NIST CSF process overview

1. The risk executives and/or the security officers identify categories and subcategories as cybersecurity policies.
2. The risk executives and/or the security officers prioritize cybersecurity activities.
3. Monitor the NIST CSF Overview dashboard

Identify the framework core

Within the NIST CSF application, the **Framework Core** section is used to identify categories and subcategories as cybersecurity policies and their statement policies.

The application uses categories to define cybersecurity activities for targets and uses subcategories to evaluate cybersecurity requirements to provide additional details on compliance.

With NIST CSF guidance, the application groups categories and subcategories into functions and represent them as activities. The NIST CSF uses the following five modules to designate individual functions:

- Identify
- Protect
- Detect
- Respond

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Recover
- Govern

Each module points to a grouping of policy and control objectives that relates to that function.

Review the framework core

Review the Framework Core that's activated with the NIST CSF application.

Before you begin
Policy and Compliance Management Role required: admin

NIST CSF role required: sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer

Procedure

1. Navigate to **All** > **NIST CSF** > **Framework Core** and then select one of the following modules:
   - **Identify**
   - **Protect**
   - **Detect**
   - **Respond**
   - **Recover**
   - **Govern**
2. In the Policy to Control Objectives form, click on one of the policy statements to review the information.

   Note:
   Policy statements are grouped by policies based on NIST CSF guidelines.

3. If necessary, update the record with additional information.
4. Click **Update**.

Align and prioritize cybersecurity activities

Within the NIST CSF application, the **Framework Profiling** section is used to help an organization to align and prioritize its cybersecurity activities with its requirements, risk tolerances, and resources.

First, a target is created from a entity or entity type. The application flow begins at **Orient Targets**. The user locates a target and sets it up for use with NIST CSF providing basic information. Next, the user identifies if the target is critical and establishes a tier for the target per NIST guidelines.

Note:
NIST recommends focusing on critical targets for prioritizing the Cybersecurity risks.

Next, users log their cybersecurity activities. The activities require users to identify targets, functions, and categories that are associated with it.

Note:
These activities are uniquely created to avoid creating duplicate activities for the same targets.

As the activities are created, users then determine the implementation state of these activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Next, users perform gap analysis on the cybersecurity activities. The analysis gives a detailed insight into the security position and evaluates the target for a specific cybersecurity activity.

The ServiceNow® GRC suite of applications play a crucial role in tracking the data that enables these metrics. The NIST CSF application is designed to provide the Cybersecurity framework, but it is completely enabled by the ServiceNow® GRC product.

Generate a target for an entity

Generate a target record for an entity to track NIST CSF attributes for that entity.

Before you begin

Role required: admin, sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer

Procedure

1. Generate a target for an entry.
   a. Navigate to **Policy and Compliance** > **Scoping** and select one of the following modules:
      - **Entity Types**
      - **My Entities**
      - **All Entities**
   b. Select one of the records.
   c. From the Entity form, click **Generate target**.

      Note:
      When you click Generate target, it generates the target only if the entity has not been used for other frameworks, such as GDPR DPIA.

   d. Click **Update**.
2. Identify the target.
   a. Navigate to **NIST CSF** > **Framework Profiling** > **Orient Targets**.
   b. Search for the target using the **Name** or **Profile** fields.
   c. Confirm that the target appears in the list.

Set up target for NIST CSF framework

Set up a target record to use with NIST CSF framework after you've identified a target.

Before you begin

NIST CSF Role required: none. sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer

Procedure

1. Navigate to **All** > **NIST CSF** > **Framework Profiling** > **Orient Targets**.
2. Search for the target using the **Name** or **Profile** fields.
3. Open the target record.
4. Click the **Framework** field and select **NIST CSF**.
5. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Targets list, open the record again.
7. Verify the information in the Target form.
8. In the NIST CSF section, fill out the fields (see table for field descriptions).

Field	Description
Critical	Check box that indicates the target is focused on during cyber risks. NIST CSF recommends that organizations prioritize cybersecurity activities for critical targets
Tier	Tier for a target that describes its capability to address cyber risks.

9. Click the **Activities** related list and validate the activities that are associated with the target.

Orient target

After you've identified a target, orient the target to use with the NIST CSF framework.

Before you begin

Policy and Compliance Management Role required: admin.

NIST CSF role required: sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer

Procedure

1. Navigate to **All** > **NIST CSF** > **Framework Profiling** > **Orient Targets**.
2. Search for the target using the **Name** or **Profile** fields.
3. Open the record.
4. Verify that the **Framework** field has **NIST CSF** selected.
5. Ensure that the NIST CSF form fields are accurate.
6. Click **Update**.

Create activity

Create a cybersecurity activity for a target.

Before you begin

Policy and Compliance Management Role required: admin

NIST CSF Role required: sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer or sn_irm_nist_csf.control_provider

Procedure

1. Navigate to **All** > **NIST CSF** > **Framework Profiling** > **Create Activity** and create a new record (see table for field descriptions).

NIST CSF Activity form

Field	Description
Number	Number that identifies the activity.
Target	Name of the target that has the activity associated with it.
Function	Type of function activities that are grouped in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Identify ○ Protect ○ Detect ○ Respond ○ Recover ○ Govern
Category	Cybersecurity activity that is identified as a policy.
Implementation state	Status of the activity, whether it is being performed or a planned activity.

2. Click **Submit**.

Note:
Every time a cybersecurity activity is created, the system validates the combination of target, function, and category for uniqueness.

Perform gap analysis

Perform a Gap analysis of cybersecurity activities.

Before you begin

Policy and Compliance Management Role required: admin

NIST CSF sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer

About this task

Note:
The Gap analysis process should not take more than a minute. A weekly job that runs the gap analysis for users so the metrics are up-to-date.

Procedure

1. Navigate to **All** > **NIST CSF** > **Framework Profiling** > **Gap Analysis**.
2. Search for the target using the **Name** or **Profile** fields.
3. Open the target record.
4. Click the **Activities** related list and select the activity.
5. Review the activity and click **Gap Analysis** to initiate the Gap analysis.
6. To view control objectives for the cybersecurity policy that do not have any controls in-place for the target's profile, click the **Gaps** related list.
7. To view issues with cybersecurity controls that are non-compliant because of implementation issues, click the **Non-compliant controls** related list.
8. To view Failed indicators of controls and risks for the target's profile, click the **Failed Indicators** related list.
9. To view risks associated with controls for the target's profile, click the **Risks** related list.
10. To view issues related to the controls and risks for the target's profile, click the **Issues** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. To view action plans for the target's profile, click the **Action Plans** related list.
12. Click **Save**.

Review action plan

Review the remediation tasks created for the controls or risks associated with cybersecurity activities. You can only edit or update action plans if you have sufficient privileges for the GRC suite.

Before you begin

Policy and Compliance Management Role required: admin

NIST CSF role required: sn_irm_nist_csf.risk_executive or sn_irm_nist_csf.security_officer or sn_irm_nist_csf.control_provider

About this task

Action plans are typically created in the ServiceNow® GRC product through the Policy and Compliance Management, Risk Management, or Audit Management applications.

Procedure

1. Navigate to **All** > **NIST CSF** > **Framework Profiling** > **Action Plan**.
2. Search for an action plan using parameters, such as issue, control, or risk, that are associated it.
3. Open the record.
4. Review the action plan.

NIST RMF Use Case Accelerator

The NIST RMF Use Case Accelerator gives customers an operational head-start when adopting the NIST RMF. When the accelerator is downloaded and activated in the GRC applications, pre-configured policies, scopes (profile, profile type recommendations), indicators, risks and other GRC elements appear.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Who uses the NIST RMF Use Case Accelerator

Persona	Description
Risk executive	Ensures that risks are identified and managed consistently across the organization. Defined access to the following sections: • **NIST RMF** > **Overview** • **NIST RMF** > **Categorize** • **NIST RMF** > **Select** • **NIST RMF** > **Implement**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Persona	Description
	• **NIST RMF** > **Assess** • **NIST RMF** > **Authorize** • **NIST RMF** > **Monitor** • **NIST RMF** > **Content**
Authorizing officer	Confirms that a target is operating within an acceptable level of risk. Defined access to the following sections: • All Modules in **NIST RMF** > **Overview** > • **NIST RMF** > **Authorize** > **Targets** • **NIST RMF** > **Authorize** > **My Approvals**
Security officer	Provides insight and understanding into the current security procedures and capabilities for a target and implements the controls, managing issues, and completing remediation tasks Defined access to the following sections: • **NIST RMF** > **Categorize** • **NIST RMF** > **Select** > **Targets** • **NIST RMF** > **Implement** • **NIST RMF** > **Assess** > **Overview** • **NIST RMF** > **Assess** > **Control Attestations** • **NIST RMF** > **Assess** > **Control Effectiveness** • **NIST RMF** > **Assess** > **Remediation Tasks** • **NIST RMF** > **Authorize** • **NIST RMF** > **Monitor**
Control provider	Assists in the creation and tailoring of security controls within the organization. Defined access to the following sections: • **NIST RMF** > **Select** > **Review Baseline Controls** • **NIST RMF** > **Select** > **Tailor Baseline Controls** • **NIST RMF** > **Content**
Sys admin	Access to the following sections: **NIST RMF** > **Administration**
GRC admin	Access to the following sections: **NIST RMF** > **Administration**

Install the NIST RMF Use Case Accelerator

The NIST RMF Use Case Accelerator is used with the GRC core applications: Policy and Compliance Management, Risk Management, and Audit Management applications.

Before you begin

Role required: none.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Complete the following setup checklist prior to installation. These setup tasks are required for a smooth installation.

Setup task	Description
Verify that the following applications have been installed: • Policy and Compliance Management • Risk Management • Audit Management	To verify that these applications are activated, navigate to **Subscription Management** > **Subscriptions** in your instance. The list displays the subscriptions your organization has purchased. For more information about the setup and activation of the Risk Management plugin, see Install Risk Management
Verify that you have the required roles.	The System Admin (admin) assigns the following roles: • Policy and Compliance Management roles ○ Attestation Creator (sn_compliance.attestation_creator) ○ Compliance Administrator (sn_compliance.admin) ○ Compliance Developer (sn_compliance.developer) ○ Compliance Manager (sn_compliance.manager) ○ Compliance Reader (sn_compliance.reader) ○ Compliance User (sn_compliance.user) • Risk Management roles ○ Risk Admin (sn.risk.admin) ○ Risk Reader (sn.risk.reader) ○ Risk Manager (sn.risk.manager) ○ Risk User (sn.risk.reader) • Audit Management roles ○ Audit Admin (sn_audit.admin) ○ Audit Developer (sn_audit.developer) ○ Audit Manager (sn_audit.manager)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup task	Description
	○ Audit User (sn_audit.user) ○ External Auditor (sn_audit.external_auditor)

Procedure

1. Log in to the instance you want to install the application on.
2. Navigate to **System Applications** > **All Available Applications** > **All**.
3. Locate the **GRC: NIST RMF Accelerator** application.
4. If you want to load demo data, select the **Demo Data** check box.
5. Click **Install**.

Verify the NIST RMF Use Case Accelerator

After installing the GRC: NIST RMF Use Case Accelerator, review the NIST RMF application structure, core content, and demo data, if selected during installation.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Roles** and review the roles installed with the NIST RMF application.

   These roles contain nist_rmf in their names; for example, sn_irm_nist_rmf.security_officer. The roles are associated with NIST RMF application modules to provide access based on the user's role.

   Note:
   Use the basic NIST RMF user role is to access the application. This role contains the reader or user roles from the ServiceNow® GRC suite of applications.

2. In the Application Navigator, type **NIST RMF**, and verify the application core content.

Navigate to	Verify
NIST RMF > **Content** > **Control Objective**	Review the Policies and Control objectives installed for NIST RMF.
NIST RMF > **Content** > **Risk Statements**	Review the Risk Frameworks and Risk Statements installed for NIST RMF.
NIST RMF > **Content** > **Test Templates**	Review the Test Templates installed for NIST RMF.
NIST RMF > **Content** > **Indicator Templates**	Review the Indicator Templates installed for NIST RMF.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to	Verify
NIST RMF > **Content** > **Attestation Types**	Review the Control Attestation Types installed for NIST RMF.
NIST RMF > **Content** > **Assessment Types**	Review the Risk Assessment Types installed for NIST RMF.

3. Validate the application demo content, if loaded.

Navigate to	Verify
NIST RMF > **Impact Analysis**	Review the sample Targets installed in the system for use with the NIST RMF application.
User Administration > **Users**	Review the sample Persona users installed in the system for use with the NIST RMF application. The User IDs for these users end with .RMF and their names contain RMF.
Policy and Compliance > **Scoping** > **Profile Classes**	Perform a search for profile classes with the **Name** field containing **with NIST**. Review their relationships by reviewing their roll up to field in respective profile classes.
Policy and Compliance > **Scoping** > **Profile types**	Perform a search for profile types with the **Name** field starting with **NIST RMF**.
Policy and Compliance > **Policies and Procedures** > **All Controls**	Perform a search for all controls referencing **Control Objectives** with a **Source = NIST 800-53-r4**.
Risk > **Risk Register** > **All Risks**	Perform a search for all risks referencing **Risk Statements** with a **Source = NIST 800-53-r4**.
Audit > **Audit Testing** > **Test Plans**	Perform a search for test plans with **Test Templates** that begin with **NIST RMF**.
Policy and Compliance > **Indicators** > **Indicators**	Perform a search for all indicators where **Item.Content.Source = NIST 800-53-r4**.
Risk > **Indicators** > **Indicators**	Perform a search for all indicators where **Item.Content.Source = NIST RMF**.
Policy and Compliance > **Issues** > **All Issues**	Perform a search for all issues where**Item.Content.Source = NIST 800-53-r4**.
Risk > **Issues** > **All Issues**	Perform a search for all issues where **Item.Content.Source = NIST 800-53-r4**.
Policy and Compliance > **Remediation Tasks** > **All Open Remediation Tasks**	Perform a search for all Remediation tasks where an issue identified on the remediation task has**Item.Content.Source = NIST 800-53-r4**.
Risk > **Remediation Tasks** > **All Open Remediation Tasks**	Perform a search for all Remediation tasks where an issue identified on the remediation task has **Item.Content.Source = NIST 800-53-r4**.

NIST RMF supporting concepts

Familiarize yourself with these concepts, developed from the NIST RMF guidance.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Concept	Description
Target	The target is the foundation of the NIST RMF Use Case Accelerator and all related concepts. The target is a shared table between the ServiceNow® GRC products and several Use Case Accelerators. They are similar to the concept of profiles in the core GRC applications. They are optionally linked to profiles, but are used for any attributes that are specific to the Use Case Accelerators. **Note:** Each NIST RMF Target uniquely represents a single profile throughout its RMF life-cycle.
Confidentiality (C)	Confidentiality is a security objective of a Target, and is defined as the act of preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information. Confidentiality is expressed as High, Moderate, and Low values
Integrity (I)	Integrity is a security objective of a Target is defined as act of guarding against improper information modification or destruction, and includes ensuring information non-repudiation and authenticity. Integrity is expressed as High, Moderate, and Low values
Availability (A)	Availability is a security objective of a Target is defined as act of ensuring timely and reliable access to and use of information. Availability is expressed as High, Moderate, and Low values
Baseline controls	Baseline Controls are recommended set of security controls from National Institute of Standards and Technology (NIST) which when implemented and determined to be effective, would mitigate security risk while complying with security requirements. Baseline controls have a designated impact value which is a combination of High, Moderate, or Low values.
Impact analysis	Impact analysis determines the extent to which proposed or actual changes to the Target or its environment of operation can affect or have affected the security state of the Target. A Target in which all three CIA security objectives evaluate to Low is considered Low-impact and uses any of the security controls which are tagged as Low impact value. Likewise, a Target in which any of the three CIA security objectives evaluate to Moderate is considered Moderate-impact and uses any of the security controls which are tagged as Moderate impact value. Likewise, a Target in which any of the three CIA security objectives evaluate to High is considered High-impact and uses any of the security controls which are tagged as High impact value.
Assurance	Assurance controls increase both the strength of security and degree of confidence that the functionality of Targets is correct, complete, and

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
	consistent and would mitigate the security risk and assists in complying with security requirements
Common	Common controls are controls that are inheritable by one or more Targets
Compensating	Compensating controls are controls which can be employed in lieu of recommended baseline security controls and provide equivalent or comparable protection for the Targets
Supplemental	Supplemental controls are controls which can be employed as added security controls to adequately meet the risk management needs of a Target
Tailoring	Tailoring is a process by which a security control baseline is modified based on: (i) Targets scoping guidance; (ii) specification of the security controls, for example, compensating, if needed; and (iii) the specification of organization — defined parameters in the security controls via explicit assignment and selection statements

NIST RMF Use Case Accelerator dashboards and reports

The NIST RMF Use Case Accelerator contains various reports displayed on different dashboards, available within each of the sections in the NIST RMF process: Categorize, Select, Implement, Assess, Authorize, and Monitor.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Overview reports

Reports under NIST RMF > Overview.

Reports	Purpose
Security Compliance Overview	Provides an overall compliance summary of the security policies.
Profiles Compliance Overview	Provides an overall compliance summary of the profiles implementing security controls.
Security Compliance Details	Provides a detailed compliance summary of the security policies.
Inherent Security Risk Heatmap	Heatmap of security risks based on the Inherent qualitative results of risks.
Residual Security Risk Heatmap	Heatmap of security risks based on the Residual qualitative results of risks.
Inherent Security Risk	Bubble chart of security risks based on the average Inherent quantitative results of risks.
Residual Security Risk	Bubble chart of security risks based on the average Inherent quantitative results of risks.
Inherent Annual Loss Exposures Security Risk	Provides an insight into Inherent Annualized Loss Expectancy (ALE) for different security risks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview reports

Reports under NIST RMF > Overview.

(continued)

Reports	Purpose
Residual Annual Loss Exposures Security Risk	Provides an insight into Residual Annualized Loss Expectancy (ALE) for different security risks.
Issues summary	Plots issues noted for security policies on a week by week basis.

Categorize reports

Reports under NIST RMF > Categorize > Overview.

Targets with no Baseline Controls	Targets with completed security impact analysis with no baseline control generated. Baseline Controls are recommended set of security controls from National Institute of Standards and Technology (NIST) which when implemented and determined to be effective, would mitigate security risk while complying with security requirements. The Baseline Controls to be implemented can be determined from the recommended Baseline Policy Statements on the Target.
Targets pending Impact Analysis	Security impact analysis when conducted by the organizations, determines the extent to which proposed or actual changes to the target or its environment of operation can affect or have affected the security state of the target. Changes to the target or its environment of operation may affect the security controls currently in place (including system-specific, hybrid, and common controls), produce new vulnerabilities in the target, or generate requirements for new security controls that were not needed previously.
Targets status	Targets organized by their current state of Risk Management process. The Risk Management process is provided by National Institute of Standards and Technology (NIST) Risk Management Framework (RMF) is a disciplined and structured process that integrates information security and risk management activities.
Confidentiality Impact	Targets grouped for each confidentiality rating value. National Institute of Standards and Technology (NIST) defines Confidentiality as preserving authorized restrictions on information access and disclosure, including means for protecting personal privacy and proprietary information. Confidentiality is expressed as High, Moderate, and Low values.
Integrity Impact	Targets grouped for each Integrity rating value. National Institute of Standards and Technology (NIST) defines Integrity as guarding against improper information modification or destruction, and includes ensuring information non-repudiation and authenticity. Integrity is expressed as High, Moderate, and Low values.
Availability Impact	Targets grouped for each Availability rating value. National Institute of Standards and Technology (NIST) defines Availability as ensuring timely and reliable access to and use of information. Availability is expressed as High, Moderate, and Low values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Categorize reports

Reports under NIST RMF > Categorize > Overview.

(continued)

Impact	Targets grouped for each Impact rating value. National Institute of Standards and Technology (NIST) defines Impact as the loss of confidentiality, integrity, or availability could be expected to have: (i) a limited adverse effect; (ii) a serious adverse effect; or (iii) a severe or catastrophic adverse effect on organizational operations, organizational assets, or individuals. Whereas security impact analysis is defined as organizations determination of the extent to which the security state is affected. Impact is expressed as High, Moderate, and Low values.
Review Baseline Controls	Provides an overview for the NIST Risk Management select step of the framework in-order to facilitate review of the baseline policy statements and controls. NIST RMF > Select > Review Baseline Controls launches this dashboard
Baseline Security Policy Statements	Baseline Security Policy Statements are recommended set of security control definitions from National Institute of Standards and Technology (NIST) which when implemented and determined to be effective, would mitigate security risk while complying with security requirements.
Baseline Security Controls	Baseline Security Controls are recommended set of security controls from National Institute of Standards and Technology (NIST) which are being implemented and if determined to be effective, would mitigate security risk while complying with security requirements.

Baseline control reports

Reports under NIST RMF > Select > Review Baseline Controls.

Reports	Purpose
Baseline Security Policy Statements	Baseline Security Policy Statements are recommended set of security control definitions from National Institute of Standards and Technology (NIST) which when implemented and determined to be effective, would mitigate security risk while complying with security requirements.
Baseline Security Controls	Baseline Security Controls are recommended set of security controls from National Institute of Standards and Technology (NIST) which are being implemented and if determined to be effective, would mitigate security risk while complying with security requirements.

Tailor baseline controls reports

Reports under NIST RMF > Select > Tailor Baseline Controls.

Reports	Purpose
Baseline Assurance	Baseline Security Assurance Policy Statements are recommended set of security control definitions from National Institute of Standards and

Tailor baseline controls reports

Reports under NIST RMF > Select > Tailor Baseline Controls.

(continued)

Reports	Purpose
Policy Statements	Technology (NIST) which are designated as Assurance control definitions which when implemented increase both the strength of security and degree of confidence that the functionality is correct, complete, and consistent and would mitigate security risk while complying with security requirements.
Baseline Assurance Controls	Baseline Security Assurance Controls are recommended set of security control definitions from National Institute of Standards and Technology (NIST) which are designated as Assurance control are being implemented to increase both the strength of security and degree of confidence that the functionality is correct, complete, and consistent and would mitigate security risk while complying with security requirements.
Baseline Common Policy Statements	Baseline Security Common Policy Statements are set of security control definitions from National Institute of Standards and Technology (NIST) which when designated as Common control definitions by organizations indicate these are inheritable by one or more organizational targets.
Baseline Common Controls	Baseline Security Common Controls are set of security control definitions from National Institute of Standards and Technology (NIST) are being implemented and which when designated as Common controls by organizations indicate these are inheritable by one or more organizational targets.
Baseline Compensating Policy Statements	Baseline Security Compensating Policy Statements are set of security control definitions from National Institute of Standards and Technology (NIST) which when designated as Compensating control definitions by organizations indicate these can be employed in lieu of other security controls and provide equivalent or comparable protection for organizational targets.
Baseline Compensating Controls	Baseline Security Compensating Controls are set of security control definitions from National Institute of Standards and Technology (NIST) are being implemented and which when designated as Compensating controls by organizations indicate these can be employed in lieu of other security controls and provide equivalent or comparable protection for organizational targets.
Baseline Supplemental Policy Statements	Baseline Security Supplemental Policy Statements are set of security control definitions from National Institute of Standards and Technology (NIST) which when designated as Supplemental control definitions by organizations indicate these can be added to security controls to adequately meet the risk management needs for organizational targets.
Baseline Supplemental Controls	Baseline Security Supplemental Controls are set of security control definitions from National Institute of Standards and Technology (NIST) are being implemented and which when designated as Supplemental controls by organizations indicate these can be added to security controls to adequately meet the risk management needs for organizational targets.

Attestation and assessment reports

Reports under NIST RMF > Assess > Overview.

Reports	Purpose
Control Attestations completed	Displays the number of NIST Risk Management control attestations completed.
Control Attestations upcoming due date	Displays the number of NIST Risk Management control attestations due within 7 days.
Control Attestations due after 7 days	Displays the number of NIST Risk Management control attestations due after 7 days.
Control Attestations missed due date	Displays the number of NIST Risk Management control attestations that have missed their due date.
Control Attestations by profile	Provides an overview of the NIST Risk Management control attestations grouped by profiles.
Control Attestations past due	Provides an overview of the NIST Risk Management control attestations grouped by due date.
Risk Assessments completed	Displays the number of NIST Risk Management risk assessments completed.
Risk Assessments upcoming due date	Displays the number of NIST Risk Management risk assessments due within 7 days.
Risk Assessments due after 7 days	Displays the number of NIST Risk Management risk assessments due after 7 days.
Risk Assessments missed due date	Displays the number of NIST Risk Management risk assessments that have missed their due date.
Risk Assessments by profile	Provides an overview of the NIST Risk Management risk assessments grouped by profiles.
Risk Assessments past due	Provides an overview of the NIST Risk Management risk assessments grouped by due date.

Approval reports

Reports under NIST RMF > Authorize > Overview.

Reports	Purpose
Target approval status	Provides an overview of the current state of approvals of the target.
Risk Executive approvers	Provides an overview of targets as assigned to the risk executive approvers.
Authorizing Official approvers	Provides an overview of targets as assigned to the authorizing official approvers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring reports

Reports under NIST RMF > Monitor > Overview.

Reports	Purpose
In-effective Profiles	Total number of profiles having at least one control test of a security control flagged as in-effective.
In-effective Controls	Total number of security controls having atleast one control test flagged as in-effective.
In-effective Test Plans	Total number of test plans having at least one control test of a security control flagged as in-effective.
Non-compliant Controls	Total number of security controls with status non-compliant.
Risks	Total number of Risks that are associated with security controls.
Issues	Total number of issues that are related to security controls and risks.
Control compliance	Provides compliance overview of the security controls.
Profile effectiveness	Provides an overview of the profile effectiveness for profiles having security controls based on the effectiveness of the associated control tests.
Control effectiveness	Provides an overview of the control effectiveness for security controls based on the effectiveness of the associated control tests.
Test Plan effectiveness	Provides an overview of the test plan effectiveness of security controls based on the effectiveness of the associated control tests.
Risks	List of Risks grouped by profiles and associated with security controls.

NIST RMF process overview

The NIST RMF navigation structure facilitates the management of the NIST security controls through activities of categorization, selection, implementation, assessment, authorization, and monitoring. These security controls are described in the NIST 800-37.r1 special publication.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

NIST RMF process overview

1. The risk executives and/or the security officers categorize the targets.
2. The risk executives, the security officers and/or the control providers select baseline control definitions.
3. The risk executives and/or the security officers implement baseline security controls.
4. The security accessors, the risk executives, and/or the security officers assess the security controls:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Manage and address issues

b. Manage and address remediation tasks

5. The authorizing official, the risk executives, and/or the security officers authorize targets.
6. The risk executives and/or the security officers monitor security controls:
   a. Review and manage indicators
   b. Monitor the NIST RMF Overview dashboard

Categorize targets

Within the NIST RMF application, the **Categorize** section facilitates the categorization of targets through a preliminary risk assessment and an impact analysis.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

First, a target is created from an entity or an entity type. The application flow begins at Impact Analysis. The user locates a target and sets it up for use with NIST RMF providing basic information. Next, the user performs a preliminary risk assessment determining the potential impact value on each of the following parameters: **Confidentiality**, **Integrity**, and **Availability**. The highest impact rating of these values determines the **Impact** value.

Note:
The user can override the **Impact** value, as necessary.

The **Impact** value is used to identify the baseline security policy statements recommended for the target, based on the NIST 800-53.r4 special publications catalog. The user reviews the baseline security policy statements and implements security controls for that target (for example, Profile). The standard approach is outlined in the Policy and Compliance Management application.

Generate target from profile or entity type

Generate a target record for a profile to track NIST RMF attributes.

Before you begin

Role required: admin.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Policy and Compliance Management

NIST RMF role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Scoping** > **Profile Types**
   - **Policy and Compliance** > **Scoping** > **My Profile**
   - **Policy and Compliance** > **Scoping** > **All Profiles**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select and open Profile Type of Profile record.
3. Check **Generate Target** and click **Update**.
4. Identify the target:
   a. Navigate to **NIST RMF** > **Categorize** > **Impact Analysis**.
   b. Search for the target using the **Name** or **Profile** fields.
   c. Confirm that the target appears in the list.

Set up a target for use with NIST RMF

Set up a target and populate the basic information.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Categorize** > **Impact Analysis**.
2. Search for the target using the **Name** or **Profile** fields.
3. Open the target record.
4. In **Framework**, select **NIST RMF**, and click **Update**.
5. Open the target record again and update the following fields:

   Note:
   Review NIST RMF supporting concepts, for more detailed information about these fields.

   - **RMF State**: Identify the current NIST RMF state for the target.
   - **Scoping Considerations**: Provide guidance on the selection of security controls for implementation.
6. Verify that the NIST RMF related lists are visible:
   - Baseline Policy Statements
   - Baseline Controls
   - Risks
   - Approvals

Perform preliminary risk assessment and impact analysis

Perform a preliminary risk assessment and impact analysis of the target.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Categorize** > **Impact Analysis**.
2. Search for the target using the **Name** or **Profile** fields.
3. Select and open the target record.
4. Open the target record again and update the following fields in the NIST RMF section:

Note:
Review NIST RMF supporting concepts, for more detailed information about these fields.

NIST RMF section

Field	Description
Confidentiality	Target category based on confidentiality. Identify the security objective as: High, Moderate, or Low.
Integrity	Target category based on integrity. Identify the security objective as: High, Moderate, or Low.
Availability	Target category based on availability. Identify the security objective as: High, Moderate, or Low.
Impact	Impact to business function if the target loses its confidentiality, integrity, or availability. Impact is automatically determined and may be overridden.
Scoping Considerations	Operational or environmental scoping considerations for the target.
Risk Executive	Names of the person who ensures risks are identified and managed.
Authorizing Official	Name of the person who verifies that the target is operating with an acceptable level of risk.
Justification	Security posture description for risk executive, authorizing official, and owner.
Approval status	Status of the security compliance posture of the target.

5. Verify that the NIST RMF related lists are visible:
   - Baseline Policy Statements
   - Baseline Controls
   - Risks
   - Approvals
6. Navigate to the **NIST RMF** tab and review the **Baseline Policy Statements**.
7. Implement security controls for the target following the standard approach outlined in the Policy and Compliance Management application.

Monitor the NIST RMF Categorize Overview

The NIST RMF categorization activity dashboard provides insights into the overall status of the target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Categorize** > **Overview**
2. Review all the reports on the dashboard.
3. Review the report details in the dashboard and reports sections.

Select baseline control definitions

Within the NIST RMF application, the **Select** section focuses on the review of the initial set of baseline control definitions. You can also tailor the control definitions, by tagging them based on organizational requirements.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

After performing **Impact Analysis**, the user selects and tailors the baseline controls for that target. A dashboard provides an overview of the baseline policy statements in the catalog, alongside the catalog of baseline controls being implemented.

Next, the user tailors the baseline controls. Another dashboard contains several reports detailing the baseline policy statements alongside baseline controls which are tagged as **Assurance**, **Common**, **Compensating** and **Supplemental**.

Note:
Both **Review Baseline Controls** and **Tailor Baseline Controls** require that you implement all necessary controls following the standard Policy and Compliance Management application procedures. Return to these dashboards for the selecting and tailoring of those controls.

Review baseline controls

Review the baseline policy statements and baseline controls.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Review Baseline Controls requires that you implement all necessary controls following the standard Policy and Compliance Management application procedures.

Role required: sn_irm_nist_rmf.risk_executive, sn_irm_nist_rmf.security_officer, or sn_irm_nist_rmf.control_provider

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **NIST RMF** > **Select** > **Review Baseline Controls**.
2. Review all the reports on the dashboard.
3. Implement changes for the baseline policy statements and baseline controls following the standard approach outlined Policy and Compliance Management application.

Tailor baseline controls

Tailor the baseline policy statements and baseline controls.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Tailor Baseline Controls requires that you implement all necessary controls following the standard Policy and Compliance Management application procedures.

Role required: sn_irm_nist_rmf.risk_executive, sn_irm_nist_rmf.security_officer, or sn_irm_nist_rmf.control_provider

Procedure

1. Navigate to **All** > **NIST RMF** > **Select** > **Tailor Baseline Controls**.
2. Review all the reports on the dashboard.
3. Implement changes for the baseline policy statements and baseline controls following the standard approach outlined in the Policy and Compliance Management application.

Implement security controls

Within the NIST RMF application, the **Implement** section focuses on the physical implementation of the baseline security controls. The NIST RMF application may also include other standard security controls, already used by the targets or its environment of operation.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Users can view a list of all controls that originate from a NIST 800-53.r4 policy statement, update any implementation details, and update the controls.

Note:
The NIST RMF application provides read-only access to the security controls. Update these controls following the standard Policy and Compliance Management application procedures.

An important aspect of implementing controls is testing them appropriately. Users can view a list of all control tests that were created for security controls with a policy statement source of NIST 800-53 r4.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The NIST RMF application provides read-only access to the security control tests. Update these tests following the standard Audit Management application procedures.

Manage and implement controls

From a list of security controls stemming from NIST 800-53.r4 policy statements, review the controls and update implementation details.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Implement** > **Active Controls**.
2. Review each control and physically implement them following the standard approach outlined in the Policy and Compliance Management application.

Manage and implement control tests

From a list of security controls stemming from NIST 800-53.r4 policy statements, review the control tests and update implementation details.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Implement** > **Active Control Tests**.
2. Review each control test and physically implement them following the standard approach outlined in the Audit Management application.

Assess controls, risks, issues, and remediation tasks

Within the NIST RMF application, the **Assess** section involves performing security control attestations, evaluating the control effectiveness, managing associated risks and issues, and performing remediation tasks.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Broadly, assessment also involves managing the controls, risks, issues, and remediation tasks that stem from the implementation of the security controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The NIST RMF application provides read-only access to the content. Update the content following the standard GRC procedures, as outlined in the Policy and Compliance Management, Risk Management, and/or Audit Management applications.

Users can:

- review and perform control attestations currently in the system relating to NIST RMF security attestations
- view all control tests, highlighting the control and current effectiveness of each control test in place
- manage and address any risks stemming from risk statements having a content source of NIST 800-53.r4
- identify risks and perform their assessments
- view a list of issues and remediation tasks stemming from the implementation of security controls and related risks having a content source of NIST 800-53 r4

Review and perform control attestations

Review and perform control attestations relating to NIST RMF security attestations.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_accessor, sn_irm_nist_rmf.risk_executive, or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Control Attestations**.
2. Review each control attestation and its results.
3. Perform any control attestations assigned to you following the standard approach outlined in the Policy and Compliance Management application.

Review and evaluate control effectiveness

Review and evaluate the effectiveness of the controls through the execution of control tests related to NIST-800.53.r4.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_accessor, sn_irm_nist_rmf.risk_executive, or sn_irm_nist_rmf.security_officer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Control Effectiveness**.
2. Review each control test and their related security controls.
3. Review the control effectiveness results in the system.
4. Perform the control tests assigned to you following the standard approach outlined in the Audit Management application.

Manage and address risks

Review and manage all risks stemming from risk statements having the content source of NIST 800-53.r4.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_accessor or sn_irm_nist_rmf.risk_executive

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Risks**.
2. Review each risk and their related risk statements.
3. Manage and address any risks following the standard approach outlined in the Risk Management application.

Review and perform risk assessments

Review and execute the risk assessments relating to NIST RMF security assessments.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_accessor or sn_irm_nist_rmf.risk_executive

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Risk Assessments**.
2. Review each risk assessment and its results.
3. Perform any risk assessments assigned to you following the standard approach outlined in the Risk Management application.

Manage and address issues

Review all issues stemming from controls and risks with NIST 800-53.r4 as the source and address them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_officer or sn_irm_nist_rmf.risk_executive

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Issues**.
2. Review the issues with NIST 800-53.r4 as the source.
3. Manage and address any risks following the standard approach outlined in the Risk Management application.

Manage and address remediation tasks

Review all remediation tasks stemming from controls and risks with NIST 800-53.r4 as the source and address them.

Before you begin

Role required: none.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

NIST RMF

sn_irm_nist_rmf.security_officer or sn_irm_nist_rmf.risk_executive.

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Remediation tasks**.
2. Review the issues with NIST 800-53.r4 as the source.
3. Manage and address any risks following the standard approach outlined in the Risk Management application.

Monitor the NIST RMF Assess dashboard

The NIST RMF assess dashboard provides insights into the overall status of the target.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_officer or sn_irm_nist_rmf.risk_executive

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **NIST RMF** > **Assess** > **Overview**.
2. Review all the reports on the dashboard.
3. Review the report details in the dashboard and reports sections.

Authorize targets

Within the NIST RMF application, the **Authorize** section involves the authorization of targets based on their compliance and risk posture.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Users request authorization from the appropriate parties directly from the target form.

Authorize targets

Authorize a target record based on the overall security posture determined by the security officer.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_official, sn_irm_nist_rmf.risk_executive, or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Authorize** > **Targets**.
2. Search for the target using the **Name** or **Profile** fields.
3. Select and open the target record.
4. From the NIST RFM section, review the **Approval Status** field.
5. Click **Request Approval**.

Result

The approval is triggered for the target.
If you are an approver, use the **My Approvals** module to review the approval request.

Monitor the NIST RMF Authorize dashboard

The NIST RMF Authorize dashboard provides insights into the overall status of the target.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_officer or sn_irm_nist_rmf.risk_executive

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **NIST RMF** > **Authorize** > **Overview**.
2. Review all the reports on the dashboard.
3. Review the report details in the dashboard and reports sections.

Monitor security controls

Within the NIST RMF application, the **Monitor** section involves the on-going monitoring of the security controls for targets documenting changes to them or their environments of operation, conducting security impact analyses of the associated changes, and reporting their security state to designated officials.

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Monitoring is a critical step in the RMF process. In-effective targets (profiles), controls, and test plans can be continuously monitored and their known risks and issues addressed. Security controls should be automatically monitored where possible using indicators, triggering alerts for remediation.

To continuously monitor a security control, users can use the indicator templates provided with the NIST RMF Use Case Accelerator application, by navigating to **NIST RMF** > **Content** > **Indicator Templates**. The sample indicator templates and indicators begin with **NIST**. Users must create new indicators beginning with **NIST** for monitoring the security controls.

Review and manage indicators

Review all indicators that are set up for NIST and manage them to track their results.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.risk_executive or sn_irm_nist_rmf.security_officer

Procedure

1. Navigate to **All** > **NIST RMF** > **Monitor** > **Indicators**.
2. Review all indicators beginning with NIST.
3. Search for the indicator using the **Name** field.
4. Select and open the indicator record.
5. Review the record and click **Save**.

Monitor the RMF Monitor dashboard

The NIST RMF monitor dashboard provides insights into the overall status of the target.

Before you begin

Note:
Starting with version 10.1.0, the NIST RMF Use Case Accelerator will be supported only for customers who currently use the product. New and existing customers should consider using the GRC: Continuous Authorization Monitoring application. For details, Continuous Authorization and Monitoring.

Role required: sn_irm_nist_rmf.security_officer or sn_irm_nist_rmf.risk_executive

Procedure

1. Navigate to **All** > **NIST RMF** > **Monitor** > **Overview**.
2. Review all the reports on the dashboard.
3. Review the report details in the dashboard and reports sections.

Technology Controls Monitoring Accelerator

The Technology Controls Monitoring Accelerator is a collection of pre-defined indicator templates designed to ease collection of data, and aid validation and continuous monitoring of technology controls. This application can be run with the Cybersecurity Controls Accelerator or as a standalone application.

The indicator templates contained in the Technology Controls Monitoring Accelerator are linked to specific ServiceNow® applications to allow compliance validation for standards and frameworks such as:

- ISO/IEC 27001
- ISO/IEC 27002
- CIS Controls

These packaged indicator templates have also been mapped to related common controls in the Unified Compliance Framework (UCF) to enable validation of controls across a wide range of regulations and industry standards. The indicator templates can be used to validate compliance with related control objectives in custom policies. You can monitor controls obtained via the CIS Controls™ or technology controls common to CIS or ISO 27002, even if you do not subscribe to the CIS Controls. Or you can use the indicators from the Technology Controls Monitoring Accelerator to monitor data coming from UCF.

Continuous monitoring of CIS Controls™ v8

CIS Controls™ are a prioritized set of safeguards to mitigate the cyber-attacks against systems and networks. These controls are mapped to and referenced by multiple legal, regulatory, and policy frameworks. CIS Controls™ v8 has been enhanced to continue supporting the modern systems and software such as cloud-based computing, virtualization, mobility, outsourcing as businesses shift their working model to fully cloud and hybrid environments.

Beginning with the Xanadu release, Technology Controls Monitoring Accelerator provides pre-packaged CIS v8 controls and indicator templates to monitor them along with its common controls mapped to various standards.

The following enhancements are supported with CIS Controls™ v8:

- Enable continuous monitoring of CIS Controls™ v8 using the predefined indicator templates.
- Enable monitoring of common controls from ISO 27002, PCI DSS 4.0, NIST 800-53, NIST CSF, CSA CCM 4.0 mapped to CIS V8.

Download the Technology Controls Monitoring Accelerator

Before you run the Technology Controls Monitoring Accelerator application in your instance, you must download it from the ServiceNow Store.

Before you begin

If you downloaded the Cybersecurity Controls Accelerator application, you can skip this procedure as this application was installed as a dependency to the Cybersecurity Controls Accelerator application.

Prior to running the Technology Controls Monitoring Accelerator application, you must download and activate the following GRC applications:

- GRC: Policy and Compliance Management
- GRC: Profiles

Role required: admin

Procedure

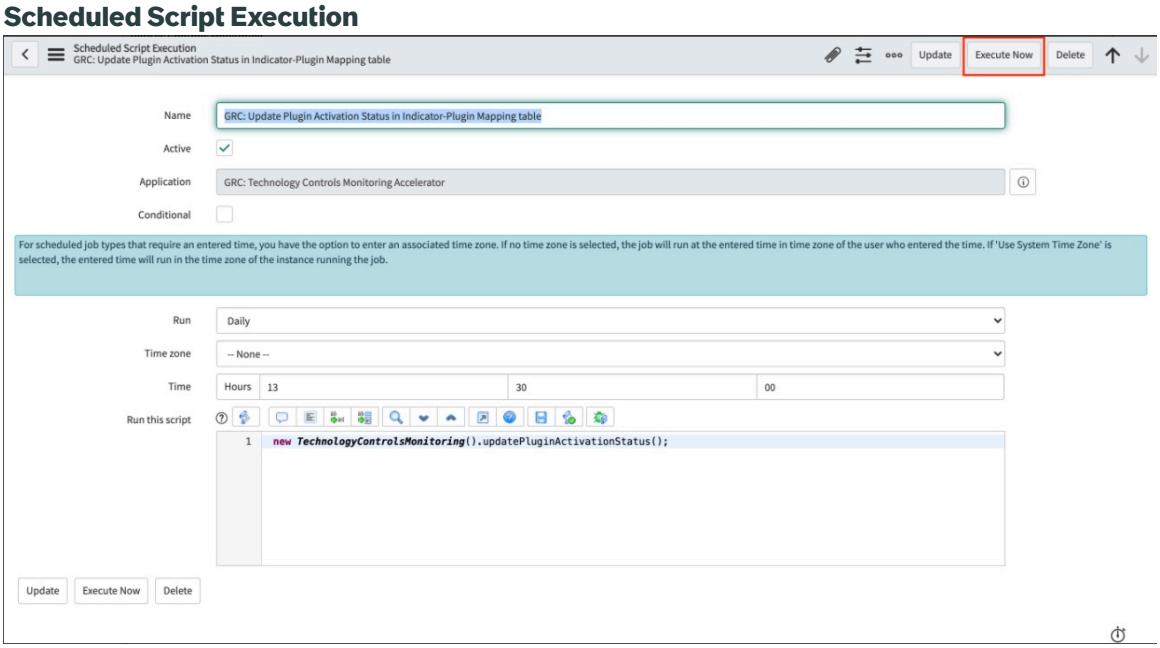
Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Ensure that all the appropriate indicator templates are activated

When you download the GRC: Technology Controls Monitoring Accelerator application, all indicator templates are available, but they are not yet active. Before activating them, you need to ensure that you have the necessary applications activated and can access the tables that are mapped to the indicator templates.

Before you begin

Role required: admin



About this task

Starting with version 12.0.1 of the Technology Controls Monitoring Accelerator application, several of the indicators that were Manual were converted to either Basic or Scripted. This added automation makes many of the tasks associated with continuous monitoring easier.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. Locate and open **GRC: Update Plugin Activation Status in Indicator-Plugin Mapping table**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Execute Now**.
   The job scans the Indicator Template to Plugin Mapping table [sn_grc_ind_template_plugin_mapping_details] on your instance, and 1) determines which applications that can use the Technology Controls Monitoring Accelerator for monitoring indicator templates are installed on your instance, and 2) automatically activates the indicator templates that are mapped to tables in those applications.

   Note:
   You must repeat this process any time you upgrade this application.

View your operational status

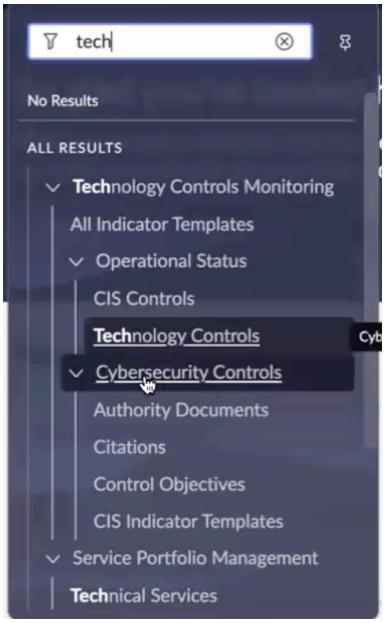
View the Operational Status modules for a list of the CIS Controls and technology Controls. Each control also includes the technology used to validate compliance, type of indicator template available, and the control's source table.

Before you begin

Role required: admin or sn_compliance.reader

About this task

Starting with Version 12.0.2, the Operational Status modules provide a view of all of your CIS Controls and/or ISO 27002-based indicator templates mapped to specific CIS/ISO controls in one place. This information can be useful for monitoring your controls and the health of your system. The application is able to scan your instance and determine which controls you have implemented, along with the various technologies available for validating each control and protecting your data.



Beginning with the Xanadu release, Technology Controls Monitoring Accelerator provides pre-packaged CIS v8 controls and indicator templates.

Procedure

1. Navigate to **All** > **Technology Controls Monitoring** > **Operational Status**.

   You can view the module as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The CIS controls module is renamed from CIS controls @R to Cybersecurity Controls. The Indicator Templates module is renamed to CIS Indicator Templates.

2. Select either **CIS Controls** or **Technology Controls**.

Note:
The screen shown below results from selecting **CIS Controls**. The default columns will be slightly different if you select **Technology Controls**. However, you can select the gear icon to add or remove columns as needed.

Operational Status

Field	Description
Controls	The controls included when you download and activate the Cybersecurity Controls Accelerator application.
Control family and description	The family and description of the control as defined in the CIS Controls.
Domain	Domains of the controls: ○ Basic ○ Foundational ○ Organizational
Implementation Group (IG)	The implementation group to which the control is included: IG1, IG2, or IG3. IG1 covers most of the essential security controls to serve as a foundation. Then, as needed to improve your security posture, you can add IG2 and IG3 to provide additional levels of support. As illustrated here, IG2 includes all of the controls included in IG1, and IG3 includes all of the controls in IG1 and IG2. 
Compliance validated by	The technology on your instance you can use to automate the validation of your controls.
Validating technology activated?	Identifies whether the specified technology is activated in your instance.
Controls implemented?	Identifies whether you have adopted the control objective and deployed it in your system.
Indicator template type	Identifies whether you have an indicator template type defined so you can begin validating and monitoring the control. The available types are Basic, Manual, and Script.
Source table	The source table for the data being monitored by the control.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View the Cybersecurity Controls module

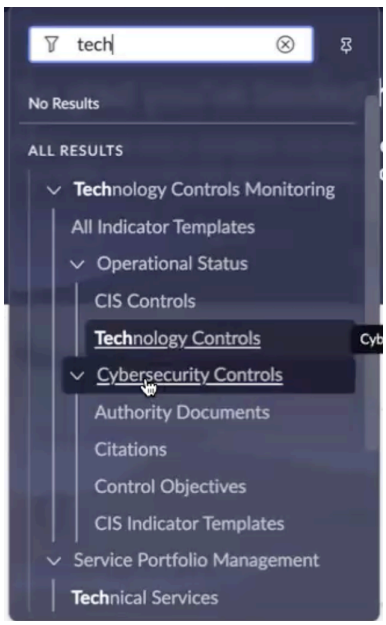
View the Cybersecurity Controls module for a list of the Authority documents, Controls, Control Objectives, and CIS Indicator Templates mapped to specific CIS controls classified by domain, implementation group, and ISO controls.

Before you begin

Role required: admin or sn_compliance.reader

About this task

Note:
The Authority documents, Controls, and Control Objectives display the data related to source CIS, CIS v8, and CSA CCM v4. The module filters display the following data:



- Authority Document - Source is CIS or CIS v8 or CSA CCM v4.
- Citations - Source is CIS or CIS v8 or CSA CCM v4.
- Control objectives - Source is CIS or CIS v8 or CSA CCM v4.
- Indicator templates - Source is CIS or CIS v8.

Beginning with the Xanadu release, Technology Controls Monitoring Accelerator provides pre-packaged CIS v8 controls and indicator templates.

Procedure

1. Navigate to **All** > **Technology Controls Monitoring** > **Cybersecurity Controls**.

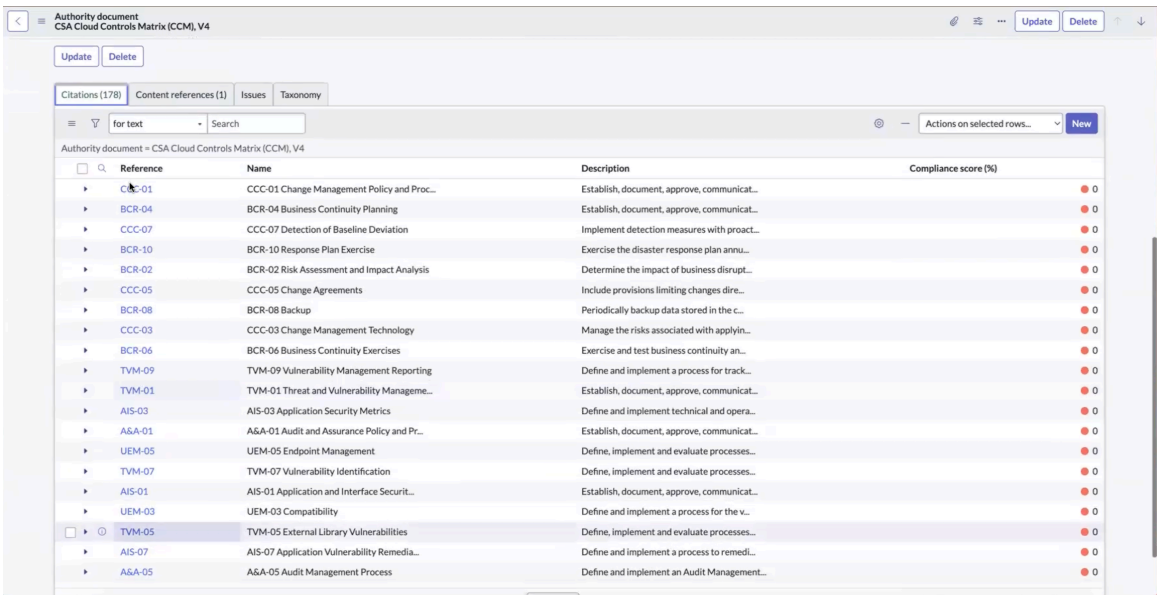
   You can view the module as shown in the example.

   Note:
   The CIS controls module is renamed from CIS controls @R to Cybersecurity Controls. The Indicator Templates module is renamed to CIS Indicator Templates.

2. Select **Authority Documents**.

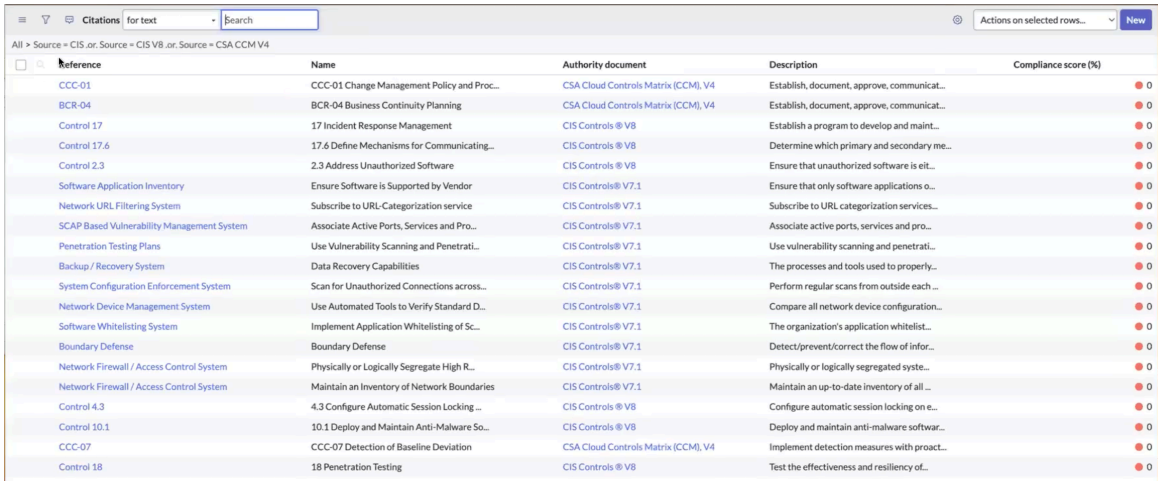
   The authority documents for source CIS, CIS v8, and CSA CCM v4 are listed as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

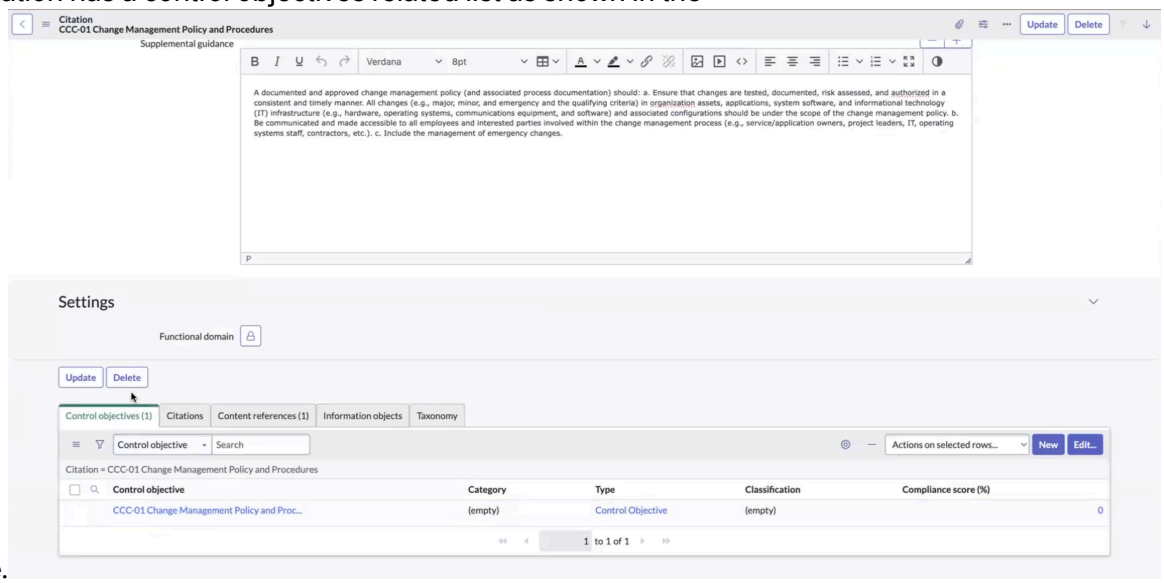


The authority document ADCIS10002 is added for CIS v8. Similarly, AD0020002 is added for CSACCMv4.

For the authority document record, the Content References related list is added for mapping.



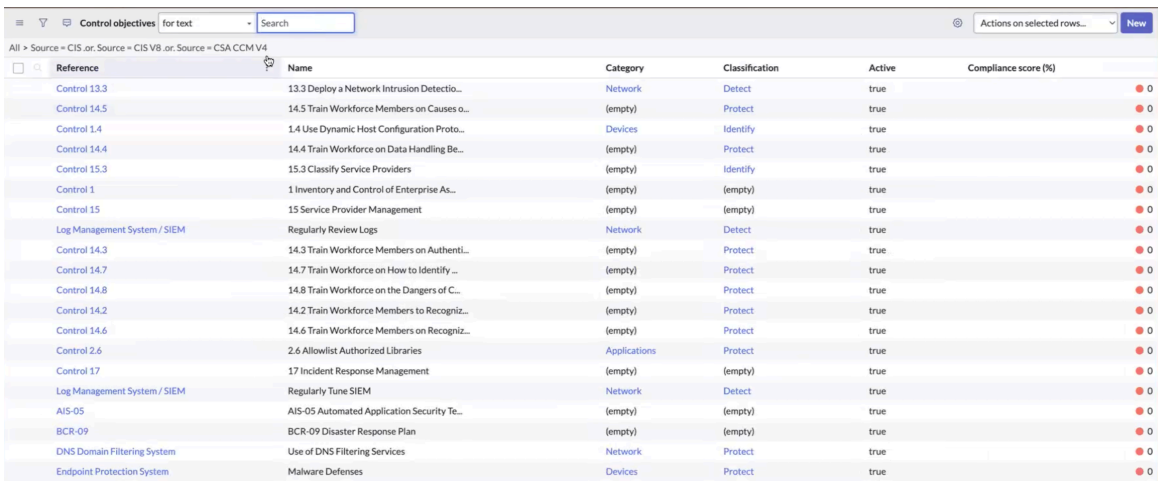
The citations associated with the authority document are shown in the example.



3. Select **Citations**.

The citations for source CIS, CIS v8, and CSA CCM v4 are listed as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Every citation has a control objectives related list as shown in the

example.

4. Select **Control Objectives**.

   The control objectives for source CIS, CIS v8, and CSA CCM v4 are listed as shown in the example.

5. Select **CIS Indicator Templates**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The CIS indicator templates for source CIS, CIS v8, and CSA CCM v4 are listed as shown in the example.

The indicator template is mapped to the Content column as shown in the example.

6. Select **CIS Indicator Templates**.
   The CIS Indicator Templates are displayed in the instance.

Using indicator templates

Indicators collect data to monitor a single control or risk. Indicator templates allow you to create multiple indicators for similar controls or risks. The Technology Controls Monitoring Accelerator application provides a collection of 171 predefined indicator templates for monitoring cybersecurity controls.

Indicators and Indicator templates

The indicators collect data to monitor the controls and risks and collect the audit evidence. Indicators monitor a single control or risk.

The indicator templates allow the creation of multiple indicators for similar controls or risks.

The indicator templates obtained with the Technology Controls Monitoring Accelerator application provide the instructions that you must run the indicators, as described in the following sections.

Supporting information can be collected for the indicators through automatic data collection or manual tasks. Indicator results are then used to perform the following tasks:

- Create issues for the controls.
- Update the risk scores.
- Provide supporting information for the audit activities and control testing

The following types of indicators are available:

1. Basic: Evidence is collected from on the source table.
2. Manual: Evidence is not collected. This type of indicator requires a third party data source.
3. Scripted: Evidence can be collected from multiple source tables.

Flow of the indicator process

The indicator process consists of the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Set up the indicator template.
- Apply the indicator template to a risk statement or control. When the control or risk statement is scoped with an entity type or specific entities, then all the controls or risks under that control objective or risk statement have an indicator generated for them.

Indicators can be automated or manual. The indicator tasks are generated that show the final state of the indicator.

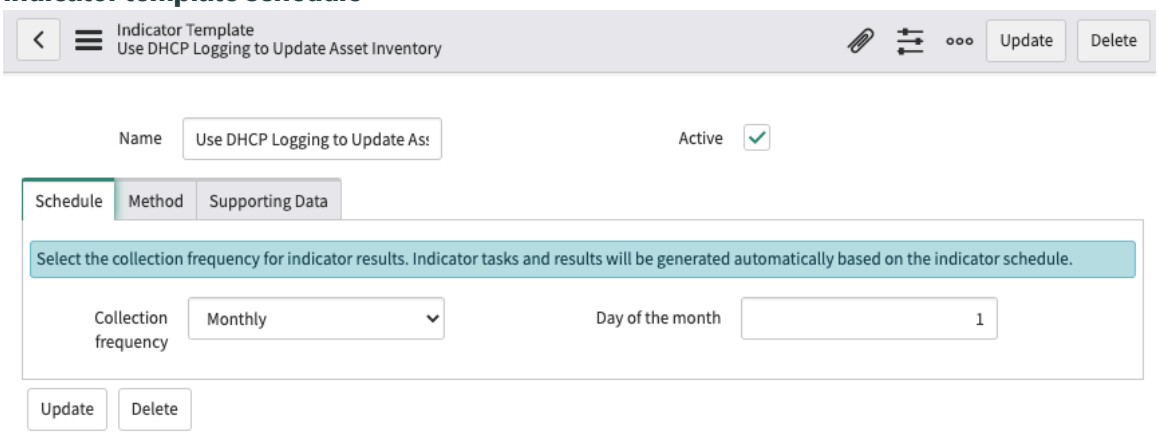
Examples of automated indicators and manual indicators

An example of an automated indicator would be to check that all servers in the CMDB are up to date. Another example would be that all LDAP passwords are less than three months old.

An example of a manual indicator would be to ask the network administrator to conduct the annual Network Penetration Tests are conducted and the results are attached to the task. If a result indicates failed or not passed, it is used to trigger the creation of GRC issues.

Usage of indicator templates

You can link the indicator templates to the policy statements or risk statements so that the indicators are automatically created for the controls or risks. The status of the controls is also automatically calculated by the linked indicator results and it may affect any linked risks. For example, if the indicator tied to a control fails, then the overall status cannot be completed unless the remediation task is closed by the user.



The Calculated Risk Score for the risk is also adjusted automatically by the indicators results of the risk. The Indicator Failure Factor field in the Risk table displays the impact of the failures.

Note:
Indicators are not weighted. When you weigh their impact on a control or risk, they are considered equalizing. Indicators are not executed when the risks and controls are in the **Retired** state.

Indicator template collection frequency

Each indicator template includes a schedule for identifying the frequency of data collection, as shown here.

Indicator template schedule

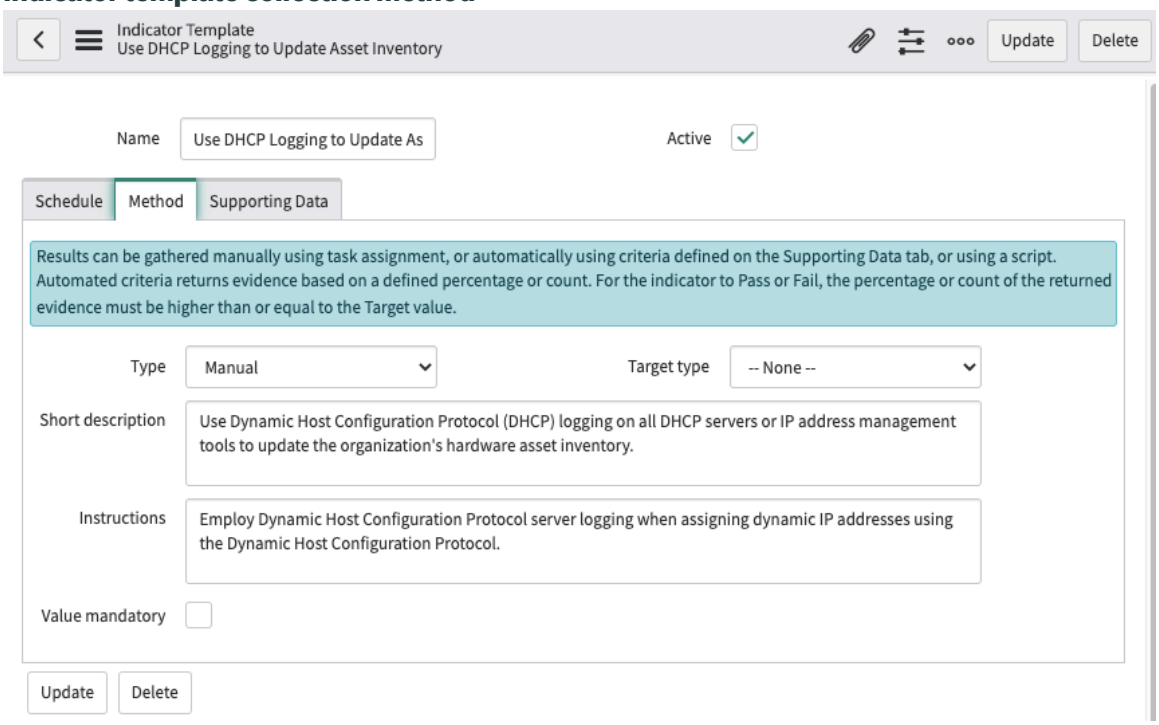
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Schedule tab

Field	Description
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule. • Daily • Weekly: The day of the week to perform the collection. • Monthly: The day of the month to perform the collection. • Quarterly: The date of the first collection run. • Semi-Annually: The date of the first collection run. • Annually: The month and day to perform the collection.

Indicator template collection method

The Method tab identifies how the results are collected, as shown here.

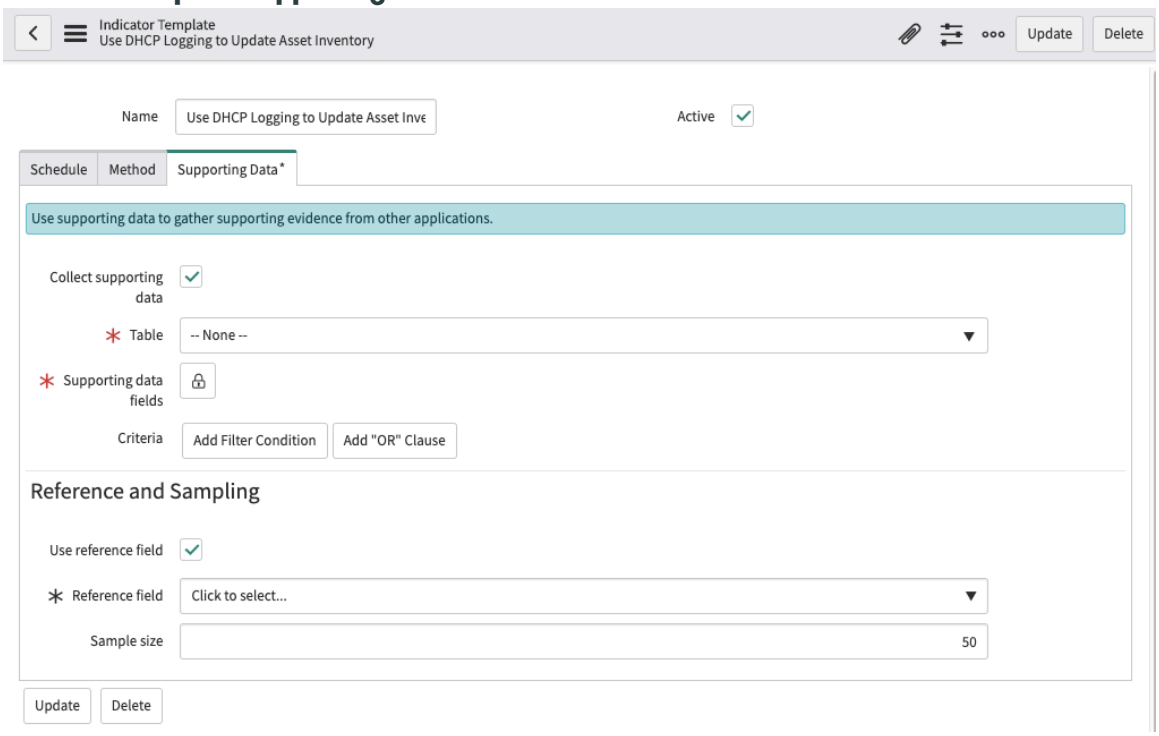
Indicator template collection method

Method tab

Field	Description
Type	Results can be gathered manually using task assignment or automatically using basic filter conditions, Performance Analytics, or a script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Method tab (continued)



Field	Description
Target Type	Identifies whether the target is a percentage or a count.
Short Description	If **Type = Manual**, a brief description of the issue.
Instructions	If **Type = Manual**, instructions for the collection of indicator results.
Value Mandatory	If **Type = Manual**, the check box indicates whether the value is mandatory for the indicator task.
Passed/Failed	If **Type = Basic**, the conditions defined on the Supporting Data tab are met, and the results exceed the **Target** value, it indicates whether the indicator passed or failed.
Target	If **Type = Basic**, the threshold by which the results returned based on the conditions defined on the Supporting Data tab determine whether the indicator template passes or fails.
PA Threshold	If **Type = PA Indicator**, the associated PA Threshold.
Script	If **Type = Script**, the script that obtains the desired system information.

Indicator template supporting data

Starting with version 10.1, the Supporting Data tab displays actual historical data for the supporting data records from the indicator results or indicator tasks. In earlier versions, only the real-time state of the records collected could be viewed.

Indicator template supporting data

Indicator template supporting data

Field	Description
Collect supporting data	Indicates that you want to collect supporting data. The following three fields are displayed.
Table	The supporting data table.
Supporting Data Fields	The fields from the supporting data table to be considered.
Criteria	Filter conditions.
Use reference field	Indicates that you want to use a reference field. The following two fields are displayed.
Reference field	The reference field that you want to use for sampling.
Sample size	The number of records you want to use for data sampling.

You can also view information on the following tabs:

- Indicators
- Control Objectives/Risk Statements
- Content References

Note:
The **Control Objectives/Risk Statements** tab allows you to reuse the same template for multiple control objectives or risk statements.

Indicator templates for controls

The Technology Controls Monitoring Accelerator includes 273 indicator templates (94 Basic, 174 Manual, and 5 Scripted) for CIS v7 and includes new 67 indicator templates (64 Basic and 3 Scripted) for CIS v8.

When the Technology Controls Monitoring Accelerator is used along with the Cybersecurity Controls Accelerator application, you can manage indicator templates within the Cybersecurity Controls Accelerator application.

When Technology Controls Monitoring Accelerator is run as a standalone application; however, it can be run with the Policy and Compliance Management application. You can also map UCF controls to indicator templates from with the Policy and Compliance Management application.

Note:
For information on the different types of indicator templates, see Using indicator templates.

Indicator templates for CIS v8 Controls

The following table lists the indicator templates for CIS v8 Controls.

Note:
Controls currently not covered by either basic or scripted indicator templates have manual indicator templates defined for the purposes of compliance validation. For more information on CIS v8 indicator templates, see KB0555526.

Indicator templates for CIS v8 Controls

Control	Name/Description	Type	Compliance validated by	Source table	Related control objectives
CIS Control V8 1.1	Establish and Maintain Detailed Enterprise Asset Inventory: Establish and maintain an accurate, detailed, and up-to-date inventory of all enterprise assets with the potential to store or process data, to include: end-user devices (including portable and mobile), network devices, non-computing/IoT devices, and servers. Ensure the inventory records the network address (if static), hardware address, machine name, data asset owner, department for each asset, and whether the asset has been approved to connect to the network. For mobile end-user devices, MDM type tools can support this process, where appropriate. This inventory includes assets connected to the infrastructure physically, virtually, remotely, and those within cloud	BASIC	HAM	cmdb_ci_hardware	CIS v8 (1.1) CSF (ID.AM-1, PR.DS-3) ISO 27002 (5.9, 8.8) PCI (9.5.1, 9.5.1.1, 11.2, 11.2.1, 11.2.2, 12.5, 12.5.1) CCM (UEM-04)

Indicator templates for CIS v8 Controls (continued)

Control	Name/Description	Type	Compliance validated by	Source table	Related control objectives
	Apply secure design principles in application architectures. Secure design principles include the concept of least privilege and enforcing mediation to validate every operation that the user makes, promoting the concept of "never trust user input." Examples include ensuring that explicit error checking is performed and documented for all input, including for size, data type, and acceptable ranges or formats. Secure design also means minimizing the application infrastructure attack surface, such as turning off unprotected ports and services, removing unnecessary programs and files, and renaming or removing default accounts.				
CIS Control V8 16.11	Leverage Vetted Modules or Services for Application Security Components: Leverage vetted modules or services for application security components, such as identity management, encryption, and auditing and logging. Using platform features in critical security functions will reduce developers' workload and minimize the likelihood of design or implementation errors. Modern operating systems provide effective mechanisms for identification, authentication, and authorization and make those mechanisms available to applications. Use only standardized, currently accepted, and extensively reviewed encryption algorithms. Operating systems also provide mechanisms to create and maintain secure audit logs.	Manual	NA	NA

360° Relationship Visualization

The 360° Relationship Visualization application allows you to visually explore the relationships between the different types of critical data that affect your business, such as controls, risks, and issues. The visualization also facilitates quick actions upon the information, such as adding a relationship, closing an issue, or approving a policy exception.

Before you can use the 360° Relationship Visualization application, you must set up the data registry to define the kinds of relationships to be viewed and to configure the views of the data to be shown in the 360° View.

Who uses the 360° Relationship Visualization

360° Relationship Visualization is used by GRC practitioners, such as compliance managers and analysts, risk managers and analysts, and auditors. 360° Relationship Visualization helps GRC practitioners to understand the critical data that affects their business. It also aids in effectively communicating the relationships and their impacts to C-suite executives or business users such as application or business service owners.

This table contains the responsibilities of all stakeholders involved with the 360° Relationship Visualization application and the Data Registry.

360° Relationship Visualization and Data Registry roles and responsibilities

Role title	Description	Contains roles
Data registry administrator [`sn_data_registry.admin`]	The data registry administrator has CRUD access to all records in the 360° views.	csn_data_registry.reader
Data registry reader [`sn_data_registry.reader`]	The data registry reader role must be granted to all GRC users (for example, ompliance managers and analysts, risk managers and analysts, and auditors) who are working on 360° Relationship Visualization-enabled GRC forms.	• canvas_user • workspace_user

Download and activate the GRC: 360° Relationship Visualization and Data Registry applications

Before you can run the GRC: 360° Relationship Visualization (com.servicenow_sn_grc_360_degree_visualization) and Data Registry (com.sn_app_grc_data_registry) applications in your instance, you must download them from the ServiceNow Store.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

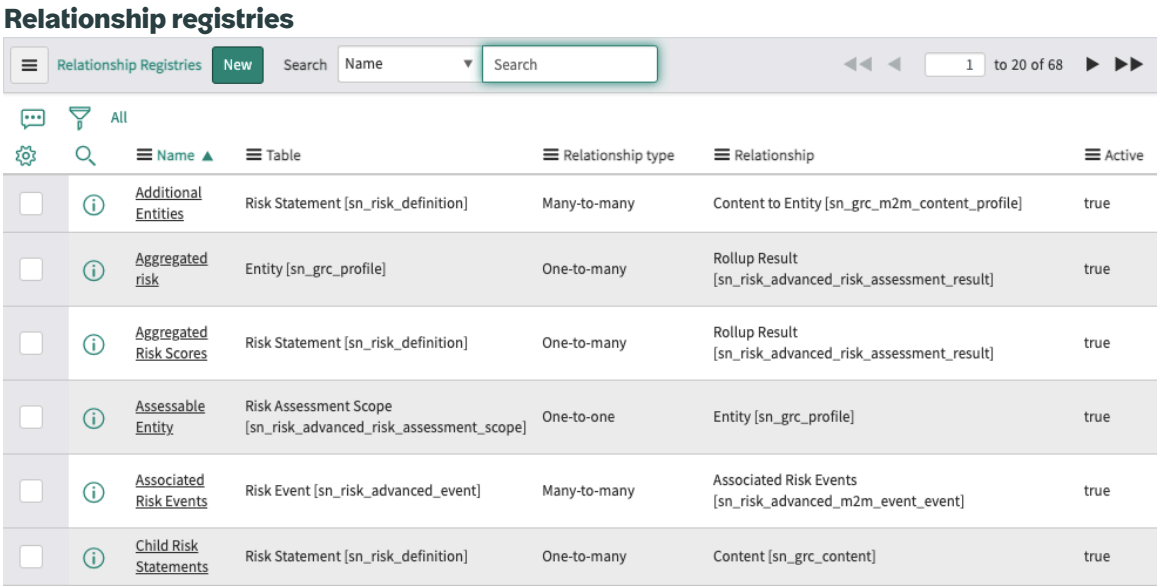
Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Setting up the 360° views

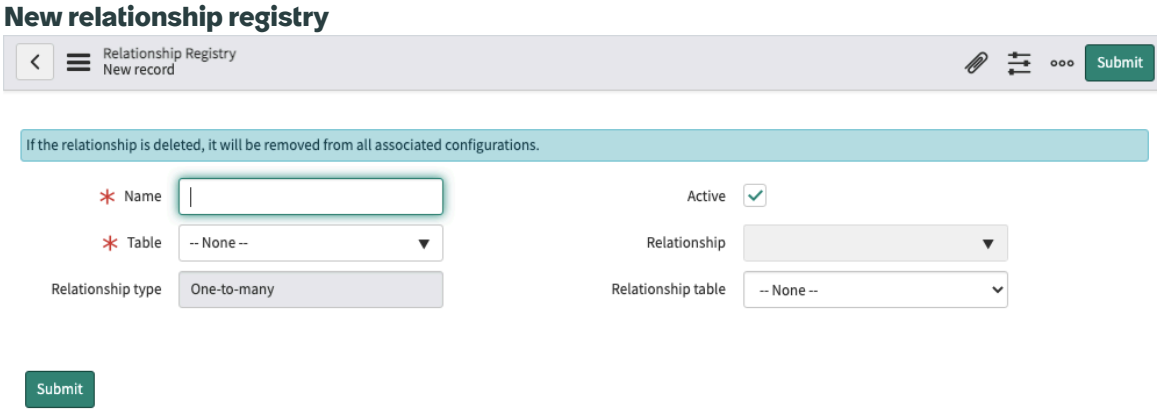
To effectively use the 360° Relationship Visualization application, you need to register existing relationships between the types of data you want to view, and then configure how the 360° view displays that data.

Register 360° relationships



The first step in setting up your data registry is to register the relationships you want displayed in the 360° Relationship Visualization.

Before you begin



Role required: Data registry administrator

Procedure

1. Navigate to **360° View Configurations** > **Relationship Registries**.

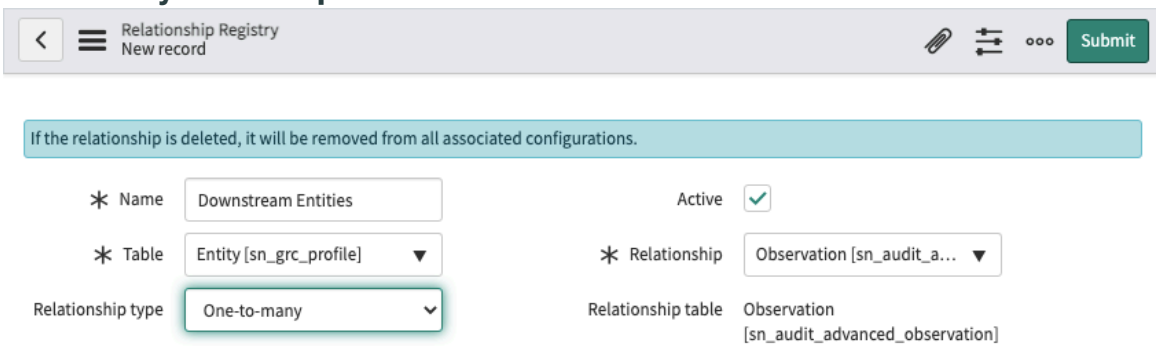
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Create new relationship registry

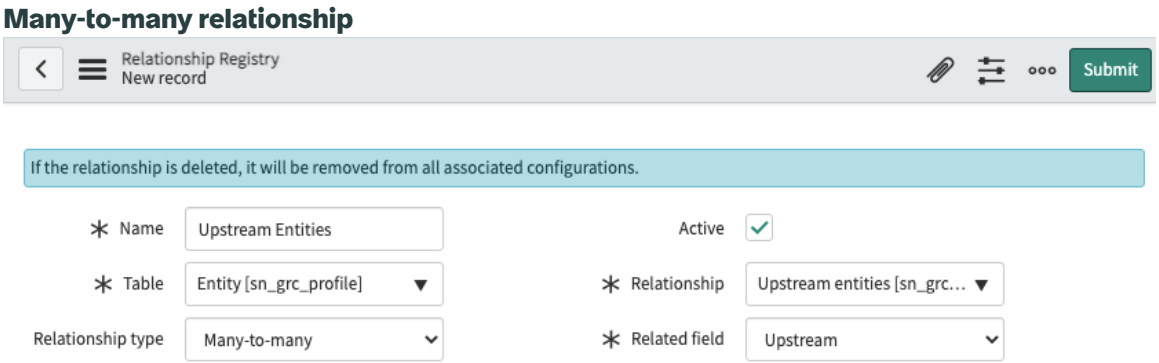
Field	Description
Name	A descriptive name for this registry.
Table	The table for which you want to define a relationship.
Relationship type	The type of relationship you are defining: ○ One-to-many ○ Many-to-many ○ Scripted: a custom relationship from the ServiceNow AI Platform ○ One-to-one: any relationship that is available as a field in the selected table
Active	Select if the relationship is active.
Relationship	The relationship table of the selected relationship type. For example, if you are defining relationships for the Entity table and select a many-to-many relationship type, the list of relationship tables consists of all many-to-many relationships that apply to the Entity table.
Relationship table	The table name you selected in the **Relationship** field.



4. Click **Submit**.
5. Repeat this process for all of the relationships you want to appear in the 360° Relationship Visualization interface.

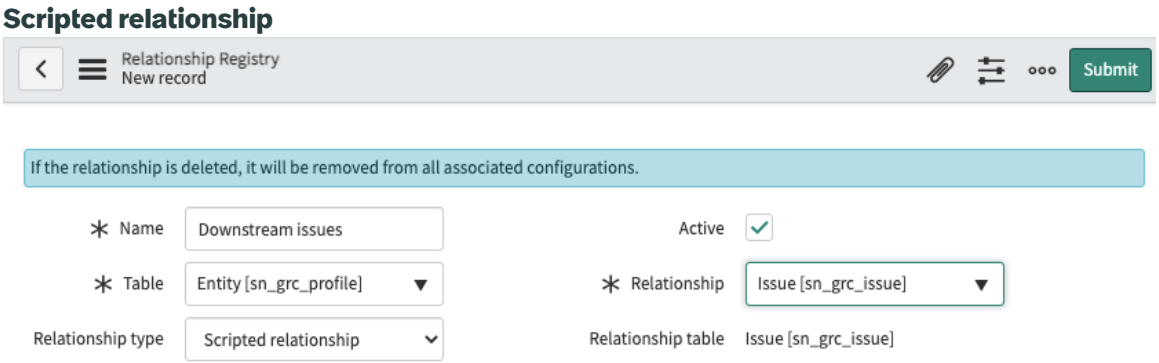
360° relationship examples

These screen shots illustrate the various relationship types you can register.

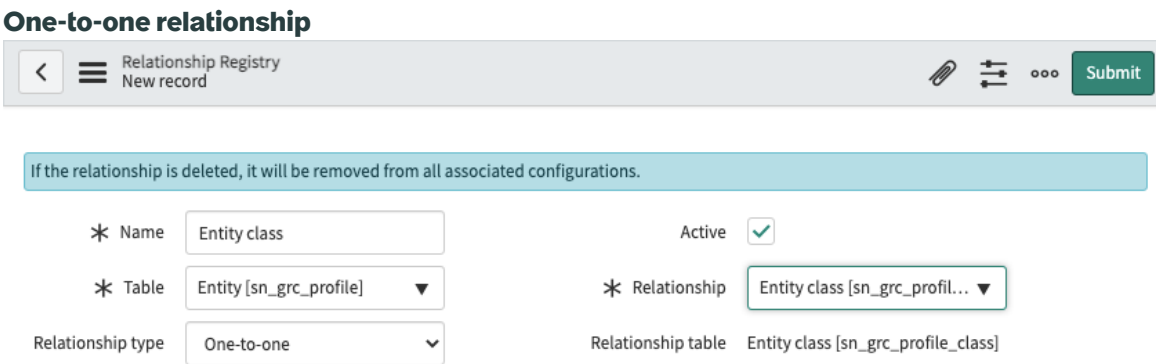


One-to-many relationship

One-to-many relationship



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Many-to-many relationship

Scripted relationship

One-to-one relationship

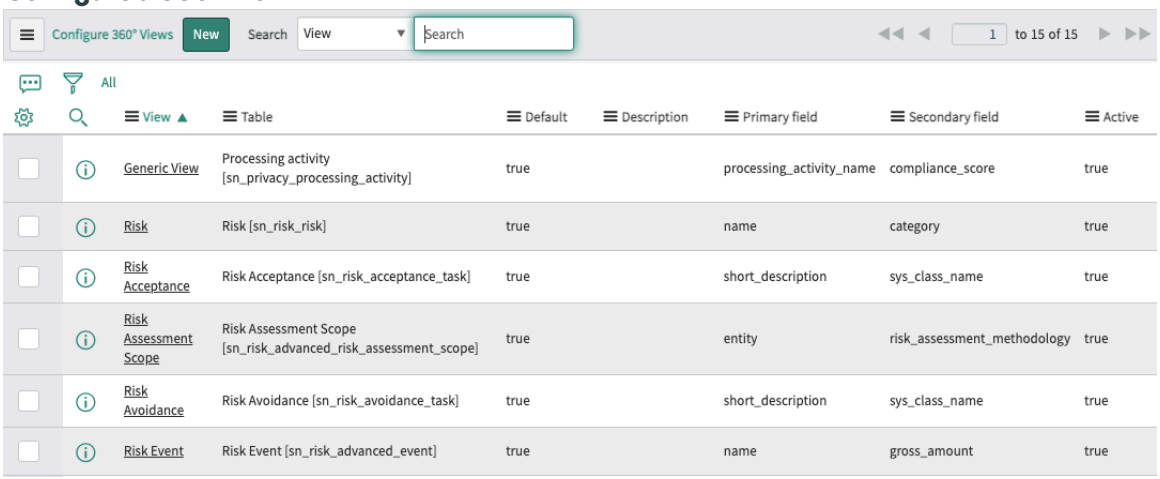
Configure 360° views

After the data registry has been defined, you can configure the 360° Relationship Visualization to effectively display the relations you created.

Before you begin

Role required: Data registry administrator

About this task

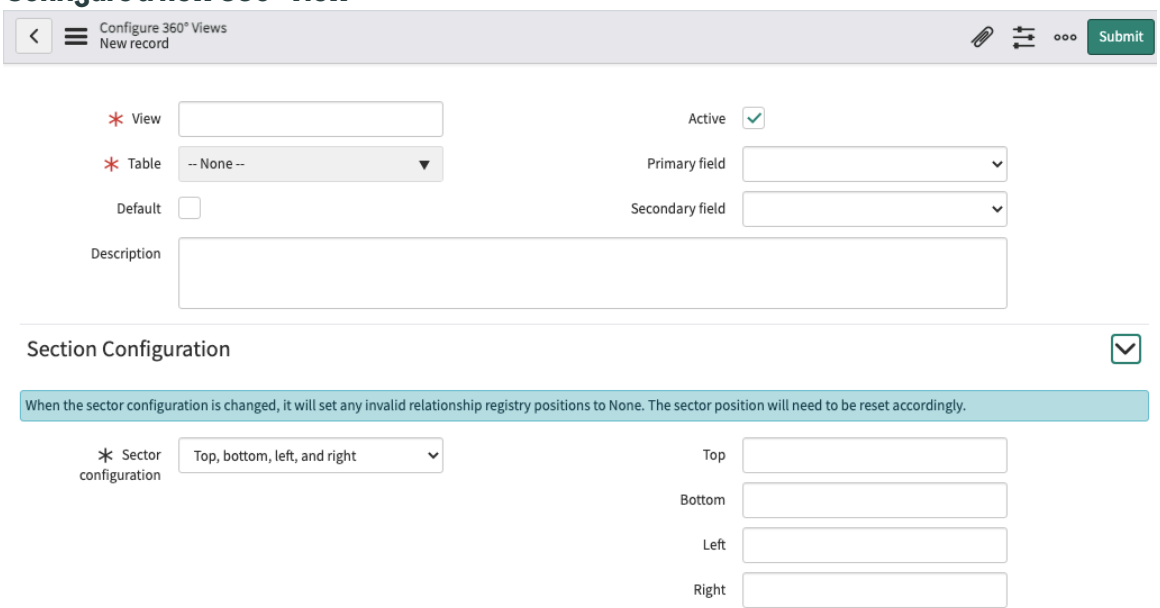


Multiple 360° Relationship views can be configured for a table. For example, the Entity table can be configured with multiple views, such as Compliance view, Risk view, Audit view, and others.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **360° View Configurations** > **Configure 360° Views**.

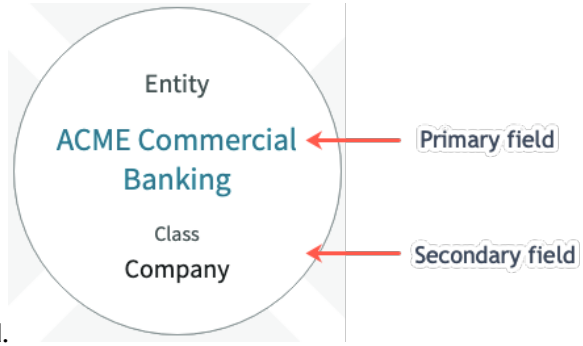


Configure a 360° view

View	Table	Default	Description	Primary field	Secondary field	Active
Generic View	Processing activity [sn_privacy_processing_activity]	true		processing_activity_name	compliance_score	true
Risk	Risk [sn_risk_risk]	true		name	category	true
Risk Acceptance	Risk Acceptance [sn_risk_acceptance_task]	true		short_description	sys_class_name	true
Risk Assessment Scope	Risk Assessment Scope [sn_risk_advanced_risk_assessment_scope]	true		entity	risk_assessment_methodology	true
Risk Avoidance	Risk Avoidance [sn_risk_avoidance_task]	true		short_description	sys_class_name	true
Risk Event	Risk Event [sn_risk_advanced_event]	true		name	gross_amount	true

2. Click **New**.

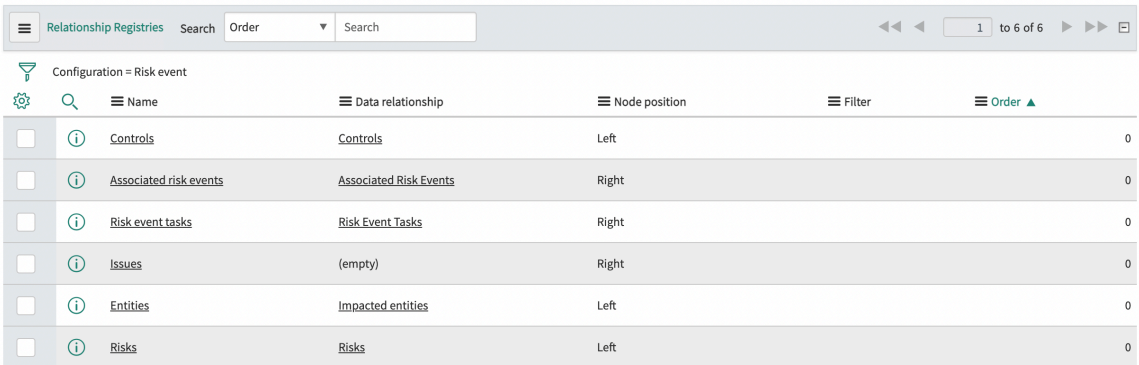
Configure a new 360° view



3. On the form, fill in the fields.

Create 360° view

Field	Description
View	A descriptive name for this view.
Table	The table for which you want to define the view.
Default	Select if this is the first view you are defining or your only view.
Active	Select if this 360° view is active.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

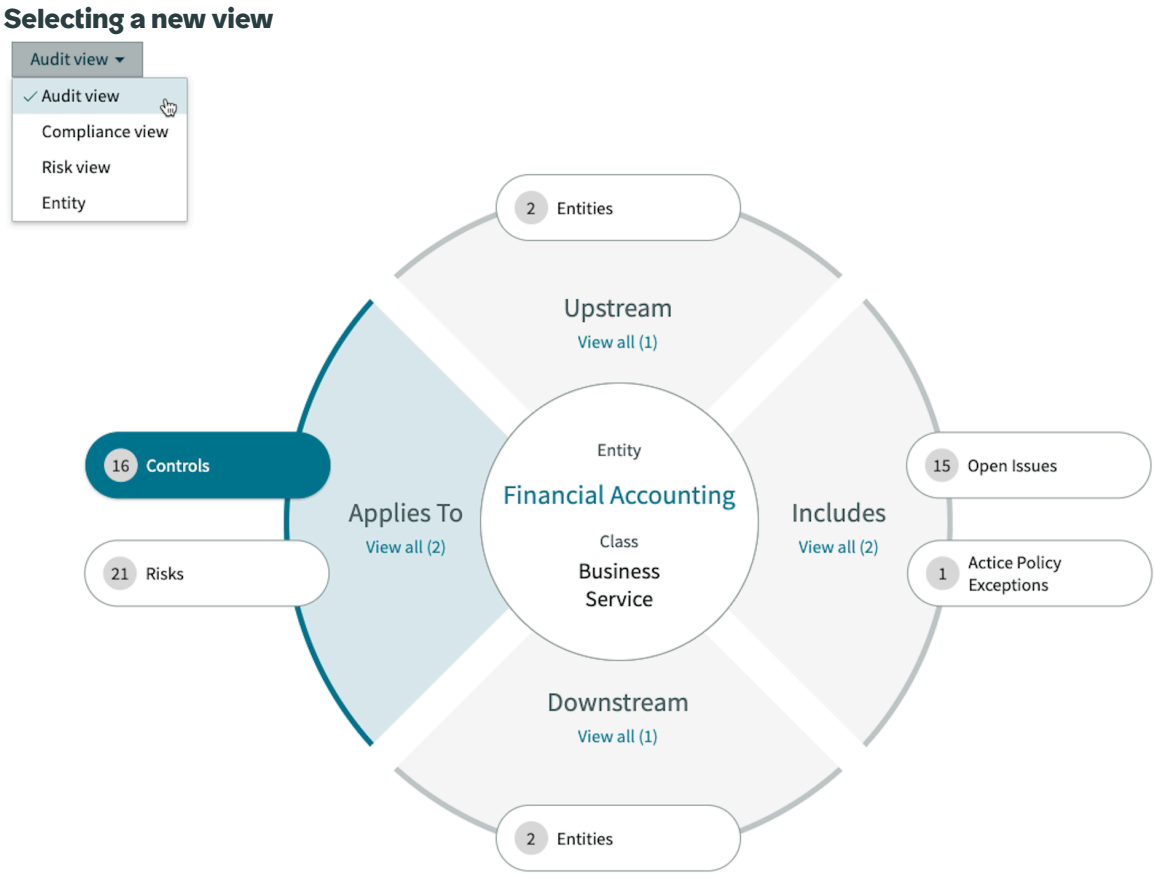
Field	Description
Primary field and secondary field	The primary and secondary fields in the selected table to be used to display the title and secondary title of the main object, as  illustrated.
Description	A description of the 360° view.
Section Configuration	
Sector configuration	Select the number of sectors to be displayed in the 360° view. For example, select `top, bottom, left, and right` to indicate you want four sectors.
Top, Bottom, Left, Right	Based on your **Sector configuration** selection, enter labels for each of the sectors.

4. Save the record.

   The Relationship Registries related list appears.

Relationship registries

5. Click **Select Relationships**.
6. On the form, fill in the fields.



DataNav Config to Data Relationship

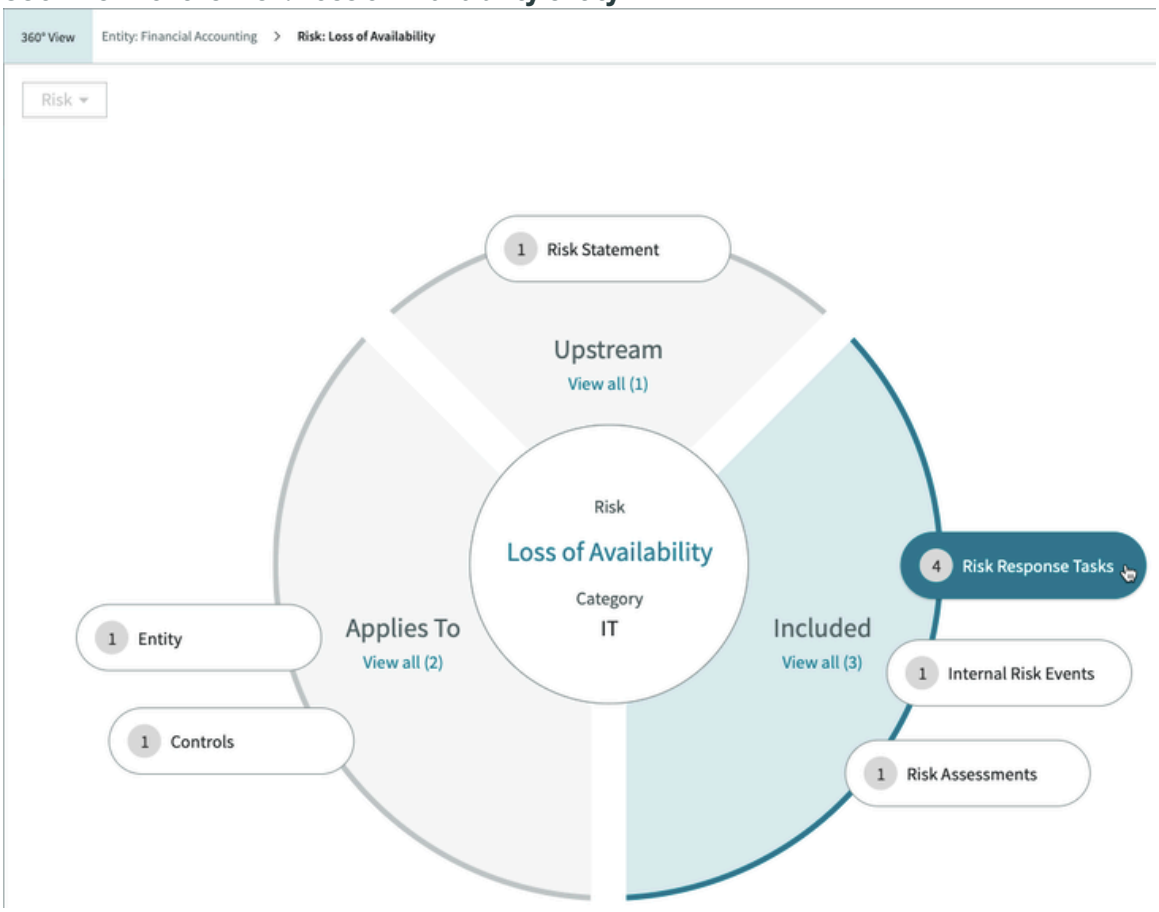
Field	Description
Name	A name to identify this relationship.
Data relationship	The data relationship you previously defined.
Relationship table	The table associated with the selected data relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Node position	The sector you previously defined to which you want to add this relationship.
Filter	Enter conditions to define the types of relationships you want to display. For example, you could define conditions for all controls with failures.
Configuration	The configuration defined for the relationship.
Table	The table defined for the relationship.
Order	Based on the **Order** value given the position of element in the 360° view will change. For example, if you change the order value from 0 to 1 for an element, the position will be moved to next in the 360°view.

7. Click **Submit**.
   The new view you have defined is now available on the 360° view.

Exploring the 360° view



After you have successfully set up your data registries for the tables you use, you can use the 360° view feature to view the relationships between a selected record and related objects, such as controls, risks, and entity types.

When you launch the 360° view from a particular record, the relationships between the selected record and all associated objects are displayed in a distinctive visualization that allows you to instantly understand how the objects interact with one another. The relationships are linked to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

your data so you can perform actions on the displayed records, such as drilling down into them to view additional details or creating new records.

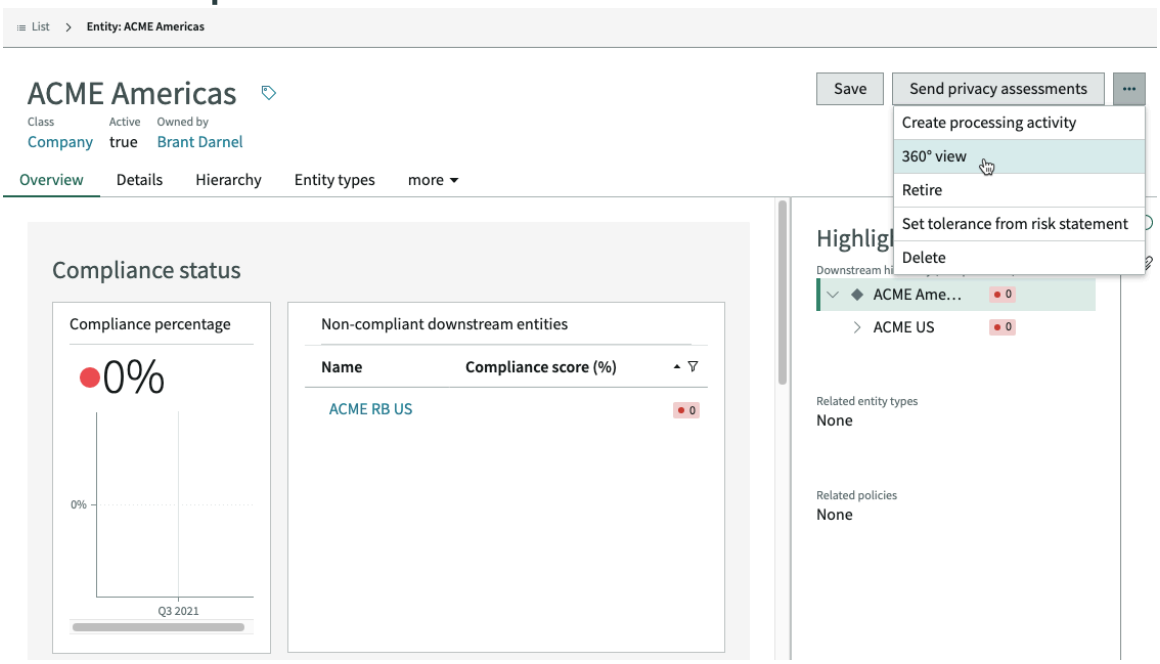
360° view for the Risk: Loss of Availability entity

The screen above shows the relationships that you set up in the data registry for the selected main object (in this case, the Risk: Loss of Availability entity). As you can see, one entity and one control apply to the main object. And the main object includes a range of relationships related to risk response tasks, internal risk events, and risk assessments. Additionally, there is a risk statement relationship upstream from the main object. All these relationships to the main object are available to you at a glance.

Launch the 360° view

After data registries have been set up, you can launch 360° view from any record screen in any GRC workspace application to view relationships between the various types of data associated with the selected record.

Before you begin



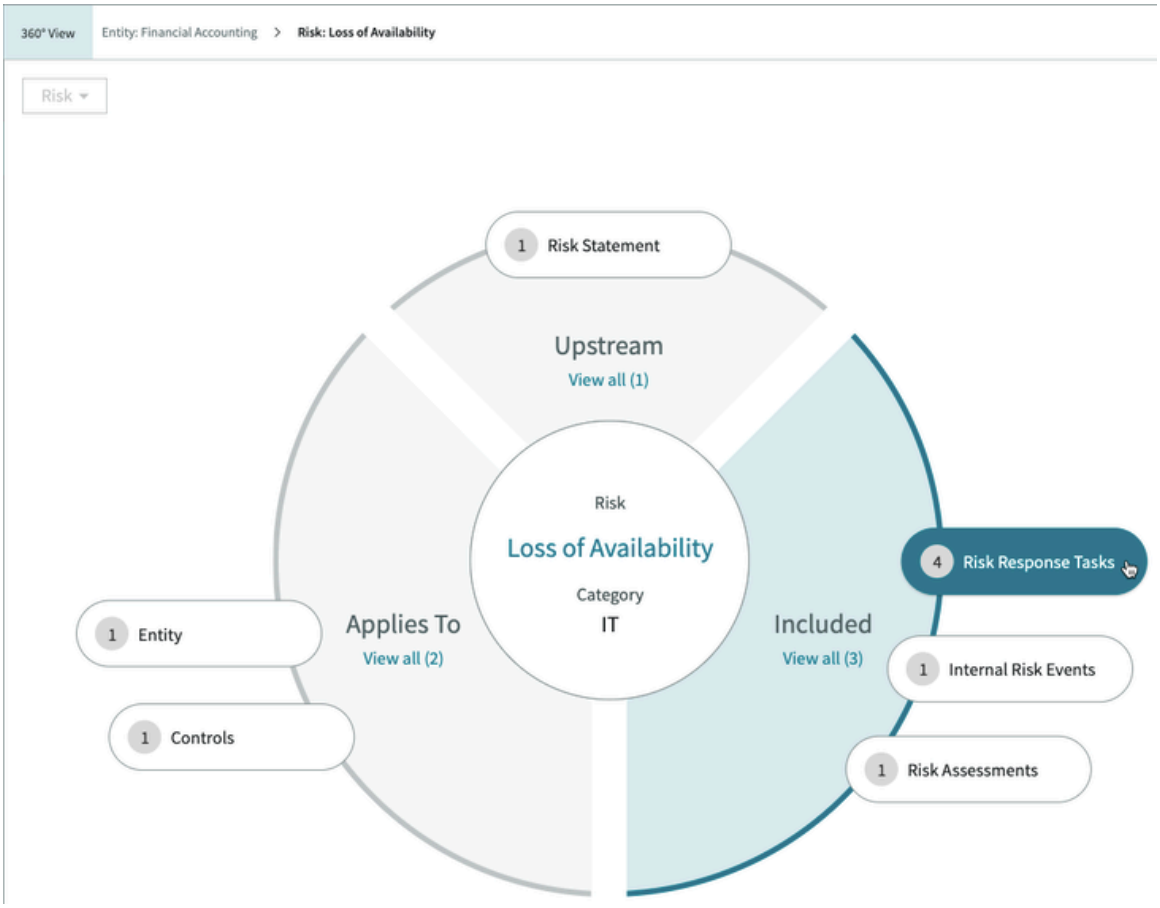
Role required: data registry reader

Procedure

1. Navigate to any GRC workspace, for example the Compliance Workspace.
2. Open a record for which you want to open in the 360° view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record in workspace



Note:
Depending on the record screen, you may need to click the ellipsis icon to view the **360° view** button.

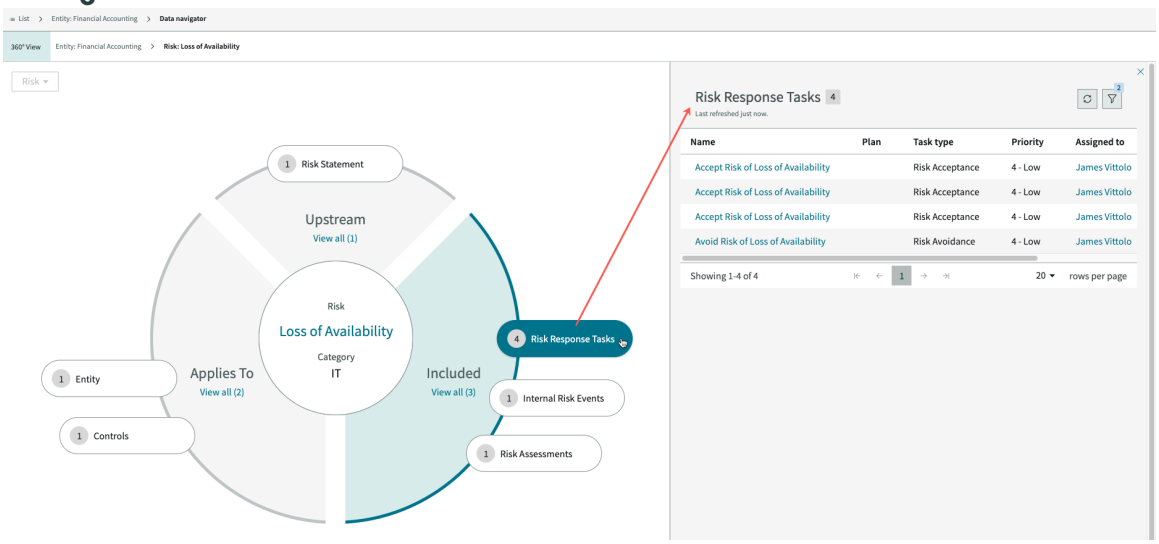
3. Click **360° view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

360° view of selected record

Note:
If you launch the 360° view prior to configuring your data registries, or if you click on an object within the 360° view that has not been configured, the visualization screen opens in fallback (or unconfigured) mode. All one-to-many and many-to-many relationships for the object are automatically calculated and displayed in the view.

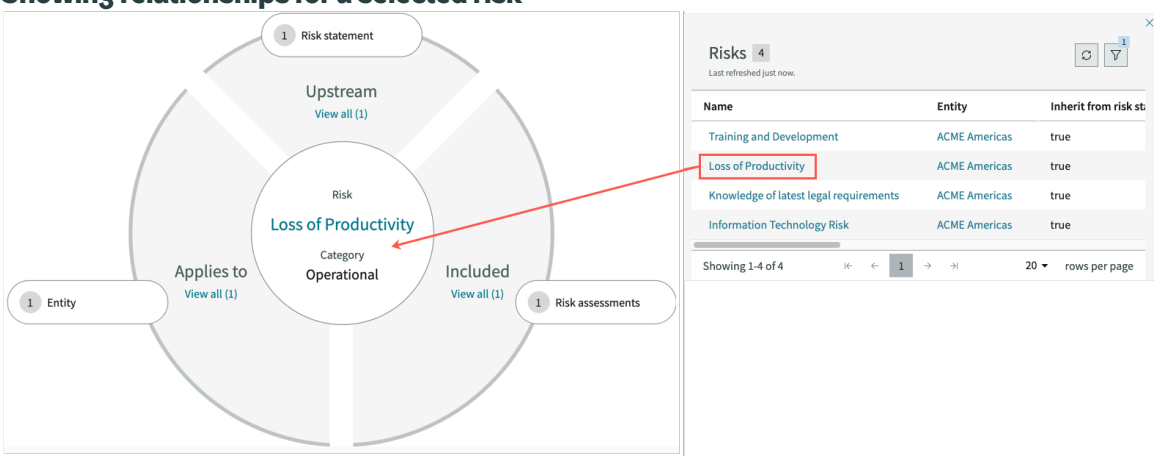
A system property called `sn_data_registry.max_count_of_fallback_relationships` allows you to define the maximum number of relationships to display in the 360° view. The default is 25.



Drilling-down for 360° details

In the 360° view, you can click on any relationship to view details.

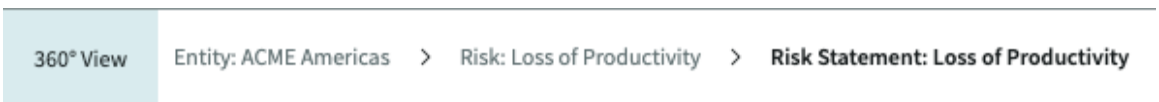
For example, you can click on the **Risks** relationship to view details on four risks.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Drilling down on risks

You can then select one of the risk records to view relationships specific to that risk record.

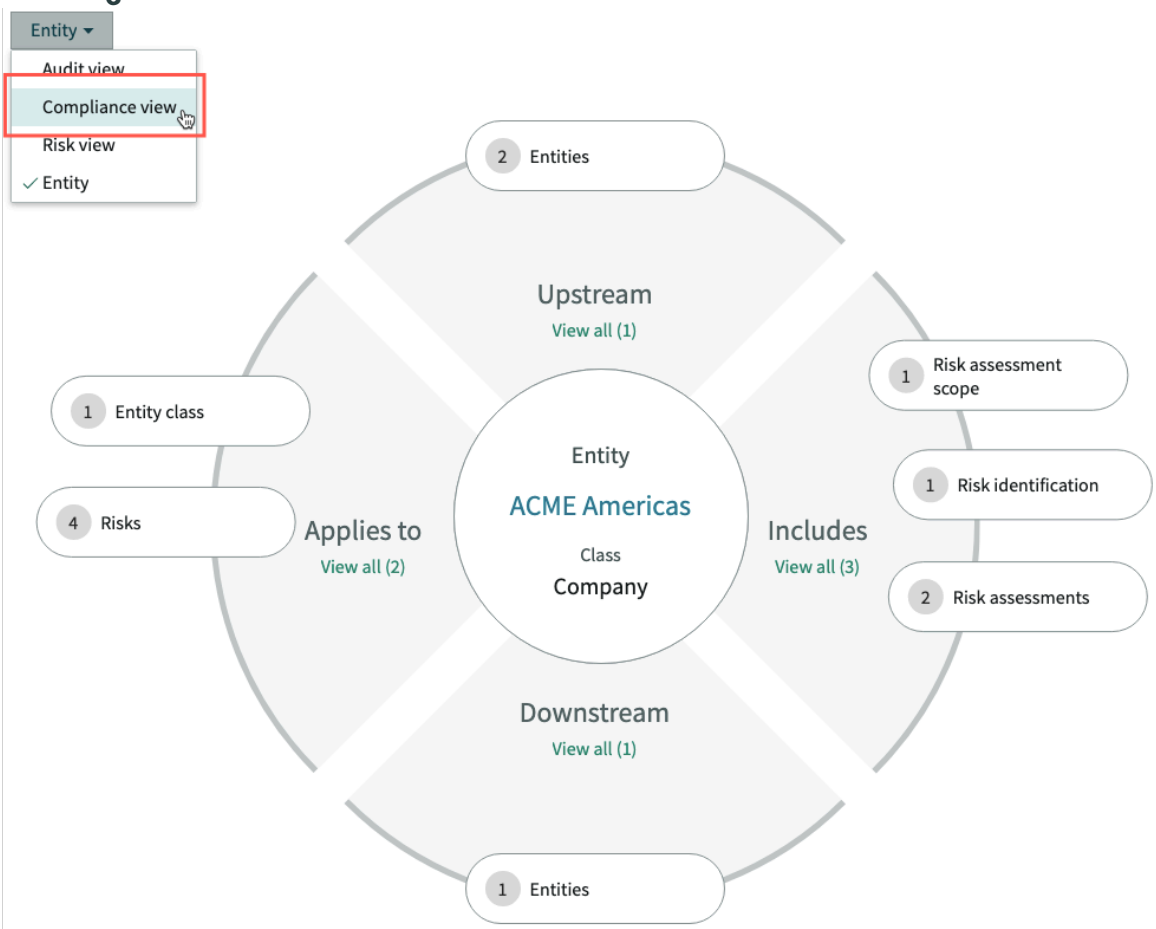


Showing relationships for a selected risk

Navigating the 360° view using breadcrumbs

As you navigate through 360° view relationship visualizations, the breadcrumbs along the top edge keep track of where you've been and allow you to return to previously viewed information.

360° view breadcrumbs



Clicking the **Entity: ACME Americas** breadcrumb returns you to a visualization of those relationships.

Selecting different 360° views

If you have defined different views, you can select them from any 360° view visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting a different view

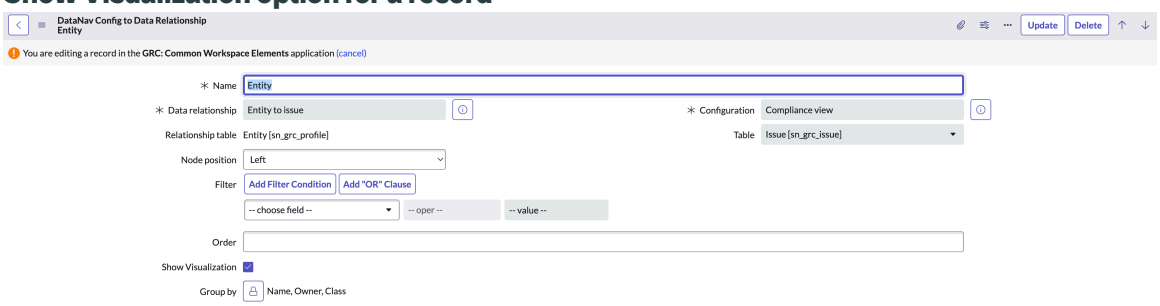
The Compliance view presents you with relationships for the main object that are specific to compliance, as you configured it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance view

Related topics

Configure 360° views

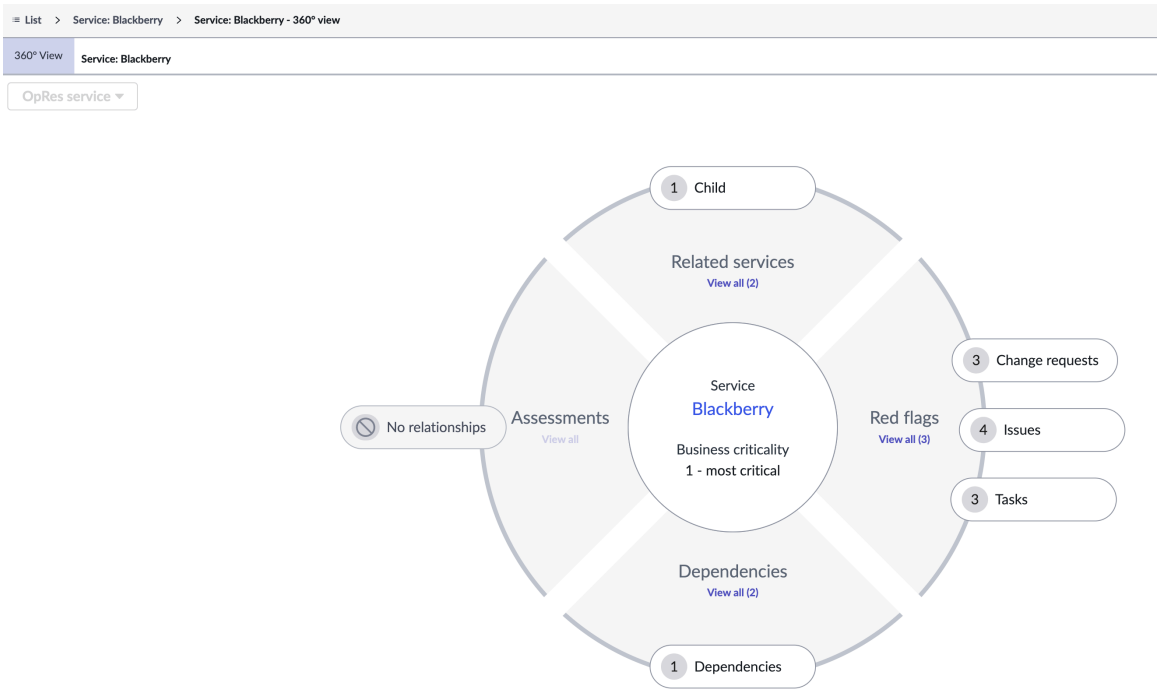


Enhancements in the 360° view

You can configure some functionality enhancements for the 360° view of each record as part of the GRC updates.

The following enhancements and bug fixes are supported with the updated 360° view:

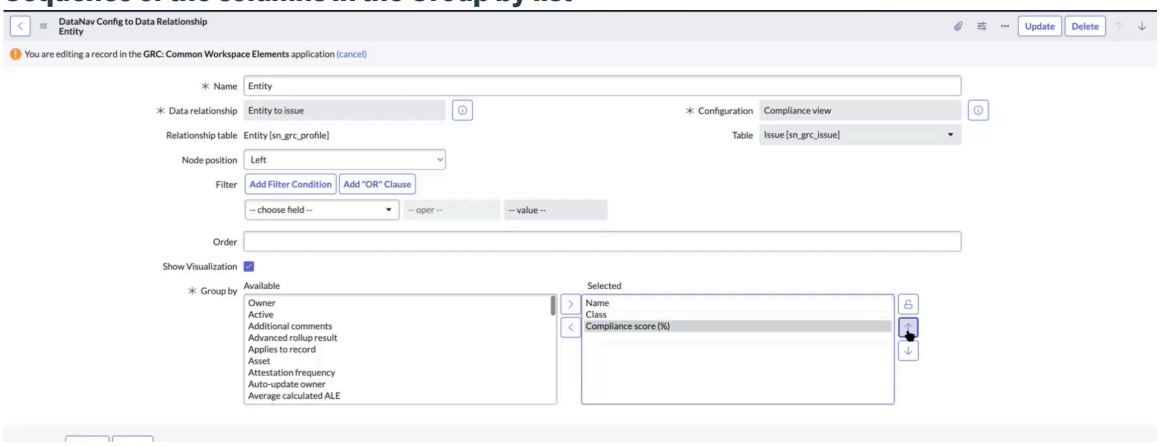
- Displaying an interactive donut chart: You can enable the **Show Visualization** option for each record and select the display columns in the **Group by** list. See the following example.



Show Visualization option for a record

When you enable the **Show Visualization** option for a record, the 360° view is displayed. In the 360° view, you can view all the objects that are associated with the record as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



360° view for a record

When you click any sector of the donut chart, the related lists that are associated with the selected object are refreshed. When you click an object pill, it displays the donut chart for the selected object in the side-panel.

- Configuring the Group by list: You can configure the number and order of the columns in the Group by list. When you update the columns in the Group by list as shown in the following example, the donut chart is refreshed for the selected columns.

Sequence of the columns in the Group by list

When you select a specific order of the columns in the Group by list, the same order of the columns is reflected in the UI. The first column that is displayed in the Selected list is the default value in the display for the customers.

- Order of the pills: You can configure the order of the pills for each section in the **Order** field. If you have not configured the order of the pills and all the pills have the same order value (for example, if each pill has an order value of 1), the pills appear alphabetically.
- The defect fixes are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Defect fix on the related lists: A defect on the related lists was fixed. A new sys_relationship field was added in the code to avoid a conflict among the related lists that refer to the same table.
- Defect fix for the Apple iPad Pro devices: Earlier, multiple vertical and horizontal scrolls were displayed in the default view on the smaller Apple iPad devices such as the 12.9-inch (0.328 meter) and 16-inch (0.406 meter) Apple iPad Pro devices. The defect related to the view on the smaller Apple iPad devices has been fixed. You can see the entire 360° component on an Apple iPad device without needing to scroll the view.
- Defect fix on the navigation path: A defect that is related to the caching issue that existed in the prior releases was fixed. You can now view the navigation path correctly for the records.

Tagging records with functional domain

Functional domain tagging is a mechanism that allows you to classify risk records based on the specific business function, process, or use case they support. A functional domain represents a logical grouping, such as Cybersecurity and risk, IT risk and compliance, Compliance, Third-Party Risk, or Operational Risk.

To understand feature adoption across diverse business functions, you can apply functional domain tags to records, either manually or through automation. This tagging allows organizations to identify how Integrated Risk Management capabilities are used across different teams, departments, and use cases.

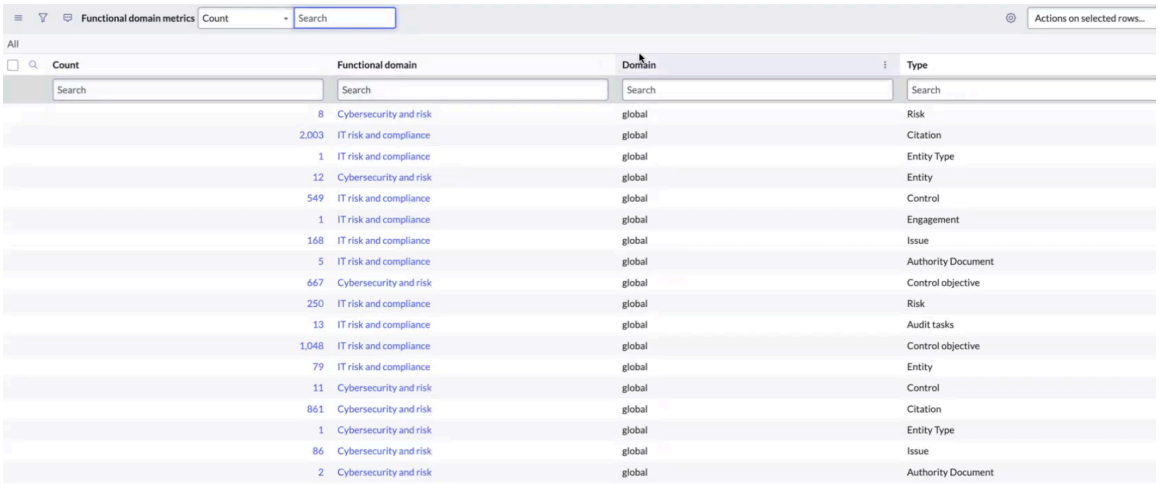
Functional domain tagging provides a mechanism to capture structured metadata that reflects actual business usage across domains. This record tagging is critical for understanding adoption trends, identifying gaps in utilization, and informing targeted enablement efforts. By aggregating domain-specific usage data, organizations can generate metrics for reporting, continuous improvement, and stakeholder alignment.

Key benefits

The following benefits highlight the value of implementing functional domain tagging.

- Facilitates targeted analysis of risk feature adoption across business units.
- Enables more informed decision-making for product planning and enablement.
- Supports domain-specific guidance and best practice recommendations.
- Contributes to the development of adoption metrics and reporting frameworks.

Tagging records



A scheduled job named `Populate Functional domain metrics table weekly` has been implemented to maintain accurate and up-to-date adoption metrics. This job systematically queries key Risk-related tables such as sn_risk, sn_control, and sn_citation, identifies and counts records tagged with functional domains. It then calculates the count of tagged records, aggregates the data, and inserts the results into the `Functional domain metrics` (sn_grc_functional_domain_metrics) table. This automated process ensures reliable visibility into domain-level usage and supports informed reporting for adoption tracking and analysis.

The scheduled job is configured to run every Monday at 1:00 AM. Upon successful execution, the `Functional domain metrics` table is updated with the latest aggregated data. Users with the `usage_admin` role can see the data in this table.

The `Functional domain metrics` table includes the following columns: Count, Functional Domain, Domain, and Type.

Functional domain metrics table

Supported record types

The following is a list of supported record types:

- Risk
- Control
- Issue
- Authority Document
- Audit tasks
- Engagement
- Citation
- Policy
- Control objective
- Entity
- Entity Class
- Entity Type
- Risk Statement

Using the item generation process to generate controls and risks

The ServiceNow® GRC suite of applications can automatically generate controls and risks for your organization with the enhanced item generation process. The enhanced item generation process (v2) in version 13.x.x fixes the stalling and performance issues from the item generation process (v1) in version 12.x.x and earlier releases.

Overview of the item generation process

By using the Governance, Risk, and Compliance application, you can use the item generation process to generate controls and risks for your organization.

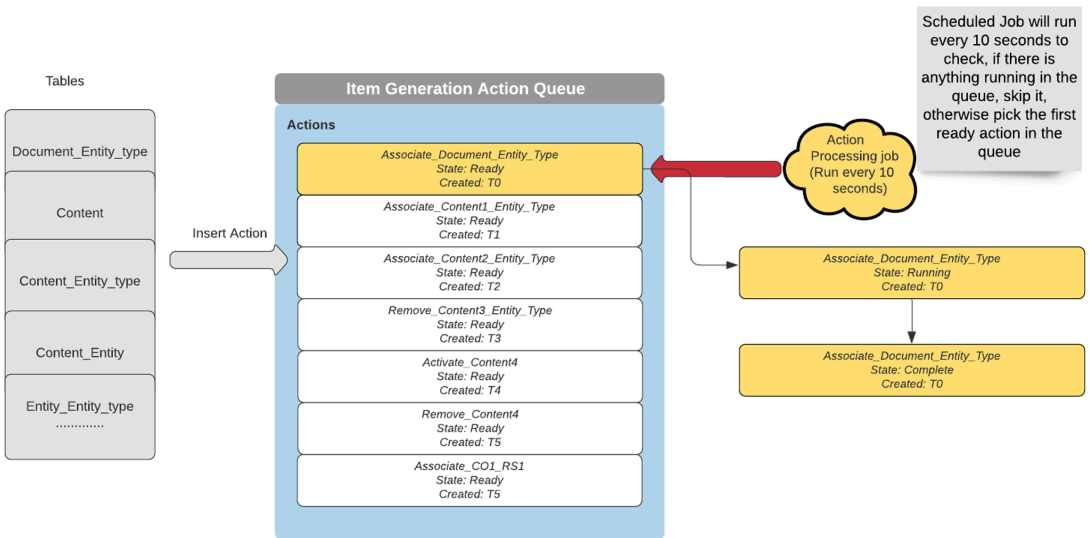
A control is the actual control activity that an organization performs. For example, a control can be related to authoritative source content (legal articles, regulations, or public records), policies,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and risks. A control is automatically generated when you associate a policy with an entity type (grouping of the entities that match a set of filter conditions) or an entity type with a control objective. For more information on controls, see Manage controls.

A risk is any threat or vulnerability that could adversely affect an organization's business objectives. For example, a risk can be related to any item, policy, control, or remediation task. A risk is automatically generated when you make associations between risk frameworks or risk statements and entity types.

Note:
Risk statements are general statements about potential risks or threats that could occur in an organization. A risk framework consists of a risk assessment, response, and accountability for the risk and mitigation activities around it.



For more information on risks, see Using Risk Management.

The item generation process (v1) in version 12.x.x and earlier releases generated out-of-sync updates due to the stalled actions in the action queue. The enhanced item generation process (v2) eliminates the stalling issues and improves the processing time of the controls and risks significantly. For example, the legacy item generation process (v1) generated 10,000 risks in approximately 13.7 minutes where the new item generation process (v2) can generate 10,000 risks in approximately 5.27 minutes.

Flow of the item generation process

The item generation process inserts an action in the action queue and executes the actions one by one in a sequence. A scheduled job runs periodically to check the action queue. If an action is running in the queue, the scheduled job skips it. When the current running action is completed and no other action is in process, the scheduled job picks up the next action in the Ready state in the queue as shown in the following example.

Item generation process flow

Benefits of the item generation process

The new item generation process provides the following key benefits:

- Processes the controls and risks quickly by using the item generation action event queue.
- Eliminates the stalled actions and race conditions in the queue that generated the non-consistent updates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Logs the history and status of the item generation actions.
- Provides more information about an error in the item generation action event queue. It helps you to track and troubleshoot the issues quickly and efficiently.
- Helps the compliance and risk managers to manage the controls and risks in an auto-pilot mode without much maintenance.

Applications that are used in the item generation process

The following GRC applications are used in the item generation process:

- GRC: Policy and Compliance Management
- GRC: Risk Management
- GRC: Profiles

The GRC: Profiles application is automatically installed when either the GRC: Policy and Compliance Management or GRC: Risk Management application is activated.

Upgrade scenarios and their impact on the existing implementations

You must upgrade both Policy and Compliance Management and Risk Management applications to version 13.x.x. When you upgrade the Policy and Compliance Management and Risk Management applications to version 13.x.x, the new item generation process (v2) replaces the legacy item generation process (v1).

Note:
Upgrading the Policy and Compliance Management and Risk Management applications to version 13.x.x automatically upgrades the GRC: Profiles application to version 13.x.x.

Ensure that you have the required versions of the Policy and Compliance Management and Risk Management applications installed in your instance. If you have one of the following scenarios for the installed applications, you receive an error message on the screen:

- You have both the Policy and Compliance Management and Risk Management applications previously installed in your instance and you upgrade only one of them to version 13.x.x.
- You have only one of the Policy and Compliance Management or Risk Management applications installed in your instance and you upgrade the GRC: Profiles application to version 13.x.x.
- You have both Policy and Compliance Management or Risk Management applications installed in your instance and you upgrade the GRC: Profiles application to version 13.x.x.

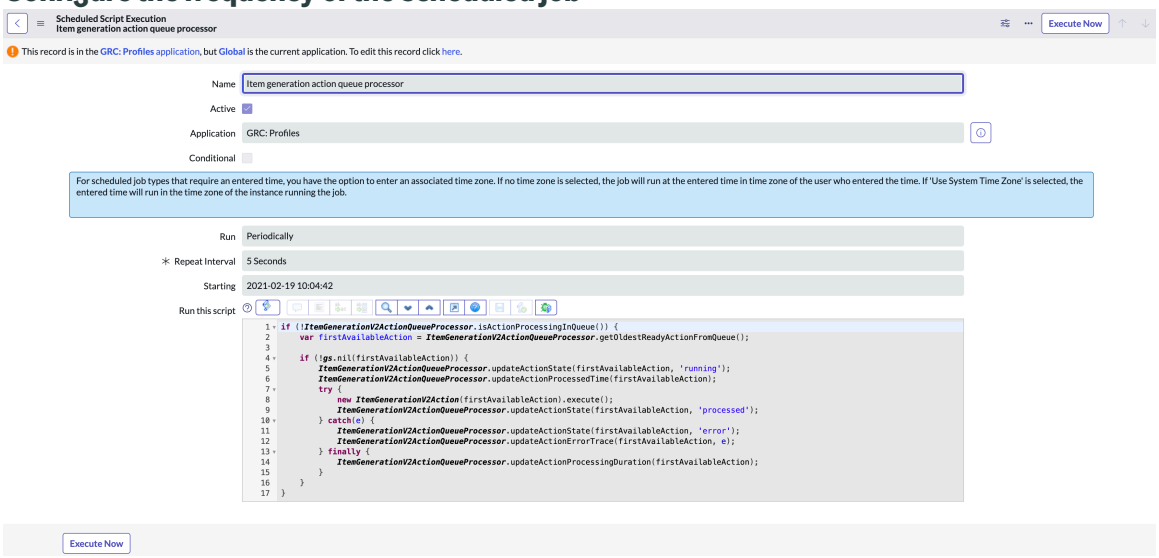
The error message states that you must upgrade both Policy and Compliance Management and Risk Management applications to version 13.x.x as shown in the following example.

Message for upgrading the applications

When you upgrade, you don't see any visible impact to your existing implementations of the item generation process.

Note:
If you haven’t upgraded to version 13.x.x, the legacy item generation process is still supported.

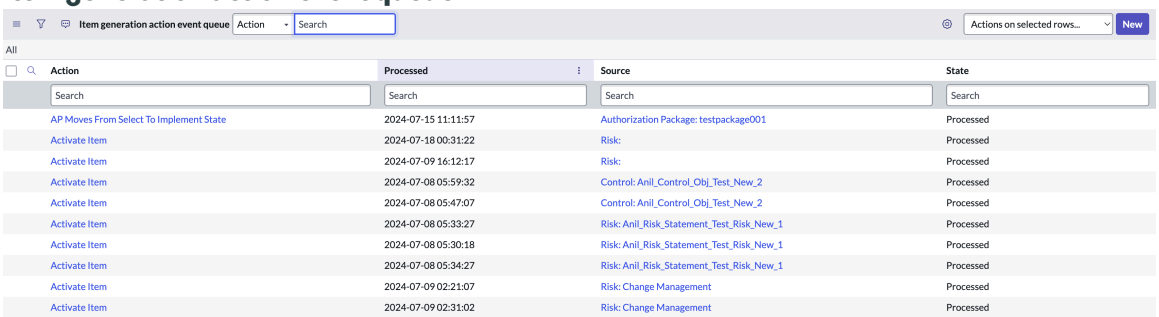
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Components that are used by the item generation process

The item generation process uses several types of reference components such as tables, scheduled jobs, and action handlers. For more information on the components that are used with the item generation process, see Components installed with the item generation process.

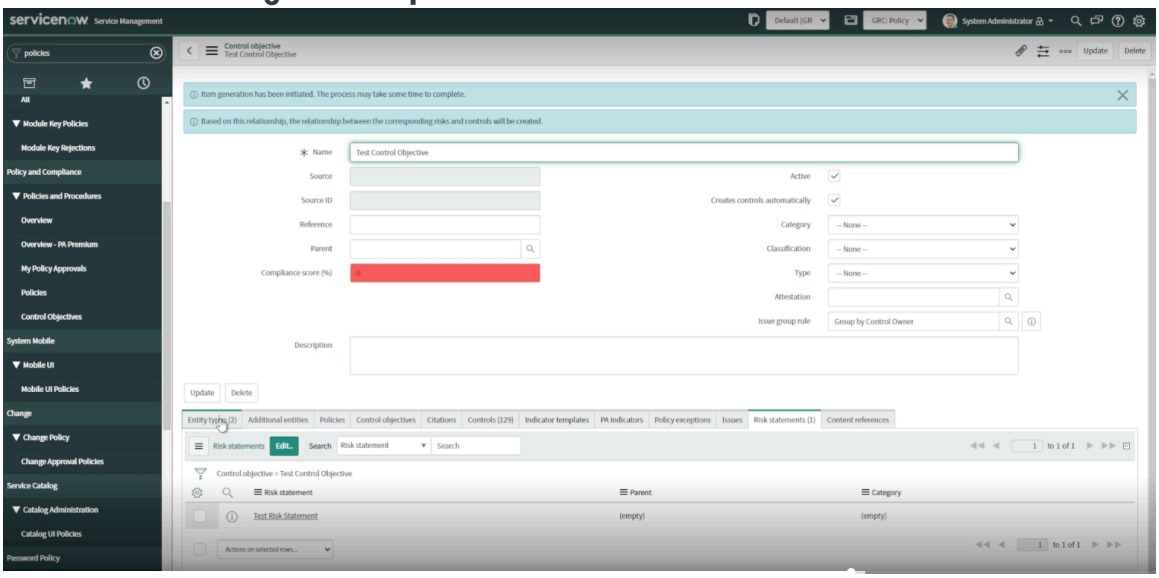
Using the scheduled job and action event queue



The item generation process uses the *Item generation action queue processor* scheduled job and an action event queue in the background. As a user with the sn_grc.admin role, you can configure the frequency of the scheduled job as shown in the following example.

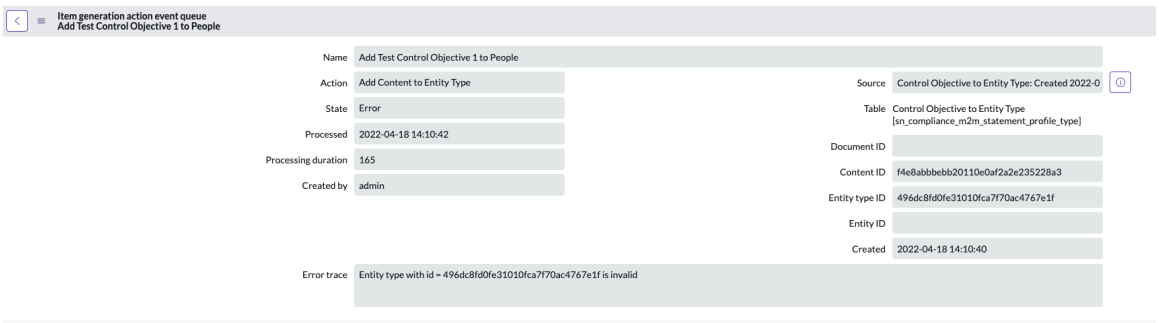
Configure the frequency of the scheduled job

When you initiate an action that results in generating, updating, or deleting a control or risk, the scheduled job inserts a record for each action in the sn_grc_item_generation_action_event_queue.list table. The item generation action event queue is shown in the following example.



Item generation action event queue

When an action is generated by using the item generation process, a message that the item generation process has been initiated is displayed. For example, when you add a risk statement to a control objective, you see the message that is shown in the following example.

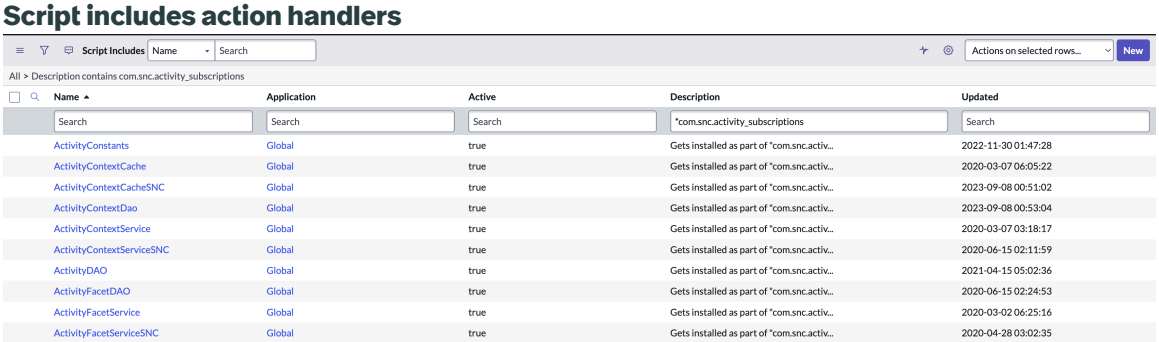


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Initiation of the item generation process

If an error occurs while processing an action in the queue, the item generation process displays more information about the error. For example, you might see an error trace with the object ID as shown in the following example.

Error trace

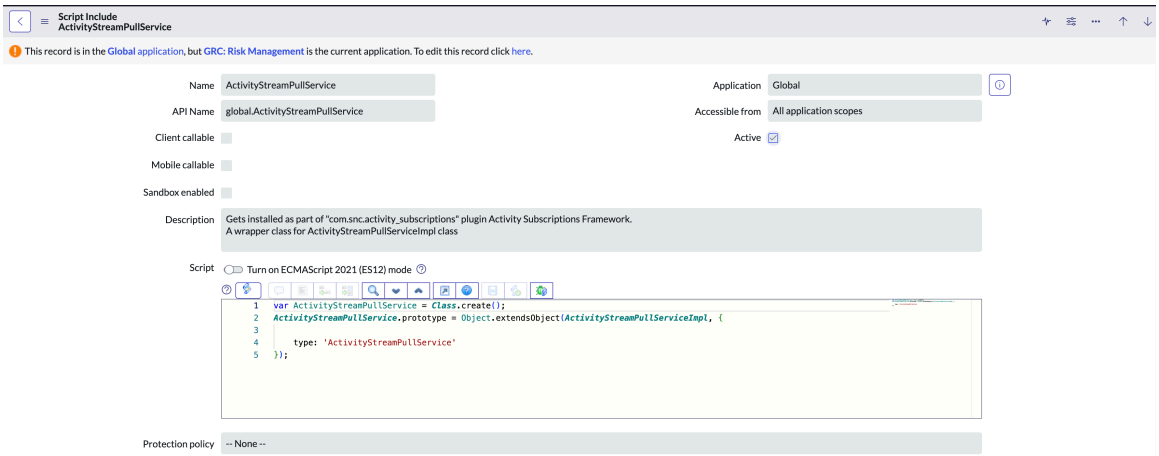


You can use the error trace and other details in the queue to track and troubleshoot the issue.

Script includes action handlers

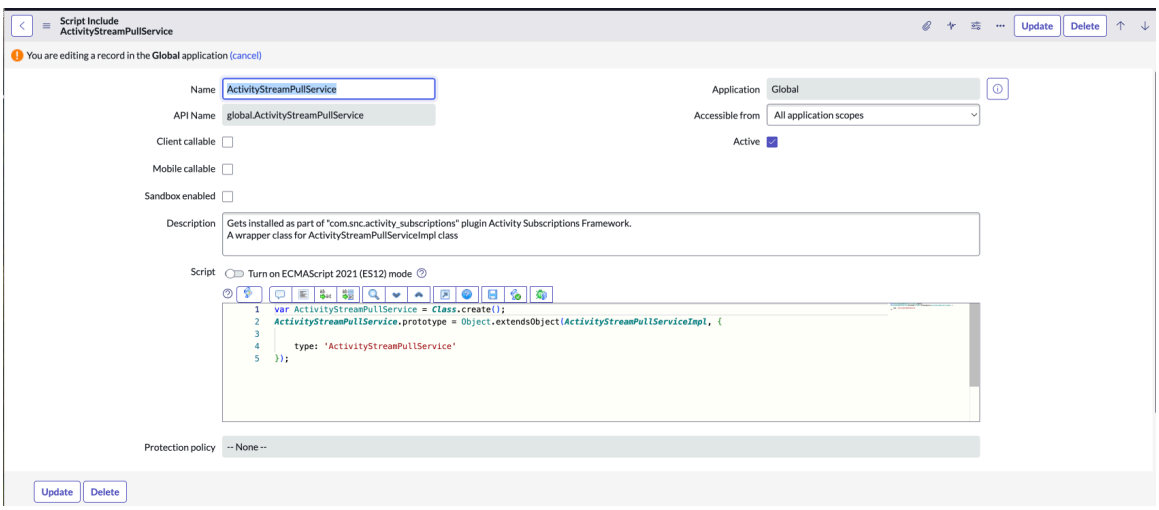
The item generation process uses the script includes action handlers that process the actions for the Policy and Compliance Management and Risk Management applications.

You can view the list of the supported action handlers by navigating to **Script Includes** in the application navigator as shown in the following example.



Script includes action handlers

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



All script includes action handlers contain the base version and the extended version. The item generation process uses the base version for handling the actions. As a user with the sn_grc.manager role, you can review the base functions that are listed in the action handler as shown in the following example.

Base functions

As a user with the script_include_admin role, you can revise the action strategy for a control or risk by overriding the base functions as shown in the following example.

Override the base functions

Components installed with the item generation process

Several types of components are installed with the item generation process, including tables, scheduled jobs, and action handlers.

The following components are installed with the item generation process in version 13.x.x.

Components that are installed with the item generation process

Component	Description
Table	
Item Generation Action Event Queue table (sn_grc_item_generation_action_event_queue)	Table that lists the actions that are generated during the item generation process.
Scheduled job	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components that are installed with the item generation process (continued)

Component	Description
Item generation action queue processor	Scheduled job to process the action queue. The job runs every five seconds by default.
Action handlers	
ItemGenerationV2Action	Single view of all the action handlers that are used for item generation.
IGContentToEntityTypeActionHandler	Handler to be called when you perform one of the following actions: • Add control objectives and risk statements to the entity type. • Remove control objectives and risk statements from the entity type.
IGDocumentToEntityTypeActionHandler	Handler to be called when you perform one of the following actions: • Add policies and risk frameworks to an entity type. • Remove policies and risk frameworks from an entity type.
IGEntityTypeActionHandler	Handler to be called when you perform one of the following actions: • Activate entity type. • Delete entity type. • Deactivate entity type.
IGEntityToEntityTypeActionHandler	Handler to be called when you perform one of the following actions: • Add an entity to an entity type. • Remove an entity from an entity type.
IGContentActionHandler	Handler to be called when you perform one of the following actions: • Activate control objectives and risk statements. • Deactivate control objectives and risk statements. • Create control objectives and risk statements. • Set an auto-control create flag. • Add control objectives to risk statements.

Components that are installed with the item generation process (continued)

Component	Description
	• Remove control objectives from risk statements. • Delete control objectives and risk statements.
IGDocumentActionHandler	Handler to be called when you perform one of the following actions: • Activate policies and risk frameworks. • Deactivate policies and risk frameworks. • Add control objectives and risk statements to policies and risk frameworks. • Delete control objectives and risk statements from policies and risk frameworks.
IGEntityActionHandler	Handler to be called when you perform one of the following actions: • Activate an entity. • Deactivate an entity.
IGContentToAddtlEntityActionHandler	Handler to be called when you perform one of the following actions: • Add control objectives and risk statements to an additional entity. • Remove control objectives and risk statements from an additional entity.
IGItemActionHandler	Handler to be called when you perform one of the following actions: • Activate an item. • Deactivate an item. • Delete an item.
IGItemToEntityActionHandler	Handler to be called when you perform one of the following actions: • Add entity to item. • Activate entity to item. • Remove entity from item. • Deactivate entity to item.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components that are installed with the item generation process (continued)

Component	Description
IGItemToEntityTypeActionHandler	Handler to be called when you perform one of the following actions: • Add entity type to item. • Remove entity type from item.

Note:
For more information on the item generation process for common controls, see the new action types in generation of items.

Roles and users for the new item generation process

Users with the sn_grc.admin or sn_risk.manager role role can access the sn_grc_item_generation_action_event_queue.list table in an instance and view the item generation action queue.

The compliance and risk user roles and their associated tasks that trigger the item generation process are listed in the following table.

Note:
The compliance and risk user roles that are listed in the table are available with version 12.x.x and earlier releases.

Compliance and risk user roles and their associated tasks

Compliance and risk user roles	Associated tasks
• sn_compliance.admin • sn_risk.admin	• Delete policies. • Delete risk frameworks. • Delete control objectives and risk statements. • Delete an entity. • Delete an entity type.
• sn_compliance.manager • sn_risk.manager	• Associate policies or risk frameworks to an entity. • Delete policies or risk frameworks from an entity. • Associate policies or risk frameworks to an entity type. • Delete policies or risk frameworks from an entity type. • Activate an entity type. • Deactivate an entity type. • Associate an entity to an entity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance and risk user roles and their associated tasks (continued)

Compliance and risk user roles	Associated tasks
	• Delete an entity from an entity type. • Add control objectives to a risk statement. • Delete control objectives from a risk statement.
• sn_compliance.manager • sn_risk.manager • Entity owner	• Activate an entity. • Deactivate an entity.
• sn_compliance.user • sn_risk.user	• Create control objectives and risk statements. • Enable the **Creates controls automatically** option.
sn_risk.manager	• Add risk statements to a risk framework. • Modify risk statements that are added to a risk framework.

Operational changes in item generation of common controls

Operational changes are made in item generation mainly because item generation either creates a control or activates an existing standard control. When it comes to associating a control to an entity, then associating a reliant entity to a common control takes precedence over creating a control for that entity.

Creation of controls

If the existing controls in your system can be used for testing entities, then you can take advantage of the existing data and avoid creating controls. Having many controls can lead to control explosion. If that is not feasible, then you can associate a primary entity with a common control, test the common control, and implement the test results on the reliant entities of the common control. If both these options don't work, then you can create a control.

To create a common control, select **Common** in the **Function** field of the Control form. Select the **Convert to common** list UI action. A common control is created upon validation. It's mandatory that you select a control objective before you convert a standard control to common control.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Association of reliant entities to common control

1. Use the Reliant entities related list in the Control form to add individual entities to the common control. You can also remove the reliant entities using the **Remove** button.
2. Use Reliant entity types related list in the Control form to add entity types to the common control. You can also remove the reliant entity types using the **Remove** button.
3. Use the **Inherit common controls** UI action in the Controls related list of the Risk form to select common controls grouped by control objectives.

Note:
For more information on reliant entity associations for a common control, see Create a control using the Compliance Workspace and Convert standard control to common control and add reliant entities.

Item generation – Assumptions

- There's no auto-generation of common controls.
- When the existence of common controls or associations of reliant entities to common control or standard controls are checked, the control's name, entity, and control objective must match.
- Order of precedence between standard and common controls:
  - If reliant association and standard control do not exist, then based on the action type, a standard control is created. Action types, for example can be Add content to entity type, Add document to entity type, Activate content, Activate document.
  - If reliant association and standard control do not exist, then based on the action type a reliant association to common control is created. Action type can be Add entity type to common control.
  - If the user's intent is not clear from the action type and a standard control does not already exist, then in conflicting entity type, the preference is to associate the reliant entity to the common control over creation of a standard control. Action type, for example can be Add entity to entity type.

Item generation changes

New action types in the generation of items

Item generation action type	Description
Add entity type to common control	If the entity is not associated with the common item, then the application associates the entity with the common item by creating an m2m association between the two.
Remove entity type from common control	If the entity is associated with the common item, and the Entity types field has other entity types or **Individually_added** is true in the m2m record, then the application removes the Entity type ID from the Entity types column or deletes the entity to common item m2m record.
Add entity to item	If Risk Management is installed, based on the risk statement associated to the control objective, the risk to common control m2m

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New action types in the generation of items (continued)

Item generation action type	Description
	records are added in the Control to Entity m2m table after considering the reliant entities.
Remove entity from item	• If Risk Management is installed, based on the risk statement associated to the control objective, risk to common control m2m records are deleted in consideration of the reliant entities. • If Privacy Management is installed, then the Processing Activity to common control m2m association based on its reliant entity and also the Processing Activity to control objective m2m association are removed.
Activate entity to item	If Risk Management is installed, based on the risk statement associated to the control objective, risk to common control m2m records are added in the Control to Entity m2m table in consideration of its reliant entities.
Deactivate entity to item	• If Risk Management is installed, based on the risk statement associated to the control objective, then the risk to common control m2m records are deleted after considering the control's reliant entities. • If Privacy Management is installed and the Processing Activity corresponds to a reliant entity, then the Processing Activity to common control m2m association and also the Processing Activity to control objective m2m association are removed.
Activate item	A common item is added: **1.** When no standard control exists with the same name, content (control and control objective), and entity combination. **2.** If the entity is not reliant on any other common item with the same name, content, and entity. **3.** When the entity is active. A standard item is added: **1.** Risk Management and Policy and Compliance Management plugins are installed **2.** Based on the risk statement and control objective association, risks are associated to controls.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New action types in the generation of items (continued)

Item generation action type	Description
Deactivate item	• Common item: Deactivates all Control to Entity m2m records. • Standard item: Deletes risks to control associations based on the Risk statement and Control objective associations.

Using Approver Configurator for setting up approvals

The GRC: Approver Configurator application provides you with capabilities to define multiple levels of approvals based on the business assignment rule configurations.

To set up multiple levels of approvals in your application, you must complete the following setup steps:

1. Set up an approval configuration record. For more information, see Set up an approval configuration record.
2. Set up the approval levels. For more information, see Assign an approval level for the approval configuration record.
3. Set up assignment configurations. For more information, see Auto-assign configuration for regulatory alerts.
4. Set up the approval rules. For more information, see Set up an approval rule for the approval level.

Note:

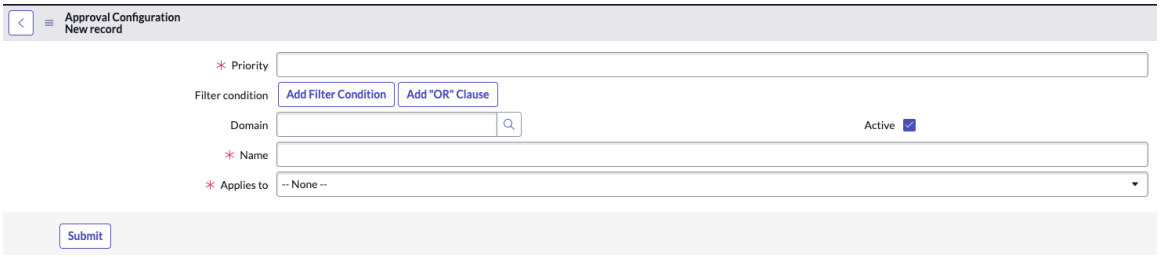
For more information on the roles in the GRC: Approver Configurator application, see Roles installed with GRC: Approver Configurator.

Set up an approval configuration record

Set up an approval configuration record to enable multiple levels of approvals and select approvers for each level based on approval rules.

Before you begin

The GRC: Approver Configurator (sn_grc_appr) application for approval configurations is installed with the GRC: Policy and Compliance Management application.



Role required: sn_grc_appr.admin, sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager

Procedure

1. Navigate to **All** > **Approval Configurator** > **Approval Configurations**.
2. Select **New**.

The Approval Configuration New Record is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.
   For information on the fields in the form, see Approval Configuration New Record.

   Note:
   You cannot have more than one approval configuration applying to the table with the same priority.

4. Select **Submit**.

Approval Configuration New Record

Use the Approval Configuration New Record form to create an approval configuration record.

Approval Configuration New Record

Approval Configuration form

Field	Description
Priority	Priority for approval configuration.
Filter condition	Condition applied on the table with reference to the **Applies to** field. The approval configuration with higher priority that matches the filter condition for the business document is selected for approver evaluation.
Domain	Domain selected for the approval configuration record.
Active	Option to enable the approval configuration as active.
Name	Name of the approval configuration.
Applies to	Table from which a record is submitted for approval. For example, business impact analysis or any table.

Assignment Configuration New Record

Use the Assignment Configuration new record form to create auto-assignments for regulatory events of the type regulatory alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment Configuration New Record

Assignment Configuration New Record form

Field	Description
Name	Name of the assignment configuration. For example, Assignment configuration 1.
Applies to	Name of the table on which the assignment configuration is being applied.
Order	Value that is used by the assignment configuration engine to pick the assignment configuration for execution. For example, if there are multiple assignment configurations on the same table with different conditions, the one with the lowest value is picked for execution.
Active	Option to mark the assignment configuration record as active.
Conditions	
Choose a field	Field on which you want to apply the condition.
Operator	Required operator.
Value	Value of the field on which you're applying the condition.
Actions	
Assign to	• Individuals influenced by user full name. • Individuals referenced in associated context. • Individuals based on programmatic logic.
User Influenced by	User category to which you want to assign the configuration. • None. • Assigned to. • Closed by. • Issue manager. • Opened by.
Group Influenced by	User group category to which you want to assign the configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment Configuration New Record form (continued)

Field	Description
	• Assignment group. • Issue manager group.
Assignee (user)	User to whom you want to assign the configuration.
Assignee (group)	User group to which you want to assign the configuration.

Assign an approval level for the approval configuration record

Assign one or more approval levels for the approval configuration record to support each step of approval.

Before you begin

Role required: sn_grc_appr.admin

Procedure

1. Navigate to **All** > **Approval Configurator** > **Approval Configurations**.
2. Click an approval configuration record in the list to set up the approval levels.
3. Click **New** in the Approval Levels section.
4. On the form, fill in the fields.

Approval Level form

Field	Description
Name	Name of the approval level.
Level	Stage of approval.

Note:
You cannot have more than one approval level for an approval configuration with the same level.

5. Click **Submit**.

Approval Level New Record form

Use the Approval Level New Record form to create an approval configuration on a policy record.

Approval Level New Record

Approval Level New Record form

Field	Description
Name	Name for the approval level. For example, Level 1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Level New Record form (continued)

Field	Description
Level	Number for the approval level for the policy record. For example, Level 1. You can set up a maximum of 10 levels of approval for the policy record.

Set up an approval rule for the approval level

Set up an approval rule for the approval level. You can define the source, filter conditions on the source table to which the approval rule is applied, approver type, and approvers in the record.

Before you begin

Role required: sn_grc_appr.admin

About this task

An approval rule is required for an approval level because it defines the conditions under which that level of approval is triggered. For example, you can create approval rules for a risk administrator or BCM administrator.

You can select specific approvers, approvers from the selected source table, dynamic approvers, or approvers that you choose to approve your business documents. For example, an approver can be a risk administrator, BIA owner, BCM administrator, or a contributor.

Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**.
2. Click an approval configuration record in the list.
3. Click the approval levels record in the **Name** column of the Approval Levels section.
4. Click **New** in the Approval Rules section.
5. On the approval rule form, fill in the fields.
6. Click **Submit**.

Approval Rule New Record form

Use the Approval Rule New Record form to create an approval rule for the approval level for a policy record.

Approval Rule form

Field	Description
Name	Name of the approval rule. For example, Approval rule 1.
Description	Brief description about the approval rule.
Active	Option to mark the approval rule record as active.
Source	Source table that the approval rule is applied to. Optionally, you can apply an additional condition on the source table. Select a field to filter the source records based on the **Applies**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Rule form (continued)

Field	Description
	to table that is to be filled in the approval configuration.
Additional condition	Additional filter condition that can be applied on the source table.
Query using field	Field that connects the approving table and the source table.
Approver type	Type of approvers for the policy. See the following options for approver types. • Specific approvers: Select users as approvers by selecting **Users**, **Group**, or both. • Approver from source: Select approver from the source table. You can select a user column, group column, or both from which to read the approver. • Dynamic approvers: Select approvers dynamically from the approver table by applying static and/or advanced dynamic conditions. You can select a user column, group column, or both from which to read the approver. • Scripted approvers: Write a script to determine approvers. Variables **users** and **groups** are used in the script. **Note:** For security reasons, the Approver Configurator developers have read and write access to the **Script** field on the Approval Rule form. For more information on setting up the approval rules, see Set up an approval rule for the approval level.
Approval required from	One or more stakeholders from whom the approval is required.
Approver type (Approvers selected for the record)	
Option 1: **Specific approvers**	When the Approver type is **Specific approvers**, the approvers are as follows: • Users: User reference or list of approvers from the approver table. • Group: User group reference as approver from the approver table.
Option 2: **Approver from source**	When the Approver type is **Approver from source**, the approvers are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Rule form (continued)

Field	Description

	• In the **Approval required from** field, the available options are:
	  ○ **All**
	  ○ **Anyone**
	• In the **Approvers** section, the available options are:
	  ○ **Approvers from**
	  ○ **User field**
	  ○ **Group field**

Option 3: **Dynamic approvers**	When the Approver type is **Dynamic approvers**, the approvers are as follows:
	• In the **Approval required from** field, the available options are:
	  ○ **All**
	  ○ **Anyone**
	• In the **Approvers** section, the available options are:
	  ○ **Approvers from**
	  ○ **Filter by**
	  ○ **Advanced**
	  ○ **User field**
	  ○ **Group field**

Option 4: **Scripted approvers**	When the Approver type is **Scripted approvers**, the approvers are as follows:
	• In the **Approval required from** field, the available options are:
	  ○ **All**
	  ○ **Anyone**
	• In the **Scripted approvers** section, the custom script for the approval configuration is displayed.
	Note:
	Only users with a developer role can modify the custom script.

Roles installed with GRC: Approver Configurator (continued)

Role title [name]	Description	Contains roles
Approver Configurator approver [sn_grc_appr.approver]	Create, read, update, and delete access to the Approval tables.	None
Approver Configurator developer [sn_grc_appr.developer]	• Create, read, update, and delete access to the Approval Configuration, Approval Levels, and Approval Rules tables. • Create and write access to the script field. **Note:** The Approver Configurator developer has create and write access to the **Script** field on the Approval Rule form.	sn_grc_appr.admin

Confidential records

You can mark sensitive GRC records as confidential. You can then make sure that the right people have access to these records.

You can mark sensitive GRC records as confidential by setting the confidential option for a record. By doing this action, you can ensure that only certain users or users from specific user groups can access these confidential records.

Confidentiality property

A new option *`Enable record level confidentiality`* is available under GRC properties at the record level to enable confidentiality.

Important:
The *`Enable record level confidentiality`* property is turned off by default. When it is enabled, it can't be turned off again.

The confidential records in GRC are listed under the GRC Confidential module. The GRC confidential records module is displayed in the application navigator only when you enable the *`Enable record level confidentiality`* property.

Starting with San Diego, the GRC Confidential Records module is available for the Audit Management, GRC core, Policy and Compliance Management, and Risk Management applications.

Unmarking confidentiality on the record

When you unmark confidentiality on a record, allowed users and groups on that record will be removed and all the users will get access to the record based on ACL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User roles that are required to access the confidential records

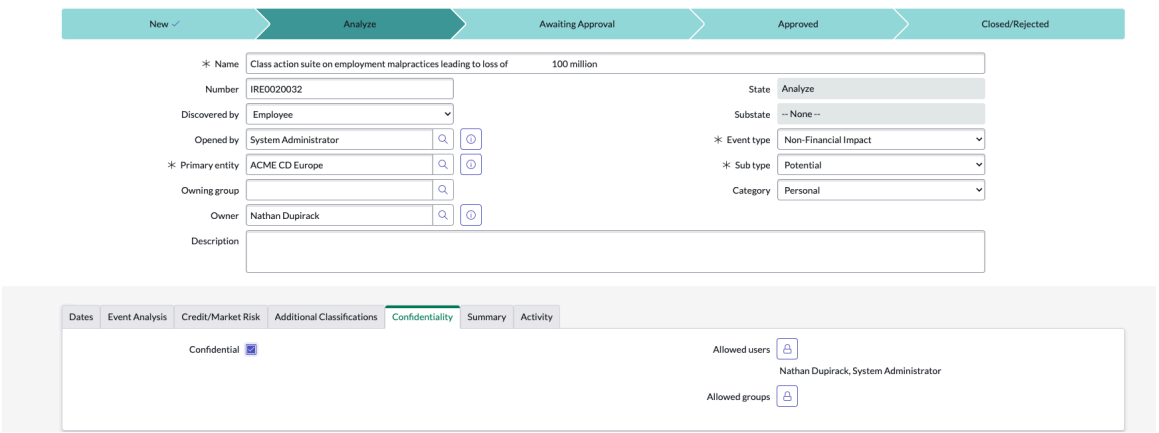
Users with the GRC confidential user (sn_grc.confidential_user) role can access the confidential records. This role is for the users who are not GRC users but who want to access the GRC confidential records.

Users who have access and who are named in the record continue to have access to the record with the existing GRC role.

Consider the following examples for different roles:

- You are a risk user and you were given access to a risk record earlier. Now, you are part of the allowed users list for the same record. Therefore, even if you don't have the sn_grc.confidential_user role, you can access the record because you had access to this record earlier and your name is now listed on the allowed users list.
- Your name is listed on the record, but you don't have the sn_grc.confidential_user role. You must have the sn_grc.confidential_user role first to access the record.

When a record is marked as confidential, an email notification is sent out to the users and the user group members informing them about the assignment and the roles that are required to access the record. Every user that is listed in the Allowed users and Allowed groups list gets an email notification about the assignment of the record.



Confidentiality tab on the form

The **Confidentiality** tab on the form displays the following lists and options:

- Confidential option: Enabling the **Confidential** option on the Confidentiality tab displays the Allowed users and Allowed groups lists as shown in the following figure.

  Note:
  A user with write access to the record can enable the **Confidential** option on the Confidentiality tab.

  ### Confidentiality tab on a form

- Allowed users list: When a record is marked as confidential, only the users in the Allowed users list have access to the record. A user who is listed in the Allowed users list should either have read access to the record or have the sn_grc.confidential_user role to access the confidential records.

  The logged-in user who enables the **Confidential** option gets auto-populated in the Allowed users list. The user who enables the **Confidential** option on the tab is auto-appended to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Allowed users list by default. Those users with write access to the record can unlock and update the Allowed users list.

Note:
There are no restrictions on which users can be added to the Allowed users list. A user who doesn't have the GRC role should have the sn_grc.confidential_user role to access the record. An email notification is also sent to the user about the role requirement.

- Allowed groups list: When a record is marked as confidential, only the users that are listed in the Allowed groups list have access to the record. Those users with write access to the record can unlock and update the Allowed groups list.

Note:
Confidential records are visible to the users who are listed in the Allowed users or Allowed groups list. By default, the administrators can also view the confidential records. If you do not want the administrators to view the confidential records, follow the steps mentioned in KB1497382.

Users who don't have the GRC user role but are listed in the Allowed users list or Allowed groups list can be assigned with the sn_grc.confidential_user role to access the confidential records.

Confidentiality is supported on the following tables.

Tables on which confidentiality is supported

Table label	Table name	Application scope	Users that get auto-populated in the allowed users list	Groups that get auto-populated in the allowed groups list

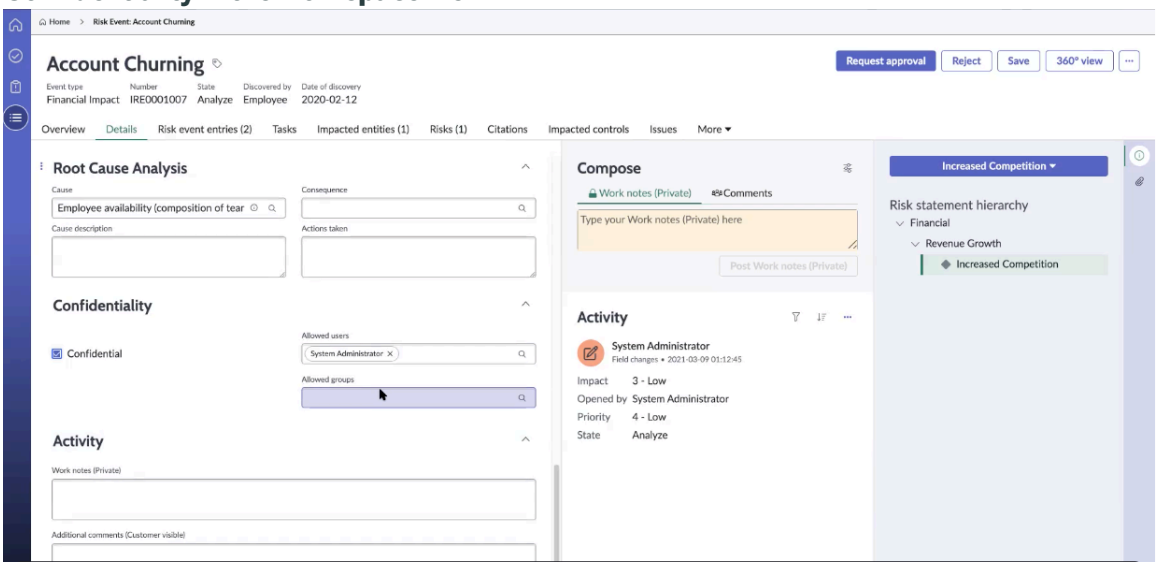
Metrics	sn_grc_metric	ESG Management and Reporting	Logged in user, enterprise owner, data owner	Enterprise owner group, data owner group
Metric definitions	sn_grc_metric_definition	ESG Management and Reporting	Logged in user, enterprise owner, data owner	Enterprise owner group, data owner group
Composite metric definitions	sn_grc_composite_metric_definition	ESG Management and Reporting	Logged in user, enterprise owner	Enterprise owner group

Starting with Utah, confidential configuration for all the Out Of the Box confidentiality enabled GRC tables except sn_esg_material_topic, sn_grc_metric, sn_grc_metric_definition, sn_grc_composite_metric_definition, are shipped to sn_grc_confidentiality_configuration table. You can update and remove the user and group fields that are auto-populated into allowed users and groups of a record from this configuration.

To know more about the confidentiality feature, see KB1218856.

Configure confidentiality in your GRC tables

To enable confidentiality in your GRC tables, you must perform additional configuration, such as updating the client scripts and updating access control lists (ACLs). After you update the configuration for a specific ServiceNow platform table, the confidentiality functionality can be used on those table's forms.



For information on how to enable confidentiality in your GRC tables, see KB1497382.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must log in to Now Support to view the Knowledge Base articles.

You can also enable Confidentiality on a form in the workspace view as shown in the following figure.

Confidentiality in the workspace view

Create a confidential record

Create a record and mark it as confidential so that you can make sure that only the users with a specific role can access it.

Before you begin

Role required: sn_grc.admin, sn_grc.business_user who has opened the risk event, sn_audit.user, sn_compliance.user, sn_esg.user, sn_risk.user

Procedure

1. Navigate to **All > Administration > GRC Properties**.
2. Select **Yes** for **Enable record level confidentiality** property and click **Save**.
   Perform the following steps by logging in with the sn_grc.business_user role or a module specific role as defined in the Role required section.
3. Navigate to the record that should be marked as confidential and select **Confidentiality** tab.
4. On the **Confidentiality** tab, select the **Confidential** option.
   The Allowed users and Allowed groups lists are displayed. The user who enables the **Confidential** option is auto-appended to the Allowed users list by default.
5. To add more users, update the Allowed users list.
   Allowed users can update the confidential record.
6. To add more groups, update the Allowed groups list.
   Allowed groups can update the confidential record.
7. Click **Update**.

Result

The selected record is marked as confidential. Only the users who belong to the Allowed users list or the Allowed groups list can access this confidential record.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure confidentiality in GRC tables

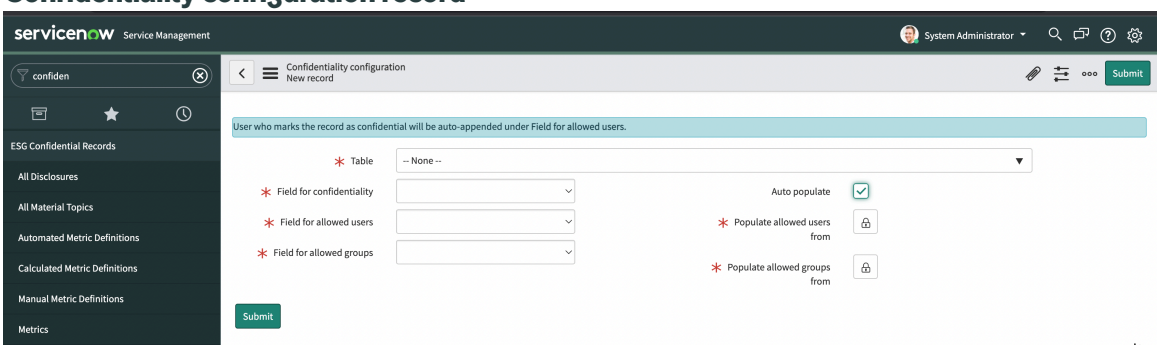
You can create a confidentiality configuration record in your GRC tables.

Before you begin

Before you begin the confidentiality configuration on your table, you must create three new columns in the table that you want to enable confidentiality in.

Role required: sn_grc.admin.

Fields to enable confidentiality



Type	Comments	Example column name	Description
Boolean	Confidential	u_confidential	Flag that marks or unmarks whether a field is confidential.
List, Reference to sys_user table	Allowed users	u_allowed_users	Field that contains the list of users who can access the confidential record.
List, Reference to sys_user_group table	Allowed groups	u_allowed_groups	Field that contains the list of user groups who can access the confidential record.

For more information, see KB1497382.

Procedure

1. Navigate to **All** > **GRC Administration** > **Confidentiality Configuration** and click **New**.
2. In the new confidential configuration form, fill in the fields that are required for enabling confidentiality for the GRC tables.
   For more information about the fields, see Confidentiality configuration form.

Confidentiality configuration record

3. Click **Submit**.

Result

Confidentiality is enabled for the GRC table that you selected.

Confidentiality configuration form

The Confidentiality configuration form is used for the configuration of the confidential records for your GRC tables.

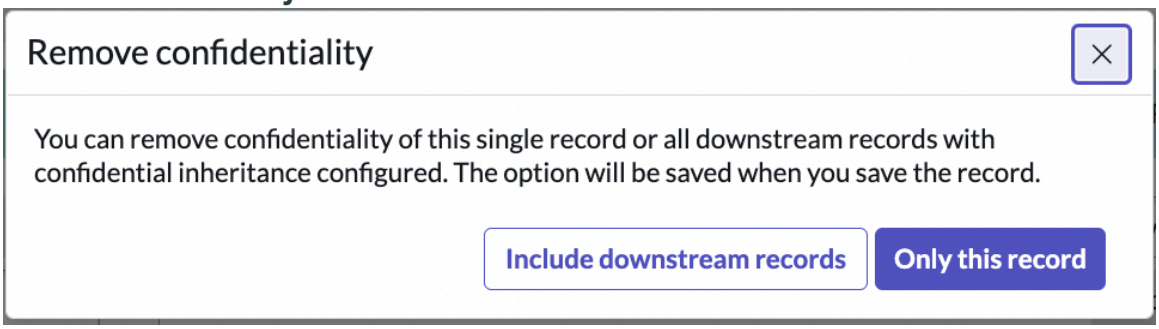
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Confidentiality configuration form

Field	Description
Table	Table that you want to add the Confidentiality feature in.
Field for confidentiality	Boolean field where you can enable for confidentiality in.
Field for Allowed users	Field where you can add the allowed users who can access the confidential records.
Field for Allowed groups	Field where you can add the user groups that are allowed to access the confidential records.
Populate allowed users from	Field where the allowed users are automatically filled in based on the list of columns in the GRC tables.
Populate allowed groups from	Field where the allowed user groups are automatically filled in based on the list of columns in the GRC tables.

Note:
Populate allowed users from and **Populate allowed groups from** fields appear only when the **Auto-populate** field is selected.

Configuring confidential inheritance in your tables



You can set up confidentiality inheritance in the tables that are already configured in the confidentiality configuration module. In the GRC application, whenever a parent record is marked or unmarked as confidential, its related table records are also marked or unmarked as confidential.

When you mark an issue as confidential, a related remediation task is automatically marked as confidential. For example, let's look at issue A. Issue A has the remediation tasks P, Q, and R. If issue A is marked as confidential, the remediation tasks P, Q, and R are also marked as confidential. The allowed users and groups are automatically appended based on the remediation task's confidentiality configuration record. Issue A's allowed users and groups are automatically appended to the inherited records P, Q, and R.

When an issue's confidentiality is unmarked, the corresponding confidentiality of a remediation task is also unmarked. Let's look at issue A again. Remember that issue A has the remediation tasks P, Q, and R. If the confidentiality is unmarked for issue A, then a dialog box appears with a question about whether it's okay to unmark the confidentiality for all the related tasks P, Q, and R or only for issue A. Based on what the selection is in the following example, the related records are unmarked as confidential.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unmark confidentiality

As shown in the example dialog box, if **Include downstream records** was selected, then the confidentiality is unmarked for all the downstream records. If **Only this record** was selected, the confidentiality is unmarked for that single record only.

If you have access to the related confidential records and remove the confidentiality for a parent record, then the related records are also non-confidential.

Note:
An inheritance configuration should exist between the parent and inherited tables.

Examples of confidentiality inheritance

Inheritance works only at the point of marking a parent record as confidential. Let's look at the following two examples:

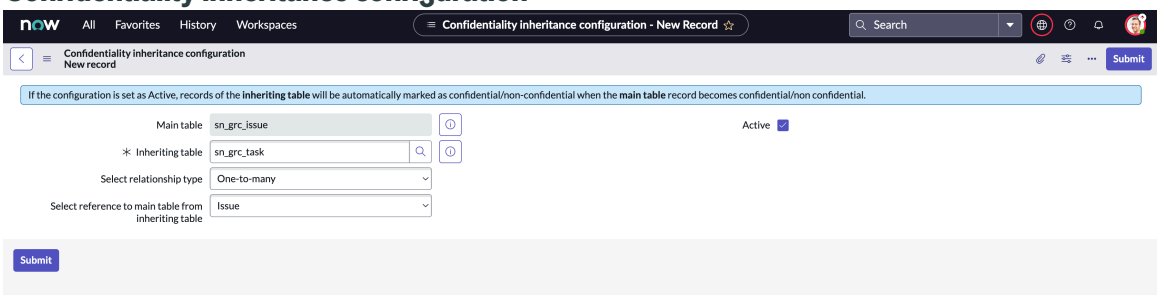
1. When a parent record is marked as confidential, the related non-confidential records are also marked as confidential due to the inherited configuration. But, if a related record is added later, it isn't automatically marked as confidential.
2. Whenever confidentiality is marked on a parent record and the inheritance isn't passed to the related records, the changes that are made later to the allowed users and groups of the parent record are not inherited in the related records.

For more information about the confidentiality inheritance configuration, see KB1213404 You must log in to the Now Support to view the Knowledge Base articles.

Create confidentiality inheritance

Create confidentiality inheritance in the tables that are already configured in the confidentiality configuration module. In the GRC application, whenever a parent record is marked or unmarked as confidential, its related table records are also marked or unmarked as confidential, if an inheritance record is also set up.

Before you begin



Role required: sn_grc.admin

Procedure

1. Navigate to **All** > **GRC Administration** > **Confidentiality Configuration**.
2. Select the table that you want to configure the inheritance in.
3. In the Confidentiality inheritance configurations related list, select **New**.
4. On the form, fill in the fields.
   The following example shows how to configure the confidentiality inheritance. For more information about the fields, see Confidentiality Inheritance Configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Confidentiality inheritance configuration

5. Select **Submit**.

> **Note:**
>
> This configuration doesn't affect the existing confidentiality of the records in the parent and inheriting tables.
>
> Only records that are marked as **Active** support the inheritance.

Result
A new inheritance configuration record is created under the confidentiality inheritance configuration related list.

Confidentiality Inheritance Configuration form

Use the Confidentiality Inheritance Configuration form in the GRC application to create the inheritance configuration record.

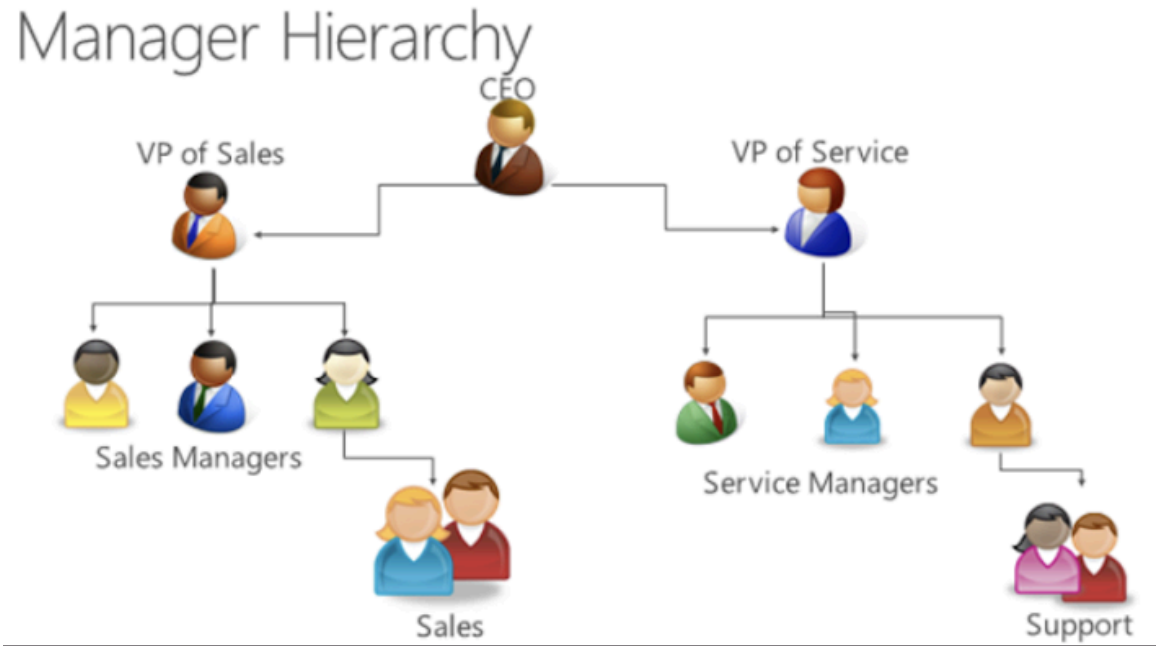
Confidentiality Inheritance Configuration form

Field	Description
Active	Option that when selected marks the inheriting tables of the main table as confidential.
Main table	Main table that shows the table that is selected in the confidentiality configurations.
Inheriting table	Table that has records where the confidentiality is marked or unmarked.
Select relation type	Relation types that exist between the main and inheriting table.
Select relationship table	Option to select a relationship table. The **Select relationship table** field appears only when you select the relation type as **Many to Many** or **Scripted relationship**.
Select reference to main table from relationship/inheriting table	Reference to the main table and inherited tables.

> **Note:**
> If only one relationship exists between the main table and the inheriting table fields of the form, the remaining fields are automatically filled in and hidden on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User hierarchy



With a user hierarchy, your managers can see the records of those users who report to them.

The user hierarchy is based on the configuration in the sys_user table. The user hierarchy is stored separately for the GRC tables.

To understand how a user hierarchy works, let's look at the following example. Users Abel and Jack report to Adam. Adam reports to Daniel. With a user hierarchy, Adam can view the work performed by Abel and Jack. Similarly, Daniel can view the work performed by Adam, Abel, and Jack.

Let's see another example of a manager and a user hierarchy.

Manager and user hierarchy

In this example, the sales manager can see the data that the sales team has submitted. The VP of sales can see the data or reports that are submitted by the sales managers and the sales team.

The VP of service can see the data that is submitted by the service managers and the support team. The CEO of the organization can see the work performed by both sales and service teams.

Enabling the properties for the user hierarchy functionality

As a GRC administrator, you can enable the following properties under the GRC properties module in an instance.

User hierarchy properties

Property	Action
Enable user hierarchy access control	Enable the user hierarchy functionality by selecting the **Yes** option on the *Enable user hierarchy access control* property. This property is turned off by default. After you enable this property, you can also turn it off again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User hierarchy properties (continued)

Property	Action
Frequency of user hierarchy recalculation	Use the *Frequency of user hierarchy recalculation* property to calculate the user hierarchy for all the records in the sn_grc_user_hierarchy_configuration table. The property is set to **Weekly** by default. To calculate the user hierarchy for the records at different intervals, select *sn_grc.user_hierarchy_sync_frequency* and change the schedule from **Weekly** to **Daily** or **Monthly**.
Maximum batch size while recalculating hierarchy for user hierarchy records	Use the *Maximum batch size while recalculating hierarchy for user hierarchy records* property to process the records in a maximum batch size so that you can recalculate the user hierarchy of the records. This property is set to 1000 by default. To recalculate the user hierarchy of the records, select the property and update the maximum batch size to an integer value.

Note:
After you enable the user hierarchy properties, the user hierarchy functionality is supported only in certain sets of tables. You can learn more about these tables in the next section.

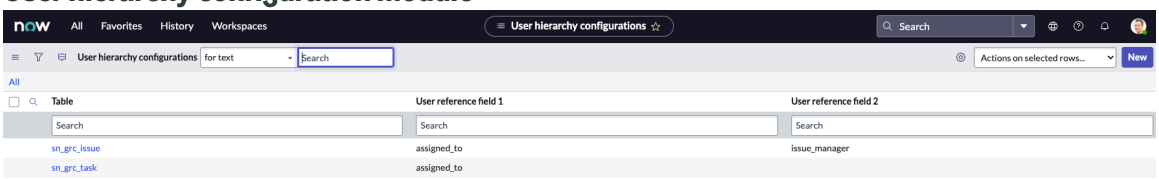
Tables that are used to support the user hierarchy functionality

The following tables are used to support the user hierarchy functionality.

Tables that are used to support the user hierarchy functionality

Table	Description
sn_grc_hierarchy	Table that maintains the hierarchy of the users.
sn_grc_user_hierarchy	Table that displays the name of the user, the managerial hierarchy, and the last synchronized details. As a user with the sn_grc.user_hierarchy_reader role, you can read the records in this table. No other user can manually create, update, or delete the records in this table.
sn_grc_user_hierarchy_configuration	Table that contains a separate record for each table where the user hierarchy access control is enabled. As a GRC administrator, you can manually create and delete the records in this table. As a user with the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tables that are used to support the user hierarchy functionality (continued)

Table	Description
	sn_grc.user_hierarchy_admin role, you can also read or update the records in this table.

User hierarchy configurations module

The User hierarchy configuration module is displayed in your instance only after you enable the user hierarchy properties. The User hierarchy configuration module, which is shown in the following example, lists the tables on which you have enabled the user hierarchy functionality.

User hierarchy configuration module

Access control lists (ACLs): By default, a few access control lists are shipped with the GRC application, and they are stored in the sys_security_acl table. You can define a filter condition to check if the user hierarchy access control is enabled. You can create your own access control lists depending on your configuration and requirements.

For information on how to configure the user hierarchy access control on your custom tables, see KB1095957.

Note:
You must log in to Now Support to view the Knowledge Base articles.

Create a user hierarchy configuration record

Create a user hierarchy configuration record for a table so that you can enable your managers to view the records of the users who report to them.

Before you begin

Role required: sn_grc.admin

Procedure

1. Navigate to **All** > **GRC User Hierarchy > User hierarchy configuration**.
   The tables where you have enabled the user hierarchy access control are displayed.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

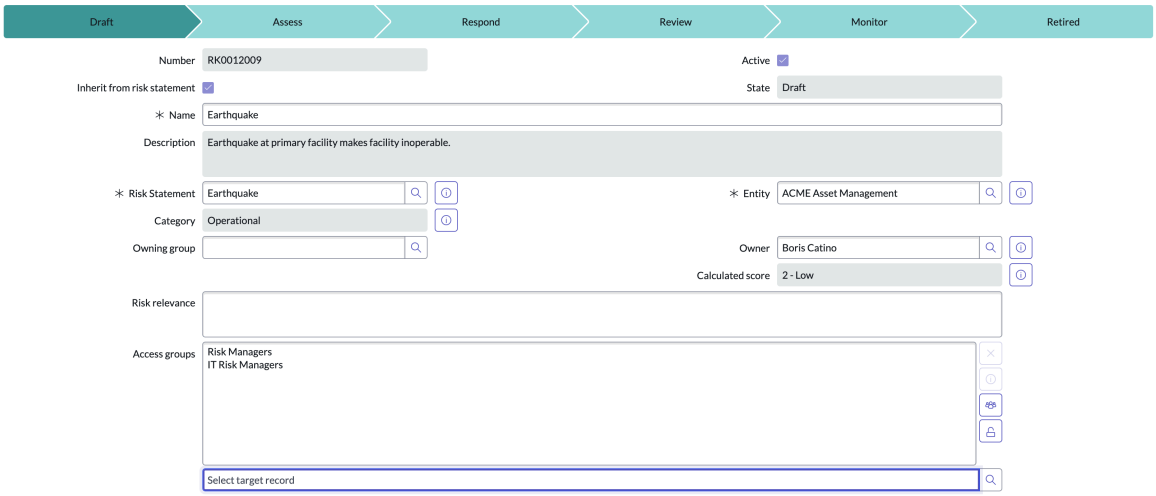
User hierarchy configuration form

Field	Description
Table	Table that you can use to configure the user hierarchy. For example, Issue [sn_grc_issue].
Active	Option to enable the user hierarchy. When you enable this option, the user hierarchy functionality is enabled on the table records.
User reference field 1	Field that corresponds to User reference field 1 in the user table. For example, you can select the value of the User reference field 1 as Assignee or Assigned to.
User reference field 2	Field that corresponds to User reference field 1 in the user table. For example, you can select the value of the User reference field 2 as Approver or Issue manager.
User hierarchy field 1	Field to configure the user hierarchy for User reference field 1.
User hierarchy field 2	Field to configure the user hierarchy for User reference field 2.
User hierarchy status field	Field that represents the status of the user hierarchy processing for the selected table.
Triggered event	Event that is used to recalculate the user hierarchy in the source table records.

4. Click **Submit**.

User group-based access on the GRC tables

You can allow a set of users to access only specific records by creating user groups on the GRC tables. When you have created the user groups, you can segregate your data based on a specific criteria and allow only those users who belong to a user group to view the data.



Note:
User group-based access is not enabled on any ServiceNow tables as part of the base system. To implement the feature and to configure the Access groups option on any GRC form, follow the steps listed in the KB1514113.

To view the Access groups option on the respective tables where you have configured user group-based access, you must enable the *`Enable access groups`* property in the GRC Properties module.

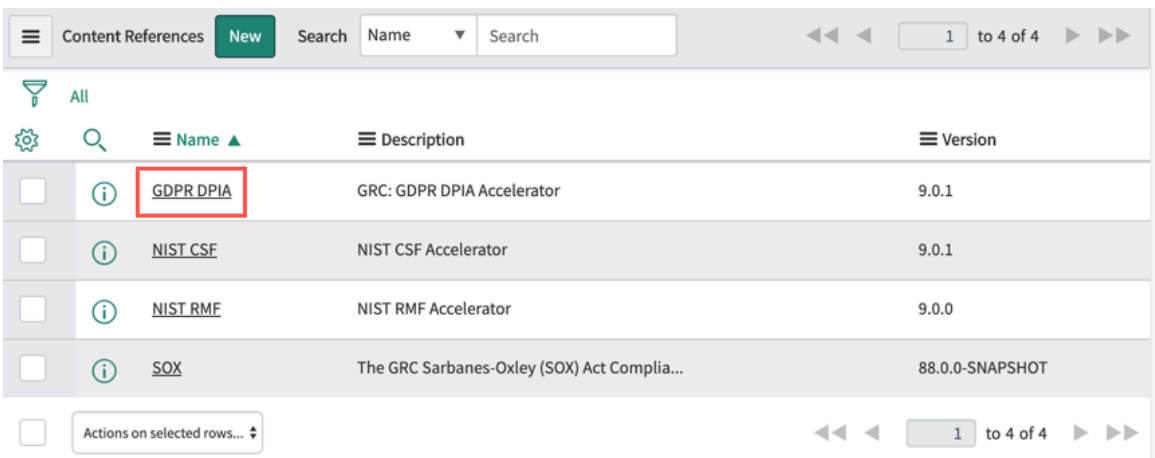
The following example shows the Access groups option in the form that appears when you enable user group-based access. The layout of the form depends on your configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access groups option in the form

When a value is selected for the Access groups list, only the members of the groups that are mentioned in the list can access the data within the same role.

For example, consider this scenario. Within the Risk Managers access group, you have two managers who can work on a financial risk and other managers who can work on an operational risk. By giving the same risk manager role to all the managers in this access group, the first two managers can be assigned to the financial group and the other managers can be assigned to the operational risk group.

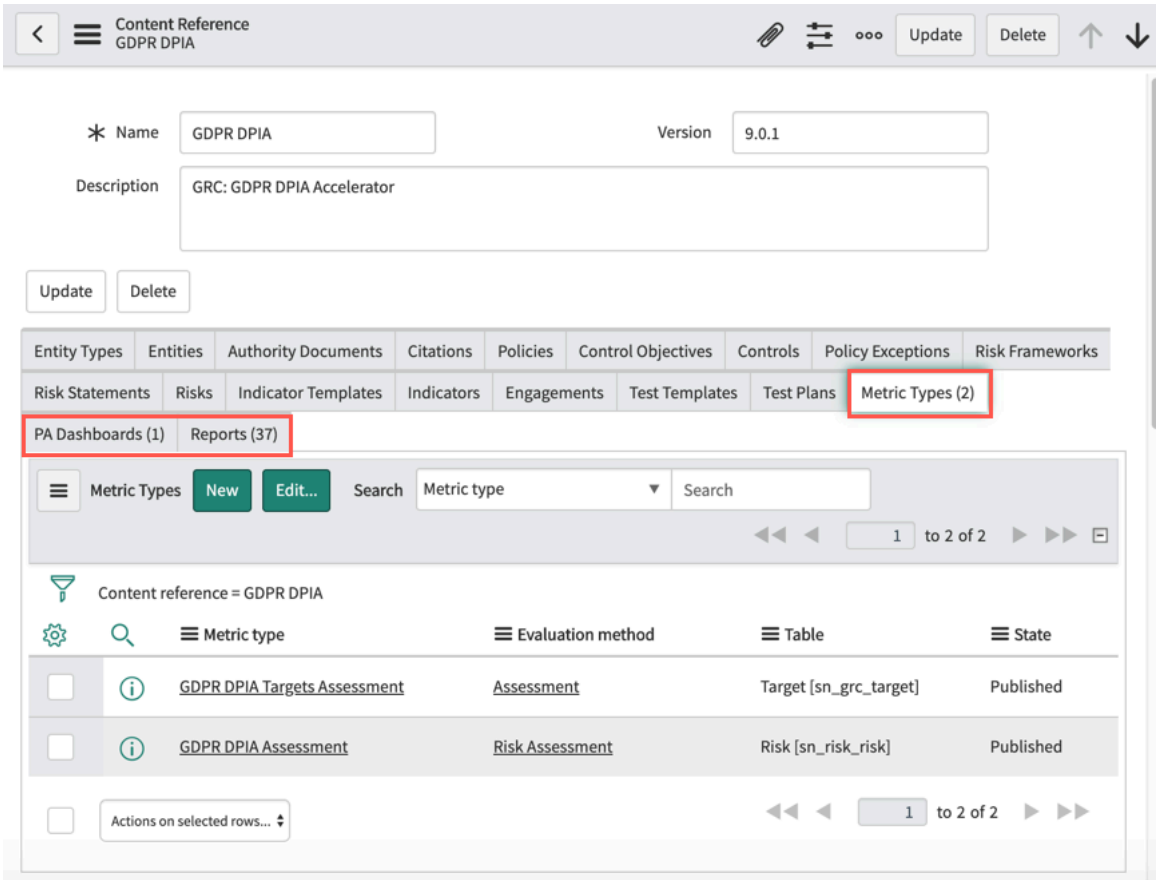


Content references in GRC

You can add tags to virtually any type of record defined in GRC applications that reference GRC content packs, integrations, use case accelerators, or any new regulations that use those records. After the records have been tagged, you can filter the content reference tags to identify which records are used within each application.

For example, you can tag all SOX control objectives that are scoped for the NIST RMF integration. You can also create reports that show relevant records that are tagged for specific integrations, use case accelerators, and so forth.

After records have been tagged, you can access all of the content references used within a specific GRC application by viewing the Content References module under each. In Policy and Compliance, for example, you can view all tagged records for the GDPR DPIA use case accelerator in a series of related lists.



Content reference list

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After selecting GDPR DPIA, a series of related lists show all records tagged with content references to the GDPR DPIA Use Case Accelerator.

Content references for GDPR DPIA

Records you can tag with content references

In the GRC Audit Management, Policy and Compliance Management, and Risk Management applications, you can tag any of the following types of records.

Note:
Not all of these records are available within each of the GRC applications listed above The related lists displayed in each of the applications, however, include all of the record types regardless of whether they are available.

- Authority Documents
- Citations
- Control Objectives
- Controls
- Engagements
- Entity Types
- Entities
- Indicator Templates
- Indicators
- Metric Types

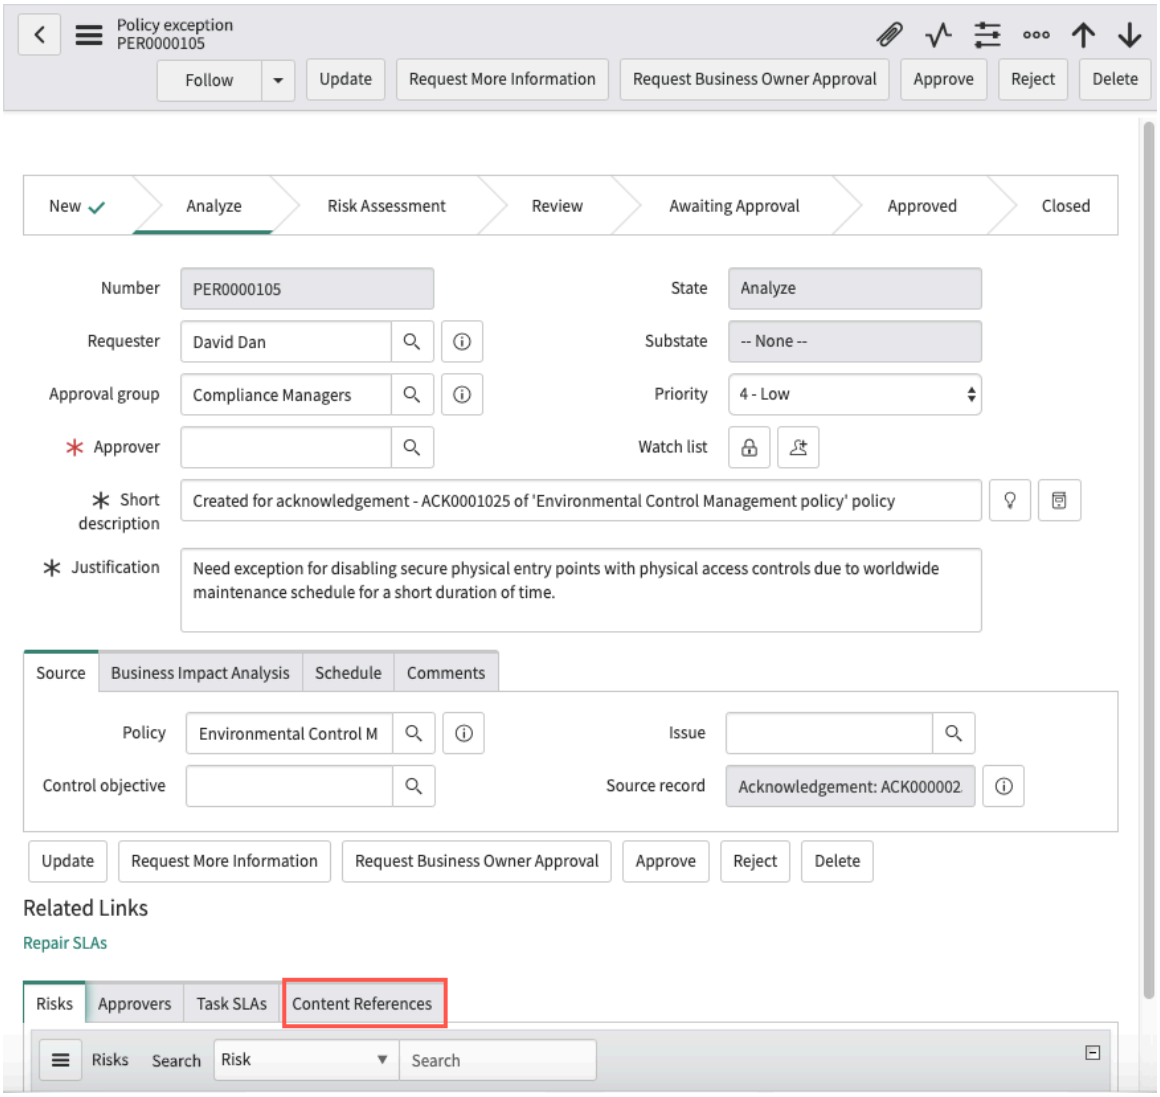
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Dashboards
- Policies
- Policy Exceptions
- Reports
- Risk Frameworks
- Risk Statements
- Risks
- Test Plans
- Test Templates

Add content reference tags to records

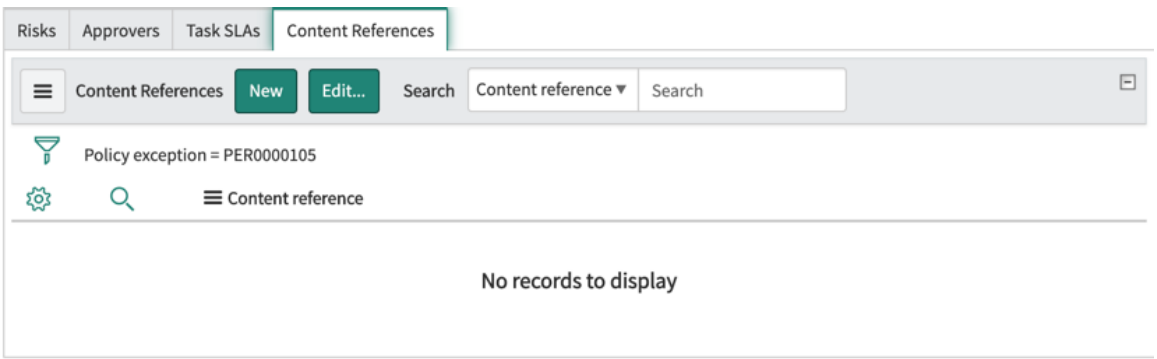
As you are analyzing any of the many types of records available in GRC applications, it is easy to add a content reference tag so the record can be included when you perform searches for records associated with a given integration, content pack, use case accelerator, and so forth.

Before you begin



Role required: admin

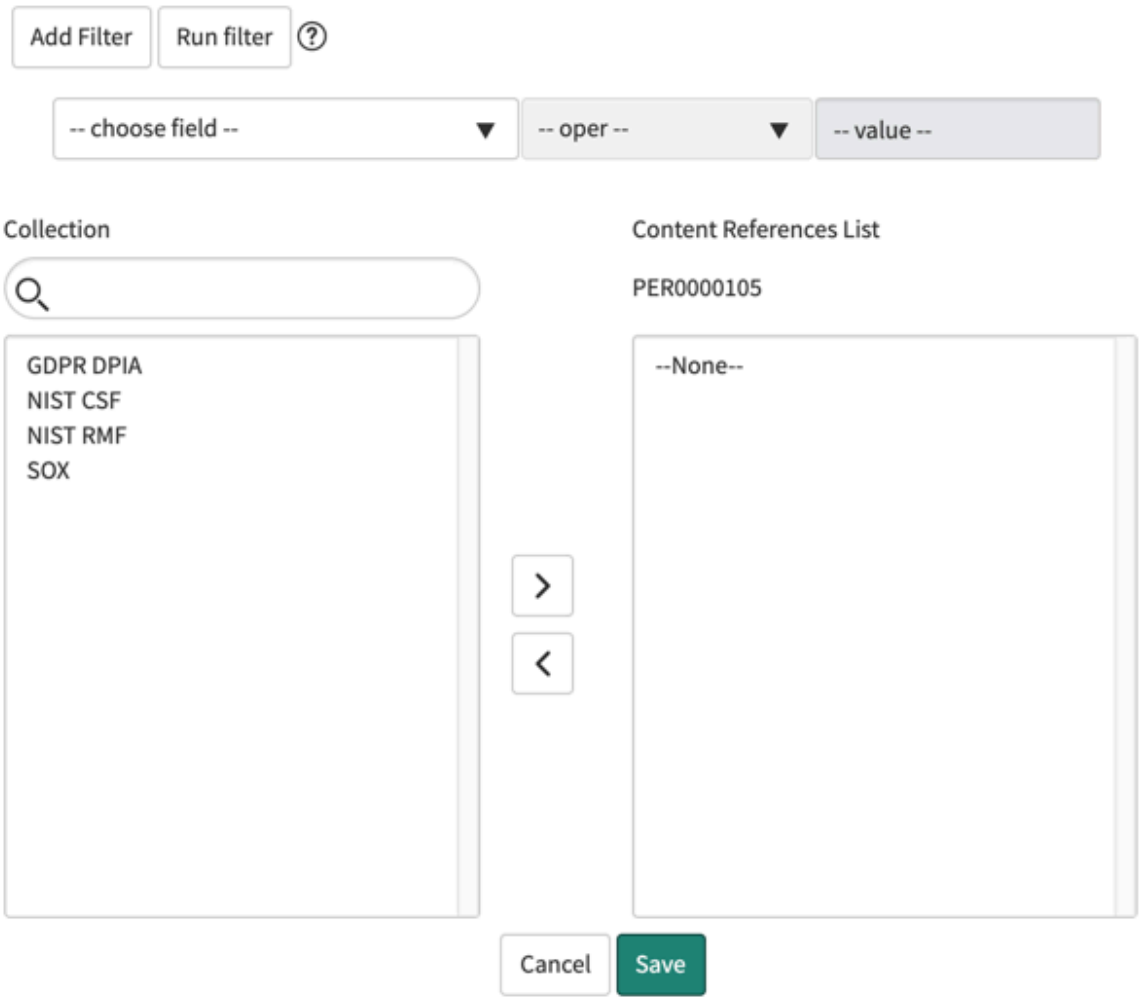
Procedure



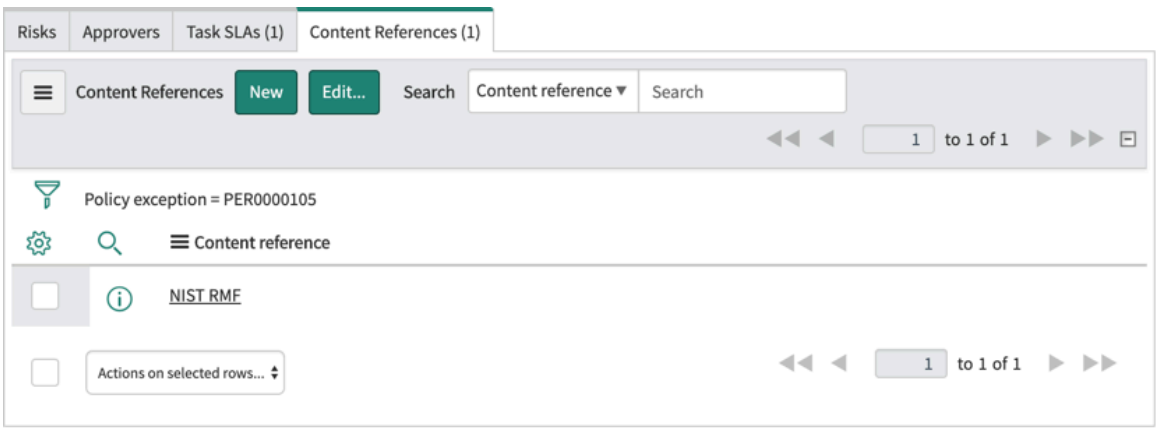
1. Navigate to **Policy and Compliance** > **Policy Exceptions** > **My Policy Exceptions**, and open a specific policy exception record.
   If you are already working within a specific GRC application, open the record to which you want to add a content reference tag. Otherwise, navigate to the record.

   Note:
   For the sake of example, a Policy Exception record is used to illustrate how to add a content reference to a GRC record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

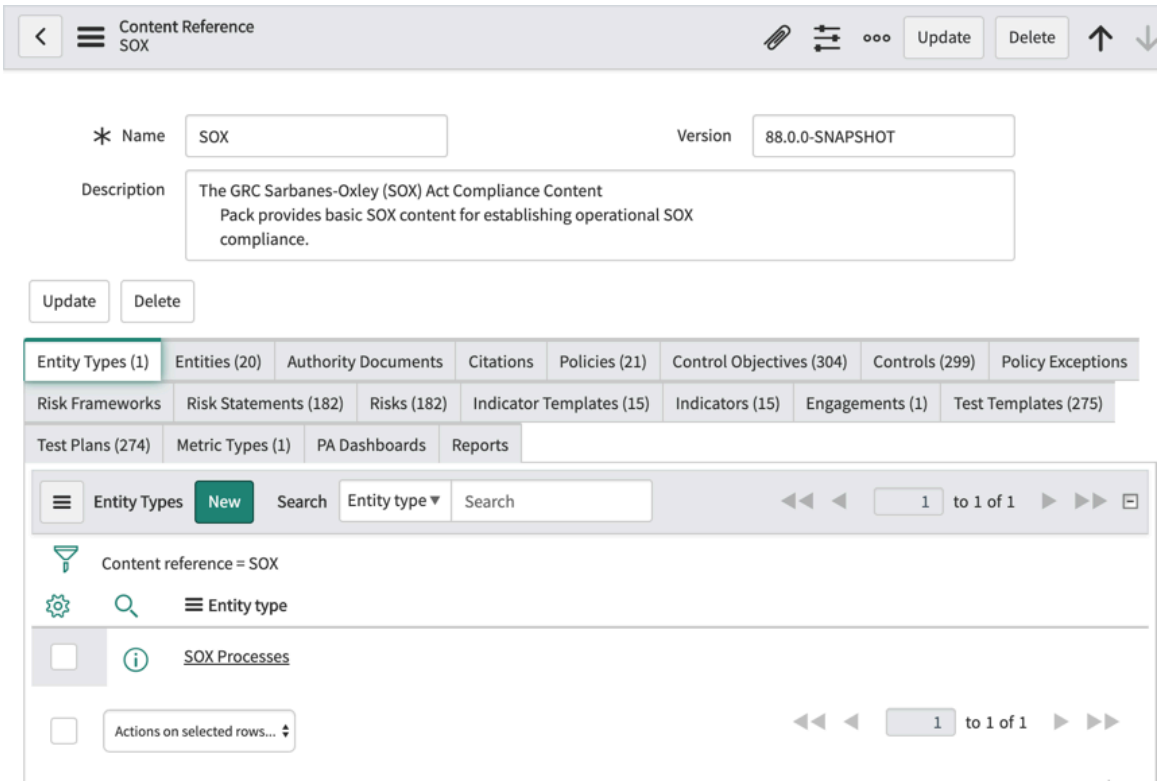


2. Scroll down and click the **Content References** related list.



3. Click **Edit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Click **Save**.
   Move the integrations, use case accelerators, and so forth to which you want to associate with this policy exception record from the **Collection** box to the **Content References List**, then click **Save**. In this example, policy exception record PER0000105 has been tagged as being associated with the NIST RMF Use Case Accelerator.

5. Navigate to the **Content References** module under that application and select the associated use case accelerator.

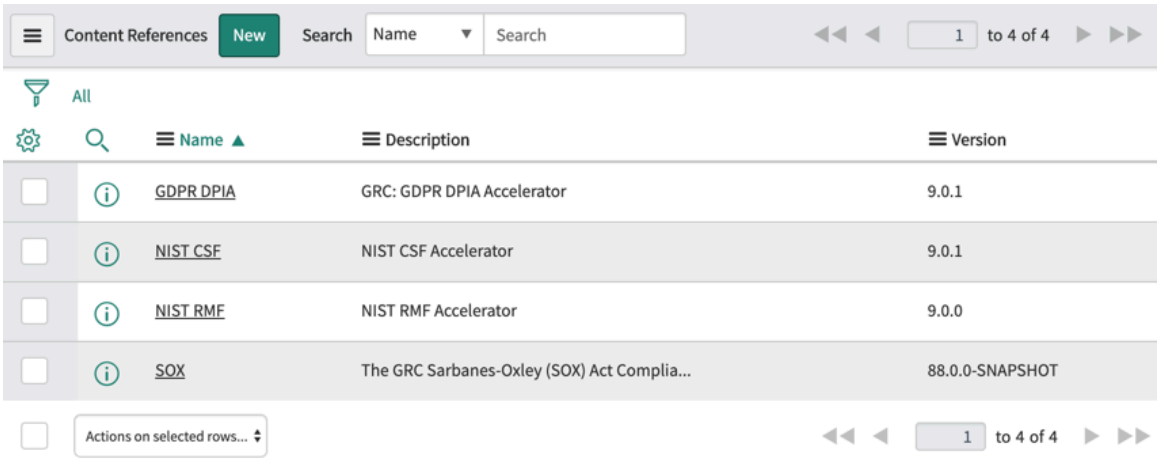
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view all records tagged for a specific use case accelerator within a specific GRC application, For example, to see all records tagged with content references in Risk Management for the SOX content pack, navigate to **Risk** > **Administration** > **Content References**, and click **SOX**.

6. Click any of the related lists that show a number to see the records tagged as content references for SOX.

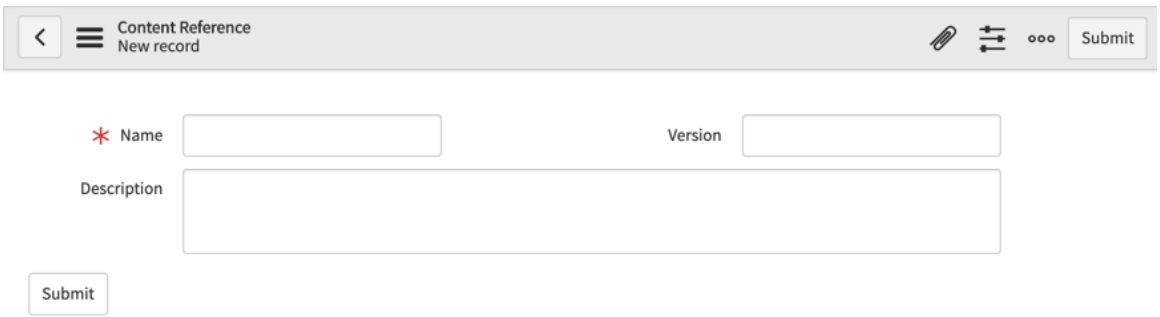
Create content reference tags

You can define new content reference tags, as needed, to accommodate new regulations as they arise. You can define new tags in any GRC application, and they are then available in all GRC applications.



Before you begin

Role required: admin



Procedure

1. Navigate to the Content References module in any GRC application.
   For example, you can navigate to **All** > **Audit** > **Administration** > **Content References**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click **New**.

3. Provide a **Name**, **Version** number, and **Description** for the new tag.

> **Note:**
> The **Version** number can be the software version released from the ServiceNow Store

4. Click **Submit**.
   The new content reference tag is added to the list and is available from the Content Reference module in the GRC Audit Management, Policy and Compliance Management, and Risk Management applications.

Manage issues

You can measure the effectiveness of your company's risk management program by how quickly and completely it identifies and reacts to risk and compliance issues.

Issues can be submitted using two methods, depending on the type of user involved:

- Employees and business users within your company can self-identify an issue and submit it via the ServiceNow® Service Portal. Following submission, a triage issue is automatically created and the issue triage process begins.
- GRC users can manually create an issue from within their instance to document audit observations and remediations, and compliance and risk issues.

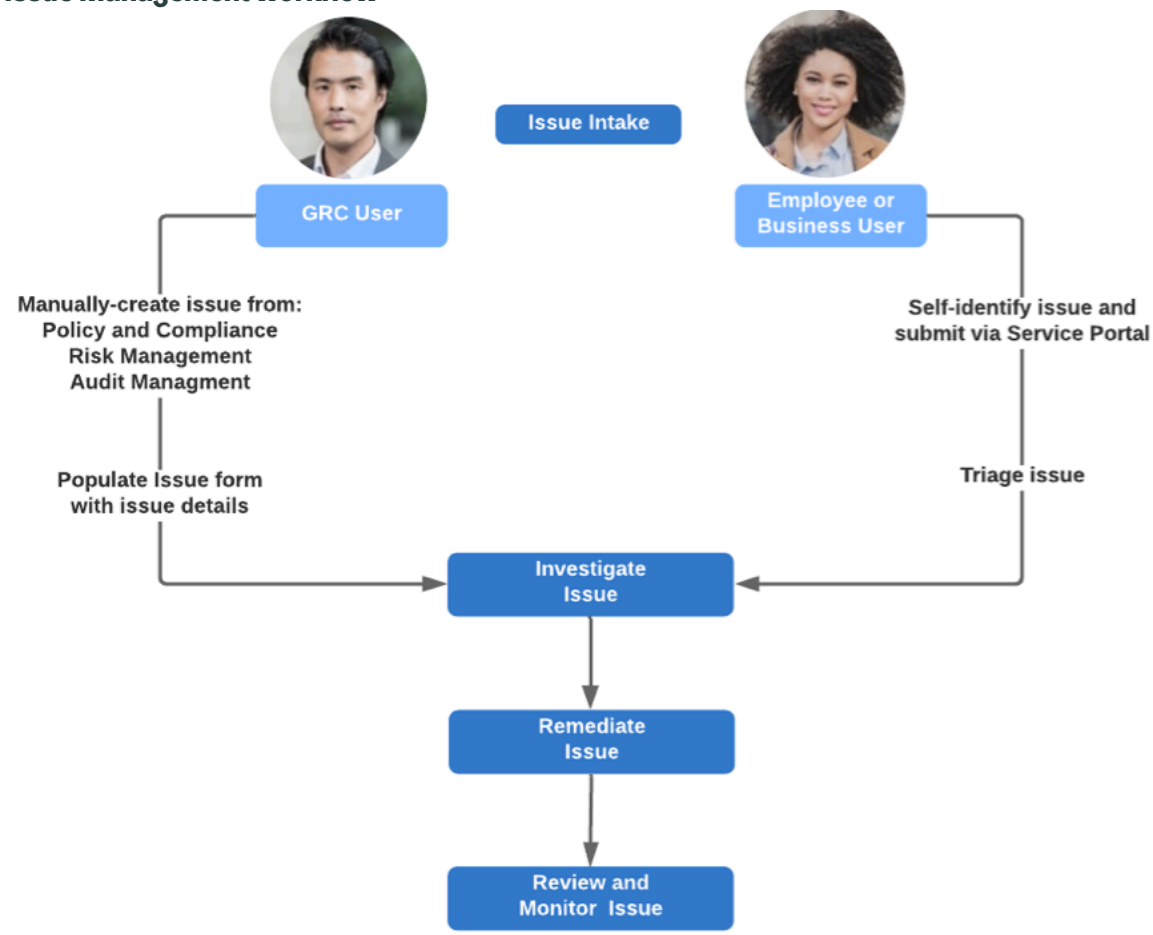
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Various types of issues can also be automatically generated under the following conditions (these types of issues are not triaged):

- Control issue: Created when a control attestation is completed, indicating that the control is not implemented, or when an indicator fails.
- Control test issue: Created when a control test is closed complete with the control effectiveness set to **Ineffective**.

Goals of issue management

The goals of issue management include:



- Eliminating noise.
- Consolidating duplicate issues.
- Focusing on issues that expose the organization to the greatest risk.
- Identifying and prioritizing remediation actions.
- Identifying new issues across the business operations.
- Analyzing operational weakness in policies, processes, and controls.

Issue management workflow and life cycle

By remediating issues, controls can be kept compliant, and risk can be mitigated. The Issue Management workflow and life cycle are illustrated and described here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Management workflow

Issue Management life cycle

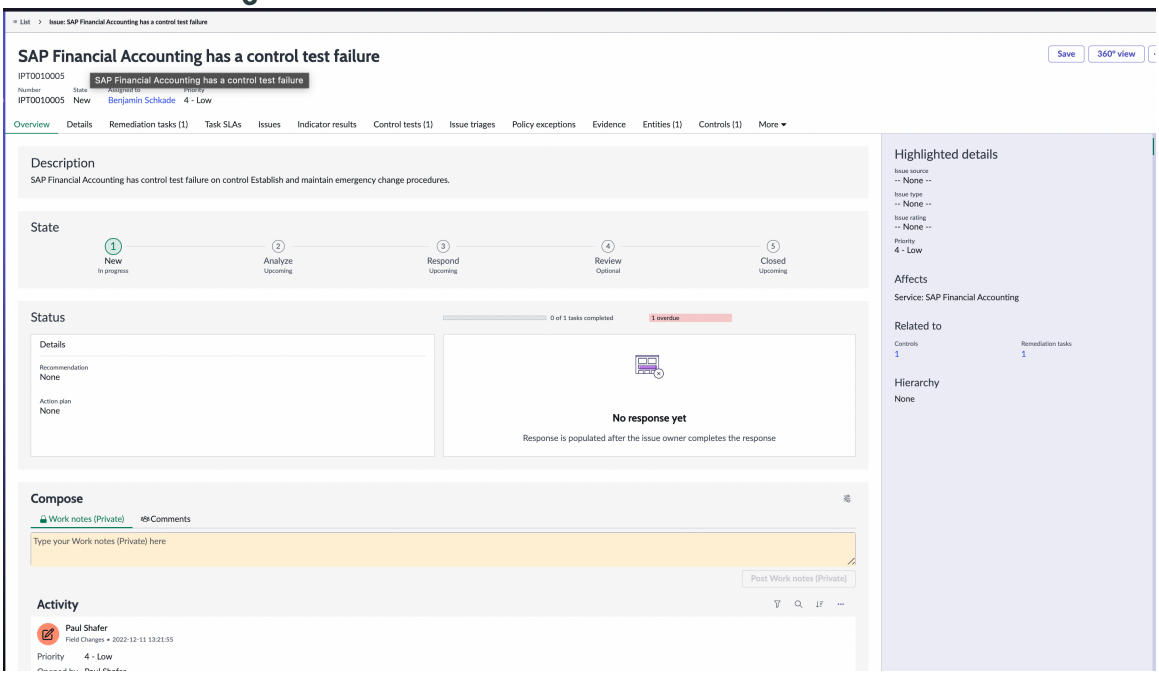
Stage	Description
Issue intake	As described earlier, issues can be submitted using two methods, depending on the type of user involved: • Employees and business users within your company can self-identify an issue and submit it via the ServiceNow® Service Portal. Following submission, a triage issue is automatically created and the issue triage process begins. • GRC users can manually create an issue from within their instance. These types of issues are not triaged.
Investigate the issue	During the investigation phase, it is determined whether the issue requires additional study. If a triage is being performed, the triage issue is assigned to a triage team for analysis. The triage team may request more information from the issue creator. The team can also optionally send the issue to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Management life cycle (continued)

Stage	Description
	compliance manager, risk manager, or triage manager with a triage result.
Remediate the issue	After the team has confirmed the issue, the necessary steps to remediate it are performed. If a triage was performed, the triage issue is converted into an actual issue or risk event. The team may also decide to track the issue as a recommendation or close it as a non-issue.
Review and monitor the issue	Prior to closing the issue, the policy owner reviews and approves it. The review also allows the organization to: • track past due tasks • benchmark issue timelines • identify where losses could have been mitigated • reduce gaps in the future

Issues in the Workspace



You can track all your issues or one specific issue from the Workspace. Issues are listed under the **Issues** module in the list view of the Workspace.

Issue overview page

The issue form displays the details about your issues. You can see information about an issue's description, state, status, work notes, and what activity has occurred so far. The information about an issue is organized in different tabs such as the **Overview** tab and the **Details** tab as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Overview Page

In the **Details** tab, you can find information about the issue, assignment, schedule, issue grouping, action plan, confidentiality, and activity and settings.

Note:
The details section has been removed from the **Details** tab.

Associating objects that are related to an issue

GRC user or business user or business user lite of Issue personas can associate objects, such as the control, risk, risk event, entities, engagements, control objectives, risk statements, policies, authority documents, or processing activities, or remove the existing objects that are related to the issue.

For example, consider an entity that you can select as a related list. You can either add the other related entities or remove the existing entities by using the **Add** or **Remove** UI buttons of the entity form.

The related lists on the issue form display the dependencies that are related to the issues. The following table lists a description of the tabs and sidebar on the Issue form.

Tabs and sidebar on the Issue form

Tab	Description
Overview	Overview of an issue, such as the description, state, status, work notes, and activity.
Details	Details about an issue, such as the assignment, schedule, issue grouping, action plan, confidentiality, activity, settings, and work notes. The Issue grouping section provides grouping information, such as Parent issue and Issue group rule. When advanced Issue grouping is enabled, it shows **Group level** field, indicating whether it's a parent, child, or standalone issue. It also shows the

Tabs and sidebar on the Issue form (continued)

Tab	Description
	Management method field, indicating whether it's managed from parent or child issues individually.
Highlighted details	Highlighted information, such as the issue source, issue type, issue rating, priority, effects, related to, and hierarchy.
Affects	Entities that are affected by this issue.
Related to	Count of the different objects that are affected by this issue such as the controls, risks, policies, authority documents, engagements, regulatory change tasks, remediation tasks, and risk events.
Hierarchy	Issue hierarchy.

The following table lists the related lists in the Issues section.

Related lists in the Issues section

Related lists	Description
Remediation tasks	Details of the remediation tasks, such as the name, number, state, assigned to, priority, planned end date, and actual date.
Task SLAs	Details of the task service level agreements (SLAs), such as the SLA definition, type, target, stage, business time left, business-elapsed time, business elapsed percentage, start time, and stop time.
Issues	Details of the related issues, such as the name, number, issue source, issue type, state, issue manager, assigned to, priority, and due date.
Indicator results	Details of the indicator results, such as the name, result, indicator, and data owner.
Control tests	Details of the control tests, such as the name, number, parent, assigned to, state, planned start date, and planned end date.
Issue triages	Issue triages details, such as the name, number, source, issue type, state, substate, triage owner, and reviewer.
Policy exceptions	Details of the policy exceptions, such as the name, number, requester, reason, policy, control objective, state, substate, valid from, valid to, and risk rating.

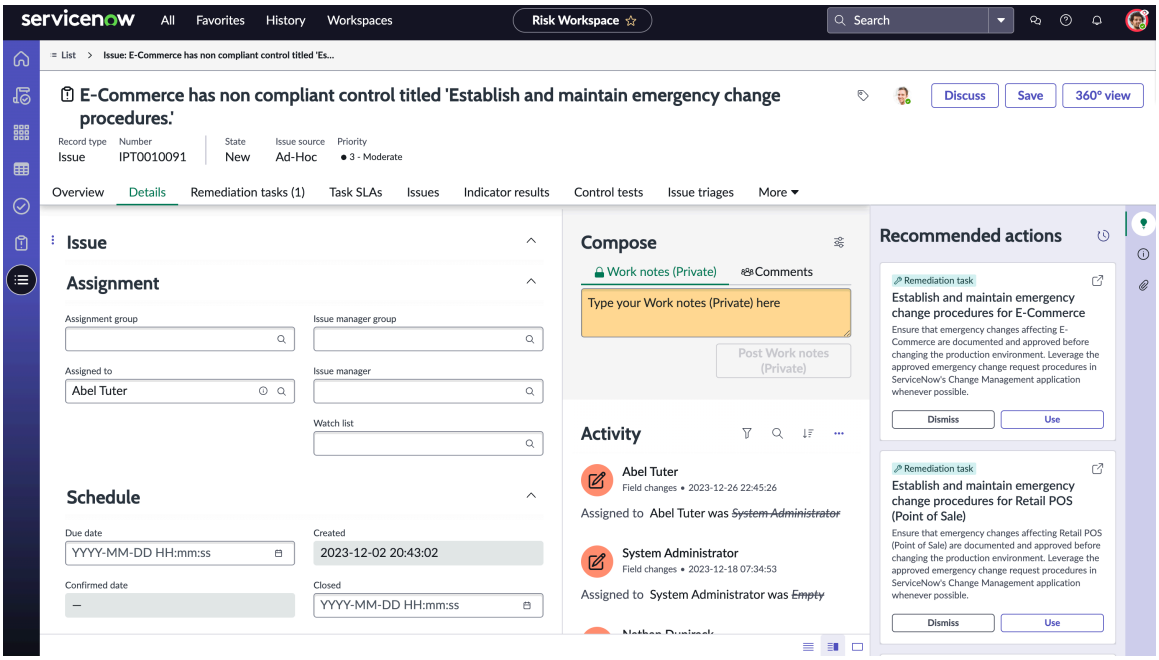
Related lists in the Issues section (continued)

Related lists	Description
Evidence	Details of Evidence, such as the name, number, evidence for, request reason, state, substate, requester, assigned to, and due date.
Entities	Details of the entities, such as the entity, description, class, and owner.
Controls	Details of the controls, such as the name, number, entity, function, state, status, exempt, owner, and description.
Risks	Details of the risks, such as the name, number, entity, risk statement, owning group, owner, state, and risk assessment methodology.
Engagements	Details of the engagements, such as the name, number, type, engagement lead, state, engagement planned start date, and engagement planned end.
Control objectives	Details of the control objectives, such as the name, source ID, source, parent, category, classification, type, and compliance.
Risk Statements	Details of the risk statements, such as the name, framework, category, description, and appetite status.
Policies	Details of the policies, such as the name, type, owner, state, valid from, valid to, and compliance score.
Authority documents	Details of the authority documents, such as the name, common name, type, and compliance score.
Risk events	Details of the risk events, such as the risk event,primary entity, event type, subtype, state, date of discovery, net loss, expected loss, and non-financial impact.
Processing activities	Details of the processing activities, such as the processing activity, processing activity category, owner, and privacy analyst.

The following example shows a 360-degree view of the entire relationship for a selected issue, such as the upstream issues, downstream issues, controls, and remediation tasks that are associated with the Issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



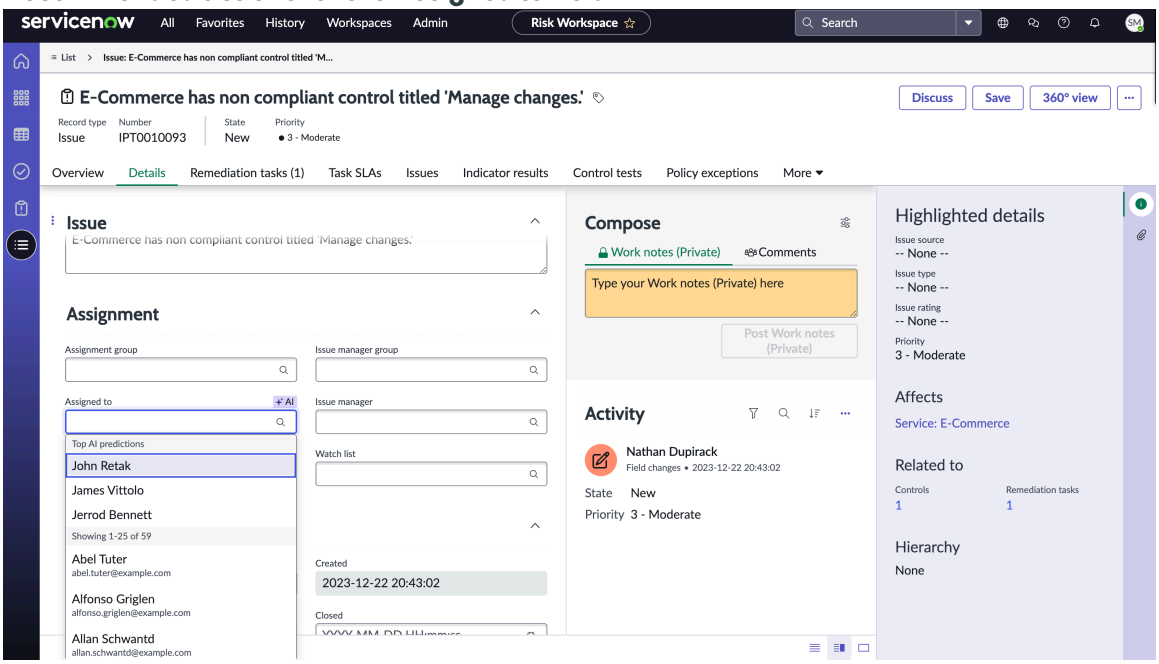
360-degree relationship of an issue

Recommended actions

Recommended actions are system-generated suggestions that can help you quickly select a remediation task or assign an issue to the correct person.

Remediation tasks recommended actions

As shown in the figure, recommended actions for remediation tasks are shown in the right side pane. You can see the list of recommended actions and perform the following:



- **Use**: When you select a **Use** button, a form is shown with pre-populated data. You can assign to any user using the **Assigned to** field and select **Save**. You can see this record in the **Remediation tasks** tab.
- **Dismiss**: If you don't want to use the recommended action, select **Dismiss**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Recommendations are shown only to the users with the following roles:

1. Users with minimum roles of `sn_grc.business_user`, `sn_grc.business_user_lite`. You must add the `sn_nb_action.next_best_action_use` role to the `sn_grc.business_user` and `sn_grc.business_user_lite`.
2. Users who have minimum role of `sn_grc.user` though they are not part of the issue persona.
3. Users with minimum role of `sn_grc.business_user` and `sn_grc.business_user_lite` must be part of the issue persona.

Recommended actions for the Assigned to field

As shown in the figure, system-generated recommendations are shown for the **Assigned to** field. You can see the top three predictions (John Retak, James Vittolo, and Jerrod Bennett) above the list of alphabetized users.

Configuring an issue relationship

If an issue isn't reusable and you know that multiple similar issues were created for different controls, risk statements, or control objectives, you can still configure the issue relationship to reuse the issue in the GRC application.

You can avoid duplicating issues by reusing the same issue. All you have to do is add it to different objects. When an issue is linked to a control or risk, it's automatically linked to the entity, control objective, or risk statement of that control or risk.

By using the **Issue Relationship Configuration** tab under the GRC Administration module, you can add an issue to different objects.

Note:
This module is visible only if you have the workspaces installed.

You can also disable an issue relationship by stopping the automatic linking of the related objects to an issue. For more information, see Configure an issue relationship.

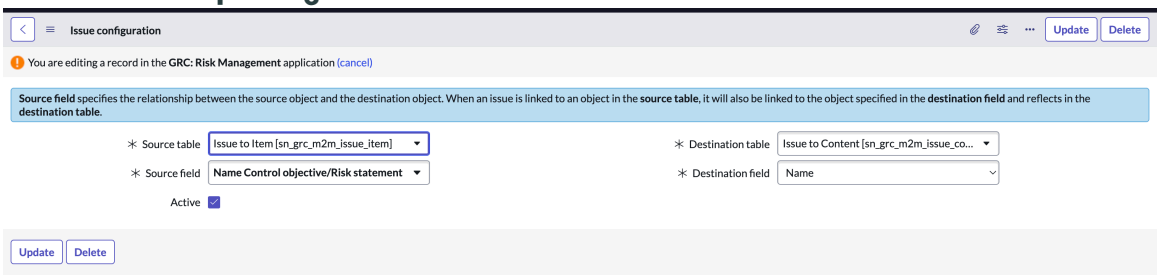
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure an issue relationship

Enable or disable an issue relationship configuration record so that you can automatically link an issue with its related objects in the GRC application.



Before you begin

Role required: sn_grc.admin.

Procedure

1. Navigate to **All** > **GRC Administration** > **Issue Relationship Configurations**.
2. Select any record that you want to configure the issue relationship to.
3. Enable or disable the configuration records by selecting or deselecting the **Active** field.

Issue relationship configuration form

For more information about the fields in the issue relationship configuration form, see Issue Relationship Configuration form.

Issue Relationship Configuration form

Use the Issue Relationship Configuration form in the GRC application to automatically link a destination record with an issue when it's linked to the source record.

Issue Relationship Configuration form

Field	Description
Source table	Many to Many (MtoM) table in which the original record gets created when you link an issue to an object. For example, if you linked an issue to a control, the relationship record is created in this table.
Destination table	Target table where the record is created when the issue is linked to the destination object. For example, let's say that you selected the issue to link to a control in the **Source table** field. The issue is linked to the control's entity if you selected the issue to link to the entity MtoM in the **Destination table** field.
Source field	Source field that displays the relationship between the source object and the destination object.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Relationship Configuration form (continued)

Field	Description
Destination field	Destination field that contains the object that is linked to the issue in the **Destination table field.** For example, if you selected the issue to link to an entity relationship in the **Destination table** field, then the destination field value is entity. **Note:** The object types that you select in the source field and destination field should be the same types.

Note:

- **Source object**: It's the original object that is linked to an issue manually.
- **Destination object**: It's the object that is automatically linked to the issue due to the issue relationship configuration.

Group issues in the Workspace

Group issues within your workspaces to organize and manage related issues. Grouping similar issues can streamline your workflow and save time.

Before you begin

Role required: risk_admin, risk_manager, or sn_risk.user

About this task

Grouping issues under a parent can streamline your workflow and save time. All child issues are managed under a single parent, making it easier to track and address them collectively. You can group different types of issues under a single parent when issues belong to the same project or audit to gain a holistic view of how different issues are managed. Grouping issues under a parent helps in organizing and prioritizing them, reducing the redundancy of solving similar issues, and ensuring that issues are addressed in a coordinated manner.

You can enable the **Advanced issue grouping functionality** property to use the advanced issue grouping features, such as management methods for issue grouping and making standalone issues into parents. For more information, see Governance, Risk, and Compliance properties.

Important:
When you group issues with confidentiality enabled, you can add confidential child issues only under a confidential parent issue.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
   You can navigate to your specific workspace.
2. Select the list icon and navigate to the issues.
3. Select the check boxes next to the issues that you want to group.
4. Select **Group**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, fill in the fields.

Group issues form

Field	Description
Group type	Option to select the group type. The available options are as follows: ○ **Create a group**: Option to create a new parent issue to form a group. ○ **Add to an existing group**: Option to create a group with an existing parent issue. ○ **Make standalone issue as a parent**: Option to select an existing standalone issue and make it as a parent to create a group. **Note:** The **Make standalone issue as a parent** option is only available if the **Advanced issue grouping functionality** property is enabled. For more information, see Governance, Risk, and Compliance properties.
Parent issue name	Name of the new parent issue. This field appears only when **Create a group** is selected from **Group type** field.
Parent issue	Option to select an existing parent issue or to select an existing standalone issue and make it as a parent. This field appears only when **Create a group** or **Make standalone issue as a parent** is selected from **Group type** field.
Management method	Option to specify whether the issue is managed from a parent issue or as an individual child issue. The available options are as follows: ○ **Manage parent**: When you select the Management method as **Manage parent**, the child issues inherit the values of the **State**, **Response**, and **Explanation** fields from the parent issue. ○ **Manage child**: When **Manage child** is selected, the child issue maintains its own **State**, **Response**, and **Explanation** fields individually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The **Management method** field is only available if the **Advanced issue grouping functionality** property is enabled. For more information, see Governance, Risk, and Compliance properties.
Description	Additional information about the issue group.

6. Select **Group**.

Domain separation in GRC

This is an overview of domain separation and the Governance, Risk, and Compliance applications. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.

These users can choose to expand or collapse the domain scope to show or hide data from other domains.

Note:
Users always have access to data from domains that have been explicitly granted to them by domain visibility.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in GRC

- While GRC supports separation of data, separation of logic and process is not fully supported.
- Many types of records in GRC are automatically generated through user processes. Entities, controls, risks, indicators, and control tests are all fields that can be generated automatically. For records that are automatically generated, the domain of the record is determined by the domain iterator configured for the job. Otherwise, it defaults to the default domain (if defined) or to the Global domain. For records that are manually generated, the domain is derived from the domain of the user creating the record.

  Automatic generation should be kept in mind when working in a domain-separated GRC implementation. Users should be sure that they are creating / generating records at the right domain level so that they are visible to the right set of users.

  For example, suppose you have domains that look like:

  - Global
  - TOP
    - Domain A
    - Domain B

- If you have a risk or control that you want to be assessed by users in domains A and B, the risk or control should be generated or manually created at the global level. If the risk or control is created in Domain B, you will not be able to recreate the risk or control in Domain A due to indexing.
- If you have a risk or control that you want to be assessed by users in TOP and Domain A, you can create the risk or control in Domain A.

Unless the risks and controls are in the Global domain, users should not assign risks or controls in a higher domain to users in a lower domain. In the example above, if you have a control in the TOP domain, you should not assign it for attestation to users in Domains A or B since those users would not have access to the control; thus the attestation or assessment questionnaire would not be generated.

Similarly, users should not assign control objectives and risk statements in a higher domain to attestations and assessments in a lower domain. Otherwise the attestation or assessment questionnaire would not be generated.

Use case

GRC data for IT can be separated from the GRC data of other departments. Each business area using the GRC application can have separate data that cannot be shared with other departments. Therefore each department can have its own entities, policies, controls, risks, and so on.

When looking at a control from the IT domain, the user can choose to expand the domain scope to show values from the Finance domain or collapse the domain scope to show only controls that match the IT domain.

By default, domain separation adds a domain field to the Task `[task]` and Configuration Items `[cmdb_ci]` tables and their extensions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can extend domain separation to any new tables you create by adding a `sys_domain` field to the table's dictionary definition. By default, the system only domain-separates platform and baseline application tables where appropriate.

Warning:
ServiceNow does not recommend domain separating platform tables (any table with the sys_ prefix such as the Dictionary Entry `[sys_dictionary]` and Dictionary Entry Override `[sys_dictionary_override]` tables) because it can produce unexpected results.

In this use case, client scripts, business rules, workflows, processes, and so on can be domain-separated.

While the behavior offered with domain separation provides multi-tenancy support, multi-tenancy is still contained within a single instance. This means that some global properties, some global data, and some global processes are shared across all domains. For example, the system's "Remember me" option on the login page is global and cannot be specified per domain.

If you need complete and total separation of all system properties and do not require global reporting or global processes, separate instances are the best option.

How domain values are allocated to GRC objects

Records that are automatically generated, the domain of the record is determined by the domain iterator configured for the job. The following table shows how domain values are allocated to different GRC objects:

GRC objects	Domain source
Entity	Gets domain value from Applies_to.
Entity to entity type	Gets domain value from Entity type.
Item assessment	Gets domain value from item (risk or control).
Issue	Gets domain value from item (risk or control).
Entity to information object	Gets domain value from Entity.
Indicator	Gets domain value from control or risk.
Indicator Task	Gets domain value from indicator.
Supporting Data	Gets domain value from indicator.
Indicator Result	Gets domain value from indicator.

Note:
When the domain source is global or nil, then that object's domain will be set to Default.

Domain separation for service providers

Create a domain

You can create a domain by creating a record in the [domain] table.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When creating a new domain, keep the following in mind:

- Only one domain can be the default domain.
- Only one domain can be the primary domain.

Procedure

1. Navigate to **All** > **Domain Admin** > **Domains**.
2. Click **New**.
3. Fill in the necessary fields (see table).
4. Click **Submit**.

Domain form fields

Field	Description
Name	Enter a unique name for the domain.
Type	Select a domain type that describes the domain. By default the domain types are *Vendor*, *Customer*, and *MSP*. You can also add your own choices.
Primary	Select the check box if this domain is to be the top-level domain in the hierarchy. The top-level domain only has child domains and no parent domains.
Default	Select if this domain is to be the default domain for your hierarchy.
Parent	Select the name of the domain higher in the hierarchy that contains this domain. This field must have a value for the domain to appear in the domain map.
Active	Select the check box to make the domain available for use. You must select this option for this domain to appear in the domain map.
Description	Enter a description for the domain.

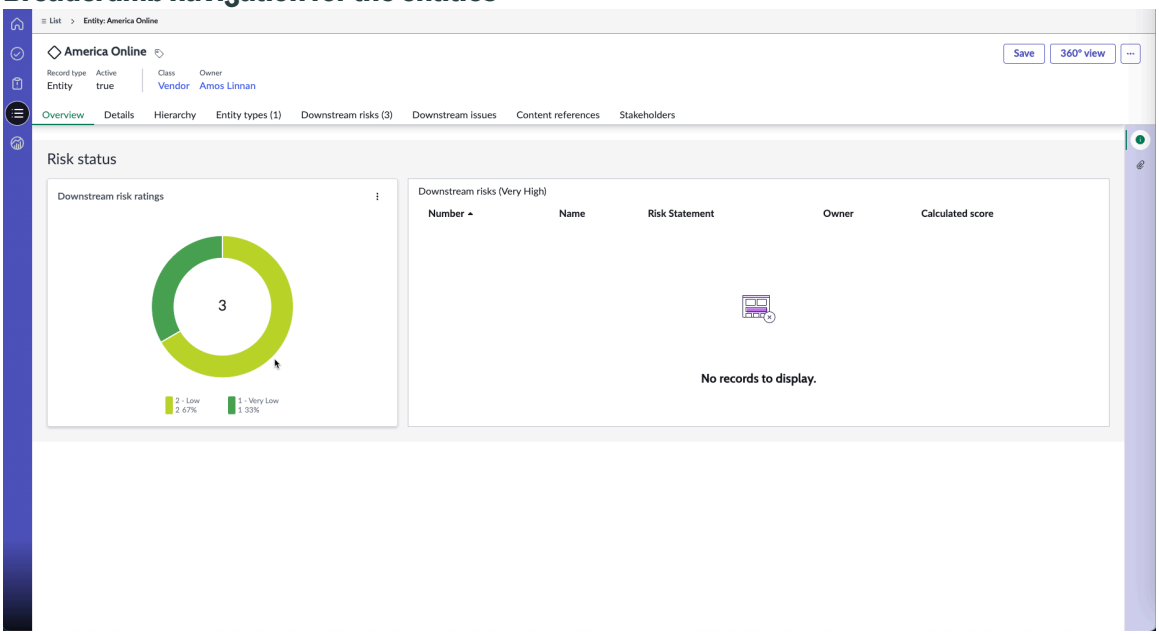
Each domain record can also have several related records:

- Companies
- Contains Domains
- Contained By

What to do next

To change the domain hierarchy, go to the Contains Domains related list and select the domain records that is the child (contained) domains of the contains relationship.

Breadcrumb navigation



The ServiceNow® Xanadu release supports breadcrumb navigation for all GRC modules including workspaces. Breadcrumbs provide a browser path to navigate a hierarchy of linked pages with related content.

Breadcrumbs provide context, consistency, and familiarity for the users. The breadcrumb style navigation provides a digital trail from the user's starting hover over the current content, with the ability to navigate to each link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the breadcrumb style navigation that provides a browser path to navigate a hierarchy of linked pages with related content. Breadcrumbs offer a quick form of filter navigation. They're ordered from left to right. The left condition is the most general, and the right condition is the most specific. For example, you can see the navigation path for the Entities in the workspace view:

Breadcrumb navigation for the entities

The navigational path **List** > **Entity: America Online** in the example indicates that you can navigate to the America Online page from the Entity menu in the List view. Selecting any link in the path returns you to the selected screen.

Taxonomy management in GRC

Taxonomy is used to organize, classify, and label the elements of the unstructured content. The content is organized into granular elements that provide more information about the context of the content.

Use the new GRC: taxonomy management application to manage categories for your content classification across GRC modules by using the Taxonomy module. In addition, you can use the GRC: taxonomy management application to store your taxonomy. The GRC: taxonomy management application is automatically installed with the GRC: Policy and Compliance Management application.

It helps to adapt and reuse the content efficiently across different segments and products. The GRC: taxonomy management application stores the taxonomy and it provides a way to map the taxonomies via a UI component for all the GRC modules.

The new GRC: taxonomy management application provides the following benefits:

- It provides a better alignment with the regulations.
- It categorizes and classifies the regulatory content easily within the GRC module.
- It sets up an internal taxonomy or maps the taxonomy from an external provider to categorize different types of library objects such as Authority documents and Citations.
- It provides the following out-of-the-box (OOTB) classification elements:
  - Content type
  - Jurisdiction

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Regulatory body
  - Sector
  - Theme
- It offers the flexibility to add the new taxonomy categories with a new taxonomy class record in addition to the taxonomy categories provided out-of-the-box (OOTB).
- It helps you to streamline your regulatory compliance, trace the regulatory requirements, and update the external regulations.

Note:
If you have downloaded the Regulatory Change Management application previously and you are upgrading to the Xanadu GA release, copy the data from the old taxonomy tables to the new taxonomy tables.

Landing Page Configurations module

GRC administrators can now configure the Tasks and Issues overview landing pages in the workspaces by using the GRC Landing Page Configurations module in the classic user interface. The role required to configure the tasks, issues, and other items in the Landing Page Configurations module is the sn_grc_workspace.task_admin role. GRC administrators are assigned the sn_grc_workspace.task_admin role by default.

Landing Page Configurations module

The GRC Landing Page Configurations module displays the following modules:

- Tasks Page Configuration
- Issue Page Configuration

Tasks Page Configuration module

The Tasks Page Configuration module in the classic user interface displays the configurations related to the Tasks section in the landing pages of the workspaces. The configurations in the Tasks Page Configuration module help the users to view the data in different workspaces.

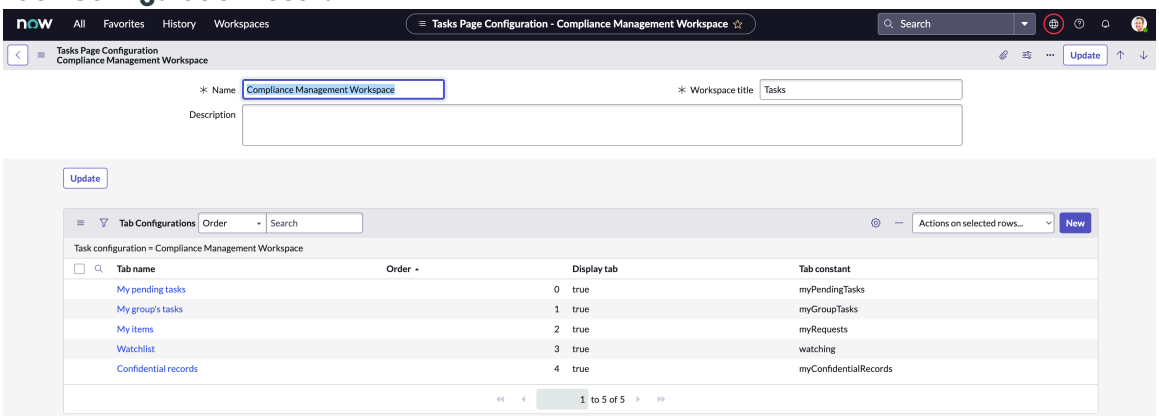
Only users with the sn_grc_workspace.task_admin role can configure the Tasks landing pages for the workspaces using the Tasks Page Configurations module in the classic user interface. The administrators are assigned the sn_grc_workspace.task_admin role by default.

GRC administrators perform task page configurations, including the workspaces, tabs, and filters configurations in this module. Based on all the filter conditions that are applied at table levels or state levels, the users can view the data in the Tasks landing page in the workspace.

In the homepage view of the workspace, the widgets displayed about the tasks such as My tasks and My group's work are configured using the UI Builder. Clicking these widgets in the homepage view directs the users to the Tasks page in the workspace.

For the Audit workspace, Compliance workspace, Privacy workspace, and Risk workspace, the following pre-configured tabs are shipped by default:

- My pending tasks
- My group's tasks
- My items
- Watchlist



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with GRC: Common Workspace Elements application version 14.x, the administrators with the sn_grc_workspace.task_admin role can add or remove the tabs in the Task Configuration record. They can also prioritize or order the tabs in a sequence. When a tab is created in the Task Configuration record under the Tasks Page Configuration module, it is displayed in the workspace UI.

The task administrators can change the order of the tabs in the UI. If the same order is configured for two tabs, the tabs are displayed in an alphabetical order.

The following image shows the updated Task Configuration record.

Task Configuration record

GRC administrators can configure the names of the task configuration records that are displayed in the landing pages. Administrators can do the following:

- Update the name and description of the record in the classic user interface. Only administrators can view this data in the classic user interface. End users cannot view this data in the workspace view.
- Update the title of the workspace that is displayed in the Tasks landing page in the workspace. End users can view this data in the workspace view.
- Update the title of the applicable table, filter condition, and column names.
- Update the filter conditions for the tabs.
- Filter the records based on the group selection for the applicable table.
- Add, update, remove, or override the state labels of the tables.
- Update the type of the tab such as group tab or regular tab.

Update the Tasks Page Configuration record

Update the Tasks Page Configuration record in the classic user interface to display the task configurations in various workspaces. The Tasks Page Configuration record displays the configurations that an end user can view in the My Tasks landing page in each workspace.

Before you begin

Role required: sn_grc.admin, sn_grc_workspace.task_admin

About this task

GRC administrators can configure the tasks that the workspace users can view in the workspace. The following tabs are used to configure the tasks and they are provided by default for each workspace:

- My pending tasks
- My group's tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- My items
- Watchlist

Depending on the workspace selection, these configurable tabs are displayed in the workspace. GRC administrators can modify these tabs using the Landing Page Configurations module.

State filters or second-level filters are available for the My pending tasks, My group's tasks, My items, and Watchlist tabs.

Procedure

1. Navigate to **All** > **GRC Landing Page Configurations** > **Tasks Page Configuration**.
   The Tasks Page Configuration record displays the configuration records for each of the following workspaces:
   - Audit Workspace
   - Compliance Workspace: Displayed under the Policy and Compliance module.
   - Operational Resilience workspace
   - Privacy Workspace
   - Regulatory Change Management Workspace: Displayed under the Policy and Compliance module.
   - Risk Workspace
   - Risk Portal
   - Vendor Management Workspace
2. Click the configuration record for the workspace that you are working in.
3. On the form, update the fields as needed.

   The tasks page configuration record for the selected workspace displays the following fields.

Tasks Page Configuration record

Field	Description
Name	Name of the task configuration that is displayed in the tasks page configuration record.
Description	Description of the task configuration that can be updated.
Workspace title	Title of the My Tasks page that is displayed in the workspace.

The **Tab Configurations** related list displays the following tabs in the Task Configuration record:

- My pending tasks
- My group's tasks
- My items
- Watchlist
- Confidential records

The following configuration fields are displayed for all the tabs in the Task Configuration record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Task Configuration record

Field	Description
Tab name	Name of the tab that is displayed in the workspace.
Order	Order of the tab in the workspace.
Display tab	Option to display the tab in the UI. When this option is enabled, the tab is displayed in the UI. Similarly, when this option is disabled, the tab is not displayed in the UI.
Enable group selection	Option to select the groups in the filter. When this option is enabled, administrators can filter the records based on the group selection for the applicable table.

The related list for each tab displays the following information:

Related list for each tab in the Task configuration record

Field	Description
Applicable tables	List of the tables that are displayed in the workspace and that are shipped with the release. These tables are the records that the user can act upon based on the matching conditions. You can create a new applicable table or click an existing applicable table from the list to update its configuration record. ○ The table configuration record displays the fields that are related to the selected applicable table. ○ The Map states related list displays the states that are applicable to the selected applicable table. You can select a state and update its filter condition so that it is correctly displayed in the tab in the workspace.
Applicable states	List of the states that are applicable to the tab. These states are displayed in the workspace with the Overridden label column. You can configure and update the name of the state by adding the updated state name in the Overridden label column.

4. If needed, in the Applicable tables related list, update an existing table by doing the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click a table to open its configuration record.

b. Configure the **Task title**, **Table**, **Tab level filter**, and **Displayed columns** fields and click **Update**.
The updated fields for the selected table are displayed to the end user in the workspace.

c. Configure the name of the state by adding the updated state name in the Overridden label column.

5. Click the **My pending tasks** tab and update the configuration fields if necessary.

   The My pending tasks tab configuration displays the available configuration and the list of the tasks configured within the tab.

6. Click the **My group's tasks** tab and update the configuration fields if necessary.

   The My group's tasks tab configuration displays the list of the tasks assigned to your group.

   Note:
   You can configure the tab name for the My group's tasks tab and its associated fields similar to the My pending tasks tab.

7. Click the **My items** tab and update the fields if necessary.

   The My items tab configuration displays the list of items that are either created by you or opened by you.

   Note:
   You can configure the tab name for the My items tab and its associated fields similar to the My pending tasks tab.

8. Click **Watchlist** and update the fields if necessary.

   The My watchlist tab configuration displays the list of the tasks for which you are in the watchlist.

   Note:
   You can configure the tab name for the Watchlist tab and its associated fields similar to the My pending tasks tab.

9. Click **Confidential records** and update the configuration fields if necessary.

   The Confidential records tab configuration displays the confidential records for the selected table.

10. Click **New** in the **Tab Configurations** related list to add a new tab in the Task Configuration record.

    a. Fill in the fields on the form.

    b. Click **Submit**.
    The new tab is displayed in the UI with the information for the selected groups.

11. Click **Update** to update the task configuration record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Page Configuration module

The Issue Page Configuration module displays the configurations related to the Issues overview landing pages in various workspaces. The data displayed in the Issues overview landing page is configured using the Issue Page Configurations module in the classic user interface. The Issues overview landing page includes the Issues, Issue triages, Tracking status of the issues, and Audit observations pages.

The Issues Overview Landing page is available in the following workspaces:

- Audit workspace
- Compliance workspace
- Privacy workspace
- Risk workspace

GRC administrators can configure, monitor, and report issues for an active workspace by mapping the states, filter conditions, and tables using the Issue Page Configuration module.

Based on the configurations performed in the Issue Page Configuration module, workspace users can view the data that is assigned to them in the Issues overview landing page in the workspace.

Administrators can perform the following tasks using the Issue Page Configuration module:

- Create new Issue page configurations records in the classic user interface that are displayed in the Issues overview page in the workspace.
- Configure the issues related to the tables, tracking, issue triages, and observations for the selected tables and track policy exceptions, evidence, and so on.

The homepage in each workspace displays the issues section that provides the following information:

- The My issues section displays the Issues and Triage issues sections in a number format. Issues subsection displays the details such as Assigned to, Managing, Remediation assigned, To review, Overdue. Triage issues subsection displays the details such as Assigned to and To review.
- The My group's issues section displays the Issues and Triage issues sections in a number format. Issues subsection displays the details such as Assigned to, Managing, Unassigned manager, To review, Overdue. Triage issues subsection displays the details such as Assigned to, Unassigned owner, To review, and Unassigned reviewer.
- The Watching section displays the details such as Triage issues and Remediation tasks in a number format.

Create a new Issue Page Configuration record

Create a new issue page configuration record in the Issue Page Configuration module in the classic user interface. The Issue Page Configuration module displays the configurations related to the Issues section in the landing pages of the workspaces. The newly created issue is displayed in the Issue overview landing page in the selected workspace.

Before you begin

Role required: sn_grc.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Landing Page Configurations** > **Issue Page Configuration**.
2. Click **New**.
   The Issue page configuration record is displayed.
3. On the form, fill in the fields.

Issue page configuration form

Field	Description
Name	Configurable name of the workspace. This is the name of the tab that is displayed in the workspace.
Issues tab	
Table	Name of the table used for configuring the issues that are displayed in the workspace. The **Filter** field displays the filter condition that you can configure and display the matching records.
Tracking tab	
Policy exceptions	Option to display the policy exceptions under the Tracking section in the Compliance workspace. **Note:** On the Risk workspace, policy exceptions are by default not displayed.
Evidence requests	Option to display the evidence requests under the Tracking section in the Compliance workspace. This option is available only when the Advanced core plugin is installed in the instance.
Issue triage tab	
This tab is available only when the Advanced core plugin is installed in the instance.	
Show issue triages	Option to display or hide the issue triages in the workspace. **Note:** For the Audit workspace, this option is inactive by default.
Table	Name of the table used for configuring the issue triages.
Filter	Filter condition that you can configure to display the matching records.
Observations tab	
This tab is available only when the Advanced Audit plugin is installed in the instance.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show observations	Option to display or hide the audit observations in the workspace. **Note:** This option is by default selected for the Audit workspace.
Table	Name of the table used for the observation.
Field	Filter condition that you can configure and display the matching records.

4. Click **Submit**.

Result
A new Issue Page Configuration record is created.

Link a new Issue Page Configuration record to a workspace

Create a new Issue Page Configuration record and link it from the classic user interface to the desired workspace. After linking the Issue Page Configuration record, the workspace view displays the new settings in the Issues overview landing page.

Before you begin
To link a new configuration to the desired workspace, you have to update the *issuePageConfigId* property for the workspace.

Role required: sn_grc.admin

About this task
When a new issue configuration is created and saved in the Issue Page Configurations record, it is displayed in the workspace only after linking it to the desired workspace.

Procedure

1. Create a new issue configuration in the Issue page configurations record.
   For instructions, see Create a new Issue Page Configuration record.
2. Copy the sys_id of the new configuration and keep note of it.
   You will later use the sys_id to update the Issue Page Configuration record.
3. Navigate to the Experiences list in the classic user interface.
4. From the UX Applications list, select the workspace where you want to integrate the change.
5. In the selected workspace, select the *issuePageConfigId* property.
6. On the issuePageConfigId property page, set the **Value** field to the sys_id of the new configuration, and click **Save**.

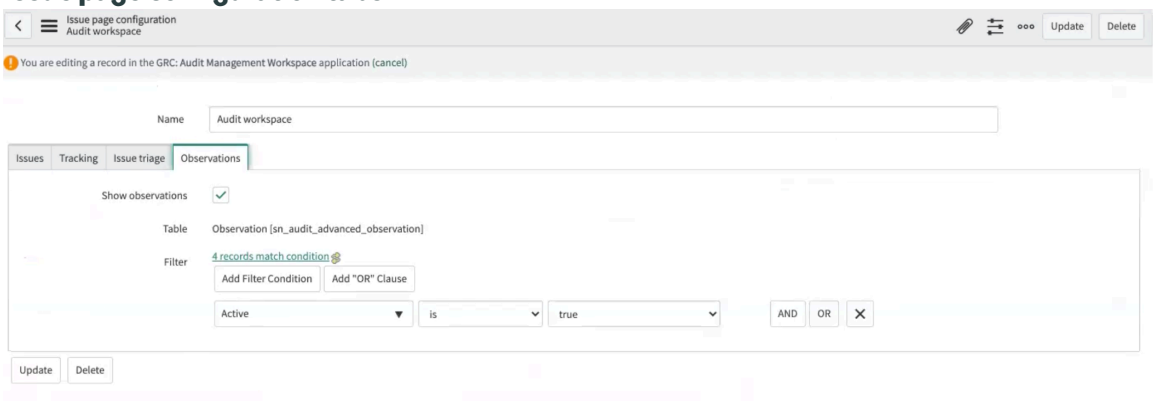
   Note:
   Multiple configuration records can be configured in the workspace. But only the configuration record for which the sys_id is configured in the *issuePageConfigId* property is displayed in the workspace.

Result
The new issue page configuration setting is displayed in the desired workspace view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update an Issue Page Configurations record

Update an existing Issue Page Configurations record in the classic user interface to update the issue page configurations that are displayed in the Issues overview landing page in the workspace. After modifying the configurations in the Issue Page Configuration record, the issues, issue triages, and tracking status of the issues are displayed for the users in the desired workspace.



Before you begin

Role required: sn_grc.admin

Procedure

1. Navigate to **Landing Page Configurations** > **Issue Page Configurations**.
   The names of the available workspaces are listed in the Issue Page Configurations record.
2. Select the workspace configuration record that you want to update.
   The Issue page configuration record for the selected workspace displays a list of the tabs. You can check the filter conditions for the selected table displayed in the respective tabs and update the fields if necessary.
   - Name: Name of the tab that is displayed in the workspace.
   - Issues: Configuration to be performed to display the issues widget in the workspace.
   - Issue triage: Configuration to be performed to display the issue triage widget in the workspace.
   - Tracking: Configuration to be performed to display the Policy exceptions and Evidence requests in the workspace.
   - Observations: Configuration to be performed to display the audit observations in the workspace.

   Issue page configuration tabs

3. In the **Issues** tab, check the filter conditions for the selected table and update the fields if necessary.
4. In the **Issue** triage tab, check the filter conditions for the selected table.
5. In the **Tracking** tab, select the **Policy exceptions** and **Evidence** options.
6. In the **Observations** tab, select the **Show observations in the Audit workspace** option, and update the filter condition.
   The page displays the name of the table for observations (sn_audit_advanced_observation) and the filter condition to be selected such as **Active is True**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Observations widget is displayed only in the Audit workspace.

7. To update the issue page configuration record, click **Update**.

My tasks in the workspace

GRC administrators can configure the tasks for the individual users and user groups in the GRC Landing Page Configurations module. Based on these configurations, the workspace users can view the individual user tasks, user group tasks, my items, and watchlist on the Tasks page in the workspace view.

The roles required to configure and view the workspaces are listed below.

Roles required to configure the Tasks Page Configuration and view the Tasks page in the workspaces

Role	Actions associated with the role for the workspace
sn_grc.admin, sn_grc_workspace.task_admin	Configure the Tasks Page Configuration records in all the workspaces.
sn_grc.business_user	View the Tasks page in the Risk Portal workspace.
sn_audit_ws.supervisor, sn_audit_ws.auditor,	View the Tasks page in the Audit workspace.
sn_compliance.admin	Configure and view the Tasks page in the Compliance workspace.
sn_oper_res.admin	Configure and view the Tasks page in the Operational Resilience workspace.
sn_privacy.admin	Configure and view the Tasks page in the Privacy workspace.
sn_grc_reg_change.it_admin	View the Tasks page in the Compliance workspace.
sn_risk_workspace.IT_risk_manager and sn_risk_workspace.operational_risk_manager,	View the Tasks page in the Risk workspace.
sn_vdr_risk_asmt.vendor_risk_manager	View the Tasks page in the Vendor Management workspace.

Based on the tasks that were set up by the administrators, the tasks are displayed under the following tabs in the configuration records for workspaces:

- My pending tasks
- My group's tasks
- My items
- Watchlist
- Confidential records

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Task configurations are maintained in the Applicable Table, which now includes an Active/Inactive flag. The Active/Inactive flag determines whether a configuration is considered in My Tasks. When marked active, the configuration appears in the relevant task tabs such as My Pending Tasks or My Group Tasks; when marked inactive, it is excluded. This functionality enables you to control visibility without deleting records. Toggle the flag to activate or deactivate entries as needed.

You can view the Tasks page in the following workspaces:

- Audit Workspace
- Operational Resilience workspace
- Policy and Compliance Workspace: Displayed under the Policy and Compliance module.
- Privacy Workspace
- Regulatory Change Management Workspace in Policy and Compliance Workspace
- Risk Workspace
- Risk Portal
- Vendor Management Workspace

Note:
My items and Watchlist are not displayed in the Vendor Management Workspace.

Monitor my tasks in the Tasks page in the workspace

Configure and monitor the tasks that are related to an assigned user in the workspace. Configure the landing pages and the widgets that are displayed in the workspaces using the Landing Page Configurations module. The configurations performed using the Landing Page Configurations module help you to filter the data that is displayed in different workspaces.

Before you begin
Role required: sn_grc.admin, sn_grc_workspace.task_admin, sn_grc_workspace.task_reader

About this task
Navigate to the individual workspaces to view the tasks, items, and watchlist for the individual users and user groups.

Procedure

1. Navigate to the right workspace in one of the following ways:
   - **All** > **Audit** > **Audit Workspace**.
   - **All** > **Operational Resilience** > **Operational Resilience Workspace**.
   - **All** > **Policy and Compliance** > **Compliance workspace**.
   - **All** > **Privacy** > **Privacy workspace**.
   - **All** > **Regulatory Change Management** > **Compliance workspace**.
   - **All** > **Risk** > **Risk workspace**.
   - **All** > **Risk** > **Risk Portal**.
   - **All** > **Vendor Management** > **Workspace**.
2. To navigate to the Tasks page, click the tasks icon ( ).
3. Navigate to the tab that you want to view, and monitor the tasks.
   The Tasks page displays the following tabs based on the workspace configuration:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **My pending tasks**: Monitor the pending tasks assigned to you. The **Applicable Tables** tab under the **My pending tasks** tab on the Tasks Page Configuration module displays the list of tables that are applicable to the tasks. If the data is relevant to the user and if it matches the defined conditions, then it is populated under the **My pending task** tab in the workspace UI.

  If there is no data pertaining to you or if you do not have any assigned tasks, no data is not displayed under the **My pending tasks** tab. Only open and active tasks assigned to you are listed under the **My pending tasks** tab.

- **My group's tasks**: Monitor the tasks assigned to the user groups that you belong to. The My group's task page displays the pending tasks assigned to the user groups that you belong to. When there are no pending tasks for the user group, a message displays that All tasks are completed. Select the group from the list for which you want to filter the tasks.
- **My items**: Monitor the tasks assigned to you and the issues reported by you. The My items tab displays the list of items that are either created by you or opened by you.
- **Watchlist**: Monitor the tasks for which you are in the watchlist. The My watchlist tab configuration displays the list of the tasks for which you are in the watchlist.
- **Confidential records**: Mark sensitive records as confidential and ensure that the right people have access to these records. The Confidential records tab configuration displays the confidential records for the selected table.

Note:
When a user or user group does not have any pending or associated tasks, a message displays under the respective tab that `All your tasks are done`.

Exploring the entities

Entities are one of the most fundamental and crucial elements for using Governance, Risk, and Compliance. Entities can be people, processes, departments, applications, or objects that are examined for risks.

To effectively maintain the risk and compliance universe of your organization, you have to define entity types, entity classes, and entity tiers. A risk universe refers to a list of risks that your organization either faces or might face in the future. The list contains a description of each risk's criticality and frequency.

Entities are used within all offerings of GRC such as GRC: Policy and Compliance Management, Audit Management, GRC: Privacy Management and GRC: Regulatory Change Management.

Entities in GRC

In Governance, Risk, and Compliance, an entity can be a person, process, department, application, or object, whose exposure must be managed. These entities have controls that are defined to view the status.

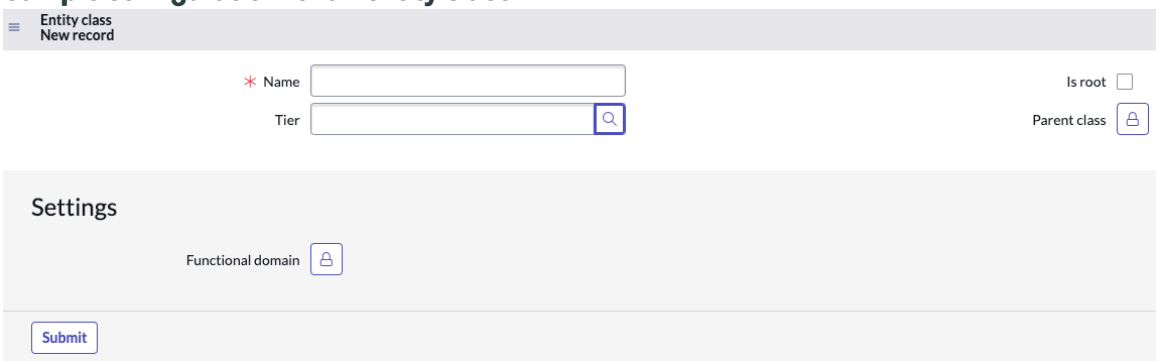
To understand entities, consider the following example. Assume that you're a new GRC user and you want to implement a change management process to all your critical financial systems. All the systems can be considered as individual entities. Map all the systems to an entity class called Financial. Have an entity type filter for critical financial systems to determine the systems that are identified as critical.

The primary benefit of creating entities is that you can maintain accountability because each entity has an owner. To understand this benefit, assume that you want to configure all the servers in a new way. After you finish the configuration, you perform an audit and then discover that only one server failed to comply with the new configuration. If you had not defined all the entities, then the entire audit result would have been deemed as failed. But because you have the entities

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

defined, then only the non-compliant server entity and its identified owner are held accountable instead of all the servers.

Having defined entities ensures that the entity owners can be identified and that appropriate controls can be applied to those entities. It also helps in tracking the entities that are non-compliant. Any entity that has child entities can be said to have downstream entities. Any entity that has parent entities can be said to have upstream entities.



When a source record linked to an entity filter is created, an entity is automatically generated in GRC. If the source record name changes after the entity is created, the entity name updates to match the source record name. This behavior is controlled by the Sync Entity name with source record check box. When selected, the Name field becomes read only and stays in synchronization with the source record. Clearing the check box enables you to manually override the entity name.

After creating entities, you can tag the similar entities by defining the entity class for them individually or you can link them to an existing entity class.

Entity classes

Entity classes are used to add a conceptual information about the entity or tag the entity. To understand the concept of entity class, consider the following example. A company has office branches in three cities. The office space is considered as an entity and the entity class for these entities would be the location. You can create an entity class by associating it with an entity tier as shown in the following example.

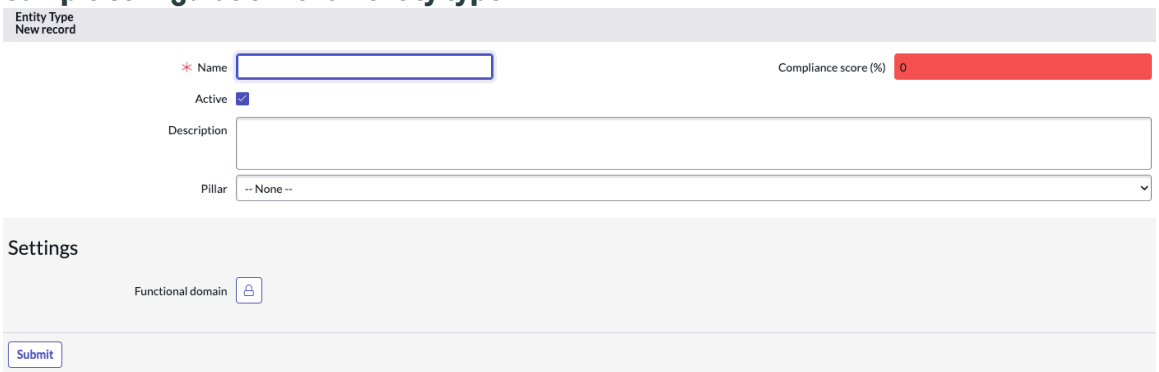
Sample configuration for an entity class

Entity class rules

Entity class rules help to assign classes to the entities at the table level. Any new entity created on the table gets that entity class automatically. Entity classes are used to tag your entities.

When you create an entity over a specific table, the class associated with that table automatically gets assigned to the entity. You can set a new entity class rule for a table.

Entity types



An entity type is a grouping of entities that is based on filtering. Entity types enable you to find and create entities that match a set of filter conditions. Hierarchy can be created within the entity classes.

Entity types also enable you to create risks and controls for each entity without spending much time. For example, an organization can have multiple departments, such as finance, HR, or IT. All these departments can be considered as entities and can be grouped under the entity type called Departments.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create an entity type by associating it with the core business pillar such as Technologies or Facilities as shown in the following example.

Sample configuration for an entity type

Entity tiers

When you create entity tiers, you apply a level or hierarchy to the entity classes. This level applies to all the entities in those entity classes. Entity tiers enable you to select and view the status of the most critical items in the business as shown in the following example.

List view for an entity tier

Name	Label	Domain	Tier level
application	Application	global	20
business	Business	global	10
it_asset	IT Asset	global	30

Composite entity in Governance, Risk, and Compliance

Composite entity in Governance, Risk, and Compliance is a combination of two or more entities created from different entity classes. The Composite Entity Management application enables you to create multidimensional entities and manage them in a more granular level.

Overview of a composite entity

A composite entity is a multidimensional entity that consists of entities from different entity classes. In a single entity structure, you can only manage risk and compliance on individual entities, which limits visibility and control for complex organizations with multifaceted structures. Using the composite entity structure, you can define valid combinations by setting up relevant entity classes and then creating the composite entities. Composite entities integrate into existing workflows, enabling risk and compliance management with the same depth and flexibility as standalone entities. Composite entity enables you to assess and manage risks and compliance across a combination of multiple entities from different entity classes.

For example, consider an organization's Retail Banking division wants to evaluate its KYC (Know Your Customer) process within its UK operations. Creating a composite entity, “Retail Banking | KYC | UK,” enables stakeholders from KYC, the Retail Banking division, and the UK location to assess and monitor risks, compliance, and controls impacting each area. This approach enables for more granular and interconnected risk management, which is important for large organizations with multiple business lines and locations.

Note:
Activate the `sn_grc_comp_ent` plugin to use the composite entity functionality.

Benefits of composite entity

The following are the key benefits of a composite entity:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Manage risk and compliance workflows at multiple levels, combining different entity dimensions, such as Company | Department | Business Process for a clearer and more detailed assessment context.
- Aggregate risk and compliance posture automatically across impacted entity hierarchies, and confirming accurate risk score roll-ups.
- Add stakeholders with customizable roles relevant to composite entities, enabling effective team involvement in assessment projects.
- Map relevant risks and controls to composite entities that can be used for the risk assessment project.

Related topics

Create an entity class

Create a composite entity

Create a composite entity

Create multidimensional entities by combining two or more entities from different entity classes using the Composite Entity Management application. In Governance, Risk, and Compliance, entities can be people, processes, departments, applications, or objects.

Before you begin

Roles required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

The Composite Entity Management application and Risk Workspace must be installed to create a composite entity.

About this task

When you create a composite entity by combining two or more individual entities, the composite entity automatically becomes a downstream entity for each of the individual entities involved. For example, if you create a composite entity named "Document handover | Mexico" using the entities "Document handover" and "Mexico," the composite entity appears as a downstream entity for both "Document handover" and "Mexico." This structure helps in organizing related data and simplifies tracking dependencies across entities.

Procedure

1. Navigate to **All** > **Risk** > **Risk Workspace**.
2. Navigate to the list view and select **Entities**.
3. Select **New**.
4. On the form, fill in the fields.
   For a description of the field values on the Create New Entity form, see Create new composite entity form.
5. Select **Save**.

> **Note:**
> When you create an entity, only the **Details** tab is displayed. After the entity is created, the **Overview** tab, **Details** tab, and other related lists are displayed.

After saving the entity, an entity form is displayed with the Details tab, Hierarchy tab, and the following related lists.

For information on the fields in these related lists, see An entity in the workspace view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Create an entity class

Create new composite entity form

Use the Create New Entity form to create a composite entity by combining two or more entities from different entity classes using the Composite Entity Management application.

See the following table for a description of the field values.

Create New Entity form

Field	Description
Structure	Structure of entity. The options are as follows: • **Single**: Option to create a single dimension entity. • **Composite**: Option to create a multidimensional entity. **Note:** Select this option as you're creating a composite entity.
Active	Status of the entity.
Class	Option to select the composite entity class for which you want to create a composite entity. For more information on how to create a composite entity class, see Create an entity class.
Owner	Owner of the composite entity.
Applicable entities	Option to select the entities for each entity class. Select the Add + icon. When you search for an entity, the application displays the entity hierarchy, and you can also view the complete content tree.
Name	Name of the composite entity. The name is automatically generated based on the selected entity classes, with a separator between them. To change the separator, see Governance, Risk, and Compliance properties.
Description	Information about the composite entity.
Activity journal	
Additional comments	Additional information about the composite entity.
Settings	
Functional domain	Functional domain of the composite entity.

An entity in the workspace view

The Entity form in the workspace provides a complete view of an entity across your organization. The Entity form is listed under the Library menu of the List view in the workspace. Select an entity in the list view so that you can display its overview, details, hierarchy, entity types, or downstream risks.

Overview details on the Entity form

The Entity form displays the details on the entity such as Compliance status, Risk status, and Tracking. The information about an entity is organized in different tabs such as Overview, Details, and Hierarchy as shown in the following example.

Overview tab on the Entity form

The related lists on the Entity form display the dependencies that are related to the entities as explained in the following table:

Tabs and Highlighted details on the Entity form

Tab	Description
Details tab	Information about the entity such as Name, Active condition that shows whether the entity is active, Owned by, Class, Description, and Location information in the Entity section. The Compliance section displays the Attestation frequency such as Annually. The Cybersecurity Risk Profile (CRI) displays the following fields: **Tier** Tier levels such as Tier 1, Tier 2, Tier 3, and Tier 4. Controls are generated based on the change of the tier. If you

The 360° view displays an entire relationship view for the selected entity the upstream entities, downstream entities, entity class and entity type associated with the entity, and the relationships that the entity includes.

360 degree view of the entity

Create an entity

Create an entity for your enterprise. In Governance, Risk, and Compliance, entities can be people, processes, departments, applications, or objects. These entities have controls that are defined to mitigate their exposure, and their audits must be completed.

Before you begin

Roles required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

About this task

An entity is an object for an action. The entities have controls to mitigate their risk exposure. Follow this procedure to create new entities for your organization and view the downstream hierarchy, entity types, policies, and so on, related to the entity.

Procedure

1. Navigate to the desired workspace, go to the List view, and click **Entities**.
2. To create a new entity, click **New**.
3. Navigate to the **Details** tab and fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details tab in Entities record

Field	Description
Refers to existing record	Option that refers the new entity to an existing record.
Name	Name of the entity.
Active	Option that indicates whether the entity is active.
Owned by	Details of the owner of the entity such as System administrator.
Class	Name of the class associated with the entity such as Application or Business Entity.
Location	Location record of the entity with details such as address, city, state, and country.
Description	Description of the entity.
Compliance	
Attestation frequency	Option for attestation frequency such as daily or weekly.

4. Under the Compliance section, add the attestation frequency such as **Weekly** or **Annually**.
5. View attachments for the entity in the side panel.
6. To save the entity, click **Save**.

> **Note:**
> When you create a new entity, only the **Details** tab is displayed. After the new entity is created, the **Overview** tab, **Details** tab, and other related lists are displayed.

After saving the entity, a new entity form is displayed with the Details tab, Hierarchy tab, and the following related lists:

- Entity types
- Downstream risks
- Downstream controls
- Downstream engagements
- Downstream issues
- Downstream tasks
- Policy exceptions
- Privacy assessments
- CRI Tiering assessments
- CRI assessments

For information on the fields in these related lists, see An entity in the workspace view.

7. View the highlighted details side-panel for information such as the downstream hierarchy, entity types, and policies related to the entity.
8. To save the updates to the entity, click **Save**.

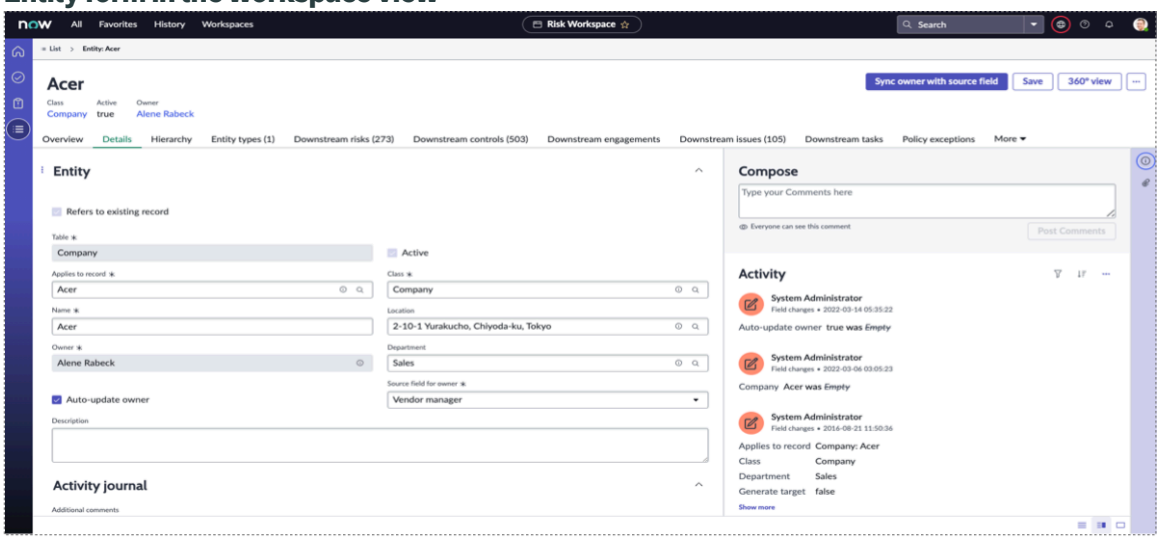
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Functionality enhancements for the entities

You can configure some functionality enhancements for the entities as part of the GRC updates.

The following enhancements are available for the entities:

- Email notification: When you update the entity owner value or when you assign a new owner to an entity, an email notification is sent to the entity owner about the assignment of the entity.
- Auto-update the entity owner: You can select the **Auto-update owner** option to keep the entity owner in synchronization with the value from its reference (source) field. See the following example.



Auto-update entity owner option

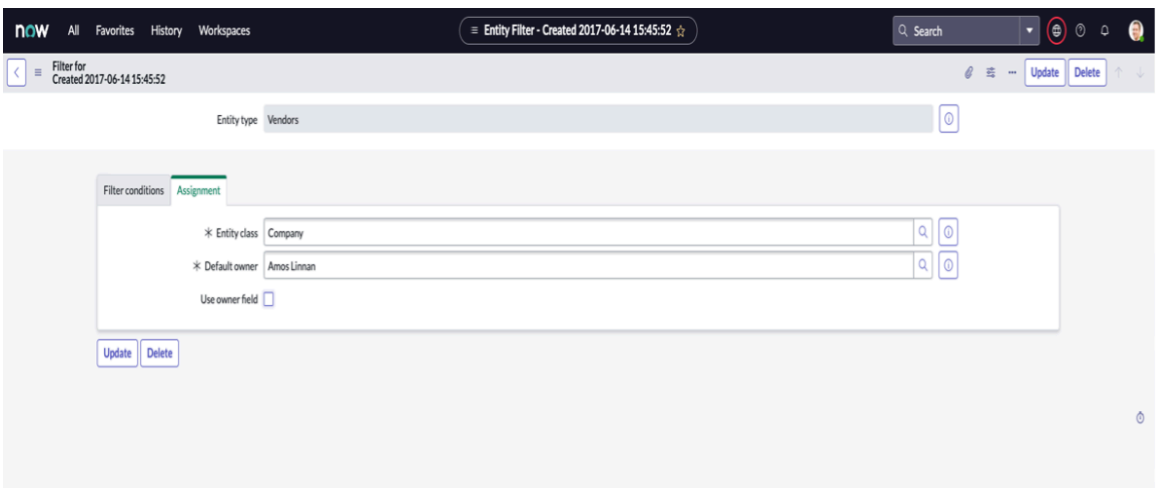
The **Auto-update owner** option is visible only for those entities that you have created by using the entity filter and that you have enabled by using the **Use owner field** option in the filter.

You can also view the **Auto-update owner** option on the entity form in the workspace view. See the following example.

Entity form in the workspace view

- Form design changes: The following form design changes are introduced in the entity and entity filter forms.

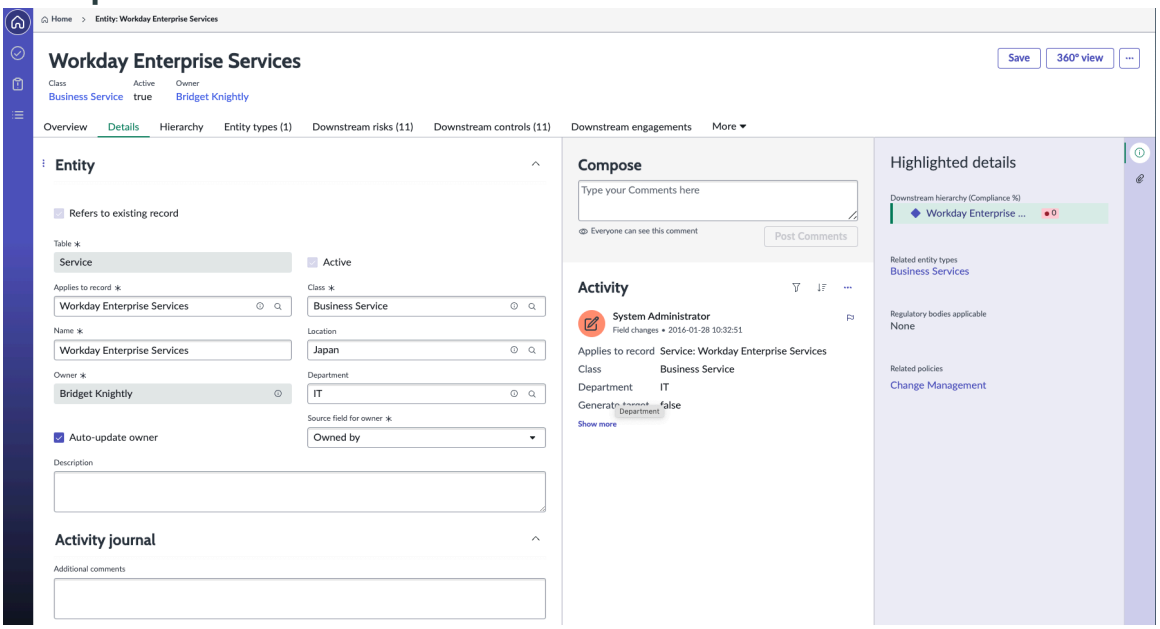
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- You must fill in the **Entity class** and **Default owner** fields in the form as shown in the following example.

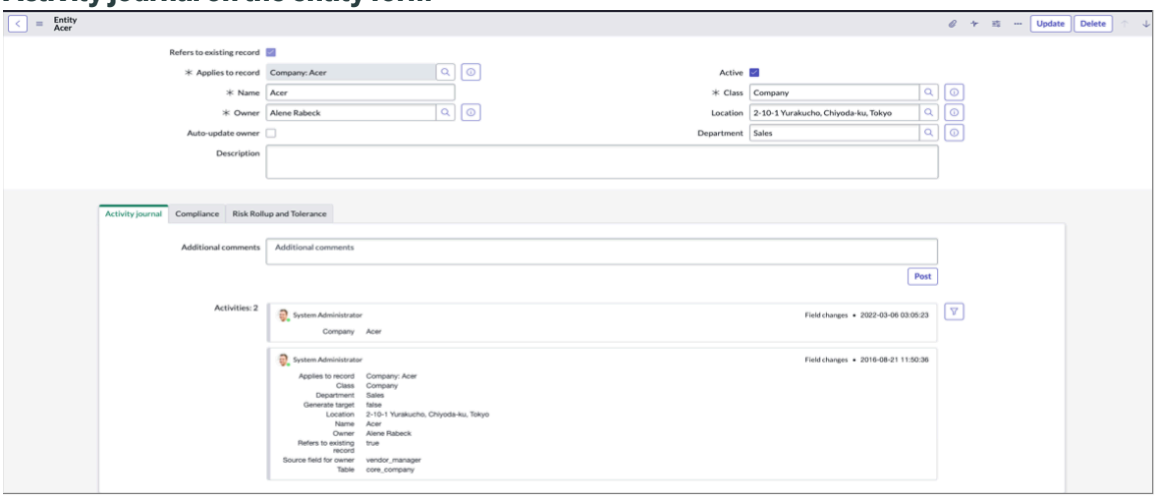
Class and owner fields in the entity form

- You must fill in the **Default owner** field even if you have cleared the **Use owner field** as shown in the following example. This update ensures that every entity that has been created has an owner assigned to it.



Default owner field

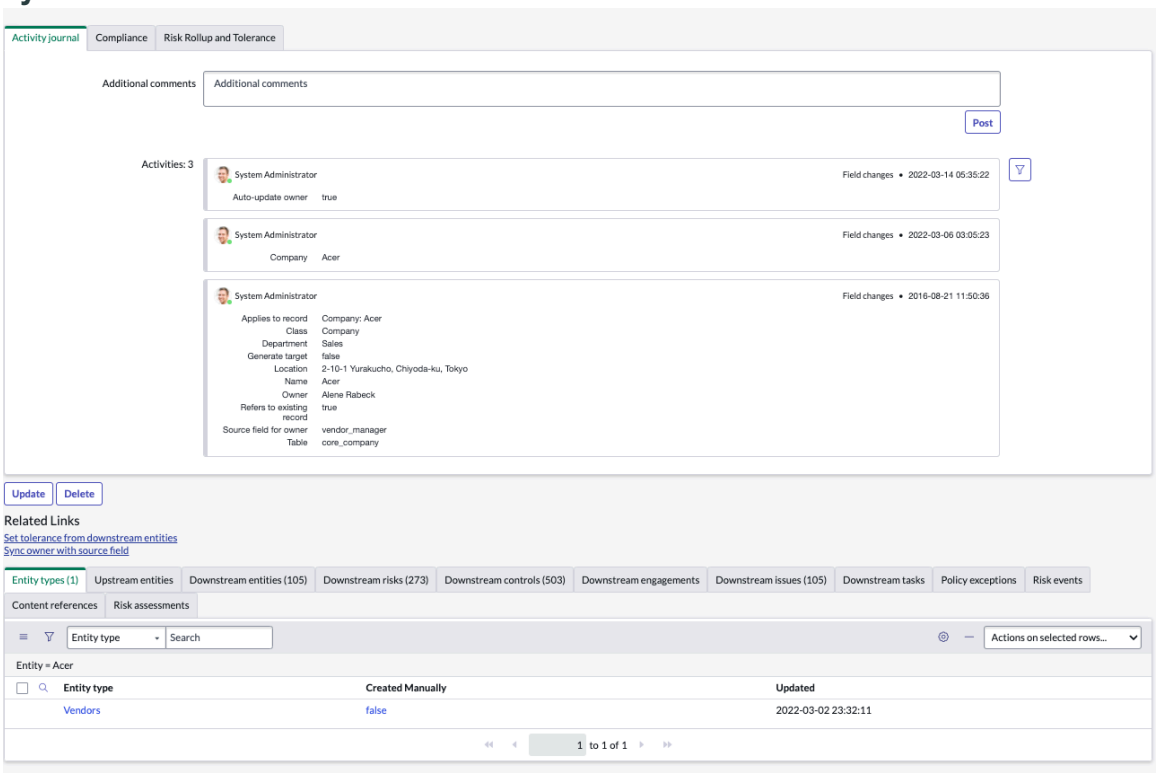
- The **Department** field is added to the entity form. You can add context to an entity by selecting the department, location, and class fields.
- The **Auto-update owner** and **Source field for owner** fields are displayed in the form. The **Source field for owner** is visible only if you have enabled the **Auto-update owner** field as shown in the following example.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-update owner and Source field for owner fields

- The Activity journal displays the log of the changes that are made to the fields as shown in the following example.



Activity journal on the entity form

- The new **Sync owner with source field** related link is displayed in the entity form as shown in the following example. It synchronizes the owner of an entity with its source record's field value. It is visible on the form only if the value of the source field and the owner of an entity are not in synchronization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sync owner with source field UI action

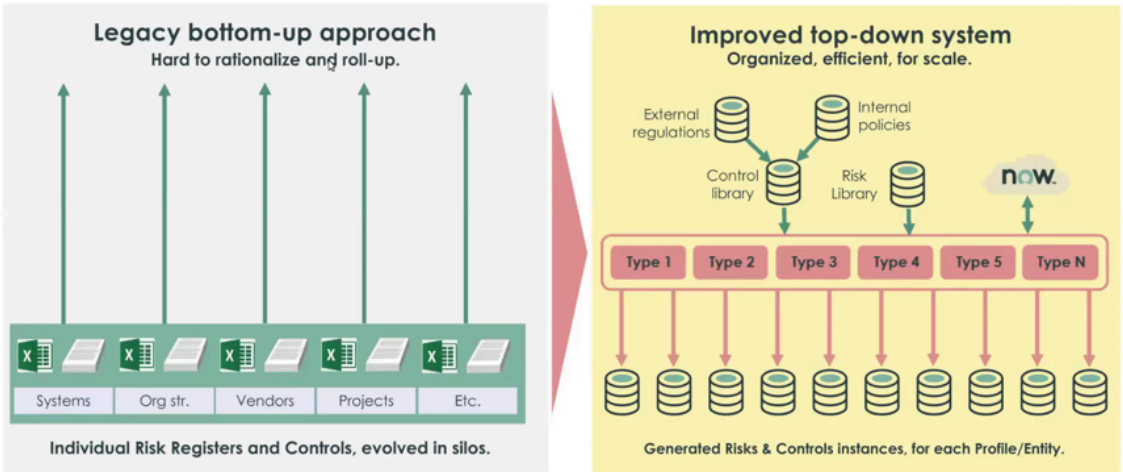
- Activate the job that synchronizes the entity owner before enabling the property. You can enable the **Frequency of syncing the entity owner with the source record** property under GRC properties to synchronize the entity owner with its source record on a daily, weekly, or monthly basis.

  Activate the job that synchronizes the entity owner before enabling the property. You can enable the **Maximum batch size while syncing the entity owner with that of its source record** property under GRC properties to set the maximum batch size to an integer value. By doing this action, you synchronize the entity owner with its source record value.

Entity scoping in GRC

Entity scoping is permitted in each of the core GRC applications. Scoping provides a way to allocate risks and controls at different levels. Dependencies are created using the dependency map in the GRC Workbench.

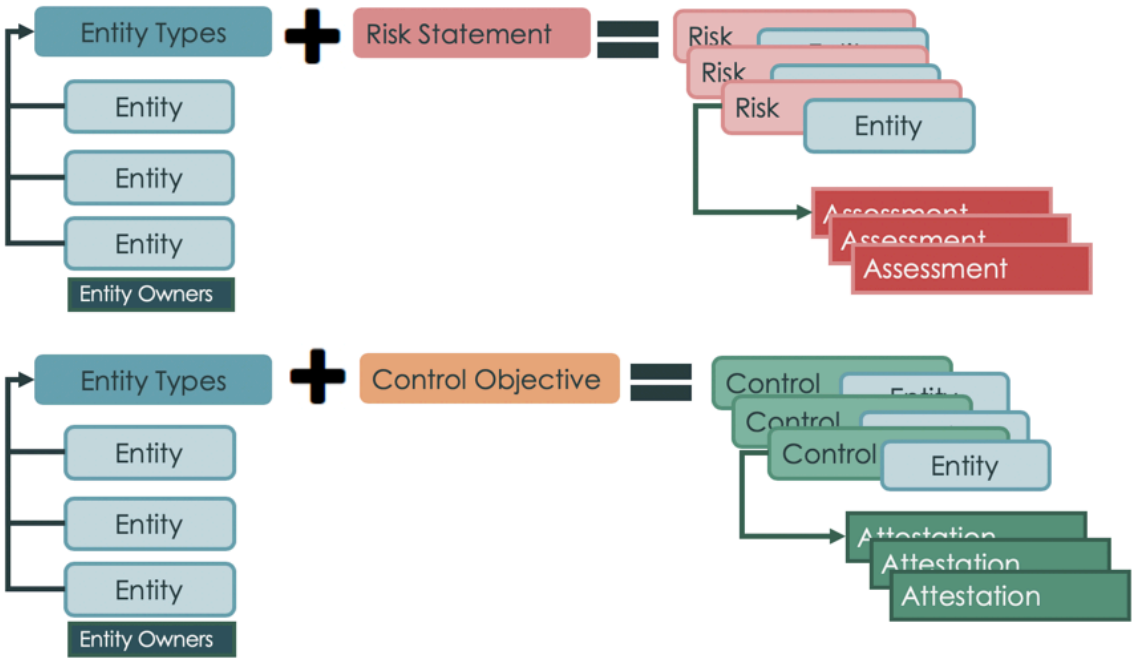
Entity scoping overview



Note:
Starting with the New York release, the term profile was replaced with the term entity. See Governance, Risk, and Compliance application nomenclature updates and industry terminology for more information about all updated GRC application terms.

Organizations have various control owners maintaining individual files and spreadsheets for tracking the compliance of different systems, projects, organizations, etc. In this environment, risk managers cannot prevent or even be aware of the duplicate risks and controls created on shared entities. The entire purpose of entity scoping is to provide a top-down approach for maintaining your risk universe, which is the hierarchical library of both risks and controls. Mature organizations with a healthy risk posture find that most risks are standard and recurring. Entity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



scoping helps you catalog and visualize upstream and downstream risks and controls based on the roll up of the related entities.

From an organic approach to a structured system

1. Create or edit **Entity Types** and map them using the **Entity Filter** to existing ServiceNow® tables.
2. Map these entity types to external regulations and internal policies using control objectives and risk statements.
3. Generate risk and control instances on related entities.
4. Maintain your risk appetite and scoring results by the aggregated calculation for entities; all combos for risk scores on risk roll up.

Scoping process

Generate risks and controls from entity types

Create and edit entity types and map them to existing ServiceNow® tables for which you must track compliance (applications, departments, regions, processes, systems, etc.). Entities are assigned to control objectives and risk statements, which generate controls and risks for every entity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager
- sn_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager

About this task

An entity type provides you a method to group Entities together. An entity type can be explained in the following example: Assume that you want to generate a risk of earthquake for all the data centers in a particular region. You could simply create an entity type called "Data Center" and associate all the entities of that region to the risk of earthquake based on the risk statement.

Procedure

1. Navigate to one of the following locations.
   - **Policy and Compliance** > **Scoping** > **Entity Types**.
   - **Risk** > **Scoping** > **Entity Types**.
   - **Audit** > **Scoping** > **Entity Types**.
2. Do one of the following actions.

Option	Description
To create a new entity type	Click **New**.
To edit an entity type	Open the entity type from the list.
To delete an entity type	Open the entity type from the list and click **Delete**. The item generation process executes these actions in the background. With the legacy im plementation of the item generation process (v1), the entity type that was marked for dele tion would get deleted instantly. With the implementation of the item genera tion process (v2), an entity type that is marked for deletion is not deleted instantly by the item generation process, but it is marked for deletion. When the nightly scheduled job runs, it deletes the entity type. For more information on the item genera tion process, see Using the item generation process to generate controls and risks.

3. Fill in the fields on the form, as appropriate, and click **Submit** or **Update**.

Entity type

Name	Description
Name	Name of the entity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Description	Explanation of the entity type with any additional information that a user finds helpful.

4. Once the entity type is saved, click the **Entity filters** tab and On the form, fill in the fields.

Entity filters

Name	Description
Entity Type	Indicates the entity type that the filters belong to.
Table	Table that contains the records to be queried.
Filter condition	Filter conditions for the source table to generate entities.
Owner field	Person who owns any new entities generated from the entity type. Identify the user reference field on the source table to automatically identify risk and control owners. Use default owner to assign risks to a single user when the owner field is empty.
Empty owner	○ Create ○ Do not create ○ Use default

5. Click **Submit**.
6. From the **Entity type** form, click **Update Entities from Filters**.
An informational message appears: Updating entities for this entity type.

Create independent entities

Entities can be created manually, rather than generating them from the entity types. Entities can also be created without needing to refer to an existing ServiceNow® table, like assets, applications, business services, or processes.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager,
- n_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Scoping** > **All Entities**.
   - **Risk** > **Scoping** > **All Entities**.
   - **Audit** > **Scoping** > **All Entities**.
2. Do one of the following actions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
To create a new entity	Click **New**.
To edit an entity	Open the entity from the list.

3. On the Entity form, fill the fields as appropriate.

Entity form

Name	Description
Refers to existing record	Select this checkbox if the entity is already part of a ServiceNow® table record. Clear this check box to create a stand-alone entity.
Applies to record	Select the table name and the corresponding document. This field is visible only when the **Refer to existing record**check box is selected.
Active	Check box to activate the entity.
Name	The name of the entity.
Compliance Score Percentage	Compliance percentage derived from Downstream controls.
Owned by	Select the control owner for this entity. Notifications are automatically sent to entity owners and risk managers in the event of a breach. **Note:** The control owner must be a valid, active user. If an entity is assigned to an inactive user, the entity will be neglected, unless it is observed in reports.
Class	Entity class to which the application belongs.
Generate target	Select this check box if you want to create a target. Every time an entity is created in the system, a target record is also created. This field is only visible if at least one of the use case accelerator applications is installed.

4. In the Compliance related list, in the **Attestation frequency** field select the appropriate option. This field refers to the frequency with which the attestations are sent out to the attestation respondents. The value here defaults the control frequency. If the control owner wants to have a different frequency at the control level, it can be overwritten.
5. Click Risk Rollup and Tolerance related list and fill in the form as appropriate.
This related list is visible only when Advanced Risk has been downloaded.

Risk Rollup and Tolerance related list

Field	Description
Expected ALE	Annual Loss of Expectancy (ALE) refers to the product of the annual rate of occurrence (ARO) and the single loss expectancy (SLE).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Expected ALE is the expected value of the ALE for the risk statement. Enter currency and amount for the expected ALE. **Note:** This value must be less than or equal to the **Maximum acceptable ALE**.
Maximum acceptable ALE	Threshold value for the ALE for the risk statement. **Note:** This value must be greater than or equal to the**Expected ALE**. This value has an impact on the Tolerance status field.
Sum of calculated ALE	This calculation is based on the sum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Average calculated ALE	This calculation is based on the average of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Maximum calculated ALE	This calculation is based on the maximum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Minimum calculated ALE	This calculation is based on the minimum of calculated ALE of all the underlying risks of the risk statement and its children risk statements.
Tolerance Status	Automatically calculated based on tolerance values. ○ If the **Calculated ALE** is less than or equal to the **Expected ALE** = Acceptable in green ○ If the **Calculated ALE** is greater than the **Expected ALE**, but less than or equal to the **Max acceptable ALE** = Needs Attention in orange ○ If the **Calculated ALE** is greater than the **Maximum acceptable ALE** = Unacceptable in red **Note:** If the Tolerance Status changes to Needs Attention or Unacceptable, emails are automatically sent to the entity owner and risk manager to investigate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Calculated Score	The corresponding score for the calculated ALE: ○ Low ○ Med ○ High

6. In the Basel Business Line related list, in the **Basel business lines** field, map your entity to the Basel lines of business.
7. Click **Update downstream entities business line** if you want all the downstream entities to inherit the Basel business line that you have selected.
8. Click **Submit** or **Update**.

Relate entities to each other

Create relationships between entities to understand how controls and risks affect each other and how they affect the enterprise.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager
- sn_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager

Procedure

1. Navigate using any of these options.
   - **Policy and Compliance** > **Scoping** > **All Entities**.
   - **Risk** > **Scoping** > **All Entities**.
   - **Audit** > **Scoping** > **All Entities**.
2. Open the entity record from the list.
3. Perform one of the following actions.

Option	Description
To specify that the current entity is down stream of another entity	Click the **Add** button in the **Upstream entities** related list.
To specify that the current entity is up stream of another entity	Click the **Add** button in the **Downstream enti ties** related list.

4. Select the desired entities to relate the current entity to and click **Create Relationship**.

Result

The entities displayed after clicking **Add** on the **Upstream entities** or **Downstream entities** related lists are limited based on the current entity's class and the tier it belongs to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If there are no eligible entities which can be related to the current entity, then the **Add** button is not displayed on the **Upstream entities** or **Downstream entities** related lists.

Entity classes

Entity classes are used to add a conceptual information about the entity or to tag the entity. They are used to classify the entities and they represent a collection of entities that have the same attributes.

To understand the concept of entity class, consider an example. A company has office branches in three cities. The office space is considered as an entity and the entity class for these entities would be the location. For example, Risk as an entity could be a process or it could be the department in an organization. The entity class defines whether it belongs as a process or as a class in this example.

Entity classes are listed under Lists in the workspace view. Click an entity class in the List view to display its details.

The **Details** tab in the Entity classes form displays the following fields:

- Name
- Tier
- Parent class
- Description
- Is root check box condition

The Entity classes page displays the following related lists:

Related lists in the Entity class form

Related list	Description
Entities	Information on the entities: • Name • Owned by • Compliance Score (%)
Child classes	Information on the child classes: • Name • Tier • Is root check box

To save the newly created entity class configuration, click **Save**.

Create an entity class

Create an entity class that is associated with an entity. Entity classes are used to add a conceptual information about the entity and classify the entities. They represent a collection of entities that have the same attributes such as Department, Business Unit, or Business Service. You can gather data about the entities based on the entity class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Roles required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

About this task

Entity classes are used to classify and tag your entities. After tagging the entities, you can gather data about the entities based on the entity classes.

Procedure

1. Navigate to the desired workspace, go to the List view, and select **Entity classes**.
2. To create a entity class, select **New**.
3. In the **Details** tab, fill in the fields.

Create New Entity Class form

Field	Description
Structure	Structure of the entity class. The options are as follows: ○ **Single**: Option to configure a single dimension entity class. ○ **Composite**: Option to configure a multidimensional entity class. **Note:** The Composite Entity Management application must be installed to configure a composite entity class.
Number of dimensions	Option to select the required number of entity class dimensions. This field appears only when **Composite** is selected from **Structure**. **Note:** You can select up to 5 dimensions.
Applicable entity classes	Option to select the required entity classes. The order in which you select them doesn't affect the risk roll-up, but the same order will be used to choose entities from each class. This field appears only when **Composite** is selected from **Structure**.
Name	Name of the entity class. **Note:** If you select **Composite** in the **Structure** field, the name is automatically generated based on the selected entity classes, with a separator between them.
Description	Additional information about the entity class.
Parent class	Parent class associated with the new entity class such as Company or Department. This field appears only when **Single** is selected from **Structure**.
Is root	Condition to check if the new entity class is a root. Options are **True** or **False**. This field appears only when **Single** is selected from **Structure**.
Primary risk assessment methodology	Risk assessment methodology that must be used as the primary methodology for the entity class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Tier	Tier for the new entity class such as Application or Business. This field appears only when **Single** is selected from **Structure**.
Attachments	Attachments associated with the entity class that is displayed in the side panel.

4. Select **Save**.
   After saving, the new entity class is displayed in the Entity classes list in the List view. When you select the new entity class, the following additional related lists are displayed:
   - Entities
   - Child classes
5. Navigate to the Entities related list and fill in the fields under the Entity class section.

Entity class information on the Entities related list

Field	Description
Name	Name of the entity.
Owned by	Owner of the entity.
Compliance Score percentage	Compliance score percentage for the entity.

6. Navigate to the Child classes related list and fill in the fields under the Entity class section.

Entity class information on the Child classes related list

Field	Description
Name	Name of the entity class.
Tier	Tier for the new entity class.
Is root	Condition to check if the new entity class is root. Options are True or False.

7. To save the entity class, select **Save**.

Update entity classes for multiple entities

Provide an entity class for multiple entities where the class field is empty. Entity classes are used to add a conceptual information about the entity and classify the entities. As an administrator, you can update the entity classes for multiple entities with a single click.

Before you begin

Role required: sn_grc.admin

About this task

The classes are only added for the entities that match the filter conditions and that do not have any entity classes associated with them. You can use the **Bulk Update Entity Class** option in the classic user interface to perform the action in the following different ways:

- **All entities with empty class**: Use this option to apply a common class to all entities that have an empty class field across all tables that match the filter criteria. As an administrator, you can set the filter conditions.
- **Select a table**: Use this option to apply a common class to all the entities that have an empty class field in the selected table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the classic user interface, navigate to **Administration** > **Bulk Update Entity Class**.
2. To select your entities, do one of the following:
   - In the **Record Selection** field, select the **All entities with an empty class**.

     add the filter condition if applicable with an **ADD** or **OR** clause.
   - In the **Record Selection** field, select **Select a table** to select the entities from a table.
3. After selecting the record, click **Refresh**.
   The number of updated records that match the filter condition are displayed. The classes are added only for the entities that match the filter conditions and that do not have any classes associated with them.
4. To select the class that will be applied to the selected record, use the **Set the entity class as** field.
5. Click **Submit**.

Result

The entity classes for multiple entities are updated.

Scheduled jobs for Governance, Risk, and Compliance

Scheduled jobs are automated pieces of work that can be performed at a specific time or on a recurring schedule. GRC administrators run the scheduled jobs on demand to automate the tasks such as setting an entity class on the entities depending on the entity class rule.

Starting with the Xanadu release, the following scheduled jobs are provided for GRC:

- *`GRC set entity class on entities based on entity class rule`*: Use this scheduled job to populate the entity class rule for multiple entities at a time. The scheduled job script checks all the entity class rules, checks all the entities where the entity class field is empty, and updates the entity class for multiple entities.

- *`GRC set entity class on entities same as pillar`*: This scheduled job is provided for the GRC: Operational Resilience application users.

  The Operational Resilience base system includes five pillars. Pillars are the categories that are used to organize risk data that is pulled from their associated entity types. If the GRC: Operational Resilience application is installed in the instance, the **Pillar** field displays the pillar in the application to which an entity type is assigned. If an entity class is not defined for the entity type, it is mapped to the value that is displayed in the **Pillar** field using the *`GRC set entity class on entities same as pillar`* job.

Entity class rules

Entity class rules help to assign classes to the entities at the table level. Any new entity created on the table gets that entity class automatically. Entity classes are used to tag your entities.

When you create an entity for a table, the class associated with that table automatically gets assigned to the entity. You can set a new rule for the entity class. Entity class rules provide the categories of the entities at the class level. The Entity class rules option is displayed under Lists in the workspace view. Click an Entity class rule to display its details.

The **Details** tab in the Entity class rules form displays the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details tab in the Entity class rules page

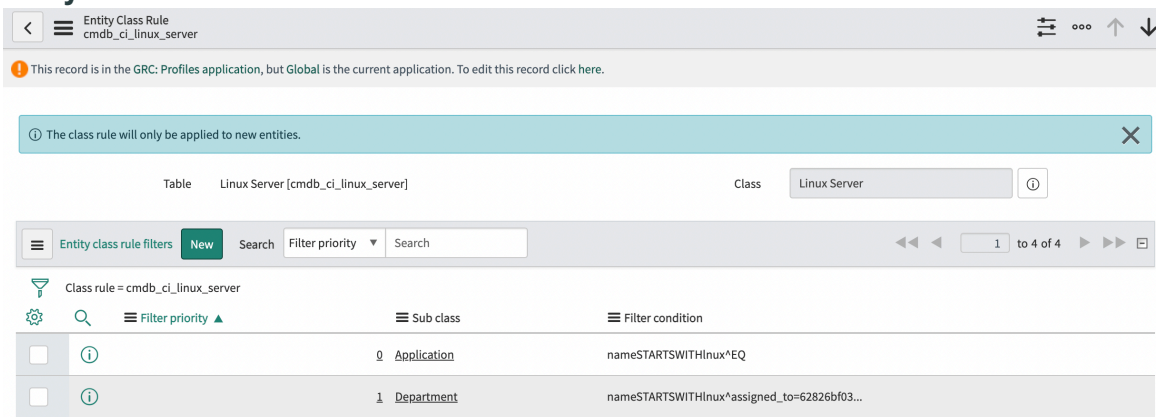
Field	Description
Table	Name of the table that the entity class is associated with after creating an entity class rule.
Class	Name of the entity class to be associated with the table that uses the new entity class rule.

Entity class rule filter

Entity class rule filter is added in the entity class rule page to provide additional filters. Earlier, records of a table can be associated to only one entity class. Using the entity class rule filter, you can associate different classes to the records of the same table.

The **Entity class rule filter** table displays the following information:

Entity class rule filter



Field	Description
Filter Priority	Filter priority is the range for the subclass. The class is populated in the entity form based on the priority given.
Subclass	Subclass is the child class of the parent class that is displayed in the details tab of entity class rules.
Filter Condition	Filter Condition is used to filter out the records of the table that defines the entity class rule. For example, if there are two subclasses with different condition then the parent class is populated instead of the subclasses. **Note:** The subclasses are displayed in the entity forms only if they meet the same filter condition.

Logic for assigning entity classes

Assume that there is a record in the cmdb_ci_linux_server table and an entity class rule associated to this table. The entity class rule has these class rule filters:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity class rule

Scenario 1: If the entity's source record belongs to the cmdb_ci_linux_server table and matches all the conditions of the second filter, then the entity's class is auto-populated as sub class, **Department**.

Scenario 2: If the entity's source record belongs to the cmdb_ci_linux_server table and its name starts with lnux (satisfies both the filters), then the sub class **Application** is auto-populated as an entity class.

Scenario 3: If the entity's source record doesn't satisfy any of the class rule filters, then the class **Linux Server** is auto-populated as an entity class.

Create an entity class rule

Create a rule for an entity class. Entity class rules provide the classification of the entities at the class level. You can create a new entity class rule for an entity class that is associated with a table. After creating the new entity class rule, the Entity class rules table is updated with the new record.

Before you begin

Roles required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

Procedure

1. Navigate to the desired workspace, go to the List view, and click **Entity class rules**.

   Note:
   You can't create an entity class rule from the Compliance Workspace. You can create it only in the Core UI.

2. Click **New**.
   A Create New Entity class rule page with the **Details** tab is displayed.
3. On the form, fill in the fields.

Create entity class rule form

Field	Description
Table	Table that the entity class belongs to.
Class	Class associated with the entity such as Business unit or Application.

4. To save the entity class rule, click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an entity class rule filter

You can create an entity class rule filter to assign classes at the filter level on the same table that is defined on the class rule.

Before you begin

Role required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

Procedure

1. Navigate to the desired workspace, go to the List view, and click **Entity class rules**.

   Note:
   You can't create an entity class rule filter from the Compliance Workspace. You can create it only in the Core UI.

2. Select any entity class rule from the list.
3. To add a new entity class rule filter, in the **Entity class rule filters** tab, click **New**.
4. Fill in all the fields in the table.
   For more information about the fields, see Entity class rule filter fields.
5. Click **Submit**.

Result

A new record is created under the Entity class rule filters tab on the Entity Class Rule form.

Entity class rule filter fields

You can create an entity class rule filter by filling out the fields that display after you click the **New** option in the entity class rule filters related list.

Entity class rule filter fields

Field	Description
Table	Table that is auto-filled from the associated entity class rule.
Subclass	Entity class to be applied for all the entities whose source record matches the class rule filter.
Filter condition	Condition that can filter out the records from the table. The entity class that is specified in the subclass may be applied (as per the class assignment rules) to the entity that is associated to any of these records.
Filter priority	Filter priority. If a source record of an entity satisfies a multiple class rule filters condition, the class is picked from the filter with the lowest priority. For example, if you have two subclass applications and departments that have priority 0 and 1, respectively, the application

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity class rule filter fields (continued)

Field	Description
	subclass that has the lower priority is auto-filled in the rule and control form.

Entity types

Entity type is a grouping of the entities that match a set of filter conditions. You can create a hierarchy of the entity types within the entity classes. The Entity types option is displayed under the Lists view in the workspace. Click an entity type to display its details.

An entity type is a grouping of entities that is based on filtering. Entity types enable you to find and create entities that match a set of filter conditions. Hierarchy can be created within the entity classes. Entity types also enable you to create risks and controls for each entity without spending much time. For example, an organization can have multiple departments, such as finance, HR, or IT. All these departments can be considered as entities and can be grouped under the entity type called Departments.

Within an entity type, you can assign an owner and an entity class. You can associate a control objective and risk statements to the entity type so that risks and controls get automatically created for those entities. For every entity created using the entity type, the configuration and filter are applied so that the entity class and entity owner get automatically assigned for each entity.

When you create entity types and associate risk statements and control objectives to them, the risk and controls are automatically created for all the entities. The benefit of creating entity types is that it eliminates the need for maintaining multiple spreadsheets with the associated risks and controls for each entity. By applying entity types, you can quickly create entities by using the entity filters that are present within the entity types. Entity types can contain entities associated with different classes.

Grouping entities also helps in rolling up and aggregating the risk scores after risk assessments are performed. To understand how grouping entities contribute to rolling up the risk scores, consider the following example. Assume that there's a banking organization called Acer Finance. Acer Finance has two business lines: Banking and Retail. The Banking division has further subdivisions such as Commercial Banking and Private Banking. The risk assessments are generally performed at the bottom-most level. In this example, the assessment is performed at the Commercial Banking and Private Banking levels. The reporting, however, is done at the top-most level. This means that the risk assessment scores of Commercial Banking and Private Banking roll up and aggregate at the Banking level. Similarly, the scores of the Banking and Investment roll up to the Acer Finance organization level.

Entities in entity type are created based on the conditions set in the Entity Filter. In entity filters, the following filter conditions are defined:

- Build your own conditions: The entity filter defines the table from which the data is pulled into each entity type for display. Options in the Entity filter related list under Entity Type are revised such that **Build your own conditions** is same as the previous condition builder.
- Select from predefined queries: A new option is introduced as **Select from predefined queries** that uses the Configuration Management Database (CMDB) queries.

The Details tab in the Entity type page displays the following information:

- Name
- Compliance Score (%)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Check box condition to display if the entity type is active
- Description

The Entity type page displays the following related lists:

Related lists in the Entity type section

Related list	Description
Entities	Information on the entities: • Entity • Description • Class • Owned by • Residual rating • Compliance Score (%)
Entity Filters	Information on the entity filters: • Entity filter type • Table • Filter condition • Use owner field • Owner field
Risk frameworks	Details of the risk framework. Click **Add** to add a new risk frameworks record.
Risk Statements	Details of the risk statements such as Risk Statement, Framework, Category, and Description.
Policies	Details of the policies such as number, name, Type, Owner, State, Valid from, Valid to, and Compliance Score percentage.
Control Objectives	Details of the control objectives such as Control objective, Category, Type, Classification, and Compliance Score percentage.
Entity Filters	Details of the entity filter such as Entity Filter type, Table, Filter Condition, Query, Information objects, Use owner field, Owner field.
Policy Exceptions	Details of the policy exceptions.
Content References	Details of the content references.
Privacy assessments	Details of the privacy assessments for the entity type.

Related list	Description
Attachments	Attachments associated with the entity type displayed in the side panel.

Create an entity type

Create an entity type for the entities in your system. Entity types enable you to find and create new entities that match a set of filter conditions. You can create a hierarchy of the entity types within the entity classes.

Before you begin

Roles required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

Procedure

1. Navigate to the desired workspace, go to the List view, and click **Entity types**.
2. Click **New**.
   A Create New Entity Type page with the **Details** tab is displayed.
3. In the **Details** tab, fill in the fields.

Details tab in the Create New Entity Type page

Field	Description
Name	Name of the entity type.
Compliance Score Percentage	Compliance score percentage assigned to the entity type.
Active	Option to set the entity type as active.
Description	Description of the entity type.

4. To save the entity type, click **Save**.
   When you save the entity type, the other related lists are displayed on the Entity type page. Update the related lists as applicable.
   - Details
   - Entities
   - Entity Filters
   - Risk Frameworks
   - Risk Statements
   - Policies
   - Control Objectives
   - Policy Exceptions
   - Content References
   - Privacy Assessments

   See An entity in the workspace view for more information.
5. To save the entity type, click **Save**.

Entity filters

Entity types enable you to find and create entities that match a set of filter conditions. Entity types include predefined entity filters that define the data to be displayed in the user interface. The entity filter defines the table from which data is pulled into each entity type for display.

Entities in entity type are created based on the conditions set in the entity filter. You can create a new entity filter by navigating to the Entity types tab under the List view.

The options in the **Entity filter** tab under the Entity type are revised so that **Build your own conditions** condition builder uses the same option that was used in the previous condition builder. In addition, the new **Select from predefined queries** option leverages the Configuration Management Database (CMDB) queries. The following options are now available in the Entity filters related list under Entity type:

- Build your own conditions.
- Select from predefined queries using the Configuration Management Database (CMDB) Query Builder.

The **Entity filters** tab displays the following information:

- Entity filter type: Entity filter type such as Build your own conditions or Select from predefined queries.
- Table: Table that contains the records to be queried such as sn_audit_advanced_auditable_unit.
- Filter condition: Filter conditions for the source table to generate entities.
- Use owner field: Use the default owner to assign risks to a single user when the owner field is empty.
- Owner field: Person who owns any new entities generated from the entity type. Identify the user reference field on the source table to automatically identify risk and control owners.

Use the new Entity class field in the entity filters under the entity type to assign an entity class to an entity filter. When you use an entity filter to create an entity, an entity class gets assigned to it automatically.

Create an entity filter

Create an entity filter under an entity type in the workspace view. Entities in entity type are created based on the conditions set in the Entity Filter. The entity filter defines the table from which data is pulled into each entity type for display.

Before you begin

Roles required: sn_grc.manager, sn_risk_workspace.IT_risk_manager, and sn_risk_workspace.operational_risk_manager

About this task

You can use one of the following filter conditions for the entity type:

- Build your own conditions
- Select from predefined queries

Procedure

1. Navigate to the desired workspace, go to the List view, and click **Entity types**.
2. Click an entity type in the list and navigate to the **Entity Filters** tab.
3. To create a new entity filter, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Create New Entity Filter page is displayed.

4. In the **Details** tab, fill in the fields.

Create New Entity Filter form in the Details tab

Field	Description
Filter for	
Entity type	Name of the entity type under which the new entity filter is created.
Filter conditions	
Entity filter type: **Build your own conditions**	Type of the entity filter that is used for filtering the data. Use the Configuration Management Database (CMDB) Query Builder to build your own query. The Configuration Management Database (CMDB) is used to search the database for the entities. It provides the following methods for filtering: ○ **Build your own conditions** ○ **Select from predefined queries** Complete the following steps for the **Build your own conditions** entity filter type: **a.** In the **Entity filter type** field, select the entity filter type as **Build your own conditions**. **b.** In the **Table** field, select a table from the populated list. **c.** In the **Filter condition** field, click **Set conditions**, build a filter condition, click **Set**, and view the matching results.
Entity filter type: **Select from predefined queries** option	Predefined query to scope the entity. Complete the following steps for the **Select from predefined queries** option: **a.** In the **Query** field, select a predefined query such as **Business Apps using Information Object** that is applicable for the selected entity. Table associated with the entity when a predefined query is selected. The table is automatically populated. **b.** In the **Information objects** field, select only the applications and processes that have information objects associated with them. To add more information objects, click **Information objects** and type information objects such as `Email`. **Note:** To use a predefined CMDB query for entity scoping, GRC administrators must assign the **GRC Scoping** tag to the selected CMDB query. As a sn_grc.admin user, navigate to **Policy and Compliance > Administration > GRC Properties** or navigate to **Risk Administration > GRC Properties** in an instance, set the **Enable entity scoping for CMDB query** property as **Yes** and click **Save**.
Assignment	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Entity class	Entity class to be associated with the entity type. You can now assign an entity class to an entity filter under entity type. When a new entity gets created using an entity filter, an entity class gets assigned to it automatically.
Use owner field	Option to use the owner field. The owner is the identified risk owner associated with the entity type. This condition uses the **Owner** field information in the query. When the check box for this field is selected, the following fields are displayed: ○ **Owner** field: Select a table before modifying the Owner field. Then, select the owner to be associated with the new entity filter. ○ **Default owner** field: Select a default owner from the list. ○ **Empty owner** field: Select one of the following options: ▪ **Create**: Create an owner for the entity filter. ▪ **Do not create**: Do not create a new owner for the entity filter. ▪ **Use Default**: Use the default owner for the entity filter.
Attachments	Attachments associated with the entity that are displayed in the side panel.

5. To save the entity filter, click **Save**.

Create an entity filter in the Core UI

Create an entity filter under an entity type in the classic user interface. The entity filter defines the table from which data is pulled into each entity type for display. If the entities belong to an application, the users who have access to the entity class that is associated with the entity can only view those entities.

Before you begin

Role required: sn_grc.manager

Procedure

1. In the classic user interface, navigate to the **Entity types** list.
2. Click an entity type in the list and navigate to the **Entity Filters** tab.
3. To create a new entity filter, click **New**.

Create entity filter form

Field	Description
Entity type	Name of the entity type.
Entity filter type	Type of the entity filter. The options are as follows: ○ **Build your own conditions** ○ **Select from predefined queries**
Table	Name of the table from which the records are filtered.
Filter condition	Filter conditions that display the matching results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Entity class	Entity class for the entity type.
Use owner field	Option to use **Owner** field information in the query. The owner is the identified risk owner associated with the entity type. When this option is selected, the following fields are displayed: ○ **Owner** field: Select a table before modifying the Owner field. Then, select the owner to be associated with the new entity filter. ○ **Default owner** field: Select a default owner from the list. ○ **Empty owner** field: Select one of the following options: ▪ **Create**: Create an owner for the entity filter. ▪ **Do not create**: Do not create a new owner for the entity filter. ▪ **Use Default**: Use the default owner for the entity filter.

4. To save the entity filter, click **Submit**.

Entity tiers

When you create entity tiers, you can apply a level or hierarchy to the entity classes. This level applies to all the entities that are associated with the entity classes. Entity tiers enable you to select and view the status of the most critical items in the business.

Consider the following example. Assume that the Chief Product Officer of your organization wants to see the status of only the most critical financial business applications. If you have created a hierarchy or set of tiers for the entities, then you can filter the tier 1 entities and present the required data. Each entity class can belong to only one tier.

By creating entity tiers, you can better understand how your lower tier entities affect your higher tier entities. For example, assume that you created the entity hierarchy where Business is tier 1, Application is tier 2, and IT asset is tier 3. Therefore, the risks of the entities of tier 3 affect the entities of tier 2 and that in turn affects tier 1. This roll-up or aggregation provides accurate risk scores.

The Entity tiers option is displayed under the Lists view in the workspace. Click an entity tier to display its details. The **Details** tab in the Entity tiers page displays the following information:

Details tab in the Entity tiers page

Field	Description
Label	Label of the entity tier that is displayed in the user interface such as Application or Business.
Tier level	Tier level of the entity tier such as 15 or 20.
Name	Name of the entity tier such as application or business.

Create an entity tier

Create an entity tier for the entity classes in your organization. When you create entity tiers, you can apply a level or hierarchy to the entity classes. The hierarchy level applies to all the entities associated with the entity classes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Roles required: sn_grc.admin

Procedure

1. Navigate to **Administration** > **Entity Tiers** in the Core UI.
   The Entity tiers list is displayed.
2. Click **New**.
   A Create New Entity Tier page with the **Details** tab is displayed. The breadcrumb navigation menu is displayed at the top of the page.
3. In the **Details** tab, fill in the fields.

Details tab in the Entity tier form

Field	Description
Label	Label for the new entity tier.
Tier level	Tier level for the new entity tier.
Name	Name of the new entity tier.
Attachments	Attachments associated with the entity displayed in the side panel.

4. To save the entity tier, click **Save**.

Viewing and updating Governance, Risk, and Compliance exceptions

Report exceptions as it is critical for businesses to quickly identify and address key business process issues before they become a problem. Using exceptions to manage errors has advantages over traditional error-management techniques.

Before you begin
Role required: sn_grc.admin

About this task
An exception report is a document that lists instances in which actual performance is deviated from expectations. GRC exception is a capability using which you can record or associate business exceptions with GRC objects such as citations, automated factors, and so on. Each exception record has details such as the category of the exception, the record in the table, and the field with which the exception is associated. The administrator can view the list of exceptions and resolve them. Whenever an exception is raised, the solution to resolve the exception is also given in the exception description. The administrator uses the proposed solution to resolve the exception. An example of an exception is when a user has not configured a risk assessment methodology but is trying to perform an object assessment. When an administrator resolves one type of exception, all other similar exceptions get resolved.

Procedure

1. Navigate to **GRC Exceptions** > **Exception Report**.
2. Open the exception record you want to resolve.
3. On the form, fill in the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exception form

Field	Description
Number	Unique number of the exception that is raised.
Exception category	Category to which an exception belongs. The choices are: ○ Configuration: Example: A risk administrator tries configuring a form and giving a user the authority to perform a task for which the user does not have the right role. ○ Runtime: Example: When something runs automatically such as an Indicator.
State	State of exception. The default state is **Open**.
Application	Application to which the exception belongs.
Description	Detailed description of the exception and the possible solution for resolution.
Exception Record Details	
Source table	Table on which the exception has occurred.
Record reference	Record on which the exception has occurred. For example, an exception is raised on a risk assessment instance response.
Column reference	The column that contains the record.
Activity	
Additional comments	Notes on the resolution of the exception or any other additional information.
Activities	Displays the stream of activities on the exception.

4. Click **Update** after you change the state of the exception.
5. Click **Delete** to delete the record.

Cybersecurity Executive dashboard for Chief Information Security Officers

The Cybersecurity Executive Dashboard gives the Chief Information Security officer a comprehensive overview of the security posture score of an organization. However, the compliance and risk users can use the risk and compliance page to get an all-inclusive picture of all the GRC metrics.

To access the Risk and compliance dashboard and the access control limitations, see Risk and compliance dashboard for GRC: Metrics.

To know more about the features of the Cybersecurity Executive dashboard, see Cybersecurity Executive Dashboard.

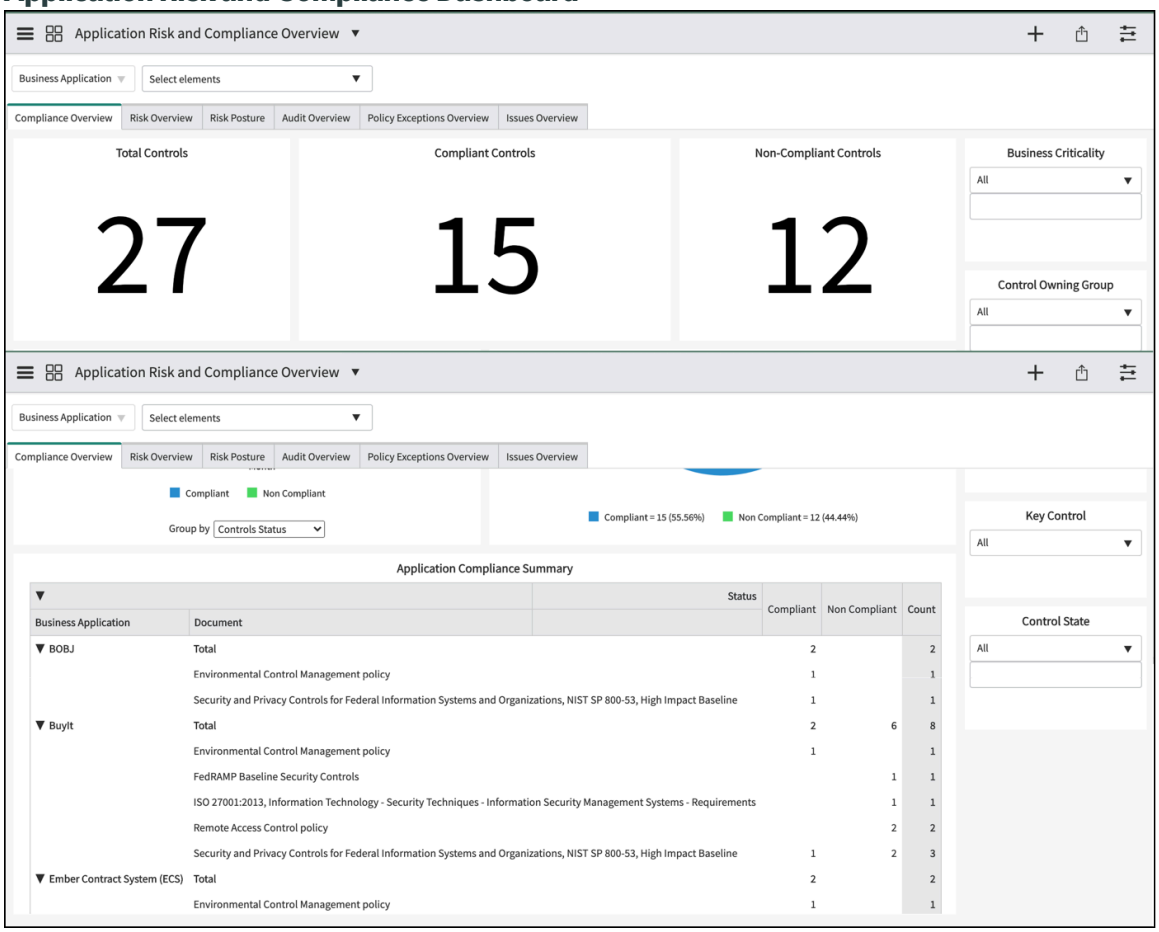
Advanced Governance, Risk, and Compliance Application Risk dashboard



The GRC **Application Risk and Compliance Overview Dashboard** provides the latest view of risk and compliance aspects for the business applications that are used in an enterprise.

The Application Risk Dashboard is useful for the Chief Information Officer (CIO) and application owners. Both these users must have the sn_compliance.reader, sn_risk.reader, and sn_audit.user roles to view the dashboard. Navigate to **Advanced GRC Dashboard** > **Application Risk Dashboard**. The **Application Risk and Compliance Overview Dashboard** is displayed.

Note:
To be able to view this dashboard, you must activate the GRC: Advanced Dashboards (com.sn_grc_pa_advanced) plugin and the GRC: Policy and Compliance Management (sn_compliance) plugin.

The Application Risk and Compliance Overview dashboard provides you a detailed report of the risk and compliance posture of all the business applications in an organization.

Application Risk and Compliance Dashboard

This dashboard highlights the following:

- The compliance impact of applications in use.
- The risk posture of applications.
- The state of remediation and exceptions activity of the issues.
- The audit activity around applications and status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This dashboard provides answers to the following questions that are of interest to the CIO and the application owner:

1. What are the key applications, and are they all operational and delivering the required services optimally?
2. What are the policies and authority documents that the applications must be compliant to? Are the applications compliant to them?
3. What are the risks faced by the applications? Are any of them high to raise a concern? Are there enough mitigations in place? Are there adequate controls in place and are they working effectively?
4. For applications that need remediation, are the remediations being done on time according to the Service Level Agreements (SLAs)? Which are the applications that generate the maximum number of issues?
5. Are exceptions being sought often on the applications and why? Are they within manageable limits?
6. Are the applications due for audit any time? How have the applications performed on these audits?

The dashboard offers various representations such as bar graphs, donut charts, and trend charts. Application owners can use various filters on the dashboard to view reports related to the business applications they own such as, critical business applications, mandated controls related to specific business application, or high priority issues and so on.

Compliance Overview

The Compliance Overview tab appears when you activate the Policy and Compliance plugin. The Compliance Overview tab provides an overview of the compliance posture of the business applications and displays the following reports:

- Total Controls: This report provides the total number of active controls.
- Compliant Controls: This report provides the total number of compliant controls which are not in draft or retired state.
- Non-Compliant Controls: This report provides the total number of non-compliant controls which are not in draft or retired state.
- Compliance Status By Month: This report provides the number of active controls by month.

> **Note:**
> This bar chart shows the compliance status for the current month and can be grouped by either Control Status or Business Application.

- Compliance %: This report provides the percentage of different statuses of active controls such as Compliant, Non Compliant, and Not Applicable.
- Application Compliance Summary: This report provides the summary of policies, authority documents, and the controls associated with business applications.

The following filters can be used to filter data on the reports:

- Business Application
- Business Criticality
- Entity Owner
- Enforcement such as mandatory or voluntary controls
- Key Control

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Control State
- Control Owning Group

Risk Overview

The Risk Overview tab appears when you activate the Advanced Risk plugin. The Risk Overview tab provides an overview of the risks associated with business applications and displays the following reports:

- Risk Heatmap by Application Criticality: This report displays the heatmap of the application risks based on criticality of applications versus the risk rating of the application.
- Risk Response Tasks Overview: This report displays the response tasks created for a risk and different states of those tasks.

  Note:
  This bar chart can be grouped by and stacked by risk response, risk response state, risk calculated score, risk response assigned to, or business application.

- Application Risk Summary: This report displays the summary of risks directly associated with the applications that contribute to the overall risk rating of the application. Other downstream risks that contribute to the application risk rating are not represented in this report. The risks considered for this report are very high, high, and moderate.
- Application Risk Mitigating Controls Status: This report provides the information for an application's risks and the associated controls. The risks considered for this report are very high, high, and moderate. The state of controls must not be in draft or retired. The risks for only one year are displayed.

The following filters can be used to filter data on the reports:

- Business Application
- Criticality
- Risk Rating
- Application Owner
- Business Owner

Risk Posture

The Risk Posture tab appears when you activate the Risk plugin. The Risk Posture tab provides information about the risk exposure of business applications. The reports in this tab can also be filtered using the Business Application filter. The Risk Posture tab displays the following:

- Very High Risks: This report displays the very high risks of an application.
- High Risks: This report displays the high risks of an application.
- Moderate Risks: This report displays the moderate risks of an application.
- Acceptance Task Expirations: This report displays the risk response acceptance tasks that have an expiration on the current day, the current week, the current month, the current quarter, and the current year.
- Contributing Risks Trend: This report displays the trend of risks directly associated with business applications and how they are performing over a period. Other downstream risks that contribute to the application risk rating are not represented in this report.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Audit Overview

The Audit Overview tab appears when you activate the Audit plugin. The Audit Overview tab provides an overview of audit and audit activities related to business applications and displays the following reports:

- Open Audit Engagements: This report displays the number of audit engagements in open state.
- Ineffective Controls: This report displays the number of ineffective controls for an audit engagement.
- Open Issues: This report displays the number of open issues for an audit engagement.
- Past Due Issues: This report displays the number of past due audit issues for an application.
- Upcoming Audit Engagements: This report displays the monthly count for the upcoming audit engagements.
- Open Issues by Audit Engagements: This report displays the monthly count for the open audit issues.
- Past Due Issues by Audit Engagements: This report displays the past due audit issues over a period.
- Ineffective Controls by Audit Engagements: This report displays the information regarding audit engagements and the associated ineffective controls.

The following filters can be used to filter data on the reports:

- Business Application
- Audit Engagement
- Criticality

Policy Exceptions Overview

The Policy Exceptions Overview tab appears when you activate the Policy and Compliance plugin. The Policy Exception Overview tab provides information about policy exceptions requested for business applications. The data displayed in the Policy Exceptions Overview tab can be filtered using the Business Application filter. This tab displays the following reports:

- New Exceptions: This report provides information about the new exceptions requested.
- Approved Exceptions: This report provides information about the number of approved exceptions.
- Rejected Exceptions: This report provides information about the number of rejected exceptions.
- Expired Exceptions: This report provides information about the number of expired exceptions.
- Exceptions Awaiting Approval: This report provides information about the exceptions that are awaiting approval and are due on the current date, the current week, the current month, and the current quarter.
- Extensions Awaiting Approval: This report provides information about the extensions that are awaiting approval and are due on the current date, the current week, the current month, and the current quarter
- Upcoming Exceptions Expirations: This report provides information about the exceptions that are about to expire and which are due on the current date, the day after the current date, the current week, the week after the current week, and the current month.
- Exceptions Requested vs. Approved: This report provides information about the exceptions requested versus the number of exceptions approved per month.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issues Overview

The Issues Overview tab appears when you activate either the Risk Management plugin or the Policy and Compliance Management plugin. The Issues Overview tab provides information about the various compliance and risk issues associated with business applications. The data displayed in the Issues Overview tab can be filtered using the Business Application filter. This tab displays the following reports:

- Open Issues: This report displays the number of issues in open state.
- Critical Priority Issues: This report displays the number of critical priority issues.
- High Priority Issues: This report displays the number of high priority issues.
- Accepted Issues: This report displays the number of issues that are accepted.
- Past Due Issues: This report displays the number of past due issues.
- Issues to be Resolved: This report displays the number of issues that must be resolved on the current date, the current week, current month, current quarter, and current year.
- Remediation Tasks to be Completed: This report displays the number of remediation tasks that must be completed on the current date, the current week, current month, current quarter, and current year.
- Past Due Issues: This report displays the number of past due issues over a time period.
- Past Due Remediation Tasks: This report displays the number of past due remediation tasks over a time period.
- Issue Creation Trend: This report displays the trend of how issues are created over a time period.
- Issue Closure Trend: This report displays the trend of how issues are closed over a time period.
- Remediation Task Creation Trend: This report displays the trend of how remediation tasks are created over a period.
- Remediation Task Closure Trend: This report displays the trend of how remediation tasks are closed over a period.

GRC licensing summary dashboard

Use the GRC licensing summary dashboard to track license usage trends and next month's projected usage. You can see the aggregated counts of license consumption across different product families. You can also search for roles to identify their combined GRC license treatment when these roles are assigned to a user.

The GRC licensing summary dashboard displays the monthly aggregated counts of license consumption across different product families including Integrated Risk Management, Business Continuity Management, and Privacy Management.

You must have the product owner role (sn_irm_shared_cmn.product_owner) to access the dashboard. Navigate to **All** > **GRC Licensing Overview** > **Licensing Summary Dashboard**.

GRC licensing summary dashboard tabs

The GRC licensing summary dashboard has the following three tabs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- License consumption- Shows the license utilization, usage trend analysis using a filter for product family, and license utilization month on month.
- Estimated next month usage- Shows the estimated license usage for the next month based solely on the current roles assigned to users.
- Role attribution to licensing mapping- Shows the license mapping of default GRC roles, users license treatment, license treatment for users who are part of a user group based on the roles assigned to the user group, and license treatment based on combination of multiple roles.

License consumption tab

Name	Description
IRM Operator	Count of IRM Operator for the previous month. **Note:** The IRM Operator card is available only when IRM Operator is selected in the **Product family** field.
IRM Lite Operator	Count of IRM Lite Operator for the previous month. **Note:** The IRM Lite Operator card is available only when IRM Operator is selected in the **Product family** field and the GRC: Business User – Lite application is installed.
PRM Operator	Count of PRM Operator for the previous month. **Note:** The PRM Operator card is available only when PRM Operator is selected in the **Product family** field.
PRM Lite Operator	Count of PRM Lite Operator for the previous month. **Note:** The PRM Lite Operator card is available only when PRM Operator is selected in the **Product family** field and the GRC: Privacy Lite User application is installed.
BCM Operator	Count of BCM Operator for the previous month. **Note:** The BCM Operator card is available only when BCM Operator is selected in the **Product family** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License consumption tab (continued)

Name	Description
BCM Lite Operator	Count of BCM Lite Operator for the previous month. **Note:** The BCM Lite Operator card is available only when BCM Operator is selected in the **Product family** field and the GRC: Business Continuity Management User - Lite application is installed.
Usage trend analysis	Displays the usage patterns of various types of licenses over a specified time period. Use this information to track changes and trends in license consumption over time. Additionally, you can filter the usage trend based on predefined or custom date ranges.
License utilization month on month	Shows the last 12 months usage of different license types, including their accrual periods and counts. Select the counts to view detailed information such as the user, licensable application family, licensing type, and license contributing roles.

License usage columns

Name	Description
User	Shows the user name.
Licensable application family	Shows the licensable family to which the user belongs to.
Licensing type	Shows if the licensing type is usage-based or role-based.
License contributing roles	Shows all the roles that contribute to the license treatment of the user.

Estimated next month usage

Name	Description
IRM Operator	Estimated count of IRM Operator for the next month. **Note:** The IRM Operator card is available only when IRM Operator is selected in the **Product family** field.
IRM Lite Operator	Estimated count of IRM Lite Operator for the next month.

Estimated next month usage (continued)

Name	Description
	Note: The IRM Lite Operator card is available only when IRM Operator is selected in the **Product family** field and the GRC: Business User – Lite application is installed.
PRM Operator	Estimated count of PRM Operator for the next month. **Note:** The PRM Operator card is available only when PRM Operator is selected in the **Product family** field.
PRM Lite Operator	Estimated count of PRM Lite Operator for the next month. **Note:** The PRM Lite Operator card is available only when PRM Operator is selected in the **Product family** field and the GRC: Privacy Lite User application is installed.
BCM Operator	Estimated count of BCM Operator for the next month. **Note:** The BCM Operator card is available only when BCM Operator is selected in the **Product family** field.
BCM Lite Operator	Estimated count of BCM Lite Operator for the next month. **Note:** The BCM Lite Operator card is available only when BCM Operator is selected in the **Product family** field and the GRC: Business Continuity Management User - Lite application is installed.
User role allocation	Provides an overview of the users, the licensable application family they're associated with, and the roles assigned to them. Use this information to visualize the estimated license usage for the next month based on the current role allocations to each user.

Role attribution to license mapping

Name	Description
License treatment of default roles	Provides an overview of the default GRC roles and the licensable application family that they're mapped with. Seeing which license is tied to the default GRC role helps you identify the correct license treatment for each role.
User(s)/User group(s) license treatment	Shows the license treatment of a specific user. You can search for users to see which licensable application family they belong to based on their assigned roles. Helps you understand the license treatment of a user when added to a user group based on the roles that are assigned to the user group.
License treatment based on roles	Shows the license treatment for a specific combination of roles. You can search for roles to identify their combined GRC license treatment when these roles are assigned to a user. **Note:** The combined role license treatment results are based on customer license entitlements and installed applications.

The following illustration shows the tabs, sections, and cards that are available on the GRC licensing summary dashboard:

GRC licensing summary dashboard

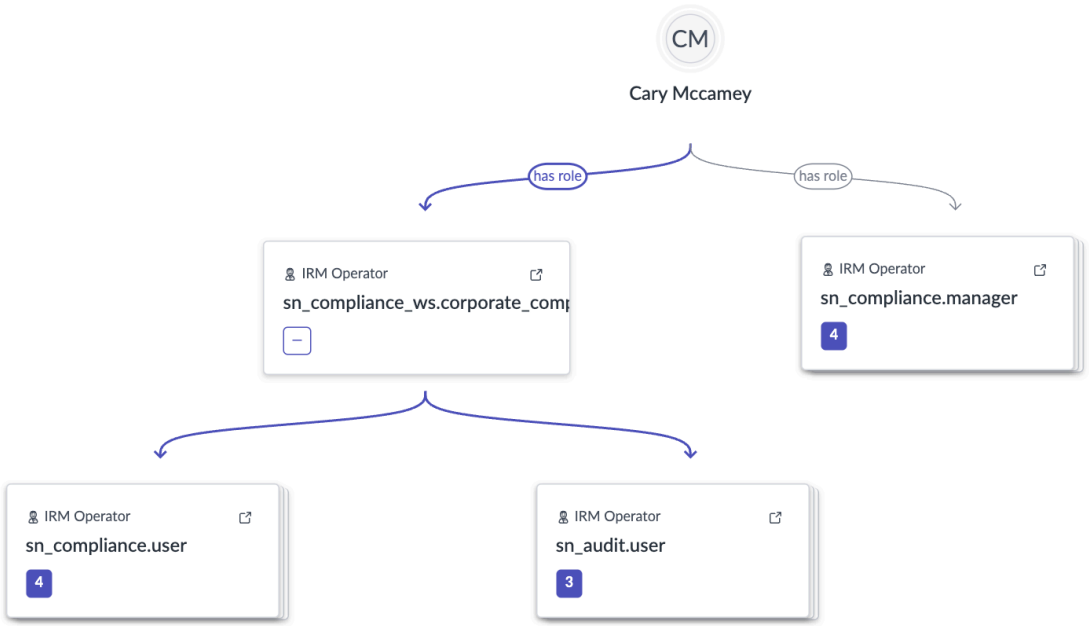
Displaying the role hierarchy of a user

The role hierarchy node map displays the relationship between the license contributing roles for role-based users and provides insights into the licensing treatment of a user.

If a user is assigned a direct role that has child roles, then the user inherits all the permissions of the child roles. In such a case, the license treatment of the user depends on the combination of the roles.

GRC users can have usage-based or role-based use of licenses. If the license usage is usage-based, there's no role hierarchy for the selected user.



To see the role hierarchy of a user, use either of the following methods:

- On the GRC licensing summary dashboard, under the License consumption tab, select the user count, then a user and select **Show role hierarchy**.
- On the GRC licensing summary dashboard, under the Estimated next month usage tab, select the user count, then a user and select **Show role hierarchy**. Or select a user under User role allocation and then select **Show role hierarchy**.

The role hierarchy node map displays the child relationships of a user. If a user has multiple roles assigned, the role hierarchy node map displays the entire hierarchy.

Note:
Your license consumption is calculated based on the licensable roles that are available at the time of calculation. Same roles might not be available at the time you view the role hierarchy node map.

The following illustration shows a sample node map for user Cary Mccamey. Cary has the roles sn_compliance_ws.corporate_compliance_analyst, and sn_compliance.manager. The sn_compliance_ws.corporate_compliance_analyst role contains the sn_compliance.user and sn_audit.user roles. Selecting the count on each node expands it further.

Configuring document templates using the Document Designer with Word add-in

Configure the audit report templates using the ServiceNow Document Designer with Word add-in.

Perform the following steps to successfully configure the ServiceNow Document Designer with Word add-in and create your audit report templates.

Configure templates for Document Designer

Configure the template to specify the fields from which data must be obtained and displayed on the audit report.

Create data relationships

Create a path to go from a record in the template configuration to any table that you require. When you create these paths, you can get the necessary data from each of these paths in your audit report template.

Create content configurations

Define the data that you want to view or fetch, whether it's a list of records or an aggregation when creating an audit report. For example, specify if you want to see a list of remediation tasks or the list of the top five high priority issues. A maximum of 200 records can be fetched from any table.

Set up Microsoft 365 reporting configuration

Set up the Microsoft 365 reporting configuration records to specify the data points and reports that you want to import in to a Microsoft Word document for disclosure reporting purposes.

Add additional reporting configuration filters for a Microsoft 365 configuration record

Add additional reporting filters to specify at a granular level what data must be imported to the disclosure report from a table.

Install the ServiceNow Document Designer add-in

Install ServiceNow Document Designer add-in to your Microsoft Word document. This add-in is required to create audit and CAM report templates.

Create an audit report template using ServiceNow Document Designer

Use the template configurations to create placeholders for an audit report template tailored to your needs.

Configure templates for Document Designer

Configure the template to specify the fields from which data must be obtained and displayed on the audit report.

Before you begin

Role required: sn_grc_doc_design.admin and sn_audit.admin

Procedure

1. Navigate to **All** > **Audit** > **Audit Report** > **Template Configurations**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Template configuration form

Field	Description
Name	Name of the template configuration. For example, you can specify `Engagement template configuration`.
Business domain	Domain from which the template is being configured. In this example, it is set to **Audit**.
Table	Table on which the report is generated.
Fields	Fields from which data must be displayed on the report. Move the required fields from the **Available** list to the **Selected** list.

4. Select **Submit**.

What to do next

Create a data relationship path from the template configuration to go to any table that you require. For more information, see Create data relationships.

Create data relationships

Create a path to go from a record in the template configuration to any table that you require. When you create these paths, you can get the necessary data from each of these paths in your audit report template.

Before you begin

Role required: sn_grc_doc_design.admin and sn_audit.admin

About this task

When you create data relationships, for example, for an audit engagement, you can specify how the issues, remediation tasks, test plans, and so on, are related to the record in the template relationship registry and you create a path to navigate to these respective records. You can create as many relationships as you require.

Procedure

1. Navigate to **All** > **Audit** > **Audit Report** > **Template configurations**.
2. Open the template configuration that you created.
3. In the Data relationships related list, select **New**.
4. On the form, fill in the field.

Data relationship form

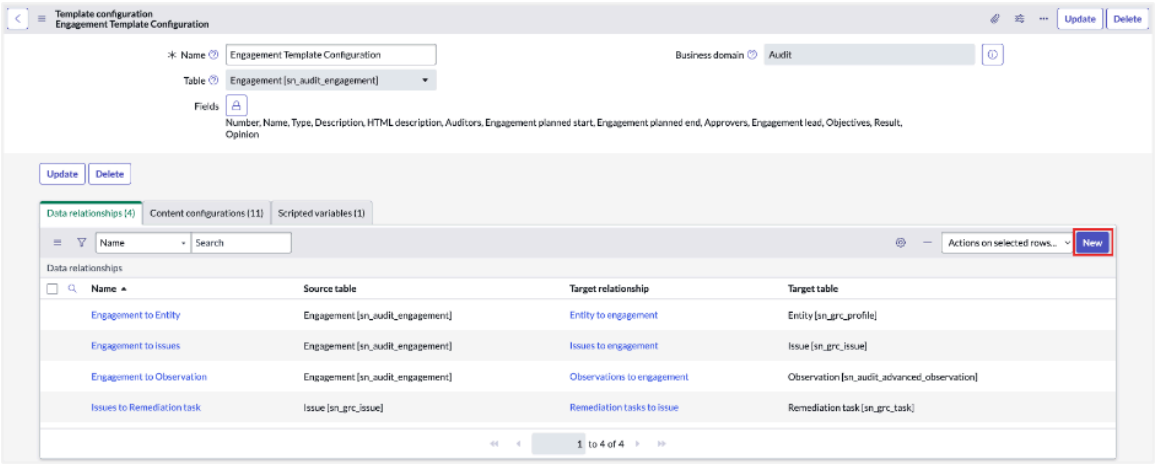
Field	Description
Name	Level that you want to go to. For example, you can specify `Engagement to issues`.
Source	
Parent relationship	Parent of the data relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source table	Source table used for the data relationship created. This field is automatically set.
Target	
Target relationship	Select an existing relationship or create a target relationship. For example, you can select **Issues to engagement**. **Note:** For more information, refer to Setting up the 360° views. You can register only existing relationships between the types of data you want to view.
Relationship type	Type of the relationship such as many to many or one to many. This field is automatically populated based on the selection made in the **Target relationship** field.
Target table	Table from which the data is obtained. This field is automatically populated.

5. Select **Submit**.

What to do next
Create content configurations to specify the type of data you want to fetch on the report. For more information, see Create content configurations.



Create content configurations

Define the data that you want to view or fetch, whether it's a list of records or an aggregation when creating an audit report. For example, specify if you want to see a list of remediation tasks or the list of the top five high priority issues. A maximum of 200 records can be fetched from any table.

Before you begin
Role required: sn_grc_doc_design.admin and sn_audit.admin

Procedure
1. Navigate to **All** > **Audit** > **Audit Report** > **Template configurations**.
2. Open the template for which you want to create content configurations.
3. On the Content configurations related list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Content configuration form

Field	Description
Name	Name of the content configuration. For example, `List of remediation tasks`.
Template configuration	Template configuration for which you're defining the content configuration. This field is automatically set based on the configuration that you selected in step 2.
Target table	Table from which data must be fetched.
Data relationship	Data relationship for which you want to create content configurations. Only the data relationships that you have previously created are available for selection.
Filter criteria	Filter condition and the number of records that can be displayed.
Aggregation criteria	Aggregation query to be used for the content configuration record. Use Data columns and Intermediate filters related lists for the content configuration record.
Content block criteria	Parent block configuration to specify a table or data that you want to insert in the content block as a table.

5. Build the Filter criteria and the Aggregation criteria as required.
6. To specify a table or data that you want to insert in the content block as a table, select the **Content block criteria** tab.
   a. In the **Parent block configuration** field, select the required content configuration.
   b. Select **Submit**.
7. In the Data columns related list, specify the columns you want on the report from the table that you have selected.
   For more information, see Configure Data columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. In the Intermediate filters related list, define the filters that should apply to the dataset to refine the results displayed in the report.
   For more information, see Configure Intermediate filters.
9. Select **Update**.

Configure Data columns

Configure data columns to choose which fields from the selected table appear in your report. This helps ensure that only relevant information is displayed, making reports clear and actionable.

Before you begin

Role required: sn_grc_doc_design.admin and sn_audit.admin

Procedure

1. Navigate to the **Data columns** related list.
2. Select **New**.
3. Review the Content configuration field.
   This field is pre-populated with the name of the selected entity and is read-only. To preview the record, click the info icon.
4. In the Type field, select Column or Script from the drop-down list.
5. In the Column field, select the column you want to include.
   A tree view appears showing available fields from the selected table. Expand folders if needed and select the required column.
6. Select **Submit**.

What to do next

Configure Intermediate filters

Configure Intermediate filters

Set up filters for intermediate data relationship nodes based on the selected data relationship in the content configuration. This ensures only relevant information is displayed, making reports clear and actionable.

Before you begin

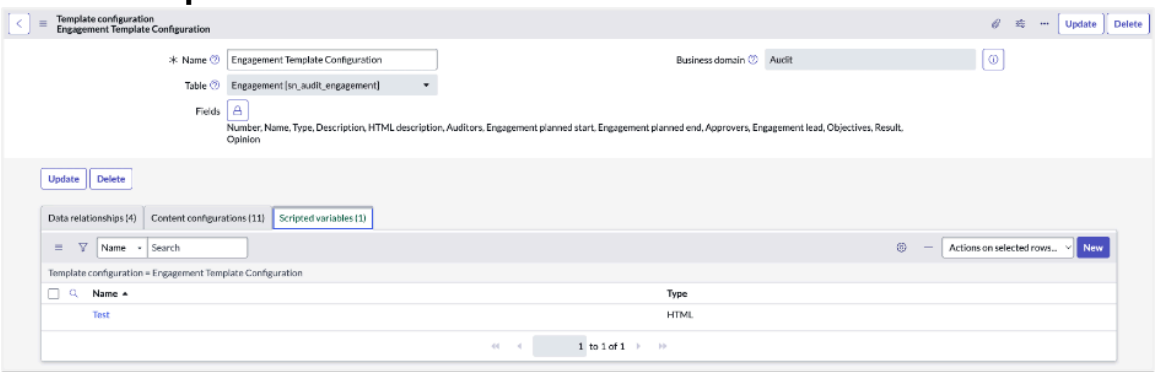
Role required: sn_grc_doc_design.admin and sn_audit.admin

Procedure

1. Navigate to the **Intermediate filters** related list.
2. Select **New**.
3. On the Data column new record form, fill in the fields.
4. Select **Submit**.

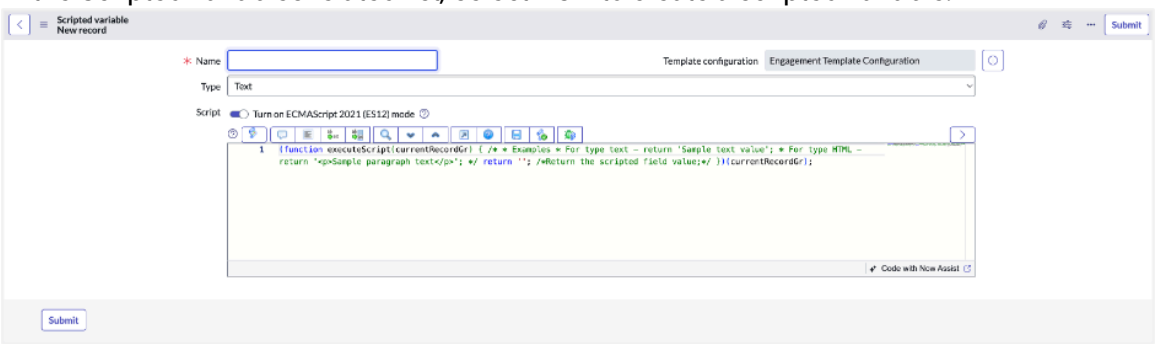
Define the scripted variables

Define data for the scripted variables using the Template Configurations module for creating a report template in the Audit application. You can configure the data in either text or HTML format.



Before you begin

Role required: sn_grc_doc_design.developer



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **Audit Report** > **Template Configurations**.
2. Open the template for which you want to create scripted variables.
3. Select the **Scripted variables** tab.

4. In the Scripted variables related list, select **New** to create a scripted variable.

5. In the **Name** field, provide a descriptive name for the template.
6. From the **Type** drop-down list, select either Text or HTML based on your requirement.
7. Turn on the **Script** toggle to enable custom script for the scripted variable.
8. Select **Submit**.
   The Scripted variables for the template appear in the related list.

Install the ServiceNow Document Designer add-in

Install ServiceNow Document Designer add-in to your Microsoft Word document. This add-in is required to create audit and CAM report templates.

Before you begin

Ensure that the following plugins are activated:

- sn_grc_doc_design
- sn_outlook_addin

Role required: sys_admin

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In Manifests**.
2. From the Office Manifests list, select **ServiceNow Document Designer**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Download Manifest**.
4. To enable the add-in, contact your Microsoft 365 account manager who can use the manifest file you downloaded in step 3.

What to do next

For detailed instructions on how to deploy the manifest file, see the Deploy add-ins in the Microsoft 365 admin center [KB1307378] article in the Now Support Knowledge Base.

To configure the HTTP response headers for add-in for Microsoft Word in the browser, see the Response header resolution [KB1434453] article in the Now Support Knowledge Base.

Reference information for Document designer

There are several properties that get installed with the Document designer plugin. These properties help to control the various aspects of how the plugin works.

Properties installed

Property	Description
com.snc.word_doc_api.size_limit_mb	This property restricts the size of contract documents in mega bytes. The default value is 5.
com.snc.word_doc_api.unzip_word_size_limit_mb	This property restricts the size of unzipped Word documents in mega bytes. The default value is 10.
com.snc.word_doc_api.supported_image_types	This property ensures that only the image types specified in the property will be processed by the plugin and inserted into the Word Document. The supported image types are: png, jpg, jpeg, and gif.
com.snc.word_doc_api.disable_wordapi	This property ensures that the API will not work if the property is set to true. The default value is false.
com.snc.word_doc_api.image_size_limit_kb	This property ensures that if the image size in KB is more than the property value, the plugin will not start processing and will result in status failure with an error message. The default value is 100.
com.snc.word_doc_api.max_repetitions	This property sets the number of times a repeater block (a defined section of content) will be duplicated and inserted consecutively into the Word document. Each repetition adds a new instance of the block immediately following the previous one, creating a sequential chain of repeated sections. The default value is 100.

Create an audit report template using ServiceNow Document Designer

Use the template configurations to create placeholders for an audit report template tailored to your needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Install and activate the ServiceNow Document Designer with Word (sn_grc_doc_design) plugin. For more information, see Install the ServiceNow Document Designer add-in.

Confirm that you have the templates configured. For more information, see Configure templates for Document Designer.

If you want to insert and update reporting content, set up Microsoft 365 reporting. For more information see, Set up Microsoft 365 reporting configuration and Add additional reporting configuration filters for a Microsoft 365 configuration record.

Role required: sn_audit.manager and sn_grc_doc_design.reader

Procedure

1. Navigate to the Microsoft Word document that you want to use for template creation.
2. To create placeholders, select **Design template** On the ribbon.
3. To log in to your ServiceNow instance, select **Log in** using the audit manager credentials.
   a. On the ServiceNow login screen, provide your credentials.
   b. Select **Allow**.
4. On the ServiceNow Document Designer pane, fill in the following fields.
   a. In the **Business domain** field, select **Audit**.
   b. In the **Template configuration** field, select the configuration record you want to insert.
   c. To confirm the selected template configuration, select **Confirm**.
   d. Select the **Data** tab then the **Data element** field and from the list, select the fields you would like to see on the template.
   Only the configured fields are available for selection.
   e. Move the mouse device at the point where you want to insert data and insert the fields such as Logo, Type, Name, and so on.
   f. Select the **Table** tab, in the **Table element** field, from the list, select the configured table elements that you would like to see on the template.
   For example, the list of top five high priority issues.
5. To insert a content block with styling that can appear repeatedly, select **Block**.
   a. In the document, add the content that must be used for repeated styling.
   b. In the Content block source field, select the item that you want to map to the content block.
   c. Select **Add content block**.
   The content in the document is wrapped in the content block and the options **Data** and **Table** are available.
   d. To insert data from the configured columns in the content block, select **Data**.
   e. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. To insert content from a table, select **Table**.
After selecting the table you want, you can select **Edit columns** to reorder columns as needed.

g. Select **Add**.

6. To insert reporting content, select **Insert content** on the ribbon.

a. Select the **Data** tab.

b. In the **Business domain** field, select **Audit**.

c. In the **Reporting item** field, select the configuration record you want.

d. In the available fields, make the selections that you would like to see on the template. Only the configured fields are available for selection.

e. Move the mouse device at the point where you want to insert content and select **Add**. The data is inserted in to the template. The inserted text takes the formatting of the document. You can modify the formatting as required.

f. Select the **Table** tab.

g. In the **Business domain** field, select **Audit**.

h. In the **Reporting item** field, select the configuration record you want.

i. In the available fields, make the selections that you would like to see on the template. Only the configured fields are available for selection.

j. Move the mouse device at the point where you want to insert the table and select **Add**. The table is inserted in to the template. The inserted table takes the formatting of the document. You can modify the formatting as required.

k. Select the **Chart** tab.

l. In the **Business domain** field, select **Audit**.

m. In the **Reporting item** field, select the configuration record you want.

n. In the available fields, make the selections that you would like to see on the template. Only the configured fields are available for selection.

o. Move the mouse device at the point where you want to insert the chart and select **Add**. The chart is inserted in to the template. The inserted chart can be modified according to your preferences. For example, you can change the colors, the type of chart and so on.

7. To update reporting content, select **Update content**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the field that you would like to get the updated data for and select **View and refresh links**.
Only the fields added to the table are available for selection.
The selected fields and content are updated with the latest data available.

Note:

To help avoid potential errors:

- Don't add a content block within another content block.
- Don't add more than 10 images.
- Don't add more than one table inside a content block.
- Don't add more than two content blocks.

8. Save the template.

Related topics

Set up Microsoft 365 reporting configuration

Add additional reporting configuration filters for a Microsoft 365 configuration record

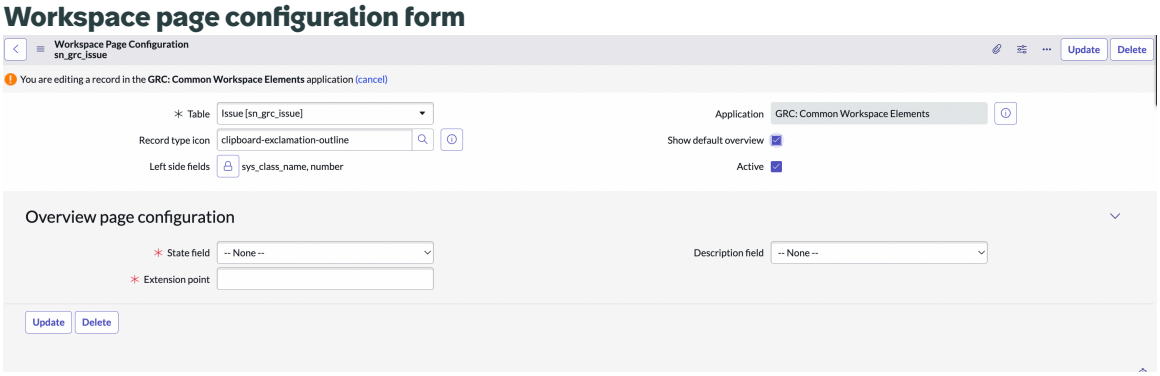
Add related fields to a Microsoft 365 configuration record

Workspace page configuration

A common record page can be used and configured within all the GRC applications.

A common record page template is introduced to customize tables in any GRC workspaces. You can configure the record page to show icons, separator, and stepper component. For more information on how to configure the workspace, see Configure workspace page topic.

Configure workspace page



You can configure and customize your workspaces so that all the GRC applications have a similar appearance.

Before you begin
Role required: sn_grc_workspace.admin.

Procedure

1. Navigate to **All** > **GRC Administration** > **Workspace Page Configuration**.
2. Select the record that you want to configure.
3. Open the record and on the form, click **here** to edit the record.
On the form, fill in the fields. For more information, see Workspace page configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Update**.

Result

Workspace is customized as per the configuration and looks similar in all the GRC applications.

Workspace page configuration form

Description of field values for the workspace configuration form.

Workspace page configuration form

Fields	Description
Table	Table for which you want to configure the record page.
Application	Scope of the current application.
Record Type Icon	List of all the base system icons that are existing. **Note:** Use the icons that are available in the ServiceNow AI Platform. You can't create any custom icons.
Left side fields	Standard information of a record is given in these fields. Record type is shown in the record page by default based on the record selected. **Note:** The secondary header fields that are not configured for left side, are shown as default fields on the right side of the separator.
Show default overview	Option to select default overview page on the record page.
Active	Customizations will be shown on the record page only if this option is selected.
Overview page configuration	

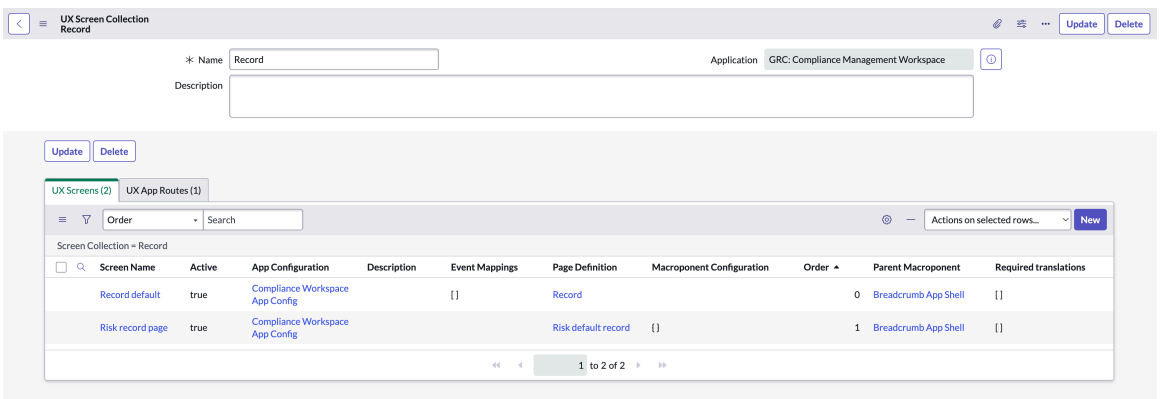
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workspace page configuration form (continued)

Fields	Description
State field	Process flow information for the stepper seismic component in the default overview page. The workflow state information captured from the process flow table for the current record.
Description field	Additional information or context about the record in default overview page.
Extension Point	Custom process flow information for the stepper seismic component in the default overview page. **Note:** This field is greyed out when the **State field** is selected.

Revert record page templates to the pre-17.x version

If you're an existing customer and have a customized record page, you can revert to that old page.



Before you begin

Role required: workspace_admin.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Click the workspace in which you want to make changes, from the **My Experiences** list.
3. Click **Record** page that belongs to your workspace from the .
4. In the record page, click **Developer** listed under **Menu** tab and click **Open variant collection**.

UX screen variants

In the **UX Screens** tab, you see two screens, **Record default** and **Risk record page**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The two screens are shown only if you're upgrading to version 17.x.

5. Click the variant for which you want to change the order.
   If you give a high-order value, you revert to the old record page. If you want to switch to the new record page, set to low-order value.

Record type icons configured for forms in GRC Common Workspace Elements

The table gives you a list of icons configured for the forms in the Audit Workspace and Compliance Workspace.

Icons configured for the forms in Audit Workspace

Form name	Table name	Record icon type	Icon name
Evidence request	sn_grc_advanced_evide	e_request	panel-display-popout-outline
Evidence response	sn_grc_advanced_evide	e_response	pop-in-outline
Engagement	sn_audit_engagement		calendar-days-clock-outline
Indicator	sn_grc_indicator		chart-speedometer-outline

Governance, Risk, and Compliance reference

Reference topics provide information about tables, roles, and properties installed with the GRC application.

Components installed with Governance, Risk, and Compliance

Reference topics provide additional information about components that are installed with the activation of the GRC plugin. These components include tables, user roles, and properties.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Common roles in Governance, Risk, and Compliance

Certain common roles are used in multiple GRC modules.

Common roles

Role title [name]	Description	Contains roles
GRC Business User [sn_grc.business_user]	Role that is a part of the GRC Profiles application. Assign this role to users who require access only to GRC applications for performing their assigned tasks, providing them limited access to data and information relevant to those tasks. For example, assign this role to a business user who must respond to an attestation or risk assessment, or who must remediate an issue. Starting with the 14.x release, the following permissions are available to the users with the sn_grc.business_user role: Policy and Compliance Management:	• sn_grc.user_hierarchy_reader • workspace_user • sn_grc_workspace.task_reader • canvas_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common roles (continued)

Role title [name]	Description	Contains roles
	• Create issues or view all issues that are assigned to them or their group. • Accept and approve evidence responses. • Assign a remediation task. • Acknowledge policies. • Contribute to policies. • Group or ungroup attestations. • Request or approve policy exceptions. • Report issues. • Respond to observations. • Submit and request issue triages. • Take an attestation. Risk Management: • Create or view all issues that are assigned to them or their group. • Assign indicator tasks. • Assign issues. • Assign remediation tasks. • Assign risk event tasks. • Assign risk response tasks. • Approve or assess an advanced risk assessment. • Respond to indicator tasks. • Respond to the risk identification questionnaire. • Respond to the metrics data task. • Report issues. • Submit issue triage requests. • Take the risk assessment. • View the risk assessment scope. • View risk statements.

Common roles (continued)

Role title [name]	Description	Contains roles
	• View the risk assessment scope. • View and report risk events. • View indicator supporting data. Integration with Project Portfolio Management: • Create a risk from a library. • Elevate an enterprise risk. • Initiate an object assessment. • View the Project Risk Overview dashboard. During an upgrade to either version 11.x or 12.x of GRC: Profiles, users who have previously performed a GRC operation in the past 90 days are automatically assigned with the sn_grc.business_user role. This is a one-time event. The group and role are assigned once during the 11.x or 12.x upgrade. For more information on the sn_grc.business_user role, see KB0864247. **Note:** You must log in to Now Support to view the Knowledge Base articles.

Common roles (continued)

Role title [name]	Description	Contains roles
	Note: You can manage who can access your GRC records with the GRC user roles. Earlier, your users with the snc_internal role could also access the GRC records. As part of the security updates, each GRC application has modified access control lists (ACLs) where access to the GRC records is restricted only to the users with the GRC roles. **Note:** When you (a GRC user) run a job to create a record, this will create an entry to the user in the Unique user table.	
GRC Business User – Lite [sn_grc.business_user_lite]	Role that enables a user to perform only a subset of the tasks that can be performed by the sn_grc.business_user. This role is applicable only for customers who are entitled to and have installed the GRC: Business User – Lite application from the ServiceNow Store. Risk Lite Operators are users who have the right to perform only one or more of the listed operations. The users with this role can perform the following activities: • Read or update the policy acknowledgment, control attestation, take attestation, issues that are assigned to them, remediation task, or evidence request. • Report or read the submitted issues, risk events, or policy exceptions.	• sn_grc_workspace.task_reader • canvas_user • sn_grc.user_hierarchy_reader

Common roles (continued)

Role title [name]	Description	Contains roles
GRC System Admin sn_grc.sn_grc_system_admin	Role that is a system role for running scheduled jobs. This role is equivalent to the admin role. For example, if you want to run a scheduled job for policy acknowledgment, you can set up the system to run the job as GRC admin. The GRC system administrator is a default user that contains the sn_grc.sn_grc_system_admin role. **Note:** This role isn't assigned to a person. It's a technical back-end role that is used for running the scheduled jobs.	• admin • import_admin • sn_grc.admin
GRC Reader [sn_grc.reader]	Role that provides a user with read access to the GRC suite of applications and modules.	• pa_viewer • cmdb_read • sn_data_registry.reader
GRC Manager [sn_grc.manager]	Role that provides a user with management access to the GRC suite of applications and modules.	• sn_grc.user • sn_grc.compliance_manager • business_process_manager • cmdb_query_builder_read
GRC User [sn_grc.user]	Role that provides a user with management access to the GRC suite of applications and modules.	• sn_grc.reader • business_process_user • sn_grc_pa.sn_grc_pa_viewer
GRC Developer [sn_grc.developer]	Role that enables a user to perform script-based work such as write scripted factors, scripted formulae for advanced risk assessment, scripted indicators, and so on in GRC.	sn_grc.admin
GRC Confidential User [sn_grc.confidential_user]	Role that provides a user with access to the GRC confidential records.	None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common roles (continued)

Role title [name]	Description	Contains roles
GRC User Hierarchy Reader [sn_grc.user_hierarchy_reader]	Role that provides a user with read access to the records in the sn_grc_user_hierarchy table.	None
GRC User Hierarchy Admin [sn_grc.user_hierarchy_admin]	Role that enables a user to create or delete the records in the sn_grc_user_hierarchy_configuration table.	None
Workspace task reader [sn_grc_workspace.task_reader]	Role that enables a user to read the records in the configuration tables such as the tab configuration, applicable tables, and so on.	None
Audit reader [sn_audit.reader]	Role that enables a user to read the audits and audit-related tables. This role is applicable only for customers who are entitled to and have installed the GRC: Business User – Lite application from the ServiceNow Store.	None
Audit approver [sn_audit.approver]	Role that enables a user to approve the audits. This role is applicable only for customers who are entitled to and have installed the GRC: Business User – Lite application from the ServiceNow Store.	None
Roles that are installed with the GRC Employee User application		
Note: The following role is applicable only to customers who are entitled to and have installed the GRC Employee User application. For more details, review the entitlement on the subscription dashboard or contact ServiceNow customer service.		
GRC Employee [sn_grc_emp_user.grc_employee]	Role that is applicable only to customers who are entitled to and have installed the GRC Employee User application from the ServiceNow Store. The users with this role can perform the following activities from Employee Center:	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common roles (continued)

Role title [name]	Description	Contains roles
	• Read and acknowledge organizational policies. • Report risk events and issues. • Request policy exceptions. • Report a compliance case to the Compliance team. • Raise inquiries or requests to the Compliance team.	

The following Operator roles are reclassified as Lite Operator roles when the GRC Employee User application and GRC Business User Lite applications are installed:

- sn_grc.business_user
- sn_risk_advanced.ara_assessor
- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.reader
- sn_irm_cont_auth.executive_read

Note:
This reclassification is applicable only to customers who are entitled to and have installed the GRC Employee User application. For more details, review the entitlement on the subscription dashboard or contact ServiceNow customer service.

GRC Feature roles

GRC Feature roles are specialized roles that grant access to capabilities of specific GRC features or application areas.

GRC Feature roles plugin

Download and install the GRC Feature roles plugin (sn_grc_ftr_role) from the ServiceNow Store to granular obtain access to individual IRM features. GRC Feature roles provide access to individual Integrated Risk Management (IRM) capabilities, instead of granting access to the entire IRM feature set. This approach enables users for granular access to specific functionalities, such as Compliance Library, Policy Management, and Control Attestations and Monitoring. It also enables precise control over what is shared with non-IRM products.

Feature sets

GRC features are logically grouped into feature sets. Feature roles are associated with a specific feature set and provide access to the features available in that feature set.

Non-IRM users can perform the following actions when assigned appropriate feature roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Library and Control feature set
  - Create and manage library objects such as authority documents, citations, and control objectives.
  - Associate entity and entity types to control objectives and generate controls.
  - Manage control workflows, monitor controls effectively using attestations and indicators, and generate issues.
- Policy feature set
  - Create and manage policies and the policy lifecycle.
  - Create policy acknowledgments and policy exceptions.
- Audit feature set

  Create and manage engagements, activities, and scoping entities within those engagements. This role also provides access to a lite version of audit workspace.
- Evidence feature set

  Create and manage evidence requests, collection details, and evidence responses.

Important:
GRC Feature roles uses the functional domain field on the individual record to identify the type of the record. Access to the record is restricted based on the functional domain enabling the required access to users who need it. For more information about functional domains, see Tagging records with functional domain.

GRC Feature roles

Role	Description
sn_compliance.library_employee_reader [Employee Operator]	Users with this role have read access to all library objects (Authority documents, Citation, Control objectives, Policies).
sn_compliance.policy_exception_employee_user [Employee Operator]	Users with this role have read access to library, implementation, and can request extension of a policy extension.
sn_compliance.control_employee_reader [Employee Operator]	Users with this role have read access to library, implementation objects like controls and control requirements.
sn_compliance.policy_ack_employee_user [Employee Operator]	Users with this role have read access to library, policies, and acknowledge policies.
sn_grc.issue_employee_user [Employee Operator]	Users with this role have read access to library, and policies.
sn_grc.library_reader [Lite Operator]	Users with this role have read access to entities, content, document, audience, audience filters.
sn_grc.compliance_assurance_reader	Users with this role have read access to item, issues, assessments, indicators, and indicator templates.

GRC Feature roles (continued)

Role	Description
[Lite Operator]	
sn_compliance.library_reader [Lite Operator]	Users with this role have read access to Compliance Library (Authority Documents, Citations, Control Objectives, Policies).
sn_compliance.control_framework_reader [Lite Operator]	Users with this role have read access to controls and control requirements.
sn_compliance.policy_reader [Lite Operator]	Users with this role have read access to policies, policy exceptions, and policy acknowledgments.
sn_grc.compliance_assurance_business_user [Lite Operator]	Users with this role can create an issue, respond to indicator task, create remediation task, and associate issue to related objects.
sn_compliance.control_framework_business_user [Lite Operator]	Users with this role can associate impacted controls to policy exception.
sn_compliance.policy_business_user [Lite Operator]	Users with this role can request policy exception, extension, acknowledge policies, and contribute to policies.
sn_grc.shared_configurator [Lite Operator]	Users with this role have enable access to common functionalities irrespective of the feature set.
sn_grc.library_user [Operator]	Users with this role can associate document/ content with related objects like information objects, issues, and entities.
sn_grc.compliance_assurance_user [Operator]	Users with this role can create item, define assessment grouping, associate item to entity/ entity types, associate entity with content, document, indicator, and indicator templates.
sn_compliance.library_user [Operator]	Users with this role can create control objectives and policies.
sn_compliance.control_framework_user [Operator]	Users with this role can create controls, control requirements, and associate controls to entities.
sn_compliance.policy_user [Operator]	Users with this role can create policies, acknowledgment campaign, and define policy exception related records.
sn_grc.library_manager [Operator]	Users with this role can create content, document, audience, indicator templates, entity, and entity types.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Feature roles (continued)

Role	Description
sn_grc.control_framework_manager [Operator]	Users with this role can manage item, associate items to related objects, create indicators, supporting data, associate indicator to related objects, attestation designer, types, grouping criteria, associate control objectives to indicator templates, entities, and entity types.
sn_compliance.library_manager [Operator]	Users with this role can create authority documents, citations, control objectives, policies, and associate library to taxonomy
sn_compliance.policy_mgr [Operator]	Users with this role can manage compliance library objects, perform policy lifecycle, configure exception reasons, define policy exception approval rules, and configure dynamic approval rules.
sn_grc.library_admin [Operator]	Users with this role can delete or deactivate library.
sn_grc.compliance_assurance_admin [Operator]	Users with this role can delete indicator, item, assessment criteria, and create or delete functional domain registry records.
sn_compliance.library_admin [Operator]	Users with this role can delete or deactivate library.
sn_compliance.control_framework_admin [Operator]	Users with this role can delete control, control requirements, create association between control to control objectives and compliance score record.
sn_compliance.policy_admin [Operator]	Users with this role can delete policy, acknowledge campaign, policy, and policy exception.

Tables installed with Governance, Risk, and Compliance

Tables are added with activation of GRC plugin.

Tables installed

Table	Description
Control objective to object staging table [sn_grc_pci_control_objective_object_staging]	Stores the staged data of control objective and configuration test mappings.
Control objective mapping import configuration [sn_grc_pci_control_objective_mapping_import_configuration]	Stores the metadata of the configuration information required to ship the records from the staging table to the target table.

© 2026 ServiceNow, Inc. All rights reserved.

Tables installed (continued)

Table	Description
Control objective mapping import additional fields configuration [sn_grc_pci_control_objective_mapping_import_additional_fields_configuration]	Stores the metadata of key-value pairs pertaining to any additional columns on the target m2m tables.
Content Reference to Authority Document sn_grc_m2m_cont_ref_auth_doc	Many-to-many relationship table that stores the mapped data between the content references and authority documents.
Content Reference to Citation [sn_grc_m2m_cont_ref_citation]	Many-to-many relationship table that stores the mapped data between the content references and citation.
Content Reference to Control Objective [sn_grc_m2m_cont_ref_ps]	Many-to-many relationship table that stores the mapped data between the content references and control objectives.
Functional domain [sn_grc_functional_domain]	Stores the metadata of the list of functional domains.
Functional domain configuration [sn_grc_functional_domain_configuration]	Stores the configuration information of all audit and compliance objects that are classified as IT related.
Functional domain configuration m2m relationship registry [sn_grc_functional_domain_config_m2m_relationship_registry]	Stores the m2m mapping of the relationship registries that determine the parent table, child table, and the relationship between the two.
GRC functional domain user action [sn_grc_functional_domain_user_action]	Stores the manually triggered user actions of adding and removing of objects as IT related.
Issue to Content [sn_grc_m2m_issue_content]	Many-to-many relationship table that is used to manage relationships between issue and control objective.
Issue to Document [sn_grc_m2m_issue_document]	Many-to-many relationship table that is used to manage relationships between issue and policy table and between issue and authority document.
Issue to Engagement [sn_grc_m2m_issue_engagement]	Many-to-many relationship table that is used to manage relationships between issue and engagement.
Issue to Item [sn_grc_m2m_issue_item]	Many-to-many relationship table that is used to manage relationships between issue and control.
Item to entity [sn_grc_m2m_item_entity]	Many-to-many relationship table that stores associated reliant entities with common controls.
Item to entity type [sn_grc_m2m_item_entity_type]	Stores entity type ID record for entity type association.
Indicator [sn_grc_indicator]	Stores details of indicators.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed (continued)

Table	Description
Supporting Data [sn_grc_indicator_supporting_data]	Stores the supporting data collected after the indicator job run (GRC indicator nightly run).
Indicator Supporting Data Statistics [sn_grc_indicator_supporting_data_statistics]	Stores statistics of indicators for collecting supporting data, which is leveraged by the supporting data collection job.

Governance, Risk, and Compliance properties

The following are the common GRC properties under Policy and Compliance and Risk Management.

Common GRC properties

Navigate to **Policy and Compliance** > **Administration** > **GRC Properties**. Alternatively, you can navigate to **Risk** > **Administration** > **GRC Properties**.

Properties for GRC

Property	Description
Consider executing indicator result business rules on indicator job run sn_grc.indicator_result_execute_business_rules_on_indicator_job_run	The property is a GRC indicator for the executed result business rules on the indicator job run and is in GRC: Profiles. • Type: true or false • Default value: false
Consider executing indicator task business rules on indicator job run sn_grc.indicator_task_execute_business_rules_on_indicator_job_run	The property is a GRC indicator for the executed task business rules on the indicator job run and is in GRC: Profiles. • Type: true or false • Default value: false
Consider executing indicator business rules on indicator job run sn_grc.indicator_execute_business_rules_on_indicator_job_run	The property is a GRC indicator for the executed business rules on the indicator job run and is in GRC: Profiles. • Type: true or false • Default value: false
Enable same response assessment grouping option. sn_grc.enable_consolidate_asmt	This property is used by the feature “Attestation Response Consolidation.“

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for GRC (continued)

Property	Description
	When this is set to true, an additional option "Provide same response for all assessments" is added to the grouping choices. • **Type**: Yes or No • **Default value**: Yes
Total number of questions allowed in a different response type grouped assessment = number of questions in one assessment * number of selected assessments. sn_grc.grouped_questions_limit	This property is used when creating a group (different response type) of attestations/risk assessments. If total number according to formula exceeds it throws an error to restrict group creation to prevent too many questions in a group. If this property is increased by customer it may impact performance.
Automatically make indicators for item. sn_grc.auto_create_indicator	If this property is set to true indicators are automatically generated once the content(Risk statement/ Control objective) is linked to indicator template. • **Type**: Yes or No • **Default value**: Yes
Maximum number of indicator events allowed. sn_grc.indicator_max_events	These are the maximum number of indicator run related events that are allowed to be fired during a scheduled indicator run. Typically the no of events to be fired is determined by Total no of indicators/ Batch size of indicator to run. If the result event count exceeds Maximum number of indicator events allowed then the batch size id adjusted to total indicators/ Maximum number of indicator events allowed.
Batch size of indicator to run. sn_grc.indicator_min_batch_size	This property controls how many indicators must run in a batch. Indicators are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for GRC (continued)

Property	Description
	always run in batches. For each batch there is an event fired with sys_ids of the indicators to be run. For example, if the total number of indicators are 10000 and the batch size is 1000 there will be 10 events fired and each event has list of 1000 indicators to be run.
Total number of questions allowed in a same response type grouped assessment = number of questions in one assessment * number of selected assessments. sn_grc.consolidated_questions_limit	This property is used when creating a group (same response type) of attestations/risk assessments. If total number as per formula exceeds it throws an error to restrict group creation to prevent too many questions in a group. If this property is increased by customer it may impact performance.
Maximum number of open indicator tasks. sn_grc.max_open_indicator_tasks	Each indicator that is run will have an associated task created in the sn_grc_indicator_task table. This property controls the number of indicator tasks active at any point of time. If the indicators exceed the count, a sn_grc.max_tasks_exceeded event is fired. For more information, see KB0788099.
Automatically close a issue when all its related remediation tasks are closed. sn_grc.automatically_close_all_issues_when_all_tasks_closed	When this property is set to true, an issue will be automatically closed when all its children tasks are closed. Otherwise, the user has to manually close the issue. • **Type**: Yes or No • **Default value**: Yes
Issue assignee suggestion based on. sn_grc_pred_intel.issue_assignee_suggest	If this property is set to "None" the Suggest icon wouldn't be available beside

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for GRC (continued)

Property	Description
	the Assigned To field on the issue form. If it is set to “Similarity Analysis” then the suggest icon would be available and the assignment predictions would happen based on the similarity solution definition name provided in the property " Machine learning solution for prediction of issue assignees”, when the user clicks the suggest icon.
Machine learning solution for prediction of issue assignees. sn_grc_pred_intel.ml_solution_for_issue_assigned_to	This property is used for mentioning the name of the Similarity solution definition that would be used for prediction of issue assigned to. If this field is left blank or has an incorrect/non-existent Similarity solution definition name then the user would get an error on clicking the suggest icon next to the issue assigned to field. The user could have many existing similar solutions on their instance. This provides some amount of flexibility to select the appropriate solution definition name.
Default sample size of indicator templates and indicators. sn_grc.indicator.default.sample_size	The property is used to set the default sample size of indicator templates and indicators.
Max number of records to be processed by indicator supporting data collection job. sn_grc.max_supporting_data_records_to_process	The property is used to collect the configured number of records from the supporting data statistics table whenever the supporting data collection job runs. The default value is 500.
Supporting data limit for indicators with % based sampling. sn_grc.supporting_data_percentage_max_records_limit	The property is used to set an upper limit in collecting supporting data although you have set a percentage of records to be collected when you select **Percentage**

Properties for GRC (continued)

Property	Description
	Explanation will be non-editable on child issues. • If the management method is Manage parent, the **State**, **Response**, and **Explanation** fields are inherited by the child issues from the parent issue. **Note:** If the mandatory fields, such as **Assigned to** and **Issue manager** fields are empty in the child issues, the child issues will inherit those fields from the parent issue. **Note:** After you enable this property, you can't disable it.
Execute pending actions asynchronously post indicator run. sn_grc.execute_indicator_next_actions_async	If the property is set to True, then the two custom queues are leveraged to process indicators at a high level. If the property is set to False, then the indicator processing is done by the default queue processor.
Collect supporting data asynchronously for an indicator using collection job. sn_grc.process_indicator_supporting_data_async	If True, then the supporting data collection job collects the supporting data into the supporting data statistics table. If False, then the supporting data are collected from the Default queue. The supporting data collection job isn't leveraged in this case.
Number of days after indicator task due date to send overdue notification.	This property is used to notify the users of the number of days lapsed since the due date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for GRC (continued)

Property	Description
Number of days before indicator task due date to send reminder notification.	The property is used to notify the users of the upcoming due date for an indicator task.

Composite Entity properties

Navigate to **All** > **Composite Entities** > **Properties**.

Properties for Composite Entity Management

Property	Description
Separator used to auto-generate the name of composite entity and composite entity classes [sn_grc_comp_ent.name_separator]	Property to specify the separator that is used for the composite entity and composite entity class name.
Maximum number of entities that can be rendered inside the content tree [sn_grc_comp_ent.max_content_tree_entity_count]	Property to define the maximum number of entities displayed in the content tree during an entity search.
