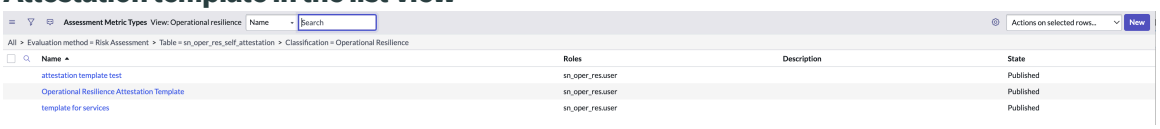
   b. To create a customized template, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customized attestation template

Attestation template



c. On the Assessment Metric Type New Record form, enter the name for the attestation template and select **Submit**.

For a description of the field values on the form, see Assessment Metric Type New Record form.

The attestation template is displayed in the templates list view as shown in the following example.

Attestation template in the list view

By selecting **Submit**, you add the Operational Resilience tables and the application users to your customized attestation template.

Assessment Metric Type New Record form

Use the Assessment Metric Type New Record form to create an attestation template to create the attestations. Use the template form to create a record.

Assessment Metric Type New Record form

For a description of the field values on the form, see the following table.

Assessment Metric Type New Record form

Field	Description
Name	Name of the template.
Description	Information about the template.
Active	Option to enable the template.
State	State of the assessment. The available options are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric Type New Record form (continued)

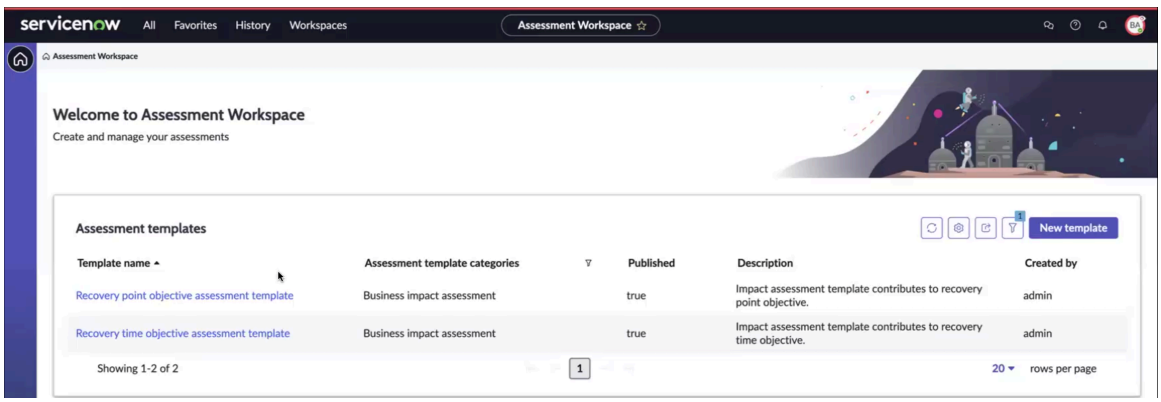
Field	Description
	• **Draft** • **Published** This field is auto-filled.
Metric categories	Category that represents a theme for evaluating assessable records in a given metric type. It displays the name of the template, description of the category, its weight, order, and so on. For information on Weight categories and metrics in the Assessments application, see Assessment metric categories.

Create a Smart Assessment template

Create a Smart Assessment template and impact automation that can be used in the vulnerability types of an operational vulnerability.

Before you begin

Role required: sn_oper_res.admin



About this task

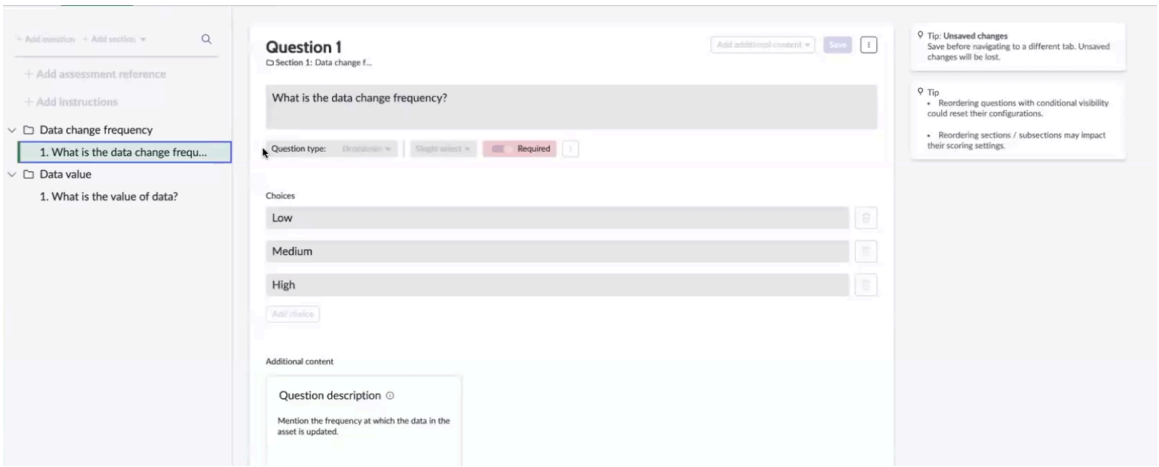
Operational Resilience administrators contain the flow_designer role, enabling them to update automation flows as needed.

Procedure

1. Navigate to **Workspaces** > *Assessment Workspace* or navigate to **All** > *Smart Assessment Engine* > **Administration** > **Template Categories**.
2. Select **New template**.

   You can create assessment templates to manage your assessments in the Assessment Workspace. The following example shows demo data in an instance.

   When you select **New template**, the **General** and **Questions** tabs are displayed.
3. In the Create assessment template form, fill in the fields.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create assessment template form

Field	Description
Template name	Unique meaningful name for the template, for example, BIA template using Smart Assessment.
Description	Description of the template such as why it is being used.
Purpose	Purpose or intended use of the template, such as, Self attestation assessment.
Assessment target	Table records that are used for the assessment.

You can now fill in the template with instructions, questions, and optional guidance for responding to a question, as well as sections that group the related questions.

4. Navigate to the **General** tab.
   a. Verify the template details, displayed in the **Details** section of the **General** tab.
   b. In the Settings section, assign the Assessment reader role in the **Assessment reader role** field.
   c. Select **Save**.
   For information on creating an assessment template, see Create an assessment template.
5. Navigate to the **Questions** tab and set up the assessment questions.
   For information on adding instructions and questions to the assessment template, see Add instructions and questions to an assessment template.

6. In the **Automations** tab, view the user responses and select **Open** to view the actions that are automatically triggered based on user responses.
7. Select **Save** and **Publish**.
   A message is displayed that the assessment template is published and it can be used to send assessments. You can select **OK** or select **Return to template list**. The **Automations** and **Scoring** tabs are displayed in the assessment template. The Smart Assessment template is created and saved in the instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

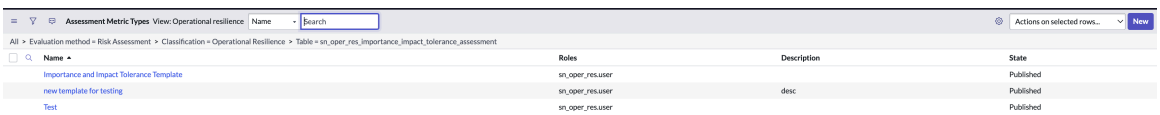
What to do next
Configure the vulnerability type after adding the Smart Assessment template. For more information, see Set up the Operational vulnerability type.

Set up Legacy assessment template

Create your own questionnaire (assessment) template instead of using the default template in the Operational Resilience application to suit your business needs.

Before you begin
Role required: sn_oper_res.admin

About this task
Create your own questionnaire (assessment) template and request the responses from the assessor. This task is optional.



Procedure
1. Navigate to **All** > **Operational Resilience** > **Administration** > **Assessment Templates**.
2. To create an assessment template, click **New** as shown in the following example.

New risk assessment

3. On the Assessment Metric Type form, fill in the fields and click **Submit**.
   The new assessment template is listed in the Assessment Metric Types list as shown in the following example.

New assessment

For a description of the field values on the Assessment Templates form, see Assessment Metric Type form.

Assessment Metric Type form

Use the Assessment Metric Type form to create an assessment questionnaire template instead of using the default template. You can also use this form to request responses from the assessor.

Assessment Metric Type form
For a description of the field values, see the following table.

Assessment Metric Type form

Field	Description
Name	Name of the assessment template.
Roles	Additional user roles that can view the results and access records that are associated with this template. Users with the specified roles have read access to this template record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric Type form (continued)

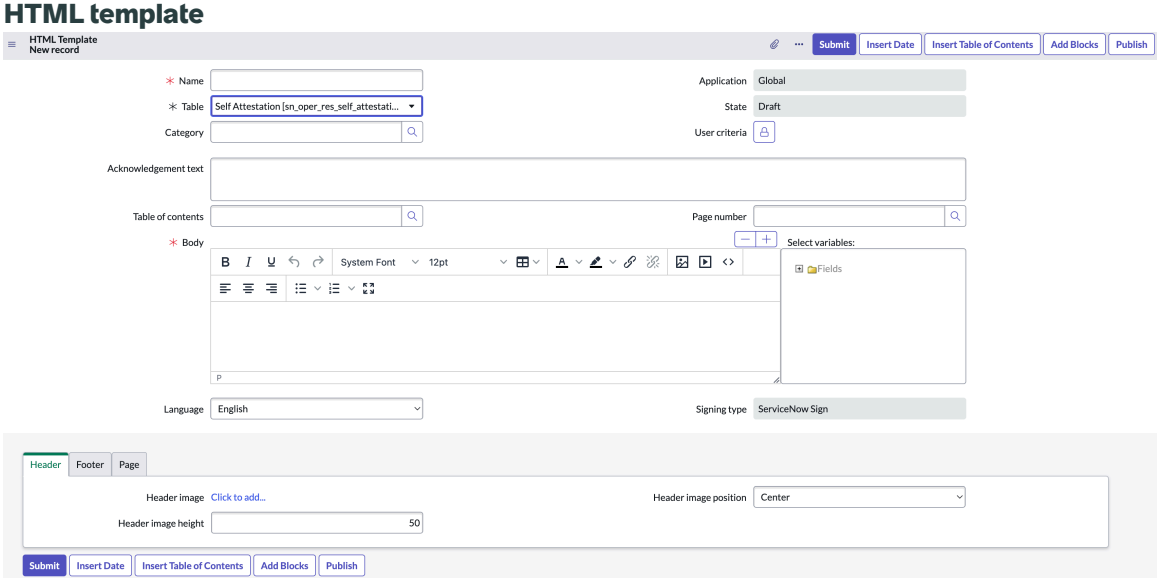
Field	Description
	and to the associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrices.
Active	Option to enable the assessment template.
State	Status of the assessment: **Draft** or **Published**. This field is auto-filled.
Description	Helpful information about the assessment template. Enter a clear description of the template and its purpose.

Create HTML and PDF document templates

Create a customized HTML document template in the Operational Resilience application to suit your business needs. You can use the customized HTML document template instead of the default HTML template to export an attestation.

Before you begin

Role required: sn_oper_res.admin



About this task

Creating a customized HTML document template is optional.

Procedure

1. Navigate to **All** > **Document Templates** > **All Document Templates** and click **New**.
   The following question is displayed on the form: *What kind of document template would you like to create?* The available options are as follows:
   - HTML Document Template
   - PDF Document Template
2. Select **HTML Document Template**.
3. In the **Table** field, select the **Self Attestation [sn_oper_res_self_attestation]** table.
   The sample form is shown in the following example.

HTML template

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields and click **Submit**.
   The new template is displayed in the Document Templates list. For descriptions of the field values, see HTML Template form.

Result

If you have the sn_oper_res.manager role, you can use the HTML template to generate a self-attestation report.

HTML Template form

If you have the sn_oper_res.admin role, use the HTML Template form to create an HTML template instead of using the default HTML template.

HTML Template form

For a description of the field values on the form, see the following table.

HTML Template form

Field	Description
Name	Unique name for the HTML template.
Table	Type of table that is used for the template. The default value is the Self attestation [sn_oper_res_self_attestation] table.
Category	Category of the document template, such as Operational Resilience.
Application	Type of the application such as Global. This field is auto-filled.
State	State of the application such as Global. This field is auto-filled.
User criteria	Target record for the user criteria such as GRC Business Users.
Acknowledgment text	Acknowledgment text for the HTML template.
Page number	Page number for the HTML template such as Default.
Body	Body text for the HTML template.
Language	Language for the HTML template. The default is English.
Signing type	Signature type for the HTML template.
Related lists	
Header	Information about the header image. The options are as follows: • **Header image**: Click to add a header image. • **Header image position**: Position the header image by using the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML Template form (continued)

Field	Description
	○ **Left**: Align the header image on the left of the page. ○ **Center**: Align the header image in the center of the page. ○ **Right**: Align the header image on the right of the page. • **Header image height**: Value of the header image height in pixels.
Footer	Information about the footer image. The options are as follows: • **Footer image**: Click to add a footer image. • **Footer image position**: Position the footer image by using the following options: ○ **Left**: Align the footer image on the left of the page. ○ **Center**: Align the footer image in the center of the page. ○ **Right**: Align the footer image on the right of the page. • **Footer image height**: Enter the value of the footer image height. • **Footer text**: Add a footnote on the document. • **Footer text position**: Position the footer text by using the following options: ○ **Left**: Align the footer text on the left of the page. ○ **Center**: Align the footer text in the center of the page. ○ **Right**: Align the footer text on the right of the page. • **Vertical alignment**: Align the footer text by using the following options: ○ **Above the footer image**: Align the footer text above the footer image. ○ **Below the footer image**: Align the footer text below the footer image.
Page	Information about the page. The options are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML Template form (continued)

Field	Description

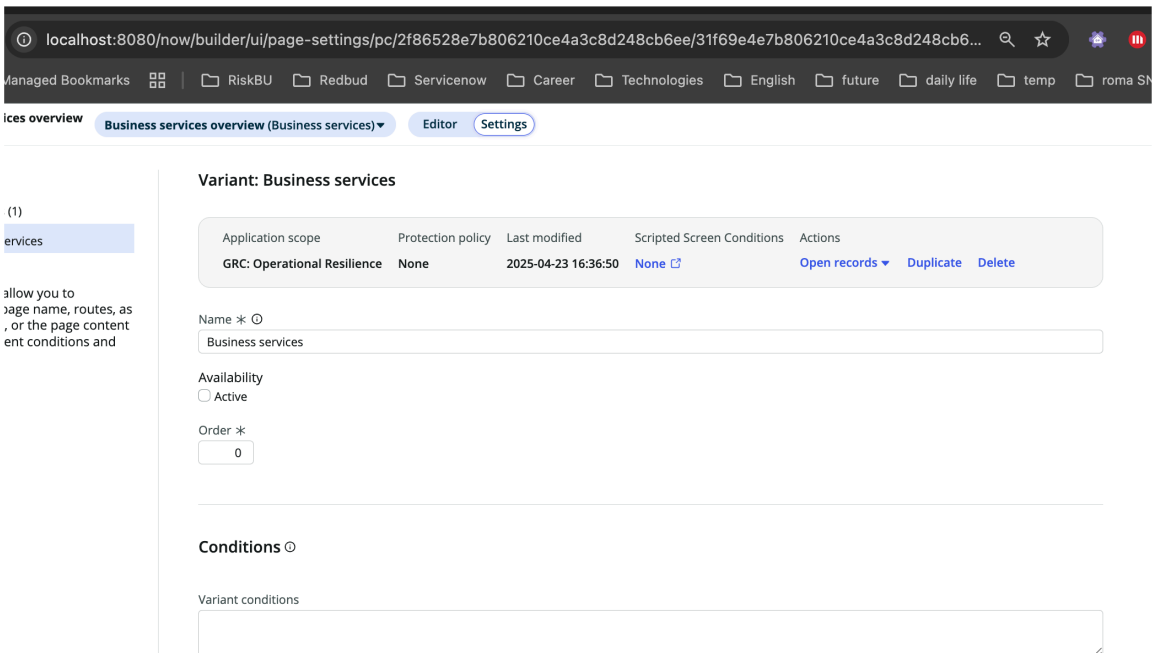
	• Page size: Size of the page. The available options are as follows:
	  ○ **A4**: A4 page size for the HTML template.
	  ○ **Letter**: Letter page size for the HTML template.
	  ○ **Legal**: Legal page size for the HTML template.
	• **Top/Bottom margin**: Top and bottom margin dimensions for the page in pixels.
	• **Left/Right margin**: Left and right margin dimensions for the page in pixels.

Show Business services overview tab in Workspace view

Starting with Release 20.1.x, the **Services overview** and **Business services overview** tabs are displayed on the landing page of the Operational Resilience Workspace. Administrators or UI Builder administrators can show or hide one of these tabs from the Workspace view based on organizational needs.

Showing the Business services overview tab

To show the **Business services overview** tab and hide the **Services overview** tab, UI Builder administrators can open the **Settings** tab in the UI Builder and choose **Hide tab** as shown in the example.



Once the settings are saved, the **Business services overview** tab is displayed and the **Services overview** tab is hidden from the landing page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Showing the Services overview tab

To show the **Services overview** tab and hide the **Business services overview** tab, UI Builder administrators can open the **Settings** tab in the UI Builder and deselect the **Active** flag (mark it as inactive) as shown in the example.

Once the settings are saved, the **Services overview** tab is displayed and the **Business services overview** tab is hidden from the landing page.

UIB setup to display or hide a tab

UI Builder administrators can configure the UI Builder pages to show or hide a tab in the Workspace view as needed.

For more information, see the following reference links:

- UIB setup for tabs
- Community article on displaying a component in UI Builder

Setting up the Operational vulnerability module

Configure the Operational vulnerability feature in the Operational Resilience Workspace to help identify and address operational vulnerabilities within your organization.

Operational vulnerability configuration overview

The Operational vulnerability feature is included by default with the Operational Resilience application.

Here are the typical configuration steps in the Operational Resilience Workspace:

1. Report an operational vulnerability by creating an Operational vulnerability record.
2. Review the assigned and unassigned Operational vulnerability records. The Operational Resilience administrator [sn_oper_res.admin] can assign the Operational vulnerability record.
3. Review the status of the approvals for the assigned operational vulnerabilities.
4. Set up the Operational vulnerability type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

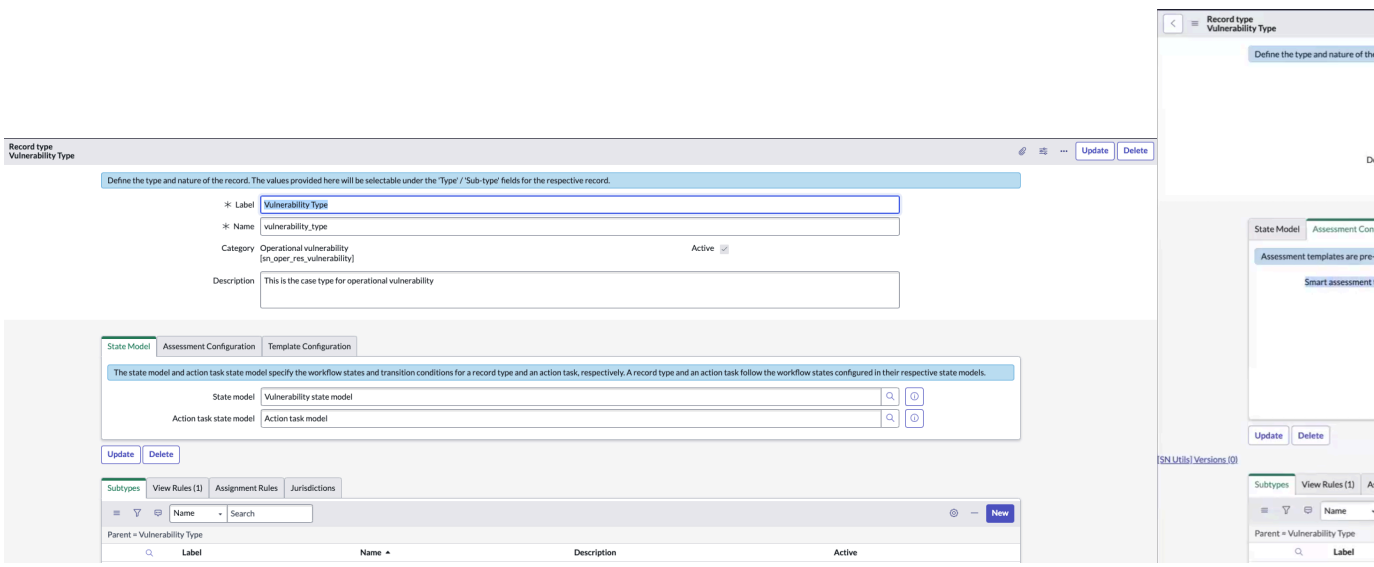
5. Set up the State model and Action task model to define the state transitions for the operational vulnerability record and action tasks.
6. Set up the Vulnerability Assessment Template for configuring important assessment details such as the assessment duration, associated tables, filter conditions of the operational vulnerability.
7. Set up the Document Template (HTML Template) for generating the PDF of the operational vulnerability.

Set up the Operational vulnerability type

Set up the Operational vulnerability type. By defining the type and nature of the Operational vulnerability, Operational Resilience administrators can efficiently assign the operational vulnerabilities to the appropriate teams and address any issues in a timely manner.

Before you begin

Role required: sn_oper_res.admin



About this task

Administrators of Operational Resilience can create only one Vulnerability Type record within the Operational Resilience Workspace.

Procedure

1. Navigate to **All** > **Operational Vulnerability** > **Vulnerability Types**.
2. On the Vulnerability Type record form, fill in the fields.

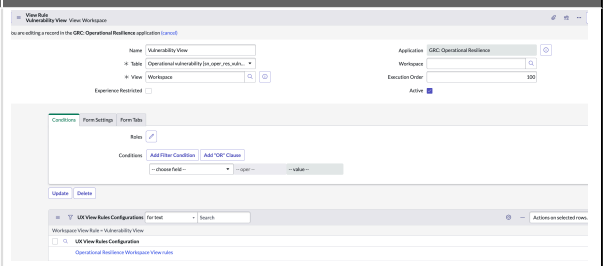
   The Vulnerability Type record form is shown in the example.

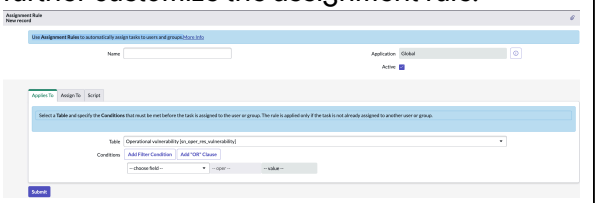
   For more information on the fields, see Vulnerability Type form.

3. Select the Smart Assessment template for the vulnerability type.
4. To update the record, select **Update**.
   The Smart Assessment template is used to process the operational vulnerability.
5. To delete a record, select **Delete**.

Vulnerability Type form

On the Vulnerability Type form, fill in the fields for Operational vulnerability.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Operational vulnerability form

Field	Description
Label	Label for the vulnerability type record.
Name	Name of the vulnerability type. For example, vulnerability_type.
Category	Category of the vulnerability type. For example, Operational vulnerability [sn_oper_res_vulnerability].
Description	Description of the vulnerability type.
Active	Option to activate the vulnerability type.
State Model	
State Model	Vulnerability state model. The state model and action task state model specify the workflow states and transition conditions for a record type and an action task, respectively.
Action task state Model	Action task model. A record type and an action task follow the workflow states configured in their respective state models.
Assessment Configuration	
Assessment templates	Pre-defined formats to request responses from assessors or reviewers that help to evaluate the record. You can use one or multiple assessment templates and use them in the action tasks. Use the Smart Assessment template that has been added to the vulnerability type.
Template Configuration	
Document templates	Pre-defined formats to generate the PDF of the vulnerability record.
Related lists	
Subtypes	Sub-type of vulnerability type record. For example, **Documentation Loss**.
View Rules	Rules to define the form view of the vulnerabilities in the Operational Resilience Workspace. Specifying the rules helps you to define the view you want to use for the vulnerabilities and control how the vulnerability form appears. For example, Default view or Workspace view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Operational vulnerability form (continued)

Field	Description
	
Assignment Rules	Rules to assign the tasks to users and groups by default. **Note:** Assignment rules apply only when the operational vulnerability is created from the Employee Center. Otherwise, they do not apply. In the Applies to related list, you can select a table and specify the conditions that must be met before the task is assigned to the user or group. The rule is applied only if the task is not already assigned to another user or group. In the Script related list, you can use a script to further customize the assignment rule. 
Jurisdiction	Jurisdictions for the impacted regions. **Note:** Jurisdictions are not currently supported in Operational vulnerability.

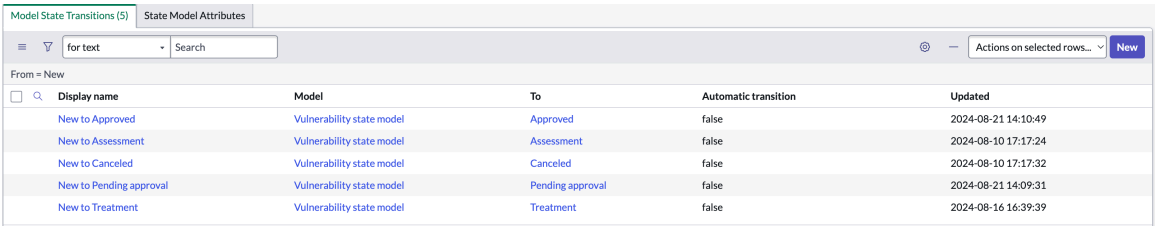
Set up the State model and Action task model

Set up the Vulnerability state model and Action task model to manage the workflow of the Operational vulnerability record. These models define the workflow states and transition conditions for a record type and an action task, respectively. Both the Operational vulnerability record type and the action task adhere to the workflow states configured in their corresponding models.

Before you begin

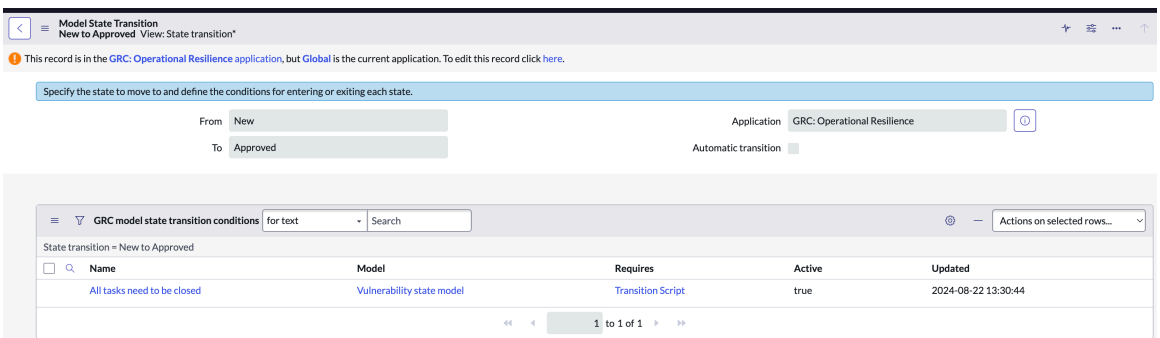
Role required: sn_oper_res.admin

About this task



An operational vulnerability typically goes through the following workflow states:

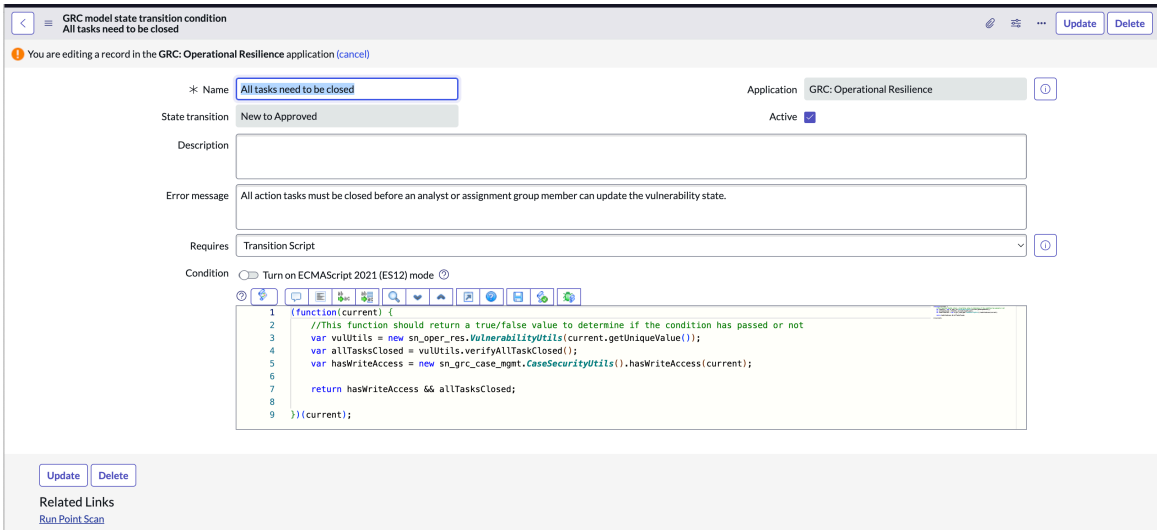
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- **New**: The vulnerability has been opened and it is in the initial stage of review.
- **Assessment**: The vulnerability is being evaluated to determine the appropriate course of action.
- **Treatment**: The vulnerability is being actively investigated to gather information and evidence. The course of action and treatment is being decided.
- **Pending approval**: The vulnerability is being worked on to find a resolution.
- **Approved**: A review of the vulnerability is being done after it is resolved.
- **Closed**: The vulnerability is closed and is no longer active.
- **Canceled**: The vulnerability is canceled and it is no longer being pursued.

When the state transition conditions are satisfied, each vulnerability state gets updated to the next state. For example, the **New** state can be transitioned to the following states as shown in the example:

- **Assessment**
- **Treatment**
- **Pending approval**
- **Approved**
- **Closed**
- **Canceled**

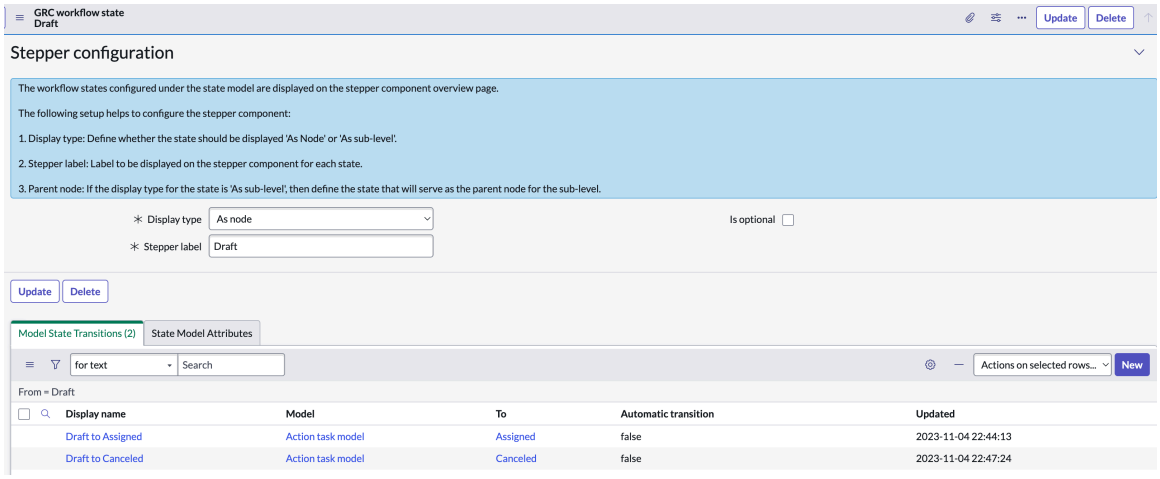


- **New to Approved**: Users can select **New to Approved** to view the state transition condition. Once this condition is met, the vulnerability status updates from **New** to **Approved** as shown in the example.

When all action tasks are closed, the users with write access can update the state as shown in the example.

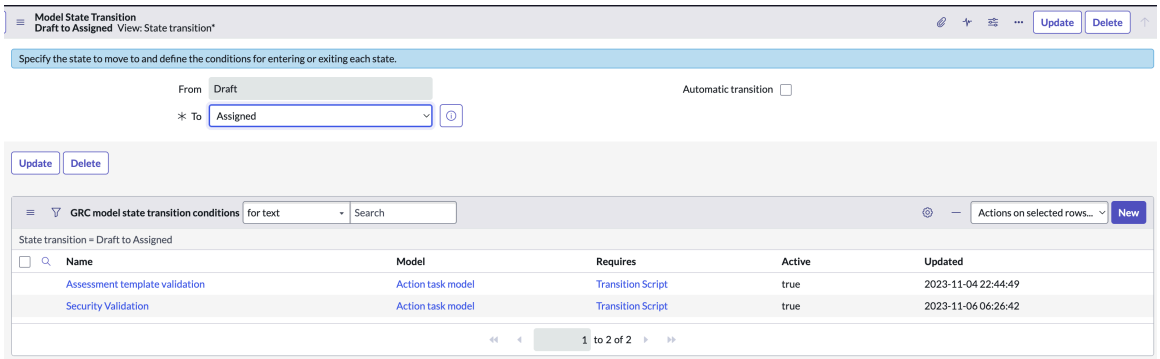
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **New to Assessment**: Once the state transition condition is met, the vulnerability status updates from **New** to **Assessment**.
- **New to Canceled**: Once the state transition condition is met, the vulnerability status updates from **New** to **Canceled**. The vulnerability is canceled and it is no longer being pursued.
- **New to Pending approval**: Once the state transition condition is met, the vulnerability status updates from **New** to **Pending approval**. The vulnerability is being worked on to find a resolution.
- **New to Treatment**: Once the state transition condition is met, the vulnerability status updates from **New** to **Treatment**. The vulnerability is being actively investigated to gather information and evidence. The course of action and treatment is being decided.



The following model state transitions are displayed in the Model State Transitions related list: These states can vary depending on the organization's vulnerability management process.

Workflow states for an action task are defined as follows:



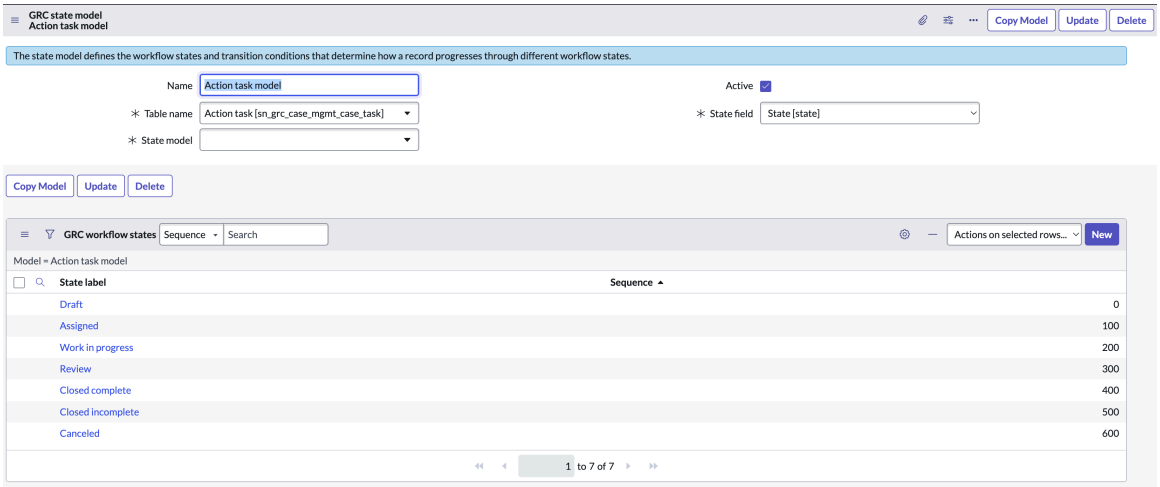
- **Draft**: The action task is in the draft stage.
- **Assigned**: The action task has been assigned to an appropriate user.
- **Work in progress**: Work on the action task is in progress.
- **Review**: The action task is in the review stage.
- **Closed complete**: The action task is in the Closed complete stage.
- **Closed incomplete**: The action task is in the Closed incomplete stage.
- **Canceled**: The action task has been canceled.

When the action task transition conditions are satisfied, each action task state gets updated to the next state. For example, the **Draft** state can be transitioned to the **Assigned** and **Canceled** states as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once the condition is met, the action task is updated from **Draft** to **Assigned** as shown in the example.

When the state transition condition is fulfilled, the state gets updated or else an error message is displayed as shown in the example.

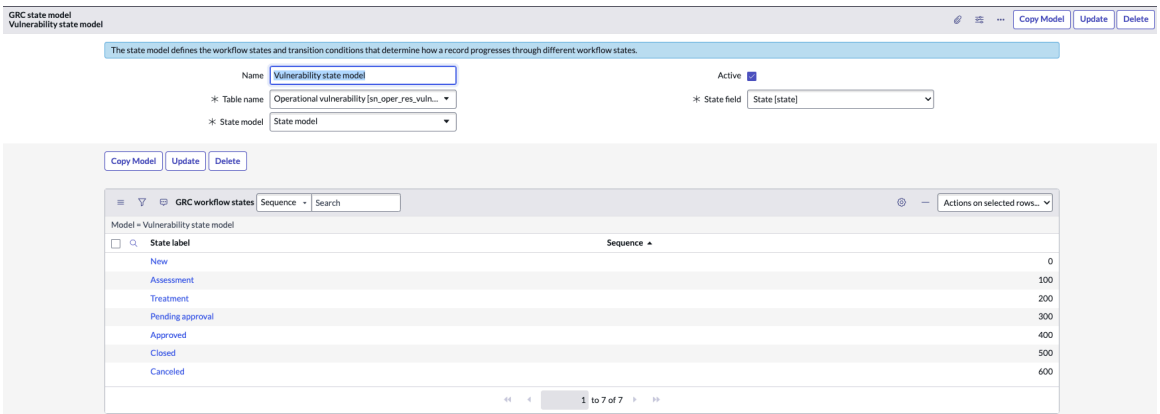


Procedure

1. Navigate to **All** > **Operational Vulnerability** > **State Models**.
2. Update the table name.

   The Action task model is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the State model form, fill in the other fields.

   For more information on the fields, see GRC state model form.

4. Select **Submit**.
5. To copy an existing State model, select it from the state models list and select **Copy Model**.

   You can copy an existing Vulnerability state model as shown in the following example.

6. To update an existing State model, select it from the list and select **Update**.
7. To delete an existing State model, select it from the list and select **Delete**.

GRC state model form

On the GRC state model form, fill in the fields.

State model form

Field	Description
Name	Name of the state model. For example, `IT vulnerability`.
Table name	Table that the state model applies to. Available options are: • To configure Vulnerability state model, select **New** and select Operational vulnerability [sn_oper_res_vulnerability] as the table name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State model form (continued)

Field	Description
	• To configure Action task model, select **New** and select Action task [sn_grc_case_mgmt_case_task] as the table name.
State model	Fields that contain the state model value in the table that this state model applies to.
Active	Option to indicate that the state model is active or inactive.
State field	Fields that contain the state value in the table that this state model applies to. This field is automatically set to **State [state]**.

Define the state transitions model

Define the model state transitions and conditions to control how a vulnerability traverses through the different workflow states.

Before you begin

Role required: sn_oper_res.admin

About this task

The workflow states set up within the state model are shown on the stepper component overview page. Refer to the following setup to configure the stepper component:

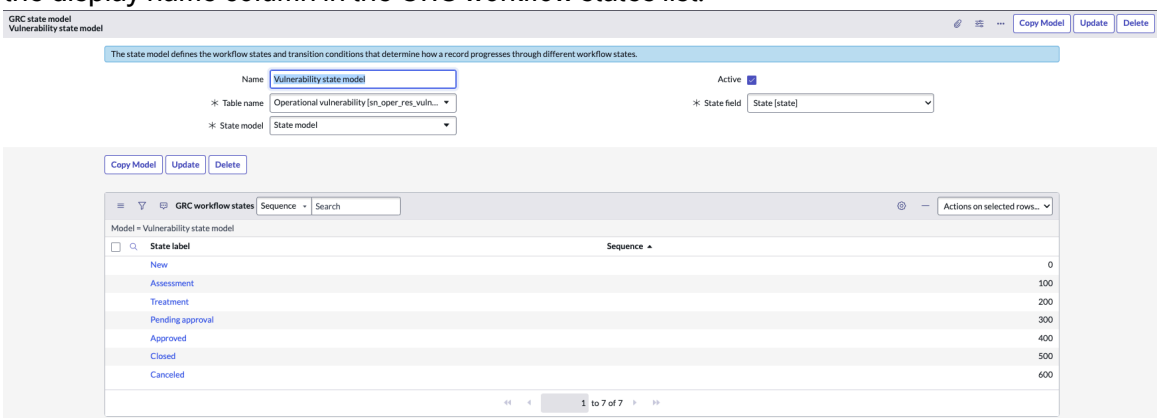
1. Display type: Specify whether the state should appear as **As Node** or **As sub-level**.
2. Stepper label: This label is displayed on the stepper component for each state.
3. Parent node: If the display type for the state is set to **As sub-level**, then define the state that will act as the parent node for this sub-level.

Procedure

1. Navigate to **All** > **Operational Vulnerability** > **State Models**.
2. To add a new workflow state, select **New** in the State label column.
3. On the form, fill in the fields.

Workflow state form

Field	Description
State	Name of the workflow state. Choices is: **New**
Model	State model that uses this workflow state. This field is automatically set to the state model name.
Display type	Display type of the workflow state. Choices are the following:



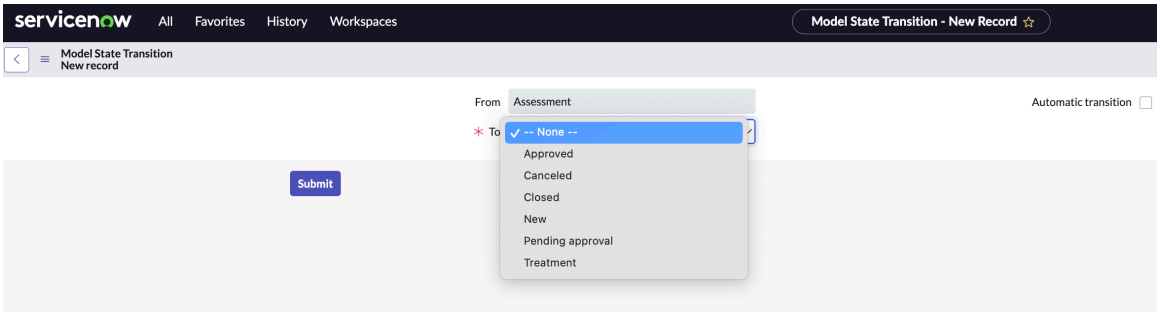
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **As node**: Display as a parent state. ○ **As sub-level**: Display as a sub-state of the parent state.
Stepper label	Label to be displayed on the stepper component for the state. This field is automatically set to the state.
Is optional	Option to select the state as optional. This field appears only when **As node** is selected from the **Display type** field.

4. Select **Update**.

   The example shows the Assessment state. The Model State Transitions and State Model Attributes related lists are displayed.

5. To update the model state transition from the Model State Transitions related list, select it from the display name column in the GRC workflow states list.



6. To add the model state transition, select **New** on the Model State Transitions context menu.

   The Model State Transitions context menu is shown in the example.

   The Model State Transition New record is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the Model State Transition record form, fill in the fields.

Model State Transition record form

Field	Description
From	Name of the state. This field is automatically set to **State [state]**.
To	State that you want to move to from the selected state
Automatic transition	Option to enable the automatic transition of the workflow state.

8. Select **Submit**.

   The newly added Model State Transition is displayed in Model State Transitions related list.

Set up the Vulnerability Assessment Template

Create the Vulnerability Assessment Template by defining the assessment parameters for Operational vulnerability. The assessment template is based on the Metric type assessment. It helps you to define important assessment details such as the assessment duration, associated tables, filter conditions, and so on.

Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Operational Vulnerability** > **Vulnerability Assessment Template**.
2. To create the Vulnerability Assessment (Assessment Metric Type) template, select **New**.
3. On the Assessment Metric Type record form, fill in the fields.

   For more information on the fields, see Assessment metric type form.
4. Use the Smart Assessment template that has been added to the vulnerability type.
5. Select **Submit**.
6. To copy an existing assessment template, select it from the list and select **Copy**.
7. To update an existing assessment template, select it from the list and select **Update**.
8. To delete an existing assessment template, select it from the list and select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment metric type form

Use the Assessment Metric Type form to create an assessment questionnaire template instead of using the default template for Operational vulnerability.

Assessment metric type form

For a description of the fields, see the following table:

Assessment metric type form

Field	Description
Name	Name of the assessment template.
Assessment duration	Length of time allowed for completing the assessment from the time the assessment is generated.
Table	Table this assessment template applies to.
State	Status of the assessment. This field is automatically set to **Draft**. After creating the assessment template, ensure that you publish it and the state is set to **Published**. Or else, you cannot generate the instance.
Enforce condition	Option to indicate that the Enforce condition is active or inactive.
Roles	Roles that have read access to the template.
Scale factor	Scale value for all assessment results.
Condition	Filter conditions for the assessment template.
Description	Purpose of the assessment template and the reason for its creation.
Related lists	
Metric categories	All metric categories for this assessment. For more information on the Metric category form, see Metric Category form.
Assessable records	All assessable records associated to the metric category. For more information on the Assessable records, see Assessable records.

Set up the Document Template

Set up the Document Template (HTML Template) that is used for generating the PDF of the Operational vulnerability record.

Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Operational Vulnerability** > **Document Templates**.
2. To create the document template, select **New**.
3. On the HTML Template record form, fill in the fields.

   For more information on the fields, see HTML Template form.
4. Select **Submit**.
5. To insert date variables in the PDF, select **Insert Date**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

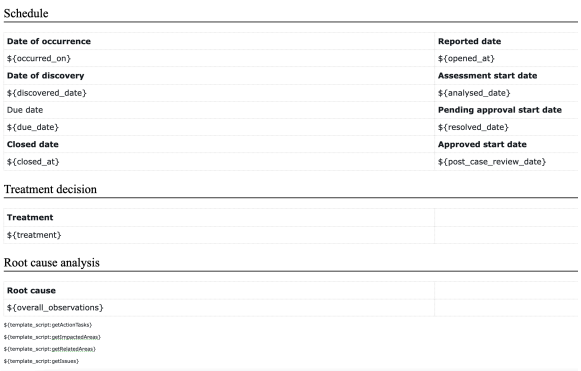
You can use the button multiple times to add different types of dates based on the variables you choose.

6. To insert the table of contents in the PDF, select **Insert Table of Contents**.
7. To add blocks for advanced search, select **Add Blocks**.

Option	Description
To add an existing document block to the template	In Search blocks, type in the name of an ex isting document block, select the document block, and select **Insert**.
To add a new document block to the tem plate	Select **Create New Block**.

8. To publish the template, select **Publish**.
   Ensure that the template is published so that the PDF is generated with the right attributes.
9. To copy an existing assessment template, select it from the list and select **Copy**.
10. To update an existing assessment template, select it from the list and select **Preview**.
11. To update an existing assessment template, select it from the list and select **Update**.

HTML Template form



On the HTML Template form, fill in the fields.

HTML Template form

Field	Description
Name	Name of the document template.
Table	Table associated with the type of template. The table determines the available variables that can be used. **Note:** Tables appear based on the application scope that is selected.
Category	Document category in which the template is added.
Application	Application that you are working in. This field is automatically set to **Global**.
State	State of the record. This field is automatically set to **Draft**.
Template date format	Format in which you want the date to appear when the user previews the document, generates the attachment, or initiates document tasks for participants. Available options are: • **MM-dd-yyyy** • **MM/dd/yyyy** • **dd/MM/yyyy** • **dd-MM-yyyy**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML Template form (continued)

Field	Description
	• **dd.MM.yyyy** • **yyyy-MM-dd**
User criteria	Audience criteria for this document. For example, you can create a letter intended for only US employees.
Acknowledgement text	Acknowledgement text to be used in the document.
Table of contents	Table of contents in the template.
Page number	Page number in the template.
Body	Body text in the template. To insert variables, place your cursor in the desired location and select the variable. Available variables are listed under Fields. Use the formatting tools in the Body to apply formatting options, such as bold, italic, underline, font styling. The body is a place holder for HTML text and tokenized variables. For example, you can select **Fullscreen** to view how the PDF layout is formatted. In the Root cause analysis (Overall observations) section of the PDF, you can include the following related lists information:  Schedule **Date of occurrence** / **Reported date** ${occurred_on} / ${opened_at} **Date of discovery** / **Assessment start date** ${discovered_date} / ${analysed_date} Due date / **Pending approval start date** ${due_date} / ${resolved_date} **Closed date** / **Approved start date** ${closed_at} / ${post_case_review_date} Treatment decision **Treatment** ${treatment} Root cause analysis **Root cause** ${overall_observations} ${template_script:getActionTasks} ${template_script:getImpactedAreas} ${template_script:getRelatedAreas} ${template_script:getIssues} • Action tasks • Impacted areas • Related areas • Issues
Select variables	List of variables that can be used in the body of the template. Variables pull information from the selected table to customize the template.
Template language	Language used for both full template translation and translation of fillable fields during attachment preview and generation.
Signing type	Option to specify the application that is used for signing the document. This field is automatically set to **ServiceNow Sign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HTML Template form (continued)

Field	Description
Header	
Header image	Image to be displayed in the header. You can add your company logo using this feature.
Header image height	Height of the image in the header.
Header image position	Position where you want the header image to appear: left, right, or center.
Footer	
Footer image	Image to be displayed in the footer.
Footer image height	Height of the image in the footer.
Footer image position	Position where you want the footer image to appear: left, right, or center.
Footer text	Text to be displayed in the footer. For example, you can add proprietary and confidential statements.
Footer text position	Position where you want the footer image to appear: left, right, or center.
Vertical alignment	Vertical alignment of the footer text with the footer image.
Page	
Page size	Size of the page that can be selected from the list such as Letter, A4, or Legal.
Top/Bottom margin	Space from the top of the page until the starting of the HTML content or space from the bottom of the page until the ending of the HTML content.
Left/Right margin	Space from the left of the page until the starting of the HTML content or space from the right of the page until the ending of HTML content.

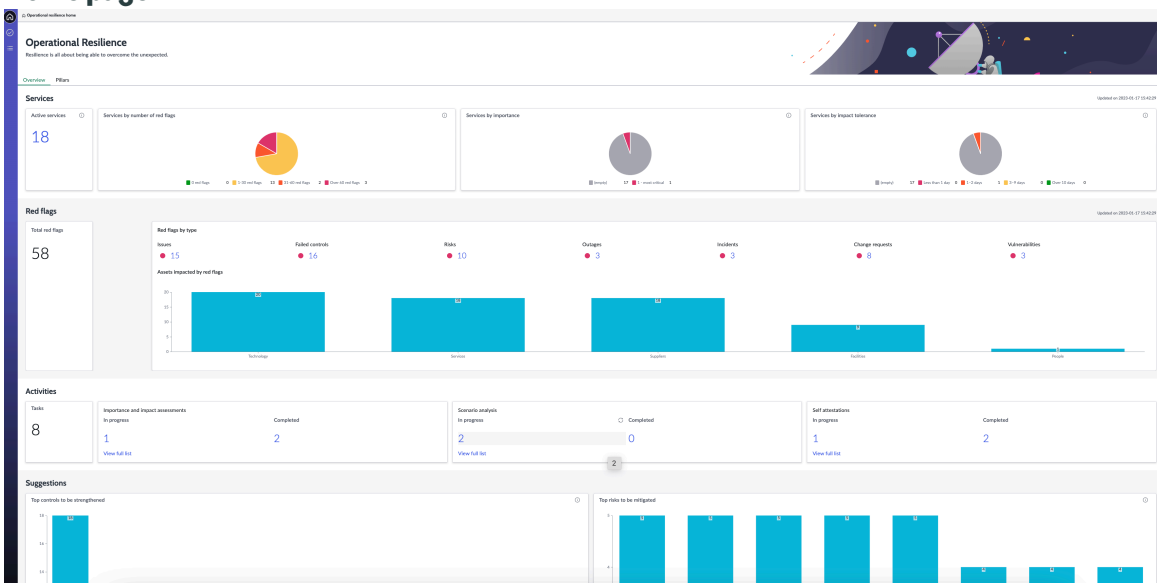
Managing Operational Resilience

Starting with GRC version 16.x.x, a new workspace has been introduced for the GRC: Operational Resilience application. You can use Operational Resilience Workspace for managing your resilience tasks and monitoring the resilience metrics from a single dashboard.

Overview of Operational Resilience Workspace

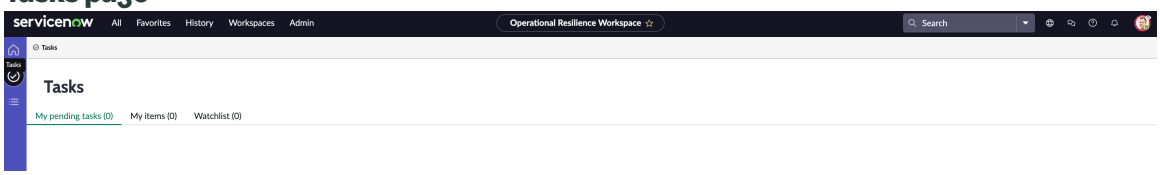
Operational Resilience Workspace provides a single-pane view for an improved User Experience (UX) and a simplified user journey. The highlights of Operational Resilience Workspace are as follows:

- Configure the resilience tasks by using the interactive forms.
- Visualize the resilience metrics on the dashboard.
- Track the risks, controls, and issues from the GRC applications on the related tabs in the Service form.
- Remediate the incidents, outages, vulnerabilities, and change requests for a business service.



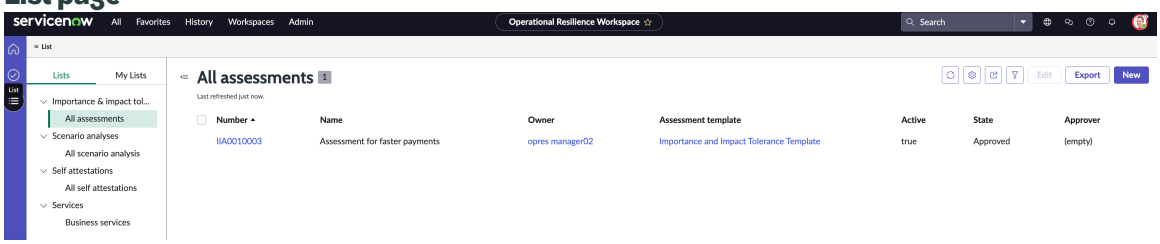
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the data visualization components of the resilience metrics on the following pages:



- Home page: The Home page displays the status of the services and the pillars on the dashboard.
- Tasks page: The Tasks page displays your individual tasks and your team's tasks on the dashboard.
- List page: The List page displays the configurable resilience tasks, such as the importance and impact tolerance assessment or a scenario analysis in the list format.

The Home page, Tasks page, and List page are displayed in the following examples.



Home page

Tasks page

List page

Roles required to access Operational Resilience Workspace

You can access Operational Resilience Workspace with the following user roles:

- Operational Resilience administrator [sn_oper_res.admin]
- Operational Resilience manager [sn_oper_res.manager]
- Operational Resilience user [sn_oper_res.user]

Note:
For information on the administrative tasks, see Completing general administrative tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configurable features in Operational Resilience Workspace

You can configure the following Operational Resilience features in Operational Resilience Workspace:

- Importance and impact tolerance assessments
- Scenario analyses
- Self-attestations
- Business services
- Operational vulnerability

Gathering data aligned with the CSDM setup

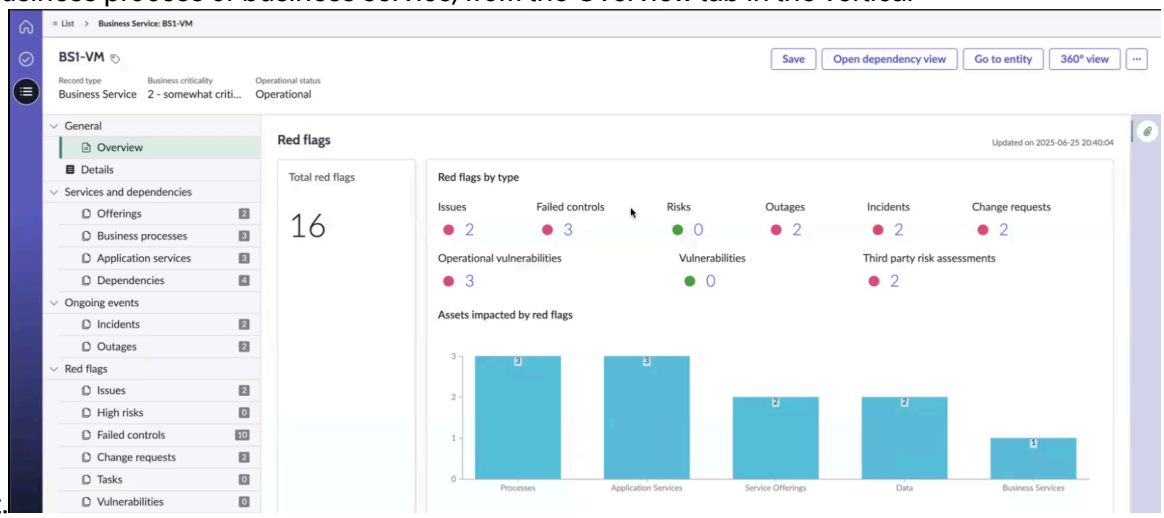
Beginning with Release 20.1.x, the Operational Resilience application supports the latest Common Service Data Model (CSDM). This section details the steps for setting up services, business services, service offerings, and business processes in Operational Resilience and gathering data aligned with the latest CSDM setup.

Using the flexible data model

Starting with Operational Resilience, Release 21.0.x, the flexible data model enhances operational resilience metrics by improving data visualization and the flow of dependent services. It also supports multiple dashboards with insights into red flags, business service importance, and impact tolerance.

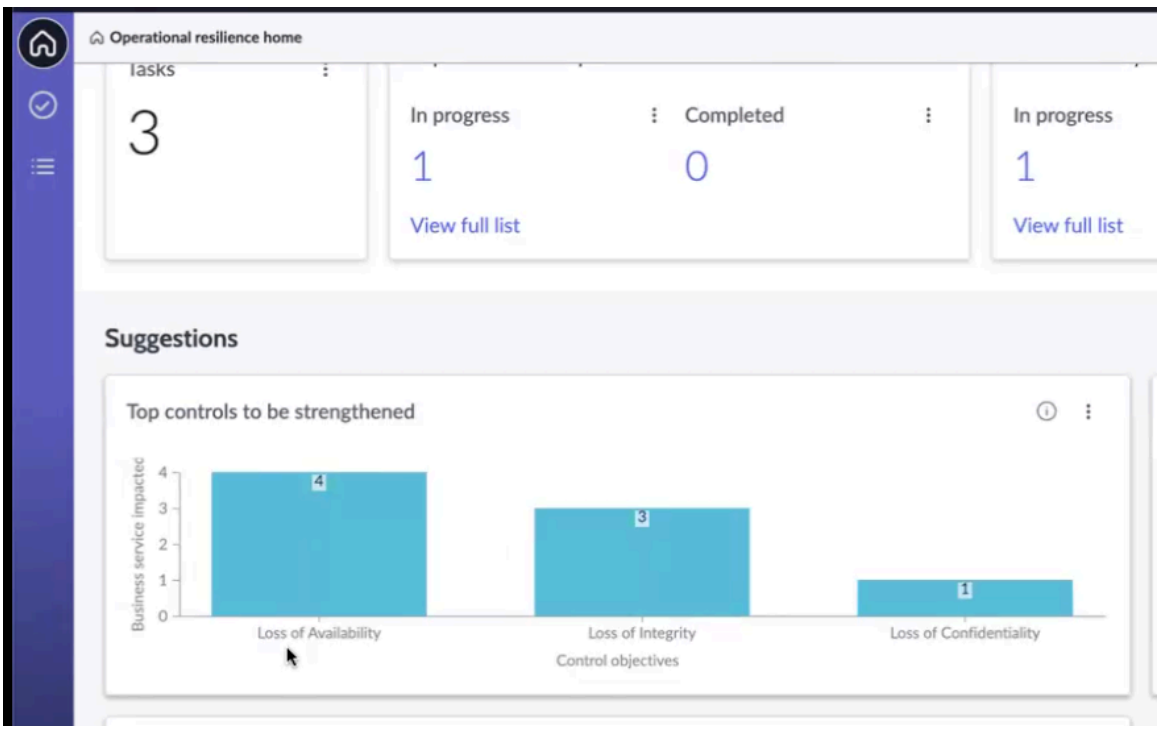
Starting with Operational Resilience, Release 20.1.x, the Main node configurations, supported by the Data Relationships Framework, were introduced with Operational Resilience to define dependency roll-up chains. The Main node configurations, with the source being the OpRes CMDB, are shipped out-of-the-box. For information on the Main node configurations, creating a new Main node configuration, or updating an existing Main node configuration, see Main node configurations: A component of the Data Relationships Framework.

In the previous data model, the CSDM objects [sn_oper_res_profile] table stored the entire dependency chain, including all possible combinations, making data retrieval cumbersome and maintenance challenging. This approach has been deprecated in favor of a more efficient model.



Key features of the flexible data model

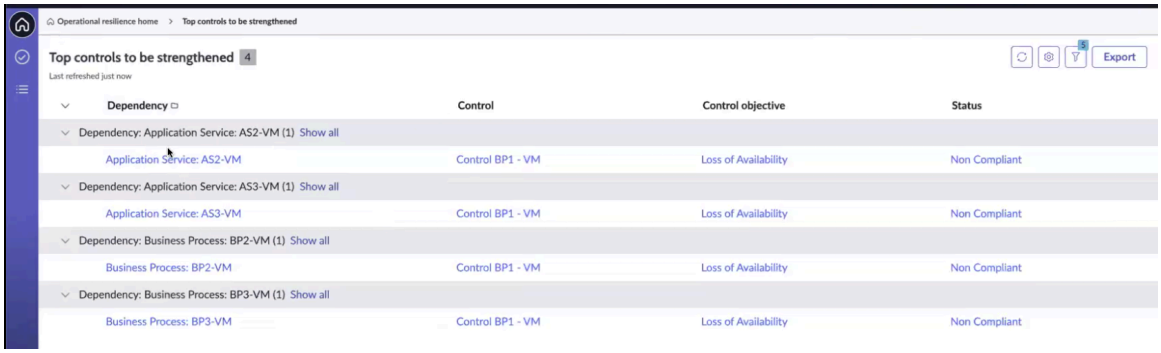
The flexible data model offers several key features that enhance operational resilience metrics.



- Enhanced data visualization: The Services, Business services, Offerings, Business processes, and Application services modules now feature a vertical layout, replacing traditional horizontal tabs and enhancing navigation within the Operational Resilience Workspace. You can view the entire resilience metrics for an object, such

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

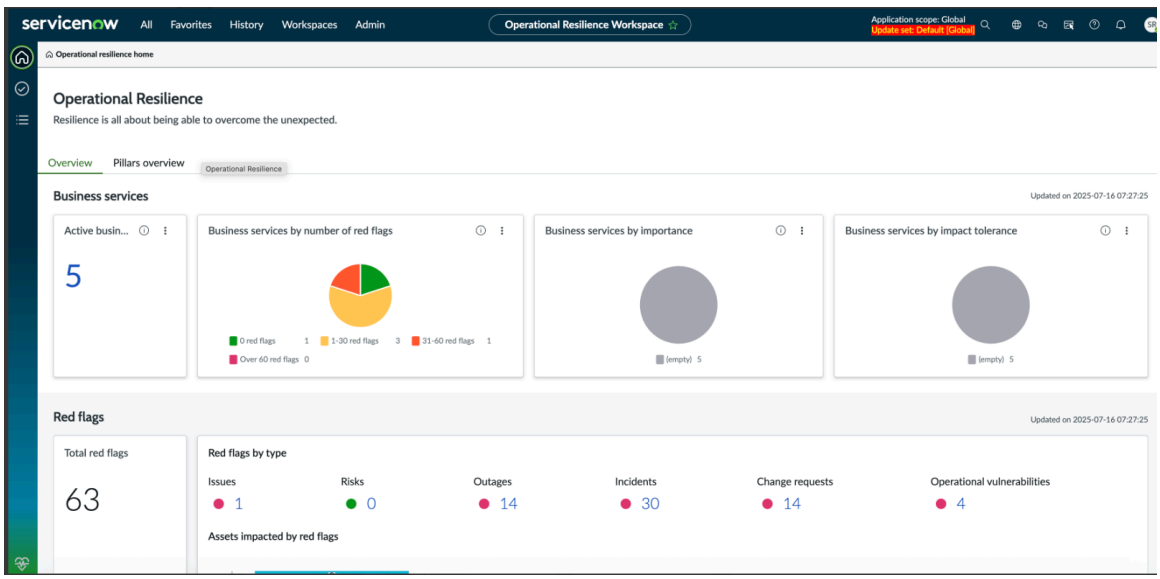
as a business process or business service, from the Overview tab in the vertical layout.



You can then view the downstream data and various dashboards based on the selected top class. The following example shows the top controls to be strengthened for the business service.

Selecting the graph shows detailed information on the dependency records, related controls, control objectives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Streamlined navigation: You can directly access related lists and metrics for a specific business service, such as its service offerings, business processes, application services, dependencies, incidents, and metrics from the vertical layout.

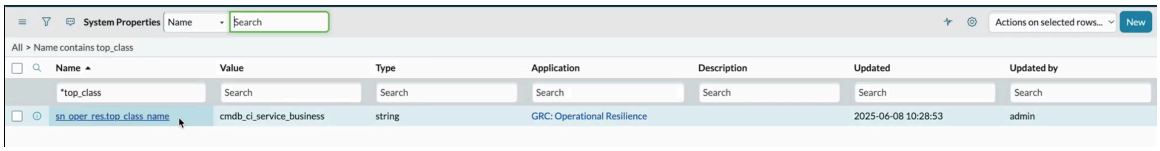
Technical implementation

Starting with Operational Resilience, Release 21.0.x, the data model for operational resilience configurations has been optimized. Now, each node in a hierarchical chain, such as a business service to offering to processes, is stored separately in the [sn_oper_res_profile] CSDM objects table along with its class and parent nodes. This means that only relevant objects (for example, 500 out of 1,000 entities) that are part of main node configurations are stored, improving data management efficiency.

The flexible data model introduced with Operational Resilience, Release 21.0.x provides a foundation for the dashboards and tracks the flow of dependent services. The data, including red flags by type, such as failed controls, incidents, and outages, and business service metrics such as number of flags, importance, and impact tolerance, is updated in the dashboard through changes to the flexible data model.

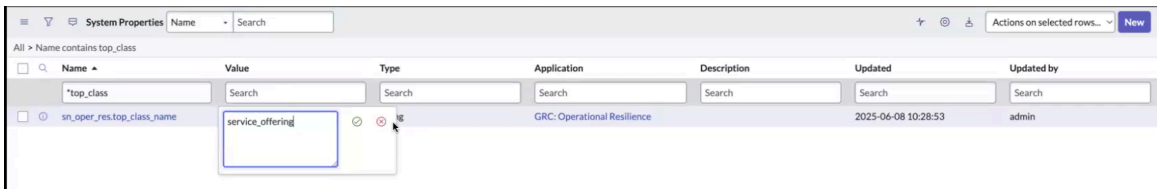
The data shown in the example is for business services such as business service by number of red flags, business service by importance, business service by impact tolerance. You can configure the *sn_oper_res.top_class_name* property to designate any class as the top class.

Configuring the sn_oper_res.top_class_name property



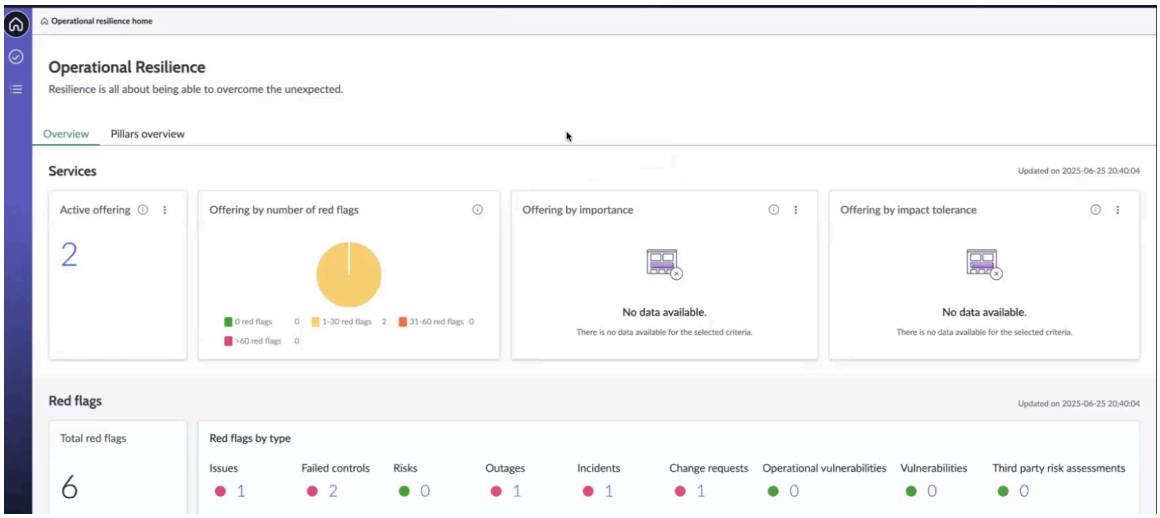
You can configure the *sn_oper_res.top_class_name* property to designate any class as the top class in the dashboard view so that any node, such as business service, business

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



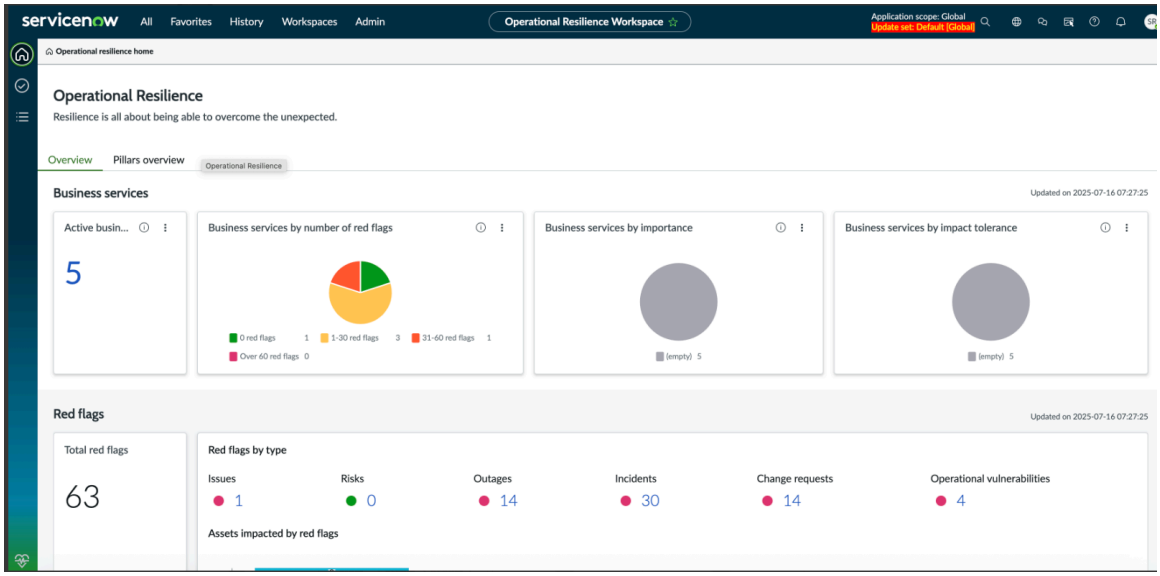
process, or application service, can be the top node. You can then view the downstream data and various dashboards based on the selected top class, such as the number of application services that are under a business service. It enables you to switch between different views, such as business services, service offerings, business processes, or applications, on the dashboard and view relevant data accordingly.

For example, if the data is displayed for a business service, you can change the top class to service offerings, business processes, or application services by configuring the *sn_oper_res.top_class_name* property. You can then change the top class to another object and the system shows data with respect to that specific top class. This property is applicable only for the dashboards and not for the Workspace forms. For more information on the properties, see Configure Operational Resilience properties.

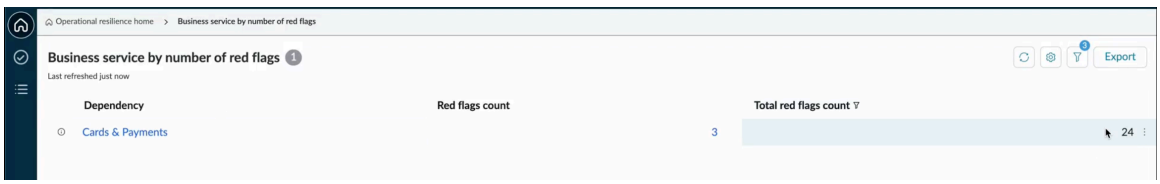


The following example shows that the top class name is set to *cmdb_ci_service_business*.

You can modify the property value to represent a service offering or application, and the dashboard will populate with the corresponding data. The following example demonstrates how to update the top class name to "service offering."



Based on the updated property name, data for service offering is displayed in the Operational Resilience dashboard as shown in the example.

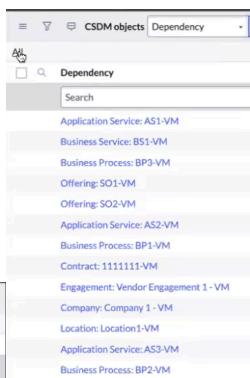


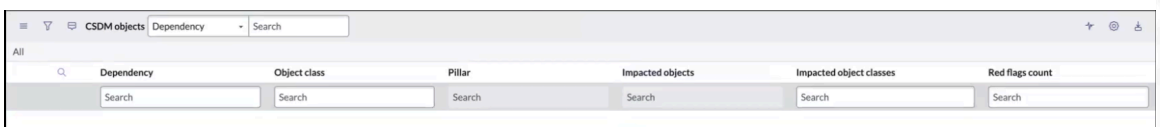
Calculation and roll-up of red flags

When the *Calculate red flags for CSDM and dependencies* scheduled job is executed, the red flags data is populated in the dashboard. The dashboard in the following example displays a range of 1-30 red flags in the "Business service by number of red flags" section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting the card shows a detailed breakdown for the business service. It shows a total of 24 red flags, with 3 specifically attributed to the "Cards and payments" service. The following illustration shows the roll-up functionality, which aggregates the red flags for the entities associated with the selected "Cards and Payments" business service, providing a hierarchical view of the data.



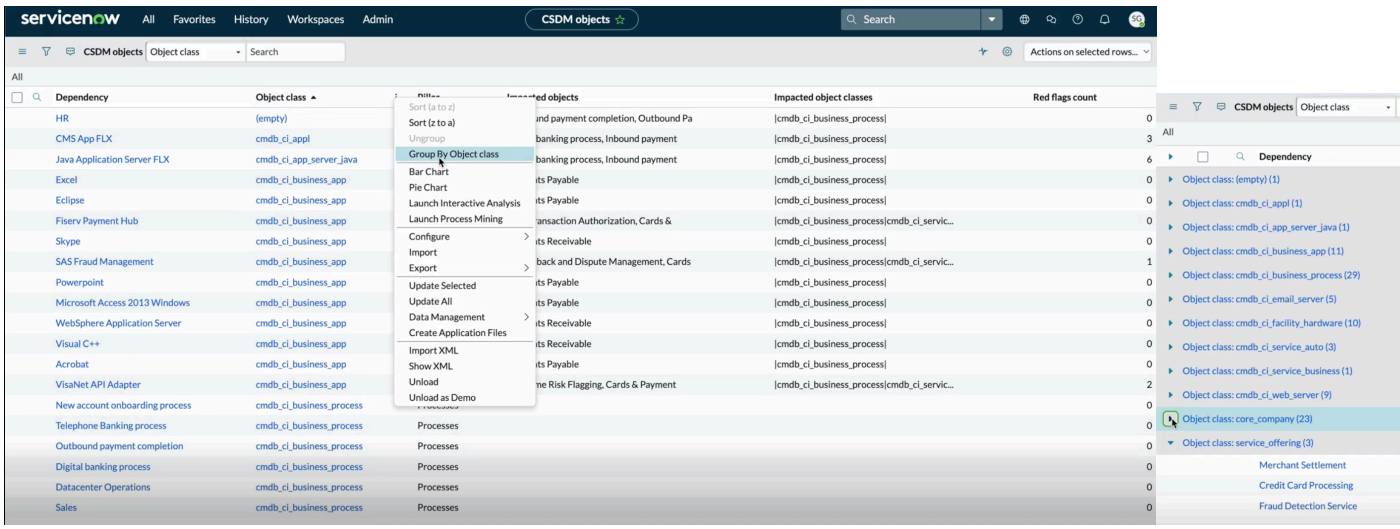


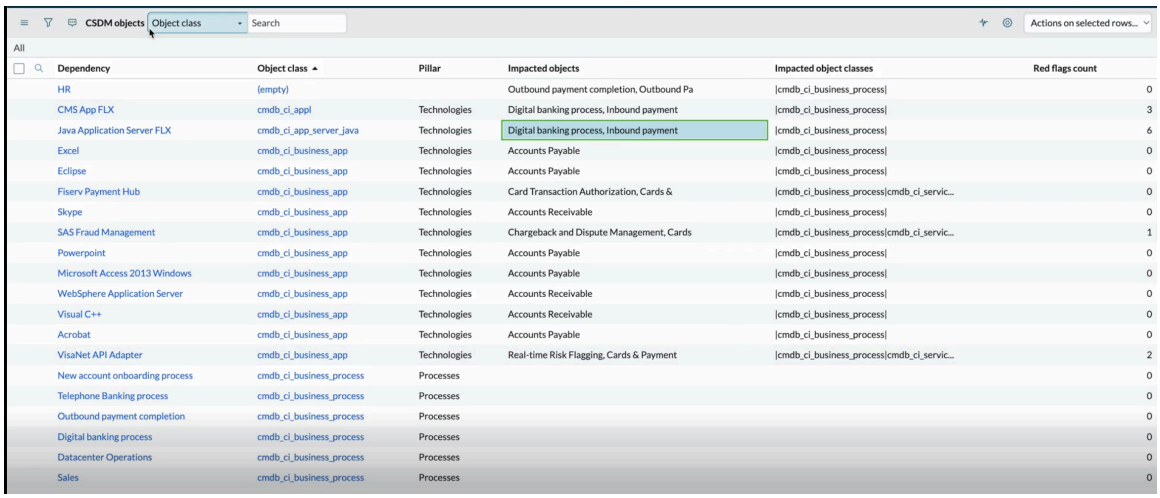
The value "24" shown in the Total red flags count column is the roll-up value of the red flags for all entities under the "Cards and Payments" business service.

CSDM objects table

In the CSDM objects [sn_oper_res_profile.list] table, the following columns are displayed:

- The Impacted objects column displays the parent objects.
- The Impacted objects classes column shows the classes.
- The Red flags count column indicates the number of the red flags that are directly assigned to a node.
- The Total red flags count column displays the total count of the red flags directly assigned to a node and its children as shown in the table.





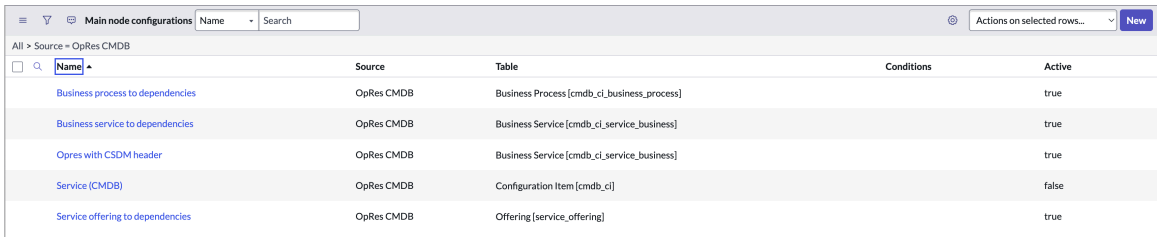
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The object classes displayed in the Object class column in the example provide a clear representation of various entities, including business applications and processes. This data is then fed into the system using fix scripts, ensuring that the information is accurately populated and up-to-date. By using these scripts, the system can effectively display and manage the complex relationships between different object classes.

You can group the objects with respect to their object classes. Then you can the object classes for service offerings, core company, business processes, and so on.

The upstream impacted objects for a specific object class are added to the Impacted objects column. For example, the Java Application Server FLX has upstream impacted objects such as digital banking process and inbound payment, which get added and are shown in the Impacted objects column.

This process starts with the lowest level object and includes the level above it, populating the impacted objects. The data is then directly integrated into the main node configurations.



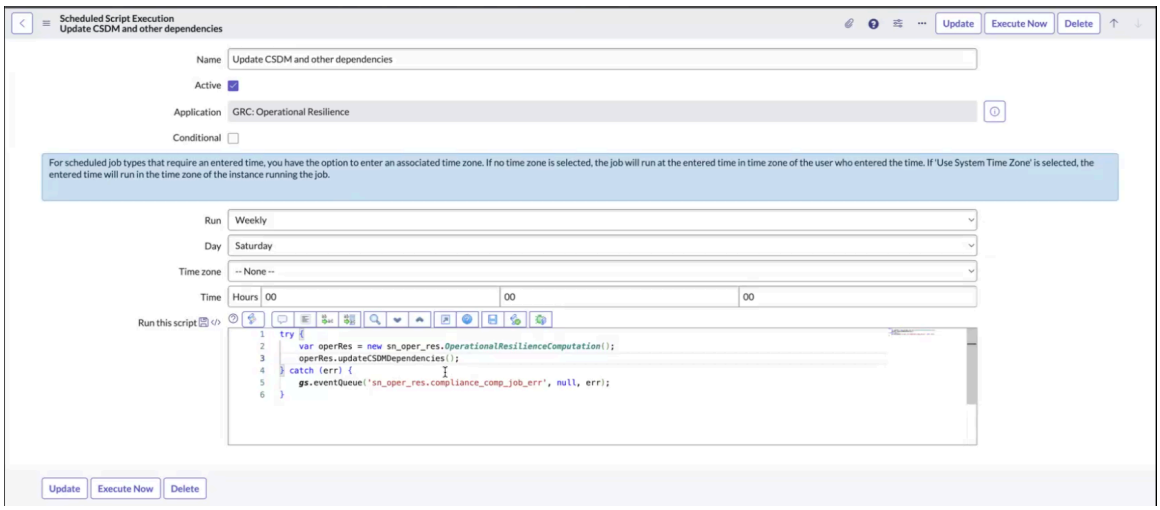
Main node configurations

The Main node configurations provide the data flow of what you want to see. The following Main node configurations, with the source being the OpRes CMDB, are shipped out-of-the-box:

- Business process to dependencies
- Business service to dependencies
- Opres with CSDM header

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service (CMDB)
- Service offering to dependencies

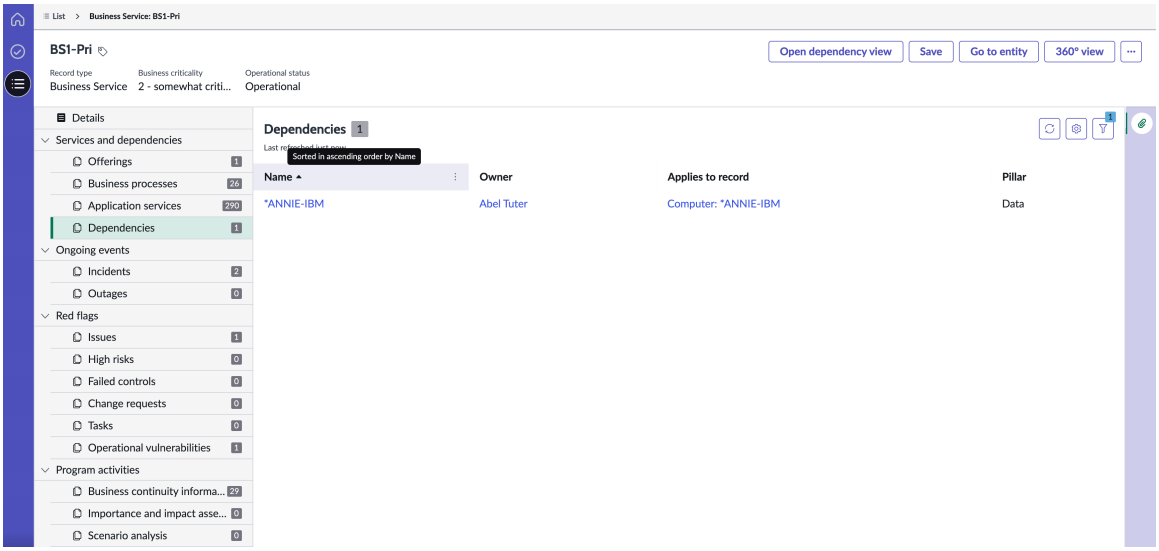


The entire flow that goes from a business service to business process to service offering and then to an application is created in the Main node configurations and then the configurations are mapped to the impacted objects.

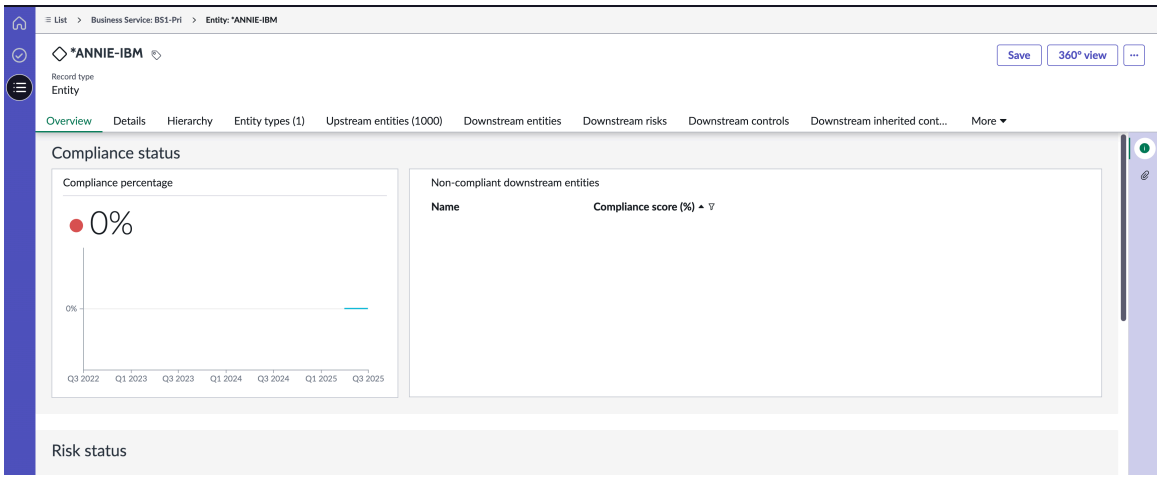
For information on setting up the Main node configurations, see Configure the Main node configurations.

Running the scheduled jobs

Two scheduled jobs, *`Update CSDM and other dependencies`* and *`Calculate red flags for CSDM and dependencies`* run at regular intervals populate data in the CSDM objects [sn_oper_res_profile.list] table and the red flags. For more information, see Execute the scheduled jobs.



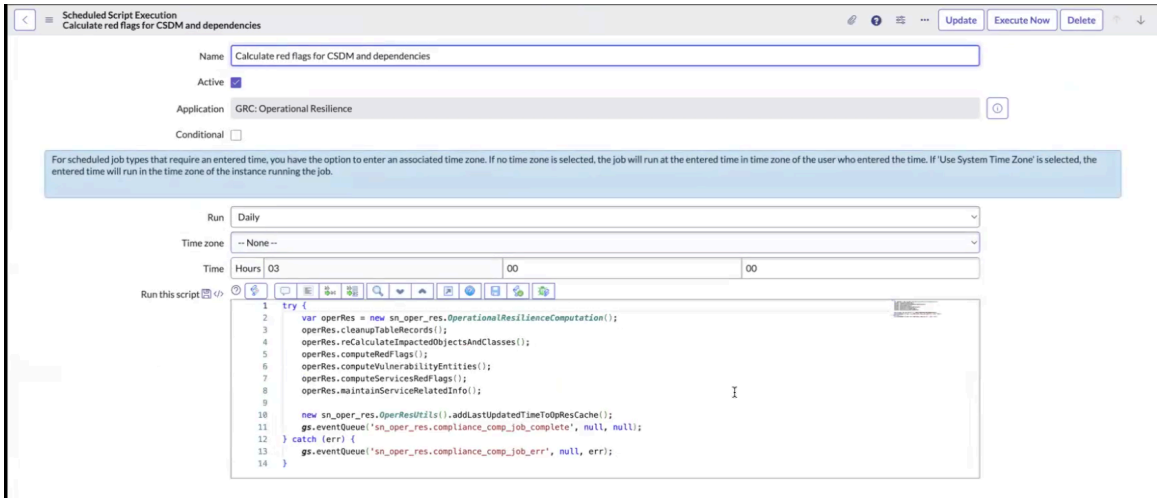
All the Main node configurations are handled in parallel. A separate event is triggered for each Main node configuration, enabling parallel processing. The enhanced configuration eliminates the need for sequential processing, significantly improving efficiency.



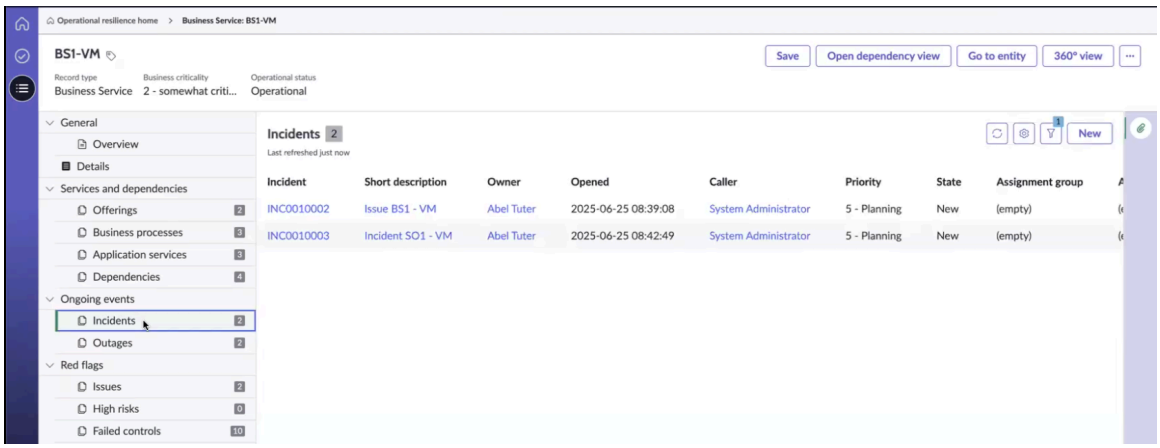
After running the *`Update CSDM and other dependencies`* scheduled job, the data is fetched into the CSDM Objects table. Dependencies are updated for the objects and are shown in the modules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service form

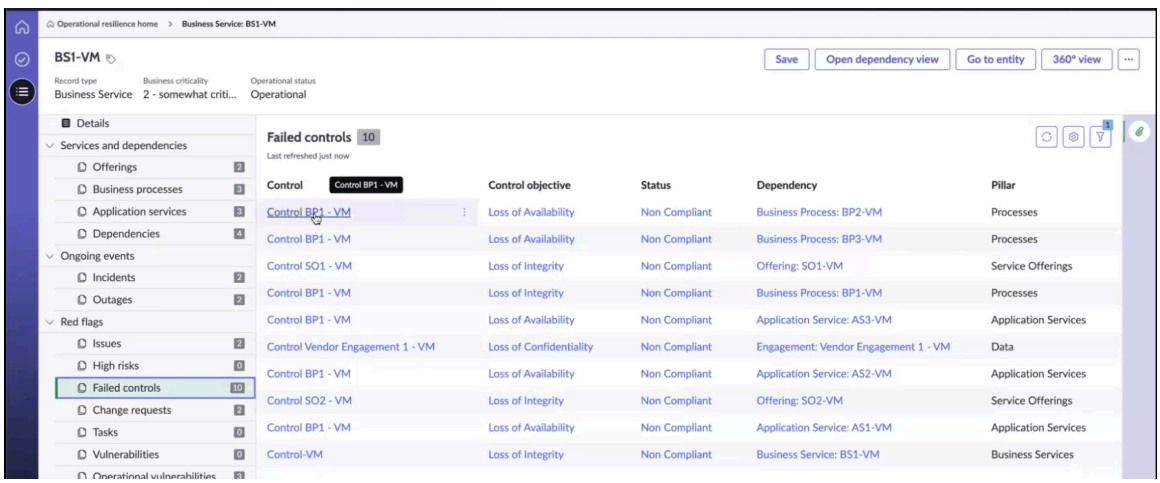


Previously, traversing many-to-many tables to find related records was time-consuming. Now, by storing impacted objects in the table itself, you can directly retrieve related records from a single column, eliminating the need for recursive hierarchy creation, improving efficiency significantly.



Dependencies are fetched from the Entity [sn_grc_profile] (many-to-many) table first. When you run the *`Calculate red flags for CSDM and other dependencies`* scheduled job, the red flags data is fetched and rolled up according to the configured settings.

After the scheduled job is completed, the Main node configurations are no longer required. The dashboard uses the top class property to traverse the red flags staging table and retrieve downstream red flags that match the specified record type, such as business service or service offering, and so on.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows that Incident SO1 - VM is rolled up from SO1.

Failed controls from business processes and service offerings are rolled up and shown in the modules.

Data setup for business services

Operational Resilience managers typically verify that data is set up for services or business services and monitor their resilience metrics on the dashboard. The Service (CMDB) Main node configuration fetches service-related data, while the Opres with CSDM header Main node configuration sets up the business services-related data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

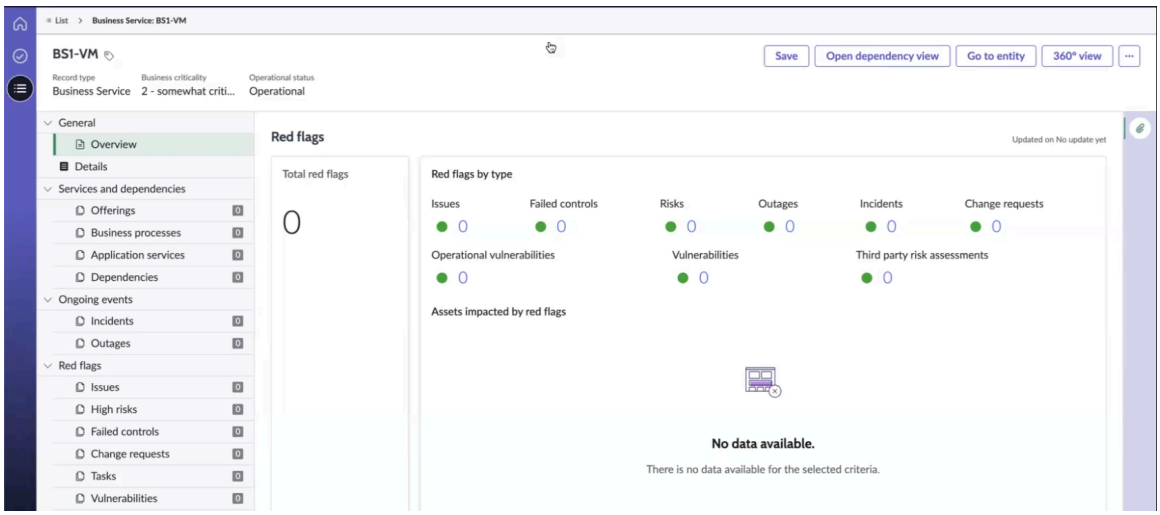
Business services overview on the dashboard

A service performs a business-level function, such as email, IT services, e-commerce, or telephone banking. Existing customers use the Service (CMDB) Main node configuration, while new customers use the OpRes with CSDM header Main node configuration. The Service form or the business services form list risks, issues, control failures, and other areas that require attention.

Note:
Administrators can show or hide the **Services overview** or **Business services overview** tabs based on their organizational needs. For more information, see Show Business services overview tab in Workspace view.

Setup of entity types and pillars

Before proceeding, ensure that entity types and pillars are properly configured; refer to the Set up pillars, entity types, and generate entities for setup instructions.



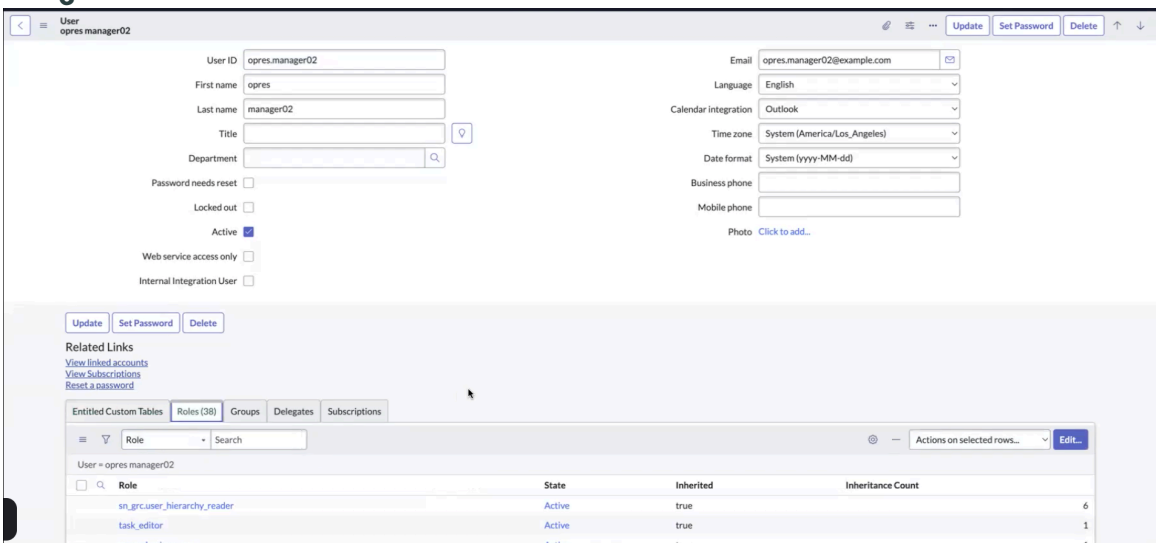
Vertical layout for Service records

Beginning with Operational Resilience, Release 21.0.x, records in the Services, Business services, Offerings, Business processes, and Application services modules feature a vertical layout.

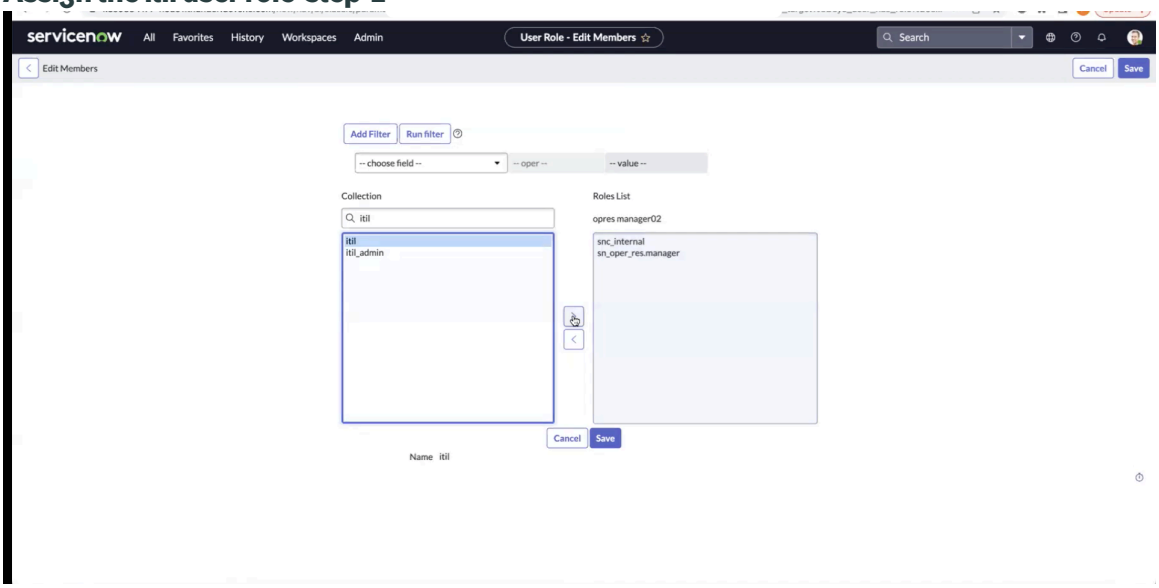
The vertical layout within the Operational Resilience Workspace eliminates the need for horizontal tabs. Instead, it maps the business services, offerings, business processes, and application services to organize related information in a more streamlined manner.

When viewing a specific business service, such as "Cards and Payments," all dependent lists are accessible through this vertical menu. This includes service offerings, business processes, application services, dependencies, incidents, and relevant metrics. The new layout allows users to directly access related information, streamlining navigation and improving the overall user experience.

This layout displays detailed information, including service dependencies, events, red flags data, and related issues, making it easier to read and understand.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Assigning the itil user role to the Operational Resilience administrators or managers

To configure child services or processes for a service, assign the itil user role to Operational Resilience administrators or managers in the following steps.

Assign the itil user role

Assign the itil user role-step-2

Note:

To add or remove services and processes in the Operational Resilience Workspace, you must have the sn_oper_res.manager and itil role or the sn_oper_res.admin and itil roles. In the CMDB, granting the itil role allows users to add or remove services and processes from the backend. However, the Operational Resilience Workspace application prevents users with the sn_oper_res.user role from making these changes in the Operational Resilience Workspace.

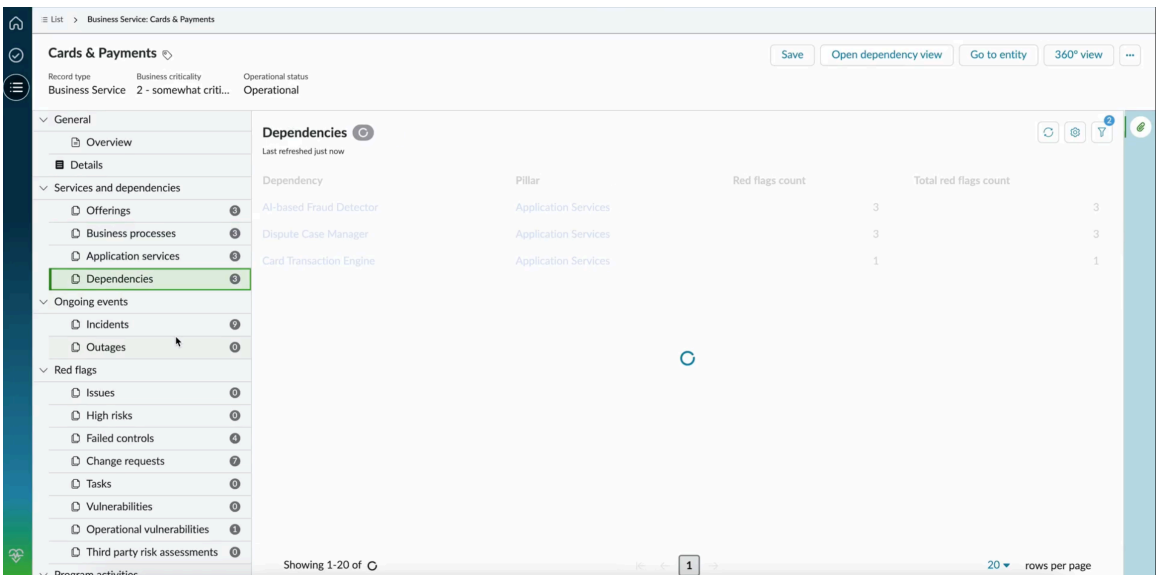
Adding a service to reporting

You can add a service to Operational Resilience reporting by selecting the **Add to OpRes reporting** UI action as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Instead of adding services directly to Operational Resilience reporting, set up the entity filters for the desired services. For instructions on setting up the entity filters, see Configure entity types and entity filters.

Add a service to OpRes reporting



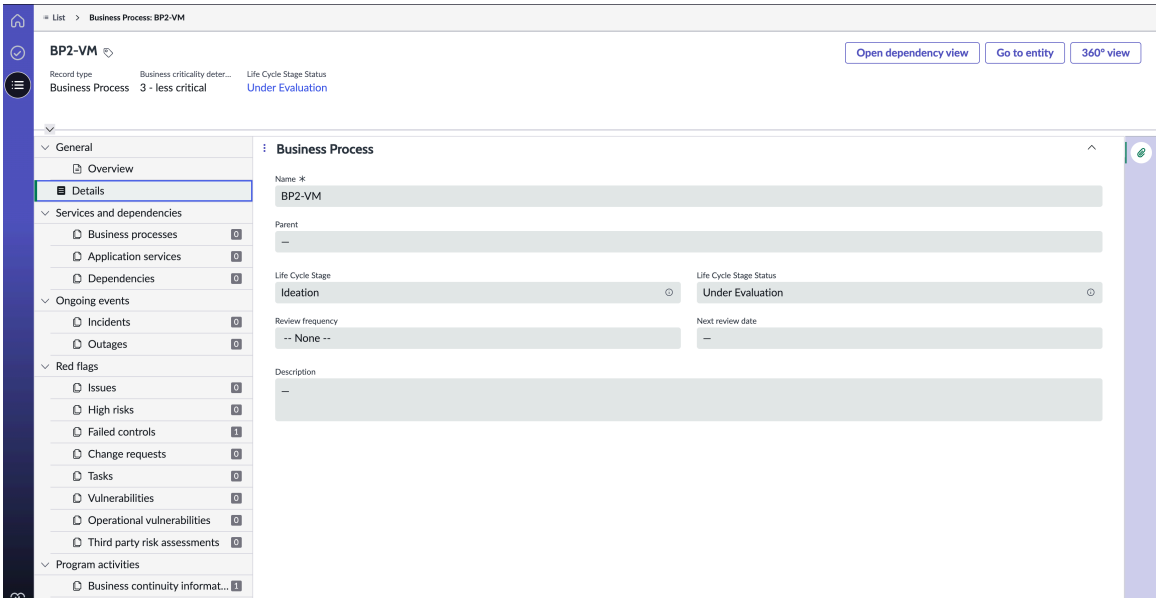
Note:
After adding a service to Operational Resilience reporting in the Operational Resilience Workspace, the **Add to OpRes reporting** option is no longer displayed in the UI for that service.

After adding a service to Operational Resilience reporting, you can view the **Add** or **New** options in the Service form. Use these options to configure the relationship between the service and its entities. To remove an associated service or process, select the service or process and then choose **Remove**.

Overview and Details tabs in the Service form

On the **Overview** tab in the Service form, you can view the resilience metrics for a service as shown in the following example.

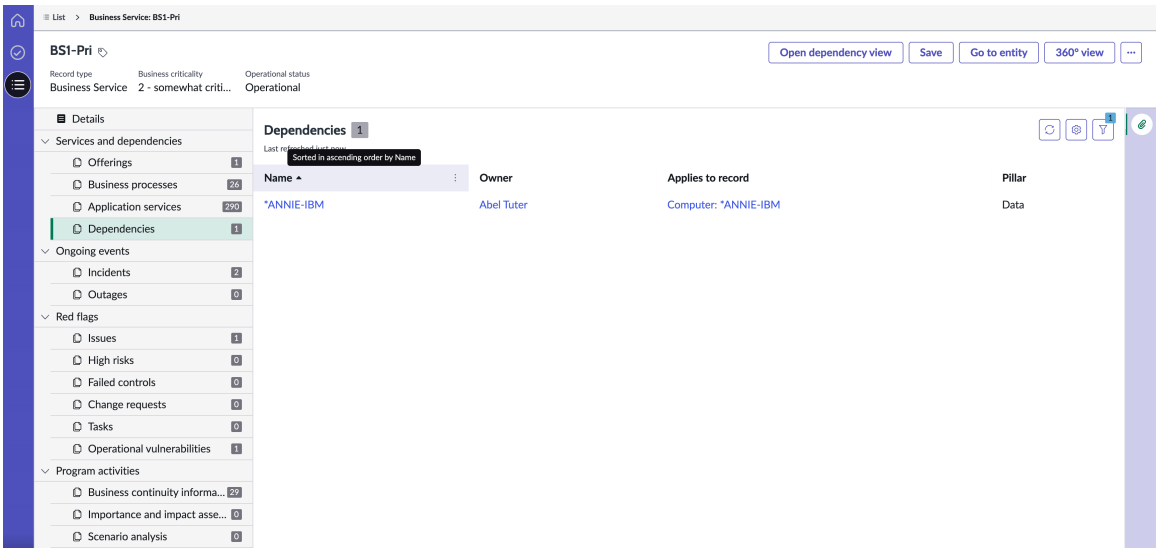
Resilience metrics on the Overview tab



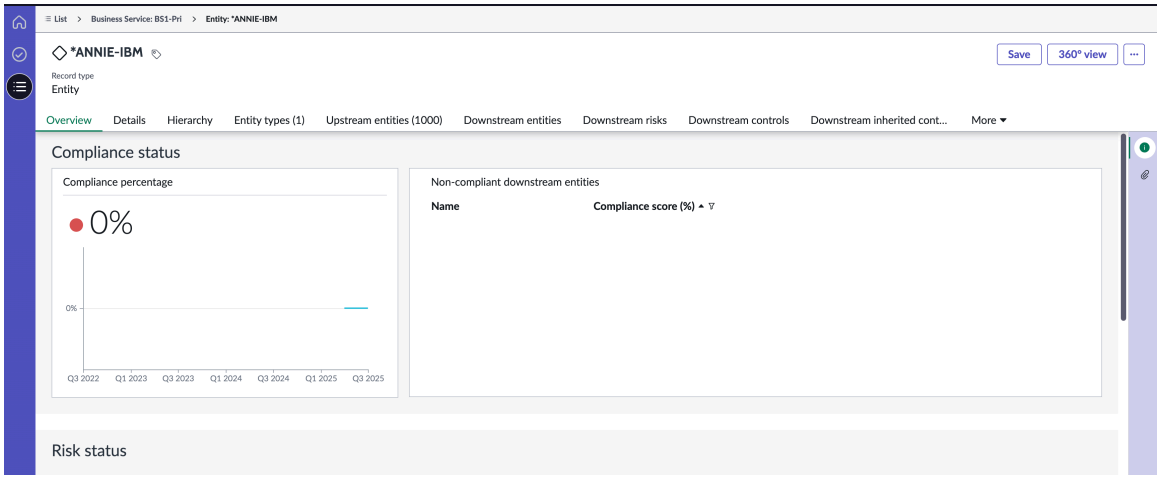
The Red flags section displays the total number of red flags, red flags by type, and details of the assets that are impacted by the red flags.

On the **Details** tab in the Service form, you can view the key attributes of a service as shown in the following example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Details tab



Child services, processes, and dependencies of a service

When you add a service to Operational Resilience reporting, you can view and configure its child services, processes, and dependencies, as shown in the following examples.

Service form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reporting data for an object without a business service as the parent entity

When you have a business service or service as the parent entity, any red flags or dependencies roll up to that business service or service. Even if an object like a service offering (SO) or business process (BP) does not have a business service or service as the parent entity, running the scheduled job still fetches its dependencies and integrates them with the red flags.

Other related lists in the Service form

Depending on the integrations and installed applications, the following related lists are displayed in the Service form.

Other related tabs that are displayed in the Service form

Tab	Description	New action	Add action	Remove action
Child services	List of the child services for a service. To associate an existing child service with a service, select **Add**. To create a child service for the current service, select **New**. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

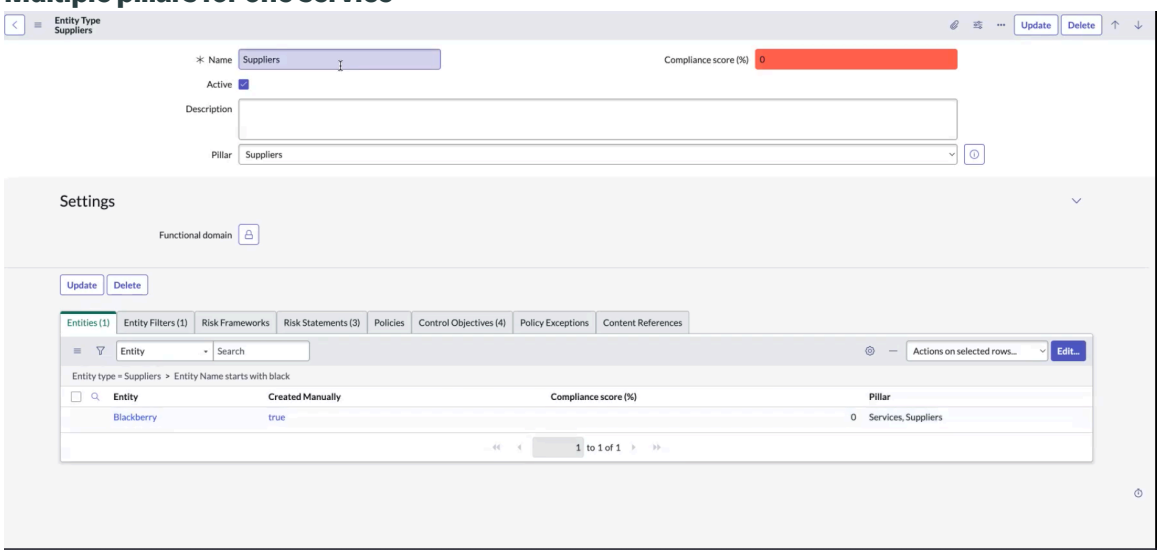
Service added as an entity of Services (OR) type

When you add a service to the Operational Resilience reporting, the service is added as an entity of the Services (OR) type, as shown in the following example.

Service added as an entity of Services (OR) type

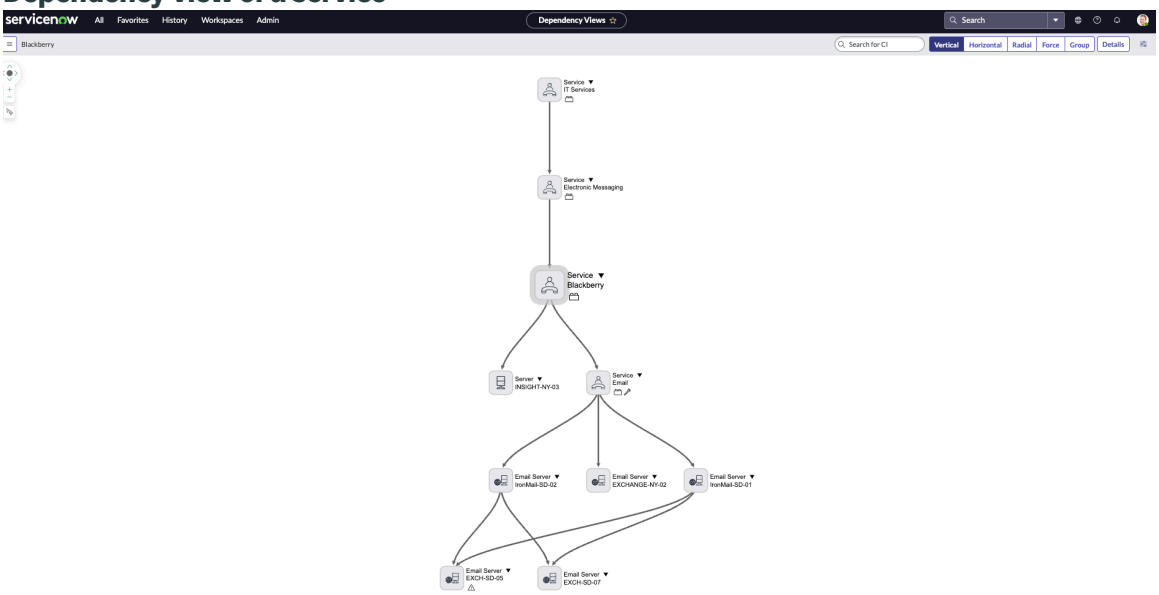


All services in Operational Resilience belong to the Services pillar. As shown in the example, the Pillar column for the entities displays the Services pillar.

Note:
You can only add the entities that are part of the [cmdb_ci_service] table to the Services (OR) entity type.

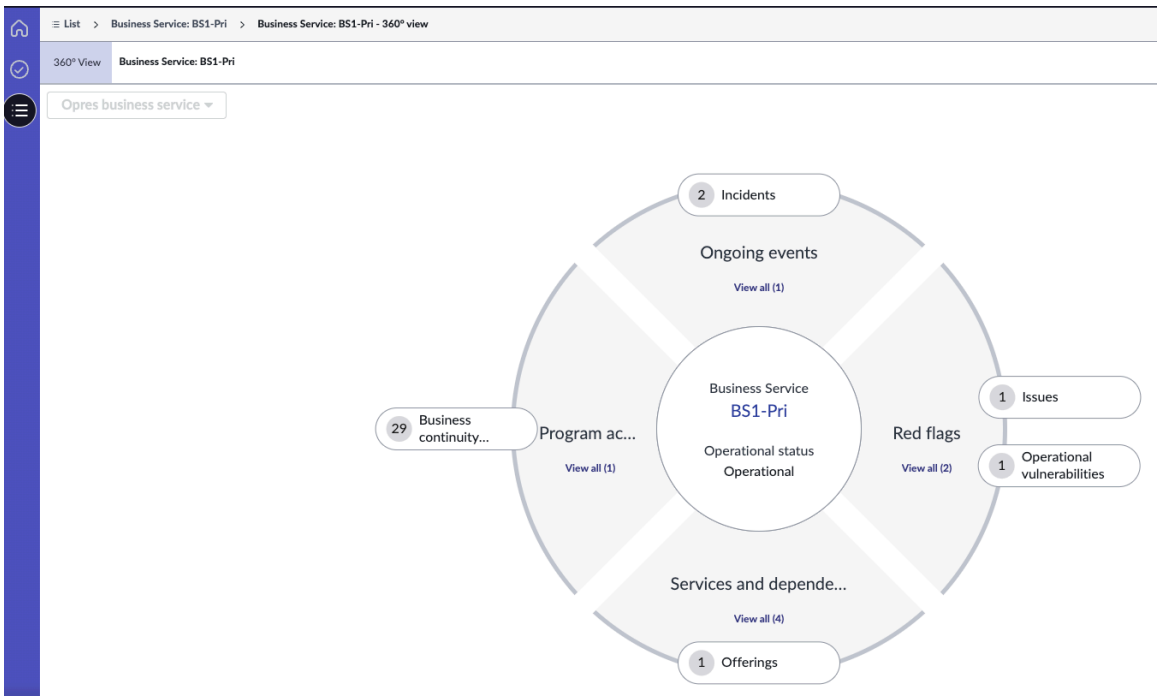
Similarly, a service (as an entity) can belong to multiple pillars. The following example shows a service that belongs to two pillars, such as the Services and Suppliers pillars.

Multiple pillars for one service



Open dependency view and 360-degree view for a service

In the Service form, you can select the **Open dependency view** option to display the infrastructure relationship for a service. The dependency view of a service displays its



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

relationship with the parent services, child services, and processes as shown in the following example.

Dependency view of a service

On the **360° view** tab, the Operational Resilience managers can monitor the 360-degree view of a service and measure its performance.

If you have the Operational Resilience manager role, in the 360-degree view for a service, you can visualize the following entities:

- Parent and child services
- Dependencies that are related to a pillar, such as the Process, Technology, People, Supplier, and Facility pillars in your organization
- Operational Resilience metrics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a service to Operational Resilience reporting

Manage services, business services, service offerings, business processes, and application services from the CSDM modules in the Operational Resilience Workspace.

Before you begin

Role required: sn_oper_res.manager with the itil user role, sn_oper_res.admin with the itil user role

About this task

Beginning with Operational Resilience, Release 21.0.x, records in the Services, Business services, Offerings, Business processes, and Application services modules feature a vertical layout.

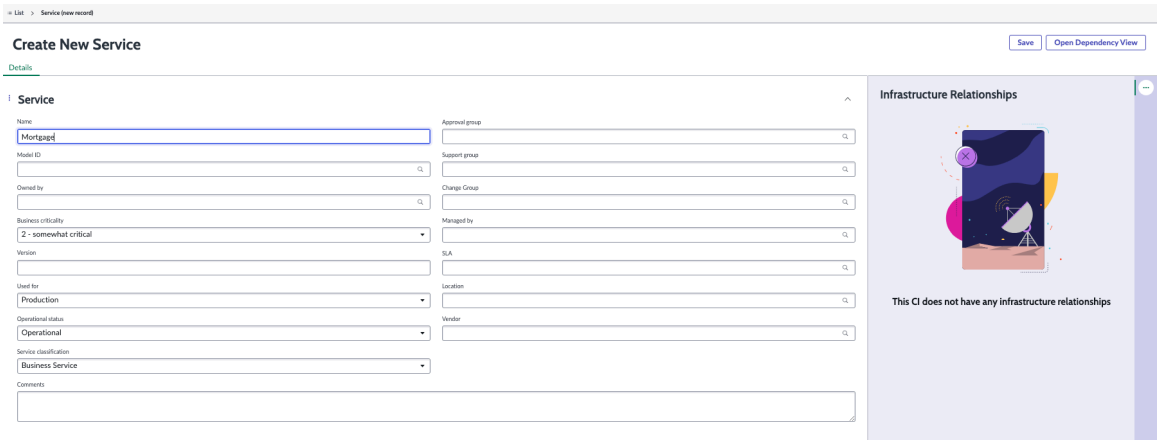
The following modules are displayed in the Operational Resilience Workspace.

- Services
- Business services
- Offerings
- Business processes
- Application services

Note:
The Services module is typically used by existing customers whereas the Business services module is used by new customers.

When the *Compute Operational Resilience Compliance* scheduled job runs in the background daily, you can view the status reports of the services in Operational Resilience. The Services module in the Operational Resilience Workspace is mostly used by the existing customers.

Procedure



1. Navigate to **Operational Resilience Workspace** > **List** > **Services**.
   A list of the available services is displayed in the form.
2. To add a service to Operational Resilience, select **New** in the Services list view and fill in the details regarding the service on the Create New service form.

   Note:
   You must have the itil user role to create a service. If you do not have the itil user role, the **New** button for creating a service is not displayed.

   For a description of the field values on the Service form, see Create New Service form.
   The Create New Service form is displayed.
3. In the **Details** tab, fill in the fields.
   A sample **Details** tab is shown in the following example.

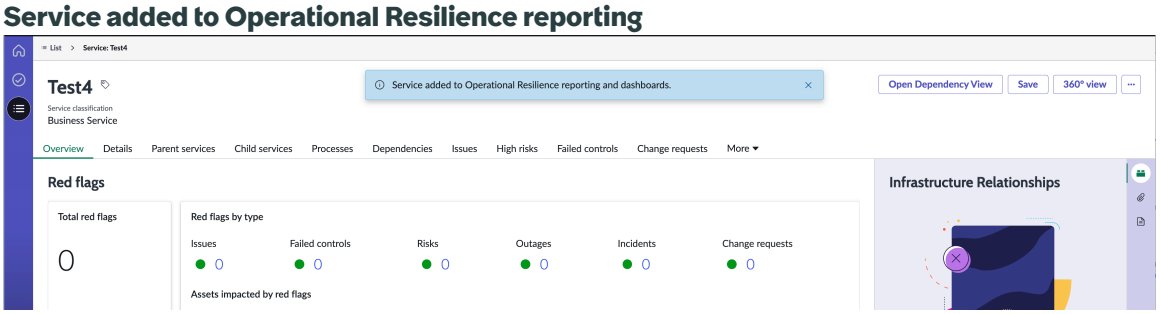
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details tab in the Create New Service form

4. To save details of the service, select **Save**.

Details of a service

In releases prior to 20.x.x, a single level of hierarchy was supported, such as from a parent service to the child service, from the child service to the process, and from the process to a dependency. This hierarchy is supported for services for existing customers and it is displayed in the Services form, as shown in the example.



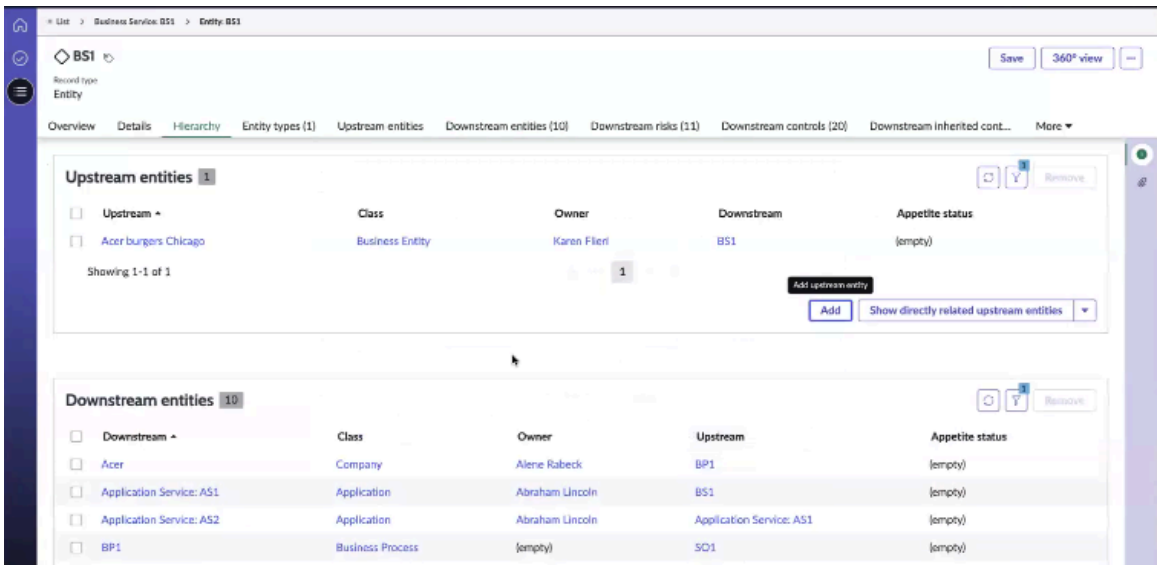
5. To add the selected service to Operational Resilience reporting, select **Add to OpRes reporting**.
   A message is displayed that the selected service is synchronized with Operational Resilience reporting and dashboards.

   a. To navigate to the entity record and maintain the upstream and downstream entities, select **Go to entity**.

      Once you add the service to Operational Resilience reporting, its entity record is created and the **Go to entity** UI action is displayed on the form.

      The service is added to Operational Resilience reporting as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
After you've added the service to Operational Resilience reporting, the **Add to OpRes reporting** option isn't displayed for the service anymore on the Service form.

6. To maintain the upstream and downstream relationships for the selected record, select **Go to entity**.
   The **Go to entity** button is visible only if the entity for the record has already been created. It is provided to maintain the upstream and downstream relationships for the selected record. Operational Resilience managers can add the upstream and downstream dependencies. Selecting **Go to entity** displays the entity record for the select object.

   a. Navigate to the **Hierarchy** tab in the entity record.

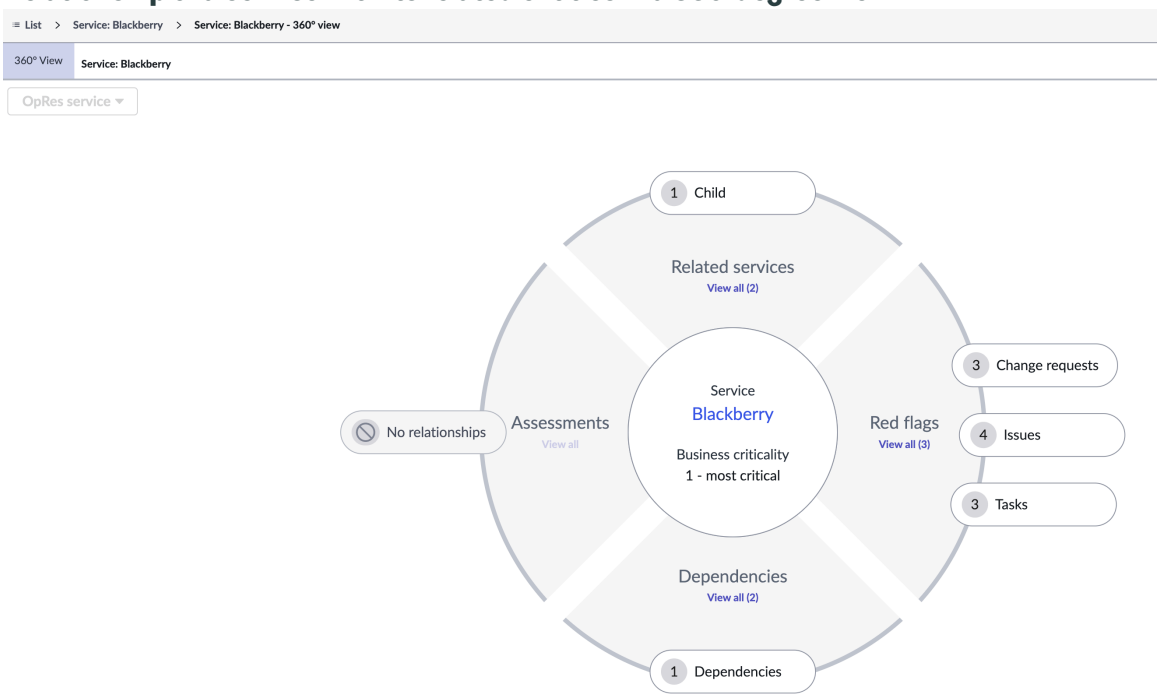
   b. Add upstream or downstream entities for the selected record.

      You can add upstream or downstream entities to the entity record as shown in the example.

   c. To save the upstream or downstream relationships, select **Save**.

7. To view the infrastructure relationship of the service, select **Open dependency view**.
   The infrastructure relationship of a service with its parent services and child services is displayed as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

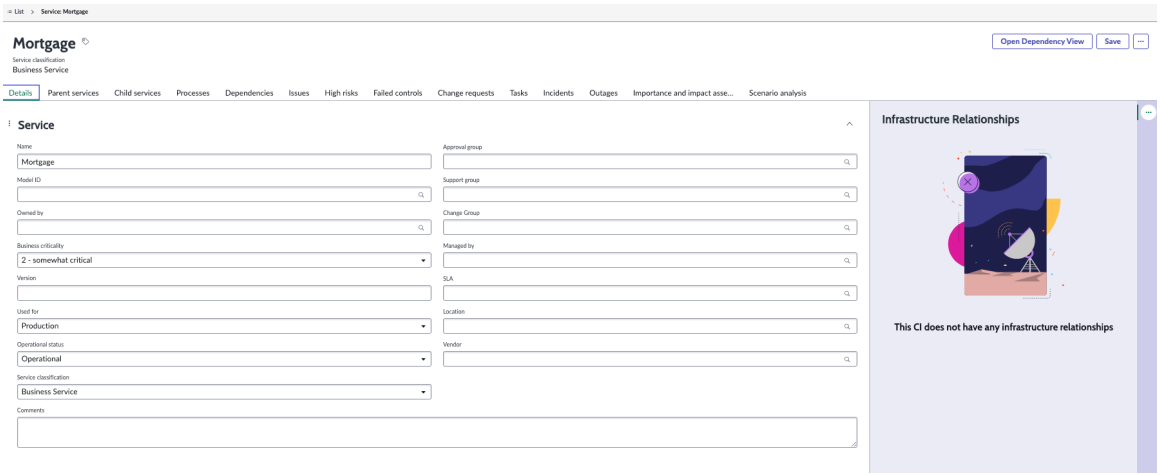


Sample dependency view

You can view the dependencies in the desired map view such as the vertical, horizontal, radial, force, group, or details view.

8. To view the relationship of the service with its related entities, select **360° view**.
   The relationship of a service with its related entities, such as the dependencies and red flags in a 360-degree view, is displayed as shown in the following example.

Relationship of a service with its related entities in a 360-degree view



9. To save the details on the form, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Service form is displayed as shown in the following example.

Service form with the related tabs

Create New Service form

Use the Create New Service form in Operational Resilience Workspace to set up a business service and configure its related lists.

Create New Service form

For a description of the field values, see the following table.

Create New Service form

Field	Description
Details tab	
Name	Name of the service.
Approval group	Approval group that is responsible for the approval of the service. For example, Application Development or Application Security group.
Model ID	Model ID for the service.
Support group	Support group for the service.
Owned by	Owner of the service. This field is auto-filled.
Change group	Change group that is responsible for updating the service.
Business criticality	Criticality of the service. The available options are as follows: • 1—most critical • 2—somewhat critical • 3—less critical • 4—not critical
Managed by	User that manages the service.
Version	Version of the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Service form (continued)

Field	Description
SLA	Service level agreements (SLAs) for the service.
Used for	Usage category that the service is used for. For example, Staging. The available options are as follows: • Production • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Location	Physical location of the service.
Operational status	Operational status of the service. The available options are as follows: • Operational • Non-Operational • Repair in Progress • DR Standby • Ready • Retired • Pipeline • Catalog
Vendor	Vendor that is responsible for operating the service.
Service classification	Classification of the service. The available options are as follows: • Business Service • Technical Service • Application Service
Comments	Comments section for the service. Typically, the Operational Resilience administrators add the comments about the service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related tabs

In the Create New Service form, you can add a parent service, child service, and process for the business service. You can also configure the related tabs, such as the tabs for change requests, incidents, and tasks for the service. You can then view the service attributes and resilience metrics on the dashboard. The following table describes the related tabs that are associated with a service.

Related tabs that are associated with the service

Related tab	Description
General	
Overview tab	Displays the following red flags data: **1.** Total red flags **2.** Red flags by type ○ Issues ○ Failed controls ○ Risks ○ Outages ○ Incidents ○ Change requests ○ Operational vulnerabilities ○ Vulnerabilities ○ Third party risk assessments **3.** Assets impacted by red flags
Details tab	Details of the selected service record. For more information on the fields and their description, see the "Create New Service form" table on this page.
Services and dependencies	
Child services	Child services that are associated with the service. The tab displays the following sample information about the child services: • Dependency • Pillar • Impacted objects • Red flags count
Business processes	Processes that are associated with the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related tabs that are associated with the service (continued)

Related tab	Description
	The tab displays the following sample information about the business processes: • Dependency • Pillar • Impacted objects • Red flags count
Dependencies	Dependencies that are associated with the service. The tab displays the following sample information about the dependencies: • Dependency • Pillar • Impacted objects • Red flags count
Ongoing events	
Incidents	Incidents that are associated with the service. The tab displays the following sample information about the incidents: • Incident • Short description • Owner • Opened • Caller • Priority • State • Category • Assignment group • Assigned to • Updated • Updated by • Dependency • Pillar
Outages	Outages that are associated with the current service. You can create an outage for the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related tabs that are associated with the service (continued)

Related tab	Description
	The tab displays the following sample information about the outages: • Number • Outage • Type • Begin • End • Dependency • Pillar
Red flags	
Issues	Issues that are associated with the service. The tab displays the following sample information about the issues: • Issue • Priority • Status • Planned end date • Dependency • Pillar
High risks	High risks that are associated with the service. The tab displays the following sample information about the high risks: • Risk • Risk assessment • Risk statement • Risk response • Inherent rating • Computed inherent rating • Residual rating • Computed residual rating • Dependency • Pillar
Failed controls	Failed controls that are associated with the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related tabs that are associated with the service (continued)

Related tab	Description
	The tab displays the following sample information about the failed controls: • Control • Control objective • Status • Dependency • Pillar
Change requests	Change requests that are associated with the service. The tab displays the following sample information about the change requests: • Change request • Short description • Type • State • Planned start date • Planned end date • Assigned to • Dependency • Pillar
Tasks	Tasks that are associated with the service. The tab displays the following sample information about the tasks: • Task • Short description • State • Task type • Priority • Assigned to • Dependency • Pillar
Vulnerabilities	Vulnerabilities associated with the service. The tab displays the following sample information about the vulnerabilities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related tabs that are associated with the service (continued)

Related tab	Description
	• RPO • BIA date • RTO gap
Importance and impact assessment	Importance and impact assessment that is done for the service. The tab displays the following sample information about the assessment: • Impact tolerance (Duration) • Impact tolerance assessment • Justification for overriding impact tolerance (Duration) • Justification for overriding impact tolerance (Customer impact) • Justification for overriding impact tolerance (Financial impact) • Justification for overriding impact tolerance (Transaction Volume) • Overridden importance • Impact tolerance (Customer impact) • Impact tolerance (Financial impact) • Impact tolerance (Transaction Volume) • Importance
Scenario analysis	Scenario analysis that is associated with the service. The tab displays the following sample information about the scenario analysis: • Breach status • Disruption duration • Impact tolerance • Deviation (%) • Importance • Scenario analysis • Service • Created by • Created • Domain

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view Related lists and Red flags data in the Operational Resilience Workspace, you must have appropriate user roles. See the "Roles to view elated lists and Red flags data" table for more information.

Roles to view Related lists and Red flags data

Related lists and Red flags data	Roles required	Notes
Business continuity information related list	BCM manager role	
Failed controls red flags	BCM manager role	
Risks and Third party risk assessments red flags	IRM manager role	**TPRM is not installed** If TPRM is not installed, Operational Resilience users cannot access risk red flags without the IRM roles. **TPRM is installed** However, if TPRM is installed, Operational Resilience users can access both risk red flags and Third-party Risk Management red flags because they are assigned the TPRM viewer role. The TPRM viewer role includes risk viewer capabilities, thus eliminating the need for IRM roles.
Rest of the related lists and red flags in the dashboard	Accessible with Operational Resilience roles	

Add a business service to Operational Resilience reporting

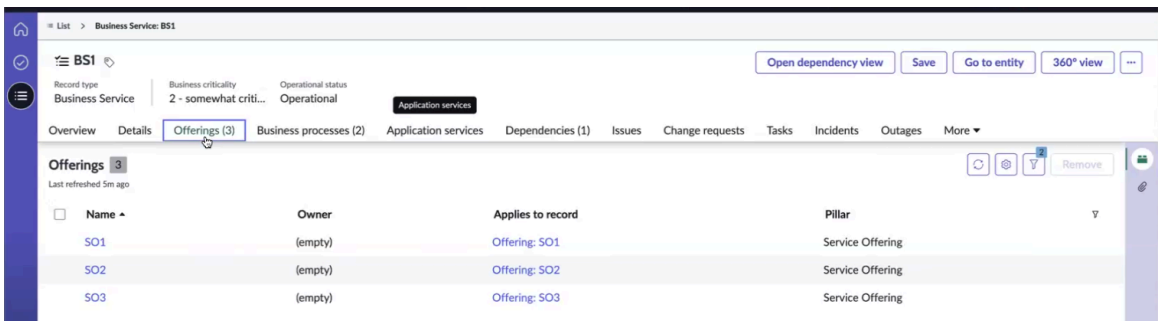
Add a business service to Operational Resilience reporting in the Operational Resilience Workspace. The Operational Resilience managers with [sn_oper_res.manager] roles can add business services, service offerings, business processes, and application services to their entity types from the business service form or the list actions.

Before you begin

Role required: sn_oper_res.manager with the itil user role, sn_oper_res.admin with the itil user role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task



Beginning with Operational Resilience, Release 21.0.x, records in the Services, Business services, Offerings, Business processes, and Application services modules feature a vertical layout.

Note:
The Services module is typically used by existing customers whereas the Business Services module is used by new customers.

Procedure

1. Navigate to **Operational Resilience Workspace** > **List** > **Business service**.
2. Open any one record of a business Service.

   The form view of the Business Service form is visible.

   As shown in the example, a business service could have a service offering. A service offering such as SO1 could have an embedded child service offering SO2. Similarly, associated business processes, application services, dependencies are shown in the form.

   The Operational Resilience managers can perform UI actions such as Open dependency view, 360 view. In the record header, the Operational Resilience managers can view the Record Type, Owned by, Business criticality, and Operational status.

   The following related lists are displayed:

   - Overview
   - Details
   - Service offering
   - Business Process
   - Application Service
   - Dependencies

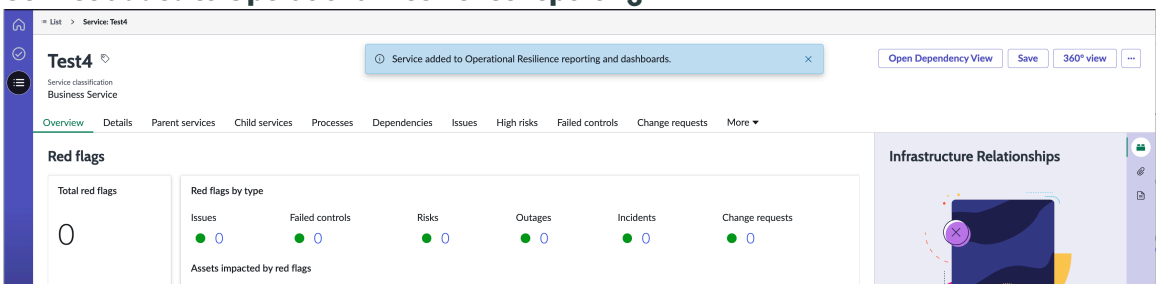
   All the UI actions such as viewing the records, removing the records can be performed by the Operational Resilience managers in the related list.

   The **Add** and **Remove** buttons are visible on the related list through which the managers can add or remove the records in the related list. The related list records are the entity of the displayed record.

3. Select **Open dependency view** to display the hierarchy relationship for the record.

   Note:
   The hierarchy relationship for the record is displayed only when the relationship is added in the records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **360 view** to display all the related records.
5. To add a business service to the Operational Resilience application, select **New** in the Business services list view and fill in the details regarding the service on the Create New service form.
   For a description of the field values on the Business service form, see Create New Business Service form.
6. To save updates to the existing record, select **Save**.
7. To add the selected business service to Operational Resilience reporting, select the **Add to OpRes reporting** UI action.
   A message is displayed that the selected business service is synchronized with Operational Resilience reporting and dashboards.

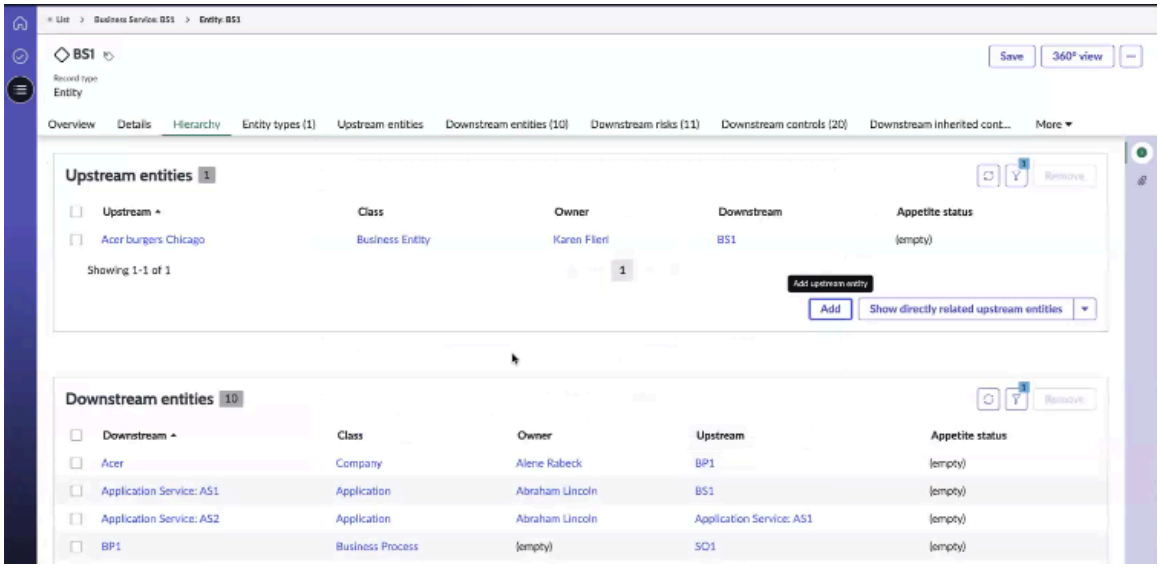
   a. To navigate to the entity record and maintain the upstream and downstream entities, select **Go to entity**.

      Once you add the service to Operational Resilience reporting, its entity record is created and the **Go to entity** UI action is displayed on the form.

      The service is added to Operational Resilience reporting as shown in the following example.

Service added to Operational Resilience reporting

Note:
After you've added the service to Operational Resilience reporting, the **Add to OpRes reporting** option isn't displayed for the service anymore on the Service form.



8. To maintain the upstream and downstream relationships for the selected record, select **Go to entity**.
   The **Go to entity** button is visible only if the entity for the record has already been created. It is provided to maintain the upstream and downstream relationships for the selected record. Operational Resilience managers can add the upstream and downstream dependencies. Selecting **Go to entity** displays the entity record for the select object.

   a. Navigate to the **Hierarchy** tab in the entity record.

   b. Add upstream or downstream entities for the selected record.

      You can add upstream or downstream entities to the entity record as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. To save the upstream or downstream relationships, select **Save**.

9. To view dependencies of the selected business service, select the **Open dependency view**. You can view the dependencies in the desired map view such as the vertical, horizontal, radial, force, group, or details view.

10. To navigate to the 360° view and monitor upstream and downstream relationships, entity class, entity types of the business service, select the **360° view**.

Create New Business Service form

Use the Create New Business Service form in Operational Resilience Workspace to set up a business service and configure its related lists.

Create New Business Service form

For a description of the field values, see the following table.

Create New Business Service form

Field	Description
Details tab	
Name	Name of the business service.
Approval group	Approval group that is responsible for the approval of the business service. For example, Application Development or Application Security group.
Model ID	Model ID for the business service.
Support group	Support group for the business service.
Owned by	Owner of the business service. This field is auto-filled.
Change group	Change group that is responsible for updating the business service.
Business criticality	Criticality of the business service. The available options are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a service offering to Operational Resilience reporting

Add a service offering to Operational Resilience reporting.

Before you begin

Role required: sn_oper_res.manager

About this task

Beginning with Operational Resilience, Release 21.0.x, records in the Services, Business services, Offerings, Business processes, and Application services modules feature a vertical layout.

Procedure

1. Navigate to **Operational Resilience Workspace** > **List** > **Services**.
   The following modules are displayed:
   - Services
   - Business Services
   - Service Offerings
   - Business Process
2. To add a service offering to the Operational Resilience application, select **New** in the Service offerings list view and fill in the details regarding the service offering on the Create New Offering form.
3. Select **Save**.

Create New Offering form

Use the Create New Offering form in Operational Resilience Workspace to set up a service offering and configure its related information.

Create New Offering form

For a description of the field values, see the following table.

Create New Offering form

Field	Description
Details tab	
Name	Name of the offering, for example, Service Offering for Datacenter.
Approval group	Approval group that is responsible for the approval of the service offering. For example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Offering form (continued)

Field	Description
	Application Development or Application Security group, for example, capacity Mgmt.
Model ID	Model ID for the service offering, for example, Dell Inc. 7700FullHD.
Support group	Support group for the service offering, for example, Application Development.
Owned by	Owner of the service offering.
Change group	Change group that is responsible for updating the service offering, for example, App Engine Admins.
Business criticality	Criticality of the service offering. The available options are as follows: • 1—most critical • 2—somewhat critical • 3—less critical • 4—not critical
Managed by	User that manages the service offering.
Version	Version of the service offering.
SLA	Service level agreements (SLAs) associated with the service offering.
Used for	Usage category that the service offering is used for. For example, Staging. The available options are as follows: • Production • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Location	Physical location of the service offering.
Operational status	Operational status of the service offering. The available options are as follows: • Operational • Non-Operational • Repair in Progress

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Offering form (continued)

Field	Description
	• DR Standby • Ready • Retired • Pipeline • Catalog
Vendor	Vendor that is responsible for operating the service offering such as APC or Amazon.
Service classification	Classification of the service. The available options are as follows: • Application Service • Business Service • Technology Management Service
Comments	Comments section for the service offering. Typically, the Operational Resilience administrators add the comments about the offerings.

Related tabs that are associated with the offering

Add a business process to Operational Resilience reporting

Add a business process to Operational Resilience reporting.

Before you begin

Role required: sn_oper_res.manager

About this task

Beginning with Operational Resilience, Release 21.0.x, records in the Services, Business services, Offerings, Business processes, and Application services modules feature a vertical layout.

Procedure

1. Navigate to **Operational Resilience Workspace** > **List** > **Services**.
   The following modules are displayed:
   - Services
   - Business Services
   - Service Offerings
   - Business Process
2. To add a business process to the Operational Resilience application, select **New** in the Business processes list view and fill in the details regarding the business process on the Create New Business Process form.
3. Select **Save**.

Create New Business Process form

Use the Create New Business Process form in Operational Resilience Workspace to set up a business process and configure its related lists.

Create New Business Process form

For a description of the field values, see the following table.

Create New Business Process form

Field	Description
Details tab	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Business Process form (continued)

Field	Description
Name	Name of the business process.
Parent	Parent service that is associated with the business process.
Life Cycle Stage	Life cycle stage of the business process, for example, Ideation.
Life Cycle Stage Status	Status of the life cycle stage, for example, Evaluation.
Review frequency	Review frequency for the business process. Available options are: • **Monthly** • **Quarterly** • **Semi Annual/Half Yearly** • **Annually**
Next review date	Next review date for the business process. This field is auto-assigned by the system.
Description	Description of the business process.

Related tabs that are associated with the business process

Add an application service to Operational Resilience reporting

Add an application service to Operational Resilience reporting. Beginning with Operational Resilience, Release 21.0.x,the Application services module is supported in the Operational Resilience Workspace.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Operational Resilience Workspace** > **List** > **Services**.
   The following modules are displayed:
   - Services
   - Business services
   - Offerings
   - Business processes
   - Application services
2. To add an application service to the Operational Resilience application, select **New** in the Application services list view.
3. On the form, fill in the fields.
   You can fill in the details of the application service in the form. For information on the fields, see Create New Service Instance form.
4. Select **Save**.

Create New Service Instance form

Use the Create New Service Instance form in Operational Resilience Workspace to set up an application service and configure its related lists.

Create New Service Instance form

For a description of the field values, see the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Service Instance form

Field	Description
Details tab	
Name	Name of the application service.
Approval group	Approval group that is responsible for the approval of the application service, for example, Analytics setting managers or Application Security group.
Model ID	Model ID for the application service, for example, AT&T SoundPoint IP 560.
Support group	Support group for the application service, for example, App Engine Admins.
Owned by	Owner of the application service.
Change group	Change group that is responsible for updating the application service, for example, Application Development.
Business criticality	Criticality of the application service. The available options are as follows: • 1—most critical • 2—somewhat critical • 3—less critical • 4—not critical
Managed by	User that manages the application service.
Version	Version of the application service.
SLA	Service level agreements (SLAs) associated with the application service, for example, Finance 99.99.
Used for	Usage category that the application service is used for. For example, Staging. The available options for the usage category are as follows: • Production • Staging • QA • Test • Development • Demonstration • Training • Disaster recovery
Location	Location and the physical address for the application service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Service Instance form (continued)

Field	Description
Operational status	Operational status of the application service. The available options are as follows: • Operational • Non-Operational • Repair in Progress • DR Standby • Ready • Retired • Pipeline • Catalog
Vendor	Vendor that is responsible for operating the application service, for example, Acer or Adobe Systems.
Service classification	Classification of the service. The available options are as follows: • Application Service • Business Service • Technology Management Service
Comments	Comments section for the application service. Typically, the Operational Resilience administrators add comments about the application service.

Related tabs that are associated with the application service

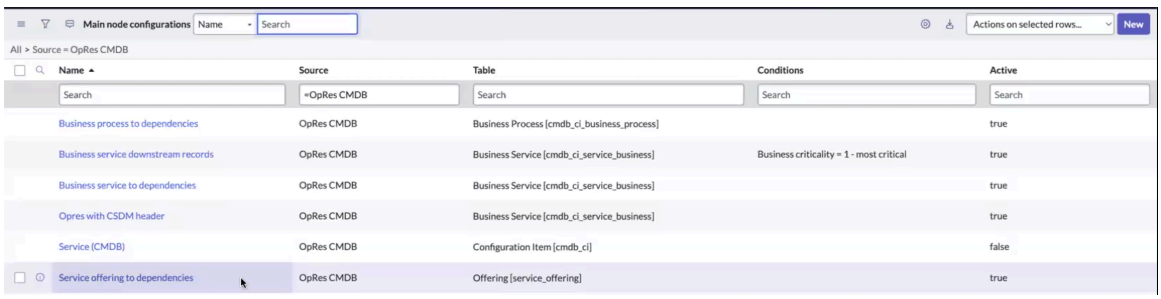
Verify the Main node configurations and relationships

Verify that the Main node configurations are set up and the relationships are configured in Operational Resilience.



Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Main node configurations**.

   The Main node configurations that are provided with the base system are displayed.

2. Verify that and CI and non-CI relationships are configured in CMDB, Main node configurations and node relationship configurations are set up, and entities are generated in Operational Resilience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To fetch the dependencies, execute the scheduled job. For more information, see Execute the scheduled jobs.

Execute the scheduled jobs

Execute the scheduled jobs required for the main node relationships. After the scheduled jobs are executed, CSDM objects with their configured relationships are imported into Operational Resilience for reporting.

Before you begin

Role required: sn_oper_res.manager

Before executing the scheduled job, ensure that the following pre-requisites are met:

1. Entity types and pillars have been defined and entities have been generated.
2. Configuration item (CI) relationships have been created as required for the Main node configuration relationships.

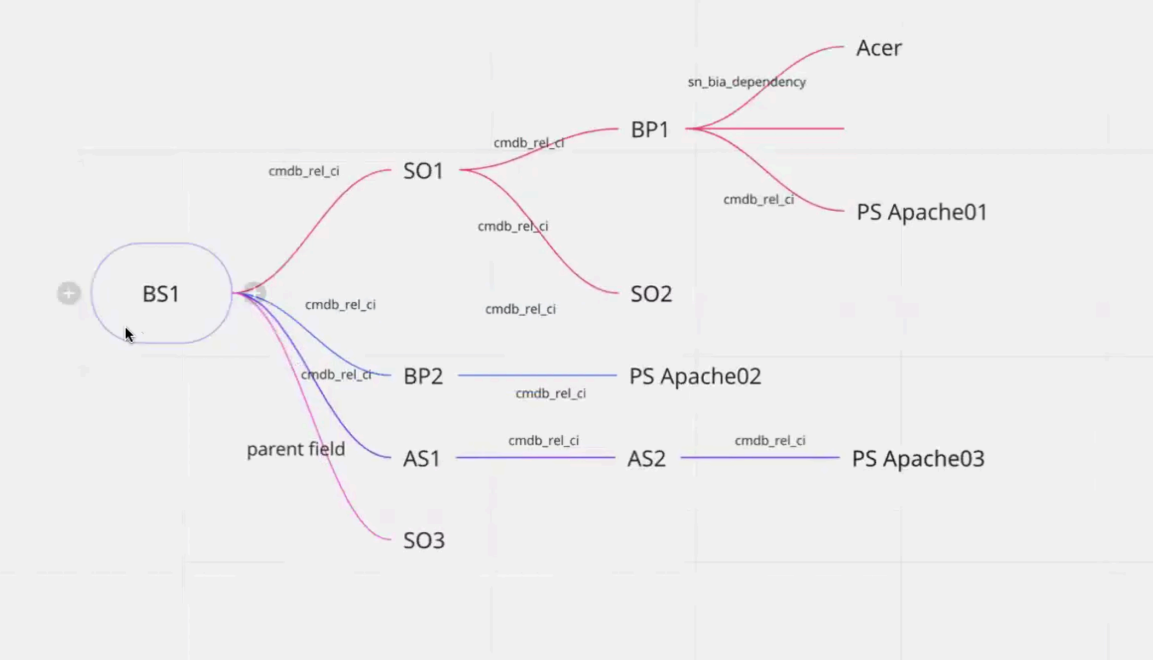
Once all these pre-requisites are met, you can execute the scheduled job.

Note:
All configurations with the source as **OpRes CMDB** run in parallel.

About this task

Note:

The *Update CSDM and other dependencies* and *Calculate red flags for CSDM and dependencies* scheduled jobs create an entity hierarchy and all types of red flags. All CSDM and red flags are rolled up based on their entity hierarchy.



The scheduled jobs are configured to run according to the following schedule:

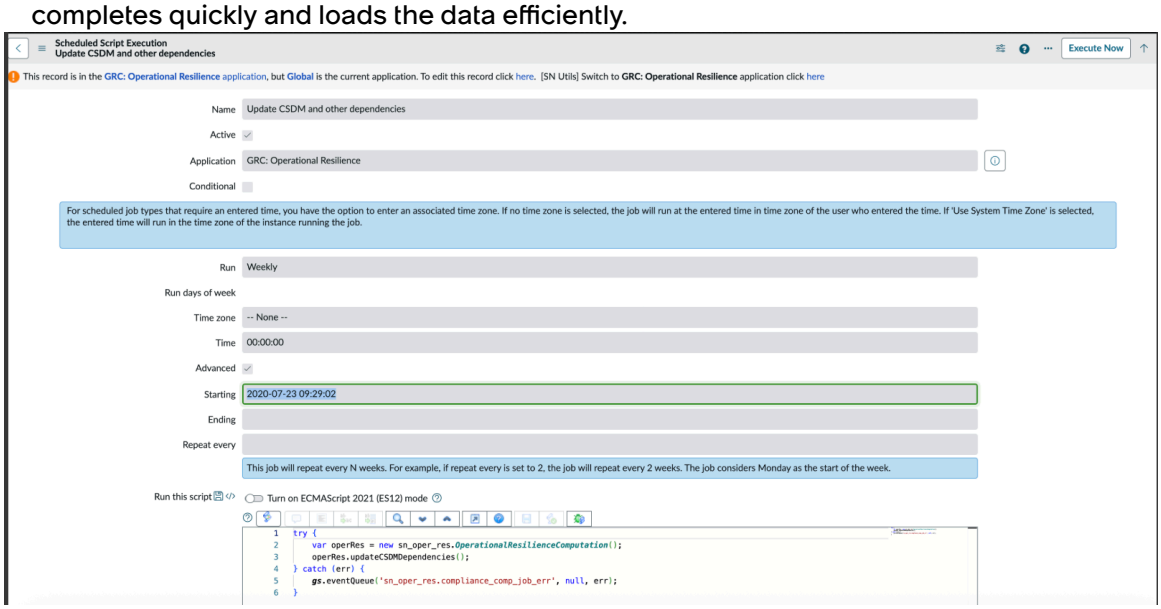
1. The *Update CSDM and other dependencies* scheduled job updates CSDM and other dependencies. It is configured to run weekly at midnight local time.
2. The *Calculate red flags for CSDM and dependencies* scheduled job calculates the red flags for the CSDM and its dependencies. It is configured to run daily at 3:00 AM local time.

Operational Resilience administrators can perform all the functions as the Operational Resilience managers. The Operational Resilience users cannot execute the scheduled job but they can verify the records in the entity and entity hierarchy tables.

Before running the scheduled job, verify that the relationships are set up for an object as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **All** > **system definition** > **Scheduled Jobs**.
2. Choose the *`Update CSDM and other dependencies`* scheduled job.

   The illustration shows the steps executed in the script of the scheduled job.

   a. When the script is run, it cleans all the records in the staging tables. Staging tables are used in Operational Resilience to save the red flags, which are displayed on the dashboard.

   b. Next, it updates the CSDM dependencies by calling the relationship API.

   c. As the final step, it runs the configurations in parallel to ensure that the scheduled job completes quickly and loads the data efficiently.

3. Select **Execute Now**.

   After the scheduled job is executed, all CMDB objects are fetched into Operational Resilience.

4. Verify that the Main node configuration, node relationship configuration, and node configuration results are displayed correctly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

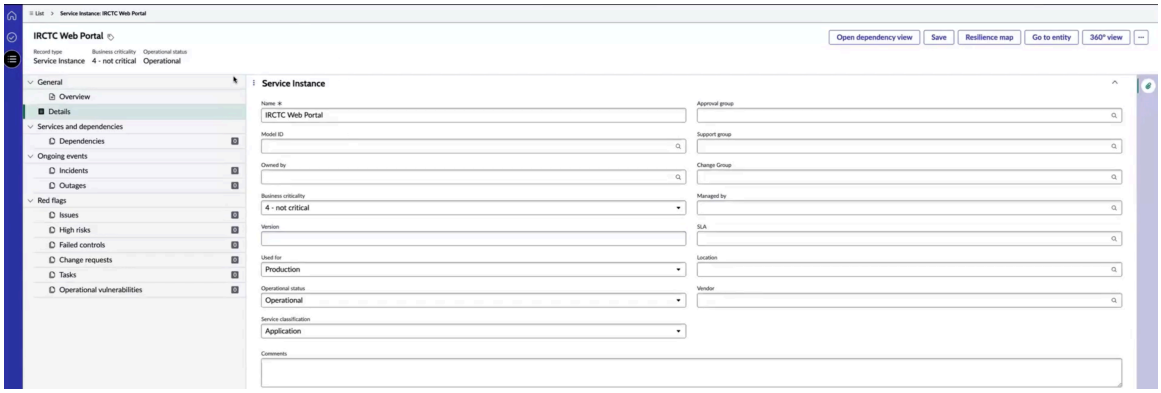
5. Verify that staging records are created according to entity hierarchies after running the scheduled job.
   Depending on the installed applications, the staging tables are created in Operational Resilience. For example, when the scheduled job is run, the following staging tables are created.
   - sn_oper_res_failed_control
   - sn_oper_res_risk
   - sn_oper_res_bcm_plan
   - sn_oper_res_vul_profile
   - sn_oper_res_third_party_risk
   - sn_oper_res_task
   - sn_oper_res_change_request
   - sn_oper_res_critical_service_outage
   - sn_oper_res_incident
   - sn_oper_res_issue

   The business views are mapped into the entity hierarchy. Red flags for the entities, such as Failed controls, High risks, Issues, Vulnerability response, are displayed in the reports on the landing page. For more information, see Business services overview tab.

Interacting with the Nexus map UI from the Workspace

Use the Nexus map (Resilience map) to define relationships between different records and configuration to show related data with hierarchy and plot those in a node map. You can examine the map's current configuration and identify areas for change. By modifying the configuration, you can observe how the map is updated accordingly.

Before you begin



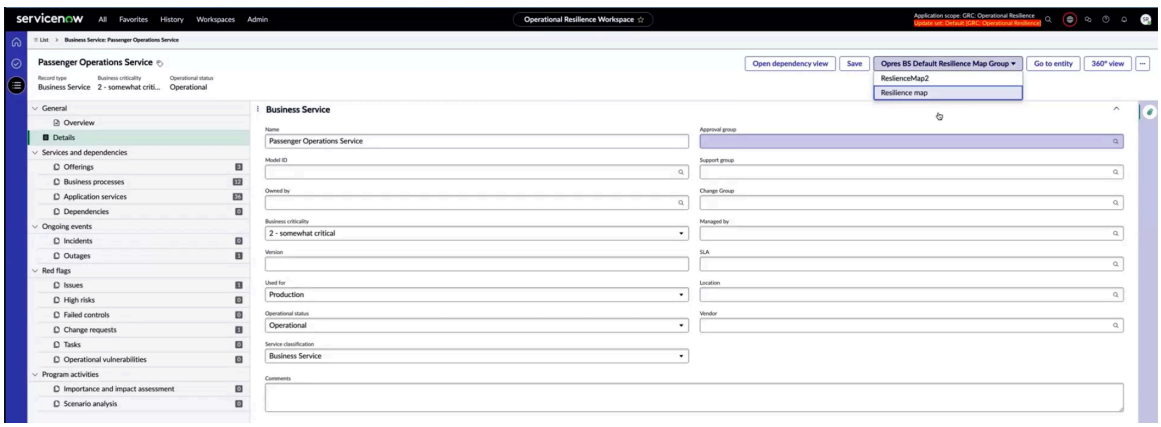
Role required: sn_oper_res.manager

Procedure

1. Navigate to **Operational Resilience Workspace** > **List** > **Services**.
2. From any of the Services modules, open the desired record that you want to work on.
   You can open the record from one of the following Services modules:
   - Services
   - Business services
   - Offerings
   - Business processes
   - Application services

   The following example shows the service record for IRCTC Web Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. To open and update the map view of the configuration record, select the **Resilience map** UI action.

   The **Resilience map** UI action is the default entry point for the node map and it's configured as the primary access point. You can navigate to this map from any entity overview, such as a service or business service overview in the Operational Resilience Workspace. After doing so, you're directed to the default resilience map that has been configured.

   Note:
   The sys_id of the nexus map is defined in the respective declarative actions.

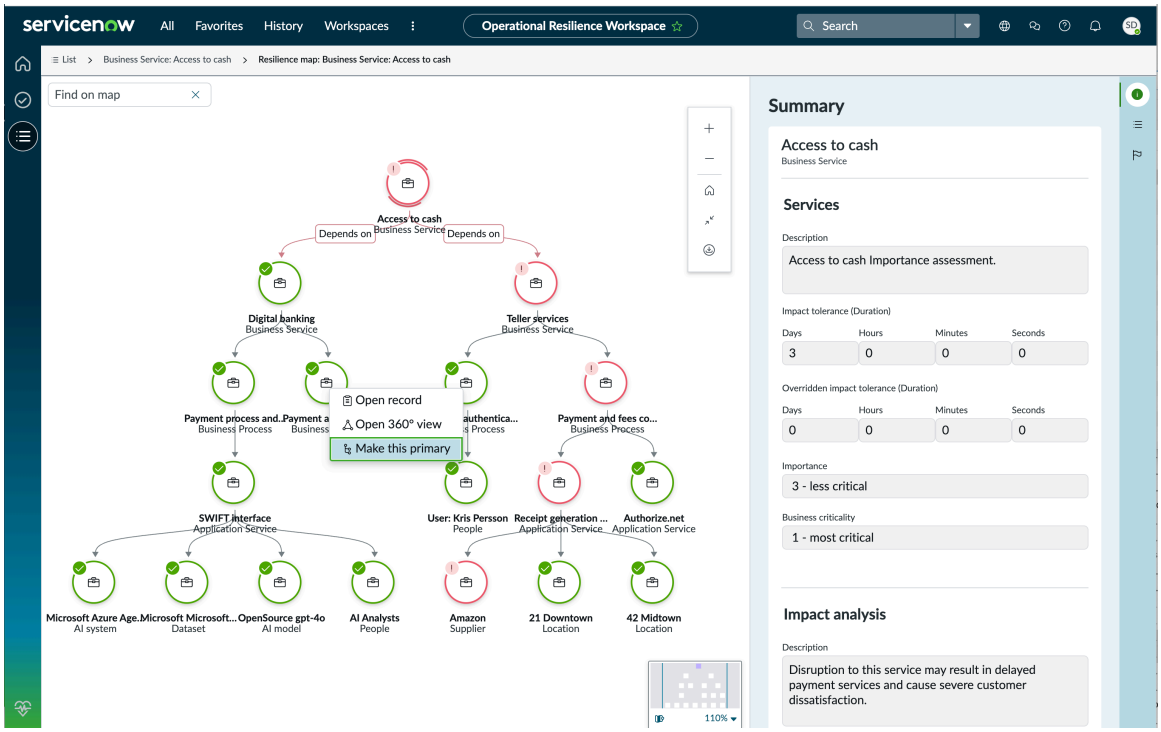
   Multiple Nexus maps: You can configure multiple Nexus maps for a single main node. When configuring a specific entity, such as a business service, you can create multiple Nexus map configurations. For example, you can configure a Nexus map for a business service resilience map group, which includes multiple buttons that link to different node maps. The group name can be customized to suit your needs.

   In the following example, two buttons are configured for the business service resilience map group, each depicting a specific node map. This functionality enables for a tailored visualization of the business service and its associated nodes. By customizing the group name and node maps, you can create a more informative and user-friendly Nexus map.

   When you navigate to the Resilience map, the default configuration loads automatically. Selecting a specific root node as shown in the example, displays the corresponding configuration associated with that node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The root node's styling is displayed, referencing a specific node within the map. The Main node configuration supports both top-to-bottom and bottom-to-top directions, enabling for flexible hierarchical visualization.



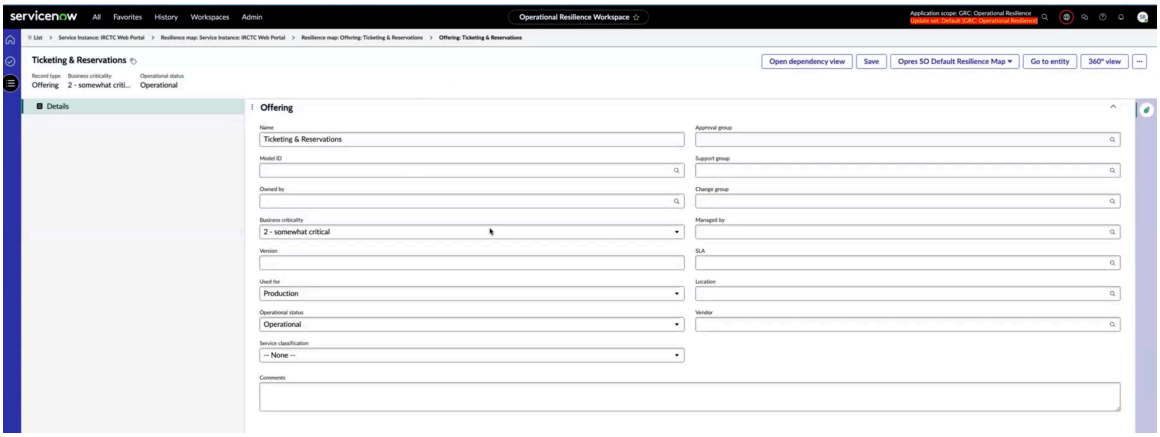
The Direction column in the example shows that both upstream and downstream Main node configurations are enabled, reflecting the same hierarchy in the map.

4. To designate a different node as the primary node, simply select it from the map, select and hold (or right-click) on it, and choose the **Make this primary** option.

   The **Make this primary** option is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you select this option, the map reloads, and a breadcrumb is added to reflect the newly designated root node. You can navigate back to the root node by selecting on the Home icon, which centers the root node on the page. The map then displays the upstream and downstream connections related to the root node.



When you update a node to be the primary (root) node, the available options are limited to **Open record** and **Open 360° view** as shown in the example.

5. To open the record associated with the node, select **Open record**.

   If you choose **Open record**, it redirects you to the node's overview page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To open the 360° view associated with the node, select **Open 360° view**.

   Selecting **Open 360° view** loads the 360° view configured for that node, as defined in the node configuration settings.

7. To navigate to the Service record or the list view, use the breadcrumb menu option in the UI.

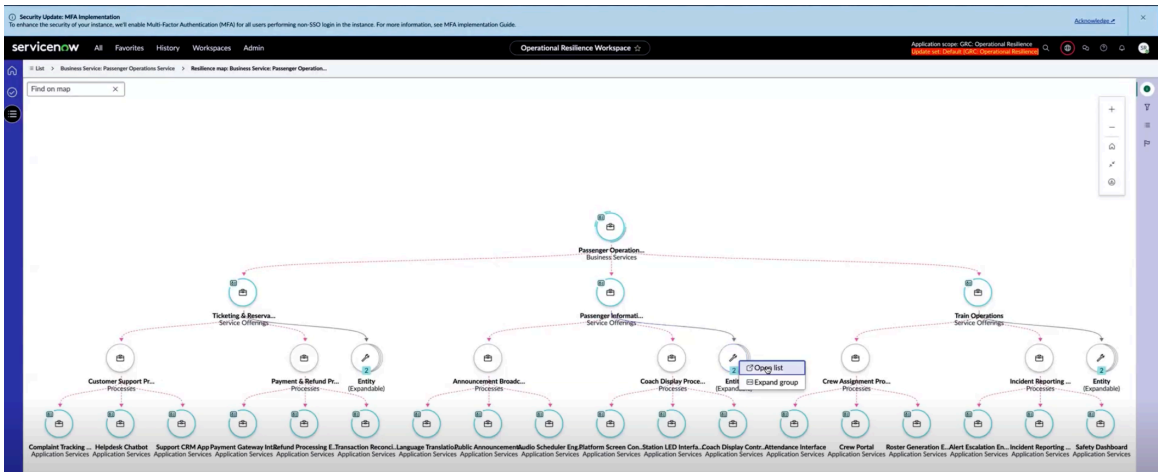
   The example displays the breadcrumb trail navigation to the Service record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To search for a specific service on the map, select **Find on map**.

   The node map includes a "Find on map" feature that enables you to search for a specific service.

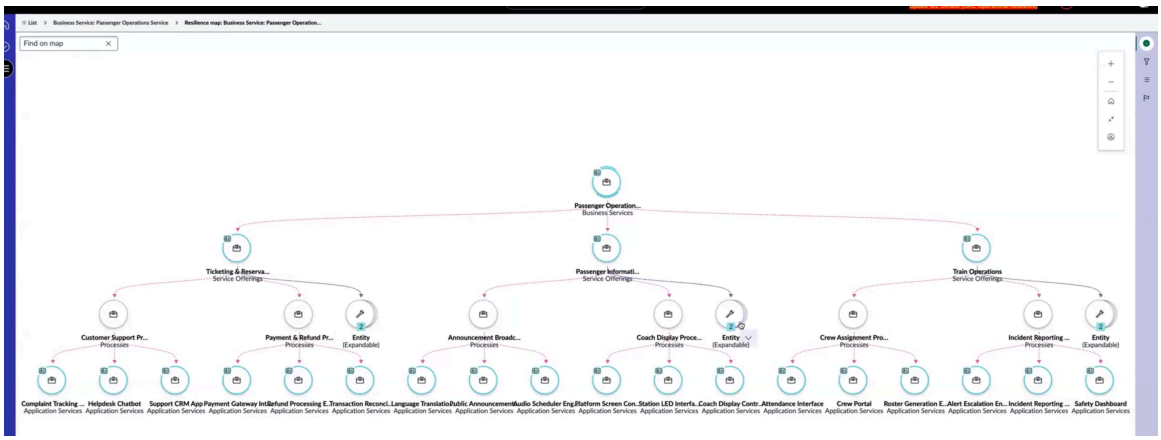
   When you initiate a search, the corresponding node is highlighted in the map, and you can select it for further actions. Clearing the search returns the map to its previous state. You can also designate the searched node as the primary node, which updates the map to display the node as the root, along with its upstream and downstream connections.



9. To view the list of grouped nodes or expand them individually, right-select on the grouped nodes.

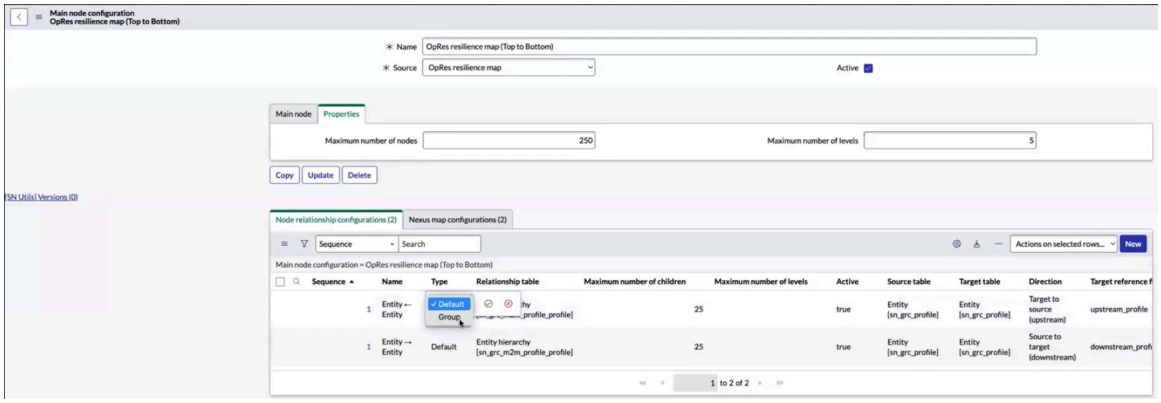
   The node map displays grouped nodes, such as first node, second node, and third group as expandable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Right-selecting on the grouped node provides options to either view the open list, which lists the number of nodes grouped at that point, or expand the node.

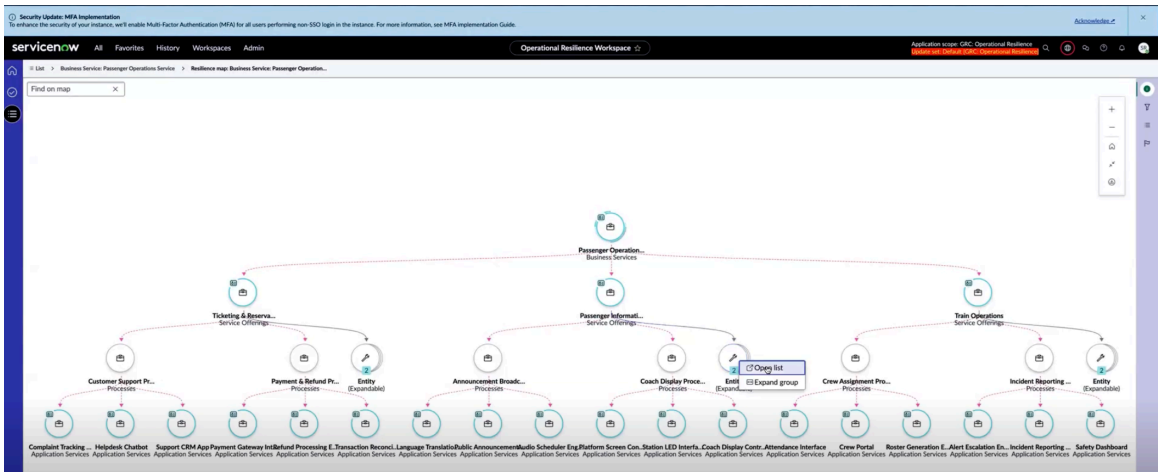
10. To view additional nodes associated with the selected node, expand the nodes.



The node expansion feature enables you to view additional nodes associated with the selected node, such as the "passenger information" level shown in the example. The expansion of the nodes is updated dynamically based on the number of levels available, enabling a more detailed and controlled exploration of the node map. By using the expand and open list options, you can efficiently navigate the map and better understand the relationships between nodes.

11. To aggregate nodes at a specific level, change the main node configuration type from "Default" to "Group" and display the consolidated view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The node map includes an aggregation feature that enables you to group nodes at a specific level. You can change the main node configuration type from "Default" to "Group" as shown in the example.

This action aggregates the nodes at the selected level, providing a more consolidated view.

12. To open the grouped nodes in the list format, right-select on the grouped node and select **Open list**.

    This action lists the entities that have been aggregated at that point, giving you a clear understanding of the nodes involved.

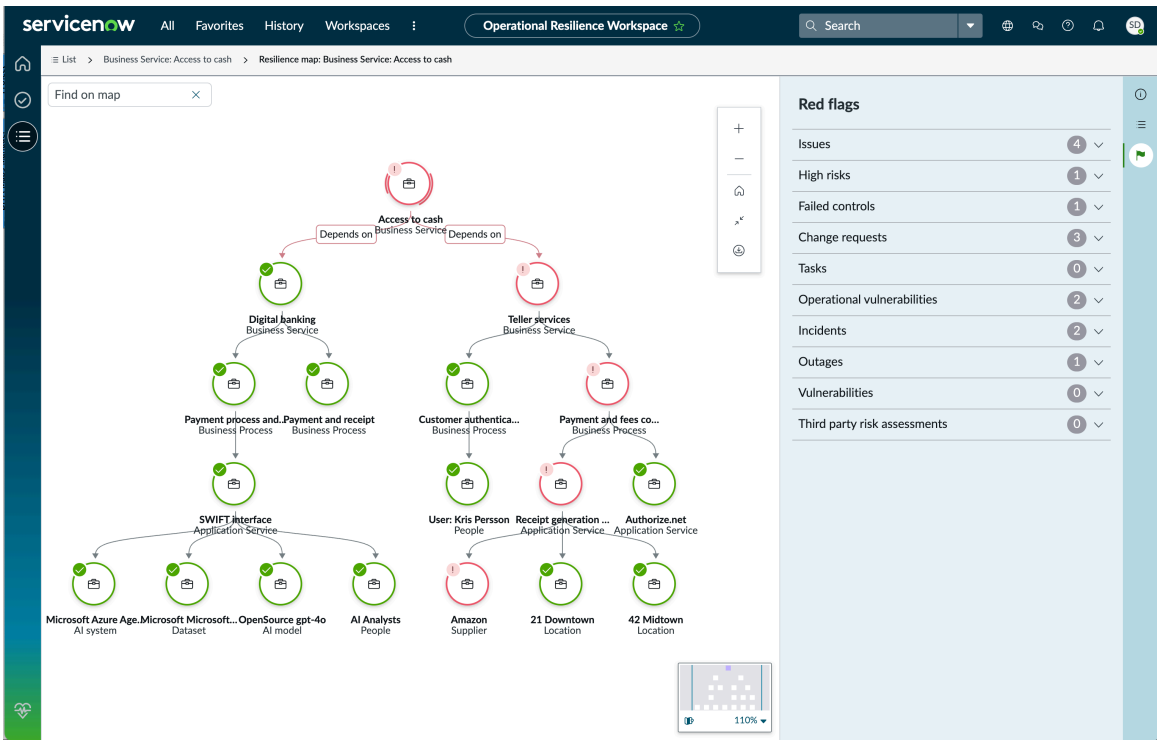
13. To access information about the selected node from the side panel, choose the **Info** icon in the side-panel summary.

    The node map includes a side panel that provides an overview of the selected configuration. When a node is selected, the side panel displays its details, which update dynamically as you switch between nodes. The default information is shown initially. The **Info** icon is displayed in the side-panel summary as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. To access information about the related lists for the selected node, choose the **Related lists** icon in the side-panel summary.

For a selected node, the side panel shows its associated services and dependencies. For example, if you select the "delay alerts process" node, the side panel displays its three application services or dependencies. Switching to a different node, such as the root node, updates the services and dependencies displayed in the side panel.

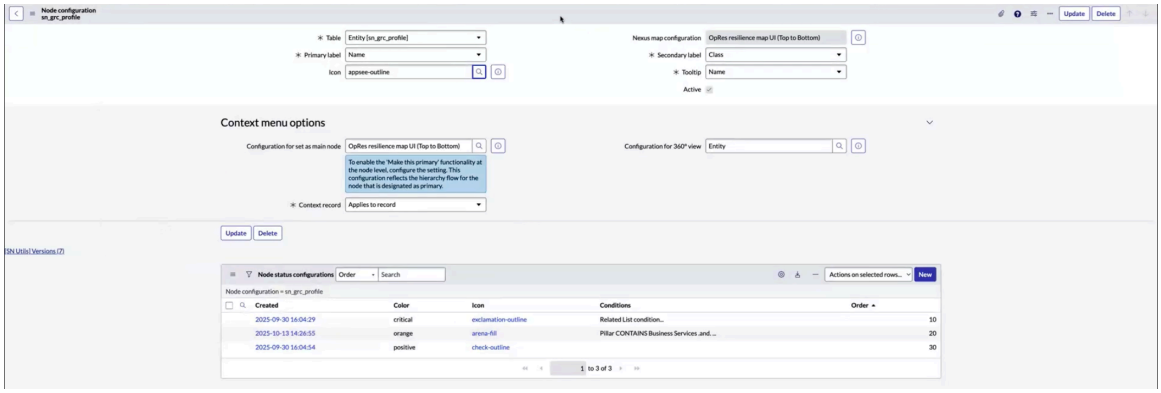


For the selected node, you can view its associated services and dependencies. The **Refresh** option reloads the related lists to verify you have the most up-to-date information. Meanwhile, the **View all** option displays all available related lists, providing a comprehensive overview.

15. To access information about the red flags for the selected node, choose the **Red flags** icon in the side-panel summary.

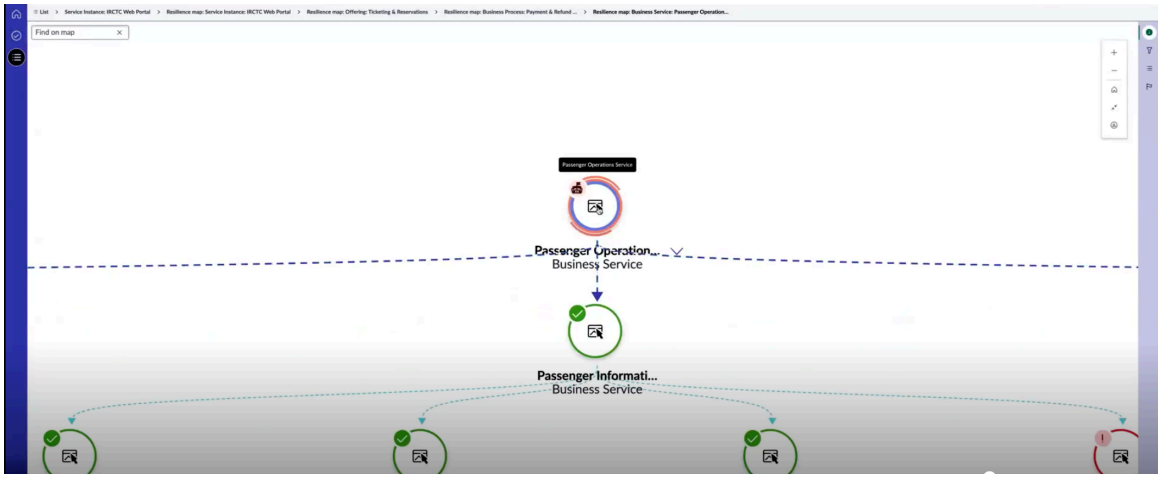
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The side panel also displays red flags, which indicate issues or outages related to the selected node. When a node has a red flag, it's marked as critical with an exclamation mark. For instance, if there's an outage or issue with a node like "SMS alert" or "live status update," it's highlighted in red.



For the selected node, the following red flags are displayed:

- Issues
- High risks
- Failed controls
- Change requests
- Tasks
- Operational vulnerabilities
- Incidents
- Outages
- Crisis events
- Vulnerabilities
- Third party risk assessments

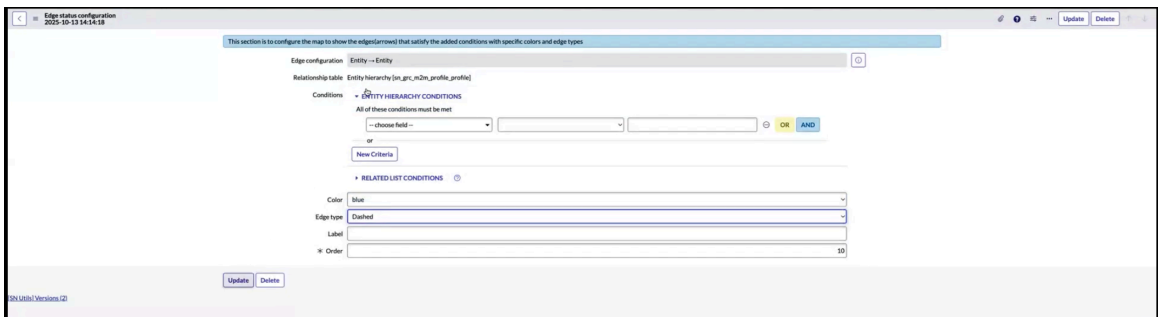


16. Change the node configuration by modifying the Node Configuration setting in the Nexus map.

    The example shows how to update the Node Configuration setting in the Nexus map.

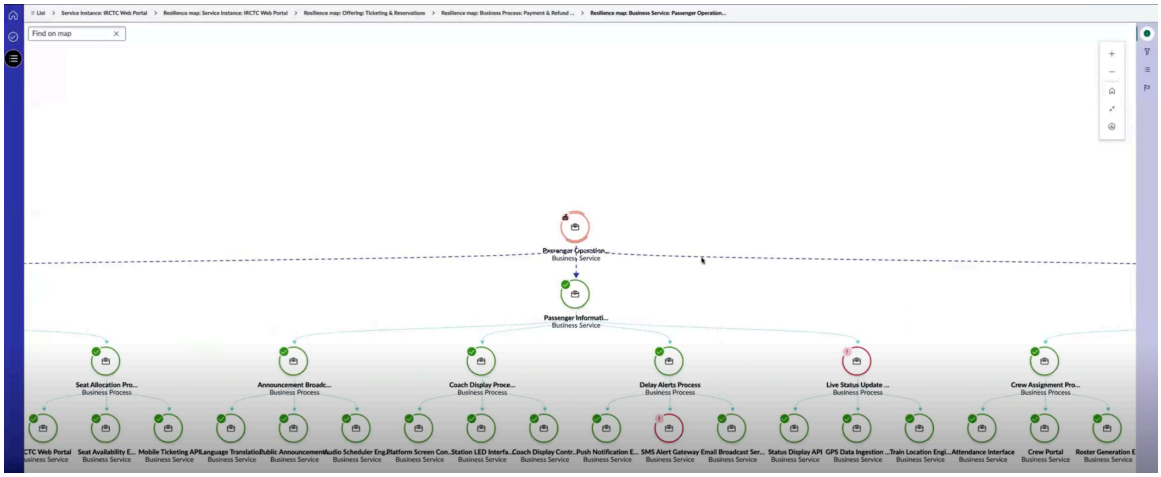
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The modified Node configuration is shown in the example.



17. To customize the Edge status configuration such as changing the color, modify the settings in the Edge status configuration within the Nexus map configuration.

    In the example, the node's edges are highlighted in magenta.



The example illustrates how to modify Edge status settings such as color and type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you save and reload the map, it reflects the updated edge configuration, displaying all edges as dashed lines in blue as shown in the example.

To refresh the map, you can either return to the initial main node configuration or simply reload it.

18. To update the zoom level of the map, adjust the percentage of the map in the Zoom level window.
19. To zoom in or zoom out of the map, select "**+**" or "**-**" in the position menu bar.

    The Zoom in icon is shown in the example.

20. To align the map to the home node, select the **Home** icon in the position menu bar.

    The Home icon is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

21. To resize the map or fit the node to the screen, select the **Fit to screen** icon in the position menu bar.

    The Fit to screen icon is shown in the example.

22. To export the map, select the **Export map** icon in the position menu bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Export map icon is shown in the example.

Fetching dependencies from the CMDB and BIA

You can fetch the dependencies for the services or business services from CMDB in Operational Resilience. Similarly, when the BCM applications are installed, the Operational Resilience scheduled job also monitors for the changes in the business impact analysis (BIA) dependencies and fetches the dependency updates.

Fetching the dependencies from CMDB for the services

Beginning with the Xanadu release, the Data Relationships Framework supports the Operational Resilience application with the underlying framework to fetch the dependencies from CMDB. The Data Relationships Framework (app-grc-relationship-config) is installed with the Operational Resilience application by default. The CMDB dependencies are retrieved by calling an API from the Data Relationships Framework.

To get the CMDB dependencies, the Operational Resilience administrator must activate the main node configuration, labeled as **Service (CMDB)** in the Data Relationships Framework first.

For each retrieved dependency, the Operational Resilience application searches for an existing entity first. If there is no existing entity, the dependency is skipped. If there is an existing entity and the entity belongs to any entity type in Operational Resilience, it is added to the downstream of its parent's entity. If the entity does not belong to any entity type, such as Facilities/People/Suppliers/Technology, you must add it manually to the corresponding entity type in Operational Resilience.

The following example shows a sample CMDB relationship setup for a business service. When the service *Windows mobile* updates its dependencies, the entity of *OWA - SD - 01* gets added to the downstream of its entity, *IronMail - SD - 01* and *IronMail - SD - 02* gets added to the downstream of the *Email* child service entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample relationship setup for a business service

Business service	Associated dependency, business process, and business service: Email	Process and dependencies associated with business service: Email
Windows mobile	• Dependency: *OWA - SD - 01* • Business process: *Inbound payment validation* • Business service: *Email*	• Process: *Fraud_escalation* • Dependency 1: *IronMail - SD - 01* (The table is cmdb_ci_email_server.) • Dependency 2: *IronMail - SD - 02* (The table is cmdb_ci_email_server.)

Fetching the dependencies from the business impact analysis (BIA)

When the BCM applications are installed, Operational Resilience fetches the BIA's dependency update if the BIA's **Applies to** field is a business process used in Operational Resilience.

The following conditions must be met for pulling the BIA dependencies in Operational Resilience:

- The BIA has to be in the **Approved** state.
- The BIA should not be in the **Expired** state.
- The dependency group has to be completed.

Note:
Only when the **Applies to** field of the BIA record matches with any business process within the **Business Processes** Entity Type, its dependencies are fetched by the scheduled job.

For each fetched dependency, the Operational Resilience application looks for an existing valid entity first. If the dependency has an existing valid entity and the entity belongs to any entity type in Operational Resilience, it is added to the downstream of its parent's entity.

To fetch the CMDB dependency updates or BIA dependency updates, the following conditions are followed:

- If there is no entity for the dependency, it is skipped. Operational Resilience does not create an entity for the dependency.
- If a dependency entity is inactive, it is ignored.
- If a dependency entity is active, but it has no pillar, it is ignored.
- If a dependency entity is active and has a pillar, but it does not belong to any Operational Resilience entity type, it is ignored.

Adding the dependencies manually

If the entity does not belong to an entity type such as Facilities, People, Suppliers, Technology, Operational Resilience users must add it to the corresponding entity type manually. Instead of using the scheduled job, Operational Resilience administrators and managers can update the dependencies manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support for main node configuration in Data Relationships Framework

For information on the Data Relationships Framework and main node configuration, see Data Relationships Framework and Create a main node configuration record.

Performing Importance and impact tolerance assessment

By analyzing the importance and the impact tolerance of your business service or service offering, you can measure how possible disruptions might impact the performance of a service. You can use the assessment questionnaire template in Operational Resilience Workspace to measure the importance and the impact tolerance of your selected business service and its child records.

Importance and impact tolerance of a business service

A business service's importance is determined by such factors as the number of customers that use the service, the revenue that the service generates, and its impact on your company's brand. By measuring the impact tolerance of a business service, you can see how long a service can be non-operational without causing some kind of loss to the business and its customers. Previously, we had only one Impact Tolerance that provided a value in terms of Duration. Now, we have four types of Impact Tolerance fields on the form:

- Impact Tolerance (Duration)
- Impact Tolerance (Customer Impact)
- Impact Tolerance (Financial Impact)
- Impact Tolerance (Transaction Volume)

If you have the sn_oper_res.admin role, you can create and maintain a pre-defined assessment template in Operational Resilience. With the sn_oper_res.manager role, you can select one or more business services that you want to analyze and use the assessment template to calculate the importance and the impact tolerance of your business services.

Using Smart Assessment to evaluate importance and impact tolerance of a service

Beginning with Operational Resilience, release 21.x.x, the Smart Assessment functionality has been integrated with the Importance and impact tolerance assessment, enabling you to create and manage the Importance and impact tolerance assessments efficiently. It includes features such as an assessment type field with legacy and smart options, default templates, and automated data updates. To progress, all assessments must be completed, after which they become read-only and are ready for approval.

The system requires assessments to be completed, as cancellations are not supported. Defining the assessment scope is mandatory, and the system prevents creation of an assessment without the scope.

With the enhanced approval flow, completed assessments are reviewed and validated, after which the assessor can request approval, and the approver can then approve the assessment, completing the workflow. With Smart Assessment, the assessment can now be moved back to the **Pending Response** state, allowing the assessor to retake the assessment and resubmit it for approval.

Tasks and states that are associated with the assessment workflow

The process for the assessment workflow is as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The owner of the assessment selects one or more business services and submits the Importance and impact tolerance assessment in Operational Resilience Workspace. This action creates an **Assessment** tab in Operational Resilience Workspace that contains the questions from the pre-populated questionnaire template.
- The assessor of the assessment receives an email notification with a link to the assessment.
- The assessor selects the link for the assessment and responds to the questionnaire. Based on the assessor's responses to the questionnaire, an assessment of the importance rating and the tolerable duration for one or more of the business services is generated.
- After the assessment is completed, the owner reviews the responses and requests an approval for the Importance and impact tolerance assessment. The owner's responses may override the importance and impact tolerance rating of the assessment.
- The approver of the assessment verifies the responses to the questions and approves the assessment.
- The owner of the assessment then closes the assessment in Operational Resilience Workspace.

When you perform the assessment tasks, the assessment is updated through different states in Operational Resilience Workspace as described in the following table.

States and UI actions that are associated with the assessment

State	Associated UI actions	Description
Draft	Select **New** in the All assessments form.	When you select **New** in the All assessments form, a record is created in the **Draft** state by default. Navigate to the **Details** tab and add the assessment details. In the **Services** tab, associate one or more business services with the assessment.
Pending response	Select **Assess** in the assessment form.	When you select **Assess** to proceed with the assessment, the application populates the assessment questionnaire under the **Assessment** tab. The state of the assessment is then automatically updated to the **Pending response** state. The assessor receives an email notification with a link to the assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States and UI actions that are associated with the assessment (continued)

State	Associated UI actions	Description
		Note: To proceed with the assessment, you must associate at least one service with the assessment.
Assessment received	Select **Submit** in the assessment template and select **Save** in the assessment form to complete and save the assessment.	When the assessment is in the **Pending response** state, you can respond to the assessment questions that are given in the assessment template. To submit the responses, select **Submit**. To save the assessment, select **Save**. The state of the assessment is updated to **Assessment received**. An importance rating and the duration of the impact tolerance are automatically generated based on the questionnaire responses. The owner of the assessment requests an approval for the assessment. The approver of the assessment receives an email notification about the assessment.
Approved	Select **Request approval** in the assessment form.	The approver of the assessment verifies the responses to the questions and selects **Request approval**. The state of the assessment is automatically updated to **Approved**.
Closed	Select **Close** in the assessment form.	An assessment can be closed only when it is in the **Approved** state. To close the assessment, select **Close** in the assessment form. The state of the assessment is updated to **Closed**.

Note:
If you have the sn_oper_res.admin role, you can delete the assessment in any state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have the sn_oper_res.admin role, you can set up the assessment ratings by updating the criticality and order of the assessment rating in the Important choices module. For more information on setting up the assessment rating, see Update the Important choices module.

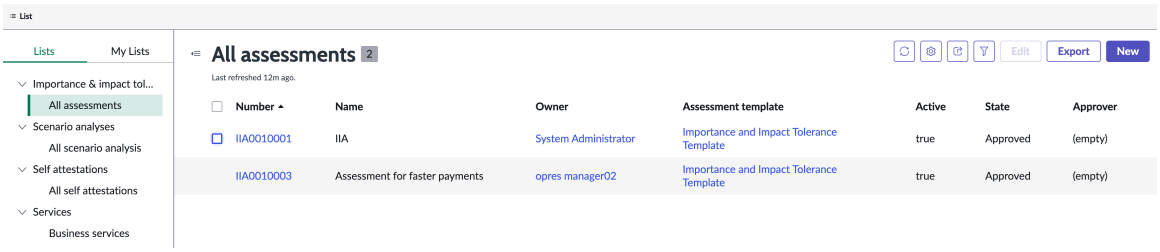
For more information on the Operational Resilience roles, see Roles installed with Operational Resilience.

Create an Importance and impact tolerance assessment

Determine the importance and impact tolerance of a business service by conducting an assessment using either Smart Assessment or Legacy assessment. The assessment questionnaire helps you to measure the service's importance and its impact on customers based on their responses. By evaluating the feedback, you can effectively gauge the significance of your business service and understand its effects on your customers.

Before you begin

Role required: sn_oper_res.user, sn_oper_res.manager



About this task

Operational Resilience Managers (sn_oper_res.manager) have the Smart Assessment reader role (sn_smart_asmt.assessment_reader). They have read-only access to the Smart Assessment template, enabling them to view but not create or edit it.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **List** > **Importance and impact tolerance assessment** > **All assessments**.
   The Importance and impact tolerance assessments (IIA) in the Operational Resilience application are displayed in the All assessments list view as shown in the following example.

   List view in the All assessments form

2. To create an assessment, select **New**.

   This action opens an assessment form where you can add the details about the assessment. The system auto-assigns a number for the Importance and impact tolerance assessment, such as IIA0010018.

3. In the **Name** and **Description** fields, provide a name and description for the assessment.
4. Select the type of assessment in the **Assessment type** field.
   You can select the following types of assessment in the **Assessment template** field:
   - Smart Assessment: You can add multiple smart assessment templates for the `Assessment type: Smart assessment` in the **Smart assessment templates** field.
   - Legacy Assessment: You can add a single assessment template for the `Assessment type: Legacy assessment` in the **Assessment template** field.

5. In the Assignees panel, select the owner, approver, and assessor for the assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The approver must be a user other than the owner and assessor.

For a description of the field values on the Importance and impact tolerance assessment form, see Create New Importance and impact tolerance assessment form.

6. In the **Assessment due date** field under the Milestones panel, select the due date for the assessment.
7. To reassign the assessment to another assessor, update the **Assessor** field in the **Details** tab.

   This step reassigns all assessment cards to the updated assessor.

   Note:
   Only open assessments can be reassigned to another user; completed assessments remain assigned to the existing assessor. Reassignment is restricted to the assessment owner, requester, or approver. If the assessment is in the **Canceled** state, it does not get reassigned to the updated user.

8. To start a Sidebar discussion on the assessment, select **More actions** and select **Discuss**.
   a. Add the subject for the discussion and add participants that have access to the record.
   b. Include a brief message for the participants.
   c. Select **Start discussion**.
9. To delete the assessment, select **Delete**, confirm the deletion, and select **OK**.
10. To save the assessment, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An assessment is created in the **Draft** state. The details of the assessment are displayed in the assessment form as shown in the following example.

Importance and impact tolerance assessment

What to do next

Add scope for the assessment. For more information, see Define the scope and begin the assessment.

Create New Importance and impact tolerance assessment form

Use the Create New Importance and impact tolerance assessment form in Operational Resilience Workspace to create an assessment for the business service.

Create New Importance and impact tolerance assessment form

For description of the field values, see the following table.

Create New Importance and impact tolerance assessment form

Field	Description
Details	
Number	Auto-assigned number of the assessment.
Name	Unique name of the assessment, for example, Assessment for payment service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Importance and impact tolerance assessment form (continued)

Field	Description
Description	Detailed description of the assessment.
Assessment type	Type of the assessment. You can choose the **Smart assessment** or **Legacy assessment**.
Smart Assessment templates	Templates supported by the Smart Assessment Engine. You can choose either the **Importance assessment template**, **Impact tolerance assessment template**, **Importance and impact tolerance assessment template** or all of them based on your assessment requirement.
Assignees	
Owner	Owner of the assessment.
Approver	Approver of the assessment. **Note:** The approver must be a different user from the owner and assessor.
Assessor	Assessor of the assessment. An assessor can be the Operational Resilience user with the sn_oper_res.user role.
Milestones	
Assessment due date	Due date for the assessment in the yyyy-mm-dd format, for example, 2025-12-02.
Compose	Private work notes and comments about the assessment.
Activity	Auto-recorded log on the activities related to the assessment.

Define the scope and begin the assessment

Define the scope by adding a business service to the Importance and impact tolerance assessment. With this assessment, you can estimate the impact and possible disruptions that can affect your business services.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **List** > **Importance and impact tolerance assessment** > **All assessments** and select the assessment that you're working on.
   The **Details** tab displays the assessment details.
   The **Scope** tab is displayed for the assessment where you can add the services to be assessed.
2. In the **Scope** tab, select **Add**, choose the services for the assessment, and select **Add** again.
   A message is displayed that the services are successfully added to the list. The services are listed in the **Scope** tab.
3. To send the assessment and request a response from the assessor, select **Assess**.

   The state of the assessment is updated to **Pending response**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

The state of the assessment is updated to **Pending response**. The assessor of the assessment receives an email notification with a link to the assessment in the Operational Resilience Workspace.

Note:
If there are no approvers, the state of the assessment automatically changes to the **Approved** state.

What to do next

The assessor logs into the instance or selects the assessment link received in the notification, responds to the assessment, and submits the results. For more information, see Submit the assessment.

Submit the assessment

Log in as an assessor of the Importance and impact tolerance assessment, respond to the questionnaire, and submit the assessment in Operational Resilience Workspace for an approval.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **List** > **Importance and impact tolerance assessment** > **All assessments** and open the assessment that you're working on.
2. Log in as the assessor of the assessment.
3. Add operational vulnerabilities relevant to the service from the **Operational vulnerabilities** tab.
4. On the **Assessment** tab, select the assessment and respond to the questions.
   As an assessor, you can respond to the questions.

   The assessment is created and visible in the **Assessment** tab, accessible only to the assessment owner and assessor. When the assessment owner attempts to access the assessment, a message indicates that it is assigned to another user. The owner can view it in read-only mode or edit it, which reassigns write access from the assessor to the owner.

5. To add a contributor to the assessment, select the Contributors icon on the contextual sidebar.
   The Contributors icon is displayed with the installation of the Smart Assessment Collaboration (sn_smart_collab) plugin.

   a. Select the **+ Add** button.

   b. On the **Add contributors** pop-up, add the names of the users in **Select users to add to this assessment** field.

      Note:
      By default, the Operational Resilience application filters users and displays only those with the sn_oper_res.user role or higher. The assessment owner can then select from these available users to add to the assessment.

   c. Select **Add contributors**.
      Contributors can view the assessment from the list view or from the Tasks page. They can respond to the assessment and save their changes, but they cannot submit it. Only primary owners of the assessment can submit them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To finish a pending assessment, select **All questions** or **Unanswered questions**.
   You can either view all questions or filter to see only the unanswered questions.
7. Respond to the questions, verify that you have answered all the questions, and save your responses.
8. To reassign the assessment, select **Reassign** from the **More options** menu.
   A confirmation message appears, warning that reassigning the assessment results in losing your current access to it. You can confirm and proceed to the next step. If the reassignment is done, the user has access to the Importance assessment.
   a. Select the desired user from the list in the modal and select **Reassign**.
   The assessment is reassigned to the selected user from the list.
9. To submit the assessment, select **Submit**.
   A confirmation message appears, stating that you have reviewed your answers and understand that submission is final and may prevent further changes.
10. Select the check box to confirm that you have reviewed the answers and select **Submit** again.
    A confirmation message is displayed, indicating that the update has been successfully processed and the assessment has been submitted.
11. Refresh the **Assessment** tab to confirm that the Importance assessment is complete and its status is Completed.

    After the assessment is submitted, its state changes to **Assessment received**. This triggers an automation flow, resulting in an update to the IIA value on the IIA page.

    The Importance and impact tolerance assessment now includes three additional fields: **Customer impact**, **Financial impact**, and **Transactional volume**, which are used to determine the overall impact tolerance values based on assessment results.

    Note:

    After the assessment is completed and it is in the **Assessment received** state, the owner has the option to override the calculated impact tolerance values if necessary.

    Once the assessment is completed and it is in the **Assessment received** state, the owner can override the calculated impact tolerance values if needed. Upon completion of all assessments, the IIA automatically transitions to the **Assessment received** state, and the importance values are updated in the **Scope** tab.

    Note:
    Unlike Legacy assessments, where retaking an assessment was not possible, the Smart Assessment method allows you to reopen and retake assessments. If an assessment is canceled or rejected, it reverts to the **Pending response** state, enabling users to retake it, unlike the Legacy system where it remained in the **Assessment received** state.

    Only the assessment's requester/owner and assigned assessor can reopen a completed assessment; contributors assigned to the assessment do not have this capability.

    Email notifications are sent at various stages, including IIA creation, scope updates, assessment assignments, reassessments, and when collaborators are added, to keep stakeholders informed throughout the process.

What to do next

The owner of the Importance and impact tolerance assessment (IIA) requests for an approval. For more information, see Request an approval for the assessment. If no approvers are specified, the record moves to the **Approved** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request an approval for the assessment

Request an approval for the Importance and impact tolerance assessment in Operational Resilience Workspace. With an approval, you can make sure that an accurate rating is assigned to your business services.

Before you begin
Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **List** > **Importance and impact tolerance assessment** > **All assessments** and then to the assessment that you're working on.
   When an assessment is in the "Assessment Received" state, its owner can see the **Request approval** UI action on the form.
2. To request an approval for the assessment, select **Request approval**.

   The state of the assessment is updated to **Pending Approval**. The approver of the assessment receives an email notification to approve the assessment. A message displays that the approval is pending for the assessment.
3. Log into the instance and open the assessment as its owner and navigate to the **Approvals** tab.
4. To approve, reject, or cancel the assessment, double-click the State column.
5. To reject the assessment, update its state to **Rejected** and select **OK**.
6. To cancel the assessment, update its state to **Cancelled** and select **OK**.
7. To approve the assessment, update its state to **Approved** and select **OK**.
   The state of the assessment is updated to **Approved** in the State column of the **Approvals** tab and also in the **Overview** tab of the record. This completes the workflow of the Importance and impact tolerance assessment.

What to do next
Having an approved Importance and impact tolerance assessment completes the workflow. To close an inactive assessment, see Close the assessment. Note that closed assessments are considered inactive.

Close the assessment

Close the inactive Importance and impact tolerance assessment in the Operational Resilience Workspace.

Before you begin
Role required: sn_oper_res.manager

About this task
The owner of the assessment typically closes the inactive assessments.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **List** > **Importance and impact tolerance assessment** > **All assessments**.
2. As the owner, select the inactive assessment you wish to close from the list.
3. To close the assessment, select **Close**.

   The state of the assessment is updated to **Closed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conducting a scenario analysis

By performing a scenario analysis, you can determine the risks that might impact your business. You can analyze the impact of the scenarios and events on your business services. You can also track the actions and improvements from the scenario analysis in Operational Resilience Workspace.

Overview of a scenario analysis

Scenarios represent the business-specific risks that are used to test how events can impact your organization. By performing a scenario analysis, you can analyze the impact of the scenarios and their associated events on your business services. Each service has a few dependencies associated with it. The *Compute Operational Resilience Compliance* scheduled job runs in the background and populates the dependencies for the services. As an owner of the scenario analysis, you can request a plan approval.

When a plan approver approves the plan approval, it triggers a response task for the scenario analysis. Participants of the analysis work on the response tasks and add their observations on the analysis.

As an owner of the scenario analysis, you can verify the status of the services and calculate the possible disruptions. After the response tasks have been completed, you can request an analysis approval for your scenario analysis. When an analysis approver approves the scenario analysis, you can close it and monitor its status in Operational Resilience Workspace.

Tasks to set up a scenario analysis

If you've got the sn_oper_res.manager role, you can set up a scenario analysis as follows:

1. Create a scenario that helps you to determine the risks that are applicable to your business.
2. Assign an owner, a plan approver, and an analysis approver to the scenario analysis in the scenario analysis form.
3. Add the scope and dependencies that are applicable to your scenario.
4. Associate one or more scenario events with the scenario analysis. Add the participants, services, dependencies, and issues that are specific to a scenario event. When a scenario event is associated with a participant, a response task is automatically generated on the **Responses** tab and it's assigned to the participants.
5. Send the scenario analysis to the plan approver of the scenario analysis and request for a plan approval.
6. Collect the observations, gaps, and recommendations from the participants about the scenario analysis event. The participants of a scenario event are the users with at least the sn_oper_res.user roles from the associated business functions, such as Finance or HR departments.
7. Compare the impact tolerance with the disruption duration to determine if any service was breached.
8. Close the open response tasks and open scenario events that are associated with your scenario analysis.
9. Send the scenario analysis to the analysis approver for a review and request an approval for the scenario analysis.
10. Close the scenario analysis and monitor its status in Operational Resilience Workspace.

States and UI actions that are associated with a scenario analysis

The states and UI actions that are associated with a scenario analysis are described in the following table.

States and UI actions that are associated with a scenario analysis

State	UI action	Description
Draft	In the All scenario analysis form, select **New**.	More details about the UI actions for this state: • In the All scenario analysis form, select **New**, add information in the **Details** tab, and select **Save**. A record is automatically created in the **Draft** state. • On the **Scope** tab, select **Add** to add a service from the list of the available services. **Note:** The services are fetched from the Services (OR) entity type in the Operational Resilience application. • Some services in the Operational Resilience application are associated with specific dependencies, for example, Acer or Adtran. To select a service that is associated with a dependency, select **Add dependency related scope**. • On the **Dependencies** tab, select **Add** to associate a dependency with the scenario analysis as shown in the following example. Some dependencies are associated with specific services. You can add a dependency that is related to a specific service by selecting **Add scope related dependency**.

States and UI actions that are associated with a scenario analysis (continued)

State	UI action	Description
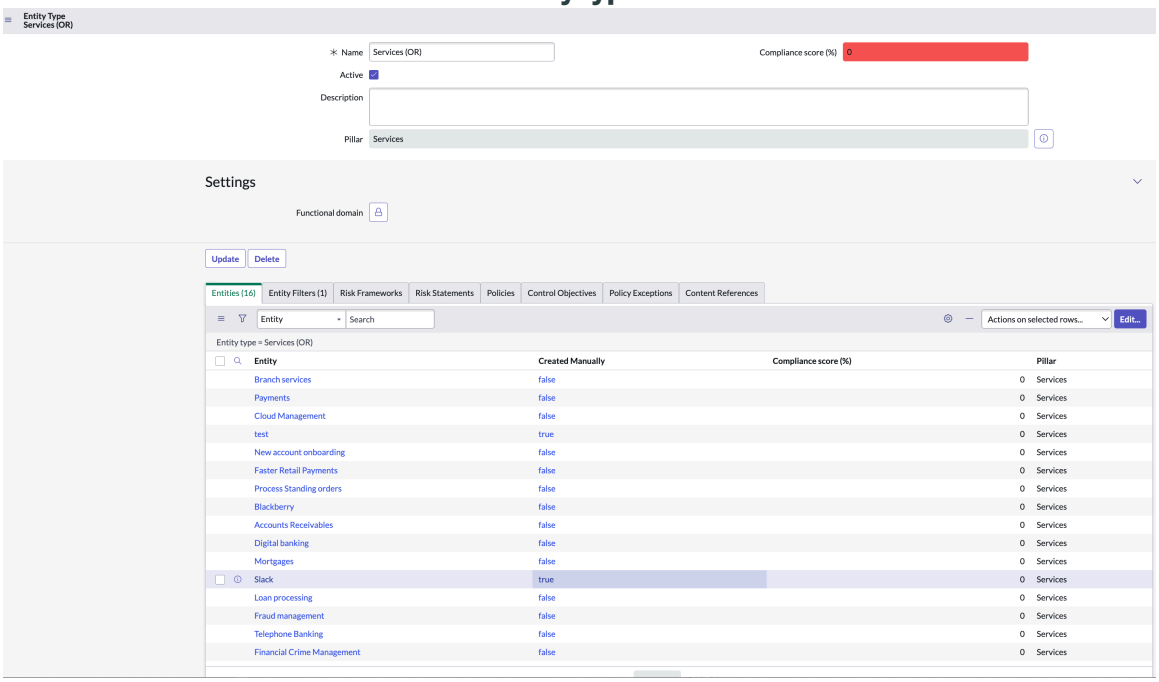
		this state in the scenario analysis form. To request an approval from the analysis approver, in the analysis form, select **Request analysis approval**. The state of the scenario analysis is then updated to **Pending analysis approval**.
Pending analysis approval	Navigate to the **Approvals** tab and update the state from **Requested** to **Approved**.	If you're the analysis approver, you can review the analysis scope in this state. Check the progress on the analysis for the selected business service. You can then approve or reject the analysis.
Approved	In the analysis form, select **Save**.	When you approve the scenario analysis, the state of the scenario analysis is updated to **Approved**. If you reject the scenario analysis, the state of the scenario analysis is reset to **Analyze**. When the state of the scenario analysis is in the **Approved** state, you can close the scenario analysis.
Closed	In the analysis form, select **Close**.	As an owner of the scenario analysis, you can close the scenario analysis. The state is updated to **Closed**.

Fetching the service entities from the Services (OR) entity type

The Operational Resilience application fetches the service entities from the Services (OR) entity type as shown in the following example.

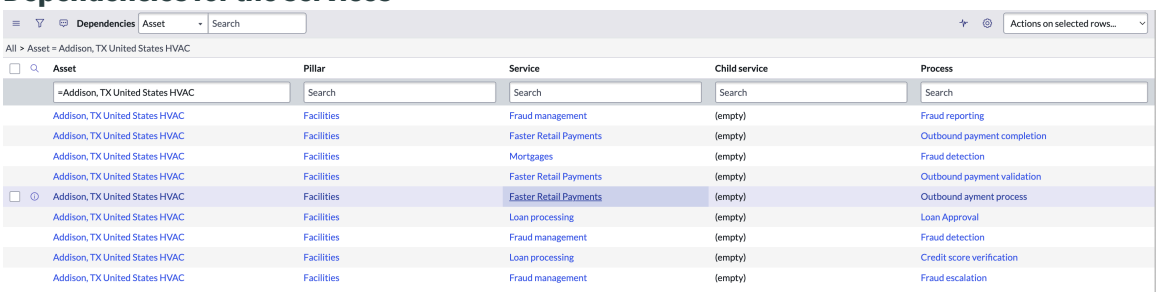


Services OR entity type

Users with the sn_oper_res.admin role can view the Entity Types module and its related lists in the Operational Resilience application UI as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service entities under the Services OR entity type



Note:
You can only select the entities that belong to the Facilities, People, Suppliers, and Technology pillars. The Services and Processes pillars are filtered out from the list of the pillars for the entities.

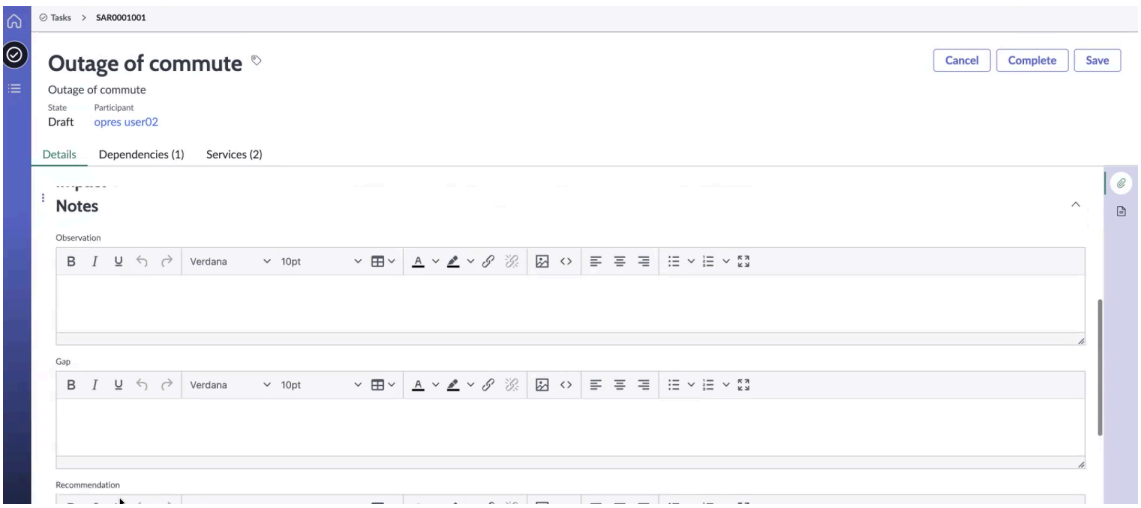
Dependencies for the services

Each service has a few dependencies associated with it. The *Compute Operational Resilience Compliance* scheduled job runs in the background and populates the dependencies for the services. The following example shows that the Addison, TX United States HVAC entity is listed as a dependency for supporting the Faster Retail Payments service.

Dependencies for the services

You can only select the dependencies that belong to the Facilities, People, Suppliers, and Technology pillars. The Services and Processes pillars are filtered out from the list of the pillars for the dependencies.

Response tasks



As a scenario analysis owner, when you create a scenario event and add a participant to it, a response task is automatically created for the participant. When a participant is assigned to a scenario event, a response task is created. An email notification is automatically sent to the participant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the **Responses** tab, the details of the response task such as the response task number, name of the assigned participant, and state of the response task are displayed.

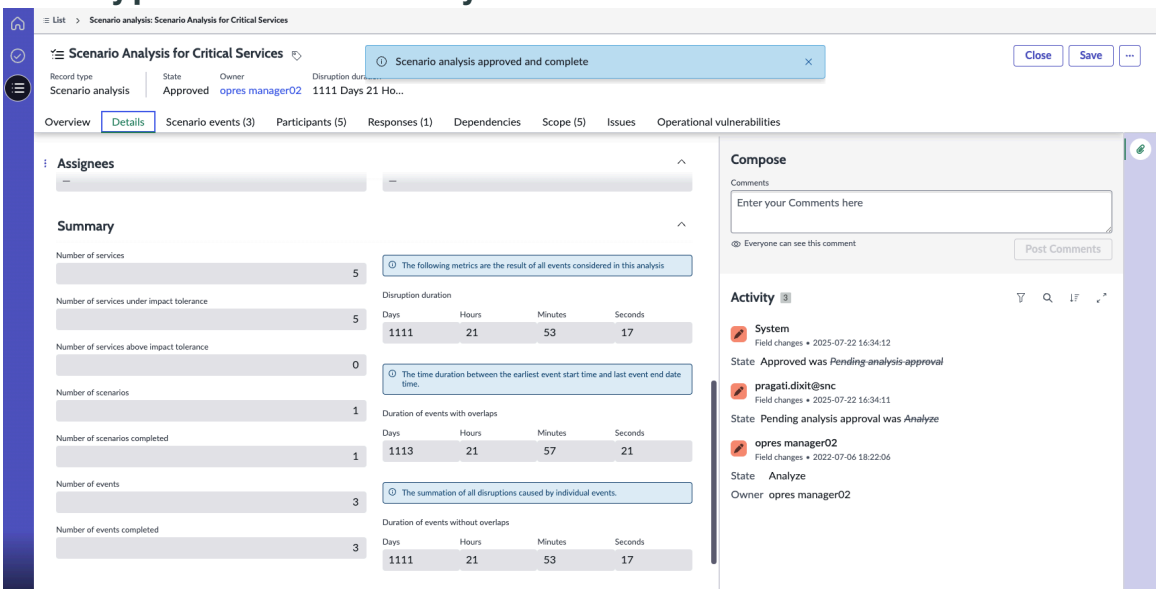
The owner of the scenario event can add a service and a dependency to the response task. The assignee of the response task can complete the response task, add their notes about the scenario event, and update the impact duration of the scenario event as shown in the following example.

Notes about the scenario event

Known issue for upgrading from Release 15.x.x to Release 16.x.x

While upgrading from Release 15.x.x to Release 16.x.x, if you have a scenario analysis in the **Analyze** state and a participant is already added to the scenario analysis, a response task is not created automatically. This is a known issue.

As a workaround for this issue, the Operational Resilience manager must remove the participants from the scenario analysis and add them to the same scenario analysis. The Operational Resilience application then automatically creates a response task for the scenario analysis.



Note:
You can also choose to proceed with the scenario analysis without a response task.

Summary of the services, scenarios, disruptions, and events

You can view information on the services, scenarios, disruptions, and events in the Summary panel as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary panel of the scenario analysis form

The Summary panel provides information about the business services, associated scenarios, disruptions, and events. For a description of the field values, see the following table.

Summary of the services, scenarios, disruptions, and events

Field	Description
Number of services	Number of services that are associated with the scenario analysis.
Number of services under impact tolerance	Number of services that are associated with the scenario analysis and that are under the impact tolerance.
Number of services above impact tolerance	Number of services that are associated with the scenario analysis and that are above the impact tolerance.
Number of scenarios	Number of scenarios that are associated with the analysis.
Number of scenarios completed	Number of completed scenarios that are associated with the analysis.
Number of events	Number of events that are associated with the analysis.
Number of events completed	Number of completed events that are associated with the analysis.
Disruption duration	Time duration between the end time of the last event and the start time of the first event. It is displayed in the number of days.
Duration of events with overlaps	Summary of all event durations including the overlapping events and pauses. It is displayed in the number of days and minutes.
Duration of events without overlaps	Summary of all event durations without the overlapping events and pauses. It is displayed in the number of days and minutes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a scenario analysis

Create a scenario analysis for the business service in Operational Resilience Workspace. You can analyze the impact of the scenarios and associated events. You can then calculate the disruptions and determine if any of your services are breached.

Before you begin

Role required: sn_oper_res.manager

About this task

If you have the sn_oper_res.manager role, you can create a scenario analysis. Only the owner of the scenario analysis and the user with the sn_oper_res.admin role can edit the analysis. After you review the analysis, you can request an approval. When the analysis is in the **Approved** state , you can close it.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace**, select the list icon) and then navigate to **All scenario analysis**.
2. To create a scenario analysis, select **New**.
   The Create New Scenario analysis form is displayed.
3. In the Scenario analysis panel, enter the name, description, and goal for the scenario analysis.
   The number for the scenario analysis is auto-filled by the system.
4. In the **Analysis start date** field in the Milestones panel, enter the start date for the analysis in the *YYYY-MM-DD HH:mm:ss* format.
   Participants receive a notification link to access the record in the Operational Resilience Workspace and start their analysis on the Analysis start date.
5. In the **Plan approver** field in the Assignees panel, select the plan approver for the analysis.
6. In the **Analysis approver** field, select the owner, plan approver, and analysis approver for the analysis.

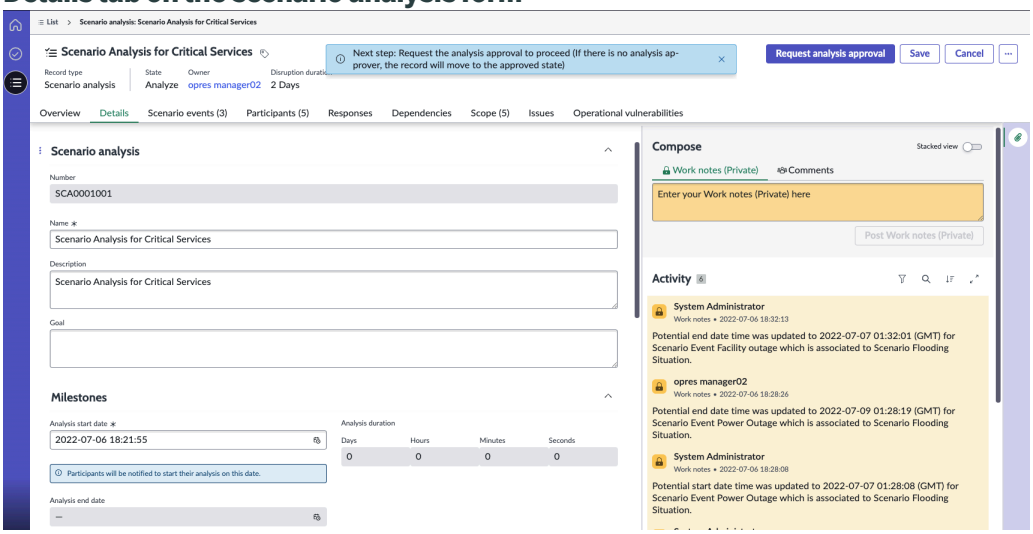
   The logged-in user is automatically assigned as the owner of the analysis.

   For the descriptions of the field values on the User New record form, see Create New Scenario analysis form.

   A sample scenario analysis form is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample scenario analysis form



7. To start a Sidebar discussion on the scenario analysis, select **More actions** and select **Discuss**.
   a. Add the subject for the discussion and add participants that have access to the record.
   b. Include a brief message for the participants.
   c. Select **Start discussion**.
8. To delete the scenario analysis, select **Delete**, confirm the deletion, and select **OK**.
9. To save the scenario analysis, select **Save**.

Result

The scenario analysis is saved and its state is updated to **Draft**.

The following example shows that on the **Details** tab, you can see the details about the scenario analysis, its important dates, and assignees.

Details tab on the scenario analysis form

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Add the scenario events, scope, assets, and participants to the analysis. You must associate at least one scope to begin the analysis. For more information on adding a scope and dependencies, see Associate a scope and define the dependencies.

Create New Scenario analysis form

Use the Create New Scenario analysis form in Operational Resilience Workspace to add the details about the scenario analysis, milestones, assignees, and so on.

Create New Scenario analysis form

For a description of the field values, see the following table.

Create New Scenario analysis form

Field	Description
Scenario analysis panel	
Number	Number of the scenario analysis. When you create a scenario analysis, the application creates a scenario analysis and assigns it with a unique identification number. This field is auto-filled.
Name	Name of the scenario analysis.
Description	Description for the scenario analysis.
Goal	Specific goal that you want to achieve by performing the scenario analysis. For example, your goal might be to analyze the critical services for your business.
Milestones panel	
Analysis start date	Date to start the scenario analysis. The owner of the analysis fills in the Analysis start date. A notification is sent to the participants to start their analysis on this date.
Assignees panel	
Owner	Owner of the scenario analysis.
Plan approver	Approver of the scenario analysis plan.
Analysis approver	Approver of the scenario analysis.
Compose panel	
Work notes	Work notes for the activities that are related to the record.
Additional comments (Customer visible)	More comments that can be shared with the customer.
Activity panel	
Activity section	List of activities with the dates and times that are related to the scenario analysis.
Tabs associated with the scenario analysis

Create New Scenario analysis form (continued)

Field	Description
Scenario Events	**Note:** You must add at least one service, one scenario event, and one participant before proceeding with the scenario analysis. Scenario events that an analysis owner can associate with the analysis. As an owner, select **Add** to associate a scenario event with the analysis. When you add a scenario event to the analysis, the following details about the event are displayed on the form: • Name. For example, Facility outage. • Event group. For example, Infrastructure Events. • Scenario. For example, Flooding Situation. • Pillars. For example, Facilities, People, Suppliers, or Technology. • Potential start date time. For example, the date and time when a user starts working on the event. • Potential end date time. For example, the date and time when a user finishes working on the event. • Duration. For example, the calculated duration of the event. • Observations. For example, the observations about the scenario event. • Gaps. For example, the gaps or missing information about the scenario event. • Recommendations. For example, the recommendations about the scenario event. • Status of the scenario event.
Services	Services that an analysis owner can associate with the analysis. As an owner, select **Add** to associate a service with the analysis. When you associate a service with the analysis, the following details about the service are displayed on the form: • Name • Owned by • Importance • Impact tolerance • Disruption duration • Breach status • Deviation (%)
Participants	Participants that an analysis owner can add to the analysis. To add a new participant, you can select **New** on the form. When you add a participant to the analysis, the following details about the participant are displayed on the form:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Scenario analysis form (continued)

Field	Description
	• Name • Role • Instruction
Dependencies	Assets that are added to a scenario analysis. When you add an asset to the analysis, the following details about the asset are displayed on the form: • Name of the asset • Associated analysis scenario event
Responses	Response task that is associated with the scenario event. The following details are displayed on the Responses form: • Number • Participant • State • Short description • Observation • Gap • Recommendation
Issues	Issues that are associated with the scenario analysis. The following details are displayed on the Issues form: • Issue • Number • State • Priority • Assigned to • Issue manager • Scenario event
Summary	
Number of services	Number of services that are associated with the scenario analysis.
Actual start date	Actual start date of the scenario analysis.
Actual end date	Actual end date of the scenario analysis. This field is auto-filled.
Actual duration	Actual duration of the scenario analysis. This field is auto-filled.
Number of services under impact tolerance	Number of services that are associated with the scenario analysis that are under the impact tolerance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Scenario analysis form (continued)

Field	Description
Number of services above impact tolerance	Number of services that are associated with the scenario analysis that are above the impact tolerance.
Number of scenarios	Number of scenarios that are associated with the analysis.
Number of scenarios completed	Number of completed scenarios that are associated with the analysis.
Number of events	Number of events that are associated with the analysis.
Number of events completed	Number of completed events that are associated with the analysis.
Disruption duration	Time duration between the end time of the last event and the start time of the first event.
Duration of events with overlaps	Summation of all event durations including the overlapping events and pauses.
Duration of events without overlaps	Summation of all event durations without the overlapping events and pauses.
Approvers	Approvers that are associated with the scenario analysis.

Associate a scope and define the dependencies

Associate a scope by adding services and define the dependencies with the scenario analysis by adding services. You can then begin to analyze the impact of the scenarios and events in Operational Resilience Workspace.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis** and open the scenario analysis that you're working on.
2. On the **Scope** tab, select **Add**.
   A list of all available services that are fetched from the Services (OR) entity type is displayed.

   a. Select one or more services from the list and select **Add**.

   The selected service is successfully added as the scope of the analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. To add the scope related to a dependency, select **Add dependency related scope**, select the dependency, and select **Add** again.

> **Note:**
> In the Operational Resilience application, some of the services use specific dependencies. You can add the services that are related to a dependency. You must add one or more dependencies on the **Dependencies** tab, as explained in the previous step, before you can add one or more dependency related services to the analysis.

3. To add a dependency to the scenario analysis, select **Add** in the **Dependencies** tab.

a. Select one or more dependencies from the list and select **Add**.
The dependencies are displayed on the **Dependencies** tab.

b. To add the scope related to a dependency, select **Add scope related dependency**, select the dependency, and select **Add** again.

4. Select **Save**.

Request the plan approval

Request the plan approval from the analysis approver. You can then proceed with the scenario analysis in Operational Resilience Workspace.

Before you begin
Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis** and select the scenario analysis that you're working on.
2. Select **Request plan approval**.
   As the plan approver, you can log into the scenario analysis and complete the process.

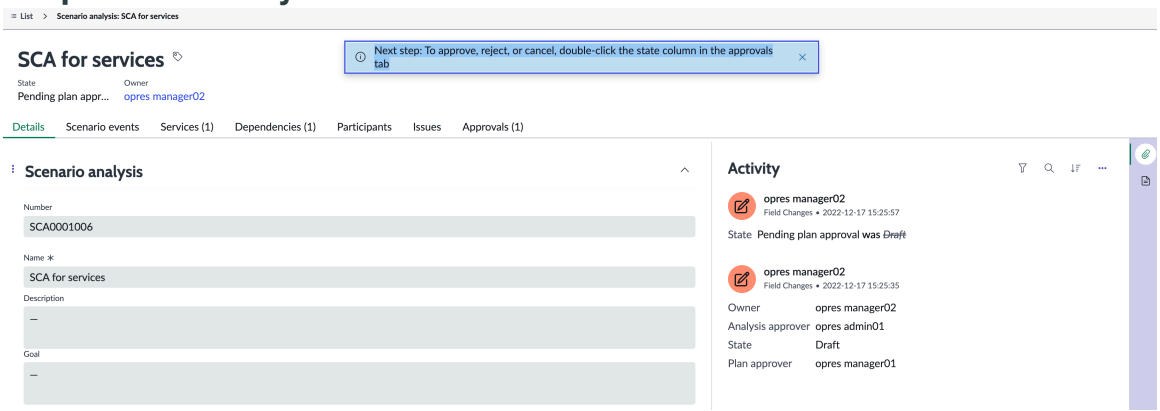
   The state of the scenario analysis is updated to **Pending plan approval**. The state and the owner of the scenario analysis are displayed in the header of the scenario analysis form.
3. To approve, reject, or cancel the scenario analysis, double-click the State column.
4. To reject the scenario analysis, update its state to **Rejected** and select **OK**.
5. To cancel the scenario analysis, update its state to **Canceled** and select **OK**.
6. To approve the scenario analysis in the **Pending plan approval** state, update its state to **Approved** and select **OK**.
   The state of the scenario analysis record is updated to **Analyze**.

What to do next
As the next step, request analysis approval. For more information, see Submit the scenario analysis and receive an approval.

Approve the plan for the scenario analysis

Approve the plan for the scenario analysis in Operational Resilience Workspace if you're the plan approver. You can track the actions for the scenario analysis by checking your email notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

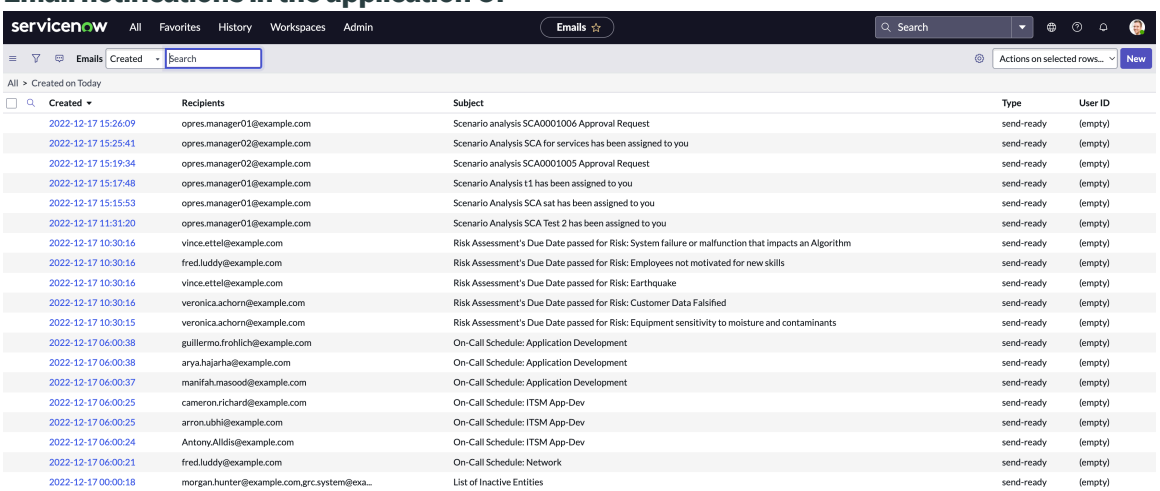


Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **All** > **Operational Resilience Workspace** > **All scenario analysis** and select the scenario analysis that you're working on.
2. Log in as the plan approver of the scenario analysis and navigate to the **Approvals** tab.
   A sample scenario analysis form is shown in the following example.



Sample scenario analysis form

3. Check your emails for notifications.

   a. Log in as an administrator and navigate to **All > Emails** in the application UI.
   During the execution of a scenario analysis, the email notifications are automatically sent to the owner, approver, and participants. You can view the email notifications as displayed in the following example.

Email notifications in the application UI

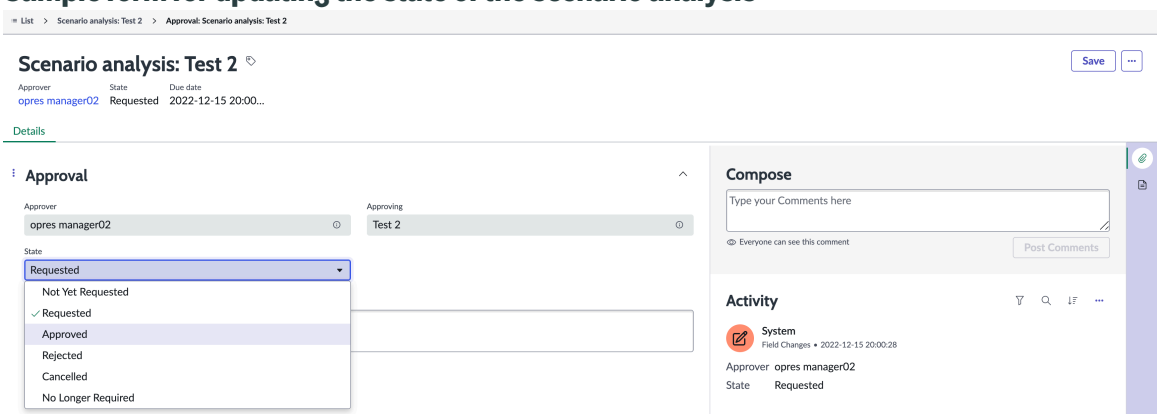
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email notifications in the application UI

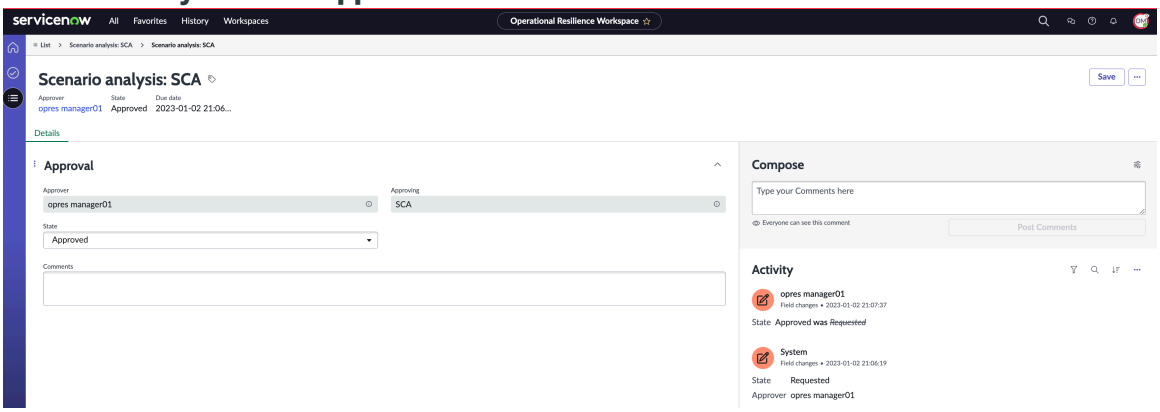


d. In the email, select **Approve**.

You can approve or reject the scenario analysis from the **Comments** section or you can view the **Approval Request** links as shown in the example. The approved analysis is updated to the **Analyze** state. The rejected scenario analysis is reset to the **Draft** state.

4. To approve, reject, or cancel the scenario analysis, double-click the state column on the **Approval** tab.
A sample form for updating the state of the scenario analysis is shown in the following example.

Sample form for updating the state of the scenario analysis



5. Update the state from **Requested** to **Approved**.

6. In the scenario analysis form, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a plan approver, you've approved the scenario analysis as shown in the following example.

Scenario analysis that is approved

Adding a scenario event to the analysis

You can add a scenario event to the scenario analysis and analyze its impact on your business service. If you are the scenario analysis owner, you can add the stakeholders and reviewers to the scenario analysis in Operational Resilience Workspace. You can then collate the observations of all participants and use their inputs to analyze the scenario.

Workflows for adding a scenario event

You can add a scenario event to the scenario analysis by completing one of the following workflows:

- You can add a scenario event to the scenario analysis first and then add the participants, dependencies, services, issues, and so on. For more information on this workflow, see Add a scenario event.
- You can also add a participant to the scenario analysis first and then add the scenario event, services, issues, and so on. For more information on this workflow, see Add a participant and monitor the responses.

Add a scenario event

Add a scenario event to the scenario analysis and analyze its impact on the business service. By adding the participants, dependencies, services, issues to the scenario analysis in Operational Resilience Workspace, you can determine the impact of the scenario event on the business service.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis** and select the scenario analysis that you own.
2. On the **Scenario events** tab, select **Add**, select an event from the list, and select **Add** again.

   a. Select **Add**.

   b. In the Scenario events form, select an event from the list and select **Add**.

   For the descriptions of the field values on the Scenario event form, see Scenario event form.

   In the **Scenario events** tab, the selected scenario event is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Open the scenario event from the list.
   The scenario event form is displayed as shown in the following example.

4. Navigate to the **Participants** tab in the scenario event form and then either add a participant from an available list or add a new participant.

   a. Select **New**.
      The Create New Participant form is displayed.

      The name of the scenario analysis is auto-filled by default.

   b. In the **Role** field, select a role for the participant.
      The following options are available for the role: HR, Legal, Finance, Technology, People, Data, Security, Supplier Tier1, Supplier Tier2.

   c. In the **Participant** field, select a participant from the list in the Participant form.
      When you select a participant, the role is auto-filled in the Role field.

   d. In the **Instruction** field, add instructions for the participant.

   e. Select **Save**.

      When you create a scenario event and add a participant to it, a response task is automatically created for the participant. An email notification is automatically sent to the participant.

5. On the **Responses** tab, select the response task and on the form, fill in the fields.

   a. Complete the open response task and select **Complete**.
      The response task is completed and the state of the response task is updated to **Closed Complete**.

   On the **Responses** tab, the details of the response task such as the response task number, name of the assigned participant, and state of the response task are displayed. For the descriptions of the field values on the scenario analysis response task form, see Scenario analysis response task form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the **Dependencies** tab, select **Add** to add a dependency or select **Add scope related dependency** for the scenario event.
7. On the **Scope** tab, select **Add** to add the scope or select **Add dependency related scope** for the scenario event.
8. On the **Issues** tab, select the issues that are associated with the event.
9. Log in as an owner of the scenario analysis, navigate to the open scenario event, and update its state from **Draft** to **Completed**.
10. Update the **Potential start date time** and **Potential start date time**.
    The scenario event form is displayed.

Result

The state of the scenario analysis is updated to **Analyze**.

Scenario event form

Use the Scenario event form in Operational Resilience Workspace to associate a scenario event with your scenario analysis.

Scenario event form

For a description of the field values, see the following table.

Scenario event form

Field	Description
Details tab	
Analysis scenario event panel	
Event Name	Unique name for the event. This field is auto-filled.
Event group	Unique name for the event group. This field is auto-filled.
Status	Status of the event. Available options are: • Draft • Completed
Description	Description of the event. This field is auto-filled.
Scenario	Scenario associated with the event. This field is auto-filled.
Pillars	Pillars associated with the event. This field is auto-filled.
Description	Description of the event. This field is auto-filled.
Impact panel	
Potential start date time	Potential start date and time for the event. This field is auto-filled.
Potential end date time	Potential end date and time for the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario event form (continued)

Field	Description
Duration	Duration of the event. This field is auto-filled.
Notes	
Observations	Observations added for the event by the participant.
Gaps	Gaps added for the event by the participant.
Recommendations	Recommendations added for the event by the participant.
Participants tab	
Scenario analysis	Scenario analysis that is associated with the scenario event. This field is auto-filled.
Role	Role of the participant. Available options are: • HR • Legal • Finance • Technology • People • Data • Security • Supplier Tier1 • Supplier Tier2 • Supplier Tier3
Participant	Participant of the scenario analysis such as Operational Resilience administrator or manager.
Instruction	Text box for adding the instructions for the participants of the scenario event.
Responses	Details about the response task such as its number, participant, impact duration, state, and so on.
Dependencies	Dependencies (assets) that are associated with the scenario event.
Scope	Services that are associated with the scenario event.
Issues	Issues that are associated with the scenario event.

Scenario analysis response task form

Use the Scenario analysis response task form in Operational Resilience Workspace to add the details about the response task that is associated with a scenario event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario analysis response task form

For a description of the field values, see the following table.

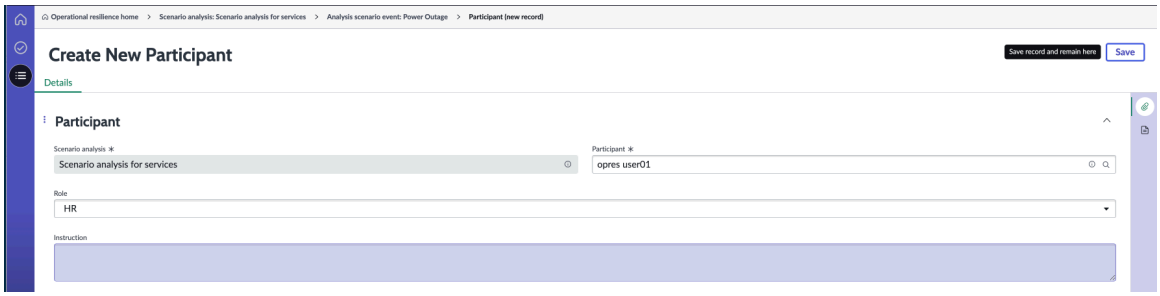
Scenario analysis response task form

Field	Description
Scenario Analysis Response panel	
Number	Number of the scenario analysis response task such as SAR0001006. This field is auto-filled.
Role	Role of the assignee of the response task.
Instruction	Instruction for the assignee of the response task.
Impact panel	
Impact duration	Impact duration of the scenario event in Days, Hours, Minutes, and Seconds.
Notes panel	
Observations	Observations about the scenario event that are added by the assignee of the response task.
Gaps	Gaps or inconsistencies about the scenario event that are added by the assignee of the response task.
Recommendations	Recommendations about the scenario event that are added by the assignee of the response task.
Scenario analysis panel	
Scenario analysis	Name of the scenario analysis.
Pillar	Pillars that are associated with the scenario analysis.
Description	Description of the scenario analysis.
Goal	Goal for performing the scenario analysis.

Add a participant and monitor the responses

Add a participant to the scenario analysis first and then add the scenario event, services, issues, and so on. If you are the scenario analysis owner, you can add the stakeholders and reviewers to the scenario analysis in Operational Resilience Workspace. You can then collate the observations of all participants and monitor their responses to analyze the scenario.

Before you begin



Role required: sn_oper_res.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis** and select the scenario analysis that you own.
2. Navigate to the **Participants** tab in the scenario event form and then either add a participant from an available list or add a new participant.

   a. Select **New**.
   The Create New Participant form is displayed as shown in the following example.

   The name of the scenario analysis is auto-filled by default.

   b. In the **Participant** field, select a participant from the list in the Participant form.
   When you select a participant, the role is auto-filled in the Role field.

   c. In the **Instruction** field, add instructions for the participant.

   d. Select **Save**.

   You can view the tabs on the Participant form as shown in the following example.

   When you create a scenario event and add a participant to it, a response task is automatically created for the participant. The following example shows that when a participant is assigned to a scenario event, a response task is created.

   An email notification is automatically sent to the participant.

   On the **Responses** tab of scenario analysis responses, the details of the response task such as the response task number, name of the assigned participant, and state of the response task are displayed. An email notification is sent to the assigned user.

3. On the **Responses** tab, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Log in as the assigned user of the scenario analysis response and update the impact duration of the scenario analysis response in days, hours, minutes, seconds in the **Impact Duration** field.

b. Add notes in the **Observation**, **Gap**, and **Recommendation** fields.

c. Modify the dependencies and scope for the scenario analysis response.

d. To save the scenario analysis response, select **Save**.

e. To mark the scenario analysis response as complete, select **Complete**.
The state of the scenario analysis response is updated to **Closed Complete**.

f. Log out from the scenario analysis response record.

For the descriptions of the field values on the scenario analysis response task form, see Scenario analysis response task form.

4. Log in as the owner of the scenario event.
5. On the **Dependencies** tab, add a dependency for the scenario event.
6. On the **Scope** tab, add the scope for the scenario event.
7. On the **Issues** tab, select the issues that are associated with the event.
8. Ensure that the open response task is complete.
9. Verify that the **Potential start date time** and **Potential start date time** are filled in for the scenario event.
10. Update the state of the scenario event from **Draft** to **Completed**.

What to do next

To associate an issue or operational vulnerability with the scenario analysis, see Link issues and operational vulnerabilities.

Link issues and operational vulnerabilities

Link an issue to your scenario analysis by either creating a new issue or adding an existing one. You can also include operational vulnerabilities in the analysis to identify resilience gaps and create a plan to mitigate them.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis** and select the scenario analysis that you're working on.
2. In the scenario analysis form, navigate to the **Issues** tab.

You can add an existing issue to the analysis or create an issue that you can add to the analysis.

Note:
If you've associated an open issue with your scenario analysis, you can still request an approval for the scenario analysis. It isn't required to close the open issues for requesting an approval for the scenario analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Operational vulnerabilities tab, add an operational vulnerability to the scenario analysis.

   a. Select **New**.
   The Create New Operational vulnerability form is displayed.

   b. On the form, fill in the fields.
   For more information on the fields, see Create New Operational vulnerability form.

4. Select **Save**.

What to do next

Request the scenario analysis approval and as the analysis approver, approve the scenario analysis. For information, see Submit the scenario analysis and receive an approval.

Submit the scenario analysis and receive an approval

Submit the scenario analysis for an approval in the Operational Resilience Workspace. The analysis approver for the scenario analysis reviews the details and subsequently approves it. Having an scenario analysis is the final step in the workflow.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to the scenario analysis that you're working on in one of the following ways:
   - **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis**
   - **Workspaces** > **Operational Resilience Workspace** > **Tasks** > **Scenario analysis approvals**

   If you navigate to the scenario analysis from the Tasks page, you can skip steps 2 and 3 and update the state of the scenario analysis as outlined in step 4.

2. Select **Request analysis approval**.

   Note:
   To submit the analysis result, you must select at least one scope, one participant, and one event.

   The state of the scenario analysis is updated to **Pending analysis approval**.

3. Ensure that the scenario event associated with the scenario analysis is completed and its status is shown as **Completed**.

   Note:
   The potential start date time and end date time cannot be empty before completion of the scenario event.

4. As the analysis approver for the scenario analysis, log into the instance and navigate to the scenario analysis.
5. To approve, reject, or cancel the scenario analysis, double-click the State column in the **Approvals** tab.
6. Update the state of the scenario analysis to **Approved**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.
   The scenario analysis is approved by the analysis approver and the state of the scenario analysis is updated to **Approved**. This action completes the scenario analysis workflow.

Close the scenario analysis

Close the scenario analysis in the Operational Resilience Workspace. Typically, scenario analyses that are incomplete or canceled are moved to the **Closed** state. Once closed, you can share your observations and notes with stakeholders.

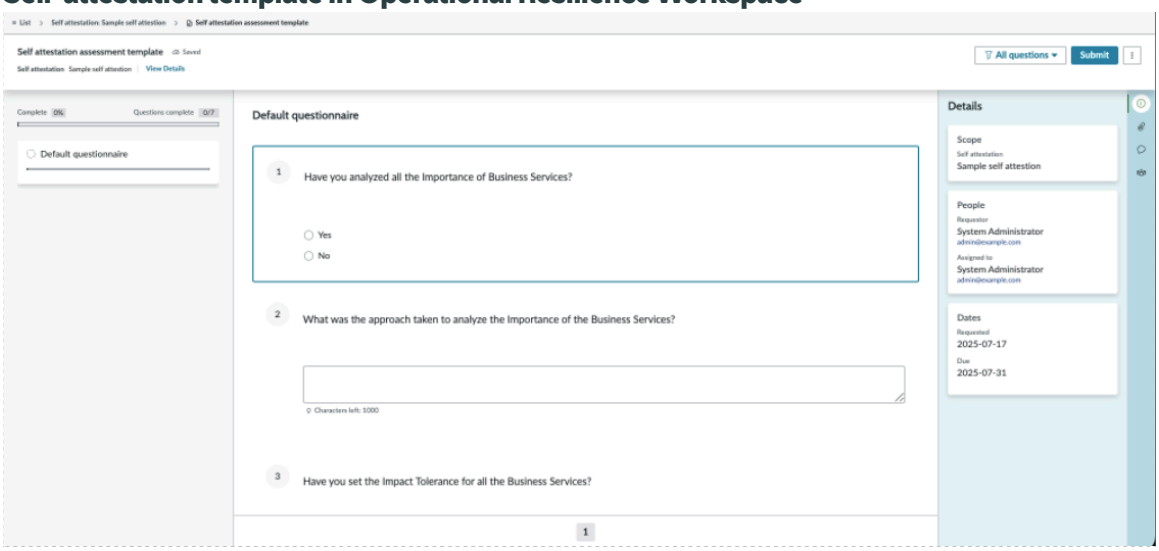
Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All scenario analysis** and select the scenario analysis that has been approved.
2. Select **Close**.
   Typically, incomplete or canceled scenario analyses are moved to the **Closed** state. When the owner of the scenario analysis closes the scenario analysis, its state is updated to **Closed**.

Certifying services using self-attestation



Certify the operational resilience status of your business services by completing the self-attestation process in the Operational Resilience Workspace. Complete the self-assessment questionnaire about the services, generate a self-attestation report, and upload the PDF so that you can have a copy of the report for your records. You can perform self-attestation on the selected business service and its child records.

Creating a self-attestation

To create a self-attestation in the Operational Resilience application, navigate to **All** > **Operational Resilience Workspace** > **All self attestations** in an instance.

Use the self-attestation template supported by the Smart Assessment Engine to submit an assessment on the services. The following example shows the self-attestation template in the Operational Resilience Workspace.

Self-attestation template in Operational Resilience Workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Self-attestation tasks and the states related to each task

With the sn_oper_res.manager role, you can complete the following self-attestation tasks in Operational Resilience Workspace:

1. Initiate a self-attestation to attest one or more business services.
2. Select the assessment type as Smart Assessment.
3. Select the Operational Resilience Attestation Template as the attestation template.
4. Use the Default Self Attestation HTML Template as the PDF template for the self-attestation in the self-attestation form. This template provides the format for the PDF and an option to include your e-signature in the report. For instructions on configuring the attestation template, see Create and edit the attestation template.
5. Add the services that you want to certify the status for in the self-attestation form. Respond to the pre-defined set of questions in the assessment, such as the names and description of the services, details on the scenario analysis of the important services, your approach for the scenario analysis, and so on.
6. Submit the assessment and attest for the services.
7. Download a PDF of the self-attestation from the Activity section of the self-attestation form and save a copy of the report for your records. For instructions on configuring the attestation PDF template, see Create HTML and PDF document templates.
8. Close the self-attestation so that the self-attestation process is complete.

As you complete the self-attestation tasks outlined in the self-attestation process, the associated states are automatically updated in a predetermined sequence. The states and corresponding UI actions for these tasks are detailed in the following table.

States and UI actions related to the self-attestation tasks

States	Associated UI actions	Description
Draft	Select **New** in the self-attestation form.	When you select **New** to submit a self-attestation for the services, a record is created in the **Draft** state by default. The information on the self-attestation is displayed on the **Details** tab in the self-attestation form.
Awaiting attestation	Select **Attest** in the self-attestation form.	When you select the services that you want to certify, you can choose the attestation template and select **Attest** to proceed with the attestation. The application then creates an assessment instance automatically on the **Assessment Instances** tab. This action moves the state of the self-attestation record to **Awaiting attestation**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States and UI actions related to the self-attestation tasks (continued)

States	Associated UI actions	Description
		Note: To proceed with the attestation process, you must associate at least one service with the self-attestation.
Cancelled	In the self-attestation form, select **Cancel** .	When the self-attestation record is in the **Awaiting Attestation** state, you can cancel an erroneous or invalid attestation by selecting **Cancel** in the self-attestation form. This is an optional step. The state of the self-attestation is then updated to **Cancelled**.
Attestation received	In the attestation template, select **Submit** and select **Save** to complete the attestation process. Select **Export to PDF** to export the questionnaire response to a PDF.	When the self-attestation record is in the **Awaiting attestation** state, you can respond to the assessment questions that are given in the attestation template. To submit the responses, select **Submit** and then select **Save** to save the assessment. The state of the self-attestation is automatically updated to **Attestation received**. Select **Export to PDF** to export the questionnaire response to a PDF, sign the self-attestation, and save a copy for your records. You can download the PDF from the Activity section of the self-attestation form.
Closed	Select **Close** in the self-attestation form.	To close the attestation, select **Close** in the self-attestation form. The state of the self-attestation is then updated to **Closed**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Optionally, if the self-attestation contains invalid data and you're the owner of the self-attestation, you can delete the self-attestation by selecting **Delete** in the self-attestation form. The self-attestation is then deleted from the self-attestations list in Operational Resilience Workspace.

Downloading the PDF of the self-attestation

As an owner of the self-attestation, you can download the PDF from the Activity section of the self-attestation form. You can also share it offline with the auditors, external contacts, or stakeholders.

Roles required to perform the self-attestation tasks

If you're a user of Operational Resilience Workspace, you can perform different self-attestation tasks with the following roles:

- With the sn_oper_res.admin role, you can create and maintain the pre-defined assessment questionnaire templates.
- With the sn_oper_res.manager role, you can complete the self-attestation of the operational resilience profile of the services by selecting one or more services, by choosing the template for the self-attestation, and by providing the answers to a pre-defined set of questions.

Note:

If you're the owner of the self-attestation with the Operational Resilience manager or the Operational Resilience administrator role, you can create a self-attestation, update its details, or delete the self-attestation.

As an Operational Resilience administrator, you can create and modify the assessment questionnaire template. You must have the Operational Resilience manager role to respond to the assessment questionnaire in the Operational Resilience application.

Reference information

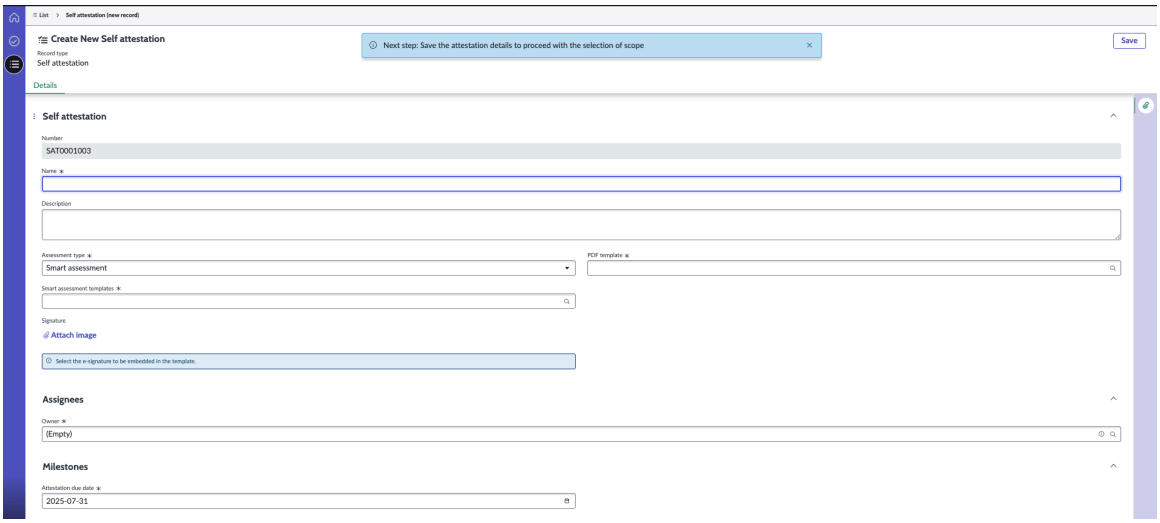
For more information on submitting a self-attestation in Operational Resilience Workspace, see Perform the self-attestation assessment.

For the description of the field values that are listed in the self-attestation form in the Operational Resilience Workspace, see Create New Self attestation form.

As an optional task, when you have the sn_oper_res.admin role, you can create a customized attestation template instead of using the default attestation template that is provided with the base system. For more information on creating a customized attestation template, see Create and edit the attestation template.

Perform the self-attestation assessment

Create an assessment for the self-attestation and certify the resilience status of services in the Operational Resilience Workspace. Perform the self-attestation assessment using the Smart Assessment template provided with the base system.



Before you begin
Role required: sn_oper_res.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** and select **All self attestations** from the list view.
2. Select **New**.
   You can create the self-attestation assessment in the Operational Resilience Workspace.

   The Create New Self-attestation form is displayed.

3. In the **Name** and **Description** fields, add the name and description for the self-attestation.
4. Choose the assessment type from the **Assessment type** field.
   You can select the type of assessment as shown in the table.

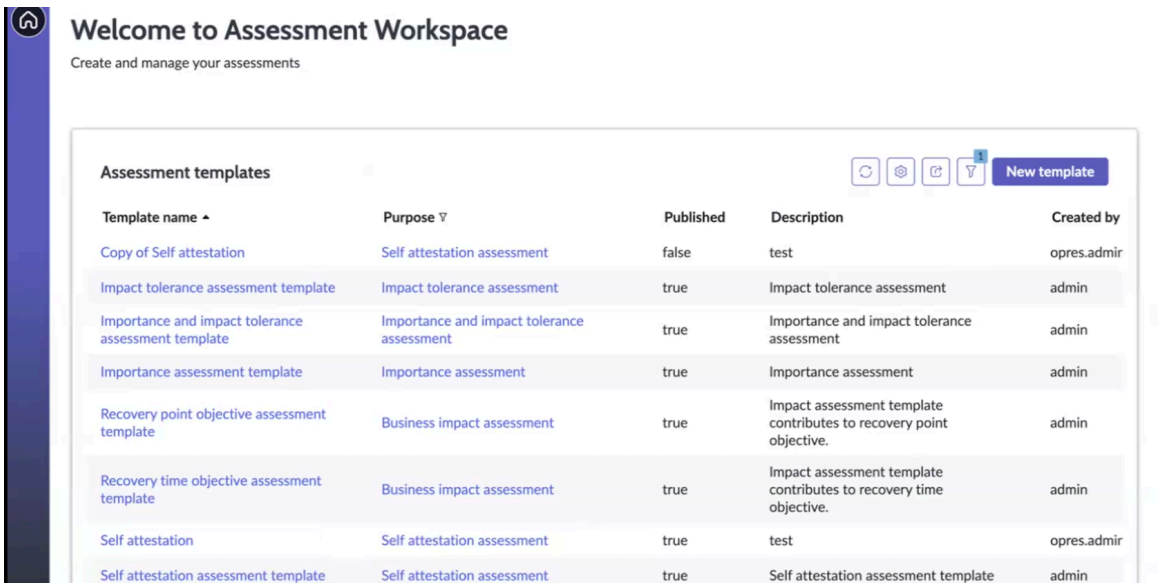
5. To use the Legacy assessment, select the **Operational Resilience Attestation Template** option.
   The attestation template contains the pre-defined questions for the assessment. The Operational Resilience application provides an attestation template as part of the base system.

   Note:
   If you have the sn_oper_res.admin role, you can customize the default attestation template for your own business needs. For information on creating a customized attestation template, see Create and edit the attestation template.

6. To use the Smart Assessment, select the default **Self attestation assessment template** populated in the **Smart assessment templates** field.

   The base version includes the default **Self attestation assessment template**, using the Smart Assessment, with a pre-configured questionnaire. Operational Resilience administrators can set up their own attestation templates in the Assessment Workspace and choose from various data types to suit their needs.

   Note:
   Before starting the self-attestation process, verify that Operational Resilience administrator has set up and published the Self-attestation template in the Assessment Workspace. If the Smart Assessment template for Self-attestation is not set up and published in the Assessment Workspace, it will not be displayed for selection in the **Smart assessment templates** field in the self-attestation form.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on setting up Smart Assessment templates, see Create and edit the attestation template.

For information on Smart Assessment documentation, see Create a Smart Assessment template and Create an assessment template.

When creating a template, ensure that you select **Self attestation assessment** as the purpose from the Assessment templates list in the Assessment Workspace as shown in the example.

7. Select the **Default Self Attestation HTML Template** from the **PDF Template** field.
   You can use the Default Self Attestation HTML Template to generate the PDF of the self-attestation report.

   Note:
   To access the PDF template option in the self-attestation form, ensure that the Document Templates application is installed on your instance. The PDF template option will only be visible if this application is available.

8. In the **Signature** field, select **Attach image** to attach the signature image for the self-attestation.
   The following informational message is displayed: *`Select the e-signature to be embedded in the template.`*

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must select the supported file format, such as either the JPEG, PNG, BMP, GIF, ICO, SVG format, for the signature image. If you select a file format that is not supported, such as the Microsoft Word format, the following error message is displayed on the screen: *Selected file type is invalid. Valid field types: JPEG, PNG, BMP, GIF, ICO, SVG.*

If you want to delete an existing image and add a new image instead, you can use the **Delete** icon in the **Signature** field and add another signature image.

9. In the Assignees panel, update the **Owner** field to select the owner of the self-attestation.
10. In the Milestones panel, add the due date for the self-attestation.
    The following informational message is displayed on the screen: *Next step: Save the attestation details to proceed with the selection of services.*
11. Select **Save**.
    The self-attestation details are saved in the instance.

    The self-attestation is created in the **Draft** state.

    The **Details** tab is updated with the self-attestation information. The attestation details are saved. You can define the scope of the self-attestation in the **Scope** tab.
12. In the **Scope** tab, select **Add**, select one or more services, and select **Add** again in the modal.
    You can select the services to be certified in the self-attestation report.

    Note:
    You must add at least one service to proceed with the self-attestation.
13. To send the attestation to the owner, select **Attest** in the form.
    The self-attestation record moves to the **Awaiting attestation** state and an assessment is created for it. The owner of the self-attestation record receives an email notification with a link to access the record in the Operational Resilience Workspace.

What to do next
Request responses on the assessment and then submit the self-attestation to the owner for the certification. For more information, see Submit the self-attestation report.

Create New Self attestation form

If you're the owner of the self-attestation, use the Create New Self attestation form in Operational Resilience Workspace to submit the self-attestation for the services.

Create New Self attestation form
For a description of the field values on the form, see the following table.

Create New Self attestation form

Field	Description
Details tab	
Number	Number of the self-attestation record. This field is auto-filled.
Name	Unique name for the self-attestation record.
Description	Helpful information about the self-attestation record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Self attestation form (continued)

Field	Description
Attestation template	Default attestation template that is provided with the base system and that is used for creating the self-attestation. The base version includes the default **Self attestation assessment template**, using the Smart Assessment, with a pre-configured questionnaire.
PDF template	Default PDF Template that is provided with the base system to export an attestation to a PDF. The name of the template is *`Default Self Attestation HTML Template`*.
Signature	Field to attach the signature image with the attestation. Select the e-signature that you can embed in the template. **Note:** You must select the supported file format, such as either the JPEG, PNG, BMP, GIF, ICO, SVG format, for the signature image.
Assignees panel	
Owner	Label for the self-attestation record that is displayed in the UI. This field is auto-filled.
Milestones panel	
Attestation due date	Date on which the attestation is due.
Attested date	Date and time when the attestation is certified.
Compose panel	
Additional comments (Customer visible)	Extra comments for the self-attestation. This field is auto-filled.
Work notes (Private)	Work notes for the self-attestation. This field is auto-filled.
Activity	Activities that are associated with the self-attestation.
Attachments	Attachments that are available with the self-attestation, such as the PDF of the self-attestation. You can download, rename, or remove the PDF from the form.
Scope tab (This tab is displayed after you add a service to the attestation.)	
Name	Name of the business service.
Owned by	Owner of the business service.
Business criticality	Business criticality of the service.
Assessment tab (This tab is displayed after you submit the attestation.)	
Operational Resilience	Assessment questionnaire for the services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Self attestation form (continued)

Field	Description
Attestation Template	**Note:** If you're the owner of the attestation, you can view the assessment. You can fill in the responses to the questions and submit the assessment for the self-attestation.

Submit the self-attestation report

Submit the self-attestation report to its owner for the certification. You can then generate the PDF of the self-attestation report in the Operational Resilience Workspace for your records.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **List** > **Self attestations** and select the self-attestation that you're working on.
2. Respond to the questions in the assessment as an assessor or owner in the **Assessment** tab. In the **Assessment** tab, an assessment questionnaire for the services is displayed. As an assessor, you can respond to the questions in the assessment.
3. To reassign the self-attestation to another assessor, update the **Assessor** field in the **Details** tab.

   Note: Reassignment and collaboration are not supported for self-attestation assessments. Any reassignment must be completed before the self-attestation moves to the **Awaiting Attestation** state and can only be performed from the **Assessment Details** tab.

4. Ensure that all questions are answered and select **Submit**.
   When you submit the assessment, your responses are stored in the application and then the state of the self-attestation is updated to **Attestation received**.
   When the self-attestation is updated to the **Attestation received** state, the attestation is complete and the **Export to PDF** button is displayed on the form.
5. To export the self-attestation report to the PDF format, select **Export to PDF**.
   The self-attestation PDF is generated for download and is available in the activity section of the self-attestation record, containing details such as the owner, name, description, template name, and responses to the questions.
6. To save the self-attestation record, select **Save**.
7. To close the self-attestation record, select **Close**.

Managing Operational vulnerability

Operational vulnerabilities are weaknesses in systems, processes, or procedures that can be exploited by attackers to compromise the security and integrity of an organization's operations. These vulnerabilities can arise from a variety of factors, including IT and non-IT operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vulnerability in operational processes

In today's ever-changing business environment, organizations may face various operational vulnerabilities at unforeseen times. These vulnerabilities can originate from IT-related issues or non-IT areas like third party problems or facility issues that might affect organizational functioning. Through Operational vulnerability, you can identify these weaknesses or vulnerabilities in IT systems and other operational processes within your organization.

Upon identifying vulnerabilities, analysts and owners undertake action tasks and determine the optimal response strategy. To address the vulnerability, stakeholders carry out risk assessments, pinpoint affected areas, and create corresponding assessment and treatment tasks. A treatment plan is then developed to either accept, avoid, mitigate, or transfer the vulnerability. Once the associated tasks are completed, approval for the vulnerability is requested. Following approval, the vulnerability is closed.

By addressing these vulnerabilities and implementing effective controls, organizations can significantly reduce the risk to their operations and ensure the timely delivery of the business services.

Starting with Release 19.0.x, the Operational vulnerability feature is integrated into the Operational Resilience application by default.

Get started

Explore  Learn about Operational vulnerability	**Configure**  Configure Operational vulnerability
Manage  Manage Operational vulnerability	**Reference**  Components installed with Operational vulnerability

To identify and address operational process vulnerabilities, follow these steps:

1. Report an operational vulnerability from the Employee Center or the Operational Resilience Workspace.
2. Identify and link the impacted and related areas to the operational vulnerability.
3. Generate action tasks and request approval for them.
4. Decide a treatment plan to address the operational vulnerability and conduct a root cause analysis.

Operational vulnerability

The Operational vulnerability capability in Operational Resilience empowers users to flag operational vulnerabilities or critical functionality gaps, engage with key stakeholders, analyze underlying causes, and identify remedies.

Using Operational vulnerability, teams can address issues stemming from violations, software gaps, or breaches. Users can submit reports on operational vulnerabilities through the Employee Center or directly create a report in the Operational Resilience Workspace.

Some typical operational vulnerabilities include the following situations:

- Exposed customer data
- Third party issues
- Software defects
- Political or environmental situations

Benefits of Operational vulnerability

The Operational vulnerability capability offers the following advantages to your organization:

- Empowers business users to report any discrepancies, breaches, or complaints that need team attention.
- Enables creation from multiple sources like importance and impact tolerance assessments, scenario analyses, self-attestations, and services.
- Records impacted and related organizational areas requiring attention, such as entities, locations, users, and companies.
- Facilitates collaboration among teams to investigate, assess, gather evidence, record observations, and decide on responses for further review.
- Enables initiation of remediation and preventive measures and conducts root cause analysis to eliminate the source of the vulnerability.

Defining technical and operational vulnerabilities

In an organization, operational vulnerabilities can be categorized into main groups:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Technical vulnerabilities: These are substantial gaps, flaws, or weaknesses within an organization's IT infrastructure. This category includes deficiencies in security protocols, system designs, internal controls, or daily operational practices.
2. Operational vulnerabilities: These pertain to non-IT, process-related, or external factors that could impact an organization's operations. Typically, these involve issues with third parties, facilities, or external situations that evade detection by scanning tools.

Workflows for Operational vulnerability

Resolving an Operational vulnerability involves several key steps:

1. Identification: Recognize the operational gap.
2. Assessment: Evaluate if the vulnerability needs to be addressed. This assessment, which can be done once or repeatedly, involves weighing the repair costs against the potential savings from fixing the issue.
3. Decision-making: Based on the assessment, determine the course of action. If the decision is to address the vulnerability, complete the following tasks:
   - Task assignment: Assign specific tasks to the relevant individuals.
   - Completion and verification: Once tasks are completed, verify that the vulnerability has been resolved.
4. Alternative path as acceptance: After assessment, the vulnerability may be accepted as is. In this case, no further action is taken, and the vulnerability is acknowledged and closed.

Use cases for Operational vulnerability

The situations outlined in the following examples demonstrate operational vulnerabilities. These issues cannot be detected by IT scanners but can be identified by subject matter experts. They represent weaknesses or gaps in daily operations, such as working with a particular third party or depending on a single facility.

Scenarios	Description
Working with a third party or relying on a single facility	Consider a company outsourcing its critical processes to third parties from a particular geography. Due to current affairs, the third-parties are prevented from providing the services and the company is prevented from receiving services from this geography. With a commitment to deliver the services to the customers, the company must identify an alternate third-party swiftly to continue operations. The key takeaway for the company is to address the risk of third-party concentration.
Non-IT related vulnerability that requires manual intervention	Consider a vital financial institution situated in a distant location. If a nearby situation puts the area at risk, the management team might identify this as a vulnerability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenarios	Description
	This serves as another example of a non-IT related vulnerability that necessitates manual intervention.

To tackle these operational vulnerabilities, an organization could investigate various approaches such as diversifying third parties across multiple regions or moving financial facilities. To implement these solutions, an organization would usually perform a cost-benefit analysis, weighing factors like the cost of mitigating the operational vulnerability and whether the solution is a one-time fix, temporary measure, or permanent solution.

Reporting Operational vulnerability

Any Operational Resilience application user can report an operational vulnerability that needs the attention of the Operational Resilience team.

Users of the Operational Resilience feature can report an operational vulnerability using one the following options:

- To create an operational vulnerability from the Employee Center, see Report operational vulnerability from the Employee Center. The user must have the Operational Resilience business user [sn_oper_res.operational_resilience_business_user] role.
- To create an operational vulnerability from the Operational vulnerability menu in the Operational Resilience Workspace, see Report an operational vulnerability from the module. The user must have the Operational Resilience manager [sn_oper_res.operational_resilience_manager] role.
- To create an operational vulnerability from the records in the Operational Resilience Workspace, see the following topics:
  - Report an operational vulnerability from the Importance assessment
  - Report an operational vulnerability from the Scenario analysis
  - Report an operational vulnerability from the Self-attestation module
  - Report an operational vulnerability from the Service record

States of the vulnerability

An operational vulnerability record moves through the following workflow states.

States of a vulnerability record

States	Description
New	The vulnerability has been opened and it is in the initial stage of review.
Assessment	The vulnerability is being evaluated to determine the appropriate course of action.
Treatment	The vulnerability is being actively investigated to gather information and evidence. The course of action and treatment is being decided.
Pending approval	The vulnerability is being worked on to find a resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States of a vulnerability record (continued)

States	Description
Approved	A review of the vulnerability is being done after it is resolved.
Closed	The vulnerability is closed and is no longer active.
Canceled	The vulnerability is canceled and it is no longer being pursued.

Email notifications for the vulnerabilities

When the vulnerability is assigned to the users, they receive email notifications informing them about the vulnerability details, upcoming actions, and due dates. Email notifications are sent to the following users:

1. When the vulnerability is assigned to an analyst or a user, they receive the email notifications.
2. When the vulnerability is approved or rejected, the analyst receives the email notification.
3. When the vulnerability is canceled, the approver, requester, analyst, and people on the watchlist receive the email notifications.

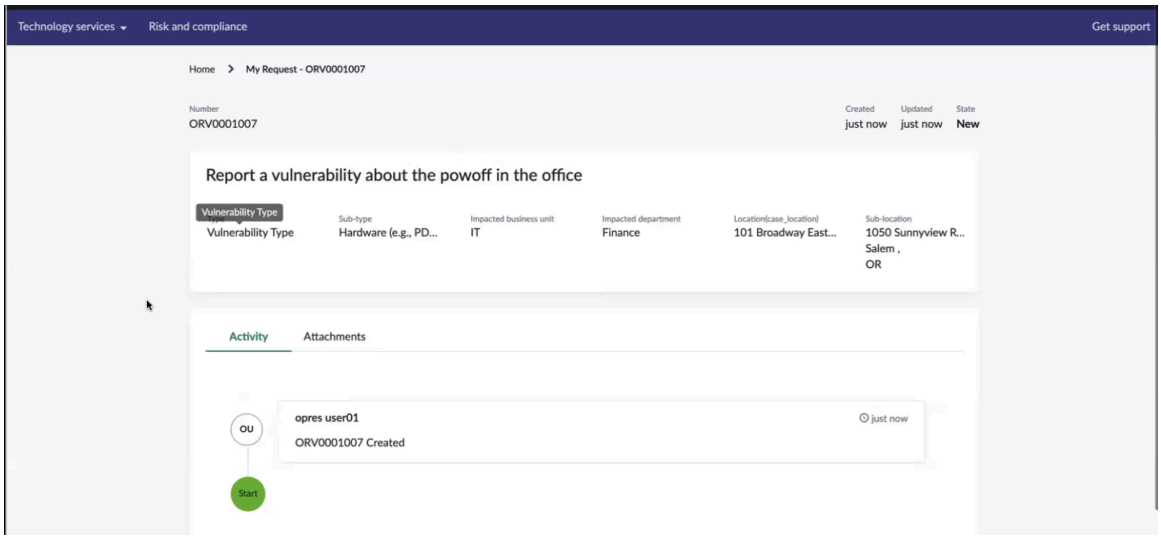
Report operational vulnerability from the Employee Center

Report an operational vulnerability from the Employee Center. Any employee or user can report the operational vulnerabilities and complaints directly to the supporting teams for a quick response. The user in the assignment group can assign an analyst for the operational vulnerability. Reporting the issues helps to reduce and avert losses in a timely manner.

Before you begin

Role required: sn_oper_res.operational_resilience_business_user

About this task



When an operational vulnerability is reported, it is opened in the **New** state, marking the beginning of its initial review.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select the **Risk & Compliance** tab.
3. In Risk and compliance topics, select Operational Resilience.
4. Select **Report Operational Vulnerability**.
5. On the form, fill in the fields.
   See the Report operational vulnerability form for an explanation of each field.
6. To provide supporting material or evidence, select **Add attachments**.
7. To save vulnerability details as a draft, select **Save as Draft**.
8. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The vulnerability is shown in the following example.

Report operational vulnerability form

On the Report operational vulnerability form, fill in the fields.

Report operational vulnerability form

Field	Description
Title	Name of the vulnerability. For example, `Customer data compromised due to malware`.
Description	Brief description of the vulnerability.
Vulnerability type	Nature or type of the vulnerability. This field is automatically set to **Vulnerability Type**.
Sub-type	Sub-type of the vulnerability. For example, **Documentation Loss**.
Date of occurrence	Date the vulnerability occurred. For example, the vulnerability may have occurred on March 21, 2024.
Date of discovery	Date the vulnerability was discovered by you. For example, the vulnerability may have occurred on March 21, 2024, but it was discovered only on May 21, 2024.
Primary origin	
Impacted business unit	Business unit that is impacted by the vulnerability.
Impacted department	Department impacted by the vulnerability.
Location of occurrence	Location of the vulnerability occurrence. For example, the location is **Japan**.
Sub-location	Sub-location of the vulnerability occurrence. For example, the sub-location for the vulnerability is **Tokyo**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report operational vulnerability form (continued)

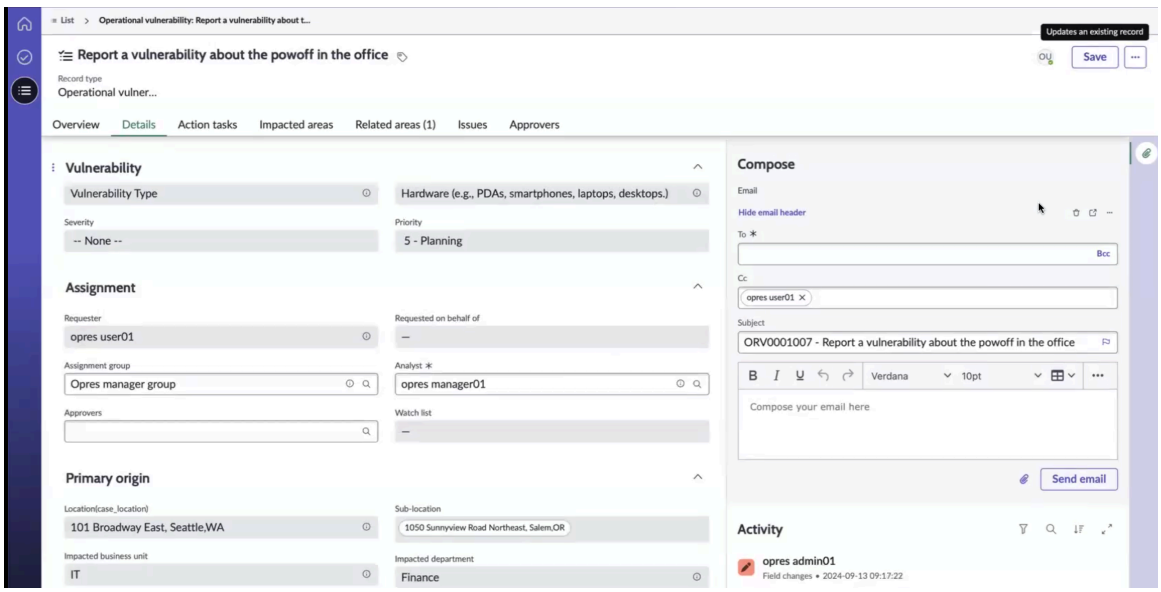
Field	Description
Related area	
Source	Source of the vulnerability. For example, Manual, Importance and impact analysis, Service.
Source table	Table indicating the source of the vulnerability.
Source record	Name of the source record for the vulnerability. For example, Blackberry service This field is not displayed only when the source is **Manual**.
Add attachments	Attachments for the vulnerability. You can choose a file or drag it so that it is attached with the form.

Assign the reported vulnerability to an analyst

Assign a reported vulnerability to an analyst in the Operational Resilience Workspace.

Before you begin

Role required: Role required: sn_oper_res.admin



About this task

Administrators of the Operational Resilience Workspace can assign a reported vulnerability to an analyst within the application.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Unassigned Operational Vulnerabilities**.
2. Select the reported vulnerability from the list.
3. Assign it to an analyst.

   Details on the form are shown in the example.

4. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report an operational vulnerability from the module

Report an operational vulnerability from the Operational vulnerability module in the Operational Resilience Workspace.

Before you begin

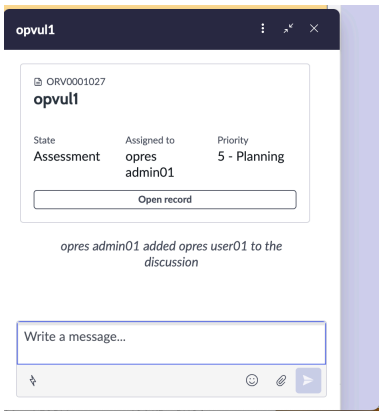
Role required: sn_oper_res.manager

About this task

When an operational vulnerability is reported, it is opened in the **New** state, marking the beginning of its initial review.

Users of the operational vulnerability are listed in the Assignment section on the form and can find their tasks if their names are listed on any of the following fields:

- The Operational vulnerability record is assigned to the person who reports the vulnerability. The name of the person is listed in the **Requester** and **Analyst** fields. The analyst receives a notification when the vulnerability is assigned to them.
- Typically, Operational Resilience administrators and Operational Resilience managers are part of the assignment group. The names of the groups are listed in the **Assignment group** field.
- The requester can report the vulnerability on behalf of someone by selecting the person in the **Requested on behalf of** field.
- The requester can add one or more approvers of the vulnerability in the **Approvers** field. The approvers receive a notification when the vulnerability is moved to the **Pending approval** state.
- The requester can add one or more persons on the watchlist of the vulnerability in the **Watchlist** field.
- The requester of the vulnerability and persons on the Watchlist and Requested on behalf of fields do not receive any notifications when a vulnerability is assigned to them.



Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Select **New**.
3. Enter the name and description of the Operational vulnerability record.
4. On the Vulnerability New record form, fill in the fields.
   To view more information on the fields, see the Create New Operational vulnerability form.
5. Select the treatment decision for the vulnerability.
   To make decisions for the treatment, you can use one of the following choices:
   - **Accept**
   - **Avoid**
   - **Mitigate**
   - **Transfer**
   - **None**
6. Select **Submit**.
   The Operational vulnerability record is assigned to the requester and analyst by default. The requester is a person who reports the vulnerability. An Analyst is a person who analyzes and works on the vulnerability.
7. To update the state of the vulnerability, select **Update state**.
8. To save the vulnerability, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. To view the relationship data for the vulnerability, select **360-degree view**.
10. To start a sidebar discussion, select **Discuss**.

    The sidebar discussion is displayed as shown in the example.

    The New discussion created is also displayed in the Activity panel of the record.

11. To export the details of the vulnerability in PDF format, select **Export PDF**, select the template to be exported such as Operational Vulnerability Template, and select **Export**.
    The PDF report is generated and it is displayed in the Attachments section of the Activity panel in the record.
12. To create an email draft of the vulnerability record, select **Compose Email**, enter the details, and select **Save**.
    You can enter the details of the email draft in the record. You can save and view the email details, email draft recipients, and email draft attachments in the respective related lists.
13. To delete the vulnerability record, select **Delete**.

Create New Operational vulnerability form

On the Create New Operational vulnerability form, fill in the fields.

Create New Operational vulnerability form

Field	Description
Number	Number of the vulnerability. This field is automatically set.
Name	Name of the vulnerability. For example, `Environmental vulnerability`.
Description	Description of the vulnerability.
State	Workflow state of the vulnerability. This field is automatically set to **New**.
Type	Nature or type of the vulnerability. This field is automatically set to **Vulnerability Type**.
Severity	Severity of the vulnerability. The choices are as follows: • **Low** • **Medium**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Operational vulnerability form (continued)

Field	Description
	• **High** • **Critical**
Sub-type	Sub type of vulnerability. For example, **Documentation Loss**.
Priority	Priority of the vulnerability. The choices are as follows: • **1 - Critical** • **2- High** • **3 - Moderate** • **4 - Low** • **5 - Planning** • **None** **Note:** The default value in this field is set to **Planning**.
Primary entity	Entity impacted by the case. Only the entities identified in the impacted areas are available for selection as the primary entity.
Entity owner	User who is the owner of the entity. This field is automatically set based on the entity selected in the Impacted areas related list.
Personal information	
Contains personal information	Field to decide if the breach contains personal information. The choices are as follows: • **To be decided**: Select this option if you're not sure if the breach has personal information. • **Yes**: Select this option if the breach has personal information. • **No**: Select this option if the breach doesn't have personal information.
Number of impacted individuals	Number of people impacted by the case.
Categories of data subjects/individuals impacted	Define who is impacted by the case. The choices are as follows: • **Customers** • **Employees**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Operational vulnerability form (continued)

Field	Description
Assignment	
Requester	Person who reported the vulnerability.
Assignment group	Group assigned to the case. **Note:** The assignment group is preconfigured to the case type during configuration setup.
Approvers	Approvers of the vulnerability.
Requested on behalf of	Name of the person on whose behalf you've created the vulnerability.
Analyst	Analyst who will analyze and work on the vulnerability. The analyst is a part of the Assignment group.
Watch list	People who must be aware of the vulnerability.
Primary origin	
Location	Location where the vulnerability occurred. For example, the location is **Japan**.
Impacted business unit	Business unit that is impacted by the breach.
Sub-location	Sub-location of the vulnerability occurrence. For example, the sub location is **Tokyo**.
Source	Source of the vulnerability creation. This field is automatically set to **Manual** when the operational vulnerability is manually created. If the operational vulnerability is reported from the Employee Center, the field displays the source as **Employee Center**. The Operational Resilience manager can update the source or add the new source to the related area.
Impacted department	Department impacted by the vulnerability. The choices are as follows: • **Finance** • **HR** • **IT** • **Marketing** • **Sales**
Source table	Source table from where the vulnerability is created.
Source record	Source record of source object from where the vulnerability is created. For example, if the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Operational vulnerability form (continued)

Field	Description
	vulnerability is reported from risk events, then this field displays the name of the risk event from which the vulnerability is reported.
Schedule	
Date of occurrence	Date that the vulnerability occurred on. For example, the vulnerability may have occurred on 18-02-2024.
Date of discovery	Date that the vulnerability is discovered by you. For example, the vulnerability may have occurred on 18-02-2024, but is discovered by the user only on 12-03-2024.
Due date	Date that the vulnerability is due on.
Closed date	Date that the vulnerability is closed on.
Reported date	Date that the vulnerability gets reported on.
Assessment start date	Start date for the assessment or date that the vulnerability was analyzed on.
Pending approval start date	Date that the vulnerability was resolved on.
Approved date	Post case review date of the vulnerability.
Findings	
Treatment	Decision made for the treatment. The choices are as follows: • **Accept** • **Avoid** • **Mitigate** • **Transfer** • **None**
Root cause analysis	
Root cause	Primary cause of the vulnerability occurrence.
Activity	
Work notes (Private)	Notes or information regarding the vulnerability.
Comments (Customer visible)	Additional information regarding the vulnerability for the customers.
Email	Option to compose an email about the vulnerability to the stakeholders.
Attachments	Option to attach the PDF of the vulnerability.
Action tasks	Action tasks associated with the vulnerability.
Primary origin	Primary origin of the vulnerability.

Create New Operational vulnerability form (continued)

Field	Description
Impacted areas	Impacted areas related to the vulnerability.
Issues	Issues related to the vulnerability.
Approvers	Approvers of the vulnerability.

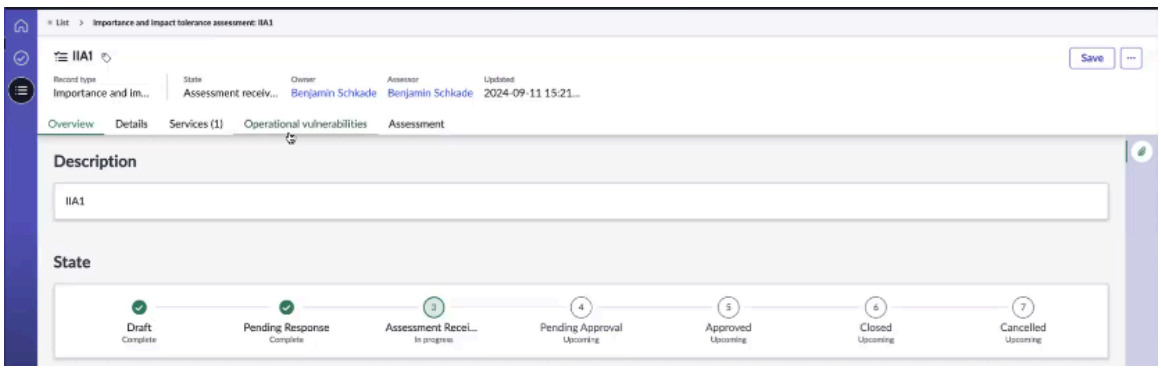
Report an operational vulnerability from the Importance assessment

Report an operational vulnerability from the Importance and impact assessment in the Operational Resilience Workspace.

Before you begin

Role required: sn_oper_res.manager

About this task



To create an Operational vulnerability from the assessment record, you can use the Operational vulnerability related list in these records. This example shows creating a vulnerability from the Importance and impact tolerance assessment record. When you associate an assessment record to the Operational vulnerability record, the related area for the vulnerability is displayed in the Related areas related list.

When a vulnerability is reported, it is opened in the **New** state, marking the beginning of its initial review.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Importance and impact tolerance assessment**.
   A list of the available assessments is displayed.
2. Select an assessment from the list.
   The Importance and impact tolerance assessment record with Operational vulnerabilities related list is displayed.
3. Check the state of the Importance and impact tolerance assessment.

   If the state is in the **Assessment received** state, you cannot add a vulnerability at this stage as shown in the example. You can add or remove the vulnerability before the vulnerability is in the **Assessment received** state.

   You can create an Importance and impact tolerance assessment record and then add a vulnerability.

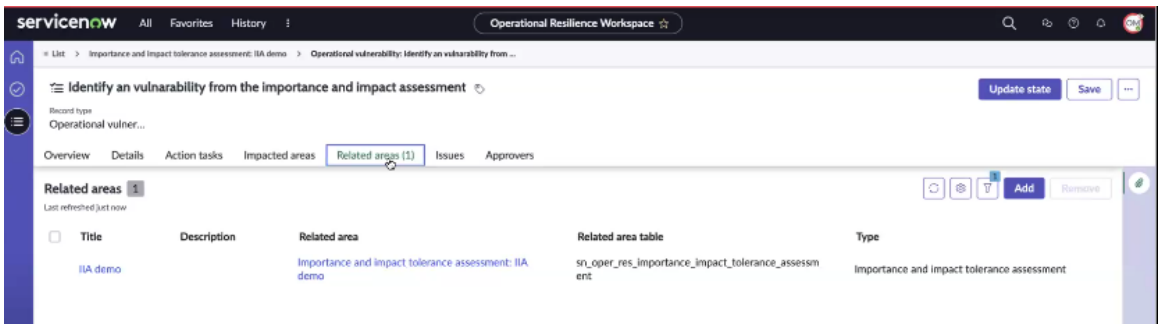
4. Create an Importance and impact tolerance assessment record and save it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Add a service to the Importance and impact tolerance assessment record.

   The service record is shown in the example.

   When the service is added to the Importance and impact tolerance assessment record, you can add the operational vulnerability and the **New** button is displayed in the Operational vulnerabilities related list.



6. Select **New** in the Operational vulnerabilities related list and add an operational vulnerability.
7. On the Vulnerability New record form, fill in the fields.

   The source of the vulnerability is the Importance and impact tolerance assessment. Therefore, the **Source** field on the form shows the source as Importance and impact assessment and the **Source table** field on the form shows the table as Importance and impact tolerance assessment.

   To view more information on the fields, see the Create New Operational vulnerability form.

8. Select **Save**.

   The Vulnerability record is saved. When you associate the Importance and impact tolerance assessment to the vulnerability, the related area is created as shown in the example.

   You can add another related area to the vulnerability.

Report an operational vulnerability from the Scenario analysis

Report an operational vulnerability from the Scenario analysis in the Operational Resilience Workspace.

Before you begin

Role required: sn_oper_res.manager

Procedure

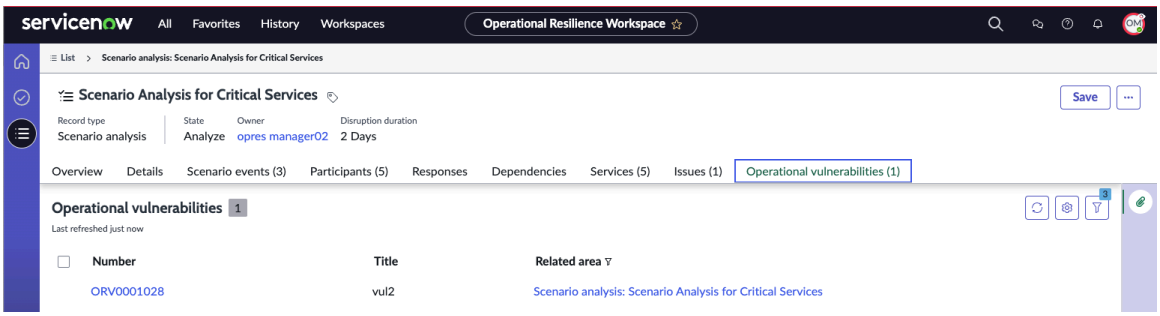
1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Scenario analyses**.
   A list of the available scenario analyses is displayed.
2. Select a Scenario analysis record from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you create a Scenario analysis record and save it, the Operational vulnerabilities related list is displayed.
The Scenario analysis record with the Operational vulnerabilities related list is displayed.

3. Check the state of the Scenario analysis record.

   If the scenario analysis is in the **Pending analysis approval** state, you cannot add or remove a vulnerability at this stage.



4. Select **New** in the Operational vulnerabilities related list and add an operational vulnerability.
5. On the Vulnerability New record form, fill in the fields.

   The source of the vulnerability is the Scenario analysis. Therefore, the **Source** field on the form shows the source as Scenario analysis and the **Source table** field on the form shows the table as Scenario analysis. The **Source table** field is auto-filled.

   To view more information on the fields, see the Create New Operational vulnerability form.

6. Select **Save**.

   The following example shows how the Scenario analysis record is displayed in the Operational vulnerabilities related list and the Operational vulnerability is associated with the Scenario analysis for critical services.

7. Select **Save**.

   The Scenario analysis record is saved.

Report an operational vulnerability from the Self-attestation module

Report an Operational vulnerability from the Self-attestation module in the Operational Resilience Workspace.

Before you begin

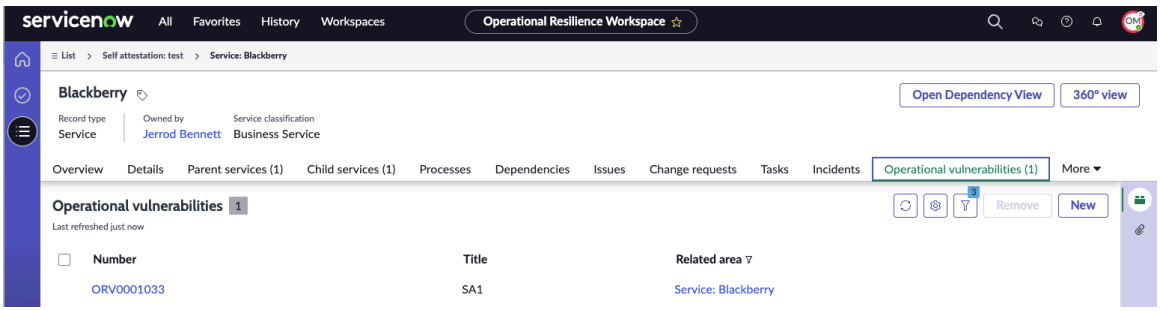
Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Self-attestations**.
   A list of the available Self-attestations is displayed.
2. Select a Self-attestation record from the list.
   If you create a Self-attestation record and save it, the Operational vulnerabilities related list is displayed.
   The Self-attestation record with the Operational vulnerabilities related list is displayed.
3. Check the state of the Self-attestation record.

   If the self-attestation is in the **Attestation received** state, you cannot add or remove a vulnerability at this stage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Add a service to the self-attestation record.
5. Open the Service record, select **More** and add the **Operational vulnerabilities** related list.
6. Select **New** in the Operational vulnerabilities related list and add an operational vulnerability.
7. On the Vulnerability New record form, fill in the fields.

   The source of the vulnerability is the Self-attestation. Therefore, the **Source** field on the form shows the source as Self attestation and the **Source table** field on the form shows the table as Self attestation. The **Source table** field is auto-filled.

   To view more information on the fields, see the Create New Operational vulnerability form.

8. Select **Save**.

   The following example shows how the Self-attestation record is displayed in the Operational vulnerabilities related list and the Operational vulnerability is associated with the Self-attestation for critical services.

9. Select **Save**.

   The Self-attestation record is saved.

Report an operational vulnerability from the Service record

Report an operational vulnerability from the Service record available in the Self-attestations list.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Self-attestations**.
   A list of the available Self-attestations is displayed.
2. Select and open a Service record from the list.
3. Select **More** and add the **Operational vulnerabilities** related list.
4. Select **New** in the Operational vulnerabilities related list and add an operational vulnerability.
5. On the Vulnerability New record form, fill in the fields.

   The source of the vulnerability is the selected service. Therefore, the **Source** field on the form shows the source as Service and the **Source table** field on the form shows the table as Service. The **Source table** field is auto-filled.

   To view more information on the fields, see the Create New Operational vulnerability form.

6. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

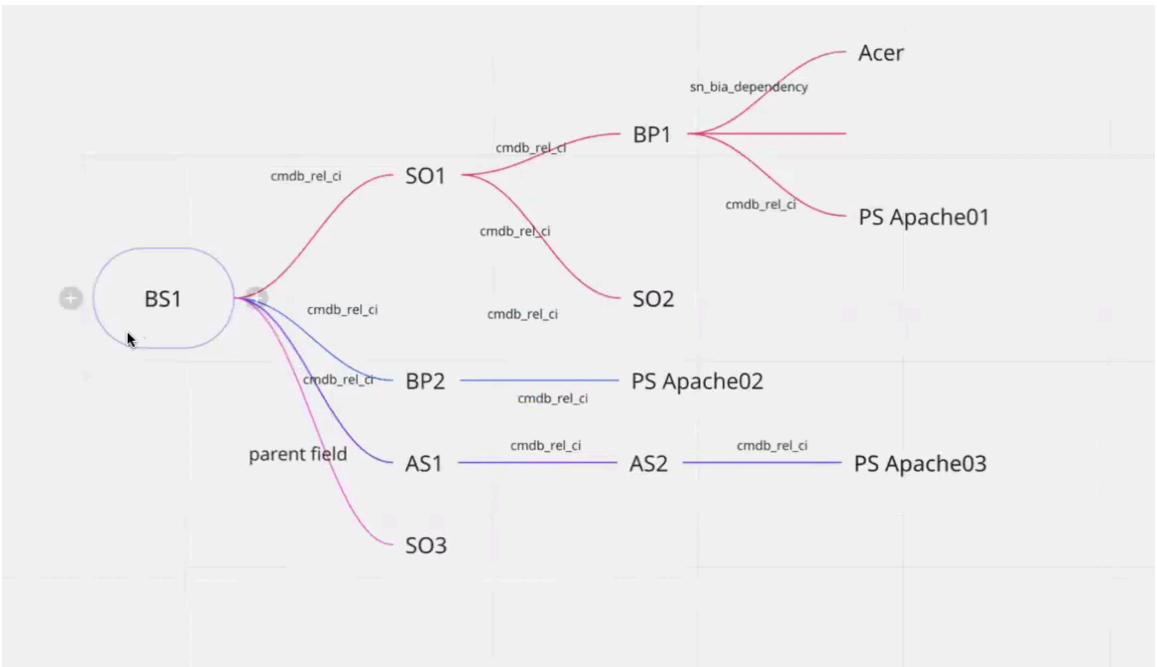
The following example shows how the Service record is displayed in the Operational vulnerabilities related list and the related area for the Operational vulnerability is Blackberry service.

7. Select **Save**.

The Service record is saved.

Add the primary origin

Add a primary origin of an operational vulnerability in its record. Once the primary origin of the operational vulnerability is specified, its upstream dependencies are automatically included in the impacted areas. It enables you to view the operational vulnerability from all affected perspectives. The source is automatically added as the primary origin on the **Primary origin** tab.



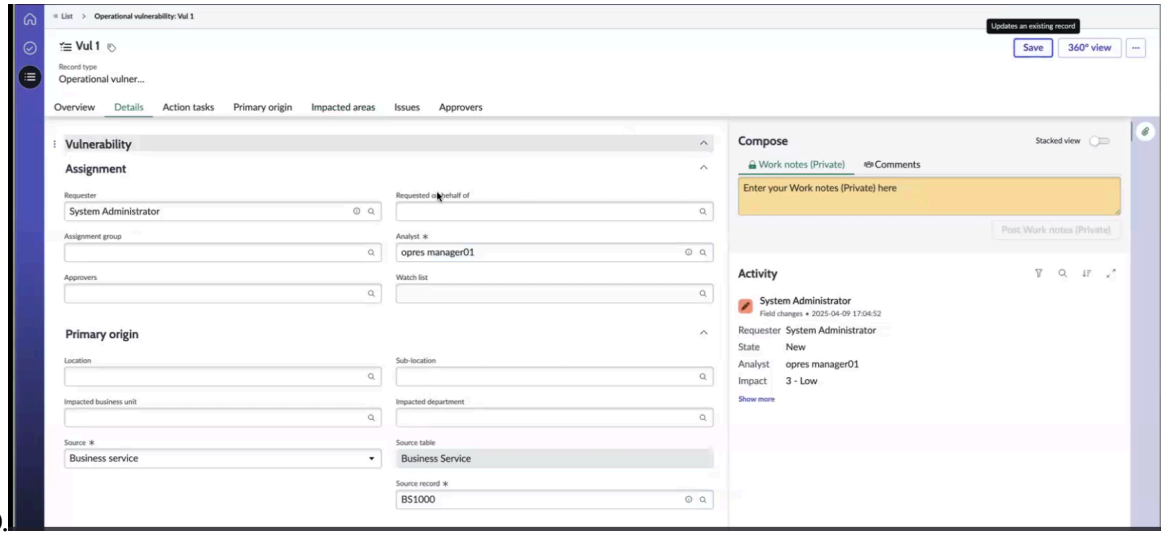
Before you begin

Role required: Analyst assigned to the operational vulnerability

About this task

Beginning with Release 20.1.x, the Operational Resilience application supports the latest Common Service Data Model (CSDM). The enhanced functionality supports the roll up of the dependencies.

Consider the following example where the relationships are configured between objects.

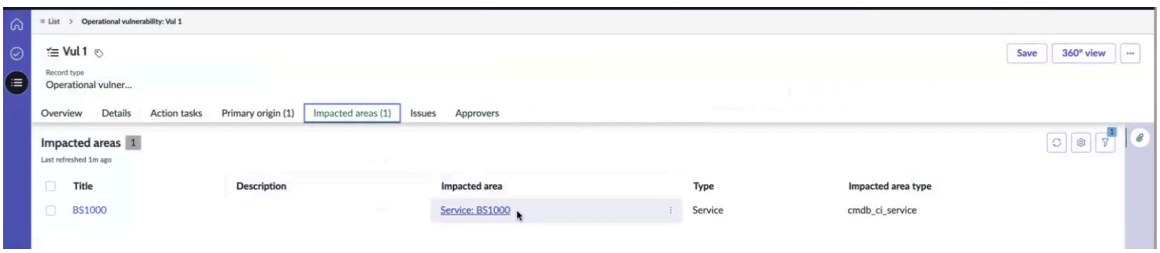


If you have a business process BP1 as shown in the relationship diagram, it has service offering SO1 and business service BS1 as upstream relationships. With the enhanced functionality,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

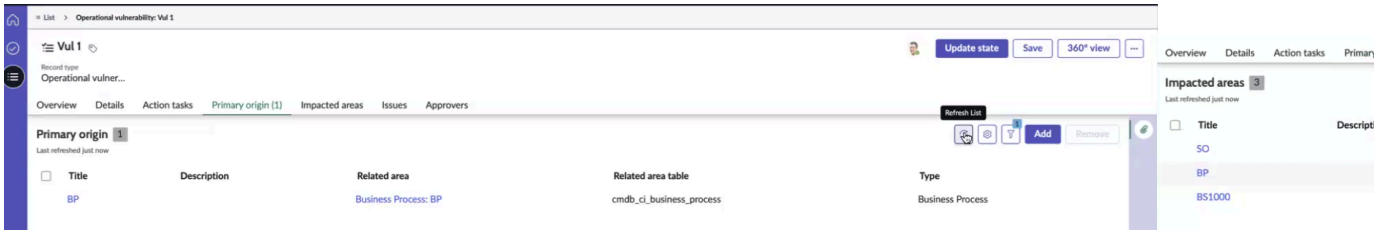
adding BP1 as an operational vulnerability automatically includes SO1 and BS1 in the impacted areas, which are displayed in the Impacted Areas tab of the operational vulnerability record.

Procedure



1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Open the vulnerability for which you want to add the related area.
3. Update the source in the **Source** field.
4. Update the source record in the **Source record** field in the Primary origin section of the **Details** tab and select **Save**.
   If you add the source in the **Source** field and the source record in the **Source record** field in the Primary origin section of the **Details** tab, the system automatically edits the primary origin and displays it on the **Primary origin** tab. In the following example, the Source Table is Business Service, the Source is Business service, and the selected source record is BS1000.

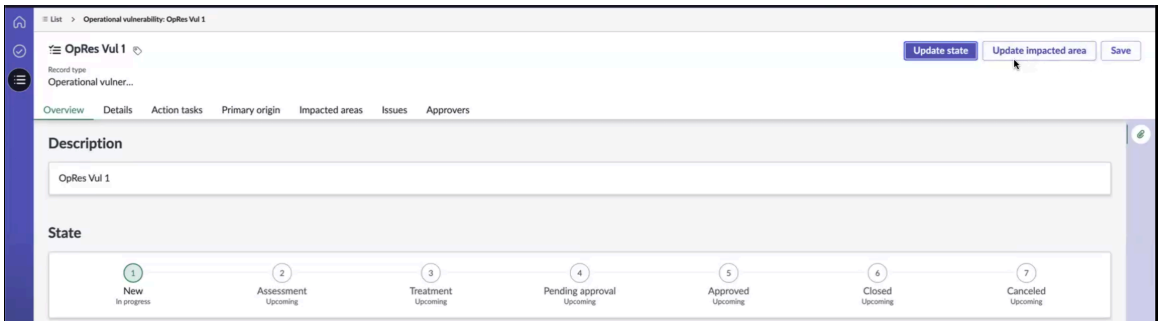
As shown in the example, the source record BS1000 is automatically updated as the primary origin on the **Primary origin** tab.



Adding the primary origin automatically adds its upstream dependencies to the impacted areas as shown in the example. The operational vulnerability can be seen from all the impacted area.

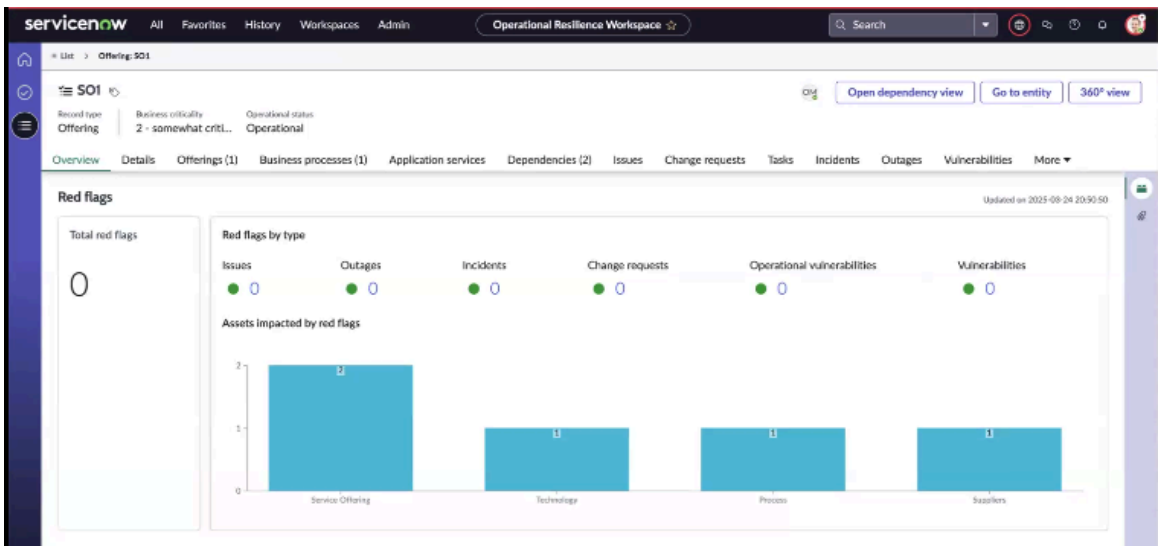
For example, you establish a relationship from a business service to a service offering, and from the service offering to a business process (BS - SO - BP), where SO is the downstream entity of BS and BP is the downstream entity of SO. In the **Primary origin** tab of the operational

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



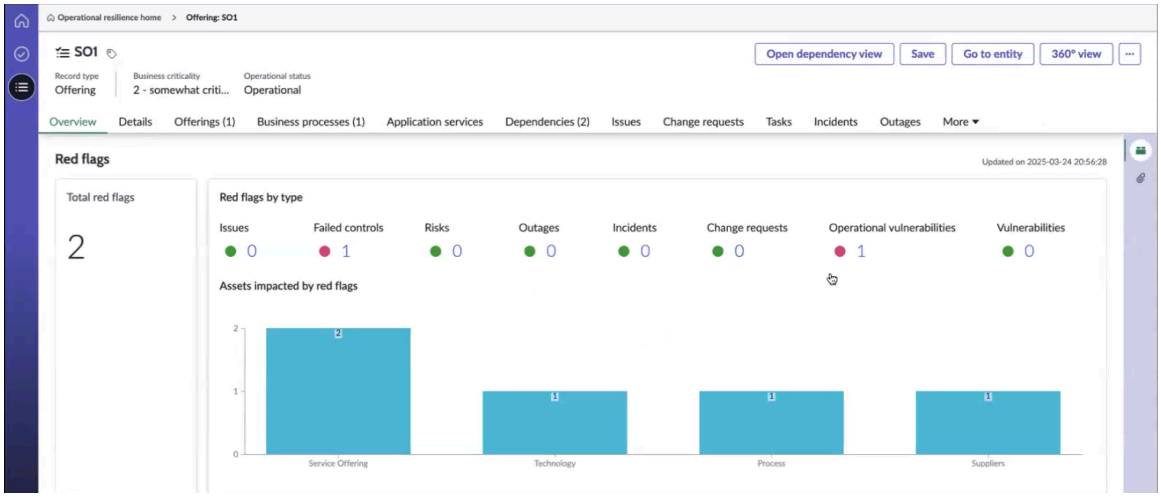
vulnerability, if you fetch the business process (BP), it automatically adds its upstream dependencies, as shown in the examples.

Note:
When the scheduled job is run, the operational vulnerabilities are gathered and shown in the red flags section of the Home page.



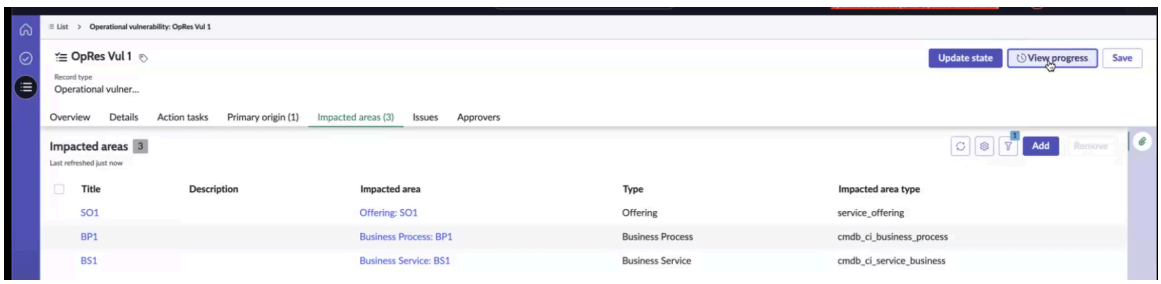
5. On the **Primary origin** tab, select **Add**.

You can add the primary origin of the operational vulnerability.



When you add the primary origin of the operational vulnerability, its impacted areas with upstream entities are updated on the **Impacted areas** tab.

When the *`Calculate red flags for CSDM and dependencies`* scheduled job is executed, the updated impacted areas and the operational vulnerability count are updated on the dashboard.



For example, when the impacted areas in the operational vulnerability are updated, the operational vulnerability count on the overview page of SO1 is 0 before the scheduled job runs. After running the scheduled job, the operational vulnerability count on the overview page of SO1 is updated to 1. This ensures that the updated data is promptly reflected on the Operational Resilience dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To update the impacted areas for a primary origin of the operational vulnerability, select **Updated impacted area**.
   The application fetches the impacted areas for the primary origin.
7. To view the status of the uploaded upstream assets of the primary origin, select the **View progress** UI action.

   The Operational Resilience administrator or manager can view the progress when adding the impacted assets to the operational vulnerabilities. The assets are listed in the **Impacted areas** tab as shown in the example.

Primary origin form

On the Primary origin form, fill in the fields.

Primary origin form

Field	Description
Title	Title of the related area.
Description	Brief description of the related areas.
Related area	Areas that are related to the vulnerability or event reported. This field is available only when a value is selected from **Related area type**.
Related area table	Table associated with the related area. For example, sn_oper_res_importance_impact_tolerance_assessment.
Type	Type of the related area. For example, any related risk event. The choices are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Primary origin form (continued)

Field	Description
	• **Citation** • **Policy** • **Control objective** • **Risk event**

Add the impacted area

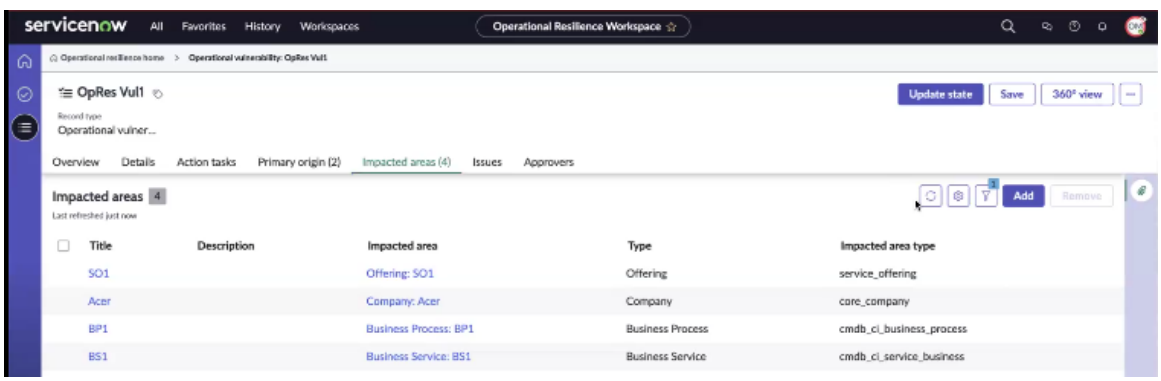
Add an impacted area or an object to the operational vulnerability record in the Operational Resilience Workspace.

Before you begin

Role required: sn_oper_res.manager

About this task

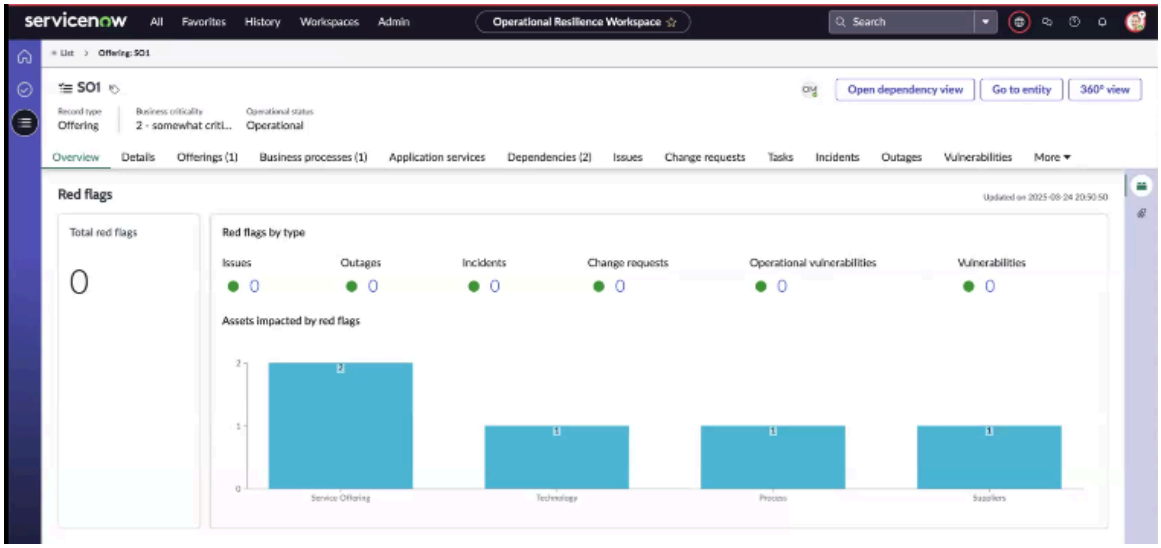
When an impacted area is added for the vulnerability, its state is updated to **New (In progress)** as shown on the **Overview** tab of the vulnerability record.



Beginning with Release 20.1.x, the Operational Resilience application supports the latest Common Service Data Model (CSDM). The enhanced functionality supports the roll up of the dependencies.

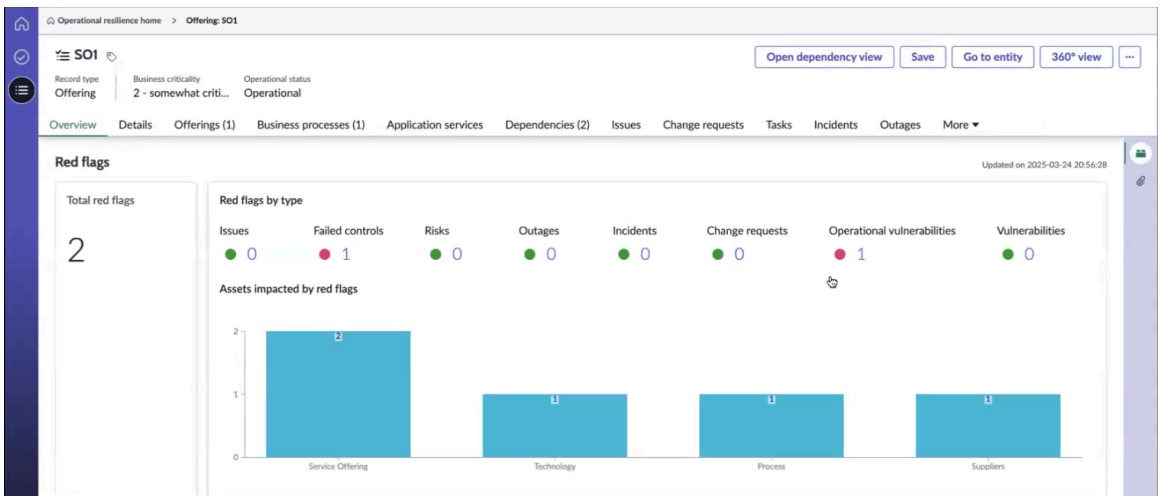
Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Open the vulnerability for which you want to add an impacted area.
3. Select **New**.
4. On the Impacted area form, fill in the fields.
   To view more information on the fields, see the Impacted area form.
5. Select **Save**.



> **Note:**
> The operational administrator can view the progress of adding impacted assets to the operational vulnerabilities and they can also change the order of the dependencies.

When you add the primary origin of the operational vulnerability, its impacted areas with upstream entities are updated on the **Impacted areas** tab.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the scheduled job is executed, the updated impacted areas and the overall operational vulnerability count are reflected in the dashboard.

For example, when the impacted areas in the operational vulnerability are updated, the operational vulnerability count on the overview page of SO1 remains at 0 before the scheduled job runs.

After running the scheduled job, the operational vulnerability count on the overview page of SO1 is updated to 1. This ensures that the updated data is promptly reflected on the Operational Resilience dashboard.

Impacted area form

On the Impacted area form, fill in the fields.

Impacted area form

Field	Description
Title	Title of the impacted area.
Description	Brief description of the impacted areas or objects.
Impacted area	Areas or objects that are affected by the vulnerability or event. This field is available

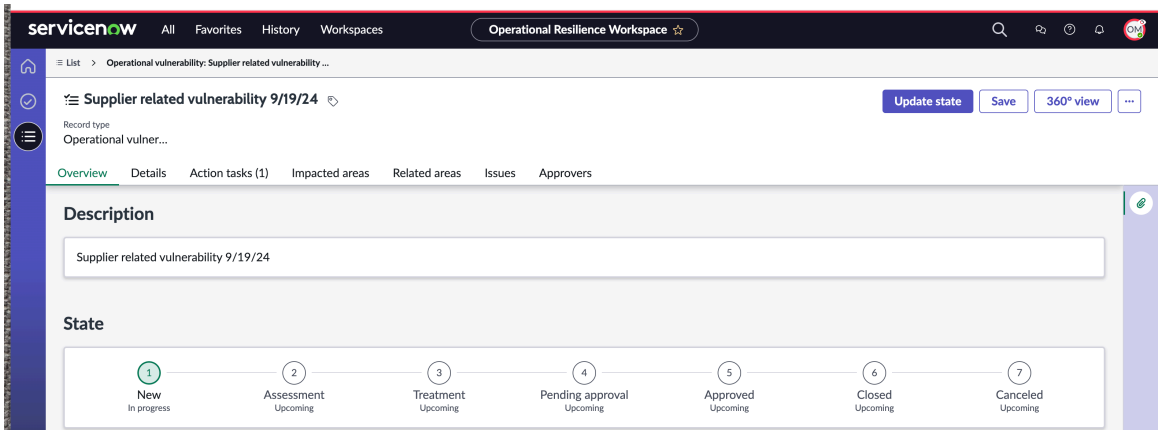
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impacted area form (continued)

Field	Description
	only when a value is selected from **Impacted area type**. For example, **Company: 3Com**.
Type	Type of the impacted area. For example, User or Company.
Impacted area type	Type of the impacted area. For example, the location of the event or vulnerability. The choices are as follows: • **Entity** • **Location** • **User** • **Company** **Note:** You can also configure your own impacted area type.

Update the state of the operational vulnerability

Update the state of the Operational vulnerability record to the **Assessment** or **Treatment** state. At this stage, the vulnerability is being evaluated to determine the best course of action and create an action task accordingly.



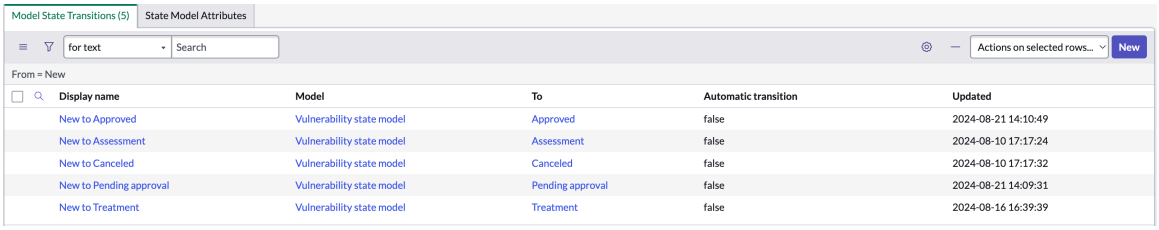
Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Open the vulnerability record from the list.

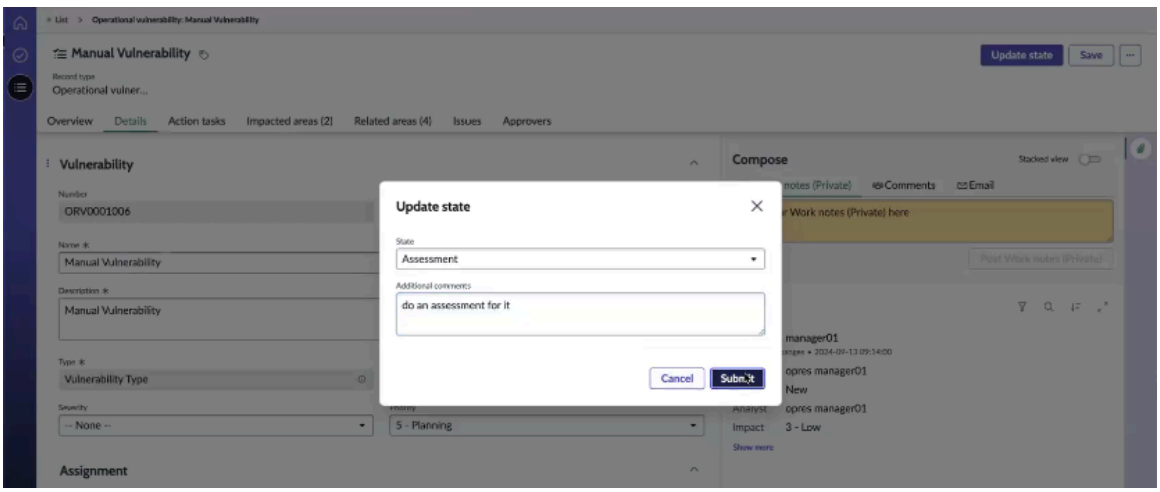
   The Operational vulnerability record is in the **New** state.



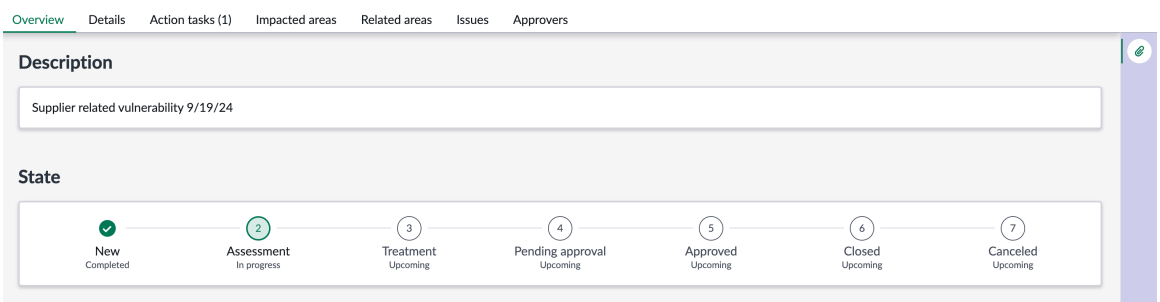
3. Select **Update state** UI action.

   The **New** state can be transitioned to the following states as shown in the example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- **Assessment**
- **Treatment**
- **Pending approval**
- **Approved**
- **Closed**
- **Canceled**



For more information on the state transition model, see Set up the State model and Action task model.

4. Update the state of the vulnerability record.

   The Update state window is shown in the example.

When the state is updated to **Assessment**, the state of the Operational vulnerability record is updated to the **Assessment in progress** state as shown in the example.

What to do next

When the vulnerability record is in the **Assessment** state, the task owner creates an assessment-type action task. For more information, see Manage an assessment-type action task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the vulnerability record is in the **Treatment** state, the task owner creates an investigation-type action task. For more information, see Manage an investigation-type action task.

Creating an action task for the operational vulnerability

The Operational vulnerability analysts gather additional information or an evidence on the vulnerability by creating one or more action tasks. An action task can be of an assessment or investigation type.

The Operational vulnerability analysts assign the assessment or investigation action tasks to appropriate task owners. The task owners then review the tasks, note their observations, finish the assigned work, and inform the task owners to review their work.

Task owners typically perform the following actions:

- Manage an assessment-type action task
- Manage an investigation-type action task

Workflow states for an action task

An action task moves through the following workflow states.

Workflow states for an action task

States	Description
Draft	The action task is in the draft stage.
Assigned	The action task has been assigned to an appropriate user.
Work in progress	Work on the action task is in progress.
Review	The action task is in the review stage.
Closed complete	The action task is in the Closed complete stage.
Closed incomplete	The action task is in the Closed incomplete stage.
Canceled	The action task has been canceled.

Notifications for the action tasks associated with the vulnerabilities

When an action task [sn_grc_case_mgmt_case_task] associated with the vulnerability is assigned to the users, they receive email notifications informing them about the task details, upcoming actions, and due dates. Email notifications are sent to the following users:

1. When the action task is assigned to the task owner, they receive the email notification.
2. When the action task is assigned to the assignment group, the users in the assignment group receive the email notifications.
3. When the action task is submitted for a review, the analyst assigned to the operational vulnerability record receives the email notification to review the task.

Manage an assessment-type action task

Create and manage an action task for the Operational vulnerability, where the type of the task is assessment. You can then assign it to an appropriate task owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_oper_res.manager

About this task
After completing the steps outlined in this section, the state of the Operational vulnerability record is updated to the **Assessment** state.

Procedure
1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities** and open the Operational vulnerability record that is in the **Assessment** state.
2. In the Operational vulnerability record, select the **Action tasks** related list and select **New**.
3. On the Create New Action task form, fill in the fields.
   For more information, see Create New Action task form.
4. In the **Type** field, select **Assessment**.
   The **Assessment template** field is displayed.
5. In the Assessment template window, select the assessment template that is used to perform the assessment.
6. Select **Save**.

   The selected assessment template is displayed in the **Assessment template** field of the Action task form.

   The action task is in the **Draft** state.
7. Navigate to the Assignment section of the Action task form and assign the task owner in the **Task owner** field.
8. In the Schedule section, add the due date for the action task in the **Due date** field and select **Save**.
   The action task of assessment type is saved.
9. To assign the action task to the action task owner, select **Update state** on the action task, update the state to **Assigned** in the Update state window, and select **Submit**.

   The action task is in the **Assigned** state.

   The action task is now assigned to the task owner. The example shows that the task is assigned to the user, Opres manager02.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An automated email notification as shown in the example is sent to the task owner to notify about the action task and review the task details.

The task owner logs in, reviews the assigned action task, and completes the next steps.

What to do next

The task owner then logs in, reviews the assigned action task, and creates an investigation-type action task if necessary, or directly requests for an approval for the assessment-type action task.

For more information, see Manage an investigation-type action task and Request an approval for the action task.

Create New Action task form

On the Create New Action task form, fill in the fields.

Create New Action task form

Field	Description
Name	Name of the action task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

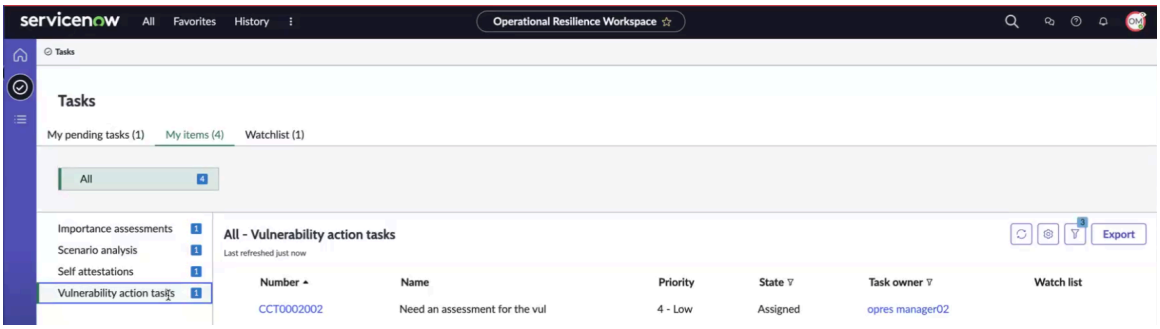
Create New Action task form (continued)

Field	Description
Description	Brief description of the action task.
Type	Type of the action task. Available options are: • **Assessment** • **Investigation** • **Others** Select **Assessment**.
Assessment template	Assessment template to be selected for the action task.
Priority	Priority of the action task. Available options are: • **Critical** • **High** • **Moderate** • **Low** • **Planning**
Assignment	
Assignment group	Assignment group that the action task is assigned to.
Task owner	Owner of the action task.
Watch list	Team members that are on the watch list for the action task.
Schedule	
Due date	Due date for the action task in the `yyyy-MM-dd HH:mm:ss` format.
Summary	
Observations	Observations entered by the analyst for the action task.
Activity	
Additional comments	Additional comments for the action task.

Reassign or accept the assigned action task

Reassign or accept the assigned action task that is listed in the My items list of the Tasks module if you are the task owner. You must review the task details listed in the Details tab, reassign the action task to another task owner, or accept the work.

Before you begin



Role required: sn_oper_res.manager, action task owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. In the Tasks page, select **My items** and open the action task listed in **Vulnerability action tasks**.

   The Tasks page with Vulnerability action tasks is shown in the example.

3. Review the details of the task.
4. To reassign the task to another task owner, select **Reassign**.

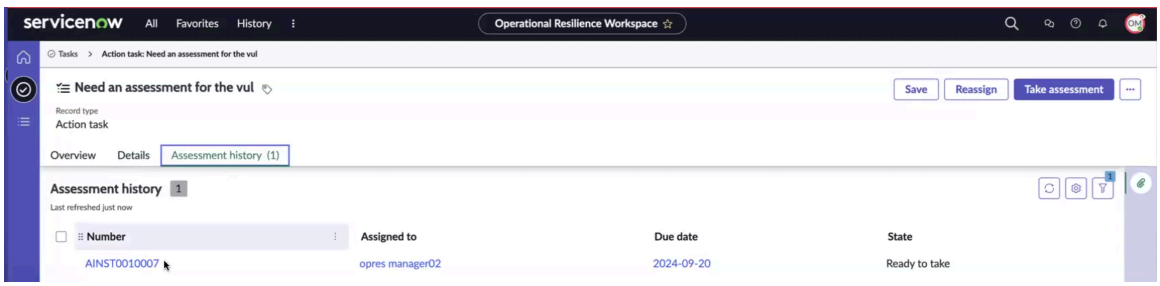
   When the action task owner reassigns the action task, it moves to the **Draft** state.

5. To accept the work on the action task, select **Accept work** UI action.
   The Confirmation window is displayed. The action task is updated to the **Work in progress** state.
6. Add the work notes for the task and select **Accept work** in the Confirmation window.

   The **Accept work** UI action on the action task form changes to **Take assessment** UI action.

   The subsequent step requires the task owner to perform an assessment on the action task by reviewing its assessment details. The vulnerability record is in the **Assessment** state.

Perform an assessment on the action task

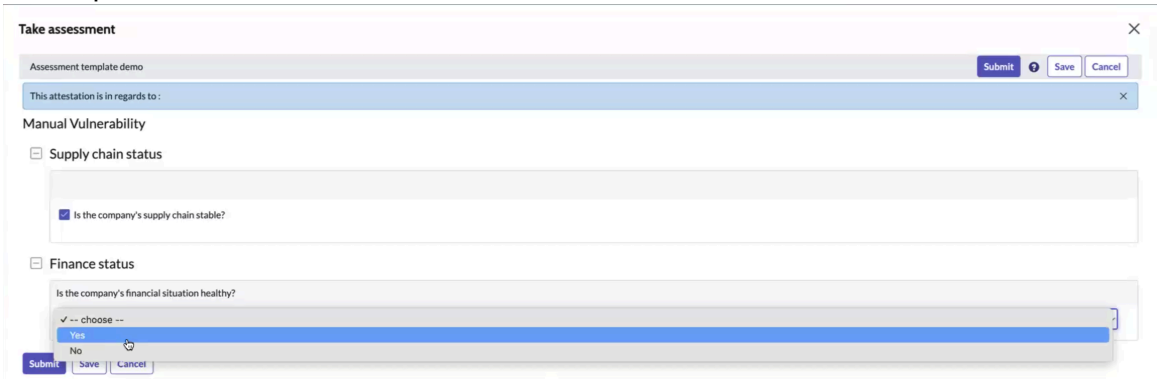


Perform an assessment on the action task by reviewing its assessment details. As the action task owner, you can view the details of the action task and assessment history in the action task record and then complete the assessment.

Before you begin

Role required: sn_oper_res.manager, action task owner

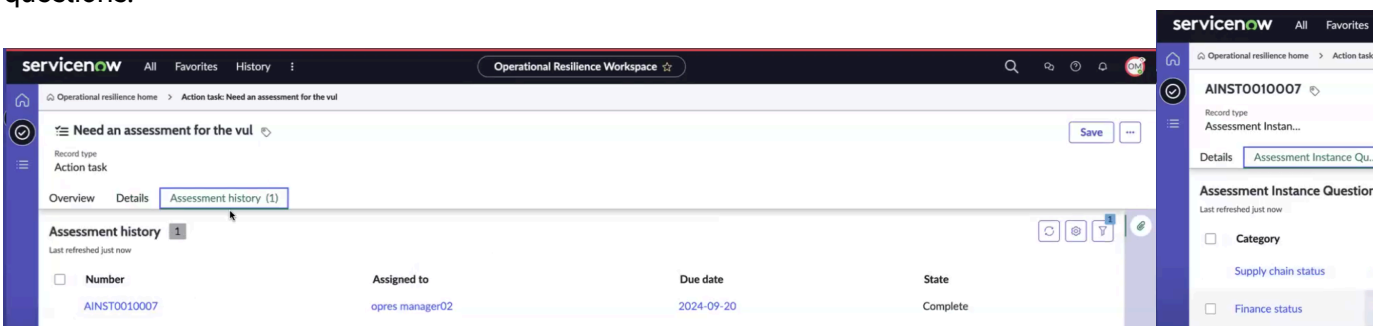
About this task



The details of the action task and assessment history are displayed in the record as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **My items** and open the action task listed in **Vulnerability action tasks**.
2. To complete the assessment for the action task, select **Take assessment**.

3. Answer the questions and select **Submit**.

   The state of the action task is updated to the **Review** state.

4. Navigate to the Assessment history, select the assessment, and review the responses to the questions.

5. To add a new assessment instance question, select **New**.
6. To view user responses to the questions, select **View user's response**.
7. Select **Save**.

   The action task is saved. The state of the action task is updated to the **Review** state.

What to do next

Request an approval on the action task and complete its workflow. For more information, see Request an approval for the action task.

Manage an investigation-type action task

Manage an investigation-type action task for the Operational vulnerability. An investigation-type action task is initiated when additional investigation is needed to resolve the vulnerability. If the approver rejects the Operational vulnerability and requests more investigation, the task owner can create an investigation-type of action task, assign it to an appropriate user, review their completed work, and then request an approval again.

Before you begin

Role required: sn_oper_res.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If the approver rejects the vulnerability, its state is updated to **Treatment**. The vulnerability may need further investigation. The task owner completes the following steps to complete the work on the vulnerability record:

1. Create an investigation-type action task for the vulnerability.
2. Assign the action task to an appropriate user.
3. Review the investigation work related to the action task.
4. Update the vulnerability state to pending approval and request for its approval.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Navigate to the vulnerability record and select **New** in the Action tasks related list.

   You can open the operational vulnerability record from the list and review the information in the **Details** tab. When an investigation-type action task is created, the state of the record is updated to the **New** state.

3. On the Create New Action task form, fill in the fields.
   For more information, see Create New Action task form.
4. Select the type of the action task as **Investigation**.
5. Assign the task to a task owner and add people on the watchlist of the action task.
6. Add a due date for the action task.
7. Select **Save**.
   The action task is saved in the operational vulnerability record. An email notification is sent to the action task owner about the action task.
8. To complete work on the action task of the rejected vulnerability record, assign it to an appropriate user.

   An email notification is sent to the user about the action task. The user navigates to the vulnerability action task, review the details, provides observations in the Summary section of the action task form, and saves the action task.

   The task owner receives an email notification about the completion of the work and assigns the action task to the user as outlined in the next step.

9. Navigate to the action task in the vulnerability record, select **Update state** UI action, select the **Assigned** state, and select **Submit**.
   The action task is assigned to the user. The user completes the next step on the action task.
10. Log in as the user and select **Accept work** in the action task record.
    The user accepts the work and completes the following steps for the action task of the vulnerability record.

    a. Finish work on the action task, select the **Ready for review** UI action, add work notes in the Confirmation window, and select **Ready for review**.
       The action task is in the **Ready for review** state. A notification is sent to the action task owner about completion of the work.

What to do next

The task owner reviews the work on the action task and then requests an approval for the vulnerability record. For more information on the steps, see Request an approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request an approval for the action task

Complete the work on the assessment-type or the investigation-type action task and then request an approval from the approvers of the Operational vulnerability record.

Before you begin

Role required: sn_oper_res.manager, Action task owner

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Review the email notification and open the action task record from the email.
3. Review the action task details and provide observations in the Summary section of the action task form.
4. Select **Save**.
   The action task record is saved. The vulnerability record analyst reviews the notes and assigns the action task again to the task owner. An email notification is sent to the user.
5. Open the action task record from the email and select **Accept work** in the action task record.
   The user accepts the work and completes the following steps for the action task of the vulnerability record.
6. Finish work on the action task and select the **Ready for review** UI action.
   The action task is in the **Ready for review** state.
7. Add work notes in the Confirmation window and select **Ready for review**.
   A notification is sent to the Operational vulnerability record owner or analyst about completion of the action task.

What to do next

Devise a course of treatment plan and perform root cause analysis. For more information, see Decide the treatment and perform a root cause analysis.

Decide the treatment and perform a root cause analysis

Decide the treatment and perform a root cause analysis for the Operational vulnerability. After completing the action tasks, the vulnerability analyst devises the next course of treatment and updates their observations and analysis in the **Details** tab of the Operational vulnerability record.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Navigate to the vulnerability record and ensure that the action tasks are closed.
3. Review the details of the vulnerability, select the **Discuss** action to collaborate with the participants, and plan the treatment.
4. In the **Treatment decision** field, select one of the options and choose the treatment plan.
   The choices are as follows:
   - **Accept**: Accept the vulnerability.
   - **Avoid**: Avoid the vulnerability.
   - **Mitigate**: Moderate the effect of the vulnerability.
   - **Transfer**: Transfer the vulnerability to another department or function in the organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Root cause analysis** field, add observations and notes on the root cause.
   It is necessary to record the root cause and relevant details for future reference.
6. Select **Save**.
   Details on the treatment and root cause analysis of the Operational vulnerability are saved in the record.

Add or create an issue for the operational vulnerability

Add an existing issue from the available issues or create an issue for the Operational vulnerability.

Before you begin
Role required: sn_oper_res.manager

About this task
While addressing the Operational vulnerability, an issue can be in the open state. The Operational vulnerability can be closed even if the associated issue is in the **Open** or **Work in progress** state.

Procedure
1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Open the vulnerability for which you want to add an issue.
3. Select the Issues related list and add or create an issue.
4. Select **Save**.

   The issue related to the vulnerability is displayed in the Issues related list.

   The vulnerability record is still in the **Assessment** state.

Request an approval

Request an approval for the Operational vulnerability record. When you request an approval, the state of the vulnerability is updated to the **Pending approval** state and then to the **Requested** state respectively.

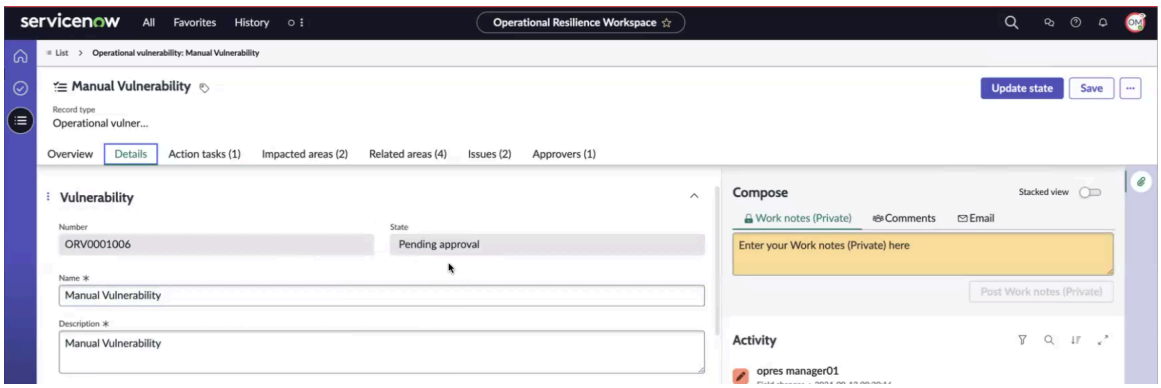
Before you begin
Role required: sn_oper_res.manager

Procedure
1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Open the vulnerability that you want to submit for an approval.

   Note:
   All action tasks must be closed before an analyst or assignment group member can update the vulnerability state.

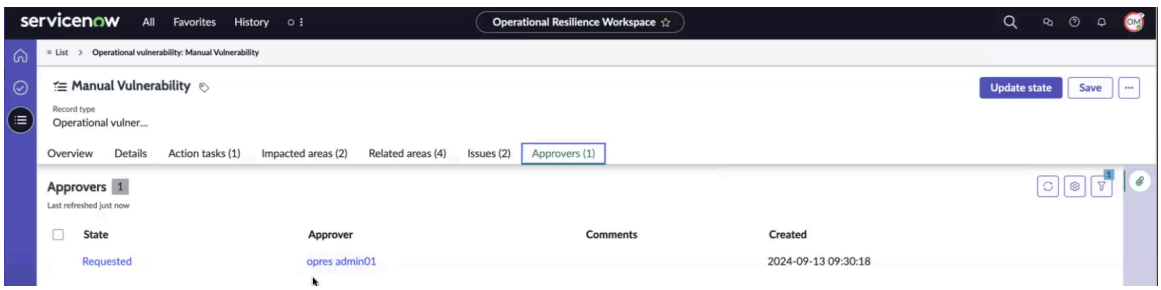
3. In the vulnerability record, select **Update state**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



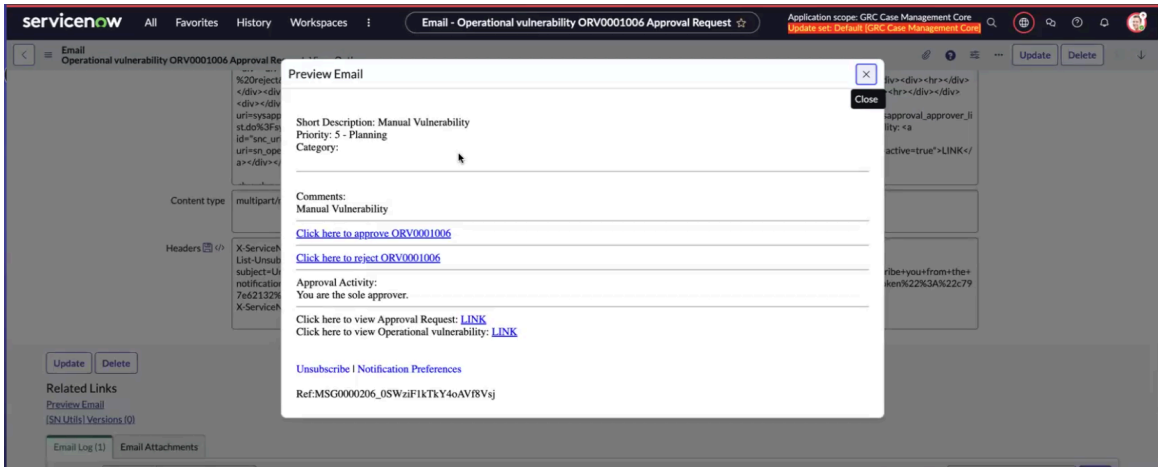
If any of the action tasks for the vulnerability are not closed yet, a message is displayed that All action tasks must be closed before an analyst or assignment group member can update the vulnerability state.

The following example shows that the action task for the vulnerability is in the **Review** state.



4. Select the open action task, review its details, and select the **Update state** UI action.
5. To close the open action task, update its state to **Closed complete** in the Update state window, and select **Submit**.
   The state of the action task is now updated to **Closed complete**.
6. In the vulnerability record, select **Update state** UI action, update the state to **Pending approval** in the Update state window, and select **Submit**.

   The state of the vulnerability record is updated to **Pending approval**.



The list of the approvers is displayed in the Approvers related list. The Operational vulnerability record owner requests an approval by updating the state to **Requested** as shown in the example.

An email notification is sent to one or more reviewers with the Operational vulnerability details and a link to approve the Operational vulnerability. A sample email notification is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Operational vulnerability record is now in the **Pending approval** state.

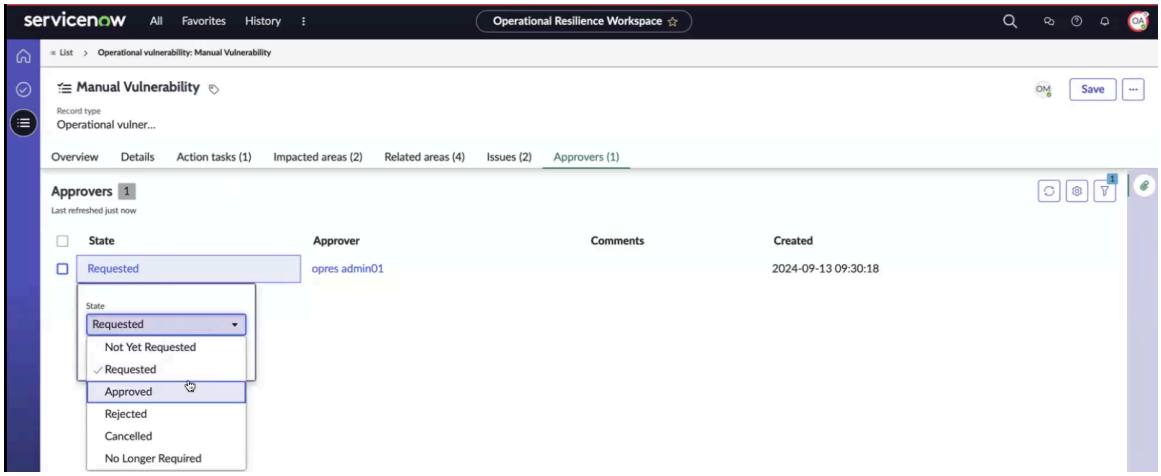
What to do next

The subsequent step requires the approver to review the email notification, select the approval link from the email, and approve the Operational vulnerability. For more information, see Approve the operational vulnerability.

Approve the operational vulnerability

Approve the Operational vulnerability record after verifying its details such as the root cause analysis, treatment plan, timelines, and so on.

Before you begin



Role required: sn_oper_res.manager, sn_oper_res.admin, approver of the vulnerability

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Navigate to the operational vulnerability record from the list or select **Vulnerability approvals** in **My pending tasks**.
3. Select the record for which you have been assigned as the approver.
4. Review the details of the operational vulnerability record.
5. To approve the operational vulnerability record, select **Update state** UI action.

   The state of the operational vulnerability is updated from **Requested** to **Approved**. The state transition in the Approvers related list is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The state of the operational vulnerability record is updated to **Approved**. The fields on the vulnerability record are now locked.

Even though the Operational vulnerability record is in the **Approved** state, users can still perform an assessment or further investigation on the approved vulnerability by selecting one of the following states:

- **Assessment**
- **Treatment**

6. To close the vulnerability, select **Update state** UI action and select **Closed**.
   The vulnerability record is in the **Closed** state. The fields on the vulnerability record are locked.

What to do next

The Operational vulnerability analyst reviews the details and closes the Operational vulnerability record.

Close the operational vulnerability

Verify the details and close the Operational vulnerability record as the Operational vulnerability analyst.

Before you begin

Role required: sn_oper_res.manager, sn_oper_res.admin, Analyst of the vulnerability

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **All Operational Vulnerabilities**.
2. Log in as an analyst and navigate to the Operational vulnerability record from the list or select **Vulnerability approvals** in **My pending tasks**.
3. Select the Operational vulnerability record for which you have been assigned as the analyst.
4. Close the Operational vulnerability record.
   The Operational vulnerability is now in the **Closed** state. It completes the workflow of the Operational vulnerability record.

Maintaining Digital resilience third-party registers

The Digital resilience third-party registers application enables the customers to maintain the contractual arrangements on the use of Information and Communication Technology (ICT) services, that support critical or important functions provided by ICT third-party service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

providers. Customers can manage the contractual arrangements details through the graphical user interface (GUI) or by importing or exporting Microsoft Excel files.

Get started

Explore  Learn about Digital resilience third-party registers	**Configure**  Configure Digital resilience third-party registers
Use  Add branches, contracts and upload records	**Reference**  Components installed with Digital resilience third-party registers

Exploring Digital resilience third-party registers

The Digital resilience third-party registers application empowers the financial entities to maintain registers of contractual arrangements with Information and Communication Technology (ICT) third-party service providers and comply with Digital Operational Resilience Act (DORA) regulation.

Applications for DORA compliance

Beginning with Release 19.1.x, the following applications are supported for ICT Third-party Risk Management as part of DORA compliance.

- Digital Operational Resilience Management: This application is used for uploading and downloading of all individual DORA tables.
- Digital Resilience Third-party Information Register: This application is used to download the Digital resilience third-party registers. The application contains the Microsoft Excel template that includes all tabs for reporting purposes. It helps the financial entities to maintain a comprehensive register of their contractual arrangements with ICT Third-party service providers at the individual entity, sub-consolidated, and consolidated levels.

  Customers use Digital resilience third-party registers to create or edit the records in bulk or individually for assessments, branches, contracts, functions, legal entities, supply chains, third parties, or third-party engagements using the Microsoft Excel upload and download feature.

Note:
The IRM Professional license users can access Digital resilience third-party registers in the Operational Resilience Workspace. The TPRM license users can access Digital resilience third-party registers in the TPRM Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Digital resilience third-party registers application fulfills multiple functions for the entities:

- Assists the entities in tracking their ICT third-party risks.
- Empowers the competent authorities in European Union to oversee ICT and third-party risk management within financial entities.
- Aids European Supervisory Authorities (ESA) in identifying Critical ICT third-party service providers (CTPP) for EU level supervision.

Digital Operational Resilience

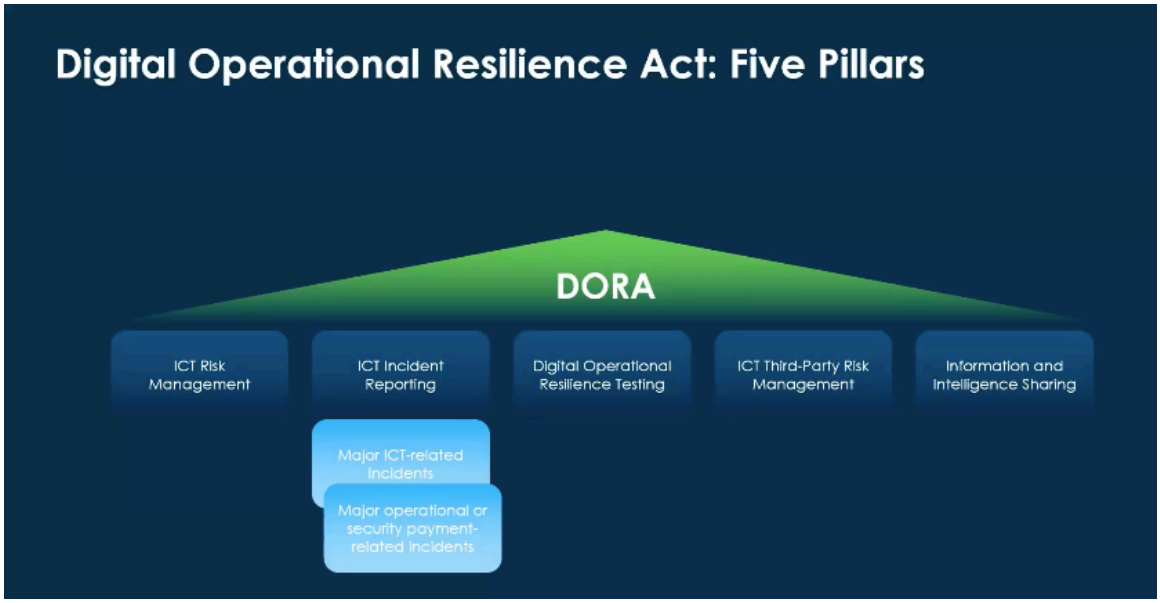
Digital Operational Resilience refers to the ability of a financial entity to build, assure, and review its operational integrity and reliability. It ensures that the entity has the full range of ICT related capabilities that are needed to secure its network and information systems. These systems support the continuous provision of financial services and maintain their quality, even during disruptions. The continuity can be achieved directly or indirectly with the services provided by the ICT third-party service providers.

Digital Operational Resilience Act (DORA)

Digital Operational Resilience aligns with the Digital Operational Resilience Act (DORA). It is a European Union (EU) regulation that came into effect on 16 January 2023 and it will be applicable from January 17, 2025. It enhances the ICT security of financial entities supervised by the European Supervisory Authorities (ESA)s and protects Europe's financial sector from major digital disruptions.

Regulatory Technical Standards

DORA Regulation mandates that financial entities incorporate and periodically review a strategy for managing ICT third-party risk within their ICT risk management framework. This strategy must include a policy governing the use of ICT services that support critical or important functions, as provided by third-party ICT service providers.



A financial institution's policy on using third-party ICT service providers plays a crucial role in defining key aspects of its governance, risk management, and internal control frameworks for these services. Financial entities must perform risk assessments and due diligence before signing contracts with third-party ICT service providers. They must also ensure they can terminate these arrangements if needed and maintain business continuity for critical or important functions. For instance, an action could be necessary where the service is not optimal, external ICT systems malfunction, or the service is disrupted due to sanctions.

Pillars for DORA

Digital Operational Resilience Act (DORA) comprises the important pillars:

1. ICT Risk Management
2. ICT Incident Reporting
3. Digital Operational Resilience Testing
4. ICT Third-party Risk Management
5. Information and Intelligence Sharing

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Operational Resilience, Release 19.1.x focuses on the ICT Third-party Risk Management pillar only.

Processing the records using GUI or Microsoft Excel

Customers can manage the contractual arrangements by processing the records by using the graphical user interface (GUI) or by importing or exporting Microsoft Excel files in the Digital resilience third-party registers application.

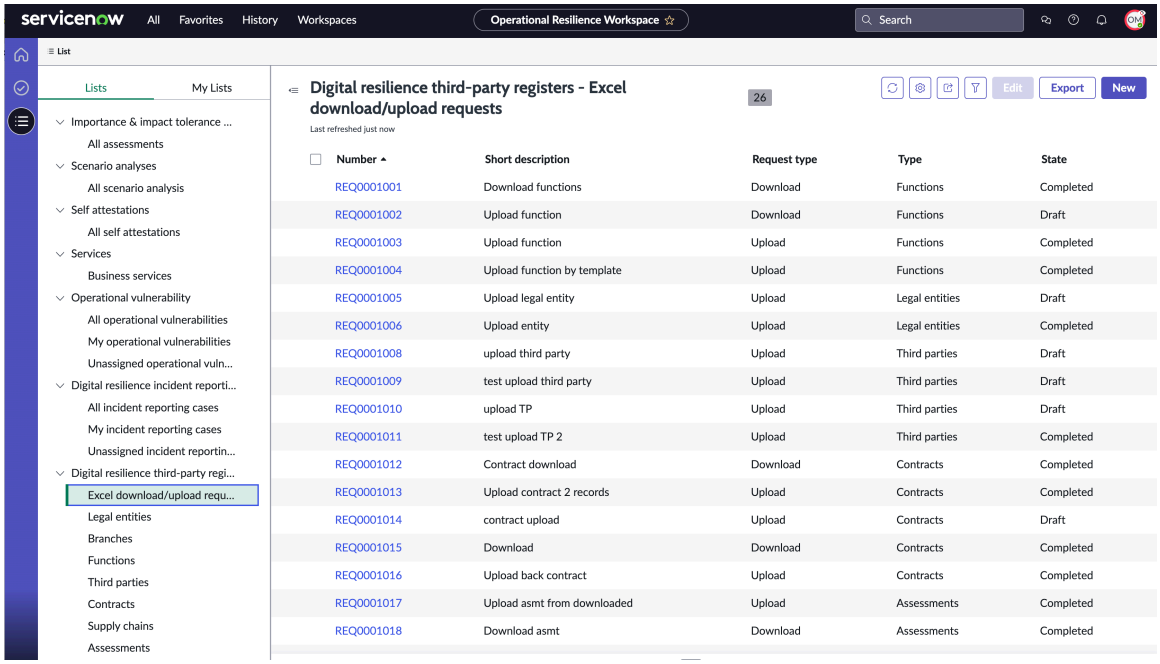
For information on processing the records through the graphical user interface (GUI) or by importing or exporting Microsoft Excel files, see Using Digital resilience third-party registers.

Licensing requirements

Users can access the Digital resilience third-party registers application in the following ways:

- Beginning with Release 19.1.x, customers who already have the Operational Resilience or the TPRM applications can access the Digital resilience third-party registers.
- These customers can download, install, and start using the Digital resilience third-party registers application.

The licensing information and the associated workspaces are listed in the following table.



Licensing and associated workspaces

License	Application displayed in the UI	Associated workspaces
IRM Professional	Digital resilience third-party registers	Operational Resilience Workspace
TPRM	Digital resilience third-party registers	TPRM Workspace

Digital resilience third-party registers in Operational Resilience Workspace

Upon opening the Operational Resilience Workspace, the menu featuring Digital resilience third-party registers is displayed.

© 2026 ServiceNow, Inc. All rights reserved.

Digital resilience third-party registers in the TPRM Workspace

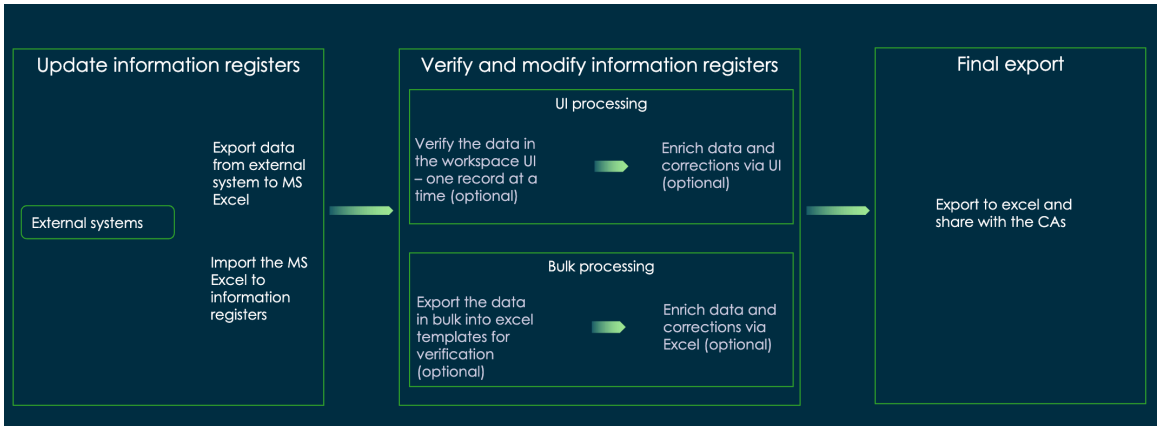
For information on Digital resilience third-party registers in the TPRM Workspace, see Third-party Risk Management.

Use cases for updating the information registers

Users with third-party registers and contractual details spread across various systems can automate the process of populating their information registers. This section outlines common scenarios for recording third-party data into Digital resilience third-party registers.

Typical use cases for updating data in the Digital resilience third-party registers are described in the following sections.

Use cases for updating data in the information registers



Users generally input third-party data into the Digital resilience third-party registers using one of these methods:

1. Exporting data from external applications using Microsoft Excel
2. Creating and modifying the registers manually

Exporting data from external applications using Microsoft Excel

Users can export data from external systems to Microsoft Excel, then import the Microsoft Excel file into the Digital resilience third-party registers application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The process for using Microsoft Excel to get data from external systems involves the following tasks:

1. Collect data from external applications via Microsoft Excel, then import the Microsoft Excel file into the Digital resilience third-party registers.

2. Updating and verifying information registers via UI processing: After importing the data, users can process each entry individually through our graphical user interface (GUI). Dedicated pages are created in the Operational Resilience Workspace where users can view details, review, approve, advance entries through workflows, and export them as needed. Users can inspect each record individually in the information registers workspace UI, enriching data where it's incomplete and correcting any inaccuracies.

   Updating and verifying information registers via bulk processing: User can use the bulk export and import feature using Microsoft Excel for processing multiple records at once. If data integration is time-consuming, users can simply export files from external systems, upload them to Digital resilience third-party registers tables, edit the data, and re-upload. This allows for efficient bulk processing.

3. Final step of exporting data: Lastly, data can be exported using a template, specifically Microsoft Excel based output. Users can export data into Microsoft Excel sheet for future reference or sharing with regulatory authorities. The Microsoft Excel template in Digital resilience third-party registers is aligned with (DORA) regulatory requirements.

Creating and modifying the registers manually

Users can create and modify data manually in the Digital resilience third-party registers application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The process for modifying the registers manually involves the following tasks:

1. Users enter and modify data in the Digital resilience third-party registers application manually.

2. Updating and verifying information registers via UI processing: After importing the data, users can process each entry individually through our graphical user interface (GUI). Dedicated pages are created in the Operational Resilience Workspace where users can view details, review, approve, advance entries through workflows, and export them as needed. Users can inspect each record individually in the information registers workspace UI, enriching data where it's incomplete and correcting any inaccuracies.

   Updating and verifying information registers via bulk processing: User can use the bulk export and import feature using Microsoft Excel for processing multiple records at once. If data integration is time-consuming, users can simply export files from external systems, upload them to Digital resilience third-party registers tables, edit the data, and re-upload. This allows for efficient bulk processing.

3. Final step of exporting data: Lastly, data can be exported using a template, specifically Microsoft Excel based output. Users can export data into Microsoft Excel sheet for future reference or sharing with regulatory authorities. The Microsoft Excel template in Digital resilience third-party registers is aligned with (DORA) regulatory requirements.

Register of Information (ROI) regulatory packages

The Register of Information (RoI) is a regulatory reporting requirement under the Digital Operational Resilience Act D (DORA) and is supported by the Digital resilience third-party registers application in the Operational Resilience Workspace.

RoI overview

The Register of information (ROI) is a structured data package that financial entities must submit to regulators to demonstrate compliance with DORA. It includes information about legal entities, third-party service providers, contracts, and functions.

Starting with version 21.1.x, users of the Operational Resilience Workspace and Digital resilience third-party registers application can generate regulator-ready RoI packages using the **Plain-CSV Report Package option** on the download page. The ZIP file includes metadata and report folders structured to regulator specifications, with file names containing LEI, entity ID, and release version. This enhancement ensures EU DORA compliance and supports automated validation workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can use the **Excel master template** option to download a document to use for data preparation and internal review and the **Plain-CSV reporting package** option to download a document to use for regulator submission and compliance validation.

The RoI framework is designed to align with DORA's five pillars, particularly ICT third-party risk management and incident reporting. RoI packages generated in the Operational Resilience Workspace follow the European Banking Authority's structure and validation requirements.

Digital Resilience Third-party Information Register support for RoI

The Digital Resilience Third-party Information Register provides the following capabilities to support RoI compliance:

- Data capture for entities, contracts, functions, and third parties
- CSV report generation aligned with regulator specifications
- ZIP packaging with metadata and report folders
- Validation workflows for technical, schema, and business rule checks
- Role-based access for managing RoI requests

Note:

All RoI-related actions are performed in the **Digital resilience third-party registers** section in the Operational Resilience Workspace. This workspace provides access to download/upload requests, validation tools, and main templates.

For more information, see Generate a Register of Information package.

Validation framework for Register of Information in Operational Resilience

The validation framework helps to verify that RoI packages meet regulatory requirements defined by the DORA.

Validation overview

The validation framework for the Digital Resilience Third-party Information Register application ensures that downloaded RoI packages comply with the structural, formatting, and data integrity requirements defined by the DORA. It supports a real-time, three-level validation system that automatically checks for technical accuracy, regulatory alignment, and business rule compliance during the upload process.

- Level 1 (Technical checks): 29 rules validating file encoding, structure, and naming.
- Level 2 (Data package mode technical checks): 12 rules ensuring template and schema alignment.
- Level 3 (Data package model business rules): 70 rules verifying regulatory logic and field dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Data Package Model is used to structure and validate RoI packages.

The DPM business validation rules and report.json, reportPackage.json, FrameworkCodeModuleVersion properties enable Third-party risk admins [sn_vdr_risk_asmt.vendor_admin] to view and maintain validation logic and configuration settings for CSV reporting and automated validation. Third-party risk admins can access these properties by navigating to **All** > **Digital Operational Resilience Management** and then selecting **Properties** or **DPM Business Validation Rules**.

Validation process

Validation is now performed automatically during the upload of RoI CSV files. As soon as the ZIP package is uploaded via an Excel download/upload request, the system initiates real-time validation without requiring a separate request type. The system performs checks across multiple dimensions:

- File-level validation: Ensures correct encoding, naming conventions, and file structure.
- Template-level validation: Verifies that required templates are present and formatted correctly.
- Field-level validation: Applies rule expressions to check for missing values, incorrect formats, and invalid references.

Validation results are returned in a downloadable report that includes:

- Mappings to regulator fields such as Template Code, Row Code, and Column Code.
- Rule expressions and descriptions.
- Real-world field labels and record identifiers.
- Row-level error summaries.

Operational Resilience managers (sn_oper_res.manager) can validate downloaded RoI packages using the same Plain-CSV Report Package option. After a validation report is generated for a Register of Information (RoI) package, the system automatically sends an email notification to whoever initiated the download or upload request. This email alerts the user that the process has completed and provides access to the results. If validation warnings are detected, both the validation report and the CSV package are attached to the request record. If no issues are found, only the CSV package is included. This automated notification ensures timely awareness and facilitates efficient follow-up actions for compliance and data correction workflows.

To assist with error resolution, users can cross-reference the validation report with downloadable templates that mirror the CSV structure. These templates help identify the location and context of each issue, making it easier to correct data in the ServiceNow instance or source system. Validation reports are only generated when errors or warnings are detected. If no issues are found, only the CSV package is returned.

To improve troubleshooting, the system maps rule expressions to real-world field labels and record identifiers. Even when malformed data is uploaded, the validation API returns meaningful error messages to help users identify and resolve issues efficiently.

Excel templates are available for download from the **Download/Upload Request** page. These templates mirror the expected CSV structure and provide field definitions, formats, and sample values to assist with validation and error resolution.

Important:
The Operational Resilience administrators (sn_oper_res.admin) and managers (sn_oper_res.managers) can perform the validation tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common validation issues

Refer to the following guidance to troubleshoot common validation issues when submitting RoI packages.

- Validation report is missing: The uploaded package contains no errors or warnings. Check the **Result** section of the request. If no issues are found, only the CSV package is returned and no validation report is generated.
- Missing required fields: One or more required fields are empty or incorrectly formatted. Open the validation report and locate the affected row and column. Use the template to identify the correct field name and expected format. Update the record in the ServiceNow instance or source system and revalidate.
- Rule expression failures: The data violates one or more business rules defined in the validation framework. Review the rule expression and description in the validation report. Use the record identifier to locate the affected record and correct the data. Common issues include invalid LEI formats, empty currency fields, or missing contract references.
- Invalid use of “Not applicable” values: These values are used in fields that don’t support them. Check the field definition in the template. Replace “Not applicable” with a valid value or remove it if the field is required. Revalidate the updated package.
- Validation report is difficult to interpret: The report lacks context or field labels are unclear. Download the template and use it to cross-reference the row number, sheet name, and record identifier. This helps locate the affected record and understand the validation error in context.
- File size or encoding issues: The uploaded ZIP file exceeds the 5 MB limit or uses unsupported encoding. Compress the file to meet the size requirement and ensure all CSV files use UTF-8 encoding. Re-upload the corrected package.

For more information, see Validate the Register of Information packages.

Configuring Digital resilience third-party registers

Set up Digital resilience third-party registers in the Operational Resilience Workspace to manage the records of ICT third-party service providers.

List of DORA applications

Beginning with Release 19.1.x, the Digital resilience third-party registers application is available from the ServiceNow Store.

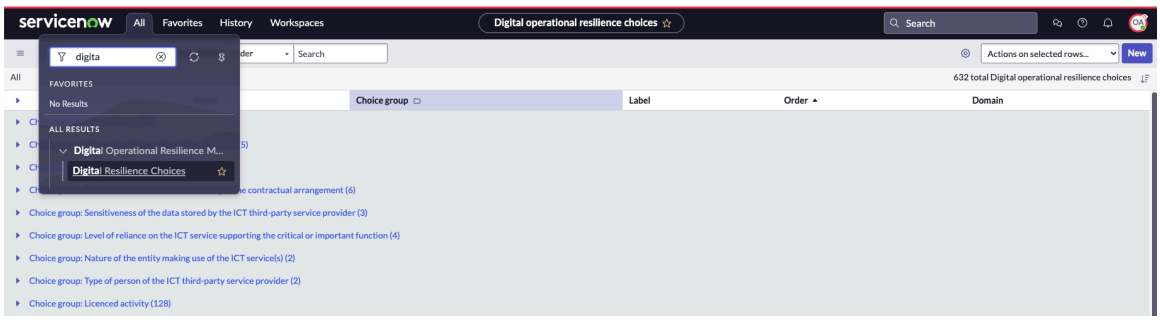
The following applications are used in the background for the Digital resilience third-party registers application:

- Digital Resilience Third-party Information Register: This application is used to download the Digital resilience third-party registers application. It contains the Microsoft Excel template including all tabs for reporting purposes.
- Digital Operational Resilience Management: This application is used for uploading and downloading of all individual DORA tables. It is automatically installed when the Digital Resilience Third-party Information Register is activated.

Creating and reviewing the records

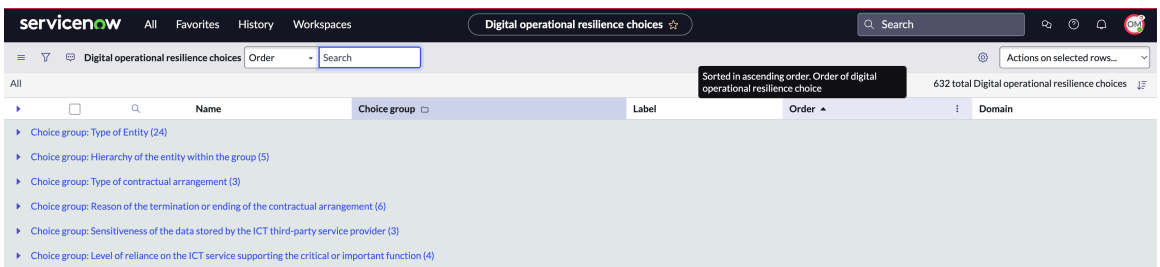
The Operational Resilience administrators and managers can access the Digital Resilience Choices records in an instance. For best results, it is important to create or update the records such as legal entities, branches, functions, contracts, and so on in a specific order into the Digital resilience third-party registers application. Those specifics are outlined in this section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Order for creating or updating the records

For best results, it is important to create or update the records in the following order:



1. Legal entities
2. Branches
3. Functions
4. Third parties
5. Contracts
6. Supply chains
7. Assessments

Reviewing the choice records

Operational Resilience administrators can locate and access Digital Resilience Choices records by navigating to the **All > Digital Operational Resilience Management > Digital Resilience Choices** menu within an instance, as demonstrated in the example.

Similarly, Operational Resilience managers can locate and access the Digital Resilience Choices records as shown in the example.

Create records in bulk

Create records in bulk from the Digital resilience third-party registers rather than creating one record at a time for single or multiple entities. You can save time and effort by working on multiple records at a time.

Before you begin

Role required: sn_oper_res.admin

About this task

Only Operational Resilience administrators can view the **Upload** option on the form and create records in bulk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Select the request type as **Upload**.

   Note:
   Only Operational Resilience administrators can view the **Upload** option and perform this task.

3. Select an appropriate record that you want to work on.
4. Download the default template.
5. Follow the instructions in each template to fill out the columns in the template.
6. Create an upload request for the record type and attach the completed template from your local hard drive.
7. Submit the request.
8. View the results to get an overview of the records that are uploaded successfully and the records with errors.
9. Navigate to the spreadsheet to view the errors.
   a. Correct the errors in the Microsoft Excel spreadsheet.
   b. Upload the record again.
10. Repeat the steps for other records.
    The records are downloaded in bulk from the Digital resilience third-party registers.

Update existing records in bulk

Update existing records in bulk from the Digital resilience third-party registers.

Before you begin

Role required: sn_oper_res.admin

About this task

Only Operational Resilience administrators can view the **Upload** option and update existing records in bulk.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Select the request type as **Download**.
3. Select the records to be updated and submit the request.
4. Download the Microsoft Excel spreadsheet to update your local hard drive.
5. Follow the instructions in each template to fill out the columns in the template.
6. Create an upload request for the record type and attach the completed template from your local hard drive.

   Note:
   Only Operational Resilience administrators can view the **Upload** option and perform this task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Submit the request.
8. Review the results to see a summary of the successfully uploaded records and those with errors.
9. Navigate to the spreadsheet to view the errors.
   a. Correct the errors in the Microsoft Excel spreadsheet.
   b. Upload the record again.
10. Repeat the steps for other records.

Validate the Register of Information packages

Run real-time validation on Register of Information (RoI) packages to help ensure compliance with DORA requirements.

Before you begin

Role required: sn_oper_res.manager

Generate a Plain-CSV Reporting Package and an Excel Master Template. For more information, see Generate a Register of Information package.

About this task

Validation is performed automatically when a ZIP file containing RoI CSV templates is uploaded via an Excel download/upload request. The system initiates real-time validation without requiring a separate request type.

Once validation is complete, the system sends an email notification to whoever initiated the request. If validation warnings are detected, both the validation report and the CSV package are attached to the request record. If no issues are found, only the CSV package is included.

The validation report contains mappings to regulator fields such as Template Code, Row Code, and Column Code, along with rule expressions, field labels, and record identifiers. These details help users locate and resolve issues efficiently.

To review and resolve validation errors, download the Excel template from the **Download/Upload Request** page. The template mirrors the CSV structure and includes field definitions, formats, and sample values. Use it to cross-reference the validation report and identify the location and context of each issue.

Validation reports are only generated when errors or warnings are present. If no issues are found, only the CSV package is returned.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Open the request record you want.
3. Download the validation report from the attachment area of the request record.
4. Cross-reference the validation report with the Excel template to identify and correct issues.
5. Update the affected records in the system or spreadsheet and re-upload the corrected package for re-validation.

Display the help tips on the forms

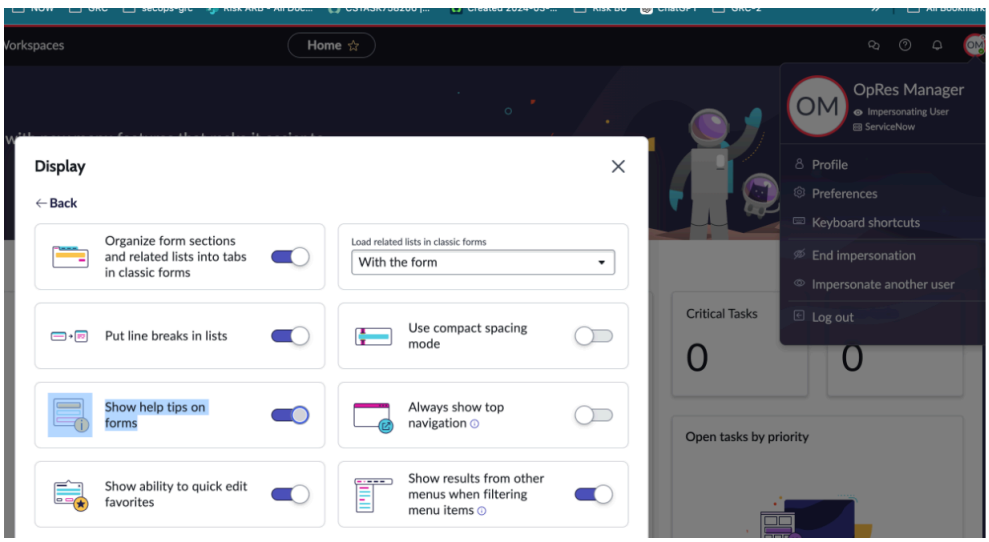
Display the help tips on the forms by updating the preferences. Help tips provide extra details about the fields and their related actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

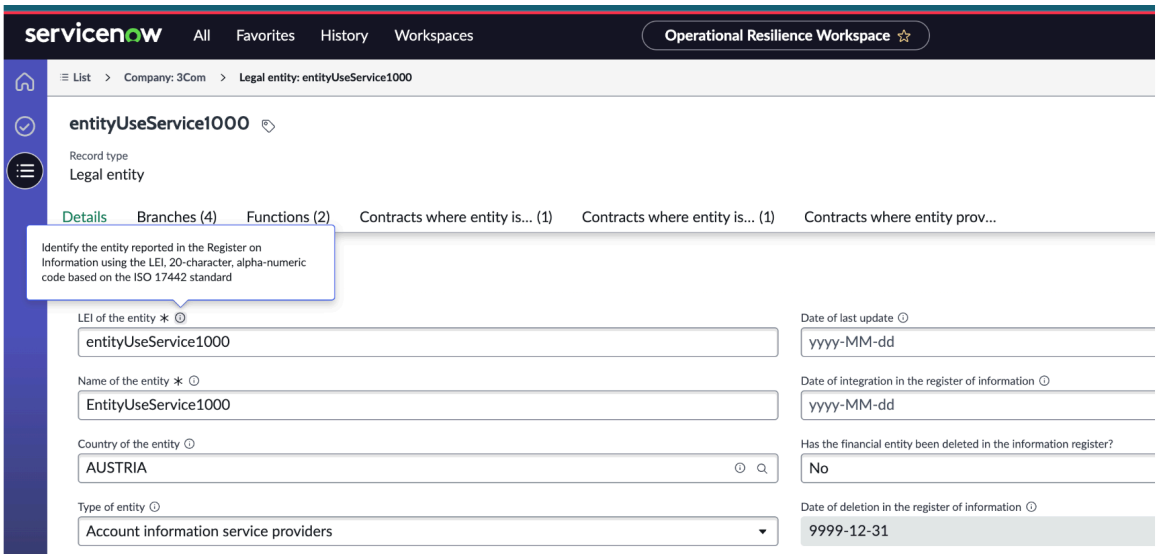
Role required: sn_oper_res.manager

Procedure



1. Navigate to > **Preferences** in the user profile.

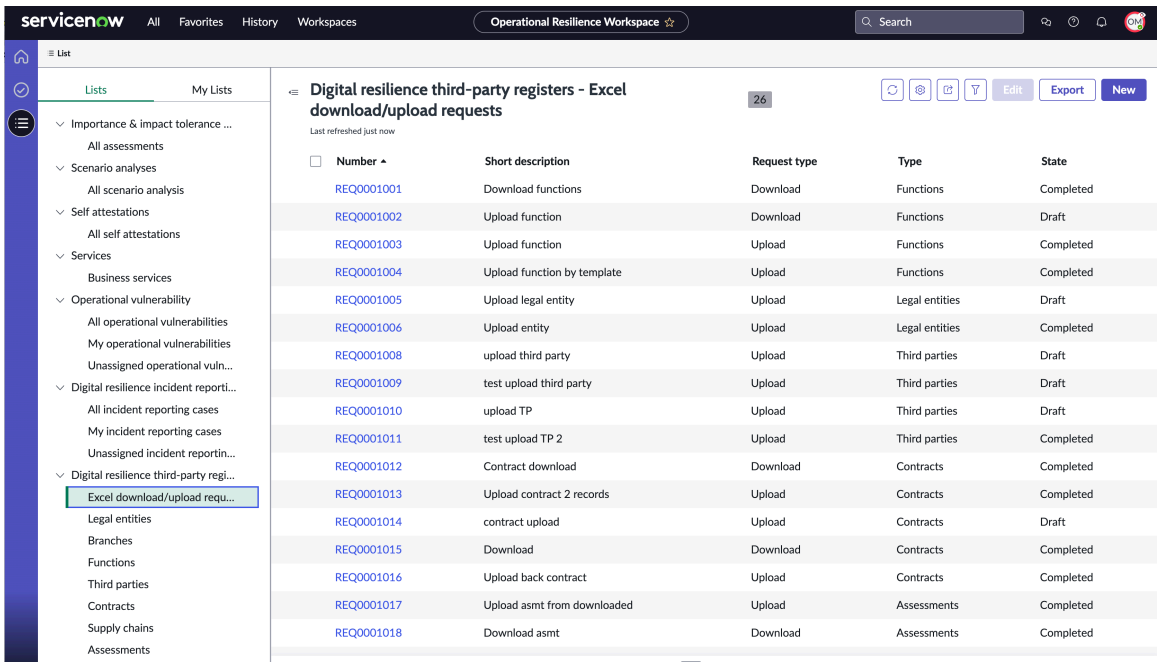
   The user profile is shown in the example.



2. Select **Display**.
3. Enable the **Show help tips on forms** option.

   The option is displayed in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The help tips are displayed on the form as shown in the example.

Using Digital resilience third-party registers

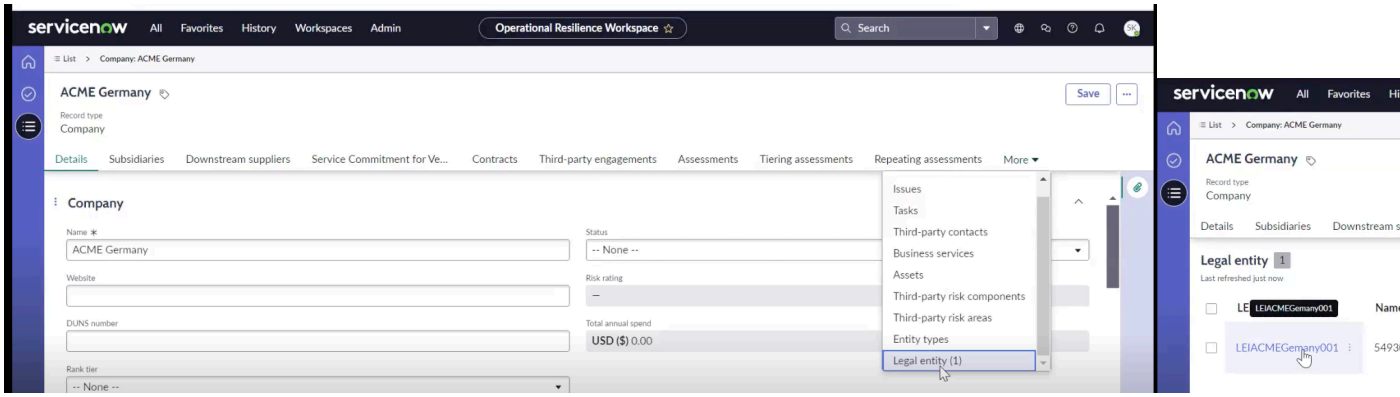
Use the Digital resilience third-party registers application in the Operational Resilience Workspace to create, update, and track records of ICT third-party service providers.

When you launch the Digital resilience third-party registers application in the Operational Resilience Workspace, you can view the different functionalities that can be accessed from the application menu.

Create a legal entity and enhance digital resilience data

Create a legal entity record in Digital resilience third-party registers. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

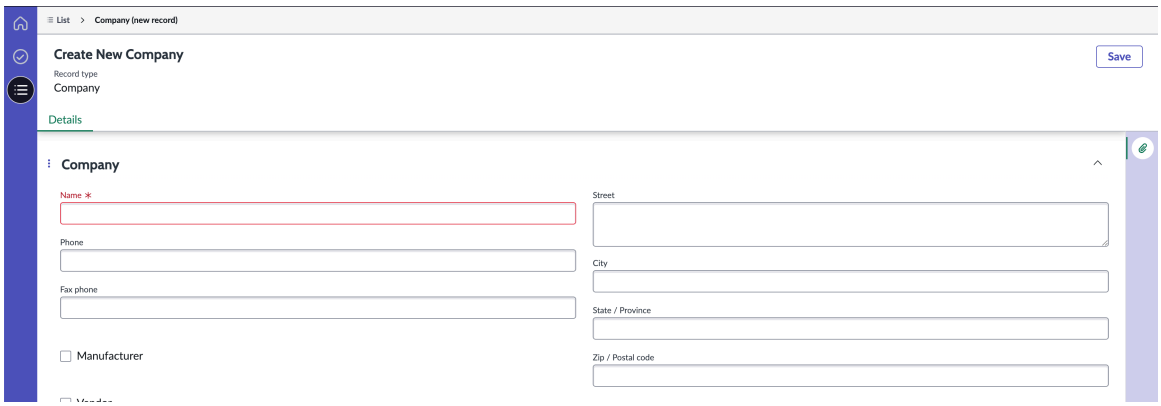


Role required: sn_oper_res.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you select the Legal entities record in Digital resilience third-party registers menu item in the Operational Resilience Workspace, you can view the existing legal entities (core companies) in the system.



When you install Digital resilience third-party registers, the **Legal entities** tab gets added for the existing companies. You can launch the **Legal entities** tab and configure the details.

Procedure

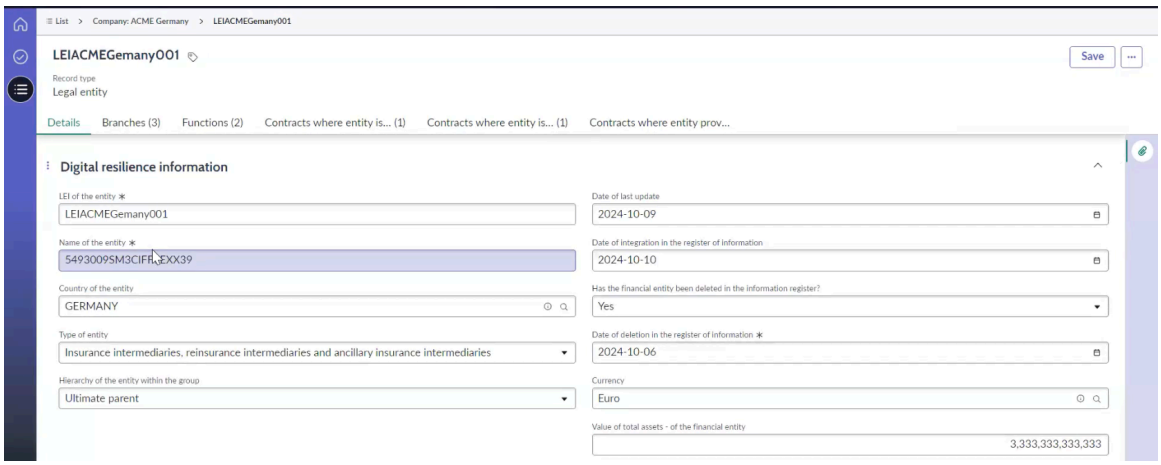
1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Legal entities**.
2. Select **New**.

   The Create New Company form is displayed.

3. On the form, fill in the fields.
   For more information, see Create New Company form.
4. Select **Save**.

   The company record is set up. Users can set up the legal entity for the company and the digital resilience information on the **Legal entity** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. To create a legal entity record and set up its digital resilience information for DORA regulation, navigate to the **Legal entity** tab and select **New**.
   For information on setting up the digital resilience information for a legal entity, see Create New Legal entity form.

   The Create New Legal Entity form is displayed.

6. Select **Save**.

   The Legal Entity record contains fields that provide the necessary information for regulatory reporting of the legal entity. This includes details like Legal Entity Identifier (LEI), name, country of registration, entity type (as defined by the regulator), and more. These fields are offered as choice lists within the system for users to select from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system acknowledges the entity hierarchy, with no additional details required for ultimate parents, while subsidiaries must specify their parent entity. The date of registration for each legal entity is also noted.

For each entity, the system records the following details:

- Last update to the record
- Integration date of the information register
- History of the financial entity's removal from the register, if any (and if so, the deletion date, currency used, and total asset value at that time)

Regulators mandate these specific details for legal entities engaging with external third parties for outsourced technical services.

7. To edit the Legal entity record, select it from the list and select **Edit**.
8. To export the Legal entity record, select **Export**.
9. To delete the Legal entity record, select it from the list and select **Delete**.

What to do next

Set up branches for a legal entity. For more information, see Create a branch and enhance digital resilience data.

Create New Company form

On the Create New Company form, fill in the fields for the legal entity.

Create New Company form

Field	Description
Name	Unique name of the company.
Website	Website details of the company.
DUNS Number	Unique identification number for the company that is generated by the application. Data Universal Numbering System number, is a unique nine-digit number that identifies a business.
Rank tier	Rank tier for the company. Available options are: • **Strategic Partner** • **Valued Partner** • **Tactical Supplier** • **Excluded Supplier** • **Other**
Third-party tier	Tier assigned for the company. Available options are: • **1 - Very High** • **2 - High** • **3 - Moderate**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
	• **4 - Low** • **5 - Very Low**
Vendor manager	Vendor manager of the company.
Business owner	List of business owners for the company.
Parent	Parent organization that determines the corporate hierarchy.
Status	Current standing of the company. You can define your own third#party or legal#entity lifecycle and corresponding states for [core_company]. Available options are: • **Not Selected**: Vendor/third party has been identified but not chosen for engagement. • **Selected**: Vendor has been chosen as the preferred option but is not fully onboarded yet. • **Onboarding**: Vendor is going through the onboarding steps such as risk review, compliance checks, contract processing etc. • **Prospect (In evaluation)**: Vendor is being assessed before selection. • **Active**: Vendor is fully approved, authorized, and currently engaged. • **Active unauthorized**: Vendor is in use but has not passed required onboarding, compliance, or authorization steps. • **Terminated**: Relationship with the vendor has ended. It is no longer in use. • **Onboarding rejected**: Vendor failed onboarding due to unmet requirements (risk, compliance, legal etc.)
Risk rating	Rating assigned to the company based on risk evaluation. This field is auto-filled.
Total annual spend	Total amount that the company spends annually. This field is auto-filled.
Notes	Further remarks or comments regarding the company.
General	
Industry	Sector or industry classification for the company. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
	• **Agriculture** • **Apparel** • **Banking** • **Biotechnology** • **Chemicals** • **Communications** • **Construction** • **Consulting** • **Education** • **Electronics** • **Energy** • **Engineering** • **Entertainment** • **Environmental** • **Finance** • **Food & Beverage** • **Government** • **Healthcare** • **Hospitality** • **Insurance** • **Machinery** • **Manufacturing** • **Media** • **Not For Profit** • **Recreation**
Vendor	Choice to identify the company as a vendor. By default, this option is set to **False** (checkbox is not selected) for companies and legal entities.
Manufacturer	Manufacturers who produce the items that users procure.
Number of employees	Number of employees that the company has.
Banner image	Banner image for the company with a height between 60 and 70 pixels.
Attach image	Option to attach the banner image.
Banner text	Banner text that is displayed with the banner image.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
Location	
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax phone	Standard contact information for the company.
Latitude and Longitude	Values that are used to mark the location of the company on the Risk concentration map.
Financial	
Publicly traded	Option to mark if the company is publicly traded.
Stock symbol	Stock symbol of the company.
Stock price	Stock price of the company.
Revenue per year	Revenue per year for the company.
Market cap	Market cap for the company.
Profits	Profits for the company.
Fiscal year	Fiscal year for the company in YYYY-MM-DD format.
Risk ratings	
Computed risk rating	Calculated risk rating. This field is auto-filled. The value is overall risk rating for the company, calculated after the assessment by rolling up all of the TPR assessors' risk ratings.
Override risk rating	Option to override the computed risk rating. If you select the check box, then specify the following values: • **Overridden risk rating**: Select the new risk rating. • **Overridden on**: Date that overridden risk rating or justification is updated. • **Justification**: Enter the reason for overriding the value.
Overridden risk rating	Rating that has been manually changed by a user, overriding the rating that was calculated by a system. Available options are: • **1 - Very High** • **2 - High** • **3 - Moderate**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Company form (continued)

Field	Description
	• **4 - Low** • **5 - Very Low**
Overridden on	Date when the overridden risk rating or its justification was last updated.
Justification	Reason for overriding the risk rating.
Assessment risk rating	Risk level for the assessment. This field is auto-filled.
Engagement risk rating	Risk level for the engagement. This field is auto-filled.
Subsidiary risk rating	Risk level for the subsidiary. This field is auto-filled.
Risk intelligence rating	Score that reflects the probability and impact of a risk event. This field is auto-filled.

Create New Legal entity form

On the Create New Legal entity form, fill in the fields to set up the digital resilience information.

Create New Legal entity form

Create New Legal entity form

Field	Description
Digital resilience information	
LEI of the entity	Legal Entity Identifier. A unique global identifier for the entity reported in the register of information. It uses the 20-character, alpha-numeric code based on the ISO 17442 standard.
Name of the entity	Legal name of the entity that maintains and updates the register of information.
Country of the entity	Two-letter country code where the license or the registration of the entity, as listed in the information register, was issued.
Type of entity	Types of the entity. Identify the type of the entity by using one of the following options: • **Credit institutions** • **Investment firms** • **Central counterparties (CCPs)** • **Asset management companies** • **Account information service providers** • **Electronic money institutions**

Create New Legal entity form (continued)

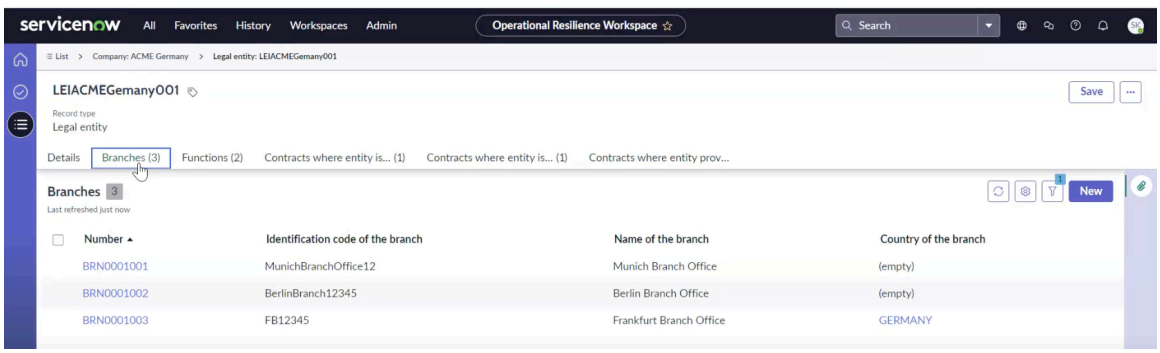
Field	Description
	• **Crypto-asset service providers** • **Central security depository** • **Trading venues** • **Trade repositories** • **Payment institution** • **Other financial entity** • **Securitization repository** • **Crowdfunding service providers** • **Administrator of critical benchmarks** • **Credit rating agency** • **Institutions for occupational retirement provision** • **Insurance intermediaries, reinsurance intermediaries and ancillary insurance intermediaries** • **Insurance and reinsurance undertakings** • **Data reporting service providers** • **Managers of alternative investment funds** • **Non-financial entity: Other than ICT intra-group service provider** • **Non-financial entity: ICT intra-group service provider** • **Issuers of asset-referenced tokens**
Hierarchy of the entity within the group	Hierarchy of the entity within the group that is identified by using one of the following options: • **Ultimate parent** • **Parent other than ultimate parent** • **Subsidiary** • **Entities other than entities of the group** • **Outsourcing**
LEI of the direct parent undertaking of the entity	Legal Entity Identifier (LEI) of the direct parent undertaking of the entity reported in the register of information. This field is displayed when the **Hierarchy of the entity within the group** field has one of the following values: • **Parent other than ultimate parent** • **Subsidiary**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Legal entity form (continued)

Field	Description
	• **Entities other than entities of the group** • **Outsourcing**
Date of last update	Date of last update made in the register of information in relation to the entity in the YYYY-MM-DD format.
Date of integration in the register of information	Date on which the entity was included in the register of information in the YYYY-MM-DD format.
Has the financial entity been deleted in the information register?	Information of the legal entity such as whether the financial entity been deleted in the information register. Available options are: • **Yes**: Displays the **Date of deletion in the register of information** field. • **No**: If the financial entity has been deleted in the information register, the date is auto-filled in the following field: **Date of deletion in the register of information**.
Currency	Code of currency used in preparing the financial entity's financial statements.
Value of total assets - of the financial entity	Monetary value of the total assets of the entity using the ICT services, as per the previous year's financial statement.

Create a branch and enhance digital resilience data



Create a branch record in Digital resilience third-party registers. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_oper_res.manager

About this task

A legal entity may operate multiple branches across various cities or countries, all of which can be documented on the form.

If a new branch is launched, its information is also required for regulatory reporting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Branches**.
2. Select **New**.

   The Create New Branch form is displayed.
3. On the form, fill in the fields.

   Users typically fill in the following details of the branch:
   - Branch name and its description
   - Owner's details
   - Tagging of business units and departments for reporting purpose
   - Specifying the branch as a head office or as a different branch other than the head office
   - ID of the branch and its originating country

   The number for the branch is auto-generated. Once the branch details are complete, the information is ready to be captured in the information register.

   For more information, see Create New Branch form.
4. Select **Save**.

   The digital resilience information for the branch is shown in the example.

5. To edit the branch record, select it from the list and select **Edit**.
6. To export the branch record, select **Export**.
7. To delete the branch record, select it from the list and select **Delete**.

What to do next

Specify the functions that are associated with a branch. For more information, see Create a function and enhance digital resilience data.

Create New Branch form

On the Create New Branch form, fill in the fields.

Create New Branch form

Field	Description
SysID	Unique 32-character GUID (Globally Unique ID) that identifies each branch record in an instance. Provide this value if you want to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Branch form (continued)

Field	Description
	update an existing record. Provide a value of -1 if you want to create a new record in the system.
Name	Name of the branch.
Description	Description for the branch.
Number	Unique identification number for the branch that will be generated by the application, for example, BRN0001005. This field is auto-filled.
Department	Department that the branch belongs to, for example, Customer Support, Product Management.
Owner	Name of the owner of the branch.
Business unit	Name of the business unit that is associated with the branch, for example, HR, IT, Legal.
Digital resilience information	
Is Branch different from Financial Entity head office of the branch	Option to confirm if the branch is different from the head office. Available options are: • **Yes**: When you select the **Yes** option, the **Identification code type** and **Identification code of the branch** fields are displayed. • **No**
Identification code type	Type of identification code used for the branch. Available options are: • **LEI** • **Other**
Identification code of the branch	An overseas branch of the financial entity, uniquely identified by a specific code, for example, FB97521. The financial entity uses the branch's Legal Entity Identifier (LEI) or another identification code to distinguish it.
LEI of the financial entity head office of the branch	Legal Entity Identifier (LEI) of the head office of the financial entity to which the branch belongs, for example, LEIACMEGermany001 or LEIACMEAmericas001
Name of the branch	Name of the branch that is used for identification. When the LEI of the financial entity head office of the branch is entered, this field is auto-filled, for example, Frankfurt branch office.
Country of the branch	Two-letter country code where the branch is located. When the LEI of the financial entity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Branch form (continued)

Field	Description
	head office of the branch is entered, this field is auto-filled, for example, Germany.

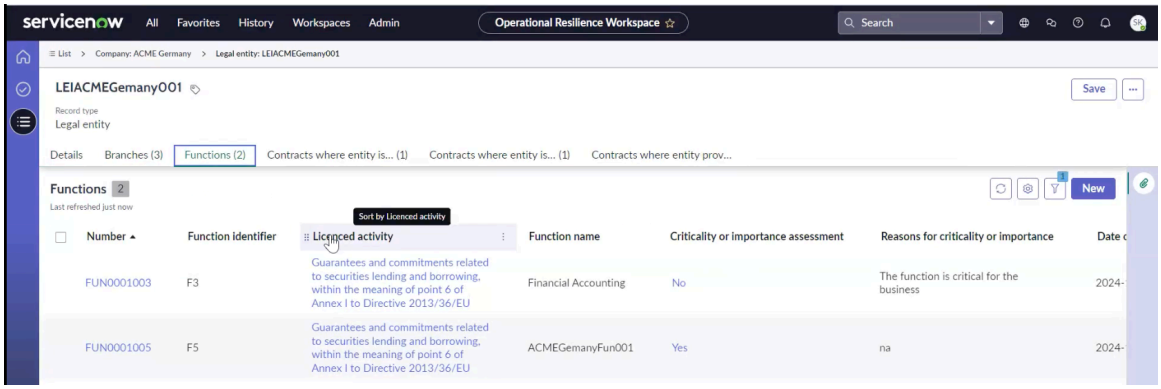
Create a function and enhance digital resilience data

Create a function record in Digital resilience third-party registers where you can configure details of the function such as function identifier, license activity, function name, criticality or importance assessment details, and so on. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_oper_res.manager

About this task



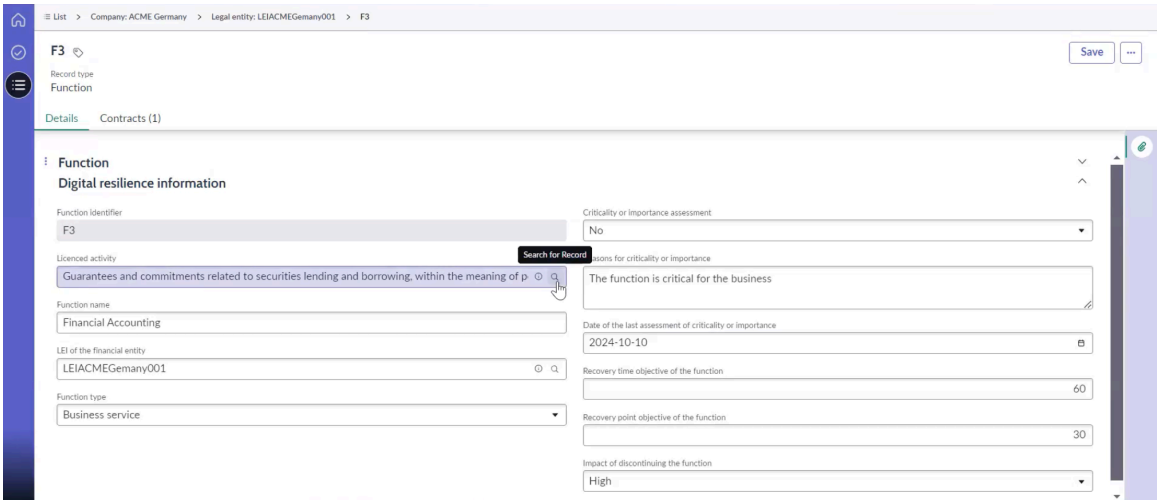
A legal entity can have multiple branches and across these branches, different functions operate. Thus, the legal entities, branches, and functions are the users of the ICT service that is outsourced.

A function can be a service, a service offering, or a process.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Functions**.
2. Select **New**.

   The Create New Function form is displayed. You can select and view multiple functions within an organization.



3. On the form, fill in the fields.
4. Select **Save**.

   The function record is displayed in the list view.

   The digital resilience information for the function is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To set up the digital resilience information for DORA regulation, navigate to the **Digital resilience information** tab and select **New**.

   An organization can have various functions, each representing a specific service, service offerings, or group of services and their service offerings, as defined by the Digital Operational Resilience Act (DORA). You can select and view these functions. The functions form is designed to capture the detailed information about each function.

   You can view and fill in the following details on the form:

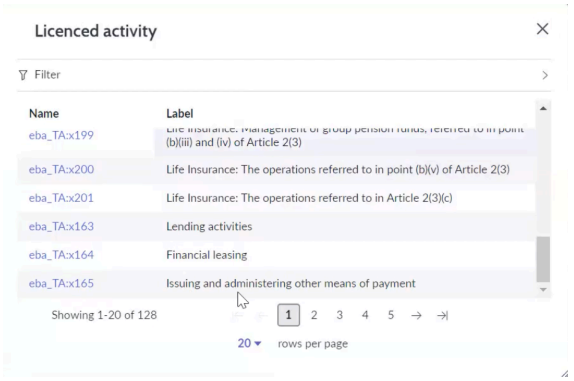
   - Function identifier
   - Licensed activity (choice list)
   - Function name
   - Associated legal entity and function type (business process or service)
   - Specific business process or service represented
   - Function criticality

   Additionally, if you have the Business Continuity Management application installed, you can see the Recovery Time Objective (RTO), Recovery Point Objective (RPO), and the business's criticality. You can also include descriptive notes on the form. Upon completion, you will have documented the details of the third-party ICT service usage.

   For information on setting up the digital resilience information for a legal entity, see Create New Function form.

6. Select **Save**.
7. To edit the function record, select it from the list and select **Edit**.
8. To export the function record, select **Export**.
9. To delete the function record, select it from the list and select **Delete**.

Create New Function form



On the Create New Function form, fill in the fields.

Create New Function form

Field	Description
Name	Name of the function, for example, Financial Accounting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Function form (continued)

Field	Description
Description	Description for the function.
Number	Unique identification number for the function that will be generated by the application, for example, FUN0001003. This field is auto-filled.
Department	Department that the function belongs to, for example, Finance.
Owner	Name of the owner for the function.
Business unit	Name of the business unit that is associated with the function, for example, HR, IT, Legal.
Digital resilience information	
Function Identifier	Function identifier that is composed by the letter F (capital letter) followed by a natural number (for example, "F1" for the 1st function identifier and "Fn" for the nth function identifier with "n" being a natural number). For example, when you create newer functions, it will be F1, F2, F3, and so on. This field is auto-filled.
Licensed activity	Licensed activity that is referred to in Annex II for different type of financial entities. List of activities that the function is related to. Licensed activity is a particular drop-down list that's been provided by the user and the set of values that are required by the regulator. 
Function name	Function name according to the financial entity's internal organization, for example, Financial Accounting.
LEI of the financial entity	Financial entity using the LEI, 20-character, alpha-numeric code, for example, LEIACMEGermany001.
Function Type	Type of the function. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Function form (continued)

Field	Description
	• **Business capability** • **Business service** • **Business process** • **Service offering** • **Is an independent object** When you select the **Business capability** option the **Select the business capability** field is displayed. When you select the **Business service**, **Business process**, or **Service offering** options, the following fields are displayed: • **Select the business service** • **Select the business process** • **Select the service offering**
Criticality or importance assessment	Criticality or importance of the function according to the financial entity's assessment. Available options are: • **Yes** • **No** • **Assessment not performed**
Reasons for criticality or importance	Brief explanation on the reasons to classify the function as critical or important. Maximum 300 characters are allowed.
Date of the last assessment of criticality or importance	Date of the last assessment of criticality or importance in case the function is supported by ICT services provided by ICT third-party service providers. If you have Operational Resilience, this information is auto -populated. If you do not have Operational Resilience and you are using the application with TPRM, you must fill in this information manually. If the function is service-related and you have Operational Resilience, and you've completed an importance and impact assessment, the default values are copied from that assessment.
Recovery time objective of the function	Recovery time objective of the function in number of hours. If the recovery time objective

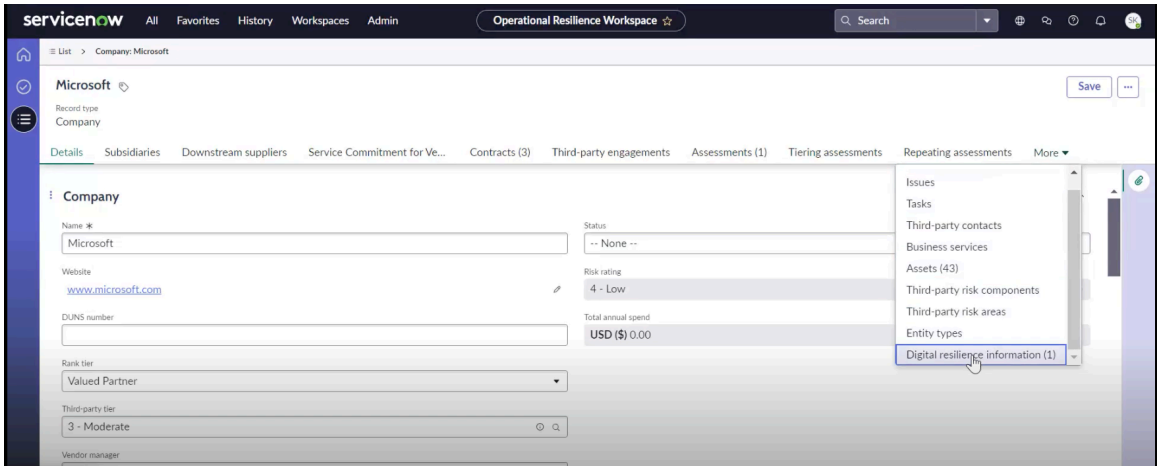
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Function form (continued)

Field	Description
	is less than 1 hour, '1' is reported. In case the recovery time objective of the function is not defined, '0' is reported. If a Business Impact Analysis (BIA) has been conducted for the business process, service, or service offering, and Business Continuity Management (BCM) is also set up in the same instance, then the values are copied from the relevant BIA for this function.
Recovery point objective of the function	Recovery point objective of the function in number of hours. If the recovery point objective is less than 1 hour, '1' is reported. In case the recovery point objective of the function is not defined, '0' is reported. If a Business Impact Analysis (BIA) has been conducted for the business process, service, or service offering, and Business Continuity Management (BCM) is also set up in the same instance, then the values are copied from the relevant BIA for this function.
Impact of discontinuing the function	Impact of discontinuing the function according to the financial entity's assessment. One of the options in the corresponding drop-down list is used. Available options are: • **Low** • **Medium** • **High** • **Assessment not performed**

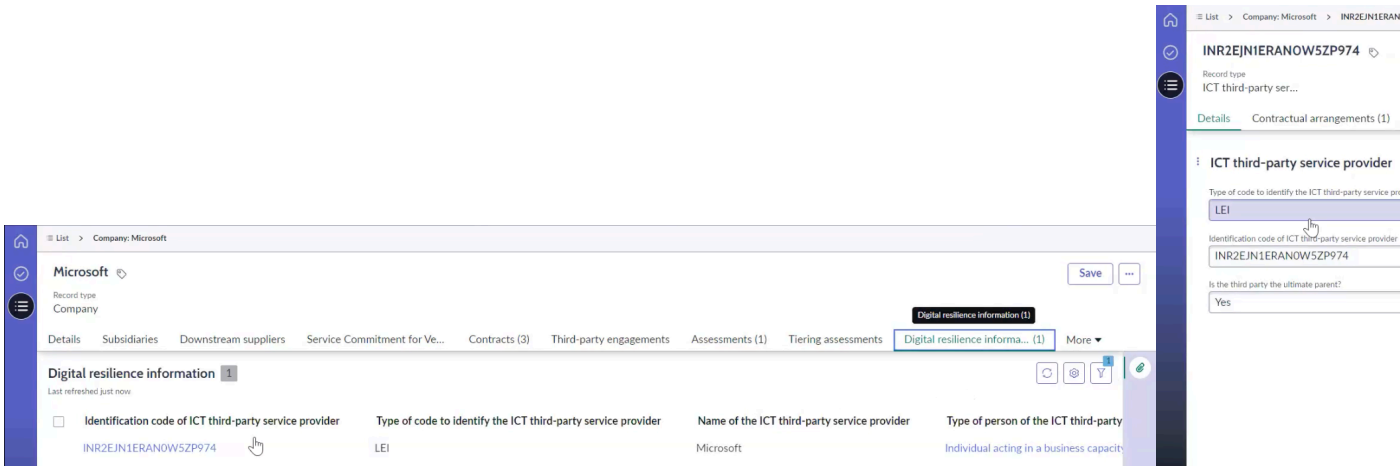
Create a third party and enhance digital resilience data

Create a third party record in Digital resilience third-party registers. Add the details of the third party company such as its name, address, phone number, vendor manager, and so on. You can then enhance its digital resilience information for compliance with DORA regulation.



Before you begin

Role required: sn_oper_res.manager

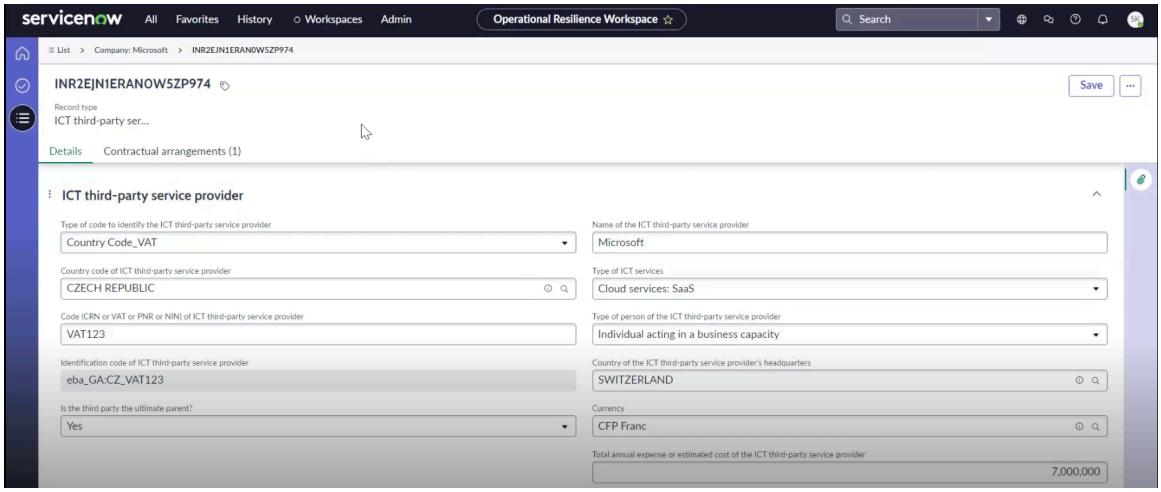


About this task

To access and view the existing third parties in the system, you can navigate to the Third parties menu item within the Operational Resilience Workspace. Upon installing the Digital resilience third-party registers, the **Digital resilience information** tab is added for third parties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can open this tab and set up the digital resilience information details.



Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Third parties**.
2. Select **New**.
   The Create New Company form is displayed.
3. On the form, fill in the fields.
   For more information, see Create New Company form.
4. Select **Save**.
5. To set up the digital resilience information for DORA regulation, navigate to the **Digital resilience information** tab and select **New**.
6. On the form, fill in the fields.

   For more information, see Create New ICT third-party service provider form. Details on the fields are displayed in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the legal entity ID of the third party, which can be captured by the Value Added Tax (VAT) number or Company Registration Number (CRN) number. You can specify the country of registration and their code, which the system uses to generate the ID.

You can also indicate if the third party is ultimate or a subsidiary. Include the name of the ICT third party and the type of service they provide, such as Software as a Service (SaaS). Optionally, you can note if an individual acts on behalf of the organization. Additionally, select the reporting currency and input the total annual expense for this engagement.

For more information, see Create New Company form.

7. Select **Save**.
8. To edit the third party company record, select it from the list and select **Edit**.
9. To export the third party company record, select **Export**.
10. To delete the third party company record, select it from the list and select **Delete**.

Create New Company form

On the Create New Company form, fill in the fields for the third party.

Create New Company form

Field	Description
Name	Unique name of the company.
Website	Website details of the company.
DUNS Number	Unique identification number for the company that is generated by the application. Data Universal Numbering System number, is a unique nine-digit number that identifies a business.
Rank tier	Rank tier for the company. Available options are: • **Strategic Partner** • **Valued Partner** • **Tactical Supplier**

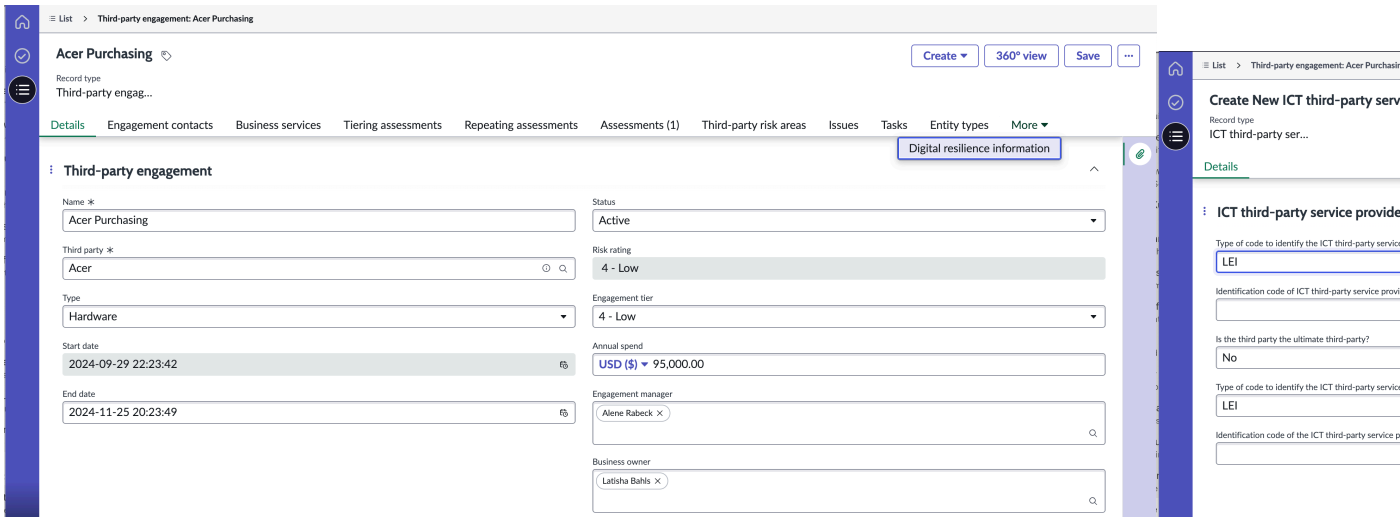
Create a third-party engagement and enhance digital resilience data

Create a third-party engagement record in Digital resilience third-party registers. Add details of the third-party engagement such as name of the third party, its type, annual spend, engagement tier, and so on. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin



Role required: sn_oper_res.manager

About this task

By selecting the Third-party engagements menu item within the Digital resilience third-party registers from the Operational Resilience Workspace, you can access and view the existing third-party engagements in the system.

The **Digital resilience information** tab is also available for the Third-party engagement module, allowing you to report on third-party engagements at a more detailed, granular level. This module is visible only when the Third-party Risk Management application is installed. If you don't have this application, you can still use the Third-Party tables and digital resilience information for your third parties.

Upon installing the Digital resilience third-party registers, the **Digital resilience information** tab is added for third-party engagements. You can open this tab and set up the digital resilience information details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Third-party engagements**.
2. Select **New**.
   The Create New Third-party engagement form is displayed.
3. On the form, fill in the fields.
   For more information, see Create New Third-party engagement form.
4. Select **Save**
5. Add digital resilience information.
   For more information, see Add Digital resilience information to third-party engagements.
6. To edit the third-party engagement record, select it from the list and select **Edit**.
7. To export the third-party engagement record, select **Export**.
8. To delete the third-party engagement record, select it from the list and select **Delete**.

Add Digital resilience information to third-party engagements

Add Digital resilience information to third-party engagements.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Third-party engagements** and open an engagement record.
2. Launch the **Digital resilience information** tab.
3. Select **New**.
   The Create New ICT third-party service provider form is displayed.
4. Set up the digital resilience information details.
   For more information, see Create New ICT third-party service provider form.
5. Select **Save**.
   The ICT third-party service provider record is created and its details are displayed in the **Details** tab.
6. Navigate to the Contractual arrangements tab and view the details.

Create New Third-party engagement form

On the Create New Third-party engagement form, fill in the fields.

Create New Third-party engagement form

Field	Description
Name	Unique name for the engagement. Ideally, mention the product or service that is the subject of the engagement.
Third party	The third party for whom you are creating this engagement record.
Type	Type of product or service to be provided by the engagement organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Third-party engagement form (continued)

Field	Description
Start date	Enter start and end dates to define how long the engagement is valid.
End date	Preferred dates for the beginning and end of interactions with the third party.
Status	Select the current status of the engagement. Available options are: • **Active** • **Onboarding** • **Prospect** • **Active unauthorized** • **Terminated** • **Onboarding rejected**
Risk rating	Displays the risk rating assigned to the engagement after an assessment has been performed.
Engagement tier	The tier used for this engagement. See VRM third-party risk tiering assessments for details of how the tier is determined.
Annual spend	The annual monetary spend associated with this engagement's services.
Engagement manager	Specify the person who will monitor, prioritize, and act on responses to external questionnaires, issues, and tasks. Click the lock to lock/unlock the field.
Business owner	Specify the person who is familiar with the engagement organization and the product or services that will be engaged. Click the lock to lock/unlock the field.
Notes	Enter text that describe the engagement to other users.
Third-party engagement: Contact	
Street, City, State/Province, ZIP/Postal code, Country, Phone, Fax	Standard contact information for the engagement organization.
Latitude and Longitude	The **Latitude** and **Longitude** values are used to mark the location on the Risk concentration map. See TPRM Risk concentration map.
Risk ratings

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Third-party engagement form (continued)

Field	Description
Computed risk rating	Calculated **Computed risk rating**. This field is auto-filled. The value is overall risk rating for the third party, calculated after the assessment by rolling up all of the TPR assessors' risk ratings.
Override risk rating	Option to override the computed rating. If you select the check box, then specify the following values: • Overridden risk rating: Select the new risk rating. • Overridden on: Date that overridden risk rating or justification is updated. • Justification: Enter the reason for overriding the value.
Overridden risk rating	Rating that has been manually changed by a user, overriding the rating that was calculated by a system. Available options are: • **1 - Very High** • **2 - High** • **3 - Moderate** • **4 - Low** • **5 - Very Low**
Overridden on	Date that overridden risk rating or justification is updated.
Justification	Reason for overriding the value.
Assessment risk rating	Risk rating for the assessment. This field is auto-filled.
Engagement risk rating	Risk rating for the engagement. This field is auto-filled.
Subsidiary risk rating	Risk rating for the subsidiary. This field is auto-filled.
Risk intelligence rating	Score that corresponds to the likelihood and consequence of a risk event. This field is auto-filled.
Related lists on the form	
Engagement contacts	Engagement contacts for the third party engagement.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Third-party engagement form (continued)

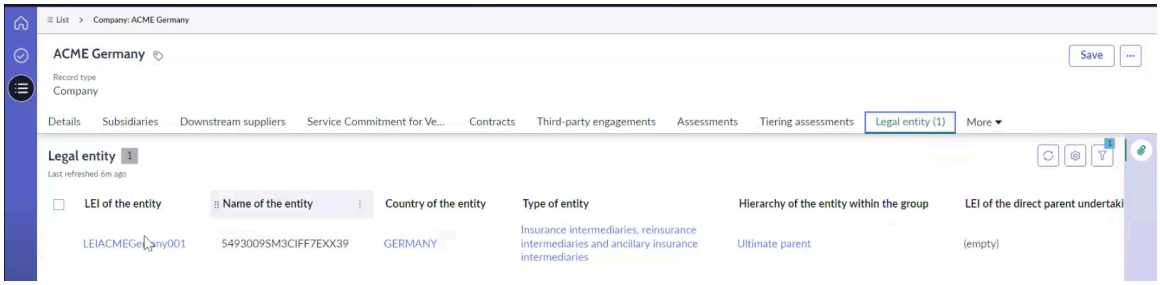
Field	Description
Business services	Business services related to the third party engagement.
Tiering assessments	Tiering assessments for the third party engagement.
Repeating assessments	Repeating assessments for the third party engagement.
Assessments	Assessments for the third party engagement.
Third-party risk areas	Risk areas related to the third party engagement.
Issues	Issues related to the third party engagement.
Tasks	Tasks related to the third party engagement.
Entity types	Entity types related to the third party engagement.
Digital resilience information	Digital resilience information for the third party engagement. You can add the following parameters: • Name • Third party • Identification code of ICT third-party service provider • Type of code to identify the ICT third-party service provider • Name of the ICT third-party service provider

Create a contract and enhance digital resilience data

Create a contract record in Digital resilience third-party registers where you add details of the contract such as vendor name, start and end dates, state, substate, and so on. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_oper_res.manager



About this task

The Digital resilience third-party registers include details about who within your organization is using externally outsourced ICT services, which functions and branches are using them, and who the third-party providers and their engagements are. The contracts link these two aspects together.

The contracts link both parties—those using the information and those providing it. Essentially, they bind legal entities, branches, and functions to third parties and third-party engagements.

You can navigate to the contracts from the Contracts menu item in Digital resilience third-party registers. Alternately, you can navigate to the legal entities record, open the Legal entities tab, and navigate to the contracts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Contracts**.
2. Select **New**.
   The Create New Contract form is displayed.
3. On the form, fill in the fields.
   For more information, see Create New Contract form.
4. To submit the contract for review, select **Submit for Review**.
5. Select **Save**.
6. To add entities signing the contract to use the ICT services associated with the contract, navigate to the **Entities signing contract to use service** related list of the contract record and select **Add**.
7. Select **Save**.
8. To add entities using the ICT services associated with the contract, navigate to the **Entities making use of services** related list of the contract record and select **Add**.
9. Select **Save**.

> **Note:**
> When creating multiple entities using the ICT services, the combination of LEI and Nature of the entity must be unique. If the nature of the entity is a branch, the combination of the LEI of the entity, Nature of the entity, and the identification code of the branch must be unique.

10. To add entities signing the contract to provide ICT services associated with the contract, navigate to the **Entity providing services** related list of the contract record and select **Add**.
11. Select **Save**.
12. To add third parties signing the contract to provide ICT services associated with the contract, navigate to the **Third party signing contract to provide services** related list of the contract record and select **Add**.
13. Select **Save**.
14. To add third-party engagements signing the contract to provide ICT services associated with the contract, navigate to the **Third-party engagements signing contract** related list of the contract record and select **Add**.
15. Select **Save**.
16. To set up the digital resilience information for DORA regulation, navigate to the **Specific information** related list and create a contractual arrangement by selecting **New**.
17. On the form, fill in the fields.
18. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

19. To add intra-group contractual arrangements, navigate to the **Intra-group contractual arrangements** tab of the contract and select **Add**.
20. Select **Save**.
21. To add ICT service supply chains associated with the contract, navigate to the **ICT service supply chains** tab of the contract and select **New** and fill in the fields.
22. Select **Save**.
23. To add Assessments of the ICT services associated with the contract, navigate to the **Assessments of the ICT services** tab of the contract and select **New** and fill in the fields.
24. Select **Save**.
    For descriptions of all these fields, see Create New Contractual arrangement form.
25. To edit the contract record, select it from the list and select **Save** after making your edits.
26. To export contract records, select **Export**.
27. To delete the contract record, select it from the list and select **Delete**.

Create New Contract form

On the Create New Contract form, fill in the fields.

Create New Contract form

Field	Description
Contract	
Contract number	Unique identifier number for the contractual arrangement, for example, CNTR0009002. This field is auto-filled.
Contractual arrangement reference number	Internal reference number of the contractual arrangement assigned by the financial entity. It is used to identify the contractual arrangement between the financial entity and the direct ICT third-party service provider.
Name	Name and short description of the contract.
Type of contractual arrangement	Type of contractual arrangement that is identified by using one of the options in the corresponding drop-down list: • **Standalone arrangement** • **Overarching arrangement** • **Subsequent or associated arrangement**
State	State of the contract. For example, Draft state.
Contract model	Type of contract being created such as a Service or a Purchase Agreement.
Currency	Code of the currency that is used to report the amount.
Annual expense or estimated cost for the past year	Annual expense or estimated cost (or intragroup transfer) of the ICT service arrangement for the past year.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contract form (continued)

Field	Description
Description	Detailed description of the contract.

Create New Contractual arrangement form

On the Create New Contractual arrangement form, fill in the fields. For each contract, a separate form would be required.

Create New Contractual arrangement form

Create New Contractual arrangement form

Field	Description
Contractual arrangement	
Contract number	Unique identifier number for the contractual arrangement, for example, CNTR0009002. This field is auto-filled.
Contractual arrangement reference number	Internal reference number of the contractual arrangement assigned by the financial entity. It is used to identify the contractual arrangement between the financial entity and the direct ICT third-party service provider.
Name	Name and short description of the contract.
Type of contractual arrangement	Type of contractual arrangement that is identified by using one of the options in the corresponding drop-down list: • **Standalone arrangement** • **Overarching arrangement** • **Subsequent or associated arrangement**
State	State of the contract. For example, Draft state.
Contract model	Type of contract being created such as a Service or a Purchase Agreement.
Currency	Code of the currency that is used to report the amount.
Annual expense or estimated cost for the past year	Annual expense or estimated cost (or intragroup transfer) of the ICT service arrangement for the past year.
Description	Detailed description of the contract.
Entities signing contract to use service	
LEI of the entity signing the contractual arrangement	Legal Entity Identifier (LEI) code to identify the entity that would be signing the contractual arrangement, for example, LEI0000000000000000B.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
Name of the entity	Name of the entity that would be signing the contractual arrangement, for example, ACME NA.
Entities making use of services	
LEI of the entity making use of the ICT services	LEI of the entity making use of services, for example, LEI0000000000000000C.
Name of the entity	Name of the entity making use of services, for example, ACME SA.
Nature of the entity making use of the ICT services	Nature of the entity making use of services, for example, branch of a financial entity.
Identification code of the branch	Identification code of the branch making use of services, for example, ACMESAbranch2LEI.
Entities providing services	
LEI of the entity making use of the ICT services	LEI of the entity making use of services, for example, LEI0000000000000000C.
Name of the entity	Name of the entity providing services, for example, ACME AMERICAS.
Third parties signing contract to provide info	
Identification code of the ICT third-party service provider	Identification code of the ICT third-party service provider, for example, LEI0000000000EXTTPP2.
Type of code to identify the ICT third-party service provider	Type of code to identify the ICT third-party service provider, for example, LEI.
Name of the ICT third-party service provider	Name of the ICT third-party service provider, for example, Adobe.
Third-party engagements signing contract	
Identification code of the ICT third-party service provider	Identification code of the ICT third-party service provider, for example, LEI0000000000EXTTPE1.
Type of code to identify the ICT third-party service provider	Type of code to identify the ICT third-party service provider, for example, LEI.
Name of the ICT third-party service provider	Name of the ICT third-party engagement service provider, for example, Acer engagement 1.
Specific information	
Contractual arrangement reference number	Contractual arrangement reference number for the contract, for example, CNTR0009002.
LEI of the entity making use of the ICT service(s)	LEI of the entity making use of the ICT service(s), for example, LEI0000000000000000C.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
Function identifier	Function as defined by the financial entity, for example, F3,F1.
Type of ICT services	Type of the ICT service used by the entity, for example, Computation, Data analysis.

Service provider type	• **Third party**: Selecting this option displays the following fields:
	  ○ Identification code of ICT third-party service provider
	  ○ Type of code to identify the ICT third-party service provider
	• **Third-party engagement**: Selecting this option displays the following fields:
	  ○ Identification code of ICT third-party engagement service provider
	  ○ Type of code to identify the ICT third-party engagement service provider
	• **Legal entity**: Selecting this option displays the LEI of the entity providing ICT services field.

Identification code of ICT third-party service provider	Code to identify the ICT third-party service provider, for example, LEI00000000000000000D.
Identification code of ICT third-party engagement service provider	Identification code of ICT third-party engagement service provider.
LEI of the entity providing ICT services	Entity providing ICT services using LEI, 20-character, alpha-numeric code based on the ISO 17442 standard, for example, LEI00000000000000000D.
Type of code to identify the ICT third-party service provider	Type of code that is to identify the ICT third-party service provider, for example, LEI.
Start date of the contractual arrangement	Date of entry into force of the contractual arrangement, for example, 2025-07-01.
End date of the contractual arrangement	End date as stipulated in the contractual arrangement, for example, 2028-07-01.
Reason of the termination or ending of the contractual arrangement	Reason for the termination or ending of the contractual arrangement. Available options are: • **Termination not for cause: Expired and not renewed** • **Termination for cause: Provider in breach of applicable law, regulations or contractual provisions**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
	• **Termination for cause: Identified impediments of the provider capable of altering the supported function** • **Termination for cause: Provider's weaknesses regarding the management and security of sensitive data or information** • **Termination: As requested by the competent authority** • **Other reasons for termination**
Notice period for the financial entity making use of the ICT service(s)	Notice period for terminating the contractual arrangement by the financial entity making use of the ICT service(s) in a business-as-usual case.
Notice period for the ICT third-party service provider	Notice period for terminating the contractual arrangement by the direct ICT third-party service provider in a business-as-usual case.
Country of the governing law of the contractual arrangement	Country whose legal system oversees the contract.
Country of provision of the ICT services	Country where the ICT services are provided.
Storage of data	Option to specify if the ICT service is related to storage of data. Available options are: • **Yes** • **No**
Sensitiveness of the data stored by the ICT service provider	Option to identify the level of sensitiveness of the data stored or processed by the ICT service provider. Available options are: • **Low** • **Medium** • **High**
Level of reliance on the ICT service	Option to specify the level of reliance on the ICT service. Available options are: • **Not significant** • **Low reliance** • **Material reliance** • **Full reliance**
Intra-group contractual arrangements	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
Contractual arrangement linked to this contractual arrangement	Contract number linked to this contractual arrangement, for example, CNTR0009004.
Name	Name of the intra-group contractual arrangements, for example, Staffing agency.
ICT service supply chains	
Number	ICT service supply chain number associated with the contract, for example, SCHAIN0001002.
Recipient of sub-contracted ICT services	Recipient of sub-contracted ICT services of the supply chain. It is the parent supplier.
Identification code of the recipient of sub-contracted ICT services	Identification code of the recipient of sub-contracted ICT services of the supply chain. This field is auto-filled.
Type of code to identify the recipient of sub-contracted ICT services	Type of code to identify the recipient of sub-contracted ICT services of the supply chain. This field is auto-filled.
Type of ICT services	Type of ICT service associated with the supply chain, for example, Data storage.
Contractual arrangement reference number	Contract number associated with the supply chain, for example, CNTR0009002.

Service provider type	• **Third party**: Selecting this option displays the following fields:
	  ○ Identification code of ICT third-party service provider
	  ○ Type of code to identify the ICT third-party service provider
	• **Third-party engagement**: Selecting this option displays the following fields:
	  ○ Identification code of ICT third-party engagement service provider
	  ○ Type of code to identify the ICT third-party engagement service provider
	• **Legal entity**: Selecting this option displays the LEI of the entity providing ICT services field.

LEI of the entity providing ICT services	Entity providing ICT services using LEI, 20-character, alpha-numeric code based on the ISO 17442 standard, for example, LEI00000000000000000D.
Identification code of ICT third-party service provider	Identification code of ICT third-party service provider, for example, LEI0000000000EXTTPP1.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
Identification code of ICT third-party engagement service provider	Identification code of ICT third-party engagement service provider.
Type of code to identify the ICT third-party service provider	Type of code to identify ICT third-party service provider, for example, LEI. Starting with version 21.1.x, the field Type of code to identify the ICT third-party service provider is now updated to be a choice field in the Digital resilience third-party registers in the contract record. This update aligns the field with regulator-defined options for selecting identification systems when creating new providers.
Rank	Rank of the supply chain, for example, 1 or 2.
Assessment of the ICT service	
Name	Name of the assessment in the <first-name.last-name> format.
Description	Description for the assessment.
Number	Unique identification number for the assessment that will be generated by the application. For example, TPA0001001. This field is auto-filled.
Department	Department that the assessment belongs to.
Owner	Name of the owner for the assessment.
Business unit	Name of the business unit that is associated with the assessment.
Contract number	Unique identifier number for the contractual arrangement, for example, CNTR0009002. This field is auto-filled.
Contractual arrangement reference number	Contract number associated with the assessment, for example, CNTR0009002.

Service provider type	• **Third party**: Selecting this option displays the following fields:
	  ○ Identification code of ICT third-party service provider
	  ○ Type of code to identify the ICT third-party service provider
	• **Third-party engagement**: Selecting this option displays the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
	○ Identification code of ICT third-party engagement service provider ○ Type of code to identify the ICT third-party engagement service provider • **Legal entity**: Selecting this option displays the LEI of the entity providing ICT services field.
Identification code of ICT third-party service provider	Identification code of ICT third-party service provider, for example, LEI0000000000EXTTPP1.
Identification code of ICT third-party engagement service provider	Identification code of ICT third-party engagement service provider.
LEI of the entity providing ICT services	Entity providing ICT services using LEI, 20-character, alpha-numeric code based on the ISO 17442 standard, for example, LEI00000000000000000D.
Type of code to identify the ICT third-party service provider	Type of code to identify ICT third-party service provider, for example, LEI.
Type of ICT services	Type of ICT services, for example, Data analysis.
Substitutability of the ICT third-party service provider	Substitutability of the ICT third-party service provider. The following options are available: • Not substitutable • Easily substitutable • Medium complexity in terms of substitutability • Highly complex substitutability
Reason for the substitutability classification	Reason for the classification.
Is the ICT third party audited?	Option to specify if the ICT third party has been audited. Available options are: • **Yes** • **No**
Date of the last audit on the ICT third-party service provider	Date when the last audit was performed.
Existence of an exit plan	Availability of an exit plan. The following options are available: • Yes • No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Contractual arrangement form (continued)

Field	Description
Possibility of reintegration of the contracted ICT service	Choice to verify the feasibility of reincorporating the contracted ICT service. Available options are: • **Easy** • **Difficult** • **Highly complex**
Impact of discontinuing the ICT services	Choice to specify the impact of discontinuing the ICT services. Available options are: • **Low** • **Medium** • **High** • **Assessment not performed**
Are there alternative ICT third-party service providers identified?	Choice to indicate if any other ICT third-party service providers have been identified. Available options are: • **Yes** • **No** • **Assessment not performed** If you select the check box, then specify the following field value: **Identification of alternative ICT TPP**.
Identification of alternative ICT TPP	Supplementary details on the identification of alternative ICT third-party providers (TPP).

Create a supply chain and enhance digital resilience data

Create an Information and Communication Technology (ICT) service supply chain record in Digital resilience third-party registers. Add details of the supply chain such as type of the ICT services, Legal Entity Identifier (LEI) of the entity that provides the ICT services, and so on. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers**.
2. Select **Contracts** and then select the contract record you want to associate a supply chain record with.
3. Navigate to the ICT service supply chains related list and select **New**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For descriptions of all these fields, see Create New Contractual arrangement form.

5. Select **Save**.
6. To edit the supply chain record, complete the following.
   a. Navigate to **Supply chains** and select the check box of the record you want from the list.
   b. Select **Edit** and update the fields as required.
   c. Select **Update**.
7. To export supply chain records, complete the following.
   a. Navigate to **Supply chains** and select the check box of the record you want from the list.
   b. Select **Export**.
   c. Select the **File Type**.
   Available choices are:
      - **Excel**
      - **CSV**
      - **JSON**
      - **PDF**
   d. Select the **Delivery Type**.
   Available choices are:
      - **Download**
      - **Email**
8. To delete the supply chain record, select it from the list and select **Delete**.

Create an assessment and enhance digital resilience data

Create an assessment of the Information and Communication Technology (ICT) service in Digital resilience third-party registers. Add details such as the contractual arrangement reference number, identification code, and type of code for the ICT third-party service provider. You can then enhance its digital resilience information for compliance with DORA regulation.

Before you begin

Role required: sn_oper_res.manager

About this task

If you have the TPRM application, you can have third-party risk management assessments. If you don't have the TPRM application, you can still comply with the regulatory requirements by using the assessments table.

It's required that you review your contracts and third parties annually. You can provide the following assessment details on the assessment form:

- Contractual reference number, which helps identify the following details:
  - Users of the contract
  - Providers of the contract
  - Other relevant details that are automatically pulled in
- Audit information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Has the third-party provider been audited?
- When was the audit last conducted?

- Exit strategy details:
  - Existence of an exit plan
  - Possibility of integrating with the ICT service provider if terminated
  - Impact assessment of discontinuing the ICT service
  - Identification of any alternatives

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers**.
2. Select **Contracts** and then select the contract record you want to associate an assessment record with.
3. Navigate to the Assessments of the ICT services related list and select **New**.
4. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Contractual arrangement form.
5. Select **Save**.
6. To edit the assessment record, select it from the list and select **Edit**.
7. To export the record, select **Export**.
8. To delete the assessment record, select it from the list and select **Delete**.

What to do next

Once all details are captured, you can perform the following tasks:

- Download the information using the Microsoft Excel download feature
- Upload requests as needed

Create Microsoft Excel upload and download request

Create a Microsoft Excel upload and download request to upload and download the records from and into the Digital resilience third-party registers for auditing purposes.

Before you begin

Role required: sn_oper_res.admin

About this task

Use the Excel download/upload requests module in Digital resilience third-party registers to export and import the records in Microsoft Excel format. The European Union auditors and regulators can download these records for audit and reviewing purposes and take appropriate actions.

To become familiar with the process before handling more complex operations, you can follow these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create records on the UI: Create new records for each type on the user interface. It helps you to understand which fields are mandatory and their required formats.
- Download data: Next, download the data to get a clear understanding of the values in each Microsoft Excel column.
- Upload data with changes: Finally, make a simple change to a column and upload the data back to verify that the process works as expected.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Select **New**.
   The Create New Excel download/upload request form is displayed.
3. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Excel download/upload request form.
4. For the Upload request, select the **Attach file** option in the **Select file** field.
5. To download the template for uploading the selected type of record such as Assessments, select **Download template**, select the file in the **Save as** field in the modal, and select **Save**.
6. To upload the selected file, select **Upload**.
7. Select **Save**.
   After saving a download request, you can choose which records you want to download by navigating to its corresponding tab. For example, you would navigate to the **Contracts** tab for a Third-party information register download request or the **Assessments** tab for an Assessments download request.
8. Select the records that you want from the list and perform one of the following steps.
   For information on Register of information regulatory packages, see the following topics:
   - Register of Information (ROI) regulatory packages
   - Generate a Register of Information package
   - Validation framework for Register of Information in Operational Resilience
   - Validate the Register of Information packages
9. Add the name that you want for the Microsoft Excel file and select **Save**.

   In releases prior to 21.x.x of Digital resilience third-party registers, downloading the contract created a single sheet with all the contract data. Starting with version 21.x.x of Digital resilience third-party registers, when you generate a report on the contracts, it mirrors the UI and provides details, including information on entities, third parties, third-party engagements, and specific contract information in the Microsoft Excel sheet.

   It generates a Microsoft Excel sheet that you can submit directly to your regulatory authority. The file strictly adheres to the format of the template issued by the regulatory authority and includes all necessary details for reporting your third-party engagements.

   Starting with version 20.x.x of Digital resilience third-party registers, you can see choice or reference values in the downloaded Microsoft Excel files. For example, Departments can be created in the system as 'Research and Development'. When the functions are downloaded, department values are displayed as options in the Microsoft Excel template for selection. The template includes drop-down lists for departments, business units, and other yes or no questions (as seen in the Branch template). Additional drop-downs are added for countries, currencies, etc.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The application also handles translations for meta data, including headers and drop-down options.

Ensure that no duplicate records are present after downloading data for Legal entities, Functions, etc. When downloading the template, ensure that there are no duplicate Third party rows. For example, creating one DORA Third party and two DORA entities, then creating DORA contracts for the same vendor using the same entity, result in only one Third party row in the downloaded template and not two duplicate rows. You can add new entities and enter their LEI (even if not in the drop-down list) in the downloaded contract file without needing to download the contract records again. You can upload the modified contract records back to the application.

10. To export Excel download/upload requests, select the requests you want and then **Export**.

Create New Excel download/upload request form

On the Create New Excel download/upload request form, fill in the fields.

Create New Excel download/upload request form

Field	Description
Short description	Brief description of the request. For example, legal_entity_template.
Type	Type of the download request. The choices are as follows: • **Excel master template** • **Plain-CSV reporting package** • **Assessments** • **Branches** • **Contracts** • **Functions** • **Legal entities** • **Supply chains** • **Third parties** • **Third-party engagements** • **Third-party information register**
Number	Number of the request, for example, REQ0001001. This field is auto-filled.
Request type	Type of the request. The choices are as follows: • **Upload** • **Download**
State	State of the record. This field is auto-filled to **Draft** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Excel download/upload request form (continued)

Field	Description
Base currency	Currency used for reporting monetary values in the report. For example, US Dollar or Euro.
Report type	Specifies whether the report covers a single entity **Individual** or a **Consolidated** group of entities.

Update existing records in bulk

Update existing records in bulk from the Digital resilience third-party registers using Third-party Risk Management.

Before you begin

Role required: sn_oper_res.admin

About this task

To achieve the best results, upload the records in the following order due to their interdependent reference fields:

1. Legal Entities
2. Branches
3. Functions
4. Third-parties
5. Third-party engagements
6. Contracts
7. Supply chains
8. Assessments

Complete the following steps for each data type of the record:

- Create at least one record on the UI.
- Create a Download request and select this record to download.
- Make changes to one or more columns in the downloaded file.
- Create an Upload request, attach the modified file, and click **Upload**.
- Verify the changes on the UI for this record.

Repeat these steps for each data type to ensure consistency across all categories. Following this sequence helps ensure data consistency and accuracy across related records.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Create an Excel download request by selecting **New**.
3. On the form, select **Download** as the request type and fill in the remaining fields.
   For descriptions of all these fields, see Create New Excel download/upload request form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Save**.
   After saving a download request, you can choose which records you want to download by navigating to its corresponding tab. For example, you would navigate to the **Contracts** tab for a Third-party information register download request or the **Assessments** tab for an Assessments download request.
5. Select the records that you want to update from the list and select **Export to Excel**.
6. Add the name that you want for the Microsoft Excel file and select **Save**.

   It creates a Microsoft Excel sheet that you can use to make bulk updates for the records you selected.

   After downloading the templates to add options on the reference fields, the upload templates are updated to a dynamic format with drop-downs for choice and reference fields, rather than hard-coding the values.

   The dynamic templates automatically handle translations for headers and reference field options. They fetch these elements in real-time, ensuring they remain up-to-date without the need for manual updates. The default template stays up-to-date because the options are generated dynamically.

   You can view instructions for filling out the template by navigating to the **Instructions** tab of the template file. You can add your updated record creation information by navigating to the **Digital resilience information** tab and filling out the template.

   Note:
   You can only upload or download one type of record for each request. For example, if you made an upload request for Assessment records, you can only include Assessment record information in the template.

7. Follow the instructions in the template file and add your updated information.
8. Create an upload request by navigating to **Excel download/upload requests** and selecting **New**.
9. On the form, select **Upload** as the request type and fill in the remaining fields.
   For descriptions of all these fields, see Create New Excel download/upload request form.

   Note:
   Only DORA administrators can view the **Upload** option and perform this task.

10. Select **Save**.
11. Attach the updated template file by selecting **Attach File** and selecting the file from your local hard drive.
12. Select **Upload**.
13. Navigate to the **Result** section of the upload request to view the records that were uploaded successfully and any errors.
    a. Correct the errors in the Microsoft Excel spreadsheet.
    b. Upload the record again.
14. Repeat the steps until all errors are resolved and all records are uploaded successfully.
    The updated records are uploaded in bulk from the Digital resilience third-party registers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create records in bulk

Create records in bulk from the Digital resilience third-party registers using Third-party Risk Management rather than creating one record at a time for single or multiple entities. You can save time and effort by working on multiple records at a time.

Before you begin
Role required: sn_oper_res.admin

About this task
Only DORA administrators can view the **Upload** option and perform this task.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Create an Excel upload request by selecting **New**.
3. On the form, select **Upload** as the request type and fill in the remaining fields.

   Note:
   Only DORA administrators can see the **Upload** option type and perform this task.

   For descriptions of all these fields, see Create New Excel download/upload request form.

   Note:
   You can only upload one type of record for each upload request. For example, if you made an upload request for Assessment records, you can only include Assessment record information in the template.

4. Select the type of record, for example, Assessments or Branches.
5. Enter the short description for the request.
   This field is mandatory.
6. Select **Save**.
   A template file is generated and available for download. The **Download template** UI action is displayed.
7. Download the default template by selecting **Download template** and fill it out.

   a. Save the downloaded template and assign it a name in the **Save as** field.

   b. Select **Save**.
   The file download is in progress. Once it completes, you can close the modal window.

8. Open the saved template and fill it up as required and save your changes.
   You can view instructions for filling out the template by navigating to the **Instructions** tab of the template file. You can add your record creation information by navigating to the **Digital resilience information** tab and filling out the template.
9. To select the completed template file and attach it to the request, select **Attach File** and select the file from your local hard drive.
10. Select **Upload**.
    The Microsoft Excel is attached to the form.
11. Navigate to the **Result** section of the upload request to view the records that were uploaded successfully and any errors.

    a. Correct the errors in the Microsoft Excel spreadsheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. Repeat the steps until all errors are resolved and all records are uploaded successfully.
    The records are uploaded in bulk from the Digital resilience third-party registers.

Generate a Register of Information package

Generate a register of information package. Use the CSV report option in the download page to generate regulator-ready Register of Information (RoI) packages.

Before you begin
Role required: sn_oper_res.manager

About this task
Register of Information (RoI) reports can be generated for both individual and consolidated legal entities. When viewing an individual entity, only contracts associated with its specific LEI are displayed. For a consolidated view, all contracts across the system are visible.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience third-party registers** > **Excel download/upload requests**.
2. Create an Excel download request by selecting **New**.
3. On the form, fill in the fields.
   The **Excel Master Template** option downloads documents to use for data preparation and internal review. The **Plain-CSV Reporting Package** option downloads documents you can use for regulator submission and compliance validation.

   For descriptions of all these fields, see Create New Excel download/upload request form.
4. Select **Export info register** to initiate the download process.

   When a Register of Information (RoI) package is uploaded using the Plain-CSV Report Package option, the system automatically generates a ZIP file containing metadata and report folders with CSV files formatted to meet DORA specifications. Real-time validation is performed during the upload process. If any errors or warnings are detected, a validation report is generated and attached to the request record alongside the CSV package. This report includes mappings to regulator fields (such as Template Code, Row Code, and Column Code), rule expressions, field labels, and record identifiers to help users locate and resolve issues.

   An email notification is sent to whoever initiated the request once the download is complete. If no issues are found, only the CSV package is attached. Users can access the report from the attachment area of the request record and cross-reference it with the downloadable Excel template, which mirrors the CSV structure and assists with error resolution.

   For more information on validation, see .

Using Digital resilience incident reporting

Beginning with the Yokohama release, users of the Operational Resilience Workspace can report Information and Communication Technology (ICT) related incidents to regulators using the Digital resilience incident reporting module. This module, integrated with Incident Management and Security Incident Response, creates or updates incident case task records whenever a major incident is created or updated in these applications. The report is generated in the specified format and shared with regulators.

Regulatory bodies have established a streamlined framework for reporting ICT related incidents in a compliant format specified by the regulatory authorities. The Digital resilience incident reporting (DRIR) application is used to report critical Digital Resilience Incidents (DRIs) according to regulatory requirements. When critical incidents are reported through Incident Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and Security Incident Response applications, the corresponding reporting cases are generated in Digital resilience incident reporting.

The Digital Resilience Incident Reporting (DRIR) streamlines the case reporting process by creating assessments for regulatory reporting, assigning action tasks, determining reportability, and generating initial, intermediate, and final reports in the format specified by regulators. Using DRIR ensures that critical incidents are properly documented, tracked, and reported to authorities within the required timelines for regulatory compliance.

Additional resources

- Ask or answer questions in the GRC community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support
- Developer training
- Developer documentation

Explore Digital resilience incident reporting

The Digital resilience incident reporting module in the Operational Resilience Workspace is used to log and report incidents data to the regulators.

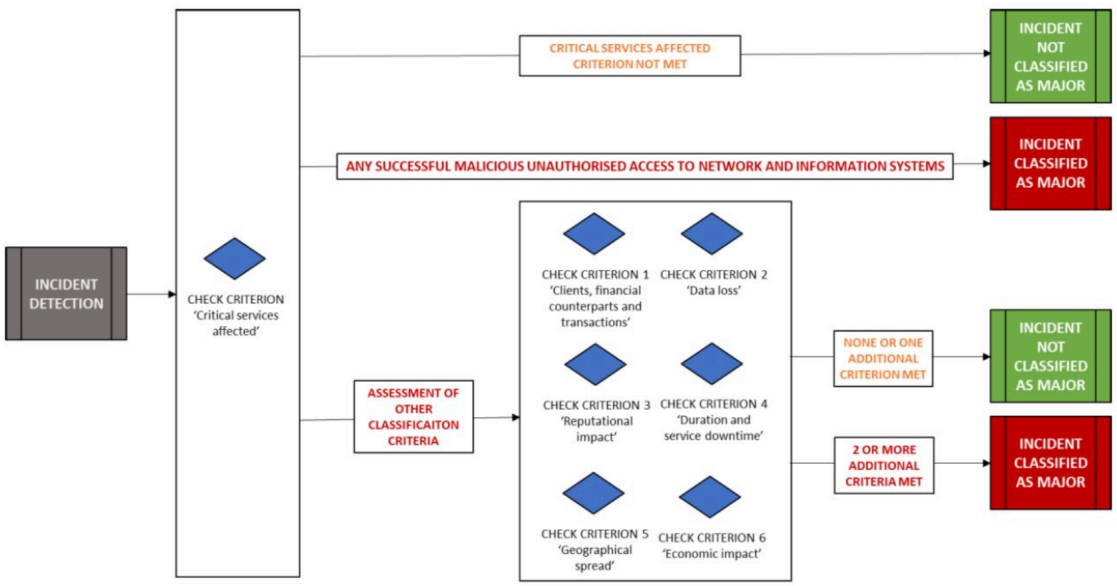
Key features of Digital resilience incident reporting

The Digital resilience incident reporting application module in the Operational Resilience Workspace offers the following key features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Creates reporting cases automatically from major incidents reported in the Incident Management and Security Incident Response applications.
- Initiates a structured assessment process, including Regulatory reporting assessment to determine if the incident is reportable.
- Tracks the status of reports and assessments, ensuring timely submission and compliance with regulatory timelines.
- Uses automated reporting workflow to generate reports within regulatory reporting timelines:
  - Regulatory reporting assessment of IT incidents
  - Initial Report (within 24 hours)
  - Intermediate Report (every three days until resolved)
  - Final Report
- Allows users to export incident reports for further analysis in the format specified by regulatory authorities.

Integration with Incident Management or Security Incident Response



The Digital resilience incident reporting module is available in the Operational Resilience Workspace by default. If you are using the Incident Management or Security Incident Response applications, you can report critical incidents from these Workspaces into the Digital resilience incident reporting module.

Auto-populating the responses in the Assessment Workspace

For the reported DIR case task, an assessment action task is created and assigned to a DIR user. Smart assessment in the Assessment Workspace is used for auto-populating the responses to the assessment. The Assessment Workspace is available to the Digital resilience incident reporting users by default.

Incident classification

When an incident is detected, it is determined whether critical business services are affected. The following approach is followed to classify the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Digital resilience incident reporting workflow

To classify major incidents, the Digital resilience incident reporting (sn_dri_inc_rptg) automatically initiates reporting cases.

Reporting cases are triggered and reported in Digital resilience incident reporting by using one of the following conditions:

1. Incident Management
   - The incident is classified as critical in the Service Operations Workspace.
   - Incident duration: The incident has been open for more than 24 hours and it is still in the **Work in progress** or **Analysis** stage.
   - The incident involves a critical business service where the business criticality value is 1.
2. Security Incident Response:
   - The incident is classified as critical in the SIR workspace.
   - Incident duration: The incident has been open for more than 24 hours and it is still in the Work in progress or Analysis stage.
3. Manual: The incident has been reported manually in the Digital resilience incident reporting module.

States of the case task

1. **Draft**: Any DIR user can create a DIR case task and assign it to the DIR managers group. A notification is sent to the managers group to assign it to one of the managers. DIR case task can also be created automatically from the IM incidents or SIR incidents if they meet the criteria defined in the creation flow (Integration with IM or SIR)
2. **In progress**:
   a. An action task is created for the DIR case task and assigned to a DIR user. The breach status of the DIR case task is updated based on the response.
   b. The DIR case task is classified as Parked for Monitoring, Not Reportable, or Reportable based on the assessment response. If it is initially marked as Parked for Monitoring, further updates on the source incident can lead to additional assessments, which may change the status to Reportable if the impacts or breach status warrant it.
   c. If the DIR case task is identified as Reportable, a new action task is created for the initial report assessment with a due date of 24 hrs and is assigned to any DIR user by the DIR manager handling the case.
   d. After the initial report action task is completed and submitted, a new action task for the intermediate report is created with a due date as three days.
   e. Intermediate report assessments are generated every three days until the source incident is closed (Incident Management or Security Incident Response).
   f. A final report action task is created with a due date of 30 days from the closing date of the source incident.
3. **Pending approval** and **Approved**: Once the reports are completed, the DIR case task is approved and closed.

Data displayed in Digital resilience incident reporting

The Digital resilience incident reporting modules display the following data on the reporting cases:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All incident reporting cases
- My incident reporting cases
- Unassigned incident reporting cases

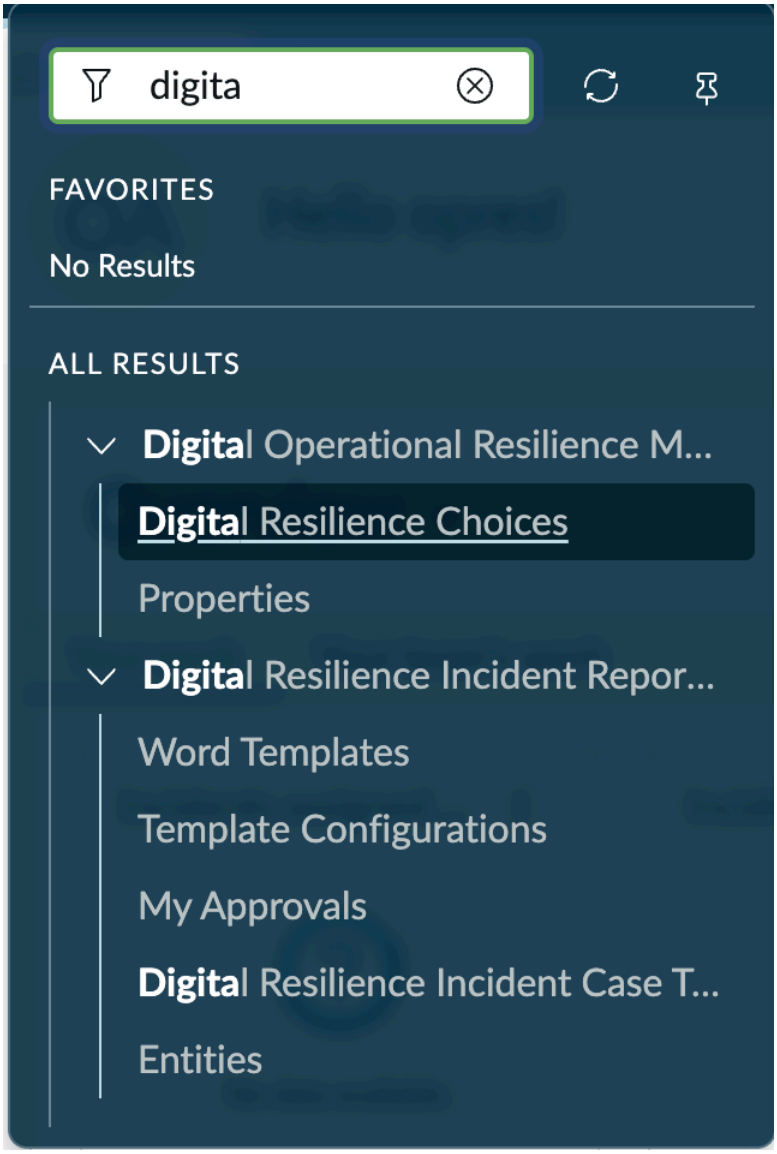
My tasks

The **My tasks** page in the Operational Resilience Workspace displays all the reporting cases and action tasks that have been assigned to the signed-in user. This section includes the following information for the signed-in user:

- **My pending tasks**
- **My items**
- **Watchlist**

Roles, Scripts, and Tables used for reporting

For information on the roles, scripts, and tables used in Roles installed with Digital resilience incident reporting, see Digital resilience incident reporting reference.



Configure Digital resilience incident reporting

Digital Resilience Incident administrators can configure conditions in Workflow Studio to auto-trigger incident reporting in Digital resilience incident reporting.

Setting up templates and modules

Operational Resilience administrators set up Word templates, Template configurations, and the Digital resilience incident (DRI) case type required for Digital resilience incident reporting as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Word Templates and Template Configurations for generating reports in Microsoft Word format. For more information, see Generating Word reports using Document designer.

The Digital Resilience Incident Case module lists all Digital Resilience Incident Cases associated with an incident or security incident. A new 'Regulation Mappings' related list is now available in each Digital Resilience Incident Case record. It displays the relationships between entities related to the cases and their corresponding regulations.

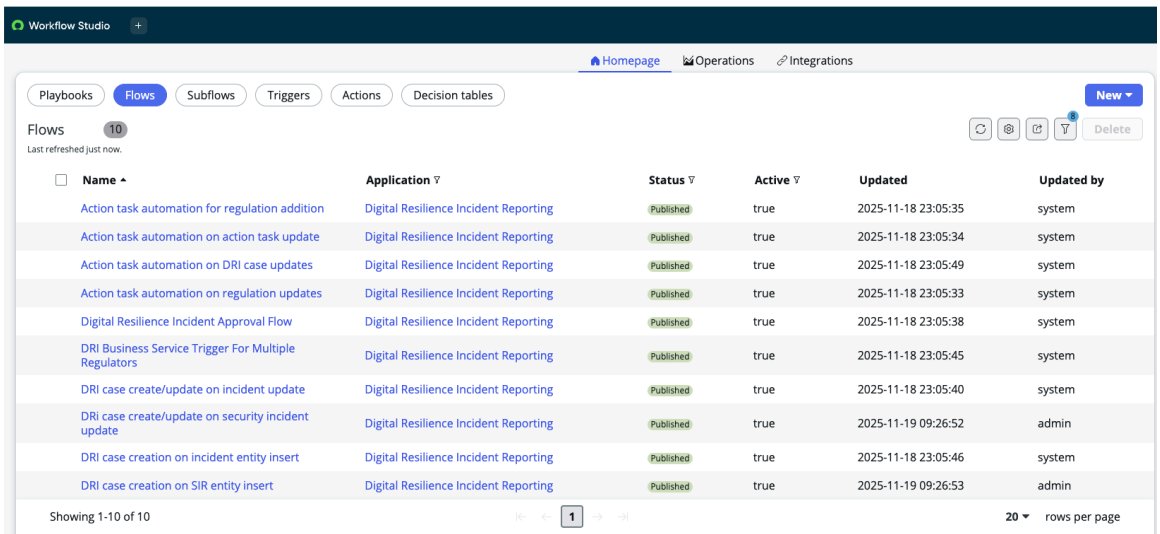
Conditions for setting up the Workflow

Workflow Studio contains preconfigured flows and conditions for creating DRI case tasks from incidents in the Incident Management or Security Incident Response applications. Access the Digital resilience incident reporting flows by navigating to **Workflow Studio** > **Flows** > **Flow Designer**.

The following flows, previously used in the Digital resilience incident reporting application, have been deprecated:

1. Digital Resilience Incident Flow
2. Digital Resilience SIR Flow
3. DRI Business service Trigger

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

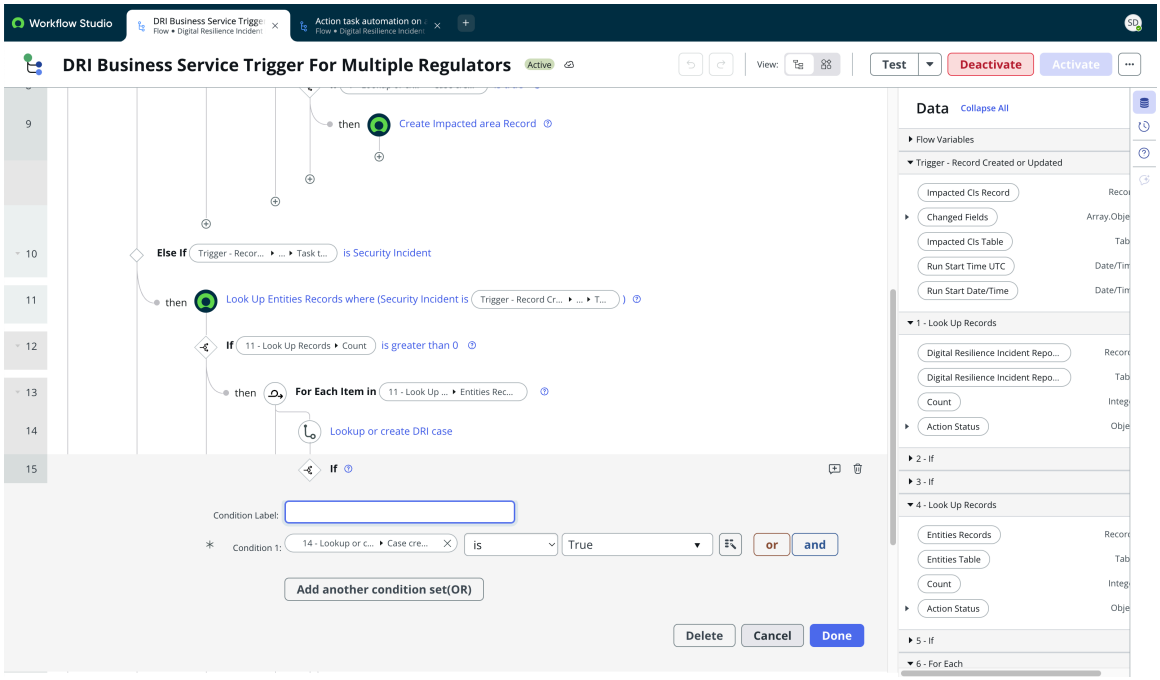


Note:
To use the previously deployed flows, deactivate the new flows (listed in this section) and then activate the Digital Resilience Incident Flow, Digital Resilience SIR Flow, and DRI Business Service Trigger Flow.

The following flows in Digital resilience incident reporting are still active:

1. Digital Resilience Incident Approval Flow
2. DRI case create/update on incident update
3. DRI case create/update on security incident update
4. DRI case creation on incident entity insert
5. DRI case creation on SIR entity insert

New flows have been introduced in Digital resilience incident reporting to manage action tasks, regulations, and trigger conditions for multiple regulators, as illustrated in the example:



1. Action task automation for regulation addition
2. Action task automation on action task update
3. Action task automation on DRI case updates
4. Action task automation on regulation updates
5. DRI Business Service Trigger For Multiple Regulators

Note:
If the Security Incident Response application is installed in your instance, flows related to the security incidents (SIR) are listed in the Flows list view.

The Digital Resilience Incident Flow and Digital Resilience SIR Flow are prebuilt into the Digital resilience incident reporting application. The flow configuration impacts all incident records in the instance. As administrators of the Operational Resilience application, you can update (customize) the flow configurations to meet your organizational requirements as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Insert condition

Conditions such as the priority of the incident is Critical, the urgency is High, and the incident has been open for more than 24 hours, are prebuilt in the flow. When all these conditions are met, it's automatically reported in the Digital resilience incident reporting application.

Update condition

When an incident is reopened or updated, that classification condition is also defined in the flow. When the configured conditions are met, the incident is reported in the Digital resilience incident reporting application.

Required and optional plugins

The Digital resilience incident reporting application is available from the ServiceNow Store. This section details its required and optional plugins.

List of required plugins

Application name	Plugin
Document designer	(com.sn_grc_doc_design)
Digital Operational Resilience Management	(com.sn_app_grc_digital_resilience)
GRC	(app-grc)
GRC Base Workspace	(app-grc-base-workspace)
GRC: Compliance Case Management	(app-grc-case-mgmt)
GRC Operational Resilience	app-grc-operational-resilience (com.sn_grc_oper_res)
GRC: Policy and Compliance Management	(com.sn_compliance)
Regulatory Agency Library	(com.sn_reg_body_mgmt)
Reusable impact framework	(sn-reusable-impact-framework)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of required plugins (continued)

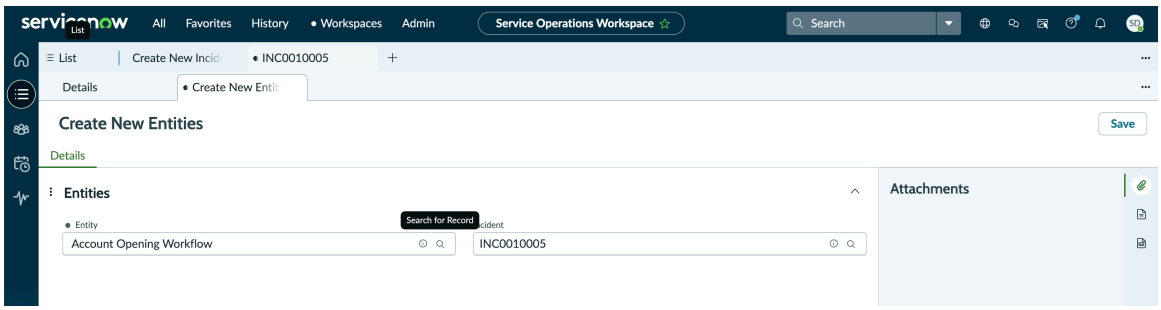
Application name	Plugin
Smart Assessment impact automation	(app-smart-assessment-impact-automation)
Smart Assessment response automation	(app-smart-assessment-response-automation)
Smart Assessment Core	(sn_smart_asmt)
Smart Assessment designer	(sn_smart_asmt_desg)

List of optional plugins

Application name	Plugin
Security Incident Response	(app-sir)
Digital Resilience Third-party Information Register	(sn_info_reg)

Set up entities for the targets

Set up an entity record in the instance and map it to an incident or security incident. You can map one or multiple entities to the selected incident.



Before you begin

Role required: sn_oper_res.admin, sn_dri_inc_rptg.digital_resilience_incident_admin

Procedure

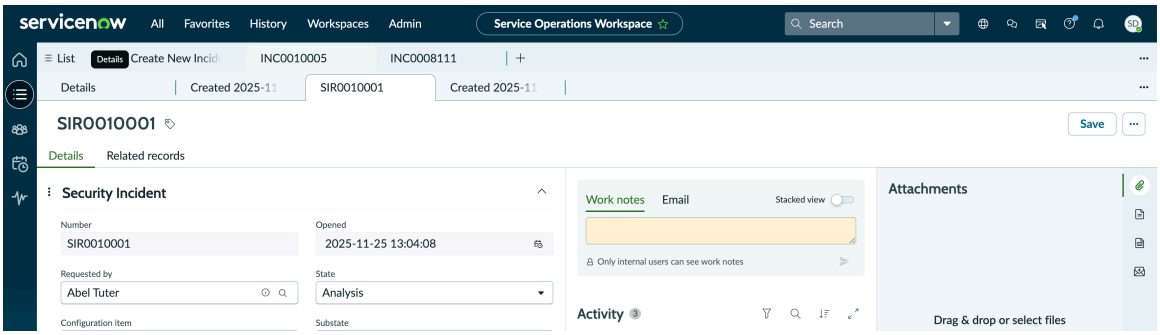
1. Navigate to **Workspaces** > **Service Operations Workspace** and open an incident from the list view.
2. To add one or multiple entities to the selected incident, select **Add** in the Entities related list.

   The Entities related list is shown in the example.

   a. Choose the entity from the list view.

   b. Select **Add**.

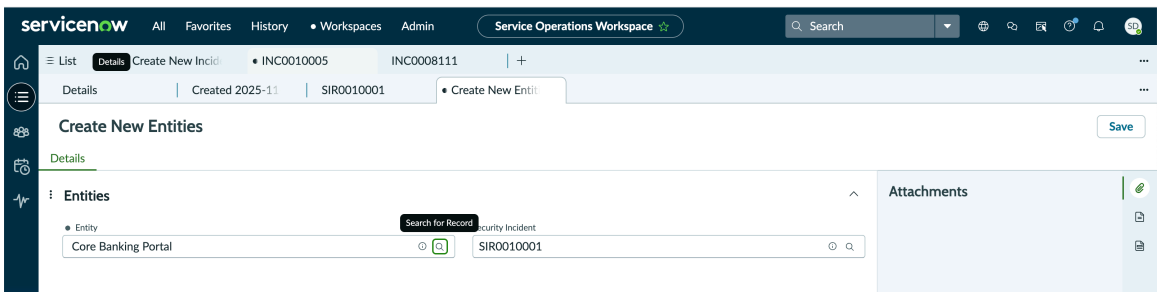
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The selected entities are added to the incident. The example shows that the "Account Opening Workflow" entity is added to the Entities related list of the "Facility issue" incident.

3. To create a security incident from the incident record, select **Create Security Incident**.

Note:
Verify that the Security Incident Response application is installed in your instance.



The security incident is created as shown in the example.

4. To map an entity to the security incident, navigate to Entities related list, select **New**, and follow the substeps.

   a. Select the entity from the drop-down list to associate with the security incident.

   An entity is added to the security incident; for example, the 'Core Banking Portal' entity is added to SIR0010001.

   b. To save the changes, select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The entity is displayed in the related record of the security incident.

The entities are now set up for the target incidents.

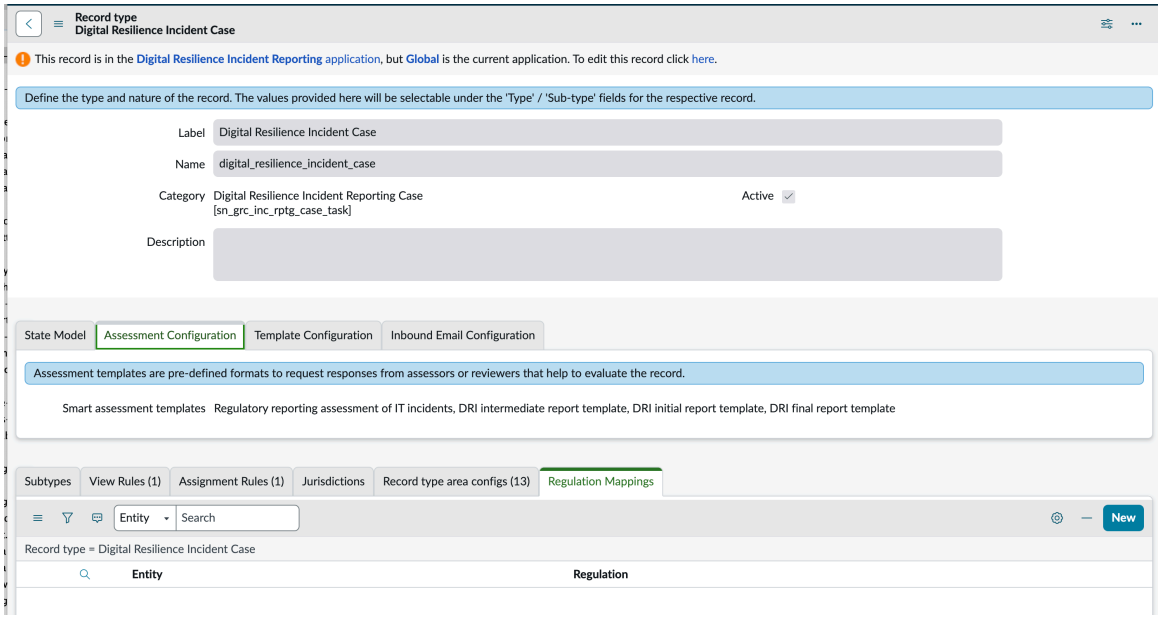
Map regulations to the entities

Map single or multiple regulations with the entity linked to an incident or security incident.

Before you begin

Role required: sn_oper_res.admin, sn_dri_inc_rptg.digital_resilience_incident_admin

About this task



The Digital Resilience Incident Case module in the Operational Resilience Workspace lists all Digital Resilience Incident Cases associated with an incident or security incident. A new Regulation Mappings related list, now available in each Digital Resilience Incident Case record, displays the relationships between entities related to the cases and their corresponding regulations.

Procedure

1. Navigate to **All** > **Digital Resilience Incident Reporting** > **Digital Resilience Incident Case Type** and open the desired case record.

   The Digital Resilience Incident Case record is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

It contains the following tabs for the record:

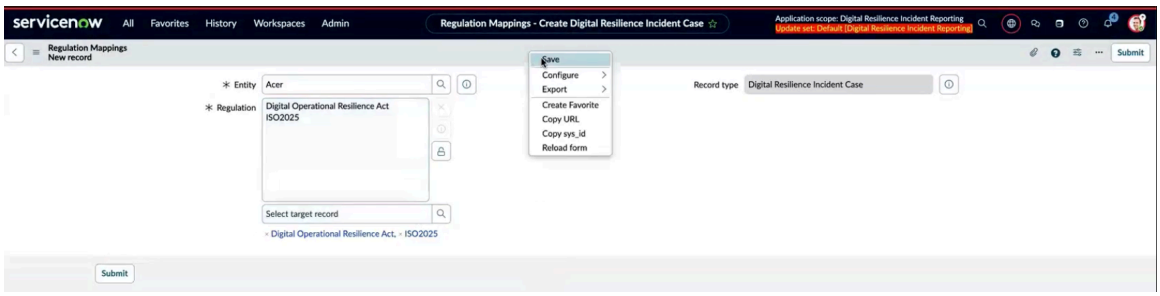
- **State Model**: The state model and action task state model specify the workflow states and transition conditions for a record type and an action task, respectively. A record type and an action task follow the workflow states configured in their respective state models.
- **Assessment Configuration**: Assessment templates are pre-defined formats to request responses from assessors or reviewers that help to evaluate the record.
- **Template Configuration**: Document templates are set up for generating word reports.
- **Inbound Email Configuration**: Group email configuration is set up to inform the group members about the case record.

You can configure the following related lists as outlined in the next steps.

- Subtypes
- View Rules
- Assignment Rules
- Jurisdictions
- Record type area configs
- Regulation Mappings

2. To map a regulation to an entity associated with the case, select **New** in the Regulation Mappings related list.
The Regulation Mappings New record is displayed.

   a. On the form, fill in the fields.

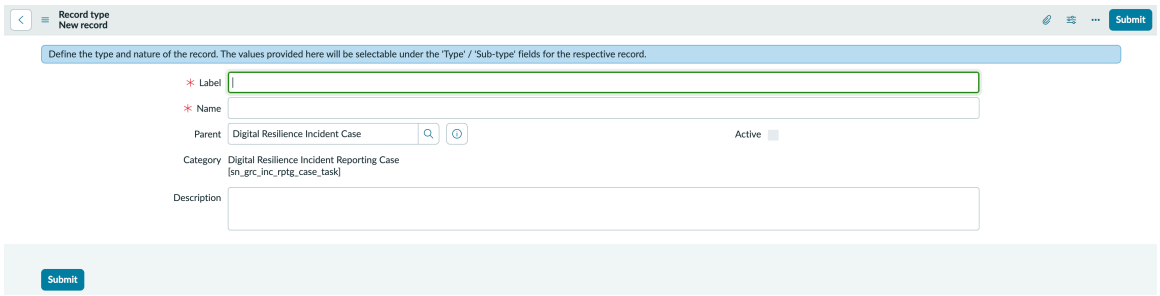


Regulation Mappings New record form

Field	Description
Entity	Name of the entity, for example, Acer.
Regulation	Regulation that is mapped to the entity associated with the case, for example, Digital Operational Resilience Act.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Record type	Digital Resilience Incident Case record. This field is auto-filled.



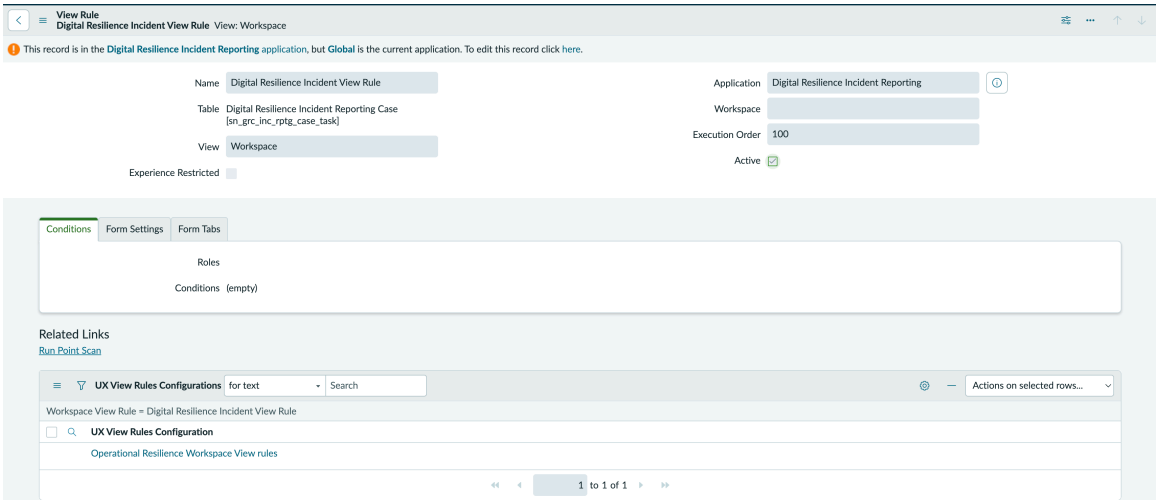
The example illustrates mapping the Acer entity to the 'Digital Operational Resilience Act' (a single regulation). However, entities can also be mapped to multiple regulations.

3. To add a subtype for the case, navigate to the Subtypes related list and select **New**.

a. Add the parameters such as Label, Name, Parent, Category, and Description.

The following example shows a Subtypes record.

b. To mark the record as active, set the Active option.



c. Select **Submit**.

4. To set up rules, navigate to the View Rules related list and complete the substeps.

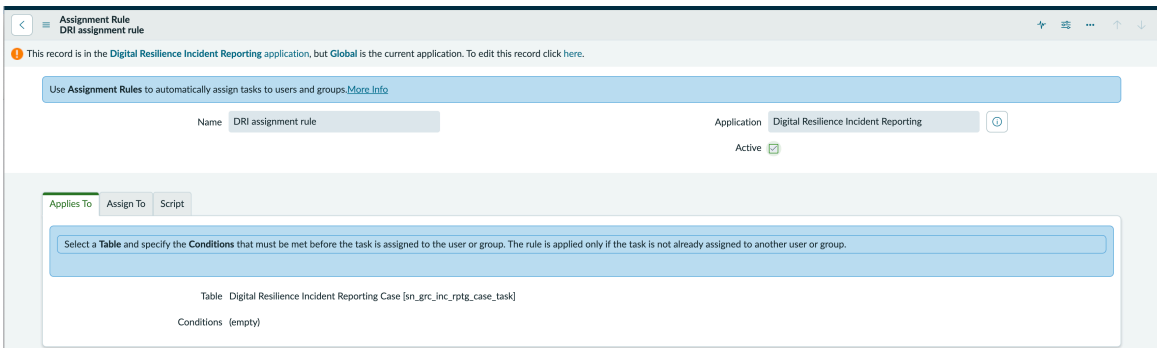
a. Add Name, Table, View, Workspace type, and Execution Order number.

The following example shows a Rules record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Set the Active flag.

c. Set up the roles and conditions in the **Conditions** tab.



d. Select Hide details & UI actions, Hide section navigation, and Disable section collapsing in the **Form Settings** tab.

e. Set up the Default tab order and focus in **Form Tabs**.

f. Select **Submit**.

5. To assign tasks to specific users and groups automatically, navigate to the Assignment Rules related list and set up the assignment rules.

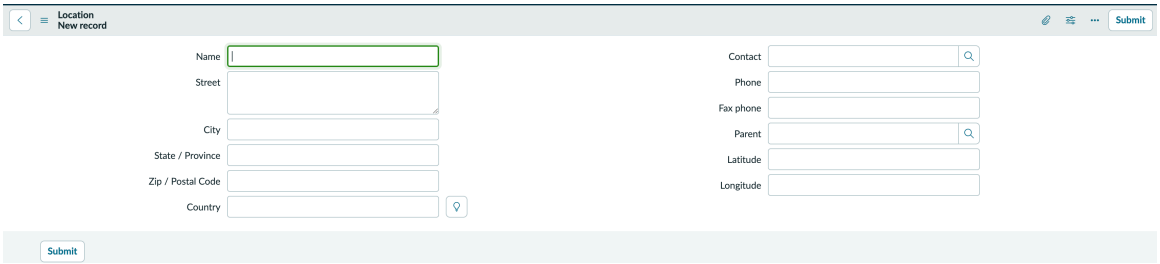
The following example shows an Assignment rules record.

a. Add the name of the rule and set the Active flag.
The name of the application is auto-filled as Digital Resilience Incident Reporting.

b. Select a table in **Applies to** and specify the conditions that must be met before the task is assigned to the user or group.
The rule is applied only if the task isn't already assigned to another user or group.

c. To assign a task to the users or groups, configure the users or groups in the **Assign to** tab.

d. To customize the assignment rule further, enter a script in the **script** tab.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scripts provide access to the pool of current variables.

e. Select **Submit**.

6. To set up the location details and jurisdiction of the case, navigate to the Jurisdictions related list and select **New**.

   The following example shows a Jurisdictions location record.

   a. Add Name, City, Zip code, State, country, Phone, Latitude, Longitude details.

   b. Select **Submit**.

   c. To edit an existing Jurisdictions record, select **Edit**.

7. To define the area type for the case and the table associated with it, navigate to the Record type area configs related list and complete the substeps.

   The following example shows a Record type area configuration record.

   a. Set its order and Active flag.

   b. Select **Submit**.
   The area type can be Impacted area, Related area, Cause area. The associated table can be Entity [sn_grc_profile] or Citation [sn_compliance_citation] table.

8. Select **Save**.
   The regulation mappings, subtypes, rules, and other details for the entity are saved in the case record.

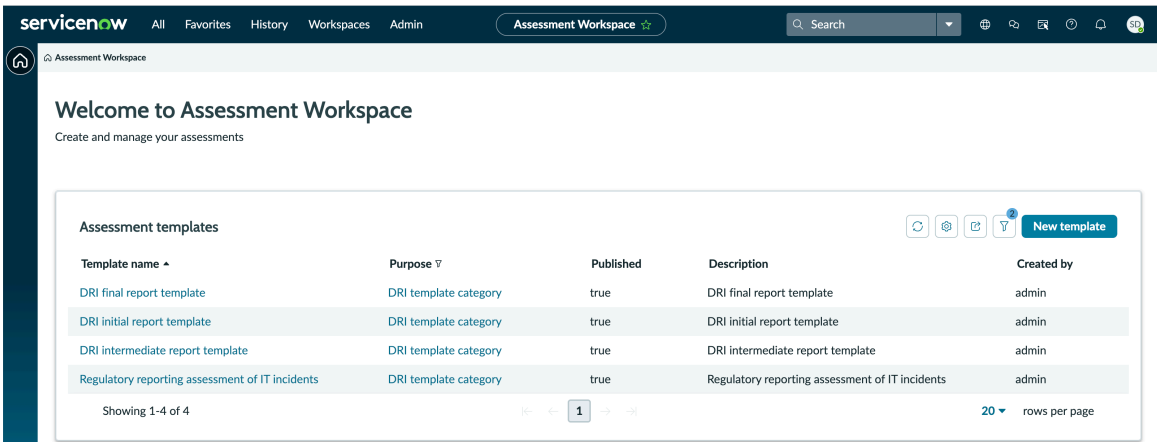
Related topics

Complete action tasks and report incidents associated with regulations

Set up DRI Smart Assessment templates

Set up the Smart Assessment templates in the Assessment Workspace. You can then use them to set up the action task configuration templates in the Regulatory Agency Profile for Digital resilience incident reporting.

Before you begin



Role required: sn_oper_res.admin, sn_dri_inc_rptg.digital_resilience_incident_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > *Assessment Workspace* to access the Assessment Workspace landing page.
2. Select **New template** in the Assessment Workspace.

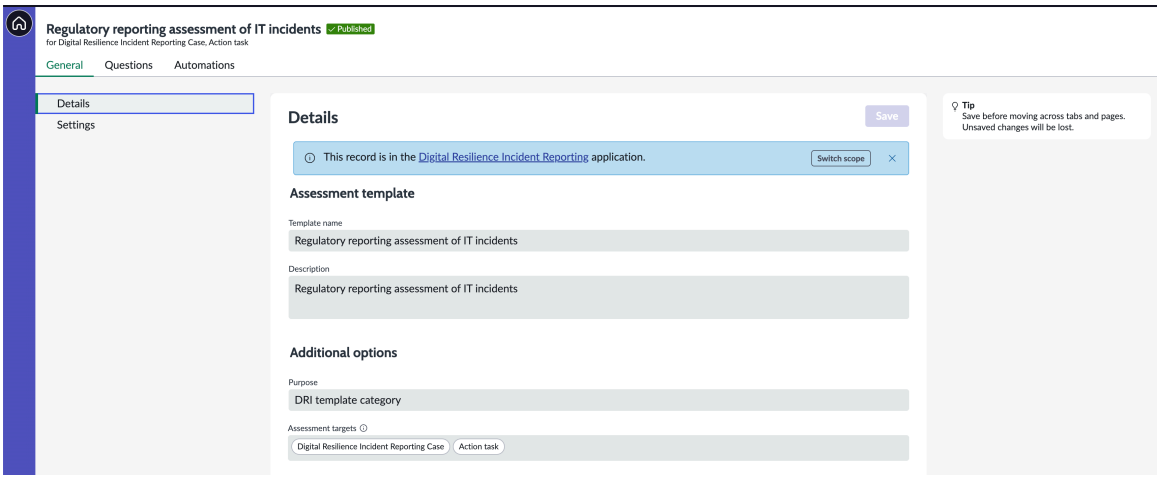
   You can create assessment templates in the Assessment Workspace to manage your assessments. The example shows the assessment templates included in the demo data.

   When you select **New template**, the Create assessment template form, **General** tab, and **Questions** tab are displayed.

3. Fill in the fields in the Create assessment template form and select **Create**.

   The example shows the Create assessment template form.

Create assessment template form

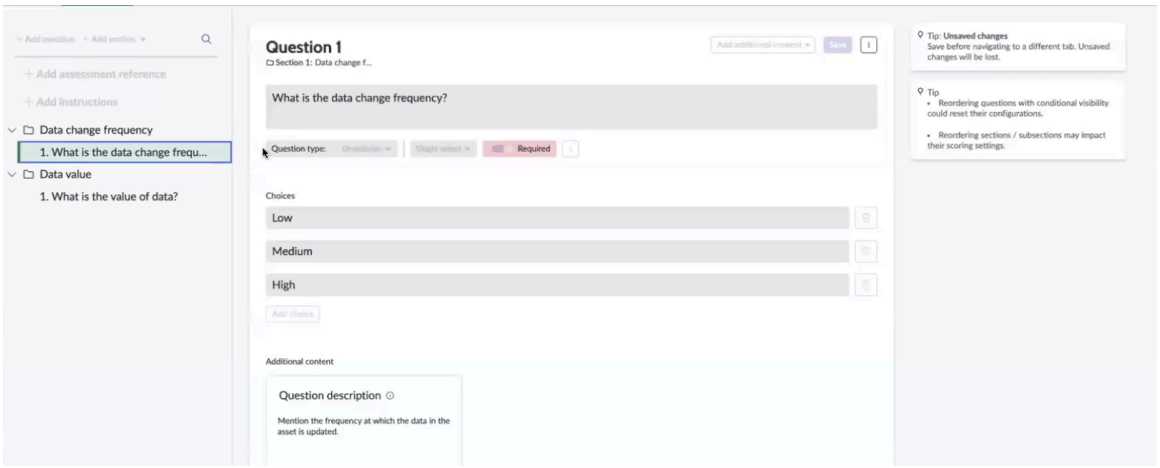


Field	Description
Template name	Unique meaningful name for the template, for example, DRI initial report template. For example, Regulatory reporting assessment of IT incidents.
Assessment name	Name for the assessment.
Description	Description of the template such as why it is used. For example, Regulatory reporting assessment of IT incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

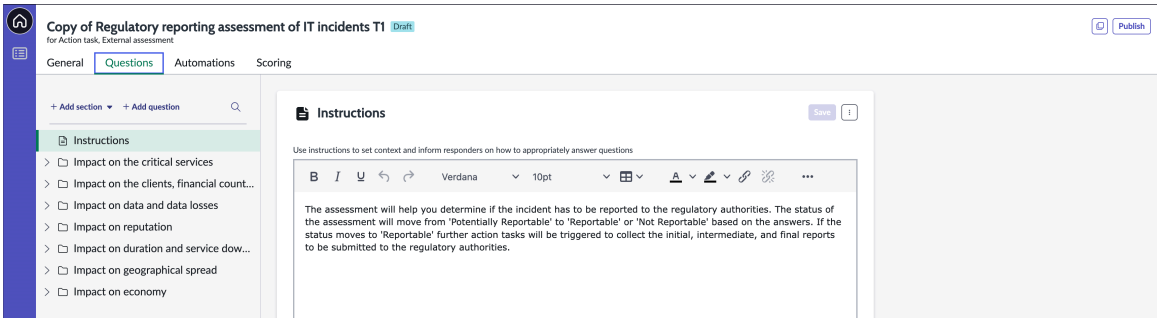
Field	Description
Purpose	Purpose or intended use of the template, such as, DRI template category. For example, DRI template category
Assessment target	Table records that are used for the assessment. For example, Digital Resilience Incident Reporting Case, Action task.

For more information on creating templates, see Create an assessment template.



The assessment template is created and displayed in the Details section of the **General** tab as shown in the example.

You can now fill in the template with instructions, questions, and optional guidance for responding to a question, and sections that group the related questions. For more information on creating an assessment template, see Create an assessment template.

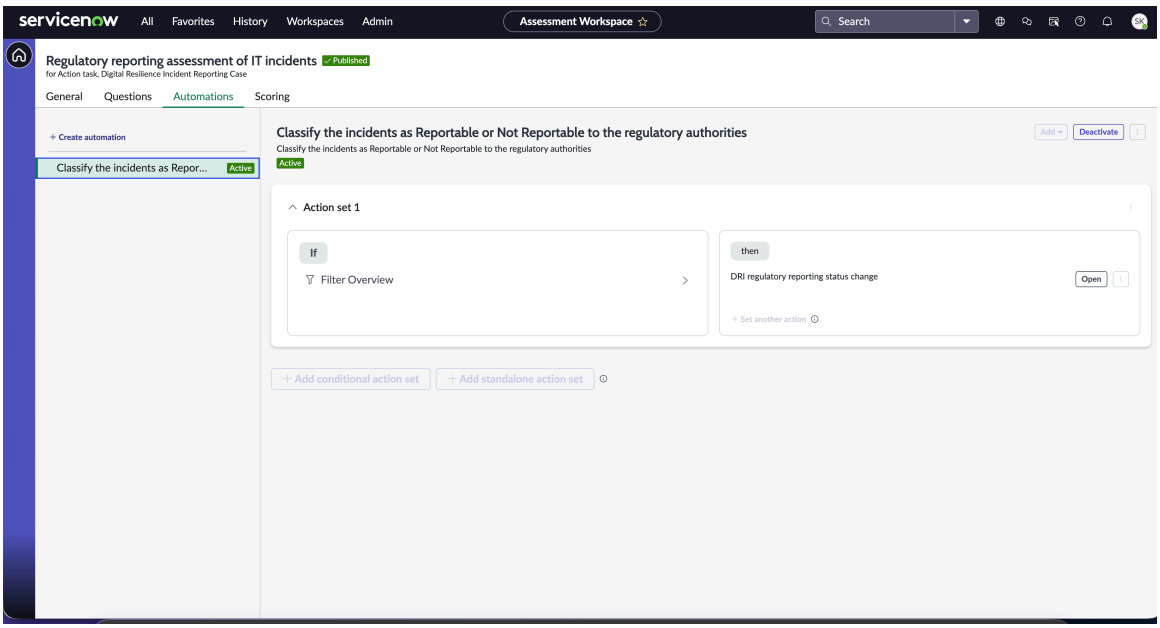


4. Set up the assessment questions in the **Questions** tab.
   For information on adding instructions and questions to the assessment template, see Add instructions and questions to an assessment template.

   The example shows how to set up the assessment questions.

The example shows how questions are configured in the **Questions** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

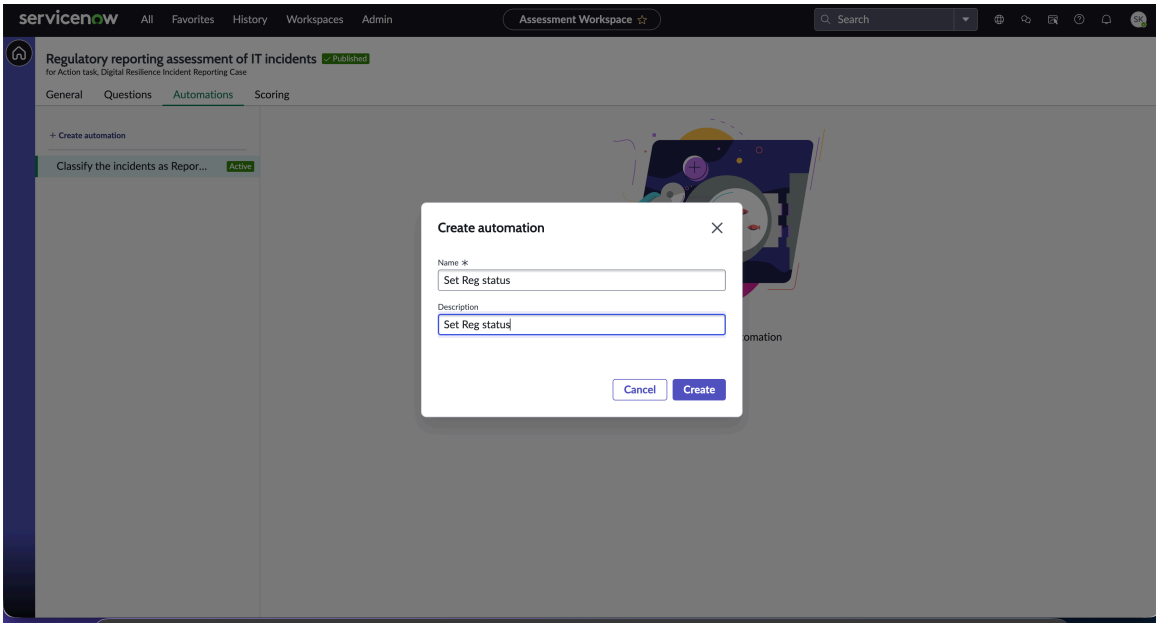


5. Select **Save**.
6. To publish the template, select **Publish**.
   A message is displayed that the assessment template is published and you can use it to send assessments.
7. Configure response-based automation and corresponding actions by creating automation rules in the **Automations** tab of the published template.

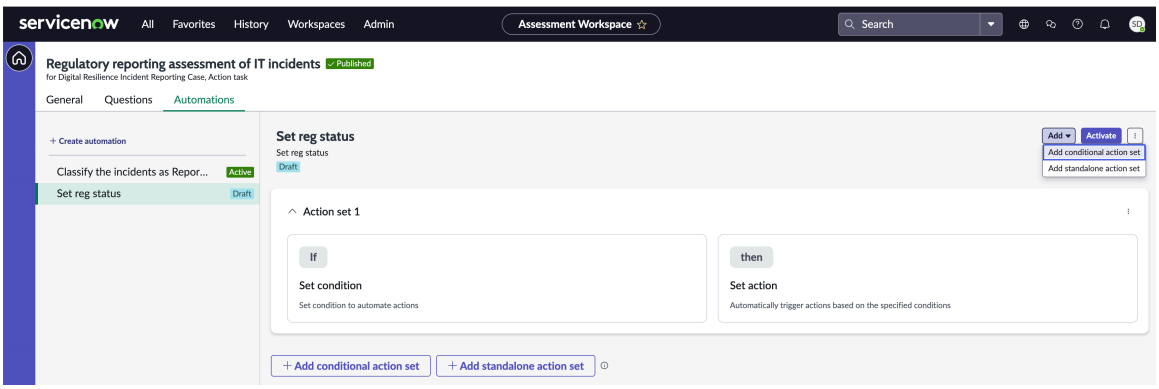
   Automation streamlines the assessment workflow by eliminating repetitive manual tasks, enabling assessors to focus on analysis rather than data entry. Pre-configured responses verify consistency and accuracy across assessments while significantly reducing completion time.

   The example shows an active automation named "Classify the incidents as Reportable or Not Reportable to the regulatory authorities" that automatically classifies incidents based on regulatory reporting requirements.

   Note:
   You can edit an existing automation only if you have access to it and the corresponding DRI template is published. Otherwise, the automation is available as read-only.



Follow these steps to add automations to your assessment template.

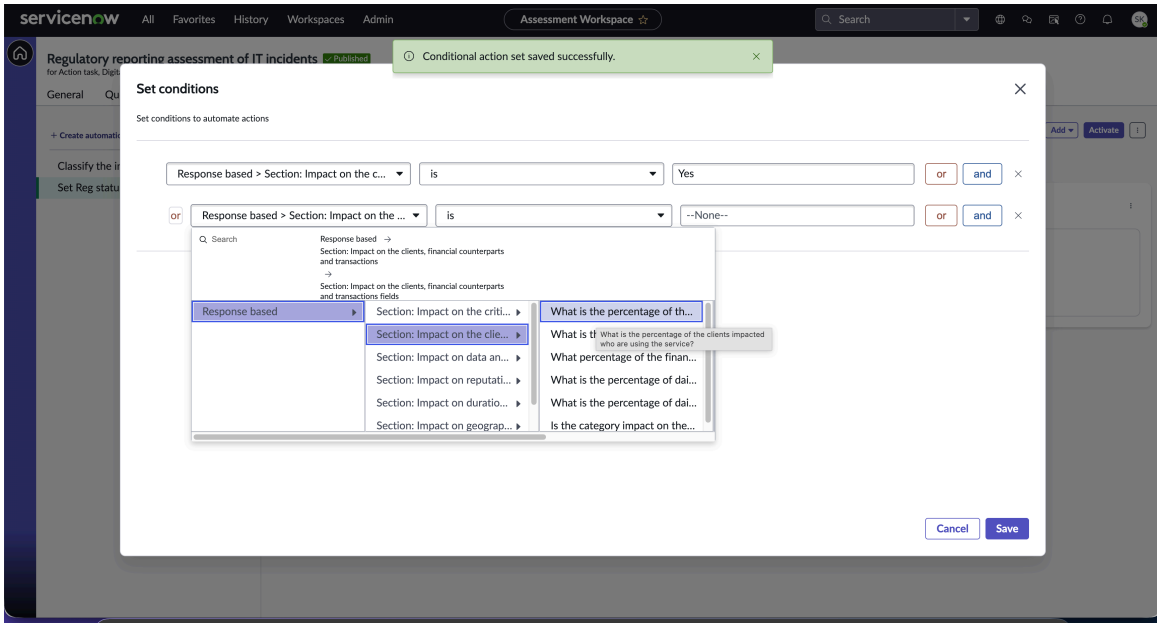


a. Select **+ Create automation**, add the name and description for the rule, and select **Create**.

   The example shows the Create automation modal where you can add the name and description of the automation rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The automation is created in the Draft state.

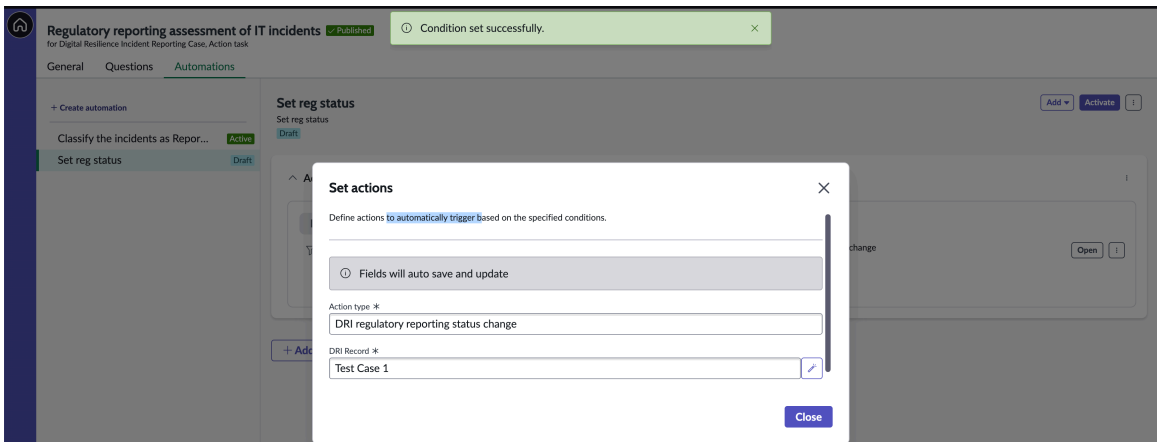


The Action set in this example consists of an "If" block and a "Then" block. The "If" block sets conditions that trigger automation. The "Then" block defines the actions that execute automatically when those conditions are met.

b. Select **Set condition** in the "If" block.

c. To add a condition, select **+ New condition set** in the Set conditions dialog box and select **Save**.

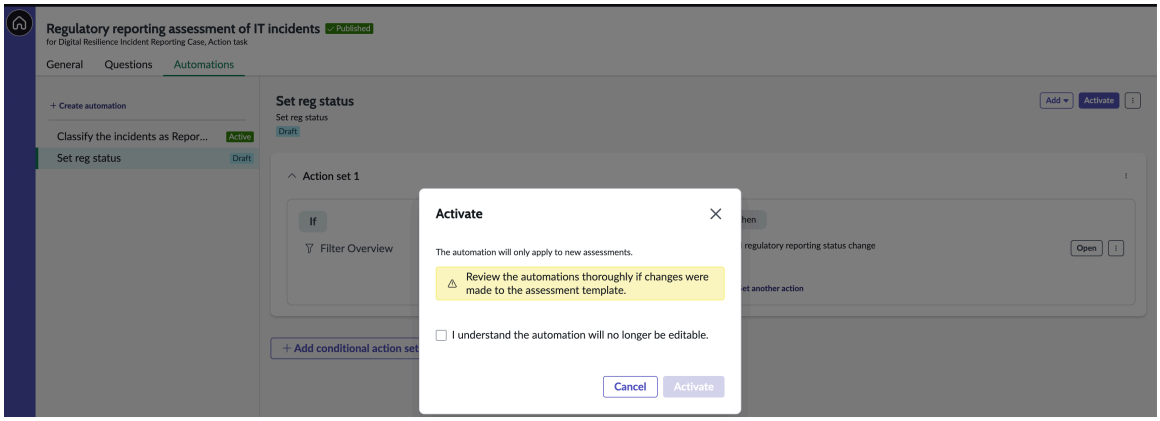
The example shows how you can add one or more conditions to automate actions based on user responses.



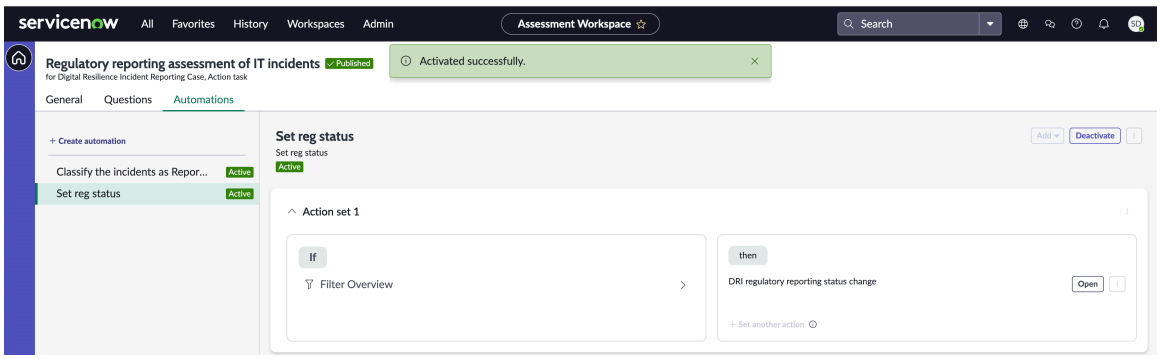
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The conditional action set is saved and the automation conditions are now configured.

d. To set an automated action for a specified condition, select **Open** in the "Then" block, choose the action and the DRI record, then select **Close**.



In this example, "DRI regulatory reporting status change" is the action that triggers automatically when the conditions in the "If" block are met. The associated DRI record is selected to complete the action setup.



e. To activate the automation, select **Activate** in the **Automations** tab, confirm the details in the Activate dialog box, and select **Activate** again.

The Activate dialog box is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once activated, the automation appears in the **Automations** tab.

For more information on automations, see Automate response and Configure post-assessment actions.

8. Configure scoring settings on the **Scoring** tab.

   For more information on assigning scores to the assessments, see Scoring assessments. For more information on the Smart Assessment Engine, see Smart Assessment Engine.

9. Select **Save**.
10. To copy a published template, select **Copy template**, update the fields, and save your changes.
11. To edit a published template, verify you have the required roles, select **Edit**, update the fields, and save your changes.

    Note:
    Templates that are associated with assessments cannot be moved to Draft status.

12. To publish the assessment template, select **Publish**.

    A message confirms that the assessment template is published and ready to use.

    a. To proceed, select **OK**.
    b. To return to the template list on the landing page, select **Return to template list**.

    The assessment template is now published and available in the Digital resilience incident reporting module.

    The examples display pre-configured DRI templates for DORA regulation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Smart Assessment templates for the action tasks are created and saved in the instance.

The following example shows the demo data for action task configurations in the Regulatory agency profile.

Note:
After setting up Smart Assessment templates in the Assessment Workspace, you can use them to configure action task templates in the Regulatory Agency Profile table.

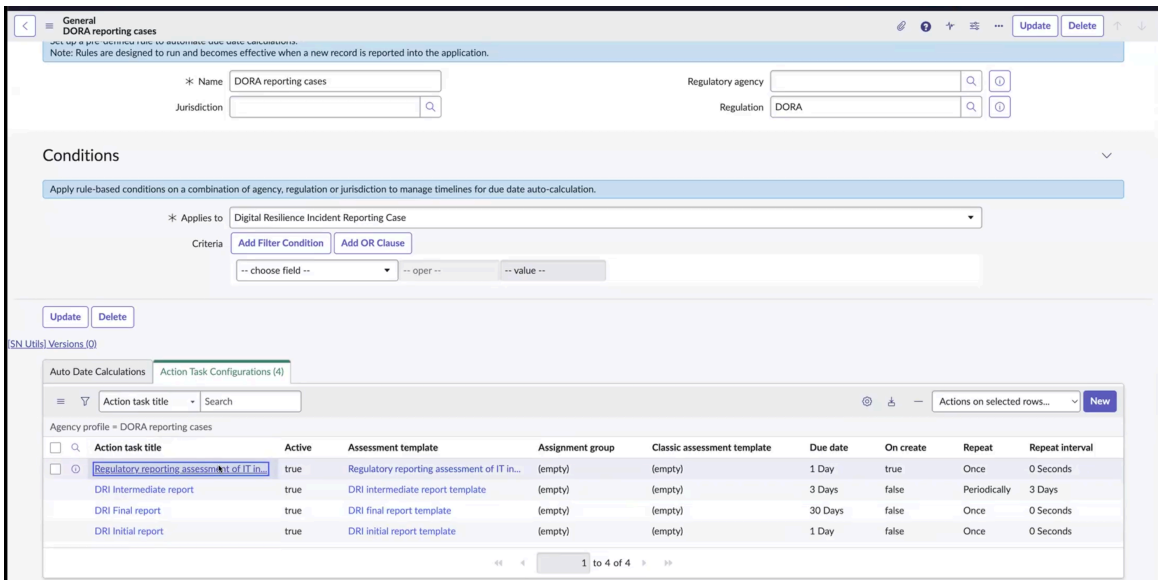
For more information on setting up action task templates, see the Set up action task templates in Regulatory agency profile section.

Set up action task templates in Regulatory agency profile

Set up action task templates in the Regulatory Body Management Agency Profile [sn_reg_body_mgmt_agency_profile.list] table. Verify that the action task configurations (with Smart Assessment Smart Assessment template configurations) for the selected regulation are correctly set up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin



Role required: sn_oper_res.admin, sn_dri_inc_rptg.digital_resilience_incident_admin

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** and open the "Regulatory Body Management Agency Profile" [sn_reg_body_mgmt_agency_profile.list] table for the selected regulation.
2. Configure the action tasks (with Smart Assessment templates.

   As a Digital Resilience Incident administrator (sn_dri_inc_rptg.digital_resilience_incident_admin), you can modify action tasks or configure additional action tasks to meet your organizational requirements.

   This example shows the Regulatory agency profile's "DORA reporting cases" record, featuring the 'European Union' as the regulatory agency and 'Digital Operational Resilience Act' as the regulation. This record also contains action tasks preconfigured with Smart Assessment templates.

   a. Configure single or multiple regulatory agency profiles for the Digital Resilience Incident Reporting Case [sn_grc_inc_rptg_case_task] table, based on different combinations of agency, regulation, or jurisdiction criteria.

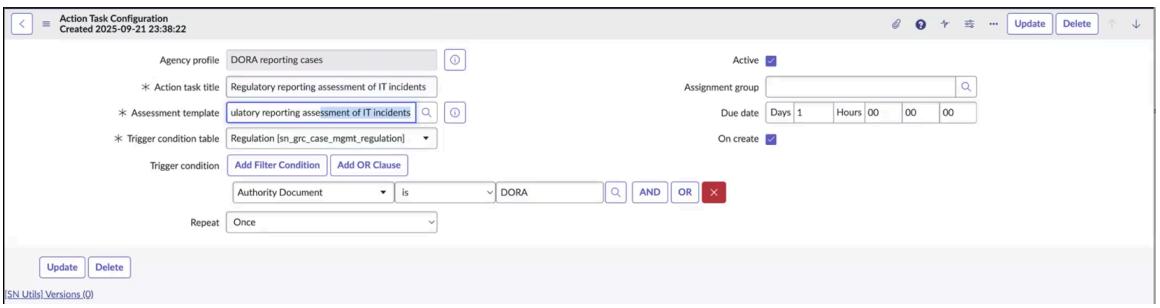
   b. Verify the action task configurations preconfigured with Smart Assessment templates.

   Note:
   Use an action task configuration to set up contextual information for different regulations. The configuration includes the assessment template, assignment group, trigger conditions, due dates, and more.

   Note:
   The templates shown in this example are specific to DORA regulation. If other regulations are mapped to the entities in use, verify that their corresponding Smart Assessment templates are set up and published in the Assessment Workspace first. For more information, see Set up DRI Smart Assessment templates.

   The DORA regulations include four Smart Assessment template configurations as shown in the Action Task Configurations related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

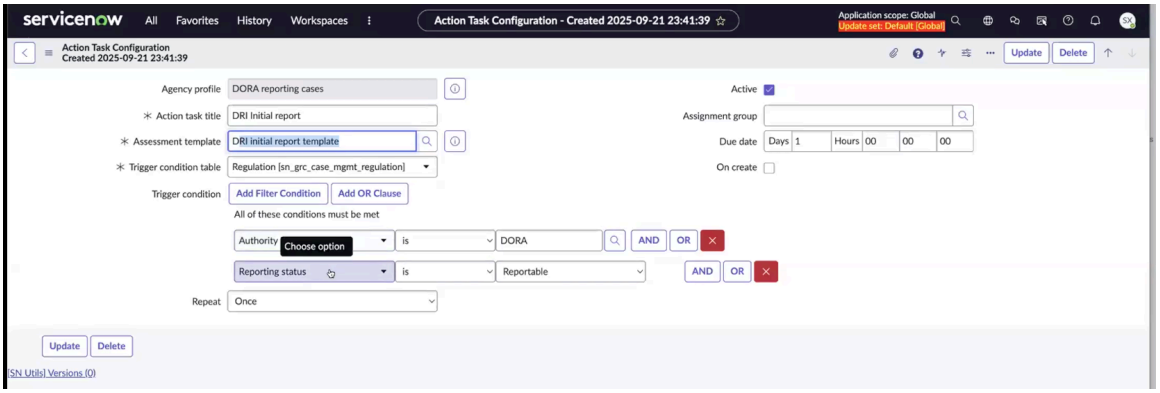


Regulatory reporting assessment of IT incidents template

When a case is created, the 'Regulatory reporting assessment of IT incidents' template is used to generate the action tasks.

The following example shows that when you create a DIR case with DORA as the authority document, an action task is generated automatically using the 'Regulatory reporting assessment of IT incidents' template. The system creates a case with DORA as the authority document, assigns it a specific title, and routes it to a designated group.

The **Repeat** field indicates that the action tasks can be configured for either once or periodically. For regulatory reporting, the initial action task is created only once.



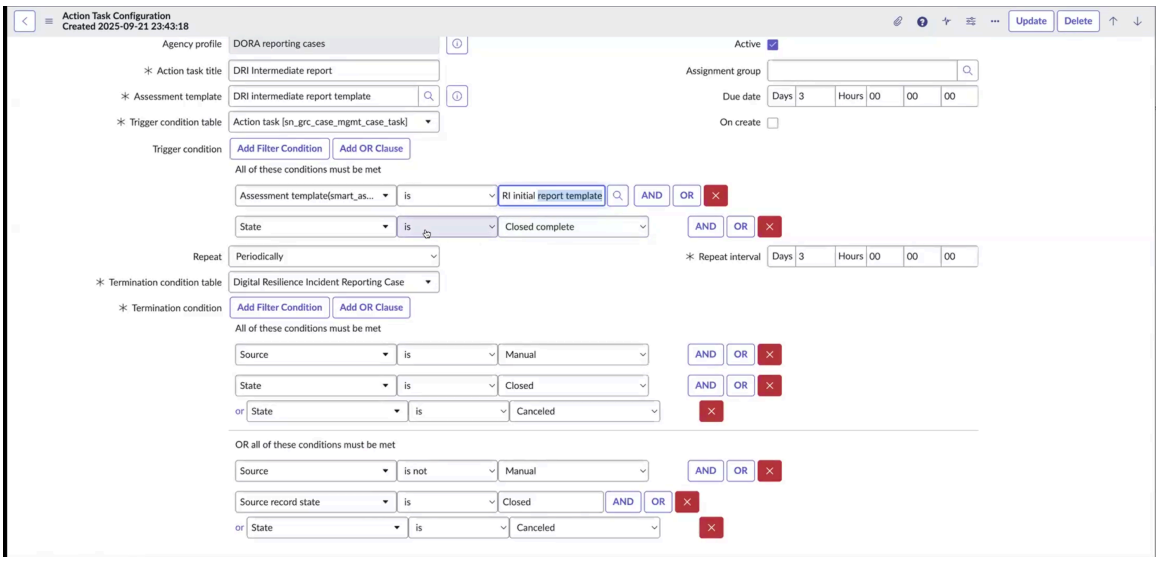
The **On create** field shows that the action tasks are generated only when a DRIR case is created. If the **On create** field is inactive (cleared), the action task isn't generated. The **Assignment group** field assigns the action task to a designated group automatically.

DRI Initial report template

When the reporting status of a regulation changes from "To be determined' to 'Reportable' after the first assessment, an initial report is sent automatically. Similar to other action tasks, you can configure the assignment group and due date, and this template is created only once according to trigger.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A single DIR case can be associated with multiple regulations. When the reporting status of any individual regulation changes to 'reportable,' a dedicated initial report is generated for that specific regulation. For example, if a case involves five regulations, and each one's status becomes 'reportable,' five separate initial reports are created, demonstrating comprehensive support for multiple regulations.



DRI Intermediate report template

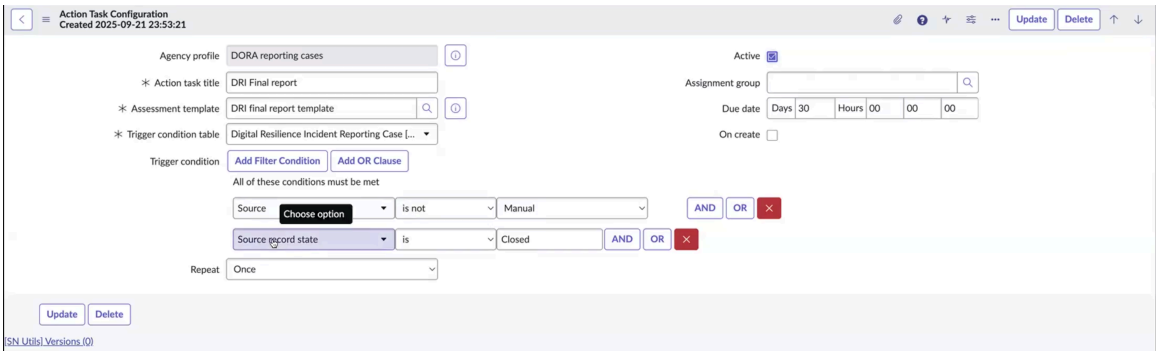
Intermediate reporting and periodic assessments: When the DRI initial report is completed, the DRI intermediate reporting is triggered, specifically when its status changes to **Closed Complete**.

Periodic action tasks: Following the initial report's completion, action tasks for intermediate assessments can be generated periodically as shown in the **Repeat** field. Configure the repetition frequency in the **Repeat interval** field. The example shows that you're going to create an action task with the given template every 3 days.

Termination conditions: When specific conditions are met, the periodic generation of these action tasks is terminated, indicating the underlying issue is resolved or no longer requires ongoing assessment. The system doesn't send the intermediate action task anymore.

These conditions are evaluated against the DIR case state or the incident or the security incident source record.

The example shows the following termination conditions:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The source of DIR case is 'Manual' and its state is 'Closed' or 'Canceled'.
- The source of DIR case isn't 'Manual', the source record state of incident or security incident is Closed' or the state of DIR case is 'Closed' or 'Canceled'.

When any of these termination conditions are met, no further intermediate assessment action tasks are generated.

DRI Final report template

When the associated source record's state is 'Closed' and the source isn't manual as shown in the example, the final report is generated automatically.

If the source is manual, you must create the final report manually.

3. Modify the action tasks as necessary.
4. Select **Save**.
   Completing the configuration steps outlined in this section sets up the action task configurations in the 'Regulatory Body Management Agency Profile' table.

Set up the flows in Workflow Studio

Set up the flows and conditions for Digital resilience incident reporting in Workflow Studio. As administrators of the Operational Resilience application, you can update (customize) the flow configurations to meet your organizational requirements.

Before you begin

Role required: sn_oper_res.admin, sn_dri_inc_rptg.digital_resilience_incident_admin

About this task

The Workflow Studio lists the preconfigured flows and conditions for Digital resilience incident reporting.

Procedure

1. Navigate to **All** > **Flow Designer** and open the Digital resilience incident reporting flows.

   The following flows used from previous releases of the Digital resilience incident reporting application have been deprecated:

   a. Digital Resilience Incident Flow

   b. Digital Resilience SIR Flow

   c. DRI Business service Trigger

> **Note:**
> To use the previously deployed flows, you must deactivate the new flows (listed in this section) and then activate the Digital Resilience Incident Flow, Digital Resilience SIR Flow, and DRI Business Service Trigger Flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following flows in Digital resilience incident reporting are still active.

a. Digital Resilience Incident Approval Flow

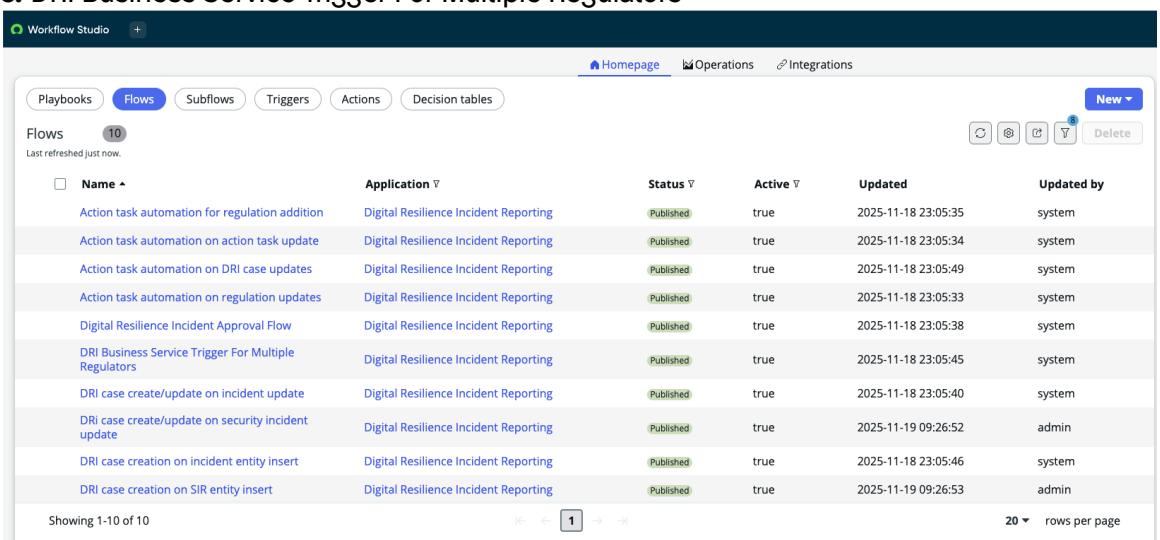
b. DRI case create/update on incident update

c. DRI case create/update on security incident update

d. DRI case creation on incident entity insert

e. DRI case creation on SIR entity insert

New flows are introduced in Digital resilience incident reporting for action task management, regulation management, and trigger conditions for multiple regulators as shown in the example.



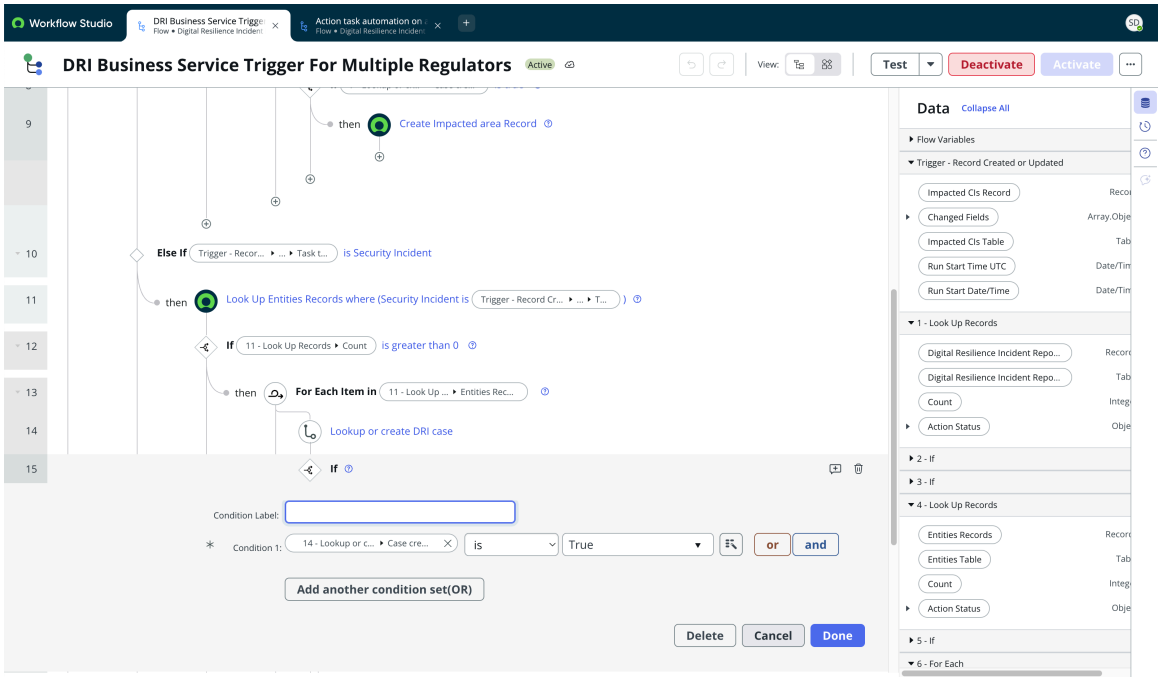
a. Action task automation for regulation addition

b. Action task automation on action task update

c. Action task automation on DRI case updates

d. Action task automation on regulation updates

e. DRI Business Service Trigger For Multiple Regulators



Note:
If the Security Incident Response application is installed in your instance, flows related to security incidents (SIR) are listed in the Flows list view.

2. To update (customize) the flow configurations to meet your organizational requirements, select **Edit flow** in the desired flow, update the conditions, and select **Done**.

   A sample condition for the "DRI Business Service Trigger For Multiple Regulators" flow is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To publish the flow, choose the flow from the list and select **Publish**.
   Published flows are available to the users of the Digital resilience incident reporting application.

Managing Digital resilience incident reporting

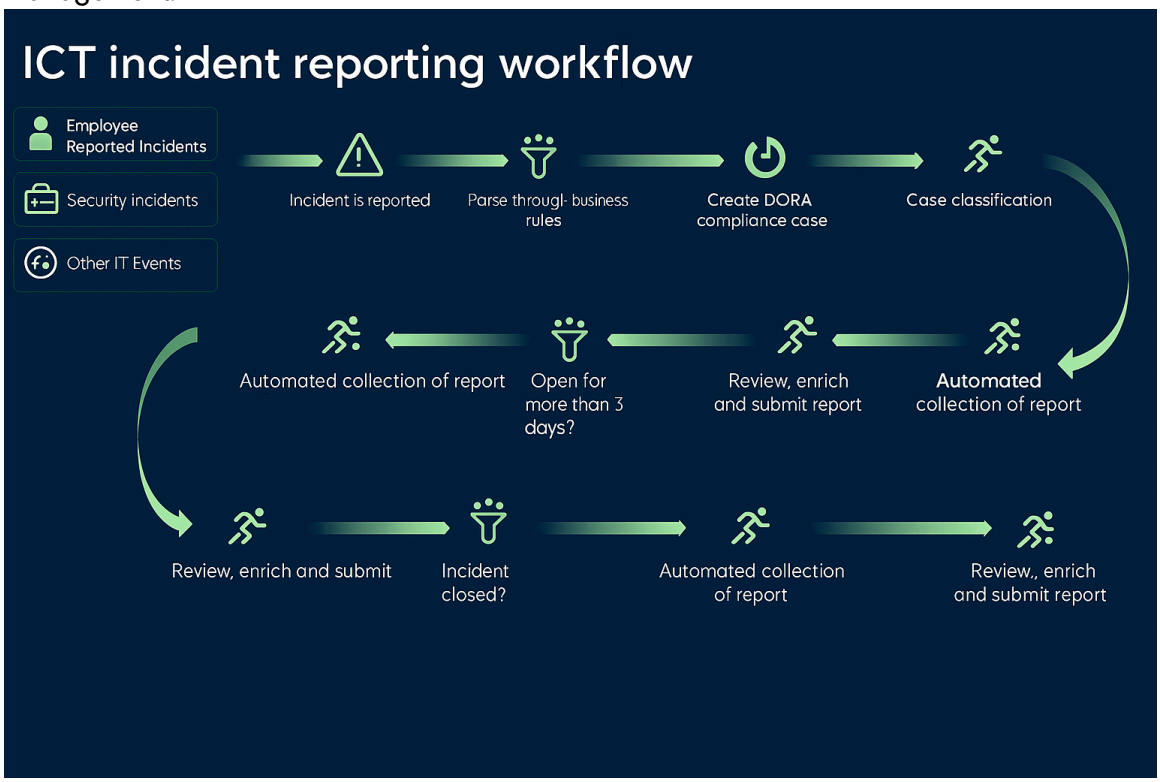
This section details the steps that you can take to report major incidents in the Digital resilience incident reporting application. Assess whether any critical services are affected and classify the reported incident as a major incident if necessary. Notify regulators of major incidents, categorized by their severity and security ratings.

The Digital resilience incident reporting module, accessible from the Operational Resilience Workspace, is integrated with Incident Management and Security Incident Response to generate and share reports in the format that is specified by the regulators.

You can generate an initial report within 24 hours, an intermediate report within 72 hours, and a final report within 1 month. All of these reports are automatically triggered by the application from the time that the incident is classified as a major incident.

Report an incident from Incident Management and Security Incident Response or you can report an incident manually in the Operational Resilience Workspace.

You can export the initial, intermediate, and final reports to Microsoft Excel format. The exported file includes tabs for each section of the questionnaire, with questions in the first row and user responses in the second row. You can add more sections and questions in the assessment workspace, and the exported file reflects these changes.



Reporting incidents from SOW and SIR Workspace in DRIR

When a high-impact, high-urgency incident is created or an existing incident is marked as high priority in the Service Operations Workspace (SOW) of Incident Management or Security Incident Response Workspace (SIR Workspace), it is classified as a major incident. These major incidents are then logged and reported in the Digital resilience incident reporting application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

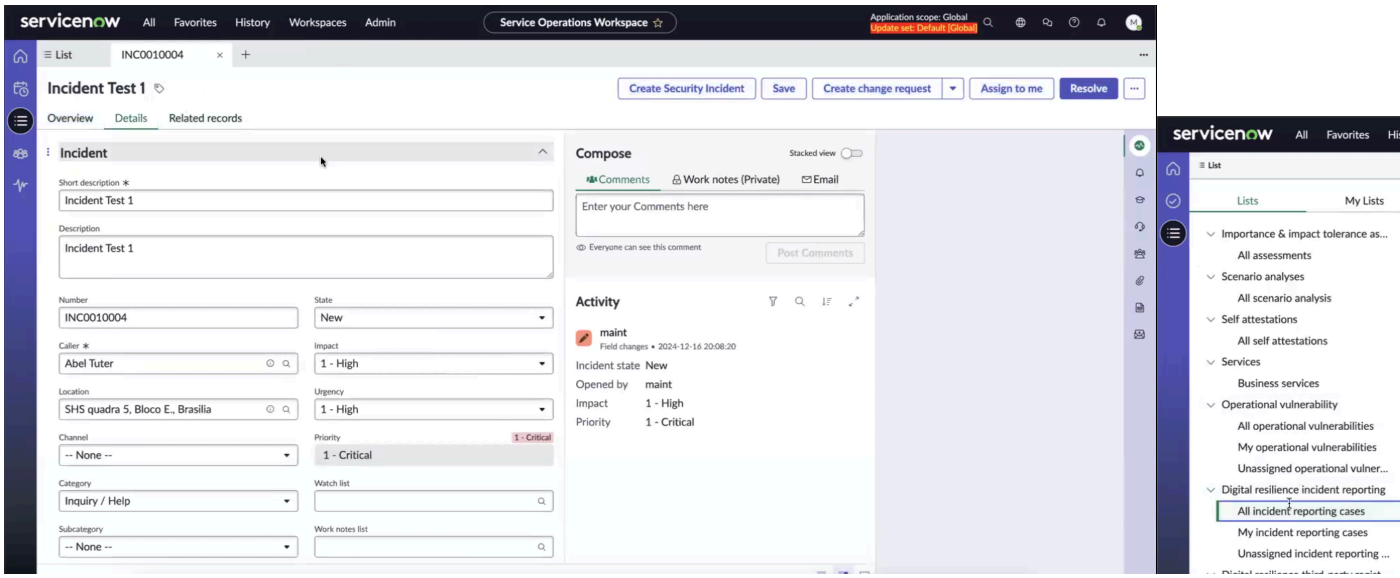
Incident reporting workflow

The following example shows a sample workflow for reporting an incident in Incident Management.

1. Determine if the reported DRI case is a major ICT-related incident, a security breach, or an operational payment issue. Assess whether any critical services are impacted.
2. If the critical services affected criterion is not met, the DRI case is not classified as major. If there is any report of malicious unauthorized access to the network and information systems, the incident is automatically classified as major.
3. Create a DRI case record. The **Details** tab includes information such as the case number, source, state, subtype, priority, requester, and other relevant details. Review actions related to the case which are documented in the Activities panel on the **Details** tab.
4. Notification: Send an email notification to the DORA analyst to update them on the progress of the case.
5. Initial report: Automatically collect initial report data. Generate an initial report no later than 24 hours once the incident is classified as major.
6. Response activation: Activate the response steps for the incident.
7. Intermediate report: Review the incident report, if the incident has been open for more than three days. Update the incident data in the intermediate report, which is generated no later than 72 hours after the incident is classified as major.
8. Response review: If the incident is still open, review the response steps.
9. Final report: Verify if the incident is closed and enrich the notes in the record. Update the final report with the revised notes, which is generated one month after the incident is classified as major.

Incident reporting timelines

To report an incident, the following timelines are considered.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reporting timelines

Report type	Timeline (From the time the incident is classified as major)
Initial report	24 hours
Intermediate report	72 hours
Final report	1 month

Case generation in Digital resilience incident reporting

When an incident is marked as critical in the Service Operations Workspace of the Incident Management application as shown in the example, a case is generated in Digital resilience incident reporting.

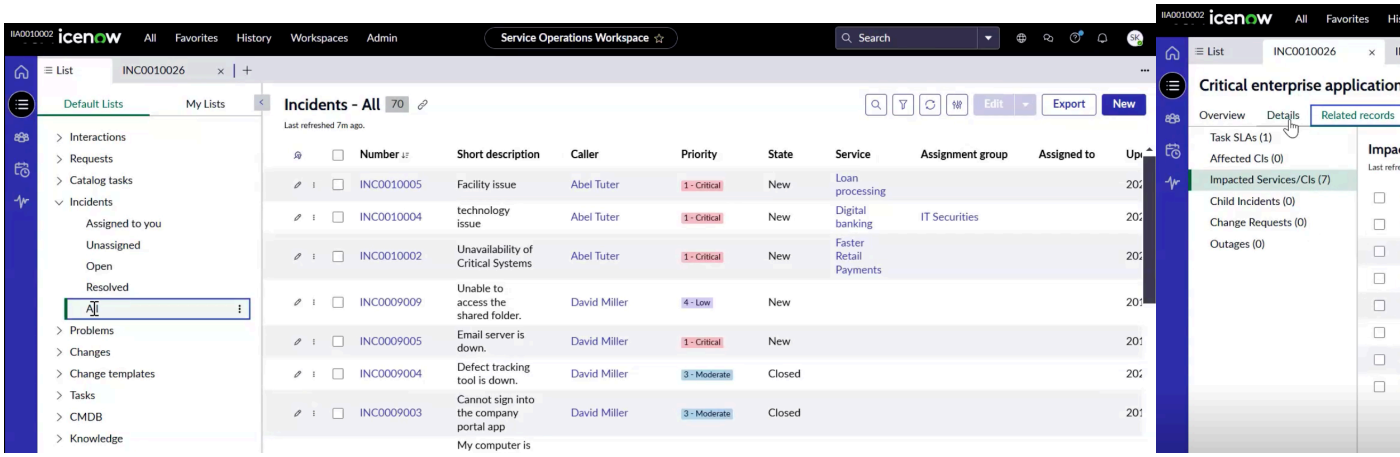
The SIR Workspace deploys a similar workflow for reporting high-impact incidents which are then logged in Digital resilience incident reporting.

Report a major incident from Incident Management

Report a critical incident from the Service Operations Workspace of the Incident Management application into the Digital resilience incident reporting application.

Before you begin

Role required: sn_dri_inc_rptg.digital_resilience_incident_manager



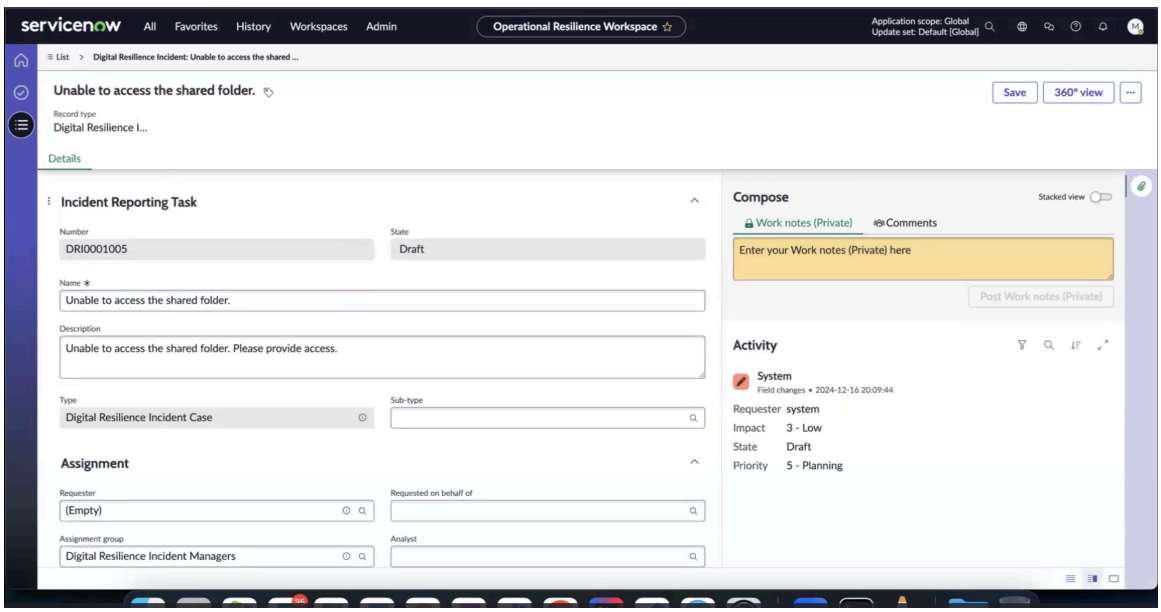
About this task

Incident Management reporting workflow consists of the following steps:

1. Configure the rules engine to automatically update the regulatory status on the incident reporting case.
2. Create an incident report from SOW in Incident Management.
3. Create action tasks and regulatory assessments for the initial, intermediate, and final reports.
4. Copy the impacted areas from the source tables.
5. Respond to the assessments and populate the responses.
6. Extract the reports in Microsoft Excel format for the regulators.

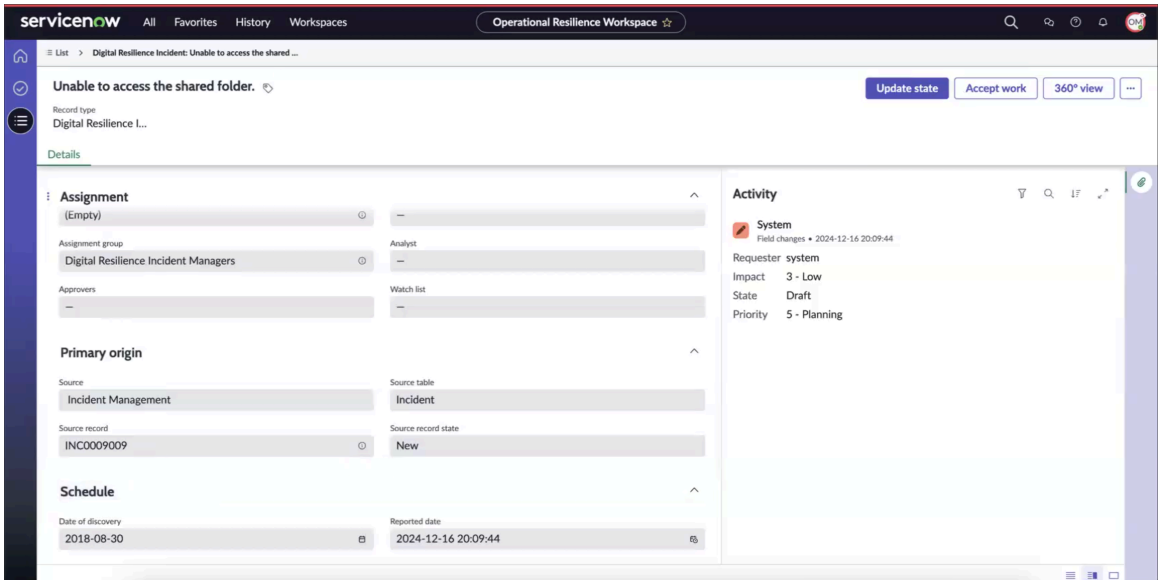
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A critical incident is reported in the Service Operations Workspace and impacts related services as shown in the examples.



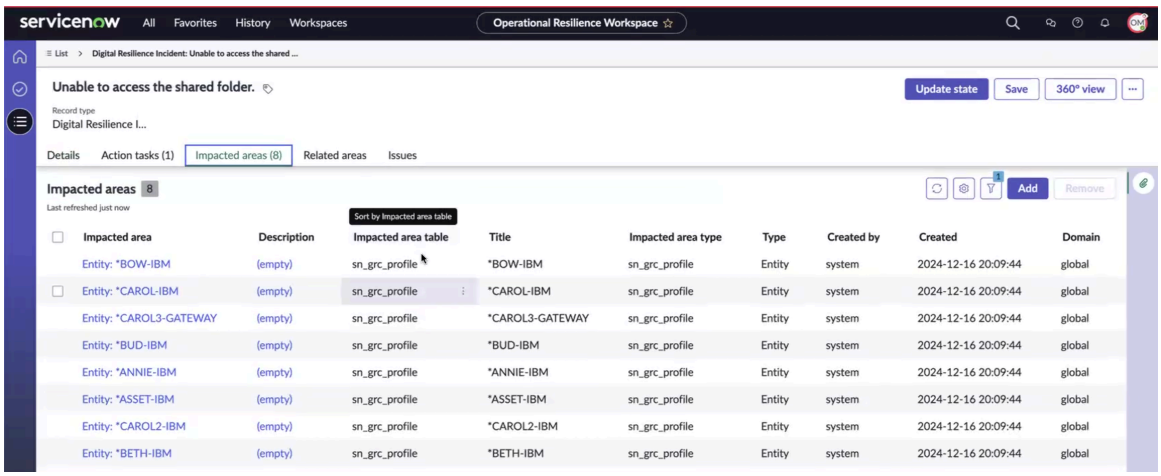
The incident triggers a Digital resilience incident reporting case in the Operational Resilience Workspace.

Procedure



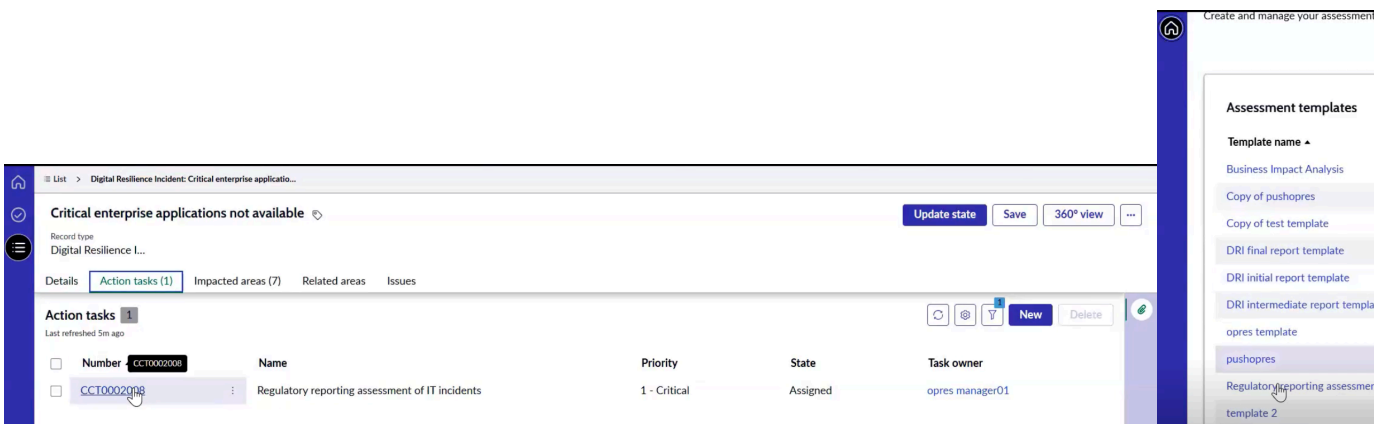
1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience incident reporting** > **All incident reporting cases**.
   When a DIR case is reported from the Service Operations Workspace, it is added to the queue under the Unassigned incident reporting cases module. When the case is assigned to a particular user or a group of users, it is listed in the My incident reporting cases module. The assigned user logs in to the Operational Resilience Workspace and works on the reporting case.
2. Log in as the assigned user into the Operational Resilience Workspace and open the case from the My incident reporting cases module.

   As the assigned user, you can view details such as the case name, description, assigned user, analyst, status, original source record, and whether the incident is potentially reportable to regulatory authorities, as shown in the example.



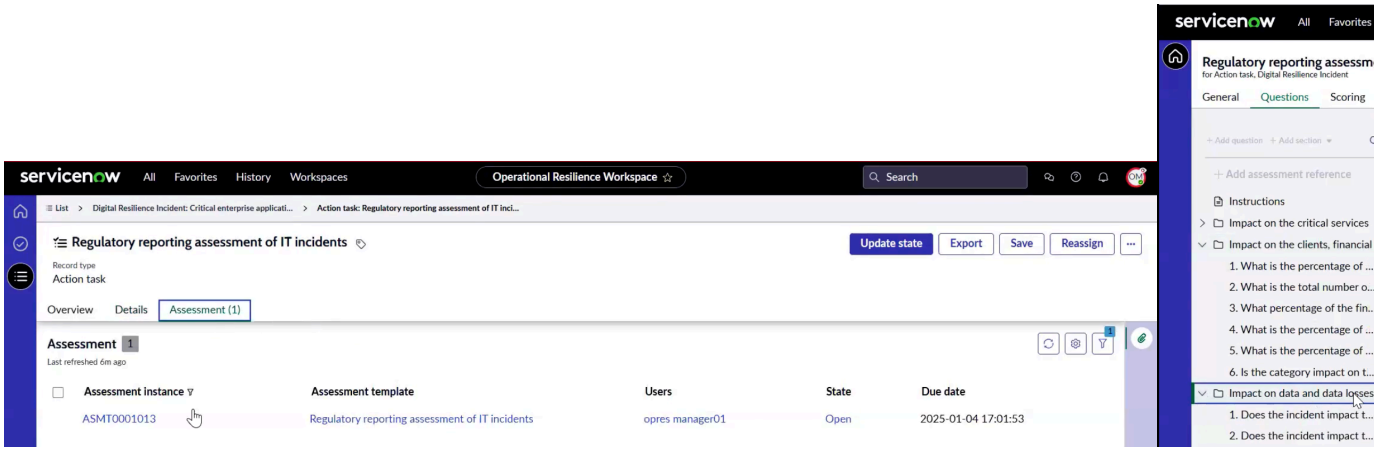
The source of the case is Incident Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

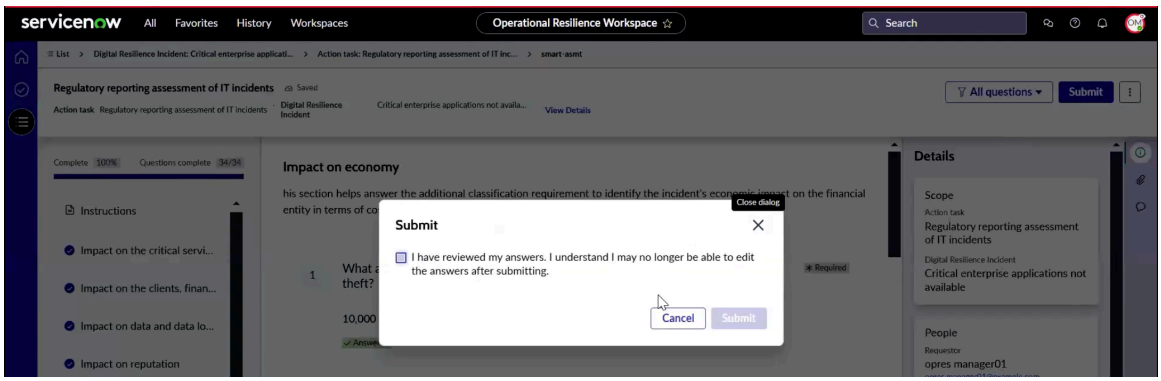


The case is assigned to the Digital Resilience Incident Managers group.

The action tasks and impacted areas related to the incident are copied in the case record.



An action task is automatically generated for the incident to help you determine if it must be reported to regulatory bodies. When you open the action task, you can view its name, description, type, and the associated assessment template. This template, created by the administrator, is already available in the Assessment Workspace, where you can view its sections and questions.

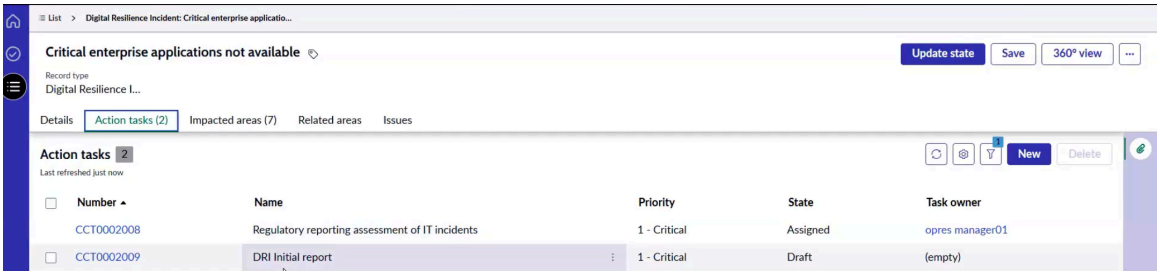


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The assessment template is aligned with the Digital Operational Resilience classification for major Information and Communication Technology (ICT) incidents. The same assessment template is tagged in the reported incident as shown in the example.

The analyst assigned to the case assesses the incident's impact on factors such as critical services, clients (including financial counterparts and third parties), data and data losses, reputation, service downtime, geographical spread, and economy. These sections in the template help you determine the impact of the incident and whether it should be reported to the regulators and responds to the questions in the questionnaire. For information on the assessment template, see Create an assessment template.

3. Select **Accept work**.
4. Monitor how the status of the incident has changed once the answers are provided in the questionnaire.
   Once all answers are provided, the impact on the economy is automatically calculated using the impact automation in the assessment template.
5. To submit the response to the questionnaire as an analyst, verify the responses and select **Submit**.



A confirmation message is displayed that the answers are submitted successfully.

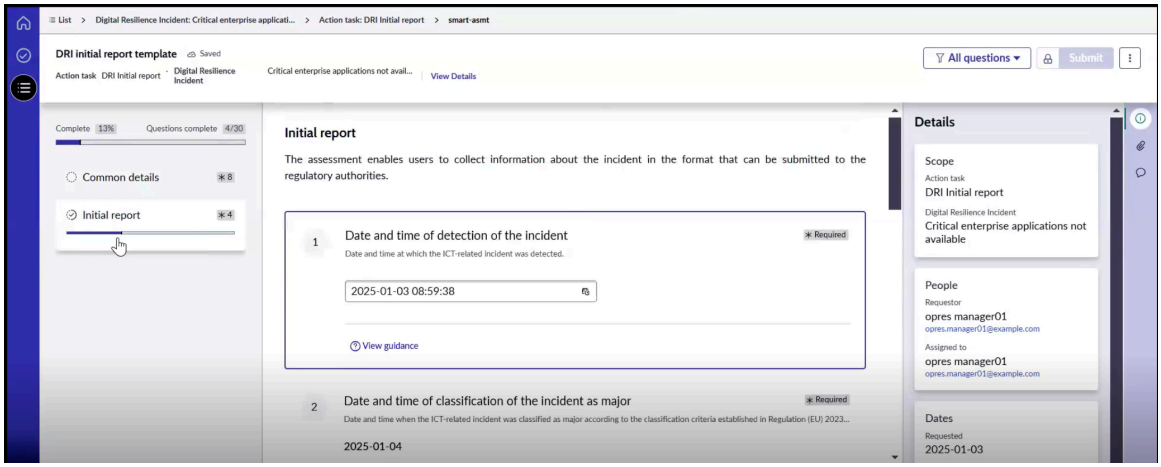
6. Navigate to the **Details** tab of the incident and check the reporting status.
   You can check whether the auto-calculated regulatory reporting status of the incident is shown as Reportable.
7. Navigate to the **Action tasks** tab and check if an action task has been added for the reportable incident.

   As shown in the example, an action task is generated to collect the initial report that should be submitted to the regulator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Navigate to the action task in the incident and assign it to themselves or another user in the Assignment section of the **Details** tab.
9. Save the action task, select **Update state**, and select **Submit**.

   The action task is assigned to the user and the Task owner field is locked on the form. The user can either reassign or complete the task. A due date is provided for the action task which is a 1-day time, 24 hours from when the incident got classified as major. Within the next 24 hours, this report must be submitted to the authorities.



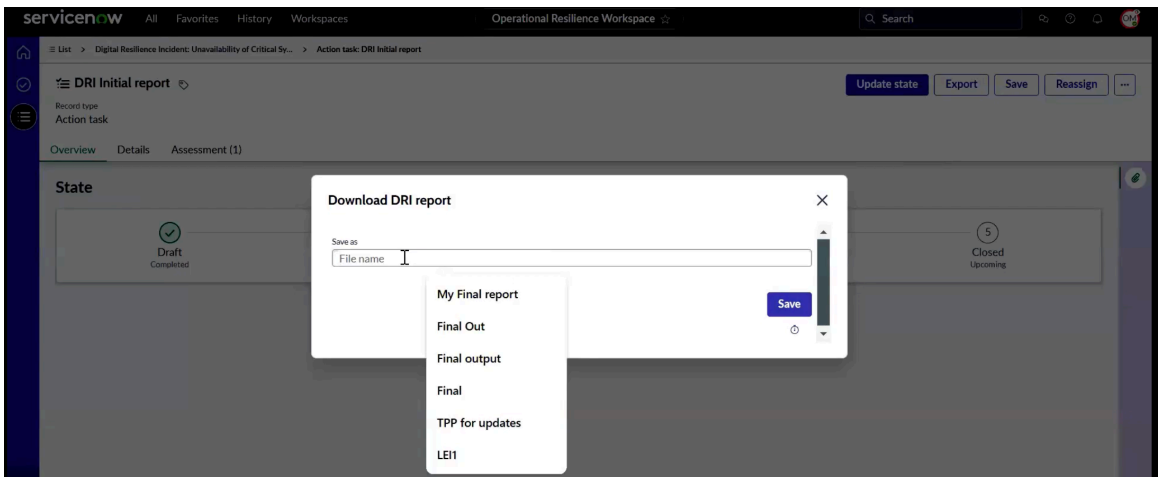
10. Navigate to the **Assessment** tab and respond to the assessment for the initial report.

    The first assessment, which is the regulatory reporting assessment, is used to determine if the incident needs to be reported to regulatory authorities. For reportable incidents, three assessment templates are created for the initial, intermediate, and final report in the Assessment Workspace.

    In this case, an assessment is already created in the **Assessment** tab of the action task, where you can provide incident details. Automation used in the assessment template helps to collect information and calculate responses quickly.

    The date of detection and classification are pre-filled, and some fields are auto-populated. You can automate or manually configure the remaining responses. Once all answers are provided, generate an Excel sheet and submit it to regulatory authorities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



11. To submit the assessment, select **Submit** and generate an Excel sheet.
You can submit the Microsoft Excel sheet to the regulatory authorities.

    The initial report is automatically generated, and an intermediate report is created every third day the incident remains open. Once the incident is closed or resolved in Incident Management, it is moved to a Closed status, and a final report is generated with a due date of 30 days.

    Action tasks are automatically added to the incident, and you can manually add and assign additional tasks to the owner.

12. To add an action task manually, select **New** in Action tasks and complete its workflow.
13. To export and download the DRI report, select **Export**, add the file name, and select **Save**.

    The export functionality generates a Microsoft Excel sheet based on the reporting cases, which can be saved to your local hard drive and shared with regulatory authorities. You can download the DRI report as shown in the example.

The Microsoft Excel report contains the Common details and Initial report tabs. All fields from the initial report are exported with their names as column headers.

Report a major incident from Security Incident Response

Report a critical incident from Security Incident Response in the Digital resilience incident reporting application.

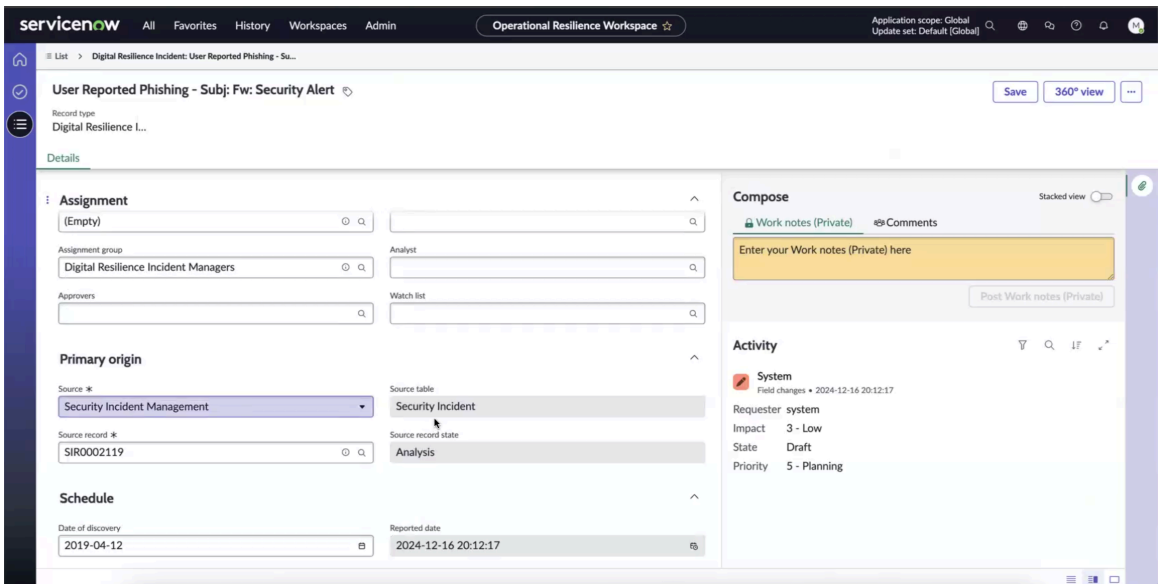
Before you begin

Role required: sn_dri_inc_rptg.digital_resilience_incident_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Security Incident Response reporting workflow consists of the following steps:



1. Configure the rules engine to automatically update the regulatory status on the incident reporting case.
2. Create an incident report from SOW in Incident Management.
3. Create action tasks and regulatory assessments for the initial, intermediate, and final reports.
4. Copy the impacted areas from the source tables.
5. Respond to the assessments and populate the responses.
6. Extract the reports in Microsoft Excel format for the regulators.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience incident reporting** > **All incident reporting cases**.
2. Open the Digital resilience incident case from the list view.

   The following example shows the Digital resilience incident case generated from the Security Incident Response application.

   The source of the case is SIR.

   The case is assigned to the Digital Resilience Incident Managers group.

   The action tasks related to the incident are copied in the case record.

   An action task is automatically generated for the incident to help you determine if it must be reported to regulatory bodies. When you open the action task, you can view its name, description, type, and the associated assessment template. This template, created by the Digital resilience incident administrator (sn_dri_inc_rptg.digital_resilience_incident_admin), is already available in the Assessment Workspace, where you can view its sections and questions.

   The assessment template is aligned with the Digital Operational Resilience classification for major Information and Communication Technology (ICT) incidents. The same assessment template is tagged in the reported incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The analyst assigned to the case assesses the incident's impact on factors such as critical services, clients (including financial counterparts and third parties), data and data losses, reputation, service downtime, geographical spread, and economy. These sections in the template help you determine the impact of the incident and whether it should be reported to the regulators and responds to the questions in the questionnaire. For information on the assessment template, see Create an assessment template.

3. Select **Accept work**.
4. Monitor how the status of the incident has changed once the answers are provided in the questionnaire.
   Once all answers are provided, the impact on the economy is automatically calculated using the impact automation in the assessment template.
5. To submit the response to the questionnaire as an analyst, verify the responses and select **Submit**.

   A confirmation message is displayed that the answers are submitted successfully.
6. Navigate to the **Details** tab of the incident and check the reporting status.
   You can check whether the auto-calculated regulatory reporting status of the incident is shown as Reportable.
7. Navigate to the **Action tasks** tab and check if an action task has been added for the reportable incident.

   An action task is generated to collect the DRI initial report that should be submitted to the regulator.
8. Navigate to the DRI initial report action task in the incident and assign the action task to themselves or another user in the Assignment section of the **Details** tab.
9. Save the action task, select **Update state**, and select **Submit**.

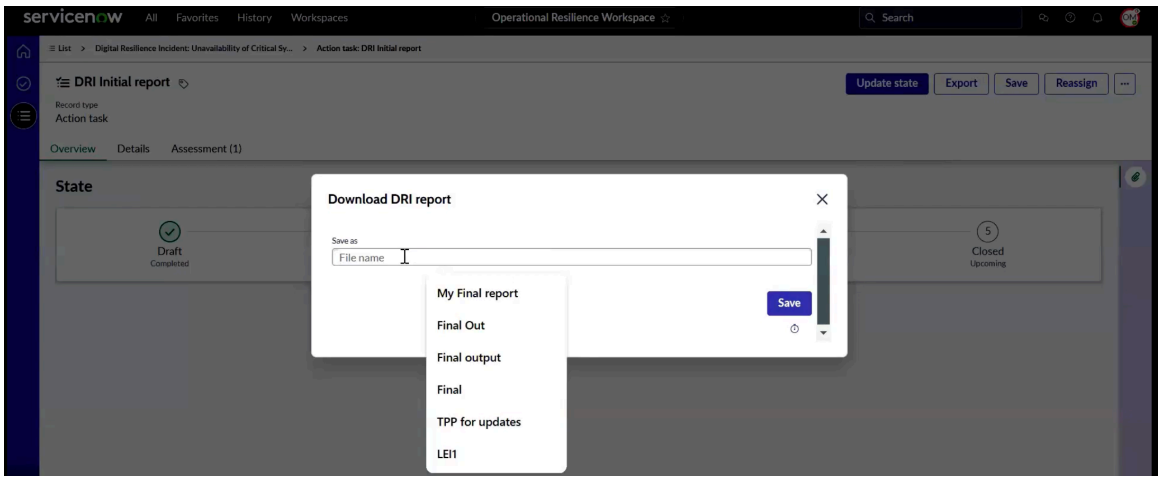
   The action task is assigned to the user and the Task owner field is locked on the form. The user can either reassign or complete the task. A due date is provided for the action task which is a 1-day time, 24 hours from when the incident got classified as major. Within the next 24 hours, this report must be submitted to the authorities.
10. Navigate to the **Assessment** tab and respond to the assessment for DRI initial report.

    The first assessment, which is the regulatory reporting assessment, is used to determine if the incident needs to be reported to regulatory authorities. For reportable incidents, three assessment templates are created for the initial, intermediate, and final report in the Assessment Workspace.

    In this case, an assessment is already created in the **Assessment** tab of the action task, where you can provide incident details. Automation used in the assessment template helps to collect information and calculate responses quickly.

    The date of detection and classification are pre-filled, and some fields are auto-populated. You can automate or manually configure the remaining responses. Once all answers are provided, generate an Excel sheet and submit it to regulatory authorities.
11. To submit the assessment, select **Submit** and generate an Excel sheet.
    You can submit the Excel sheet to the regulatory authorities.

    The initial report is automatically generated, and an intermediate report is created every third day the incident remains open. Once the incident is closed or resolved in Incident



© 2026 ServiceNow, Inc. All rights reserved.

Management, it is moved to a Closed status, and a final report is generated with a due date of 30 days.

Action tasks are automatically added to the incident, and you can manually add and assign additional tasks to the owner.

12. To add an action task manually, select **New** in Action tasks and complete its workflow.
13. To export and download the DRI report, select **Export**, add the file name, and select **Save**.

    The export functionality generates a Microsoft Excel sheet based on the reporting cases, which can be saved to your local hard drive and shared with regulatory authorities. You can download the DRI report as shown in the example.

    The Microsoft Excel report contains the Common details and Initial report tabs. All fields from the initial report are exported with their names as column headers.

14. To save the case record, select **Save**.

Report a major incident manually

Report a critical incident manually in the Digital resilience incident reporting application from the Operational Resilience Workspace.

Before you begin

Role required: sn_dri_inc_rptg.digital_resilience_incident_manager, sn_oper_res.manager

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience incident reporting** > **All incident reporting cases**.
2. Select **New**.
3. Enter the name and description of the incident case record.
4. On the New record form, fill in the fields.
   To view more information on the fields, see the Create New Digital Resilience Incident form.
5. Select **Accept work**.
6. Monitor how the status of the incident has changed once the answers are provided in the questionnaire.
   Once all answers are provided, the impact on the economy is automatically calculated using the impact automation in the assessment template.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To submit the response to the questionnaire as an analyst, verify the responses and select **Submit**.

   A confirmation message is displayed that the answers are submitted successfully.

8. Navigate to the **Details** tab of the incident and check the reporting status.
   You can check whether the auto-calculated regulatory reporting status of the incident is shown as Reportable.
9. Navigate to the **Action tasks** tab and check if an action task has been added for the reportable incident.

   An action task is generated to collect the DRI initial report that should be submitted to the regulator.

10. Navigate to the DRI initial report action task in the incident and assign the action task to themselves or another user in the Assignment section of the **Details** tab.
11. Save the action task, select **Update state**, and select **Submit**.

    The action task is assigned to the user and the Task owner field is locked on the form. The user can either reassign or complete the task. A due date is provided for the action task which is a 1-day time, 24 hours from when the incident got classified as major. Within the next 24 hours, this report must be submitted to the authorities.

12. Navigate to the **Assessment** tab and respond to the assessment for DRI initial report.

    The first assessment, which is the regulatory reporting assessment, is used to determine if the incident must be reported to regulatory authorities. For reportable incidents, three assessment templates are created for the initial, intermediate, and final report in the Assessment Workspace.

    In this case, an assessment is already created in the **Assessment** tab of the action task, where you can provide incident details. The automation used in the assessment template helps to collect information and calculate responses quickly.

    The date of detection and classification are pre-filled, and some fields are auto-populated. You can automate or manually configure the remaining responses. Once all answers are provided, generate an Excel sheet and submit it to regulatory authorities.

13. To submit the assessment, select **Submit** and generate an Excel sheet.
    You can submit the Excel sheet to the regulatory authorities.

    The initial report is automatically generated, and an intermediate report is created every third day the incident remains open. Once the incident is closed or resolved in Incident Management, it is moved to a Closed status.

    Action tasks are automatically added to the incident, and you can manually add and assign additional tasks to the owner.

14. To add an action task manually, select **New** in Action tasks.
15. To export and download the DRI report, select **Export**, add the file name, and select **Save**.

    The export functionality generates a Microsoft Excel sheet based on the reporting cases, which can be saved to your local hard drive and shared with regulatory authorities. You can download the DRI report as shown in the example.

The Microsoft Excel report contains the Common details and Initial report tabs. All fields from the initial report are exported with their names as column headers.

16. To save the case record, select **Save**.

Create New Digital Resilience Incident form

On the Create New Digital Resilience Incident form, fill in the fields.

Create New Digital Resilience Incident form

Field	Description
Number	Number of the case. This field is automatically set. For example, DRI000108.
Name	Name of the incident. For example, `DRI Case 1`.
Description	Description of the incident.
State	Workflow state of the incident. This field is automatically set to **Draft**.
Type	Nature or type of the incident. This field is automatically set to **Digital Resilience Incident Case**.
Subtype	Sub type of incident. For example, **Documentation Loss**.
Assignment	
Requester	Person who reported the incident.
Assignment group	Group assigned to the case. **Note:** The assignment group is preconfigured to the case type during configuration setup.
Approvers	Approvers of the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Create New Digital Resilience Incident form (continued)

Field	Description
Requested on behalf of	Name of the person on whose behalf you've created the incident.
Analyst	Analyst who analyzes and works on the incident. The analyst is a part of the Assignment group.
Watch list	People who must be aware of the incident.
Primary origin	
Source	Source of the case. This field is automatically set to **Manual** when the reporting case is manually created.
Schedule	
Date of discovery	Date that the case is discovered by you. For example, the case may have occurred on 18-02-2024, but is discovered by the user only on 12-03-2024.
Date of occurrence	Date that the case occurred on. For example, the case may have occurred on 18-02-2024.
Closed date	Date that the case is closed on.
Reported date	Date that the case gets reported on.
Pending approval start date	Date that the case was resolved on.
Approved date	Post case review date of the case.
Reporting status	
Regulatory reporting status	Primary cause of the case occurrence. Available options are: • **Potentially reportable** • **Reportable**
Regulatory area	Digital Operational Resilience Act
Activity	
Work notes (Private)	Notes or information regarding the case.
Comments (Customer visible)	Additional information regarding the case for the customers.
Email	Option to compose an email about the case to the stakeholders.
Attachments	Option to attach the PDF of the case.

Reporting incidents or security incidents for multiple regulations

You can now report incidents or security incidents for multiple regulations for various legal entities in Digital resilience incident reporting. The application streamlines operations by automating tasks, migrating data, helping to prevent duplicates, and verifying accurate reporting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automated reporting workflow

Starting with Digital resilience incident reporting, release 21.1.1, the application uses an automated reporting workflow to generate reports within regulatory reporting timelines:

- Regulatory reporting assessment of IT incidents
- Initial Report (within 24 hours)
- Intermediate Report (every three days until resolved)
- Final Report

You can complete these tasks and generate reports in Microsoft Word format, as required by regulatory authorities for analysis.

Case creation by adding entities

Digital resilience incident reporting is used for incident reporting and assessment for legal entities or other objectives according to regulations. You can now add entities to an incident, which automatically create a Digital resilience incident reporting case.

For information on setting up the entities, see Set up entities for the targets.

Sequence of action tasks

The sequence of action tasks in the Digital Resilience Incident Reporting (DIR) process, as outlined in the document "Digital resilience incident reporting for multiple regulations," is primarily driven by template configurations. Here's an overview of how action tasks are created and sequenced:

Action task creation and sequence are explained:

1. Initial action task creation: When a DIR case is created (triggered by sources like incidents), the system automatically generates action tasks. For example, the template shown creates the 'Regulatory reporting assessment of IT incidents' action task.
2. Template configuration: Templates are configured to create specific action tasks. For example, the 'DRI Initial report' template, which runs only once, automatically creates the 'DRI Initial report' action task when the regulation’s reporting status changes to 'Reportable.' Administrators can then update its name, due date, and termination conditions.
3. Closure of action tasks: When the 'DRI Initial report' is closed, the 'DRI Intermediate report' action task is created. If the 'DRI Initial report' task remains open, the system creates the 'DRI Intermediate report' action task every three days until the DIR case is closed or canceled, or the source incident is closed.
4. Closure of incident: When the source incident or security incident is closed, the “DRI Final report” action task is created, with a due date of 30 days.
5. Automated action task generation: These template configurations enable automatic creation of action tasks, as previously demonstrated. as administrators, you can create multiple action tasks and tailor their sequence to meet your organizational requirements and applicable regulations.
6. Completion of action tasks: Action tasks are completed according to the conditions defined in their templates, promoting efficient process management and required task completion.

> **Note:**
> As administrators, you can customize the configurations available with the base version or add additional action tasks as needed.

For information on mapping regulations and setting up action task templates, see Map regulations to the entities and Set up action task templates in Regulatory agency profile.

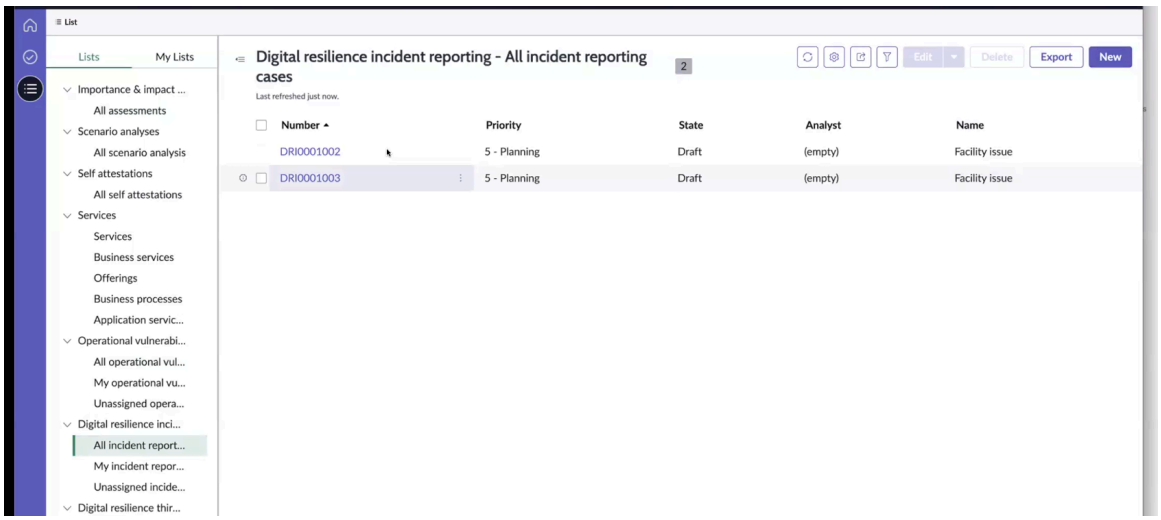
For information on completing action tasks, refer to Complete action tasks and report incidents associated with regulations.

Complete action tasks and report incidents associated with regulations

Report incidents or security incidents associated with multiple regulations for various legal entities. The automated workflow generates regulatory reporting assessments of IT incidents, and Digital resilience incident (DRI) Initial, Intermediate, and Final reports, all within regulatory timelines. Complete the action tasks and generate reports in Microsoft Word format, as required by regulatory authorities for analysis.

Before you begin

Role required: sn_oper_res.manager



About this task

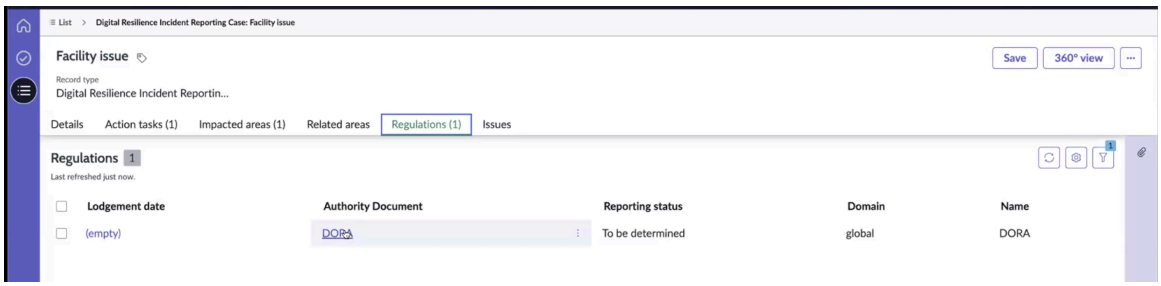
Note:
The regulation status, previously a field on the Digital resilience incident reporting (DRIR) case form, is now displayed within the Regulations related list.

Procedure

1. Navigate to **Workspaces** > **Operational Resilience Workspace** > **Digital resilience incident reporting** > **All incident reporting cases**.
2. Open the incident reporting case from the list that you want to work on.

   From the Digital resilience incident reporting cases in the instance, DRI0001003 is selected for this example.

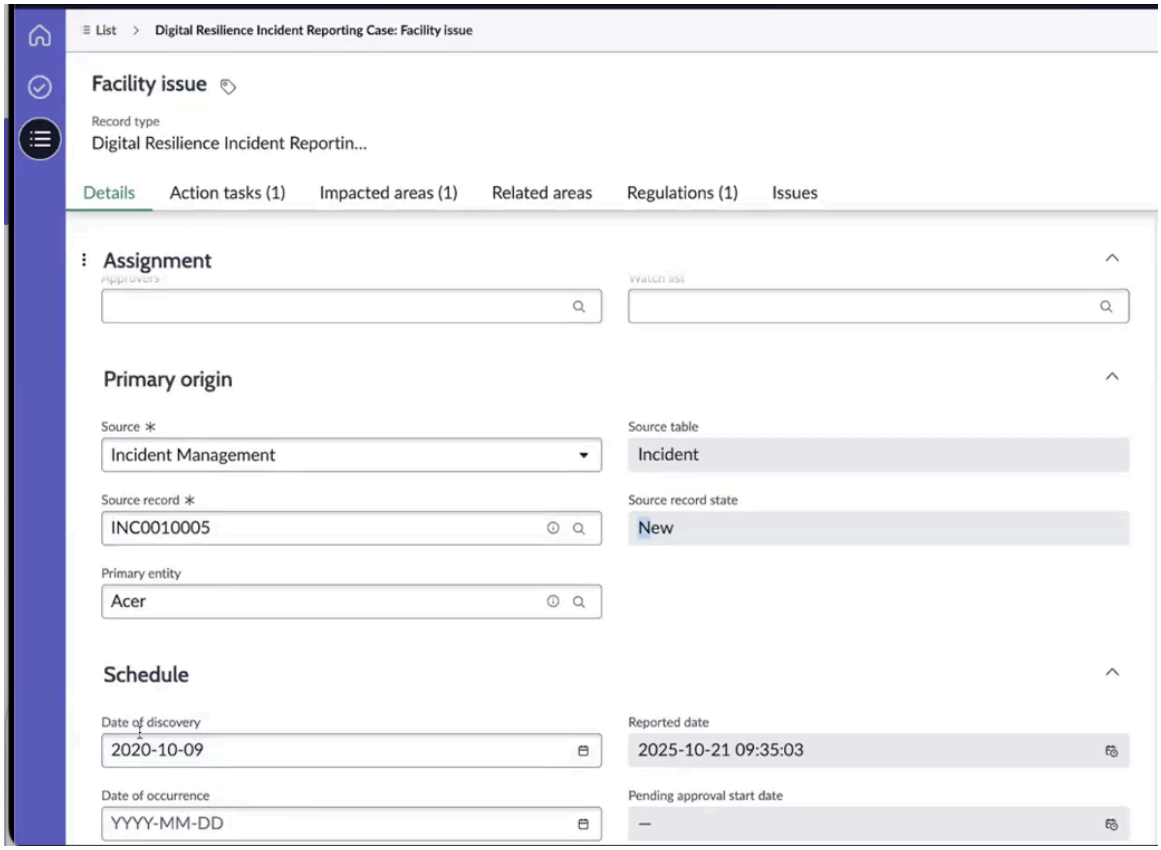
   Its automated workflow generates the Regulatory reporting assessment of IT incidents, DRI Initial report, DRI Intermediate report, and DRI Final report action tasks.



3. Review the incident record's 'Action tasks' and 'Regulations' related lists for assigned tasks and mapped regulations.

   The examples show that an action task is assigned automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A regulation is mapped to the case.

4. Review the details of the Digital resilience incident reporting case and verify that the owner of the case is a member of the assignment group.

   A sample Digital resilience incident reporting incident is shown where the source is Incident, Source record is in the New state, the source record is an Incident INC0010005, and the date of discovery is listed. The case is assigned to the 'Digital Resilience Incident Managers' assignment group.

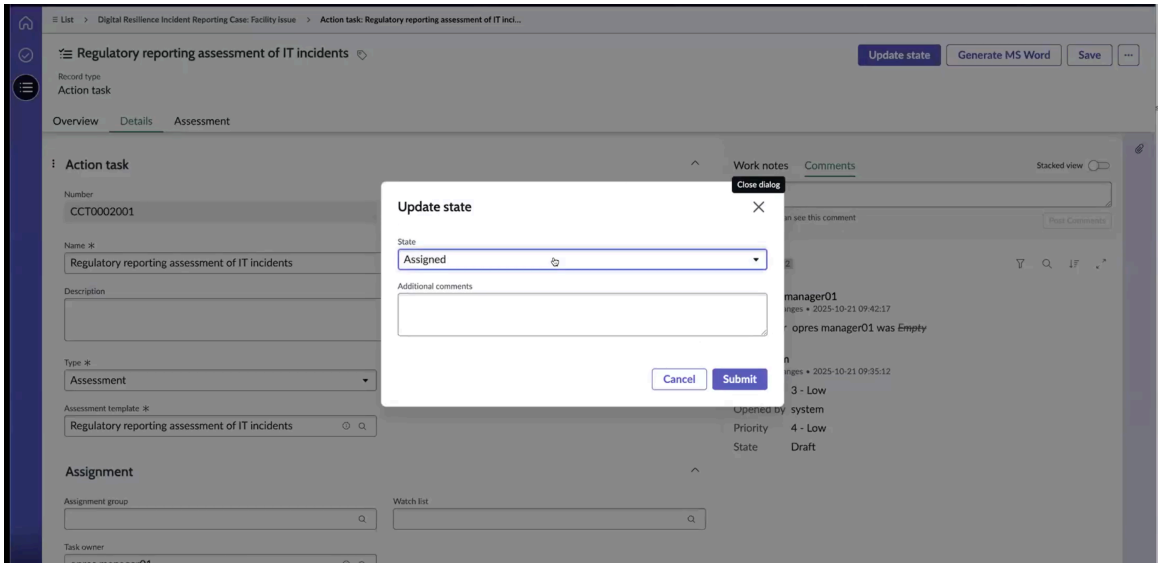
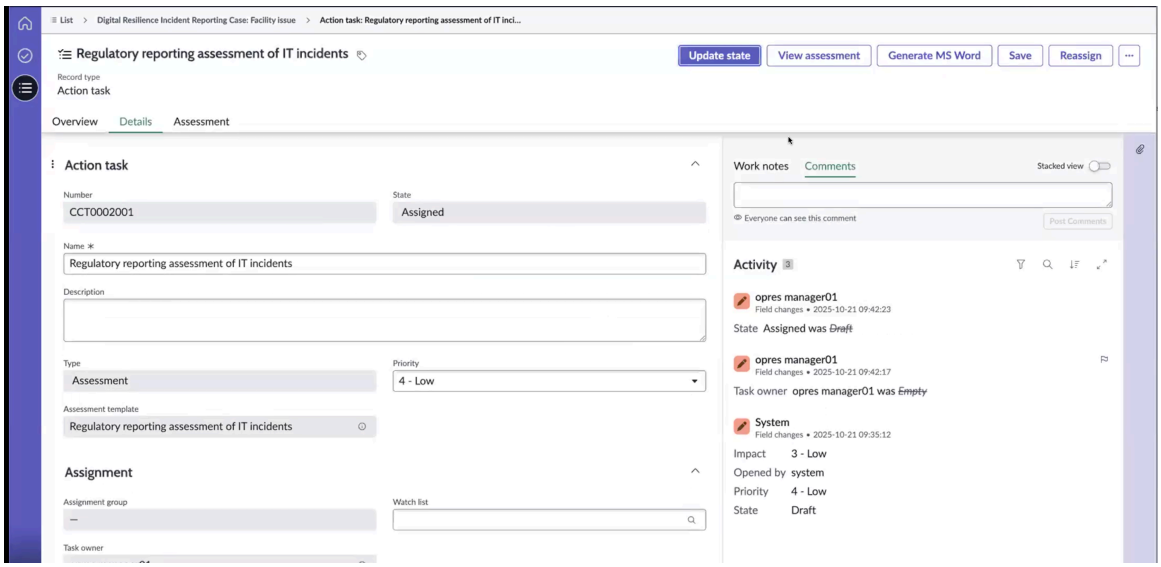
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. As a Digital Resilience Incident Manager, log in to the case record, assign it to an analyst from your group, and select **Save**.

   The example shows that an analyst, Opres manger01, is assigned to the 'Digital resilience incident reporting: Facility issue' case.



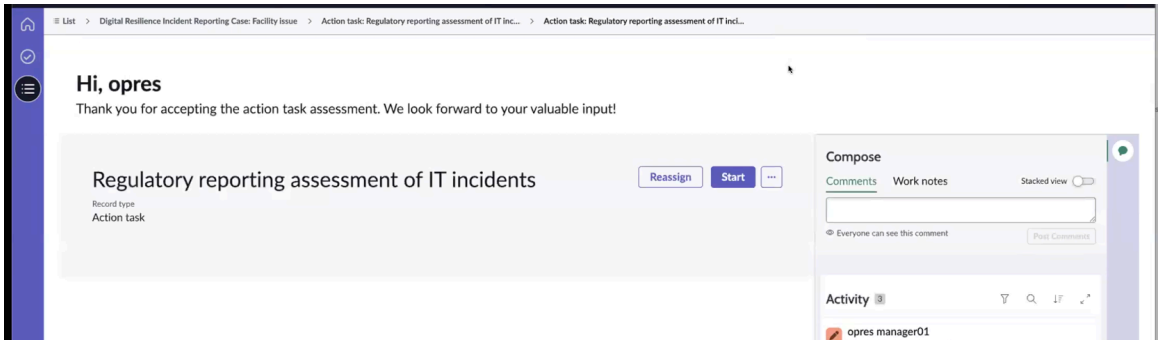


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As the assigned analyst, you can begin working on the action tasks.

6. Open the first action task in the case and verify that it's assigned to a user.
7. Update the state of the action task to **Assigned**.

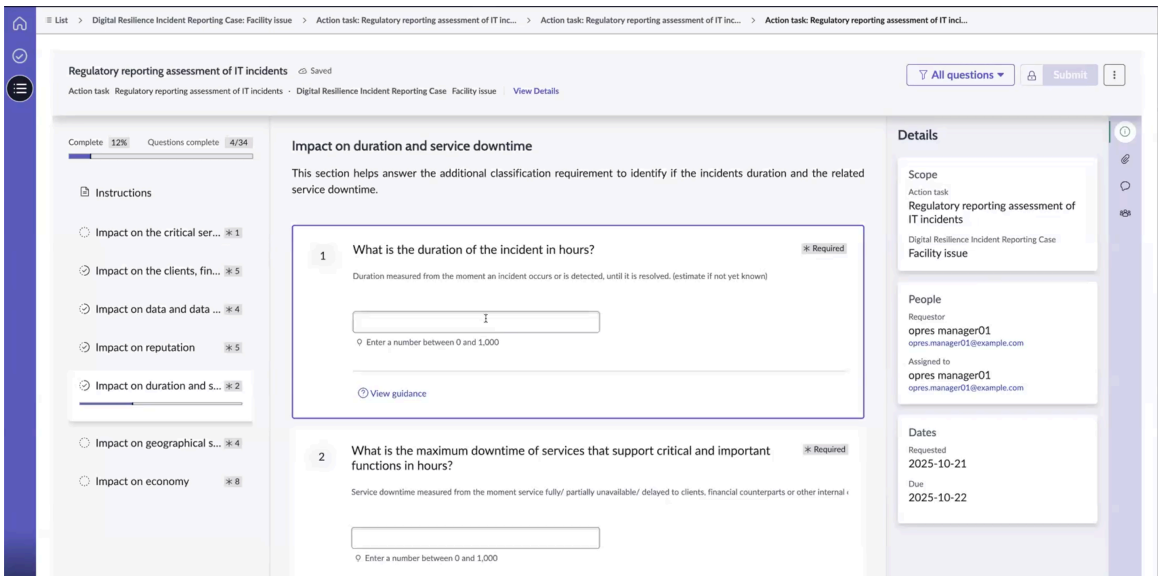
   The example shows that the 'Regulatory reporting assessment of IT incidents' action task is updated to the **Assigned** state.



8. Select **View assessment** and then select **Start** in the assessment section of the action task.

> **Note:**
> The **View assessment** UI action is displayed only when the action task is in the **Assigned** state.

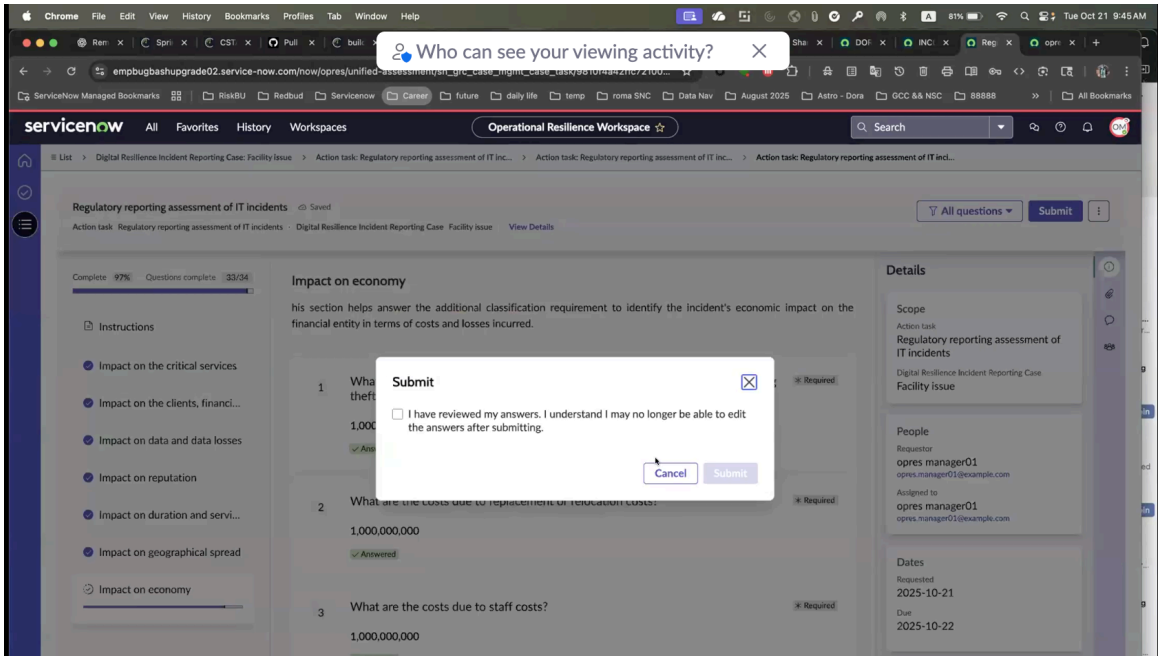
As an analyst, you can start the assessment as shown in the example.



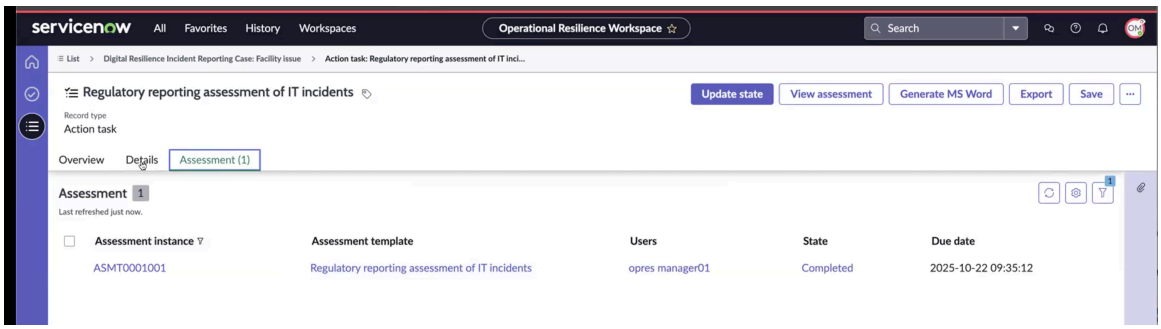
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Respond to the questions in the assessment template.

> **Note:**
> You can trigger the assessment from an incident or a security incident.

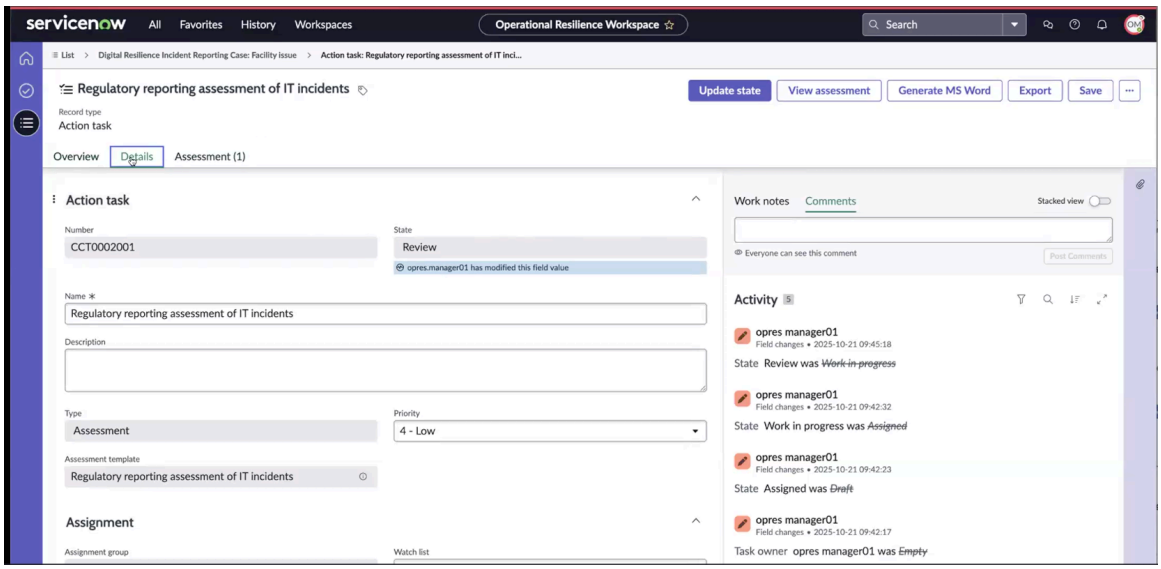


Sample assessment questions and answers are shown in the example.



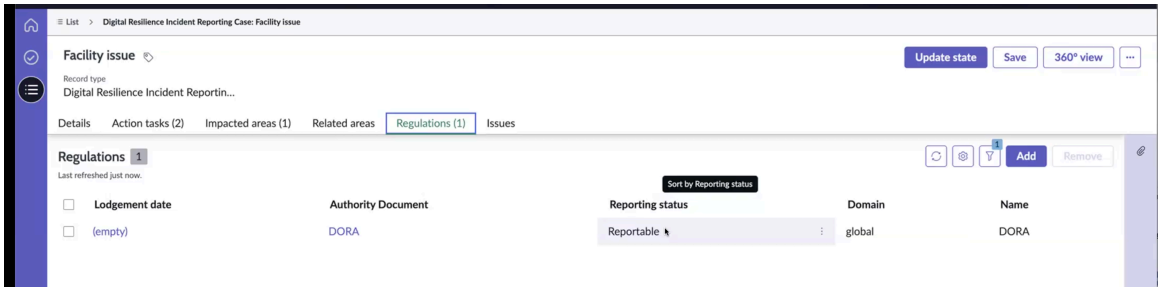
10. To submit the responses to the questions, select **Submit** and respond to the confirmation message by selecting **Submit** again.

The assessment submission form is shown in the example.

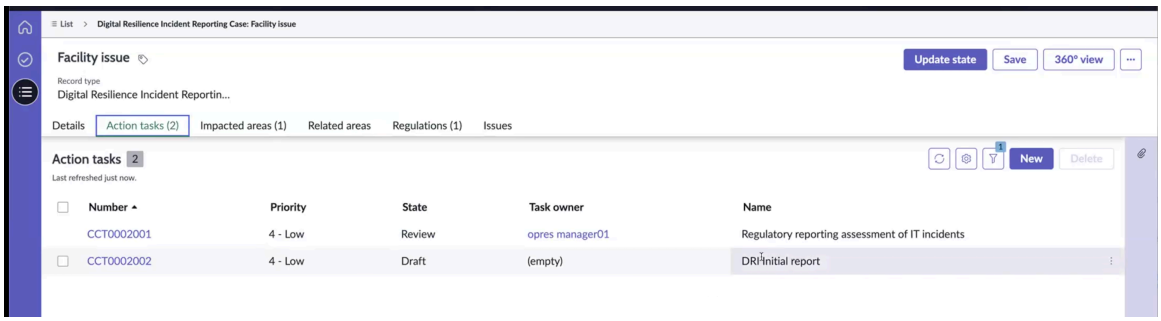


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you complete the assessment, its state is shown as **Completed** in the **Assessment** tab.



The assessment is pending for review and the state is updated to **Review** as shown in the action task.



Once the assessment is submitted, the regulation status is updated to 'Reportable' as shown in the Regulations related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this example, the action task CCT002001 is in the 'Review' state, while CCT002002 for 'DRI Initial report' has been created automatically.

11. As a reviewer of the action task, log in and complete the review.
12. Assign the second action task, 'DRI Initial report', to a user from the assignment group, update its state to **Assigned**, and select **View assessment** to respond to the assessment.
13. Complete the review and submit the assessment for the 'DRI Initial report' action task.
    The next action task, 'DRI Intermediate report' is created automatically.
14. Assign the 'DRI Intermediate report' action task to a user from the assignment group, update its state to **Assigned**, respond to the questions, complete the review, and submit the assessment for the 'DRI Intermediate report' action task.
    The next action task, 'DRI Final report' is created automatically.
15. Assign the 'DRI Final report' action task to a user from the assignment group, update its state to **Assigned**, respond to the questions, complete the review, and submit the assessment for the 'DRI Final report' action task.

    The action task, 'DRI Final report' is complete.

    You have now completed all action tasks required for reporting the incident or security incident mapped to the regulation.
16. To generate the report of an action task in Microsoft Word format, select **Generate MS Word**.

    Action task reports must be generated in Microsoft Word format as required by regulatory authorities for analysis. When you select the **Generate MS Word** UI action, the Generate report window is displayed.

    a. In the Generate report window, choose the desired Word template in the **Report template** field.

    b. Add the name of the report in the **Name of report** field.

       The example shows the Word template and sample name of the report.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Generate**.
A message is displayed that the report is being generated.

The action task report is generated in the Microsoft Word format. It includes information from the **Details** and **Assessments** tabs and attachments. It includes information such as form sections, questions, template sections, question answers, and attachment links as shown in the examples.

For information on Word templates and Template configurations, see Generating Word reports using Document designer.

The generation of Microsoft Word reports, required by regulatory authorities for analysis in Digital resilience incident reporting, is completed with this step.

17. To export the report of the action task to your local drive, select **Export**.

18. To save the action task in the instance, select **Save**.

Saving the action task in the instance completes the required reporting workflow.

Generating Word reports using Document designer

Operational Resilience administrators can now set up Microsoft Word templates and Operational Resilience managers can download action task reports in MS word format.

© 2026 ServiceNow, Inc. All rights reserved.

Using the ServiceNow Document designer with Microsoft Word

The ServiceNow Document designer with Word application offers a low-code solution, enabling you to configure different aspects of Microsoft Word documents without requiring extensive technical expertise. The templates offered by ServiceNow are designed to align with the company's brand guidelines, verifying consistent and professional documentation.

Use the ServiceNow Document designer with Word application to generate intuitive and audit-ready Microsoft Word reports for action tasks directly from your ServiceNow instance. Configure the Microsoft Word templates in the application to include specific data from the records, such as tables and columns, into the reports. Options include using predefined templates, customizing them with low-code implementation, or creating your own templates to meet your company's specific guidelines.

You can save these reports either within your ServiceNow instance or as cloud documents in Microsoft SharePoint.

Benefits of using Document designer

The ServiceNow Document designer with Word application enables you to pull metadata, such as fields and related lists, from ServiceNow tables. It also enables you to add content blocks that repeat for each record in a table, for example, 10 blocks for 10 issues. Apply the templates to specific records and create reports in Microsoft Word format.

Workflow for configuring and managing the report templates

To configure and manage the report templates, complete the following steps in the given sequence.

1. Install Document designer.
2. Create template configuration
3. Create Data relationships
4. Create Content configurations
5. Download the manifest file and side-load it in the ServiceNow Document designer with Word.
6. Build the word template using the add-in.
7. Generate the word report.

Install Document designer with Word

Install the ServiceNow Document designer with Word (sn_grc_doc_design) application. It extracts metadata (including fields, related lists, and reference fields with their associated elements) from ServiceNow® tables and enables the insertion of repeating content blocks (for example, 10 blocks for 10 issues) based on record count. When applied to specific records, the template generates a Microsoft Word document.

Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Document designer with Word application using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Install**.
   The ServiceNow Document designer with Word application is installed in your ServiceNow® instance.

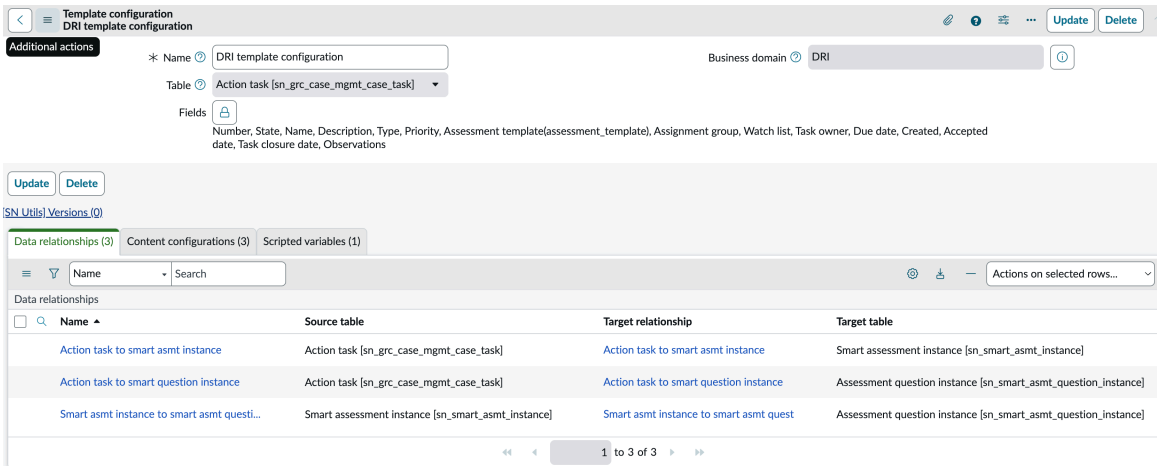
Create Template configurations

Create Template configurations

Use the Template Configurations module to set up the template relationship registry. This module displays document design template configurations for action tasks. It enables you to configure data relationships, content, and scripted variables via the Document designer application so that required data is displayed in your reports.



Before you begin
Role required: sn_oper_res.admin

About this task
From the Administration menu, the Template Configurations module displays document design template details for DIR action tasks. The Word Templates module, on the other hand, provides DIR Word templates necessary for generating Microsoft Word reports.

Procedure

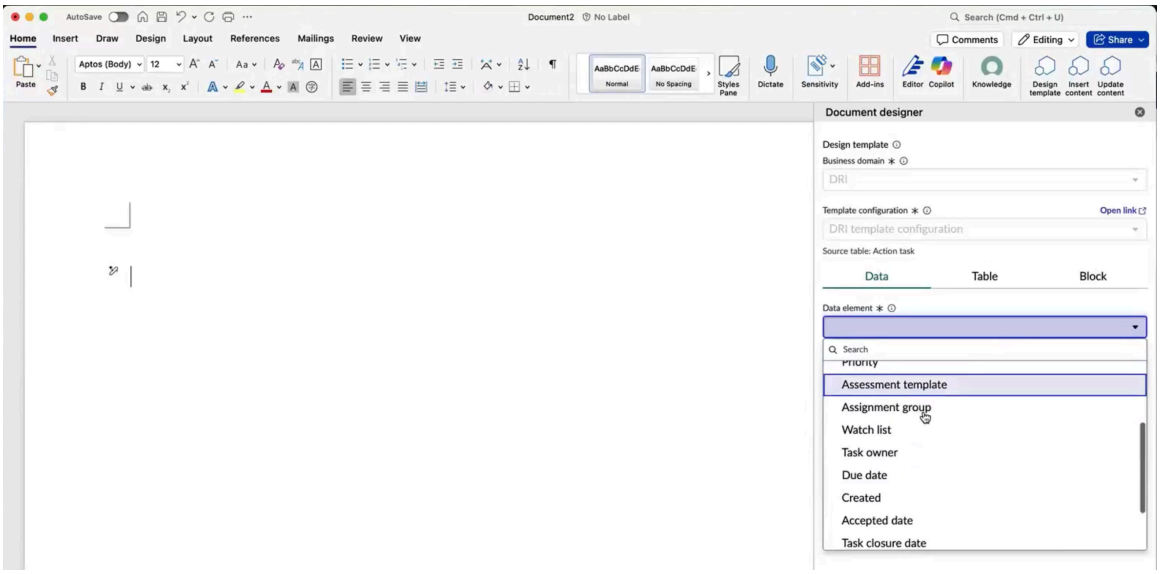
1. Navigate to **All** > **Digital resilience incident reporting** > **Template Configurations**.

   Predefined Microsoft Word templates, available with the base version, are displayed in the Template Configurations module. The example shows a predefined DRI template.

2. To create a template, select **New** in the Template Configurations module.

   You can either use the predefined templates or create your own templates in the Template Configurations module.

3. On the form, fill in the fields.



Template configuration form

Field	Description
Name	Name of the template configuration. For example, you can specify Engagement template configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Business domain	Domain from which the template is being configured. (Refers Microsoft 365 business domain table)
Table	Source table on which the word template would be built.
Fields	Fields from which data must be displayed on the report. Move the required fields from the Available list to the Selected list.

The example shows how the fields are used in a Microsoft Word document.

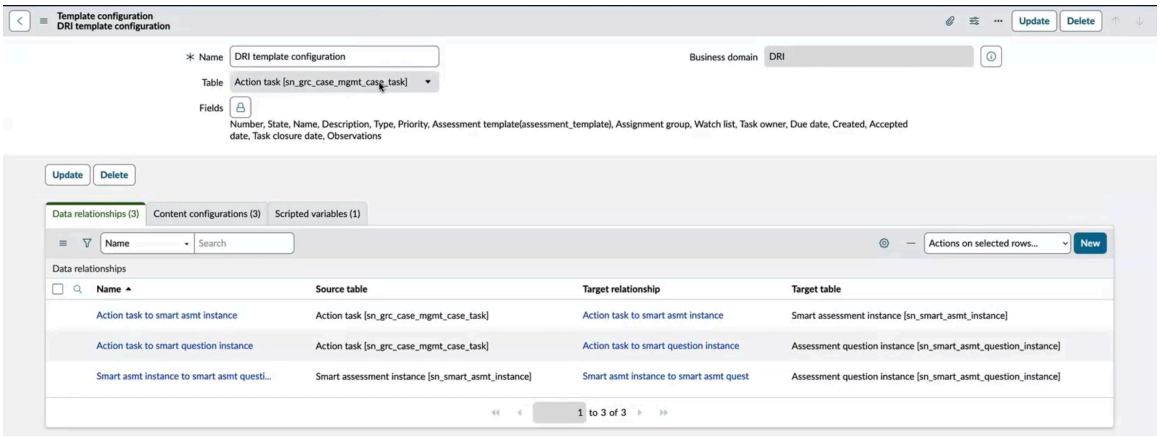
4. Select **Submit**.
5. To edit an existing template, select it from the list, edit the data relationships, content configurations, and scripted variables, then select **Update**.
   You can update the data relationships, content configurations, and scripted variables for the predefined templates.

Create Data relationships

Create the data relationships in the Template Configurations module, which helps you to navigate from a record in the template configuration to any table. When you create these paths, you can fetch the necessary data from each of these records in the Operational Resilience report template.

Before you begin

Role required: sn_oper_res.admin



Procedure

1. Navigate to **All** > **Digital resilience incident reporting** > **Template Configurations**.
2. In the Template Configurations module, open the template configuration that you created.
3. Select **New** in the Data relationships related list.

   The Data relationship new record is displayed.
4. Add the source and target relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A sample record is shown for reference.

5. On the form, fill in the fields.

Data relationship form

Field	Description
Name	Level that you want to go to. For example, you can specify `Plan to Documentation`.
Source	
Parent relationship	Parent of the data relationship.
Source table	Source table used for the data relationship created. This field is automatically set.
Target	
Target relationship	Target relationship. You can select an existing relationship or create a relationship. For example, you can select `Plan to Asset dependencies`. **Note:** For more information, refer to Setting up the 360° views. You can register only existing relationships between the types of data you want to view.
Relationship type	Type of the relationship such as many to many or one to many. This field is automatically populated based on the selection made in the **Target relationship** field.
Target table	Table from which the data is obtained. This field is automatically populated.

6. Select **Submit**.

Based on the selections, the data is shown in the template.

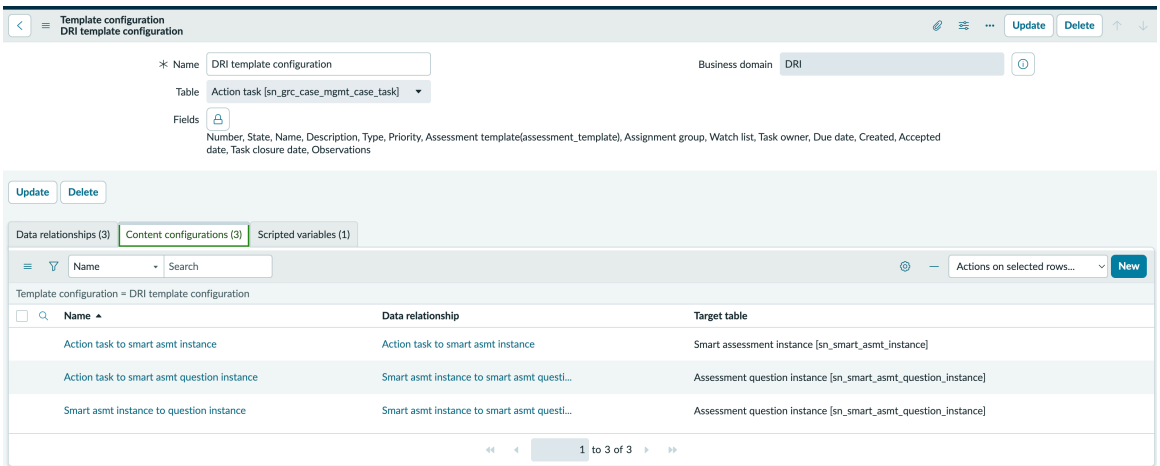
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Create content configurations to specify the type of data you want to fetch on the report. For more information, see Set up the content configurations.

Create Content configurations

Set up the content configurations in the Template Configurations module to define the data you want to view or fetch when creating a report template. You can configure it to display a list of records or aggregated data, such as a list of remediation tasks or top priority issues. You can fetch up to 200 records from any table.



Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Digital resilience incident reporting** > **Template Configurations**.
2. Open the template for which you want to create content configurations.
3. On the Content configurations related list, select **New**.

   The Content configurations related list is shown in the example.

4. On the form, fill in the fields.

Content configuration form

Field	Description
Name	Name of the content configuration. For example, List of remediation tasks.
Template configuration	Template configuration for which you're defining the content configuration. This field is automatically set based on the configuration that you selected in step 2.
Target table	Table from which data must be fetched.
Data relationship	Data relationship for which you want to create content configurations. Only the data relationships that you have previously created are available for selection.
Filter criteria	Filter criteria and the Aggregation criteria to be built as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Aggregation criteria	Aggregation query to be used for the content configuration record. Use Data columns and Intermediate filters related lists for the content configuration record.
Content block criteria	To specify table or data that you want to insert in the content block as a table, select the Content block criteria tab. In the Parent block configuration field, select the required content configuration. In the Data columns related list, specify the columns you want on the report from the table that you have selected. You can either specify the standard columns available or you can write a custom script for the column.

5. Build the Filter criteria and the Aggregation criteria as required.
6. To specify a table or data that you want to insert in the content block as a table, select the **Content block criteria** tab.
   a. In the **Parent block configuration** field, select the required content configuration.
   b. Select **Submit**.
7. Choose which columns from the Data columns list to include in the report.
   You can either specify the standard columns available or you can write a custom script for the column.

   Note:
   You can add up to 20 columns in a table and in a content block. Similarly, certain content blocks can be repeated 200 times in Xanadu and 500 times in Zurich.

8. Specify the order of the columns as they must appear on the report template.
9. Select **Update**.

   The Content configurations related list is displayed.

Download the manifest file

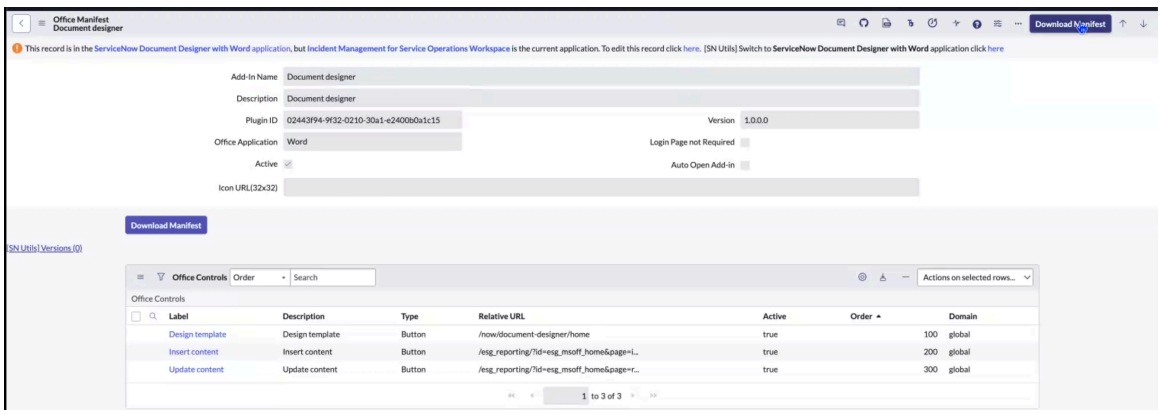
Install ServiceNow Document designer manifest file. This add-in should be enabled for customizing the reports and Microsoft Word templates, according to your business needs.

Before you begin
Role required: sn_oper_res.admin

About this task
An Office add-in manifest file is an XML (or JSON for unified manifests) file that describes an add-in to Microsoft Word, including its name, ID, version, and permissions. It specifies how the add-in integrates with Microsoft Word, such as defining custom UI elements like ribbon buttons and the HTML files for its UI.

Before you begin
Verify that the following plugins are activated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- sn_grc_doc_design
- sn_outlook_addin

Role required: sys_admin

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In Manifests**.
2. From the Office Manifests list, select **ServiceNow Document Designer**.
3. Select **Download Manifest**.

   The manifest file is downloaded in your local drive.

4. To enable the add-in, contact your Microsoft 365 account manager who can use the manifest file you downloaded in step 3.

What to do next

For detailed instructions on how to deploy the manifest file, see the Deploy add-ins in the Microsoft 365 admin center [KB1307378] article in the Now Support Knowledge Base.

To configure the HTTP response headers for add-in for Microsoft Word in the browser, see the Response header resolution [KB1434453] article in the Now Support Knowledge Base.

Build the Word template using the add-in

Build the word template using the add-in. The Word Templates module provides the DIR Word templates used to generate Microsoft Word reports.

Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Digital resilience incident reporting** > **Word Templates**.
2. To create a Word template, select **New**.

   The Word templates form is displayed.

3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Word template form

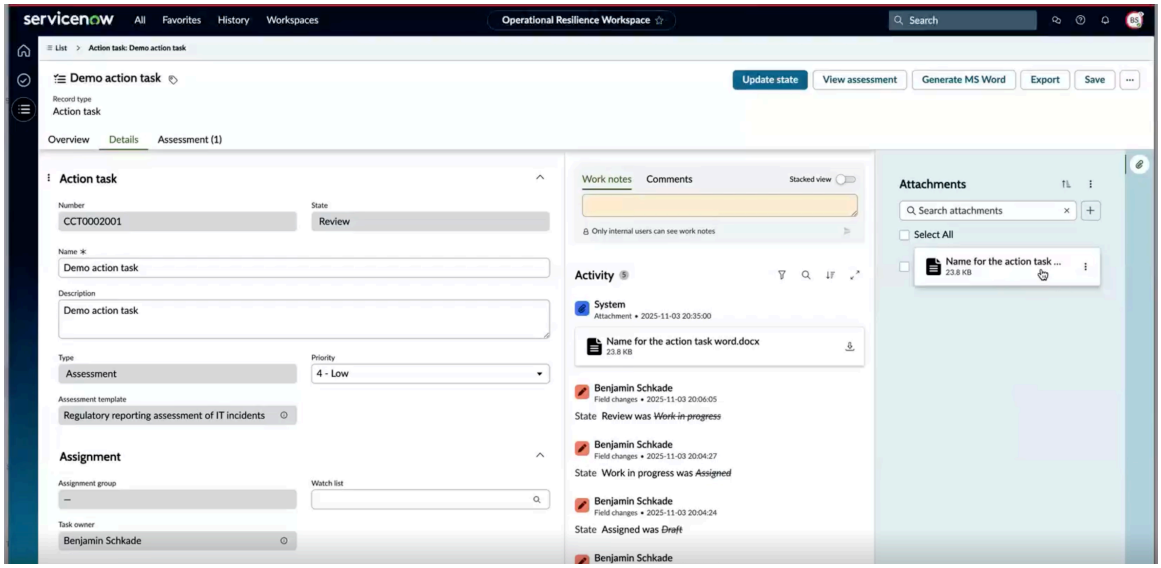
Field	Description
Name	Unique name of the Word template for the table that is selected in the **Table** field.
Category	Classification or group to which the Word template belongs.
Table	Table for which the Word template is being created.
Document	Word template that was created based on content configuration. **Note:** The document must be a docx file only. If you attach a document that is in any other format, then an error message appears.
State	State of the Word template record defaults to **Draft**. ○ **Draft**: Defaults to Draft state when you open the record. ○ **Published**: State when the Word template is published. You can't update a template when it is in the published state. ○ **Edit**: State in which the record details can be updated. **Note:** The Word template record in the **Edit** state can’t be used for report generation. The record isn't available to select in the Generate report pop-up.
Active	Option to activate the record.
Word document generation configurations	
Cloud enabled	Option to manage the generated report either as a sys_attachment in the engagement record or as a cloud document. You can access the document in the cloud either from the Microsoft SharePoint or Google Drive site based on your cloud upload configuration.
Post processing action	Option to update the generated Word template report with fields from the Report section of the Engagement record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To edit an existing pre-defined template, open the desired Microsoft Word template from the list and select the **Edit** UI action.
5. Select **OK**.
6. To delete an existing Word template, select the **Delete** in the record.
7. To update an existing Word template, complete the following steps.
   a. Update the name, category, table, or active option of the record.
   b. To add a brand new document to the Word template, select the **Update** option provided with the Document field.
   c. Select **Click to add..** in the **Document** field.
   d. In the Choose an attachment file: dialog box, select **Choose file**, and select **OK**.
   e. To update an existing document associated with the template, select the **Update** option provided with the Document field.
   f. Select **Update** in the Word template record.
   The Word template record is updated and the updated template is displayed in the list view.
8. To publish the Word template, select **Publish** in the record.
   You must publish the Word template before you can use it to generate a Microsoft Word report.

Generate Microsoft Word report

Generate customized Microsoft Word reports for different records using Word templates. This functionality enables you to streamline reporting in a standardized format.

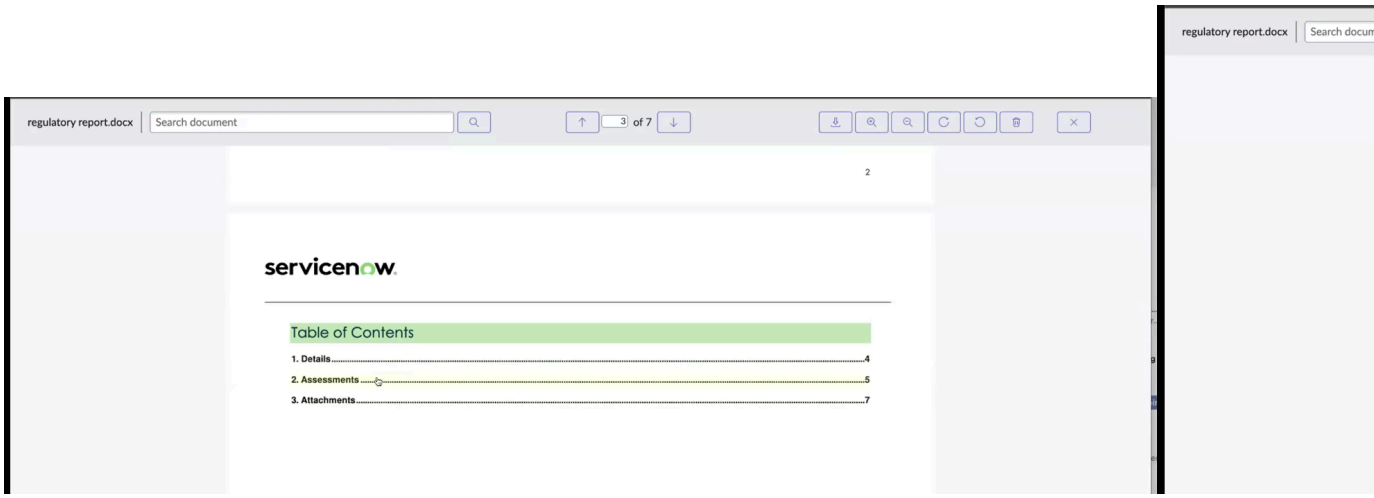


Before you begin

Role required: sn_oper_res.manager

Procedure

1. Navigate to **All** > **Business Continuity** > **Operational Resilience Workspace**.
2. Open a record, such as an action task, from the list view.
3. To generate the report in Microsoft Word format, select **...** and select **Generate MS Word** in the record view.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Generate report window is displayed.

4. Select the action task report template and add a name of the report.
5. Select **Generate**.

   The action task report is generated in the Microsoft Word format. It includes information from the **Details** and **Assessments** tabs and attachments. It includes information such as form sections, questions, template sections, question answers, and attachment links as shown in the examples.

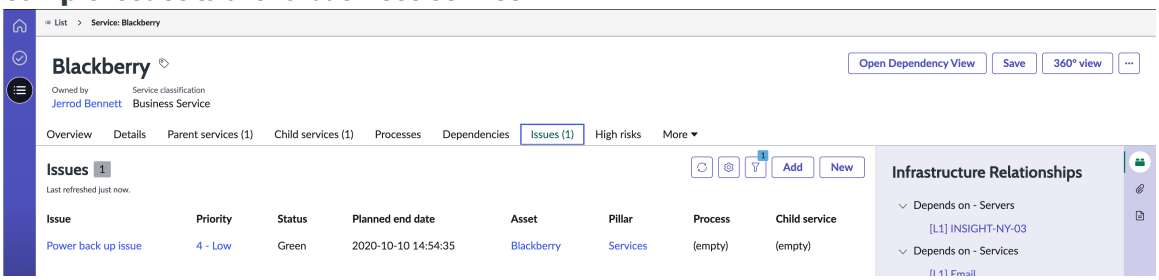
   For information on Word templates and Template configurations, see Generating Word reports using Document designer.

   The generation of Microsoft Word reports, required by the authorities for analysis in Digital resilience incident reporting, is completed with this step.

6. Navigate to the attachment section of the record and view the report listed in the Activity section.
   The report is generated in Microsoft Word format and it is displayed in the Activity section of the record.
7. Download the report in your ServiceNow instance or in the cloud (Microsoft Office 365).
   You can save the generated reports of the action tasks in your ServiceNow instances or in the cloud (Microsoft Office 365) for future references.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

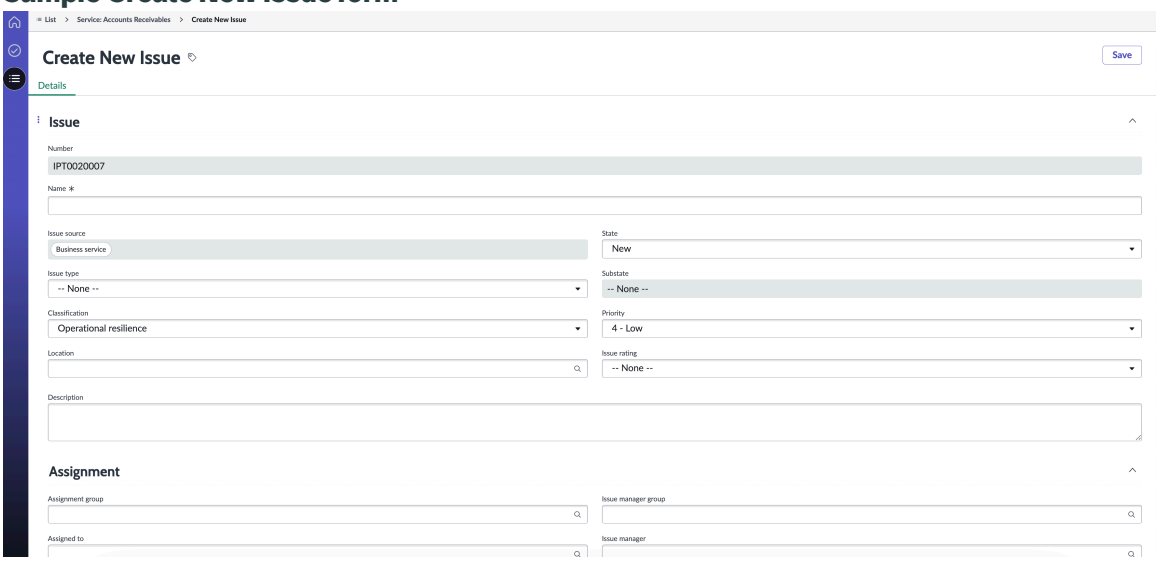
Creating or adding an issue



You can associate an issue with multiple objects such as controls, control objectives, risks, and so on in Operational Resilience Workspace. You can add an existing issue or create an issue for a business service or a scenario analysis in the Operational Resilience application.

Issues are used to capture the current problems or gaps that have been observed in the application environment. You can also track a plan of action to remediate the gaps.

With the new issue architecture, you can associate an existing issue with the controls or risks. You can also create an issue where you can now specify one or multiple controls, control objectives, risks, risk statements, citations, and so on, that are impacted by the issue.



In Operational Resilience, you can add an existing issue or create an issue for a given business service or a scenario analysis. A sample **Issues** tab for a business service is shown in the following example.

Sample Issues tab for a business service

When you select **New** on the **Issues** tab to create an issue for a business service or a scenario analysis, the Create New Issue form is displayed as shown in the following example.

Sample Create New Issue form

For the descriptions of the field values on the Create New Issue form, see Create New Issue form.

Create New Issue form

Use the Create New Issue form in Operational Resilience Workspace to add an issue to a business service or a scenario analysis.

Create New Issue form

For a description of the field values, see the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form

Field	Description
Issue	
Number	Number of the issue. This field is auto-filled.
Name	Name of the issue.
Issue source	Source of the issue, such as Business service or Scenario analysis. This field is auto-filled.
Issue type	Source from where the issue was created. This field is auto-populated with one of the following options based on how the issue is created: • Control design effectiveness failure • Control operative effectiveness failure • Control does not meet requirement • Control does not exist • Non-compliance to a regulation • Non-compliance to a policy • Improvement or suggestion to an existing policy • Recommendation for a new policy • process optimization or improvement • Observation • Data breach • Fraud • Misstatement • Training • Documentation
Classification	Classification of the issue. This field is auto-populated with one of the following options: • Audit • Compliance • Operational Resilience • Risk • Vendor
Location	Location of the issue.
State	State of the issue. Available options are: • New • Analyze • Respond • Review

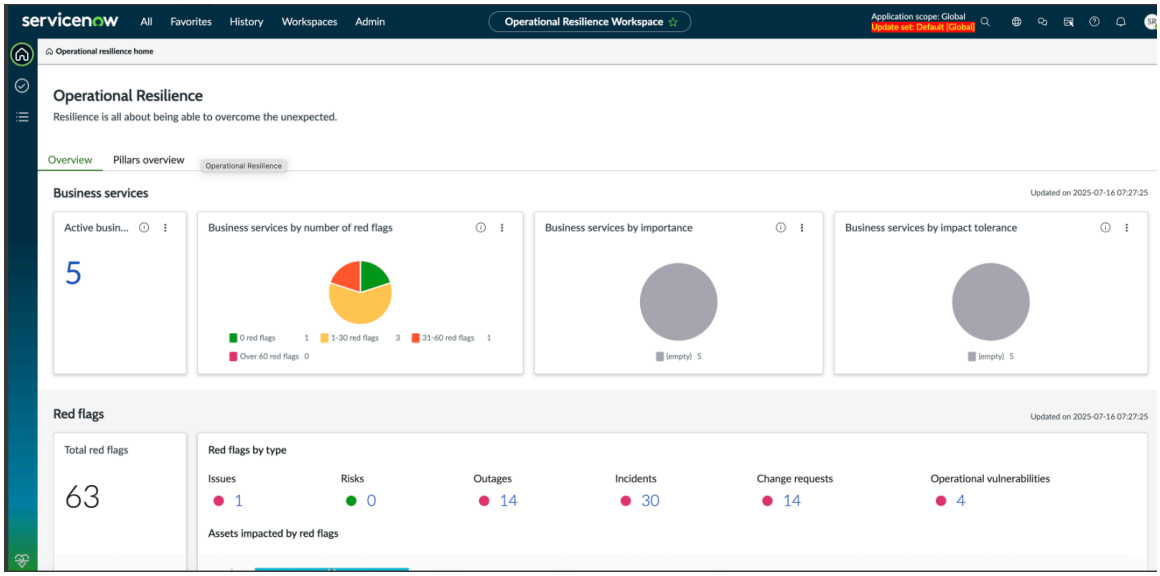
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
	• Closed Complete • Closed Incomplete
Substate	Substate of the issue. This field is auto-filled.
Priority	Priority of the issue. Available options are: • Critical • High • Moderate • Low • Planning
Issue rating	Rating of the issue. Available options are: • Very High • High • Moderate • Low • Very Low
Description	Approver of the scenario analysis plan.
Assignment	
Assignment group	Assignment group for the issue. For example, Application Development group.
Assigned to	User that the issue is assigned to.
Issue manager group	Manager group that the issue is assigned to. Available options are: • Compliance Managers • IT Risk Managers • Risk Managers
Issue manager	Manager that the issue is assigned to.
Watchlist	Users who are on the watchlist for the issue.
Schedule	
Due date	Date when the issue is due.
Confirmed date	Confirmation date for the issue. This field is auto-filled.
Planned start date	Planned start date for the issue.
Planned end date	Planned end date for the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

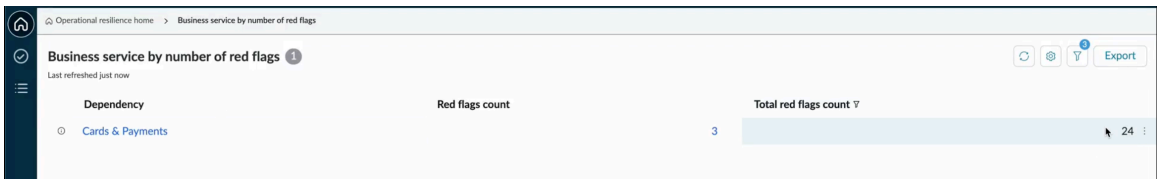


Field	Description
Duration	Duration for the issue in days, hours, minutes, and seconds.
Created	Date on which the issue is created. This field is auto-filled.
Closed	Date on which the issue is closed.
Actual start date	Actual start date for the issue.
Actual end date	Actual end date for the issue.
Actual duration	Actual duration for the issue in days, hours, minutes, and seconds.
Issue grouping	
Parent issue	Parent issue that is associated with the issue.
Issue group rule	Group rule for the issue. This field is auto-filled.
Action plan	
Recommendation	Recommendation for the issue.
Action plan	Action plan for the issue.
Activity	
Work notes	Work notes for the issue.
Additional comments	Additional comments for the issue.
Settings	
Functional domain	Functional domain that the issue belongs to. For example, an issue may belong to the IT Risk and Compliance domain.

Landing page and dashboard views

The landing page in the Operational Resilience Workspace provides a single-pane overview of the services, business services, and pillars in your organization. The dashboard displays resilience metrics, including operational status, completed activities, red flags, and suggestions for improvement.

The flexible data model introduced with Operational Resilience, Release 21.0.x provides a foundation for the dashboards and tracks the flow of dependent services. The data, including red flags by type, such as failed controls, incidents, and outages, and business service metrics such as number of flags, importance, and impact tolerance, is updated in the dashboard through changes to the flexible data model.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The data shown in the example is for business services such as business service by number of red flags, business service by importance, business service by impact tolerance. You can change it service offerings, business processes, or application services by configuring the *sn_oper_res.top_class_name* property. You can then change the top class to another object and the system shows data with respect to that specific top class.

Calculation and roll up of red flags

The dashboard shown in the earlier example displays a range of 1-30 red flags. Upon selecting, it shows a detailed breakdown, showing a total of 20 red flags, with 3 specifically attributed to the "cards and payments" level. This illustrates the roll-up functionality, which aggregates red flags beneath the selected "Cards and Payments" business service, providing a hierarchical view of the data.

The value "24" shown in the Total red flags count column is the roll-up value of the red flags for all entities under the "Cards and Payments" business service.

The *Calculate red flags for CSDM and dependencies* scheduled job does not create new records in the [sn_oper_res_profile] table. Instead, it recomputes the impacted objects for the existing sn_oper_res_profile records using data from the [sn_grc_m2m_profile_profile] table.

The *Calculate red flags for CSDM and dependencies* scheduled job fetches the red flags for the profiles in the [sn_oper_res_profile] table only when the following conditions are met:

- The *sn_oper_res_profile.pillar* is not empty.
- The *sn_oper_res_profile.applies_*to field is not empty.

The red flags fetching mechanism can use either the *sn_oper_res_profile.profile* condition, the *sn_oper_res_profile.applies_to* condition, or a combination of both.

The red flags also inherit the impacted objects and impacted object classes from the [sn_oper_res_profile] record. For example if an application service's Operational Resilience

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

profile lists Business service, Offering, and Business process as impacted objects (shown in the Impacted objects column), these objects are copied to all associated red flags for the application service and its related entities.

Conditions for calculating the red flags

This section uses the *sn_oper_res_profile.profile* and *sn_oper_res_profile.applies_to* conditions for reference. The criteria for calculating red flags and the relevant tables are detailed in the Red flags calculation table.

Red flags calculation

Red flags	Table	Conditions	Notes
High risks - Advanced risk	[sn_risk_advanced_risk_assessment_instance]	Conditions: • entity_1=profile • status=30 • summary_residual_risk_score should be greater then the higher than the max criteria defined in risk_assessment_methodology • Should not have any open assessments linked to sn_risk_advanced_risk_assessment_instance	For all these risks, staging records are created in the [sn_oper_res_risk] table.
Failed controls: Step 1 (Optional)	[sn_compliance_m2m_control_entity] (sn_compliance_control ← → sn_grc_profile)	Conditions: • entity=profile • control.status=non_compliant • control.exempt=false • control.state=monitor • control.active=true	A list of controls is extracted and are valid red flags.
Failed controls: Step 2	[sn_compliance_control]	Conditions: • entity=profile or sys_id in the list of controls • control.status=non_compliant • control.exempt=false • control.state=monitor • control.active=true	For all these controls, staging records are created in the [sn_oper_res_failed_control] table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Red flags calculation (continued)

Red flags	Table	Conditions	Notes
Issues: Step 1 (Optional)	[sn_grc_m2m_issue_to_entity] (sn_grc_issue ←→ sn_grc_profile)	Conditions: • entity=profile • sn_grc_issue.active=true	A list of issues is extracted and are valid red flags.
Issues: Step 2 (Optional) If one of the following pillars is used, then this step is considered: • Service • Business service • Offering	• [sn_oper_res_m2m_scenario_event_issue] (scenario_event ←→ sn_grc_issue) • [sn_oper_res_m2m_scenario_event_service] (scenario_event ←→ service)	A joint query is performed using the two tables and [sn_grc_issue] is retained for the service, business service, and offering.	These are appended in the list of issues from step 1.
Issues: Step 3	[sn_grc_issue]	Conditions: • entity=profile or sys_id in the list of controls • active=true • In addition, the issues should not have any exception policy. • Exception policy can be checked in the [sn_compliance_policy_exception] table with two conditions: ○ validity>now ○ state=8	For all these issues, staging records are created in the [sn_oper_res_issue] table.
Incident: Step 1	incident	Conditions: • cmdb_ci=profile.applies_to • state IN [1,2]	For all these incidents, staging records are created in the [sn_oper_res_incident] table.
Incident: Step 2 (Optional)	[task_ci]	Conditions: • ci_item=profile.applies_to • task.sys_class_name=incident • task.state IN [1,2]	
Incident: Step 3	[task_cmdb_ci_service]	Conditions:	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Red flags calculation (continued)

Red flags	Table	Conditions	Notes
		• cmdb_ci_service=profile.applies_to • task.sys_class_name=incident • task.state IN [1,2]	
Change request: Step 1	[change_request]	Conditions: • cmdb_ci=profile.applies_to • active=true	For all these change requests, staging records are created in the [sn_oper_res_change_request] table.
Change request: Step 2 (Optional)	[task_ci]	Conditions: • ci_item=profile.applies_to • task.sys_class_name=change_request • task.active=true	
Change request: Step 3	[task_cmdb_ci_service]	Conditions: • cmdb_ci_service=profile.applies_to • task.sys_class_name=change_request • task.state IN [1,2]	
Outage	• [cmdb_outage_ci_mtom] (cmdb_ci ←→ cmdb_ci_outage) • [cmdb_ci_outage] (cmdb_ci) For each record in [cmdb_ci_outage], one record is created in the [cmdb_ci_outage_ci_mtom] table. In [cmdb_ci_outage], for each affected CIs, a record is inserted in the [cmdb_ci_outage_ci_mtom] table.	Conditions: • ci_item=profile.applies_to • outage.type IN [degradation, outage] • outage.end IS empty OR outage.end > now	For all these outages, staging records are created in the [sn_oper_res_outage] table.
Task	[task]	Conditions: • cmdb_ci=profile.applies_to • active=true • sys_class_name IN <list of classes fetched	For all these tasks, staging records are created in the [sn_oper_res_task] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Red flags calculation (continued)

Red flags	Table	Conditions	Notes
		from property sn_oper_res.allowed_task_tables • As part of base system, it considers only problem records.	
Operational vulnerabilities: Step 1 (optional)	[sn_grc_case_mgmt_related_area]	Conditions: • related_area=profile OR related_area=profile.applies_to • core_case.sys_class_name=sn_oper_res_vulnerability • core_case.active=true	For all these vulnerabilities, staging records are created in the [sn_oper_res_vulnerability_profile] table.
Operational vulnerabilities: Step 2 (optional)	[sn_grc_case_mgmt_impacted_area]	Conditions: • impacted_area=profile OR impacted_area=profile.applies_to • core_case.sys_class_name=sn_oper_res_vulnerability • core_case.active=true	
Third party risk assessments	[sn_vdr_risk_asmt_assessment]	Conditions: • applies_to IN [core_company, sn_vdr_risk_asmt_vendor_engagement] • state IN [5, 8, 9] • risk_rating_valid_to > now • risk_rating = highestRiskRating • vendor = profile.applies_to (Note: This condition is different than the **applies_to** field in the [sn_vdr_risk_asmt_assessment] table.) • engagement = profile.applies_to (Note: This condition is different than the **applies_to**	For all these assessments, staging records are created in the [sn_oper_res_tprm] table.

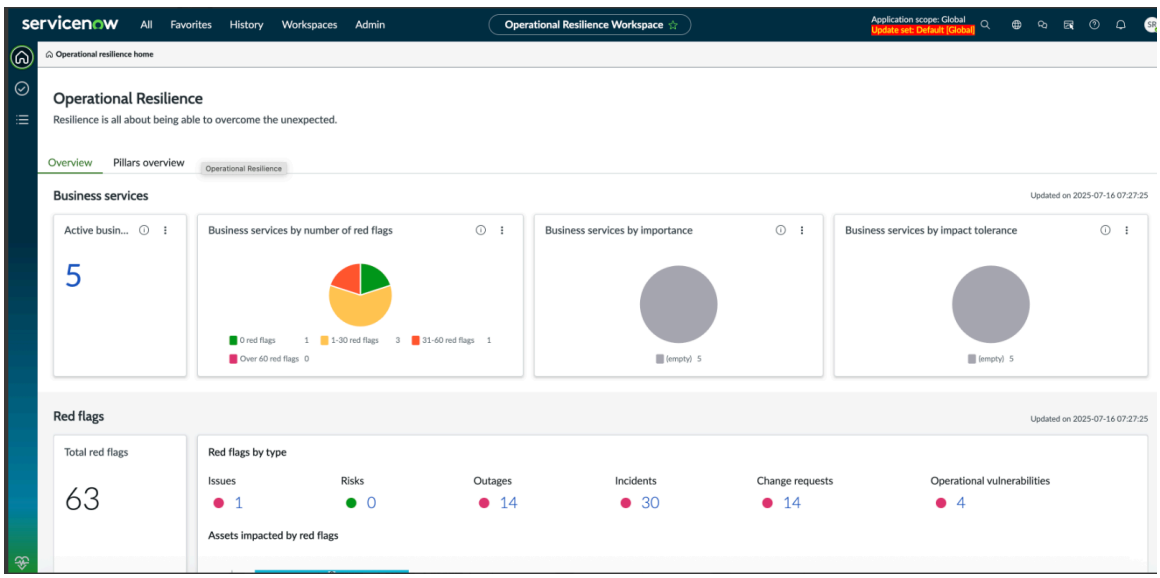
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Red flags calculation (continued)

Red flags	Table	Conditions	Notes
		field in the [sn_vdr_risk_asmt_assessment] table.)	



You can calculate red flags for entities with a pillar; for vulnerable items, the pillar must be Technology. For other red flags, entities must have a pillar, with no restrictions on the type.

Resilience metrics

You can view resilience metrics for services or business services, and pillars on the landing page of the Operational Resilience Workspace.

Services, Business services, and Pillars overview

The landing page displays a summary of the resilience metrics for the services or business services and pillars.

The landing page of the Operational Resilience Workspace displays the following tabs:

- **Services overview** tab—Displays an overview of the status of the services in your organization. The Service (CMDB) Main node configuration fetches service-related data. Resilience metrics for the services, including their operational status, completed activities, red flags, and suggestions for improvements, are displayed on this tab. For information on the resilience metric displayed on the **Services overview** tab, see Services overview tab.
- **Business services overview** tab—Displays the status of the business services in your organization. The Opres with CSDM header Main node configuration sets up the business services-related data. Resilience metrics for the business services, including their operational status, completed activities, red flags, and suggestions for improvements, are displayed on this tab. For information on the resilience metric displayed on the **Business services overview** tab, see Business services overview tab.
- **Pillars overview** tab—Displays the status and metrics of the pillars in your organization. For information on the resilience metric displayed on the **Pillars overview** tab, see Pillars overview tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Existing customers typically use the Service (CMDB) Main node configuration, while new customers use the OpRes with CSDM header Main node configuration. Depending on the setup done by your administrator, either the **Services overview** or the **Business services overview** tab, is shown on the landing page.

Administrators or UI Builder administrators can show or hide these tabs from the Workspace view based on organizational needs. For information on how to display or hide either the **Services overview** or **Business services overview** tab, see Show Business services overview tab in Workspace view.

Third-party Risk Management (TPRM) integration

Starting with Operational Resilience, release 21.0.x, you can track third-party risk assessments as red flags in the Operational Resilience reports and the overview pages for business services, service offerings, and business processes.

TPRM risk assessments are integrated into Operational Resilience if they meet the following conditions:

- The risk rating is Very High (using the overridden risk rating if applicable).
- The risk rating is valid beyond the current date.
- The state is one of the following: **Generating observations**, **Responses received**, or **Finalizing with third party**.
- The risk assessment applies to either the Company or an engagement.

Opening a third-party risk assessment from Operational Resilience displays the same view as when accessed directly from the Vendor Management Workspace.

To view Related lists and Red flags data in the Operational Resilience Workspace, you must have appropriate user roles as explained in this section.

TPRM is not installed

If TPRM is not installed, Operational Resilience users cannot access risk red flags without the IRM roles.

TPRM is installed

However, if TPRM is installed, Operational Resilience users can access both risk red flags and Third-party Risk Management red flags because they are assigned the TPRM viewer role. The TPRM viewer role includes risk viewer capabilities, thus eliminating the need for IRM roles.

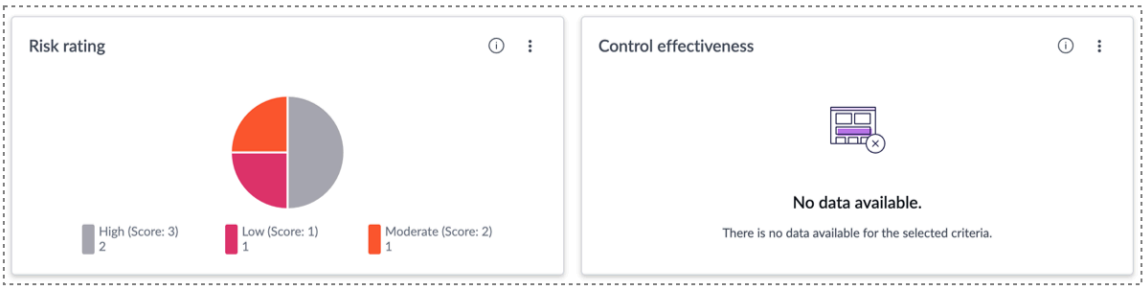
For information on the roles required to view the related lists and red flags data, see the "Roles to view elated lists and Red flags data" table in the Create New Service form page.

Displaying reports for different user roles

Separate reports are displayed in the Operational Resilience Workspace landing page for BCM Professional and IRM Professional users.

Enhanced roles for accessing the reports

The roles installed with Operational Resilience now contain the relationship for BCM Professional and IRM Professional users.



All Operational Resilience users can access general reports on the landing page.

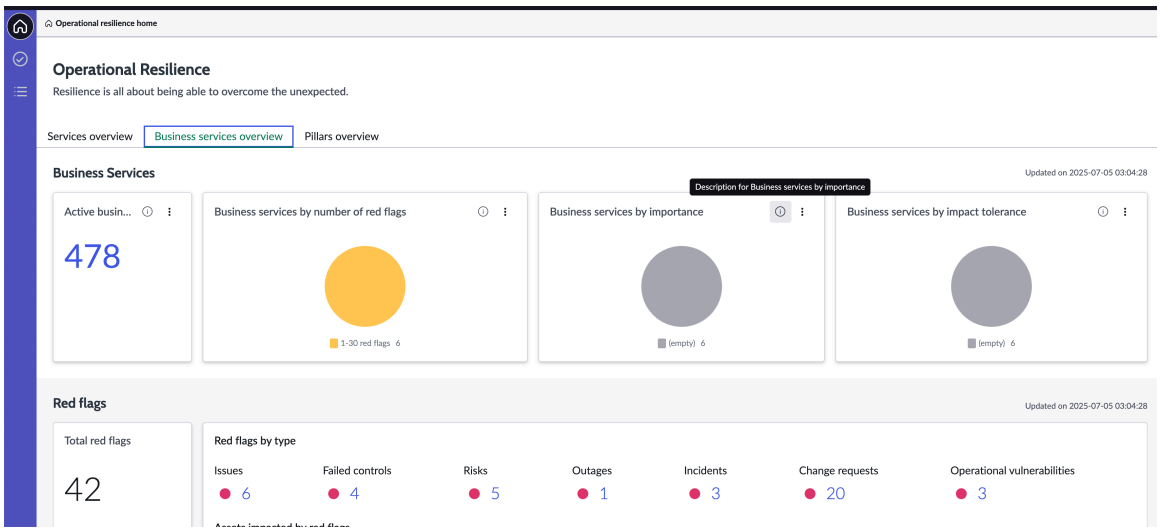
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The roles required to access the BCM and IRM reports in the Operational Resilience Workspace are explained in the following table.

Roles to access the reports

Type of reports	Required roles	Information	Contains
BCM reports	sn_oper_res.bcm_opres_admin	Users with this role can create and delete both operational resilience activities and BCM activities.	• sn_oper_res.admin • sn_bcm.bcm_opres_manager
	sn_oper_res.bcm_opres_manager	Users with this role can create both operational resilience activities and BCM activities.	• sn_oper_res.manager • sn_bcm.bcm_opres_user
	sn_oper_res.bcm_opres_user	Users with this role can participate in both operational resilience activities and BCM activities.	• sn_oper_res.user • sn_bcm.viewer
IRM reports	sn_oper_res.irm_opres_admin	Users with this role can create and delete both operational resilience activities and IRM activities.	• sn_oper_res.admin • sn_bcm.irm_opres_manager
	sn_oper_res.irm_opres_manager	Users with this role can create both operational resilience activities and IRM activities.	• sn_oper_res.manager • sn_bcm.irm_opres_user
	sn_oper_res.irm_opres_user	Users with this role can participate in both operational resilience activities and IRM activities.	• sn_oper_res.user • sn_compliance.reader • sn_risk.reader

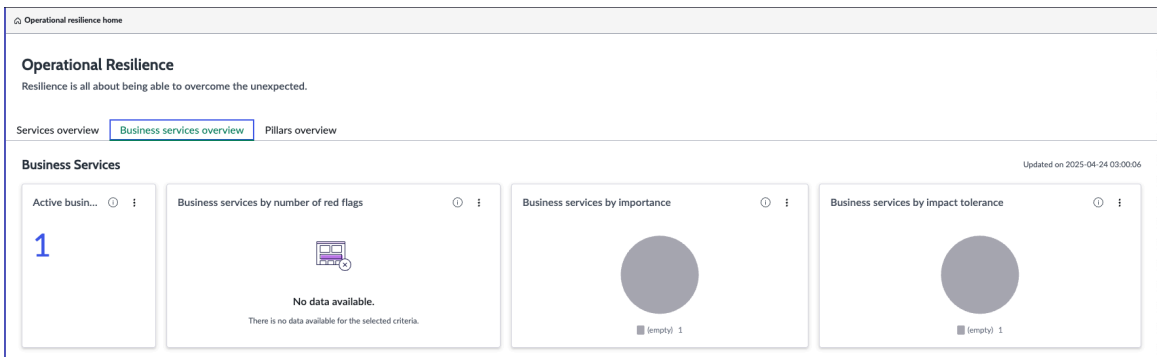
Business services overview tab



The **Business services overview** tab in the Operational Resilience Workspace provides a comprehensive summary of active business services, highlighting any red flags or urgent issues,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

status of resilience activities like assessments, scenario analysis, self-attestations. It also offers suggestions for mitigating top risks or vulnerabilities and strengthening top controls.

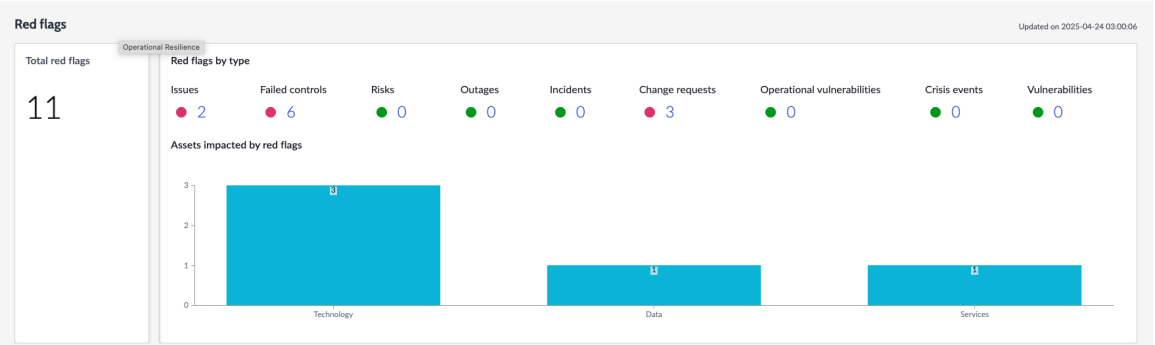


Business services overview section on the landing page

Existing customers typically use the Service (CMDB) Main node configuration, while new customers use the Opres with CSDM header Main node configuration. Administrators show the **Business services overview** tab and hide the **Services overview** tab from the Operational Resilience Workspace view based on your organizational needs.

Summarized report on the business services

The Business services report on the **Business services overview** tab provides a quick summary with precise metrics on the types of business services and their current status.



- Active business services
- Business services by number of red flags
- Business services by importance
- Business services by impact tolerance

Report on the red flags

The Red flags report on the **Business services overview** tab shows the total number of red flags that require immediate attention for the associated assets, controls, issues, and risks related to the selected business service. It breaks down details of the red flags based on the integrations with the Operational Resilience application. For example, if you have installed the Policy and Compliance Management application, business services data for the failed controls is pulled from that application and displayed in this report.

A sample Red flags report for the business services is shown in the example.

The following data is displayed for the business services in the report:

- Total red flags: Number of total red flags for the business services is shown in this report. You can select the count in the report and view the actual status of the business services.
- Red flags by type: The counts for incidents, outages, change requests, operational vulnerabilities, risks, failed controls, and issues are updated on the service's overview page. Selecting the count takes you to a detailed red flags table. Depending on the applications integrated with Operational Resilience, business services data is pulled from them and displayed in the report as shown in the following example.
  - Issues
  - Failed controls
  - Risks
  - Outages
  - Incidents
  - Change requests
  - Operational vulnerabilities
  - Crisis events
  - Vulnerabilities

  Note:

  As an administrator, you can navigate to **System properties > All properties** in your instance and configure the *sn_oper_res.red_flags_exclusion* property for the red flags section.

  By default, the services tasks, Business Continuity Management plan, and dependencies are excluded from the display list in the Red flags section.

- Assets impacted by red flags: Assets with red flags that are categorized by the pillar are shown.

Tables associated with the Business services overview tab

The following table lists all the tables that are associated with each section of the **Business services overview** tab report.

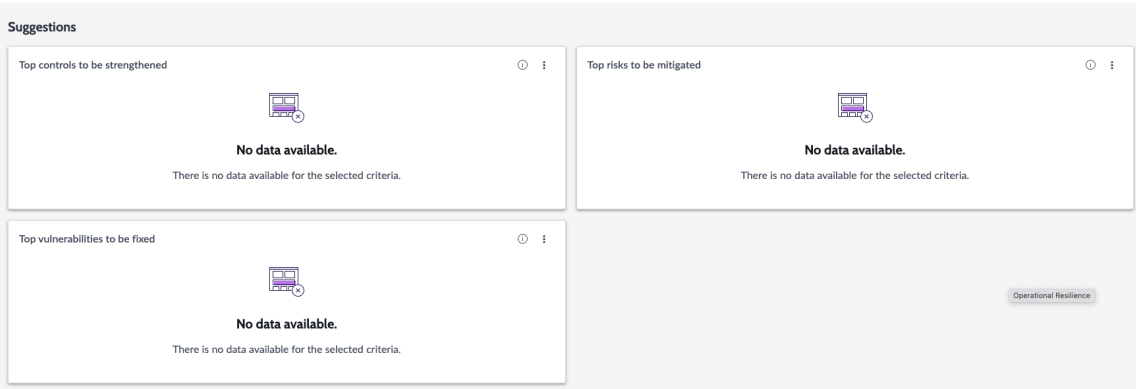
Report on the Operational Resilience activities



The Activities report on the **Business services overview** tab displays tasks and status for the following Operational Resilience activities for the business services.

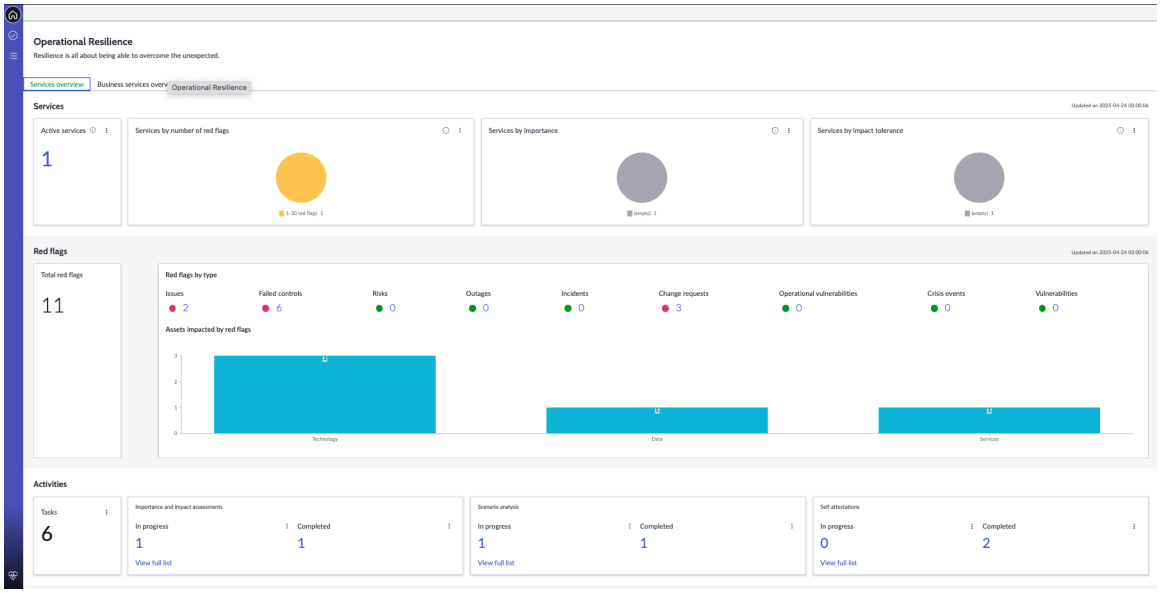
- Tasks
- Importance and impact assessments
- Scenario analysis
- Self attestations

Suggestions for mitigating the issues

The Suggestions report on the **Business services overview** tab offers recommendations and workarounds to mitigate issues and risks for various resilience metrics for the business services.

Depending on the applications integrated with Operational Resilience, suggestions are displayed in the report. For example, if you have installed the Policy and Compliance Management, Risk Management, and Vulnerability Response applications, the following suggestions are displayed in the report.

- Top controls to be strengthened
- Top risks to be mitigated
- Top vulnerabilities to be fixed



Services overview tab

The **Services overview** tab in the Operational Resilience Workspace provides a comprehensive summary of active services, highlighting any red flags or urgent issues, status of resilience activities like assessments, scenario analysis, self-attestations. It also offers suggestions for mitigating top risks or vulnerabilities and strengthening top controls.

Services overview section on the landing page

Existing customers typically use the Service (CMDB) Main node configuration, while new customers use the Opres with CSDM header Main node configuration. Administrators can show the **Services overview** tab and hide the **Business services overview** tab from the Operational Resilience Workspace view based on your organizational needs.

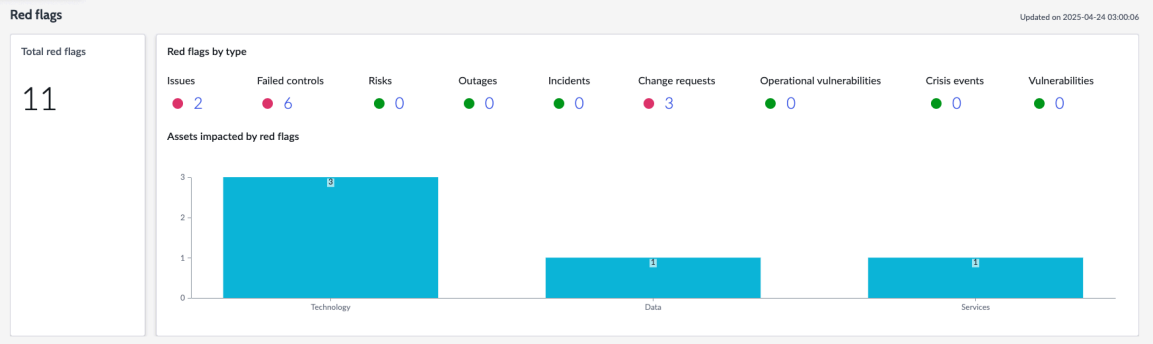
Summarized report on the services

The Services report on the **Services overview** tab provides a quick summary with precise metrics on the types of services and their current status.



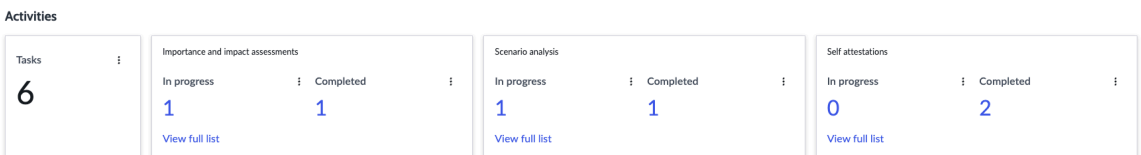
- Active services
- Services by number of red flags
- Services by importance
- Services by impact tolerance

Report on the red flags

The Red flags report on the **Services overview** tab shows the total number of red flags that require immediate attention for the associated assets, controls, issues, and risks related to the selected service. It breaks down details of the red flags based on the integrations with the Operational Resilience application. For example, if you have installed the Policy and Compliance Management application, services data for the failed controls is pulled from that application and displayed in this report.

A sample Red flags report for the services is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

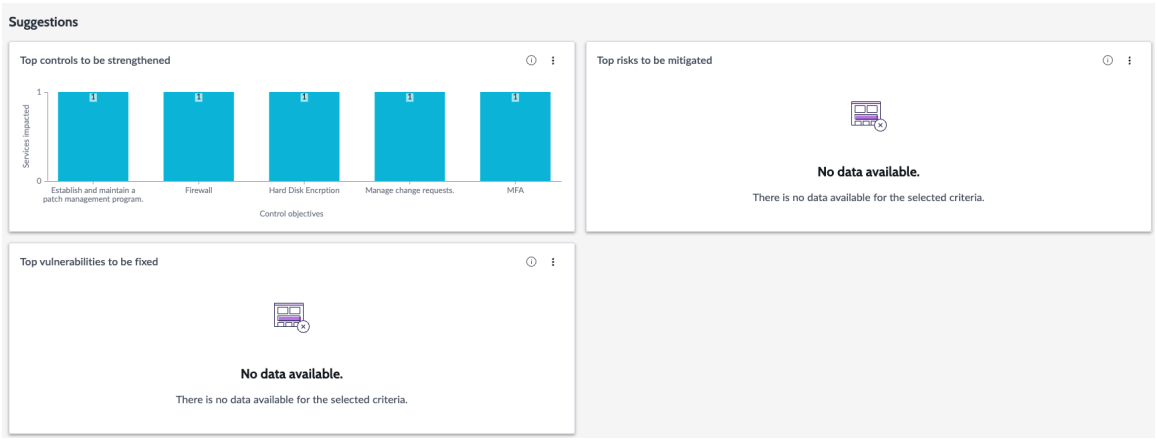


The following data is displayed for the services in the report:

- Total red flags: Number of total red flags for the services is shown in this report. You can select the count in the report and view the actual status of the services.
- Red flags by type: The counts for incidents, outages, change requests, operational vulnerabilities, risks, failed controls, and issues are updated on the service's overview page. Selecting the count takes you to a detailed red flags table. Child services are consolidated under their parent services for all services and dependencies. Depending on the applications integrated with Operational Resilience, services data is pulled from them and displayed in the report as shown in the example. The following data is displayed in the Red flags report:
  - Issues
  - Failed controls
  - Risks
  - Outages
  - Incidents
  - Change requests
  - Operational vulnerabilities
  - Crisis events
  - Vulnerabilities
- Assets impacted by red flags: Any service, child service, business process, or their dependencies are flagged as red flags under various pillars.

Report on the Operational Resilience activities

The Activities report on the **Services overview** tab displays tasks and status for the following Operational Resilience activities for the services.



- Tasks
- Importance and impact assessments
- Scenario analysis
- Self attestations

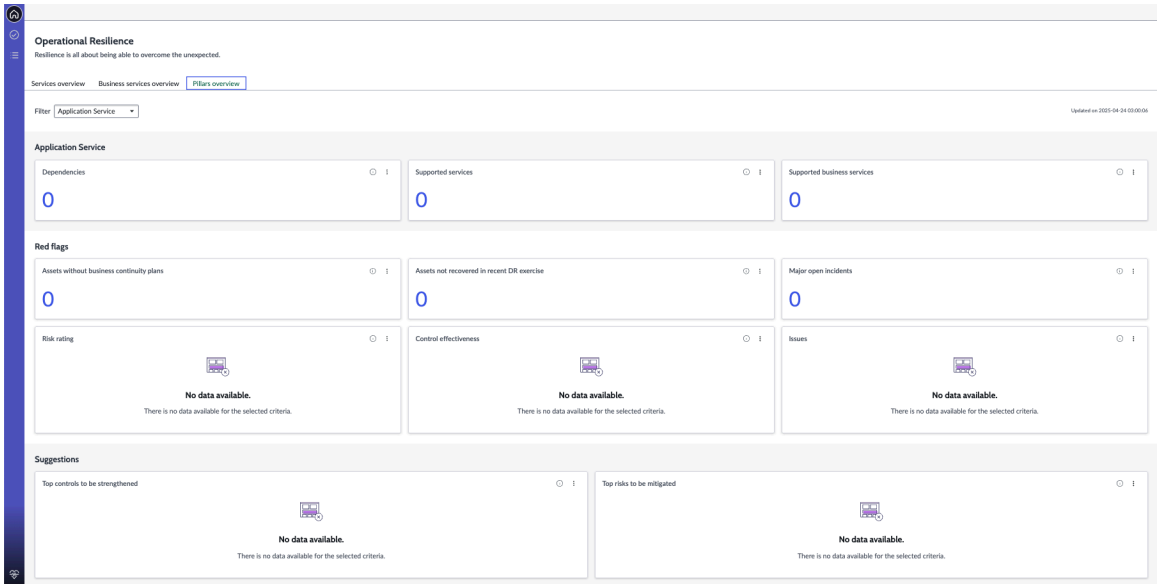
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Suggestions for mitigating the issues

The Suggestions report on the **Services overview** tab offers recommendations and workarounds to mitigate issues and risks for various resilience metrics for the services.

Depending on the applications integrated with Operational Resilience, suggestions are displayed in the report. For example, if you have installed the Policy and Compliance Management, Risk Management, and Vulnerability Response applications, the following suggestions are displayed in the report.

- Top controls to be strengthened
- Top risks to be mitigated
- Top vulnerabilities to be fixed



Pillars overview tab

A pillar is a foundational element that supports your organization's operational resilience. You can map business services and processes to these pillars in the Operational Resilience application to establish relationships and monitor their status on the dashboard in the Operational Resilience Workspace.

Pillars overview tab on the landing page

The **Pillars overview** tab on the landing page of the Operational Resilience Workspace provides information on the pillars, which are part of the base system in Operational Resilience. From the dashboard, you can monitor the status of the services for each pillar. The Pillars overview section displays data filtered for the selected pillar as shown in the example.

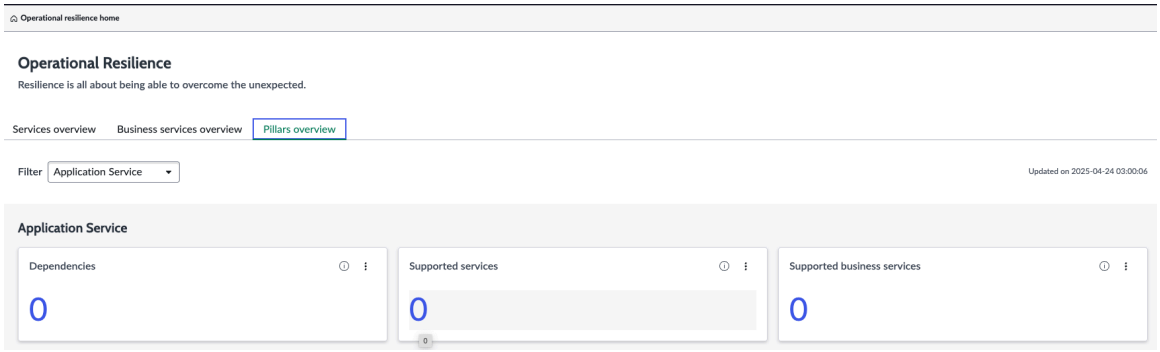
Tables associated with the Pillars overview tab and the reports (continued)

Title	Description
Issues	Source table for issues: Issue [sn_oper_res_issue]
Suggestions	
Top Controls to be Strengthened	Failing controls that impact the most critical services. Source table for this report: Services with Failed Controls [sn_oper_res_failed_control]
Top Risks to be Mitigated	Top risks threatening your organization compared with your impacted services. This report can be useful for determining where to start your mitigation efforts and in what areas you should devote the most resources around implementing controls. Source table for this report: Services with High Risks [sn_oper_res_risk]
Top vulnerabilities to be fixed	Top vulnerabilities to be fixed for the services.



You can view data for the following pillars from the dashboard:

- Application Service
- Business Services
- Data
- Facilities
- People
- Process
- Services
- Service offering
- Suppliers
- Technology

The following sample report shows data for the Application Service pillar with its precise metrics.

- Dependencies
- Supported services
- Supported business services

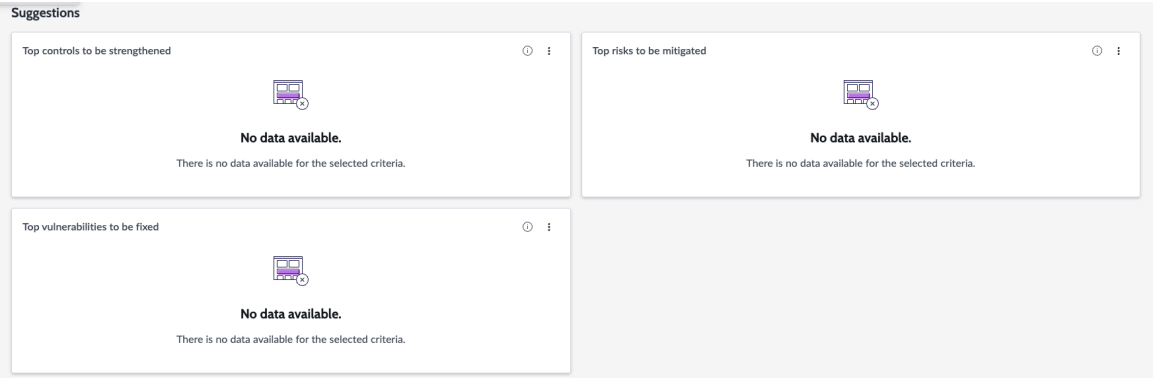
Report on the red flags

The Red flags report on the **Pillars overview** tab shows the total number of red flags that require immediate attention for the associated assets, controls, issues, and risks related to the selected pillar. It breaks down details of the red flags based on the integrations with the Operational Resilience application. For example, if you have installed the Risk Management application, data for the risk ratings is pulled from that application and displayed in this report.

If you install the optional applications from the GRC product suite, such as Business Continuity Management and Vulnerability Response in your instance, you can also view the Business Continuity plan and Vulnerability Response reports on the dashboard.

A sample Red flags report for the pillars is shown in the example.



The following data is displayed for the pillars in the Red flags report:

- Assets without business continuity plans and Assets not recovered in recent DR exercise: These red flags are shown for the selected pillar in the example as the Operational Resilience application is integrated with the BCM application.
- Major open incidents
- Scores for Risk rating, Control effectiveness, and Issues

Suggestions for mitigating the issues

The Suggestions report on the **Pillars overview** tab offers recommendations and workarounds to mitigate issues and risks for various resilience metrics associated with the pillar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

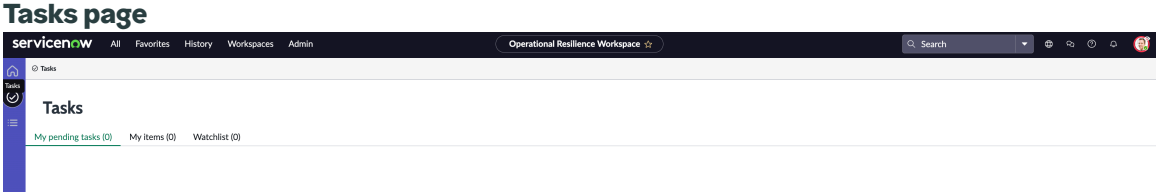
Depending on the applications integrated with Operational Resilience, suggestions are displayed in the report. For example, if you have installed the Policy and Compliance Management, Risk Management, and Vulnerability Response applications, the following suggestions are displayed in the report.

- Top controls to be strengthened
- Top risks to be mitigated
- Top vulnerabilities to be fixed

For more information on the pillars in Operational Resilience, see Exploring Operational Resilience.

Task page and List view

The Tasks page in Operational Resilience Workspace provides a single-pane view of your pending tasks, your group's tasks, and the tasks that are on your watchlist. You can also update the tasks directly from the dashboard. On the List page, you can configure your operational resilience tasks.



Tabs in the Tasks page

The Tasks page in Operational Resilience Workspace displays the following tabs:

- **My pending tasks**
- **My items**
- **Watchlist**

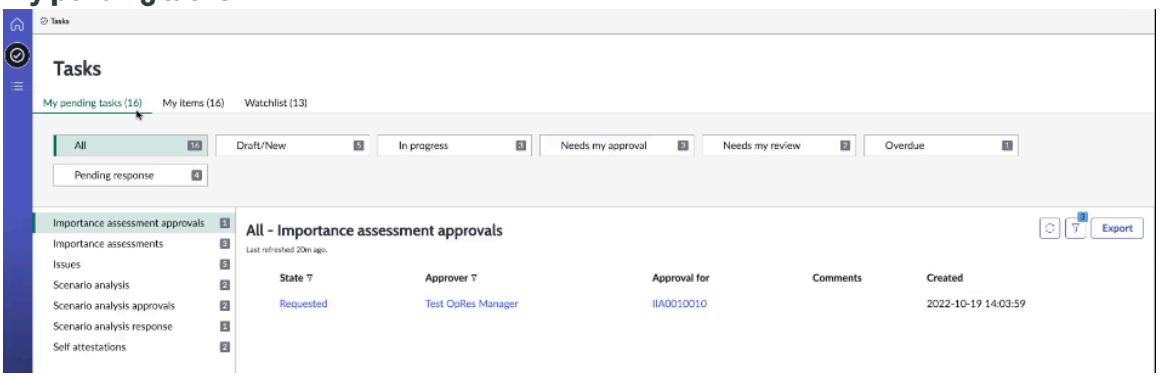
A sample Tasks page for a logged-in user is shown in the following example.

Tasks page

My pending tasks

The **My pending tasks** tab displays an overview of the pending tasks that are assigned to you and the tasks that require an action from you.

Note:
The data displayed in the Tasks page is based on the roles of the users.

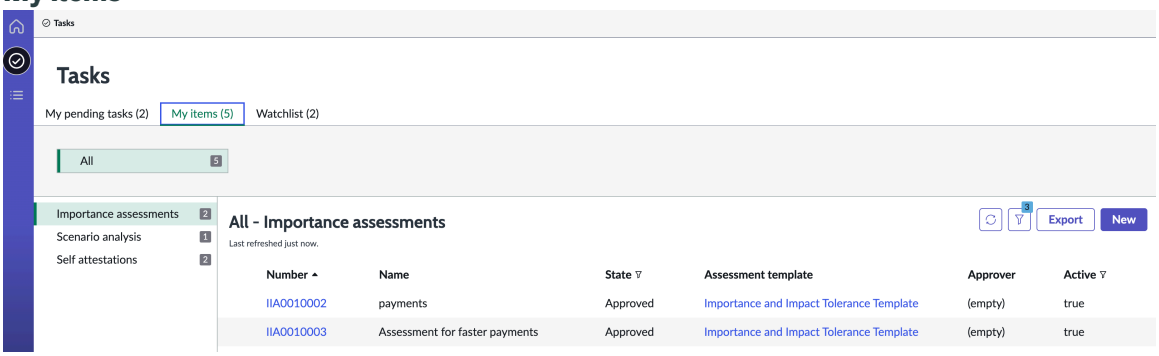


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **My pending tasks** tab displays your pending tasks in different states. You can filter your pending tasks by using the following types of the states:

- All
- Draft/New
- In progress
- Needs my approval
- Needs my review
- Overdue
- Pending response

The following example shows the pending tasks for the signed-in user.

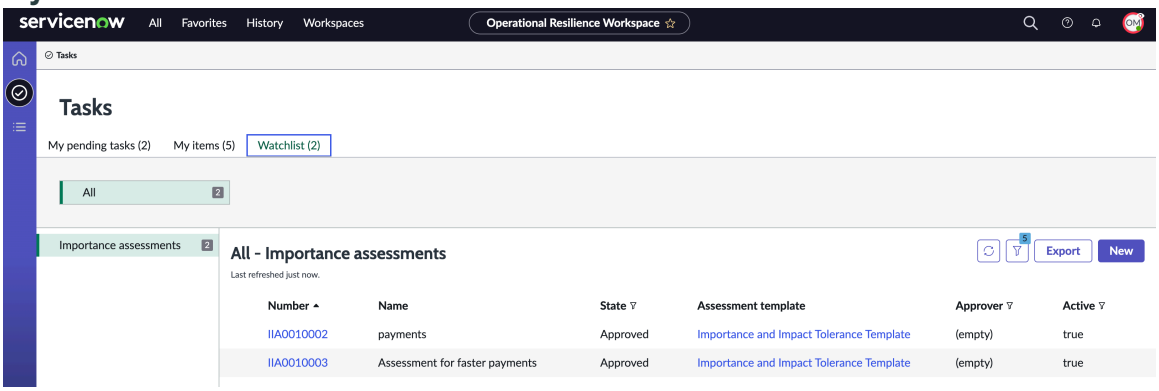


My pending tasks

My items

The **My items** tab displays a list of the tasks that are assigned to the signed-in user, such as the Operational Resilience Manager as shown in the following example.

My items



Watchlist

The **Watchlist** tab displays a list of the tasks that are on your watchlist. When a task is approved or completed, you receive a notification on the tab. The following example shows the updates on the assessments tasks that are on the signed-in user's watchlist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

My watchlist

Note:
On the **My pending tasks**, **My items**, and **Watchlist** tabs, you can only view the records that are in-progress. On the **My pending tasks**, **My items**, and **Watchlist** tabs, the closed and canceled records aren't displayed. In Operational Resilience Workspace, you can view the closed and canceled records on their respective forms.

If you have the Operational Resilience administrator role, you can customize Operational Resilience Workspace by updating the Tasks page configurations. To update the Tasks page configurations, you can navigate to **All > GRC Landing Page Configurations > Tasks Page Configuration** in your instance.

If you have the Operational Resilience manager or Operational Resilience user roles, you can also get relevant recommendations on your resilience tasks on the landing page.

To view more information on the Tasks Page Configuration, see Update the Tasks Page Configuration record.

List view in Operational Resilience Workspace

From the List view, you can set up a business service, analyze its importance and impact tolerance, perform a scenario analysis, and generate a self-attestation report.

For more information on setting up a business service in Operational Resilience Workspace, see Data setup for business services.

For more information on analyzing the importance and impact tolerance of a business service in Operational Resilience Workspace, see Performing Importance and impact tolerance assessment.

For more information on performing a scenario analysis in Operational Resilience Workspace, see Conducting a scenario analysis.

For more information on self-attesting your business services in Operational Resilience Workspace, see Certifying services using self-attestation.

Operational Resilience reference

Reference topics provide additional information such as tables, roles, and properties that are installed with the Operational Resilience application. Several types of components are installed with the activation of the Operational Resilience application, including properties, roles, and tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Operational Resilience

When you install the Operational Resilience application, several system properties are added to your instance. You may not need to modify these properties. The user with the sn_oper_res.admin role can maintain these properties.

Roles installed with Operational Resilience

Several types of roles are installed with the Operational Resilience application.

Roles that are installed with Operational Resilience

Note:
For more information on roles and FAQs, see KB0555605.

Roles installed with Operational Resilience

Role name	Description
Operational Resilience administrator [sn_oper_res.admin]	The Operational Resilience administrator is responsible for: • Configuring scenarios • Setting up entity types, entity filters, and reporting pillars based on dashboard requests from the business teams. • Customizing reports on the Operational Resilience dashboard. The Operational Resilience administrator should have the ITIL role to add the CMDB relationship between the service and the process. The Operational Resilience administrator role contains the following roles: • sn_grc.admin • sn_oper_res.manager • Contains sn_grc_case_mgmt.grc_case_admin, who inherits the ability to set up the vulnerability type, state models, vulnerability assessment templates, and document templates.
Operational Resilience Manager [sn_oper_res.manager]	The Operational Resilience Manager is responsible for: • Ensuring operational resilience in the organization using the dashboards and reports • Reviewing reports on the Operational Resilience dashboard, as well as supporting data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with Operational Resilience (continued)

Role name	Description
	The Operational Resilience Manager role contains the following roles: • sn_grc.manager • sn_compliance.reader • sn_oper_res.user • sn_risk.reader • Contains sn_grc_case_mgmt.grc_case_manager, who inherits the ability to submit operational vulnerability (A type of case).
Operational Resilience User [sn_oper_res.user]	The Operational Resilience User is responsible for: • Reviewing reports on the Operational Resilience dashboard, as well as supporting data. • Completing impact tolerance and test plans for individuals assigned to the service impact analysis. The Operational Resilience User can access the Vulnerability Response data. The Operational Resilience User role contains the following roles: • sn_incident.read • sn_grc.reader • task_editor • Contains sn_grc_case_mgmt.grc_case_business_user, who can be assigned tasks or issues in the operational vulnerability.
sn_oper_res.operational_resilience_business_user	Submits "Report operational vulnerability" from the employee center from: instancename/esc?id=emp_taxonomy_topic&topic_id=14aedd93a314121051b1ab18
BCM and Operational Resilience Administrator [sn_oper_res.bcm_opres_admin]	The BCM and Operational Resilience Administrator role contains the following roles: • sn_oper_res.bcm_opres_manager • sn_oper_res.admin
BCM and Operational Resilience Manager [sn_oper_res.bcm_opres_manager]	The BCM and Operational Resilience Manager role contains the following roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with Operational Resilience (continued)

Role name	Description
	• sn_oper_res.bcm_opres_user • sn_oper_res.manager
BCM and Operational Resilience User [sn_oper_res.bcm_opres_user]	The BCM and Operational Resilience User role has the following permissions: • Can read the BCM UIB Workspace. • Cannot access the IRM reports or data. The BCM and Operational Resilience User role contains the following roles: • sn_bcm.viewer • sn_oper_res.user
IRM Operational Resilience User [sn_oper_res.irm_opres_user]	The Integrated Risk Management (IRM) Operational Resilience User role cannot access the BCM reports and data. It contains: • sn_grc.reader • sn_oper_res.user The following user roles are contained only when policy and compliance management and risk management are installed: • sn_compliance.reader • sn_risk.reader
IRM Operational Resilience Administrator [sn_oper_res.irm_opres_admin]	The IRM Operational Resilience Administrator role contains the following roles: • sn_oper_res.irm_opres_manager • sn_oper_res.admin
IRM Operational Resilience Manager [sn_oper_res.irm_opres_manager]	The IRM Operational Resilience Manager role contains the following roles: • sn_oper_res.irm_opres_user • sn_oper_res.manager

Model types when Lite Apps are installed

Roles	Family	Comments
sn_oper_res.admin	IRM	None
sn_oper_res.manager	IRM	None

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model types when Lite Apps are installed (continued)

Roles	Family	Comments
sn_oper_res.user	IRM	The sn_oper_res.user role is required to access Vulnerability profile records.
New roles introduced		
sn_oper_res.bcm_opres_admin	BCM	The sn_bcm.viewer role is required to access the BCM Configurable Workspace. A user with the sn_oper_res.bcm_opres_user + role can access both Operational Resilience Workspace and BCM Configurable Workspace.
sn_oper_res.bcm_opres_manager	BCM	
sn_oper_res.bcm_opres_user	BCM	
sn_oper_res.irm_opres_admin	IRM	A user with the sn_oper_res.irm_opres_user + role can access the Operational Resilience Workspace, but cannot access the Compliance Workspace and Risk Workspace. Extra roles are needed to access the Compliance Workspace and Risk Workspace.
sn_oper_res.irm_opres_manager	IRM	
sn_oper_res.irm_opres_user	IRM	

Roles created for BCM Professional and IRM Professional

- The following roles are created for the BCM Professional users:

  Note:
  When the app-grc-bcm-lite applications are not installed, the users with these roles are counted as operators.

  - sn_oper_res.bcm_opres_admin
  - sn_oper_res.bcm_opres_manager
  - sn_oper_res.bcm_opres_user
- The following roles are created for the IRM Professional users:

  Note:
  When the app-grc-bcm-lite applications are not installed, the users with these roles are counted as operators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sn_oper_res.irm_opres_admin
- sn_oper_res.irm_opres_manager
- sn_oper_res.irm_opres_user

- When the following Lite applications are installed, the users with the sn_oper_res.bcm_opres_user, sn_oper_res.irm_opres_user, or sn_oper_res.user roles are counted as Lite operators.
  - BCM Lite application: app-grc-bcm-lite (Plugin id: com.snc.app_grc_bcm_lite)
  - IRM Lite application: app-grc-business-user-lite (Plugin id: com.sn_grc_lite)
- The sn_oper_res.admin, sn_oper_res.manager, and sn_oper_res.user roles are included in IRM.

Roles required for accessing the Workspaces

A user with one of the following roles can access the Operational Resilience Workspace and BCM Configurable Workspace:

- sn_oper_res.bcm_opres_user
- sn_oper_res.bcm_opres_manager
- sn_oper_res.bcm_opres_admin

A user with any following role can access the Operational Resilience Workspace:

- sn_oper_res.irm_opres_user
- sn_oper_res.irm_opres_manager
- sn_oper_res.irm_opres_admin

A user with one of the following roles can access the Risk Workspace:

- sn_risk_workspace.business_op_risk_manager
- sn_risk_workspace.IT_risk_manager
- sn_risk_workspace.operatonal_risk_manager

A user with one of the following roles can access the Compliance Workspace:

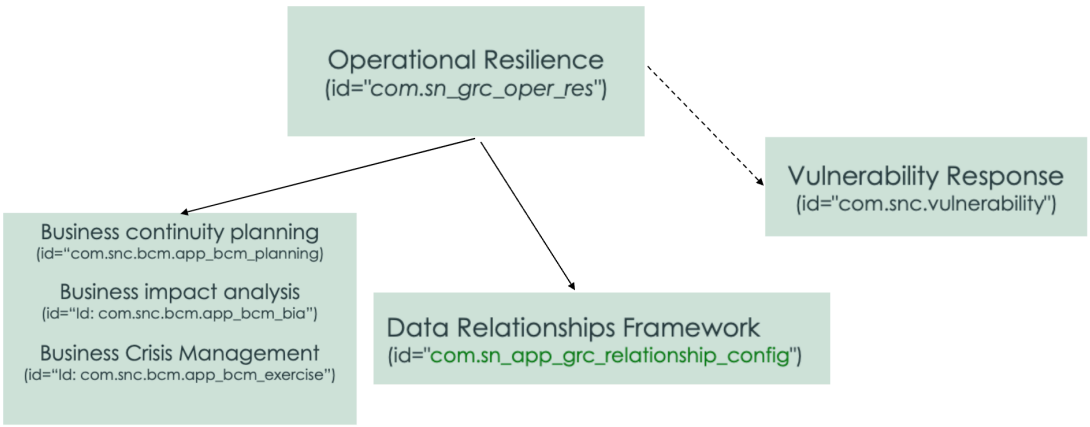
- sn_compliance_ws.corporate_compliance_analyst
- sn_compliance_ws.corporate_compliance_manager
- sn_compliance_ws.it_compliance_manager

Roles used for reporting the incidents

The following roles are used for reporting incidents in the Digital resilience incident reporting module.

Roles used for reporting the incidents

Role	Description
sn_dri_inc_rptg.digital_resilience_incident_admin	Role for setting up administrative and Digital resilience incident activities.
sn_dri_inc_rptg.digital_resilience_incident_manager	Role for creating Operational Resilience and Digital resilience incident activities.



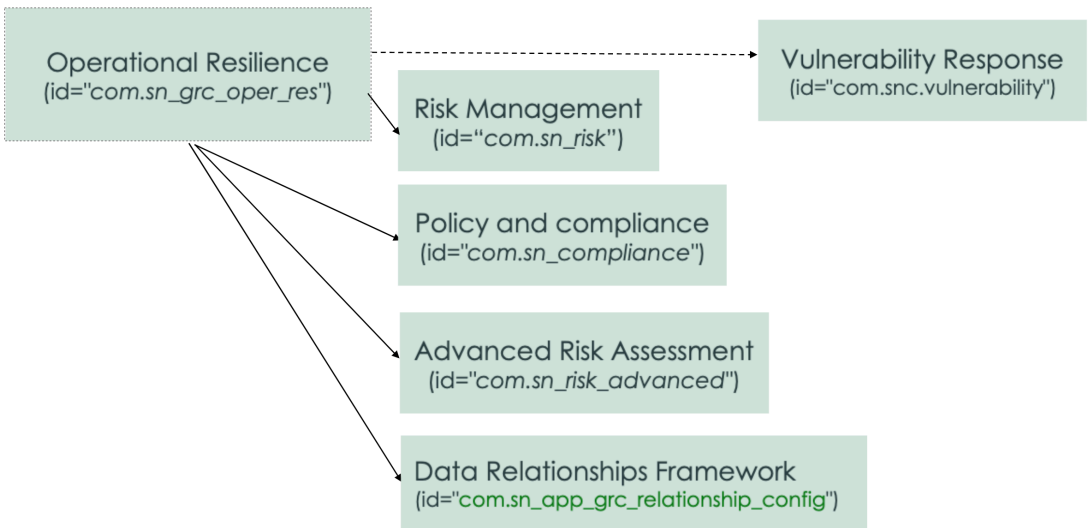
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles used for reporting the incidents (continued)

Role	Description
sn_dri_inc_rptg.digital_resilience_incident_user	Role for participating in Operational Resilience and Digital resilience incident activities.

Plugin dependencies for BCM Professional

For BCM Professional, the following mandatory applications are installed with Operational



Resilience.

- Business Continuity Planning (com.snc.bcm.app_bcm_planning)
- Business Impact Analysis (com.snc.bcm.app_bcm_bia)
- Crisis Management (com.snc.bcm.app_bcm_exercise)
- Data Relationships Framework (com.sn_app_grc_relationship_config)
- Optional: Vulnerability Response (com.snc.vulnerability)

Plugin dependencies for IRM Professional

For IRM Professional, the following mandatory applications are installed with Operational

Resilience.

- Advanced Risk Assessment (com.sn_risk_advanced)
- Data Relationships Framework (com.sn_app_grc_relationship_config)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Policy and Compliance Management (com.sn_compliance)
- Risk Management (com.sn_risk)
- Optional: Vulnerability Response (com.snc.vulnerability)

Scheduled jobs installed with Operational Resilience

When you install the Operational Resilience application, the *Update CSDM and other dependencies*, *Calculate red flags for CSDM and dependencies*, *Update other dependencies* scheduled jobs are added to your instance. As a user with the sn_oper_res.admin role, you may find this information useful.

Scheduled jobs installed with the Operational Resilience application

The following scheduled jobs are installed with the Operational Resilience application:

Scheduled jobs installed with Operational Resilience

Scheduled job	Description
Update CSDM and other dependencies	Scheduled job that gathers data from different applications including such as GRC: Advanced Risk, GRC: Risk Management, and GRC: Policy and Compliance Management, BCM, CMDB, and Vulnerability Response to calculate supporting data for various reports. The scheduled job runs once a day and removes all the data from the previous day before creating new supporting data for the reports. The job uses different conditions to retrieve the data from different sources and saves it to the Operational Resilience staging tables. Updates CSDM and other dependencies. It is configured to run weekly at midnight local time.
Calculate red flags for CSDM and dependencies	Calculates the red flags for the CSDM and its dependencies. It is configured to run daily at 3:00 AM local time to refresh the red flags.

Script includes installed with Operational Resilience

When you download the Operational Resilience application, several Script includes are added to your instance.

Script includes and other references installed

Script includes, Client scripts, Catalog Client scripts, Events, Event script actions

Script Name	Description	Process step used
Add to related area after insert	Script include	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes, Client scripts, Catalog Client scripts, Events, Event script actions (continued)

Script Name	Description	Process step used
Build scratchpad values	Script include	
Cancel vulnerability notification	Script include	
Delete relevant records after deletion	Script include	
Update relevant records after update	Script include	
Show Opres tables only upon loading	Client script	Load options for the source field on operational vulnerability
Hide activity journal in workspace	Client script	Hide activity journal on operational vulnerability
Validate due date	Client script	Validate due date when submitting operational vulnerability
Disable attachments if inactive	Client script	Disable attachments if inactive when loading the operational vulnerability
Synch source to source table	Client script	Change the source table, when the source is changed on operational vulnerability
Hide or show related lists	Client script	Hide or show related lists in terms of the installation of the integrated apps.
Make type read-only for operational vulnerability	Catalog UI Policy	
Validate date of occurrence	Catalog Client script	
Show/Hide fields when source changes	Catalog Client script	
Validate date of discovery	Catalog Client script	
Show Opres tables only upon loading	Catalog Client script	
Synch source to source table	Catalog Client script	
VulnerabilityUtils VulnerabilityUtilsBase	Script include	Used for the operational vulnerability.
OperationalResilienceEntitiesLists	Script include	Used for the roll up of the red flags, CSDM, and dependencies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes, Client scripts, Catalog Client scripts, Events, Event script actions (continued)

Script Name	Description	Process step used
OperationalResilienceEntitiesListsBase		
OpResLogger	Script include	Used for logging.
OperationalResilienceComputation OperationalResilienceComputationBase	Script include	Contains the utility functions that are being used to fetch the data from different places in Operational Resilience and also to fetch all the issues that are related to a business service's entity or configuration item (CI). Used for updating the CSDM, dependencies, and their red flags.
OperResBusinessServiceUtil OperResBusinessServiceUtilBase	Script include	Contains the utility functions for the related lists in the business service form. Utility classes used for service and business service.
OpResAssessmentUtils OpResAssessmentUtilsBase	Script include	Used for importance and impact duration assessment.
OpResRedFlags OpResRedFlagsBase	Script include	Used to calculate red flags.
OperResUtils OperResUtilsBase	Script include	Utility class used for Operational Resilience.
OperationalResilienceConstants	Script include	Contains the constants that are required in different places in the application. Used to define constants.
OperationalResilienceAjax	Script include	Client callable script include that handles the interaction between the client side and the service side. AJAX utilities for Operational Resilience.
sn_oper_res.businessservice_dependencies	Event	Event to trigger the updating of business service dependencies
sn_oper_res.businessprocess_dependencies	Event	Event to trigger the updating of business process dependencies

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes, Client scripts, Catalog Client scripts, Events, Event script actions (continued)

Script Name	Description	Process step used
sn_oper_res.serviceoffering_dependencies	Event	Event to trigger the updating of service offering dependencies
sn_oper_res.compliance_comp_job_error	Event	Event to trigger the logging.
sn_oper_res.set_entity_type_pillar	Event	Event to trigger adding pillar to the entities.
sn_oper_res.set_child_service_pillar	Event	Event to add pillar to the child service
sn_oper_res.remove_child_service_pillar	Event	Event to remove pillar from the child service
sn_oper_res.set_entity_pillar	Event	Event to add pillar to single entity
Fetch business service dependencies	Event script action	Updating of business service dependencies
Fetch service offering dependencies	Event script action	Updating of service offering dependencies
Fetch business process dependencies	Event script action	Updating of business process dependencies
Compliance job error handler	Event script action	Logging an error if the scheduled job throws exception.
Set pillar for entities in entity type	Event script action	Adding the pillar of the entity type to its entities.
Set service pillar for child services	Event script action	Adding service pillar from the child services. (Only used for the service)
Remove service pillar for child services	Event script action	Removing service pillar from the child services. (Only used for the service)
Set pillar for entity	Event script action	Adding the pillar for single entity

Tables installed with Operational Resilience

Several types of tables are installed with the Operational Resilience application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with Operational Resilience

Tables installed with Operational Resilience

Table name	Description
Activity log [sn_oper_res_activity_log]	Activity log for the application.
ASMT rating scale [sn_oper_res_asmt_rating_scale]	ASMT rating scale.
BCM plan [sn_oper_res_bcm_plan]	BCM plan.
Choice [sn_grc_choice]	List of all GRC choices.
Change request [sn_oper_res_change_request]	Change request created for the application.
Critical service outage [sn_oper_res_critical_service_outage]	Outage of the critical service.
Event [sn_oper_res_event]	Event recorded for the application.
Failed control [sn_oper_res_failed_control]	Failed control.
GRC Profile [sn_grc_profile]	List of all GRC entities.
Importance impact tolerance assessment [sn_oper_res_importance_impact_tolerance_assessment]	Importance of the impact tolerance assessment.
Incident [sn_oper_res_incident]	Incident registered due to an event.
Issue [sn_oper_res_issue]	Issue logged due to an event.
M2M analysis participant [sn_oper_res_m2m_analysis_participant]	Association between analysis and participant.
M2M analysis scenario event [sn_oper_res_m2m_analysis_scenario_event]	Association between analysis and scenario event.
M2M scenario analysis service [sn_oper_res_scenario_analysis_service]	Association between scenario and analysis service.
M2M scenario event [sn_oper_res_m2m_scenario_event]	Association between scenario and event.
M2M service importance impact tolerance assessment [sn_oper_res_m2m_service_importance_impact_tolerance_assessment]	Association between service and importance of the impact tolerance assessment.
Operational Resilience profile [sn_oper_res_profile]	Operational Resilience entity. The table has all the latest dependencies.
Profile type [sn_grc_profile_type]	List of all GRC entity types.
Risk [sn_oper_res_risk]	Risk defined in the application. Starting with the Xanadu release (Release 19.0.4), the Advanced Risk Assessment (ARA) integration with Operational Resilience uses the **Status** field. When an entity is shared between Operational Resilience and Advanced Risk Assessment (ARA), and the ARA has the highest risk rating with a status of **Completed**, a record is created for the ARA integration and stored in the [sn_oper_res_risk] table.

Tables installed with Operational Resilience (continued)

Table name	Description
Scenario [sn_oper_res_scenario]	Scenario defined in the application.
Scenario analysis [sn_oper_res_scenario analysis]	Scenario analysis defined in the application.
Service impact analysis [sn_oper_res_service_impact_analysis]	Service impact analysis defined in the application.
Service process pillar [sn_oper_res_service_process_pillar]	Service process pillar defined in the application.
Task [sn_oper_res_task]	Task defined in the application.
Vulnerability profile [sn_oper_res_vul_profile]	Vulnerability profile defined in the application.
Services with operational vulnerabilities [sn_oper_res_vulnerability_profile]	Services with operational vulnerabilities.
M2M scenario event participant [sn_opres_res_m2m_scenario_event_participant]	Each participant can be associated with one or more scenario events. This table stores many-to-many relationships between the participant and scenario events.
M2M scenario event issue [sn_oper_res_m2m_scenario_event_issue]	Stores many-to-many relationships between the issues and scenario events.
Service related information [sn_oper_res_service_related_info]	Service related information defined in the application.
Service Summary [sn_oper_res_service_summary]	Service summary defined in the application.
Service tasks [sn_oper_res_resp_task]	Service tasks defined in the application.
Response tasks [sn_oper_res_response_task]	Response tasks that are defined in the application.

Tables installed with Digital resilience incident reporting

Tables installed with Digital resilience incident reporting

Table name	Description
Action task [sn_grc_case_mgmt_case_task]	Action tasks associated with the case.
Digital Resilience Incident [sn_grc_inc_rptg_case_task]	Incident reporting case task.
Impacted area [sn_grc_case_mgmt_impacted_area]	Impacted area for the case.
Related area [sn_grc_case_mgmt_related_area]	Related area for the case.

Database views

Database views

Table view name	Database view label	Plural
sn_oper_res_risk_dependency	Services with high risk	Services with high risks
Services with high risk	Vulnerable entity	Vulnerable entities
sn_oper_res_failed_control_dependency	Services with failed control	Services with failed controls
sn_oper_res_service_outage	Service Outage	Service Outage

Tables relevant to CSDM

Reference topics provide additional information about CSDM, including the associated roles, scheduled jobs, and tables. This section lists the tables relevant to CSDM.

Tables for CSDM

Tables for CSDM

Table label and name	Description
Application Service [cmdb_ci_service_auto]	Application service which extends the Service table.
Business process [cmdb_ci_business_process]	Business process and its details stored in the table.
Business service [cmdb_ci_service_business]	Business service and its details stored in the table.
CI relationships [cmdb_rel_ci]	Configuration item (CI) relationships table.
Contract [ast_contract]	Details of the Contracts table.
Contract CIs [contract_rel_ci]	Details of the Contract Configuration item (CIs) table.
Core company [core_company]	Details of the Core company table.
Entity types [sn_grc_profile_type]	Details of the Entity types table.
Location [cmn_location]	Details of the Location table. Includes location details of the object.
Pillars [sn_grc_choice]	Details of the Pillars table.
Profile [sn_grc_profile]	Details of the Profile table.
Profile profile [sn_grc_m2m_profile_profile]	Details of the type of relationship configured in the Many-to-many Profile table. The table contains all the history dependencies.
Profile profile type [sn_grc_m2m_profile_profile_type]	Details of the type of relationship configured in the Many-to-many Profile type table.
Service [cmdb_ci_service]	Details of the Service table.
Service Offerings [task_service_offering]	Details of the Service Offerings table.
Sys relationships [sys_relationship]	Details of the System relationships table.

Tables for CSDM (continued)

Table label and name	Description
Vendor [sn_risk_asmt_vendor_engagement]	Details of the vendor engagement covered in the Vendor table.

Tables relevant to Operational vulnerability

Reference topics provide additional information about the Operational vulnerability, including the associated tables and roles.

Tables installed

Operational vulnerability tables

Table	Description	Application
GRC case [sn_oper_res_vulnerability]	Stores all the vulnerability details.	GRC: Operational Resilience
Case classification [sn_grc_case_mgmt_case_classification]	Stores the case classifications.	GRC: Core Case Management
Case task [sn_grc_case_mgmt_case_task]	Stores all the case tasks created for the operational vulnerabilities.	GRC: Core Case Management
Case type [sn_grc_case_mgmt_case_type]	Stores the case type and case subtype details.	GRC: Core Case Management
Cause [sn_grc_case_mgmt_cause]	Stores the causes added to the library and mapped at the case level.	GRC: Core Case Management
Cause and consequence [sn_grc_case_mgmt_cause_consequence]	Stores the causes and consequences mapped at the case level.	GRC: Core Case Management
Consequence [sn_grc_case_mgmt_consequence]	Stores the consequences added to the library and mapped at the case level.	GRC: Core Case Management
GRC core case [sn_grc_case_mgmt_core_case]	Stores the details of core functionality of the case.	GRC: Core Case Management
Impacted area [sn_grc_case_mgmt_impacted_area]	Stores the impacted areas mapped at the case level.	GRC: Core Case Management
Case Task to Assessment Instance [sn_grc_case_mgmt_m2m_case_task_assessment_instance]	Stores the assessment details of the case tasks that are of task assessment type.	GRC: Core Case Management
Issue to Case [sn_grc_case_mgmt_m2m_issue_case]	Stores the issues mapped to the case record.	GRC: Core Case Management
Regulation [sn_grc_case_mgmt_regulation]	Stores the regulations mapped at the case level.	GRC: Core Case Management
Related area [sn_grc_case_mgmt_related_area]	Stores the related areas associated with the case.	GRC: Core Case Management

Digital resilience third-party registers reference

Reference topics provide additional information about Digital resilience third-party registers including roles and tables.

Roles installed with Digital resilience third-party registers

Specific roles are installed with Digital resilience third-party registers.

Roles installed with Digital resilience third-party registers

Roles installed with Digital resilience third-party registers (DORA) roles

Role	Description	Contains roles
DORA Accelerator Administrator [sn_dora_accel.admin]	Role that has full control over all DORA accelerator data, including data in DORA accelerator choice table.	sn_dora_accel.manager
DORA Accelerator Manager [sn_dora_accel.manager]	Role to create, update, and delete most DORA accelerator data, except data in DORA accelerator choice table. They can create and update [ast_contract] and [core_company] data.	• sn_dora_accel.user • contract_manager • vendor_editor
DORA Accelerator User [sn_dora_accel.user]	Role to view most DORA accelerator data, except data in DORA accelerator choice table. They can view [ast_contract] and [core_company] data.	vendor_reader
TPRM roles		
TPR assessor (Third-party risk assessor) [sn_vdr_risk_asmt.vendor_assessor]	Role that includes all permissions of the Third-party assessment reviewer role including managing third parties, third-party contacts, external risk assessments, and issues.	• sn_grc.user • sn_grc.reader • sn_vdr_risk_asmt.vendor_assessment_reviev • sn_dora_accel.manager • vendor_editor • vendor_reader
TPR assessment approver [sn_vdr_risk_asmt.approver]	Role to approve the third-party risk management.	• sn_vdr_risk_asmt.vendor_assessment_reviev • sn_dora_accel.manager
TPR Contract Negotiator [sn_vdr_risk_asmt.contract_negotiator]	Role to work in the contracting stage of the onboarding process.	sn_vdr_risk_asmt.vendor_assessor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with Digital resilience third-party registers (DORA) roles (continued)

Role	Description	Contains roles
TPR Assessment Reviewer [sn_vdr_risk_asmt.vendor_assessment_reviewer]	Role to review and edit assessments.	• vendor_reader • task_editor • template_editor_global • survey_reader • sn_dora_accel.user • sn_grc.reader • sn_grc.business_user
TPR Administrator [sn_vdr_risk_asmt.vendor_risk_admin]	Role that has full control over all Vendor Risk Management data. The role also has full control over Assessment Metric Types.	• assessment_admin • sn_grc_appr.admin • sn_vdr_risk_asmt.vendor_risk_manager • sn_dora_accel.admin
TPR Manager [sn_vdr_risk_asmt.vendor_risk_manager]	Role to manage third parties, third-party contacts, third-party assessment templates, questionnaire templates, documentation request templates, and scheduled assessments.	• sn_vdr_risk_asmt.vendor_assessment_reviev • sn_dora_accel.manager • sn_data_registry.admin • sn_vdr_risk_asmt.vendor_assessor

Tables installed with Digital resilience third-party registers

Specific tables are installed with Digital resilience third-party registers.

Table installed with Digital resilience third-party registers

Table label	Name	Description
Contract	[ast_contract]	Stores information for the contract records.
Company	[core_company]	Stores information for the core company records.
Assessment of the ICT service	[sn_dora_accel_assessment]	Stores the assessment of the ICT service for DORA regulation requirement.
Branch	[sn_dora_accel_branch]	Stores the branch records for DORA regulation requirement.
Digital operational resilience choice	[sn_dora_accel_choice]	Stores the Digital operational resilience choice tables for DORA regulation requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Table installed with Digital resilience third-party registers (continued)

Table label	Name	Description
Contractual arrangement	[sn_dora_accel_contract]	Stores the contractual arrangement records for DORA regulation requirement.
Digital operational resilience core information	[sn_dora_accel_core_info]	Stores the Digital operational resilience core information for DORA regulation requirement.
Legal entity	[sn_dora_accel_entity]	Stores the legal entity records for DORA regulation requirement.
Entity making use of the ICT services	[sn_dora_accel_entity_using_service]	Stores info about the entity making use of the ICT services.
Function	[sn_dora_accel_function]	Stores the function records for DORA regulation requirement.
ICT service supply chain	[sn_dora_accel_ict_service_supply_chain]	Stores the ICT service supply chain records for DORA regulation requirement.
Entity signing contract to provide services	[sn_dora_accel_m2m_entity_providing_service]	Stores the entity signing contract to provide services
Entity signing contract to use services	[sn_dora_accel_m2m_entity_signing_contract]	Stores the entity signing contract to use services
Entity making use of services	[sn_dora_accel_m2m_entity_using_service]	Stores the entity making use of services
Intra-group contractual arrangements	[sn_dora_accel_m2m_intra_group_contract]	Stores the intra-group contractual arrangements
Third-party engagement signing contract to provide services	[sn_dora_accel_m2m_third_party_engagement_providing_service]	Stores the third-party engagement signing contract to provide services
Third party signing contract to provide services	[sn_dora_accel_m2m_third_party_providing_service]	Stores the third-party signing contract to provide services
Excel download/upload request	[sn_dora_accel_report]	Stores the Excel download/upload request records for DORA regulation requirement.
ICT third-party service provider	[sn_dora_accel_third_party]	Stores the ICT third-party service provider records for DORA regulation requirement.
ICT third-party engagement service provider	[sn_dora_accel_third_party_engagement]	Stores the ICT third-party engagement service

Table label	Name	Description
		provider records for DORA regulation requirement.

Digital resilience incident reporting reference

Reference topics provide additional information about the Digital resilience incident reporting application, including the associated tables and roles.

Roles installed with Digital resilience incident reporting

Certain roles are installed with the Digital resilience incident reporting functionality.

Roles used with Digital resilience incident reporting

The following roles are used for reporting incidents with Digital resilience incident reporting.

Roles used with Digital resilience incident reporting

Role	Description
sn_dri_inc_rptg.digital_resilience_incident_admin	Role for setting up administrative and Digital resilience incident activities. Users with this role can create and delete a few Operational Resilience activities and Digital resilience incident activities. A user with this role has the following permissions: • Create access to all cases • Read access to all cases • Write access to all cases
sn_dri_inc_rptg.digital_resilience_incident_manager	Role for creating Operational Resilience and Digital resilience incident activities. Users with this role can create and delete a few Operational Resilience activities and Digital resilience incident activities. A user with this role has the following permissions: • Create access to all cases • Read access to all cases • Write access to the DRI case where the manager is assigned as an analyst
sn_dri_inc_rptg.digital_resilience_incident_user	Role for participating in Operational Resilience and Digital resilience incident activities. Users with this role can create and delete a few Operational Resilience activities and Digital resilience incident activities. A user with this role has the following permissions:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles used with Digital resilience incident reporting (continued)

Role	Description
	• Create access to all cases • Read access to all cases • Smart assessment actor access

Script includes installed with Digital resilience incident reporting

Several Script includes are added to your instance with Digital resilience incident reporting.

Script includes used for Digital resilience incident reporting

Name	Description
DriIncRptgUtils	Contains common functions that are used across various components of the DRI application, such as business rules (BR), Script Actions, UI actions, and more. One important function within this module is getIntermediateDUE, which is used to modify the creation of intermediate report schedules.
DriIncRptgAjax	Contains functions that are used on the client side. It is a client-callable Script Include designed to provide important data to the client side.
DRIGenerateReport	Contains client-callable Script include that is used to generate or export Microsoft Excel files for reports.
DriIncRptgConstants	Stores all constants for the DRI application.
DRIIncRptgResponseAutomation	Used for response automation, which automatically populates certain questions based on data from previous templates, incidents, or source records.

Tables installed with Digital resilience incident reporting

The tables installed with Digital resilience incident reporting are listed in this section.

Tables for Digital resilience incident reporting

Tables installed for Digital resilience incident reporting

Table name	Description
Action task [sn_grc_case_mgmt_case_task]	Action tasks associated with the case.
Digital Resilience Incident [sn_grc_inc_rptg_case_task]	Incident reporting case task.
Impacted area [sn_grc_case_mgmt_impacted_area]	Impacted area for the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Tables installed for Digital resilience incident reporting (continued)

Table name	Description
Related area [sn_grc_case_mgmt_related_area]	Related area for the case.
Entities [sn_grc_inc_rptg_entities]	Entities used for Incident reporting.
Entities [sn_grc_inc_rptg_sir_entities]	Entities used for Security incident reporting (SIR).
Due date configuration [sn_reg_body_mgmt_agency_profile]	Due date configuration for regulatory agency profile.
Action Task Configuration [sn_reg_body_mgmt_template_configuration]	Action task configuration for template configuration.

Applications provided with IRM Pro and BCM Pro SKUs

This section outlines the applications required for the IRM Pro SKU (stock keeping units) and BCM Pro SKU (stock keeping units).

Applications provided with IRM Pro SKU and BCM Pro SKU

IRM Pro SKU

The IRM Pro SKU contains the following applications.

1. GRC: Advanced Risk
2. GRC: Policy and Compliance Management
3. GRC: Risk Management

BCM Pro SKU

The BCM Pro SKU contains the GRC: Business Continuity Management applications.

Policy and Compliance Management

The ServiceNow® Policy and Compliance Management product provides a centralized process for creating and managing policies, standards, and internal control procedures that are cross-mapped to external regulations and benchmarks. Additionally, the application provides structured workflows for the identification, assessment, and continuous monitoring of control activities.

Exploring Policy and Compliance Management

The ServiceNow Policy and Compliance Management product provides a centralized process for creating and managing policies, standards, and internal control procedures that are cross-mapped to external regulations and benchmarks. Additionally, the application provides structured workflows for the identification, assessment, and continuous monitoring of control activities.

Policy and Compliance Management overview

A comprehensive integrated risk management (IRM) program is defined by the requirements established by an organization's policies. For instance, controls may mitigate risk, but they are primarily implemented to enforce policies. Therefore, the normalization and consolidation of policies is an integral step in an organization’s strategy to manage risk and meet compliance requirements across an ever-growing regulatory landscape. For more information, see Structural overview of Policy and Compliance Management

The scope of Policy and Compliance Management includes:

- Process to create policies and controls.
- Control risk exposure by continuously monitoring risks and control or configuration changes.
- Reduce manual burden and cost through automation.

The process objectives of Policy and Compliance Management are:

- Create a centralized platform for creating policies, control objectives, and controls, and map them to regulations and industry guidelines.
- Manage the life cycle of the policies with a consistent process. For a graphical representation of a policy's life cycle, see An overview of policy life cycle in Policy and Compliance Management.
- Communicate policies across the organization using a tool.
- Assess the state of compliance.
- Provide a systematic and consistent approach to managing the life cycle of controls.

Policy and Compliance Management centralizes the following activities:

- Establish controls and control owners
- Define control tests and expected results
- Establish test and control frequencies
- Identify risks: impact and likelihood
- Prepare attestations
- Map authoritative sources to policies, procedures, controls, and risks

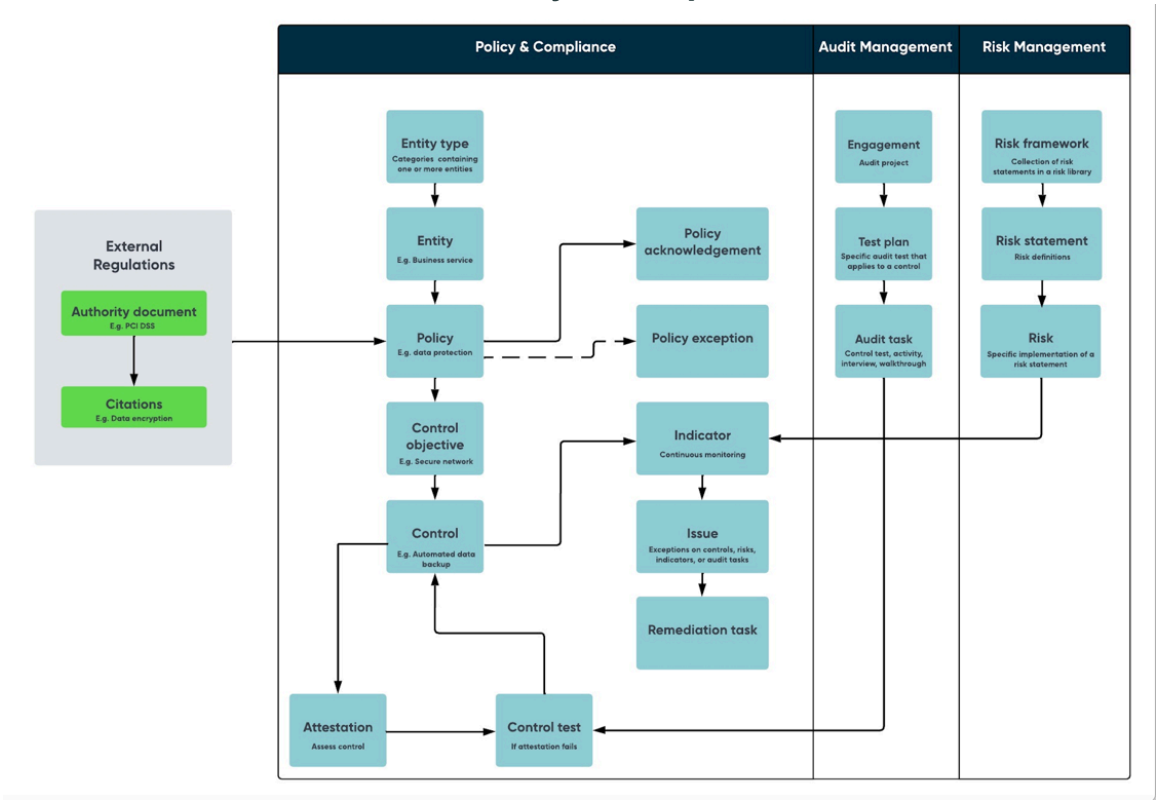
Policy and Compliance Management users

Policy and Compliance activities involve all levels of management. A key function of good governance involves the establishment of a strong organization structure.

- Board of directors
- IT steering committee
- Audit committee
- All levels of management

Policy and Compliance Management and the ServiceNow AI Platform



Structural overview of Policy and Compliance Management

The structural overview of Policy and Compliance Management enables you to understand how the different modules that make up the Policy and Compliance Management application of ServiceNow integrate and interact with one another.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Structural overview of the modules in Policy and Compliance

Authority document

Policy and Compliance Management application begins by identifying authority documents. These documents are external regulations that include laws, regulations, and standards that your organization need to be compliant with, which depend on the type of business that your organization does and its location. Regulatory requirements are usually published by regulatory agencies that provide requirements outlined by law or a certain industry. These requirements might come from federal or state regulations such as Health Insurance Portability and Accountability Act (HIPAA), international regulations such as General Data Protection Regulation (GDPR), or industry regulations such as Payment Card Industry (PCI). Each of these documents such as HIPAA, GDPR, and PCI is an authority document.

For example, Payment Card Industry Data Security Standards (PCI DSS) is an information security standard and an authority document that is meant to reduce payment card fraud. It provides a set of security standards for all organizations that accept credit card payments. Financial service providers must comply with PCI standards to prevent fraud and protect cardholder data and ensure that their business services are safe and legal.

Citation

A citation is a passage or an expression from an authority document (for example, Unified Compliance Framework (UCF)) that your business must specifically comply with. It is an individual requirement within an authority document. For example, encrypting transmission of cardholder data across public networks is one of the requirements of PCI DSS to prevent theft of consumer's personal financial information through payment card transactions.

Citations can be created manually or imported via UCF.

Entity type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity type is a grouping of the entities that match a set of filter conditions. You can automatically generate entities based on a conditioned query to any table within your instance. For example, consider a customer holding an account in a bank as an entity type. The customer has attributes such as a Name, Customer ID, Account type, Income source, and others, which are stored in a customer information table, which can be queried based on any of the attributes.

Entity

An entity can be people, departments, applications, objects, servers, external network equipments, different locations, data servers, data warehouse – essentially anything you are going to do a control test against and is of policy and compliance in nature. For example, a person holding an account in a bank with a name and related financial information.

Entities are automatically generated when an entity type is created.

Policy

After authority documents are identified, companies develop policies that specify how the business unit would comply with the authority documents. At a high level, policy statements define what the business should or should not do. For example, an organization can set a policy for data protection that defines the requirements for protecting sensitive customer information. Policies are internal documents of an organization and can be like a firewall policy, networking policy, acceptable use policy, information security, networks security, environmental protection, and others. They are an aggregation of different controls and control objectives that deal with a particular aspect of the business.

Policy acknowledgement

The policy acknowledgement module allows policy owners or compliance teams to send out policies for review and acknowledgement by employees to meet compliance requirements.

Policy exception

This allows you to have an exception on a policy. For some reason, if you cannot comply with a policy or a control, then you can log an exception.

The Policy Exception module documents any situation where the organization is not able to follow the documented control. Policy exception has its own life cycle and approvals.

Control objective

Control objectives are specific goals that the controls are meant to achieve. For example, to ensure data protection policy, the company can build and maintain a secure network. For an acceptable use policy, there can be a control objective to have a proxy to keep control over the websites that the users are visiting. For a network policy, there can be a control objective to have strong passwords.

It is through the control objectives that authority documents and policies can be tied together to ease the burden of compliance – one control objective can enforce multiple internal and external requirements. Citations can also be associated to one or more control objectives. It is also at the control objective level the controls and policies are tied to one another. Alternatively, you can look at a Control Objective and see the mappings back to Authority Documents and Policies that show why you do the actions indicated in the objectives.

The control objectives module is the main hub of the Policy and Compliance Management application. While authority documents state regulatory objectives,

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and policies document what the organization should or shouldn’t do, the control objectives define exactly how to adhere to those policies and authority documents.

Control

A control is a specific implementation of a control objective. For example, for a data protection policy, the company may ensure data is backed up regularly, or set up automated backup system.

Controls are automatically generated when you associate a policy with an entity type or an entity type with a control objective where a control is created for each entity listed in the entity type for the control objective. However, controls can also be manually created. Controls are tested to see if they are successful in achieving the intended control objective.

Control test

A control is put to test to ensure that it is effective in achieving the control objective. For example, a penetration test ensures proper implementation of data encryption.

Indicator

An indicator allows you to do a test on the controls, and tests can be scheduled daily, weekly, monthly, or quarterly. An indicator task is created and sent to the user to check whether the control is compliant, and the indicator can be marked as Pass or Fail. If the task fails, then the control is not compliant, and an issue is created. If the indicator passes the test, then the control is compliant until the next scheduled test.

Indicator templates allow the creation of multiple indicators for similar controls. The Indicator template defines the parameters of the Indicators and is mapped to the Risk Statement or the Control objective according to the Type of Indicator it monitors.

A task is created each time when the indicator is executed to collect the indicator result. An indicator task is created according to a schedule to ensure monitoring according to a pre-set frequency on the indicator form.

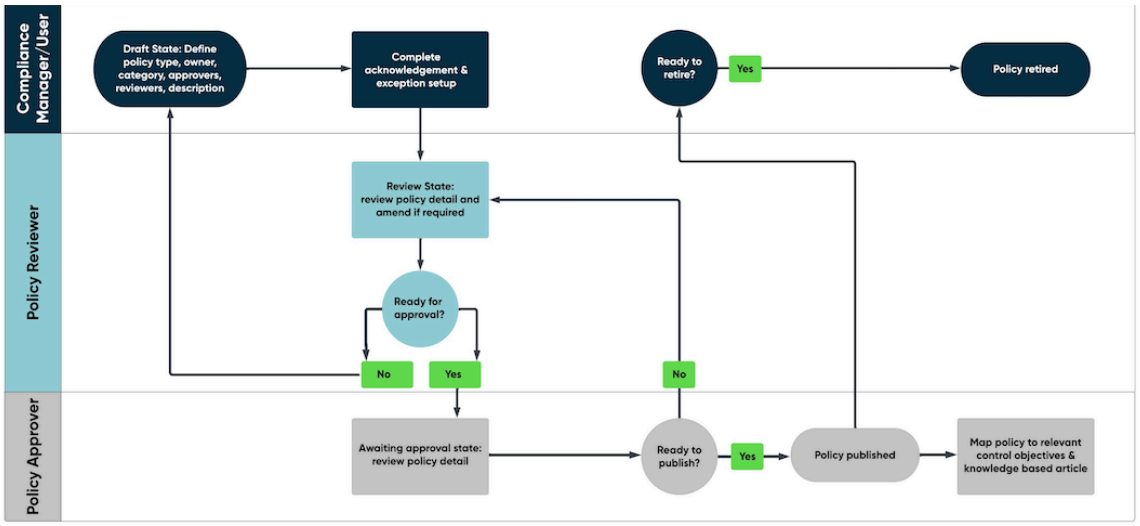
Attestation

An attestation assesses the control to continuously monitor its compliance. Unlike an indicator, attestation is mostly ad hoc and may not be scheduled.

Issue

If a gap is identified while testing a control, then that gap is termed as an issue. Issues can include operational observations from audits, regulatory compliance violations, security breaches, or other negative results. Or, when a control test fails and is non-compliant, an issue is created. Issues can be shared amongst the Policy and Compliance Management, Risk Management, and Audit Management GRC applications. You can measure the effectiveness of your company's risk management program by how quickly and thoroughly it identifies and reacts to risk and compliance issues.

Remediation task



After an issue is confirmed, the organization identifies necessary steps to remediate the issue. To mitigate a risk you can create a remediation task to track the remediation work. If a triage was performed, the triage issue is converted into an actual issue or risk event. You can also track the issue as a recommendation or close it as a non-issue.

An overview of policy life cycle in Policy and Compliance Management

Policies ensure compliance and reduce exposure to risks. A policy can be of any type – it can be a policy, procedure, standard, plan, checklist, framework, or template. Publishing a policy is within its approval process.

When you create a policy, it is in a Draft state, and all the required information about the policy are defined and captured in the record. The required information that you capture are the attributes that drive the process flow of the policy.

The life cycle of a policy record passes through different states. This is designed to understand where the record currently resides and to display its progress. Each state has a specific set of related activities before it moves to the next state. A policy may also move to the previous state, if required, which is configured and identified according to the current state.

Draft

A compliance admin, compliance manager, or a compliance user can create a policy, define and capture its related information. In this draft state, reviewers are identified, who have the ability to edit the policy in its review state, and approvers who can approve the policy. Control objectives that already exist can be added to the policy or new ones can be created. Each policy has a Valid to period, within which it is updated, reviewed, republished, or retired. In this state, the actions that are available for you to perform on the policy are Update, Ready for Review, and Delete.

Review

Only the policy reviewers can Update the policy in this state to ensure that it satisfies all regulatory requirements. They review the control objectives, its associated entities, controls, and citations, and add additional information, remove unnecessary mappings, or create new control objectives. The reviewer can move the policy Back to Draft state if the policy does not fulfil the requirements or if more details are needed. The reviewer can also Request Approval for the policy or Delete if no longer needed.

Awaiting approval

If a policy approver is assigned to the policy, the policy moves to the Awaiting approval state. Otherwise, it moves to the Published state. In this state, the approver can Delete the policy as well. In the Awaiting approval state, a policy approval task is created and assigned to the approver. The task is in Requested state, and the approver can change it to any of the following states:

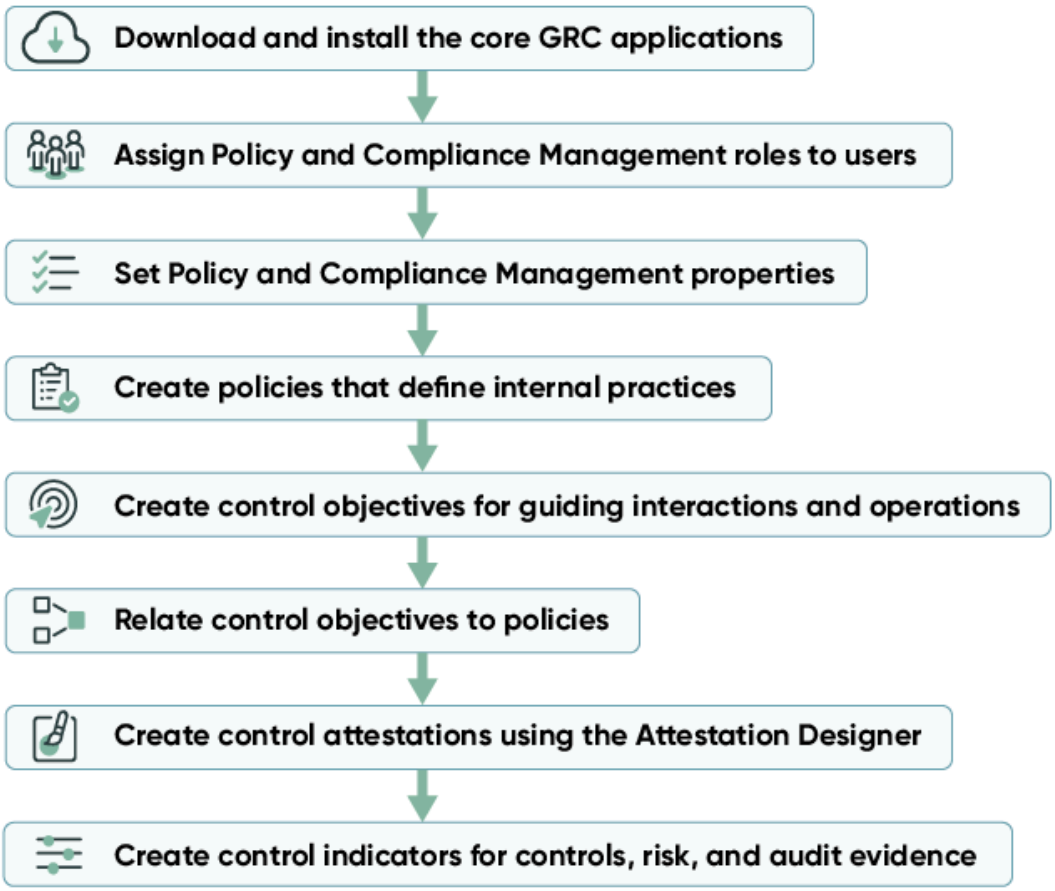
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Requested
- Approved
- Rejected
- Cancelled
- No longer required

Published

When the policy moves to the Published state the system automatically generates a Knowledge Base article. The policy becomes a mandate for all users to follow its guidelines and requirements, which is through the controls that are mapped to the policy. In this state, the policy can also be sent Back to Review, Retired, or Deleted.

Retired



A policy may be retired if no longer required, or when it no longer serves a business purpose. The Knowledge Base article that was created is removed, but the policy stays in retired state for audit purpose. If the policy is needed again, it can be sent back to the Draft stage, and the policy's life cycle begins again.

Implementing Policy and Compliance Management

Use the steps in the GRC: Policy and Compliance Management application checklist to download the Policy and Compliance Management from the ServiceNow Store, and get it ready for operation. Mandatory and optional setup steps, as well as an implementation checklist are provided to simplify the setup.

The flow of mandatory steps in the checklist are illustrated here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you have completed the mandatory steps outlined above, other optional setup procedures are available.

Implement setup checklist for the GRC: Policy and Compliance Management application

This checklist includes the setup tasks that you are required to complete in your ServiceNow AI Platform® instance. When you have completed these tasks, the base system is ready for operation. Optional setup procedures are also included to enhance GRC: Policy and Compliance Management functionality.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager
Consider creating and printing a PDF of this checklist topic. You can then check off tasks as you complete them.

Procedure

To generate a PDF, click the **Save As PDF** icon ( ) at the top of the topic and click **Selected topic**.

GRC: Policy and Compliance Management application checklist

Item	Description
☐	As a user with the Compliance Administrator or Compliance Manager role, verify that you have the GRC core applications installed on a ServiceNow AI Platform instance. **Note:** The GRC core applications and the ServiceNow AI Platform instance should be from the same family release. **a.** To verify the GRC: GRC Profile Dependencies core application is installed on your instance, navigate to **Plugins** and search for GRC Profile. **b.** If the GRC Profile core application is not already installed, click **Install** to install it. **c.** After the GRC Profile application is installed, install the Policy and Compliance Management core application. If Policy and Compliance Management is not visible in your instance, all of the GRC core applications are available from the ServiceNow Store. For more information about getting entitlement, downloading, and installing the GRC core applications, see GRC and the ServiceNow Store.
☐	As a user with the Compliance Administrator role, in your ServiceNow AI Platform instance, verify that you have assigned users with the required ServiceNow AI Platform roles. For detailed instructions and a list of Policy and Compliance Management roles, see Assign Policy and Compliance Management roles to your users.
☐	As a user with the Compliance Administrator role, set Policy and Compliance Management properties to control various behaviors in the system. For example, you can define states for which a control is active or inactive. For detailed instructions, see Set Policy and Compliance Management properties.
☐	As a user with the Compliance Administrator or Compliance Manager role, create policies. A policy is a document that defines an internal practice that processes must follow. Policies are defined as policies, procedures, standards, plans, checklists, frameworks, and templates. For detailed instructions, see Create a policy.
☐	As a user with the Compliance Administrator or Compliance Manager role, create control objectives. A control objective is an objective, direction, or standard that acts as guidance for company interactions and operations. They can be categorized, classified, and related to policies. For detailed instructions, see Create a control objective.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
☐	As a user with the Compliance Administrator or Compliance Manager role, relate control objectives to policies. You can associate control objectives to a policy individually when the policy is in the Review or Draft state. For detailed instructions, see Relate a control objective to a policy.
☐	As a user with the Compliance Administrator, Compliance Manager, or Attestation Creator role, create an attestation. The Attestation Designer allows you to create and edit metric types, as well as define different metric types for different controls. For detailed instructions, see Create a control attestation using the Attestation Designer.
☐	As a user with the Compliance Administrator or Compliance Manager role, create control indicators. Indicator data for controls, risk, and audit evidence are measured differently depending on the GRC application. For detailed instructions, see Create a control indicator.

Congratulations! You have successfully set up the GRC: Policy and Compliance Management base system. Depending on the needs of your organization, optional setup procedures are available. For example, if you integrate with Network Frontiers Unified Compliance Framework (UCF), procedures for managing the integration are here. Or if you want to set up the mobile experience for GRC: Policy and Compliance Management, those procedures are also here.

For detailed instructions for optional features, see Policy and Compliance Management enhancement steps.

Download GRC: Policy and Compliance Management

Before you run GRC: Policy and Compliance Management (com.sn_compliance) in your instance, you must download it from the ServiceNow Store.

Before you begin

Role required: admin

Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Note:
Starting with Version 10.1, you can leverage new policy exception capabilities in Policy and Compliance Management from within Version 10.3 of the Vulnerability Response application. To use this feature, you must upgrade Policy and Compliance Management before upgrading Vulnerability Response. For more information, see

Quick start tests

Perform Policy and Compliance Management administration

Prior to performing application-specific setup, you need to prepare the system. This involves assigning user roles and setting properties.

Assign Policy and Compliance Management roles to your users

Before you can successfully implement or use the Policy and Compliance Management application, you must assign roles to your users.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Click the name of a user.
3. Click the **Roles** tab.
4. Click **Edit**.
5. Move the roles you want to assign to the user from the Collection side to the Roles List, then click **Save**.
6. Repeat these steps for each of your users.

For a comprehensive list of compliance users, see Roles installed with GRC: Policy and Compliance Management.

Role title [name]	Description
Compliance Reader [sn_compliance.reader]	The Compliance Reader has read-only access to all modules of the Policy and Compliance Management application. This role is typically assigned to users who need

What to do next

Return to the Policy and Compliance Management setup checklist.

Policy and Compliance Management mandatory setup

After you have assigned roles to your users and set Policy and Compliance Management properties, proceed with the mandatory setup steps.

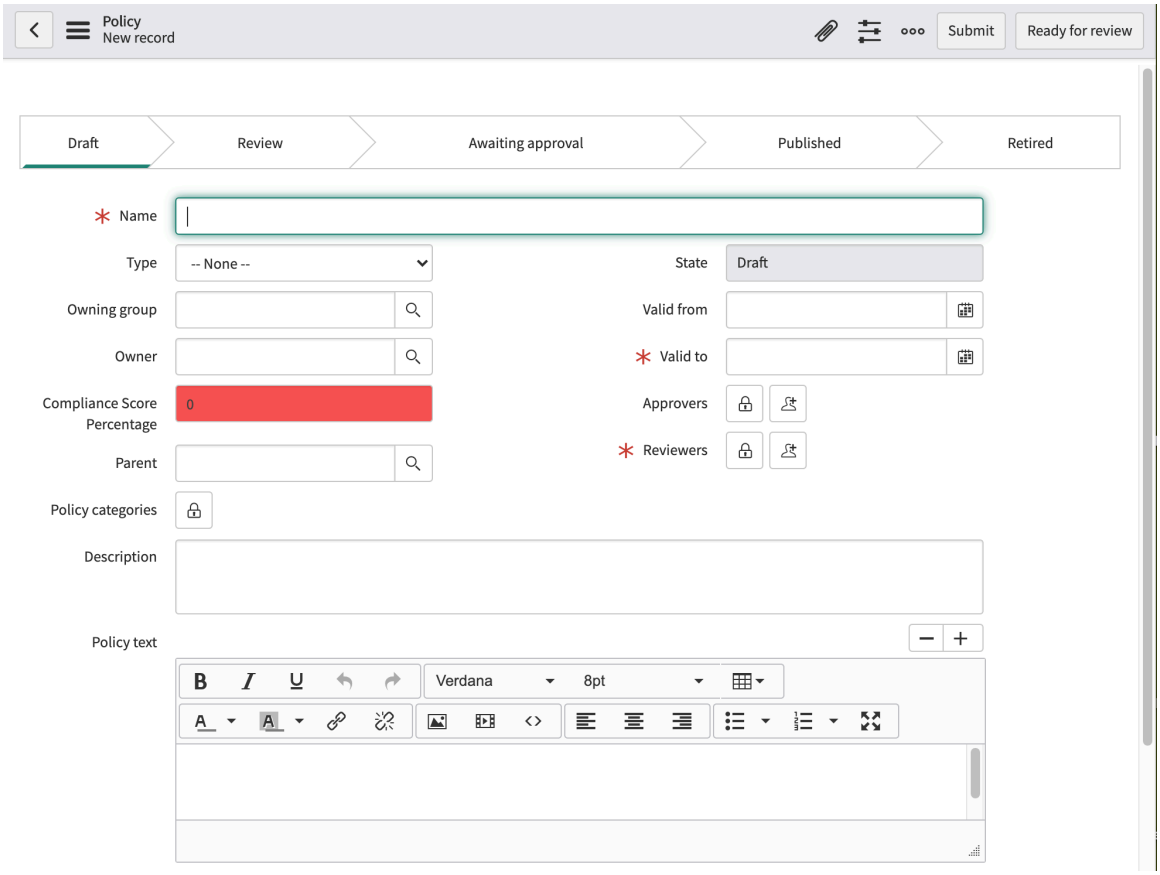
The flow of mandatory steps in the checklist are illustrated here.

When you have completed the mandatory steps outlined above, other optional setup procedures are available.

Create a policy

A policy defines an internal practice that processes must follow. Policies are defined as policies, procedures, standards, plans, checklists, frameworks, and templates.

Before you begin



Role required: sn_compliance.admin or sn_compliance.manager

Users with Compliance user (sn_compliance.user) role can also create policies.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Policy

Field	Description
Name	The name of the policy.
Type	List of options: ○ Policy ○ Procedure ○ Standard ○ Plan ○ Checklist ○ Framework ○ Template
Owning Group	Group that owns the policy.
Owner	User that owns the policy.
Compliance Score Percentage	The compliance score percentage assigned to this policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent	The policy containing this policy. If you create a control objective from within a policy, this field is automatically filled.
Policy categories	Click the lock icon and select one or more categories for filtering policies. For example, select Vulnerability Response to view policies associated with that application.
State	The state is a read-only field. Possible choices are: ○ **Draft** In this state, all compliance users can modify the policy and control objectives. All compliance users can click **Request review** button. Enter a message in the Request review pop-up and click **Request** , which sets the state to Review. ○ **Review** In this state, the owner, owning group, and reviewers can modify the policy and control objectives. The owner, owning group, and reviewers click **Request approval**, starting the workflow by sending approvals to the users in the Approvers list. The owner, owning group, and reviewers move the policy back to Draft, by clicking **Back to draft**, as well. ○ **Awaiting approval** In this state, the policy and control objectives are read-only for all. Approvers can approve the policy by updating the approval state in the **Approvals** Related List on the policy form, or by viewing **My Approvals**. If the policy is approved, the policy goes to the **Published** state. Otherwise, it goes back to the **Review** state. ○ **Published** In this state, the policy and control objectives are read-only for all. Admins can click **Retire** which sets the state of the policy to **Retired** ○ **Retired** In this state, the policy is read-only for all.
Valid from	The date and time for which the policy becomes valid.
Valid to	The date and time for which the policy is no longer valid.
Approvers	The users you want to be included in the approval process.
Reviewers	Select the users you want to be included in the review process.
Description	A general description of the policy.
Policy text	A detailed description of the policy.
Knowledge Base	
Knowledge base	The knowledge base article related to this policy.
KB article	The KB article number and link where the policy is published.
Article template	The article template to use for the publication of this policy.
Acknowledgement Setup	
Audience	Select the default audience responsible for acknowledging this policy.
Reference Material URL	Click the lock icon to add the URL for any needed reference materials, such as certification or training materials.
Allow users to decline policy	Select this check box to give users the option of declining policy acknowledgements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Allow users to request exception	Select this check box to give users the option of requesting exceptions for policy acknowledgements.
Exception Setup	
Maximum exception duration (days)	Enter the maximum number of days for which a policy exception can be requested for a given policy.

4. Continue with one of the following options.
   - To save and submit the policy, click **Submit**.
   - To mark the policy ready for review, click **Request review** .

What to do next
If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Create a control objective

A control objective is an objective, direction, or standard that acts as guidance for company interactions and operations. Control objectives can be categorized, classified, and related to policies.

Before you begin
Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

About this task
To understand the difference between a control objective and a control, see Structural overview of Policy and Compliance Management.

Procedure
1. Navigate to **All** > **Policy and Compliance** > **Control Objectives**.
2. Click **New**.
3. On the form, fill in the fields.

Control Objectives form

Field	Description
Name	Name of the control objective.
Source	Source of the control objective. For example, if the control objective is from a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this control objective.
Reference	Unique numerical identifier.
Parent	Control objective that is not a child of the current control objective. This is to avoid cyclic parent – child relationship.
Compliance Score Percentage	Compliance score percentage calculated for this control objective and it's color code:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ 80 and higher in green ○ 80 to 50 in yellow ○ below 50 in red
Active	Option that indicates whether a control objective is active.
Creates controls automatically	Option that indicates that controls are automatically created from the control objective. **Note:** Select this option if the control objective can also serve as the control.
Category	List of options: ○ Acquisition or sale of facilities, technology, and services ○ Audits and risk management ○ Compliance and Governance Manual of Style ○ Human Resources management ○ Leadership and high-level objectives ○ Monitoring and measurement ○ Operational management ○ Physical and environmental protection ○ Privacy protection for information and data ○ Records management ○ System hardening through configuration management ○ Systems continuity ○ Systems design, build, and implementation ○ Technical security ○ Third Party and supply chain oversight ○ Root ○ Deprecated
Classification	List of options: ○ Preventive ○ Corrective ○ Detective
Type	List of options: ○ Acquisition/Sale of Assets or Services ○ Actionable Reports or Measurements ○ Audits and Risk Management ○ Behavior

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Business Processes ○ Communicate ○ Configuration ○ Data and Information Management ○ Duplicate ○ Establish Roles ○ Establish/Maintain Documentation ○ Human Resources Management ○ Investigate ○ IT Impact Zone ○ Log Management ○ Maintenance ○ Monitor and Evaluate Occurrences ○ Physical and Environmental Protection ○ Process or Activity ○ Records Management ○ Systems Continuity ○ Systems Design, Build, and Implementation ○ Technical Security ○ Testing ○ Training
Attestation	List of options. ○ **GRC Attestation** is chosen by default ○ **Note:** If the user changes the control attestation, the related control objective attestation type is changed also.
Issue group rule	Group rule assigned to this control objective.
Description	Description of the control objective.

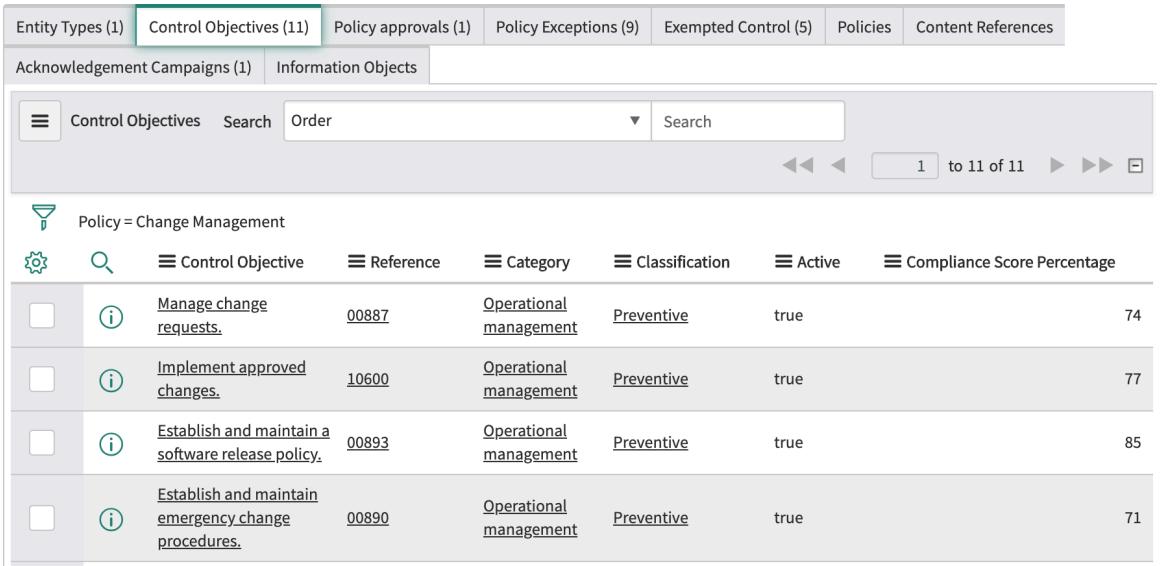
4. Click **Submit**.
   The control objective is created and all related lists are visible.
   - A control is created for every control objective when a policy is associated with an entity.
   - The control attributes default to the same attributes as the related control objective.

What to do next

If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relate a control objective to a policy



Associate the control objective to a policy individually when the policy is in the review or draft state by clicking the edit button in the Control Objective related list.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the policy record.
3. Click **Edit** in the **Control Objectives** related list.
   The slushbucket contains active control objectives with no associated policy selected.
4. Select the control objectives.
5. Click **Save**.
   Those control objective are listed in the **Control Objective** related list.

What to do next

If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Create a control attestation using the Attestation Designer

Use the Attestation Designer to create and edit metric types. Use different metric types for different controls. Select multiple respondents for an attestation, as well as change scoring parameters.

Before you begin

Role required: sn_compliance.attest_creator, sn_compliance.manager, sn_compliance.administrator

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Attestation Types**.
2. Click **Attestation Designer**.
   The designer contains the following elements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element	Description
Controls	Supported question data types are available in the Controls palette. Drag a control onto the designer canvas to create a question of that type.
Questions	A library of questions for various categories, so you do not have to build each questionnaire from scratch.
Categories	New assessment opens in the **Design** view. The questionnaire **Name** field appears above the first category in the canvas. A blank question field appears in the category container.

3. Enter a name in the **Name** field.
4. Drag a control onto the designer canvas to create a question of that type.

Question controls

Data type	Description	Scored
Attachment	Question with a Manage Attachments icon that allows users to attach one or more files.	N
Boolean	Question with a check box or a **Yes/No** list for user responses.	Y
Choice	List of predefined options. For more information, see the definition for **Choices**.	Y
Date	Date field.	N
Date/Time	Date and time field.	N
Number	Number field with predefined minimum and maximum values. The default is 1–10.	N
Percentage	Percentage field with a prescribed range.	N
Scale	Predefined Likert scale. Answer options appear as radio buttons.	Y
Numeric Scale	Selectable number scale. The default is 1–5. Answer options appear as radio buttons.	Y
String	Single or multi-line text field.	N
Template	Choice list of templates that provide a predefined scale of options. **Note:** It is important to assign a template to every attestation. This allows controls to be created automatically based on control objectives and entity types.	Y
Reference	Choice list of fields from a specified reference table. This data type does not support reference qualifiers.	N

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Set the correct answer for the metric that you want to be scored. Scored metrics determine the compliance status of the controls.

5. Point to the menu icon in the upper right of the Attestation Designer to select one of the following options.

Note:
The availability of each option depends on the status of the attestation that is opened in the designer.

Option	Description
New Attestation	Opens a fresh canvas for a new attestation.
Load Attestation	Opens a list of existing attestations that you can select and edit.

Unlike other types of assessments, control attestations do not appear in the **Self-Service** > **My assessments & surveys** module, because many control attestations could be generated at once. Instead, controls attestations are shown as a list in the **Policy and Compliance** > **Controls** > **My Attestations** module and **All Attestations** module.

What to do next
If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Create a control indicator

Indicator data for controls, risk, and audit evidence are measured differently depending on the GRC application.

Before you begin
Role required: sn_compliance_admin, sn_compliance_manager

Procedure
1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Indicators** > **Indicators**.
   - **Risk** > **Indicators** > **Indicators**.
   - **Audit** > **Indicators** > **Indicators**.
2. Select **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	Select **Compliance Indicator** for a control indicator and **Risk Indicator** for a risk indicator.
Name	Name of the indicator.
Applies to	Entity related to the **Item**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Owning group	Group that owns the indicator.
Owner	Indicator owner.
Number	Unique identification number.
Active	Option that indicates whether the indicator is active.
Item	Related control or risk.
Template	Related indicator template.
Override Template	Option that indicates whether to override the indicator template associated to this indicator
Last result passed	Option that indicates whether the last result passed.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
Next run time	Next collection time for indicator results.
Method	
Type	Results can be gathered manually using task assignment or automatically using basic filter conditions, Performance Analytics, or a script. ○ Manual ○ Basic
Short Description	If Type is **Manual**, this field is present. Brief description of the issue.
Instructions	If Type is **Manual**, this field is present. Instructions for the collection of indicator results.
Value Mandatory	If Type is **Manual**, this field is present.
Passed/Failed	If Type is **Basic**, this field is present. Indicator passes or fails.
PA Threshold	If Type is **PA Indicator**, this field is present. The associated PA Threshold.
Script	If Type is **Script**, this field is present. Script that obtains the desired system information.
Supporting Data	

Note:
Starting with Version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks is displayed. Earlier, only the real-time state of the records collected could be viewed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Use supporting data to gather supporting evidence from other applications.
Supporting data fields	Supporting data fields based on the selected table.

4. Select **Submit**.

Note:
As a compliance manager or compliance admin, you can assign the indicator task to a user with Business User Lite role. If you assign a user with a Business User Lite role as an owner in the **Owner** field and **Execute** the indicator, an indicator task is created in the Open Tasks related list. This indicator task is assigned to the owner with the Business User Lite role.

As a user with the Business User Lite role, you can navigate to **Policy and Compliance** > **Indicators** > **My Indicator Tasks** to view the indicator tasks that are assigned to you. You can view the indicator by selecting the information icon next to the Indicator field. You can also update the **Result** field, **State** field, **Value** field, **Additional comments**, and **Work notes** in the Indicator Task form.

To accomplish similar tasks from the employee center, see GRC tasks in the employee center portal.

What to do next
If you're implementing the Policy and Compliance Management software, then you've completed the required setup steps. Return to the Policy and Compliance Management setup checklist and proceed to the optional steps, as needed.

Policy and Compliance Management enhancement steps

After you have set up the Policy and Compliance Management base system, you can perform the procedures listed in the following sections to enhance the functionality of the application.

Related topics

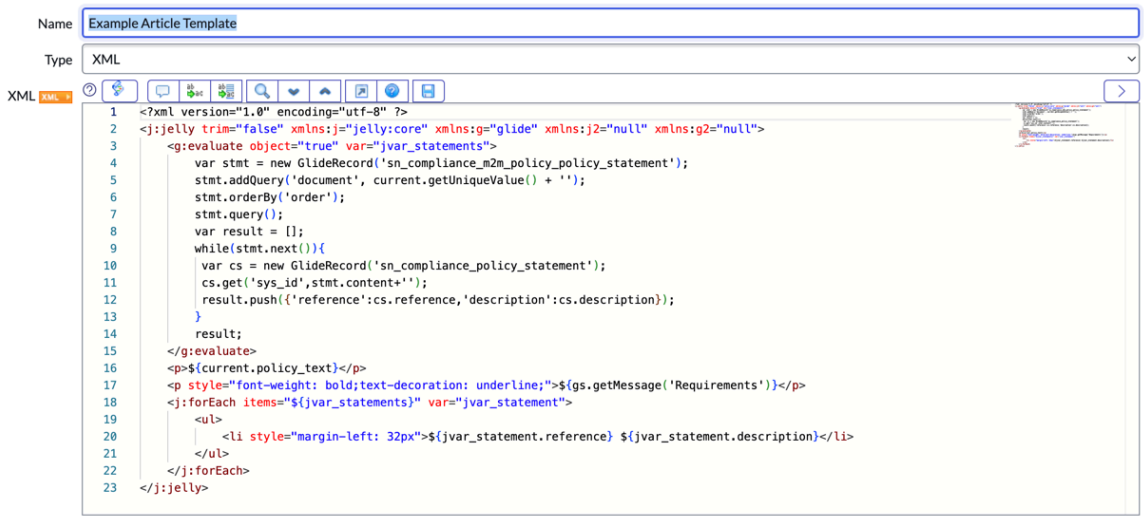
- Managing mobile experience for GRC Policy and Compliance
- Create a GRC article template
- Create or deactivate a citation
- Set notification properties
- Set up GRC Virtual Agent for requesting an exception to a policy or a control objective
- Allow policy exception requests from other applications

Create a GRC article template

Policy and Compliance managers can create templates for policy article publishing.

Before you begin
Role required: sn_compliance.developer

Procedure



1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Article Templates**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Authority Document

Field	Description
Name	Name of the article template.
Type	○ Script ○ HTML ○ XML
Script	The script code. This field depends on the **Type** field.
HTML	The HTML code. This field depends on the **Type** field.
XML	The XML code. This field depends the **Type** field.
Is default	Option to indicate that this template is used as the default template for all KB articles.

4. Click **Submit**.

Create or deactivate a citation

Usually, authority documents, citations, and control objectives are downloaded from a third-party provider. However, citations can be created manually from an authority document. The **Active** option in a citation indicates whether the citation is active or inactive.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Authority Documents**.
2. Open an authority document.
3. In the **Citations** related list, click **New**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Citation form

Field	Description
Name	User-defined name that identifies this citation.
Source	Source of the policy. For example, if the statement is from a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this authority document.
Reference	Content reference.
Type	Type of citation created. Optional field not used for any processing. Use the value in this field in reports or to query for records of a specific type. ○ Core Topic ○ Process ○ Control Objective ○ Control ○ Supporting information
Authority document	Name of the parent authority document for this citation. When you create citations from the authority document form, the system completes this field automatically.
Active	Option that indicates if a policy is active. A policy is marked active if it is not in the **Draft** or **Retired** state. To deactivate a citation, clear the check box marked **Active**.
Parent	References the parent content.
Description	Description of the citation.

Set notification properties

After an acknowledgement request has been sent to an audience, different reminder notifications are sent based on the timeliness and state of the response. Properties allow you to configure the notifications.

These properties are available for Policy and Compliance Management.

Note:
Navigate to **Policy and Compliance > Administration > Properties**.

Properties for Policy and Compliance Management

Property	Description
Specify how many days after due date to send Policy Acknowledge summary notification.	The number of days after an acknowledgement due date has passed before a Policy Acknowledge summary notification is sent.
States for which the control is active (the first state is the default active state)	States of the control in which it is considered active. The first state in the list is the default active state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Policy and Compliance Management (continued)

Property	Description
Number of days after Policy Acknowledgement Due Date to send overdue notification.	The number of days after an acknowledgement due date has passed before an overdue notification is sent.
Send a summary of the Policy Acknowledge after its due date. Use property sn_compliance.policy_ack_after_due_summary_timer to specify how many days after due date to send notification.	Select Yes to send a Policy Acknowledge summary notification after the days specified in the **Specify how many days after due date to send Policy Acknowledge summary notification** property has elapsed. For example, if the property is set to 1 day, the notification is sent when the acknowledgement is 1 day late.
Send a summary of the Policy Acknowledge before its due date. Use property sn_compliance.policy_ack_before_due_summary_timer to specify how many days before due date to send notification.	Select Yes to send a Policy Acknowledge summary notification prior to the number of days specified in the **Specify how many days after due date to send Policy Acknowledge summary notification** property is reached. For example, if the property is set to 1 day, the notification is sent 1 day before the due date.
Repeat the Policy Acknowledgement overdue notification daily	Select Yes to repeat the overdue notification on a daily basis until it is completed.
Number of days before Policy Acknowledgement Due Date to send reminder notification.	The number of days prior to the acknowledgement due date to begin sending reminder notifications.
Repeat the Policy Acknowledgement Due Date reminder daily until Policy Acknowledgement is due	Select Yes to send reminder notifications on a daily basis starting on the day determined by your setting in the **Number of days before Policy Acknowledgement Due Date** to send reminder notification property. For example, if you select Yes in this property and the due date occurs in 7 days, and you specified 3 days in the previous property, reminder notifications begin in 3 days and repeat daily.
Specify how many days before due date to send Policy Acknowledge summary notification.	The number of days prior to the due date to send the Policy Acknowledge summary notification.

Set up GRC Virtual Agent for requesting an exception to a policy or a control objective

Set up the Governance, Risk, and Compliance Virtual Agent to request an exception to a policy or a control objective from the Service Portal.

Before you begin

Role required: sn_risk.admin.

Customers must have the following plugins activated for setting up the GRC Virtual Agent:

- Glide Virtual agent (com.glide.cs.chatbot) activated with a valid license.
- GRC
- Policy and Compliance Management.

About this task

A virtual agent chatbot enables customers to request an exception. The chatbot assists the customers by saving their time. The information exchanged during the conversation flow enables the chatbot to fulfill a user request or assist a user in completing a task.

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. Click **Page Editor**.
3. In the search field, type `Index`.
4. Click **Service Portal index**.
5. At the top of the page, click **Edit Service Portal (index) page in Designer**.
6. In the Filter Widget search field, type `Virtual Agent Service Portal Widget` and drag and drop the widget anywhere on the screen.

   You can see the chat icon at the bottom-right of the screen.

Allow policy exception requests from other applications

Starting with Version 10.1, you can leverage new policy exception capabilities in Policy and Compliance Management from within other applications.

Requests are routed through multiple approvals based on risk rating, policy, and control objective associated with an exception. Compliance and risk teams obtain better visibility with respect to exceptions raised for vulnerabilities.

Note:
Starting with Version 10.1, if you have installed Version 10.3 of the Vulnerability Response application, you can request policy exceptions using the GRC policy exception management capability inherent in the Policy and Compliance Management application. For details, see Policy Exception Integration with Vulnerability Response.

Before allowing other applications to leverage the policy exception capabilities of Policy and Compliance Management, you must first add the application to the Integration Registry and then perform some preliminary setup.

Configure policy exceptions from other applications

Before you can request policy exceptions from applications other than Policy and Compliance Management, you must add a UI action for making the request and, optionally, create a new list view to see policy exception target records on the Policy Exception form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_compliance.manager, ui_action_admin or admin

The GRC business user (sn_grc.business_user) or business user – lite (sn_grc.business_user_lite) is the minimum required role to raise a policy exception from an upstream application.

About this task

Starting with Version 10.1 of Policy and Compliance Management, if you have installed Version 10.3 of the Vulnerability Response application, you can request policy exceptions using the GRC policy exception management capability inherent in the Policy and Compliance Management application. The procedure below is not necessary requesting policy exceptions from Vulnerability Response as the UI action is automatically installed.

Procedure

1. Navigate to **All** > **System Definition** > **UI Actions**.
2. Select the table on which you want to create the UI action.
3. Click **New**.
4. Create a new UI action with the following parameters:
   - **Name**: Request policy exception
   - **Show update** check box: Selected.
   - **Form button** check box: Selected.
   - **Onclick**: Type the `popupDispList()` function call.

     Note:
     This field is available only when **Client** option is selected.

   - **Condition**: Apply any conditions you require.
   - **Script**: Enter this script:

```
function popupDispList(){

 ScriptLoader.getScripts(['sn_compliance.PolicyExceptionUtils
.jsdbx'], function() {

 sn_compliance.PolicyExceptionUtils.createPolicyException('in
cident');

            });

}
```

Note:
The argument for the `createPolicyException` function varies based on the integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Save the UI action.
6. To create a new list view to see policy exception target records on the Policy Exception form, see KB0783018.

Register other applications to request policy exceptions

Enable other applications to request policy exception from any table such as Problem or Incident and so on. The applications must be added and configured in the Integration Registry.

Before you begin

Role required: sn_compliance.manager
The GRC business user (sn_grc.business_user) or business user – lite (sn_grc.business_user_lite) is the minimum required role to raise a policy exception from an upstream application.

About this task

Starting with the New York release, users from any ServiceNow application can request for policy exceptions using (GRC)'s policy exception management capability. For example, users can request policy exception for a problem related to a group of incidents that cannot be resolved for a specific duration. To be able to request policy exception, you must register the application for policy exception and create a UI action for requesting policy exception, unless one is provided with the ServiceNow application.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Exceptions** > **Integration Registry**.
2. Click **New**.
3. On the form, fill in the fields.

Policy Exception Integration Registry form

Field	Description
Name	Enter a name of the registry entry.
Policy exception target table	Select the table on which a policy exception will be applied.
Exception applied on	Target record on which the exception is applied. The options are: ○ One target record: Specific target record on which the exception is applied. Select the assessed object in the Compliance data source registry. ○ All target records: All target records on which the exception is applied. Select the policy exception target table on which the exception is applied.
Source type	Auto-populates **Controls** if the **Exception applied on** is **One target record**. Auto-populates **Control objective** if the **Exception applied on** is **All target records**.
Policy categories	Select one or more categories for filtering policies. For example, if you select the Vulnerability Response category, and are requesting an exception using that application, the list of all policies is filtered by that category, saving you time. For more information, see Define policy categories.
Entity Mapping	
Relationship	Select **Reference field** when the entity is a field in the Policy Exception [sn_compliance_policy_exception] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **Related list** when the entity is in a related list of the Policy Exception table.
Entity field	Enter the name of the field that points to the Entity [sn_grc_profile] table. This field displays only if you selected **Reference field** as the **Relationship**.
Mapping table	Select the table that establishes a relationship between the Policy Exception table and the Entity table. This field displays only if you selected **Related list** as the **Relationship**.
Policy exception target field	Select the field in the mapping table that points to the Policy Exception table. This field displays only if you selected **Related list** as the **Relationship**.
Entity field	Enter the name of the field in the mapping table that points to the Entity table.
Request Source **Note:** The fields in this section are needed only if you are requesting a policy exception from a table other than the Policy Exception Target table.	
Table	Select the table that contains the records from which the policy exception will be requested.
Relationship	Select **Reference field** when the entity is a field in the Policy Exception [sn_compliance_policy_exception] table. Select **Related list** when the entity is in a related list of the Policy Exception table
Request source field	Select the field that points to the request source table. This field displays only if you selected **Reference field** as the **Relationship** field in the **Request Source** section.
Mapping table	Select the table that establishes a relationship between the Policy Exception table and the Entity table. This field displays only if you selected **Related list** in the **Relationship** field in the **Request Source** section.
Policy exception target field	Select the field in the mapping table that points to the Policy Exception table. This field displays only if you selected **Related list** in the **Relationship** field in the **Request Source** section.
Request source field	Select the field in the mapping table that points to the request source table. This field displays only if you selected **Related list** in the **Relationship** field in the **Request Source** section.
Questionnaire Details	
Exception questionnaire	Select a questionnaire template to generate a questionnaire for the requested policy exception. For more information, see Create an exception questionnaire.

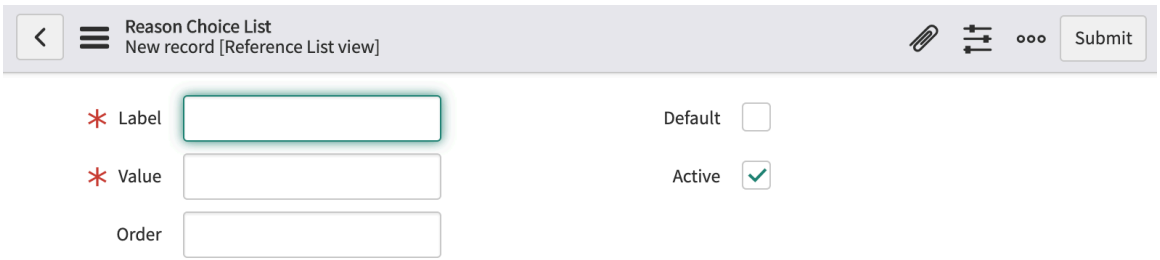
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Save the record.

   The Reason Choices related list appears.

> **Note:**
> The Reason Choices are available to the person who requests a policy exception to explain the purpose of the request. So define reasons that apply to your specific situation. For more information, see Define policy exception reason choices.

Define policy exception reason choices



You can define reason choices to be available to any user who requests an exception.

Before you begin

Role required: sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Exceptions** > **Exception Reason Choices**.
2. Click **New**.

3. On the form, fill in the fields.

Reason Choice List form

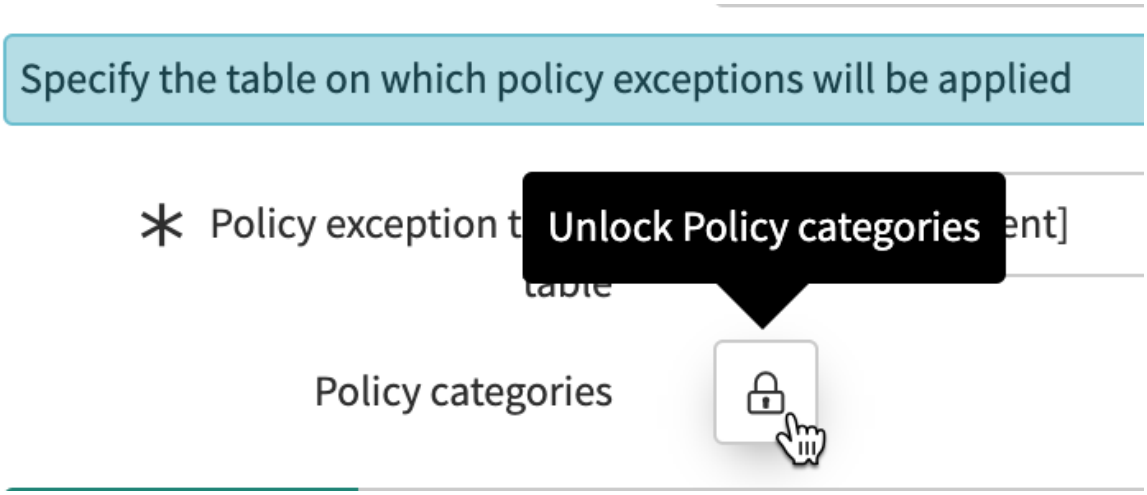
Field	Description
Label	Enter a unique label for this choice.
Value	Enter a unique value for this choice.
Order	Enter an order for this choice. Reasons are ordered based on this number.
Default	Select this check box to indicate that this reason choice will be available whenever an ad hoc policy exception is requested. If the integration registry does not contain any application-specific choices, all reason choices with **Default** selected will be available.
Active	If this is selected, this choice is displayed in the list of reason choices.

4. Click **Submit**.
   The reason choice is added and will be available in the **Reason** field of the policy exception request form for the selected application.
5. Repeat this process for as many reason choices as required by your users.

> **Note:**
> For additional details about this process, see KB0783018.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define policy categories



You can filter policies by specific criteria to limit the number of policies displayed when you are creating policy exceptions.

Before you begin

Role required: sn_compliance.manager

Procedure

1. When defining the Policy Exception Integration Registry, click the lock icon on the **Policy categories** field.

2. In the Policy categories form, click **New**.
3. Enter the name and description of the category you want to define.
4. Repeat for any other categories you want to define.
5. When you have finished defining categories, click the lock icon again.
   When you save the registry, the policy categories you defined are available on the Policy form for filtering policies.

Example:

Assume you defined registry entries for the Incident and Problem applications and selected Incident [incident] and Problem [problem] as the policy exception target tables. Also assume you created policy categories of **incident** and **problem**.

You have defined five policies and they are tagged as follows.

- Policy 1 is tagged **incident**.
- Policy 2 is tagged **incident** and **VR**.
- Policy 3 is tagged **VR**.
- Policy 4 is tagged **Problem**.
- Policy 5 is untagged

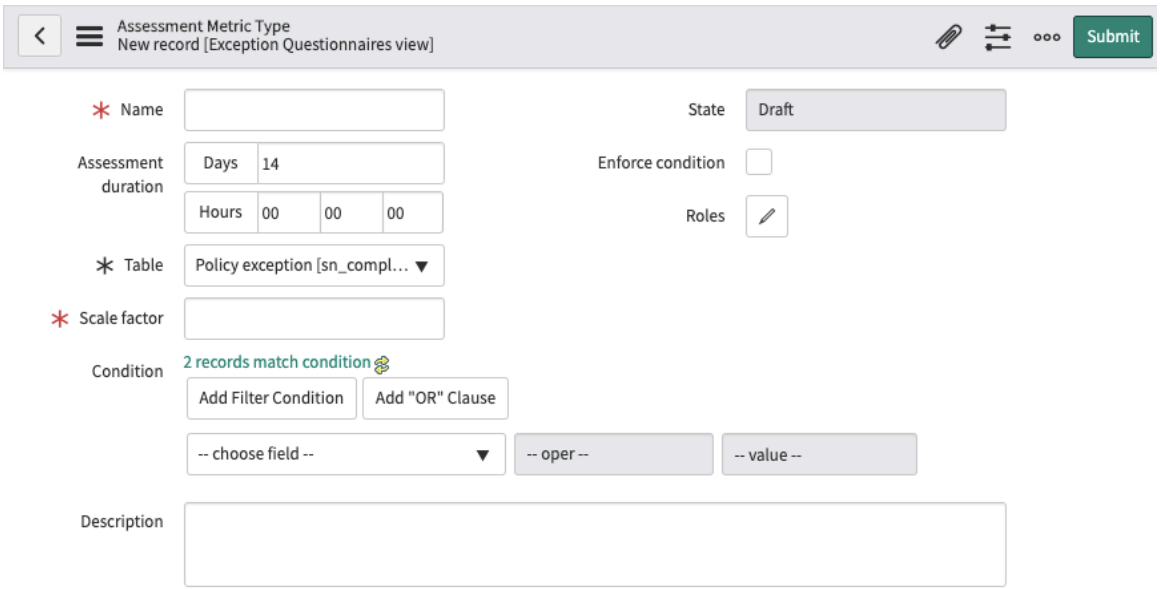
You open the Problem form and click the **Request Policy Exception** button. You are prompted to enter specific details about the exception (for example, the policy, control objective, and so forth).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you click the search icon in the **Policy** field, only Policy 1, Policy 2, and Policy 4 appear. If you select one of the three policies and click the search icon on the **Control objective** field, only control objectives related with that policy appear.

If none of your policies are tagged, all 5 appear. If you have only one policy tagged, that policy appears in the **Policy** field by default.

Create an exception questionnaire



When you are setting up the Policy Exception Integration Registry, you can define configurable questions that can be included in risk assessments created from templates. The Policy Exception Integration Registry can be associated with one template at a time.

Before you begin

Role required: sn_compliance.attestation_creator

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Exceptions** > **Exception Questionnaire**.
2. Click **New**.

> **Note:**
> Notice that the Assessment Metric Type screen opened. In the terminology of GRC applications, a question in a questionnaire is considered a metric. A group of questions is a category. A group of categories is a metric type.

3. On the form, fill in the fields.

Assessment Metric Type form

Field	Description
Name	The name of the questionnaire.
Assessment duration	The amount of time allowed from the creation of the assessment to its completion.
Table	The table containing the records to be assessed.
Scale factor	The scale factor to be used for all questionnaire results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	The publish state of the assessment: **Draft** or **Published**.
Enforce condition	When selected, all records that do not meet the conditions defined are deleted.
Roles	Roles that have Read access to the information in the assessment.
Condition	Conditions for selecting records from the selected table to be assessed. For more information, see Condition builder.
Description	A description for this exception questionnaire.

4. Save the questionnaire record.
5. Click **Attestation Designer** to create the questionnaire.
   For more information, see Attestation Designer.

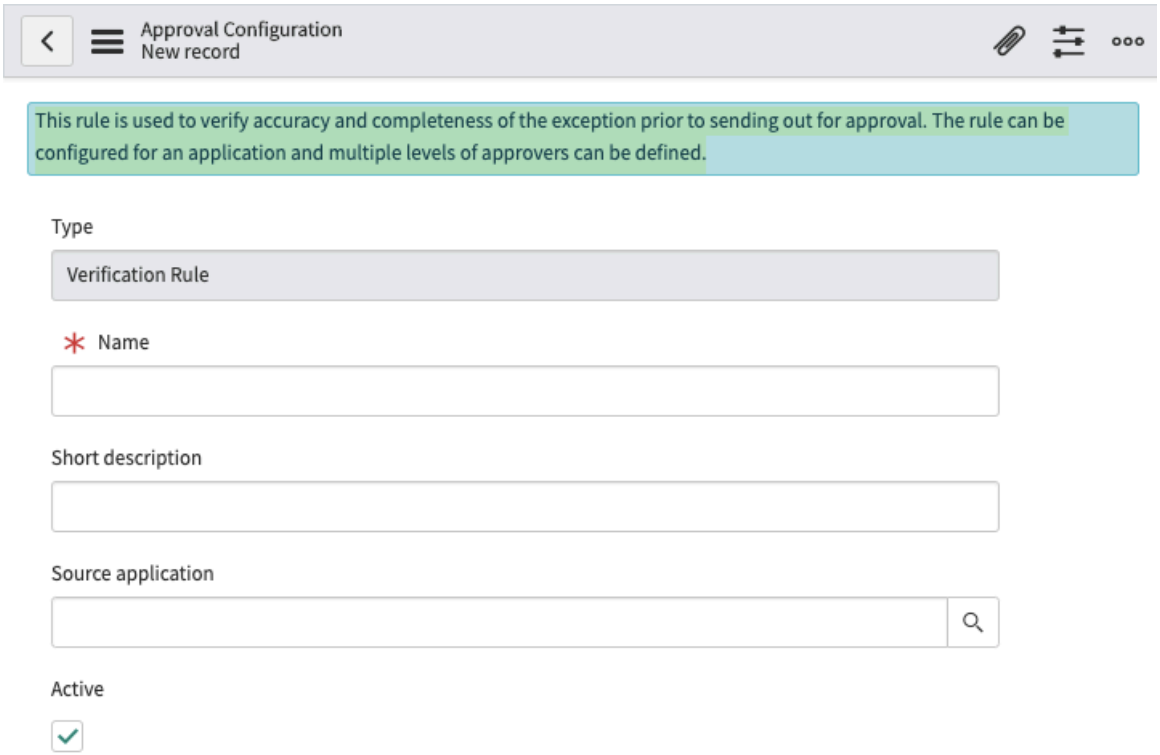
Define policy exception verification rules

The verification rule is used to verify the accuracy and completeness of a policy exception request prior to sending it out for approvals. You can define multiple levels of approvers for an application.

Before you begin

Role required:

- sn_compliance.manager to create the policy exception verification rules
- survey_reader to review and verify the questionnaire



About this task

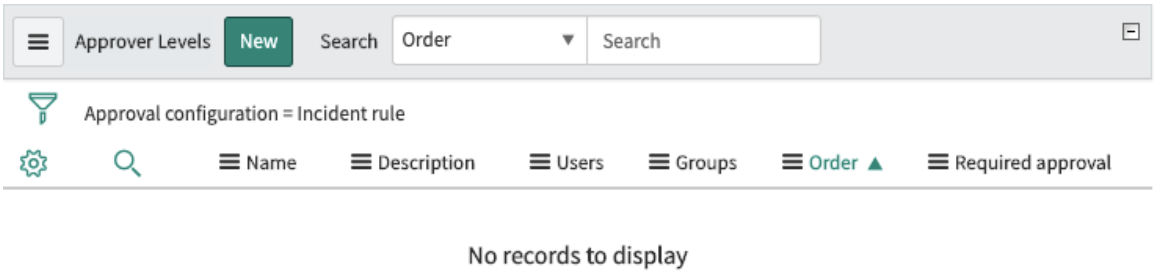
Defining verification rules is an optional step. If you do not define verification rules or define them and do not activate them, approvals from the requester's team will not be required.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Exceptions** > **Verification Rule**.
2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.



Approval Configuration form

Field	Description
Type	Defaults to Verification Rule.
Name	Enter a name for this approval configuration.
Short description	Provide a brief description of the purpose of the configuration.
Source application	Select the application for that applies to this verification rule. Only applications that have been previously added to the Integration Registry are listed.
Active	If this is selected, this verification rule is active and the requester will have the option of requesting an initial approval prior to sending it to the compliance manager for approvals.

4. Click **Update**.

The Approver Levels related list appears. This related list allows you to define multiple approver levels for a rule. One or more users, or a group of users can be selected as approvers for each level. Approvers must be assigned the survey_reader role. You can make it mandatory for all selected users to approve the exception or optionally allow a single user to approve on behalf of all approvers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Submit**.
   When the policy exception record transitions to the Pending Verification state, the designated approvers are notified that their approval is required. If any fields in the policy exception request were not filled in by the requester (for example, the Policy or Control Objective), those fields become mandatory for the approvers. When the approvers have reviewed, completed, and approved the request, it transitions to the Analyze state and is assigned to the compliance manager for further analysis and approval.

Define policy exception approval rules

Approval rules define the criteria (risk rating, policy or control objective) that is used for sending approval requests for an exception. Rules can be configured for an application and you can identify multiple levels of approvers, as needed.

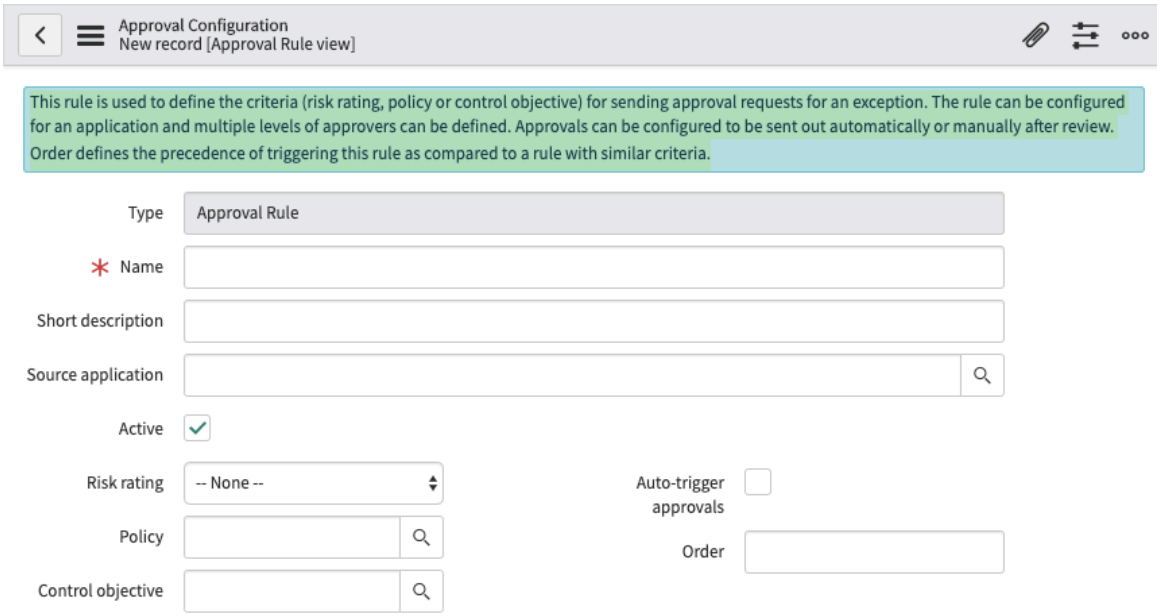
Before you begin

Role required: sn_compliance.manager

About this task

You can configure approvals to be sent out automatically or manually after review.

Note:



When policy exceptions are created from upstream applications (from Vulnerability Response for example), the policy exception must have impacted controls present before you can request approval.

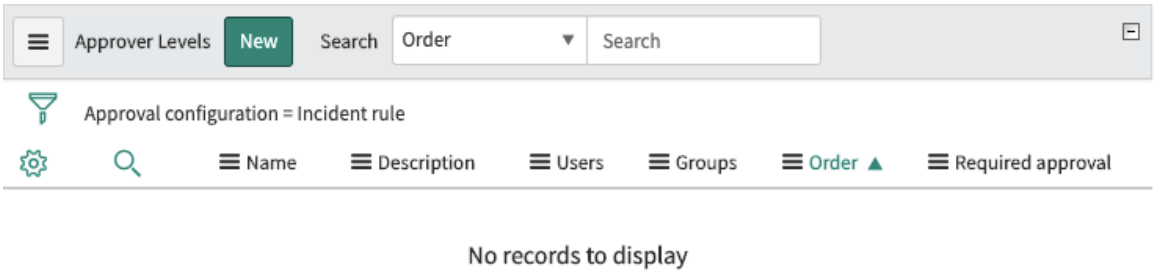
For policy exceptions created using Policy and Compliance Management, exceptions can be requested for a policy without impacted controls being present, even if both policies and control objectives are added to the exception form. However, for policy exceptions created for control objectives alone, impacted controls must be present before you can request approval.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Exceptions** > **Approval Rule**.
2. Click **New**.

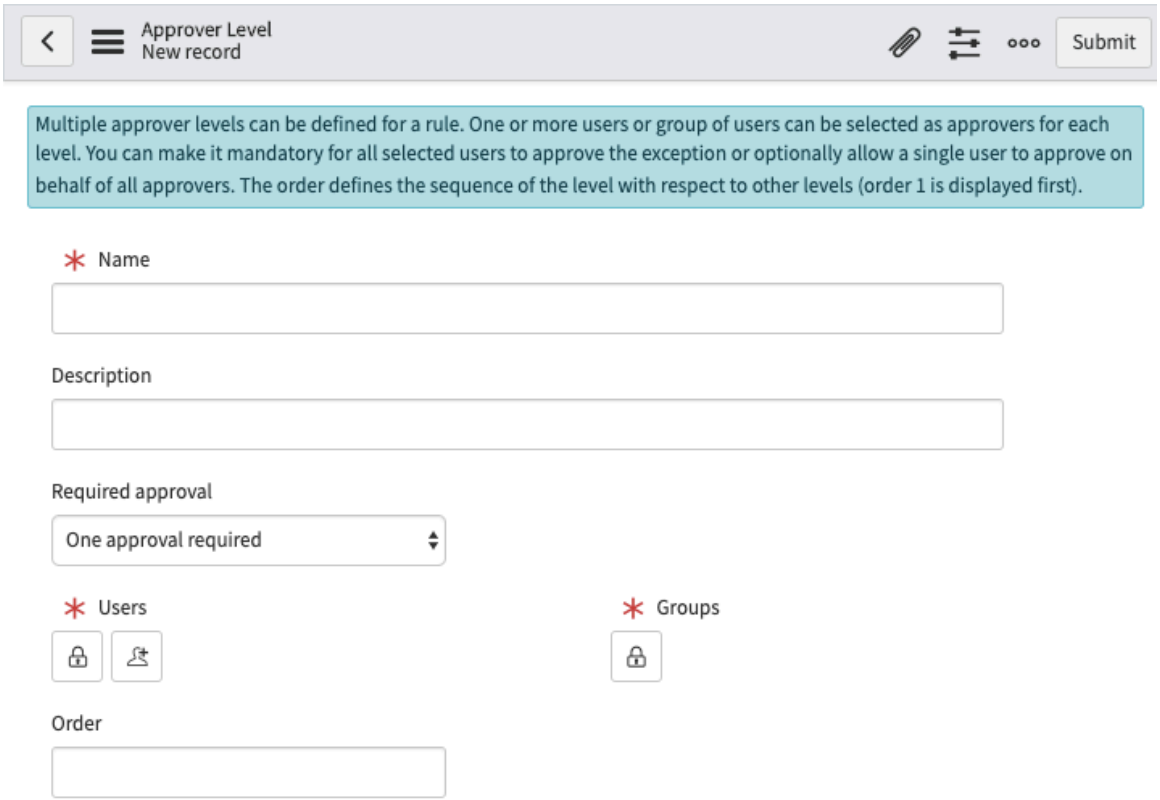
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.



Approval Configuration form

Field	Description
Type	Defaults to Approval Rule.
Name	Enter a name for this approval configuration.
Short description	Provide a brief description of the purpose of the configuration.
Source application	Select the application for that applies to this approval rule. Only applications that have been previously added to the Integration Registry are listed.
Active	If this is selected, this approval rule is active.
Risk rating	The risk rating is determined by running a risk assessment on the policy exception.
Policy	Select the policy against which this policy exception is being applied.
Control objective	Select the control objective that references the selected policy.
Auto-trigger approvals	Select this check box to automatically trigger all approvals after the review is completed. If you do not select it, the compliance manager can manually trigger the approvals defined by this rule.
Order	Order defines the precedence of triggering this rule as compared to another rule that is applicable to the exception and defined with similar criteria.



4. Click **Update**.

The Approver Levels related list appears. This related list allows you to define multiple approver levels for a rule. One or more users, or a group of users can be selected as approvers for each level. Approvers must be assigned the survey_reader role. You can make it mandatory for all selected users to approve the exception or optionally allow a single user to approve on behalf of all approvers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **New**.

6. On the form, fill in the fields.

Approver Level form

Field	Description
Name	Enter a name for this approval level.
Description	Provide a brief description of the approval level.
Required approval	Select **One approval required** to allow a single user to approve on behalf of all approvers. Select **All users must approve** to make it mandatory that all designated users approve the selection.
Users	Select one or more users to act as policy exception approvers.
Groups	Select one or more groups to act as policy exception approvers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Users who belong to the group must have GRC business user (sn_grc.business_user) role.
Order	Select the order to determine the sequence of levels used with respect to other levels (that is, order 1 is displayed first).

7. Click **Submit**.
   If you selected the **Auto-trigger approvals** check box, the designated approvers are notified that their approvals are required. Alternatively, the approvers are notified when the compliance manager clicks the **Send for Approval** button.

Define policy exceptions and extensions with the GRC Approval Configurator

If you're a compliance manager, you can define the policy exceptions and extensions for granular, multi-level approval workflows by using the GRC Approval Configurator. The GRC Approval Configurator is a tool within the Governance, Risk, and Compliance application.

GRC Approval Configurator Overview

A policy exception is a formal, temporary authorization to deviate from a standard policy or procedure, typically for a defined business reason or in response to an issue. A policy extension is a request to prolong the duration of an existing policy exception, requiring a re-assessment of the situation and potentially another approval. Both processes can be handled by using the GRC Approval Configurator.

The GRC Approval Configurator enables you to define the approval rules for exceptions and extensions, assign approvals to designated users or groups, and implement multi-level approval flows. Exception and Extension requests are automatically routed based on the configured rules and data within the record, and approvers can directly approve or reject extensions within their workspace.

Benefits of using the GRC Approval Configurator for policy exceptions and extensions

The GRC Approval Configurator provides the following benefits for managing policy exceptions and extensions:

- Customized approval processes: Create customized approval rules that are based on specific conditions such as the exception type, requester role, or policy domain. This process helps to control the approval workflow and verify that each request is evaluated appropriately.
- Multi-level approvals: Configure a workflow that contains sequential approval levels to enable a thorough review and accountability. The workflow can include various stakeholders, such as compliance managers, subject matter experts (SMEs), and designated approvers.
- Dynamic rule-based approvals: Set up multi-level approval rules that are based on dynamic conditions. For example, an approval workflow can be sent to users or groups that are selected from fields in the source record, or can be assigned to users or groups that you select manually. You can also configure whether only one approval or all approvals are required at each level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Automated routing: Automate direct exception and extension requests to the relevant approvers based on the configured rules. The automated routing reduces manual effort and minimizes delays.
- Workspace integration: Enable your approvers to review and act on requests directly within their workspace so that you can help to maintain a clear audit trail and improve operational efficiency.

Workflow for policy exception approvals

The policy exception approval process consists of the following states:

- New: When a policy exception is created, it enters the New state.

  At this stage, the verification approvals are triggered to validate whether the exception request is legitimate. These approvals are created by using the Verification Configuration template.

- Analyze: After the verification is complete and approved (based on the verification rule), the request moves to the Analyze state.

  In this state, a compliance manager evaluates the request. If additional domain-specific insight is needed, they can either move it to the Review state for further analysis, or request input from an SME.

- Review: In this state, the request is reviewed in detail by the SME for technical validation.

- Awaiting Approval: After the SME input is gathered, the request enters the Awaiting Approval state for gathering the final approvals from the designated approvers (based on the final approval configuration rules).

- Approved: After final approval, the policy exception is marked as Approved and becomes active.

- Closed: When the exception is no longer required, it's moved to the Closed state.

Workflow for policy extension approvals

You can extend approved extensions through a similar approval process. Extension requests are routed by using the same GRC Approval Configurator. You can configure multiple approvers or groups to approve or reject extension requests.

Roles required for configuring policy exceptions and extensions

To configure policy exceptions and extensions, you must have the following roles:

- sn_compliance.manager to create approval rules.
- sn_grc.business_user or sn_grc.business_user_lite to view exception and extension records.

Configuring policy exceptions and extensions

After you have the required roles, you can then configure the policy exceptions and extensions by using the Approval Configurator.

Enable the GRC Approval Configurator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable the GRC Approval Configurator so that you can manage policy exceptions and extensions with granular, multi-level approval flows.

Define the policy verification rules

Configure granular approval rules for policy exception verification rules by using the GRC Approval Configurator.

Define the policy exception approval rules

Configure granular approval rules for policy exception approval rules by using the GRC Approval Configurator.

Define extension rules for policy exceptions

Enable the GRC Approval Configurator from the Policy and Compliance Properties page to allow multiple approvers for policy extension approvals, replacing the single default approver (Compliance Manager).

Enable the GRC Approval Configurator

Enable the GRC Approval Configurator so that you can manage policy exceptions and extensions with granular, multi-level approval flows.

Before you begin

Role required: sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Properties**.
2. Locate the **Enable GRC Approval Configurator instead of legacy and verification rules for policy exception** property, and select **Yes**.
3. Select **Save**.

Define the policy verification rules

Configure granular approval rules for policy exceptions and extensions by using the GRC Approval Configurator. This allows you to manage approvals with precise rule definitions and support multi-level approval workflows.

About this task

Verification rules validate policy exception or extension requests before they proceed to review or approval. These rules are configured using the Verification Configuration template, allowing you to define conditions based on status, sub-status, and other filters. When a policy exception is created, it enters the New state, triggering verification approvals. Upon successful verification, the request advances to the Analyze state for further evaluation.

Before you begin

Role required: sn_compliance.manager to create the policy verification rules.

Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**.
   The GRC Approval Configurator is shipped with default template for verification called **Policy Exception - Verification Config**.
2. Select **Policy Exception - Verification Config**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verification Configuration form

Field	Description
Priority	By default, the verification configuration is set with priority 1. **Note:** The verification configuration is set to priority 1 by default and should be retained to ensure initial verification approval before
Filter Condition	Filter conditions to define when the configuration should be activated. The available values are sourced from the Policy Exception table. By default, State is set to New. This is a mandatory condition. You can set other filter conditions as well. Use logical operators such as AND or OR to build complex condition sets.
Domain	Functional group or role that should be associated with the approval flow.
Applies to	Verify that the **Policy exception (sn_compliance_policy_exception)** option is selected.
Active	Option to enable the configuration.
Name	Name of the verification configuration. By default, the template name is **Policy Exception - Verification Config**. You can change the template name.

4. Add approval levels to the configuration in the Approval Levels table.
   A default approval level called **Verification Config - Level 1** is already set up. You can add multiple levels for the configuration. Each level can have its own rules, assigned users or groups, and triggering conditions.
5. Select **Verification Config - Level 1**.
6. On the form, change the following fields:

Verification Level form

Field	Description
Name	By default, the name provided is Verification Config - Level 1. You can retain the same name or change the name.
Level	Keep the level as 1, as this is the first level that we are configuring.

7. Select **Submit**.
8. Add additional approval levels to the configuration by selecting **New** in the Approval Levels table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verification Level form

Field	Description
Name	Provide a name to the new level.
Level	Assign the level.

9. Select **Submit**.
   After adding the required approval levels, add verification rules to each level.
10. To add verification rules, select the configured verification level, and do the following:

    a. In Approval Rules, select **New**.

    b. On the form, fill in the fields.

Rule configuration form

Field	Description
Name	Name for this rule.
Description	Description for the rule.
Source	Source table for rule evaluation.
Additional condition	Option to refine the source table by applying additional filters.
Query using field	Field on the source record to query for matching approval conditions.
Approve type	Approval type options: ▪ **Specific approvers**: Select individual users, groups, or both as approvers directly. This option enables you to assign approvers manually without relying on dynamic or source-based logic. ▪ **Approver from source**: Select approvers that are based on values from the source table. You can select a user field, a group field, or both to determine approvers dynamically from the source record. ▪ **Dynamic approvers**: Define approvers dynamically using the source. Apply static or advanced dynamic conditions to filter approvers. You can select a user field, group field, or both to determine who should approve. ▪ **Scripted approvers**: Use a script to determine the approvers programmatically. The script must populate the users and groups variables.
Approval required from	Approval options: Select **All** to make it required for all the selected users to approve the exception. Select **Anyone** to enable a single user to approve on behalf of all approvers.

    c. Select **Submit**.

Define the policy exception approval rules

Approval rules define how policy exception requests are reviewed and approved, enabling organizations to create customized, multi-level workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_compliance.manager to create the policy exception approval rules.

About this task
Approval rules enable organizations to create customized, multi-level workflows for reviewing and approving policy exception requests based on specific filter conditions. These rules support dynamic assignment of approvers and allow configuration of approval requirements at each level. Once configured, requests are automatically routed to the designated approvers, streamlining the approval process.

Procedure
1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**.
   The GRC Approval Configurator is shipped with default template for approval called **Policy Exception - Approval Config**.
2. Select **Policy Exception - Approval Config**.
3. On the form, fill in the fields.

Approval Configuration form

Field	Description
Active	Option to enable the configuration.
Filter Condition	Filter conditions to define when the configuration should be activated. The available values are sourced from the Policy Exception table. By default, State is set to Awaiting Approval. This is a mandatory condition. You can set other filter conditions as well. Use logical operators such as AND or OR to build complex condition sets.
Name	Name of the approval configuration. By default, the template name is **Policy Exception - Approval Config**. You can change the template name.
Domain	Functional group or role that should be associated with the approval flow.
Priority	By default, the approval configuration is set with priority 2. **Note:** The approval configuration is set to priority 2 by default and should be retained to ensure that this approval triggers immediately after verification of policy exception requests.
Applies to	Verify that the **Policy exception (sn_compliance_policy_exception)** option is selected.

4. Add approval levels to the configuration in the Approval Levels table.
   A default approval level called **Approval Config - Level 1** is already set up. You can add multiple levels for the configuration. Each level can have its own rules, assigned users or groups, and triggering conditions.
5. Select **Verification Config - Level 1**.
6. On the form, change the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verification Level form

Field	Description
Name	By default, the name provided is Approval Config - Level 1. You can retain the same name or change the name.
Level	Keep the level as 1, as this is the first level that we are configuring.

7. Select **Submit**.
8. Add additional approval levels to the configuration by selecting **New** in the Approval Levels table.

Verification Level form

Field	Description
Name	Provide a name to the new level.
Level	Assign the level.

9. Select **Submit**.
   After adding the required approval levels, add verification rules to each level.
10. To add verification rules, select the configured verification level, and do the following:

    a. In Approval Rules, select **New**.

    b. On the form, fill in the fields.

Rule configuration form

Field	Description
Name	Name for this rule.
Description	Description for the rule.
Source	Source table for rule evaluation.
Additional condition	Option to refine the source table by applying additional filters.
Query using field	Field on the source record to query for matching approval conditions.
Approve type	Approval type options: ▪ **Specific approvers**: Select individual users, groups, or both as approvers directly. This option enables you to assign approvers manually without relying on dynamic or source-based logic. ▪ **Approver from source**: Select approvers that are based on values from the source table. You can select a user field, a group field, or both to determine approvers dynamically from the source record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ **Dynamic approvers**: Define approvers dynamically using the source. Apply static or advanced dynamic conditions to filter approvers. You can select a user field, group field, or both to determine who should approve. ▪ **Scripted approvers**: Use a script to determine the approvers programmatically. The script must populate the users and groups variables.
Approval required from	Approval options: Select **All** to make it required for all the selected users to approve the exception. Select **Anyone** to enable a single user to approve on behalf of all approvers.

c. Select **Submit**.

Define extension rules for policy exceptions

Enable the GRC Approval Configurator from the Policy and Compliance Properties page to allow multiple approvers for policy extension approvals, replacing the single default approver (Compliance Manager).

Before you begin

Role required: sn_compliance.manager to create the policy exception approval rules.

About this task

Extension rules govern how requests to prolong an existing policy exception are reviewed and approved. Using the GRC Approval Configurator, organizations can define tailored workflows for these extensions, including assigning multiple approvers, setting dynamic conditions, and automating routing based on record data. This configuration allows multiple approvers to be designated, thereby overcoming the previous constraint of relying on a single default approver, namely the Compliance Manager.

Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**. The GRC Approval Configurator is shipped with default template for approval called **Policy Exception - Extension Config**.
2. Select **Policy Exception - Approval Config**.
3. On the form, fill in the fields.

Approval Configuration form

Field	Description
Active	Option to enable the configuration.
Filter Condition	Filter conditions to define when the configuration should be activated. The available values are sourced from the Policy Exception table. By default, State is set to Approved, and Substate to Under review. These are mandatory conditions. You can set other filter conditions as well. Use logical operators such as AND or OR to build complex condition sets.
Name	Name of the approval configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	By default, the template name is **Policy Exception - Extension Config**. You can change the template name.
Domain	Functional group or role that should be associated with the approval flow.
Priority	By default, the approval configuration is set with priority 2. **Note:** The approval configuration is set to priority 2 by default and should be retained to ensure that this approval triggers immediately after verification of policy exception requests.
Applies to	Verify that the **Policy exception (sn_compliance_policy_exception)** option is selected.

4. Add approval levels to the configuration in the Approval Levels table.
   A default approval level called **Extension Approval - Level 1** is already set up. You can add multiple levels for the configuration. Each level can have its own rules, assigned users or groups, and triggering conditions.
5. Select **Extension Approval - Level 1**.
6. On the form, change the following fields:

Verification Level form

Field	Description
Name	By default, the name provided is Extension Approval - Level 1. You can retain the same name or change the name.
Level	Keep the level as 1, as this is the first level that we are configuring.

7. Select **Submit**.
8. Add additional approval levels to the configuration by selecting **New** in the Approval Levels table.

Verification Level form

Field	Description
Name	Provide a name to the new level.
Level	Assign the level.

9. Select **Submit**.
   After adding the required approval levels, add verification rules to each level.
10. To add verification rules, select the configured verification level, and do the following:
    a. In Approval Rules, select **New**.
    b. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rule configuration form

Field	Description
Name	Name for this rule.
Description	Description for the rule.
Source	Source table for rule evaluation.
Additional condition	Option to refine the source table by applying additional filters.
Query using field	Field on the source record to query for matching approval conditions.
Approve type	Approval type options: ▪ **Specific approvers**: Select individual users, groups, or both as approvers directly. This option enables you to assign approvers manually without relying on dynamic or source-based logic. ▪ **Approver from source**: Select approvers that are based on values from the source table. You can select a user field, a group field, or both to determine approvers dynamically from the source record. ▪ **Dynamic approvers**: Define approvers dynamically using the source. Apply static or advanced dynamic conditions to filter approvers. You can select a user field, group field, or both to determine who should approve. ▪ **Scripted approvers**: Use a script to determine the approvers programmatically. The script must populate the users and groups variables.
Approval required from	Approval options: Select **All** to make it required for all the selected users to approve the exception. Select **Anyone** to enable a single user to approve on behalf of all approvers.

c. Select **Submit**.

Using the Classic user interface for Policy and Compliance tasks

You can continue to use the Classic environment to perform all Policy and Compliance Management activities.

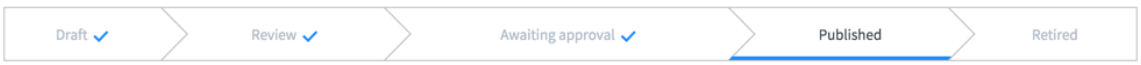
As a compliance manager or compliance user with specific roles you can perform Policy and Compliance Management related tasks such as manage control objectives, policies, policy exceptions and extensions, issues, and others.

Manage control objectives and policies

The Policies and Procedures module contains overview and detailed information related to policy approvals, policies, and control objectives.

Policies and Procedures Overview

Policies and Procedures Overview is contained in the **Policies and procedures** module and provides an executive view into compliance requirements, overall compliance, and compliance breakdowns so areas of concern can be identified quickly. Users with the compliance administrator and compliance manager roles view the **Policies and Procedures Overview**.



© 2026 ServiceNow, Inc. All rights reserved.

Policies and Procedures Overview reports in the base system

Name	Visual	Description
Control compliance	Donut chart	Displays the overall compliance of all the controls in the system.
Control details	Donut chart	Displays a breakdown of controls grouped by owner, category, or type.
Control Overview	Column Chart	Displays the total number of controls related to each policy. The chart is stacked to display the overall control compliance status for each policy.
Control Issues by Policy (Opened Date)	Line Chart	Displays the number of control issues opened each week, grouped by policy.
Policy Exceptions	List	Displays a list of control issues that have been closed with a response value of accept, meaning the issue was not remediated.
Total Control Objectives by Policy	Bar graph	Displays a count of the overall number of control objectives in each policy. The chart is stacked to display control objectives by type.

Policy approval process

Policies are part of a strict approval process that ensures compliance and reduces exposure to risk. When a policy is published, it is automatically incorporated in the approval process. Compliance managers set the length of time that policies are valid, ensuring that the team reviews the policy often to affirm its validity. Policies have a type, such as a policy, procedure, standard, plan, checklist, framework, or template.

Policy approval states

State	Description
Draft	All policies start in **Draft** state. In this stage, all compliance users can modify the policy and control objectives.
Review	The owner, owning group, and reviewers can modify the policy and control objectives and send it on to the next state.
Awaiting Approval	The policy is read only in this state. Approved policies transition to the **Published** state. Unapproved policies return to **Review**. If no approvers are identified on the policy form, the state is skipped and the policy is published without an approval.
Published	Approved policies are automatically published to a template-defined KB article, and the policy remains in a read-only state. The **Valid to** field

Policy approval states (continued)

State	Description
	on the policy form defines how long the policy is valid. **Note:** After the policy is published and when the valid to date on the policy is reached, then based on the value of the *Number of days after reaching a policy "Valid to" date in which the expired policy will automatically move from its Published state back to a Draft/Review state* property, the policy moves back to the Draft/Review state. For example, if the value of the property is 10, then the policy moves back to review state 10 days after the valid to date is reached. When a policy reaches the end of the **Review** state and is **Approved** for publishing, it is automatically published to the GRC knowledge base (as defined in **Policy and Compliance** > **Administration** > **Properties**. The **Article template** field on the policy form defines the style of the published policy.
Retired	When a policy is put into the **Retired** state, its associated KB article is removed.

Policies

Compliance managers catalog and publish internal policies that define a set of business processes, procedures, and or standards.

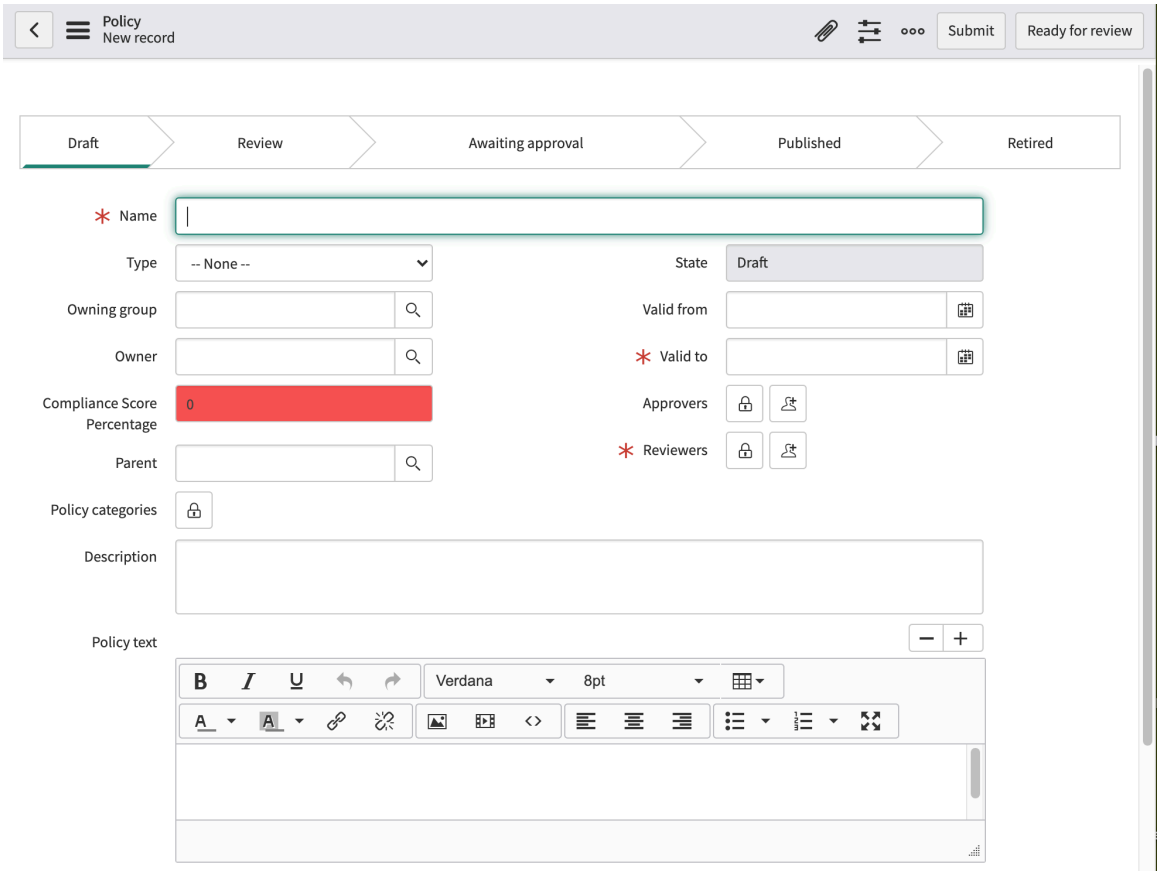
Control objectives

Compliance managers catalog the control objectives and generate controls from those control objectives.

Note:
UCF refers to control objectives as controls. When UCF data is imported, controls are imported into the control objectives table.

Create a policy

A policy defines an internal practice that processes must follow. Policies are defined as policies, procedures, standards, plans, checklists, frameworks, and templates.



Before you begin
Role required: sn_compliance.admin or sn_compliance.manager

Users with Compliance user (sn_compliance.user) role can also create policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Click **New**.

3. On the form, fill in the fields.

Policy

Field	Description
Name	The name of the policy.
Type	List of options: ○ Policy ○ Procedure ○ Standard ○ Plan ○ Checklist ○ Framework ○ Template
Owning Group	Group that owns the policy.
Owner	User that owns the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Compliance Score Percentage	The compliance score percentage assigned to this policy.
Parent	The policy containing this policy. If you create a control objective from within a policy, this field is automatically filled.
Policy categories	Click the lock icon and select one or more categories for filtering policies. For example, select Vulnerability Response to view policies associated with that application.
State	The state is a read-only field. Possible choices are: ○ **Draft** In this state, all compliance users can modify the policy and control objectives. All compliance users can click **Request review** button. Enter a message in the Request review pop-up and click **Request** , which sets the state to Review. ○ **Review** In this state, the owner, owning group, and reviewers can modify the policy and control objectives. The owner, owning group, and reviewers click **Request approval**, starting the workflow by sending approvals to the users in the Approvers list. The owner, owning group, and reviewers move the policy back to Draft, by clicking **Back to draft**, as well. ○ **Awaiting approval** In this state, the policy and control objectives are read-only for all. Approvers can approve the policy by updating the approval state in the **Approvals** Related List on the policy form, or by viewing **My Approvals**. If the policy is approved, the policy goes to the **Published** state. Otherwise, it goes back to the **Review** state. ○ **Published** In this state, the policy and control objectives are read-only for all. Admins can click **Retire** which sets the state of the policy to **Retired** ○ **Retired** In this state, the policy is read-only for all.
Valid from	The date and time for which the policy becomes valid.
Valid to	The date and time for which the policy is no longer valid.
Approvers	The users you want to be included in the approval process.
Reviewers	Select the users you want to be included in the review process.
Description	A general description of the policy.
Policy text	A detailed description of the policy.
Knowledge Base	
Knowledge base	The knowledge base article related to this policy.
KB article	The KB article number and link where the policy is published.
Article template	The article template to use for the publication of this policy.
Acknowledgement Setup	
Audience	Select the default audience responsible for acknowledging this policy.
Reference Material URL	Click the lock icon to add the URL for any needed reference materials, such as certification or training materials.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Allow users to decline policy	Select this check box to give users the option of declining policy acknowledgements.
Allow users to request exception	Select this check box to give users the option of requesting exceptions for policy acknowledgements.
Exception Setup	
Maximum exception duration (days)	Enter the maximum number of days for which a policy exception can be requested for a given policy.

4. Continue with one of the following options.
   - To save and submit the policy, click **Submit**.
   - To mark the policy ready for review, click **Request review** .

What to do next

If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Approve and publish a policy

When a policy is approved, it is automatically published.

Before you begin

Role required: sn_compliance.user or sn_compliance.manager

Note:
For more information:

- About a policy, see An overview of policy life cycle in Policy and Compliance Management.
- About GRC application, see Governance, Risk, and Compliance.

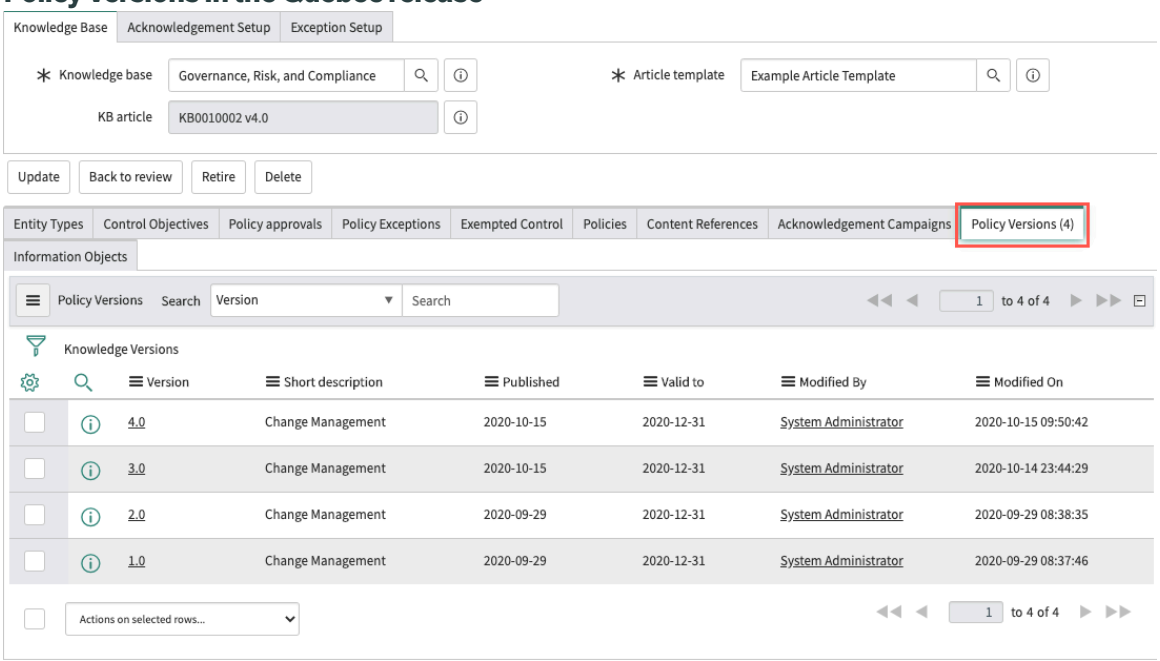
About this task

Prior to Version 11.0.2 of the GRC: Policy and Compliance Management application, a new knowledge base article overwrote the previous version whenever you made changes to a policy. Starting with Version 11.0.2, when you again approve a policy, a new version of the KB article is created and listed in the **Policy Versions** tab, along with a history of previous versions.

This feature requires that you manually install and activate the Knowledge Management Advanced Installer [com.snc.knowledge_advanced.installer] plugin. For more information, see Activate a plugin .

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the policy record.
3. Review the policy details.
4. Click the **Request Approval** button.
   Reviewers cannot request approval for a policy. However, the owner of the policy with sn_compliance.user, which is the minimum required role, and users with compliance manager



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

role can request approval for a policy. When approval is granted, the policy is published and a knowledge base (KB) article is automatically created with the details of the policy.

5. Any time you need to make changes to the policy, you can click **Edit policy** and enter a message in the pop-up, and click **Request Approval**. Add a comment in the pop-up. When approval is granted, a new version of the knowledge base article is created.

Note:
As described above, if you activated the Knowledge Management Advanced Installer [com.snc.knowledge_advanced.installer] plugin, a new version of the KB article is created and listed in the **Policy Versions** tab, along with a history of previous versions as shown below.

Policy versions in the Quebec release

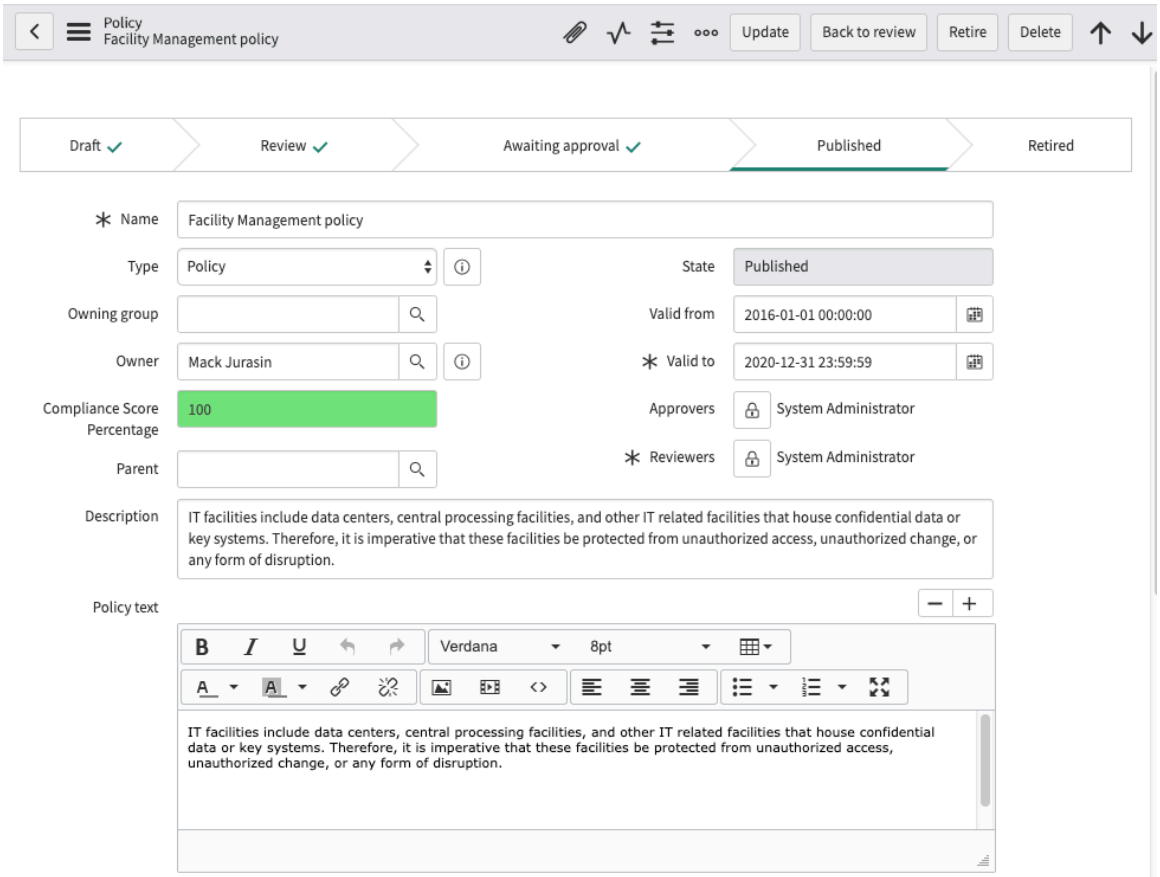
So, if you create links to this policy from the Service Portal or elsewhere, the latest version of the KB article is always displayed.

Acknowledge a policy

After a policy has been published, you can create an acknowledgement campaign to define a group of your employees who must provide an acknowledgement that a particular policy is in compliance. When the campaign has been defined, you can submit the request to the audience.

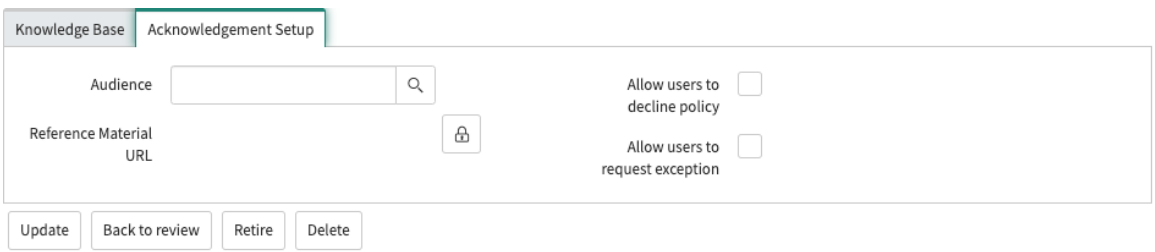
Set up a policy acknowledgement campaign

A policy campaign is the record used to prepare for a policy acknowledgement request. It defines the audience who must provide an acknowledgement that a particular policy is in compliance. A policy campaign is requested only if the compliance user decides it is needed.



Before you begin

Role required: Compliance User

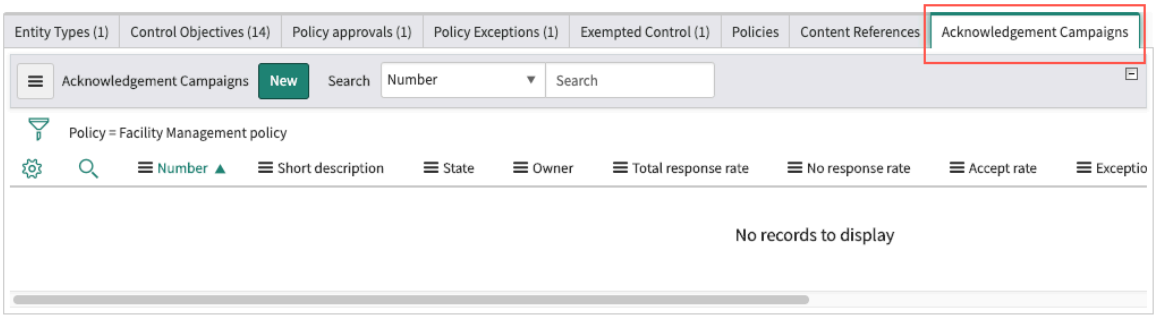


Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the Policy record in the **Published** state you want to acknowledge.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Scroll down and click the **Acknowledgement Setup** related list.



4. On the form, fill in the fields.

Field	Description
Audience	Select the employees who are responsible for acknowledging the policy. You define the audience using the Audience module.
Reference Material URL	Click the lock icon and add a URL to reference materials for the policy that the audience can review. When you have completed your entry, click the lock icon again.
Allow users to decline policy	Select if you want members of the audience to be able to decline the policy.
Allow users to request exception	Select if you want to members of the audience to be able to request a policy exception.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Save the record.
6. Scroll down and click the **Acknowledgement Campaigns** related list.

7. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Notice that the majority of the fields are pre-filled with data from the policy record.

8. On the form, fill in the fields.

Note:
Only field description that were not previously described are provided here.

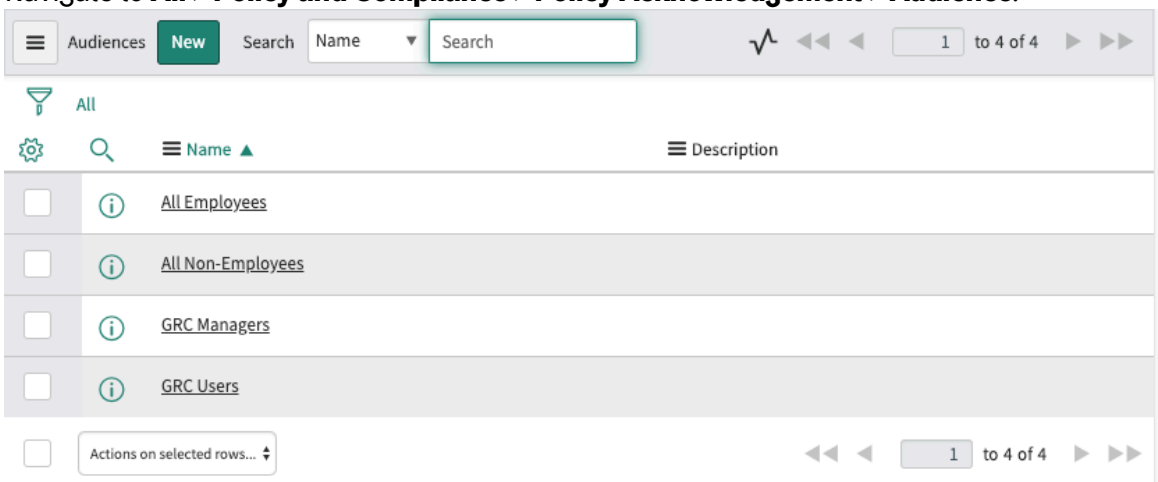
Field	Description
Number	An auto-generated record number for the acknowledgement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	The current state of the acknowledgement campaign. The default state is New.
Valid from/to	Select the period of time the acknowledgement is valid. The acknowledgement is valid from the beginning of the **Valid from** date until the end of the **Valid to** date. **Note:** The **Valid from** date cannot be prior to the current date. The **Valid to** date cannot be beyond the **Valid to** date defined in the policy.
Number of days to respond	The number of days by which members of the audience have to respond.
Short description	A brief description of the policy.
Acknowledgement Details tab	This tab shows details and requirements from the policy, as well as the **Reference Material URL** defined during acknowledgement setup.

9. Click **Submit**.
   The acknowledgement request is now ready for you to send to the defined audience.

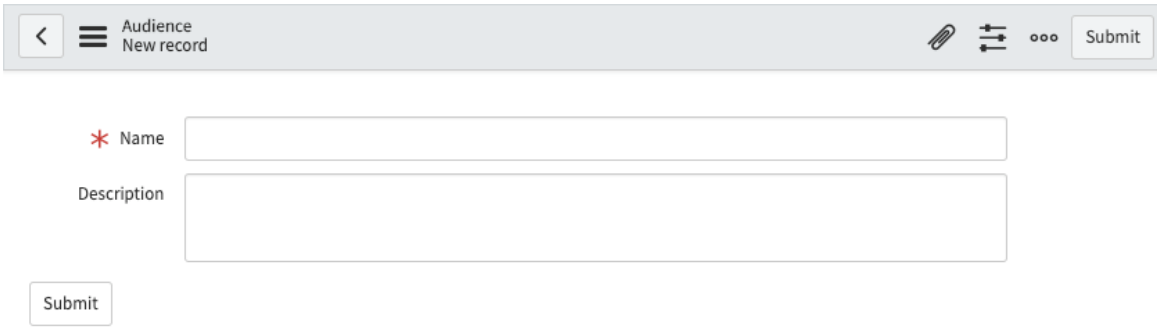
Create an audience



When you set up a policy acknowledgement request, you must identify an audience responsible for providing the acknowledgement.

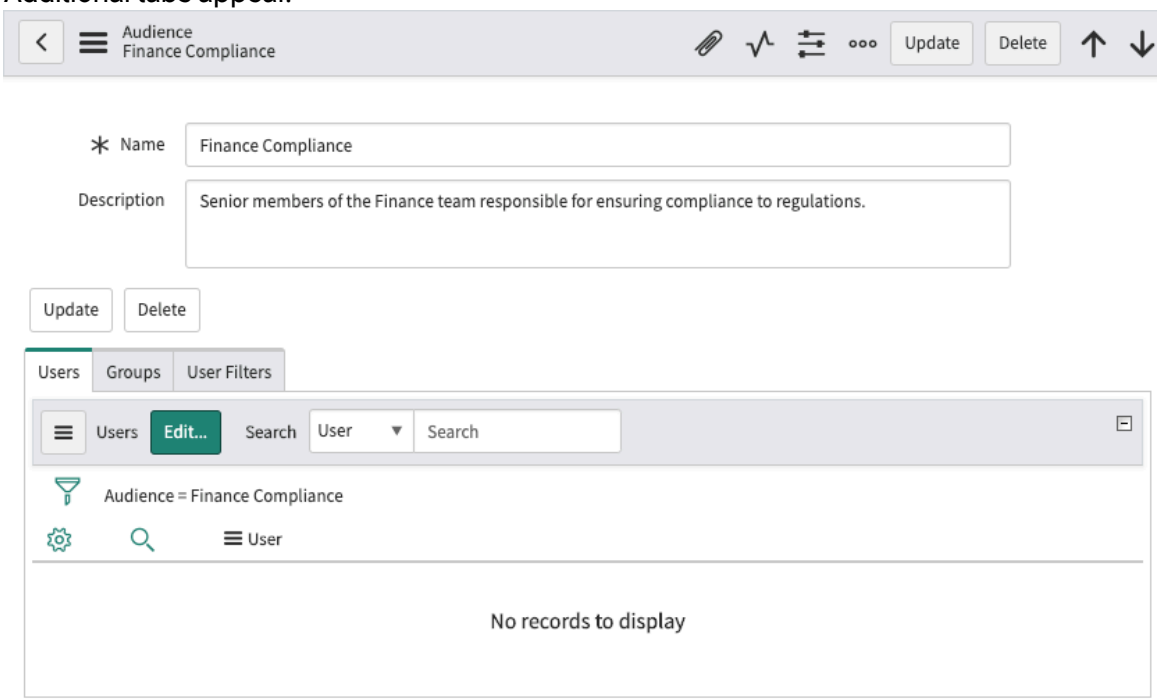
Before you begin

Role required: sn_compliance_admin or sn_compliance_manager



Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Acknowledgement** > **Audience**.



2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enter a name and description for the new audience, and save the record.
4. Additional tabs appear.

5. Use the three tabs to identify members for this audience.

Option	Description
Users	Click **Edit** and add one or more individual users to the audience.
Groups	Click **Edit** and add one or more predefined groups of users to the audience.
User Filters	Click **New** to define a new filter for audience member inclusion. Click **Edit** to modify an ex isting user filter. You can save filters for future use.

6. When the audience has been defined, you can add the users, groups, or user filters to an acknowledgement request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Submit an acknowledgement request

After you have created an acknowledgement campaign, you can submit the acknowledgement request to the defined audience.

Before you begin

Role required: sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **My Acknowledgement Campaigns**.
2. Open the Policy Acknowledgement Campaign (PAC) record you want to submit to the defined audience.
3. Ensure that you have set up and saved the acknowledgement in the Acknowledgement Setup related list.
4. Click the **Acknowledgement Campaigns** related list.
5. Click **New**.

   Note:
   The majority of the fields are pre-filled with data from the policy record.

6. On the form, fill in the fields.

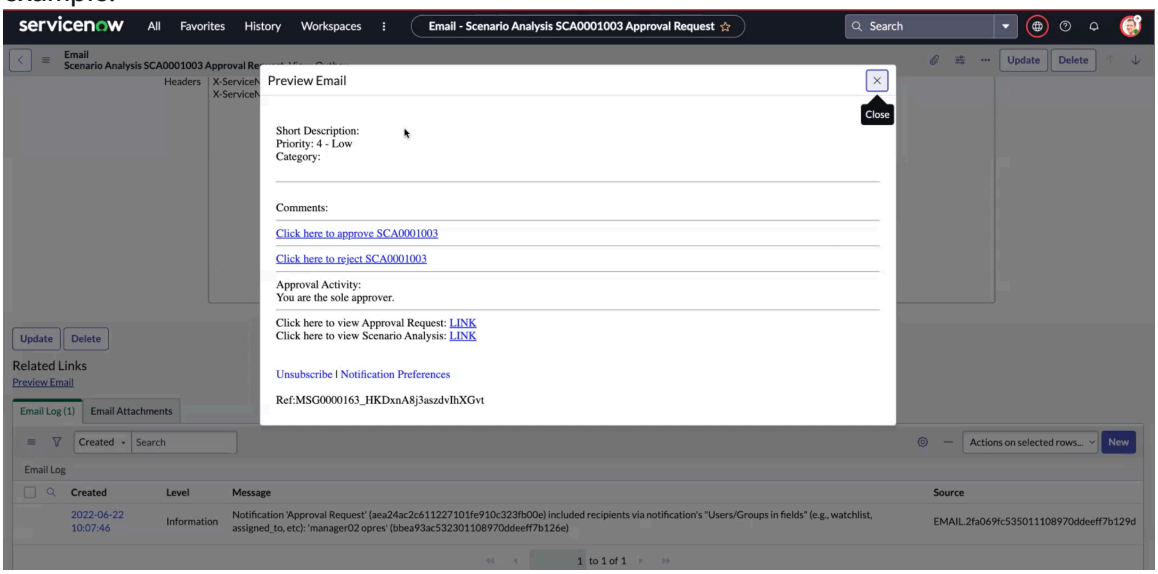
   Note:
   Only field description that were not previously described are provided here.

   ### Acknowledgement Campaign form

Field	Description
Number	An auto-generated record number for the acknowledgement.
State	
Valid from/to	Select the period of time the acknowledgement is valid. The acknowledgement is valid from the beginning of the **Valid from** date until the end of the **Valid to** date. **Note:** The **Valid to** date cannot be beyond the **Valid to** date defined in the policy.
Number of days to respond	The number of days by which members of the audience have to respond.
Short description	A brief description of the policy.
Acknowledgement Details tab	This tab shows details and requirements from the policy, as well as the **Reference Material URL** defined during acknowledgement setup.

7. Click **Submit**.
   The **Request Acknowledgement** button appears.
8. Click **Request Acknowledgement**.
9. Notice that the following changes occur.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- The state of the acknowledgement campaign changes to **Pending Acknowledgement**.
- Acknowledgement (ACK) records for each member of the audience appear at the bottom of the screen.
- The **Acknowledgement Results** tab shows the progress of the acknowledgement process. That is, it reports the total number of acknowledgements sent, and keeps a running tally of the number and types of responses received (for example, number of accepted, declined, exempted, and so forth).

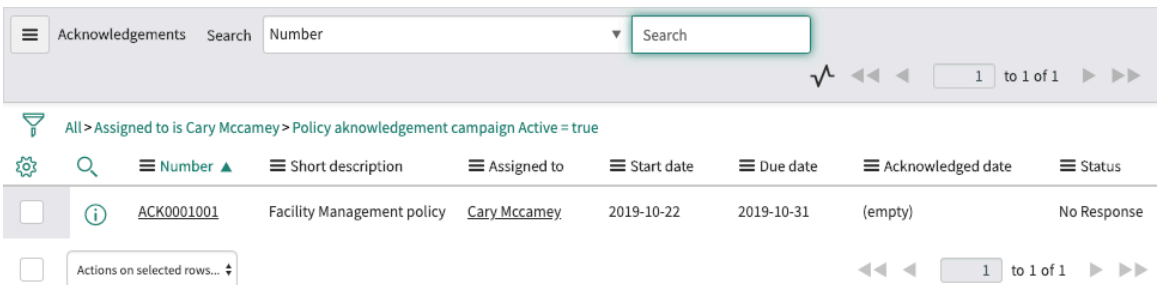
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Activity** tab shows acknowledgement activities as they happen. The compliance user can click the Work notes check box and post work notes to track changes. The Additional comments box can be used to communicate with the audience.

Also, each member of the audience receives an email notification similar to the following example.

10. As the acknowledgement period elapses, you can monitor the progress of the responses by navigating to **Policy and Compliance** > **Policy Acknowledgement** > **Pending Acknowledgements**.
11. You can also identify any audience members who have exceeded the acknowledgement time line by navigating to **Policy and Compliance** > **Policy Acknowledgement** > **Overdue Acknowledgements**.

Respond to an acknowledgement request



After you have been identified as a member of an audience to provide a policy acknowledgement, you must open and review the record, and then acknowledge it.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

Procedure

1. After you have received a notification that you are required to acknowledge a policy, navigate to **Policy and Compliance** > **Policy Acknowledgement** > **My Acknowledgements**.

2. To provide the acknowledgement, open the record and perform one of the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The available options depend on how the acknowledgement request was configured.

The available options depend on how the acknowledgement request was configured.

- The default status of the policy acknowledgement is **New**.
- The policy acknowledgement is set to **Pending Acknowledgement**, if:
  - the policy acknowledgement has reached the time set as **Frequency**.
  - the policy acknowledgement has reached the Valid From date, if it is the ad hoc acknowledgement
  - you click the **Pending Acknowledgement** button to move its state manually.
- The policy acknowledgement is in Closed state, if:
  - you move it manually to **Closed** state
  - it reaches the **Valid to** date
- The state moves to **Cancel** if:
  - you manually click **Cancel** button
  - the policy exception is rejected, the acknowledgement is reset to Cancel

Following options are available when the policy acknowledgement instance is set to different states:

Accept

If the policy is in compliance, click **Accept**.

Decline

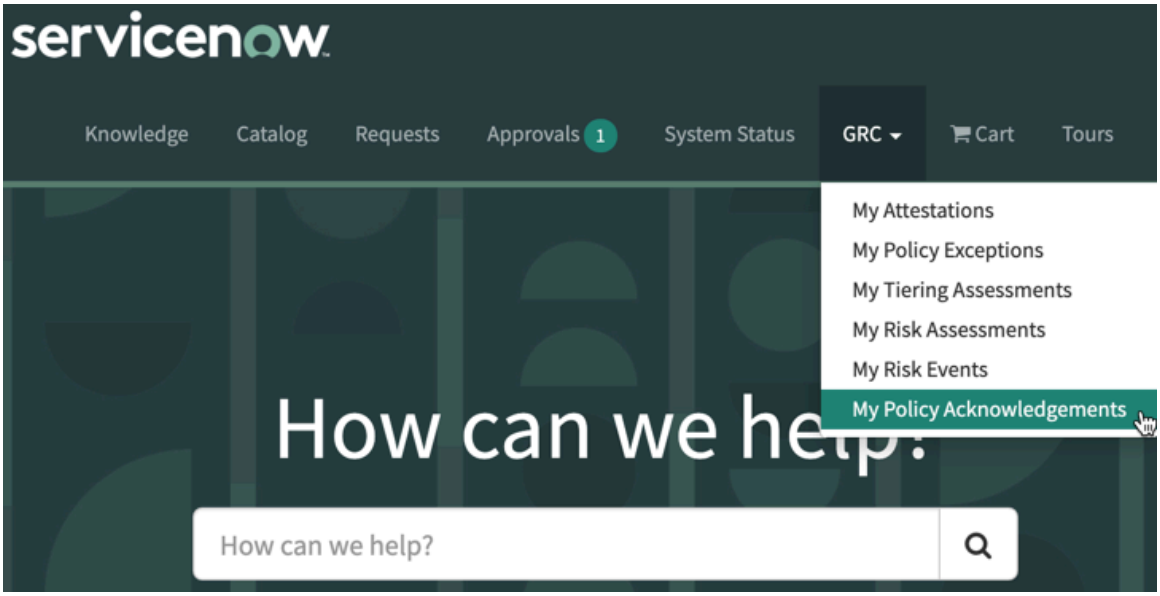
If the policy is not in compliance and the request is configured in such a way that you are allowed to decline the request, click **Decline**.

Request Exception

If, for any reason, you do not want to respond, and the request is configured in such a way that you can opt out, click **Request Exception**.

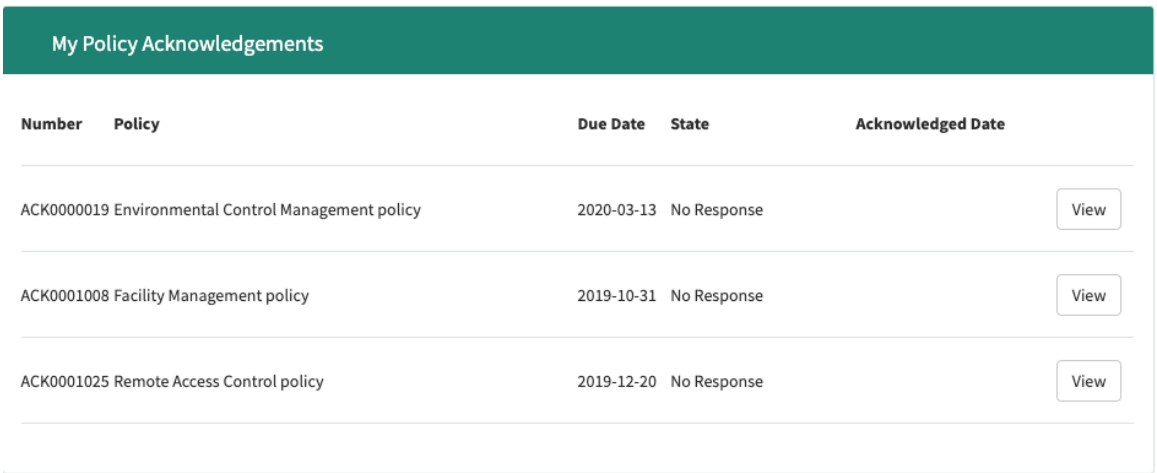
Work with acknowledgements using the Service Portal

After you have received a request to provide acknowledgement for a policy, you have the option of working with the request in the ServiceNow AI Platform, or you can perform your actions in the ServiceNow Service Portal.



Before you begin

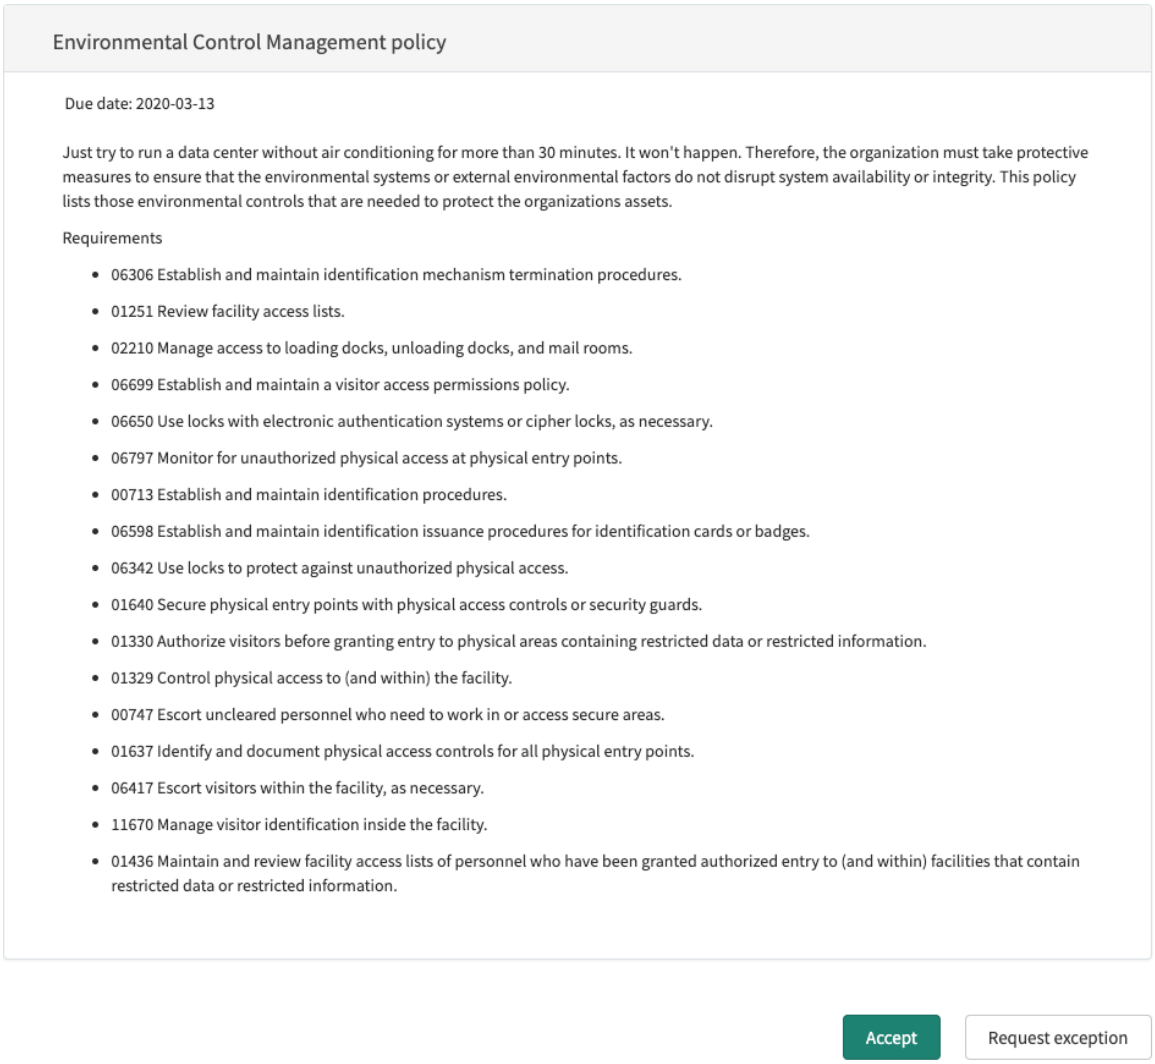
Role required: sn_grc.business_user, sn_grc.business_user_lite, sn_grc_emp_user.grc_employee



Procedure

1. Navigate to the ServiceNow Service Portal.
2. In the header bar, navigate to **GRC** > **My Policy Acknowledgements**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



All pending policy acknowledgement requests assigned to you appear.

3. To view details of the request, click **View**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The actions you can perform on the policy acknowledgement depend on how the acknowledgement campaign was configured, as follows.

Option	Description
If the policy is in compliance	Click **Accept**.
If the policy is not in compliance and you are allowed to decline the request	Click **Decline**.
If you do not want to respond, and you want to opt out	Click **Request Exception**.

Retire a policy

Retiring a policy is part of the policy management process.

Before you begin
Role required: sn_compliance_admin or sn_compliance_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A policy can be retired anytime after being approved and published to the KB. If the policy has reviewers, then one month before the policy retires, it is moved to the Review state. If there are no reviewers for the policy, then it is moved to the Draft state.

Procedure

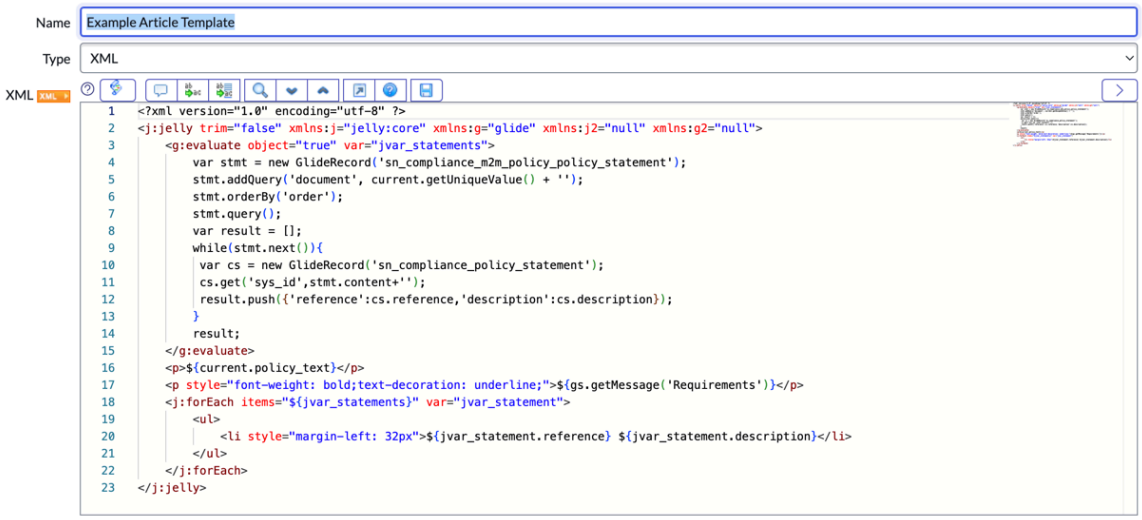
1. Navigate to **All** > **Policy and Compliance** > **Policies**.
2. Open the Policy record.
3. In the top-right corner, click **Retire**.
   This option is available only for policies in a published state.

Create a GRC article template

Policy and Compliance managers can create templates for policy article publishing.

Before you begin

Role required: sn_compliance.developer



Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Article Templates**.
2. Click **New**.
3. On the form, fill in the fields.

Authority Document

Field	Description
Name	Name of the article template.
Type	○ Script ○ HTML ○ XML
Script	The script code. This field depends on the **Type** field.
HTML	The HTML code. This field depends on the **Type** field.
XML	The XML code. This field depends the **Type** field.
Is default	Option to indicate that this template is used as the default template for all KB articles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.

Create a control objective

A control objective is an objective, direction, or standard that acts as guidance for company interactions and operations. Control objectives can be categorized, classified, and related to policies.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

About this task

To understand the difference between a control objective and a control, see Structural overview of Policy and Compliance Management.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Control Objectives**.
2. Click **New**.
3. On the form, fill in the fields.

Control Objectives form

Field	Description
Name	Name of the control objective.
Source	Source of the control objective. For example, if the control objective is from a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this control objective.
Reference	Unique numerical identifier.
Parent	Control objective that is not a child of the current control objective. This is to avoid cyclic parent – child relationship.
Compliance Score Percentage	Compliance score percentage calculated for this control objective and it's color code:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ 80 and higher in green ○ 80 to 50 in yellow ○ below 50 in red
Active	Option that indicates whether a control objective is active.
Creates controls automatically	Option that indicates that controls are automatically created from the control objective. **Note:** Select this option if the control objective can also serve as the control.
Category	List of options: ○ Acquisition or sale of facilities, technology, and services ○ Audits and risk management ○ Compliance and Governance Manual of Style ○ Human Resources management ○ Leadership and high-level objectives ○ Monitoring and measurement ○ Operational management ○ Physical and environmental protection ○ Privacy protection for information and data ○ Records management ○ System hardening through configuration management ○ Systems continuity ○ Systems design, build, and implementation ○ Technical security ○ Third Party and supply chain oversight ○ Root ○ Deprecated
Classification	List of options: ○ Preventive ○ Corrective ○ Detective
Type	List of options: ○ Acquisition/Sale of Assets or Services ○ Actionable Reports or Measurements ○ Audits and Risk Management ○ Behavior

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Business Processes ○ Communicate ○ Configuration ○ Data and Information Management ○ Duplicate ○ Establish Roles ○ Establish/Maintain Documentation ○ Human Resources Management ○ Investigate ○ IT Impact Zone ○ Log Management ○ Maintenance ○ Monitor and Evaluate Occurrences ○ Physical and Environmental Protection ○ Process or Activity ○ Records Management ○ Systems Continuity ○ Systems Design, Build, and Implementation ○ Technical Security ○ Testing ○ Training
Attestation	List of options. ○ **GRC Attestation** is chosen by default ○ **Note:** If the user changes the control attestation, the related control objective attestation type is changed also.
Issue group rule	Group rule assigned to this control objective.
Description	Description of the control objective.

4. Click **Submit**.
   The control objective is created and all related lists are visible.
   - A control is created for every control objective when a policy is associated with an entity.
   - The control attributes default to the same attributes as the related control objective.

What to do next

If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deactivate a control objective

Deactivate control objectives that are no longer relevant to their citation or parent control objective.

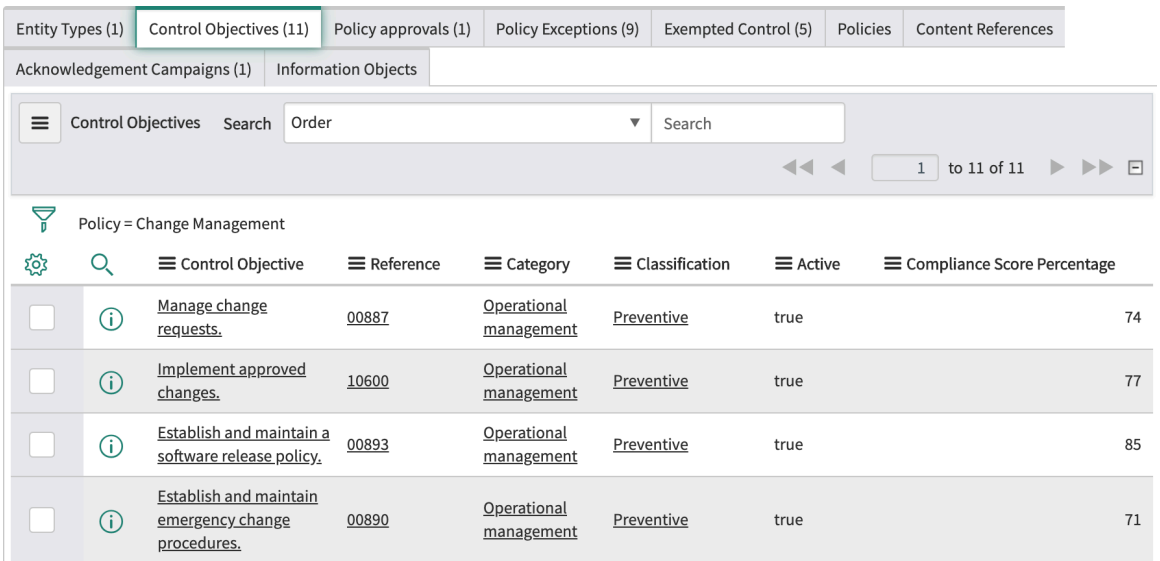
Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Control objective**.
2. Open a control objective.
3. In the control objective, clear the check box marked **Active**.
4. Click **Update**.

Relate a control objective to a policy



Associate the control objective to a policy individually when the policy is in the review or draft state by clicking the edit button in the Control Objective related list.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the policy record.
3. Click **Edit** in the **Control Objectives** related list.
   The slushbucket contains active control objectives with no associated policy selected.
4. Select the control objectives.
5. Click **Save**.
   Those control objective are listed in the **Control Objective** related list.

What to do next

If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relate a control objective to a citation

A single control objective can be mapped to many citations from different authority documents. This function allows you to test a control objective once while complying with many different citations.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance** > **Citations**.
2. Open a citation.
3. In the **Control Objectives** related list, click **New**.
4. On the form, fill in the fields.

Control objective form

Field	Description
Name	Name of the control objective.
Source	Source of the policy. For example, if the statement is from a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this authority document.
Reference	Unique numerical identifier.
Policy	Parent control objective supported by this control objective.
Parent	References the parent content.
Active	Option that indicates if a policy is active. If the control objective is not in the **Draft** or **Retired** states, a policy is marked active.
Category	Select from a list of options: ○ Acquisition or sale of facilities, technology, and services ○ Audits and risk management ○ Compliance and Governance Manual of Style ○ Human Resources management ○ Leadership and high-level objectives ○ Monitoring and measurement ○ Operational management ○ Physical and environmental protection ○ Privacy protection for information and data ○ Records management ○ System hardening through configuration management ○ Systems continuity ○ Systems design, build, and implementation ○ Technical security

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Third Party and supply chain oversight ○ Root ○ Deprecated
Classification	Select from a list of options: ○ Preventive ○ Corrective ○ Detective ○ IT Impact Zone
Type	Select from a list of options: ○ Acquisition/Sale of Assets or Services ○ Actionable Reports or Measurements ○ Audits and Risk Management ○ Behavior ○ Business Processes ○ Communicate ○ Configuration ○ Data and Information Management ○ Duplicate ○ Establish Roles ○ Establish/Maintain Documentation ○ Human Resources Management ○ Investigate ○ IT Impact Zone ○ Log Management ○ Maintenance ○ Monitor and Evaluate Occurrences ○ Physical and Environmental Protection ○ Process or Activity ○ Records Management ○ Systems Continuity ○ Systems Design, Build, and Implementation ○ Technical Security ○ Testing ○ Training
Description	Description of the control objective and how it supports the goals of the organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Submit**.
   The control objective that you created is related to the citation.

Create or deactivate a citation

Usually, authority documents, citations, and control objectives are downloaded from a third-party provider. However, citations can be created manually from an authority document. The **Active** option in a citation indicates whether the citation is active or inactive.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Authority Documents**.
2. Open an authority document.
3. In the **Citations** related list, click **New**.
4. On the form, fill in the fields.

Citation form

Field	Description
Name	User-defined name that identifies this citation.
Source	Source of the policy. For example, if the statement is from a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this authority document.
Reference	Content reference.
Type	Type of citation created. Optional field not used for any processing. Use the value in this field in reports or to query for records of a specific type. ○ Core Topic ○ Process ○ Control Objective ○ Control ○ Supporting information
Authority document	Name of the parent authority document for this citation. When you create citations from the authority document form, the system completes this field automatically.
Active	Option that indicates if a policy is active. A policy is marked active if it is not in the **Draft** or **Retired** state. To deactivate a citation, clear the check box marked **Active**.
Parent	References the parent content.
Description	Description of the citation.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an authority document

Authority documents manage a process and citations are created within them to manage points of the process. For example, the process called Building Security contains a citation for Entry Control.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **Policy and Compliance** > **Compliance** > **Authority Documents**.
2. Click **New**.
3. On the form, fill in the fields.

Authority Document

Field	Value
Name	Name of the document.
Number	Read-only field that is automatically populated with a unique identification number.
Source	A non-editable field with the source of the policy. For example, if the statement is from the UCF import, the source is UCF.
Source ID	The unique identification number used by the source to catalog this authority document.
Version	The unique version number used by the source to identify this authority document.
Common name	Abbreviated version of the **Name** field.
Category	Category for this authority document.
Type	The document type: ○ Audit Guideline ○ Best Practice Guideline ○ Bill or Act ○ Contractual Obligation ○ International or National Standard ○ Not Set ○ Organizational Directive ○ Regulation of Statute ○ Safe Harbor ○ Self-Regulatory Body Requirement ○ Vendor Documentation
Valid From	The date and time for which the policy becomes valid.
Valid To	The date and time for which the policy is no longer valid.
Url	The URL of the stored authority document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Description	More information about the authority document.

4. Right-click in the header bar and select *Save* from the context menu.
   The authority document is created and all related lists are visible.

> **Note:**
> Starting with Version 13.0.3 of the Policy and Compliance Management application, a **Taxonomy** related list appears. This related list allows you to update an existing taxonomy or map a new taxonomy to the authority document.

What to do next
Create a citation from the **Authority document** related list.

Related topics
Create or deactivate a citation

Deactivate an authority document

The **Active** option in an authority document indicates whether the authority documents have been retired.

Before you begin
Role required: sn_compliance.admin or sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance** > **Authority Documents**.
2. Open an authority document.
3. In the authority document, clear the check box marked **Active**.

   For Authority documents imported from UCF, users are not allowed to clear the **Active** check box as it is a read-only form.

Manage policy exceptions and extensions

Policy exceptions and extensions provide temporary relief for non-compliant controls.

The policy exception captures the rationale, comments, and evidence to support the acceptance or rejection of a policy exception request. Also, you can request an extension to an approved policy exception before the policy exception validity period. The control owner, the compliance manager, and the risk manager may be involved in the policy exception and extension workflow.

Request a policy exception

Users can request exceptions for policies, control objectives, or issues by specifying the reason of exception on a particular list of the systems, applications, networks, or entities for which the exception will apply. The user must also specify the duration for which the exception is required.

Before you begin
Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task
Exceptions provide temporary relief for users unable to meet compliance requirements due to extraordinary situations. For example, if the user is unable to meet a control that stipulates that all critical OS servers must be patched within 48 hours after the OS vendor releases patches.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **My Policy Exceptions**.
2. Click **New**.
3. On the form, fill in the fields.

Policy Exception form

Field	Description
Number	Unique identification number.
Requester	Person requesting the policy exception, usually the control owner.
Approval group	Group that has the compliance manager role. You cannot edit the approval group if the policy exception reaches Review state. If you do not provide an approval group, then the field defaults to compliance manager. Compliance manager is the default role if the policy exception is raised from any upstream application that is integrated with GRC. For example, if you raise a policy exception for a problem that is related to an incident and that problem is related to GRC.
Approver	User from the approval group. If the exception policy moves to the **Analyze** state, then you must select an approver.
State	State of the policy exception within the approval workflow.
Substate	Approval substate of the policy exception within the approval workflow.
Priority	Approval priority of this policy exception
Watch list	Users that are notified when the request is updated.
Name	Unique name of the policy exception.
Reason	Reason for requesting the policy exception. The requester can change the reason until the policy exception is approved.
Justification	Statement of explanation for the policy exception. Justification is also displayed in the **Additional comments** field of the **Comments** tab.
Source	
Source type	Type of policy exception that you want to create. The options are: ○ Policy: Create a policy exception based on a policy. ○ Control objective: Default is a single control objective on which the policy exception is created. When you select a control objective, the**Impacted controls** tab appears, where you can select controls associated to the control objective. ○ Controls: Option to create a policy exception on multiple controls. Select **Control** to associate multiple controls from different control objectives. This option supports multiple controls objectives for your policy exception, instead of creating multiple policy exceptions that could be applied on multiple controls. ○ Issue: Issue associated with this policy exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Control objective	Control objective associated with this policy exception.
Issue	Issue associated with this policy exception.
Target record	Target record table on which the policy exception is applied. This table is also referenced in the **Policy exception target table** field of the Policy Exception Integration Registry form.
Risk assessment	
Risk rating	Select the risk rating as determined by the risk assessment performed on the policy exception.
Risk description	Description of the risk as performed by the risk manager during risk assessment.
Analysis of risk and impact	Details on the likelihood of this risk occurring and residual impacts of this risk on the policy exception.
Risk mitigation plan	The risk mitigation plan for this policy exception.
Schedule	
Valid from	Day on which the policy exception begins.
Valid to	Day on which the policy exception ends. **Valid to** date must be after **Valid from** date and cannot be a past date.
Duration	Number of days between the **Valid from** and **Valid to** dates.
Approved extensions	Number of times extensions have been requested so far and have been approved.
Remaining extensions	Number of times extensions can be requested in future. `Remaining extensions = Value in the` *`Number of extensions allowed for a policy exception`* `property - Number of Approved extensions.`
Created	Date on which the policy exception was requested.
Date approved	Date on which the request was approved.
Extension date	Requested extension date, which is after the **Valid to** date.
Extension reason	Reason for extension.
Original valid to	Date until which the policy exception was originally requested and approved. The original **Valid to** date is populated only when the extension is approved.
Comments	
Work Notes	Work notes can be used by exception reviewers and approvers to share Information about the exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional comments	These comments are used by the reviewer to communicate additional information to the exception requester.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

Note:
In versions prior to Version 10.1, the **Risk assessment** tab was called **Business Impact Analysis** and required that the GRC: Risk Management application be activated. Starting in Version 10.1, the dependency on Risk Management has been removed and the associated field names have changed.

Approved extensions, **Remaining extensions**, **Date approved**, **Extension date**, **Extension reason**, **Original valid to** fields appear only when you have requested an extension on the policy exception and has been approved by the approver.

4. Save the policy exception.
5. Click any of the tabs to view the various types of information for the policy exception
6. Click **Update**.

Request an extension

Request an extension for the policy exception that you created.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

Procedure

1. Navigate to **All** > **Policy and Compliance** > **My Policy Exceptions**.
2. Open the policy exception for which you want to request extension.

   As a requester you can request extensions to a policy exception that is in Approved state more than once. Configure the *Number of extensions allowed for a policy exception* property to request policy extension multiple times.

   a. To set up the property, navigate to **All** > **Policy and Compliance** > **Administration** > **Properties**

   b. Enter the number in the *Number of extensions allowed for a policy exception* property.
   If you enter 20, then you can request 20 extensions for each policy exception.

   Note:
   If an extension request is rejected by the approver, then you can request another extension until the **Valid to** date is reached.

3. Click the **Request Extension** button.
4. On the pop-up, fill in the **Extension date**, **Extension reason**, and **Justification** fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request extension form

Field	Descriptions
Extension date	Requested extension date, which is later than the **Valid to** date.
Extension reason	Reason for extension.
Justification	Statement of explanation for the request extension. Justification is also displayed in the **Additional comments** field of the **Comments** tab.

5. Click **Request**.
   You can see the policy extension details in the Schedule tab of the Policy exception form after the requester has requested for an extension and the extension has been approved by the approver.

Review the policy exception and extension request

After reviewing a policy exception request, a compliance manager can accept or reject the request. However, if the compliance manager doesn't have enough information decide, they can request a risk assessment by the risk manager.

Before you begin
Role required: compliance manager

Procedure
1. Navigate to **All** > **Policy and Compliance** > **My Policy Exceptions**.
2. Select the policy exception.
3. Perform one of the following actions.

4. Perform one of the following actions.

5. Click **Update**.

Request a policy exception through Service Portal

Your employees and business users within your company can request a policy exception through the ServiceNow® Service Portal.

Before you begin
Role required: sn_compliance.user, sn_grc.business_user, sn_grc.business_user_lite, sn_grc_emp_user.grc_employee

Procedure
1. Navigate to **All** > **Service Portal** > **Service Portal Home**.
2. In the screen header, navigate to **GRC** > **My Policy Exceptions** to view all policy exceptions that you requested.
3. Click **New Policy Exception**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complete the Policy Exception form. Specify what the policy exception is for and select appropriate policy, control objective, or issue. This question is for you to identify the appropriate source type.

When you select a control objective, the **Impacted controls** tab appears, where you can select controls associated to the control objective. You can also search and select an entity.

Select **Control** to associate multiple controls from different control objectives. This option supports your policy exception for multiple controls objectives, instead of creating multiple policy exceptions that could be applied on multiple controls.

If you are creating a policy exception from **GRC** > **My Policy Acknowledgements**, then **What is the exception for?** field auto-populates the value as Policy. The name of the policy also appears in the **Policy** field.

In **Issue** field, you can search by the description and select the appropriate issue.

5. Click **Submit**.

   If you raise a policy exception from Service Portal and if verification rules are not configured, then the policy exception moves to the Analyze state. However, if verification rules are configured for the policy exception, then the policy exception moves to the New state and the verification approval process is triggered. As verification rules are configured the approver is required to verify the policy exception and approve it, only then the policy exception moves to Analyze state.

Request a policy extension through Service Portal

From the ServiceNow® Portal, anyone who has requested a policy exception can request an extension before the policy deadline.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

Add the My Policy Exceptions widget to the Service Portal index page. The widget is visible only if there is at least one policy exception in your list.

Procedure

1. Click **My Policy Exceptions** in the Service Portal.
2. Open the policy exception for which you want to request for extension.
   The number of remaining extensions that you can request is displayed.
3. In the **Request extension** section, enter the date until which you want to extend.
   A note displays the remaining number of extensions that you can request.
4. Click **Request**.

Result

The extension request is sent for approval to the approving authority.

Policy Exception Integration with Vulnerability Response

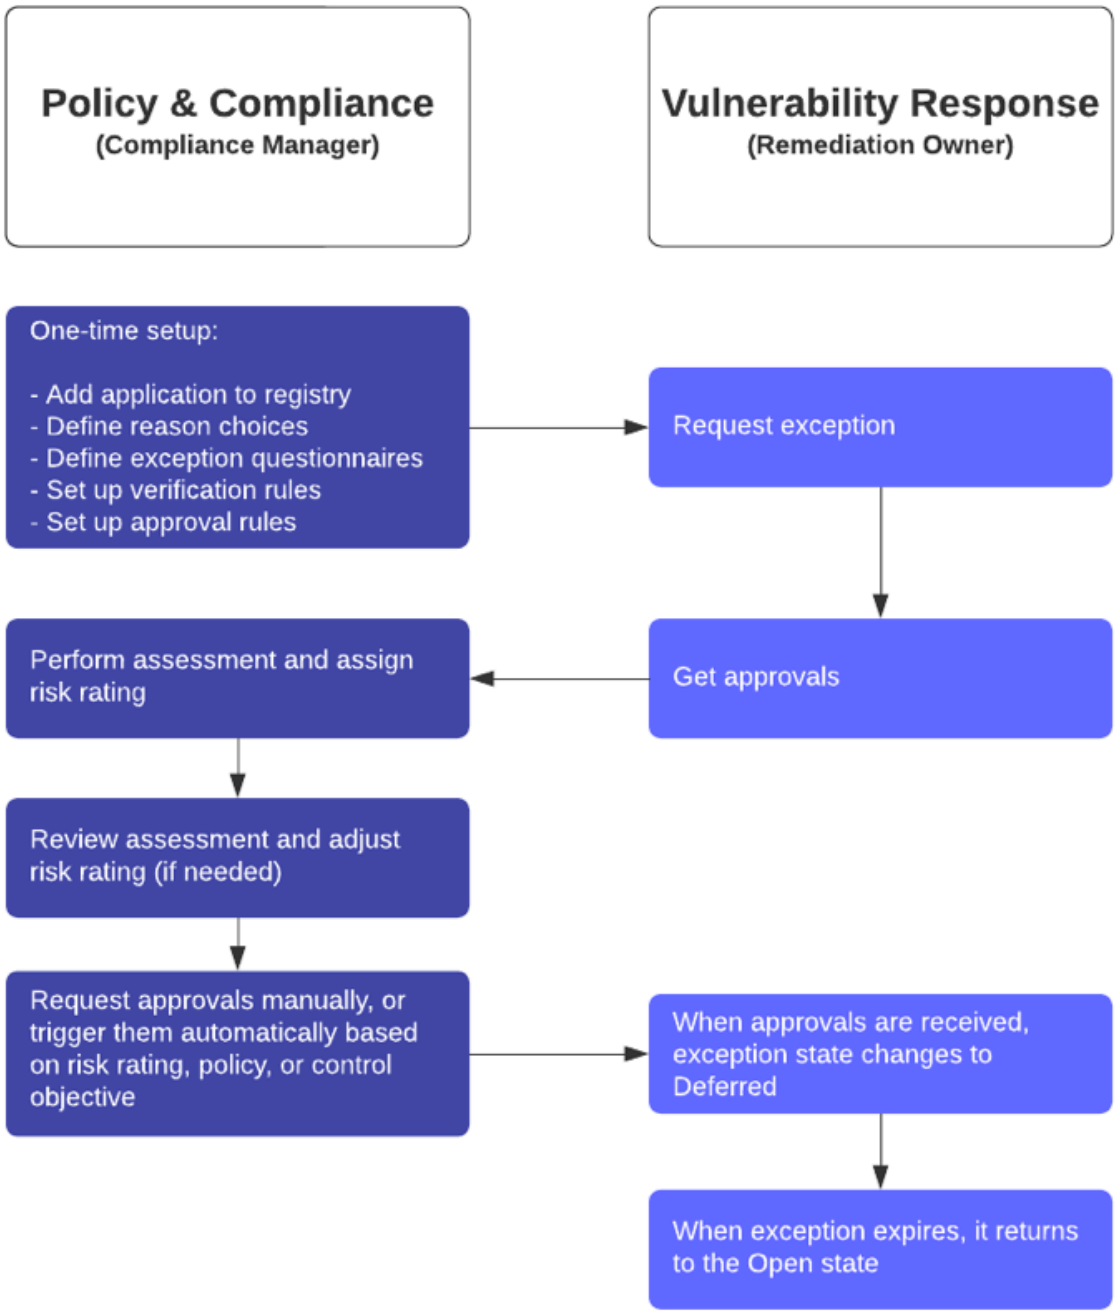
Starting with Version 10.1, you can request policy exceptions using the GRC policy exception management capability inherent in the Policy and Compliance Management application from within version 10.3 of the Vulnerability Response application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits of using the Policy Exception Integration

Requesting exceptions using the policy exception integration with Policy and Compliance Management provides the following benefits:

- Perform assessments to gather additional information about the requests.
- Request exceptions based on a specific policy or control objective. This action shows the effects on compliance when an exception is approved.
- Configure approvals to be triggered automatically based on the risk rating, policy, or control objective associated with the policy exception.



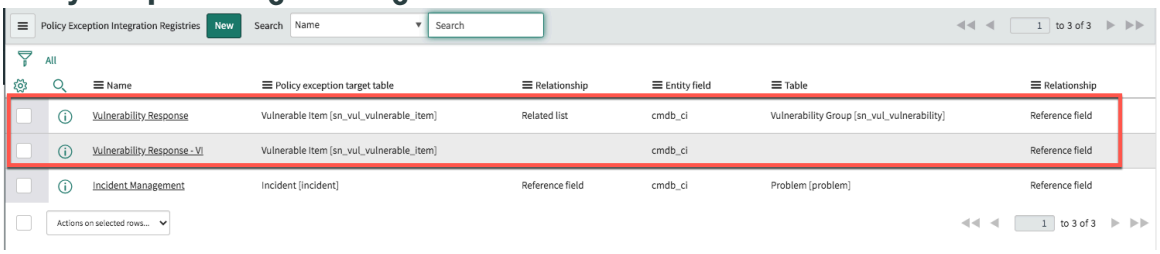
How the Policy Exception Integration works

The scenario described here assumes that a vulnerability has been identified in your system and your remediation owner has determined that a software patch is needed. The patch has not been fully tested and the owner is requesting a policy exception to defer deployment of the patch until testing is complete.

The following diagram illustrates the steps performed by the compliance manager and the remediation owner in each of the applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy Exception integration



Note:
The GRC business user (sn_grc.business_user) or business user – lite (sn_grc.business_user_lite) is the minimum required role to raise a policy exception from an upstream application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. When the Vulnerability Response application was installed, two policy exception integration records are automatically created and added to the Integration Registry, one for a vulnerability group and one for a vulnerable item.

Policy exception integration register

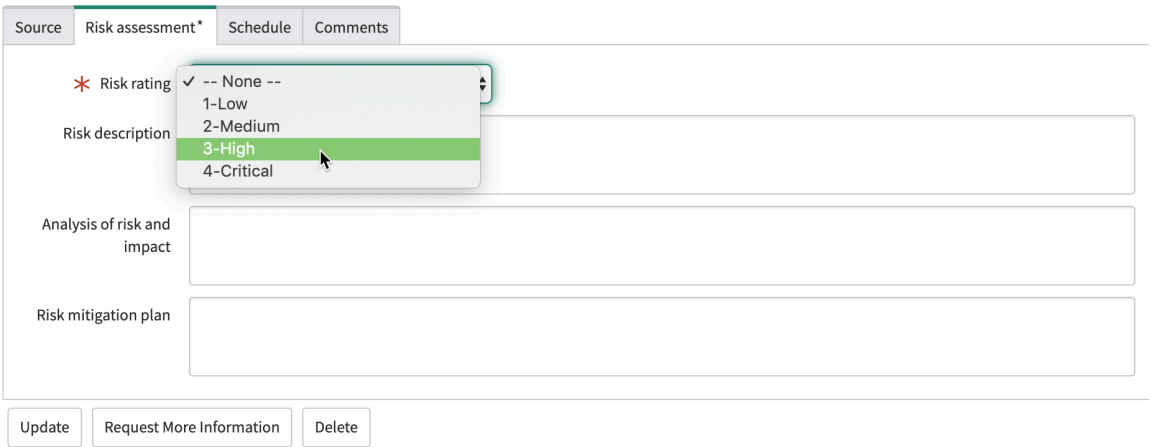
To configure the vulnerable item record, the compliance manager performs the following steps.

a. Identifies the mapping of tables used to integrate the two applications.

b. Defines reasons for requesting exceptions.

c. (optionally) Defines policy categories for filtering policies

d. (optionally) Creates one or more questionnaires to be sent to the requester to gather additional information about the policy exception request.



2. The compliance manager also defines optional verification rules and approval rules to automate the process of getting approvals for the policy exception.

3. In Vulnerability Response, the remediation owner Request an exception using GRC: Policy and Compliance Management .

4. If a verification rule was defined for the application, the designated approvers are notified that their approval is required. If any fields in the policy exception request were not filled in by the requester (for example, the Policy or Control Objective), those fields become mandatory for the approvers. When the approvers have reviewed, completed, and approved the request, it transitions to the Analyze state and is assigned to the compliance manager for further analysis and approval.

5. In Policy and Compliance Management, the compliance manager receives the approved request, and assigns a risk rating to the policy exception request on the **Risk assessment** tab.

Policy exception request on the Risk assessment tab

When the policy exception record is saved, information in the **Source** tab, including the source application and source record, as well as information in the **Vulnerable Items** related list are auto-populated. The compliance manager now has access to all the data needed to review and approve the policy exception.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In Policy and Compliance Management, the compliance manager performs the exception assessment, if assessments were configured. When the assessment is completed, the compliance manager returns to the **Risk assessment** tab and updates the **Risk rating** based on the findings of the assessment, if needed. The compliance manager also populates the following fields with information gathered during the assessment.

Risk assessment tab

Field	Description
Risk description	Provide details about the risk associated with this policy exception.
Analysis of risk and impact	Provide details about your analysis of the risk and impact to the policy exception.
Risk mitigation plan	Provide details about the mitigation plan associated with this policy exception.

7. If the policy exception is missing any information, the compliance manager can click **Request More Information** and add comments to identify the type of data needed. The requester is notified and provides the requested information.
8. Optionally, the compliance manager can send the policy exception out for an additional in-house review before approving it by clicking **Request Review**.

> **Note:**
> Prior to requesting a review, ensure that the Impacted Controls related list contains the controls that are impacted by the policy exception. Simply open the related list, click **Add**, and select the controls.

9. If the policy exception is of a particularly high risk, and the compliance manager believes that approval should come from someone higher in the organization (for example, the CIO), the compliance manager can click **Request Approval**.

   Otherwise, approval is performed in the following scenarios.

Approval rule defined	Effect on approval
If an approval rule was not defined for Vulnerability Response	Clicking the **Approved** button causes the policy exception to be approved.
If an approval rule was defined, but the **Auto-trigger** check box was not selected	You can click **Request Approval** to send the policy exception to the users or groups defined in the rule. For example, an approval rule may indicate that when the policy exception is based on a particular policy, a certain set of users or groups are notified that they need to provide approval for the policy exception. Or, an approval rule may be defined so that any policy exception with a risk rating of Critical is automatically sent to a certain set of approvers. The number of approvers necessary to approve the policy exception depends on the setting in the **Required Approval** field in the rule. You can also click **Approve** to approve the policy exception yourself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval rule defined	Effect on approval
If an approval rule was defined, and the **Auto-trigger** check box was selected	Clicking the **Approve** button causes the approval rule to be executed and the policy exception is automatically sent to the users or groups defined by the rule for approval. Auto-trigger causes this step to be mandatory. When approvals are received, the policy exception goes into effect.

10. In Vulnerability Response, after the approvals have been received, the policy exception becomes active and the patching activity on the vulnerable item is deferred until the policy exception expires. When the **Valid until** date is reached, the policy exception expires and the state of the vulnerable item changes from Deferred to Open.

Manage issues in Policy and Compliance Management

You can measure the effectiveness of your company's risk management program by how quickly and completely it identifies and reacts to compliance issues.

To know more about how issues function across all GRC applications, see GRC issues.

Manually create GRC issues

As a GRC user, you can manually create issues to document policy, risk, or audit observations, or to accept any GRC problems. You can also identify the source of the issue to help analyze and classify the issues.

Before you begin

Role required: (per product)

- In Policy and Compliance Management: sn_grc.business_user, sn_grc.business_user_lite
- In Risk Management: sn_grc.business_user, sn_grc.business_user_lite
- In Audit Management: sn_grc.business_usersn_grc.business_user_lite

Note:
Starting with Version 12.0.1 of the products mentioned above, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

For more information on the access control limitations to issues, see GRC business user role to control access and track usage of compliance tables.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with Version 12.0.1 of the products mentioned above, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

2. On the Issue form, fill in the fields.

   The due date under the **Dates** tab is automatically calculated based on the issue rating. You can manually override the calculated due date. The Task SLAs related list creates and displays SLAs based on the **Due date**.

3. Save the issue record.
   The tabs at the bottom of the screen enable you to perform various tasks for remediating the issue. You can add policy exceptions and create remediation tasks. Additionally, you can view other issues, indicator results, and task SLAs related to the issue.

   Note:
   Starting with Version 12.0.1, the **Task SLA** tab creates and displays SLAs based on the **Due date**. Notifications are sent to the issue owner and issue manager when the issue **Due date** reaches 50%, then 75%, then when it breaches. If the **Assigned to** and **Due date** fields are not empty and the issue is not in the **New** state, an SLA is created for the issue.

   If the due date for the SLA changes, a new SLA is created. The SLA is completed when the issue transitions to **Closed Complete** or **Closed Incomplete**. Also, the SLA is cancelled if the **Due date** or **Assigned to** fields are empty, or the state is New.

   Also starting with Version 12.0.1, remediation tasks can be created with the Assigned to user and issue manager user roles, as well as any user with the GRC Business User role.

Group similar issues under a new parent issue

When you are creating an issue, you have the option of grouping the issue with other similar issues.

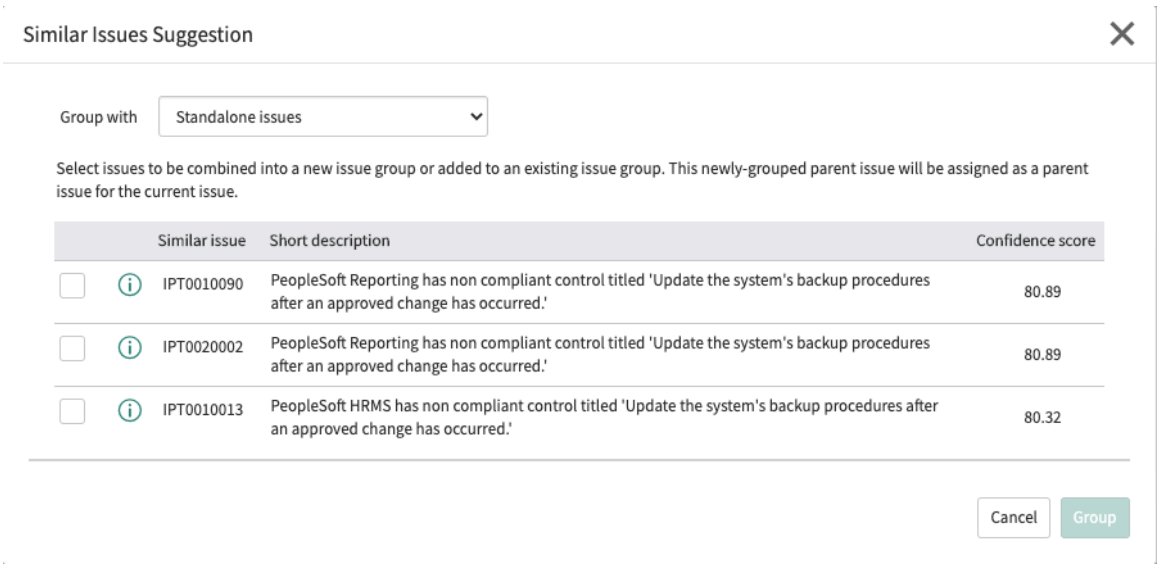
Before you begin

Role required: (per product)

- In Policy and Compliance Management: compliance_admin, compliance_manager, or sn_compliance.user
- In Risk Management: risk_admin, risk_manager, or sn_risk.user
- In Audit Management: audit_admin, audit_manager, audit_admin, or sn_audit.user

About this task

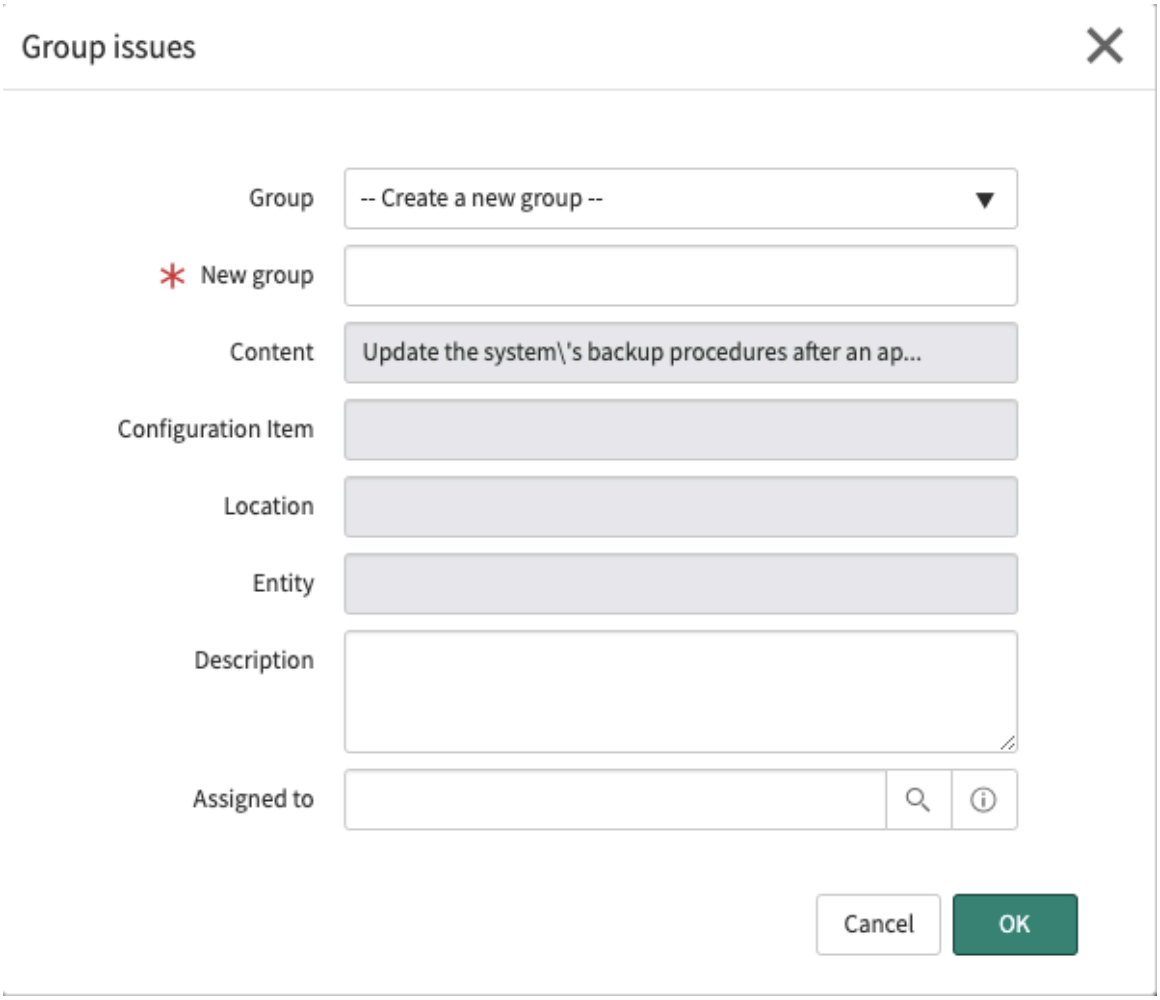
Grouping issues under a parent can save you valuable time. For example, assume you have an issue related to patching Windows servers. Since each server is a separate entity, all controls associated with "Windows servers should be patched every Tuesday" will have the same issue. Therefore, the issue can be resolved once for all of the Windows servers by applying the relevant patch one time. So, this feature can be used to group similar issues and resolve them all at the parent level.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.
2. On the form, locate the **Parent issue** field.



3. Click the bulb icon ( ) to view similar issues that you may want to assign to this parent issue.

Note:
Standalone issues are similar to the current issue, but that are not assigned to a parent issue group. The Confidence score is calculated using a similarity definition included in the GRC: Predictive Intelligence application base system.

4. You can click the Information icon to view details for any similar issues in order to help determine whether they should be grouped with the current issue.
5. Select the similar issues you want to group with the current issue, and click **Group**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the form, fill in the fields.

Issue form

Field	Description
Group	To group the selected issues and assign them to a new group, select **Create a new group**. To add the selected issues to an existing group, select the group.
New group	This field displays only if you selected **Create a new group**. Type the name of the new group.
Description	This field displays only if you selected **Create a new group**. Type a description of the group.
Assigned to	This field displays only if you selected **Create a new group**. Select the user to whom the group is assigned.

7. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The selected issues are added to a new or existing group.

8. You can view the issue in the group by clicking the **Issues** tab.

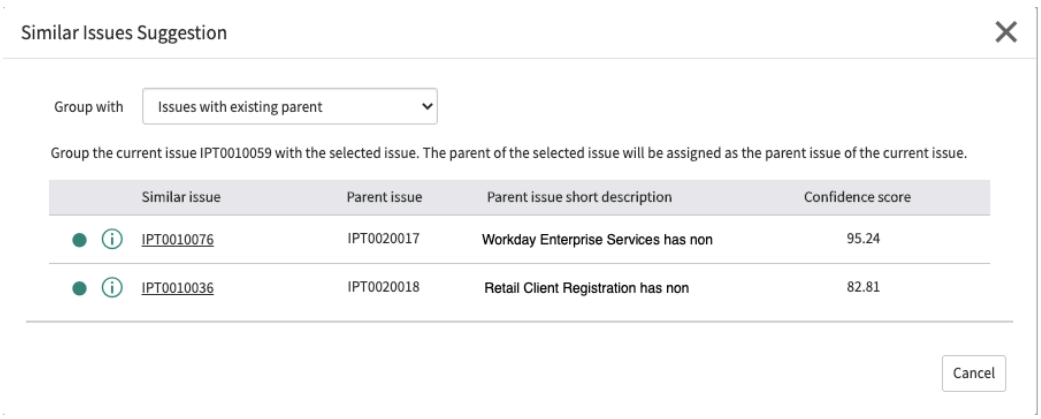
Group similar issues under an existing parent issue

When you are creating an issue, you have the option of grouping the issue with other similar issues as part of an existing parent issue group.

Before you begin

Role required: (per product)

- In Policy and Compliance Management: compliance_admin, compliance_manager, or sn_compliance.user
- In Risk Management: risk_admin, risk_manager, or sn_risk.user
- In Audit Management: audit_admin, audit_manager, audit_admin, or sn_audit.user



Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.
2. On the form, locate the **Parent** field.

3. Click the bulb icon ( ) and select **Issues with existing parent** from the **Group with** drop-down list.

   You are shown a list of similar issues.

4. Click the **Similar issue** you want to group with the current issue.
   The parent issue of the issue you select becomes the parent issue of the current issue.
5. You can view the issue in the group by clicking the **Issues** tab.

User hierarchy access control for issue and remediation task records

If a user is assigned to an issue or a remediation task, then the manager of the user and the manager above in the hierarchy also get access to the issue or remediation task record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The user reference in the **Assigned to** field, **Opened by** field, or **Owner** field are configurable in the User hierarchy configurations [sn_grc_user_hierarchy_configuration] table. Therefore, you can configure the fields in the table and enter the user reference, for example **Assigned to** or **Issue Manager** as User reference field 1 or User reference field 2. However, you can configure only two fields in a table.

The manager of the user in the user reference field and the manager above in the hierarchy can be configured as User hierarchy field 1 and User hierarchy field 2, respectively. If one of them is no longer the manager of the user in the user reference field, then that user in the hierarchy loses access to the record. You can view the hierarchy of users in the User Hierarchy [sn_grc_user_hierarchy] table.

The prerequisites to enable user hierarchy access control are:

- Users in the hierarchy must have at least the GRC business user (sn_grc.business_user) role.
- The *sn_grc.enable_user_hierarchy_access_control* system property must be set as **true**.

The concept of user hierarchy is helpful as it provides more visibility to the users in the hierarchy in tracking its completion when it is assigned to a user in a team. User hierarchy fields are not visible in the Issue or Remediation task form, however internally this feature enables you to restrict access to records based on those users in the hierarchy who can access them.

Report self-identified issues via the Service Portal

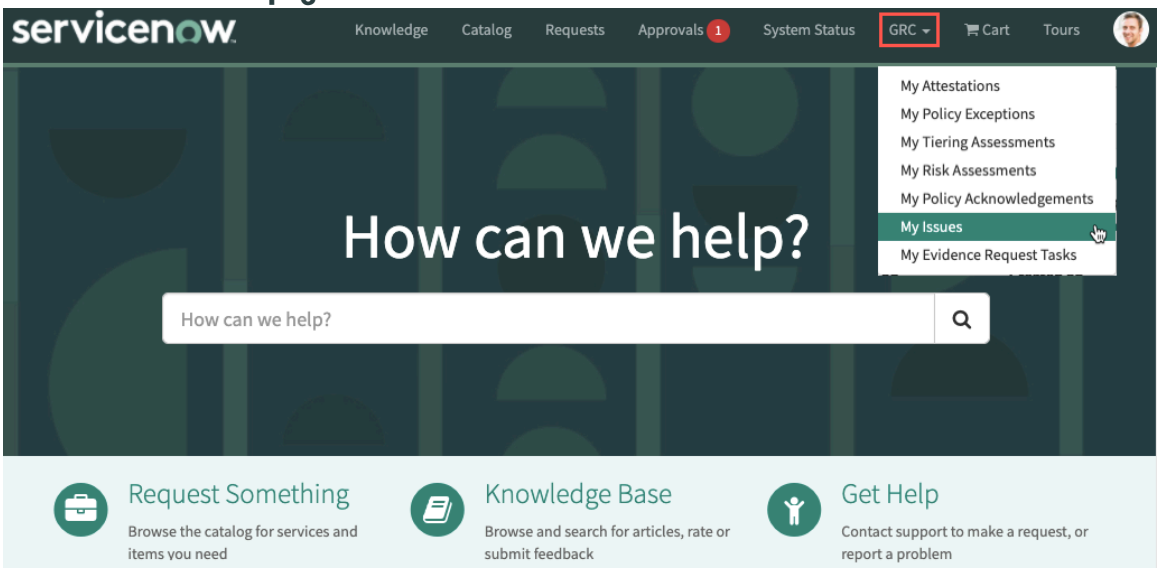
Your employees and business users within your company can self-identify an issue and submit it via the ServiceNow® Service Portal. Following submission, a triage issue is automatically created.

Before you begin

You must download the GRC: Advanced Core application before you can use the Issue Triage featuring within Policy and Compliance Management. For more information, see Download a GRC application from the ServiceNow Store for the first time.

Role required: sn_compliance.user, sn_grc.business_user, sn_grc.business_user_lite

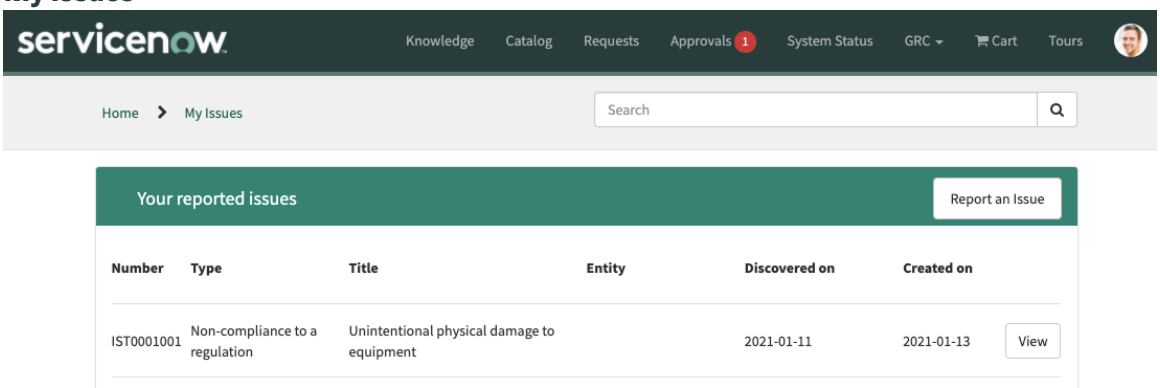
About this task



There are multiple methods you can use to report an issue using the Service Portal. For example, you can click the **Request Something** button on the Service Portal home page, select the **Governance, Risk, and Compliance** category, and then click **Report Issue**. An alternate, and perhaps simpler, method is described here.

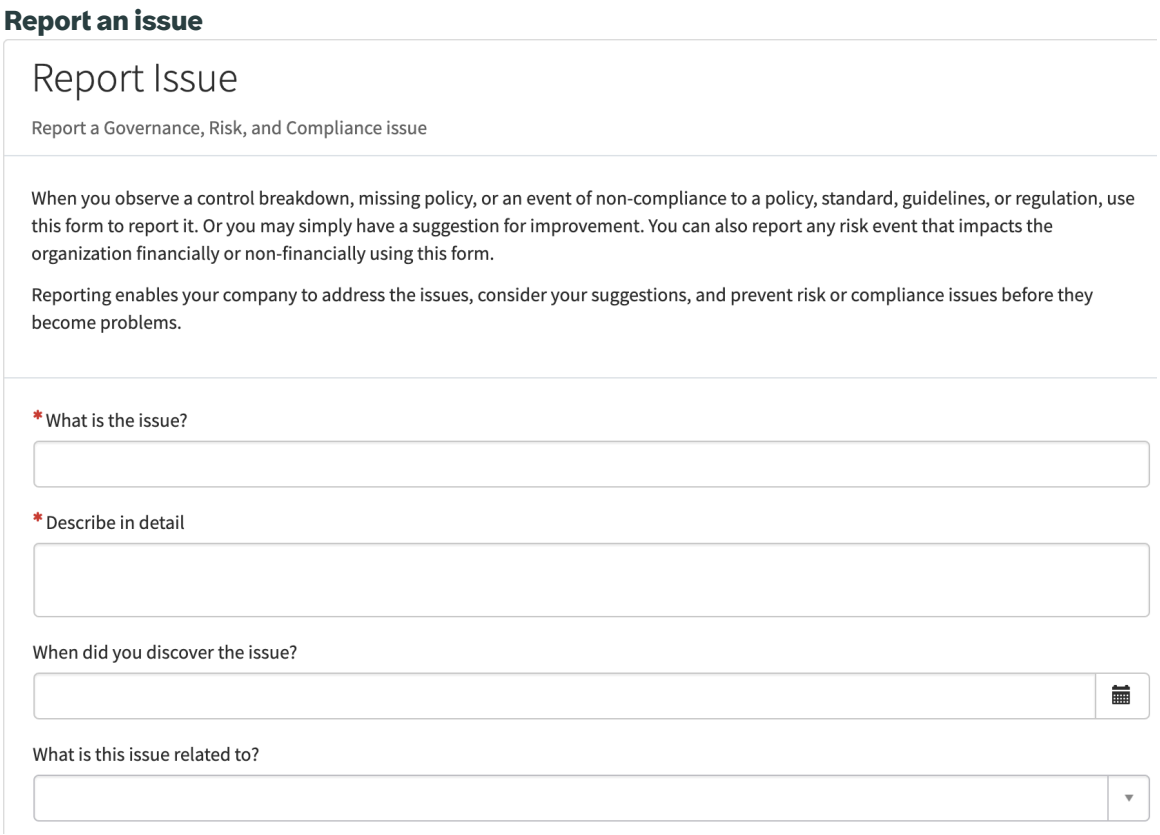
Procedure

1. Open the Service Portal.
   a. In your instance URL, type sp after your instance name.
   b. Press the Return key.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Portal home page



2. In the screen header, navigate to **GRC** > **My Issues** to view issues already assigned to you.

My issues

3. Click **Report an Issue**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Answer the questions presented.

   Example
   Additional questions may appear depending on the answers you provide. For example, if your response to the **What type of issue is this?** field is **Incident or loss event**, additional questions relating to the incident or loss event are presented to you. Or if you select **Non-compliance to a policy** at that field, you are asked for the affected policy and what you consider to be the root cause of the issue.

5. When you have completed all of the questions, click **Submit**.

   The request is submitted, and an issue triage record is created. This kicks off the issue triage process.

   Note:
   You can control the options displayed in the Service Portal **GRC** option menu by returning to your instance and navigating to **Policy and Compliance** > **Issue Triage** > **Administration** > **Properties**, and setting the **sn_grc_advanced.enable_my_issues_hide_my_reported_issues** property.

   If it is set to **Yes**, the **GRC** > **My Issues** menu option is available, and the **My Reported Issues** option is hidden. You can use the **My Issues** menu option to create risk or compliance issues that must be triaged before being released as actual issues.

   If the property is set to **No**, the **GRC** > **My Reported Issues** menu option is available, and the **My Issues** option is hidden. You can use the **My Reported Issues** menu option to create actual risk or compliance issues directly from the Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

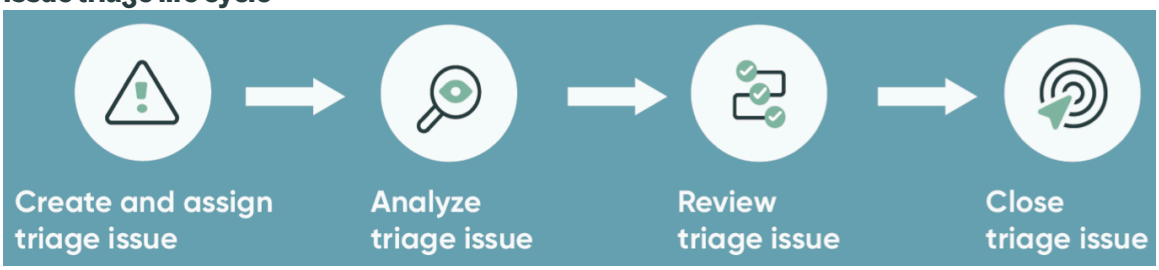
Triage a self-identified issue

After an issue has been identified and submitted by employees or business users via the Service Portal, the issue triage process begins. The actual problem is identified and assigned to the appropriate owner for prioritization and resolution.

Before you begin

Role required:

- sn_compliance.manager
- sn_compliance.user
- sn_grc_advanced.issue_triage_manager
- sn_grc_advanced.issue_triage_user



About this task

The assigned triage teams identify whether the self-identified issues are actual reported issues, risk events, or observations to be tracked and possibly closed out as noise.

Note:
In the initial release, only self-identified issues are handled by the triage process. In a later release, system-generated issues, such as those caused by indicator or attestation failures, will also be triaged.

The end-to-end flow of the issue triage life cycle is illustrated and described here.

Issue triage life cycle

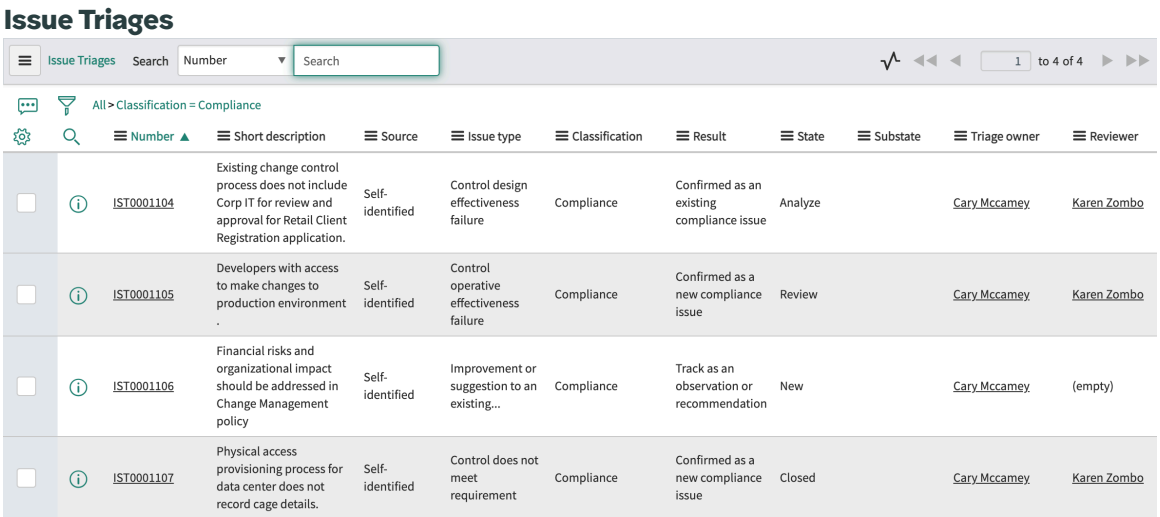
Stage	Description
Create and assign triage issue	An employee identifies an issue related to an entity, control, policy, authority document, process, or risk, and submits a triage request in the ServiceNow Service Portal. Based on the type of issue submitted and an issue assignment rule, the issue is assigned to a triage team and a triage owner.
Analyze triage issue	The triage team decides whether the issue should be analyzed as an actual issue or risk event, or tracked as a recommendation for a policy or for optimizing a process. During analysis, the triage team may request more information from the issue creator. The team may also optionally send the issue to the compliance manager, risk manager, or triage manager with a triage result. Possible results include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stage	Description
	• Confirmed as a new issue • Confirmed as an existing issue • Confirmed as a risk event • Track as a recommendation • Close as a non-issue/No action required
Review triage issue	The Review state is optional. The team may send the issue and result to the compliance manager, risk manager, or triage manager for review. They may also request more information from the triage owner. The compliance manager, risk manager, or triage manager decides whether the issue should be confirmed as an issue or risk event, tracked as a recommendation, or closed as a non-issue.
Close triage issue	If the issue had been determined to be an actual issue or risk event, those records are created, or the triage issue is added to an existing issue. When the triage process is completed, the triage issue is automatically closed. The issue can also be manually closed by the manager and triage team.

The following user roles are involved in the issue triage process.

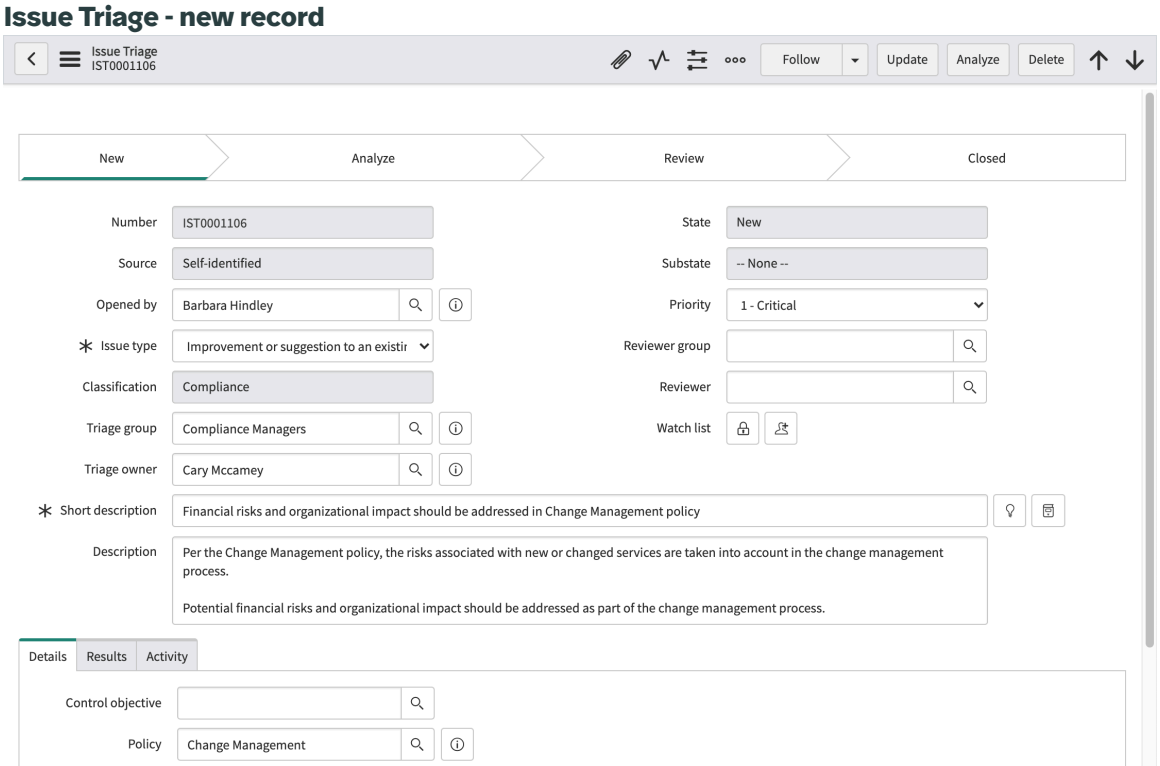
Issue triage personas



Persona/Role	Description
Business user/Employee	Ability to report issue.
• Compliance user/manager • Risk user/manager • Triage user/manager	Ability to triage and review issues
Issue manager	Ability to manage and review the reportable issue
Issue owner	Ability to resolve the reportable issue assigned to them

Note:
The triage user/manager and Issue manager roles were introduced in GRC: Policy and Compliance Management version 11.1.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

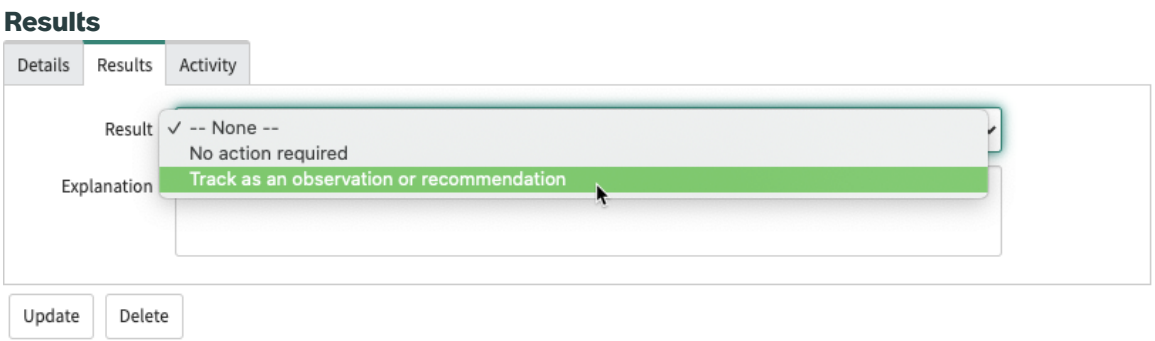


Procedure

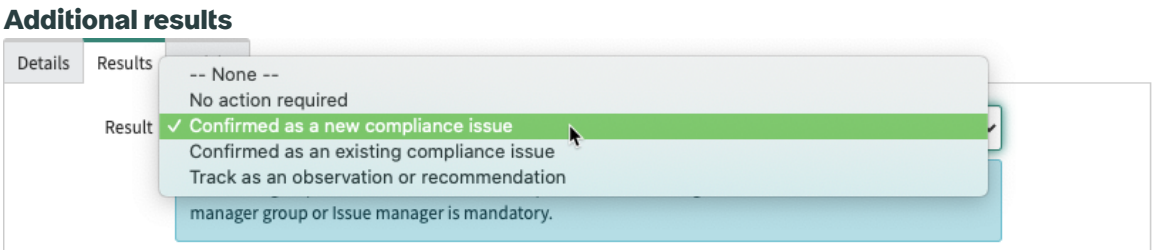
1. Navigate to **All** > **Policy and Compliance** > **Issue Triage** > **My Triage Issues** or **Risk** > **Issue Triage** > **My Triage Issues**.
   The list shows triage issues previously created and assigned to you.

Number	Short description	Source	Issue type	Classification	Result	State	Substate	Triage owner	Reviewer
IST0001104	Existing change control process does not include Corp IT for review and approval for Retail Client Registration application.	Self-identified	Control design effectiveness failure	Compliance	Confirmed as an existing compliance issue	Analyze		Cary Mccamey	Karen Zombo
IST0001105	Developers with access to make changes to production environment .	Self-identified	Control operative effectiveness failure	Compliance	Confirmed as a new compliance issue	Review		Cary Mccamey	Karen Zombo
IST0001106	Financial risks and organizational impact should be addressed in Change Management policy	Self-identified	Improvement or suggestion to an existing...	Compliance	Track as an observation or recommendation	New		Cary Mccamey	(empty)
IST0001107	Physical access provisioning process for data center does not record cage details.	Self-identified	Control does not meet requirement	Compliance	Confirmed as a new compliance issue	Closed		Cary Mccamey	Karen Zombo

2. Click the number of the issue that you want to triage.



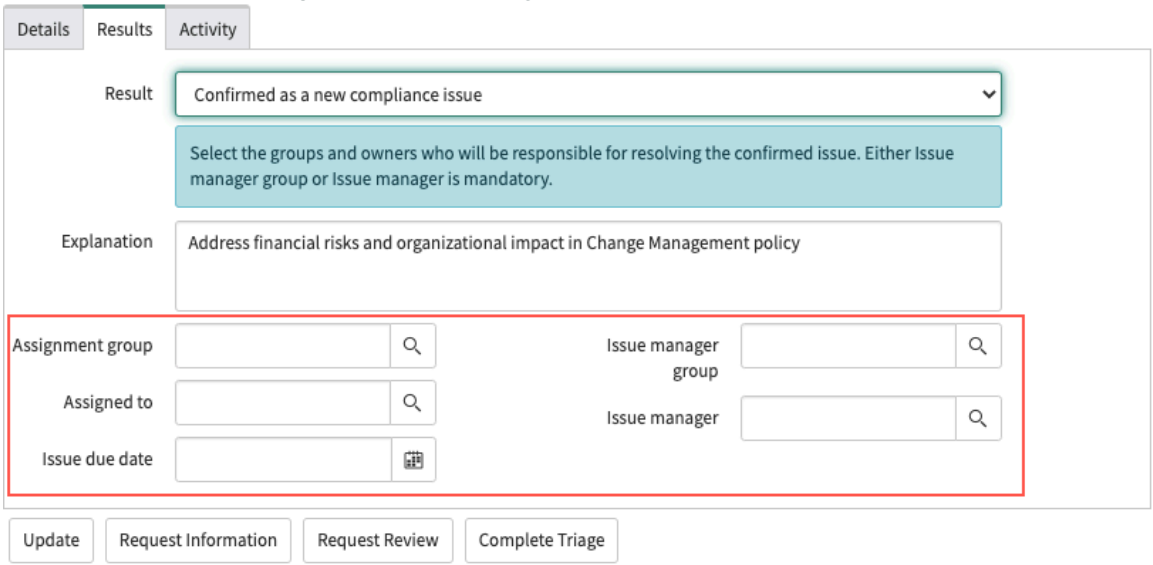
Note:
The **Classification** field is automatically pre-filled based on the **Issue type** selected. Similarly, an assignment rule called sn_grc_advanced_issue_triage runs and pre-fills the **Triage group**. This rule uses the **Source** and **Classification** to determine the group to which the triage is assigned. Assignment rules also handle issue triages in Risk Management and triages where the **Classification** is set to **Other** (that is, it is initially unknown). For the second use case, you must manually set the **Triage group** to **Risk** or **Compliance**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. When you are ready for triage of this issue to begin, select a **Triage owner** and click **Analyze**. The assigned Triage owner can now open the issue and begin analyzing the issue.
4. During analysis, the triage owner can perform several tasks.

   Example
   The owner may, for example, decide that the issue is misclassified and can change the **Issue type**. This action could result in the Triage group and Triage owner changing. In this example, the assignment rule runs in the background and the issue is removed from the current owner's queue.
5. The triage owner can also perform the following actions:
   - Click **Request Information** to request additional information from the issue submitter.
   - Click **Request Review** to request a review from the user identified in the **Reviewer** field. That user can open and review the issue by navigating to **Policy and Compliance** > **Issue Triage** > **My Pending Reviews**.
   - Select the **Details** related list to provide additional enrichment to the issue.
6. After it has been determined what action (if any) should be performed on the issue, the triage owner can select a result of the analysis from the **Results** related list.

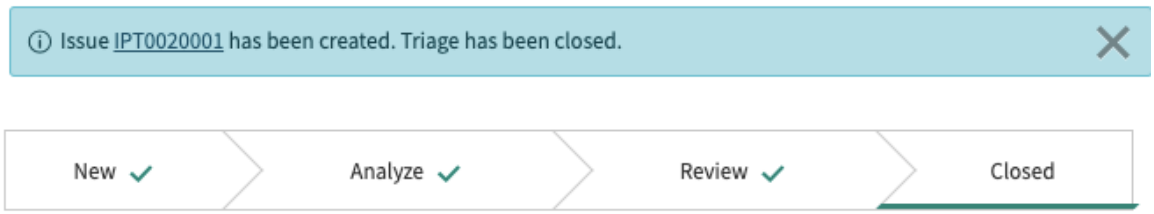


Note:
The options available in the **Result** field depend on the **Issue type** identified for this issue. For example, if you select **Control design effectiveness failure** as the **Issue type**, the following results may be selected.

7. If you select a result, such as **Confirmed as a new compliance issue**, which requires more action than simple observation, additional analysis fields display, as shown in the following screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional fields displayed after selecting Result



If the result is **Confirmed as an existing compliance issue**, then an **Existing issue** field appears where you must identify the existing issue that you are referring to.

8. When the issue triage is complete, the triage owner can click **Complete Triage**.

> **Note:**
> If the issue is out for review, the reviewer can also click **Complete Triage** to complete the triage and create an actual issue.

The issue triage transitions to the **Closed** state and a link to the issue displays at the top of the screen.

Triage closed and new issue created

9. The issue can be analyzed using the usual issue management procedures.
   One significant change on the **Issue** form is the addition of an **Issue Triages** related list.
   Opening the triage record provides the analyst with the details of the triage that resulted in the creation of this issue.

Remediate an issue in Policy and Compliance Management

After an issue has been identified, triaged, and investigated, you can remediate it.

Before you begin

Role required: compliance_admin, compliance_manager, sn_compliance.user, sn_grc.business_user, sn_grc.business_user_lite

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with Version 12.0.1, the minimum role for the **Assigned to** user on the Remediation task form is GRC Business User [sn_grc.business_user]. The minimum role for the **sn_compliance.user** is GRC User [sn_grc._user].

For more information on the access control limitations to remediation tasks, see GRC business user role to control access and track usage of compliance tables.

About this task

Remediating an issue marks an intention to fix the underlying issue causing the control failure or risk exposure. Accepting an issue marks an intention to create an exception for a known control failure or risk. Controls that are **Accepted** remain in a non-compliant state until the control is reassessed. In this way, the issue can be used to document observations during audits.

Procedure

1. Open the issue you want to remediate.
2. Click the **Remediation Tasks** tab.

   Note:
   You have two options for creating a remediation task:
   - Click **Suggested Remediation Tasks** and click **Copy** to use an existing task as a basis for creating this task. A copy of the selected remediation task is created with certain information from that task copied to the new task. You can manually complete the other fields.
   - Clicking **New** and manually creating the task.

3. On the form, fill in the fields.

Remediation task form

Field	Description
Number	Unique identification number.
Assigned to	Select the user responsible for working this task. You can configure a hierarchy of users to access the remediation task. For more information, see User hierarchy access control for issue and remediation task records.
Issue	The issue for which this task was created.
State	The current state of the task.
Priority	Select the priority or sequence this task needs to be resolved, based on its impact and urgency.
Watch list	Select users who want to be notified when changes occur.
Created/Updated	Displays the date/time when the task was created and updated.
Name	Brief description of the task. This will appear in lists of tasks.
Description	Enter a complete description of the task.
Notes and Comments	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional comments	As needed, enter any customer-facing comments related to this task.
Work notes	Enter any non-customer-facing notes related to the remediation of the issue.
Task Schedule	
Planned duration	Estimated amount of work time. Calculated using the **Planned start date** and **Planned end date**.
Planned start date	Date and time that work on the task is expected to begin.
Planned end date	Date and time that work on the task is expected to end.
Actual duration	Amount of actual work time. Calculated using the **Actual start date** and **Actual end date**.
Actual start date	Time when work began on this task.
Actual end date	Time when work on this task was completed.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

4. Click **Submit**.

Manage the UCF integration

Network Frontiers Unified Compliance Framework (UCF) integrates with your ServiceNow instance through an authentication process that validates your subscription. On the UCF Configuration form, you select the type of authentication, and then enter a UCF-provided API key or a ServiceNow – provided Oauth2 client and secret.

Important:
Introduced in Kingston, UCF integration using the ServiceNow-provided Oauth client and the UCF Common Controls Hub is still supported; however, it is no longer the recommended method for integrating your instance with UCF. The preferred method is to configure the UCF integration using a UCF-supplied API key (see link below).

Activate Compliance UCF

The GRC: Compliance UCF (com.sn_comp_ucf) plugin is available as a separate subscription.

Before you begin
Role required: admin

About this task
This plugin includes demo data and activates related plugins if they are not already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

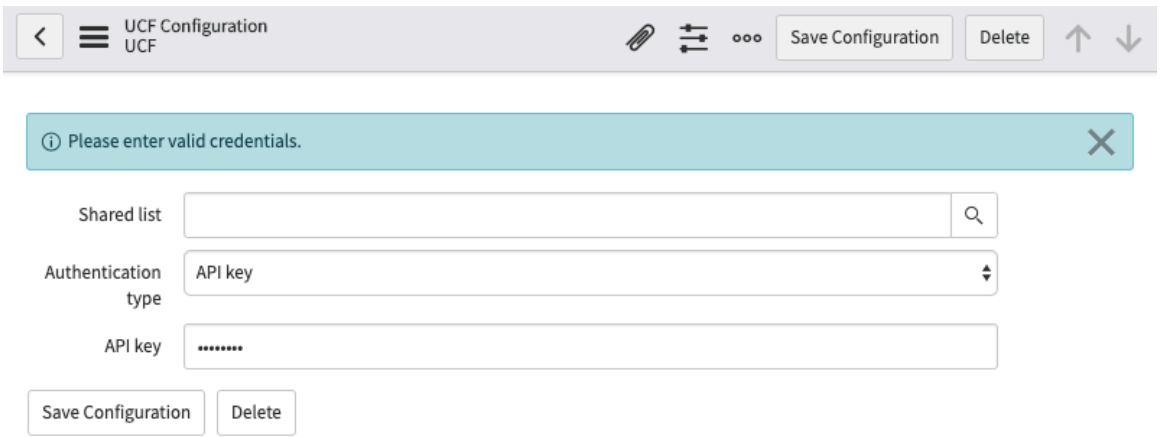
What to do next

Configure the source of your control library using an API key supplied by UCF (this is the recommended method) or using the UCF Common Controls Hub, which you can purchase as a subscription from the ServiceNow Store. For more information, see Common Controls Hub or Unified Compliance Framework.

Configure the UCF integration using a UCF-supplied API key

UCF integrates with your ServiceNow instance through an authentication process which validates your subscription.

Before you begin



Role required: admin

About this task

Prior to configuring the UCF integration, you need a UCF basic subscription and use the API Key Manager in your account to acquire an API key from UCF. You must also define shared lists of UCF authority documents in your account.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Unified Compliance Integration**.
2. Click the UCF configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

UCF Configuration

Field	Description
Shared List	Select the shared list from your UCF account.
Authentication type	Select **API Key**.
API Key	Enter the API key you acquired from your UCF account.

4. Click **Save Configuration**.

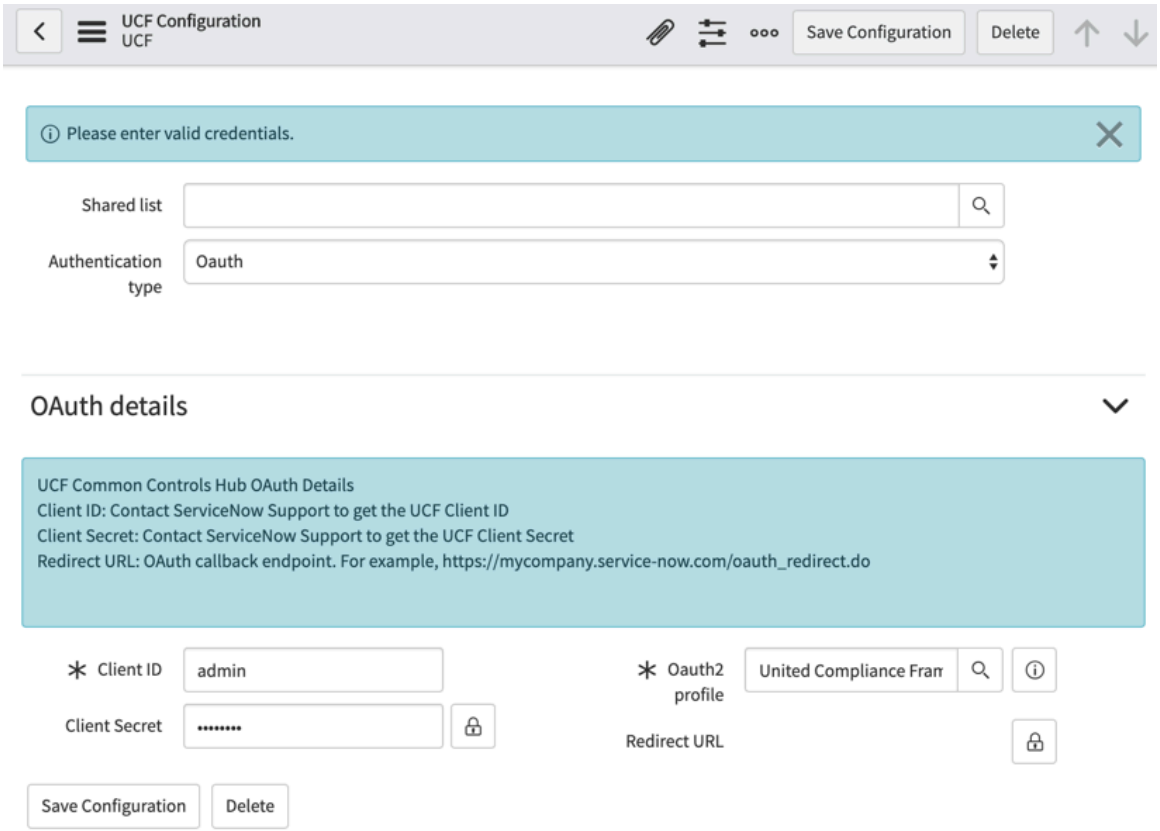
Configure the UCF integration using the UCF Common Controls Hub

Compliance administrators can download content from Network Frontiers Unified Compliance Framework (UCF) to use as GRC authority documents, citations, controls, and control objectives.

Before you begin

Role required: sn_comp_ucf.admin and oauth_admin
The documents can be updated on pre-defined intervals. You must have a UCF Common Controls Hub account to create shared lists and import them into the ServiceNow® instance. API access is required to download UCF content from the UCF-CCH.

Note:
Please take note of the following guidelines before configuring the UCF integration using the UCF Common Controls Hub



- Only the UCF Oauth administrator has access to the system Oauth tables. You must grant the UCF Oauth administrator role to the GRC UCF administrator, so the UCF administrator can set up UCF configuration page.
- UCF integration requires that GRC is configured and users must be a Common Controls Hub administrator.
- The configuration page for the global domain is loaded by default. If you are using Domain Separation, delete the default configuration page, and create one specific to your domain.

About this task

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Unified Compliance Integration**.
2. Click the UCF configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

UCF Configuration

Field	Description
Shared List	The shared list to be imported. **Note:** Shared lists appear for subscription authentication.
Authentication type	Select **Oauth**.
OAuth details	
Client ID	Enter the Client ID or UCF OAuth Client ID provided by Customer Service and Support. See Create a Now Support Case for UCF-CCH account integration information for information. **Note:** Configuration information is specific to the ServiceNow® instance. Be sure to enter accurate information for any test, development, or production instances you are using. Do not include spaces in the entry.
Client Secret	Enter a Client Secret to be used by the OAuth Client to authenticate to the Authorization Server. The Client Secret must be sufficiently random to not be guessable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Oauth2 profile	Enter the OAuth2 profile to use for downloading. The default is the United Compliance Framework Default Profile that is installed with the UCF plugin. This field doesn't typically need to be changed.
Redirect URL	Enter the Redirect URL, provided by Customer Service and Support. For example, `https://mycompany.service-now.com/oauth_redirect.do`

4. Right-click the form header and click **Save**.
5. In the UCF Integration dialog that appears, click **Request New Token**.

> **Note:**
> For initial configuration, a user with an UCF administrator account performs this setp and the next step.

6. Enter your Common Controls Hub credentials to log in.
7. In the application authorization message that displays, click **Authorize**.
8. Select a shared list and click **Save Configuration**.

What to do next

If UCF introduces new fields and content, administrators can use staging tables and transform maps to accommodate those changes to UCF data formats. This is an advanced configuration and not required. The following import sets and tables can be configured to customize the UCF download logic.

Staging table [extends from import set row table: import_set_row] used for UCF integration

Staging table	Description
UCF Authority Document [sn_comp_ucf_authority_document]	The UCF Authority Document staging table is used to store authority documents that are downloaded from the UCF Common Controls Hub
UCF Citation [sn_comp_ucf_citation]	The UCF Citation staging table is used to store citations that are downloaded from the UCF Common Controls Hub
UCF Control [sn_comp_ucf_control]	The UCF Control staging table is used to store controls that are downloaded from the UCF Common Controls Hub
UCF Citation to Control [sn_comp_ucf_m2m_control_citation]	The UCF Citation to Control staging table is used to store citation to controls that are downloaded from the UCF Common Controls Hub

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transform maps used for UCF integration

Transform maps	Description
Default Authority document transform	Transforms data from the UCF Authority document staging table into the Authority Document table
Default Citation Transform	Transforms data from the UCF Citation staging table into the Citation table
Default Control transform	Transforms data from the UCF Control staging table into the Control Objective table
Control to Citation transform map	Transforms data from the UCF Citation to Control table into the Control Objective to Citation table

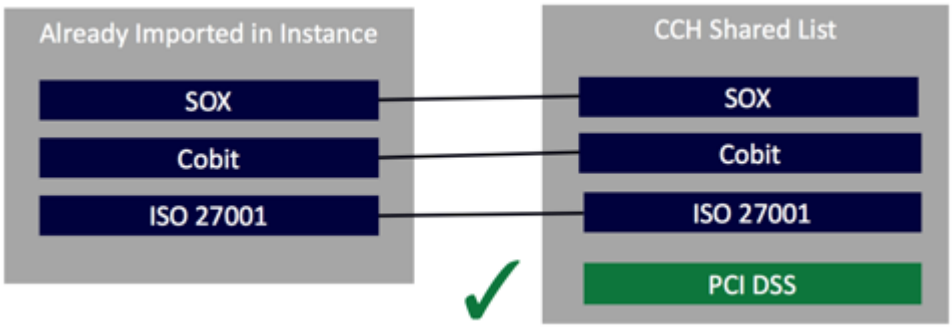
Integrate with UCF Common Controls Hub to manage compliance frameworks

Compliance administrators can download content from Network Frontiers Unified Compliance Framework (UCF) to use as GRC authority documents, citations, controls, and control objectives. The documents can be updated on pre-defined intervals. You must have a UCF Common Controls Hub account to create shared lists and import them into the ServiceNow® instance.

If your organization wants to use UCF Common Controls Hub as the source for your controls library, you can purchase a subscription from the ServiceNow Store or see Common Controls Hub. For more information, see Unified Compliance Framework.

Note:
The previous arrangement for free access to UCF content inclusive of your GRC license ended November 30, 2018. All customers must purchase a subscription from Unified Compliance directly.

Warning:
All data imported from UCF Authority Documents is read-only and must be protected. Do not customize the authority documents, citations, or control objectives on any UCF fields transformed into GRC tables.



1. Sign up for a UCF CCH account and customize your basic subscription to include API Access.
2. Activate Compliance UCF.
3. Create a Now Support Case for UCF-CCH account integration information.
4. Configure the UCF integration using the UCF Common Controls Hub.
5. Download a UCF shared list.

Import authority document using single shared list

Every authority document already imported into the ServiceNow® instance must be in any shared list you wish to import from the UCF CCH. This prevents inconsistencies between what is in the UCF CCH (which may have changed) and what you've already imported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shared list import successful

Shared list import unsuccessful

An error is rendered since SOX is not being reimported within this Shared List.

Import authority documents using multiple shared lists

If you need to import more than 100 authority documents then you must import them into multiple shared lists, as there is a limitation that a shared list can contain only 100 authority documents. You can create multiple shared list (SL), for example SL1 to import 100 authority documents and SL2 for the rest of the authority documents. Group similar authority documents as one group when you import the authority documents into multiple shared list, so that there is no dependency of the documents between the multiple shared list.

To support multiple shared list, the system property *sn_comp_ucf.deactivate_deprecated_docs* that is by default **true**, must be set to **false**.

- If the system property is set to true, then the existing validation is done to check if the authority documents imported are already imported in the ServiceNow instance.
- If the system property is set to false, then the imported authority documents are not validated at all.

Set the property as false and import the UCF content in multiple shared list. If the authority documents, citations, and control objectives that are imported in the shared list are deprecated, then such documents will not be deactivated in the ServiceNow instance. Instead, the user must manually validate the documents and the links between the citation and control objectives. An email is sent with the links to the mapping between the citation and control objectives.

UCF and GRC terminology differences

Authority documents in the UCF content are organized and mapped to their proper citations, which in turn are mapped to a common set of controls. The terminology between UCF and the GRC applications differs slightly as explained in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminology differences

UCF	GRC application
Authority Document	Authority Document
Citation	Citation
Control	Control Objective

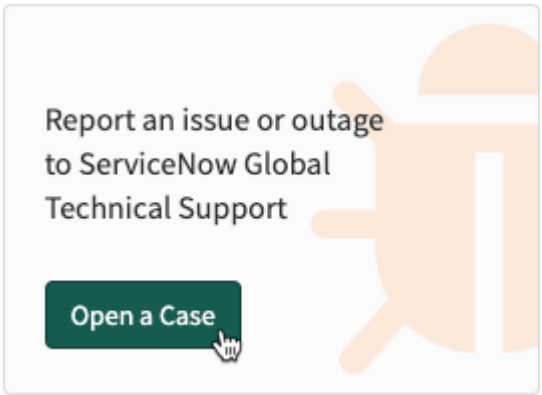
Create a Now Support Case for UCF-CCH account integration information

After establishing your UCF CCH account, use the Now Support Service Portal to initiate the account integration process.

Before you begin

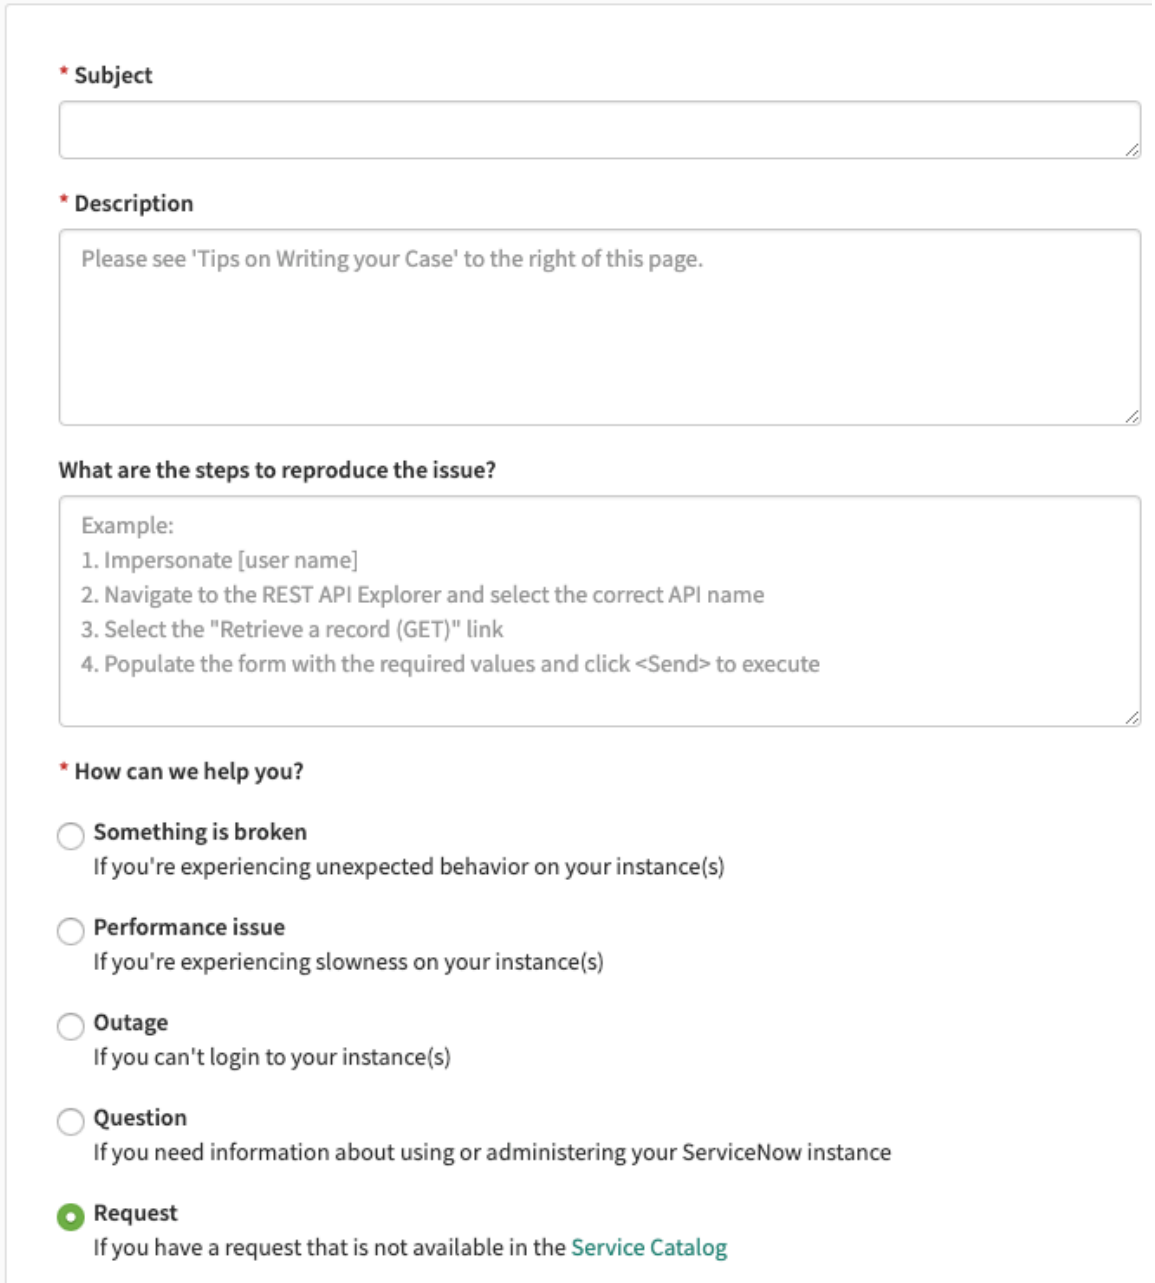
Sign up for a UCF CCH account and customize your basic subscription to include API Access. A user with the UCF administrator role must log into the CCH account and generate the API key.

Note:
The previous arrangement for free access to UCF content inclusive of your GRC license ended November 30, 2018. All customers must purchase a subscription from Unified Compliance directly.



Role required: admin

Procedure



1. After activating the Compliance UCF plugin, sign in to the Hi Service Portal.
2. Click **Get Help**.

3. Click **Open a Case**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Fill out the **Create Case** form.

Field	Description
Subject	A brief description of the case.
Description	Describe the issue and provide the following information: ○ Enter `I have activated the new GRC: Compliance UCF (com.sn_comp_ucf) plugin. I have already subscribed to the UCF CCH. I am requesting that you provide me with the necessary OAuth information to complete the integration.` ○ Include your company name and company account number. ○ Include the requester's name, business email address, and phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: By providing your company and requester contact information, you authorize ServiceNow® customer service to contact and share that information with Network Frontiers, a third party, to complete your UCF CCH account enrollment.
How can we help you?	Click **Request**.
Attachments (screenshots, logs, etc.)	Attach screenshots, as necessary.
Which of your instances are affected?	Enter your company's GRC instance.
What is the impact?	Select your answer.

5. Click **Submit**.
   Customer Service and Support initiates the OAuth integration process and contacts the requester with the integration information.

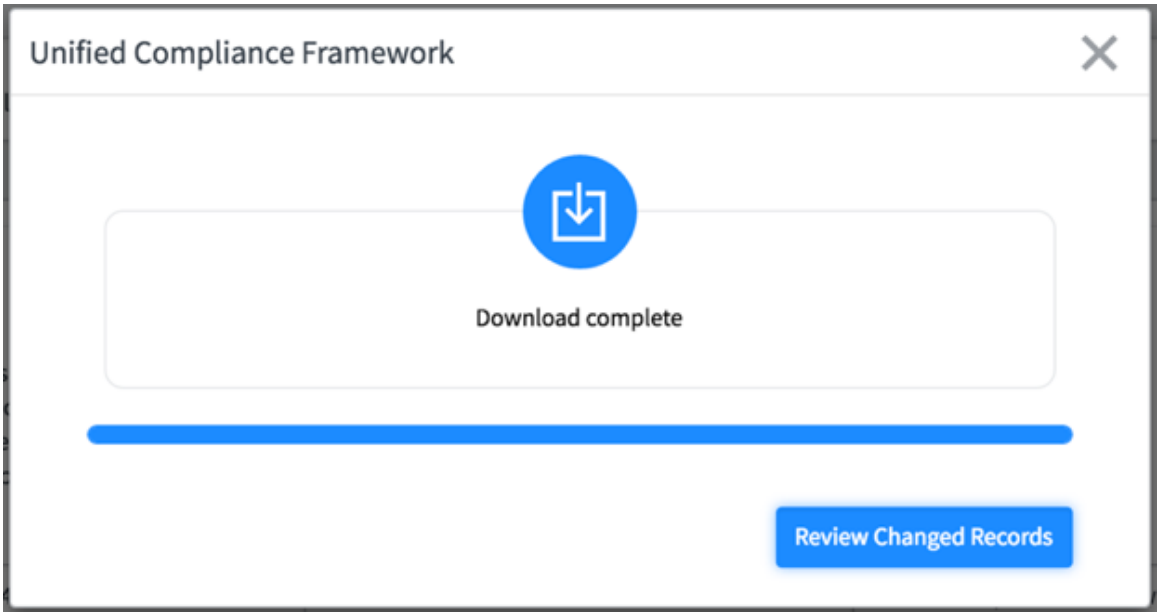
Download a UCF shared list

In order for compliance managers to download UCF authority documents from the UCF CCH, the list must be marked as Shared. When updating Authority Documents or adding new ones, you must update all your authority documents to ensure that the common controls framework remains in sync with the authority documents you are using.

Before you begin

Role required: sn_compliance.admin or sn_compliance.manager

Note:
The current design of UCF supports the downloading of mandated and implied controls. The downloading of implementation controls is not supported. See the Unified Compliance Documentation How do I distribute an authority document list to other accounts?.



All data imported from UCF Authority Documents is read-only and must be protected. Do not customize the authority documents, citations, or control objectives on any UCF fields on the GRC tables.

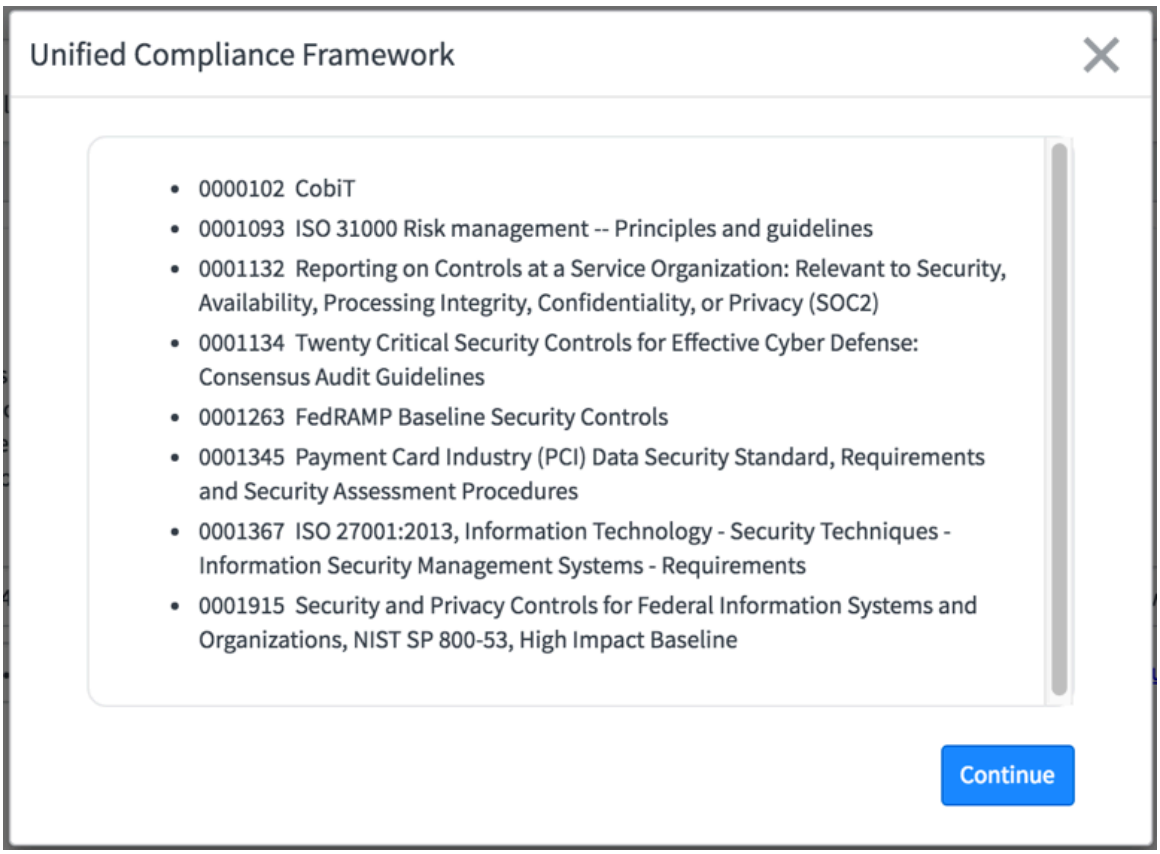
Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Unified Compliance Integration**.
2. Click the **UCF** configuration.
3. Configure the UCF integration using the UCF Common Controls Hub, if necessary.
4. Click **Import Shared List**.

   A progress bar shows the progress of downloading and importing the documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You may encounter any of the following errors:



UCF Shared List Errors

Error	Explanation	Resolve
Error encountered while downloading UCF content. Try again or contact your system administrator for further assistance.	If the internet connection is lost for any reason, this message appears.	Click **Import Shared List** to download again.
Error encountered while downloading UCF content. Try again or contact your system administrator for further assistance.	This message may also indicate that the authority documents are part of an existing shared list or a possibility of a UCF import error. It suggests that you review the validity of the authority documents, citations, control objectives,	Starting with Policy and Compliance Management version 12.0.4, your UCF Administrator receives an email with links to any invalid records. **a.** Click a link in the mail and fix the record(s) listed. **b.** Repeat for other invalid records, if they appear in the email. **c.** Click **Import Shared List** to download again. **Note:** A system property called *sn_comp_ucf.deactivate_deprecated_docs* controls whether an email notification is sent when invalid or deprecated records are encountered during a shared list import. The property defaults to true. Set the property as false if you are downloading UCF content in multiple shared list. When the property is set as false the documents are not deprecated but an email is sent.

Error	Explanation	Resolve
	and the links to the mapping of citation and control objectives.	
The selected Shared List does not match the existing Authority Document list. Select a different Shared List or update the existing Shared List.	If the selected UCF Shared List that you are downloading does not include all the authority documents you have already downloaded, this message appears.	**a.** Return to the CCH and verify that the Shared List you are trying to download includes all the Authority Documents from the original import to your instance. **b.** Click **Import Shared List** to download again.

5. Click **Review Changed Records** to review the list of changed records.

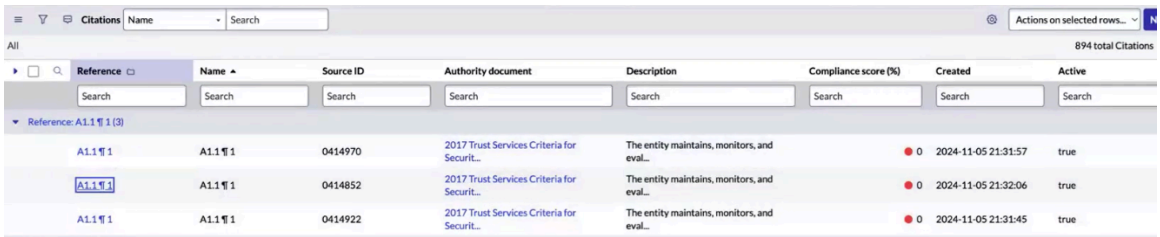
Authority documents in the UCF content are organized and mapped to their proper citations, which in turn are mapped to a common set of controls. The terminology between UCF and the GRC applications differs slightly as explained in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminology differences

UCF	ServiceNow GRC application
Authority Document	Authority Document
Citation	Citation
Control	Control objective

Elimination of duplicate citations from UCF Shared list download



You can eliminate duplicate citations associated with the authority documents when you receive citations from UCF content as part of the same Shared list.

You can retain one citation as active and mark the duplicate citations as inactive. Move the control objectives of the duplicate citations to the active citation. If the duplicate citation is part of a parent–child hierarchy, then its Source ID is updated with the Source ID of the active citation.

Duplication of UCF citations

Duplication occurs when you download UCF content that has multiple citations tied to the same Authority Document (AD). However, each of these citations is linked to a control objective or can be linked to multiple control objectives. In such cases, when you download UCF there would be as many citations linked to control objectives. The citations have different Source ID and different control objectives linked to them. Nevertheless, such citations are linked to the same AD.

Duplication is identified when the downloaded citations tied to an authority document have similar **Reference**, **Authority document**, and **Description** details but a different **Source ID**. Such citations that belong to the same authority document but downloaded multiple times are termed as duplicate citations.

Deduplication of UCF citations

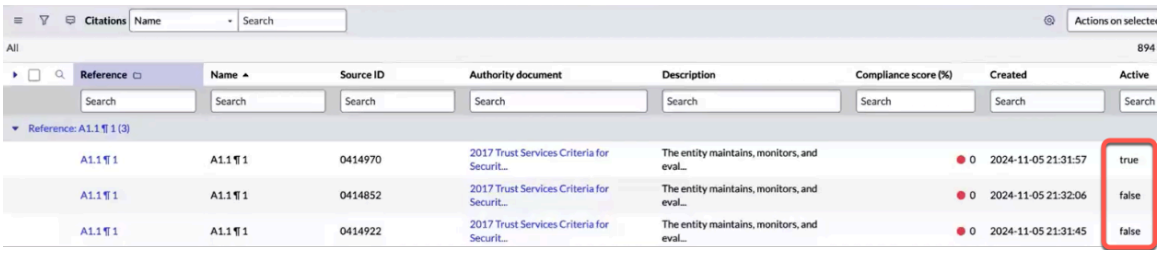
You can retain one citation as active and mark the rest of the duplicate citations as inactive. The relationship of this inactive citation with that of the control objective is removed from the m2m table. In its stead, the record of the active citation is added to the control objective in the m2m table.

Similarly, the child citations of the duplicate citations, if any, can be grouped with the child citations of the active parent citation in the Citations related list of the active citation. For example, if the citation with Source ID 0123 is being retained, then the parent of the duplicate citation's child citation must be updated as 0123. Or, the child citation's parent Source ID as 0123 must be updated, so that the citation's parent–child relationship is retained.

Fix provided to eliminate duplicate citations

This enhancement helps you to eliminate duplicate citations associated with the authority documents when you download UCF content, or by running an on-demand job after UCF content is downloaded. The fix is available when you:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Import data from the UCF Shared list. To download a UCF shared list, see Download a UCF shared list.
- Run the *UCF citation deduplication issue fix* on-demand job if you don't want to import UCF again. This job eliminates the duplicate citations and fixes the parent–child relationship by appending the child citations of the inactive parent citation to the active parent.

1. To run the on-demand job, navigate to **All** > **System Definition** > **Scheduled jobs**.
2. Select *UCF citation deduplication issue fix* and click **Execute Now**.

After the fix:

1. Navigate to **All** > **Policy and Compliance** > **Citations**
2. Select **Group By** and right-click the List controls icon.
3. Select **Reference** in the list.

   You can view citations with unique Reference ID, unique Description, and each citation belongs to a different AO. In the **Active** column, the active citation is **true**, and the duplicate citations are marked as **false**. Select and open one of the citation record, all control objectives are grouped in the Control objectives related list, and its child citations in the Citations related list.

Note:
Citations are considered as duplicate only when their **Reference ID**, **Authority document**, **Description** are the same. Even if one of these conditions isn't fulfilled, then they're considered as two different citations and not as duplicate.

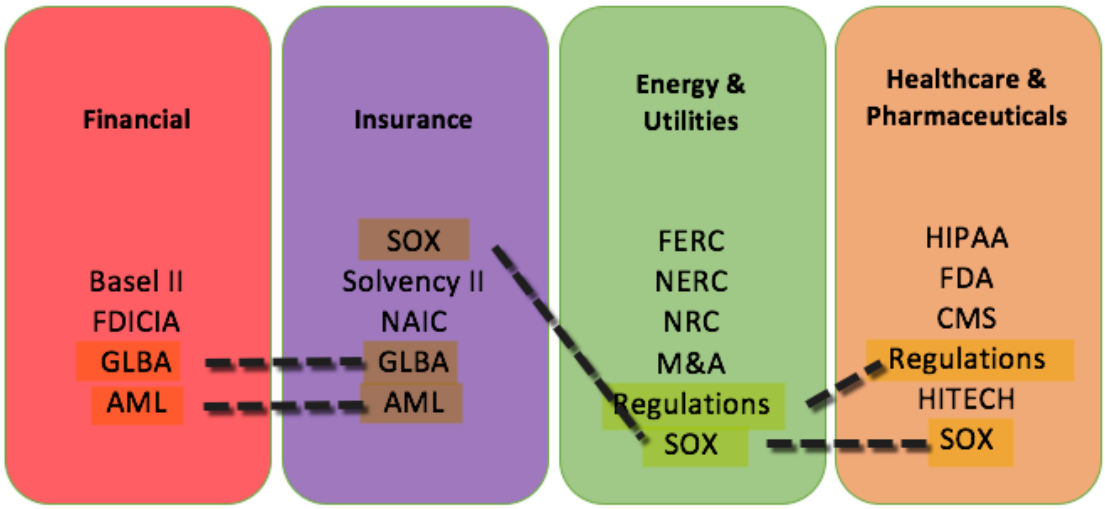
Manage controls

Controls are specific implementations of a control objective. Retired controls do not appear in the list. Before defining controls, take time to rationalize, consolidate, and define the important controls in your organization.

Rationalize your controls

If you upload all your controls in bulk, you are missing the opportunity to refine and streamline your controls set. As your business changes, and your IT data, processes, and technology improve, replace outdated controls and procedures when you implement your GRC application. Consider the following:

- How does this control affect my business objective?
- Is this control actually preventing or detecting risk?
- Is there a different control you can place that better protects your business?
- Is there a control you can put in place that reduces process overhead and improves IT performance while also mitigating risk?
- Can a complicated control be replaced with a simpler more effective control?



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you define controls manually or when you import them from the Unified Compliance Framework (UCF), an entity is associated with the controls. It is a mandatory field on the Control form. If, however, you import controls from a source other than the UCF, you may encounter controls that do not have associated entities. It is important that you return to the Control form and add an entity to the control. Missing entities can cause unreliable results in calculations. Also, if you encounter a control with an entity that has been disabled, the control should be retired.

Consolidate your controls

Look for opportunities to consolidate controls. Look for common, repeated controls across multiple regulatory authorities of frameworks (for example, SOX and GLBA and AML). Avoid operating a single control multiple times for each regulation, by cross-mapping controls and eliminating the redundant ones. This process establishes a single consolidated set of controls = control framework, performing and preserving the cross mapping of controls is critical for audits.

Industry regulations and requirements overlap

Define controls and business rules

The business rules you define up front, establish the GRC configuration settings later. Be prepared to:

- Identify controls and control owners
- Define control tests and expected results
- Establish test and control frequencies
- Identify risks: impact and likelihood
- Prepare attestations, assessments, questionnaires, and required evidence
- Compose likely use-cases (who needs to interact with or view the contents of the GRC system and for what purposes)
- Map authoritative sources to policies, to procedures, to controls, and to risks

Create a control

Controls are automatically generated when you associate a policy with an entity type or an entity type with a control objective. A control is created for each entity listed in the entity type for the control objective. Controls can also be manually created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_compliance.admin or sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Controls** > **All Controls**.
2. Click **New**.
3. On the form, fill in the fields.

Control form

Field	Description
Name	Name of the control.
Number	Unique identification number.
Entity	Related entity. **Note:** If you change the state of the entity to Active from Retired state, then the manually created control on the entity also moves to the Draft state.
Inherit from control objective	Option to indicate whether the control is created through item generation process. For more information, see Multiple controls for a unique entity–control objective combination.
Control Objective	Related control objective.
Owning group	Group that owns the policy.
Owner	User that owns the policy. **Note:** The owner is always added as a respondent. The control owner that you select belongs to the owning group.
Key control	Indicator that the control is a key control.
Weighting	Value used to calculate the control score effectiveness. Based on the control weighting, in the control score effectiveness value is calculated
Status	Control status. Possible choices are: ○ **Compliant** ○ **Non-compliant** ○ **Not applicable**
State	Control state. Possible choices are: ○ **Draft** In this state, all compliance users can modify the control. Only available when creating a one-off control. One-off controls are possible but not recommended. ○ **Attest** When the control is created from a control objective, controls are in this state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: When a control is set back to draft, the attestation is canceled. ○ **Review** Controls are automatically moved to review from the attestation phase. ○ **Monitor** In this state, all compliance managers can move the control from review to monitor. ○ **Retired** Compliance managers or administrators can move a control from Monitor to Retired. **Note:** When a control is retired: ▪ Associated indicators do not run ▪ Associated attestations are canceled ▪ Changes to associated control objectives do not update the control
Exempt	Mark the control as exempted.
Enforcement	List of options: ○ Mandated ○ Voluntary
Category	List of options: ○ Acquisition or sale of facilities, technology, and services ○ Audits and risk management ○ Compliance and Governance Manual of Style ○ Human Resources management ○ Leadership and high-level objectives ○ Monitoring and measurement ○ Operational management ○ Physical and environmental protection ○ Privacy protection for information and data ○ Records management ○ System hardening through configuration management ○ Systems continuity ○ Systems design, build, and implementation ○ Technical security ○ Third Party and supply chain oversight ○ Root ○ Deprecated
Type	List of options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Acquisition/Sale of Assets or Services ○ Actionable Reports or Measurements ○ Audits and Risk Management ○ Behavior ○ Business Processes ○ Communicate ○ Configuration ○ Data and Information Management ○ Duplicate ○ Establish Roles ○ Establish/Maintain Documentation ○ Human Resources Management ○ Investigate ○ IT Impact Zone ○ Log Management ○ Maintenance ○ Monitor and Evaluate Occurrences ○ Physical and Environmental Protection ○ Process or Activity ○ Records Management ○ Systems Continuity ○ Systems Design, Build, and Implementation ○ Technical Security ○ Testing ○ Training
Classification	List of options: ○ Preventive ○ Corrective ○ Detective ○ IT Impact Zone
Frequency	Frequency at which the control is tested. This field is for the control's testing and reporting purpose. List of options: ○ Event Driven ○ Daily ○ Weekly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Monthly ○ Quarterly ○ Semi-Annually ○ Annually **Note:** For information on the difference between the **Frequency** field for a control and the **Attestation Frequency** field in an entity, see KB0694607.
Description	Description of the control.
Additional Information	Additional information about the control.
Assignment	
Owning group	Group that owns the control.
Owner	User that owns the control.
Attestation	
Attestation	Select from a list of options. ○ Other attestation types can be configured. ○ If this field is populated, then the **Attestation Respondents** field automatically becomes mandatory, and the owner is made the respondent. **Note:** If the user changes the attestation type in the control objective, all the related controls are changed also.
Attestation respondents	○ Users assigned to the attestation of this control. ○ Only a user with the sn_grc.user role can be added as a respondent. **Note:** When both the **Attestation** and **Attestation respondents** fields are set, attestations are created when you click **Attest**.
Attestation frequency	Frequency at which attestations on the control are triggered. If the field has no value selected, then the associated entity's **Attestation frequency** value defaults to this field. Options for attestation frequency: ○ Daily ○ Weekly ○ Monthly ○ Quarterly ○ Semi-Annually ○ Annually

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: After the attestation is complete, the control moves to Review and Monitor states. The control is then monitored for its next due date of attestation. You have the option to trigger the control's attestation frequency based on the attestation's **Created date** or the last completed attestation's **Updated date**. This option is based on the value in *Trigger control attestations based on the created or updated date of the last completed attestation* system property.
Activity Journal	
Additional comments	Public information about the control.

4. Select **Copy entity frequency** related link to copy the value of the **Attestation frequency** field of the entity to the **Attestation frequency** field of the control.
   When you select the **Copy entity frequency** related link, the respective entity's attestation frequency gets copied to the **Attestation frequency** field in the Attestation section of the control table, and does not update the **Frequency** field of the control table.
5. Click **Submit**.

What to do next

After you create a control, you can convert the control to a common control and add reliant entities and reliant entity types to it. For more information, see Testing common control and implementing results on multiple reliant entities.

Follow a control

Connect integrates with Policy and Compliance Management providing an overlay to the standard interface, allowing users to participate in conversations while they work and collaborate on the control record.

Before you begin

Role required: sn_compliance.user or sn_compliance.reader
For more information about Connect, see Connect.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Controls** > **All Controls**.
2. Open the control record.
3. Click **Follow** > **Following** and select one of the options from the drop-down.

Attest a control

Attestations are surveys that gather evidence to prove that a control is implemented. If the control attestation and respondents fields are selected, when the control moves from the **Draft** state to the **Attest** state, a notification is sent to the attestation respondents.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users can create multiple attestation types and set their control objectives to different attestations. A sample attestation called **GRC Attestation** is also provided as the default attestation.

About this task

When controls are attested, a new questionnaire is created. As a result, attestations do not appear in the **Self-Service** > **My assessments & surveys** module. Hundreds of GRC assessment records could be generated at once and should be separated from other assessments in a separate list view.

Procedure

1. Navigate to **Policy and Compliance** > **Controls** > **My Attestations**.
2. Open the attestation and review the details.

Option	Description
If you are unable to answer the questions	**a.** Reassign the attestation to another user in the **Assigned to** field. **b.** Click **Update** and close the record. **Note:** Only a user with the sn_grc.user role can be re-assigned the attestation. The list of attestations refreshes when you re assign an attestation to another user.
If you are able to answer the questions	**a.** Click **Take attestation**. **b.** Answer the questions and attach informa tion, as required. **c.** Click **Submit**. The list of attestations refreshes when you close the **Take Assessment** pop-up window.

Multiple controls for a unique entity–control objective combination

You can create multiple controls for a unique combination of an entity and a control objective to get granular control information.

For an organization that handles multiple products, operational lines, and practices, having a single control for an entity and a control objective combination is ineffective. Multiple levels of control objectives, controlled and managed centrally helps to get the granular control information.

The benefits of creating multiple controls for the same entity and control objective combinations are:

- You can create high-level control objectives and more granular controls.
- The control owner, compliance manager, and compliance user can manage the compliance library more efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create multiple controls for the same combination of entity and control objective by enabling the **Inherit from control objective** option in the Control form. Controls can be created either through item generation process or, by default, inherited from the control objective. Such controls have a unique name as they are unique to the entity–control objective combination. By default, only one control can be inherited from the control objective. However, if you want to create multiple controls for the same combination of entity and control objective you have to do it manually and the name of the control must be unique.

When you select the **Inherit from control objective** option in the Control form, the control automatically inherits the name and description of the control objective. However, when the option is not selected, then you must enter the name of the control manually.

Manage control attestations

Attestations are surveys that gather evidence to prove that a control is implemented. Attestations document how the control is measured. This method is frequently used during the Draft and Monitor state.

The attestation designer provides a single interface that users can use to create, and edit attestations, as well as change scoring parameters. The question bank offers a library of questions for various categories, so you do not have to build each questionnaire from scratch.

Note:
To know more about control attestations, see An overview of policy life cycle in Policy and Compliance Management.

Users can create multiple attestation types and set their control objectives to different attestations. A sample attestation called **GRC Attestation** is also provided as the default attestation, which is composed of the following simple questions:

By default, **GRC Attestation** is used for controls and provides the following assessment questions:

- Is this control implemented?
- Attach evidence
- Explain

My Attestations is in the **Controls** section of the Policy and Compliance application and contains active attestations for which you are the respondent. The attestations appear in a list with a single attestation record per control.

My Grouped Attestations contains attestations that you have grouped to eliminate the task of providing repetitive responses for similar assessments.

All Attestations is contained in the **Controls** section of the Policy and Compliance application and contains all active attestations.

Compliance managers can create attestation types containing different types of questions to fit their needs. See Create a control attestation using the Attestation Designer.

Compliance managers can create a new set of questions for each control objective. The Question Bank offers a library of questions for various categories, so you do not have to build each questionnaire from scratch. See Create an attestation type.

Attestation Designer

The attestation designer provides a single interface that users can use to create, and edit attestations, as well as change scoring parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All attestation records are stored in assessment tables and displayed in Attestation views of those tables.

Create a control attestation using the Attestation Designer

Use the Attestation Designer to create and edit metric types. Use different metric types for different controls. Select multiple respondents for an attestation, as well as change scoring parameters.

Before you begin

Role required: sn_compliance.attest_creator, sn_compliance.manager, sn_compliance.administrator

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Attestation Types**.
2. Click **Attestation Designer**.
   The designer contains the following elements:

Element	Description
Controls	Supported question data types are available in the Controls palette. Drag a control onto the designer canvas to create a question of that type.
Questions	A library of questions for various categories, so you do not have to build each questionnaire from scratch.
Categories	New assessment opens in the **Design** view. The questionnaire **Name** field appears above the first category in the canvas. A blank question field appears in the category container.

3. Enter a name in the **Name** field.
4. Drag a control onto the designer canvas to create a question of that type.

Question controls

Data type	Description	Scored
Attachment	Question with a Manage Attachments icon that allows users to attach one or more files.	N
Boolean	Question with a check box or a **Yes/No** list for user responses.	Y
Choice	List of predefined options. For more information, see the definition for **Choices**.	Y
Date	Date field.	N
Date/Time	Date and time field.	N
Number	Number field with predefined minimum and maximum values. The default is 1–10.	N
Percentage	Percentage field with a prescribed range.	N

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description	Scored
Scale	Predefined Likert scale. Answer options appear as radio buttons.	Y
Numeric Scale	Selectable number scale. The default is 1–5. Answer options appear as radio buttons.	Y
String	Single or multi-line text field.	N
Template	Choice list of templates that provide a predefined scale of options. **Note:** It is important to assign a template to every attestation. This allows controls to be created automatically based on control objectives and entity types.	Y
Reference	Choice list of fields from a specified reference table. This data type does not support reference qualifiers.	N

Note:
Set the correct answer for the metric that you want to be scored. Scored metrics determine the compliance status of the controls.

5. Point to the menu icon in the upper right of the Attestation Designer to select one of the following options.

Note:
The availability of each option depends on the status of the attestation that is opened in the designer.

Option	Description
New Attestation	Opens a fresh canvas for a new attestation.
Load Attestation	Opens a list of existing attestations that you can select and edit.

Unlike other types of assessments, control attestations do not appear in the **Self-Service** > **My assessments & surveys** module, because many control attestations could be generated at once. Instead, controls attestations are shown as a list in the **Policy and Compliance** > **Controls** > **My Attestations** module and **All Attestations** module.

What to do next
If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Create an attestation type

Rather than using the default **GRC attestation** type, the compliance manager can create a new set of questions for each control objective.

Before you begin
Role required: sn_compliance.attestation_creator or sn_compliance.manager or sn_compliance-admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Attestation Types**.
2. Click **New**.
3. On the form, fill in the fields.

Assessment Metric Type form

Field	Description
Name	Name of the assessment type.
Assessment duration	Length of time allowed from generation to completion of the assessment.
Table	Table this assessment applies to.
Scale factor	Scale value to use for all assessment results.
Condition	Define specifics records from the table.
Description	More details about the assessment.
State	State of the assessment: **Draft** or **Published**
Enforce condition	Option that indicates whether accessible records of this type that do not meet the conditions specified are deleted.
Roles	Roles that have access to information about this metric type.

4. Click **Submit**.

Consolidate control attestations using the Same Response feature

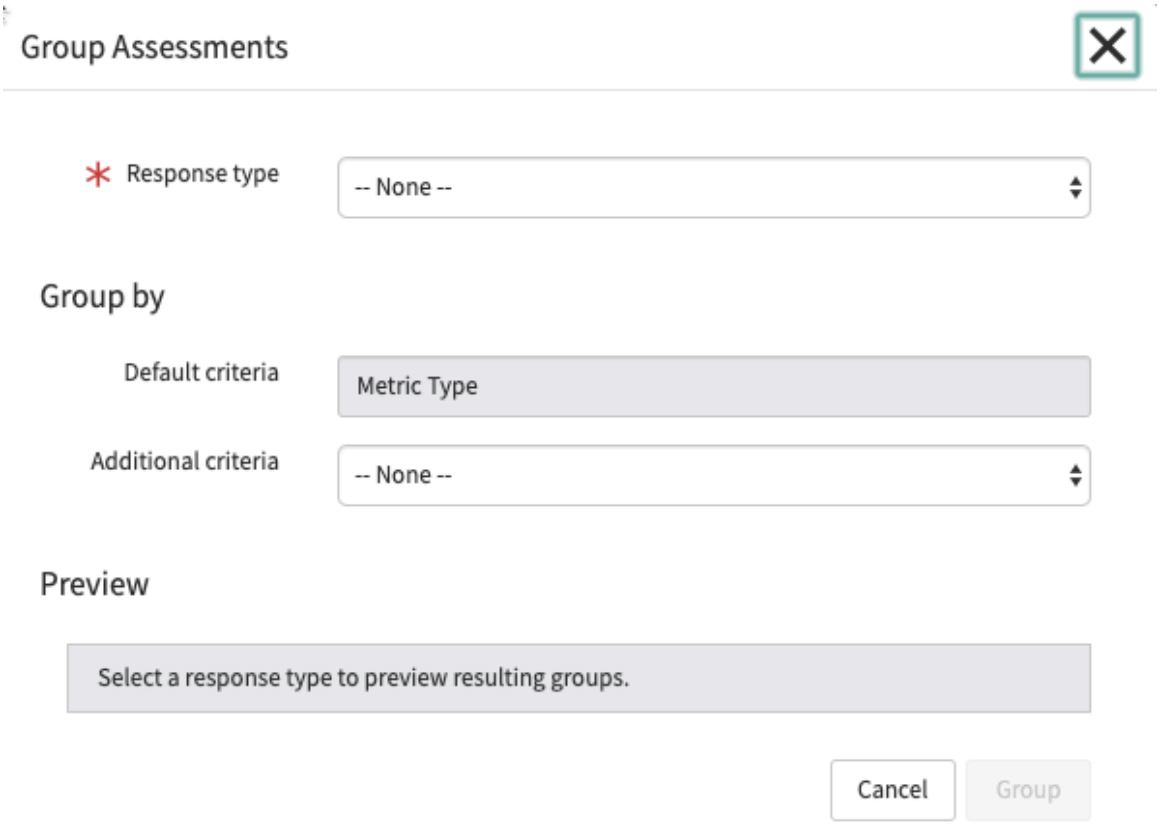
Policy and Compliance Management and Risk Management offer two methods for consolidating attestations and risk assessments into groups that help eliminate the task of providing repetitive responses for similar assessments. You can provide the same evidence to the grouped assessments or respond to individual assessments in the same user interface.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

When you consolidate control attestations using the Same Response feature, you can group attestations that contain a maximum of 1000 questions. When the attestation or risk assessment for the group is taken, all records in the group inherit the answers.



Note:
To change the 1000-question limit, navigate to **All** > **Policy and Compliance** > **Administration** > **GRC Properties** and modify the **sn_grc.consolidated_questions_limit** property.

If you do not want your users to access to this capability, navigate to **All** > **Policy and Compliance** > **Administration** > **GRC Properties**, and disable the **sn_grc.enable_consolidate_asmt** property.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Controls** > **My Attestations**.
2. Select the attestations you want to group.
3. From the **Actions on selected rows** choice list, click **Group Assessments**.

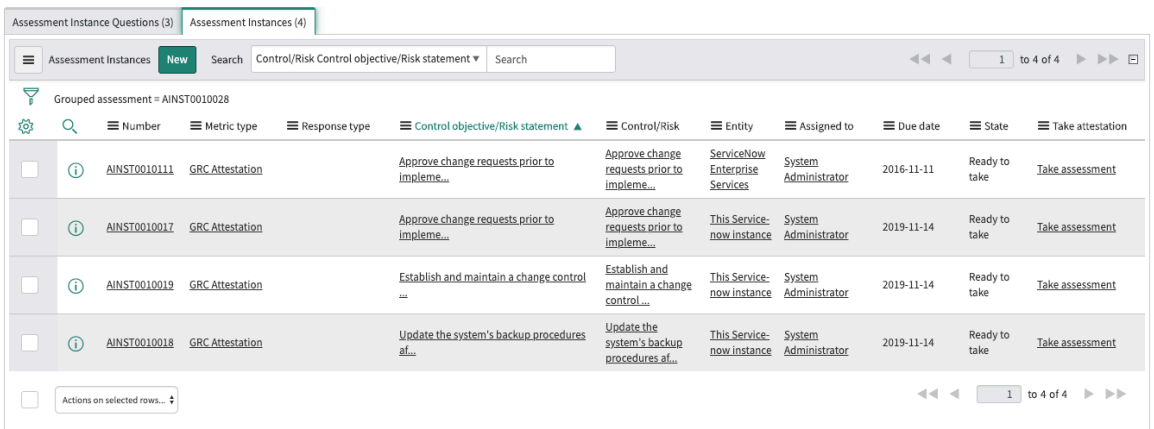
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In **Response Type**, select **Provide same response for all assessments**.
5. Fill in the fields, as needed.

Field	Description
Default criteria	This field defaults to **Metric Type**.
Additional criteria	You can optionally define additional grouping criteria: ○ Category ○ Control Objective/Risk Statement ○ Entity You can also define additional assessment criteria options if the defaults do not meet your needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Using these grouping schemes makes sense if the grouped attestations contain multiple instances of the selected criteria. For example, if you selected a group of 20 attestations with 10 associated with one entity and the other 10 associated with a different entity, selecting **Entity** in this field causes two separate groups of attestations to be created. If, however, the group consists of 5 attestations associated with one entity and each of the other 15 attestations associated with different entities, only those 5 are grouped and the rest are ignored.
Preview	The **Preview** shows the number of attestations to be grouped. Depending on the **Additional criteria** you selected, the Preview may show multiple groups. If you want to see the attestations to be grouped, click the link that shows the number of attestations or risk assessments to be grouped.



6. When you are satisfied with the attestations or risk assessments to be consolidated, click **Group**.

   A confirmation message displays, along with a link to the attestation group.

Note:
When attestation groups are created, you can view them by navigating to **Policy and Compliance** > **Controls** > **My Grouped Attestations**. If you open a grouped attestation, you have the option of removing one or more attestations from the group. This is achieved by selecting the ones you want removed, and selecting **Ungroup Assessment** from the **Actions on selected rows** choice list. If you remove attestations from a group to the point where there is only one attestation, the group is removed.

7. When you are ready to take the assessment, click the link in the confirmation message or the attestation number in **My Grouped Attestations**.

8. Click **Take assessment**.
9. Complete the assessment like you would any other, and click **Submit**.
   All attestations in the group inherit the answers you provided and the state of each attestation in the group changes to **Complete**.

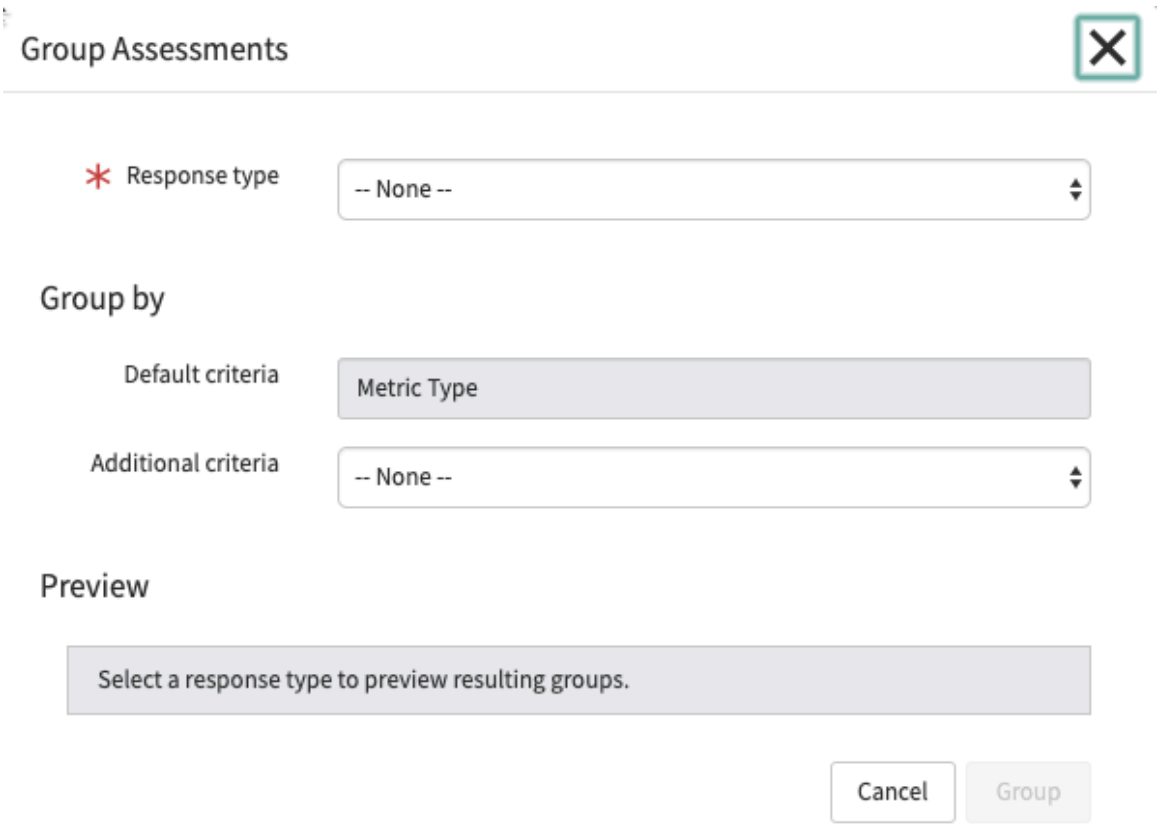
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consolidate control attestations using the Different Response feature

Policy and Compliance Management and Risk Management offer two methods for consolidating attestations and risk assessments into groups that help eliminate the task of providing repetitive responses for similar assessments. You can provide the same evidence to the grouped assessments or respond to individual assessments in the same user interface.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite



About this task

When you consolidate control attestations or risk assessments using the Different Response feature, you can group up attestations or risk assessments that contain a maximum of 150 questions. All of the questions appear in a single UI.

Note:
To change the 1000-question limit, navigate to **Policy and Compliance** > **Administration** > **GRC Properties** and modify the **sn_grc.grouped_questions_limit** property.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Controls** > **My Attestations**.
2. Select the attestations you want to group.
3. From the **Actions on selected rows** choice list, click **Group Assessments**.

4. In **Response Type**, select **Provide different response for each assessment**.
5. Fill in the fields, as needed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Default criteria	This field defaults to **Metric Type**.
Additional criteria	You can optionally define additional grouping criteria: ○ Category ○ Control Objective/Risk Statement ○ Entity You can also define additional assessment criteria options if the defaults do not meet your needs. **Note:** Using these grouping schemes makes sense if the grouped attestations contain multiple instances of the selected criteria. For example, if you selected a group of 20 attestations with 10 associated with one entity and the other 10 associated with a different entity, selecting **Entity** in this field causes two separate groups of attestations to be created. If, however, the group consists of 5 attestations associated with one entity and each of the other 15 attestations associated with different entities, only those 5 are grouped and the rest are ignored.
Preview	The **Preview** shows the number of attestations to be grouped. Depending on the **Additional criteria** you selected, the Preview may show multiple groups. If you want to see the attestations to be grouped, click the link that shows the number of attestations or risk assessments to be grouped.

6. When you are satisfied with the attestations or risk assessments to be consolidated, click **Group**.

   A confirmation message displays, along with a link to the attestation group.

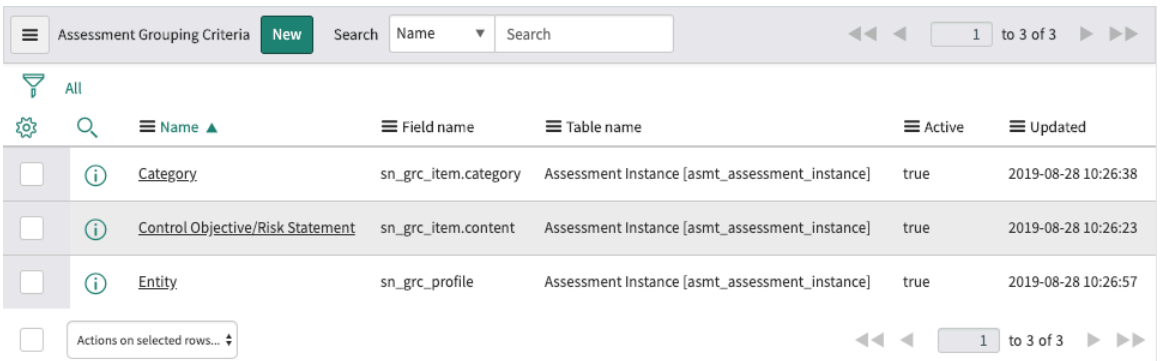
   Note:
   When attestation groups are created, you can view them by navigating to **Policy and Compliance** > **Controls** > **My Grouped Attestations**. If you open a grouped attestation, you have the option of removing one or more attestations from the group. This is achieved by selecting the ones you want removed, and selecting **Ungroup Assessment** from the **Actions on selected rows** choice list. If you remove attestations from a group to the point where there is only one attestation, the group is removed.

7. When you are ready to take the assessment, click the link in the confirmation message or the attestation number in **My Grouped Attestations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Take assessment**.
   You see questionnaires for all of the selected attestations in the group.
9. Complete the assessment for each of the attestations, and click **Submit**.

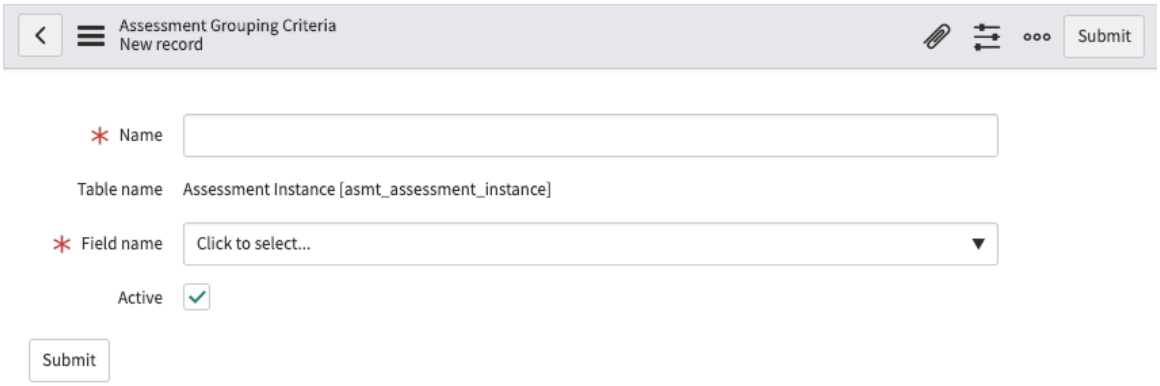
Define assessment grouping criteria



You can optionally define additional grouping criteria if the default criteria does not meet your needs.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager



Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Assessment Grouping Criteria**.

2. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Field	Description
Name	Name of the assessment grouping criteria.
Field name	Select the field name from the Assessment Instance [asmt_assessment_instance]table.
Active	Select to activate the grouping criteria.

4. Click **Submit**.

Manage control indicators

Continuous monitoring involves activities related to identifying and creating key risk and controls indicators. The Compliance Overview is available to compliance administrators and compliance managers, providing an executive view into compliance requirements, overall compliance, and compliance breakdowns.

Supporting information can be collected for indicators through automatic data collection or manual tasks. Indicator results are then used to create issues for controls, update risk scores, and provide supporting information for audit activities and control testing.

Indicators

Indicators collect data to monitor controls and risks, and collect audit evidence. Indicators monitor a single control or risk.

Indicator templates

Indicator templates allow the creation of multiple indicators for similar controls or risks.

Compliance Overview

Compliance Overview reports in the base system

Name	Visual	Description
Compliance Requirements	Donut chart	Select a wedge to focus on a specific compliance area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance Overview reports in the base system (continued)

Name	Visual	Description
Overall Compliance	Donut chart	Displays the overall compliance of all the control requirements in the system. Selecting a specific wedge in the previous widget brings that area into focus.
Entity	Drop down list	Select one or more entities to view and compare their compliance across multiple items.
Control State	Check list	Select or clear check boxes to view filter reports by control state.
Compliance by Authority Document	Bar Chart	Compare level of compliance depending on the selected entity and/or authority document.
Compliance breakdown	Multi-level Pivot	View a breakdown of control compliance by related authority documents and policies.
Non Compliant Entities	Column Chart	Count of non-compliant control requirements grouped by entity.

Authority Documents

Authority documents define policies, risks, controls, audits, and other processes to ensure adherence to the authoritative content.

Each authority document is defined in a record and the related lists on that record contain the individual conditions of the authority document.

The relationships of these authority document related list items are visible in the GRC Workbench in the Policy and Compliance Management application.

Note:
You can add content reference tags to authority documents. Content reference tags allow you to filter records in order to more easily identify the content packs, integrations, and use case accelerators associated with the authority documents.

Citations

Citations contain the provisions of the authority document, which can be interrelated. Citations break down an authority document into manageable themes.

You can create citations or import them from UCF authority documents and then create any necessary relationships between the citations.

Note:
You can add content reference tags to citations. Content reference tags allow you to filter records in order to more easily identify the content packs, integrations, and use case accelerators associated with the citations.

Create a control indicator

Indicator data for controls, risk, and audit evidence are measured differently depending on the GRC application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_compliance_admin, sn_compliance_manager

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Indicators** > **Indicators**.
   - **Risk** > **Indicators** > **Indicators**.
   - **Audit** > **Indicators** > **Indicators**.
2. Select **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	Select **Compliance Indicator** for a control indicator and **Risk Indicator** for a risk indicator.
Name	Name of the indicator.
Applies to	Entity related to the **Item**.
Owning group	Group that owns the indicator.
Owner	Indicator owner.
Number	Unique identification number.
Active	Option that indicates whether the indicator is active.
Item	Related control or risk.
Template	Related indicator template.
Override Template	Option that indicates whether to override the indicator template associated to this indicator
Last result passed	Option that indicates whether the last result passed.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
Next run time	Next collection time for indicator results.
Method	
Type	Results can be gathered manually using task assignment or automatically using basic filter conditions, Performance Analytics, or a script. ○ Manual ○ Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Short Description	If Type is **Manual**, this field is present. Brief description of the issue.
Instructions	If Type is **Manual**, this field is present. Instructions for the collection of indicator results.
Value Mandatory	If Type is **Manual**, this field is present.
Passed/Failed	If Type is **Basic**, this field is present. Indicator passes or fails.
PA Threshold	If Type is **PA Indicator**, this field is present. The associated PA Threshold.
Script	If Type is **Script**, this field is present. Script that obtains the desired system information.
Supporting Data	
Note: Starting with Version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks is displayed. Earlier, only the real-time state of the records collected could be viewed.	
Table	Use supporting data to gather supporting evidence from other applications.
Supporting data fields	Supporting data fields based on the selected table.

4. Select **Submit**.

Note:
As a compliance manager or compliance admin, you can assign the indicator task to a user with Business User Lite role. If you assign a user with a Business User Lite role as an owner in the **Owner** field and **Execute** the indicator, an indicator task is created in the Open Tasks related list. This indicator task is assigned to the owner with the Business User Lite role.

As a user with the Business User Lite role, you can navigate to **Policy and Compliance** > **Indicators** > **My Indicator Tasks** to view the indicator tasks that are assigned to you. You can view the indicator by selecting the information icon next to the Indicator field. You can also update the **Result** field, **State** field, **Value** field, **Additional comments**, and **Work notes** in the Indicator Task form.

To accomplish similar tasks from the employee center, see GRC tasks in the employee center portal.

What to do next

If you're implementing the Policy and Compliance Management software, then you've completed the required setup steps. Return to the Policy and Compliance Management setup checklist and proceed to the optional steps, as needed.

Create a GRC indicator template

Compliance or risk managers create indicator templates from which many indicators can be created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager
- sn_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager
- sn_grc.user

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Indicators** > **Indicator Templates**.
   - **All** > **Risk** > **Indicators** > **Indicator Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Indicator template form

Field	Description
Name	Name of the indicator.
Description	Description of the indicator.
Category	Category for which you're creating an indicator template. For example, select **Risk Indicator Template** to create a risk indicator template.
Active	Option that determines whether the indicator template is active.
Method	
Type	The method used to determine the type of indicator template. The choices are as follows: ○ **Manual**: Manual indicators are used for data that cannot be retrieved from a ServiceNow instance because it comes from an external system, such as customer data from a third-party sales system. ○ **Basic**: Basic indicators are automated indicators based on an indicator source. The indicator source specifies a table and a frequency at which the scores from this table are saved. ○ **Script**: Scripted indicators use a custom script to collect the data.
Result if the value meets or exceeds the target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, assume you enter 100 in this field. If the indicator result output is more than 100, then the indicator status will pass or fail based on the value configured in this field.
Target Type	Type of the target value. The choices are as follows: ○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Target	The value that determines if the indicator should pass or fail.
Instructions	Additional instructions for the template.
Value mandatory	Option to decide if a value must be compulsory in the indicator task for a manual indicator. **Note:** This option appears only if **Manual** is selected from the **Type** field. This option is automatically selected if **Count** or the **Percentage** is selected from the **Target type** field.
Supporting Data	
Note: Starting with version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks are displayed. Earlier, only the real-time state of the records collected could be viewed.	
Collect supporting data	Option to enable collecting supporting data or evidence every time the indicator runs.
Table	Table used for collecting supporting data.
Supporting data fields	Fields of the source table to be used for collecting the supporting data.
Sample collection type	Type of supporting data collection, such as count or percentage.
Sample size	Minimum number of records that must be used for collecting supporting data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, a basic indicator could query a large table, returning thousands of records with each indicator execution. You do not need to save all of them; just a sample of those records. If you enter a sample size of 100, only 100 records are saved, even though the query returned thousands.
Basic Criteria	
Criteria	Criteria to filter the data from the source table.
Use reference field	Option to enable the use of the **Reference field**.
Reference field	Connection between the supporting data table and the **Applies to record** field of the entity.
Additional Criteria	
To create indicators with targets, use the advanced filter criteria. This section appears only when you select **Basic** from the **Type** field. This section is used to provide more filter criteria.	
Additional criteria	More criteria to filter the data to calculate the target value. This section only appears when **Percentage** is selected from the **Target type** field.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
First run date	First collection time for indicator results. This field is automatically set based on when an indicator or an indicator template runs for the first time. The value in this field can't be modified.
Next run date	Next run time to collect indicator results of all downstream indicators for this indicator template.
Due date duration (days)	Due date duration in days between the creation and due date of the indicator task and generation of its results. The due date duration added to the creation date reflects as the **Due date** of the indicator task. This field appears only when **Manual** is selected from the **Type** field. For more information, see Performance enhancements for Indicator nightly job.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. When you have completed these entries, you can also view information on the following related lists:
   - Control Objectives/Risk Statements
   - Content References

   Note:
   The **Control Objectives/Risk Statements** tab enables you to reuse the same template for multiple control objectives or risk statements, or both of them.

5. Select **Submit**.

Monitor controls using GRC Performance Analytics Indicators

You can link Policy and Compliance Management content and items to Performance Analytics indicators, breakdowns, and thresholds. You can associate Performance Analytics indicators with control objectives and controls to view scorecards and trends and analyze current conditions and trends.

The risks and controls associated with a PA indicator or PA indicator/breakdown/element automatically monitor any PA threshold with the same PA indicator or PA indicator, breakdown, or element relationship. Any PA threshold breach is reported at the risk or control and Performance Analytics indicators relationship level within a breach counter.

PA threshold breach impact

When a risk or control and Performance Analytics indicators relationship breach counter is different than zero (for example, a PA threshold with the same PA indicator or PA indicator, breakdown, or element relationship has breached), and if no opened issue exists, then an issue is created which is associated to the risk or control. Also for risks, the **Indicator failure factor** represents the number of risk and Performance Analytics indicators relationships with a breach counter different than zero.

Reset all PA Indicator breach counters

Reset breach counters associated to a risk or control by clicking **Reset all PA Indicator breach counters** or opening the specific relationship and clicking **Reset Breach Counter**.

© 2026 ServiceNow, Inc. All rights reserved.

GRC PA indicator breach reports

There are two reports for the reporting of breaches:

- Risk PA Indicator Breaches
- Control PA Indicator Breaches

Activate GRC: Performance Analytics Integration

The GRC: Performance Analytics Integration plugin provides an integration between Performance Analytics and the Risk Management and Policy and Compliance Management applications. This plugin provides more insight into organizational risk and compliance performance.

Before you begin
Role required: admin

About this task
This plugin includes demo data and activates related plugins if they are not already active.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next
After activating the GRC: Performance Analytics Integration plugin on an instance with customized related lists on content (risk or control objective) or items (risk or control), you may have to manually add the PA Indicator to content relationships and/or the PA indicator to item relationships.

Related topics

List of plugins

Associate a PA indicator with a risk statement or control objective

You can associate Performance Analytics indicators with risk statements and policy statements to analyze trends related to the risk or policy.

Before you begin
Role required: sn_risk.manager or sn_compliance.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Policies and Procedures** > **Control objectives**.
   - **All** > **Risk** > **Risk Library** > **Risk Statements**.
2. Open a risk statement or control objective.
3. In the **PA Indicators** related list, click **New**.
4. On the form, fill in the fields.

PA Indicators form

Field	Description
PA Indicator	The performance analytics indicator to associate the Risk Statement or control objective with.

5. Click **Submit**.
   On the risk statement or control objective form, in the **PA Indicators** related list, you see the associated indicator. You can optionally click **View Indicator** on the desired indicator to see the Performance Analytics scorecard of the indicator. The PA Indicator associations are carried over to all risks or controls associated to the original risk statement or control objective. Also, if the indicator has a breakdown that matches the risk or entity of the control (for example a Business Service breakdown), the **Breakdown** and **Element** fields for the relationship are automatically filled in.

Associate a PA indicator with risks and controls

You can associate Performance Analytics indicators with risks and controls to analyze trends related to the entity that risk or control belongs to.

Before you begin

Role required: sn_risk.manager or sn_compliance.manager

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Controls** > **All Controls**.
   - **Risk** > **Risk Register** > **All Risks**.
2. Open a risk or control.
3. In the **PA Indicators** related list, click **New**.
4. On the form, fill in the fields.

PA Indicators form

Field	Description
PA Indicator	Performance analytics indicator to associate the Risk or Control with.
Breakdown	Break down to view a specific trend based on the breakdown element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Element	Break down element to view a particular trend and scorecard. **Note:** This field depends on the **Breakdown** field being populated. When visible, it is mandatory.

5. Click **Submit**.
   On the Risk or Control form, in the **PA Indicators** related list, you see the associated indicator. You can optionally click **View Indicator** on the desired indicator to see the Performance Analytics scorecard of the indicator.

Update associated GRC indicators for a set of items

You can update all the items belonging to a GRC content record so each item is individually related to the PA indicator.

Before you begin

Role required: sn_risk.manager or sn_compliance.manager

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Policies and Procedures** > **Control Objectives**.
   - **All** > **Risk** > **Risk Library** > **Risk Statements**.
2. Open a Risk Statement or Control Objective that has an associated Performance Analytics Indicator.
3. Click the **Update PA Relationships** related link.
   All the risks or controls related to the risk statement or policy statement are automatically associated with all the risk statement or policy indicators of the statement. Also, if the indicator has a breakdown that matches the risk or entity of the control (for example a Business Service breakdown), the **Breakdown** and **Element** fields for the relationship are automatically filled in.

Manage evidence requests

Evidence request is used by audit and compliance teams for requesting supporting documents during an audit. Auditors and compliance teams require these documents from the first line of defense.

Evidence request: Evidence is all the information used by an auditor in determining the audit opinion. Evidence includes the information contained in the accounting records underlying the financial statements and other information. Evidence is cumulative in nature. It includes evidence obtained from audit procedures performed during the audit. Evidence may also include audit evidence obtained from other sources such as, previous audits.

An evidence request is frequently introduced during the audit preparation or planning phase after the audit announcement. The documents requested are used by the audit team to understand the in-scope controls and processes, and to begin fieldwork testing. As an audit progresses through various stages, the audit team frequently adds new requests to the list. The compliance teams use the collected evidence for control testing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with version 11.0.2 release, an unplanned evidence request is supported by the Audit Management and Policy and Compliance Management applications in the following ways.

- Evidence can be requested from an engagement and all audit tables. To understand how to request evidence, see Request evidence for audit.
- Compliance teams can request evidence from control owners, business stakeholders, and process owners.
- Audit teams can request evidence from control owners, business stakeholders, process owners, and compliance teams.
- Assigned users can provide evidence directly from the Service Portal.
- Managers can approve evidence requests based on various criteria, such as confidentiality and criticality.
- Improved communication channels between requesters and assignees streamline the approval process.
- Improved confidentiality constraints prevent unauthorized persons from viewing request information.

Evidence request workflow and users

Evidence request helps customers to electronically request the information that they need from the first and second line of defense. The individuals being audited can then immediately upload their documents to the system, significantly reducing manual processing time.

The evidence request workflow is as follows:

1. An audit user with the sn_audit.user role requests evidence and assigns the request to another user. This requester can either request the evidence for themselves or raise a request on behalf of another audit user or GRC user. If the requester determines that an evidence task has been created erroneously, then the requester can cancel that particular evidence task. The ability to cancel the evidence request is available when the request is in **Draft** state. A requester can cancel the evidence request tasks any time until the tasks reach the **Review** state.
2. After you create an evidence request, you must create evidence collection records and then the requester must request evidence. Evidence Collection records contain the evidence collection instructions, assigned to, and assignment group. On clicking **Request Evidence**, evidence request tasks are generated and they are assigned to a group or user.
3. The assignee then receives an email with the link to provide the requested evidence.

   Note:
   If the requester changes the assignee after requesting evidence, then the original assignee can no longer view the request. Only the person who is assigned the request can view the request. This feature ensures confidentiality.

4. The assignee can either attach the requested evidence or provide a URL or location that contains the required evidence.
5. The assignee can also add an approver for verifying and approving the evidence. Adding approvers is necessary if the evidence is sensitive and confidential in nature.
6. The approver can then review the evidence and either approve it, request revision, or request further details about the evidence.
7. If the approver approves the evidence, the requester receives the evidence and can process it further.
8. The requester can then review the evidence and do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- accept the evidence.
- request for its review.
- request further details about the evidence.
- cancel the evidence request if it is not required anymore.
- delete the request.

9. If the requester accepts all the evidence tasks, the request is closed.

The evidence request workflow is shown in the following

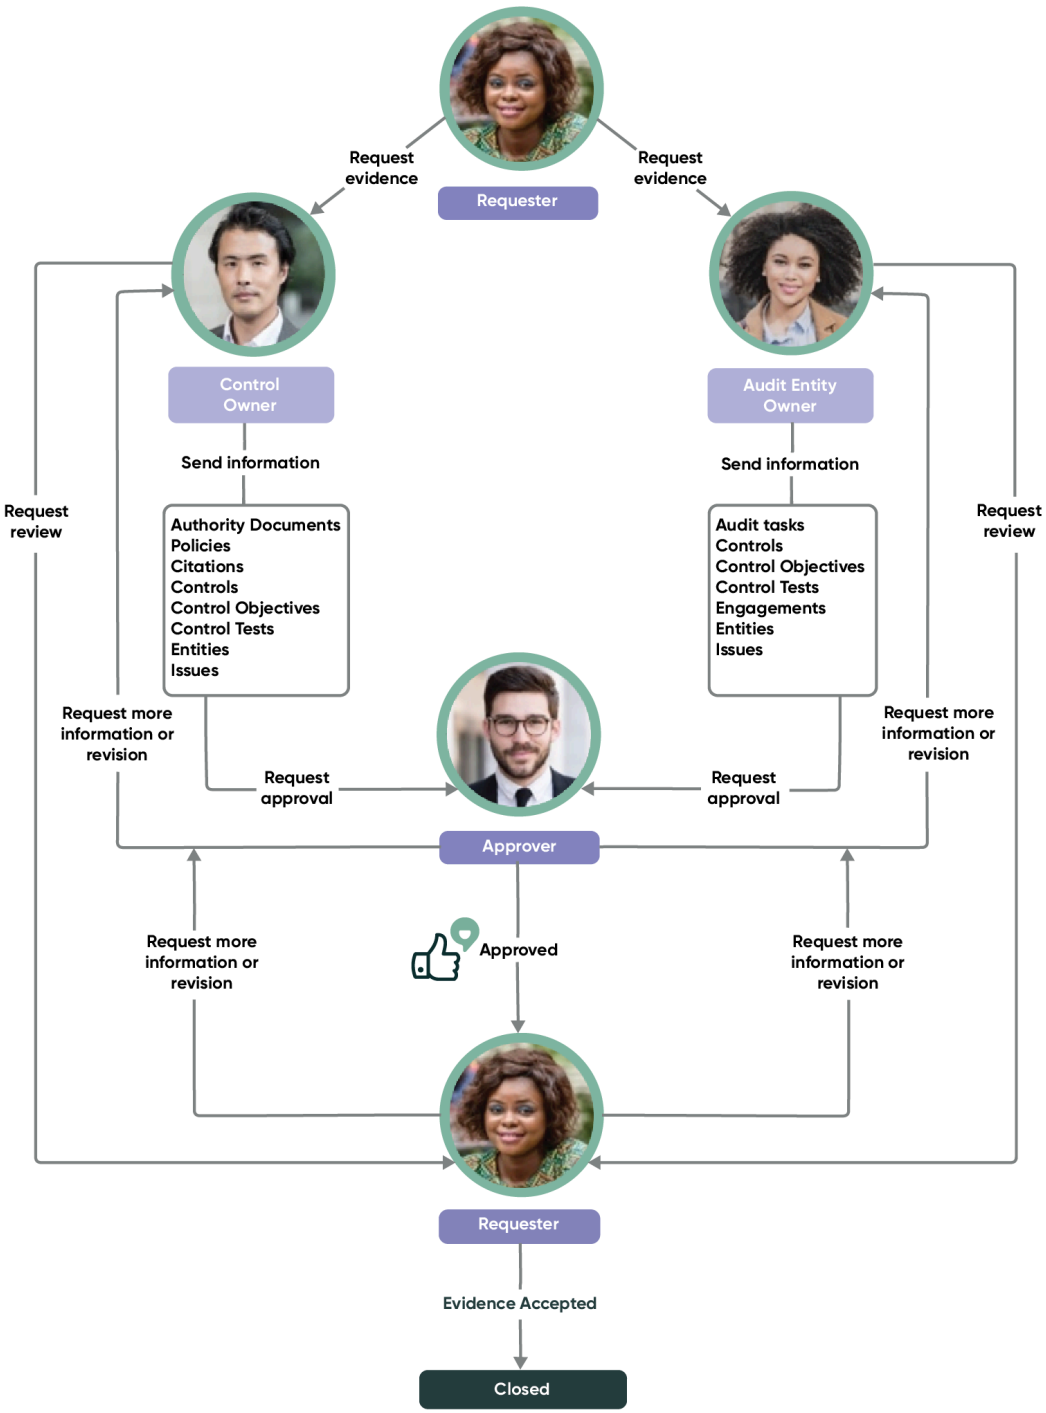

figure:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table describes the roles and their responsibilities during the evidence request workflow:

Evidence request users, responsibilities, and requirements

User	Responsibilities	Requirements
Internal auditor	• Perform audit testing. • Request audit testing. • Review all audit findings and the evidence collected.	• Visibility into compliance and risk activity. • A job queue (pending, current, upcoming) to plan their team efforts. • Track and monitor audit findings. • Track and monitor audit activities.
Compliance manager, Audit manager	• Can request evidence. • Request compliance test evidence. • Review all findings and evidence collected.	• Visibility into compliance activities. • A job queue (pending, current, upcoming) to plan their team efforts. • Track and monitor compliance findings.
Compliance user, Control owner	• Ensure that the controls are implemented. • Attest to the controls. • Test the controls. • Provide audit evidence requested by the auditor.	• A job queue to direct their day-to-day activities. • Track the time spent and performance of activities and tasks they own. • Ensures the task they own and additional request from the auditor is fulfilled.

Request evidence during audits

Request evidence at any stage during an audit. The details about the items for which evidence is requested are also provided to the person responsible for providing the evidence.

Before you begin

Role required: sn_audit.user

About this task

An evidence can be requested in the following three ways:

My Evidence

By creating an evidence record from the **My Evidence** module.

Request Evidence

From the Entity, Control, Audit Task, Control Test Issue, and Other Issues related lists in an engagement record. To request evidence from these sources, navigate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to **Audit** > **Engagements** > **My Engagements**. Open the engagement record, and select the related list from which you want to request evidence. From the **Action on selected rows** list, select **Request Evidence**. Here, you can either create a new evidence request or add more requests to an existing evidence request. The Evidence request is created but not evidence request tasks. For more information on adding existing evidence, see Reuse existing evidence from the related items of an engagement.

Entity, Control, Control Objective, Control Test, Engagement, Issue tables

From tables such as Entity, Control, Control Objective, Control Test, Engagement, Issue. However, when the users request evidence from these tables, the evidence request is created not the actual evidence request task. The users must navigate to the evidence request record that is generated and then add evidence request tasks.

In this procedure, the method to request evidence from the **My Evidence** module is described.

Procedure

1. Navigate to **Audit** > **My Evidence Request**.
2. Click **New**.
3. On the form, fill in the fields.

Evidence Request form

Field	Description
Number	Unique number of the evidence request.
Requester	User requesting evidence. This field is automatically populated.
Requested on behalf of	User for whom evidence is being requested.
Assignment group	Group assigned to provide evidence.
Assigned to	User responsible for providing the evidence.
State	State of the request. The default state is **Draft**.
Type	Type of evidence that is created. Can be either Audit or Compliance.
Request reason	Reason for requesting evidence.
Watch list	Users interested in viewing the evidence collected. If a person is added on the watch list, they can navigate to **Audit** > **Evidence Request** > **Watched Evidence Requests** to view the requests.
Name	Name of the evidence request.
Description	Detailed description of the evidence request.
Schedule	
Due date	Expected date of evidence submission.
Opened	Date the request is opened. This date is automatically updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Closed	Date the request is closed. This date is automatically updated.
Activity	
Work notes	Type any notes that might be required.
Activities	Activity log for the request.

4. Save the form.
   The Evidence Collection Details related list appears. This related list is used to list the items for which evidence is requested.
5. Click **New**.
6. On the form, fill in the fields.

Evidence Collection Detail form

Field	Description
Evidence request	Unique number of the evidence request task.
Evidence for	Record for which evidence is requested. Lists all tables to which the evidence is applied.
Name	Evidence collection detail name.
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing evidence.
Evidence collection instructions	Instructions for providing evidence. For example, list of supporting documents, files, and so on.

7. Click **OK**.
8. Click **Submit**.
9. Click **Request Evidence**.
   When an evidence request is already in the Work in Progress state, and a new evidence collection detail is added, then evidence request task is sent to the assignee immediately. The Evidence related list appears with the list of evidences and the person who is assigned the request receives an email notification to provide the requested evidence. Also, the state of the request changes to **Work in Progress**.
10. Navigate to **Audit** > **Evidence Request** > **My Evidence Request Tasks**.
11. Open the record for which you want to provide evidence.
12. Click **Accept Work**.
13. On the form, fill in the fields.

Evidence form

Field	Description
Number	Number of the evidence request. This value is generated by default.
Requester	User requesting evidence. This value is generated by default. If you are the approver, requester, watch list member, or user in the Assigned to field, then you can edit the details in the **Watch list**, **Name**, and **Description** fields when the evidence is in **New** or **Work in progress** states.
Requested on behalf of	User for whom evidence is being requested. This value is generated by default.
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing the evidence. This value is generated by default.
State	State of the request.
Substate	None. This value is generated by default.
Request reason	Reason for requesting evidence.
Approvers	Users to approve evidence before it is returned to the requester for review. Usually, an approver is the manager of the person providing the evidence.
Watch list	Users interested in viewing the evidence collected.
Name	Name of the evidence request. The name defaults to Evidence collection details name.
Description	Detailed description of the evidence request. The description defaults to the description given in the Evidence request form.
Request Details	
Evidence request	Unique ID of the evidence request associated with the task. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence for	Record for which the evidence is requested.
Evidence for description	Description of the record for which the evidence is being requested. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence collection instructions	Instructions to collect the evidence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If you are the manager or requester, you can edit this field when the evidence request task is in work in progress state.

14. To request approval for the attached evidence, click **Request Approval**.
15. If no approvers are required, click **Request Review**.
16. Navigate to **Audit** > **Evidence Request** > **My Approvals**.
17. Open the record for which you want to approve evidence.
18. Review the attached evidence on the form and click one of the following options:

Option	Description
Approve	Approve the attached evidence. The requester gets the evidence provided.
Request Revision	Request that the attached evidence be reviewed. Enter comments when you request revision. The assignee gets a notification to review the attached evidence.
Request Information	Seek more information and details about the attached evidence. The assignee gets a notification to provide more information about the attached evidence.

19. Navigate to **Audit** > **Evidence Request** > **My Pending Reviews**.
20. On the Evidence form, review the attached evidence, and click one of the following options:

Option	Description
Accept Evidence	Accept the evidence that is provided.
Request Revision	Request for the evidence to be reviewed, if it is not appropriate, or modified.
Cancel	Cancel the evidence request task.
Delete	Delete the evidence request task.

21. Navigate to the form for which you want to display the **Evidence Request** related list.
22. Right-click in the form header, and click **Configure** > **Related Lists**.
23. Locate the **Related Evidence** item in the **Available** box and move it to the **Selected** box.
24. Click **Save**.

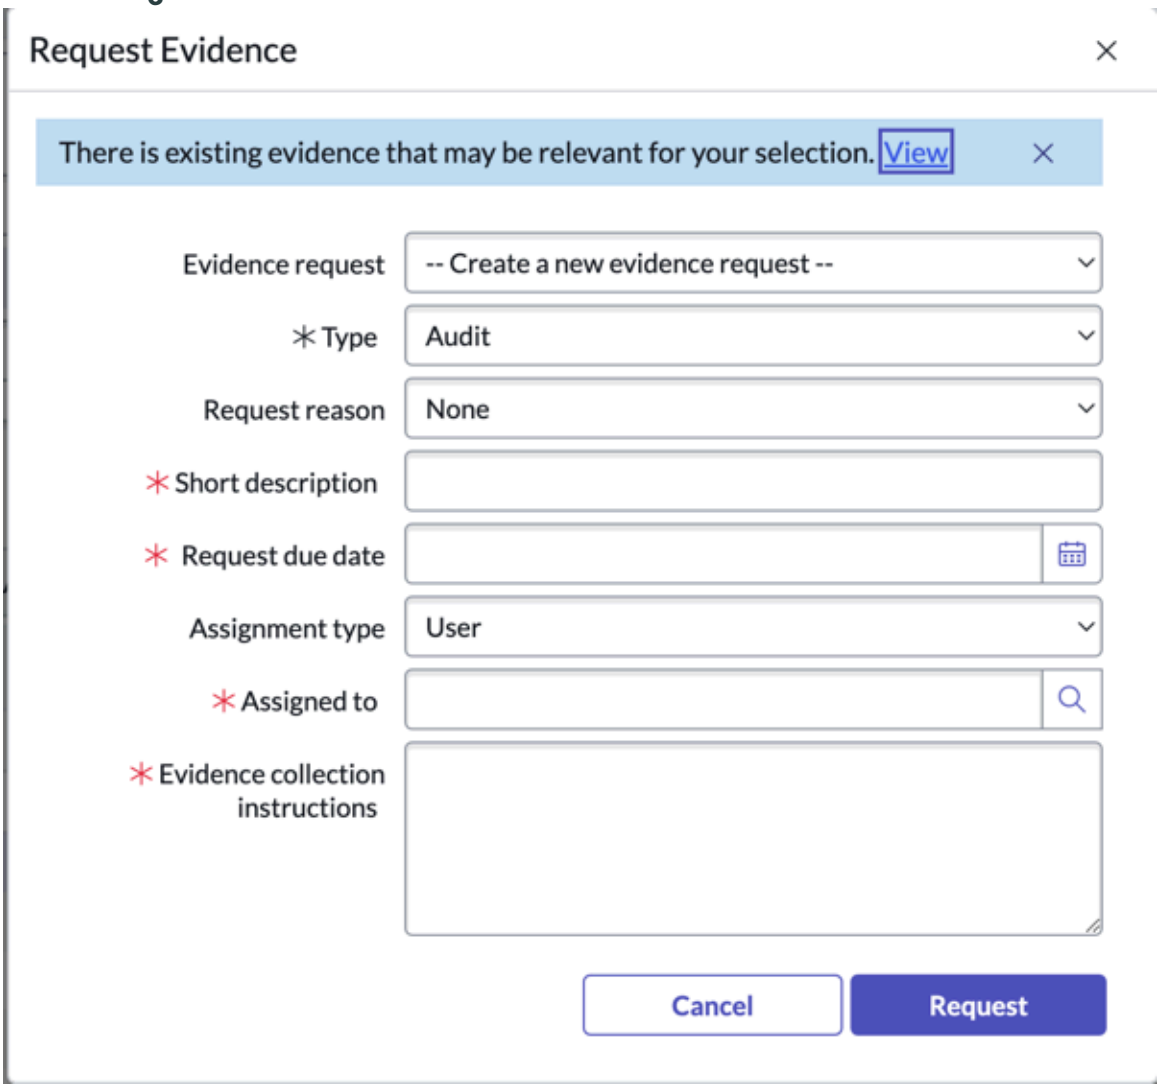
Reuse existing evidence from the related items of an engagement

Inform the audit and compliance user about the evidences that are already existing for the related items of an engagement. You can add such an evidence, if it is already existing for any of the related item table of an engagement for which you are requesting an evidence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_audit.user

About this task
For an engagement, an evidence can be created on Entity, Control, Audit Task, Control Test Issue, Other Issues, or any of the related item table. If there are existing evidences, then the Request Evidence pop-up displays a message that there are existing evidences that you might want to add.



Note:
Evidences that are directly created on a related item, and existing evidences that are in **Closed** state as well as those that are within six months from the due date of evidence response can only be added.

The logged in user must also have access to the engagement for which evidence records exist or must be the user who has access to the engagement record to view and add them. If the logged in user does not have access to those records, although there are evidences existing on those related items, they are not displayed for the user to add.

Procedure
1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Click to open an engagement.
3. Select the related list from which you want to request evidence.
4. From the **Action on selected rows** list, select **Request Evidence**.
   You can either create a new evidence request or add existing evidence request. The Evidence request is created but not evidence request tasks.
5. To create a new evidence request, enter details on the Request Evidence pop-up and click the **Request** button.
6. To view existing requests, click **View** in the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add existing evidence

Note:
If there is no existing evidence, then the message does not appear in the Request Evidence pop-up.

7. To view all existing evidences created on the related items, click the Evidence related list. When the evidence is in **Closed Complete** state, the UI action buttons such as **New**, **Add existing evidence**, **Remove**, and **Delete** are disabled. You can perform these UI actions only when the engagement or any other audit and compliance object is in an active state.
8. To associate the evidence, click the **Add Existing Evidence** button and select the evidence.

Note:
The **Add Existing Evidence** button is only available in the Evidence related item of an Engagement form and not in any other compliance or audit objects of the Classic environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. To remove the association of the evidences linked to the engagement, select the evidences in the Evidence related list and click **Remove** in the **Actions on selected rows** list.

Note:
The remove action only removes the association of the existing evidences from the engagement and does not remove the evidence record from the database.

Provide requested evidence

Provide evidence when you are requested. When evidence is requested, the person who must provide the evidence receives an email. The process to provide the evidence begins.

Before you begin
Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task
When the assignee receives the email to provide the requested evidence, the assignee can either provide the requested evidence or reassign the request to another user. The assignee can also add approvers before sending the requested evidence to ensure additional security of the evidence. If the assignee reassigns the request to some other user, the original assignee can no longer view the request. If the evidence provided does not need an approver, then the assignee can directly request a review of the evidence, and the requester gets a notification to review the evidence.

Procedure

1. Navigate to **Audit** > **Evidence Request** > **My Evidence Request Tasks**.
2. Open the record for which you want to provide evidence.
3. Click **Accept Work**.
4. On the form, fill in the fields.

Evidence form

Field	Description
Number	Number of the evidence request. This value is generated by default.
Requester	User requesting evidence. This value is generated by default. If you are the approver, requester, watch list member, or user in the Assigned to field, then you can edit the details in the **Watch list**, **Name**, and **Description** fields when the evidence is in **New** or **Work in progress** states.
Requested on behalf of	User for whom evidence is being requested. This value is generated by default.
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing the evidence. This value is generated by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	State of the request.
Substate	None. This value is generated by default.
Request reason	Reason for requesting evidence.
Approvers	Users to approve evidence before it is returned to the requester for review. Usually, an approver is the manager of the person providing the evidence.
Watch list	Users interested in viewing the evidence collected.
Name	Name of the evidence request. The name defaults to Evidence collection details name.
Description	Detailed description of the evidence request. The description defaults to the description given in the Evidence request form.
Request Details	
Evidence request	Unique ID of the evidence request associated with the task. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence for	Record for which the evidence is requested.
Evidence for description	Description of the record for which the evidence is being requested. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence collection instructions	Instructions to collect the evidence. If you are the manager or requester, you can edit this field when the evidence request task is in work in progress state.

5. To request approval for the attached evidence, click **Request Approval**.
6. If no approvers are required, click **Request Review**.

Approve evidence before evidence review

Approve the evidence being provided before the requester views the evidence. When evidence is provided in response to an evidence request, the evidence may need an approval before the evidence is sent back to the requester. This ability ensures security and confidentiality of the evidence.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

After receiving a request to approve evidence, an approver can do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Approve the request if there are no issues or concerns.
- Request revision of the evidence attached in case it is not correct or needs rectification.
- Request information if the approver wants more details about the attached evidence.

Procedure

1. Navigate to **Audit** > **Evidence Request** > **My Approvals**.
2. Open the record for which you want to approve evidence.
3. Review the attached evidence on the form and click one of the following options:

Option	Description
Approve	Approve the attached evidence. The requester gets the evidence provided.
Request Revision	Request that the attached evidence be reviewed. Enter comments when you request revision. The assignee gets a notification to review the attached evidence.
Request Information	Seek more information and details about the attached evidence. The assignee gets a notification to provide more information about the attached evidence.

Accept, reject, or cancel evidence request

Accept, reject, or cancel an evidence request when you receive the evidence you requested. After requesting an evidence request, when the requester receives the evidence, the requester can accept, reject, or cancel the evidence request.

Before you begin

Role required: sn_compliance.user

Procedure

1. Navigate to **Audit** > **Evidence Request** > **My Pending Reviews**.
2. On the Evidence form, review the attached evidence, and click one of the following options:

Option	Description
Accept Evidence	Accept the evidence that is provided.
Request Revision	Request for the evidence to be reviewed, if it is not appropriate, or modified.
Cancel	Cancel the evidence request task.
Delete	Delete the evidence request task.

Review related evidence

The Evidence Request feature includes a related list called Related Evidence, which it not visible by default. This related list provides a list of evidence that is not directly requested for the current record, but is associated to a related record. For example, the Related Evidence list on the Control Objective form shows evidence requested for associated controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The Related Evidence related list is available to a wide variety of forms throughout the Evidence Request feature; however, it is not visible in the base system. You can personalize any of the forms in which is it available, but keep in mind that activating this related list can impact system performance.

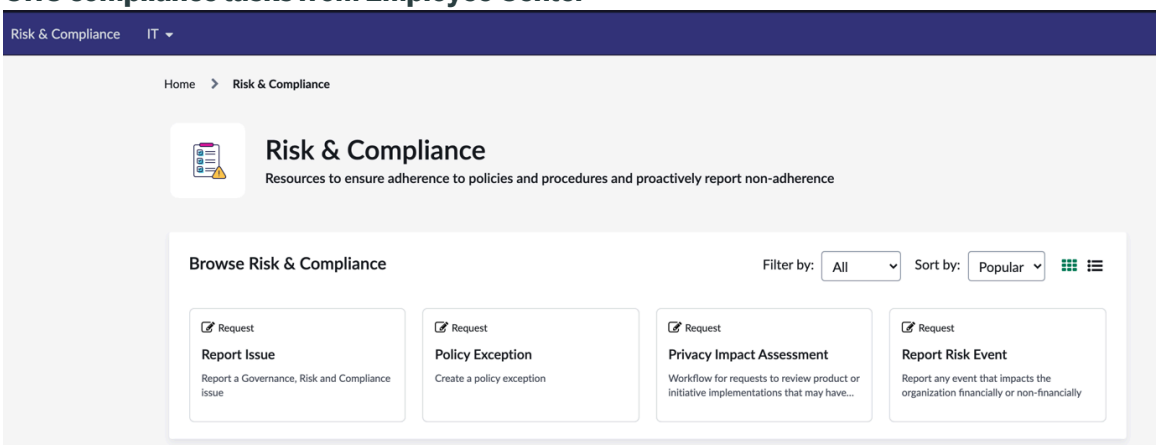
Tables that can display the Related Evidence related list

Table name	Type of related evidence displayed
Authority document	Evidence request tasks created on the citations mapped to this authority document.
Citation	Evidence request tasks created on the control objective associated to the citation.
Control	Evidence request tasks created on the control test mapped to the control and Issues created for the control.
Control objective	Evidence request tasks created on the controls associated to the control objective.
Control test	Evidence request tasks created on the controls associated to the control test.
Engagement	Evidence request tasks created on the entities, controls, control tests, audit tasks, control test issues, and issues mapped to the engagement are displayed.
Entity	Evidence request tasks created on the controls associated to the entity, Issues created on the entity.
Policy	Evidence request tasks created on the control objective associated to the policy.

Procedure
1. Navigate to the form for which you want to display the **Evidence Request** related list.
2. Right-click in the form header, and click **Configure** > **Related Lists**.
3. Locate the **Related Evidence** item in the **Available** box and move it to the **Selected** box.
4. Click **Save**.

Managing GRC tasks from Employee Center

Employee Center is designed for enterprise services based on employee needs. The employee center is also called as Business user service portal as the portal is exclusively for GRC business users to request an issue triage or raise a policy exception.



You can use Risk and Compliance section of the Employee Center to manage some of the common compliance tasks like triage issues, raise policy exceptions, and GRC assessments.

You can view all the tasks that are assigned to you if you login as a user with GRC business user role.

© 2026 ServiceNow, Inc. All rights reserved.

Report a GRC issue from Employee Center

Use the employee portal to review and work on the action plan related to the observation which is confirmed as an issue that as an auditee or issue owner you need to remediate.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

Note:
If you have installed GRC: Advanced Core, then by default the value of the *sn_grc_advanced.enable_my_issues_hide_my_reported_issues* system property is also set to **true**. These two conditions must be fulfilled to view the Issue triage form in Employee Center. Otherwise, you can view only the Issue form.

About this task

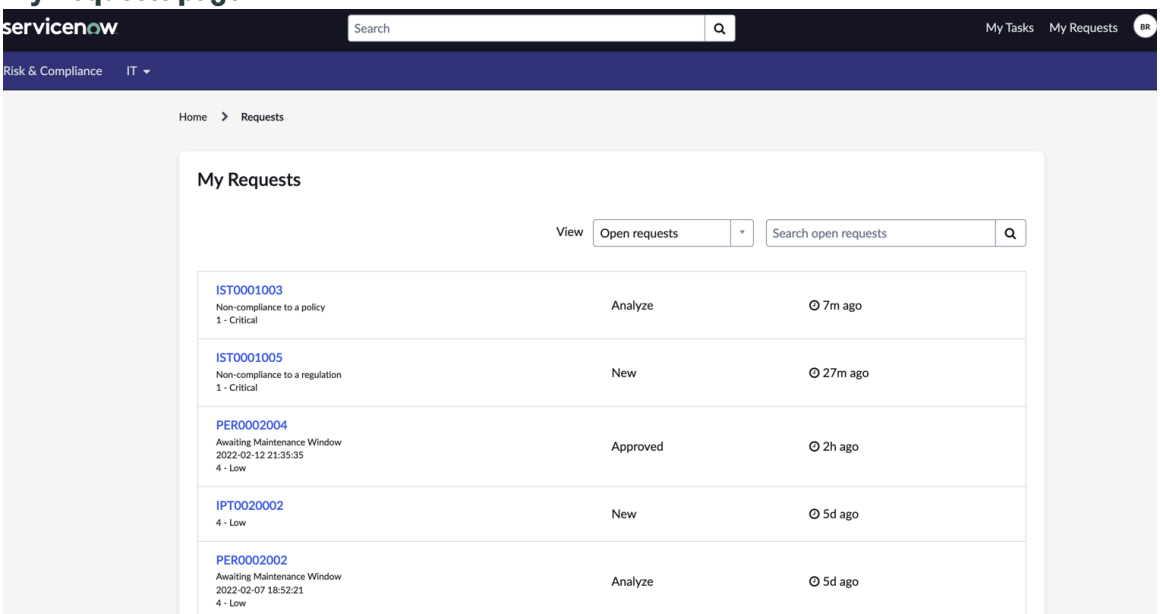
Use the Report Issue form to report an issue based on a control breakdown, missing policy, or an event that is non-compliant to a policy, standard, guideline, or regulation. You can also use this form to suggest an improvement or to report a risk event.

Procedure

1. Navigate to **Self-Service** > **Employee Center**.
2. Select the **Browse all Risk & Compliance** section.
3. Select the **Report Issue** catalog item.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report Issue form



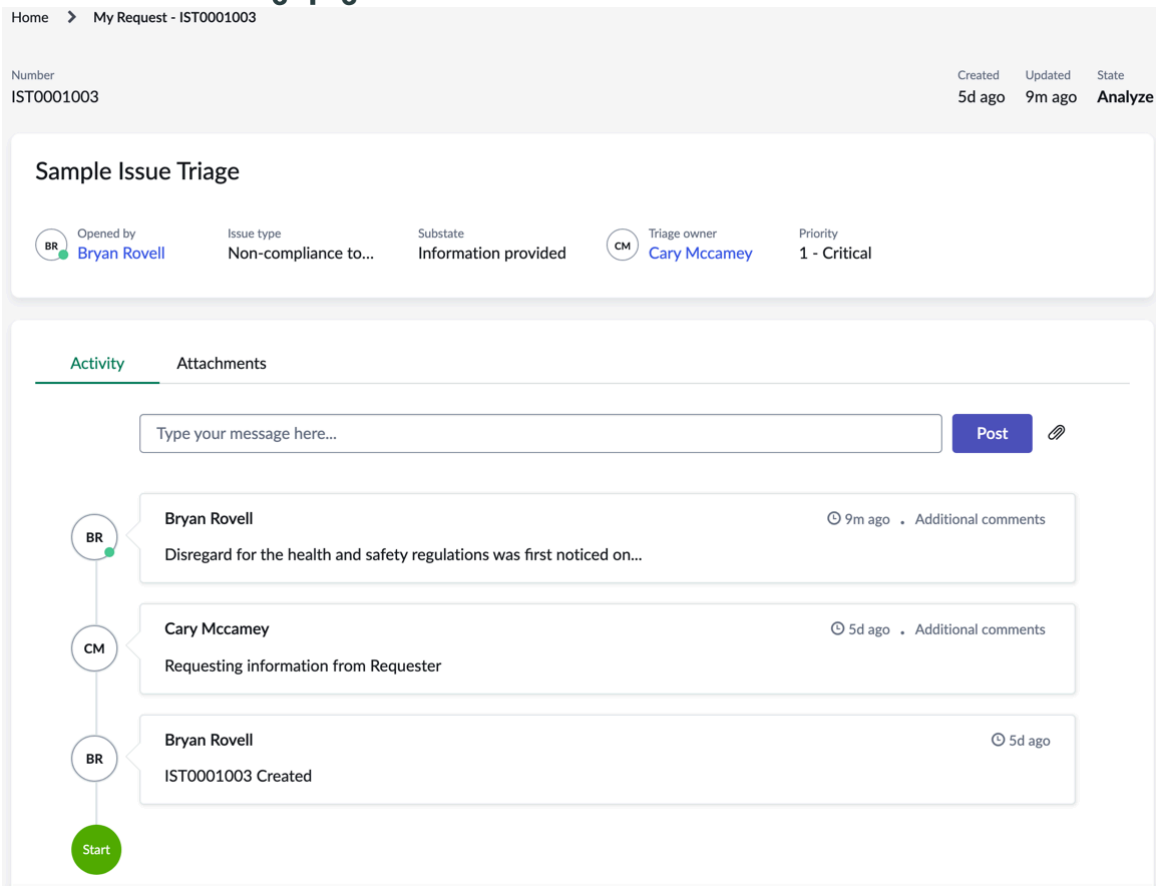
Field	Description
What is the issue?	Brief description about the issue.
Describe in detail	Detailed description of the issue.
When did you discover the issue?	Date the issue was identified.
What is the issue related to?	Entity to which the issue is related.
What was affected?	Record details of the entity that you selected. The options in this field depend on the entity that you select in the previous field.
What type of issue is this?	Type of issue.
Other	Option to select if you do not find the correct category of entity to which your issue is related. Following four fields appear if you select the **Other** option.
Has the incident already occurred?	Indicate whether the incident has occurred before.
Was there a monetary loss?	Monetary loss associated to the issue.
Currency	Currency in which the loss is estimated. If there was a monetary loss, then this field appears.
What is the expected monetary loss?	Estimated monetary loss as a result of the issue.
Select the impact rating	Non-monetary impact of the issue. The choices are as follows: ○ **Low** ○ **Medium** ○ **High**
How was the event discovered?	Source through which the issue was identified.
What actions have you taken so far to contain or remediate the issue?	Brief description of the action taken to remediate the issue.
What do you believe to be the root cause of this issue?	Analysis of the root cause of the issue.

5. Select **Submit**.
   You are directed to the My Request summary page where you can view your issue triage request number. This page is read-only and you can view all your requests that you have raised as a business user.
6. Post a message in the **Activity** field to prioritize your issue when it is being triaged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the **Attachments** tab to attach any document related to the issue.
8. Click **My Requests** link at the top right corner to view all the requests that includes your issues and issue triage.

My Requests page



9. Click the issue triage request number, which has a prefix IST, to view messages, if any, from the approver.
   The issue triage list view header displays the name of the person who opened the issue triage, issue type, substate, triage owner, and its priority.
10. To send additional information on the issue triage to the triage owner, click the **Actions** list.
11. Enter your information in the **Comments** field of the Send additional information pop-up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

12. Click the **Send** button.

List view of issue triage page

Create a policy exception from Employee Center

Use the Employee Center to request exceptions for policies, control objectives, controls, or issues by specifying the reason of exception on a particular list of the systems, applications, networks, or entities for which the exception applies.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite, sn_grc_emp_user.grc_employee

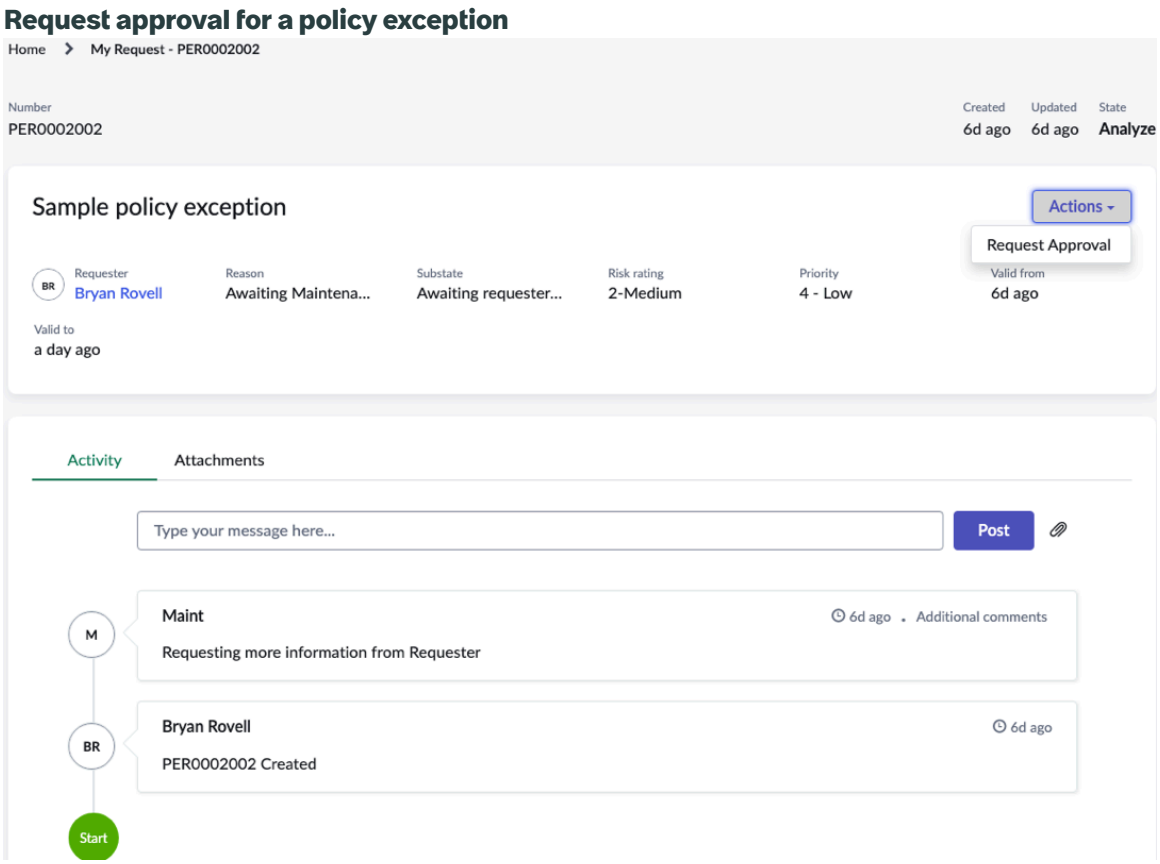
Procedure

1. Navigate to **Self-Service** > **Employee Center**.
2. Select the **Browse all Risk & Compliance** section.
3. Select the **Policy Exception** catalog item.
4. On the form, fill in the fields.

Policy Exception form

Field	Description
What is the exception for?	Type of policy exception that you want to create. The options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
	○ Policy: Create a policy exception based on a policy. ○ Control objective: Default is a single control objective on which the policy exception is created. ○ Controls: Option to create a policy exception on multiple controls. ○ Issue: Option to create a policy exception on an issue.
Policy	Policy associated with this policy exception.
Control objective	Control objective associated with this policy exception. When you select a control objective, the**Impacted controls** field appears.
Control	Select **Control** to associate multiple controls from different control objectives. This option supports multiple controls objectives for your policy exception, instead of creating multiple policy exceptions that could be applied on multiple controls.
Issue	Issue associated with this policy exception.
Impacted controls	Controls associated to the control objective.
Short description	Brief description about the policy exception request.
Description	Detailed description of the policy exception request.
Reason	Reason for the exception
Justification	Evidence or rationale for the policy exception.
Risk description	Description of the risk as performed by the risk manager during risk assessment.
Valid from	Day on which the policy exception begins.
Valid to	Day on which the policy exception ends.
Priority	Approval priority of this policy exception.
Watch list	Users that are notified when the request is updated.

5. Click **Submit**.
   You are directed to the My Request page where you can view your policy exception number for the submitted policy exception request. This page is read-only and you can view all your requests that you have raised as a business user.
6. Post a message to support the policy exception in the **Activity** field.
7. To attach a document related to the policy exception, select the **Attachments** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **My Requests** link at the top right corner to view a list of all your requests that includes your issues and policy exceptions.
   The list shows 15 requests at a time. Click **Show More Requests** for more requests to be listed.
9. Select **Request Approval** from the **Actions** list if the request is in **Analyze** state.

   If you raise a policy exception from Employee Center and if verification rules are not configured, then the policy exception moves to the Analyze state. However, if verification rules are configured for the policy exception, then the policy exception moves to the New state and the verification approval process is triggered. As verification rules are configured the approver is required to verify the policy exception and approve it, only then the policy exception moves to Analyze state.

10. After the policy exception is approved, you can request extension of your policy exception, select **Request extension** from the **Actions** list.

    a. Enter the new extension date that is later than the current **Valid to** date.
       By default, you cannot extend your policy for more than 30 days from the **Valid from** date. However, the extension can be relaxed based on the maximum exception duration days of the policy.

    b. Select a reason for extension from the list in the **Extension reason** field.

    c. Enter a justification for the extension.

    d. Click **Request**.
       The number of remaining extensions that you can avail to request is displayed as **Remaining extensions**.

Complete control assessments from the Employee Center portal

Use the Employee Center Home page to view all your requests, raise issue requests and policy exceptions, and complete all your GRC assessments.

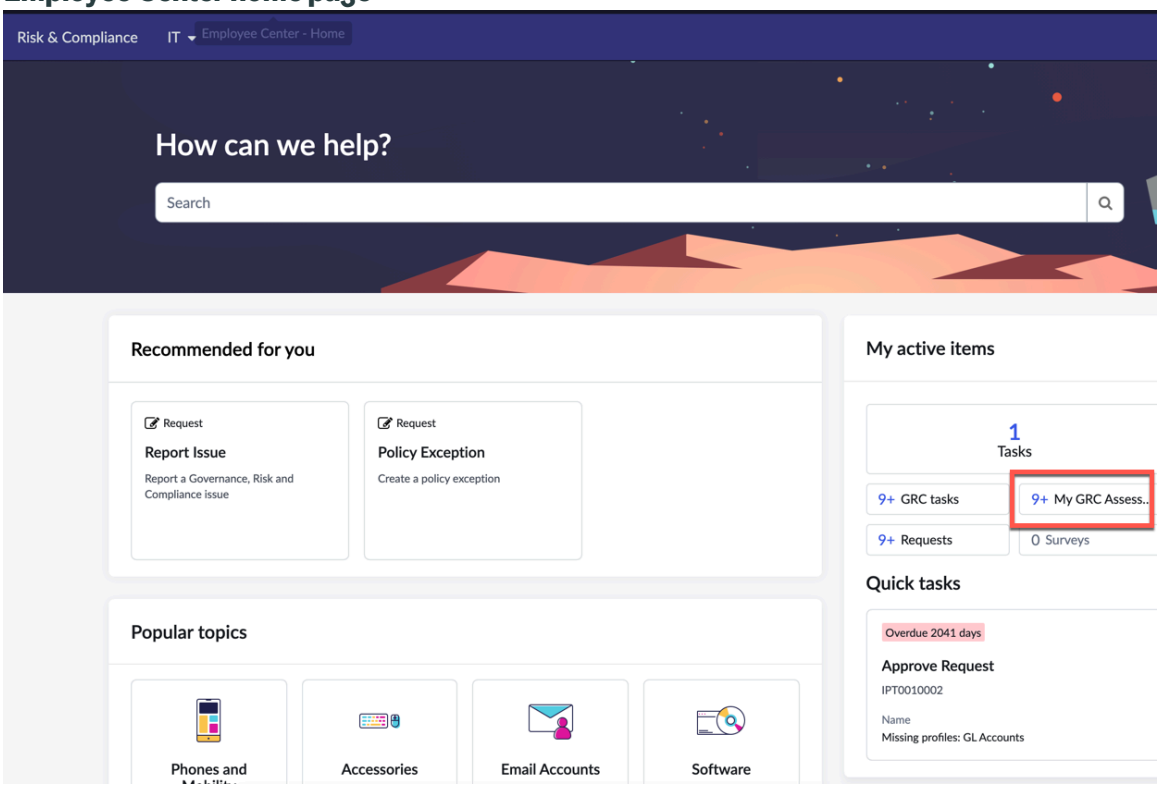
Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

You can manage all your pending tasks that are open by selecting the GRC tasks link. By default, you can view all the Indicator tasks that are assigned to you and in Open state. To view the indicator tasks in other states, select the filter icon next to the **State** column.

From this page, you can navigate to manage all your active items that include all GRC assessments, such as Control attestations, Risk assessments, Risk identification questionnaires, and Privacy assessments.

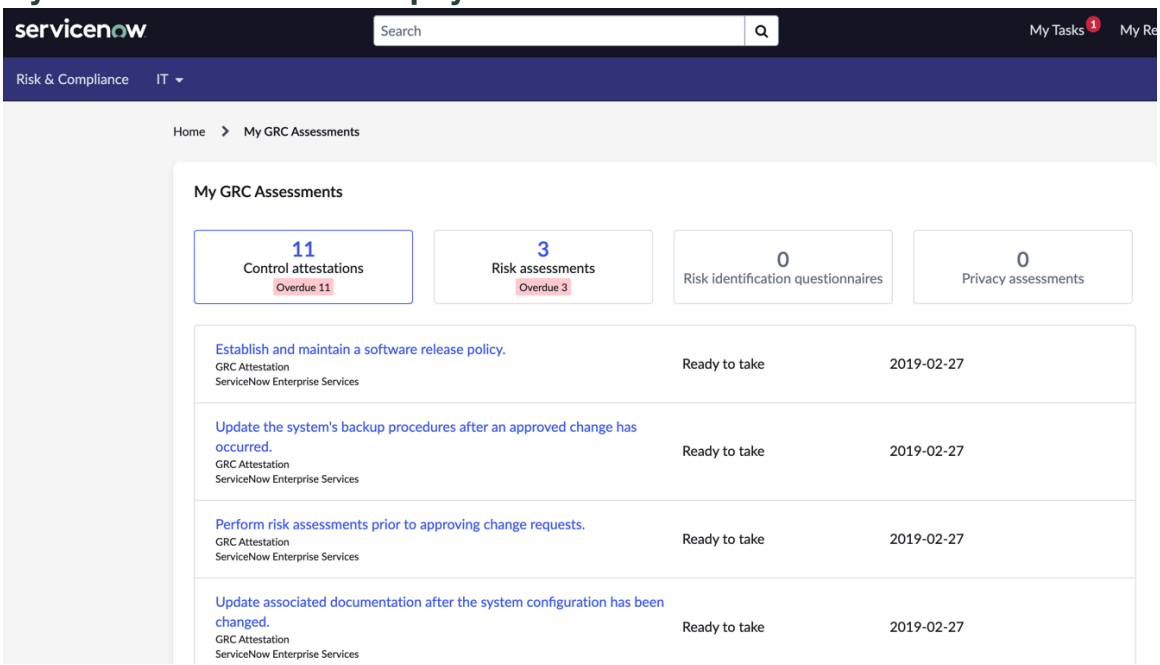


Note:

The **Risk identification questionnaires** tile is available only if GRC: Advanced Core plugin is installed.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select **My GRC Assessments** in the **My active items** pane of the Home page.



Employee Center home page

The Control attestations tile is highlighted listing all your attestations that are active and due. It also displays the number of control attestations that are overdue and they're enlisted first in the list.

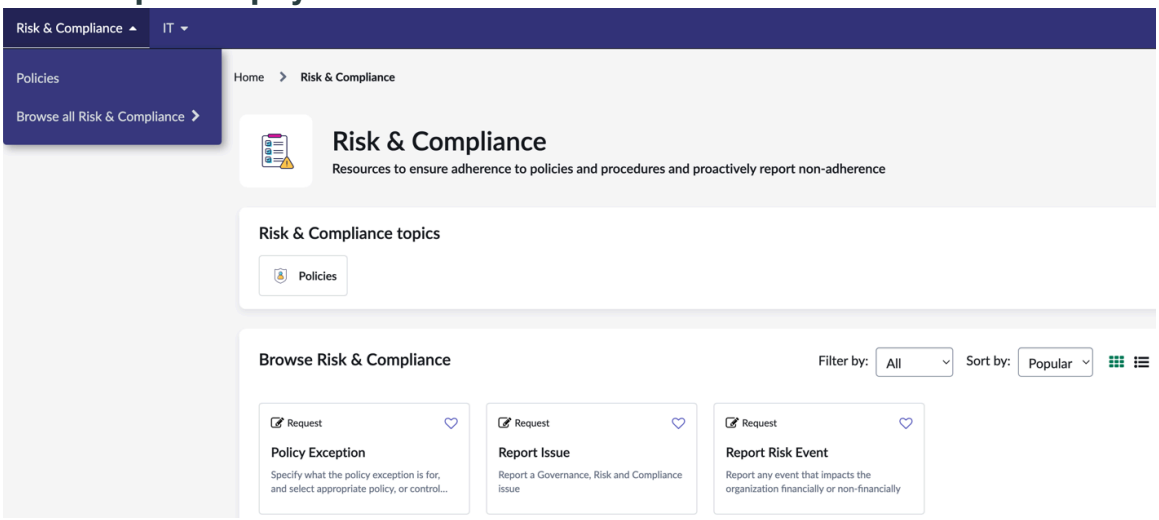
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

My GRC assessments in the Employee Center

There's a pagination limitation of displaying only 15 items at a time.

3. Select **Show More Requests** to display more requests.
4. Select the control attestation item in the list that you want to attest.
   The header displays the control objective, an entity that the control attestation belongs to, and its description.
5. Select the **Get Started** button.
6. Complete the attestation, providing an attachment and explanation, and select **Submit**.

Policy knowledge base and quick links in the Employee Center portal

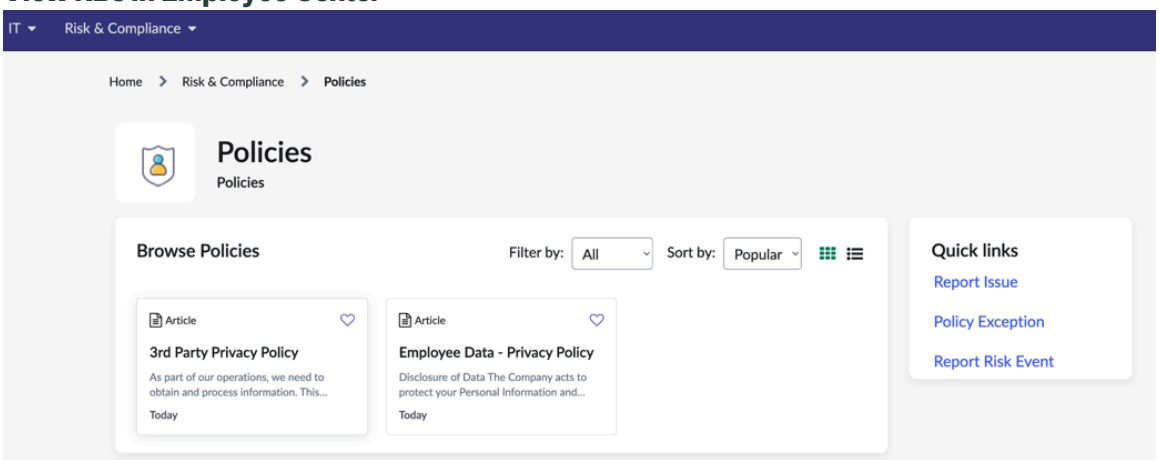


You can view all the Knowledge base (KB) articles related to the published policies in Employee Center.

Selecting the **Policies** option in the Risk & Compliance section takes you to the Policies page, where you can view all the Knowledge base (KB) articles that haven't expired yet.

Note:
You can view all KBs even if the **Valid to** date is passed. However, when the policy retires, the corresponding KB will also retire, and such KBs will not appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Policies topic in Employee Center

The admin executes the scheduled job, *`Pull the knowledge base articles related to policies`*, on demand to pull all the KB articles of the published policies and list them in the Policies topic. The KBs of the published policies are listed in the policies page only when the scheduled job is run. Users with the business user or business user lite roles do have read access to the published KBs.

Access **Quick links** to the respective forms to create and accomplish your respective tasks. For example, to create an issue, select Report Issue link, enter the issue details, and submit it. Similar links are listed for quick access to report events and raise exceptions on policies with respect to Risk and Policy and Compliance, respectively.

View KBs in Employee Center

Group assessments for similar assessments in Employee Center

Group the assessments that have the same entity or control objective based on metric type, and additionally the same entity, control objective, or category to provide response to similar assessments.

Before you begin

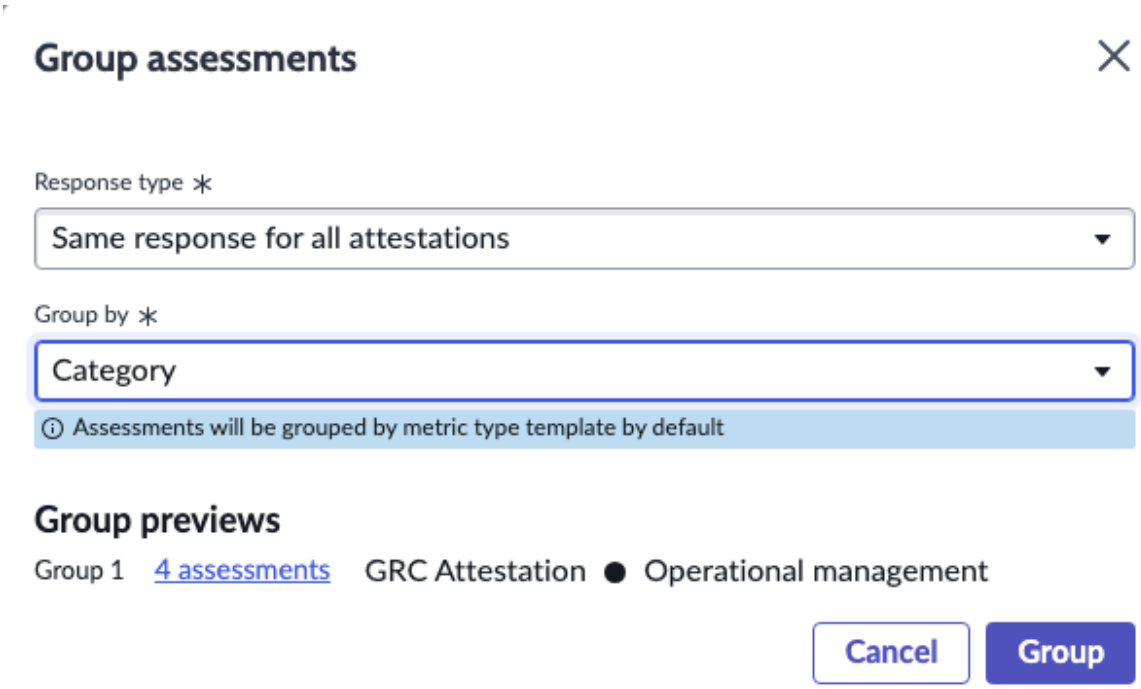
Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

In Configurable Workspace, you can only group control attestations, and not risk assessments, vendor assessments, or privacy assessments. Such assessments and those assessments that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can't be grouped by the selected **Group by** criterion are marked as invalid and are displayed in the **Group previews** of the Group assessment pop-up, with a link to view such assessments.



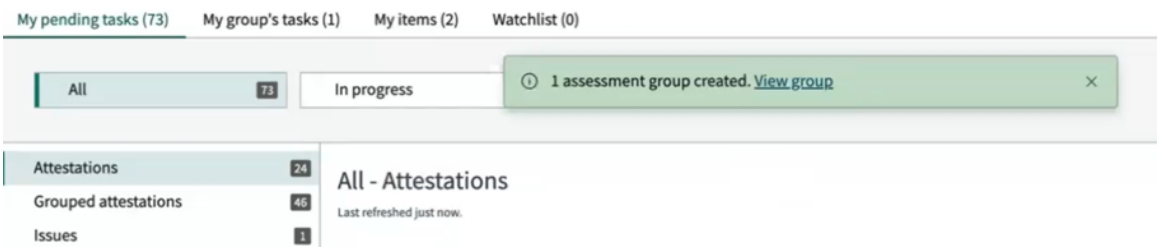
Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select **GRC tasks** in the **My active items** pane of the Home page.
3. Select the Tasks icon on the left pane.
4. Select the attestation records in the list view of the Tasks page that you'd like to group.

   Note:
   You must select at least two and can select up to a maximum of 13 assessment records for grouping.

5. Select the **Group assessments** button.
6. Select a **Response type** in the Group assessments pop-up.
   For more information on the response types, see Consolidate control attestations using the Same Response feature.
7. Select a criterion to group the assessments in the **Group by** list.
   By default, assessments are grouped by the metric type template. You can group the assessments by Category, Entity, or Control objective. If the selected assessments have a common category, entity, or control objective then they're grouped accordingly based on your selection. However, if the assessments selected do t have any of the common criteria by which they can be grouped, then the assessments are not grouped at all.

   The **Group previews** section displays the grouping details, assessments with links, and an appropriate message information if they're grouped or can't be grouped based on the Group by criterion, status, assignee, or the evaluation method of the metric type.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select the **Group** button.
   If the grouping of assessments is successful, then you get a message indicating that the assessment group has been created, followed by a link to the grouped assessments.

   If a few of the assessments among the selected assessments couldn't be grouped by the selected criterion, then the **Group previews** pane displays the number of assessments that couldn't be grouped. Nevertheless, as there are other assessments in your selection that could be grouped by the selected **Group by** criterion, the **Group** button is active for you to select and group the rest, where the grouping is successful.

   On the other hand, if all the assessments that you selected are invalid, for example, risk assessments or privacy assessments, then the **Group** button is inactive as grouping isn't possible for such assessments.

Note:
You can group the assessments that are in **Ready to take** or **In Progress** state, but not the assessments that are in **Complete** or **Canceled** state.

If the status of a record that you've selected for grouping has changed and is being assessed before you select the **Group** button to group the assessments, then such a record can't be grouped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select the link to the grouped assessment in the UI message.
   The link takes you to the list view of the grouped assessments. Alternatively, you can also select the **Grouped attestations** on the left pane. The Assessment Instance page opens up, where you can take the assessment.

Performing compliance tasks in Compliance Workspace

Starting with Version 13.0.0, a new workspace has been introduced for the GRC: Policy and Compliance Management application. The new workspace provides you with an improved User Experience (UX) and a simplified user journey.

Note:
Compliance Workspace has a dependency on GRC: Policy and Compliance Management application and the latter is automatically installed when the workspace plugin is installed.

To know more about Compliance Workspace, see GRC Compliance Workspace. For persona-based Compliance Workspace pages, see:

- Compliance Home page for the compliance manager
- Compliance Home page for the compliance analyst
- Compliance Home page for the IT compliance manager

GRC Compliance Workspace

Compliance Workspace is a unified interface where you can manage all your tasks related to policies, control objectives, controls, and policy exceptions.

Compliance Workspace overview

The highlights of the Compliance Workspace are:

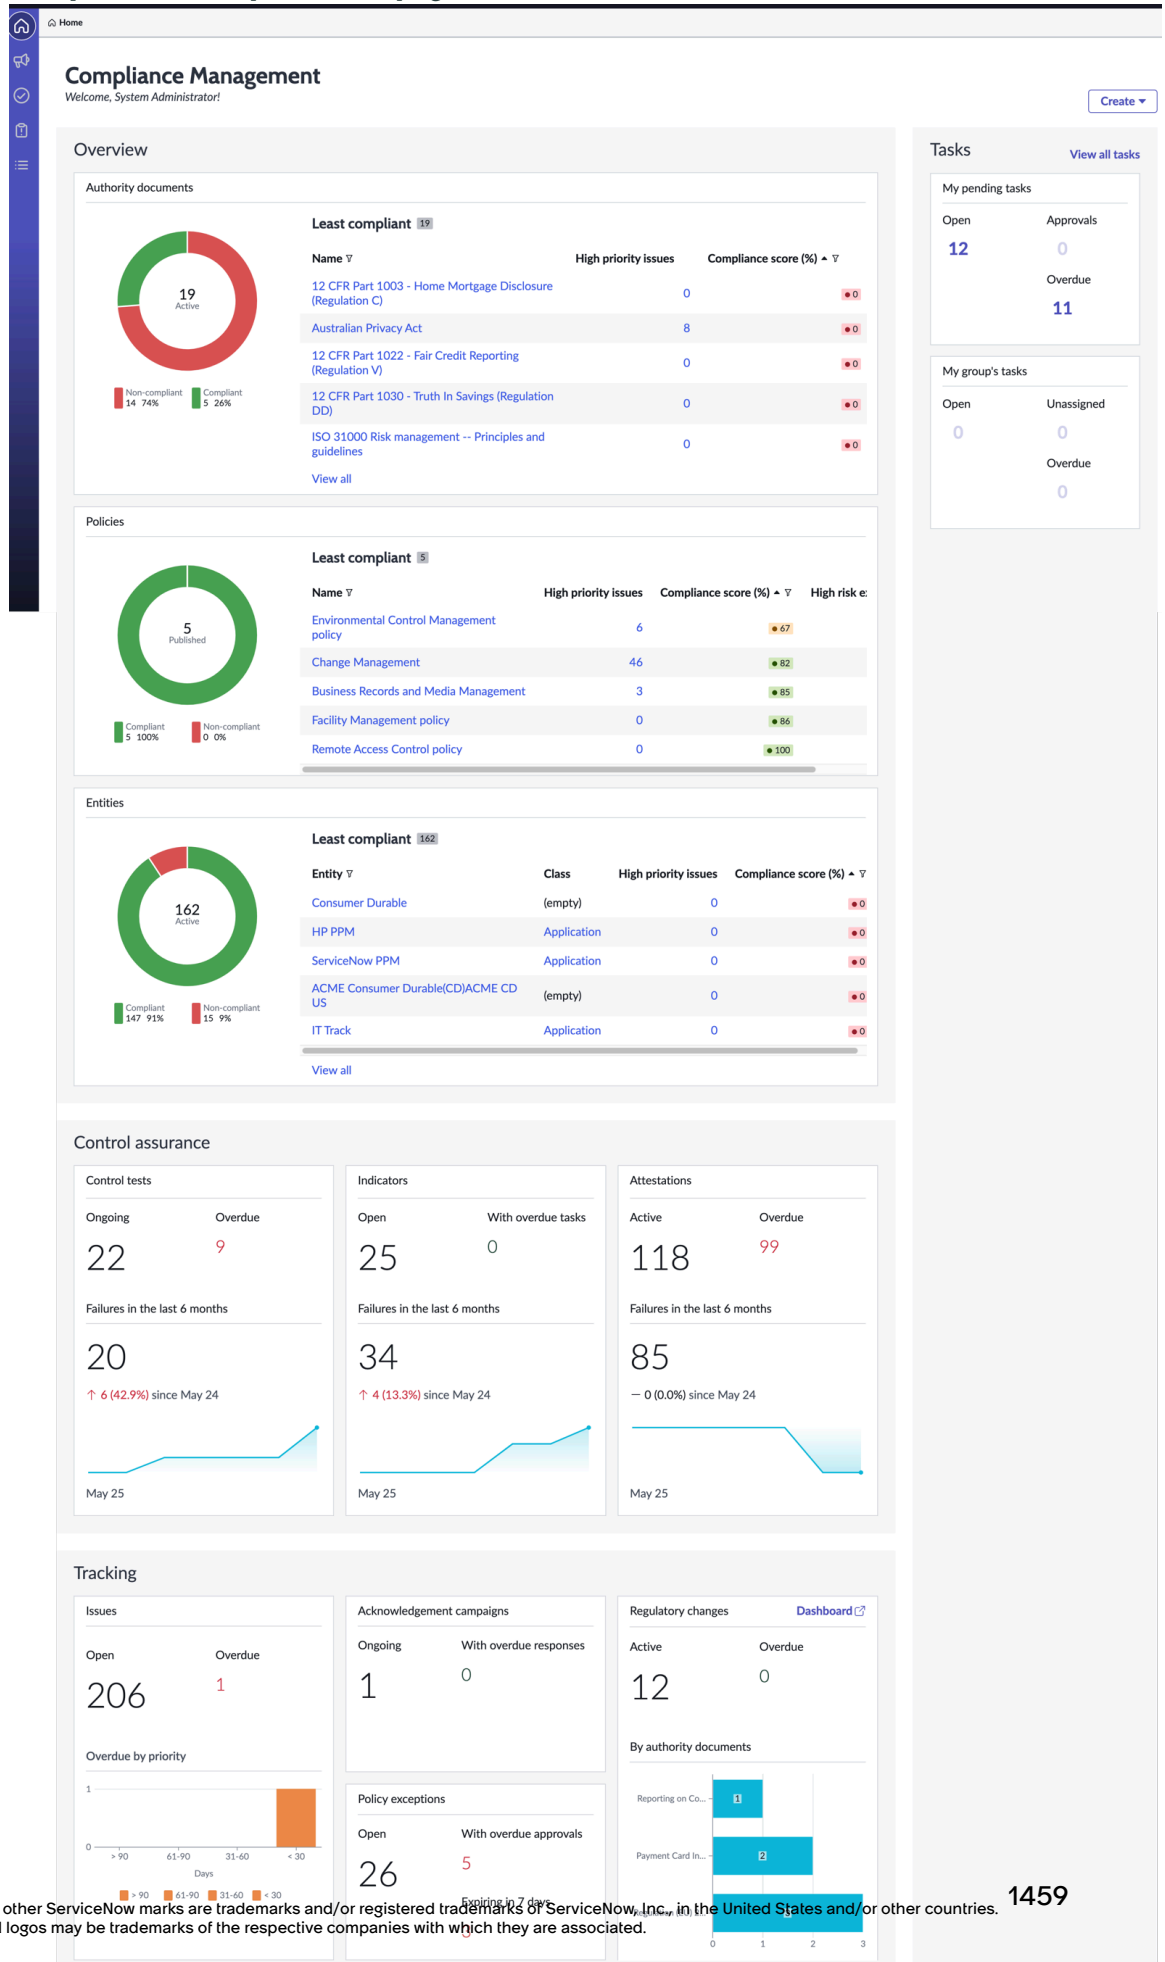
Reimagined user experience

From the minute you navigate to the Compliance Workspace home page, all the tasks that you can possibly do in the workspace are streamlined to fulfill your business goals.

Workspace designed for different compliance user roles

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Distinct page views for the exclusive activities of a Corporate compliance manager, Corporate compliance analyst, and IT compliance manager.



Home page with different sections

Overview

Donut charts display the categorical data of compliant and non-compliant authority documents, policies, and entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance workspace home page

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control assurance

Displays the donut charts, grouping indicators by status, and attestations by state. Control test horizontal bar grouped by control and classification stacked by control effectiveness.

Tracking

Displays controls widget grouped by state and stacked by classification.

Tasks

View your pending tasks and the group's tasks. You can navigate to the unified tasks page by clicking the **View all tasks** link.

Note:
Control tests widget, Regulatory change, Compliance case, and Privacy widgets are conditionally visible based on the respective plugins installation status.

Unified Tasks page

Track your tasks and team's tasks from a single interface. View your tasks by categories, filter them by various parameters, monitor those tasks that you've initiated, and track through the watchlist.

Lists

List view of all compliance-related records, providing the summary of the record in a single view that helps in your analyses and take an informed decision.

Note:
The **Control tests** widget, **Regulatory changes** widget, and **Domain compliance status** section appear with the installation of audit, regulatory change management, and privacy management plugins, respectively. For more information, see Other GRC plugins for an overall view.

Roles in the Compliance Workspace

The targeted users of the Compliance Workspace are the corporate compliance managers and the corporate compliance analysts. For more information on the roles, the responsibilities, and the tasks that the users can accomplish in the Compliance Workspace, see

- Compliance Home page for the compliance manager.
- Compliance Home page for the compliance analyst.
- Compliance Home page for the IT compliance manager.

Compliance Home page for the compliance manager

The compliance manager home page in the Compliance Workspace gives a complete overview of the compliance posture of the organization. The workspace helps the compliance manager to centrally manage internal standards, policies, and control processes that match the external regulatory standards.

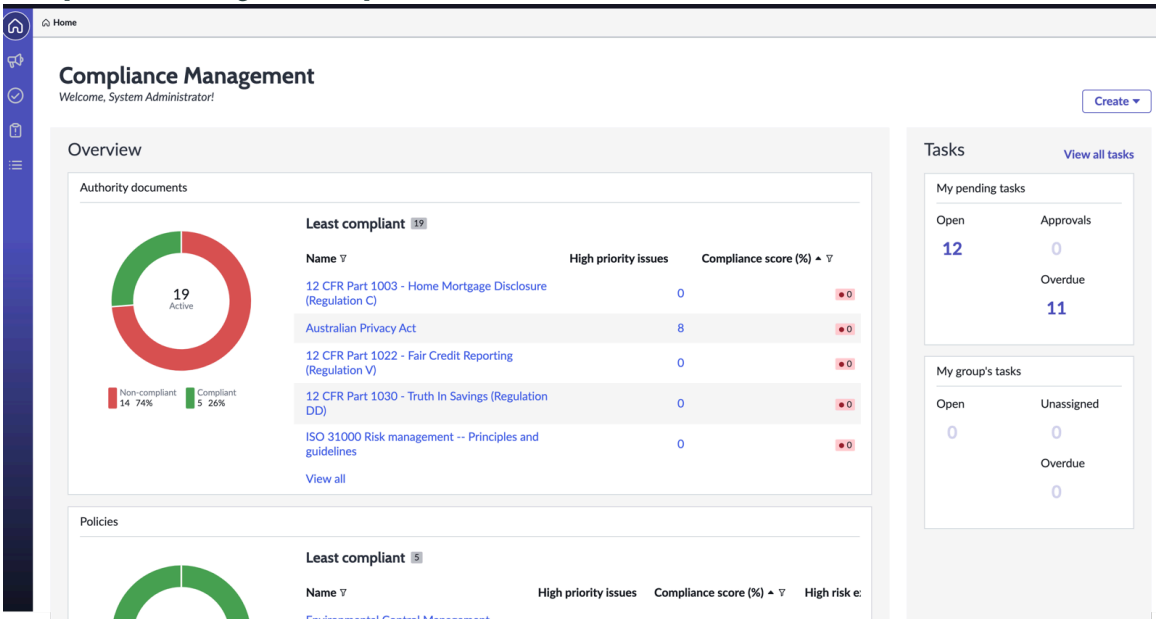
Compliance manager most often reports to a compliance director and ensures that the company complies with organizational and industrial regulations and standards.

The user persona may vary across organizations, however, a corporate compliance manager, IT compliance manager, compliance manager, or compliance analyst, depending on the organizational structure, can be tasked with ensuring that the organization is complying with policies and regulations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Responsibilities of a compliance manager

The compliance manager must



- Ensure that all policies and regulations are being followed.
- Create and maintain policies up to the level of defining and applying controls.
- Approve and track policy exceptions.
- Manage the team appropriately.

Compliance Workspace for compliance manager tasks

To fulfil the above responsibilities, a compliance manager has certain daily and weekly functional tasks that can be performed in the compliance workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance manager workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the Overview section to review the authority documents, policies, and entities and know their compliant status. Get the list of least compliant authority documents, policies, and entities, and their compliance score.
- Review compliance tasks such as controls, control attestations, indicator tasks, ongoing and overdue control test count in the control assurance section.
- Monitor and analyze new key controls and track the performance of existing controls.
- Identify past due tasks and inadequate remediation strategies.
- Get an overview of all your compliance tasks – pending tasks and group's tasks.
- Track the changes done to the authority documents, regulations, and policies.

As a compliance manager, you can create authority documents, citations, policies, control objectives, controls, indicator tasks, acknowledgement campaigns, policy exceptions, and engagements.

To help the compliance manager attend to tasks that need immediate action, the compliance records in the overview section are listed in an order starting from the least compliant ones. The data displayed for control tests, indicators, and attestations in the control assurance section help the compliance manager to prioritize the tasks as well. Tracking of acknowledgement campaigns and policy exceptions can be managed effectively.

Note:
To track the issues the compliance manager can access the issue details from the "Issues Overview" section.

Other GRC plugins for an overall view

As the compliance manager requires an overall view of all compliance tasks, they can view the privacy management and regulatory change management application domains as well in the compliance manager home page. However, you require the following plugins to be installed for certain widgets to be displayed on the home page.

- GRC: Audit Management for the control tests widget in the Control assurance section.
- GRC: Regulatory Change Management for the Regulatory changes widget in the Tracking section. The logged in user must also have the RCM manager role (sn_grc_reg_change.manager).
- GRC: Privacy Management for the Domain compliance status section. The logged in user must also have a privacy manager role (sn_privacy.manager).

Compliance Home page for the compliance analyst

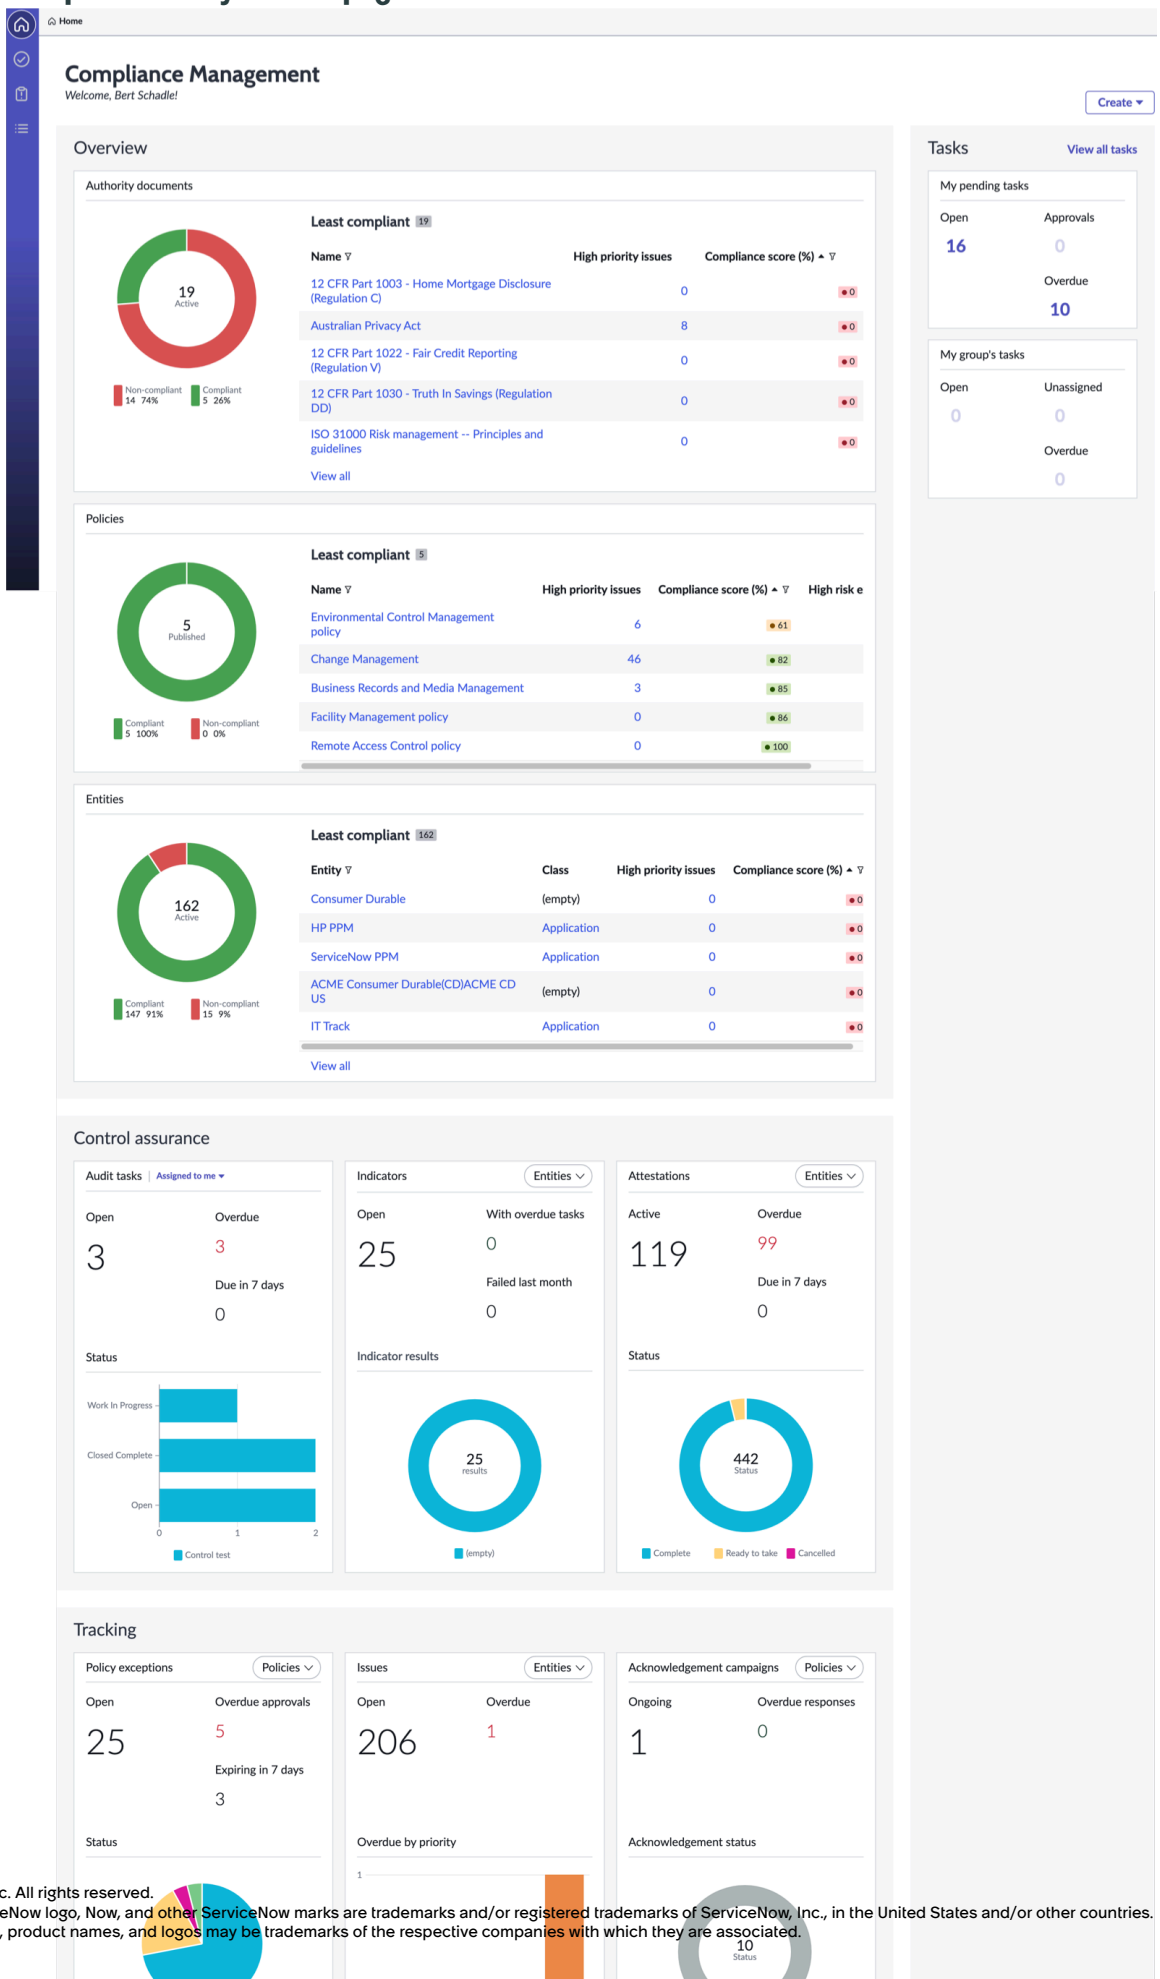
The compliance analyst home page in the Compliance Workspace enables the compliance analyst to track compliance activities and helps compliance managers to ensure that the organization is compliant with various regulations and policies.

Responsibilities of a compliance analyst

The compliance analysts oversee specific areas of compliance including specific policies, regulations, and related compliance activities. Therefore, the filter option help them to filter the compliance records based on the required criteria. They can view and work on the tasks that they are assigned to.

- Analyze and update the existing policies and related documents.
- Implement policies and controls when assigned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Monitor the performance of controls.
- Schedule and follow up attestations.

Compliance Workspace for compliance analyst tasks

The compliance analyst home page is designed to fulfil the above tasks of an analyst. Although the Home page is similar to the compliance manager home page, yet there are features that are unique to help the analysts perform their tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance analyst home page

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The compliance analyst Home page provides a personalized experience for a corporate compliance analyst to manage their work.

Overview

Provides a summary of the overall compliance stance of the organization.

Authority documents

The widget displays the overall count of authority documents, summing up the counts of compliant and non-compliant authority documents. The section also gives you details of the compliance score percentage. Clicking the name of the authority document takes you to a detailed overview of the document showing its compliance status and tracking details.

Policies

In addition to the count of compliant and non-compliant policies, list of least compliant policies and compliance score, this section also provides the number of high risk exceptions for each listed policy.

Entities

Provides the total count of active entities, and a list of least compliant entities along with their entity class. Click the name of an entity to know its compliance status and tracking details.

Control Assurance

Provides an overview of testing and monitoring controls. By default, the audit tasks are filtered and displayed based on the **Assigned to me** condition of the logged in user. Whereas, the analyst can filter the indicators and attestations based on the entities that they manage.

Tracking

Provides a summary of important and open tasks and exceptions and helps the analyst to manage policy exceptions. Since the analyst is required to understand the policy exceptions created on the policies that is assigned to them, they can apply the filter on the required policies and view the exceptions created on these policies. Similarly, the analyst can select specific policies to view its campaign details.

Note:
To track the issues the compliance analyst can access the issue details from the "Issues Overview" section.

Tasks

Provides a summary of My pending tasks and My group's tasks – the job queue directs their day-to-day activities.

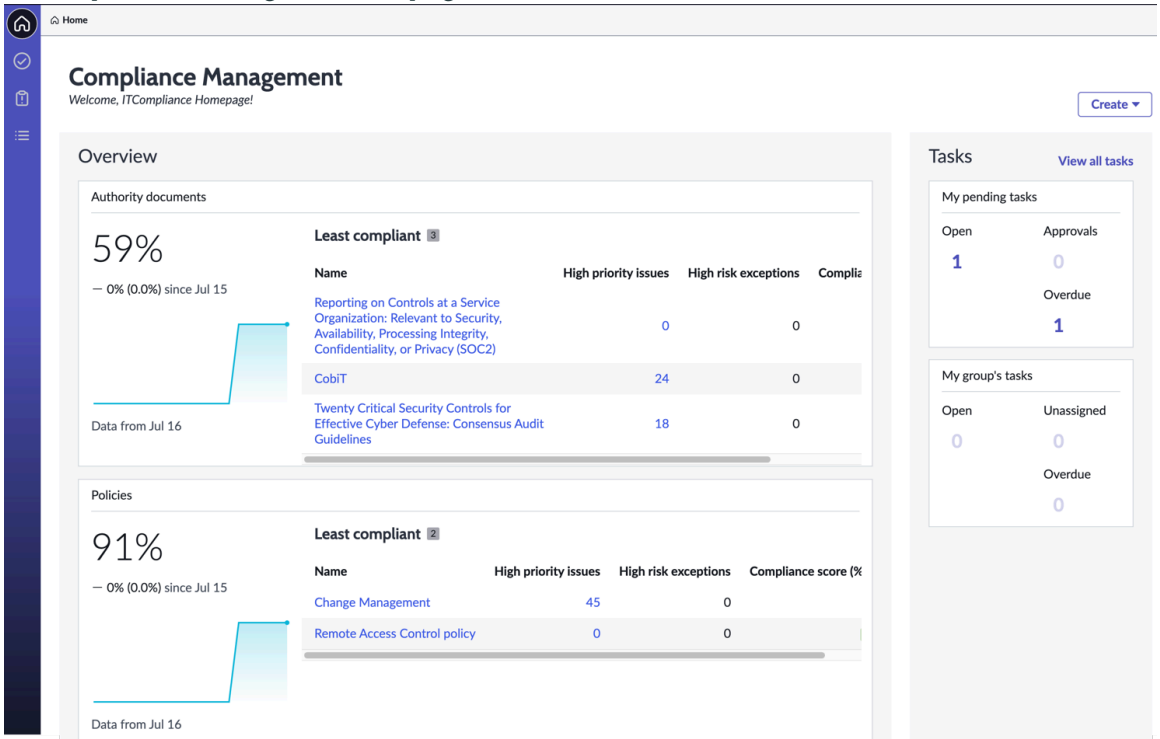
Quick links

Enables the analyst to create new records such as control objectives, controls, acknowledgement campaigns, and policy exceptions.

Compliance Home page for the IT compliance manager

The Compliance Workspace provides an exclusive home page for the IT compliance manager to view the IT-related risk and compliance data. The workspace helps the IT compliance manager to centrally manage internal standards, policies, and control processes that are exclusively IT-related to comply with the external regulatory standards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Configuring IT Compliance Workspace

- To set up the IT Compliance Home page, see Configuring IT compliance workspace.
- For information on the tables that support IT compliance workspace and the user roles, see Components installed with Policy and Compliance Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IT Compliance Home page

IT compliance manager's home page

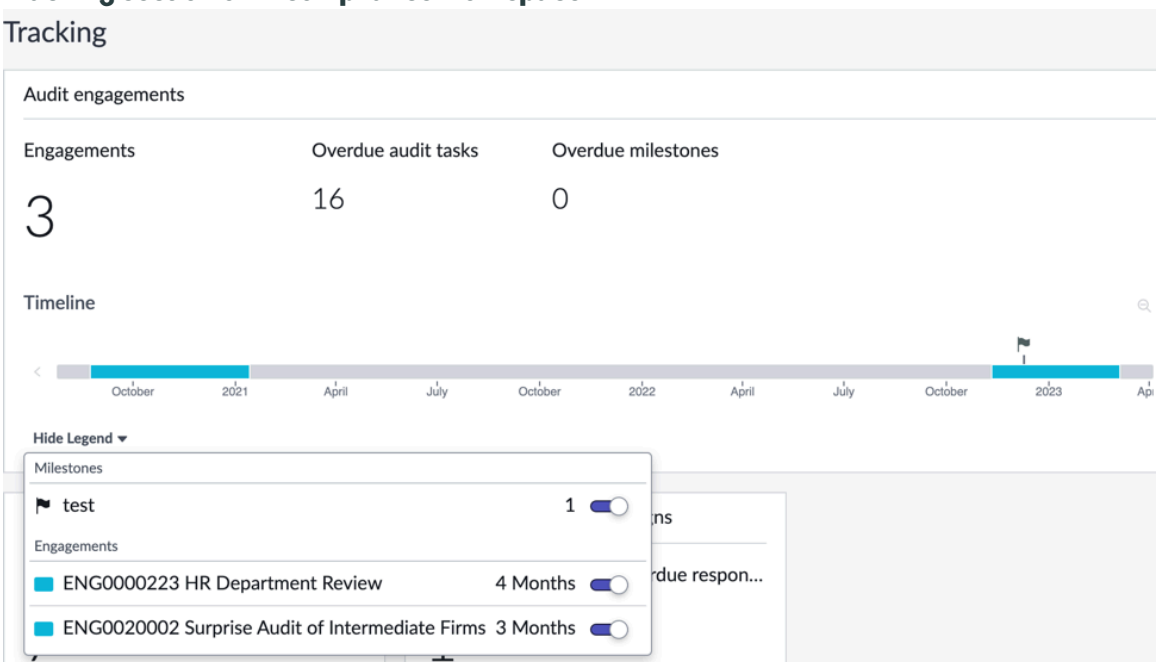
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview

The compliant percentage of IT-related authority documents, IT-related policies, and IT-related entities are indicated by PA indicator widgets.



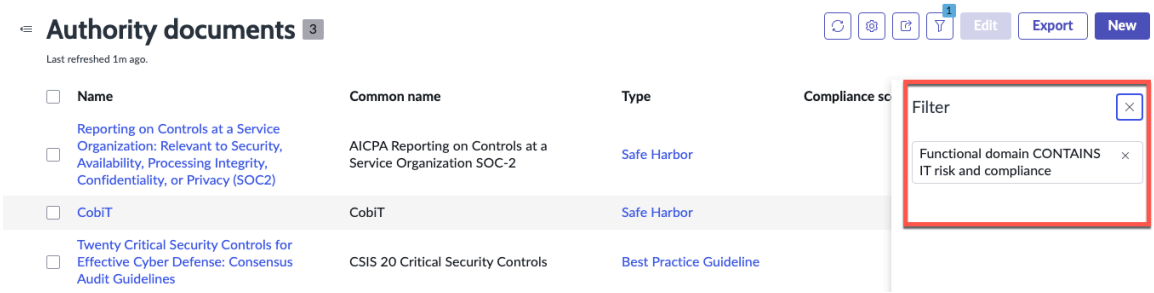
Control effectiveness

This section provides reports, gathering real-time information, on IT-related controls, the indicators that run on the IT-related controls, and the attestations that are associated to those controls.

Tracking

Tracks all the IT-related policies that are in queue for the IT compliance manager's action. The timeline shows the upcoming engagements and the milestones associated to each engagement. It also shows similar reports on exceptions that are active, expiring in seven days, and are at high risk. Similar reports on acknowledgement campaigns that are active and the number of overdue responses are also displayed.

Tracking section of IT compliance workspace



Note:
To track the issues the IT compliance manager can access the issue details from the "Issues Overview" section.

IT Compliance List overview

As you log in as an IT compliance manager, all the data in the List view of the Compliance Workspace are filtered to display those records that fall within the IT risk and compliance functional domain. Therefore, you get to view those records that are related to your user role and complete the IT-related tasks without filtering them manually.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IT-related records in List view

Note:
An admin or any user with both corporate compliance manager and IT compliance manager roles can view two list modules with the same name.

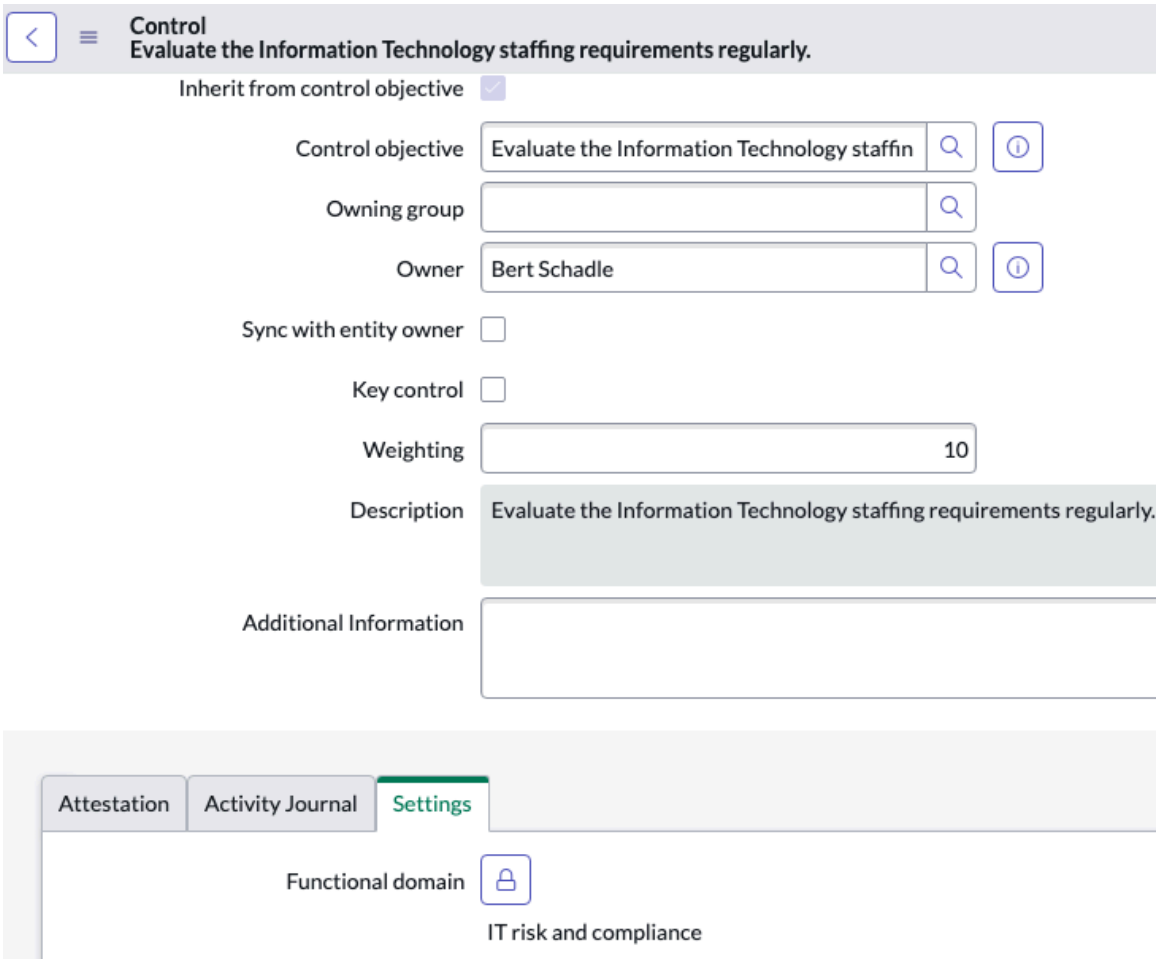
Configuring GRC Compliance Workspace

Configuring the Compliance Workspace requires setting up certain pre-requisite steps.

The following configurations are required to set up the compliance workspace for different users who would be using the workspace:

- To set up the IT Compliance Home page, see Configuring IT compliance workspace.
- For different components installed with GRC: Policy and Compliance Management, see Components installed with Policy and Compliance Management.
- For user roles and access control limitations, see GRC business user role and Assign policy and compliance management roles to your users.
- To set up system properties required in policy and compliance, see Set Policy and Compliance Management properties.
- For mandatory setup steps, see Policy and Compliance mandatory steps.
- To define other properties, rules, templates, and other integrations, see Policy and Compliance enhancement steps.

Configuration steps to filter IT-related data for IT Compliance Home page



There are three distinct steps that must be followed to segregate, associate, and display the IT-related data for the IT compliance manager to view in the IT Compliance Home page.

GRC data segregation

In all the Compliance Workspace related forms, the **Functional domain** field is added in the **Settings** tab to segregate a particular data and classify it as IT related data. The user must add **IT risk and compliance** as the functional domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

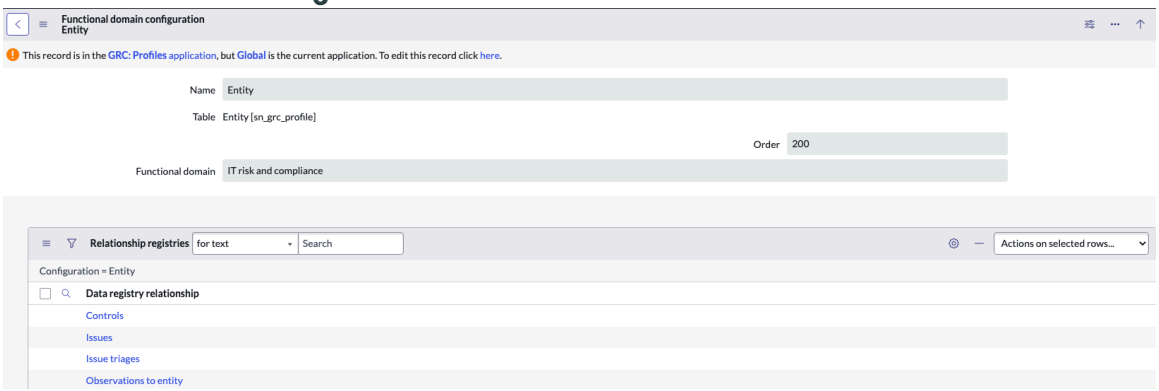
Functional domain field

The **Functional domain** field is available in all GRC compliance and audit workspace related forms such as Entity, Control, Control Objective, Policy, Authority document, Citation, Entity type, Entity class, Issue, Indicator, Indicator template, Acknowledgement campaign, Policy exception, Engagement, Test template, Test plan, Issue triage, Observation, Plan, Audit task, Milestone, Evidence request, and Evidence.

Auto-association of the segregated data

If an audit or compliance object is identified as IT related, then all the related items associated to this object are also identified as IT related. The Functional domain configuration [sn_grc_functional_domain_configuration] table stores the data registry relationship between the parent object and its related child objects within the IT risk and compliance functional domain.

For example, if an entity is classified as IT related entity, then all the controls associated to this entity are auto-associated as IT-related controls. The related child object has all the configurations defined such as the parent table, the child table, and the relationship between the two.



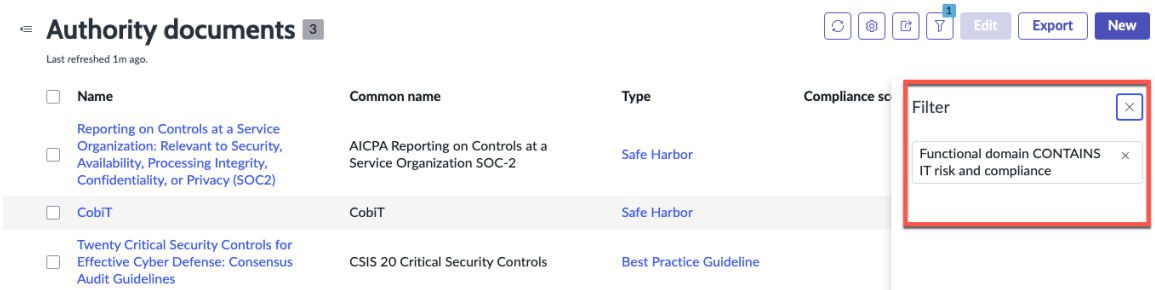
As a system admin, you can define this configuration by navigating to **GRC Administration** > **Functional domains** > **Domain inheritance**. User must manually add the tag, functional domain, in the base forms such as Policy, Authority document, Entity type, Entity class, Entity, Plan, Engagement for auto-tagging the child records. When a parent table is tagged with a particular functional domain, and if the user removes the tag from one of its child records, then the removed tag is not added during auto-association. Similarly, if the user manually adds a tag, then the added tag is not removed during auto-association. The GRC functional domain user action [sn_grc_functional_domain_user_action] table captures and stores all manual actions of the user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

in the **Functional domain** field of the record that belong to a particular table in the respective functional domain.

For more information on setting up auto-tagging, see the IT Compliance Workspace – Setup and Configurations for auto-tagging [KB1124058] article in the Now Support Knowledge Base.

Functional domain configuration



A scheduled daily job (GRCObjectsFunctionalDomainChanges) runs and gathers the user's manual actions recorded in the table to read these relationships, auto-associate the child object to IT risk and compliance functional domain, and auto-populate the record in the related item of the parent table.

For more information on the tables used for IT compliance workspace, see Components installed with Policy and Compliance Management.

Display segregated data to IT compliance manager in IT Compliance Home page

The IT compliance manager is the user who can access the IT risk and compliance data in the Compliance Workspace. In the List view of the Compliance Workspace, there is a filter that restricts the display of all audit and compliance data but refines to display only the IT risk and compliance data. The filter uses the Functional domain field in the all the audit and compliance related base forms to filter and display the IT related data in the Compliance Workspace List modules.

IT risk and compliance data filter

Note:
An admin or any user with both corporate compliance manager and IT compliance manager roles can view two list modules with the same name.

Using the Compliance Workspace

The Compliance Workspace has a unified tasks page. Based on the user role you can fulfil all your tasks and your team's tasks in the page.

The tasks that appear in the Compliance Workspace are unique to the logged in user and therefore can complete all assigned tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the Tasks page to view the tasks by categories, filter them by various parameters, and track the tasks that you've initiated.
- Use the Issues page to know all about issues.
- The record overview page provides the summary of each record in a single view.
- The contextual pane in the overview page provides contextual information of the record. It provides the record's key information in a hierarchy with attachments, if available.
- Use the 360° view to visualize the record's data relationship within the enterprise, its scores and ratings, and drill down further for more granular information.

Manage control objectives and policies using the Compliance Workspace

You can use the Compliance Workspace to manage information related to policy approvals, policies, and control objectives.

Create a policy using the Compliance Workspace

A policy defines an internal practice that processes must follow. You can define policies using the Compliance Workspace as policies, procedures, standards, plans, checklists, frameworks, and templates.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst or sn_compliance_ws.corporate_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the **Create** list and select **Policy** from the **Home** page.
3. On the form, fill in the fields.

Create New Policy form

Field	Description
Name	The name of the policy.
Type	List of options: ○ Policy ○ Procedure ○ Standard ○ Plan ○ Checklist ○ Framework ○ Template
Parent	The policy containing this policy. If you create a control objective from within a policy, this field is automatically filled.
Policy categories	Select the lock icon and select one or more categories for filtering policies. For example, select Vulnerability Response to view policies associated with that application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	A general description of the policy.
Policy text	A detailed description of the policy.
State	The state is a read-only field. Possible choices are: ○ **Draft** In this state, all compliance users can modify the policy and control objectives. All compliance users can select **Request review** button. Enter a message in the Request review pop-up and select **Request** , which sets the state to Review. ○ **Review** In this state, the owner, owning group, and reviewers can modify the policy and control objectives. The owner, owning group, and reviewers select **Request approval**, starting the workflow by sending approvals to the users in the Approvers list. The owner, owning group, and reviewers move the policy back to Draft, by selecting **Back to draft**, as well. ○ **Awaiting approval** In this state, the policy and control objectives are read-only for all. Approvers can approve the policy by updating the approval state in the Approvals related list of the policy form, or by viewing **My Approvals**. If the policy is approved, the policy goes to the **Published** state. If the policy is rejected, then it goes back to the **Draft** state. ○ **Published** In this state, the policy and control objectives are read-only for all. Admins can select **Retire** which sets the state of the policy to **Retired** ○ **Retired** In this state, the policy is read-only for all.
Compliance Score Percentage	The compliance score percentage assigned to this policy.
Assignment	
Owning Group	Group that owns the policy.
Approvers	The users you want to be included in the approval process.
Approval method	Approval method for dynamic approval configuration. Available options are: ○ Manually select approvers ○ Use approval rules
Approvers	Approvers to be selected for the policy.
Reviewers	Select the users that you want to be included in the review process.
Contributors	Contributors selected for the policy.
Schedule	
Valid from	The date and time for which the policy becomes valid.
Valid to	The date and time for which the policy is no longer valid.
Knowledge Base	
Policy template	The article template to use for the publication of this policy.
Policy knowledge base	The knowledge base article related to this policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Published policy	The KB article number and link where the policy is published.
Acknowledgement setup	
Audience	Select the default audience responsible for acknowledging this policy.
Reference Material URL	Select the lock icon to add the URL for any needed reference materials, such as certification or training materials.
Allow users to decline policy	Select this check box to give users the option of declining policy acknowledgements.
Allow users to request exception	Select this check box to give users the option of requesting exceptions for policy acknowledgements.
Exception Setup	
Maximum exception duration (days)	Enter the maximum number of days for which a policy exception can be requested for a given policy.

4. Select **Save**.
   In the reporting overview page of the policy, you can see the description of the policy, its state, and its status of overall compliance, entities, control objectives, and control. It also gives you the tracking information of policy acknowlegements, policy exceptions, and issues. The non-compliant entities widget also lists all the non-compliant reliant entities, each with its compliance score. For more information, see Manage compliance of a policy from the overview page
5. Select any of the related lists to provide more information for the policy.
6. From the **Overview** page, select the **Issues** tab.
   You can add existing one or more related issues to the policy that you created. By mapping the existing issues to the policy, you can reduce the count of open issues.

   a. Select the **Add** button.

   b. Select a related issue or issues from the Issues pop-up.

   c. Select **Add**.
      The selected issues are added to the policy as related issues and an m2m relationship is created between the policy and the issues in the Issue to Document [sn_grc_m2m_issue_document] table. You can also create an issue for the policy by selecting the **New** button, which takes you to the Create New Issue form.

   d. To remove an issue that is mapped to the policy, select the issue and select **Remove**.

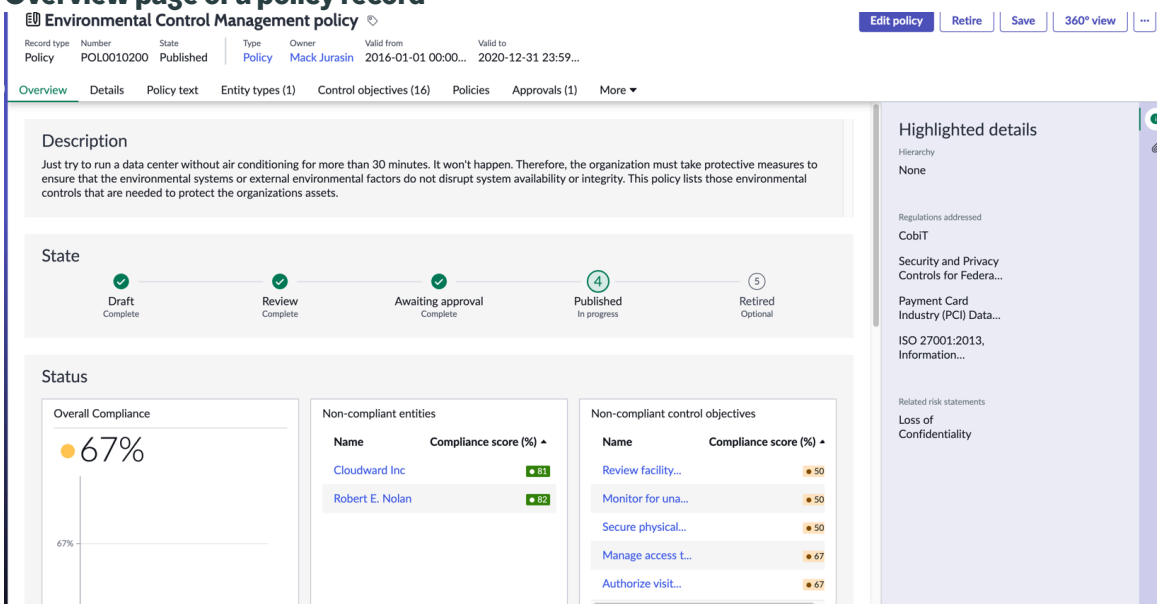
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The remove action only removes the mapping or the association between the policy and the issue in the m2m table and doesn't delete the issue record.

Note:
The UI action buttons such as New, Add, Remove aren't available if the policy is in Draft or Retired state. A policy in draft state is considered inactive and becomes active when it moves to Review state.

7. To mark the policy ready for review, select **Request review** .

Manage compliance of a policy from the overview page



The policy module helps you to create and document all policies. Policies are high-level statements that define what a business should or should not do.

Overview of a policy

The overview page of a policy record describes the necessity of the policy with respect to the organization's assets. It also gives you the status of the policy, its overall compliance percent, non-compliant entities, and control objectives. It also tracks the open and overdue policy acknowledgements, policy exceptions, and issues.

Select the icon to know the regulations that the policy has addressed and the related risk statements.

Overview page of a policy record

Approve and publish a policy using the Compliance Workspace

When a policy is approved, it is automatically published.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst or sn_compliance_ws.corporate_compliance_manager

About this task

Prior to Version 11.0.2 of the GRC: Policy and Compliance Management application, a new knowledge base article overwrote the previous version whenever you made changes to a policy. Starting with Version 11.0.2, when you again approve a policy, a new version of the KB article is created and listed in the **Policy Versions** tab, along with a history of previous versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This feature requires that you manually install and activate the Knowledge Management Advanced Installer [com.snc.knowledge_advanced.installer] plugin. For more information, see Activate a plugin.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the policy record.
3. Review the policy details.
4. Click the **Request Approval** button.
   Reviewers cannot request approval for a policy. However, the owner of the policy and users with the Corporate compliance manager role can request approval for a policy. When approval is granted, the policy is published and a knowledge base (KB) article is automatically created with the details of the policy.
5. Any time you need to make changes to the policy, you can click **Edit policy** and enter a message in the pop-up, and click **Request Approval**. Add a comment in the pop-up. When approval is granted, a new version of the knowledge base article is created.

   Note:
   As described above, if you activated the Knowledge Management Advanced Installer [com.snc.knowledge_advanced.installer] plugin, a new version of the KB article is created and listed in the **Policy Versions** tab.

   So, if you create links to this policy from the Service Portal or elsewhere, the latest version of the KB article is always displayed.

Acknowledge a policy using the Compliance Workspace

After a policy has been published, you can create an acknowledgement campaign in the Compliance Workspace to define a group of your employees who must provide an acknowledgement that a particular policy is in compliance. When the campaign has been defined, you can submit the request to the audience.

Set up a policy acknowledgement campaign using the Compliance Workspace

A policy campaign is the record used to prepare for a policy acknowledgement request. It defines the audience who must provide an acknowledgement that a particular policy is in compliance. A policy campaign is requested in the Compliance Workspace only if the compliance user decides it is needed.

Before you begin

Role required: Compliance User

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the Policy record in the **Published** state you want to acknowledge.
3. Scroll down and click the **Acknowledgement Setup** related list.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Audience	Select the employees who are responsible for acknowledging the policy. You define the audience using the Audience module.
Reference Material URL	Click the lock icon and add a URL to reference materials for the policy that the audience can review. When you have completed your entry, click the lock icon again.
Allow users to decline policy	Select if you want members of the audience to be able to decline the policy.
Allow users to request exception	Select if you want to members of the audience to be able to request a policy exception.

5. Save the record.
6. Scroll down and click the **Acknowledgement Campaigns** related list.
7. Click **New**.

   Note:
   Notice that the majority of the fields are pre-filled with data from the policy record.

8. On the form, fill in the fields.

   Note:
   Only field description that were not previously described are provided here.

Field	Description
Number	An auto-generated record number for the acknowledgement.
State	The current state of the acknowledgement campaign. The default state is New.
Valid from/to	Select the period of time the acknowledgement is valid. The acknowledgement is valid from the beginning of the **Valid from** date until the end of the **Valid to** date. **Note:** The **Valid from** date cannot be prior to the current date. The **Valid to** date cannot be beyond the **Valid to** date defined in the policy.
Number of days to respond	The number of days by which members of the audience have to respond.
Short description	A brief description of the policy.
Acknowledgement Details tab	This tab shows details and requirements from the policy, as well as the **Reference Material URL** defined during acknowledgement setup.

9. Click **Submit**.
   The acknowledgement request is now ready for you to send to the defined audience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an audience using the Compliance Workspace

When you set up a policy acknowledgement request in the Compliance Workspace, you must identify an audience responsible for providing the acknowledgement.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policy Acknowledgement** > **Audience**.
2. Click **New**.
3. Enter a name and description for the new audience, and save the record.
4. Use the three tabs to identify members for this audience.

Option	Description
Users	Click **Edit** and add one or more individual users to the audience.
Groups	Click **Edit** and add one or more predefined groups of users to the audience.
User Filters	Click **New** to define a new filter for audience member inclusion. Click **Edit** to modify an ex isting user filter. You can save filters for future use.

5. When the audience has been defined, you can add the users, groups, or user filters to an acknowledgement request.

Submit an acknowledgement request using the Compliance Workspace

After you have created an acknowledgement campaign using the Compliance Workspace, you can submit the acknowledgement request to the defined audience.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ( ).
3. Navigate to **Policy acknowledgements** > **All campaigns**.
4. Open the Policy Acknowledgement Campaign (PAC) record you want to submit to the defined audience.
5. Scroll down and click the **Acknowledgement Setup** related list.
6. On the form, fill in the fields.

Field	Description
Audience	Select the employees who are responsible for acknowledging the policy. You define the audience using the Audience module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Reference Material URL	Click the lock icon and add a URL to reference materials for the policy that the audience can review. When you have completed your entry, click the lock icon again.
Allow users to decline policy	Select if you want members of the audience to be able to decline the policy.
Allow users to request exception	Select if you want to members of the audience to be able to request a policy exception.

7. Save the record.
8. Scroll down and click the **Acknowledgement Campaigns** related list.
9. Click **New**.

   Note:
   The majority of the fields are pre-filled with data from the policy record.

10. On the form, fill in the fields.

    Note:
    Only field description that were not previously described are provided here.

Field	Description
Number	An auto-generated record number for the acknowledgement.
State	
Valid from/to	Select the period of time the acknowledgement is valid. The acknowledgement is valid from the beginning of the **Valid from** date until the end of the **Valid to** date. **Note:** The **Valid to** date cannot be beyond the **Valid to** date defined in the policy.
Number of days to respond	The number of days by which members of the audience have to respond.
Short description	A brief description of the policy.
Acknowledgement Details tab	This tab shows details and requirements from the policy, as well as the **Reference Material URL** defined during acknowledgement setup.

11. Click **Submit**.
12. Click **Request Acknowledgement**.

    Notice that the following changes occur.

    - The state of the acknowledgement campaign changes to **Pending Acknowledgement**.
    - Acknowledgement (ACK) records for each member of the audience appear at the bottom of the screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Acknowledgement Results** tab shows the progress of the acknowledgement process. That is, it reports the total number of acknowledgements sent, and keeps a running tally of the number and types of responses received (for example, number of accepted, declined, exempted, and so forth).

Note:
The **Activity** tab shows acknowledgement activities as they happen. The compliance user can click the Work notes check box and post work notes to track changes. The Additional comments box can be used to communicate with the audience.

Also, each member of the audience receives an email notification similar to the following example.

13. As the acknowledgement period elapses, you can monitor the progress of the responses by navigating to **Policy and Compliance** > **Policy Acknowledgement** > **Pending Acknowledgements**.
14. You can also identify any audience members who have exceeded the acknowledgement time line by navigating to **Policy and Compliance** > **Policy Acknowledgement** > **Overdue Acknowledgements**.

Respond to an acknowledgement request using the Compliance Workspace

After you have been identified as a member of an audience to provide a policy acknowledgement, you must open and review the record in the Compliance Workspace, and then acknowledge it.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst

Procedure

1. After you have received a notification that you are required to acknowledge a policy, navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. To provide the acknowledgement, open the record in the **My pending tasks** section of the Tasks page and perform one of the following actions.
   The available options depend on how the acknowledgement request was configured.
   - The default status of the policy acknowledgement is **New**.
   - The policy acknowledgement is set to **Pending Acknowledgement**, if:
     - the policy acknowledgement has reached the time set as **Frequency**.
     - the policy acknowledgement has reached the Valid From date, if it is the ad hoc acknowledgement
     - you click the **Pending Acknowledgement** button to move its state manually.
   - The policy acknowledgement is in Closed state, if:
     - you move it manually to **Closed** state
     - it reaches the **Valid to** date
   - The state moves to **Cancel** if:
     - you manually click **Cancel** button
     - the policy exception is rejected, the acknowledgement is reset to Cancel

   Following options are available when the policy acknowledgement instance is set to different states:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accept

If the policy is in compliance, click **Accept**.

Decline

If the policy is not in compliance and the request is configured in such a way that you are allowed to decline the request, click **Decline**.

Request Exception

If, for any reason, you do not want to respond, and the request is configured in such a way that you can opt out, click **Request Exception**.

Exempt

If the policy is approved

Retire a policy using the Compliance Workspace

Retiring a policy is part of the policy management process. It can be retired using the Compliance Workspace anytime after being approved and published to the KB.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies**.
2. Open the Policy record.
3. In the top-right corner, click **Retire**.
   This option is available only for policies in a published state.

Create a GRC article template

Policy and Compliance managers can use the Compliance Workspace to create templates for policy article publishing.

Before you begin

Role required: sn_audit.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Article Templates**.
2. Click **New**.
3. On the form, fill in the fields.

Authority Document

Field	Description
Name	Name of the article template.
Type	○ Script ○ HTML ○ XML
Script	The script code. This field depends on the **Type** field.
HTML	The HTML code. This field depends on the **Type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
XML	The XML code. This field depends the **Type** field.
Is default	Option to indicate that this template is used as the default template for all KB articles.

4. Click **Submit**.

Create a control objective using the Compliance Workspace

A control objective is an objective, direction, or standard that acts as guidance for company interactions and operations. Control objectives can be categorized, classified, and related to policies using the Compliance Workspace.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Click the **Create** list and select **Control objective**.
3. On the form, fill in the fields.

Create New Control Objective form

Field	Description
Name	Name of the control objective.
Source	Source of the policy. For example, if the statement is from the a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this authority document.
Reference	Unique numerical identifier.
Parent	Control objective that is not a child of the current control objective. This is to avoid cyclic parent – child relationship.
Compliance Score Percentage	Compliance score percentage calculated for this control objective and its color code: ○ Green: 80 and higher ○ Yellow: 80 to 50 ○ Red: below 50
Active	Option that indicates whether a policy is active.
Creates controls automatically	Option that indicates that controls are automatically created from the control objective. **Note:** Select this option if the control objective can also serve as the control.
Create control requirements	Option to generate control requirements automatically for every control generated under an entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ If no control objective requirements exist, then control requirements are not generated. ○ The number of control requirements equals the number of control objective requirements.
Category	List of options: ○ Acquisition or sale of facilities, technology, and services ○ Audits and risk management ○ Compliance and Governance Manual of Style ○ Human Resources management ○ Leadership and high-level objectives ○ Monitoring and measurement ○ Operational management ○ Physical and environmental protection ○ Privacy protection for information and data ○ Records management ○ System hardening through configuration management ○ Systems continuity ○ Systems design, build, and implementation ○ Technical security ○ Third party and supply chain oversight ○ Root ○ Deprecated
Classification	List of options: ○ Preventive ○ Corrective ○ Detective
Type	List of options: ○ Acquisition/Sale of Assets or Services ○ Actionable Reports or Measurements ○ Audits and Risk Management ○ Behavior ○ Business Processes ○ Communicate ○ Configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Data and Information Management ○ Duplicate ○ Establish Roles ○ Establish/Maintain Documentation ○ Human Resources Management ○ Investigate ○ IT Impact Zone ○ Log Management ○ Maintenance ○ Monitor and Evaluate Occurrences ○ Physical and Environmental Protection ○ Process or Activity ○ Records Management ○ Systems Continuity ○ Systems Design, Build, and Implementation ○ Technical Security ○ Testing ○ Training
Attestation method	List of options: ○ Classic attestation: ServiceNow AI Platform classic method of control assessment. ○ Attestation: Method by which controls are assessed. **Note:** If you select Attestation, then the Attestation field is populated with **GRC Attestation**
Attestation	**GRC Attestation** is chosen by default. **Note:** If the user changes the control attestation, the related control objective attestation type is also changed.
Issue group rule	Group rule assigned to this control objective.
Description	Description of the control objective.

4. Click **Save**.
   To view and manage the details of the control objective that you created, see Manage a control objective from the overview page.
   The control objective is created and all related lists are visible.
   - A control is created for every control objective when a policy is associated with an entity.
   - The control attributes default to the same attributes as the related control objective.
5. From the **Overview** page, click the **More** tabs and select **Issues** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add existing one or more related issues to the control objective that you created. By mapping the existing issues to the control objective, you can reduce the count of open issues on the control objective.

a. Click the **Add** button.

b. Select the related issue or issues from the Issues pop-up.

c. Click **Add**.
The selected issues are added to the control objective as related issues and an m2m relationship is created between the control objective and the issues in issue to control objective [sn_grc_m2m_issue_content] table. You can also create an issue for the control objective by clicking the **New** button.

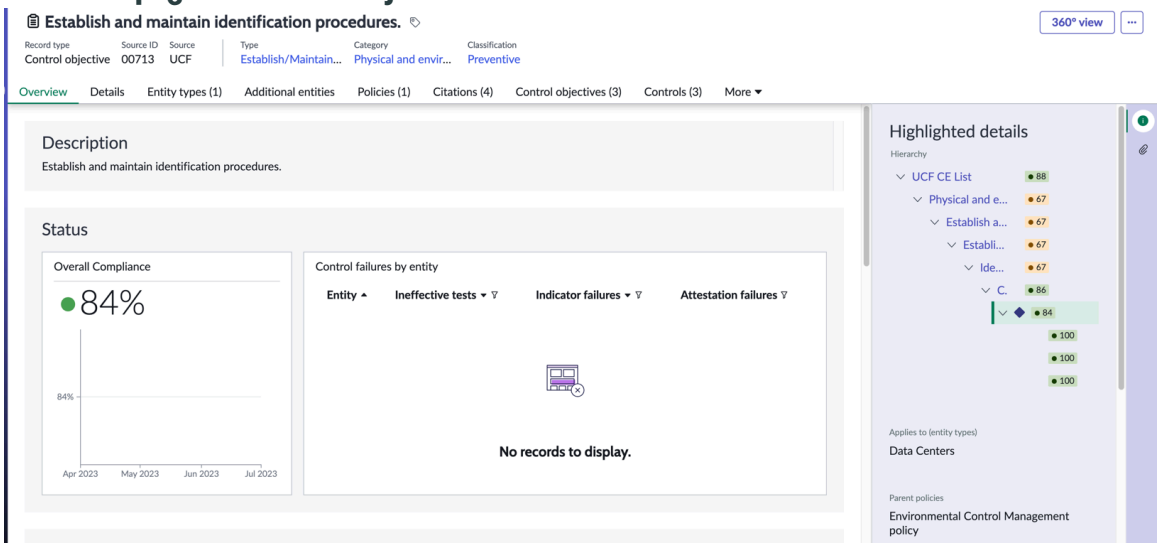
d. To remove an issue that is mapped to the control objective, select the issue and click **Remove**.
The remove action only removes the mapping between the control objective and the issue. The action doesn't delete the issue record.

Note:
The UI action buttons such as New, Add, Remove aren't available if the control objective is in Retired state.

What to do next

If you're implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Manage a control objective from the overview page



The Overview page of the control objective record gives you the overall details of its compliance status.

Overview page of a Control objective record

The control assurance section helps you to know if different attestations are in place, which demonstrates that the control has been implemented correctly. The indicators, in addition to control attestations, help to assess the controls or to monitor their compliance continuously. The ongoing and overdue status of tests conducted on controls is the key determinant by which the organization determines that its policies and authority documents are being followed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview page of a control objective record

For more contextual information about the control objective, select the sidebar icon ( ). For a given control objective record, you can view the hierarchy of mappings back to the authority documents and policies that show why you do the actions indicated in the control objective.

A control objective record has many related lists that come from different applications such as Advanced Risk, GRC Metric, PaCE, and others, which are listed next to the Overview. You can map or associate any of these available related list item with the control objective. For example, if you would like to add an entity type to the control objective, you can navigate to the Entity types related list, select the **Add** button, and map the required entity type.

Control objective requirements

A control objective requirement is a granular layer under a control objective that specifies a distinct compliance condition or expectation. Each control objective can have multiple statements, and each statement becomes a control objective requirement.

When control objectives are imported, if any control objective requirements are available in the source, they will also be imported with the control objective. Control objective requirements can also be manually added or selected from existing requirements when configuring a control objective.

When controls are generated under an entity, the control objective requirements help create corresponding control requirements.

Add control objective requirements

Control objective requirements can be manually added or selected from existing requirements when configuring a control objective.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the List icon.
3. Under Compliance Library, select **Control objectives**.
4. Select the control objective for which you want to add control objective requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the control objective page, navigate to **Control objective requirements** tab.
6. To add existing control objective requirements, do the following:

   a. Select **Add**.
   The Control objective requirements list appears. These are ones that are not already associated with the control objective.

   b. Select the control objective requirements from the list, and select **Add**.

7. To create new control objective requirements, do the following:

   a. Select **New**.
   The Create new control objective requirements page appears.

   b. In the Reference field, enter a unique numerical identifier for the control objective requirement (for example, you can use source or reference of the control objective and a number).

   c. In the Description field, enter a description for the control objective requirement.

   d. Select **Save**.

Control assessment based on GRC attestation template

You can select the option to attest controls using an assessment method. This assessment is an alternative method to the classic assessment that is based on ServiceNow AI Platform method of assessment.

Pre-requisites to enable smart assessment in Policy and Compliance Management

Smart assessment scoped applications

The base system ships the GRC smart assessment template to the users when the GRC: Policy and Compliance Management (sn_compliance) plugin is installed. However, the following scoped applications are required:

1. Smart Assessment core (sn_smart_asmt)
2. Smart assessment Migration tools (sn_smart_asmt_mig). For more information, see Migrate a legacy metric type to an assessment template
3. Smart Assessment Connected (sn_smart_asmt_conn)
4. Smart Assessment Designer (sn_smart_asmt_desg). For more information, see Using the template designer

Enable smart assessments system property

The *Enable smart assessments on control* system property must be set to true if you want to assess the controls using the assessment method based on GRC attestation template. For more information on the system property, see Enable smart assessments on control.

Migrate the template

Create a new template in Smart Assessment Engine. For more information, see Creating an assessment template from legacy assessment metric types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access control limitations for smart assessment user roles

sn_grc.business_user and sn_grc.business_user_lite

As logged in users they can respond to attestations in **My Attestations** on the Task page of Compliance Workspace, Risk Portal, and Employee Center.

sn_compliance_ws.corporate_compliance_manager and sn_compliance_ws.it_compliance_manager

Can view and edit the templates.

sn_compliance.attestation_creator

Can create template category and template migration.

sn_compliance.user

Can read all the assessments related to control category.

Assessment template category and migration tables

Assessment template categories [sn_smart_asmt_template_category]

The **Category role** field has the configuration of the minimum reader role required to read the template of this category. The role must contain sn_smart_asmt.template_reader role.

Assessment template migrations [sn_smart_asmt_mig_template_migration]

Used to migrate the existing source metric type and template category to the new assessment template format.

Impact of attestation method on control objective and control generation

When the *Enable smart assessments on control* system property is set to true and the Control objective record has the value **Attestation** in the **Attestation method** field, then all the controls that are generated for this control objective record after attestation has values defaulted from the control objective. The **Attestation method** field value defaults to **Attestation**.

Note:
The old control objectives will have default assessment method as classic assessment. If you would like to explore smart assessment method, then you should make necessary changes to either the control objective or the control. The control can be updated only if it does not have any control objective. After you create a new record, you can either opt the classic attestation or attestation as your attestation method.

- If the control objective is associated with the control, then the generated control inherits the **Attestation method** and **Attestation** field values.
- If a control is created from a control objective, the **Attestation method** and the **Attestation** fields are pre-populated, if the control objective has values in these fields.

  Note:
  The controls are automatically created if the **Create controls automatically** option is enabled for the control objective.

  The **Attestation method** field is read only. However, you can edit the **Attestation** field and select a different template for attestation. Any changes done to the control objective are automatically updated in the associated controls.

- After the control is saved and attested, the **Attestations** related list appears in the Control record. This related list displays all Assessment instances that are in Open and Completed states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the assessment method is changed from Classic attestation to Attestation in the control objective record, then the changes are reflected in all the control records generated for the control objective. Up until the control moves to the Attest state, the **Attestation method** and **Attestation** field values can be updated.

- If the control was previously generated opting the classic attestation method, then the **Classic attestation** related list has the details of all completed attestations.
- If the control is moved to the Draft state by selecting the **Return to Draft** button, all the assessments that were active are canceled. Similarly, if the control retires, all related assessments are canceled as well.
- If the control is marked **Exempt** owing to a policy exception, all the associated assessments are canceled. However, if the **Exempt** option is cleared for the control and if the control is in the Attest state, then the assessments are re-triggered. And, all the fields in the Attestation section of the control becomes read only.
- If a policy is associated to the control objective, and the policy is published, then all the fields of the control objective form become read only.
- When the control moves to the Attest state, the assessments are triggered. An email notification is sent to the control owner and the attestation respondents of the control, with the subject line referencing the new attestation name of the control number and the due date by which the attestation must be completed.
- If an attestation fails for one of the controls generated from a control objective, then the control becomes non-compliant and an issue is created. Or, if the control has an issue that already exists, then the **Issue source** field is updated. If the control moves to the Attest state and if the attestation passes, then the existing issues are closed, and the control becomes compliant.

- You can respond to the attestations from any of these portals:
  - Respond to attestations from the Employee Center.
  - Respond to attestations on the Risk Portal.
  - Respond to attestations from Tasks page of Compliance Workspace.
- To view the Control objective and Control form changes, see:
  - Create a control objective using the Compliance Workspace.
  - Create a control using the Compliance Workspace.
- To view the attestation widgets in the control and control objective overview pages, see User interface changes for assessments based on GRC attestation.
- To view the control attestations in 360° view, see 360° Relationship Visualization for Policy and Compliance Management.

Respond to attestations from the Employee Center

Respond to your attestations by logging in to the Employee Center.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

As an attestation respondent of a control you can log in to the Employee Center portal and respond to the attestations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select **GRC tasks** in the **My active items** pane of the Home page.
3. Select the new task in My to-dos section.
4. Select the assessment instance link in the My pending tasks related list.
5. Enter your response to the set of questions, and attach an evidence document.
6. Select the **Next** button.
7. Select the **Provide acknowledgement** option.
8. Select the **Submit assessment** button.
9. Select **Close** in the Submission Successful pop-up.
   All the questions are read only now that you have submitted the response.

Respond to attestations on the Risk Portal

Respond to your attestations by logging in to the Risk Portal.

Before you begin
Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task
As an attestation respondent of a control you can log in to the Risk Portal and respond to the attestations.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Risk Portal**.
2. Select the new task in My pending tasks section of the Risk Portal.
   You can view the Attestations on the left panel.
3. Select the assessment instance link on the right panel of the My pending tasks related list.
4. Enter your response to the questions in the category.
5. To attach an evidence, select the Add File link, select the document in the folder, and click **Open**.
6. Select the **Upload** button.
7. Select the **Next** button.
8. Select the **Provide acknowledgement** option in the Submit page.
9. Select the **Submit assessment** button.
10. Select **Close** in the Submission Successful pop-up.
    All the questions are read only now that you have submitted the response.

Respond to attestations from Tasks page of Compliance Workspace

Respond to your attestations by logging in to the Tasks page of the Compliance Workspace.

Before you begin
Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task
As an attestation respondent of the control you can log in to the Compliance Workspace, navigate to the Tasks page and respond to the attestations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

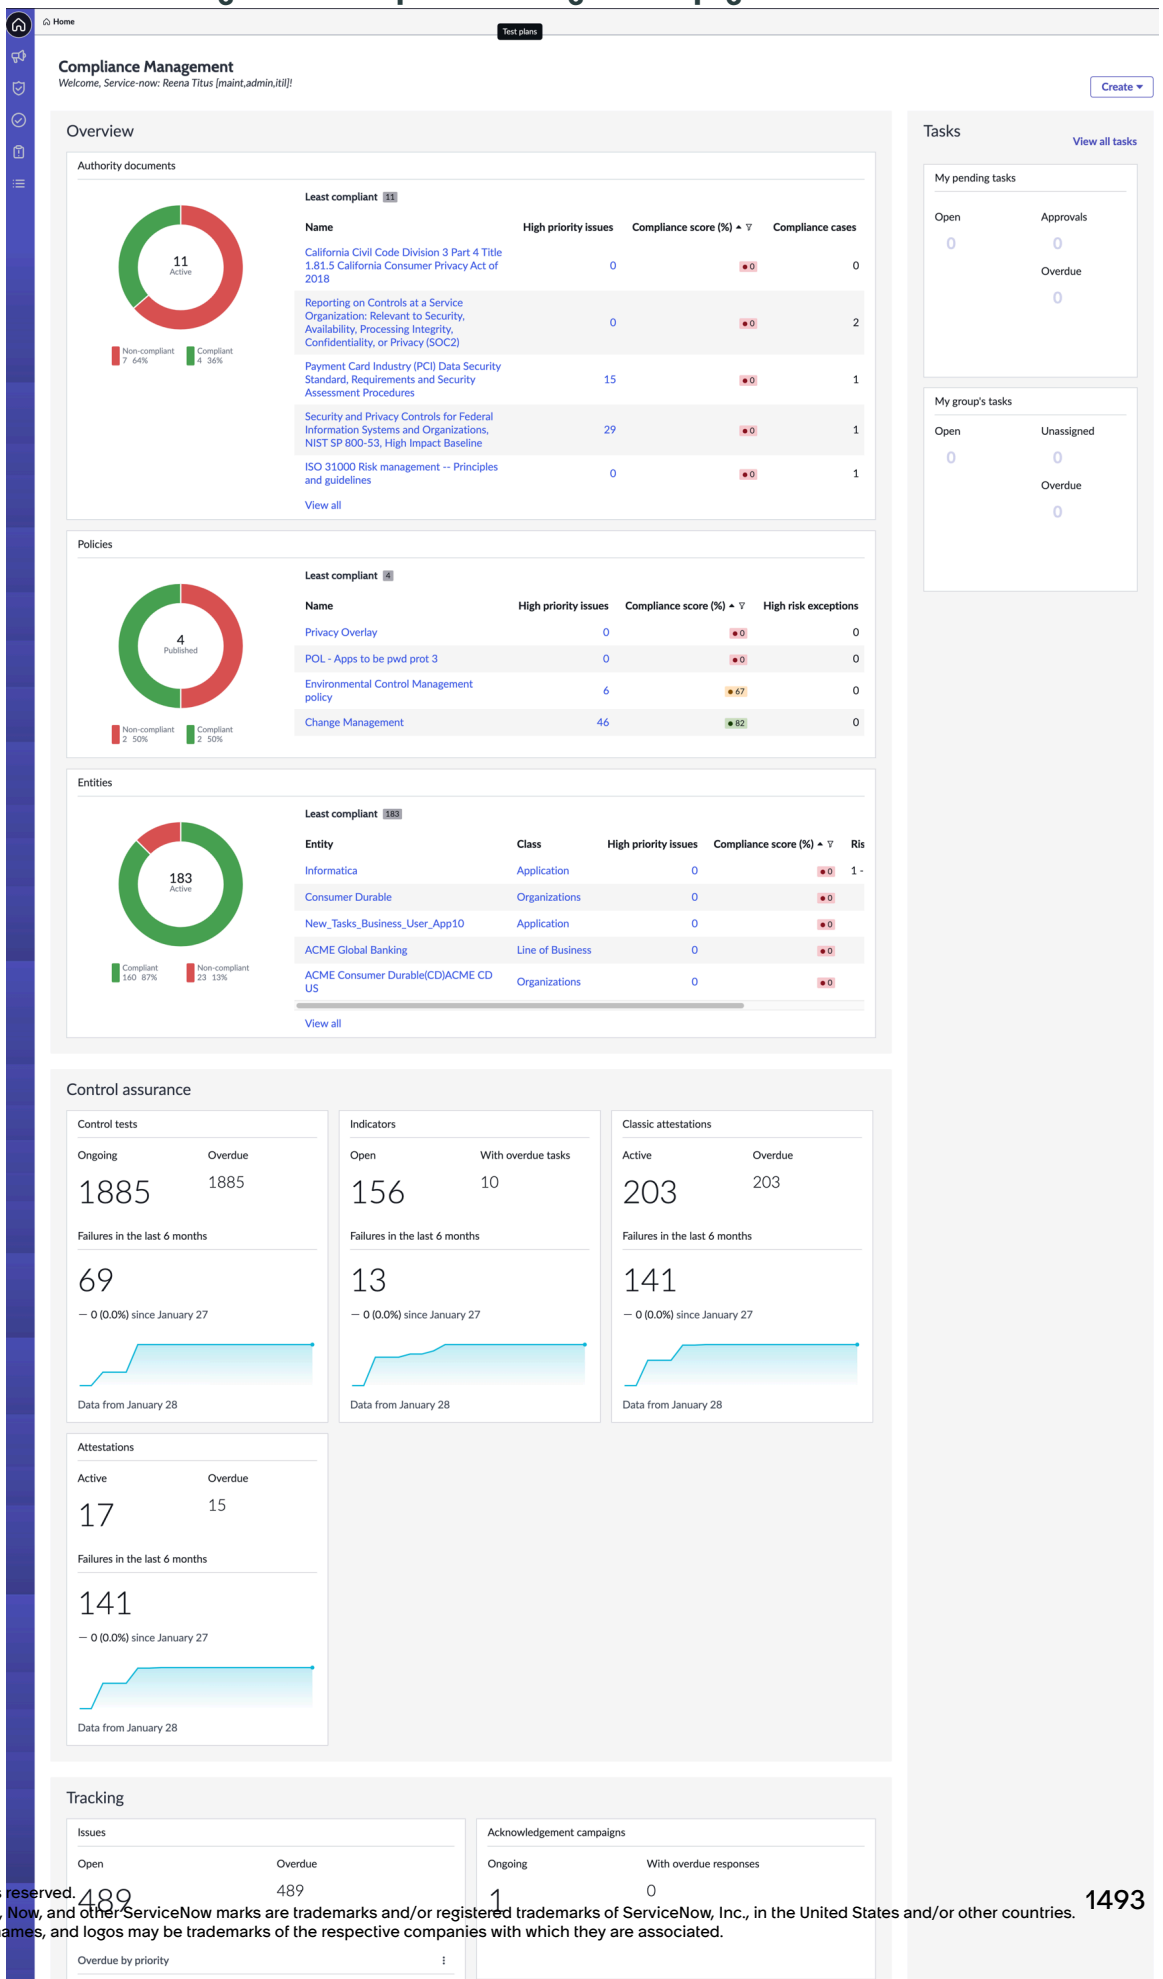
1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the tasks icon ( ).
   You can view the Control attestations on the left panel.
3. Select the assessment instance link on the right panel of the My pending tasks related list.
4. Enter your response to the set of questions, and attach an evidence document.
5. Select the **Next** button.
6. Select the **Provide acknowledgement** option.
7. Select the **Submit assessment** button.
8. Select **Close** in the Submission Successful pop-up.
   All the questions are read only now that you have submitted the response.

User interface changes for assessments based on GRC attestation

The Lists pane of the Compliance Workspace is updated with assessments link to navigate to the assessments. The attestation and classic attestation widgets are displayed in the home pages of the compliance manager, compliance analyst, and the IT compliance manager.

Lists page of the Compliance Workspace

You can select the Assessments list option in the Control attestations list of the Compliance Workspace List view to view the list of assessments that are not in complete state.



Attestation widgets in Compliance Workspace home pages

Compliance Home page for the compliance manager

The home page for the compliance manager is updated with the Attestations widget. The existing attestation widget has been renamed as Classic attestations that has the data of the completed attestations for the control when the attestation method was Classic attestation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attestations widget in the compliance manager home page

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance Home page for the compliance analyst

Similarly, the home page for the compliance analyst is updated with the Attestations widget. The existing attestation widget has been renamed as Classic attestations and has the data of the completed attestations for the control when its attestation method was Classic attestation.

Compliance Home page for the IT compliance manager

So also the home page for the IT compliance manager displays the attestations data, and classic attestations if the control was formerly assessed by classic attestation method.

Attestation widgets in the Overview pages of control objective and control

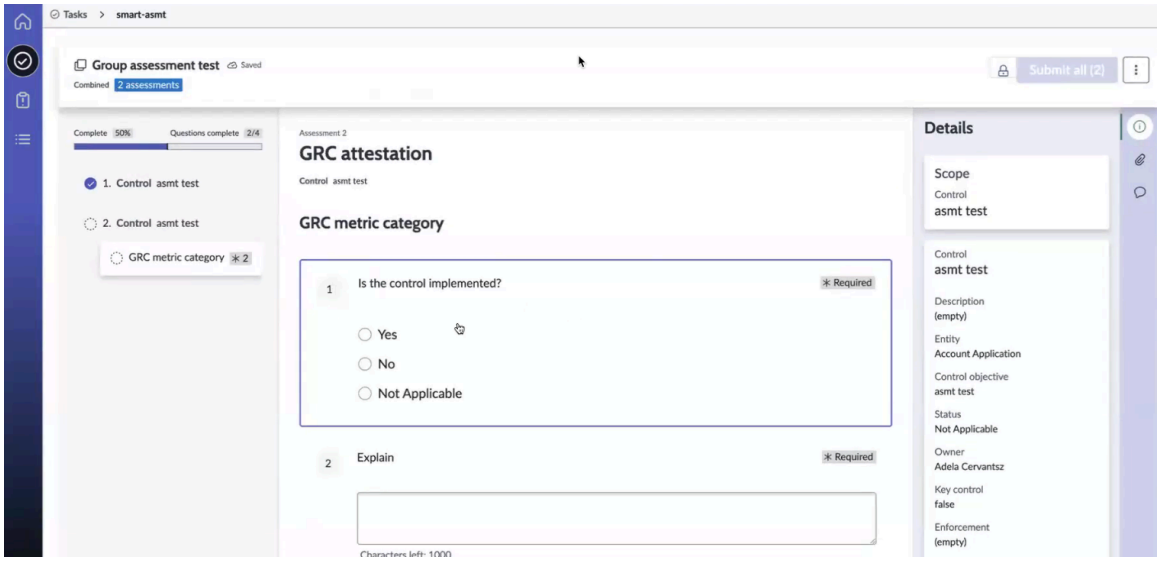
Overview page of a control objective record

The overview page displays the Attestations widget with the open and overdue attestations for the last six months if the assessment method was Attestation.

Overview page of a control record

Displays the Attestations widget with the open and overdue attestation details. If the control was previously assessed by the Classic attestation method, then the data of all completed attestations are displayed. You can also view the **Completed attestation** widget with its details.

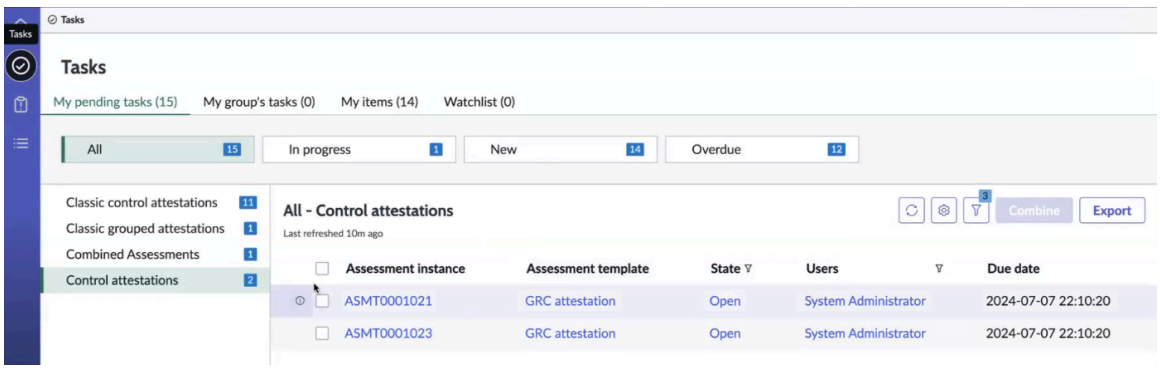
Grouping assessments for control attestations



Control attestation feature is enhanced to display all the control related information in the assessment page. You can also group assessments for a user and combine them together. Therefore, all assessments that the user has to assess can be done together without having to assess one after the other.

Control information as Assessment reference

The **GRC attestation** template for control category of assessment had two targets as Control and Entity to display the control and entity related information on the assessment template. With the referential information of the assessment engine, Entity information is no longer displayed. Instead, all the relevant information about the control are added as Assessment reference in the GRC attestation template.



The contextual information such as its name, description, entity, control objective, status, owner, current compliance score, tier value, tiering assessor, enforcement, classification, and others are populated and displayed as you open an assessment in the Details pane on the right.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Grouping control attestations

You can group a list of assessments assigned to a particular user as Combined Assessments and assign a new name for the grouped assessments.

To group assessments, see Combine assessments for control attestations.

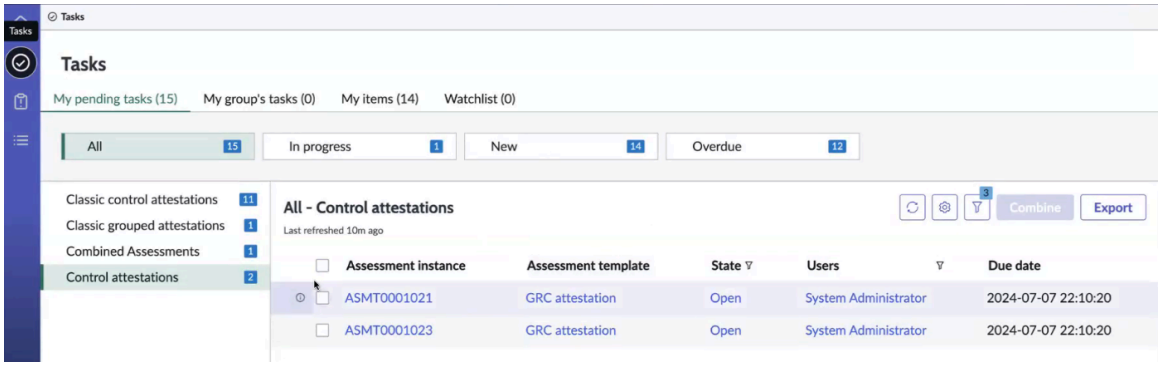
Combine assessments for control attestations

Provide response to similar assessments by grouping the assessments for a user in the Tasks page of the Compliance Workspace.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

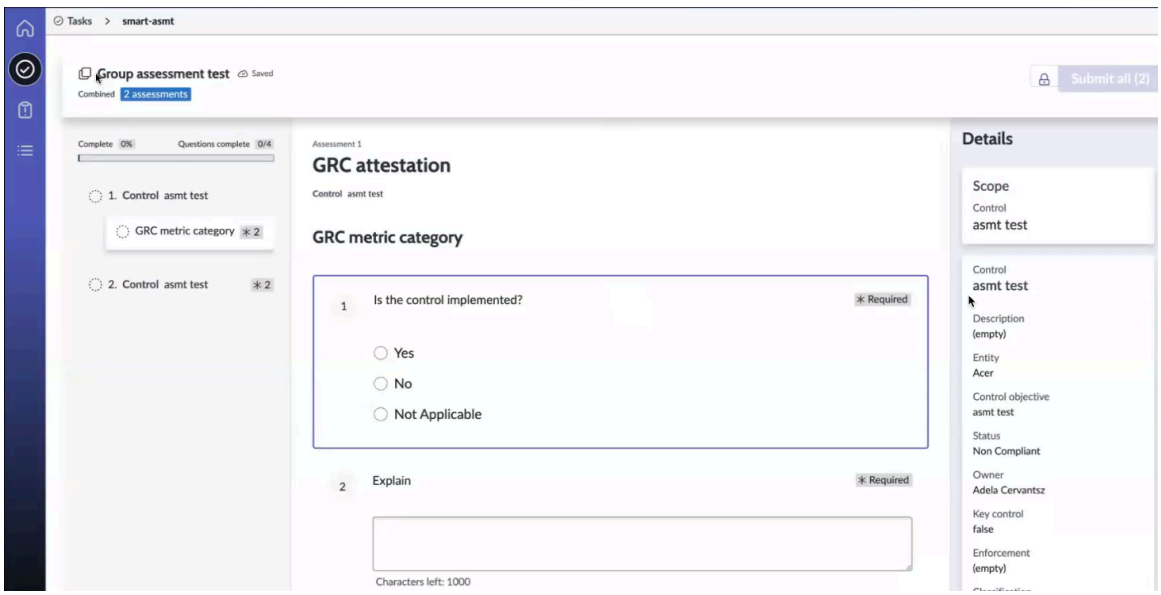
Procedure



1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the tasks icon ( ).
3. Select the Control attestations on the left panel.
4. From the My pending tasks related list, select the assessment instances on the right panel that you wish to group.
   Once you select more than one assessment instance records, the **Combine** button is enabled.
5. Select the **Combine** button.
6. In the Combine pop-up, enter a name for the assessments that you are grouping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you do not enter a name, then the name defaults to the assessment name, which is GRC attestation.



7. Click **Proceed**.

   The individual assessments are listed in the **Control attestations** list, and the grouped assessments in the **Combined Assessments** list in the My pending tasks related list.

   The selected assessments are grouped under one attestation name. You can respond to the assessments individually or as one in the grouped combined assessments. You can respond to one assessment even if you had grouped them. The Combined Assessments lists only those assessments that have not been taken.

8. Select the assessment and answer the questions.

9. Select the check box in the Submit combined assessment pop-up and click the **Submit all** button to submit the assessments.
10. Navigate to My pending tasks, and refresh the page.
    Since you completed the assessments, the Combined Assessments and Control attestations lists are removed.
11. Navigate to the Controls related list of the Control objective record page in the Compliance Workspace.
    You can view the completed assessments from their states for different entities.

Perform CRI tiering questionnaire to determine the tier value of entity

Perform CRI tiering questionnaire on an entity to determine its tier, evaluation controls associated with the tier will be created or updated. Based on the response to the CRI questionnaire from the assessor, the compliance status of each mapped control to a question is determined and the overall compliance score of the entity is calculated.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.it_compliance_manager

About this task

Cyber Risk Institute (CRI) focuses on collaborating with financial sector customers and regulators and streamlines the standards in managing compliance in financial organizations. To mitigate the risks, CRI has created a profile as CRI Profile that is based on NIST CSF v2.0 content.

The content is based on NIST CSF v2.0 functions such as identify, protect, detect, respond, recover, and govern that are called as diagnostic statements. These statements map to various citations coming from the industry standards and generalized into common control objectives. When financial institutions comply with these diagnostic statements, they automatically comply with all the regulations and standards enforced by the financial sector.

ServiceNow base system provides this CRI Profile content to customers and they are:

- Authority documents for CRI Profile.
- FFIEC CAT is part of CRI Accelerator. For more information, see Cyber Risk Institute accelerator.
- NIST CSF content is part of CSF Accelerator. For more information, see NIST CSF process overview.

The CRI assessment is done in two steps:

CRI tiering questionnaire

With CRI, you can tier your organization with a prescriptive set of questions that you take to assess your company. Based on the responses to the assessment, your company is assigned a tier value.

CRI profile assessment

After the CRI tiering questionnaire is complete and based on the tier state of your company, you are required to complete the second step that is CRI profile assessment, which determines the compliance status of the controls and the overall compliance score of your company.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the lists () icon.
3. From the Compliance library of Authority documents list on the left pane, select an authority document based on CRI Profile v2.0.
4. Select the Citations related list to view the citations associated with the authority document, and select a citation.
   Each of these citations have a control objective associated to it.
5. From the Citation record's overview page, select the Control objective related list.
6. Select a control objective record and click the Citations related list to see the related citations that are from the CSF Profile v2.0 and FFIEC.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You will know how the records are mapped to the CSF Profile v2.0 content. You also have the content for FFIEC CAT and NIST CSF v2.0 in the Compliance library – Authority documents. With these content available, you can perform the tiering questionnaire for your company or subsidiary.

7. From the Lists page select **All entities** and click an entity record.
8. Select the **Details** related list of the entity record and click the **Class** field.
   Select any entity class, where the **Is CRI** option is enabled for **Cybersecurity Risk Profile (CRI)**. This flag determines whether this class is applicable for CRI profile assessment. Any entity related to this class is entitled to be assessed for the CRI tiering questionnaire.
9. Close the record, and select the Details related list of the entity.
10. Enter the tier details in the Cybersecurity Risk Profile (CRI) related list.
    For more information, see
    - The Entity form in Create an entity.
    - The Related lists in the Entities section.
11. Select the ••• icon and click the **Initiate CRI tiering questionnaire** option.
12. Enter a message in the **Message** field and select the **Initiate tiering questionnaire** button in the CRI tiering questionnaire pop-up.
    After you initiate the tiering questionnaire the **CRI tiering questionnaire** related list appears in the Entity record.
13. Select the **CRI tiering questionnaire** related list and click the assessment instance link.
    You can also respond to the assessment from the **Tier assessments** list of the My pending tasks related list in the Tasks page and from the Employee Portal. Review the tiering assessment instructions and respond to the questions. Based on your response to each question, the tier level of the entity is determined.

    To respond to an attestation, see Respond to attestations from Tasks page of Compliance Workspace and Responding to assessments.
14. After you submit your assessment, open the entity record to view the tier value in the **Tier** field of the **Cybersecurity Risk Profile (CRI)** section.
    Additionally, based on the tier value you can also know the number of controls that are generated based on the control objectives coming from the tier profile.
15. To view the controls mapped to the tier value, select the **Downstream controls** related list.
    After the tier is determined based on the tiering questionnaire, you can now perform the CRI profile assessment.

Perform CRI profile assessment per CRI guidelines using control assessment engine

Perform CRI profile assessment based on the tiering questionnaire of an entity to determine the compliance status of the controls and know the compliance score that rolls up to the entity.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.it_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the lists ( ) icon.
3. Select **All entities** from the Scoping list on the left pane and click the entity record for which you completed the CRI tiering questionnaire.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. As an owner of the entity, select the ••• icon and click the **Initiate CRI profile assessment** option.
   The CRI profile assessment is created based on the tier value, and you can view the assessments in the **CRI profile assessment** related list, which takes a few seconds to be generated. The controls are also created simultaneously.

   Note:
   When the tier assessment is in progress, you will not be able to trigger either tier assessment or CRI profile assessment. When one CRI profile assessment is in the process of creation, then you will not be able to trigger another CRI tier assessment. If one CRI assessment is open, then the tier assessment option is also not visible.

5. Select the CRI profile assessments related list and refresh the page to view the assessment.
6. Select the assessment link.
   The assessment is divided into many sections based on the functions of the CSF v2.0 content. You can read the instructions and answer the questions. Each question is mapped to the control objective which in turn maps to the diagnostic statement of the CRI profile. Each of these questions have a multiple choice answers out of which you can choose an answer.

   a. Select the **View guidance** link
      The text in the link gives more context and guides you in your response to the question that is being asked by providing a response guidance. It gives examples of effective evidence as to what kind of evidence you can attach.

   b. Write your justification in the **Provide justification for this response** field.

   c. Select the **Add attachments** button in the **Provide attachments for this response** field.
      Justification and adding attachments are optional, however these are recommended by CRI. The related information on the right pane of the questionnaire gives you more context about the scope, entity, people, requested and due dates of the assessment.

7. Answer all the questions and select **Submit**.
   After you complete the assessment, based on your responses the corresponding controls reflect the compliance status. The compliance score rolls up to the entity level.
8. Select the **Downstream controls** related list to view the status of each control if it is Compliant or Non Compliant.
   If non compliant then an issue is generated that you can view in the **Downstream issues** related list. Compliance score is calculated at the entity level, which you can view in the Overview page of the entity.

Deactivate a control objective using the Compliance Workspace

Using the Compliance Workspace, you can deactivate control objectives that are no longer relevant to their citation or parent control objective.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Control objective**.
2. Open a control objective.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the control objective, clear the check box marked **Active**.
4. Click **Update**.

Relate a control objective to a policy using the Compliance Workspace

Control objective can be associated to a policy individually when the policy is in the review or draft state. Using the Compliance Workspace, you can choose the policy in the document field on the control objective, or edit the Control Objective related list.

Before you begin
Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the policy record.
3. Click **Edit** in the **Control Objectives** related list.
   The slushbucket contains active control objectives with no associated policy selected.
4. Select the control objectives.
5. Click **Save**.
   Those control objective are listed in the **Control Objective** related list.

What to do next
If you are implementing the Policy and Compliance Management software, return to the Policy and Compliance Management setup checklist and proceed to the next step.

Relate a control objective to a citation using the Compliance Workspace

Using the Compliance Workspace, you can map a single control objective to many citations from different authority documents. This function allows you to test a control objective once while complying with many different citations.

Before you begin
Role required: sn_compliance_admin, sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ( ).
3. Navigate to **Compliance library** > **Citations**.
4. Open a citation record.
5. In the **Control Objectives** related list, click **Add**.
6. Select the control objectives from the Control Objectives pop-up.
7. Click Add.
   The control objectives that you added are related to the citation.

Create a citation using the Compliance Workspace

Authority documents, citations, and control objectives are usually downloaded from a third-party provider. However, citations can be created manually from an authority document using the Compliance Workspace. The **Active** option in a citation indicates whether the citation is active or inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_compliance_admin or sn_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the lists icon ().
3. Select Authority documents in the Compliance library list.
4. Select to open an authority document.
5. In the **Citations** related list, select **New**.
6. On the form, fill in the fields.

Citation form

Field	Description
Name	User-defined name that identifies this citation.
Source	Source of the policy. For example, if the statement is from a third-party provider, indicate which one.
Source ID	Unique identification number used by the source to catalog this authority document.
Reference	Content reference.
Type	Type of citation created. Optional field not used for any processing. Use the value in this field in reports or to query for records of a specific type. ○ Core Topic ○ Process ○ Control Objective ○ Control ○ Supporting information
Authority document	Name of the parent authority document for this citation. When you create citations from the authority document form, the system completes this field automatically.
Active	Option that indicates if a policy is active. A policy is marked active if it is not in the **Draft** or **Retired** state. To deactivate a citation, clear the check box marked **Active**.
Parent	References the parent content.
Description	Description of the citation.

7. Select **Save**.
   You can view the description of the citation and monitor the overall compliance, its breakdown, and the non-compliant entities in the different widgets of the **Status** pane in the default **Overview** page. There is also a sidebar, which highlights all the citation record details.

Create an authority document using the Compliance Workspace

Authority documents manage a process, and citations are created within them to manage the points of the process. For example, the process called Building Security contains a citation for Entry Control.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.it_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the **Create** list and select **Authority document**.
3. On the form, fill in the fields.

Create New Authority document form

Field	Value
Name	Name of the document.
Number	Read-only field that is automatically populated with a unique identification number.
Source	A non-editable field with the source of the policy. For example, if the statement is from the UCF import, the source is UCF.
Source ID	The unique identification number used by the source to catalog this authority document.
Version	The unique version number used by the source to identify this authority document.
Common name	Abbreviated version of the **Name** field.
Category	Category for this authority document.
Type	The document type: ○ Audit Guideline ○ Best Practice Guideline ○ Bill or Act ○ Contractual Obligation ○ International or National Standard ○ Not Set ○ Organizational Directive ○ Regulation of Statute ○ Safe Harbor ○ Self-Regulatory Body Requirement ○ Vendor Documentation
Valid From	The date and time for which the policy becomes valid.
Valid To	The date and time for which the policy is no longer valid.
Url	The URL of the stored authority document.
Description	More information about the authority document.

4. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The authority document is created and all its related lists are available for your view. By default, the Overview page opens up to display the **Description** of the authority document record and highlights the record details in the sidebar of the page.

5. From the **Overview** page, select the **Issues**.
   You can add existing one or more related issues to the authority document that you created. By mapping the existing issues to the authority document, you can reduce the count of open issues on the document.

   a. Select the **Add** button.

   b. Select the related issue or issues from the Issues pop-up.

   c. Select **Add**.
      The selected issues are added to the authority document as related issues. You can also create an issue for the authority document by selecting the **New** button.

   d. To remove an issue that is mapped to an authority document, select the issue and click **Remove**.
      The remove action only removes the mapping between the authority document and the issue, and doesn't delete the issue record.

      Note:
      The UI action buttons such as New, Add, Remove aren't available if the authority document is in Retired state.

Deactivate an authority document using the Compliance Workspace

The **Active** option in an authority document indicates whether the authority documents have been retired.

Before you begin
Role required: sn_compliance.admin or sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance** > **Authority Documents**.
2. Open an authority document.
3. In the authority document, clear the check box marked **Active**.

   For Authority documents imported from UCF, users are not allowed to clear the **Active** check box as it is a read-only form.

Manage policy exceptions and extensions using the Compliance Workspace

Policy exceptions and extensions provide temporary relief for non-compliant controls. The policy exception captures the rationale, comments, and evidence to support the acceptance or rejection of a policy exception request.

Also, you can request an extension to an approved policy exception before the policy exception validity period. The control owner, the compliance manager, and the risk manager may be involved in the policy exception and extension workflow.

Request a policy exception using the Compliance Workspace

Use the Compliance Workspace to request exceptions for policies, control objectives, or issues by specifying the reason of exception on a particular list of the systems, applications, networks,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

or entities for which the exception applies. You must also specify the duration for which the exception is required.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

Exceptions provide temporary relief when you are unable to meet compliance requirements due to extraordinary situations. For example, you are unable to meet a control that stipulates all critical OS servers must be patched within 48 hours after the OS vendor releases patches.

Note:
For more information on policy exceptions, see Manage policy exceptions and extensions.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Click **Policy exception** in the **Create** list.
3. On the form, fill in the fields.

Create New Policy Exception form

Field	Description
Number	Unique identification number.
Name	Name of the policy exception.
Requester	Person requesting the policy exception, usually the control owner.
Reason	Reason for requesting the policy exception. The requester can change the reason until the policy exception is approved.
Short description	Description for the policy exception request.
State	State of the policy exception within the approval workflow.
Substate	Approval substate of the policy exception within the approval workflow.
Priority	Approval priority of this policy exception
Justification	Evidence or rationale for the policy exception.
Source	
Source type	Type of policy exception that you want to create. The options are: ○ Policy: Create a policy exception based on a policy. ○ Control objective: Default is a single control objective on which the policy exception is created. When you select a control objective, the **Impacted controls** tab appears, where you can select controls associated to the control objective. ○ Controls: Option to create a policy exception on multiple controls. Select **Control** to associate multiple controls from different control objectives. This option supports multiple controls objectives for your policy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	exception, instead of creating multiple policy exceptions that could be applied on multiple controls. ○ Issue: Issue associated with this policy exception.
Policy	Policy for which the exception is created.
Control objective	Control objective associated with this policy exception.
Issue	Issue associated with this policy exception.
Target record	Target record table on which the policy exception is applied. This table is also referenced in the **Policy exception target table** field of the Policy Exception Integration Registry form.
Schedule	
Valid from	Day on which the policy exception begins.
Valid to	Day on which the policy exception ends. Valid to date must be after Valid from date and cannot be a past date.
Duration	Number of days between the **Valid from** and **Valid to** dates.
Approved extensions	Number of times extensions have been requested so far and have been approved.
Remaining extensions	Number of times extensions can be requested in future. `Remaining extensions = Value in the` *`Number of extensions allowed for a policy exception`* `property - Number of Approved extensions`.
Created	Date on which the policy exception was requested.
Date approved	Date on which the exception was approved.
Extension date	Requested extension date, which is after the **Valid to** date.
Extension reason	Reason for extension.
Original valid to	Date until which the policy exception was originally requested and approved. The original**Valid to** date is populated only when the extension is approved.
Assignment	
Watch list	Users that are notified when the request is updated.
Approval group	Group that has the compliance manager role. If the policy exception reaches Review state you cannot edit the approval group. If you don't provide an approval group, then the field defaults to compliance manager. Compliance manager is the default role if the policy exception is raised from any upstream application that is integrated with GRC. For example, if you raise a policy exception for a problem that is related to an incident and that problem is related to GRC.
Approver	User from the approval group. If the exception policy moves to the **Analyze** state, then you must select an approver.
Risk assessment	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Method	Method to assess risk: ○ Select risk rating: Select the risk rating associated to this policy exception. ○ Take risk assessment: Take a risk assessment to calculate the risk rating. **Note:** This option is available only when GRC: Advanced Risk plugin is installed. Risk assessment can be triggered by clicking the **Assess risk** button on the form. This button is available only when **Take risk assessment** is selected.
Risk rating	Risk rating as determined by the risk assessment performed on the policy exception. If you had selected **Select risk rating** option in the **Method** field, then you can select a value from the list. If you select **Take risk assessment** option in the **Method** field, then this field is auto-populated with the response provided in risk assessment.
Override	Option to override **Risk rating** that was auto-populated based on the responses provided for the risk assessment. This field appears if the **Method** is **Take risk assessment** option.
Risk description	Description of the risk as performed by the risk manager during risk assessment.
Analysis of risk and impact	Details on the likelihood of this risk occurring and residual impacts of this risk on the policy exception.
Risk mitigation plan	Risk mitigation plan for this policy exception.
Comments	
Work Notes	Work notes can be used by exception reviewers and approvers to share Information about the exception.
Additional comments	These comments are used by the reviewer to communicate additional information to the exception requester.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In versions prior to Version 10.1, the **Risk assessment** related list was called **Business Impact Analysis** and required that the GRC: Risk Management application be activated. Starting in Version 10.1, the dependency on Risk Management has been removed and the associated field names have changed.

Approved extensions, **Remaining extensions**, **Date approved**, **Extension date**, **Extension reason**, **Original valid to** fields appear only when you've requested an extension on the policy exception and has been approved by the approver.

With regard to the m2m association of an issue with policy exceptions, there are certain considerations you must know about the values populating in the **Issue** field, **Control objective** field, and in the Impacted control tab:

a. If you select an issue in the **Source type** field, then the **Issue** reference field lists issues that have one or more active controls associated with them. Active controls are the ones in Attest, Review, or Monitor states and not in Draft or Retired states. You can navigate to the Impacted controls tab to view the controls associated to the issue.

b. If the issue is linked to only one control objective, then that linked control objective is populated in the **Control objective** reference field. If the issue is linked to more than one control objective, then no value is populated in the **Control objective** field. Click the **Control objective** reference field to select a control objective.

c. If you didn't select an issue in the **Issue** field, but a control objective is populated in the **Control objective** reference field, then the Issue reference field will list only those issues that are linked to this control objective.

d. As soon as you add an issue in the **Issue** field, then all the controls linked to the issue are added in the Impacted controls tab. However, when you select a control objective in the **Control objective** reference field, then all the controls listed in the Impacted controls tab are replaced with only those controls that are linked to the selected control objective and the issue. Controls can be in any state but not in Draft or Retired state.

e. An impacted control linked to one issue of a policy exception will not be listed for you to add in another policy exception because that control is already listed in the Impacted control tab of the first policy exception. If you add more controls to the issue later, and when you link the issue to the second policy exception, then all the newly added controls will be added as impacted controls but not the one that was already added as an impacted control of the first policy exception.

f. Previously, an issue-based exception required a linked policy or control objective for additional approvals. Now, it requires any one of the following: a linked policy, control objective, or control. If a control is used, it must be linked to the policy exception itself, not just to the issue.

4. Save the policy exception.
   The Policy exception is in **New** state.
5. Click the **Request approval** button.
   If verification rules are configured, then verification approvals are triggered. After the verification approvals are approved, the policy exception moves to Analyse state.

   After the policy exception is approved and if the **Valid to** date is reached, then the state moves to **Closed** and the substate moves to **Expired**.

   You can also withdraw the policy exception anytime before the policy exception is approved, if it's no longer required, right from the **New** state.

6. To withdraw the policy exception, click the **Cancel Request** button.
   The state moves to **Closed** and the substate to **Canceled**.

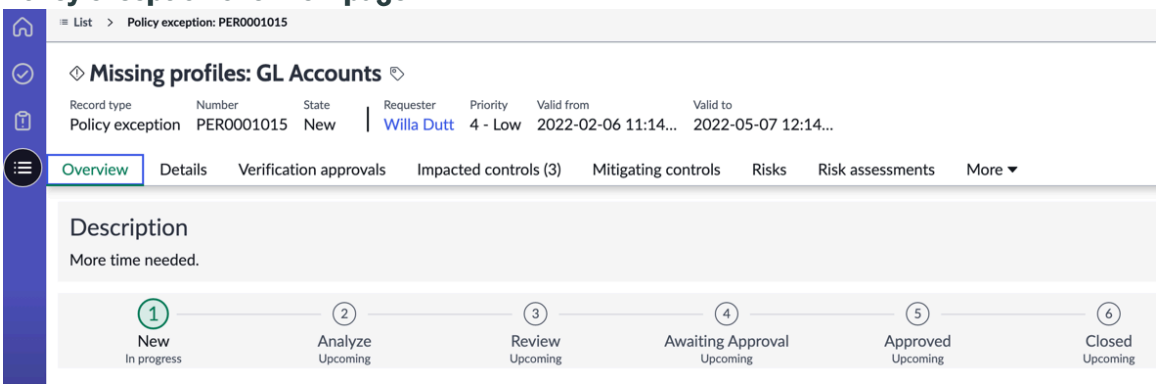
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

As a requester you can request extensions to a policy exception that is in the Approved state more than once. Configure the *Number of extensions allowed for a policy exception* property to request policy extension multiple times.

To set up the property, see Configure the number of extensions allowed for a policy exception.

To request extension, click the **Request extension** button and enter the details in the Request extension pop-up.



Click **Request**. You can see the policy extension details in the Schedule tab of the Policy exception form after the requester has requested for an extension and the policy extension has been approved by the approver.

Manage policy exception from the overview page

The overview page of the policy exception gives you the overall basic details of the policy exception.

As soon as you save and submit a policy exception, the Overview page opens by default that gives you all the basic details of the policy exception. The header shows the name of the policy exception, the description tells you the justification for the policy exception, and the stepper shows the different states the policy exception would pass through before it is finally approved, New state being the default.

Policy exception overview page

Review the policy exception and extension request using the Compliance Workspace

After reviewing a policy exception request using the Compliance Workspace, a compliance manager can accept or reject the request. However, if the compliance manager doesn't have enough information to decide, they can request a risk assessment by the risk manager.

Before you begin

Role required: sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ( ).
3. Click **All policy exceptions** in the Policy exceptions list.
4. Click the link to the policy exception record in the **Name** column.
5. Perform one of the following actions.

6. Perform one of the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **Update**.

Assess risks of policy exception using advanced risk assessments

Take the advanced risk assessment to evaluate the risk involved with the policy exception.

Before you begin

Role required: sn_compliance.manager

GRC: Advanced Risk is the required plugin for the integration with Advanced risk assessment to assess risk using the advanced risk assessment feature.

About this task

After the policy exception is submitted, as a compliance manager you can do the risk analysis on the policy exception to evaluate its risk status and determine its approval based on its risk impact on the policy.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ( ).
3. Click **All policy exceptions** in the Policy exceptions list.
4. Click the link to the policy exception record, for which you want to assess the risk, in the **Name** column.
5. Select the **Take risk assessment** option in the **Method** field of the Risk assessment section.
   For more information on the risk assessment options, see Risk assessment section.
6. Click **Save**.
7. Click the **Assess risk** button.
   You can assess the risk of a policy exception only when its state is Analyze.
8. Select a risk assessor and an approver in the Specify risk assessor and approver pop-up.
   Any user with compliance user role or risk user role can be a risk assessor or an approver.
9. Click the **Send assessment** button.
   Assessment is sent to the user selected in the pop-up. For more information, see Assess risks and objects on an assessment instance.

   After the assessment is complete, the **Risk rating** field on the policy exception form is auto-populated with the values configured in Policy exception risk rating mapping table.
10. Click the **Details** tab.
    The score calculated based on the risk assessment responses that you provided is mapped with the value in the **Risk rating** field.

Set up advanced risk assessments for policy exception

Customize the risk assessment methodology by creating your values for each question in risk assessment and calculate your risk rating scores.

Before you begin

Role required: sn_compliance.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If you want to make changes to the Risk Assessment Methodology that is provided by the base system or create a new methodology for policy exception, then the following procedure must be followed after creating or updating the risk assessment methodology for policy exception.

Map the Qualitative Rating Criteria of the risk assessment methodology with the risk rating of the policy exception in the Policy exception risk rating mapping (sn_compliance_policy_exception_risk_rating_mapping) table for the final risk rating score.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Policy exception risk rating mapping**.
2. Enter the corresponding policy exception risk rating value for each risk assessment rating.

   Note:
   The qualitative rating criteria of a residual assessment from a published risk assessment methodology on policy exception table are available options in this field.

3. Click **Save**.
   The score in the risk assessment is converted to the corresponding value in the policy exception risk rating column.

   Note:
   All qualitative rating criteria that are newly configured must have an equivalent mapping with the policy exception risk rating. If the mapping of the Risk assessment rating with the Policy exception risk rating in the Policy exception risk rating mapping table is incorrect, then the **Risk rating** field displays the result as **NONE** along with a message. In this case, you have an option to override the risk rating result of the **Take risk assessment** method and select a value in the **Risk rating** field by selecting the **Override** check box.

   If you are creating a different assessment methodology from the one that is provided by the base system, then you must add the sys_ID of the new methodology in the value field of *sn_risk_advanced.rams_with_extension_points* system property.

Manage issues using the Compliance Workspace

Using the Compliance Workspace, you can measure the effectiveness of your company's risk management program by how quickly and completely it identifies and reacts to risk and compliance issues.

Manually create GRC issues using the Compliance Workspace

Using the Compliance Workspace, GRC you can manually create issues to document policy, risk, or audit observations, or to accept any GRC problems. You can also identify the source of the issue to help analyze and classify the issues.

Before you begin

Role required: compliance_admin, compliance_manager, or sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ().
3. Navigate to **Issues** > **All issues**.
   The list displays all issues. However, the base condition to filter issues is that the Classification must be Compliance or empty, or in the case where the issue has an m2m association with

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

an engagement, the logged-in user must be one of the three users, such as an auditor, engagement lead, or approver.

4. Click **New**.

   For field descriptions of the Create New Issue form, see Compliance workspace issue form.

   Note:
   Starting with Version 12.0.1 of the Policy and Compliance Management application, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

5. Save the issue record.

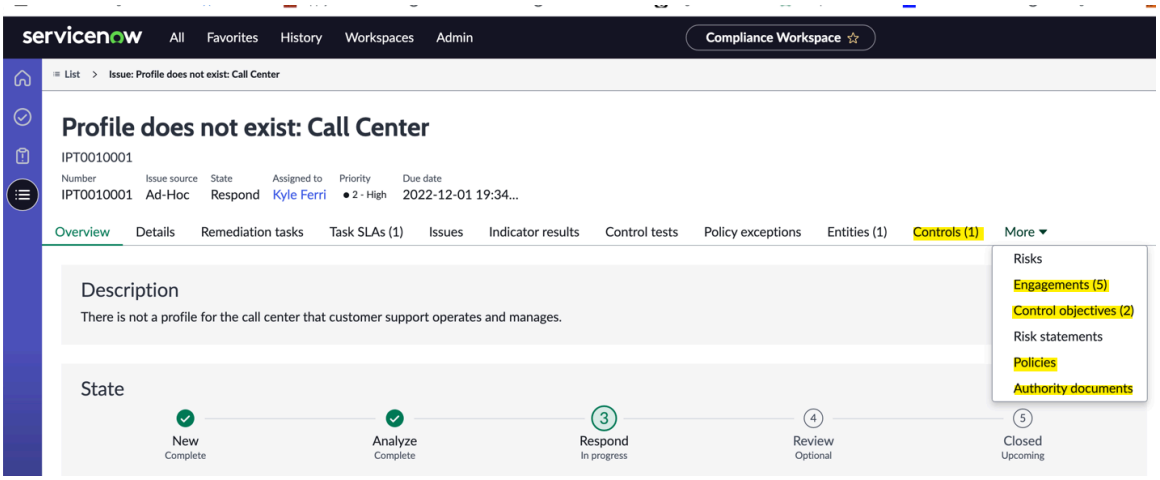
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The tabs enable you to perform various tasks for remediating the issue. You can add policy exceptions and create remediation tasks. You can also view other issues, indicator results, and task SLAs related to the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with Version 12.0.1, the **Task SLAs** tab creates and displays SLAs based on the **Due date**. Notifications are sent to the issue owner and issue manager when the issue **Due date** reaches 50%, then %75, then when it breaches. If the **Assigned to** and **Due date** fields aren't empty and the issue isn't in the **New** state, an SLA is created for the issue.

If the due date for the SLA changes, a new SLA is created. The SLA is completed when the issue transitions to **Closed Complete** or **Closed Incomplete**. Also, if the **Due date** or **Assigned to** fields are empty, or the state is New, the SLA is cancelled.



Also starting with Version 12.0.1, remediation tasks can be created by users with the **Assigned to** user and issue manager, as well as any user with the GRC Business User role.

You can navigate to the issue record that you created and use the related lists to.

- Link the issue to multiple records of the same object type such as a control. For example, if there are three controls that monitor Google Cloud, Microsoft Azure cloud, and AWS cloud and there are three different issues raised for them being down, you can link all the three controls to one issue as cloud services is down.
- Link the issue to different objects such as controls, control objectives, policies, and engagements.
- Relate the issue to different type of objects.

Note:
If the issue is closed, then you cannot create, add, or remove any of the objects from the issue form. You can view the Control, Control objective, Authority document, Policy, Engagement related lists in the Issue Overview page. However, the UI action buttons in each of these related lists such as New, Add, and Remove are inactive.

Related lists in the Issue form

The related lists in the issue form for each type of object where the issue can be linked helps to:

- Reduce the number of open related issues existing in an organization.
- Help identify the root cause of the issue and group similar issues.
- Solve one issue, which resolves the related issues.

Compliance Workspace issue form details

Field descriptions to enter on the New Issue form in the Compliance Workspace.

Create New Issue form

Field	Description
Number	Unique identification number.
Name **Note:** Until Version 12.0.1, this label was **Short description**.	A name for the issue.
Issue source	Source from where the issue was created. This field is auto-populated with one of the following options based on how the issue is created: • Indicator Failure: Issue is created by a failure of the indicator • Risk Assessment: Issue is created in a risk • Risk Event: Issue is created in a risk event • Control Attestation Failure: Issue is created due to a non-compliant control • Control Test Failure: Issue is created when a control is ineffective and the control test is marked as closed and complete • Ad-hoc: Issue is manually created
Issue type	Type of issue. Choices are: • Control design effectiveness failure • Control operative effectiveness failure • Control does not meet requirement • Control does not exist • Non-compliance to a regulation • Non-compliance to a policy • Improvement or suggestion to an existing policy • Recommendation for a new policy • Process optimization or improvement • Observation • Data Breach • Fraud • Misstatement • Training

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
	• Documentation • Risk issue • Other
Classification	The classification of the issue as a risk, compliance, or audit, based on the issue type.
Location	Location where the issue occurred.
State	• New • Analyze • Respond • Review • Closed Complete • Closed Incomplete
Substate	The substate and applicable details for the substate.
Priority	The sequence in which an issue needs to be resolved, based on its impact and urgency: • **1 — Critical** • **2 — High** • **3 — Moderate** • **4 — Low** • **5 — Planning**
Issue rating	Starting with Version 12.0.1, the issue manager can assign the issue rating to the issue. Based on the issue rating, the **Due date** under the **Dates** tab is calculated as follows and displayed: • Very high (2 days) • High (4 days) • Moderate (8 days) • Low (10 days) • Very Low (15 days) You can manually override the **Due date**.

Create New Issue form (continued)

Field	Description
	Note: Users with the sn_grc.manager and sn_grc_advanced.issue_triage_manager role can navigate to **Policy and Compliance** > **Administration** > **Issue rating** and define additional issue ratings. When the issue transitions to the **Respond** state, the Issue rating field is read only.
Description	Comprehensive description of the issue.
Assignment	
Assignment group	Group to which this issue has been assigned. Each member receives a notification when activity has occurred on this issue.
Assigned to	Member of the group assigned to resolve the issue. Starting with Version 12.0.1, the user must have at least the sn_grc.business_user role. **Note:** Use the bulb icon to get suggestions on who must the issue be assigned to. The bulb icon only appears if you have the GRC: Predictive Intelligence application activated, the form is saved, the **Assigned to** field is not disabled, and the GRC Property is selected as Similarity Analysis. For more information, see Governance, Risk, and Compliance properties. Starting with Version 12.0.1, the assigned-to user receives an email notification when the issue manager requests more information. Starting with Version 12.0.1, when an issue transitions to the **Respond** state, an entry in the **Assigned to** field is mandatory.
Issue manager group	The group responsible for managing and reviewing the issue. Starting with Version 12.0.1, the following enhancements and requirements were introduced:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description

	• Members of the issue manager group must have one of the following roles:
	  ○ sn_audit.manager
	  ○ sn_audit.user
	  ○ sn_compliance.manager
	  ○ sn_compliance.user
	  ○ sn_grc.manager
	  ○ sn_grc.user
	  ○ sn_risk.manager
	  ○ sn_risk.user
	• When an issue transitions to the **Analyze** state, an entry in either the **Issue manager group** or **Issue manager** field is mandatory.
	• When an issue is assigned to the group, the members receive an email notification. Additionally, the issue manager receives an email notification when the issue transitions to the **Review** state.

Issue manager	The user responsible for managing and reviewing the issue. Starting with Version 12.0.1, the following enhancements and requirements were introduced: • The issue manager must have at least the sn_grc.user role. • The issue manager receives an email notification when the assigned-to user requests more information. • When an issue transitions to the **Analyze** state, an entry in either this field or **Issue manager** is mandatory. • When an issue transitions to the **Respond** state, an entry in this field is mandatory.
Watch list	Users who are on the watch list for the issue.
Schedule	
Due date	(Starting with Version 12.0.1) This date is auto-populated based on a GRC property. Navigate to **Policy and Compliance** > **Administration** > **GRC Properties**. If the **Auto populate due date based on issue rating** property is set to **Yes**, this field is auto-populated based on the predefined remediation time frame for

Create New Issue form (continued)

Field	Description
	the issue's risk rating. Otherwise, you can manually enter a due date. When an issue transitions to the **Respond** state, an entry in this field is mandatory.
Confirmed date	(Starting with Version 12.0.1) The date when the issue is confirmed. This field is read-only, and displays today's date when the issue is moved from **New** to any of the following states: • **Analyze** • **Review** • **Respond** **Note:** If a triage issue is converted to an actual issue, this field displays the date it was converted.
Planned start date	Date and time that work on the issue is expected to begin.
Planned end date	Date and time that work on the issue is expected to end.
Duration	Estimated amount of work time. Calculated using the **Planned state date** and **Planned end date**.
Created	The date and time the issue was created.
Closed	The date and time the issue was closed.
Actual start date	Time when work began on this issue.
Actual end date	Time when work on this issue was completed.
Actual duration	Amount of work time. Calculated using the **Actual state date** and **Actual end date**.
Issue grouping	
Parent issue	Parent issue this issue belongs to.
Issue group rule	Group rule assigned to this issue. The Issue group rule is used to group similar issues together into a parent issue based on conditions defined in the rule. This allows you to work on similar issues simultaneously and close out the parent issue after all issues are resolved. This closes out all the child issues.
Action plan	
Recommendation	Resolution actions recommended by the risk, compliance, or audit teams.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
Action Plan	The plan for remediating the issue.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.
Activity	
Work notes (Private)	Click the **Work notes** check box to display the **Work notes** field. Information about how to resolve the issue, or steps already taken to resolve it, if applicable. Work notes are visible to users who are assigned to the issue. Click **Post** to add your work notes to the issue.
Additional comments (Customer visible)	Public information about the issue. Click **Post** to add your comments to the issue.
Settings	
Functional domain	Functional domain for the issue.
Details	
Control/Risk	The control or risk associated with the issue. When the control is associated, the corresponding entity of the control is added to the **Entity** field, and the corresponding control objective is added to the **Control Objective/ Risk Statement** field. The control objective and entity are the ones that are linked to this control. When the control is associated to the issue form, an m2m record is created in the source [sn_grc_m2m_issue_item] table. Whenever a record is added in the source table, a corresponding record, Issue to Entity is added in the destination [sn_grc_m2m_issue_to_entity] table, and another record Issue to Content is added in the destination [sn_grc_m2m_issue_content] table for the associated entity and control objective of the control.
Entity	Related entity.
Policy	The policy associated with the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Issue form (continued)

Field	Description
Authority document	The authority document associated with the issue.
Control Objective/Risk Statement	The control objective or risk statement related to this issue.
Processing activity	
Engagement	
Engagement	The related engagement.
Risk Event	
Risk event	The related risk event.

Group similar issues under a new parent issue using the Compliance Workspace

When you are creating an issue using the Compliance Workspace, you have the option of grouping the issue with other similar issues.

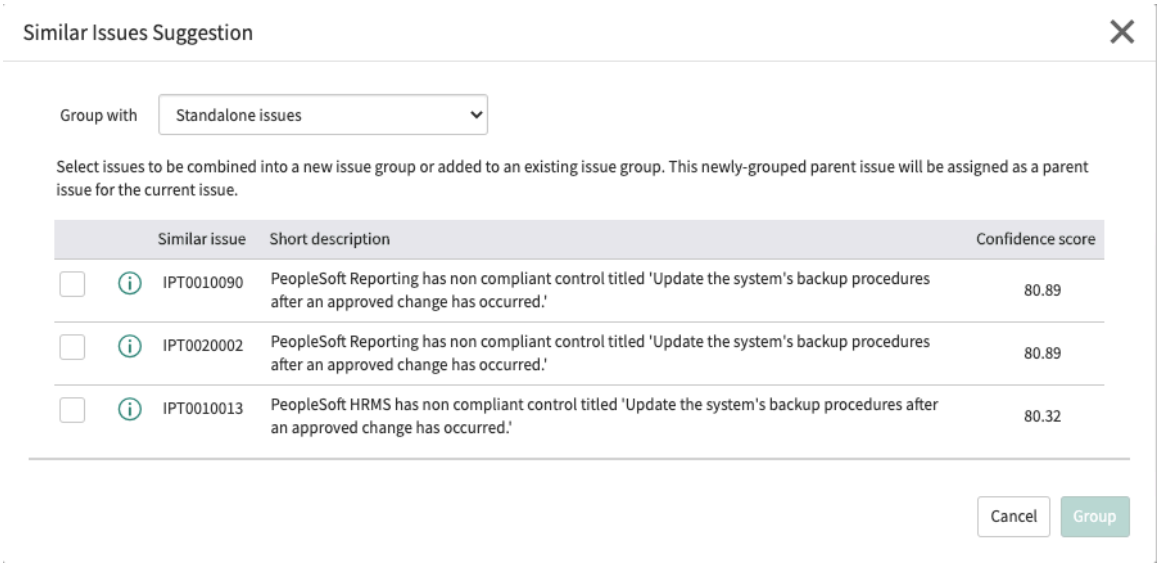
Before you begin

Role required: (per product)

- In Policy and Compliance Management: compliance_admin, compliance_manager, or sn_compliance.user
- In Risk Management: risk_admin, risk_manager, or sn_risk.user
- In Audit Management: audit_admin, audit_manager, audit_admin, or sn_audit.user

About this task

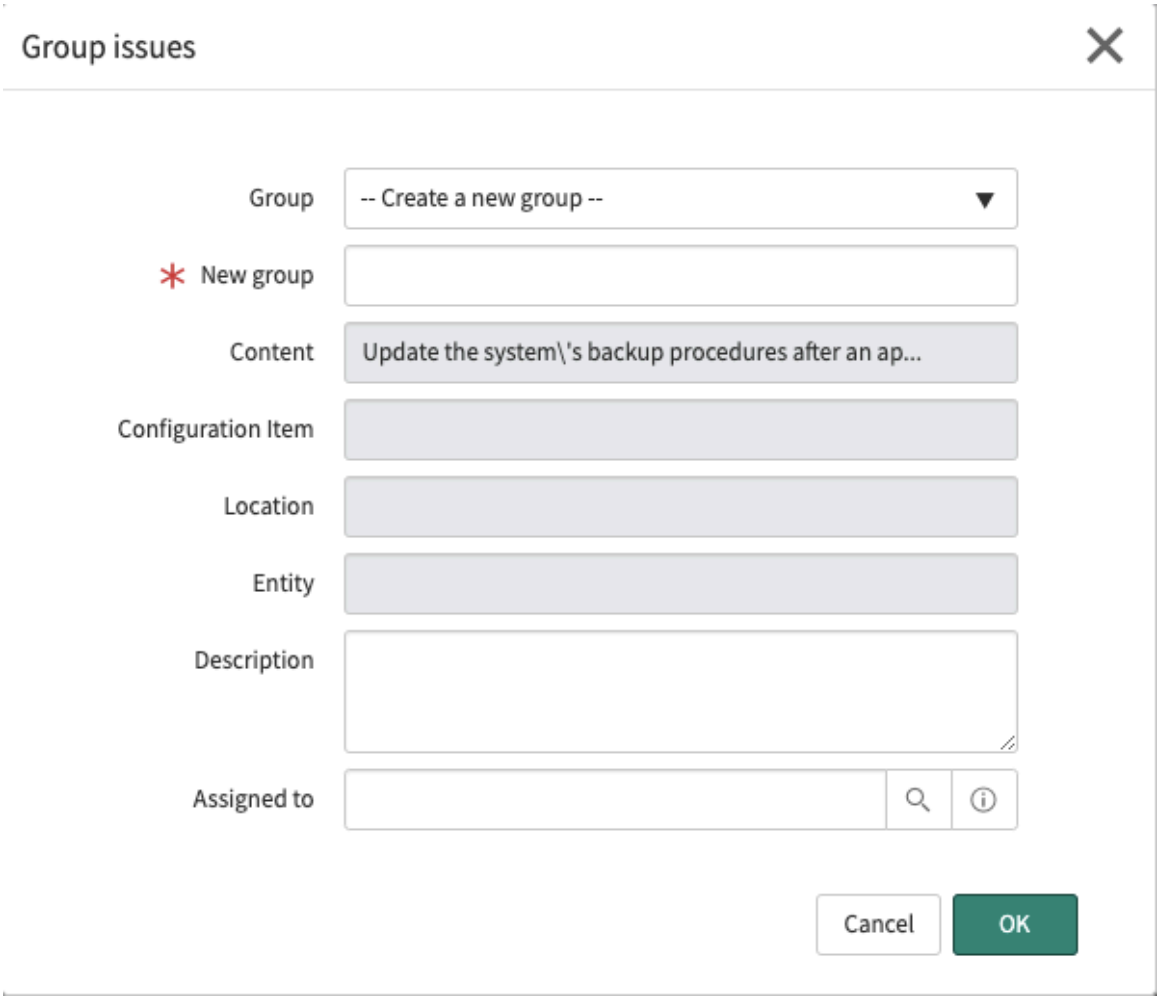
Grouping issues under a parent can save you valuable time. For example, assume you have an issue related to patching Windows servers. Since each server is a separate entity, all controls associated with "Windows servers should be patched every Tuesday" will have the same issue. Therefore, the issue can be resolved once for all of the Windows servers by applying the relevant patch one time. So, this feature can be used to group similar issues and resolve them all at the parent level.



Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.
2. On the form, locate the **Parent issue** field.

3. Click the bulb icon ( ) to view similar issues that you may want to assign to this parent issue.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Standalone issues are similar to the current issue, but that are not assigned to a parent issue group. The Confidence score is calculated using a similarity definition included in the GRC: Predictive Intelligence application base system.

4. You can click the Information icon to view details for any similar issues in order to help determine whether they should be grouped with the current issue.
5. Select the similar issues you want to group with the current issue, and click **Group**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the form, fill in the fields.

Issue form

Field	Description
Group	To group the selected issues and assign them to a new group, select **Create a new group**. To add the selected issues to an existing group, select the group.
New group	This field displays only if you selected **Create a new group**. Type the name of the new group.
Description	This field displays only if you selected **Create a new group**. Type a description of the group.
Assigned to	This field displays only if you selected **Create a new group**. Select the user to whom the group is assigned.

7. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The selected issues are added to a new or existing group.

8. You can view the issue in the group by clicking the **Issues** tab.

Group similar issues under an existing parent issue using the Compliance Workspace

When you are creating an issue using the Compliance Workspace, you have the option of grouping the issue with other similar issues as part of an existing parent issue group.

Before you begin

Role required: (per product)

- In Policy and Compliance Management: compliance_admin, compliance_manager, or sn_compliance.user
- In Risk Management: risk_admin, risk_manager, or sn_risk.user
- In Audit Management: audit_admin, audit_manager, audit_admin, or sn_audit.user

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.
2. On the form, locate the **Parent** field.
3. Click the bulb icon ( ) and select **Issues with existing parent** from the **Group with** drop-down list.
4. Click the **Similar issue** you want to group with the current issue.
   The parent issue of the issue you select becomes the parent issue of the current issue.
5. You can view the issue in the group by clicking the **Issues** tab.

Linking issues to multiple objects using Many-to-many table relationship

Issues can be linked to different types of objects such as risk, entity, control, control objective, engagement, policy, authority document, and others to determine issue impact. Use the many-to-many relationship tables for each of the objects to link similar issues to an object.

Note:
The Issue record has controls, control objectives, authority documents, policy, and engagements that can be associated with it as related items. However, you must associate the issue and each object as a corresponding m2m record which is stored in the corresponding m2m tables.

For example, issues are configured as a related list in the Controls form and you can link the issue to the control parent object. When you add an issue to a control, a record is created associating the item that is the control with the issue, in the Issue to Control [sn_grc_m2m_issue_item] table.

Viewing the issues related to a control was mainly only for reference. However, you can also link as many issues that are related to the control within the Control form. With this enhancement, you have the ability of:

- visibility of viewing, and consolidating all related issues raised on the control
- determining the impact analysis of all related issues
- reducing the effort in working on duplicate issues and manage issue impact analysis

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A user with sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.it_compliance_manager, or sn_compliance.admin roles can create and delete the records in the many-to-many tables. However, users with these roles cannot update an existing record in the m2m tables. To update a record, you require GRC admin (sn_grc.admin) role.

Many-to-many tables used in Compliance Workspace for creating and deleting the issue to object relationships are:

- sn_grc_m2m_issue_item – Issue to control
- sn_grc_m2m_issue_content – Issue to control objective
- sn_grc_m2m_issue_engagement – Issue to Engagements
- sn_grc_m2m_issue_document – Issue to Policy and Issue to Authority document

For more information, see:

- Tables installed for descriptions of the m2m tables.
- Create GRC issues for the different compliance objects that are linked to the issue.
- Create a control using the Compliance Workspace to link issues to a control.
- Linking automatically generated issues to a control in Many-to-many relationship to know how multiple issues linked to a control are categorized as automatically generated or manually created.
- Create an authority document using the Compliance Workspace to link issues to an authority document.
- Create a control objective using the Compliance Workspace to link issues to a control objective.
- Create an audit engagement in Audit Workspace to link issues to an engagement.
- Create a policy using the Compliance Workspace to link issues to a policy.
- 360° view of compliance objects and issues for a comprehensive and detailed overview of all object data that the issue is linked to in a many-to-many relationship.

Triage a self-identified issue using the Compliance Workspace

After an issue has been identified and submitted by employees or business users via the Service Portal, the issue triage process begins. The actual problem is identified and assigned to the appropriate owner for prioritization and resolution in the Compliance Workspace.

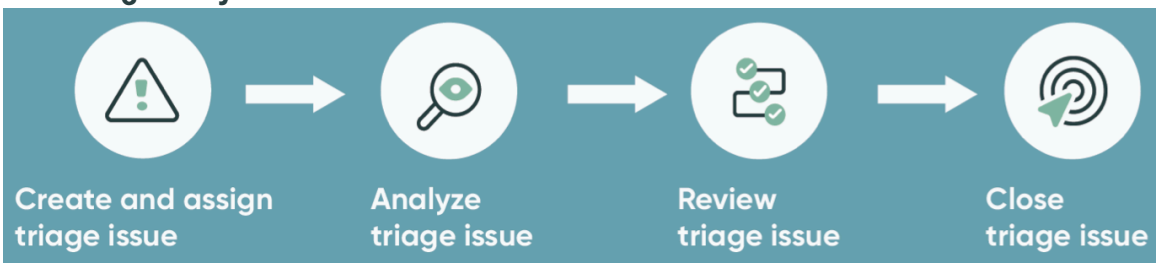
Before you begin

Role required:

- sn_compliance.manager
- sn_compliance.user
- sn_grc_advanced.issue_triage_manager
- sn_grc_advanced.issue_triage_user

About this task

Your employees and business users within your company can self-identify an issue and submit it via the ServiceNow® Service Portal. Following submission, a triage issue is automatically created. For more information, see Report self-identified issues via the Service Portal.



The assigned triage teams identify whether the self-identified issues are actual reported issues, risk events, or observations to be tracked and possibly closed out as noise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In the initial release, only self-identified issues are handled by the triage process. In a later release, system-generated issues, such as those caused by indicator or attestation failures, will also be triaged.

The end-to-end flow of the issue triage life cycle is illustrated and described here.

Issue triage life cycle

Stage	Description
Create and assign triage issue	An employee identifies an issue related to an entity, control, policy, authority document, process, or risk, and submits a triage request in the ServiceNow Service Portal. Based on the type of issue submitted and an issue assignment rule, the issue is assigned to a triage team and a triage owner.
Analyze triage issue	The triage team decides whether the issue should be analyzed as an actual issue or risk event, or tracked as a recommendation for a policy or for optimizing a process. During analysis, the triage team may request more information from the issue creator. The team may also optionally send the issue to the compliance manager, risk manager, or triage manager with a triage result. Possible results include: • Confirmed as a new issue • Confirmed as an existing issue • Confirmed as a risk event • Track as a recommendation • Close as a non-issue/No action required
Review triage issue	The Review state is optional. The team may send the issue and result to the compliance manager, risk manager, or triage manager for review. They may also request more information from the triage owner. The compliance manager, risk manager, or triage manager decides whether the issue should be confirmed as an issue or risk event,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stage	Description
	tracked as a recommendation, or closed as a non-issue.
Close triage issue	If the issue had been determined to be an actual issue or risk event, those records are created, or the triage issue is added to an existing issue. When the triage process is completed, the triage issue is automatically closed. The issue can also be manually closed by the manager and triage team.

The following user roles are involved in the issue triage process.

Issue triage personas

Persona/Role	Description
Business user/Employee	Ability to report issue.
• Compliance user/manager • Risk user/manager • Triage user/manager	Ability to triage and review issues
Issue manager	Ability to manage and review the reportable issue
Issue owner	Ability to resolve the reportable issue assigned to them

Note:
The triage user/manager and Issue manager roles were introduced in GRC: Policy and Compliance Management version 11.1.0.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Issue Triage** > **My Triage Issues** or **Risk** > **Issue Triage** > **My Triage Issues**.
   The list shows triage issues previously created and assigned to you.
2. Click the number of the issue that you want to triage.

   Note:
   The **Classification** field is automatically pre-filled based on the **Issue type** selected. Similarly, an assignment rule called sn_grc_advanced_issue_triage runs and pre-fills the **Triage group**. This rule uses the **Source** and **Classification** to determine the group to which the triage is assigned. Assignment rules also handle issue triages in Risk Management and triages where the **Classification** is set to **Other** (which is initially unknown). For the second use case, you must manually set the **Triage group** to **Risk** or **Compliance**.

3. When you are ready for triage of this issue to begin, select a **Triage owner** and click **Analyze**.
   The assigned Triage owner can open the issue and begin analyzing the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. During analysis, the triage owner can perform several tasks.

   Example
   The owner may, for example, decide that the issue is misclassified and can change the **Issue type**. This action could result in the change of Triage group and Triage owner. In this example, the assignment rule runs in the background and the issue is removed from the current owner's queue.

5. The triage owner can also perform the following actions:
   - Click **Request Information** to request additional information from the issue submitter.
   - Click **Request Review** to request a review from the user identified in the **Reviewer** field. That user can open and review the issue by navigating to **Policy and Compliance** > **Issue Triage** > **My Pending Reviews**.
   - Select the **Details** related list to provide additional enrichment to the issue.

6. After it has been determined what action (if any) should be performed on the issue, the triage owner can select a result of the analysis from the **Results** related list.

   Note:
   The options available in the **Result** field depend on the **Issue type** identified for this issue. For example, if you select **Control design effectiveness failure** as the **Issue type**, the following results may be selected.

   If you select a result, such as **Confirmed as a new compliance issue**, which requires more action than simple observation, additional analysis fields appear.

   If the result is **Confirmed as an existing compliance issue**, then an **Existing issue** field appears where you must identify the existing issue that you are referring to.

7. When the issue triage is complete, the triage owner can click **Complete Triage**.

   Note:
   If the issue is out for review, the reviewer can also click **Complete Triage** to complete the triage and create an actual issue.

   The issue triage transitions to the **Closed** state and a link to the issue displays at the top of the screen.

8. The issue can be analyzed using the usual issue management procedures.
   One significant change on the **Issue** form is the addition of an **Issue Triages** related list. Opening the triage record provides the analyst with the details of the triage that resulted in the creation of this issue.

Remediate an issue using the Compliance Workspace

After an issue has been identified, triaged, and investigated using the Compliance Workspace, you can remediate it.

Before you begin

Role required: (per product)

- In Policy and Compliance Management: compliance_admin, compliance_manager, or sn_compliance.user
- In Risk Management: risk_admin, risk_manager, or sn_risk.user
- In Audit Management: audit_admin, audit_manager, audit_admin, or sn_audit.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Remediating an issue marks an intention to fix the underlying issue causing the control failure or risk exposure. Accepting an issue marks an intention to create an exception for a known control failure or risk. Controls that are **Accepted** remain in a non-compliant state until the control is reassessed. In this way, the issue can be used to document observations during audits.

Procedure

1. Open the issue you want to remediate.
2. Click the **Remediation Tasks** tab.

> **Note:**
> You have two options for creating a remediation task:
>
> - Click **Suggested Remediation Tasks** and click **Copy** to use an existing task as a basis for creating this task. A copy of the selected remediation task is created with certain information from that task copied to the new task. You can manually complete the other fields.
> - Clicking **New** and manually creating the task.

3. On the form, fill in or modify the fields.

Issue form

Field	Description
Number	Unique identification number.
Assigned to	Select the user responsible for working this task.
Issue	The issue for which this task was created.
State	The current state of the task.
Priority	Select the priority or sequence this task needs to be resolved, based on its impact and urgency.
Watch list	Select users who want to be notified when changes occur.
Created/Updated	Displays the date/time when the task was created and updated.
Short description	Enter a brief description of the task. This will appear in lists of tasks.
Description	Enter a complete description of the task.
Notes and Comments	
Additional comments	As needed, enter any customer-facing comments related to this task.
Work notes	Enter any non-customer-facing notes related to the remediation of the issue.
Task Schedule	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Planned duration	Estimated amount of work time. Calculated using the **Planned start date** and **Planned end date**.
Planned start date	Date and time that work on the task is expected to begin.
Planned end date	Date and time that work on the task is expected to end.
Actual duration	Amount of actual work time. Calculated using the **Actual start date** and **Actual end date**.
Actual start date	Time when work began on this task.
Actual end date	Time when work on this task was completed.

4. Click **Submit**.

Manage controls using the Compliance Workspace

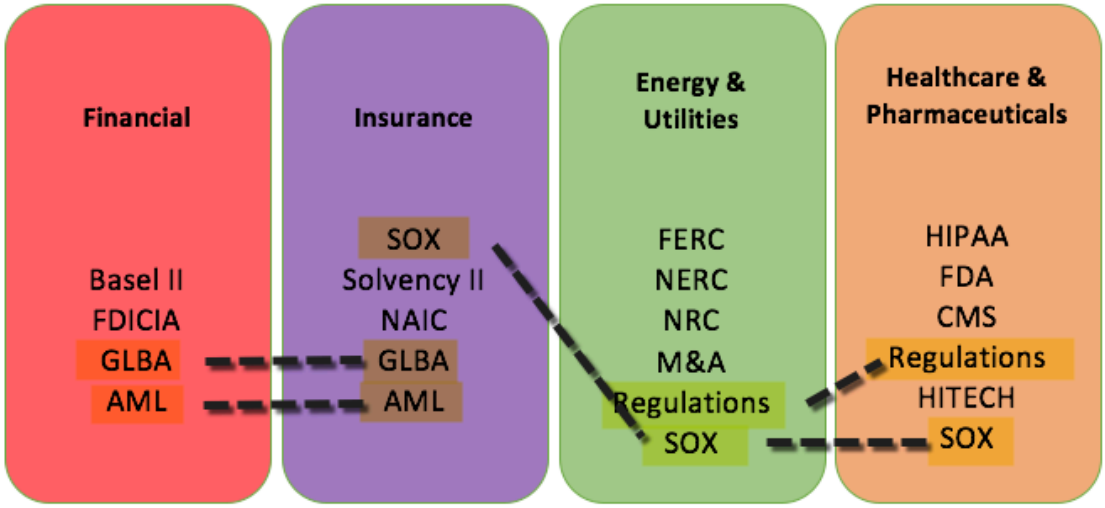
Controls are specific implementations of a control objective. Retired controls do not appear in the list. Before defining controls, take time to rationalize, consolidate, and define the important controls in your organization.

Rationalize your controls

If you upload all your controls in bulk, you are missing the opportunity to refine and streamline your controls set.

- How does this control affect my business objective?
- Is this control actually preventing or detecting risk?
- Is there a different control you can place that better protects your business?
- Is there a control you can put in place that reduces process overhead and improves IT performance while also mitigating risk?
- Can a complicated control be replaced with a simpler more effective control?

As your business changes, and your IT data, processes, and technology improve, replace outdated controls and procedures.



Note:
When you define controls manually or when you import them from the Unified Compliance Framework (UCF), an entity is associated with the controls. It is a mandatory field on the Control form. If, however, you import controls from a source other than the UCF, you may encounter controls that do not have associated entities. It is important that you return to the Control form and add an entity to the control. Missing entities can cause unreliable results in calculations. Also, if you encounter a control with an entity that has been disabled, the control should be retired.

Consolidate your controls

Look for opportunities to consolidate controls. Look for common, repeated controls across multiple regulatory authorities of frameworks (for example, SOX and GLBA and AML). Avoid operating a single control multiple times for each regulation, by cross-mapping controls and eliminating the redundant ones. This process establishes a single consolidated set of controls = control framework, performing and preserving the cross mapping of controls is critical for audits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Industry regulations and requirements overlap

Define controls and business rules

The business rules you define up front, establish the GRC configuration settings later. Be prepared to:

- Identify controls and control owners
- Define control tests and expected results
- Establish test and control frequencies
- Identify risks: impact and likelihood
- Prepare attestations, assessments, questionnaires, and required evidence
- Compose likely use-cases (who needs to interact with or view the contents of the GRC system and for what purposes)
- Map authoritative sources to policies, to procedures, to controls, and to risks

Control requirements

When Create control requirements option is enabled for a control objective, for every control generated under an entity type, control requirements are also created automatically. Previously, only controls were created for entity types. The number of Control Requirements equals the number of control objective requirements.

Attestation at control requirement level

The Attestation at control requirement level feature allows attestation at a granular level for individual control requirements within a control. Admins can enable requirement-level attestation,assign respondents, and generate assessment tasks for each control requirement. Respondents then attest to requirements by indicating whether they are implemented or not, providing evidence or explanations as required. Failed attestations automatically generate issues, mark the parent control as non-compliant, and roll up the status to the associated entity and control objective.

Entity Based Access (EBA)

The Entity Based Access feature provides a framework for more granular approach to management of data access to objects associated with an entity. Administrators can grant

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

access to an entity's related records by adding users or user groups, or by using entity user fields for entity-based access configuration.

When a user is qualified based on these configurations and has the minimum required roles, they will have access to the following tables:

- Control
- Attestation
- Policy exception to control

Entity Based Access (EBA) rules

When entity based record access rules are enabled on the Entity Based Access Configuration Properties page, any newly created controls, control attestations, indicators, and indicator tasks associated with a configured entity will automatically inherit the entity-based access (EBA) value from that entity. Previously, users had to run bulk access updates to apply EBA restrictions whenever new objects were created.

Create a control using the Compliance Workspace

Controls are automatically generated when you associate a policy with an entity type, or an entity type with a control objective, or when an entity is added to a control objective. A control is created for each entity listed in the entity type for the control objective. Controls can also be manually created using the Compliance Workspace.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst, sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.it_compliance_manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the **Create** list and click **Control**.
3. On the form, fill in the fields.

Create New Control form

Field	Description
Number	Unique identification number.
Name	Name of the control.
Entity	Related entity. **Note:** If you change the state of the entity to Active from Retired state, then the manually created control on the entity also moves to the Draft state.
Status	Control status. Possible choices are: ○ **Compliant** ○ **Non-compliant** ○ **Not applicable**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Inherit from control objective	Option to indicate whether the control is created through an item generation process. For more information, see Multiple controls for a unique entity–control objective combination.
State	Control state. Possible choices are: ○ **Draft** In this state, all compliance users can modify the control. Only available when creating a one-off control. One-off controls are possible but not recommended. ○ **Attest** When the control is created from a control objective, the controls are in this state. **Note:** When a control is set back to draft, the attestation is canceled. ○ **Review** Controls are automatically moved to review from the attestation phase. ○ **Monitor** In this state, all compliance managers can move the control from review to monitor. ○ **Retired** Compliance managers or administrators can move a control from Monitor to Retired. **Note:** When a control is retired: ▪ Related indicators do not run ▪ Associated attestations are canceled ▪ Changes to the associated control objectives do not update the control
Key control	Indicator that the control is a key control.
Exempt	Mark the control as exempted.
Control Objective	Related control objective. If you're creating a common control, you must select a control objective.
Enforcement	List of options: ○ Mandated ○ Voluntary
Function	Read-only function field. All controls created are **Standard control** by default. When you convert the control to a common control, the value changes to **Common control**.
Weighting	Weight used to calculate the control failure factor of a risk. Set the weighting between one and 10.
Frequency	Frequency at which the control is tested. This field is for the control's testing and reporting purpose.List of options: ○ Event Driven ○ Daily

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Weekly ○ Monthly ○ Quarterly ○ Semi-annually ○ Annually **Note:** For information on the difference between the**Frequency** field for a control and the**Attestation Frequency** field in an entity, see KB0694607.
Category	List of options: ○ Acquisition or sale of facilities, technology, and services ○ Audits and risk management ○ Compliance and Governance Manual of Style ○ Human Resources management ○ Leadership and high-level objectives ○ Monitoring and measurement ○ Operational management ○ Physical and environmental protection ○ Privacy protection for information and data ○ Records management ○ System hardening through configuration management ○ Systems continuity ○ Systems design, build, and implementation ○ Technical security ○ Third party and supply chain oversight ○ Root ○ Deprecated
Type	List of options: ○ Acquisition/Sale of Assets or Services ○ Actionable Reports or Measurements ○ Audits and Risk Management ○ Behavior ○ Business Processes ○ Communicate ○ Configuration ○ Data and Information Management ○ Duplicate

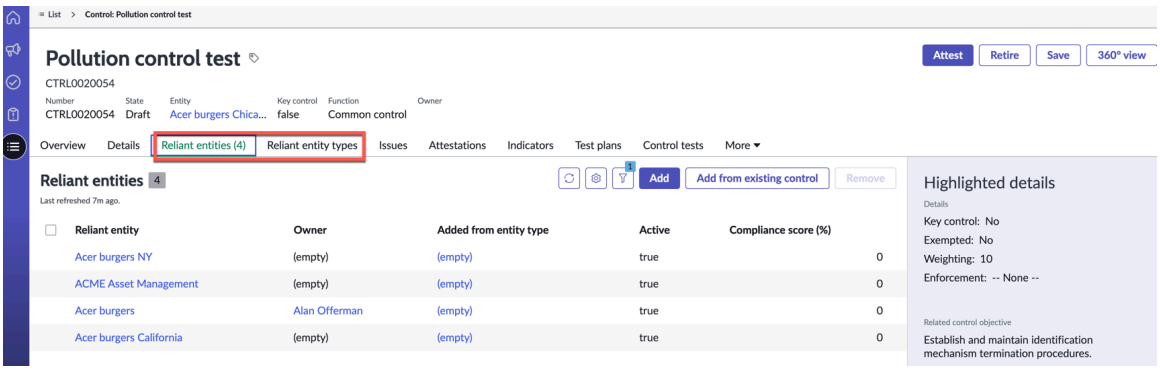
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Establish Roles ○ Establish/Maintain Documentation ○ Human Resources Management ○ Investigate ○ IT Impact Zone ○ Log Management ○ Maintenance ○ Monitor and Evaluate Occurrences ○ Physical and Environmental Protection ○ Process or Activity ○ Records Management ○ Systems Continuity ○ Systems Design, Build, and Implementation ○ Technical Security ○ Testing ○ Training
Classification	List of options: ○ Preventive ○ Corrective ○ Detective ○ IT Impact Zone
Description	Description of the control.
Additional Information	Additional information about the control.
Assignment	
Owning group	Group that owns the policy.
Owner	User that owns the policy. **Note:** The owner is always added as a respondent. The control owner that you select belongs to the owning group.
Attestation	
Attestation method	Defaults to Classic attestation. ○ Classic attestation: ServiceNow AI Platform classic method of control assessment. ○ Attestation: Method by which controls are assessed.
Attestation	Select from a list of options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Other attestation types can be configured. ○ If this field is populated, then the **Attestation Respondents** field automatically becomes mandatory, and the owner is made the respondent. **Note:** If the user changes the attestation type in the control objective, all the related controls are changed also.
Attestation respondents	○ Users assigned to the attestation of this control. ○ Only a user with the sn_grc.user role can be added as a respondent. **Note:** When both the **Attestation** and **Attestation respondents** fields are set, attestations are created when you click **Attest**.
Take attestation at requirement level	Option to generate attestation tasks for each control requirement. This provides the ability to attest compliance at the control requirement level, not just at the control level.
Attestation frequency	Frequency at which attestations on the control are triggered. If the field has no value selected, then the associated entity's **Attestation frequency** value defaults to this field. Options for attestation frequency: ○ Daily ○ Weekly ○ Monthly ○ Quarterly ○ Semi-Annually ○ Annually **Note:** After the attestation is complete, the control moves to Review and Monitor states. The control is then monitored for its next due date of attestation. You have the option to trigger the control's attestation frequency based on the attestation's **Created date** or the last completed attestation's **Updated date**. This option is based on the value in *Trigger control attestations based on the created or updated date of the last completed attestation* system property.
Activity Journal	
Additional comments	Public information about the control.

4. Select **Copy entity frequency** related link to copy the value of the **Attestation frequency** field of the entity to the **Attestation frequency** field of the control.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you select the **Copy entity frequency** related link, the respective entity's attestation frequency gets copied to the **Attestation frequency** field in the Attestation section of the control table, and does not update the **Frequency** field of the control table.

5. Click **Save**.
   The control is created and all related lists are visible.

   If you had created a common control, then there are Reliant entities and Reliant entity types related lists along with other related lists of the control. Use the Reliant entities related list to associate entities to the common control. Or, you can use the Reliant entity types related list to add a group of entities of an entity type instead of associating them one by one.

Related lists for common controls

Note:
For more information on the reliant entity association for a common control, see Convert standard control to common control and add reliant entities.

6. From the **Overview** page, click the **Issues**.
   You can add existing one or more related issues to the control that you created. By mapping the existing issues to the control, you can reduce the count of open issues on the document.

   When you add an issue to a control, a record is created associating the item that is the control with the issue, in the Issue to Control [sn_grc_m2m_issue_item] table.

   a. To add an issue to the control, click the **Add** button.

   b. Select the issue or issues related to the control from the Issues pop-up.

   c. Click the **Add** button.
      The selected issues are added to the control as related issues. You can also create an issue for the control by clicking the **New** button.

   d. To remove an issue that is already added to the control, select the issue and click **Remove**.
      The associated record mapping between the issue and control is removed from the Issue to Item table.

      Note:
      The UI action buttons such as New, Add, Remove aren't available if the control is in Retired state.

Linking automatically generated issues to a control in Many-to-many relationship

You can link an automatically generated issue that belongs to a different control as a related issue to a control. The **Originator** flag helps you to differentiate those control issues that were automatically generated from the controls that were manually created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manually created and automatically generated issues

Note:
You can identify the origin of an issue whether it was automatically generated or manually created after you link the issue from one control to another only in a control form.

You can create an issue manually for a control when you click the **New** button in the Issues related list of a Control form. For manually created issues, see Manually create GRC issues.

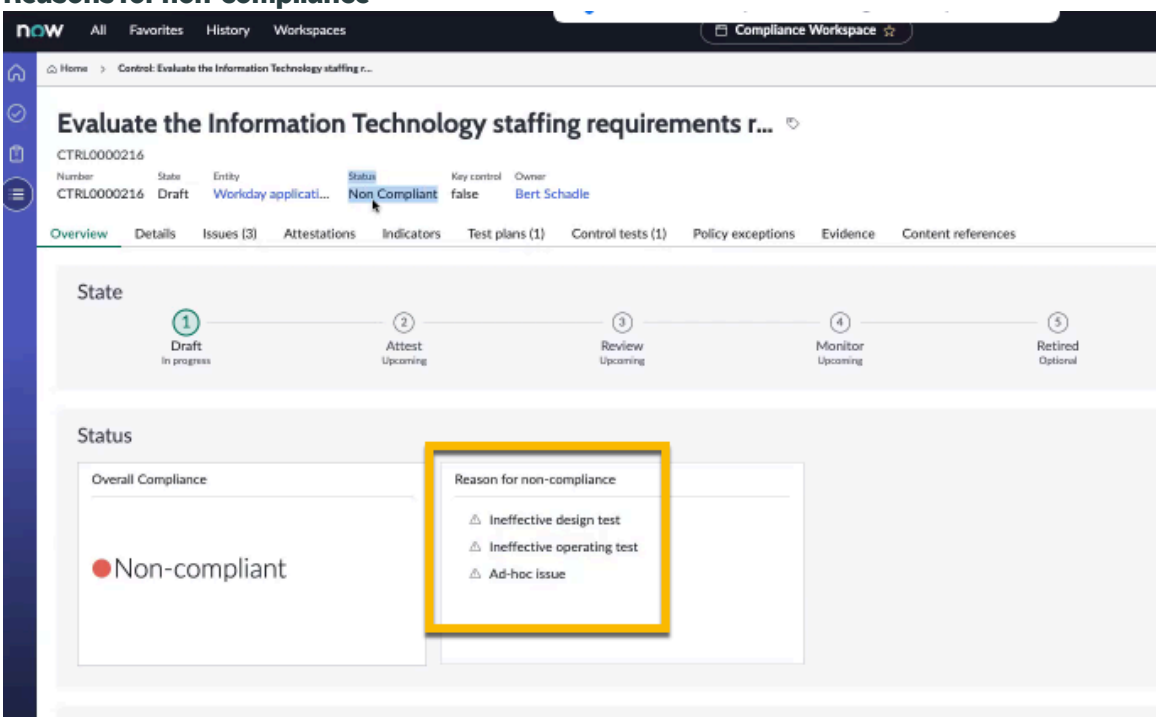
However, issues are also automatically generated when there are:

Control test failure

If there's a control test which is linked to a control and when one of the test is marked ineffective and closed, then the control becomes non-compliant. As a result, an issue is automatically generated. Control tests can be design test or operational test which can be marked ineffective and the tests can be common across all controls.

Control attestation failure

When the user who is an attestation respondent of a control rejects the control, then the status of the control becomes non-compliant and an issue is automatically generated.



Control indicator failure

Similarly, when a control indicator fails, the control becomes non-compliant and an issue is automatically generated.

The source of the issue generation for one or more of the three failures can be tracked with the tags in the **Issue source** field of the Issue details. If there is a control test failure, the **Issue source** field is updated with a tag, **Control Test Failure**. If the issue was created manually, then the Issue source tag is **Ad-Hoc**.

When a control's status moves to non-complaint, all the reasons for non-compliancy are pulled from the **Issue source** field and displayed as **Reasons for non-compliance** in the Status widget of the control's Overview page.

Reasons for non-compliance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Handling more than one automatically generated issue while linking to a control

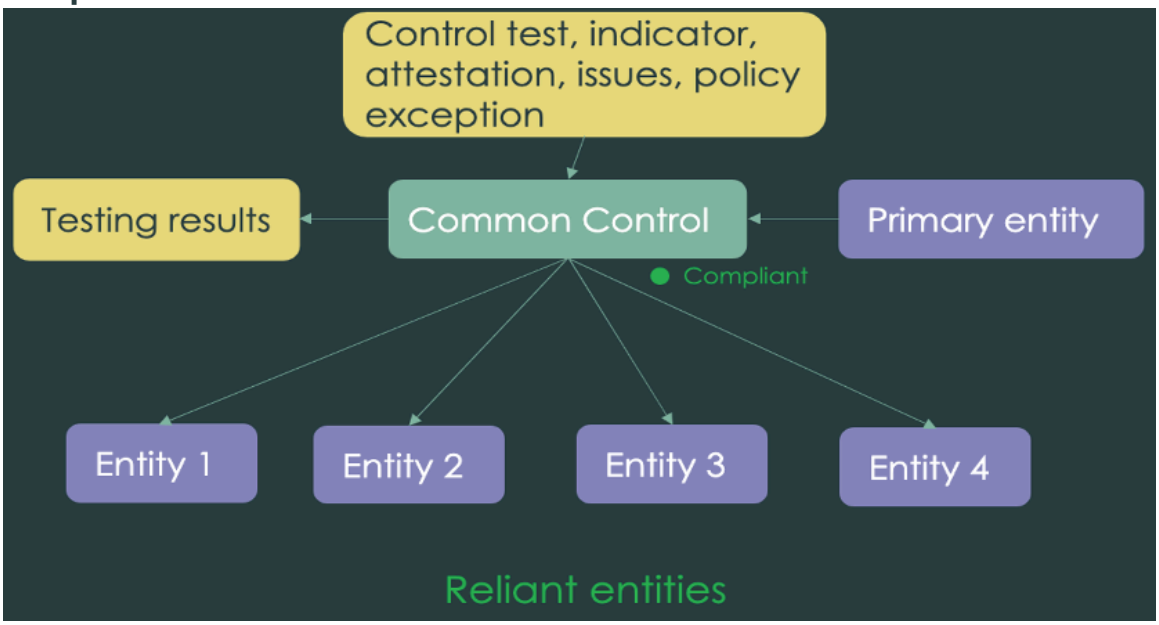
You can add an automatically generated issue that belongs to another control, to a control in an m2m relationship using the **Add** button. However, adding an automatically generated issue from another control to a control with an existing automatically generated issue conflicts the source of the issue generation. To track the source of issue generation, a back-end flag, **Originator**, is used. It is a true or false flag and is false, by default. Originator is flagged true or false, if:

- An automated issue of another control is associated to the current control, then the **Originator** is false.
- It is a manual issue of the current control, then the **Originator** is false.
- It is an automated issue of current control then the **Originator** is true.

1. When there is an issue that exists with Originator as true, and if a control failure happens, the **Issue source** field of the issue is updated with the source of the issue. For example, there's an issue with originator as true already present and the issue source is Control test failure. If another control failure happens, such as control attestation failure, then the Issue source is updated with two tags, namely Control test failure and Control attestation failure.
2. When there is no issue present with Originator as true, and if one of the three control failures happens a new automated issue with originator as true is created. For example, if there's a control attestation failure for a particular control that has no issue linked to the control with the originator as true, then a new automated issue with Issue source as control attestation failure is created and the originator is true.

Data migration

The logic behind flagging an issue as automatically generated or manually created with the Originator flag is handled automatically when you install the latest plugin. For all automated issues linked to existing controls, the originator flag is true in the m2m records between the control and the issue.



Testing common control and implementing results on multiple reliant entities

Instead of generating controls for individual entities and testing each entity separately with an individual control, you can use a common control and associate a primary entity to it.

Test the common control for control tests, indicators, attestations, issues, and policy exceptions. Use the test results that are inheritable and implement them on all the reliant entities associated to the common control.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multiple entities linked to a common control

Using common controls gives you the ability to:

- Mark a control as common and associate reliant entities to it.
- Associate entities of existing controls as reliant entities to a common control.
- Save time and effort in testing. The result of the common control tests can be inherited by other reliant entities, especially when a new system is deployed and pre-validation audits are conducted within an organization or environment.
- Reduce redundancy of workforce in documenting test results.

Requirements and use case:

- Create a control and convert a control to common.
- Associate reliant entities to a common control to inherit test results.
- Associate entity types to a common control.
- Test the common control once and apply results to multiple entities.
- Can convert a common control back to standard.
- Avoid voluminous increase in controls.

For more information, see:

- Tables installed for descriptions of the common item m2m tables.
- Control form changes with respect to common controls.
- Convert standard control to common control to add reliant entities.
- Action handler components for common controls.
- Operational changes in item generation of common controls.
- Impact of common control on compliance score calculation.

Convert standard control to common control and add reliant entities

Mark a control as common and associate reliant entities to it. Test the common control tied to the primary entity. The reliant entities inherit the results of the common control.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.corporate_compliance_analyst

About this task
All existing controls are termed as standard controls. You can convert a standard control to common and reverse its function as standard if you so require. However, by default all controls whether existing or created are standard.

Procedure
1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ( ).
3. Navigate to **Compliance library** > **All controls**.
   You can either create a control by clicking the **New** button or select one of the existing standard controls from the All controls list and convert it to a common control. Either way, the control is standard, by default, and you must convert it to common to add reliant entities.

   Note:
   Before you convert a control from standard to common, ensure that you select a value in the **Control objective** field, and save the form details. Control objective is required for a common control as there are validations to ensure that the common control does not have the same Name, Entity (primary or reliant), and Control objective combination as any other control.

4. Click the More Actions on the top right.
5. Select the **Convert to common** list UI action.
   The **Convert to common** UI action appears only when the control is in the initial states such as **Draft** or **Attest**. When the control progresses beyond these states, then it can neither be converted to common nor reverted as standard control. **Convert to standard** UI action does not appear when the control is common and in the **Review** state.

   When a control is common, its **Source** field is Entity. When the control is converted back to standard, the entity source is removed if it was added when the control was converted to common. When a common control is converted to standard control, the entity type and reliant entity type associations are deleted.
6. Click **Okay**.

   Note:
   The **Function** field changes from Standard control to Common control. Also, the Reliant entities and Reliant entity types related lists appear on the control form to help you add the reliant entities.

7. To add reliant entities, select the Reliant entities related list.
   a. Click the **Add** button.
   b. Select the entities in the Entities pop-up and click **Add**.
      The message confirms that the reliant entities are added successfully to the common control. The association of the entity as reliant to the common control creates a record in the Item to entity [sn_grc_m2m_item_entity] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have an entity type with entities, then you can select the entity type to add the bulk of entities instead of selecting them one by one.

c. To pick out a primary entity and associate it as a reliant entity, click the **Add from existing control** button.
This action enables you to:

- retire that existing control
- associate the entities of that control as reliant entities

You can add up to 15 entities at a time by this option. When you select the entities and click **Add**, not all existing entities are added. All of the entities may be added, some of them may be added, or sometimes none of them is added. For reasons as to why the entities are skipped from being added and their controls are not retired, see the GRC Common control inheritance [KB1221601] article in the Now Support Knowledge Base.

Note:
You must log in to Now Support to view the articles.

When you select the **Continue to add** button in the pop-up, the existing control is retired and its associated entity is added as reliant entity. The control is treated as manually retired control.

d. To remove a reliant entity, select the reliant entity and click **Remove**.

8. To add entity types, select the Reliant entity types related list.

a. Click the **Add** button.

b. Select the entity type in the Reliant entity types pop-up and click **Add**.

The downstream action of associating entity types to a common control creates an upstream action of associating entities to the common control. All the entities that are added as part of the entity type are also listed in the Related entities related list. **Added from entity type** column lists the source of the entity type.

The association of the entity type as reliant to the common control creates a record in the Item to entity type [sn_grc_m2m_item_entity_type] table.

Note:
For more information on the m2m tables that store the records of entity and common control association, see Tables installed with Policy and Compliance Management.

The advantage of using Reliant entity types is that even if you update the entity type later by adding more entities to it, after it is associated to a common control, then those added entities get automatically associated as reliant entities.

c. To remove a reliant entity type, select the record and click **Remove**.

9. To add a risk to the control, select the Risks related list and click the **Add from reliant entities** button.
Based on the reliant entities' association with risks, you can associate the common control with risks. For more information, see Common controls in Risk Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. To view the reliant entities associated to the control, click the **360° view** button from the control record.
    The primary entity and the list of all reliant entities are displayed in a distinctive visualization.

Result
Associating reliant entities to a common control has an impact on compliance scoring.

Impact of common control on compliance score calculation

Whenever an entity is associated to a common control and termed as a reliant entity, there is an impact on the compliance score of the entity on account of the common control test results.

All active, associated common controls contribute to the compliance score as any other control that exists.

Whenever a control changes its compliance status or weightage, the compliance score for the entities is recalculated. Similarly, in the case of a common control, the compliance score for reliant entities is recalculated as well.

All primary actions trigger recalculation of compliance score. When reliant entities are added or removed using the Add or Remove UI action in the Reliant entities related list as an upstream action, the compliance score for that particular reliant entity is recalculated. It is also recalculated when you retire a common control or convert a common control to standard control. Controls that are either compliant or non-compliant contribute to the compliance score calculation of an entity.

For more information, see the https://support.servicenow.com/kb?id=kb_article_view&sysparm_article=KB0716583 article in the Now Support Knowledge Base.

Note:
You must log in to Now Support to view the articles.

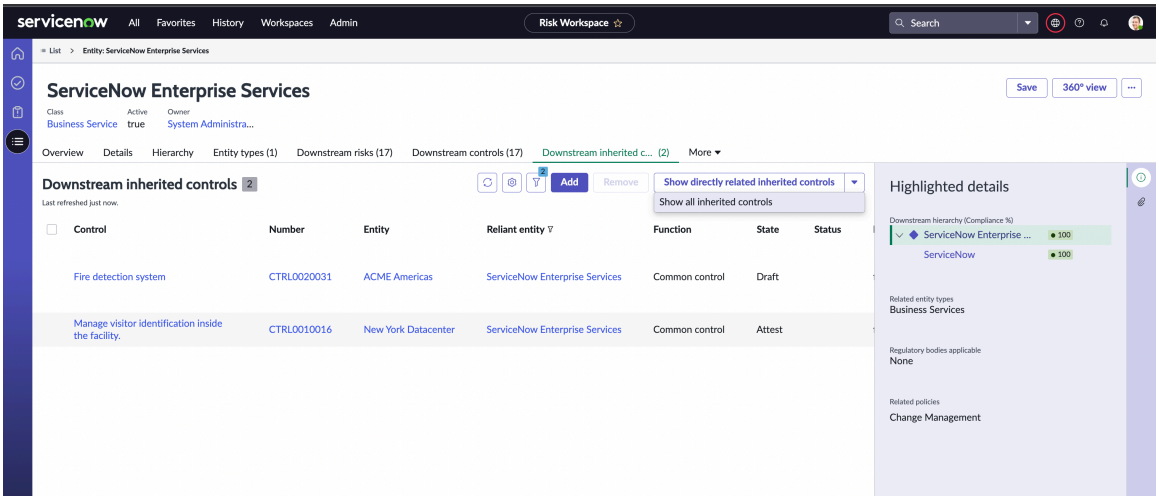
Entity enhancements to support common controls

Learn about the entity enhancements of the downstream inherited controls in the GRC application. For example, you can see information about the downstream inherited controls by looking at the entity record page. You can also see a summary of the downstream inherited controls by using a widget that is available on the entity overview page.

Overview of downstream controls

With the Entity form, you can see the common controls that the current entity or its downstream entities rely on. In the Downstream inherited controls related list, use the **Add** and **Remove** buttons to update the associations of the common controls.

You can also see the common controls that the current entity relies on by using the **Show directly related inherited controls** button and the **Show all inherited controls** button. These buttons display the common controls that the downstream entities are reliant on.



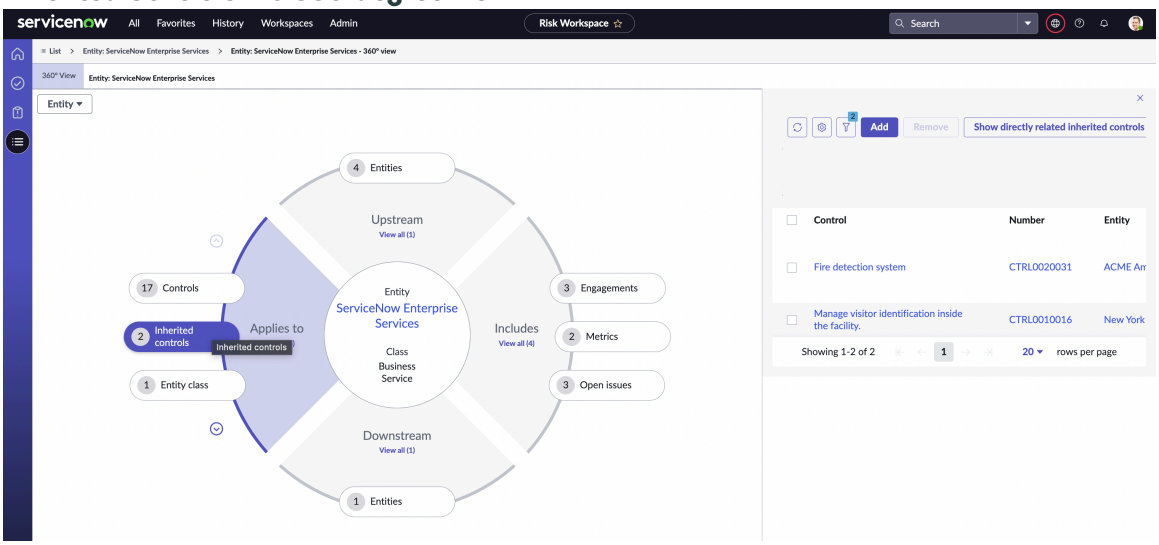
To learn more about the common controls, see Common controls in risk management.

The Downstream Controls related list also displays the common controls that the current entity or its downstream entities use to implement the common controls. By using the Function column in the form, you can differentiate between the standard and common controls. The following example shows the downstream inherited controls.

Note:
You can add or remove the reliant entity association with the common controls in Workspaces only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Downstream inherited controls



In the downstream inherited controls related list, you can see the information about the control, entity, and its reliant entity. The control is implemented by the entity that is listed. The same control is inherited by the reliant entity.

360-degree view

The 360-degree view of the entity shows the controls and the inherited controls.

The following example shows that the 360-degree view of the Enterprise Services entity has two inherited controls.

Inherited Controls in a 360-degree view

Group assessments for similar assessments in the Tasks page

Provide response to similar assessments by grouping the assessments based on metric type, and additionally the same entity, control objective, or category in the Tasks page of the Compliance Workspace.

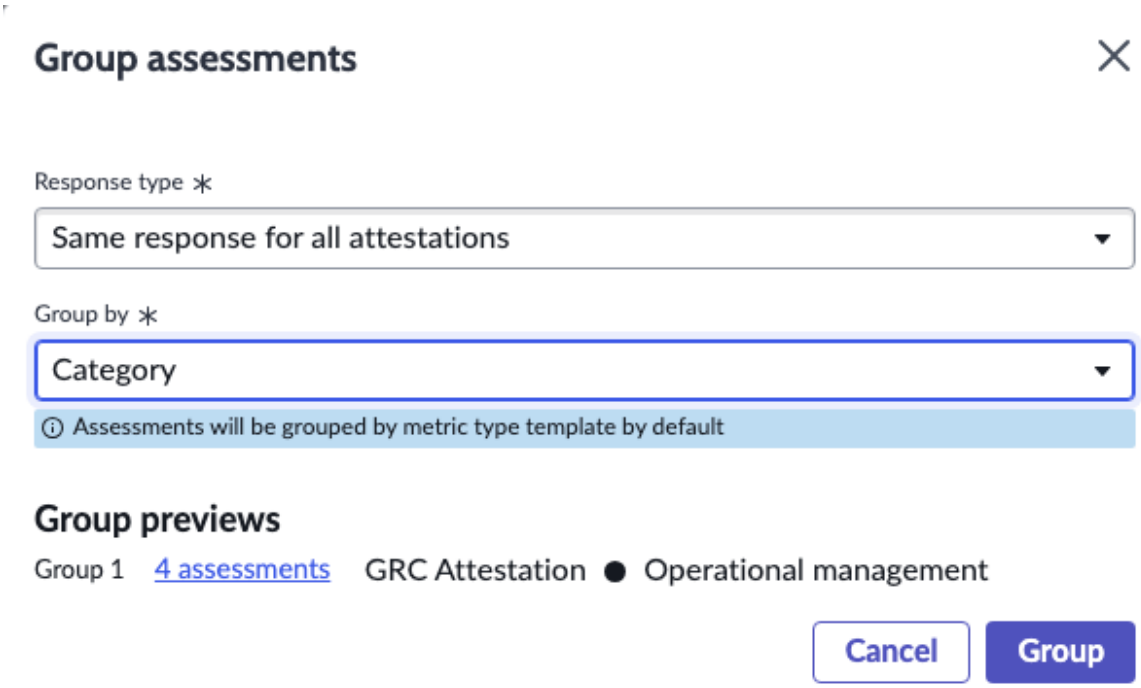
Before you begin

Role required: sn_compliance_ws.corporate_compliance_manager or sn_compliance_ws.corporate_compliance_analyst

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

In Configurable Workspace, you can only group control attestations, and not risk assessments, vendor assessments, or privacy assessments. Such assessments and those assessments that can't be grouped by the selected **Group by** criterion are marked as invalid and are displayed in the **Group previews** of the Group assessment pop-up, with a link to view such assessments.



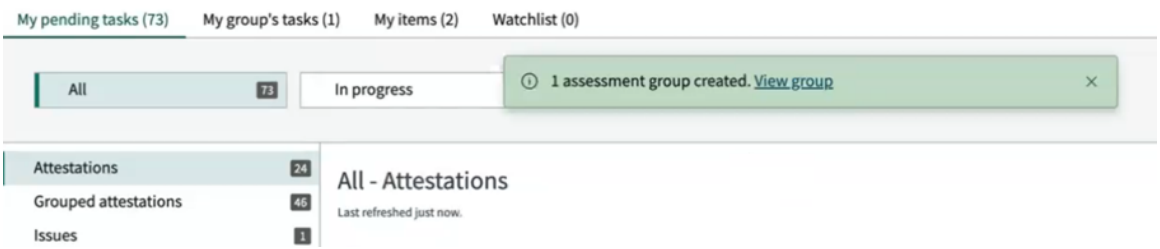
Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the Tasks icon on the left pane.
3. Select the attestation records in the My pending tasks tab that you'd like to group.

   Note:
   You must select at least two and can select up to a maximum of 13 assessment records for grouping.

4. Select the **Group assessments** button.
5. Select a **Response type** in the Group assessments pop-up.
   For more information on the response types, see Consolidate control attestations using the Same Response feature.
6. Select a criterion to group the assessments in the **Group by** list.
   By default, assessments are grouped by the metric type template. You can group the assessments by Category, Entity, or Control objective. If the selected assessments have a common category, entity, or control objective then they're grouped accordingly based on your selection. However, if the assessments selected don't have any of the common criteria by which they can be grouped, then the assessments aren't grouped.

   The **Group previews** section displays the grouping details, assessments with links, and an appropriate message information if they're grouped or cannot be grouped based on the Group by criterion, status, assignee, or the evaluation method of the metric type.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the **Group** button.
   If the grouping of assessments is successful, then you get a message indicating that the assessment group has been created, followed by a link to the grouped assessments.

   If a few of the assessments among the selected assessments couldn't be grouped by the selected criterion, then the **Group previews** displays the number of assessments that couldn't be grouped. Nevertheless, as there are other assessments in your selection that could be grouped by the selected **Group by** criterion, the **Group** button is active for you to select and group the rest, where the grouping is successful.

   On the other hand, if all the assessments that you selected are invalid, for example, risk assessments or privacy assessments, then the **Group** button is inactive as grouping isn't possible for such assessments.

Note:
You can group the assessments that are in **Ready to take** or **In progress** state, but not the assessments that are in **Complete** or **Canceled** state.

If the status of a record that you've selected for grouping has changed and is being assessed before you select the **Group** button to group the assessments, then such a record can't be grouped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select the link to the grouped assessment in the UI message.
   The link takes you to the list view of the grouped assessments. Alternatively, you can also select the **Grouped attestations** on the left pane. The Assessment Instance page opens up, where you can take the assessment.

Take attestation at control requirements level

The Take attestation at requirement level option enables administrators to perform compliance attestation at a granular level for individual control requirements within a control.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager, sn_compliance.user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the List icon.
3. Under Compliance library, select **Controls**.
4. Select the control that contains the control requirements you want to attest.
5. In the Details tab, select **Take Attestation at Requirement Level**.
6. The Attestation field will default to **GRC CR Attestation**.
7. In the Assign Respondent field, specify the user or role responsible for attestation (for example, System Administrator).
8. Select **Attest**.
9. Navigate to **Control requirements** tab, and select each control requirement.
   Attestation tasks are generated for each control requirement under Assessment Instances.
10. For each assessment instance, select **Take assessment**.

    a. Select Yes (implemented) or No (not implemented).

    b. If Yes, attach evidence and provide an explanation.

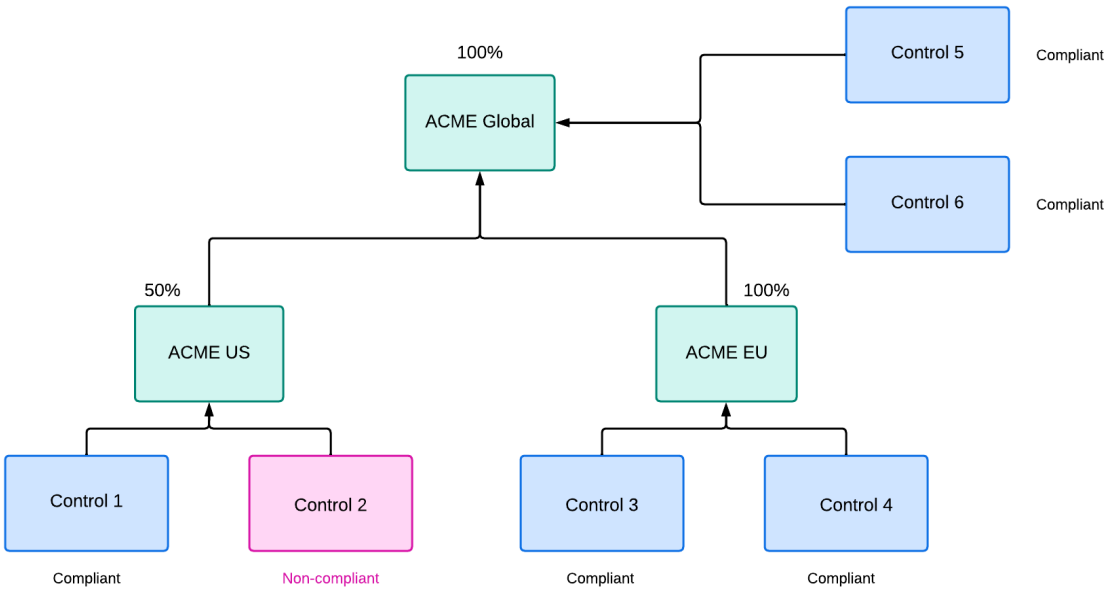
    c. If No, provide a reason in the Explain field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Submit**.
:

11. Review the following information for any failed assessment.

- Generates an issue for that control requirement.
- Marks the parent control as non-compliant.
- Rolls up the same status to the entity and control objective level.



Compliance score calculation of an entity

There are two ways to calculate the compliance score of an entity. The existing method includes only the entity's direct controls, whereas the new logic considers the average of immediate downstream entities along with the average of direct controls of the entity.

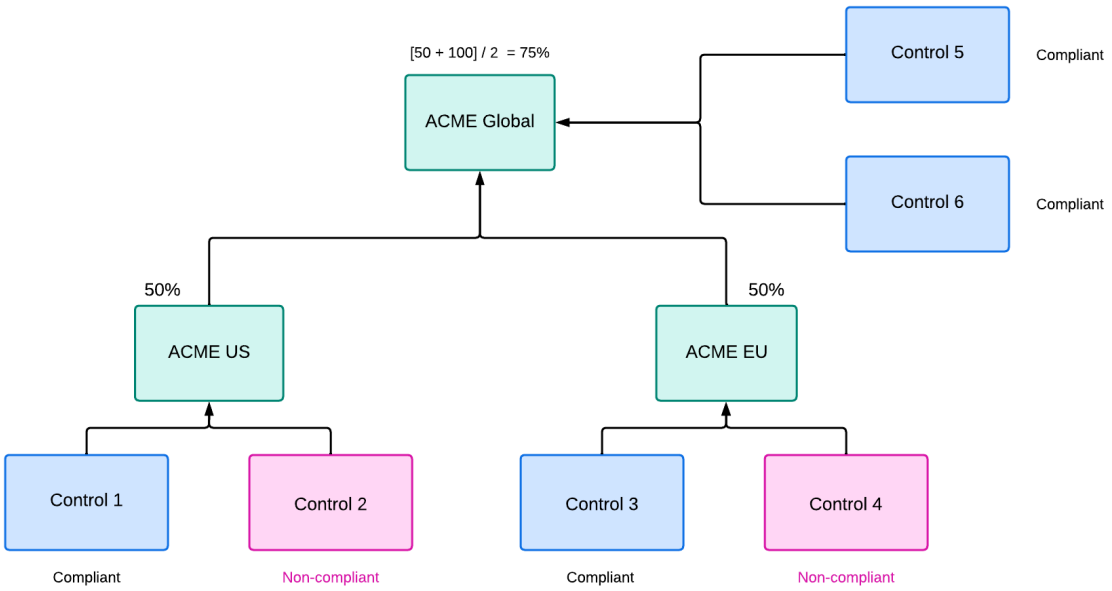
Compliance score calculation based on direct controls

Calculating the compliance score of an entity is based on the controls that are directly associated with the entity. It is by using a simple formula:

```
Average of all direct controls of an entity
```

Example: Compliance score calculation rollup - existing logic

The compliance score of ACME US is the average of all its direct controls, which is `(100 + 0) # 2 = 50`. Whereas while calculating the compliance score of ACME Global, the average of its direct controls is only considered, and not the average of controls associated with its downstream entities, which is `(100 + 100) # 2 = 100`.



Although there's a control associated with the downstream entity (ACME US), which is non-compliant, the reflection of its non-compliance status is not reflected in the parent entity (ACME Global) and it does not alter the overall compliance score of the parent entity (ACME Global).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance score calculation based on downstream entities and direct controls

Compliance score of an entity can also be calculated based on its downstream entities' compliance scores, which is the average of immediate downstream entities' compliance scores along with its direct controls, by using the formula:

```
Average [Average (downstream entities) + Average (direct
 controls)]
```

Example: Compliance score calculation rollup - new logic

In this hierarchy, the compliance score of ACME US is 50 and ACME EU is 50. This logic considers the average of the downstream entities that is ACME US and ACME EU while calculating the compliance score of ACME Global, which is `(50 + 50) # 2 = 50%`. Considering the downstream entities and the direct controls of the parent entity, the compliance score is now `(50 + 100) # 2 = 75%`. That is `average of ACME US and ACME EU + average of Control 5 and Control 6`.

Set up the steps required for entity compliance score calculation

Enable the system property and run the on-demand job to calculate the compliance score of an entity based on its downstream entities' compliance scores and also its direct controls.

Before you begin

Role required: sn_compliance.admin, sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Properties**.
2. Select the **Entity hierarchy based scoring** property to set it to **true**.
   By default the property is set to false. When it is false, the compliance score is calculated based on direct controls, which is the average of the controls that are directly associated with the entity. See Compliance score calculation of an entity.

   However, if you want to calculate the compliance score of an entity based on its downstream entities and direct controls, then you must set the property to true. There can be a scenario where you might have to update the existing entities' compliance score by this new logic. For

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

this purpose, there is a scheduled job that you must execute manually whenever you want to calculate the compliance score.

3. To execute the scheduled job, navigate to **All** > **Scheduled Definition** > **Scheduled Jobs**.
4. Select the **Update compliance scores for hierarchy entities** on-demand job from the list. Execute the *Update compliance scores for hierarchy entities* job on demand whenever you are switching the value in the preceding property so that the compliance score of all the entities can be recalculated honoring the property's value.

   Failing to run the on-demand job after changing the value in the property leads to inconsistencies in the calculation of compliance scores of entities.

   Note:
   Whenever you are executing the *Update compliance scores for hierarchy entities* job you must deactivate the *Compliance Score V2* scheduled job until the execution of the *Update compliance scores for hierarchy entities* job is complete. This step is a manual intervention that you must do to streamline the process of compliance score calculation for an entity.

5. Select **Execute Now** in the Scheduled Script Execution Update compliance scores for hierarchy entities.

Determining the logic in calculating compliance score

Determining the calculation of an entity's compliance score, either by its direct controls or based on its downstream entities and direct controls, is based on the **Entity hierarchy based scoring** property.

Calculating entity score based on the property

The *Compliance Score V2* scheduled job runs at a periodical interval of every two minutes. When the compliance status of a control changes, the job picks up the record in its next scheduled run to process its compliance in an order. Thereafter, an entry is created in the compliance score table [sn_compliance_compliance_score].

The point at which the compliance status of a control changes and the calculation of the score at the entity level gets impacted is a trigger point.

Compliance score update scenarios for an entity based on the average of direct controls and average of downstream entities

Trigger points at which the compliance score of an entity is impacted and the entity record is added to the compliance score table:

1. If one of the downstream entity is deleted, then the entity's compliance score is recalculated. If the **Entity hierarchy based scoring** property is true, then the parent entity's compliance score is calculated based on the average of its downstream entities and also the average of its direct controls. On the other hand, if the property is false, then the compliance score is calculated based on the average of its direct controls only.
2. When an upstream entity is deleted in the hierarchy.
3. When a downstream entity or an upstream entity is added in the hierarchy.
4. When a downstream entity or an upstream entity is updated in the hierarchy.
5. When an entity becomes active.
6. When an entity is inactivated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. When a control is added to an entity or deleted from an entity.
8. When the control's status changes.

The *Compliance Score V2* scheduled job picks up the records from the compliance score table to calculate the score. Based on the **Entity hierarchy based scoring** property value, the logic in calculating the entity's compliance score is determined. For more information, see Properties installed with GRC: Policy and Compliance Management.

Manage control indicators using the Compliance Workspace

Continuous monitoring involves activities related to identifying and creating key risk and controls indicators. The Compliance Overview is available to compliance administrators and compliance managers, providing an executive view into compliance requirements, overall compliance, and compliance breakdowns.

Supporting information can be collected for indicators through automatic data collection or manual tasks. Indicator results are then used to create issues for controls, update risk scores, and provide supporting information for audit activities and control testing.

Indicators

Indicators collect data to monitor controls and risks, and collect audit evidence. Indicators monitor a single control or risk.

Indicator templates

Indicator templates allow the creation of multiple indicators for similar controls or risks.

Compliance Overview

Compliance Overview reports in the base system

Name	Visual	Description
Compliance Requirements	Donut chart	Select a wedge to focus on a specific compliance area.
Overall Compliance	Donut chart	Displays the overall compliance of all the control requirements in the system. Selecting a specific wedge in the previous widget brings that area into focus.
Entity	Drop down list	Select one or more entities to view and compare their compliance across multiple items.
Control State	Check list	Select or clear check boxes to view filter reports by control state.
Compliance by Authority Document	Bar Chart	Compare level of compliance depending on the selected entity and/or authority document.
Compliance breakdown	Multi-level Pivot	View a breakdown of control compliance by related authority documents and policies.
Non Compliant Entities	Column Chart	Count of non-compliant control requirements grouped by entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authority Documents

Authority documents define policies, risks, controls, audits, and other processes to ensure adherence to the authoritative content.

Each authority document is defined in a record and the related lists on that record contain the individual conditions of the authority document.

The relationships of these authority document related list items are visible in the GRC Workbench in the Policy and Compliance Management application.

Note:
You can add content reference tags to authority documents. Content reference tags allow you to filter records in order to more easily identify the content packs, integrations, and use case accelerators associated with the authority documents.

Citations

Citations contain the provisions of the authority document, which can be interrelated. Citations break down an authority document into manageable themes.

You can create citations or import them from UCF authority documents and then create any necessary relationships between the citations.

Note:
You can add content reference tags to citations. Content reference tags allow you to filter records in order to more easily identify the content packs, integrations, and use case accelerators associated with the citations.

Create a control indicator using the Compliance Workspace

Indicator data for controls, risk, and audit evidence are measured differently depending on the GRC application.

Before you begin
Role required: sn_compliance_admin, sn_compliance_manager

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Compliance Workspace** > **Control monitoring** > **All indicators**.
   - **Risk** > **Control monitoring** > **All indicators**.
   - **Audit** > **Control monitoring** > **All indicators**.
2. Click **New**.
3. On the form, fill in the fields.

Indicator form

Field	Description
Category	The type of indicator being created. Select **Compliance Indicator** for a control indicator and **Risk Indicator** for a risk indicator.
Inherit from template	Use a selected template to fill in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Template	If you selected the **Inherit from template** check box, select the template you want to use to fill in the form. After you have selected a template, the rest of the fields in the Create New Indicator screen are pre-filled and set to Read-only. For more information, see Create a GRC indicator template using the Compliance Workspace.
Override template	If you selected the **Inherit from template** check box, and you want to customize your entries in the form, select this check box. You can then edit some or all of the fields on the form.
Name	Name of the indicator.
Description	A description of this indicator.
Entity	Entity associated with this indicator.
Control	Control associated with this indicator.
Owning group	Group that owns the indicator.
Owner	Indicator owner.
Method	
Type	Results can be gathered manually using task assignment or automatically using basic filter conditions, Performance Analytics, or a script. ○ Manual ○ Basic ○ Script For manual indicators, if the associated control is exempt through policy exception, indicator tasks are not generated.
Applies to	Entity related to the **Item**.
Last result passed	Option that indicates whether last result passed.
Short Description	If Type is **Manual**, this field is present. Brief description of the issue.
Instructions	If Type is **Manual**, this field is present. Instructions for the collection of indicator results.
Value Mandatory	If Type is **Manual**, this field is present.
Passed/Failed	If Type is **Basic**, this field is present. Indicator passes or fails.
PA Threshold	If Type is **PA Indicator**, this field is present. The associated PA Threshold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Script	If Type is **Script**, this field is present. Script that obtains the desired system information.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
Next run date	Next collection time for indicator results.
Supporting Data	
Note: Starting with Version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks is displayed. Earlier, only the real-time state of the records collected could be viewed.	
Table	Use supporting data to gather supporting evidence from other applications.
Supporting data fields	Supporting data fields based on the selected table.

4. Click **Submit**.

What to do next

If you are implementing the Policy and Compliance Management software, you have completed the mandatory setup steps. Return to the Policy and Compliance Management setup checklist and proceed to the optional steps, as needed.

Create a GRC indicator template using the Compliance Workspace

Compliance or risk managers create indicator templates in the Compliance Workspace from which many indicators can be created.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager
- sn_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager
- sn_grc.user

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Compliance Workspace** > **Indicators** > **Indicator Templates**.
   - **Risk** > **Indicators** > **Indicator Templates**.
   - **Audit** > **Indicators** > **Indicator Templates**.
2. Select the **Create** list and click **Indicator**.
3. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Indicator template form

Field	Description
Name	Name of the indicator.
Description	Description of the indicator.
Category	Category for which you're creating an indicator template. For example, select **Risk Indicator Template** to create a risk indicator template.
Active	Option that determines whether the indicator template is active.
Method	
Type	Method used to determine the type of indicator template. The choices are as follows: ○ **Manual**: Manual indicators are used for data that can't be retrieved from a ServiceNow instance because it comes from an external system, such as customer data from a third-party sales system. ○ **Basic**: Basic indicators are automated indicators based on an indicator source. The indicator source specifies a table and a frequency at which the scores from this table are saved. ○ **Script**: Scripted indicators use a custom script to collect the data.
Target Type	Type of the target value. The choices are as follows: ○ **None**: Use this option if you don't want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Result if the value meets or exceeds the target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed** For example, assume you enter 100 in this field. If the indicator result output is more than 100, then the indicator status will pass

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	or fail based on the value configured in this field.
Target	Value to determine if the indicator will pass or fail.
Value mandatory	Option to decide if a value must be compulsory in the indicator task for a manual indicator. **Note:** This option appears only if **Manual** is selected from the **Type** field. This option is automatically selected if **Count** or the **Percentage** is selected from the **Target type** field.
Instructions	Additional instructions for the template.
Supporting Data	
Note: Starting with version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks are displayed. Earlier, only the real-time state of the records collected could be viewed.	
Collect supporting data	Option to enable collecting supporting data or evidence every time the indicator runs.
Table	Table used for collecting supporting data.
Supporting data fields	Fields of the source table to be used for collecting the supporting data.
Sample size	Minimum number of records that must be used for collecting supporting data. For example, a basic indicator could query a large table, returning thousands of records with each indicator execution. You don't have to save all of them; just a sample of those records. If you enter a sample size of 100, only 100 records are saved, even though the query returned thousands.
Basic Criteria	
Criteria	Criteria to filter the data from the source table.
Use reference field	Option to enable the use of the **Reference field**.
Reference field	Connection between the supporting data table and the **Applies to record** field of the entity.
Additional Criteria	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
To create indicators with targets, use the advanced filter criteria. This section appears only when you select **Basic** from the **Type** field. This section is used to provide more filter criteria.	
Additional criteria	More criteria to filter the data to calculate the target value. This section only appears when **Percentage** is selected from the **Target type** field.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
Due date duration (days)	Due date duration in days between the creation and due date of the indicator task and generation of its results. The due date duration added to the creation date reflects as the **Due date** of the indicator task. This field appears only when **Manual** is selected from the **Type** field. For more information, see Performance enhancements for Indicator nightly job.
First run date	First collection time for indicator results. This field is automatically set based on when an indicator or an indicator template runs for the first time. This value in this field cannot be modified.
Next run date	Next run time to collect indicator results of all downstream indicators for this indicator template.

5. When you have completed these entries, you can also view information on the following related lists:
   - Control Objectives/Risk Statements
   - Content References

   Note:
   The **Control Objectives/Risk Statements** tab enables you to reuse the same template for multiple control objectives or risk statements, or both of them.

6. Select **Submit**.

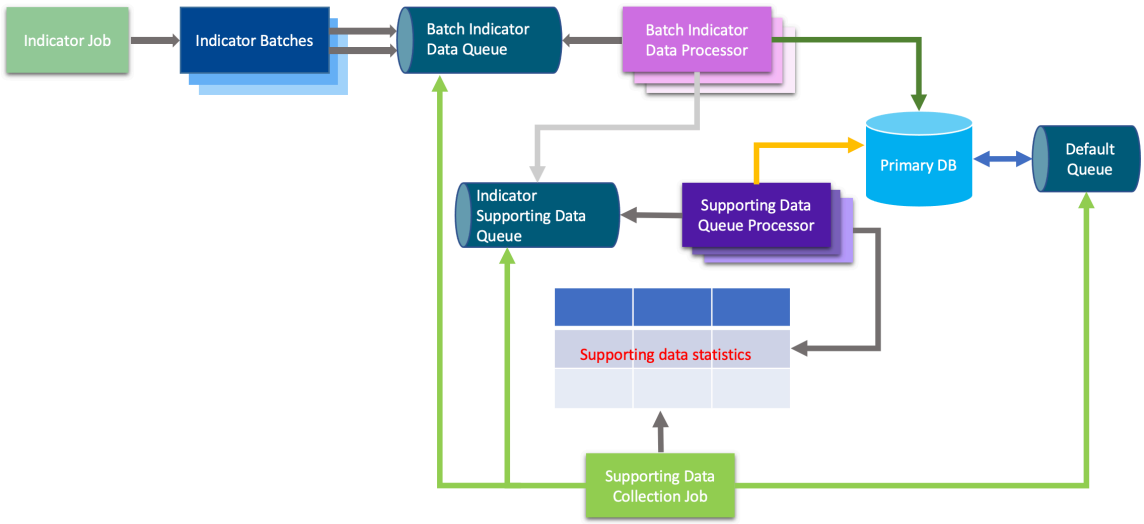
Performance enhancements for Indicator nightly job

To support parallel processing capabilities, two additional custom queues such as the Indicator Data Queue for processing indicators, and the Supporting Data Queue for handling events related to control, risk, and issue updates and to collect the supporting data, have been introduced.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New architecture for effective processing of indicators

The execution of indicators has been optimized by implementing a three-step process, utilizing two custom queues for efficient processing.



In the initial step, a set of indicators requiring processing is queued up in the Batch Indicator Data Queue. The Batch Indicator Data Processor then runs the indicators, sets the status, and creates the indicator results or tasks. The indicators are then moved to another custom queue for supporting data collection and updating dependent objects like controls, risks, and issues.

In the second step, the Indicator Supporting Data Processor picks up the indicator records from the Indicator Supporting Data Queue and updates the control or risk status, also creating or updating issues based on the configuration. Then the indicator is pushed to the Indicator Statistics Table for support data collection.

Finally, the Supporting Data Collection Job picks up the indicator records from the Supporting Data Statistics Table, starts collecting supporting data for the indicators, and leverages both the default queue and additional custom queues for efficient processing.

Note:
Indicator result business rules are not executed during the indicator job run. However, the same business rules are used while completing the indicator task. The indicator business rules are moved to the indicator job for achieving better performance during the execution.

Processing indicator jobs using additional queues

This architecture supports execution of a large number of indicators in significant time. The Supporting Data Collection Job introduced to collect supporting data improves the data handling process considerably. Moreover, the time taken to execute the data is considerably less.

Note:
The Supporting Data Collection Job assigns the batches of indicator records to the default queue initially for supporting data collection. Depending on the availability of the batch processing queue and supporting data queue, the scheduled job assigns the subsequent batches of indicator records to these queues in a round-robin fashion, that is, only if these queues are free to process them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data model changes

The **Sample collection type** field added in the Indicator template form, has options either **Count** or **Percentage**. The default value is Count. If you select Percentage, you can provide the percentage value to collect the supporting data.

The **Due date duration (days)** field is added for manual indicator in the Indicator template and Indicator forms to capture the indicator task due date. Based on this due date, reminder emails are sent to the indicator task owners.

A new field introduced in the indicator supporting data table, which is of type JSON, helps in efficient data management.

- For more information related to the table changes, see Tables installed with Governance, Risk, and Compliance.
- For more information on the additional system properties, see Governance, Risk, and Compliance properties.
- For Indicator form changes, see Create a GRC indicator.
- For the Indicator template form changes in Compliance Workspace, see Create a GRC indicator template using the Compliance Workspace.
- For the Indicator template form changes in the classic UI, see Create a GRC indicator template.

Manage evidence requests using the Compliance Workspace

Evidence request is used by audit and compliance teams for requesting supporting documents during an audit. Auditors and compliance teams require these documents from the first line of defense.

Evidence request: Evidence is all the information used by an auditor in determining the audit opinion. Evidence includes the information contained in the accounting records underlying the financial statements and other information. Evidence is cumulative in nature. It includes evidence obtained from audit procedures performed during the audit. Evidence may also include audit evidence obtained from other sources such as, previous audits.

An evidence request is frequently introduced during the audit preparation or planning phase after the audit announcement. The documents requested are used by the audit team to understand the in-scope controls and processes, and to begin fieldwork testing. As an audit progresses through various stages, the audit team frequently adds new requests to the list. The compliance teams use the collected evidence for control testing.

Starting with version 11.0.2 release, an unplanned evidence request is supported by the Audit Management and Policy and Compliance Management applications in the following ways.

- Evidence can be requested from an engagement and all audit tables. To understand how to request evidence, see Request evidence for audit.
- Compliance teams can request evidence from control owners, business stakeholders, and process owners.
- Audit teams can request evidence from control owners, business stakeholders, process owners, and compliance teams.
- Assigned users can provide evidence directly from the Service Portal.
- Managers can approve evidence requests based on various criteria, such as confidentiality and criticality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Improved communication channels between requesters and assignees streamline the approval process.
- Improved confidentiality constraints prevent unauthorized persons from viewing request information.

Request evidence during audits using the Compliance Workspace

Request evidence at any stage during an audit using the Compliance Workspace. The details about the items for which evidence is requested are also provided to the person responsible for providing the evidence.

Before you begin

Role required: sn_audit.user

About this task

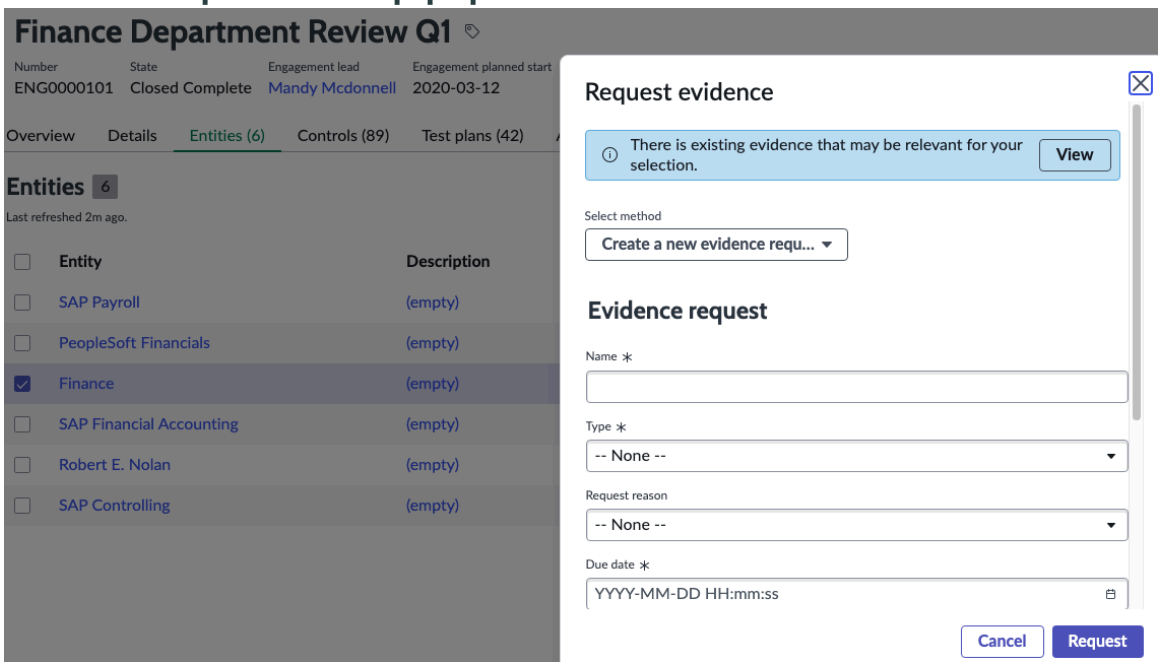
Evidence can be requested in the following three ways:

My Evidence

By creating an evidence record from the **My Evidence** module.

Request Evidence

From the Entity, Control, Audit Task, Control Test Issue, and Other Issues related lists in an engagement record. To request evidence from these sources, navigate to **All** > **Policy and Compliance** > **Compliance Workspace**. In the List view of the workspace, select **Engagements** in the Control testing list. Open the engagement record, and select the related list from which you want to request evidence. Select the **Request Evidence** button. Here, you can either create an evidence request or add more requests to an existing evidence request. The Evidence request is created but not the evidence request tasks.



You can inform the user of the evidence records that already exist for any of the related item tables of the engagement, which they can reuse.

1. To create a new evidence request, select **Create a new evidence request** in the **Select method** list of the Request Evidence pop-up. Enter the details and select the **Request** button.
2. To view the information about existing related evidences, select the **View** link in the Request Evidence pop-up.

> **Note:**
> If there is no existing evidence, then the message does not appear in the Request Evidence pop-up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View link in Request evidence pop-up

3. To view all existing evidences created on the related items, select the Evidence related list.

   When the evidence is in **Closed Complete** state, the UI action buttons such as **New**, **Add existing evidence**, **Remove**, and **Delete** are disabled. You can perform these UI actions only when the engagement or any other audit and compliance object is in an active state.

4. To add existing evidence, select the **Add Existing Evidence** button and select the evidence.

   Note:
   The **Add Existing Evidence** button is available in the Evidence related item of all compliance and audit objects in the Compliance Workspace such as Engagement, Audit task, Issue, Policy, Entity, Control, Control Objective, Authority document, Citations, and Evidence request.

5. To remove the association of the evidences linked to the engagement, select the evidences in the Evidence related list and select the **Remove** button.

   Note:
   The action only removes the association of the existing evidence records from the engagement and doesn't remove the evidence record from the database.

Note:
The logged-in user must also have access to the engagement for which evidence records exist or must be the user who has access to the record to view and add them. If the logged-in user doesn't have access to those records, although there are evidenced existing on those related items, they aren't displayed for the user to add.

Entity, Control, Control Objective, Control Test, Engagement, Issue tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From tables such as Entity, Control, Control Objective, Control Test, Engagement, Issue. However, when the users request evidence from these tables, the evidence request is created not the actual evidence request task. The users must navigate to the evidence request record that is generated and then add evidence request tasks.

In this procedure, the method to request evidence from the **My Evidence** module is described.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ().
3. Navigate to **Evidence requests** > **My request**.
4. Select **New**.
5. On the form, fill in the fields.

Evidence Request form

Field	Description
Number	Unique number of the evidence request.
Name	A name for this request.
Requester	User requesting evidence. This field is automatically populated.
Requested on behalf of	User for whom evidence is being requested.
Type	Type of evidence that is created. Can be either Audit or Compliance.
Request reason	Reason for requesting evidence.
State	State of the request. The default state is **Draft**.
Substate	An additional state for the request.
Description	Detailed description of the evidence request.
Assignment	
Assignment group	Group assigned to provide evidence.
Assigned to	User responsible for providing the evidence.
Watch list	Users interested in viewing the evidence collected. If a person is added on the watch list, they can navigate to **Audit** > **Evidence Request** > **Watched Evidence Requests** to view the requests.
Schedule	
Due date	Expected date of evidence submission.
Opened	Date the request is opened. This date is automatically updated.
Closed	Date the request is closed. This date is automatically updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Activity	
Work notes	Type any notes that might be required.
Activities	Activity log for the request.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

6. Save the form.
   Monitor the state of the Evidence in the stepper of the Overview page. The record progresses through a sequence of logical steps when you accept evidence, request revision of the evidence, and request information.

   The Evidence collection details related list appears. This related list is used to list the items for which evidence is requested.
7. Select **New**.
8. On the form, fill in the fields.

Evidence collection details form

Field	Description
Number	Unique number for the evidence collection detail.
Name	A name for this request.
Evidence collection type	Record for which evidence is requested. If the request was entered by a user with the compliance user role, the available options are: ○ Authority document ○ Citation ○ Control ○ Control objective ○ Control test ○ Entity ○ Issue ○ Policy If the request was entered by a user with the audit user role, the available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Audit task ○ Control ○ Control objective ○ Control test ○ Engagement ○ Entity ○ Issues
Evidence for	Lists all the tables to which the evidence is applied.
Evidence request	Unique number of the evidence request task.
Assignment	
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing evidence.
Instructions	
Evidence collection instructions	Instructions for providing evidence. For example, list of supporting documents, files, and so on.

9. Select **Save**.
10. Select **Request Evidence**.
    When an evidence request is already in the Work in Progress state, and a new evidence collection detail is added, the evidence request task is sent to the assignee immediately. The Evidence related list appears with the list of evidences and the person who is assigned the request receives an email notification to provide the requested evidence. Also, the state of the request changes to **Work in Progress**.You can view the description and monitor the state of the Evidence request in the stepper of the Overview page as it progresses through the evidence request process flow.

Provide requested evidence using the Compliance Workspace

Using the Compliance Workspace, you can provide evidence when you are requested. When evidence is requested, the person who must provide the evidence receives an email. The process to provide the evidence begins.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

When the assignee receives the email to provide the requested evidence, the assignee can either provide the requested evidence or reassign the request to another user. The assignee can also add approvers before sending the requested evidence to ensure additional security of the evidence. If the assignee reassigns the request to some other user, the original assignee can no longer view the request. If the evidence provided does not need an approver, then the assignee

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

can directly request a review of the evidence, and the requester gets a notification to review the evidence.

Procedure

1. Navigate to **Audit** > **Evidence Request** > **My Evidence Request Tasks**.
2. Open the record for which you want to provide evidence.
3. Click **Accept Work**.
4. On the form, fill in the fields.

Evidence form

Field	Description
Number	Number of the evidence request. This value is generated by default.
Requester	User requesting evidence. This value is generated by default. If you are the approver, requester, watch list member, or user in the Assigned to field, then you can edit the details in the **Watch list**, **Name**, and **Description** fields when the evidence is in **New** or **Work in progress** states.
Requested on behalf of	User for whom evidence is being requested. This value is generated by default.
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing the evidence. This value is generated by default.
State	State of the request.
Substate	None. This value is generated by default.
Request reason	Reason for requesting evidence.
Approvers	Users to approve evidence before it is returned to the requester for review. Usually, an approver is the manager of the person providing the evidence.
Watch list	Users interested in viewing the evidence collected.
Name	Name of the evidence request. The name defaults to Evidence collection details name.
Description	Detailed description of the evidence request. The description defaults to the description given in the Evidence request form.
Request Details	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Evidence request	Unique ID of the evidence request associated with the task. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence for	Record for which the evidence is requested.
Evidence for description	Description of the record for which the evidence is being requested. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence collection instructions	Instructions to collect the evidence. If you are the manager or requester, you can edit this field when the evidence request task is in work in progress state.

5. To request approval for the attached evidence, click **Request Approval**.
6. If no approvers are required, click **Request Review**.

Approve evidence before evidence review using the Compliance Workspace

Using the Compliance Workspace, approve the evidence being provided before the requester views the evidence. When evidence is provided in response to an evidence request, the evidence may need an approval before the evidence is sent back to the requester. This ability ensures security and confidentiality of the evidence.

Before you begin

Role required: sn_grc.business_user, sn_grc.business_user_lite

About this task

After receiving a request to approve evidence, an approver can do one of the following:

- Approve the request if there are no issues or concerns.
- Request revision of the evidence attached in case it is not correct or needs rectification.
- Request information if the approver wants more details about the attached evidence.

Procedure

1. Navigate to **Audit** > **Evidence Request** > **My Approvals**.
2. Open the record for which you want to approve evidence.
3. Review the attached evidence on the form and click one of the following options:

Option	Description
Approve	Approve the attached evidence. The requester gets the evidence provided.
Request Revision	Request that the attached evidence be reviewed. Enter comments when you request revision. The assignee gets a notification to review the attached evidence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Request Information	Seek more information and details about the attached evidence. The assignee gets a notification to provide more information about the attached evidence.

Accept, reject, or cancel an evidence request using the Compliance Workspace

Accept, reject, or cancel an evidence request when you receive the evidence you requested. After requesting an evidence request using the Compliance Workspace, when the requester receives the evidence, the requester can accept, reject, or cancel the evidence request.

Before you begin
Role required: sn_compliance.user

Procedure

1. Navigate to **Audit** > **Evidence Request** > **My Pending Reviews**.
2. On the Evidence form, review the attached evidence, and click one of the following options:

Option	Description
Accept Evidence	Accept the evidence that is provided.
Request Revision	Request for the evidence to be reviewed, if it is not appropriate, or modified.
Cancel	Cancel the evidence request task.
Delete	Delete the evidence request task.

Review related evidence using the Compliance Workspace

The Evidence Request feature includes a related list called Related Evidence that is not visible by default.

Before you begin
Role required: admin

About this task
This related list provides a list of evidence that is not directly requested for the current record, but is associated to a related record. For example, the Related Evidence list on the Control Objective form shows evidence requested for associated controls.
The Related Evidence related list is available to a wide variety of forms throughout the Evidence Request feature; however, it is not visible in the base system. You can personalize any of the forms in which it is available, but keep in mind that activating this related list can impact system performance.

Tables that can display the Related Evidence related list

Table name	Type of related evidence displayed
Authority document	Evidence request tasks created on the citations mapped to this authority document.
Citation	Evidence request tasks created on the control objective associated to the citation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables that can display the Related Evidence related list (continued)

Table name	Type of related evidence displayed
Control	Evidence request tasks created on the control test mapped to the control and Issues created for the control.
Control objective	Evidence request tasks created on the controls associated to the control objective.
Control test	Evidence request tasks created on the controls associated to the control test.
Engagement	Evidence request tasks created on the entities, controls, control tests, audit tasks, control test issues, and issues mapped to the engagement are displayed.
Entity	Evidence request tasks created on the controls associated to the entity, Issues created on the entity.
Policy	Evidence request tasks created on the control objective associated to the policy.

Procedure

1. Navigate to the form for which you want to display the **Evidence Request** related list.
2. Right-click in the form header, and click **Configure** > **Related Lists**.
3. Locate the **Related Evidence** item in the **Available** box and move it to the **Selected** box.
4. Click **Save**.

Policy authoring and redlining in Compliance Workspace

Policies are effective when they're carefully monitored and revised periodically. By reviewing and updating them at regular intervals, organizations can maintain updated policies to avoid audit and compliance risks.

Policies of an organization tend to get outdated over time either due to the growth of the organization or due to the changes that happen in an organization structure. For these reasons, policies must be carefully monitored and revised consistently.

Policy owners, collaborators, reviewers, and approvers enable policy authoring and redlining. Review and redlining of policy results in multiple versions that must be maintained for an audit purpose.

Key benefits of policy redlining

It improves the overall policy authoring and redlining experience by enabling:

- Policy owners, collaborators, reviewers, and approvers to collaborate using O365 or Google Drive.
- Redlining and reviewing capability.

Key features

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Policy owners and collaborators can collaborate and draft a policy using O365 or Google Drive.
2. Policy reviewers can collaborate, review, and redline policy.
3. Approvers can review and approve the policy.
4. Ability to maintain different versions of the policy, and retain its history.
5. Ability to copy policy text from a document to the policy text field in HTML, retaining the format.
6. Ability to convert the policy to PDF format.
7. Simplify user experience by guiding the user through policy authoring, redlining, and publishing.

Import policy text for redlining

Import the policy text as an attachment if you're unable to do the word editing.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

About this task

You can import the content only when you're the policy owner and the policy must also be in Draft state.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ().
3. Navigate to **Compliance library** > **My policies**.
   You can create a new policy or open a record to enable the redlining feature.
4. Select a policy to open.
5. Select a Policy text related list to view the contents of the policy text.
   If you do not have Microsoft or Google Drive integration, then you can import the policy text as an attachment. You can import the content only when you're the policy owner and the policy must also be in Draft state.
6. Navigate to **All** > **Policy and Compliance** > **Administration** > **GRC properties**.
7. Select the option **None** in the *`Select a file sharing service to host documents and attachments`* system property list.

   a. Select the **Import policy text** button.

   b. Select **Add File** in the Import policy text pop-up.

   c. Select **Import**.
   The content of the file can be previewed in the **Policy text** field.

Pre-requisites to enable policy redlining feature

Certain configurations are required to be set up for policy collaborators to use the policy redlining feature in the Compliance Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Currently, the policy authoring and redlining feature is available exclusively to ServiceNow cloud-based customers.

Spoke support for cloud hosting services

Spokes required for Policy authoring – integration with Microsoft Office 365

- Microsoft OneDrive Spoke – 2.1.1
- Microsoft OneDrive Spoke for Document Service Framework – 1.0.5

Spokes required for Policy authoring – integration with Microsoft SharePoint

- Microsoft OneDrive spoke 2.3.1
- Document services framework for OneDrive – 2.0.0

Spokes required for Policy authoring – integration with Google Drive

- Document Service Framework for Google Drive Spoke – 1.0.1
- Google Drive Spoke – 1.4.1

Note:
Integration Hub entitlements included in the Compliance Workspace are for Policy authoring – integration with O365 and integration with Google Drive. Using Microsoft integration or Google Drive integration requires Integration Hub transactions not included in the Compliance Workspace product but requires an Automation Engine or Integration Hub entitlement.

Connecting to cloud hosting services

If you're a policy collaborator wanting to use the policy redlining feature in the Compliance Workspace, then you must set up the following configurations.

Note:
You can establish a connection with only one of the following cloud hosting services: either Microsoft or Google Drive.

Microsoft implies both Microsoft OneDrive and Microsoft SharePoint.

Establish a connection with cloud hosting services

Connection with Microsoft OneDrive

You must first set up the Microsoft OneDrive to perform actions in Microsoft OneDrive from ServiceNow. For more information, see Setup Microsoft OneDrive for Document Services.

Note:
To set up connection you require Microsoft Azure App permissions such as email, openid, profile, Files.ReadWrite, offline_access, User.Read, User.ReadBasic.All, Sites.ReadWrite.All.

Connection with Microsoft SharePoint

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You must first set up the Microsoft SharePoint to perform actions in Microsoft SharePoint site from ServiceNow. For more information, see Setup Microsoft OneDrive for Document Services.

The Microsoft OneDrive setup configured in ServiceNow is the same as that is done for Microsoft SharePoint as well. However, the Microsoft Azure App permissions are required for Microsoft SharePoint.

Note:
To set up connection you require Microsoft Azure App permissions such as email, openid, profile, Files.ReadWrite, offline_access, User.Read, User.ReadBasic.All, Sites.ReadWrite.All.

Connection with Google Drive

To set up Google Drive as a cloud hosting service and to create or update the policy text document that resides in Google Drive, you must:

1. Set up Google Drive spoke account.
2. Integrate the Document Services with Google Drive. For more information, see Document Services Framework for Google Drive.
3. To manage documents in Google Docs from your ServiceNow instance, you must integrate the ServiceNow instance with Google docs. For more information, see Set up the Google Docs.

Setting up system properties to connect with cloud hosting services

Enable system properties to use policy redlining in Compliance Workspace

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **GRC properties**.
   a. To opt Microsoft OneDrive as your cloud hosting service, select **One drive** in the *Select a file sharing service to host documents and attachments* system property list.

      If you select **None** in the *Select a file sharing service to host documents and attachments* system property list, then you can import the policy text. For more information, see Import policy text for redlining.

   b. To opt Google Drive as your cloud hosting service, select **Google drive** in the *Select a file sharing service to host documents and attachments* system property list.
   c. To opt Microsoft SharePoint, select **SharePoint** in the *Select a file sharing service to host documents and attachments* system property list.
2. Set the folder path that is to be created in Microsoft OneDrive in the *Default folder path where documents and attachments will be located. You can organize files in sub-folders within this path* system property list.

Provide mp_document_user role

The mp_document_user role is required to access policy redlining document-related tables. This role is required for users using the policy redlining feature to create, update, and delete the related documents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a sys admin you can establish the cloud hosting connection, enable system properties, and provide the mp_document_user role and compliance user (sn_compliance.user) role for the policy redlining users.

Creating and associating policy texts from Cloud documents

You can create and associate a policy text of a policy record with any document that exists in Microsoft OneDrive, Google Drive, or in Microsoft SharePoint. You can sync the policy text and the document in cloud and get the latest version attached to the policy for publishing.

Note:
Policy redlining is enabled only for policy authoring in Compliance Workspace and not in ServiceNow AI Platform.

Although policy redlining as a feature isn't available in ServiceNow AI Platform, the following changes that are made in Compliance Workspace to enable redlining for a policy are also visible in the policy form if you access it in ServiceNow AI Platform:

- Owner field is required.
- Approvers must be identified before you request approval. Previously, the policy can be auto-published even if there was no approver.
- Contributors field is added.
- Policy history related list is available.
- Activity field is added.

However, these changes support the redlining feature of the policy in Compliance Workspace and don't support any policy-related activities on ServiceNow AI Platform.

Contextually, Cloud refers to documents that reside in Microsoft OneDrive, Microsoft SharePoint, or Google Drive.

Create and associate a policy text document in Microsoft OneDrive

Create a policy text document in Microsoft OneDrive and enable document editing with the approvers, reviewers, and contributors. You can share the document with your stakeholders and collaborate on the document editing in real-time.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ().
3. Navigate to **Compliance library** > **My policies**.
   You can create a new policy or open a record to enable the redlining feature.
4. Select a policy to open.
5. For Microsoft OneDrive, select the Policy text related list to view the contents of the policy text.

   a. Select the **Enable document editing** button.
   If the policy is in **Draft** state, then the policy owner can alone create a document or associate a document from Microsoft OneDrive to enable the policy text for editing by the approvers, reviewers, and contributors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. To create a document as a policy owner, select **Create new document** in the **Enable document editing** list.

c. Enter the path of the folder where the document resides in the **Folder location** field. For example, GRC/Folder.

d. Enter the name of the document in the **Document name** field.

e. Select **Create**.

f. To view the document that is created, select the **Open in Word** button.

6. To view the users that have read or write access to the document, navigate to the Document access related list.
7. To create another document or connect to a different document for a redlining-enabled policy, select the **Enable document editing** button.
   To create another document, select **Create new document** that opens the Create a document pop-up.
8. To update the content of the document in the **Policy text** field, select the Update link below the document link.
9. If the policy has been drafted and is complete, the policy owner can request a review by selecting the **Request review** button.
10. Enter a message for the reviewers in the Request review pop-up.
11. Select **Request**.
    As a reviewer, you can view the policy, if ready for review, when you log in to **My pending tasks** in the Tasks view.
12. Select the **Submit review** button.
    You can review the policy text, add a comment in the Submit review pop-up, and submit it.
13. To preview the document and to get the latest update after your collaborators have edited, select the Update link in the **Policy text** tab.
    As a policy owner, you can edit the content of the document in Microsoft OneDrive to maintain a sync between the document in Cloud and the policy text of the policy.

    All activities between the policy owner and the reviewers are captured in the **Activity** tab of the **Details** related list. If all reviewers have completed the review, then the policy owner can complete the publishing checklist.

14. Select the **Complete publishing checklist** button.
    If all reviews are complete, then as a policy owner you can complete the publishing process. This action creates a playbook. The policy owner must go through the publishing checklist before requesting approval. See, Complete publishing checklist for the policy and request approval.
15. To view the history of the policy, select the Policy history related list.
    For more information, see View the history of a redlining-enabled policy.

Connect an existing document in Microsoft OneDrive to policy

Enable redlining in a policy document that is existing in your Microsoft OneDrive instead of creating a document in Microsoft OneDrive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Procedure
1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy.
5. Select a Policy text related list to view the contents of the policy.
   If you already have a document on Microsoft OneDrive with some content in it, which you want to associate with the policy, then you can associate that document.
6. Select the **Enable document editing** list.
   If the policy is in **Draft** state, then only the policy owner can associate a document from Microsoft OneDrive to enable the policy text for the approvers, reviewers, and contributors to edit.
7. To link an existing document with the policy that is enabled for redlining, select **Connect Existing document** in the Enable document editing list.
   a. Enter the location of the folder in the **Folder location** field.
   b. Enter the name of the document in the **Document name** field.
   c. Select **Connect**.
   d. To open the document, select the link.
   e. To update the content of the document in the **Policy text** field, select the Update link below the document link.

   You can still create another document or connect to a different document for a policy that is already enabled with redlining.
8. To create another document or connect to a different document for a redlining-enabled policy, select the **Enable document editing** button.
   To connect to a different document, select **Connect existing document** that opens a Connect existing document pop-up.
   a. Enter the path of the folder where the document resides in the **Folder location** field.
   b. Enter the name of the document in the **Document name** field.
   c. Select **Create**.
   d. To update the content of the document in the **Policy text** field, select the Update link below the document link.

Upload a Microsoft Word document to Microsoft OneDrive

Upload a Microsoft Word document that exists in your local machine to Microsoft OneDrive and link the document with the policy. As a user, you can access the document from any device and enable multiple users to collaborate on the policy document.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Note:
Verify that you have set up the pre-requisite steps appropriately to upload the Microsoft Word document to cloud. For more information, see Pre-requisites to enable policy redlining feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy and click the Policy text related list to view the contents of the policy.
   You can upload a Microsoft Word document that exists locally in your machine.
5. To upload a Microsoft Word document that exists in your local machine to Microsoft OneDrive, select the **Enable document editing** button.
6. Select the **Upload a document** option.
7. Enter the path of the folder or the location where the document must be uploaded in the **Folder Path** field.
8. Select the Add File link to browse and open the Microsoft Word document that exists in your local machine.
   The name of the Microsoft Word document defaults as the **Title** of the file in the Upload a file pop-up. If necessary, you can change the name of the file in the **Title** field.

   Note:
   You can upload only one file at a time to the folder.

9. Select **Upload**.
   The selected file from your local machine is uploaded to the folder path that you'd specified in Microsoft OneDrive.

Create and associate a policy text document in Google Drive

Create a policy text document in Google Drive and enable document editing with the approvers, reviewers, and contributors. You can share the document with your stakeholders and collaborate on the document editing in real-time.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Important:
Google document creation support is enabled from 19.1.1 version of Policy and Compliance Management application

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
   You can create a new policy or open a record to enable the redlining feature.
4. Select a policy to open.
5. For Google Drive, select a Policy text related list to view the contents of the policy text.

   a. Select the **Enable document editing** button.
      If the policy is in **Draft** state, then the policy owner can alone create a document or associate a document from Google Drive to enable the policy text for editing by the approvers, reviewers, and contributors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. To create a document as a policy owner, select **Create new document** in the **Enable document editing** list.

c. Copy the shareable folder link from Google Drive and paste it in the **Folder link** field in the Create a document pop-up.

To get the folder link, right-click the folder in Google Drive, select the ⋮ icon. Select **Share** and **Copy link**.

d. Enter the name of the document in the **Document name** field.

e. Select the type of document that you want to create in the **Type** field.
The options are:

- Google docs: You can create a Google document in Google Drive when you select this option.
- Word: You can create a Microsoft Word document in Google Drive that you can access through a browser and store in Google Drive.

f. Select **Create**.
On selecting create, the document is created in the folder of the Google Drive account that you provided. If you're providing a link to a shared folder, then you must have edit access to create a file within that folder.

g. To view the document that is created, select the **Open in Google docs** button.

6. To view the users that have read or write access to the document, navigate to the Document access related list.
7. To create another document or connect to a different document for a redlining-enabled policy, select the **Enable document editing** button.
   - To create another document, select **Create new document** that opens the Create a document pop-up.
   - To connect to a different document, select **Connect existing document** that opens a Connect existing document pop-up.
8. To update the content of the document in the **Policy text** field, select the Update link below the document link.
9. If the policy has been drafted and is complete, the policy owner can request a review by selecting the **Request review** button.
10. Enter a message for the reviewers in the Request review pop-up.
11. Select **Request**.
    As a reviewer, you can view the policy, if ready for review, when you log in to **My pending tasks** in the Tasks view.
12. Select the **Submit review** button.
    You can review the policy text, add a comment in the Submit review pop-up, and submit it.
13. To preview the document and to get the latest update after your collaborators have edited, select the Update link in the **Policy text** tab.
    As a policy owner, you can edit the content of the document in Google Drive to maintain a sync between the document in Cloud and the policy text of the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All activities between the policy owner and the reviewers are captured in the **Activity** tab of the **Details** related list. If all reviewers have completed the review, then the policy owner can complete the publishing checklist.

14. Select the **Complete publishing checklist** button.
    If all reviews are complete, then as a policy owner you can complete the publishing process. This action creates a playbook. The policy owner must go through the publishing checklist before requesting approval. See, Complete publishing checklist for the policy and request approval.
15. To view the history of the policy, select the Policy history related list.
    For more information, see View the history of a redlining-enabled policy.

Connect an existing document from Google Drive to policy

Connect a document that exists in your Google Drive folder to a policy that you created. Use this existing document and enable redlining in the policy text instead of creating a document.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Important:
Starting from version 19.1.1 Google documents are supported in the connect document policy.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy.
5. Select a Policy text related list to view the contents of the policy.
   If you already have a document on Google Drive with content in it, which you want to associate with the policy, then you can associate that document.
6. To connect a document that is in your Google Drive folder.
   a. Navigate to My Drive in https://drive.google.com/
   b. Select the document that you want to connect to the policy.
   c. Select the More actions icon (⋮) in the document that you want to connect.
   d. Select the **Copy link** option from the **Share** list.
7. Navigate back to the Policy text tab of the policy record.
8. Select the **Enable document editing** list.
   The policy must be in **Draft** state, only then the policy owner can associate a document from Google Drive to enable the policy text for the approvers, reviewers, and contributors to edit.
9. Paste the copied Google Drive in the **File link** field of the Connect existing document pop-up.
10. Select **Connect**.
    You should be able to connect the document from the Google Drive to the policy record.

Note:
However, you can't connect a Google document if it exceeds 10 MB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

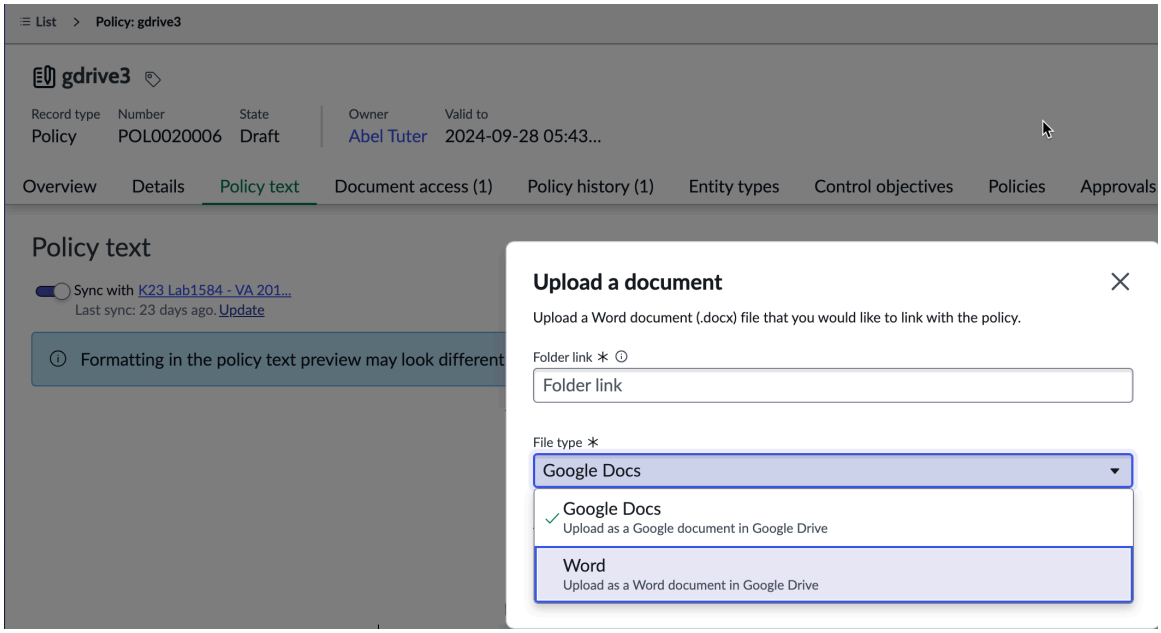
11. Select **Update**.
    The Policy text field displays the text from the Google Drive document in the ServiceNow policy record.

    For more information on Google Drive Integration for Policy authoring and redlining, see the Google Drive Integration for Policy authoring and redlining – General guidelines and Known limitations [KB1587198] article in the Now Support Knowledge Base.

Upload a Microsoft Word document to Google Drive

Upload a Microsoft Word document that exists in your local machine to Google Drive and link the document with the policy. As a user, you can access the document from any device and enable multiple users to collaborate on the policy document.

Before you begin



Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Note:
Verify that you have set up the pre-requisite steps appropriately to upload the Microsoft Word document to cloud. For more information, see Pre-requisites to enable policy redlining feature.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy and click the Policy text related list.
   You can upload a Microsoft Word document that exists locally in your machine.
5. To upload a Microsoft Word document that exists in your local machine to the Google Drive, and attach it to the policy, select the **Enable document editing** button.
6. Select the **Upload a document** option.
7. Enter the shareable link of the folder from Google Drive where the document must be uploaded in the **Folder link** field.
8. Select the **File type** field and click to choose a Google document or Microsoft Word document that you want to upload in the Google Drive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Google Docs: Upload as a Google document in Google Drive.
- Word: Upload as a Microsoft Word document in Google Drive.

9. Select the Add File link to browse and open the document that exists in your local machine. The name of the Microsoft Word document defaults as the **Title** of the file in the Upload a file pop-up. If necessary, you can change the name of the file in the **Title** field.

> **Note:**
> You can upload only one file at a time to the folder.

10. After you have selected the file as an attachment, select **Upload**.
11. After the file is attached, select **Upload**.
    The selected file is uploaded to the Google Drive folder link that you'd specified.

Create and associate a policy document in Microsoft SharePoint

Enable redlining in a policy document that exists in your Microsoft SharePoint location instead of creating a document in Microsoft SharePoint and associating the document with the policy record.

Before you begin

Role required: Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

> **Important:**
> Policy redlining integration with Microsoft SharePoint is available from Washington DC ServiceNow AI Platform version. The feature isn't available even if you are on the 19.x version of Vancouver.

About this task

Apart from associating documents that reside in Microsoft OneDrive and Google Drive, you can now associate documents that are in Microsoft SharePoint site to your policy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
   You can create a new policy or open a policy record to associate a document.
4. Select a policy to associate a policy document from the Microsoft SharePoint site.
   You can create a document in the Microsoft SharePoint site and associate with the policy record when the policy is in Draft state.
5. From the Policy text related list of the policy record, select the **Enable document editing** UI action list and click the **Create new document** option.
6. Enter the URL to the site in the **Site URL** field of the Create a Word document pop-up.
   If you hover over the Site URL icon, you can get the site URL location information.
   a. To get the site URL, log in to the Microsoft SharePoint site.
   b. Select the **Share** list and click the **Copy link to page** option.
7. Enter the path of the folder that you copied in the **Folder location** field.
   This path is the location where the document resides.
8. Enter the name of the document in the **Document name** field.
9. Select **Create**.
   On selecting create, the document is created in the folder of the Microsoft SharePoint account that you provided. If you're providing a link to a shared folder, then you must have edit access to create a file within that folder.

   After the document is created, the contributors and policy owners who have access to the policy in the Draft state can edit the document in Microsoft SharePoint to add content.
10. To update the content in the **Policy text** field of the policy record, select the Update link below the document link.
    Alternatively, you can also select the **Open in Word** button.

    The content that is present in the specified document of the Microsoft SharePoint location is copied to the **Policy text** field. A message stating that **Policy text is updated with the latest content from policy document in the cloud** confirms that the content in the policy text and the document are in sync.
11. To view the users that have read or write access to the document, navigate to the Document access related list.
    After the document is associated with the policy record, the access for the policy users to the document is also established. The access to the policy document varies with users depending on their roles and the state of the policy.

    Draft

    If the policy is in Draft state, the Owner and Contributors have edit access.

    Review

    If the policy is in Review state, the Reviewers and Owners have edit access. However, the Contributors and Approvers have only read access.

    Approved

    If the policy moves to the Approved state, all the stakeholders of the policy have only read access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also verify the users' access rights by navigating to the Microsoft SharePoint document, selecting the **Share** list in the Microsoft SharePoint document and clicking **Manage Access**. Sometimes the access rights that users have on the ServiceNow policy document may not be the same as the rights that users have when they collaborate on the document in the Microsoft SharePoint site. This difference is because of the root permissions that are set in Microsoft SharePoint site, which get inherited to the folders within the site. The users of the folders within the site inherit those permissions. You can override the permissions.

a. To override the Microsoft SharePoint site permission, select the settings icon ( ).

b. Select the **Site permissions** option in the **Settings** list.

c. Right-click the folder where the document resides and select **Manage Access**.

d. Select **Advanced settings** and click **Stop Inheriting Permissions**.
This folder no longer inherits permissions from the parent or from the level of the Microsoft SharePoint site. Now, when you provide access to the document from ServiceNow, then the same level of access that you see in the Document access related list will be available to the users collaborating on the Microsoft SharePoint document also.

12. If the policy has been drafted and is complete, the policy owner can request a review by selecting the **Request review** button.

a. Enter a message for the reviewers in the Request review pop-up.

b. Select **Request**.
As a reviewer, you can view the policy when you log in to **My pending tasks** in the Tasks view, if it's ready for review.

c. Select the **Submit review** button.
You can review the policy text, add a comment in the Submit review pop-up, and submit it.

13. To preview the document and to get the latest update after your reviewers have reviewed, select the Update link in the **Policy text** tab.
Reviewers can add suggestions and comments in the document by selecting **Review** > **Track Changes** > **For everyone** in the Microsoft SharePoint.

As a policy owner, you can fetch the updated content of the document from Microsoft SharePoint by selecting the **Update** link. This action maintains a sync between the content present in the Cloud document and the content in the policy text field of the policy.

Note:
Updates done frequently aren't captured in the version history records of Microsoft SharePoint and the content may not be available in real time. Therefore, there can be a delay in fetching the latest updated content from Microsoft SharePoint to the policy text field.

All activities between the policy owner and the reviewers are captured in the **Activity** tab of the **Details** related list. If all reviewers have completed the review, then the policy owner can complete the publishing checklist.

14. Select the **Complete publishing checklist** button.
If all reviews are complete, then as a policy owner you can complete the publishing process. This action creates a playbook. The policy owner must go through the publishing checklist

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

before requesting approval. See, Complete publishing checklist for the policy and request approval.

After the publishing process is complete, you can either attach the policy as a PDF to the policy record or generate a Knowledge Base article when the policy moves to the Published state.

15. Select the attachments icon ( ) in the sidebar of the policy's Overview related list to see the PDF version of the Knowledge Base article.
16. To view the history of the policy, select the Policy history related list.
For more information, see View the history of a redlining-enabled policy.

Connect an existing document in Microsoft SharePoint

Connect a document that exists in your Microsoft SharePoint folder to a policy that you created. Use this existing document and enable redlining in the policy text instead of creating a document.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy.
The policy must be in **Draft** state, only then the policy owner can associate a document from Microsoft SharePoint to enable the policy text for the approvers, reviewers, and contributors to edit.
5. Select the Policy text related list to view the contents of the policy.
If you already have a document on Microsoft SharePoint with relevant policy content, which you want to associate with the policy, then you can associate that document to the policy.
6. To connect a document that is in your Microsoft SharePoint folder.
   a. Log in to Microsoft SharePoint site.
   b. Navigate to the document that you want to connect to the policy.
   c. Select the **Share** list in the Home page and click the **Copy link to page** option.
7. Navigate back to the Policy text related list of the policy record.
8. Select the **Enable document editing** list and click the **Connect existing document** option.
9. Paste the copied Microsoft SharePoint site URL in the **Site URL** field of the Connect existing Word document pop-up.
10. Enter the details in the **Folder path** and **Document name** fields.
11. Select **Connect**.
A message appears stating that Microsoft Word editing is enabled. The policy record is connected to the document.
12. Select **Update**.
The **Policy text** field displays the text from the Microsoft SharePoint document in the ServiceNow policy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upload a Microsoft Word document to Microsoft SharePoint

Upload a Microsoft Word document that exists in your local machine to Microsoft SharePoint and link the document with the policy. As a user, you can access the document from any device and enable multiple users to collaborate on the policy document.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Note:
Verify that you have set up the pre-requisite steps appropriately to upload the Microsoft Word document to the cloud. For more information, see Pre-requisites to enable policy redlining feature.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy and click the Policy text related list to upload a document.
   You can upload a Microsoft Word document that exists locally in your machine.
5. To upload a Microsoft Word document that exists in your local machine to the Microsoft SharePoint site, select the **Enable document editing** button.
6. Select the **Upload a document** option.
7. To copy the URL of the Microsoft SharePoint site, navigate to the Microsoft SharePoint site Home page, select **Share** and click **Copy link to page**.
8. Enter the copied URL of the Microsoft SharePoint site in the **Site URL** field.
9. Enter the path of the folder where the document must be uploaded in the **Folder Path** field.
10. Select the Add File link to browse and open the Microsoft Word document that exists in your local machine.
    The name of the Microsoft Word document defaults as the **Title** of the file in the Upload a file pop-up. If necessary, you can change the name of the file in the **Title** field.

    Note:
    You can upload only one file at a time to the folder.

11. After you have selected the file as an attachment, select **Upload**.
12. After the file is attached, select **Upload**.
    The selected file from your local machine is uploaded to the folder path that you'd specified in the Microsoft SharePoint site.

Sync document and view policy text

Update the document and view the content in the Policy text field.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

About this task
Contextually, Cloud refers to documents that reside in Microsoft OneDrive, Microsoft SharePoint and Google Drive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy to open.
5. Select the **Policy text** tab to view the contents of the policy.
6. Select **Update**.
   The **Policy text** field is updated with the latest content from the document.

   As there are many collaborators on the policy, you must update the content to get the latest update. Last sync information helps you to know when the document was last synced.

   Note:
   If the document size exceeds 10 MB, then you can't fetch the latest document to view its latest content in policy text tab.

7. To open the content, select the document link next to **Sync with** in the **Policy text** field or select the **Open in Word** button in case of Microsoft OneDrive or the **Open in Google docs** button in case of Google Drive.
   - The **Sync with** Word action is enabled or disabled by default for all the policy records that are redlining enabled based on the value in **Enable redlining document text sync by default** property that is set to **true** by the base system.

     You can opt to enable or disable sync at the individual policy level by selecting the sync toggle in the Policy text tab of the policy record.

   - If you enable **Sync with**, then the document cannot be simultaneously edited both in the Cloud and in the **Policy text** field. The content can be updated in the Cloud and can be pulled into the **Policy text** field.
   - If you disable Sync with, then your policy text document content is disconnected from the Cloud document and you can edit the content independently. You can save this content by selecting the **Save** button.

     In the disconnected state, if one of the reviewers had updated the policy text and logging in as a policy owner if you select the **Complete publishing checklist**, then the **Attach policy as PDF** becomes a required step to attach the PDF.

     You must manually remove the previous policy attachments, if any, and confirm before you attach the current policy as a PDF in the playbook.

   You can also view the policy text in the Details related list. If you update the policy text in the Details related list, then the policy text is automatically updated in the **Policy text** field of the Policy text related list.

   For a policy that is redlining enabled or not

   - If you are a compliance user and if the policy is in the draft state, then you can edit the policy text.
   - If you are an owner or a reviewer and if the policy is in the review state, then you can edit the policy text.

   For redlining-enabled policy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In addition to the preceding conditions, you can also edit the policy text for a final review and correction after you complete the publishing checklist and before requesting approval and publishing.

You can then complete the publishing checklist, request approval, and publish the policy.

Provide document access to policy users

Grant access to the users who have assigned roles to collaborate on the redlining-enabled policy.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the list icon ( ).
3. Navigate to **Compliance library** > **My policies**.
4. Select a policy to open.
5. To view all the users of this policy and their respective roles who can access the document, select the **Document access** related list.
   The **Document access** related list is visible only when policy redlining is enabled for the policy. The Document access [sn_irm_shared_cmn_document_access] table stores the created and updated information of the policy record whenever there were corresponding changes to the user roles such as approvers, contributors, reviewers, or owners who have access to the redlining-enabled policy.

   The users identified in the **Policy Assignment** section of the Details related list as Owners, Approvers, Reviewers, and Contributors are users listed in the Document access related list for the redlining-enabled policy. A user can also have multiple roles.

   The **Status** column reveals the status of access each user has on the policy.

   A valid email address of the user, configured in the sys_user table, is required to access the document hosted in cloud from the Document Access related list.

   Note:
   Although users of Microsoft OneDrive are granted edit access, not all of them can edit the document. The edit access depends on the state of the policy.

   - If the policy is in Draft state, the Owner and Contributors have edit access. The Approvers and Reviewers get read access only.
   - If the policy is in Review state, the Owner and Reviewers have edit access to the document. Contributors at this state do not contribute to the policy and can only read the document. Approvers also have only read access.
   - If the policy is in Awaiting approval, Published, or Retired states, then all users have read access only.

Complete publishing checklist and request policy approval

Use the playbook available with Compliance Workspace to complete the publishing checklist before you request approval. If approvals are complete, then the policy is automatically published.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the list icon ().
3. Navigate to **Compliance library** > **My policies**.
4. Select the policy publishing checklist icon () in the right panel.
   A playbook checklist is created.
5. Complete the activities as a policy owner in the playbook.

Publishing policy playbook activities

Activity	Description
Finalize document	Complete the task of accepting or rejecting the track changes and removing open comments. To avoid having internal comments in the published policy and thereafter in the Knowledge Base article, you must clean up the document. **a.** Select **Open Document** to open the document and remove the comments. **b.** After the document is auto-saved, select **Mark Complete** to mark the step as complete and to pull the updated content from Microsoft OneDrive, Microsoft SharePoint, or Google Drive account to this section.
Review formatting	Review the formatting of the text in the **Policy text** field before it's published as Knowledge Base article and select **Mark Complete**.
Review attachments	Review the existing policy attachments and remove documents that are outdated. You can also add new attachments to the policy at this stage.
Attach policy as PDF	Attach the policy document as a PDF to the Knowledge Base article. Attaching a PDF is recommended if your Microsoft OneDrive, Microsoft SharePoint, or Google Drive document and the **Policy text** field aren't in sync. **a.** Select **Attach** to append the PDF to the policy. **b.** Select **Mark Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity	Description
	Note: Starting with the Xanadu release you can also generate accessible PDFs. In order to generate an accessible PDF you must set the property `com.snc.document.conversion.accessibili` to true. To enable the property, see Enable accessibility features for DOCX to PDF conversion.
Review Publishing settings	Refresh the browser after completing this step. Update the policy Knowledge base and the Policy template fields if necessary, and mark the step as complete.

The **Complete publishing checklist** button is no longer available.

6. To view your attachments, select in the right panel.
7. Select the **Request approval** button to request approval for the policy.
8. Select **Approvers** in the Request approval pop-up.
9. Select **Request**.
   The policy moves to the **Awaiting approval** state.

   The policy approver can view the policy by navigating to the Approvals related list of the policy. Based on the approver's action, the policy either gets approved or rejected. If rejected, the policy moves back to the Draft state.
10. To edit a published policy, select the **Edit policy** button.

View the history of a redlining-enabled policy

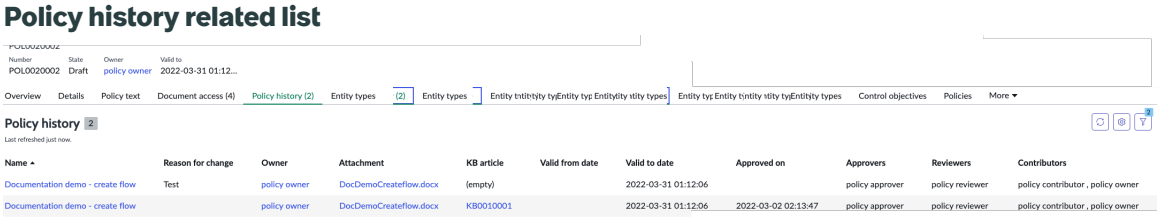
Use the policy history related list to track the modifications made to the policy document.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst; mp_document_user

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon ( ).
3. Navigate to **Compliance library** > **My policies**.
   You can create a new policy or open a record to enable the redlining feature.
4. Select a policy to open.
   If the policy is already published and requires a review, then reopen the policy for the review and approval processes.
5. To update the published policy, select the **Edit policy** button.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter a reason for updating the policy in the **Reason for edit** field of the Edit policy pop-up.

b. Select the **Edit** button.
Edit policy action moves the policy back to the Draft state and opens it for yet another round of review and approval processes. When this cycle is complete and the policy is published, another record is created in the policy history.

6. Select the Policy history related list.
The history of the policy document with the basic information such as the name of the policy, reason for change, policy owner, the latest version of the policy text as an attachment, the validity period of the document, the approvers, reviewers, and contributors of the document are added when the policy is created. However, the Knowledge Base article is created only after the policy is published. So is the **Approved on** field updated when the approvers approve and the policy is published.

   The records are added and are maintained in the policy history list whenever there's a change made to the policy and reviewed, approved, and republished.

   You can view the entire history of the corrections and modifications made to the policy document from the time it was created. Update the policy document periodically to keep the policies current and up to date with the changing business processes. Maintaining a history of the policy document helps organizations track the next review cycle according to the changing business needs.

Set up dynamic approval configuration on a policy record

A policy is a set of guidelines and rules established by a business organization to govern its operations. Creating an approval configuration record for a policy enables you to define one or more approval levels and approval rules based on various dynamic conditions.

Beginning with the Xanadu release, you can set up dynamic approval configuration on a policy record. The policy table consists of the policy records that regulate the status of the policies. Before implementing a policy, it goes through a review and approval process.

Setting up dynamic approval configuration on a policy record enables you to define multiple levels of approvals based on various dynamic conditions such as policy type, state, and owner that are related to the policy fields. When you set up dynamic approval configuration on a policy record, the approvers for a policy are added dynamically to the policy record.

Limitations of adding the approvers manually

The existing approval configuration process uses the manual approach that has the following limitations:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The approval configuration process uses a single level of approval. If multiple levels of approval are not used, it increases the possibility of introducing errors and oversights in the approval process.
- The approvers for a policy cannot be changed based on dynamic or changing conditions of the approval process.
- The approvers are added manually to the record. The process can be time consuming, especially in large organizations or complex decision-making structures.
- Adding the approvers manually can lead to significant delays. Waiting to receive all approvals can slow down the decision-making process and decrease productivity.

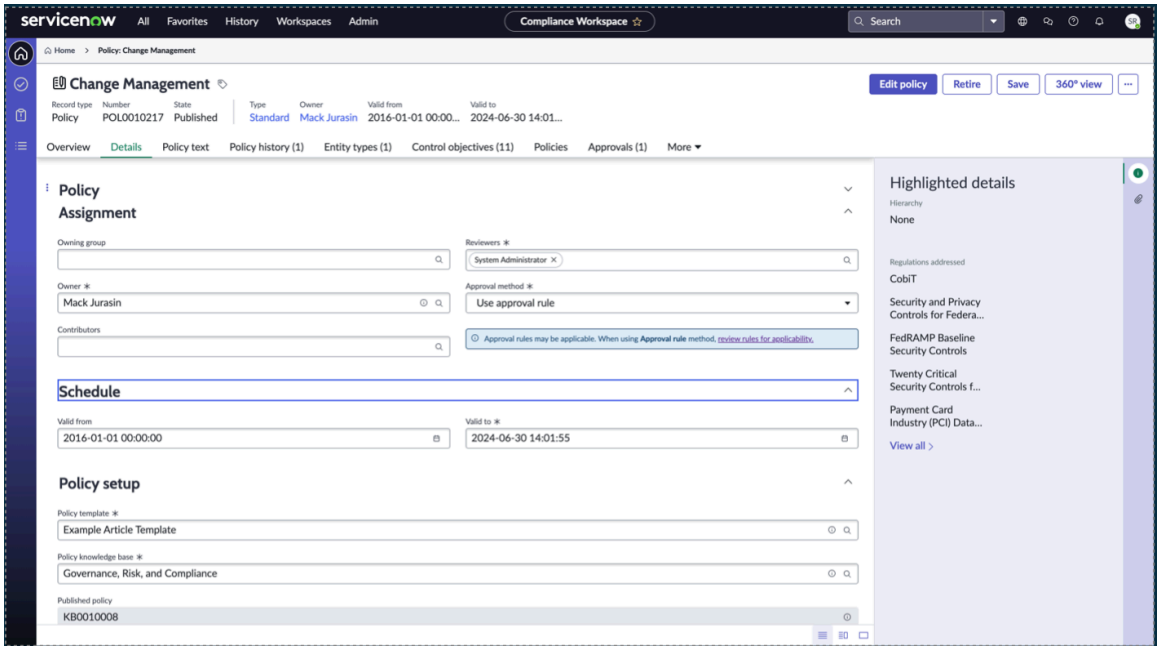
Benefits of dynamic approval configuration

Setting up dynamic approval configuration on a policy record offers the following benefits:

- Organizations often encounter dynamic and changing environments. Having the flexibility to change the approvers allows the approval process to adapt to shifting circumstances. It ensures that the most appropriate individuals are involved in the approval process at any given time.
- For complex or high-stake decisions, configuring multiple levels of approvals enables the reviewers to conduct a comprehensive review of relevant factors. It ensures that the decisions are not rushed and that the potential impacts are carefully assessed for different scenarios.
- Changing the approvers dynamically can streamline the approval process and reduce the administrative overhead, thereby saving time and resources.

Use cases for requesting multiple levels of approvals

Approval configuration can help create complex approval levels without manually adding approvers for each policy. In some cases, a policy owner may want to conduct multiple levels of approvals for a policy. For example, a policy is related to the HR domain. The compliance team, legal team, and HR team want to review and approve it. The policy owner can assign the HR team as Level 1 approvers of the policy.



When the HR team approves the policy, it is assigned to the Compliance team for Level 2 approval. It is then assigned to the legal team for Level 3 approval of the policy. Also, the policy owner may want to select the approvers dynamically based on certain rules that match with the policy.

This use case highlights the importance of integrating dynamic approval configuration with a policy and configuring the policy approval rules with Approval Configurator.

Approval configurator

To use the approval configuration, the approval method on the policy should be selected as **Use approval rule** as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval configuration should be created for the policy and valid approval rules should be configured for the users.

In the Compliance Workspace, you can navigate to **Policy Approval Rules** to configure the approval rules.

Configuring policy approval rules using Approval Configurator

You can set up various approval rules using the Approval Configurator:

- Set up multi-level approval rules based on dynamic conditions.
- Send approvals to a user or a group of users selected from a field from the source record or select the user or groups manually.
- Set up only one approval or all approvals as required approvals.

To set up approval configuration on a record, see the following sections.

1. To set up an approval configuration record, see Set up an approval configuration record.
2. To assign an approval level for the approval configuration record, see Assign an approval level for the approval configuration record.
3. To set up an approval rule for the approval level in the approval configuration record, see Set up an approval rule for the approval level.

Note:

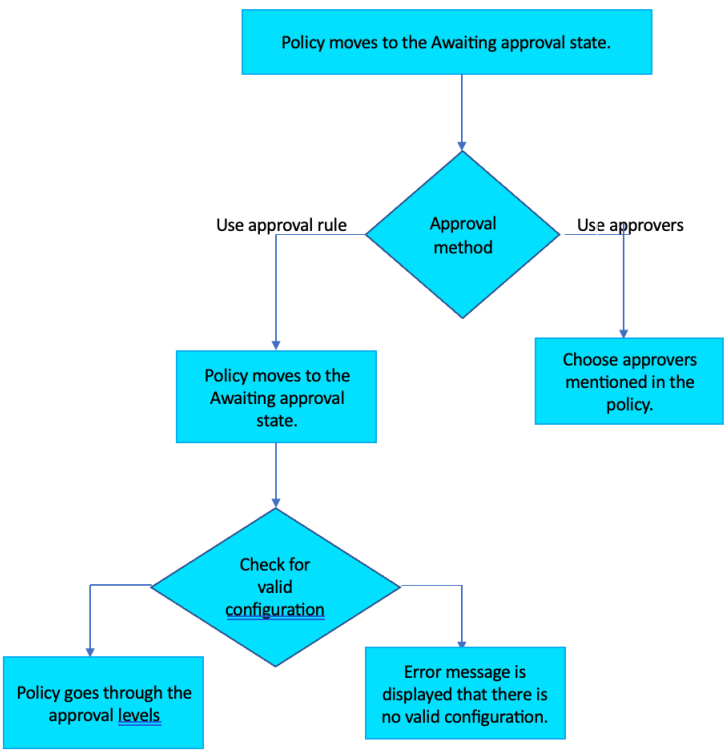
For more information on the roles in the GRC: Approver Configurator application, see Roles installed with GRC: Approver Configurator.

Roles required for creating policy approval rules

To create the policy approval rules, the following roles are required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A user with the sn_compliance.manager role can create policy approval rules with the sn_grc_appr.admin role.
- Users with the sn_grc.business_user and sn_grc.business_user_lite and above roles can view a policy.
- A user should have mp_document_user with either the sn_grc.business_user or sn_grc.business_user_lite role to access the document when redlining is enabled.



Workflow for setting up approval configuration

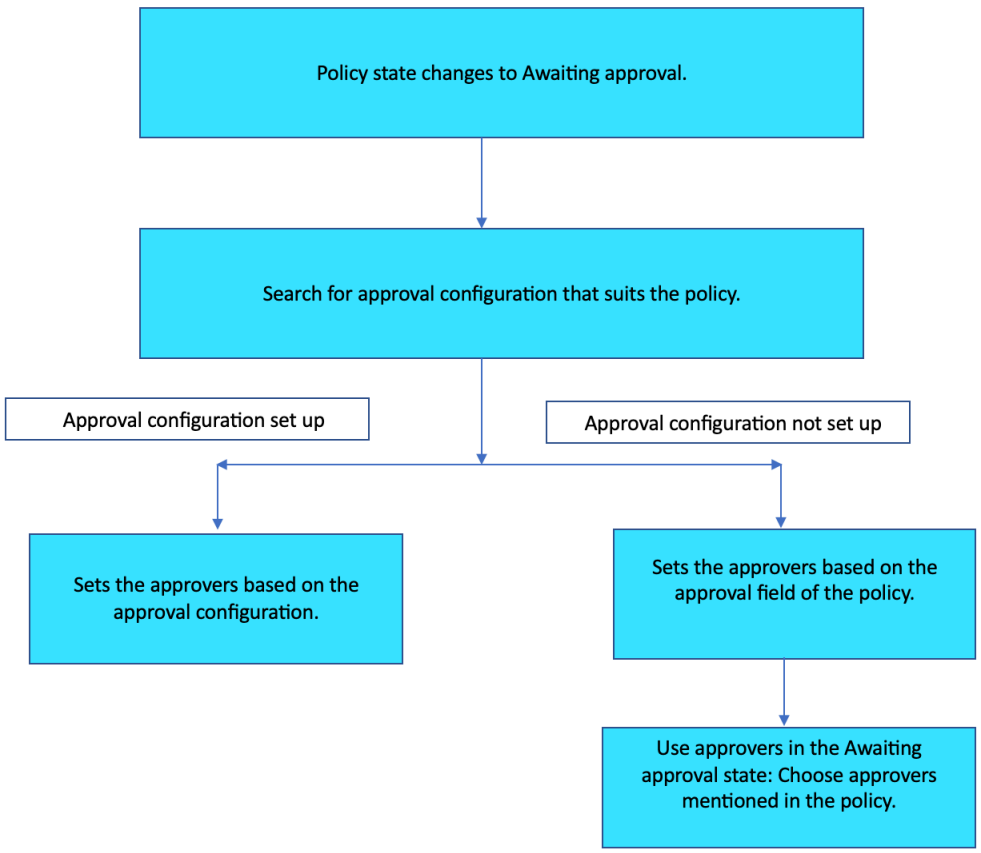
When you set up approval configuration on a policy record, the workflow contains the following steps.

1. When an approval is requested for a policy record, the state of the policy changes to the **Awaiting approval** state.
2. If the approval method is selected as **Use approvers**, it uses the approvers mentioned in the policy record.
3. If the approval method is selected as **Use approval rule**, it checks for a valid configuration that suits the policy record. The dynamic approval configuration searches for the approval configuration record that is related to the policy.
4. The dynamic approval configuration then retrieves the approvers from each approval level record and sends an approval request for each level.
5. If a valid configuration is not found, an error message is displayed that there is no valid configuration for the policy.

The workflow steps are shown in the following example.

Workflow for setting up approval configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

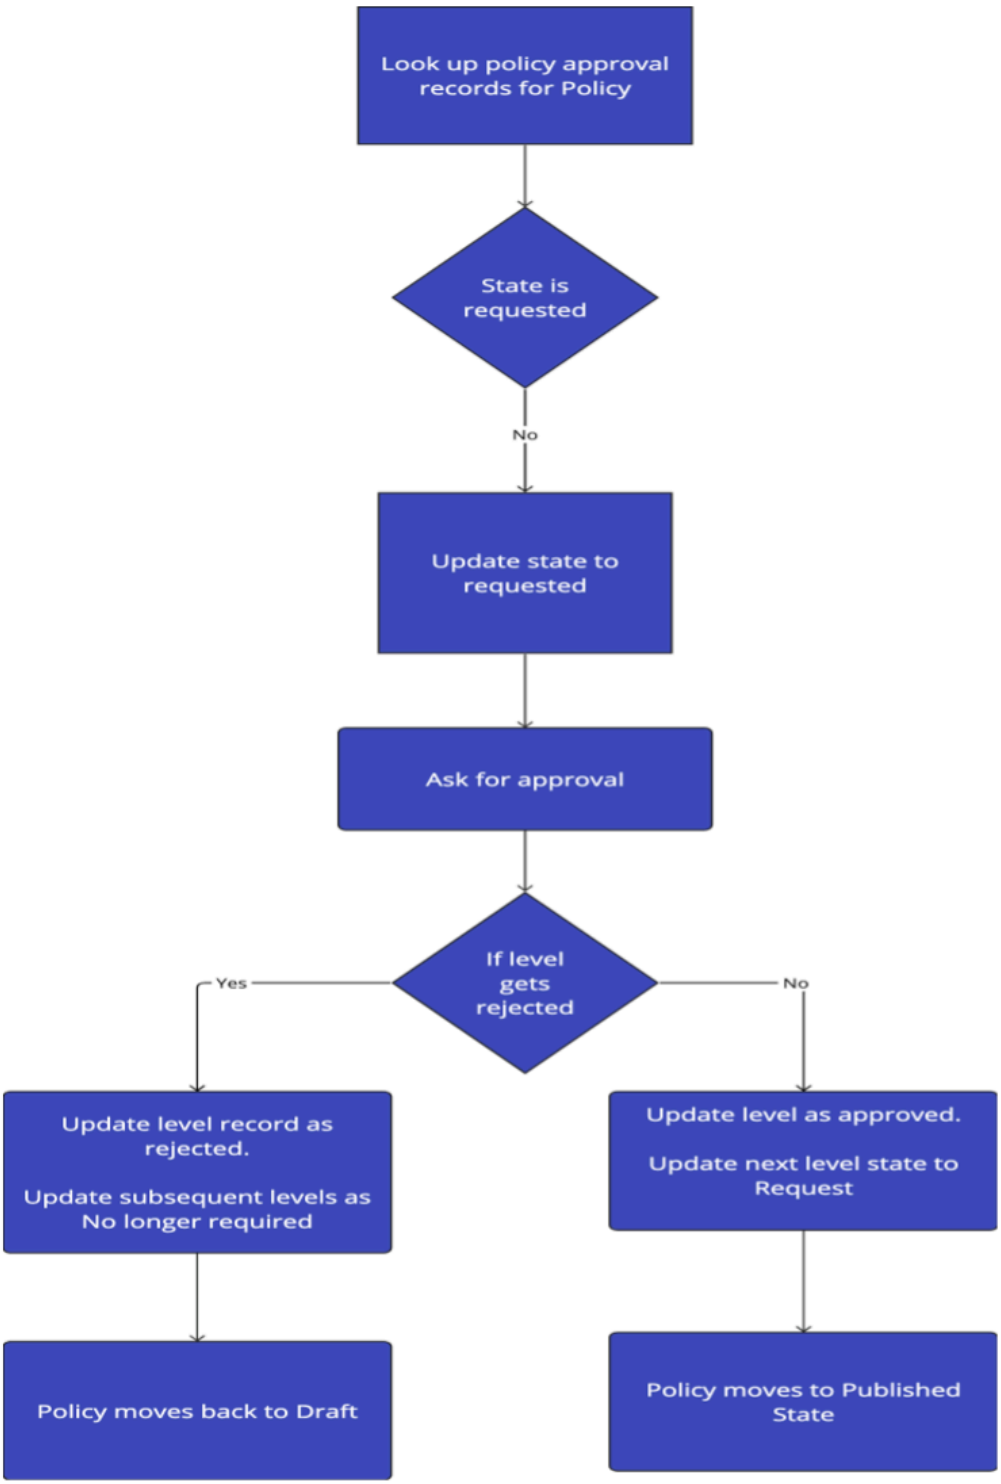


If you are the policy owner, you can select the approvers for the policy in the **Approvers** field of the Policy form. The approvers are usually the users who have the Compliance User role. If you do not have proper access, you cannot access the policy record. To request access to the policy record, you must contact the Compliance Administrator.

Integrating dynamic approval configuration with a policy

To integrate dynamic approval configuration with a policy record, you can set up multiple approval levels and for each level, you can set up the approval rules. Based on the approval levels and rules setup, the approvals are triggered automatically. When one level is approved, the policy record is submitted for the next level of approval.

The workflow for integrating dynamic approval configuration with a policy is shown in the following example and steps.



Integrating dynamic approval configuration with a policy

- When an approval is requested for the policy, the state of the policy changes to the **Awaiting approval** state.
- The dynamic approval configuration searches for the approval configuration record that is suitable to the current policy.
- If dynamic approval configuration is not set up on a policy record or even though it is set up, it is not applicable to that particular policy record, an error message is displayed that no valid configuration is found for the policy record and the record gets aborted. Users have to go back to your policy record and select the approvers or create a valid configuration for the policy record.
- If dynamic approval configuration is set up, the approvers, approval levels, and rules are added based on the configuration of the approval configuration record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The complete workflow is shown in the following example.

Components used for dynamic approval configuration

The following components are used for setting up the dynamic approval configuration on a policy:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Policy approval rules module creates or checks the approval configurations with the source table as policy.
- The Policy approval table stores the approvers of each level of the approval configuration. It can be used for tracking the status of the approval levels.
- Based on the current level decision, the policy either gets forwarded to the next level of approval or if it gets rejected, it is reset to the **Draft** state. If all levels are approved, the policy moves to the **Published** state.

Configure dynamic approval configuration on a policy

Set up dynamic approval configuration on a policy. Based on the configured approval levels, the Policy and Compliance Management application configures one or more approval rules on the policy record.

Before you begin

Role required: sn_compliance.manager, sn_compliance.user

About this task

A user with the sn_compliance_ws.corporate_compliance_manager role can create dynamic approval configuration and a user with the sn_compliance_ws.corporate_compliance_user role has read permission for the policy record.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon.
3. Navigate to **Compliance library** > **My policies** and select **New**.
4. Enter the name of the policy.
5. In the Policy Assignment panel, update the **Owner** and **Reviewers** fields.
6. Select the approval method in the **Approval method** field.

   For more information on creating a policy in the Compliance Workspace, see create a new policy.

   Note:
   If dynamic approval configuration is not set up on the policy record, the approvers are added in the **Approval** field of the policy.

7. In the Schedule panel, update the date for the record in the **Valid to** field.
8. Select **Save**.
9. Select **Request approval**.

   The policy owner can request approval and complete the workflow on the policy record. For a given approval configuration on the policy record, the system applies the configured approval rules dynamically at each approval level. Once the **Awaiting approval** state is triggered and the **Use approval rule** option is selected as the approval method, the field gets populated with the details such as the configuration being used for the approvers.

   If the policy gets rejected at any level, it is reset to the **Draft** state. When all levels are approved, the policy moves to the **Published** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure dynamic approval configuration on a policy with redlining enabled

Set up dynamic approval configuration on a policy for which redlining is enabled.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_manager, sn_compliance_ws.corporate_compliance_user

About this task

A user with the sn_compliance_ws.corporate_compliance_manager role can create dynamic approval configuration and a user with the sn_compliance_ws.corporate_compliance_user role has read permission for the policy record.

To use dynamic approval for policy redlining, ensure that the redlining setup is done and the users in the approver rule have required roles for document access. When redlining is enabled, a user should have the mp_document_user role with either the sn_grc.business_user or sn_grc.business_user_lite role to access the documents.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, select the List icon.
3. Navigate to **Compliance library** > **My policies** and open a policy record.
   You can create a new policy or open a policy record to enable the redlining feature.
4. Select the Policy text related list to view the contents of the policy text.
   a. Select the **Enable Word editing** button.
   b. To create a document as a policy owner, select **Create new document** in the **Enable Word editing** list.
   c. Enter the path to the Folder including the Folder name in the **Folder link** field in the Create a document pop-up.
   d. Enter the name of the document in the **Document name** field.
   e. Select **Create**.
5. Select the **Request review** button.
6. Select **Request**.
7. Select the **Complete publishing checklist** button.
   You can complete the tasks in the publishing checklist. For more information on redlining, see Policy authoring and redlining in Compliance Workspace.
8. Select **Save**.
9. Select **Request approval**.

   If an active dynamic approval configuration does not have any users associated with it, it is not considered as a valid configuration. In such cases, selecting **Request approval** returns an error message: `Could not request approvals because matching approval rule could not be found. Make sure to configure appropriate approval rule for this policy here.` To rectify the error, edit the configuration and request approval again.

   The **Document access** tab displays the revised list of the users who can access the policy as described in the following example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. When the policy first moves to the **Awaiting approval** state, approval configuration is applied on the policy record. If the policy has two levels of approval, the document access is provided only to level 1 users by default. Group users of level 1 can get access through the **Request document access** UI action.

b. Once level 1 users approve the policy, the document access is added for level 2 users. If any user rejects the policy at level 1, it moves to the **Draft** state.

c. When the policy moves to the **Awaiting approval** state again, next level of approval configuration (for example, approval configuration 2) is applied on the policy record. In this case, all users that are common between the two levels and have access to the document, can access the policy and the document access is removed for the rest of the users.

The **Request document access** UI action is visible to the users with the business user role and business user lite role. If any user groups do not have these user roles, they cannot access the document. The approvers have the view access or comment access in the approval state.

Note:
In the approval rule, the access is given to the individual users only and not to the group users. Giving access to many users in the group can lead to performance issues.

If you are a group user, you must select **Request document access**. The group users can log in as one of the users in the group and select **Request document access**. The group users are then granted the document access and a message is displayed: `Doc access request has been raised, please refresh or try to access document in a few minutes.`

In the approval configuration workflow, if an approver rejects the policy at any level, it moves to the **Draft** state. The **Document access** tab in the form displays a list of the users who have access to the policy with the roles and status displayed. Only level 1 users can access and review the record. When level 1 users approve the record, then the document access is provided to level 2 users, and so forth.

When all levels are approved, the policy moves to the **Published** state.

10. In the **Policy text** tab, select **Open in Word**.

The Word document opens up in the tab. In the **Manage access** tab of the document, you can also view the users who have permissions to view the document. The configured policy approval rule is displayed in the **Approval rule** field. The Approval levels related list displays information on the approval levels, users, and status of the approval for the policy record.

If the policy gets rejected at any state, it is reset to the **Draft** state. Once the approvers approve the policy, it moves to the **Published** state.

360° Relationship Visualization for Policy and Compliance Management

When you launch the 360° view from a particular compliance record, you can instantly explore the relationship between the selected record and all its associated objects in a distinctive visualization.

360° view

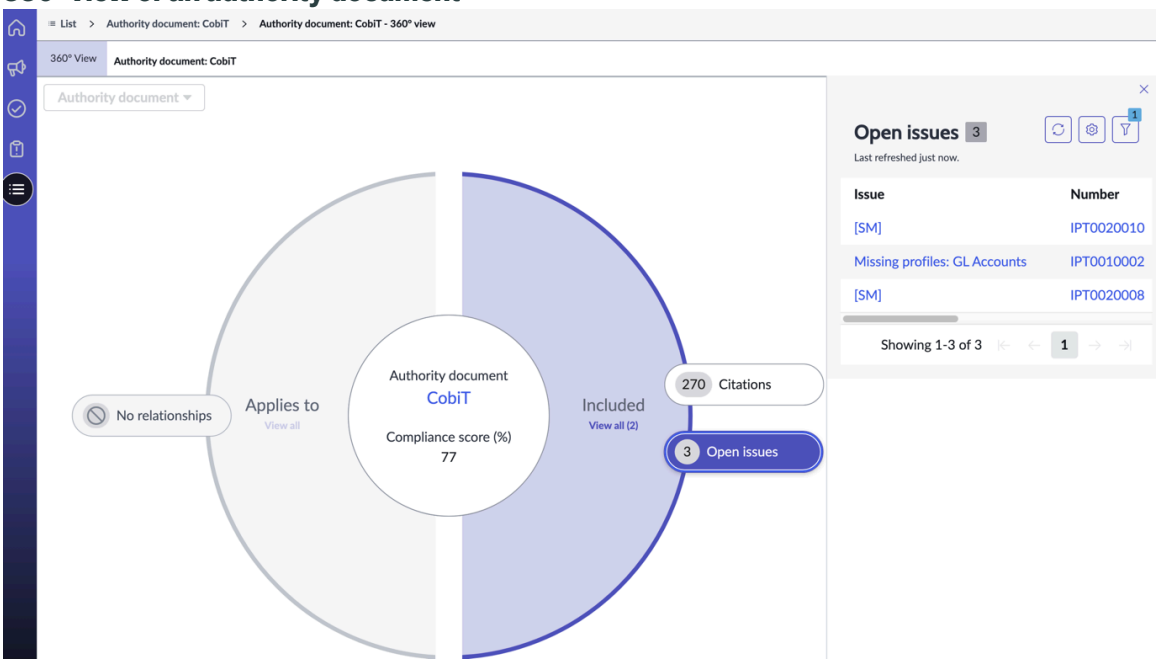
In Policy and Compliance Management, the 360° relationship view button is enabled in the following workspace forms:

- Authority document [sn_compliance_authority_document]
- Policy [sn_compliance_policy]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Citation [sn_compliance_citation]
- Control [sn_compliance_control]
- Control objective [sn_compliance_policy_statement]

To explore the 360° view and for instructions to launch the view, see Exploring the 360° view.

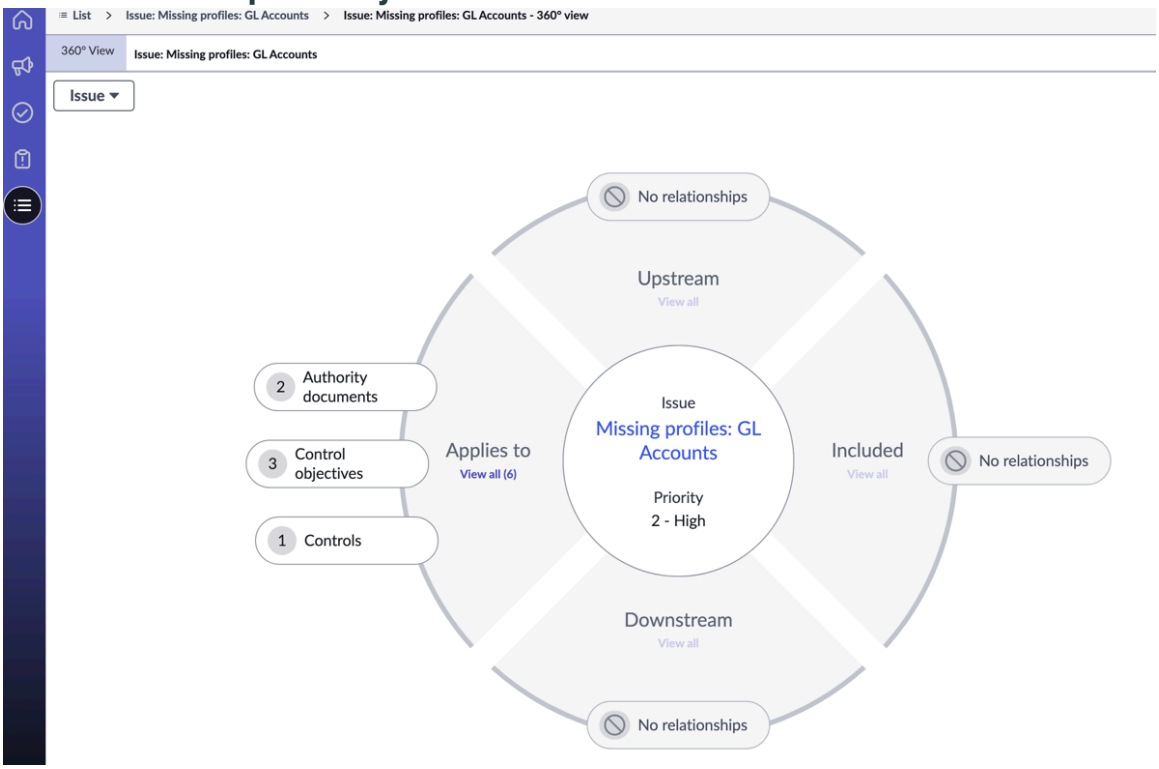


To know more about the users who could use 360° Relationship Visualization, their roles, and responsibilities, see 360° relationship visualization.

360° view of compliance objects integrating with issue in an m2m relationship

The 360° views from the compliance objects such as authority document, policy, control, control objective, and engagement in the Compliance Workspace give you a comprehensive and detailed overview of the issues that are linked to these objects in a many-to-many (m2m) relationship.

For example, clicking the **360° view** button from the authority document that is linked to an issue launches the 360° view enabling you to view the issues that are open for the authority document. You can get more details of the issues when you click the Open issues link.



360° view of an authority document

Similarly, you can navigate to the Issue's Overview page and click the **360° view** button. If the issue applies to any of the objects, or if it is linked to the objects in an m2m relationship, then the view gives you comprehensive integration details.

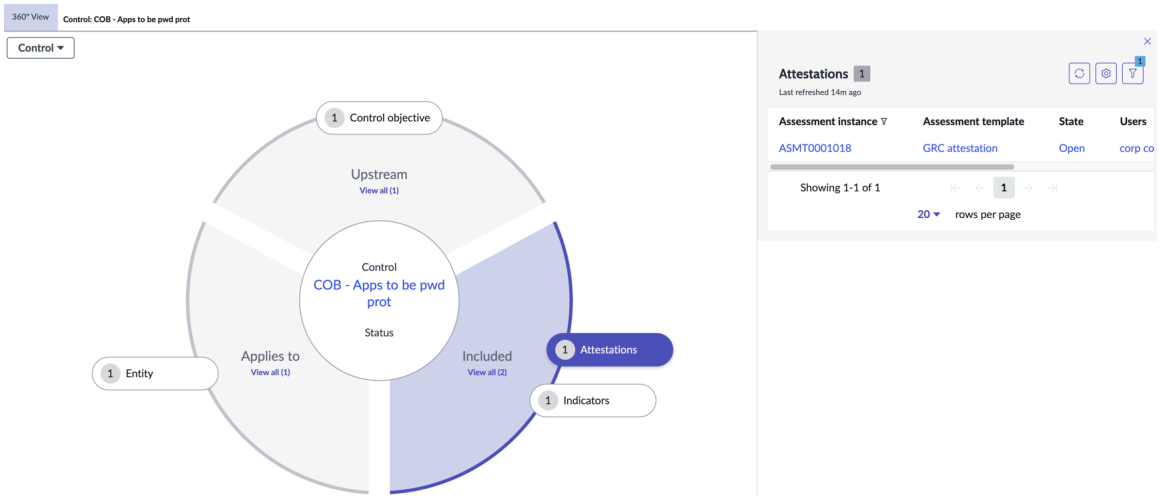
Issue linked to compliance objects

You can click the View all link to view all the compliance objects that the issue applies to.

Objects to which the issue applies



If you had selected **Attestation** in the **Attestation method** for the control, then you can view the attestations added as a component in the 360° view of the control. Select and click the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Attestations link in the donut and you can view the Attestations panel on the right with the assessment instance and template details.

Attestations in 360° view of a control

Policy as Code Engine for Preventive compliance management

Compliance managers can map the control objective with the Policy as Code Engine (PaCE). PaCE calls GRC passing the document reference and the PaCE policy for which exceptions need to be determined. Control owners can view the PaCE logs to understand the compliance or non-compliance instances.

With increasing number of regulations that organizations must comply with and equally increasing technology risks, organizations are obligated to integrate preventive controls in the digital workflows. For example, when a new software application is developed during a DevOps process, there are several IT policies and controls that have to be implemented and validated to reduce technology risk.

With Policy as Code Engine, you can write your own custom code logic to validate a policy and integrate in a deployable instance. PaCE policy validates the code even before it is committed into a deployable instance and checks for its compliance. If there is non-compliance, the deployment is stopped. To integrate with GRC, PaCE as a policy is added to a control objective using the Compliance Data Source Registry feature.

Preventive compliance management through integration with PaCE prevents compliance team, operations team, DevOps engineers from performing non-compliant activities. On the other hand, this integration helps them to raise exceptions in advance.

Key features of this integration are:

- Compliance is embedded in the employee workflows to improve the overall experience of the employees.
- Customers can codify their controls and based on the execution status, employees can be informed if their action in the workflow would determine non-compliance.
- In case of non-compliance, based on a business requirement the employees can request an exception and continue with the digital workflow.

Key benefits through this integration are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reduced reliance on employee training: Since the controls are embedded in the workflows, the number of trainings that employees have to go through are considerably reduced.
- Automated reviews and compliance monitoring: Automated checks ensure that controls are not violated, thereby decreasing the task of manual reviews.
- Automated audit logs: Audit and compliance teams can access the automated audit logs, which reduce the task of manual audits and evidence collection.
- Lower risks and reduced violations: Continuous monitoring of controls minimizes the probability of violations.
- Visibility: Provides real-time visibility of compliance to stakeholders such as business, risk, and compliance teams.
- Velocity: Increases the velocity of workflows as employees can request exceptions if there is business need without impeding the completion of the workflow.

Configure compliance data source registry

Set up the Compliance Data Source Registry (CDSR) that provides the ability to associate policies in other ServiceNow products with control objectives in Policy and Compliance to inform an organization's overall compliance stand, and to perform policy exceptions when required.

Before you begin

Role required: sn_compliance.admin

About this task

Based on the association, entities are generated for the associated assessed objects from the target application table and controls are generated automatically. CDSR facilitates easy integrations between GRC and other ServiceNow products such as DevOps, HR, SecOps, and others to meet the customers' compliance validation and management needs across the enterprise.

Select the application table that is linked to the assessed object table. Establish a relationship between an item in the application table and a control objective in a target table. To do this, the items must first be configured and mapped to the control objective. Secondly, establish a relationship between the target table and the entities in the entity table.

Incidentally, entities are people, processes, departments, applications, or objects that must be measured for compliance against control objectives.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Compliance data source registry**.
2. Click **New**.
3. On the form, fill in the fields.

Compliance data source registry form

Field	Description
Name	Name of the item registry.
Application table	Table of records associated to control objective.
Related entity identification	
Assessed object table	Table in which controls are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Relationship to application table	Relationship between the item table and the target table. The choices are: ○ One to many: One record in the application table is linked to multiple records in the assessed object table, and one record in the assessed object table is linked to only one record in the application table. ○ Many to many: One record in the application table is linked to multiple records in the assessed object table, and one record in the assessed object table is linked to multiple records in the application table.
Application field on assessed object table	Field name that points to the target table.
Application field on m2m table	Field name in the mapping table that points to the item table.
Assessed object field on m2m table	Field name in the mapping table that points to the target table.
Is the assessed object table equivalent to entities?	Flag to create an entity in the target table.
Entity relationship to assessed object table	Relationship between the item table and the entity table. The choices are: ○ One to one: When one record in the assessed object table is linked to only one record in the entity table. ○ Many to many: When one record in the entity table is linked to multiple records in the assessed object table, and when one record in the assessed object table is linked to multiple records in the entity table.
Many to many table	Table that establishes the relationship between the item table and the target table.
Entity field on assessed object table	Name of the field that points to the entity table.
Entity field on m2m table	Name of the field in the mapping table that points to an entity table.
Entity owner field	Owner of the entity in the entity table.

For more detailed information on the set up of generic framework compliance data source registry, see the Set up of generic framework compliance data source registry [KB1112478] article in the Now Support Knowledge Base.

Note:
You must log in to Now Support to view the articles.

4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate an item in application table to a control objective

Use the Policy as Code Engine (PaCE) policy related list in the Compliance Workspace to map the control objective with a PaCE policy. Compliance managers have the ability to map the control objectives with PaCE policies.

Before you begin

Role required: sn_compliance.manager

About this task

When a PaCE policy is mapped to a deployable instance and if the PaCE policy is already associated to a control objective, then when the association of the policy to the deployable instance occurs a trigger is initiated from Configuration Data Management (CDM) to create an entity and controls.

When a PaCE policy is mapped to a deployable instance, and if the policy is not associated to any control objective, then when the PaCE policy is mapped to the control objective the entity and controls are auto-generated since the deployable instance is already mapped to the policy.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Compliance Workspace, click the List icon ( ).
3. Navigate to **Compliance library** > **Control objectives**.
4. Click open a control objective or create a control objective.
5. Click the Details related list.
6. To automatically generate the controls for the control objective, select the **Creates controls automatically** option.
   Whenever an entity type is added to the control objective, controls are automatically generated if the **Creates controls automatically** option is selected.
7. Click **Save** button.
8. To view the controls generated for the control objective, click the Controls related list.
9. Select the **Active** option in the Details related list.

   Note:
   The control objective must be active to add a PaCE policy to it. Or, the **Add** and **Remove** buttons in the PaCE policies related list are available only when the control objective is active.

10. To add the PaCE policy to the control objective, click the PaCE policies related list.
11. Click the **Add** button.
12. Select a PaCE policy from the list of policies that are mapped to the deployable instance in the PaCE policies pop-up.

    Note:
    The PaCE policies that are inactive are listed in the pop-up.

    If the PaCE policy does not have a deployable instance mapped to it at the time of this association, then the entity and the controls are generated whenever the deployable instance is associated to the PaCE policy.

13. Click **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The corresponding entities and controls for the configuration items associated to PaCE policy are created if the **Creates controls automatically** option is selected. Existing retired controls are activated if they were not manually retired.

If an entity has already been added to the control objective as an additional entity, then a control is not created but is updated with a different status. This is to fulfill the condition that only one control can exist per entity. If the control has been generated by the item generation process, then the source of the control is updated. If the control has multiple sources then such control is not retired.

14. To remove a PaCE policy from a deployable instance, click the PaCE policies related list.
15. Click the **Remove** button.
    When the PaCE policy is disassociated from the deployable instance, or when the PaCE policy related to the control objective is removed, then all the entities and controls that were generated earlier from this association are moved to **Retired** state. They are not deleted but continue to exist in retired state.
16. To view the PaCE policy execution results on controls and engagements, click the DevOps Config results related item by navigating to the control record.

Association of citations to controls

A direct citation-to-control mapping feature that improves compliance score accuracy and provides flexibility to manage associations between controls and citations without relying on control objectives.

In many compliance frameworks, a single control objective may be referenced by multiple citations across different standards, regulations, or policy requirements. Without proper association management, organizations risk duplicating controls, misinterpreting coverage, or inaccurately reporting compliance. The association of citations to controls feature addresses this challenge by enabling users to associate controls with citations directly. When this feature is enabled, compliance scores update dynamically based on the status of directly associated active controls.

Direct citation-to-control mapping for accurate compliance scoring

The new Citation to Control Mapping feature remedies this by introducing an association table called sn_compliance_mtm_citation_control, which allows direct mapping between citations and controls. This enhancement enables users to manually associate or disassociate controls with citations, ensuring flexibility and accuracy. It also improves compliance score calculations by basing them on controls rather than indirect relationships through control objectives.

To enable this feature, a property named Association of Citations to Controls Mapping is added. This property is disabled by default. To enable this feature, see Enable associations of citation to controls mapping.

New compliance score formula

When this feature is enabled, the compliance score formula changes to:

```
Citation compliance score = Average(Child Citations) +
 Average(Directly Linked Controls)
```

This shift ensures that the compliance scores reflect only the relevant controls associated with each citation. For more information on compliance score calculations, see Compliance score calculation for a citation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI changes to Citation page

When the Enable association of Citations to Controls Mapping property is set to Yes, the following changes appear in the Citation page:

- You will see a related list of controls that are currently associated with that citation.
- When you click Add to associate more controls, the system does not show all the available controls. Instead, it applies hierarchy-based eligibility rules.
- The Add list displays the following eligible controls:
  - All controls from control objectives directly associated with the citation.
  - Controls from child control objectives of those directly associated control objectives (traverse downward in the hierarchy).
  - Controls from grandchild control objectives, until the last level.
  - All the independent controls (those without any control objective) are always eligible for association.
- When you add controls to the citation, the compliance score will change based on the compliance or non-compliance state of the controls.

> **Note:**
> Controls must be active for them to be included in the compliance score calculations.

UI changes to Control page

When the Enable association of Citations to Controls Mapping property is set to Yes, the following changes appear in the Control page:

- You will see a related list of citations that are currently associated with that control.
- When you click Add to associate more citations, the system does not show all citations in the instance. Instead, it applies hierarchy-based eligibility rules.
- The Add list displays the following citations:
  - All citations directly associated with the control objective linked to the control.
  - Citations associated with parent control objectives (traverse upward in the hierarchy).
  - Citations associated with child control objectives (traverse downward in the hierarchy).
  - If the control is independent (not linked to any control objective), all citations are available for association.

Enable associations of citation to controls mapping

Enable the Citation to Control Mapping feature for more accurate compliance scoring and management.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Administration** > **Properties**.
2. Set the Enable association of Citations to controls Mapping property to **Yes** and select **Save**.

> **Note:**
> You cannot disable this feature after enabling it, because manual associations might exist that cannot be automatically reverted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Deactivate the Compliance Score V2 scheduled job.
   Compliance Score V2 runs every 2 minutes and processes incremental changes. For example, when a control status changes. If it remains active during the bulk recalculation, it may pick up partial updates and overwrite or interfere with the new formula logic.
4. Run the Calculate All Citations and Authority Documents Compliance Score scheduled job to recalculate all scores using the new formula.

   Note:
   Recalculating compliance scores after enabling this feature is mandatory to ensure accurate results.

5. Reactivate the Compliance Score V2 scheduled job.

Result
Dashboards and reports will now reflect the new citation compliance score formula.

Compliance score calculation for a citation

Two methodologies determine a citation's compliance score. The previous method (which averaged child citations and associated control objectives) and the current method (which averages child citations and directly linked controls)

Old formula (before enabling property)

```
Compliance Score for a Citation = Average(Child Citations +
 Associated Control Objectives)
```

Under the old calculation method, a citation's compliance score is based on the following factors:

- The compliance scores of its child citations
- The compliance scores of its associated control objectives.

Example 1:

If a citation has no child citations and is associated with one control objective that has a compliance score of 42%, then the citation's compliance score is 42%.

The control objective's score (42%) comes from averaging its own controls (50%) and its child control objective's score (33%).

Example 2:

If a citation has one child citation with a compliance score of 70% and one associated control objective with a compliance score of 42%, then the compliance score is 56%, which comes from averaging 70% and 42%.

```
Compliance Score = (70% + 40%) ÷ 2 = 56%
```

New formula (after enabling property)

```
Compliance Score for a Citation =
(Average of child citations + Average of directly linked
 Controls) ÷ 2
```

With the new feature enabled, the compliance score calculation changes significantly:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Control objective scores are no longer used.
- Instead, the calculation considers the compliance scores of directly linked controls (Level 1 controls).

> **Note:**
> Level 1 controls are the controls of the control objectives directly associated with the citation.

Example:

If a citation has one child citation with a compliance score of 70% and four directly linked controls with compliance statuses of 100%, 0%, 100%, and 0%, then average compliance score for controls is as follows:

```
Average compliance score for controls =
(100% + 0% + 100% + 0%) ÷ 4 = 50%
```

Compliance score = 70% + 50% = 60%.

Weighted control average

When the Use weighted control average when calculating compliance scores property is enabled, the compliance score of a citation changes.

For example, consider the following scenario:

1. Controls associated to the citation through one control objective: 3
2. The status of the controls: 1 compliant, 2 non-compliant
3. The weights of each control:
   - Control A (Compliant) → **100**
   - Control B (Non-compliant) → **10**
   - Control C (Non-compliant) → **10**

If you consider flat average, the compliance score is 33%.

```
Compliance score = (100% + 0% + 0%) ÷ 3 = 33%
```

If you consider weighted average, the compliance score is 83.3%.

```
Compliance score = (Sum of weights of compliant controls X 100)
÷ Sum of weights of all the controls
So Compliance score = (100 X 100) ÷ 120 = 83.3%
```

Factors affecting compliance score for citations

Compliance scores for citations dynamically change based on changes to controls and control objectives.

Property dependency

- When the system property, Enable association of Citations to Controls Mapping is Off, compliance scores are calculated using the old formula: Average of child citations + Average of associated control objectives.
- When the property is ON, compliance scores use the new formula: (Average of child citations + Average of directly linked controls) ÷ 2.
- After enabling the property:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Run the scheduled job Calculate All Citations and Authority Documents Compliance Score to recalculate scores.
- Disable the periodic job Compliance Score V2 during recalculation to avoid conflicts.

Manual actions

When the system property is enabled, the following manual actions affect compliance score for citations:

1. Adding a control to a citation: Adding a control directly to a citation recalculates the citation's compliance score using the new formula.

   Example: A citation currently has two controls, and both are compliant, so its compliance score is 100%. When you add a non-compliant control, the new score becomes the average of the two compliant controls and one non-compliant controls: (100% + 100 + 0%) ÷ 3 = 33%.

2. Removing a control from a citation: Removing a control triggers recalculation based on remaining controls.

   Example: A citation has three controls: two compliant and one non-compliant, giving it a compliance score of 66%. If you remove the non-compliant control, the score recalculates to 100% because only the two compliant controls remain.

3. Adding a citation to a control: Adding a citation to a control updates compliance scores for that citation.

   Example: A citation initially has no controls, so its compliance score is 0%. When you link a compliant control to it, the score updates to 100%.

4. Remove citation from a control: Removing a citation from a control recalculates compliance scores.

   Example: A citation has two controls, and both are compliant, resulting in a compliance score of 100%. If you remove one of the compliant controls, the score remains 100%, as the remaining control is still compliant, though fewer controls are associated.

Changes to controls

1. Control creation due to adding entity or entity types to control objectives: When a new control is created for a control objective that is directly linked to a citation, it is automatically associated with all citations linked to that control objective.

   Example: Adding an entity to a control objective generates new controls. These controls are auto-linked to all citations associated with that control objective, updating their compliance scores.

2. Control deletion: When a control is deleted from a control objective that is associated to a citation, the compliance score of all the associated citations changes.

   Example: A citation is linked to one control objective that has two controls: one compliant and one non-compliant (score = 50%). Deleting the non-compliant control updates the score to 100%.

3. Control status: Changing a control's status (Compliant, Non-Compliant, Not Applicable) recalculates compliance scores for all associated citations.

   Example: When a citation has only one control with compliant status, the compliance score is 100%. When the status changes to non-compliant, the new score is 0%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Control weight change: If weighted average is enabled, changing a control's weight impacts compliance score.

   Example: A compliant control with weight of 100 and a non-compliant control with weight 10 changes the compliance score. So compliance score = (100 ÷ 110) × 100 = 91%.

5. Control active flag change: Activating or deactivating a control recalculates compliance scores for associated citations.

   Example: Deactivating a compliant control reduces the citation's score because fewer controls remain in calculation.

Changes to citations

1. Citation deletion: When a citation is deleted, all the citation-to-control associations are deleted. No recalculation of compliance score for the citation itself, as it's deleted. Authority document scores may update internally.
2. Citation associated to a control objective: When a citation is associated to a control objective, all the L1 controls from the control objective are added to the citation and the compliance score is recalculated.

   Example: Linking a citation to a new control objective adds its controls, changing the citation's compliance score.

3. Citation disassociated from a control objective: When a citation is disassociated from a control objective, automatically added controls are deleted. The manual controls (flagged as "outside hierarchy") are not deleted. The compliance score is recalculated.

   Example: Removing a control objective association deletes automatically-added controls but keeps manually added controls, updating the citation's compliance score accordingly.

Additional notes

- Manual associations are flagged as Associated Manually = True and are never auto-deleted.
- When controls go outside hierarchy due to disassociation, the system displays an info message listing those controls for user review.
- All compliance breakdowns, dashboards, and widgets now source data from the M2M table instead of control objective hierarchy.

Add related controls to a citation manually

Enable the Citation to Control Mapping feature for more accurate compliance scoring and management.

Before you begin

Role required: Compliance Manager (sn_compliance_ws.corporate_compliance_manager) or Corporate Compliance Analyst (sn_compliance_ws.corporate_compliance_analyst)

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the List icon ().
3. Navigate to **Compliance library** > **Citations**.
4. Select the citation where you want to associate additional controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the Citation page, navigate to the Controls tab, and select **Add**.
   The Controls available for associations displays only the eligible controls that can be associated to the citation:
   - Controls within the citation's hierarchy (directly associated control objectives and their descendants).
   - Independent controls.
6. Select the controls that you want to associate and select **Add**.

Result
The new controls now appear in the Controls tab. And the Compliance score for the citation is automatically recalculated.

Add related citations to a control manually

Enable the Citation to Control Mapping feature for more accurate compliance scoring and management.

Before you begin
Role required: Compliance Manager (sn_compliance_ws.corporate_compliance_manager) or Corporate Compliance Analyst (sn_compliance_ws.corporate_compliance_analyst)

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the List icon ().
3. Navigate to **Compliance library** > **Controls**.
4. Select the control where you want to associate additional citations.
5. In the Control page, navigate to Citations tab, and select **Add**.
   The Citation available for associations dialog displays only the eligible citations that can be associated to the control:
   - Citations linked to the control's control objective and its parent hierarchy.
   - If the control is independent (no control objective), all citations are available.
6. Select the citations that you want to associate and select **Add**.

Result
The new citations now appear in the Controls tab.

GRC: Policy and Compliance integrator

The GRC: Policy and Compliance integrator application provides a common framework so that your content providers can push their content into the GRC applications. The application also enables you to review, approve, and import the data into the Policy and Compliance Management tables.

Starting in Xanadu, you can use the GRC: Policy and Compliance integrator application with the GRC: integrations with third-party content application.

For more information on how to complete the data import process, see Workflow for GRC: Policy and Compliance integrator and Using the GRC: Policy and Compliance integrator to display batch records and import tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow for GRC: Policy and Compliance integrator

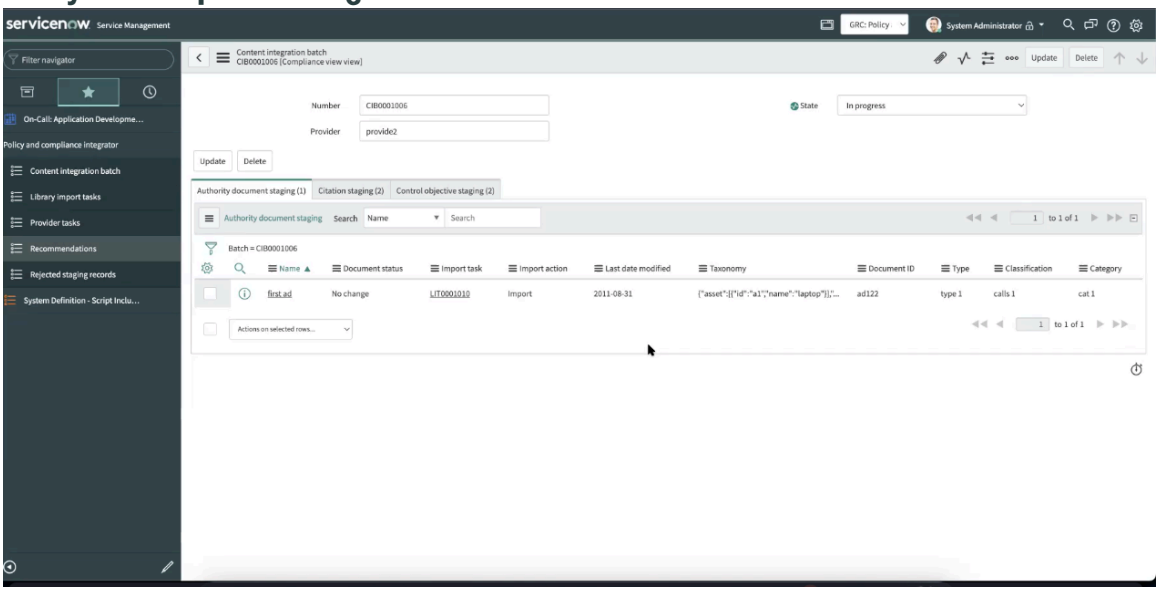
You can install the GRC: Policy and Compliance integrator application from the ServiceNow Store and execute the workflow to complete the data import process.

The GRC: Policy and Compliance integrator application workflow consists of the following steps:

1. Download the GRC: Policy and Compliance integrator application from the ServiceNow Store. When you download the GRC: Policy and Compliance integrator application, the GRC: integrations with third-party content and Policy and Compliance Management applications are automatically downloaded in your instance.
2. Log in with the sn_compliance.admin role into an instance and assign the sn_grc_cim.admin role to a user.
3. Use the APIs and staging tables that are supported with the applications and move the data from the staging tables into the GRC: Policy and Compliance Management application.

   For more information about how to integrate batch records and assign library import tasks with the GRC: Policy and Compliance Management application, see Using the GRC: Policy and Compliance integrator to display batch records and import tasks, Accessing the batch records in the content integration batch table, and Assign a library import task for approval.

Using the GRC: Policy and Compliance integrator to display batch records and import tasks



You can use the GRC: Policy and Compliance integrator application module to display the details of the batch records and to import tasks. For example, you can see the content integration batch records, library import tasks, staging records, and recommendations for the records.

You can access the Content integrator module by navigating to **All** > **Policy and compliance integrator** > **Content integrator** in the application UI. The module displays the following details as shown in the illustration:

- Content integration batch
- Library import tasks
- Provider tasks
- Recommendations
- Rejected content

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy and compliance integrator module

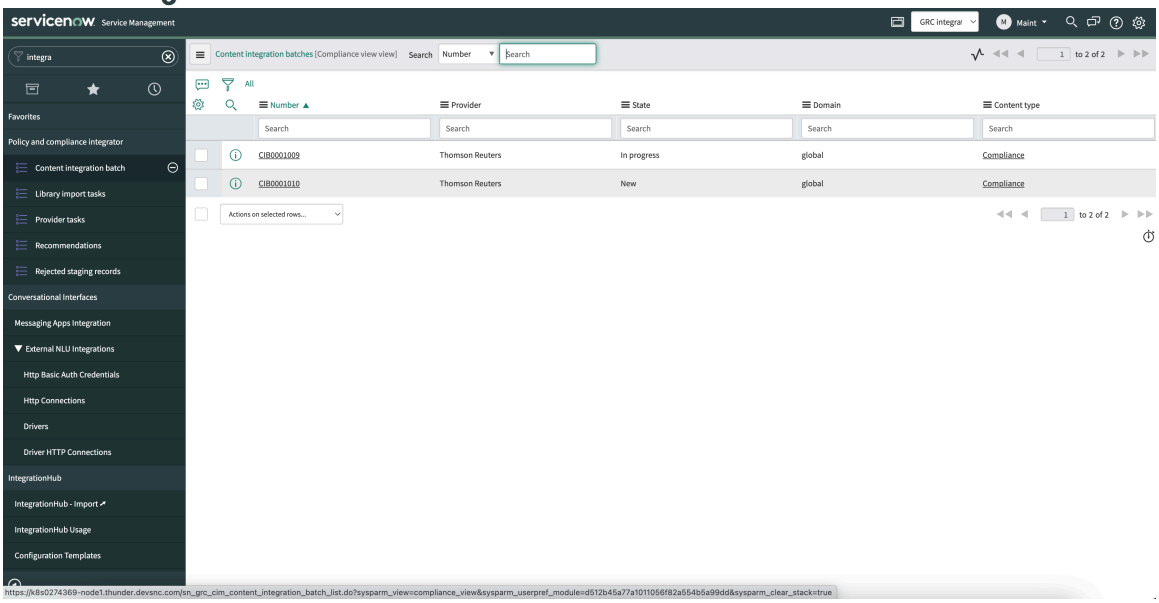
For information on how you can import the content from your third-party content providers into the Policy and Compliance Management application tables, see Accessing the batch records in the content integration batch table and Assign a library import task for approval.

Accessing the batch records in the content integration batch table

You can access the batch records in the content integration batch table that is displayed in the GRC: Policy and Compliance integrator application UI. By accessing these records, you can import the data into the Policy and Compliance Management application.

Overview of the content integration batch table

As a user with the sn_compliance.admin role, you can access the batch records in the content integration batch table and create a library import task for each record. The compliance managers assignment group reviews the library import task and imports the staging records into the Policy and Compliance Management tables.



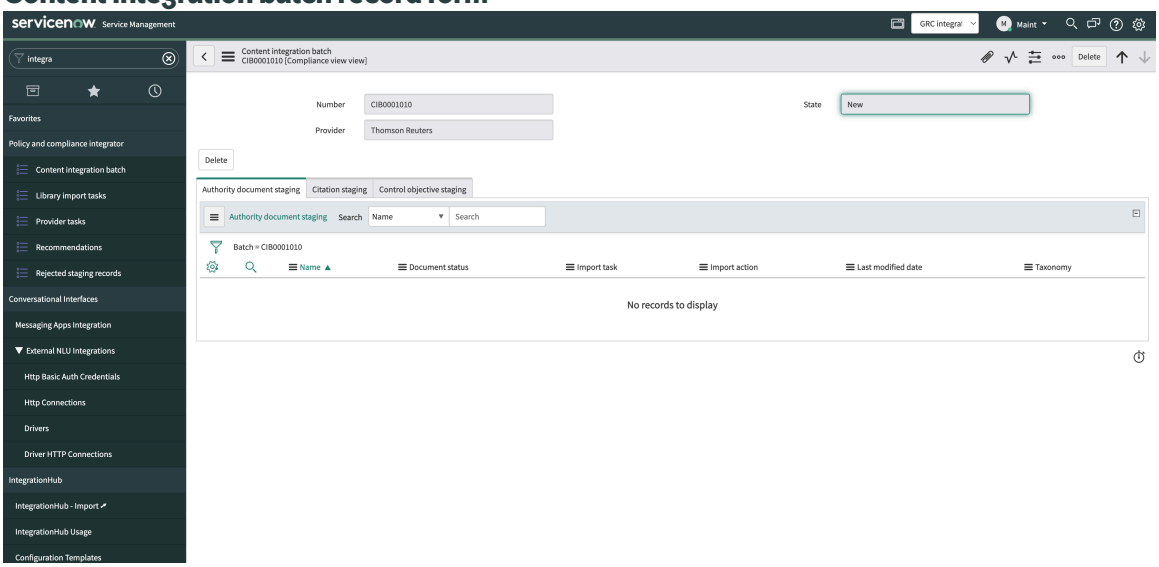
Details of the content integration batch table

The content integration batch table displays the details that are shown in the following example:

- Number of the content integration batch record. In the example, CIB0001006 is the record number.
- Provider of the content integration batch. In the example, Thomson Reuters is the provider.
- State of the content integration batch. In the example, the state is New.
- Domain of the content integration batch. In the example, the domain is Global.
- Content type of the content integration batch. In the example, the type is Compliance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Content integration batch records table

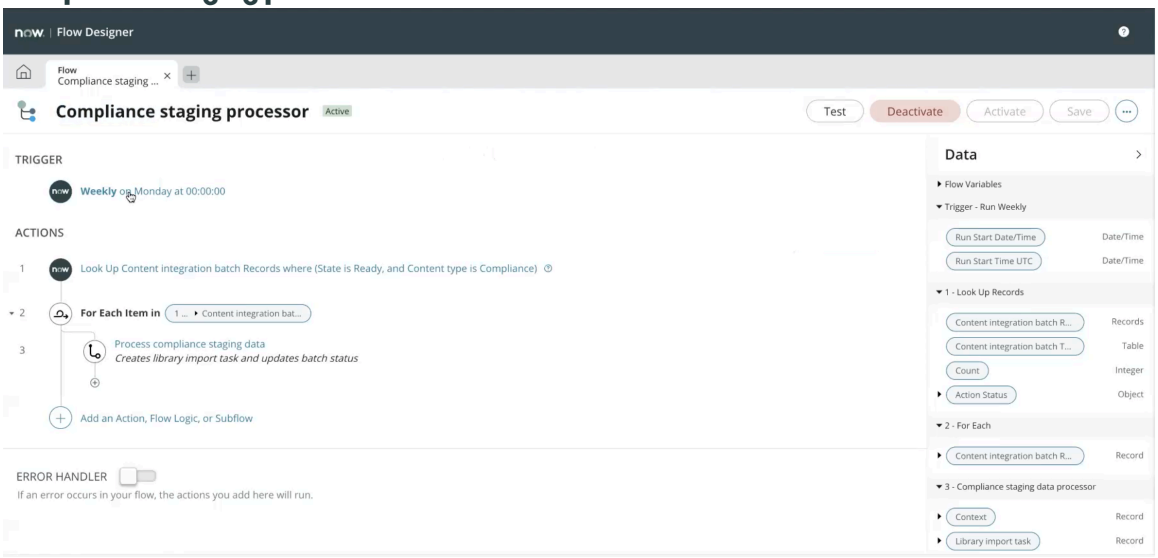


To learn how you can use the user roles to access the APIs and batch records, see User roles for the integration process.

Select a record in the table to display the content integration batch record form and its related lists. See the following example.

Note:
The fields in the form and the related lists are auto-populated.

Content integration batch record form



Using the Compliance staging processor flow

You can use the new Compliance staging processor flow that is provided with the GRC: Policy and Compliance integrator application. See the following example. The flow is used to process the compliance staging data and it runs in the background on a weekly basis. It searches for the content integration batch records where the state is Ready and the content type is Compliance. For each record in the content integration batch, it creates a library import task and it updates the content integration batch status automatically.

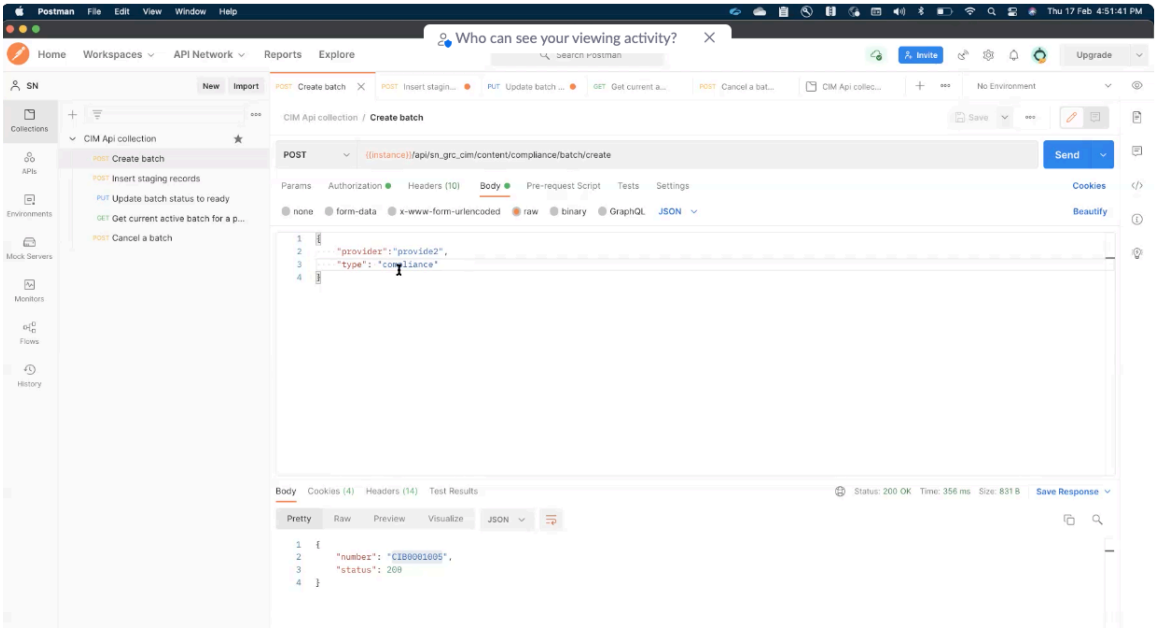
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance staging processor flow

Note:
You can update the flow to change its setting. For example, you can update the start time of the flow.

Using the REST APIs

You can use the REST APIs to insert the records in the GRC: integrations with third-party content and later move the records to the Policy and Compliance Management tables by using the GRC: Policy and Compliance integrator application. The following internal APIs are provided with the GRC: integrations with third-party content application and the GRC: Policy and Compliance integrator application:



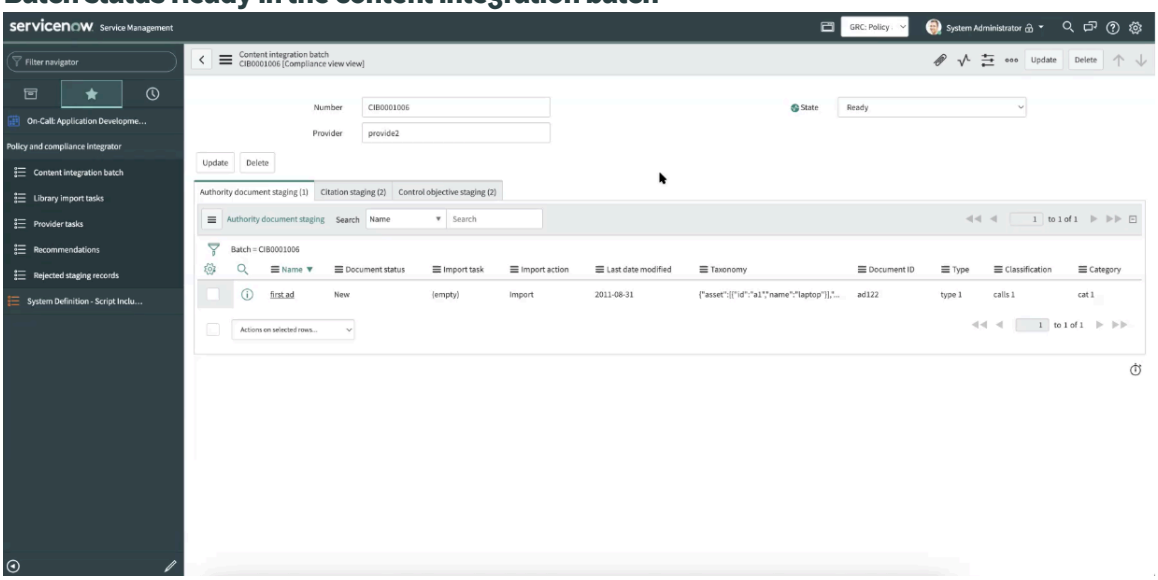
- Create batch
- Insert policy staging records
- Update batch status to ready
- Get batch
- Cancel batch

Note:
You can use third-party tools, such as the Postman API platform, to execute the APIs.

When you execute the APIs in the Postman API platform as shown in the following example, the staging records are imported in the Policy and Compliance Management tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a batch using the Postman API platform

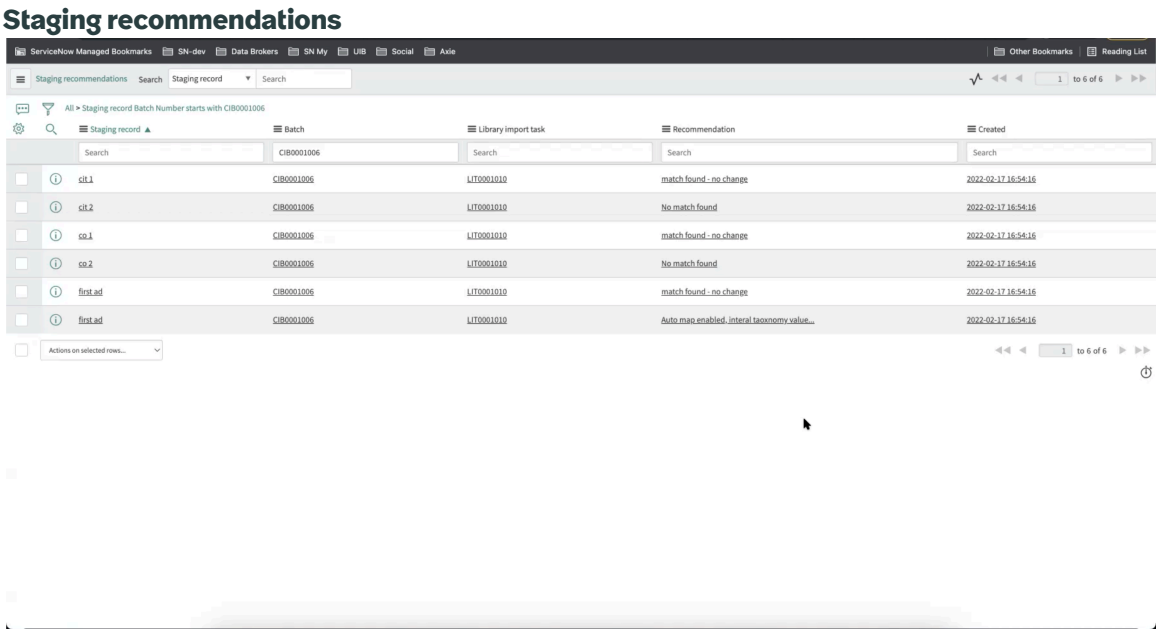


Processing the batch records

The Update batch status to ready API and the Compliance staging processor flow process the batch records as follows:

1. The Update batch status to ready API updates the content integration batch status to Ready as shown in the figure.

Batch status Ready in the content integration batch



2. The Compliance staging processor flow picks up the content integration batch and its records. When the Update batch status to Ready API sets the content integration batch status to Ready, the Compliance staging processor flow acknowledges the content integration batch.

3. When the state of the content integration batch is updated to Ready, the Compliance staging processor flow starts importing the records from staging to the GRC: Policy and Compliance integrator application.

   The system automatically creates a library import task to track the import process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. When the library import task is created, the Compliance staging processor flow automatically updates the batch status to In progress.
5. When the library import task is created and the provider that is mentioned in the content integration batch is not found, the state of the task is updated to Provider onboarding. A provider import task is created in the content onboarding task related list of the library import task.
6. As the library import task is created, the staging recommendations for each record are generated for the content integration batch as shown in the following example.

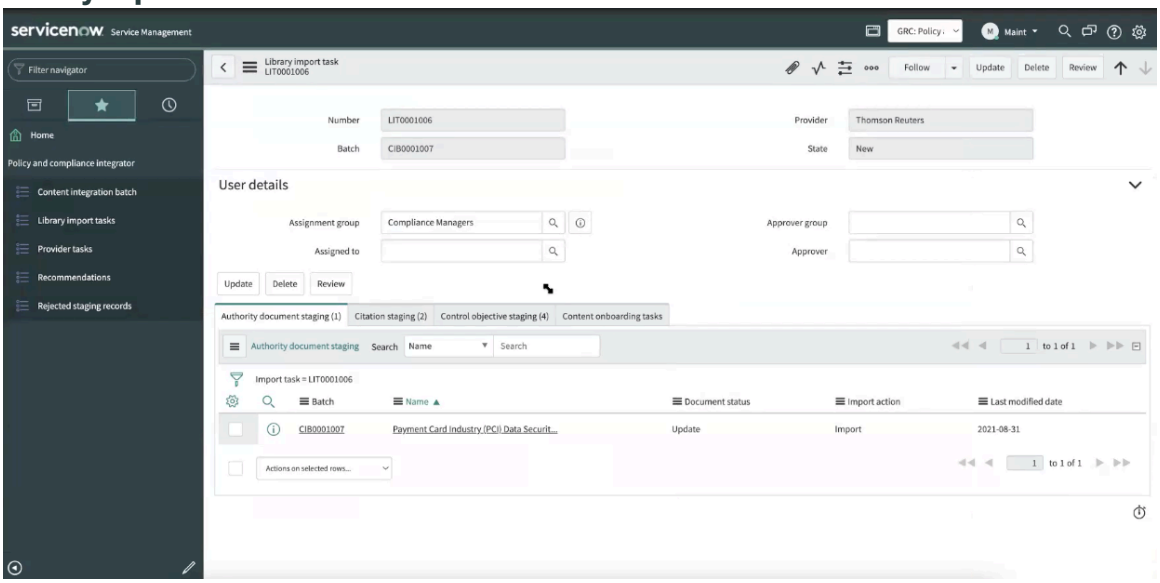
The library import task is used to import the staging records in the Policy and Compliance Management tables. The library import task and staging recommendations for each record are displayed for the content integration batch table in the GRC: Policy and Compliance integrator module. A user with the sn_compliance.admin role can assign the library import task to the compliance managers assignment group. To learn how to assign a library import task, see Assign a library import task for approval.

Assign a library import task for approval

Assign a library import task to the compliance managers assignment group by using the library import task form in the GRC: Policy and Compliance integrator application.

Before you begin

For this procedure, you must log in with the sn_compliance.admin role first and then submit the library import task to be approved.



Role required: sn_compliance.admin

Procedure

1. Navigate to **All** > **Policy and compliance integrator** > **Content integrator** > **Library import task**. The library import task is displayed in the New state as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Library import task in the New state

2. On the form, fill in the fields.

Library import task form

Field	Description
Number	Number for the library import task. The number is LIT0001001 in the example. This field is auto-populated.
Provider	Name of the provider. This field is auto-populated.
Batch	Content integration batch number. The number is CIB0001001 in the example. This field is auto-populated.
State	State of the library import task. This field is auto-populated.
Assignment group	Assignment group that the library import task is assigned to. Select **Compliance managers** group.
Approver	Approver for the library import task.
Assigned to	Assignment group that the task is assigned to.
Approver group	Approver group for the library import task.
Related lists	
Authority document staging	Authority document staging records that are related to the library import task.
Citation staging	Citation staging records that are related to the library import task.
Control objective staging	Control objective staging records that are related to the library import task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Content onboarding tasks	Provider import tasks that are related to the library import task. This task is created when the provider that is mentioned in the content integration batch is not found in the provider (sn_grc_provider) table. If the provider import task is created, the state of the library import task is updated to **Provider onboarding**. When the provider import task is completed, the state of the library import task is updated to **New**.

3. Click **Update**.

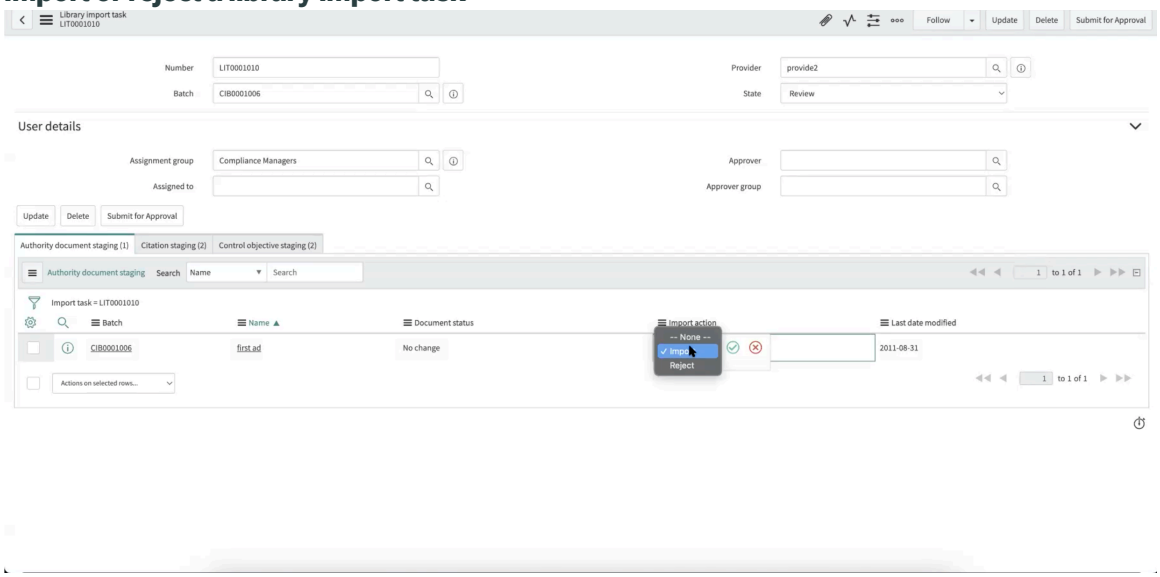
What to do next

To learn how to approve the library import task that is assigned to the compliance managers assignment group, see Approve the library import task.

Approve the library import task

Approve the library import task by using the Library import task form in the GRC: Policy and Compliance integrator application.

Before you begin



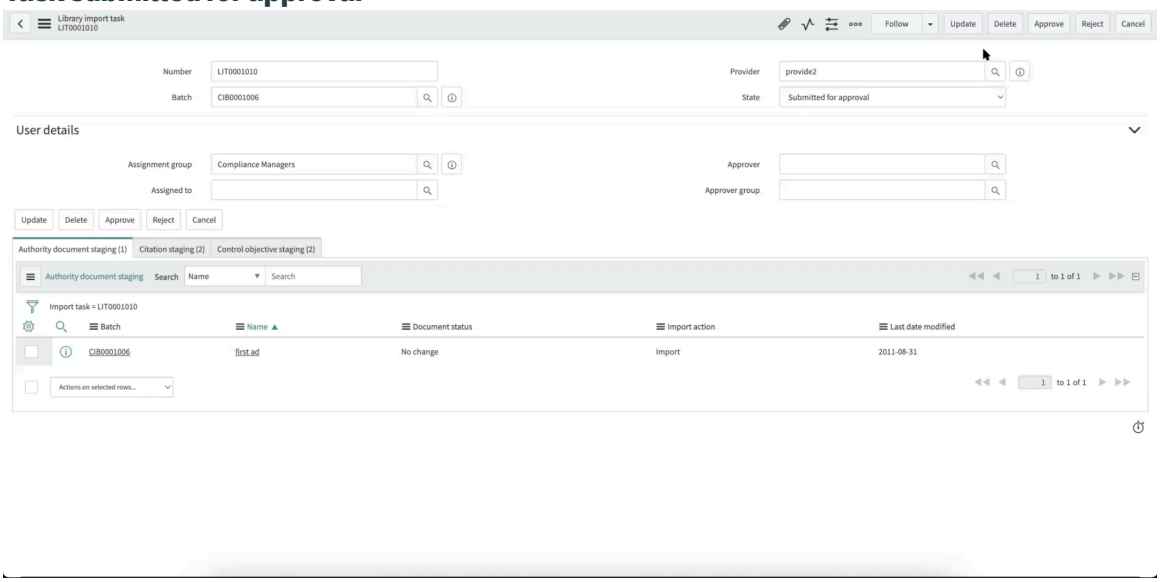
Role required: sn_compliance.manager

Procedure

1. Navigate to **All** > **Policy and compliance integrator** > **Content integrator** > **Library import task**.
2. Review the library import task and the related lists for the authority document staging records, citation staging records, control objective staging records, and content onboarding tasks.
3. In the application navigator, go to Recommendations and review the recommendations that are provided by the application for the task.
4. On the form, click **Import** or **Reject**.
   Review the details of the library import task and either import or reject the record as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import or reject a library import task

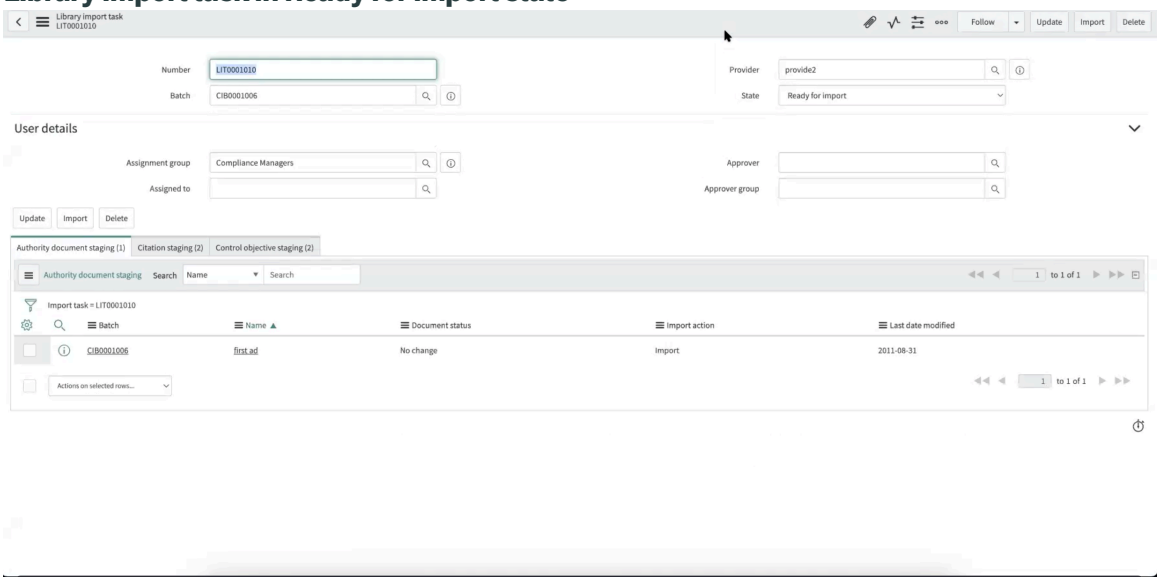


Clicking **Import** imports the record that is associated with the library import task into the GRC: Policy and Compliance Management staging tables.

Clicking **Reject** rejects the record that is associated with the library import task. As a result, the data is not imported into the GRC: Policy and Compliance Management staging tables.

5. Click **Submit for approval**.
   The task is submitted to the compliance managers group for approval. The state of the library import task is updated to Submitted for approval as shown in the following example.

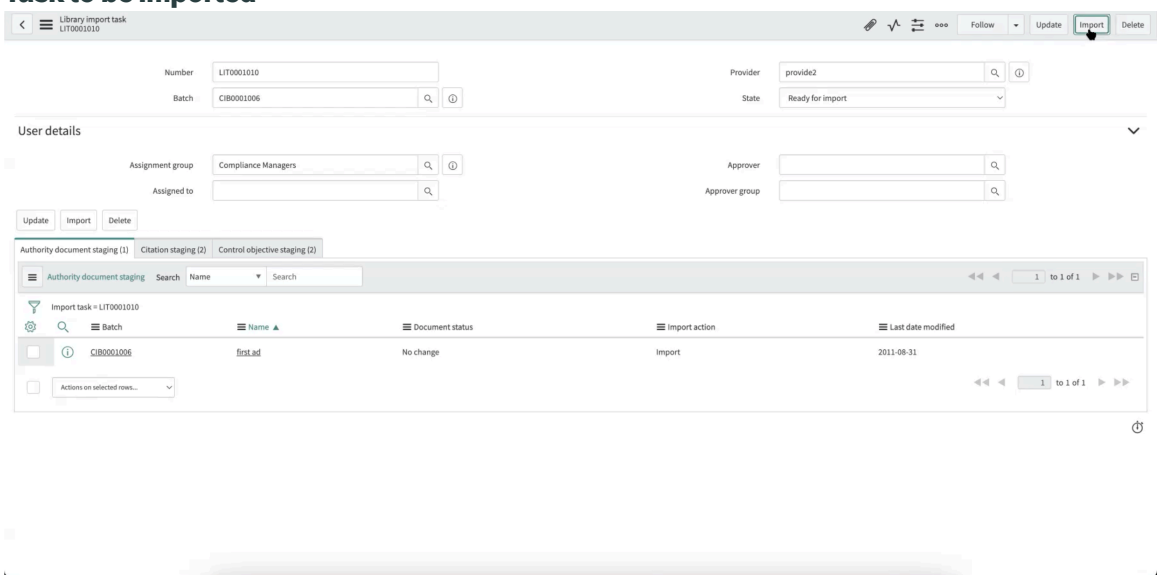
Task submitted for approval



6. Review the library import task and click **Approve**.

   This action moves the library import task to Ready for import state.

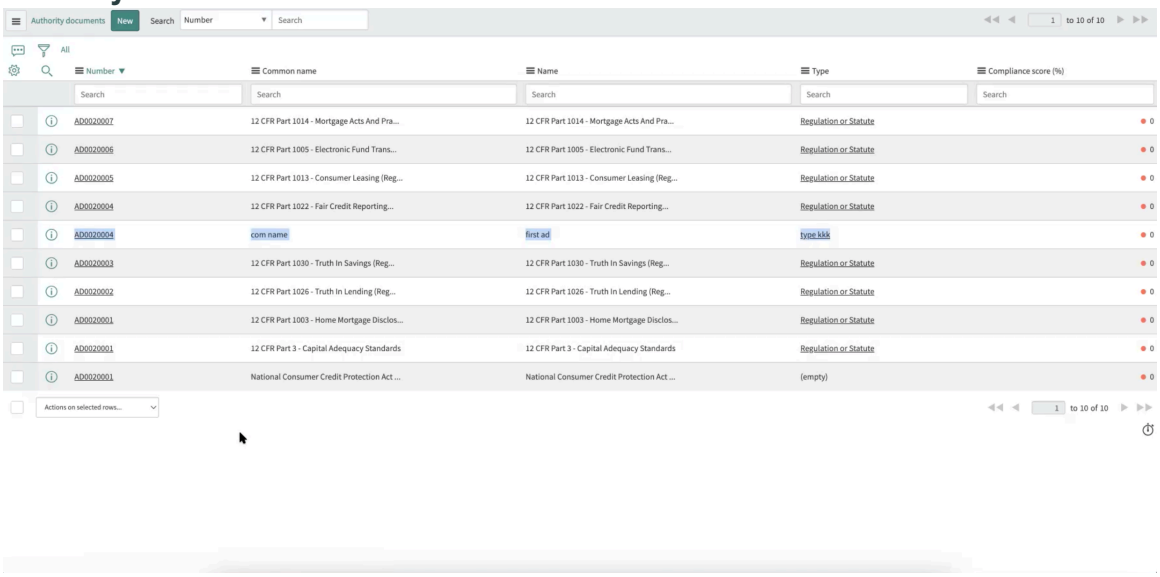
> **Note:**
> Clicking **Reject** rejects the library import task and moves it to New state again as shown in the following example.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

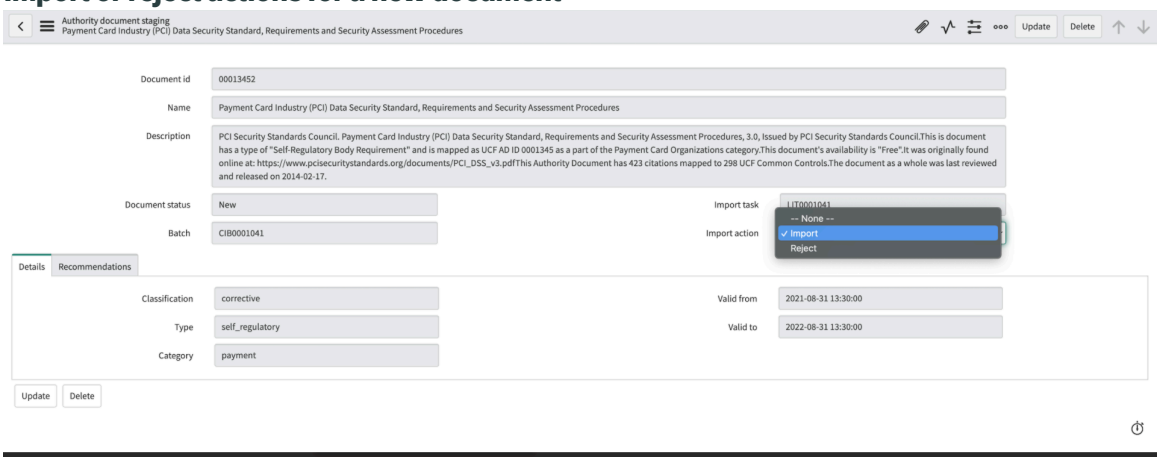
Library import task in Ready for import state

When the task is in the Ready for import state, the Import action is displayed as shown in the following example.



Task to be imported

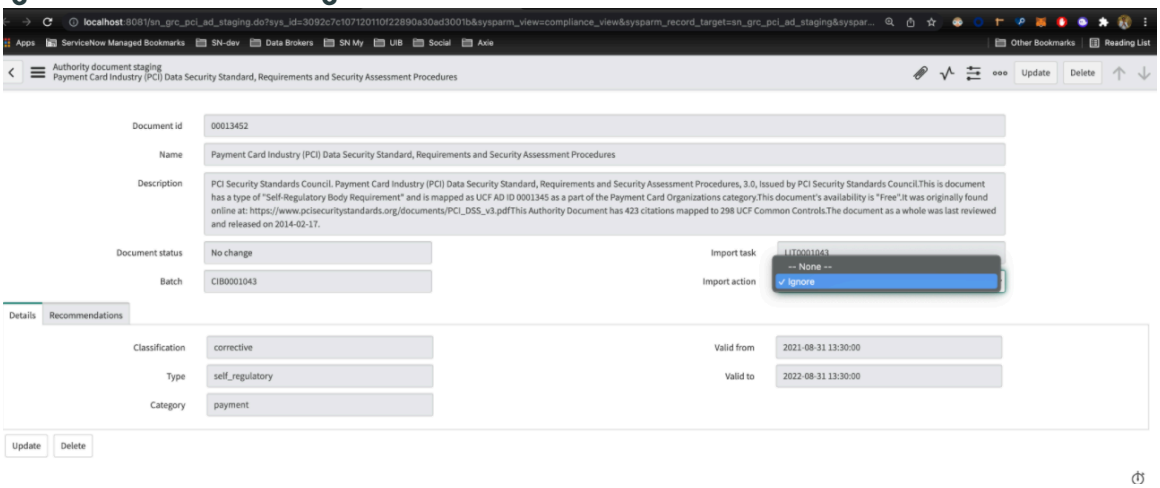
7. Click **Import**.
   This action imports the staging records under the library import task into the GRC: Policy and Compliance Management tables. You can view the tables by navigating to the authority document tables, citation tables, or control objectives tables in the GRC: Policy and Compliance Management application. See the sample Authority documents table as shown in the following example.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authority documents table

When you click an authority document, such as AD0020004 that is displayed in the table, it displays the details of the authority document staging record. In the staging record, the Document status field on the form displays information on the current document status. When the document status field value is New or Update, the Import or Reject actions are available for the record, and the import task can be imported or rejected as shown in the following example.



Import or reject actions for a new document

When the document status field value is No change, only the Ignore option is available in the Import action for the record. The import task can be ignored as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ignore action for no change in the document status

See the following table for the criteria of the Document status field values.

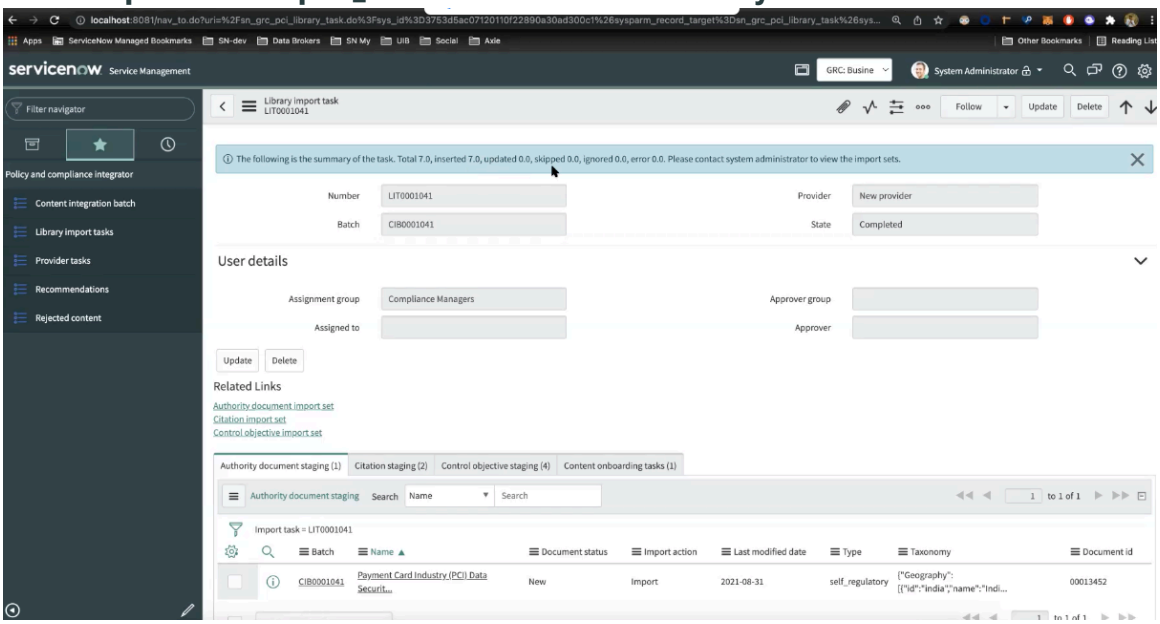
Document status field value and its criteria

Field	Description
Document status = New	Record that is not found in the GRC: Policy and Compliance Management tables.
Document status = No change	**Source last modified date** of the existing record in the GRC: Policy and Compliance Management table that is later than the incoming staging record date. The document status does not change.
Document status = Update	**Source last modified date** of the existing record in the GRC: Policy and Compliance Management table that is earlier than the incoming staging record date. The document status is updated.

After the workflow is completed, the Compliance staging processor flow automatically updates the status of the library import task to Completed.

Note:

If an error occurs in the processing of the flow, the Compliance staging processor flow updates the state of the library import task to Completed with errors. This error can happen due to one of the following reasons:



- The taxonomy value mappings of the record are not found and the automap value of the provider taxonomy configuration is false.
- The parent of the record is ignored.

The record with the error is rejected by the Compliance staging processor flow.

When the status of the library import task is Completed, the import task summary and the related links of the import sets are displayed only to the users with the import_transformer role as shown in the following example. The import_transformer role is a global role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task completed and import_transformer role view summary

The import_transformer role view summary is not available to any other users of the GRC: Policy and Compliance integrator application.

Result
The library import task is now in the Completed state and the content is imported into the Policy and Compliance Management application.

DevOps accelerator for control compliance, PaCE execution, and exception management

GRC: DevOps Accelerator is an application that enables your customers to evaluate the compliance for DevOps policies and GRC control objectives integrating with Policy as a Code Engine (PaCE).

> **Important:**
> Starting with the *Washington DC* release, GRC DevOps Use Case Accelerator is being prepared for future deprecation. It will be hidden and no longer activated on new instances but will continue to be supported.

GRC: DevOps Accelerator (com.sn_grc_devops) plugin maps the control objectives drawn from regulations, standards, and frameworks, such as CIS controls, NIST 800-53, ISO 27002, PCI DSS, and others with DevOps Policy as a Code Engine (PaCE). The DevOps policies are provided by the DevOps Config Policy Content Pack.

With this integration you can evaluate the compliance status. The integration also enables the DevOps managers to monitor control compliance, visualize evidence of PaCE execution, and manage exceptions.

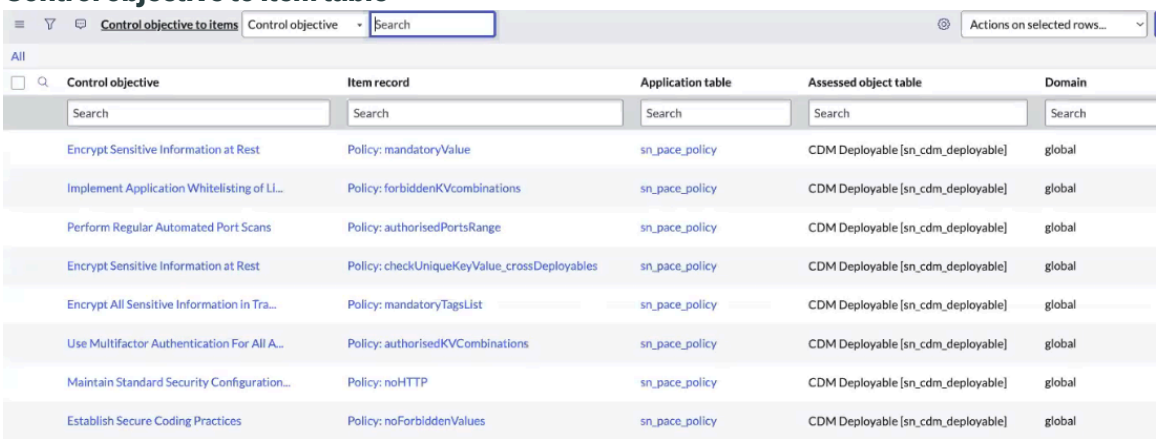
Pre-requisites for DevOps accelerator

1. Hierarchy of PaCE-related plugins and CDM-related plugins.
2. DevOps Config Policy Content Pack provided by PaCE.
3. GRC plugins: GRC: Cybersecurity Controls Accelerator, GRC: Compliance UCF, and GRC: Continuous Authorization and Monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
GRC: DevOps Accelerator (com.sn_grc_devops) is dependent on DevOps Config Policy Content Pack and GRC: Policy and Compliance Management. However, if GRC: Cybersecurity Controls Accelerator (CIS), GRC: Unified Compliance Framework (UCF), and GRC: Continuous Authorization and Monitoring (CAM) plugins are not installed on the instance, then the staging data relevant to the control objectives from these plugins would not be available on installing GRC: DevOps Accelerator.

GRC: DevOps Accelerator plugin maps the relationship between PaCE policies and control objectives.

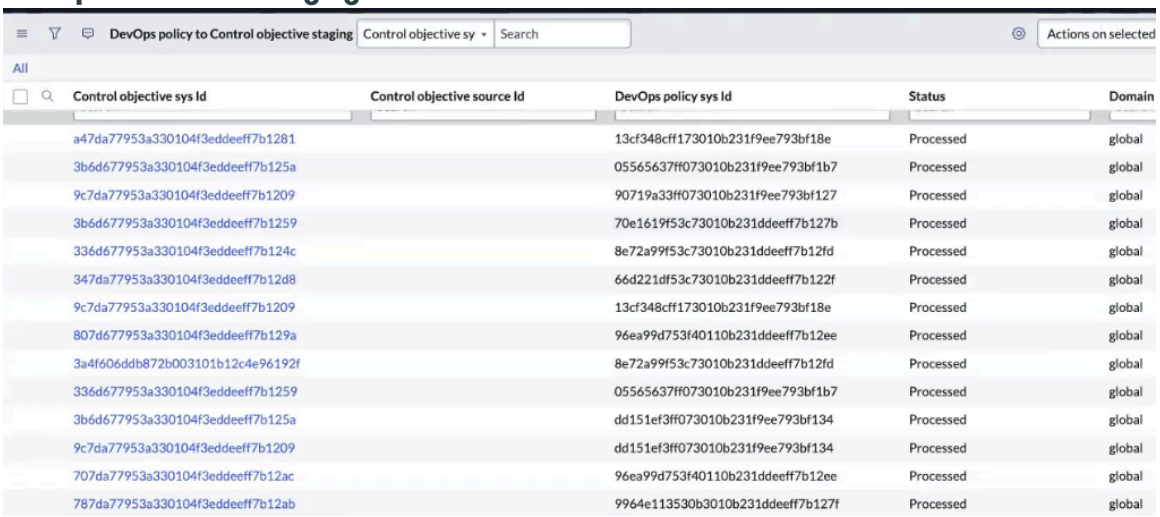


Note:
Not all GRC control objectives may have a relationship with every PaCE policy.

Populating control objective and PaCE mapping data from the instances to staging table

Control objective to items mapping table

As part of DevOps accelerator, the mapping relationships between control objectives and PaCE policies are shipped to the customers. The relationship is captured in Control objective to items [sn_compliance_control_objective_item] table, where the **Control objective** column and **Item record** column, which is the PaCE policy, list the data.



Control objective to item table

DevOps policy to control objective staging table

There is a staging table as a part of DevOps accelerator, which is DevOps policy to control objective staging [sn_grc_devops_policy_control_objective_staging] table. A user with Compliance admin role can view the table.

For CAM and CIS, the sys IDs of the control objectives map with the DevOps policy sys IDs. However, for UCF the source ID of the control objective imported from the Shared List is mapped with the DevOps policy sys ID.

The data in the DevOps policy to control objective staging [sn_grc_devops_policy_control_objective_staging] table is shipped in Pending status. The data is populated in the staging table based on the applications that are installed in the instance. The data is not processed if the control objective and the PaCE policy do not exist in the instance.

Scheduled job to move data from the staging to the main table

A daily job (Import DevOps policy to Control Objective mapping from staging) runs after the applications and the DevOps accelerator are installed to add the records to the Control objective to items (sn_compliance_control_objective_item) table. If the record is successfully added to the mapping table, then the status of the record in the staging table moves to Processed. If a control objective is not populated or present in the application, then the record is not processed but is in Pending status.

Manage continuous monitoring for controls between Configuration Compliance and Policy and Compliance Management

Continuous monitoring for controls is a feature integration between the GRC: Policy and Compliance Management product and the Security Operations Configuration Compliance products. This feature integrates the scan results from third-party applications, like Qualys to determine the compliance status for each associated control.

Continuous monitoring is a pro-active security management approach. Customers monitor and validate compliance and manage risks against authority documents.

Continuous monitoring workflow

1. The system admin activates the Configuration Compliance and Policy and Compliance Management plugins.
2. The compliance manager maps control objectives or controls to configuration tests, which generate controls, entities, and indicators related to those configuration tests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The integration ingests the results of the third-party configuration test scan results at defined intervals.
4. If the configuration test scan results of the configuration tests indicate a failure, then the control is non-compliant and an issue is automatically generated.
5. If the next scan result of the configuration test indicates that the failure has been remediated, then the control is compliant and the issue is automatically closed.

Map control objective or controls to configuration tests

The compliance manager maps control objectives or controls to the configuration tests, which generate the controls, entities, and indicators associated with configuration compliance.

Before you begin

Role required: compliance manager

The Configuration Compliance plugin must be activated to access this feature and the **sn_compliance.auto_create_profile_and_control** property must be set to true.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Policies**.
2. Open the policy record, click the Control Objectives related list, and click **Edit**.

   Note:
   The **Password** Policy is used in this example.

3. Select each control objective to associate to the policy.
4. Open a control objective, and click the Citations related list to view the authority document citation that is associated to this control objective.

   Note:
   The **Configure the maximum password age** control objective is used in this example.

5. Click the Configuration Tests related list and select one of the following add options:
   - Click **Add**
   - Click **Add from Policies**
   - Click **Add from Authoritative Sources**

   Note:
   The **Source** field for each configuration test identifies the third-party provider of the information.

6. After selection, click **Add**.
   All the configuration items (controls, entities, and indicators) are mapped and displayed on the Configuration Tests related list. The results may take a few minutes to generate.

Interpret configuration compliance scan results

If the configuration test scan results of the control indicate any failures, the control is marked non-compliant. If the scan results indicate the control passed, all the configuration tests, then the control is marked compliant.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: compliance manager

The Configuration Compliance plugin must be activated to access this feature and the *sn_compliance.auto_create_profile_and_control* property must be set to true

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Control Objectives**.

   Note:
   The **Configure the maximum password age** policy statement is used in this example.

2. Open the control objective record and click the Controls related list.
   11 controls were generated from the configuration compliance test scan. Each control has an associated **Profile** and because all the controls show a **Status** of **Non Compliant**, an equal number of issues have been automatically generated.
3. Open a control record, and click the Indicator related list.
4. Open the indicator record to see the indicator results.
   The configuration test scan results are updated at regular intervals. If the scan results indicate that the failure has been remediated, then the control is marked compliant and the issue is automatically closed.

Managing mobile experience for GRC Policy and Compliance

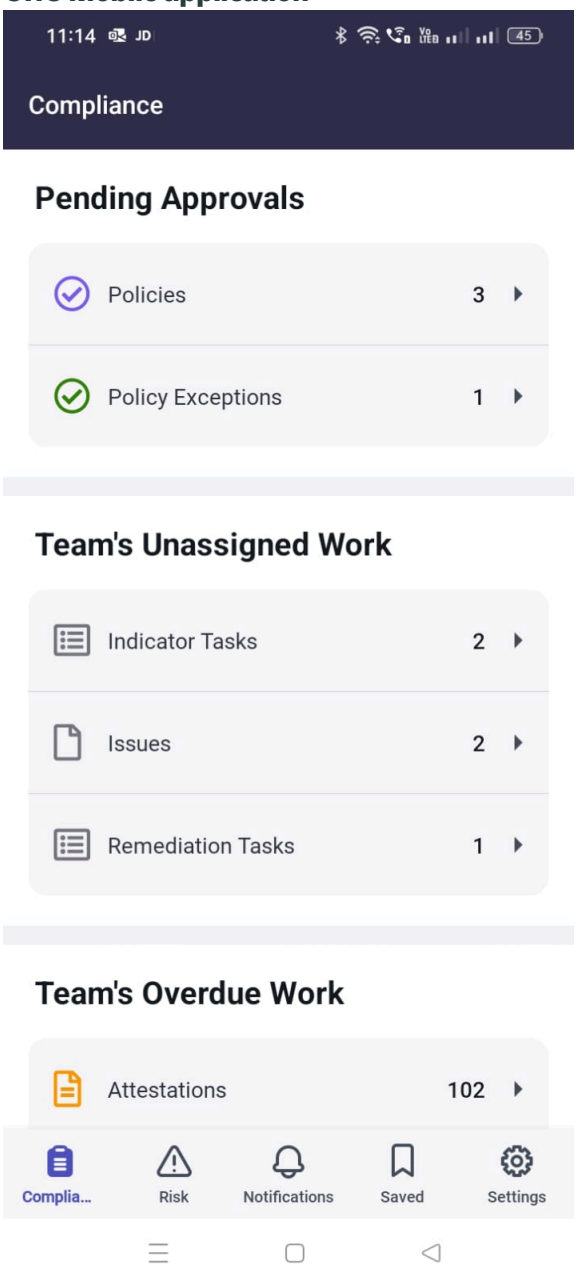
As a policy and compliance manager, use your Android or iOS mobile device to manage your work.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

User role actions for a compliance manager

As a user with the ServiceNow AI Platform® compliance manager (sn_compliance.manager) role, manage your work without being tied to the desktop. Receive timely notifications for current alerts, as well as risk and compliance status for your critical assets, vendors, and impacted essential business services all on your mobile device.



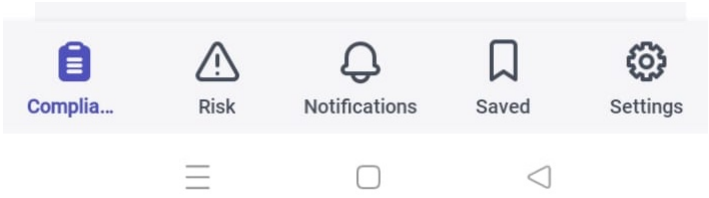
With the GRC Mobile application, you can perform the following Policy and Compliance Management activities without being tied to the desktop:

- Approve or reject pending Policies and Policy Exception requests that are assigned to you.
- Assign unassigned tasks and issues to your team with the Indicator Tasks, Issues, and Remediation Tasks applets.
- Manage and reassign your team's overdue tasks with the Attestations and overdue Issues applets.

The following figure illustrates how you log in to your ServiceNow AI Platform instance from your mobile device and the landing screen that is displayed after you log in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Mobile application



For step-by-step instructions about how to set up your ServiceNow AI Platform instance and install the GRC Mobile application, see Setup checklist for the GRC Mobile application. For instructions about how to log in, see Log in to the GRC Mobile application.

Applications

Applications are the ServiceNow® software components such as Policy and Compliance Management, Risk Management, and Audit Management that provide specific features and functionalities within your ServiceNow AI Platform instance. After you install these core applications and the GRC Mobile app on your ServiceNow AI Platform instance, these applications are displayed as icons on the bottom of your Android or iOS mobile device after you log in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Folders

Each ServiceNow® mobile application contains folders that separate the applets by categories. In the preceding image, **Pending Approvals**, **Team's Unassigned Work**, and **Team's Overdue Work** are the folders of the Policy and Compliance Mobile app.

Applets

Applets are the different options within the application. In the preceding image, the icons under **Pending Approvals**, **Team's Unassigned Work**, and **Team's Overdue Work** are the available applets for the Policy and Compliance Mobile app.

Setup checklist for the GRC Mobile application

The following checklist includes the set up tasks that you are required to complete in your ServiceNow AI Platform® instance and on your mobile device prior to using the GRC Mobile application. Complete these set up tasks prior to using the GRC Mobile application to view the Policy and Compliance Management application on your mobile device.

Before you begin

As an option, print this checklist and use it to guide you through the set up tasks that are required for the GRC Mobile application.

Estimated time to complete this task: 15-20 minutes.

Roles required: admin, sn_compliance.manager

Procedure

Verify that you complete each item on the list so that you can log in to the GRC Mobile application and add a ServiceNow AI Platform instance.

GRC Mobile application checklist

Item	Description
☐	As a user with the admin role, verify that you have the GRC core applications installed on a ServiceNow AI Platform instance. This is the ServiceNow AI Platform instance that you view on your mobile device. **Note:** The GRC core applications and the ServiceNow AI Platform instance should be from the same family release. **a.** To verify the GRC: GRC Profile Dependencies core application is installed on your instance, navigate to **Plugins** and search for GRC Profile. **b.** If the GRC Profile core application is not already installed, click **Install** to install it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

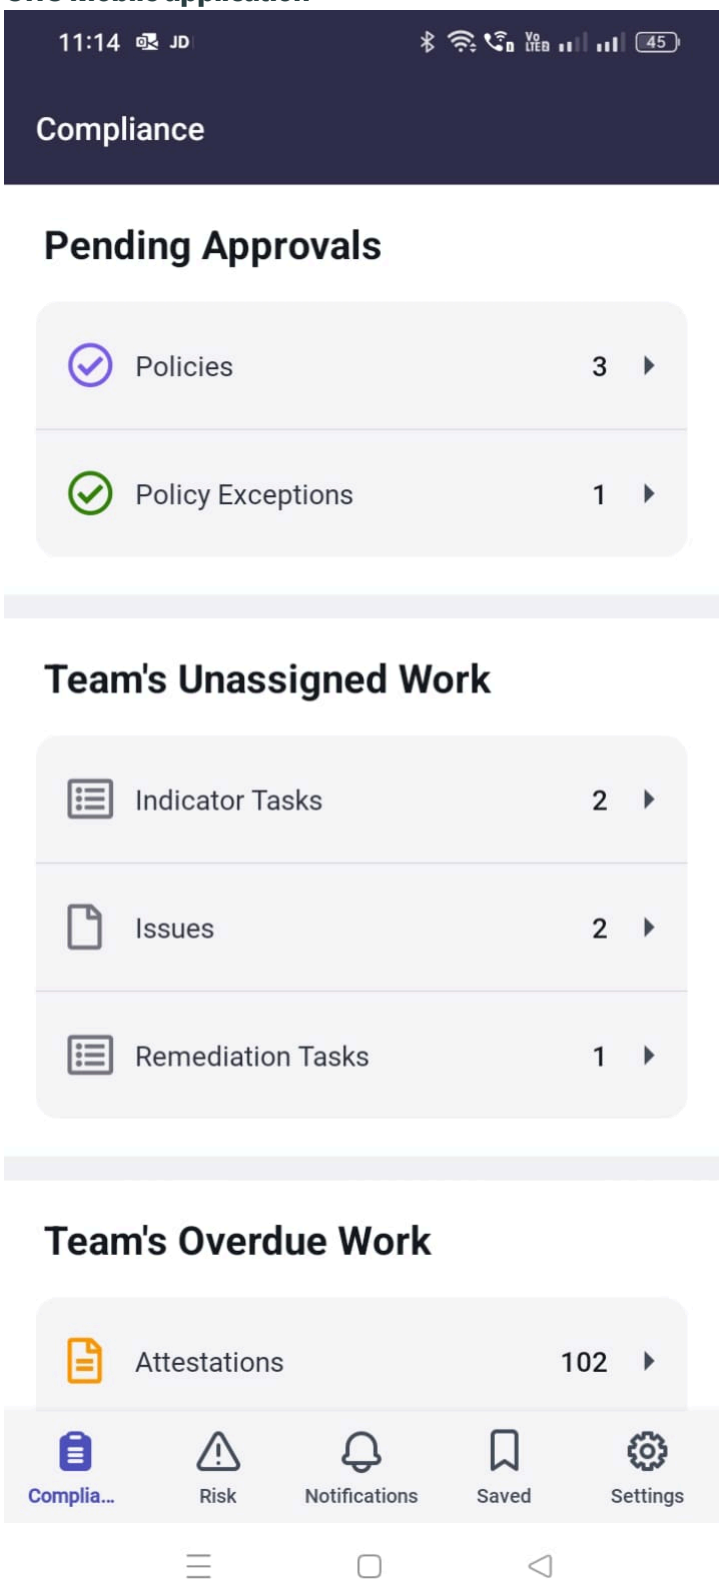
Item	Description
	c. After the GRC Profile application is installed, install either the Policy and Compliance Management core application, or the Risk Management core application, or both the Policy and Compliance Management and Risk Management applications. These are the two GRC applications that you can view with the GRC Mobile application. If not visible in your instance, all of the GRC core applications are available from the ServiceNow Store. For more information about getting entitlement, downloading, and installing the GRC core applications, see GRC and the ServiceNow Store. When you install the GRC core applications, the dependency plugins for the GRC Mobile application, (com.glide.sg and com.glide.sg.agent_native_client) are also automatically installed. To verify that these dependency plugins are installed and activated: **a.** Navigate to **Plugins**. **b.** Search for the plugin IDs (com.glide.sg and com.glide.sg.agent_native_client). **c.** If they are not activated, activate these plugins.
☐	As a user with the admin role, verify that you have the GRC mobile app installed on the ServiceNow AI Platform instance that you want to view on your mobile device. **Note:** The GRC mobile app and the ServiceNow AI Platform instance should be from the same family release. For more information about getting entitlement, downloading, and installing the GRC Mobile application, see GRC and the ServiceNow Store.
☐	As a user with the admin role, in your ServiceNow AI Platform instance verify that you have assigned mobile users with the required ServiceNow AI Platform roles. **a.** To view the roles that are assigned to a user, navigate to **Users and Groups** > **Users**. **b.** Select the user name followed by the roles related list. All roles assigned to this user are displayed. **c.** Verify a user is assigned, or assign a user with the IT Infrastructure Library role (itil). Users with the itil role can create, open, and update records. Only users with the itil role can have tasks assigned to them. **d.** Verify a user is assigned, or assign a user with the compliance manager role (sn_compliance.manager). This role is automatically added when you assign the itil role. **e.** Verify you have created any required assignment groups and assigned mobile users to these groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
	Note: If you have multiple users for the mobile application, you alternatively can assign the sn_compliance.manager role to a group. Each user you add to the group inherits this role. For more information on users and assigning roles to users and groups, see Create a user, Assign a role to a user, Assign a role to a group.
☐	As a mobile user with the sn_compliance.manager role, download and install the most current ServiceNow® Agent app on your mobile device. The most current Agent app is available on the Apple iOS App Store and the Google Play Store. 
☐	As a user with the sn_compliance.manager role, verify notifications are enabled on your mobile device and in your ServiceNow AI Platform instance. Notifications inform you when critical pending approval requests are assigned to you or to your assignment group. To assist you with timely remediation, after you enable notifications, click on a notification in the GRC Mobile application and navigate directly to the record. To enable notifications in your ServiceNow AI Platform instance so they are displayed on your mobile device, follow these steps. **a.** Verify you have downloaded and installed the GRC Mobile application on your ServiceNow AI Platform instance. **b.** In System Settings in your ServiceNow AI Platform instance, under Notifications, verify you have enabled the **ServiceNow Mobile Application**. ServiceNow AI Platform notifications are also displayed on the messages screen on your mobile device. Verify that notifications are also enabled in the settings of your mobile device.

You have successfully set up your mobile device and the ServiceNow AI Platform for the GRC Mobile application. The next step is to log in to your ServiceNow AI Platform instance with the ServiceNow Agent app on your mobile device.

Log in to the GRC Mobile application



Open the GRC Mobile application and add a ServiceNow AI Platform® instance with Policy and Compliance Management to your mobile device.

Before you begin

Verify that you have completed the setup steps described in Setup checklist for the GRC Mobile application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Mobile application

Role required: GRC Compliance manager (sn_compliance.manager)

About this task

Time to complete this task: 5-7 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On your mobile device, tap the **ServiceNow Agent** app.

   If you are not already logged in to a ServiceNow AI Platform instance, the Instances screen is displayed.

2. If the ServiceNow AI Platform instance with the Policy and Compliance Management core application is not already added to your mobile device, follow these steps to add it.

   a. On the Instances screen that is displayed, tap the plus icon ().
   A screen is displayed that prompts you to enter and save an address of a ServiceNow AI Platform instance.

   b. Fill in the fields.

Field name	Description
Enter the instance address or scan a QR code.	Choose one to continue: ▪ Before the `.service-now.com` in the field, enter the name of your ServiceNow AI Platform instance, for example, `grcmobile`. ▪ Enter an address. This address is the URL of your ServiceNow AI Platform instance that you want to view on your mobile device. ▪ Scan a QR code. For more information about the mobile app, see "Log in to an instance with the mobile app" on the ServiceNow product documentation website.
(Optional) Enter nickname	Enter a nickname for this instance. If you have multiple instances added to the device, nicknames can help you quickly locate a ServiceNow AI Platform instance.

   c. Tap **Save and Login**.

3. On the ServiceNow login screen that is displayed, enter the User name and Password for the ServiceNow AI Platform instance that you want to add and tap **Login**.
   The Policy and Compliance landing screen is displayed. You have successfully logged in to the GRC Mobile application.

4. After you log in, verify notifications are enabled in the GRC Mobile application.

   a. On the landing screen on the bottom, tap **More**.

   b. On the More screen, tap **Notification**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the Notifications screen, tap **Enable Notifications** if not enabled.
Notifications from the ServiceNow AI Platform are displayed on the Notifications screen in the GRC Mobile application.

5. After you log in to an instance on your mobile device, it is the default ServiceNow AI Platform instance on the device.
If you want to view another ServiceNow AI Platform instance on your device, you must log out of the default instance. To log out:

a. On the bottom of the screen, tap the **More**.
The More screen is displayed.

b. Tap **Settings**.

c. On the screen that is displayed, tap **Logout**.
The Instances screen is displayed with any ServiceNow AI Platform instances you have added to the mobile device.

d. **Optional:** Tap another instance to log in to it, or, alternatively, follow the preceding steps to add another instance.

Trouble?

If the instances screen for the GRC Mobile application is not displayed after you tap the **ServiceNow Agent** app on your device, verify that the **ServiceNow Agent** app is permitted as a trusted app on your device. To permit access as a trusted app, navigate to the settings and general device management on your device and tap the option (**Trust app**, etc.) to permit access.

If an error message is displayed after you enter your credentials in the log in screen, verify that your User name and password for the ServiceNow AI Platform instance is correct.

If you have problems viewing the landing screen, verify your network connection.

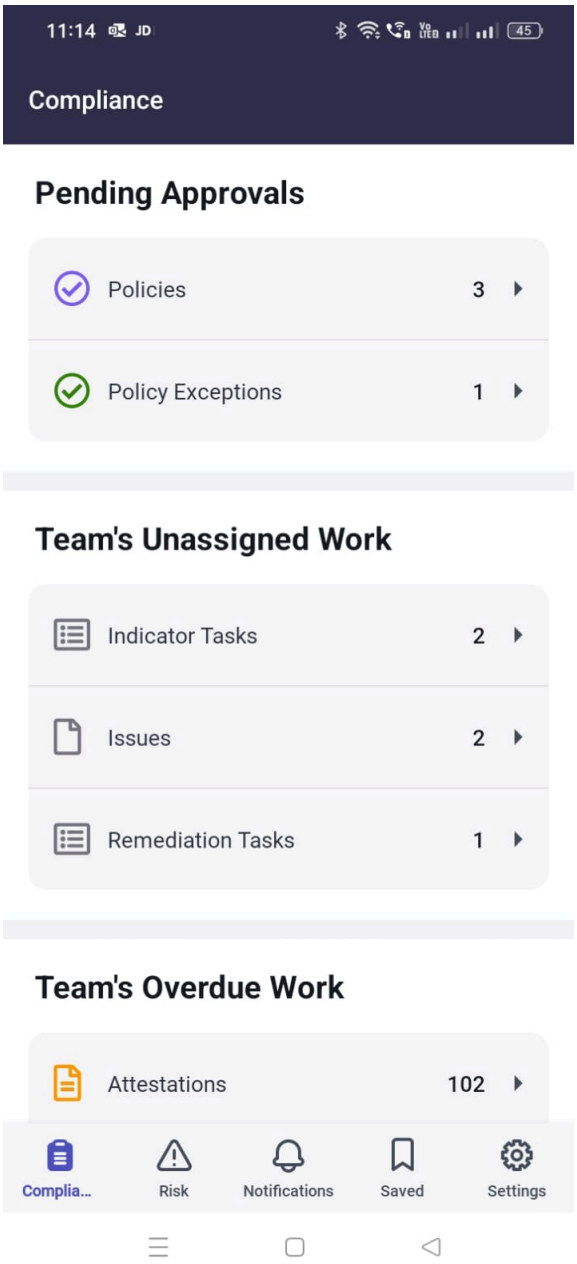
If you cannot view the Instances screen after you tap the **ServiceNow Agent** app, try uninstalling it from your device. Verify you have the most current version of the app from the Apple iOS App Store or the Google Play Store and try reinstalling it.

What to do next
Select one of the following topics for more information about each applet.

Process pending Policy and Compliance Management approval requests with the GRC Mobile application

Approve or reject pending policy approval requests that are submitted to you.

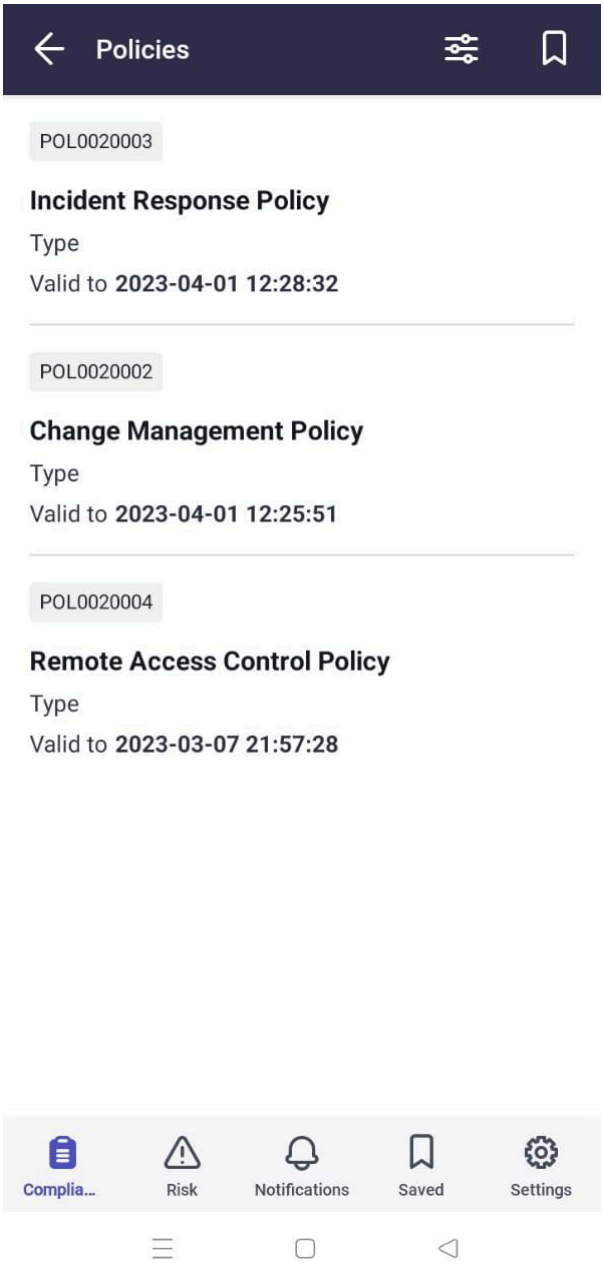
Before you begin
Role required: Compliance manager (sn_compliance.manager)



About this task
Approve or reject a pending Policy and Compliance Management request from the list of records. Alternatively, view the details of the record or add a work note prior to processing the request. Time to complete this task: 5-10 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

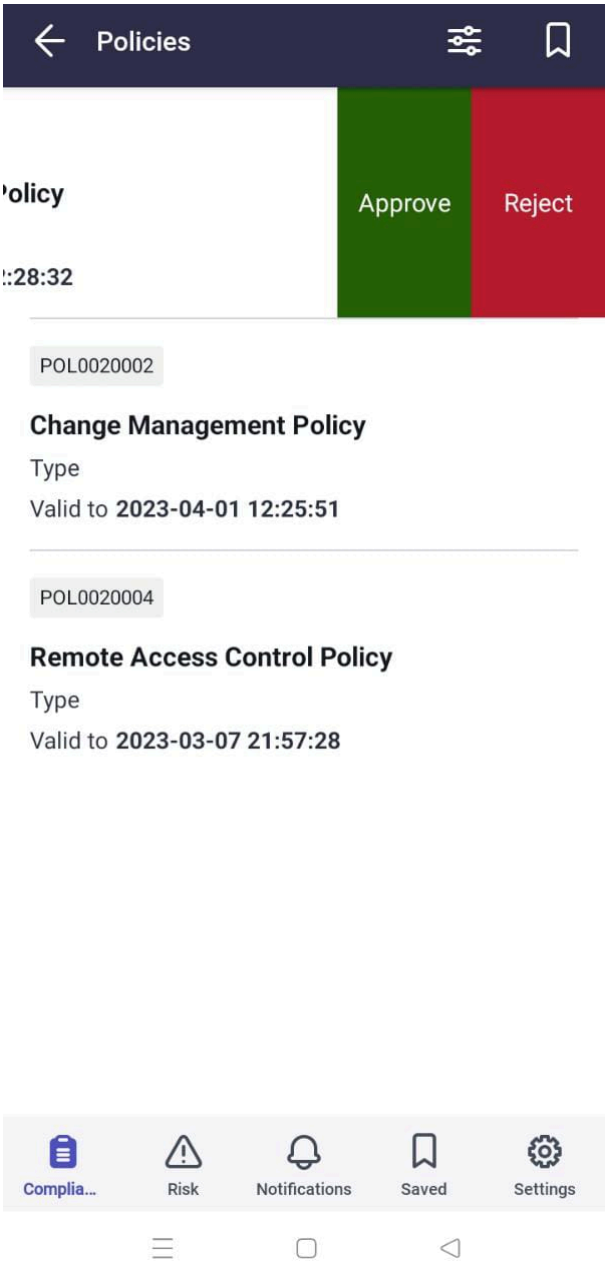


1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Policy and Compliance landing screen displayed, tap **Policies**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

The Policies screen is displayed with a list of records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

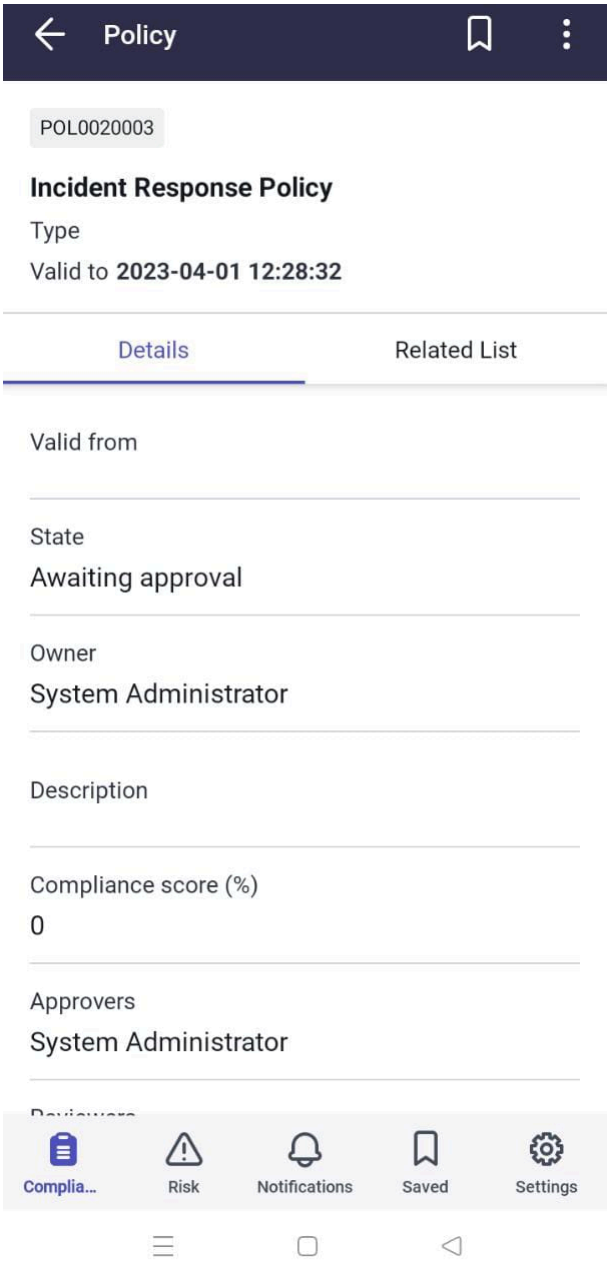


3. **Optional:** If you want to reduce the number of records that are displayed on the screen, see Filter records with the GRC Mobile application to search for records that match specific search criteria.

   (Optional) Filtering records on screens in the mobile app works like filtering with a condition builder on the ServiceNow AI Platform. Setting filters can reduce the number of records that are displayed on screens.

4. With the Policies screen displayed with a list of records, swipe left on a record to open the menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. On the menu that is displayed, choose one to process the request.

6. Alternatively, with the Policies screen displayed, tap a record on the list to open it and view more details.

   With the fields on the policy records displayed as shown in the following figure, choose one in the table to continue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process pending approvals for Policy exceptions with the GRC Mobile application

Approve or reject pending policy exceptions and policy exception extension requests that are assigned to you.

Before you begin

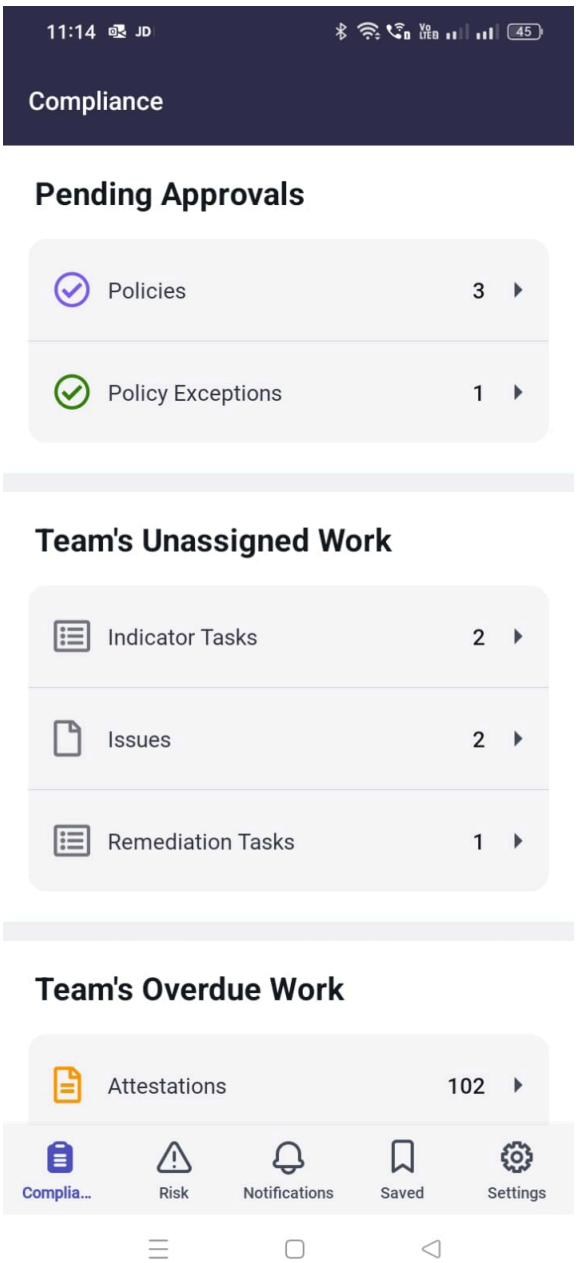
Role required: Compliance manager (sn_compliance.manager)

About this task

With this applet, you can perform the following tasks on a list of policy exception records:

- Edit
- Request more information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Approve, or reject pending policy exceptions or extension requests
- View the details of the record or add a work note prior to processing the request

Time to complete this task: 5-10 minutes.

Procedure

1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Policy and Compliance landing screen displayed, tap **Policy Exceptions**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

The Policy Exceptions screen is displayed with a list of records.

© 2026 ServiceNow, Inc. All rights reserved.

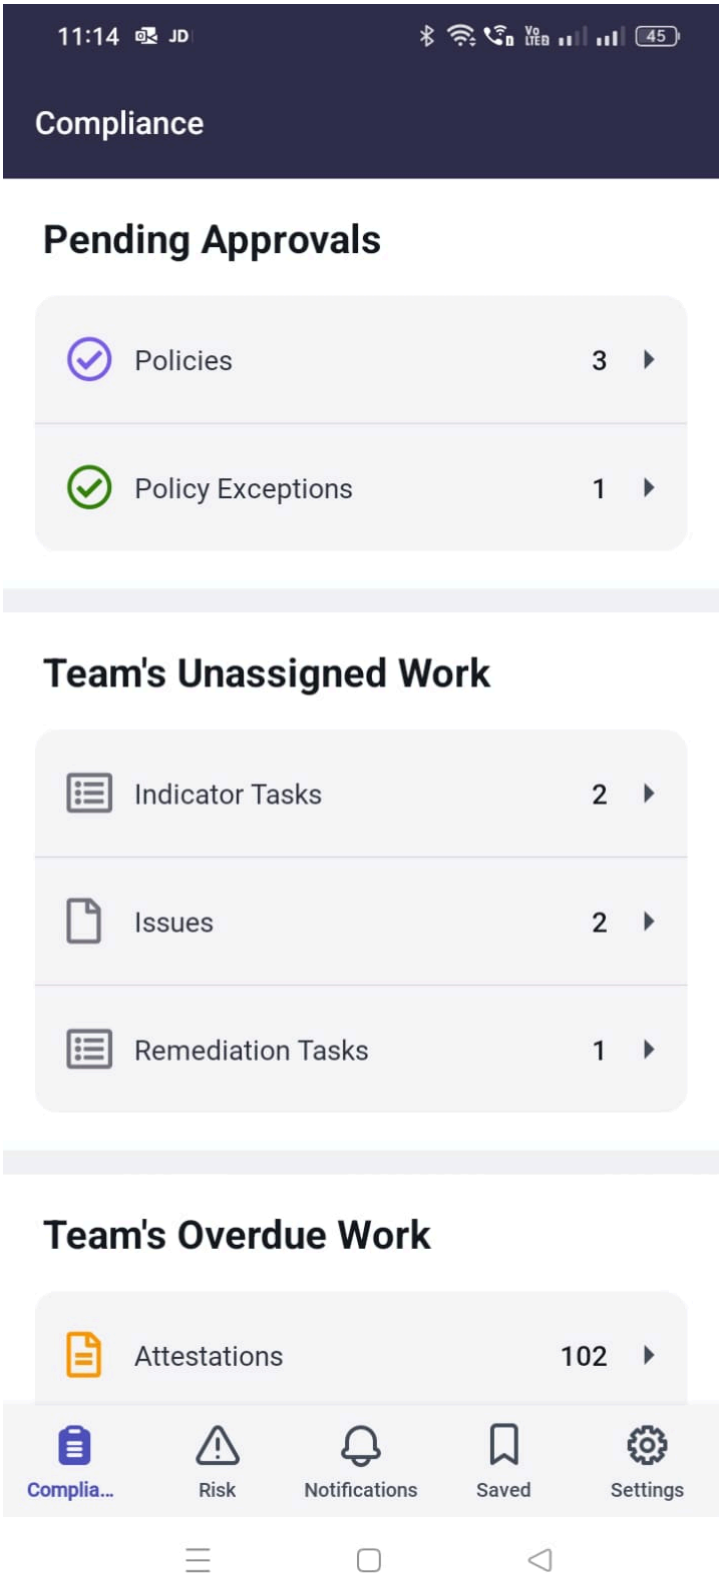
Assign Policy and Compliance Management indicator tasks with the GRC Mobile application

Assign unassigned Policy and Compliance Management indicator tasks to a member of your assignment group. An indicator task is related to a Control record that is assigned to your compliance group.

Before you begin

Role required: GRC Compliance manager (sn_compliance.manager)

About this task



Assign a task from the list of records. Alternatively, view the details of the record or add a work note prior to assignment. Time to complete this task: 5-10 minutes.

Procedure

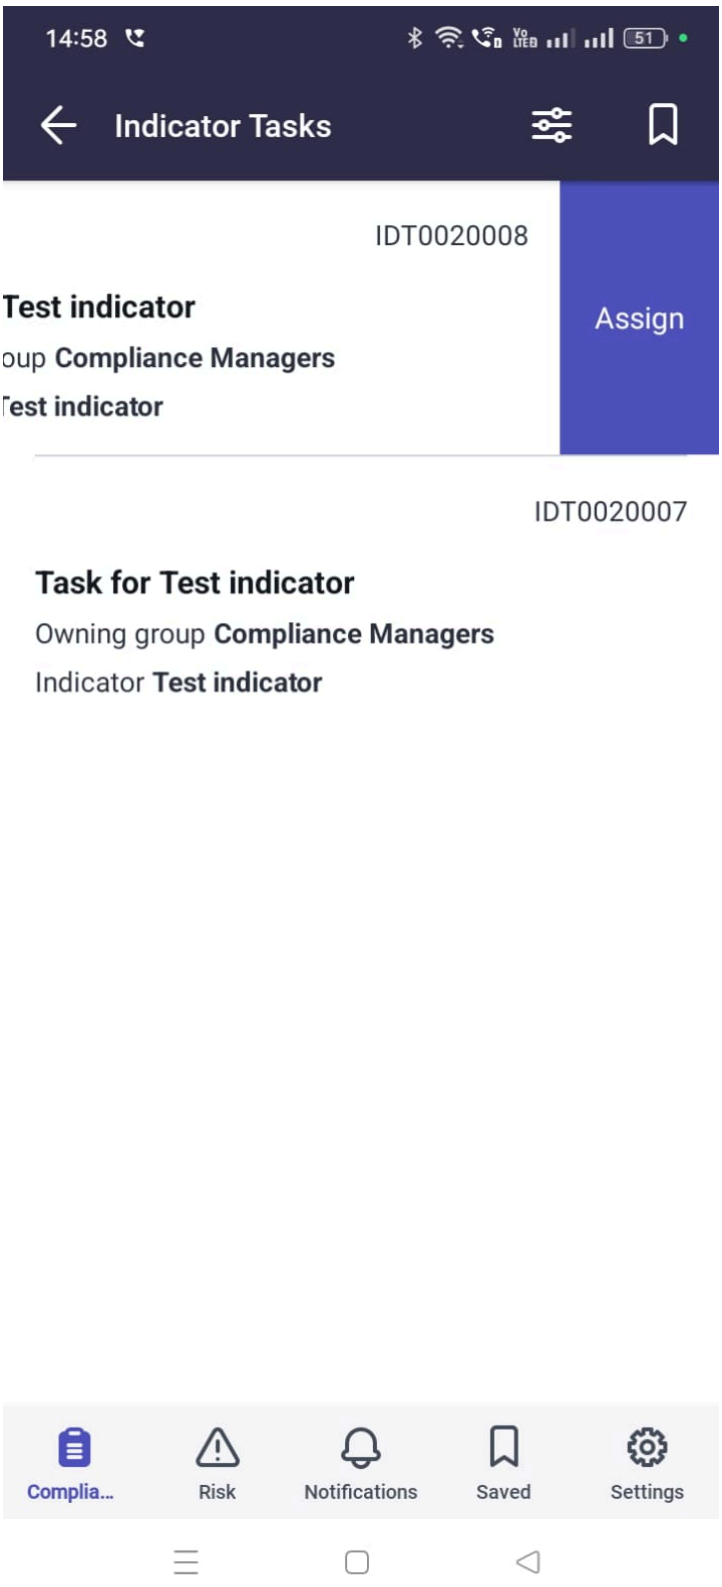
1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Policy and Compliance screen displayed, under the section titled, `Team's Unassigned Work`, tap **Indicator Tasks**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Indicator Tasks screen is displayed with a list of records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. **Optional:** If you want to reduce the number of records that are displayed on the screen, see Filter records with the GRC Mobile application to search for records that match specific search criteria.

   (Optional) Filtering records on screens in the mobile app works like filtering with a condition builder on the ServiceNow AI Platform. Setting filters can reduce the number of records that are displayed on screens.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. With the fields on the record displayed, choose one in the following table to continue.

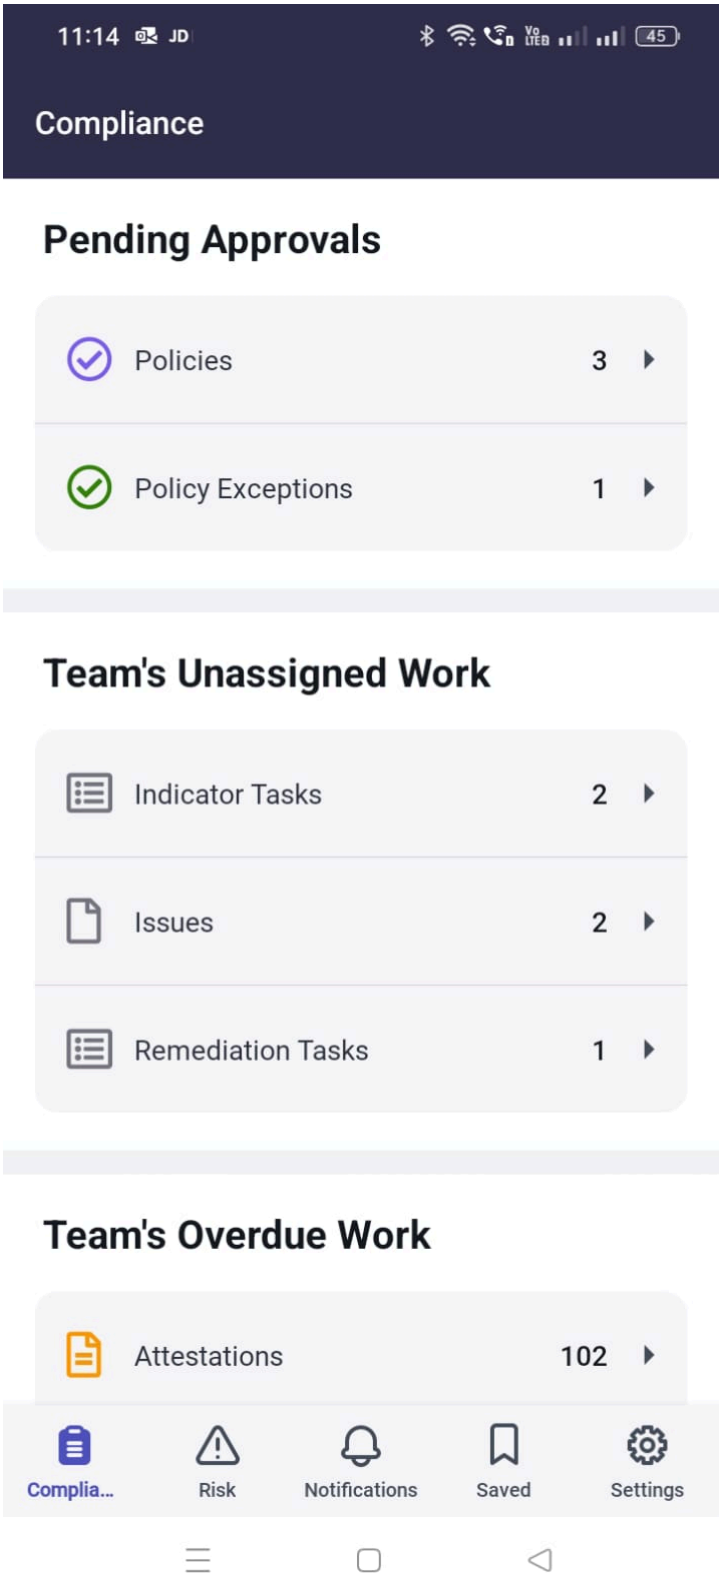
Assign Policy and Compliance Management issues with the GRC Mobile application

Assign unassigned Policy and Compliance Management issues to a member of your assignment group. Navigate through the record to view more details about the Control Objective, the Control record, and Remediation Tasks associated with an issue.

Before you begin

Role required: GRC Compliance manager (sn_compliance.manager)

About this task



Time to complete this task: 5-10 minutes.

Procedure

1. If you are not logged in to your ServiceNow AI Platform instance on your mobile device, for more information see Log in to the GRC Mobile application.
2. With the Policy and Compliance landing screen displayed, under the section titled, `Team's Unassigned Work`, tap **Issues**.

   If you navigate away from the GRC Mobile application after you have logged in, tap the Now Agent app at any time to return to the last screen you had displayed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Filter records with the GRC Mobile application

Set additional filters to limit the number of records that are displayed on a screen. Filtering records in the mobile app works like filtering with a condition builder on the ServiceNow AI Platform.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: Compliance manager (sn_compliance.manager)

About this task
Time to complete this task: 5 minutes.

Procedure
1. To further refine your search results, or to enter additional filter criteria on any list of records that is displayed, tap the filter icon ( ).
2. With the Filters screen displayed, tap a field to expand it.
3. From the options that are displayed, tap the check box or tap an option for your filter.
   For many of the filters, you can select more than one option.
4. Tap the Back icon ( ) or **DONE** to save your changes to a field.
   The criteria you chose are displayed on the Filters screen. The number of records that match your criteria is also displayed at the top of the screen. Tap **Clear** or **RESET** to remove any filters and restore the default setting.
5. **Optional:** Repeat steps 1 - 4 with the Filters screen displayed to continue setting your filter criteria.
6. Tap the intersection union after you set all criteria to create AND conditions.).
   Alternatively, tap the union icon ( ) to create OR conditions.
7. After you have added all the criteria you want, with the Filters screen displayed, tap **DONE**.
   On the screen, only the records that match your filter criteria are displayed.

What to do next
View the records that are displayed after your search for more details.

Policy and Compliance Management reference

Reference topics provide information about tables, roles, and properties installed with the GRC: Policy and Compliance Management application.

Components installed with Policy and Compliance Management

Reference topics provide additional information about components that are installed with the activation of the Policy and Compliance Management plugin. These components include tables, user roles, and properties.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application .

Demo data is available for this feature.

Tables installed with Policy and Compliance Management

Tables are added with activation of GRC: Policy and Compliance Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table	Description
Authority Document [sn_compliance_authority_document]	Extends the Document [sn_grc_document] table and stores all Authority Documents.
Control [sn_compliance_control]	Extends the Item [sn_grc_item] table and stores all controls.
Policy [sn_compliance_policy]	Extends the Document [sn_grc_document] table and stores all policies.
Article Template [sn_compliance_article_template]	Used to format the policy text contained in a policy record when publishing the policy to the knowledge base (KB).
Citation [sn_compliance_citation]	Extends the Content [sn_grc_content] table and stores all citations.
Policy exception risk rating mapping [sn_compliance_policy_exception_risk_rating_mapping]	Stores the mapping details of the risk assessment rating with the policy exception risk rating.
Policy to Entity Type [sn_compliance_m2m_policy_profile_type]	Extends Document to Entity Type [sn_grc_m2m_document_profile_type] and is a many-to-many relationship table that is used to manage the relationships between policies and entity types.
Control Objective to Citation [sn_compliance_m2m_statement_citation]	Many-to-many relationship table that is used to manage relationships between control objectives and their related citations.
Control Objective to Entity Type [sn_compliance_m2m_statement_profile_type]	Extends Content to Entity Type [sn_grc_m2m_content_profile_type] and is a many-to-many relationship table that is used to manage the relationships between control objectives and entity type.
Control objective [sn_compliance_policy_statement]	Extends the Content [sn_grc_content] table and stores all control objectives.
Control objective requirement [sn_compliance_policy_stmt_requirement]	Stores the requirement number and the requirement description of a control objective requirement.
Control objective to Control objective requirement [sn_compliance_m2m_policy_stmt_policy_stmt_rqmt]	Many-to-many relationship table that is used to manage relationships between control objective and control objective requirement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed (continued)

Table	Description
Control requirement [sn_compliance_control_requirement]	Stores the requirement number of control
Control to Control requirement [sn_compliance_m2m_control_control_requirement]	Many-to-many relationship table that stores the control and control requirement details. The **Implementation status** field gives the information whether the requirement is inherited or self implemented.
Requirement selection [sn_compliance_hybrid_selection]	Stores the selections of control requirements. It contains the details of control requirements, control objective, entity, and authorization package.
Policy exception [sn_compliance_policy_exception]	Stores all policy exceptions.
Policy to Policy Statement [sn_compliance_m2m_policy_policy_statement]	Many-to-many relationship table that is used to manage relationships between policy and control objectives.
Control to entity [sn_compliance_m2m_control_entity]	Extends Item to entity [sn_grc_m2m_entity_item] table.

Note:
All additional tables installed by the dependent plugins are also needed for Policy and Compliance Management.

Roles installed with GRC: Policy and Compliance Management

Roles are added with activation of GRC: Policy and Compliance Management.

Roles installed

Role title [name]	Description	Contains roles
Compliance Administrator [sn_compliance.admin]	Contains the reader, user, manager, and admin roles in sn_grc scopes, and the reader, user, and manager roles in the Policy and Compliance Management application. In addition to the inherited permissions, the compliance admin can delete authority documents, citations, policies, control objectives, and controls.	• sn_compliance.manager • sn_grc.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed (continued)

Role title [name]	Description	Contains roles
Attestation Creator sn_compliance.attestation_creator	Role used for creating the GRC attestation metric type, as well as exception questionnaires.	assessment_admin
Compliance Developer [sn_compliance.developer]	Contains the reader, user, manager, admin, and developer roles in sn_grc scopes, and the reader, user, manager, and admin roles in the Policy and Compliance Management application. In addition to the inherited permissions, the compliance developer can create article templates and edit scripts.	• sn_compliance.admin • sn_grc.developer
Compliance Manager [sn_compliance.manager]	Contains the reader, user, and manager roles in sn_grc scopes, and the reader and user roles in the Policy and Compliance Management application. In addition to the inherited permissions, the compliance manager can create authority documents, citations, control objectives, and controls.	• sn_compliance.user • sn_grc.manager • sn_vdr_risk_asmt.vendor_assessment_review
Compliance Reader [sn_compliance.reader]	Contains the reader role in sn_grc scopes. In addition to the inherited permissions, the compliance reader can be assigned indicators templates, indicators, and issues.	• sn_grc.reader • survey_reader
Compliance User [sn_compliance.user]	Contains the reader and user roles in sn_grc scopes, and the reader role in the Policy and Compliance Management application. In addition to the inherited permissions, the compliance user can be assigned controls and create policies, and has read-only access to the Risk Management application and modules. The compliance user can also create control objectives.	• sn_compliance.reader • sn_grc.user • sn_risk.reader • survey_reader • vendor_reader
Corporate compliance analyst [sn_compliance_ws.corporate_compliance_analyst]	Contains the reader and user roles in sn_grc scopes,	• sn_compliance.user • sn_audit.user

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed (continued)

Role title [name]	Description	Contains roles
	and the reader role in the Compliance Workspace.	
Corporate compliance manager [sn_compliance_ws.corporate_compliance_manager]	Contains the reader, user, and manager roles in sn_grc scopes, and the reader and user roles in the Compliance Workspace.	• sn_compliance.manager • sn_compliance_ws.corporate_compliance_ar • sn_audit.manager
IT compliance manager [sn_compliance_ws.it_compliance_manager]	Contains the reader, user, and manager roles in sn_grc scopes, and the reader and user roles in the Compliance Workspace.	• sn_compliance.manager • sn_audit.manager

GRC business user role to control access of compliance tables

The access control limitations (ACLs) or no role conditions with snc_internal role (or no role) is replaced with sn_grc.business_user role to control the access level of different users to compliance tables and also to track their usage.

GRC business user (sn_grc.business_user) role

GRC business user role is granted to users who could perform any GRC operations. It is also granted to users with snc_internal role who have performed all operations like creating policy exception, issues, and responding to attestations, acknowledgements, and other operations. This role comes with installing GRC Profiles plugin.

GRC business user – lite (sn_grc.business_user_lite) role

Users who could do limited operations with snc_internal role are considered as lite operators. Such users are given the GRC business user – lite (sn_grc.business_user_lite) role so as to track the lite usage of compliance tables using the role. This role is granted through explicit roles plugin, GRC: Business User – Lite, which can be installed by users with maint access or ServiceNow support teams.

For more information on install, upgrade, and role assignments, see GRC Business User Role [KB0864247] article in the Now Support Knowledge Base.

Note:
You must log in to Now Support to view the articles.

The access limitations of users with GRC business user role and other roles for different compliance tables and other related tables are listed herewith. For more information, see the Security tightenings for GRC: Policy and Compliance Management [KB1112315] article in the Now Support Knowledge Base.

Control Objective

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Users with GRC business user or business user lite role can read all control objectives.
- If GRC: Audit Management application is installed and the control objective has a published policy associated to it, then users with external auditor role can read such control objectives.
- Users with business user lite have read access to report an issue or policy exception.

Policy

- Users with GRC business user or business user lite role can read all policies.
- If GRC: Audit Management application is installed, users with external auditor role can read all published policies.
- Users with business user lite have read access to policies so as to create policy exceptions.

Policy to Control Objective M2M

- Users with GRC business user or business user lite role can read a policy to control objective M2M record.
- If GRC: Audit Management application is installed, users with external auditor role can read a policy to control objective M2M record if the policy is published.

Control [sn_compliance_control]

- Users with GRC business user or business user lite role can view a control.
- If GRC: Audit Management application is installed, users with external auditor role can read a control.

Assessment Instance [asmt_assessment_instance]

- Users with GRC business user and business user lite role can view attestations that are assigned to them.
- ServiceNow users with GRC business user or business user lite role can take assessments.
- Users with GRC business user or business user lite role can view My Grouped Attestations module.
- Users with GRC business user and business user lite role can view Group Assessment UI and Ungroup Assessment UI actions.
- Users with GRC business user and business user lite role can view **My Attestations** option in GRC application menu.

Assessment Metric Type [asmt_metric_type]

User role is set to GRC business user or business user lite if the evaluation is attestation, the table is Policy Exception, and the role is empty.

Control Overview report

User with GRC reader role can view the control overview report.

Issue [sn_grc_issue]

Report and View issues in Service Portal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users with GRC business user role can report an issue and view their reported issues in Service Portal. GRC business user is the minimum role required to view **My Issues** in the Service Portal.

Read

Users with the following roles can view an issue:

- GRC user (sn_grc.user) role
- GRC business user or business user lite role. Furthermore, the user must fulfil any one of the following conditions:
  - **Assigned to** field in the issue is the user.
  - **Assigned to** of the parent issue is the user or **Assignment group** of the parent issue is one of the user's groups.
  - **Assignment group** is one of the user's groups. Additionally, the user must also have the GRC business user role.
  - **Issue manager** is the user.
  - **Issue manager group** is one of the groups that belong to the logged in user.
  - **Control/Risk** of the issue has an owner and the owner is the user.
  - Issue is created by the logged in user.
  - Issue is created out of an issue triage opened by the user.
  - Logged in user is the assignee or watchlist user on a remediation task for the issue.
  - If GRC: Audit Management is installed, you are an external auditor only; and an auditor on a closed engagement that had control test issues or other issues, can view only those issues.

Write

If the user with the business user role is also the user designated in the **Assigned to** field, then the user can edit:

- Name
- Description
- Issue manager
- Issue manager group
- Action plan
- State
- Parent issue
- Additional comments
- Work notes
- Response
- Explanation

If the user with the business user lite role is also the user designated in the **Assigned to** field, then the user can edit:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Issue manager
- Issue manager group
- State
- Parent issue
- Additional comments
- Work notes
- Response
- Explanation

Note:
If users with business user and business user lite roles have reported an issue, then they can add comments to the issue. However, a GRC user can edit all issues.

View My Open Issues

Users with a minimum role of a GRC business user or business user lite can view their open issues.

Issue grouping

Issue grouping is only open to users with GRC user role.

Send information

A minimum of GRC business user or business user lite role is required to send information for the issue.

Issue Source [sn_grc_issue_source]

A minimum of GRC business user role is required to view and edit the Issue Source table.

Remediation task [sn_grc_task]

- User in the **Assigned to** field of the Remediation task table must have a minimum of GRC business user or business user lite role.
- For read access, users who have a remediation task assigned to them or who are the watchlist users on the remediation task must have a GRC business user or business user lite role. The **Assigned to** user of the issue, the issue manager of the issue, or any user with GRC manager (sn_grc.manager) role can view a remediation task.
- **My Open Remediation Tasks** is visible to users with a minimum role of GRC business user or business user lite.

My Indicator Task [sn_grc_indicator_task]

Users with GRC business user or business user lite role can access My Indicator Tasks.

Policy Acknowledgement

Users with GRC business user or business user lite role can:

- Acknowledge policies from ServiceNow AI Platform UI and Service Portal.
- View **My Acknowledgements** menu option in Service Portal.
- View Acknowledgement instances [sn_compliance_policy_acknowledgement_instance] that are assigned to them.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy Exception [sn_compliance_policy_exception]

Users with GRC business user or business user lite role can:

- Raise Policy Exceptions from ServiceNow AI Platform and Service Portal.
- View policy exception. Users with read access include users who requested policy exception, are present in watch list, and are verification approvers, final approvers, impacted control owners, and compliance managers.

For more information, see:

- GRC Business user role [KB0864247] article in the Now Support Knowledge Base.
- Governance, Risk, and Compliance License Compliance update [KB1096178] article in the Now Support Knowledge Base.

Properties installed with GRC: Policy and Compliance Management

Properties are added with activation of GRC: Policy and Compliance Management.

Name	Description
Entity hierarchy based scoring sn_compliance.entity_hierarchy_based_scoring	• **Type**: true or false • **Default value**: false • **Location**: **All** > **Policy and Compliance** > **Administration** > **Properties**
Trigger control attestations based on the created or updated date of the last completed attestation sn_compliance.attestation_run_reference_date_field	• **Type**: string • **Default value**: Created date, Updated date • **Location**: **All** > **Policy and Compliance** > **Administration** > **Properties**
States for which the control is active (the first state is the default active state) sn_compliance.active_states	Compliance administrators can change this setting. • **Type**: string • **Default value**: draft, assess, review, monitor • **Location**: **Policy and Compliance** > **Administration** > **Properties**
States for which control is inactive (the first state is the default inactive) sn_compliance.closed_states	Compliance administrators can change this setting. • **Type**: string • **Default value**: retired • **Location**: **Policy and Compliance** > **Administration** > **Properties**

Name	Description
Name of the assessment metric type that is used for attestations sn_compliance.default_attestation	System administrators can change this setting. • **Type**: string • **Default value**: GRC Attestation • **Location**: **Policy and Compliance** > **Administration** > **Properties**
sn_compliance.glide.script.block.client.globals	• **Type**: true or false • **Default value**: false • **Location**: **Policy and Compliance** > **Administration** > **Properties**
Name of the knowledge base used to publish Policy articles sn_compliance.knowledge_base	Compliance administrators can change this setting. • **Type**: string • **Default value**: Governance, Risk, and Compliance • **Location**: **Policy and Compliance** > **Administration** > **Properties**
Enable smart assessments on control sn_compliance.enable_smart_assessments	Property that enables the assessment of controls using the non-classic assessment engine. • Type: true or false • Default value: false

Domain separation in GRC: Policy and Compliance Management

Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Benefits of having domain-separated tables in Policy and Compliance Management

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.

These users can choose to expand or collapse the domain scope to show or hide data from other domains.

Note:
Users always have access to data from domains that have been explicitly granted to them by domain visibility.

How GRC handles domain separation

While GRC supports separation of data, separation of logic and process is not fully supported.

- Many types of records in GRC are automatically generated through user processes. Entities, controls, risks, indicators, and control tests are all records that can be generated automatically. For records that are automatically generated (and for any GRC record that is manually generated), the domain of the record is the same as the domain of the user responsible for creating or generating the records.
- Automatic generation should be kept in mind when working in a domain-separated GRC implementation. Users should be sure that they are creating / generating records at the right domain level so that they are visible to the right set of users.

  For example, suppose you have domains that look like:

  Domain separation

- If you have a risk or control that you want to be assessed by users in domains A and B, the risk or control should be generated or manually created at the global level. If the risk or control is created in Domain B, you will not be able to recreate the risk or control in Domain A due to indexing.
- If you have a risk or control that you want to be assessed by users in TOP and Domain A, you can create the risk or control in Domain A.

Unless the risks and controls are in the Global domain, users should not assign risks or controls in a higher domain to users in a lower domain. In the example above, if you have a control in the TOP domain, you should not assign it for attestation to users in Domains A or B since those users

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

would not have access to the control; thus the attestation or assessment questionnaire would not be generated.

Similarly, users should not assign control objectives and risk statements in a higher domain to attestations and assessments in a lower domain. Otherwise the attestation or assessment questionnaire would not be generated.

Use case

GRC data for IT can be separated from the GRC data of other departments. Each business area using the GRC application can have separate data that cannot be shared with other departments. Therefore each department can have its own entities, policies, controls, risks, and so on.

When looking at a control from the IT domain, the user can choose to expand the domain scope to show values from the Finance domain or collapse the domain scope to show only controls that match the IT domain.

By default, domain separation adds a domain field to the Task `[task]` and Configuration Items `[cmdb_ci]` tables and their extensions.

You can extend domain separation to any new tables you create by adding a `sys_domain` field to the table's dictionary definition. By default, the system only domain-separates platform and baseline application tables where appropriate.

Warning:
ServiceNow does not recommend domain separating platform tables (any table with the sys_ prefix such as the Dictionary Entry `[sys_dictionary]` and Dictionary Entry Override `[sys_dictionary_override]` tables) because it can produce unexpected results.

In this use case, client scripts, business rules, workflows, processes, and so on can be domain-separated.

While the behavior offered with domain separation provides multi-tenancy support, multi-tenancy is still contained within a single instance. This means that some global properties, some global data, and some global processes are shared across all domains. For example, the system's "Remember me" option on the login page is global and cannot be specified per domain.

If you need complete and total separation of all system properties and do not require global reporting or global processes, separate instances are the best option.

Allocation of domain values to Policy and Compliance Management objects

Records that are automatically generated either through scheduled jobs or background scripts are domain separated based on their parent object or user domain for all Policy and Compliance objects. Similarly, controls, risks, or risk assessments that are auto-generated based on the entities must also be domain separated.

The following changes are made to the domain assignment process to manage data segregation by the Managed Service Providers related to Policy and Compliance Management tables:

Policy and Compliance Management objects	Domain source
Policy	User Domain
Acknowledgement Campaign	Policy Domain

Analytics and Reporting solutions for GRC: Policy and Compliance Management

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

The Analytics and Reporting Solution for GRC: Policy and Compliance Management is available on the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

To enable the Analytics and Reporting solution for GRC: Policy and Compliance Management, perform these steps.

1. Visit the ServiceNow Store and obtain an entitlement to the Performance Analytics - GRC: Policy and Compliance Management application and associated applications. See Install a ServiceNow Product on the ServiceNow Store.
2. On the instance, navigate to **System Applications** > **All Applications** > **All**.
3. Locate and install the Performance Analytics - GRC: Policy and Compliance Management application.

Important:

Starting with version 18.1.0 of the Policy and Compliance Management application, the Analytics and Reporting solutions for Policy and Compliance are available in the Next Experience UI Framework.

Compliance Overview Performance Analytics dashboard

The Compliance Overview dashboard provides an executive view into compliance requirements, overall compliance, and compliance breakdowns so areas of concern can be identified quickly.

Compliance Overview dashboard

Important:
Starting with version 18.1.1 of the Policy and Compliance Management application, the Compliance Overview dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

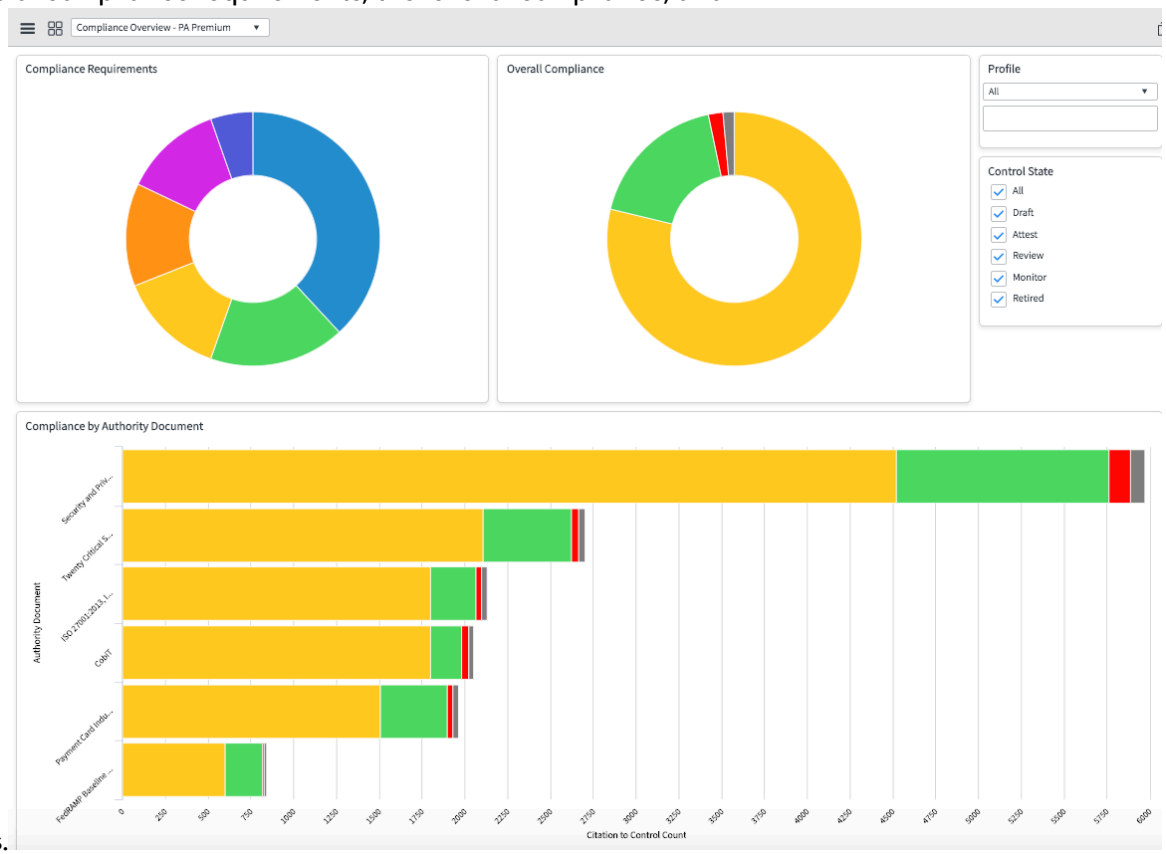
The following roles and tasks are associated with this solution:

- Audit Manager (sn_compliance.manager): To have clear visibility into the overall state and volume of vulnerabilities within the organization.
- Audit Administrator (sn_compliance.admin): To pinpoint areas of concern quickly.
- Audit Analyst (sn_compliance.user): To prioritize which risks or tasks to focus on based on criticality to the organization.

To open the dashboard, navigate to **All** > **Policy and Compliance** > **Compliance** > **Analytics Overview**.

The Compliance Overview dashboard contains the following visualizations:

Name	Type	Description
Compliance Requirements	Donut chart	The number of open requirements by authority document
Overall Compliance	Donut chart	Overall compliance percentage of Citation Authority Document
Non compliant entities	Bar chart	Overall entities with non-compliant controls.
Compliance by authority document	Bar chart	The regulations, certifications, frameworks, standards, and best practices that an organization chooses or is required for compliance with regulations.
Compliance score trends	Horizontal bar	Overall compliance by Authority Document
Compliance Breakdown	Multilevel pivot	Citations are records with the specific requirements cited by an authority document.



Compliance Overview – PA Premium dashboard

Important:
The Compliance Overview dashboard with PA filters is now available as part of the Policy and Compliance Management plugin.

Starting with version 18.1.0, the Compliance Overview – PA Premium dashboard is being prepared for future deprecation. It will be no longer available on new instances.

Policy Overview dashboard

Required ServiceNow AI Platform roles

- Compliance administrator (sn_compliance.admin): To view and edit the details in the Policy Overview dashboard.
- Compliance reader (sn_compliance.reader): To view the compliance requirements, overall compliance, and compliance breakdowns.

Access the Policy Overview dashboard

To open the dashboard, navigate to **All** > **Policy and Compliance** > **Policies and Procedures** > **Analytics Overview**.

Reports

Important:
Starting with version 18.1.1 of the Policy and Compliance Management application,the following Policy Overview dashboard reports can be viewed in the Next Experience UI Framework.

Policies and Procedures Overview reports in the base system

Title	Type	Description
Control compliance	Donut chart	Displays the overall compliance of all the controls in the system.
Control details	Donut chart	Displays a breakdown of controls grouped by owner, category, or type.
Compliance score by department	Bar chart	Overall (average) compliance score by assignment group/ department
Control Overview	Bar chart	Displays control counts exempted by entities.

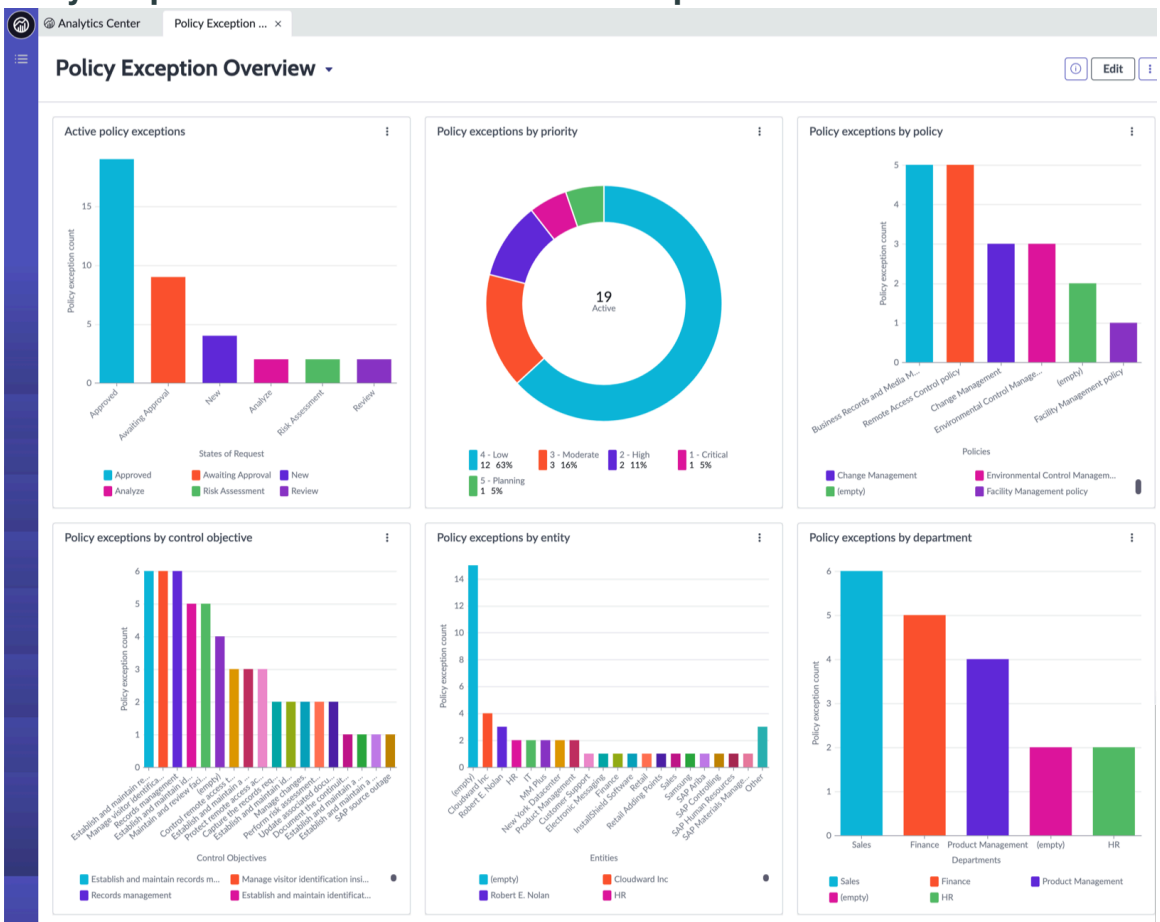
Policies and Procedures Overview reports in the base system (continued)

Title	Type	Description
Exempted controls by policy	Bar chart	Displays the number of controls exempted by policies.
Exempted controls by entity	Bar chart	Displays a list of control issues that have been closed with a response value of accept, meaning the issue was not remediated.
Control Issues by Policy (Opened Date)	Line chart	Displays the number of control issues opened each week, grouped by policy.
Total Control Objectives by Policy	Bar chart	Displays a count of the overall number of control objectives in each policy. The chart is stacked to display control objectives by type.

Policy Exception Overview Performance Analytics dashboard

The Policy Exception Overview Performance Analytics dashboard provides views into the number, severity, and source of policy exceptions. It also shows exempted controls.



Policy Exception Overview dashboard

Important:
Starting with version 18.1.1 of the Policy and Compliance Management application, the Policy Exception Overview dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

Application Risk and Compliance Overview dashboard in the Next Experience UI Framework

Required ServiceNow AI Platform roles

- Admin (sn_grc.admin), to provide admin rights and edit the reports in the dashboard.
- Reader (sn_grc.reader), to view the reports in the dashboard.

Access the Application Risk and Compliance Overview dashboard

To open the dashboard, navigate to **All** > **Advanced GRC Dashboards** > **Analytics Application Risk Dashboard**.

Reports

- The Compliance Overview tab appears when you activate the Policy and Compliance plugin. The tab provides an overview of the compliance posture of the business applications.
- The Risk Overview tab appears when you activate the Advanced Risk plugin. The tab provides an overview of the risks associated with business applications.
- The Risk Posture tab appears when you activate the Risk plugin. The tab provides information about the risk exposure of business applications. The reports in this tab can also be filtered using the Business Application filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Audit Overview tab appears when you activate the Audit plugin. The tab provides an overview of audit and audit activities related to business applications.
- The Policy Exceptions Overview tab appears when you activate the Policy and Compliance plugin. The tab provides information about policy exceptions requested for business applications. The data displayed in the Policy Exceptions Overview tab can be filtered using the Business Application filter.
- The Issues Overview tab appears when you activate either the Risk Management plugin or the Policy and Compliance Management plugin. The tab provides information about the various compliance and risk issues associated with business applications. The data displayed in the Issues Overview tab can be filtered using the Business Application filter.

Title	Description
Compliance Overview tab	
Total Controls	Provides the total number of active controls.
Compliant Controls	Provides the total number of compliant controls which are not in draft or retired state.
Non-Compliant Controls	Provides the total number of non-compliant controls which are not in draft or retired state.
Compliance Status By Month	Provides the number of active controls by month. This bar chart shows the compliance status for the current month and can be grouped by either Control Status or Business Application.
Compliance %	Provides the percentage of different statuses of active controls such as Compliant, Non Compliant, and Not Applicable.
Application Compliance Summary	Provides the summary of policies, authority documents, and the controls associated with business applications.
Risk Overview tab	
Risk Heatmap by Application Criticality	Displays the heatmap of the application risks based on the criticality of applications versus the risk rating of the application.
Risk Response Tasks Overview	Displays the response tasks created for a risk and different states of those tasks. This bar chart can be grouped and stacked by risk response, risk response state, risk calculated score, risk response assigned to, or business application.
Application Risk Summary	Displays the summary of risks directly associated with the applications that contribute to the overall risk rating of the application. Other downstream risks that contribute to the application risk rating are not represented in this report. The risks considered for this report are very high, high, and moderate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Description
Application Risk Mitigating Controls Status	Provides the information for an application's risks and the associated controls. The risks considered for this report are very high, high, and moderate. The state of controls must not be in draft or retired. The risks for only one year are displayed.
Risk Posture tab	
Very High Risks	Displays the very high risks of an application.
High Risks	Displays the high risks of an application.
Moderate Risks	Displays the moderate risks of an application.
Acceptance Task Expirations	Displays the risk response acceptance tasks that have an expiration on the current day, the current week, the current month, the current quarter, and the current year.
Contributing Risks Trend	Displays the trend of risks directly associated with business applications and how they are performing over a period. Other downstream risks that contribute to the application risk rating are not represented in this report.
Audit Overview tab	
Open Audit Engagements	Displays the number of audit engagements in open state.
Ineffective Controls	Displays the number of ineffective controls for an audit engagement.
Open Issues	Displays the number of open issues for an audit engagement.
Past Due Issues	Displays the number of past due audit issues for an application.
Upcoming Audit Engagements	Displays the monthly count for the upcoming audit engagements.
Open Issues by Audit Engagements	Displays the monthly count for the open audit issues.
Past Due Issues by Audit Engagements	Displays the past due audit issues over a period.
Ineffective Controls by Audit Engagements	Displays the information regarding audit engagements and the associated ineffective controls.
Policy Exceptions Overview tab	
New Exceptions	Provides information about the new exceptions requested.
Approved Exceptions	Provides information about the number of approved exceptions.
Rejected Exceptions	Provides information about the number of rejected exceptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Description
Expired Exceptions	Provides information about the number of expired exceptions.
Exceptions Awaiting Approval	Provides information about the exceptions that are awaiting approval and are due on the current date, the current week, the current month, and the current quarter.
Extensions Awaiting Approval	Provides information about the extensions that are awaiting approval and are due on the current date, the current week, the current month, and the current quarter.
Upcoming Exceptions Expirations	Provides information about the exceptions that are about to expire and which are due on the current date, the day after the current date, the current week, the week after the current week, and the current month.
Exceptions Requested vs. Approved	Provides information about the exceptions requested versus the number of exceptions approved per month.
Issues Overview tab	
Open Issues	Displays the number of issues in open state.
Critical Priority Issues	Displays the number of critical priority issues.
High Priority Issues	Displays the number of high priority issues.
Accepted Issues	Displays the number of issues that are accepted.
Past Due Issues	Displays the number of past due issues.
Issues to be Resolved	Displays the number of issues that must be resolved on the current date, current week, current month, current quarter, and current year.
Remediation Tasks to be Completed	Displays the number of remediation tasks that must be completed on the current date, current week, current month, current quarter, and current year.
Past Due Issues	Displays the number of past due issues over a time period.
Past Due Remediation Tasks	Displays the number of past due remediation tasks over a time period.
Issue Creation Trend	Displays the trend of how issues are created over a time period.
Issue Closure Trend	Displays the trend of how issues are closed over a time period.
Remediation Task Creation Trend	Displays the trend of how remediation tasks are created over a period.

Privacy Management

Use the Governance, Risk, and Compliance: Privacy Management application to help protect your customers, employees, and suppliers with integrated data privacy risk and compliance management solutions and privacy by design concepts.

The Privacy Management application helps you to manage multiple privacy regulations such as the General Data Protection Regulation (GDPR), the California Consumer Privacy Act (CCPA), and the Australian Privacy Act. It also helps you to manage frameworks such as the National Institute of Standards and Technology (NIST), ISO 27001, and so on. The Privacy Management solution

Exploring Privacy Management

The ServiceNow® Privacy Management application enables you to manage your company's privacy programs. Some examples of privacy programs are privacy regulatory compliance programs, privacy impact assessments, privacy policy management, and so on.

All organizations collect personal data of customers, employees, and third parties in some form. Some examples of personal data are as follows:

- Home address
- Location data
- Identification card number
- Biometric data

When your organization collects personal data, the data is exposed to multiple risks such as using the personal data for an organizational purpose without taking consent from the owners and the data getting inadvertently leaked. These events lead to compliance failure. Failure to manage data privacy laws can result in heavy fines and loss of customer and employee trust. This failure to protect data can also impact brand reputation.

The Privacy Management application helps you to manage multiple privacy regulations such as the General Data Protection Regulation (GDPR), the California Consumer Privacy Act (CCPA), and the Australian Privacy Act. It also helps you to manage frameworks such as the National Institute of Standards and Technology (NIST), ISO 27001, and so on. The Privacy Management solution

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

enables you to implement privacy policies and acknowledgments to handle the personal data of customers and employees.

The following are the key capabilities to help you manage your organization's privacy programs effectively:

- Creating an inventory of critical business processes, applications, and vendors for privacy assessments.
- Setting up the privacy library content such as authority documents, citations, control objectives, risk statements, and policies.
- Managing privacy impact assessments.
- Managing privacy risk assessments.
- Discovering processing activities that process personal information.
- Managing processing activities to track their risk and compliance posture with continuous monitoring and issue management capabilities.
- Understanding and analyzing the overall privacy posture of your organization with various dashboards and reports.

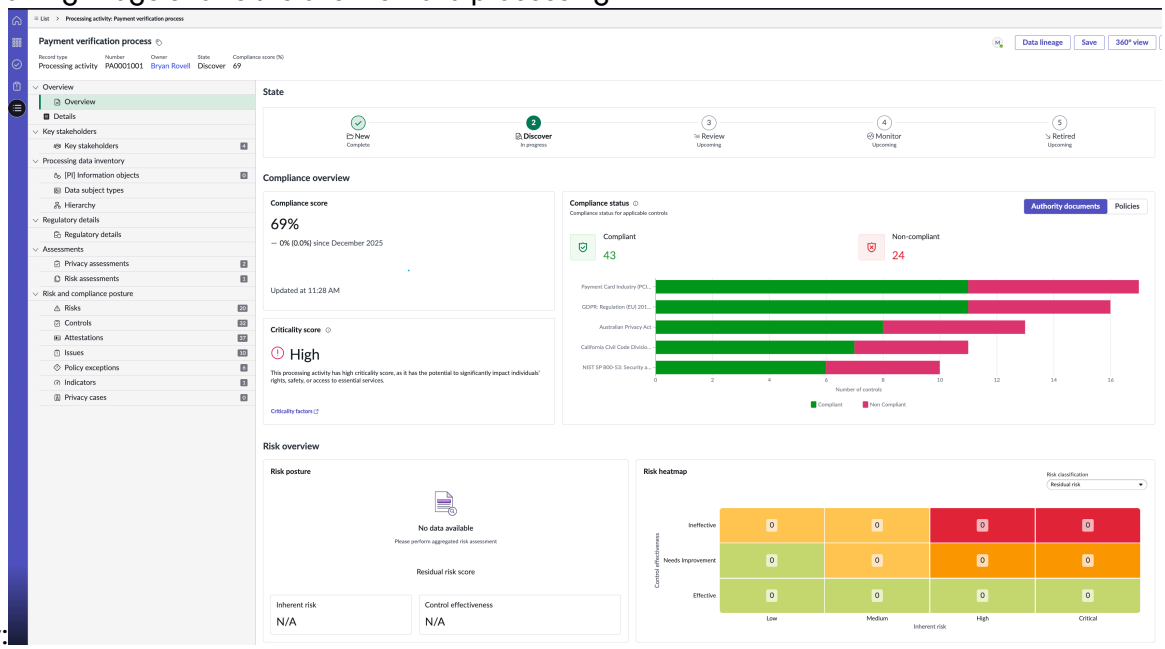
The Privacy Management application is available on the Privacy Workspace. This workspace displays Home page, the Tasks page, the Issues overview page, and the List view. Every item on and inside these pages and lists are only specific to the Privacy Management application. This means that, for example, if you view citations and authority documents, they are specific to Privacy Management.

The Privacy Management solution is available as an add-on in the Integrated Risk Management (IRM) suite.

Processing activities

A processing activity is a record that processes personal data. Examples of such records can be a business process or a business application of an organization that has personal information. Processing activities enable the privacy management teams to understand how personal information is being processed or used.

To manage the privacy programs, use any business process or business application that is available as inventory or records in the Configuration Management Database (CMDB) to create a processing activity record. Each business process or an application is a separate processing activity. After the privacy teams understand how personal data is being used, they can work with the business owners who own the processing activity and help them to be compliant with the necessary privacy regulations.



A processing activity stores the following type of information:

- Name and contact information of the data controller and the data processor.
- Regulatory details such as data sensitivity, scale of data processing and so on.
- The purpose for which a processing activity is processing personal data. For example, lawful basis, legal obligations, and so on.
- Categories of data subjects and categories of personal data being processed. Examples of data subjects are customers or employees.
- Recipients with whom personal data is shared. For example, vendors or third parties and internal systems.
- Third parties in other countries and international organizations that receive the personal data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Privacy regulations, policies, risks, controls, and issues related to each processing activity.
- Key stakeholders of the processing activity such as the entity owners and others who are involved in the processing activity.

The following image shows the overview of a processing activity:

Note:
The policies and controls that appear on the **Overview** page of the processing activity are specific to Privacy Management.

Processing activity hierarchy

Each processing activity involves multiple information objects classified as personal information. These objects exchange data with various other entities, making it essential to establish a data lineage or hierarchy that tracks where personal data is shared. This understanding helps mitigate privacy-related risks.

Methods to create data lineage

You can create a data lineage in the following ways:

- From the Hierarchy tab of a processing activity.
- From the Data lineage button on a processing activity. For more information see, Create a data lineage for a processing activity.

Importance of data lineage

To understand why data lineage is important, consider the following example of data management in a Human Resources organization. Any HR organization contains information such as the following.

- Employee records: These include personal details like names, addresses, phone numbers, and email addresses.
- Prospective interview candidate records: Contains candidate names, interview dates, and times.

The entities involved in this example could be:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Internal departments such as Talent acquisition, Recruiters, People Management teams.
- External tools and applications to track time off, benefits, and so on.

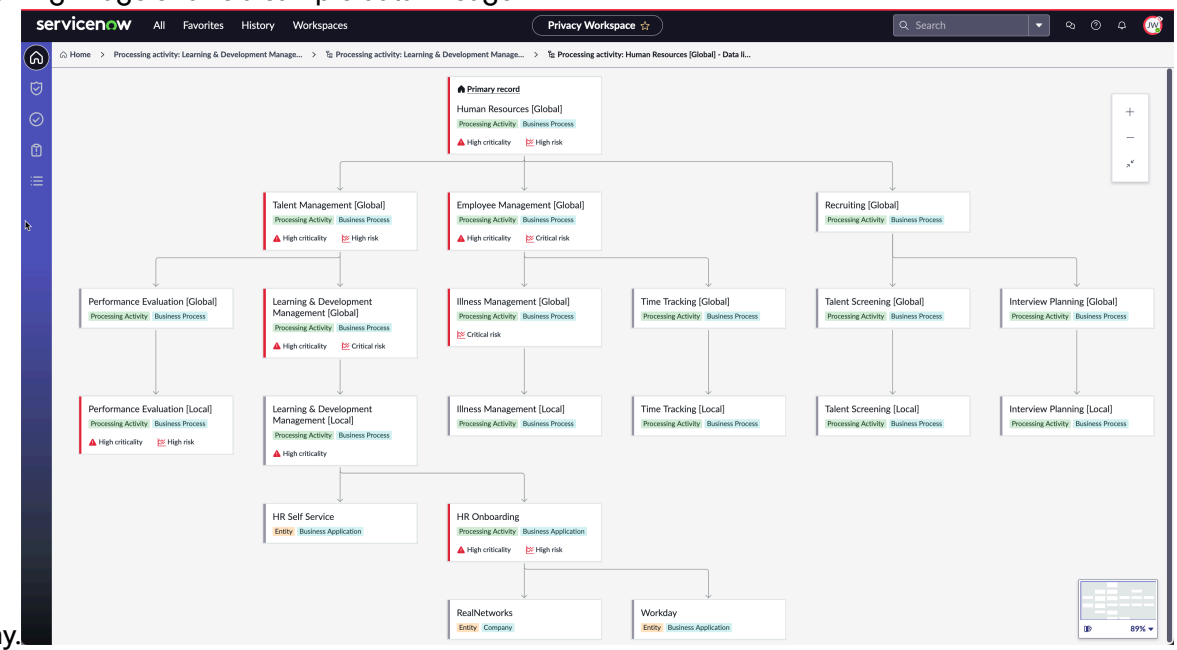
When a new candidate registers, their personal information is entered into the HR organization's database. This information is shared with the administrative staff for appointment scheduling. Data lineage helps track the flow and transformation of data through various processes. In this example, the following could be a workflow:

1. Candidate registration:
   - A person registers on the careers portal and submits their resume.
   - The candidate's details such as name, email, phone number are entered into the applicant tracking system (ATS).
2. Scheduling an interview:
   - The Talent Acquisition team selects the candidate for an interview and enters the interview date and time into the calendar application.
   - The calendar application sends an email to the candidate with the interview details.
3. Conducting the interview:
   - The recruiters access the candidate’s profile on the ATS, review the resume, and conduct the interview.
   - Post-interview, they add their feedback to the candidate's ATS profile.
4. Hiring process:
   - The candidate is selected for the position.
   - The candidate details are transferred from the ATS to the HR database, and additional information is collected and updated.
   - The HR database uses other external applications to create the candidate’s employee profile, including time-off records and benefits information.

By establishing a data lineage, the HR organization can track where each piece of personal data originates, how it’s processed, and where it’s shared. Understanding the data flow helps identify potential privacy risks, such as unauthorized access or data breaches at any point where data is shared. By establishing the data lineage in this way, the HR organization can ensure that they’re aware of all points where personal data is exchanged. This understanding helps them implement appropriate safeguards to mitigate privacy-related risks.

Information displayed on the data lineage page

After you establish the relationship of the data flow, the data lineage page displays the following key information on the right side pane.



- Description of the processing activity along with its owner and the type.
- Criticality score of the processing activity if the score is High.
- Risk rating of the processing activity if the score is High and Critical.
- Compliance score of the processing activity.
- Number of open issues.
- Number of critical open issues.
- On going assessments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a selected CMDB record already has a processing activity linked to it, then that information is also displayed during the hierarchy creation. A toggle switch **View roll-up** is provided to view the rollup of personal information objects. If this switch is turned on, then the personal information objects associated with the selected asset and its associated destinations are displayed.

Data lineage example

The following image shows a sample data lineage hierarchy.

Create a data lineage for a processing activity

Privacy classic assessments

Privacy assessments are used to collect information from business owners. This information helps the privacy teams to understand how personal information (PI) is being used or stored in a processing activity.

Using the privacy assessment capability, you can configure various types of assessments and send those assessments to the business process or business application owners to collect their responses. Some examples of the assessments that you can configure are as follows:

- Privacy screening initial assessments
- Privacy impact assessments (PIA)
- Privacy readiness assessments

When a privacy assessment is initiated, the business owners respond to the questions in the assessments. Their responses automatically create processing activities in the system. The necessary controls and information objects are then automatically mapped to the processing activities.

The privacy assessment capability provides multiple configurations options such as:

- Configuring various types of questions using a simple user interface.
- Configuring the creation of processing activities using the responses of the assessments.
- Mapping controls to question responses to determine the responses that will automatically map controls to the processing activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configuring [PI] Information objects for responses to automatically map the information objects to a processing activity. For more information, refer to Information objects in Privacy Management.
- Mapping question responses to processing activity fields to automatically fill the required data in the processing activity.

Smart assessments in Privacy Management

The new and improved assessment experience in Privacy Management uses the Smart Assessment Engine (SAE) application. The assessment engine enables you to perform privacy screening and privacy impact assessments to collect the necessary information for the privacy teams.

In Privacy Management, assessments play an important role. There are two types of assessments.

- Privacy screening assessment: A privacy screening assessment is a preliminary evaluation used to determine whether a processing activity involves personal data and whether it may pose privacy risks. It's a high-level review conducted to identify whether a more detailed privacy review, such as a privacy impact assessment (PIA), is necessary. For example, when a new business application or process is created, the privacy teams must understand if the application or the business process processes personal data or not. To determine this, the screening assessments are sent to the business application or business process owners. After the assessment is approved by the privacy manager, a processing activity is created.
- Privacy impact assessment: After a screening assessment is performed, based on the responses, a privacy impact assessment may be generated. A Privacy impact assessment is a comprehensive evaluation of how a business application, system, or process affects personal data privacy. It assesses the privacy risks associated with processing activities and identifies measures to mitigate these risks. Each time a privacy impact assessment is performed, the risks are revisited to determine if the risk score changed. This helps the privacy teams remain vigilant and address the risks as required.

To perform these assessments, you can use the Smart Assessment Engine application. This application provides several benefits such as configuration of templates, workflows, guidance for questions, and reviewing of assessment results with actionable insights. For more information about the Smart Assessment Engine application, refer to Exploring Smart Assessment Engine.

Note:
To use Smart Assessment Engine, you must enable the *sn_privacy.enable_smart_assessment* property that is located under system properties.

Benefits of using the new assessment experience

The new assessment experience offers the following benefits.

- Capture all the required information during the assessment eliminating the need for manually adding details to the processing activity.
- Capture the hierarchy or flow of data and specify where the data is coming from and where is the data going.
- Collect the lawful basis of collecting and processing data.
- Create multiple sections for logical grouping of questions
- Migrate assessments from older systems.
- Provide inline guidance for questions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

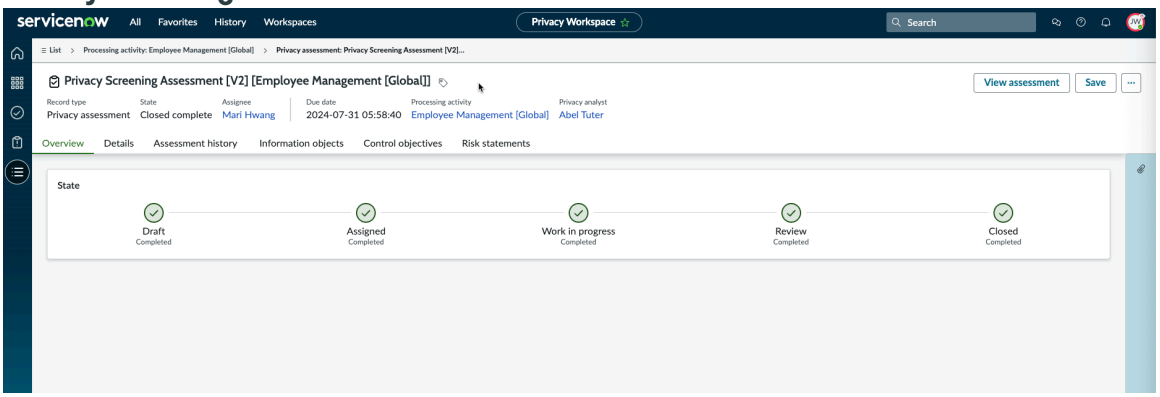
- Reassign the assessment to the correct responder.
- Create highly configurable templates.

Types of assessment templates

To perform the screening and the impact assessments, you require assessment templates. While the assessment templates are based on the Smart Assessment Engine, there are some additional configurations provided for the users of Privacy Management. Starting with the Zurich release, two assessment templates, **Privacy Screening Assessment [V4]** and **Privacy Impact Assessment [V4]** are provided to perform smart assessments. **Privacy Screening Assessment [V3]** and **Privacy Impact Assessment [V3]** templates are also available. Some important differences between these templates and the additional configurations are explained as follows.

Privacy screening assessment

Starting with the Zurich release, a new template for Privacy screening assessment (Privacy Screening Assessment [V4]) is available.



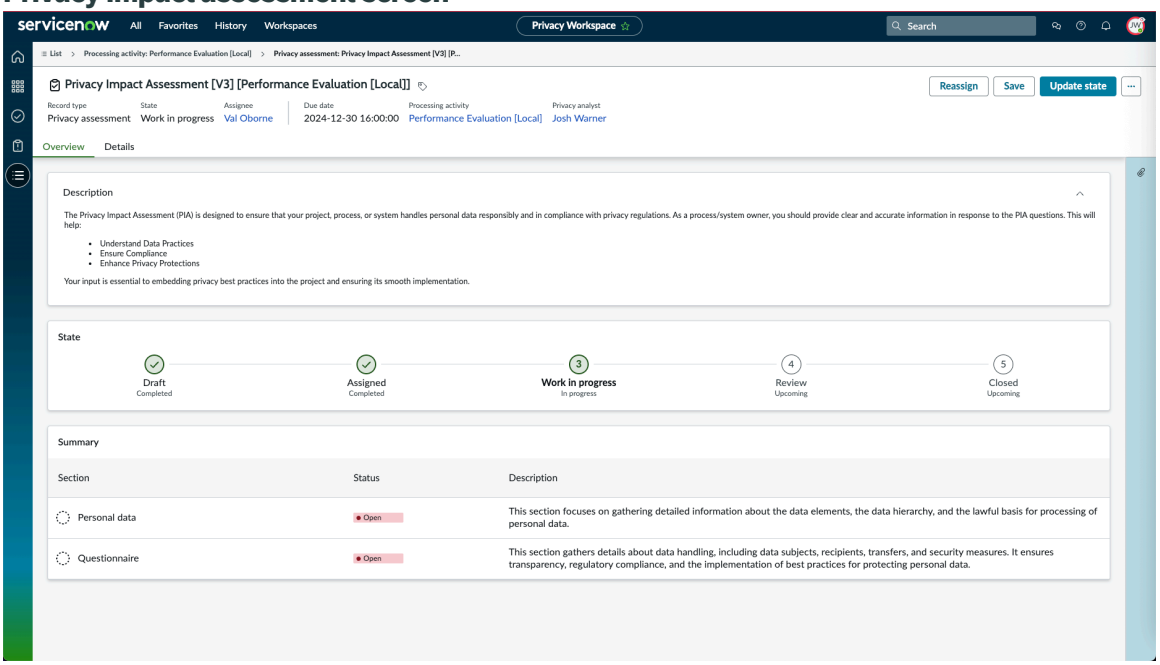
For a screening assessment template, there are three sections:

- **General**: In this section, you specify the assessment template category as **Privacy category** and also specify the assessment targets. For a screening assessment, the assessment targets are entities and privacy tasks.
- **Questions**: This section contains questions for the assessment responders. This section also contains data elements which are single units of information that represent a specific attribute or characteristic about a data subject or entity. Examples of data elements are name, email address, date of birth, and so on. In this section, you'll also find a section titled **Criticality factors** and these questions are used to calculate the criticality score.
- **Automations**: In this section, you can define the rules that allow the automatic creation of processing activities based on the responses to questions. This section uses Workflow Studio. These automations are mapped to their relevant questions. Automation streamlines various processes, including the application of risk statements and control objectives based on user responses. When users select specific responses during an assessment, the system automatically applies the appropriate risks and controls to the relevant records. For example, consider an organizational policy stating that personal data can only be transferred outside the EU with explicit consent. During an assessment, if a user indicates that data is being transferred outside the EU, the system will automatically apply the Data Transfer risk to the processing activity: Assign Explicit Consent as a control to mitigate the identified risk. This automation ensures consistency, saves time, and reduces the likelihood of human error in managing risks and controls.

For detailed information on how to configure a screening assessment template, see Configure smart assessment templates for screening assessments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Privacy screening assessment



Privacy impact assessment

Starting with the Xanadu release, a new template for Privacy impact assessment (Privacy Impact Assessment [V4]) is available.

For a privacy impact assessment template, like the screening assessment template, you have the **Overview** and **Details** sections, and while by default, the **Automations** section is present, it does not contain any predefined automations. You can add automations if you require them. For an impact assessment template, apart from the questionnaire, you can add the personal data elements. For detailed information on how to configure an impact assessment template, see Configure smart assessment templates for impact assessments.

Privacy impact assessment screen

Note:
Only published templates are available for assessments.

Review of an assessment

When privacy analysts receive an assessment, they review the assessment. During the review, they can either request for a revision of the assessment or directly approve it. During the **Review** state, the privacy managers can view the following items:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Information objects**: The information objects tab displays the information objects identified as part of the screening assessment.
- **Hierarchy**: The hierarchy of where data comes from and where it goes.
- **Outcomes**: The outcomes tab displays the risk statement and the control objectives associated with the assessment.

Add instructions and questions to an assessment template

Risk assessments in Privacy Management

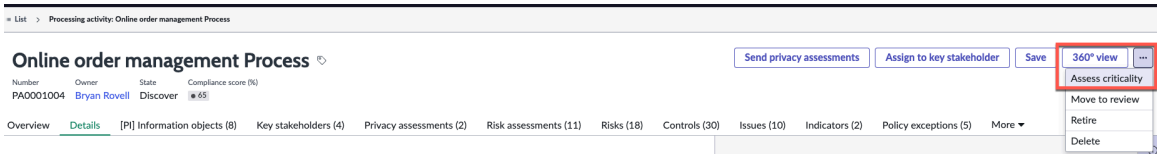
You can perform risk assessments on your processing activities to determine their risk scores and find out the privacy risk posture of your organization.

To understand the risk posture, the following assessments are performed.

Criticality assessments

A criticality assessment uses risk assessment to determine the initial risk level of a processing activity. Using the resulting criticality score, the privacy team can prioritize or deprioritize the activity accordingly. An example of a criticality factor could be that the assessment questions help identify whether personal data is being processed in a way that influences key decisions or enables impactful autonomous decision making.

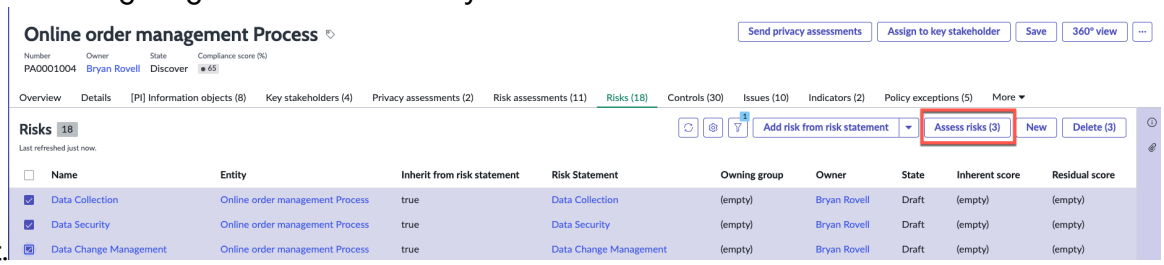
Criticality assessments can be performed using one of the following two methods.



Manual criticality assessment

Using the manual method, as a privacy manager initiates the criticality assessment from a processing activity. If you're already working on a processing activity and want to assess its criticality, you can manually trigger this assessment using the **Assess criticality** action in the user interface. When you trigger the criticality assessment, the system automatically calculates the criticality score based on the information already available in the fields of the processing activity form. On the Regulatory details tab of a processing activity, you can provide the risk-related details. After entering this information, triggering the criticality assessment uses these values to calculate the risk score. The system can calculate the criticality score multiple times if triggered manually. Each time, it uses the most recent data entered in the processing activity fields and regulatory details.

Automated criticality assessment



Using the automated method, the privacy manager uses the **Automated criticality factors** risk assessment methodology (RAM) that is provided by default to calculate the criticality score of a processing activity. The privacy managers must publish this RAM before it can be used. By default, the RAM is provided in the **Draft** state. When a user performs a screening assessment, they are prompted to respond to several questions, including those related to criticality and risk assessment. If the user provides answers to these criticality-related questions during the screening assessment, the system automatically calculates the criticality risk score. The calculated score is then displayed on the Overview page when the user proceeds to the processing activity. Because only two RAMs are supported at a time, they must deactivate any other existing criticality factors RAM. It is crucial to note that when an existing criticality factors RAM is deactivated, all the in-progress risk assessments associated with that RAM get canceled.

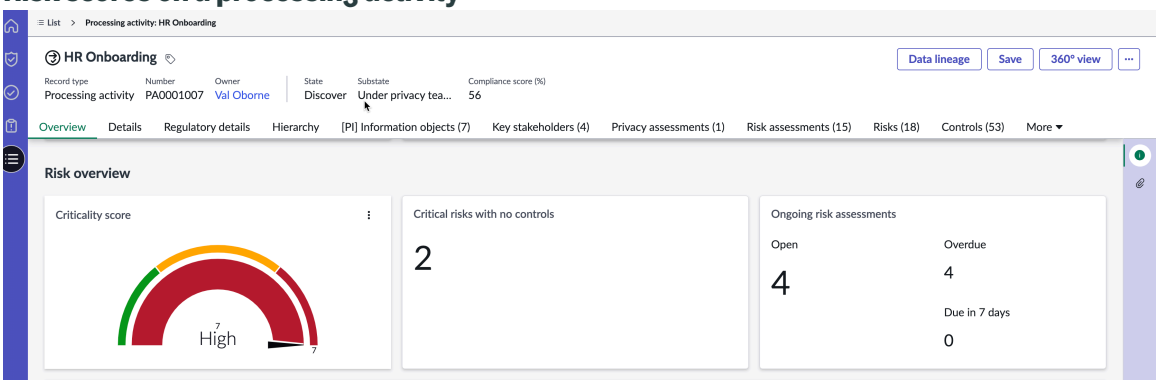
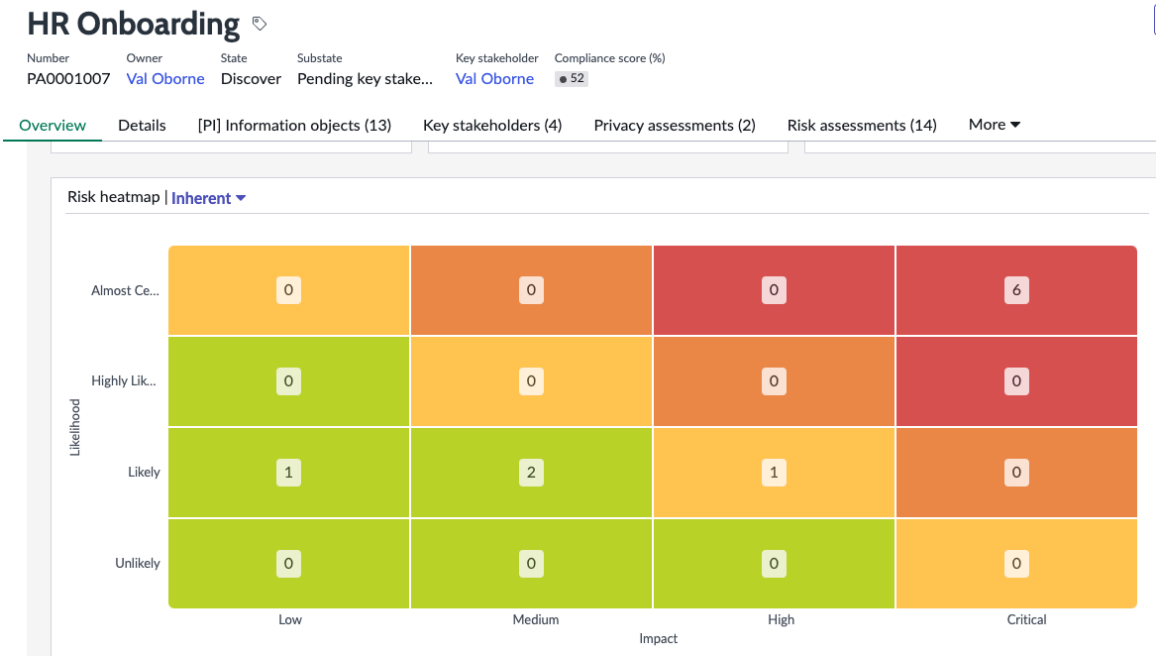
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Privacy risk assessments



Privacy risk assessments are detailed assessments that are conducted if the criticality score is high. Assess each risk that is associated with the processing activity and know the aggregated risk score on the processing activity. After you assess the privacy risks, you can view the privacy risk posture on the risk heatmap in the overview section. The heatmaps provide detailed information about your inherent and residual risks. See the following image to understand how you can initiate the detailed risk assessment.

Risk heatmap scores



The risk assessments results and the risk heatmaps appear on the processing activity home page as shown in the following image.

Risk scores on a processing activity

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk heatmap on the processing activity

To understand the details about how to perform the risk assessments, see Privacy assessment configurations.

Risk Assessment Methodology (RAM)

Risk Assessment Methodology (RAM) provides a systematic and repeatable approach to identifying, evaluating, and mitigating privacy risks associated with data processing activities.

RAM is central to establishing accountability in data handling practices and supports regulatory compliance by embedding risk management into daily operations. It helps privacy and compliance teams to assess data processing risks, identify exposure across systems, and implement timely strategies to reduce those risks. As organizations operate in an increasingly complex regulatory environment, the methodology confirms that risks are evaluated consistently and documented transparently.

For information about configuring your own RAMs, see Create a Risk Assessment Methodology.

Base Risk Assessment Methodologies

The Privacy Management application provides the following RAMs in the Draft state:

- Automated criticality factors
- Criticality assessment
- Privacy Risk Assessment

Note:
Starting with the Xanadu release, you can publish up to three Risk Assessment Methodologies.

Privacy assessment configurations

To perform a processing activity criticality and privacy risk assessment, two risk assessment methodologies (RAMs) are provided by default.

The RAM is a configuration or a record in the risk assessment engine. It is a part of the Advanced Risk application. The RAM is used for assessing either the risks or objects in your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A configured RAM is an object with associated assessment types that have associated factors. This allows an organization to have different methodologies for assessing risk. To understand more about the factors or questions used in the assessments, refer to Factors in Advanced Risk Assessment.

The privacy-specific RAM records have the **Domain** field set to **Privacy**. As a privacy administrator, you can make a copy of the default RAMs and modify them. To understand more about RAM configurations, refer to Configure a risk assessment methodology. To understand how you can make a copy of a RAM, refer to and Copy a risk assessment methodology.

Note:
Because only two RAMs are permitted for use at a time, you must retire the old criticality RAM and publish the new RAM to utilize the criticality automation.

It is important to consider the following points when performing risk assessments.

- In the **Privacy** domain, you can only modify a RAM. Creation of a RAM is not permitted.
- Only two active RAMs are allowed. If you must copy or modify more than two RAMs, you must retire one.
- The RAM can be configured and its order can be modified according to your requirements.
- Users with the following roles can perform the privacy-related criticality and detailed privacy risk assessments.
  - Privacy business user (sn_privacy.business_user)
  - Privacy analyst who owns the processing activity
  - Privacy assessment responder (sn_privacy.assessment_responder)
  - Privacy manager (sn_privacy.manager)

Information objects in Privacy Management

The purpose of an information object is to logically describe the type of data that is exchanged between an application and a database.

To determine which information objects process personal data, you can classify the information objects as **Personal information**. For more details on how to classify an information object, see Classify information objects as personal information.

After the information objects are created, they are mapped to business applications or business processes. This activity helps the privacy management teams to discover the information objects processing personal data. Some examples of [PI] Information objects in Privacy Management are:

- Email addresses
- Bank account numbers
- Educational details
- Personal email address

Creation of information object categories

Information object categories provide a systematic way to classify information objects, making it easier to align with regulatory requirements. For instance, regulators often group attributes like iris scans and fingerprints under the category of biometric data. Similarly, email addresses and phone numbers are commonly categorized as contact information. While regulators focus on these broad classifications, business users typically refer to the individual data elements

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

rather than the overarching category. In such scenarios, information object categories serve as a framework to organize and classify these data elements into their respective broader categories.

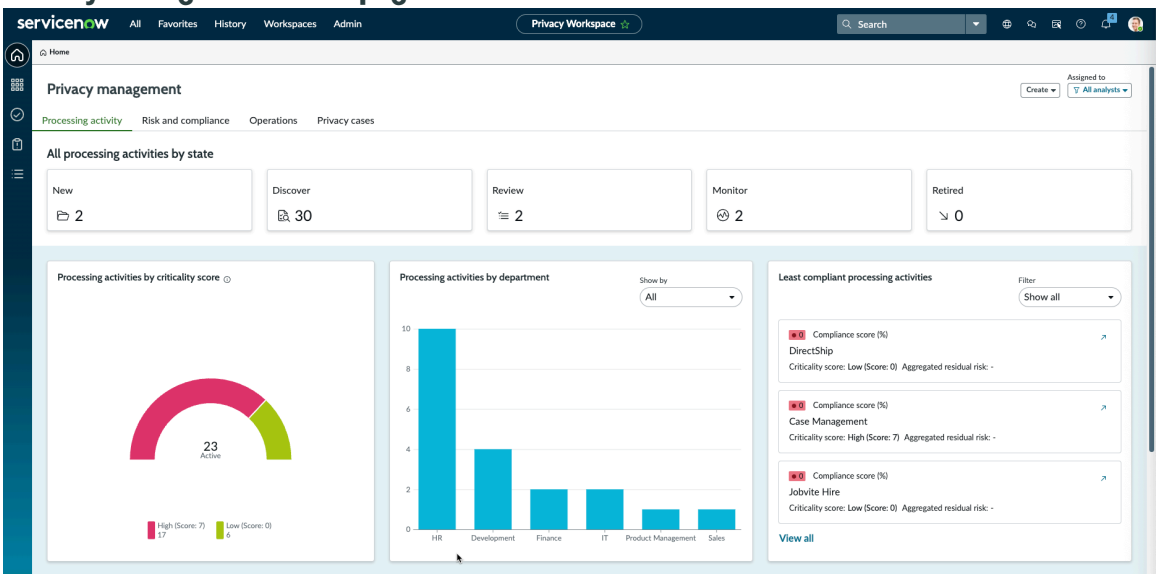
Also, if the regulators identify a new data element for a certain category, then the privacy administrator simply needs to add the data element to the data category and all the assessments are refreshed. This ability helps save time and you do not have to manually add the new information objects to the assessments. For information on how to configure information object categories, see Configure information object categories.

You can create information objects manually. See Create an information object.

Privacy Workspace for the privacy manager

The Privacy management dashboard provides a centralized interface for monitoring and managing privacy-related data processing activities within the organization.

The visual dashboard provides insights into ongoing processing activities. Privacy managers and compliance officers can identify potential compliance risks. Data privacy initiatives can be managed more effectively.



The privacy manager develops and maintains company policies and regulations. A privacy manager has the sn_privacy.manager role. Privacy managers do the following:

- Manage and monitor the overall organization-level privacy risk and compliance posture. The risk and compliance posture represents the overall status of an organization's risk and compliance. It spans across business processes, business applications, and related areas. Assessment is based on risk scores and the compliance status of controls. Evaluation includes both compliant and non-compliant controls across various regulations.
- Develop and implement privacy regulations, authority documents, policies, and privacy risk statements.
- Review privacy regulatory requirements and policies.
- Design and monitor risks and controls to deal with breaches of privacy regulations and internal policies.
- Plan privacy programs and scope entities.
- Create privacy impact assessment templates.
- Perform privacy risk assessments to understand the criticality of the processing activities.
- Continuously monitor control effectiveness and suggest effective improvements.
- Supervise the privacy compliance team.
- Report the compliance posture to management and the board of directors.

The following image shows the home page for the privacy manager.

© 2026 ServiceNow, Inc. All rights reserved.

Privacy management home page

Processing activity tab

The Processing activity tab on the Privacy management dashboard provides a comprehensive and real-time overview of all data processing activities across the organization.

The Processing activity tab on the Privacy management dashboard supports privacy teams, compliance officers, and data protection professionals. This dashboard consolidates key metrics and visualizations to track the status, criticality, compliance levels, and categorization of processing activities.

By offering intuitive insights through charts, graphs, and filters, the dashboard enables proactive management of data privacy obligations and facilitates informed decision-making in line with regulatory requirements. You can use filters and drop-down lists in the widgets to customize the views based on your preferences.

This dashboard displays the following widgets.

Processing activities by state

This section displays a summary of processing activities categorized by their current workflow states: New, Discover, Review, Monitor, and Retire. Each state block provides a quick overview of volume and enables direct navigation to filtered activity lists.

Processing activities by criticality score

The gauge chart displays the total number of active processing activities segmented by criticality score: High and Low. This chart enables stakeholders to prioritize efforts based on regulatory risk classification levels.

If any criticality factor under Regulatory details is marked Yes and criticality is assessed, the processing activity's criticality score is set to High. If all factors are answered as No, then the score is Low. The score is determined using the Automated criticality factors RAM and can be configured according to requirements.

Processing activities by department

The bar chart displays a breakdown of processing activities across different departments. It enables departmental accountability and visibility into privacy management's distribution. You can also filter by the criticality score to view the criticality score of processing activities across different departments.

Least compliant processing activities

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This widget highlights activities with the lowest compliance scores in a list view. Each entry shows criticality score and aggregated residual risk. With the filter, the analysts can focus on processing activities having low compliance and high criticality score or low compliance and high aggregated residual risk.

Processing activities by data subject type

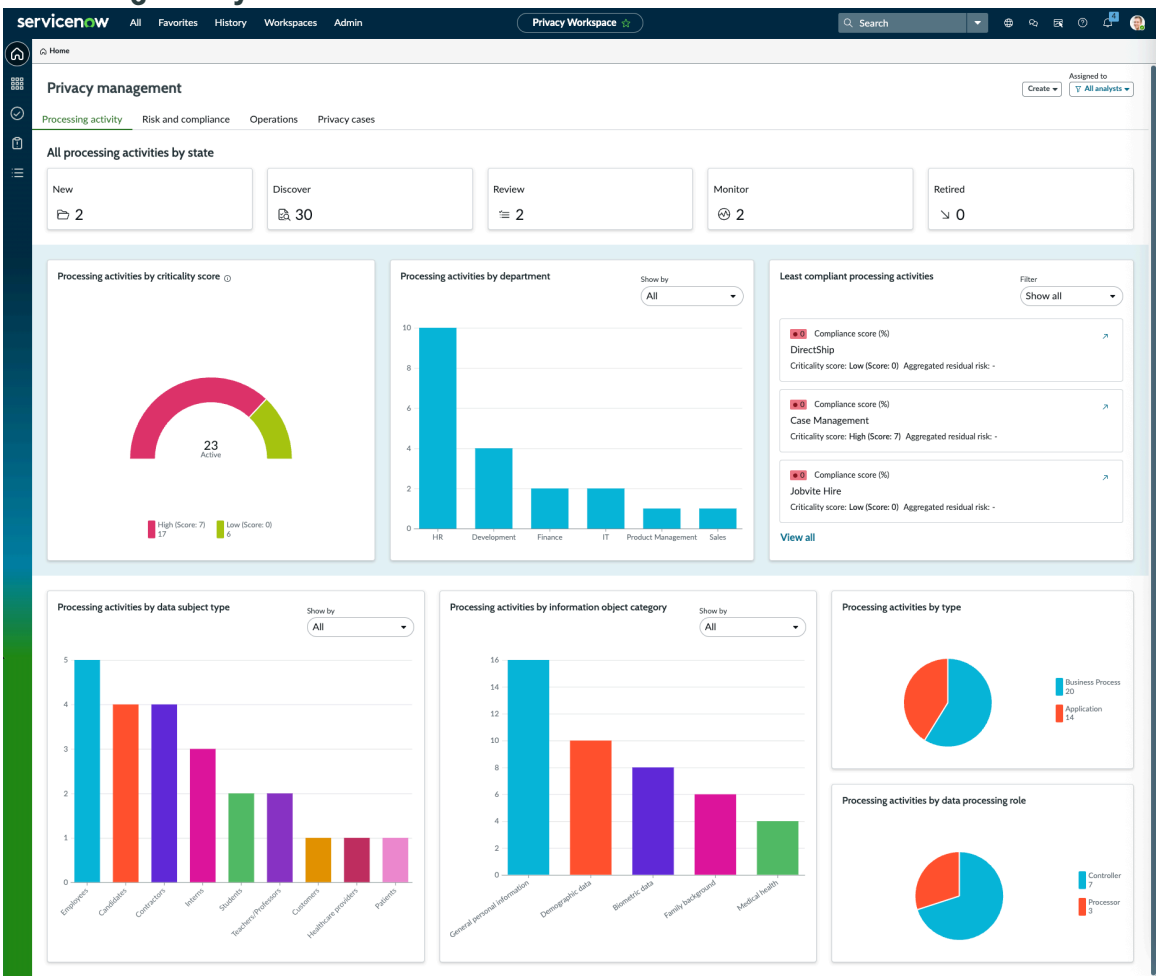
The bar chart illustrates activities grouped by data subject types such as Employees, Candidates, Customers, Internal Staff, Job Applicants, and so on. It helps in assessing which categories of data subjects are most involved in processing activities and take appropriate measures to safeguard the data of these data subjects. You can apply a filter to focus specifically on vulnerable data subjects.

Processing activities by information object category

The bar chart presents classification based on the types of data processed. The categorization supports the identification of data types most involved in processing. It also enables filtering by sensitive Information Object (IO category), helping the privacy team identify data types and implement appropriate measures to safeguard the data.

Processing activities by type

The pie chart depicts the underlying record (entity type) based on which the processing activity is created. This categorization helps in determining the scope of privacy initiatives across business functions and technology platforms.



Processing activities by data processing role

The pie chart shows the roles undertaken in data processing like Controller and Processor. Clarity about the role played in processing activities is vital for assigning responsibilities and meeting legal requirements.

The following image shows the Processing activity dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Processing activity tab

Risk and compliance tab

The Risk and compliance tab on the privacy management dashboard provides a centralized view of privacy-related risk exposure and regulatory compliance performance.

The Risk and compliance tab on the privacy management dashboard enables organizations to monitor the risk and compliance postures of the privacy program within the organization. It helps evaluate how effective current privacy controls are in mitigating identified risks and supporting compliance.

Using this dashboard, teams can track adherence to major regulatory frameworks, including NIST SP 800-53 and the EU GDPR. The dashboard presents data through intuitive visualizations such as heatmaps, compliance scores, and summaries of control objectives that need attention. These visuals provide immediate insights into risk exposure and compliance gaps across the organization. Privacy teams can identify high-risk areas and assign priority to remediation tasks based on real-time data.

The dashboard also assists in confirming continuous regulatory alignment as requirements evolve, or new risks emerge. By consolidating risk and compliance insights into one view, it supports faster decision-making and improved accountability across privacy functions.

The visualization and data-driven layout support informed decision-making for privacy teams, confirming adherence to industry standards and legal obligations. This dashboard displays the following widgets.

Risk overview

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This donut chart displays the distribution of processing activities across different aggregated risk levels. By default, the distribution is based on the aggregated residual risk scores. However, you can apply a filter to view the distribution based on aggregated inherent risk classification instead. Each activity is color-coded by its associated risk level.

The Risk heatmap widget displays the visualization of all identified risks within each processing activity. By default, residual risk filter is applied, but you can filter it based on inherent risk level. The heatmap is segmented, and the segmentation changes based on the filter. The activities fall under the respective combination of risk and control effectiveness, or impact and likelihood. The combination is based on the selected risk classification filter.

Compliance overview

This section summarizes compliance posture across different regulatory frameworks like NIST SP 800-53 and GDPR. It also provides a consolidated view. You can filter compliance information with specific Authority documents. Filtering the data by Policies shows compliance posture across privacy policies; for example, Employee Data Privacy Policy, Customer Data Privacy Policy, or third-party Privacy Policy. Select the appropriate authority document or policy in the drop-down filter to view compliance score.

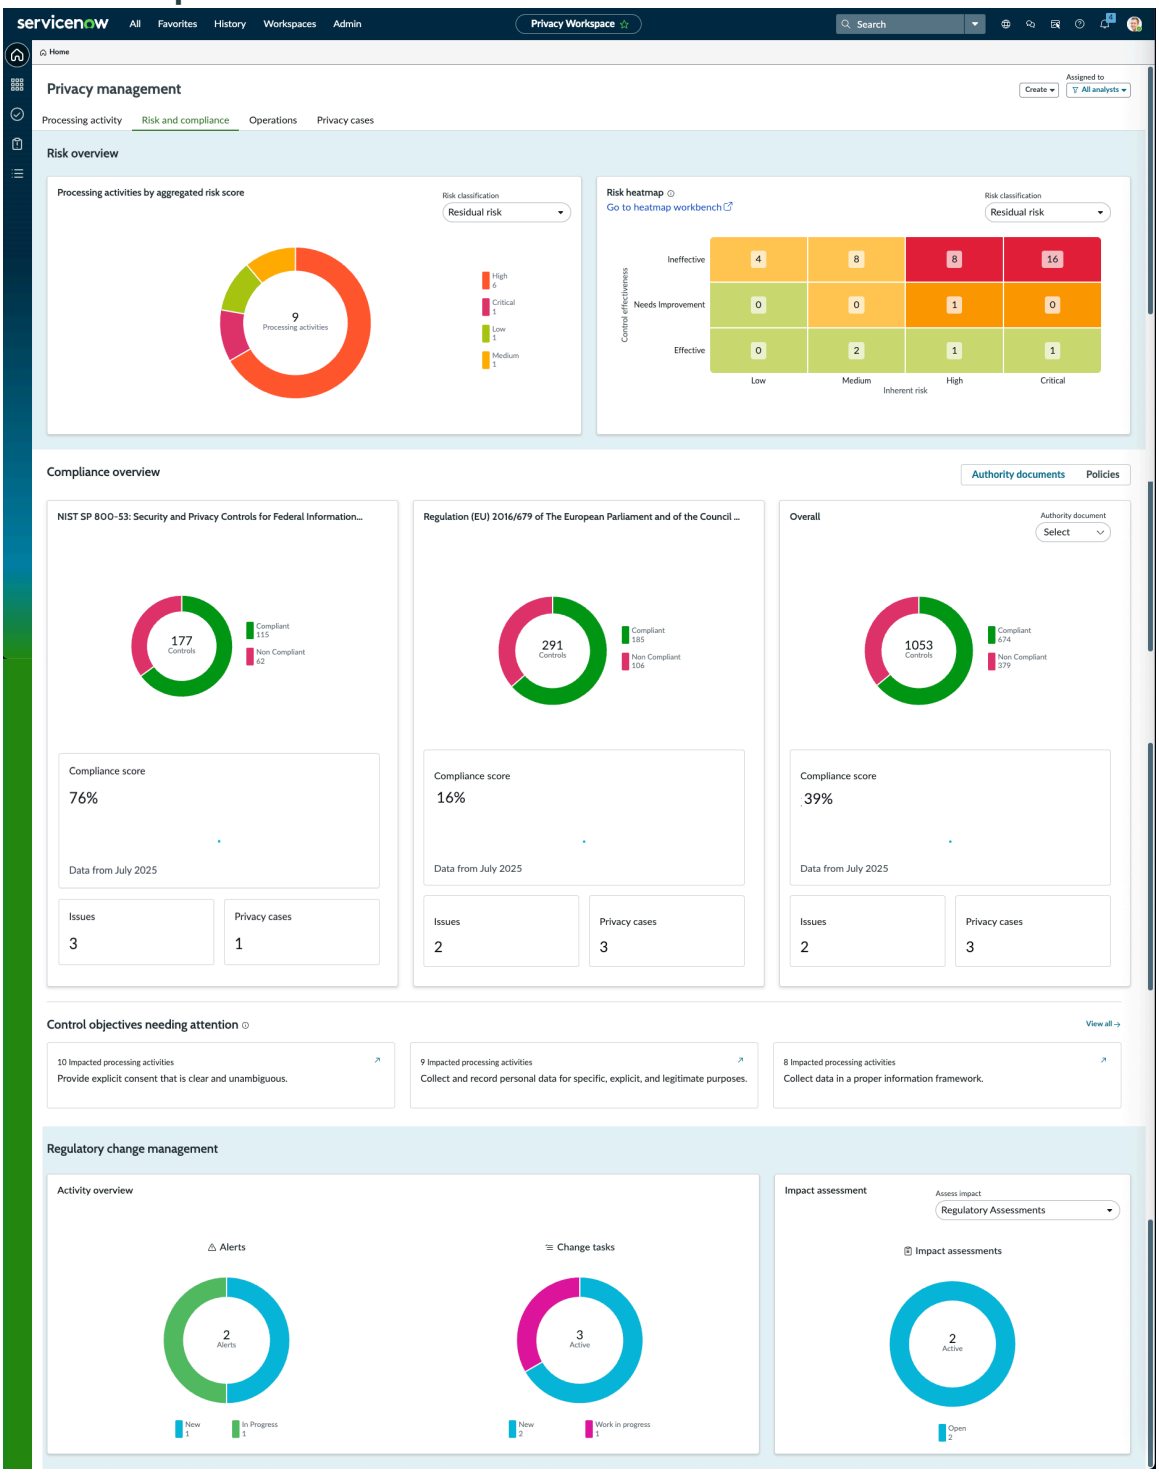
Use the `sn_privacy.highlighted_policy` and `sn_privacy.highlighted_authority_document` properties to configure the top two policies and authority documents that appear on this widget.

Control objectives needing attention

This section highlights specific control objectives requiring immediate remediation, along with the number of impacted processing activities. Each control objective is hyperlinked for detailed review.

Regulatory change management

The Activity overview widget displays the status of change-related activities triggered by regulatory updates. Each segment is represented using donut charts with status-based color coding.



The Impact assessment widget shows ongoing Impact Assessments related to Regulatory Assessments. The drop-down menu enables you to change the assessment category.

> **Note:**
> These widgets are available only when you have the Regulatory Change Management application installed.

The following image shows the Risk and compliance dashboard.

Risk and compliance dashboard

Operations tab

The Operations tab on the privacy management dashboard offers visibility into operational performance across key privacy compliance processes, supporting proactive management and confirming adherence to regulatory and internal risk standards.

The Operations tab on the privacy management dashboard provides a centralized and real-time overview of key privacy-related operational metrics. This dashboard is designed to help analysts, privacy officers, and compliance personnel. It supports monitoring the progress and status of various privacy assurance activities. These activities include risk assessments, privacy assessments, issues, policy exceptions, and control assurance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Operations dashboard helps monitor the progress and status of operational activities. These activities include risk assessments, privacy impact assessments, issues, policy exceptions, and control assurance. Data is displayed using intuitive pie and donut charts. Charts are categorized by status, priority, and risk rating for clarity. This categorization makes it easier to identify areas that need attention. You can quickly see open, overdue, or upcoming tasks in each category.

This dashboard displays the following widgets.

Risk assessments

A donut chart displays the breakdown of the total number of ongoing risk assessments by states like New or In progress. Additional details like Open, Resolved, Closed, Overdue, or Due in 7 days are also highlighted. You can drill-down into the risk assessments from the chart.

Privacy assessments

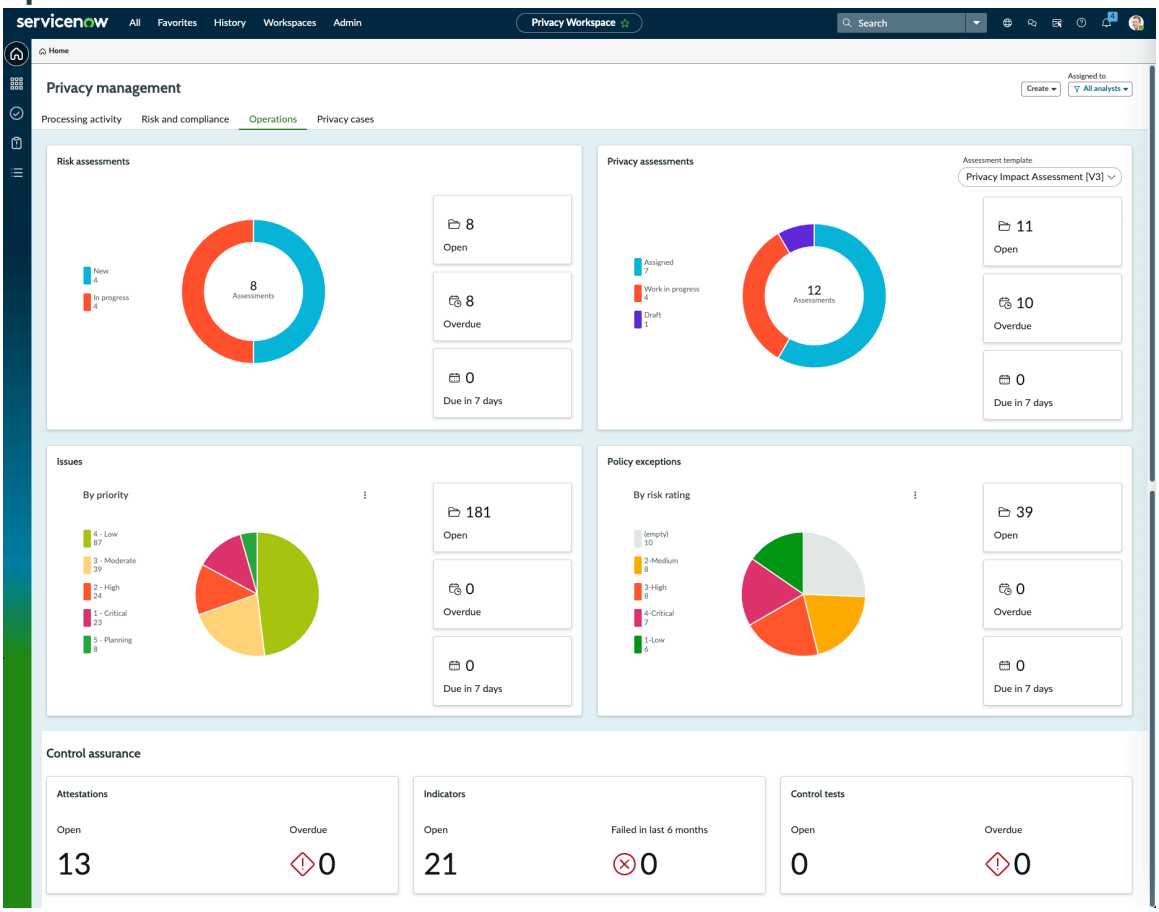
A donut chart categorizes assessments based on their current workflow states like Assigned or Work in progress. Additional details like Draft, Open, Overdue, or Due in 7 days are also highlighted. You can filter privacy assessments by the assessment template.

Issues

Issues are categorized in a pie chart by priority levels such as High, Medium, Low, and Critical. Additional details like Open, Overdue, and Due in 7 days are also highlighted. You can drill down into the record details from the chart.

Policy exceptions

Policy exceptions are categorized by risk rating and presented in a pie chart, with labels such as Low, Medium, High, Critical, Open, Overdue, and Due in 7 days. You can drill down into the policy exceptions from the chart.



Control assurance

This section provides a summary of the organization's control assurance activities, segmented into Attestations, Indicators, and Control tests.

The following image shows the Operations dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operations dashboard

Privacy cases tab

The Privacy cases tab on the privacy management dashboard serves as a centralized interface for monitoring, analyzing, and managing privacy-related incidents and requests within an organization.

The Privacy cases tab on the privacy management dashboard helps organizations achieve and maintain compliance with data protection regulations. It supports adherence to laws such as the General Data Protection Regulation (GDPR). It also includes the California Consumer Privacy Act (CCPA) and other global privacy frameworks.

The dashboard empowers privacy managers, analysts & compliance teams, to manage cases efficiently. It helps quickly identify critical cases needing immediate attention. The dashboard also reveals emerging trends and recurring issues over time. It uses historical data analysis and graphical visualizations for deeper insights. You can evaluate cases using multiple criteria like severity and priority. They can also review the breach status and root cause for each case. This view helps enable effective resource allocation and timely risk mitigation.

By consolidating case data into an intuitive and interactive interface, the Privacy Cases Dashboard enhances operational efficiency. It supports data-driven decision-making. It fosters a proactive, rather than reactive, approach to privacy incident management. It helps to ensure that all privacy-related inquiries, complaints, or breaches are addressed in accordance with internal policies and external regulatory requirements.

This dashboard displays the following widgets.

Needs attention

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This top-level summary section highlights cases that require immediate or near-future attention. It comprises three tiles: Overdue cases, Cases due in 7 days, and Unassigned cases. You can drill-down into the privacy cases from each card.

Case overview

This section offers a high-level graphical breakdown of existing cases based on various parameters like by state, by breach status, by priority. You can drill-down into cases from the chart.

Cases

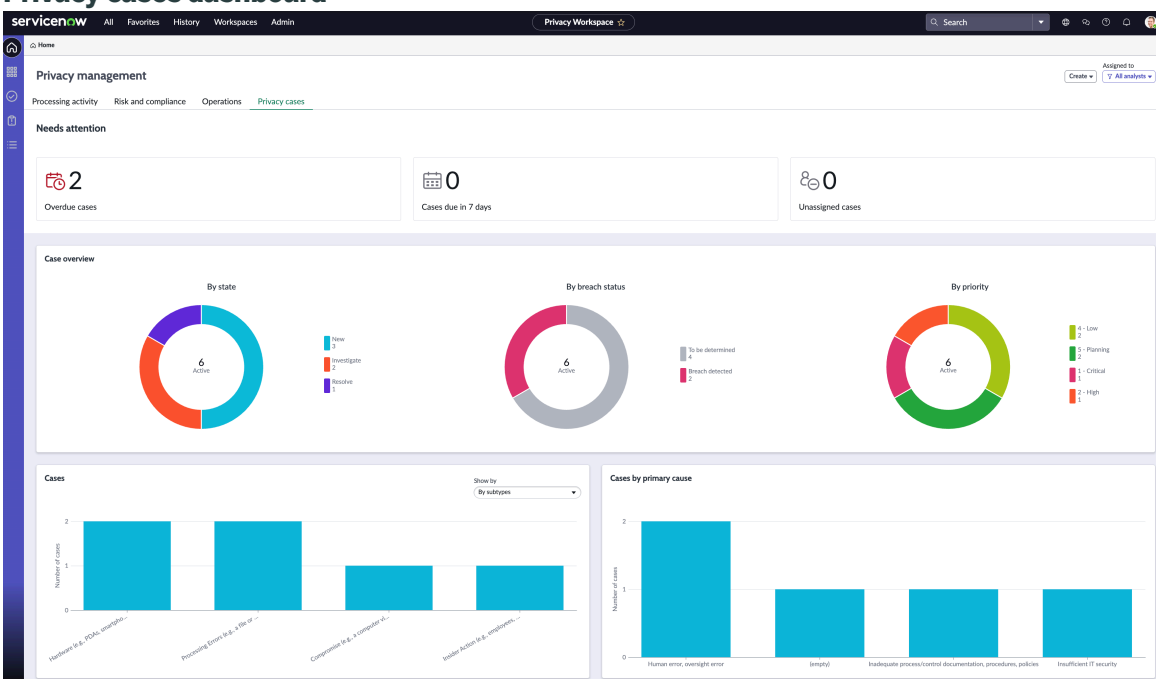
This section displays cases by subtypes by default. You can filter the cases by impacted business units or by locations.

Cases by primary cause

This section displays a breakdown of cases based on their root or primary cause.

Opened and closed cases in last 12 months

This widget offers historical context by showing trends in opened and closed privacy cases over the past year. This graph helps identify patterns and workload over time.



Issues

This widget displays a pie chart summarizing open issues related to privacy cases. The pie chart is categorized by severity levels like Green (low), Yellow (medium), Orange (high), and Red (critical). This section enables teams to monitor the volume and severity of issues, confirming timely follow-up and resolution. You can drill-down into cases from the chart.

You can create a processing activity, privacy case, or an issue using the **Create** button. Additionally, you can filter the privacy cases assigned to all analysts or me.

The following image shows the Privacy cases dashboard.

Privacy cases dashboard

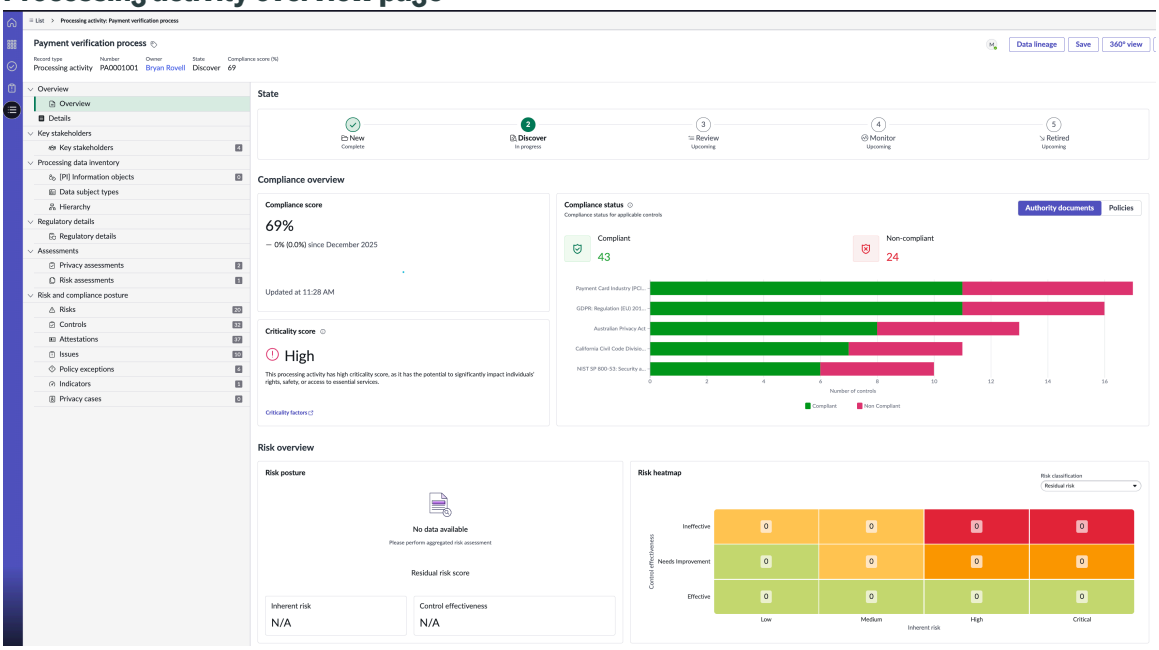
Privacy Workspace for the privacy analyst



Privacy analysts manage the privacy compliance posture of the processing activity owned by them. Compliance posture refers to the overall compliance status of an organization, business process, or business application, and so on based on the compliant and non-compliant status of controls across various regulations.

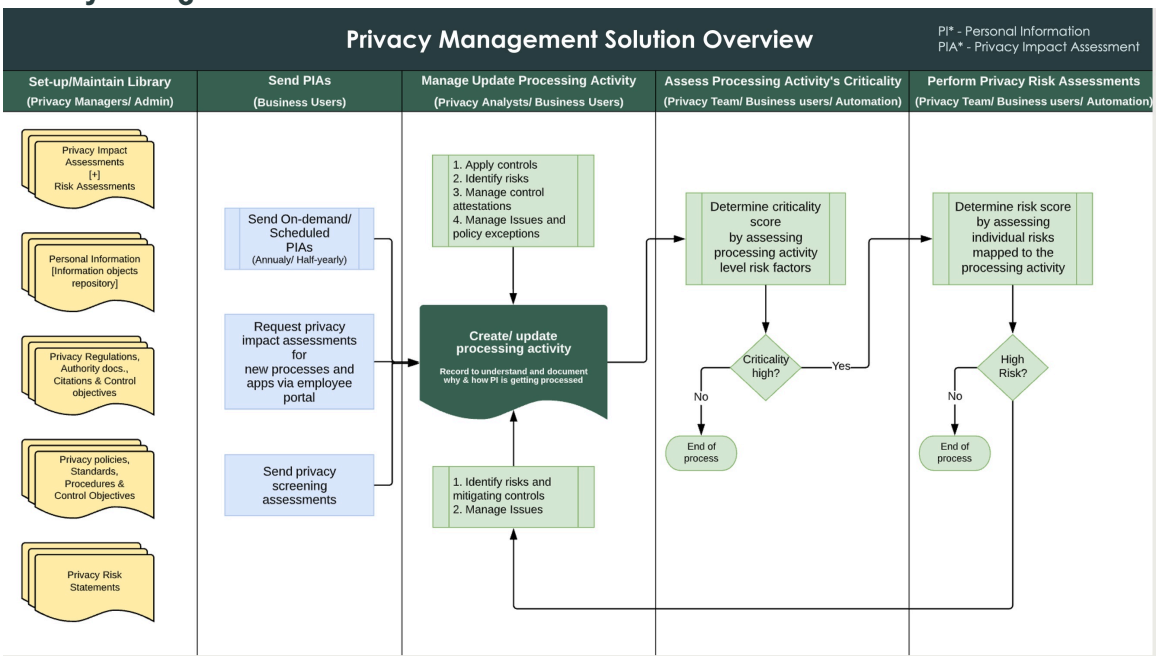
A privacy analyst has the sn_privacy.analyst role. The primary tasks for a privacy analyst are as follows.

- Assess the processing activities regularly by sending and reviewing privacy impact assessments.
- Work with the management and business users to identify and manage controls related to a processing activity.
- Manage and resolve the concerns of business users about compliance-related issues and policy exceptions.
- Test and monitor control effectiveness.

The following image shows the processing activity overview page for the privacy analyst.

Processing activity overview page

Privacy Management solution overview



The Privacy Management solution provides you with a framework to manage your privacy-specific libraries such as citations, policies, control objectives, risk statements, privacy impact assessments, and privacy risk assessments. It also provides processing activity records to track privacy risk and compliance posture.

Before planning your privacy program, confirm that you set up the privacy libraries according to the privacy regulations that you plan to implement. For more information on the library setup, refer to Manage the Privacy Management library.

The following figure demonstrates the Privacy Management solution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Privacy management solution overview

The Privacy Management solution is described as follows.

Create a library

As a privacy manager, with the role sn_privacy.manager, or privacy administrator, with the role sn_privacy.admin, you must set up your libraries using the following.

- Privacy impact assessments
- Personal information objects
- Privacy regulations, authority documents, citations, and control objectives.
- Privacy policies and procedures
- Privacy risk statements

Privacy impact assessments

As part of establishing a robust privacy program, privacy managers must first identify and document the inventory of organizational assets that handle personal data. This foundational step involves discovering and classifying business processes, applications, vendors, and services that process personally identifiable information (PII). The following approaches outline how to discover systematically, validate, and document these inventories using entity types, screening assessments, and system-driven insights.

1. Discover inventory: As a privacy manager, with the role `sn_privacy.manager`, identify, or discover the inventory such as business processes, business applications, vendors, and business services that process personal data. All such inventory is stored in the respective Configuration Management Database (CMDB) tables. The respective business owners manage the inventory. As a privacy manager, use the Entity types feature and create an entity for each inventory record. For more information about entity types, see Exploring the entities. At this stage, based on the discovery method, you can use one of the following approaches to create processing activities.

   a. Search business processes or applications that process personal data: Use this approach when business processes, applications, services, or vendors are associated with information objects. Using the entity type functionality, search for entities that process [PI]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information objects. Based on the search results, directly create the processing activity records. This approach is used only when the business owners associate the inventory with information objects. For more information, see Entity scoping to plan a privacy program.

b. Send privacy screening assessments: Use this approach when information objects aren't associated with the inventory such as business applications and processes. In this approach, send privacy screening assessments to the respective business owners. These screening assessments contain basic questions. Some examples of the questions are as follows:

- Are you processing personal information as a part of the business process or application that you own?
- What kind of personal information you're processing? For example, email, phone, and address.

If the assessment responses determine that there's personal data, processing activities are created automatically.

2. Business users can proactively submit privacy impact assessments for new applications and processes from the Employee Center.

Manage and update the processing activities

1. Create or update a processing activity: As a privacy analyst, with the role sn_privacy.analyst, send a privacy impact assessment (PIA) to the processing activity or business owners after a processing activity is created. The privacy impact assessment helps to understand why and how the processing activity processes personal information. The assessment collects information such as justification for storing PI data, exchange of PI data with other systems, and the security of PI data.

2. Send or automatically initiate PIA: As a privacy analyst, send a privacy impact assessment (PIA) from a processing activity whenever you must collect more information. Alternatively, you can also automatically initiate the assessments based on the privacy program frequency defined by the privacy manager and the privacy administrator. An auto-initiate schedule can be created using the ServiceNow AI Platform capabilities.

3. Apply risks and controls related to the processing activity: As a privacy analyst, after you understand how personal information is being used in the processing activity, the necessary risk statements, controls, policies, and authority documents are automatically applied to the processing activities based on the assessment responses. For more information on how to configure assessments, see Create an assessment template. After the controls are added, the privacy analyst can review the controls and add or remove the controls as necessary.

4. Send control attestations: After the final set of controls is associated with the processing activity, the control attestations are sent to the business process owners or the application owners to collect the evidence for every control that is applied. When the business owners respond to control attestations with evidence for each control, compliant and non-compliant controls are identified. This identification determines the compliance posture of the processing activity.

5. Report and monitor issues: Issues are created automatically for non-compliant controls and are assigned to their respective business owners. The privacy analyst monitors the issues.

6. Manage issues: To manage issues, business owners can do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Resolve the issue: Resolving the issue makes the control compliant.
- Raise a policy exception: An exception is raised for an issue that can't be resolved immediately. Privacy analysts can review the policy exceptions and can either accept or reject the exceptions based on the criticality of the issue.

7. Continuous control monitoring: Privacy analysts continuously monitor the controls on a processing activity using the indicator functionality. For more information about indicators, see Risk indicators, control indicators, and indicator templates.

Assess the criticality of processing activities

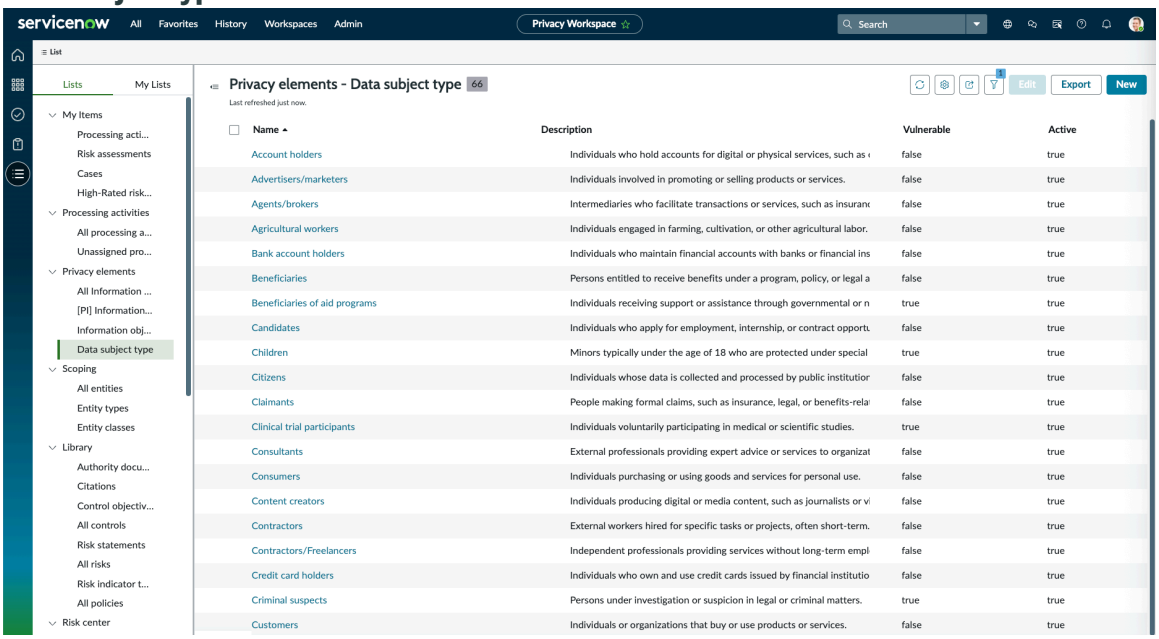
The criticality score provides the risk posture at the processing activity-level by assessing the factors at processing activity-level. When a processing activity is created or updated, a criticality assessment is performed on the processing activity to understand the high-level risk score or the criticality score.

Perform privacy risk assessments

Privacy risk assessments are detailed assessments that are conducted if the criticality score is high. Assess each risk that is associated with the processing activity and know the aggregated risk score on the processing activity. After you assess the privacy risks, you can view the privacy risk posture on the risk heatmap in the overview section. The heatmaps provide detailed information about your inherent and residual risks.

Data subject types

Data subjects are individuals whose personal data is collected, used, and processed by an organization. Data subject classification enables organizations to define and manage distinct groups, enabling a granular and context-specific representation of data processing activities.



Data subjects are a newly introduced dynamic table designed to support the structured definition and classification of multiple data subject groups. It enables you to create and manage distinct data subject groups based on relevant organizational, operational, or regulatory criteria. Each group can be associated with specific geographical locations to reflect regional data handling requirements and obligations.

For each data subject type, you can now record their location, the volume of data subjects involved, and the associated information objects being collected. Collected data elements for each group can also be specified to provide clear visibility into the types of data being processed. This approach facilitates a more realistic and detailed representation of data processing activities within the organization. It also supports scalability and adaptability as data processing operations evolve or expand over time.

The Privacy Management application provides 64 data subject types by default. Any user with at least the privacy manager role can see the data subject types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data subject types

Benefits of using data subject types

- Improved transparency: Facilitates a better understanding of data processed within the processing activities whose data is collected or processed.
- Enhanced risk management: Supports the identification of high-risk (vulnerable) data subject types such as children, patients, and so on by enabling configuration of vulnerable groups.
- Operational efficiency: Enables standardized classification and reuse of data subject groups across multiple privacy workflows.

Configuring Privacy Management

Follow the order of the tasks given here to configure Privacy Management. These tasks will help you manage your privacy program effectively.

Download Privacy Management

Before you run GRC: Privacy Management (sn_privacy) in your instance, you must download it from the ServiceNow Store.

Before you begin

Role required: admin

Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Manage the Privacy Management library

The Privacy Management library consists of authority documents, citations, control objectives, policies, and [PI] Information objects that help to manage the privacy content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authority documents

Authority documents are the principles, guidelines, regulations, standards, and frameworks that organizations must comply with. Some examples of authority documents are:

- Statutes (Bills or Acts)
- Regulations
- Audit Guidelines

Organizations can either create the authority documents, citations, and control objectives or they can download and import them from a third-party provider such as the Network Frontiers Unified Compliance Framework (UCF).

Citations

Citations are records with the specific requirements cited by an authority document. A citation relates authority documents to its applicable controls. Each citation has control objectives.

Policies

Policies include control objectives. Policies can also be associated to authority documents. Policies are published and regularly updated with incremented versions. For more information on policies, refer to Policy and Compliance Management.

Risk statements

Using risk statements you can create a central risk register to manage potential privacy risks that may occur any time and any where in an organization.

Privacy assessments

Privacy assessments are used to collect information from business owners. This information helps the privacy teams to understand how personal information (PI) is being used or stored in a processing activity.

Risk assessments

The risk assessments capability enables you to determine the organizational privacy risk posture using criticality and privacy risk assessments.

PI Information objects

[PI] Information objects refer to information objects that are of type **Personal information**. To understand the benefit of using information objects in the Privacy Management solution, refer to Information objects in Privacy Management. Maintaining a library of [PI] Information objects and associating them with the processing activities helps the privacy teams to understand what personal information (PI) is being processed by the processing activity.

Only the information objects that are tagged with the **Personal information** tag are available to be added to a processing activity. For more information on how to tag information objects see, Classify information objects as personal information.

Create an information object

Create information objects manually to associate the right data subject types with business processes or applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_privacy.admin

Procedure
1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. In the Privacy Workspace, select the List icon ( ).
3. Navigate to **Privacy elements** > **AllInformation objects**.
4. Select **New**.
5. On the form, fill in the fields.

Create New Information Object form

Field	Description
Name	Name of the information object category. For example, `Financial data`.
Owned by	User who owns the information object.
Data Classification	Data classification of the information object.
Business Unit	Business unit that uses this information object.
Department	Department that uses this information object.
Description	Description of the types of information objects the category contains.

6. Select **Save**.
   The information object is created.

Result
Once the information object is created, you can see the Processing activities and Information object categories related lists.

Configure information object categories

Configure information object categories to classify information objects effectively. For example, attributes like iris scans and fingerprints are often referred to as biometric data, or email addresses and phone numbers can be grouped as contact information. Information object categories enable you to categorize these information objects under these broader classifications.

Before you begin
Role required: sn_privacy.admin

Procedure
1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **List** > **Lists** > **Privacy elements** > **Information object category**.
2. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information object category

Field	Description
Name	Name of the information object category. For example, `Financial data`.
Description	Description of the types of information objects the category contains.
Active	Option to indicate if the category is active.
Sensitive category	Option to indicate if the data is sensitive in nature.
Functional domain	Domain of the category. This field is automatically set to **Privacy**.

4. Select **Save**.
   A new tab **Information objects** appears.
5. Select the Information objects related list.
6. Add the information objects that belong to the category.
7. Select **Save**.

Classify information objects as personal information

Categorize information objects as personal information. Only information objects classified as personal information can be associated with the processing activities.

Before you begin
Role required: sn_privacy.manager

About this task
Information objects that are classified as personal information can be used in the privacy assessments and processing activities.
Even if you create a new information object from the **[PI] Information objects** list view, you must classify the data as personal information. Do not assume that because you are creating an information object in the [PI] Information objects list, the information object is automatically classified.

Procedure
1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. In the Privacy Workspace, click the List icon ( ).
3. Navigate to **Privacy elements** > **All Information objects**.
4. Select and open the information object you want to tag.
5. In the **Data Classification** field, select **Personal Information**.
6. Select **Save**.

Result
The information object that you classified as personal information appears in the [PI] Information Objects list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure smart assessment templates for screening assessments

Create a privacy assessment template using the Smart Assessment Engine as a base for sending screening assessments and use it to detect the privacy risks and mitigate those risks.

Before you begin

Role required: sn_privacy.admin

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Lists** > **Configure privacy management** > **Assessment template configuration**.
2. Select **New**.
3. On the form, fill in the fields.

Create New Assessment template configuration form

Field	Description
Name	Name of the configuration. For example, `Privacy Screening Assessment Configuration`.
Smart assessment template	Smart assessment template for which you're adding the configurations. **Note:** A template can be mapped to only one classification.
Classification	Logical grouping of the template. The choices are as follows. ○ **Initial Assessment** ○ **Privacy Impact Assessment** Select **Initial Assessment**.
Description	Description of the assessment. This description is displayed to the responder during the assessment.
All information object categories	Option to display either all the information object categories or a subset of the information object categories during the assessment. **Note:** This option is applicable if you add the **Data elements** subsection that is not part of the screening assessment.
State model	State model of the assessment. This field is automatically set to **Privacy assessment task model**.
Information object categories	Information object categories to display during the assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field only appears when the **All information object categories** option is not selected. This field is applicable if you add the **Data elements** subsection that is not part of the screening assessment.
Active	Option to indicate if the configuration is active.
Functional domain	Domain of the configuration. When accessed from the Privacy Workspace, this field is automatically set.

4. Select **Save**.
   A new tab titled Sections appears that contains the questionnaire that is fetched from the Smart Assessment Engine.

Configure smart assessment templates for impact assessments

Create privacy assessment templates using the Smart Assessment Engine as a base for sending privacy impact assessments and using them to detect the privacy risks and mitigate those risks.

Before you begin

Role required: sn_privacy.admin

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Lists** > **Configure privacy management** > **Assessment template configuration**.
2. Select **New**.
3. On the form, fill in the fields.

Create New Assessment template configuration form

Field	Description
Name	Name of the configuration. For example, `Privacy Screening Assessment Configuration`.
Smart assessment template	Smart assessment template for which you're adding the configurations. **Note:** A template can be mapped to only one classification.
Classification	Logical grouping of the template. The choices are as follows. ○ **Initial Assessment** ○ **Privacy Impact Assessment**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **Privacy Impact Assessment**.
Description	Description of the assessment. This description is displayed to the responder during the assessment.
All information object categories	Option to display either all the information object categories or a subset of the information object categories. **Note:** This option is useful only when you have configured the **Data elements** subsection under the **Personal data section**.
State model	State model of the assessment. This field is automatically set to **Privacy assessment task model**.
Information object categories	Information object categories to display during the assessment. **Note:** This field only appears when the **All information object categories** option is not selected.
Active	Option to indicate if the configuration is active.
Functional domain	Domain of the configuration. When accessed from the Privacy Workspace, this field is automatically set.

4. Select **Save**.
   A new tab titled **Sections** appears that contains the questionnaire that is fetched from the Smart Assessment Engine.
5. Select **Add**.
   a. Select **Personal data**.
   b. Select **Add**.
   The Sections tab now displays two sections: Personal data and Questionnaire. You can modify the label and the description of the personal data section and these will be visible to the responder on the assessment page.
6. Select **Save**.
7. To add subsections to a section, open the section for which you want to add subsections.
   a. Select **Subsections**.
   b. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the subsections to add.

d. Select **Add**.
For example, for the Personal data section, you can add Data elements, Data subject types, Hierarchy, and Legal basis. The details in the **Guidance** field of the subsections appear during the assessment to help the responder understand the questions in the assessment.

Create a privacy assessment

Create various types of assessments and send those assessments to the business process or business application owners to collect their responses. The responses help you to understand how personal information (PI) is being used or stored in a processing activity.

Before you begin
Role required: sn_privacy.admin and sn_privacy.manager

About this task
Using the privacy assessment capability, you can create various types of assessments such as privacy screening initial assessments, privacy impact assessments (PIA), and privacy readiness assessments.
The following capabilities are provided to configure the assessments:

- Mapping control objectives to the responses of the question.
- Mapping information objects to the responses of the question.
- Mapping the processing activity fields to the responses of the questions.

While configuring the assessments, consider the following terminology:

- Metric type refers to the assessment template.
- Metric category refers to the section label in the assessment.
- Metric refers to a question.

Procedure

1. Navigate to **All** > **Privacy Management** > **New Assessment Template**.
2. On the form, fill in the fields.

Assessment Metric Type form

Field	Description
Name	Name of the assessment template.
Assessment duration	Length of time allowed for completing the assessment from the time the assessment is generated.
Table	Table that contains the records.
Auto approve privacy assessment tasks	Option to indicate that the privacy assessment tasks must be automatically approved without a review. When this option is selected, after the assessment task is submitted, automatically the assessment task is approved and controls, risks and the information objects are created on the processing activity, and the task is closed.
State	State of the assessment. This field is automatically set to **Draft**.
Roles	Roles that have read access to the template.
Classification	Classification of assessment metric type. The choices are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **None** ○ **Initial Assessment** ○ **PIA Assessment**
Description	Purpose of the assessment template and the reason for its creation.
Introduction	Guidance text for business users who respond to the assessment.

3. Click **Save and Open Designer**.
   The designer contains the following elements.

Element	Description
Controls	Supported question data types that are available in the Controls palette.
Questions	Library of questions for various categories.
Categories	New assessment opens in the Design view. The questionnaire **Name** field appears above the first category in the canvas. An empty question field appears in the category container.

4. Drag a control on the designer canvas to create a question of that type.

   The canvas contains the following types of questions controls.

Question controls

Data type	Description
Attachment	Questions that enable users to attach one or more files as a response.
Boolean	Questions with the following value types: ○ A check box to select or clear. ○ A Yes or No answer.
Choice	Questions with a list of predefined options.
Date	Date field. Enables you to collect the date information filled in by a respondent.
Date/Time	Date and time field. Enables you to collect the date and time information filled in by a respondent.
Number	Number field with predefined minimum and maximum values. The default range is 1–10.
Percentage	Percentage field with a prescribed range.
Scale	Predefined Likert scale. Answer options appear as radio buttons.
Numeric Scale	Numeric or numerical scale. Requires the respondent to provide the response in terms of numerical values.
String	Single or multi-line text field.
Template	List of templates that provide a predefined scale of options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data type	Description
Reference	List of fields from a specified reference table.
Image Scale	Image question. Enables you to click images as your answer to a question.
Multiple Selection	Multiple options. You can select multiple options as responses.
Ranking	Question type with options as answers. The options must be ranked.

5. Point to **Save** and then click **Save and Publish**.
   The state of the template changes to Published.

Result
The assessment template with the questions is ready to be sent to the entity owner.

What to do next
Map the assessment responses to a processing activity. For more information, see Map the processing activity fields to a question response.

Write a processing activity script

Write custom scripts on the assessment templates to update the processing activity fields using a script. The script runs when the assessment response is completed. You can write multiple scripts for both screening assessments and impact assessments.

Before you begin
Role required: sn_privacy.developer

Procedure
1. Navigate to **All** > **Privacy Management** > **Assessments** > **All Assessment Templates**.
2. Open the assessment template for which you want to write the script.
3. Select the Processing activity script configurations related list.
4. Select **New**.
5. On the form, fill in the fields.

Processing activity script configuration form

Field	Description
Name	Name of the script.
Assessment template	Assessment template to use. This field is automatically set.
Active	Option to indicate if the script is active. An active script is executed when the assessment response is submitted and the processing activity is created. **Note:** Only one script can be marked as active at a time.
Description	Script description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Script	Script to be used to update the processing activity.

6. Select **Submit**.

Map a control objective to a question response

Map the control objectives to the responses of the assessment questions to automatically create and apply the respective controls on the processing activity.

Before you begin

You can apply active and inactive controls to an assessment response. However, when an assessment is submitted by the business user, only the mapped control objectives that are in the **Active** state are considered to create and apply the controls on the processing activity.

Role required: sn_privacy.admin and sn_privacy.manager

About this task

You can relate control objectives to an assessment question only if the questions are of the following types:

- Choice
- Image scale
- Numeric scale
- Ranking
- Boolean
- Template

Note:
For Boolean questions, the question can either use yes or no answers or use check boxes that must be selected or cleared.

Procedure

1. Navigate to **All** > **Privacy Management** > **Assessment Templates**.
2. Click and open the required assessment template.
3. Click **Update**.

Result

The control objectives are related to the processing activity.

Map an information object to a question response

Map the [PI] Information objects to the responses of the assessment questions that must be associated to the processing activity. This association helps the privacy teams to understand what personal information is being processed by the processing activity.

Before you begin

Role required: sn_privacy.admin and sn_privacy.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can relate information objects to an assessment question only if the questions are of the following types:

- Choice
- Image scale
- Numeric Scale
- Ranking

To understand more about information objects and their uses, see Information objects.

Procedure

1. Navigate to **All** > **Privacy Management** > **Assessment Templates**.
2. Click and open the required assessment template.
3. In the Metric Categories related list, click the required metric.
   The metric category expands.
4. In the Assessment Metrics related list, click the required question.
5. In the Assessment Metric Definitions related list, select a value for which you want to map information objects.
6. From the Information objects related list, click **Edit**.
7. Double-click the required information objects in the Collection list.
   Double-clicking automatically moves the objects to the Information objects List list.
8. Click **Save**.
9. Click **Update**.

Result

The information objects are related to the processing activity.

Map a risk statement to a question response

Map the risk statements to the responses of the assessment questions to automatically create and apply the respective risks on the processing activity.

Before you begin

Role required: sn_privacy.admin and sn_privacy.manager

About this task

When a user responds to a question, based on the answers, the corresponding risk statement is mapped to the processing activity.
You can relate risk statements to an assessment question only if the questions are of the following types:

- Choice
- Image scale
- Numeric scale
- Ranking
- Boolean
- Template

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For Boolean questions, the question can either use yes or no answers or use check boxes that must be selected or cleared.

Procedure

1. Navigate to **All** > **Privacy Management** > **Assessment Templates**.
2. Click and open the required assessment template.
3. Open the question for which you want to add risk statement

4. Click **Update**.

Map the processing activity fields to a question response

Map some of the processing activity fields with the responses of the assessment questions to update the processing activity details based on the assessment response.

Before you begin
Role required: sn_privacy.admin

About this task
A processing activity form has multiple fields. You can choose which responses of the assessment questions must be copied to the various fields of the processing activity record. For example, you can configure that if a certain question has Yes as an answer, then the short description of that question must be used in the **Name** field of the processing activity form.

The following table shows mappings between the fields on the processing activity form with the assessment template configurations:

Field type in assessment configuration	Field labels on the assessment template configurations	Field labels on the processing activity form
String	Name	Name
String	Description	Processing activity purpose
String	Data retention period (in days)	Data retention period (in days)

Procedure

1. Navigate to **All** > **Privacy Management** > **Assessments** > **All Assessment Templates**.
2. Click and open the required assessment template.
3. In the Metric Categories related list, click the required metric.
   The metric category expands.
4. Click the question from which you want to copy the fields to the processing activity.
5. Click the **Processing Activity Configuration** section.
6. From the **Processing activity field** field, select the field that must be populated in the processing activity form.
7. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and validate an assessment configuration

Create your assessment configurations to determine when a processing activity must be automatically created.

Before you begin

Role required: sn_privacy.admin or sn_privacy.manager

About this task

When a privacy screening assessment is sent to the entity owners, their responses determine the creation of processing activity. You can also modify the default configurations on the privacy screening assessment to create processing activities automatically.
You can also create a new processing activity creation condition for your own privacy screening assessments.

After you create the configurations, you can validate if the responses create the processing activities according to the defined conditions.

Procedure

1. Navigate to **All** > **Privacy Management** > **Assessments** > **Processing activity creation rules**.
2. Click **New**.
3. On the form, fill in the fields.

Processing activity creation rule form

Field	Description
Name	Name of the assessment configuration.
Description	Brief description of the configuration.
Assessment template	Template for which the configuration is being created.
Active	Option to make the configuration active.
Advanced	Option to add more than three conditions.

4. In the Conditions related list, create filters by selecting **Metric** and using the condition builder.
5. In the Advanced related list, specify the script for adding more than three conditions.
   The Advanced related list only appears if you select the **Advanced** option.
6. Click **Validate**.
   a. In the **Assessment instance** field, select the instance on which this configuration must be used.
   b. Click **Validate**.

Map a table with a processing activity

Keep your processing activity updated and in sync with any table in ServiceNow® by mapping the entity fields with the processing activity.

Before you begin

Role required: sn_privacy.analyst

About this task

A processing activity is associated with a CMDB table record such as a business process record or a business application record. Whenever a CMDB record is updated, the respective

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

processing activity must also be updated so that the privacy teams can apply the controls based on the updates to the processing activity. Using the **Sync fields** button on the processing activity form the privacy managers and analysts can update the processing activity. The processing activity is updated based on the configurations available in the processing activity mapping.

When the **Sync fields** button is selected, only the fields that are mapped with the processing activity are updated.

When mapping a **Processing activity field** with a **Mapping field**, it is important to note that the following mapping combinations are supported:

- String to String
- Reference type to the same Reference type
- True or False
- Integer to Integer and String

Additionally, ensure that there is valid data for both the fields. For example, if there are filter conditions applied in the Processing activity field, these must match the filter conditions in the Mapping field.

Procedure

1. Navigate to **All** > **Privacy Workspace** > **Configure privacy management** > **Processing activity mapping**.
2. Click **New**.
3. In the **Mapping table** field, select **Business Application**.
4. In the **Description** field, provide a brief description of the table.
5. Click **Save**.
   The Processing activity field mappings related list appears.
6. Click the Processing activity field mappings related list.
   a. Click **New**.
   b. In the **Processing activity field**, select the field of the processing activity form that you want to map with the business application table field.
   c. In the **Mapping field**, select the field of the business application table field that you want to map with the processing activity field.
   d. Click **Save**.

Result

The mapping is successfully created. The fields that are mapped will be populated in the processing activity form.

Using Privacy Management

As a privacy analyst or a privacy manager, you can identify which business applications or processes store and use personal information.

Entity scoping to plan a privacy program

When a privacy manager plans the privacy program for an organization, the first step is to scope those business applications or processes that contain personal data. In Governance, Risk, and Compliance, these business applications or business processes are called as entities. After

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

you identify the entities processing personal data, the processing activities are automatically created.

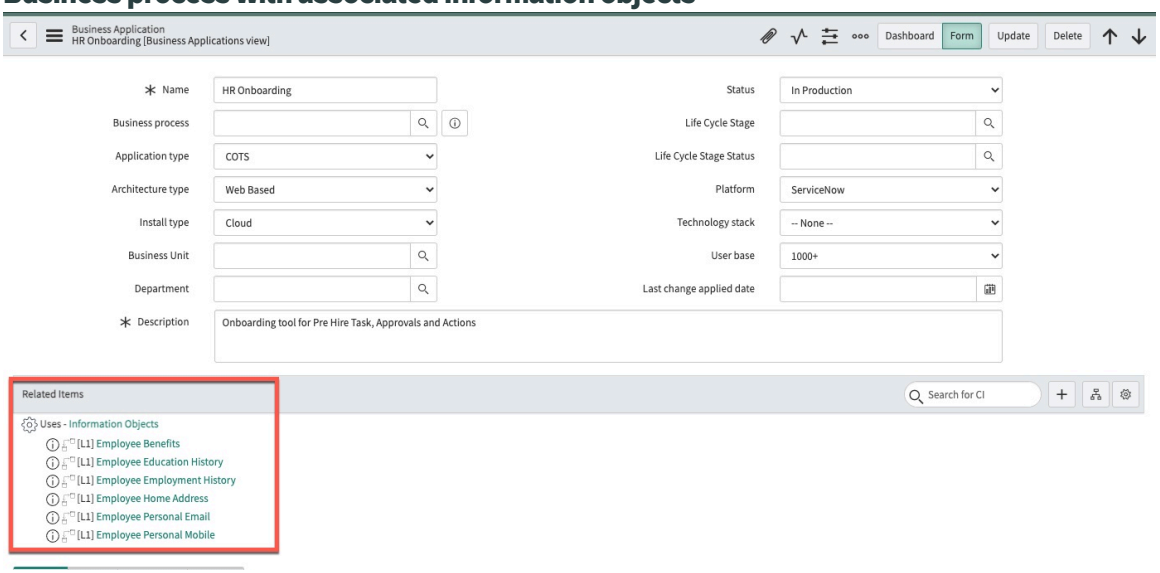
A privacy manager, with the role sn_privacy_manager, plans various privacy programs. Some examples of the privacy programs are:

- Identifying all the business processes and vendors that process personal data of customers.
- Identifying business applications that process personal data of employees.

All the inventory related to business processes, applications, vendors, or business services is stored in the respective Configuration Management Database (CMDB) tables. The respective business owners manage this inventory.

You can identify or discover entities that process personal data by using one of the following methods.

- Filtering the entities either by discovering the processing activities by their usage of personal information.
- Sending initial privacy assessments.



Both these methods are explained in the following sections.

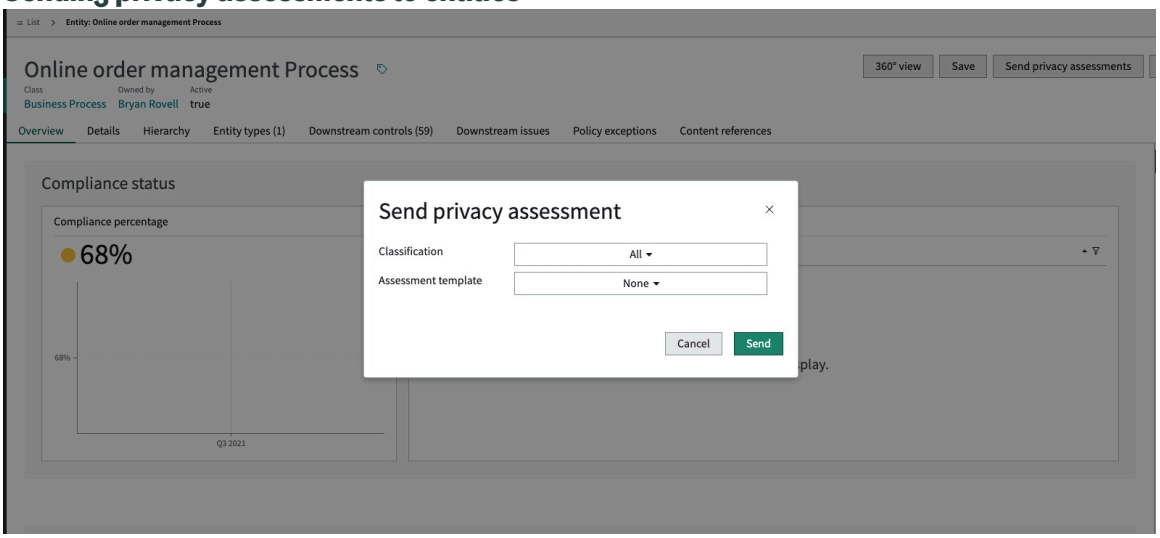
Discover processing activities by their usage of personal information

At an inventory level, when business processes, business applications, and other inventory records are mapped with information objects of type Personal information (PI), the privacy manager can discover those records that process specific PI information. For details about information objects and their role in Privacy Management, see Information objects in Privacy Management.

The following image shows a business process with information objects associated with it. To identify such business applications or processes associated with information objects, the enhanced entity filter capability in the entity scoping functionality is used. For more information, see Scope entities to discover processing activities with personal information.

Business process with associated information objects

Identify potential entities and sending initial privacy assessments



If the information objects are not mapped to the business applications or processes, you can send initial privacy assessments to all the entities and use their

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

responses to determine if personal data is being processed. The steps to send the assessment are as follows:

1. Create an Entity type. For example, `Business processes that process customer personal information` or `Business applications that store employee information`.
2. Identify entities using Entity Type you created.
3. Select the relevant entities and send privacy screening assessments to the respective entity owners.
4. Based on the responses, processing activities are created automatically when relevant questions are answered.

Sending privacy assessments to entities

After the entities are scoped, then, in the applications, only those entities appear that contain personal information.

Scope entities to discover processing activities with personal information

Determine which entities have and process personal information using the ServiceNow® Configuration Management Database (CMDB) application.

Before you begin

Ensure that you created the CMDB queries. For more information on the CMDB queries, see Querying the CMDB.

Role required: sn_privacy.manager

About this task

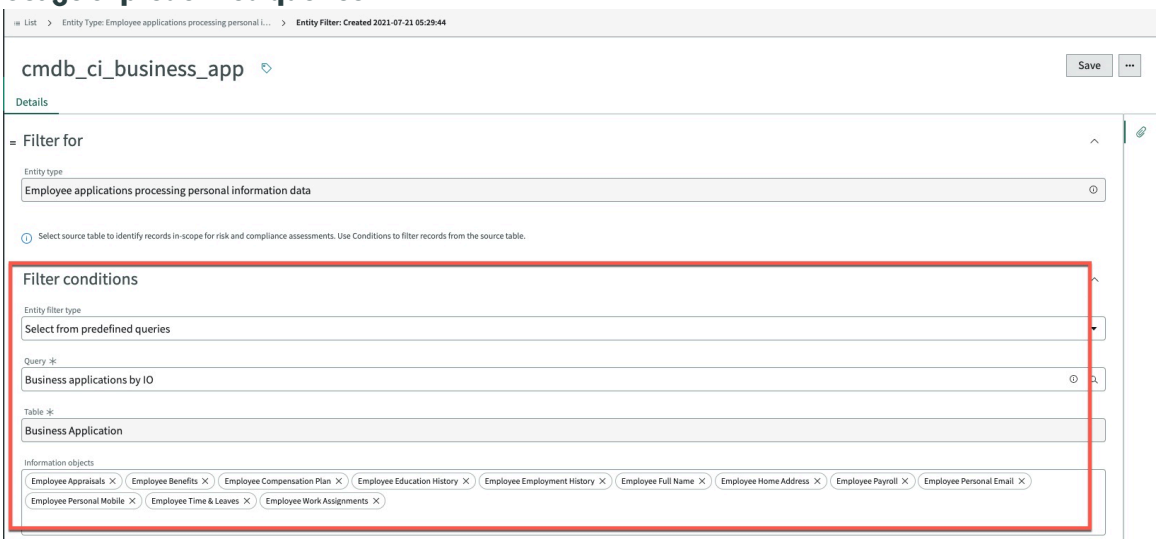
In the Configuration Management Database (CMDB), you can search the database for entities that process personal data using one of the following methods:

- Using the predefined queries and selecting only those applications and processes that have associated information objects. For more information about information objects and their role in Privacy Management, see Information objects in Privacy Management. For information on how to scope entities with personal information, see Scope entities to discover processing activities with personal information
- Building your own query. For more information on building the CMDB queries, see Querying the CMDB

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To filter entities that contain personal data, you must filter the entities using the appropriate queries. ServiceNow® provides two default queries for you to use to filter entities with personal data. The default queries are provided for the following tables:

- Business process
- Business application



You can also create your own queries. This procedure demonstrates using the default queries.

Procedure

1. Navigate to **All** > **Privacy Workspace** > **Scoping** > **Entity types**.
2. Open the entity you want to filter for personal information.
3. Click the Entity Filters related list.
4. Click **New**.
   The Entity Filter form is displayed.
5. In the Filter conditions section, in the **Entity filter type** field, select **Select from predefined queries**.
6. In the Query field, select **Business applications by IO**.
   The **Table** field is automatically set.
7. **Optional:** To add more information objects that contain personal information such as email address, click **Information objects** and type `Email`.
8. Click **Submit**.

Example:

Usage of predefined queries

Types of privacy assessments

Privacy assessments can be sent using various methods such as entities, entity types, and processing activities.

Multiple types of privacy assessments such as privacy screening assessment, privacy impact assessment, transfer impact assessment, and so on can be configured according to your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Initiating privacy assessments for an entity or a processing activity

To discover whether a business process or an application is processing personal data, you can use privacy screening assessments. To regularly assess how processing activities are processing personal data, you can use privacy assessments such as privacy impact assessment (PIA).

Privacy screening assessment

Conducting a privacy screening assessment helps you discover whether the entity is processing personal information or not.

You can send the privacy screening assessments in the following ways:

- From the entity record only when a processing activity is not available.
- From the entities related list in entity types.

When you initiate privacy screening assessments for entities, processing activities are created based on the responses submitted by the entity owners.

Note:
The processing activity creation rules can be configured based on the screening assessment responses.

After a processing activity is created, based on the assessment configurations, the following events occur:

1. The necessary information objects are mapped to the processing activity record. To understand more about information objects and their uses, see Information objects.
2. The necessary controls are mapped to the processing activity record.
3. Critical assessment responses such as the purpose of the processing activity, data subject type and so on are copied over to the processing activity record.

Note:
If you accidentally send an assessment and the assessment is not completed, you can cancel the assessment.

Privacy assessments

When processing activity records are identified, to understand how a processing activity is processing personal information, various types of privacy assessments such as privacy impact assessments (PIA) and transfer impact assessment (TIA) are sent. You can trigger PIAs from a single processing activity record. For more information, see Send a privacy assessment from a processing activity. Alternatively, you can send privacy impact assessments to multiple processing activities, using the Entity type capability or from the processing activity list view. For more information on how to send an assessment to multiple entities, see Send a privacy assessment to multiple entities.

Related topics

Send a privacy assessment to multiple entities

Send a privacy assessment from an entity

Send a privacy assessment to an entity owner to determine if there's personal data involved in the processing activities.

About this task

You can send a privacy screening assessment from an entity if you do not have a processing activity created for that entity. After a processing activity is created for an entity, any further assessments can only be sent through the processing activity.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Scoping** > **My entities**.
2. Select and open the entity from which you want to send the assessments to the entity owner.
3. Select **Initiate privacy assessments**.
   The Send privacy assessment dialog box opens.
4. Provide the required information such as the template to use, the due date, and so on in the dialog box.
   The description of the assessment is automatically fetched from the description provided at the time of the assessment template configuration. You can modify the description as required.
5. Select **Send**.

Send a privacy assessment to multiple entities

Send the privacy screening assessment or the Privacy impact assessment (PIA) assessments to multiple entities to understand why and how personal data is being processed.

Before you begin

Role required: sn_privacy.manager

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **List** > **Scoping** > **Entity types**.
2. Select the entity types that contain the entities for which you want to send the assessments.
3. Select the entities related list.
4. To select the required entities, select the selection icon ().
5. Click **Send privacy assessments**.
6. From the **Classification** field, select the type of assessment.
7. From the **Assessment template** field, select the template you want to use.
8. In the **Due Date** field, select the due date for completing the assessment.
9. Click **Send**.

Result

The assessment is sent to the entity owners.

Send a privacy assessment from a processing activity

Send a privacy assessment to a processing activity owner from a processing activity record to collect more information on why and how the processing activity is using personal information.

Before you begin

Role required: sn_privacy.manager or sn_privacy.analyst

any assessments in the **Monitor** state or the **Closed** state. When you move a RAM back to the **Draft**, the on-going assessments and the associated scopes are deleted.

Procedure

1. Navigate to **All** > **Privacy Management** > **Risk Assessments** > **Risk assessment methodologies**.
2. On the Risk Assessment Methodology page, select **New**.
3. On the form, fill the details.
   For a description of the field values on the risk assessment methodology form, see Risk Assessment Methodology form.
4. Right-click and save the form.
5. To configure the various assessments, select one of the following options.

6. Select **Publish**.

> **Note:**
> After a new assessment is created on the same risk and the assessment is in the **Monitor** state, the other assessments automatically move to the **Completed** state. When an assessment instance is in the **Monitor** state, you can't move the RAM back to the **Draft** state. A RAM can only be moved back to the **Draft** state if there are no assessment instances.

Result
A new Risk Assessment Methodology is created and is available for use.

Risk assessment methodology form

Use the Risk Assessment Methodology form in the Core UI to create a risk assessment methodology (RAM).

Risk Assessment Methodology form

Field	Description
Name	Name of the risk assessment methodology. For example, `Data Risk Evaluation`.
Assess	Select the assessment context: • Risk • Object
Applicable entity classes	Unlock this field and add the entity classes for which you want to create the risk assessment methodology.
Workflows	Specify the assessments and workflow that are performed in the risk assessment methodology. Depending on the options selected, the corresponding assessment type and workflows are enabled.
Rollup Configurations	
Calculate ALE based on	Select the basis for calculating ALE:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Respond to a privacy smart assessment

Respond to either a screening assessment or an impact assessment from the Assessment Workspace. The assessment results help to understand the potential privacy risks and their mitigation measures.

Before you begin

Role required: sn_privacy.business_user

About this task

A screening assessment is the first assessment that is sent to any responder to determine if the privacy teams need to be aware of any application that processes personal data. If there is personal data involved, then an impact assessment is sent to the key stakeholders. While the screening assessment only has the **General** section for questions, the impact assessment has two sections: **Personal data** and **Questionnaire**. Under the Personal data section, you find the following sections:

- **Data elements**: This section displays the information object categories and each information object that belongs to that category. Based on your selection during template configuration, you can view either all information object categories or only the selected ones.
- **Hierarchy**: In this section, the responders specify the source and the destination of data.
- **Legal basis**: In this section, the responders specify the lawful basis on which the data is processed. For example, an information is processed for legal obligations. Here, you can specify the granular levels of the create, read, update, delete operations that can be performed on the data and also where is the data coming from and where is being sent.

Because the assessments use the Smart Assessment Engine, the responders can see the detailed description of each question and the guidance that helps the responder in answering the questions.

Procedure

1. Navigate to **All** > **Self Service** > **Employee Center** > **My active items** > **GRC tasks** > **My to-dos** > **My pending tasks** > **Privacy assessments**.
2. Select and open the assessment you want to take.
   The assessment opens in the Assessment Workspace.
3. To take the assessment, select **Start**.
4. **Optional:** To reassign the assessment, select **Reassign**.
   You can only reassign the assessment to a user who has the privilege to respond to an assessment and is a key stakeholder.
5. If responding to a screening assessment, respond to the questions in the questionnaire.
6. To view the guidance for a question, select **View guidance** at the bottom of the question.
7. Select **Submit**.
8. **Optional:** If responding to an impact assessment, on the **Personal data** section, provide the responses for Data elements, Hierarchy, and Legal basis.
   a. Select **Move to questionnaire**
   b. Select **Submit**.
   c. On the confirmation box, select **Submit**.
9. To view your responses after submission, on the assessment page, select **View**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
After an assessment is submitted, the privacy team receives a notification about the assessment submission. The team can then choose to either act on it or reject it based on their analysis. If the privacy team closes the assessment, then a processing activity gets created.

Respond to a privacy screening assessment

As an entity owner or a processing activity key stakeholder, respond to the privacy assessment that is initiated by the privacy lead.

Before you begin
Role required: sn_privacy.assessment_responder, sn_privacy.business_user

About this task
While responding to an assessment, you can reassign the assessment to another user even if you have started the assessment. When you reassign the partially completed privacy assessment to another user, the data that is already provided also gets copied over and is available when the new assignee takes the assessment. This data can be modified by the new assignee.

Procedure

1. Navigate to **All** > **Self Service** > **Employee Center** > **My active items** > **GRC tasks** > **My to-dos**.
2. Open the assessment assigned to you.
3. Perform one of the following actions.

Result
The responses are captured in the respective entity and the processing activity. The responses are then reviewed by the privacy teams.

Review a privacy assessment

As a privacy analyst, review a privacy assessment after the responders submit the assessment. You can either close the assessment after a review or you can also request for revision if you determine that the assessment requires more information.

Before you begin
Role required: sn_privacy.analyst

About this task
As a reviewer, you can also preview the assessment with the applicable risk statements, information objects, and control objectives.

Procedure

1. Navigate to **All** > **Privacy Workspace** > **Tasks**.
2. Select and open the privacy assessment that you want to review.
3. Select **View response**.
4. Review the assessment responses.
5. To request for more information from the responder, select **Request for revision**.
6. To mark the assessment as complete, select **Update state**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **State** field, select **Closed complete**.

b. In the Additional comments field, provide any additional information.

c. Select **Submit**.

Create or update a processing activity

Manually create a processing activity or update a processing activity that is automatically created out of a privacy screening assessment. You can also update a processing activity that is created from an entity record. When you update a processing activity, you can fill in the relevant details about the personal data that is being processed.

Before you begin

Role required: sn_privacy.analyst (who owns the processing activity) or sn_privacy.manager

Procedure

1. Navigate to one of the following.

2. On the form, fill in the fields.

New processing activity form

Field	Description
Name	Name of the processing activity.
Processing activity purpose	Business justification or reason for using an application or a process that stores personal data.
Number	Number of the processing activity. This field is automatically set.
Privacy analyst	Analyst responsible for the processing activity.
Business unit	Business unit of the processing activity.
Department	Department of the processing activity.
Processing activity type	Context of the processing activity such as a business application or a business process.
Entity	Entity of the processing activity.
Applies to record	Reference record used to create the processing activity record.
Owned by	Owner of the processing activity.
Data processing role	Defines if a processing activity is a data controller or a data processor.
Processing activity status	Status of the processing activity. The choices are as follows: ○ **Implementing** ○ **In Production** ○ **Pilot**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Retired** ○ **Under Evaluation**
Processing activity category	Category to which the processing activity belongs for example, customer care, finance, and so on.
Compliance score	Privacy compliance score calculated based on all the controls mapped to this processing activity.
Process owner	Any user, with the sn_privacy.business_user role, from the list of key stakeholders who has the editing privileges for the processing activity. **Note:** The user selected in this field can update the this field and select a new process owner. Updating this field is only possible when the processing activity is in the **Discover** or **Review** state.
Data subject	
Data storage type	Format in which the personal information is stored. The choices are as follows: ○ **Digital** ○ **Paper** ○ **Both**
Data storage locations	Physical location of where the personal information is stored.
Data retention period (in days)	Number of days for which personal information must be retained.
Data subject type	User type related to the personal information that is being used and processed. The choices are as follows: ○ **Customers** ○ **Employees** ○ **Others**
Data subject range	Range of users for whom the personal information is being processed.
Contains special category data?	This field is automatically set to either **Yes** or **No**. If any information object associated with the processing activity is classified as special category data, then this field is automatically set to **Yes**.
Obtain special category data?	Does this processing activity process any special category data such as racial, ethnic, political information? The choices are as follows: ○ **Yes** ○ **No**
Activity

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional comments	Additional information about the processing activity.
Work notes	Internal notes not visible to the external people.

3. Click **Save**.

Create or manage an information object within a processing activity

Add information objects to the processing activity after a processing activity is created. Adding information objects helps you understand the types of personal information that is being processed and the way it is processed. This task helps in applying the appropriate controls to the processing activity.

Before you begin

Role required: sn_privacy.analyst (who owns the processing activity) or sn_privacy.manager

About this task

It is important to note that only the information objects that are tagged with the **Personal information** tags are available to be added to a processing activity. For more information on how to tag information objects see, Classify information objects as personal information.

Procedure

1. Navigate to **All** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Select and open the processing activity to which you want to add controls.
3. Click the [PI] Information objects related list.
4. Click **Add**.
5. Select the information objects you want to add.
6. Click **Add**.

Related topics

Modify an information object within a processing activity

Modify an information object within a processing activity

Add details such as justification for storing data to an information object after you add it to the processing activity. Adding details enables you to define how the personal data is being processed.

Before you begin

Role required: sn_privacy.analyst (who owns the processing activity) or sn_privacy.manager

About this task

As a privacy analyst, you must provide details how personal data is being used in a given processing activity. Adding relevant details to an information object helps you achieve this objective.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **List** > **Lists** > **Processing activities** > **All processing activities**.
2. Select and open the processing activity that contains the information object you want to modify.
3. Select **Processing data inventory** > **[PI] Information objects**.
4. Open the information object that you want to modify.
5. On the Information object to processing activity form, fill in the fields.

Field	Description
Information object	Name of the information object. This field is automatically set.
Processing activity	Name of the processing activity the information object is part of. This field is automatically set.
Type of data	Type of personal data. The choices are the following: ○ **General personal information**: Examples are: Name, phone number, address. ○ **Special Category**: Examples are: Political opinions, religious beliefs, and so on. **Note:** If any information object associated to a processing activity is categorized as special category, the **Sensitive** field on the processing activity form is automatically set to **Yes**. ○ **Criminal Conviction**: Examples are court verdicts, information about legal proceedings and so on.
Lawful basis for processing	Reason for processing personal data. ○ **None** ○ **Legal Obligation** ○ **Legitimate Interests**
CRUD operations	Operations that can be performed on the processing activity. The choices are the following: ○ **Create** ○ **Read** ○ **Update** ○ **Delete**
Data coming from	Asset from which the data is coming. For example, you can select the application from

Field	Description
	where the data in this processing activity is populated.
Data sent to	Specify where the data is sent.
Information object categories	Category of the information object.
Justification for storing this data	Reasons for storing and using the personal data.

6. Click **Save**.

Add data subject type to a processing activity

Add data subject types to a processing activity in the Privacy Workspace.

Before you begin

Role required: sn_privacy.manager or sn_privacy.analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. In the Privacy Workspace, select the List icon ( ).
3. Navigate to **Processing activities** > **All processing activities**.
4. Select and open the processing activity to which you want to add a data subject type.
5. Navigate to **Processing data inventory** > **Data subject types**.
6. Select **Add**.
7. In the Add a new data subject type window, select the **Data subject type**.
8. Select a value for **Data subject volume**.
9. Select **Data subject locations**.
10. Select the **Information Objects** you want to add to the data subject type.
11. Select **Add**.

Result

The data subject type that you added appears in the **Data subject types** table.

Add data subject type to privacy impact assessment

Add data subject types to privacy impact assessment from the Employee Center.

Before you begin

Role required: sn_privacy.business_user or sn_privacy.admin

About this task

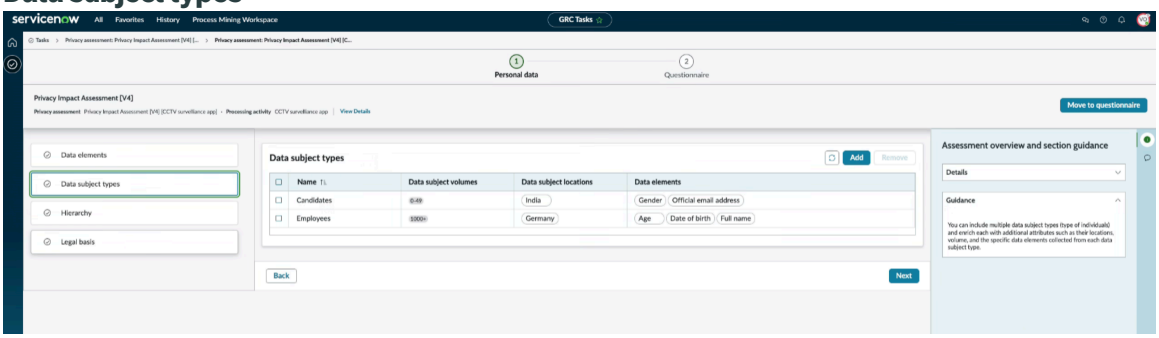
The data subject types you add are automatically added to the processing activity after the privacy impact assessment (PIA) is approved.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. On the Employee Center home page, select **GRC tasks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the GRC Tasks home page, select **Tasks**.
4. Go to **My pending tasks** > **Privacy assessments**.
5. Open the PIA to which you want to add data subject types.
6. On the **Data subject types** related list, select **Add**.
7. On the Add a new data subject type dialog box, fill the fields.



Add a new data subject type form

Field	Description
Data subject type	Type of the data subject.
Data subject volume	Volume of the data subject. ○ 0-49 ○ 50-99 ○ 100-499 ○ 500-999 ○ 1000+
Data subject locations	Locations that are applicable to the data subject type.
Information Objects	Type of information object. ○ Full name ○ Home address ○ Age ○ Date of birth ○ Education History ○ Gender ○ Email address ○ Criminal Record

8. Select **Add**.
   A confirmation message saying that new record has been created appears.

Result
The data subject types appear in a tabular format.

Data subject types

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Classify data subject type as vulnerable

Classify a data subject type as vulnerable. When you mark a data subject type as vulnerable, the criticality score is calculated as High.

Before you begin

Role required: sn_privacy.manager

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. In the Privacy Workspace, select the List icon ( ).
3. Navigate to **Privacy elements** > **Data subject type**.
4. Select and open the data subject type you want to classify as vulnerable.
5. Select **Vulnerable** to mark the data subject type as vulnerable.
6. Select **Save**.

Result

The data subject type that you classified as vulnerable contributes to the criticality score being High.

Add key stakeholders and send privacy assessments

Add key stakeholders to a processing activity to identify the key members who are responsible for processing the personal data within the processing activity. You can then send the respective privacy assessments to the stakeholders based on their responsibilities. For example, an entity owner is a key stakeholder for a processing activity.

Before you begin

Role required: sn_privacy.analyst

About this task

A processing activity can have multiple key stakeholders. While you can add or delete as many key stakeholders as you want, by default, the entity owner is one of the key stakeholders. All the stakeholders can respond to privacy assessments and some stakeholders can also edit the processing activity based on their privileges. Only users with the sn_privacy.assessment_responder and sn_privacy.business_user can be added as stakeholders. You can add key stakeholders only when the processing activity is either in the **Discover** or **Review** states.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Open the processing activity to which you want to add key stakeholders.
3. Click the Key stakeholders related list.
4. Click **Add**.
   a. Select the stakeholders to add.
   b. Click **Add**.
   The key stakeholders are added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To modify the privileges and responsibilities of a stakeholder, select the name of the stakeholder.
6. In the **Responsibility** field, provide the responsibilities of the stakeholder.
7. In the **Processing activity privileges** field, select one of the following options.

8. Click **Save**.
9. Return to the processing activity using the breadcrumb navigation.
10. To send the privacy assessments to a stakeholder, click **Send privacy assessment**
    a. From the **Classification** field, select the type of assessment.
    b. From the **Assessment template** field, select the template you want to use.
    c. From the **User** field, select the user you want to send the assessment to.
    d. Click **Send**.

Add a regulatory agency

Add a regulatory agency in the Privacy Workspace to identify the relevant regulatory authorities that are responsible for overseeing the industries or sectors within each jurisdiction. The jurisdictions consolidate all the regulatory communications via emails and implement the notification rules for data privacy or security breaches for the reported privacy cases.

Before you begin

Role required: sn_privacy.analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Lists** > **Regulatory information** > **Agencies**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the fields, see Regulatory agency form .

Regulatory agency form

Use the Create Regulatory Agency form in the Privacy Workspace to create a regulatory agency. The regulatory agency is a new record type that handles regulatory changes.

Create Regulatory Agency form

Field	Description
Name	Name of the regulatory agency. For example, `Australian Prudential Regulation Authority`
Summary	Brief summary of the regulatory agency. For example, `The Australian Prudential Regulation Authority (APRA) is a statutory authority of the Australian Government and the prudential regulator of the Australian financial services industry.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Regulatory Agency form (continued)

Field	Description
Description	Detailed description of the regulatory agency.
Acronym	Acronym of the regulatory agency, if any. For example, APRA
Logo	Logo of the regulatory agency.
Executive owner	Person who is the head of the agency.
Website link	Link to the official website of the agency
Classification	
Category	Category for classifying the regulatory agency. The choices are as follows. • **Regulatory** • **Legislative** • **Governmental** • **Others**
Scope	Areas in which an agency operates and its specific products or services. For example, **Bill**, **Decisions**, **Circulars**. You can select more than one scope in this field.
Sector	Segment of the economy where different agencies or businesses engage in similar activity or provide similar products or services. For example, **Banking**.
Theme	Subject that is the core idea on which the agency is focused. For example, **Anti-money laundering**.
Key dates	
Establishment date	Date the agency was established. Future dates are not allowed in this field.
Created	Date the agency is created.
Settings	
Functional domain	Functional domain of the regulatory agency. This field is automatically set to **Privacy** when the regulatory agency is created from the Privacy Workspace.

Create a data lineage for a processing activity

Establish a data lineage to visualize data consumption, sharing, and the associated risks for a processing activity. Each processing activity involves multiple information objects classified as personal information. These objects exchange data with various other entities, making it essential to establish a data lineage or hierarchy that tracks where personal data is shared. This understanding helps mitigate privacy-related risks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_privacy.business_user

About this task
Although data lineage can be created from the Hierarchy tab of a processing activity, this procedure shows how to create it from the Data Lineage page, which offers a visual representation of the hierarchy. When creating the hierarchy, make sure not to use the same asset as both the source and the destination.

When you create the hierarchy of relationships, you can view up to five levels of relationships. However, you can configure the number of levels according to your preference in the *sn_privacy.nodemap.maxLevel* property.

Procedure
1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Open the processing activity to which you want to create data lineage.
3. On the form, select **Data lineage**.
4. Select the record for which you want to create a relationship.
5. Select **Create new relationship**.
6. In the New relationship dialog box, fill in the fields.

Field	Description
Primary Node	Record for which you're creating the relationship. While this field is automatically set to the record that is selected, you can change the node.
Hierarchy	Level at which you want to create the relationship. The choices are as follows. ○ **Data coming from**: If you select this option, the data will flow to the levels above the primary node. ○ **Data sent to**: If you select this option, the data will flow to the levels below the primary node.
Related to	CMDB record with which the personal data is associated. For example, if the primary node is related to a business application, a business process, a business service, and so on. After you make a selection in this field, select the required records. This field provides the following choices. ○ **Business Application** ○ **Business Process** ○ **Business Service** ○ **Company** ○ **Vendor**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Entity** ○ **Processing Activity**
Relationship Type	Nature of the relationship between the personal data and the selected item. The choices are as follows. ○ **Depends**: Indicates that the personal data is reliant on the specified item. ○ **Contains**: Specifies that the item includes or holds the personal data. ○ **Sends data to**: Shows that the item transmits the personal data to another application or party. ○ **Uses**: Demonstrates that the item utilizes the personal data for its operations or processes. **Note:** You can add more choices to appear in this field in the sn_grc_choice table.
Description	Brief description of the relationship.

7. Select **Create**.
   The relationship node is created.
8. To view the inflow and outflow of data for a particular record, select the icon.
9. To view the details of the processing activity and the entity if a processing activity is associated with the selected record, select the icon.

Create or manage a control on a processing activity

Add new controls or manage the controls that are automatically added to the processing activity from the assessment responses. Adding controls ensures that the appropriate regulations are applied to the processing activity.

Before you begin

Role required: sn_privacy.analyst who owns the processing activity or sn_privacy.manager

About this task

You can add or manage controls to a processing activity in the following ways:

- Selecting control objectives: You can add existing control objectives to a processing activity. When you add a control objective to a processing activity, the controls associated with that particular control objective are added to the processing activity.
- Creating controls: You can create controls and add them to the processing activity.
- Selecting from the recommended controls: This option enables you to choose from a list of recommended controls based on the information object that is mapped to a processing activity. If an information object is mapped to one or more control objectives, and the same information object is mapped to a processing activity, the system recommends the corresponding control objectives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Managing the automatically added controls: You can manage the controls that are automatically created based on the assessment responses.
- Applying controls from entities: You can apply privacy-related controls on the processing activity from the related entity.
- Adding common controls: You can add common controls to a processing activity so that the privacy teams can be notified of control failures and avoid duplicate common control attestation process. For more information on common controls, refer to Testing common control and implementing results on multiple reliant entities.

Note:

Procedure

1. Navigate to **All** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Select and open the processing activity to which you want to add controls.
3. Click the Controls related list.
4. To add a control to the processing activity, do one of the following.

Result

The mitigating controls are added to the processing activity.

Delete a control from a processing activity

Delete the controls that are no longer required in the processing activity.

Before you begin

Role required: sn_privacy.admin

About this task

You can delete controls if the control objectives associated with those controls have been erroneously added. If you want to add new controls, you may want to delete existing controls.

Note:
If a control is associated with any other entity or entity type, then you cannot delete the control. By deleting a control, you can only remove the association of that control with the processing activity.

Procedure

1. Navigate to **All** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Select and open the processing activity from which you want to delete controls.
3. Click the Controls related list.
4. Select the controls that you want to delete.
5. Click **Delete**.

Result

The selected controls are deleted from the processing activity.

Create or manage risks on a processing activity

Add new risks or manage the risks that are automatically added to the processing activity from the assessment responses. Adding risks helps you manage processing activities using the risk-based approach.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_privacy.analyst who owns the processing activity or sn_privacy.manager

About this task
You can add or manage risks to a processing activity in the following ways:

- Selecting risk statements: You can add existing risk statements to a processing activity. When you add a risk statements to a processing activity, the risks associated with that particular risk statement are added to the processing activity.
- Selecting from the recommended risks: This option enables you to choose from a list of recommended risks based on the information object that is mapped to a processing activity. If an information object is mapped to one or more risk statements, and the same information object is mapped to a processing activity, the system recommends the corresponding risk statements.
- Creating risks: You can create risks and add them to the processing activity.
- Applying risks from entities: You can apply privacy-related risks on the processing activity from the related entity.

Procedure
1. Navigate to **All** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Select and open the processing activity to which you want to add controls.
3. Click the Risks related list.
4. To add a risk to the processing activity, do one of the following.

Result
The mitigating controls are added to the processing activity.

Manage chat collaborations of a processing activity

Initiate quick discussions with key stakeholders while working on a processing activity, privacy case, or a personal data rights request. The chat feature is integrated with Microsoft Teams and a group is automatically created on Microsoft Teams when a discussion is initiated.

Before you begin
Role required: sn_privacy.analyst

About this task
Because privacy cases are time-sensitive, they sometimes need quick collaborations. The Discuss button facilitates these collaborations and the chats are stored making it simpler for the privacy teams to refer to them when working on a task. Apart from processing activities, the Discuss feature is available for privacy cases, and personal data rights requests. For more information, refer to Sidebar and Microsoft Teams.

Procedure
1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **List** > **My items** > **Processing activities**.
2. Open the processing activity that you want to discuss.
3. Select the More actions icon.
4. Select **Discuss**.
   The Start a Sidebar discussion window opens with the key stakeholders added as participants.
5. Type your message and select **Start discussion**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The chat gets stored and can be viewed under Activity on the side panel.

Create or add issues on a processing activity

Create issues or add existing issues for a processing activity. Associating issues to a processing activity helps you to identify and prioritize remediation actions. Relating issues reduces the number of issues customers need to manage, thus improving the overall organizational efficiency in management of these issues.

Before you begin
Role required: sn_privacy.analyst (who owns the processing activity) or sn_privacy.manager

About this task
Issues get created when there are control attestation failures. You can also manually add or create multiple issues for a processing activity. You can also map one issue to multiple processing activities. If you create an issue for a processing activity from the Privacy Workspace, the **Issue source** field is set to **Ad-Hoc**.

Procedure
1. Navigate to **All** > **Privacy Workspace** > **Processing activities** > **All processing activities**.
2. Select and open the processing activity to which you want to add issues.
3. Click the More related list.
4. Click Issues.
5. Click **Add**.
   a. Select the issues to add.
   b. Click**Add**.
6. **Optional:** To create an issue, refer to the issue creation form.
7. Click **Save**.

Assign a processing activity to a key stakeholder

Assign a processing activity to the defined key stakeholders for the stakeholders to start working on the processing activity.

Before you begin
Role required: sn_privacy.analyst

About this task
You can assign a processing activity to a key stakeholder when the processing activity is in the **Discover** state. After the key stakeholder updates the processing activity, they can assign the processing activity back to the privacy team.

Procedure
1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **List** > **Processing activities** > **Unassigned processing activities**.
2. Select the processing activity that you want to assign to a key stakeholder.
3. Select **Assign to key stakeholder**.
4. In the Assign to key stakeholder window, select a stakeholder.
5. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The processing activity is assigned to the key stakeholder. The processing activity is available for review and update in the Employee Center under **GRC tasks**.

Integrating Employee Center and Risk portal with Privacy Management

Access control through organizational structure

Describes how access to processing activity records can be restricted by using Entity-Based Access (EBA).

User access to processing activity records and related data can be restricted based on an organizational structure. This structure may reflect a legal entity, jurisdiction, business unit, or any segmentation aligned with how your privacy teams operate. This approach enables granular security and supports regulatory compliance for organizations functioning across multiple regions or subsidiaries.

Entity-Based Access (EBA) implements this control by enforcing data segregation according to the defined organizational structure. With EBA, users can only view and manage records for the entities or jurisdictions to which they have been explicitly granted access. Records outside this defined scope remain hidden.

Key characteristics

- Dynamic segmentation: Access can be assigned based on the organizational structure, such as legal entity, jurisdiction, business unit, or any defined grouping. So processing activity records are only visible to the appropriate teams.
- Regulatory alignment: Access controls can be mapped to organizational structures, helping organizations meet local regulatory requirements and maintain clear audit trails.

For information about configuring access control, see Configure access control.

UI impact

- Processing activity details: Hidden for records outside the user's scope.
- Data lineage: Information for inaccessible entities is hidden, and navigation buttons on the side panel are disabled.
- Reports and dashboards: Visibility in reports such as processing activity, risk scan, and compliance is filtered based on entity configuration.

Role capabilities

Role capabilities

Role	Capabilities
Privacy admin	• Create entity configurations • Perform bulk access updates
Privacy manager	View entity configurations
Privacy analyst	Access records for configured entities and their associated downstream entities

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role capabilities (continued)

Role	Capabilities
Privacy business user	Access records for configured entities and their associated downstream entities

Note:
Assigned roles such as assignee, reviewer, and analyst retain access to their assigned records even if those records fall outside the configured entity.

Configure access control

Describes the step-by-step process for configuring Entity-based access control in Privacy Management, including property activation, hierarchy setup, record mapping, user assignment, bulk updates, and activating entity-based record access rules.

The following steps outline how to configure access control in Privacy Management using Entity-based access (EBA). This process enables organizations to restrict user access to processing activity records and related data according to their position in the organizational hierarchy. By following these steps, administrators can ensure that privacy teams and users only access records relevant to their assigned entities, supporting both security and regulatory compliance.

1. Install Entity-based access plugin and enable the entity-based access control property. This activates entity-based access features and allows you to configure access restrictions by legal entity.

   For information, see Configure Entity-based access.

2. Establish the organizational structure (parent-child relationships), where a global entity contains regional entities, and those in turn contain country-level entities.

   For information, see Add hierarchical relationships between entities.

3. If processing activities already exist, map each record to the appropriate entity in the organizational hierarchy, ensuring it is correctly linked as a downstream entity under the relevant legal entity, jurisdiction, or other defined structure. This guarantees that access restrictions are enforced accurately, as each record is tied to the correct part of the organization.
4. In the Entity Configuration module, do the following:
   - Provide access to teams and users based on your organizational structure. You can grant access to individual users, such as entity owners or privacy analysts, or to groups.
   - Specify whether access applies only to the selected entity or also to downstream entities. This step ensures that only the appropriate teams or users can access records for their part of the organization.

   For information, see Create an entity configurations.

5. Run a bulk access update to switch from role-based access to entity-based access for all applicable records. Bulk Access Update enforces entity-based access restrictions across relevant records in Privacy Management.

   When performing a bulk update:
   - Select the entity configuration and associated entities.
   - Choose the tables where restrictions apply (for example, Processing Activity or Privacy Assessment).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Preview the affected records to validate changes.
- Enable the update to apply restrictions.

The system queues a scheduled job that processes the update and applies the new access rules to all selected records.

For information on how to run batch updates, see Set access restrictions using an entity based record access update utility.

6. Use entity-based record access rules to enable continuous monitoring. These rules automatically apply restrictions to new or modified records, ensuring access settings stay enforced without manual updates. When the structure of the entities change, the system updates access controls automatically.

   For information on how to configure entity-based record access rules, see Set Entity based record access rules.

Configure Entity-based access

Configure entity-based access by installing the Entity-based Access Configurations plugin and enabling properties for record types.

Before you begin

Role required: sn_privacy.admin

Procedure

1. Navigate to **All** > **System definition** > **Plugins**.
2. Find the **Entity Based Access Configurations** plugin by using the filter criteria and search bar.
3. Select a version from the list and select **Install**.
   The plugin is installed in your instance.
4. Navigate to **All** > **Entity Based Access Configurations** > **Properties**.
5. Enable the **Entity-based access on record types related to entity** property.
6. Select **Save**.

   Based on your selected settings, the entity-based access properties are configured in your system.

Create an entity configurations

Create an organizational structure by configuring entity-based access for different levels such as headquarters, regional offices, and subsidiaries, and define access rules for users and groups.

Before you begin

Role required: sn_privacy.admin

Procedure

1. Navigate to **All** > **Entity Based Access Configurations** > **Entity Configurations**.
2. Select **New** to open the Entity Access Configuration form.
3. Create entities for each level of your organization, such as global headquarters, regional offices, and country subsidiaries.
   Fill in the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Configuration type	Type of entity access configuration, such as Entity.
Entity	Name of the entity for which entity-based access is being configured.
Applicability	Option to define whether access applies to the selected entity only, or to the selected entity and downstream entities. Available options are: ○ **Selected entity only** ○ **Selected entity and downstream entities**
Users	Users that the access is configured for.
User groups	User groups that the access is configured for.
Entity user fields	User fields on the Entity table that should be granted access.
Entity group fields	User group fields on the Entity table that the access should be granted to.
Description	Description of the entity configuration.
Active	Option to set the configuration to active to enforce the access rules.

4. Select **Submit**.

Add hierarchical relationships between entities

Define hierarchical relationships between entities (Global → Regional → Country-level) using Upstream and Downstream options. Adding an hierarchy creates a clear organizational structure.

Before you begin

Role required: sn_privacy.admin

Procedure

1. Navigate to **Workspaces** > **Privacy Workspace** > **List**.
2. Under Scoping, select **Entities**.
3. Select the entity you want to configure.
4. In the entity record, navigate to the **Hierarchy** tab.
5. To add a parent entity, select **Add** under Upstream entities.

   An upstream entity represents higher-level entity in the hierarchy. For example, for a Regional entity, the upstream entity is the Global entity.

6. To add a child entity, select **Add** under Downstream entities.

   A downstream entity represents a lower-level entity contained within the current entity.

7. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.

Set access restrictions using an entity based record access update utility

Set access restrictions for the existing records in bulk by using the Entity based record access update utility guided-experience. Use the workflow to enable or disable access to record types.

Before you begin

Role required: sn_privacy.admin

About this task

By configuring a bulk access update, you can apply the entity-based access restrictions to multiple records in bulk.

The system provides real-time status tracking of update operations, categorized as Completed, Failed, or Update queued. After each update, a comprehensive log is generated, detailing updated records, applied scopes, and execution outcomes.

Procedure

1. Navigate to **All** > **Entity Based Access Configurations** > **Entity based record access update utility**.
2. Select **New**.
3. In the **Scope entities** section, do the following:
   a. Select the entity scope from the **Make entity scope selection based on** drop-down list.
   b. Select the name of the entity (for which you have created the access configuration) in the Select entities option.
   c. Mark **Select downstream entities also** to include the downstream entities in scoping.

      Note:
      You can see this option only when you select one entity.

   d. Select **Mark as complete and proceed**.
4. In the **Scope related records** section, select the related records you want to set access to, and do the following:
   a. Select a record type from the **Add a record type** drop-down list (for example, Processing Activity or Privacy Assessment).
   b. **Optional:** Select another record type from the **Add another record type** drop-down list.
   c. **Optional:** Apply conditions on each record type.
   d. Select **Mark as complete and proceed**.
5. **Optional:** In the **Preview record counts** section, preview how many records for each record type are impacted based on the selected scope of entities and record types.
   a. Select **I want to preview** to preview record counts.
   b. Select **Back to scope related records** to navigate to the previous step where you can select the related records.
   c. From **Set Access**, either **Enable access restrictions** or **Disable access restrictions** for the scoped entities and record types.
   d. Confirm applying access restrictions to the selected records by selecting **Proceed**.
6. In the **View results** section, you can see the status of the update operation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also view log details for the configuration record, including the update status. The system supports three states: **Update queued**, indicating the update is actively being processed; **Completed**, meaning the update was successfully applied to all selected records; and **Failed**, which occurs when the update cannot be executed due to configuration issues or system errors. In the Failed state, a **Retry** button is available to trigger the update again.

Result

Entity-based restrictions are enabled at the record level for the scoped entity. The system creates a scheduled job that runs at intervals (default: 1 hour) to update records in batches for entity-based access restrictions.

Set Entity based record access rules

Use entity-based record access rules to secure records and enable continuous monitoring. These rules automatically apply restrictions to new or modified records, ensuring access settings stay enforced without manual updates. When entities or processing activities change, the system updates access controls automatically.

Before you begin

Role required: sn_privacy.admin

About this task

This task explains how to activate entity-based record access rules for continuous monitoring in ServiceNow. By enabling these rules for specific record types, you ensure that access restrictions are applied automatically to new or updated records, reducing manual intervention and maintaining compliance.

Procedure

1. Navigate to **All** > **Entity Based Access Configurations** > **Entity based record access rules**.
2. In the Entity based record access rules list, do the following:
   a. Check whether sn_privacy_privacy_task and sn_privacy_processing_activity are active.
   b. If they are not active, select the record type (sn_privacy_privacy_task and sn_privacy_processing_activity).
   c. In the configuration page, select **Apply entity based access restriction on new records** and then select **Update**.

   The sn_privacy_privacy_task and sn_privacy_processing_activity record types turn active.

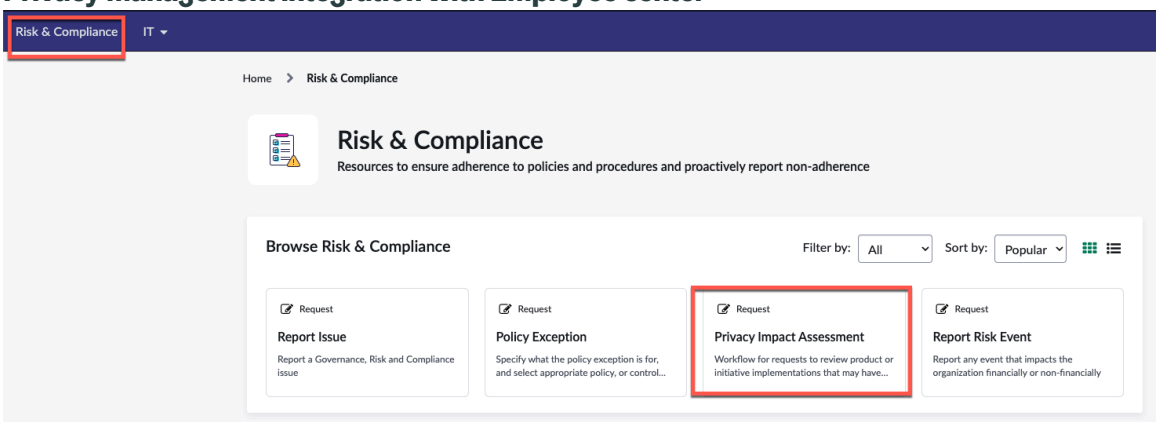
Result

EBA rules are automatically applied to records whenever changes occur in the entity structure.

Integrating Employee Center and Risk portal with Privacy Management

The integration of Employee Center with Privacy Management provides all employees and users a simplified user experience to perform tasks such as submitting a privacy impact assessment for a new implementation, responding to control attestations, and accessing processing activities and privacy impact assessments.

Employee Center

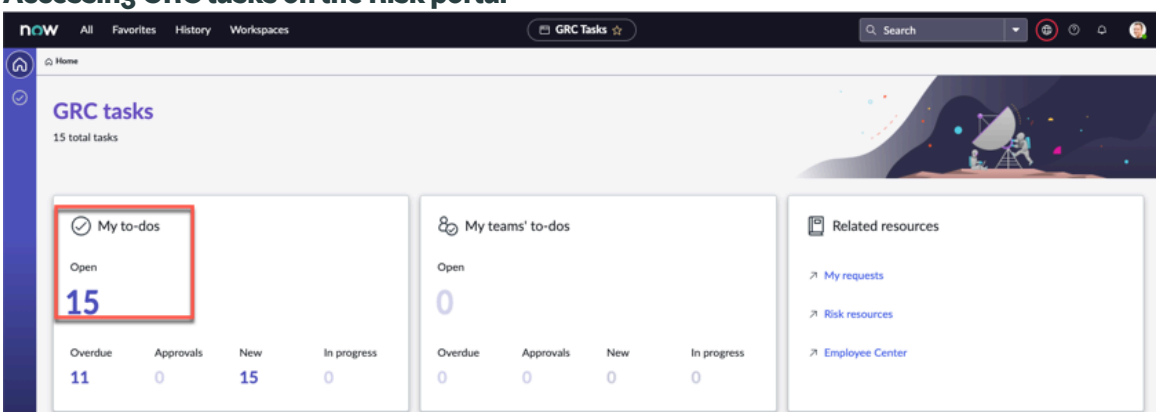


The Employee Center portal is a unified portal that helps connect systems across the enterprise to one destination site that provides a simple and centralized experience for employees with

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

easy to configure options. To learn more about the Employee Center, refer to Exploring Employee Center.

If you integrate Privacy Management with the Employee Center, you can provide all employees an interface to create a privacy impact assessment that would result in the creation of a processing activity. Only users with the roles sn_privacy.assessment_responder and sn_privacy.business_user can view the option to create a privacy impact assessment. The following image shows the page from where you can submit a new implementation request. For example, a team can use the Employee Center if a business plans a new implementation. Before creating a business application record, the team can contact the privacy team by responding to the Privacy Impact Assessment for the new implementation request. This helps to get the privacy team's guidance in the initial or inception phase of the new implementation.



Privacy management integration with Employee center

Risk portal

If a privacy analyst assigns a processing activity to a business user to get more details on the processing activity, the business users can access the assigned processing activity from the risk portal.

Accessing GRC tasks on the Risk portal

Privacy Case Management

The Governance, Risk, and Compliance: Privacy Case Management application enables you to report and manage privacy violations and complaints. The solution allows for the swift and efficient management of privacy breaches and complaints through collaboration with various teams which help in investigating the root cause and key details of the breach reported.

With the ability to integrate with other systems and record impacted areas, the application helps to identify key stakeholders and information objects associated with a case. This helps privacy

teams to take appropriate preventive measures and remediation steps to manage the breach and its impact.

Explore  Learn about how privacy managers, privacy users, and privacy administrators use the Privacy Case Management application.	Configure  Configure your Privacy Case Management application.	Use  Work on creating privacy assessments, processing activities and so on.
Reference  Learn about the tables and roles that are installed with the Privacy Case Management application.		

Exploring Privacy Case Management

The Governance, Risk, and Compliance: Privacy Case Management application enables users to report any privacy breaches or complaints, collaborate with key stakeholders, perform breach investigations, and analyse the causes and consequences of breaches.

Some examples of when privacy cases arise are as follows:

- Lost IT assets
- Exposed customer data
- An email delivered to a group of wrong recipients
- Loss of paperwork and documentation

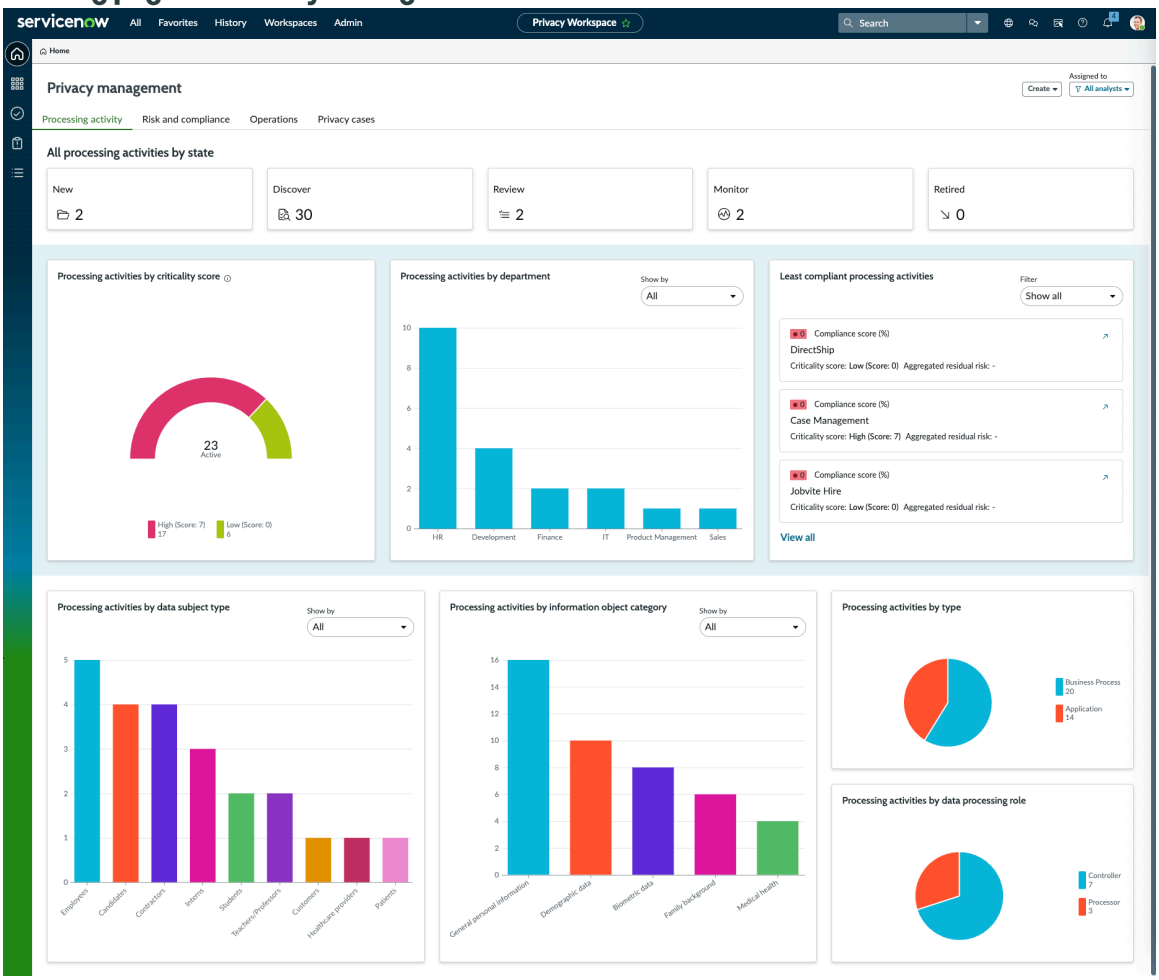
The Privacy Case Management application helps the privacy teams to manage any case that involves a privacy violation or a breach. The privacy cases can be reported by any user using the Employee Center or can also be created by the privacy teams using the Privacy Workspace. The application facilitates APIs to create privacy cases from various sources such as other ServiceNow solutions, for example, Security Incident Response, IT Incidents, HR Cases, and third party integrations.

The Privacy Case Management application offers the following benefits for your organization:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Helps business users to report any privacy breaches or complaints that require the attention of the privacy teams.
- Ensures collaboration with multiple teams to investigate, assess, gather evidence, capture observations, and responses for further review.
- Records the impacted areas and related areas that must be addressed such as policies and regulations, IT assets, impacted business units, and so on.
- Helps to identify key stakeholders and information objects associated with the case.
- Provides the ability to initiate remediation, preventive measures, and conduct root cause analysis to eradicate the cause of the case.
- Helps to identify and manage issues that arise from the privacy cases.

Privacy Case Management home page



The Privacy Case Management application home page offers the privacy case manager an overview of processing activities, risk and compliance information, operations details, and all your privacy case-related information.

The home page contains the following tabs:

- Processing activity dashboard
- Risk and compliance dashboard
- Operations dashboard
- Privacy cases dashboard

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Landing page for Privacy management

Privacy Case overview page

The Privacy case overview page shows details, such as description, state, schedule and milestones, case tasks, and issues related to the case in the Privacy Case Management application.

The Privacy Case Management overview related list includes the following sections:

- Description
- State
- Case schedules and milestones
- Case tasks overview
- Tracking
- Attachments

Description section

The Description section includes the detailed information that you can fill in when you're creating a privacy case. For example, you can add the purpose, action being taken, time line, applicable rules and regulations, and any relevant evidence or documents. By using this section, you can understand the context of the case and take the necessary steps to resolve it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State section

The State section includes the workflow states of a privacy case. For example in this section, you see various stages of the privacy case, such as New, Triage, Investigate, Resolve, Post case review, and Close. These states determine the status of the case. A privacy case administrator can configure these states in the Privacy Case Management application. For more information, see Define the workflow states for a privacy case.

Case schedules and milestones section

The Case schedules and milestones section includes the details on all the milestones or events during the case life cycle in a time-line range. In this section, you can see an outline of the key events, such as the date when the case was reported, occurred, discovered, or closed. You can also filter the events to view the following options on the time-line range after you select the **Show events** option:

Case creation date

Date when the case was created.

Date of discovery

Date when the case was discovered.

Date of occurrence

Date when the case occurred.

Milestone

Dates related to the investigation remediation milestones.

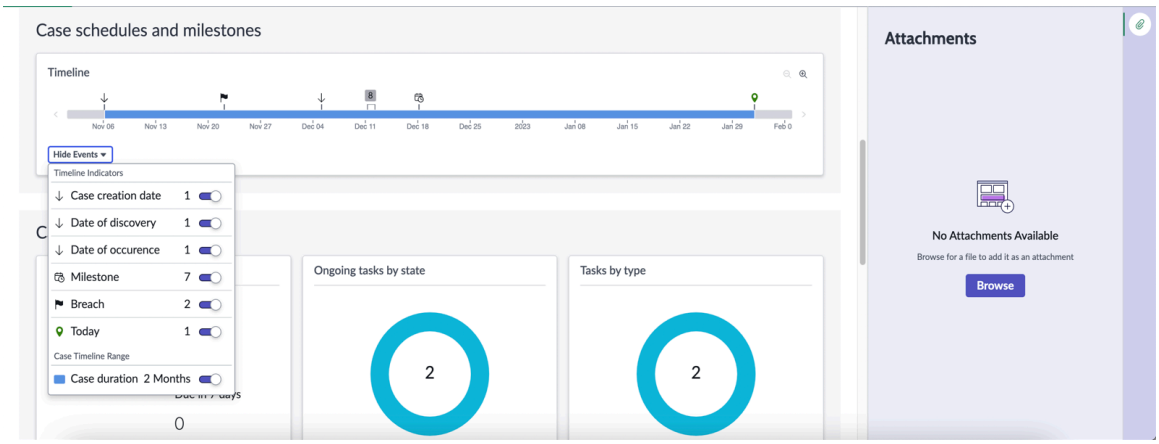
Breach

Dates related to the breach analysis.

Today

Current date on the time line.

Case closure



Date when the case was closed or met the case closure service level agreement (SLA).

Case duration

Date when the case was created to the last milestone date.

The following example shows the options available after you select the **Show events** option.

Case schedules milestones

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The options that are displayed after you select the **Show events** option are limited to the events and milestones that are available for the case.

Case tasks overview section

The case task overview section includes the following subsections:

Tasks

Total number of case tasks, any overdue case tasks, and case tasks that are due in seven days.

Ongoing tasks by state

Number of active case tasks by the states.

Tasks by type

Number of active case tasks by the case type.

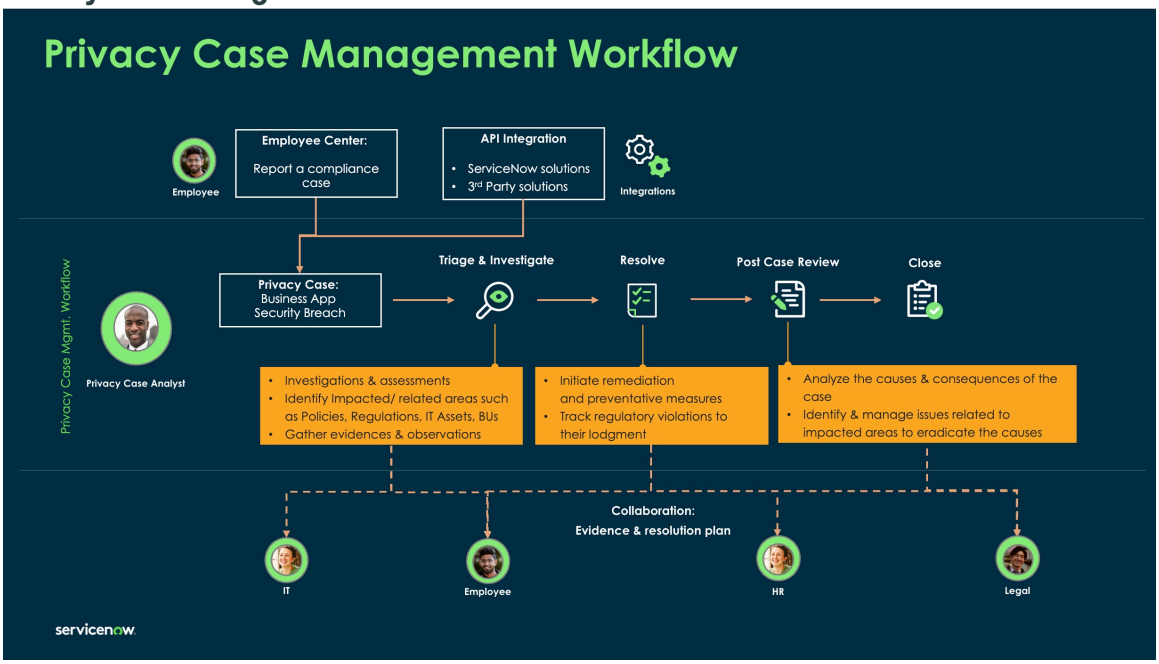
Tracking section

The Tracking section displays the following information:

- Number of open issues for a privacy case
- Number of overdue issues
- Number of issues due in the next seven days

Attachments section

The Attachment section enables you to upload a file as an attachment to a case. In this section you can find all the attachments that have been added.



Privacy Case Management workflow

The Privacy Case Management solution provides you a framework to manage any privacy breaches reported by the users. The solution provides an end-to-end workflow for the privacy team to triage the reported breach and perform the required investigation and analysis, gather evidence, record the key stakeholders, impacted areas, and regulatory violations, if any.

The following image shows the workflow of the Privacy Case Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Privacy Case Management workflow

The life cycle of a privacy case is explained as follows:

1. A case can be reported by the business users from the Employee Center or users can also reach out to the privacy teams using other modes such as phone call or email, after which the privacy team can create the case on behalf of the user from the Privacy Workspace and attach the related details.
2. The privacy case team assigns a case analyst to the case.
3. The case analyst triages and investigates the case and creates Case task workflow tasks. Each task is assigned to a case task owner.
4. The case task owners add the relevant details to the tasks and submit them for the case analyst to review.
5. The case analyst then does the following tasks:
   a. Reviews the responses submitted by the task owners.
   b. Records [PI] information objects, key stakeholders, impacted areas, and related areas.
   c. Tracks regulatory breaches and their appropriate lodgement.
   d. Initiates preventive measures and tracks the causes and their consequences.
   e. Manages the issues that arise out of the impacted areas.
6. The case analyst reviews all the details and closes the case.

Smart assessments in Privacy Case Management

Utilize the Smart Assessment Engine to perform smart assessments on privacy case action tasks.

Using the abilities of the Smart Assessment Engine, you can empower the privacy teams to initiate privacy case assessments. These assessments assist privacy case analysts in identifying impacted and related areas during a privacy case investigation. They also help determine whether employees in your organization adhere to the required regulations. The analyst can then collect observations and evidence from the stakeholders and arrive at a resolution. The Smart Assessment Engine provides numerous benefits some of which are listed as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configuring the assessment templates
- Identifying the assessment responders
- Defining the due date for responding to the assessment

In the Assessment Workspace, you can view the templates available for Privacy Case Management. You must ensure that the assessment template category is set to **Privacy Case Assessment** and the assessment targets are set to **Action task** and **Privacy case**. Only the assessment templates that are published are available for performing the assessments.

For more information about Smart Assessment Engine, refer to Exploring Smart Assessment Engine

Pre-requisites to enable smart assessment in Privacy Case Management

Smart assessment scoped applications

The base system ships the GRC smart assessment template to the users when the Privacy Case Management plugin is installed. However, the following scoped applications are required:

1. Smart Assessment core (sn_smart_asmt)
2. Smart assessment Migration tools (sn_smart_asmt_mig). For more information, see Migrate a legacy metric type to an assessment template
3. Smart Assessment Connected (sn_smart_asmt_conn)
4. Smart Assessment Designer (sn_smart_asmt_desg). For more information, see Using the template designer

Enable smart assessments system property

The administrator sets the *sn_grc_case_mgmt.enable_smart_assessments* system property to **true** for the privacy case manager to assess the action tasks using the smart assessment method.

Migrate the template

Create a new template in Smart Assessment Engine. For more information, see Creating an assessment template from legacy assessment metric types.

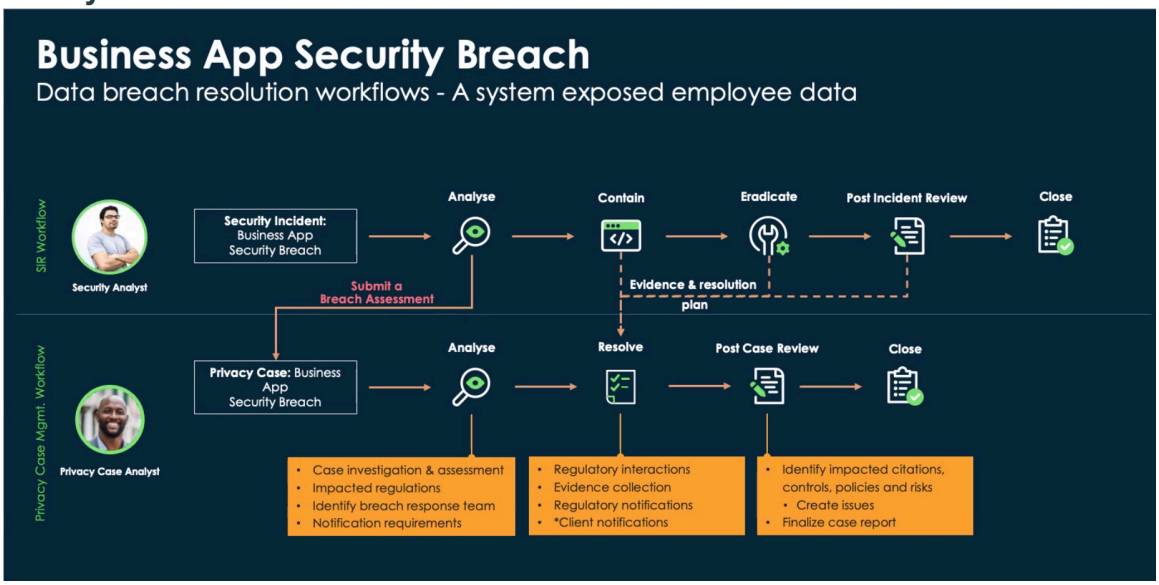
To get started with smart assessments, the privacy case administrator (sn_comp_case.compliance_case_admin), configures the assessment questionnaire. When an action task moves from the **Draft** state to the **Assigned** state, the assessment is sent. Based on the assessment results, appropriate remediation measures are identified and implemented. To learn more about how to configure a questionnaire in the Exploring Smart Assessment Engine, refer to Configuring Smart Assessment Engine. To learn how to perform smart assessment on action tasks, refer to Perform smart assessment on action tasks.

Privacy breach assessments

Privacy breach assessments play an important role whenever there is an incident that threatens the privacy of individuals. These assessments help to determine if there is a breach and then serve as a measure to gauge the extent and impact of a breach.

There are two pathways to trigger a breach assessment: it can be initiated directly from a privacy case or you can initiate the breach assessment as a standalone assessment. When an assessment is initiated as a standalone assessment, the results are analysed and a privacy case may be created if required. This flexibility ensures that organizations can promptly respond to potential breaches. You can perform only one breach assessment for each privacy case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



In the event of a breach, any specific criteria, for example, a server being compromised with personal data, may prompt the initiation of a breach assessment before creating a privacy case. The primary objective of this assessment is to quickly determine the nature of the compromised data. For example, if the incident is related to security incident, the security analysts are tasked with filling out the breach assessment, providing details on the incident type, impacted locations, and any existing mitigation measures like encryption. Subsequently, privacy analysts review the assessment, delving into the specifics of the incident. Based on this analysis, a privacy case may be created to prevent future occurrences and manage legal obligations linked to the breach.

Workflow of a privacy breach assessment

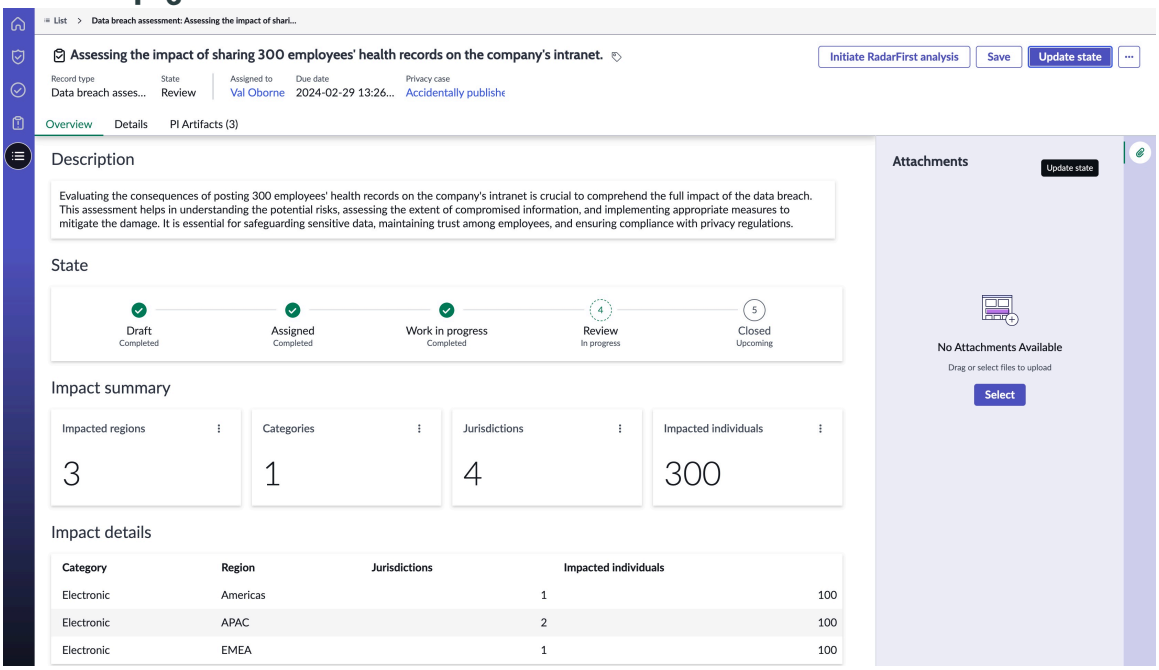
While a breach assessment can be initiated from the Employee Center, it can also be initiated from an application. The following image illustrates the breach assessment workflow using the example of a security incident.

Note:
This image uses security incident purely as an example for a better understanding of the workflow.

Privacy breach assessment workflow

Overview page of a breach assessment

After a breach assessment is completed, the overview page of the assessment displays the summary of the relevant and critical information for the privacy analyst to review.



The following sections are displayed in the overview page of a breach assessment.

- Description: Displays a brief description or summary of the breach.
- State: Displays the **Review** state the of the assessment when the privacy analyst must review the assessment.
- Impact summary: Displays key information such as the number of individuals impacted by the breach, the categories of the breach such as visual, verbal, electronic, or paper, and the impacted jurisdictions and regions.
- Impact details: Displays in detail the items captured in the Impact summary widget.

An image of the overview page is displayed as follows.

Overview page of a breach assessment

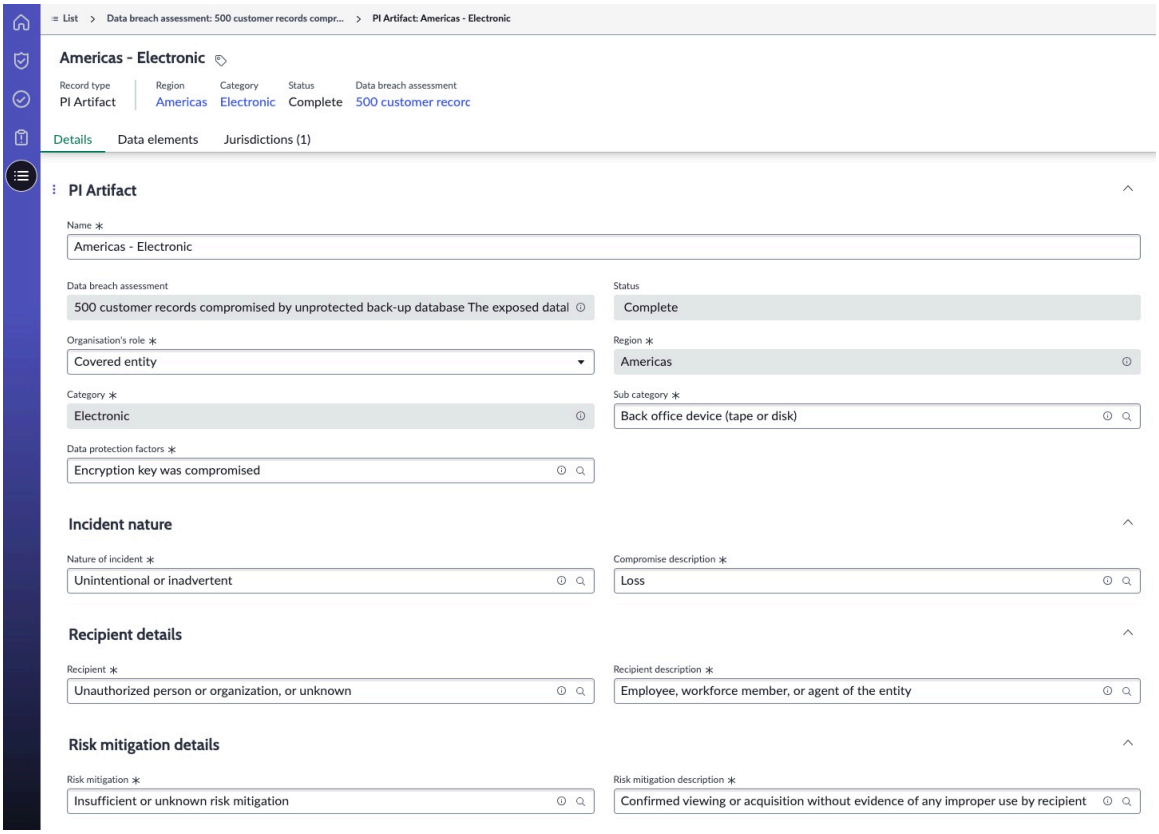
States of a privacy breach assessment

After a privacy analyst initiates a privacy breach assessment, the assigned reviewer contributes their insights and includes the personally identifiable information (PI) artifacts and relevant jurisdictions before it is completed and closed.

The states of a breach assessment are listed as follows:

1. **Draft**: This is the default state when a breach assessment is initiated.
2. **Assigned**: This is the state when the privacy analyst assigns the assessment to a user.
3. **Work in progress**: This is the state when the reviewer accepts the assignment and adds PI artifacts and jurisdictions to the breach. The reviewer then sends the assessment for a review to the privacy analyst.
4. **Review**: In this state, the privacy analyst reviews the assessment.
5. **Closed**: After the reviewer completes the review, the reviewer completes and closes the assessment.

Elements of a privacy breach assessment



A privacy breach assessment must clearly indicate the jurisdiction in which the breach occurred. This is crucial because each jurisdiction operates under distinct laws and regulations pertaining to privacy and data protection. It must also specify the personally identifiable information (PI) artifacts.

PI Artifact

PI artifacts typically refer to the physical or digital forms of personally identifiable information that may be lost or stolen. These artifacts can include verbal (spoken or recorded), visual (printed or displayed), electronic (stored on devices or systems), or paper-based (documents or records) forms of data that contain personal information. A PI artifact contains details such as the nature of the incident, the description of the compromise, the recipient's details, the risk mitigation plan, and so on. Each PI artifact collects data for a particular region and category. The following image shows the information that is collected using the PI artifact form.

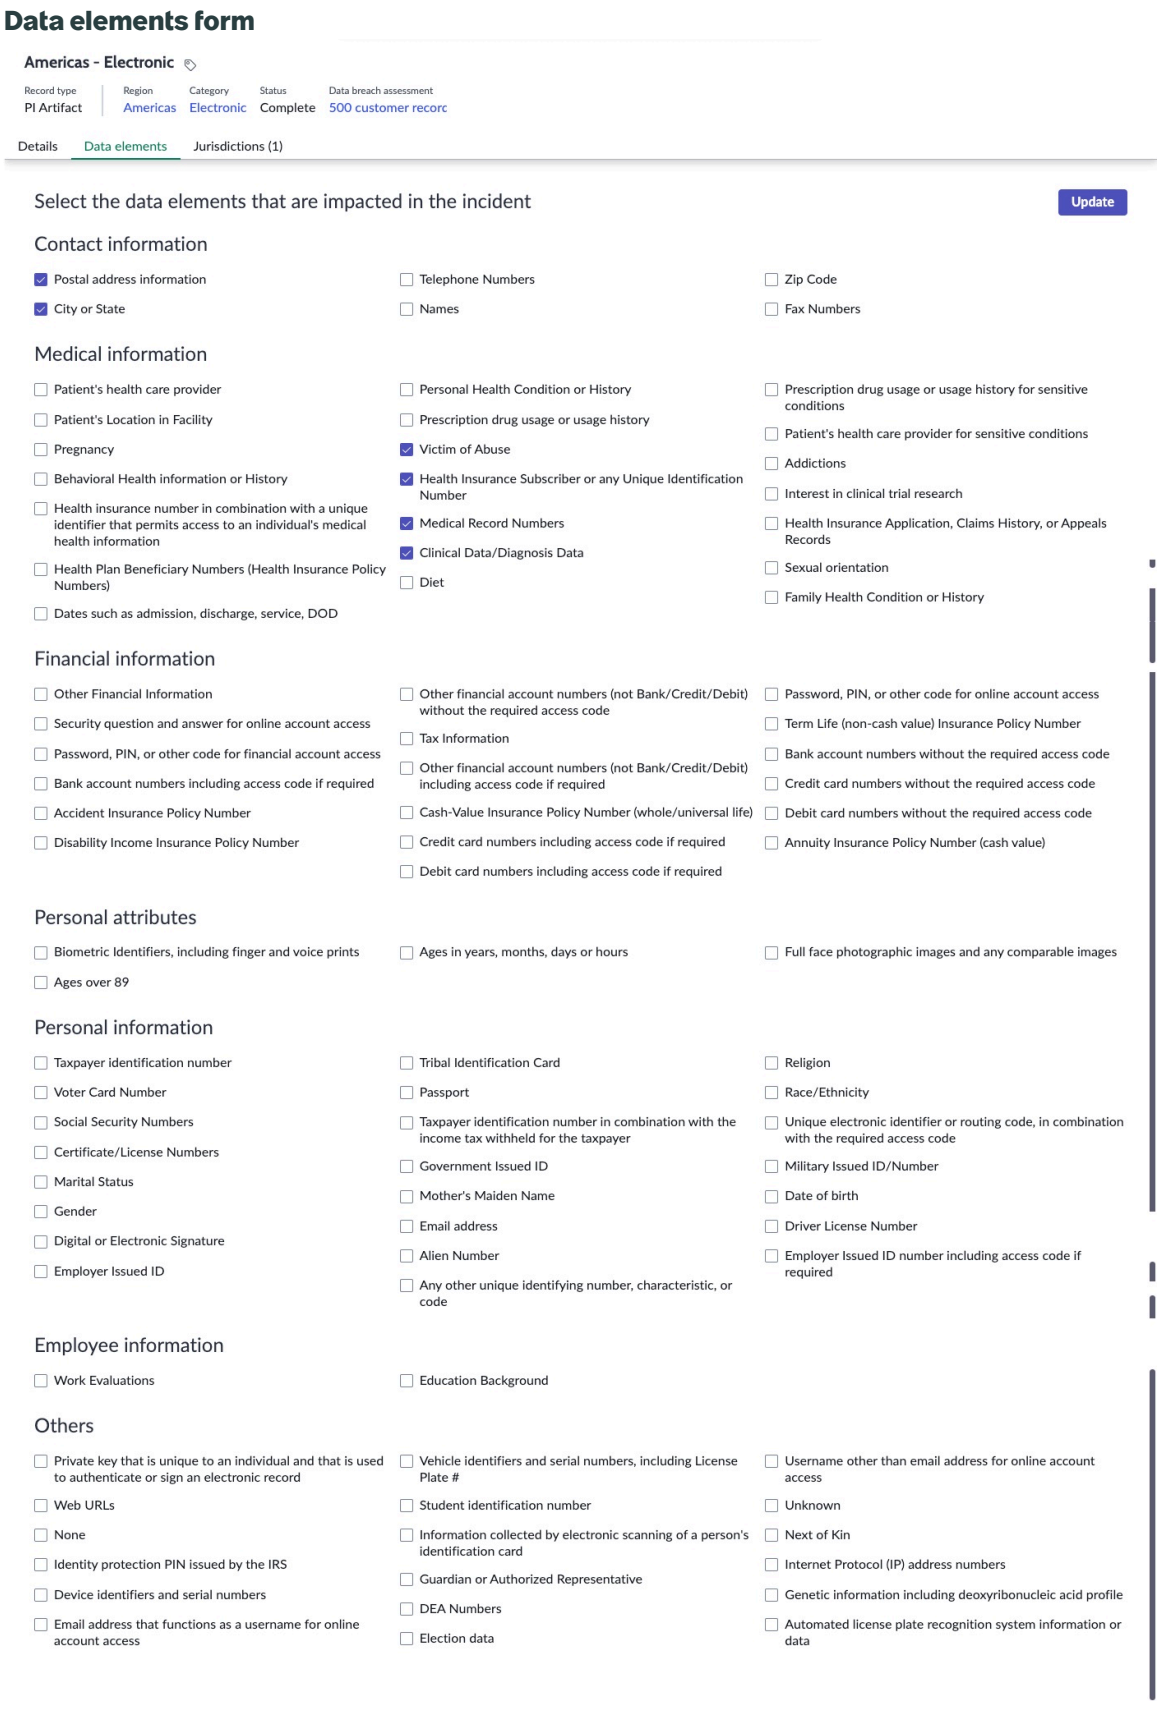
PI artifact form



A PI artifact consists of the following.

- **Data elements**: Data elements are specific pieces of information that are part of a larger dataset. In the context of a breach incident, data elements refer to the specific types or categories of data that are impacted or compromised. Examples of data elements can include contact information (such as names, addresses, phone numbers, or email addresses), medical information (such as medical history, diagnoses, or treatment records), financial information (such as credit card numbers, bank account details, or transaction records), and so on.

  When a breach incident occurs, it is important to identify and assess which data elements have been affected or exposed. This helps in understanding the potential risks and impacts of the breach, as well as determining the appropriate response and mitigation measures to protect the affected individuals and their data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

United States of America, California is considered a jurisdiction with its own governing laws. Therefore, when a breach occurs in California, the applicable laws and regulations specific to California are applied. Jurisdictions also provide important details, such as the number of individuals impacted within that specific region.

Configuring Privacy Case Management

Follow the order of the tasks given here to configure Privacy Case Management application. These tasks help you to manage the compliance cases effectively.

Install Privacy Case Management

You can install the Privacy Case Management application (sn_privacy_case) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application .

Role required: admin

About this task

The following items are installed with Privacy Case Management:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Privacy Case Management application (sn_privacy_case) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Create a view rule

Create view rules to define the form view of the privacy cases in the Privacy Workspace. Specifying the rules helps you to control how the privacy case form appears.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Case type**.
2. Select the **View Rules** related list on the case type form.
3. Select **New**.
4. On the View Rule form, fill in the fields.
   For a description of the fields on the View Rule form, see View rule form.
5. Select **Submit**.

View rule form

Learn about the fields on the view rule form. Use this form to define workspace and default view rules in the Privacy Case Management application.

On the view rule form, fill in the fields.

View rule form

Field	Description
Name	Unique name to identify the rule.
Table	Table this view rule applies to. This field is automatically set to **Privacy case [sn_privacy_case_privacy_case]**.
View	View for which you're creating the rule. The choices are as follows: • **Default view**: Select this option to define the form view on the Core UI. • **Workspace**: Select this option to define the form view on the Privacy Workspace.
Experience Restricted	Option to decide if the rule must be restricted to one workspace or to multiple workspaces.
Application	Name of the application this view rule applies to. This field is automatically set to **GRC: Advanced Risk**.
Execution Order	Order in which this view rule executes if there are multiple rules.
Active	Option to activate the view rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an assignment rule

Specify the conditions for assigning a privacy case to a particular user or group by creating assignment rules.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

About this task

To determine the appropriate person or group to handle a privacy case, establish assignment rules that outline the necessary criteria. For instance, if the case pertains to data protection and information security, it should be assigned to the appropriate individual or team.

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Case type**.
2. Select the **Assignment Rules** related list on the Assignment Rule form.
3. Select **New**.
4. On the Assignment Rule form, fill in the fields.
   For a description of the field values on the Assignment Rule form, see Assignment rule form.
5. Select **Submit**.

Assignment rule form

Learn about the fields on the assignment rule form. Use this form to define case assignment rules in the Privacy Case Management application.

Assignment rule form

For a description of the field values, see the following table:

Assignment rule form

Field	Description
Name	Name of the assignment rule.
Application	Name of the application this assignment rule applies to. This field is automatically set to **GRC: Privacy Case Management**.
Active	Option to enable the assignment rule.
Applies To	
Table	Table this assignment rule applies to. This field is automatically set to **Privacy case [sn_privacy_case_privacy_case]**.
Conditions	Conditions to be defined for the case type's assignment rule.
Assign to	
User	User the case is assigned to.
Group	Group the case is assigned to.
Script	
Script	Script to define advanced assignment rule.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create state model transition

Create state models to control the workflow of a privacy case by defining the states and transition conditions.

Before you begin

Ensure that you are in the GRC: Privacy Case Management application.

Role required: sn_privacy_case.privacy_case_admin

Procedure

1. Navigate to **All** > **Privacy Case Management** > **State Models**.
2. Select **New**.
3. On the form, fill in the fields.

State model form

Field	Description
Name	Name of the state model. For example, `Breach case`.
Application	Scope of the application. This field is automatically set to **GRC: Privacy Case Management**.
Active	Option to indicate that the state model is active or inactive.
Table name	Table this state model applies to.
State model field	Fields that contain the state model value in the table that this state model applies to.
State field	Fields that contain the state value in the table that this state model applies to. This field is automatically set to **State [state]**.

4. Select **Submit**.

Define the workflow states for a privacy case

Define the workflow states for a privacy case that govern the lifecycle of the case.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

About this task

A privacy case typically goes through the following workflow states that can be configured in the Privacy Case Management application:

- New: The case has been opened and is in the initial stage of review.
- Triage: The case is being evaluated to determine the appropriate course of action.
- Investigate: The case is being actively investigated to gather information and evidence.
- Resolve: The case is being worked on to find a resolution.
- Post case review: A review of the case is being done after it is resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Close: The case is closed and is no longer active.
- Cancel:The case is cancelled and it is no longer being pursued.

These states can vary depending on the organization's privacy case management process.

Procedure

1. Navigate to **All** > **Privacy Case Management** > **State Models**.
2. Open the state model that you created and want to add the workflow for.
3. On the GRC workflow states context menu, select **New**.
4. On the form, fill in the fields.

Workflow state form

Field	Description
State	Name of the workflow state. Choices are the following: ○ **New** ○ **Triage** ○ **Investigate** ○ **Resolve** ○ **Post case review** ○ **Close** ○ **Canceled**
Model	State model that uses this workflow state. This field is automatically set to the state model name.
Application	Name of the application this state model applies to. This field is automatically set to **GRC: Privacy Case Management**.
Display type	Display type of the workflow state. Choices are the following: ○ **As node**: Display as a parent state. ○ **As sub-level**: Display as a sub-state of the parent state.
Stepper label	Label to be displayed on the stepper component for the state.
Parent model state	Parent state for the sub-level state. This field appears only when **As sub-level** is selected from **Display type**.
Is optional	Option to select the state as optional. This field appears only when **As node** is selected from the **Display type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Create the other states similarly.
6. Select **Submit**.

Define the model state transitions for a privacy case

Define the transition conditions to control how a compliance case traverses through the different workflow states by using the Privacy Case Management application.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

About this task

The state transitions are a list of conditions for entering or exiting each state that is defined for a table. In the State Transitions table, use the condition builder to build a list of required conditions for entering or exiting each state.

Procedure

1. Navigate to **All** > **Privacy Case Management** > **State Models**.
2. Open the state model that you want to define the model state transition for.
3. To define the model state transition, select the required workflow state.
4. On the Model State Transitions context menu, select **New**.
5. Select the state that you want to move to from the selected state.
6. **Optional:** To enable the automatic transition of the workflow state, select the **Automatic transition** option.
7. Open the form context menu and select **Save**.
   The GRC model state transition conditions related list appears.
8. On the GRC model state transition conditions context menu, select **New**.
9. On the form, fill in the fields.

   For a description of the field values on the GRC model state transition form, see GRC model state transition condition form.
10. Select **Submit**.

GRC model state transition condition form

Use the GRC Model State Transition Condition form to define the transition conditions to control how a compliance case traverses through the different workflow states by using the Privacy Case Management application.

See the following table for a description of the field values.

GRC Model State Transition Condition

Field	Description
Name	Name of the condition.
State transition	Transition of states. This field is automatically set to the model state transition value.
Active	Option to enable the model state transition condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Model State Transition Condition (continued)

Field	Description
Description	Description of this state transition. For example, in the **Description** field for the New state, you could enter `New state can move only to Analyze state`.
Error message	Error message to be displayed when the conditions aren't met.
Requires	Transition conditions: • **Task has been through Approval**: Condition passes if the related task has an approval that is either accepted or rejected. • **Task is Approved**: Condition passes when the task is approved. • **Task is Rejected**: Condition passes when the task is rejected. • **Transition Condition**: Conditions for this state transition. • **Transition Script**: Advanced conditions for this state transition.
Condition	Conditions to be defined for this state transition. This field appears only when **Transition Condition** is selected from **Requires**.
Script	Script to be defined for this state transition. This field appears only when **Transition Script** is selected from **Requires**.

Create a privacy case assessment template

Create an assessment and send those assessments to the privacy case task owners to collect their responses. The responses help the privacy case analysts to determine the breaches that have occurred due to the privacy case.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

About this task

Instead of using the default template, you can create a questionnaire template for assessing privacy cases. After you set up the assessment template, it's available in the case task section for the **Assessment** case type.

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Assessment Templates**.
2. Select **New**.
3. On the Assessment Metric Type form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values on the Assessment Metric Type form, see Assessment metric type form.

4. Select **Submit**.

Assessment metric type form

Use the Assessment Metric Type form to create an assessment questionnaire template instead of using the default template.

Assessment metric type form

For a description of the fields, see the following table:

Assessment metric type form

Field	Description
Name	Name of the assessment template.
Assessment duration	Length of time allowed for completing the assessment from the time the assessment is generated.
Table	Table this assessment template applies to.
State	Status of the assessment. This field is automatically set to **Draft**.
Roles	Roles that have read access to the template.
Description	Purpose of the assessment template and the reason for its creation.
Introduction	Guidance text for business users who respond to the assessment.

Configure inbound email to enable privacy case creation

This configuration allows administrators to set up a designated email address that employees can use to report privacy cases through email.

Before you begin

Role required: Privacy admin

Procedure

1. Configure inbound email configuration:
   a. Navigate to **All** > **System Properties** > **Email Properties**.
   b. In Inbound Email Configuration section, do the following:
   - Set **Email receiving enabled** to **Yes**.

     This enables the instance to process incoming emails.
   - Set **Automatically create users for incoming emails** from trusted domains to **Yes**.

     This enables the application to create user records for senders from trusted domains.
2. Add the group email address for privacy case creation:
   a. Navigate to **All** > **Privacy Case Management** > **Case Configuration** > **Case Type**.
   b. Select the Inbound Email Configuration tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Add the group email address (for example, create-<case/inquiry>@emaildomain.com). This email address is used by requesters to send privacy requests that automatically generate as cases.

Configure Record Type Area

The Record Type Area Configuration feature allows privacy case managers or analysts to add additional relevant business area types in impacted and related areas.

Before you begin

Role required: Privacy admin

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Case Configuration** > **Case Type**.
2. Select Record Type Area Configuration tab and click **New**.
3. Select the Area Type, such as Impacted Area or Related Area.
4. Select the appropriate area type from the configuration options.
5. Select the Active box to make the area available for use.
6. Set the Order to define the sequence in which this area appears.
7. Select **Submit** to save the configuration.

Result

The configured options are available for the user to add during case creation, ensuring that each case accurately reflects its business context.

Configuring privacy breach assessment

Follow the order of the steps such as creating breach factor types, breach factors, PI data element types, and PI data elements to configure privacy breach assessment.

Create a breach factor type

Create categories to help responders to identify breach factors within specific categories. For example, incident nature is a breach factor type which has factors under it as Intentional and Malicious, or Intentional and not malicious, and Unintentional or inadvertent.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Breach Assessment Configuration** > **Breach Factor Types**.
2. Select **New**.
3. On the form, fill in the fields.

Breach factor type form

Field	Description
Label	Category to which the factor type belongs. For example, Incident nature, Recipient and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Element of the breach factor.
Active	Option to activate the factor.
Application	Name of the application this factor applies to. This field is automatically set to **GRC: Privacy Case Management**.
Description	Brief description of the breach factor type.

4. Select **Submit**.

Create breach factors

Create breach factors to help privacy teams understand the characteristics of a breach and evaluate the related risks. Exercise your flexibility to either use the default breach factors or generate new ones. Additionally, link breach factors to specific regions or implement them universally across multiple regions or selected ones.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Breach Assessment Configuration** > **Breach factor**.
2. On the form, fill in the fields.

Breach factor form

Field	Description
Label	Category to which the factor belongs. For example, Electronic, Paper, and so on.
Name	Unique name to identify the factor.
Type	Type of preconfigured breach factors with which the factor must be associated.
Application	Name of the application this factor applies to. This field is automatically set to **GRC: Privacy Case Management**.
Active	Option to activate the factor.
Applied to	Location of where the factor is applicable. The options are as follows: ○ **All regions** ○ **Specific to a region**
Description	Brief description of the factor.

3. Select **Submit**.

Create a PI data element type

Create categories to help responders to identify personal data elements within specific categories. For example, for a PI data element type such as Personal information, the PI data elements can be Name, Age, Employer ID, Marital Status, Email, and so on.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Breach Assessment Configuration** > **PI Data Element Types**.
2. Select **New**.
3. On the form, fill in the fields.

PI data elements type form

Field	Description
Label	Category to which the PI data element type belongs. For example, for type `Financial Information`, the data elements can be bank account numbers, credit card numbers, and so on.
Name	Name of the PI data element type. This name is usually the same as the label.
Order	Order of the element type as it should appear on the assessment form.
Application	Name of the application this element type applies to. This field is automatically set to **GRC: Privacy Case Management**.
Active	Option to activate the data element type.
Description	Brief description of the PI data element type.

4. Select **Submit**.

Create PI data elements

Create PI data elements based on residents' personal information collected during the business process, such as phone numbers and email IDs. Use pre-configured elements or create new ones. Customize for data elements for specific regions or map a single PI data element to multiple regions.

Before you begin

Role required: sn_privacy_case.privacy_case_admin

Procedure

1. Navigate to **All** > **Privacy Case Management** > **Breach Assessment Configuration** > **PI Data Elements**.
2. On the form, fill in the fields.

PI data element form

Field	Description
Label	Category to which the data element belongs. For example, phone number, email address, and so on.
Name	Unique name to identify the data element.
Type	Type of preconfigured PI data element type with which the data element must be associated.
Application	Name of the application this data element applies to. This field is automatically set to **GRC: Privacy Case Management**.
Active	Option to activate the PI data element.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applied to	Location of where the data element is applicable. The options are as follows: ○ **All regions** ○ **Specific to a region**
Description	Brief description of the data element.

3. Select **Submit**.

Create a region

Create geographic regions based on the data of the residents that is collected as a part of your business operations. Examples of regions are America, Europe, Asia Pacific, and so on.

Before you begin
Role required: sn_privacy_case.privacy_case_admin. This role must contain the user_admin role.

About this task
When you create a region, it is necessary to set the **Parent** field as empty.

Procedure
1. Navigate to **All** > **Privacy Case Management** > **Breach Assessment Configuration** > **Regions**.
2. Select **New**.
3. On the form, fill in the fields.
4. Select **Submit**.

Create a jurisdiction for a region

Create jurisdictions for regions for data breach notification obligations as each obligation is broken down by jurisdiction. Jurisdiction can be created two levels below a region.

Before you begin
Role required: sn_privacy_case.privacy_case_admin. This role must contain the user_admin role.

Procedure
1. Navigate to **All** > **Privacy Case Management** > **Breach Assessment Configuration** > **Regions**.
2. Open the region for which you want to add jurisdictions.
3. Select the Locations related list.
4. Select **New**.
5. On the form, fill in the fields.
6. Select **Submit**.

Using Privacy Case Management

You can use the Privacy Case Management application to report privacy cases and manage the lifecycle of a privacy case.

Reporting a privacy case

Any user can report a privacy case or an event that needs the attention of the privacy team.

As a business user, you can report a case using one the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Employee Center
- Privacy Workspace

Report a privacy case from the Employee Center

Use the Employee Center to report any privacy breaches and complaints directly to the privacy teams. Reporting these cases helps to reduce and avert losses.

Before you begin

Role required: sn_privacy.business_user

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Select the **Risk & Compliance** tab.
3. Select **Report a privacy case**.
4. On the form, fill in the fields.
   See the Employee Center privacy case creation form for an explanation of each field.
5. To provide supporting material or evidence, select **Add attachments**.
6. Select **Submit**.

Employee Center privacy case creation form

On the new privacy case form in the Employee Center, fill in the fields as appropriate.

Report a privacy case form

Field	Description
Title	Name of the case. For example, `Customer records compromised by unprotected back-up database`.
Description	Brief description of the case.
Case type	Nature or type of the case. This field is automatically set to **Privacy case**.
Case subtype	Subtype of the case. For example, **Documentation Loss**.
Date of occurrence	Date the case occurred. For example, the case may have occurred on 18-02-2022.
Date of discovery	Date the case was discovered by you. For example, the case may have occurred on 18-02-2022, but was discovered only on 12-03-2022.
Personal information	
Categories of data subjects/individuals impacted	People impacted by the case. The choices are: • **Customers** • **Employees**
Number of impacted individuals	Number of people impacted by the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report a privacy case form (continued)

Field	Description
Select the personal information attributes involved	Attributes of personal information that have been compromised in the case.
Provide additional personal information	Details of other personal information that is impacted by the breach.
Select the key stakeholders who own this application	Key stakeholders of the application.
Case origin	
Impacted business unit	Business unit that is impacted by the breach.
Impacted department	Department impacted by the breach.
Where the case occurred (location)?	Location of the case occurrence. For example, the location is **Japan**.
Where the case occurred (Sub-location)?	Sub location of the case occurrence. For example, the sub location is **Tokyo**.

Create a privacy case in the Privacy Workspace

Report any privacy breaches and complaints to help reduce and avert losses.

Before you begin

Role required: sn_privacy.analyst

About this task

At times, users can also report a case to the privacy teams using offline modes such as phone calls or emails. The privacy teams then create these cases in the Privacy Workspace and then attach the relevant details to the case.

Procedure

1. Navigate to **All** > **Privacy Workspace**.
2. Select the Privacy Case Management icon ( ).
3. Select **Create**.
4. Select **Case**.
5. On the form, fill in the fields.
   See the privacy new case form for an explanation of each field.
6. Select **Save**.

Privacy new case form

On the new privacy case form, fill in the fields.

New Privacy case form

Field	Description
Number	Number of the case. This field is automatically set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New Privacy case form (continued)

Field	Description
Title	Name of the case. For example, `Customer records compromised by unprotected back-up database`.
Type	Nature or type of case. This field is automatically set to **Privacy case**.
State	Workflow state of the case. This field is automatically set to **New**.
Requester	Person who reported the case.
Primary entity	Entity impacted by the case. Only the entities identified in the impacted areas are available for selection as the primary entity.
Sub-type	Sub type of case. For example, **Documentation Loss**.
Priority	Priority of the case. The choices are as follows: • **1 - Critical** • **2- High** • **3 - Moderate** • **4 - Low** • **5 - Planning** **Note:** The default value in this field is set to **Planning**.
Requested on behalf of	Name of the person on whose behalf you've created the case.
Entity owner	User who is the owner of the entity. This field is automatically set based on the entity selected in the Impacted areas related list.
Description	Brief description of the case.
Personal information	
Contains personal information	Field to decide if the breach contains personal information. The choices are as follows: • **To be decided**: Select this option if you're not sure if the breach has personal information. • **Yes**: Select this option if the breach has personal information. • **No**: Select this option if the breach doesn't have personal information.
Number of impacted individuals	Number of people impacted by the case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New Privacy case form (continued)

Field	Description
Categories of data subjects/individuals impacted	Define who is impacted by the case. The choices are as follows: • **Customers** • **Employees**
Assignment	
Assignment group	Group assigned to the case. **Note:** The assignment group is preconfigured to the case type during configuration setup.
Case analyst	Analyst who will analyze and work on the case. The case analyst is a part of the Assignment group.
Watch list	People who must be aware of the case.
Accountable executive	Executive who is accountable for the case.
Primary origin	
Location	Location where the case occurred. For example, the location is **Japan**.
Impacted business unit	Business unit that is impacted by the breach.
Source	Source of the case creation. This field is automatically set to **Manual** when the case is manually created. If the case is reported from the Employee Center, the field displays the source as **Employee Center**.
Additional source	Mode of how the case is reported when the case is created manually. This field is available only when **Manual** is selected from the **Source** field and the record is saved. The choices are as follows: • **Email** • **Phone**
Sub-location	Sub location of the case occurrence. For example, the sub location is **Tokyo**.
Impacted department	Department impacted by the case. The choices are as follows: • **Finance** • **HR** • **IT**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New Privacy case form (continued)

Field	Description
	• **Marketing** • **Sales**
Source record	Source record of source object from where the case is created. For example, if the case is reported from risk events, then this field displays the name of the risk event from which the case is reported.
Schedule	
Date of occurrence	Date the case occurred. For example, the case may have occurred on 18-02-2022.
Date of discovery	Date the case is discovered by you. For example, the case may have occurred on 18-02-2022, but is discovered by the user only on 12-03-2022.
Reported date	Date the case is reported.
Case closure SLA	Expected date of case closure.
Investigation planned start	Planned start date to investigate the case.
Investigation actual start	Actual start date of case investigation.
Remediation planned start	Planned start date to remediate the case.
Remediation actual start	Actual start date of case remediation.
Investigation planned end	Planned end date to investigate the case.
Investigation actual end	Actual end date of case investigation.
Remediation planned end	Planned end date of case remediation.
Remediation actual end	Actual end date of case remediation.
Breach analysis	
Breach status	Status to indicate if a breach has occurred or not. The choices are as follows: • **To be determined**: This is the default value. • **Breach detected**: If the breach is confirmed. • **Future potential**: If the breach has not occurred but may occur in the future. • **Not a breach**: When there is no breach detected.
Breach start	Date the breach started. This field only appears when **Breach detected** or **Future potential** is selected from the **Breach status** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New Privacy case form (continued)

Field	Description
Reporting status	Status of the case being reported to the regulators. This field is automatically set based on the reporting status of the regulations associated with the case. If a case has many regulations and even if one regulation is identified as reportable, then the reporting status of the case is set to **Reportable**. The default value of this field is **To be determined**.
Breach end	Date the breach ended. This field only appears when **Breach detected** or **Future potential** is selected from the **Breach status** field.
Breach significance identified	Date when the user identifies that the breach is significant. This field only appears when **Breach detected** or **Future potential** is selected from the **Breach status** field.
Root cause analysis	
Primary cause	Primary cause of the case occurrence. This field is automatically set to the primary cause that is selected in the Cause and consequences related list.
Related consequence	Consequences of the primary cause for the case.
Overall observations	Observations made regarding the case.
Remediation taken	Field to indicate if remediation measures have been taken to address the case. The choices are as follows: • **Yes** • **No**
Overall preventive measures	Preventive measures taken toward the case.
Activity	
Work notes (Private)	Notes or information regarding the case.
Additional comments (Customer visible)	Additional information regarding the case for the customers.

Report a privacy case through email

Identify and manage issues related to the impacted areas for the reported privacy case. You can also create issues from the Privacy Case Management landing page.

Before you begin
Role required: N/A

You must know:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The email address designated for reporting privacy incident (for example privacy@company.com).
- The instance email ID for your ServiceNow environment (for example, <instancename>@service-now.com).

Procedure

1. Compose the email in Outlook.
   a. In the To field, enter the designated privacy request email address and the instance email ID. The instance name should be in the format: <instancename>@service-now.com
   b. **Optional:** Add recipients in CC if you want them added to the case watchlist.
2. Use Outlook's Importance setting to mark the priority (for example, High or Low). This priority will map to the Priority field in the created case.
3. Add email Content
   a. In the Subject, provide a clear subject line that will help classify the case easily.
   b. In the Body, include the information about the privacy incident.
4. Add any relevant attachments. Attachments are stored in the case record for reference.
5. Select **Send**.

Result

The email triggers an inbound email action in the Privacy Management application and creates a privacy case.

Field mapping after email submission:

- Subject → Title field

  The subject in the email is automatically captured in the Title field of the privacy case.

- Body Content → Description field in the case

  The text in the email body is automatically captured in the Description field of the privacy case.

- Importance → Priority field

  The importance level set in the email (for example, High) is mapped to the Priority field in the case.

- Source → Email

  The source of the case is recorded as Email, indicating that the case was created from an inbound email.

- Sender → Requester field

  The email sender's name is added as the Requester in the case.

- CC Recipients → Watchlist

  Any recipients included in the CC field of the email are added to the case Watchlist, allowing them to receive updates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For privacy admin, the case will be visible in **Workspaces** > **Privacy Workspace** > **List** > **Cases** > **Unassigned cases**.

Any reply sent by the admin appears in the Email tab of the privacy case.

Initiate a breach assessment from a case

Initiate a breach assessment from a privacy case to capture the details of breach, the type of data that is impacted, and so on. These details help the privacy analyst to identify if the breach must be notified to a regulator.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list  icon.
3. Select **All Cases**.
4. Open the case that from which you want to initiate the breach assessment.
5. Select **Initiate breach assessment**.
6. On the new breach assessment form, fill in the fields.

New data breach assessment form

Field	Description
Priority	Urgency of the breach.
Reviewers	Reviewer who would review the details of the breach.
Name	Name of the breach. For example, `500 customer records compromised by unprotected back-up database The exposed database contained 50 gigabytes.`
Description	Brief description of the breach. For example, `500 customer records compromised by unprotected back-up database The exposed database contained 50 gigabytes. This assessment helps in understanding the potential risks, assessing the extent of compromised information, and implementing appropriate measures to mitigate the damage. It is essential for safeguarding sensitive data, maintaining trust among employees, and ensuring compliance with privacy regulations.`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Observations	Observations made by the creator of the assessment.
Due date	Due date of the assessment.
Date of discovery	Date when the assessment was discovered.
Assignment group	Group that must review the assessment.
Assigned to	User who must review the assessment.
Additional comments	Additional information or comments for the reviewer.

7. Select **Save**.

Work on a privacy breach assessment

Accept the work of assessing a privacy breach assessment and work on the assessment.

Before you begin

Role required: admin

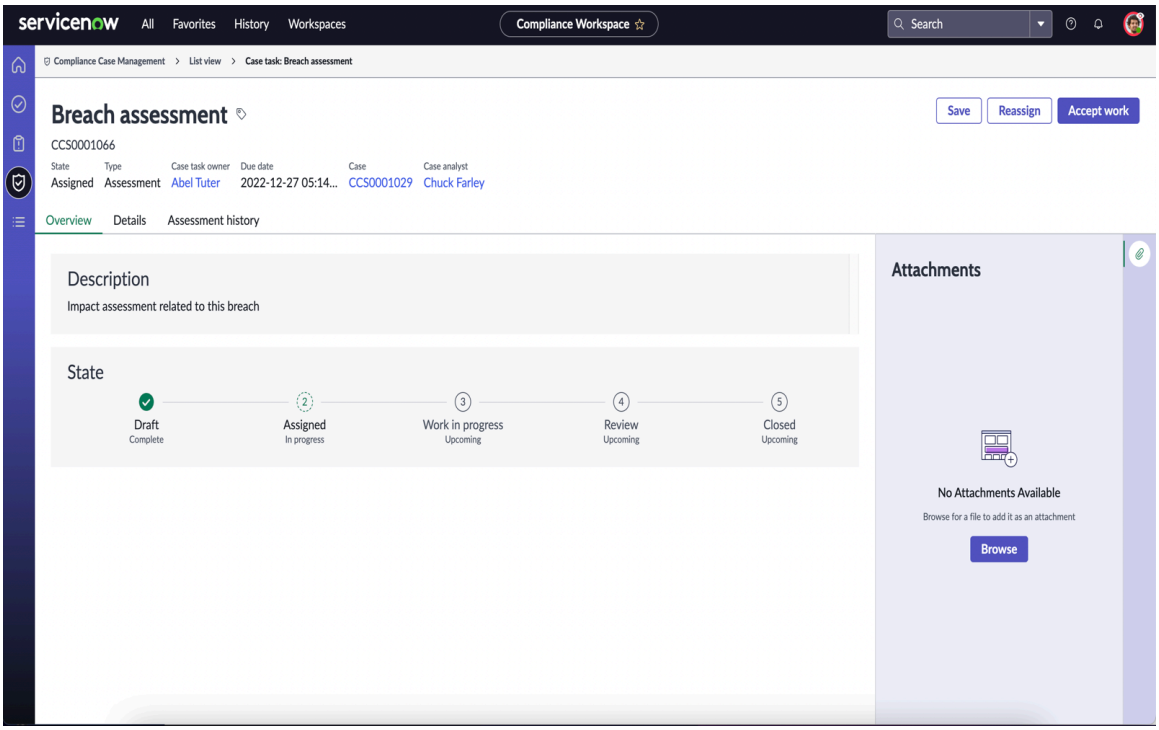
Procedure

1. Navigate to **All** > **Self Service** > **Employee Center** > **GRC tasks** > **My To-dos** > **Data breach assessments**.
2. Select and open the assessment that you want to work on.
3. Select **Accept work**.
4. In the Confirmation dialog box, provide any notes as necessary.
5. Select **Accept work**.
6. To add personal information artifacts, select **PI Artifacts**.
7. In the Create PI Artifact dialog box, select the region and category.
   a. Select **Create**.
   b. Select **Save**.
8. Select the PI artifact and fill in the details as required.
   a. Select the Data elements related list and add the data elements to add.
   b. Select **Update**.
   c. Select the Jurisdictions related list and add the jurisdictions.
9. To send the assessment for review, select **Request review**.
10. To confirm, select **Request**.

Case task workflow

Case tasks help you to collaborate with multiple teams to investigate, perform impact assessment to establish case criticality, and gather evidence to capture the details and responses for further review.

After a privacy case is reported, the privacy analyst can create case tasks and assign each of those tasks to various case task owners. The case task owners then work on the tasks and submit them for the case analyst to review. There are three types of case tasks:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Assessment**: This type of case task requires the case task owner to take an assessment and provide their responses. Case tasks that belong to this type can only be reassigned.
- **Investigation**: This type of case task requires the case task owner to provide their observations.
- **Others**: Like Investigation, this type of case task also requires the case task owner to provide their observations.

After case task owners work on a task, they submit the task for the case analyst to review.

The following image displays the life cycle of a case task.

Case task workflow

Create a case task

Create case tasks to work on the various tasks such as investigations, assessments, inquiries, gathering evidence, and so on required to analyze and work on the case that has been reported. Each case can have multiple case tasks that can be assigned to different owners from various teams.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

About this task

After a case is reported to the privacy teams, a privacy case analyst can create case tasks and assign those tasks to the relevant owners to work on and provide the required inputs and responses.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace** > **Lists** > **Cases** > **All cases**.
2. Open the case for which you want to create a case task.
3. Select the Case task related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.
   See the privacy new case task form for an explanation of each field.
5. Select **Save**.
6. To assign the task to the case task owner, select **Assign task**.
7. **Optional:** In the confirmation dialog box, provide your notes.
8. Select **Move to assigned**.
   The state of the record changes to **Assigned** and is assigned to a case task owner.
9. **Optional:** To reassign the case task to another user before the case task is accepted by the case task owner specified by you, select **Reassign**.
   You can only reassign case tasks that are of type **Assessment**.
   a. In the Assignment group field, select the relevant group.
   b. In the **Case task owner** field, select a new owner.
   c. Select **Reassign**.

Case task form

On the new case task form, fill in the fields.

Case task form

Field	Description
Number	Number of the case task. This field is automatically set.
Title	Name of the task being created for the case. For example, `Investigation for loss of data`.
Type	Type of task. The choices are as follows: • **Assessment**: Use this option if you want to perform an assessment to collect responses from users regarding the case. **Note:** Only case tasks with type Assessment type can be reassigned to a different task owner if required. • **Investigation**: Use this option if you want to create a case task to perform any investigation for the case reported. For example, you may want to determine the type of data lost. • **Others**: Use this option for any other type of task that you configure.
Assessment template	Assessment template to assess the case. This field appears only when **Assessment** is selected from the **Type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case task form (continued)

Field	Description
	Note: Each case type can be mapped to specific assessment templates during configuration. Only the templates mapped to the case are available for selection. For example, if the case type is **Financial**, then the assessment templates specific to the Financial type will be available for selection. You cannot select the same assessment template if there is already an open assessment with the assessment template that you have selected is being worked upon.
State	Workflow state of the case task. This field is automatically set to **Draft**.
Description	Brief description of the task. This description is useful for the user who works on the task.
Assignment	
Assignment group	Group that will work on the case task. Any user who belongs to the selected group can work on the case task if a case task owner is not specified.
Case task owner	Person who owns the case task. The user selected in this field must be a member from the assignment group.
Watch list	Users who must have the access to view the case task.
Schedule	
Due date	Date within which the case task must be completed. The due date must be before the date specified in the **Case closure SLA** field on the case form.
Accepted date	Date the case is accepted.
Created	Date the case is created and assigned to the case task owner.
Task closure date	Date of the task closure.
Summary	
Observations	Observations you make about the case while working on the case task.
Activity	
Work notes (Private)	Worknotes for the case task.
Additional comments (Customer visible)	Comments related to the case task, if any.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work on a case task

As a case task owner, accept the task, provide the details requested by the case analyst, and submit it for a review. If a case task is assigned to an assignment group, and not to a specific user, then any user who is a part of the assignment group can accept the task and work on it.

Before you begin
Role required: sn_privacy_case.privacy_case_business_user

About this task
If a case task is of type **Assessment**, a case requires the case task owner to take an assessment to determine losses incurred from a case. In this case, the task owner can accept the work and then take the assessment. If the case task is of type **Investigation** or **Others**, the case task owner can accept the task, provide their observations, and submit the case for review to the case analyst.

Procedure

1. Navigate to **Self Service** > **Employee Center**.
2. Access your task from the **My tasks** module.
3. Open the task assigned to you.
4. Select **Accept work** .
5. In the confirmation dialog box, select **Accept work**.
6. Depending on your case task type, perform the following steps.

What to do next

1. Create or manage an information object within a processing activity.
2. Add key stakeholders and send privacy assessments.
3. Add impacted areas to a case.
4. Add related areas to a case.
5. Add causes and consequences to a case.
6. Add regulations to a case.
7. Add issues to a case.

Reassign an assessment type case task

Reassign an **Assessment type** case task to another user. A case analyst or a case task owner can reassign a task to another case task owner, if required.

Before you begin
Role required: sn_privacy_case.privacy_case_analyst, sn_privacy_case.privacy_case_business_user

About this task
There are three types of case tasks and they are described as follows.

- **Assessment**: This type of case task requires the case task owner to take an assessment and provide their responses.
- **Investigation**: This type of case task requires the case task owner to provide their observations.
- **Others**: Like Investigation, this type of case task also requires the case task owner to provide their observations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a case analyst, after a task is assigned to a case task owner, you can reassign the task to another privacy business user. Possible reasons for reassignment can be that a case task is wrongly assigned or is not accepted by the case task owner and so on. You can reassign a task to privacy business users.

As a case task owner, you can also accept the task, start working on it, and then reassign the partially completed task to another user. When you reassign the partially completed case task to another user, the data that you have provided also gets copied over and is available when the new case task owner takes the assessment. This data can be modified by the new task owner.

Note:
You can only reassign those case tasks that have the **Type** field set to **Assessment**.

Procedure

1. Navigate to **Self Service** > **Employee Center**.
2. Access your task from the **My tasks** module.
3. Open the task that you want to work on.
4. Select **Reassign**.
   The Reassign case task dialog box appears.
5. In the **Assignment group** field, select the assignment group.
6. In the **Case task owner** field, select the owner.
7. Select **Reassign**.

Review and close a case task

Review a case task after a case task owner provides their responses and observations for the case.

Before you begin
Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. From the **Tasks** module, open the task to review.
3. Review the case task and then do one of the following.

Add an impacted area to a privacy case

Add the impacted areas or objects that are affected by the privacy case or event in the Privacy Case Management application.

Before you begin
Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list  icon.
3. Select **All Cases**.
4. Open the case for which you want to add an impacted area.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **New**.
6. On the **Impacted area** form, fill in the fields.

Impacted area form

Field	Description
Case	Case for which you're adding the impacted areas. This field is automatically set to the case name.
Impacted area type	Type of the impacted area. For example, the location of the event or case. The choices are as follows: ○ **Control** ○ **Entity** ○ **Location** ○ **User** ○ **Company** ○ **Processing activity** **Note:** You can also configure your own impacted area type.
Impacted area	Areas or objects that are affected by the case or event. This field is available only when a value is selected from **Impacted area type**. For example, **10065 East Harvard Avenue, Denver,CO**.
Title	Title of the impacted area.
Description	Brief description of the impacted areas or objects.

7. Select **Save**.

Add PI information objects to a privacy case

Add information objects to the privacy case after a privacy case is created. Adding information objects helps you understand the types of personal information that is being compromised during a breach.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list icon.
3. Select **All Cases**.
4. Open the case for which you want to add [PI] information objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the [PI] Information objects related list.
6. Click **Add**.
7. Select the information objects you want to add.
8. Click **Add**.

Add key stakeholders to a privacy case

Add key stakeholders to a privacy case to identify the key members who are responsible for the data that is lost during the breach. You can then send the respective breach assessments to the stakeholders based on their responsibilities.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list icon.
3. Select **All Cases**.
4. Open the case for which you want to add a key stakeholders.
5. Click the Key stakeholders related list.
6. Click **Add**.
   a. Select the stakeholders to add.
   b. Click **Add**.
      The key stakeholders are added.

Add a related area to a privacy case

Add the related areas that are related to a privacy case or event reported in the Privacy Case Management application.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

About this task

You can specify the related areas, such as policies, citations, control objectives, and risk events related to the privacy case or event reported. A privacy administrator can also configure the options for the related areas in the application setup.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list icon.
3. Select **All Cases**.
4. Open the case for which you want to add a related area.
5. Select **New**.
6. On the **Related area** form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related area form

Field	Description
Case	Case for which you're adding the related areas. This field is automatically set to the case name.
Related area type	Type of the impacted area. For example, any related risk event. The choices are as follows: ○ **Citation** ○ **Policy** ○ **Control objective** ○ **Risk event**
Related area	Areas that are related to the privacy case or event reported. This field is available only when a value is selected from **Related area type**. For example, **Employees education data loss**.
Title	Title of the related area.
Description	Brief description of the related areas.

7. Select **Save**.

Add causes and consequences to a privacy case

Define the root cause for the reported privacy case or event and its consequences on the organization using the Privacy Case Management application.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

About this task

You can add multiple causes to a privacy case and define a primary cause. Any privacy case can only have one primary cause. You can also add a cause that is suspected but not confirmed. Apart from specifying the primary the cause, you can specify the consequence and any remediation measures taken to address the case.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list icon.
3. Select **All Cases**.
4. Open the case for which you want to add a cause and consequence.
5. Select **New**.
6. On the **Cause and consequence** form, fill in the fields.
   For a description of the field values on the **Cause and consequence** form, see Cause and consequence form.
7. Select **Save**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause and consequence form

Learn about the fields on the cause and consequence form. Use this form to define cause and consequence in the Privacy Case Management application.

On the view rule form, fill in the fields as appropriate.

Cause and consequence form

Field	Description
Cause	Cause for the case or event.
Cause status	Status of the cause. The choices are as follows: • **Suspected**: Select this option, if the cause isn't yet confirmed. • **Confirmed**: Select this option, if the cause is confirmed.
Primary cause	Option to select the cause as primary.
Cause description	Brief description of the cause.
Consequences and actions	
Consequences	Consequences of the case or event. You can select multiple consequences for a reported case.
Actions taken	Any action or measures taken to address the case.
Summary	
Observations	Overall observations, if any.

Add a privacy regulation related to a case

Add the necessary regulations that are or can be impacted by the case that has been reported. In the ServiceNow platform, regulations are captured as authority documents. Adding the regulations to the case enables you to identify which regulations are breached or violated and prevents penalties and fines.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

About this task

After you add the regulations, you can analyse the case to determine which regulations are violated. You can then mark the reporting status of the regulations as reportable, non-reportable, or potentially reportable. By default, all the regulations present in the system are displayed and the status of the regulations is set to **To be determined**.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the Tasks icon ( ).
3. Select **Cases**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open the case for which you want to add the regulations.
5. Select the Regulations related list.
   a. Select **Add**.
   b. Select the regulations to add.
   c. Select **Add**.
6. To set the reporting status of a regulation, select and open the regulation.
7. On the form, fill in the fields.

Regulation form

Field	Description
Case	Case for which you're adding the regulation. This field is automatically set to the case name.
Reporting status	Status to determine if the regulation must be reported immediately, or in the future or does not require to be reported at all. The choices are as follows: ○ **To be determined**: Select this option if the you're not sure if the violation must be reported. ○ **Reportable**: Select this option if the violation must be reported. ○ **Non-reportable**: Select this option if the violation does not need to be reported. ○ **Potentially reportable**: Select this option if you think that the violation can be reported in the future based on the case investigation.
Authority document	Authority document which forms the regulation.
Lodgement date	Date the regulation is reported to the regulators.
Description	Brief description of the regulation violation based on your analysis.

8. Select **Save**.

Add or create an issue for a privacy case

Identify and manage issues related to the impacted areas for the reported privacy case. You can also create issues from the Privacy Case Management landing page.

Before you begin
Role required: sn_privacy_case.privacy_case_analyst

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list icon.
3. Select **All Cases**.
4. Open the case for which you want to add an issue.
5. Select the Issues related list and do one of the following.

6. Select **Save**.

Export a privacy case as a PDF

Export a privacy case as a PDF to easily share it with various stakeholders.

Before you begin

Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list icon.
3. Select **All Cases**.
4. Open the case that you want to export as a PDF.
5. Select the More actions icon on the top right corner.
6. Select **Export PDF**.
7. Select the appropriate PDF template.
8. Select **Export**.

Perform smart assessment on privacy action task

Use the **Tasks** page on the Employee Center for a consolidated view of all your privacy tasks, including all assessments, enabling you to access and complete them efficiently.

Before you begin

Ensure that following:

- the *sn_grc_case_mgmt.enable_smart_assessments* system property is enabled.
- the assessment templates are configured and published.

Role required: sn_comp_case.privacy_case_business_user

About this task

About this task

When a privacy case action task moves from **Draft** to **Assigned** state, an assessment is initiated. When you perform smart assessment on an action task that is of type **Assessment**, and the smart assessment property is enabled, the smart assessment appears on the unified tasks page which is present on the Privacy Case Management. The tasks that appear in the Compliance Workspace are unique to the logged in user and therefore can complete all assigned tasks. If you're not the rightful responder of the assessment, you can reassign the assessment to the correct responder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Employee Center** > **GRC Tasks** > **My to-dos** > **Open** > **My pending tasks** > **Action tasks**.
2. Select the action task you want to assess.
3. Select **Start**.
4. Respond to the questionnaire.
   You can view detailed guidance for each question on the right hand side of the screen. The guidance helps you in responding to the questions.
5. Select **Submit**.
6. On the success dialog box, select **OK**.
7. After you submit the assessment, to view the assessment, select **View**.

Result

After the assessment is submitted, the state of the assessment gets updated to **Review** and the status of the assessment is set to **Completed**. A compliance case analyst reviews the assessment and updates the state of the assessment to **Close Complete**.

Send an email from a privacy case

Send emails from a privacy case to seamlessly communicate with various stakeholders and regulators and gather more information about the case. All the emails sent and received are stored in the Privacy Case Management application.

Before you begin

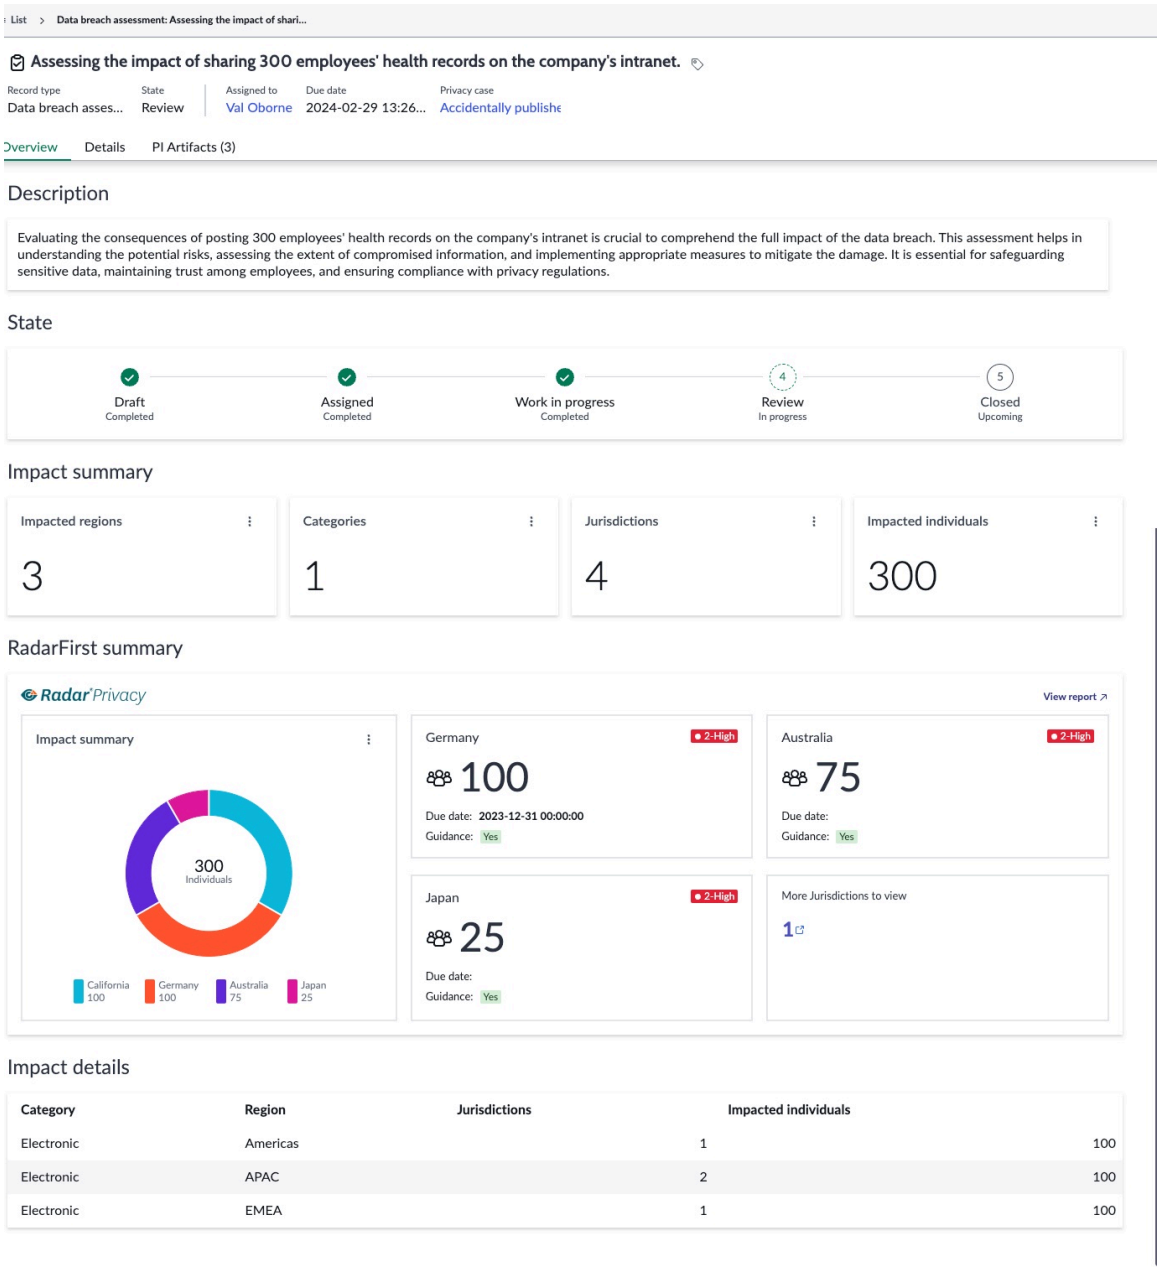
Role required: sn_privacy_case.privacy_case_analyst

Procedure

1. Navigate to **All** > **Privacy Management** > **Privacy Workspace**.
2. Select the list  icon.
3. Select **All Cases**.
4. Open the case that from which you want to send an email.
5. Select the More actions icon on the top right corner.
6. Select **Compose Email**.
7. Draft the email.
8. Select **Send Email**.

Privacy Case Management integration for RadarFirst

RadarFirst specializes in privacy and incident response solutions, particularly in the context of data breach incidents. RadarFirst helps organizations manage and respond to data breaches and privacy incidents effectively.



RadarFirst provides tools for incident response planning, risk assessment, and compliance with data breach notification laws.

In the event of a privacy breach, if you have integrated with RadarFirst by activating the sn_privacy_rf plugin and have an account can submit the breach details. RadarFirst then analyzes the breach in accordance with all relevant privacy regulations for all the locations involved, determining whether it is necessary to notify a regulator about the breach. This notification helps the privacy teams to get their actionable items and act as necessary.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To configure the Privacy Case Management integration for RadarFirst, follow the Guided set up steps and navigate to **Privacy Case Management** > **RadarFirst Integration** > **RadarFirst Integration Guided Setup**.

When you integrate with RadarFirst the overview page displays the RadarFirst summary widget. This widget displays the impact of a breach jurisdictions and the number of individuals impacted in the form of a pie chart. To view the detailed reports of the breaches, select **View report**. The following image shows the RadarFirst widget on the breach assessment overview page.

Privacy Case Management reference information

Exploring Personal Data Rights

Personal data rights (PDR) refer to the legal rights individuals have regarding the collection, use, storage, and protection of their personal data.

The Personal Data Rights application enables you to efficiently manage and fulfill Data Subject Access Requests (DSARs), consumer rights requests, and so on, ensuring compliance with privacy regulations. The application helps organizations to handle requests related to the personal data rights of their consumers while ensuring that employees can maintain data protection standards globally.

Some common personal data rights include:

Right to Access

Individuals have the right to access the personal data that organizations hold about them and to request copies of this data.

Right to Erasure

Individuals have the right to request the deletion or removal of their personal data when there is no compelling reason for its continued processing.

Right to Data Portability:

Individuals can request that their personal data be provided to them or transferred to another organization in a commonly used, machine-readable format.

Right to Restrict Processing

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Individuals can request that the processing of their personal data be restricted under certain conditions, such as when the accuracy of the data is contested or when the processing is unlawful.

Right to Information

Individuals have the right to be informed about how their personal data is being processed, including the purposes of processing, the categories of data being processed, and any recipients of the data.

These rights are designed to empower individuals to have greater control over their personal data and to ensure that organizations handle personal data responsibly and transparently. Organizations that collect and process personal data are generally required to uphold these rights and comply with applicable data protection laws.

Workflow of Personal Data Rights

A personal data rights request is initiated by a requester and directed to the Personal data rights (PDR) agent. The agent then processes the request, assigns it to the appropriate task owners, the task owners work on their tasks, and then request is closed.

The detailed workflow is explained as follows:

1. A requester requests for information on personal data using one of the following methods.
   - Email
   - Phone
   - Other applications using API integrations
2. A designated user validates if the user is authentic and genuine and the request is sent to the PDR agent.
3. The agent then identifies the action task owners to handle the data request.
4. The action task owners work on the request and notify the agent.
5. The agent reviews the tasks and then closes the request and notifies the requester.

Using Personal Data Rights

Personal Data Rights workspace

The Personal Data Rights Workspace offers you the ability to create new personal data rights request and view the requests by their type, due date, and status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following image shows the Personal Data Rights workspace homepage.

From the homepage you can create a new PDR request. The following are the sections on the home page.

Overview section

The overview section displays the tasks that need attention and are either overdue or are about to be overdue. It also shows the requests by type and by requester. You can also view the tasks by status and the summary of the previous 12 months.

Task overview

In the task overview section, you can view the tasks by their SLA and by their status. You can click on each item on the charts to obtain more details.

Configuring Personal Data Rights

Set up the Personal Data Rights to address various types of data rights request.

The following are the configuration tasks that must be performed before using the Personal Data Rights application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring Personal Data Rights request type

Create a request type in the Personal Data Rights application to categorize and manage the personal data rights requests. After you create a request type, the personal data rights agents and the task owners can select the required request type on the request form while working on a personal data rights request.

Before you begin

Role required: sn_grc_pdr.pdr_admin

Procedure

1. Navigate to **All** > **Personal Data Rights** > **Request Configuration** > **Request type**.
   The default personal data rights request record type opens.
2. On the form, fill in the fields.

   For a description of the field values on the request type form, see Personal Data Rights request type form.
3. Open the form context menu and select **Save**.
   The Subtypes related list appears.
4. On the Subtypes related list, select **New** to define a request subtype.
5. On the form, fill in the fields.

Subtype form

Field	Description
Label	Label to be displayed for the subtype. For example, `Right to delete`.
Name	Name of the subtype. For example, `right_to_delete`.
Parent	Parent request type. This field is automatically set to the **Personal data rights request**.
Active	Option to select the subtype as active or inactive.
Category	Category of the subtype. This field is automatically set to **Personal data rights request [sn_grc_pdr_request]**.
Description	Description of the purpose of the subtype. This description is for the administrator to understand the request subtype.

6. Select **Submit**.
7. To add Jurisdictions that are affected by the record type, select **New** and fill in the form as required.

Personal Data Rights request type form

Use the Request Type form in the Personal Data Rights application to categorize the personal data rights requests by their type.

The following table lists the descriptions of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request Type form

Field	Description
Label	Label to be displayed for the request type. This field is automatically set to **Personal data rights request**.
Name	Name of the request type. This field is automatically set.
Category	Category of the request type. This field is automatically set to **Personal data rights request [sn_grc_pdr_request]**.
Active	Option to select the request type as active or inactive.
Description	Description about this request type. This description is for the administrator to understand the request type.
State Model	
State Model	Workflow states for the request type.
Action task state model	State model transition defined at Action task state model. The states change for the action task workflow according to the state model.
Inbound Email Configuration	
Group email	Email address that automatically generates a request upon receiving an email.

Create an action task template

Create action task templates accessible to personal data rights administrators to align with various request types, such as the right to correct, delete, know, or opt-out. Using these templates for auto-generated action tasks ensures that each task meets the specific requirements of the request type. This alignment guarantees consistency, compliance, and efficiency in handling personal data rights requests.

Before you begin

Role required: system administrator

Procedure

1. Navigate to **All** > **Personal Data Rights** > **Request Configuration** > **Action Task Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Template form

Field	Description
Name	Name of the template. For example, `Right to correct personal data`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Table to use for the template. This field is automatically set to **Action task [sn_grc_case_mgmt_case_task]**
Active	Option to denote if the template is active. Only active templates are available to use.
Application	Name of the application for which the template is created. This field is automatically set to **GRC Personal Data Rights**.
Domain	Domain of the template. This field is automatically set to **global**.
User	This field is automatically set to **System Administrator**.
Groups	Groups that can view and use the template.
Global	Option to denote that the template is available for all the users of an organization.
Template	Fields to use to build the template

4. Build the conditions as required.
5. Select **Submit**.

Create a data registry

Create a repository of the users and specify the owners of various applications. This repository helps to identify which user must be assigned the personal data rights (PDR) request tasks.

Before you begin
Role required: sn_grc_pdr.pdr_admin, sn_grc_pdr.pdr_manager

About this task
A data registry provides information about the business application or business process, its owner, and the type of data it stores, such as customer data, employee data, prospect data, or ex-employee data. When a privacy data rights request is created, based on this registry or repository, the action tasks are created for the right owners.

Procedure
1. Navigate to **All** > **Personal Data Rights** > **Personal Data Rights Workspace** > **Lists** > **Data registries**.
2. Select **New**.
3. On the form, fill in the fields.

Create new data owner registry form

Field	Description
Data owner registry	
Requester type	Type of personal data stored. The choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Customer** ○ **Employee** ○ **Ex-Employee** ○ **Prospect**
Asset type	Type of asset that contains the data.
Select asset	Specific asset that belongs to the asset type.
Description	Description of the registry.
Assignment	
User assignment method	Assignment rule. The choices are as follows: ○ **Manually assign the user and group**: Select this option if you must manually assign a user and a group. ○ **Choose user from selected asset record**: Select this option if you must use the user specified in the selected asset record.
Group	Group to which the asset belongs.
User	User responsible for the PDR request.

4. Select **Save**.

Result
When the PDR agents generate tasks, based on the registry, the action tasks will be created for the various task owners.

Generate action tasks for a personal data rights request

Automatically create action tasks for a personal data rights request. These action tasks are generated based on the data registry that is created by the personal data rights admin and are assigned to the right data owners.

Before you begin
Role required: sn_grc_pdr.pdr_agent

About this task
Creating a data registry helps identify which user should be assigned personal data rights (PDR) request tasks. When you generate action tasks based on the data registry details, they are created and assigned to the appropriate data owners. Once these tasks are created, they must be moved to the assigned state for the data owners to begin working on them. The action tasks use provided task templates, which are applied to the auto-generated tasks, to ensure they meet the specific requirements of the request type.

Procedure

1. Navigate to **All** > **Personal Data Rights Workspace** > **Lists** > **Personal data rights** > **All requests**.
2. Open the request for which you want to generate tasks.
3. Select the **Details** tab.
4. Select **Generate tasks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the generated tasks and select **Move to the Assign state**.
6. **Optional:** Select the More actions icon on the top-right and select **Compose Email** to inform the right users that the request is being worked upon.

Using Personal Data Rights

Use the Personal Data Rights application to create new requests to manage your personal data.

Create a Personal Data Rights request

Create a request regarding your personal data to request access to, correction of, or deletion of personal information held by an organization or entity.

Before you begin

Role required: sn_grc_pdr.pdr_requester

Procedure

1. Navigate to **All** > **Personal Data Rights Workspace**.
2. Select **Create**.
3. Select **Request**.
4. On the form, fill in the fields.

   For a description of the field values on the personal data rights request form, see Personal data rights request form.
5. Select **Save**.
6. On the Details tab, select **Update state**.
7. Provide additional comments.
8. Select **Submit**.
   The state of the task moves from **Draft** to **Assigned**.

Personal data rights request form

Use the Personal data rights request form in the Personal Data Rights application to initiate a process to access, correct, or delete personal data.

The following table lists the descriptions of the field values.

New personal form

Field	Description
Number	Request number. This field is automatically set.
Source	Source from which the request is initiated. The choices are as follows. • **Email** • **Phone** • **Employee Center** • **Chat bot** • **Public API**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New personal form (continued)

Field	Description
Priority	Priority of the request. • **1 - Critical** • **2- High** • **3 - Moderate** • **4 - Low** • **5 - Planning**
State	Workflow state of the request. This field is automatically set to **New**.
Name	Name of the request. For example, `Rectification of data`.
Description	Brief description of the request. For example, `An employee discovered that their address is incorrectly recorded in our accounts. The employee called requesting access to their personal data and specifically ask for the correction of the address. As per the process, respective Data Admin should call the employee and get the new address address details to correct in the HR systems.`
Regulation	Regulation that governs the request.
Requester details	
Requester name	Name of the person who requests the data.
Location	Requester's geographical location.
Email	Email ID of the requester.
User validation	Method used to validate and confirm the user. The choices are as follows. • **IVR (Interactive voice response)** • **To be validated** • **Security questions (Manual verification)** • **SSO (Single sign on)**
Requester type	Category of the requester. The choices are as follows. • **Prospect** • **Customer**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New personal form (continued)

Field	Description
	• **Employee** • **Ex-Employee**
Request type	Type of request made by the requester. The choices are as follows: • **Right to correct** • **Right to delete** • **Right to know** • **Right to opt-out**
Phone number	Phone number of the requester.
Business unit	Business unit of the requester.
Validation comments	Additional comments to validate the user.
Schedule	
Creation date	Date the request is created.
Due date	Due date for the completion of the request.
Actual start	Start date of request processing.
Assignment	
Assignment group	Group assigned to the request.
Assigned to	User assigned to the request.
Verification approvers	Users who approve the verification.
Watch list	Users who must be aware of the request and must track it.
Summary	
Overall observations	Additional observations.
Activity	
Work notes (Private)	Notes or information about the case.
Additional comments (Customer visible)	Additional information about the case that you want to share with the customers.

Add action tasks to a Personal Data Rights request

Create action tasks for a Personal Data Rights request and assign them to the appropriate task owners. Action tasks are tasks that are created to facilitate and complete a valid personal data rights request

Before you begin

Role required: sn_grc_pdr.pdr_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Personal Data Rights Workspace**.
2. Open the request for which you want to add action tasks.
3. Select the Action tasks related list.
4. Select **New**.
5. On the form, fill in the fields.
   For information on the form fields, see New action task form.
6. Select **Save**.

New action task form

Use the new action task form to create action tasks for the appropriate owners.

The following table lists the descriptions of the field values.

New Action task form

Field	Description
Name	Name of the action task. For example, `Verification of Requester's Data and Disclosure of Usage`.
Description	Brief description of the action task. For example, `Verification of Requester's Data and Disclosure of Usage: Specify Locations and Purposes of Personal Information Utilization`.
Priority	Priority of the task.
IT asset	IT asset that is used in the request.
Assignment group	
Assignment	
Assignment group	Group responsible for working on the task.
Task owner	User who owns the task.
Watch list	Users who must be notified of the task and its progress.
Schedule	
Due date	Date for completion of the task.
Summary	
Observations	Any observations of importance for the task owners.
Activity	
Additional comments	Additional comments or information for the task owners.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accept and work on a Personal Data Rights task

Accept Personal Data Rights (PDR) tasks that are assigned to you. Unless you accept the work, you will not be able to work towards closing the task.

Before you begin

Role required: sn_grc_pdr.pdr_agent

Procedure

1. Navigate to **All** > **Personal Data Rights Workspace** > **Lists** > **Personal data rights** > **All requests**.
2. Open the required request.
3. On the Action tasks related list, select the action task that you want to accept.
4. Select **Accept work**.
5. Provide your notes and select **Accept work**.
6. On the Details tab, provide the details for the task.
7. After you complete the task, select one of the following.

Personal Data Rights (PDR) external-facing form

The Personal Data Rights (PDR) external-facing form enables secure submission of Data Subject Requests (DSRs) from a public website, without logging in. The form is customizable, supports jurisdiction-based privacy rights, and verifies requester identity via email before creating a case.

The Personal Data Rights (PDR) external-facing form enables customers, ex-employees, or third party individuals to securely initiate Data Subject Requests (DSRs), without logging into internal portals. Organizations can embed a dedicated PDR form URL into their public website or privacy page, allowing a requester to submit a privacy request end-to-end while the system verifies identity through email-based verification before a case is created. The PDR form is customizable and can be easily embedded on external sites.

Audience

- Requester (customer, ex-employee, or third-party individual).
- Privacy administrators and developers configuring the form, jurisdiction mappings, and email templates.

Key benefits

- Enables requesters to submit PDRs directly from the organization's public site. No Employee Center access is required.
- Ensures that the identity of the requester is verified through an email-based verification code before any request is accepted.
- Supports region-specific jurisdiction-driven request types and privacy-by-design practices.
- Smoothens the intake of PDR requests, triggers acknowledgments with PDR numbers, and hands off to privacy agents for fulfillment.

Configurable privacy rights

Administrators can configure which privacy rights are available per jurisdiction. The country (and state, where applicable) selected by the requester determines which rights appear on the external-facing PDR form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Examples:

- Right to opt-out: Request to be opted out from sales or targeted marketing.
- Right to correct: Request correction of inaccurate or incomplete personal data.
- Right to delete: Request personal data to be erased.
- Right to know: Request details about the personal data collected and its use.

Administrators can add additional rights beyond these defaults as needed to meet organizational or regulatory requirements.

Submit a privacy request using the external facing PDR form

Submit a privacy request using the external-facing Personal Data Rights (PDR) form. After submitting, verify your email address using a six-digit code. On successful verification, your request is processed and you receive an acknowledgment email with your PDR case number.

Before you begin

Role required: N/A.

This form is embedded into an organization's website and is publicly available to customers, ex-employees, and third-party Individuals.

Procedure

1. Navigate to the Personal Data Rights (PDR) request form on your organization’s site.
2. In the Country field, select your country of residence.
3. If applicable, select your State or region.
   The form automatically displays the privacy rights available for your jurisdiction.
4. In the "I am a" field, choose your relationship to the organization (for example, customer or ex-employee).
5. In the Request Type field, select the privacy right you wish to exercise (for example, Right to Opt-Out, Right to Correct, Right to Delete, Right to Know).
6. Provide a detailed Request Description to clarify your request, and select **Next**.
7. In the Requester details page, provide contact information:
   a. Enter your first name.
   b. Enter your last name.
   c. Enter the email address.
   d. **Optional:** Enter phone number.
   e. Select **Next**.
8. Review the information you've provided, and select **Continue**.
   A six-digit verification code is sent to your email address.
9. Enter the six-digit verification code sent to your email address and select **Submit**.
   On successful OTP validation, your privacy request is submitted for processing.You will receive an acknowledgment email containing your PDR case number and confirmation that your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

request has been received. The privacy team will review your request and respond within the timeframe required by applicable privacy laws.

Note:

- If the verification code is entered incorrectly or not provided, your request will not be processed. For security reasons, you cannot retry the verification code again on the same submission.
- You must start a new request if verification fails. This approach helps protect your data and the organization's systems from unauthorized or repeated attempts.

Privacy data request fulfillment workflow

After a requester successfully submits a privacy request and completes email verification, the request is routed to a Personal Data Rights (PDR) agent. The agent assigns action tasks to internal owners, reviews all completed tasks, closes the request, and notifies the requester by email with relevant details.

After a requester successfully submits a privacy request and completes email verification, the following workflow is initiated:

1. Assignment to PDR agent: The validated privacy request is automatically assigned to a Personal Data Rights (PDR) agent within the organization. The PDR agent reviews the request details and confirms the applicable privacy right and jurisdiction.
2. Identification of action task owners: The PDR agent determines which internal teams or individuals (action task owners) are responsible for fulfilling the specific data request. Action tasks may include data retrieval, correction, deletion, or providing information, depending on the request type.
3. Completion of required actions: The Task owners complete the required actions (for example, updating records, erasing data, compiling information) and notify the PDR agent that their tasks are finished.
4. Review and closure by PDR agent: The PDR agent reviews all completed action tasks. After the agent is satisfied that the request has been fully addresses, the agent closes the privacy request.
5. Notification to the requester: On completion, an email notification is sent to the requester confirming fulfillment of the request and providing all relevant details and supporting documentation.

Configure request types and map jurisdictions

Configure new privacy request types by adding a request type with relevant details, and then map it to a specific jurisdiction.

Before you begin

Role required: sn_grc_pdr.pdr_admin

Procedure

1. Navigate to **All** > **Personal Data Rights** > **Request Configuration** > **Request Types**.
2. Select **New** to create a new request type, and fill in the following fields:
   - Label: Enter the display name for the request type (for example, Right to data portability).
   - Name: Specify a unique system identifier for the request type. It should contain lowercase alphanumeric characters and underscores.
   - Parent: Select an existing parent category or request type if you want to create a subtype or group related rights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Active: Set to “Active” to make the request type available on forms.
- Category: Assign the request type to a category for organizational or reporting purposes (for example, “Access Rights,” “Correction Rights”).
- Description: Provide a brief summary of the request type’s purpose and scope.

3. Select **Submit** to create the new request type.
4. Select the newly added request type from the list.
5. In the Jurisdictions section, select **New**, and fill in only the following fields:
   - Name: Enter a descriptive name for the mapping.
   - Country: Select the country where this request type should be available.
   - State: For the United States and Canada, select both the country and the specific state or province to enable region-specific rights.

   Note:
   - For most countries, mapping by country is sufficient.
   - For the United States and Canada, privacy rights might vary by state, so always specify both country and state when applicable.
   - Regularly review and update jurisdiction mappings to stay compliant with changing regulations.

6. Select **Submit** to create the new jurisdiction mapping.

Modify email templates

You can modify the email templates to align the messages with your organization’s branding, or to add disclaimers required by regional regulations.

Before you begin
Role required: sn_grc_pdr.pdr_admin

About this task
The following email notifications are sent to the requesters when they use the external facing PDR form:

- Verification email: Sends verification code to validate their identity.
- Acknowledgment email: Notifies requesters that their privacy request has been received and is being processed.

Procedure

1. Navigate to **All** > **System Mailboxes** > **Outbound** > **Outbox**.
2. Select the email template (verification or acknowledgment email) that you want to add.
3. **Optional:** After making the changes, select **Preview email** to review the changes.
4. Select **Update** to save the changes.

Privacy Management reference

Reference topics provide additional information such as tables, and roles that are installed with the Privacy Management application. These topics also provide supporting information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with Privacy Management

Tables are added with activation of GRC: Privacy Management.

Tables installed

Table	Description
Assessment configuration [sn_privacy_assessment_configuration]	Privacy manager or admin can configure the rules for auto creating the processing activity on an assessment response. This table stores the assessment configuration rules on assessment template.
Control Objective to Processing Activity [sn_privacy_m2m_policy_statement_processing_activity]	Each processing activity can be associated to the applicable control objectives. This table enables tracking the processing activity to CO relationships.
Control to Processing Activity [sn_privacy_m2m_control_processing_activity]	Stores many-to-many relationships between controls and processing activity.
Entity Type to Assessment Instance [sn_privacy_m2m_profile_type_assessment_instance]	Privacy users can send multiple privacy assessments on Entity Type. This table enables the privacy assessments to processing activity relationships.
Information object to processing activity [sn_privacy_m2m_information_object_processing_activity]	Each processing activity can be associated to applicable Information objects. This table enables tracking the processing activity to IO relationships.
Privacy Unique User Usage [sn_privacy_unique_user_usage]	Collects the unique count of users who are using GRC Privacy Management tables.
Processing activity [sn_privacy_processing_activity]	Extends task table [sn_grc_item] and stores processing activities.
Processing activity hierarchy [sn_privacy_m2m_pa_pa]	Personal data can be moved from one processing activity to another processing activity. This table stores the upstream and downstream processing activities information for each processing activity.

Roles installed with Privacy Management

The GRC: Privacy Management application installs the roles for the privacy analyst, the privacy manager, and the privacy administrator to perform their respective tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions

Role title [name]	Description	Contains roles
Privacy Analyst [sn_privacy.analyst]	Privacy analysts are responsible for managing the privacy compliance posture of the processing activities owned by them. They perform the following tasks: • Assess the processing activities regularly by sending and reviewing privacy impact assessments . • Work with the management and business users to identify and manage controls related to a processing activity. • Manage and resolve the concerns of business users about compliance-related issues and policy exceptions. • Test and monitor control effectiveness.	• sn_grc_workspace.task_reader • sn_risk_advanced.ara_approver • sn_risk_advanced.ara_assessor • sn_risk.user • sn_compliance.user • sn_privacy_case.privacy_case_analyst
Privacy Manager [sn_privacy.manager]	Privacy managers are responsible for managing the overall organization level privacy compliance posture. They perform the following tasks: • Develop and implement privacy regulations, authority documents, and policies. • Review privacy regulatory requirements and policies. • Design and monitor controls to deal with violations of privacy regulations and internal policies. • Plan privacy programs and scope entities. • Creating privacy impact assessment templates. • Continuously monitor control effectiveness and	• sn_compliance.manager • sn_privacy.analyst • sn_risk.manager • sn_grc_workspace.task_admin • sn_compliance.attestation_creator • sn_grc_reg_change.manager • sn_privacy_case.privacy_case_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	recommend effective improvements. • Supervise the privacy compliance team. • Report to management and the Board of Directors on compliance posture. • Discover who is implementing privacy regulation for the first time in their organization.	
Privacy Admin [sn_privacy.admin]	Privacy administrators administer the privacy policy and compliance management. Users assigned this role are responsible for configuring privacy management solutions as per the privacy team's requirements. They perform the following tasks: • Configure privacy impact assessments and automated flows to trigger assessments • Configure rules to auto-create processing activities out of privacy screening assessments. • Monitor the ServiceNow AI Platform dependencies with other applications and modules. • Can read the scripts under Processing activity script configurations related list.	• sn_privacy.manager • sn_risk_advanced.ara_admin • sn_compliance.admin • sn_privacy_case.privacy_case_admin
Privacy assessment responder [sn_privacy.assessment_responder]	Privacy assessment responders can respond to the privacy assessments as key stakeholders. They can also raise privacy requests from the portal.	• sn_grc_workspace.task_reader • canvas_user
Privacy business user [sn_privacy.business_user]	Privacy business users can edit the assigned processing activities in the Discover	• sn_grc_workspace.task_reader • canvas_user

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	on each risk identified on a processing activity. • Work on breach assessments and other privacy case tasks. • Respond to the assessment and investigation tasks assigned by the privacy team. • Work on personal data rights action tasks to handle data according to the requester's requests. • Respond to the assigned control attestations. • View, update, and close assigned issues. • Create, update, and close assigned remediation tasks. • Respond to the assigned manual indicator tasks.	

Personal Data Rights reference

Reference topics provide additional information such as tables, and roles that are installed with the Personal Data Rights application. These topics also provide supporting information.

Roles installed with Personal Data Rights

Roles of the Personal data rights application

Role title	Description	Contains roles
Personal data rights request admin [sn_grc_pdr.pdr_admin]	Users with this role can configure the personal data rights request type	• sn_grc_case_mgmt.grc_case_admin • sn_grc_pdr.pdr_manager
Personal data rights request agent [sn_grc_pdr.pdr_agent]	Users with this role work on the personal data rights request assigned to them.	• sn_grc_pdr.data_owner_admin • sn_grc_case_mgmt.grc_case_analyst
Personal data owner admin [sn_grc_pdr.data_owner_admin]	Users with this role are the asset owners who respond on action tasks when their assets are involved in a request.	• sn_grc_workspace.task_reader • sn_grc_workspace.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles of the Personal data rights application (continued)

Role title	Description	Contains roles
Personal data request manager [sn_grc_pdr.pdr_manager]	Users with this role oversee all personal data rights request until they are closed.	• sn_grc_case_mgmt.grc_case_manager • sn_grc_pdr.pdr_agent
PDR Requester [sn_grc_pdr.pdr_requester]	Users with this role can submit new PDRs, track the status of their requests, and receive communications or notifications related to their requests.	

Tables installed with Personal Data Rights

Tables of the Personal data rights application

Table name	Description
Data owner registry sn_grc_pdr_data_owner_registry	Maintains a mapping between data assets and their owners.
Personal data rights request sn_grc_pdr_request	Collects information with respect to personal data rights.

For information about feature roles, see GRC Feature roles.

Privacy Management email notifications

Reminders enable relevant users to perform their assessments and complete the tasks associated with them.

By default, the Privacy Management application includes the following types of email notifications.

- Email notifications to the entity owner for privacy screening assessment.
- Email notifications to the entity owner for privacy impact assessment.
- Email notification received for Entity owner for when Privacy Assessment is cancelled when Assessment is in Open state.
- Email notification received for Entity owner for when Privacy Assessment is cancelled when Assessment is in Work-in-progress state.

The following table describes the recipient list of notifications and the associated conditions when a notification is sent.

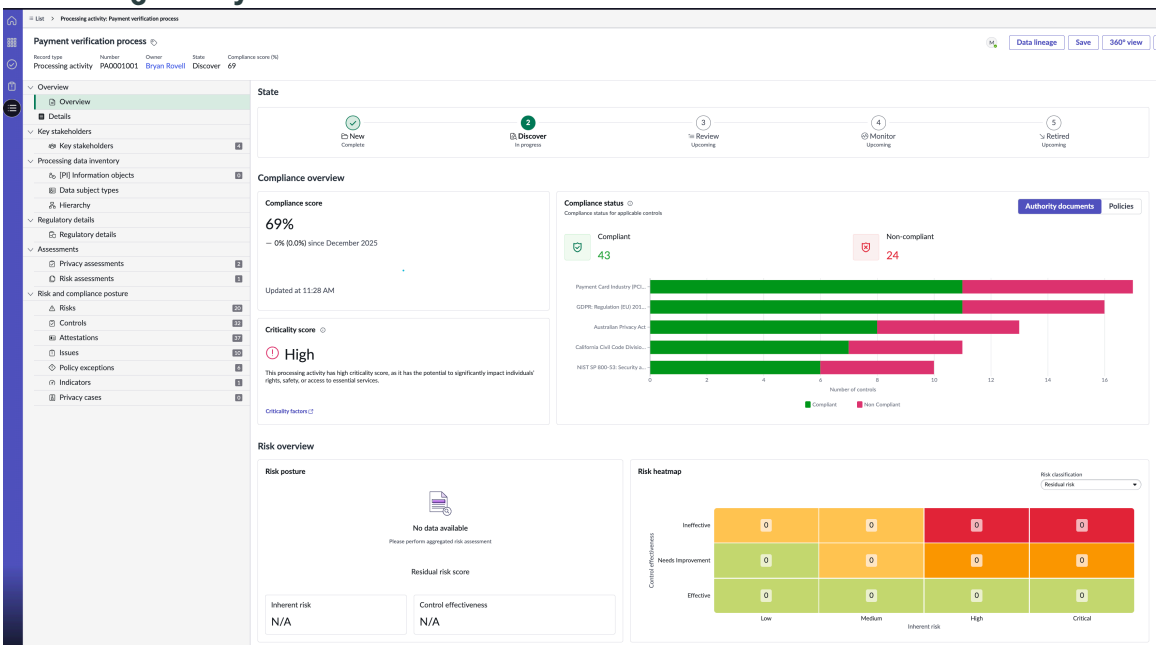
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications sent in the Privacy Management application

Notification	Condition	Recipients
Privacy assessment notification: New assessment on Privacy Screening Assessment	When a new privacy screening assessment is initiated.	Entity owner
Email notification sent to the entity owner for Privacy Impact Assessment.	When an entity owner receives a Privacy Impact Assessment.	Privacy manager
Email notification sent to the entity owner when Privacy Assessment is canceled when the assessment is in **Open state**.	When a privacy assessment is canceled and the assessment is in **Ready to take** state.	Entity owner
Email notification sent to the entity owner when Privacy Assessment is canceled when Assessment is in **Work In progress** state.	When a privacy assessment is canceled and the assessment is in **Work in progress** state.	Entity owner
Remainder email notification sent to the entity owner when the Privacy Assessment is in the due date.	Reminder email for when the assessment is due.	Entity owner
Overdue email notification sent to the entity owner when Privacy Assessment is overdue.	Overdue email	Entity owner

Uses of a processing activity in Privacy Management

A processing activity is a record that processes personal data. Examples of such records are a business process or a business application of an organization. Processing activities enable the privacy management teams to understand how personal information is being processed or used.



To understand more details about a processing activity, refer to Processing activities. A processing activity helps the privacy teams to record the following details:

- Processing activity details such as the business unit it belongs to, data subject type, data storage location, and so on.
- [PI] Information objects that are being processed as a part of this processing activity.
- Past and ongoing privacy assessments.
- Controls that are applied to the processing activity and the respective control attestation responses.
- Issues and policy exceptions associated with this processing activity.

The following image shows the Overview tab of a processing activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Processing activity record

Workflow of a processing activity

A processing activity workflow helps the privacy analysts to manage the life cycle of a processing activity.

The following section explains the different stages of the processing activity workflow.

> **Note:**
> Privacy analysts who do not own the processing activity can only view the processing activity. They cannot edit it.

New

This is a state to confirm if the business application, business process, vendors, or business service must be considered for determining privacy compliance. A processing activity is in this state only when it is created manually. A privacy manager or a privacy analyst can create a processing activity manually and then confirm it as a processing activity based on their analysis. In this stage, the following fields of the processing activity can be modified:

- **Name**
- **Justification**
- **Privacy analyst**
- **Entity**: Only when this field is filled, and the processing activity form is saved. After saving the form, the privacy manager or a privacy analyst can move the processing activity the **Discover** state.

Discover

In this state, the privacy manager or the privacy analyst, who owns the processing activity, can understand further details about the processing activity such as, why and how a processing activity is processing personal information. These details are collected by sending privacy assessments. Based on the responses, they apply the right set of controls. The following is the list of activities that can be performed on the processing activity form in this state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Send privacy assessments.
- Update the processing activity **Details** section based on the assessment responses.
- Assign the processing activity to one of the key stakeholders for the key stakeholders to update the details, the PI-tagged information objects, and the key stakeholders.

> **Note:**
> You can assign the processing activity to those users who have the sn_privacy.business_user role.

- Review the controls applied based on the privacy assessment responses.
- Add or remove additional controls as necessary.

The processing activity then moves to the **Review** state.

Review

In this state, the privacy manager or the privacy analyst, who owns the processing activity, sends control attestations and reviews the compliance posture based on the attestation responses and issues that are created due to non-compliant controls. The following is the list of activities performed on the processing activity form by a privacy manager or the privacy analyst who owns the processing activity.

- Update the processing activity Details section based on the assessment responses.
- Associate information objects and capture additional details related to the information objects based on the assessment responses.
- Review the controls applied automatically based on the privacy assessment responses, and add or remove additional controls as necessary.
- Send control attestations and track issues and policy exceptions.

Monitor

This is a state to track the processing activity for continuous monitoring. The indicator functionality is used for continuous monitoring. When the processing activity is in this state, the privacy analyst can move the processing activity back to **Discover** or **Review** state based on the processing activity updates that must be assessed by the privacy analyst or the privacy manager. The following is the list of activities that can be performed on the processing activity form by a privacy manager or the privacy analyst who owns the processing activity.

- Auto execution of indicator functionality to continuously monitor controls associated with processing activity.
- Create, manage issues, and track issues.

> **Note:**
> When a new privacy assessment is sent for a processing activity while it is in the **Monitor** state, the system automatically moves the processing activity to the **Discover** state.

Retire

This is a state to retire the processing activity when the respective business application or business process is no longer used in the organization. When moved to this state, all the controls associated with the processing activity are retired. The privacy team cannot make any updates to a processing activity in the retired state. When an entity gets inactivated, the related processing activity is also automatically moved to the Retired state.

Domain separation in Privacy Management

This is an overview of domain separation and the Governance, Risk, and Compliance application Privacy Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview of domain separation

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.

These users can choose to expand or collapse the domain scope to show or hide data from other domains.

Note:
Users always have access to data from domains that have been explicitly granted to them by domain visibility.

How domain separation works in GRC

- While GRC supports separation of data, separation of logic and process is not fully supported.

- Many types of records in GRC are automatically generated through user processes. Entities, controls, risks, indicators, control tests, and processing activities are all fields that can be generated automatically. For records that are automatically generated (and for any GRC record that is manually generated), the domain of the record is the same as the domain of the user responsible for creating or generating the records.

  Automatic generation should be kept in mind when working in a domain-separated GRC implementation. Users should be sure that they are creating or generating records at the right domain level so that they are visible to the right set of users.

  For example, suppose you have a domain hierarchy that has Global at the top level followed by Top domain. Top domain, in turn, has two sub domains: Domain A and domain B.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have an entity that you want to send a privacy assessment that must assessed by users in domains A and B, the entity should be generated or manually created at the global level. If the entity is created in Domain B, you will not be able to recreate the entity in Domain A due to indexing.
- If you have an entity that you want to be assessed by users in Top and Domain A, you can create the entity in Domain A.

Unless the entities are in the Global domain, users should not assign entities in a higher domain to users in a lower domain. In the example above, if you have an entity in the TOP domain, you should not assign it for privacy assessment to users in Domains A or B since those users would not have access to the assessment; thus the assessment questionnaire would not be generated.

Similarly, users should not assign control objectives and risk statements in a higher domain to attestations and assessments in a lower domain. Otherwise the attestation or assessment questionnaire would not be generated.

Use case

GRC data for IT can be separated from the GRC data of other departments. Each business area using the GRC application can have separate data that cannot be shared with other departments. Therefore each department can have its own entities, policies, controls, risks, and so on.

When looking at a control from the IT domain, the user can choose to expand the domain scope to show values from the Finance domain or collapse the domain scope to show only controls that match the IT domain.

By default, domain separation adds a domain field to the Task `[task]` and Configuration Items `[cmdb_ci]` tables and their extensions.

You can extend domain separation to any new tables you create by adding a `sys_domain` field to the table's dictionary definition. By default, the system only domain-separates platform and baseline application tables where appropriate.

Warning:
ServiceNow does not recommend domain separating platform tables (any table with the sys_ prefix such as the Dictionary Entry `[sys_dictionary]` and Dictionary Entry Override `[sys_dictionary_override]` tables) because it can produce unexpected results.

In this use case, client scripts, business rules, workflows, processes, and so on can be domain-separated.

While the behavior offered with domain separation provides multi-tenancy support, multi-tenancy is still contained within a single instance. This means that some global properties, some global data, and some global processes are shared across all domains. For example, the system's "Remember me" option on the login page is global and cannot be specified per domain.

If you need complete and total separation of all system properties and do not require global reporting or global processes, separate instances are the best option.

Reporting for Privacy Management

The Privacy Management reports are available as overview pages in the various records.

Required roles

To view the home page, you must have sn_privacy.manager and the sn_privacy.analyst roles.

Use cases

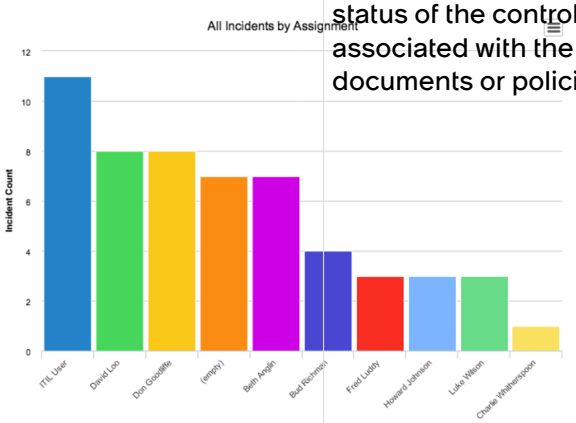
For examples of how different people in your organization would use this home page, see the following use cases.

User	Dashboard use
Privacy manager	The privacy manager can view and understand the privacy compliance posture considering all the processing activities and privacy assessments. They can also view the privacy team's tasks.
Privacy analyst	The privacy analyst can view and understand the privacy compliance posture considering only the processing activities assigned to the privacy analyst. They can also access the tasks that need their attention.

Indicators

The processing activity compliance score percentage indicator shows the compliance score percentage of the processing activity.

Breakdowns



- Processing activity
- Privacy analyst

Reports

This dashboard displays the following reports:

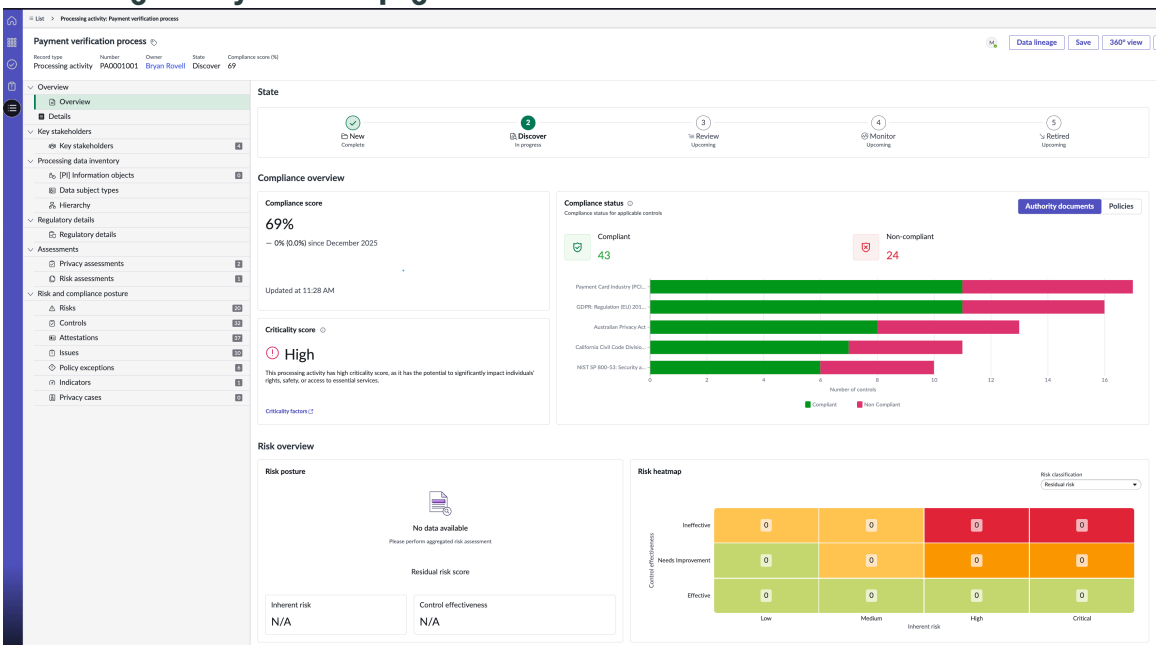
Title	Type	Description
Compliance posture by month	Trend chart 	Compliance posture by month is plotted by referring to the overall compliance score across all the processing activities.
Compliance status	Donut 	Provides the compliance status of all the controls across all the processing activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Controls (by authority documents or by policies)	Bar  chart	Provides the compliance status of the controls that are associated with the authority documents or policies.
Processing activities by state	Donut	Shows the active processing activities breakup by the following states: • New • Discover • Review • Monitor
Least compliant processing activities	List report	Shows the list of least compliant processing activities.
Privacy assessments status	Single score 42	Shows the number of assessments that are open, overdue, and approaching due date.
Recently completed privacy assessments	List report	Shows the list of recently completed privacy assessments.
Issues	Single score 42	Shows the number of issues that are open, overdue, and approaching due date.
Issues by priority	Donut	Shows the issues by their priority.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Description
Policy exceptions	 Single score	Shows the number of policy exceptions that are active, expiring, and requested.
By risk rating	 Donut	Shows the policy exceptions by their risk ratings.
Indicators	 Single score	Shows the number of open and failed indicators.
Attestations	 Single score	Shows the number of attestations that are open, overdue, and approaching due date.



Processing activity overview page

The processing activity overview page provides the privacy risk and compliance posture for a processing activity. This page contains details such the overall compliance score, and trends, privacy criticality assessment scores and risk heatmap based on privacy risk assessments, privacy assessment status, control attestations and issues-specific status.

The vertical layout of a processing activity provides a structured, top-down view that presents information in a clear and sequential manner. This design facilitates an intuitive understanding of the data processing lifecycle by visually representing each step of the workflow in a linear progression. You can easily trace the flow of information from initiation through to completion, enabling better insight into how personal data is collected, used, shared, and retained. This layout supports streamlined navigation and improves the ability to identify key elements and dependencies within the processing activity, enhancing both usability and compliance oversight.

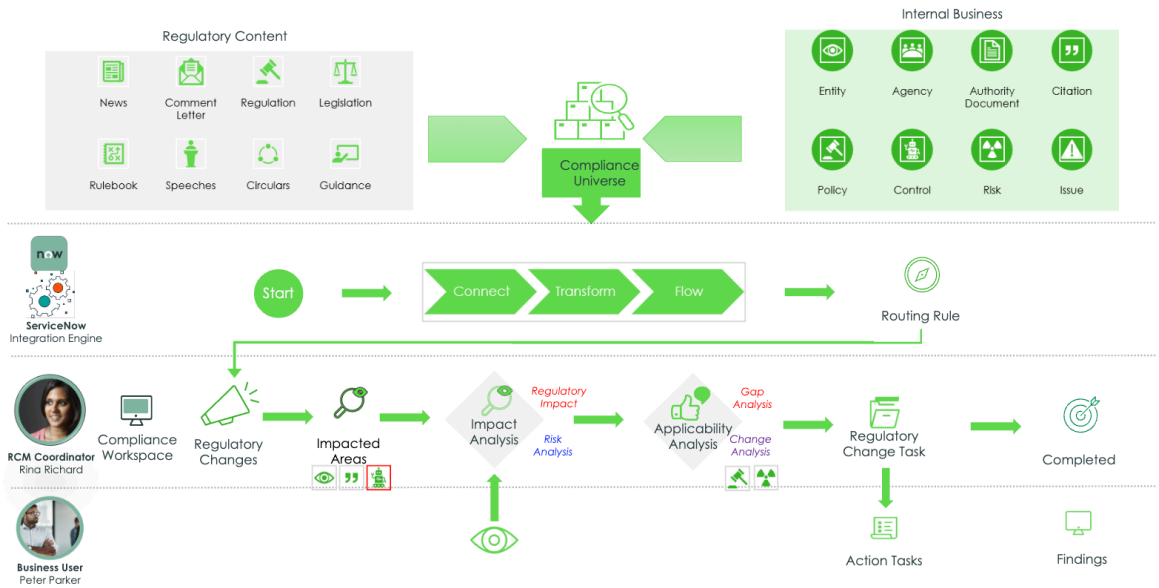
Exploring Regulatory Change Management



The Regulatory Change Management application provides a framework that your organization can use to integrate with third-party regulatory intelligence providers to keep up with the regulatory changes and external regulations.

Regulatory Change Management overview

The Regulatory Change Management application enables you to manage your upcoming regulatory changes efficiently. The application provides the structured workflows that help your organization to assess the applicability of the regulatory changes, assess their impact, and implement risk and compliance-related changes.

The following infographic shows the process flow of the Regulatory Change Management application.

Process flow of the Regulatory Change Management application

The Regulatory Change Management application works with the following types of components:

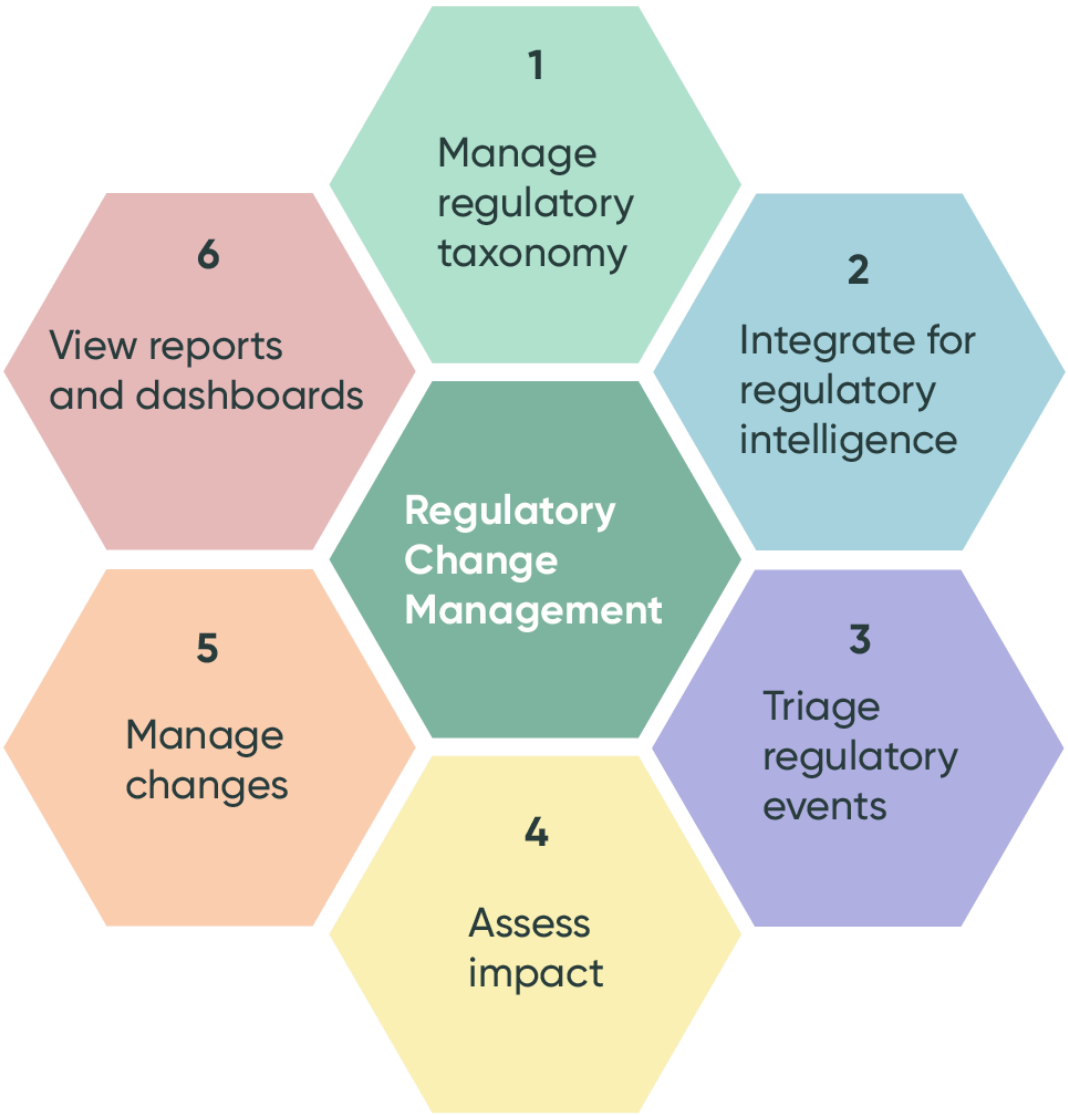
- Integration component: The regulatory intelligence partners typically provide the integration component. Through this integration, you can consume regulatory alerts into your instance.
- Application framework component: The Regulatory Change Management application has an application framework component. This component provides the structured workflows that you can use to analyze and process the regulatory alerts that are received in the regulatory alerts table.

The Regulatory Change Management application consists of the following workflow:

1. Manage regulatory taxonomy: Create an internal regulatory taxonomy that is specific to the ServiceNow AI Platform. You can map the taxonomy with the external taxonomies that are provided by the third-party regulatory intelligence providers for standardization. The internal taxonomy contains the following design elements:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Content Type
- Jurisdiction
- Regulatory Body
- Sector
- Theme



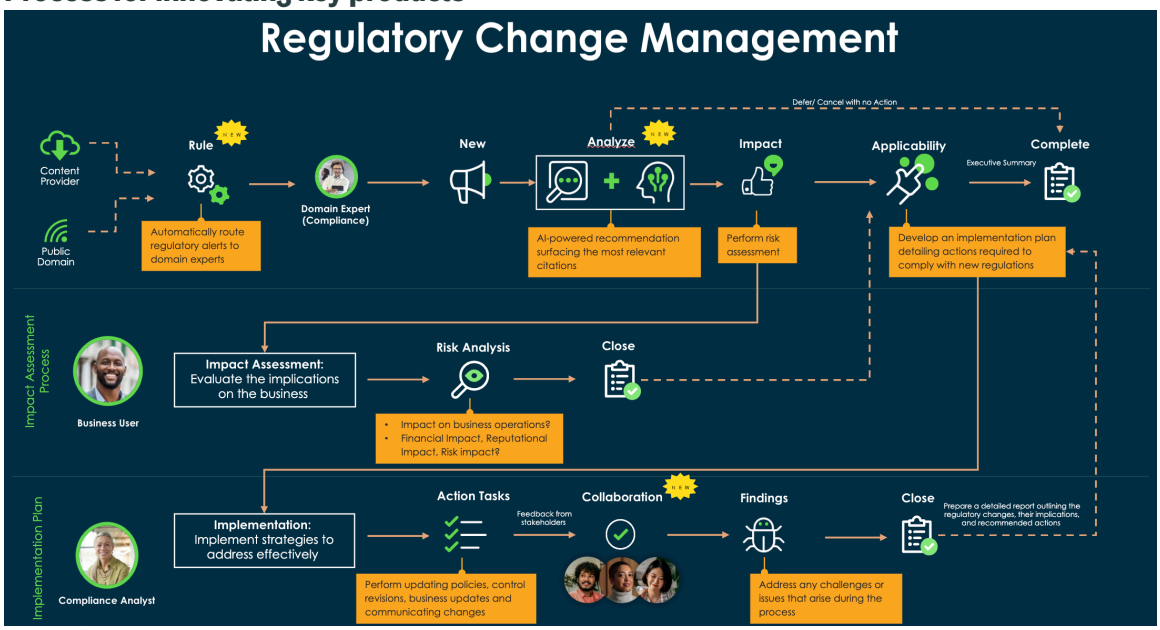
You can create and map these elements with the external taxonomy during the setup process.

2. Integrate for regulatory intelligence: Integrate with the third-party regulatory intelligence providers and consume the alerts into your instance at regular intervals. You can monitor regulatory data in a rapidly changing environment.
3. Triage regulatory events: Analyze the regulatory alerts and identify the regulatory events that are relevant to your organization.
4. Assess impact: Assess the impact of regulatory events by using configurable impact assessment methodologies.
5. Manage changes: Identify changes that should be done. These changes are implemented through the following action tasks:
   - Update the underlying GRC objects, such as the policies, processes, risks, and controls in the regulatory library.
   - Update the existing citations or import the new citations from the providers in the regulatory library.
6. View reports and dashboards: Assess the state of the regulatory compliance by using reports and dashboards. You can maintain an audit trail of the compliance activities.

The following diagram shows the workflow of the Regulatory Change Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow of the Regulatory Change Management application



Key product innovations

The following infographic shows the process for making innovations for the key products of the Regulatory Change Management application.

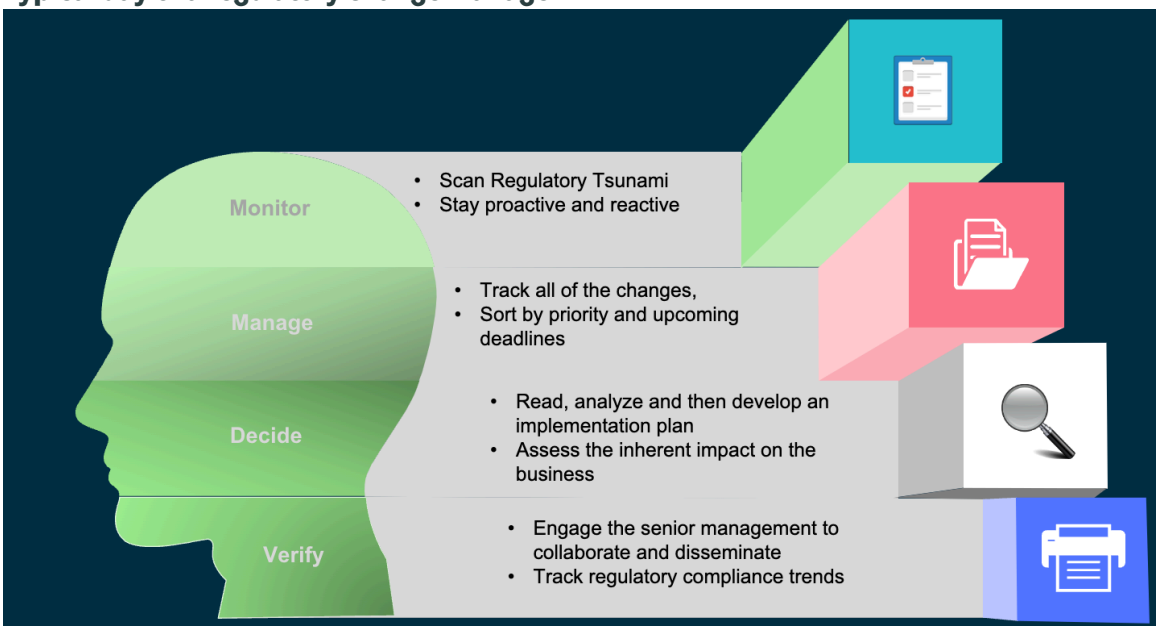
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process for innovating key products

The steps to complete the Regulatory Change Management process flow to innovate key products are:

1. Set up the integration. Your customers can subscribe to a public RSS feed for the regulatory bodies or a subscription provider such as Thomson Reuters Regulatory Intelligence (TRRI) that is a curated intelligence provider. A subscription provider can aggregate the regulatory changes from different sources and provide the collective changes as feeds.
2. Set up an internal taxonomy. The taxonomy elements are different classifiers that an organization can apply to its regulatory content to categorize it. You can use the taxonomy elements to create a hierarchical structure of the different classifications for setting up the regulatory content for an organization.
3. Review a regulatory alert. A user with the sn_grc_reg_change.manager role (RCM manager) reviews a regulatory alert and assigns it to a coordinator or a user with the sn_grc_reg_change.user role (RCM user). The user with the sn_grc_reg_change.user role reviews the alert. If the regulatory change requires an impact assessment, the RCM user sends it to a subject matter expert (SME) with a business user role.
4. Assess the impact. The subject matter expert (SME) with a business user role assesses the impact of the regulatory change and sends the score of the impact assessment to the Regulatory Change Management application. If the alert is not applicable to the organization, the RCM user closes the alert. If the alert is applicable to the organization, the RCM user creates a new regulatory change task and assigns it to the same coordinator or to a new coordinator.
5. Devise an action plan. The coordinator identifies the steps to comply with the regulatory change, devises an action plan, and creates the action tasks for the different teams that must complete the identified action items. The coordinator then creates the action tasks that are associated with the regulatory change task. After the action plan is created, it's sent to the RCM manager for an approval. The manager reviews the action plan and confirms if more action tasks must be created or if some of the action tasks aren't necessary.
6. Complete the action tasks and send them for review to a user with the sn_grc_reg_change.manager role (RCM manager). If the action plan is rejected, the coordinator goes through the action plan, updates the actual tasks, and sends the action plan back for an approval. The compliance manager can see all compliance-based action tasks and the risk manager can see all risk-based action tasks. After the tasks are assigned to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



risk and compliance users, the action tasks are tracked until they're completed. A due date is marked and tracked for the action tasks. When the tasks are completed, the regulatory alert and the parent regulatory change tasks are closed and the change process flow is completed.

A day in the life of a regulatory change manager

A user with the sn_grc_reg_change.manager role (RCM manager) monitors, manages, decides, and verifies the regulatory changes on a daily basis.

The following infographic depicts a typical day for a regulatory change management.

Typical day of a regulatory change manager

Regulatory Change Management application landing page

The Regulatory Change Management application landing page view provides the overview of the regulatory activities in your organization. Users with the sn_grc_reg_change.manager roles only can view the Regulatory Change Management landing page in the primary navigation in the Compliance Workspace.

The prerequisites for displaying the Regulatory Change Management landing page in the Compliance Workspace are:

- Download the GRC: Regulatory Change Management application from the ServiceNow Store in your instance.
- Log in as a user with the sn_grc_reg_change.manager role into the Regulatory Change Management application.

Use the regulatory change icon to access the landing page.

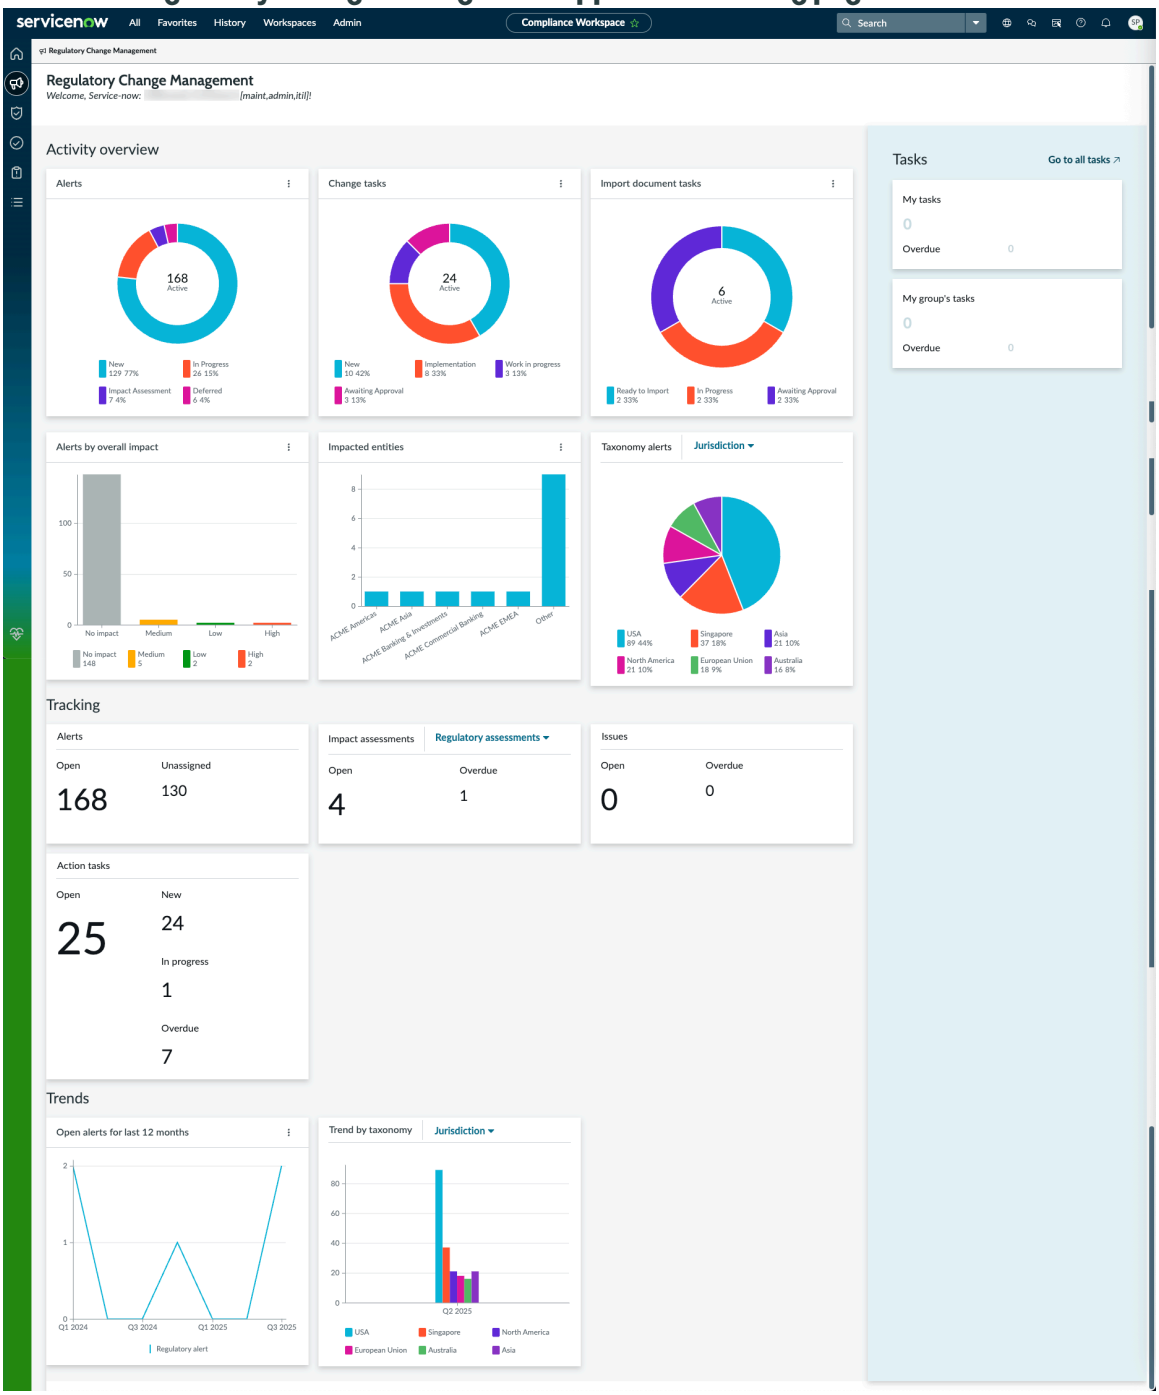
The Regulatory Change Management application managers with the sn_grc_reg_change.manager user role assign the regulatory alerts and monitor the associated regulatory change tasks, import document tasks, and action tasks.

The Regulatory Change Management application in the Compliance Workspace is designed for the users with the following roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Regulatory Change Management application managers with the sn_grc_reg_change.manager role: Only the users with the sn_grc_reg_change.manager role can view the Home page of the Regulatory Change Management application in the Compliance Workspace.
- Regulatory Change Management application users with the sn_grc_reg_change.user role: Users with the sn_grc_reg_change.user role can view the tasks assigned to them in the Regulatory Change Management application, but they cannot view the Regulatory Change Management application landing page in the Compliance Workspace.

Landing page view



The landing page view consists of the data visualization widgets that display the regulatory activity across your organization. The data visualization widgets are selectable widgets that use color coding to distinguish the states of the alerts and the tasks. You can select each widget to view all the associated regulatory alerts or tasks. The color scheme for each donut chart or bar graph is displayed in each subsection.

The GRC: Regulatory Change Management landing page displays the following sections:

- Activity overview
- Trends
- Tracking

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The GRC: Regulatory Change Management application landing page view

- Activity overview: This section contains an overview of the regulatory alerts and the tasks associated with the regulatory alerts across your organization.

Activity overview

Section	Description
Alerts	Active regulatory alerts that are new, in progress, and deferred in numbers and percentage displayed in a donut chart. Also displays impact assessment tasks associated with the alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section	Description
Change tasks	Active change tasks that are in new, implementation, respond, and awaiting approval state displayed in a donut chart. The tasks are displayed in numbers and the percentage.
Import document tasks	Active import document tasks that are in ready to import, in progress, and awaiting approval state displayed in a donut chart. The tasks are displayed in numbers and the percentage.
Alerts by overall impact	Displays the overall impact of the regulatory alerts such as no impact, low, medium, and high impact alerts displayed in a bar graph.
Impacted entities/ Business lines impacted	Grouping of the impact assessment reports based on the impacted entities in a bar graph. The bar graph displays a maximum of five entities for a better display.
Taxonomy alerts	Taxonomy alerts as per the taxonomy elements such as content type, jurisdiction, regulatory body, sector, and theme.

- Tracking: This section displays the tracking status of the regulatory alerts and the associated regulatory tasks.

Tracking

Section	Description
Alerts	Tracking status of the regulatory alerts such as open and unassigned alerts.
Impact assessments	Status of the impact assessments such as open and unassigned impact assessments.
Issues	Status of the issues such as open and overdue issues.
Action tasks	Active action tasks that are open including the action tasks that are in new, in progress, and overdue states.

- Trends: This section displays the trends for the open alerts or trends by the taxonomy elements.

Trends

Section	Description
Open alerts for last 12 months	Timeline of the incoming regulatory alerts that are active and are not closed over a period of 12 months. For example, if 10 records are received every month, they are grouped by a quarter and a total of 30 records for each quarter are displayed in the line graph. Four plots are displayed on the X-axis and 30 records are displayed in each plot.
Trends by taxonomy	Trends noted by the taxonomy elements such as content type, jurisdiction, regulatory body, sector, and theme.

- Tasks: This section contains an overview of the user's tasks and user group's tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tasks

Section	Description
My tasks	Tasks assigned to the user such as open and overdue tasks.
My group's work	Tasks assigned to the user group such as open and overdue tasks.
View all tasks	Link to the Tasks view in the Home page.

Tasks page in the Compliance Workspace

The Tasks page within the Compliance Workspace provides a centralized, task-centric interface for managing all activities related to regulatory events, source documents, and compliance workflows. It helps you stay organized, ensures timely and accountable action, and promotes overall regulatory readiness.

Each task relates to a step in the regulatory response process, such as impact assessment, policy review, control updates, or evidence collection. Tasks can be created both manually and automatically. Automatic task creation depends on workflow settings linked to regulatory alerts or change requests.

This interface supports individual and team-level accountability, promotes timely completion of tasks, and enables compliance with internal and external regulatory obligations. You can filter, sort, and act on tasks directly within this interface, making it an essential tool for compliance officers, analysts, and business stakeholders.

The key features of the Tasks page are as follows:

- Segment task responsibilities across individual and group levels.
- Filter tasks and view personal contributions or monitored items.
- Manage compliance through a task-centric interface.
- Integrate seamlessly with alerts, change requests, and compliance activities.

The page includes four distinct tabs, each serving a specific purpose to enhance task visibility and management.

My pending tasks

Shows all active or outstanding tasks assigned directly to the logged-in user. This view reinforces individual accountability by clearly identifying required actions.

The pending tasks view:

- Originates from regulatory alerts, change requests, or compliance workflows.
- Provides access to task details, due dates, and related items.
- Enables you to update status, add comments, or complete tasks directly.

My group’s tasks

Shows tasks assigned to groups or teams that the user belongs to, even if the user isn't the direct assignee. This data is useful for teams with shared responsibilities or collaborative workflows.

The group's tasks view:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Promotes visibility across shared or collective responsibilities.
- Supports collaboration and effective task delegation among team members.
- Assists managers and leads to monitor and coordinate group tasks.

My items

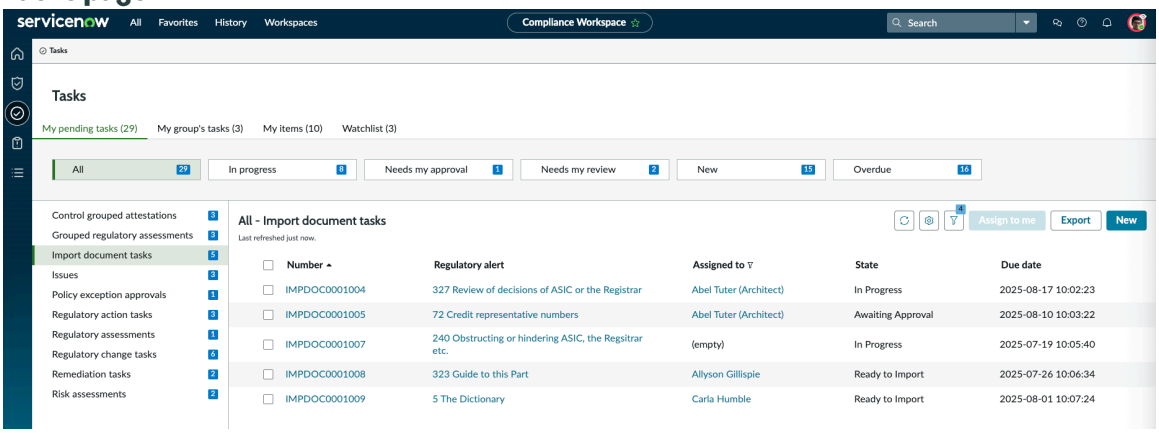
Lists all tasks or items created, requested, or owned by me, even if not directly assigned. It ensures ownership continuity throughout the compliance life-cycle.

The item view:

- Includes regulatory change requests, impact assessments, and policy reviews initiated by me.
- Provides full visibility into the user's regulatory contributions.
- Monitors progress and outcomes for user-initiated items.

Watchlist

Shows tasks that the user has manually chosen to monitor. It's ideal for users involved in passive oversight of key compliance activities.



The watchlist view:

- Allows tracking of high-priority or cross-functional tasks without direct ownership.
- Supports monitoring of relevant tasks across multiple workstreams.
- Keeps supervisors, coordinators, and compliance officers informed of relevant updates.

The Tasks page helps you manage duties efficiently, ensuring proactive compliance with regulations within set timelines.

The following image shows the Tasks page in the Compliance Workspace.

Tasks page

Source document import tasks

The Regulatory Change Management application processes external alerts that may include citation titles, citation numbers, and references to legislative or regulatory materials relevant to compliance.

Each alert record contains metadata that supports the import of the document into the regulatory library. The metadata includes citation names and other relevant reference information for proper classification and traceability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regulatory alerts of the source document type provide citation titles and citation numbers when received. Source documents may reference legislative or regulatory materials relevant to compliance and governance.

Unassigned source document alert records are assessed to determine applicability. If marked as applicable, a source document import task is created automatically. The import task originates from the regulatory alert record and follows a defined workflow or life-cycle. The source document import life-cycle begins when the alert is marked applicable by a user with the `sn_grc_reg_change.manager` role. The import document task then appears in the Ready to import state for stakeholder review.

Compliance team members evaluate the citation associated with the alert and determine the appropriate action. Each import task facilitates ingestion of a specific source document into the regulatory library. Compliance team members are responsible for importing the document and maintaining consistency within the regulatory library.

You can associate multiple source document import tasks with a single regulatory alert. This configuration simplifies management and improves tracking of regulatory content ingestion processes. Each task adds relevant documents to the regulatory library for comprehensive capture and organization. Grouping tasks under one alert enhances traceability throughout the regulatory change management process.

New workflow of a source document import task

Upgrade the following applications to get the new workflow:

- GRC: Common Workspace Elements (`sn_grc_workspace`)
- GRC: Regulatory Change Management (`sn_grc_reg_change`)

Starting with version 19.0.x, a source document task progresses through the following states:

- Ready to Import- The task has been identified and prepared for import into the system. No work has started yet.
- In Progress- The task is actively being worked on. This includes analyzing the source document and defining necessary regulatory changes.
- Implementation- Identified changes are being executed. This may involve creating related tasks such as policy updates, control modifications, or process changes.
- Awaiting Approval- All implementation activities are complete, and the task is pending review and approval from the appropriate stakeholders or compliance team.
- Closed- The task has been reviewed, approved, and all required actions are completed. No further work is needed.

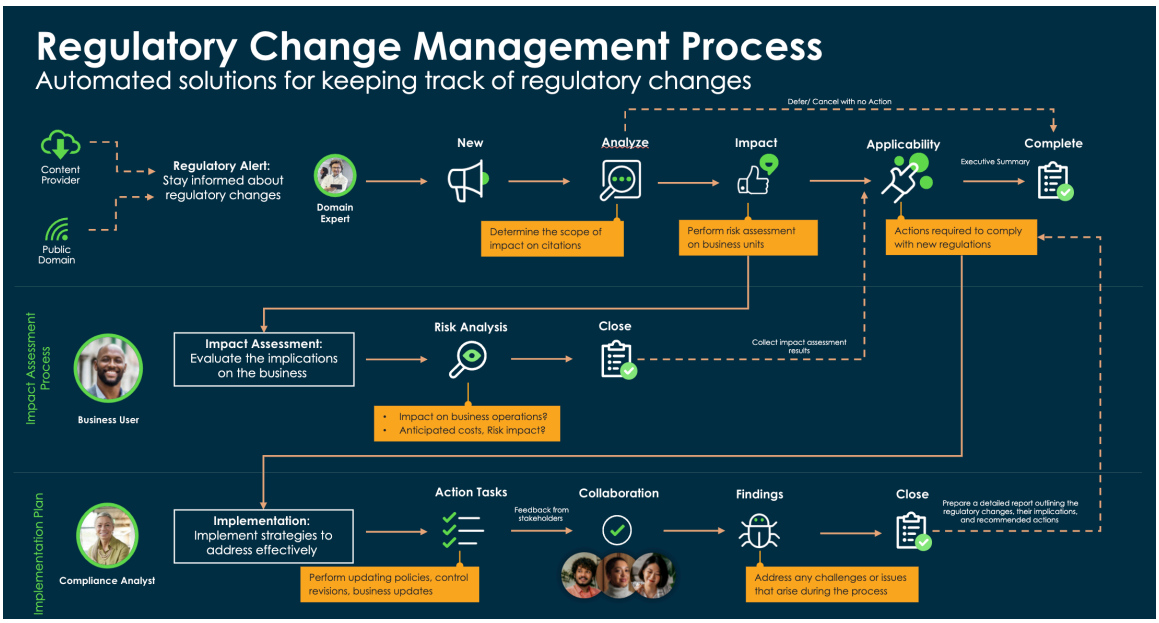
Regulatory process flow and tasks

The Regulatory Change Management process flow includes the tasks that different users can perform to help your organization manage and comply with regulatory changes.

Regulatory alerts are sourced from the external providers that provide the data as regulatory alerts. The alert may be received as Really Simple Syndication (RSS) feeds or from an external provider such as the Thomson Reuters Regulatory Intelligence (TRRI). The Regulatory Change Management application receives the new regulatory changes that are applicable to an organization.

The Regulatory Change Management application has the following user roles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- RCM administrator: A user who has the sn_grc_reg_change.admin role.
- RCM Manager: A user who has the sn_grc_reg_change.manager role.
- RCM User or coordinator: A user who has the sn_grc_reg_change.use role. This user ensures that the regulatory changes are assigned to the correct teams and that the changes are completed in time.
- Business user role: A user who has the sn_grc.business_user role.
- Risk or Compliance manager: A user who has the sn_risk.manager or sn_compliance.manager role. This user would perform the changes as part of the Regulatory Change Management application.

For more information about the roles, see User roles in Regulatory Change Management.

Regulatory Change Management process flow

The following infographic shows the Regulatory Change Management process flow.

Regulatory Change Management process flow and tasks performed by different users

The steps to complete the Regulatory Change Management process flow are:

1. Set up the integration. Your customers can subscribe to a public RSS feed for the regulatory bodies or they can subscribe to a subscription provider such as TRRI that is a curated intelligence provider. A subscription provider can aggregate the regulatory changes from different sources and provide the collective changes as feeds.
2. Set up an internal taxonomy. The taxonomy elements are the different classifiers that an organization can apply to its regulatory content to categorize it. You can use taxonomy elements to create a hierarchical structure of different classifications for setting up the regulatory content for an organization.
3. Review a regulatory alert. A user with the sn_grc_reg_change.manager role (RCM manager) reviews a regulatory alert and assigns it to a coordinator or a user with the sn_grc_reg_change.user role (RCM user). The user with the sn_grc_reg_change.user role reviews the alert. If the regulatory change requires an impact assessment, the RCM user sends it to a subject matter expert (SME) with a business user role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Assess the impact. The subject matter expert (SME) with a business user role assesses the impact of the regulatory change and sends the score of the impact assessment to the Regulatory Change Management application. If the alert is not applicable to the organization, the RCM user closes the alert. If the alert is applicable to the organization, the RCM user creates a new regulatory change task and assigns it to the same or a new coordinator.
5. Devise an action plan. The coordinator identifies the steps to comply with the regulatory change, devises an action plan, and creates the action tasks for the different teams that need to complete the identified action items. The coordinator then creates the action tasks that are associated with the regulatory change task. After the action plan is created, it's sent to the RCM manager for an approval. The manager reviews the action plan and confirms if more action tasks need to be created or if some of the action tasks aren't necessary.
6. Complete the action tasks. The compliance analyst sends the actions for approval to a user with the sn_grc_reg_change.manager role (RCM manager). If the action plan is rejected, the coordinator goes through the action plan, updates the actual tasks, and sends the action plan back for an approval. The compliance manager can see all compliance-based action tasks and the risk manager can see all the risk-based action tasks. After the tasks are assigned to the risk and compliance users, the action tasks are tracked until they are completed. A due date is marked and tracked for the action tasks. When the tasks are completed, the regulatory alert and the parent regulatory change tasks are closed and the change process flow is completed.

RSS feeds overview

A Really simple syndication (RSS) feed in Regulatory Change Management is like a subscription service for updates about new or changed rules and regulations. Instead of visiting multiple websites to check for updates, you can subscribe to feeds from regulatory bodies or industry news.

When a new regulation is published, it automatically appears in your feed, for example, getting notifications from a news app. This ability helps companies stay on top of important changes quickly and easily, ensuring they remain compliant with the latest rules.

Key benefits of RSS feeds

Automated updates

RSS feeds help compliance professionals monitor regulatory changes without manually checking multiple websites or sources.

Centralized information

By aggregating feeds from various regulatory bodies, companies can centralize all updates in one place, making it easier to track changes.

Timely alerts

Subscribing to relevant feeds ensures that stakeholders receive near real-time notifications of new regulations or amendments, which is critical for staying compliant.

Customization

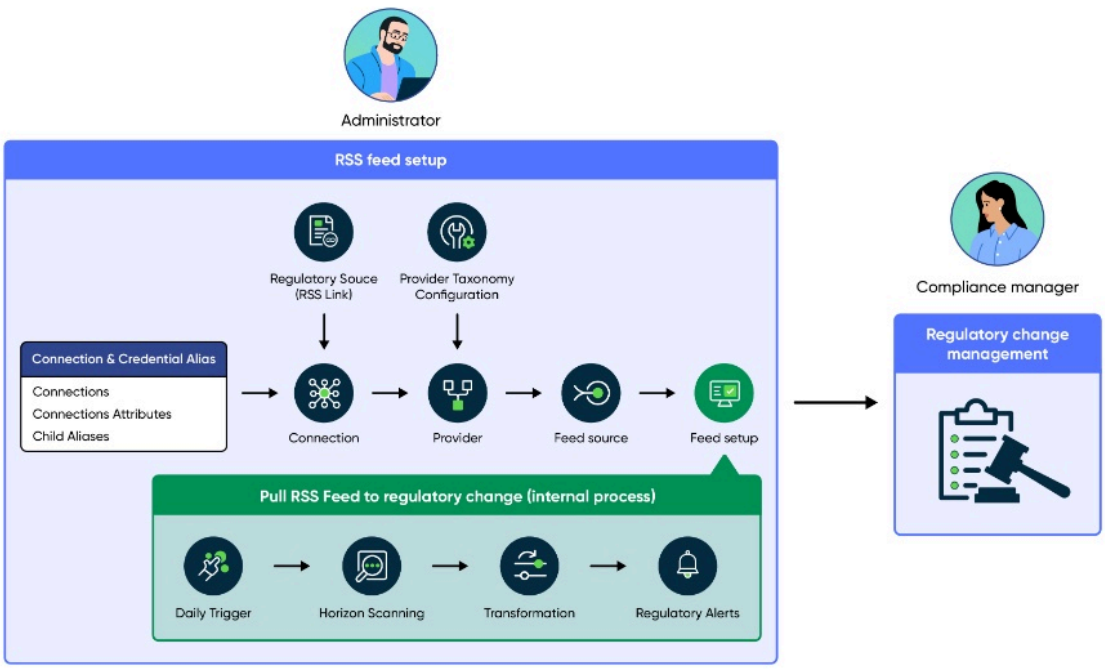
Users can tailor their feeds to focus on specific regions, industries, or types of regulatory changes relevant to their operations.

Example: RSS feed

A financial institution might subscribe to RSS feeds from regulatory bodies like the SEC, FINRA, or the European Central Bank. Updates from these feeds would inform the compliance team of new rules or guidelines affecting their operations. By leveraging RSS feeds, organizations can reduce the risk of missing critical updates and streamline their regulatory compliance processes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow to obtain RSS feeds



Establishing a robust connection to obtain your feeds requires you to perform the following actions:

1. Establishing the connection and credential aliases with the RSS feed sources.
2. Activating the RSS feed workflow.
3. Setting up feed sources.
4. Configuring the provider taxonomy.
5. Managing feed request responses

Note:
If you encounter issues while trying to obtain your RSS feeds, refer to General guidelines for RSS feeds.

The following image shows the workflow of RSS feeds are set up to ensure they pull the feed responses.

Workflow of setting up and pulling RSS feeds

General guidelines for RSS feeds

When an RSS feed isn't working, common errors or issues often stem from improper formatting, server issues, or misconfiguration. An RCM administrator can remediate some of the common errors that users may encounter.

Overview of common issues in RSS feeds

RSS issues often arise from invalid XML syntax, incorrect URLs, server or authentication problems, caching, incompatible media, outdated standards, size limits, encoding errors, or security and access restrictions. Here's a list of common problems that users may encounter and their general guidelines to help you get started.

Feed syntax errors

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The RSS feed XML isn't properly formatted, leading to parsing errors. To remediate this issue, perform the following checks because as per RSS Standards, all RSS feed files must conform with XML specifications:

- Validate the RSS feed using tools like W3C feed validation service.
- Check for missing or mismatched tags, unescaped characters, or improperly nested elements

Incorrect or outdated feed URL

This issue occurs when the URL for the RSS feed is incorrect or has changed. To resolve this issue, verify the feed URL and update it if necessary.

Server issues

This issue occurs when the server hosting the RSS feed is down or slow to respond. To resolve this issues, check server logs, ensure uptime, and optimize performance

HttpException: Session contains no certificates - Untrusted

This happens when the feed source is pointing to a site for which the certificates are expired. This must be handled by the customer. The customer can validate the source URLs in online validation portals. For example, https://validator.w3.org/feed/ & https://www.sslshopper.com/ssl-checker.html

Response size exceeds limit

This happens when the response from REST step is more than what is allowed. You can try increasing the limit by updating the value of property "glide.pf.rest.response_payload_max_size". Refer to https://www.servicenow.com/docs/bundle/xanadu-build-workflows/page/administer/flow-designer/reference/rest-request-action-designer.html for more information.

Response status is 404

This error occurs when the website doesn't function.

Other issues

Upgrade your instance and debug by looking at the execution logs for the flow titled **Pull RSS feed into regulatory change**.

Regulatory taxonomy overview

Regulatory taxonomy simplifies identifying necessary changes in a customer's regulatory library by enabling algorithms to match incoming regulatory intelligence to existing content using taxonomy terms.

Regulatory change management products can integrate intelligence data from multiple vendors. However, these vendors differ in:

1. Delivery mode: File-based feeds vs. stream-based feeds.
2. Data format: XML, JSON, CSV, and so on
3. Taxonomy information: Contextual metadata added to regulatory intelligence, such as geography, sector, or regulatory body.

Note:
To integrate with any regulatory intelligence provider, you need an active subscription and a connector to ingest the provider's data. You can use connectors from the ServiceNow Store or build your own.

Some examples of taxonomy are as follows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Geography: Identifies applicable regions, for example, North America, Paris, or New Delhi.
- Sector: Defines relevant industries, for example, Banking, IT, or Logistics.
- Regulatory Body: Lists regulatory organizations, for example, NIST, European Central Bank.

Some vendors include additional categories like regulatory themes or topics.

Note:
Access to external content requires an end-user license to authorize the credentials granted by technology partners.

Benefits of mapping taxonomy

Users of Regulatory Change Management often use their own terms for business reasons, creating mismatches between external and internal taxonomies. For example, the vendor term could be North America while the users may term it as USA and Canada or vendor term could be Singapore and the user term could be Southeast Asia. To ensure accurate mapping, administrators must manually align external taxonomy terms with their internal taxonomy. This process is known as taxonomy mapping. Mapping taxonomies can sometimes be a challenge for many users. Regulatory Change Management provides the ability to integrate taxonomy-mapping capabilities. For more information, refer to Map the taxonomy.

Impact assessments for the regulatory alerts

A regulatory event alert may result in a regulatory change to an organization. You can evaluate the impact of the regulatory change on your organization by performing impact assessments.

Regulatory updates are frequent and come from various sources. These updates often involve a high volume of complex information that the regulatory domain experts must address. The first task for a regulatory change manager is to interpret the update and determine its implications for the business. This involves identifying affected policies, controls, or citations, and specific regulatory references or requirements.

Types of impact assessments

The impact assessment process is used as a reporting tool for evaluating the impact of a proposed regulatory change. For a given regulatory event alert, the assigned user triggers an impact assessment to a subject matter expert who is an expert in a certain regulatory area. The expert then performs an impact assessment on the regulatory event alert. Impact assessments are of the following types.

- Risk assessment: This process traditionally uses a risk-based approach to prioritize and manage the impact of the regulatory updates. This approach helps experts focus on the entities most likely to be affected. The findings and responses generated from this risk assessment process are gathered and documented systematically. This ensures that your organization can track compliance actions, and mitigate risks. Refer to Respond to a regulatory alert risk assessment to understand how to respond to a risk assessment.
- Regulatory assessment: This assessment utilizes the Smart Assessment Engine to perform smart assessments on regulatory alerts. In this assessment you can customize your impact assessment process by creating your own assessment questionnaire templates. For example, if your organization deals with regulations like the Digital Operational Resilience Act (DORA) or the European Union AI Act, you can design assessment templates focused solely on the aspects and obligations of these regulations. To learn more about a regulatory assessment, refer to Regulatory assessment for a regulatory alert. For more information about Smart Assessment Engine, refer to Smart Assessment Engine.

Note:
For more information on how to initiate either of these assessments, refer to Assess the impact of a regulatory alert.

Regulatory assessment for a regulatory alert

Utilize the Smart Assessment Engine to perform smart assessments on regulatory alerts. This ability enhances regulatory decision-making by enabling impact assessments directly at the regulatory alert level, streamlining processes through a unified core assessment framework, and assigning analysis to multiple stakeholders for improved collaboration and efficiency.

When you initiate an assessment to assess the impact of a regulatory alert, you get an option select either to start a regulatory assessment or the classic risk assessment. Regulatory assessment utilizes the Smart Assessment Engine application and when it is initiated, a new related list called **Regulatory assessments** is available on a regulatory alert that displays the list of uniquely generated regulatory assessments. The assessor can access the assessment from the unified **Tasks** page on the Employee Center. The unified **Tasks** page provides you a consolidated view of all your tasks, including all assessments, enabling you to access and complete them efficiently. For more information on how to perform a regulatory assessment, refer to Respond to a regulatory assessment.

To understand the benefits of using the Smart Assessment Engine, refer to Exploring Smart Assessment Engine.

To understand the process of creating assessment templates and questionnaires, refer to Configuring Smart Assessment Engine.

To understand how to initiate assessments, see Assess the impact of a regulatory alert.

Next Experience Discuss and Chat Collaboration

On a regulatory change management case, select **Discuss** from other options. Collaborate with virtual agents by using **Next Experience Chat Collaboration** and Discuss.

- Using Next Experience Chat and Discuss streamline communication and enhance collaboration among distributed risk and compliance teams working on compliance cases/ requests.
- Fill out preliminary information and context for the discussion. Identify subject matter experts to help and collaborate within the discussion. Managers can access multiple discussions at once using the docked windows feature.
- Identify subject matter experts to help and collaborate with the discussion.
- Managers can access multiple discussions at once using the docked windows feature.

Regulatory Change Management application in the Compliance Workspace

Starting with GRC: Regulatory Change Management, version 13.0.1, the Regulatory Change Management application is available in Compliance Workspace. Compliance Workspace provides your users with a single-pane view so that they can check upcoming regulatory changes, assess their impact, and implement risk and compliance-related changes for the organization.

You can access Regulatory Change Management in the Compliance Workspace using the regulatory change icon  icon.

Highlights of the Regulatory Change Management application in Compliance Workspace

The Compliance Workspace using the provides a single-pane view with a personalized experience and simplified user journey for your users.

- The default home page for the Regulatory Change Management manager displays actionable insights and quick links.
- The contextual side panel displays the regulatory taxonomy for each regulatory alert record.
- View the number of overdue or open risk and regulatory assessments.
- The record pages provide a quick summary and insights that are specific to what is being viewed.
- The form layout, field labels, messages, and breadcrumb navigation provide a consistent experience to the users across the ServiceNow AI Platform.
- A 360° view provides an overview of the data relationship for a record across an enterprise.

Regulatory Change Management application views in Compliance Workspace

The Regulatory Change Management application in Compliance Workspace contains the following views for the users.

Home page view

Provides an overview of the compliance posture of your organization.

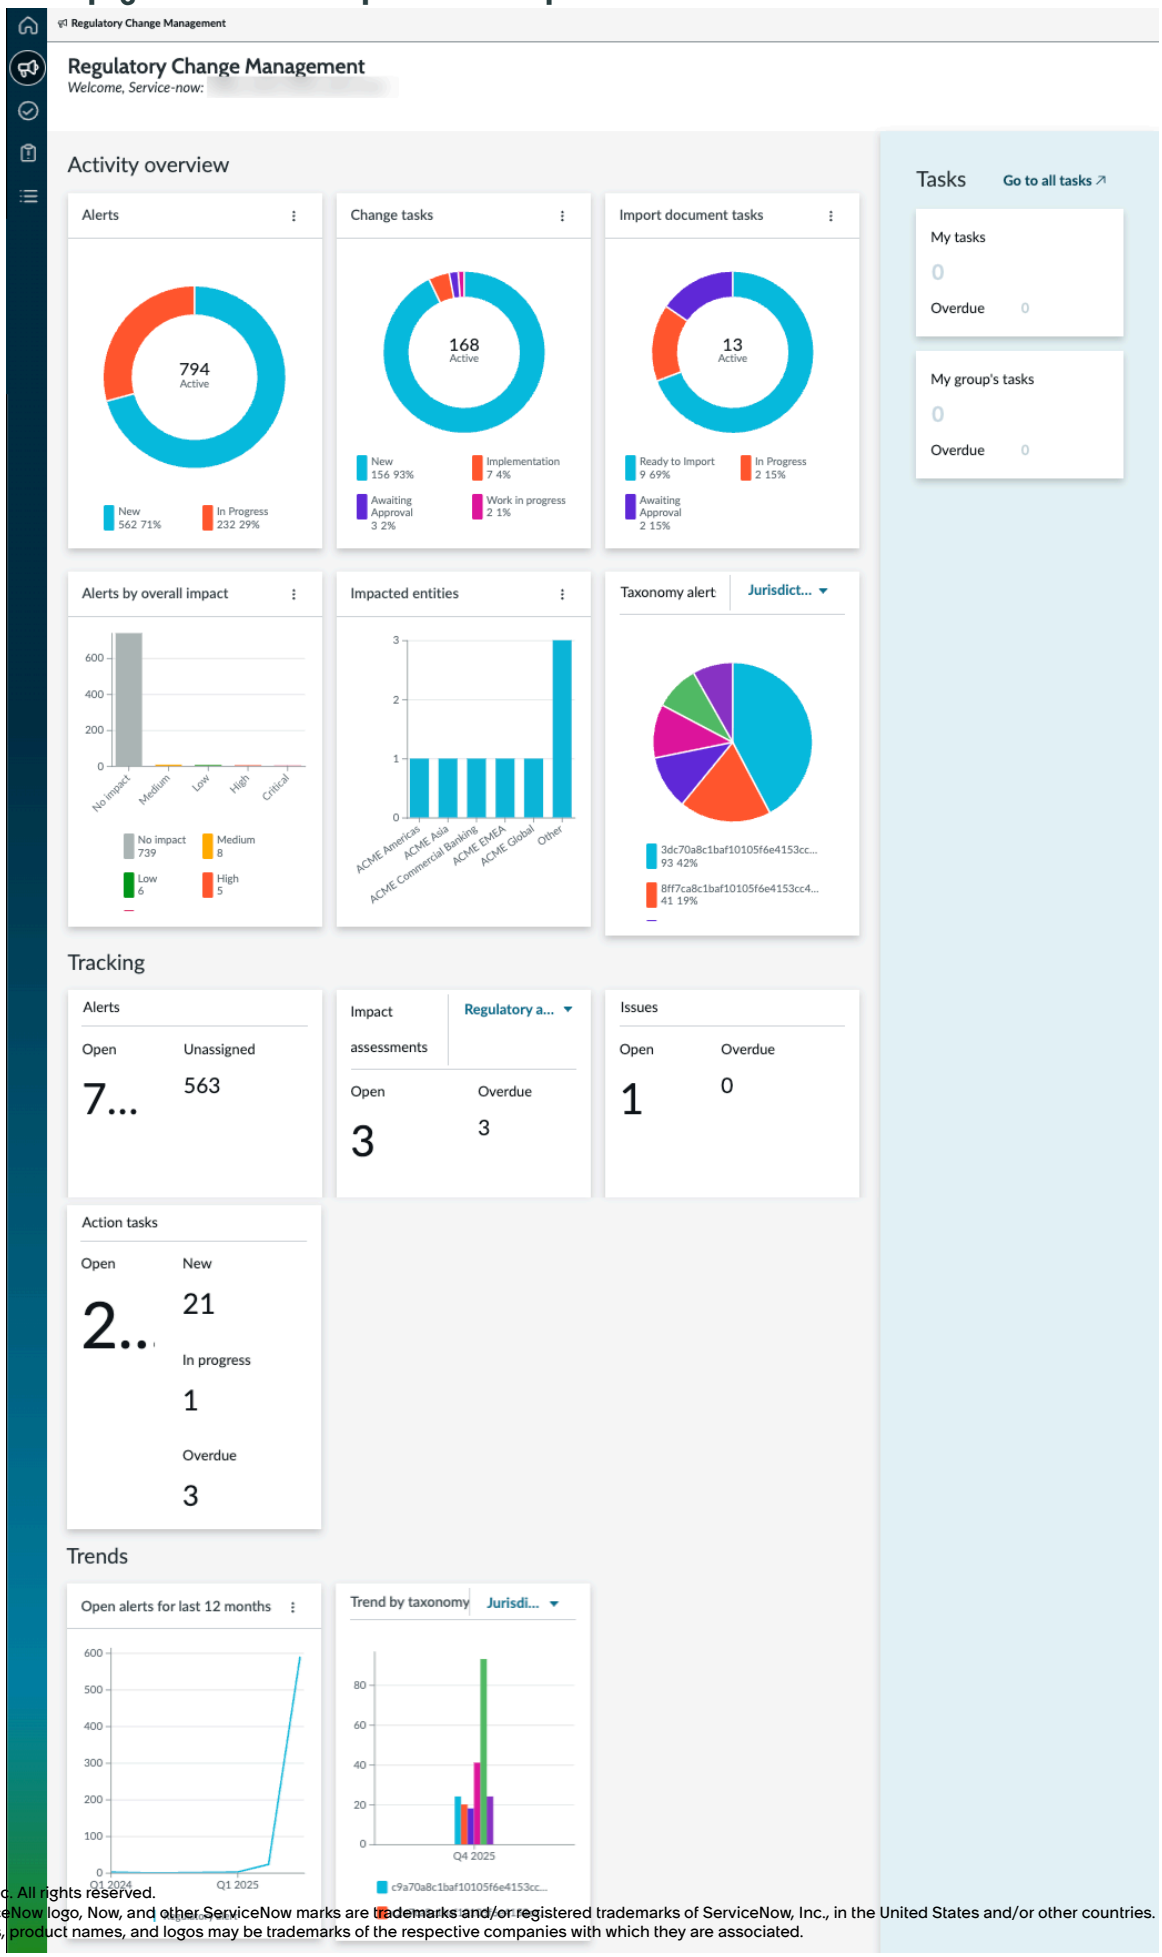
Regulatory Change Management application landing page view

Provides an overview, trends, and tracking status of the regulatory activity across your organization.

Tasks view

Provides an overview of the tasks that are assigned to the users, user groups, reported items, and watchlist.

Issues overview landing page view



Provides an overview, tracking status, and performance trends of the issues.

List view

Provides the list of the GRC objects in the Compliance Workspace.

Note:
GRC administrators configure the tasks and issues in the Landing Page Configurations module in the classic user interface. These tasks and issues are visible to the end users in the landing pages of various workspaces. For more information, see Landing Page Configurations module.

Configuring your compliance needs and integration with regulatory content providers

Configure the Regulatory Change Management application to manage your compliance needs and integration with regulatory intelligence content providers.

A typical configuration of the Regulatory Change Management application consists of the following steps:

1. Download the Regulatory Change Management application from ServiceNow Store. For more information, see Download Regulatory Change Management application.
2. Do the setup tasks for the Administration module. For more information, see Manage Administration portal.

Download and install GRC: Regulatory Change Management

Download the GRC: Regulatory Change Management application from the ServiceNow Store and run it in your ServiceNow instance.

Before you begin
Role required: sn_grc_reg_change.manager, sn_grc_reg_change.it_admin, or sn_grc_reg_change.admin

Procedure

1. Download the GRC: Regulatory Change Management application from the ServiceNow Store. Follow the instructions for Download a GRC application from the ServiceNow Store for the first time. Downloading the Regulatory Change Management application automatically installs the following required applications:
   - GRC: Policy and Compliance Management
   - GRC: Advanced Risk
2. In your instance, navigate to **All** > **System Applications** > **All Available Applications** > **All**.
3. Locate GRC: Regulatory Change Management.
4. Select an appropriate release in the Details section.
   You can select either the latest release or up to one of the two previous releases.
5. Select **Install**.
   A new Application installation window is displayed.
6. Confirm the details of the application and select **Install**.

Result
The GRC: Regulatory Change Management application is installed on your ServiceNow instance.

Setup checklist for Regulatory Change Management

Complete the tasks that are required to set up the Regulatory Change Management application. When you have completed these tasks, the base system is ready for operation. Optional setup procedures are also included to enhance Regulatory Change Management application functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_grc_reg_change.admin

Ensure that the following applications are installed:

- ServiceNow® GRC: Policy and Compliance Management application
- ServiceNow® Advanced Risk application

Procedure

1. Install the Regulatory Change Management (RCM) application from the Store.
   For details, see Download and install GRC: Regulatory Change Management.
2. Assign RCM roles to the users.
   For details, see User roles in Regulatory Change Management.
3. To set up the feeds, choose one of the following options.

4. Create and validate the connections and credentials.
   For details, see Establish an SFTP or REST API connection.
5. Activate the integration flows.
   For details, see GRC integration with Thomson Reuters Regulatory Intelligence and Setting up the RSS feeds infrastructure.
6. Create an internal regulatory taxonomy and map the taxonomy.
   For details, see Map the taxonomy.
7. Assign regulatory feeds.
   For details, see Manage and assign regulatory event alerts.
8. Assess the impact and assign related regulatory tasks.
   For details, see Manage the regulatory change tasks.
9. Prepare an action plan to identify the changes that must be done.
   For details, see Action tasks in Regulatory Change Management.
10. Create action tasks to implement the identified changes, and complete them.
    For details, see Create an action task.
11. Provide an overview of the regulatory changes via dashboards and reports.
    For details, see Regulatory Change Management dashboard.

Setting up the RSS feeds infrastructure

To ensure you can obtain all the necessary Really simple syndication (RSS) feeds in your ServiceNow instance, you must set up the infrastructure required to seamlessly obtain the feeds.

Properly configured infrastructure allows seamless integration of RSS feeds, enabling you to stay updated without disruptions. As an RCM administrator or IT administrator, ensure all prerequisites are in place for optimal performance. If you encounter issues while trying to obtain your RSS feeds, refer to General guidelines for RSS feeds.

Activate and pull RSS feeds

Use the Workflow Studio to pull RSS feeds from the defined RSS sources after you activate the workflow. Regular pulling of RSS feeds ensures that you to stay on top of all your regulatory compliance needs. By default, the schedule to pull the feeds runs daily.

Before you begin

The workflow to pull RSS feeds is built with ServiceNow® Workflow Studio, so make sure you're familiar with the Flow Designer basics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The RCM IT Admin schedules the Pull RSS Feed to Regulatory Change flow to run on a daily, weekly, or monthly basis and sets up the time for the flow.

Procedure

1. Navigate to **All** > **Regulatory Change Management** > **RSS Feeds**.
2. To set up the RSS feed, select **Feed setup**.
3. From the Feed Setup module, complete the following steps.
   a. Select the **Pull RSS Feed to Regulatory Change** in the Flow Designer UI page.
   b. Select **Test** and then **Activate** to activate the flow.

Result

Upon successful activation of the flow, the system starts scanning the Regulatory Horizon to fetch the latest regulatory updates from the regulator websites.

Set up RSS feed sources

Set up RSS feed sources to efficiently aggregate and monitor updates from multiple websites or content providers in one centralized location. This saves time, ensures you stay informed, and enables automated data retrieval.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Regulatory Change Management** > **RSS Feeds** > **Feed Sources**.
2. Select **New**.
3. On the form, fill in the fields.

Feed source table

Field	Description
Name	Name of the website that generates and provides the RSS feed. For example, `Consumer Financial Protection Bureau Alerts`.
Connection	Connection that has the details from which the feed would be obtained. For more information, refer to Create an HTTP(s) connection.
Active	Option to denote if the source is active. Only active sources are able to fetch the feeds.
Provider	Service or platform that generates and distributes RSS feeds for websites or content creators.

4. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The feed source is set up and ready to provide the feed to your instance.

Map the taxonomy

Create an internal taxonomy when you are setting up the Regulatory Change Management application. Map the external taxonomy to the internal taxonomy so that the Regulatory Change Management application refers to only one taxonomy.

Before you begin
Role required: sn_grc_reg_change.admin

About this task
The Regulatory Change Management application stores the taxonomy and it provides a way to map the taxonomies using the UI component.

Procedure

1. Navigate to **Application** > **Regulatory Change Management** > **Taxonomy** > **Taxonomy Classes**.
   The pre-defined taxonomy classes are displayed:
   - Content Types- Content types provide site-specific control of how system data defined by templates is rendered.
   - Jurisdictions- Jurisdictions in regions are used for data breach notification obligations as each obligation is broken down by jurisdiction.
   - Regulatory Bodies- Regulatory bodies that govern the regulations. For example, RBI, SEBI, SEC, TRRI, and so on.
   - Sectors- Sectors businesses that are governed by government rules. For example, FRM, FDIC, SEC.
   - Themes- Themes indicate the ares that organisations should consider in their regulatory change management.
2. Navigate to the following taxonomy tables if you want to view or update the taxonomy class name:
   - **Content Types**
   - **Jurisdictions**
   - **Regulatory Bodies**
   - **Sectors**
   - **Themes**

   As an example, when you select Jurisdiction, the Class name field displays Jurisdiction as the taxonomy class.

   Note:
   Only users with the sn_grc_reg_change.admin roles can update the taxonomy tables.

3. Select **Update** to update the class name.
4. Select **New** under Taxonomy class related list.
   A new Taxonomy class record is displayed on a separate page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Taxonomy class record

Field	Description
Name	Name of the taxonomy class.

The new taxonomy class is displayed on the Taxonomy Class page.

5. Open the Taxonomy Class page to create a new Taxonomy class mapping record.
6. On the form, fill in the fields.
   Depending on what regulatory table was previously selected, the form title is different.

Taxonomy class mapping record

Field	Description
Provider	Provider of the alerts.
External taxonomy class	External taxonomy class that is mapped with the internal taxonomy class.
Taxonomy class	Taxonomy class provided by default such as Jurisdictions or Content type.

7. Select **Submit** to map the external taxonomy class to the internal taxonomy class.
   The external taxonomy class is mapped to the internal taxonomy class.

Configure a provider taxonomy configuration record

Align the provider with the appropriate taxonomy profile to categorize regulatory intelligence data and feeds for informational reporting purposes. This approach is particularly useful when integrating multiple feed sources, as it ensures consistent naming conventions across systems or applications.

Before you begin

Role required: sn_grc_reg_change.admin

Note:
Certain fields on this form are only visible if the *`Default Taxonomy Configuration`* property is set to **true**.

Procedure

1. Navigate to **Application** > **Regulatory Change Management** > **RSS Feeds** > **Provider Taxonomy Configuration**.
2. Select **New** on the page.
3. On the form, fill in the fields.

Provider taxonomy configuration record form

Field	Description
Provider	Provider of the taxonomy configuration record.
Default taxonomy configuration	Option to use the default taxonomy configuration. Clear the default taxonomy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	configuration option to see the Taxonomy Loader configuration.
Taxonomy	Internal taxonomy to which the external taxonomy is mapped. Unlock the list to add the taxonomy.
Taxonomy Loader	Taxonomy Loader configuration field when the default taxonomy configuration option is unchecked. Select the import mode for importing the taxonomy data: ○ Data source: Use Data source if the taxonomy can be imported via ServiceNow platform data source. ○ Custom script: Use Custom script if the taxonomy import needs custom logic. For Data source: Update the following fields: ○ Data source: Data source to be defined such as Azure AD, Auth0. For more information, refer to, Create a data source. ○ Scheduled data import: The import job that runs the data source frequently. For more information, refer to Schedule a data import. For Custom script: Update the following fields: ○ Taxonomy file required: Select the check box if the data to be imported via the selected mode needs a file to be attached. ○ Variables: Use the variables defined in the script. ○ Script: Script to be populated. This is a required step.

4. Select **Submit**.

Result

The new provider taxonomy configuration record is listed on the Provider taxonomy configuration page.

Managing feed request responses

When the job to pull RSS feeds runs at the scheduled time, the responses are automatically fetched from the configured feed sources.

No manual effort is required to fetch the response from an RSS feed.

Administration module

Use the Administration module to manage third-party providers and the configuration of entity classes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regulatory Intelligence providers deliver regulatory alerts that include a variety of regulatory changes. Each regulatory alert record contains the taxonomy section for the regulatory taxonomy associated with the alert. This taxonomy helps in classifying and categorizing the alert. The internal taxonomy design contains the following five elements:

- Regulatory Body
- Sector
- Theme
- Content Type
- Jurisdiction

When setting up the Regulatory Change Management application, you have to map the external taxonomy to your own internal taxonomy for standardization. The design elements are created and mapped from the provider's external taxonomy during the setup process.

After you set up the internal taxonomy, the next step is to update the provider configuration record with the name and description of the providers. To maintain a generic provider configuration, a provider record is used. Providers can send the data via multiple combinations, such as via a single file or as an API. To learn more, see Map the taxonomy.

You can use the Administration module to configure various records. You can do the following:

- Update provider configuration record to define and receive the data from the providers.
- Configure the entity classes that may be impacted due to the regulatory changes.

Using Regulatory Change Management

You can use the classic environment to perform all Regulatory Change Management application activities.

As an RCM manager with the sn_grc_reg_change.manager role, you can capture any problems or exceptions that are observed during the workflow by assigning regulatory alerts or creating an action task or issue that is related to the regulatory change tasks and source document tasks. You can also monitor the regulatory change tasks and action tasks.

You can also use a setup checklist that can help you to get your base system ready for operation.

Starting with version 18.1.2, all the new features and enhancements are available only in the Workspace view.

Regulatory Change Management Playbook

Configure a Regulatory Change Management RCM playbook for your organization or business by following this process:

1. Manage your user entitlements, include the customers and providers that read and access the regulatory content, and establish a regulatory team:
   - Designate a team of subject matter experts, legal counsel, or compliance professionals that can track regulatory changes.
   - Include the representatives from legal, audit, compliance, risk management, and operational departments.
   - Include your customers and providers. You include the customers who subscribe to a public RSS feed for the regulatory bodies or a subscription provider, such as Thomson Reuters Regulatory Intelligence (TRRI). You also include the providers, such as Thomson Reuters

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regulatory Intelligence (TRRI), that aggregate the regulatory changes from different sources and provide the collective changes as feeds.

- Set up an internal taxonomy. The taxonomy elements are different classifiers that an organization can apply to its regulatory content to categorize it. You can use taxonomy elements to create a hierarchical structure of the different classifications for setting up the regulatory content for an organization.

2. Monitor the regulatory changes:
   - Stay informed about the new and updated regulations that could affect your organization or business.
   - Subscribe to industry newsletters, updates for the regulatory bodies, and relevant legal databases that are made publicly available and accessible via RSS.
   - Integrate with regulatory intelligence providers such as Thomson Reuters or LexisNexis, to monitor changes in real time.
3. Assess the impact:
   - Evaluate the implications of regulatory changes on your organization or business.
   - Analyze regulatory changes:
     a. If you have the sn_grc.business_user role (Business User), review the regulatory alerts and assign them to a user with the sn_grc_reg_change.user role (RCM user) for review. If the regulatory change requires an impact assessment, the RCM user sends it to a subject matter expert (SME) with a business user role.
     b. Review the new regulations and draft new requirements, policies, or control measures.
     c. Determine the scope of the impact on your various business units including the functions, departments, and processes.
4. Conduct an impact assessment:
   a. Perform a risk assessment or gap analysis to evaluate the potential impact on the operations, finances, and compliance of your organization or business.
   b. Assess the impact of the regulatory change and send the impact assessment score to the Regulatory Change Management application. If the alert is not applicable, close the alert. If the alert is applicable, create a new regulatory change task and assign it to the same or a new coordinator.
   c. Engage stakeholders from affected departments to gather insights.
5. Perform a gap analysis:
   a. Identify your current state. Assess your existing inventory of policies, citations, and controls in relation to the new regulations.
   b. Identify gaps. Compare the current state with the new regulatory requirements (draft, final rules, or enforcement actions) to identify any discrepancies.
   c. Prioritize gaps. Evaluate the significance (high, medium, or low) of each gap by the potential risk and impact to your organization or business.
   d. Develop a gap remediation plan. Create a plan to address the identified gaps, and specify the actions, timelines, and responsibilities for your organization or business.
6. Document your findings:
   a. Prepare a detailed report that outlines the regulatory changes, their implications, and recommended actions.
   b. Report the regulatory findings, compliance deviations, or non-material outcomes that are due to the regulatory change.
7. Manage the regulatory changes and strategies:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Implement strategies to address the regulatory changes.
- Develop an implementation plan:
  a. Identify the steps to take to comply with the regulatory change, devise an action plan, and create the action tasks for different teams. After the action plan is created, send it to the RCM manager for approval and to confirm that all the action tasks are sufficient or if any aren't necessary.
  b. Create a clear action plan that details the actions required to comply with the new regulations. The action plans could be legal review, business change, policy updates, control revisions, or training.
  c. Define the timelines, resources or watch list teams, and responsibilities.

8. Communicate changes:
   a. Inform all relevant stakeholders about the regulatory changes and the planned actions.
   b. Provide the training and resources to help employees understand and adapt to the new requirements.
9. Update your policies and procedures:
   a. Revise your existing policies, procedures, or controls to align with the new regulations.
   b. Confirm that your documentation reflects the changes and is easily accessible.
10. Monitor your implementation plan:
    a. Track the progress against the implementation plan.
    b. Address any challenges or issues that arise during the process.
11. Review your plan and identify ways to keep improving it:
    - Evaluate how effective the regulatory change management process is and make improvements where needed.
    - Conduct post-implementation reviews:
      a. If the action plan is rejected, assign the same coordinators to go through the action plan, update the actual tasks, and send the action plan for an approval. All compliance-based action tasks are visible to the compliance manager and risk managers can see the Risk-based action tasks. After the tasks are assigned to the risk and compliance users, track the action tasks through completion. Select a due date and track the action tasks. After the actual tasks are completed, close the regulatory alert and the parent regulatory change tasks.
      b. Assess the effectiveness of the implemented changes and compliance status.
      c. Gather feedback from your stakeholders to identify the areas for improvement.
12. Update the playbook:
    a. Revise the playbook based on the lessons learned and evolving usage guidelines.
    b. Incorporate the feedback to enhance the monitoring and management processes.

Create an action task

Create an action task that is related to the regulatory change tasks and source document import tasks so that you can complete the regulatory tasks.

Before you begin

Role required: sn_grc_reg_change.manager, sn_grc_reg_change.user, or sn_grc_reg_change.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
