Governance, Risk, and Compliance

Respond to business risks in real time. Connect security and IT with an integrated risk program offering continuous monitoring, prioritization, and automation.

Governance, Risk, and Compliance applications

Audit Management

Use risk data to scope and prioritize audit plans and automate cross-functional processes.

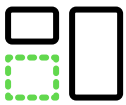
Business Continuity Management

Plan, exercise, and recover from disasters effectively and efficiently.

Compliance Case Management

Report, investigate, analyze, and resolve compliance cases.

Continuous Authorization and Monitoring



Accelerate the process of bringing IT systems online and continuously monitoring them.

Model Risk Management

Learn how you can use the Model Risk Management application to identify, assess, validate, and address risks associated with a model throughout their life-cycle.

Operational Resilience

Gain real-time visibility into the resilience of your technology, people, processes, and facilities.

Policy and Compliance Management

Automate and manage policy life-cycles and continuously monitor for compliance.

Privacy Management

Manage privacy risk and compliance across the enterprise in real time.

Regulatory Change Management

Keep pace with today's complex regulatory landscape with integration to leading content providers.

Risk Management

Enable fine-grained business impact analysis to appropriately prioritize and respond to risks.

Smart Assessment Engine

Reduce the manual burden and costs of your risk assessment processes through automation.

Third-party Risk Management

Continuously monitor, detect, assess, mitigate, and remediate risks in third-party ecosystems.

Common GRC features

Leverage the power of entities, 360 degree views, the tasks landing page, and security features across GRC products.

Request apps on the Store

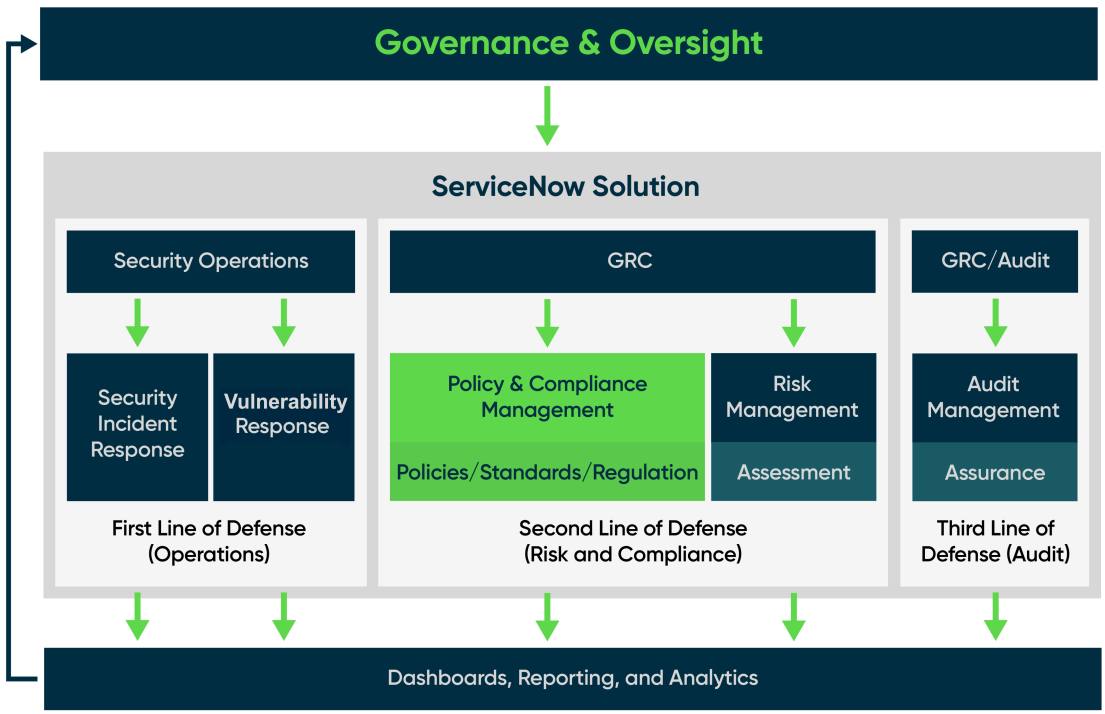
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Respond to business risks in real time with ServiceNow GRC

ServiceNow Governance, Risk, and Compliance (GRC) helps transform inefficient processes across your extended enterprise into an integrated risk program. Through continuous monitoring and automation, the GRC applications deliver a real time view of compliance and risk, improve decision making, and increase performance across your organization and with vendors.

Only ServiceNow applications can connect the business, security, and IT with an integrated risk framework that transforms manual, siloed, and inefficient processes into a unified program that is built on a single platform.

View and download the full info card for a highlight of GRC features.



Streamline and automate activities in the face of an emergency

Mobilize your business continuity efforts during natural disasters and pandemics like COVID-19.

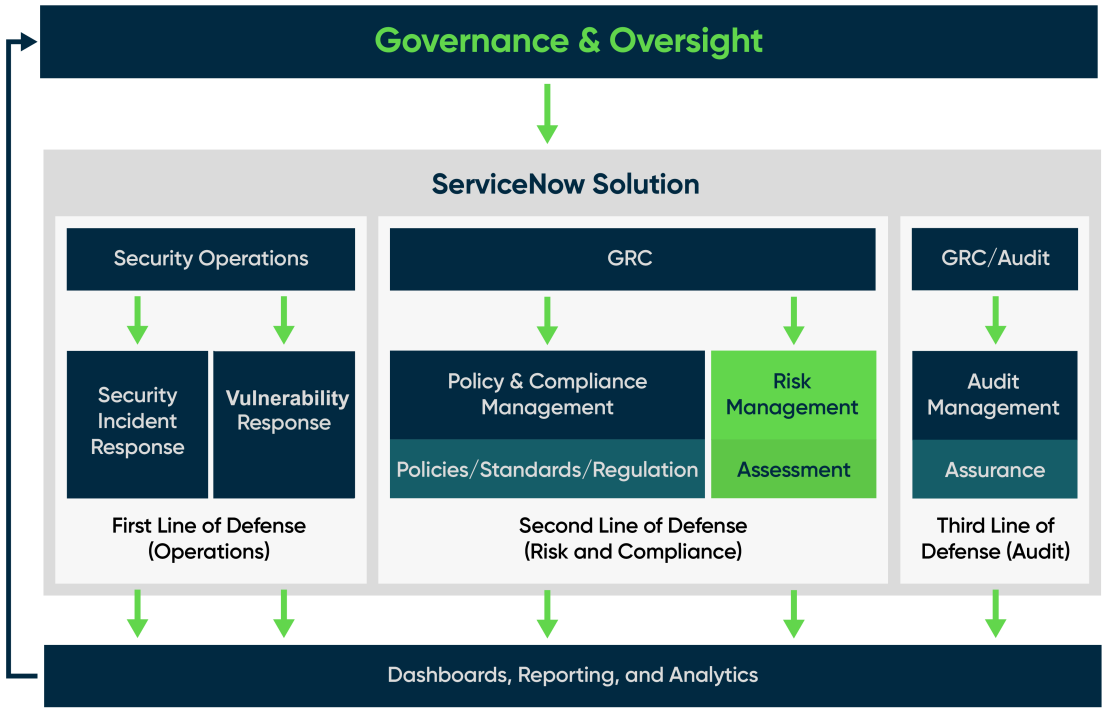
	Automate and manage policy life cycles and continuously monitor for compliance. It makes perfect sense to embrace a single platform that can make all compliance efforts more organized, simpler, more transparent, and highly reliable.
	Enable fine-grained business impact analysis to appropriately prioritize and respond to risks. Respond to business risks in real-time with integrated risk management.
	Use risk data to scope and prioritize audit plans and automate cross-functional processes. Reduce audit costs, improve efficiency, and minimize risk.
	Continuously monitor, detect, assess, mitigate, and remediate risk in vendor ecosystems. As your vendors become privy to more of your sensitive systems and data, their risk and compliance posture becomes even more important to your security. It's important to assess your vendors regularly and proactively mitigate any issues that arise.



Automate and manage policy life cycles and continuously monitor for compliance

The ServiceNow® Policy and Compliance Management product provides a centralized process for creating and managing policies, standards, and internal control procedures. The process automatically cross-maps the procedures to external regulations. Also, the application provides structured workflows for the identification, assessment, and continuous monitoring of control activities.

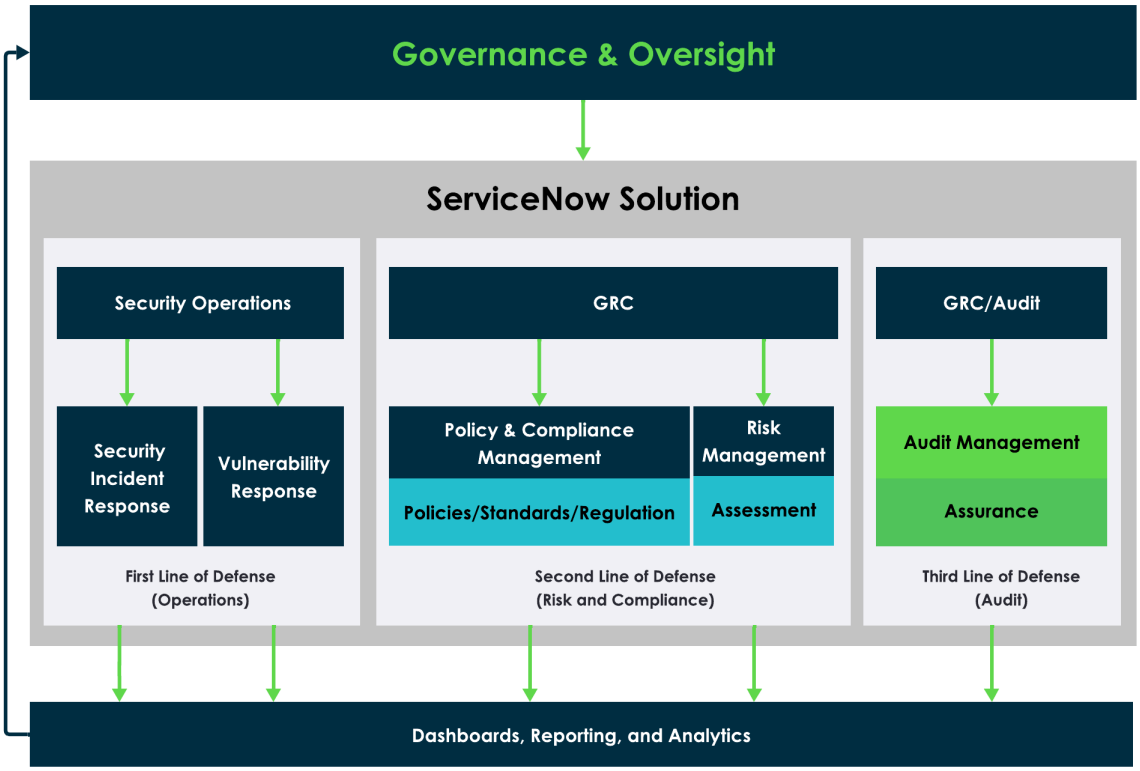
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Enable fine-grained business impact analysis to appropriately prioritize and respond to risks

The ServiceNow Risk Management product provides a centralized process to identify, assess, respond to, and continuously monitor Enterprise and IT risks that may negatively impact business operations. The application also provides structured workflows for the management of risk assessments, risk indicators, and risk issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use risk data to scope and prioritize audit plans and automate cross-functional processes

The ServiceNow Audit Management product automates the work streams of internal audits teams, optimizing resources and productivity, and eliminating recurring audit findings. Audit Management uses compliance and risk data to scope, plan, and prioritize audit engagements. The ongoing review of policies and procedures, risks, and control breakdowns provide an opportunity for fixing issues before they become audit failures.

The ServiceNow Regulatory Change Management application empowers the customers to check upcoming regulatory changes, assess their impact, and implement risk and compliance related changes, ensuring overall regulatory compliance.

Continuously monitor, detect, assess, mitigate, and remediate risk in vendor ecosystems

As your vendors become privy to more of your sensitive systems and data, their risk and compliance posture becomes even more important to your security. It's important to assess your vendors regularly, but until now, it has been a time-consuming and error-prone exercise comprised of spreadsheets, email, and rudimentary legacy risk management tools.

The Vendor Risk Management application transforms the way you manage vendor risk through vital reporting of vendor risk and issues, a consistent assessment and remediation process, and automated assessment procedures. It provides a means to facilitate stakeholder interactions, drive transparency and accountability, and effectively monitor vendor-related risks.

By aligning Vendor Risk Management with overall enterprise risk management priorities, you can create an essential integrated view of risk and a stronger extended enterprise risk posture.

GRC and the ServiceNow Store

All GRC applications are available from the ServiceNow Store, allowing you to obtain new and updated features more rapidly. Before you can use any GRC applications, you must verify that you have entitlement to them (that is, you have valid licenses to use them). Then, you can download them from the ServiceNow Store and activate them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The list of GRC applications available for download includes:

- Audit Management (and supported integrations)
- Business Continuity Management
- Operational Resilience
- Policy and Compliance Management (and supported integrations)
- Regulatory Change Management
- Risk Management (and supported integrations)
- Vendor Risk Management (and supported integrations)

Watch this five-minute video to learn about downloading Security Operations and GRC applications from the ServiceNow Store. This 5-minute video describes how to download Security Operations and GRC applications from the ServiceNow Store

The process you use to obtain GRC products depends on whether you are downloading a product for the first time, updating a product that you previously downloaded from the ServiceNow Store, or upgrading from one family release to the next one.

Download a GRC application from the ServiceNow Store for the first time

Downloading an application from the ServiceNow Store for the first time involves several easy steps. Some steps are performed on the ServiceNow Store and some in your ServiceNow AI Platform instance.

Before you begin
Role required: admin

About this task
The ServiceNow Store allows you to download core products and applications. A product contains one or more applications that are licensed as a group.

Dependency plugins are automatically installed when you activate these GRC core applications:

- Audit Management
- Policy and Compliance Management
- Risk Management

For example, when you activate the Risk Management application, the Risk Management Dependencies plugin is also activated.

Important:
Vendor Risk Management, you must first activate the Vendor Risk Management Dependencies plugin before activating the Vendor Risk Management application. For more information, see Activate an entitled GRC ServiceNow Store application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

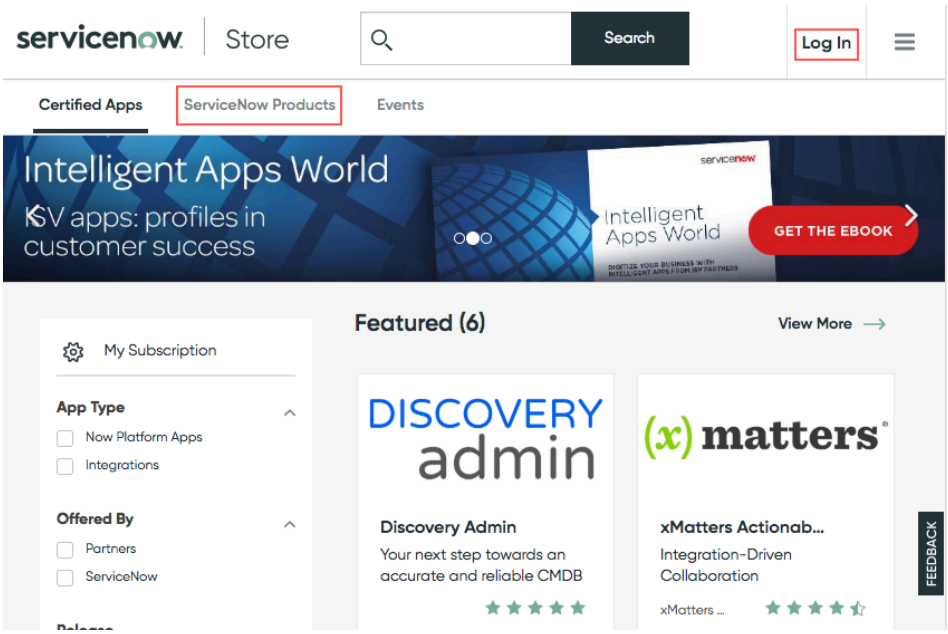
1. Ensure that you have entitlements (or licenses) to the application and its dependent applications.
2. Activate the application and run it on your instance.

Related topics

List of plugins

Get entitlement for a GRC product or application

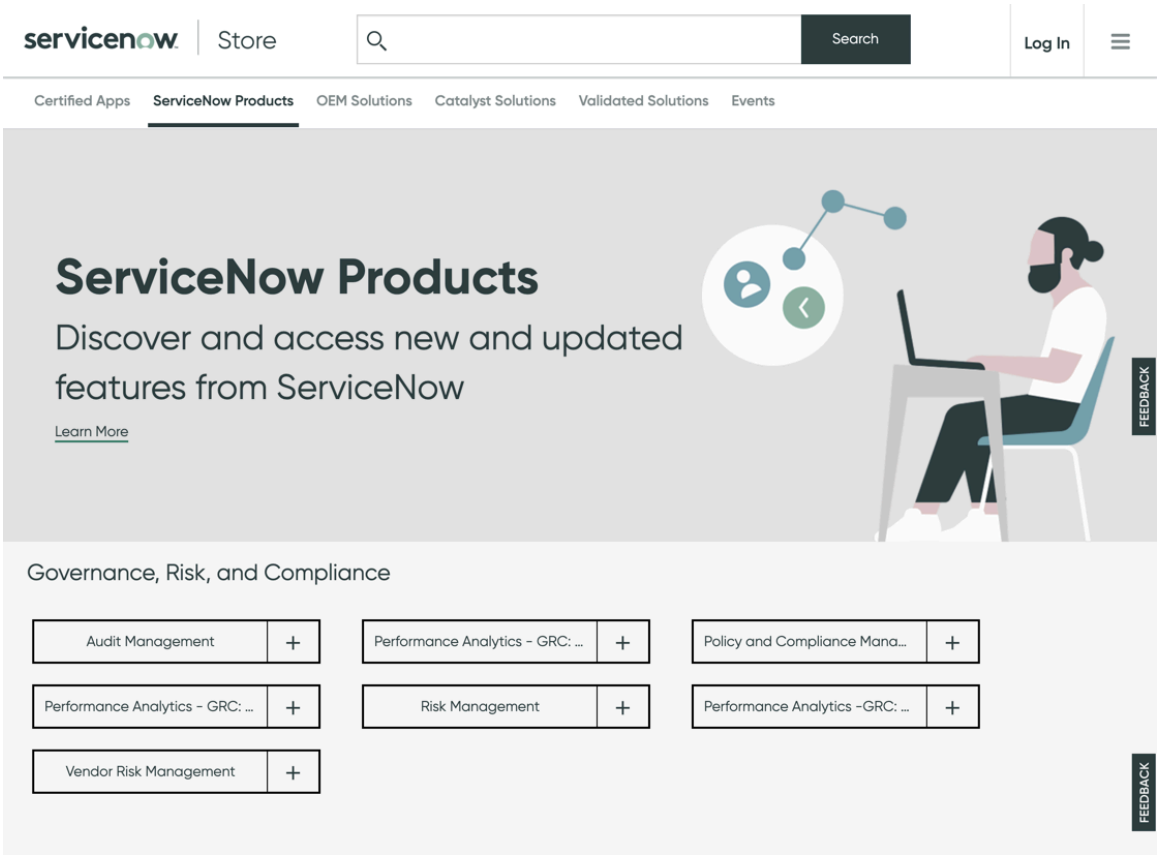
The first step in installing an application is to verify that the application or the product and its associated applications have valid ServiceNow entitlements.



Before you begin

Role required: admin
Individuals performing entitlement must have a Now Support account and have permission to request applications for the instances under consideration.

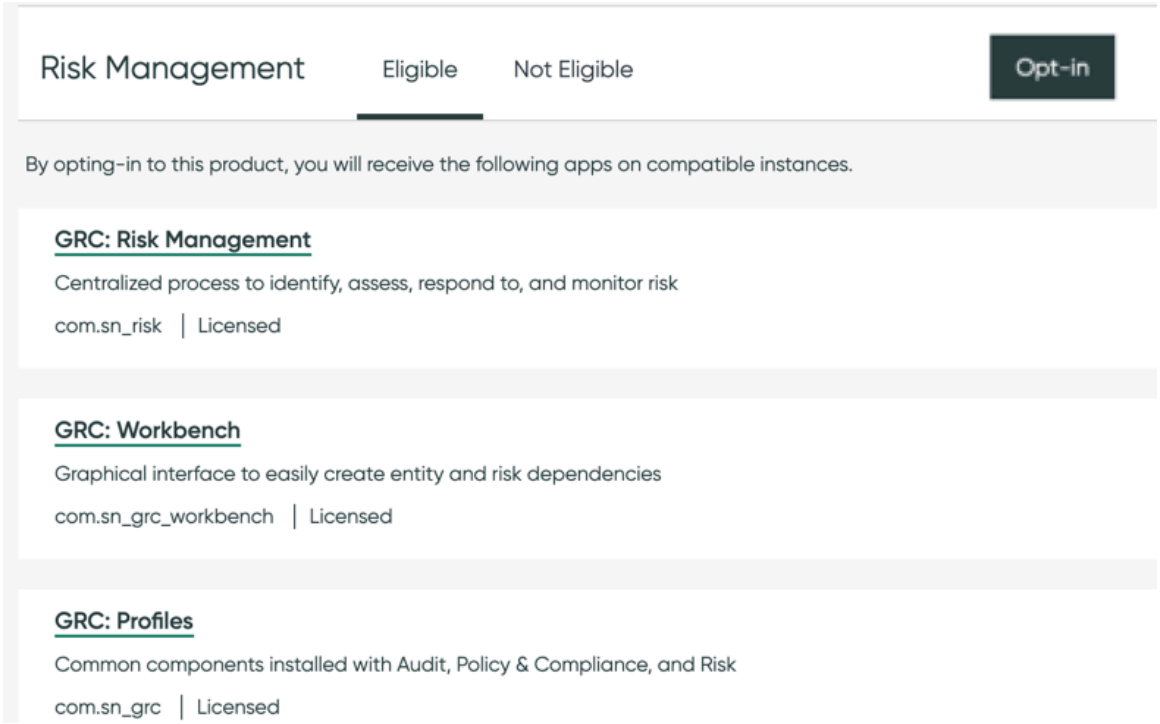
Note:
This process applies only to applications downloaded to production instances. If you are downloading applications to sub-production or development instances, it is not necessary to get entitlements. Proceed to Activate a ServiceNow Store application.



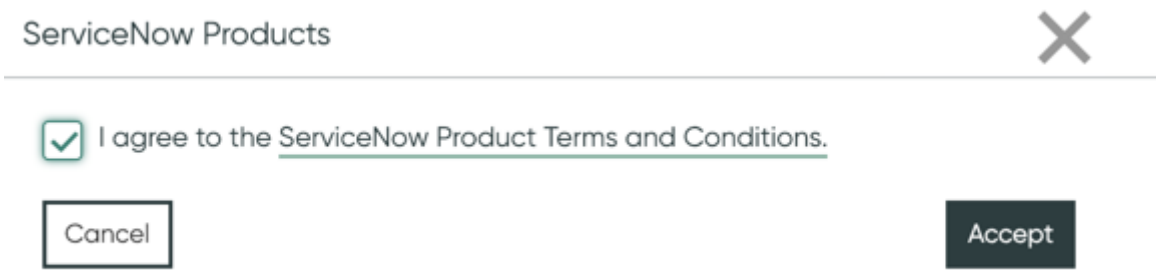
Procedure

1. Navigate to the ServiceNow Store.

2. Click **Login** and log in using your HI credentials.
3. Click the **ServiceNow Products** tab to view all available ServiceNow products. Integrations and other types of content are shown on the **Certified Apps** tab.

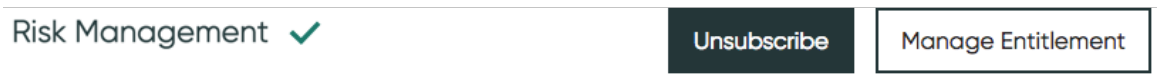


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



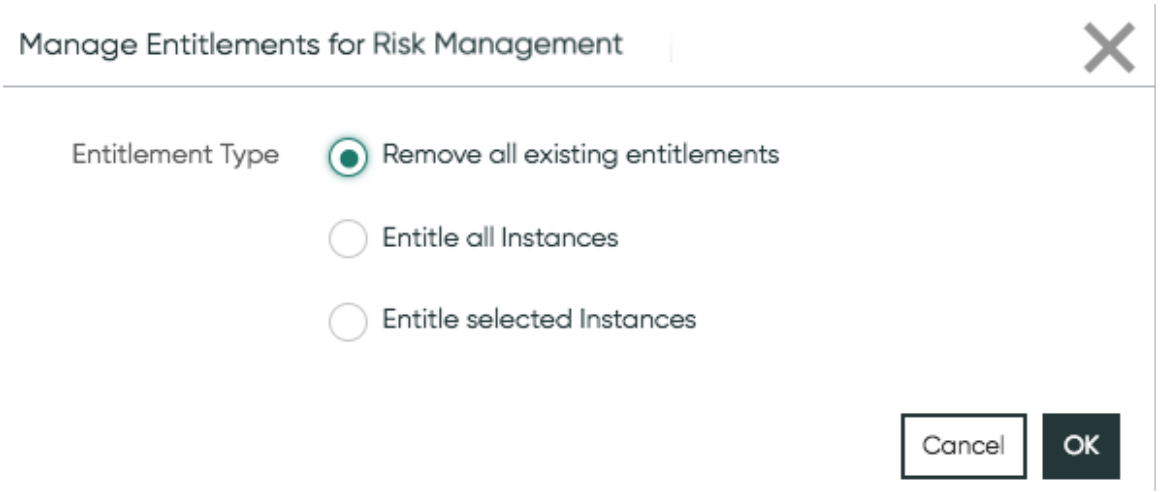
Note:
For the sake of this example, assume you are acquiring entitlement for the Risk Management product.

4. Click the product name of the product you are getting entitlement to.
   All applications associated with the product you are entitling are listed. When you have obtained entitlement to the core product, the applications listed under it are also entitled.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Opt-in** to verify that you have entitlement to the product and the applications listed. You are prompted to read and accept the ServiceNow terms and conditions.



6. Select the check box and click **Accept**.
7. Notice that a check mark appears next to the product name and the Manage Entitlements button appears.

The check mark indicates that you have subscribed to the product and its associated applications. It is time to manage your entitlements. This is a one-time process for this product and any other products you want to install in the future.

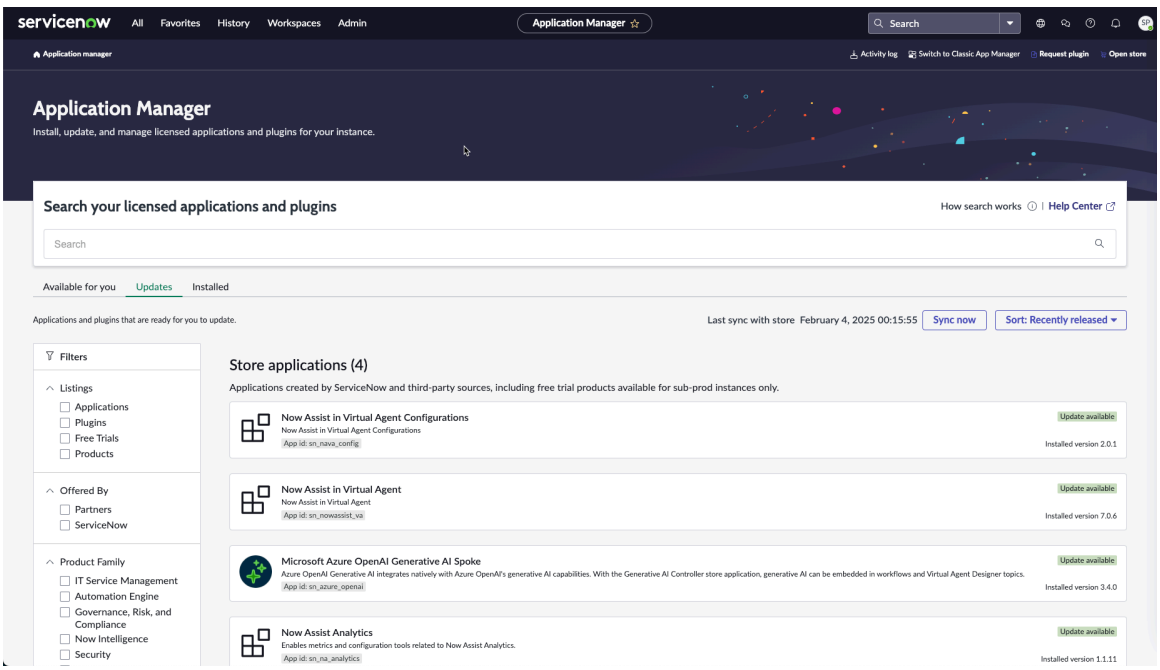
8. **Optional:** Click **Manage Entitlements** to change the instances affected by the applications to which you are entitled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. After you have agreed to the ServiceNow Terms and Conditions and managed entitlements, you can entitle other products by clicking the plus sign (+) next to the product name.

Note:
You are now ready to activate the product.

Activate an entitled GRC ServiceNow Store application



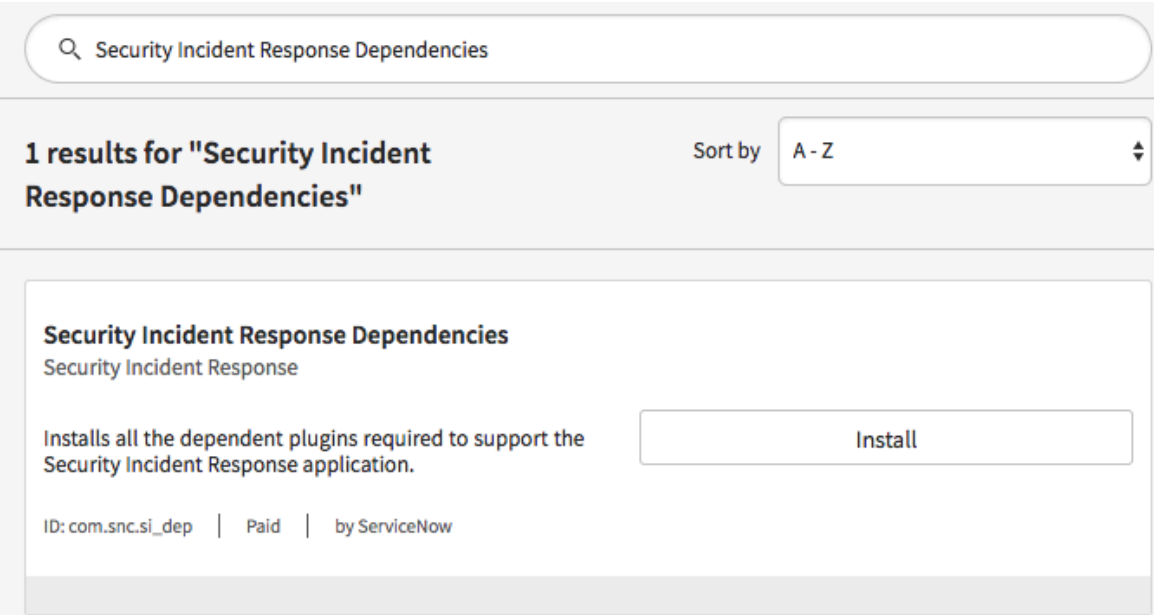
After an application has been given entitlement, you can activate it. This process applies to applications downloaded to sub-production instances.

Before you begin

Role required: admin

Procedure

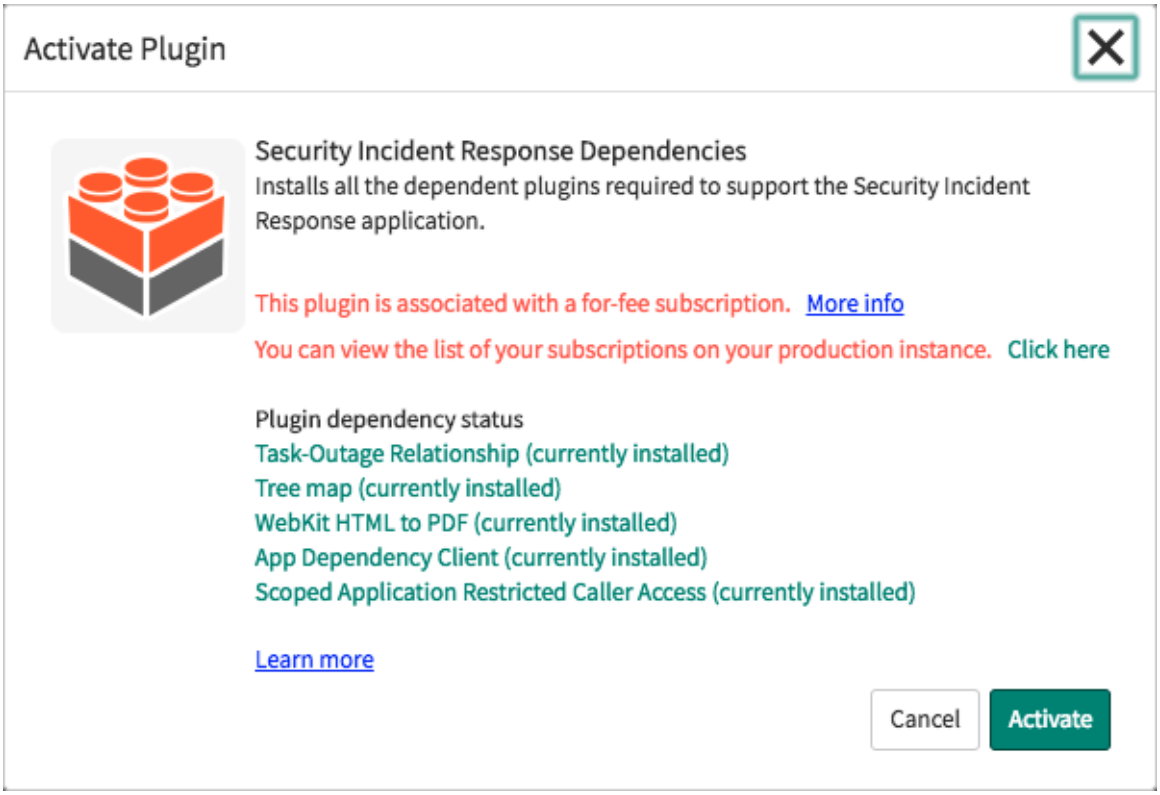
1. Navigate to **System Applications** > **All Available Applications** > **All**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Starting with Orlando, dependency plugins are automatically activated when you activate a core application. For example, when you activate the Audit Management application, the Audit Management Dependencies plugin is also activated.



ImportantThe information in the previous Note does not apply to the Vendor Risk Management application. If you are activating Vendor Risk Management, proceed with the next step. If you are activating any of the other GRC applications, steps 2 through 5 are optional.

2. Search for the dependencies plugin for the application you want to activate.
   For example, if you are activating Security Incident Response, locate the Security Incident Response Dependencies plugin.

3. Click **Install**.
   The Activate Plugin dialog box appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the Activate Plugin dialog box, click **Activate**.
5. When the activation is complete, click **Close & Reload Form**.
6. Locate the core product you are activating.
7. If you want to load demo data, click the **Load demo data** check box.
8. Click **Install**.
   Your application is automatically installed on your instance.

Note:
If you do not select the **Load demo data** check box, demo data is not available to install from the **Application Manager** later. For information on how to install or reinstall demo data after the initial installation, see the Work around to install demo data if application is already installed [KB0722909] article in the HI Knowledge Base.

Install GRC content packs and integrations

All ServiceNow integrations are available on the ServiceNow Store. Core applications, such as Policy and Compliance Management, are visible in the **ServiceNow Products** tab on the store. Content pack and integration add-ons are visible in the **Certified Apps** tab.

Before you begin

Role required: admin
Sore installation requires a Now Support account and have permission to request applications for the instances under consideration.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Locate the application you want to install and click **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you are installing the app to a sub-production instance, the application installs on the instance.
- If you are installing the app to a production instance, and you have a valid license (that is, you have entitlement to the application), the application installs on the instance.
- If you are installing the app to a production instance, and you do not have a valid license, a message is shown. Perform the following steps.

a. Click **Find in Store** to open the ServiceNow Store.

b. Locate the application and click its tile.

c. Click **Get** and enter your Now Support login credentials.

d. Click **Request Install**.

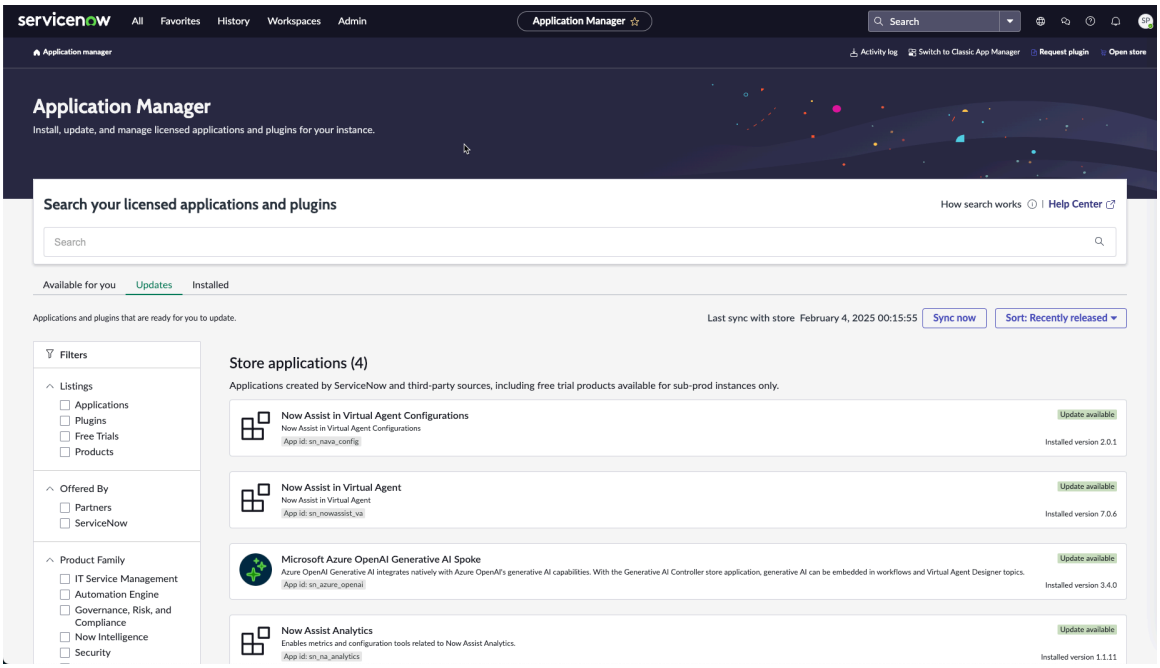
> **Note:**
> For store applications developed by ServiceNow, the **Get** button is shown.

e. Click **Request**.
Enter the instance name and a reason for the request, then click **Request**. You are sent an email with detailed installation instructions.

f. Navigate to **System Applications** > **All Available Applications** > **All**.
A list of applications available for installation is displayed.

g. Click **Install**.
Locate the application, select it, and click **Install**. Your application is automatically installed on your instance.

Update a GRC application previously downloaded from the ServiceNow Store



If you have previously downloaded an application from the ServiceNow Store and a new version is available, you can update it in your instance. When you update, the latest version of the application is installed from the application store along with the application package.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.

2. Search for the application you want to update.
3. Select the version you want to update to and click **Update**.
   Your application is automatically updated on your instance.

Upgrade your instance to the next GRC family release

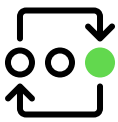
If you are currently running a family release (London for example) and want to upgrade to the next release, it is not necessary to acquire the applications from the ServiceNow Store. The application is automatically updated when the platform is updated to the minimum required version.

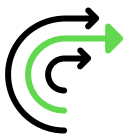
Audit Management

The ServiceNow® Audit Management application involves a set of activities related to planning audit engagements, executing engagements, and reporting findings to the audit committee and executive board. Engagement reporting assures key stakeholders that the organization's risk and compliance management strategy is effective.

Audit Workspace

As of version 13.0.2, there are two interfaces available for Audit Management users. They are the Classic model and Audit workspace. The Audit workspace offers a single-pane view for the audit supervisors and auditors to view the overall audit timeline and status, track budget and resources for engagement, and monitor control tests and audit task progress. For more information on the new workspace, see Risk workspace.





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The GRC: Audit Management product allows you to schedule internal audits, conduct resource planning, and scope engagements. You can also conduct audit activities, review continuous monitoring results, and report findings.

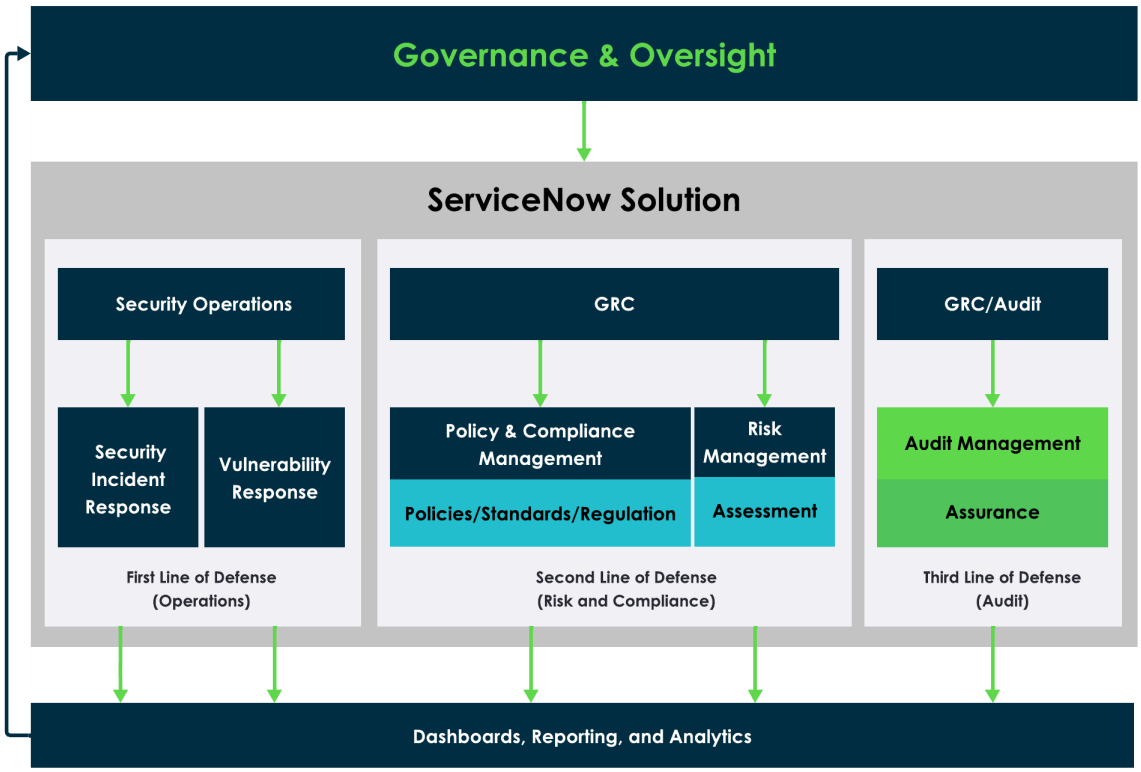
Audit Management users

Auditors (an independent body, typically reporting to the board of directors).



Key activities for Audit Management

Auditors are responsible for the following:

- Review policies and procedures
- Review risks
- Review control design
- Review control test design
- Review control test results
- Test controls
- Issue observations

Audit Management and the ServiceNow platform

Audit Management and the ServiceNow AI Platform

Note:
For more information on the GRC application nomenclature and industry terminology, see Governance, Risk, and Compliance application nomenclature updates and industry terminology.

Audit Management application checklist

Item	Description
☐	As an audit administrator or audit manager, create engagements to manage audit information and include entities, controls, and control tests that are relevant to the audit. For details, see Create an engagement.
☐	As an audit administrator or audit manager, after you have created engagements, define which entities are scoped in the audit engagement. For details, see Add entities to an engagement scope.
☐	After defining a control, audit managers create control tests that run periodically and provide documented evidence of whether the associated control is operating correctly. For details, see Create a control test from an engagement. You can also generate control tests automatically. For details, see Automatically generate control tests from an engagement
☐	After defining a control, audit managers create activities that explore and provide documented evidence of whether the associated control is operating correctly. For details, see Create an audit task activity.
☐	After defining a control, audit managers create interviews with control owners to discuss and provide documented evidence of whether the associated control is operating correctly. For details, see Create an interview
☐	After defining a control, audit managers create walkthroughs that will be conducted to observe and provide documented evidence of whether the associated control is operating correctly. For details, see Create a walkthrough.
☐	As an audit manager, generate an audit report that summarizes the findings of an engagement so report findings can be communicated to executives. For details, see Generate an audit report from an engagement

Download Audit Management

Before you run GRC: Audit Management (com.sn_audit) in your instance, you must download it from the ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

Follow the instructions for Download a GRC application from the ServiceNow Store for the first time.

Quick start tests for Audit Management

Validate that GRC: Audit Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

GRC Audit Management

GRC: Audit Management quick start tests require activating the GRC: Audit Management plugin (com.sn_audit) and loading the demo data.

GRC: Audit Management test suite

Test	Description	Release version
GRC: Create Audit Engagement and Generate Audit Task	Validates audit engagement creation and associates entities to generate controls and test plans. Generates audit task which is associated to a test plan.	Paris
GRC: Create and process a milestone	Create a milestone in an engagement, notice that the due date cannot be in past and the completion date cannot be in future and for a milestone in open state the percent complete is 0 which changes in accordance with the milestone state change.	Paris
GRC: Cost and Resource plan rollup	Create an audit plan and associate an engagement to it, on adding cost plan and resource plan to this engagement, notice that these costs are rolled up to the plan. Any edits to these costs in engagement reflects in the plan.	Paris
GRC: Create Engagement Project Manual and automatic	On an engagement in the validate state, once the Enable advanced planning ui-action is performed notice an engagement project	Paris

Setup checklist for the GRC Advanced Audit application

Complete the checklist that includes the setup tasks required to complete in your ServiceNow AI Platform® instance. When you have completed these tasks, the base system is ready for operation.

Before you begin

Role required: admin

Consider creating and printing a PDF of this checklist topic. You can then check off tasks as you complete them.

Procedure

1. To generate a PDF, click the save as PDF icon ( ) at the top of the topic.
2. Click the **Selected topic**.

Audit Management application checklist

Item	Description
☐	As an audit manager, and IT project manager, create an audit plan to manage different types of audits in a periodic manner and group engagements in a logical manner. For details see, Create an audit plan

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
☐	As an audit user or an audit manager, create auditable units with entities such as business units, departments, vendors, products, business processes, business applications, locations, authority documents, and policies to perform risk assessments on the auditable units. For details, see Create an auditable unit
☐	As an audit manager, use the advanced planning capabilities to create an engagement that automatically creates an engagement project. For details, see Create an engagement with advanced planning
☐	As an audit manager, create milestones that can be used to track the progress of an engagement. After you create milestones for an engagement, you can also add audit tasks to the milestone and track those tasks as milestones. For details see, Create an engagement milestone
☐	As a resource user, you can create a resource plan from the Resource Management application for any task such as demand, project, project task, incident, problem, or change. You can edit and adjust the plan until you submit it for approval. For details see, Create a resource plan
☐	As an IT project manager, create a cost plan to specify the unit cost of a cost type for a fiscal period. Project cost plans capture the costs of projects. For details see, Create a cost plan
☐	Audit observations are the results of an audit. As an important part of the audit report, audit observations represent the results of reviews, analysis, interviews, and discussions. For details see, Audit observations
☐	As an audit user, request evidence. Evidence request is used by audit and compliance teams for requesting supporting documents during an audit. Auditors and compliance teams require these documents from the first line of defense. For details see, Request evidence for audit

Using Audit Management

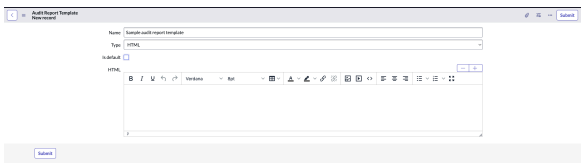
The scope of audit management includes automation of the work streams of internal audit teams, optimizing resources and productivity, and eliminating recurring audit findings.

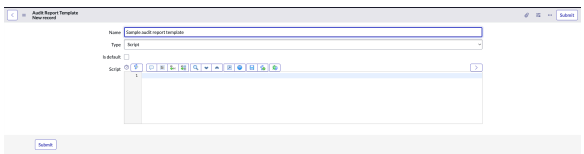
The objectives of audit management are to:

- Ensure that risks are properly identified and quantified
- Ensure that controls are designed in a way that effectively reduces the identified risks
- Ensure that controls are properly monitored for operating effectiveness
- Ensure that control deficiencies are identified and remediated

Create an audit report template in classic formats

Create an audit report template to generate an audit report. If you're an audit developer, you can use either the HTML, Script, or XML format to create an audit report template. You can then use the audit report template to display data in an audit report.





Before you begin
Role required: sn_audit.developer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **Audit Report** > **Classic Report Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Audit report template form

Field	Value
Name	Name of the audit report template.
Type	Type of the audit report template. Available options are: ○ **Script** ○ **HTML** ○ **XML** You can use these formats to generate the audit report template. These templates are used in the audit reports to display data in HTML, Script, or XML format.
Is default	Option that indicates that this template is used as the default template for all KB articles.
HTML	HTML code. When you select the **HTML** option, you can add the HTML code in the audit report template as shown in the following example: 
Script	Script code. When you select the **Script** option, you can add the Script code in the audit report template as shown in the following example: 
XML	XML code. When you select the **XML** option, you can add the XML code in your audit report template as shown in the following example: 

4. Select **Submit**.
   The audit report template is displayed in the list view as shown in the following example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the audit report template to display data according to the defined format in an audit report.

Manage test templates and test plans

An audit engagement may include control testing activities during which controls are evaluated for design and operational effectiveness.

Test Templates and Test Plans

To conduct control testing, before an engagement starts, audit managers create test plans for the relevant controls. Audit managers can use test templates to create multiple test plans for similar controls at one time.

During the **Validate** state of an audit engagement, the test plans that are associated with the controls in the engagement's scope are automatically associated with the engagement. Audit managers can generate control tests from those associated test plans and create individual control tests as needed.

Create a test template

Test templates allow audit managers to quickly create many test plans using much of the same testing criteria.

Before you begin

Role required: sn_audit.admin, sn_audit.manager, or sn_audit.user

Procedure

1. Navigate to **All** > **Audit** > **Audit Testing** > **Test Templates**.
2. Click **New**.
3. On the form, fill in the fields.

Test template form

Field	Description
Number	Unique identification number.
Duration	Duration of the test.
Short description	A brief and general description of the test template.
Design Test*	
Design expectations	Expectations of how a control is designed.
Design assessment procedures	Document how to assess if a control is designed effectively.
Operation Test*	
Operation expectations	Expectations of how a control operates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Operation assessment procedures	Document how to assess if a control is operating effectively

4. Click **Submit**.

Relate a test template to a control objective

Audit owners can create generic control test templates for a control objective, avoiding the creation of individual control test plans for every control.

Before you begin
Role required: sn_audit.admin or sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Audit Testing** > **Test Templates**.
2. Open the test template record.
3. Select a control objective and click **Update**.

Create an audit test plan

Test plans can be created from scratch or based on test templates and describe how a feature is to be tested.

Before you begin
Role required: sn_audit.user, sn_audit.external_auditor

Procedure

1. Navigate to **All** > **Audit** > **Audit Testing** > **Test Plans**.
2. Click **New**.
3. On the form, fill in the fields.

Test template form

Field	Description
Number	Unique identification number.
Control	The control that this test plan covers. **Note:** This field is only visible when the Policy and Compliance Management plugin is activated.
Test Template	The related test template.
Duration	The expected duration of the test.
Name	A brief and general description of the test plan.
Design Test	
Design expectations	Expectations of how a control is designed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Design assessment procedures	Document that shows how to assess if a control is designed effectively.
Operation Test	
Operation expectations	Expectations of how a control operates.
Operation assessment procedures	Document that shows how to assess if a control is operating effectively.

4. Click **Submit**.

Create multiple test plans from a test template

If GRC: Policy and Compliance Management is installed, a test template can be used to create test plans for all the controls associated with the control objective of the test plan.

Before you begin
Role required: sn_audit.manager or sn_audit.admin

Procedure

1. Navigate to **All** > **Audit** > **Audit Testing** > **Test Templates**.
2. Select the test template from which to generate test plans.
3. Click the **Create Test Plans for All Controls** related link.

> **Note:**
> This link is only visible if there are controls associated with the test plan's control objective that have not yet had a test plan generated from the current test template.

Manage engagements

The audit engagement process involves creating, planning, scoping, and conducting engagements as well as reporting on engagement findings.

Engagement process

The base system audit engagement process includes steps for scoping, validating, conducting, and approving engagement results. It also contains steps for following up on open audit tasks and issues, and finally closing out the audit engagement.

States of the engagement process

State	Description
Scope	During the **Scope** state, audit managers define which entities are involved in the audit engagement. For example, for a financial audit, one may include all business services that the finance department relies on and the finance department itself. See Add entities to an engagement scope.
Validate	After an engagement has moved to the **Validate** state, all the risks, controls, and test plans associated with the entities in the engagement's scope will be associated with the audit. Indicator results that were collected during the audit period of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States of the engagement process (continued)

State	Description
	engagement will also be associated with the audit. Audit managers can review the risks, controls, test plans, and indicator results, and update the scope of the engagement, if necessary. Audit managers can also begin creating and planning audit tasks for the engagement. To move an engagement into the **Validate** state, click **Validate** on any engagement currently in the **Scope** state.
Fieldwork	Auditors complete their assigned audit tasks during the **Fieldwork** state. These tasks include control testing, interviews, walkthroughs, and other activities. Issues that are found during control testing are associated with the engagement. Auditors can also create general issues associated with the engagement. Audit managers can create additional audit tasks as needed. When the audit is done, audit managers specify the result of the engagement, whether it's satisfactory, adequate or inadequate, and provide details on their opinion. To move an engagement into the **Fieldwork** state, click **Advance to Fieldwork** on any engagement currently in the **Validate** state. See Audit task management.
Awaiting Approval	During the "Awaiting Approval" state, the approvers specified in the **Approvers** field of the engagement review the results of the audit tasks conducted and the issues that were created. After reviewing the results of the engagements, approvers approve or reject the engagement. To move an engagement into the **Awaiting Approval** state, click **Request approval** on any engagement currently in the **Fieldwork** state. See Approve or reject an engagement.
Follow Up	After an engagement has been approved, if there are any remaining open tasks, issues or milestones, in case of GRC Advanced Audit, associated with the engagement, the engagement automatically goes into the **Follow Up** state. During this stage, auditors must close out all remaining issues, tasks, and milestones before the engagement are marked as complete.
Closed	Engagements move into the "Closed" state under one of three conditions: • The engagement is closed as incomplete during the **Scope**, **Validate**, or **Fieldwork** states. • There are no open audit tasks, issues, and milestones after the engagement is approved. In this case, the engagement automatically moves from the **Awaiting Approval** state to the **Closed** state. • All follow-up tasks, issues, and milestones are closed out. In this case, the engagement automatically moves from the **Follow Up** state to the **Closed** state.

Audit task management

Audit tasks are completed throughout an engagement and provide documented evidence that the organization is complying with external regulations and internal policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When audit tasks are created or reassigned, a notification is sent to the assigned user. A notification is also sent when the task reaches 75% of its planned duration.

Create an engagement

Audit managers create engagements to manage audit information and collect entities, controls, and control tests that are relevant to the audit.

Before you begin

Role required: sn_audit.admin or sn_audit.manager

Note:
For more information on engagements, see Manage engagements.

About this task

To know more about how to define a control and control objective, see:

- Create a control
- Create a control objective

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **Create New**.
2. On the form, fill in the fields.

Engagement form

Field	Description
Number	A unique identification number.
State	○ Scope ○ Validate and plan ○ Fieldwork ○ Awaiting approval ○ Follow up ○ Closed
Name	Name of the engagement.
Type	Type of engagement. The choices are: ○ None ○ Internal Audit ○ External Audit ○ SOX Audit ○ IT Audit ○ Financial Audit ○ Compliance Audit ○ Certification Audit ○ Regulatory Audit ○ Operational Audit

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	this field is populated with the longest planned duration from the audit tasks.
Fieldwork actual start	Actual start date of the fieldwork. If audit tasks are defined, this field is populated with the earliest actual start date from the audit tasks.
Fieldwork actual end	Actual end date of the fieldwork. If audit tasks are defined, this field is populated with the latest actual end date from the audit tasks.
Fieldwork actual duration	Duration of fieldwork start date and end date.
Results	
Result	○ Satisfactory ○ Adequate ○ Inadequate
Opinion	Justification for the selected result.
Report	
Knowledge base	Knowledge base to be used.
Report template	Template to be used to generate the knowledge base article reporting the engagement results.
KB article	Recently generated knowledge base article containing the engagement results
Activity	
Additional comments	Customer-viewable comments.
Work notes	Comments that are viewable by the admin audit manager.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned users or groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

3. Select **Submit**.

Generate an audit report from an engagement

Generate an audit report and maintain different versions of audit reports from an engagement in Follow up state.

Before you begin

Role required: sn_audit.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When an engagement is in the **Follow up** state, the audit lead can generate an audit report. An audit report is represented in the form of a knowledge base (KB) article. After an audit report is generated, an incremented version of the report is created instead of a new report or KB article. After you make major changes to an audit report and publish the report, a new major version of the report is created.

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open the engagement for which you want to generate an audit report.
3. Click the **Report** tab.
   a. In the **Knowledge base** field, select the knowledge base.
   b. In the **Report template** field, select the template.
4. Click **Generate report**.
5. To publish the KB article without making any changes, click **Publish**
6. To edit the KB article, click **Edit**.
   The KB article page appears with the state of the KB article as **Draft** and a minor version of the article is created.
7. Edit the KB article as necessary and click **Publish**.

Result

The incremented version of the report appears in the **KB article** field in the **Report** tab.

Create an engagement from a previous engagement

Audit managers can create engagements from previous engagements to reduce the need to redefine the scope, auditors, and approvers for similar engagements that are conducted throughout the year.

Before you begin

Role required: sn_audit.admin or sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagement** > **All Engagements**.
2. If necessary, clear the search filter criteria.
3. Open the engagement to copy from.
4. Right-click the header of the engagement and click **Copy Engagement**.

Create a control test from an engagement

After defining a control, audit managers create control tests that run periodically and provide documented evidence of whether the associated control is operating correctly.

Before you begin

Role required: sn_audit.admin and sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open the engagement for the audit task you want to create.
   Assign audit tasks to engagement in one of the following states:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Validate
- Fieldwork
- Awaiting approval

3. In the **Audit Tasks** Related List, click **New**.
4. In the Audit Tasks Interceptor, click **Control Test**.
5. On the form, fill in the fields.

Control test form

Field	Description
Number	Unique identification number.
State	○ Open ○ Work in Progress ○ Review ○ Closed Complete ○ Closed Incomplete ○ Closed Skipped
Parent	Parent audit task.
Control effectiveness	Control effectiveness.
Assigned to	User assigned to this control test.
Issue	Issue related to this control test.
Test plan	Test plan associated with this control test.
Short description	Brief description of the control test.
Schedule	
Planned start date	Intended date the control test should begin.
Planned end date	Intended date the control test should end.
Planned duration	Expected duration of this control test. As with actual duration, the planned duration shows total activity time and takes the control test schedule into consideration.
Actual start date	Date that this control test began.
Actual end date	Date that this control test ended.
Actual duration	Duration of the control test from control test start to control test closure.
Design test	
Design effectiveness	○ Effective ○ Ineffective
Design expectations	Basic requirement that should be met by a control so that it is effective. This checks if

Field	Description
	the control was designed properly to achieve the control objective.
Design assessment procedures	Procedure or steps to be followed to conclude whether the design of the control is effective to achieve the control objective or not. This is based on the design expectation.
Design results	Results of testing the design of the control based on the design assessment procedure.
Operation test	
Operation effectiveness	○ Effective ○ Ineffective
Operation expectations	Expectations that should be met to ensure that the control is operating effectively to achieve the control objective.
Operation assessment procedures	Detailed steps, to carry out the operation expectations, which need to be performed to conclude that the control is operating successfully.
Operation results	Results of testing the operation of the control based on the operation assessment procedure.
Activity journal	
Work notes	Comments that are viewable by the audit manager.
Additional comments	Customer-viewable comments.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

6. Click **Submit**.

Automatically generate control tests from an engagement

After adding an entity to an engagement, you can automatically generate control tests.

Before you begin
Role required: sn_audit.admin and sn_audit.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open the engagement for which you want to generate control tests.
3. Click the Test Plans related list.
4. Select the test plans for which you want to generate control tests.
5. Click **Generate Control Tests**.

Result

The controls tests for each test plan is created under the Audit Task related list.

Create an audit task activity

After defining a control, audit managers create activities that explore and provide documented evidence of whether the associated control is operating correctly.

Before you begin

Role required: sn_audit.admin and sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open the engagement for the audit task you want to create.
   Assign audit tasks to engagement in one of the following states:
   - Validate
   - Fieldwork
3. In the **Audit Tasks** related list, click **New**.
4. In the Audit Tasks Interceptor, click **Activity**.
5. On the form, fill in the fields.

Activity form

Field	Description
Number	Unique identification number.
State	○ Open ○ Work in Progress ○ Review ○ Closed Complete ○ Closed Incomplete ○ Closed Skipped
Parent	Parent audit task.
Assigned to	User assigned to this activity.
Short description	Brief description of the activity.
Description	Detailed explanation of the activity.
Schedule	
Planned start date	Intended date the activity should begin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Planned end date	Intended date the activity should end.
Planned duration	Expected duration of this activity. As with actual duration, the planned duration shows total activity time and takes the activity schedule into consideration.
Actual start date	Date that this activity began.
Actual end date	Date that this activity ended.
Actual duration	Actual duration of the project from project start to project closure.
Activity	
Additional comments	Customer-viewable comments.
Work notes	Comments that are viewable by the audit manager and audit manager.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

6. Click **Submit**.

Create an interview

After defining a control, audit managers create interviews with control owners to discuss and provide documented evidence of whether the associated control is operating correctly.

Before you begin

Role required: sn_audit.admin and sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open the engagement for the audit task you want to create.
   Assign audit tasks to engagement in one of the following states:
   - Validate
   - Fieldwork
   - Awaiting approval
3. In the **Audit Tasks** Related List, click **New**.
4. In the Audit Tasks Interceptor, click **Interview**.
5. On the form, fill in the fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For more information on confidential option, see Confidentiality flag for audit and compliance records.

6. Click **Submit**.

Create a walkthrough

After defining a control, audit managers create walk throughs that will be conducted to observe and provide documented evidence of whether the associated control is operating correctly.

Before you begin

Role required: sn_audit.admin and sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open the engagement for the audit task you want to create.
   Assign audit tasks to engagement in one of the following states:
   - Validate
   - Fieldwork
   - Awaiting approval
3. In the **Audit Tasks** Related List, click **New**.
4. In the Audit Tasks Interceptor, click **Walkthrough**.
5. On the form, fill in the fields.

Walkthrough form

Description	Detailed explanation of the walkthrough.
Schedule	
Planned start date	Intended date the walkthrough should begin.
Planned end date	Intended date the walkthrough should end.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Planned duration	Expected duration of this walkthrough. As with actual duration, the planned duration shows total activity time and takes the walkthrough schedule into consideration.
Actual start date	Date that this walkthrough began.
Actual end date	Date that this walkthrough ended.
Actual duration	Duration of the walkthrough from start to end.
Walkthrough	
Primary Contact	User to contact for this walkthrough.
Other Contacts	Other users to contact for this walkthrough, if the primary contact is unavailable.
Execution Steps	Detail the activities to be performed during the walkthrough.
Explanation	Intended purpose of the walkthrough.
Additional Information	Additional information the user conducting the walkthrough needs to be aware of.
Results	Details of what transpired during the walkthrough.
Activity	
Additional comments	Customer-viewable comments.
Work notes	Comments that are viewable by the audit manager and audit manager.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

6. Click **Submit**.

Generate a KB article from an engagement

Audit managers can generate a KB article that summarizes the findings of an engagement so report findings can be communicated to executives.

Before you begin

Role required: sn_audit_manager
KB articles can be generated for engagements in the **Awaiting approval**, **Follow up**, and **Closed complete** states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **All Engagements**.
2. Open the engagement record.
3. Fill in the fields on the **Reports** tab, as appropriate.

Reports tab on engagement form

Field	Description
Report template	Select the report template to use for this KB article.
KB article	Read-only field that is automatically populated with a unique identification number.

4. Click **Generate report**.

Approve or reject an engagement

Audit users that are assigned as approvers for an engagement can approve or reject engagements in the **Awaiting Approval** state.

Before you begin

Role required: sn_audit.user

Procedure

1. Navigate to **All** > **Audit** > **My Audit Approvals**.
2. Open the approval record associated with the engagement.
3. Click **Approve** or **Reject**
   One of the following actions occurs:
   - If the engagement is approved and there are remaining open tasks or issues, it automatically moves into the **Follow Up** state.
   - If the engagement is approved and there are no remaining open tasks or issues, it automatically moves into the **Closed** state.
   - If the engagement is rejected, it automatically moves back to the **Fieldwork** state

Add entities to an engagement scope

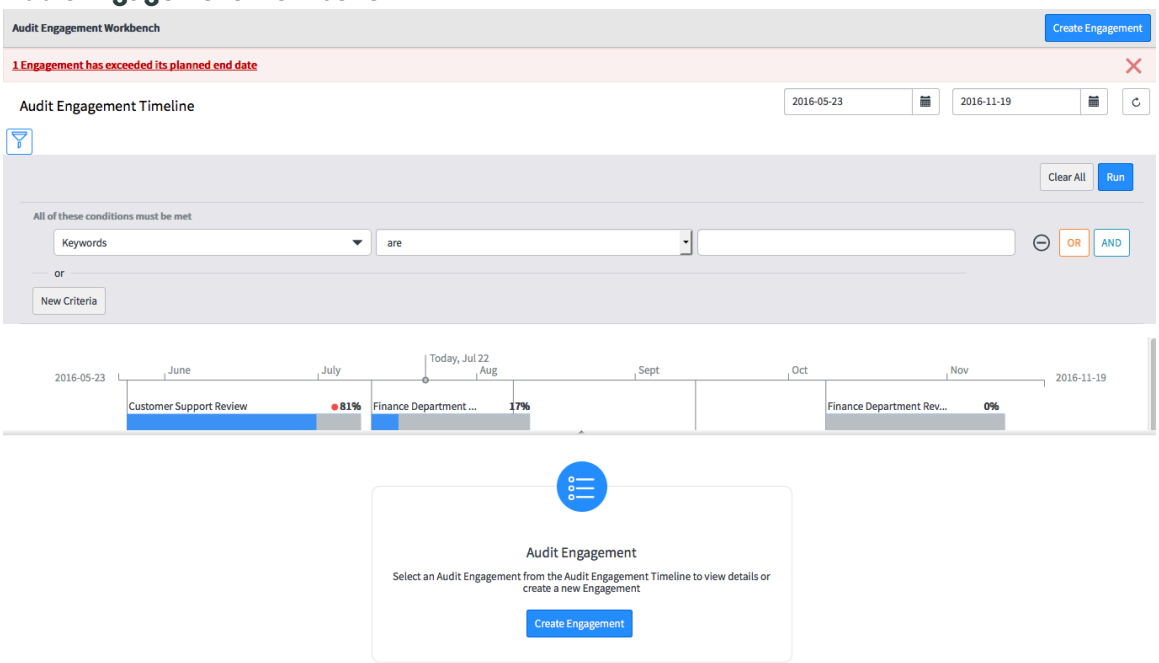
Audit managers can define which entities are involved in the audit engagement. When you add an entity to an engagement, the corresponding risks, controls, test plans, and indicator results of the entity are also added to the engagement.

Before you begin

Role required: sn_audit.manager or sn_audit.admin

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **All Engagements**.
2. Open an engagement in the **Scope** state.
3. In the **Entities** related list, click **Add**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the desired entities that are included in the audit engagement.
5. Click **Add**.
   If there are risks and controls, test plans, and indicator results associated with an entity then they appear in their respective sections.

Use the Audit Engagement Workbench to visually manage engagements

The Engagement Workbench provides a timeline view from which you can select an audit engagement to view details or create a new engagement.

Audit Engagement Workbench

Create an engagement from Audit Workbench

The Engagement Workbench provides a timeline view from which you can select an audit engagement to view details or create a new engagement. Audit managers create engagements directly from the Workbench to manage audit information and collect entities, controls, and control tests that are relevant to the audit.

Before you begin

Role required: sn_audit.admin or sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **Workbench**.
2. Click **Create Engagement**.
3. On the form, fill in the fields.

Engagement form

Field	Description
Name	Name of the engagement.
Assigned to	User assigned to the engagement.
Description	General description of the engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Objectives	Objectives of the engagement.
Planned start date	Intended date the activity should begin.
Planned duration	Expected duration of this activity. As with actual duration, the planned duration shows total activity time and takes the activity schedule into consideration.
Audit period start	Date that work on the engagement is expected to begin.
Audit period end	Date that work on the engagement is expected to end.
Auditors	Auditors assigned to the engagement.
Approvers	Approvers assigned to the engagement.

4. Click **Create**.

Manage your documents and work papers with Audit Management as cloud files

You can manage your documents and work papers with Audit Management as cloud files using cloud providers like Microsoft instead of attaching them to the record.

Beginning with the Washington DC release, the document integration functionality is supported on the engagement and audit task records.

Key benefits of workpapers and document management using Microsoft

The document integration provides the following benefits for the users:

- Connect to the existing documents on Microsoft OneDrive such as Excel, Microsoft PowerPoint presentations, and Microsoft Word documents etc.
- Mark a document as sharable or non-sharable.
- Share a non-sharable document with multiple GRC records.
- Control read and write access to the cloud files based on the configurable permissions.
- Collaborate on the documents present in the Microsoft SharePoint site.

Use cases for managing the cloud files

The document integration functionality addresses the following use cases for the customers:

- Edit and read the documents and workpapers using Microsoft based on the configured access.
- Link the documents and workpapers present in the Microsoft SharePoint site with GRC records in ServiceNow.
- Connect to the existing documents and workpapers on Microsoft OneDrive.
- Reference and link the cloud files that are already linked to other GRC records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Mark a file that cannot be shared between the records as non-sharable so that the corresponding cloud file on Microsoft cannot be shared with other records in ServiceNow.
- Configure the cloud file access to provide read and write access to the users based on the defined conditions.

Roles required to manage the document integration tasks

The following roles are required to manage the document integration tasks.

Roles required and corresponding tasks

Roles	Tasks
Auditor (sn_audit_ws.auditor) and Audit Supervisor (sn_audit_ws.supervisor)	Can perform the following tasks: • Link the existing documents and workpapers on Microsoft OneDrive. • Edit and read the documents and workpapers using Microsoft based on the configured access. • Reference and link the cloud files that are already connected to other GRC records.
Workspace Admin (sn_grc_workspace.admin)	Can configure the cloud file access to provide read and write access to the users based on the defined conditions.

Note:
For general guidelines on managing the documents using Microsoft Office 365, see KB1587297.

Complete the prerequisites to manage your documents using Microsoft

Complete the prerequisites to manage your documents using Microsoft so that you can enable the cloud file integration.

Before you begin
Role required: sn_grc_workspace.admin

About this task
Ensure that you have installed the following applications:

- Document Management (com.snc.platform_document_management)
- Microsoft OneDrive Spoke for Document Service Framework (sn_docs_onedrive)

Note:
Integration Hub entitlements included in the Audit Workspace are solely restricted to the use for Microsoft integration. All other use requires the applicable purchase of an additional Integration Hub entitlement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Set up the Microsoft OneDrive Integration Hub Spoke.

   - For grant type as *Authorization Code*, use a service account to generate the *OAuth* token. All the file operations in Microsoft OneDrive from ServiceNow are executed using this service account. The end user must ensure that the service account is also the owner of the file that the user is trying to link with the file.

     The required API permissions in Azure application registration are *openid*, *email*, *Files.Read*, *Files.ReadWrite.All*, *offline_access*, *User.Read*, *User.ReadBasic.All*.

   - For grant type as *Client Credentials*, the required API permissions in Azure application registration are *Files.Read.All* and *Files.ReadWrite.All*.

   For more information, see Document Services Framework for Microsoft OneDrive.

2. Navigate to the **Cloud file configurations** module and configure this feature for Engagement and Audit tasks.

   The Cloud file configuration record is displayed.

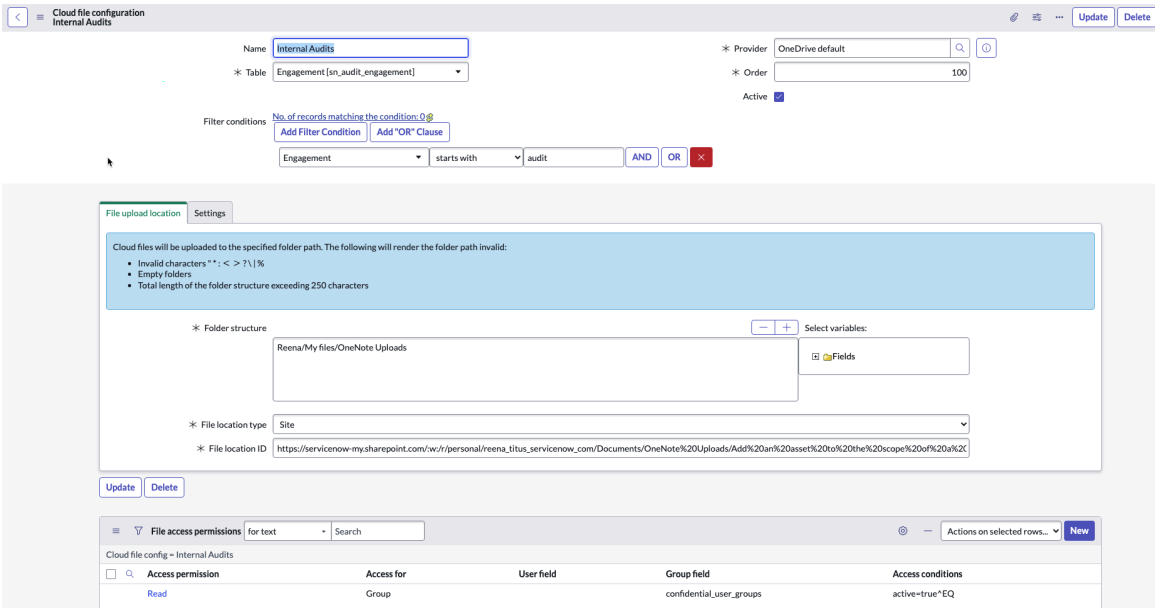
   For more information on the fields, see Create a Cloud file configuration record.

Create a Cloud file configuration on engagements and audit tasks

The GRC Workspace administrators can create a Cloud file configuration on engagements and audit tasks from the Cloud file configuration module.

Roles required to access the Cloud file configuration module

Workspace users with the following roles can access the Cloud file configuration module:



Roles

Role	Permissions
Workspace administrator [sn_grc_workspace.admin]	CRUD permissions
Workspace user [sn_grc_workspace.user]	Read permissions

Cloud file configuration module

If you are the Workspace administrator with the sn_grc_workspace.admin role, you can update the following fields in the Cloud file configuration module to configure the permissions as shown in the example.

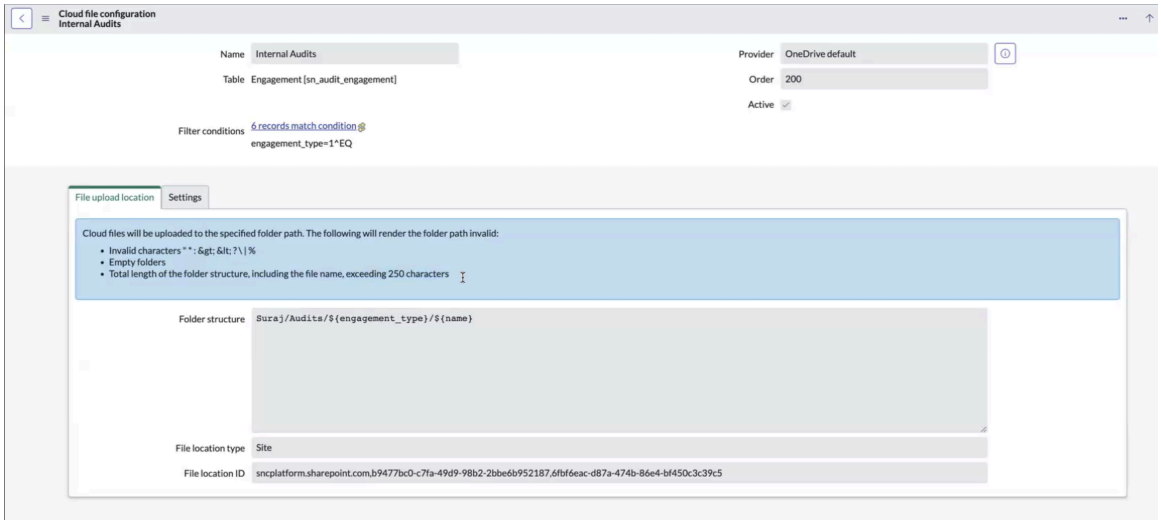
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Name: Name of the document access record. For example, Engagement document access.
- Table: Table that is used for the document access record. For example, Engagement [sn_audit_engagement].
- Active flag: Flag to mark the cloud file configuration as active.
- Provider: Provider for the document access record. The default option for this field is Microsoft OneDrive.
- Cloud action condition: Filter conditions for the cloud files. Based on the configured conditions, the action buttons are rendered in the Cloud files related list.

Create a Cloud file configuration record

Create a cloud file configuration record to manage the access permissions on the cloud document.

Before you begin



Role required: sn_grc_workspace.admin (CRUD), sn_grc_workspace.user (Read)

Procedure

1. Navigate to **All** > **GRC Administration** > **Cloud file configuration**.
2. Select **New**.
3. On the Cloud file configuration form, fill in the fields.

   For more information on the fields in the form, see Cloud file configuration record form. Once the parent cloud file configuration is active, you can configure the File access permissions for the Cloud file configuration record as shown in the example.

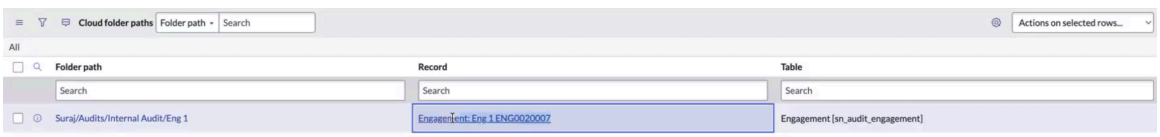
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud file and folders are validated based on the following:

Folder structure

You can either dynamically configure the folder structure or enter a static folder structure.

In the folder path, the name of the engagement `${name}` may change, which might change the folder path too. However, the folder path to which the first file was uploaded for this record is picked for all subsequent uploads, even if the values in the dynamic fields change.



Folder access

- If you have access to the folder but no access to the file in the folder, then you cannot view the particular file but can view the other files in the folder that you have access to.
- If you do not have access to the folder but can access the file in the folder, then you can view only that particular file in the folder that you have access to.

Folder name

If you change the name of the folder or the folder path, then you must manually migrate all the files from the older file path to the new file path. The same must be changed in the cloud folder structure as well.

The folder path where the file is uploaded is stored against every ServiceNow record in the Cloud folder path [sn_grc_workspace_cloud_folder_path] table.

4. Select **Submit**.

Cloud file configuration record form

Update the access permissions for a record in the Cloud file configuration record form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud file configuration record form

For a description of the field values, see the following table.

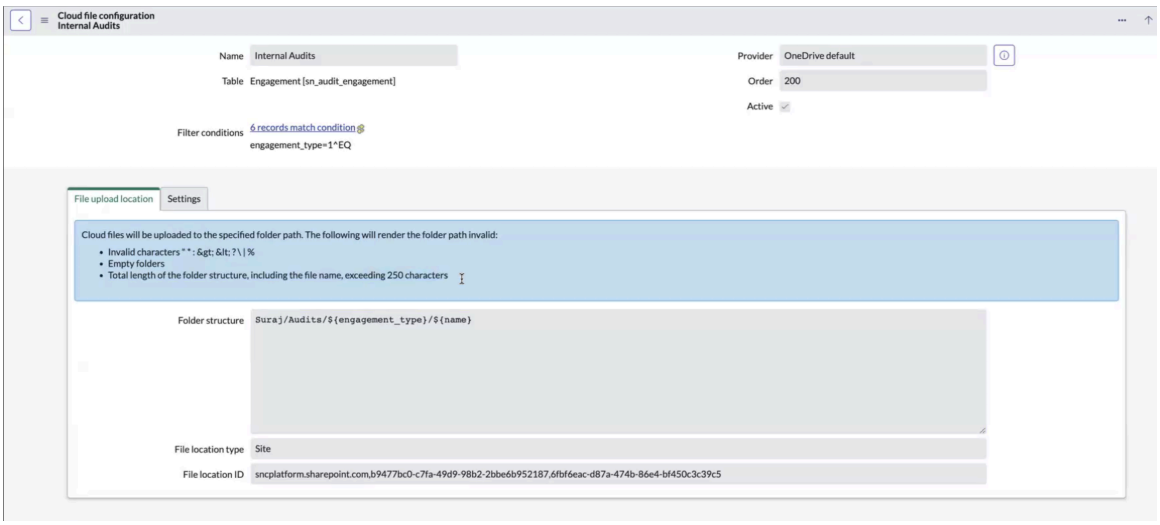
Cloud file configuration record form

Field	Description
Name	Name of the Cloud file configuration record. For example, Engagement document access.
Table	Table used for the Cloud file configuration record. For example, Engagement [sn_audit_engagement]. For all the files used in this table, the access permissions are configured in this form.
Provider	Provider for the Cloud file configuration. Location where the files are present in the cloud. The default option is **OneDrive default**.
Order	The precedence of executing the configuration relative to another configuration with similar criteria when both the configurations apply to a record.
Active	Option to mark the record as active.
Filter condition	Condition used to create the document access record. A sample condition would be: "**State**" "**is one of**" "**Open**, **Work In Progress**, **Review**."
File upload location	
Folder structure	Folder path to which the cloud files must be uploaded. The folder structure can be set up using static text and dynamic variables.
Fields	Field picker that lists all the fields from the selected table.
File location type	Default document library in the Microsoft SharePoint site where the files will be uploaded.
Field location ID	ID of the selected file location type mentioned in the **File location type** field.
Settings	
Cloud actions conditions	Cloud actions such as Link cloud file or Upload files to cloud, which will be displayed in the Cloud files tab based on the selected condition.

Create a File access permission record to manage the permissions

Create a File access permission record and manage the access permissions on the cloud document.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



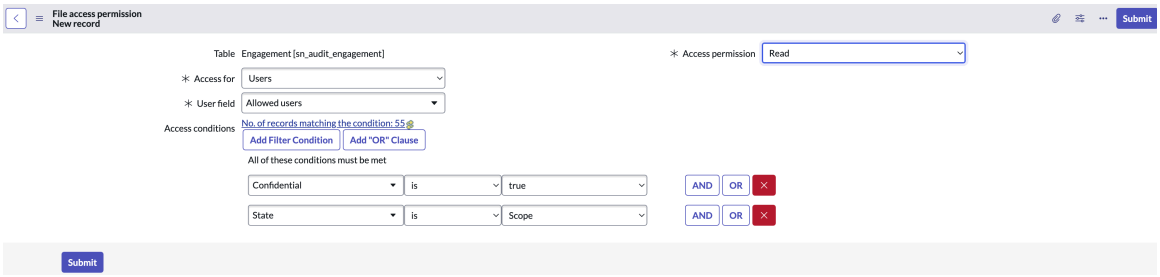
Before you begin
Role required: sn_grc_workspace.admin (CRUD), sn_grc_workspace.user (Read)

About this task
By default, the file access permissions are enabled on the engagement and audit task records. A user that is part of a group can select **Request access** to request an access to the file. The **Request access** UI action is available only to the group members. A user that is part of a cloud file configuration can use **Refresh file access** to refresh or configure the file access. The **Refresh file access** action is available to the users that are listed in the cloud file configuration.

Instead of using the manual **Request access** and **Refresh file access** actions, you can configure file access permissions on other tables such as control records or policy records. For more information, see the configuration steps in KB1587297.

About this task
The File access permission record enables the users to manage access permissions on the cloud document.

Procedure
1. Navigate to **All** > **GRC Administration** > **Cloud file configuration**.
2. Select an active parent cloud file configuration record.
   The cloud file configuration record is displayed.



3. In the File access permissions related list, select **New**.

   You can use the **Users** field to select one of the user (sys_user) fields from an engagement or audit task such as engagement lead, auditors, and others. The users selected in the **Users** field are granted access to the cloud file.

   You can configure the file access permissions for one or more users of the record as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the **Group** field on the form to select one of the group (sys_user_group) fields from an engagement or audit task such as an assignment group. The users that are part of the group are granted access to the cloud file. A File access group permission record is displayed in the following example.

4. On the form, fill in the fields.
   For more information on the fields in the form, see File access permission record form.
5. Select **Submit**.
   Based on the configuration set up in the form, the permissions on the cloud document are evaluated.

File access permission record form

Update the File access permission record form for a Cloud file.

File access permission record form

For a description of the field values, see the following table.

File access permission record form

Field	Description
Table	Name of the table for which the access permissions are configured. For example, Control Test [sn_audit_control_test].
Access for	Access for the users or a group. For example, Engagement [sn_audit_engagement]. For all the files used in this table, the access permissions are configured in this form.
User field	Access permissions that can be configured for the users. Displays a tree structure of all the user fields for the selected record. When the permissions are refreshed, they're automatically refreshed and assigned to the users.

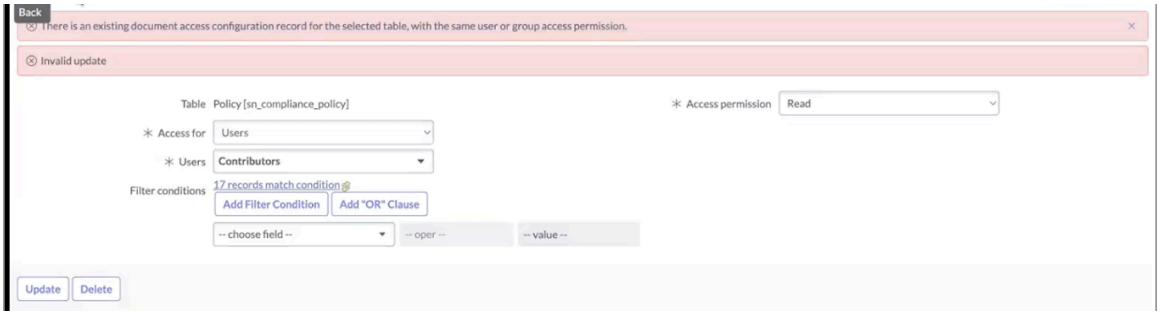
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File access permission record form (continued)

Field	Description
	Note: The field appears if you'd selected Users in the **Access for** field.
Group field	Access permissions that can be configured for the users of a group. Displays a tree structure of all the group fields for the selected record. When the permissions are refreshed for the first time, every group member in the group who wants to have access to the document, should select the engagement record and select the **Request access** action manually to access the document. The users of a group do not automatically receive an access to the record for the first time. They must request an access for the first time. For the subsequent operations on the record, access for the users (who requested it for the first time) is also refreshed. **Note:** The field appears if you'd selected Group in the **Access for** field.
Access permission	Type of access permission to be configured for the selected user. For example, Read or Write.
Access condition	Condition that describes when the file access permissions are applied.

File access permissions

The Workspace administrators with the sn_grc_workspace.admin role can configure the file access permissions for the users and groups.



Conditions for file access permissions

The Workspace administrators with the sn_grc_workspace.admin role can configure different conditions for file access permissions:

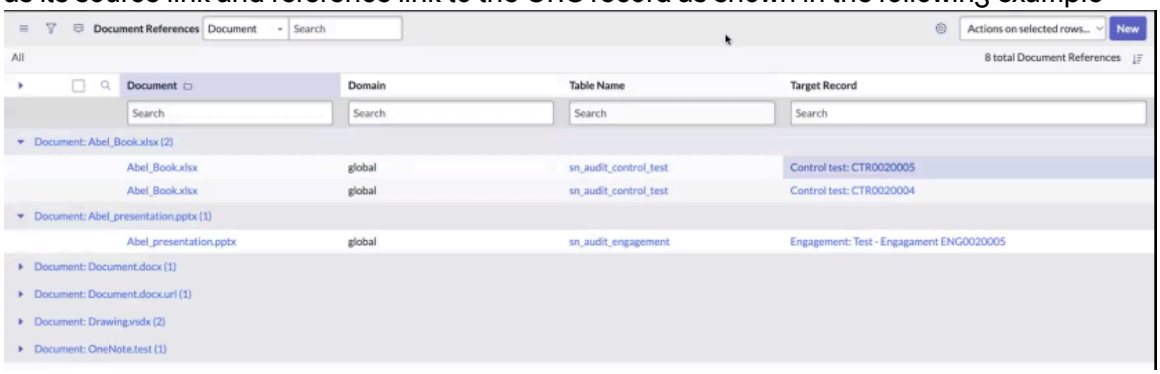
- For a combination of the **Table** field, **Access permission** field, and **Users** field, you can have only one File access permission record. If you have an existing record for a table with a given set of user and access permissions, you cannot create a duplicate record with the same access permissions. For example, if a contributor has Read access permission for the policy (sn_compliance_policy) record, creating another record for the same condition is not permitted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a given combination of the **Table** field, **Provider** field, and **Active** option, only one Cloud file configuration record is permitted. A duplicate configuration is not permitted for an active table as shown in the following example.

- If a user is part of multiple **User** fields or a **Group** field, a higher access is granted to the user.

Source link and reference link to the GRC record



When a cloud file is connected to a GRC record for the first time, the connection is considered as a source link to the GRC record.

When the same cloud file is mapped to another GRC record, then it is considered as a reference link to the GRC record.

A source link to the GRC record always has the write access and the reference link to the GRC record always has the read access.

When a record is mapped as a source link to the cloud file, the configuration is applied as it is to the cloud file. For example, if the configuration contains write access for some users and read access for some users, the same configuration is maintained and applied to the users.

The Document reference table shows how one document record is being referenced such as its source link and reference link to the GRC record as shown in the following example

Consider the example of Engagement_memo.xslx for which Control test CTR0020005 is a source link and Control test CTR0020004 is a reference link. For any configuration that matches the configuration of Control test CTR0020004, all the users under this configuration even though they have Write access in the configuration has only read access.

Consider the following example where a Risk and Controls Matrix Report is connected to Engagement record 1 and Engagement record 2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Access document and the associated records

Document	Record that the document is connected to
Risk and Controls Matrix Report	Engagement record 1. It is the source for the access document.
Risk and Controls Matrix Report	Engagement record 2. It is the reference for the access document.

See the following table for the permissions assigned for the example.

Example: Assigned access permissions

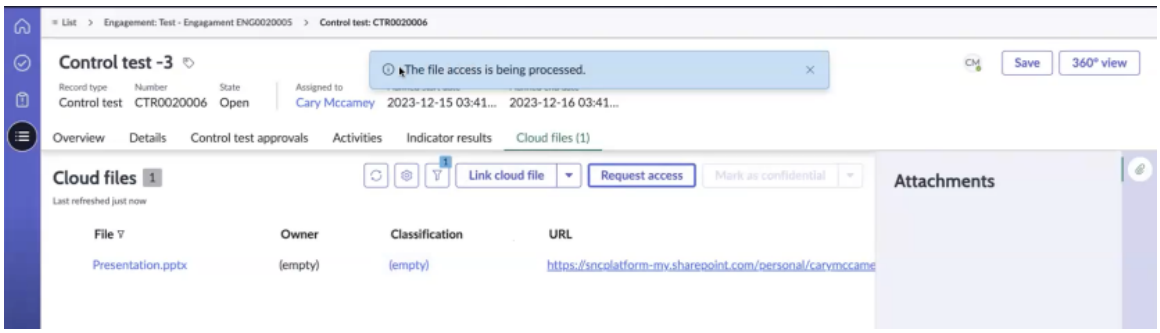
Access doc connected to the record	Users field value	Type of access	Description
Engagement record 1	Contributors	Have Write access	For the source record, the permission configuration is considered as it is configured. Therefore, the contributors have the Write access to Engagement 1.
Engagement record 2	Reviewers	Have Write access	The same access record is mapped to Engagement 2, for which the reviewers should have the Write access. Because Engagement record 2 is a reference record, the reviewers have the Read access instead of the Write access.

Another use case for source link

When the cloud document is mapped to a record, it becomes a source link for the cloud document. If the same record is removed and the cloud document is mapped to another GRC record, the next record becomes the source link for the cloud document.

For example, the Engagement_memo.xlsx file is mapped to the engagement 1 and engagement 2 records. The engagement 1 record is the source link and the engagement 2 record is the reference link. If the mapping between the Engagement_memo.xlsx file and the engagement 1 record is removed, the Engagement_memo.xlsx file does not have any source link. If the Engagement_memo.xlsx file is mapped to the engagement 3 record, then the engagement 3 record becomes the source link for the document.

Request access and Refresh file access actions



By default, the file access permissions are enabled on the engagement and audit task records. For other records, you can use the **Request access** and **Refresh file access** actions on the form. By default, the file access permissions are enabled on the engagement and audit task records. If a user is part of a group, they can use the **Request access** UI action to request access to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

file. The **Request access** UI action is available only to the group members. If the user is part of a cloud file configuration, they can use the **Refresh file access** action to refresh or configure the file access. The **Refresh file access** action is available to the users mentioned in the cloud file configuration.

To configure the file access permissions on other tables such as control records or policy records (instead of using the manual **Request access** and **Refresh file access** actions), see the configuration steps in KB1587297.

The users that are part of a group should request access to the cloud file by using the **Request access** action button. When a user who is part of the Audit Managers group selects **Request access** on the form, a UI message is displayed as shown in the example: `The file access is being processed.`

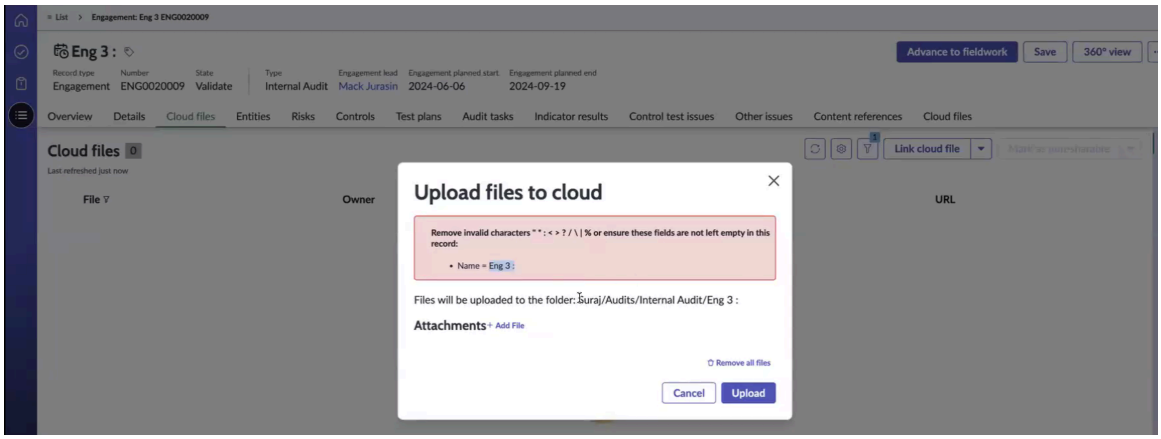
Requesting access to the cloud file is a one-time activity for the users of a group. If a user selects **Request access** more than once and the access has already been granted, the following message is displayed: `File access has already been granted.`

If the user requests access to the cloud file and if the request is not processed in time, an error message is displayed on the screen. The user must select **Refresh file access** to request an access to the file again.

Upload a file to cloud

Upload local documents from your local to Microsoft cloud and manage the access to the cloud files.

Before you begin



Role required: sn_audit_ws.auditor, sn_audit_ws.supervisor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the tasks icon ( ).
   The list displays the engagements that are assigned to you.
3. Create an audit engagement or navigate to an existing engagement record and select the **Cloud files** tab.
4. In the **Cloud files** tab, select **Upload file**.
5. In the Upload files to cloud pop-up, browse through your local system and select the file to upload.
6. Click the **Upload** button.
   Before selecting the Upload option if you cancel the action, the file would still be selected in the pop-up but not uploaded. Unless you select the **Upload** button, the file will not be uploaded to cloud.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File names and folder structures are validated while file upload. Therefore, exercise caution in naming your files. Invalid characters, if present in the file name, cause failure in file upload action.

7. To remove the invalid character in the file name, select the ⋮ icon and rename the file correctly.
8. Click the file's URL link attached to the record in the **Cloud files** tab to navigate to the cloud file in Microsoft.

Link to a cloud file

Link a cloud file on Microsoft using file path and file name with a GRC record in the Workspace.

Before you begin

Role required: sn_audit_ws.auditor, sn_audit_ws.supervisor

Ensure that the cloud file UI actions on the Cloud files related list are visible on the forms based on the configured conditions. Ensure that file access permissions of read and write are added for the auditor and engagement leads. For more information, see Create a Cloud file configuration on engagements and audit tasks.

About this task

Beginning with the Washington DC release, cloud file integration is enabled on the engagement and audit task records using Microsoft integration. Therefore, this task refers to linking a cloud file from Microsoft OneDrive to an engagement record.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the tasks icon ( ).
   The list displays the engagements that are assigned to you.
3. Create an audit engagement or navigate to an existing engagement and go to the **Cloud files** tab.
4. In the **Cloud files** tab, select **Link cloud file**.
   An Add file pop-up is displayed.
5. In the **File location** field, enter the path of the folder where the file resides on Microsoft.
6. In the **File name** field, enter the name of the file with the file format.
   The file name should also include the file extension such as .docx, .ppt, .xls.
7. Select the **Mark as non-sharable** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When this option is selected, the cloud file that is linked to the record is marked as non-sharable. It cannot be linked with other records in ServiceNow. If you attempt to link a non-sharable file to another ServiceNow record, an error message is displayed.

8. Select **Link** in the pop-up.
   After the file is connected to Microsoft, the auditor or engagement lead gets read or write access based on the defined access permissions.

   For more information on file access permissions, see Create a Cloud file configuration on engagements and audit tasks.

Link a reference cloud file

Link a reference cloud file that is already associated to other GRC records. You can link sharable files only.

Before you begin

Role required: sn_audit.admin, sn_audit.manager, sn_grc_workspace.user

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the tasks icon ( ).
3. Create a new audit engagement or navigate to an existing engagement and go to the **Cloud files** tab.
   The list displays the engagements that are assigned to the logged-in user.
4. In the **Cloud files** tab, select **Link reference file**.
   The Link reference file pop-up is displayed.
5. In the **Select file** field, select the reference file that you want to link to the record.

   The field populates the cloud files that are sharable.

   Note:
   You cannot link a non-sharable document as a reference file with other records. The files that are marked as non-sharable are not displayed in the list of available files in the pop-up.

6. Select **Link** in the pop-up.
   The reference cloud file that is already associated to other GRC records is now linked. After the file is connected to Microsoft, the auditor or engagement lead gets read or write access based on the defined access permissions.

   For information on File access permissions, see Create a Cloud file configuration on engagements and audit tasks.

Mark a cloud file as a non-sharable file

Select one of the already linked files and mark it as a non-sharable file. Once a cloud file is marked as non-sharable, it cannot be linked to another record, or it cannot be referenced by any other record.

Before you begin

Role required: sn_audit.admin or sn_audit.manager, sn_grc_workspace.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the tasks icon ().
3. Select an engagement in the Engagements list.
   The list displays the engagements that are assigned to the logged-in user.
4. In the **Cloud documents** related list, select the cloud document.
5. Select **Mark as non-sharable**.
   When a cloud file is marked as a non-sharable document, it cannot be linked to other records.
   The cloud document is marked as a non-sharable document. It cannot be shared or referenced by any other records.

Mark a cloud file as a sharable file

Select one of the non-sharable files and mark it as sharable. Once the cloud file is marked as sharable, it can be linked to another record, or it can be referenced by other records.

Before you begin

Role required: sn_audit.admin, sn_audit.manager, sn_grc_workspace.user

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the tasks icon () and select a record from the list.
3. In the **Cloud files** related list, select the cloud document.
4. Select **Mark as sharable**.
   When a cloud file is marked as a sharable document, it can be linked to other records.
   The cloud file is marked as sharable. It can be shared or referenced by other records.

Remove a linked cloud file from a record

Remove a linked cloud file from a record in the Audit Workspace.

Before you begin

Role required: sn_audit.admin, sn_grc_workspace.user

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the tasks icon ().
3. Select an engagement in the Engagements list.
4. In the **Cloud files** related list, select the cloud document.
5. Select **Remove linked file**.
   A confirmation pop-up is displayed with the following message: `Do you want to remove the linked file?`
6. Select **Remove linked file** in the pop-up.
   When a cloud file is linked to a record, the file access permissions are refreshed according to the set permissions on the table. For information on File access permissions, see Create a Cloud file configuration on engagements and audit tasks.
   A confirmation message is displayed that the cloud file is removed from the record.

Manage GRC key risk and control indicators

Continuous monitoring involves activities related to identifying and creating key risk and controls indicators. Supporting information can be collected for those indicators through automatic data collection or manual tasks. Indicator results are then used to create issues for controls, update risk scores, and provide supporting information for audit activities and control testing.

Indicators collect data to monitor controls and risks, and collect audit evidence. Indicators monitor a single control or risk.

Indicator templates

Indicator templates allow the creation of multiple indicators for similar controls or risks.

Engagement Overview

The Engagement Overview is contained in the Audit Management application and provides an executive view into audit results, engagement breakdowns by task, and allows areas of concern to be identified quickly.

The Engagement Overview module displays audit information that is tailored to the role of the user.

Audit Engagement Overview

Users with the Audit Administrator, Audit User, and Audit Manager roles view the Audit Engagement Overview. It contains the following reports in the base system.

Audit Engagement Overview reports

Name	Visual	Description
Engagement Results	Column Chart	Displays an overall count of audit engagements conducted for each entity. The chart is stacked to display the overall audit results for each entity.
Entities by Engagement	Donut chart	Displays the total number of entities included in the scope of each audit engagement.
Controls by Engagement	Donut chart	Displays the total number of controls included in scope of each audit engagement.
Entity	Drop down list	Select one or many entities to view and compare their audit findings.
Select Engagement	Drop down list	Select one or many engagements to view and compare their audit findings.
Satisfactory Engagements	Single Score	Displays the number of engagements closed with a satisfactory result.
Adequate Engagements	Single Score	Displays the number of engagements closed with an adequate result.
Inadequate Engagements	Single Score	Displays the number of engagements closed with an inadequate result.
Control Test Results	Donut chart	The number of completed control tests, broken down by overall control effectiveness rating.

© 2026 ServiceNow, Inc. All rights reserved.

Audit Engagement Overview reports (continued)

Name	Visual	Description
Issue Breakdown	Bar Chart	Count of issues grouped by Engagement, State, or Response
Audit Task Breakdown	Bar Chart	Count of audit tasks grouped by Task Type, Assigned to, Top Task and State. Stacked by Task Type, Assigned to, Top Task, and State.
Overdue Audit Tasks	List	List of open audit tasks that have exceeded the planned end date.

Create a GRC indicator

Create an Indicator to monitor the controls and risks and collect evidence of performance.

Before you begin

Role required: compliance_admin or compliance_manager, risk_admin or risk_manager, audit_admin or audit_manager

Procedure

1. Navigate to one of the following locations:
   - **Policy and Compliance** > **Indicators** > **Indicators**.
   - **Risk** > **Indicators** > **Indicators**.
   - **Audit** > **Indicators** > **Indicators**.
2. Select **New**.
3. On the form, fill in the fields.

Indicator

Field	Description
Number	A unique identification number.
Name	Name of the indicator.
Template	Related indicator template.
Category	Category associated with the Control/Risk that is selected. This field can't be edited.
Active	Option that determines whether the indicator is active.
Control/Risk	Related control or risk.
Applies to record	Profile related to the **Item**.
Owner	Owner of the indicator.
Owning group	The group that owns the indicator.
Override Template	Option to override the indicator template associated with this indicator
Last result passed	Option that indicates whether the controls were compliant or non-compliant. If the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	controls were compliant, the check box is selected.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
First run date	First collection time for indicator results. This field is automatically set based on when an indicator or an indicator template runs for the first time. The value in this field can't be modified.
Next run date	Next run time to collect indicator results of all downstream indicators for this indicator template.
Due date duration (days)	Due date duration in days between the creation and due date of the indicator task and generation of its results. The due date duration added to the creation date reflects as the **Due date** of the indicator task. This field appears only when **Manual** is selected from the **Type** field. For more information, see Performance enhancements for Indicator nightly job.
Method	
Type	Results can be gathered manually using task assignment or automatically using basic filter conditions, Performance Analytics, or a script. ○ Manual: Used to create an Indicator task for an assignee to complete. ○ Basic: Used to designate whether the indicator identifies the passed or failed controls. ○ Script: Used to write a script to collect the required data.
Short Description	If Type is **Manual**, this field is present. A brief description of the issue.
Instructions	If Type is **Manual**, this field is present. Instructions for the collection of indicator results.
Value Mandatory	If Type is **Manual**, this field is present.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Passed/Failed	If Type is **Basic**, this field is present. The indicator passes or fails.
Script	If Type is **Script**, this field is present. Script that obtains the required system information.
Supporting Data	
Note: Starting with version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks is displayed. Earlier, only the real-time state of the records collected could be viewed.	
Table	Use supporting data to gather supporting evidence from other applications.
Supporting data fields	Supporting data fields based on the selected table.
Criteria	Conditions that must be met for the supporting data.
Sample size	Number of records to select for the supporting data.

4. Select **Submit**.

Create a GRC indicator template

Compliance or risk managers create indicator templates from which many indicators can be created.

Before you begin

Role required:

- sn_compliance.admin or sn_compliance.manager
- sn_risk.admin or sn_risk.manager
- sn_audit.admin or sn_audit.manager
- sn_grc.user

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Indicators** > **Indicator Templates**.
   - **All** > **Risk** > **Indicators** > **Indicator Templates**.
2. Select **New**.
3. On the form, fill in the fields.

Indicator template form

Field	Description
Name	Name of the indicator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of the indicator.
Category	Category for which you're creating an indicator template. For example, select **Risk Indicator Template** to create a risk indicator template.
Active	Option that determines whether the indicator template is active.
Method	
Type	The method used to determine the type of indicator template. The choices are as follows: ○ **Manual**: Manual indicators are used for data that cannot be retrieved from a ServiceNow instance because it comes from an external system, such as customer data from a third-party sales system. ○ **Basic**: Basic indicators are automated indicators based on an indicator source. The indicator source specifies a table and a frequency at which the scores from this table are saved. ○ **Script**: Scripted indicators use a custom script to collect the data.
Result if the value meets or exceeds the target value	Result configuration field. The choices are as follows: ○ **Passed** ○ **Failed** For example, assume you enter 100 in this field. If the indicator result output is more than 100, then the indicator status will pass or fail based on the value configured in this field.
Target Type	Type of the target value. The choices are as follows: ○ **None**: Use this option if you do not want to set up any target or threshold for the indicator. ○ **Percentage**: Use this option to determine the indicator result by a percentage value. ○ **Count**: Use this option to determine the indicator result by a count value or total number.
Target	The value that determines if the indicator should pass or fail.
Instructions	Additional instructions for the template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Value mandatory	Option to decide if a value must be compulsory in the indicator task for a manual indicator. **Note:** This option appears only if **Manual** is selected from the **Type** field. This option is automatically selected if **Count** or the **Percentage** is selected from the **Target type** field.
Supporting Data	
Note: Starting with version 10.1, the actual historical data for the supporting data records from the indicator results or indicator tasks are displayed. Earlier, only the real-time state of the records collected could be viewed.	
Collect supporting data	Option to enable collecting supporting data or evidence every time the indicator runs.
Table	Table used for collecting supporting data.
Supporting data fields	Fields of the source table to be used for collecting the supporting data.
Sample collection type	Type of supporting data collection, such as count or percentage.
Sample size	Minimum number of records that must be used for collecting supporting data. For example, a basic indicator could query a large table, returning thousands of records with each indicator execution. You do not need to save all of them; just a sample of those records. If you enter a sample size of 100, only 100 records are saved, even though the query returned thousands.
Basic Criteria	
Criteria	Criteria to filter the data from the source table.
Use reference field	Option to enable the use of the **Reference field**.
Reference field	Connection between the supporting data table and the **Applies to record** field of the entity.
Additional Criteria	
To create indicators with targets, use the advanced filter criteria. This section appears only when you select **Basic** from the **Type** field. This section is used to provide more filter criteria.	
Additional criteria	More criteria to filter the data to calculate the target value. This section only appears when

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Percentage is selected from the **Target type** field.
Schedule	
Collection frequency	Collection frequency for indicator results. Indicator tasks and results are generated automatically based on the indicator schedule.
First run date	First collection time for indicator results. This field is automatically set based on when an indicator or an indicator template runs for the first time. The value in this field can't be modified.
Next run date	Next run time to collect indicator results of all downstream indicators for this indicator template.
Due date duration (days)	Due date duration in days between the creation and due date of the indicator task and generation of its results. The due date duration added to the creation date reflects as the **Due date** of the indicator task. This field appears only when **Manual** is selected from the **Type** field. For more information, see Performance enhancements for Indicator nightly job.

4. When you have completed these entries, you can also view information on the following related lists:
   - Control Objectives/Risk Statements
   - Content References

   Note:
   The **Control Objectives/Risk Statements** tab enables you to reuse the same template for multiple control objectives or risk statements, or both of them.

5. Select **Submit**.

Confidentiality flag for audit and compliance records

You can set the confidentiality flag at the record level for an issue, engagement, observation, control test, activity, interview, and walkthrough records. The users whom you determine to view and update these records are allowed users.

When the **Confidential** option is selected, a list of users who can be an engagement lead, auditors, and approvers are auto-populated as **Allowed users**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a system admin, you can add more audit users or GRC business users to the list or remove some of the existing users based on your access control criteria and can set them as allowed users.

Also, you can also add random users to the record, who are not audit users or GRC business users. However, an email notification is sent to all allowed users who have neither an audit user nor a GRC business user role intimating them to acquire the confidential role (sn_grc.confidential_user) from the admin if they are to access the record.

You can also select groups as **Allowed groups** who can access the record as well.

You can view all issues, remediation tasks, evidence request tasks, engagements, observations, and all audit tasks marked as confidential records from the application navigator as GRC confidential records. For more information, see Confidential records in common GRC features.

Similarly, if you are working in the Audit and Compliance workspaces, you can monitor the **Confidential records** in a separate tab in the Tasks page. For more information, see My tasks in the workspace.

To enable the Confidentiality property at the system level:

1. Navigate to **Policy and Compliance** > **Administration** > **GRC Properties**.

   Note:
   The user must have sn_grc.admin role.

2. Select **Yes** for **Enable record level confidentiality**.
3. Click **Save**.

Manage audit issues and remediation

Issues can be created manually to document audit observations or remediations, or to accept any problems. They are automatically generated from indicator results, attestation results, or control test effectiveness.

Various types of issues are created under the following conditions:

Issue

Created when an indicator fails

Control issue

Created when a control attestation is completed indicating that the control is **Not implemented**

Control test issue

Created when a control test is closed complete with the control effectiveness set to **Ineffective**

Other issue

Created by the user manually

Remediating an issue marks an intention to fix the underlying issue causing the control failure or risk exposure. Accepting an issue marks an intention to create an exception for a known control failure or risk. Controls that are **Accepted** remain in a non-compliant state until the control is reassessed. In this way, the issue can be used to document observations during audits.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manually create GRC issues

As a GRC user, you can manually create issues to document policy, risk, or audit observations, or to accept any GRC problems. You can also identify the source of the issue to help analyze and classify the issues.

Before you begin

Role required: (per product)

- In Policy and Compliance Management: sn_grc.business_user, sn_grc.business_user_lite
- In Risk Management: sn_grc.business_user, sn_grc.business_user_lite
- In Audit Management: sn_grc.business_usersn_grc.business_user_lite

Note:
Starting with Version 12.0.1 of the products mentioned above, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

For more information on the access control limitations to issues, see GRC business user role to control access and track usage of compliance tables.

Procedure

1. Navigate to one of the following locations:
   - **All** > **Policy and Compliance** > **Issues** > **Create New**.
   - **Risk** > **Issues** > **Create New**.
   - **Audit** > **Issues** > **Create New**.

   Note:
   Starting with Version 12.0.1 of the products mentioned above, the minimum role for the **Assigned to** user on the Issues form is GRC Business User [sn_grc.business_user]. The minimum role for the **Issue manager** is GRC User [sn_grc._user].

2. On the Issue form, fill in the fields.

   The due date under the **Dates** tab is automatically calculated based on the issue rating. You can manually override the calculated due date. The Task SLAs related list creates and displays SLAs based on the **Due date**.

3. Save the issue record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The tabs at the bottom of the screen enable you to perform various tasks for remediating the issue. You can add policy exceptions and create remediation tasks. Additionally, you can view other issues, indicator results, and task SLAs related to the issue.

Note:
Starting with Version 12.0.1, the **Task SLA** tab creates and displays SLAs based on the **Due date**. Notifications are sent to the issue owner and issue manager when the issue **Due date** reaches 50%, then 75%, then when it breaches. If the **Assigned to** and **Due date** fields are not empty and the issue is not in the **New** state, an SLA is created for the issue.

If the due date for the SLA changes, a new SLA is created. The SLA is completed when the issue transitions to **Closed Complete** or **Closed Incomplete**. Also, the SLA is cancelled if the **Due date** or **Assigned to** fields are empty, or the state is New.

Also starting with Version 12.0.1, remediation tasks can be created with the Assigned to user and issue manager user roles, as well as any user with the GRC Business User role.

Issue form

Use the Issue form to create a new issue.

Issue form

Field	Description
Number	Unique identification number.
Assignment group	Group to which this issue has been assigned. Each member gets a notification when an activity happens on this issue.
Assigned to	Member of the group assigned to resolve the issue. Starting with Version 12.0.1, the user must have at least the sn_grc.business_user role. **Note:** Use the bulb icon to get suggestions on who must the issue be assigned to. The bulb icon only appears if you have the GRC: Predictive Intelligence application activated, the form is saved, the **Assigned to** field is not inactive, and the GRC Property is selected as Similarity Analysis. For more information, see Governance, Risk, and Compliance properties. You can configure a hierarchy of users to access the issue record. For more information, see User hierarchy access control for issue and remediation task records. Starting with Version 12.0.1, the assigned-to user gets an email notification when the issue manager requests more information.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description
	Starting with Version 12.0.1, when an issue transitions to the **Respond** state, an entry in the **Assigned to** field is mandatory.
Issue source	Source from where the issue was created. This field is auto-populated with one of the following options based on how the issue is created: • Indicator Failure: Issue is created by a failure of the indicator • Risk Assessment: Issue is created in a risk • Risk Event: Issue is created in a risk event • Control Attestation Failure: Issue is created due to a non-compliant control • Control Test Failure: Issue is created when a control is ineffective and the control test is marked as closed and complete • Ad-hoc: Issue is manually created
Issue type	Type of issue. Choices are: • Control design effectiveness failure • Control operative effectiveness failure • Control does not meet requirement • Control does not exist • Non-compliance to a regulation • Non-compliance to a policy • Improvement or suggestion to an existing policy • Recommendation for a new policy • Process optimization or improvement • Observation • Data Breach • Fraud • Misstatement • Training • Documentation • Risk issue • Other
Classification	The classification of the issue as a risk, compliance, or audit, based on the issue type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description

Issue manager group	The group responsible for managing and reviewing the issue.
	
	Starting with Version 12.0.1, the following enhancements and requirements were introduced:
	• Members of the issue manager group must have one of the following roles:
	  ○ sn_audit.manager
	  ○ sn_audit.user
	  ○ sn_compliance.manager
	  ○ sn_compliance.user
	  ○ sn_grc.manager
	  ○ sn_grc.user
	  ○ sn_risk.manager
	  ○ sn_risk.user
	• When an issue transitions to the **Analyze** state, an entry in either the **Issue manager group** or **Issue manager** field is mandatory.
	• When an issue is assigned to the group, the members receive an email notification. Additionally, the issue manager receives an email notification when the issue transitions to the **Review** state.

Issue manager	The user responsible for managing and reviewing the issue. Starting with Version 12.0.1, the following enhancements and requirements were introduced: • The issue manager must have at least the sn_grc.user role. • The issue manager receives an email notification when the assigned-to user provides requested information. • When an issue transitions to the **Analyze** state, an entry in either this field or **Issue manager** is mandatory. • When an issue transitions to the **Respond** state, an entry in this field is mandatory.
State	• New • Analyze • Respond

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description
	• Review • Closed Complete • Closed Incomplete
Substate	The substate and applicable details for the substate.
Priority	The sequence in which an issue must be resolved, based on its impact and urgency: • **1 — Critical** • **2 — High** • **3 — Moderate** • **4 — Low** • **5 — Planning**
Issue rating	Starting with Version 12.0.1, the issue manager can assign the issue rating to the issue. Based on the issue rating, the **Due date** under the **Dates** tab is calculated as follows and displayed: • Very high (2 days) • High (4 days) • Moderate (8 days) • Low (10 days) • Very Low (15 days) You can manually override the **Due date**. **Note:** Users with the sn_grc.manager and sn_grc_advanced.issue_triage_manager role can navigate to **Policy and Compliance** > **Administration** > **Issue rating** and define additional issue ratings.p When the issue transitions to the **Respond** state, the Issue rating field is read only.
Issue group rule	Group rule assigned to this issue. The Issue group rule is used to group similar issues together into a parent issue based on the conditions defined in the rule. This rule enables you to work on similar issues simultaneously and close out the parent issue

© 2026 ServiceNow, Inc. All rights reserved.

Issue form (continued)

Field	Description
	after all issues are resolved. This closes out all the child issues.
Parent Issue	Parent issue this issue belongs to.
Configuration item	Item associated with this issue. If all child issues have the same configuration item, it gets copied over to the parent issue
Location	Location where the issue occurred.
Short description Starting with Version 12.0.1, this label is changed to **Name**.	A name for the issue.
Description	A more comprehensive description of the issue.
Details	
Control/Risk	Control or risk associated with the issue. When the control is associated, the corresponding entity of the control is added to the **Entity** field, and the control objective is added to the **Control Objective/Risk Statement** field. These control objective and entity are the ones that are linked to this control. When the control is associated to the issue form, an m2m record is created in the source [sn_grc_m2m_issue_item] table. Whenever a record is added in the source table, a corresponding record, Issue to Entity is added in the destination [sn_grc_m2m_issue_to_entity] table, and another record Issue to Content is added in the destination [sn_grc_m2m_issue_content] table for the associated entity and control objective of the control.
Entity	Related entity.
Policy	The policy associated with the issue.
Authority document	The authority document associated with the issue.
Control Objective/Risk Statement	The control objective or risk statement related to this issue.
Recommendation	Resolution actions recommended by the risk, compliance, or audit teams.
Action Plan	The plan for remediating the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description
Dates	
Planned start date	Date and time that work on the issue is expected to begin.
Planned end date	Date and time that work on the issue is expected to end.
Planned duration	Estimated amount of work time for the issue.
Confirmed date	(Starting with Version 12.0.1) The date when the issue is confirmed. This field is read-only, and displays today's date when the issue is moved from **New** to any of the following states: • **Analyze** • **Review** • **Respond** **Note:** If a triage issue is converted to an actual issue, this field displays the date it was converted.
Due date	(Starting with Version 12.0.1) This date is auto-populated based on a GRC property. Navigate to **Policy and Compliance** > **Administration** > **GRC Properties**. If the **Auto populate due date based on issue rating** property is set to **Yes**, this field is auto-populated based on the predefined remediation time frame for the issue's risk rating. Otherwise, you can manually enter a due date. When an issue transitions to the **Respond** state, an entry in this field is mandatory.
Actual start date	Time when work began on this issue.
Actual end date	A read-only value that is determined by the **Actual duration** input field.
Actual duration	Amount of work time.
Created	The date and time the issue was created.
Closed	The date and time the issue was closed.
Engagement	
Engagement	The related engagement.
Activity	
Additional comments (Customer visible)	Public information about the issue. Click **Post** to add your comments to the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue form (continued)

Field	Description
Work notes	Click the **Work notes** check box to display the **Work notes** field. Information about how to resolve the issue, or steps already taken to resolve it, if applicable. Work notes are visible to users who are assigned to the issue. Click **Post** to add your work notes to the issue.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.
Risk Event	
Risk event	The related risk event.

Evidence request

Evidence request is used by audit and compliance teams for requesting supporting documents during an audit. Auditors and compliance teams require these documents from the first line of defense.

Evidence is all the information used by an auditor in determining the audit opinion. Evidence includes the information contained in the accounting records underlying the financial statements and other information. Evidence is cumulative in nature. It includes evidence obtained from audit procedures performed during the audit. Evidence may also include audit evidence obtained from other sources such as, previous audits.

An evidence request is frequently introduced during the audit preparation or the planning phase after the audit announcement. The documents requested are used by the audit team to understand the in-scope controls and processes, and to begin fieldwork testing. As an audit progresses through various stages, the audit team frequently adds new requests to the list. The compliance teams use the collected evidence for control testing. Starting with the latest release, unplanned evidence request is supported by Audit Management and Policy and Compliance Management. The following are the benefits of the evidence request feature:

- Helps the second line and third line of defense to create and send all their evidence requests quickly.
- Helps in the management of requests and evidence.
- Eliminates multiple emails by providing a tool for communication.
- Compliance teams can request evidence from control owners, business stakeholders, and process owners.
- Audit teams can request evidence from control owners, business stakeholders, process owners, and compliance teams.
- Enables providing the due date for the evidence to be submitted.
- Provides the ability to send email reminders to the assignee.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The assignee can provide evidence directly from the Service Portal.
- Simplified manager approval of evidence requests can be based on various criteria, such as confidentiality and criticality.
- The assignee can store evidence in a common evidence folder, such as Box or SharePoint.
- Improved communication channels between requesters and assignees streamline the approval process.
- Improved confidentiality constraints prevent unauthorized persons from viewing request information.

Evidence can be requested from an engagement and all audit tables. To understand how to request evidence, refer to Request evidence for audit.

Evidence request workflow and users

Evidence request helps customers to electronically request the information that they need from the first and second line of defense. The individuals being audited can then immediately upload their documents to the system, significantly reducing manual processing time.

The evidence request workflow is as follows:

1. An audit user with the sn_audit.user role requests evidence and assigns the request to another user. This requester can either request the evidence for themselves or raise a request on behalf of another audit user or GRC user. If the requester determines that an evidence task has been created erroneously, then the requester can cancel that particular evidence task. The ability to cancel the evidence request is available when the request is in **Draft** state. A requester can cancel the evidence request tasks any time until the tasks reach the **Review** state.
2. After you create an evidence request, you must create evidence collection records and then the requester must request evidence. Evidence Collection records contain the evidence collection instructions, assigned to, and assignment group. On clicking **Request Evidence**, evidence request tasks are generated and they are assigned to a group or user.
3. The assignee then receives an email with the link to provide the requested evidence.

   Note:
   If the requester changes the assignee after requesting evidence, then the original assignee can no longer view the request. Only the person who is assigned the request can view the request. This feature ensures confidentiality.

4. The assignee can either attach the requested evidence or provide a URL or location that contains the required evidence.
5. The assignee can also add an approver for verifying and approving the evidence. Adding approvers is necessary if the evidence is sensitive and confidential in nature.
6. The approver can then review the evidence and either approve it, request revision, or request further details about the evidence.
7. If the approver approves the evidence, the requester receives the evidence and can process it further.
8. The requester can then review the evidence and do one of the following:
   - accept the evidence.
   - request for its review.
   - request further details about the evidence.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- cancel the evidence request if it is not required anymore.
- delete the request.

9. If the requester accepts all the evidence tasks, the request is closed.

The evidence request workflow is shown in the following

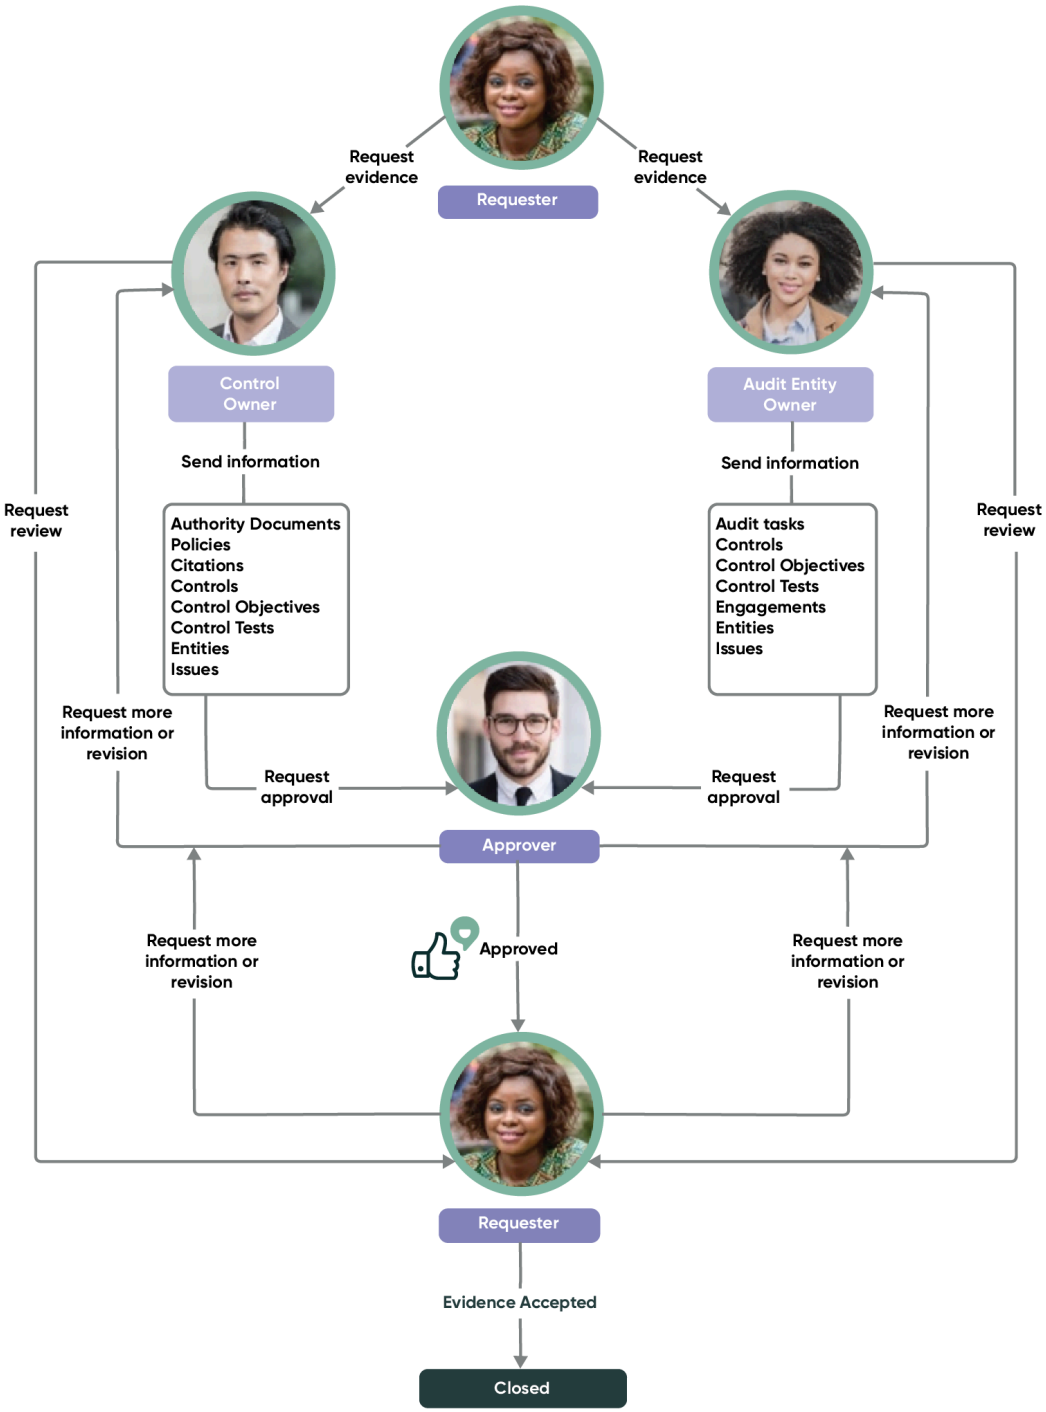

figure:

The following table describes the roles and their responsibilities during the evidence request workflow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Evidence request users, responsibilities, and requirements

User	Responsibilities	Requirements
Internal auditor	• Perform audit testing. • Request audit testing. • Review all audit findings and the evidence collected.	• Visibility into compliance and risk activity. • A job queue (pending, current, upcoming) to plan their team efforts. • Track and monitor audit findings. • Track and monitor audit activities.
Compliance manager, Audit manager	• Can request evidence. • Request compliance test evidence. • Review all findings and evidence collected.	• Visibility into compliance activities. • A job queue (pending, current, upcoming) to plan their team efforts. • Track and monitor compliance findings.
Compliance user, Control owner	• Ensure that the controls are implemented. • Attest to the controls. • Test the controls. • Provide audit evidence requested by the auditor.	• A job queue to direct their day-to-day activities. • Track the time spent and performance of activities and tasks they own. • Ensures the task they own and additional request from the auditor is fulfilled.

Request evidence for audit

Request evidence at any stage during an audit. The details about the items for which evidence is requested are also provided to the person responsible for providing the evidence.

Before you begin

Role required: sn_audit.user

About this task

An evidence can be requested in the following three ways:

- By creating an evidence record from the **My Evidence** module.
- From the Entity, Control, Audit Task, Control Test Issue, and Other Issues related lists in an engagement record. To request evidence from these sources, navigate to **Audit** > **Engagements** > **My Engagements**. Open the engagement record, and select the related list from which you want to request evidence. From the **Action on selected rows** list, select **Request Evidence**. Here, you can either create a new evidence request or add more requests to an existing evidence request. The Evidence request is created but not evidence request tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- From the following tables: Entity, Control, Control Objective, Control Test, Engagement, Issue. However, when the users request evidence from these tables, the evidence request is created not the actual evidence request task. The users must go to the evidence request record that is generated and then add evidence request tasks.

In this procedure, the method to request evidence from the **My Evidence** module is described.

Procedure

1. Navigate to **Audit** > **My Evidence Request**.
2. Click **New**.
3. On the form, fill in the fields.

Evidence Request form

Field	Description
Number	Unique number of the evidence request.
Requester	User requesting evidence. This field is automatically populated.
Requested on behalf of	User for whom evidence is being requested.
Assignment group	Group assigned to provide evidence.
Assigned to	User responsible for providing the evidence.
State	State of the request. The default state is **Draft**.
Type	The default type is **Audit**.
Request reason	Reason for requesting evidence.
Watch list	Users interested in viewing the evidence collected. If a person is added on the watch list, they can navigate to **Audit** > **Evidence Request** > **Watched Evidence Requests** to view the requests.
Short description	Brief description of the evidence request.
Description	Detailed description of the evidence request.
Schedule	
Due date	Expected date of evidence submission.
Opened	Date the request is opened. This date is automatically updated.
Closed	Date the request is closed. This date is automatically updated.
Activity	
Work notes	Type any notes that might be required.
Activities	Activity log for the request.
Confidentiality	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.

4. Save the form.
   The Evidence Collection Details related list appears. This related list is used to list the items for which evidence is requested.
5. Click **New**.
6. On the form, fill in the fields.

Evidence Collection Detail form

Field	Description
Evidence request	Unique number of the evidence request task.
Evidence for	Record for which evidence is requested.
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing evidence.
Evidence collection instructions	Instructions for providing evidence. For example, list of supporting documents, files, and so on.

7. Click **OK**.
8. Click **Submit**.
9. Click **Request Evidence**.
   When an evidence request is already in the Work in Progress state, and a new evidence collection detail is added, then evidence request task is sent to the assignee immediately. The Evidence related list appears with the list of evidences and the person who is assigned the request receives an email notification to provide the requested evidence. Also, the state of the request changes to **Work in Progress**.

Provide requested evidence

Provide evidence when you are requested. When evidence is requested, the person who must provide the evidence receives an email. The process to provide the evidence begins.

Before you begin

Role required: sn_grc.business_user

About this task

When the assignee receives the email to provide the requested evidence, the assignee can either provide the requested evidence or reassign the request to another user. The assignee can also add approvers before sending the requested evidence to ensure additional security of the evidence. If the assignee reassigns the request to some other user, the original assignee can no

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

longer view the request. If the evidence provided does not need an approver, then the assignee can directly request a review of the evidence, and the requester gets a notification to review the evidence.

Procedure

1. Navigate to **All** > **Audit** > **Evidence Request** > **My Evidence Request Tasks**.
2. Open the record for which you want to provide evidence.
3. Click **Accept Work**.
4. On the form, fill in the fields.

Evidence form

Field	Description
Number	Number of the evidence request. This value is generated by default.
Requester	User requesting evidence. This value is generated by default.
Requested on behalf of	User for whom evidence is being requested. This value is generated by default.
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing the evidence. This value is generated by default.
State	State of the request.
Substate	None. This value is generated by default.
Request reason	Reason for requesting evidence.
Approvers	Users to approve evidence before it is returned to the requester for review. Usually, an approver is the manager of the person providing the evidence.
Watch list	Users interested in viewing the evidence collected.
Name	Name of the evidence request. This description is generated by default and is fetched from the record that was created to request evidence.
Description	Detailed description of the evidence request. This value is generated by default and is fetched from the record that was created to request evidence.
Request Details	
Evidence request	Unique ID of the evidence request associated with the task. This value is generated by default and is fetched from the record that was created to request evidence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Evidence for	Record for which the evidence is requested.
Evidence for description	Description of the record for which the evidence is being requested. This value is generated by default and is fetched from the record that was created to request evidence.
Evidence URL	URL of the evidence if the user prefers to share the evidence as a link instead of an attachment. For example, this can be a link to a shared folder.

5. To request approval for the attached evidence, click **Request Approval**.
6. If no approvers are required, click **Request Review**.

Approve evidence before evidence review

Approve the evidence being provided before the requester views the evidence. When evidence is provided in response to an evidence request, the evidence may need an approval before the evidence is sent back to the requester. This ability ensures security and confidentiality of the evidence.

Before you begin

Role required: sn_grc.business_user

About this task

After receiving a request to approve evidence, an approver can do one of the following:

- Approve the request if there are no issues or concerns.
- Request revision of the evidence attached in case it is not correct or needs rectification.
- Request information if the approver wants more details about the attached evidence.

Procedure

1. Navigate to **All** > **Audit** > **Evidence Request** > **My Approvals**.
2. Open the record for which you want to approve evidence.
3. Review the attached evidence on the form and click one of the following options:

Option	Description
Approve	Approve the attached evidence. The requester gets the evidence provided.
Request Revision	Request that the attached evidence be reviewed. Enter comments when you request revision. The assignee gets a notification to review the attached evidence.
Request Information	Seek more information and details about the attached evidence. The assignee gets a notification to provide more information about the attached evidence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accept, reject, or cancel evidence request

Accept, reject or cancel an evidence request when you receive the evidence you requested. After requesting an evidence request, when the requester receives the evidence, the requester can accept, reject, or cancel the evidence request.

Before you begin

Role required: sn_audit.user and sn_compliance.manager

Procedure

1. Navigate to **All** > **Audit** > **Evidence Request** > **My Pending Reviews**.
2. On the Evidence form, review the attached evidence, and click one of the following options:

Option	Description
Accept Evidence	Accept the evidence that is provided.
Request Revision	Request for the evidence to be reviewed, if it is not appropriate, or modified.
Cancel	Cancel the evidence request task.
Delete	Delete the evidence request task.

Audit plan overview

An audit plan enables you to plan all your audit engagements in a systematic and logical manner.

An audit engagement is like a project which involves multiple tasks and it is difficult to manage all audit activities without planning well. Having a well-defined plan with all the audits, their projects, and costs helps audit managers to perform their tasks efficiently.

Audit plan uses and benefits

An audit team conducts multiple audits in an organization. Creating an audit plan enables the audit teams to plan their audits and engagements better. By creating an audit plan, the auditor directors or audit leads with the role sn_audit.manager can:

- Plan engagements effectively and ensure that the goals set in the annual internal audit plan are accomplished.
- Help the auditor obtain appropriate evidence for the circumstances.
- Keep audit costs at a reasonable level.
- Ensure that potential problems are promptly identified
- Get the scope of the audit program determined by an auditor to perform the audit tasks in a well-defined manner.

Audit planning workflow

- Defining the purpose of the audit
- Risk assessment
- Audit scoping
- High-level audit schedule and detailed audit timeline with milestones

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Resource planning by necessary skills and building audit team
- Cost planning

When you create an audit plan with advanced planning capabilities and add engagements to the plan, and move the engagement to either **Validate** or **Fieldwork** state, an associated engagement project is automatically generated.

Note:
A project is only created if the PPM Standard plugin is installed and the user has the it_project_manager role. If the user does not have the it_project_manager role and has only the sn_audit.manager role, even when advanced planning capabilities are enabled on the plan, the engagements do not have corresponding projects when they move into **Validate** or **Fieldwork** states.

After you add engagements to an audit plan, you also have the flexibility to change the parent plan of the engagements. It is important to note the following points:

- Engagements can be either added or removed from a plan only when the plan is in **Draft**, **Awaiting Approval**, and **Approved** states.
- The parent plan can only be changed on an engagement when the engagement is in **Scope**, **Validate** and, **Fieldwork** states.

Create an audit plan

Create an audit plan to manage different types of audits in a periodic manner and group engagements in a logical manner.

Before you begin
Role required: sn_audit.manager, it_project_manager (to create projects)

Activate the Advanced Audit plugin (com.sn_audit_advanced).

About this task
When an audit plan is created and engagements are added to the plan, the plan is sent to the approver for approval.

Procedure
1. Navigate to **All** > **Audit** > **Plans** > **Create New**.
2. On the form, fill in the fields.

Plan form

Field	Description
Number	Unique number of the plan.
Name	Name of the plan. For example, Annual Audit Plan for Payroll.
Timeframe	Duration of the plan. The choices are: ○ Annual ○ Semi-annual ○ Quarter ○ Other

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Start date	Date the plan begins.
End date	Date the plan ends. This field is automatically populated based on the choice made in the **Timeframe** field. If the **Timeframe** field has **Other**, then enter an end date manually.
Owning group	Group responsible for owning the plan.
Owner	Plan owner.
State	State of the plan. The default state is **Draft**.
Substate	Substate of the plan. The value in this field changes based on the workflow.
Type	Type of the plan. The choices are: ○ None ○ Internal Audit Plan ○ External Audit Plan ○ SOX Audit ○ Compliance Audit Plan ○ Vendor Audit Plan ○ Customer Audit Plan
Plan with	Planning capability to use for the engagements. The choices are: ○ Basic planning capabilities: ○ Advanced Planning capabilities: If you select this option, engagement projects are automatically created.
Approvers	Person who approves the plan.
Description	Brief description of the plan.
Objectives	Objectives of the plan.
Expenses and Resources	
Budgeted expenses	Budget allocated for the engagements under the plan.
Planned expenses	Rolled up planned expenses from the engagements.
Actual expenses	Rolled up actual expenses from the engagements.
Expense comments	Notes about the expense details.
Budgeted resources	Number of hours allocated for the engagements under the plan.
Planned resources	Rolled up planned resources from the engagements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actual resources	Rolled up actual resources from the engagements.
Resource comments	Notes about the resource details.

3. Save the form.
   The Engagements related list appears.
4. In the Engagements related list, add engagements by either clicking **New** or **Edit**.
5. Click **Request Approval**.
   The state changes from **Draft** to **Awaiting approval**.

Approve a plan

Approve a plan if you're assigned as an approver after plan creation. You can also request that the plan be reviewed or request more information about the plan from the plan creator.

Before you begin

Role required: sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **My Plan Approvals**.
2. Select and open the plan you want to approve.
3. Review the plan and click one of the following options:

Option	Description
Approve	Approve the plan that is created.
Request Revision	Request for the plan to be reviewed or modified, if it is not appropriate.
Request Information	Request more information about the plan.
Cancel	Cancel the plan.

Create an engagement with advanced planning

Use the advanced planning capabilities to create an engagement that automatically creates an engagement project. After an engagement project is created, you can add resource plans and cost plans to the engagement. The values of these plans roll up to the engagement and to the audit plan.

Before you begin

To use the advanced planning feature, you must activate the following store applications and plugins:

- GRC Advanced Audit plugin (com.sn_audit_advanced)
- GRC Profiles
- GRC Policy and Compliance Management
- GRC Risk Management
- GRC Advanced Core
- GRC Advanced Risk

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- GRC Audit Management
- Project Portfolio Management Standard

You can choose to create audit plans for the engagement.

Note:
To know more about the applications in GRC module, see Governance, Risk, and Compliance.

Role required: sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Engagements** > **Create New**.
2. On the form, fill in the fields.

Engagement form

Field	Description
Number	Unique identification number of the engagement.
Name	Name of the engagement.
Type	Type of engagement. The choices are as follows: ○ None ○ Internal Audit ○ External Audit ○ SOX Audit ○ IT Audit ○ Financial Audit ○ Compliance Audit ○ Certification Audit ○ Regulatory Audit ○ Operational Audit ○ Continuous Audit ○ Vendor Audit ○ Customer Audit ○ Store Audit ○ Quality Audit ○ Project Audit **Note:** For more information on the types of audits, see Audit types.
Assigned to	User assigned to the engagement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	State of the engagement. The choices are as follows: ○ Scope ○ Validate ○ Fieldwork ○ Awaiting Approval ○ Follow Up ○ Closed Complete ○ Closed Incomplete **Note:** For more information on each of these states, see Manage engagements.
Percent complete	Percentage of the engagement that is complete.
Auditors	Auditors assigned to the engagement.
Approvers	Approvers assigned to the engagement.
Description	General description of the engagement.
Objectives	Stated objectives of the engagement.
Schedule	
Engagement planned start	Estimated start date of the engagement.
Engagement starts	Choice to automatically determine the start date of the engagement. The choices are as follows: ○ Scope ○ Validate ○ Fieldwork
Engagement actual start	Actual date when the engagement begins.
Engagement planned end	Estimated end date of the engagement.
Engagement ends	Choice to automatically determine the end date of the engagement. The choices are as follows: ○ Follow Up ○ Closed **Note:** For more information on the Follow Up and Closed states, see Manage engagements.
Engagement actual end	Actual date the engagement ends.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Fieldwork planned start	Estimated start date of the fieldwork.
Fieldwork planned end	Planned end date that was originally set in the engagement. **Note:** This field is automatically set to one day after the planned start date for fieldwork.
Fieldwork planned duration	Number of days and hours planned for fieldwork. The duration and planned start date of fieldwork are used to calculate the planned end date. If audit tasks are defined, this field is automatically set to the longest planned duration from the audit tasks.
Fieldwork actual start	Actual start date of the fieldwork. If audit tasks are defined, this field is automatically set to the earliest actual start date from the audit tasks.
Fieldwork actual end	Actual end date of the fieldwork. If audit tasks are defined, this field is automatically set to the latest actual end date from the audit tasks.
Fieldwork actual duration	Duration of fieldwork start date and end date.
Results	
Result	Results of the engagement. The choices are as follows: ○ Satisfactory ○ Adequate ○ Inadequate
Opinion	Justification for the selected result.
Report	
Knowledge base	Knowledge base to use to select the report template.
Report template	Template that is used to generate the knowledge base article which reports the engagement results.
KB article	Recently generated knowledge base article which contains the engagement results.
Activity	
Additional comments	Comments that are viewable by customers.
Work notes	Comments that are viewable by the administrator and by the audit manager.
Plan Details	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent plan	Plan to associate the engagement with.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.
Expenses and Resources	
Budgeted expenses	Budgeted expenses for the engagement.
Planned expenses	Estimated expenses for the engagement. If the cost plan is defined, this field automatically displays the estimated expenses.
Remaining budgeted expenses	Difference between **Budgeted expenses** and **Planned expenses**. This field is automatically set.
Actual expenses	Actual expenses incurred. If timecards are defined, this field is automatically set.
Budgeted resources	Budgeted resources for the engagement, in hours.
Planned resources	Estimated resources for the engagement, in hours. If resource plans are defined, this field is automatically set.
Actual resources	Actual resources for the engagement, in hours. If timecards are defined, this field is automatically set.
Project Details	
Project	Automatically created engagement project. This field is populated when you click **Validate and Plan**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field also gets populated when you click **Enable Advanced Planning** on the engagement, in the Validate or Fieldwork state. This field also gets populated if any of the following are true: ○ The field is already linked to a plan with advanced planning capabilities. ○ The user has the required roles. ○ The engagement is in the correct state.
Time card approver	Person assigned to the engagement. You can also change the approver in this field. **Note:** If more than one user is selected, then everyone on the list must approve the time cards.

3. Click **Validate and Plan**.

   Note: The **Validate and Plan** button only appears if the Advanced Audit plugin is activated.

   The project details are populated.
4. Click **Enable Advanced Planning**.

Result
An engagement project is created in the background for the engagement. The Resource Plan and Cost Plan related lists also appear.

What to do next
Create a resource plan and Create a cost plan.

Add auditors for an engagement from resource plans

Assign audit tasks to auditors in an engagement from the resource plans. Resource plans track the cost associated to auditors. Considering this cost is important while planning the engagement.

Before you begin
If you have an engagement record with a resource plan created, the resource plan must be in Allocated state. The users in the Resource Allocations section of the resource plan contain resources that can be added as auditors. The auditors you add must have sn_audit.user or external auditor role, and pps_resource role. The Resource Plans related list with its associated workflow is only available when the GRC Advanced Audit and the Project Portfolio Management plugins are activated.

Role required: sn_audit.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **Engagements**.
2. Open the engagement record to which you want to add auditors.
3. Click the Resource Plan related list.
4. Click the **Add Auditors** button.
   The resources who have the required roles are automatically added to the auditors field, if they are not already present.

Create an auditable unit

Create auditable units with entities such as business units, departments, vendors, products, business processes, business applications, locations, authority documents, and policies to perform risk assessments on the auditable units.

Before you begin

Role required: sn_audit.user or sn_audit.manager

Activate the GRC Advanced Audit plugin (com.sn_audit_advanced).

About this task

You can create an auditable unit and decide the type of risk assessment you want to perform on the auditable unit. After the risk assessment is done, based on the risk ratings, the audit managers can decide if they want to audit the entities. You can scope an auditable unit as an entity on an engagement.

Procedure

1. Navigate to **All** > **Audit Universe** > **All Auditable Units**.
2. Click **New**.
3. On the form, fill in the fields.

Auditable Unit form

Field	Description
Number	Unique number of the auditable unit.
Name	Name of the auditable unit. For example, Accounts Payable - Finance.
Owning group	Group that owns the auditable unit.
Owner	Owner of the auditable unit.
State	State of auditable unit. The default state is **Draft**.
Priority	Priority of the auditable unit.
Description	Brief description of the auditable units.
Risk Assessment	
Method	Type of risk assessment to obtain the risk rating of the auditable unit. The choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Basic Risk Assessment. This option allows you to manually enter a value for the risk rating. ○ Detailed Risk Assessment. This option appears when the Advanced Audit plugin is activated. When you select this option, the Risk Assessments related list appears.
Risk rating	Risk rating of the auditable unit obtained from a basic risk assessment. This field appears if the **Method** field has **Basic Risk Assessment**.
Inherent risk rating	Inherent risk score. The value in this field is derived from advanced risk assessment. This field appears if the **Method** field has **Detailed Risk Assessment**.
Control effectiveness	Control effectiveness score. The value in this field is derived from advanced risk assessment. This field appears if the **Method** field has **Detailed Risk Assessment**.
Residual risk rating	Residual risk score. The value in this field is derived from advanced risk assessment. This field appears if the **Method** field has **Detailed Risk Assessment**.

4. If you have selected **Basic Risk Assessment** in the **Method** field, click **Submit**.
5. If you have selected **Detailed Risk Assessment** in the **Method** field, click **Assess Risk**.
   a. In the **Assessor** field, select an assessor for the risk assessment.
   b. In the **Approver** field, select an approver for the assessment.
   c. Click **Submit**.
   A risk assessment instance link is created at the top left and the assessor gets a notification to perform the risk assessment. After the detailed risk assessment is performed, the Risk Assessments related list shows the assessment.
6. Click the following available related lists, and add entities to them as required.
   - Business Units
   - Departments
   - Vendors
   - Products
   - Business Processes

Audit types

There are many types of audits and each of the audit types has a specific use in an audit engagement.

Audit Type	Description
Internal Audit	An internal audit checks a company's internal controls, corporate governance, and accounting processes.
External Audit	An external audit is an independent examination of the financial statements prepared by the organisation.
SOX Audit	A Sarbanes Oxley (SOX) compliance audit is a measure of how well your company manages its internal controls. While SOX doesn't specifically mention information security, for practical purposes, an internal control is understood to be any type of protocol dealing with the infrastructure that handles your financial data.
IT Audit	An IT audit is the examination and evaluation of an organization's information technology infrastructure, policies and operations.
Financial Audit	A financial audit is an independent, objective evaluation of an organization's financial reports and financial reporting processes. The primary purpose for financial audits is to give regulators, investors, directors, and managers reasonable assurance that financial statements are accurate and complete.
Compliance Audit	A compliance audit is an independent evaluation to ensure that an organization is following external laws, rules, and regulations or internal guidelines, such as corporate bylaws, controls, and policies and procedures.
Certification Audit	A certification audit is an audit your registrar conducts to verify conformance against the ISO 9001 standard before they issue your official ISO 9001 certificate.
Regulatory Audit	The aim of a regulatory audit is to verify that a project is compliant with regulations and standards.
Operational Audit	An operational audit is an examination of the manner in which an organization conducts business, with the objective of pointing out improvements that will increase its efficiency and effectiveness.
Continuous Audit	A continuous audit is an internal process that examines accounting practices, risk controls, compliance, information technology systems, and business procedures on an

Audit Type	Description
	ongoing basis. Continuous audits are usually technology-driven and designed to automate error checking and data verification in real-time.
Vendor Audit	A vendor audit is performed for a company that aims to attain an objective assessment of its contractors' or vendors' compliance to the terms, conditions and intent of the contracts or agreements between two entities.
Customer Audit	A customer audit is a detailed review of how your company is perceived by its customers, a review of each customer's needs, and an evaluation of the role your company is playing in each of your customer's businesses.
Store Audit	A store audit assesses the health of your retail location using hard data. Retailers, staff, or a third party combs through your store or pop-up shop to collect information on what's working and what's selling or what isn't.
Quality Audit	A Quality audit is the process of systematic examination of a quality system carried out by an internal or external quality auditor or an audit team.
Project Audit	A project audit is a formal review of a project, often intended to assess the extent to which project management standards are being upheld. Audits are generally carried out by a specially designated audit department, the Project Management Office, an approved management committee or an external auditor.

Manage milestones

Milestones can be used to track the progress of an engagement.

After you create milestones for an engagement, you can also add audit tasks to the milestone and track those tasks as milestones. You can assign the milestone to a user who is responsible for the milestone. When a person is assigned to a milestone, they receive a notification informing them of the assignment. The user who is assigned the milestone must have the sn_audit.user role. When an engagement moves to the **Follow Up** state, if there are no open audit tasks, open milestones, and open observations, then the engagement moves to the **Closed** state.

After you create a milestone from an engagement, you can manage your milestones by navigating to **Audit** > **Milestones** > **My Milestones**.

Create an engagement milestone

Create milestones for an engagement to track the progress of an engagement. You can also add audit tasks to a milestone.

Before you begin

Activate the Advanced Audit plugin.

Role required: sn_audit.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Audit** > **Engagements**.
2. Open the engagement for which you want to create a milestone.
3. Click the Milestones related list.
4. Click **New**.
5. On the form, fill in the fields.

Milestone form

Field	Description
Number	Unique number of the milestone. This number is automatically generated.
Type	Audit milestone type. The choices are: ○ Scoping ○ Planning ○ Fieldwork ○ Follow up ○ Reporting ○ Closure
Name	Name of the milestone.
Assignment group	Group responsible for the milestone. The group members must have the sn_audit.user role.
Assigned to	Person responsible for working on the milestone.
State	State of the milestone. The default state is **Open**.
Percent complete	Percentage of milestone completion. When a value is entered in this field, the state changes to **Work in progress**.
Parent	Parent engagement of the milestone.
Key milestone	Option to mark the milestone as important.
Auto complete and close	Option to mark the milestone as close complete when all the associated audit tasks are completed and closed. If this option enabled, then the percent complete is automatically updated as per the number of tasks marked as closed complete.
Description	Brief description of the milestone.
Schedule	
Due date	Expected completion date of the milestone.
Completion date	Actual completion date of the milestone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Closed date	Actual close date of the milestone.
Activity	
Worknotes	Worknotes for the milestone.
Additional comments (Customer visible)	Comments related to the milestone, if any.

6. Save the form.
   The Audit Tasks related list appears.
7. On the Edit Members form, move the required audit tasks from the available audit tasks in the Collection column to the Audit Tasks List column, and then click **Save**.
   The milestone is created.

Create a milestone from an audit task

Create and track an audit task as a milestone.

Before you begin

Role required: sn_audit.manager

Procedure

1. Navigate to **All** > **Audit** > **Milestones** > **All Milestones**
2. Open the Milestone that contains the audit task that you want to track.
3. From the Audit Tasks related list, open the audit task you want to track.
4. Click **Track as a Milestone**.
   The milestone is created and the task is added to the milestone.

Audit observations

Audit observations are the results of an audit. As an important part of the audit report, audit observations represent the results of reviews, analysis, interviews, and discussions.

Audit observations are used to bring significant issues to the attention of audit managers. Observations are logged in the system. For example, if a bank's operations are being audited, then the audit observations are based on evidence about how the bank's operations perform against the audit criteria. During control testing, interviews, and walkthroughs, audit observations are recorded. An audit user can create an observation from an engagement if the engagement is not in the Follow Up or Closed states. An observation can also be created from all types of audit tasks.

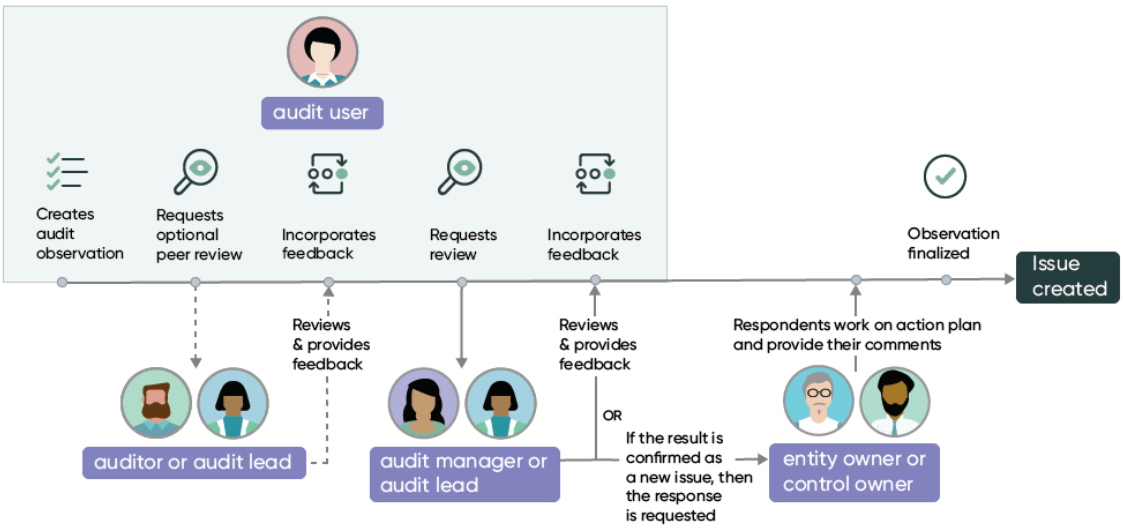
After the auditor completes the audit, the auditor then presents the audit observations to the audit managers. By using the audit observations, the auditor can present a summary of problems, discoveries, and recommendations. The audit team reviews the observations to determine if the observation is a reportable issue. The audit team can also determine if the observation can be tracked as a recommendation, an observation, or a best practice.

In its life cycle, an audit observation moves through the following states:

1. Draft
2. Review
3. Respond

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Finalize
5. Closed



The workflow of an observation is as follows:

1. An audit user with the role sn_audit.user creates an observation.
2. The observation creator assigns respondents and peer reviewers to the observation. The respondents are the entity owners and control owners. The peer reviewers are the auditors and audit leads of the engagement.
3. The observation creator can request a peer review of the observation. In that case, the following then happens.
   a. The peer reviewer gets a notification to perform the peer review. The peer reviewer can view the task under **Audit** > **Observations** > **My Pending Peer Reviews**.
   b. The peer reviewer completes the review.

> **Note:**
> When a peer review is requested, the state remains as Draft but the substate changes to the Peer review requested substate.

4. The observation creator can also request a review. The reviewer can be an audit manager or the audit lead.
   a. The reviewer gets a notification to perform the review. The reviewer can view the task under **Audit** > **Observations** > **My Pending Reviews**.
   b. The reviewer can either request a revision of the observation or request a response from the respondent. The reviewer can also provide feedback in the Results section by selecting the appropriate option.
5. If the reviewer requested a response from the respondent, then the respondent responds to the observation by navigating to **Audit** > **Observations** > **My Pending Response**.
6. The observation moves to the Finalize state.
7. The observation is closed and an issue is created.

Audit observations workflow

Roll up expenses and resources in an engagement

Any audit project has associated costs, budgets, and resources. Roll ups of these costs, budgets, and resources enable the audit manager to view the entire costs and resources in a consolidated manner.

Starting with the new release, a new plugin called Advanced Audit has been introduced in the Audit Management application. When you activate the Advanced Audit plugin and install the Project Portfolio Management application, you can utilize the project management capabilities to automatically create engagement projects.

When an audit plan is created, the audit manager must be able to view the complete expenses and the resources involved in the engagement. Activating the Advanced Audit plugin enables the rollup of the expenses and resources cost of all engagements for a consolidated view. You can also use the advanced planning capabilities to automatically roll up the expenses and resources of each individual engagement to the parent plan of the engagements.

Project budget rollup

After an engagement project is automatically created, if the user has the it_portfolio_manager role, the user can create a project budget. When a budget is created, the budget cost gets copied over to the **Budgeted expenses** field of the engagement from the engagement project. When you use the advanced planning capabilities to automatically create a plan, the values in the expenses and the resources field are rolled up from the associated engagements and the engagement projects. To allocate a project budget, see Allocate budget to a project. If you allocate a project budget, then the data from the budget cost field gets copied over to the engagement. For example, if you have an engagement where the budget expense is $100. Then, if you create a project budget for the engagement project of this engagement, and enter the budget cost as $200, then the budget expense of $100 in the engagement is overwritten and replaced by $200.

Actual expenses and resources rollup

If actual effort is updated on an engagement project, then that value gets copied over to actual resources on the engagement. The **Actual resources** and **Actual expenses** both are copied over from the **Actual effort**and **Actual cost** fields.

Resource plan rollup

With Project Portfolio Management, you can add resource plans and cost plans to an engagement. To learn how to create an engagement with advanced planning, see Create an engagement with advanced planning

After you create a resource plan and it is in the **Allocated** state, all the confirmed and allocated hours from the resource plan are summed up in the planned resources on the engagement project. When a resource plan is created, you cannot manually enter the hours in the **Planned resources** field on the engagement form as the values get automatically rolled up. To manually enter hours in the **Planned resources** field, you must delete the resource plan that you have created.

Cost plan rollup

If you create an independent cost plan that is not created as a result of a resource plan, then you cannot manually enter values in the **Planned expenses** field on the engagement form. You can still edit the **Planned resources** field.

Integrating Audit Management with Time Card management

Audit users and audit managers can now use the Time Card Management feature to log and capture hours for engagements and other tasks on an engagement.

The Time Card management feature enables users to submit and track their time for the assigned tasks. With the Time Card Management feature:

- The time card users can record the time worked on a task using time cards and time sheets. They can then submit their time cards and time sheets for approval.
- Time cards and time sheets are routed for approval based on the **Non-project time approver** field in the user time sheet policy. Managers with the time card approver role can also log time and submit the time sheet of their resources.

When you integrate Audit Management with Time Card management, you can report a time card for:

- an engagement
- audit tasks
- issues
- milestones

To use the Time Card management feature integration with GRC Advanced Audit, you must activate the following plugins:

- Project Portfolio Management
- GRC: Advanced Audit

Note:
You must enable advanced planning for the engagement.

When an audit user logs time using time cards, the time cards are sent for approval based on the approvers defined in the time sheets policy. To learn more about time sheets policy, see Time sheet policy

Note:
If there's no approver identified or **None** is selected in the **Non-project time approver** field on the time sheet policy assigned to the user, then the users in the **Time card approver** field are able to approve the time cards associated to that engagement. If **User Manager** or **Auto** is selected in the **Non-project time approver** field, then the approvers are not overridden and remain as is. For details on the roles required to approve time cards, see Roles required for Advanced planning capability and Project Portfolio Management integration

To create a time card, see Create a time card.

A user can submit the time cards through the time sheet portal directly without coming to the engagement. To submit a time card, see Submit a time card. To submit a time card from the time sheet portal, see Submit time card from the time sheet portal

Time cards and rollup of expenses and resources

In the version 12.0.1, release of Audit Management, when an engagement has a project associated with it, after a time card is approved and expense lines are processed, both the **Actual resources** and the **Actual expenses** values roll up on the engagement. Although you can create a time card and log hours before you create a project for an engagement, it

is recommended to create a time card after a project is created. This task ensures accurate reporting of the expenses and resources. The Time Cards related list appears on an engagement only after a project is created.

Audit Workspace

Audit workspace is a single-pane view for audit supervisor and auditor to view the overall audit timeline and status, track budget and resources for engagements, trace high priority observations and issues, and monitor ongoing control testing and audit task progress.

Highlights of the new Audit Workspace

The workspace provides a new user experience.

- Default home page for the audit supervisor and auditor displays actionable insights and quick links.
- Organized navigation menu that lists the modules based on each user's needs.
- Re-imagined page layout with improved experience for practitioners, business users, and executives.
- Record pages that provide holistic view and actionable insights specific to what is being viewed.
- 360° view to consider scores and ratings, and visualize data relationship across the enterprise for a record.

Audit supervisor view

An audit supervisor can use the workspace to:

- define plans and engagements
- assign budget and resource to engagements
- track the progress of engagements

Auditor view

An auditor using the workspace can:

- test effectiveness of controls
- request evidence
- create observations
- complete all audit activities

Audit Workspace for the Audit supervisor

An audit supervisor organizes and manages internal audits according to plans.

Overview of audit supervisor workspace

Audit workspace provides a personalized experience for audit supervisors to manage their work better. There are four main sections that help in accomplishing their audit tasks better.

Overview

Links to create records for audit supervisor

The responsibilities of audit supervisors include overseeing the process of audits, making recommendations on policies, and ensuring that the organization fulfills international and governmental obligations of compliance.

Tasks of an audit supervisor

The following table lists the key tasks that you perform in your role as an Audit supervisor.

Tasks of an Audit supervisor

Activity	Task
Plan and schedule audit programs and send plans for approval.	Create a plan
Approve an plan.	Approve a plan
Create audit engagements and monitor the progress.	Create an audit engagement
Perform risk assessments and scope auditable units and entities based on the risk rating.	Create auditable units and scope entities at risk
Create test plans to document control testing procedure. Coordinate walkthroughs and interviews for assessing internal control processes.	• Create a test template • Create a test plan
Review audit observations, issues and follow up on them.	• Create issues for the engagement • Create observations for the engagement
Review and approve audit engagements.	Approve or reject an engagement
Developing recommendations and reports based on audits and presenting these ideas to senior management.	Generating report for an engagement

Create a test template in Audit Workspace

Create a test template and use it to create test plans applying much of the same testing criteria.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor, sn_audit.user, sn_audit_ws.auditor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click **Create** and select **Test template** from the **Home** page.
   You can also create a test template by navigating to the Audit workspace List page.
   a. Click the lists icon ().
   b. Click **Test templates** in the Execution list.
   c. Click **New**.
3. On the form, fill in the fields.

Create New Test template form

Field	Description
Number	Unique identification number.
Name	Name of the test template.
Control objective	Objective that acts as a guidance for the control test.
Duration	Duration of the test in days, hours, minutes, and seconds.
Design test	
Design expectations	Basic requirement that should be met for a control to be effective.
Design assessment procedures	Procedure or steps to be followed to conclude whether the design of the control is effective to achieve the control objective or not. This is based on the design expectation.
Operational test	
Operational expectations	Expectations that should be met to ensure that the control is operating effectively to achieve the control objective.
Operational assessment procedures	Detailed steps, to carry out the operational expectations, which need to be performed to conclude that the control is operating successfully.

4. Click **Save**.
5. To visually explore the relationships between the different types of critical audit data that affect your business, click **360° view** button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To update all associated test plan with the content of the test template that you created, click **Update all** button.
7. To create test plans for all controls related to the control objective, as in the test template, if the test plan does not exist already, then click **Create test plans for all controls** button.

Create a test plan in Audit Workspace

Create a test plan to document the control testing procedure. You can create a test plan from scratch or based on a test template to describe how a feature is to be tested.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor, sn_audit_ws.auditor, sn_audit.user

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click **Create** and select **Test plan** from the **Home** page.
   You can also create a test plan by navigating to the Audit workspace List page.
   a. Click the lists icon ( ).
   b. Click **Test plans** in the Execution list.
   c. Click **New**.

   You can also create a test plan from an engagement that is in **Validate** or **Fieldwork** state by selecting the test plan and clicking the **Generate Control Tests** button in the Test plans related list.
3. To change the content of the test plan to the content in the test template, click **Revert to template** button.
4. On the form, fill in the fields.

Create New Test plan form

Field	Description
Number	Unique identification number.
Name	Name of the test plan.
Control	The control that this test plan covers.
Entity	Entity is auto-populated based on the value selected in the **Control** field.
Test template	Related test template. If you select a test template, all the fields in the **Design test** and **Operational test** sections are populated with the test template values.
Duration	Expected duration of the test.
Design test	
Design expectations	Basic requirement that should be met for a control to be effective.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Design assessment procedures	Procedure or steps to be followed to conclude whether the design of the control is effective to achieve the control objective or not. This is based on the design expectation.
Operational test	
Operational expectations	Expectations that should be met to ensure that the control is operating effectively to achieve the control objective.
Operational assessment procedures	Detailed steps, to carry out the operational expectations, which need to be performed to conclude that the control is operating successfully.

5. Click **Save**.
6. To visually explore the relationships between the different types of critical audit data that affect your business, click **360° view** button.

Create a plan in the Audit Workspace

Create a plan to manage different types of audits in a periodic manner and group engagements in a logical manner.

Before you begin

Activate the Advanced Audit plugin (com.sn_audit_advanced).

Role required: sn_audit_ws.supervisor or sn_audit.manager

About this task

When an audit plan is created and engagements are added to the plan, the plan is sent to the approver for approval.

Procedure

1. Navigate to **All** > **Audit** > **Audit workspace** > **Planning** > **All Plans**.
2. **Optional:** Alternatively, navigate to **Audit** > **Audit workspace** > **Planning** > **My Plans**.
3. Select **New**.
4. On the form, fill in the fields.

Plan form

Field	Description
Number	Unique number of the plan.
Name	Name of the plan. For example, Annual Audit Plan for Payroll.
Type	Type of the plan. The choices are: ○ None ○ Internal Audit Plan ○ External Audit Plan

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ SOX Audit ○ Compliance Audit Plan ○ Vendor Audit Plan ○ Customer Audit Plan
State	State of the plan. The default state is **Draft**.
Substate	Substate of the plan. The value in this field changes based on the workflow.
Description	Brief description of the plan.
Objectives	Objectives of the plan.
Schedule	
Timeframe	Duration of the plan. The choices are as follows: ○ Annual ○ Semi-annual ○ Quarter ○ Other
Start date	Date the plan begins.
End date	Date the plan ends. This field is automatically set based on the choice made in the **Timeframe** field. If the **Timeframe** field has **Other**, then enter an end date manually.
Assignment	
Owning group	Group responsible for owning the plan.
Owner	Plan owner.
Approvers	People who must approve the plan.
Expenses	
Budgeted expenses	Budget allocated for the engagements under the plan.
Planned expenses	Rolled up planned expenses from the engagements.
Actual expenses	Rolled up actual expenses from the engagements.
Expense notes	Notes about the expense details.
Resources	
Budgeted resources	Number of hours allocated for the engagements under the plan.
Planned resources	Rolled up planned resources from the engagements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actual resources	Rolled up actual resources from the engagements.
Resource notes	Notes about the resource details.
Activity	
Work notes	Notes for this plan. These notes are for internal use and aren't visible to the customers.
Additional comments (Customer visible)	Additional comments about the plan that are visible to the customer.

5. Save the form.
   You can monitor the state of the plan in the stepper of the Overview page as it progresses through the plan process flow.
6. In the Engagements related list, do one of the following.
   - To add engagements, select **New**.
   - To add existing engagements, select **Add**.
7. Select **Request approval**.
   The state changes from **Draft** to **Awaiting approval**.

Result
The plan is sent for approval to the approver. After the plan is approved, the form displays the **Approved by** and **Approved on** fields with the values automatically set.

Create an audit engagement in Audit Workspace

Create an engagement in the workspace and assign it to an audit supervisor. Use the workspace to schedule the engagement, plan the details, and budget the expenses.

Before you begin
Role required: sn_audit.manager, sn_audit_ws.supervisor

About this task
As an audit supervisor you can create an engagement to manage the audit information and collect entities, controls, and control tests that are relevant to the audit. You can supervise the audit engagement, monitor its execution, and verify its completion on time as directed.

Procedure
1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the **Create** list and select **Engagement** from the **Home** page.
   You can also create an engagement by navigating to the Audit workspace List page.
   a. Select the lists icon ( ).
   b. Select **All engagements** or **My engagements** in the Execution list.
   c. Select **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Engagement form

Field	Description
Number	Unique identification number of the engagement.
Name	Name of the engagement.
Type	Audit type based on its specific use in the engagement.
State	State of the engagement. The default state is Scope.
Fieldwork complete (%)	Percentage of the engagement that is complete.
Description	General description of the engagement.
Objectives	Stated objectives of the engagement.
Assignment	
Engagement lead	Audit supervisor who oversees and completes the engagement according to directions.
Auditors	Auditors assigned to the engagement.
Approvers	Approvers assigned to the engagement.
Engagement schedule	
Fieldwork planned start	Estimated start date of the engagement.
Fieldwork planned end	Estimated end date of the engagement.
Fieldwork planned duration	Number of days and hours planned for fieldwork. The duration and planned start date of fieldwork are used to calculate the planned end date. If audit tasks are defined, this field is automatically set to the longest planned duration from the audit tasks.
Fieldwork actual start	Actual start date of the fieldwork. If audit tasks are defined, this field is automatically set to the earliest actual start date from the audit tasks.
Fieldwork actual end	Actual end date of the fieldwork. If audit tasks are defined, this field is automatically set to the latest actual end date from the audit tasks.
Fieldwork actual duration	Duration of fieldwork start date and end date.
Plan details	
Parent plan	Plan that is to be associated with the engagement.
Start date	Start date of the plan.
End date	End date of the plan.
Expenses and resources	
Budgeted expenses	Calculated expenses for the engagement.
Planned expenses	Estimated expenses for the engagement.
Actual expenses	Actual expenses incurred.
Budgeted resources	Budgeted resources for the engagement, in days,hours, minutes, and seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Planned resources	Estimated resources for the engagement, in days,hours, minutes, and seconds. If resource plans are defined, this field is automatically set.
Actual resources	Actual resources for the engagement, in days,hours, minutes, and seconds.
Results	
Result	Results of the engagement. The choices are as follows: ○ Satisfactory ○ Adequate ○ Inadequate
Opinion	Justification for the selected result.
Report	
Template type	Type of template used to generate the audit report for the engagement record. ○ Classic report template: Generates the report using the classic report templates such as HTML, script, or XML, provided the engagement record is in Follow up or Closed states. For more information, see Create an audit report template in classic formats and Generate a report for an engagement in a classic report template. ○ Word report template: Generates the report using the Microsoft Word template, provided the engagement record is in Validate, Fieldwork, or Follow up states. For more information, see Generate an audit report for an engagement using Microsoft Word template. The **Generate report** button is available in the engagement record only in the states mentioned for each **Template type**. You can generate only one report at a time.
Report template	Template used to generate the knowledge base article that reports the engagement results. This field is a reference field after a Word report is generated.
Report knowledge base	Knowledge base to be used.
Report	Reference field that displays the attachment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This attachment field contains the URL if the Word template is Cloud enabled or a sys attachment if the Word template isn't Cloud enabled. In addition, the report is also attached to the engagement record as an attachment. You can select the attachment () icon to view or download the Word document. If it's a cloud-based report, then the report is also present in the cloud file.
Activity	
Additional comments	Comments that customers can also view.
Work notes (Private)	Comments that only the administrator and audit supervisor can view.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

Note:

- If you had selected the **Classic report template** option in the **Template type** field while creating the engagement record, then the reports are created using HTML, script, or XML templates. For more information, see Create an audit report template in classic formats.
- If you had selected the **Word report template** option in the **Template type** field while creating the engagement, then the report is created using the Word template. For more information, see Generate an audit report for an engagement using Microsoft Word template.

4. Select **Save**.
   You can define the entities that are involved in the audit engagement.
5. From the **Overview** page, select the **Other issues** tab.
   You can add the existing one or more related issues to the engagement that you created. By mapping the existing issues to the engagement, you can reduce the count of open issues.

   a. Select the **Add** button.

   b. Select a related issue or issues from the Issues pop-up.

   c. Select **Add**.
   The selected issues are added to the engagement as related issues and an m2m relationship is created between the engagement and the issues in the Issue to Engagement [sn_grc_m2m_issue_engagement] table. You can also create an issue for the engagement by selecting the **New** button, which takes you to the Create New Issue form.

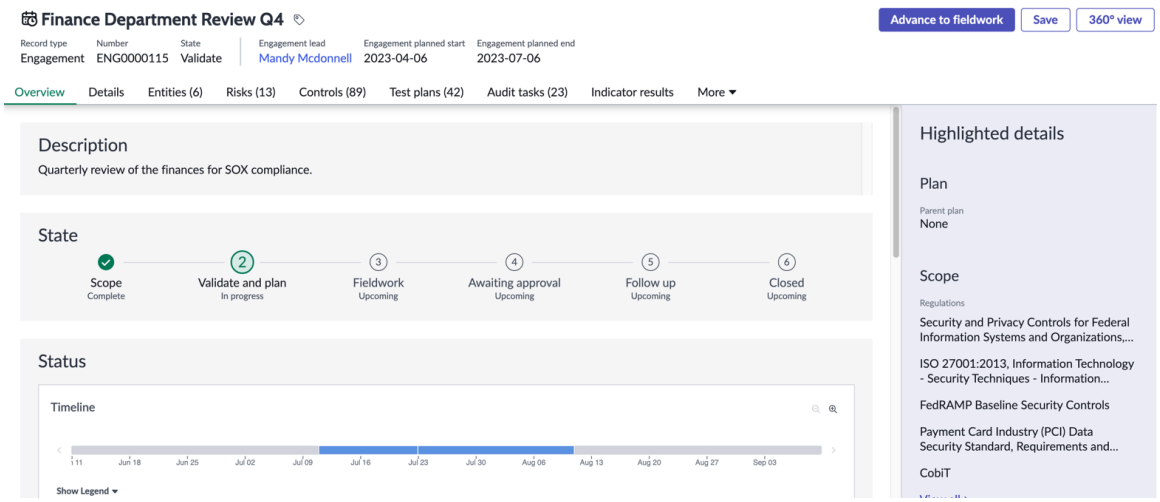
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. To remove an issue that is mapped to the engagement, select the issue and click **Remove**. The remove action only removes the mapping or the association between the engagement and the issue in the m2m table and doesn't delete the issue record.

> **Note:**
> The UI action buttons such as New, Add, Remove aren't available if the engagement is in the Retired state.

Manage an engagement from the overview page

After you create and save an engagement with the basic information such as the description, dates, scope, and the objectives, you can see the overview page.



Overview page of an audit engagement

Use the overview page to get the necessary details and monitor the state flow of the audit engagement in the stepper. You can

- define and scope an audit engagement
- assign team members to it
- perform and review fieldwork
- manage issues
- complete the audit engagement using the different related items

Select the  icon to view the scope of the engagement.

Overview of an audit engagement

Create an auditable unit and scope entities at risk

Create auditable units to identify business entities that can possibly be at risk and scope them into audits.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor, sn_audit.user, sn_audit_ws.auditor

About this task

Auditable units are a combination of different entities such as business units, products or services, legal entities, regulatory required audits, processes, programs, systems, policies, regulation, financial statements, and others.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you determine the nature and scope of the auditable units, your goal is to perform risk assessments, and scope auditable units and entities based on the risk rating.

See also Perform advanced risk assessment in the Risk workspace.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click **Create** and select **Auditable unit** from the **Home** page.
   You can also create an auditable unit by navigating to the Audit workspace List page.
   a. Click the lists icon ( ).
   b. Click **All auditable units** or **My auditable units** in the Scoping list.
   c. Click **New**.
3. On the form, fill in the fields.

Create New Auditable Unit form

Field	Description
Number	Unique number of the auditable unit.
Name	Name of the auditable unit. For example, Accounts Payable – Finance.
State	State of auditable unit. The default state is **Draft**.
Priority	Priority of the auditable unit.
Description	Brief description of the auditable unit.
Assignment	
Owning group	Group that owns the auditable unit.
Owner	Owner of the auditable unit.
Risk assessment	
Method	Type of risk assessment to obtain the risk rating of the auditable unit. The choices are: ○ Basic Risk Assessment: Allows you to manually enter a value for the risk rating. ○ Detailed Risk Assessment: Appears when the Advanced Audit plugin is activated. When you select this option, the Risk Assessments related list appears.
Risk rating	Risk rating of the auditable unit obtained from a basic risk assessment.
Inherent risk rating	Inherent risk score. The value in this field is derived from advanced risk assessment. This field appears if the risk assessment method is **Detailed Risk Assessment**.
Control effectiveness	Control effectiveness score. The value in this field is derived from advanced risk

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	assessment. This field appears if the **Method** field has **Detailed Risk Assessment**.
Residual risk rating	Residual risk score. The value in this field is derived from advanced risk assessment. This field appears if the **Method** field has **Detailed Risk Assessment**.

4. Click **Save**.
5. To add entities such as business units, department, vendors, products, business processes, and others to the auditable unit, click the respective related list in the Details page.
6. Select the records from the respective pop-up.
7. Click **Add**.
8. Click **Activate**.
   The state of the auditable unit becomes Active.
9. To retire the auditable unit, click the **Retire** button in the more actions icon (•••)
10. If you have GRC: Advanced Risk application installed and if you have selected Risk Assessment Method as **Detailed Risk Assessment**, then you can assess risk by clicking the **Assess risk** button.
    For more information, see risk assessment method in Create an auditable unit.

Create a milestone for an engagement

Create a milestone for an engagement to track the progress of an engagement. You can also add audit tasks to a milestone.

Before you begin
Role required: sn_audit.manager, sn_audit_ws.supervisor

About this task
A milestone is used to track the progress of an engagement.

After you create milestones for an engagement, you can also add audit tasks to the milestone. You can track those tasks as milestones.

You can assign a milestone to a user who is responsible for the milestone. The assigned user must have the sn_audit.user role. The assigned user then receives a notification about the assignment.

If an engagement moves to the Follow Up state, and if there are no open audit tasks, open milestones, or open observations, then the engagement moves to the **Closed** state.

Procedure
1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** or **My engagements** in the Execution list.
4. Select the link to the engagement record in the **Name** column.
5. Select the **Milestones** tab.
6. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the form, fill in the fields.

Create New Milestone form

Field	Description
Number	Unique number of the milestone. This number is automatically generated.
Name	Name of the milestone.
Parent	Parent engagement of the milestone.
Type	Audit milestone type. The choices are: ○ Scoping ○ Planning ○ Fieldwork ○ Follow up ○ Reporting ○ Closure
State	State of the milestone. The default state is **Open**.
Percent complete	Percentage of milestone completed. When a value is entered in this field, the state changes to **Work in progress**.
Key milestone	Option to mark the milestone as important.
Auto complete and close	Option to mark the milestone as close complete when all the associated audit tasks are completed and closed. If this option is enabled, then the percent complete is automatically updated according to the number of tasks marked as closed complete.
Description	Brief description of the milestone.
Assignment	
Assignment group	Group responsible for the milestone. The group members must have the sn_audit.user role assigned.
Assigned to	Person responsible for working on the milestone.
Schedule	
Due date	Expected completion date of the milestone.
Completion date	Actual completion date of the milestone.
Closed date	Actual close date of the milestone.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Activity	
Additional comments	Comments that customers can also view.
Work notes (Private)	Comments that only the administrator and audit supervisor can view.

8. Select **Save**.
   You can view the description of the Milestone record and monitor its status in the **State** banner of the default Overview page.

Audit task management in Audit Workspace

Audit tasks are completed throughout an engagement and provide documented evidence that the organization is complying with external regulations and internal policies.

Audit tasks can be:

- Control test
- Activity
- Interview
- Walkthrough

These audit tasks are assigned to the engagements that are in **Validate** or **Fieldwork** state.

When audit tasks are created or reassigned, a notification is sent to the assigned user. A notification is also sent when the task reaches 75% of its planned duration.

Create a control test from an engagement

Create a control test that runs periodically and provides documented evidence of whether the associated control is operating correctly or not.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** or **My engagements** in the Execution list.
   Assign an audit task to an engagement that is in one of the following states:
   - Validate
   - Fieldwork
4. Select the link to the engagement record in the **Name** column.
   The engagement record details open in the **Overview** tab.
5. Select the Audit tasks related list.
6. Click the grouped button below the related lists and select **New control test** from the list.
7. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.

Create New Control test form

Field	Description
Number	Unique identification number.
Name	Name of the control test.
Parent	Parent engagement.
Test plan	Test plan associated with this control test.
State	State of the control test. The default state is **Open**.
Control effectiveness	Control effectiveness.
Issue	Issue related to this control test.
Assignment	
Assigned to	User assigned to the control test.
Schedule	
Planned start date	Intended start date of the control test.
Planned end date	Intended end date of the control test.
Planned duration	Expected duration of the control test. As with actual duration, the planned duration shows total activity time and takes the control test schedule into consideration.
Actual start date	Actual start date of the control test.
Actual end date	Actual end date of the control test.
Actual duration	Duration of the control test from control test start to control test closure.
Design test	
Design effectiveness	○ None ○ Effective ○ Ineffective
Design expectations	Basic requirement that should be met for a control to be effective. This field checks if the control was designed properly to achieve the control objective.
Design assessment procedures	Procedure or steps to be followed to conclude whether the design of the control is effective to achieve the control objective or not. This procedure is based on the design expectation.
Design results	Results of testing the design of the control based on the design assessment procedure.
Operational test	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Operating effectiveness	○ None ○ Effective ○ Ineffective
Operational expectations	Expectations that should be met to ensure that the control is operating effectively to achieve the control objective.
Operational assessment procedures	Detailed steps, to carry out the operational expectations, which must be performed to conclude that the control is operating successfully.
Operational results	Results of testing the operation of the control based on the operation assessment procedure.
Activity	
Work notes (Private)	Comments that the audit manager and audit supervisor can only view.
Additional comments	Comments that customers can also view.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

8. Select **Save**.
   You can view the description and monitor the state of the control test in the **State** banner of the Overview page as the record progresses through the control test process flows.

Create an activity in the Audit Workspace

Create an activity that explores and provides documented evidence of whether the associated control is operating correctly or not.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** or **My engagements** in the Execution list.
   Assign an audit task to an engagement that is in one of the following states:
   - Validate
   - Fieldwork

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the link to the engagement record in the **Name** column.
   The engagement record details open in the **Overview** tab.
5. Select the Audit tasks related list.
6. Click the grouped button below the related lists and select **New activity** from the list.
7. On the form, fill in the fields.

Create New Activity form

Field	Description
Number	Unique identification number.
Name	Name of the activity.
Parent	Parent audit task or parent engagement.
State	State of the activity. The default state is **Open**.
Description	Detailed description of the activity.
Assignment	
Assigned to	User assigned to the activity.
Schedule	
Planned start date	Intended start date of the activity.
Planned end date	Intended end date of the activity.
Planned duration	Expected duration of the activity. As with actual duration, the planned duration shows total activity time and takes the activity schedule into consideration.
Actual start date	Actual start date of the activity.
Actual end date	Actual end date of the activity.
Actual duration	Actual duration of the activity from its start to its closure.
Activity	
Additional comments	Comments that customers can also view.
Work notes (Private)	Comments that the audit manager and audit supervisor can only view.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

8. Select **Save**.

Create an interview in Audit Workspace

Create an interview with control owners to discuss and provide documented evidence of whether the associated control is operating correctly or not.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** or **My engagements** in the Execution list.
   Assign an audit task to an engagement that is in one of the following states:
   - Validate
   - Fieldwork
4. Select the link to the engagement record in the **Name** column.
   The engagement record details open in the **Overview** tab.
5. Select the Audit tasks related list.
6. Click the grouped button below the related lists and select **New interview** from the list.
7. On the form, fill in the fields.

Create New Interview form

Field	Description
Number	Unique identification number.
Name	Name of the interview.
Parent	Parent engagement.
State	State of the interview. The default state is **Open**.
Description	Detailed description of the interview.
Assignment	
Assigned to	User assigned to the interview.
Primary contact	User to be contacted for the interview.
Other contacts	Other users to be contacted, if the primary contact is unavailable.
Notes	Additional notes about the interview contacts.
Schedule	
Planned start date	Intended start date of the interview.
Planned end date	Intended end date of the interview.
Planned duration	Expected duration of the interview. As with actual duration, the planned duration shows total activity time and takes the interview schedule into consideration.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actual start date	Actual start date of the interview.
Actual end date	Actual end date of the interview.
Actual duration	Actual duration of the interview from its start to its closure.
Activity	
Additional comments	Comments that customers can also view.
Work notes (Private)	Comments that the audit manager and audit supervisor can only view.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

8. Select **Save**.
   You can monitor the state of the interview audit task in the **State** banner of the Overview page as the record progresses through the different process flows.

Create a walkthrough in the Audit Workspace

Create and conduct a walk through to observe and provide documented evidence of whether the associated control is operating correctly or not.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** or **My engagements** in the Execution list.
   Assign an audit task to an engagement that is in one of the following states:
   - Validate
   - Fieldwork
4. Select the link to the engagement record in the **Name** column.
   The engagement record details open in the **Overview** tab.
5. Select the Audit tasks related list.
6. Click the grouped button below the related lists and select **New walkthrough** from the list.
7. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Walkthrough form

Field	Description
Number	Unique identification number.
Name	Name of the walkthrough.
Parent	Parent engagement.
State	State of the interview. The default state is **Open**.
Description	Detailed description of the walkthrough.
Assignment	
Assigned to	User assigned to the walkthrough.
Primary contact	User to be contacted for the walkthrough.
Other contacts	Other users to be contacted, if the primary contact is unavailable.
Schedule	
Planned start date	Intended start date of the walkthrough.
Planned end date	Intended end date of the walkthrough.
Planned duration	Expected duration of the walkthrough. As with actual duration, the planned duration shows total activity time and takes the walkthrough schedule into consideration.
Actual start date	Date on which the walkthrough began.
Actual end date	Date on which the walkthrough ended.
Actual duration	Duration of the walkthrough from its start to end.
Walkthrough	
Execution steps	Details of activities to be performed during the walkthrough.
Explanation	Intended purpose of the walkthrough.
Additional information	Additional information the user conducting the walkthrough must be aware of.
Results	Details of what transpired during the walkthrough.
Activity	
Additional comments	Comments that customers can also view.
Work notes (Private)	Comments that the audit manager and audit supervisor can only view.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or

	confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

8. Select **Save**.
   You can view the description of the walkthrough and monitor its status in the **State** banner of the Overview page.

Add entities to an engagement scope and validate the engagement

Add entities related to the selected auditable units to the engagement. In addition, you can also add entities other than the ones created for auditable units to the engagement.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor

About this task

During the **Scope** state, as an audit supervisor you can define which entities are involved in the audit engagement. For example, for a financial audit, you can include all business services that the finance department relies on and the finance department itself.

When you add an entity to an engagement, the corresponding risks, controls, test plans, and indicator results of the entity are also added to the engagement.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click the lists icon ( ).
3. Click **All engagements** or **My engagements** in the Execution list.
   You can scope entities to an engagement that is in **Scope** state.
4. Click the link to the engagement record in the **Name** column.
   The engagement record details open in the **Overview** tab.
5. Click the Entities related list.
6. Click the **Add auditable units** button.
7. In the Auditable units pop-up, select the desired entities that are included in the audit engagement.
   These auditable units are those that have entities already created.
8. Click **Add**.
   If there are risks and controls, test plans, and indicator results associated with an entity then they appear in their respective sections.

   Risks, controls, and test plans are automatically added if the engagement is already in the **Validate** state. Other related items are added only when you click **Validate** or **Validate and plan** button.

   Note:
   If you do not have GRC: Advanced Audit application installed, only then the **Validate** button appears, otherwise the **Validate and plan** button appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After adding the auditable units as entities to the audit engagement, you can validate and plan the engagement.

9. To add entities other than the ones created for auditable units, click the **Add other entities** button.

   Note:
   If you have GRC: Advanced Audit application installed, only then the **Add auditable units** and **Add other entities** fields appear. Otherwise, an **Add** button appears in the page.

10. Click the **Validate and plan** button.
    After an engagement has moved to the **Validate** state, all the risks, controls, and test plans associated with the entities in the engagement's scope are associated with the audit. Only direct controls and risk for the entities will get scoped in the audit when the engagement moves to Validate state. Indicator results that were collected during the audit period of the engagement are also associated with the audit.

    As an audit supervisor, you can review the risks, controls, test plans, and indicator results, and update the scope of the engagement, if necessary. You can also begin creating and planning audit tasks for the engagement.

Create an issue for an engagement

Create an issue to document policy, risk, or audit observations, or to accept any GRC problems. You can also identify the source of the issue to help analyze and classify the issues.

Before you begin
Role required: sn_audit.manager, sn_audit_ws.supervisor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click the lists icon ( ).
3. Click **All engagements** or **My engagements** in the Execution list.
4. Click the link to the engagement record in the **Name** column.
   The engagement record details open in the **Overview** tab.
5. Click the Other issues related list.
6. Click **New**.
7. On the form, fill in the fields.

Create New Issue form

Field	Description
Number	Unique identification number.
Name	Name of the issue.
Issue source	Source from where the issue was created. This field is auto-populated with one of the following options based on how the issue is created:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Indicator Failure: Issue is created by a failure of the indicator. ○ Risk Assessment: Issue is created in a risk. ○ Risk Event: Issue is created in a risk event. ○ Control Attestation Failure: Issue is created due to a non-compliant control. ○ Control Test Failure: Issue is created when a control is ineffective and the control test is marked as closed and complete. ○ Ad-hoc: Issue is manually created.
Issue type	Type of issue.
Classification	Classification of the issue as a risk, compliance, or audit, based on the issue type.
State	○ New ○ Analyze ○ Respond ○ Review ○ Closed Complete ○ Closed Incomplete
Substate	Substate and applicable details for the substate.
Priority	Sequence in which an issue needs to be resolved, based on its impact and urgency: ○ 1 — Critical ○ 2 — High ○ 3 — Moderate ○ 4 — Low ○ 5 — Planning
Issue rating	Issue manager can assign a issue rating to the issue. Based on the issue rating, the **Due date** in the **Dates** tab is calculated as follows and displayed: ○ Very high (2 days) ○ High (4 days) ○ Moderate (8 days) ○ Low (10 days) ○ Very Low (15 days) You can manually override the **Due date**.
Description	Comprehensive description of the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assignment	
Assignment group	Group to which the issue is assigned. Each member receives a notification when an activity occurs on this issue.
Assigned to	Member of the group assigned to resolve the issue.
Issue manager group	Group responsible for managing and reviewing the issue.
Issue manager	User responsible for managing and reviewing the issue.
Watch list	Users added to view the issue.
Schedule	
Due date	Due date is auto-populated based on a GRC property, *`Auto populate due date based on issue rating`*. If it is set to **Yes**, the field is auto-populated based on the predefined remediation time frame for the issue's risk rating. Otherwise, you can manually enter a due date. When an issue transitions to the **Respond** state, an entry in this field is mandatory.
Confirmed date	Date on which the issue is confirmed. This field is read-only, and displays the current date when the issue is moved from **New** to any of the following states: ○ Analyze ○ Review ○ Respond **Note:** If a triage issue is converted to an actual issue, this field displays the date it was converted.
Created	Date and time the issue was created.
Closed	Date and time the issue was closed.
Planned start date	Date and time when the work on the issue is expected to begin.
Planned end date	Date and time when the work on the issue is expected to end.
Planned duration	Estimated duration of work time. Calculated using the **Planned start date** and **Planned end date**.
Actual start date	Time when work began on the issue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actual end date	Time when work on the issue was completed.
Actual duration	Duration of work time. Calculated using the **Actual start date** and **Actual end date**.
Details	
Control/Risk	Control or risk associated with the issue.
Control Objective/Risk statement	Control objective or risk statement related to this issue.
Entity	Related entity.
Configuration item	Item associated with the issue. If all child issues have the same configuration item, it gets copied over to the parent issue.
Location	Location where the issue occurred.
Risk event	Related risk event.
Engagement	Related engagement.
Policy	Policy associated with the issue.
Authority document	Authority document associated with the issue.
Issue grouping	
Parent issue	Parent issue to which the issue belongs.
Issue group rule	Group rule assigned to the issue. Issue group rule is used to group similar issues together into a parent issue based on conditions defined in the rule. This allows you to work on similar issues simultaneously and close out the parent issue after all issues are resolved. This closes out all the child issues.
Action plan	
Recommendation	Resolution actions recommended by the risk, compliance, or audit teams.
Action plan	Plan for remediating the issue.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on confidential option, see Confidentiality flag for audit and compliance records.
Activity	
Work notes (Private)	Information about how to resolve the issue, or steps already taken to resolve it, if applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Work notes are visible to users who are assigned to the issue.
Additional comments	Public information about the issue.

8. Click **Save**.

Request evidence during audits using Audit Workspace

Request evidence at any stage during an audit using the Audit Workspace. The details about the items for which evidence is requested are also provided to the person responsible for providing the evidence.

Before you begin

Role required: sn_audit.user

Procedure

1. Navigate to **All** > **Audit Workspace**.
2. In the Audit Workspace select the List icon ( ).
3. Navigate to **Evidence requests** > **My request**.
4. Select **New**.
5. On the form, fill in the fields.

Evidence request form

Field	Description
Number	Unique number of the evidence request.
Name	A name for this request.
Requester	User requesting evidence. This field is automatically populated.
Requested on behalf of	User for whom evidence is being requested.
Type	Type of evidence that is created. Can be either Audit or Compliance.
Request reason	Reason for requesting evidence.
State	State of the request. The default state is **Draft**.
Substate	An additional state for the request.
Description	Detailed description of the evidence request.
Assignment	
Assignment group	Group assigned to provide evidence.
Assigned to	User responsible for providing the evidence.
Watch list	Users interested in viewing the evidence collected. If a person is added on the watch list, they can navigate to **Audit** > **Evidence**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Request > **Watched Evidence Requests** to view the requests.
Schedule	
Due date	Expected date of evidence submission.
Opened	Date the request is opened. This date is automatically updated.
Closed	Date the request is closed. This date is automatically updated.
Activity	
Work notes	Type any notes that might be required.
Activities	Activity log for the request.
Confidentiality	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record. For more information on the confidential option, see Confidentiality flag for audit and compliance records.

6. Save the form.
   Monitor the state of the Evidence in the stepper of the Overview page. The record progresses through a sequence of logical steps when you accept evidence, request revision of the evidence, and request information.

   The Evidence collection details related list appears. This related list is used to list the items for which evidence is requested.
7. Click **New**.
8. On the form, fill in the fields.

Evidence collection details form

Field	Description
Number	Unique number for the evidence collection detail.
Name	A name for this request.
Evidence collection type	Record for which evidence is requested. If you're a user with the audit user role, the available options are: ○ Audit task ○ Authority document ○ Citation ○ Control

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Control objective ○ Control test ○ Engagement ○ Entity ○ Issue ○ Policy If the request was entered by a user with the audit user role, the available options are: ○ Audit task ○ Control ○ Control objective ○ Control test ○ Engagement ○ Entity ○ Issues
Evidence for	Lists all the tables to which the evidence is applied.
Evidence request	Unique number of the evidence request task.
Assignment	
Assignment group	Group assigned to provide evidence. The users of this group must have the sn_grc.business_user roles.
Assigned to	User responsible for providing evidence.
Instructions	
Evidence collection instructions	Instructions for providing evidence. For example, list of supporting documents, files, and so on.

9. Select **Save**.
10. Select **Request Evidence**.
    When an evidence request is already in the Work in Progress state, and a new evidence collection detail is added, the evidence request task is sent to the assignee immediately. The Evidence related list appears with the list of evidences and the person who is assigned the request receives an email notification to provide the requested evidence. Also, the state of the request changes to **Work in Progress**.You can view the description. Monitor the state of the Evidence request in the stepper of the Overview page as it progresses through the evidence request process flow.

Audit observations in Audit Workspace

Audit observations are the results of an audit. As an important part of the audit report, audit observations represent the results of reviews, analysis, interviews, and discussions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of an audit observation

Audit observations are used to bring significant issues to the attention of audit supervisors. Observations are logged in the system. For example, if a bank's operations are being audited, then the audit observations are based on evidence about how the bank's operations perform against the audit criteria. During control testing, interviews, and walkthroughs, audit observations are recorded. An audit user can create an observation from an engagement if the engagement is not in the **Follow Up** or **Closed** states. An observation can also be created from all types of audit tasks.

After the auditor completes the audit, the auditor then presents the audit observations to the audit supervisors. By using the audit observations, the auditor can present a summary of problems, discoveries, and recommendations. The audit team reviews the observations to determine if the observation is a reportable issue. The audit team can also determine if the observation can be tracked as a recommendation, an observation, or a best practice.

In its life cycle, an audit observation moves through the following states:

1. Draft
2. Review
3. Respond
4. Finalize
5. Closed

Status workflow of an audit observation in workspace

1. An audit user with the role sn_audit.user creates an observation. See Create an observation for an engagement.
   a. To create an observation, navigate to **All** > **Audit** > **Audit Workspace**.
   b. Click the lists icon ( ).
   c. Click **All engagements** or **My engagements** in the Execution list.
   d. Click the link to the engagement record in the **Name** column.
   e. Click the **Observations** tab.
   f. Click **New**.
   g. On the Create New Observation form, fill in the fields.
2. The observation creator assigns respondents and peer reviewers to the observation. The respondents are the entity owners and control owners. The peer reviewers are the auditors and audit leads of the engagement.
3. The observation creator can request a peer review of the observation. In that case, the following happens:
   a. The peer reviewer gets a notification to perform the peer review. The peer reviewer can view the task under **My pending tasks** > **All** by clicking the tasks icon ( ) in the workspace.

      Note:
      The peer reviewer can also navigate to **Tasks** > **My tasks** > **Open** in the Home page of the workspace.

   b. The peer reviewer completes the review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When a peer review is requested, the state remains as **Draft** but the substate changes to **Peer review requested**.

4. The observation creator can also request a review. The reviewer can be an audit supervisor or the audit lead.
   a. The reviewer gets a notification to perform the review. The reviewer can view the task by navigating to **My pending tasks** > **All** > **Observations**.
   b. The reviewer can either request a revision of the observation or request a response from the respondent. The reviewer can also provide feedback in the **Results** section by selecting the appropriate option.
5. If the reviewer requested a response from the respondent, then the respondent responds to the observation by navigating to **Audit** > **Observations** > **My Pending Response**.
6. The observation moves to the **Finalize** state.
7. The observation is closed and an issue is created.

Create an observation for an engagement

Create an audit observation to present a summary of problems, discoveries, and recommendations. The audit team can then review the observations to determine if the observation is a reportable issue.

Before you begin
Role required: sn_audit.manager, sn_audit_ws.supervisor, sn_audit.user, sn_audit_ws.auditor

Procedure
1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** in the Execution list.
4. Select the link to the engagement record in the **Name** column.
5. Select the **Observations** tab.
6. Select **New**.
7. On the form, fill in the fields.

Create New Observation form

Field	Description
Number	Unique identification number.
Name	Name of the observation.
Engagement	Engagement associated with this observation.
Source	Source or origin of the observation.
Issue type	Reason for creating the observation. The choices are: ○ Control design effectiveness failure ○ Control operative effectiveness failure

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Control does not exist ○ Control doesn't meet requirement ○ Other observation
State	State of the observation.
Substate	Substate of the observation.
Priority	Priority of the observation. Choices are: ○ 1 — Critical ○ 2 — High ○ 3 — Moderate ○ 4 — Low
Description	Detailed description of the observation.
Action plan	Plan for resolving the resulting issue.
Assignment	
Owner	User who creates and is responsible for the observation.
Peer reviewer	One of the auditors responsible for peer review.
Respondent	User responsible for completion of the action plan. Respondent can be the owner of the entity or control associated with the parent engagement.
Reviewer group	Group assigned to review the observation.
Reviewer	User responsible for reviewing the observation.
Watch list	Users interested in following updates to the observation.
Details	
Control	Control associated with the observation.
Control Objective	Control objective associated with the observation.
Entity	Entity associated with the observation.
Audit task	Audit task associated with the observation.
Results	
Result	Result of the observation. The choices are as follows: ○ Track as an observation ○ Track as a recommendation ○ Track as a best practice

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Confirmed as a new issue ○ Confirmed as an existing issue ○ No action required
Explanation	Explanation for the selected result.
Activity	
Work notes (Private)	Notes about the observation. Work notes are visible to users who are assigned to the observation.
Additional comments	Public information about the observation.
Security	
Confidential	Option to enable confidentiality of the record. Only the assigned confidential users or confidential groups of users can access the record.

Confidentiality flag to control access of audit records

You can set the confidentiality flag at the record level for an issue, engagement, observation, control test, activity, interview, and walkthrough records. The users whom you determine to view and update these records are confidential users.

When the **Confidentiality** option is selected, a list of users who can be an engagement lead, auditors, and approvers are auto-populated as **Confidential users**.

You can add more audit users or GRC business users to the list or remove some of the existing users based on your access control criteria and can set them as confidential users.

Additionally, you can also add random users to the record, who are neither audit users nor GRC business users. However, an email notification is sent to all confidential users who have neither an audit user nor a GRC business user role intimating them to acquire the confidential role (sn_grc.confidential_user) from the admin if they are to access the record.

You can also select groups as **Confidential groups** who can access the record as well. For more information, see Confidential records in GRC common features.

To enable the Confidentiality property at the system level:

a. Navigate to **System Properties** > **All Properties**.

b. Select *sn_grc.enable_record_confidentiality* system property.

c. Enter **true** in the **Value** field. This action enables record level confidentiality.

d. Select **Update**.

8. Select **Save**.
   You can monitor the state of the observation record in the **State** banner of the default Overview page as the record progresses through the different states.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approve or reject an engagement in Audit Workspace

If you are an audit user and are assigned as an approver for an engagement, you can approve or reject an engagement in the **Awaiting Approval** state.

Before you begin

Role required: sn_audit.user, sn_audit_ws.auditor

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click the tasks icon ( ).
   The workspace opens listing all engagements assigned to you including the ones waiting for your approval.
3. Click the **Needs my approval** button in the My pending tasks related list.
4. Click the link to open the approval record associated with the engagement in the **State** column.
5. Click **Approved** or **Rejected** in the **State** list.
6. Click **Save**.
   One of the following actions occurs:
   - If the engagement is approved and there are remaining open tasks or issues, it automatically moves into the **Follow Up** state.
   - If the engagement is approved and there are no remaining open tasks or issues, it automatically moves into the **Closed** state.
   - If the engagement is rejected, it automatically moves back to the **Fieldwork** state

Generate a report for an engagement in a classic report template

Generate a report that summarizes the findings of an engagement to communicate the report findings to executives.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor

About this task

You can generate a report for engagements that are in the **Awaiting approval**, **Follow up**, or **Closed complete** states.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** or **My engagements** in the Execution list.
4. Select the link to the engagement record in the **Name** column.
   The engagement must be in **Awaiting approval**, **Follow up**, or **Closed complete** state.
5. Select the **Details** tab.
6. If you have not entered details in the Report section of the Engagement form, then fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report section of the Engagement form

Field	Description
Report template	Template used to generate the knowledge base article that reports the engagement results.
Report knowledge base	Knowledge base to be used.

7. Select **Save**.
8. To generate the report, select the **Generate report** button.

Generate an audit report for an engagement using Microsoft Word template

Generate an audit report for an engagement record using Microsoft Word template that is in the Validate state or any subsequent states. You can manage the generated report either on cloud (Microsoft SharePoint) in the Cloud files tab or as a sys_attachment to the engagement.

Before you begin

Role required: sn_audit.manager, sn_audit_ws.supervisor, sn_irm_shared_cmn.word_template_reader

1. To apply the Word template in the engagement record and to generate the report in the Audit Workspace, you must have the Audit manager role (sn_audit.manager) and also the Word template reader role (sn_irm_shared_cmn.word_template_reader). More importantly, you must have access to the Audit Workspace.
2. To generate the report for the engagement, the record must be in the Validate, Fieldwork, or Follow Up state.
3. To view the **Generate report** button in the engagement record, you should have selected the **Word report template** option in the **Template type** field while creating the record.

Important:
You must set up the ServiceNow Document designer for Word plugin before you create a Microsoft Word template and generate the audit report for an engagement record.

For more information, see Create content configurations and Create Word template record for an audit engagement.

About this task

To generate an audit Word report, you must navigate to **All** > **Audit** > **Audit Report** and set up the following administrative steps for a Word template:

- Create content configurations
- Create Word Report Templates
- Word template category form

- If you had selected the **Classic report template** option in the **Template type** field while creating the engagement record, then the reports are generated as a Knowledge Base, while the input template is in HTML, script, or XML. For more information, see Create an audit report template.
- If you had selected the **Word report template** option in the **Template type** field as an input template while creating the engagement, then the Word template report that is generated is a Word file.

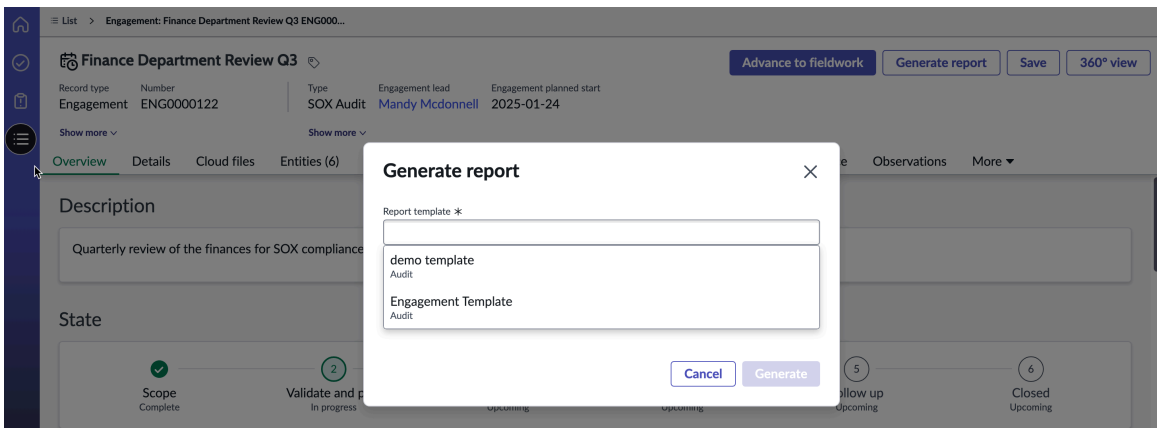
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can apply the Microsoft Word template to one or more audit engagement records and generate the audit report in Word format. You can use the Word document to collaborate with other stakeholders for report editing.

There are two steps to this process:

1. As an audit admin, you can navigate to the Word template module and configure the record for a particular table or a document.
2. As an audit manager, audit supervisor, or auditor you can then associate the Word report template to the engagement record and generate the audit report, provided you also have the template reader (sn_irm_shared_cmn.word_template_reader) role.

You also have the option to manage the generated report either as an sys_attachment or on cloud in the Audit Workspace.



The generated report can be saved at the Microsoft SharePoint or Google Drive site for report collaboration.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the lists icon ( ).
3. Select **All engagements** in the Execution list.
4. Select an engagement record for which you want to generate a report.

   Note:
   The record must have been scoped. It must be in the Validate, Fieldwork, or Follow Up state.

5. Select the **Generate report** button.
   The ServiceNow Document designer for Word plugin must be activated. Only then the **Generate report** button is available.
6. Select the audit report name in the **Report template** field of the Generate report pop-up.
   - All the Word templates that are relevant to the engagement and are active and in Published state appear for you to select.

If there are no Word templates created for this record, then a message appears stating so.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the Word template is cloud enabled, then a message pops up with the destination where the generated report would be saved after it's generated.
- If you had not set up the cloud file configuration for the engagement record, then an error message appears. To enable cloud file configuration, see Manage your documents and work papers with Audit Management as cloud files.

7. Enter a unique name for the report in the **Name of report** field.
8. Select **Generate**.
   A message appears stating that the report generation has been initiated.
9. If you hadn't selected the **Cloud enabled** option in the Word template form, then select the attachment ( ) icon to download the report.
   A message appears confirming that the report is being generated as an attachment.
   a. Select the actions ( ) icon and click the **Download** option.
   b. Select the downloaded Word file to view the audit report.
10. If you had selected the **Cloud enabled** option in the Word template, then select the Cloud files tab for the cloud-based report.
    a. Select the URL link for the cloud folder path to open the Word document in the Microsoft SharePoint site.
    b. View the contents of the audit engagement report in the cloud and share the report with your collaborators.
    You can also check your most recent report as a URL or as an attachment in the **Report** field of the Report section in the engagement form.

    For details on cloud document management, see Manage your documents and work papers with Audit Management as cloud files.

A Word report attachment is created each time you generate the report. By default, only the latest Word report is attached to the record. However, there's a system property that you can set to retain the previous attachments even when a new report is generated with the latest attachment.

By default, the property is set as false, which means that the previous Word report as a sys attachment is deleted from the engagement record when the report is generated again. The engagement, therefore, has the latest report, which is attached to the record.

As an audit admin, you can set the property as true to retain the previous attachments with the engagement record. All the previous attachments are available to view in the Attachments section. Retaining the previous attachments helps you to track an audit trail on the engagement.

To reset the property, navigate to **All** > **Audit** > **Administration** > **Properties**. See, Properties installed with Audit Management and Advanced Audit.

Create a Microsoft Word template record for an audit report

Generate your audit reports for an engagement in Microsoft Word template to collaborate with your auditors in an effortless and user-friendly manner.

Before you begin

Role required: sn_audit.admin, sn_irm_shared_cmn.word_template_creator, sn_irm_shared_cmn.word_template_reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Word template creator role (sn_irm_shared_cmn.word_template_creator) has create, read, update, and delete access to all the records in the Word template [sn_irm_shared_cmn_word_template] and Word template category [sn_irm_shared_cmn_word_template_category] tables.
- The minimum role is the Word template reader role (sn_irm_shared_cmn.word_template_reader) that has the read access to the records in the Word template and Word template category tables.

- **Note:**
  You can generate the audit report for an engagement record in a Word template in Audit Workspace only.

  To apply the Word template in the engagement record and to generate the report in the Audit Workspace, you must have the Audit manager role (sn_audit.manager). See, Generate audit report for an engagement.

Important:
You must set up the ServiceNow Document designer for Word plugin before you create a Microsoft Word template and generate the audit report for an engagement record.

For more information, see Content configuration.

About this task
As an audit admin, you can navigate to the Word template module and configure the record for a particular table or a document.

Procedure
1. Navigate to **All** > **Audit** > **Audit report** > **Word Report Templates**.
2. Select **New**.
3. On the form, fill in the fields.
   See the Word template form for values to enter in each field of the form.
4. Select **Submit**.

What to do next
You must select the Word report template as the template type for the engagement record. Then, generate the report in the Audit Workspace.

For more information, see

- Create an audit engagement in Audit Workspace.
- Generate audit report for an engagement.

Word template form
The table gives a description of the field values for the Word template form.

Word template form

Field	Description
Name	Unique name of the Word template for the table that is selected in the Table field.
Category	Classification or group to which the Word template belongs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Word template form (continued)

Field	Description
	For example, Audit for audit-related Word template. To create a Word template category, see Word template category form.
Table	Record table for which the Word template is being created.
Document	Word template that was created based on content configuration. **Note:** The document must be a docx file only. If you attach a document that is in any other format, then an error message appears.
State	State of the Word template record defaults to Draft. • Draft: Defaults to Draft state when you open the record. • Published: When the Word template record is published. You can't update the record in the published state. • Edit: State in which the record details can be updated. **Note:** The Word template record in Edit state can’t be used for report generation. The record isn't available to select in the Generate report pop-up. See Generate a report for an engagement in a classic report template.
Active	Option to activate the record.
Word document generation configurations	
Cloud enabled	Option to manage the generated report either as a sys_attachment in the engagement record or as a cloud document. You can access the document in the cloud either from the Microsoft SharePoint or Google Drive site based on your cloud upload configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Word template form (continued)

Field	Description
	For more information, see Manage your documents and work papers with Audit Management as cloud files.
Post processing action	Option to update the generated Word template report with fields from the Report section of the Engagement record. Options are: • **Populate audit word template and report fields**: If you choose Word report-based template, the fields from the Report section of the Engagement record populate in the Word report. **Note:** This option is available only if Audit Management application is installed. • **None**: Report is generated as a sys attachment or a cloud file. However, no post processing action happens to add or update any report-based fields of the engagement record to the Word report that is generated.

Word template category form

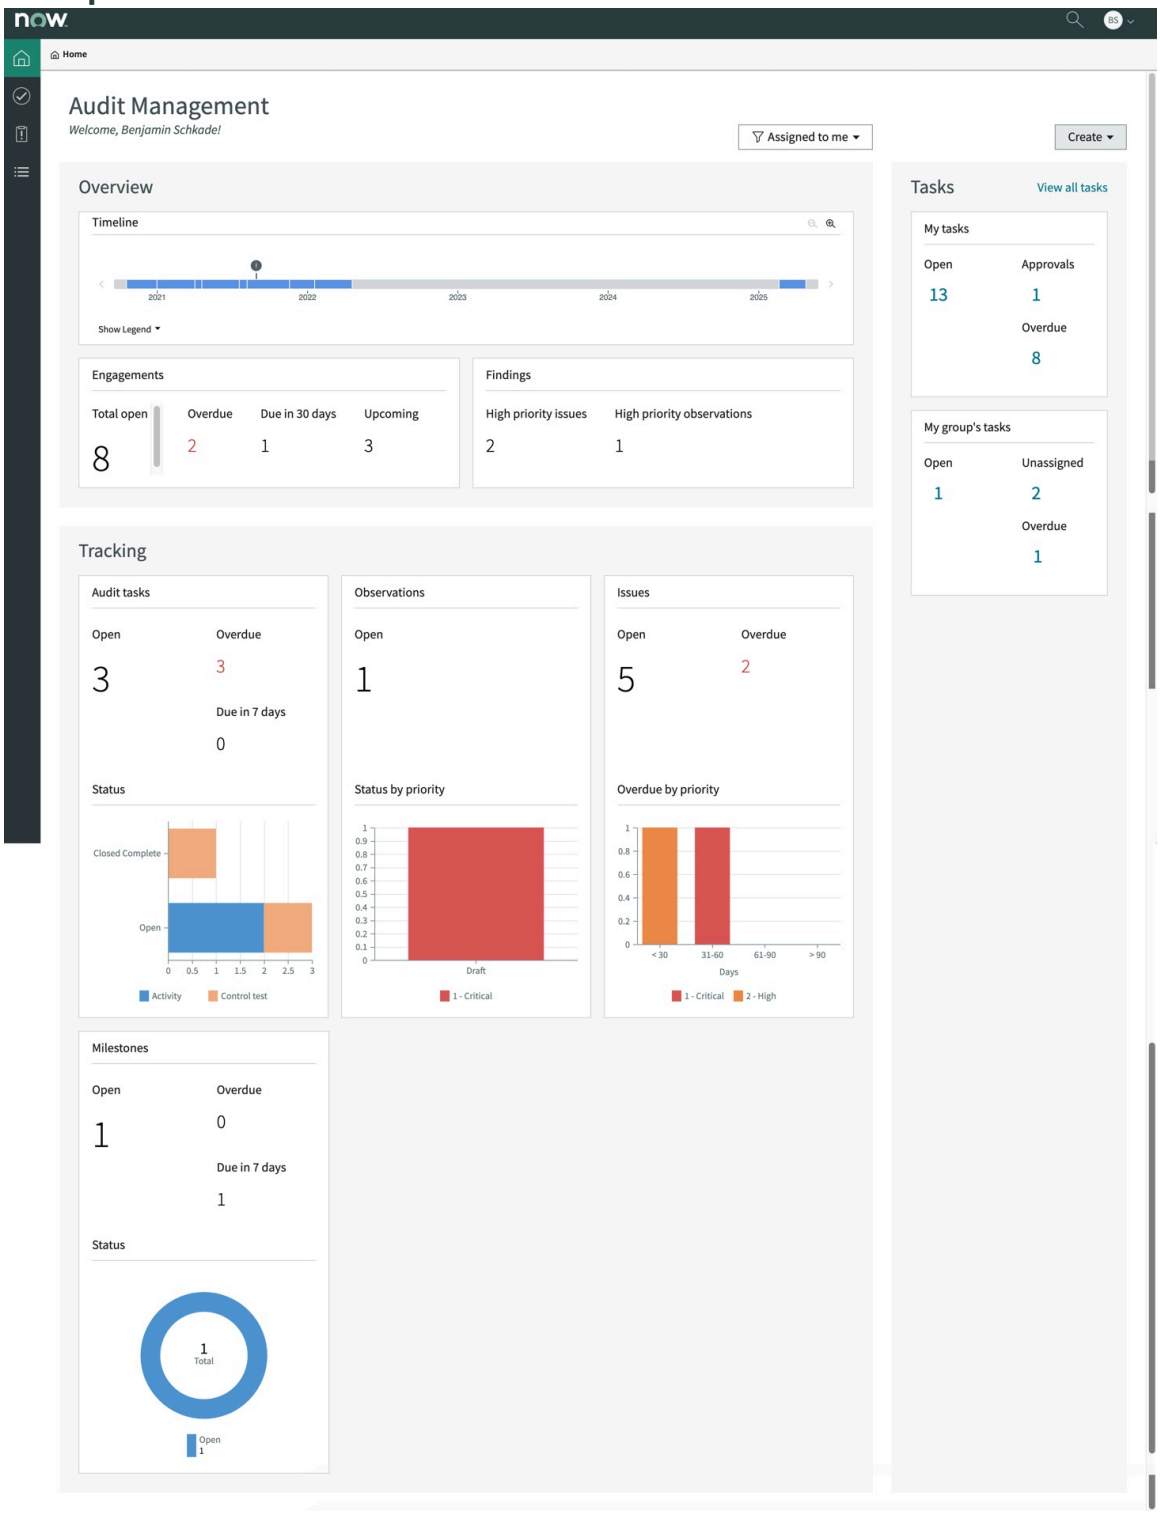
The table gives a description of the field values for the Word template category form. Template categories enable you to categorize similar reports and filter them accordingly. For example, Audit is a category.

Word template category form

Field	Description
Name	Unique name for the Word template category.
Active	Option to make the record active.

Audit Workspace for the Auditor

The auditor workspace is a centralized workspace for managing audit activities.



Overview of auditor workspace

An auditor analyses the operational and financial processes of a company to ensure compliance with industry and federal regulation. They prepare financial reports, review internal controls, collect evidence, conduct audit test, and follow up on audit findings.

Using the auditor workspace, auditors can perform fieldwork such as control tests, activities, interviews, and walkthroughs. They can document their work and findings, and resolve or follow up the audit findings.

Workspace for auditor

Tasks of an Auditor

The following table lists the key tasks that you can perform in your role as an auditor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tasks of an auditor

Activity	Task
Examine records, reports, operating practices, and documentation to ensure compliance with internal controls.	Update an assigned control test.
Create test plans to document control testing procedure.	Create a test plan.
Coordinate walkthroughs and interviews for assessing internal control processes.	Update other assigned audit tasks.
Request and review evidence for control implementation.	Request evidence for audit tasks.
Comply with federal, state, and local security legal requirements.	Create an observation for an audit task assigned to an auditor.

Update an assigned control test in Audit Workspace

Use the Audit Workspace to ensure compliance with the established internal control procedures by reviewing records, reports, operating practices, and documentation.

Before you begin

Role required: sn_audit_ws.auditor, sn_audit.user

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click the tasks icon ().
   The workspace opens listing **All** tasks assigned to you in the My pending tasks related list.
3. Move the state to **Work In progress**, and enter the details.
   You can move the control test to **Review** state if all required information are entered.
4. To approve a control test that requires your approval, click the **Needs my approval** button.
   a. Click the link to open the control test in the **State** column.
   b. Review the control test details and click the **State** list to update the requested control test to an appropriate state.
      The choices are:
      - Not Yet Requested
      - Requested
      - Approved
      - Rejected
      - Cancelled
      - No Longer Required
   c. Click **Save**.
5. Click the **Details** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Review the control test details and click the **State** list to update it to an appropriate state.
   You can now move the state of the control test to **Close Complete**.
7. Click **Save**.

Update other assigned audit tasks in Audit Workspace

Update the audit tasks such as walkthroughs and interviews that are assigned to you when you get a notification.

Before you begin
Role required: sn_audit_ws.auditor, sn_audit.user

About this task
Audit tasks are completed throughout an engagement and provide documented evidence that the organization is complying with external regulations and internal policies.

Procedure
1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click the tasks icon ().
   The workspace opens listing **All** tasks in the **My pending tasks** tab. You can view **All – Audit tasks** assigned to you.
3. Click the audit task record either an interview, activity, or a walkthrough that you want to update in the **Name** column.
   The record opens in the **Overview** tab displaying the workflow of its state.
4. Click the **Details** tab to review and update the audit task details.
   In addition to entering other details, you can also move the state of the audit task to **Work In Progress**, **Review**, or **Close Complete**.
5. Click **Save**.

Create an observation for an audit task

Create an observation for an audit task to comply with federal state and local security legal requirements by studying the existing and new security legislation.

Before you begin
Role required: sn_audit_ws.auditor, sn_audit.user

About this task
Creating an observation also helps enforce adherence to requirements, thereby advising the management on the needed actions to adhere to the federal and local security legal requirements.

Procedure
1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Click the tasks icon ().
   The workspace opens listing **All** tasks in the **My pending tasks** tab. You can view **All – Audit tasks** assigned to you.
3. Click the audit task record for which you want to create an observation in the **Name** column.
   The record opens in the **Overview** tab displaying the workflow of its state.
4. Click the **Observations** tab.
5. Click **New**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Enter the details in the Create New Observation form.
7. Click **Save**.

Matrix report in Audit Workspace

Matrix report is a structured report that you can configure to view in a grid or table format in the Audit Workspace. You can use the matrix report to analyze relationships between different objects, for example assessing risks and controls.

The matrix has rows and columns, where each row represents the object of the configured columns. The columns contain details such as name, descriptions, owner, risk ratings, and other data points.

You can have a Matrix report such as Risk and Controls Matrix, which is used in audits to assess and document risks and the internal controls designed to mitigate those risks. The matrix serves as a structured framework to evaluate the effectiveness of an organization's control environment and identify gaps that might expose the organization to potential risks.

Auditors use this matrix to verify that all significant risks have appropriate controls in place and are functioning effectively.

Configure matrix report registry to set up base table for audit matrix report

Configure the Matrix report registry to select the base table. You can create a relationship with the target table to configure the details of the report for an audit-related record or a landing page.

Before you begin

Role required: sn_matrix_report.admin

Procedure

1. Navigate to **All** > **Matrix report** > **Matrix report registry**.
2. Select **New**.
3. Enter the name of the Matrix report registry in the **Name** field.
4. Select the base table from the **Base table** list.
5. Select **Submit**.
6. Select the matrix report registry that you created by clicking the **Name**.
   The base level of the configuration is auto-populated, which contains the base target table and you can select any filter conditions. For the next level configuration, add new relationships between the base table and a target table for the matrix report.
7. In the Matrix relationships related list, select **New**.
8. On the form, fill in the fields.
   For a description of the field values, see Matrix relationship form.
9. Select **Submit**.
   You have configured the base table, which is the level 0 of the matrix report configuration. You can add new configurations as well. For example, if you have selected the base table as Risk, then you can add configurations such as risk related to controls, which would be level 1. For level 2, you can configure a relationship between controls and issues. Parent record as source helps to identify the record from which the data is taken. The Source table and the Relationship cannot be the same in the Matrix report registry.

   To configure column heads for the matrix report, see, Configure target table fields as columns for matrix report.

Matrix relationship form

The table gives a description of the field values for the Matrix relationship form.

Matrix relationship form

Field	Description
Name	Name of the matrix relationship.
Source	Source of the current relationship.
Source table	Source table of the relationship.
Relationship	Relationship between the source and the target tables.
Target table	Target table of the relationship.
Filter condition	Conditions to be set on the target table to filter required field data.
Order	Order in which the columns are represented in the report.

Configure target table fields as columns for matrix report

Configure the fields in the target table as column heads in the matrix report, which is the second level of configuration for the audit matrix report.

Before you begin

Role required: sn_matrix_report.admin

Procedure

1. Navigate to **All** > **Matrix report** > **Matrix report registry**.
2. Select the Matrix report registry **Name** that you created.
3. To configure the columns in the matrix report, select the record in the **Name** column of the Matrix relationships related list.
4. Select **New** in the Matrix column configurations related list to configure the field in the target table.
5. On the form, fill in the fields.
   For a description of the field values, see Matrix column configuration form.
6. Select **Submit**.
   You have configured one field from the target table as a column in the matrix report. You can configure other fields as well in the target table as columns for the matrix report by selecting **New** again in the Matrix column configurations related list.

What to do next

After the matrix relationship is complete, you can Create matrix report configuration for Audit Workspace.

Matrix column configuration form

The table gives a description of the field values for the Matrix column configuration form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Matrix column configuration form

Field	Description
Target table	Selected target table defaults in the field.
Field	Field from the selected target table.
Field label	Label of the column to be displayed in the report. Field name defaults as the display name in the **Field label**. You can change the label if necessary.
Order	Order in which the column is displayed in the report.

Create matrix report configuration for Audit Workspace

Create the matrix report configuration giving a name to the report, determining its display type either as a landing page or as a record page, and setting filter conditions on the base table.

Before you begin

Role required: sn_matrix_report.admin

Procedure

1. Navigate to **All** > **Matrix report** > **Matrix report configurations**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values, see Matrix report configuration form.
4. Select **Submit**.

What to do next

This configuration helps the Audit Workspace user to see the matrix report in the Audit Workspace. As an admin you have completed all the steps of matrix report configurations. Now, as a user you can View matrix report in landing page and record page of Audit Workspace.

Matrix report configuration form

The table gives a description of the field values for the Matrix report configuration form.

Matrix report configuration form

Field	Description
Name	Title of the matrix displayed in the report.
Matrix report	Matrix report registry reference.
Base table	Base table of the Matrix report registry.
Workspace	Workspace to which this report configuration applies.
Display type	Type of display such as landing page or record page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Matrix report configuration form (continued)

Field	Description
Is default	Option for default display type. The field appears only for the landing page type.
Matrix configuration	
Filter on	Additional filter conditions applied to the base table. Record or table where this configuration or report is displayed. This field appears only for the Landing page type.
Configured for	Record or table where this configuration or report is displayed. This field appears only for the Record page type.
Filter condition	Filter conditions on the configured table.
Base table relation	Relationship between the configured table and the base table.

View matrix report in landing page and record page of Audit Workspace

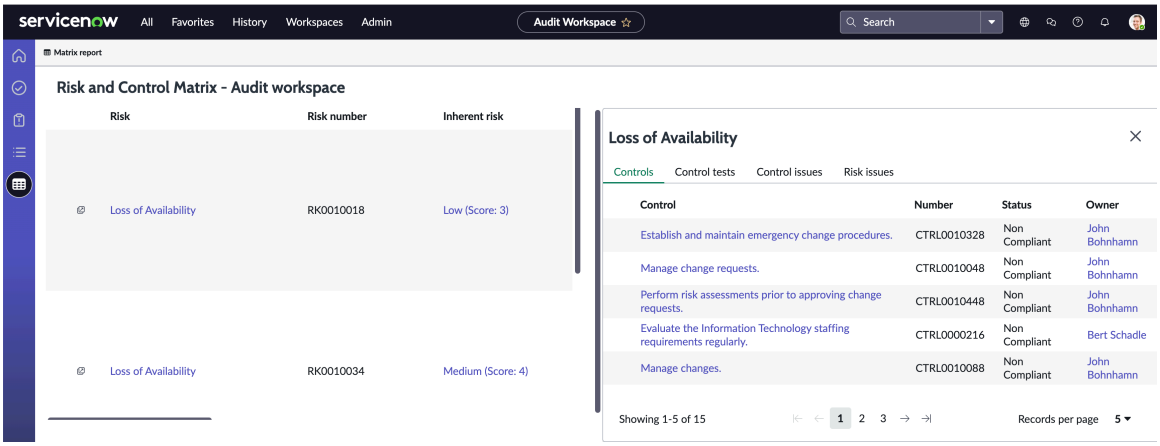
View the Matrix report in the Audit Workspace that presents the data in a structured format.

Before you begin

Role required: sn_audit_ws.auditor

About this task

As an admin you have completed the matrix report registry, relationship configuration, and column configurations. As a user you can see the report in the Audit Workspace.



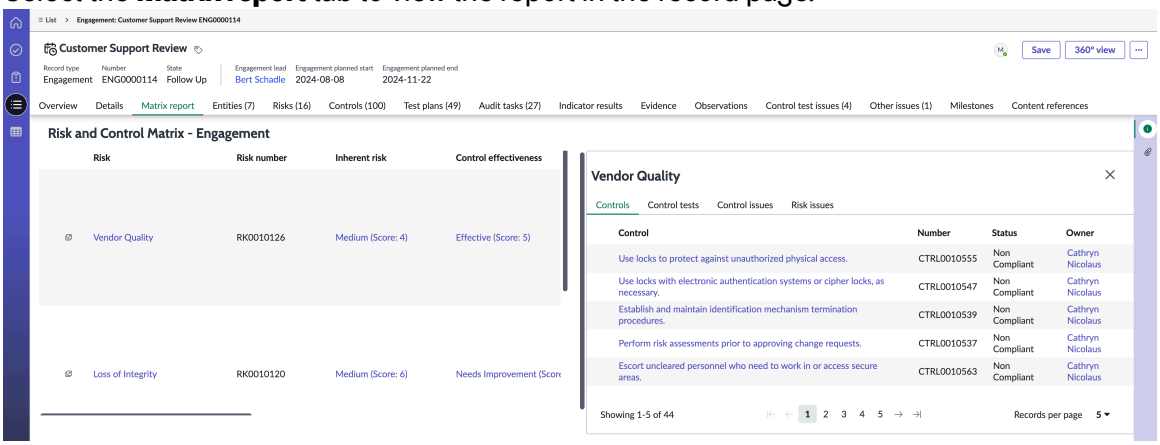
The report helps to analyze relationships between different objects such as assessing risks and controls. You can assess and document risks and the internal controls designed to mitigate those risks through the Risk and Controls Matrix.

Procedure

1. Navigate to **All** > **Audit** > **Audit Workspace**.
2. Select the matrix report icon ( ) and click the matrix report that you configured.
3. For the landing page display type matrix configuration, you can view the Matrix report in the Audit Workspace.
4. Select the view related information icon ( ) to get a complete tabular view of the matrix report.

   The source record details are displayed on the left pane for the top two orders. The target table fields that you configured are displayed as column heads on the right pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Since risk is the base source table, all the risk-related fields are displayed on the left pane. Level 0 is the risk, which is the default base table. All the data that are fetched from the risk record are Level 1.

For example, in the preceding illustration, for the **Loss of Availability** risk listed on the left pane you can view all the risk-related details that you configured from the target tables on the right pane. The control details that are retrieved from the Control table, the test plans for the control, the issues related to the control, and the issues related to the risk are all displayed in separate tabs that come from the configuration on the right pane.

For the record page display type matrix configuration, you can view the matrix report in the List view of the Audit Workspace.

5. Select the list icon ( ) of the Audit Workspace.
6. Select any record from the configured table of the Matrix report configuration.
   For example, if it's an engagement record, then select the record from **All engagements** in the **Execution** list.
7. Select the record from the list of records on the right pane.
   The **Overview** page of the selected record opens up.
8. Select the **Matrix report** tab to view the report in the record page.

Audit Management reference

The following sections show the roles and access limitations to the tables used in Audit Management.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components installed with Audit Management

Activating the GRC: Audit Management (com.sn_audit) plugin adds or modifies several tables, user roles, and other components.

Properties installed with Audit Management and Advanced Audit

Properties are added with activation of GRC: Audit Management.

Name	Description	Application
sn_audit.retain_report_attachments	Retains the previous Word report attachments with the engagement record each time the report is generated • Type: string • Default value: No	Audit Management
sn_audit.knowledge_base	Name of the knowledge base used to publish Audit reports • Type: string • Default value: Audit	Audit Management
sn_audit_advanced.default_adv_notification_duedate_duration	Default duration (in days) from the due date of a milestone, based on which, a notification is sent. • Type: integer • Default value: 8	GRC: Advanced Audit
sn_audit_advanced.role_documentation_link	Documentation link for role requirements for enabling and using advanced planning feature (with PPM integration). Type: string	GRC: Advanced Audit
sn_audit_advanced.ppm_project_documentation_link	Documentation link for project capabilities and role requirements. Type: string	GRC: Advanced Audit
sn_audit_advanced.rollup_documentation_link	Documentation link for expenses and resources rollup details, from project to related engagement and plan. Type: string	GRC: Advanced Audit

Roles installed with Audit Management

Roles are added with activation of GRC: Audit Management.

© 2026 ServiceNow, Inc. All rights reserved.

Role title [name]	Description	Contains roles
Audit Admin [sn_audit.admin]	In addition to the inherited permissions, the audit admin can delete engagements, audit tasks, test templates, and test plans.	• sn_audit.manager • sn_grc.admin
Audit approver [sn_audit.approver]	The audit approver can approve an engagement and audit plan. The user with this role can be a part of approver list and the role is classified as Lite operator role.	sn_audit.reader
Audit reader [sn_audit.reader]	The user can view the audit-related entities such as engagements, plans, observations, audit tasks, and has exclusive read access to all the entities in the Audit Management application. This role is classified as a lite operator role.	sn_grc.reader
Audit Developer [sn_audit.developer]	In addition to the inherited permissions, the audit developer can add and delete audit report templates.	• sn_audit.admin • sn_grc.developer
External Auditor [sn_audit.external_auditor]	External auditors can be assigned as auditors for an engagement and can be assigned to audit tasks. They can view closed engagements, audit tasks that are assigned to them, and closed audit tasks. If the Policy and Compliance Management plugin or Risk Management plugins are installed, they can also view published policies and all controls and risks in the **Monitor** state.	
Audit Manager [sn_audit.manager]	In addition to the inherited permissions, the audit manager can create audit tasks (such as control tests, activities, walkthroughs, and interviews), engagements, test plans, test templates, issues, remediation tasks, and entities. If Advanced Core is installed, then the audit manager can also create evidence requests.	• sn_audit.user • sn_grc.manager

Role title [name]	Description	Contains roles
Audit User [sn_audit.user]	In addition to the inherited permissions, the audit user can be assigned audit tasks and create test templates and test plans. The audit user has read-only access to the Risk Management application and modules and the Policy and Compliance Management application and modules.	• sn_compliance.reader • sn_grc.reader • sn_grc.user
Engagement Project Manager [sn_audit_advanced.engagement_project_manager]	The audit lead who does advanced planning and could handle plans of engagements. This role is available after GRC: Advanced Audit plugin is activated.	• sn_audit.manager • resource_manager • it_project_manager

Tables installed with Audit Management

Tables are added with activation of GRC: Audit Management.

Table	Description
Activity [sn_audit_activity]	Extends Audit Task [sn_audit_task] and stores audit activities
Audit Task [sn_audit_task]	Extends Planned Task [planned_task] and is a generic table for all tasks associated with an audit
Base Audit Test [sn_audit_base_test]	Base table for Test Templates and Test Plans
Control Test [sn_audit_control_test]	Extends Audit Task [sn_audit_task] and stores control tests
Control to Engagement [sn_audit_m2m_control_engagement]	Stores many-to-many relationships between controls and engagements
Engagement [sn_audit_engagement]	Extends Planned Task [planned_task] and stores engagements
Interview [sn_audit_interview]	Extends Audit Task [sn_audit_task] and stores interviews
Entity to Engagement [sn_audit_m2m_profile_engagement]	Stores many-to-many relationships between entities and engagements

Table	Description
Risk to Engagement [sn_audit_m2m_risk_engagement]	Stores many-to-many relationships between risks and engagements
Test Plan [sn_audit_test_plan]	Extends Base Audit Test [sn_audit_base_test] and stores test plans
Test plan to Engagement [sn_audit_m2m_test_plan_engagement]	Stores many-to-many relationships between test plans and engagements
Test Template [sn_audit_test_template]	Extends Base Audit Test [sn_audit_base_test] and stores test templates
Walkthrough [sn_audit_walkthrough]	Extends Audit Task [sn_audit_task] and stores walkthroughs
Audit Report Template [sn_audit_report_template]	Stores the defined xml, html, or script-based audit report templates
Assessment procedures [sn_audit_asmnt_procedure_control_test]	Stores the assessment objectives of control tests. Identifier and assessment objectives field values are copied over from the Assessment procedure plan table.
Assessment procedure plan [sn_audit_asmnt_procedure_test_plan]	Generated for the test plan. Changes made to the test plan are reflected in the control test table [sn_audit_asmnt_procedure_control_test]
Assessment procedure templates [sn_audit_asmnt_procedure]	Stores the assessment objectives
Test template to Assessment procedure [sn_audit_m2m_test_temp_asmnt_procedure]	Stores many-to-many relationships between test template and assessment procedure

Note:
All additional tables installed by the dependent plugins are also needed for GRC: Audit Management.

Tables installed with Advanced Audit

Tables are added with activation of GRC: Advanced Audit

Table	Description
Audit Task to Milestone sn_audit_advanced_m2m_audit_task_milestone	Stores many-to-many relationships between audit tasks and milestones.

Note:
All additional tables installed by the dependent plugins are also needed for GRC: Audit Management.

Roles required for Engagement project planning for Project Portfolio Management

The advanced planning capability enables integration of Advanced Audit with the Project Portfolio Management (PPM) product. The capability creates an equivalent project for the engagement, and provides planning features that could be used for resource planning, cost planning, and so on, from the engagement project.

Engagement-project planning features and roles

To understand the roles required for using the engagement-project planning features, see the following table:

Engagement-project planning features and role requirements

Feature	Description	Roles and their scope
Resource planning	As a resource requester, find the availability of the resources, and create and manage the resource plans for the project and project tasks in the project workspace. For more information, refer to Create and manage resource plans for a project	• Users with at least resource_user role can add resource plans using the **New** button and with it_project_manager role can manage and add new resource plans using the **Manage** button. Users with resource_manager role would be able to confirm and allocate resource plans. • Users with sn_ppm_read or timecard_user or resource_user role would be able to see the resource plans for the engagement project.
Cost planning	Project cost plans capture the costs of projects. Create a cost plan to specify the unit cost of a cost type for a fiscal period. For more information, refer to Create a project cost plan	• Users with sn_audit.user or sn_audit.manager role and it_project_manager would be able to manage the cost plan. Users with the it_project_manager role can add new cost plans. Users with sn_audit.user or sn_audit.manager and project_manager role would be able to add a new cost plan. • Users with sn_audit.user or sn_audit.manager role and project_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Engagement-project planning features and role requirements (continued)

Feature	Description	Roles and their scope
		role would be able to add a new cost plan. Users are suggested to use the it_project_manager role instead of project_manager role by PPM. Users with the it_project_manager role can also add new cost plans.
Related links on Engagement project	Users can enter the project budget, move projects, calculate completion estimates for the engagement project using the related links which appear based on the roles and permissions.	• Users need portfolio_manager role to create project budget. If a user role is being added manually, use the it_portfolio_manager role instead of portfolio_manager role. • Users need project_manager role to be able to calculate completion estimates, and move project. If a user role is being added manually, use the it_project_manager role instead of project_manager role.

Roles required for Engagement project planning for Project Portfolio Management

Domain separation and Audit Management

Domain separation is supported for Audit Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Benefits of having domain-separated tables in Audit Management

Domain separation is best for those customers who:

- Need to enforce absolute data segregation between business entities (data separation).
- Customize business process definitions and user interfaces for each domain (delegated administration).
- Maintain some global processes and global reporting in a single instance.

These users can choose to expand or collapse the domain scope to show or hide data from other domains.

Note:
Users always have access to data from domains that have been explicitly granted to them by domain visibility.

How domain separation works in Audit Management

While GRC supports separation of data, separation of logic and process is not fully supported.

- Many types of records in GRC are automatically generated through user processes. Entities, controls, risks, indicators, and control tests are all fields that can be generated automatically. For records that are automatically generated (and for any GRC record that is manually generated), the domain of the record is the same as the domain of the user responsible for creating or generating the records.
- Automatic generation should be kept in mind when working in a domain-separated GRC implementation. Users should be sure that they are creating / generating records at the right domain level so that they are visible to the right set of users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, suppose you have domains that look like:

- If you have a risk or control that you want to be assessed by users in domains A and B, the risk or control should be generated or manually created at the global level. If the risk or control is created in Domain B, you will not be able to recreate the risk or control in Domain A due to indexing.
- If you have a risk or control that you want to be assessed by users in TOP and Domain A, you can create the risk or control in Domain A.

Unless the risks and controls are in the Global domain, users should not assign risks or controls in a higher domain to users in a lower domain. In the example above, if you have a control in the TOP domain, you should not assign it for attestation to users in Domains A or B since those users would not have access to the control; thus the attestation or assessment questionnaire would not be generated.

Similarly, users should not assign control objectives and risk statements in a higher domain to attestations and assessments in a lower domain. Otherwise the attestation or assessment questionnaire would not be generated.

Use cases

GRC data for IT can be separated from the GRC data of other departments. Each business area using the GRC application can have separate data that cannot be shared with other departments. Therefore each department can have its own entities, policies, controls, risks, and so on.

When looking at a control from the IT domain, the user can choose to expand the domain scope to show values from the Finance domain or collapse the domain scope to show only controls that match the IT domain.

By default, domain separation adds a domain field to the Task `[task]` and Configuration Items `[cmdb_ci]` tables and their extensions.

You can extend domain separation to any new tables you create by adding a `sys_domain` field to the table's dictionary definition. By default, the system only domain-separates platform and baseline application tables where appropriate.

> **Warning:**
> ServiceNow does not recommend domain separating platform tables (any table with the sys_ prefix such as the Dictionary Entry `[sys_dictionary]` and Dictionary Entry Override `[sys_dictionary_override]` tables) because it can produce unexpected results.

In this use case, client scripts, business rules, workflows, processes, and so on can be domain-separated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

While the behavior offered with domain separation provides multi-tenancy support, multi-tenancy is still contained within a single instance. This means that some global properties, some global data, and some global processes are shared across all domains. For example, the system's "Remember me" option on the login page is global and cannot be specified per domain.

If you need complete and total separation of all system properties and do not require global reporting or global processes, separate instances are the best option.

Allocation of domain values to Audit Management objects

The following changes are made to the domain assignment process to manage data segregation by the Managed Service Providers related to Audit Management tables:

GRC Audit Management

Audit Management objects	Domain source
Activity	User creating activity or Engagement
Audit Report Template	User
Audit task	Engagement
Control test	Engagement
Control to Engagement	Engagement
Entity to Engagement	Engagement
Interview	Engagement
Issue to Engagement	Engagement
Risk to Engagement	Engagement
Test plan	User
Test plan to Engagement	Engagement
Test template	User creating template
Walkthrough	Engagement

GRC Advanced Audit

Advanced Audit	Domain source
Audit task to Milestone	Audit task or Control test
Auditable unit	User
Auditable unit to Authority document	Auditable unit
Auditable unit to Business application	Auditable unit
Auditable unit to Business process	Auditable unit
Auditable unit to Business unit	Auditable unit
Auditable unit to Department	Auditable unit
Auditable unit to Location	Auditable unit
Auditable unit to Policy	Auditable unit

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Advanced Audit (continued)

Advanced Audit	Domain source
Auditable unit to Product	Auditable unit
Auditable unit to Vendor	Auditable unit
Engagement	User
Engagement project	Engagement
Milestone	Engagement
Observation	Engagement
Plan	User

Analytics and Reporting Solutions for Audit Management

Platform Analytics contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

The GRC: Audit Management Analytics and Reporting Solution is available on the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

To enable the Analytics and Reporting solution for GRC: Audit Management, perform these steps.

1. Visit the ServiceNow Store and obtain an entitlement to the Performance Analytics - GRC: Audit Management application and associated applications. See Install a ServiceNow Product on the ServiceNow Store.
2. On the instance, navigate to **System Applications** > **All Applications** > **All**.
3. Locate and install the GRC: Audit Management application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

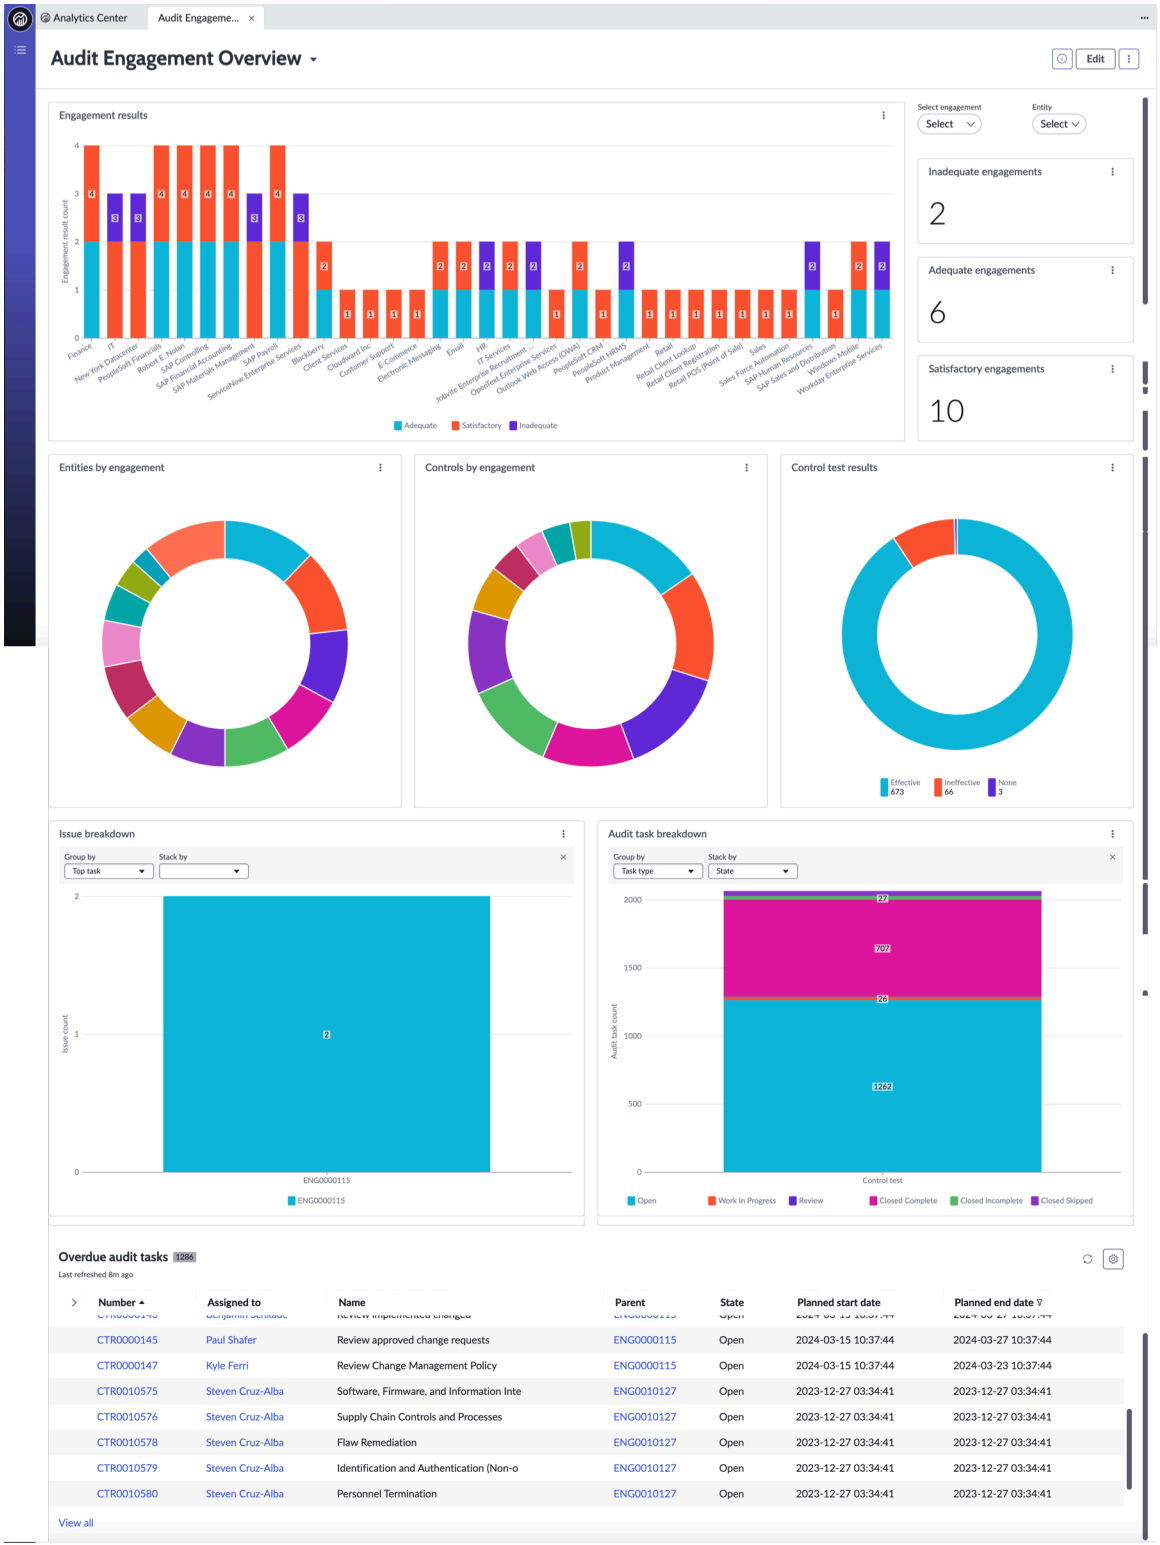
Important:

Starting with version 18.1.5 of the Audit Management application, the Analytics and Reporting solutions for Audit Management such as the Audit Engagement Overview dashboard and Audit Manager dashboard are available in the Next Experience UI Framework.

For more information, see Audit Engagement Overview Performance Analytics dashboard and Audit Manager Performance Analytics dashboard.

Audit Engagement Overview Performance Analytics dashboard

The Audit Engagement Overview dashboard provides an executive view into audit results and engagement breakdowns by task, allowing areas of concern to be identified quickly.



Audit Engagement Overview dashboard

Important:
Starting with version 18.1.5 of the Audit Management application, the Audit Engagement Overview dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

To access the Audit Engagement Overview dashboard in the Next Experience UI Framework, navigate to **All** > **Audit** > **Analytics Overview**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following roles and tasks are associated with this solution:

- Audit Manager (sn_audit.manager): To have clear visibility into the overall state and volume of vulnerabilities within the organization.
- Audit Administrator (sn_audit.admin): To pinpoint areas of concern quickly.
- Audit Analyst (sn_audit.user): To prioritize which risks or tasks to focus on based on criticality to the organization.

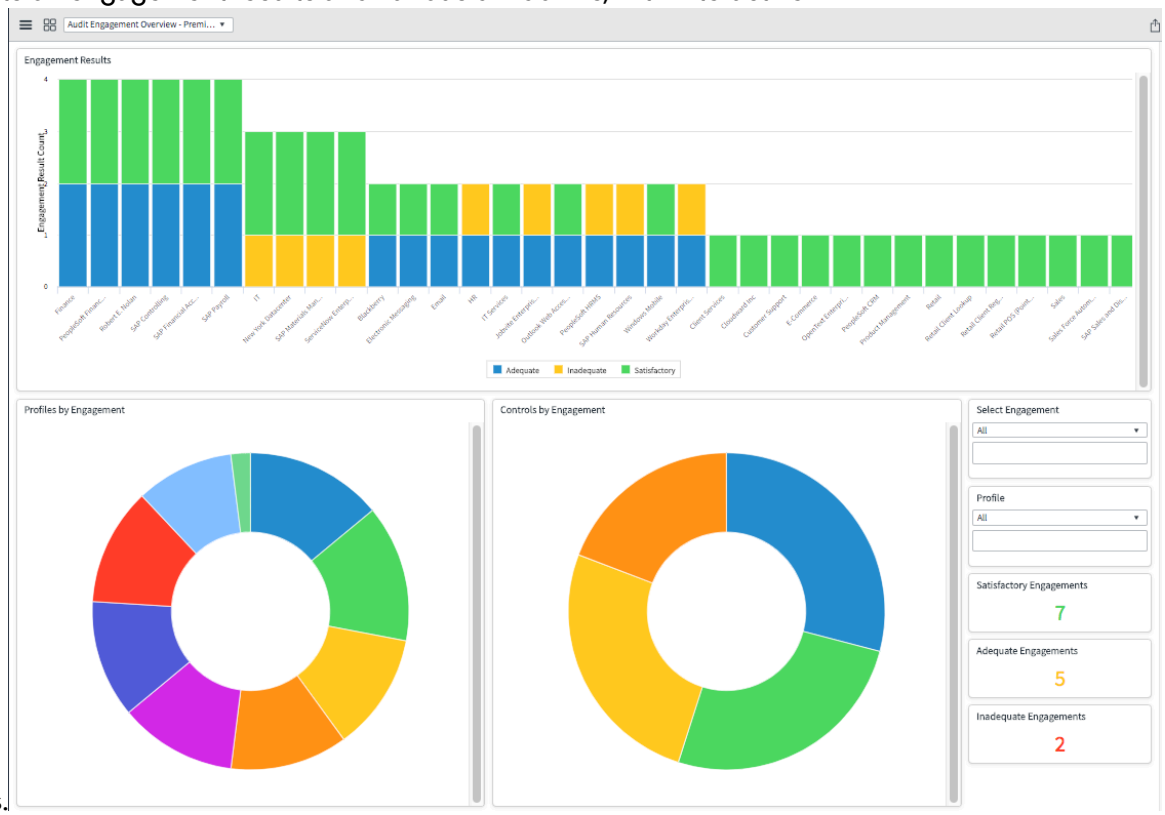
Reports

Name	Type	Description
Adequate Engagements	Single Score	Displays the number of engagements closed with an adequate result.
Audit Task Breakdown	Horizontal bar	Total number of active audit tasks broken down by type, state, and assigned to
Control Test Results	Donut	The number of completed control tests, broken down by overall control effectiveness rating.
Controls by Engagement	Donut	Breakdown of the number of open controls by audit engagement
Engagement Results	Bar	Displays an overall count of audit engagements conducted for each entity. The chart is stacked to display the overall audit results for each entity.
Inadequate Engagements	Single Score	Displays the number of engagements closed with an inadequate result.
Issue Breakdown	Horizontal bar	Count of issues grouped by Engagement, State, or Response
Overdue Audit Tasks	List	List of open audit tasks that have exceeded the planned end date.
Profiles by Engagement	Donut	Select one or many entities to view and compare their audit findings.
Satisfactory Engagements	Single Score	Displays the number of engagements closed with a satisfactory result.

Audit Engagement Overview – Premium dashboard



Important:
The Audit Engagement Overview dashboard with PA filters is now available as part of the Audit Management plugin.

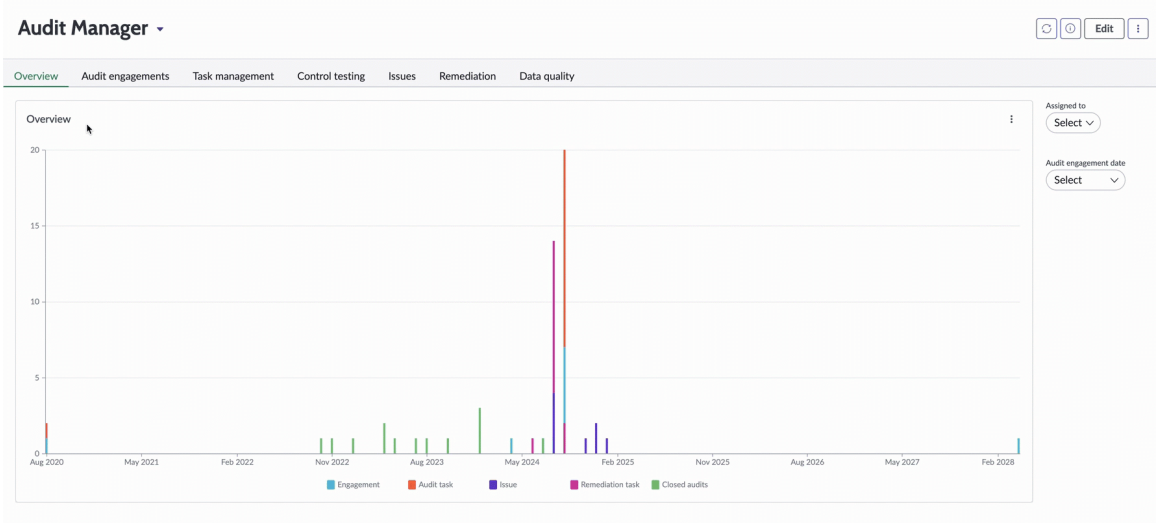
Starting with version 18.1.5, the Audit Engagement Overview – Premium dashboard is being prepared for future deprecation. It will be no longer available on new instances.

As this dashboard uses interactive filtering, the licensed version of Performance Analytics is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Audit Engagement Overview dashboard has one view, with reports on engagement results and various drilldowns, with interactive filters.

Audit Manager Performance Analytics dashboard



The Audit Manager dashboard provides the current view of audit engagements and related audit activities. Users with the sn_audit.manager role can view this dashboard. This Audit Manager dashboard is part of the Advanced GRC dashboard.

Audit Manager dashboard

Important:
Starting with version 18.1.5 of the Audit Management application the Audit Manager dashboard is available in the Next Experience UI Framework.

If you are on Vancouver or Washington DC, you can view the dashboard in the Next Experience UI Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For detailed reports on the audit activities, see the following tables.

To open the dashboard in the Next Experience UI Framework, navigate to **All** > **Audit** > **Analytics Audit Manager Dashboard**.

The Audit Manager dashboard provides detailed reports that capture audit activities, for example:

- Overview of various open and closed engagements
- Overview of audit tasks and control test status
- Overview of audit issues and control test failures
- Active remediation tasks
- Closed audits
- Data quality of audits

This dashboard provides useful answers to the following questions:

- What are the open, past due, closed, and upcoming audits? What is the audit engagement date range? Who are the audit tasks assigned to?
- What are the key audit engagements? Are the engagement results adequate or satisfactory?
- What are the various audit tasks? What is the percentage of task completion?
- How many tests are completed over given time?
- Are the issues and remediation tasks completed on time?

Users with the sn_audit.manager role can view and adjust a report chart by grouping or stacking data. To group and stack audits and their activities, use common filters such as State, Assigned to, Result, and Name.

Various interactive filters are provided to further refine reports. For example, use the Assigned to filter to view the audits assigned to Abel Tuter.

The **Overview** tab provides a color-coded bar chart report. It displays the latest view of the audit engagements and audit activities such as audit tasks, issues, and remediation tasks. You can further drill down in the individual reports.

Use the following interactive filters to filter data on the **Overview** tab reports:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Assigned to
- Audit Engagement Date

The **Audit Engagements** tab provides an overview of the audit engagements and displays the following reports.

Audit Engagements tab

Reports	Description
Open Audits	Number of audit engagements which are open
Past Due Audits	Past due audits over time
Upcoming Audits	Monthly count for the upcoming audit engagements
Started Audits	Monthly count for the audit engagements that have been started
Closed Audits	Closed audit engagements

Use the following interactive filters to filter data on the **Audit Engagements** tab reports:

- Assigned to
- Audit Engagement Date

The **Task Management** tab provides an overview of the audit tasks and displays the following reports.

Task Management tab

Reports	Description
Active Tasks	Number of active tasks
Past Due Tasks	Past due tasks
Tasks Due This Week	Tasks that are due in a given week
Upcoming Audit Tasks	Upcoming audit tasks
Tasks Completed On-Time	Number of tasks completed by the users on time
Tasks Completed After Planned End date	Tasks that are completed after the planned end date
Tasks Completed	Number of tasks completed over time

Use the following interactive filters to filter data on the **Task Management** tab reports:

- Assigned to
- Audit Engagement Date
- Task Type

  The example task types are interviews, walkthroughs, activities, and control tests.

The **Control Testing** tab provides detailed information on control tests. On further drill down, you can view detailed information about the control tests. This tab displays the following reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control Testing tab

Reports	Description
Active Tests	Number of active tests
Past Due Tests	Number of past due tests
Tests Due This Week	Tests that are due in a given week
Upcoming Tests	Upcoming control tests
Tests Completed On-Time	Number of tests completed on time
Tests Completed After Planned End date	Tests that are completed after the planned end date
Open Tests by Week	Tests that are open in a given week
Tests Completed by Month	Number of tests completed in a month

Use the following interactive filters to filter data on the **Control Testing** tab reports:

- Assigned to
- Audit Engagement Date
- Operation Effectiveness
- Design Effectiveness

The **Issues** tab provides an overview of all the issues that are created under audit and the issues that are generated due to control test failures. This tab displays the following reports.

Issues tab

Reports	Description
Active Issues	Number of active issues assigned to different users
Past Due Issues	Past due issues assigned to different users
Issues Awaiting response	Issues that are open and awaiting response
Issues Due This Week	Issues that are due in a given week
Upcoming Issues	Number of upcoming issues
Issues Completed Before Planned End date	Issues that are completed before the planned end date
Issues Completed After Planned End date	Issues that are completed after the planned end date
Issues Completed On-Time	Number of issues completed on time by the users
Issues Completed by Month	Number of issues completed in a month

Use the following interactive filters to filter data on the **Issues** tab reports:

- Assigned to
- Audit Engagement Date
- Issue Entity

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Issue State
- Issue Priority
- Issue Response

The **Remediation** tab provides an overview of the remediation tasks created for the audit issues and displays the following reports.

Remediation tab

Reports	Description
Active Remediation Tasks	Number of active remediation tasks
Past Due Planned Remediation	Number of past due remediation tasks
Remediation Tasks Due This Week	Remediation tasks that are due in a given week
Upcoming Remediation Tasks	Remediation tasks that are forthcoming
Remediation Tasks Completed Before Planned End date	Remediation tasks that are completed before the planned end date
Remediation Tasks Completed After Planned End date	Remediation tasks that are completed after the planned end date
Remediation Tasks Completed On-Time	Number of remediation tasks completed on time by the users
Remediation Tasks Issues Completed by Month	Number of remediation tasks completed in a month

Use the following interactive filters to filter data on the **Remediation** tab reports:

- Assigned to
- Audit Engagement Date
- Remediation Task Priority

The **Data Quality** tab provides the reports to validate whether the data for audits, audit issues, remediation tasks, and control tests is captured in a correct manner. This tab displays the following reports.

Data Quality tab

Reports	Description
Active Audits No Assignee	List of unassigned active audits
Audits Without Tasks	List of audits without tasks
Active Audits No Entity	List of active audits with no entities
Audit Task No Assignee	List of unassigned audit tasks
Operation Test No Result	List of operation tests with no results
Active Audits No Description	List of active audits with no description
Design Test No Result	List of design tests with no results
Issues No Description	List of issues with no description

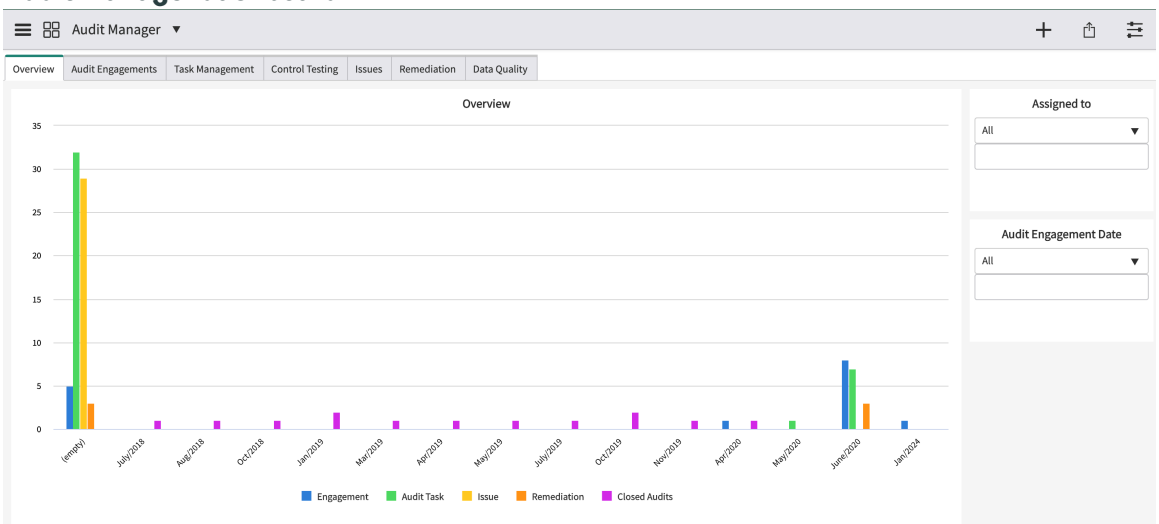
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Quality tab (continued)

Reports	Description
Control Test No Assignee	List of unassigned control tests
Issues No Assignment Group	List of issues with no assignment group
Issues No Remediation Tasks	List of issues with no remediation tasks
Control Test No Test Plan	List of control tests with no test plans
Issues No assignee	List of unassigned issues
Issues No Recommendation	List of issues with no recommendation
Issues No Explanation	List of issues with no explanation
Remediation Task No Assignee	List of unassigned remediation tasks
Issues No item	List of issues with no items
Remediation Task No Issues	List of remediation tasks with no issues

Use the Assigned to filter in the report to filter data on the **Data Quality** tab reports.

Audit Manager dashboard in classic UI



Important:
Starting with version 18.1.5 of the Audit Management application, the Audit Manager dashboard can be viewed in the Next Experience UI Framework.

To view the Audit Manager dashboard, activate the following GRC applications:

- GRC Audit Management (com.sn_audit)
- GRC Advanced Dashboards (com.sn_grc_pa_advanced)

To view the Audit Manager dashboard, navigate to **Audit** > **Audit Manager Dashboard**. Log in with the sn_audit.manager role to view reports.

Business Continuity Management

ServiceNow® Business Continuity Management application gives your organization the capability to continue to deliver products and services at an acceptable level when a disruptive incident occurs. The ongoing activities of this application are aimed to reduce the operational risks and improve your organizational ability to respond, react, and recover from issues and disruptions.

Business Continuity Management overview

The Business Continuity Management product provides a framework to perform continuous management activities. The Business Continuity Management application helps your organization to achieve the following objectives:

- Establish a clear governance structure.
- Define a consistent classification of business processes, interdependencies, and recovery objectives based on impact analysis and risk to the business.
- Develop and provide continuous improvement to the business continuity plans.
- Identify, analyze, and manage process continuity during and following a disruptive event.

For more information on Business Continuity Management, see Exploring Business Continuity Management.

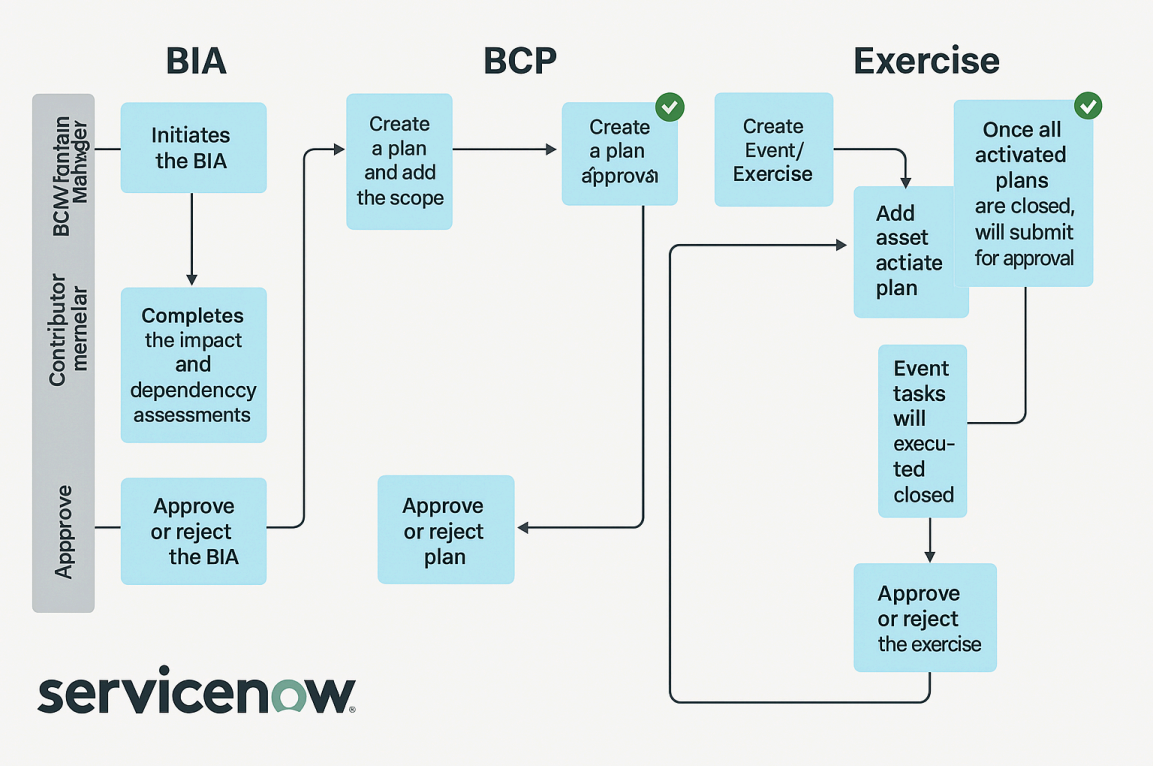
Exploring Business Continuity Management

Learn how you can use the Business Continuity Management application to manage your business continuity tasks using predefined templates and workflows.



Business Continuity Management overview

The Business Continuity Management application provides a framework to perform continuous management activities such as business impact analysis, business continuity planning, exercise management, and crisis management. The structured workflows in the Business Continuity Management application improve your organizational ability to respond to the issues and recover quickly from the disruptions.

Business Continuity Management workflow

A typical workflow in the Business Continuity Management application involves the following steps for managing your business continuity tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. An administrator downloads the Business Continuity Management application from ServiceNow Store.
2. The BCM administrator sets up the Business Continuity Management application and the templates for performing the business continuity activities.
3. The BCM program manager or business impact analysis (BIA) administrator creates a business impact analysis to determine the impact of a disruption on the business processes and IT applications. The BIA administrator also focuses on the consequences of incidents and estimates the time of recovery to resume normal business operations.
4. The BCM program manager or BCM lead reviews the assessments and approves the business impact analysis.
5. The BCM program manager or business continuity plan (BCP) administrator creates a business continuity plan and adds the relevant assets, scope, documentation, related plans, recovery teams, loss scenarios, and recovery tasks to it. The BCP administrator then sends an approval request to the BCM lead to review and approve the business continuity plan.
6. The BCM program manager creates exercise events, tracks the assets and their dependencies, and approves the exercise events.
7. The BCM program manager responds to the crisis events, tracks the assets and their associated dependencies, and manages the recovery tasks to mitigate the negative impact of a disruption.
8. The BCM program manager manages the alerts from the Crisis map interface and initiates the response workflows to minimize the downtime.
9. The BCM administrator or BCM program manager sends the emergency notifications in Everbridge notifications system and notifies the stakeholders about the crisis alerts.

Business Continuity Management benefits

The Business Continuity Management application provides the following benefits:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Feature	Users
Manage your business continuity activities from the interactive dashboard in the Home page.	Home page view	BCM program manager
Monitor your individual and team tasks from a single dashboard in the **My tasks** view.	My tasks page view	BCM program manager
Assess your critical business services and IT applications by creating a business impact analysis.	Create a business impact analysis	BCM program manager or BIA administrator
Prepare a business continuity plan with a response strategy and get it reviewed by the BCM leads and program managers.	Create a business continuity plan	BCM program manager or BCP administrator
Finalize your business continuity plan by continuously testing and exercising an event.	Create an exercise	BCM program manager or BCM planner
Respond to an actual crisis event and manage the associated event tasks.	Start a crisis event	BCM program manager or BCM planner
Respond to the alerts in Crisis map and set the recovery tasks into action to manage the alerts.	Manage alerts from the map interface	BCM administrator or BCM program manager
Notify the stakeholders about the crisis alerts by sending emergency notifications in Everbridge.	Sending notifications with Everbridge	BCM administrator or BCM program manager

Coral theme

Coral is now the default theme for the Business Continuity Workspace. This theme provides a fresh look and feel, featuring brand-neutral illustrations to enhance your user experience. A dark theme option is available for web and mobile experiences.

BCM Configurable Workspace

Starting with version 5.x.x, the Business Continuity Management application supports BCM Configurable Workspace. You can perform your business continuity tasks with an intuitive functionality in BCM Configurable Workspace.

Enhancements in BCM Configurable Workspace

BCM Configurable Workspace (also known as Business Continuity Workspace) offers an enhanced and simplified user experience for its users. The BCM application users can take advantage of the following enhancements in BCM Configurable Workspace over BCM classic Workspace:

1. Manage the crisis events, business impact analysis, planning, and exercises from an interactive dashboard in the Home page.
2. Monitor your individual and team tasks in the My tasks page and act on your pending tasks quickly.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Respond to the alerts in Crisis map and manage the recovery tasks effectively.
4. Visualize 360-degree relationship data for your business impact analysis, planning, exercises, and crisis events records and get a complete overview of all dependencies.

The Business Continuity Workspace in the classic Workspace is automatically updated to point to BCM Configurable Workspace. For information on BCM classic Workspace, see Using BCM Classic Workspace.

Configurable and role-driven Workspace

The BCM Configurable Workspace is configurable and role-driven, offering a unique experience tailored to each user or role in your organization. Logging in with specific user roles provides access to different functions and corresponding user interface views.

For more information on the user roles in the BCM application, see Components installed with Business Continuity Management.

For more information on the store apps, see Business Continuity Management and ServiceNow Store.

Support for BCM Classic Workspace

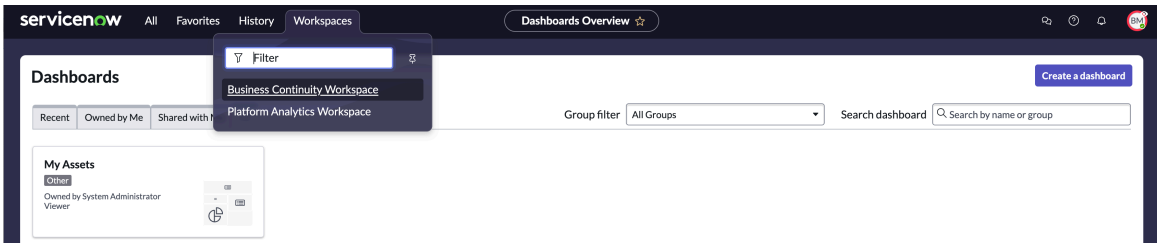
Starting with the Vancouver release, the BCM Configurable Workspace provides the latest user experience. Post Xanadu release, the BCM Classic Workspace is being prepared for future deprecation. Although the BCM Classic Workspace can still be used post Xanadu release via URLs, it will be hidden from the navigation. Using the BCM Configurable Workspace will ensure a smooth transition post Xanadu release.

The BCM Classic Workspace is an obsolete user interface that will not be compatible with the new features and enhancements introduced with the Xanadu release. If you continue to use the BCM Classic Workspace after the upgrade, you may encounter issues and errors that will not be supported by ServiceNow®.

To avoid any disruptions, transitioning to the BCM Configurable Workspace before or immediately following the Xanadu release offers the latest functionality and best user experience.

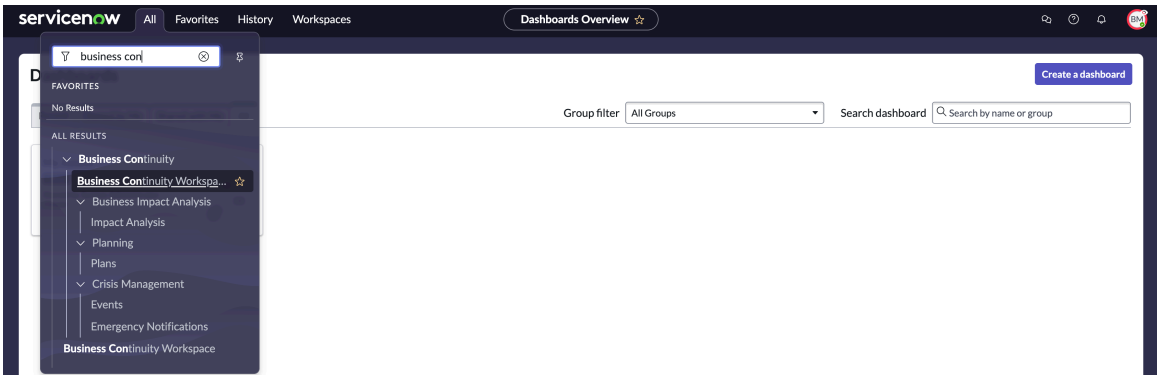
Users of the BCM application

The BCM application is the central workbench for the following types of users:



- BCM administrators
- BCM managers
- BCM planners
- BCM contributors
- BCM viewers
- Business users
- IT application owners

Navigating to BCM Configurable Workspace



When you log in to the Business Continuity Management application with a specific user role, you can navigate to the Business Continuity Workspace by using one of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- First option: Navigate to **Workspaces > Business Continuity Workspace** in the application instance as shown in the following example.

- Second option: Navigate to **All > Business Continuity > Business Continuity Workspace** in the application instance as shown in the following example.

Note:
The Business Continuity Workspace in the classic Workspace view is automatically updated to navigate to BCM Configurable Workspace.

Icons in Business Continuity Workspace

When you launch Business Continuity Workspace, you can view the following icons in the side bar of the Workspace view.

- Home page: Displays your business continuity tasks in a single pane view.
- Tasks page: Displays an overview of the tasks for the logged-in user. For more information, see My tasks page view.
- Lists: Displays the count and status of the business impact analysis, planning, exercise, and crisis event records. For more information, see List view.
- Crisis map: Displays the real-time threat alerts from different locations in a map view. For more information, see Crisis map view.

Managing functional components in BCM Configurable Workspace

You can manage the following functional components of the BCM application in BCM Configurable Workspace:

Business impact analysis

Performing a business impact analysis helps you to identify high risk assets and determine the impact of disruption on your critical business functions or services. By analyzing the impact, you can estimate the time of recovery to resume business and also focus on the consequences of incidents and disruptions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on creating a business impact analysis, see Business impact analysis. For information on the structured workflow tasks for business impact analysis, see Structured workflows for BIAs.

Business continuity planning

Planning your business continuity tasks enables you to develop continuity and recovery plans for critical business processes and IT functions. Disaster recovery enables you to protect, recover, and restore the organizational critical data and its technology systems. You can also develop a business continuity strategy for each activity.

For information on creating a business continuity plan, see Business continuity planning. For information on the structured workflow tasks for business continuity planning, see Structured workflows for BCPs.

Exercise management

Creating an event to exercise the plan in a simulated crisis helps you to validate your business continuity plans by continuous testing. You can then improve the effectiveness of the plans and usability during a simulated crisis.

For information on the exercise events, see Exercises. For information on the structured workflow tasks for exercise management, see Structured workflows for exercises.

Crisis management

Managing an actual crisis event helps you to mitigate the negative impact of a disruption to the business system. You can then prioritize the actions and apply the right strategy to minimize the downtime.

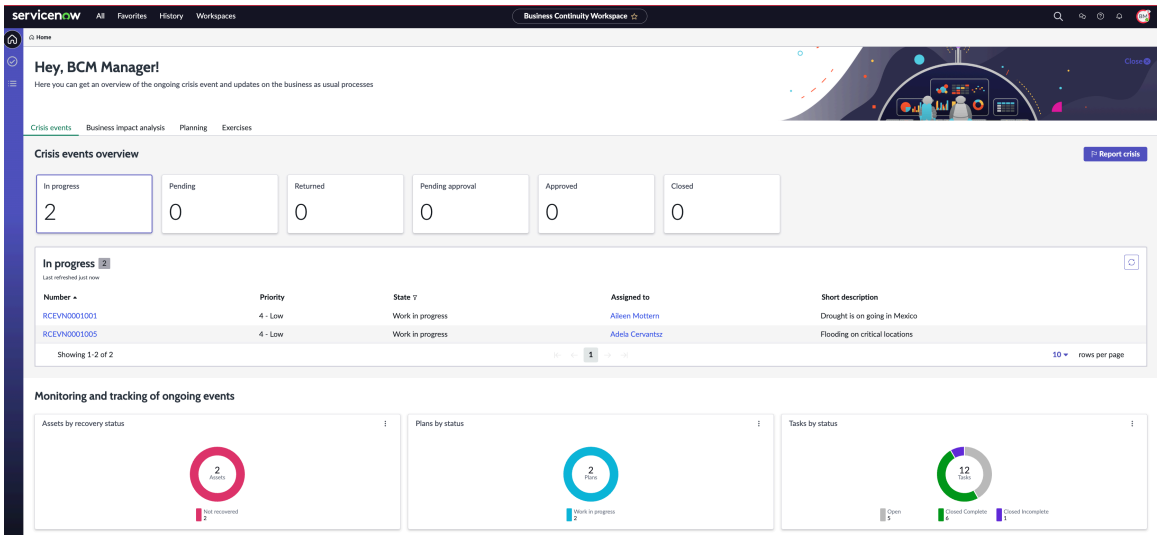
For information on the crisis events, see Crisis events. For information on the structured workflow tasks for crisis management, see Structured workflows for crisis events.

Note:
For setting up Business Continuity Management, see General administration setup for BCM.

Home page view

The Home page in Business Continuity Workspace serves as the landing page of the BCM application.

Home page in Business Continuity Workspace



The Home page in Business Continuity Workspace provides an overview of the BCM functional components in an interactive dashboard. The visualizations help the Workspace users to know the status of their tasks and act on them in an organized manner. The Home page consists of the following tabs:

- **Crisis events**
- **Business impact analysis**
- **Planning**
- **Exercises**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Crisis events tab

The **Crisis events** tab in the Home page displays various cards that offer information on the crisis events. You can review the crisis events in various states, details of the selected crisis events, and monitoring and tracking of the crisis events. The following example shows the cards in the **Crisis events** tab.

See the following table for the description of the cards in the **Crisis events** tab:

Cards in the Crisis events tab

Card	Description
Crisis events overview	Overview of the crisis events in different states. You can view the details of the crisis events in the following states: **In progress** Number of the crisis events that are in the **In progress** state. **Pending** Number of the crisis events that are in the **Pending** state. **Returned** Number of the crisis events that are in the **Returned** state. **Pending approval** Number of the crisis events that are in the **Pending approval** state. **Approved** Number of the crisis events that are in the **Approved** state. **Closed** Number of the crisis events that are in the **Closed** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Crisis events tab (continued)

Card	Description
Details of the selected event card	Details of the crisis events for the selected state of the card. For example, if you selected **In progress** in **Crisis events overview**, then details of the crisis events that are in the **In progress** state are displayed in this panel. You can view the following details on the crisis events: **Active** State of the crisis event. The state can be **True** or **False**. You can select the link to open the crisis event record. **Activity due** Activity that is due on the crisis event. **Participants** Participants of the crisis event. **Approval** Approval information for the crisis event. **Approval history** Approval history of the crisis event. **Assigned to** Name of the assignee responsible to respond to the crisis event. When you select the assignee name in the column, it opens the record form where the following tabs are displayed: • **Details** • **Roles** • **Groups** • **Delegates** **Assignment group** Assignment group for the crisis event. **Business duration** Business duration of the crisis event. **Service** Service impacted due to the crisis event.

Cards in the Crisis events tab (continued)

Card	Description
Monitoring and tracking of ongoing events	Graphical representation of all crisis events. You can filter the information based on their associated assets, plans, and tasks in a pie chart format: **Assets by recovery status** Shows the number of the assets by their recovery status for ongoing events. The following details are displayed on the asset in a pie chart: • Not recovered • Recovered The example in the image shows that out of the total 18 assets, 17 assets are not yet recovered and one asset is recovered. **Plans by status** Shows the plans by the following status of the ongoing events: • Pending • Work in Progress • Closed Complete **Tasks by status** Shows the tasks by the following status of the ongoing events: • Open • Pending • Closed Incomplete • Closed Complete • Closed Skipped
Report crisis action button	Action button to report a crisis and create a crisis event from the **Crisis events** tab. When you select **Report crisis**, it launches the **Create New Event** form where you can fill in the details of the crisis event.

Business impact analysis tab

The **Business impact analysis** tab in the Home page displays various cards that offer information on the business impact analyses. You can review the business impact analyses in various states, details of the selected analyses, and monitoring and tracking of the analyses. The following example shows the cards in the **Business impact analysis** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See the following table for the description of the cards in the **Business impact analysis** tab:

Cards in the Business impact analysis tab

Card	Description
Business impact analysis overview	Overview of the business impact analysis in different states. You can view the details of the business impact analysis in the following states: **All** Total number of the business impact analyses in the BCM application. **Draft** Number of the business impact analyses in the **Draft** state. **In review** Number of the business impact analyses in the **In review** state. **Returned** Number of the business impact analyses in the **Returned** state. **Pending approval** Number of the business impact analyses in the **Pending approval** state. **Expired** Number of the business impact analyses in the **Expired** state. **Approved** Number of the business impact analyses in the **Approved** state. **Archived**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Business impact analysis tab (continued)

Card	Description
	Number of the business impact analyses in the **Archived** state.
Details of the selected business impact analysis card	Details of the business impact analyses for the selected state of the card. For example, if you selected **In progress** in **Crisis events overview**, then details of the business impact analyses that are in the **In progress** state are displayed in this panel. You can view the following details on the business impact analyses in a tabular format: **Name** Name of the business impact analysis. **Description** Description of the business impact analysis. **Applies to** Service, process, or company that the business impact analysis applies to. **State** State of the business impact analysis. **Updated** Date and time when the business impact analysis gets updated.
Monitoring and tracking of ongoing business impact analyses	Graphical representation of all business impact analyses for their assets in a pie chart format: **Assets by RTO** Shows the number of the assets that have different recovery time objectives (RTO). The image shows an example of three assets that have an RTO of 8 hours and one asset that has an RTO of 4 hours. **Assets by recovery tier** Shows the number of assets that have different recovery tiers. The image shows an example of three assets that have mission critical recovery tiers and two assets that have business critical recovery tiers.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Business impact analysis tab (continued)

Card	Description
Create BIA action button	Action button to create a business impact analysis from the **Business impact analysis** tab. When you select **Create BIA**, it launches the **Create New Impact Analysis** form where you can fill in the details of the business impact analysis.

Planning tab

The **Planning** tab in the Home page displays various cards that offer information on the business continuity plans. You can review the business continuity plans, details of the selected plans, and monitoring and tracking of the plans. The following example shows the cards in the **Business continuity plan** tab.

See the following table for the description of the cards in the **Planning** tab:

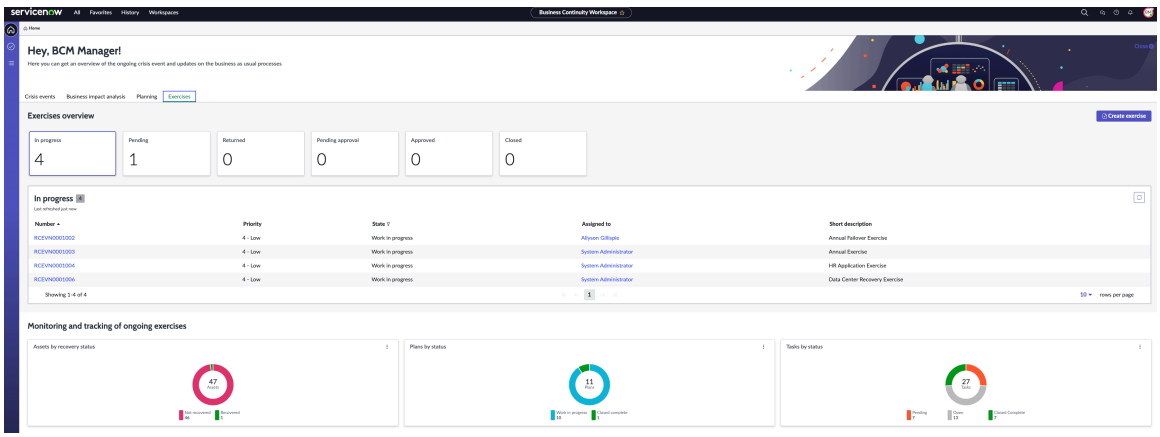
Cards in the Planning tab

Card	Description
Business continuity plan overview	Overview of the business continuity plans in different states. You can view the business continuity plans in the following states: **All** All business continuity plans in the BCM application. **Draft** Business continuity plans that are in the **Draft** state. **In review** Business continuity plans that are in the **In review** state. **Returned**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Planning tab (continued)

Card	Description
	Business continuity plans that are in the **Returned** state. **Pending approval** Business continuity plans that are in the **Pending approval** state. **Approved** Business continuity plans that are in the **Approved** state. **Archived** Business continuity plans that are in the **Closed** state.
Details of the selected business continuity plans card	Details of the business continuity plans for the selected state of the card. For example, if you selected **In progress** in **Business continuity plan overview**, then details of the business continuity plans that are in the **In progress** state are displayed in this panel. You can view the following details on the business impact analyses in a tabular format: **Name** Name of the business continuity plan. **Description** Description of the business continuity plan. **State** State of the business continuity plan. **Updated** Date and time when the business continuity plan gets updated.
Monitoring and tracking	Graphical representation of all the active business continuity plans in a pie chart format: **Plans with exercises** You can select the card to view the plans with exercises. **Plans without exercises** You can select the card to view without exercises. **Plans with events** You can select the card to view the plans with events. **Plans without events**



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Planning tab (continued)

Card	Description
	You can select the card to view the plans without events.
Create BCP action button	Action button to create a business continuity plan from the **Planning** tab. When you select **Create BCP**, it launches the **Create New Plan** form where you can fill in the details of the business continuity plan.

Exercises tab

The **Exercises** tab in the Home page displays various cards that offer information on the exercise events. You can review the exercise events in various states, details of the selected exercise events, and monitoring and tracking of the exercise events. The following example shows the cards in the **Exercises** tab.

See the following table for the description of the cards in the **Exercises** tab:

Cards in the Exercises tab

Card	Description
Exercises overview	Overview of the exercise events in different states. You can view the details of the exercise events in the following states: **In progress** Exercise events that are in the **In progress** state. **Pending** Exercise events that are in the **Pending** state. **Returned** Exercise events that are in the **Returned** state. **Pending approval**

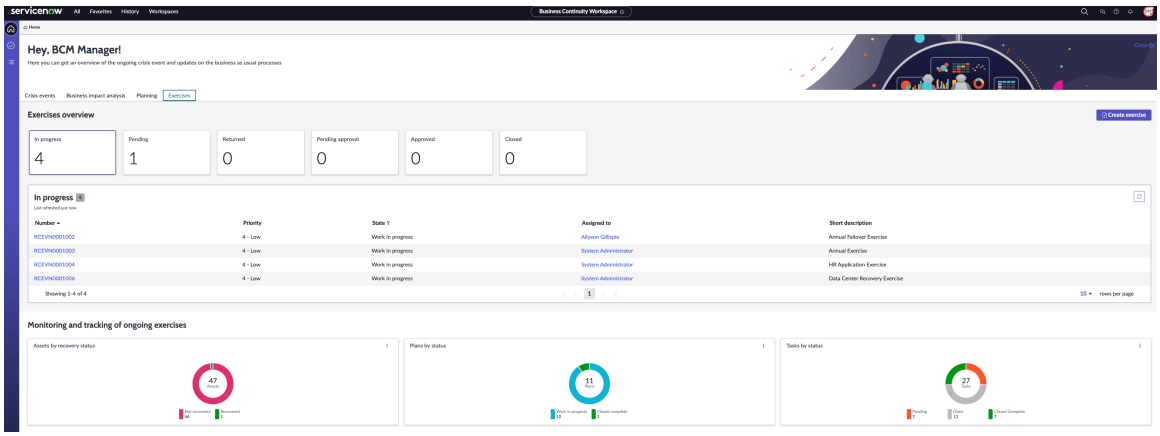
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Exercises tab (continued)

Card	Description
	Exercise events that are in the **Pending approval** state. **Approved** Exercise events that are in the **Approved** state. **Closed** Exercise events that are in the **Closed** state.
Overview of the exercises for the selected state	Details of the exercise events for the selected state of the card. For example, if you selected **In progress** in **Exercises overview**, then details of the exercise events that are in the **In progress** state are displayed in this panel. You can view the following details on the exercise events in a tabular format: **Active** State of the exercise event. The state can be **True** or **False**. You can select the link to open the exercise event record. **Activity due** Activity due on the exercise event. **Participants** Participants of the exercise event. **Approval** Approval information on the exercise event. **Approval history** Approval history of the exercise event. **Assigned to** Name of the assignee responsible for the crisis event. When you select the assignee name in the column, it opens the record form where the following tabs are displayed: • **Details** • **Roles** • **Groups** • **Delegates** **Assignment group**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cards in the Exercises tab (continued)



Card	Description
	Assignment group for the exercise event. **Business duration** Business duration for the exercise event. **Service** Service for the exercise event.
Monitoring and tracking of ongoing exercises	Graphical representation of all active exercises in a pie chart format: **Assets by recovery status** Shows the number of the assets by the recovery status for ongoing events. The following details are displayed on the asset in a pie chart: • Not recovered • Recovered The example in the image shows that out of the total 18 assets, 17 assets are not recovered and one asset is recovered. **Plans by status** Shows the plans by the following status of the ongoing events: • Pending • Work in Progress • Closed Complete **Tasks by status** Shows the tasks by the following status of the ongoing events: • Open • Pending • Closed Incomplete • Closed Complete • Closed Skipped
Create exercise action button	Action button to create an exercise event from the **Exercises** tab. When you select **Create exercise**, it launches the **Create New Event** form where you can fill in the details of the exercise event.

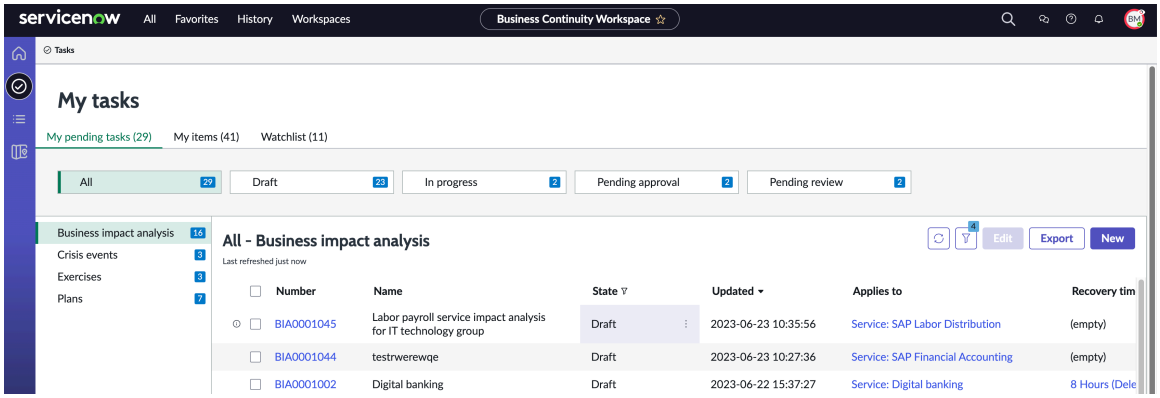
Home page views for BCM Manager and BCM Planner

When you log in to the BCM application, the Home page view is displayed according to your user role, responsibilities, and the assigned tasks.

A typical Home page view for a BCM manager is shown in the following example.

A typical Home page view for a BCM planner is shown in the following example.

For information on the tabs and their associated actions in the Home page, see Home page view.



My tasks page view

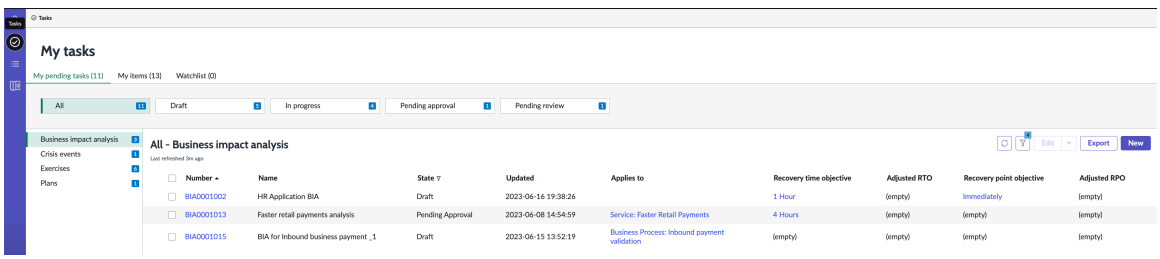
My tasks page displays a single-pane view of your pending tasks, tasks assigned to your user group, and the tasks that are on your watchlist.

Tabs in the Tasks page

The Tasks page displays the assigned tasks for the logged-in user in different tabs as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Tasks page in BCM UIB Workspace displays the following tabs:



- **My pending tasks**: Displays an overview of the pending tasks that are assigned to you and the tasks that require an action from you. You can filter your pending tasks by using the following types of the states:
  - All
  - Draft/New
  - In progress
  - Needs my approval
  - Needs my review
  - Overdue
  - Pending response

  Note:
  The data displayed in the Tasks page is based on the roles of the users.

- **My items**: Displays a list of the tasks that are assigned to the logged-in user.

- **Watchlist**: Displays a list of the tasks for which you are on the watchlist. When a task is approved or completed, you receive a notification on the **Watchlist** tab.

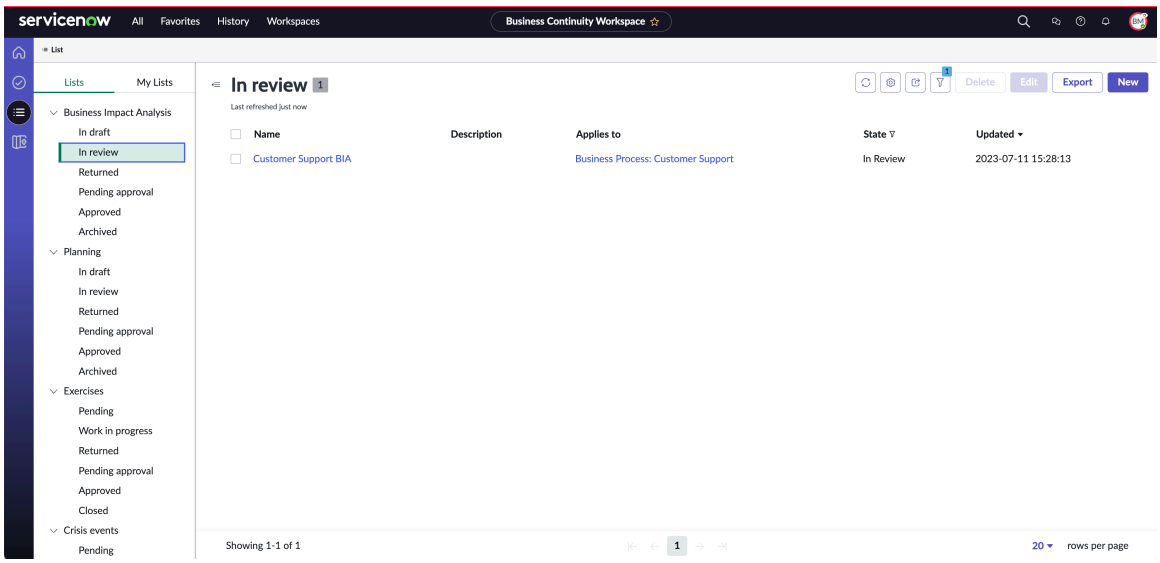
A typical My tasks page for a logged-in user is shown in the following example.

For more information on the My tasks page configurations module in the application, see My tasks page configurations.

Note:
On the **My pending tasks**, **My items**, and **Watchlist** tabs, you can only view the records that are in-progress. The closed and canceled records are not displayed on these tabs. You can view the closed and canceled records in their respective forms in BCM UIB Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have the BCM administrator role, you can customize BCM UIB Workspace by updating the Tasks page configurations module. To update the Tasks page configurations, you can navigate to **All > General administration > My tasks page configuration** in your instance.



If you have the BCM manager or BCM user roles, you can also get relevant recommendations on your business continuity tasks on the Home page.

To view more information on the Tasks Page Configuration, see Update the Tasks Page Configuration record.

List view

The List view in BCM UIB Workspace displays the scope of all BCM functional components and their key metric information.

Use the List view to know the count and status of the business impact analysis, planning, exercise, and crisis event records. A typical List view in BCM UIB Workspace is shown in the following example.

The records from each group are listed according to their current state and the record details are configurable. You can create a record by selecting **New**. You can select the link of a record in the **Name** column and view its details.

Use the List view in BCM UIB Workspace to complete the following business continuity tasks:

- Assess the impact of a possible disruption on your business services, processes, and applications. For more information on performing a business impact analysis, see Business impact analysis.
- Create business continuity plans to mitigate the risk at the time of an event. For more information on managing your business continuity planning tasks, see Business continuity planning.
- Create an event to exercise the plan in a simulated crisis. For more information on exercising an event, see Exercises.
- Apply the plan in an actual crisis. For more information on managing a crisis event, see Crisis events.

For information on managing business continuity tasks in BCM UIB Workspace, see Managing BCM workflow tasks.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitoring 360° relationship data for a record

You can monitor the 360° relationship data for your business impact analysis, planning, exercises, and crisis events records. You can also get an overview of the dependencies for each record.

The configurations for the 360° view are stored in **360° View Configurations** > **Configure 360° Views**. If you have the BCM administrator role, you can configure the relationships for the records in **360° View Configurations** > **Relationship Registries**.

For information on configuring 360° relationship registries and views, see Configure 360° relationship registries and views.

For information on how to view 360° relationships of a business impact analysis, see Visualize 360° relationships for BIAs.

For information on how to view 360° relationships of a business continuity plan, see Visualize 360° relationships for the BCP.

For information on how to view 360° relationships of an exercise or crisis event, see View 360° relationships for exercises and crises.

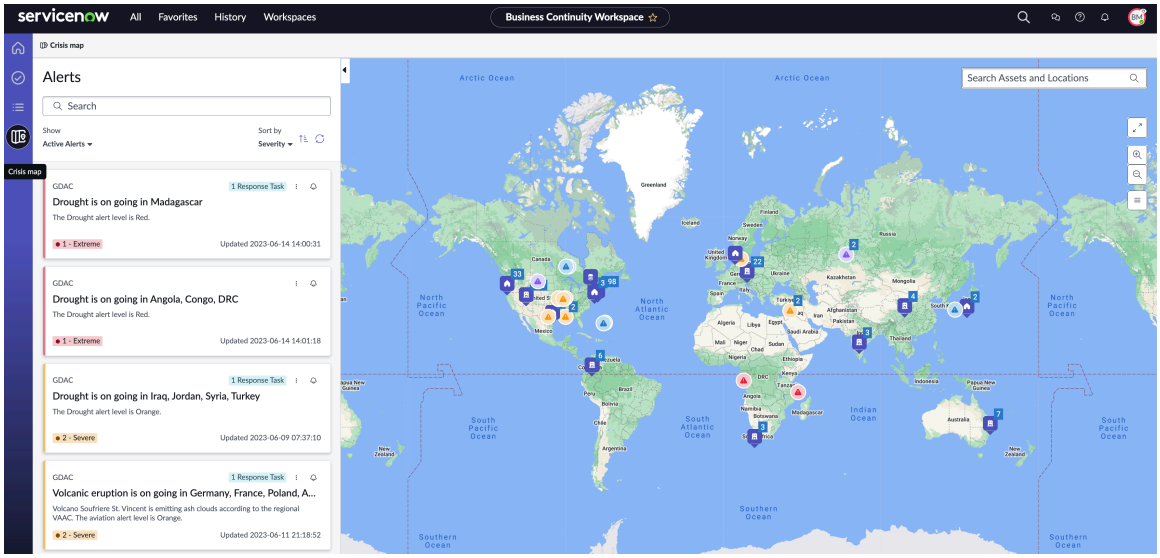
Crisis map view

When you install the GRC: Crisis map application in your instance, you can view the Crisis map icon in the List view. You can integrate the Crisis map application with BCM and analyze real-time threat alerts from different locations in a map view. You can then take remedial actions and manage the crisis events from Business Continuity Workspace.

Panels displayed in Crisis map

The Crisis map application consists of the following panels:

- Alerts panel
- Map view with the locations of the alerts



Note:

To enable the search functionality in Crisis map, you must set the *sn_bcm_map.use_google_places_lib* system property. For more information on setting the property, see Properties installed with BCM.

To enable Crisis map functionality in the GRC: Crisis map application, you must set up Google maps. For more information, see Set up Google Maps API.

A typical view of the Crisis map application is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

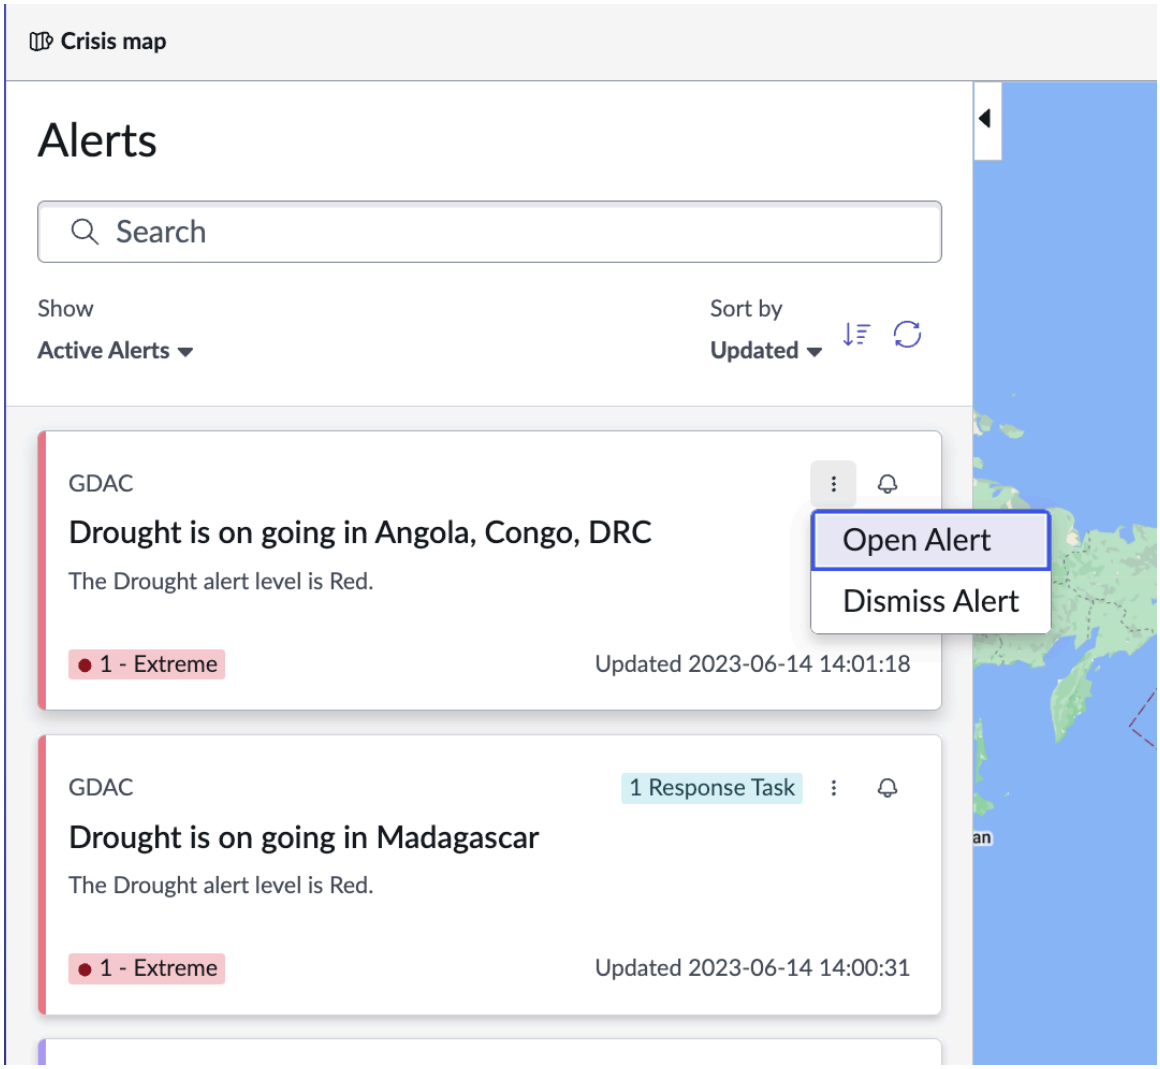
For more information on the feeds, alerts, and events in Crisis map, see Crisis map interface.

Tasks for a BCM administrator

If you are the BCM administrator, you must perform the following setup tasks for Crisis map:

- Enable threat feed integrations that are provided by the base system.
- Configure additional threat feeds into the Crisis Management application. The configurations alert the crisis managers about the threats and aids them to take an appropriate action on time.

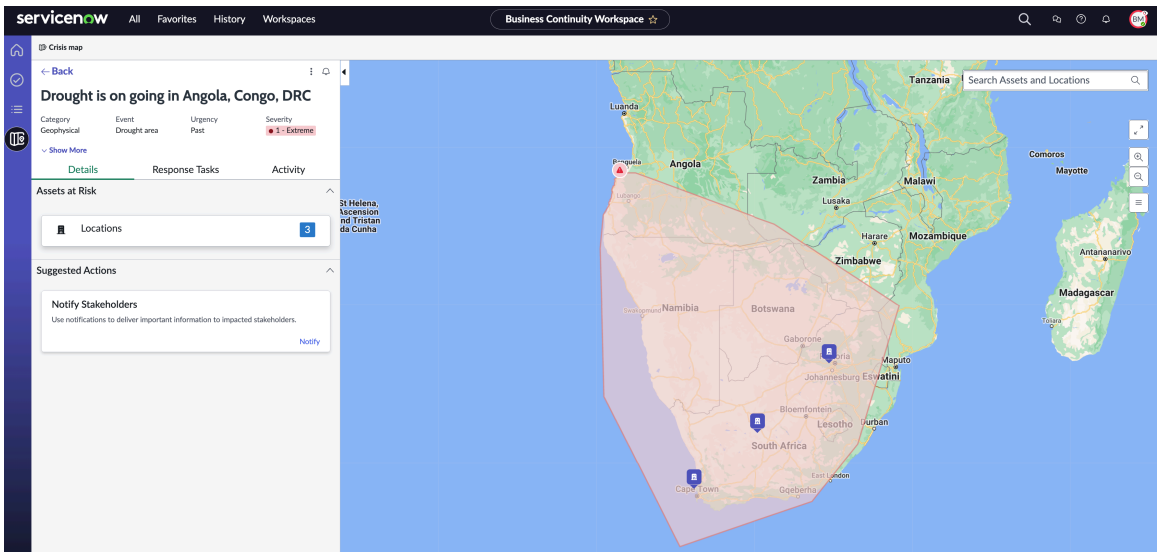
For more information on the setup tasks for Crisis map, see Setup for Crisis map in the configuration section.



Alerts panel in Crisis map

The **Alerts** panel in Crisis map displays the following details:

- **Search field**: You can search for an alert by using specific keywords.
- **Show**: You can select this option to display the following types of alerts:
  - **Active Alerts**
  - **Dismissed Alerts**
- **Sort by**: You can select this option to sort the alerts. Select one of the following options:
  - **Severity**: Select this option to sort and display the alerts based on their severity such as **Extreme** or **Severe**.
  - **Created**: Select this option to sort and display the alerts based on their creation date.
  - **Updated**: Select this option to sort and display the alerts based on the date that they were updated on.
  - **Change sort order**: Select this option to display the alerts in an ascending or descending order.
  - **Refresh**: Select this option to refresh the alerts display.



You can open or dismiss an alert in the alerts panel. You can also subscribe to an alert by selecting the bell icon as shown in the following example.

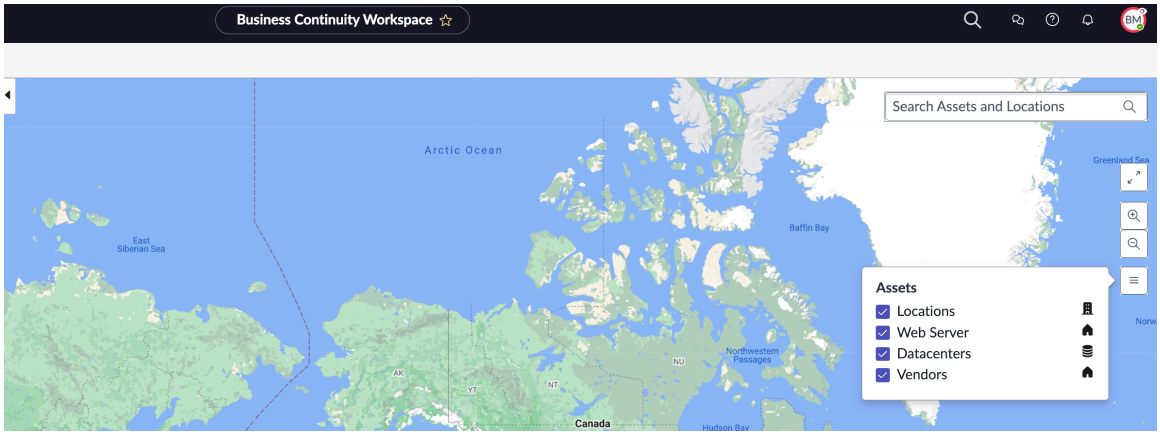
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alerts panel

When you select an alert in the **Alerts** panel, it launches a zoomed-in view with the alert details such as category, event, and so on as shown in the following example.

You can view the following details of a single alert in the Alerts panel:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Information in the Alerts panel

Field	Description
Title of the alert	Title of the alert such as Drought is ongoing in Angola, Congo, DRC.
Category	Category of the alert such as Geophysical.
Event	Event of the alert such as Drought area.
Urgency	Urgency of the alert such as Past.
Severity	Severity of the alert such as Extreme.
Certainty	Certainty of the alert such as Unknown.
Source	Source of the alert such as GDAC.
Latitude	Latitude of the alert such as -14.0701845.
Longitude	Longitude of the alert such as 13.0958574.
Web URL	Web URL of the alert such as Web https://www.gdacs.org/report.aspx?eventtype=DR&eventid=1014416.
Description	Description of the alert such as The Drought alert level is Red.
Details tab	
Assets at risk	Number of assets that are at risk as per locations. You can select the locations to view details such as Name, Contact, Phone, City, Latitude, Longitude, Updated, and so on. The Map view in the right panel shows the zoomed-in location and highlighted area of the alert.
Response tasks	Response tasks that are associated with the alert.
Activity	Activity related to the alert. It displays the Activity panel and the Compose section where you can add your notes.
Suggested actions	Suggested actions for the alert. For example, Notify Stakeholders: Use notifications to deliver important information to impacted stakeholders.
Back	Option to navigate to the Alerts panel view.

Map view in Crisis map

After you have set up Google maps, you can view the locations of the alerts in the Map view as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the following details in the Map view.

Details in the Map view

Icons	Description
Search Assets and Locations search bar	Search bar in the Map view. You can enter a location or a datacenter that is impacted by an alert. When you search for a location, a mixed list of your company results with the display value of the records along with their icons, and the Google map pin icons is displayed.
zoom-in and zoom-out	Zoom control buttons to change the zoom level of the map and view specific areas.
Layers icon	Layers icon to select and display the assets such as asset locations, datacenters, or core companies on the map. The layers on the map are displayed as pins on a Google map and they are configurable. All the layer details such as the asset locations, assets, datacenters, and core companies are displayed on the map by their configured icons. Use the Layers icon to view only the selected or all assets that can be toggled on and off on the map. As a crisis manager, when viewing the active alerts you can make an informed decision by concentrating on a single asset that can be critical at that moment from the rest. The following assets are displayed: • Locations • Web Server • Datacenters • Vendors
Reset icon	Reset icon to clear the map of all the search results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business impact analysis

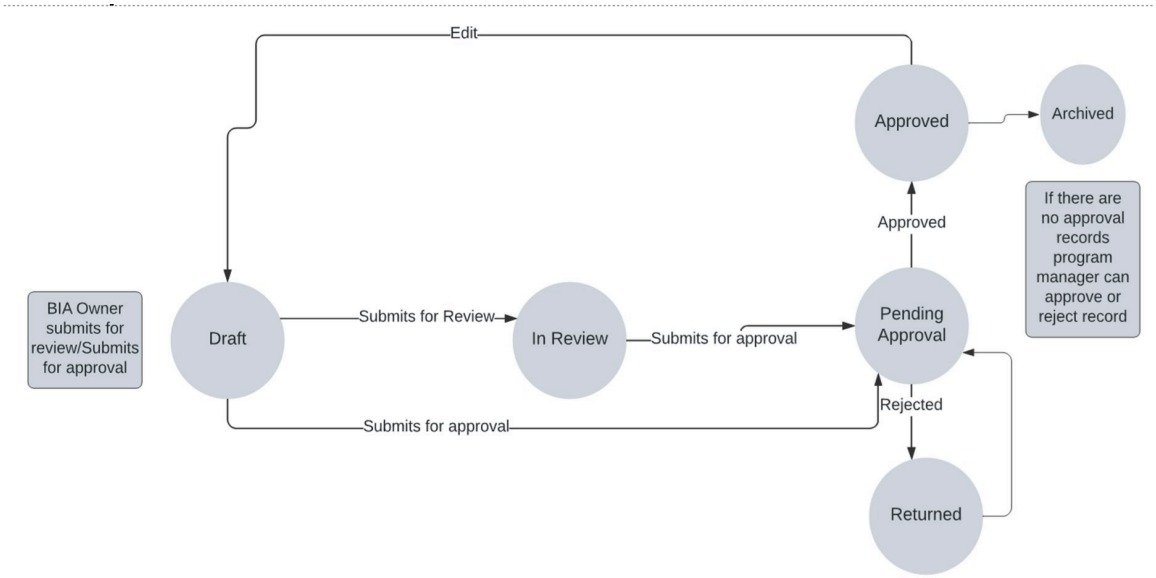
Business impact analysis is a structured process where you assess the impact categories and dependencies and predict the consequences of a disruption on a business process or business function.

An integral component of your business continuity plan

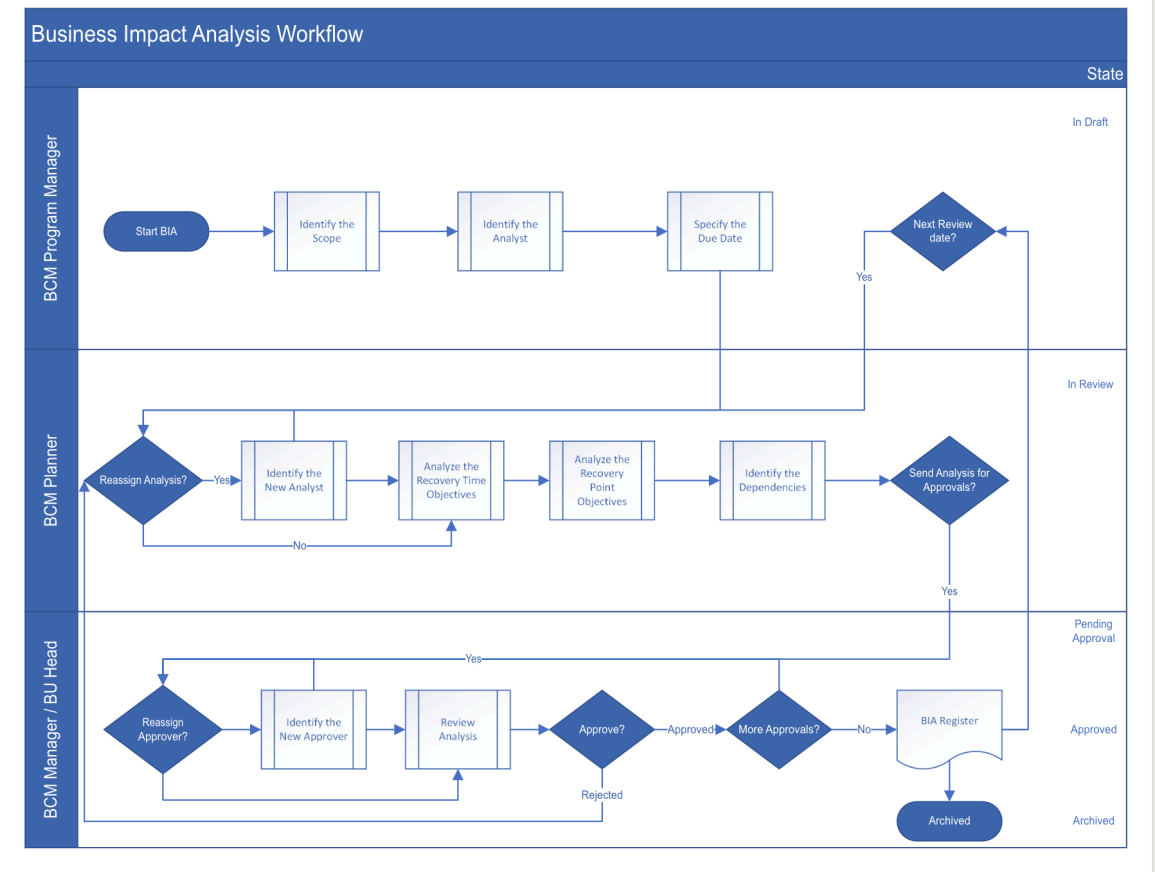
A business impact analysis is an integral component of the business continuity plan for an organization. It includes information on the important information systems and a planning component that includes the strategies for minimizing your risks.

Business managers have to make challenging decisions that can contribute to overall business growth. Sometimes, an unforeseen event or a disruption can cause disruptive effects. Performing a business impact analysis helps your business to mitigate these concerns. By evaluating the potential impact of an event or a decision, your business can predict future consequences and recover from setbacks successfully.

For information on the use cases for business impact analysis, see Use cases for business impact analysis.



Steps involved in creating a business impact analysis



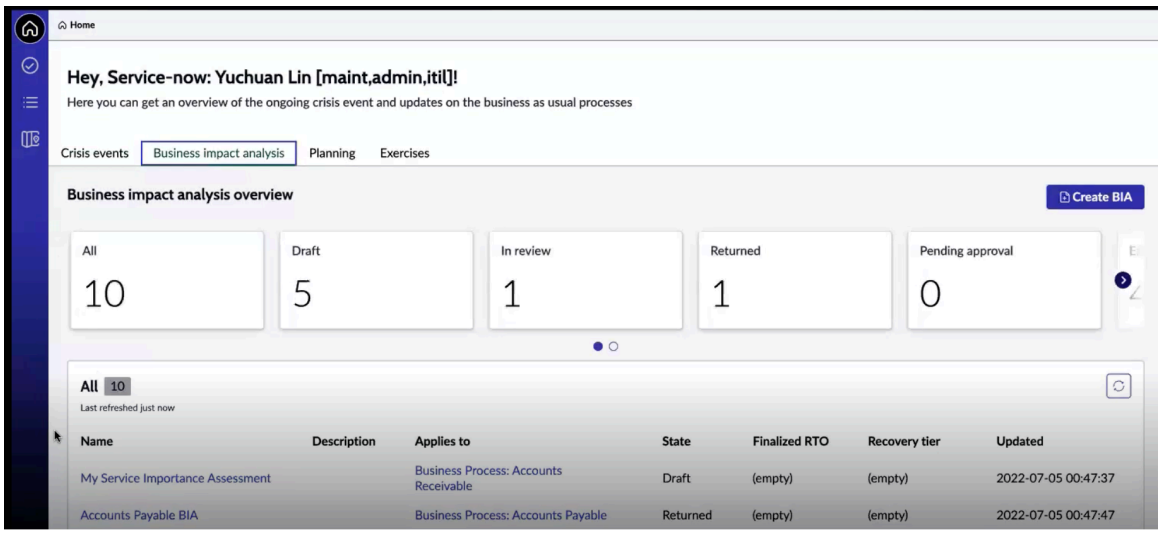
Typically, the following steps involved in creating a business impact analysis:

- The business impact analysis owner creates a business impact analysis either from the Home page or the business impact analysis record page in the List view of the BCM UIB Workspace.
- The BIA owner adds additional details for the business impact analysis on the **Details** tab.
- Different users of the BCM application respond to the assessment questionnaire for the business impact analysis on the **Assessment** tab.
- Based on the responses received, the BCM application calculates the recovery time objective (RTO), recovery point objective (RPO), and dependencies for the business impact analysis.
- The business impact analysis owner reviews the information and submits the analysis for a review and approval to the business manager for services or IT manager for applications respectively.
- The business manager, IT manager, or BCM lead review the details of the business impact analysis and approve or reject it.
- An approved business impact analysis is moved to **Approved** and later, it is moved to the **Archived** state.
- The business impact analysis owner can generate the PDF of the analysis and save a copy for reference.

A typical business impact analysis workflow is shown in the following examples:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

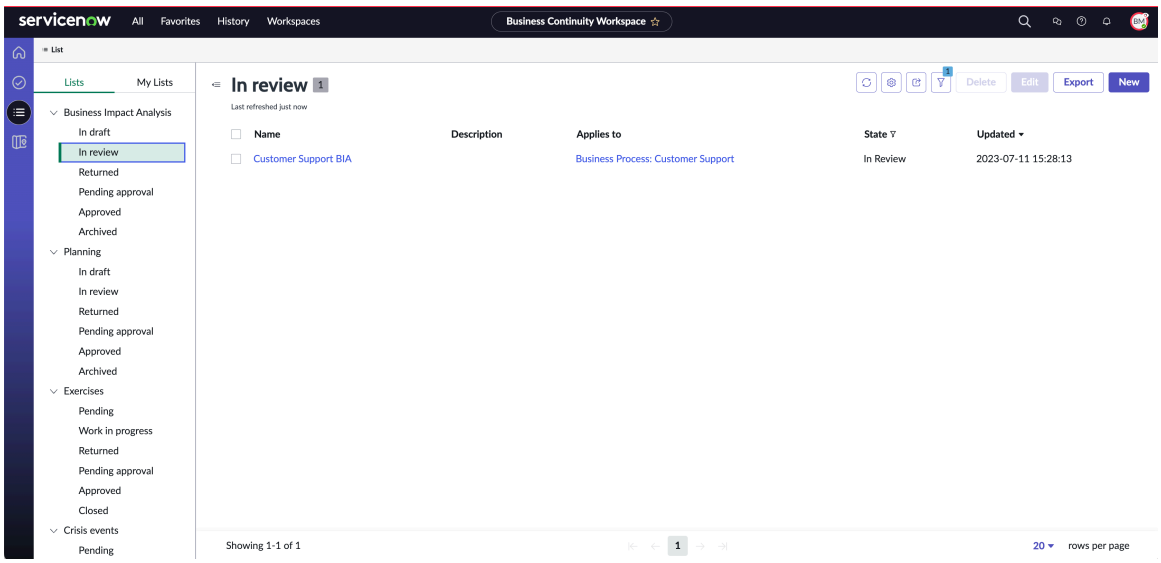
Setup tasks for the business impact analysis administrator



If you are the business impact analysis administrator, you can view Setup for a business impact analysis for information on the setup tasks.

Creating a business impact analysis in Business Continuity Workspace

if you are the business impact analysis owner, you can create a business impact analysis in Business Continuity Workspace by using one of the following options:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can navigate to the **Business impact analysis** tab in the Home page and select **Create BIA** as shown in the following example.

For the description of the cards and action buttons in the **Business impact analysis** tab of the Home page, see Home page view.

- You can also navigate to the List view and select **New** in the Business Impact Analysis records as shown in the following example.

To create a business impact analysis in Business Continuity Workspace, see Create a business impact analysis. For information on managing the tasks that are related to a business impact analysis, see Structured workflows for BIAs.

Use cases for business impact analysis

You can use the Business Continuity Management application to assess the impact of a downtime on your business services or processes and technical entities such as datacenters or applications. For creating a business impact analysis for your organization, you can refer to the common use cases that are used for managing the business continuity tasks.

Note:
Every customer's environment is different. These use case scenarios only show generic implementations for the stated use cases. Your actual implementation may be different.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Importance of performing the impact analysis

Performing the impact analysis is an important step in managing your business continuity tasks. It offers the following benefits:

- Prevents and minimizes unintended disruptions to your normal business functions.
- Helps you identify the critical business processes for your organization and develop strategies to prevent future issues.
- Assists in planning for the protection of your financial and technical assets.
- Offers guidance and support about the areas of improvement in future.

Categories of impact analysis

You can broadly classify the impact analysis in the following categories:

Business impact analysis

If you are a business user who mainly manages the business services or processes, you want to determine the impact of a downtime on your services and processes. Performing a process-related business impact analysis can help your business to achieve the following objectives:

- Prepare for the changes to a process or procedure.
- Identify the issues that are associated with a process.
- Mitigate for the risks that you may face due to an unexpected event.

Technical impact analysis

If you are an application user or the IT manager who mainly manages a datacenter or IT systems, you want to determine the impact of a downtime on your data and applications. Performing a technical impact analysis can help you to analyze the impact of technical changes in the deployed product or application. It gives the information about the areas of the information system that may be affected due to a change in the particular section or features of an application.

Goal and method for creating the business impact analysis

Business impact analysis is typically performed by the business users to analyze a business service or business process. For example, if you are a financial analyst, you can perform the business impact analysis to estimate the impact of the downtime of a business process or service.

Goal

The goals of performing a business impact analysis are to determine the following information:

- Determine the criticality of the process.
- Determine the time that a business can survive without the business service or process.

Method to perform the business impact analysis

As a business user, you want to analyze the business service or process by estimating responses to few of the following assessment questions:

- What are the Impact categories or factors that affect the business service or process?
- What is the impact of the downtime of the business process or service?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- How many customers are affected?
- What is the revenue impact of the downtime for the organization?
- Are there additional penalties that the organization may incur?
- Is there a reputational damage for the organization?
- What is the additional cost to repair the damage such as media coverage of the estimated downtime?
- What supporting systems are required on a normal day so that the business processes run efficiently?

As the BCM lead or manager, when you respond to these assessment questions, it helps you to define the goals of creating a business impact analysis.

Goal and method for creating the technical impact analysis

Technical impact analysis is typically performed by the IT owners to analyze the applications or systems that house the data. For example, if you are an IT owner of a financial organization, you can perform the technical impact analysis to determine the criticality and timelines for the applications and frequency to back up the data.

Goal

The goals of performing a technical impact analysis are to determine the following information:

- Criticality of the application.
- Timeline that the organization can survive for without the application.
- Frequency to back up the data

Method to perform the technical impact analysis

As a business user, you can perform the business impact analysis by estimating the responses to the following sample assessment questions:

- What is the impact on the business if the application is non-functional?
- How many employees are impacted?
- Is the application external facing?
- How many customers are impacted, if the application is external facing?
- What kind of data does the application process?
- How frequently does the data change?

As the business user, when you respond to these assessment questions, it helps you to define the goals of the technical impact analysis.

Using the business impact analysis workflow

If you are a user of the BCM application, you can use the business impact analysis workflow to perform the business impact analysis.

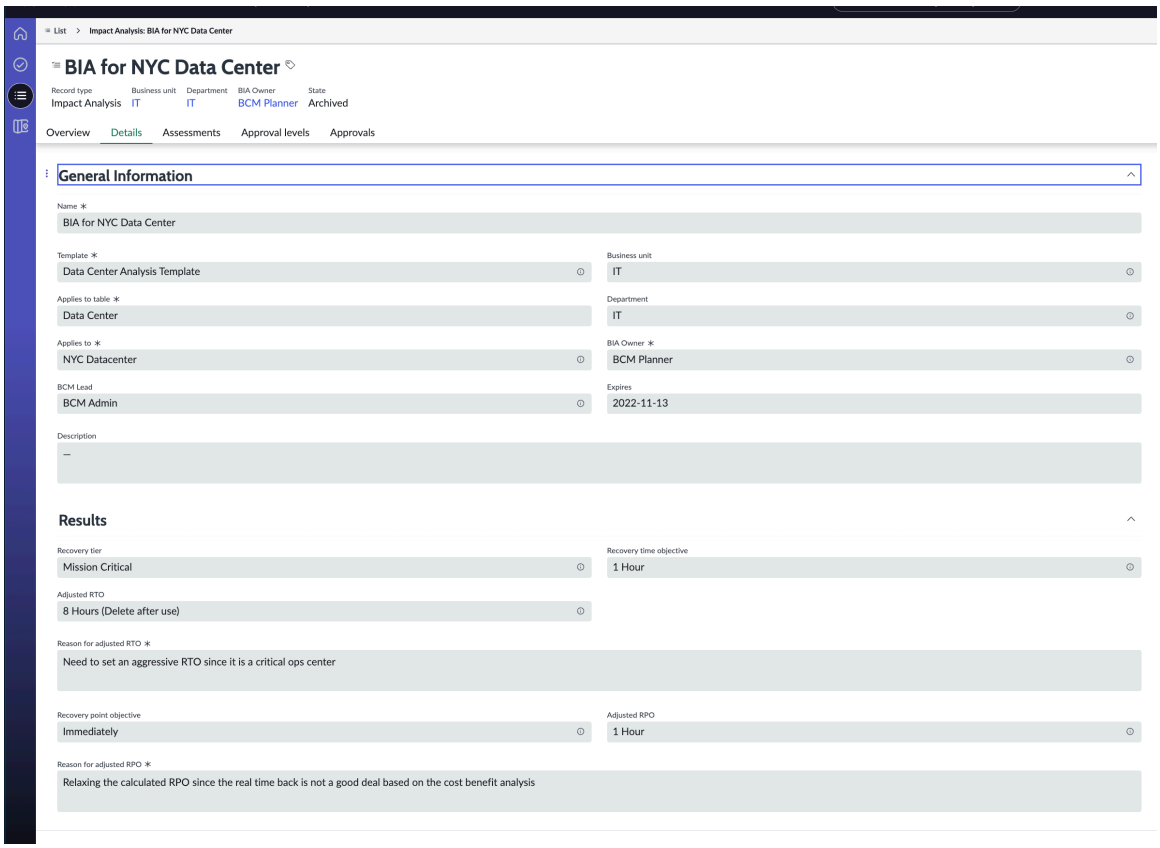
The following sample use cases are considered for creating a business impact analysis with BCM:

- Assess the recovery tier for the business processes or applications that are based on the pre-defined templates.
- Identify the recovery point objective.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Identify the recovery time objective.
- Identify the dependencies such as vendors, applications, facilities, and other foundational elements.

As a pre-requisite to the business impact analysis workflow, the BCM administrator of your organization sets up the BIA template in the BCM application. The template offers a survey-type user experience in the form of an assessment questionnaire.



If you are the BCM administrator, you can set up the questions that are relevant to your organization and scenario in the BIA template. For more information on setting up the BIA template with the BCM administrator role, see Configure BIA templates with legacy assessment.

If you are the BCM lead or BCM program manager, you can respond to the assessment questionnaire on the **Assessments** tab of the business impact analysis record. If you mainly use the business services and processes, your answers serve as key data points for the recovery time objective assessment and dependency assessment. Based on your responses, the criticality of the business process or service and recommended timelines are determined.

If you are the BCM lead or BCM program manager who handles the IT systems, data, and applications, your answers serve as key data points for the recovery point objective assessment. Based on the responses received to the questionnaire, the application calculates the criticality of the business process or service and the recommended timelines.

Outcome of the impact analysis in BCM

After receiving responses to the questionnaire, the BCM application calculates the results of the business impact analysis. The results are displayed in the **Results** section on the **Details** tab in the business impact analysis record as shown in the following example.

The BCM application displays the following key results in the business impact analysis record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recovery tier

The BCM application determines the criticality of the process. It is known as the recovery tier. For example, a recover tier can be non-essential or critical for your business.

Recovery time objective

The BCM application helps you to determine the time that the organization can survive without the business process that is the recovery time objective (RTO).

Adjusted RTO

The business impact analysis owner can adjust the recovery time objective value for practical reasons. The adjusted value is displayed in the **Adjusted RTO** field in the **Results** section. If you are the business impact analysis owner and you have adjusted the RTO value with a reason during the assessment, the reason for the adjustment is displayed in the **Reason for adjusted RTO** field.

Dependencies

The BCM application helps you to determine the supporting systems or dependencies that are required on a normal day so that the business processes run efficiently. For example, you can have the following dependencies for your business:

- People
- Facility
- Application
- Vendors

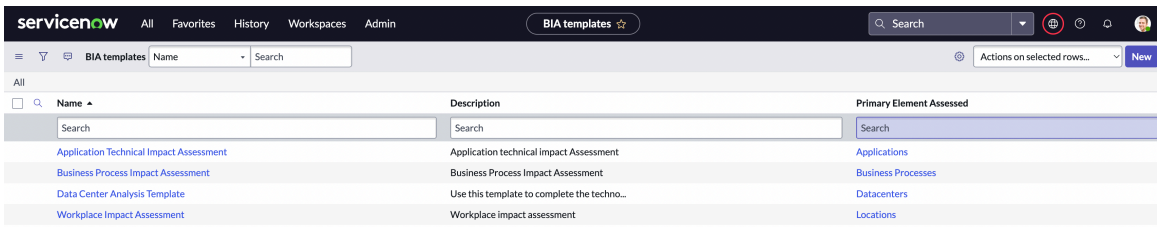
For more information on the recovery time objective, recovery point objective, and recovery tiers, see RTO, RPO, and recovery tiers.

Business impact analysis (BIA) templates

The Business Continuity Management application provides pre-configured business impact analysis (BIA) templates for creating a business impact analysis. If you are the BCM or BIA administrator, you can use the **BIA Templates** module in the Business Continuity Management application. You can then select the type of the template, elements, impact categories, and so on, for the business impact analysis.

Advantages of using a BIA template

The BIA templates store information such as the impact categories and dependency groups that a business process depends on. Using a BIA template offers the following advantages:



- Simplifies the process of creating a business impact analysis.
- Saves time and resources by pre-populating the templates.
- Helps you to define the primary object type that you can use the BIA template for. For example, you can use the Application technical impact analysis template to perform a technical impact analysis of an IT application.
- Populates the dependency groups automatically in the BIA.
- Helps you to select the impact categories that are relevant to your organization.

BIA templates in BCM

If you have the sn_bcm.admin role, you can view the BIA templates that are installed with demo data when you install the application or configure a BIA template in the **BIA Templates** module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows the BIA templates that are installed with demo data in the Business Continuity Management application.

BIA template configuration

With the sn_bcm.admin role, you can configure the following details in the BIA template:

Name and Description

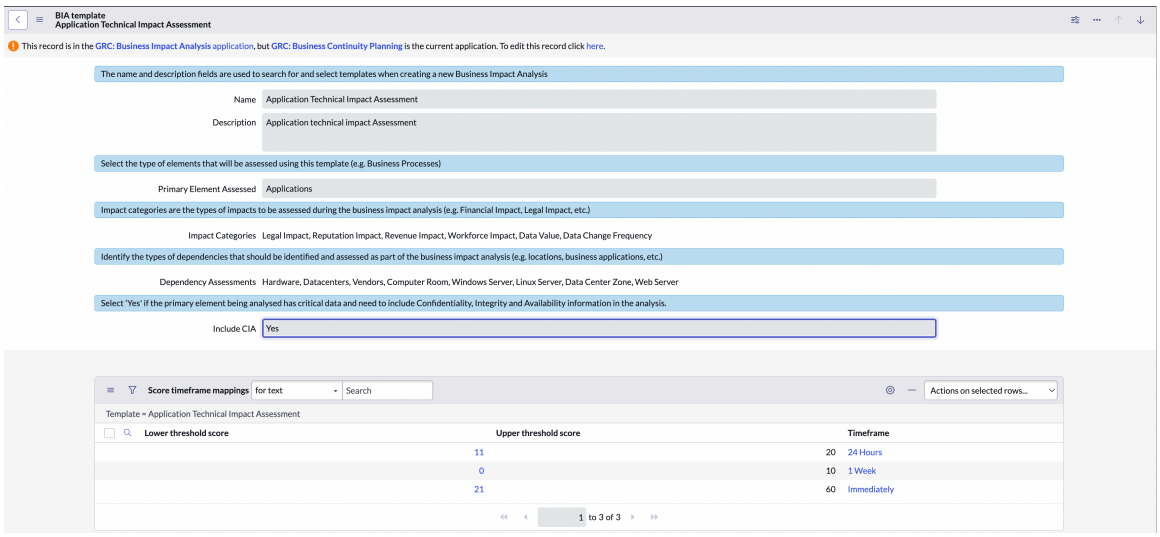
Use the **Name** and **Description** fields to search for the name and select an appropriate template for your business impact analysis.

Primary Element Assessed

Select the type of the elements that you plan to assess such as Business processes or CI service.

Impact Categories

Assess specific impact categories during the business impact analysis. For example, you plan to assess the financial impact and legal impact of a downtime.



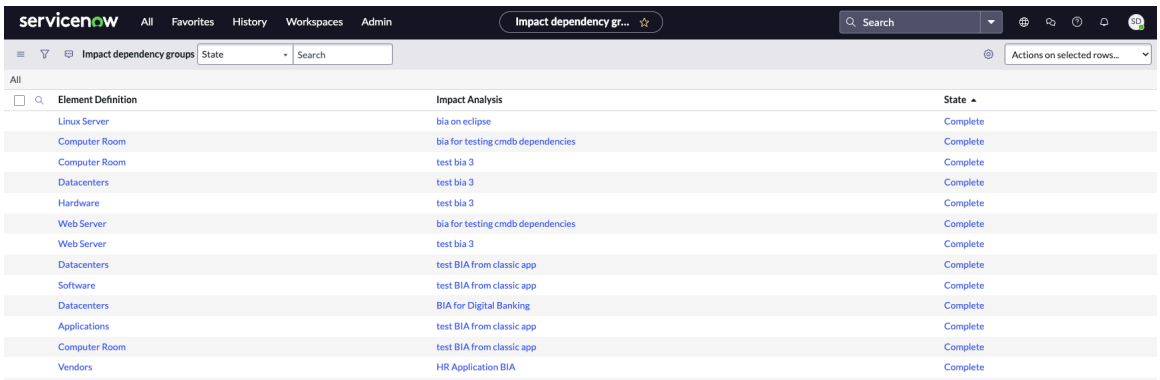
Dependency Assessments

Identify the dependencies for your business impact analysis.

Include CIA

Include CIA (Confidentiality, Integrity, Availability) information in your business impact analysis if the primary element being analyzed has critical data.

The following example shows the sample configuration of a BIA template in an instance.



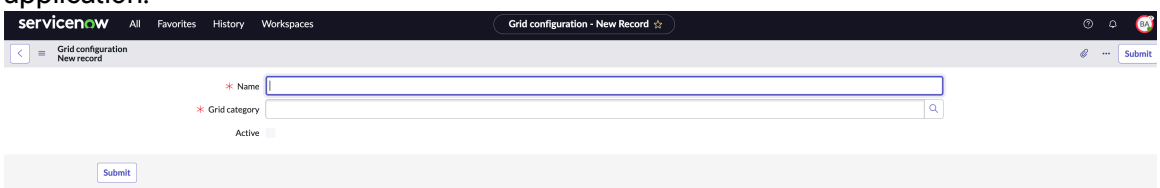
Configuring a BIA template

For more information on how to configure a BIA template with the sn_bcm.admin role, see Configure BIA templates with legacy assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact dependency groups

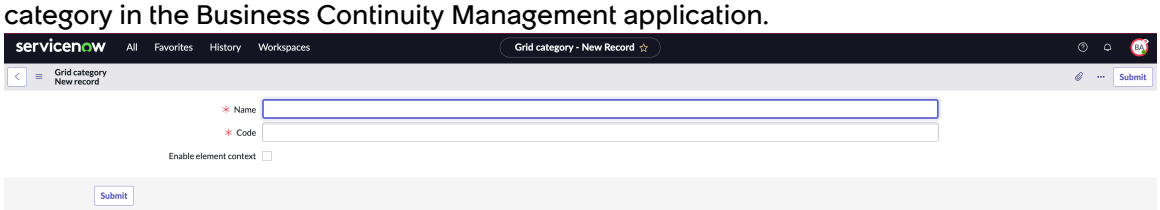
The BIA template used for creating a business impact analysis has dependency groups associated to it. When conducting an assessment, the dependency groups are automatically populated in the BIA. You can view them as Applications, Hardware, Software, Vendors, Workplaces, and others, each in its own container depending on how many of these groups are associated to the template.



Each of them is a dependency group and you can add or remove items that belong to each group within its container.

Grid configurations and categories

You can set up the grid configuration to render the BIA dependency assessment grid with configured columns. You can define the grid category such as Dependency Assessment for which the grid configuration is applicable.



The following example shows the grid configuration in the Business Continuity Management application.

Note:
Grid configuration is used in BCM classic Workspace only.

For more information on how to configure the grid in the Business Continuity Management application, see Set up grid configuration for BIA dependency assessment.

The following example shows the configuration of a grid category in the Business Continuity Management application.

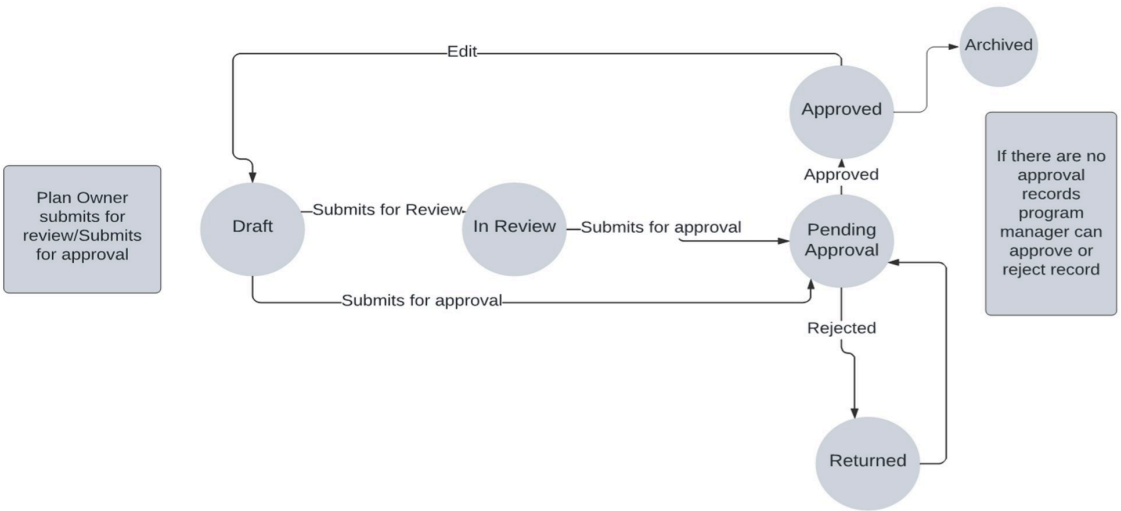
Note:
Grid categories are used in BCM classic Workspace only.

Business continuity planning

Business continuity planning helps you enact and mitigate risk at the time of an event. You can address and plan on the primary scope of the activities, documentation, loss scenarios, recovery

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

teams, approvals, and so on. You can then configure a structured workflow of your business continuity planning tasks in BCM UIB Workspace.



When you create a comprehensive business continuity plan for different possible disruptive scenarios, your organization is equipped to face a crisis or any adverse situation.

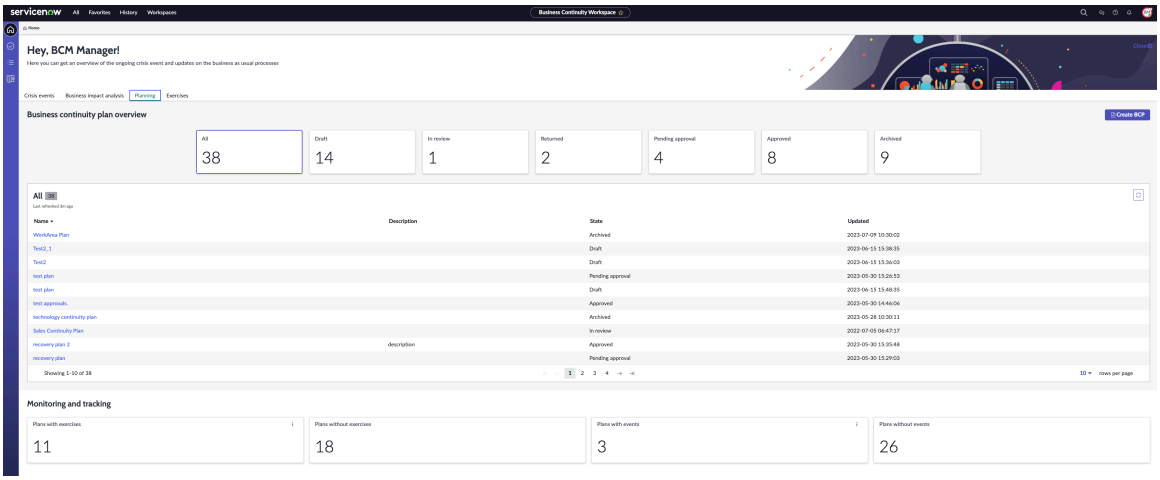
Steps involved in creating a business continuity plan

Typically, the following steps involved in creating a business continuity plan:

- The BCM program manager or planner creates a business continuity plan either from the Home page or the Planning record page in the List view of the BCM UIB Workspace.
- The BCM program manager or planner adds additional details for the business continuity plan such as its scope, documentation section, recovery teams, related plans, and so on.
- The business impact analysis owner reviews the information and submits the analysis for a review and approval to the business manager for services or IT manager for applications respectively.
- The business manager, IT manager, or BCM lead review the details of the business continuity plan and approve it.
- The approved business continuity plan is moved to **Approved** and later, it is moved to the **Archived** state.
- The business continuity plan owner can generate the PDF of the plan and save a copy for reference.

A typical business continuity plan workflow is shown in the following example:

Setup tasks for business continuity planning



If you are the BCP administrator, you can view Setup for a business continuity plan for information on the BCP setup tasks.

Creating a business continuity plan in Business Continuity Workspace

if you are the business continuity plan owner, you can create a business continuity plan in Business Continuity Workspace by using one of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can navigate to the **Planning** tab in the Home page and select **Create BCP** as shown in the following example.

  For the description of the cards and action buttons in the **Planning** tab of the Home page, see Home page view.

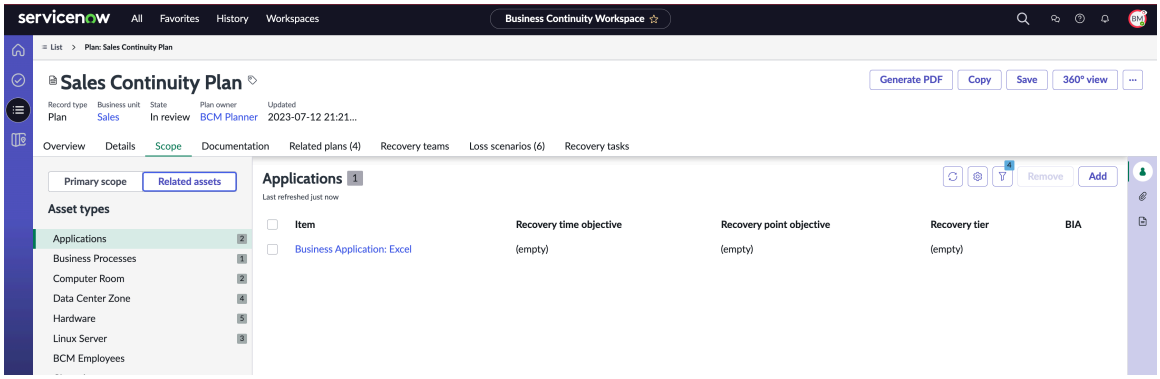
- You can also navigate to the List view and select **New** in the Planning records.

To create a business continuity plan in Business Continuity Workspace, see Create a business continuity plan. For information on managing tasks related to a business continuity plan, see Structured workflows for BCPs.

Assets and plans related to BCP

You can identify the assets and plans related to a business continuity plan. You can then recover the assets in your planning stage. Reuse the configuration item relationship data that flow from CMDB to business impact analysis (BIA) during dependency assessment to identify the assets in your plan.

Related Assets



If you have added a business process or a location as an item in the **Primary scope** panel of the record, and if the scoped item is related to the business impact analysis, then all the related assets of the business impact analysis are listed in the **Related assets** panel in the record.

In other words, the CMDB configuration item added as a dependency in the business impact analysis is pulled into the plan as a related asset. The source of these related assets is displayed as the business impact analysis.

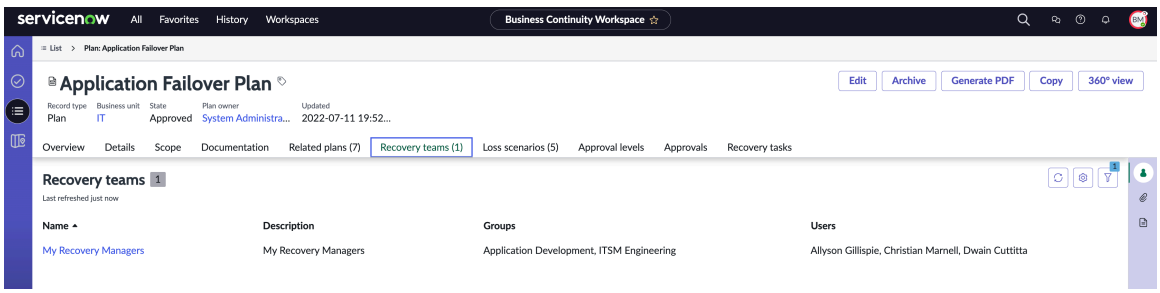
When you create a plan, you also select a primary element that the plan covers. Based on the scope that you selected in the business continuity plan or the primary element of the plan, the application adds the related assets and related plans during the planning phase. These items could be business processes, critical business applications, datacenters, or resources working from a location. All these dependencies if stored in the business impact analysis are copied over to the plan in the **Related assets** panel in addition to other dependencies that are added while creating the business impact analysis.

The following example shows the primary scope and related assets for a business continuity plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related plans

After the assets are copied over to the plan, if there are plans attached to any of the related assets, then these plans are automatically pulled and listed on the **Related Plans** tab. Assets in the plan are the entities that are to be recovered by the plan during the event. When the related plans are pulled into the planning phase, you can also create the recovery tasks. As a planner, you can set a sequence to the execution of the recovery tasks of the main plan and its dependent subplans.



Recovery teams, loss scenarios, and recovery tasks

Business continuity planning workspace guides you to complete your business continuity plan. You can create a recovery team, define roles for the users, and direct the team to execute the plan. When you create a continuity plan for a department or a business unit, it is necessary to identify the loss scenarios to the business continuity plan.

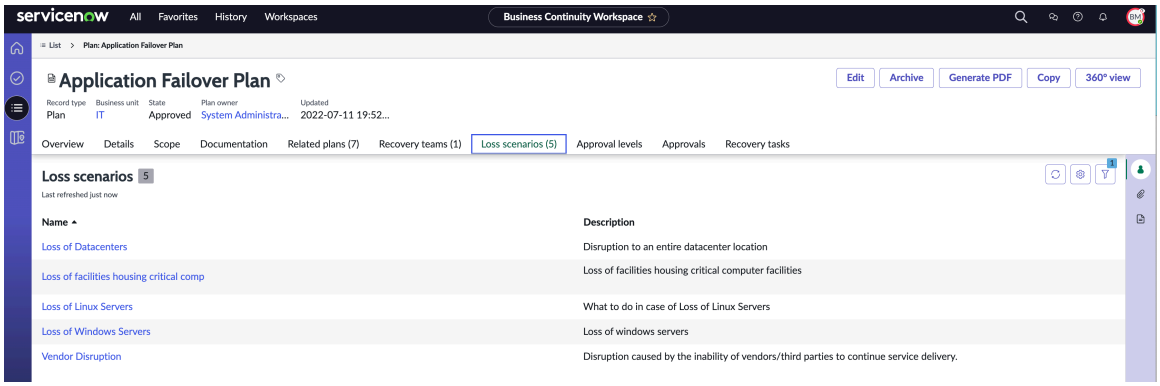
Recovery teams

You can create a recovery team by entering the name and description for a recovery team or update an existing recovery team. You can select one or more users and groups from the respective lists.

The description for the recovery team also indicates the responsibilities of the users and groups who are assigned to the recovery team. You can also create a recovery team and add the user and group assignment later as shown in the following example.

Recovery groups and assignment groups

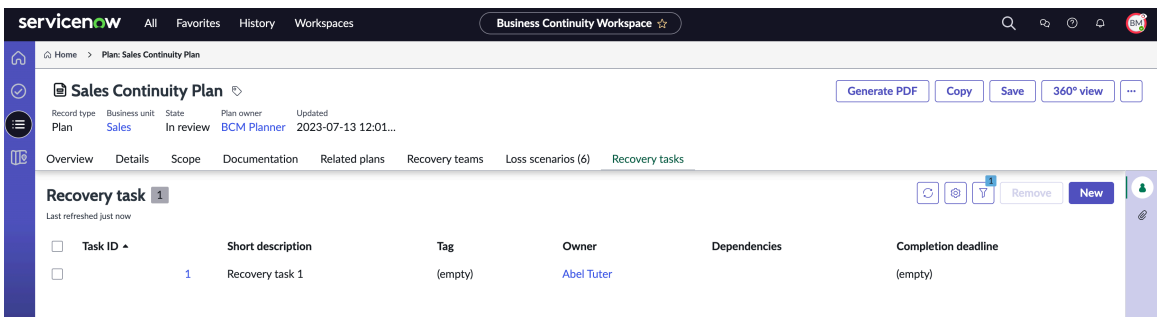
While drafting the plan details, the business continuity plan owners can assign one or more recovery groups and individual users to the recovery teams. While creating recovery tasks, the owner can assign them to one or more assignment groups and to the appropriate recovery teams. Additional assignees can also be added to the recovery task assignments.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Loss scenarios

Identifying a loss scenario helps your business to be prepared for future disruptive events and continue with your business functions as usual.



If you have the BCM administrator role, you create a business continuity plan by using the plan template. The loss scenarios that are identified in the plan template automatically get associated to the plan that you have created.

Your plan has a basic set of loss scenarios attached to it. You can then add additional loss scenarios to the plan as per your requirement in the BCM UIB Workspace as shown in the following example.

Recovery tasks

You can assign the recovery task to a group by identifying an owner to execute the processes and procedures of a recovery. The recovery task contains the details of the item to be recovered and the time by which it should be accomplished as shown in the following example.

Use cases for business continuity planning

This section describes the common use cases that are used for business continuity planning in the Business Continuity Management application. You can deploy these use cases individually or you can combine them to meet your specific needs.

You can build your business continuity plan based on your recovery strategy, partners, teams, tools, and processes that are needed to implement the plan.

Consider the example of a ransomware attack on a financial corporation. The attack may disrupt critical services such as utilities, transportation, payments, and so on. If a business continuity plan is in place, the emergency IT consultants and professionals can take the following preventive actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Shut down the IT services.
- Restore the services from the disaster data recovery component in the plan.
- Control the damage by moving the essential data servers to an off-site location.

Typical use cases for Business Continuity Planning

Typical BCP use cases

Use case name	description	Roles	Actions for the use case
Create a standardized recovery plan	BCP helps you enact and mitigate risk at the time of an event by addressing action items such as plan assets, activities, recovery teams, documentation, policies, and procedures. The plan record will go through a cycle of states before: • Draft -> In review -> Pending approval -> Approved -> Archived • In the **Pending approval** state, plan can be rejected back to **Returned** state.	BCM Planner, BCM Manager, BCM Admin	User creates a plan
Update dependencies in the plan	Update dependencies in the plan: 1. Allows users to view and configure the assets that are affected within the plan 2. Monitor the RTO, RPO, and Recovery Tier of each asset and identify any gaps/ risks when the asset is down 3. View the relationship of the	BCM Planner, BCM Manager, BCM Admin	User selects Update dependencies button. 2. Scheduled job Update BCP dependencies snapshot is executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typical BCP use cases (continued)

Use case name	description	Roles	Actions for the use case
	primary assets and related assets		
Configure the dependencies for plan	Provide configurations for users to configure what dependencies they want for plans including: 1. Configure the sources that they want to pull in from their dependencies including CMDB, BIA downstream, BIA upstream 2. Choose whether they want to pull the last updated record or all records from the source 3. Configure the users, and groups that they want to notify via emails 4. Configure what plan's fields will be updated every time they update the dependencies 5. Configure what type of plans the configurations should be applied to	BCM Admin	User creates or updates records by navigating to All -> Planning dependency update configuration
Create documentations	Provides a section and templates for the user to document the goals, objectives, and scopes that are required within the context of the plan.	BCM Planner, BCM Manager, BCM Admin	User creates a plan using a plan template with document sections defined. 2. User selects Create new section in the Documentation tab.
Create recovery teams	Defines the teams responsible for executing the plans during the recovery	BCM Planner, BCM Manager, BCM Admin	User selects New button in the Recovery teams related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typical BCP use cases (continued)

Use case name	description	Roles	Actions for the use case
	process. It is currently used in recovery tasks		
Monitor the loss scenarios of the plan	Create crisis scenarios that can be included in your plan (for example, Loss of Datacenters or Vendor disruption) and add assets dependencies or recovery strategies to the loss scenarios.	BCM Planner, BCM Manager, BCM Admin	User creates a plan using a plan template with Loss scenarios defined. 2. User selects Add in the Loss scenarios tab.
Submit for Approval	Create approval configurations including groups, users, or rules to standardize the approval process	BCM Planner, BCM Manager, BCM Admin	User selects Submit for approval.
Generate PDF	Summarize the details of the plan (scopes, asset dependencies, related plans, recovery teams, recovery tasks) in a PDF format. 2. Allows users to write scripts and format the PDF through document templates, and document scripts.	BCM Planner, BCM Manager, BCM Admin	User selects the Generate PDF button.
Copy Plan	Copy existing plans including their details and related lists	BCM Planner, BCM Manager, BCM Admin	User selects the Copy button.
Add related plan	Add related plan relationship to plan's related list.	BCM Planner, BCM Manager, BCM Admin	User adds a related plan.
Avoid creating cyclic tasks for the same plan while adding plan dependencies.	Stop processing same plan if its already part of the hierarchy. Avoid creation such plan dependencies during planning phase. Verify that plan dependency in recovery task doesn't create a cycle.	BCM Planner, BCM Manager, BCM Admin	User adds an activated plan to the plan recovery task.
Task execution order	Tasks under a plan can be parallel	BCM Planner, BCM Manager, BCM Admin	User adds recovery tasks

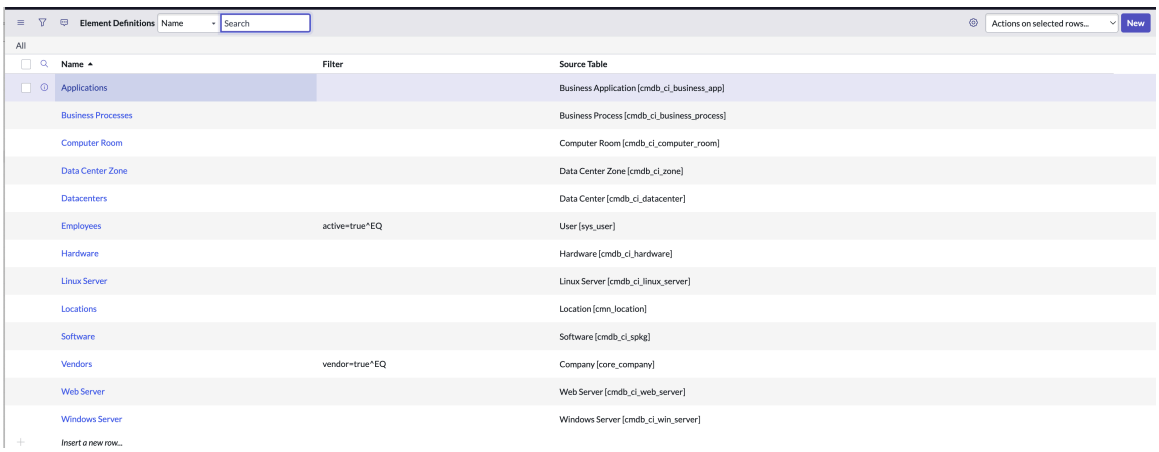
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Typical BCP use cases (continued)

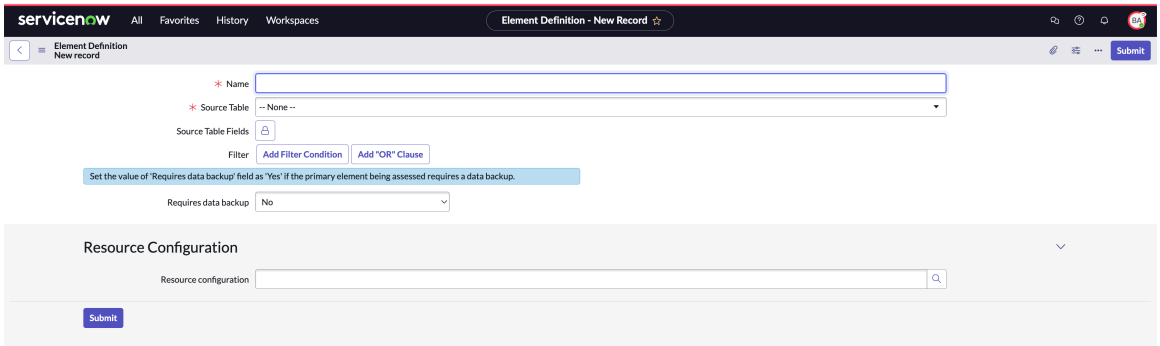
Use case name	description	Roles	Actions for the use case
	and sequential based on the task dependencies. Therefore, the tasks in a plan should be ordered.		



Element definitions and variables

An element definition is a configuration item that is assessed in the business impact analysis. The element definitions are also recovered in the business continuity plan. If you have the administrator role, you can set up an element variable that is required for a particular dependency of an element.

The BCM administrator can configure the element definitions in the Business Continuity Management application. Typically, the following element definitions are defined in the Business Continuity Management application:

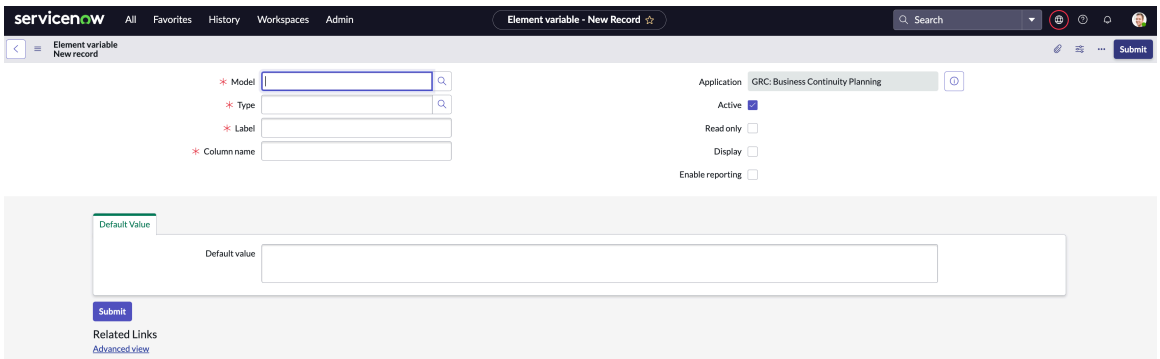


- Applications
- Business Processes
- Computer Room
- Datacenter Zone
- Datacenters
- Employees
- Linux Server
- Locations
- Software
- Vendors
- Web Server
- Windows Server

The following example shows the element definitions in an instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows the configuration of an element definition by the Business Continuity Management administrator.



Configuration of an element definition

For more information on configuring an element definition with the BCM administrator role, see Configure element definition.

Note:
Starting with the Xanadu release, the element definition filter for the Hardware element definition has been updated. You can now add a Windows server asset in the Windows server element definition or a Linux server asset in the Linux server element definition. However, you cannot add the Windows server asset or the Linux server asset in the filter of the Hardware element definition.

Configuration of an element variable

As a functional system administrator, you can set up an element variable that is required for a particular dependency of an element. The following example shows an administrator's view of the element variable record.

For more information on how to configure an element variable in the Business Continuity Management application with an administrator role, see Configure element variables for element definitions.

Exercises

Exercises are used to provide continuous testing and improving of continuity plans. You can use the exercises to finalize your business continuity plan and improve its effectiveness and usability in an actual crisis event. You can manage your exercises in BCM UIB Workspace.

Steps involved in creating an exercise

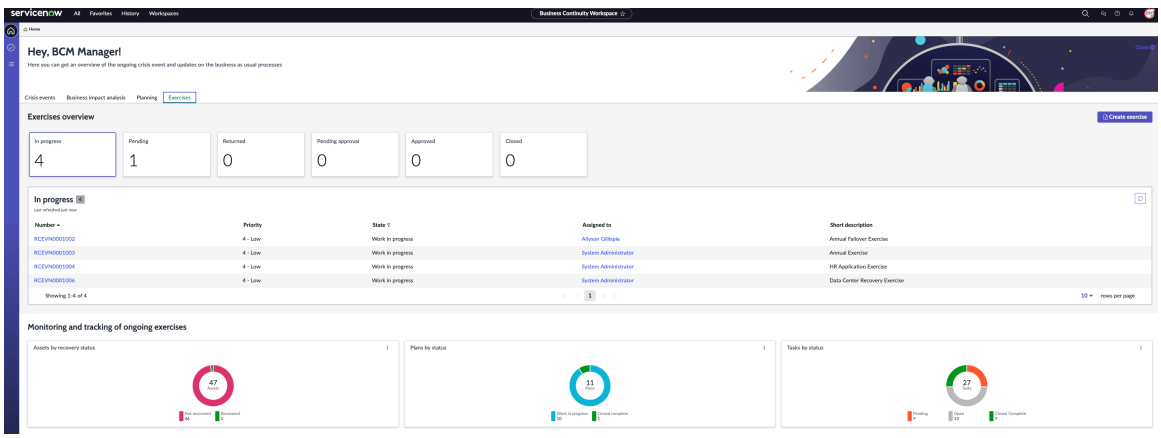
Typically, the following steps are involved in creating an exercise:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The BCM program manager creates an exercise either from the Home page or the Exercises record page in the List view of the BCM UIB Workspace.
- The BCM program manager adds additional details for the exercise such as an asset, plan, and event task.
- The BCM program manager submits the event task related to the exercise for an approval.
- The assigned BCM program manager reviews the details on the event task and approves the exercise.
- The exercise is moved to the **Approved** state. An approved exercise is moved to the **Archived** state later.
- The BCM program manager can generate the PDF of the details and save a copy for reference.

Types of exercises

The BCM application creates the following types of exercises:



- Functional
- Simulation
- Tabletop
- Walkthrough

Technically, all exercises are treated the same way. However, only Functional exercises automatically generate tasks, while Simulation, Tabletop, and Walkthrough exercises do not have any technical differences in their implementation.

Creating an exercise in Business Continuity Workspace

If you are the BCM program manager, you can create an exercise in Business Continuity Workspace by using one of the following options:

- You can navigate to the **Exercises** tab in the Home page and select **Create exercise** as shown in the following example.

  For the description of the cards and action buttons in the **Exercises** tab of the Home page, see Home page view.

- You can also navigate to the List view and select **New** in the Exercises records.

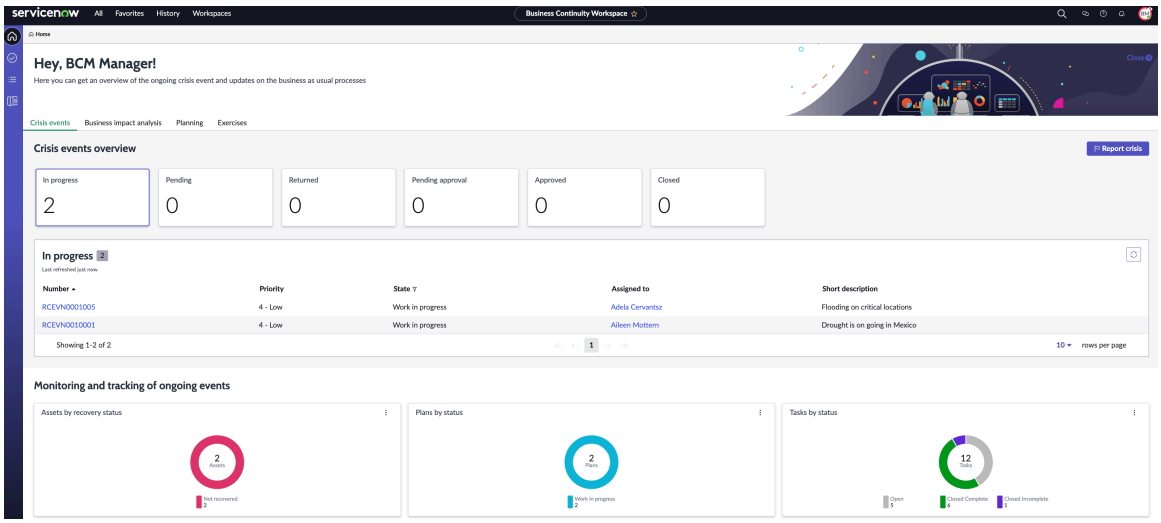
To create an exercise in Business Continuity Workspace, see Structured workflows for exercises.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Crisis events

Managing a crisis event in BCM UIB Workspace helps you to minimize the downtime of critical business functions and processes across your organization. It is also used to minimize the financial, reputation, legal, and regulatory impact during a crisis event.

Steps involved in creating a crisis event



Typically, the following steps are involved in creating a crisis event:

- The BCM program manager creates a crisis event either from the Home page or the Crisis events record page in the List view of the BCM UIB Workspace.
- The BCM program manager adds additional details for the crisis event such as an asset, plan, and event task.
- The BCM program manager submits the event task related to the exercise event for an approval.
- The assigned BCM program manager reviews the details on the event task and approves the event.
- The crisis event is moved to the **Approved** state. An approved crisis event is moved to the **Archived** state later.
- The BCM program manager can generate the PDF of the details and save a copy for reference.

Creating a crisis event in Business Continuity Workspace

if you are the BCM program manager, you can create a crisis event in Business Continuity Workspace by using one of the following options:

- You can navigate to the **Crisis events** tab in the Home page and select **Report crisis** as shown in the following example.

  For the description of the cards and action buttons in the **Crisis events** tab of the Home page, see Home page view.

- You can also navigate to the List view and select **New** in the Crisis events records.

To create a crisis event in Business Continuity Workspace, see Structured workflows for crisis events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Crisis map interface

You can integrate Crisis map with the BCM application and initiate the response workflows for crisis management. After installing the Crisis map application, you can view the **Threat and Alert Data Feeds** module in your BCM application instance.

Feeds, alerts, and events in BCM

When you integrate the Crisis map application with the BCM application, you can view and analyze the feeds, alerts, and events from different locations in the Crisis map view.

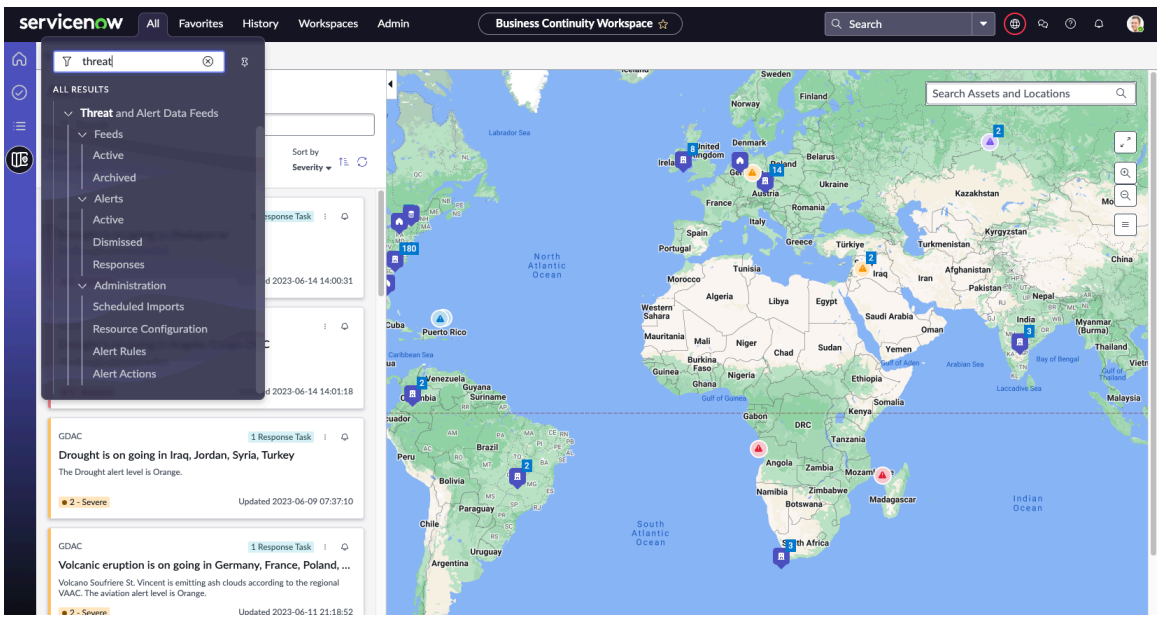
Feed

A feed is news content updated frequently and provided on a worldwide website. You can subscribe to a news feed by manually entering the URL of the feed channel in the **Web** field of the Feed form.

Alert

An alert is a notification that reports an incident happened at a particular place and time. First, an incident, or an event reportedly happens. Then, the alert triggers a notification that reports or notifies the incident to the concerned people to take an action.

Event



Based on the severity of the alerts, you can take actions such as notifying the stakeholders of the incident or declaring a crisis event. An event can become a crisis event if it disrupts the business operations. For information on the crisis events, see Crisis map view. You can then activate the business continuity plans for the locations that are impacted by the event.

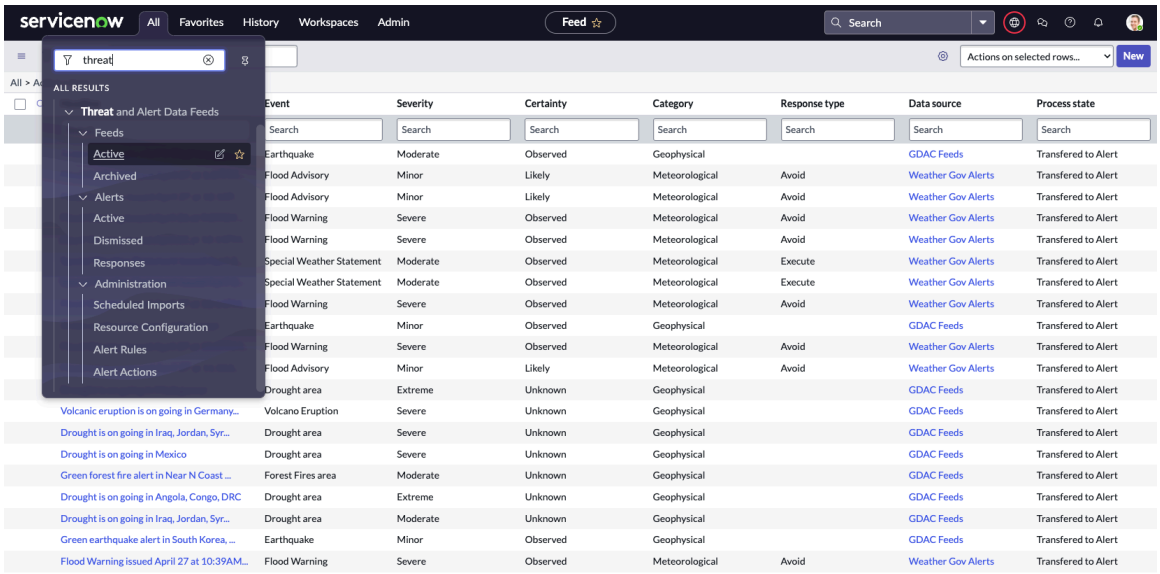
Threat and Alert Data Feeds module in BCM

The **Threat and Alert Data Feeds** module in BCM displays the following information:

- **Feeds**
- **Alerts**
- **Administration**

The **Threat and Alert Data Feeds** module is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Feeds module in BCM

A threat feed is the data intelligence information of a potential or current threat that can pose a danger to an organization. It can disrupt the business routine or disable its business processes. The Crisis map application receives the feeds from third-party sources such as GDAC Feeds and Weather Gov Alerts.

The **Feeds** module in BCM displays the following types of feeds:

- **Active feeds**
- **Archived feeds**

A sample view of the active feeds is displayed in the following example.

You can use the **Personalize List** icon to configure the list columns in the **Feeds** module. For example, you can display the following additional details on the alert:

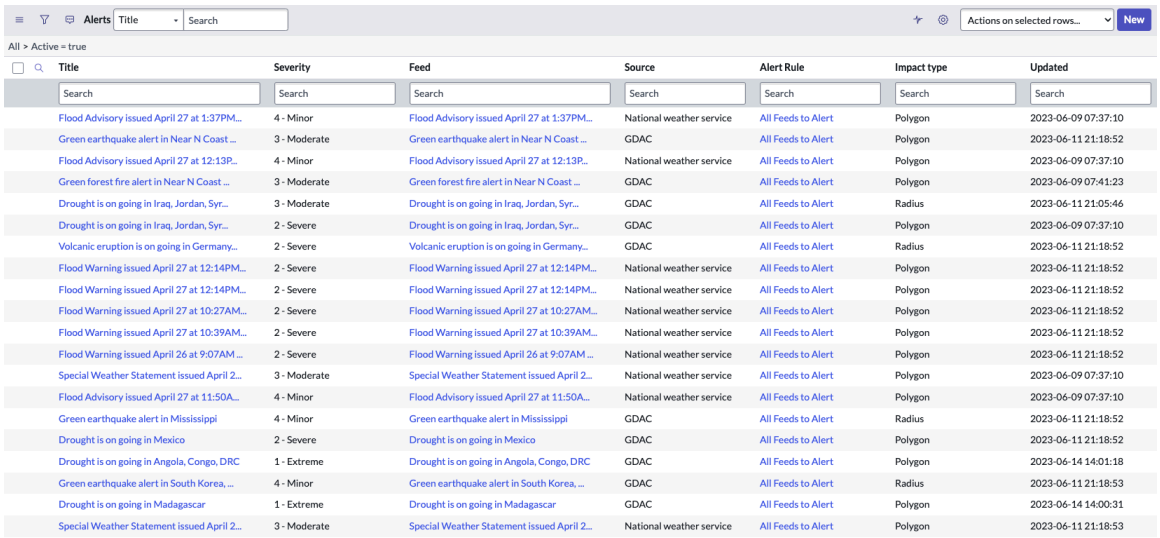
- Headline
- Event
- Severity
- Certainty
- Category
- Response type
- Data source
- Process state

Threat feeds include information about real-time disruptive events as shown in the following sample list:

- Civil unrest or riots
- Flood advisory
- Flood warning
- Drought area
- Earthquake

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Hurricane
- Wildfire or red flag warnings
- War or military conflict
- Volcano eruption



Alerts module in BCM

An alert is a notification that reports an incident happened at a particular place and time. First, an incident or an event reportedly happens. Then, the alert triggers a notification that reports or notifies the incident to the concerned people to take an action.

The **Alerts** module in BCM displays the following types of feeds:

- **Active alerts**
- **Dismissed alerts**
- **Alert responses**

A sample view of the active alerts is shown in the following example.

Title	Severity	Feed	Source	Alert Rule	Impact type	Updated
Flood Advisory issued April 27 at 1:37PM...	4 - Minor	Flood Advisory issued April 27 at 1:37PM...	National weather service	All Feeds to Alert	Polygon	2023-06-09 07:37:10

Green earthquake alert in Mississippi	4 - Minor	Green earthquake alert in Mississippi	GDAC	All Feeds to Alert	Radius	2023-06-11 21:18:52
Drought is on going in Mexico	2 - Severe	Drought is on going in Mexico	GDAC	All Feeds to Alert	Polygon	2023-06-11 21:18:52
Drought is on going in Angola, Congo, DRC	1 - Extreme	Drought is on going in Angola, Congo, DRC	GDAC	All Feeds to Alert	Polygon	2023-06-14 14:01:18
Green earthquake alert in South Korea, ...	4 - Minor	Green earthquake alert in South Korea, ...	GDAC	All Feeds to Alert	Radius	2023-06-11 21:18:53
Drought is on going in Madagascar	1 - Extreme	Drought is on going in Madagascar	GDAC	All Feeds to Alert	Polygon	2023-06-14 14:00:31
Special Weather Statement issued April 2...	3 - Moderate	Special Weather Statement issued April 2...	National weather service	All Feeds to Alert	Polygon	2023-06-11 21:18:53

You can use the **Personalize List** icon to configure the list columns in the **Alerts** module. For example, you can display the following details on the alert:

- Title
- Severity
- Feed
- Source
- Alert rule
- Impact type
- Updated

Administrative tasks in the Threat and Alert Data Feeds module

If you have the BCM administrator role, see Setup for Crisis map for information on the setup tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Administration** module in BCM displays the following types of feeds:

Scheduled imports

To manage your threat feed subscriptions that are sourced internally and externally, you must schedule a data import from the data source at defined intervals. For more information on scheduled imports, see Configure Scheduled Data Imports records.

Resource configuration

To plot your organization's assets or resources on the Crisis map, you must configure the resources in the application. For more information on resource configuration, see Configure Resource Configuration records.

Alert rules

To display the feeds as alerts on the Crisis map, configure the alert rules. For more information on alert rules, see Configure alert rules.

Alert actions

To act on a critical alert from the Crisis map dashboard, see Configure alert actions.

- For information on the administrative tasks for Crisis map, see Setup for Crisis map.
- To search for locations on the Crisis map, you must set the *sn_bcm_map.use_google_places_lib* system property. For more information, see Properties installed with BCM.

Crisis map

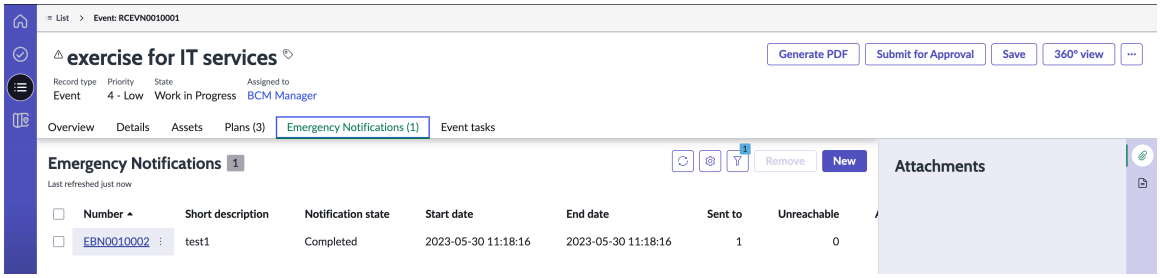
For information on managing the alerts in Crisis map, see Structured workflows for Crisis map.

Emergency notifications in Everbridge

You can integrate Crisis Management in the BCM application with Everbridge notifications system. You can then send an emergency notification to an individual or a group of people alerting them of an impending emergency. It provides a one-way notification and two-way communication through properly established delivery channels.

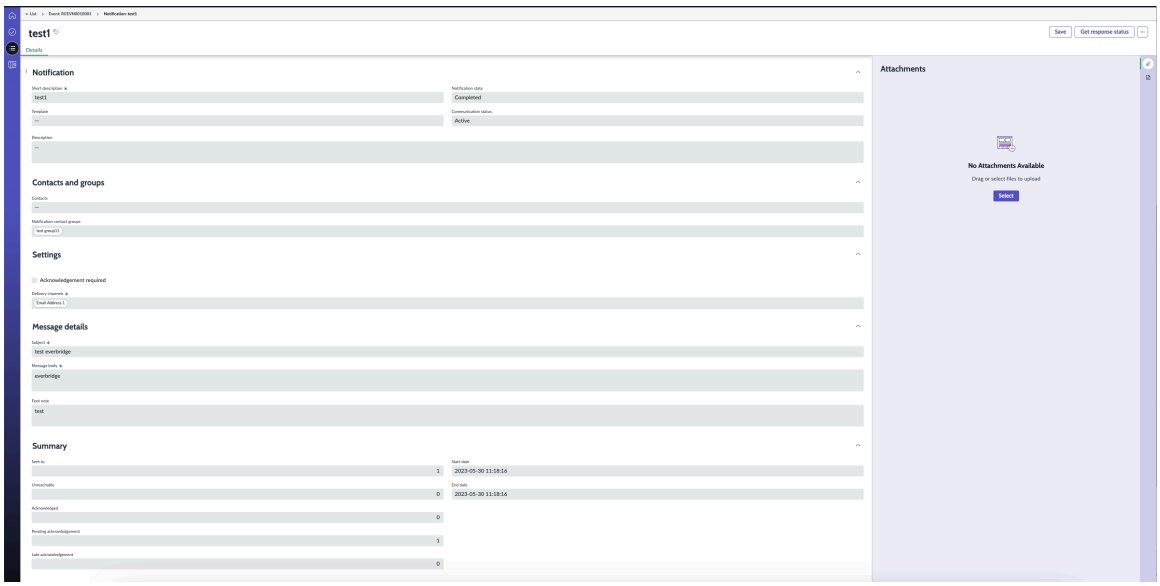
Crisis Management in Business Continuity Management application uses Everbridge to direct certain crisis response activities. This integration helps to send notifications about critical events to stakeholders and coordinates responses from them in an effective two-way delivery channel.

To send a notification, you need correct contacts, groups, and delivery channels. Delivery channels are created and stored in Everbridge and you have to import those delivery channels for your particular organization ID. These delivery channels are used for sending notifications and contact creation.



Process for sending the emergency notifications

You can send an event notification that triggers a complete workflow of the activities from the **Draft** to the **Complete** state in Everbridge. You can monitor all activities from Business Continuity Workspace.

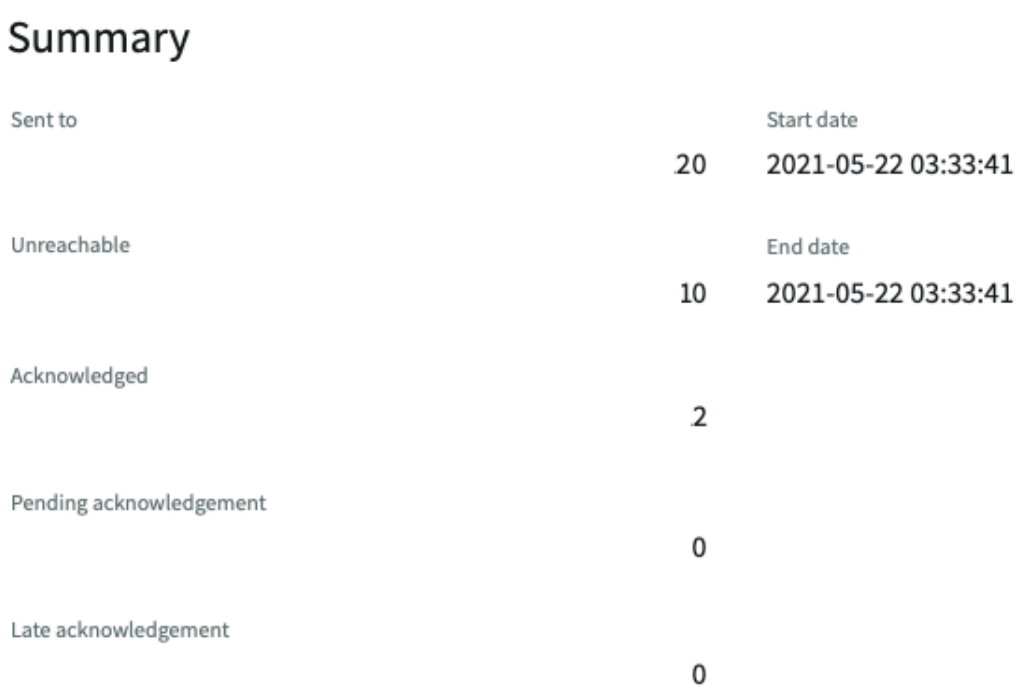


When you send an emergency notification from the Business Continuity Workspace, the action creates an incident and a notification for the incident in Everbridge to be sent to the right contacts and groups.

The emergency notifications for an event are displayed on the **Emergency notifications** tab for the event. You can view the details of the emergency notification such as the notification state, start date, end date, and so on as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The emergency notification form is shown in the following example.



Summary of the notification sent to contacts

The **Summary** section in the notification form displays a list of the contacts and groups to whom the notification was sent and their responses are also recorded. It also displays the number of contacts who could not be reached, the number of contacts who acknowledged the notification, and the number of pending acknowledgments. This information is retrieved from Everbridge and it is displayed in your Business Continuity Workspace as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary of the notification sent to the contacts

The Summary section in the notification form contains the following information:

Sent to

Number of contacts to whom the notification was sent.

Unreachable

Number of contacts to whom notification was not sent.

Acknowledged

Number of contacts who acknowledged the receipt of notification.

Pending acknowledgment

Number of contacts who did not acknowledge the receipt of notification.

Late acknowledgment

Number of contacts who confirmed the receipt of notification after the notification duration had elapsed.

If there are many contacts to whom the notification could not be delivered, then you can create another notification for the same crisis event. This time, you can send it to a team of managers, as the previous notification did not reach many contacts.

Administrative tasks for integrating Crisis Management with Everbridge

For information on the administrative tasks for integrating Crisis Management with Everbridge notifications system, see Setup for Everbridge notifications.

Configuring Business Continuity Management

Configure the Business Continuity Management application to perform the business continuity tasks for your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

Configuring Business Continuity Management involves installing the application from ServiceNow® Store and setting it up by the administrators.

Note:
If you have the BCM role, you can perform the setup tasks that are described in this section.

- Install the Business Continuity Management application from store. For more information, see Install Business Continuity Management from ServiceNow Store.

  Note:
  Installing GRC: Business Impact Analysis, GRC: Business Continuity Planning, or GRC: Crisis Management automatically installs GRC: Business Continuity Management – Core and GRC: Business Continuity Management – Components.

- Verify that you have assigned users with the required roles. For detailed instructions and a list of roles, see Components installed with Business Continuity Management.
- Set up the Business Continuity Management application by performing the administrative tasks with the BCM administrator role. For more information, see General administration setup for BCM.

  Note:
  You can view **My tasks page configurations** and **Properties** in the **General Administration** setup.

- Complete the setup for a business impact analysis by performing the administrative tasks with the BIA administrator role. For more information, see Setup for a business impact analysis.

  Note:
  When you create a business impact analysis in BCM UIB Workspace, you can assign a BCM lead to the analysis in the BIA form itself.

- Complete the setup for a business continuity plan by performing the administrative tasks with the BCP administrator role. For more information, see Setup for a business continuity plan.

  Note:
  When you create a business continuity plan in BCM UIB Workspace, you can assign a BCM lead to the plan in the BCP form itself.

- Format the PDF templates for a business impact analysis, a business continuity plan, or an event. For more information, see Format PDF templates for BIAs, BCPs, and events.
- Configure the 360° relationship registries and views. For more information, see Configure 360° relationship registries and views.
- Set up the notifications with Everbridge. For more information, see Setup for Everbridge notifications.
- Set up the Crisis map. For more information, see Setup for Crisis map.
- Review the setup tasks that are performed by an administrator. For more information, see Setup by system administrators.
- Review the setup information for UI Builder. For more information, see Setup for the UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Both BCM classic Workspace and BCM Configurable Workspace use the Workspace view. If you have made any customizations in other UI views, you must apply the same customizations before or after upgrading from a prior release to the Xanadu release.

For information on the custom components configuration in BCM classic Workspace, see the KB1442692 article.

For information on how to migrate reports and custom changes to BCM Configurable Workspace, see the KB1444397 article.

Business Continuity Management and ServiceNow Store

Business Continuity Management applications are available from the ServiceNow Store, enabling you to obtain new and updated features more rapidly. Before you can use the Business Continuity Management applications, you must verify that you have an entitlement to use them.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The list of BCM applications available on ServiceNow Store is:

Application	Description
GRC: Business Impact Analysis	Provides structured workflows for business continuity management teams to assess the impact of a disruption for critical resources such as business processes, applications, and locations.
GRC: Business Continuity Planning	Provides capabilities for business continuity management teams to create, review, and approve business continuity and disaster recovery plans.
GRC: Crisis Management	Provides capabilities for business continuity management teams to activate business continuity plans during plan exercises and actual crisis events.
GRC: Crisis Management integration with Everbridge Notifications (com.snc.bcm.app_crisis_ebn_intg)	Provides integration with Everbridge to create and send notification, and track responses.
GRC: Crisis Map (com.snc.app_bcm_crisis_map)	Provides the ability to integrate with the Feeds and Alert Management application to view the threat alerts and assets at risk on the BCM crisis map. Also, take appropriate action by triggering the Crisis Management event and notification workflows.
GRC: Approver Configurator (sn_grc_appr)	Provides capabilities to define multiple levels of approvals based on approval rule definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Installing GRC: Business Impact Analysis, GRC: Business Continuity Planning, or GRC: Crisis Management automatically installs GRC: Business Continuity Management – Core, GRC: Business Continuity Management – Components, and GRC: Approver Configurator.

GRC: Business Continuity Management – Core provides capabilities to configure data that are required for the business continuity management applications. This application also installs GRC: Business Continuity Management – Components: Now Design System components for Business Continuity Management application.

Get entitlement for the BCM application

The first step in installing an application is to verify that the application or the product and its associated applications have valid ServiceNow entitlements.

Before you begin
Role required: admin

Individuals performing entitlement must have a Now Support account and have permission to request applications for the instances under consideration.

Procedure

1. Navigate to the ServiceNow Store.
2. Select **Login** and log in using your Now Support credentials.
3. Select the **ServiceNow Products** tab to view all available ServiceNow Store products. Integrations and other types of content are shown on the **Certified Apps** tab.
4. Select the product name of the product that you are getting entitlement to.
   All applications associated with the product you are entitling are listed. When you have obtained entitlement to the core product, the applications listed under it are also entitled.
5. Select **Opt-in** to verify that you have entitlement to the product and the applications listed.
   You are prompted to read and accept the ServiceNow Store terms and conditions.
6. Select the check box and select **Accept**.

   Note:
   A check mark appears next to the product name and the **Manage Entitlements** button appears.

   The check mark indicates that you have subscribed to the product and its associated applications. It is time to manage your entitlements. This step is a one-time process for this product and any other products that you want to install in the future.

7. You can select **Manage Entitlements** to change the instances affected by the applications to which you are entitled.
   After you have agreed to the ServiceNow Store Terms and Conditions and managed entitlements, you can entitle other products by selecting the plus sign (+) next to the product name.

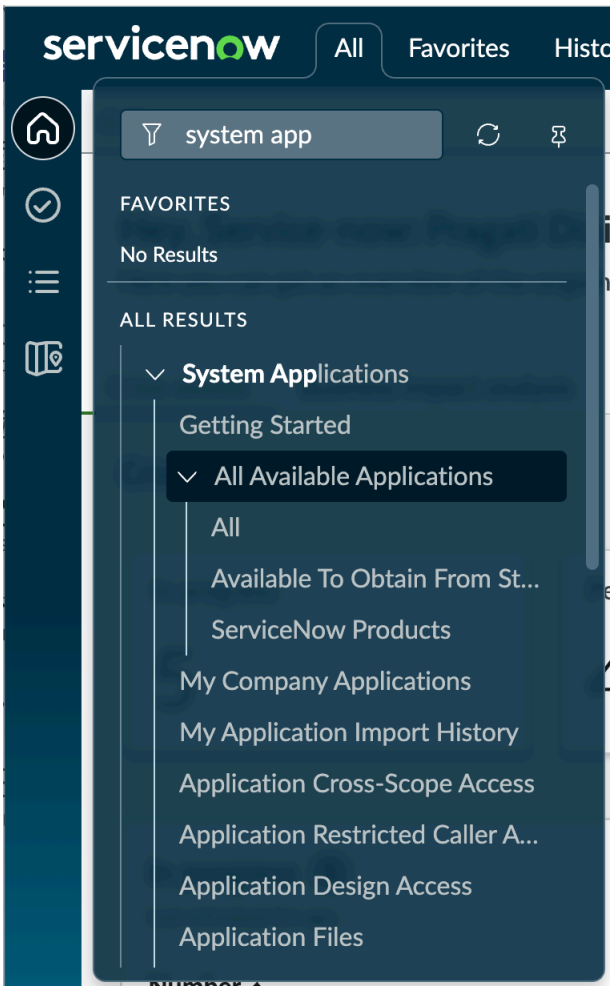
   You are now ready to install the application.

Install Business Continuity Management from ServiceNow Store

You can install the Business Continuity Management application if you have the admin role. This application includes demo data and installs the related store applications if they are not already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin



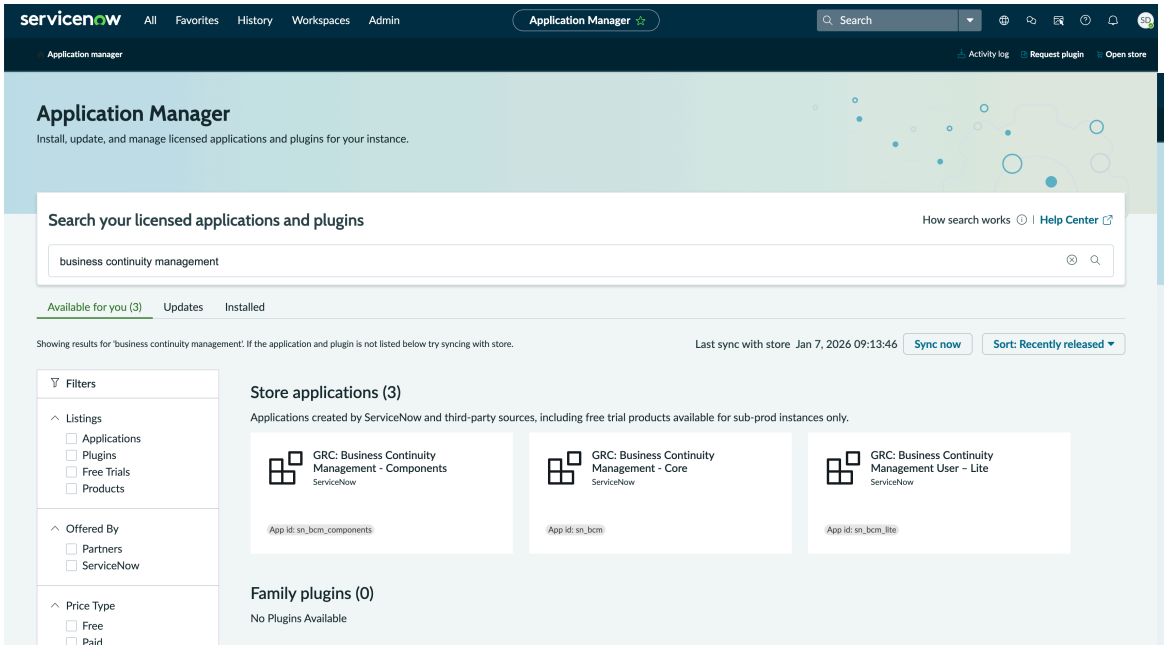
Role required: admin

In the ServiceNow Store, you must verify that you have entitlements (or licenses) to the application and its dependent applications.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.

   The navigation path is shown in the example.



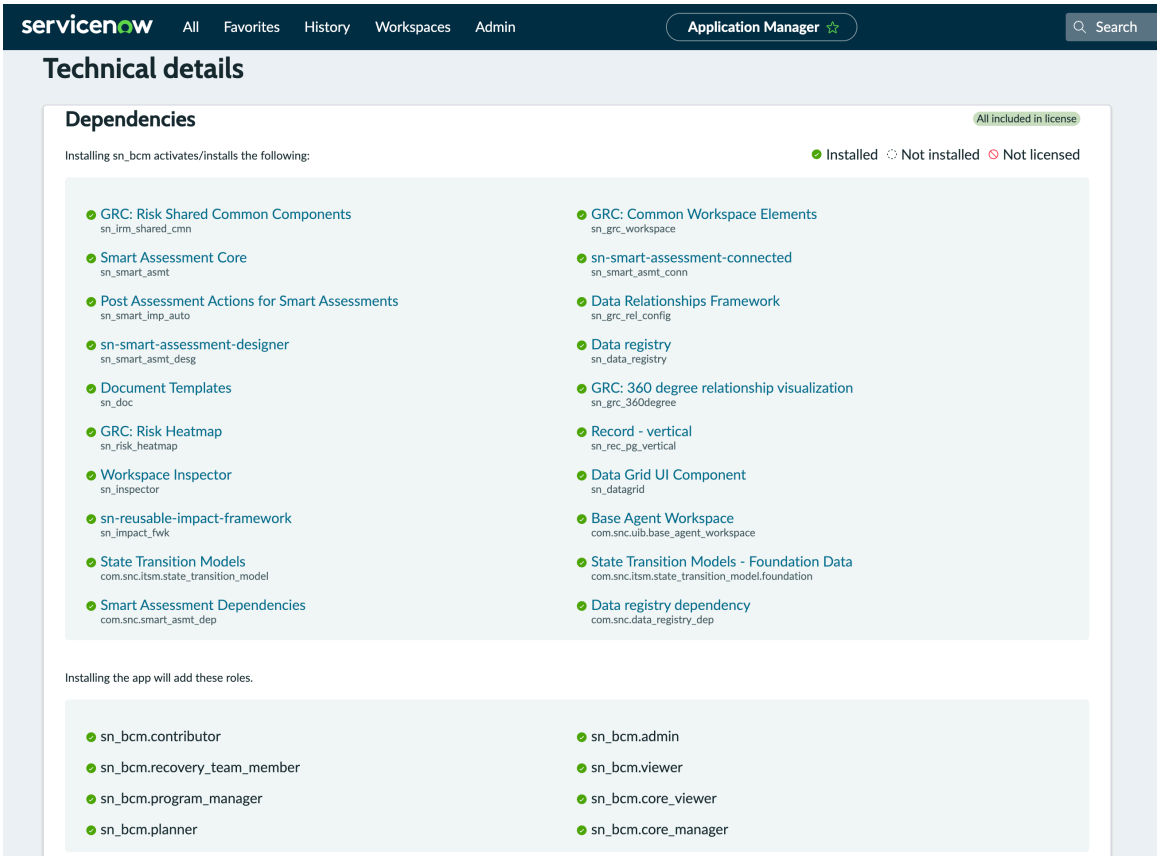
2. Find the Business Continuity Management application using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

   The path using the filter criteria is shown in the examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Install**.
4. In the Application installation dialog box, review the application dependencies.

   Review the application listing in the instance for information on dependencies, licensing or subscription requirements, and release compatibility.

   The Business Continuity Management application (com.snc.sn_bcm) requires that the required applications are downloaded as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- BCM core (com.snc.bcm.app_bcm_core)
- BIA (com.snc.bcm.app_bcm_bia)
- BCP (com.snc.bcm.app_bcm_planning)
- Crisis Management (com.snc.bcm.app_bcm_exercise)
- Crisis Map with Everbridge integration (com.snc.bcm.app_crisis_ebn_intg)
- Data registry (com.snc.data_registry_dep)
- Gantt UI Builder Component (servicenow-now-gantt)
- Data registry application (app-grc-data-registry)
- Document Templates (app-document-templates)
- Data relationship framework (app-grc-relationship-config)
- GRC Common Workspace (app-grc-base-workspace)
- GRC: Approver Configurator (app-bcm-approval-config)
- IRM shared components (irm-shared-common-components)

5. If demo data is available and you want to load it, select **Load demo data**.

   Some applications include demo data, which are sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you do not select the **Load demo data** check box for a store application during installation, demo data is not available to install from the **Application Manager** later. For information on how to install or reinstall demo data after the initial installation, see the Workaround to install demo data if application is already installed [KB0722909] article in the HI Knowledge Base.

6. Select **Install**.

Note:
Installing GRC: Business Impact Analysis, GRC: Business Continuity Planning, or GRC: Crisis Management automatically installs GRC: Business Continuity Management – Core and GRC: Business Continuity Management – Components.

BCM lite operators

The Business Continuity Management application provides flexible user licensing terms. The terms are based on whether your operator has read-only access or can complete certain types of tasks.

Overview of the lite operator classification

The Business Continuity Management roles that classify as lite operators are users who are responsible for the following tasks:

- Respond to the business impact analysis (BIA) plans when they are added as the contributors to the business impact analysis.
- Approve the assigned approval record from the record in the Lists view or My tasks page.

To enable lite operators to respond to tasks, you must assign them with the appropriate role for the activity and add them to the record as an approver. When this criteria is met, the lite operator can approve or reject a record and provide workflow notes.

For detailed information that describes how to configure BCP or BIA plan templates, see Configure the business continuity plan template and Configure BIA templates with legacy assessment.

For information about all roles that are installed with the activation of the Business Continuity Management application, see Components installed with Business Continuity Management.

BCM lite operator role

The BCM lite operator role (sn_bcm_lite.lite_operator) contains the roles listed in the following table.

BCM lite operator role classification

Role	Description	Additional Information
sn_bcm_contributor	Enables the user to respond to BIAs in which they are tagged as a contributor.	The BIA owner must add the user as a contributor to the BIA.
sn_bcm.core_viewer	Enables the user to view the BIA, plans, exercises, and events in the workspace UI.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BCM lite operator role classification (continued)

Role	Description	Additional Information
sn_bia.bia_contributor	Enables the user to respond to BIAs in which they are tagged as a contributor.	The BIA owner must add the user as a contributor to the BIA.
sn_bcm.recovery_team_member	Enables the user to receive and respond to the assigned recovery tasks.	
sn_bcm_viewer	Enables the user to view all records in the BCM application.	
sn_bcp.plan_viewer	Enables the user to view the plans in a read-only format.	
sn_bia.bia_viewer	Enables the user to view the BIA responses in a read-only format.	
sn_recovery.event_viewer	Enables the user to view an exercise or event in a read-only format.	The read-only information is needed so that the recovery event member has the context of the entire exercise though the user can only respond to assigned tasks.
sn_crisis_ebn.viewer	Enables the user to view emergency notifications in a read-only format.	
sn_recovery.event_member	Enables the user to receive and respond to the assigned recovery tasks during an exercise or event.	Recovery tasks must be assigned to the recovery team member.

BCM roles that you can't assign to your lite operators

Operator roles can't be assigned to lite operators. If you assign a role to a user, it counts the user as an operator and you no longer have a flexible licensing model.

You can't assign the following roles to your lite operators:

- sn_bia.bia_admin
- sn_bia.bia_manager
- sn_bia.bia_planner
- sn_bcp.plan_admin
- sn_bcp.plan_manager
- sn_recovery.event_manager
- sn_recovery.event_user
- sn_crisis_ebn.admin
- sn_crisis_ebn.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For additional information on role assignments, see the GRC Business User Role [KB0864247] article in the Now Support Knowledge Base.

Note:
You must log in to Now Support to view the articles.

Lite operator activities and limitations

The following table describes the lite operator activities and limitations.

BCM lite operator activities and limitations

Activity	Description	Create	Read	Update	Approve
Business impact analysis (BIA)	• Respond to the BIA analysis. • View a completed analysis. • Participate in the BIA workflow. • Review the analysis and then approve or reject it.		X	X	X
Business continuity planning (BCP)	• View and download the published continuity and disaster recovery plans. • Participate in the plan workflow. • Review and approve or reject an analysis.		X		X
Business continuity exercises	• View the exercise details. • Participate in the		X		X

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BCM lite operator activities and limitations (continued)

Activity	Description	Create	Read	Update	Approve
	recovery tasks. • Participate in the exercise results workflow. • Review and approve or reject an analysis.				
Crisis events	• Report and view the crisis details. • Participate in the recovery tasks. • Participate in the exercise results workflow. • Review and approve or reject an analysis.		X		X
Update recovery tasks status	• Receive the recovery tasks from the exercises and crisis events. • Report the progress and status back to your event coordinator.		X	X	X

© 2026 ServiceNow, Inc. All rights reserved.

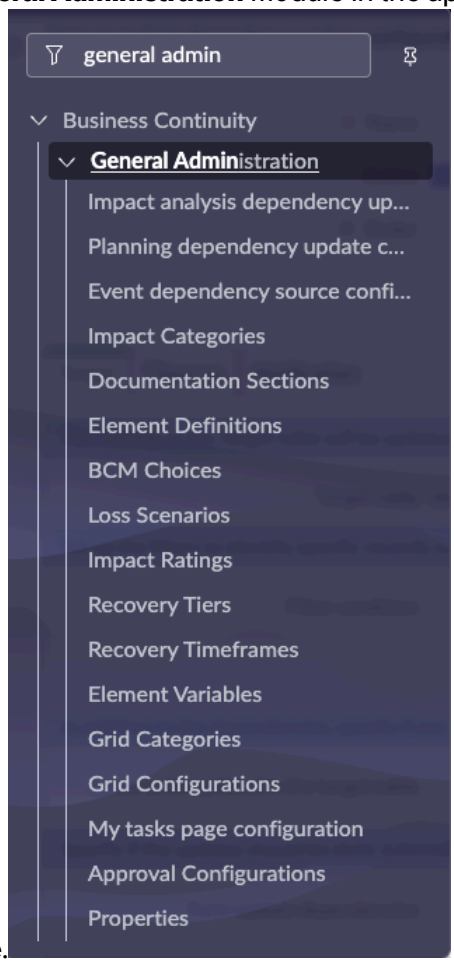
BCM lite operator activities and limitations (continued)



Activity	Description	Create	Read	Update	Approve
Emergency notification template	• View the emergency notifications. • Participate in the workflow.		X		X

General administration setup for BCM

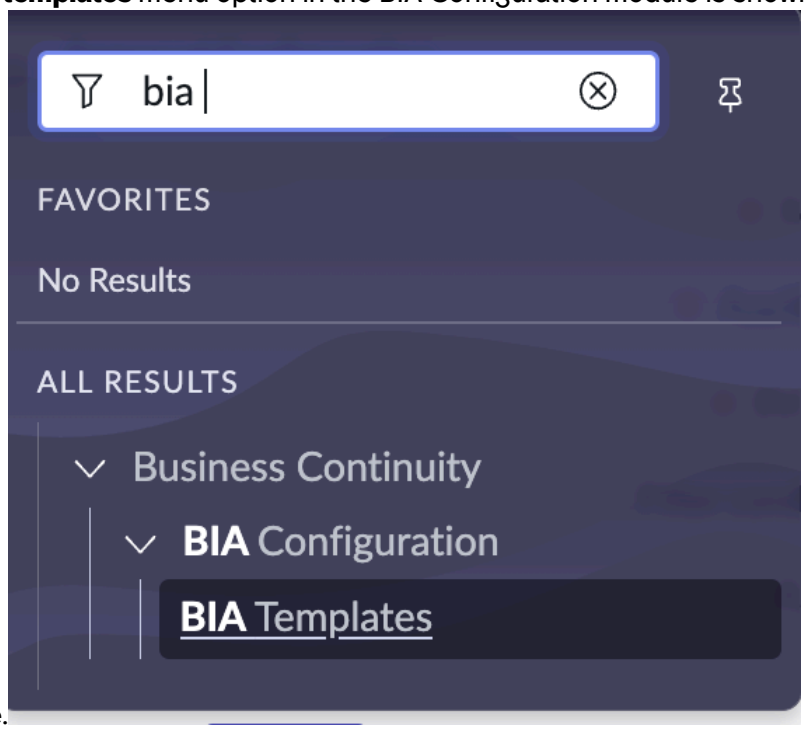
If you are the BCM administrator, you can set up the Business Continuity Management application by performing certain administrative tasks.

General Administration module

The administrative tasks that are associated with the BCM application are listed in the **General Administration** module in the application UI as shown in the following example.

The Business Continuity Management administrator with the sn_bcm.admin role is responsible to perform the administrative tasks that are associated with the Business Continuity Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



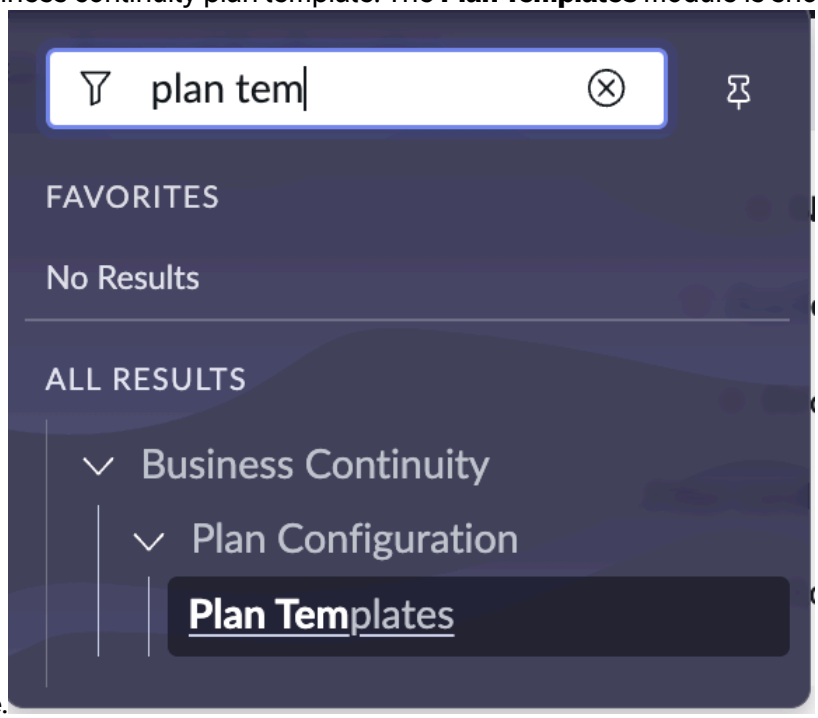
Typically, the Business Continuity Management administrator performs the following administrative tasks:

- Configure the impact categories. For more information, see Configure impact category for BIA.
- Configure the documentation sections. For more information, see Configure documentation section.
- Configure the element definitions. For more information, see Configure element definition.
- Configure the loss scenarios. For more information, see Configure loss scenarios in the plan.
- Configure the impact ratings. For more information, see Configure impact ratings.
- Configure the recovery tiers. For more information, see Configure recovery tiers for BIA.
- Configure the recovery timeframes. For more information, see Set up recovery timeframes.
- Configure the element variables. For more information, see Configure element variables for element definitions.
- View the My tasks page configurations module. For more information, see My tasks page configurations.
- Configure the approval configurations. For more information, see Approval configuration.
- Configure the properties. For more information, see BCM properties.
- For more information on the grid configurations and categories, see Configure grid for BIA assessment and Configure grid categories.

BIA Configuration module

The BCM administrator configures the BIA templates in the BIA Configuration module. Configuring the BIA templates is a pre-requisite for performing the business impact analysis.

The **BIA templates** menu option in the BIA Configuration module is shown in the following example.



For more information on configuring a BIA template, see Configure BIA templates with legacy assessment.

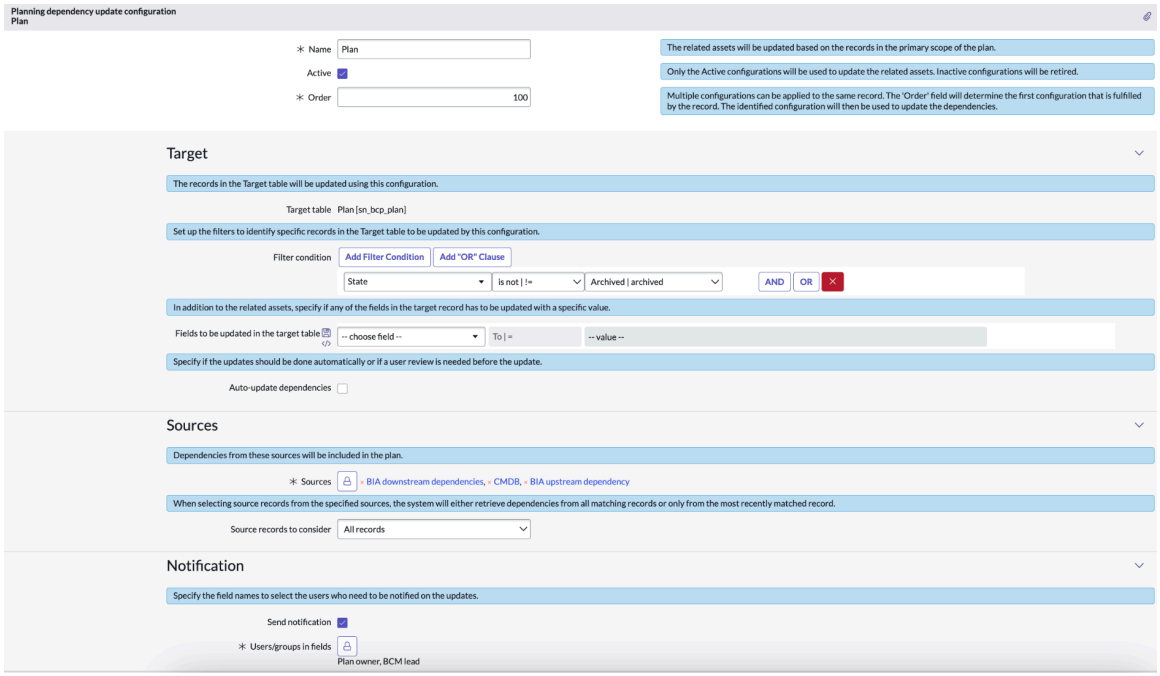
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plan Templates module

Typically, the Business Continuity Management administrator uses the **Plan Templates** module to configure a business continuity plan template. The **Plan Templates** module is shown in the following example.

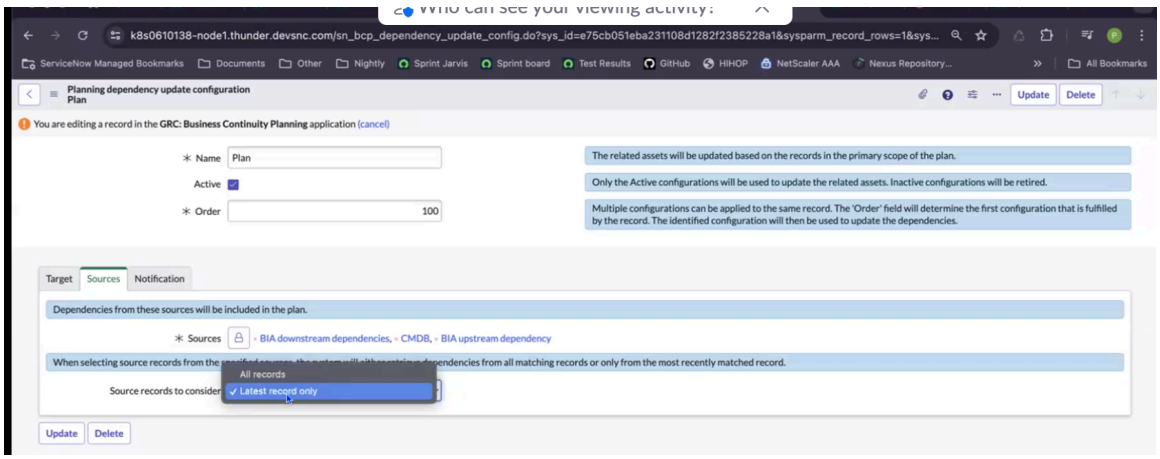
For more information on configuring a business continuity plan template, see Configuring plan template.

Dependency Configuration records



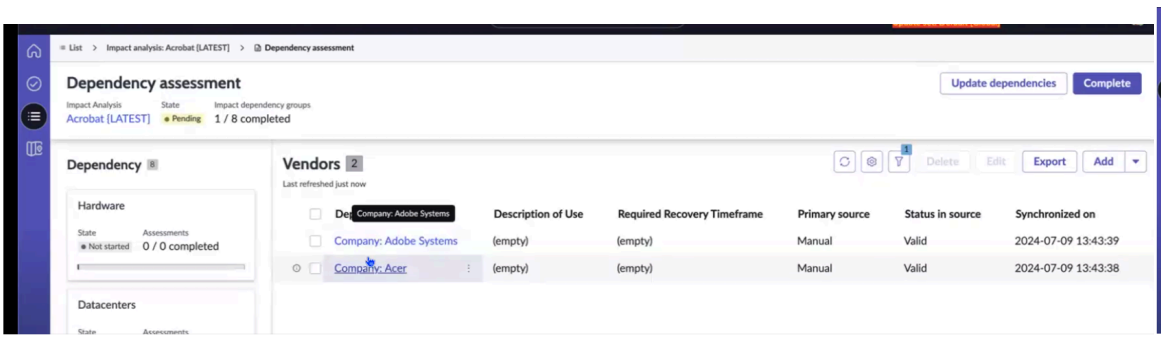
The BCM administrators configure the Dependency Configuration records.

Administrators configure the Dependency Configuration records in the administrator view (UI 16 view) to schedule an auto-update of the BIA dependencies, related assets, and sources based on the source data and relationships in the CMDB.



Note:
Beginning with the Xanadu release, you can access up-to-date information on dependencies related to Business Impact Analysis, Plans, and Events. To access the most recent updates for dependencies, choose **All records** or **Latest record only** from the **Source records to consider** option in the Impact analysis dependency update configuration, Planning dependency update configuration, and Event dependency source configuration records. Based on your selection, the application pulls dependencies from all sources or only from the latest record for each source.

The following example shows the Planning dependency update configuration record.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consider an example where you have 2 BIAs done on Acrobat and the configuration is shown in the example. When **All records** option is selected and you select **Update dependencies** UI action from the plan record, the application pulls all the dependencies in all BIA records that satisfy the requirement. As shown in the example, dependencies of both BIA Latest and BIA Old records are pulled into the plan.

When **Latest record only** option is selected and you select **Update dependencies** UI action from the plan record, the application considers one of the records of the two BIAs and it fetches the dependency assessment of that BIA record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For the **Update dependencies** UI action in the plan record and the *Update BCP dependencies snapshot* scheduled job to function, it is necessary to have the Impact analysis dependency update configuration, Planning dependency update configuration, and Event dependency source configuration records established.

Pulling latest dependency updates for impact analysis, plans, and events

You can pull latest dependency updates for impact analysis, plans, and events. Choosing All records or Latest record only functionality is applicable for Impact analysis dependency update configuration, Planning dependency update configuration, and Event dependency source configuration records.

For Impact analysis dependency updates, pulling all BIA records or the latest BIA record may yield the same information. For planning dependency updates and event dependency updates, pulling all BIA records or the latest BIA record pulls the latest dependency updates.

Dependencies are fetched from the following sources for the plans:

- BIA upstream dependency
- BIA downstream dependencies
- CMDB

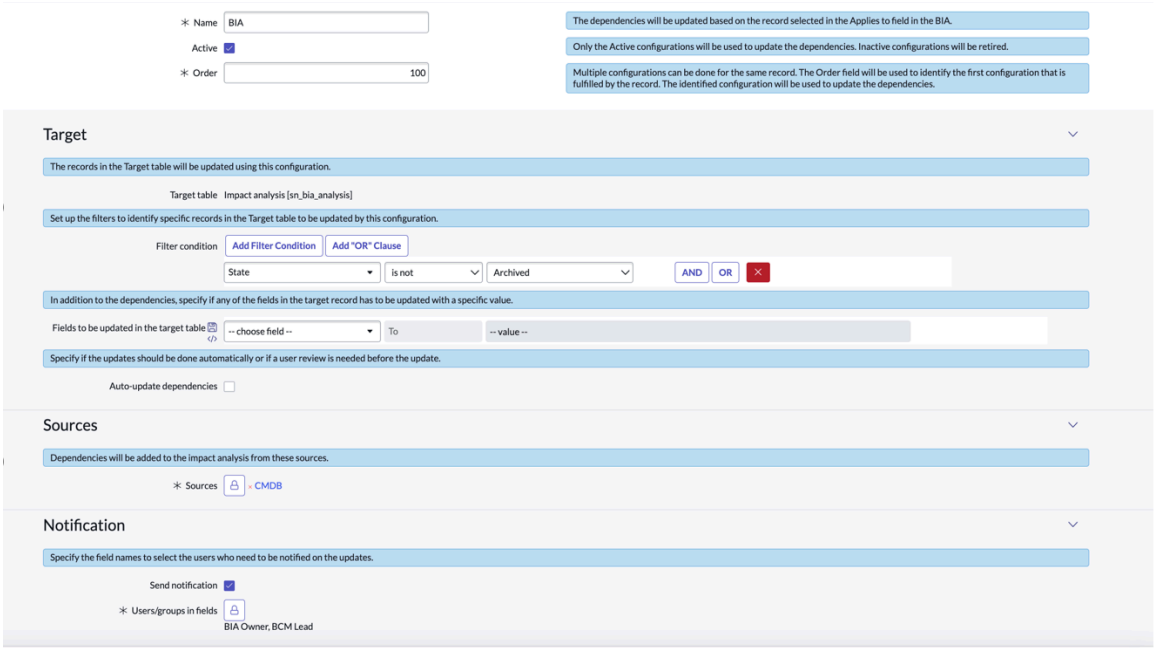
Dependencies are fetched from the following sources for the events:

- BIA upstream dependency
- BIA downstream dependencies
- CMDB
- Plan primary assets
- Plan related assets

For information on configuring the impact analysis dependency updates, see Configuring impact analysis dependency updates.

For information on configuring the planning dependency updates, see Configuring planning dependency updates.

For information on configuring the sources for adding the event dependencies, see Configuring sources for adding event dependencies.



Configuring impact analysis dependency updates

The BCM administrators configure the Impact analysis dependency update configuration record so that an auto-update of the BIA dependencies can be scheduled based on the source data and relationships in the CMDB.

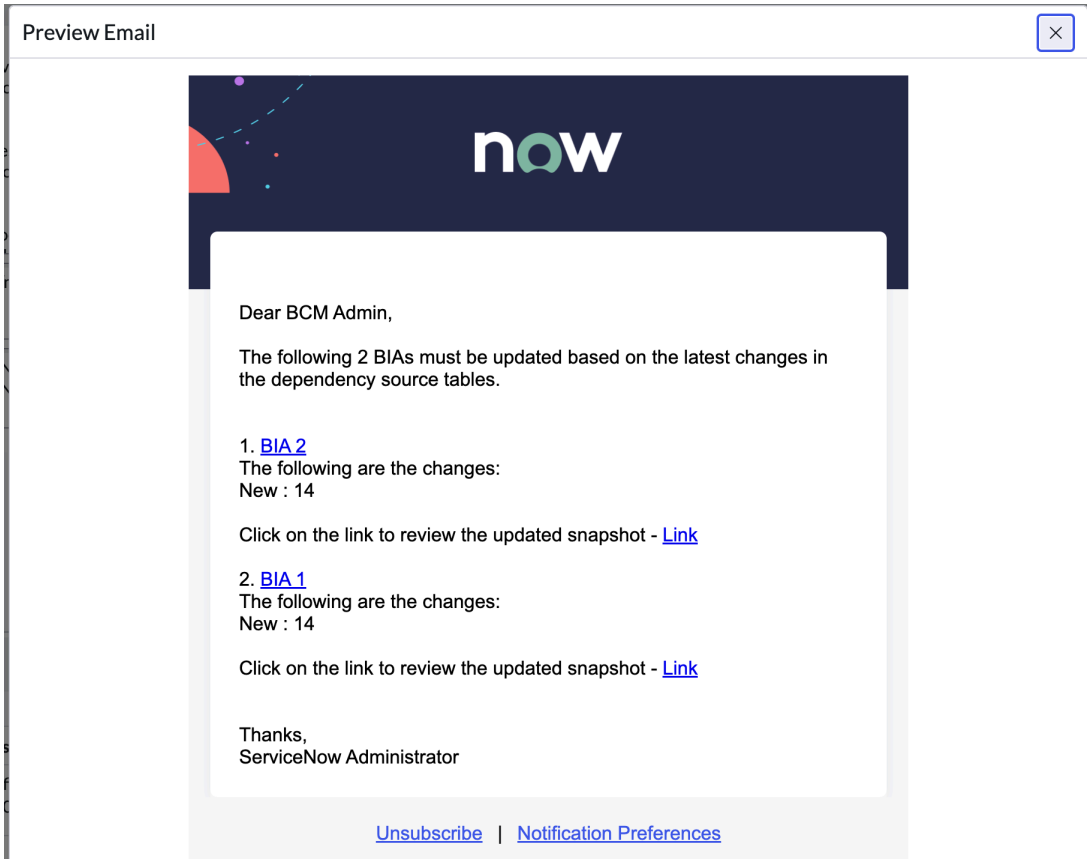
Impact analysis dependency update configuration record

The BCM administrators access the Impact analysis dependency update configuration record by navigating to **General Administration** in the application UI. The record contains the configuration details such as the name, order, target records, sources, and notification preferences as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the sources for adding the dependencies

Configure the sources in the Impact Analysis dependency update configuration record to retrieve the latest BIA dependencies. As shown in the example, select the CMDB source to read dependencies from the Configuration Management Database. The BIA's **Applies to** field specifies the input asset. The system retrieves dependencies from the CMDB based on the asset defined in the BIA.



Note:
You can fetch the latest dependencies of the BIAs from the CMDB relationships only.

Auto-update the dependencies and set the notification preferences

The BCM administrators select the **Auto-update dependencies** option to schedule an auto-update of the dependencies in the BIAs.

The BCM administrators select the **Send notification** option to notify the BIA owners about the updated dependencies. The email notification contains the details of the dependency updates for the BIA records as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The snapshot records are displayed in the Pending updates record of the BIA from the list view. The delta snapshot record displays details of the BIA and updated dependency configuration such as Added, Updated, and Deleted assets for the BIA.

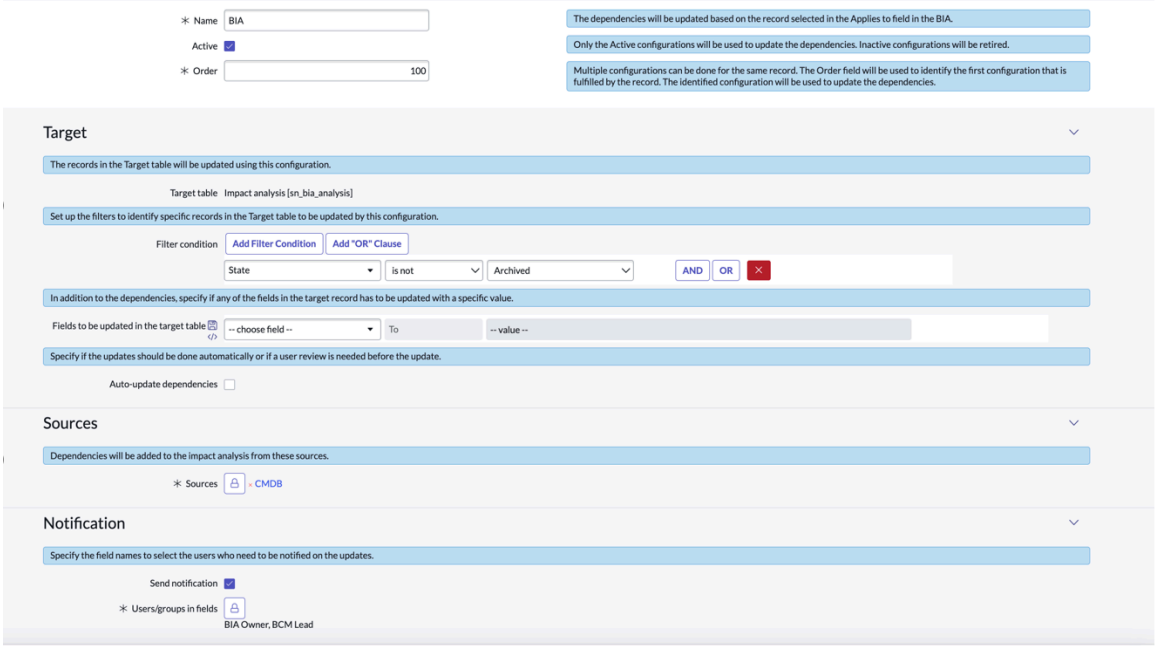
BIA owners then update the CMDB assets and dependencies manually by selecting the **Update dependencies** UI action displayed in the Dependency assessment of the BIA. The BIA owners or BIA approvers then review the dependency updates and save the changes to the BIA.

For more information on configuring the Impact analysis dependency update configuration record, see Set up Impact analysis dependency update configuration.

Set up Impact analysis dependency update configuration

Configure the Impact analysis dependency update configuration record to configure the BIA record (for which the dependencies are updated), its target records, sources, and notification preferences.

Before you begin



Role required: sn_bcm.admin, sn_bcp.plan_admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Impact analysis dependency update configuration**.
2. Select **New**.

   The example shows the Impact analysis dependency update configuration record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

   For more information on the fields in the form, see Impact analysis dependency update configuration form.

4. Select **Submit**.

   According to the configuration set up by the BCM administrator in the Impact analysis dependency update configuration record, the dependencies are updated in the BIA.

   The BIA owner and approver review the updated dependencies and complete the BIA workflow. For more information on scheduling an auto-update of the dependencies in the BIA, see Scheduling auto-update of dependencies.

Impact analysis dependency update configuration form

Use the Impact analysis dependency update configuration form to configure the details of the dependency updates such as the BIA record name, target records, sources, and notification preferences.

Impact analysis dependency update configuration record form

For the description of the field values, see the table.

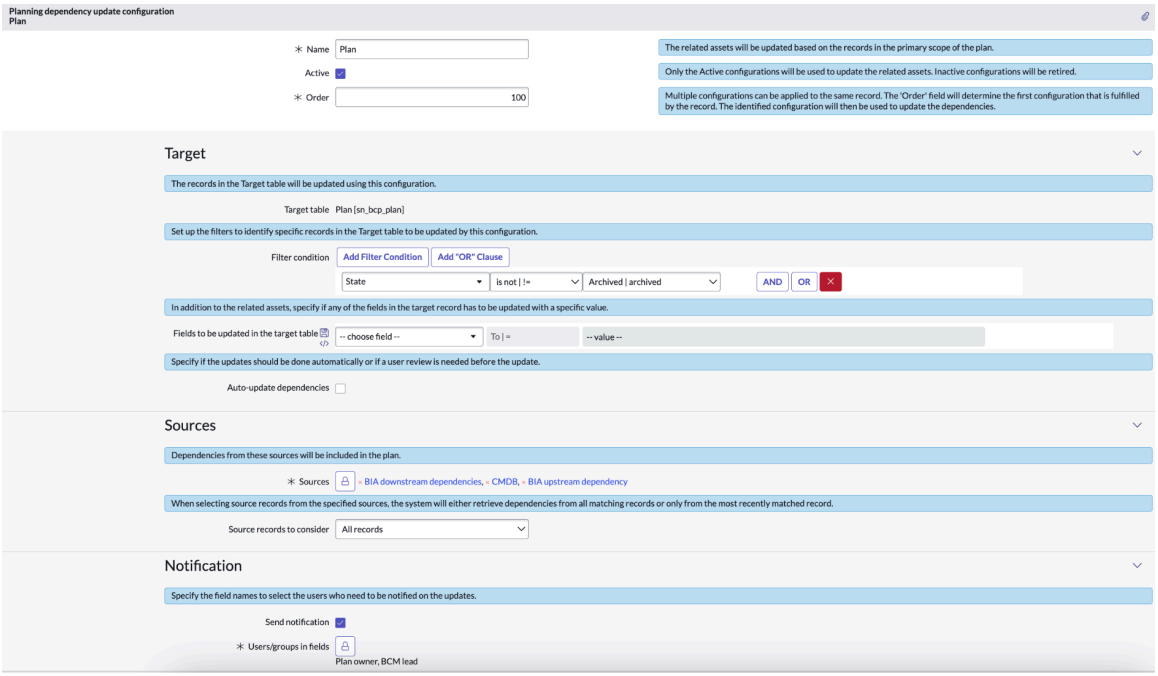
Impact analysis dependency update configuration record form

Field	Description
Name	Name of the dependency update configuration rule.
Active	Option to select the active configurations. Active configurations are used to update the dependencies. Inactive configurations are retired.
Order	Field to identify the first configuration that is fulfilled by the record. The identified

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact analysis dependency update configuration record form (continued)

Field	Description
	configuration is used to update the dependencies. Multiple configurations can be done for the same record. When the filter conditions are the same, the least order such as 0 takes the preference.
Target	
Target table	Impact analysis [sn_bia_analysis] table that contains the BIA records. These records are updated according to the configuration set up in the Impact analysis dependency update configuration record.
Filter condition	Filter conditions to identify specific records in the target table. These records are updated according to the configuration set up in the Impact analysis dependency update configuration record.
Fields to be updated in the target table	Fields in the target record that can be updated with a specific value in addition to the dependencies.
Auto-update dependencies	Option to update the dependencies automatically. BCM administrators can specify if the updates should be done automatically or if a user review is needed before the update.
Sources	
Sources	Applicable sources for adding dependencies to the impact analysis. For the BIA record, the source used is CMDB.
Source records to consider	Option to select a specific record or all records. When selecting source records from the specified sources, the system retrieves dependencies from either all matching records or only from the most recently matched BIA record.
Notification	
Send notification	Option to notify the users or user groups on the updates.
Users/groups in fields	Option to select the users or groups fields in sn_bia_analysis who should receive a notification about the updates. For example, you can select the BIA owner and BCM lead to receive the updates.



Configuring planning dependency updates

The BCM administrators configure the Planning dependency update configuration record so that an auto-update of the related assets in the plans can be scheduled based on the source data and relationships in the CMDB and BIA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

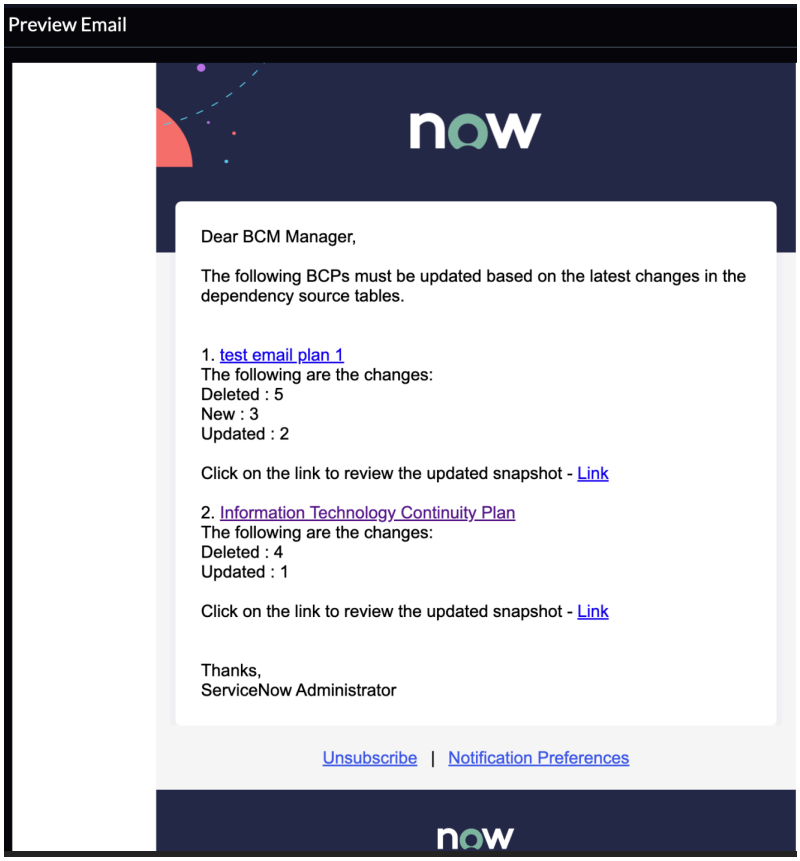
Planning dependency update configuration record

The BCM administrators configure details of the plan record, its target records, sources, and notification preferences in the Planning dependency update configuration record as shown in the following example.

Configure the sources for fetching the dependencies

The BCM administrators configure the sources for fetching the latest dependencies of the plan from different sources such as BIA upstream dependency, BIA downstream dependencies, and CMDB.

Note:
In the plans, the dependencies are fetched for all primary scope assets.



Auto-update the dependencies

The BCM administrators can select the **Auto-update dependencies** option in the Target tab of the Planning dependency update configuration record to schedule an auto-update of the related assets in the plans.

Set the notification preferences

The BCM administrators select the **Send notification** option to set the notification preferences for the plan owners. For every planning dependency update, an automated email is sent to the plan owners about the planning dependency updates and links to the updated snapshot records as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

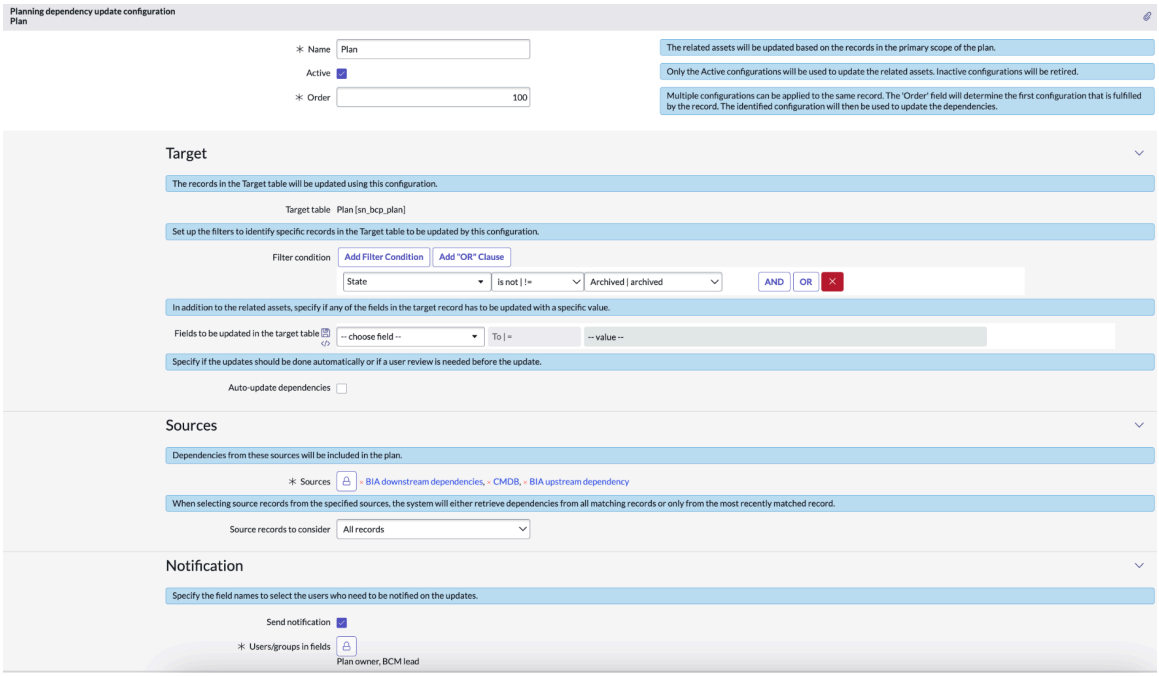
The plan owner and BCM lead reviews the dependency updates from the snapshot record. The delta snapshot record displays the updated dependencies such as Added, Updated, and Deleted assets for the selected plan record.

For more information on configuring the Planning dependency update configuration record, see Set up Planning dependency update configuration.

Set up Planning dependency update configuration

Configure the Planning dependency update configuration record to configure the plan record (for which the dependencies are updated), its target records, sources, and notification preferences.

Before you begin



Role required: sn_bcm.admin, sn_bcp.plan_admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Planning dependency update configuration**.
2. Select **New**.

   The example shows the Planning dependency update configuration record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

   For more information on the fields in the form, see Planning dependency update configuration form.

4. Select **Submit**.

   As per the sources and preferences set up by the BCM administrator in the BCM administrator in the Planning dependency update configuration record, the planning dependency updates are auto-updated for the plan record.

   The BCP owner and approver review the updated dependencies and complete the BCP workflow.

Planning dependency update configuration form

Use the Planning dependency update configuration form to configure the plan record, its sources, and preferences such as the plan record name, sources, and notification preferences and schedule an auto-update of the related assets in the plans.

Planning dependency update configuration record form

For description of the field values, see the table.

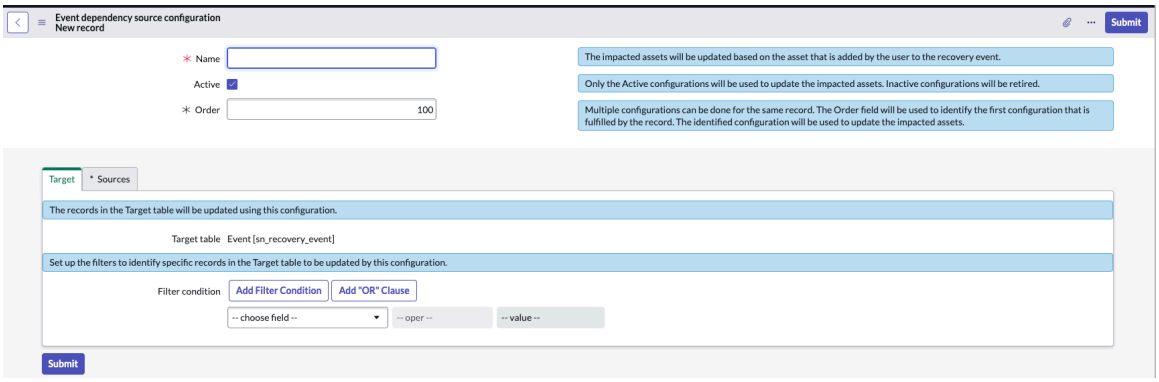
Planning dependency update configuration record form

Field	Description
Name	Name of the plan record. The related assets are updated based on the primary scope of the plan record.
Active	Option to select the active configurations. Active configurations are used to update the dependencies. Inactive configurations are retired.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Planning dependency update configuration record form (continued)

Field	Description
Order	Field to identify the first configuration that is fulfilled by the record. The identified configuration is used to update the dependencies. Multiple configurations can be done for the same record.
Target	
Target table	Plan [sn_bcp_plan] table that contains the plan records. These records are updated as per the configuration set up in the Planning dependency update configuration record.
Filter condition	Filter conditions to identify specific records in the target table. These records are updated as per the configuration set up in the Planning dependency update configuration record.
Fields to be updated in the target table	Fields in the target record that can be updated with a specific value.
Auto-update dependencies	Option to update the dependencies automatically. BCM administrators can specify if the updates should be done automatically or if a user review is needed before the update.
Sources	
Sources	Applicable sources for adding related assets to the plan. For the business continuity plan record, these sources are used: • BIA Upstream • BIA Downstream • CMDB
Source records to consider	Option to select a specific record or all records. When selecting source records from the specified sources, the system retrieves dependencies from either all matching records or only from the most recently matched BIA record.
Notification	
Send notification	Option to notify the users or user groups on the updates.
Users/groups in fields	Option to select the users or groups who should receive a notification about the updates. For example, Plan owner and BCM lead are selected to receive the updates.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring sources for adding event dependencies

The BCM administrators configure the sources in the Event dependency source configuration record so that the impacted assets are added in the events and exercises based on the source data and relationships in the BIA, CMDB, and plans.

Event dependency source configuration record

The Event dependency source configuration record contains the event dependency details such as the event record name, its target records, and sources as shown in the following example.

Dependencies are incorporated into events from all sources through the selection of the **Update dependencies** UI action by the user. When an event is created and linked to a plan, the primary asset and its associated assets are automatically retrieved from the plan, provided that the Event Dependency Configuration is active and includes the plans in its Sources, without the need to select the **Update dependencies** UI action.

Dependencies are fetched from the following sources for the events:

- BIA upstream dependency
- BIA downstream dependencies
- CMDB
- Plan primary assets
- Plan related assets

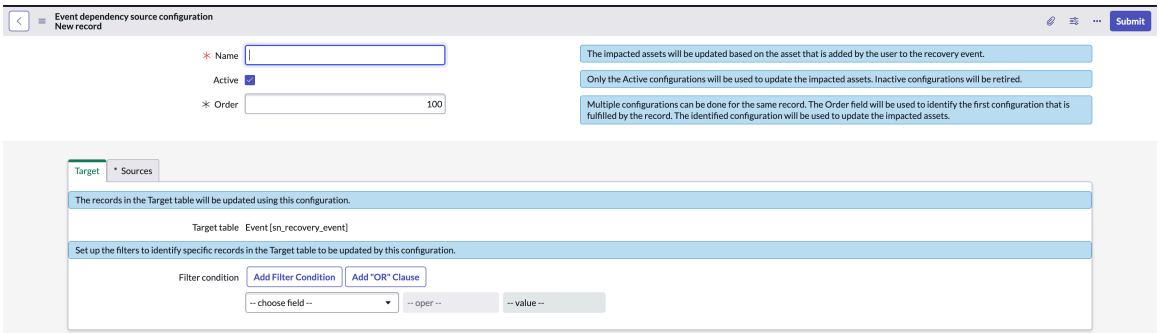
Note:
In an event, the dependencies of all assets are added manually where the source is Manual.

For more information on configuring the Event dependency source configuration record, see Configure Event dependency source configuration record.

Configure Event dependency source configuration record

Configure the sources for adding the event dependencies in the Event dependency source configuration record.

Before you begin



Role required: sn_bcm.admin, sn_bcp.plan_admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Event dependency source configuration**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example shows the Event dependency source configuration record.

3. On the form, fill in the fields.

   For more information on the fields in the form, see Event dependency source configuration form.

4. Select **Submit**.

   As per the sources set up by the BCM administrator in the Event dependency source configuration record, the dependencies are added in the event.

Event dependency source configuration form

Use the Event dependency source configuration form to add the event dependency details such as the event record name, its target records, and sources in the BCM application.

Event dependency source configuration record form

For description of the field values, see the table.

Event dependency source configuration record form

Field	Description
Name	Name of the recovery event. The impacted assets are updated based on the asset that is added by the user to the recovery event.
Active	Option to select the active configurations. Active configurations are used to update the dependencies. Inactive configurations are retired.
Order	Field to identify the first configuration that is fulfilled by the record. The identified configuration is used to update the impacted assets. Multiple configurations can be done for the same record.
Target	
Target table	Event [sn_recovery_event] table that contains the event records. These records are updated as per the configuration set up in the Event dependency source configuration record.
Filter condition	Filter conditions to identify specific records in the target table. These records are updated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

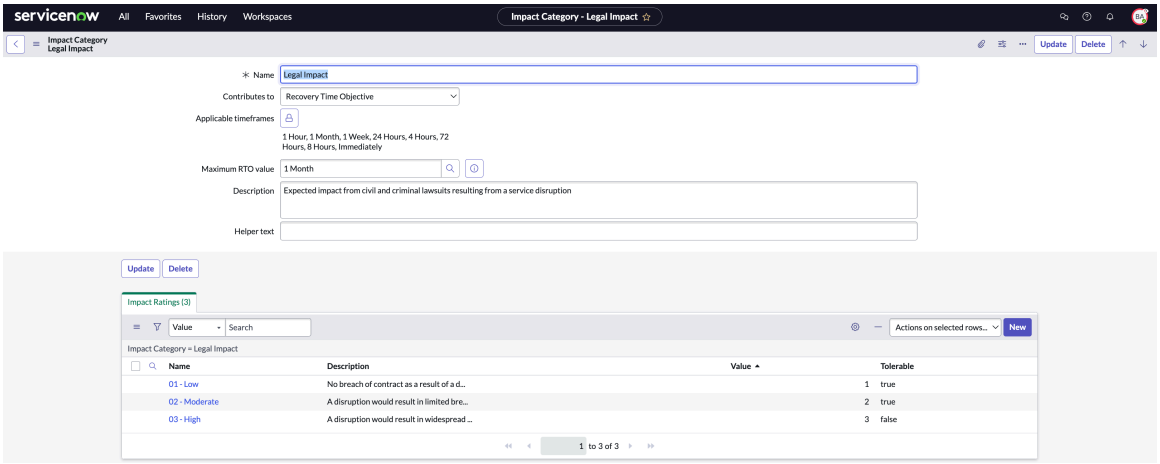
Event dependency source configuration record form (continued)

Field	Description
	as per the configuration set up in the Event dependency source configuration record.
Sources	
Sources	Applicable sources for adding impacted assets to the recovery event. For the event record, one of these sources can be used: • BIA upstream dependency • BIA downstream dependencies • CMDB • Plan primary assets • Plan related assets
Source records to consider	Option to select a specific record or all records. When selecting source records from the specified sources, the system retrieves dependencies from either all matching records or only from the most recently matched BIA record.

Configure impact category for BIA

Configure an impact category for your business, when you are performing the business impact analysis. Use the **Impact Categories** module in the Business Continuity Management application navigator to define the name, criteria that the impact category contributes to, applicable timeframes, maximum RTO value, and so on.

Before you begin



Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Impact Categories**.
2. Select **New**.

   The example shows the impact ratings that are installed with demo data for an impact category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

   For more information on the fields in the form, see Impact Category record form.

4. Select **Submit**.

Impact Category record form

Use the Impact Category record form to add details about the impact category such as name, criteria that the impact category contributes to, applicable timeframes, maximum RTO value, and so on in BCM UIB Workspace.

Impact Category record form

For description of the field values, see the table.

Impact Category record form

Field	Description
Name	Name of the impact category.
Contributes to	Contribution to RPO or RTO as a result of the impact on business disruption. If the impact category contributes to Recovery Point Objective, then the Impact analysis questions related list appears.
Applicable timeframes	Duration of business process disruption. This field appears only if the **Contributes to** field value is **RTO**.
Maximum RTO value	Metric that calculates the maximum time limit within which the business must recover an element after a disruption.
Description	Brief description of the impact category.
Helper text	Field to add the helper text. It provides a hint to the users on how to respond to the assessment questions. The helper text is then displayed for the user in the business impact analysis record.

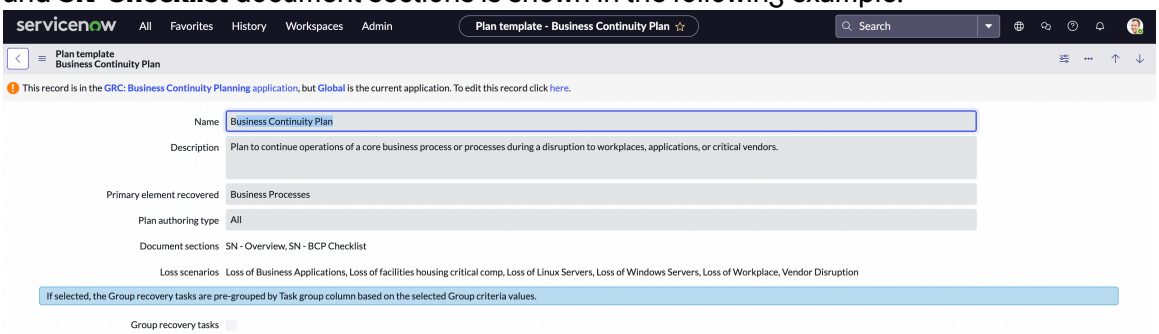
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring the documentation section

You can configure the documentation section of a business continuity plan in a structured format. You can describe high level details of the plan such as its purpose, scope, coverage areas, goals, and success criteria.



You can document the details of your business continuity plan in separate documentation sections. You can view the pre-configured documentation sections in the **General Administration** section of the Business Continuity Management application.

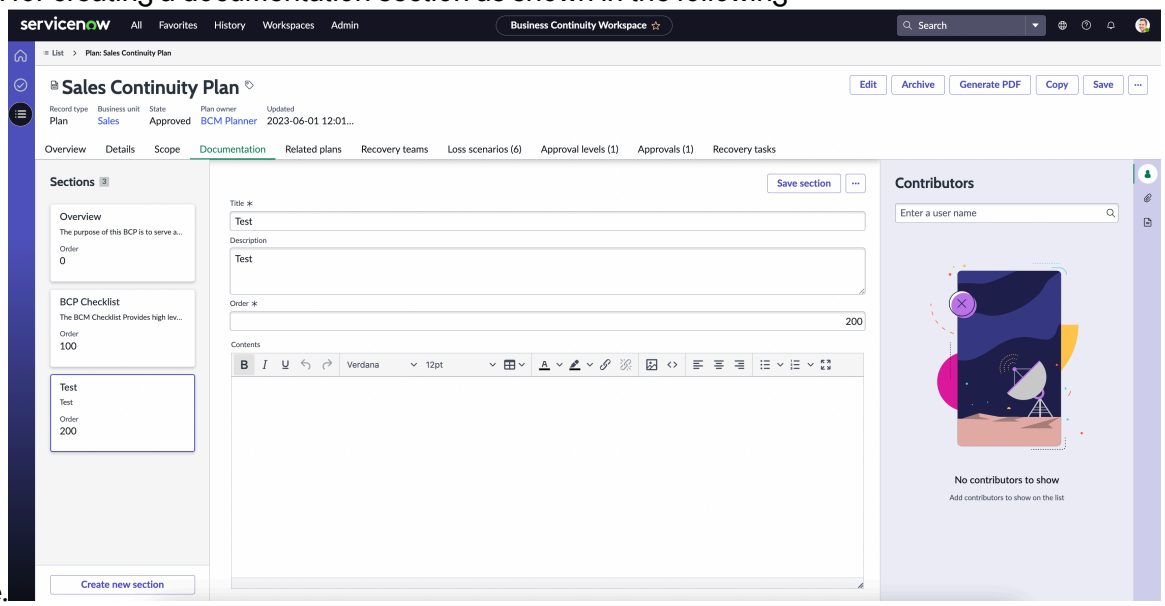
When a business continuity plan is created, it populates one or more documentation sections that are selected in the plan template.

The Business Continuity Management application provides the documentation sections that you are installed with the demo data in the plan template:

- BCP-Assumptions
- BCP-Objectives
- BCP-Scope
- BIA-Overview
- SN-BCP Checklist
- SN-Overview

A sample **Business Continuity Plan template** with the **SN-Overview** and **SN-Checklist** document sections is shown in the following example.

Creating a documentation section for your business requirement



If you have the BCM administrator role, you can use the documentation section template listed in **General Administration** for creating a documentation section. To configure a documentation section by using the documentation section template, see Configure documentation section.

Note:
When you create a documentation section in the **Documentation** tab without using the plan template, the **Reset to template** UI action is not available for that documentation section.

You can also create a documentation section on the **Documentation** tab in the Business Continuity Workspace. You can use the **Create new section**

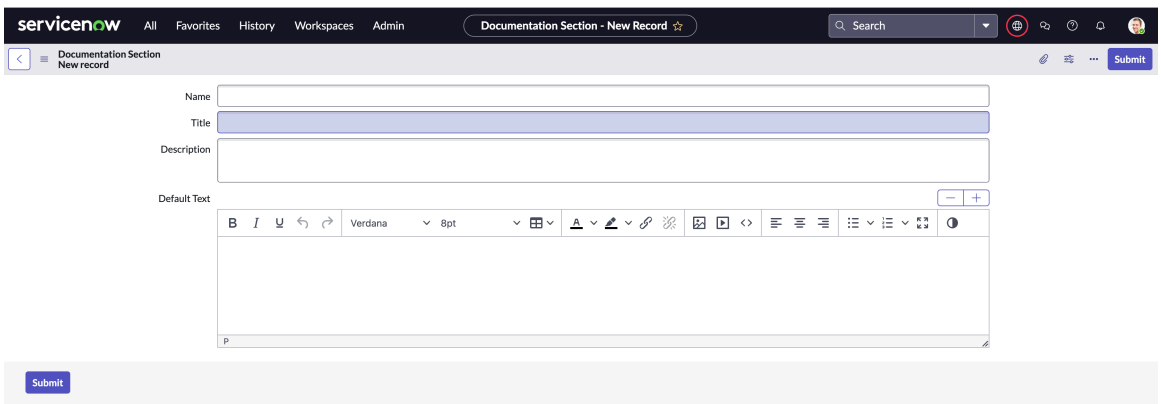
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI action for creating a documentation section as shown in the following example.

For more information on creating a documentation section for your business plan in the Business Continuity Workspace, see Create documentation sections.

Configure documentation section

Configure the documentation section to describe your plan through structured components: a high-level checklist, purpose, scope, and coverage areas.



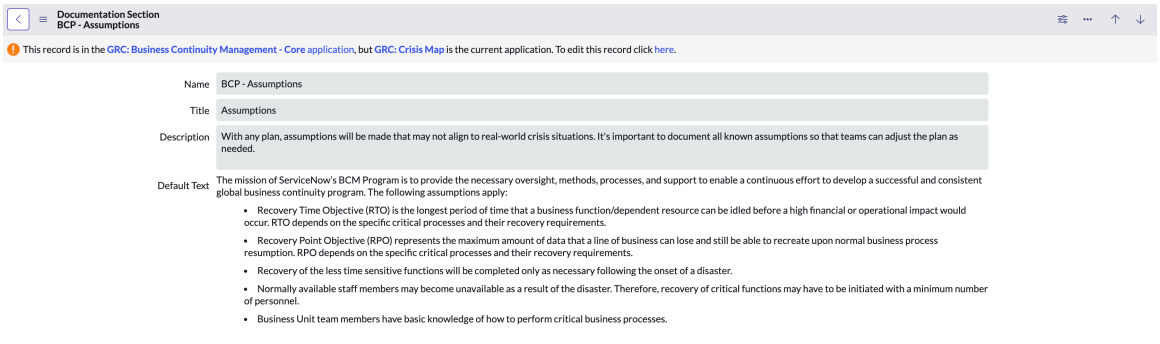
Before you begin

Role required: sn_bcm.admin, sn_bcp.plan_admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Documentation Sections**.
2. Select **New**.

   The documentation section template is shown in the example.



3. On the form, fill in the fields.

   For more information on the fields, see Documentation Section record form.

   The example shows the documentation section template from the demo data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.

Documentation Section record form

Use the Documentation Section record form to describe a plan in the structured sections in the BCM UIB Workspace.

Documentation Section record form

For description of the field values, see the table.

Documentation Section record form

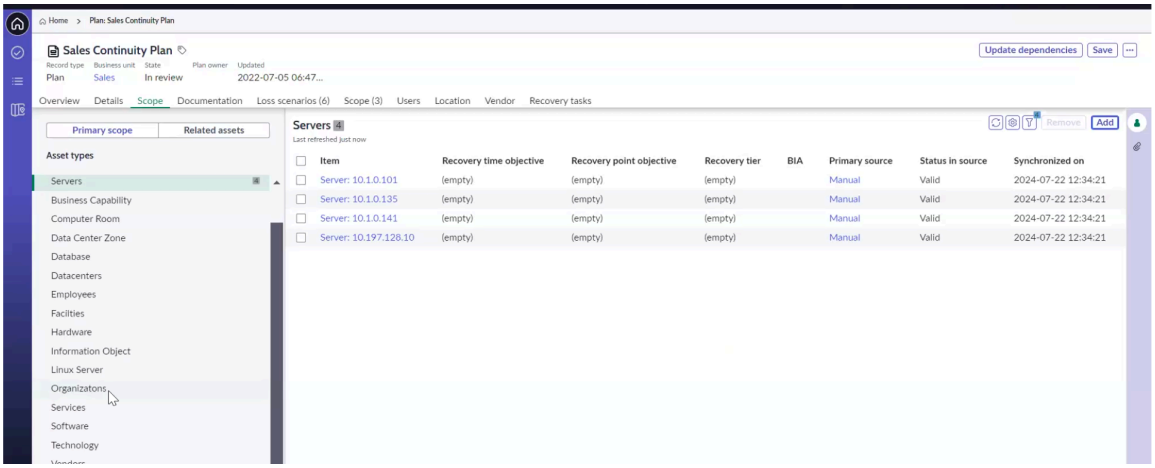
Field	Description
Name	Name of the documentation section.
Title	Documentation section title.
Description	Brief description about the documentation section.
Default Text	Default text relevant for the documentation section. The text can be edited later when the plan is formulated and the documentation sections are added, in accordance to the plan.

Configure element definition

Configure element definitions to identify the configuration item that has to be assessed in a business impact analysis and recovered in a business continuity plan. Use the **Element Definitions** module in the Business Continuity Management application navigator to configure an element definition.

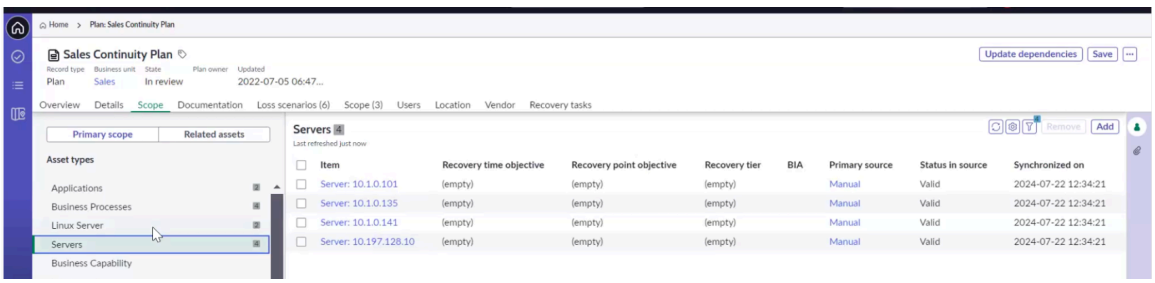
Before you begin

Role required: sn_bcm.admin



About this task

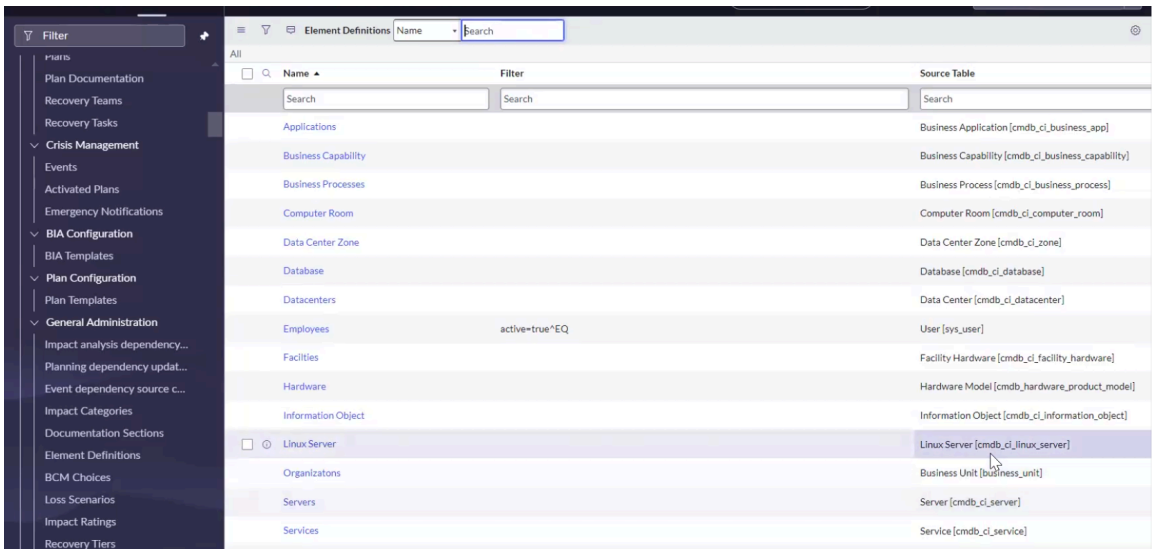
Avoid creating overlapping element definitions where one asset could fit into multiple categories. Each element definition should be unique and not overlap with another. For instance, do not define both server and Linux server as separate element definitions since a Linux server is inherently a server. The BCM application is structured to use only one of these definitions, not both, ensuring that an element definition appears in only one category.



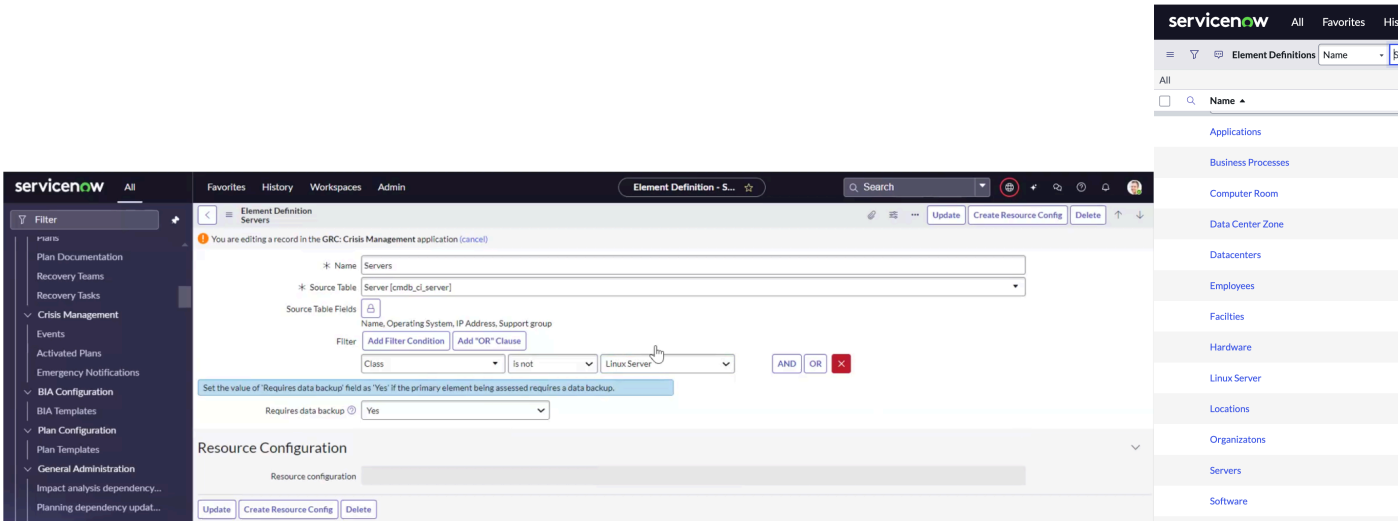
If you want to define Server and Linux Server as distinct element definitions without an overlap, apply a filter to the Server element definition specifying that the class is not Linux. This approach maintains mutual exclusivity between the two definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you select the Servers asset type as shown in the example and select **Add**, the configuration shows all the servers including Solaris, ESX, Windows, and so on.

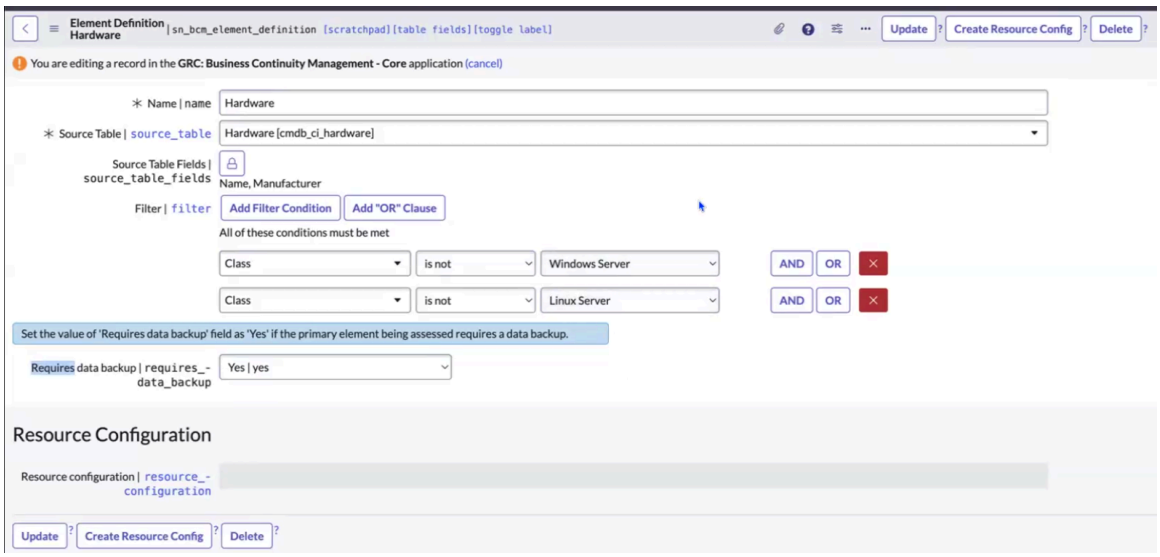


If you define the server element as a generic bucket, you can select any of the server types as shown in the example. The Servers asset type has a Linux server as a child item. However, a separate asset type called as Linux server is available in the Asset types list.



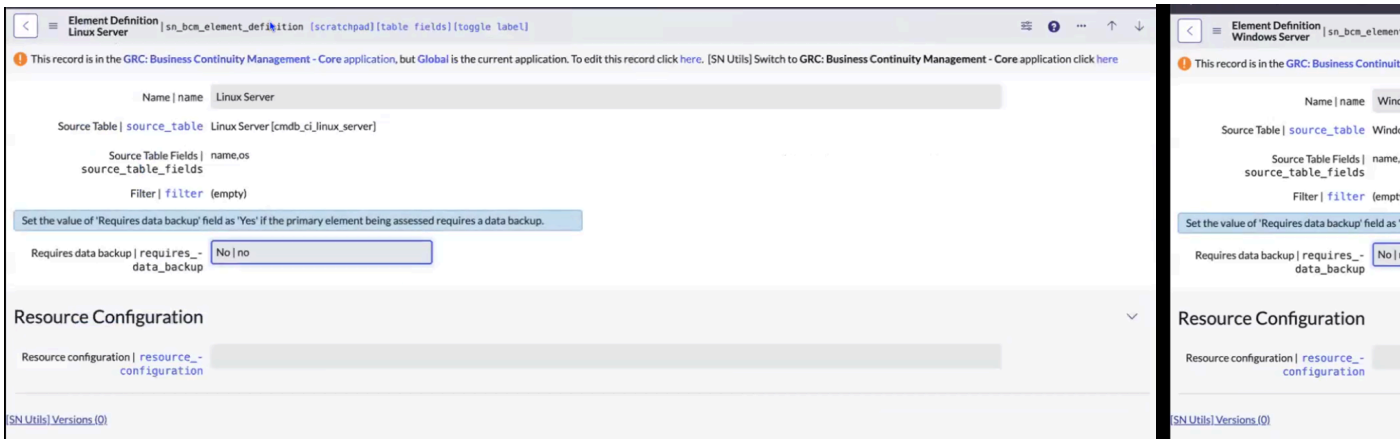
In the list, the asset types are calculated and shown as 2 Linux servers and 4 Servers where one item is a Linux server. It is possible that after the refresh or after reloading the assets, the asset types are recalculated and shown differently. For example, the system may show the asset types as 3 Linux servers and 3 Servers or 0 Linux servers and 6 Servers. The asset types are calculated differently because the element definition of Server also includes the Linux server.

In such scenarios, configuring rules that overlap with other rules may lead to an error. As a workaround, the list items should be configured as mutually exclusive and the filter condition should be configured appropriately as shown in the examples.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

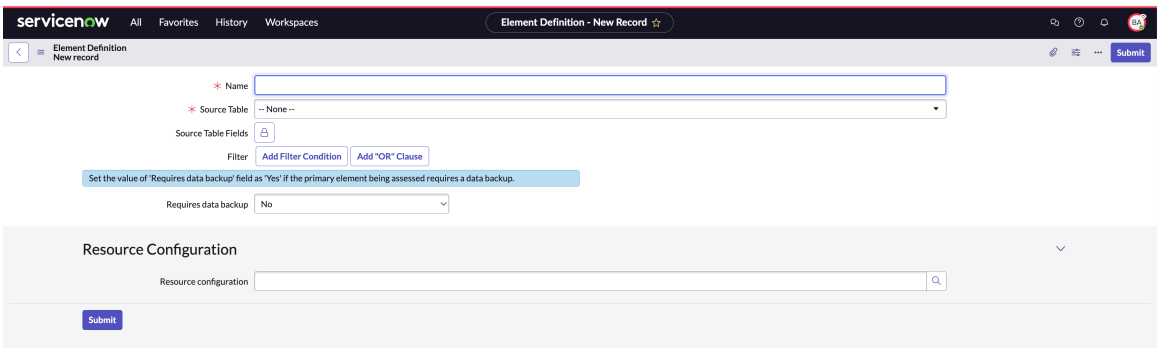
In this scenario, the Servers is the parent table and the Linux server is the child table. In the Servers table (record), configure a filter condition where the class is not Linux Server by choosing the *`Class is not Linux Server`* option.



It means that the Servers element definition includes all servers except the Linux server.

Starting with the Xanadu release, the element definition filter for the Hardware element definition has been updated. You cannot add a Windows server asset or a Linux server asset under the Hardware element as shown in the example.

However, you can now add a Windows server asset in the Windows Server element definition or a Linux server asset in the Linux Server element definition as shown in the examples.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Element Definitions**.
2. Select **New**.

   The example shows the Element Definition record.

> **Note:**
> The filter condition in the Element definition is used to add specific configuration items (CIs) via the pop-up. The **Update dependencies** UI action also considers the element definition's filter and retrieves the related CIs of the configuration item listed in the **Applies to** field of the BIA. These relationships are retrieved from the CI Relationships table.

3. On the form, fill in the fields.
   For more information on the fields in the form, see Element definition record form.
4. Select **Submit**.

Element definition record form

Use the Element definition record form to configure a recovery tier with a set of business applications by using BCM UIB Workspace.

Element definition record form

For description of the field values, see the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element Definition record form

Field	Description
Name	Name of the element definition. It uses the translated_text field type, a text field that displays translations based on the language used.
Source Table	Table that stores the record details of the configuration item.
Source Table Fields	Column heads of the source table that you can select for reference. The *source_table_fields* configuration applies to the **Scope** tab in BCPs and the **Assets** tab in recovery events. The purpose of *source_table_fields* is to set the columns for the modal based on the asset type. In the **Scope** tab of BCPs, these columns appear when you select **Add primary scope** or **Add related asset**. In the **Assets** tab of recovery events, these columns appear when you select **Add**.
Filter	Add filter condition for the element definition. **Note:** Starting with the Xanadu release, the element definition filter for the Hardware element definition has been updated. You can now add a Windows server asset in the Windows server element definition or a Linux server asset in the Linux server element definition. However, you cannot add the Windows server asset or the Linux server asset in the filter of the Hardware element definition.
Requires data backup	Option to indicate if the primary element requires a data backup. Technology assets require data backup as they pertain to important IT information stored in a system or database.
Resource configuration	Resource configuration for the element definition. Available options are: • **Location** • **Web Server** • **Datacenters** • **Vendors**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element Definition record form (continued)

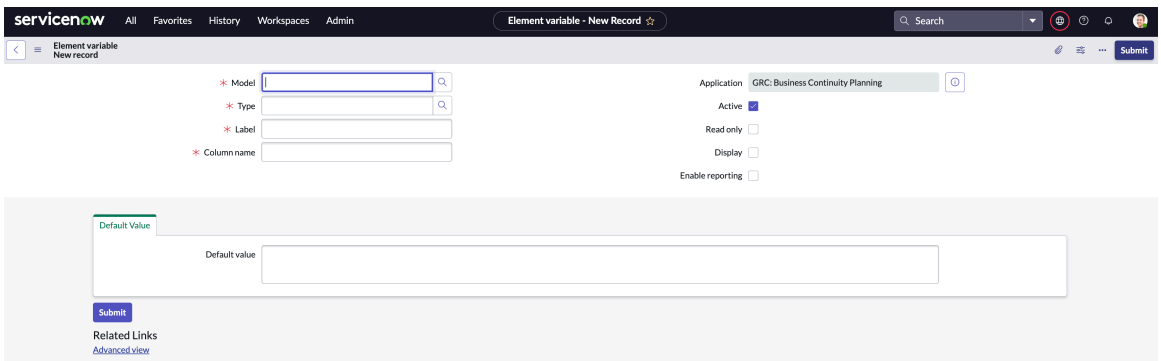
Field	Description
	For information on configuring a Resource configuration record, see Configure Resource Configuration records.

Configure element variables for element definitions

Configure an element variable for a specific dependency of an element. To do this, use the **Element variables** module in the Business Continuity Management application navigator.

Before you begin

Role required: sn_bcm.admin



About this task

Element variables are custom elements that are used in the Grid configuration. As a functional system administrator, you can configure an element variable to include specific custom columns that are essential for a particular element's dependency.

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Element variables**.
2. Select **New**.

   The example shows an administrator's view of the element variable record.

3. On the form, fill in the fields.
   For more information on the fields in the form, see Element variable record form.
4. Select **Submit**.

Element variable record form

Use the Element variable record form to configure an element variable. Element variables are custom elements that are used in the Grid configuration. You can set up an element variable that is specific custom columns, which are required for a particular dependency of an element.

Element variable record form

For description of the field values, see the table.

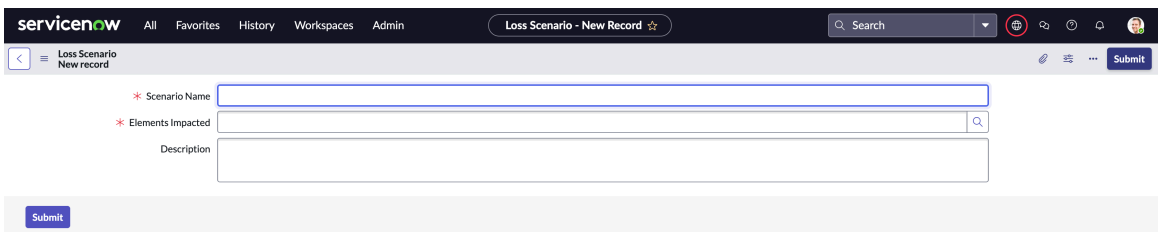
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Element variable record form

Field	Description
Model	Element definition [sn_bcm_element_definition] reference. You can create multiple element variables for an element definition.
Type	Field class in the model table.
Label	Display name in the dependency group of the BIA dependency grid.
Column name	Name of the column in the table.
Application	Application that contains the record.
Active	Option to activate the element variable.
Read only	Option to render the element variable as read only.
Display	Option to display the element variable.
Enable reporting	Option to report the element variable.
Default Value	
Default value	Description for the default value of the element variable.

Configure loss scenarios in the plan

Configure a plan for an identified loss scenario by using the loss scenario template in the Business Continuity Management application. Use the documented plan that has the needs and requirements listed for a potential disaster.



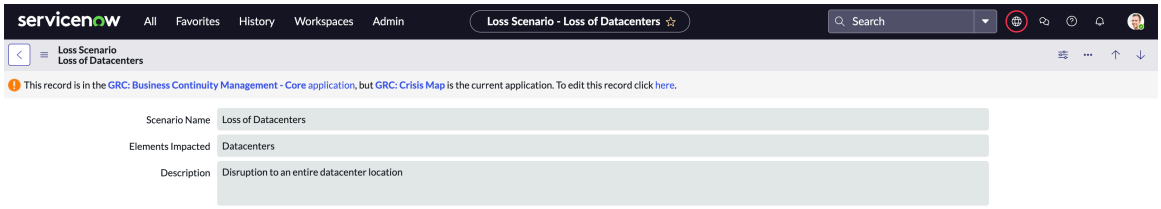
Before you begin

Role required: sn_bcm.admin, sn_bcp.plan_admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Loss Scenarios**.
2. Select **New**.

   The Loss scenario form is shown in the example.



3. On the form, fill in the fields.

   For more information on the fields, see Loss Scenario record form.

   The example shows the details of a loss scenario.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.

Loss Scenario record form

Use the Loss Scenario record form in BCM UIB Workspace to configure a plan for an identified loss scenario.

Loss Scenario record form

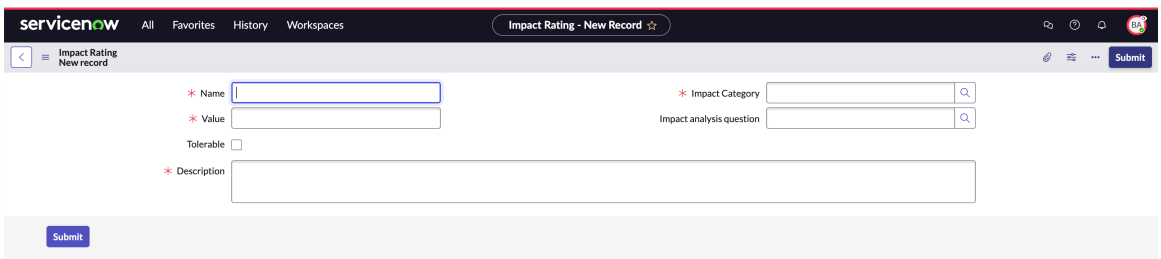
For description of the field values, see the table.

Loss Scenario record form

Field	Description
Scenario Name	Name of the impact scenario.
Elements impacted	Items or assets that are impacted because of the loss scenario.
Description	Short note about the loss scenario.

Configure impact ratings

Configure an impact rating to assess an impact category as low, moderate, high, or critical. Use the **Impact Ratings** module in the Business Continuity Management application navigator to help you measure the intensity of the loss when a business downtime occurs.



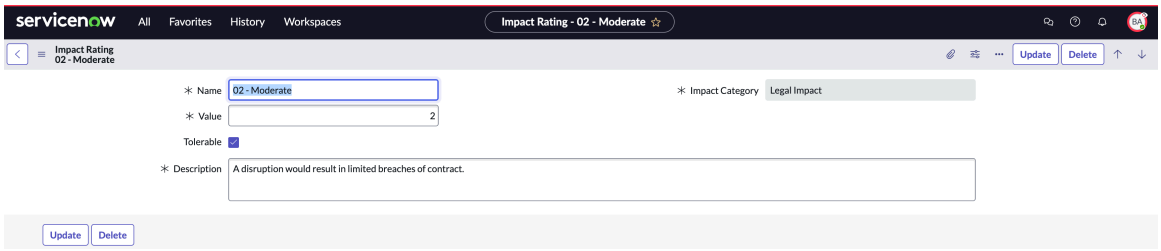
Before you begin

Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Impact Ratings**.
2. Select **New**.

   The impact rating template is shown in the example.



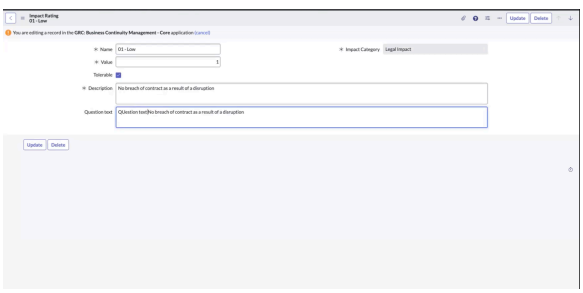
3. On the form, fill in the fields.

   For more information on the fields in the form, see Impact Rating record form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example shows an impact rating from the demo data.

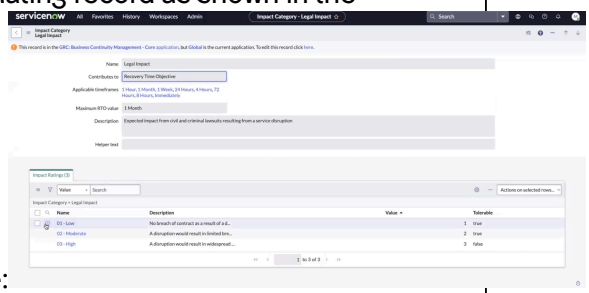
4. Select **Submit**.

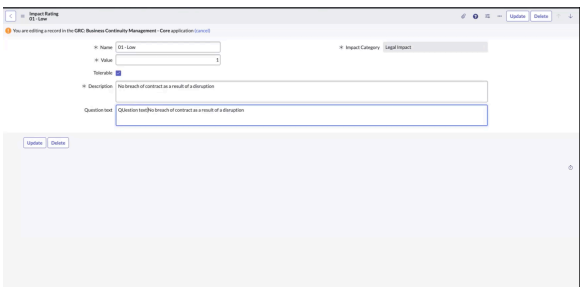


Impact Rating record form

Use the Impact Rating record form to assess an impact category such as low, moderate, high, or critical by using BCM UIB Workspace.

Impact Rating record form





For description of the field values, see the table.

Impact Rating record form

Field	Description
Name	Name of the impact rating.
Value	Numerical value for the impact rating. You can associate a unique numerical value to each impact rating. You cannot use the same value for any other impact rating in the BCM application. For example, you can assign value *1* to the *01 - Low* impact category as shown below. After you do so, you cannot assign value *1* to any other impact rating in your BCM application instance. 
Impact Category	Category of the impact. For example, Workforce impact, Regulatory impact, Revenue impact, and so on.
Impact analysis question	List of available impact analysis questions. This field is displayed if the impact category of the business disruption contributes to RPO.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

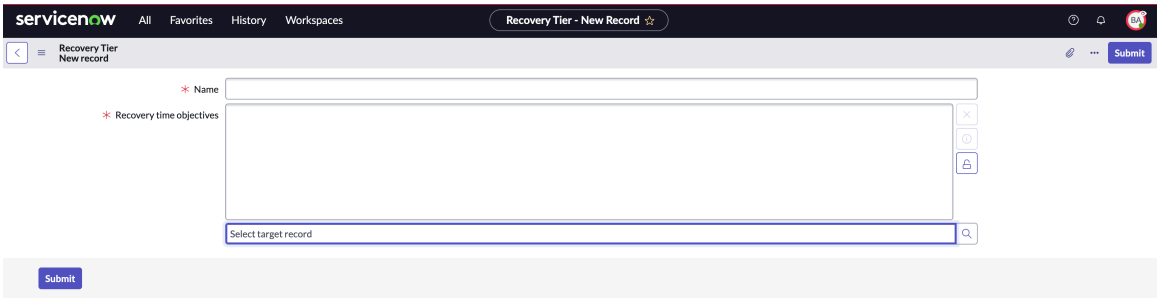
Impact Rating record form (continued)

Field	Description
Tolerable	Option for enabling the RTO impact as tolerable. This check box is displayed only if the impact category contributes to RTO.
Description	Short description about the impact rating.
Question text	Field to revise the question text. For the recovery time objective of an impact category, you can revise the question that is displayed in the RTO assessment questionnaire. You can navigate to the Impact Rating record as shown in the example:  Update the question text for the RTO assessment as shown in the example:  The revised question is then displayed in the RTO assessment of the business impact analysis record.

Configure recovery tiers for BIA

Configure a recovery tier with a set of business applications that follow a similar range of recovery time objective (RTO) values. Use the **Recovery Tiers** module in the Business Continuity Management application navigator to configure a recovery tier.

Before you begin



Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Recovery Tiers**.
2. Select **New**.
3. On the form, fill in the fields.

   The recovery tier record is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the fields in the form, see Recovery Tier record form.

4. Select **Submit**.

Recovery Tier record form

Use the Recovery Tier record form to configure a recovery tier with a set of business applications by using BCM UIB Workspace.

Recovery Tier record form

For description of the field values, see the table.

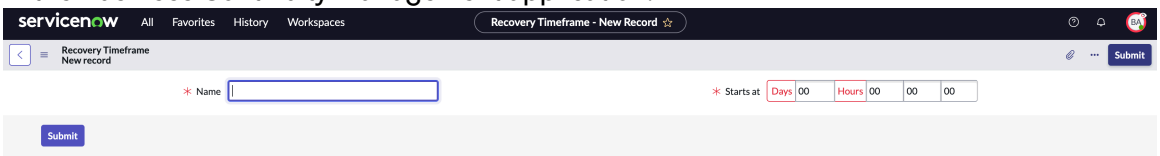
Recovery Tier record form

Field	Description
Name	Name for the recovery tier level.
Recovery time objectives	Metric that calculates how quickly the business should recover an element after a disaster.

Set up recovery timeframes

Set up a recovery timeframe for a recovery tier. The recovery timeframe starts from when a disruptive event happens to the time when your business can resume usual operations. You can use the **Recovery Timeframes** module in the Business Continuity Management application to set up the timeline for the recovery timeframe.

Before you begin



Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Recovery Timeframes**.
2. Select **New**.
3. In the **Name** field, enter the name for the recovery timeframe.
4. In the **Starts at** field, enter the start of the timeline for the recovery timeframe in days, hours, minutes, seconds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example shows the configuration of a recovery timeframe in the Business Continuity Management application.

5. Select **Submit**.

Configure grid categories

Configure a grid category such as Dependency Assessment for the grid configuration. Use the **Grid Categories** module in the Business Continuity Management application navigator to configure the grid categories.

Before you begin

Role required: sn_bcm.admin

About this task

To create custom columns (grid configuration) for the BIA dependency group from the BCM Configurable Workspace, see KB1645940.

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Grid Categories**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information on the fields in the form, see Grid category record form.
4. Select **Submit**.

Grid category record form

Use the Grid category record form to configure a grid category such as Dependency Assessment for the grid configuration by using BCM UIB Workspace.

Grid category record form

For description of the field values, see the table.

Grid category record form

Field	Description
Name	Name of the grid category.
Code	Code for the grid category.
Enable element context	Option to enable the element context for the grid category.

Configure grid for BIA assessment

Configure the grid to render the BIA dependency assessment grid with configured columns. Use the **Grid Configurations** module in the Business Continuity Management application navigator to configure the grid.

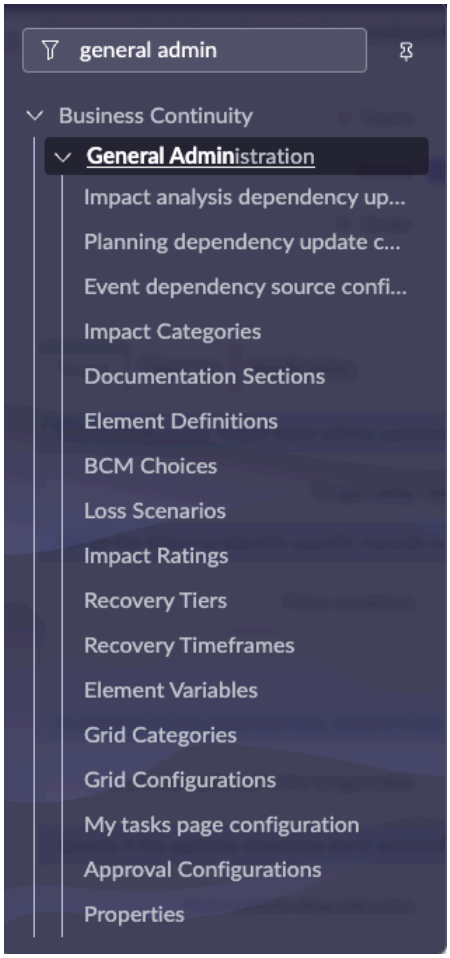
Before you begin
Role required: sn_bcm.admin

Procedure
1. Navigate to **All** > **Business Continuity** > **General Administration** > **Grid Configurations**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information, see Grid configuration record form.
4. Select **Submit**.

Grid configuration record form
Use the Grid configuration record form to set up the BIA assessment grid in the classic Workspace.

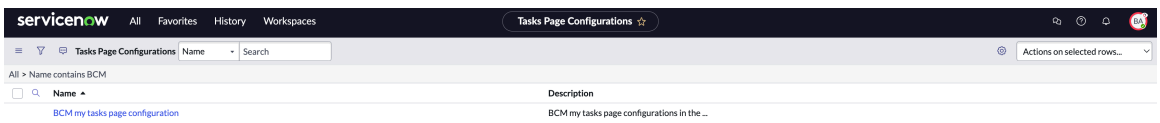
Grid configuration record form
For description of the field values, see the table.



Grid configuration record form

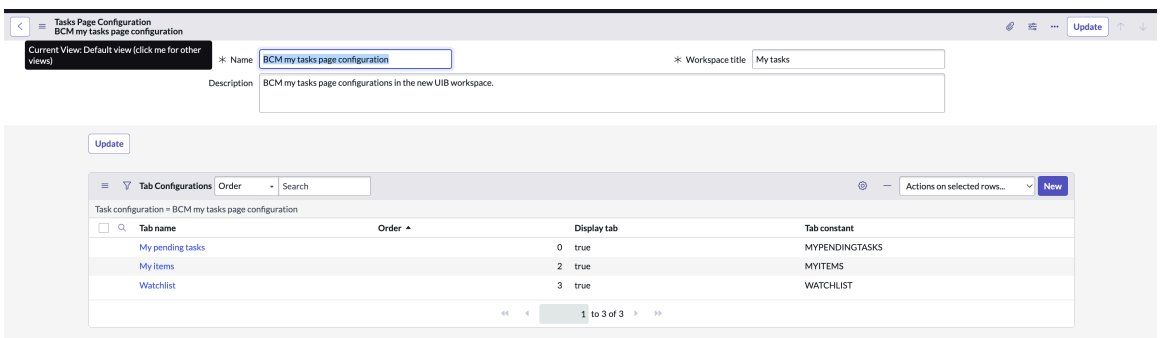
Field	Description
Name	Name of the grid configuration.
Grid category	Grid category for which the configuration is applicable. For example, DEP_ASSMNT.
Active	Option to set the record active. If the option is disabled, then the grid is rendered based on the configured view. Only one active configuration for a category and element should be present.

My tasks page configurations
If you are the Business Continuity Management application user, you can use **My tasks page configurations** in the **General Administration** module to view your assigned tasks.



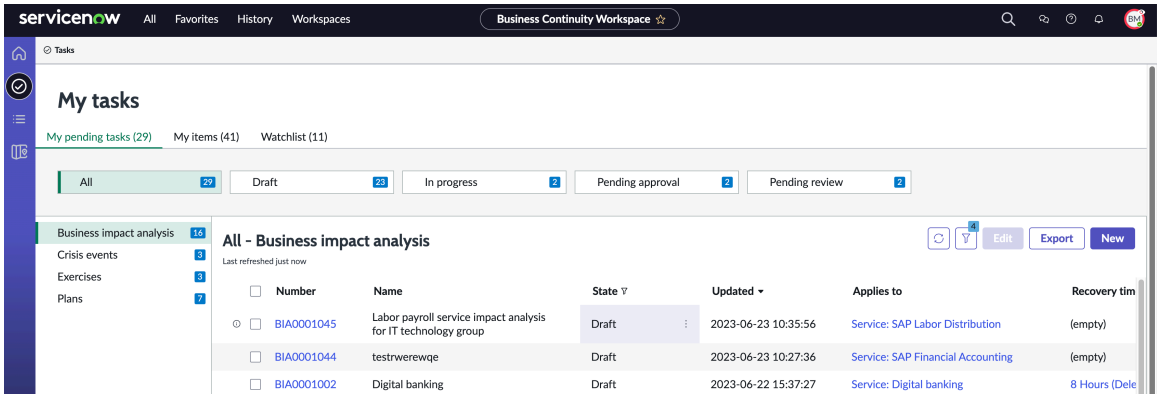
My tasks page configurations module
The administrative tasks that are associated with the BCM application are listed in the **General Administration** module in the application UI. You can view My tasks page configurations in the **General Administration** module as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you have the BCM administrator role, you can customize the BCM tasks in **My tasks page configuration**.

The **My tasks page configurations** module in the list view is shown in the following example.



The **My tasks page configurations** module record is shown in the following example.

My tasks page in the Home page displays the assigned tasks for the logged-in user as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on My tasks page view in BCM UIB Workspace, see My tasks page view.

Approval configuration

Approver configurator provides you with capabilities to define multiple levels of approvals based on business rule definitions.

To set up multiple levels of approvals in your business impact analysis and business plans, you must configure the following setup steps:

- Set up approval configuration
- Set up approval levels
- Set up approval rules

Note:

For more information on the roles in the Business Continuity Management application, see Components installed with Business Continuity Management.

For more information on the roles in the GRC: Approver Configurator application, see Roles installed with GRC: Approver Configurator.

Set up approval configuration

Set up approval configuration to enable multiple levels of approvals and select approvers for each level based on approval rules.

Before you begin

You must install GRC: Approver Configurator (sn_grc_appr) application for approval configurations.

Role required: sn_bcm.admin

Note:

Granting this role to a user is equivalent to giving the user the admin role, because workflow script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.

Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Configuration form

Field	Description
Name	Name of the approval configuration.
Applies to	Table such as a business impact analysis, business continuity plan, events, or any table from which a record is submitted for approval.
Priority	Preference of approval configuration with higher priority.
Filter condition	Condition applied on the table with reference to the **Applies to** field. The approval configuration with higher priority that matches the filter condition for the business document is selected for approver evaluation.
Active	Option to enable the approval configuration as active.

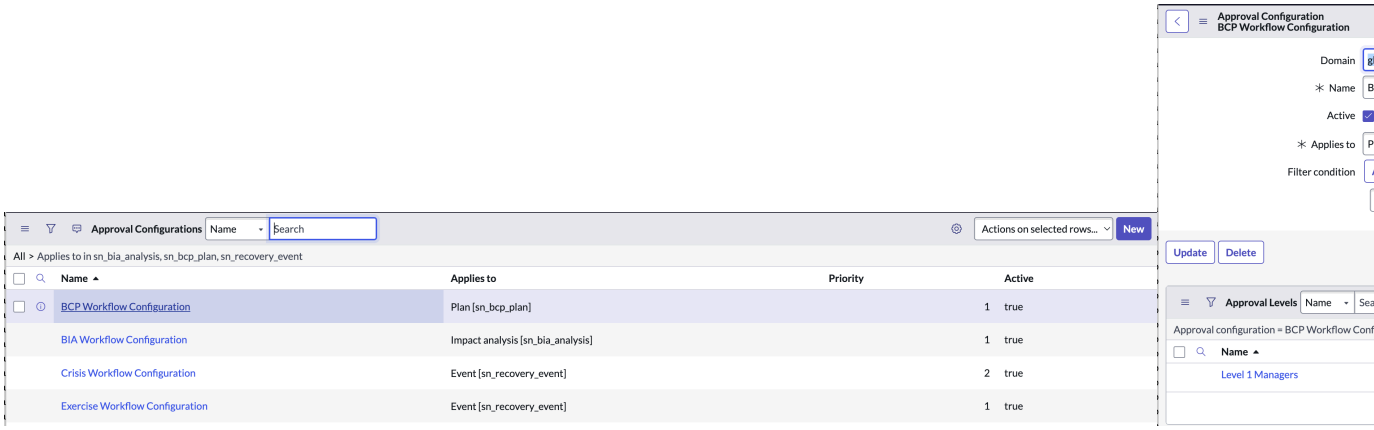
Note:
You cannot have more than one approval configuration applying to the table with the same priority.

4. Click **Submit**.

Set up approval levels

Assign multiple levels of approvals to users or groups to support each step of your BIA, BCP, or events workflow processes.

Before you begin



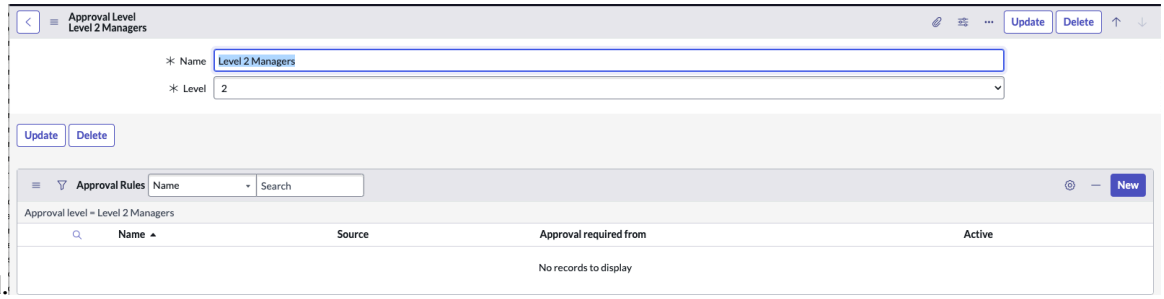
Role required: sn_bcm.admin

Note:
Granting this role to a user is equivalent to giving the user the admin role, because workflow script activities bypass access controls and grant access to all tables and database operations. Script activities do not bypass application scope settings.

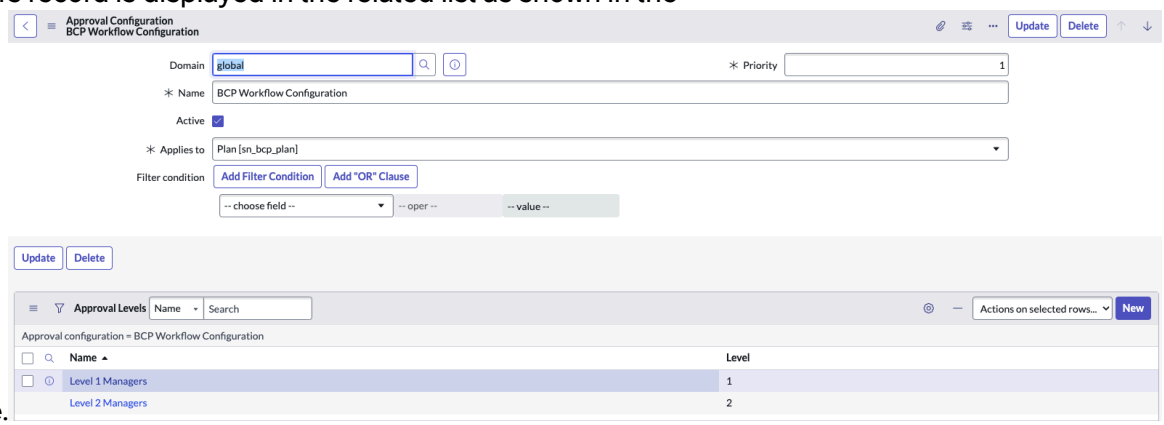
Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**.
   With the BCM application, these approval configurations are supported with the base system:
   - `BCP Workflow Configuration`
   - `BIA Workflow Configuration`
   - `Crisis Workflow Configuration`
   - `Exercise Workflow Configuration`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can update the existing BCP, BIA, Crisis, or Exercise configurations. Additionally, you can set up multiple levels of approval configurations for BCP, BIA, Crisis, or Exercise. The base system supports the Level 1 approval level by default.



2. To set up multiple approval levels for an existing configuration such as the BCP Workflow Configuration, select the **BCP Workflow Configuration** record from the list and complete the substeps.

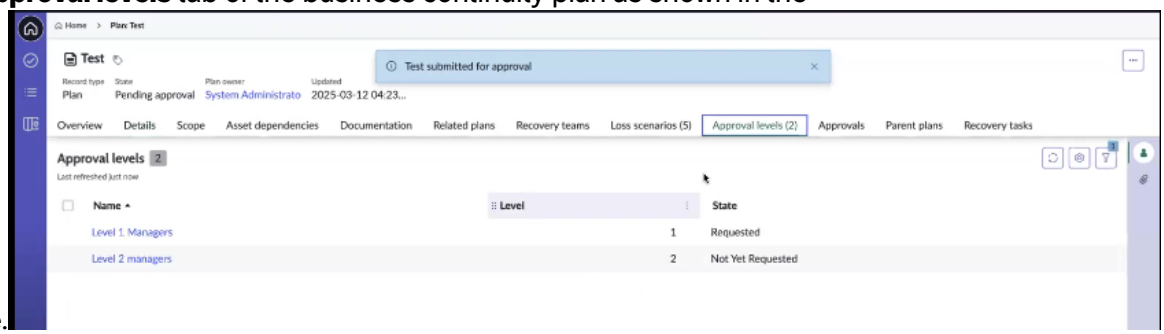
   The **BCP Workflow Configuration** record is displayed.

   a. Select **New** in the related list of the BCP Workflow Configuration record.
   The Approval level new record form is displayed.

   b. In the form, enter the name for the approval level record such as Level 2 Managers, select the level such as level 2, and select **Submit**.
   The newly created Approval level record such as Level 2 Managers record is displayed in the related list as shown in the example.

3. To configure an approval rule for the newly configured approval level record, select **New** in the Approval Rules related list of the approval level record and complete the steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Update the approval rule configuration for continuity plans by updating the filter condition and the approver type as shown in the example.

In the filter condition, you can select the source table on which rule the approval rule is evaluated. Optionally, you can apply additional condition on the source table. You can select a field to filter the source records based on the Applies to table of the approval configuration. You can configure for which records, level 1 should trigger level 2.For more information, see Approval Rule New Record form.

b. Select **Submit**.

The approval rule is now configured for the approval level. When a business continuity plan is created in the BCM Configurable Workspace and later it is sent for a review and an approval, the multiple approval levels are displayed in the **Approval levels** tab of the business continuity plan as shown in the example.

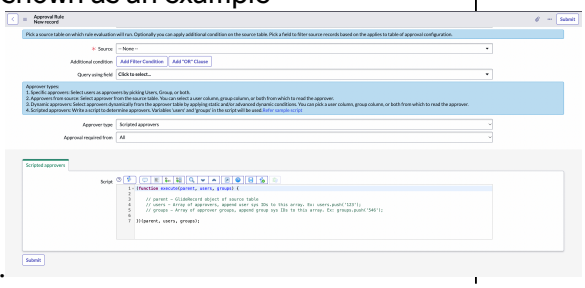
Set up approval rules

Set up rules for approvals at each approval level by selecting an approver type and the requirement of approval from either one or all the stakeholders. Define filter conditions on the source table to which the approval rule is applied.

Before you begin

Role required: sn_bcm.admin

About this task



You can select specific approvers, approvers from the selected source table, dynamic approvers, or approvers that you choose to approve your business documents. The approvers can be a BIA owner, BCM lead, BCM manager, BCM admin, contributors, or one or all of them from the source table that you select.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Assignment and Approval Configurations** > **Approval Configurations**.
2. Click an approval configuration record in the list.
3. Click the approval levels record in the **Name** column of the Approval Levels section.
4. Click **New** in the Approval Rules section.
5. On the form, fill in the fields.

Approval Rule form

Field	Description
Name	Name of the approval rule.
Source	Table to which the approval rule is applied.
Query using field	Field that connects the approving table and the source table.
Additional condition	Filter conditions applied on the source table.
Approver type	Type of approver. ○ Specific approvers: Your choice of approvers. ○ Approver from source: Users or groups from the source table. ○ Dynamic approvers: Approvers selected dynamically from any table. ○ Scripted approvers: Script to determine approvers. See the script shown as an example below. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: For security reasons, the BCM admin doesn't have write access to the **Script** field on the Approval Rule form. Only the Approver Configurator developer has create and write access to the **Script** field on the Approval Rule form. If you have the BCM admin role, you can set up an approval rule only with types of approvers from the Approver type list: ○ Specific approvers ○ Approver from source For more information on the roles in the GRC: Approver Configurator application, see Roles installed with GRC: Approver Configurator.
Approval required from	One or more stakeholders from whom the approval is required.
Description	Brief note about the approval rule.
Approvers	
Approvers from	Approver table. This field is available only if the Approver type is **Approver from source** or **Dynamic approvers**. Defaults to the source table if it is Approver from source.
Filter by	Conditions to filter records from the approver table. This field is available only if the Approver type is **Dynamic approvers**.
Advanced	Option to set a scripted dynamic condition.
User field	User reference or list of approvers from the approver table.
Group field	User group reference as approver from the approver table.
Dynamic condition	Script field to apply advanced filter on approver table.
Users	One or more users designated as approvers.
Group	Group of approvers.
Scripted approvers	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Script	Script to determine approvers; **users** and **groups** in the script are selected as approvers.

6. Click **Submit**.

Example: Sample script to add assignees from CMDB dependencies as approvers

Field values on the form:

Name

Assignee of CMDB dependency as approvers.

Source

Dependency [sn_bia_dependency].

Query using field

Dependency Group.Impact Analysis

Approver type

Scripted approvers

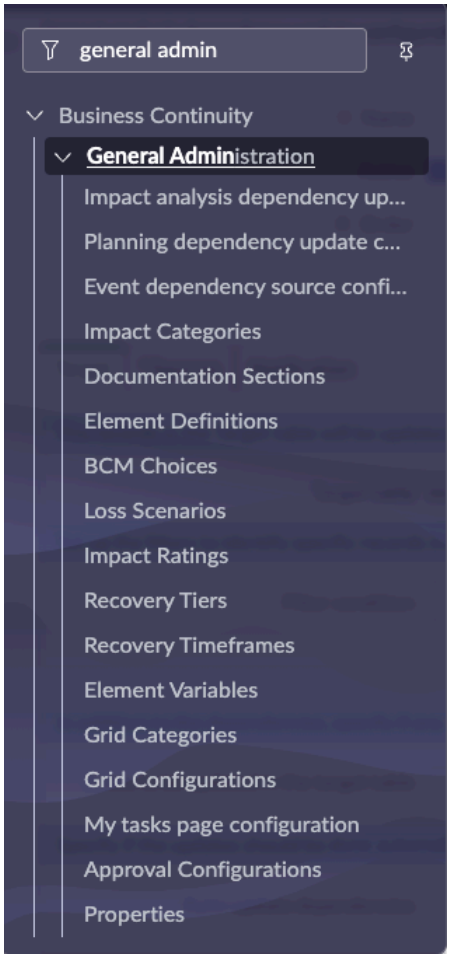
Sample script to add approvers

```
(function execute(parent, users, groups) {

    // parent - GlideRecord object of source table
    // users - List of approvers
    // groups - List of approver groups
    var gr = new GlideRecord('cmdb_ci');
    gr.addQuery('sys_id', parent.depends_on);
    gr.query();

    while (gr.next()) {
        users.push(gr.assigned_to.toString());
    }

})(parent, users, groups);
```



BCM properties

You can configure the BCM properties in the **Properties** module.

If you are the Business Continuity Management application user, you can view the properties for the Business Continuity Management application in **Properties** in the **General Administration** module.

You can view the **Properties** menu option in the **General Administration** module as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

© 2026 ServiceNow, Inc. All rights reserved.

BCM properties (continued)

Sr. No	Name	Description
8	Enable/Disable use of google map's "Places" API [sn_bcm_map.use_google_places_lib]	• Scope: GRC: Crisis Map • **Type**: true or false • **Default value**: false **Note:** Prior to enabling the Crisis Map feature, verify that you have purchased and set up the Google Maps API.
9	Maximum time (by hours) allowed to update dependencies [sn_bcm.max_dependency_update_processing_time]	• Scope: GRC: Business Continuity Management - Core • **Type**: numerical value • **Default value**: 24
10	Max relationships for each level [sn_bia.cmdb_max_relationships_per_level]	• Scope GRC: Business Impact Analysis • **Type**: numerical value • **Default value**: 5000
11	Event task count limit for asynchronous order calculation in business rule [sn_recovery.sync_task_order_calculation_limit]	• Scope: GRC: Crisis Map • **Type**: Integer • **Default value**: 500
12	Maximum number of element definitions to show in UI [sn_bcm.element_definitions_limit]	• Scope: GRC: Business Continuity Management - Core • **Type**: numerical value • **Default value**: 20
13	Default limit for Category impact assessment question responses [sn_bcm.config.category_impact.response_limit]	• Scope GRC: Business Impact Analysis • **Default value**: 10

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BCM properties (continued)

Sr. No	Name	Description
14	Maximum levels of activated plan to be created in an event [sn_recovery.max_activated_plan_levels]	• Scope: GRC: Business Continuity Management - Core • **Type**: Integer • **Default value**: 10
15	Mark the Impact Assessment as Complete once all required questions are answered, or all questions (required and optional) are answered. [sn_bia.determine_impact_assessment_status]	• Scope GRC: Business Impact Analysis • **Type**: Required questions or All questions • **Default value**: Required questions
16	Recovery task count limit for synchronous order calculation in business rule [sn_bcp.sync_task_order_calculation_task_limit]	• Scope: GRC: Business Continuity Planning • **Type**: Integer • **Default value**: 500
17	Tables referenced by the system to fetch child records when analyzing CMDB asset dependencies, even if they are not part of the element definition. [sn_bcm.read_cmdb_tables = cmdb_ci_datacenter]	• GRC: Business Continuity Management - Core • **Type**: String • **Default value**: None
18	Default limit for IRM GlideRecord getter. [sn_irm_shared_cmn.config.get_gliderecord_limit]	• Scope: GRC: Risk Shared Common Components • **Type**: Integer • **Default value**: 1000

Setup for a business impact analysis

The administrative tasks that are associated with a business impact analysis are listed in the **General Administration** module in the Business Continuity Management application.

Typically, the BIA administrator with the sn_bia.bia_admin role configures the BIA templates. For more information, see Configure BIA templates with legacy assessment.

Configure BIA templates with legacy assessment

Configure a business impact analysis (BIA) template in the Business Continuity Workspace with a legacy assessment. Select the type of elements, impact categories, and dependencies to be assessed. The legacy assessment uses the older method of selecting impact categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_bcm.admin

About this task

You can use the preconfigured BIA templates that are provided with the base system.

- Application Technical Impact Assessment
- BIA for Business processes
- Business Process Impact Assessment
- Business Service Impact Assessment
- Data Center Analysis Template
- Service Offering Impact Assessment
- Workplace Impact Assessment

Beginning with the Yokohama release, you can configure the BIA template with the legacy or Smart assessment. The legacy assessment shows only drop-down questions, while the Smart assessment enables multiple question types and configures RTO, RPO, and recovery tier calculations based on the responses to the questionnaire.

Procedure

1. Navigate to **All** > **Business Continuity** > **BIA Configuration** > **BIA Templates**.
   You can use the preconfigured BIA templates provided with the instance or select this option to configure a new BIA template.
2. Select **New**.

   The BIA template record is displayed.

3. On the form, fill in the fields.
   For more information on the fields in the form, see BIA template form for the legacy assessment.
4. Add the name and description for the BIA template.
5. Select the type of elements that are using this template, such as, Business Processes.
6. To select the legacy assessment for performing the BIA, select **Legacy assessment** in the **Assessment type** field.

   A sample BIA template with the legacy assessment is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To assess the type of impact, select the impact category in the **Impact categories** field. You can select different impact categories such as Legal impact, Regulatory impact, Reputation impact, or Revenue impact. Based on the impact category, you can calculate the recovery time objective (RTO) and recovery point objective (RPO). For information on configuring the impact category of the BIA, see Configure impact category for BIA.
8. Select the dependencies in the **Dependency assessments** field.
9. To include Confidentiality, Integrity, and Availability (CIA) information for the primary element in the BIA, select **Yes**.

   A sample BIA template is shown in the example.

10. Select **Update**.
    The BIA template with the legacy assessment is configured in the instance.

BIA template form for the legacy assessment

Use the BIA template form to configure the business impact analysis with the legacy template. You can add details such as name, description, elements, impact categories, and so on in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BIA template form with legacy assessment

For description of the field values, see the table.

BIA template form with legacy assessment

Field	Description
Name	Name of the BIA template. For example, Application downtime assessment.
Description	Brief description of the template.
Primary element assessed	Primary object type or an element that is being assessed using this template.
Assessment type	Assessment type for the BIA. Options are: • **Legacy assessment** • **Smart assessment** Select the Legacy assessment option.
Impact categories	Category of impact that is relevant to an organization and that is assessed during the business impact analysis. It can be revenue, legal, regulatory, reputation impact, and so on.
Dependency assessments	Category of items or assets that the business function depends on such as locations or business applications. The dependencies are identified and assessed as part of the business impact analysis.
Include CIA	Option to include Confidentiality, Integrity, and Availability to BIA. Available options are: • **Yes**: Set the flag as **Yes**, if the primary element that is being analyzed has critical data and whether it must include Confidentiality, Integrity, and Availability information in the analysis. • **No**: Set the flag as **No**, if the primary element that is being analyzed does not have critical data. The field appears only if the elements that selected for the **Primary Element Assessed** field in the same form require data backup.

Create Smart Assessment templates for BIA

Create Smart Assessment templates in the Assessment Workspace for the Business Impact Analysis (BIA) workflow.

Before you begin

Role required: sn_bcm.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

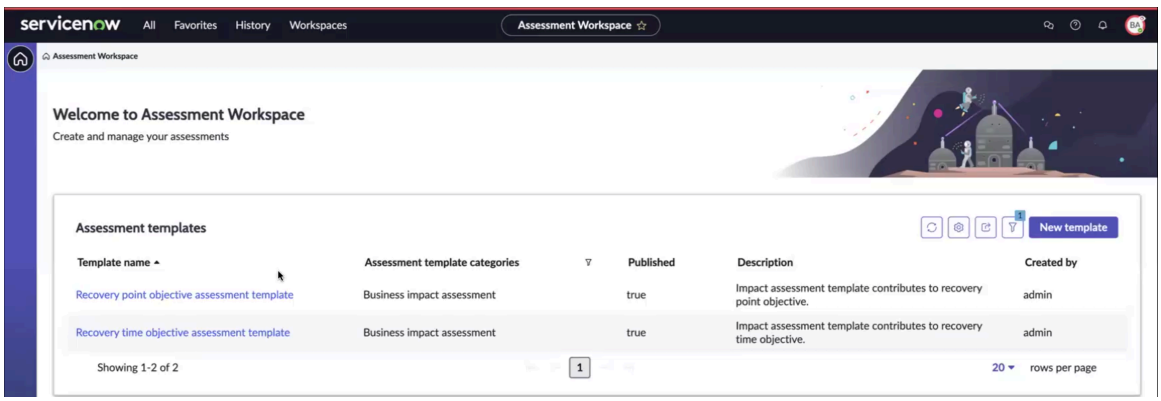
Note:
The flows shown in the examples are demo flows. You can configure the flows according to your requirements.

Required and optional apps

The store apps for using the Smart Assessment Engine application in BIA are listed.

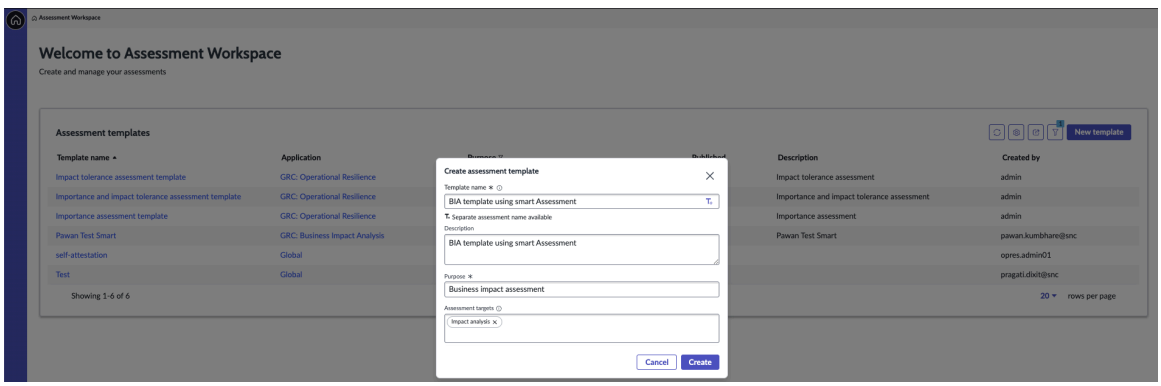
1. Required apps: Smart Assessment Core [com.sn_smart_asmt], Smart Assessment Designer [com.sn_smart_asmt_desg], Smart Assessment Connected [com.sn_smart_asmt_conn]
2. Optional apps: Smart Assessment Post-assessment Actions [com.sn_smart_imp_auto]

For information about the initial setup checklist for Smart Assessment Engine, see Configuring Smart Assessment Engine. For more information on the Smart Assessment Engine, see Smart Assessment Engine.



About this task

To configure a BIA template using Smart Assessment, see Configure BIA templates with Smart Assessment.

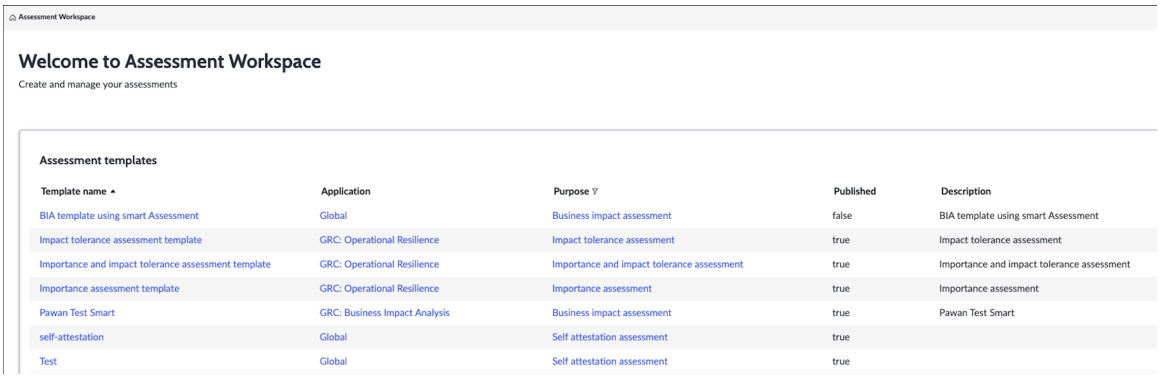


Procedure

1. Navigate to **Workspaces** > **Assessment Workspace** and select **New template**.

   You can create assessment templates to manage your assessments in the Assessment Workspace. The example shows demo data in an instance.

   The Create assessment template form is displayed.

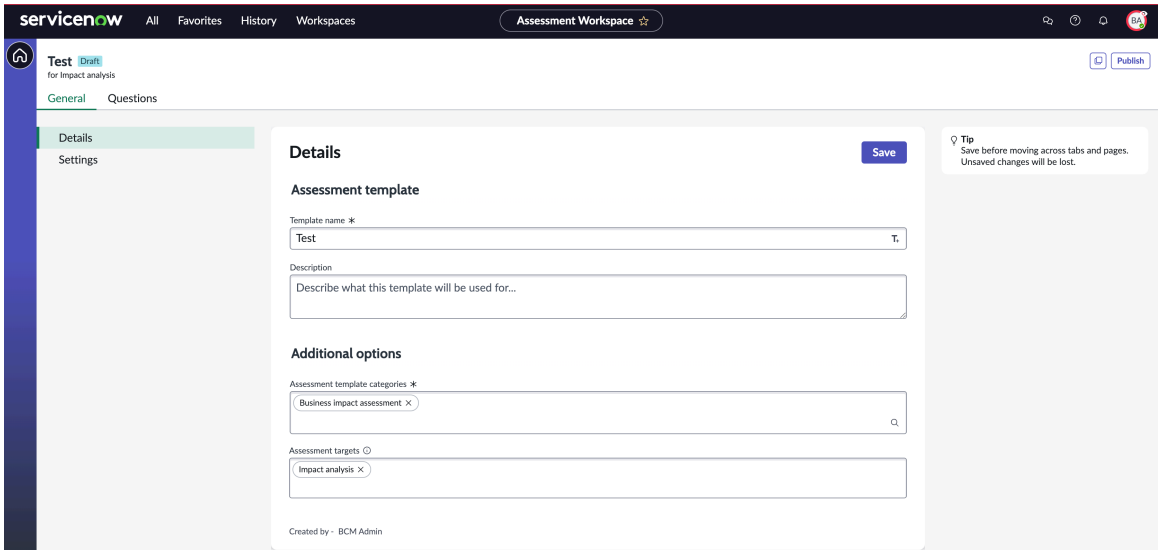


2. In the Create assessment template form, fill in the fields and select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

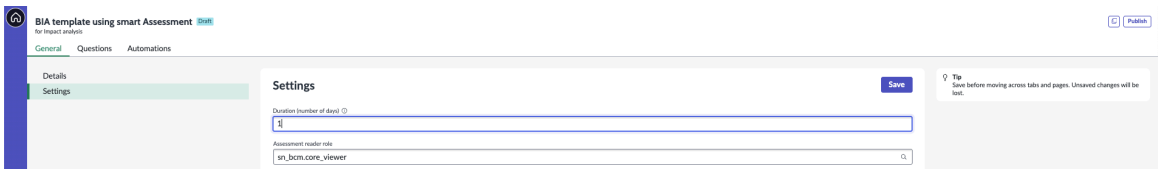
Create assessment template form

Field	Description
Template name	Unique meaningful name for the template. For example, BIA template using Smart Assessment.
Description	Brief explanation of purpose.
Purpose	Intended use of the template. For example, Business impact assessment.
Assessment target	Table records that are used for the assessment. For example, Impact analysis.



The newly created BIA template is displayed in the Assessment templates list as shown in the example.

When you select the template, the **General** and **Questions** tabs are displayed, enabling you to add instructions, questions, response guidance, and sections that group related questions. You can verify the template details displayed in the **Details** section of the **General** tab.

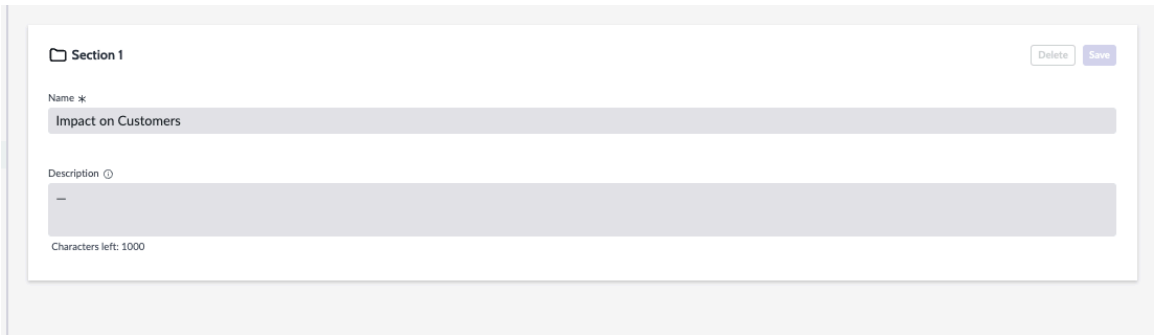


- Verify that the assessment template category selected in the Details section of the **General** tab is **Business impact assessment** as shown in the example. The Business impact assessment template category is associated with the sn_bcm.core_viewer role. Users with the sn_bcm.core_viewer role can view these templates in read-only mode.
- The assessment target in the **Assessment targets** field is set to **Impact analysis** only.
- Assessment reader role: Assign read-only access to users with the specified role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Add the assessment duration in days and assign a role in the **Assessment reader** role field in the Settings section, then select **Save**.

   The Assessment reader role option in the Smart Assessment template enables designated users to view assessments in read-only mode without being the assessor. For BIAs, BCM administrators assign the BCM Core viewer [sn_bcm.core_viewer] role as the Assessment reader role to maintain the same functionality as the legacy assessment.



> **Note:**
> For information on creating an assessment template, see Create an assessment template.

4. Set up the assessment questions in the **Questions** tab.

   a. Select **+Add section** to organize related questions, then select **Save**.

      A sample section is shown in the example.

   b. Select **+Add question**, add questions marking them as required or optional and select the type of the answer.

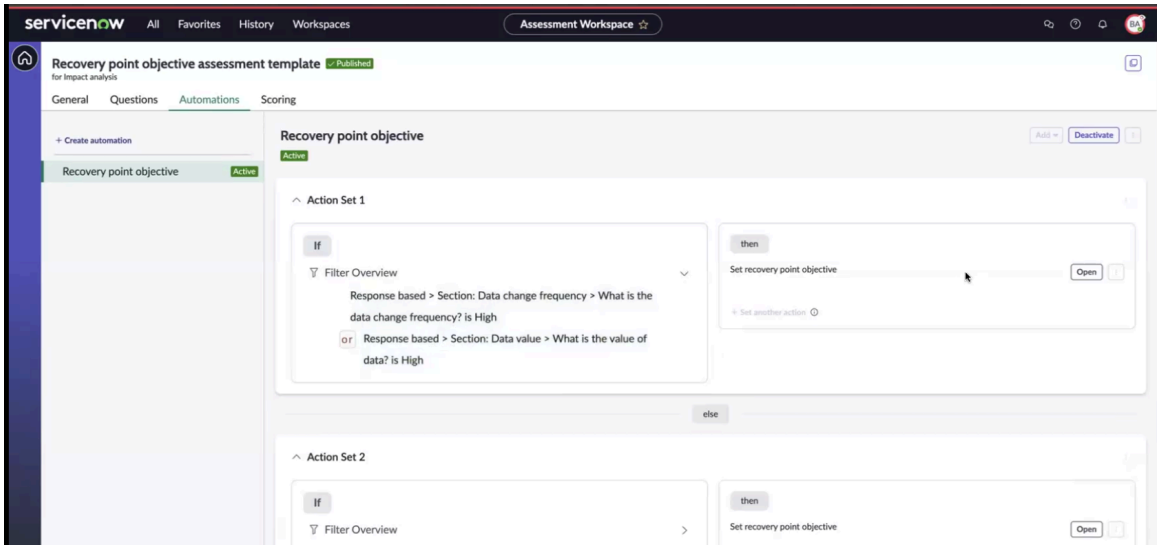
      The example shows modals with different options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. To add reference data for the assessment, select **Add assessment reference**, choose the desired columns, and select **Add**.
These cards are displayed on the side panel to add information about the assessment targets.

d. Add instructions in the text box to set the context and inform responders on how to answer the questions appropriately.

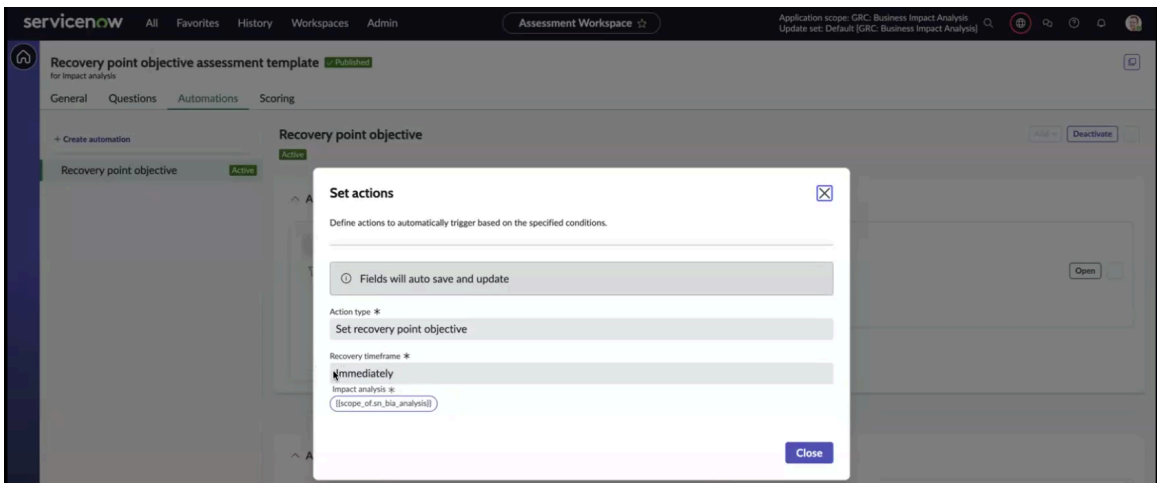
For information on adding instructions and questions to the assessment template, see Add instructions and questions to an assessment template.



5. Select **Save**.
6. To publish the template, select **Publish**.
A message is displayed that the assessment template is published and you can use it to send assessments.
7. Configure response-based automation and corresponding actions by creating automation rules in the **Automations** tab of the published template.
Automation reduces manual data entry. The system analyzes responses and automatically populates RPO and RTO fields in your impact analysis records.

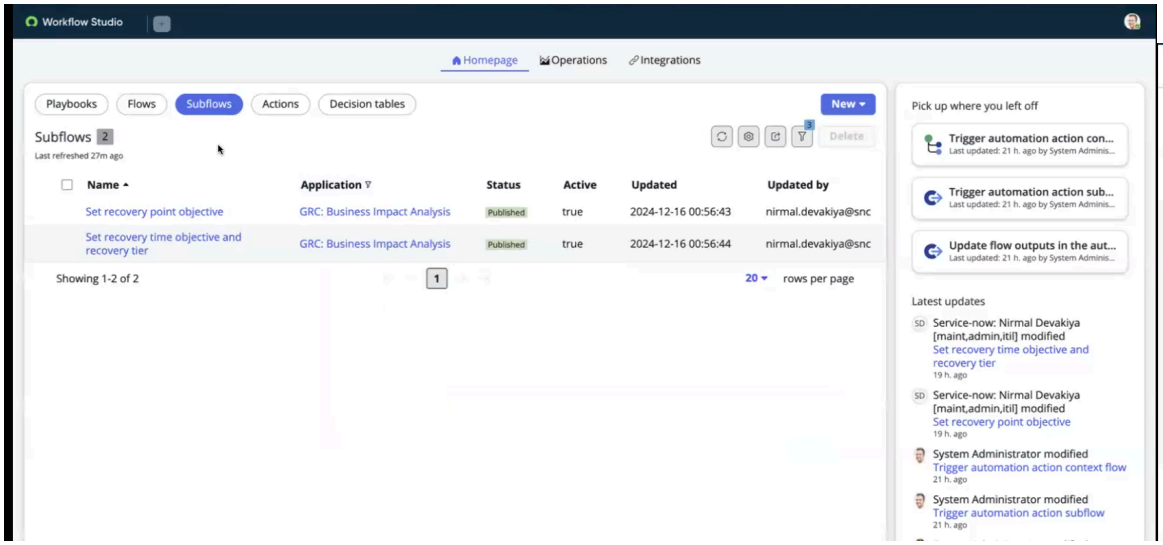
a. Select **+ Create automation**, add the name and description for the rule, and select **Create**.
The automation is created in the Draft state.

b. Define rules that automatically trigger actions based on user responses in the "If" block.



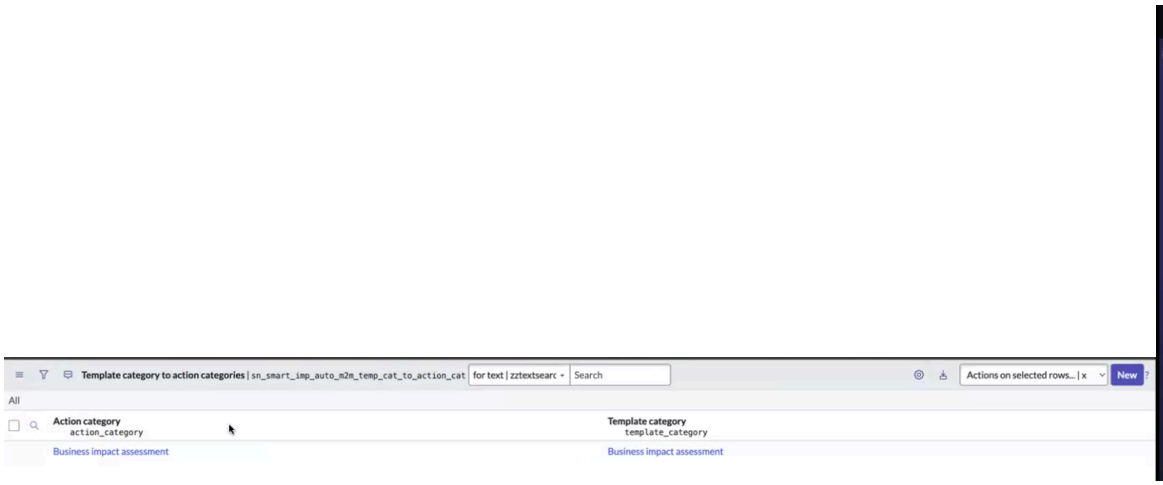
The Action set consists of an "If" block and a "Then" block. The "If" block sets conditions that trigger automation. The "Then" block defines the actions that execute automatically when those conditions are met.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. Set an action in the "Then" block that is triggered automatically based on user responses.

The system reviews user responses and suggests actions and the corresponding timeframes. For example, if data change frequency = "High", the system suggests a recovery timeframe = "Immediately" as shown in the example.



For the automation setup, two subflows are provided in the Workflow Studio as part of demo data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the properties of the subflow, the **Category** field is set to **Business impact assessment**. When the action category and the template category are mapped in the BIA as shown in the example, the **Set recovery point objective flow** is displayed in the **Action type** field in the Set actions dialog box.

d. To activate the automation, select **Activate** in the **Automations** tab, confirm the details in the Activate dialog box, and select **Activate** again.

Once activated, the automation appears in the **Automations** tab.

For more information on automations, see Automate response and Configure post-assessment actions.

8. Configure scoring settings on the **Scoring** tab.

For more information on assigning scores to the assessments, see Scoring assessments.

9. Select **Save**.

10. To copy a published template, select **Copy template**, update the fields, and save your changes.

11. To publish the assessment template, select **Publish**.

A message confirms that the assessment template is published and ready to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To proceed, select **OK**.

b. To return to the template list on the Assessment Workspace landing page, select **Return to template list**.

Result
You can use the published Smart Assessment template for the Business Impact Analysis (BIA) workflow.

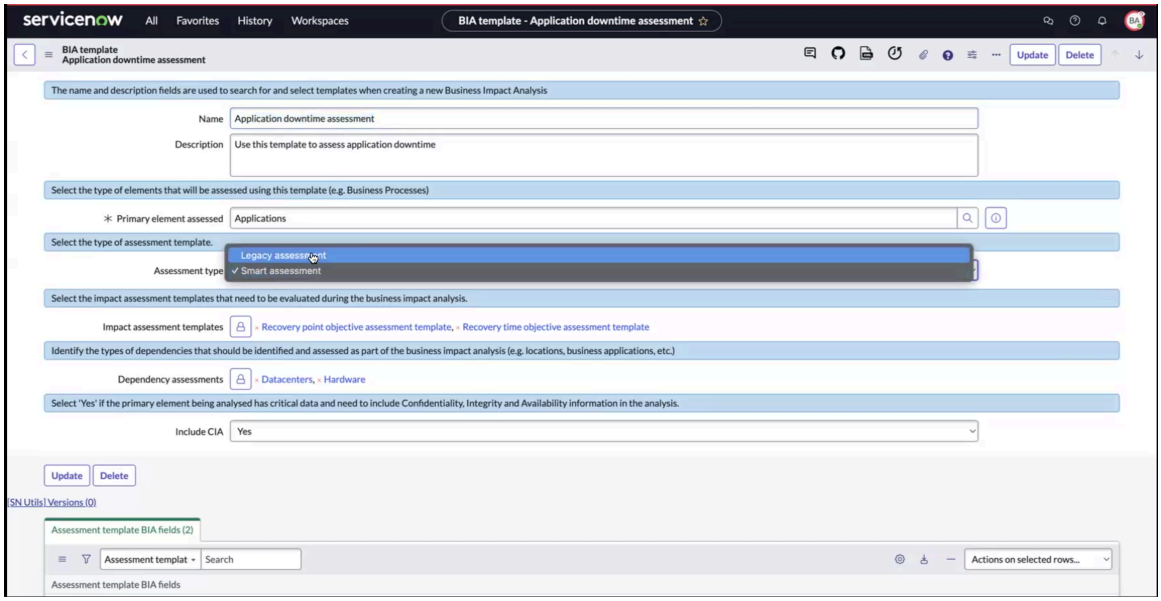
Configure BIA templates with Smart Assessment

Configure a business impact analysis (BIA) template in the Business Continuity Workspace with the Smart Assessment. Select the type of the elements, impact categories, and dependencies that are assessed in the BIA. The Smart Assessment lets you choose a custom Smart Assessment template for the BIA.

Before you begin
Role required: sn_bcm.admin

About this task
A BIA created using the Smart Assessment template includes Smart Assessment instances in the assessment section. BCM users can complete the assessment, and upon submission, the automation set up by the BCM admin triggers to update impact analysis data, including RTO, RPO, and recovery tier, based on the defined configuration.

Impact category completion configuration for Smart Assessment: To configure Impact category completion for Smart Assessment, navigate to **All > Business Continuity > General Administration > Properties**. Set the *`Mark the Impact Assessment as Complete once all required questions are answered, or all questions (required and optional) are answered`* property. Choose the preferred option to show completion based on required or all questions.



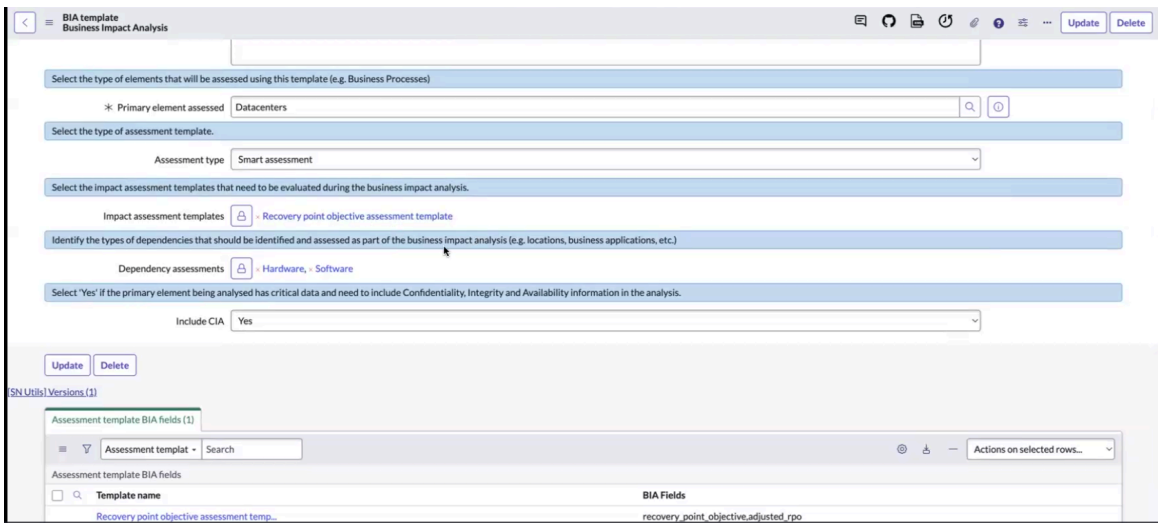
For the initial setup checklist for Smart Assessment Engine, see Configuring Smart Assessment Engine.

Procedure

1. Navigate to **All** > **Business Continuity** > **BIA Configuration** > **BIA Templates**.
2. Select **New**.
   You can use the preconfigured BIA templates in the instance or select this option to configure a new BIA template.
3. On the form, fill in the fields.
   For more information on the fields in the form, see BIA template form for the legacy assessment.
4. Select **Smart Assessment** as the assessment type.

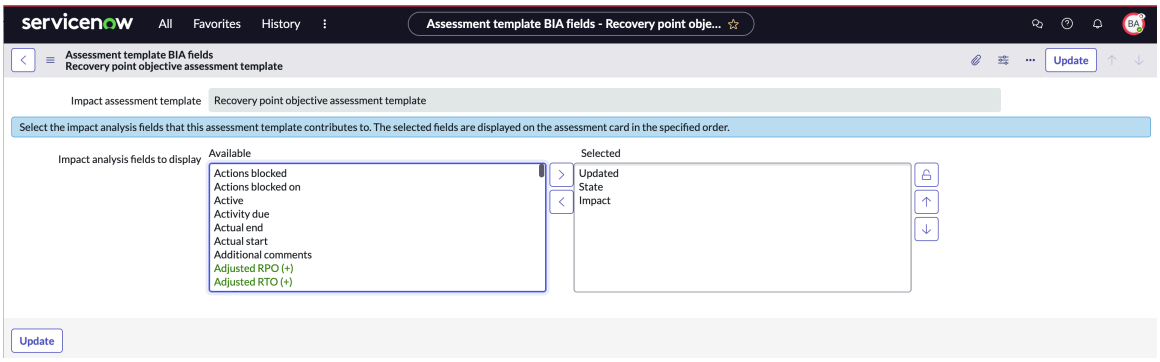
   A sample BIA template with the Smart Assessment type is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



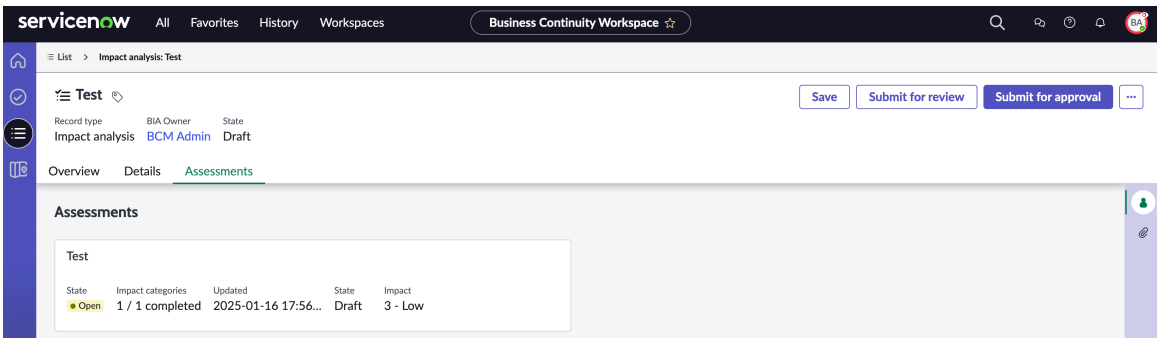
When you select the Smart Assessment, the **Impact categories** field is not displayed in the BIA template form. Instead, the **Impact assessment templates** field is displayed. The templates shown, like Recovery point objective and Recovery time objective, are demo data with a format similar to legacy assessments.

The Impact assessment template is the Smart Assessment template you configured following the steps outlined in Create Smart Assessment templates for BIA.



5. Choose the Impact assessment templates for assessments.
6. Configure other settings as needed.
7. To save the BIA template, select **Submit**.
8. To display result fields on the assessment card in the Impact analysis record within the Workspace, open the BIA template, map the BIA fields to the Impact assessment template, and save the mapping.

   The BIA template with the Smart Assessment type is set up in the instance. The related list for the BIA template depends on the selected impact assessment template. For example, choosing the Recovery Point Objective template shows the same related list mapped to the BIA fields. For more information, see Create Smart Assessment templates for BIA.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Selecting the related list opens the Assessment template BIA fields record. Here, you can view a summary of RPO or RTO details and prioritize the field order on the card. Choose the BIA fields that the assessment contributes to, and they will be displayed on the BIA assessment card in the specified order. For example, if the selection shown in the diagram is used, the card displays the selected fields.

The example shows the Recovery Point Objective card, Recovery Time Objective card, and Dependency assessment created for the BIA.

Previously, the **Assessments** tab showed a single assessment card and an **Open assessment** button. Beginning with the Yokohama release, the layout has been updated to a two-column arrangement. Assessment cards are now displayed dynamically, enabling you to attach multiple assessments to a BIA. For example, one card is shown alone in a row, while seven cards are arranged in four rows (three rows with two cards each and one row with one card).

Note:
The selected BIA fields are populated on the cards only if they are not empty.

Selecting the Dependency assessment card opens the BIA assessment. When BCM users submit the assessment, the automation configured in the Smart Assessment template updates the configured result fields.

BIA template record form for the Smart assessment

Use the BIA template record form to configure the business impact analysis with the Smart assessment. You can add details such as name, description, primary element assessed and select the impact assessment template in the form.

BIA template record form with Smart Assessment

For description of the field values, see the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BIA template record form with Smart assessment

Field	Description
Name	Name of the BIA template.
Description	Brief description about the template.
Primary element assessed	Primary object type or an element that is being assessed for which the template is used.
Assessment type	Assessment type for the BIA. Options are: • **Legacy assessment** • **Smart assessment** Select the **Smart assessment** option.
Impact assessment template	Type of the impact assessment template. You can select the Recovery point objective assessment template or Recovery time objective assessment template. For more information, see Create Smart Assessment templates for BIA.
Dependency assessments	Category of items or assets that the business function depends on, such as Datacenters, Hardware. The dependencies are identified and assessed as part of the business impact analysis.
Include CIA	Option to include Confidentiality, Integrity, and Availability to BIA. If the primary element that is being analyzed has critical data and whether it must include Confidentiality, Integrity and Availability information in the analysis, set the flag as **Yes**. The field appears only if the elements selected in the **Primary Element Assessed** field of the same form require data backup.

Setup for a business continuity plan

The BCP administrator can perform certain administrative tasks that are listed in the **General Administration** section of the Business Continuity Management application.

The administrative tasks for business continuity planning are listed in the **General Administration** section in the application navigator.

Typically, the BCP plan administrator with the sn_bcp.plan_admin role performs the following administrative tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

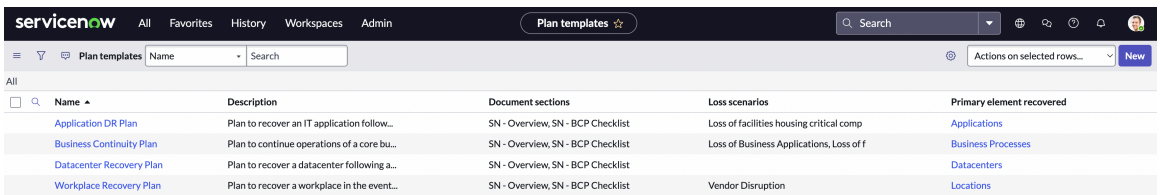
- Configure plan templates: For more information, see Configure the business continuity plan template.
- Configure documentation sections in the business continuity plan: For more information, see Configure documentation section.
- Configure loss scenarios in the business continuity plan: For more information, see Configure loss scenarios in the plan.

Configuring plan template

As a BCP plan manager, you can create a business continuity plan that can be used for your respective business units during a disruptive event. The Business Continuity Management application provides pre-configured business continuity plan templates. You can streamline the process of a plan creation by using pre-configured plan templates. You can also create a plan template for your business requirement.

You can view the pre-configured plan templates for business continuity planning in the **General Administration** section in the application navigator.

Using a plan template gives you a standard plan layout that has the document sections, loss scenarios, and primary elements that are to be recovered. Plan templates help you to focus on the plan content, its tasks, and the effective implementation of the plan.



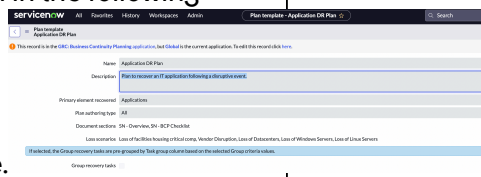
Creating a plan helps an organization to identify processes, locations, and assets that must be recovered as a priority when there is a disruption. Selecting a plan type helps to identify the elements for recovery and the time by which it should be done.

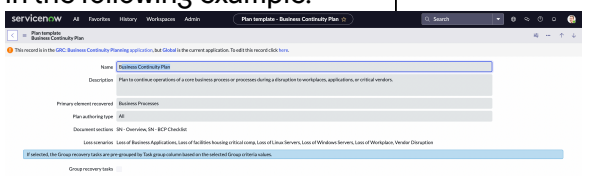
Using business continuity plan templates

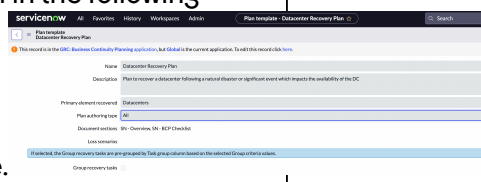
The Business Continuity Management application provides the following business continuity plan templates that are installed with demo data:

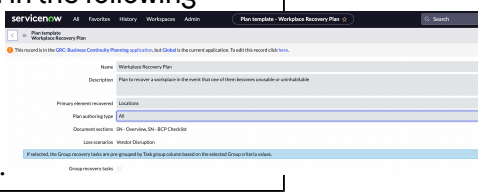
- **Application DR Plan**
- **Business Continuity Plan**
- **Datacenter Recovery Plan**
- **Workplace Recovery Plan**

The business continuity plan templates that are installed with demo data are shown in the following example.









See the following table for more information on different types of demo data plan templates that you can use in the Business Continuity Management application.

Demo data plan templates

Name	Primary element recovered	Description
Application DR Plan	Applications	Plan to recover an IT application following a disruptive event. A sample

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demo data plan templates (continued)

Name	Primary element recovered	Description
		Application DR Plan template is shown in the following example. 
Business Continuity Plan	Business Processes	Plan to continue operations of a core business process or processes during a disruption to workplaces, applications, or critical vendors. A sample Business Continuity Plan template is shown in the following example. 
Datacenter Recovery Plan	Datacenters	Plan to recover a datacenter following a natural disaster or significant event that impacts the availability of a datacenter. A sample Datacenter Recovery Plan template is shown in the following example. 
Workplace Recovery Plan	Locations	Plan to recover a workplace in the event that one of them becomes unusable or uninhabitable. A sample Workplace Recovery Plan template is shown in the following example. 

Creating a plan template for your business requirement

Instead of using the demo data templates, you can create a template for your specific requirement. For more information on creating a plan template for your business requirement, see Configure the business continuity plan template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the business continuity plan template

Configure the business continuity plan template in the Business Continuity Management application for your business. You can use the plan template to recover a specific primary element such as Employees or Web Servers. Similarly, you can create a plan template for different plan authoring types such as documentation, loss scenarios, and recovery tasks.

Before you begin

Role required: sn_bcm.admin

About this task

The sn_bcm.admin role contains the sn_bcp.plan_admin role. The sn_bcm.admin role is necessary to view the **Plan Templates** menu. The BCM administrator can navigate to the **Plan Templates** menu and then the plan administrator can update the plan templates.

By configuring the plan template, you can:

- Define the primary object type that has to be recovered.
- Define documentation sections that should be included right at the beginning of a plan.
- Identify the loss scenarios and plan accordingly using the template.

Procedure

1. Navigate to **All** > **Business Continuity** > **Plan Configuration** > **Plan Templates**.
2. Select **New**.
3. On the Plan Template form, fill in the fields.
   For more information on the fields, see Plan Template form.
4. Select **Submit**.

Plan Template form

Use the Plan Template form in BCM UIB Workspace to input details regarding the business continuity plan.

Plan Template form

For the description of the field values, see the table.

Plan Template form

Field	Description
Name	Name of the plan template. For example, Workplace Recovery Plan.
Description	Brief description about the plan template.
Primary Element Recovered	Primary object type or an element identified to be recovered in the plan. For example, Locations.
Plan authoring type	Various stages or sections of a plan that you can choose from when creating a continuity plan with this template. These choices appear as tabs in the BCP workspace as you advance through the process of filling in the plan details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plan Template form (continued)

Field	Description
	• **All** (Default): All choices such as Documentation, Loss Scenarios, Recovery Tasks, and Recovery Teams are presented in the plan that uses this template. These options are visible as tabs within the workspace. • **Documentation**: Plan that uses this template shows the documentation option alongside chosen dependencies. The documentation tab, and tabs for recovery tasks and recovery teams, are accessible for viewing in the workspace. • **Loss Scenarios**: Loss scenarios together with recovery tasks, recovery teams, and other chosen dependencies in the plan that uses this template. • **Recovery tasks**: Recovery tasks and recovery teams associated with the plan type that uses this template.
Document sections	Documentation sections to be included in the plan. Available options are: • **BCP-Assumptions** • **BCP-Objectives** • **BCP-Scope** • **BIA-Overview** • **SN-BCP Checklist** • **SN-Overview**
Loss scenarios	Loss scenarios to be included in the plan. Available options are: • **Loss of facilities housing critical comp** • **Loss of Linux Servers** • **Loss of Datacenters** • **Loss of Workplace** • **Loss of Business Applications** • **Loss of Personnel** • **Vendor Disruption** • **Loss of Windows Servers** You can also create a loss scenario and add it to the template. For more information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plan Template form (continued)

Field	Description
	on creating a loss scenario, see Add loss scenarios.
Group recovery tasks	Option to group recovery tasks. When selected, tasks are pre-organized into groups based on the chosen **Group by** criteria values. Available options are: • **Assignment group** • **Automated flow** • **Completion deadline** • **Configuration item** • **Created by** • **Description** • **Documentation** • **Plan** • **Owner** • **Recovery strategy** • **Recovery team** • **Related plan** • **Scope** • **Short description** • **Tag** • **Tag assets** • **Task classification** • **Task group** • **Updated by**

Set up the phases

Set up the phases in the Business Continuity Management application to map them to recovery and event tasks effectively. Once the phases are set up, BCM users can tag these phases to recovery tasks and event tasks and execute them in the set order, ensuring a logical execution sequence.

Before you begin

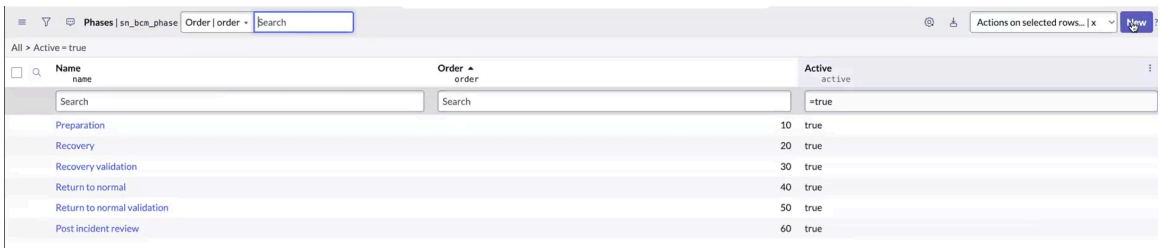
Role required: sn_bcm.admin

About this task

For information on setting up the phases, see Set up the phases.

For information and steps on mapping recovery tasks to phases, see Mapping recovery tasks to phases and Add recovery tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information on mapping event tasks to phases, see Mapping event tasks to phases and Mapping event tasks to phases.

Procedure

1. Navigate to **All** > **Business Continuity** > **General Administration** > **Active phases**.

   Recovery involves a series of phases. By default, the BCM application provides these phases as part of seed data:

   - Preparation
   - Recovery
   - Recovery validation
   - Return to normal
   - Return to normal validation
   - Post-incident review

2. Select **New**.

   The Phase form is shown in the example.

3. On the form, fill in the fields.

   For the description of the fields, see Phase form.

   A sample configuration of the phase is shown where the name of the phase is phase10, its order is 80, and the phase is active.

   The order field is automatically populated with the next available number. For example, if the previous maximum order was 70, the new order will be 80. You can, however, manually adjust this order using inline editing if required, ensuring that the order remains unique across all phases.

   Note:
   If you try to assign an existing order to the new phase, an error message is displayed that the order already exists. Similarly, if you try to assign an existing name to a phase, the system prevents that by displaying an error message.

   The error messages are shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To prevent permanent deletion, the form does not include a delete button. Instead, you can soft-delete phases by clearing the Active flag, which removes them from active use in recovery and event tasks. This approach verifies that phases are not permanently lost and can be managed effectively.

4. Select **Submit**.

   The configured phase is shown in the list view of the Phases module and it can be tagged to the recovery and event tasks, allowing for more effective tracking and management of these tasks.

Phase form

To configure phases as part of recovery activities, use the Phase form to set up phases for recovery and event tasks in the BCM Configurable Workspace. You can then associate these phases with recovery and event tasks, enabling you to track their progression effectively.

Phase form

For description of the field values, see the table.

Phase form

Field	Description
Name	Unique name of the phase. For example, Ready for preparation.
Order	Unique order assigned to the phase. You can, however, manually adjust this order using inline editing if required, ensuring that the order remains unique across all phases.
Active	Option to mark the phase as active or inactive.

Generating reports using Document designer

Starting with BCM release 9.0.x, the ServiceNow Document designer with Word application (sn_grc_doc_design) is integrated with BCM. It enables you to generate customized reports of the BIAs, BCPs, and events in Microsoft Word format. This integration addresses issues, such as improper page breaks and cut-off information that occasionally occurred in PDFs, generated by the previous template.

Using the ServiceNow Document designer with Word application

The ServiceNow Document designer with Word application offers a low-code solution, enabling you to configure different aspects of Microsoft Word documents without requiring extensive technical expertise. The templates offered by ServiceNow are designed to align with the company's brand guidelines, ensuring consistent and professional documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the ServiceNow Document designer with Word application to generate intuitive and audit-ready Microsoft Word reports for business impact analysis (BIAs), business continuity plans (BCPs), and events directly from your ServiceNow instance. Configure the Microsoft Word templates in the application to include specific data from the records, such as tables and columns, into the reports. Options include using predefined templates, customizing them with low-code implementation, or creating your own templates to meet your company's specific guidelines.

You can save these reports either within your ServiceNow instance or as cloud documents in Microsoft SharePoint.

Benefits of using Document designer with BCM

The ServiceNow Document designer with Word application enables you pull metadata, such as fields and related lists, from ServiceNow tables. It also allows you to add content blocks that repeat for each record in a table, for example, 10 blocks for 10 issues. Apply the templates to specific records and create reports in Microsoft Word format.

Workflow for configuring and managing the report templates in BCM

To configure and manage the report templates in the BCM application, complete the following steps in the given sequence.

Workflow for generating the reports in Microsoft Word

Step	Description
Install the applications and assign the roles	Install the ServiceNow Document designer with Word (sn_grc_doc_design) application and its dependent plugins. See Install Document designer with Microsoft Word for more information. Administrative roles required to manage the templates are sn_grc_doc_design.admin and sn_bcm.admin. Managers with the sn_bcm.manager roles can generate the reports and save them in your ServiceNow instance or in the cloud (Microsoft Office 365).
Set up the template relationship registry.	See Set up the template configurations for more information.
Configure data relationships, content configurations, and scripted variables	Configure data relationships in the templates so that they are displayed in the Microsoft Word reports. See Configure the data relationships, Set up the content configurations, and Define the scripted variables for more information.
Install the ServiceNow Document designer add-in	Install the add-in into your Microsoft Word document. See Install the Document designer add-in for more information.
Upload the newly created Microsoft Word template	Upload the newly created Microsoft Word template in the **All** > **Business Continuity** > **General Administration** > **Word Templates**. Alternately, use a predefined template

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow for generating the reports in Microsoft Word (continued)

Step	Description
	provided in the BCM instance to generating the reports in Microsoft Word format.
Generate the BIA, BCP, and event reports of the records.	Generate the BIA, BCP, and event reports of the records in the Business Continuity Workspace and save them in your ServiceNow instance or in the cloud. See Generate reports for BIAs, BCPs, and events for more information.

Downloading the Document designer as an optional application

The ServiceNow Document designer with Word application is optional. You can use the existing BCM functionality of generating the PDFs of BIAs, BCPs, and exercises or you can use the ServiceNow Document designer with Word application to generate Microsoft Word documents. You must manually download and install it from the ServiceNow Store.

The ServiceNow Document designer with Word application has dependencies on the following applications:

- Data registry (sn_data_registry), 19.1.0
- Microsoft 365 for ServiceNow Reporting (sn_esg_msoff_intg), 20.0.1
- Microsoft Office add-in (sn_office_addin)

Recommended release version for using the Document designer

A few limitations on the number of columns and content blocks that can be configured may affect the usability with extensive data requirements. To use the ServiceNow Document designer with Word application, you must be on Xanadu release, patch 8 or later.

Troubleshooting information related to the Document designer

If you encounter any issues with the ServiceNow Word Add-in, check the following:

- Ensure you have the latest version of the add-in installed.
- Check your ServiceNow instance URL and credentials.
- Ensure you have the necessary permissions to access the Document designer application.

By following these steps, you can effectively use the ServiceNow Document designer with the Word Add-in to create and manage documents in your ServiceNow instance.

Install Document designer with Microsoft Word

Install the Document designer with Microsoft Word (sn_grc_doc_design) application. It extracts metadata (including fields, related lists, and reference fields with their associated elements) from ServiceNow® tables and enables the insertion of repeating content blocks (for example, 10 blocks for 10 issues) based on record count. When applied to specific records, the template generates a Microsoft Word document.

Before you begin

Role required: sn_bcm.admin, sn_bcm.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

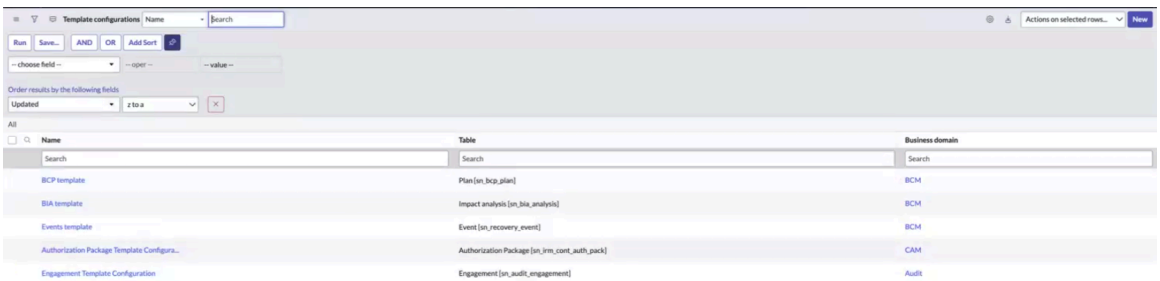
1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the Document designer with Microsoft Word application using the filter criteria and search bar.
3. Select **Install**.
   The Document designer with Microsoft Word application is installed in your ServiceNow® instance.

Related topics

Set up the template configurations

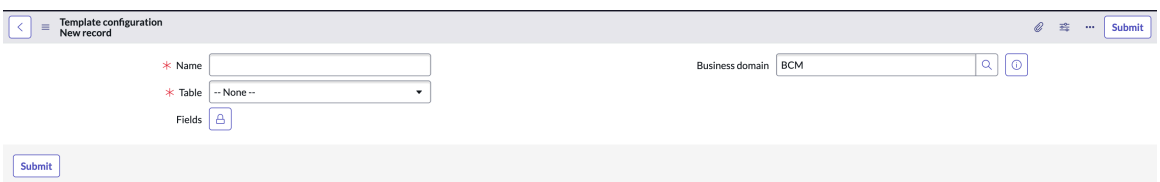
Set up the template configurations

Set up the template relationship registry using the Template Configurations module from the General administration setup. Configure data relationships, content configurations, and scripted variables for using the Document designer application so that required data gets displayed in the reports.



Before you begin

Role required: sn_bcm.admin

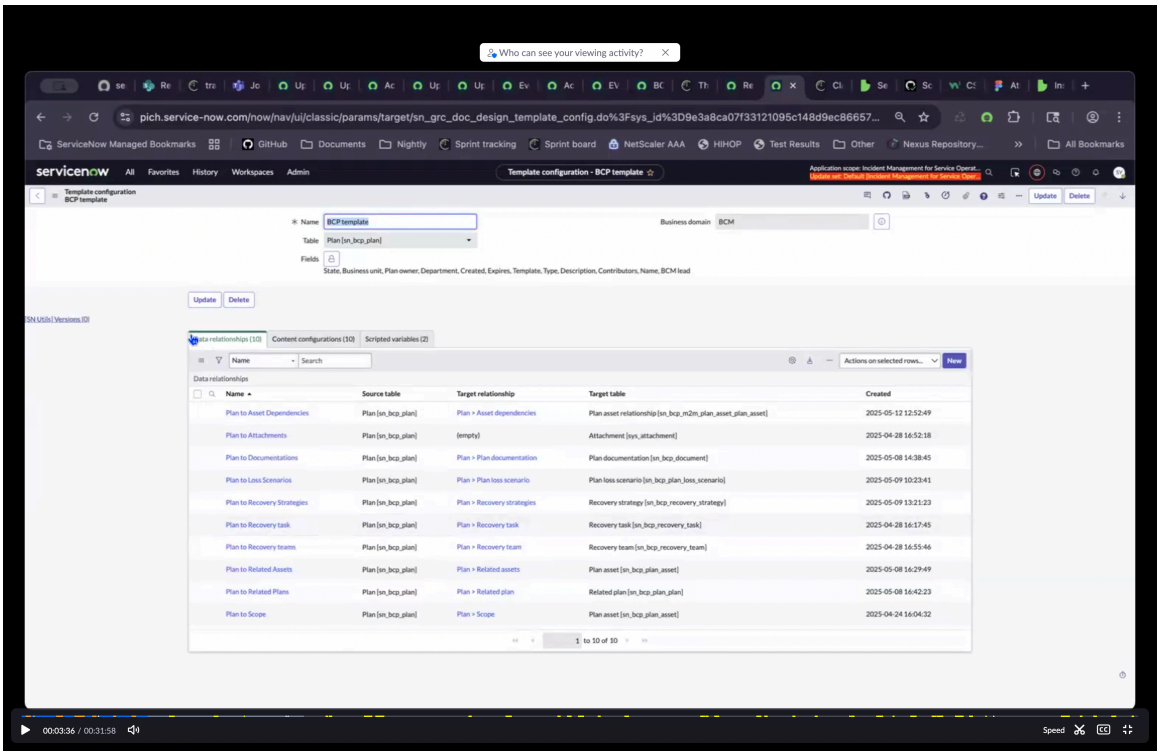


Procedure

1. Navigate to **All** > **Business Continuity** > **General Administration** > **Template Configurations**.
2. In the Template Configurations module, select **New** to create a template.
   Instead of using the predefined templates, you can create templates in the Template Configurations module.

   The predefined Microsoft Word templates that are available with the base version are displayed in the Template Configurations module. The example shows the BIA template, BCP template, and Events template.

   The example shows how to create a template configuration in your instance.



3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Template configuration form

Field	Description
Name	Name of the template configuration. For example, you can specify `BIA template configuration` or `BCP template configuration`.
Table	Table on which the report is generated.
Fields	Fields from which data must be displayed on the report. Move the required fields from the **Available** list to the **Selected** list.
Business domain	Domain from which the template is being configured. In this example, it is set to **BCM**.

The example shows the template configuration for the "BCP template."

4. Select **Submit**.
5. To edit an existing template, select the template from the list and edit the data relationships, content configurations, and scripted variables.
   You can update the data relationships, content configurations, and scripted variables for the predefined template.
6. Select **Update**.

What to do next

For the newly created template, create a data relationship path from the template configuration to navigate to any table that you require. For more information, see Configure the data relationships.

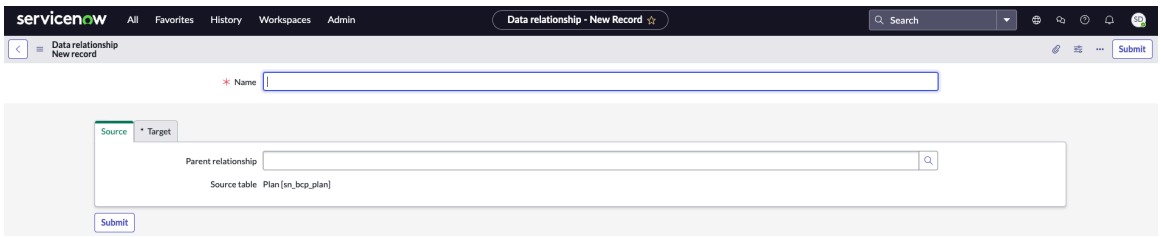
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the data relationships

Configure the data relationships in the Template Configurations module, which helps you to navigate from a record in the template configuration to any table. When you create these paths, you can fetch necessary data from each of these records in the BCM report template.

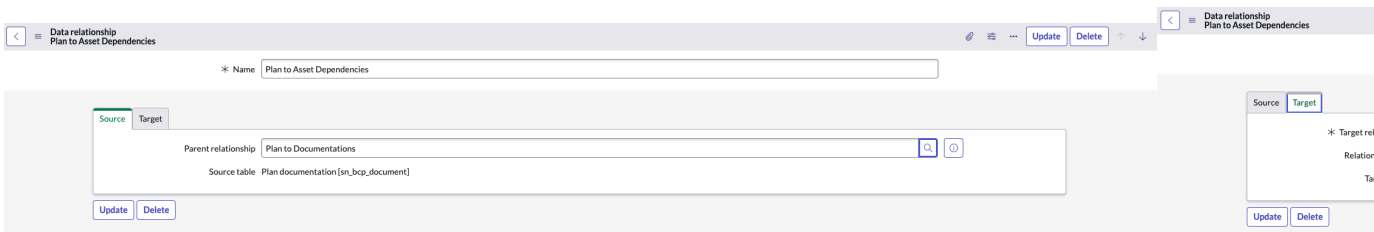
Before you begin

Role required: sn_grc_doc_design.admin and sn_bcm.admin



About this task

When you create data relationships, you can specify how selected records, such as plans to recovery teams or plans to related assets, are connected to the table (for example, [sn_bcp_plan]) in the template relationship registry. You can then establish a path to navigate to these respective records. You can create as many relationships as needed.



Procedure

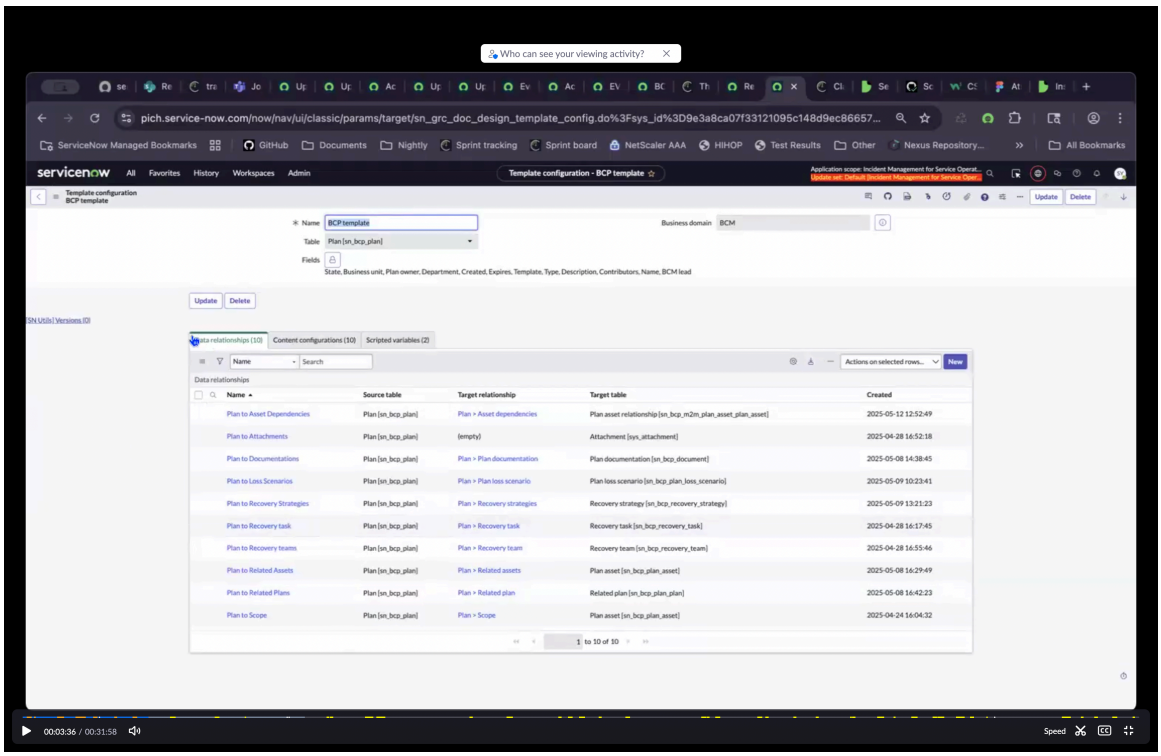
1. Navigate to **All** > **Business Continuity** > **General Administration** > **Template Configurations**.
2. In the Template Configurations module, open the template configuration that you created.
3. In the Data relationships related list, select **New**.

   The Data relationship new record is displayed.

   You can add the source and target relationships.

4. On the form, fill in the fields.

Data relationship form



Field	Description
Name	Level that you want to go to. For example, you can specify `Plan to Documentation`.
Source	
Parent relationship	Parent of the data relationship.
Source table	Source table used for the data relationship created. This field is automatically set.
Target	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target relationship	Select an existing relationship or create a target relationship. For example, you can select `Plan to Asset dependencies`. **Note:** For more information, refer to Setting up the 360° views. You can register only existing relationships between the types of data you want to view.
Relationship type	Type of the relationship such as many to many or one to many. This field is automatically populated based on the selection made in the **Target relationship** field.
Target table	Table from which the data is obtained. This field is automatically populated.

5. Select **Submit**.

   The Data relationships related list is shown in the example.

What to do next

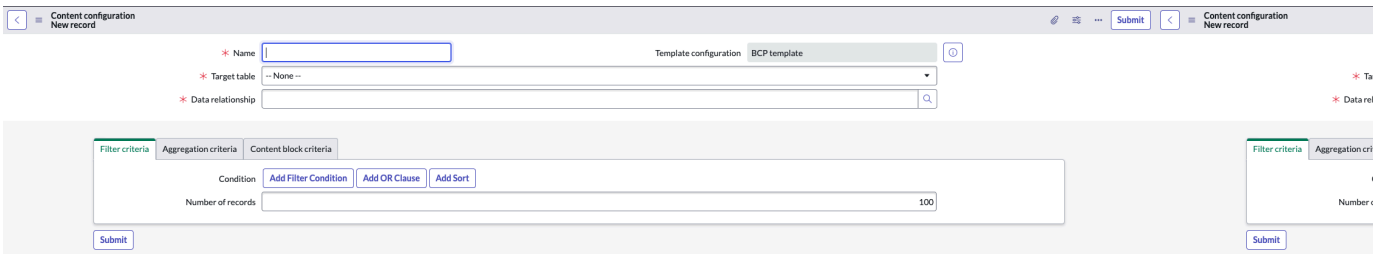
Create content configurations to specify the type of data you want to fetch on the report. For more information, see Set up the content configurations.

Set up the content configurations

Set up the content configurations in the Template Configurations module to define the data you want to view or fetch when creating a report template. You can configure it to display a list of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

records or aggregated data, such as a list of remediation tasks or top priority issues. You can fetch up to 200 records from any table.



Before you begin

Role required: sn_grc_doc_design.admin and sn_bcm.admin

Procedure

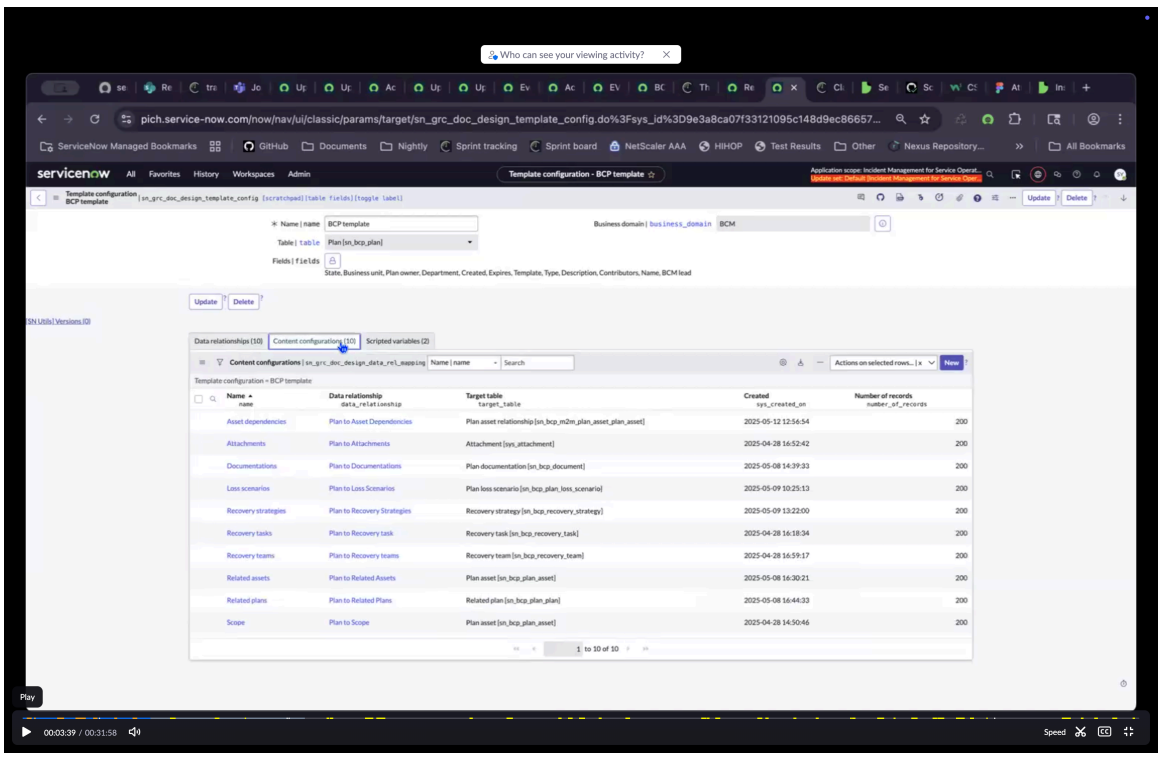
1. Navigate to **All** > **Business Continuity** > **General Administration** > **Template Configurations**.
2. Open the template for which you want to create content configurations.
3. On the Content configurations related list, select **New**.

   The Content configurations new record and its related lists are displayed.

4. On the form, fill in the fields.

Content configuration form

Field	Description
Name	Name of the content configuration. For example, `Asset dependencies`.
Template configuration	Template configuration for which you're defining the content configuration. This field is automatically set based on the configuration that you selected in step 2.
Target table	Table from which data must be fetched.
Data relationship	Data relationship for which you want to create content configurations. Only the data relationships that you have previously created are available for selection.
Filter criteria	Filter condition and the number of records that can be displayed.
Aggregation criteria	Aggregation query to be used for the content configuration record. Use Data columns and Intermediate filters related lists for the content configuration record.
Content block criteria	Parent block configuration to specify a table or data that you want to insert in the content block as a table



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Build the Filter criteria and the Aggregation criteria as required.
6. To specify a table or data that you want to insert in the content block as a table, select the **Content block criteria** tab.
   a. In the **Parent block configuration** field, select the required content configuration.
   b. Select **Submit**.
7. In the Data columns related list, specify the columns you want on the report from the table that you have selected.
   You can either specify the standard columns available or you can write a custom script for the column.

   Note:
   You can add up to 20 columns in a table and in a content block. Similarly, certain content blocks can be repeated 200 times in Xanadu and 500 times in Zurich.

8. Specify the order of the columns as they must appear on the report template.
9. Select **Update**.

The Content configurations related list is shown in the example.

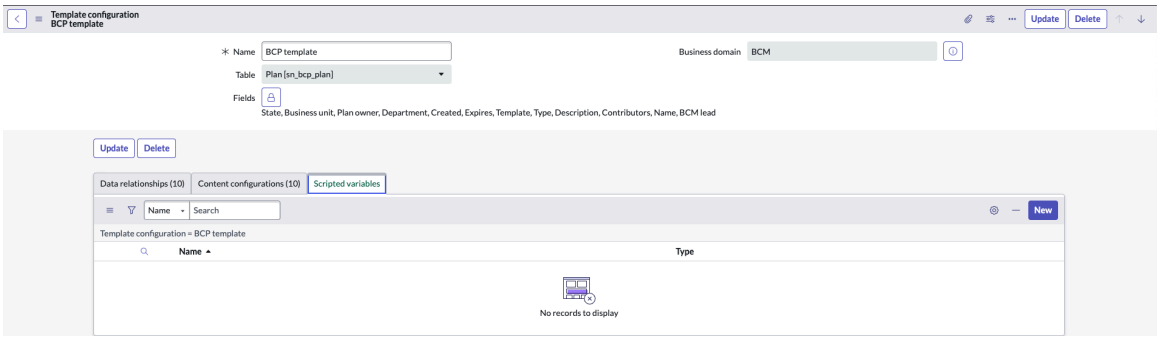
What to do next

Create a scripted variable for the report. For more information, see Define the scripted variables.

Define the scripted variables

Define data for the scripted variables using the Template Configurations module for creating a report template in the BCM application. You can configure the data in either text or HTML format.

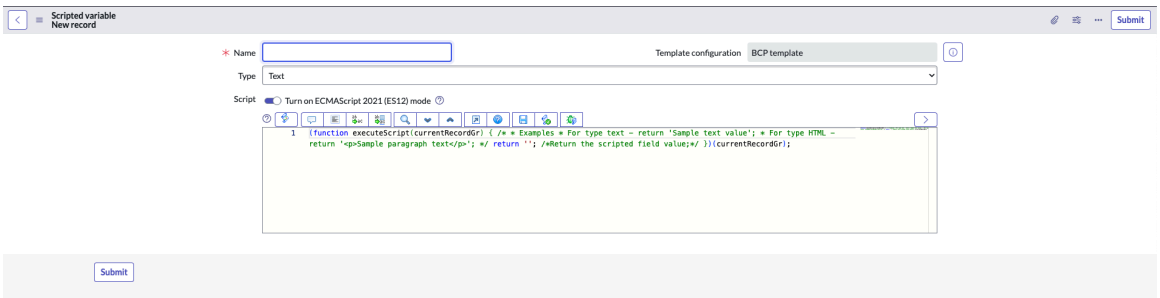
Before you begin



Role required: sn_grc_doc_design.admin and sn_bcm.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **All** > **Business Continuity** > **General Administration** > **Template Configurations**.
2. Open the template for which you want to create scripted variables.

   The Scripted variables related list is shown.

3. In the Scripted variables related list, select **New** to create a scripted variable.

   The Scripted variable new record is shown.

4. On the form, add the name, type, and the custom script for the scripted variable.
5. Select **Submit**.

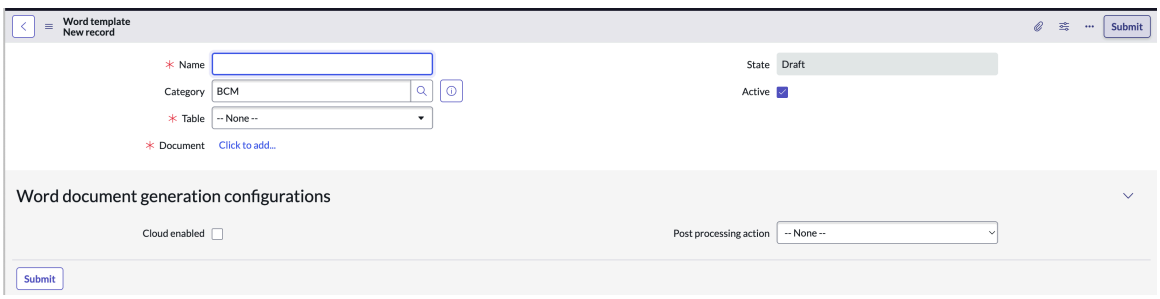
   The Scripted variables for the template, such as Asset dependencies and Attachments, are shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To edit an existing scripted variable, select it from the related list, make the changes, and select **Update**.

Manage Microsoft Word document templates

Manage Microsoft Word document templates centrally using the Admin module in the BCM application. This feature enables you to create or edit templates for BIA, BCP, or other events, providing customized and controlled document generation.



Before you begin

Role required: sn_bcm.admin

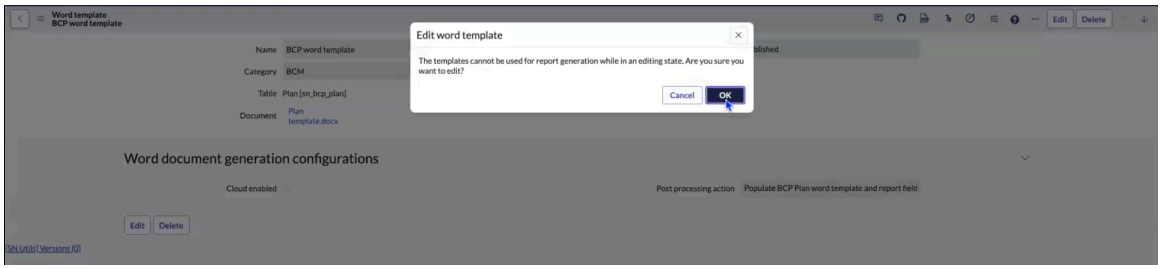
Procedure

1. Navigate to **All** > **Business Continuity** > **General Administration** > **Word templates**.
2. To create a Microsoft Word template, select **New**.

   Microsoft Word template form is displayed.

3. On the form, fill in the fields.
   For more information on the fields, see Word template form.

   Microsoft Word templates provided with an instance have two categories: BCM and BIA Smart Assessment.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Verify that you're updating Microsoft Word template with the BCM category.

4. To edit an existing pre-defined template, open the desired Microsoft Word template from the list and select the **Edit** UI action.

   The Edit Microsoft Word template window is displayed with a message: `The templates cannot be used for report generation while in an editing state. Are you sure you want to edit?`

5. Select **OK**.
6. To update a Microsoft Word template record, complete these steps.

   a. Update the name, category, table, or active option of the record.

   b. To add a document to Microsoft Word template, select the **Update** option provided with the Document field.

   c. Select **Click to add..** in the **Document** field.

   d. In the 'Choose an attachment file' dialog box, select **Choose file**, and select **OK**.

   e. To update an existing document associated with the template, select the **Update** option provided with the Document field.

   f. Select **Update** in Microsoft Word template record.
   Microsoft Word template record is updated and the updated template is displayed in the list view.

   The process to update a pre-defined template is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To delete the template, select the **Delete** in the record.
8. To publish the template, select **Publish** in the record.

Word template form

Use Microsoft Word template form to add details about Microsoft Word template for creating reports in the Business Continuity Workspace.

Microsoft Word template form

Microsoft Word template form

Field	Description
Name	Unique name of Microsoft Word template for the table that is selected in the **Table** field.
Category	Classification or group to which the template belongs. For example, BCM for BCM-related Microsoft Word template.
Table	Table for which Microsoft Word template is being created.
Document	Microsoft Word template that was created based on content configuration, for example, BIA template.docx or Plan template.docx. **Note:** The document must be a docx file only. If you attach a document that is in any other format, then an error message appears.
State	State of Microsoft Word template record defaults to **Draft**. • **Draft**: Defaults to the Draft state when you open the record. • **Published**: Microsoft Word template record is published. You can't update the record in the published state. • **Edit**: State in which the record details can be updated. **Note:** Microsoft Word template record in the **Edit** state can’t be used for report generation. The record isn't available to select in the Generate report pop-up.
Active	Option to activate the record.
Word document generation configurations	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Word template form (continued)

Field	Description
Cloud enabled	Option to manage the generated report either as a sys_attachment in the engagement record or as a cloud document. You can access the document either from the Microsoft SharePoint or Google Drive site based on your cloud upload configuration.
Post processing action	Option to update the generatedMicrosoft Word template report with fields from the Report section of the Engagement record. Options are: • **Populate BIA word template and report fields**: When you choose this template, the fields from the Report section of the BIA record populate in Microsoft Word report. • **Populate BCP Plan word template and report fields**: When you choose this template, the fields from the Report section of the BCP plan record populate in Microsoft Word report. • **Populate Recovery Event word template and report fields**: When you choose this template, the fields from the Report section of the Recovery Event record populate in Microsoft Word report. • **None**: Report is generated as a sys attachment or a cloud file. However, no post processing action happens to add or update any report-based fields of the record to Microsoft Word report that is generated.

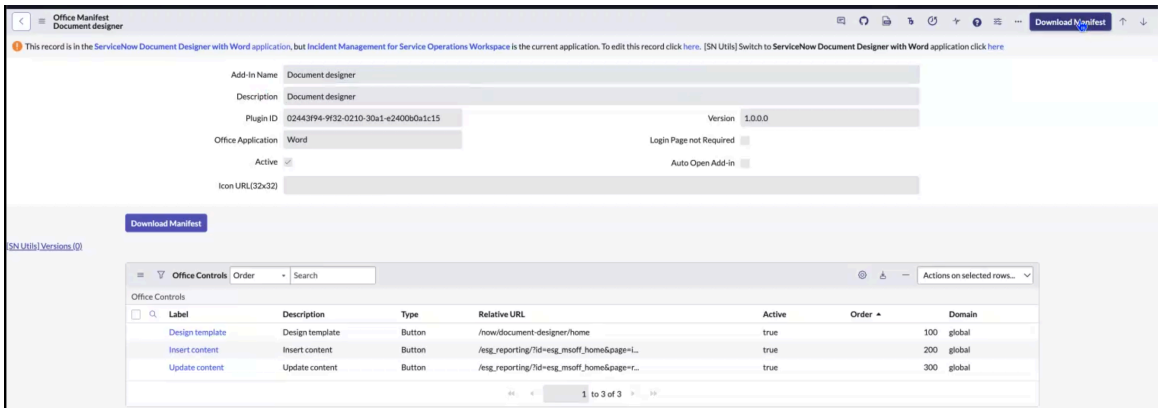
Install the Document designer add-in

Install ServiceNow Document designer add-in in Microsoft Word. You can then customize the BIA, BCP, event reports, and Microsoft Word templates according to your business needs.

Before you begin

Verify that these plugins are activated:

- sn_grc_doc_design
- sn_outlook_addin



Role required: sys_admin

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In Manifests**.
2. From the Office Manifests list, select **ServiceNow Document Designer**.
3. Select **Download Manifest**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Manifest file is downloaded in your local drive.

4. To enable the add-in, contact your Microsoft 365 account manager who can use the manifest file you downloaded in step 3.

What to do next

For detailed instructions on how to deploy the manifest file, see the Deploy add-ins in the Microsoft 365 admin center [KB1307378] article in the Now Support Knowledge Base.

To configure the HTTP response headers for add-in for Microsoft Word in the browser, see the Response header resolution [KB1434453] article in the Now Support Knowledge Base.

Save Microsoft Word document as a template

Save your Microsoft Word document as a template using the Design template provided in the Document designer, enabling you to create a reusable template in your instance.

Before you begin

Role required:sn_bcm.admin, sn_bcm.manager

About this task

Install and activate the Document designer with Microsoft Word (sn_grc_doc_design) plugin. For more information, see Install Document designer with Microsoft Word.

Confirm that you have the templates configured. For more information, see Set up the template configurations.

Procedure

1. Navigate to the Microsoft Word document that you want to use for template creation. Make sure to relaunch Microsoft Word after installing the add-in.
2. In Microsoft Word, select **Add-ins** and select **Document Designer**.
3. Select **Design template** on the ribbon.
4. To log in to your ServiceNow instance, complete the steps.
   a. On the ServiceNow login screen, provide your credentials in the **User name** and **Password** fields.
   b. Select **Log in** using the BCM administrator or BCM manager credentials.
   c. To enable the ServiceNow add-ins for Microsoft Office 365 application to connect to your ServiceNow account on the instance, select **Allow**.

On the Document designer pane, the Design template is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the Document designer pane, fill in the fields.

a. Select the **Data** tab then the **Data element** field and from the list, select the fields you would like to see on the template.
Only the configured fields are available for selection.

b. Move the mouse device at the point where you want to insert data and insert the fields such as Logo, Type, Name.

c. Select the **Table** tab, in the **Table element** field, from the list, select the configured table elements that you would like to see on the template.
For example, the list of top five high priority issues.

6. To insert a content block with styling that can appear repeatedly, select **Block**.

a. In the document, add the content that must be used for repeated styling.

b. In the Content block source field, select the item that you want to map to the content block.

c. Select **Add content block**.
The content in the document is wrapped in the content block and the options **Data** and **Table** are available.

d. To insert data from the configured columns in the content block, select **Data**.

e. Select **Add**.

f. To insert content from a table, select **Table**.
After selecting the table, select **Edit columns** to reorder columns as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Select **Add**.

Note:

For best practices, continue these steps:

- Keep content blocks separate (no nesting).
- Use up to 10 images according to block.
- Include one table according to content block.
- Create up to 2 content blocks according to document.

7. Save the template and upload it in your instance.
   You can use the saved Microsoft Word document as a template.

Related topics

Set up Microsoft 365 reporting configuration

Add additional reporting configuration filters for a Microsoft 365 configuration record

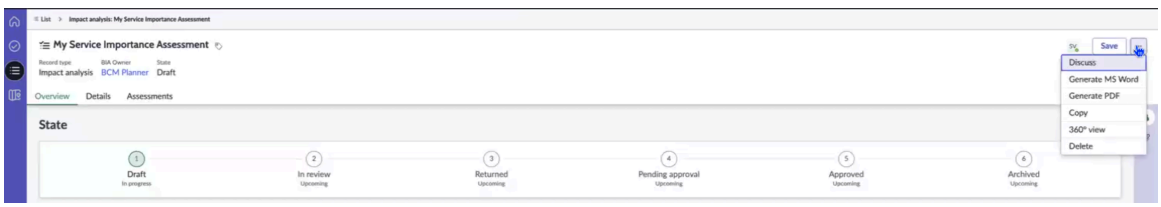
Add related fields to a Microsoft 365 configuration record

Generate reports for BIAs, BCPs, and events

Generate customized reports for BIAs, BCPs, and events directly from their respective records in Microsoft Word format. This functionality enables you to streamline reporting of impact analyses, plans, and events within your organization.

Before you begin

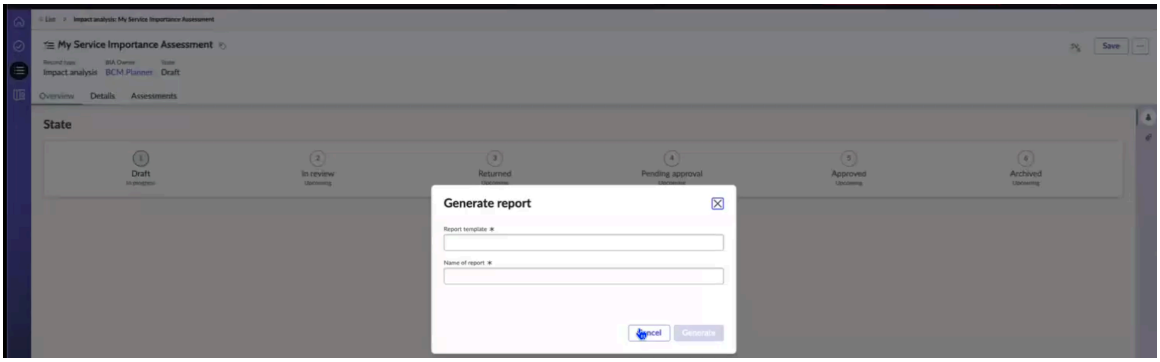
Role required: sn_bcm.manager and sn_grc_doc_design.reader



About this task

You can control whether to retain or replace the existing report attachments by configuring the *sn_bcm.retain_report_attachments* system property.

Procedure



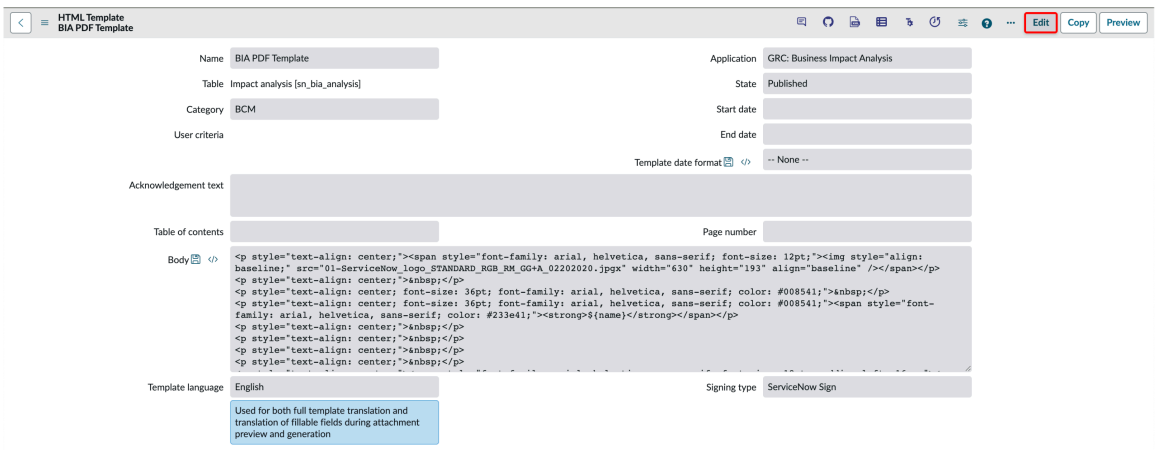
1. Navigate to **All** > **Business Continuity** > **Business Continuity Workspace**.
2. Open a BIA, BCP, or event record from the list view.
3. To generate a report of the record in Microsoft Word format, select **More (...)** and then choose **Generate MS Word** in the record view.

   A BIA record with the UI action is shown in the example.

   The Generate report window is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the report template for the BIA, BCP, or event and add the name of the report.
5. Select **Generate**.
   A message is displayed on the screen: `Report is being generated. Refresh the record shortly to view the updates.`
6. Navigate to the **Details** tab of the record and view the report listed in the Activity section.
   The report is generated in Microsoft Word format and it's displayed in the Activity section of the record.
7. Download the report in your ServiceNow instance or in the cloud (Microsoft Office 365).
   You can save the generated reports of the BIAs, BCP, and events in your ServiceNow instances or in Microsoft Office 365 for future references.



Format PDF templates for BIAs, BCPs, and events

Format the PDF templates that are used for generating the PDFs of business impact analyses, business continuity plans, or events. You can format the PDFs according to your organizational requirements and templates.

Before you begin

Role required: sn_bcm.admin, sn_bcm.planner, sn_bcm.program_manager

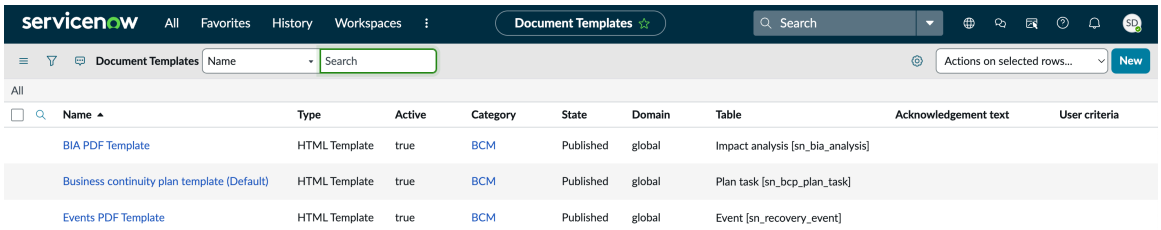
The BCM admin role (sn_bcm.admin) inherits Document Templates roles (sn_doc.reader and sn_doc.writer) through the sn_bcm.core_manager role, rather than containing them directly. These inherited roles enable BCM administrators to create, read, and write Document Templates (sn_doc_template). BCM products use the Document Templates application to generate and print PDFs. As a result, BCM administrators can edit the content of PDFs within BCM document templates.

Verify that you have downloaded the PDF of a business impact analysis, business continuity plan, or event according to the steps mentioned in these topics:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Generate BIA reports in PDF or Microsoft Word formats
- Generate BCP reports in PDF or Microsoft Word format
- Generate event reports in PDF or Microsoft Word

About this task



Beginning with the Xanadu release, the content in PDFs of Business Impact Analyses, Plans, and Events is improved by implementing a new layout:

- Arrange the various event tasks in a table format.
- Include details of the asset owner and the description from the Business Impact Analysis.
- Display a table that outlines the dependencies of the plan assets.
- Mark the date of the PDF creation on the front page.

Procedure

1. Navigate to **Document Templates** > **All Document Templates** in the Business Continuity Workspace.

   The document templates for BCM are displayed as shown in the example.

2. To update the BIA template, select it from the list view and select **Edit**.

   Note:
   To edit the PDF, save it to your local drive first, and then make your edits.

   The BIA template is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the desired UI action, update the template, and save the changes.

The PDF template can be updated according to your requirements.

You can use the same process to update the PDF of a business impact analysis, business continuity plan, exercise, or crisis event.

Note:

With the BCM administrator (sn_bcm.admin) role, you can navigate to **All Document Templates** in an instance to view the document templates that are provided with the BCM application.

You can also use an editable and fillable PDF template to format the PDF. For more information on the PDF document template that can be used to customize your PDFs, see Configure a PDF document template.

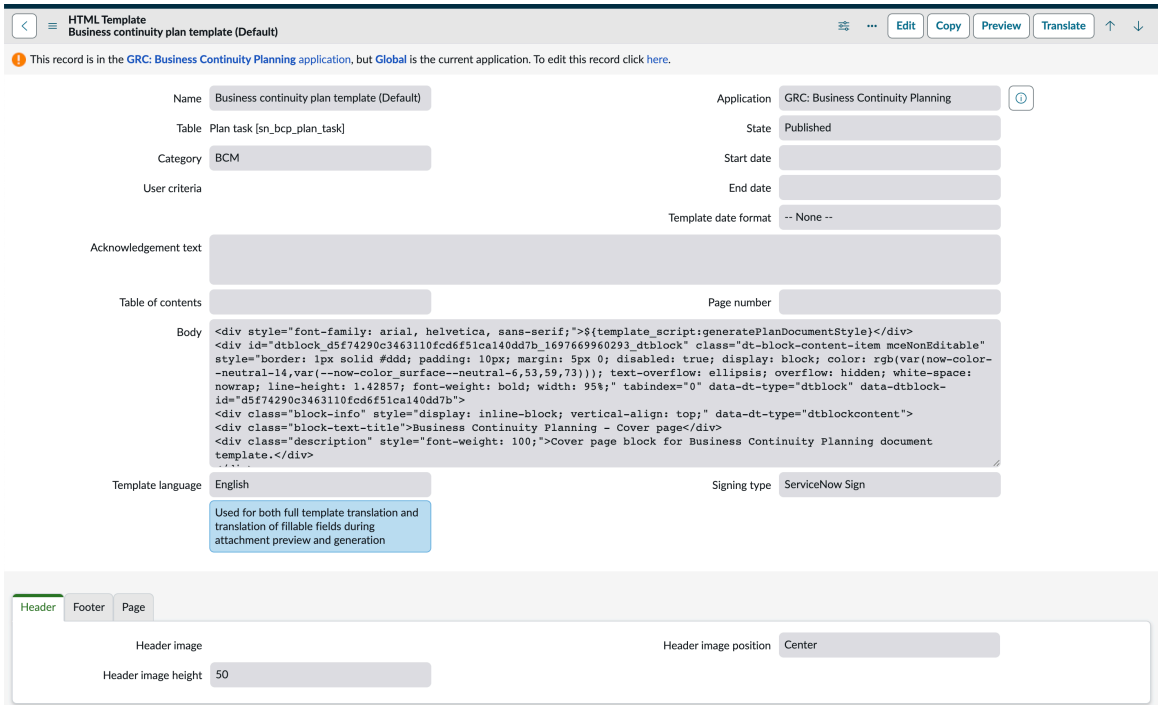
3. To insert date variables in the PDF, select **Insert Date**.

You can use the button multiple times to add different types of dates based on the variables you choose.

4. To insert the table of contents in the PDF, select **Insert Table of Contents**.
5. To add blocks for advanced search, select **Add Blocks**.

Option	Description
To add an existing document block to the template	In Search blocks, type in the name of an ex isting document block, select the document block, and select **Insert**.
To add a new document block to the tem plate	Select **Create New Block**.

6. To publish the template, select **Publish**.

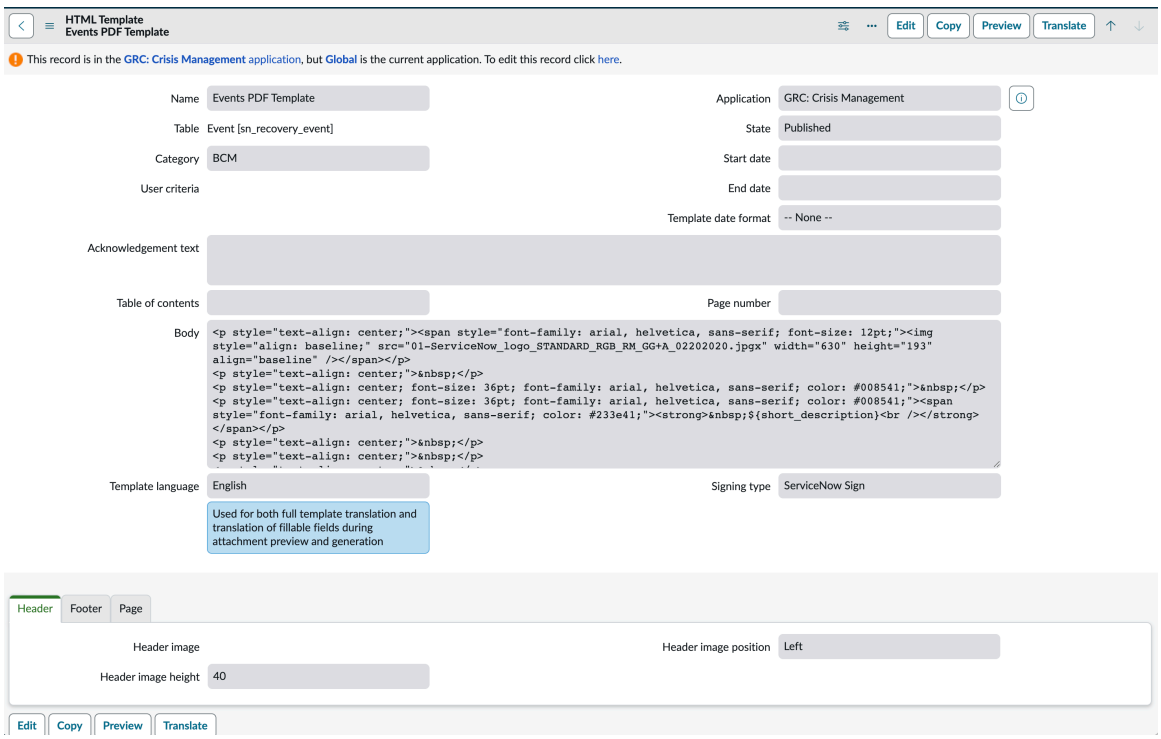


Confirm that the template is published so that the PDF is generated with the right attributes.

For more information on Document Templates, see Configure a PDF document template.

7. To copy an existing template, select it from the list and select **Copy**.
8. To update an existing template, select it from the list and select **Preview**.
9. To update an existing template, select it from the list and select **Update**.
10. To update the BCP template, select it from the list view and select **Edit**.

The BCP template is shown in the example.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the desired UI action, update the template, and save the changes.
You can update the title of the PDF and the fonts according to your organizational templates.

11. To update the Events template, select it from the list view and select **Edit**.

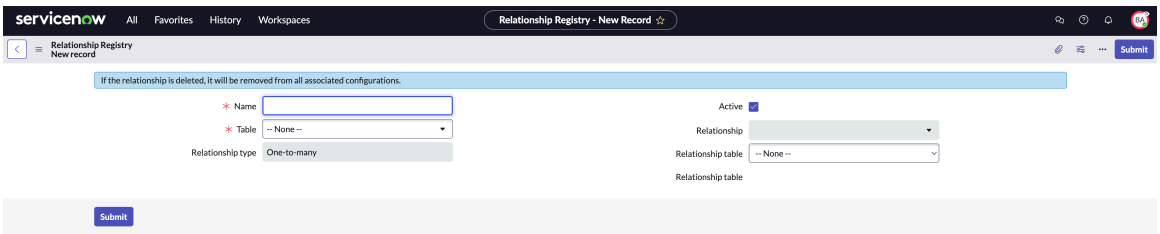
The Events template is shown in the example.

a. Select the desired UI action, update the template, and save the changes.
You can save the PDF for future reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. To add a company logo to the PDF, use a PDF editor like Adobe Acrobat Pro to insert the logo, or insert it into the source document before exporting it as a PDF.
13. To print the report, open the saved PDF or Microsoft Word copy and select **Print**.

Configure 360° relationship registries and views



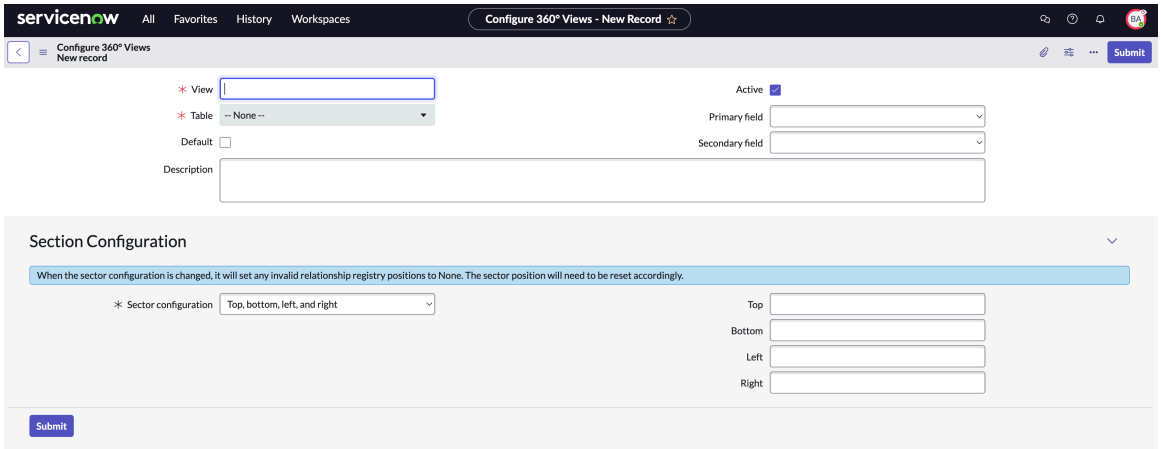
Configure 360° view configurations with the sn_bcm.admin role.

Before you begin

Role required: sn_bcm.admin

Procedure

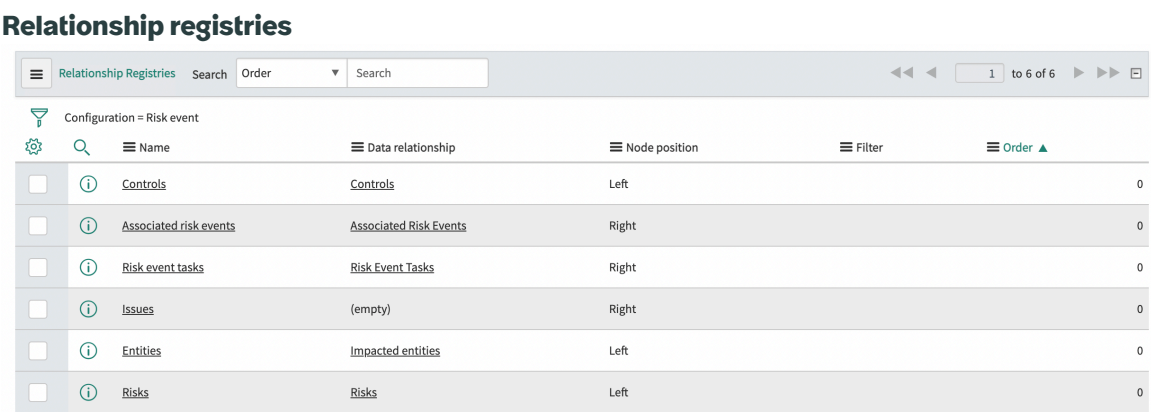
1. Navigate to **All** > **360° View Configurations** > **Configure 360° Views**.
2. To configure the relationships for the records, navigate to **360° View Configurations** > **Relationship Registries**.
   The form is shown in the example.



3. On the form, fill in the fields.

Create new relationship registry

Field	Description
Name	A descriptive name for this registry.
Table	The table for which you want to define a relationship.
Relationship type	The type of relationship you are defining: ○ One-to-many ○ Many-to-many ○ Scripted: a custom relationship from the ServiceNow AI Platform ○ One-to-one: any relationship that is available as a field in the selected table
Active	Select if the relationship is active.
Relationship	The relationship table of the selected relationship type. For example, if you are defining relationships for the Entity table and select a many-to-many relationship type, the list of relationship tables consists of all many-to-many relationships that apply to the Entity table.
Relationship table	The table name you selected in the **Relationship** field.



4. Select **Submit**.
5. To configure 360° views for the records, navigate to **360° View Configurations** > **Configure 360° Views**.
   The form is shown in the example.

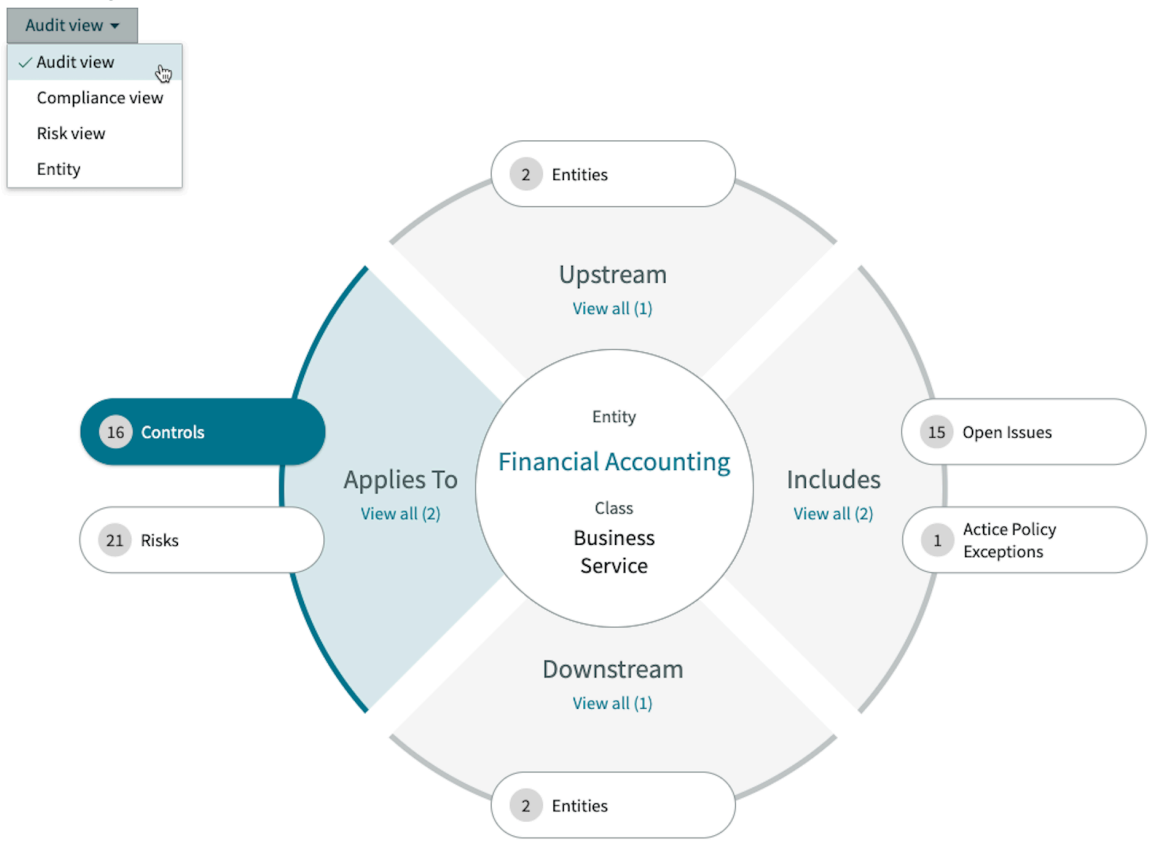
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Save the record.

   The Relationship Registries related list appears.

7. Choose **Select Relationships**.
8. On the form, fill in the fields.

DataNav Config to Data Relationship



Field	Description
Name	A name to identify this relationship.
Data relationship	The data relationship you previously defined.
Relationship table	The table associated with the selected data relationship.
Node position	The sector you previously defined to which you want to add this relationship.
Filter	Enter conditions to define the types of relationships you want to display. For example, you could define conditions for all controls with failures.
Configuration	The configuration defined for the relationship.
Table	The table defined for the relationship.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Based on the **Order** value given the position of element in the 360° view will change. For example, if you change the order value from 0 to 1 for an element, the position will be moved to next in the 360°view.

9. Select **Submit**.
   The new view you have defined is now available on the 360° view.

Selecting a new view

For more information on 360° views configurations, see Configure 360° views.

Setup for Everbridge notifications

The setup steps help you to establish a consistent connection and successful notification delivery workflow with Everbridge notifications system. The BCM administrators and application users must configure certain pre-requisite data so that you can set up emergency notifications in BCM UIB Workspace.

The following pre-requisite configurations are required to be set up for sending an emergency notification and monitoring the notification workflow:

- To create a connection and authenticate your credentials with Everbridge, see Create connections and authenticate their credentials.
- To get the delivery details of the contacts from Everbridge and use them to send a notification, see Import the delivery channels from Everbridge.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To get the details about the type of contacts from Everbridge, see Import record types from Everbridge.
- To pre-configure a notification template to send an email or SMS to your contacts, see Create templates for emergency notifications.
- To create contacts for sending the notification, see Create contacts for emergency notifications.
- To set up rules in filtering the contacts from the user table, see Create the contact import rules.
- To create a group of contacts, see Create notification contact groups.

Here is a flow diagram that shows how the different setup steps are connected for the integration:

Setup flow for an emergency notification

Create connections and authenticate their credentials

Establish a connection and authenticate your login credentials with an Everbridge instance. You can then send out a notification using the delivery channel. This connection helps you to send and receive communications with an Everbridge instance.

Before you begin

Role required: sn_bcm.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Notification Configuration** > **Connection & Credential Alias**.
2. Select the **Create New Connection & Credential** related link.
3. On the form, fill in the fields.
   For more information on the fields, see Create Connection and Credential form.
4. Select **Create**.
   A connection is established to send and receive communications with an Everbridge instance.

Create Connection and Credential form

Use the Create Connection and Credential form to establish a connection and authenticate your login credentials with an Everbridge instance.

Create Connection and Credential form

Create Connection and Credential form

Field	Description
Connection Name	Name of the connection. Enter **Everbridge** Connection.
Connection URL	Everbridge API base address.
Organization ID	Organization ID of Everbridge. **Note:** You can get the organization ID from the Everbridge instance.
Incident Template ID	Unique ID of the Everbridge incident template. **Note:** You can get the ID from the Everbridge instance.
Credential Name	Name of the Everbridge credential.
Username	User name of the API user in Everbridge.
Password	Password to validate and establish the connection.

Import the delivery channels from Everbridge

Import the delivery channels from the Everbridge instance. You can then easily send the notifications through the delivery channels.

Before you begin

Role required: sn_bcm.admin

About this task

You may face challenges in connecting with your stakeholders at the time of a crisis. Your notifications may not reach the stakeholders as they may no longer use the same delivery methods. When you have imported the delivery channels to reach your contacts and selected groups, you can send the notifications in an easier and manageable way.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Notification Configuration** > **Delivery Channels**.
2. Select **Import**.
   All delivery channels are imported from the Everbridge instance successfully. When the notification is successful, you receive a message of confirmation from Everbridge.

Import record types from Everbridge

Import the record types for your organization ID from Everbridge and use them to create the contacts for notifications.

Before you begin
Role required: sn_bcm.admin

About this task
Record types are information stored in Everbridge that are required to create the contacts for notifications.

Procedure

1. Navigate to **Business Continuity** > **Everbridge notification Configuration** > **Record Types**.
2. Select **Import**.
   Record types for your organization ID with the category are imported from the Everbridge instance. If the record type is not imported, you may receive an error message.

Create templates for emergency notifications

Create a template with pre-defined information. You can then use it to send the notifications to your users in an emergency.

Before you begin
Role required: sn_bcm.admin

About this task
You can define a sample template with the draft of an email. It can contain the notification format for a particular emergency crisis that might affect a specific business location or facility.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Notification Configuration** > **Notification Templates**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information on the fields, see Notification Template form.
4. Select **Submit**.

Notification Template form

Use the Notification Template form to create a template with pre-defined information for sending out the notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification Template form

Notification Template form

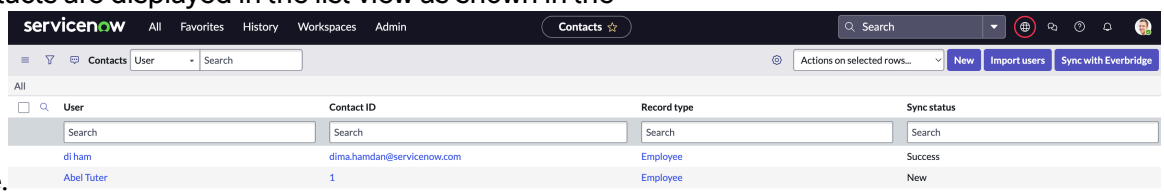
Field	Description
Name	Name of the notification template.
Description	Short note about the purpose of the template.
Delivery channels	Communication channels that are used for sending the notification.
Subject	Title of the notification.
Message body	Introductory text message for the notification.
Foot note	Closing message or a foot note for the notification.
SMS text	Text message sent through SMS.

Create contacts for emergency notifications

Create the contacts manually to send out an emergency notification and synchronize them with the Everbridge instance.

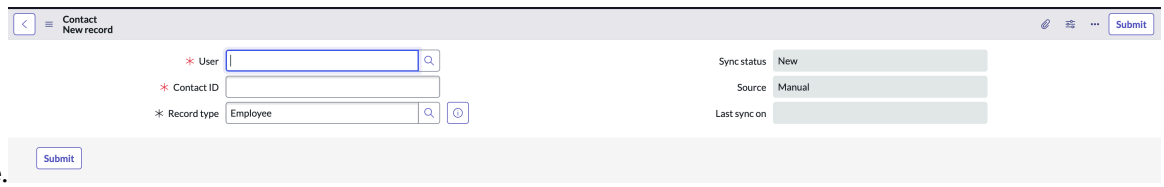
Before you begin

Role required: sn_bcm.admin



About this task

After creating the contacts from the user list, you can update and synchronize them with the Everbridge instance.



Delivery channels are imported from the Everbridge instance to the delivery channels table. By using the imported delivery channels, you can manually create the contact delivery details.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Contact Configuration** > **Contacts**.
   The contacts are displayed in the list view as shown in the example.

2. Select **New**.
   The Contact form is shown in the example.

3. On the form, fill in the fields.

   You can delete a contact that you created manually from the User table. However, the contact must be in **New** state. If the referenced user record is deleted, then a scheduled job that runs weekly deletes the contact from the Contacts table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the fields, see Contact form.

4. Select **Submit**.
5. To import contacts based on contact sync rules, select the **Import users** button.
   To import the contacts using a sync rule, you must first Create the contact import rules. Refresh the form page to get the imported list of users.

   Import users action reads the Users table [sys_user] based on the contact sync rules and creates a record in the Contacts table.
6. To synchronize your list of contacts with that of Everbridge, select the **Sync with Everbridge** button.
   After the contacts are synchronized with Everbridge, the status of the sync action is recorded in the **Sync status** field. The unique ID of the contacts that are synced successfully in Everbridge are recorded as the **External contact ID** of the Contacts table.

Contact form

Use the Contact form to create the contacts manually and then synchronize the contacts with Everbridge.

Contact form

Contact form

Field	Description
Source	Source of the contacts. • If you created the contacts manually from the users' list, then the source is **Manual**. • If you had used the sync rule to create the contacts, then the source is **Sync rule**.
Last sync on	Date on which the contact was last synchronized with Everbridge.
Contact ID	Unique ID of the contact.
Sync status	Sync status when the contact is created. Defaults to **New** when the contact is created. The status can also be: • **Success**: When the contact is successfully synced with Everbridge • **Error**: If there is an error in syncing • **Updated**: If the contact or the delivery details were modified
User	User reference from the Users table [sys_user].
External contact ID	Contact ID in Everbridge.
Sync error	Error in syncing the contact with Everbridge.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create the contact import rules

Create a contact import rule to apply on the User table. You can then filter out the users as the contacts for emergency notifications.

Before you begin
Role required: sn_bcm.admin

About this task
The default table on which the contact import rule is applied is the User table [sys_user]. The sys_id of the user table and the unique contact ID of the Contacts table are mapped.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Contact Configuration** > **Contact Import Rules**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information, see Contact Import Rules form.
4. Select **Submit**.

Contact Import Rules form

Use the Contact Import Rules form to create a contact import rule that you can apply on the User table.

Contact Import Rules form

Contact Import Rules form

Field	Description
Name	Name of the import rule.
Table	User table [sys_user] for the rule.
Filter condition	Condition applied on the User table to filter the records.
Record type	Default category of the record type.
User mapping	Unique user reference from the Users table.
Contact ID mapping	Unique ID of each contact that is used to sync with Everbridge.

Create notification contact groups

Create a notification contact group using the ServiceNow AI Platform groups. Use the group members as the contacts for an emergency notification. Synchronize the group members as the contacts with Everbridge and track the non-synchronized members as exceptions.

Before you begin
Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **Everbridge Contact Configuration** > **Notification Contact Groups**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.
   For more information, see Notification Contact Group form.
4. Select **Submit**.
5. To synchronize the group with the groups in Everbridge, select **Sync Groups to Everbridge**.
   Refresh the page to get the synchronized status of the group.

   If a group is not synchronized with Everbridge, then you get an error message.
6. To view the names of the group members that did not synchronize with Everbridge, select the **Group User Exceptions** related list.

Example:
There are five members in a group, out of which four members are already synced with Everbridge and existing as contacts. When you synchronize the group, a group is created in Everbridge with the four synced group members. However, the unsynchronized single member is logged as an exception displaying a message as to why the syncing failed.

You can synchronize this particular contact first and then the group with Everbridge.

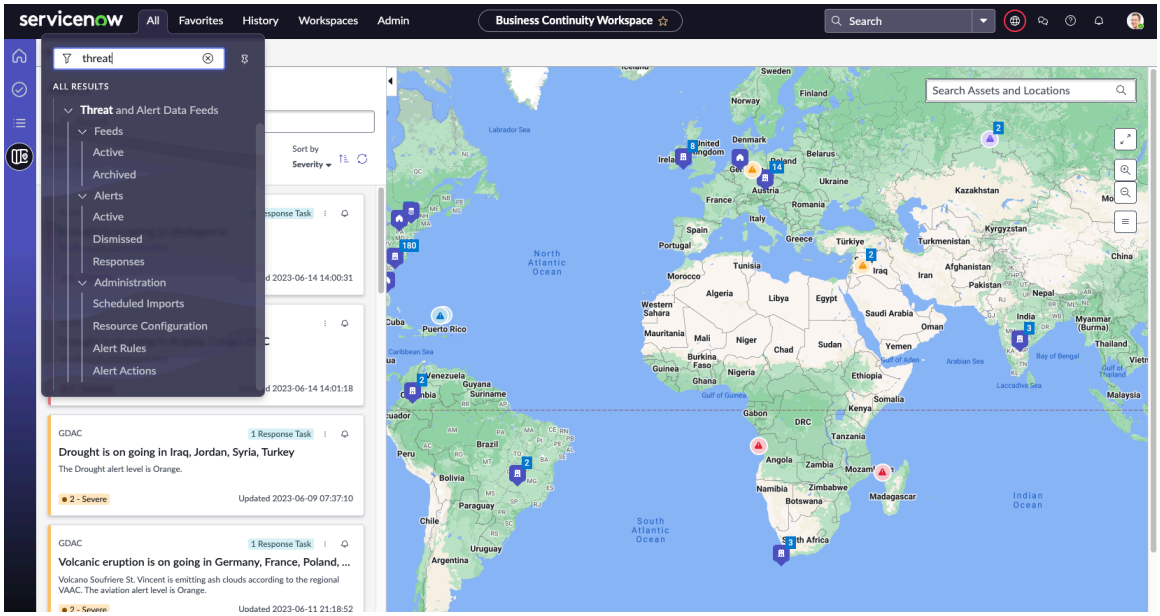
Notification Contact Group form

Use the Notification Contact Group form to create a notification contact group.

Notification Contact Group form

Notification Contact Group form

Field	Description
Group	Reference to the User Group table.
Sync status	Sync status for the group. Defaults to **New** when the group is created. • **Success**: The contact group is successfully synchronized with Everbridge. • **Error**: If there is an error in syncing • **Updated**: If the contact group is modified
Last sync on	Date on which the group was last synchronized with Everbridge.



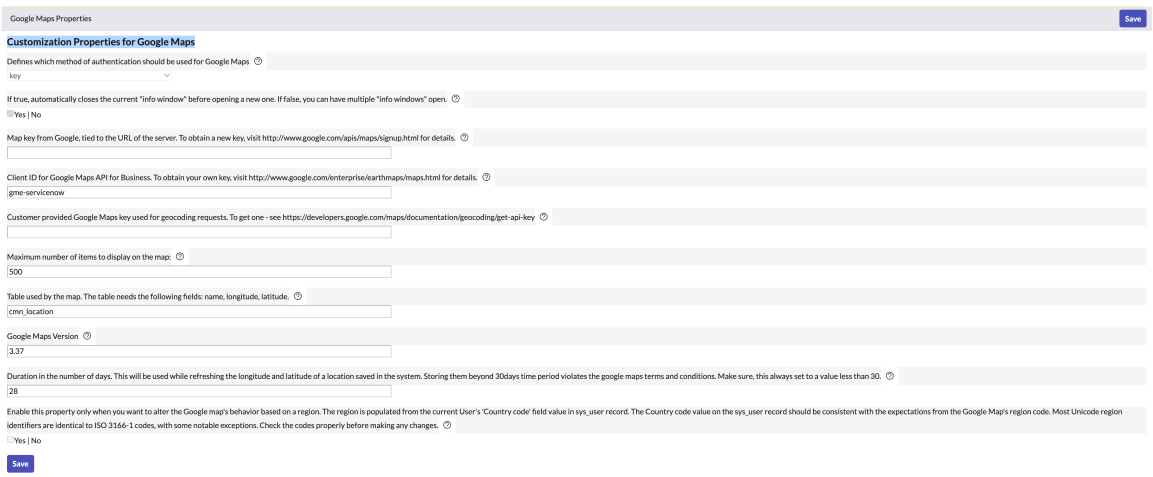
Setup for Crisis map

The BCM administrator can perform the administrative tasks to set up the Crisis map interface.

The BCM administrator performs the administrative tasks to set up the threat alerts and data feeds in Crisis map. The administrative tasks are displayed under **Administration** in the **Threat and Alert Data Feeds** module as shown in the following example.

Note:
Prior to enabling the Crisis Map feature, ensure that you have purchased and set up Google Maps API.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you have the BCM administrator role, perform the following administrative tasks to set up the Crisis map:

- **Scheduled Imports**: Configure a Scheduled Data Imports record for the Crisis map application. For more information, see Configure Scheduled Data Imports records.
- **Resource Configuration**: Configure a Resource Configuration record for the Crisis map application. For more information, see Configure Resource Configuration records.
- **Alert Rules**: Configure an alert rule in Crisis map so that you can specify the conditions under which a feed can be displayed in the dashboard as an alert. For more information, see Configure alert rules.
- **Alert Actions**: Configure an alert action in UIB Workspace for the Crisis map application. For more information, see Configure alert actions.

Customization properties for Google Maps

The Crisis map application users can configure the customization properties for Google Maps in the **Google Maps Properties** module.

When you can select the **Google Maps Properties** module in the Crisis map application, you can view the customization properties as shown in the following example.

For information on the properties, see Customization properties table for Google Maps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customization properties table for Google Maps

Customization properties for Google Maps are explained in the Google Maps Properties table.

Customization properties for Google Maps

Name of the customization property	Description
Defines which method of authentication should be used for Google Maps google.maps.method **Note:** The "Name of the customization property" column refers to the customization properties mentioned in the Customization properties for Google Maps topic.	• **Type**: choice list (client-id,key) • **Default value**: Key
If true, automatically closes the current "info window" before opening a new one. If false, you can have multiple "info windows" open. google.maps.auto_close	• **Type**: yes or no • If set to True, automatically closes the current info window before opening a new window.
Map key from Google, tied to the URL of the server. To obtain a new key, visit http://www.google.com/apis/maps/signup.html for details. google.maps.key	**Note:** The Fam-map component uses the key (google.maps.key) and client ID (google.maps.client) set for the authentication. You must use one of the options: either the key or client-ID.
Client ID for Google Maps API for Business. To obtain your own key, visit http://www.google.com/enterprise/earthmaps/maps.html for details. google.maps.client	• Map key from Google, tied to the URL of the server. • **Default value**: gme-servicenow
Customer provided Google Maps key used for geocoding requests. To get the key, see https://developers.google.com/maps/documentation/geocoding/get-api-key google.maps.key.geocoding	• Google Maps key used for geocoding requests. • **Default value**: None
Maximum number of items to display on the map google.maps.max_items	• Maximum number of items to display on the map. • **Default value**: 500

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customization properties for Google Maps (continued)

Name of the customization property	Description
Table used by the map. The table requires the fields: Name, Longitude, Latitude. google.maps.table	• Table used by the map. • **Default value**: cmn_location
Google Maps Version google.maps.version	• Google Maps Version • **Default value**: 3.37
Duration in the number of days. It is used while refreshing the longitude and latitude of a location saved in the system. Storing them beyond 30 days time period violates the Google maps terms and conditions. Verify that it is always set to a value less than 30. google.maps.refresh.latlong.duration	• Duration in the number of days. • **Default value**: 28
Enable this property only when you want to alter the Google map's behavior based on a region. The region is populated from the current User's 'Country code' field value in sys_user record. The Country code value on the sys_user record should be consistent with the expectations from the Google Map's region code. Most Unicode region identifiers are identical to ISO 3166-1 codes, with some notable exceptions. Check the codes properly before making any changes. google.maps.localization.region.enable	• Enable this property when you want to alter the Google Map's behavior based on a region. • **Type**: yes or no

Google Maps APIs used in Fam-map component

The Fam-map component in Crisis map utilizes various Google Maps APIs to provide interactive mapping functionalities. This section lists the Google Maps APIs that are integrated into the Fam-map component, along with their usage information.

Maps - Dynamic Maps JavaScript API

Maps - Dynamic Maps JavaScript API

Product	Description	Library
Maps JavaScript API	The Fam-map component relies on the Dynamic Maps JavaScript API to load the dynamic maps. This API enables for the dynamic creation and manipulation of the maps. It also provides a	@googlemaps/js-api-loader

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maps - Dynamic Maps JavaScript API (continued)

Product	Description	Library
	foundation for the interactive features in the component. For detailed documentation and pricing information, see https://developers.google.com/maps/documentation/javascript.	

Features and Modules

Features	Module	Default	Usage
Markers	google.maps.Marker	Enabled	Basic
Marker cluster	@googlemaps/markerclusterer	Enabled	Basic
Custom OverlayView	google.maps.OverlayView	Enabled	Basic
Polyline	google.maps.Polyline	Enabled	Basic
Polygon	google.maps.Polygon	Enabled	Basic
Circle	google.maps.Circle	Enabled	Basic
Rectangle	google.maps.Rectangle	Enabled	Basic
FeatureStyleFunction	google.maps.FeatureStyleFunctionOptions	Disabled	Basic
Customize map style	For a list of all available values for `featureType`, `elementType`, and `stylers`, see the https://developers.google.com/maps/documentation/javascript/style-reference.	Enabled	Basic

Map properties

Name	Description	Type	Required
mapProperties	Properties of Google Map to set when loading	array	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Places properties

Products	Description	Module	Default	Usage
Nearby Search	Billing depends on the fields that a user utilizes.	google.maps.places.PlacesService(map).nearbySearch	DisabledService	Basic
Places Details	Billing depends on the fields that a user utilizes.	google.maps.places.PlacesService	Disabled	Basic
Autocomplete - Per request+	The Autocomplete – Per Request SKU is charged for any of these calls or requests that do not include a session token: JavaScript: the Maps JavaScript API's Place Autocomplete service	google.maps.places.AutocompleteService.getQueryPredictions({input, language})	Disabled	Basic

Note:
For details about the properties and handlers usage in the Geo-map component, see the Geo-map Readme file. For information on the Google Maps APIs in the Geo-map component, see the KB article: KB1588661

Configure Scheduled Data Imports records

Configure a Scheduled Data Imports record for the Crisis map application. You can then manage your subscriptions to the threat feeds from an internal or external source in the BCM Configurable Workspace.

Before you begin

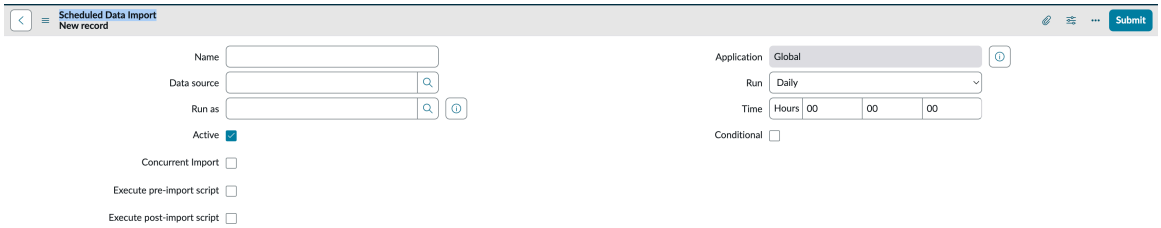
Role required: admin

You must set up the Google maps for enabling the crisis map functionality. For more information, see Set up Google Maps API.

About this task

Threat feeds provide a situational awareness of potential or current threats to the security of your organization. Threat alerts can be weather alerts, pandemic alerts, geopolitical situations, or internal events like security incidents and system outages.

Procedure



1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Scheduled Imports**.
   Following two scheduled data imports exist within the base system.

Name	Data source
GDAC Feed Source	GDAC Feeds
Weather.gov Severe Alerts Scheduled Import	Weather Gov Alerts

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. To add a new scheduled data import record, select **New**.

   The Scheduled Data Import form is displayed.

3. On the form, fill in the fields.
   For more information on the Scheduled Data Imports form, see Scheduled Data Imports form.
4. Select **Submit**.
5. To execute an existing scheduled data import, select the link to edit the record in the Threat and alert data feeds for Crisis Management application.

   The example shows a scheduled data import record where GDAC Feeds is the data source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. To delete an existing data import record, select **Delete**.
7. To update an existing data import record, select **Update**.

Result

The data import record is displayed in the **Scheduled Data Imports** record page.

Scheduled Data Imports form

Use the Scheduled Data Imports form in the BCM Configurable Workspace to add details about a Scheduled data imports record.

Scheduled Data Imports form

Field	Description
Name	Name of the scheduled data import, typically matching the alert source record name (for example, GDAC Feed Source). For information

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled Data Imports form (continued)

Field	Description
	on configuring scheduled data imports, see Configure Scheduled Data Imports records.
Data source	Internal or external source of the threat and alert data used for import, for example, GDAC Feeds.
Run as	User who has the permission to import the threat alerts, for example, System Administrator.
Application	Read-only field. Application that helps distinguish items relevant to the Crisis map, for example, Threat and alert data feeds for Crisis Management application.
Run	Frequency at which the data is imported. Available options are: • Daily • Weekly • Periodically • Monthly • After Parent Runs • Once
Active	Option to activate the scheduled import.
day	Day on which the import is scheduled to run. Visible only if you select **Active**.
Time	Time scheduled for the data import in Hours, Minutes, Seconds. Visible only if you select **Active**.
Conditional	Option to indicate if a conditional script is required for the threat alert import.
Condition	Script that evaluates whether an import should run. This field is visible only if you select **Conditional**.
Concurrent Import	Option for enabling concurrent imports. Splits data into multiple imports sets. A concurrent import splits the data into multiple import sets and runs the import sets concurrently to reduce processing time for large data sets.
Partition method	Method used to allocate each data set record to an import set. This field is visible only if you select **Concurrent Import**. Available options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled Data Imports form (continued)

Field	Description
	• Custom script: Sets the partitions with a Partition Script that you provide. • Custom size: Sets the partition size to the Partition Size specified. • Round robin: Partitions set automatically by the system.
Partition script	Script used to return a partition key. The system ensures that data set rows with the same partition key go to the same import set. Visible only if you set Partition Method to **Custom Script**.
Execute pre-import script	Option to specify a script to run before the import is performed.
Prescript	Script to run before the data imports. Visible only if you select **Execute pre-import script**.
Execute post-import script	Option for enabling the execution of a post-import script.
Post script	Script to run after the import happens. Visible only if you select **Execute post-import script**.

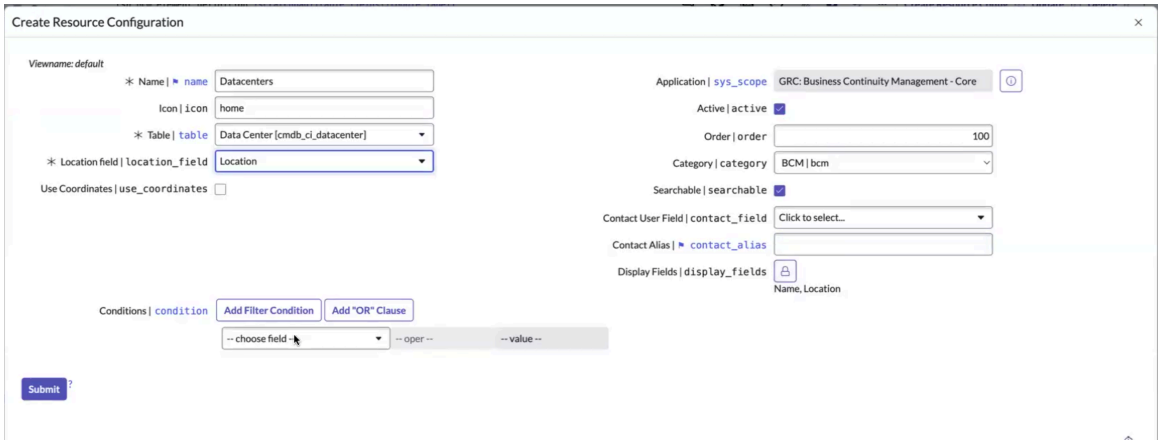
Configure Resource Configuration records

Configure a Resource Configuration record for the Crisis map application in UIB Workspace. You can then plot the assets of your organization on the Crisis map. The assets can be locations, employees, datacenters, suppliers, and others. Configuring resources is also required as an input to set up the alert rules.

Before you begin

Role required: sn_bcm.program_manager

Set up the Google maps for enabling the Crisis map functionality. For more information, see Set up Google Maps API.



Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Resource Configurations**.
2. To add a new resource configuration record, select **New**.
3. On the form, fill in the fields.

   For more information on the Resource Configuration form, see Resource Configuration form.

   A sample resource configuration is shown in the illustration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.

Result

The resource is displayed in the **Resource Configurations** record page.

Resource Configuration form

Use the Resource Configuration form in BCM UIB Workspace to add details about a resource configuration record.

Resource Configuration form

Field	Description
Name	Name of the resource configuration used in the map visualization.
Icon	Image representing a resource item on the map.
Table	Table for resources to plot on the map.
Location field	Location column of the table used as location on the map.
Use Coordinates	Option for enabling coordinates to plot the resources on the geo-map.
Application	Read-only field. The field helps distinguish items relevant to the Crisis map.
Active	Option to indicate that the resource configuration is active.
Order	Order of the record.
Category	Category of the record. The value is **BCM**. It helps to identify the BCM-related resources when multiple applications use the component.
Searchable	Option to indicate if the resource is searchable in the map visualization.
Contact User Field	Contact for communication for the resource in focus.
Contact Alias	Contacts for identification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

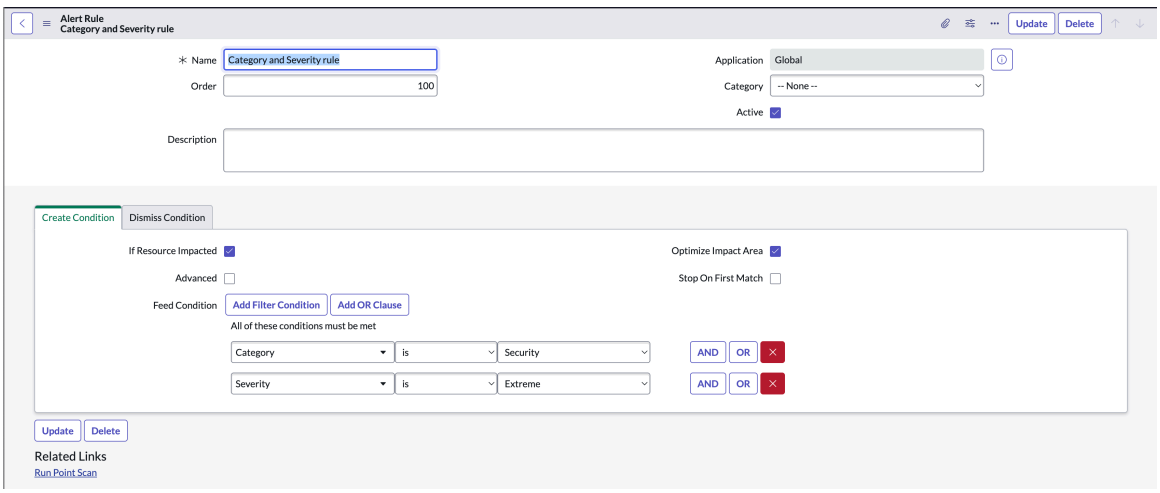
Resource Configuration form (continued)

Field	Description
Display Fields	Fields selected for display as the contacts.
Conditions	Conditions for filtering records from the table.

Configure alert rules

Configure an alert rule in the Crisis map so that you can define when a feed is displayed as an alert on the dashboard. You can also specify the conditions under which an alert is no longer valid and dismiss it from the dashboard.

Before you begin



Role required: sn_bcm.program_manager

Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Alert Rules**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information on the Alert Rules form, see Alert Rules form.
4. Add the name, description, order, and category for the alert rule.
5. In the **Create Condition** tab, define the conditions for the alert rule.

   You can create conditions to address impacted resources or optimize specific impact areas.

   The example shows an alert rule for a specific category and severity.

6. In the **Dismiss Condition** tab, define the conditions for the alert rule.

   You can dismiss conditions when a feed is deleted or resources are not impacted. The example shows how to dismiss a condition in an alert rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

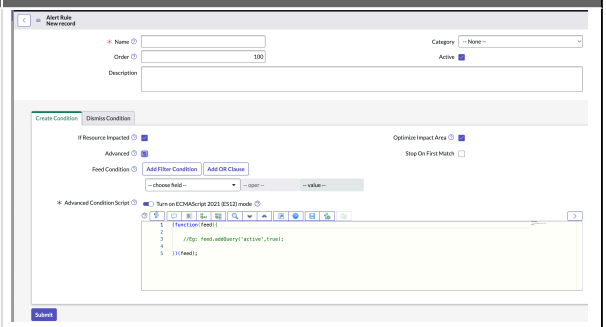
7. Select **Submit**.

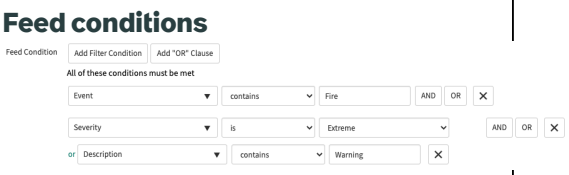
Result

The alert rule is displayed in the **Alert Rules** record page.

Alert Rules form

Use the Alert Rules form in BCM UIB Workspace to add details about the alert rules.





For the description of the field values, see the table.

Alert Rules form

Field	Description
Name	Name of the alert rule.
Order	Display order of the alert rule. By default, it is 100.
Application	Read-only field. The field helps distinguish items relevant to the Crisis map.
Category	Category of the record. The value is **BCM**. It helps to identify the BCM-related resources when multiple applications use the component.
Active	Option to set the rule active.
Description	Details about the alert.
Create Condition	
If Resource Impacted	Option for enabling an alert rule if a resource is impacted. When this option is selected, alerts are created only for resources within the feed's impacted area.
Advanced	Option for enabling advanced filter rules with a condition script for the alert rule. Use the advanced condition script as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Rules form (continued)

Field	Description
	 Enabling ECMAScript 2021 (ES12) mode allows you to use the latest JavaScript features supported in the script. Disabling it restricts you to the features supported by the application's default JavaScript mode.
Optimize Impact Area	Select this check box to enable optimization for improved performance. When enabled, the feed impact area is optimized for better performance.
Stop On First Match	Option to stop the condition on the first match of the rule. Once a condition or pattern is met, the system stops further evaluation or processing, and the action associated with that first successful match is executed.
Feed Condition	Conditions to filter alerts based on the set rule. Use these filter conditions to set your rules for a feed alert. Setting filter conditions help you to filter those alerts that are critical to your business locations from the thousands of feeds that come from the feed resources you have subscribed. Business locations can be corporate offices, employee locations, datacenters, suppliers, and others. 
Advanced Condition Script	Configuration for Advanced Condition Script. This field appears if the **Advanced** option is selected. Enter a script to filter feeds based on a criteria, for example, active alerts. Use the advanced rules option to set a filter rule with a condition script. For example, you can set a condition based on the proximity of the crisis

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Rules form (continued)

Field	Description
	to your asset locations. You can also make the rule active.
Dismiss Condition	
When Feed Deleted	Option to indicate that the alert must be dismissed from the dashboard, if the feed is deleted.
Advanced	Option for enabling advanced filter rules with a condition script for the alert rule.
When Resources Not Impacted	Option to indicate that the alert must be dismissed from the dashboard, if there are no resources impacted.
Feed Condition	Conditions to filter alerts based on the set rule.
Advanced Condition Script	Configuration for Advanced Condition Script. This field appears if the **Advanced** option is selected. Enter a script to filter feeds based on a criteria, for example, active alerts.

Configure alert actions

Configure an alert action from the Crisis map interface in the BCM Configurable Workspace.

Before you begin

Role required: sn_bcm.program_manager

About this task

You can open or dismiss an alert from the Crisis map interface. For more information, see Manage alerts from the map interface.

Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Alert Actions**.
   These alert actions are available within the base system.

Name	Description
Notify	Used to send email notifications to stakeholders and the asset managers that are within the impact radius.
Declare Crisis	Used to declare a combination of alert and critical assets as a crisis event.

2. To add a new alert action, select **New**.
3. On the form, fill in the fields.
   For more information on the fields, see Alert Action form.
4. Select **Submit**.
   You can follow up on the alert actions from the Crisis map dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The alert action is displayed in the **Alert Actions** record page.

Alert Action form

Use the Alert Action form in BCM UIB Workspace to add details about the alert actions.

For the description of the field values, see the table.

Alert Action form

Field	Description
Title	Title of the alert action.
Description	Detailed description of the alert action.
Name	Name of the action in the Crisis map dashboard.
Action name	Unique name for the alert action.
Run once	Option to indicate the execution of the action one or more times from the dashboard.
Type	Type of action to be executed. Available options are: • **Task** • **Script** • **Flow**
Task type	Task type for the alert action. For example, Asset task, Catalog task.
Application	Read-only field. The field is used as a flag to filter the items relevant to crisis management from a common list of actions.
Active	Option to indicate that the alert action is active.
Order	Display order that you can follow on the dashboard.
Run automatically	Option for enabling the action to be executed automatically based on a condition.
Roles	User roles who can execute the task successfully.
Display Fields	Fields to be displayed in the response actions after the actions are executed.
Condition	Conditions to execute the actions.
Task script	Task script to be executed when the user selects an action control on the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setup by system administrators

If you are the system administrator, you can set up the Business Continuity Management application by performing certain setup tasks.

Setting up the common administrative tasks requires configuring the pre-requisite data. The following configurations are required to set up the business continuity workspace for different users who would be using the workspace:

- To update the number of the records for a reference field, see Update number of records for reference fields.
- To update the number of the element definitions for dependency assessment, see Update the number of element definitions.
- To set up an approval configuration in the Business Continuity Management (BCM) application, see Approval configuration.
- To refer to the BCM application menu options, see Application menu options for BCM users.

Update number of records for reference fields

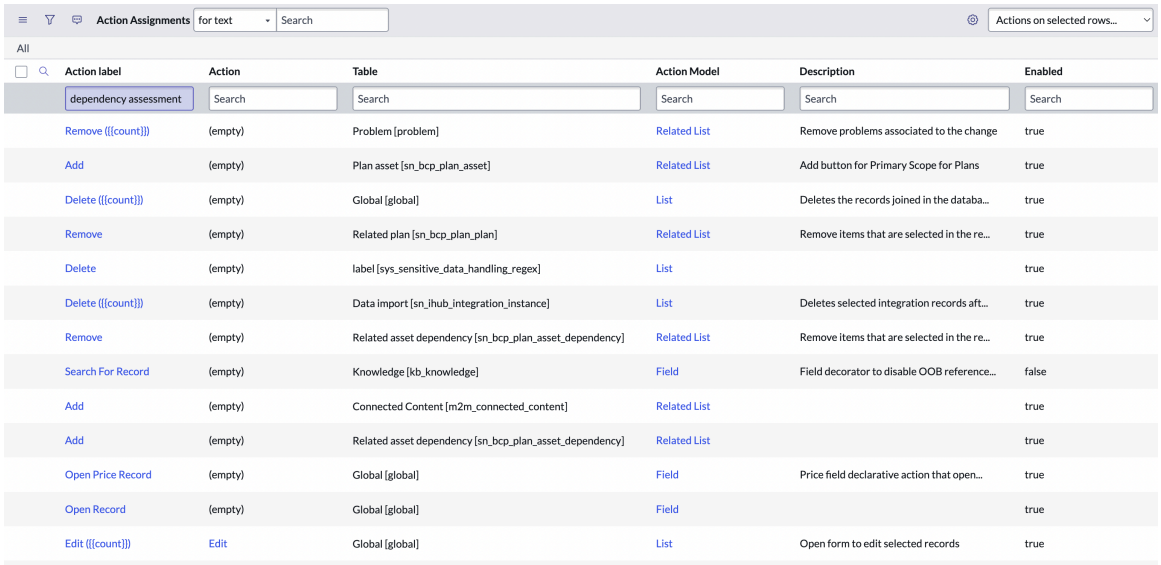
Update the number of the records that are displayed for a reference field in the Business Continuity Management (BCM) Workspace. You can configure the *`referenceFieldLoadLimit`* system property to control the number of the records that are displayed for each reference field on the grid configuration pages.

Before you begin

Role required: admin

About this task

You can configure the *`referenceFieldLoadLimit`* system property for the reference fields on these tabs:



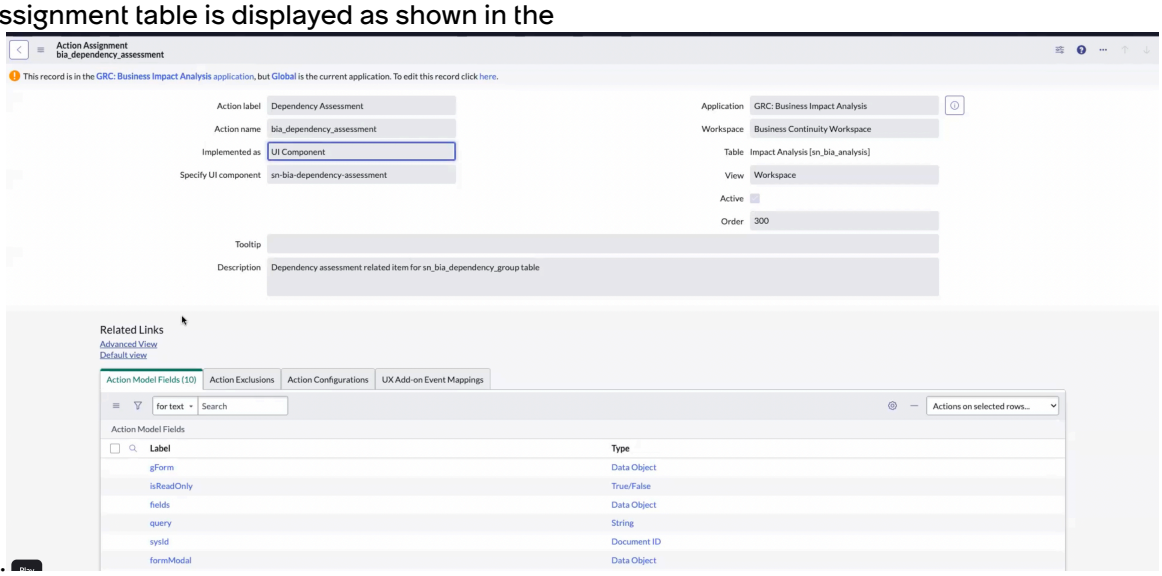
- **RTO Impact Assessment** tab, **RPO Impact Assessment** tab, and **Dependency Assessment** tab in a Business Impact Analysis
- **Recovery Tasks** tab in a Plan
- **Impacts** tab and **Event Tasks** tab in an Exercise

Procedure

1. Navigate to **All** > **sys_declarative_action_assignment.list** in the BCM application instance.

   A list view of the Action Assignments table is displayed as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. In the **Action label** column, enter the name of the assessment action and select the assessment.

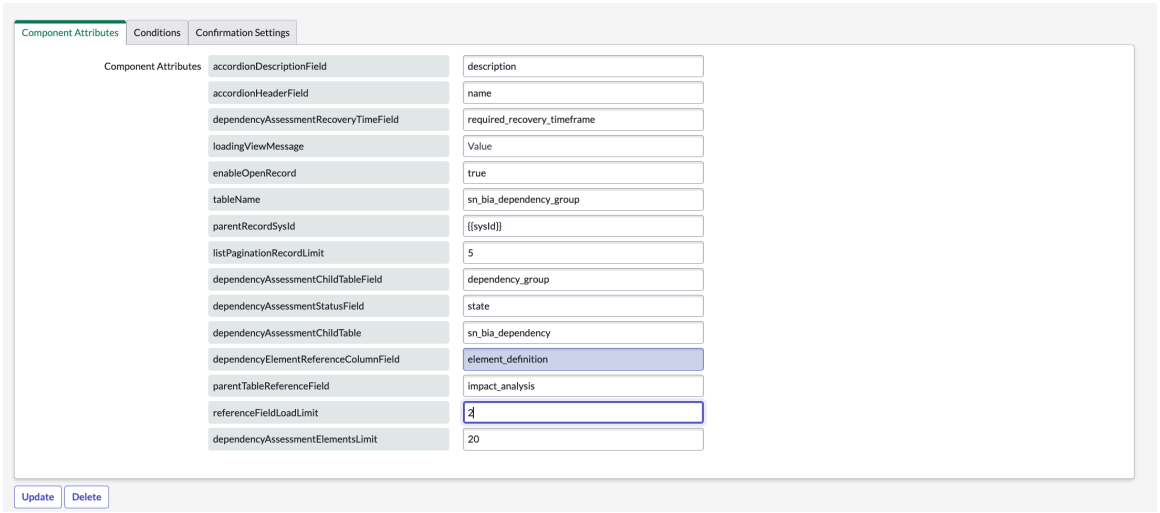
   A sample search string for the assessment is displayed in the example.

   When you select the assessment, the form view of the Action Assignment table is displayed as shown in the example.

3. In the form view of the Action Assignment table, select **Advanced View**.

   After you've selected the **Advanced View**, the properties for the selected action are displayed in the **Component Attributes** tab as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



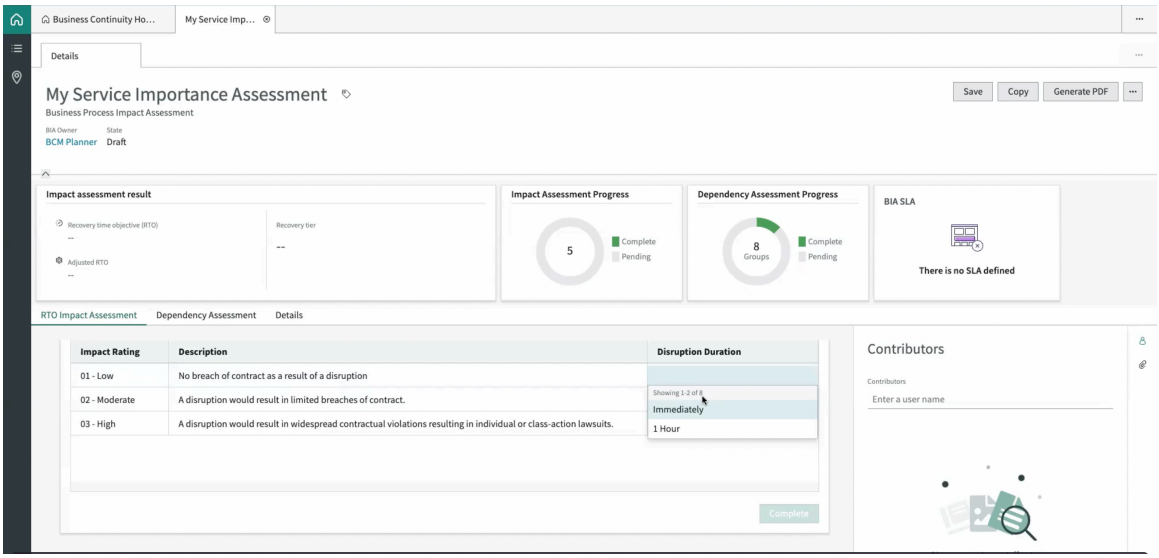
An informational message is displayed on the screen: `To edit this record, click Here`.

4. To update the *`referenceFieldLoadLimit`* property for the selected record, select **Here** in the informational message.

   By updating the *`referenceFieldLoadLimit`* property, you can control the number of the records on the grid configuration page.

   A sample configuration of the *`referenceFieldLoadLimit`* property is displayed in the example.

5. Select **Update**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You've configured the *referenceFieldLoadLimit* property for the selected assessment as shown in the example.

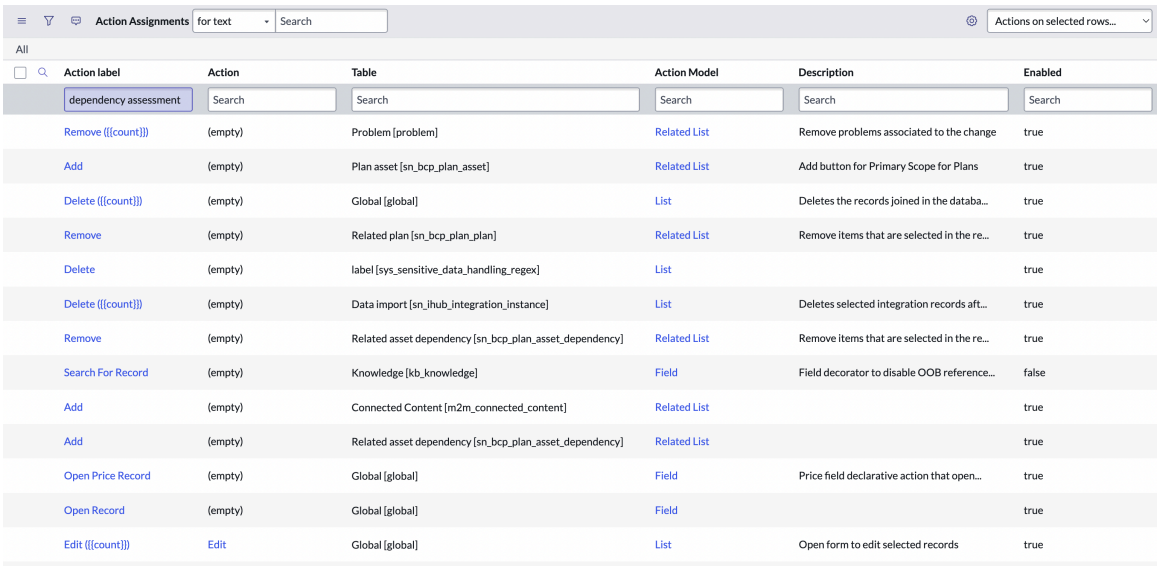
Note:
As outlined in the context of this task, you can set the *referenceFieldLoadLimit* property to control the number the reference fields on different grid configuration pages.

The example shows the updated number of the records for the **Disruption Duration** field in the **RTO Impact Assessment** tab.

Update the number of element definitions

Update the number of the element definitions that are displayed on the **Dependency Assessment** tab in the Business Continuity Management (BCM) Workspace. You can configure the *dependencyAssessmentElementsLimit* system property to control the number of the element definitions that are used for the dependency assessment in a business impact analysis.

Before you begin



Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **sys_declarative_action_assignment.list** in the BCM application instance.

   A list view of the Action Assignments table is displayed as shown in the example.

Action label	Action	Table	Action Model	Description	Enabled
dependency assessment	Search	Search	Search	Search	Search
Remove ({{count}})	(empty)	Problem [problem]	Related List	Remove problems associated to the change	true

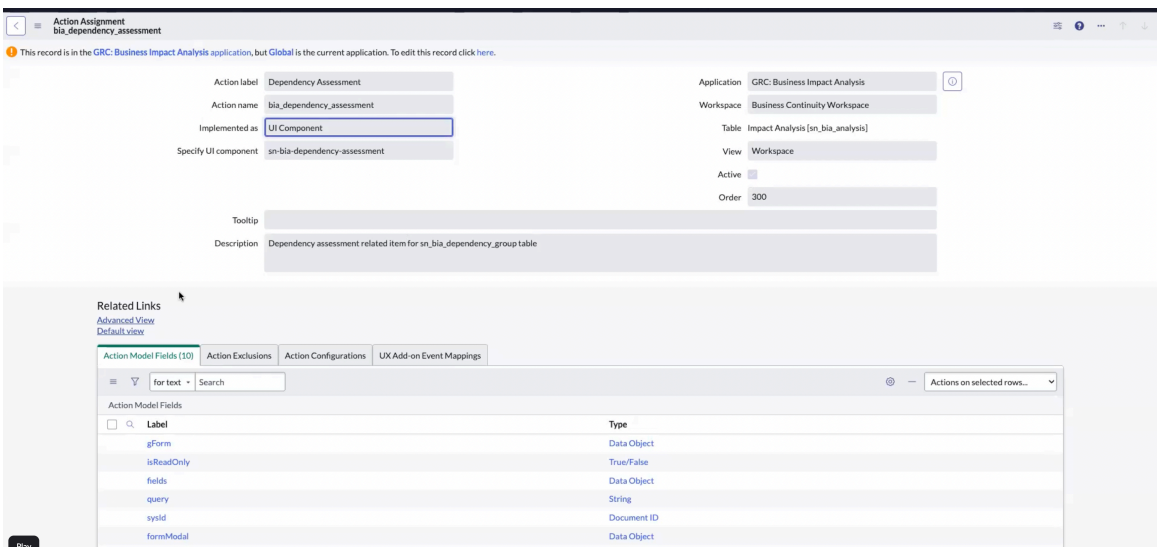
Edit ({{count}})	Edit	Global [global]	List	Open form to edit selected records	true



2. In the **Action label** column, enter the name of the assessment such as **Dependency Assessment** and select the assessment.

   A sample text string is displayed in the example.

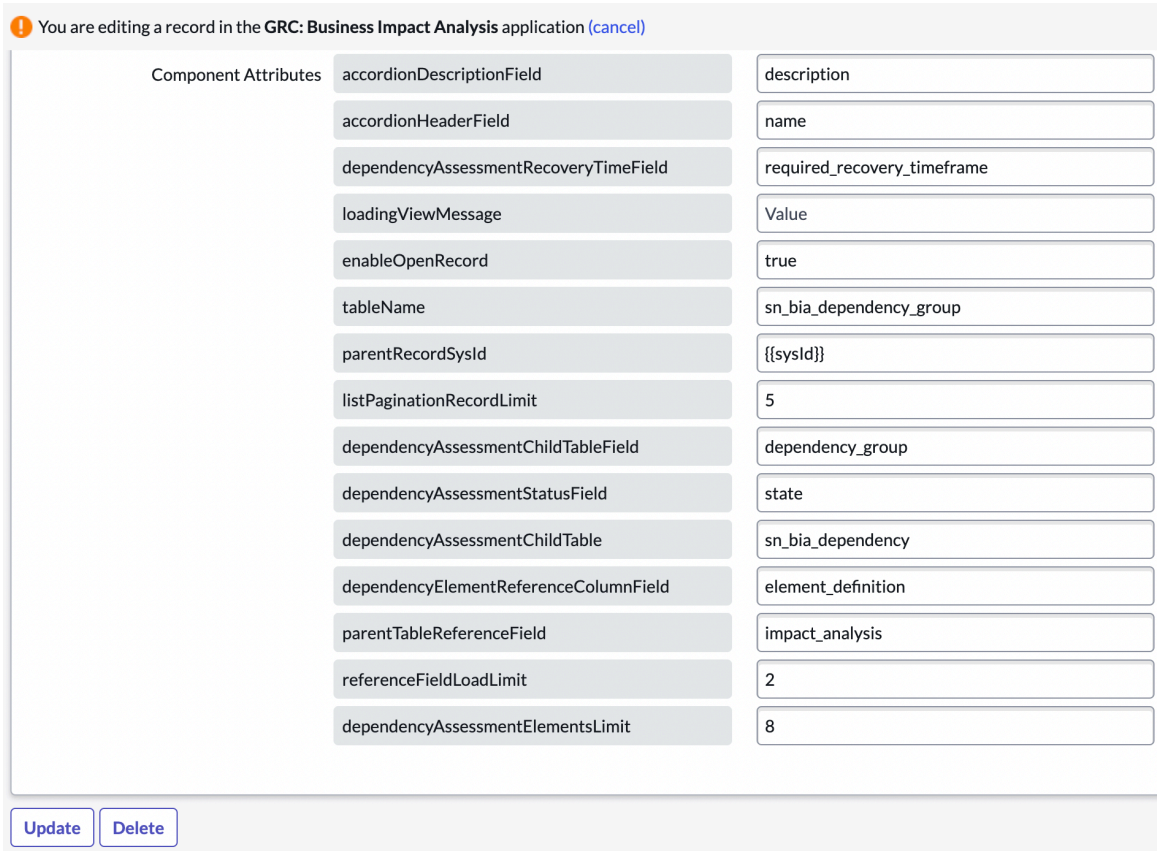
Action label	Action	Table	Action Model	Description	Enabled
dependency assessment	Search	Search	Search	Search	Search
Dependency Assessment	(empty)	Impact analysis [sn_bia_analysis]	Form	Dependency assessment related item for s...	true

   When you select the assessment, the form view of the Action Assignment table is displayed as shown in the example.

3. In the form view of the Action Assignment table, select **Advanced View**.

   After you've selected the **Advanced View**, the properties for the selected action are displayed in the **Component Attributes** tab as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



An informational message is displayed on the screen: `To edit this record, click Here`.

4. To update the *`dependencyAssessmentElementsLimit`* property, select **Here** in the informational message.

   By updating the *`dependencyAssessmentElementsLimit`* property, you can control the number of the element definitions for the dependency assessment.

   A sample configuration of the *`dependencyAssessmentElementsLimit`* property is displayed in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Update**.

You've configured the *dependencyAssessmentElementsLimit* property as shown in the example.

The updated number of the element definitions are displayed on the **Dependency Assessment** tab.

Application menu options for BCM users

The table lists the application menu options that are available for the main users of the business continuity management application to view and navigate.

BCM application menu options

For detailed information on user roles, see Roles installed table.

	BCM Admin	As a BCM administrator, you can access all menu options from the Business Continuity menu: • Business Continuity Workspace • Business Impact Analysis • Planning • Crisis Management • BIA Configuration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

		• Plan Configuration • General Administration
	BCM program manager	As a BCM program manager you can view and access the menu options: • Business Continuity Workspace • To create an impact analysis: **Business Continuity** > **Business Impact Analysis** > **Impact Analysis** • To create a plan: **Business Continuity** > **Planning** > **Plans** • To create an event: **Business Continuity** > **Crisis Management** > **Events**
	BCM planner	As a BCM planner you can view and access the menu options: • Business Continuity Workspace • To create an impact analysis: **Business Continuity** > **Business Impact Analysis** > **Impact Analysis** • To create a plan: **Business Continuity** > **Planning** > **Plans** • To create an event: **Business Continuity** > **Crisis Management** > **Events**
	BCM viewer	To view the workspace: **Business Continuity** > **Business Continuity Workspace**

Setup for the UI Builder

You can set up and extend the BCM Workspace pages and components by using the UI Builder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

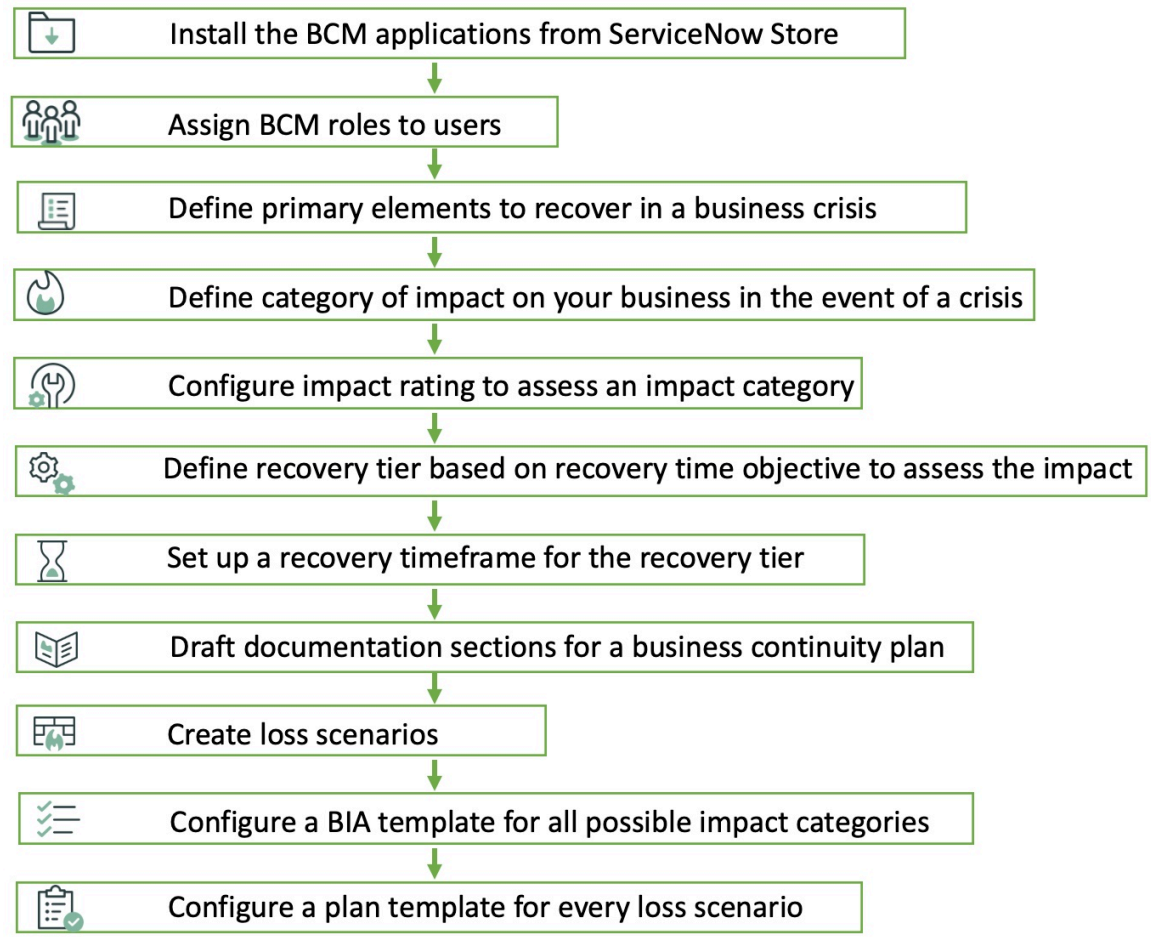
About UI Builder

UI Builder is a drag-and-drop Web user interface builder that uses the Next Experience Components and custom web Components.

To build and customize your Workspace pages and components, you must have the ui_builder_admin role.

Navigating to UI Builder in your instance

In your application instance, you can navigate to **All > Now Experience Framework > UI Builder** and select an experience that you want to work in from the UI Builder home page.



For more information on how to use a UI Builder, see UI Builder quick start.

Business Continuity Management implementation

Use the steps in the Business Continuity Management application checklist to download the Business Continuity Management from the ServiceNow Store, and get it ready for operation.

The flow of implementation steps in the checklist are illustrated here.

Graphical flowchart of BCM implementation checklist

Information on the checklist

For information on the steps that are mentioned in the *Graphical flowchart of BCM implementation checklist*, see the following sections:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To install Business Continuity Management from ServiceNow Store, see Install Business Continuity Management from ServiceNow Store.
- To learn about BCM roles, see Components installed with Business Continuity Management.
- To learn about the administration setup listed in the flowchart, see General administration setup for BCM. Refer to this section for information on the following tasks:
  - To define the primary elements to recover in a business crisis, see Configure element definition.
  - To define the category of impact on your business in the event of a crisis, see Configure impact category for BIA.
  - To configure an impact rating to assess an impact category, see Configure impact ratings.
  - To define a recovery tier based on the recovery time objective to assess the impact, see Configure recovery tiers for BIA.
  - To set up a recovery timeframe for the recovery tier, see Set up recovery timeframes.
  - To draft the documentation sections for a business continuity plan, see Configure documentation section.
  - To create a loss scenario, see Configure loss scenarios in the plan.
- To configure a BIA template for the impact categories, see Configure BIA templates with legacy assessment.

  Note:
  When you create a business impact analysis in BCM UIB Workspace, you can assign a BCM lead to the analysis in the BIA form itself.

- To configure a plan template for a loss scenario, see Configuring plan template.

  Note:
  When you create a business continuity plan in BCM UIB Workspace, you can assign a BCM lead to the plan in the BCP form itself.

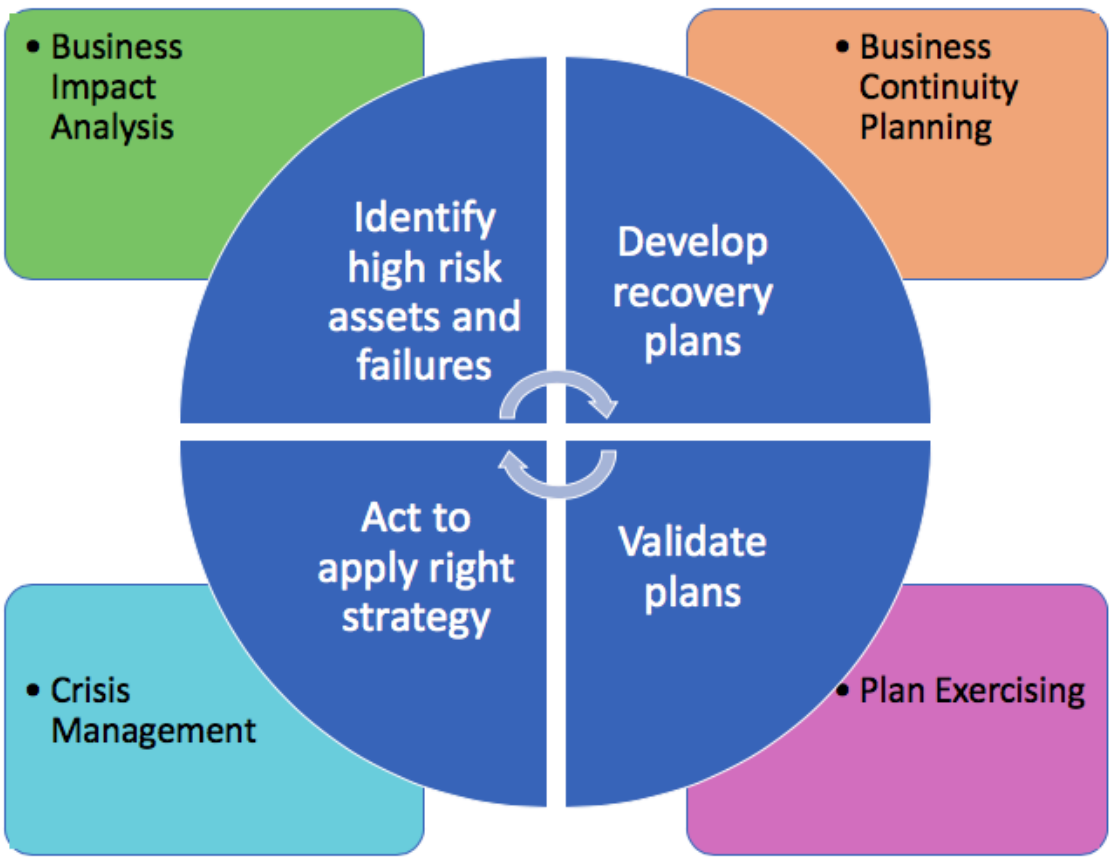
Setting up BCM in the Classic Workspace

Setting up the Business Continuity Management (BCM) application for use requires configuring certain pre-requisite data.

Configuring the BCM application data helps to equip the workspace with the necessary templates for all kinds of crises. You can define elements such as items and assets, categorize impacts, set tier levels for recovery, and timeframes. BCM users can then find all the necessary, correct, and current data required to complete their tasks on the workspace.

The following configurations are required to set up the business continuity workspace for different users who would be using the workspace:

- For user roles and access control limitations to the scoped BCM applications, see Components installed with Business Continuity Management.
- To configure element definitions, see Configure element definitions for Business Continuity Management.
- To configure impact categories, see Configure an impact category for Business Continuity Management.
- To configure an impact rating for an impact category, see Configure an impact rating to assess an impact category.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To configure a recovery tier to assess an impact, see Configure recovery tier for impact assessment.
- To set up a recovery timeframe for a recovery tier, see Set up recovery timeframe for a recovery tier.
- To configure a documentation section for a plan, see Configure a documentation section for a business continuity plan.
- To configure a grid for column display, see Grid configuration for column display in BIA dependency assessment.
- To identify a loss scenario and add it to the plan, see Configure a plan for a loss scenario.
- To configure a BIA template, see Configure a business impact analysis template.
- To configure a BCP template, see Configure a business continuity plan template.
- To know the application menu options available for different BCM users, see Application menu options for Business Continuity Management users.

BCM UIB Workspace landscape

Use the BCM UIB Workspace like a console to view and manage your business continuity tasks. You can monitor, execute, review, and report on the business impact analyses, business continuity plans, exercises, and crisis events.

Integration of BCM applications

Configure element definitions for Business Continuity Management

Configure element definitions to identify the configuration item that has to be assessed in a business impact analysis and recovered in a business continuity plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_bcm.admin

Procedure
1. Navigate to **Business Continuity** > **General Administration** > **Element Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

Element Definition form

Field	Description
Name	Name of the element definition.
Source Table	Table that stores the record details of the configuration item.
Source Table Fields	Column heads of the source table that you can select for reference.
Requires data backup	Option to indicate if the primary element requires a data backup. Technology assets require data backup as they pertain to important IT information stored in a system or database. See View business impact analysis details.

4. Click **Submit**.

Configure an impact rating to assess an impact category

Configure a rating for each category to help you measure the intensity of loss when a business downtime occurs.

Before you begin
Role required: sn_bcm.admin

About this task
You can define the impact ratings to assess an impact category as low, moderate, high, or critical.

Procedure
1. Navigate to **Business Continuity** > **General Administration** > **Impact Ratings**.
2. Click **New**.
3. On the form, fill in the fields.

Impact Rating form

Field	Description
Name	Name of the impact rating.
Value	Numerical value for the impact rating.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Impact Category	Category of impact. For example, Workforce impact, Regulatory impact, Revenue impact, and others.
Impact analysis question	This field appears if the impact category of the business disruption contributes to RPO.
Tolerable	Option for enabling the RTO impact as tolerable. This check box appears only if the impact category contributes to RTO.
Description	Short description about the impact rating

4. Click **Submit**.

Configure recovery tier for impact assessment

Configure and use recovery tier to assign a single recovery time and name to a similar range of recovery time objective (RTO) values.

Before you begin

Role required: sn_bcm.admin

About this task

Recovery tiers are also associated with other organizational expectations such as levels of support, escalation, and communication.
Recovery tiers are used in these areas:

- BIA scores and impact assessment result.
- Element recovery times.

Some examples of recovery tiers include:

- Tier 1 – Mission Critical: 2 hours RTO.
- Tier 5 – Non-Essential: 1 week RTO.

Although there is no limitation to the number of recovery tiers, an organization can set 4 to 6 recovery tiers.

Note:
Recovery tiers are automatically calculated on BIAs and element RTO by selecting the nearest recovery tier maximum time.

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Recovery Tiers**.
2. Click **New**.
3. On the form, fill in the fields.

Recovery Tier form

Field	Description
Name	Name for the recovery tier level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Recovery time objectives	Metric that calculates how quickly the business should recover an element after a disaster.

4. Click **Submit**.

Grid configuration in BIA dependency assessment

Grid configuration for column display helps you to capture specific columns in the dependency grid that corresponds to an element.

Set up the following configurations to display the desired columns in each dependency group grid by selecting the fields from the configuration table.

- Set up element variable for BIA dependency assessment grid
- Set up grid configuration for BIA dependency assessment

Set up element variable for BIA dependency assessment grid

As a functional system administrator, you can set up an element variable that is specific custom columns, which are required for a particular dependency of an element.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Business Continuity** > **General Administration** > **Element Variables**.
2. Click **New**.
3. On the form, fill in the fields.

Element variable form

Field	Description
Model	Element definition [sn_bcm_element_definition] reference. You can create multiple element variables for an element definition.
Type	Field class in the model table.
Label	Display name in the dependency group of the BIA dependency grid.
Column name	Name of the column in the table.
Active	Option to activate the element variable.
Read only	Option to render the element variable as read only.
Mandatory	Option to set the element variable as mandatory.
Display	Option to display the element variable.
Enable reporting	Option to report the element variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Reference Specification	
Reference	Reference to the table that has the element variable.
Reference qual condition	Filter conditions set for the reference.
Choice List Specification	
Choice	Specification of list choice.
Default Value	
Default value	Description for the default value.

4. Click **Submit**.

Set up grid configuration for BIA dependency assessment

Set up the grid configuration to render the BIA dependency assessment grid with configured columns.

Before you begin

Role required: sn_bcm.admin

Procedure

1. Navigate to **All** > **Business Continuity** > **General Administration** > **Grid Configurations**.
2. Click **New**.
3. On the form, fill in the fields.

Grid configuration form

Field	Description
Name	Name of the grid configuration.
Grid category	Grid category for which the configuration is applicable. For example, DEP_ASSMNT.
Element definition	Configuration item to be assessed in the BIA. In grid category, if enable element context is true then grid configuration should be based on element.
Active	Option to set the record active. If the option is disabled then the grid is rendered based on the configured view. Only one active configuration for a category and element should be present.
Grid column configuration	
Field source	Source from which the fields must be selected. For example, dependency, element, and element variable tables.
Source table	Table that has the field.
Field	Name of the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order of column appearance in the grid.
Enable filter	Option to set filter on columns.
Enable grouping	Option to enable grouping of columns.
Enable sort	Option to enable sorting of the columns.

4. Click **Submit**.

Set up recovery timeframe for a recovery tier

Set up recovery timeframe that starts from when an incident or crisis happens to the time your business can resume usual operations.

Before you begin

Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Recovery Timeframes**.
2. Click **New**.
3. On the form, fill in the fields.

Recovery Timeframe form

Field	Description
Name	Name of the recovery timeframe.
Starts at	Start time of the recovery timeframe. Time at which the recovery operations should begin.

4. Click **Submit**.

Configure a documentation section

Configure a documentation section of a plan to describe the plan in structured sections providing a checklist of high level details, purpose of the plan, scope describing purpose of the plan and coverage areas, its goals and success criteria.

Before you begin

Role required: sn_bcm.admin

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Documentation Sections**.
2. Click **New**.
3. On the form, fill in the fields.

Documentation Section form

Field	Description
Name	Name of the documentation section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Title	Documentation section title.
Description	Brief description about the documentation section.
Default Text	Default text relevant for the documentation section. The text can be edited later when the plan is formulated and the documentation sections are added, in accordance to the plan.

4. Click **Submit**.

Configure a plan for a loss scenario

Loss scenarios are identified and documented so that the plan has the needs and requirements listed for any particular disaster that may strike. Each potential threat requires unique recovery steps and the need for each loss scenario vary. Your plan must be well laid to maintain operations for any potential impacted loss.

Before you begin
Role required: sn_bcm.admin

About this task
Set up the ability to define a loss scenario that can be planned for. You can then include the loss scenario in a plan template to confirm that the BCM program managers and plan owners consider all possible critical loss scenarios.

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Loss Scenarios**.
2. Click **New**.
3. On the form, fill in the fields.

Loss Scenario form

Field	Description
Scenario Name	Name of the impact scenario.
Elements impacted	Items or assets that are impacted because of the loss scenario.
Description	Short note about the loss scenario.

4. Click **Submit**.

Configure a business impact analysis template

Define the business impact analysis (BIA) template to create and assign BIAs with standard object types. The object types can be business processes, applications, facilities, and others, the impact of which are assessed in a BIA.

Before you begin
Role required: sn_bcm.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By configuring a BIA template, you can:

- Define the primary object type that the template is to be used for.
- Choose the specific impact categories to be assessed during the BIA.
- Define the types of dependencies that should be identified during the BIA.

When you do a business impact analysis of a primary element, you can also assess its recovery time based on whether the element requires a data backup or not. If your primary element is a technology asset that is related to a server or database, then it requires data backup as it stores critical information and adds to business value. You can filter the impact categories that contribute either to Recovery Time Objective or Recovery Point Objective. This helps you to identify the recovery objective of critical primary elements when you do an impact analysis.

If the primary element assessed requires data backup (**Requires data backup** field is **Yes** in Element Definition form), then all the impact categories whether they contribute to Recovery Point Objective or Recovery Time Objective are displayed in the **Impact Categories** field. If the primary element does not require data backup, then the impact categories that contribute to RTO alone are displayed.

Procedure

1. Navigate to **Business Continuity** > **BIA Configuration** > **BIA Templates**.
2. Click **New**.
3. On the form, fill in the fields.

BIA Template form

Field	Description
Name	Name of the BIA template.
Description	Brief description about the template.
Primary Element Assessed	Primary object type or an element for which the template is used.
Impact Categories	Category of impact that an organization can confront. It can be revenue, legal, regulatory, reputation, and others.
Dependency Assessments	Category of items or assets that the business function depends on.
Include CIA	Option to include Confidentiality, Integrity, and Availability to BIA. The field appears only if the **Primary Element Assessed** field requires data backup. If the primary element requires data backup, set the flag as **Yes** in the Element Definitions form. See Configure element definitions for Business Continuity Management.

4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure a business continuity plan template

Configure the business continuity plan (BCP) template to create and assign business continuity plans with standard object types. The object types can be business processes, applications, employees, hardware, software, and others.

Before you begin

Role required: sn_bcm.admin

About this task

By configuring the plan template, you can:

- Define the primary object type that has to be recovered.
- Define documentation sections that should be included right at the beginning of a plan.
- Identify the loss scenarios and plan accordingly using the template.

Procedure

1. Navigate to **Business Continuity** > **Plan Configuration** > **Plan Templates**.
2. Click **New**.
3. On the form, fill in the fields.

Plan Template form

Field	Description
Name	Name of the plan template.
Description	Brief description about the plan template.
Primary Element Recovered	Primary object type or an element identified to be recovered in the plan.
Plan authoring type	Different phases or sections of a plan that are available as options when you create a continuity plan using this template. These options show as tabs in the BCP workspace as you proceed to complete the plan details. ○ **All** (Default): All options like Documentation, Loss Scenarios, Recovery tasks, and Recovery teams are displayed in the plan that uses this template. You can view these options as tabs in the workspace. ○ **Documentation**: Plan that uses this template displays the documentation option along with selected dependencies. Documentation tab along with Recovery tasks and Recovery teams are available for view in the workspace. ○ **Loss Scenarios**: Displays the loss scenarios along with Recovery tasks, Recovery teams, and other selected

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	dependencies in the plan that uses this template. ○ **Recovery tasks**: Displays recovery tasks and Recovery teams associated to the plan type that uses this template.
Group recovery tasks	Option to pre-group tasks in the Group column of the recovery task grid based on a group by value.
Group by	Field appears if the **Group recovery tasks** option is enabled. Group by value based on which the recovery tasks are pre-grouped in the Group column.

4. Click **Submit**.

Configure an impact category for Business Continuity Management

Configure an impact category to define the timeframe during which the organization would experience a downtime of its business processes. Based on the timeframe, you can determine the recovery time objective (RTO) of the assets that the business process depends on.

Before you begin

Role required: sn_bcm.admin

About this task

Recovery time objective (RTO) measurement helps to verify the key points:

- Assets are recovered in time to support any parent dependencies.
- Identify gaps in asset recovery capabilities.
- Prioritize asset recovery if there is a loss scenario.

While RTO calculates the acceptable time by which the business function is restored, Recovery Point Objective (RPO) confirms that the maximum tolerable data loss for a function is not exceeded.

Procedure

1. Navigate to **Business Continuity** > **General Administration** > **Impact Categories**.
2. Click **New**.
3. On the form, fill in the fields.

Impact Category form

Field	Description
Name	Name of the impact category.
Contributes to	Contribution to RPO or RTO as a result of the impact on business disruption. If the impact category contributes to Recovery Point Objective, then the Impact analysis questions related list appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applicable timeframes	Duration of business process disruption. This field appears only if the **Contributes to** field value is RTO.
Maximum RTO value	Metric that calculates the maximum time limit within which the business must recover an element after a disruption.
Description	Brief description of the impact category.

4. Click **Submit**.
5. If your impact category contributes to the recovery point objective, click the record that you created in the Impact Categories list.

   a. Click **New** in the Impact analysis questions related list.

   b. Enter an impact question on the impact category in the **Question** field.
   The Impact category field auto-populates the category of business impact.

   c. Enter a short description about the impact analysis question in the **Description** field.

   d. Click **Submit**.

Managing BCM workflow tasks

You can use the features and capabilities of the Business Continuity Management application and manage business continuity workflow tasks in BCM Configurable Workspace.

Performing business continuity tasks in BCM Configurable Workspace

Perform the tasks that are outlined in this section to manage business continuity for your organization. You can create a business impact analysis, business continuity plan, an exercise event, or manage a crisis event in Business Continuity Workspace (also known as BCM Configurable Workspace).

See the following sections for performing business continuity tasks in BCM Configurable Workspace:

- For tasks related to a business impact analysis, see Structured workflows for BIAs.
- For tasks related to a business continuity plan, see Structured workflows for BCPs.
- For tasks related to an exercise event, see Structured workflows for exercises.
- For tasks related to a crisis event, see Structured workflows for crisis events.

Structured workflows for BIAs

Perform the tasks that are outlined in this section to create a business impact analysis in Business Continuity Workspace (also known as BCM Configurable Workspace).

Typically, the business impact analysis owner performs the following tasks:

- Create a business impact analysis. For more information, see Create a business impact analysis.
- Assess the impact categories and submit the analysis for a review and approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If an approval record is already created for a BIA, the **Approve** or **Reject** buttons are not displayed in the BIA form.

For more information, see Assess impact categories and dependencies.

- As the BCM lead, approve the BIA. For more information, see Approve the business impact analysis.
- Generate and save the PDF of the analysis for reference.

BIA updates in the Xanadu release

Beginning with the Xanadu release, the reliability of business impact analysis is enhanced through the implementation of following updates.

- Access the latest BIAs of the dependent items and their recovery objectives such as Recovery Time Objectives (RTOs), Recovery Point Objectives (RPOs), and Recovery Tiers.
- Configure the columns in the dependency assessment of a BIA.
- Schedule automated updates for the dependencies from the CMDB.
- Configure the updates to be done after a manual review.

Note:
If an approval record is created for a BIA, the **Approve** or **Reject** button is not displayed on the BIA form. For a user to view the **Approve** or **Reject** button, the following conditions must be fulfilled:

- The user should have the sn_bia.bia_manager role.
- The BIA should be in the **Pending approval** state.
- The BIA should not have any approval records created.

Additional information on Business Impact Analysis

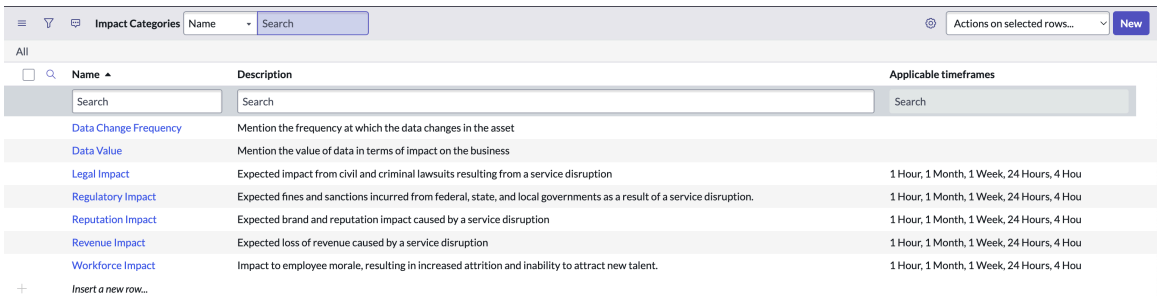
- For information on the **Business impact analysis** tab in the Home page, see Home page view.
- For information on business impact analysis, see Business impact analysis.
- For information on the administrative tasks in business impact analysis, see Setup for a business impact analysis.

Impact categories and ratings

Impact categories are the types of an impact that you can assess during a business impact analysis. The BCM administrator of an organization is responsible for defining the impact categories and the timeframe during which an organization may experience a downtime. This information is used to determine the recovery time objective and recovery point objective of the assets.

Broad classification of the impact categories

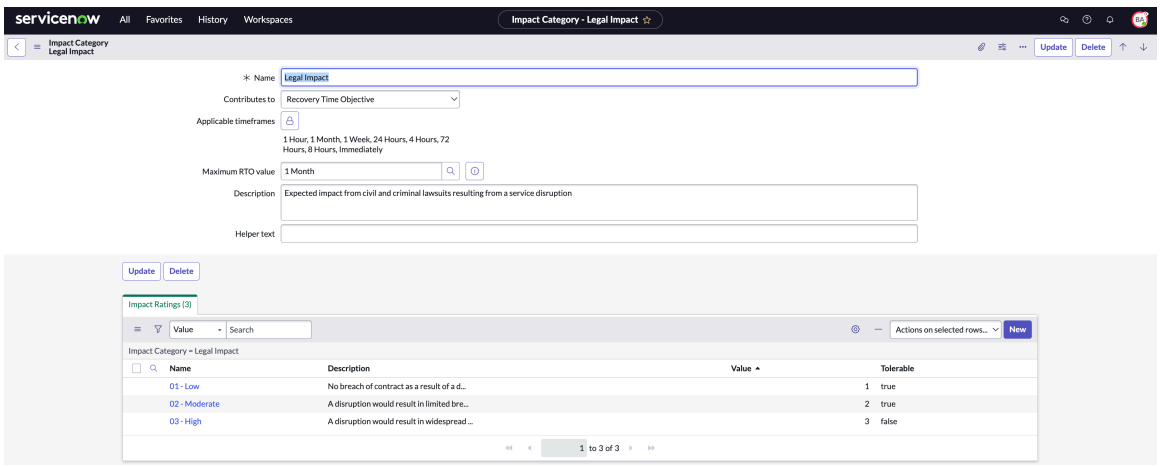
When a business service, process, or application experiences downtime due to a disruptive event, its impact can be classified in various broad categories:



- Legal impact: Classified as an impact with legal implications such as a civil lawsuit or fines that result from a service disruption.
- Regulatory impact: Classified as an impact due to a change in the existing regulation or the introduction of a new policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reputation impact: Classified as an impact to the brand image and reputation of a company.
- Revenue impact: Classified as an impact due to financial losses or low revenues.
- Workforce impact: Classified as an impact of a disruptive event on the workforce. For example, a company experiences an increased attrition rate and low employee morale post the pandemic.



Impact categories in BCM

With the BCM administrator role, you can view the impact categories that are installed with demo data and set up new impact categories in the **Impact categories** module of the BCM application. The following example shows the impact categories that are installed with demo data in an instance.

Configuration of an impact category

The BCM administrators can configure or modify the impact categories by adding key information about the impact. The following example shows the configuration details of an impact category in an instance.

The BCM administrators can configure the following details of a new impact category:

Name

Classify the impact of a downtime for your service, process, or applications by adding an appropriate name for the impact such as Legal or Reputational impact.

Contributes to

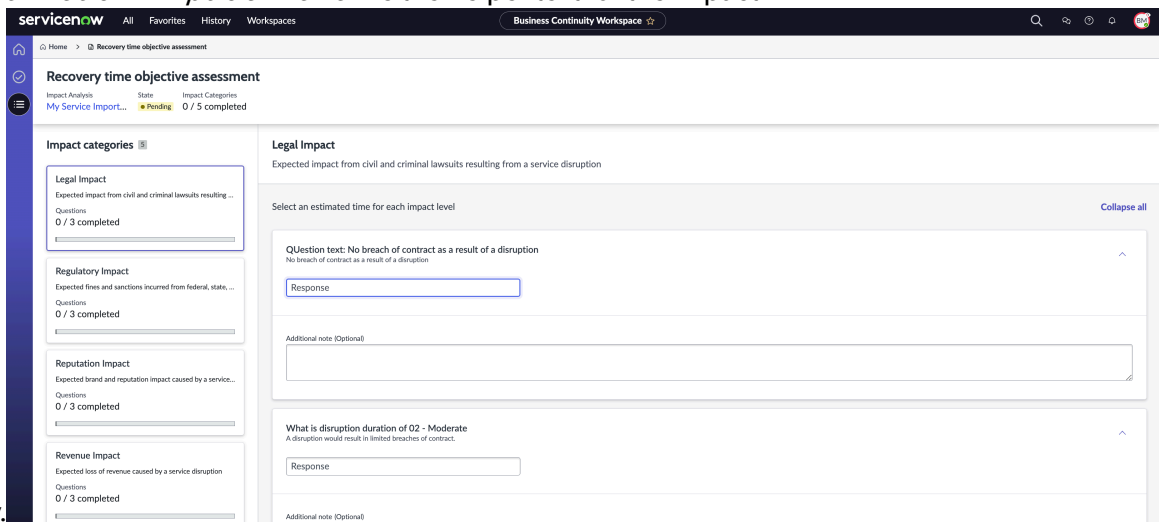
Select whether the impact contributes to recovery time objective or recovery point objective.

Applicable timeframes

Set the applicable timeframe for the impact category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Maximum RTO value



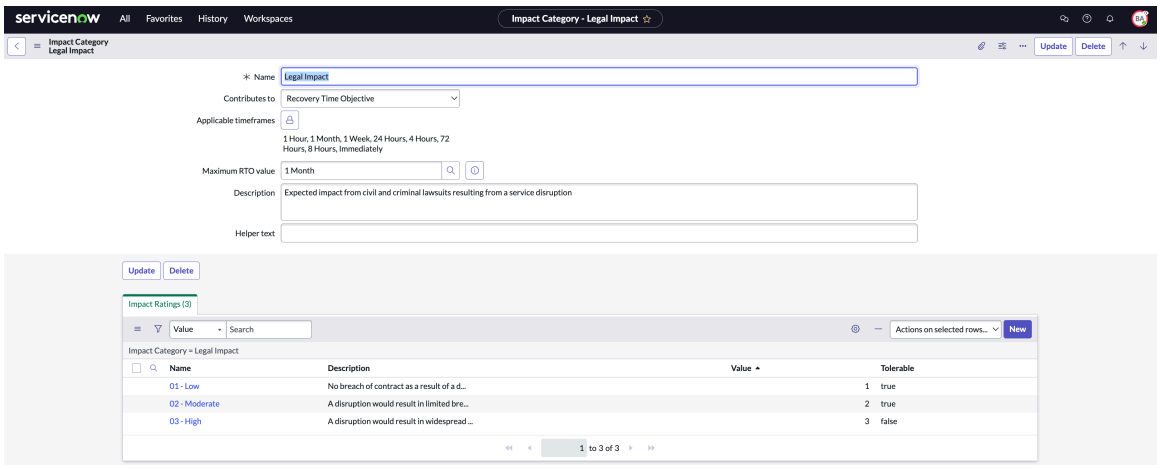
Define the maximum RTO value for the impact category.

Description

Add description for the impact category.

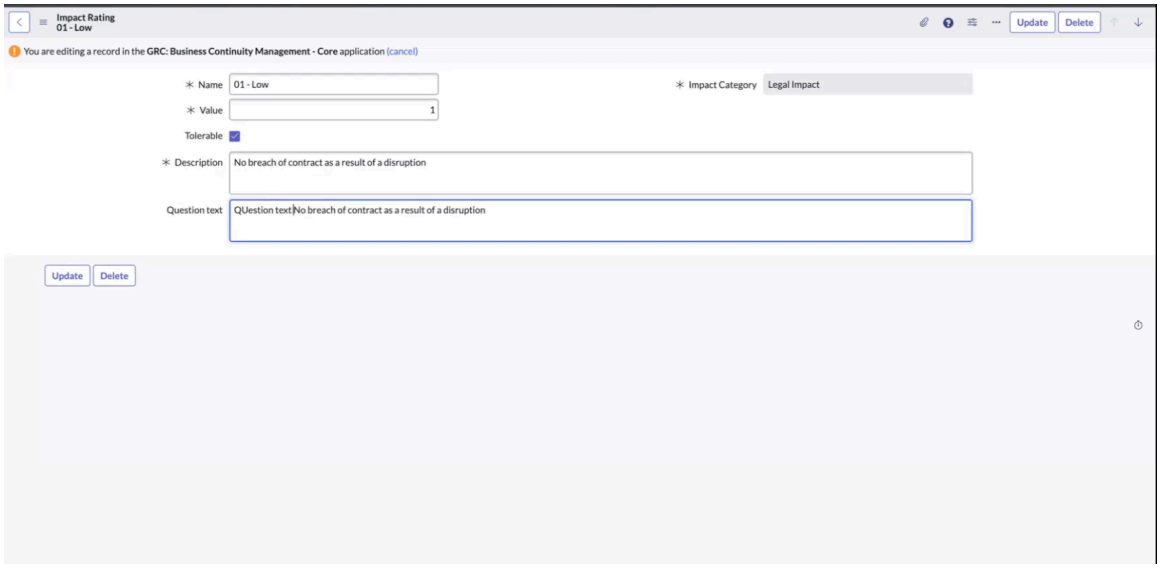
Helper text

Add the helper text that provides a hint to the users on how to respond to the assessment questions. The helper text is then displayed for the user in the business impact analysis record. In the following example, *`Select an estimated time for each impact level`* is the helper text for the impact category.



Impact category configuration by the administrators

For more information on how to configure an impact category with the sn_bcm.admin role, see Configure impact category for BIA.



Impact ratings in BCM

If you have the BCM administrator role, you can view the impact ratings that are installed with demo data and define specific impact ratings in the **Impact ratings** module. The following example shows the impact ratings that are installed with demo data for an impact category.

The impact ratings for an impact category are shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration of an impact rating

The BCM administrators can configure the following details of an impact rating for the business impact analysis:

Name

Assign a unique name to the impact rating.

Impact Category

Classify the impact category that the impact rating is associated with.

Value

Assign a unique numerical value to each impact rating. The same value can not be reused for any other impact rating in the BCM application.

Tolerable

Select the option for enabling the RTO impact as tolerable. This check box appears only if the impact category contributes to the recovery time objective.

Description

Add the description about the impact rating.

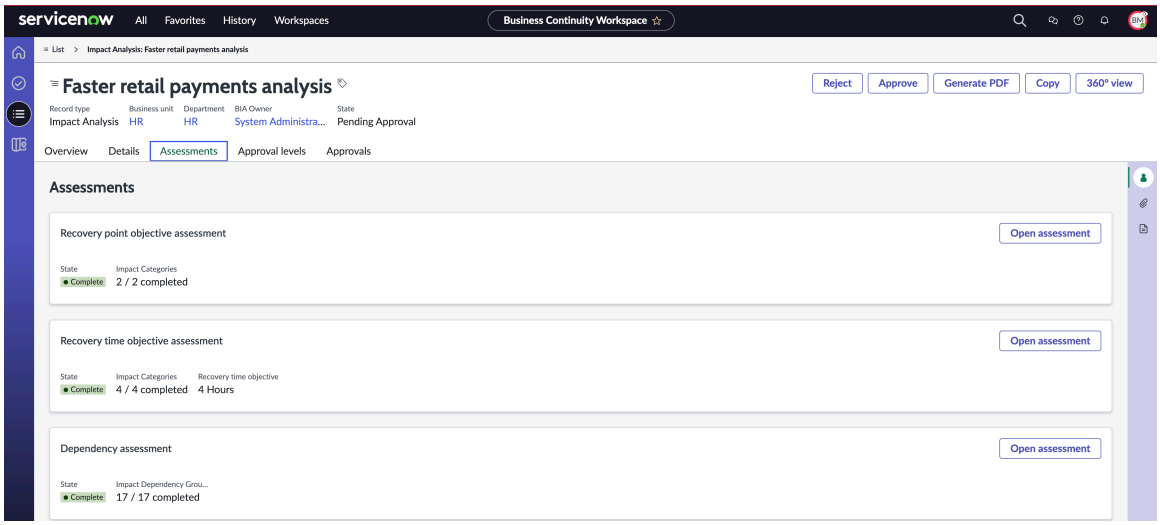
Question text

Revise the question text in the Impact Rating record for the recovery time objective of an impact category. The revised question is then displayed in the RTO assessment form of the business impact analysis record.

Impact rating configuration by the administrators

For more information on how to configure an impact rating with the sn_bcm.admin role, see Configure impact ratings.

RTO, RPO, and recovery tiers



Due to unforeseen disruptive events, the business processes in your organization can face a downtime. It is important to classify your business processes in the recovery tiers and calculate the amount of time and amount of data loss that your organization can handle without significant effect on the operations.

© 2026 ServiceNow, Inc. All rights reserved.

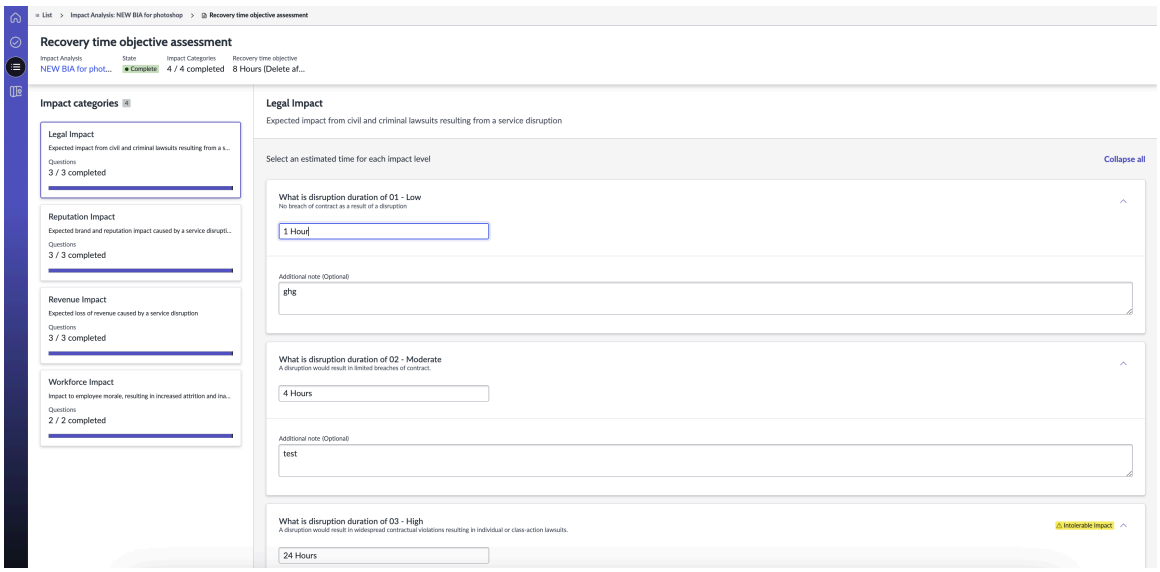
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

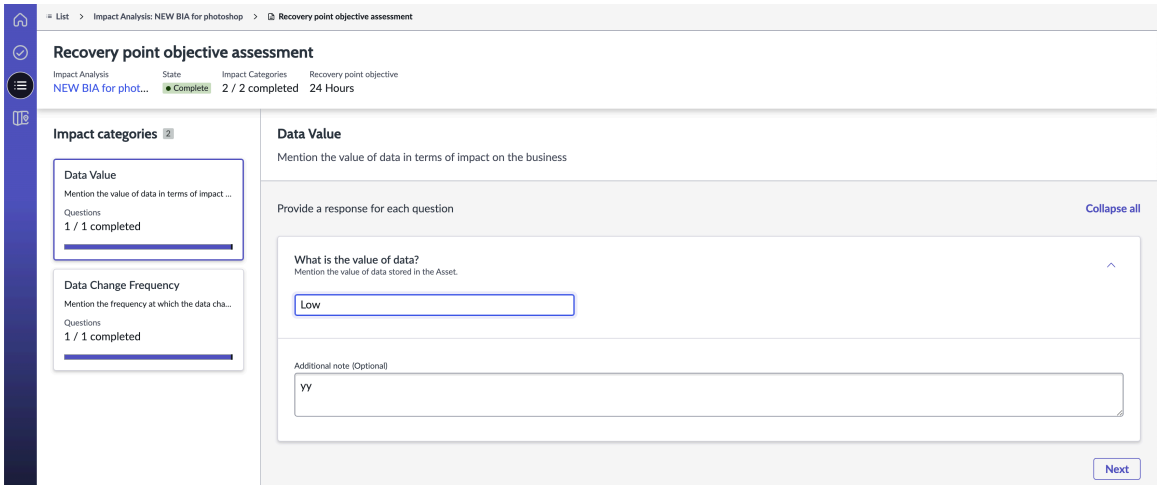


Recovery time objective

Recovery time objective (RTO) is the maximum amount of time a computer, system, network, or application takes to recover after an outage event or data loss without causing much effect to your business operations.

The business users and IT owners can perform business impact analysis and technical impact analysis respectively by responding to the assessment in the BIA component in the BCM UIB Workspace. A sample view of the **Assessments** tab is shown in the following example.

If you are the business user, you can estimate the recovery time objective for your business services and processes by responding to the Recovery time objective assessment in the **Assessments** tab. The questions are displayed in the **Recovery time objective assessment** tab according to the configuration set up by the BCM administrator. A sample Recovery time objective assessment with demo data is shown in the following example.

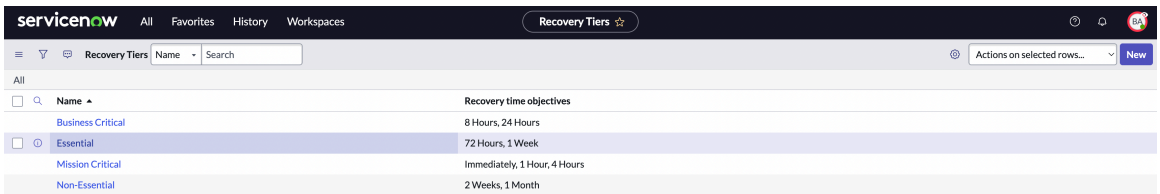


Recovery point objective

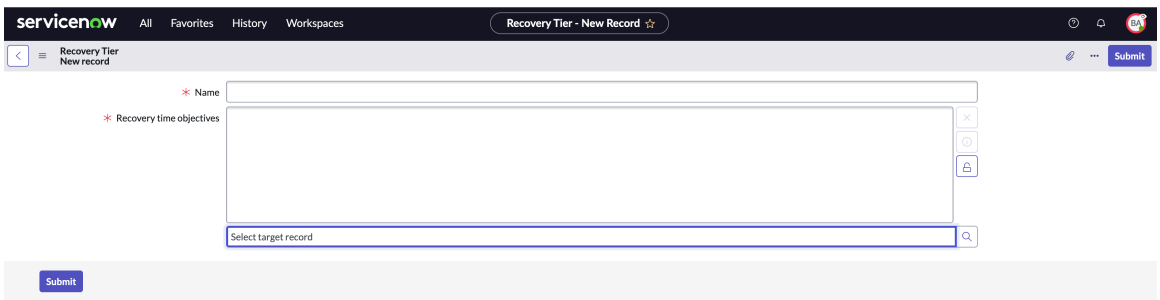
Recovery point objective (RPO) defines the maximum acceptable data loss that a business process can handle without significant effect on operations.

If you are the IT owner, you can estimate the recovery point objective for your data applications and systems by responding to the Recovery point objective assessment in the BIA. Based on the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



configuration set up by the BCM administrator, the questions are displayed in the **Recovery time objective assessment** tab as shown in the following example.



Recovery tier

If you are the BCM administrator, you can classify a set of business applications that follow a similar range of recovery time objective (RTO) values in one type of recovery tier. For example, for the Mission Critical recovery tiers, recovery time objectives can be Immediately, one Hour, and four Hours.

The recovery tiers and their associated recovery time objectives are displayed in the following example.

The BCM administrator can configure a recovery tier and set its recovery time objective as shown in the following example.

Recovery tiers are also associated with other organizational expectations such as levels of support, escalation, and communication. Recovery tiers are used in the following areas:

- BIA scores and impact assessment result
- Element recovery times

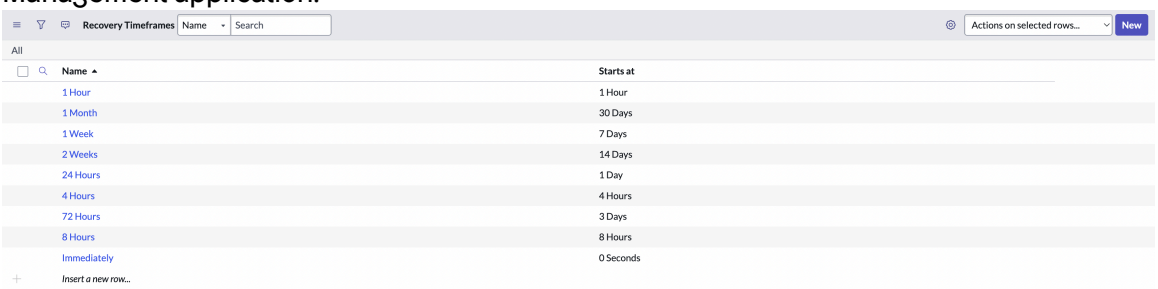
Although there is no limitation to the number of the recovery tiers, an organization can set 4 to 6 recovery tiers. Recovery tiers are automatically calculated on BIAs and element RTO by selecting the nearest recovery tier maximum time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recovery tiers can be classified as per their importance and criticality:

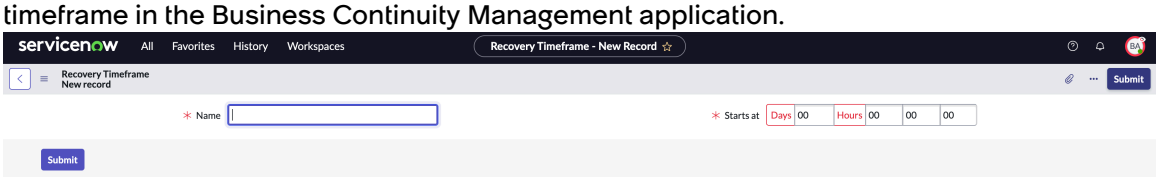
- Mission Critical
- Business Critical
- Essential
- Non-essential
- Critical
- Non-Critical

Recovery tier configuration by the administrators



For more information on how to configure a recovery tier in the Business Continuity Management application, see Configure recovery tiers for BIA.

Recovery timeframe



You can set up the recovery timeframe for a recovery tier. It is the timeframe that starts from when a disruptive event happens to the time when your business can resume usual operations. The BCM administrator can configure the recovery timeframe and its start time. You can configure different recovery timeframes as shown in the following example:

- Immediately
- 1 Hour
- 4 Hours
- 8 Hours
- 24 Hours
- 72 Hours
- 1 Week
- 2 weeks

The following example shows the configured recovery timeframes in the Business Continuity Management application.

The following example shows the configuration of a recovery timeframe in the Business Continuity Management application.

For more information on how to configure a recovery timeframe in the Business Continuity Management application, see Set up recovery timeframe for a recovery tier.

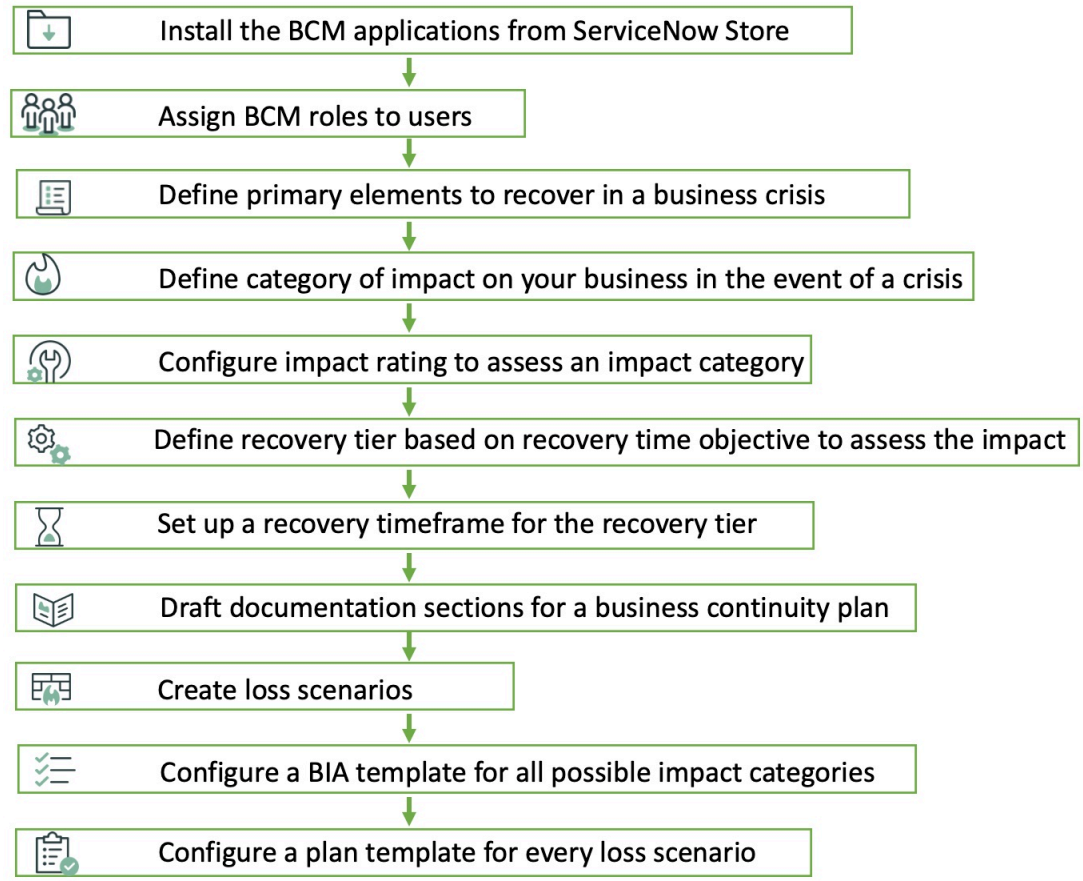
Calculating RTO and RPO

The BCM application provides an assessment questionnaire for calculating the recovery time objective (RTO) and recovery point objective (RPO) in the business impact analysis (BIA). As a pre-requisite to the BIA, the BCM administrator defines the impact ratings and sets up the assessment questions. After receiving the responses to the assessment, the BCM application calculates the RTO and RPO.

BCM dependency tree

Before calculating the recovery time objective (RTO) and recovery point objective (RPO) in the business impact analysis (BIA), ensure that all the required BCM applications are installed. The following illustration depicts the BCM dependency tree which shows how the parent applications are consumed by the child applications.

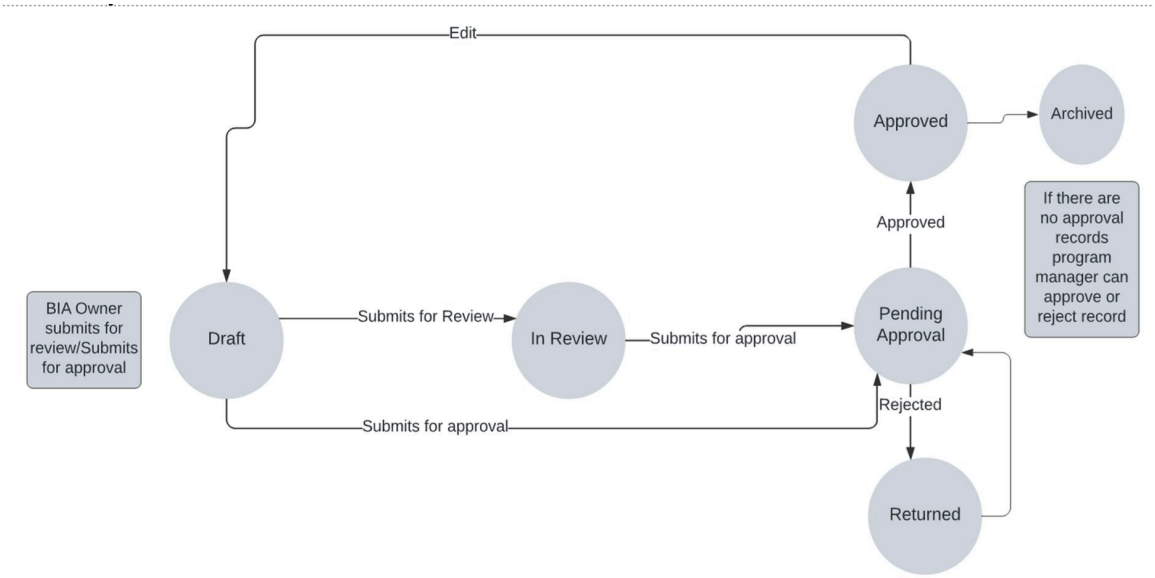


BCM implementation

Setting up the impact ratings to evaluate an impact category is a crucial step in business continuity management. To grasp the importance of configuring these impact categories, refer to the steps needed for implementing the BCM process, as outlined in the checklist.

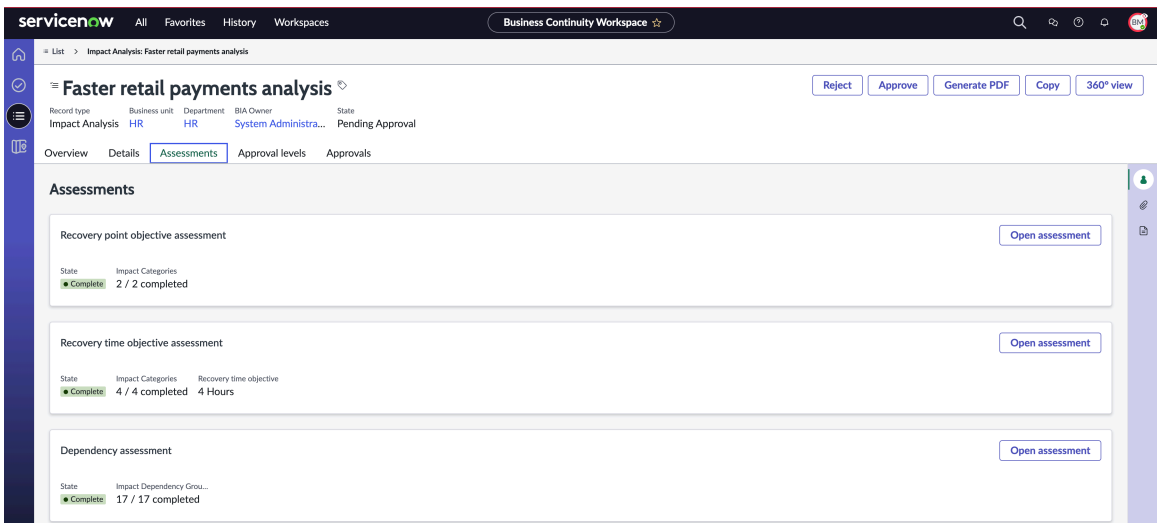
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Graphical flowchart of BCM implementation checklist



BIA workflow

When a business impact analysis (BIA) owner submits the BIA for a review, the BIA is updated to the review state. The BIA owner responds to the questions in the assessment questionnaire. If you are an IT analyst or IT owner, you can estimate the recovery point objective for your data applications and systems by responding to the Recovery point objective assessment in the BIA. Based on the configuration set up by the BCM administrator, the questions are displayed in the **Recovery point objective assessment** tab of the BIA.

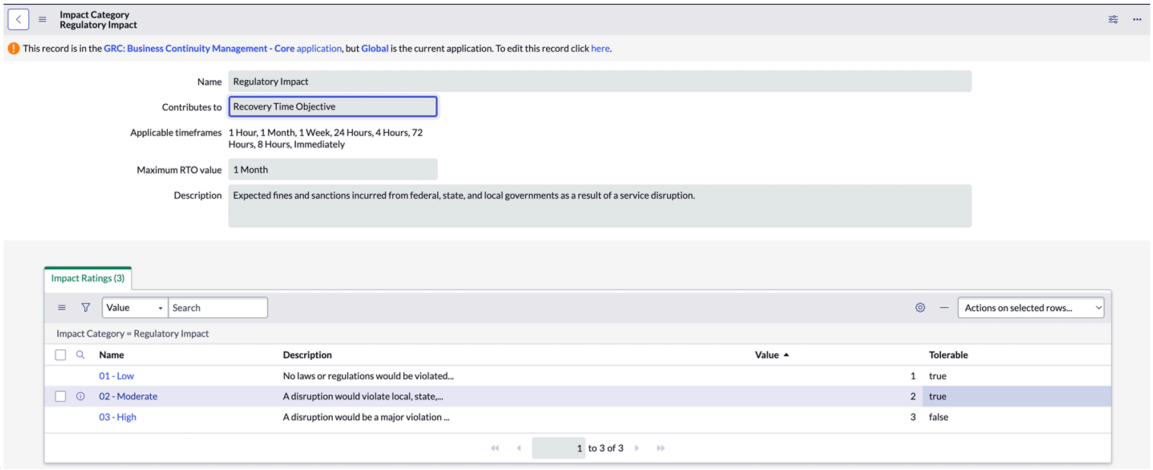


A sample BIA workflow is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Responding to the assessments

The business users and IT owners perform business impact analysis by responding to the assessments in the BIA component in the BCM UIB Workspace. A sample view of the **Assessments** tab is shown in the following example.



If you are the IT owner, you can estimate the recovery point objective for your data applications and systems by responding to the Recovery point objective assessment in the BIA.

Administrator view for configuring impact category and ratings

The BCM administrators configure the assessment questionnaire to include one or more impact ratings such as **Low**, **Moderate**, or **High** for an impact category. The Impact

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

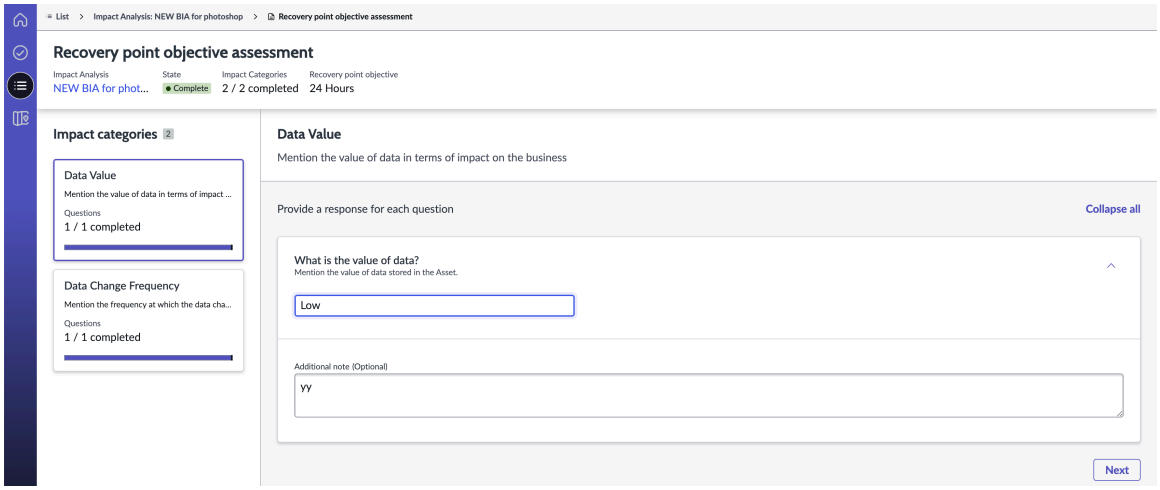
Ratings related list is displayed in the Impact Category record as shown in the following example.

The BCM administrator specifies a threshold of non-tolerance for the impact ratings according to impact category. The disruption duration for the first non-tolerable impact category is selected for the recovery time objective (RTO). The impact ratings have the following specified values:

- Low = 1
- Moderate = 2
- High = 3

The rating for the impact category is calculated based on the disruption duration as shown in the example.

Calculating the impact category



Regulatory Impact

Expected fines and sanctions incurred from federal, state, and local governments as a result of a service disruption.

Impact Rating	Description	Disruption Duration
01 - Low	No laws or regulatio...	4 Hours
02 - Moderate	A disruption would v...	24 Hours
03 - High	A disruption would ...	72 Hours

Based on the configuration set up by the BCM administrator, the questions are displayed in the **Recovery point objective assessment** tab as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Calculation of RPO score for the BIA with examples

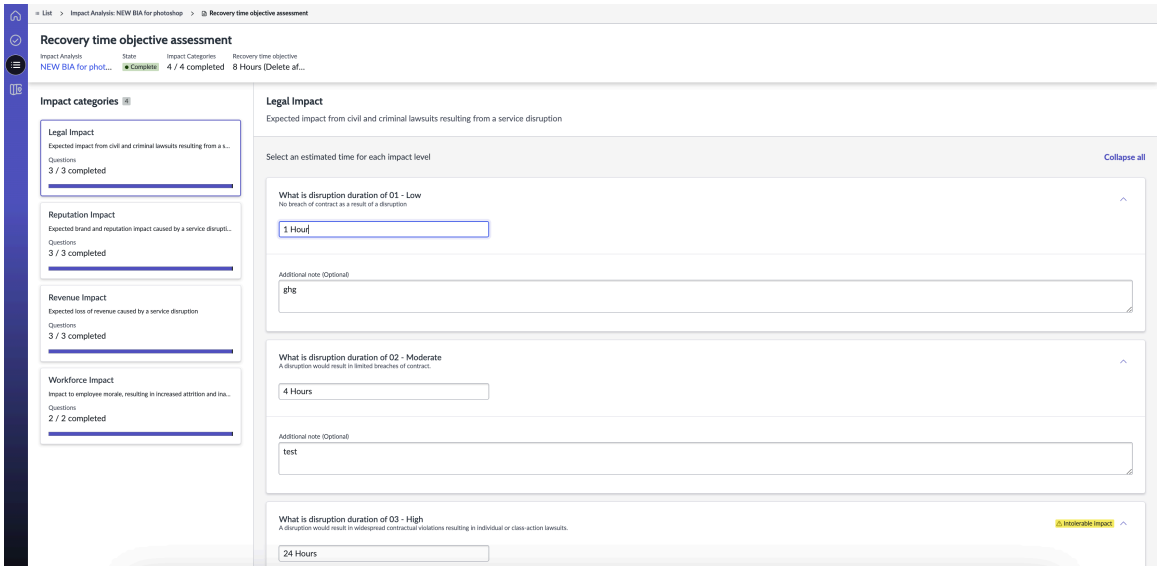
Consider the following scenario where each question response has a numeric value. The application calculates the category score for each RPO impact category based on the highest response value.

BIA:	AMS Data center		
Impact category	**Question**	**Answer (value)**	**Category score**
Data value	What is the value of data?	Medium (30)	40
	What is acceptable loss of data?	**High (40)**	
Data change frequency	What is the data change frequency?	**Low (20)**	20

The application selects the highest category score from all the RPO categories. In the following example, the highest category score is 40.

BIA:	AMS Data center		
Impact category	**Question**	**Answer (value)**	**Category score**
Data value	What is the value of data?	Medium (30)	**40**
	What is acceptable loss of data?	High (40)	
Data change frequency	What is the data change frequency?	Low (20)	20

The application uses the Score Timeframe Mapping, defined at the template level, to determine the appropriate timeframe value. In the example, the category score is 40, which falls between the lower and upper threshold scores. The timeframe mapped to this score is "Immediately." Therefore, the system-calculated RPO value is "Immediately."



Impact category	Question	Answer (value)	Category score
Data value	What is acceptable loss of data?	High (40)	**40**

BIA template:	Data Center Analysis Template	
Lower threshold score	**Upper threshold score**	**Timeframe**
0	10	1 Week
11	20	24 Hours
21	60	**Immediately**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recovery time objective assessment

If you are the business user, you can estimate the recovery time objective for your business services and processes by responding to the Recovery time objective assessment in the **Assessments** tab. The questions are displayed in the **Recovery time objective assessment** tab according to the configuration set up by the BCM administrator. A sample Recovery time objective assessment is shown in the following example.

Calculation of RTO score for the BIA with examples

Consider the following scenario where each question response is assigned a numeric value. The application identifies the highest tolerable value for each RTO Impact category.

BIA:	AMS Data center			
Impact category	**Impact rating**	**Answer**	**Tolerable**	**Value**
Legal Impact	Low	1 Hour	True	10
	Moderate	**4 Hours**	**True**	**20**
	High	8 Hours	False	30
Revenue Impact	Low	8 Hours	True	10
	Moderate	**72 Hours**	**True**	**20**
	High	1 Month	False	30

The application then calculates the “Tolerable downtime” value for each RTO Impact category as the Impact rating with a value higher than the highest tolerable value. If no value exists, the application uses the maximum RTO value (that is defined at the Impact category) as the “Tolerable downtime.” The system calculates the RTO score based on the lowest “Tolerable downtime” value from all RTO impact categories.

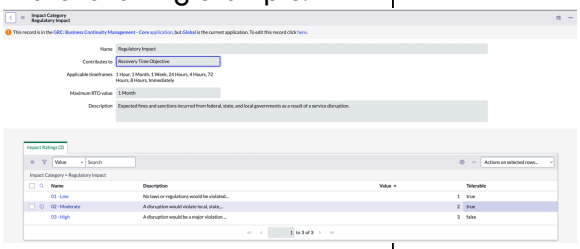
In the following example, the RTO score based on the lowest “Tolerable downtime” value is 8 Hours.

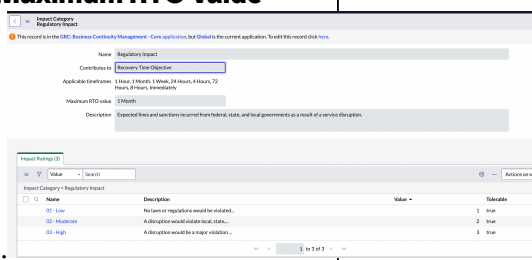
Note:
RTO cannot be calculated when the Recovery tier doesn’t exist for the “Tolerable downtime” value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BIA:	AMS Data center			
Impact category	**Impact rating**	**Answer**	**Tolerable**	**Value**
Legal Impact	Low	1 Hour	True	10
	Moderate	**4 Hours**	**True**	**20**
	High	8 Hours	False	30
Revenue Impact	Low	8 Hours	True	10
	Moderate	**72 Hours**	**True**	**20**
	High	1 Month	False	30

Sample RTO calculation





Consider the following scenario for another sample RTO calculation. The BCM administrator has configured an intolerable impact rating for the Revenue impact category and defined the intolerable impact. If you are the business impact analysis owner, you must identify the timeline at which the revenue impact may go beyond $1M. See the sample RTO calculation for different scenarios as shown in the following table.

Sample scenarios

Scenario	Non-tolerable impact	Description
Scenario 1	In the Impact Ratings table, the **Tolerable** field is set to **false**.	If the administrator has specified that Low regulatory impact is non-tolerable, its corresponding disruption duration is set as the recovery time objective (RTO). In this example, the disruption duration for the **01 - Low** impact rating is set to 4 hours. Therefore, the recovery time objective (RTO) for the impact category is above 4 hours. Even if the moderate impact disruption duration is shorter, the calculation selects the value from the first alphanumerically sorted impact rating that has the **Tolerable** field set to **false**.
Scenario 2	In the Impact Ratings table, the **Tolerable** field is set to **false**.	If the administrator has specified that Moderate regulatory impact is non-tolerable, its corresponding disruption duration is set as the recovery time objective (RTO). In this example, the disruption duration for **02 - Moderate** impact is set to 24 hours. Therefore, the recovery time

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample scenarios (continued)

Scenario	Non-tolerable impact	Description
		objective (RTO) for the impact category is above 24 hours.
Scenario 3	In the Impact Ratings table, the **Tolerable** field is set to **false**.	If the administrator has specified that High regulatory impact is non-tolerable, its corresponding disruption duration is set as the recovery time objective (RTO) as shown in the following example.  In the tabular example, the disruption duration for **03 - High** impact is set to 72 hours. Therefore, the recovery time objective for the impact category is above 72 hours.
Scenario 4	The **Tolerable** field for the Low, Moderate, and High impact ratings is set to **true**.	If the administrator has set all the impact ratings as tolerable, the value specified in the **Maximum RTO value** field in the template is selected as the recovery time objective (RTO). In the following example, the administrator has set all the impact ratings as tolerable. Therefore, the recovery time objective (RTO) is one month according to the value specified in the **Maximum RTO value** field. 

Calculation of overall impact assessment result for a BIA

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you update the **Disruption Duration** of an impact category, the RTO of the BIA is automatically updated. The RTO of the BIA is set as the lowest tolerable downtime from each impact category.

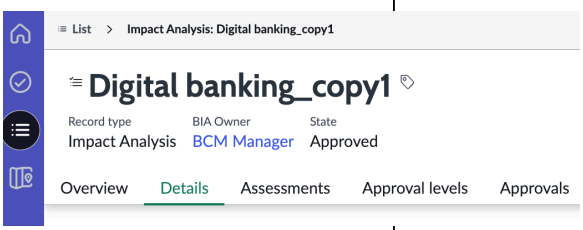
For example, consider a BIA having four impact categories – Legal, Reputation, Workforce, and Regulatory. When you update the disruption duration value of the legal impact category, then the RTO value of the BIA is recalculated based on the lowest tolerable disruption duration from each impact category. The Recovery Tier varies from organization to organization and is set based on the recalculated RTO value.

RTO value	Recovery Tier
Immediate	Mission Critical
1 Hour	Mission Critical
4 Hours	Mission Critical
8 Hours	Business Critical
24 Hours	Business Critical
72 Hours	Essential
1 Week	Essential
2 Weeks	Non-Essential
1 Month	Non-Essential

BIA states and UI actions

When you create a business impact analysis, certain UI actions are associated with each state.

States and their UI associated actions in a business impact analysis



The states and their UI associated actions in a business impact analysis are described in the following table.

States and their associated UI actions in a business impact analysis

State of the business impact analysis	UI action	Description of the action
Draft	In the Business Impact Analysis record Lists view, select **New**. **Note:** You can also navigate to the **Business Impact Analysis** section of the Home page and select **Create BIA**.	When you select **New** in the Create New Impact analysis form or **Create BIA** in the Home page, a record is created in the **Draft** state by default. On the **Details** tab, you can add details of the business impact analysis (BIA). On the **Assessments** tab, you can respond to the Recovery point objective assessment, Recovery time objective

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring Dictionary, UI policy, element variables

Starting with Release 6.1.x, administrators have the capability to configure different aspects of a dependency. This includes the Dictionary, UI policy, element variables, and UI view. These configurations play a crucial role in determining specific columns, required fields, and overall display in the list view and form view of a dependency within the dependency assessment of a BIA.

Dictionary entries [sys_dictionary] serve the purpose of providing additional details for each table and defining the columns on those tables. For more information on Dictionary entries, see Data dictionary tables.

UI policies are used to dynamically alter the behavior of information on a form. Administrators can configure the UI policies to show or hide fields, make fields required or read-only based on specific conditions. For more information on UI policies, see UI policies.

Element variables are employed to define additional data for a record, allowing for more granular control over the behavior and attributes of that record. For more information on Element variables, see Configure element variables for element definitions.

View rules are utilized to define the filter condition and execution order for a table, providing a way to customize the view and presentation of data within that table. For more information on View rules, see Create a view rule.

Administrators play a crucial role in configuring the Dictionary, UI policy, element variables, and UI view for a dependency. Their tasks typically include:

1. Configuring the Dictionary record in the instance to add required or optional fields, or marking existing fields as required or optional for a dependency.
2. Configuring the element variables record in the instance to add required or optional element variables.
3. Configuring the element definitions and UX view rules for the dependency assessment.
4. Configuring the UI policies to mark the fields in the dependency as required or optional. Starting with release 6.1.x, UI policies are used to designate fields as required or optional for a dependency. A UI policy can be created for a specific element definition or multiple element definitions within the dependency assessment.
5. Configuring the UI view for both lists and forms to specify the columns displayed in the table's list layout for the list view and form view.
6. Defining a view rule in the BIA scope. The system determines the UI view displayed for the dependency based on the defined filter condition and execution order in the view rule.

Note:
To ensure proper functionality, it is important to define the UI policies and element variables within the BCM core application scope.

The BCM application relies on the configurations of the Dictionary, UI policies, Glide variables (element variables), and View rules to retrieve the required fields for each dependency. Once these configurations are properly set up, the setup process is considered complete.

Note:
Marking fields as required through client scripts is not supported. Additionally, the **Run Script** option in the UI Policy for marking fields as required or optional is also not supported.

The BCM application automatically completes the dependency assessment when all required fields for a dependency are filled, or if the dependency does not have any required fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For detailed instructions on configuring the UI view [sys_ui_view] table, table list layout, and view rules for both the list view and form view, refer to KB1645940.

Upgrading from the previous version to Release 6.1.x

During the upgrade process from the previous version to Release 6.1.x, the required fields for the Required Recovery Timeframe are removed from the dictionary. However, it's important to note that the **Required Recovery Timeframe** field is only required for the Applications element variable and is added as part of the UI policy. No other element variables have required fields as part of the dependency assessment.

As administrators, you have the flexibility to configure your own settings to make fields required or optional. Additionally, you can customize the view for the element variables and display different columns based on the element definitions.

When the software is upgraded to Release 6.1.x, the state of each dependency is reevaluated for Business Impact Analyses (BIAs) in the **Returned**, **In review**, and **Draft** states. The system performs checks to determine if each dependency has any required fields and if all required fields are filled in. Based on these checks, the state of each dependency is then updated accordingly.

Executing the fix script

A fix script refers to server-side JavaScript code that administrators execute after installing or upgrading an application. Its purpose is to ensure that any metadata changes made by administrators in the Dictionary, UI policy, or element variables configurations for the BIA dependency are accurately reflected.

To properly update the state of the dependency, administrators must fill in the required fields and then execute the fix script. The execution of the fix script updates the state of the dependency based on the following table:

State of the dependency after running the fix script

All required fields are filled	State of the dependency
No	**Pending**
Yes	**Complete**

If a dependency is in the **Pending** state, the BIA user must fill in the required fields associated with that dependency. Once the required fields are completed, the system automatically marks the overall dependency assessment as complete. Running the fix script after filling in the required fields updates the state of the dependency to **Complete**.

For more information on the fix scripts, see Fix scripts.

Using latest assessment template for conducting BIAs

Beginning with the Yokohama release, you can use the latest assessment template for conducting a Business Impact Analysis (BIA). The BIA template is now integrated with the Smart Assessment Engine, enabling you to use the Smart assessment along with the legacy assessment.

Integrating BIA with the Smart Assessment Engine

Integrating business impact analysis (BIA) with the Smart Assessment Engine allows you to configure impact analysis assessments with various question types, set up multiple impact assessment templates for a single BIA, and calculate metrics such as Recovery Time Objective

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(RTO), Recovery Point Objective (RPO), Recovery Tier (RT), Maximum tolerable period of disruption (MTPD), and other based on user responses.

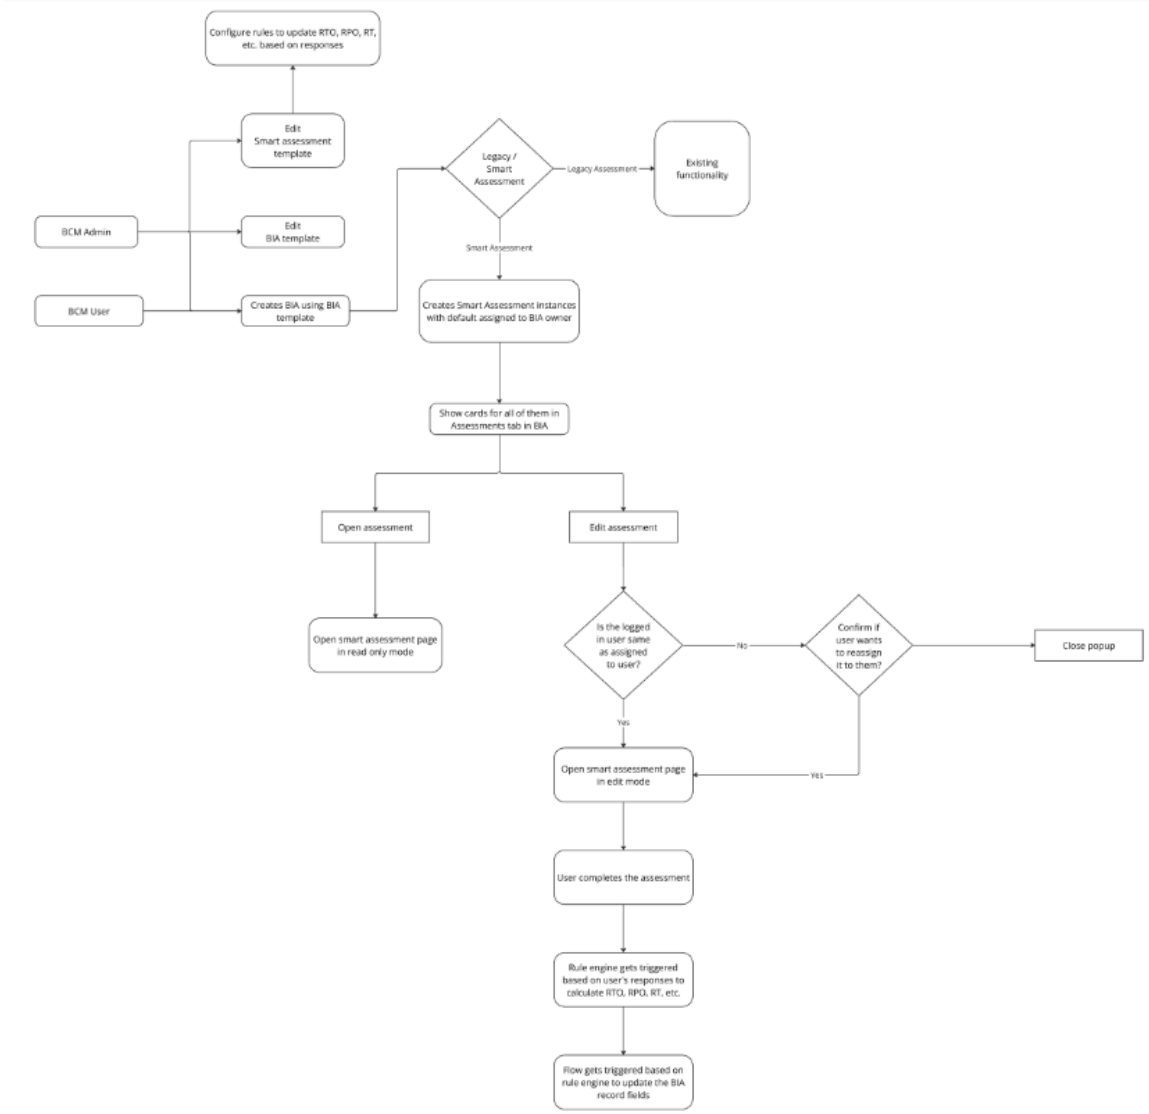
A BIA created with the Smart assessment template includes Smart assessment instances in the assessment section. The assessment template introduced with the Smart Assessment Engine allows you to create various question types and automate responses from existing data sources. BCM users can complete the assessment, and upon submission, the automation set up by the BCM administrator triggers to update impact analysis data, including recovery time objective (RTO), recovery point objective (RPO), recovery tier, or maximum tolerable downtime, based on the defined configuration.

Components used for the integration

For BIA integration with the Smart Assessment Engine, the following BCM components are used:

- BCM core
- BIA
- Smart Assessment Engine

Workflow for integrating BIA with the Smart Assessment Engine



The ServiceNow® Smart Assessment Engine (SAE) application helps you to reduce the manual burden and costs of your assessment processes through automation.

You can create the assessment templates and add instructions, questions, and reference information by using the template designer in the Smart Assessment Engine application.

The Smart Assessment Engine uses the rule engine, where the rules are based on user responses. You can fill one assessment template (only one assessment for RTO, RPO, and RT) or multiple assessment templates (one for each RTO, RPO, and RT).

The workflow for integrating BIA with the Smart Assessment Engine is shown in the illustration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring BIA templates

You can configure the BIA template with the legacy or Smart assessment. The legacy assessment shows only drop-down questions, while the Smart assessment enables multiple question types and configures RTO, RPO, and recovery tier calculations based on the responses to the questionnaire. For more information, see Setup for a business impact analysis.

Roles and responsibilities

The roles and responsibilities for the Smart assessment template are listed in the table.

Roles and responsibilities for the Smart assessment template

Roles	Responsibilities	Contains roles
Administrator [admin]	System administrator role that can set up the flow to update the BIA record based on the rules inside the Smart assessment template.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and responsibilities for the Smart assessment template (continued)

Roles	Responsibilities	Contains roles
BCM administrator [sn_bcm.admin]	BCM administrator role that can perform the following tasks: • Read and write the Smart assessment template. • Configure the BIA template. • Configure rules inside the Smart assessment template.	• [sn_smart_asmt.template_manager]: Provides access to create a Smart assessment template. • [sn_smart_imp_auto.automation_creator]: Contains the Smart assessment impact automation creator role.
BCM core_viewer [sn_bcm.core_viewer]	BCM core viewer role that can read the Smart assessment template.	• [sn_smart_asmt.assessment_reader]: Contains a Smart assessment reader role to give read access to Smart assessment instance. • [sn_smart_imp_auto.automation_reader]: Contains a Smart assessment impact automation reader role. • [sn_smart_asmt.template_reader]: Contains a Smart assessment template reader role.
BCM Program Manager [sn_bcm.program_manager]	BCM Program Manager	• [sn_smart_asmt.actor]: Contains the Smart assessment actor role to provide update access to the Smart assessment instance. • [sn_smart_asmt.reassign]: Contains the Smart assessment reassign role.
BCM Contributor [sn_bcm.contributor]	BCM Contributor	• [sn_smart_asmt.actor]: Contains a Smart assessment actor role to give update access to Smart assessment instance. • [sn_smart_asmt.reassign]: Contains the Smart assessment reassign role.
BCM Planner [sn_bcm.planner]	BCM Planner	• [sn_smart_asmt.actor]: Contains a Smart assessment actor role to

Roles and responsibilities for the Smart assessment template (continued)

Roles	Responsibilities	Contains roles
		give update access to Smart assessment instance. • [sn_smart_asmt.reassign]: Contains the Smart assessment reassign role.

Note:
Smart assessment template category: The category for the BIA is created for the Smart Assessment Engine. The BCM core_viewer [sn_bcm.core_viewer] role is assigned in the Smart assessment template category for the BIA.

Roles and responsibilities for the Smart assessment instance

Roles	Responsibilities
BIA viewer [sn_bia.viewer]	BIA viewer role that can read the assessment.
BIA contributor [sn_bia.contributor]	BIA contributor role that can perform the tasks: • Can read the assessment (if you are in the contributor list of the BIA). • Can take the assessment (if you are in the contributor list of the BIA and the BIA is in the **Draft**, **In review**, and **Returned** state).
BIA planner [sn_bia.planner]	BIA planner role that can perform the tasks: • Can read the assessment (if you are the owner of the BIA). • Can take the assessment (if you are the owner of the BIA and the BIA is in the **Draft**, **In review**, and **Returned** state).
BIA manager [sn_bia.manager]	BIA manager role that can perform the tasks: • Can read the assessment. • Can respond to the assessment when the BIA is in the **Draft**, **In review**, or **Returned** state.

UI actions

The UI actions used for performing the Smart assessment are listed in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI actions for performing the Smart assessment

Roles	Responsibilities
Open assessment	Action to open the assessment. The BIA viewer, BIA contributor, BIA planner, and BIA manager can read the impact analysis and they can also view the **Open assessment** UI action. This UI action redirects you to the Smart assessment page in read-only mode.
Edit assessment	Action to edit the assessment. The BIA planner, BIA contributor, and BIA manager can write the impact analysis and they can also view the **Edit assessment** UI action. This UI action redirects you to the Smart assessment page in edit mode.

UI page with the Smart assessment component for an assessment instance

The UI page containing only the Smart assessment component is created in the BCM core application and it can be accessed by the BCM Workspace users. This page allows users to open the Smart assessment in read-only or edit mode.

User experience

- BCM administrators can configure the Smart assessment template from the Business Continuity Workspace.
- You can view the Smart assessment instance card in the assessment list from the **Assessments** tab in the BIA, if the BIA template is configured to use the Smart assessment template.
- For the Smart assessment instance card, you can either view both **Edit assessment** and **Open assessment**, or only the **Open assessment** button based on your role.
- The **Open assessment** action opens the Smart assessment page for you to read the responses.
- The **Edit assessment** action opens the Smart assessment page for you to edit the responses.

Create a business impact analysis

Create a business impact analysis in BCM UI Builder Workspace to get the necessary information for a plan.

Before you begin

Role required: sn_bia.bia_admin, sn_bia.bia_manager, sn_bcm.program_manager, sn_bcm.planner

About this task

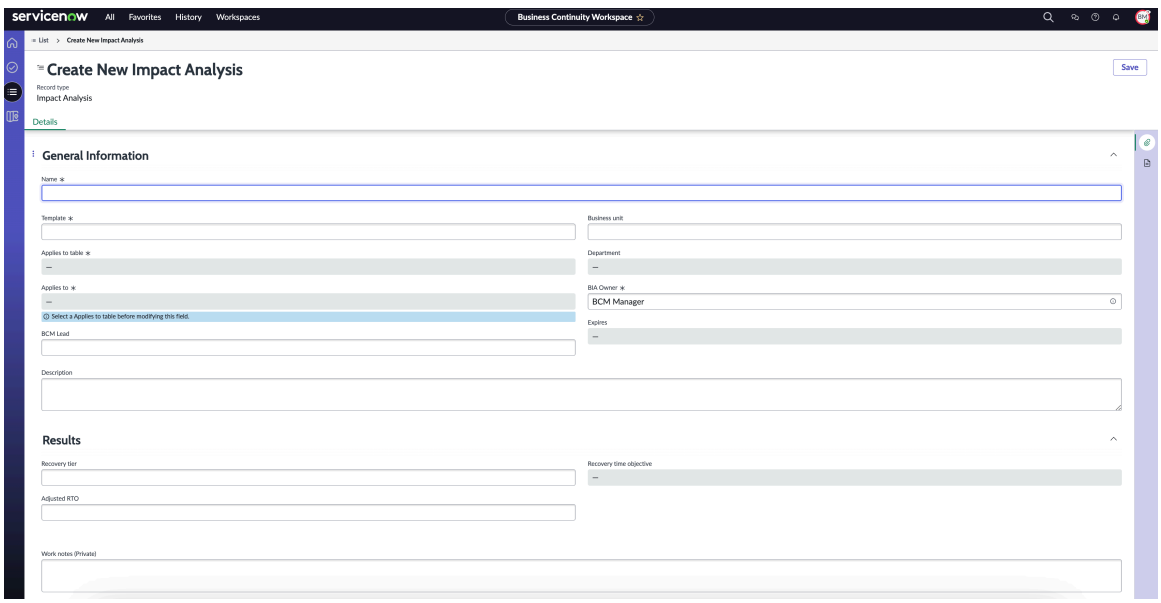
Note:

The application is configured with an out-of-the-box (OOB) limit of 1000 Business Impact Analyses (BIA) records, as defined by the *sn_irm_shared_cmn.config.get_gliderecord_limit* system property. This means that the system processes up to 1000 BIA records only, as it cannot exceed this threshold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Beginning with the Yokohama release, you can configure a business impact analysis (BIA) template with a legacy assessment or Smart assessment. The Smart assessment offers multiple question types and uses impact automation to calculate the RTO, RPO, and recovery tier based on your answers. To configure a BIA template with the legacy or Smart assessment, see Configure BIA templates with legacy assessment or Configure BIA templates with Smart Assessment.

Beginning with the Xanadu release, you can use the updated dependencies from the latest BIA record to conduct a dependency assessment on an asset. Using these updated dependencies enables for a precise execution of the business impact analysis. The business impact analysis is enhanced through the implementation of these updates:



- Access the latest BIAs of the dependent items and their recovery objectives such as Recovery Time Objectives (RTOs), Recovery Point Objectives (RPOs), and Recovery Tiers.
- Configure the columns in the dependency assessment of a BIA.
- Schedule automated updates for the dependencies from the CMDB.
- Configure the updates to be done after a manual review.

Moreover, information from the Related item BIA, Related item Recovery Time Objective (RTO), Related item Recovery Point Objective (RPO), and Related item Recovery Tier columns is used to ascertain the required recovery timeframe and data backup needs. The updated values are then displayed in the Required Recovery Timeframe and Required Data Backup columns of the BIA record.

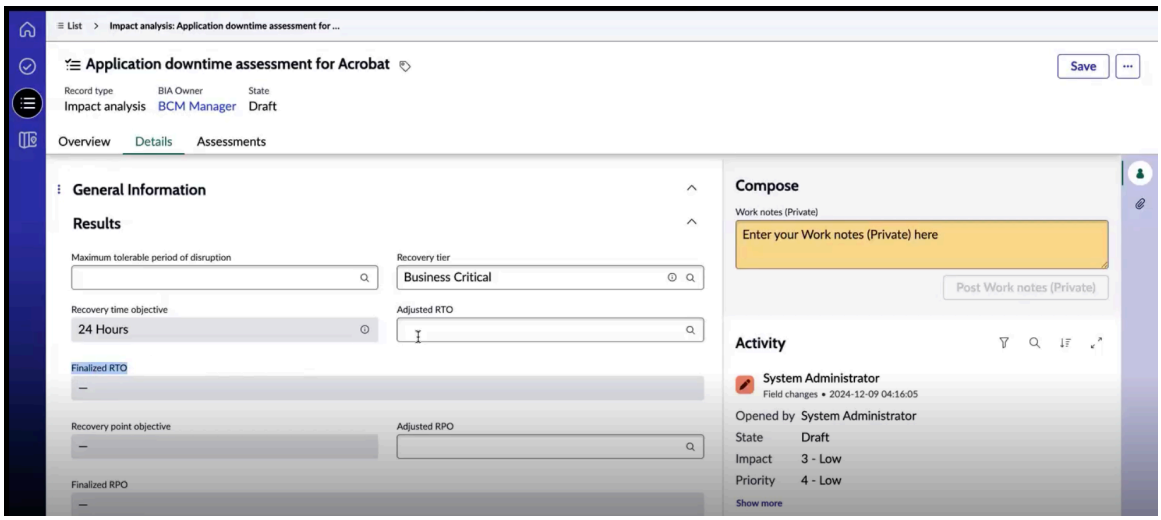
The BIA Manager (sn_bia.bia_manager) now includes the Doc writer (sn_doc.writer) role that provides read and write permissions to the document templates.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Business Impact Analysis** and select **New**.
   The **Create New Impact analysis** form is displayed as shown in the example.

3. On the **Details** tab of the **Create New Impact analysis** form, fill in the required fields.
   For more information on the fields, see Create New Impact analysis form.
   The business impact analysis is created in the **Draft** state and it's displayed in the List view.
   The state and details of the business impact analysis are displayed in these tabs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



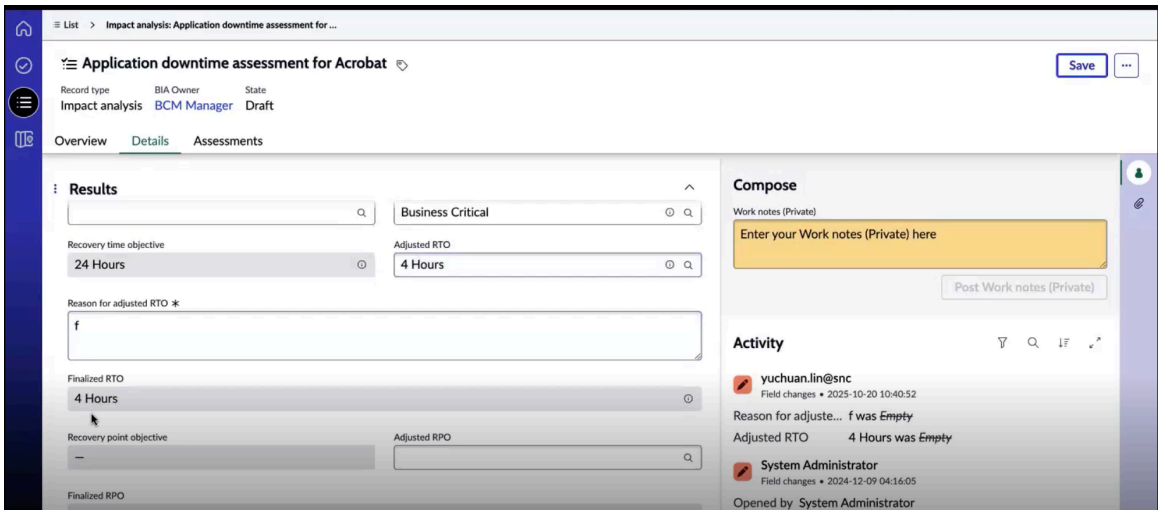
- **Overview**: You can view the current state and overall state progression for the business impact analysis.
- **Details**: You can add the details of the business impact analysis such as its name, template, business unit, department, and so on.
- **Assessment**: You can fill in responses to the assessment questionnaires for the business impact analysis in the **Recovery time objective assessment**, **Recovery point objective assessment**, and **Dependency assessment** cards.

4. In the **Details** tab, review the RTO details for the BIA.

   The **Finalized RTO** field is auto-calculated according to the values in the **Recovery time objective** and **Adjusted RTO** fields available on the same form.

   If the BIAs already have the **Recovery time objective** field, the application uses that Recovery time objective value automatically for the finalized RTO. If the BIA has the **Adjusted RTO** field, the application uses that Adjusted RTO value automatically for the finalized RTO. For information on the field, see the field description in the Create New Impact analysis form.

   The example shows that the **Finalized RTO** field is empty because the application didn't run the fix script.



5. Add the RTO manually in the **Adjusted RTO** field as an optional step, add the reason for adjusted RTO, and save the changes.

   When you update the value in the **Adjusted RTO** field manually, the **Reason for Adjusted RTO** field is displayed. You can add the reason and save the changes.

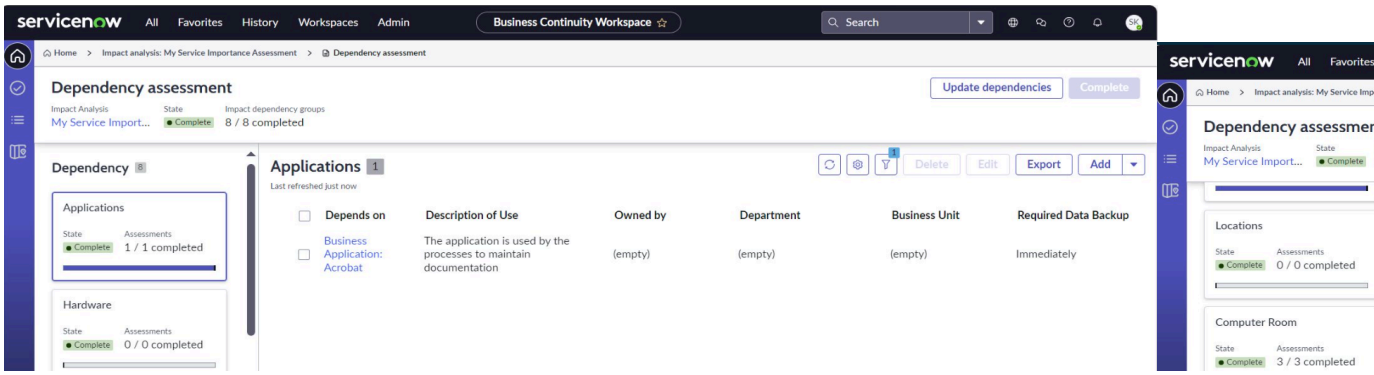
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a result, the **Finalized RTO** is populated with the **Adjusted RTO** value.

6. In the **Details** tab, review the RPO details for the BIA.

   The **Finalized RPO** field is auto-calculated according to the values in the **Recovery point objective** and **Adjusted RPO** fields available on the same form.

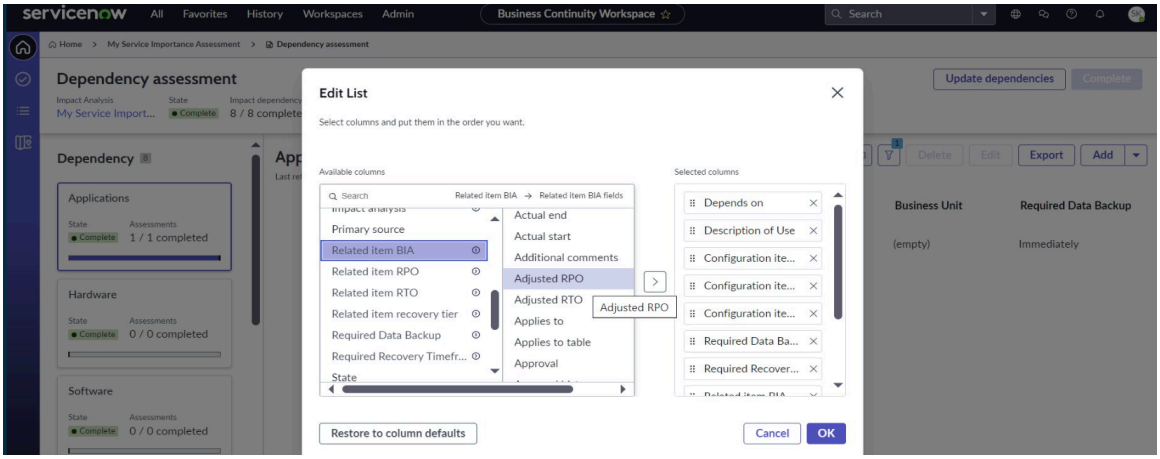
   If the BIAs already have the **Recovery point objective** field, the application uses that Recovery point objective value automatically for the finalized RPO. If the BIA has the **Adjusted RPO** field, the application uses that Adjusted RTO value automatically for the finalized RPO. For information on the field, see the field description in the Create New Impact analysis form.



7. Add the RPO manually in the **Adjusted RPO** field as an optional step, add the reason for adjusted RPO, and save the changes.

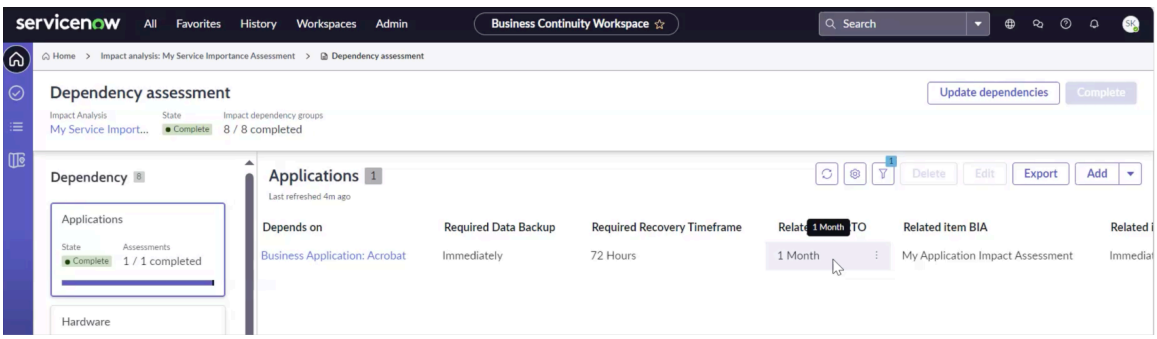
   When you update the value in the **Adjusted RPO** field manually, the **Reason for Adjusted RPO** field is displayed. You can add the reason and save the changes.

   As a result, the **Finalized RPO** is populated with the **Adjusted RPO** value.



8. On the **Assessments** tab, view the impact analysis assessments and the dependency assessment.

   You can track data specific to the dependency types as shown in the examples.

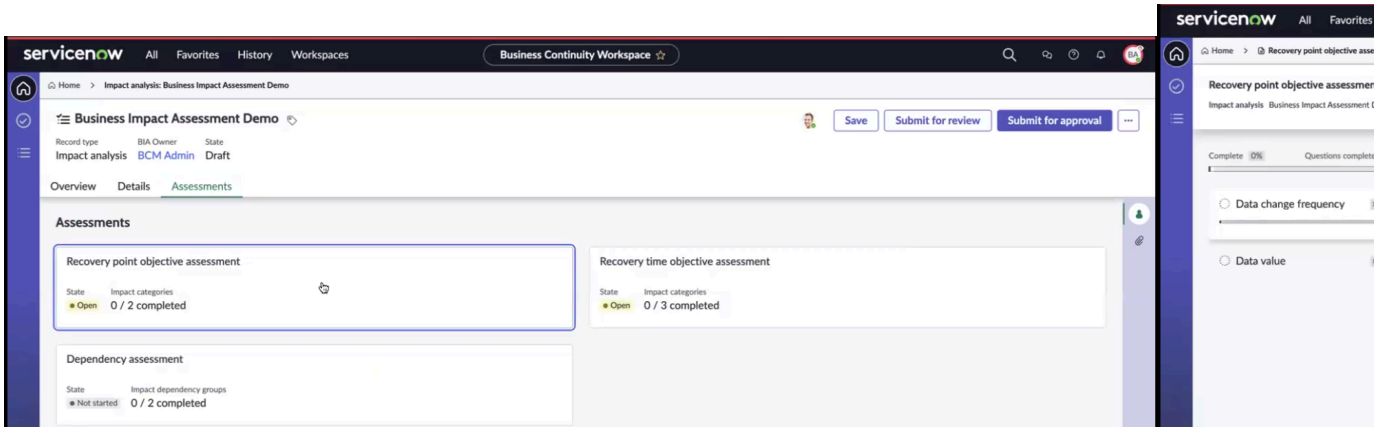


You can add details from the related BIAs as shown in the example.

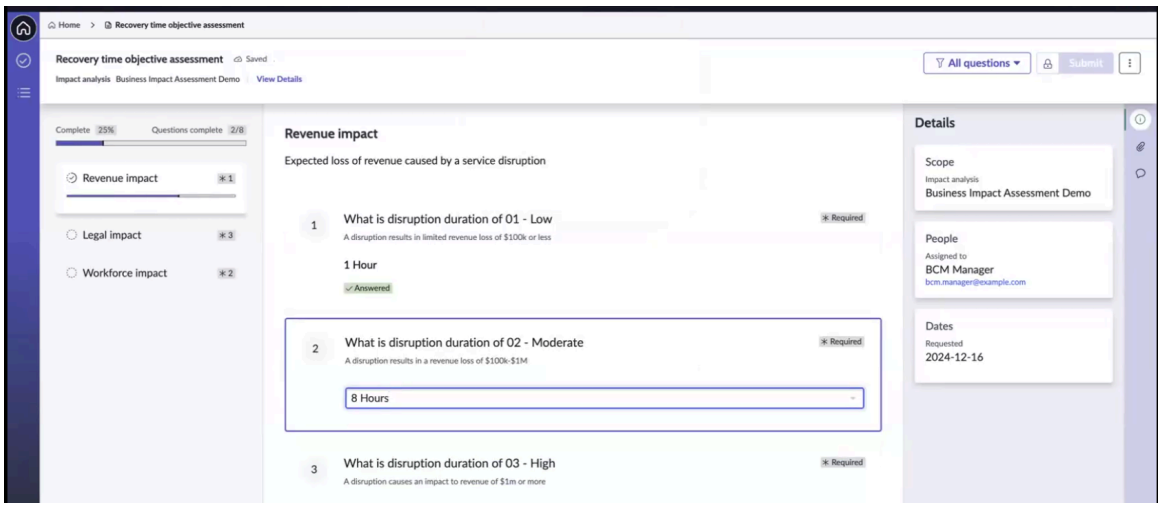
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consider a scenario where you're conducting an importance assessment for a service. This assessment is carried out by the business service owner or the business process owners. It encompasses all the necessary dependencies that support their daily operations, including teams, applications, hardware resources, vendors, and locations, to verify that the process is effectively completed and delivered.

Beginning with the Xanadu release, when conducting a dependency assessment, the dependencies are pulled in and the requirements are visible within the same record. For example, the business requirement for Business Application: Acrobat specifies that the downtime shouldn't exceed 72 hours, which is the established recovery time objective (RTO) by the business.



However, the RTO committed by the IT team, as shown in the Related item RTO, is one month. Additionally, viewing details from the Related item Business Impact Analysis (BIA), Related item Recovery Time Objective (RTO), Related item Recovery Point Objective (RPO), and Related item Recovery Tier columns on the same screen enable the BIA owner to evaluate the data and determine the necessary recovery timeframe and data backup requirements.

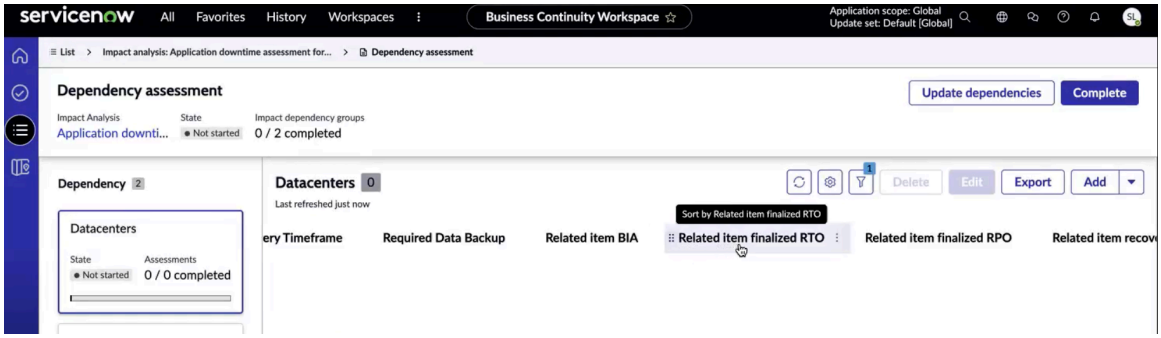


9. Launch the impact analysis assessments as an owner of the assessment, select the card for Recovery time objective assessment, Recovery point objective assessment, or Dependency assessment, and respond to the questions.

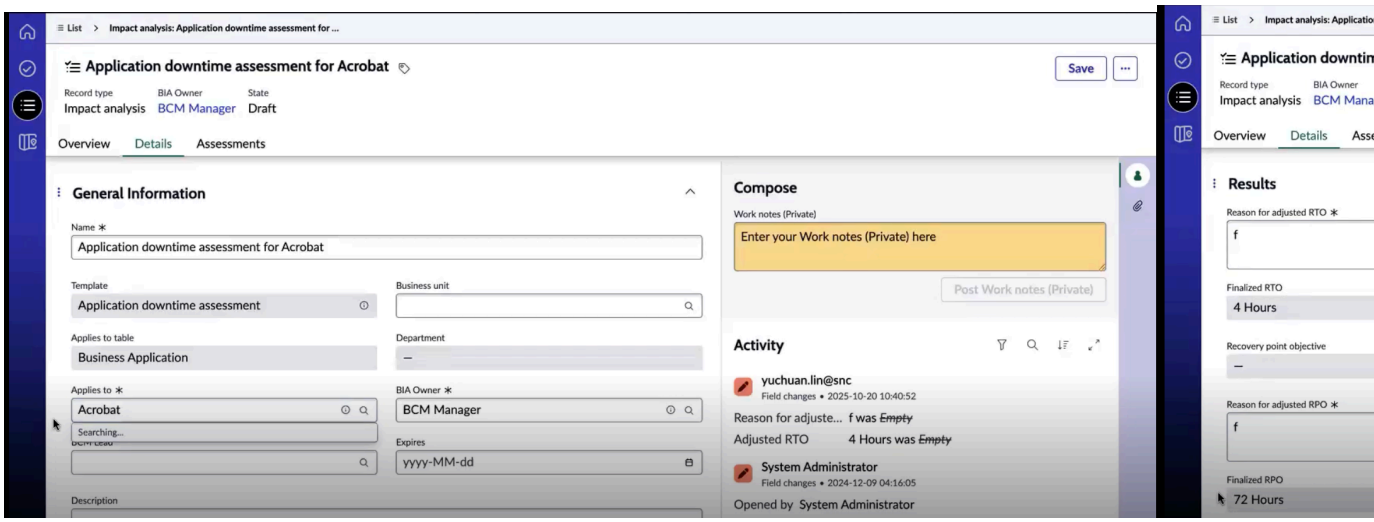
   Previously, the **Assessments** tab in the BIA displayed a single assessment card and the **Open assessment** button. Beginning with the Yokohama release, the layout of the cards in the **Assessments** tab of the BIA has been updated to display multiple assessments and dependency assessments a two-column arrangement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example shows the Recovery Time Objective (RTO) assessment.

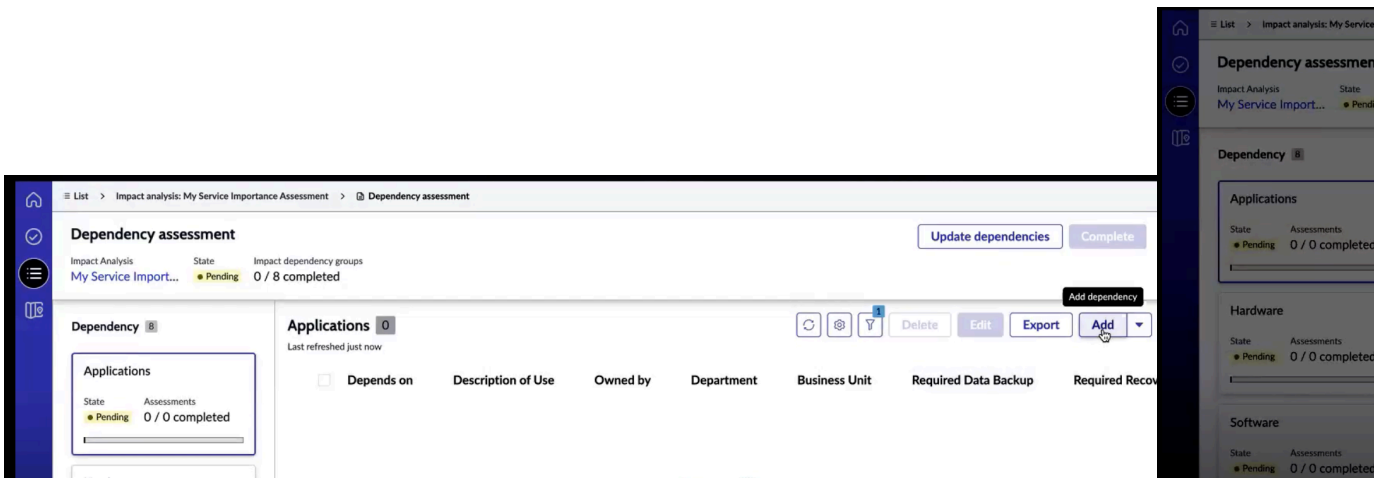


The assessment cards are now displayed dynamically, enabling you to attach multiple assessments to a BIA. For instance, if you have one card, it is shown alone in a row. If you have seven cards, they are arranged in four rows (three rows with two cards each and one row with one card). You can add multiple assessments or just one.



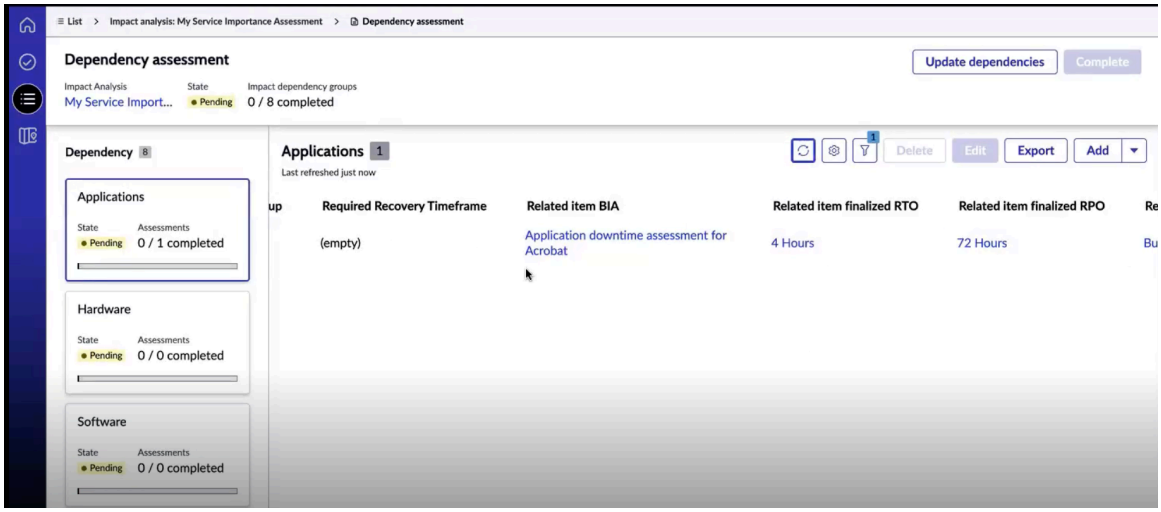
10. To perform Recovery time objective assessment, select the card for Recovery time objective assessment card and respond to the questions.
11. To perform Recovery point objective assessment, select the card for the Recovery point objective assessment card and respond to the questions.
12. Review the answers in the assessment questionnaire and select **Submit**.
    A message is displayed that the update has been successfully processed.
13. Select **OK**.
    The assessment card in the **Assessments** tab is updated. Selecting the Dependency assessment card opens the BIA assessment.
14. Complete the Dependency assessment.

    In the Dependency assessment, the Related item finalized RTO and Related item finalized RPO columns are now displayed. The values for these columns are derived from the dependencies related BIA.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consider an example where you have the BIA record that applies to the "Acrobat" application. The example shows that the "Application downtime assessment for Acrobat" BIA record applies to "Acrobat" and it has the Finalized RTO and Finalized RPO values filled in.



Example shows that "Acrobat" is added to the dependency assessment of the "My Service Importance Assessment" BIA record.

When "Acrobat" is added, the Related item finalized RTO and Related item finalized RPO values associated with the "Acrobat" BIA are populated in the Dependency assessment of the "Application downtime assessment for Acrobat" BIA record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

15. To reassign the assessment to another user, select **More actions** and select **Reassign**.
A message is displayed that the assessment is reassigned to another user. Only the assigned user can respond to the assessment.

> **Note:**
> If you open an assessment that isn't assigned to you, a message is displayed that editing the assessment reassigns it to you. Currently assigned user can no longer edit the assessment. Select **Cancel** to cancel the assessment, select **Edit** to edit and reassign the assessment to you, or select **View** to view the assessment in read-only mode.
>
> When you choose **Reassign**, it provides a list of all users in the system. You must select a user with the BCM roles to reassign the BIA.

16. To add a contributor from the list to the business impact analysis, launch the **Contributors** panel by selecting the **Contributors** icon in the side-bar and add a contributor.

    If you're the BIA owner or BCM manager, you can add a contributor to the business impact analysis.

> **Note:**
> Even though the BIA contributors with the sn_bia.bia_contributor role have read access to the BIA, they can complete the assessments on the **Assessment** tab.

    The BIA contributors can't edit the list of the contributors.

17. Select **Submit**.

    A message is displayed that the assessment is successfully submitted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to update the result in the assessment, you can select the card to update the details. The assessment then moves to the **Open** state again. You can retake and resubmit the assessment, thus completing the workflow.

18. To revert an archived BIA to the **Draft** state, select the **Edit** button.
    Starting with BCM release 9.0.x, you can revert an archived business impact analysis (BIA) to the **Draft** state by selecting the **Edit** button on the form. It helps you to have more flexibility in managing business impacted analyses and related records.
19. To perform more actions on the BIA, select **More actions**.
20. To save the BIA record, select **Save**.

Create New Impact analysis form

Use the Create New Impact analysis form to add details about the business impact analysis, assessments, approvals, and so on in BCM Configurable Workspace.

Create New Impact analysis form

For description of the field values, see the table.

Create New Impact analysis form

Field	Description
Overview tab (Displayed when an analysis is created.)	
State	Stepper component for the states of the business impact analysis.
Details tab	
Name	Name of the business impact analysis. Describe the business impact analysis within 255 characters length.
Template	Template that you can use as a model to create the business impact analysis. The BIA template has the primary elements (applications, business processes, and locations), impact categories, and the dependent assets identified for the type of assessment.
Applies to table	Business process, business application, or any other asset that is assessed in the business impact analysis. This field is auto-filled according to the template selected.
Applies to	Process that the analysis applies to.
BCM Lead	BCM lead assigned to the analysis.
Business unit	Table that stores the template's primary element data.
Department	Department that uses the business process. You can select the department based on the business unit selected.
BIA Owner	Person who owns and is responsible for completing the business impact analysis. BCM lead can review the business impact analysis.
Expires	Expiration date for the analysis. This field is auto-filled.
Description	Description of the process.
Results	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

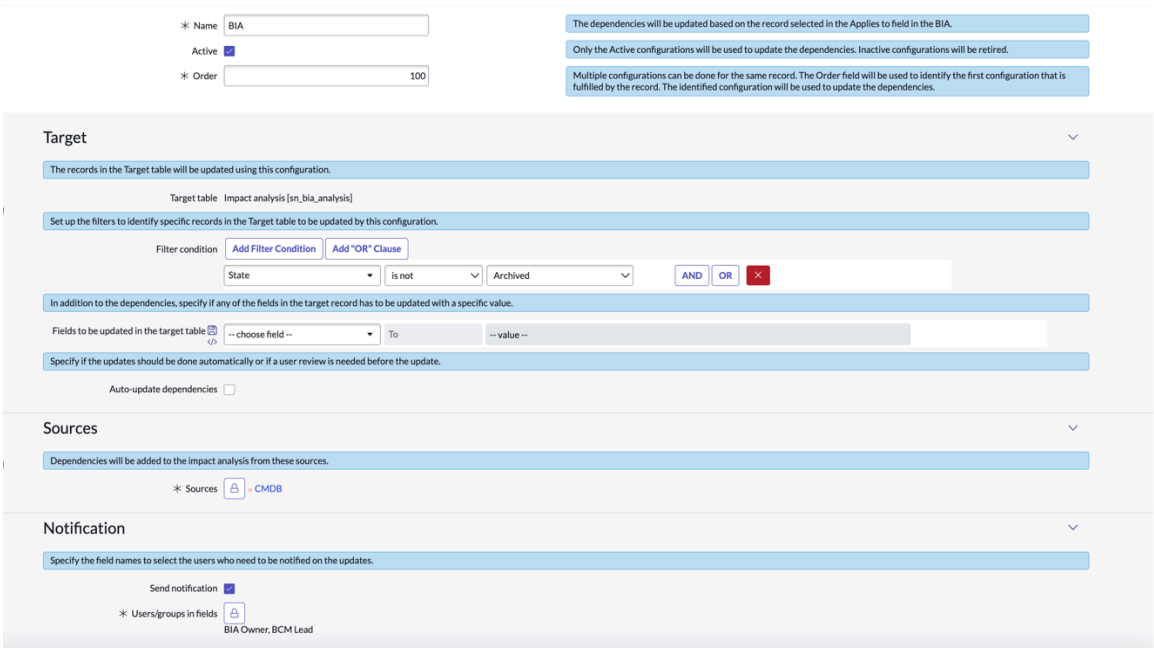
Create New Impact analysis form (continued)

Field	Description
Maximum tolerable period of disruption	Maximum amount of time that a product or service can be unavailable before it causes unacceptable consequences for an organization. **Note:** Beginning with Yokohama release, you can tag a question in the assessment to a specific field in the BIA or to the entire assessment. Similarly, you can tag questions from multiple assessments to be addressed in the BIA. One question can also provide value for multiple fields.
Recovery time objective	Read-only. System calculated value of the recovery time objective for the impact analysis. Represents the maximum acceptable downtime (recovery time objective - RTO) before normal operations are restored for users.
Recovery point objective	Read-only. System calculated value of the recovery point objective for the impact analysis.
Finalized RTO	Column shown in the chart and list views, replacing the previously shown RTO and Adjusted RTO columns. Auto-calculates values according to the values in the **Recovery time objective** and **Adjusted RTO** fields available on the same form. The **Finalized RTO** field provides an accurate time calculation and comparison for the RTO. It reflects either the original RTO or an adjusted RTO if changes were made during the recovery planning process. If only Recovery Time Objective (RTO) is set, the value of the field is set to the RTO itself. If adjusted RTO is set, the value of the field is set to the adjusted RTO.
Finalized RPO	Column shown in the chart and list views, replacing the previously shown RPO and Adjusted RPO columns. Auto-calculates values according to the values in the **Recovery point objective** and **Adjusted RPO** fields available on the same form. Finalized value for the recovery point objective (RPO). The finalized recovery point objective is the suggested acceptable data loss measured in time from a failure. If there is no adjusted RPO, this is the recovery point objective. If there is an adjusted RPO, this is the adjusted RPO. If only RPO is set, the value of the field is set to the RPO itself. If adjusted RPO is set, the value of the field is set to the adjusted RPO.
Confidentiality	Confidentiality information for the analysis.
Availability	Integrity information for the analysis.
Integrity	Confidentiality information for the analysis. You can also have one questionnaire for calculating confidentiality, availability, and integrity of the data and assets in the assessment.
Recovery tier	Recovery tier for the business impact analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Impact analysis form (continued)

Field	Description
Adjusted RTO	RTO that is adjusted manually.
Adjusted RPO	RPO that is adjusted manually.
Compose section	
Work notes	Work notes for the business impact analysis. This field is auto-filled.
Activity	Activity details of the BIA such as dates on the field changes, impact, state, severity, and so on.
Icons displayed in the side-bar of the record	
Contributors	Icon to populate the side-panel in the record. You can add contributors to the business impact analysis from the panel.
Attachment	Panel where the PDF of the business impact analysis is attached.
Template	Panel to populate the template for the business impact analysis. You can view all or customized templates in this panel.



Scheduling auto-update of dependencies

You can schedule an auto-update of the dependencies in the business impact analysis based on the source data and relationships in the CMDB. You can receive an email notification with details of the BIA dependency updates from the BCM application.

Scheduling an auto-update of the dependencies

The BCM administrators can schedule an auto-update of the BIA dependencies in the Impact analysis dependency update configuration module, based on the source data and relationships in the CMDB. You can access the auto-update configuration module by navigating to **Business Continuity Workspace** > **General Administration** > **Impact analysis dependency update configuration**.

The Impact analysis dependency update configuration module is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

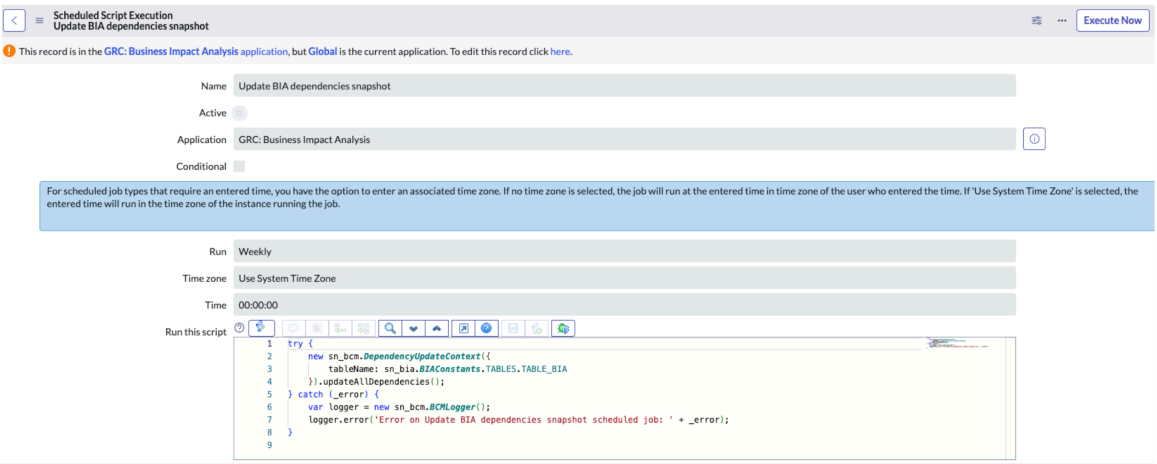
When the BCM administrators select the **Auto-update dependencies** option, the BCM application schedules an auto-update of the dependencies in the BIAs. Similarly, when the **Send notification** option is selected, the BCM application sends automated emails to the BIA owners about the dependency updates.

The source for the BIA dependencies is CMDB.

Note:
The dependencies are fetched for the BIA that is listed in the **Applies to** field of the BIA record such as HR Application BIA, Accounts Receivable BIA.

Setting up the Impact analysis dependency update configuration module is a one-time activity. Once the sources are configured in the Impact analysis dependency update configuration module, the dependency updates are synchronized in the BIA.

For more information on setting up the Impact analysis dependency update configuration module, see Configuring impact analysis dependency updates.

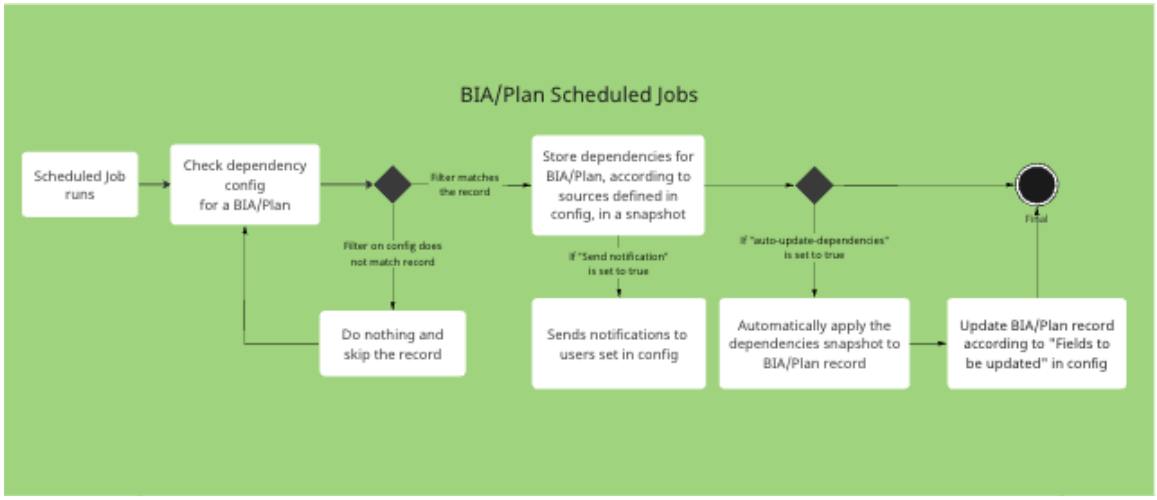


Using the updated dependencies with the Xanadu release

Beginning with the Xanadu release, you can use the updated dependencies from the latest BIA record to conduct a dependency assessment on an asset. Information from the columns labeled Related item BIA, Related item Recovery Time Objective (RTO), Related item Recovery Point Objective (RPO), and Related item Recovery Tier is used to ascertain the required recovery timeframe and data backup needs, which are then displayed in the Required Recovery Timeframe and Required Data Backup columns of the BIA record.

For more information on the source BIA records option in the Dependency configuration modules, see Set up Planning dependency update configuration.

Using the scheduled job to auto-update the dependencies



The *`Update BIA dependencies snapshot`* scheduled job is shipped as part of the base system. It runs at regular intervals and fetches the dependency updates. The scheduled job is shown in the following example.

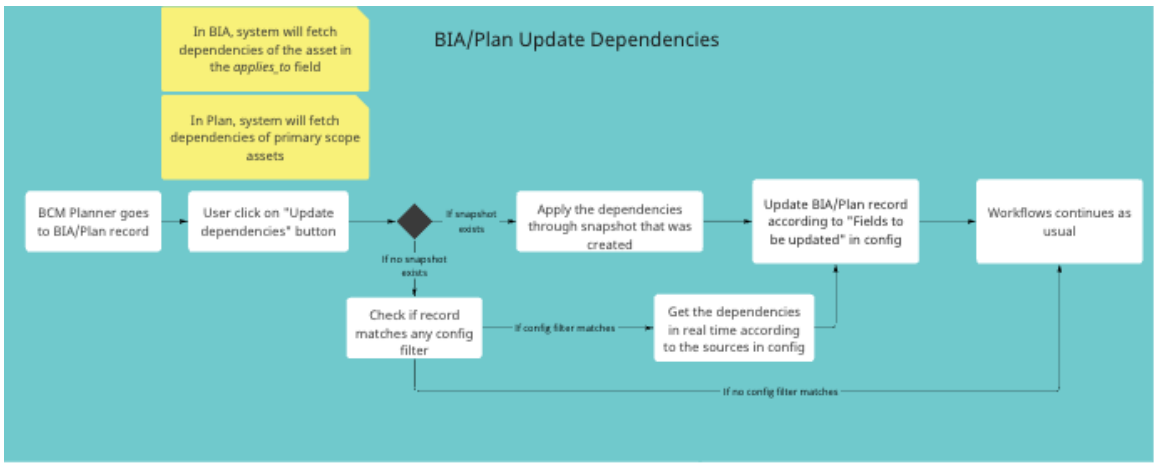
The scheduled job is not marked as Active by default. To run the scheduled job at regular intervals, the system administrators can select the **Active** option and select **Execute now** to set up a schedule. The scheduled job then runs at regular intervals, scans the BIA records for the changes, and fetches the dependency updates for the updated BIA records. It creates a snapshot record for each BIA update.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The scheduled job processes a workflow to check for the changes in the relationships and save the dependency updates automatically as shown in the following example.

1. The scheduled job runs weekly, checks the dependency configuration for each BIA record, and fetches the BIA dependencies from CMDB as defined in the **Sources** tab of the Impact analysis dependency update configuration module. It generates a list of all active BIAs and the primary and dependent assets of each BIA. If any new dependencies are added, updated, or deleted for a BIA, the scheduled job creates a snapshot record for the BIA that displays the changes for the user.

   Note:
   By default, the scheduled job checks all the BIA records that are not in the **Archived** state for any updated dependencies.



2. The scheduled job refers to the filter condition that is set in the configuration (Impact analysis dependency update configuration module). If the condition matches the BIA record, the scheduled job fetches and stores the dependencies for the BIA in the snapshot record, according to the sources defined in the configuration. If the filter condition does not match the BIA record, the application skips the record.
3. The application combines the assets list into a single list that is based on the priority defined in the Impact analysis dependency update configuration module. The application compares the asset list with the existing asset list and assigns either the **Added**, **Updated**, or **Deleted** state to each asset.
4. The application also compares the new assets to the assets listed in the Element definition and verifies the element definition condition. The application creates a snapshot of the asset and auto-completes the dependency updates in the Dependency snapshot record.
5. When the **Send notification** option is set to **True** in the Impact analysis dependency update configuration module, the users of the BIA record set in the configuration are notified about the dependency updates through the scheduled job.
6. When the **Auto-update dependencies** option is set to **True** in the Impact analysis dependency update configuration module, the scheduled job automatically applies the dependencies snapshot to the BIA record.
7. As the final step, the scheduled job updates the BIA record according to the fields to be updated in the configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Updating the dependencies manually

As the BCM application user, you can update the BIA dependencies instantaneously by using the **Update dependencies** UI action. In this way, you can update the dependencies manually before the scheduled job runs as per the weekly schedule. The **Update dependencies** UI action is listed in the Dependency assessment of the BIA. The dependencies are then updated in the sources and a snapshot record of the BIA update is created.

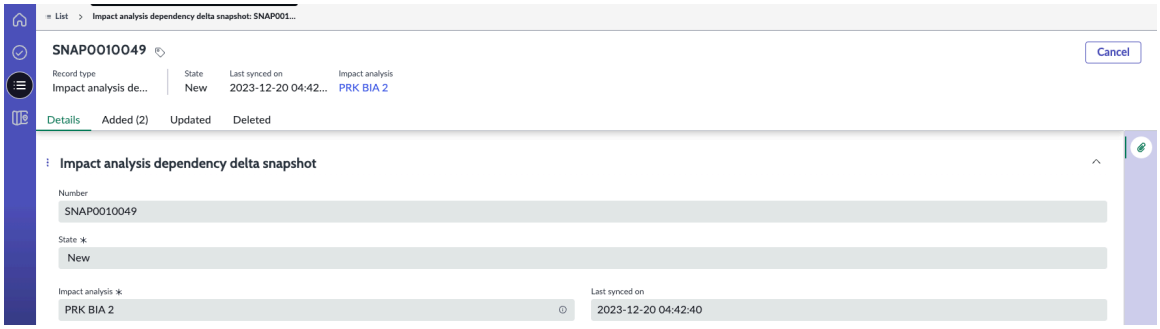
See the following workflow for using the **Update dependencies** UI action and updating the dependencies manually:

1. The BCM planner navigates to a BIA record. The application fetches the dependencies of the asset defined in the **Applies to** field of the BIA.
2. The BCM planner selects the **Update dependencies** UI action that is listed in the Dependency assessment of the BIA.
3. If the snapshot record exists for the BIA update, the system applies the dependencies through the snapshot and updates the BIA according to the **Fields to be updated** in the configuration. The BIA workflow then continues for the next steps such as requesting review and approval.

   If the snapshot record does not exist for the BIA update, the BCM planner checks if the BIA record matches any configuration filter:

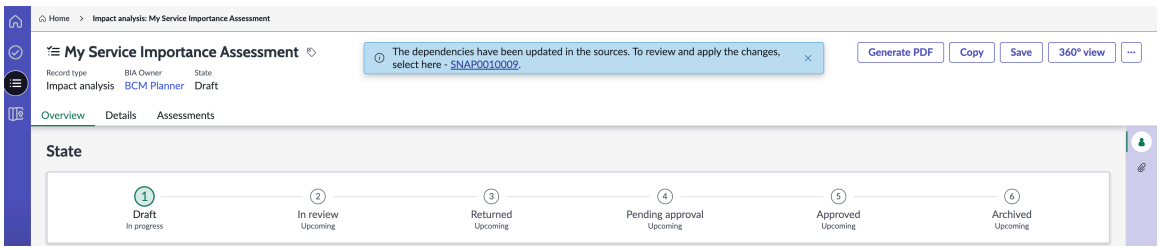
   - If the BIA record matches any configuration filter, the application gets the dependencies in real time according to the sources in the configuration. Then, update the BIA record according to the **Fields to be updated** in the configuration. The BIA workflow then continues for the next steps.
   - If the BIA record does not match the configuration filter, the BIA workflow then continues for the next steps.

For more information on updating the dependencies manually, see Update the BIA dependencies.



Note:

Note:
The Impact analysis dependency update configuration module is used for using the scheduled job and for updating the dependencies manually (by using the **Update dependencies** UI action).



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Snapshot records of the BIA

A snapshot record is created for each BIA update either with the scheduled job or with the **Update dependencies** manual UI action. If any new dependencies are added, updated, or deleted for a BIA, the snapshot record displays the delta of the changes. The snapshot records are listed in the Pending updates module in the Business Impact Analysis list view of the Business Continuity Workspace. A snapshot record is shown in the following example.

When a snapshot record gets created, the application displays the following UI message in the Dependency assessment of the BIA to inform the users about the dependency updates: `The dependencies have been updated in the sources. To review and apply the changes, select here - <link>`. The UI message is shown in the following example.

The snapshot records are used for record keeping purposes. The BCM application stores one active snapshot for each BIA at a time. Whenever the dependencies are updated, a snapshot is always created first. As the system processes all the records one by one, the snapshot records are auto-committed one by one in the system.

The snapshots that are in the **Completed** state and that have not been updated for a few months are removed from the application automatically.

If the BIA record does not have any changes in the dependencies, then a snapshot record is not created for that BIA record.

Roles associated with BIA dependency updates

Users with the following roles typically check for the dependency updates in a BIA:

- The BCM program managers, BCM planners, and BCM managers can update the latest dependencies.
- BCM administrators can configure the Impact analysis dependency update configuration module.

A user who can update the dependency assessment can import the dependency updates for a BIA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Relationships Framework

When you perform a business impact analysis (BIA) on an asset, you must evaluate the dependencies of the BIA by performing a dependency assessment. If the dependencies in the CMDB are updated, importing them manually in a BIA can be a tedious activity. Beginning with the Xanadu release, the Data Relationships Framework application (com.sn_app_grc_relationship_config) supports the BCM application with the underlying framework to fetch the dependencies in the BIA. The Data Relationships Framework application is installed with the BCM application by default.

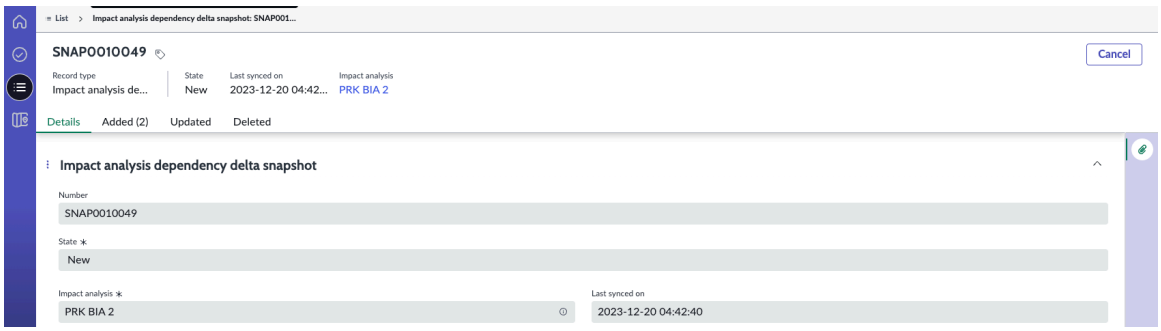
For more information on the Data Relationships Framework, see Data Relationships Framework.

Update the BIA dependencies

Update the business impact analysis (BIA) dependencies manually from the snapshot if the scheduled job is not activated in the Impact analysis dependency update configuration module. You can update the dependencies in an active BIA.

Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner, sn_bcm.admin



Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. Open a BIA in the **Draft** state and navigate to the **Assessments** tab.

   If the dependencies have been updated in the sources, the scheduled job fetches the dependencies, and a UI message is displayed on the screen: `To review and apply the changes, select here - SNAP0010078`. You can select the snapshot record to view the updates.

3. To view the snapshot record, select the **Pending updates** module in the **Business Impact Analysis** list view and select a snapshot record.

   The Impact analysis dependency delta snapshot is displayed.

   - Added: The **Added** tab shows you the assets which are newly added from the source.
   - Updated: The **Updated** tab shows you the assets which are updated from the source.
   - Deleted: The **Deleted** tab shows you the assets which are deleted from the source, which were previously pulled in. All those assets will be marked as Invalid once the snapshot is committed.

   The BCM application stores one active snapshot for the BIA at a time. The snapshots that are in the **Completed** state and that have not been updated in the past six months are removed from the application automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To update the dependencies manually, select **Open assessment** in Dependency assessment.
5. Select **Update dependencies**.

> **Note:**
> When the system is updating the dependencies, the UI actions on the BIA record are blocked and you cannot proceed further with the BIA states. The user cannot proceed with further states of the BIA unless the system completes importing the dependencies. The dependencies in the Dependency assessment should be completed before the user proceeds with further states of the BIA. Once all the dependencies have been imported and the dependencies in the Dependency assessment are completed, the user can continue with the workflow for the BIA record.

A UI message is displayed on the screen: `Dependencies are being updated. Refresh the page to view the updated dependencies and complete the assessment.`

6. To save the changes to the BIA, select **Save**.
   The BIA owners and approvers can update the dependencies by saving the changes to the BIA.

Assess impact categories and dependencies

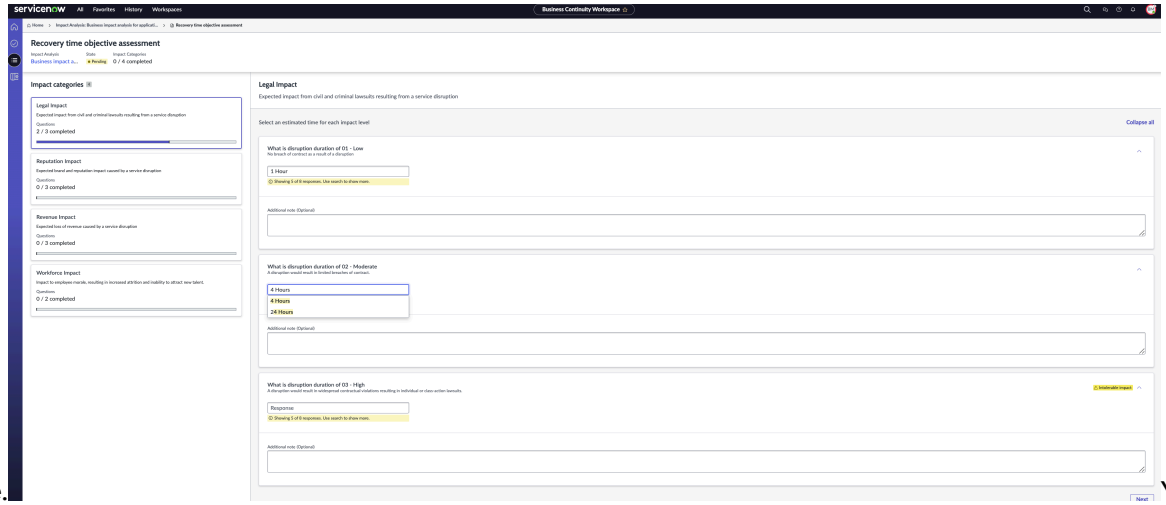
Assess the impact categories and dependencies in BCM UIB Workspace to get the necessary information for a plan. Use the business impact analysis to identify the recovery time objective for an item and prioritize the assets that have the least and most critical dependencies. Use the information to establish their recovery strategies during the planning phase.

Before you begin

Role required: sn_bia.bia_admin, sn_bcm.program_manager, sn_bcm.planner, sn_bcm.contributor or sn_bia.bia_contributor (can respond to BIAs in which they are tagged as a contributor)

About this task

Beginning with the Xanadu release, these new columns are added to the BIA dependency tables. The values of these columns can be refreshed by selecting the **Update dependencies** button in the Dependency assessment.

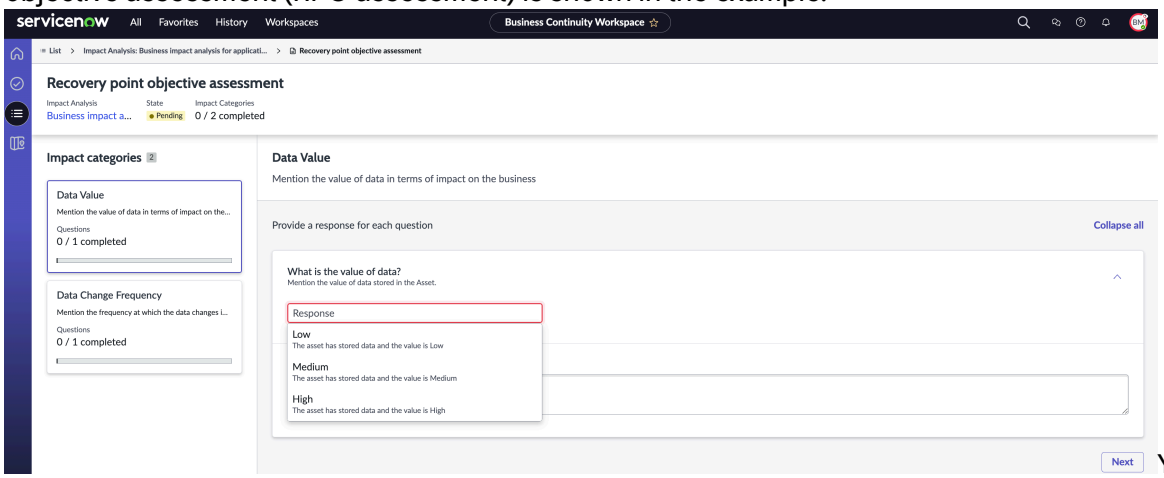


- Related item BIA - The latest unarchived impact analysis done on the dependency item
- Related item RTO - The Recovery time objective of the above impact analysis. It will take the value of adjusted RTO instead of RTO if there is any.
- Related item RPO - The Recovery point objective of the above impact analysis. It will take the value of adjusted RPO instead of RPO if there is any.
- Related item recovery tier - The recovery tier of the above impact analysis.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. To update an existing business impact analysis, select the link to the business impact analysis record in the **Name** column and navigate to the **Assessments** tab.
3. To assess different types of business impact categories on the business process, select the **Recovery time objective assessment** tab.

   A sample questionnaire for the Recovery time objective assessment (RTO assessment) is shown in the

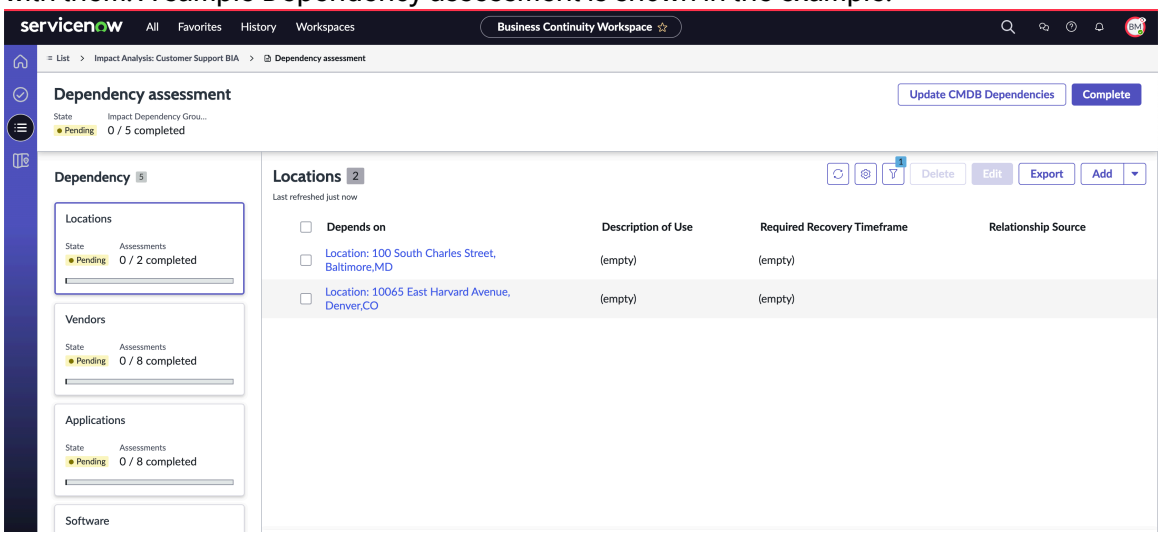


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

example. You must configure all impact categories in the Recovery time objective assessment. A business process draws a set of impact categories, by default, from the template that you have used for the business impact analysis. For more information, see: Review an impact category and assess its downtime.

4. Respond to the questions in the Recovery time objective assessment questionnaire and select **Next**.
   For information on recovery time objective and calculation of recovery time objective, see RTO, RPO, and recovery tiers and Calculating RTO and RPO.
5. To answer questions related to the data component of the asset, select the **Recovery point objective assessment** tab.

   A sample assessment questionnaire for the Recovery point objective assessment (RPO assessment) is shown in the example.

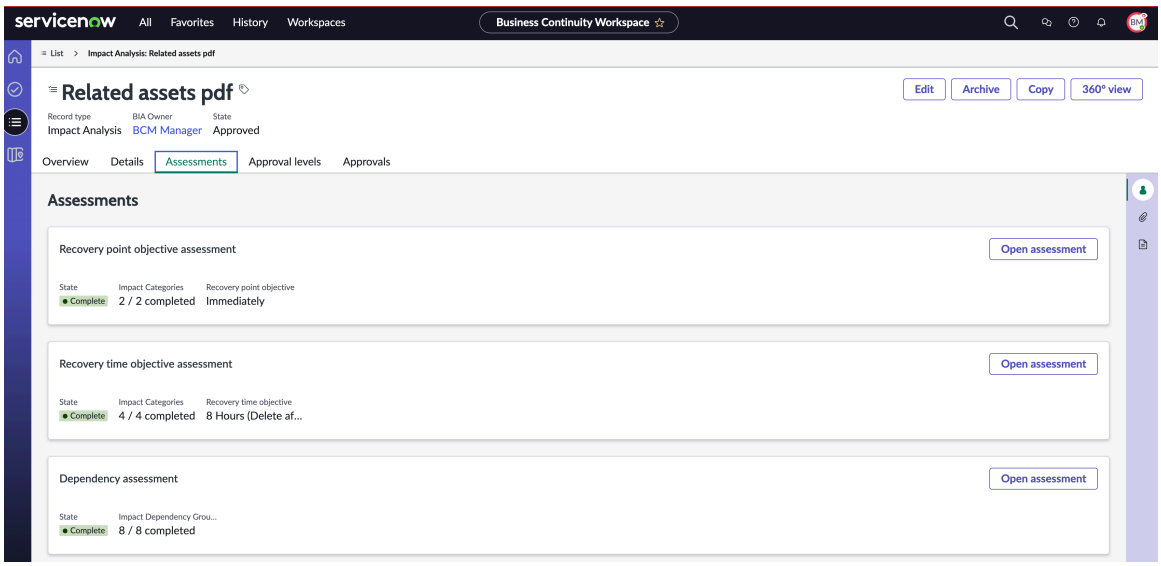


You must configure all impact categories in the Recovery point objective assessment. For more information, see Assess RPO impact of technology assets on the business. For information on recovery point objective and calculation of recovery point objective, see RTO, RPO, and recovery tiers and Calculating RTO and RPO.

6. Respond to the questions in the Recovery point objective assessment and select **Next**.
   You can respond to the questions and complete the Recovery point objective assessment.
7. To assess the dependencies and identify the items within each dependency that your business process depends on, select the **Dependency Assessment** tab.

   You can select the dependency in the Dependency panel to view the group and items that belong to that group. For example, if the group is **Locations**, you can select one or more locations and assess the dependencies associated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

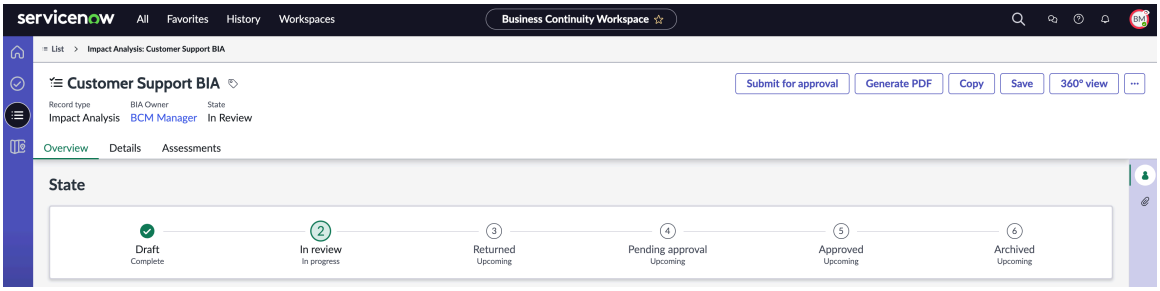


with them. A sample Dependency assessment is shown in the example.

8. To add an item to a dependency group, select one of the options.

   You can prioritize your business continuity and recovery plans based on the criticality of the assets that your business process uses.

   The completed assessments are shown in the example. The state of each assessment is marked as Complete and it is highlighted in Green. You can open the completed assessments and view their details for reference at any time.



9. Select **Submit for review**.

   Note:
   Before submitting the business impact analysis for a review, verify that all assessments are complete and the name of the BCM lead is updated in the **BCM Lead** field on the **Details** tab.

   The business impact analysis is submitted for a review to the BIA owner or BCM lead. The business impact analysis is updated to the **In Review** state.

10. Review the assessments in the business impact analysis if you are the BIA owner or BCM lead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Select **Submit for approval**.
    The business impact analysis is updated to the **Pending approval** state.

    Note:
    If an approval record is already created for a BIA, the **Approve** or **Reject** buttons are not displayed in the BIA form.

12. Select **Save**.
13. Select the **Generate PDF** button to generate the BIA in a PDF format.
    A message appears that the PDF has been generated.

    PDF download

    Customer Support BIA PDF has been successfully generated for download

    Select the link in the message to download the PDF.

    - If you have view-only access to the BIA, the option to generate a PDF helps you to download the document to your local hard drive.
    - You can download the BIA before its **Approval** state.
    - By default, the PDF is generated and attached after the BIA is approved.

14. To move a BIA from **Approved** to **Draft** state, select the **Edit** button.
15. To create a copy of the BIA, select the **Copy** button.
    If you have the permission to read and create a BIA, then you can also copy the BIA.

    a. Enter the name of the new BIA in the Copy impact analysis pop-up.
    The copy action creates an exact replica of the BIA with the name that you enter in the Copy impact analysis pop-up. It also copies all its dependencies and dependency groups on to the new BIA.

    b. Select **Confirm**.

    - The new BIA that is copied from the original BIA has all the RTO, RPO impact, dependency assessment structural details similar to the original BIA.
    - However, the impact category details for each of these assessments are editable for you to assess the dependency details exclusively for the copied BIA.
    - When a BIA that has the RTO or RPO impacted assessments completed is copied, the new copied BIA won't have the new assessment in the **Pending** state. If the impact categories of the RTO and RPO impact assessments in the original BIA are in the **Complete** state, then the impact categories in the copied BIA are in the **Complete** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Therefore, you must assess and enter the disruption duration, response, and required recovery timeframe relevant to the copied BIA.
- You can assess the details in the **Results** section. The RTO and RPO values are recalculated after you complete the assessments.
- Activities and Work notes are not copied to the new BIA. Enter this information relevant to the new BIA.
- Any attachments attached to the original BIA in any format are copied to the new BIA. However, the PDF generated for the original BIA using the **Generate PDF** button will not be copied over to the new BIA as the assessment data pertain to the original BIA. Since you have the flexibility to modify the assessment details in the copied BIA and generate a PDF, copying the PDF generated for the original BIA has no relevance.

Note:
You can delete a BIA (and its related tables) that is in the **Draft** state. BCM planner and program manager can delete a BIA that is in the **In Review** and **Returned** states, whereas a BCM admin can delete a BIA irrespective of its state.

Approve the business impact analysis

Approve the business impact analysis in BCM UI Builder Workspace in the BCM application. If you're the business impact analysis owner or the BCM lead for the business impact analysis, you can approve the business impact analysis.

Before you begin

Role required: sn_bia.bia_admin, sn_bia.bia_manager, sn_bcm.program_manager, sn_bcm.planner

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. Verify that you have completed the required steps listed in the workflow.
3. To approve the business impact analysis (BIA), navigate to the BIA record in the **Name** column.
4. Select **Approve** in the BIA form.
   If you're the business impact analysis owner or the BCM lead for the business impact analysis, you can approve the business impact analysis.

   Note:
   If an approval record is created for the BIA, the **Approve** or **Reject** actions aren't displayed on the BIA form. To view the **Approve** or **Reject** actions, these conditions must be fulfilled:

   - As a user, you should have the sn_bia.bia_manager role.
   - As a prerequisite, the BIA should be in the **Pending approval** state.
   - As a condition, the BIA shouldn't have any approval records created.

   When you approve the business impact analysis, its state is updated to **Approved**.

Update dependencies of BIAs in Self-Service

Use the contributor role to update the impact category result, RPO Impact analysis responses, state of the impact dependency group, and the work notes in the **Activity** section in the BCM application.

Before you begin

Role required: sn_bcm.contributor or sn_bcm.viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you are a BCM contributor and are part of the Contributors list or you are a BCM viewer, then you can update the dependency details of a business impact analysis (BIA).

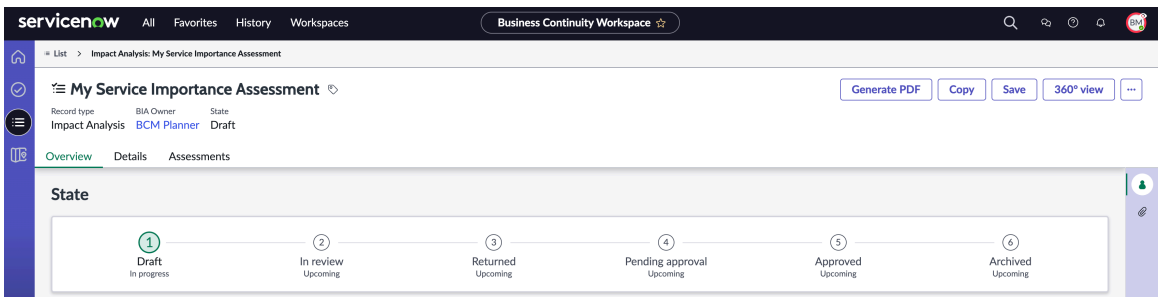
Procedure

1. Navigate to **All** > **Self-Service** > **My Impact Analysis**.
2. View the list of business impact analysis records that are assigned to you and the BIAs that you can contribute to.
3. Select the BIA record and view the details.
4. Update the **State** of the BIA.
5. To update the record, select **Update**.

Visualize 360° relationships for BIAs

Visualize the 360° relationships for a business impact analysis and its associated entities in BCM UIB Workspace. You can access the 360° view at any time while creating a business impact analysis.

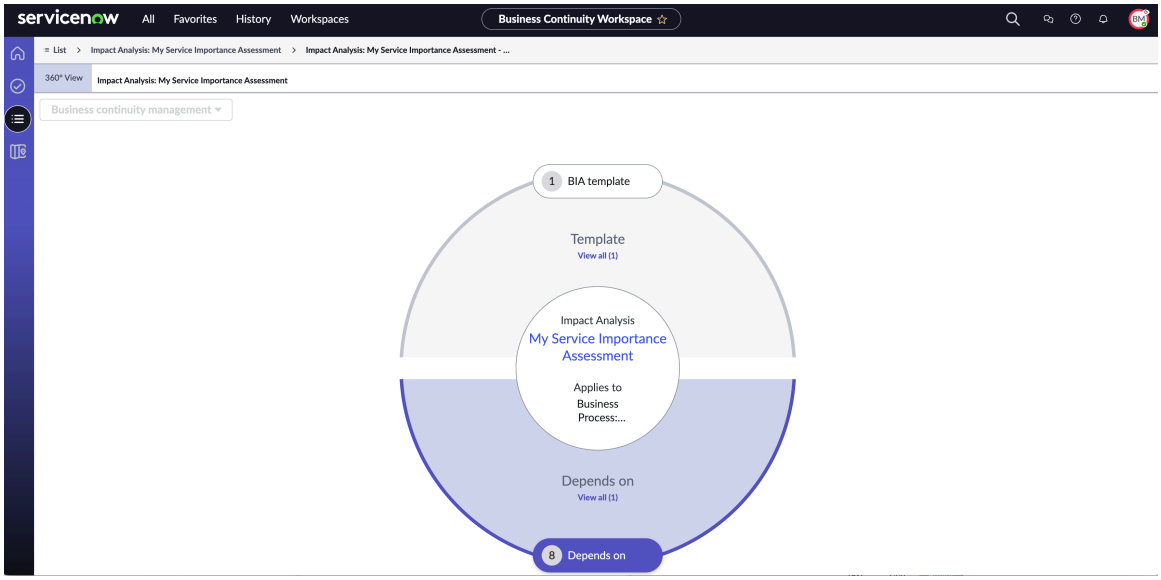
Before you begin



Role required: sn_bia.bia_admin, sn_bcm.program_manager, sn_bcm.planner

About this task

The configurations for the 360° view are stored in **360° View Configurations** > **Configure 360° Views**. If you have the BCM administrator role, you can configure the relationships for the records in **360° View Configurations** > **Relationship Registries**.

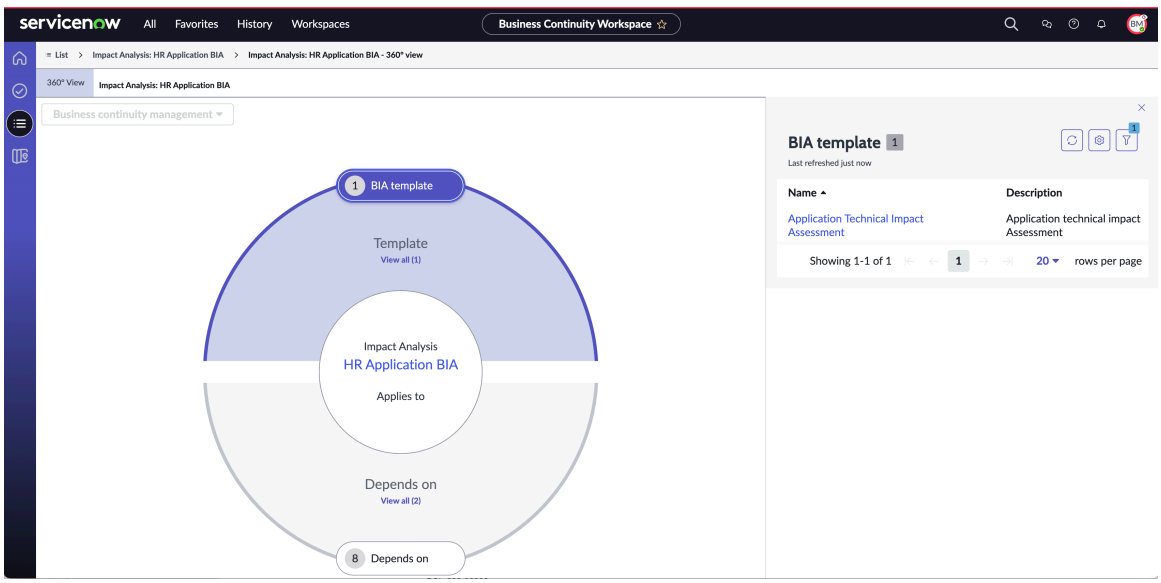


Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Business Impact Analysis** and select a record from the list.
   The business impact analysis record is displayed.
3. Select **360° view**.
   You can select **360° view** to view the relationships for a BIA as shown in the example.

The example shows the 360° view of a business impact analysis and its details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The 360° view for the business impact analysis shows these details:

- **Impact Analysis**: Name of the business impact analysis such as My Service Importance Assessment.
- **Applies to**: Entity that the business impact analysis applies to such as Business process or Business service.
- **Template**: BIA template details such as the name of the template and its description. You can select the **BIA template** capsule and view the details of the BIA template.
- **Depends on**: Dependencies associated with the business impact analysis. You can select the **Depends on** capsule and view its details.

4. Select **BIA template** in the view.

   The details of the BIA template such as the name and description of the template are displayed in the right panel of the view as shown in the example.

5. Select **Depends on** in the view.

   The details of the dependencies are displayed in the right panel of the view as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Vendors** in the view.

   The details of the vendors are displayed in the right panel of the view as shown in the example.

7. To navigate to the BIA again, select the BIA or list view in the breadcrumb navigation on the page.

Generate BIA reports in PDF or Microsoft Word formats

Generate a PDF or Microsoft Word copy of a business impact analysis in the BCM Configurable Workspace and save it for a future reference.

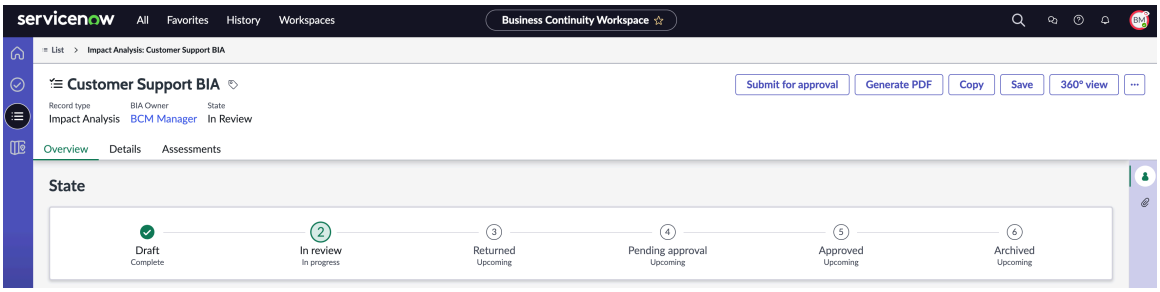
Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner

About this task

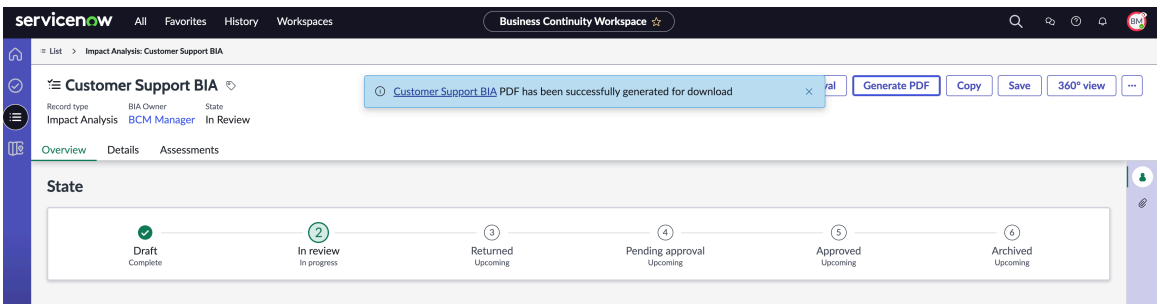
To format the PDF for your business needs, see Format PDF templates for BIAs, BCPs, and events.

Beginning with the Xanadu release, the content in PDFs of Business Impact Analyses, Plans, and Events is improved by implementing a new layout:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Arrange the various event tasks in a table format.
- Include details of the asset owner and the description from the Business Impact Analysis.
- Display a table that outlines the dependencies of the plan assets.
- Mark the date of the PDF creation on the front page.



Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Business Impact Analysis** and select any business impact analysis record that is in the **Review** or next state.
3. Select **Generate PDF** in the form.

   The example shows the **Generate PDF** option in the business impact analysis form.

   The example shows the message that is displayed on the screen: `<Name of the BIA> PDF has been successfully generated for download.`

4. To download the PDF, select the link in the message.

   The example shows the PDF of the business impact analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Save the PDF on your system.
6. To format the BIA PDF template, follow the instructions in Format PDF templates for BIAs, BCPs, and events.
7. To create the BIA report in Microsoft Word, select **Generate MS Word**.

   Generate a report of the BIA record in Microsoft Word format. The Microsoft Word copy of the BIA record is successfully generated that you can download.

   For more information on generating reports in Microsoft Word format using Document designer, see Generating reports using Document designer.
8. To print the BIA report, open the saved PDF or Microsoft Word copy and select **Print**.

Structured workflows for BCPs

Perform the structured workflows that are outlined in this section to create a business continuity plan in Business Continuity Workspace (also known as BCM Configurable Workspace).

Typically, the business continuity plan owner performs the following tasks:

- Create a business continuity plan as per the plan template. For more information, see Create a business continuity plan.
- Add an asset and scope to the plan. For more information, see Add asset and scope to the BCP.
- Create a documentation section. For more information, see Create documentation sections.
- Add the related plan and recovery team. For more information, see Add associated plans and recovery teams.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add a loss scenario, recovery strategy, and recovery task. For more information, see Add loss scenarios, Add recovery strategies for dependencies, and Add recovery tasks.
- Generate and save the PDF of the analysis for reference. For more information, see Generate BCP reports in PDF or Microsoft Word format.

BCP updates in the Xanadu release

Beginning with the Xanadu release, the handling of nested related plans has improved. This enhancement helps in managing potential cyclic dependencies by detecting and highlighting any problems that could cause cyclic dependencies during the execution of tasks.

Additionally, the refined recovery timelines enable you to monitor the planned and actual timeframes. A task may be applied to all assets within a plan or to none at all, facilitating an accurate aggregation of recovery timeframes across various levels, including assets, tasks, and plans.

Additional information on Business Continuity Planning

- For information on the **Planning** tab in the Home page, see Home page view.
- For information on business continuity planning, see Business continuity planning.
- For information on the administrative tasks in business continuity planning, see Setup for a business continuity plan.

States and UI actions for a BCP

When you create a business continuity plan (BCP), certain UI actions are associated with each state.

States and UI actions that are associated with a business continuity plan

The states and UI actions that are associated with a business continuity plan are described in the following table.

UI actions and States associated with a business continuity plan

Updated state of the BCP	UI action	Description
Draft	In business continuity plan record Lists view, select **New**. **Note:** You can also navigate to the **Planning** section of the Home page and select **Create BIA**.	When you select **New** in the Create New Plan form or **Create BIA** in the Home page, a record is created in the **Draft** state by default. On the **Details** tab, add details of the business continuity plan. Add details on the following tabs: • Scope • Documentation • Related plans • Recovery teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI actions and States associated with a business continuity plan (continued)

Updated state of the BCP	UI action	Description
		• Loss scenarios • Recovery tasks
In review	Select **Submit for review**.	When you select **Submit for review** in the Create New Plan form, the state of the business continuity plan is updated to **In review**.
Pending approval	Select **Submit for approval**.	When you select **Submit for approval** in the Create New Plan form, the state of the business continuity plan is updated to **Pending approval**.
Approved	Select **Approve**.	When you select **Approve** in the Create New Plan form, the state of the business continuity plan is updated to **Approved**. The **Overview** tab displays the progression of the states for the business continuity plan. When the business continuity plan is in the **Approved** state, you cannot edit it further.
Archived	In the Create New Plan form, select **Archive**.	When you select **Archive** in the **Create New Plan** form, the state of the business continuity plan is updated to **Archived**. Starting with BCM release 9.0.x, you can revert an archived business continuity plan (BCP) to the **Draft** state by selecting the **Edit** button on the form. You can perform the following additional UI actions in the Create New Plan form: **Generate PDF** Download the PDF of the business continuity plan

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI actions and States associated with a business continuity plan (continued)

Updated state of the BCP	UI action	Description
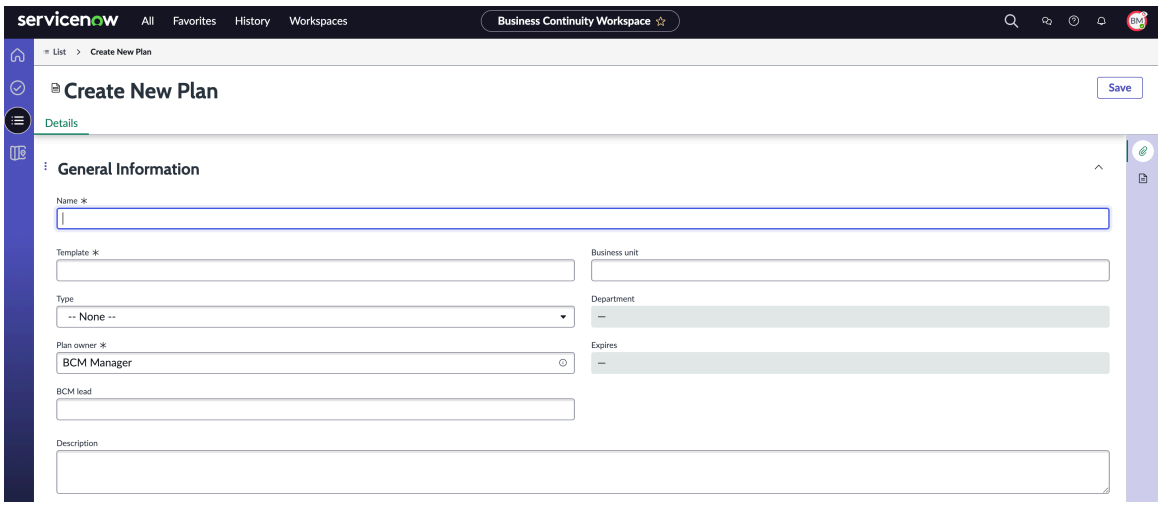
		Save the business continuity plan.
Returned	Select **Reject**.	When the BCP is rejected, it is set to **Returned**. You can edit the business continuity plan in the **Returned** state.

Create a business continuity plan

Create a business continuity plan in BCM UIB Workspace.

Before you begin



Role required: sn_bcp.plan_contributor or sn_bcp.plan_manager

The BCP Plan Manager (sn_bcp.plan_manager) now includes the Doc writer (sn_doc.writer) role that provides read and write permissions to the document templates.

Procedure

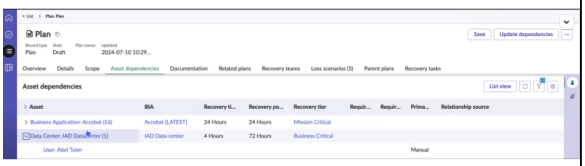
1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. Navigate to **Planning** in the list view and select **New**.

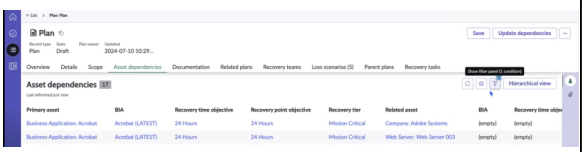
   The **Create New Plan** form is displayed as shown in the example.

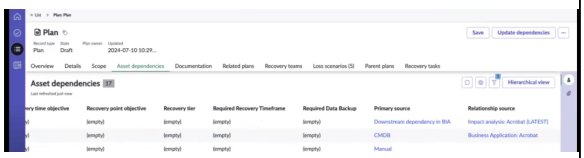
3. Fill in the required fields in the **Details** tab of the **Create New Plan** form.
   For more information on the fields, see Create New Plan form.

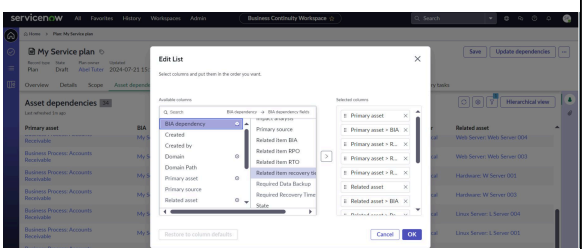
   The business continuity plan (BCP) is created in the **Draft** state and it's displayed in the List view. The state and details of the business continuity plan are displayed in the tabs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



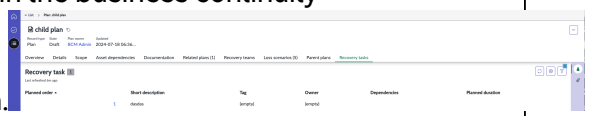


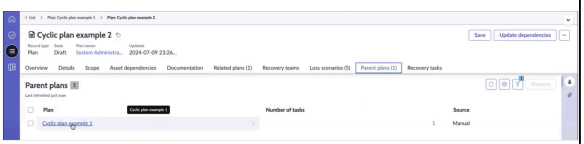


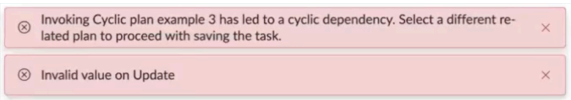


Tabs in the plan

Tab	Description
Overview	Current state and overall state progression of the BCP.
Details	Details of the plan. Contains details such as its Name, Template, Type, Plan owner, BCM lead, Business unit, Department, Expires, Description, comments, and Activity panel.
Scope	Contains the asset types list. For the selected asset type, shows the Item, Types, Recovery time objective, Recovery point objective, Recovery tier. BIA, Status in source, Synchronized on columns for detailed info. **Note:** The *source_table_fields* configuration applies to the **Scope** tab in the BCPs. These columns appear when you select **Add primary scope** or **Add related asset**. Add an asset to the scope of the plan and view the primary elements that are defined in the plan template. Beginning with the Xanadu release, the **Asset dependencies** tab now displays detailed information about the assets, replacing the Primary scope and Related asset toggles previously found in the **Scope** tab of the plan record. Additionally, the Type column in the **Scope** tab of the plan records has been renamed to Types column, enabling an asset to be categorized both as a primary scope and a related asset. The BIA column in the **Scope** tab has been updated from a document ID type to a reference type, enabling administrators to select and access the BIA record, update its information, and dot-walk to the plan record. It simplifies the process and saves time and effort. When two business impact analyses have identical asset dependencies, the most recent BIA is acknowledged as the source for these relationships. When creating a business continuity plan, you can enter details such as the Recovery Time Objective (RTO), Recovery Point Objective (RPO), Recovery Tier, and BIA link based on the primary asset in the plan record. Updating the dependencies refreshes the asset details in these columns with information from the latest unarchived

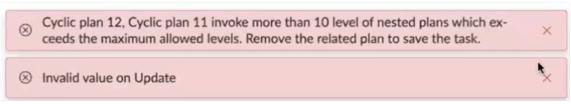


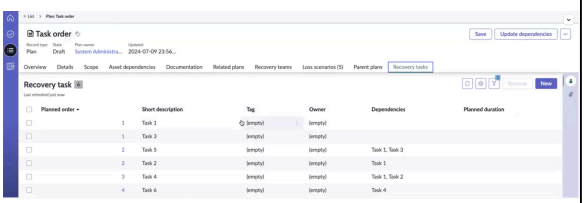




© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

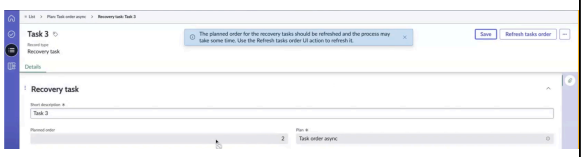
Tab	Description
	BIA record. If the asset originates from a downstream BIA, the columns for Recovery Timeframe and Required Data Backup are revised to display the latest data for that asset.
Add primary scope UI action	**Add primary scope** and **Add related asset** UI actions: You can mark an asset as a primary scope, assign it as a related asset, or link it as a related asset to a primary scope within the plan. This approach simplifies the classification of asset types and enables you to view the relationships directly on the plan record page. It shows which assets are impacted when the primary scope is operationally down, thereby saving time and effort. You can monitor the gaps in the primary and related items. The example shows that the IAD datacenter is added as both a related asset of a primary scope and as a primary scope itself.  The *source_table_fields* configuration applies to the **Scope** tab in the BCPs. These columns appear when you select **Add primary scope**.
Add related asset UI action	The **Add related asset** action enables you to add a related asset and then relate it to a primary asset. For example, Abel Tuter, employed at the IAD datacenter, is added as a related asset.  The *source_table_fields* configuration applies to the **Scope** tab in the BCPs. These columns appear when you select **Add related asset**.
Asset dependencies	Displays the Asset, BIA, Recovery time objective (RTO), Recovery point objective (RPO), Recovery tier, required Recovery Timeframe, Required Data backup, Primary source, Relationship source.

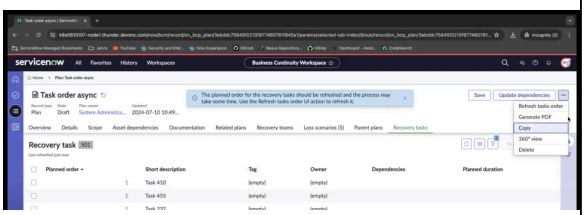




© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
	The **Asset dependencies** tab provides a Hierarchical view illustrating the relationships between parent assets and their child assets. In this example, it's shown that Abel Tuter is a related asset to the IAD data center.  Since the user, Abel Tuter, was added manually, the Primary source column indicates it as a manual source. You can track dependencies in the Hierarchical view and List view. You have the option to switch from the Hierarchical view to the List view, where all assets are displayed in the list format. The Hierarchical view displays all primary assets and up to 20 child assets. If a primary asset includes more than 20 assets, you can select the primary or related asset and it navigates you to the record view. Related assets are only present for the primary assets.  For example, the Business Application: Acrobat is considered a primary asset, while the Company: Adobe systems is identified as its related asset. The source of the asset is displayed in the Primary source column.  You can add details from the dependent items in the plan as shown in the example. 
Documentation	Record the recovery capabilities of the plan in the documentation sections. Contains

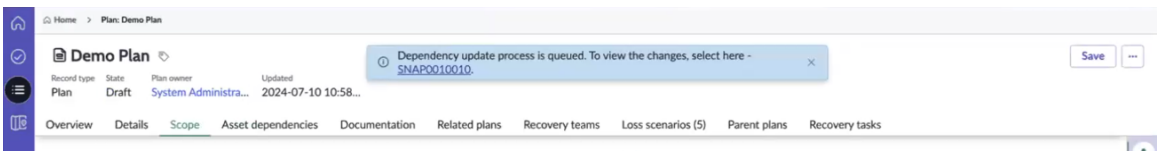




© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
	details of the plan in the Sections panel and the **Create new section** tab. Similarly, contains informational fields on the plans such as Title, Description, Order, Contents.
Associated plans	Contains the associated plan types such as Upstream plans, Downstream plans, Related plans. For more information, see Add associated plans and recovery teams.
Recovery teams	Recovery teams assigned for the business continuity plan. Contains the Name, Description, Groups, Users columns.
Loss scenarios	Loss scenarios that are applicable to the business continuity plan. Contains the Name and Description columns.
Recovery tasks	Details of the recovery tasks such as Planned order, Short description, Owner, Dependencies, Planned duration, Phase, Asset recovery level columns. You can create a recovery task within the business continuity plan.  A cyclic dependency occurs when two or more recovery tasks rely on each other, either directly or indirectly. Beginning with the Xanadu release, it's possible to help prevent cyclic dependencies in recovery tasks, verifying that the same plan is not triggered multiple times.  For example, if the recovery task in Plan 1 triggers Plan 2, Plan 2 then triggers Plan 3, and Plan 3 subsequently triggers Plan 1, this sequence creates a cyclic dependency. An error message, similar to the example provided, is displayed to inform users that triggering the plan has resulted in a cyclic dependency and suggests selecting an alternative related plan. Choosing a different related plan in such cases helps avoid these issues during an event. 

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tab	Description
	If plans are activated beyond 10 levels or hierarchical links involving more than 10 levels of plans are established, an error message is displayed, advising the removal of the plan before the record can be saved.  Beginning with the Xanadu release, the recovery tasks are organized based on their dependencies. You have the flexibility to assign dependencies to the tasks, and the application then determines a sequence for these tasks based on the assigned dependencies. If there are tasks without any dependencies linking them, they can be handled simultaneously. You can edit the *sn_bcp.sync_order_calculation_task_limit* property to change the count for the recovery task order so that it's calculated synchronously.  The sequence of tasks depicted in the illustration is clarified with the example: **a.** Task 1 and Task 3 are independent of each other, enabling them to be executed at the same time, and they're both assigned a planned order of 1. **b.** Task 5 depends on both Task 1 and Task 3 and therefore, it's assigned a planned order of 2. **c.** Task 6 depends on Task 4, which has a planned order of 3. The planned order for Task 6 is then set at 4. Tasks can be performed simultaneously, enabling several users to collaborate on the same plan at once. When a dependency is updated for a task and the task is saved, the planned order for the tasks is recalculated based on the removed dependency. If you have over 500 recovery tasks and the dependencies are updated, the planned order of these recovery tasks is not updated instantly. Rather, an informational message is displayed, suggesting that the planned order

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
	of the recovery tasks be updated using the **Refresh tasks order** UI action.  The option to refresh the task order is also accessible from the menu in the plan record, as illustrated in the example.  When you must reorder recovery tasks within a plan, a message is displayed that the reordering process may take some time. You can use the **Refresh tasks order** UI action to update the tasks order.

4. Add a primary scope and its related assets in the **Scope** tab.
   a. Update the dependencies by selecting the **Update dependencies** button.

   It pulls both related assets and their relationships. A message is displayed that the dependencies are being updated and you must refresh the page to view the updated dependencies.

   You can view dependency updates in the snapshot record.

   The Parent item column in the **Added** tab shows the parent item of the new asset. All items that are dependent on the parent item are shown in the Item column as shown in the example. The Source column shows whether the source is from CMDB, Manual, or Downstream dependency in BIA. It's used for BIA downstream. Selecting the BIA record link shows you that the dependencies are derived from this BIA record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Review the **Finalized RTO** and **Finalized RPO** values columns in the **Scope** tab.

   With GRC: Business Impact Analysis, version 9.2.x, the **Finalized RTO** and **Finalized RPO** fields are introduced in the **Scope** tab.

   When you add a dependency in the **Scope** tab, the system retrieves the most recent Business Impact Analysis (BIA) and uses its "Finalized RTO" and "Finalized RPO" values for that specific dependency.

   Additionally, values for "Recovery Tier" and "BIA" are also retrieved and displayed in the plan record.

   When you add "Acrobat" as a primary scope to the plan record, the "Finalized RTO" and "Finalized RPO", "Recovery Tier", and "BIA' values are retrieved from the BIA and populated in the columns.

   If you've already fetched a dependency and later update the BIA's RTO and RPO values and if the corresponding RTO fields for that dependency are empty, select**Update dependencies** to fetch the latest values from the BIA.

6. To add a contributor from the list to the business continuity plan record, launch the **Contributors** panel by selecting the **Contributors** icon in the side-bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The BCP contributors with the sn_bcp.plan_contributor role have read, write, and delete access to the business continuity plan. If you have the BCP manager, BCM lead, or plan contributor role, you can add or remove the contributors. The BCP contributors can edit the list of the contributors and edit the BCP.

7. To revert an archived business continuity plan (BCP) to the **Draft** state, select the **Edit** button. Starting with BCM release 9.0.x, you can revert an archived business continuity plan (BCP) to the **Draft** state by selecting the **Edit** button on the form. It helps you to have more flexibility in managing business continuity plans and related records.
8. To perform more actions on the BCP, select **More actions**.
9. Select **Save**.
   The plan is saved in the **Draft** state and it's displayed in the List view of the Planning records.
10. Select the **360° view** button to refresh the planned order for the recovery task.
11. Select the **Generate PDF** button to generate the BCP in a PDF format.
12. To create a copy of the BCP, select the **Copy** button.
13. Select **360° view** to generate the 360° relationships for the plan.
14. Select **Delete** to delete the plan.

Create New Plan form

Use the Create New Plan form in BCM UIB Workspace to add the details about the business continuity plan (BCP).

Create New Plan form

For description of the field values, see the table.

Create New Plan form

Field	Description
Overview tab	
State	Current state display and progression indicator for the business continuity plan.
Details tab	
Name	Name of the business continuity plan. You can describe the BCP within 255 characters length.
Template	Model template for creating the BCP. The template BIA has the primary elements (applications, business processes, and locations), impact categories, and the dependent assets identified for the type of assessment.
Type	Type of the business continuity plan. Available options are: • Continuity plan • Recovery plan • Crisis response plan
Plan owner	Owner of the business continuity plan.
BCM lead	BCM lead for the business continuity plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

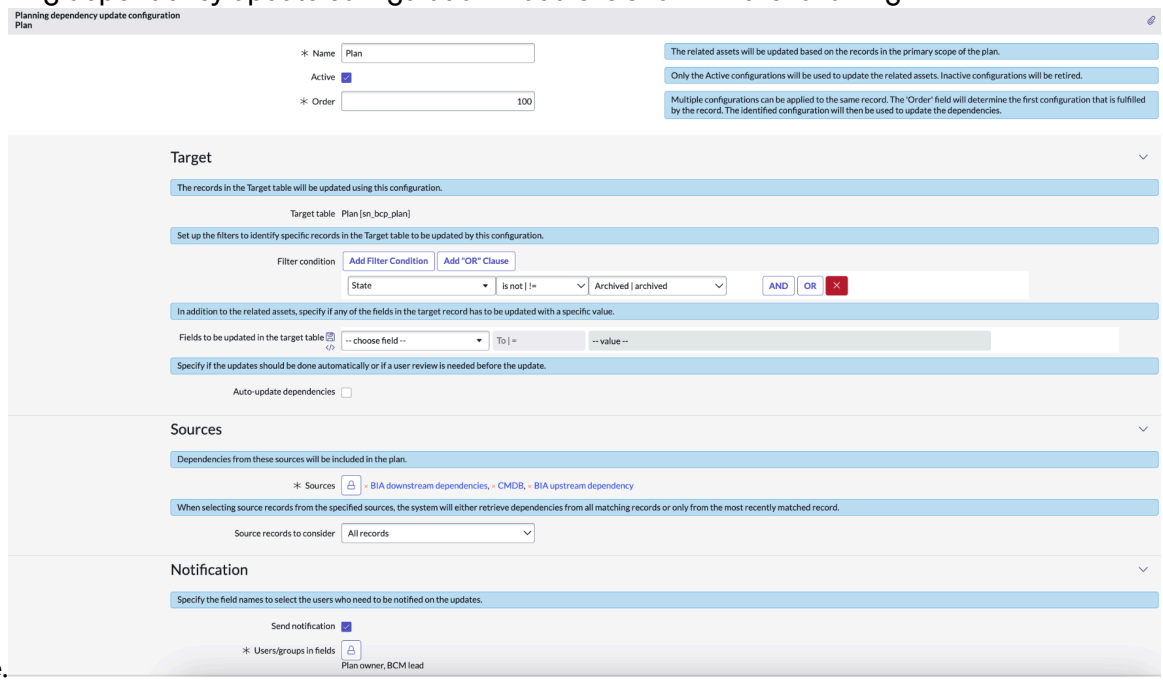
Create New Plan form (continued)

Field	Description
Business unit	Business unit that the business continuity plan is created for. Available options are: • Finance • HR • IT • Legal • Marketing • Sales
Department	Department related to the business unit. You can select the department based on the business unit selected.
Expires	Read-only field. Expiration date for the plan.
Description	Description of the business continuity plan.
Scope	
Asset types	Asset types that you can add to the plan.
Add primary scope	UI action to add the primary scope to the plan.
Add related asset	UI action to add the related asset to the plan.
Asset dependencies	
Asset dependencies	Asset dependencies related to the plan.
Documentation section	
Documentation section	Title, Description, Order, Contents of the documentation section.
Associated plans	
Associated plans	Associated plan types such as Upstream plans, Downstream plans, and Related plans.
Recovery teams	
Recovery teams	Recovery teams for the plan.
Loss scenarios	
Loss scenarios	Loss scenarios defined for the plan.
Recovery tasks	
Recovery tasks	Recovery tasks associated with the plan.
Icons displayed in the side-bar of the record	
Contributors	Icon to populate side-panel in the record. You can add contributors to the business continuity plan from the panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Plan form (continued)

Field	Description
Attachment	Panel where the PDF of the business continuity plan is attached.
Template	Panel to populate the template for the business continuity plan. You can view all or customized templates in this panel.



Scheduling auto-update of related assets

You can schedule an auto-update of the related assets in the plans based on the source data and relationships in the CMDB. You can receive an email notification with details of the plan dependency updates from the BCM application. Dependencies are fetched from different sources such as BIA upstream dependency, BIA downstream dependencies, and CMDB.

Scheduling an auto-update of the related assets

The BCM administrators can schedule an auto-update of the related assets in the plans in the Planning dependency update configuration module, based on the source data and relationships in the CMDB. You can access the auto-update configuration module by navigating to **Business Continuity Workspace** > **General Administration** > **Planning dependency update configuration**.

The Planning dependency update configuration module is shown in the following example.

When the BCM administrators select the **Auto-update dependencies** option, the BCM application schedules an auto-update of the related assets in the plans. Similarly, when the **Send notification** option is selected, the BCM application sends automated emails to the plan owners about the dependency updates.

Planning dependencies are fetched from different sources such as BIA upstream dependency, BIA downstream dependencies, and CMDB.

Note:
In the plans, the dependencies are fetched for all primary scope assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up the Planning dependency update configuration module is a one-time activity. Once the sources are configured in the Planning dependency update configuration module, the updates are synchronized in the plan.

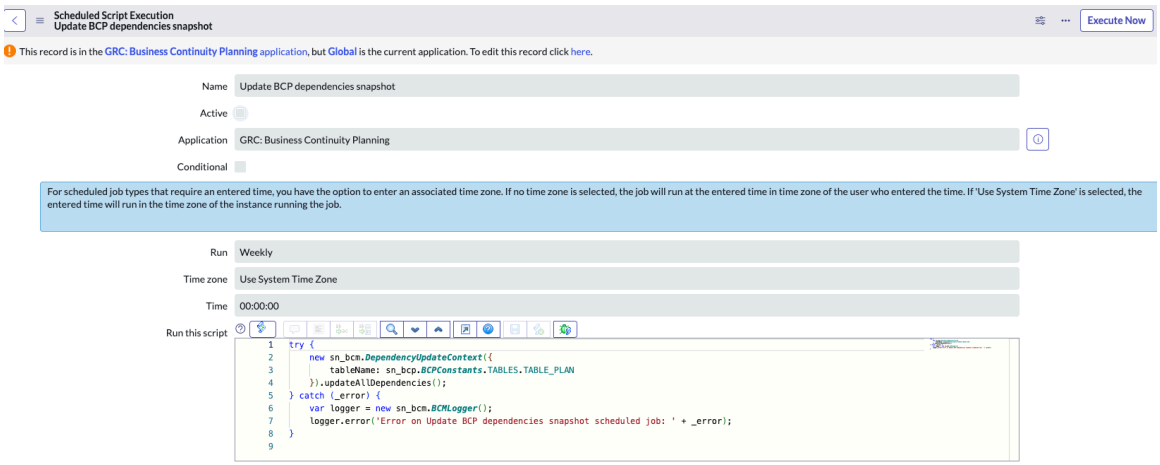
For more information on setting up the Planning dependency update configuration module, see Configuring planning dependency updates.

Using the updated dependencies with the Xanadu release

Beginning with the Xanadu release, you can use the updated dependencies from the latest BIA record to conduct a dependency assessment on an asset. Information from the columns labeled Related item BIA, Related item Recovery Time Objective (RTO), Related item Recovery Point Objective (RPO), and Related item Recovery Tier is used to ascertain the required recovery timeframe and data backup needs, which are then displayed in the Required Recovery Timeframe and Required Data Backup columns of the BIA record.

For more information on the source BIA records option in the Dependency configuration modules, see Set up Planning dependency update configuration.

Note:
The filter condition in the Element definition is used to add specific configuration items (CIs) via the pop-up. The **Update dependencies** UI action also considers the element definition's filter and retrieves the related CIs of the configuration item listed in the **Applies to** field of the BIA. These relationships are retrieved from the CI Relationships table.



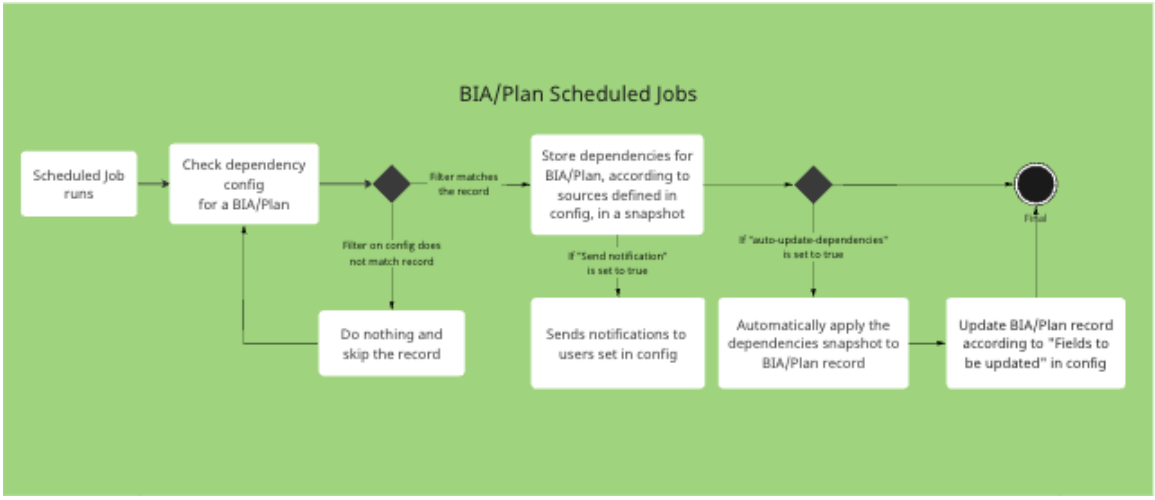
Roles associated with the auto-update of the related assets in the plans

Users with the following roles typically update the related assets in the plans:

- The BCM program managers, BCM planners, and BCM managers can update the related assets in the plans.
- BCM administrators can configure the Planning dependency update configuration module.

Using the scheduled job to auto-update the dependencies

The *Update BCP dependencies snapshot* scheduled job is shipped as part of the base system. It runs at regular intervals and fetches the updated related assets in the plans. The scheduled job is shown in the following example.

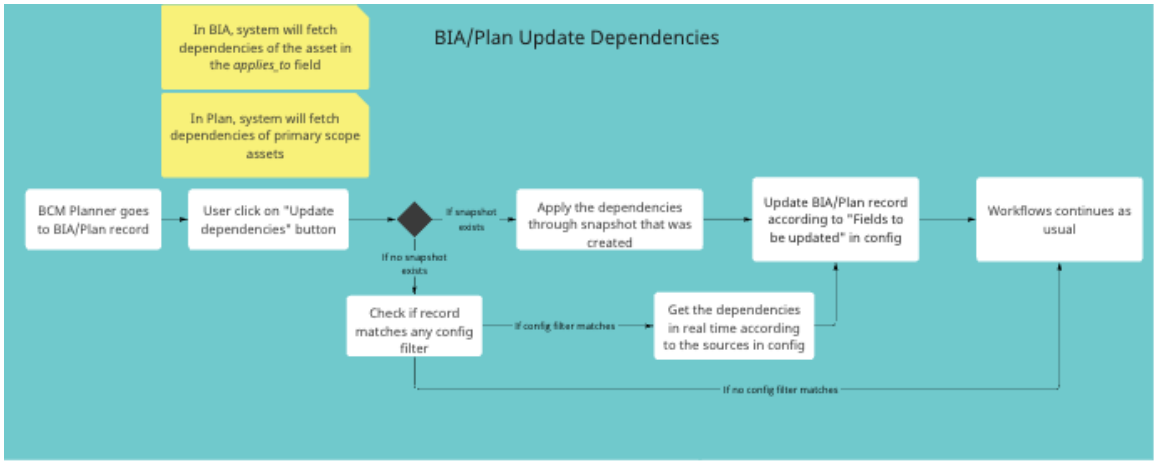


The scheduled job is not marked as Active by default. To run the scheduled job at regular intervals, the system administrators can select the **Active** option and select **Execute now** to set up a schedule. The scheduled job then runs at regular intervals, scans the plan records for the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

changes, and fetches the updated related assets for the planning records. It creates a snapshot record for each planning record update.

The scheduled job processes a workflow to check for the changes in the relationships and save the dependency updates automatically as shown in the following example.



1. The scheduled job runs weekly, checks the related assets configuration for each planning record, and fetches the related assets from the sources defined in the **Sources** tab of the Planning dependency update configuration module.
2. The scheduled job refers to the filter condition that is set in the configuration (Planning dependency update configuration module). If the condition matches the planning record, the scheduled job fetches and stores the related assets for the plan in the snapshot record, according to the sources defined in the configuration. If the filter condition does not match the planning record, the application skips the record.
3. When the **Send notification** option is set to **True** in the Planning dependency update configuration module, the users of the planning record set in the configuration are notified about the updated related assets through the scheduled job.
4. When the **Auto-update dependencies** option is set to **True** in the Planning dependency update configuration module, the scheduled job automatically applies the Plan dependency snapshot to the planning record.
5. As the final step, the scheduled job updates the planning record according to the fields to be updated in the configuration.

Updating the dependencies manually

As the BCM application user, you can update the plan dependencies instantaneously by using the **Update dependencies** UI action. In this way, you can update the dependencies manually before the scheduled job runs as per the weekly schedule. The dependencies are then updated in the sources and a snapshot record of the planning record update is created.

See the following workflow for using the **Update dependencies** UI action and updating the planning dependencies manually:

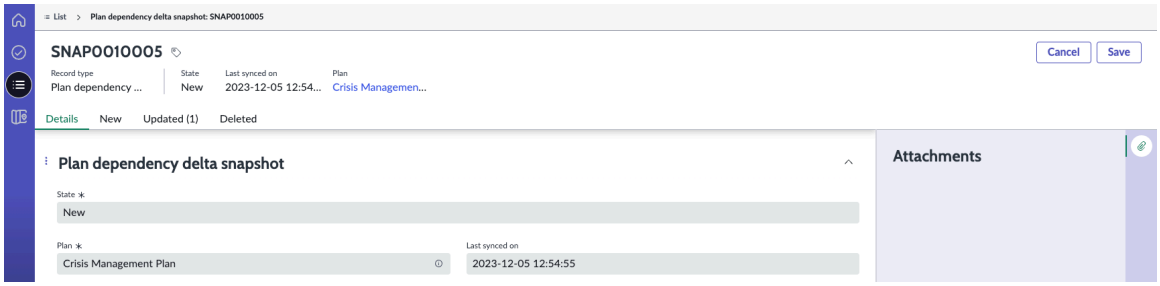
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. The BCM planner navigates to the planning record. The application fetches the dependencies of the primary scope assets defined in the plan.
2. The BCM planner selects the **Update dependencies** UI action.
3. If the snapshot record exists for the update, the BCM planner applies the planning dependencies through the snapshot and updates the plan according to the **Fields to be updated** in the configuration. The plan workflow then continues for the next steps such as requesting review and approval.

   If the snapshot record does not exist for the update, the BCM planner checks if the planning record matches any configuration filter:

   - If the planning record matches any configuration filter, the application gets the dependencies in real time according to the sources in the configuration. Then, the BCM planner updates the planning record according to the **Fields to be updated** in the configuration. The plan workflow then continues for the next steps.
   - If the planning record does not match the configuration filter, the plan workflow then continues for the next steps.

For more information on updating the planning dependencies manually, see Update the planning dependencies.



Note:

Note:
The Planning dependency update configuration module is used for using the scheduled job and for updating the planning dependencies manually (by using the **Update dependencies** UI action).

Snapshot record of the plan

When the scheduled job runs at set intervals, it creates a snapshot record of each plan update in the application. The snapshot record contains the delta of the changes in the configuration such as new, updated, and deleted assets for the plan. The snapshot records are listed in the Pending updates module in the Planning list view in the Business Continuity Workspace. A snapshot record is shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a snapshot record gets created, the application displays a UI message to inform the users about the planning dependency updates. The BCM application stores one active snapshot for a plan at a time. The snapshots that are in the **Completed** state and that have not been updated in six months are removed from the application automatically.

If the planning record does not have any changes in the dependencies, then a snapshot record is not created for that planning record.

Data Relationships Framework

When you create a business continuity plan, you must update the related assets in the plans. Beginning with the Xanadu release, the Data Relationships Framework (com.sn_app_grc_relationship_config) application supports the BCM application with the underlying framework to fetch the related assets in the plans. The Data Relationships Framework application is installed with the BCM application by default.

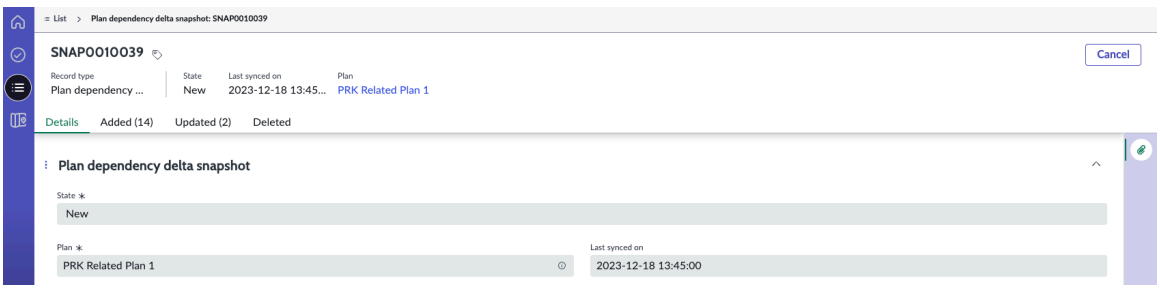
For more information on the Data Relationships Framework, see Data Relationships Framework.

Update the planning dependencies

Update the plan dependencies manually from the snapshot if the scheduled job is not activated in the Planning dependency update configuration module. You can update the dependencies in an active plan.

Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner, sn_bcm.admin



Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. Open a BCP in the **Draft** state and navigate to the **Scope** tab.

   If the dependencies have been updated in the sources, the scheduled job fetches the dependencies. You can select the snapshot record to view the updates.

3. To view the snapshot record, select the **Pending updates** module in the **Planning** list view and select a snapshot record.

   The Plan dependency delta snapshot is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The BCM application stores one active snapshot for the BCP at a time. The snapshots that are in the **Completed** state and that have not been updated in the past six months are removed from the application automatically.

4. To update the dependencies manually, navigate to the plan and select **Update dependencies**.
   A UI message is displayed on the screen: `Dependencies are being updated.`
5. To save the changes to the plan, select **Save**.
   The plan owners and BCM lead can update the planning dependencies by saving the changes to the plan.

Add asset and scope to the BCP

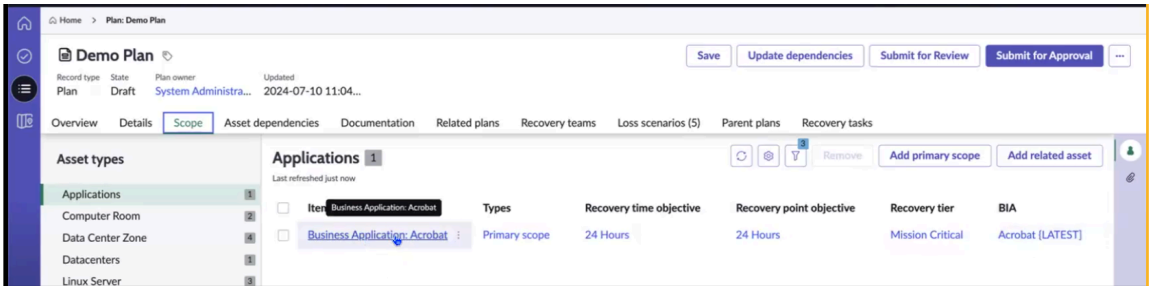
Add an asset and the scope to the business continuity plan (BCP). You can then view the primary elements in the BCM Configurable Workspace.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task

You can select a primary asset and track its related assets in the plan. You can also designate the same asset as either a primary or a related asset within the plan, as indicated in the Types column of the plan record. To add the related assets in the **Asset dependencies** tab, select the **Update Dependencies** button in the plan. The source of the relationship is displayed in the Primary Source column, which includes sources such as Configuration Management Database (CMDB), Manual, BIA upstream, or BIA downstream.

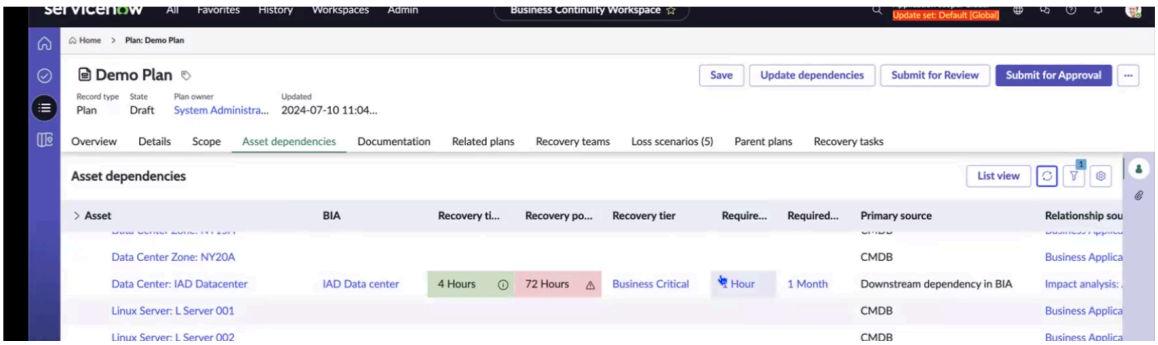


You can check the Types column in the **Scope** tab to see the classification of an asset. An asset can be classified as a primary scope type, a related asset type, or both. To understand the source of the relationship for related assets, such as an upstream BIA or a CMDB asset from which the dependency originates, refer to the Relationship Source column in the Plan Asset and Snapshot records. The Relationship source column in the **Asset dependencies** tab shows the actual record responsible for pulling this relationship. If two business impact analyses (BIAs) have the same asset dependencies, the most recent BIA is recognized as the relationship source and it is shown in the Types column in the plan.

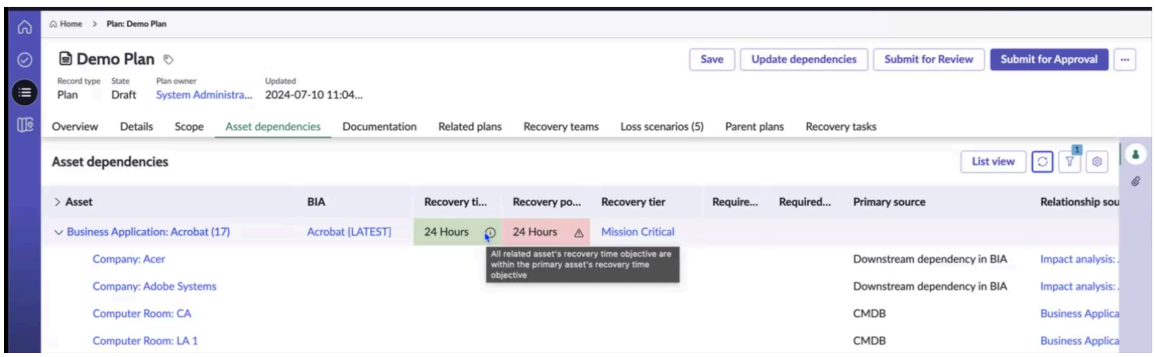
You can use the Hierarchical view in the plan form to view the parent-child relationship of the assets. You can toggle the view to display either the List view or the Hierarchical view. When the dependencies are updated, the values in the columns of the **Scope** and **Asset dependencies** tabs are updated and color-coded for reference as shown in the examples:

- BIA
- Recovery time objective (RTO)
- Recovery point objective (RPO)
- Recovery tier (RT)

You can use the updated dependencies from the most recent BIA record to conduct a dependency assessment on an asset. Employing these updated dependencies enables you to accurately carry out the business impact analysis. Additionally, it assists in determining the essential recovery timeframe and data backup needs for the assets, which are then shown in the Required Recovery Timeframe and Required Data Backup columns of the BIA record.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



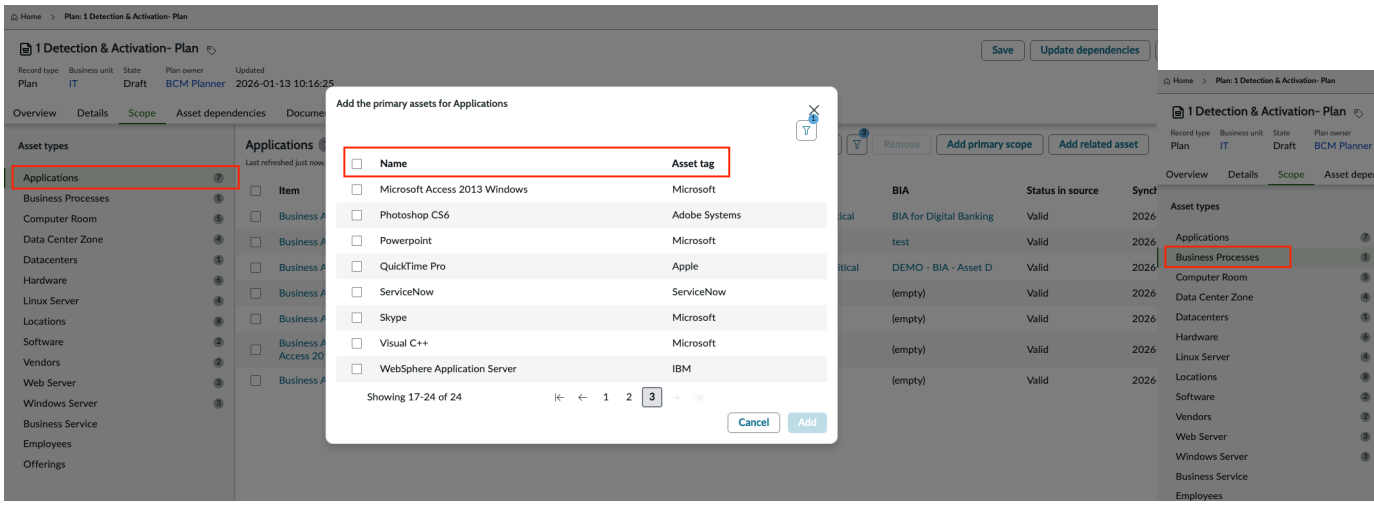
The Hierarchical view is used to evaluate the BIA, Recovery time objective (RTO), Recovery point objective (RPO), and Recovery tier (RT) values between the primary and related assets within a plan. The color coding helps Business Continuity Management (BCM) planners to compare these metrics:

- Rows where the RTO or RPO value for the primary asset is lower than that of the related asset are marked in Red.
- Rows where the RTO or RPO value for the primary asset exceeds that of the related asset are marked in Green.
- Rows where the RTO or RPO values for the primary and related assets are identical are marked in Yellow.
- Rows where the RTO or RPO values for the primary assets are missing remain uncolored.

For example, if the RTO value for the primary asset exceeds that of the related asset, it is marked in Green. If the RTO value for the primary asset is less than that of the related asset, it is marked in Red.

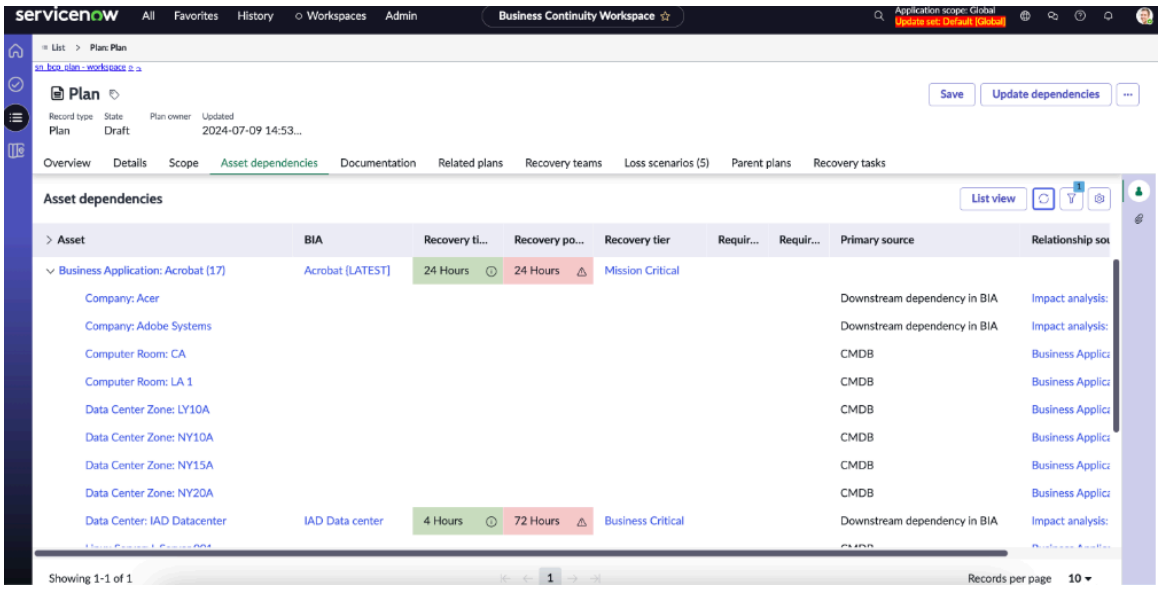
When you hover over the information icon in the column, it shows the comparison data for the primary and related asset as shown in the example.

Procedure



1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select the link to the plan record in the **Name** column.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the **Scope** tab and add primary scope for the business continuity plan.
   If the plan is created from a plan template, you can view the primary elements defined in the plan template.
4. Select the **Asset dependencies** tab.

   Asset dependencies show the relationships of the assets and allow users to assess the risk or gaps when the assets are operationally down. The example shows how to add an asset type to the business continuity plan.

   The purpose of *source_table_fields* is to set the columns for the modal based on the asset types. The following examples show the columns that appear when you select **Add primary scope** for Applications and Business Processes asset types.

   A sample plan with various asset types is shown in the example.

5. Select **Save**.

Create documentation sections

Create a documentation section in the business continuity plan. You can then document the recovery capabilities of your business continuity plan in BCM UIB Workspace.

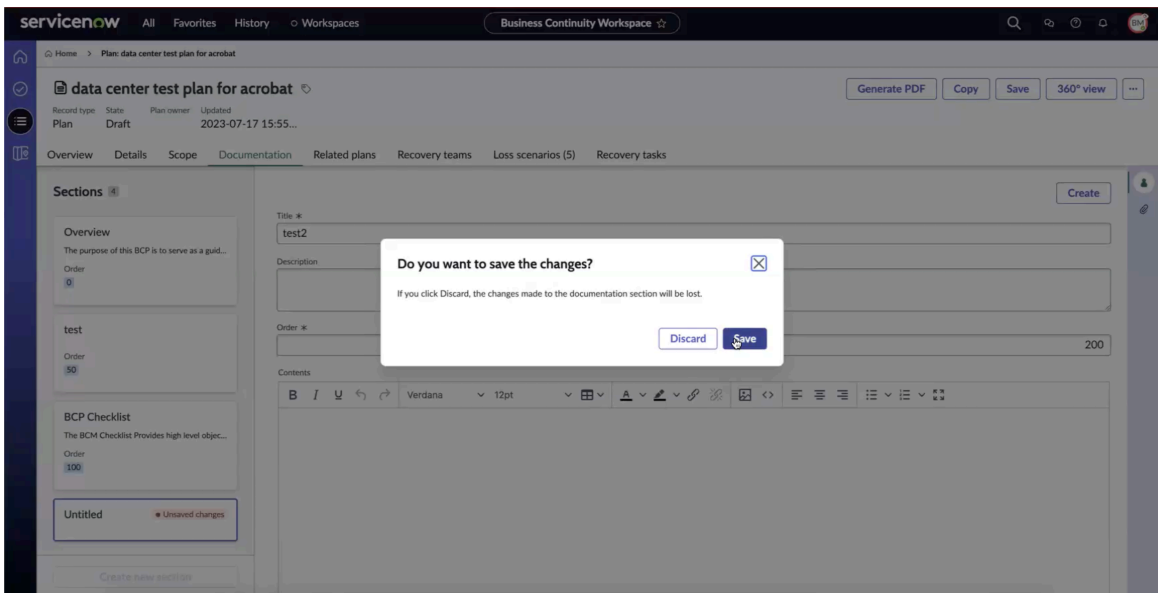
Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

These UI actions are available for the documentation sections:



- **Update**: Update an existing documentation section.
- **Delete**: Delete an existing documentation section.
- **Reset to template**: Reset an existing documentation section to the Documentation Sections template. You can view the available templates by navigating to **Documentation Sections** of **Business Continuity** in the application navigator. For an existing documentation section, the **Update**, **Delete**, and **Reset to template** actions are available. For a new documentation section, the **Reset to template** action is not available.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select the link to the plan record in the **Name** column.
3. Select the **Documentation** tab of the plan.
4. Select **Create new section**.

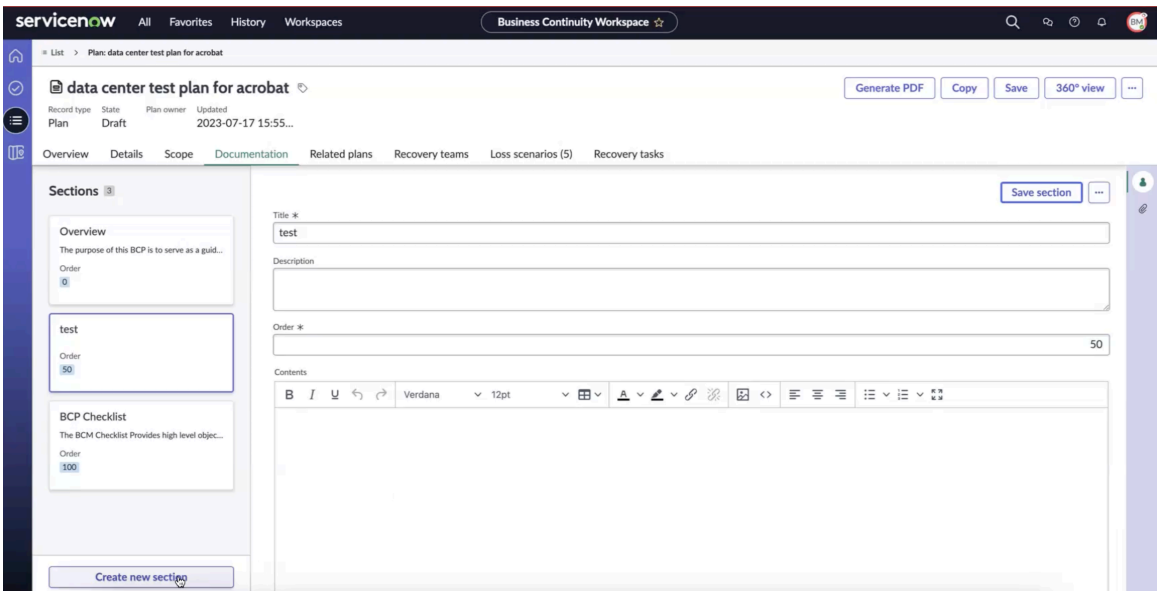
   You can add a documentation section in the business continuity plan.

   If you create a documentation section and move away without saving the changes, the documentation section is marked as **Untitled** with the **Unsaved changes** tag as shown in the example. A message is displayed on the screen: `Do you want to save the changes?`

   If you select **Save**, the documentation section is saved in the plan. If you select **Discard**, the changes to the documentation section are not saved.

5. To create a documentation section, select **Create**.

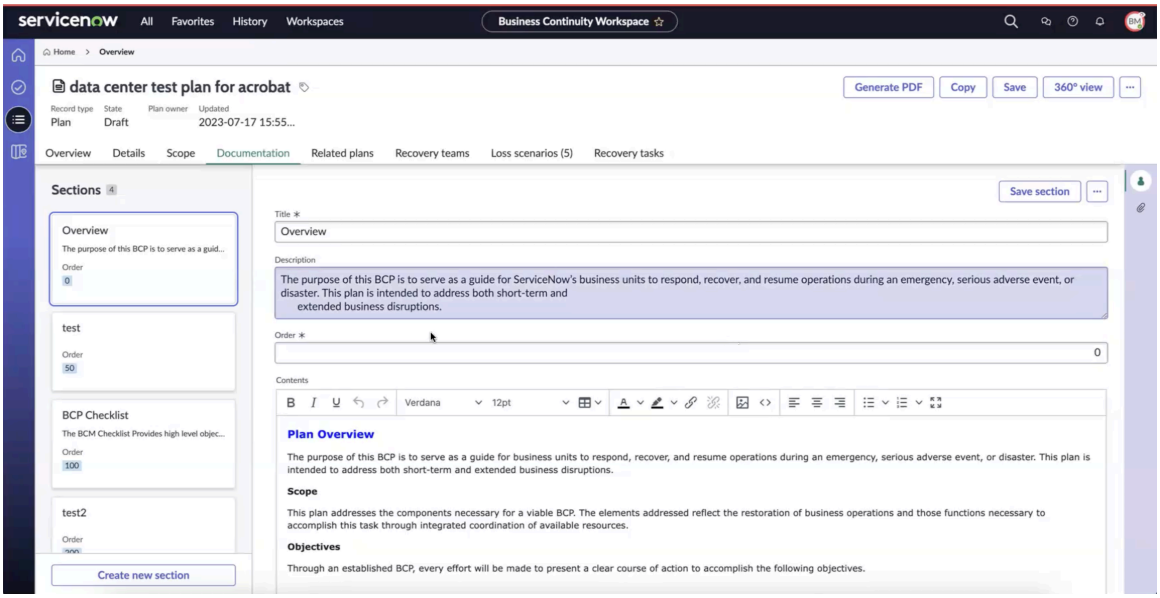
   The example shows the Overview and BCP Checklist documentation sections in a business continuity plan. The Overview documentation section has an order value of 0. The BCP Checklist documentation section has an order value of 100.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you create a documentation section on the **Documentation** tab without using the plan template, the **Reset to template** UI action is not available for that documentation section.

To create a documentation section that is displayed as the second section in the Sections panel, assign it an order value that is more than 0 and less than 100, such as 50.



The documentation section with an order value of 50 is displayed as the second documentation section in the Sections panel on the **Documentation** tab.

6. To save the documentation section in the plan, select **Save section**.

   The documentation section is saved in the business continuity plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. To delete a documentation section in the plan, select **Delete**.
8. To reset a documentation section to its template, select the More actions (**...**) icon and then select **Reset to template**.

Add associated plans and recovery teams

Add your business continuity associated plans and recovery teams to your business continuity plan. You can then view the details in BCM UIB Workspace.

Before you begin

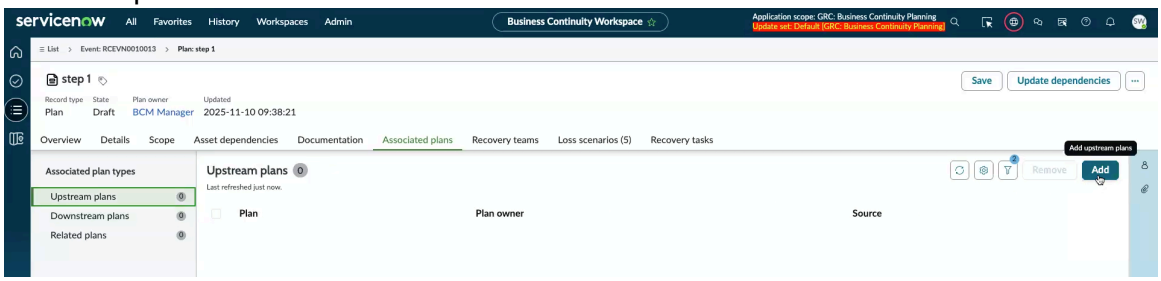
Role required: sn_bcm.admin, sn_bcm.program_manager, sn_bcm.planner, sn_bcp.plan_manager

About this task

You can add the associated plans that are listed in the Workspace view. When an associated plan is added in an exercise or event, it gets triggered from a task if the task is tagged as a dependency.

Previously, adding an associated plan would automatically include a link to the plan record in its record list. However, with the introduction of the Xanadu release, this process has changed to a one-way relationship, and the associated plan record no longer displays the link to the original plan record. To manually insert the link, you can navigate to the tab and add the link. This update provides the flexibility to designate the plan relationship as either a parent-child or sibling relationship.

Procedure



1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select the link to the plan record in the **Name** column.
3. Select the **Associated plans** tab.

> **Note:**
> The **Related plans** tab has been renamed to the **Associated Plans** tab. It helps you to manage the cross-plan dependencies.

The associated plan types are shown in the example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Upstream plans
- Downstream plans
- Related plans

The **Is Associated to Task** field in the associated plans table is set to True if the associated plan is linked to a recovery task; or else it is set to False.

> **Note:**
> Related plans that are associated with a recovery task are created as child plans in events. If the related plans aren't associated with any recovery task, they are created as related plans but not as child plans in events.

Associated plans help you to identify when and where the plans are triggered in the flow, aiding in tracking and managing the plans during the recovery process.

4. To add an upstream plan to the selected plan record, choose **Upstream plans** from the Associated plan types panel and then select **Add**.

   a. To remove the upstream plan from the plan record, select the plan from the list view and choose the **Remove** option.
   A confirmation message is displayed asking you to confirm the deletion. Once you select **Delete All**, a confirmation message is displayed that the record has been successfully deleted.

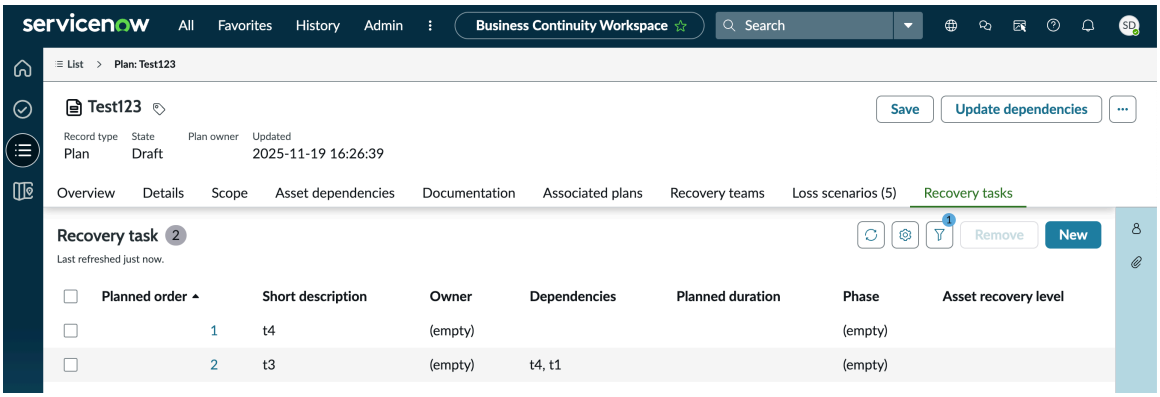
   No UI actions are available for the Downstream plans.

5. To add a related plan to the plan record, choose **Related plans** from the Associated plan types panel and then select **Add**.

   a. To set the related plan as upstream plan, select **Set as upstream plan**.
   A confirmation message is displayed asking you to confirm the selection. Once you confirm, the plan is moved to the Upstream plans list.

   b. To set the related plan as downstream plan, select **Set as downstream plan**.
   A confirmation message is displayed asking you to confirm the selection. Once you confirm, the plan is moved to the Downstream plans list.

   c. To remove a related plan from the plan record, select the plan from the list view and choose the **Remove** option.
   A confirmation message is displayed asking you to confirm the deletion. Once you select **Delete All**, a confirmation message is displayed that the record has been successfully deleted.



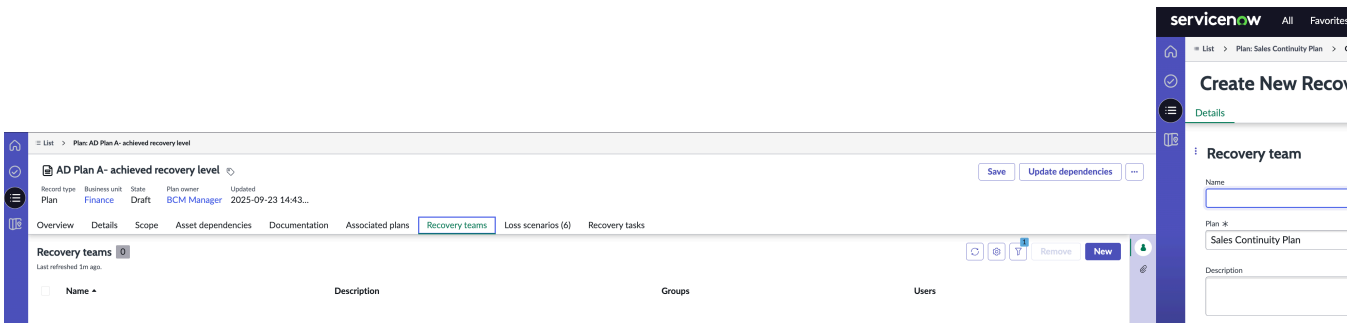
6. Verify that a cyclic dependency check is performed by the system and downstream tasks aren't added in the upstream tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

With the cyclic dependency check, you can add recovery tasks from the same downstream plan and upstream plan as dependencies. This provides a hierarchical approach to managing complex recovery sequences.

The following example shows that recovery task t3 has a dependency on t4 (another recovery task from same plan) and on t1 which is a recovery task from the upstream plan.

Note:
Recovery tasks inside a business continuity plan (BCP) can now be linked to tasks from other plans, provided they belong to a direct parent plan. These recovery tasks are carried across to the event tasks.



By performing the cyclic dependency check, you can verify that child tasks aren't added in the parent tasks and it isn't a cyclic dependency.

7. Select the **Recovery teams** tab and select **New**.

   a. Add a recovery team to the plan.

      You can add a recovery team to the plan as shown in the examples.

8. Select **Save**.
   The plan record is updated and saved.
   The selected plans and recovery teams are added to the plan record.

Associating related plans to a recovery task

You can now associate related plans with recovery tasks, making it easier to identify and manage plans during recovery. You can then use auto-generated nested plans in an event, reducing the manual effort of adding plans and improving system performance.

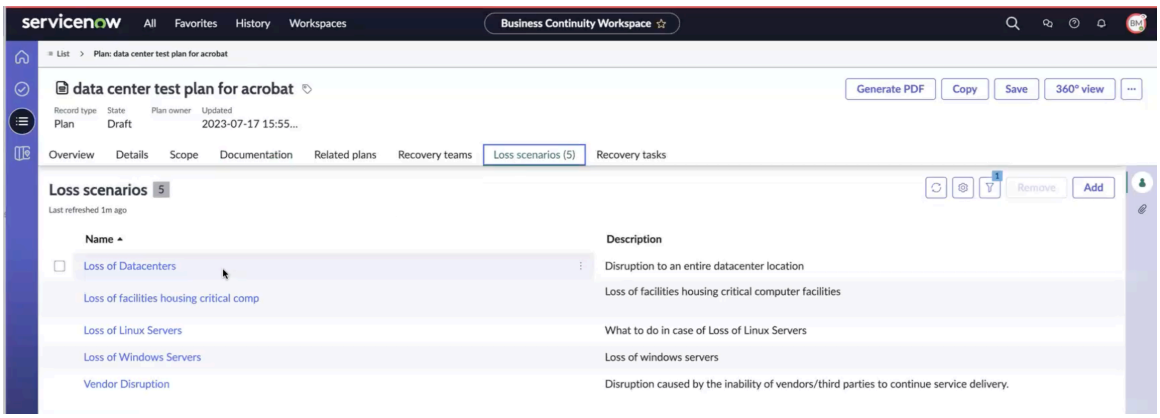
For configuring cross-plan dependencies, you must associate related plans to a recovery task. Whenever a related plan is associated with a recovery task in an event, a new activated plan is created from this task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on using nested plans in an event, see Using nested plans.

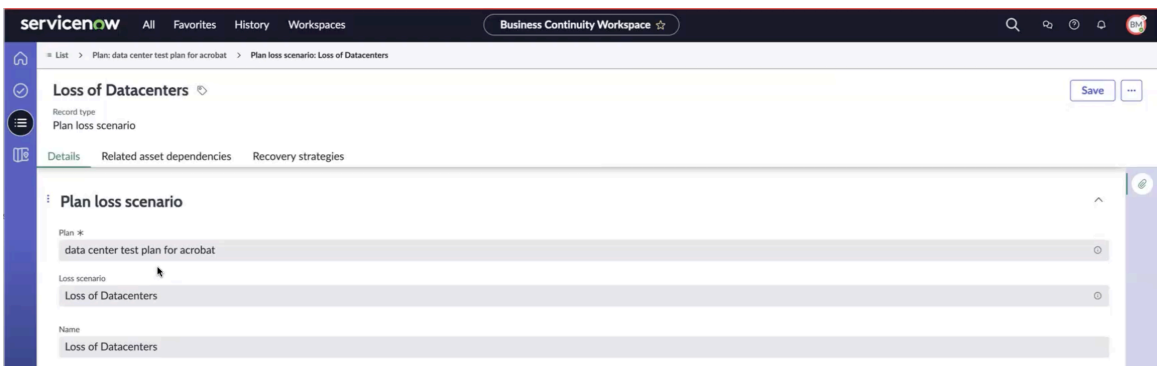
Add loss scenarios

Add a loss scenario and define the related asset dependencies in your business continuity plan. You can then view the details of the assets in BCM UIB Workspace and then plan a recovery strategy for an identified loss scenario.



Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

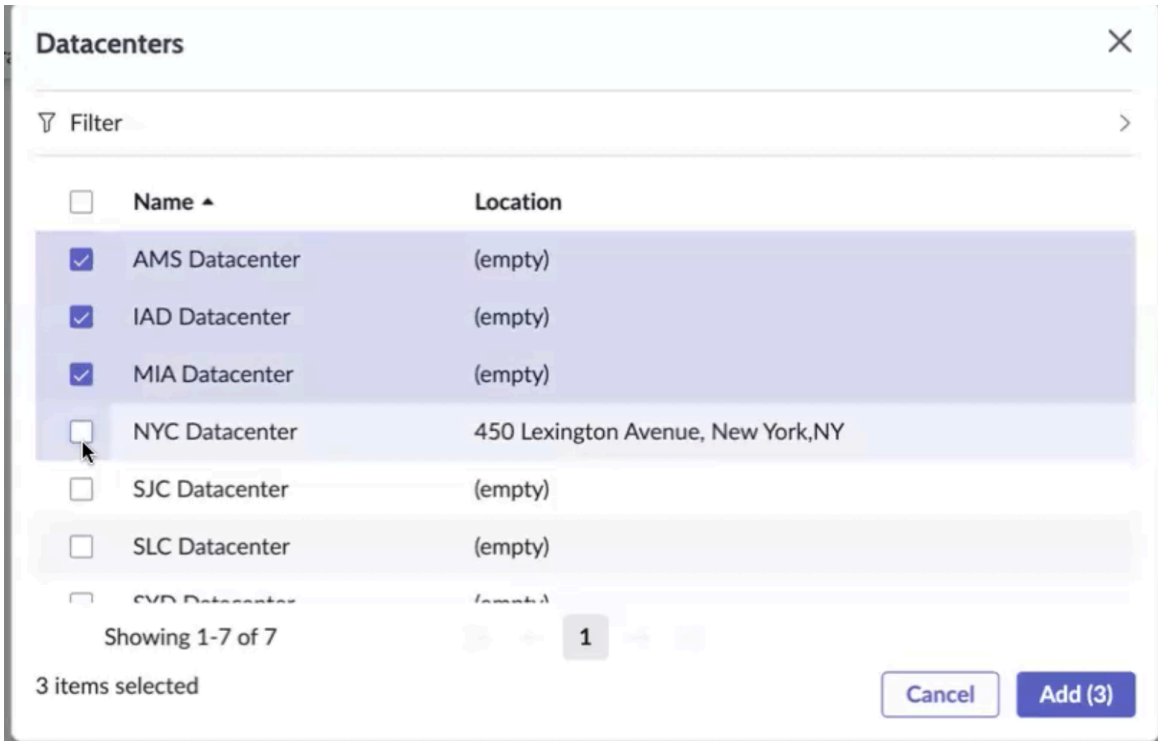


Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select the link to the plan record in the **Name** column.
3. Select the **Loss scenarios** tab and select **Add**.

   You can add a loss scenario to the business continuity plan. In the example, you can select the Loss of Datacenters loss scenario and add it to the business continuity plan.

   The loss of scenario record is displayed as shown in the example.



4. Navigate to **Related asset dependencies** tab and select **Add**.
   You can add the related asset dependencies to the loss of scenario as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

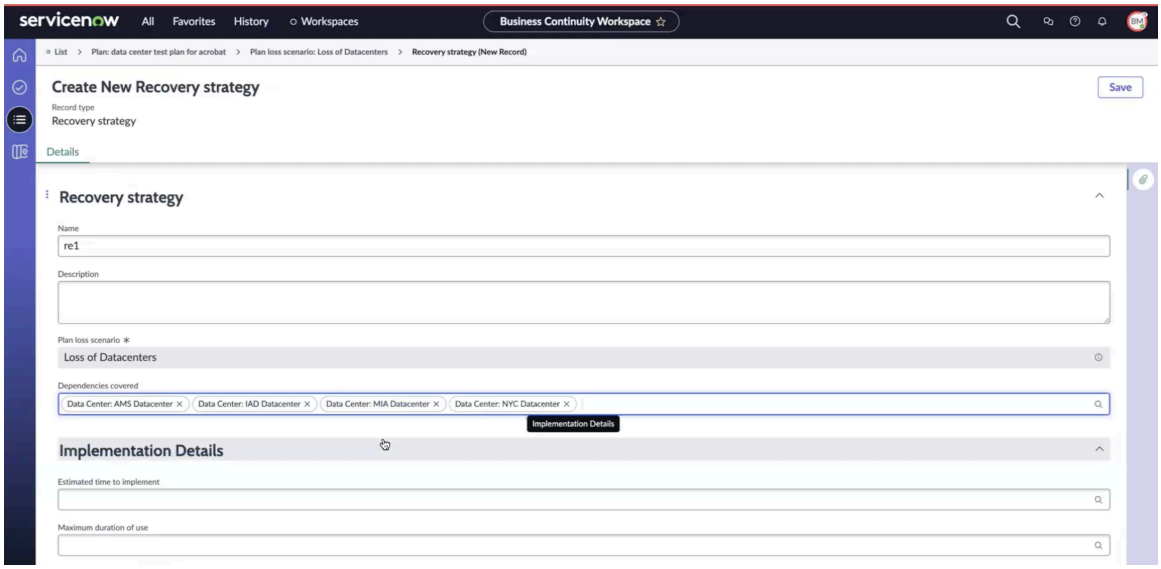
5. Select the dependencies from the list and select **Add**.

   You can add the dependencies to the loss of scenario as shown in the example.

6. Select **Save**.
   The related asset dependencies are listed on the **Related asset dependencies** tab.

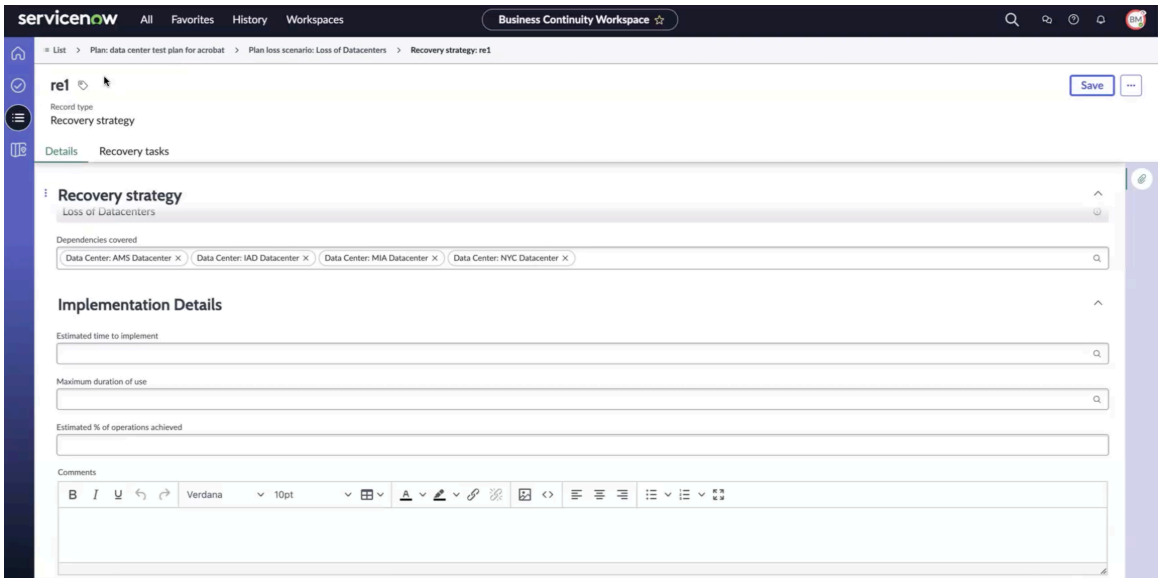
Add recovery strategies for dependencies

Add a recovery strategy for the related asset dependencies and estimate the time to implement the strategy. You can then get the assets up and running quickly in an identified loss scenario.



Before you begin

Role required: sn_bcm.program_manager or sn_bcm.planner



Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to the loss scenario in the plan record.
3. Navigate to the **Recovery strategies** tab and select **New**.
   The Create new Recovery strategy form is displayed as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.
   For more information on the fields in the form, see Create New Recovery strategy form.
5. Select **Save**.
   You can save the recovery strategy as shown in the example.

The **Recovery tasks** tab is displayed in the Recovery strategy form.

What to do next

You can add one or more recovery tasks as part of the recovery strategy as the next step.

Create New Recovery strategy form

Use the Create New Recovery strategy form in BCM UIB Workspace to add details about the recovery strategy for the identified loss scenario.

Create New Recovery strategy form

For description of the field values, see the table.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Recovery strategy form

Field	Description
Details tab	
Name	Name of the recovery strategy for the identified loss scenario in the business continuity plan.
Description	Description of the recovery strategy.
Plan loss scenario	Loss scenario for which the recovery strategy is planned.
Dependencies	Dependencies that are associated with the related assets.
Implementation Details	
Estimated time to implement	Estimated time to implement the recovery strategy.
Maximum duration of use	Maximum duration of use for the recovery strategy.
Estimated % of operations achieved	Estimated % of operations achieved for the recovery strategy.
Comments	Comments related to the recovery strategy. The BCM administrator or planner can update the comments in the plan.

Mapping recovery tasks to phases

Starting with BCM, version 9.x.x, BCM administrators set up active phases for plans and events, enhancing recovery and event task management. BCM managers then map these phases to recovery and event tasks, executing them in a desired, logical sequence.

Implementing phases in recovery

Organizing recovery and event tasks into logical phases provides a structure and context to the recovery activities. The logical grouping of phases helps you to understand the progression of plans, exercises, and crisis events, maintain flexibility in execution, and navigate complex recovery processes effectively.

Phases act as indicators of the current status of plans, exercises, or crisis events, and they provide clarity while reviewing the recovery and event tasks. You can tag the recovery tasks and event tasks to an appropriate phase such as Preparation, Recovery, Post incident review, and so on as part of the recovery process. This mapping ensures structured and efficient handling of recovery tasks and event tasks.

Default active phases

Recovery involves a series of phases, which are configured within the BCM core application. The base version of the application includes a set of default active phases, provided as seed data.

1. Preparation
2. Recovery
3. Recovery validation
4. Return to normal
5. Return to normal validation
6. Post-incident review

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These predefined phases serve as a foundation for the recovery process.

BCM administrators have the flexibility to configure these phases to meet their organization's unique requirements.

Phase column

Recovery and event tasks now include the Phase column in both list and form views, indicating association with specific phases within the recovery process. By default, the phase list view only displays active phases, streamlining the user experience.

Benefit of mapping phases to plans or events

By setting up active phases in the BCM application and mapping them to relevant plans or events, BCM managers can efficiently manage their workflows.

Phases for task classification

BCM Administrators can configure phases using the Active Phases module, which is accessible through the **General administration** menu in the Core UI. For more information on setting up the phases, see Set up the phases.

Execution of the phases

While phases are executed in a sequence, the application doesn't enforce a strict sequential execution. However, certain phase transitions require completion of all tasks in the current phase before proceeding to the next phase.

For example, all tasks in the Preparation phase must be completed before moving to the Recovery phase, and all tasks in the Recovery validation phase must be completed before proceeding to the Return to normal phase.

- Preparation → Recovery
- Recovery validation → Return to normal

In contrast, phases such as Return to normal validation and Post-incident review can progress in parallel without requiring full task completion. For example, the Recovery and Recovery validation phases, or the Return to normal and Return to normal validation phases, can run in parallel.

By default, phases serve as a tagging mechanism, and the application doesn't enforce task dependencies across them. If strict enforcement is needed—for example, ensuring Task 2 in Phase 1 starts only after Task 1 in Phase 2 is completed—a customization is required.

Flexibility to exclude tasks and assets from time calculation

In previous releases, the total time calculation included the time required to complete all recovery tasks. The newly introduced **Do not include in time calculation** field in the recovery task form provides greater flexibility in time calculations, enabling you to exclude specific recovery or event tasks from these calculations.

How it works: When creating a recovery task, you can select the **Do not include in time calculation** check box to exclude specific tasks from time calculations. The actual time taken is then calculated based on the minimum start time and maximum end time of the included tasks. The total effort is the sum of the effort for each task, excluding those with the check box checked.

Excluding time calculation at asset level: You can also apply the exclude time calculation functionality at the asset level, allowing you to exclude specific assets from time calculations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

for individual tasks. This functionality enables accurate tracking of time and effort for relevant assets, helping you focus on critical tasks and assets. By providing this flexibility, the feature enhances the accuracy of time and effort calculations.

UI changes and table updates

The user interface (UI) has been updated to include the phase column in both recovery tasks and event tasks. Additionally, a phase navigation module has been added under Business Continuity > General Administration.

Recovery task and event task tables: The Recovery task table (in BCM Planning) and Event task table (in BCM Exercises) have been updated to include the phase column, which is a reference field.

These changes enhance the overall functionality and security of the BCM system, providing a robust and controlled environment for managing phases and related tasks.

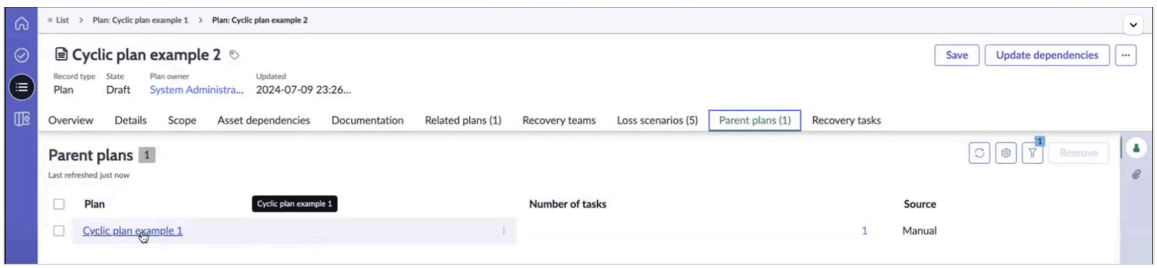
Information on setting up and mapping the phases

For information on setting up the phases, see Set up the phases.

For information and steps on mapping recovery tasks to phases, see Add recovery tasks.

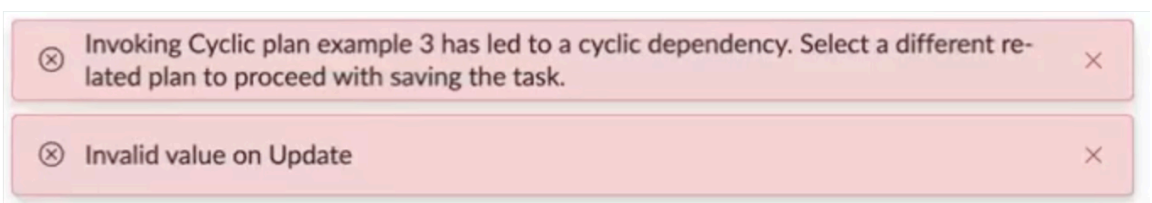
For information on mapping event tasks to phases, see Mapping event tasks to phases.

Add recovery tasks



Add a recovery task as part of the planned recovery strategy. You can add one or more recovery tasks for a loss scenario and those recovery tasks are displayed in the loss scenario itself. Automate the recovery tasks in a plan for a faster recovery.

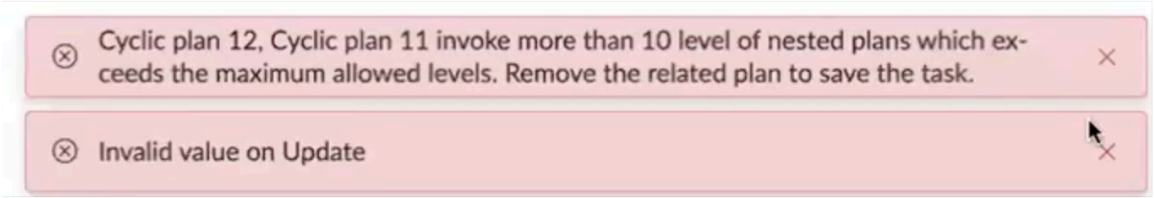
Before you begin



Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task

Beginning with the Xanadu release, cyclic dependencies in recovery tasks can be avoided to prevent repeated invocation of the same plan from other plans.



For example, in the Recovery task of Cyclic plan example 1 invokes Cyclic plan example 2, Cyclic plan example 2 invokes Cyclic plan example 3 and then again Cyclic plan example 3 invokes Cyclic plan example 1. If you attempt to add a link bet Cyclic plan example 2 and Cyclic plan example 3, it isn't allowed. An error message, similar to the one shown in the example, prompts you to choose a different related plan to help prevent such issues from occurring in an event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Similarly, if plans are activated beyond 10 levels or hierarchical links involving more than 10 levels of plans are created, an error message is displayed, suggesting the removal of the plan before saving the record.

Starting from version 6.1.x of the Business Continuity Management application, the integration of recovery task automation into the business continuity planning process is introduced. This automation aims to enhance efficiency, save time, and minimize the risk of human errors. Users who have the necessary access to the recovery task can classify it as either manual or automated. These tasks are organized in a sequential manner with dependencies.

To automate a recovery task, administrators or application developers create an automation flow and associate it with the task. When the task moves to the **Open** state (when the plan is activated as part of an exercise or an actual event), the automated flow is triggered. However, there may be instances where the automated flow fails due to system errors. In such cases, the user with access to the recovery task can activate the manual task as a backup and assign it to a designated backup assignee. The backup assignee receives a system-generated email to complete the task flow. Plan users have the opportunity to practice business continuity plan exercises and make improvements based on the results obtained.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to the loss scenario in the plan record.
3. Navigate to the **Recovery tasks** tab and select **New**.

   The recovery tasks that are added at the business continuity plan level are displayed on the **Recovery tasks** tab. You can add a recovery task to the business continuity plan as shown in the example.

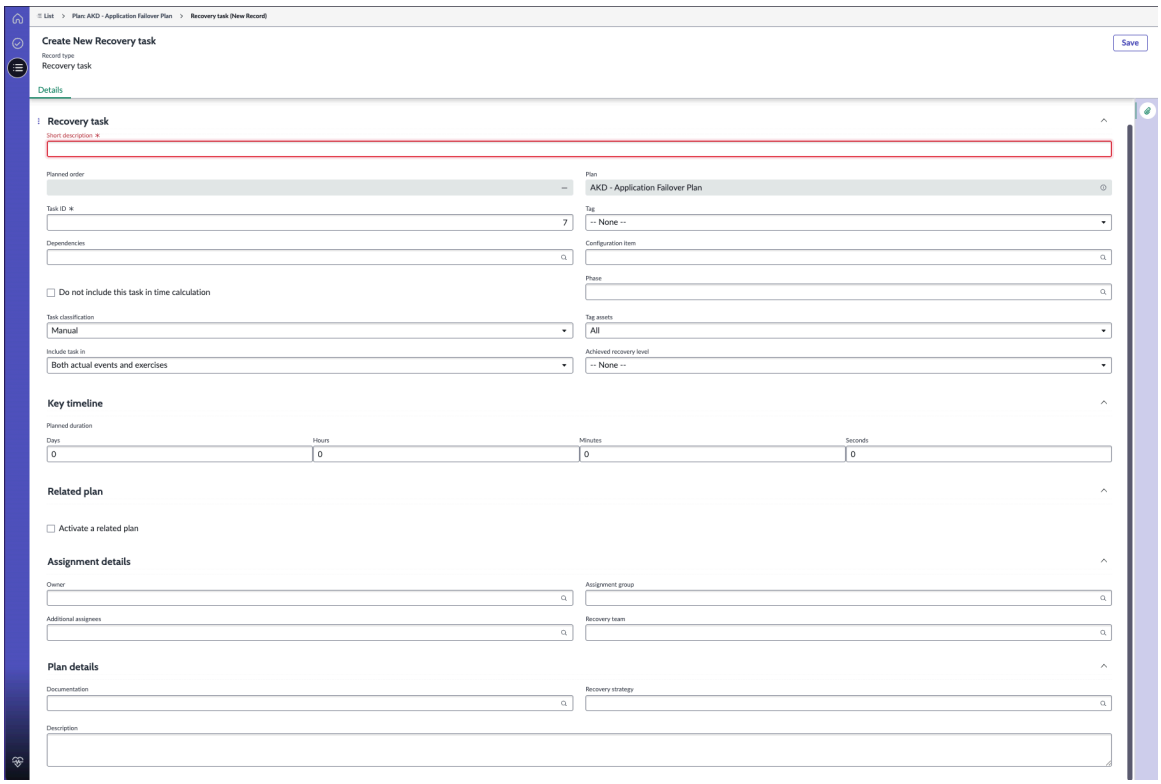
   You can use the order of the tasks calculated by the system based on their dependencies. A task that doesn't have a dependency can be started first and it has the higher assigned order. Whenever you update or save the order of the tasks, the system recalculates and displays the order of all the tasks.

   If a plan has more than 500 tasks, the system doesn't update the order of the tasks automatically. A manual intervention is required to set the order of the tasks. An informational message is displayed informing the users to select the **Update dependencies** UI action that is available in the plan and recovery task records.

   In a plan, while it's possible to tag multiple assets, you can concentrate on particular assets for certain scenarios. Beginning with the Xanadu release, you can tag specific assets to a recovery task and calculate the time taken to recover each asset accurately during an event or exercise. The actual duration and total effort of the assets in the events are determined based on the tagging of the assets. You have these options in the **Tag assets** field for assigning assets to a recovery task:

   - **None**
   - **Specific**
   - **All**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

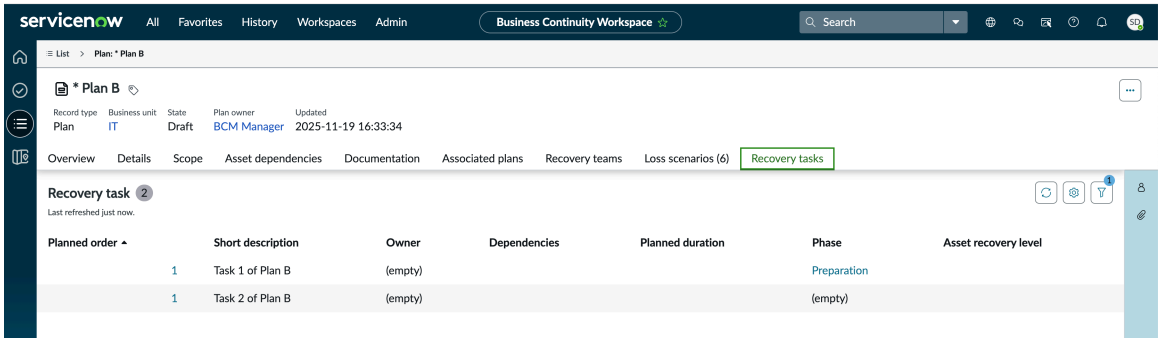


For example, when you select **Specific assets** in the **Tag assets** field, the **Asset scope** field the Asset scope field becomes visible, enabling you to specify which assets can be tagged with the selected recovery task.

The assets tagged in the recovery task are then included in the impacted assets for the event task. Properly tagging assets with recovery tasks verifies precise calculations of the recovery times for each asset. Note that only assets associated with newly created event tasks are copied over.

Beginning with the Xanadu and later releases, a new field called **Planned duration** has been added to the recovery task form. The **Planned duration** field replaces the **Completion deadline** field, which was a reference field used for time frames. The **Completion deadline** field is removed from the plan task records.

The **Planned duration** field enables you to enter the anticipated time needed to complete the task. After the event and exercise have been carried out, you can revisit and modify the data in this field. It offers a detailed view of the task's progress and the time needed for its completion.

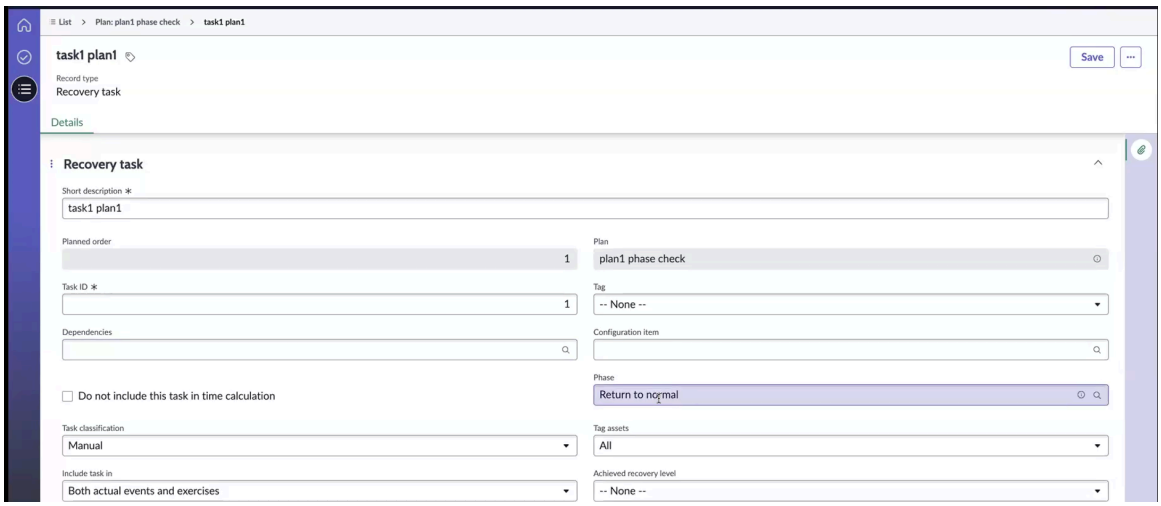


The Create New Recovery task form is displayed.

4. On the form, fill in the fields.
   For more information on the fields in the form, see Create New Recovery task form.
5. Assign a phase to the recovery task.

   The Phase column is available in both the list and form views of a recovery task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



BCM administrators and managers can update recovery task phases using inline editing. BCM planners can also update phases, but only if they are the plan owners.

Only active phases are available for selection in the Phase column as shown in the example.

The phases of a recovery task can also be updated by modifying the Phase field in the form itself.

6. To exclude specific tasks from time calculation, select the **Do not include in time calculation** option.

   When creating a recovery task, you can select this check box to exclude it from calculations.

   This feature also applies at the asset level, enabling for accurate tracking of time and effort for relevant assets. By providing this flexibility, the feature enhances the accuracy of time and effort calculations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Verify the achieved recovery level of the impacted assets of a task in the **Asset recovery level** field.

   In events, the **Asset recovery level** field indicates the achieved recovery level of the impacted assets of that event task, once all tasks with that recovery level (for example, all tasks with Partially recovered state) are completed.

   Previously, the assets were automatically marked as Recovered only when all event tasks were completed, even if those assets were in later phases such as Return to normal or Post-incident review. This approach delayed visibility into operational readiness. For example, even if an asset was functionally available during the Recovery phase, the system didn't reflect the status until all tasks were done.

   Starting with BCM release 9.x.x and later, the asset recovery status has been enhanced to provide granular tracking. Completing specific tasks now automatically updates the corresponding event asset state, progressing from **Not Recovered** → **Partially Recovered** → **Recovered**.

   Completing specific tasks now automatically updates the corresponding event asset state. Assets are marked as **Partially Recovered** when they’re operational enough to support dependent assets, and **Recovered** when they’re fully functional. This change improves visibility into operational readiness and enables recovery coordinators to identify when dependent assets can safely start their recovery process.

   In plans, the Asset recovery level column features color coding, offering visual cues for various recovery progress levels. Specifically, "partially recovered" is denoted by an info color, while "recovered" is indicated by a success color, making it easier to track recovery status at a glance.

Note:

The current demo data has an issue where both **Include task in** and **Tag asset** fields are empty. To resolve this, you have to add tasks to **Include task in** manually and select assets for the **Tag asset** field. Without these, event tasks won't be created and assets won't be marked as impacted.

If you haven't selected **Include task in**, your event task won't be created. If you don't select **Tag asset**, your asset won't be marked as an impacted asset.

This issue doesn't apply to newly created plans or old plans; it is applicable only for the current demo data.

8. Select **Save**.
   The updated recovery tasks are now displayed in the UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Recovery task form

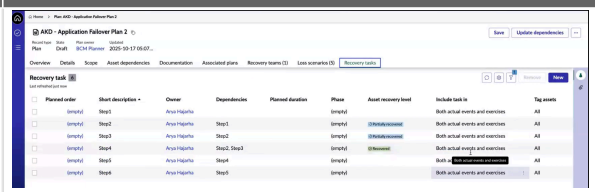
Use the Create New Recovery task form in the BCM Configurable Workspace to input the necessary details regarding the recovery task.

Create New Recovery task form

For description of the field values, see the table.

Create new recovery task form

Field	Description
Recovery task	
Short description	Short description for the recovery task.
Planned order	Planned order of the recovery task. The sequence for the recovery task is automatically determined and populated in the Planned order field. This sequence is derived from the values in the Dependencies field, which outlines the task dependencies. For instance, if task 2 relies on task 1, then task 1 is assigned order 1, and task 2 is assigned order 2. In scenarios where a task depends on two other tasks, the task with the highest planned order among the dependencies is used. It's possible for two tasks to both have a planned order of 2 if each is dependent on task 1. **Note:** To update the planned order of a recovery task, use the **Refresh task order** UI action.
Task ID	Unique number assigned to each task. It enables you to view the tasks in a particular sequence especially in a printed PDF.
Dependencies	Dependencies related to the recovery task.
Don't include this task in time calculation option	Option to exclude specific event tasks from time calculations. When this flag is checked, the selected task is excluded from time calculations during an event. In the Crisis management app, checking this flag confirms that the task is not included in the **Actual time taken** and **Total effort** field updates for both the asset and the activated plan associated with the event. For scenarios with multiple tasks, you can exclude specific tasks from overall time calculations, effectively removing them from the total time estimate. This enables for more accurate time tracking by focusing only on relevant tasks. Any task that is excluded isn't considered in the plan and asset time calculation.
Task classification	Classification of the recovery task. Available options are: • **Manual**: Classify the recovery task as a manual task. • **Automated**: Classify the recovery task as an automated task. When you classify the recovery task as an automated task, the **Automated flow** field is displayed on the form. For a faster recovery, the recovery tasks can be automated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new recovery task form (continued)

Field	Description
Include task in	Option to include the recovery task in exercises, actual events, or both. With this flag, you can prevent test tasks from coming into the events. Available options are in the order of priority: • **Both actual events and exercises** • **Actual events only** • **Exercises only**
Plan	Plan associated with the recovery task. This field is auto-filled and is read-only.
Tag	Tag marked for the recovery task.
Configuration item	Configuration item associated with the recovery task.
Phase	Phase associated with the recovery task.
Tag assets	Option to associate all assets, no assets, or specific assets with a recovery task. The actual duration and effort recorded in the events are determined by how the assets are tagged as shown with these options: • **None**: Associate no assets from the plan with the recovery task. • **Specific assets**: Select this option to display the **Asset scope** field. It enables you to define the scope for the assets that are tagged within the plan. • **All**: Associate all assets from the plan with the recovery task. Once this configuration is established and the plan is activated during an event, the assets are tagged. The time and effort recorded in the events are determined by how the assets are tagged.
Asset scope	Field visible only when the **Specific assets** option is selected in the **Tag assets** field. You can select particular assets to associate with the recovery task. When an event task is generated from this recovery task, these chosen assets are shown as the associated assets in the event task. The assets linked to the recovery task from the plan are then replicated as the assets for the event tasks.
Asset recovery level	Option to enable clearer visual indicators for different levels of recovery progress for the asset. Available options are: • **None**: The selected recovery or event task is not recovered. • **Partially recovered**: The event asset is partially recovered after completing the associated recovery task. • **Recovered**: The event asset is fully recovered after completing the associated recovery task. Color coding in the Asset Recovery Level column provides clearer visual indicators for different recovery progress levels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new recovery task form (continued)

Field	Description
	 The Asset recovery level column is introduced in both recovery tasks and event tasks. You can select the "Recovery Level" of asset. It will be updated once all tasks with similar recovery level are completed. The "Asset Recovery Level" column has been added to both recovery tasks and event tasks, enabling you to select the recovery level for an asset. Once all associated tasks with the same recovery level are completed, the asset's state is auto-updated. The existing recovery process required all steps to be completed before an asset could be marked as recovered. This functionality remains supported. Additionally, a new capability has been introduced, allowing you to mark an asset as "Partially recovered" after completing critical tasks. This enhancement provides better visibility into the recovery process, enabling teams to address smaller, ad-hoc tasks later. For example, if a recovery process involves three steps, you can consider an asset recovered after completing step two, and defer step three to a later time. This provides greater flexibility in managing your recovery processes.
Key timeline	
Planned duration	Planned duration of the recovery task shown in Days, Hours, Minutes, and Seconds. This field is crucial for determining several aspects: • Establishing the planned start and end times during execution. • Calculating any delays that occur during execution. The default setting for this field is 00:00:00:00. The **Completion deadline** field, which was a reference field used previously for indicating time frames, is now removed from the plan task records.
Related plan	
Activate a related plan	Option to activate a related plan for the recovery task. The enhanced application software checks for cyclic dependencies among the recovery tasks, as these can lead to errors during execution. If a cyclic dependency is detected in a task, an error message is displayed, helping prevent further actions on that task. If the dependency level of the tasks is more than 10, you can’t save the recovery task record. You can also record the estimated duration of a recovery task and view the sequence of the recovery tasks in the plan, which are organized based on their dependencies.
Assignment details	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new recovery task form (continued)

Field	Description
Owner	Assigned owner for the recovery task.
Additional assignees	Additional assignees listed for the recovery task.
Assignment group	Group to which the task is assigned.
Recovery team	Recovery team that the recovery task is assigned to.
Plan details	
Documentation	Documentation section defined in the business continuity plan.
Description	Description of the recovery plan.
Recovery strategy	Recovery strategy defined on the **Recovery strategy** tab.
Flow variables (Automated flow)	Automated flows that are available under the Task automation category. The automated flow gets triggered when the task moves to the **Open** state (when the plan is activated as part of an exercise or an actual event). You can add the required flow variables and then populate the automated flow.
Variables	Variables added to the flow. This field is displayed only after you save the automated flow.
Backup assignee group	Group that the backup assignee belongs to.
Backup assignee	Assignees that are used as a backup if the automated task fails during the execution.

Automate recovery tasks

Automate the manual recovery task within the business continuity plan. You can classify the manual recovery task as an automated task first and then attach an automated flow to it.

Before you begin

Role required: admin for the Workflow Studio, sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task

Administrators or low-code developers are responsible for building the automation flow. Users with the BCM planner or above role then attach the automation flow to the recovery task. The Workflow Studio is used for this purpose, requiring a local developer persona due to permission restrictions. The Workflow Studio role does not require any extra licensing. However, it requires some special roles. For more information on the Workflow Studio roles and permissions, see User access to Workflow Studio flows.

The flow setup involves these steps:

1. User defines the permissions to verify the appropriate access and control and creates a subflow to handle the automation process.
2. User then defines the inputs to provide necessary information for the automation flow.
3. The automation process includes actions to automate the manual task and update its completion status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automated tasks are executed sequentially until a manual task is encountered. If an automated task fails, manual intervention is required to trigger it again. In case of a failure in the automation process,you can retrigger it and verify its completion. If a task fails, the backup assignee is notified via email and must perform the necessary manual actions to address the failure. This confirms that the recovery process continues smoothly even in the event of automation issues.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** and select a plan record.
2. On the **Recovery tasks** tab, select a manual recovery task that you want to automate.

   You can automate a manual recovery task in the business continuity plan.
3. Open Workflow Studio and select **Create new subflow**.
4. On the form, fill in the fields.

   For more information on creating a customized subflow for automating the tasks in the BCM application, see Create a subflow form.

   For more information on creating a subflow, see Create a subflow in Workflow Studio.

   The properties for the subflow are filled in.
5. Select **Submit**.
   The subflow is designed to automate the task. Within the Actions section of the subflow, the **Action**, **Flow Logic**, and **Subflow** tabs are displayed.
6. Create the subflow inputs to specify the data available to the subflow when it starts running.

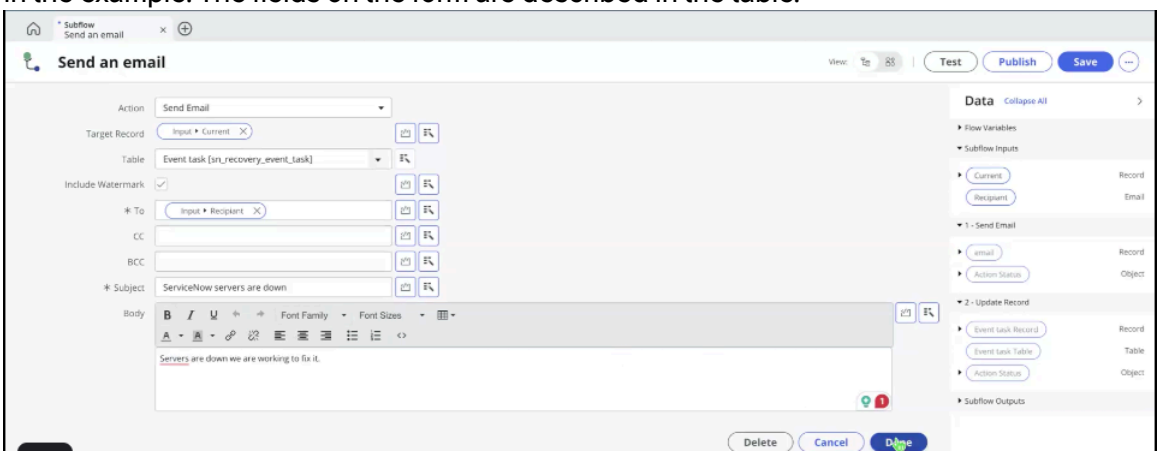
   To establish a reference to the record linked to the task, you can specify the name and type for the input in the Inputs & Outputs section of the subflow. By defining the inputs, you can create a reference to the task responsible for executing the automation.

   a. Select the label for the input in the **Label** field.
   Within the subflow, there is a special variable known as the Current variable. When the Current variable is chosen in the Inputs section, it is automatically substituted with the task that triggered the automation. This allows for dynamic referencing and processing of the specific task within the subflow.

   b. Select the name for the input in the **Name** field.
   The Name field is where you must define the variable name to be **current** (all lower case).
   The Type must always be **Document ID.Event task**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the type for the input in the **Type** field.
For example, you can select **Document ID.Event task** as the type of the input.



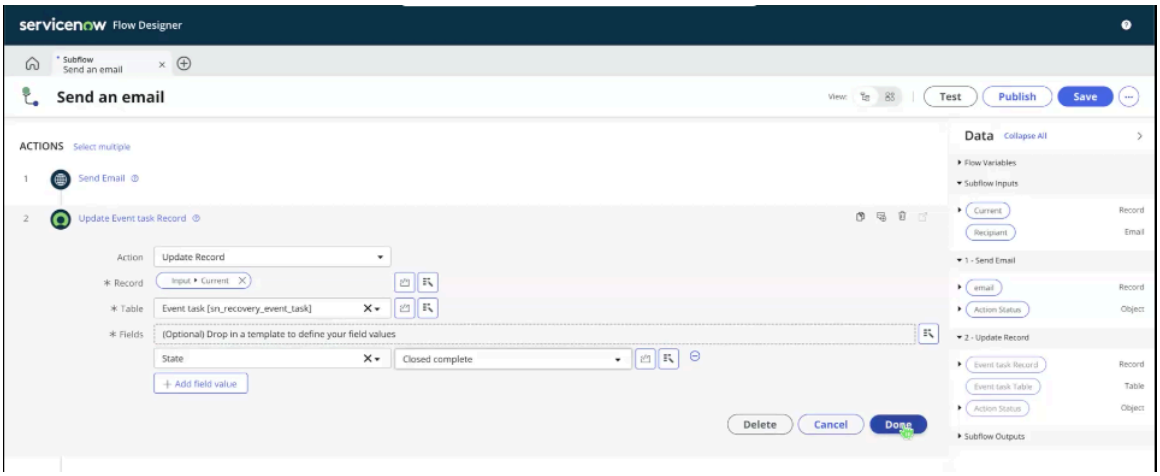
d. To mark the input as mandatory, select the **Mandatory** option.
For information on creating subflow inputs and outputs, see Create a subflow in Workflow Studio.

e. Select **+** to add a new input.

Once you create the flow variables, you can access them on Workflow Studio. For information on creating subflow inputs and outputs, see Create a subflow in Workflow Studio.

7. In the Actions section, select **Send Email**.

Expanding the Send Email section displays the fields as shown in the example. The fields on the form are described in the table.



Send Email fields

Action	Name of the action for the subflow. Default: **Send Email**
Target Record	Associated task record that is used for the subflow.
Table	Name of the table where the task resides. For example, event task [sn_recovery_event_task].
Include Watermark	Option to add a watermark in the file that is associated with the task.
To	Email addresses of the recipients that should be addressed directly.
CC	Email addresses of the copied recipients. They can view the list of the recipients that are directly addressed in the email.
BCC	Email addresses of the copied recipients whose names are not displayed in the email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subject	Subject of the email that describes the issue and reason for sending the email.
Body	Description and action steps about the issue.

8. Select **Done**.
   Once the automation is triggered, the task is considered complete. In this particular scenario, the email is automatically sent to the user that has been selected.
9. Select **Update record** in the Actions section of the subflow.
   You can update the original plan task to be completed by updating the record section of the subflow.

   a. In the **Action** field, select **Update record**.

   b. In the **Record** field, select **Current**.

   c. In the **State** field, select **closed complete**.

   d. Select **Done**.
      The state of the record moves to **Completed**.

10. To publish the workflow, select **Publish**.
    The changes are applied to all instances where the subflow is used. Similarly, you can define new flows in the subflow that can be run as an automation.
11. Navigate to the **Recovery tasks** tab in the plan with the sn_bcm.program_manager role and open the manual recovery task that was being edited.
    The recovery task form is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. In the **Task classification** field, select **Automated** to change the manual task to an automated task and select **Save**.
    After saving the form, the flow variables are displayed.
    When you select and save the task, the variables associated with the automated flow are displayed in the **Variables** field of the recovery task.

13. In the Assignment details, confirm that the **Backup assignee** field is filled in.

    When converting a manual task to an automated task, the **Backup assignee** field is displayed on the form. In the event of an error causing the automation flow to fail, an email notification is sent to the backup assignee. This email informs them about the failure of the automated flow and the need for manual intervention to resolve the task. The backup assignee can then take the necessary action to complete the task and confirm its resolution.

14. Select **Save**.
    The Recovery task form now includes a Task classification column where the automated tasks are displayed. These automated tasks are executed automatically by the system as part of the plan.

Create a subflow form

Use the Create a subflow form to automate a manual recovery task within the business continuity plan.

Create a subflow form

For description of the field values, see the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a subflow form

Field	Description
Subflow Name	Name of the subflow. For example, if you want to automate a manual task for sending an email, you can name the subflow as Send an email subflow.
Description	Description of the subflow.
Application	Application scope for creating the subflow in. For the BCM tasks, you can select GRC: Business Continuity Management.
Accessible From	All application scopes that the subflow can be accessed from.
Category	Category or logical group for the subflow. For the BCM automation tasks, you can select the **BCM: Task automation** category.
Protection	Option to mark the subflow as read-only. When you create the subflow in an application scope that you own, you can select a value for this field. Editing permissions and protection for the subflow. Select one of these options: • **None**: Default value. Select this option to edit the subflow. • **Read-only**: Mark the subflow as read-only. Only the creator of the subflow can edit it.
Subflow annotation	Annotation for the subflow. The help text under the subflow title in Workflow Studio helps the flow designers to understand the function of the subflow does when it is used in a flow.
Run As	Option to define the user who runs the subflow. Select one of these options: • **User who initiates session**: Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, use this option when you want to receive the approval email from the approver. • **System user**: Select the system user to run the subflow.
Run with roles	Roles that the subflow runs with. This option is only available when **Run as** is set to **User who initiates the session**. For example, a plan user should have the email_api_send role to send the email and the sn_bcm.program_manager role to read the BCM tasks.

For more information on creating a subflow, see Create a subflow in Workflow Studio.

Submit the BCP for approval

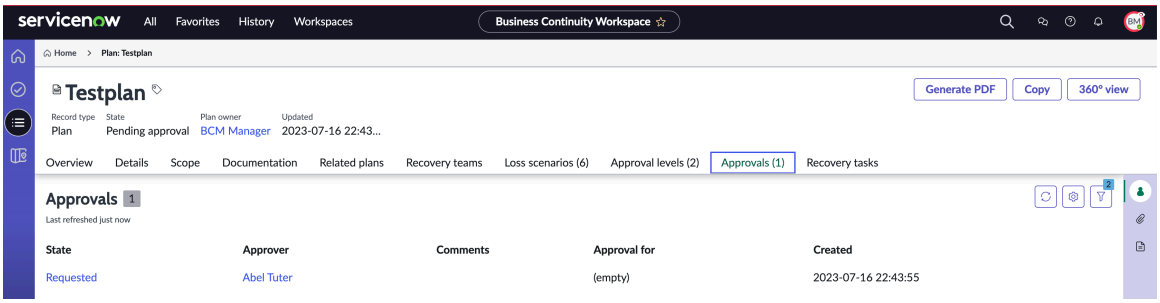
Submit the business continuity plan (BCP) for an approval. You can then view the details in BCM UIB Workspace.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

Procedure

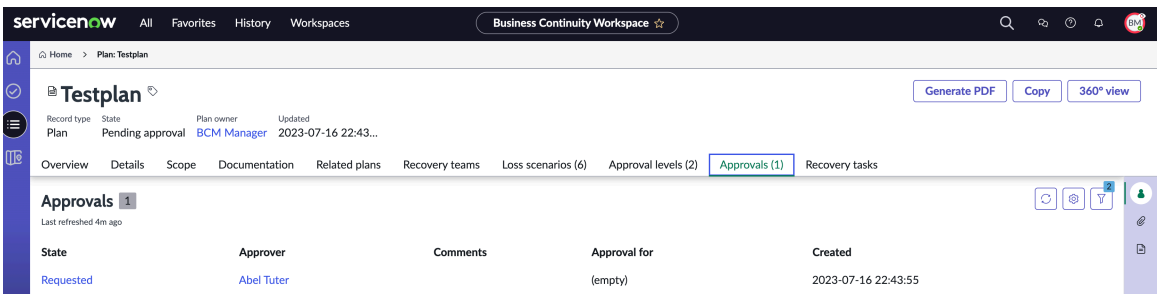
1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select the link to the plan record in the **Name** column.
3. Select **Submit for review**.
   The business continuity plan is in the **Review** state.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit for approval**.
   The business continuity plan is updated to the **Pending approval** state. The business continuity plan is submitted for a review to the business continuity plan owner.
5. Select **Approve**.

Note:
If an approval record is created for the BCP, the **Approve** or **Reject** actions are not displayed on the BCP form. For a user to view the **Approve** or **Reject** actions, these conditions must be fulfilled:



- The user should have the sn_bcp.plan_manager role.
- The BCP should be in the **Pending approval** state.
- The BCP should not have any approval records created.

If you have the BCM lead or BCM program manager role, you can approve the plan. The information is displayed on the **Approval levels** and **Approvals** tabs as shown in the example.

To configure multiple approval levels for the plan, see Set up approval levels.

The example shows the Approvals tabs and the Approve and Reject buttons are not displayed.

When you approve the business continuity plan, its state is updated to **Approved**.

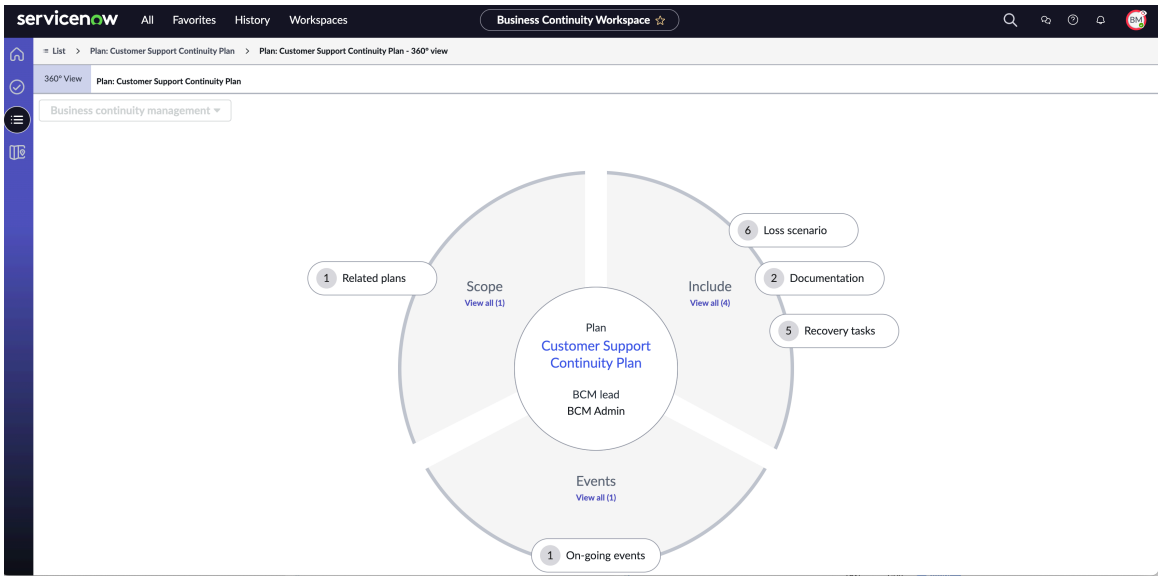
Visualize 360° relationships for the BCP

Visualize the 360° relationships for a business continuity plan (BCP) and its associated entities in BCM UIB Workspace. You can access the 360° view at any time while working on the business continuity plan.

Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner

About this task



The configurations for the 360° view are stored in **360° View Configurations** > **Configure 360° Views**. If you have the BCM administrator role, you can configure the relationships for the records in **360° View Configurations** > **Relationship Registries**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select a record from the list.
   The business continuity plan record is displayed.
3. Select **360° view**.

   The example shows the 360° view of a business continuity plan and its details.

- **Name**: Name of the business continuity plan such as Customer Support Continuity Plan. You can select the business continuity plan to view its details.
- **BCM lead**: Assigned BCM lead for the business continuity plan.
- **Scope**: Scope of the business continuity plan such as **Related plans**.
- **Events**: Events that are associated with the business continuity plan such as **Ongoing events**.
- **Include**: Entities that are associated with the business continuity plan such as **Loss scenario**, **Documentation**, and **Recovery tasks** as shown in the example.

The example shows the 360° relationship view for the Customer Support Continuity Plan and its related entities. When you select the **Loss scenario** capsule in the 360° view, the details of the associated loss scenarios for the Customer Support Continuity Plan are displayed in the Loss scenario panel on the right.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To navigate to the plan again, select the plan or list view in the breadcrumb navigation.

Generate BCP reports in PDF or Microsoft Word format

Generate a PDF or Microsoft Word copy of a business continuity plan in the BCM Configurable Workspace and save it for a future reference.

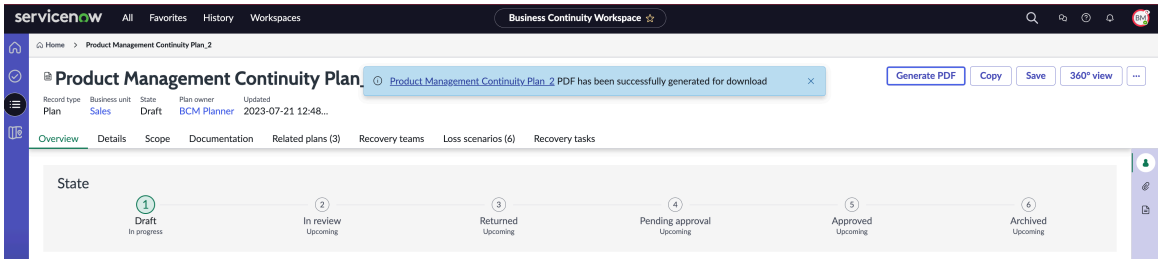
Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner

About this task

To format the PDF for your business needs, see Format PDF templates for BIAs, BCPs, and events.

Beginning with the Xanadu release, the content in PDFs of Business Impact Analyses, Plans, and Events is improved by implementing a new layout:



- Arrange the various event tasks in a table format.
- Include details of the asset owner and the description from the Business Impact Analysis.
- Display a table that outlines the dependencies of the plan assets.
- Mark the date of the PDF creation on the front page.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Planning** and select any business continuity plan record that is in the **Review** or next state.
3. Select **Generate PDF** in the form.

   The example shows the message that is displayed on the screen: `<Name of the BCP> PDF has been successfully generated for download.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. To format the BCP PDF template, follow the instructions in Format PDF templates for BIAs, BCPs, and events.
5. To download the PDF, select the link in the message and open the PDF.

   The example shows the PDF of a business continuity plan.

	BIA: None
Hardware: W Server 002	**Recovery time objective:** None **Recovery point objective:** None **BIA:** None

6. Save the PDF on your system.
   You can save the PDF for a future reference.
7. To create the BCP report in Microsoft Word, select **Generate MS Word**.

   Generate a report of the BCP record in Microsoft Word format. The Microsoft Word copy of the BIA record is successfully generated that you can download.

   For more information on generating reports in Microsoft Word format using Document designer, see Generating reports using Document designer.
8. To print the BCP report, open the saved PDF or Microsoft Word copy and select **Print**.

Structured workflows for exercises

Perform the structured workflows that are outlined in this section to manage an exercise in Business Continuity Workspace (also known as BCM Configurable Workspace).

Typically, the BCM program manager performs the following tasks to exercise an event:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create an exercise. For more information, see Create an exercise.
- Add an asset and plan to the exercise. For more information, see Track impacted assets and add associated plans.
- Add an event task to the exercise. For more information, see Monitor event tasks and create ad-hoc tasks.
- Submit the event task for the exercise event. For more information, see Request an approval and approve the event.

Additional information on Exercises

- For information on the **Exercises** tab in the Home page, see Home page view.
- For information on the exercises, see Exercises.

Bulk editing of tasks

Starting with version 6.1.x of the Business Continuity Management application, users who have editing access to the event record can now perform bulk edits on tasks directly from the Event tasks related list. This feature is beneficial for users who manage multiple event tasks simultaneously.

For more information on bulk editing of tasks, see Structured workflows for crisis events.

States for an exercise and crisis event

This section describes the states of progression for an exercises and crisis event.

States for an exercise and crisis event

States for an exercise and crisis event

State	Description
Pending	First state of the event.
Pending Approval	State of the event when an approval is requested. When you select **Submit for Approval**, the event is set to the **Pending Approval** state. In this state, you can only update the **Work notes** field in the event form. If any approval rules are configured for the event, then the approvals are generated and sent to the approvers. If no approval records are associated with the event in the requested state, then you can either select **Reject** or **Approve**. You can view the approval details of an event in the **Approvals** tab with the name of the approver, level of approval, and state of the approval. You can view the approval history of the event in the **Approval History** tab such as the approval state, name of the approver, event number, and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States for an exercise and crisis event (continued)

State	Description
	Note: If you are a BCM program manager, you can see the **Approve** and **Reject** buttons.
Returned	State of the event when an event is rejected. The state is set to **Returned**. It can be moved to the **Submit for Approval**, **Closed Complete**, or **Closed Incomplete** states. Since this action is related to an event only, you can update the description, results, and work notes in the form. When an event is in the **Returned** state, you can edit the state of the event asset. From the **Returned** state onwards, you can only add your comments and the attachments to the event task.
Closed Incomplete	State of the event when an event is incomplete.
Closed complete	When all tasks are complete, the event moves from the **Work in progress** to the **Closed complete** state.
Approved	Approved state of the event. When an event is approved, the state is set to the **Approved** state. You can perform the following additional UI actions: **Generate PDF** Download the PDF of an exercise or crisis event for reference. When you select Generate PDF, the PDF attachment is available in the **Activity** panel of the **Details** tab. For information on generating the PDF of an exercise or crisis event, see Generate event reports in PDF or Microsoft Word. **Copy** Save a copy of an exercise or crisis event for future reference as a template. **360° view**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States for an exercise and crisis event (continued)

State	Description
	Visualize the 360° representation of an exercise or crisis event. For information on how to view 360° relationships of an exercise or crisis event, see View 360° relationships for exercises and crises. **Delete** Delete an exercise or crisis event. **Edit** Edit an exercise or crisis event. **Save** Save an exercise or crisis event.
Closed	Closed state of the event.

See the following state transitions of an event task.

State transitions of an event task

State	Description
Open	Open state of the event task. When an event is started, its event tasks that do not have a dependent recovery task move to the **Open** state.
Pending	Pending state of the event task. The event tasks that are dependent on other recovery tasks are in the **Pending** state when the event is started. After the dependent tasks are closed, the parent event task moves to the **Open** state.
Skip Task	Skip Task action for the event task. This action is available only if you have logged in as the BCM program manager. The **Skip** action is displayed when the task is in the **Pending** or **Open** state and the event must be in **Work in Progress** state. Selecting **Skip Task** moves the task to the **Closed Skipped** state. The actual start time and actual end time at this state are empty.
Trigger	Trigger action for the event task. This action is available only if you have logged in as the BCM program manager. The task is in

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State transitions of an event task (continued)

State	Description
	the **Pending** state. Selecting **Trigger** moves the task to the **Open** state irrespective of its dependencies.
Work In Progress	Work In Progress state of the event task. The task is in the **Open** state. Selecting **Work In Progress** moves the task to the **Work in Progress** state. You can update the actual start time of the task in the **Actual start** field in this state. If you do not update the actual start time, the current date and time are recorded as the actual start time. The next available options are **Closed Complete** or **Closed Incomplete** state.
Closed Incomplete	Closed Incomplete state of the event task. Actual end time of the task is recorded in the **Actual end** field. If you do not update the actual end time, the current date and time are recorded as the actual end time. Update necessary information in the **Work notes** field and save the task.
Closed Complete	Closed Complete state of the event task. The task is closed and complete in this state. Actual end time of the task is recorded in the **Actual end** field. If you do not update the actual end time, the current date and time are recorded as the actual end time.

Event assets

When an event is initiated, event assets are managed by using different recovery management methods.

Beginning with the Xanadu release, you can use the time fields from an activated plan and the event asset, calculated from the dependent event tasks. When plans linked to an exercise are activated, they are now displayed in an **Open** state instead of a **Work in Progress** state. Even if a plan has recovery tasks without any tagged assets, you can still initiate an event task. When at least one of the tasks linked to an activated plan is updated to the **Work in Progress** state, the status of the activated plan is changed to **Work in Progress**.

The time needed to complete the tasks is aggregated at these levels:

- Plans
- Assets

These fields and columns are instrumental in calculating the time for plans:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When a plan transitions to the **Work in progress** state, the start date is recorded. The completion date and time of the final task are captured as the End date.
- The Total Effort column is calculated by adding up the durations of all tasks of the plan.
- The Total effort and Total time taken columns are left blank if any tasks remain in the **Open** state (The tasks are not in the **Closed** state).
- If new ad-hoc tasks are initiated, the Total effort, Total time taken, and Status columns are reset.
- Once all tasks in a plan are completed, the Total Effort, Total Time Taken, and Status columns are updated to reflect that the plan is Closed complete.
- If no tasks are listed in the plan, the Actual start date time and Actual end date time should be manually adjusted.
- Confirm to check the boxes for the mandatory **Start Date Time** and **End Date Time** fields in the list view when the tasks are marked as Closed.

These fields and columns are used to calculate time for the assets:

- For an asset, the start date and end time are populated based on its tasks. For example, if an asset is part of two tasks, the start date of the first task is recorded in the **Start date** field, and the end date of the final task is noted in the **End time** field.
- The Total effort column is calculated by adding up the duration of all tasks where the asset is tagged.
- If any tasks within the plan are not in the **Closed** state, the Total Effort and Total Time Taken columns remain blank.
- If new ad-hoc tasks are initiated, the Total effort, Total time taken, and Status columns are reset.
- If the status of any task where the asset is tagged is marked as Closed failed, then the status of the asset is not updated as Recovered. When all the tasks for an asset are closed, the status of the asset is updated as Recovered.

Recovery of event assets

Enhanced event asset management

BCM version 9.x.x introduces a significant improvement in event asset management by establishing a direct link between event assets and their corresponding Business Impact Analysis (BIA) records. This integration enables the system to automatically import Recovery Time Objective (RTO) and Recovery Point Objective (RPO) values from the BIA into recovery events. As a result, continuity managers can now directly compare actual recovery times with target recovery times, gaining a transparent and reliable metric to evaluate recovery performance and assess organizational resilience maturity.

This enhancement streamlines the process of assessing recovery performance, allowing organizations to make more informed decisions about their business continuity strategies. By providing a clear and accurate measure of how well recovery operations align with predefined objectives, BCM 9.x.x helps organizations refine their resilience capabilities.

Time measurement for recovery events

As you can exclude irrelevant task from calculation such as "Preparation" tasks, time management is enhanced.

Event asset tracking

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The latest enhancements to event asset management introduce more granular recovery tracking capabilities, including support for partial recovery scenarios and automated state updates for event assets. Key features of these updates include:

- A new **Partially recovered** state for event assets, along with the existing **Not recovered** and **Recovered** states, has been added allowing for better tracking of recovery progress.
- By completing specific event tasks, you can update the corresponding event asset state (for example, from Not Recovered → Partially Recovered → Recovered). These updates driven by the event tasks provide an accurate and timely reflection of the recovery milestones.

Refining the recovery status as Partially recovered

When an asset is largely recovered but still requires minor tasks to be fully operational, it can be marked as **Partially recovered**. This status allows teams to perform these tasks:

- Proceed with critical tasks without delay.
- Address smaller, ad-hoc tasks later.
- Update the asset status to **Recovered** once all tasks are complete.

By introducing this intermediate status, you can better manage your recovery processes, prioritize tasks more effectively, and maintain a clear overview of the asset recovery progress.

These improvements provide several benefits:

- Real-time visibility into the operational status of assets during recovery
- Clearer coordination signals for the recovery of dependent assets
- Enhanced alignment between technical recovery progress and overall business continuity outcomes

By providing more detailed and accurate tracking of recovery efforts, these updates enable organizations to better manage their recovery processes and improve their overall resilience.

Mapping event tasks to phases

Starting with BCM, version 9.x.x, BCM administrators set up active phases in the Core UI for improved event task management. BCM users then map these phases to event tasks and execute them in the set order, ensuring a logical execution sequence. The phases can be deactivated only; they cannot be deleted.

Phases in recovery

Organizing event tasks into logical phases provides a structure to the recovery activities. The logical grouping helps you to understand the progression of exercises or crisis events, maintain flexibility in execution, and navigate complex recovery processes effectively.

You can tag the event tasks to an appropriate phase such as Preparation, Recovery, Post incident review, and so on as part of recovery. This kind of mapping verifies structured and efficient handling of event tasks.

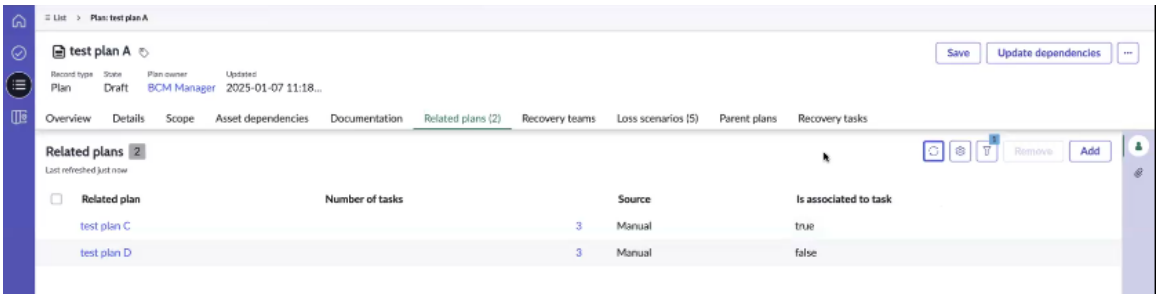
For more information on phases in recovery, see Mapping recovery tasks to phases.

Using nested plans

Configure a system property to control activated plan levels in an event. The system automatically creates nested plans within an event, reducing the manual effort of adding plans

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and improving system performance. You can also add dependencies between multiple activated plans by updating the **Dependencies** field in the event tasks.

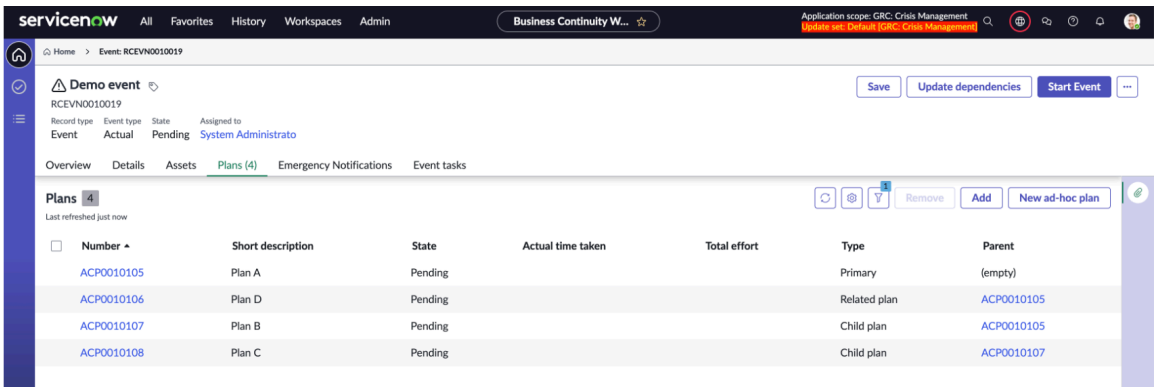


Changes in the plans and events

Beginning with the Yokohama release, new changes in the plans and events focus on the planning phase and the creation of related plans.

Associating related plans with recovery tasks

You can now associate related plans with recovery tasks, helping you identify and manage plan triggers during recovery.



A new field, **Is associated to task**, has been added to the Related Plans table. If a related plan is associated with a recovery task, the field is set to True. If it is not associated, the field is set to False.

Note:
When a related plan listed in the **Related plans** tab is associated with a recovery task, it is created as a child plan in the event. If not associated with any task, it is created as a related plan but not as a child plan.

Adding a plan to the event

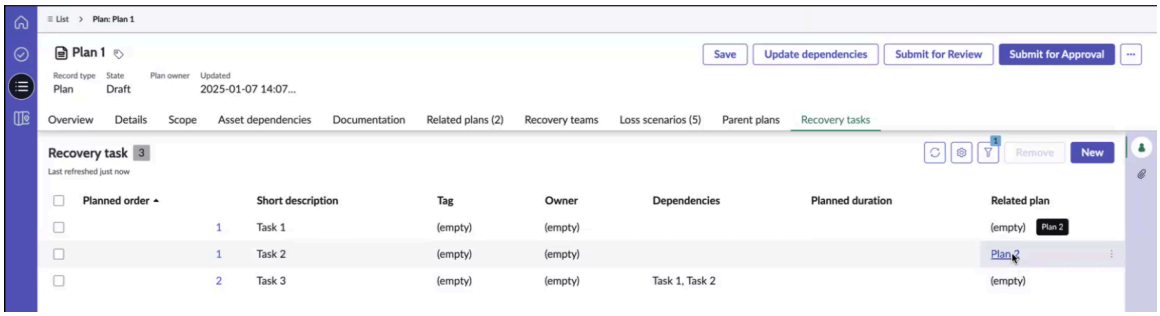
When a plan is added to an event, its related plans and their entire hierarchy are included. Plans manually added to an event are called primary activated plans. Plans without task associations are called related plans. Plans associated with recovery tasks are called child plans.

Using a hierarchy of the plans

Previously, only the primary plan and its directly related plans were included in an event. With the Yokohama release, you can set the *sn_recovery.max_activated_plan_levels* property to control the depth of activated plans in events, up to 10 levels.

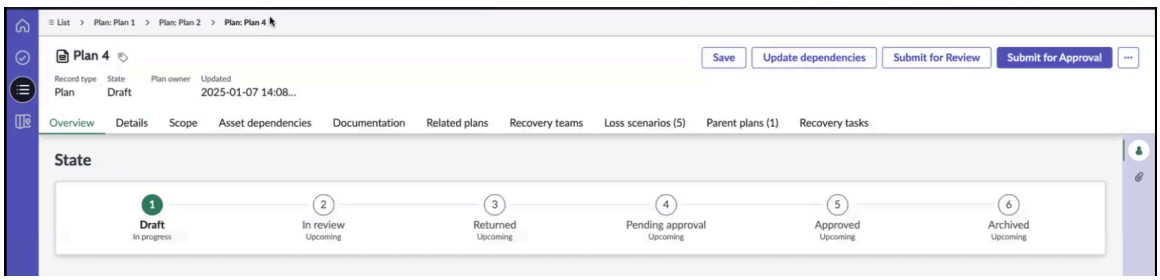
Resetting the property for activated plan levels

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can customize the *sn_recovery.max_activated_plan_levels* property as shown in the following examples to control the levels of activated plans that are created in an event.

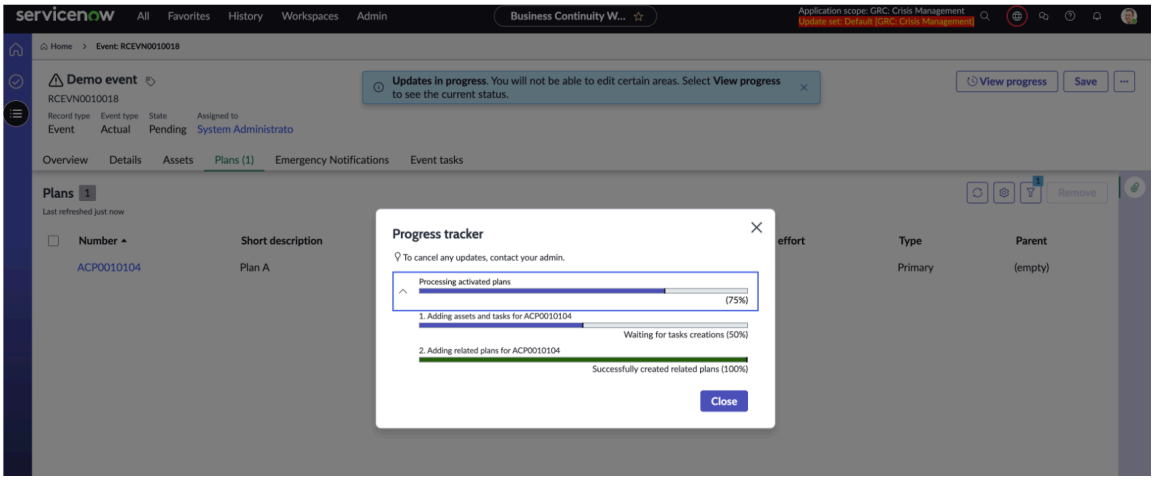
- Set the property to 1 to create only the plans added manually.
- Set the property to 2 to create only the primary plan and its first-level related plans.



Sample use case for a multi-level plan

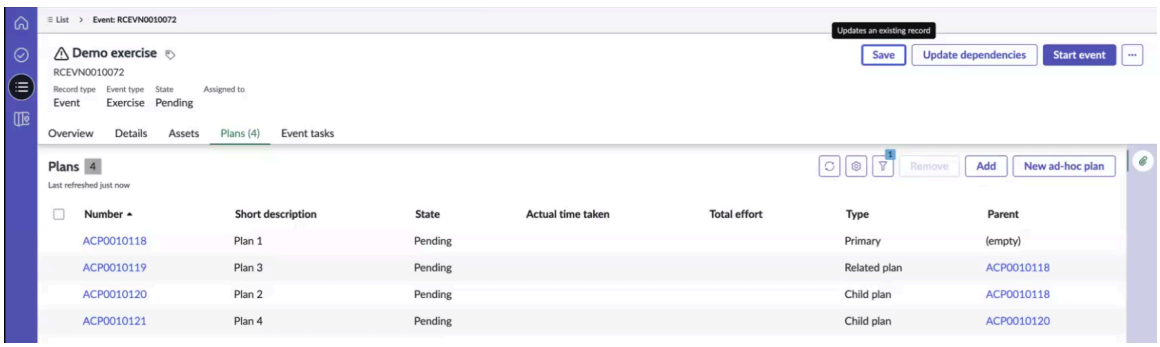
You can add a multi-level hierarchical plan to an event. Consider the following use case where the system property is configured and a few related plans have recovery tasks associated with them. An event is created where the related plans are added to the event.

The primary plan, Plan 1, has Plan 2 and Plan 3 as related plans. Plan 1 includes three recovery tasks: Task 1, Task 2, and Task 3. Task 2 has Plan 2 as a related plan.



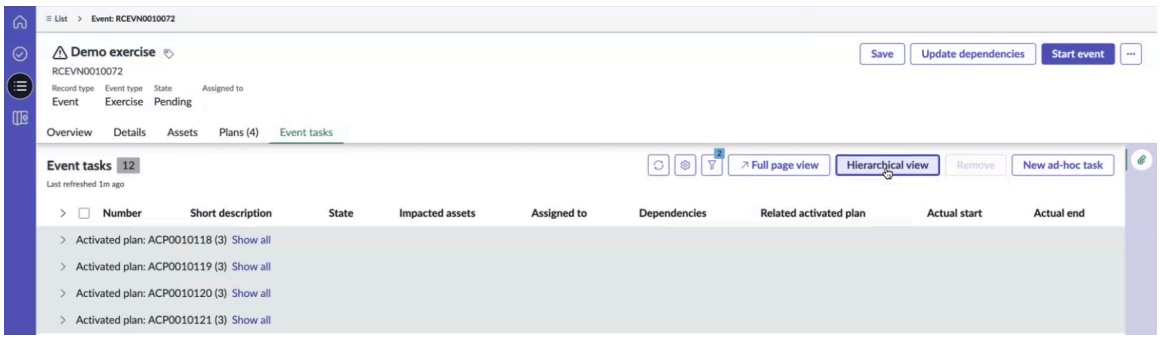
Similarly, Plan 2 has three recovery tasks: Task 1, Task 2, Task 3. Plan 1 triggers Plan 2, and Plan 2 triggers Plan 4 as shown in the example.

Previously, when a primary plan like Plan 1 was included in an event, only the first level of related plans, such as Plan 2 and Plan 3, were added. Deeper levels, like Plan 4, were not included. With the nested plan functionality, plans up to 10 levels deep, including Plan 4, can be added to the hierarchy.



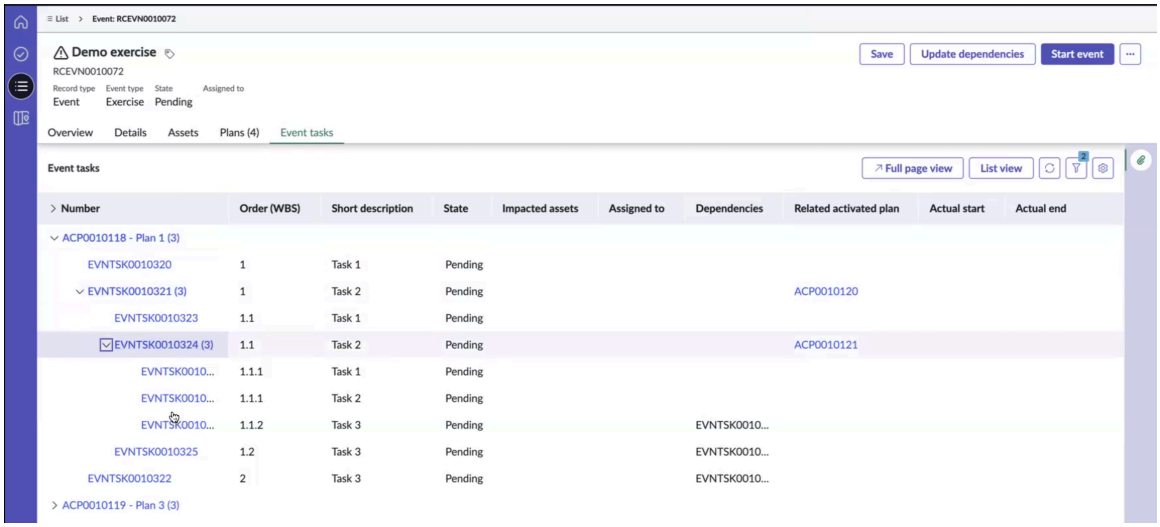
When you create an event and add Plan 1, its related plans, assets, and tasks are automatically included. Selecting the **View progress** button opens the Progress tracker window, showing the progress and status of adding plans, assets, tasks, and related plans, and the steps and status of the background process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Once all processes are completed, a message prompts you to refresh the page to see the latest updates. You can close the message and then view the created plans and event tasks.

As shown in the example, Plan 1 is the primary plan. Plan 3 is marked as a related plan of Plan 1 because it is not associated with any recovery task. Plan 2 and Plan 4 are child plans because they are associated with recovery tasks.



Event tasks: Event tasks are shown in the list view by default. Switch to the hierarchical view to display the hierarchy, with primary and related plans at the top level.

The example illustrates the hierarchy of event tasks and plans, with the primary plan (ACP0010118) and related plan (ACP0010119) at the top level.

- Plan 1 (ACP0010118) has three event tasks. The second event task (EVNTSK0010321) triggers Plan 2 (ACP0010120), and another event task (EVNTSK0010324) triggers Plan 4.
- Plan 3 (ACP0010119) has no related activated plan.
- Two child plans (ACP0010120 and ACP0010121) are shown at child levels.

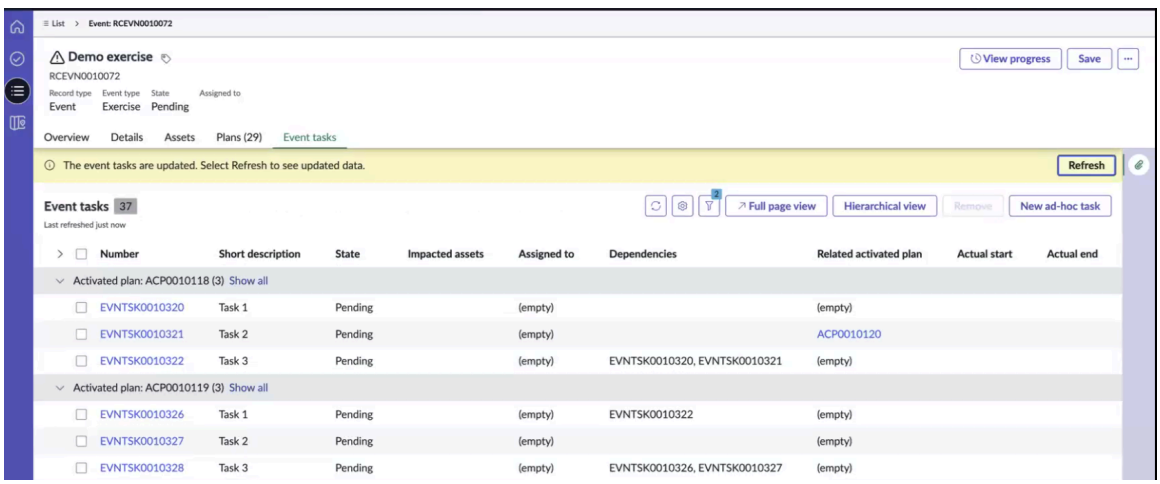
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigating between the list view, hierarchical view, and full page view

While working on event tasks, you can navigate between the list view, hierarchical view, and full page view.

List view



Arranges event tasks in a list format, making it easy to read and quickly understand the hierarchy. It helps you to scan and find specific information without sifting through lengthy text.

Hierarchical view

Visualizes plan dependencies and the order of event tasks. By default, the system shows only primary and related plans in the list view. Switch to the hierarchical view to see the full plan hierarchy.

> **Note:**
> You can edit event task and plan information in the list view, but the hierarchical view is read-only.

The Work-breakdown structure (WBS) arranges tasks based on their dependencies. For an activated plan, the WBS order is calculated considering both event task and plan dependencies.

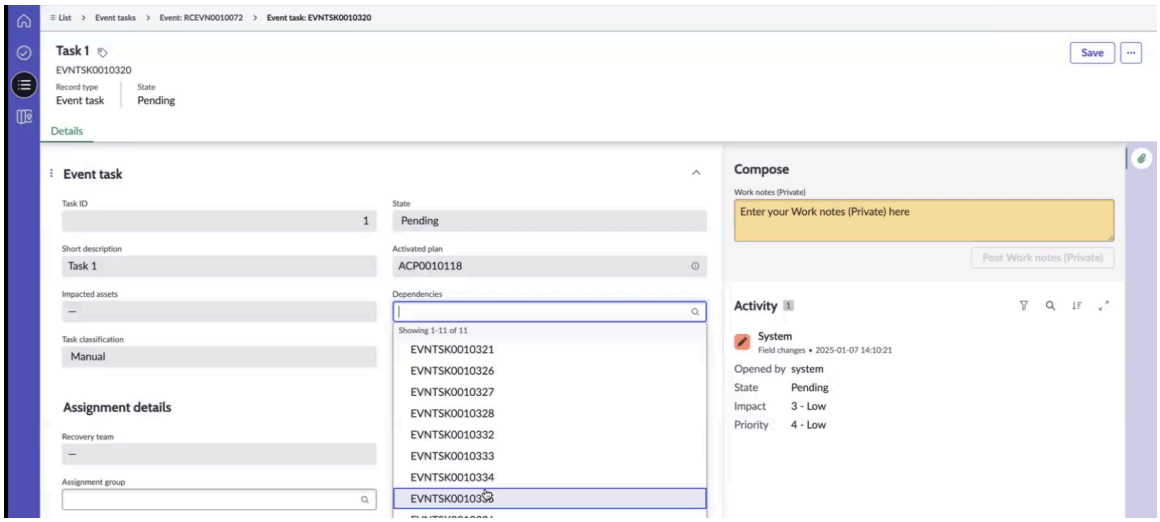
Full page view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Allows you to see more tasks at once, providing a comprehensive overview of the plan hierarchy and tasks. You can switch between the list, hierarchical, or full-page views.

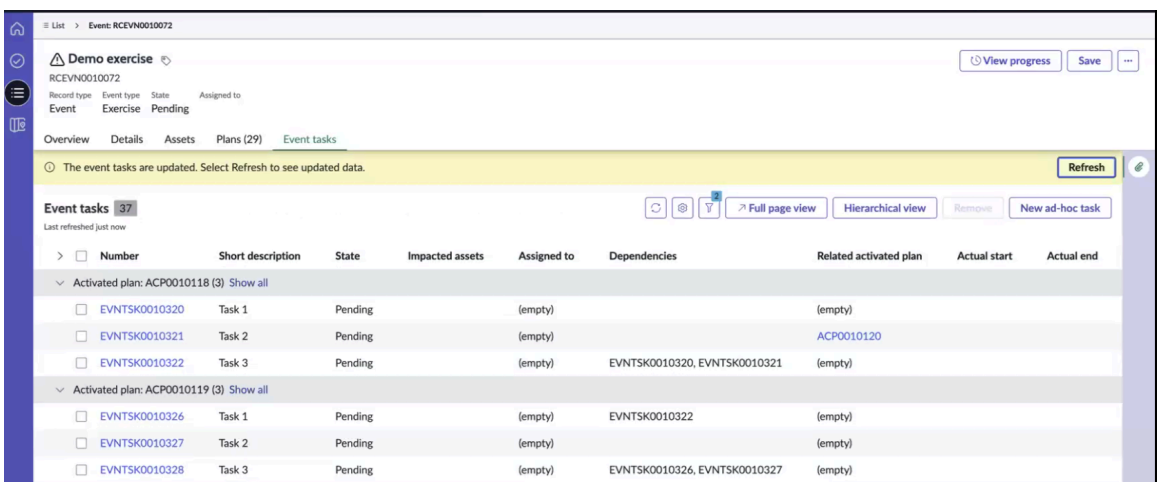
To return to the original record, select the **Back to record** button.

Records per level



UI navigation

By default, only 10 plans are shown at the first level. If there are more, select the **Show more** button to display additional records. For example, if there are 100 plans, only 10 are shown initially, and selecting **Show more** loads the next set.



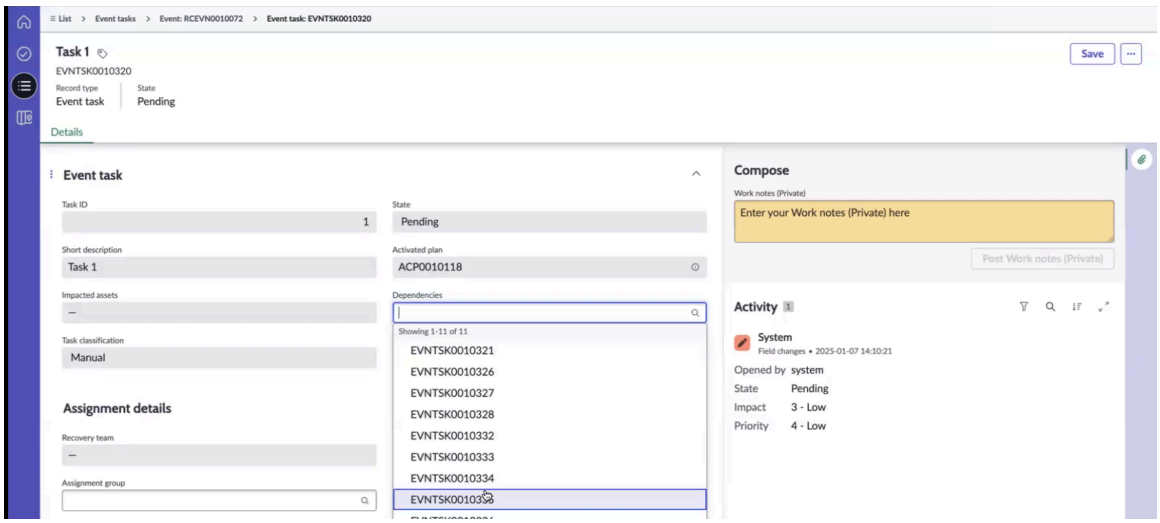
Configuring cross-plan dependencies

You can configure cross-plan dependencies by updating the **Dependencies** field as shown in the example.

Note:
You can only add dependencies between first-level activated plans.

The example shows an activated plan (ACP0010119) that depends on another activated plan (ACP0010118). Similarly, an event task (EVNTSK0010326) can start only after its dependent task (EVNTSK0010322) is completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

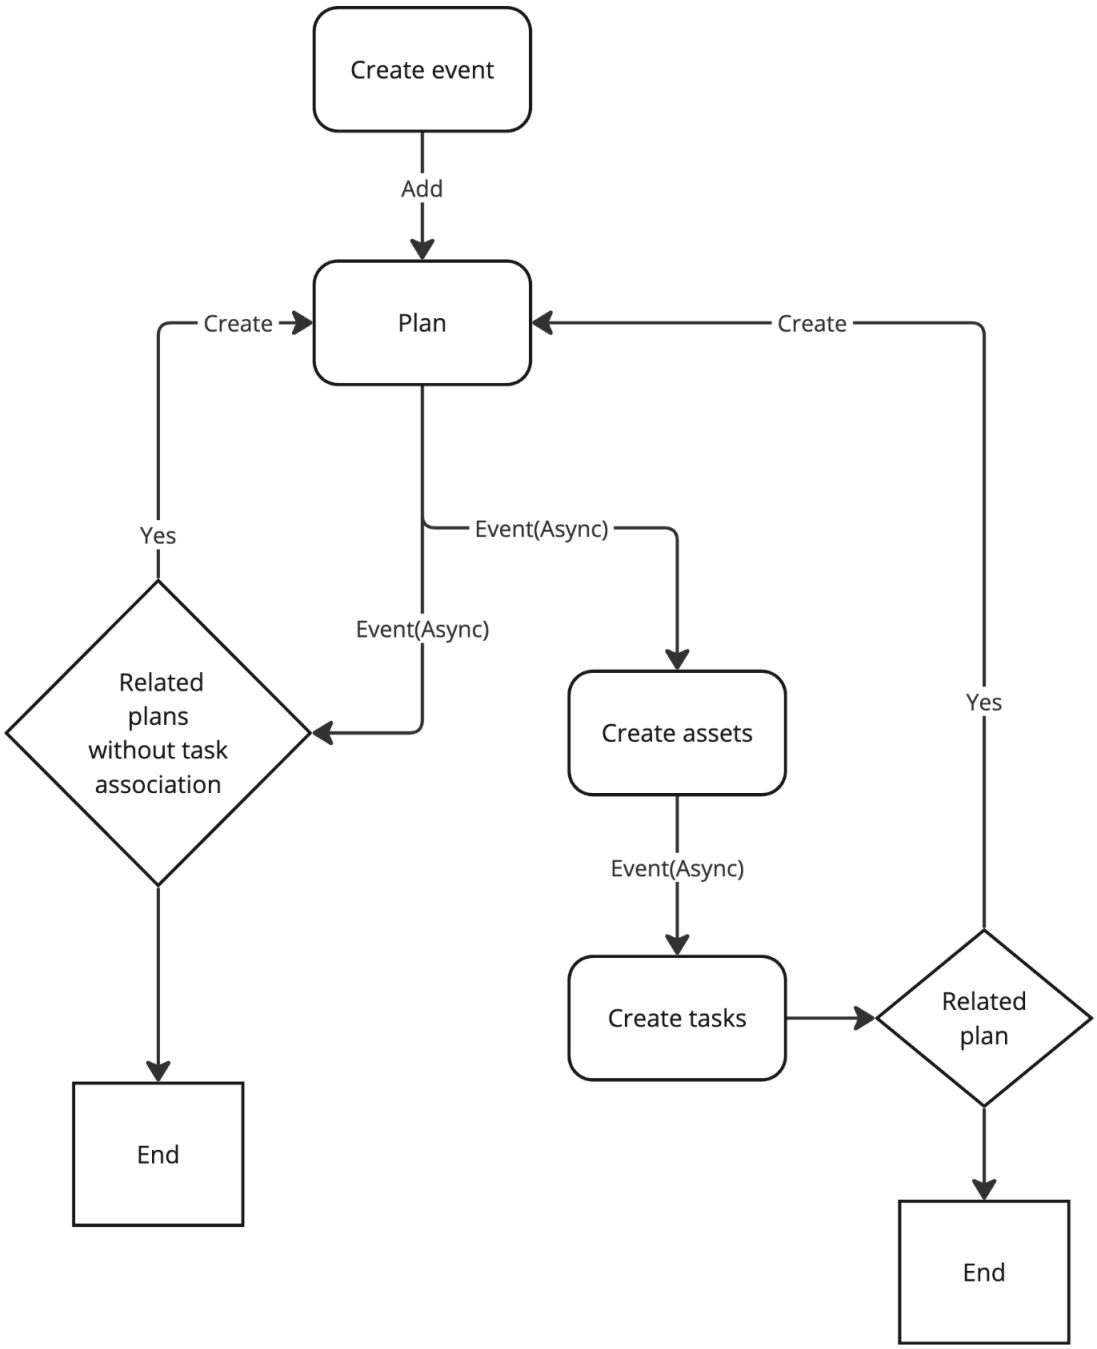


Note:
An event task from a primary or related plan can be associated as a dependency with an event task from the same or another primary or related plan. An event task from a child plan can only be associated as a dependency within the same child plan.

Whenever any event task is updated, as shown in the example, a message indicates that the event tasks have been updated. Selecting **Refresh** loads the updated data.

You can add task dependencies in primary and related plans, but not in child plans. For an event task in a child plan, dependencies can only be selected from the same child plan. For example, in Plan 4, task 3 (EVNTSK0010331) depends on tasks (EVNTSK0010329 and EVNTSK0010330) within the same child plan.

When adding task dependencies in primary and related plans, only tasks from other primary or related plans are available for selection in the **Dependencies** field.



Configuring the property to refresh the event task order

Whenever task dependencies are updated, the event task order is updated. If more than 500 event tasks are affected, the order is calculated asynchronously. The *sn_recovery.sync_task_order_calculation_limit* property sets the limit for asynchronous calculation to 500 tasks by default. When the task count exceeds this limit and dependencies are updated, the task order calculation becomes asynchronous, and a **Refresh tasks order** button appears in the event, event task, and activated plan. Selecting this button manually refreshes the event task order.

Process of creating a nested plan

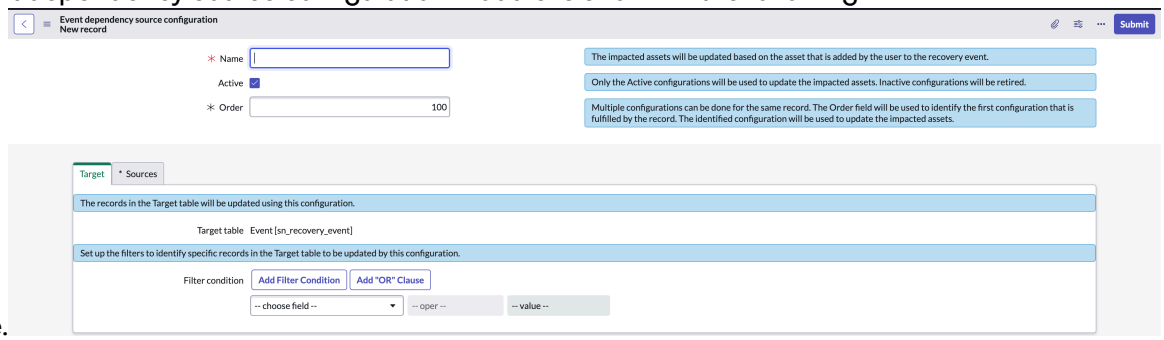
Previously, related plans were created only for primary activated plans. Starting with the Yokohama release, related activated plans can be created from an event task for all activated plan types. An example of creating a nested plan is shown in the following diagram.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The steps to create a nested plan are as follows.

1. Create an event.
2. Add a plan to the event. An activated plan is created with the plan type set as primary.
3. An event is triggered to create related plans. If the plan has related plans without any task associations and the plan level is less than the default value defined in the property, an activated plan is created with the type set as related plan.
4. An event is created to generate one or more event assets.
5. After the assets are created, an event is triggered to create event tasks.
6. If the event task has a related plan and its level is less than the level defined in the property, an activated plan is created with the type set as child plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Adding dependencies of impacted assets

You can add the dependencies of the impacted assets in the events and exercises based on the source data and relationships in the CMDB, BIAs, and plans.

Configuring the sources in the Event dependency source configuration module

The BCM administrators can configure the sources to get the event dependencies in the Event dependency source configuration module. You can access the auto-update configuration module by navigating to **Business Continuity Workspace** > **General Administration** > **Event dependency source configuration**.

The Event dependency source configuration module is shown in the following example.

When the BCM administrators can update the target records, filter condition for the records, and sources to fetch the event dependency.

Dependencies are added in the events only when the user selects the **Update dependencies** UI action. Dependencies are fetched from the following sources for the events:

- BIA upstream dependency
- BIA downstream dependencies
- CMDB
- Plan primary assets
- Plan related assets

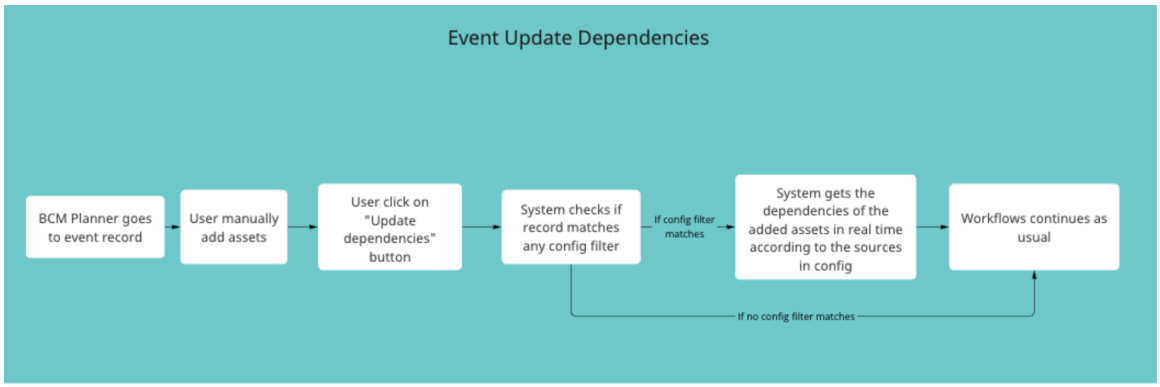
Note:
In an event, the dependencies of all assets are added manually where the source is Manual.

Setting up the Event dependency source configuration module is a one-time activity. Once the sources are configured in the Event dependency source configuration module, the updates are synchronized in the events.

For more information on setting up the Event dependency source configuration module, see Configure Event dependency source configuration record.

Roles associated with event dependency updates

Users with the following roles typically check for the dependency updates in an event:



- The BCM program managers, BCM planners, and BCM managers can update the latest dependencies.
- BCM administrators can configure the Event dependency source configuration module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow for updating the dependencies manually in the events and exercises

As the BCM application user, when you select the **Update dependencies** UI action in the Event record, the dependencies of all assets are added manually where the source is Manual.

The BCM application executes a workflow to update the impacted assets in the events and exercises as shown in the following example.

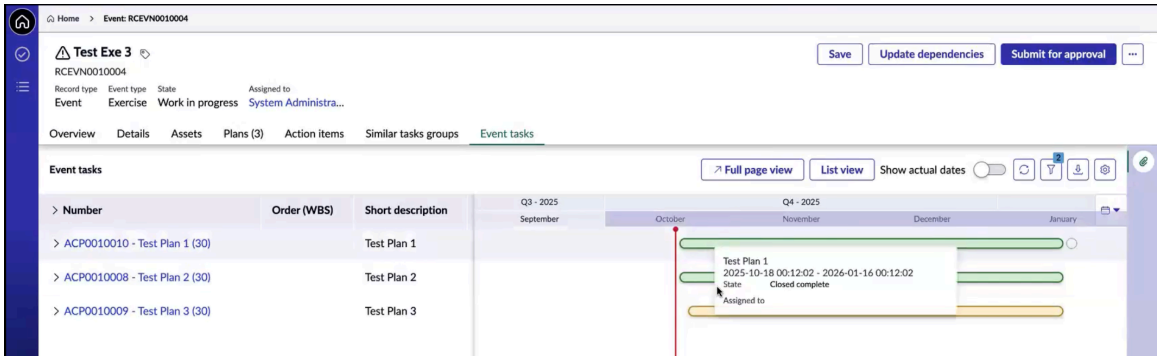
1. The BCM planner navigates to the event record.
2. The BCM planner selects the **Update dependencies** UI action to add the assets manually.
3. The application checks if the event record matches any configuration filter.
4. If the event record matches any configuration filter, the system gets the dependencies of the added assets in real time according to the sources defined in the configuration (Event dependency source configuration module).
5. If the event record does not match any configuration filter, the events workflow then continues for the next steps, the events workflow then continues for the next steps.

For more information on updating the event dependencies manually, see Update the event dependencies.

Data Relationships Framework

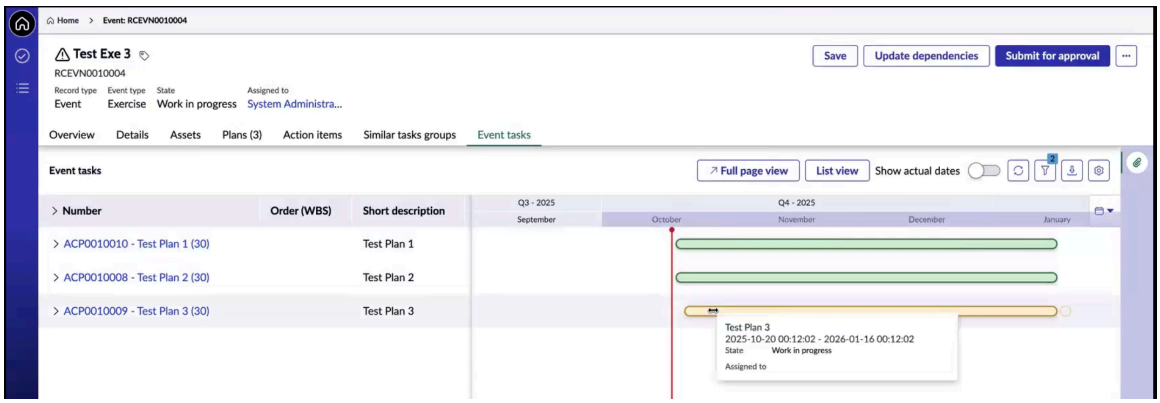
Beginning with the Xanadu release, the Data Relationships Framework (com.sn_app_grc_relationship_config) application supports the BCM application with the underlying framework to add the dependencies of the impacted assets in the events and exercises. The Data Relationships Framework application is installed with the BCM application by default.

For more information on the Data Relationships Framework, see Data Relationships Framework.



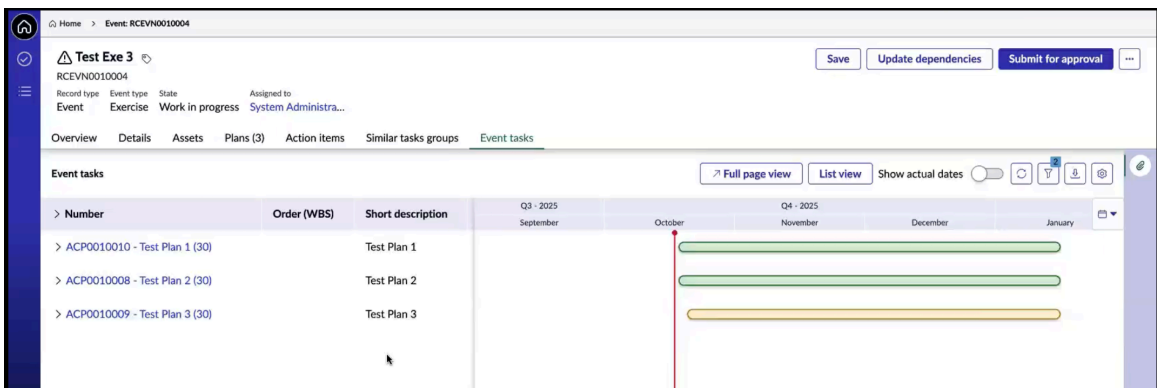
Enhancing event task management with Hierarchical view

The Hierarchical view for event tasks has been enhanced with several key features. It now displays dependencies between tasks, and shows color-coded states with planned start and end dates. Dependencies can be updated directly through the Hierarchical view (Gantt chart), streamlining event task management.



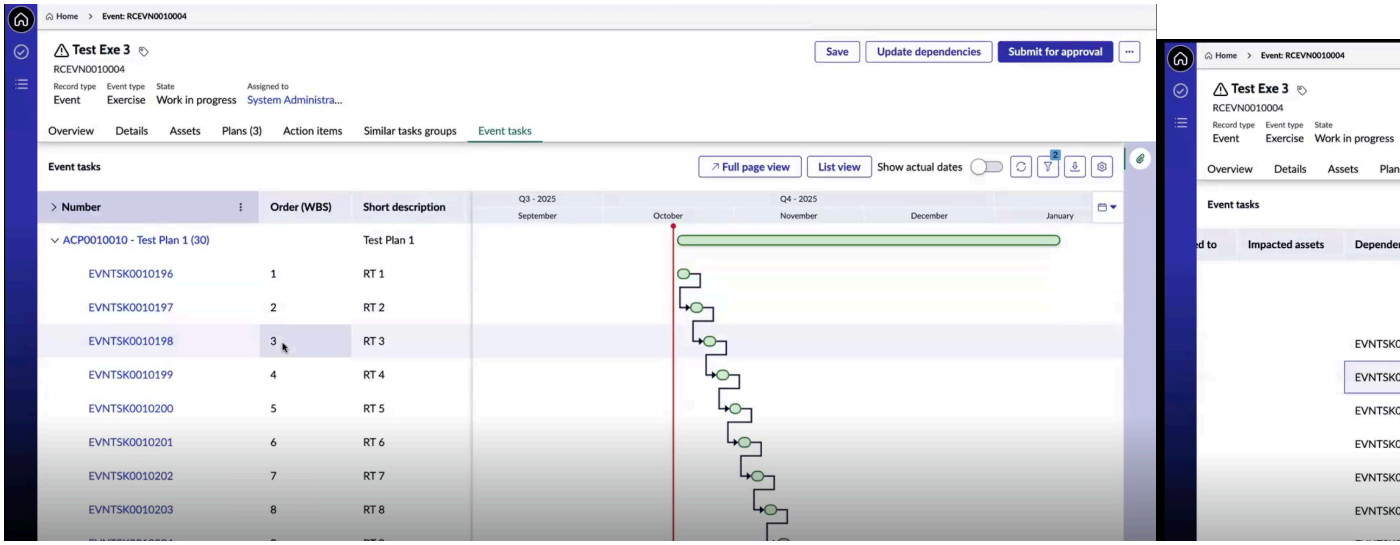
Sorting plans

In the Hierarchical view, activated plans are now sorted by their start date. The example shows an event task with activated plan, its start date, end date, state, and so on. The start date for the plan shown in the example is 18th.

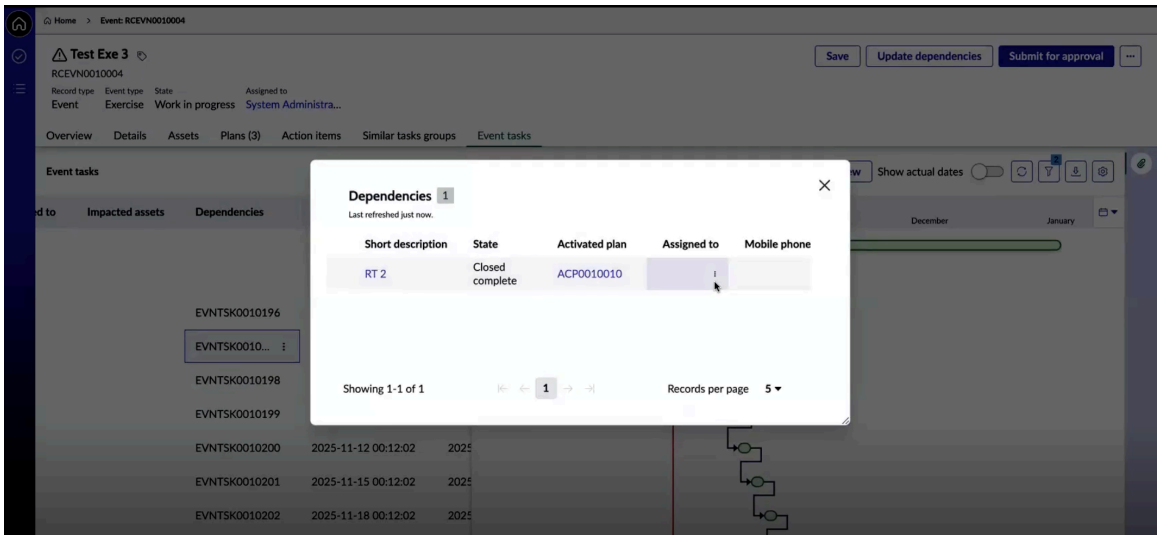


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The plans are displayed in sorted order. The example shows the next plan having a start date of the 20th.



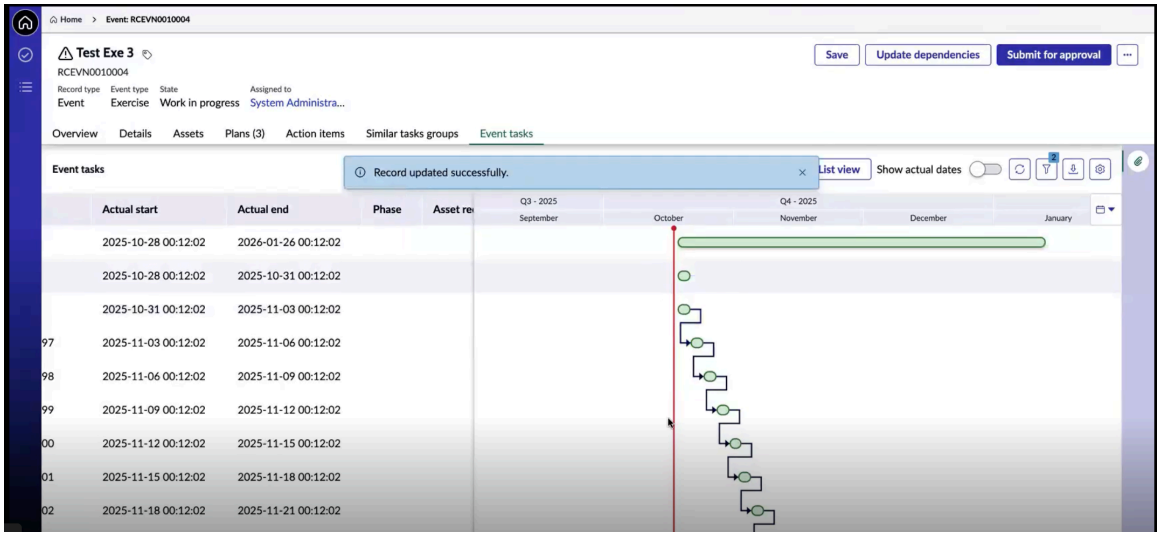
Color-coded plans offer a visually organized view.



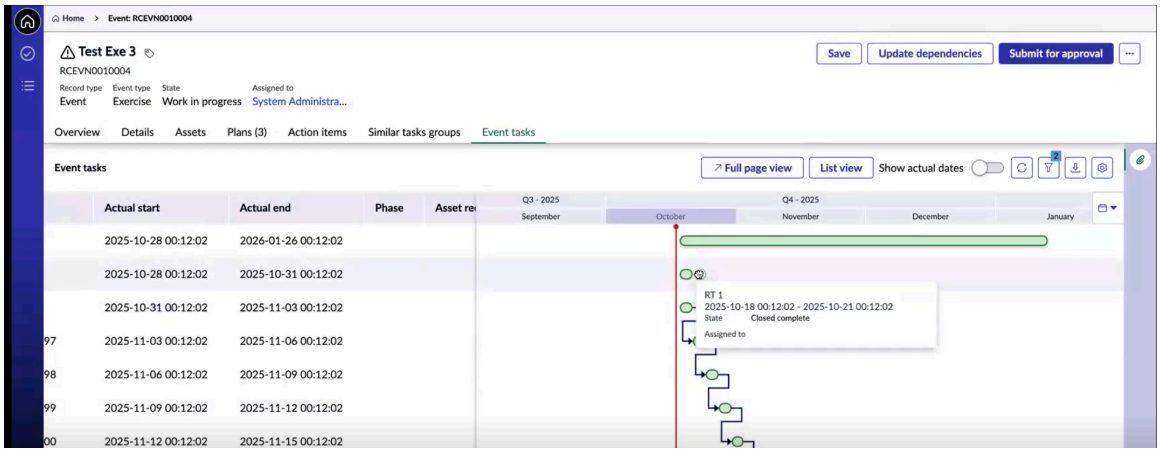
Managing task dependencies in Hierarchical view (Gantt chart)

To manage task dependencies, you can select **View dependencies** in the Dependencies column. This enhancement enables you to view the dependencies between tasks, including the state of the dependent plan and other relevant details.

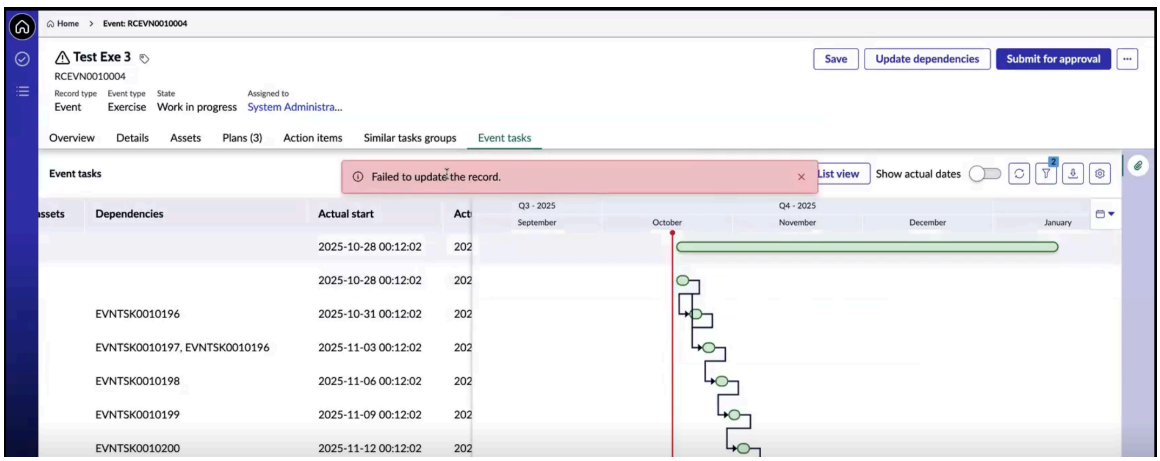
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



After selecting **View dependencies**, a modal view is shown, displaying the dependency details, including the dependent task (for example, RT3 is dependent on RT2), its dependency (RT2), and the state of the dependent plan (activated). This display provides a clear understanding of task relationships and their current status.

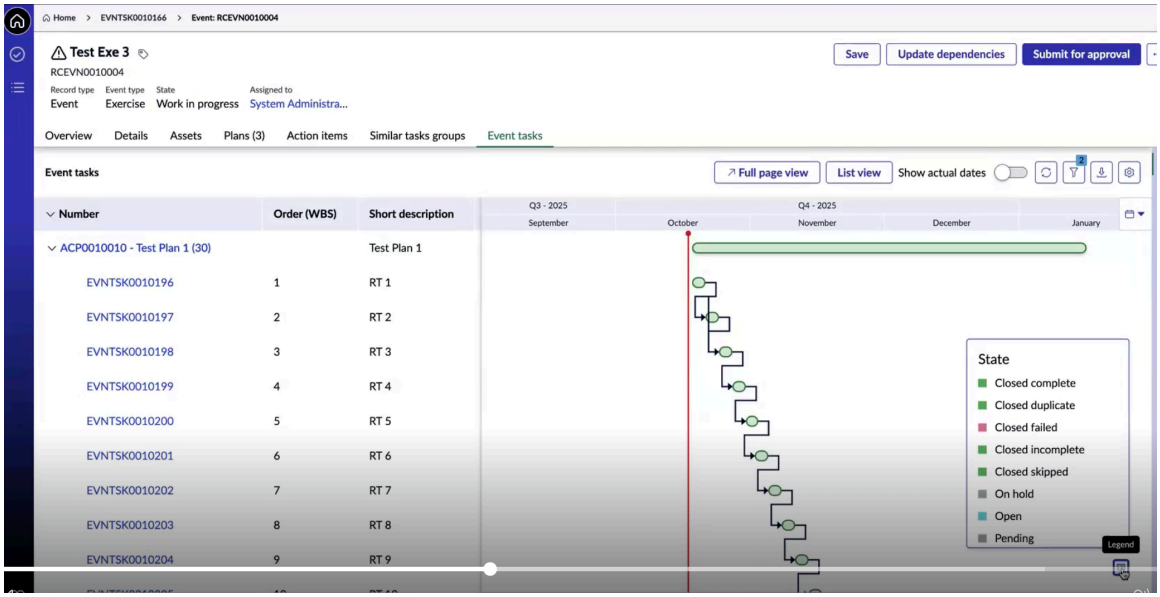


You can visualize and manage task dependencies directly in the Gantt view. All dependencies are clearly displayed, enabling you to understand task relationships at a glance. To delete a dependency, select the link between tasks and press the Backspace or Delete key on the keyboard.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

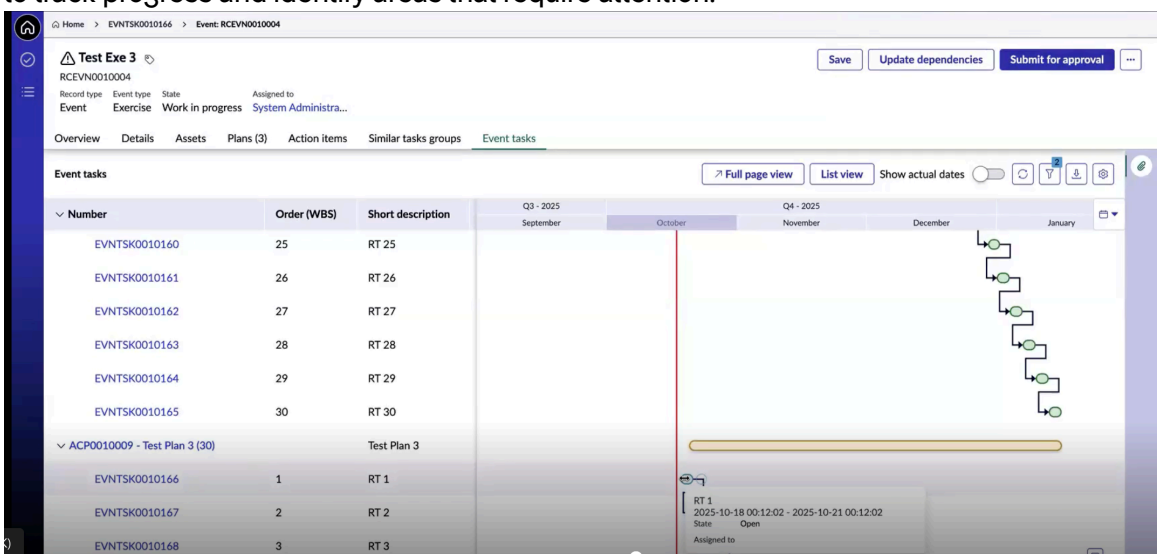
To create a new dependency, drag from the end of one task to the start of another task and add a link. This action establishes a dependency between the two tasks, enabling you to manage their relationship effectively. When a dependency changes, all affected tasks' planned start times are updated accordingly.



You can create multiple links between tasks as needed, enabling for flexible dependency management directly within the Gantt chart. However, attempting to create a cyclic dependency (for example, making Task 2 dependent on Task 1 when Task 1 is already dependent on Task 2) results in an error, as it can cause cyclic dependencies. The system helps to prevent such configurations to maintain a valid and manageable project structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

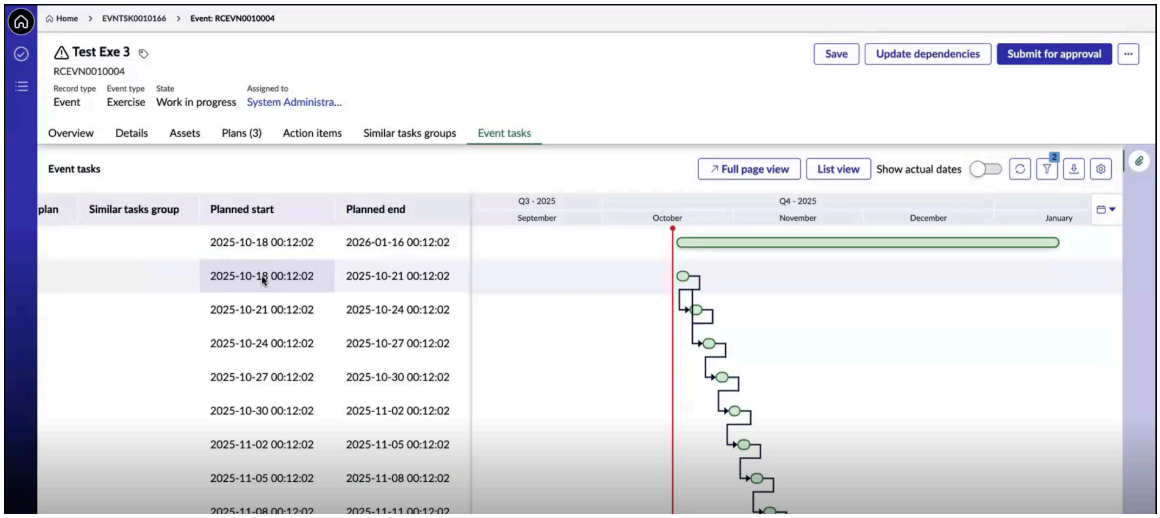
Color-coded bars



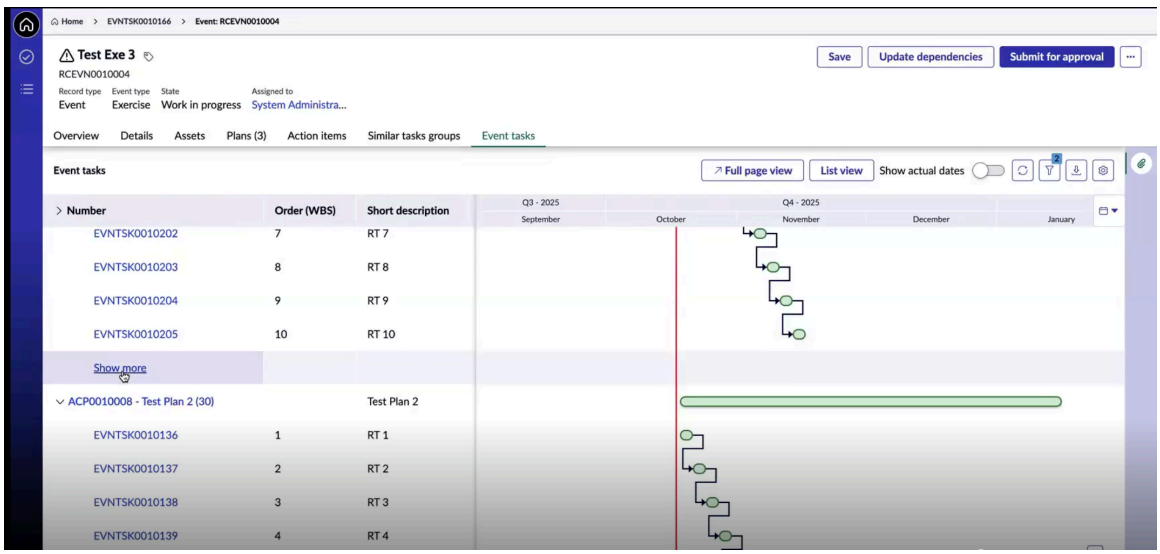
The bars in the chart are color-coded, and selecting the legends reveals the color conventions for different task states, such as Closed complete, Closed duplicate, Closed incomplete, and others. This color-coding system helps to identify the status of tasks quickly.

The task states are represented by these color codes:

- Green: All "Closed" states
- Red: "Closed failed" states
- Grey: "Hold" and "Pending" states, indicating a waiting or paused status
- Blue: "Open" state, signifying that a task is open and ready for action
- Yellow: "Working progress" state, indicating that a task is in progress



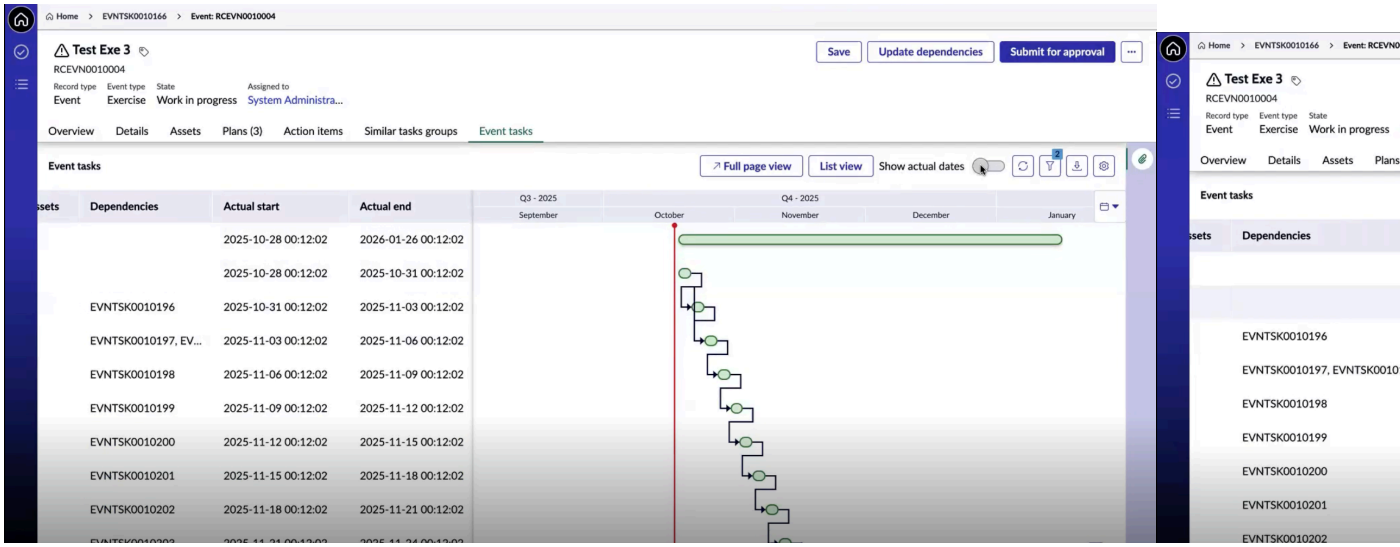
This color-coding system provides a clear visual representation of task statuses, making it easier to track progress and identify areas that require attention.



In the Gantt view, tasks are color-coded based on their status: yellow for "work in progress" and blue for "open" tasks. Hovering over a task bar displays additional information, including the task state, plan start and end dates, and assignment details if applicable. The Planned start and Planned end dates are also introduced at the activated plan level, which are calculated based

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on the associated event tasks. It's shown that the planned start date is 18th and the planned end date is 21st.



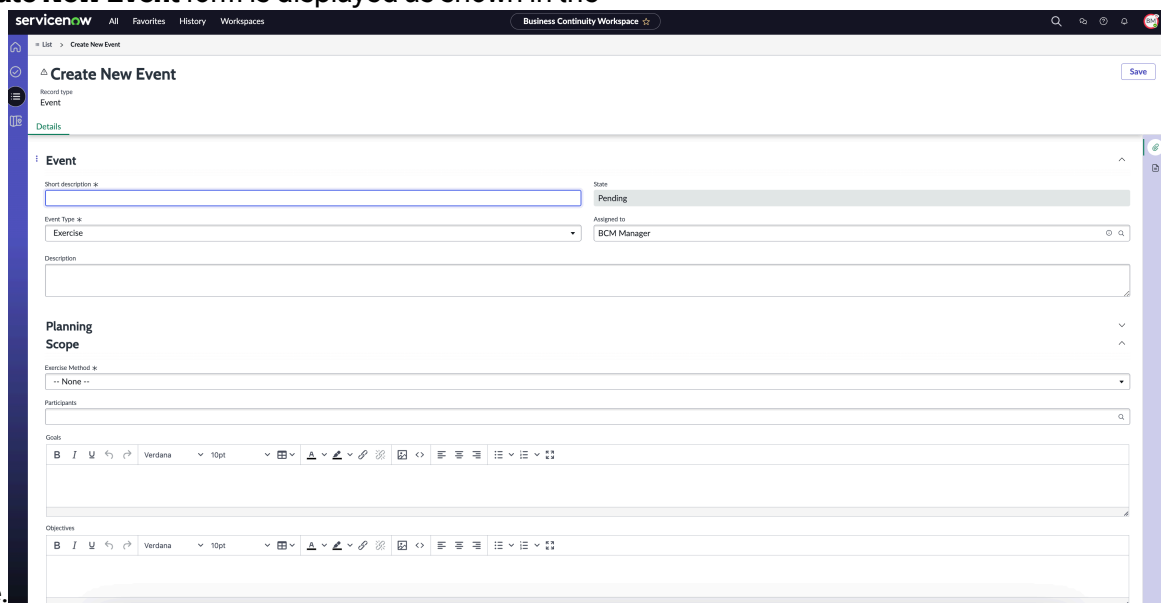
In the example, the first event task begins on the 18th and concludes on the 21st. Since the second task is dependent on the first, it starts on the 21st and ends on the 24th. This dependency-based timeline calculation applies to all subsequent tasks. The Gantt chart is interactive, enabling you to adjust its size. Selecting **Show more** on any activated plan enables you to view detailed information, including completed plans.

You can view the actual start and end dates in the Gantt chart. To view the dates, select the toggle and the chart gets updated to display the actual dates, providing an accurate representation of the progress of the project.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can toggle between viewing planned dates and actual dates using the switch button, enabling for easy comparison and tracking the progress of the project.

Create an exercise



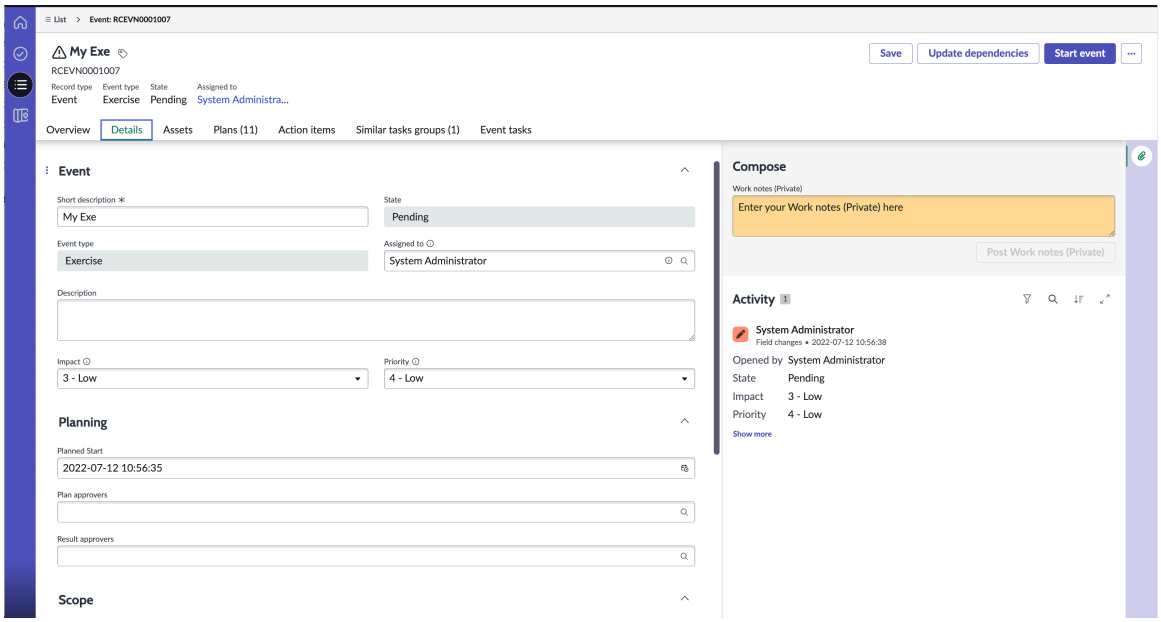
Create an exercise in BCM UIB Workspace. You can then test your business continuity and recovery plans on a planned date and monitor the completion of the event tasks.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises** > **Pending** and select **New**.
   The **Create New Event** form is displayed as shown in the example.



2. Fill in the required fields in the **Details** tab.
   For more information on the fields, see Create Exercise Event form.
   The exercise event is created in the **Pending** state and it is displayed in the List view. The state and details of the exercise event are displayed in the tabs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Overview**: You can view the current state and overall state progression of the exercise event.
- **Details**: You can update the fields in the form such as **Short description**, **Assigned to**, **Exercise method**.
- **Assets**: You can select the impacted item type or the primary elements that you want to recover for an asset type.
- **Plans**: You can add an ad-hoc plan for the selected asset to the event.
- **Emergency Notifications**: You can create an emergency notification for the exercise event.
- **Event tasks**: You can add an ad-hoc task to the event.

The Event form is shown in the example.

3. To perform more actions on the event, select **More actions**.

4. Select **Save**.
   The event is saved in the **Pending** state.

Create Exercise Event form

Use the Create Exercise Event form in BCM UIB Workspace to add details about an Exercise event.

Create Exercise Event form

For description of the field values, see the table.

Create Exercise Event form

Field	Description
Details tab	
Short description	Brief description about the event.
Event type	Type of the event. For exercise events, the event type is **Exercise**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Exercise Event form (continued)

Field	Description
State	Defaults to the **Pending** state.
Assigned to	User or users from the Assignment group. If the **Assignment group** field is empty, then select any user.
Description	Description of the exercise event.
Impact	Measure of the business criticality of the affected service. Available options are: • **1 - High** • **2 - Medium** • **3 - Low**
Priority	Sequence in which an Incident or Problem needs to be resolved, based on impact and urgency. Available options are: • **1 - Critical** • **2 - High** • **3 - Moderate** • **4 - Low** • **5 - Planning** • **None**
Planning	
Planned Start	Planned start date for the exercise event in the *YYYY-MM-DD HH:mm:ss* format.
Plan Approvers	Plan approvers for the exercise event.
Result Approvers	Result approvers for the exercise event.
Scope	
Exercise Method	Method for the exercise. Available options are: • **Simulation** • **Tabletop** • **Walkthrough** • **Functional** Technically, all exercises are treated the same way. However, only Functional exercises automatically generate tasks, while Simulation, Tabletop, and Walkthrough exercises do not have any technical differences in their implementation. **Note:** For exercise events, the exercise method is **Functional** by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Exercise Event form (continued)

Field	Description
Participants	Participants for the exercise.
Goals	Goals for the exercise.
Objectives	Objectives for the exercise.
Assets tab (Added after the event has been created)	
Asset types	Type of the asset and its info.
Short description	Short description of the asset type.
State	State of the asset type.
Actual time taken	Actual time taken for the asset type.
Finalized RTO	Finalized RTO for the asset type. The finalized recovery time objective is the suggested downtime until normal operations can be available to users. If there is no adjusted RTO, this is the recovery time objective. If there is an adjusted RTO, this is the adjusted RTO.
Total effort	Total effort for the asset type.
Primary source	Primary source of the asset type.
Status in source	Status in source for the asset type.
Target recovery time (RTO)	Target recovery time (RTO) for the event asset. This field is read-only and it is filled out from the BIA. You can select the **Update dependency** UI action to pull value from latest non-archived BIA. Target recovery time is the finalized RTO value.
Recovery tier	Recovery tier for the event asset. This field is read-only and it is filled out from the BIA.
Target recovery point (RPO)	Target recovery point (RPO) for the event asset. This field is read-only and it is filled out from the BIA. Target recovery point is the finalized RPO value.
Plans	
Plans associated with the event	Details of the plans such as Number, Short description, State, Actual time taken, Total effort, Type, and Parent.
Action items	
Action items associated with the event	Ad-hoc action items of task and assessment type, associated with the event and their details such as Number, Short description, State, Assigned to, and Due date.
Similar tasks groups	
Group of similar tasks	Group of similar tasks, their names, and original tasks associated w

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Exercise Event form (continued)

Field	Description
associated with the event	
Event tasks	
Event tasks associated with the event	Information on the event tasks such as Number, Short description, State, Impacted assets, Assigned to, Dependencies, Actual start, Actual end, Related activated plan, Similar tasks group, Phase.

Update the event dependencies

Update the event dependencies manually by selecting the **Update dependencies** UI action. You can update the dependencies in an active event.

Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner, sn_bcm.admin

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. Open an event in the **Pending** state.
3. To update the dependencies manually, select **Update dependencies**.
   A UI message is displayed on the screen: `Dependencies are being updated.`
4. To save the changes to the event, select **Save**.
   The plan owners and BCM lead can update the event dependencies by saving the changes to the event.

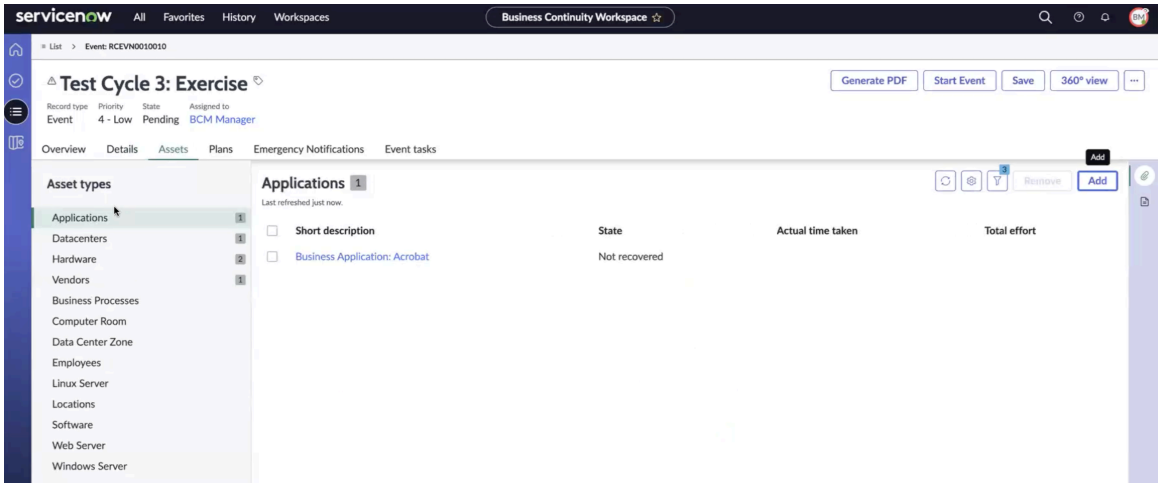
Track impacted assets and add associated plans

Track the impacted assets and add an associated plan to the exercise. You can then monitor the assets and plans for the exercise in BCM UIB Workspace.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

Procedure

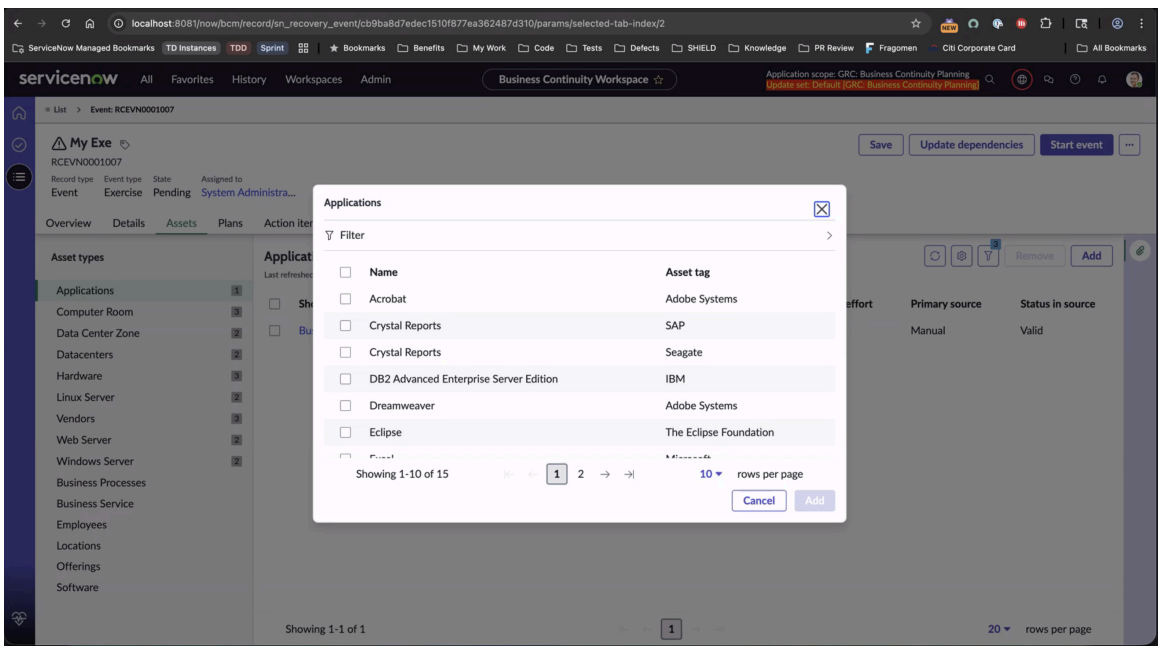


1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises** > **Pending** and select the exercise event in the list.
2. Select **Add** in the **Assets** tab.

   You can add an asset that you want to recover during the exercise. The primary elements of the asset are listed as **Asset types**. The primary elements belong to the element definition type that is identified in the plan template. When you add an asset to the event, its associated dependencies are pulled into the event. The dependencies are displayed in the **Asset types** panel.

   When you select **Add** for an application, all the dependencies that you had identified in the business impact analysis of that application are also added to the exercise. The example shows the dependencies for Business Application: Acrobat in the **Asset types** panel of the exercise.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

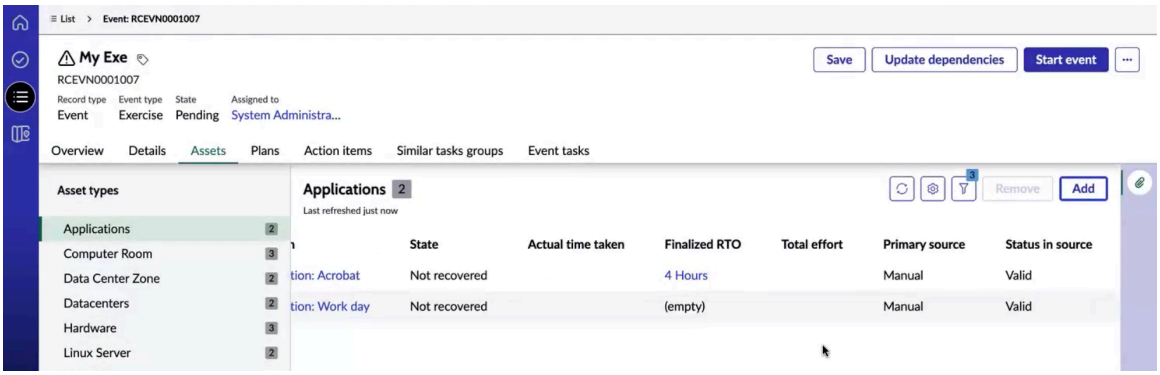


Note:
Starting with the Xanadu and later releases, the Crisis manager can initiate an event task even if the plan includes recovery tasks that do not have any assets tagged. The former requirement that every activated plan should have at least one tagged asset has been removed.

Note:

The *source_table_fields* configuration applies to the **Assets** tab in recovery events. The purpose of *source_table_fields* is to set the columns for the modal based on the asset types.

The following modal shows the columns that appear when you select **Add** for Applications asset type.



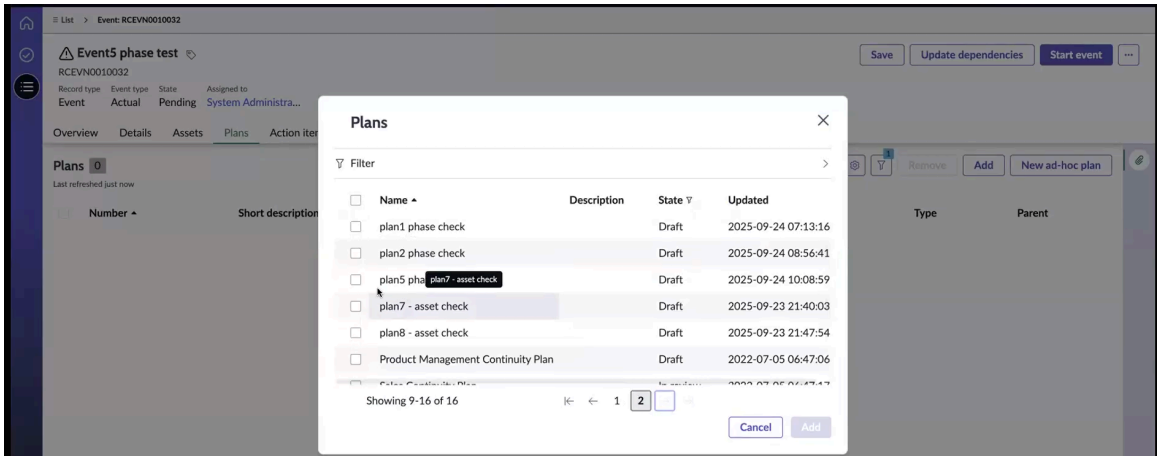
3. Add an asset in the **Assets** tab and review the populated RTO values in the **Finalized RTO** and **Finalized RPO** columns.

   When you add an event asset, for example Acrobat, the finalized RTO and RPO values from its BIA are populated in the **Finalized RTO** and **Finalized RPO** columns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Recovery assets are now linked to their corresponding BIA records, enabling automatic retrieval of key data such as RTO, RPO, and Recovery Tier.

When you open the event asset record (for example, "Acrobat"), the "Finalized RTO," "Finalized RPO," "Recovery Tier," and "BIA" values are automatically populated and displayed in the record as shown in the example.



4. To update the state of the impacted asset, open the newly added asset record from the list and select **State**.
5. To add a plan, navigate to the **Plans** tab and select **Add**.

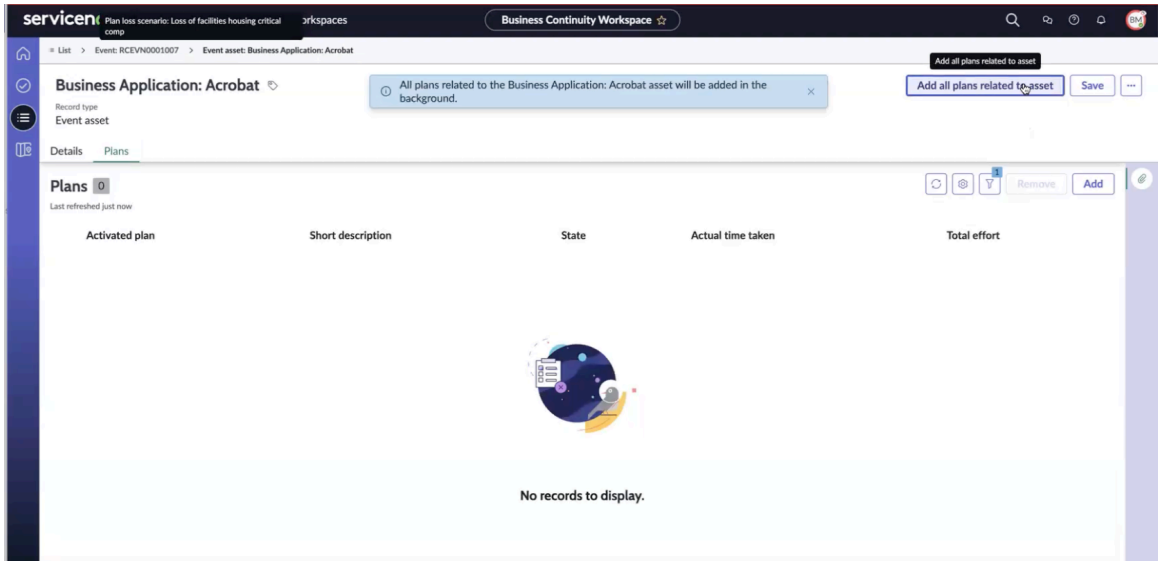
   a. Select the plan from the displayed plans list and select **Add**.

      The plans list is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with GRC: Crisis Management, version 9.1.4, the logic for fetching the plans into a recovery event is updated. Previously, all plans related to the target plan were automatically included. With a clear upstream and downstream plan hierarchy, pulling in a plan does not pull its upstream plans automatically.

The plans are added to the event.



6. To add all plans that are related to the asset, select **Add all plans related to asset**.

   Archived plans: Archived plans are not displayed in the selection modal when adding associated plans. Within an exercise or event, archived plans are no longer available in the selection modal, preventing you from adding them directly. When using **Add all plans related to asset**, primary archived plans are not pulled in. However, associated archived plans are still included, since they may be dependencies of active plans required for the event to run successfully. If you do not want these archived downstream plans included, adjust the relationships accordingly.

   An informational message is displayed that all plans related to the selected application are added in the background as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Save**.

   The actual end time for the impacted assets is updated in the **Details** tab when all event tasks associated with the assets are completed. Once these tasks are completed, the actual end time is recorded, and the actual time taken is calculated. The total effort is calculated based on the total time taken for all the tasks where this asset is related. After completion, the state of the impacted asset is updated to **Recovered**. If any tasks are in the **Close failed** state, the state of the impacted asset is not updated and it is marked as **Not recovered**.

   In the **Tag assets** field on the recovery task form of the plan, you can select the assets:

   - If you select all assets, all assets present in the plan are added to the impacted assets of the event task.
   - If you select specific assets, only those specific assets present in the plan are added to the impacted assets of the event task.
   - If you select none assets, no assets present in the plan are added to the impacted assets of the event task.

   Note:

   The current demo data has an issue where both **Included task in** and **Tag asset** fields are empty. To resolve this, you have to add tasks to **Included task in** manually and select assets for the **Tag asset** field. Without these, event tasks won't be created and assets won't be marked as impacted.

   If you haven't selected **Included task in**, your event task won't be created. If you don't select **Tag asset**, your asset won't be marked as an impacted asset.

   This issue doesn't apply to newly created plans.

   The exercise is saved in the **Pending** state.

Creating action items in events

Starting with BCM release 9.0.x, crisis managers can create action tasks for recovery members or teams anytime during a crisis event or exercise, as long as the event remains open. Crisis managers can create these tasks on the fly without mapping them to event assets or recovery plans. These action tasks are also not included in the event recovery timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action items in real-time

Action items can be used to assign tasks in real-time. For example, a crisis manager can assign an action item to verify that there are no injuries at a specific office location after an exercise or they can request someone to review the business continuity plan before proceeding to the next steps.

You can also use action items to conduct assessments during a crisis event. For example, in the event of a fire, you can assign an action item to assess the situation, determining the severity, and identify affected employees and buildings. You can perform an assessment and assign an action item.

Fields and states associated with Action items

The Action items tab contains the following details related to the ad-hoc tasks:

- Actual start date
- Actual end date
- Total time taken
- Event (Reference)
- Short description
- Description
- Due date
- Task numbers
- Type
- Task
- Assessment

The following workflow (states) are associated with action items.

States associated with action items

State	Description
Open	First state of the action item.
Work in progress	State of the action item when its work begins. When an action item moves to the **Work in progress** state, the system auto-captures its start time.
Skipped	Assigned state of the action item when it is not relevant. When an action item is skipped and considered not relevant, its time fields are removed, resulting in a total time of 0.
Closed (complete, incomplete)	Final state of the action item task. When an action item has been completed, the system auto-captures its end time.

BCM managers or planners can update the action items and can re-open the ad-hoc tasks associated with them.

You can assign the action item tasks to the groups or team members by using the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Assignment group**
- **Assigned to**
- **Additional assignee list**

Comparison between event tasks and action items

The action items are distinct from the event tasks in crises and events. The following table outlines the differences between event tasks and action items.

Comparison between event tasks and action item tasks

Fields/Criteria	Event task	Action items
Details	• Short description • Description • Task numbers • Dependencies • Activated plan • Impacted assets • Task ID	• Short description • Description • Task numbers • Type
Assignment	• Assignment group • Assigned to • Recovery team • Additional assignee list	• Assignment group • Assigned to • Additional assignee list
Access	• Plan owner, Program manager can create/ update/delete action items. • Event recovery members can read/update action items that they are assigned to.	• Plan owner, Program manager can create/ update/delete action items. • Event recovery members can read/update action items that they are assigned to.
Workflow	Pending -> Open -> Work in progress -> Skipped -> Closed (complete, incomplete, failed)	Open -> Work in progress -> Skipped -> Closed (complete, incomplete)
Dependencies	Yes	No
Automation	Yes	No
Orders	Yes, auto calculated based on dependencies.	No. Order is not calculated for the action item tasks.
Time calculation	Event tasks time is rolled up to activated plans, and impacted assets	No. Time is not rolled up for the action item tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles associated with action items

The following roles are associated with action items.

Roles associated with action item tasks

Role	Description
Plan owner	Can create, read, update, and delete action items when the plan owner is the event owner.
Program managers	Can create, read, update, and delete action items for all events.
Viewers	Can read all action items.
Recovery event/Plan owner	Can read and update all action items that they are assigned to.

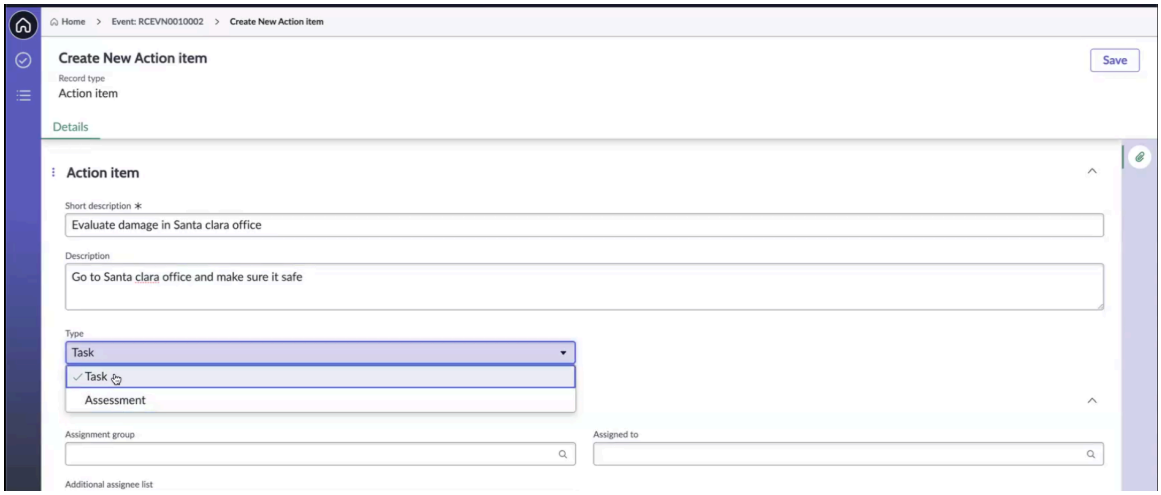
Create task and assessment-type action items in events

Use integration of events and Smart Assessment for creating necessary action items related to an event.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

About this task



Verify that you have created Smart Assessment templates for integrating crisis events with the Smart Assessment Engine.

Procedure

1. Navigate to **Crisis events** > **Pending** in the List view and select the crisis event.
2. Report the crisis event either from the home page or from the events page by creating an event.
   a. Add the description of the event.
   b. Assign it to a user by updating the **Assigned to** field.
   c. Select **Save**.
   An event is created in the application. You can create action items related to the event by updating the **Action items** tab, even before the event starts.
3. Select **New** in the **Action items** tab of the event.

   The Create New Action item form is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.
   For information on the fields, see Create New Action item form for crisis events.

   Note:
   Starting with GRC: Crisis Management, version 9.1.4, deleting an event associated with an action item now automatically deletes the action items and cancels any linked SAE assessments. Additionally, SAE assessments can now be viewed even if they are not linked to an action item.

   a. Add the description and short description of the action item.
   b. Select the type of action task by selecting **Task** or **Assessment**.
   c. Add an assignment group or a team member and an additional assignee list.
   d. Assign a due date in the Timeline section.
   e. Select **Save**.
   The Action item record is created in the **Open** state and the action item is displayed in the **Action items** tab of the event.
5. To skip the action item if it is not needed, select **Skip task**.
6. To work on the action item as a task, select **Task** in the **Type** field.

   a. To work on the action item task, select **Work in progress**.
   The state of the action item is updated to **Work in progress**. The actual start date and time for the action item task is recorded and displayed in the Actual start column of the **Action items** tab.

   b. To complete the action item task, select **Closed complete** in the action item record.
   The state of the action item is updated to **Closed complete**. The actual end date and time taken for the action item task is auto-captured and displayed in the Actual end date and Actual time taken columns of the **Action items** tab.

7. To mark the action task as an assessment, select its type as **Assessment** in **Type** field in the Create New Action item form.

   a. Select the assessment template in the **Assessment template** field.

   When you select the action task as an assessment, the **Assessment template** field is displayed in the form. The application uses Smart Assessment to perform the assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Confirm that BCM administrators have already created the necessary templates in the Assessment Workspace beforehand using the Smart Assessment Engine.

Note:
To make the desired Smart Assessment templates visible in the drop-down in the action item form in the Business Continuity Workspace, ensure that following steps are completed in the Assessment Workspace.

- Select the necessary template, such as the Fire crisis template shown in the example, in the Details section.
- Choose the **Threat assessment for crisis events** category in the **Assessment template categories** field. If you choose a different category, the desired template will not be shown in the Business Continuity Workspace.
- Choose **Event** and **Action item** as the targets in the **Assessment targets** field.
- To read the assessment, specify the reader role, such as the core viewer (sn_bcm.core_viewer) as the minimum role, in the **Assessment reader role** field of the Settings section. Usually, the core viewer (sn_bcm.core_viewer) role is specified as it is shared across all the roles.
- Publish the assessment template.

Only when these conditions are met, the template is available for selection in the drop-down of the action item form.

For information on setting up Smart Assessment templates, see Create an assessment template.

b. Add an assignment group or a team member and additional assignee list, select the timeline, and save the record.

c. To continue working on the action item assessment, select **Work in progress**.

d. To view response to the assessment as another user, select **View response**.

e. To respond to the assessment as the assignee, select **Take assessment**.

f. Respond to all the questions and select **Submit**.

g. Confirm that you have reviewed the answers and select **Submit** again in the modal. Your response is submitted and a confirmation is displayed on the screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. To complete the action item assessment, select **Closed complete**.
The state of the action item assessment is updated to **Closed complete**.

8. To re-trigger the action task, select **Re-trigger**.
9. To save the action task, select **Save**.
This step completes the workflow of the action item record.

Create New Action item form for events

Use the Create New Action item form in the BCM Configurable Workspace to add action items about a crisis event.

Create New Action item form

For description of the field values, see the table.

Create New Action item form

Field	Description
Details tab	
Number	Auto-assigned number for the action item record, for example, EVNITM0010020.
Short description	Short description of the action item.
Description	Detailed description of the action item.
State	Auto-assigned state of the action item record.
Type	Type of the action item to choose from. Available options are: • **Task** • **Assessment**
Assessment template	Template based on the Smart Assessment Engine.
Assignment details	
Assignment group	Assignment group that the action item is assigned to.
Additional assignee list	Additional assignee list for the action item.
Assigned to	User that the action item is assigned to.
Timeline	
Actual start	Actual start date and time for the action item.
Actual time taken	Actual time taken for the action item in days, hours, minutes, and seconds.
Actual end	Actual end date and time for the action item.
Due date	Due date for the action item.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Grouping similar event tasks in events

In BCM, when the same plan is activated multiple times, it can result in multiple redundant tasks. Starting with BCM release 9.0.x, the **Similar tasks groups** tab in events helps you to eliminate redundant tasks by grouping duplicate tasks from multiple plans for similar scenarios. This functionality streamlines event task management and reduces duplication of efforts.

Progression of original and duplicate tasks

The Similar tasks group functionality enables event users to group similar tasks from multiple plans aimed at resolving specific situations. The system automatically designates an original task within a group and the duplicate tasks are moved to the **On hold** state. Upon completing the original task, event users mark it as closed. The duplicate tasks are then marked as Closed duplicates.

The progression of both original and duplicate tasks is as follows:

Initial task state

When a task is part of a group, it initially moves to the **On hold** state instead of the **Open** state. The first task to enter the **On hold** state is automatically designated as the original task.

Transition to the Open state

The original task in a group is then moved to the **Open** state when all the other tasks are moved to the **On hold** state.

Handling duplicate tasks

Duplicate tasks remain on hold until the original task is closed and are not assigned to users. When the original task is completed, the duplicate tasks in the group are automatically marked as **Closed duplicate**.

Modifying duplicate tasks

Duplicate tasks cannot be modified directly; to take any action on them, you must first remove them from their associated group.

Reporting and time calculation

For duplicate tasks, the original task's state and time fields are used to roll up to the activated plans and assets. The time taken by duplicate tasks is not included in the **Total effort** field on the activated plans and assets.

Re-triggering original tasks

If the original task is re-triggered, the duplicate task remains in the **Closed duplicate** state, unaffected by the change of status of the original task.

Task grouping rules

Tasks with similar recovery task references are automatically grouped together by the system. Tasks that have internal dependencies cannot be grouped together, but they can be added to different groups. Tasks that trigger related plans cannot be added to the Similar tasks group.

Flexibility and control

You can unlink tasks from a similar task group or remove tasks from the event tasks.

By eliminating redundant task execution and enhancing task management, this feature significantly improves operational efficiency during complex exercises or events.

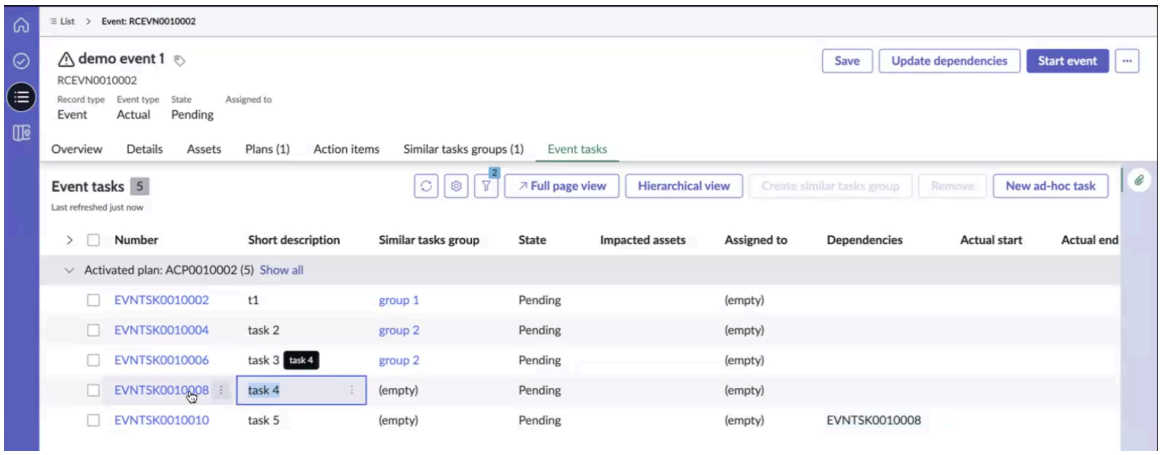
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a similar tasks group

Identify similar or duplicate event tasks associated with an event and add them to a similar tasks group by grouping them in the **Similar tasks groups** tab. It helps you to streamline event task management and reduce duplication of efforts.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager



About this task

You can create a similar tasks group and add tasks to it only in the **Draft** state of the event.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises** > **Pending** and select the event from the list.
2. To create a similar event tasks group, use one of these options.

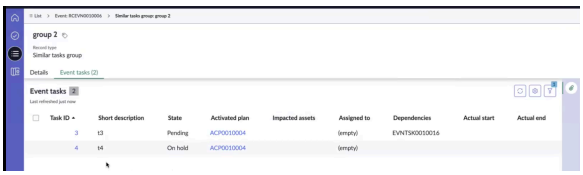
   To add events tasks with dependencies to the Similar tasks group, a cyclic dependency validation check is performed by the system. An event task and its dependent event task cannot be added to the same similar task group. For example, if you add task 4 into an event task group and task 5 is dependent on task 4, then task 5 cannot be added into the same group as task 4 as shown in the example.

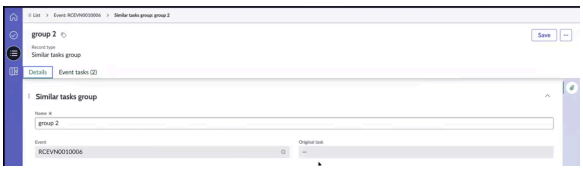
   When an event starts, the system identifies the first executed event task as the original task. Other similar tasks are marked as duplicate tasks in the group.

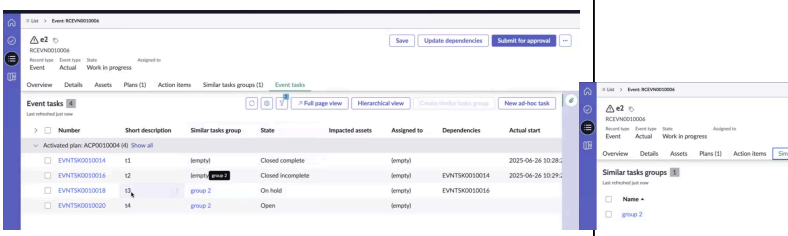
   When an event starts, a task with dependencies remains in the **Pending** state until its dependencies are resolved. Once the dependencies, such as EVNTSK0010008 in the example, are closed, the task moves to the **On hold** state.

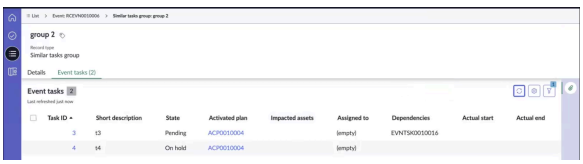
   Note:
   The **Original task** field in the Similar tasks group is automatically assigned when the event task begins execution and cannot be edited manually at any point.

3. To remove an event task from the group, select **Unlink** in the Similar tasks group record.
   The event task is removed from the Similar tasks group.
4. To delete the event task, select **Remove**.
   The event task is deleted from the event.





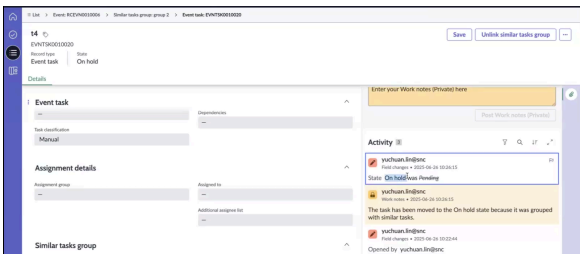


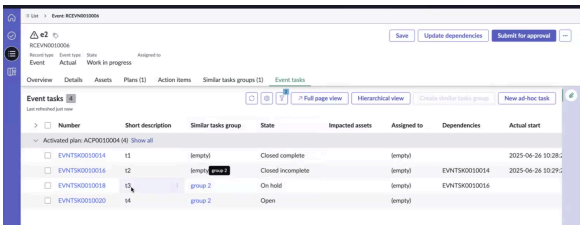


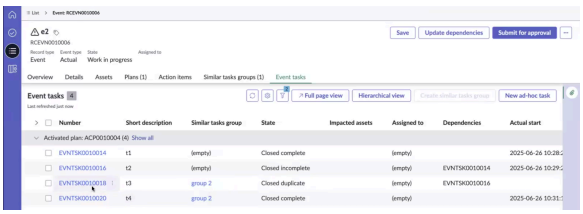
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State changes for event tasks in groups

The original and duplicate event tasks in the Similar tasks group move through different states until the original task is closed.







The state transitions of the original and duplicate event tasks are explained in the following table.

State transitions of the event task

Description	Task state
An event contains similar tasks grouped together.	The event from the list where similar event tasks are grouped together is shown in the example. 
State the **Original task** field before starting the event.	Before starting the event, the **Original task** field in the Similar tasks group is empty and in the read-only state. 
After an event is started, the original task is auto-assigned.	The first task of the event, such as t4 (EVNTSK0010020) of group 2 in the example, becomes the original task of the Similar tasks group. The following example shows that task 4 (t4) does not have any dependency. 
States of original and duplicate tasks	The original task is updated to the **On hold** state and the duplicate task is in the **Pending** state.  For context, the worknote for the original task is updated such that the task has been moved

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State transitions of the event task (continued)

Description	Task state
	to **On hold** because it was grouped by the similar task groups. 
The dependencies in the similar tasks group are closed.	Task 4 is dependent on task 3, task 3 is dependent on task 2, and task 2 is dependent on task 1. Therefore, it is closed first. 
After closing t1, t2 moves to the **Open** state.	The task, t2, is open.
After closing t2, t3 moves to the **On hold** state.	The task, t3, is on hold.
Since all tasks in the group are On hold, the original task (t4) moves to the **Open** state.	The task, t4, is open.
Final step. After closing the original task, the duplicate task moves to the **Closed duplicate** state automatically.	The duplicate task (t3) moves to the **Closed duplicate** state automatically. 

You can unlink an event task from the similar tasks group by selecting the **Unlink similar tasks group** UI action in the event task.

You can re-trigger an original task as a manual task and complete its workflow like a regular event task by selecting the **Re-trigger as a manual task** UI action in the event task. It moves the original task to the **Open** state, but its duplicate task stays in the **Closed duplicate** state.

Import plans and recovery tasks

Import the business continuity plans and associated recovery tasks in the event. Using automated tasks during an exercise enhances efficiency and reduces response time for users.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Exercises** > **Pending** and select **New**.
   The **Create New Event** form is displayed.
3. Fill in the required fields in the **Details** tab.
   For more information on the fields, see Create New Event Task form.
4. Select the plan associated with the event from the Planning list in the Workspace view.

   Enhanced plan management for events

   When adding a plan to an event, the system can now automatically include downstream plans based on the main node configuration. This feature provides flexibility by offering two options:

   - Pull in related plans: This is the existing functionality that brings in related plans associated with the added plan.
   - Pull in downstream plans: This new option automatically adds downstream plans connected to the main node configuration, streamlining the process of managing complex recovery plans.

   Scenarios and considerations: The system evaluates various scenarios as described in this section:

   - Adding or removing plans from an event.
   - Adding assets, which may trigger the addition of related plans.
   - Removing plans or assets and the associated downstream plans.

   User interface enhancements: A new UI action, **Add all plans related to asset**, is available on the Event Asset form, allowing you to easily add related plans to the event.

   By automating the inclusion of downstream plans, this feature enhances the efficiency and effectiveness of recovery planning and execution. It verifies that all relevant plans are considered and included in the event, reducing the risk of overlooking critical recovery steps.

   When you select the plan, its associated recovery tasks are pulled into the event. The tasks are then displayed on the **Event tasks** tab. When the tasks displayed on the **Event tasks** tab have a dependency between them, they are executed in a sequential order.

   Plan activation and task copying: When a plan is activated during an event, its associated recovery tasks are copied into event tasks. This includes the asset recovery level details. If the recovery progress is already complete, the **View progress** button may not be visible. The recovery tasks from the original plan are accurately replicated in the event tasks, maintaining the same step sequence. For instance, if steps 2, 3, and 4 were defined in the plan, they are copied over to the event tasks in the same order.

Monitor event tasks and create ad-hoc tasks

Monitor event task completion and create ad-hoc tasks as necessary in the exercise from the BCM Configurable Workspace. The tasks are then completed in a sequence.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

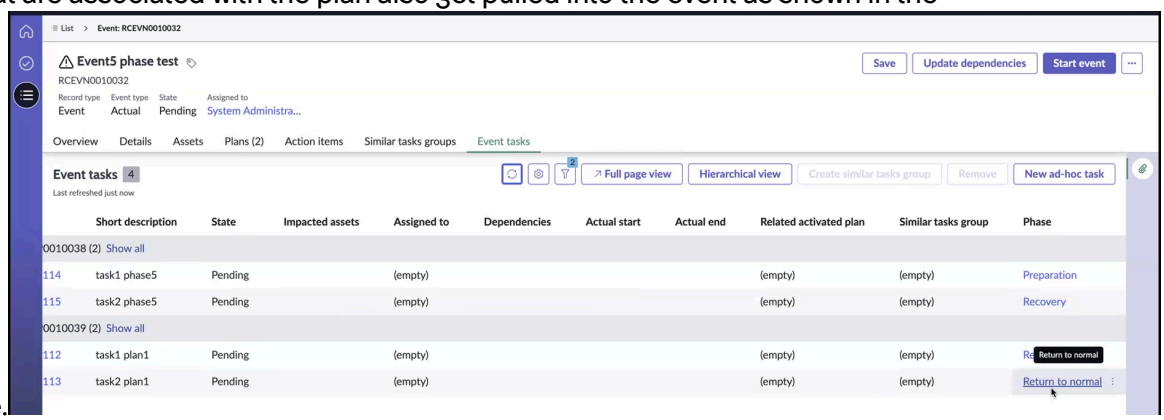
Starting with version 6.1.x of the Business Continuity Management application, these enhancements are supported for managing the tasks.

- Perform edits and change the state of tasks, making the process more efficient.
- Reduce the time spent on managing the tasks individually.
- Improve efficiency for the users who perform the exercises or events offline in tools such as Microsoft Excel. This enhancement helps streamline the transition from offline to online task management.
- Edit the **State** field of the event task if you have the BCM manager role, BCM planner role, or if you are the user assigned to the event.
- The **Retrigger as manual** UI action is used only for the automated tasks.

When the plan gets activated as part of an exercise or an actual event, the automated flow gets triggered.

The edit enhancement offers flexibility for managing the event tasks. The BCM manager, BCM planner, or user assigned to the event can manage the tasks efficiently by performing these tasks:

- Edit several fields such as the **Assignment** field.
- Edit multiple recovery tasks in the **Task status**, **Actual start**, **Actual end**, **Assigned to**, **Assigned group**, and **Additional assignee** fields in the recovery tasks list at one go.
- Open a closed task for editing that was closed by mistake. For this scenario, the **Closed failed** task state is added to the tasks. Moving a task to the **Closed failed** state brings an entire exercise to a stop unless the program manager (sn_bcm.program_manager) unblocks the task and moves it to the **Closed complete** state.



For more information on editing of tasks, see Structured workflows for exercises and Structured workflows for crisis events.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises** > **Pending** and select the exercise event.
2. Select the **Event tasks** tab.

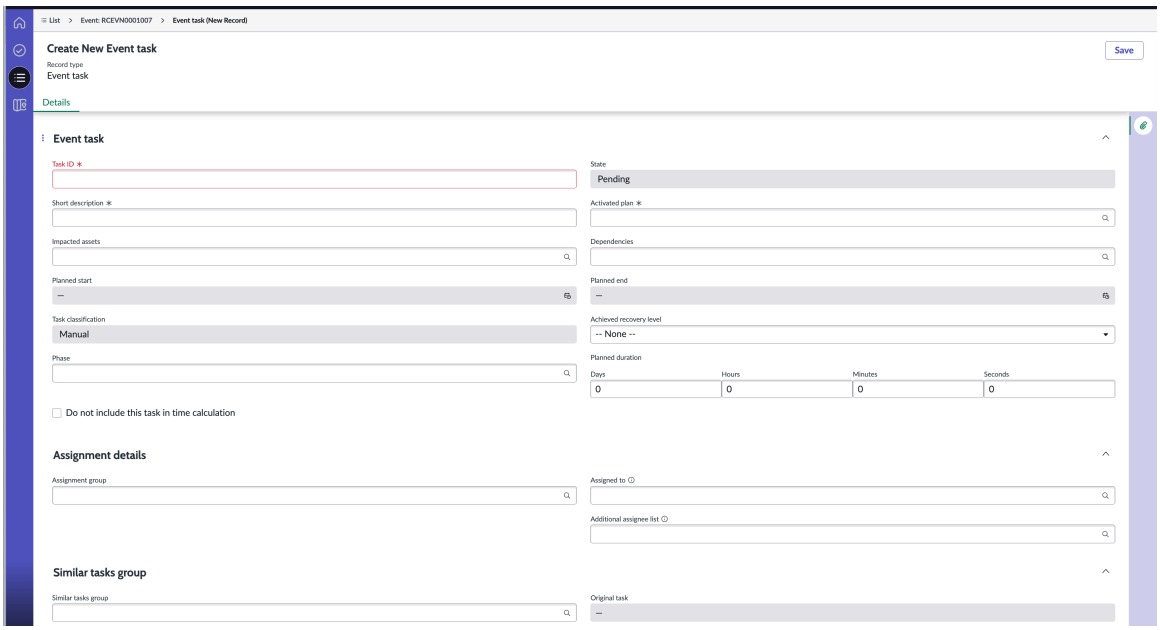
> **Note:**
> The **Event tasks** tab is displayed for the exercise events when the exercise method is **Functional**.

When you add or update the plan to the exercise event, the related plans, assets, and tasks that are associated with the plan also get pulled into the event as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can update the phase of the event task from the list view. You can also create an ad-hoc task and then associate a phase with that event task.

You can edit the phase for an event task until it reaches the **Closed** state. Once the task is marked as **Closed complete**, **Closed failed**, or **Closed incomplete**, the phase field becomes read-only. This change verifies that phases remain editable during active task management but are locked once the task is finalized.



3. To add an ad-hoc task to the event, select **New ad-hoc task**.

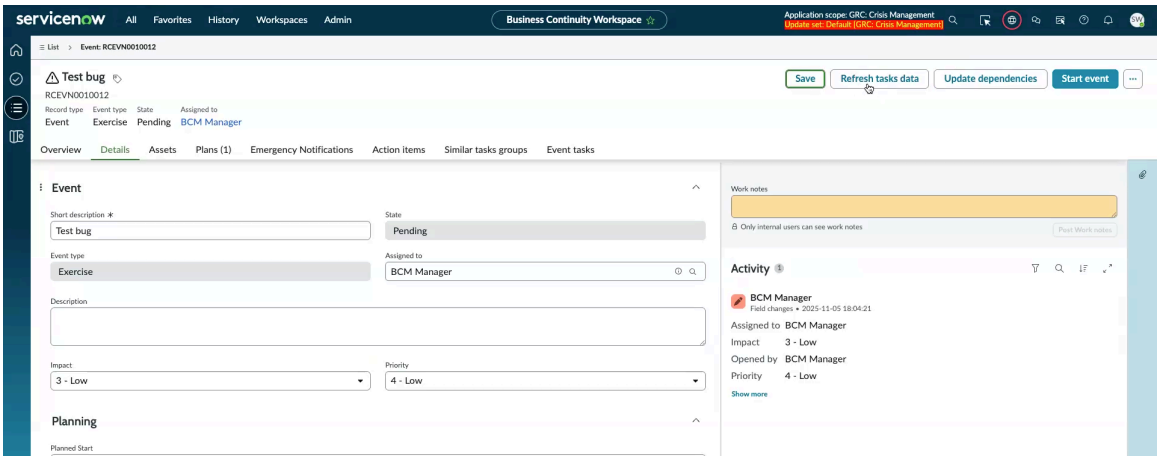
> **Note:**
> When you add an ad-hoc task to the exercise event that is in the **Work in progress** state and if the activated plan is in the **Work in progress** state, the tasks get moved to the **Open** state. If the activated plan is the **Pending** state, the task moves to the **Pending** state.

For more information on the fields in the New Event Task form, see Create New Event Task form.

> **Note:**
> You cannot create an ad-hoc task for the activated plans that are in **Closed Complete** or **Closed Incomplete** state.

The **Create New Event task** form is displayed.

4. To exclude specific tasks from time calculation, select the **Do not include in time calculation** option.



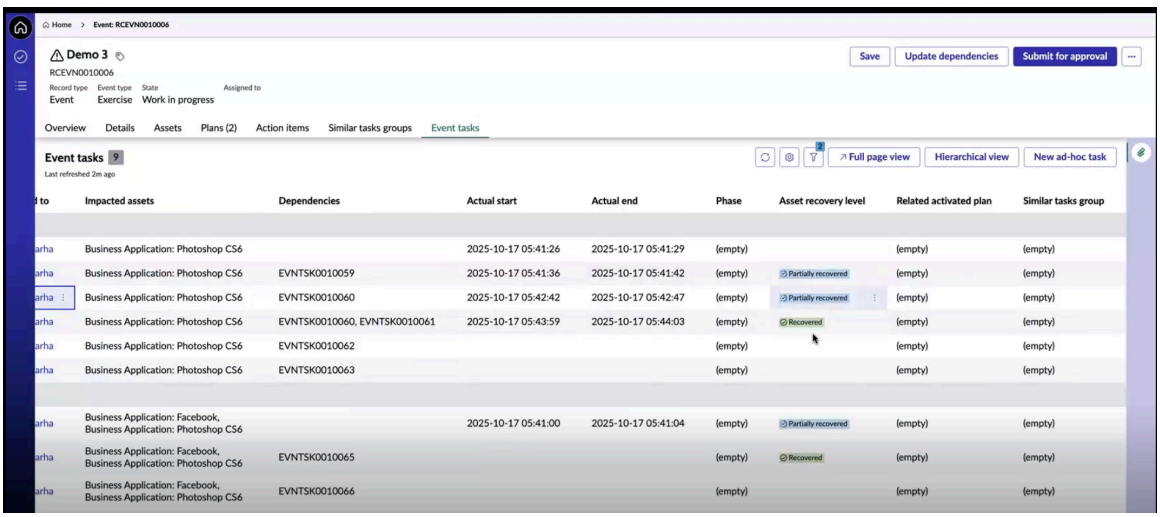
The actual time taken is then calculated based on the minimum start time and maximum end time of included tasks, while the total effort is the sum of the effort for each task, excluding those with the check box checked.

5. Enter the Planned start date in the event and select **Save**.

When you enter the Planned start date in the exercises and events, the Planned start date and the Planned end date on the activated plan and on the event tasks are calculated based upon the **Planned duration** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you have more than 500 tasks for an event or exercise, the planned times are not calculated automatically. A UI action named **Refresh tasks data** is shown. Select the UI action to refresh the Planned start date, Planned end date, and Order.



6. To indicate the achieved recovery level of the impacted asset of the task, update **Asset recovery level**.

   Previously, the assets were automatically marked as Recovered only when all plan tasks were completed, even those assets in later phases such as Return to Normal or Post-Incident Review. This approach delayed visibility into operational readiness. For example, an asset could be functionally available during the Recovery phase, but the system wouldn't reflect the status until all tasks were done.

   Starting with BCM release 9.x.x and later, the asset recovery status has been enhanced to provide granular tracking. Completing specific tasks now automatically updates the corresponding event asset state.

   It is not mandatory that a flow may progress through the **Not Recovered** → **Partially Recovered** → **Recovered** states. If the related tasks are completed, an asset can be recovered directly. It is also not mandatory to add the **Partially Recovered** state; you can specify the recovery level of an asset directly based on task completion

   The Asset recovery level column in the event task list view also features color coding, providing visual indicators for different recovery progress levels. Specifically, **Partially Recovered** is represented by an info color, and **Recovered** is represented by a success color, making it easier to track recovery status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you open the Hierarchical view (Gantt chart), it shows the background colors for the partial recovery and recovery levels.

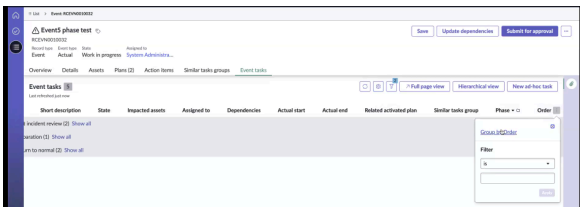
Completing specific tasks now automatically updates the corresponding event asset state. Assets are marked as **Partially Recovered** when they're operational enough to support dependent assets, and **Recovered** when they're fully functional. This change improves visibility into operational readiness and enables recovery coordinators to identify when dependent assets can safely start their recovery process.

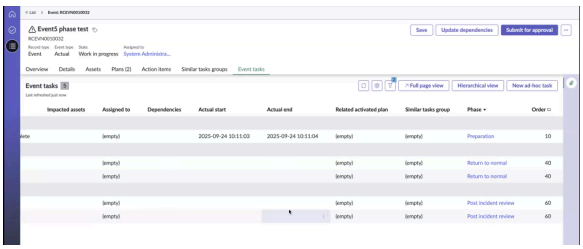
7. Select **Save**.
   The event tasks are displayed in the **Event tasks** tab.

Create New Event Task form

Use the Create New Event Task form in BCM UIB Workspace to add details about an event task.

Create New Event Task form

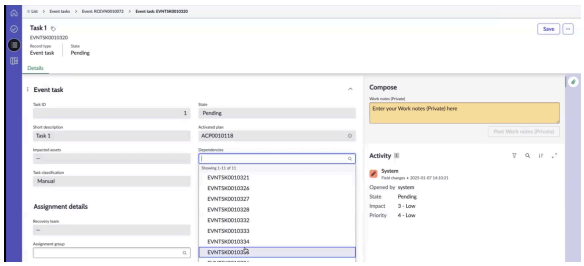




For description of the field values, see the table.

Create New Event Task form

Field	Description
Details tab	
Task ID	ID for the event task. Defaults to the next number of existing event tasks for the plan.
Short description	Brief note about the event task.
Impacted assets	Assets that are impacted for the event task.
Task classification	Classification for the event task. Options are: **Manual** and **Automatic**. When you create an ad-hoc task manually, the task classification defaults to Manual.
Planned start	Planned start date of the event task.
Phase	Active phase to be associated with the event task. You can associate these phases with an event task:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Event Task form (continued)

Field	Description
	• **Preparation** • **Recovery** • **Recovery validation** • **Return to normal** • **Return to normal validation** • **Post-incident review** You can use the **Group by Phase** option in the Phases column to organize event tasks by a specific phase and its order, making it easier to filter and manage related tasks.  When you order the event tasks by the phase order, you can view the event tasks in a sequence in which they are executed. 
Do not include this task in time calculation option	Option to exclude specific event tasks from time calculations. For scenarios with multiple tasks, you can exclude specific tasks from overall time calculations, effectively removing them from the total time estimate. This allows for more accurate time tracking by focusing only on relevant tasks. Any task that is excluded is not considered in the plan and asset time calculation.
State	State of the event. It defaults to the **Pending** state.
Activated plan	Activated plan for the event task.
Dependencies	Dependencies for the tasks. For tasks copied from the plan level, dependencies are copied from the plan recovery task. Dependencies cannot be added for ad-hoc tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Event Task form (continued)

Field	Description
	Note: Beginning with the Xanadu release, you can now manually add a dependency for the event task or select an event task from the list in the **Dependencies** field. Only applicable event tasks are shown in this field. 
Planned end	Planned end for the event task.
Asset recovery level	Option to enable clearer visual indicators for different levels of recovery progress for the asset. Available options are: • **None** • **Partially recovered** • **Recovered** The 'Asset recovery level' column is now available in both recovery and event tasks. You can manually update this column to indicate that all tasks associated with a specified asset recovery level must be completed to achieve that level. Color coding on the Asset Recovery Level column enables clearer visual indicators for different levels of recovery progress. Previously, all steps in a recovery process had to be completed before marking an asset as recovered. Now, you can mark an asset as partially recovered after completing critical steps, and address smaller, ad-hoc tasks later. For example, if a recovery process involves three steps, you can consider an asset recovered after completing step two, and defer step three to a later time. This provides greater flexibility in managing your recovery processes. For more information on enhanced event asset management, see Event assets.
Planned duration	Planned duration of the event task in days, hours, minutes, and seconds. When you enter the Planned start date, the Planned end date on the activated plan and on the event tasks is calculated based upon the **Planned duration** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Event Task form (continued)

Field	Description
	Note: If you have more than 500 tasks for an event or exercise, the planned times are not calculated automatically. A UI action named **Refresh tasks data** is shown. Select the UI action to refresh the Planned start date, Planned end date, and Order. The progress of this calculation can be tracked using the View Progress button in the **Event task** form.
Actual start	Start date and time for the event task.
Actual end	End date and time for the event task.
Actual time taken	Actual time taken for the event task.
Assignment details	
Assignment group	Group to which the event task is assigned.
Assigned to	User or users from the Assignment group. If the **Assignment group** field is empty, then select any user.
Additional assignee list	Additional users that are assigned to the event task.
Similar tasks group	
Similar tasks group	Similar tasks group that the event task can be assigned to. Only eligible event tasks are displayed in the group.
Original task	Original task assigned by the system. When an event starts, the system identifies the first executed event task as the original task. Other similar tasks are modified as duplicate tasks in the group. When a task gets added into the similar tasks group, the system marks it in the **On hold** state. Tasks with dependencies can be managed such that only one task with dependencies is added to the group, and once dependencies are resolved, duplicate tasks are closed when the original task is completed. You cannot edit the **Original task** field at any time. It is auto-assigned only after the event task starts executing.

Start an event

To initiate an event, first pull the relevant plans into the event, and then review the event tasks listed in the **Event tasks** tab.

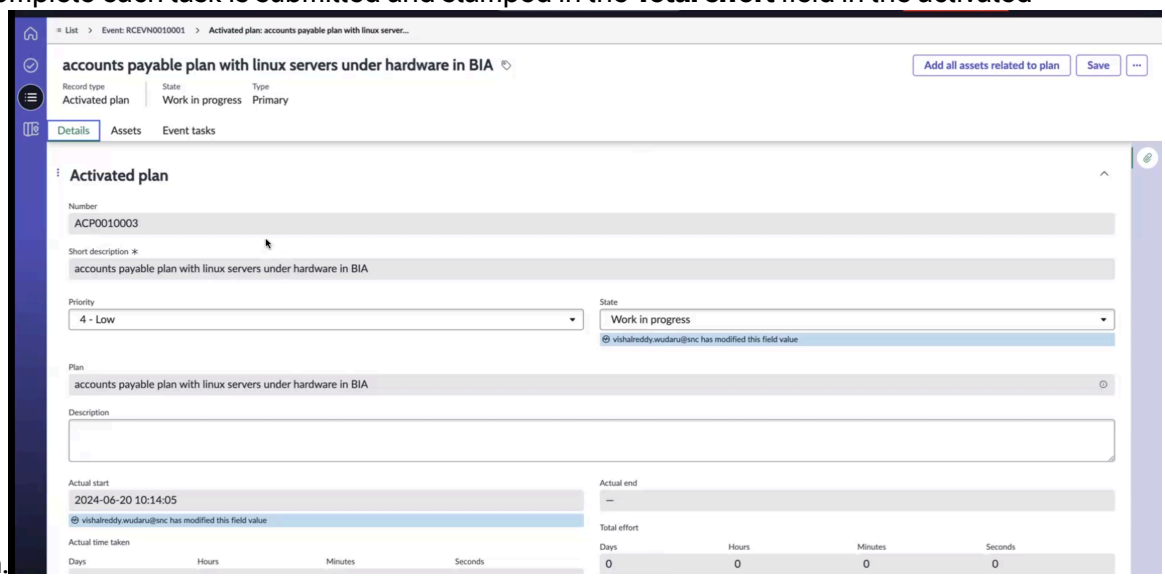
Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** and select the event from the list view.
2. To start the exercise, select **Start Event**.

   Beginning with the Xanadu release, you can monitor the activated plans linked to an exercise, that are now displayed in an **Open** state, instead of the **Work in Progress** state. The **Open** state displays an accurate status of the activated plan. The actual duration of the activated



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

plan is calculated from its start date to the end date. When the tasks linked to an activated plan are updated to the **Work in Progress** state, the status of the activated plan gets updated to **Work in Progress**.

3. Update the state of the event task to **Work in Progress**.

   When you start an event task in an activated plan and update its state to **Work in Progress**, the status of the activated plan is also updated to **Work in Progress**. The condition for the activated plan to move into **Work in Progress** is that work starts on at least one of the event tasks. Until then, all the activated plans are still in the **Open** state.

   Whenever the state of an activated plan changes from Open to **Work in Progress**, the actual start date is recorded in the **Actual start** field. When all event tasks are completed, the actual end is calculated and recorded in the **Actual end** field. Based on the actual start and actual end, the actual time taken is recorded in the **Actual time taken** field. The time required to complete each task is submitted and stamped in the **Total effort** field in the activated plan.

   You can edit multiple recovery tasks at once.

   A message is displayed that the event task has a circular dependency. You have to trigger the tasks manually for this event.

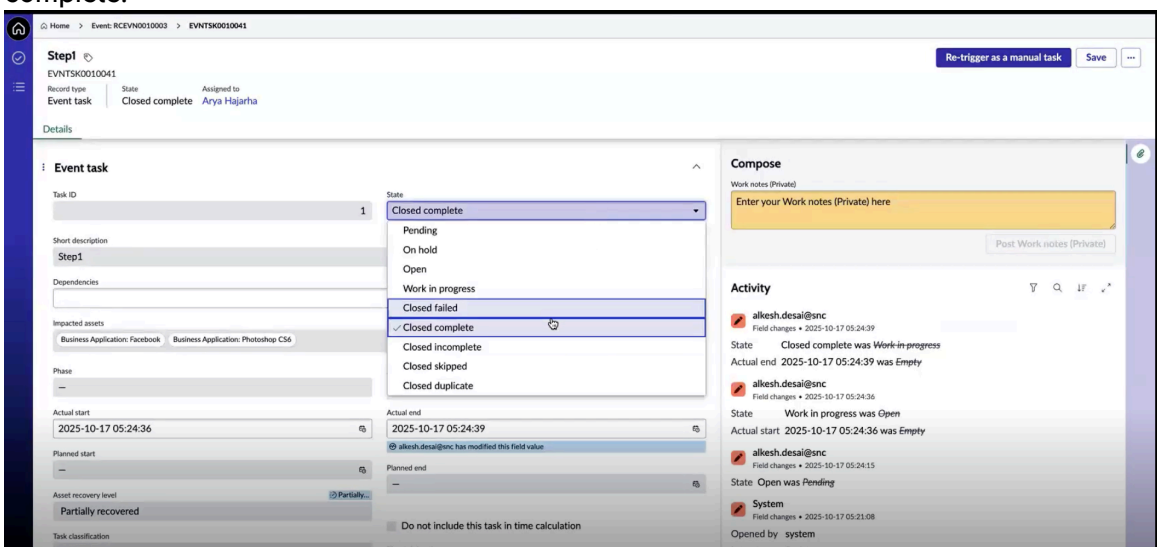
   Upon initiating an event, the event tasks that do not have any dependency between them are executed. When a task is completed, the subsequent tasks that depend on it are executed. For example, when a task transitions to the **Closed failed** state, you have the option to select the task and review its activity details. If an error message is displayed on the screen, you can examine it to identify the issue and take appropriate corrective measures. For instance, if the error message indicates that the code variable must be a positive value, you can update the code variable accordingly.

   If the task transitions to the **Closed failed** state, then its dependent tasks are not triggered. An email notification is sent to the backup assignee, informing them that the automated flow has encountered an error and manual intervention is necessary from the backup assignee.

4. To update the dependencies manually, select **Update dependencies**.
   A UI message is displayed that the dependencies are being updated.
5. To re-trigger as a manual task, select **Re-trigger as a manual task**, if the automated flow fails again.
   You can select **Re-trigger as a manual task**, if the automated flow fails again. The task transitions to the **Open** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Update the event task and select **Work in progress**.



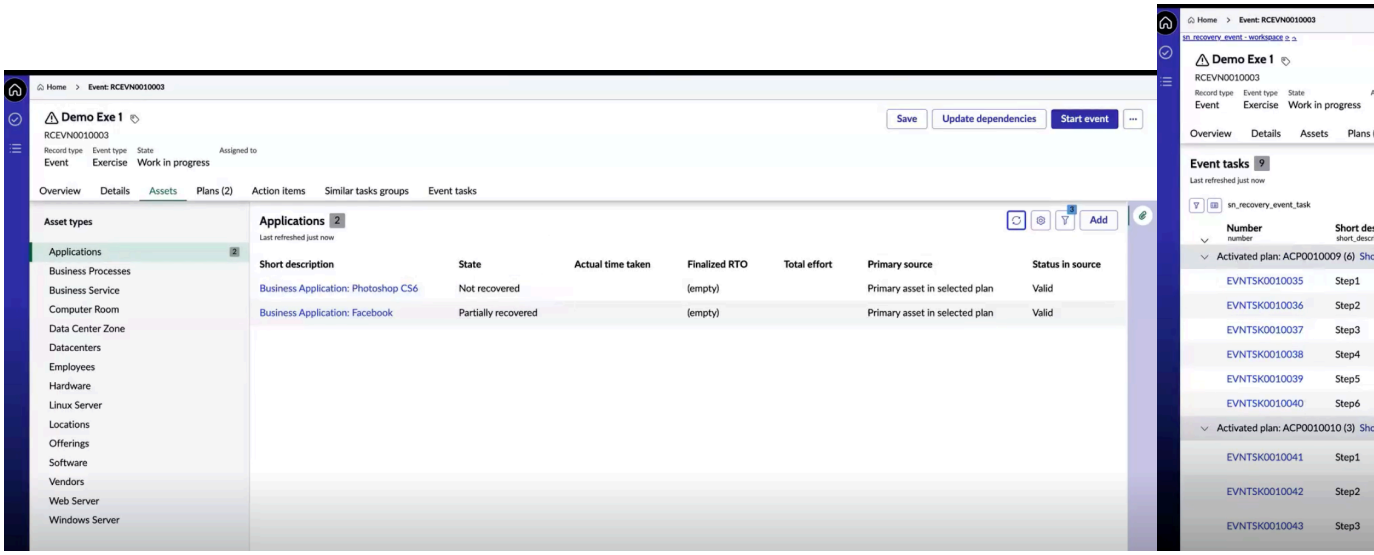
b. Mark the task as **Closed complete**.

Select one of the complete states for the event task and mark it as complete.

You can update the event task manually by selecting one of these Complete states:

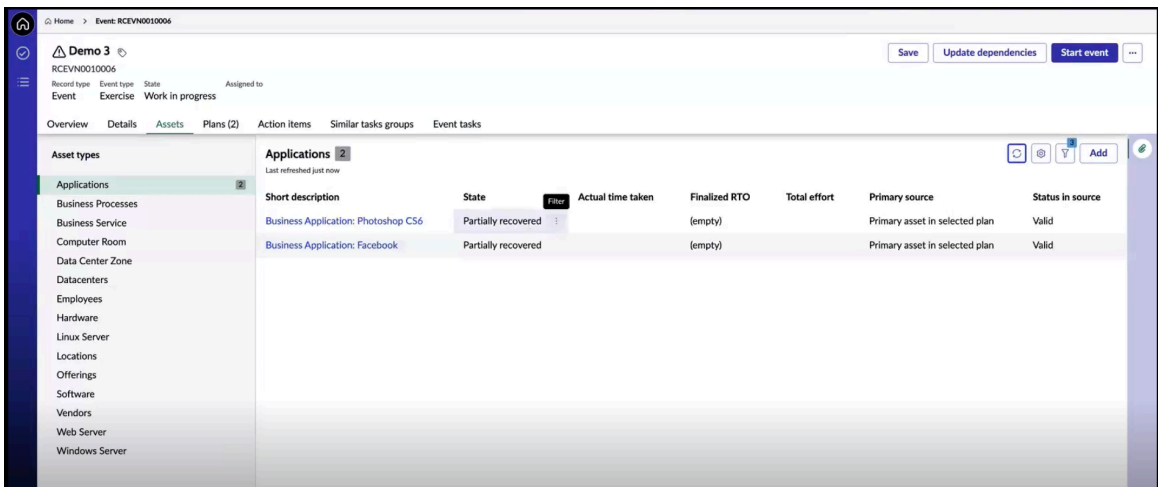
- **Closed incomplete**
- **Closed complete**
- **Closed skipped**

If the event task is in the **Closed failed** state, then the event task is not considered as complete.



Once you mark the task as complete, the subsequent event task is automatically triggered. If the next task is a manual task, its assigned user can proceed to complete the workflow for the event task.

Note:
Once an event task is in the **Closed complete** state, its phase cannot be changed. However, if you re-trigger it as a manual task, you can modify its phase.

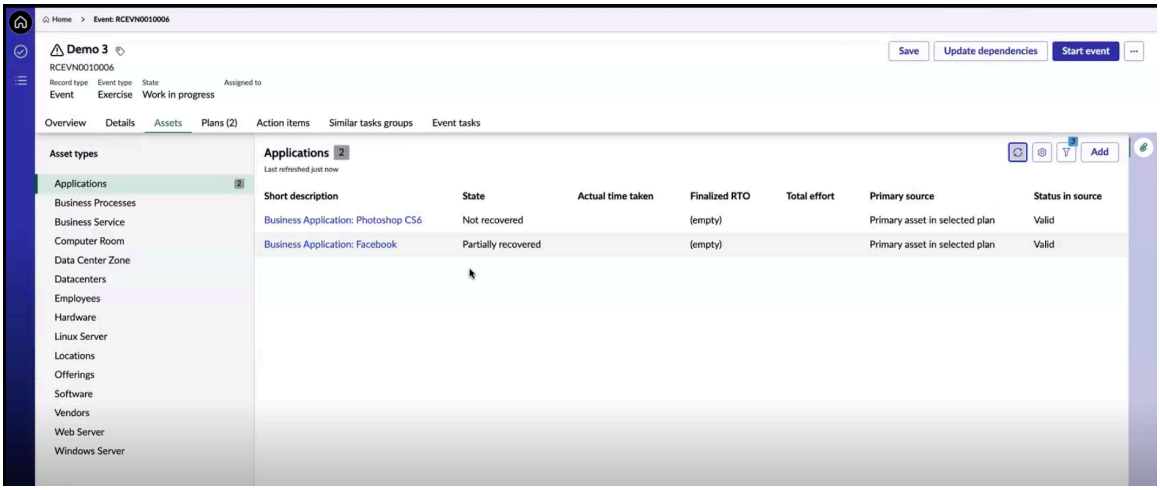


6. Check the state of the assets in the event.

The example shows that the Facebook asset is partially recovered as the partially recovered tasks of Facebook asset are completed, but the Photoshop asset is still not recovered because both its partial and full recovery tasks remain incomplete.

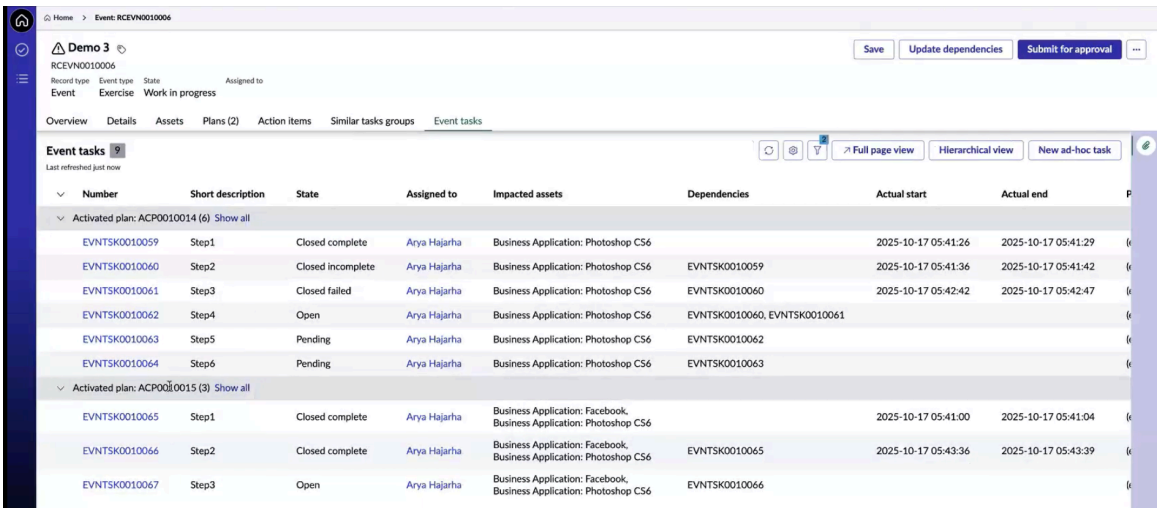
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For an asset to move to partially recovered as shown in the example or recovered, you must close all the related tasks. When all partially recovered tasks are completed, the asset moves to the partially recovered state.



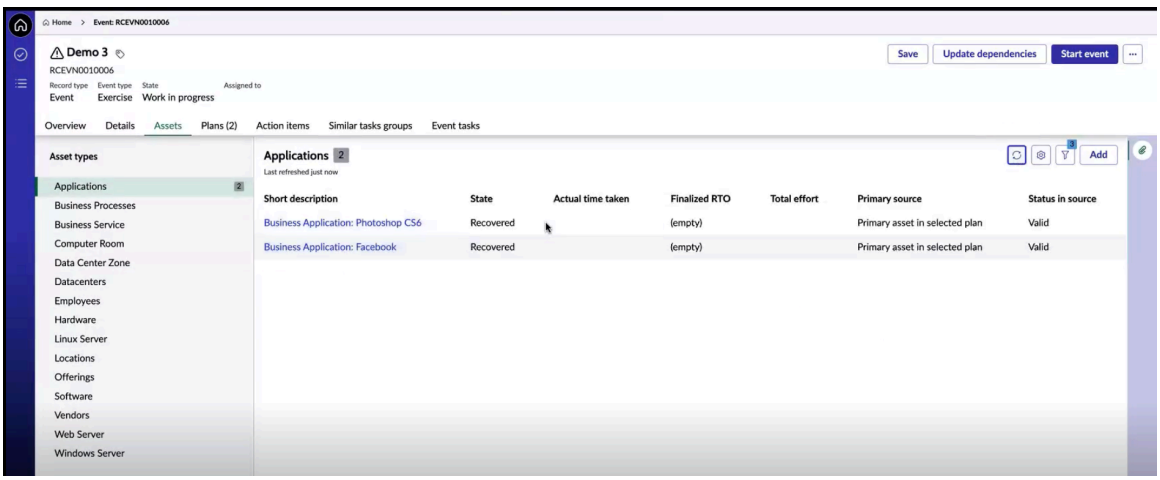
Note:

To mark an event asset as recovered, you don't need to complete the tasks marked as "partially recovered." Completing all tasks with the "recovered" status moves the asset to the "recovered" status. This simplifies the process by focusing only on tasks designated as requiring full recovery.



If no specific asset recovery level is chosen, the asset is considered as "Recovered" only after all associated tasks are completed.

The example shows the assets that are not recovered.

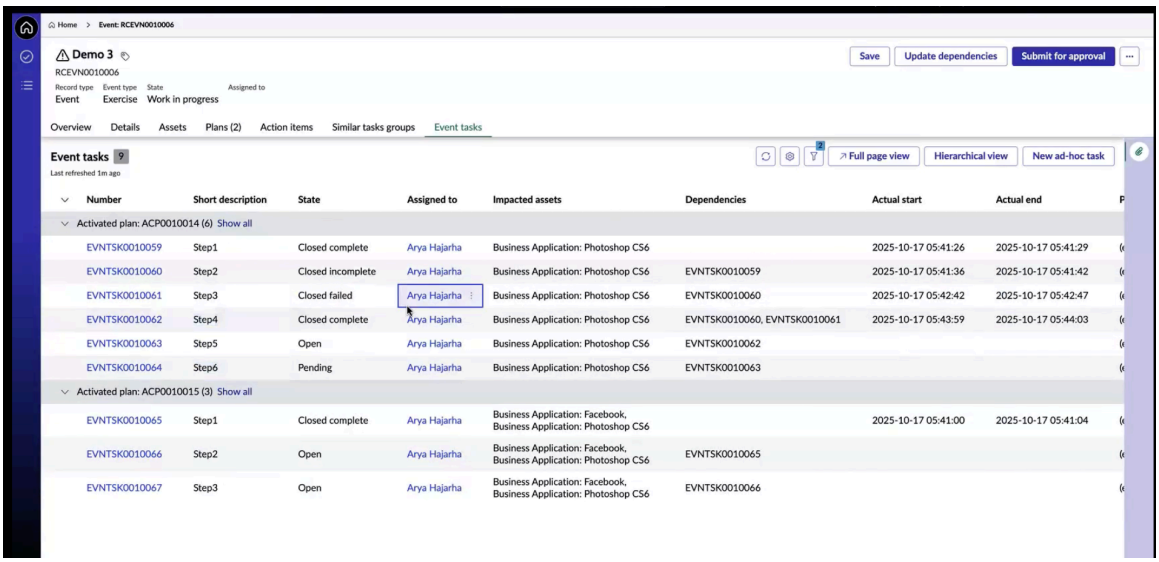


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example shows that step 4 is associated with the "Photoshop" asset and it is open.

Once you complete that open task (Step 4 in the example) and refresh the assets, both assets including the "Photoshop" asset are in the Recovered state.

If a task is retriggered manually during this process, the asset recovery level reverts to its previous level. Any progress made in the recovery process is undone, and the asset is moved back to its prior recovery status.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Once you start an exercise, you cannot delete an event task or update its state to the Pending state.

7. Add the actual start, actual end, and result in the Results section of the form and select **Save**.

Note:

If an asset is recovered with the completion of an earlier event task, such as step 4 in the example, the actual start time and actual end time are calculated until the end of the last event task in the plan (step 6 in this example).

To provide more control over time calculations, the "Don't include this task in time calculation" column is introduced in recovery and event tasks. It enables you to exclude specific steps. In this example, if Steps 5 and 6 are marked to be excluded from the time calculation, the system calculates the time up to Step 4 only. This flexibility enables you to customize the time calculation according to your requirements.

Verify that all plans and tasks are closed before submitting the event for an approval.

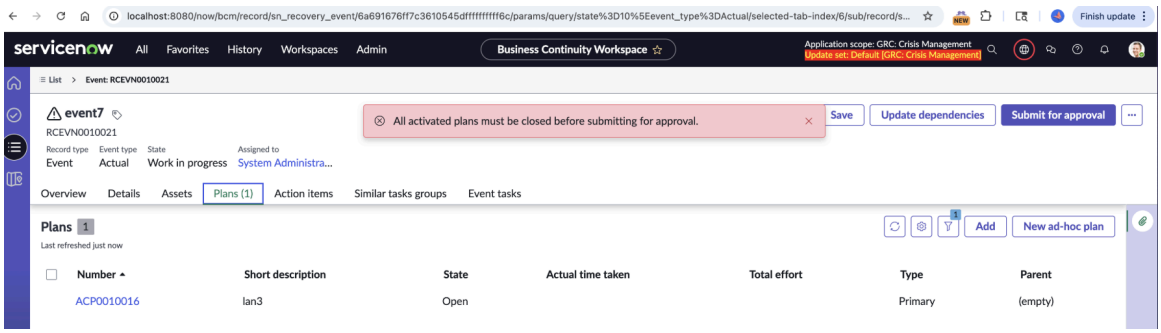
8. Update the **Actual start** and **Actual end** dates for the event task the **Results** section on the **Details** tab.
9. Update the assignment fields as necessary.
10. Enter event task-related information in the **Work notes** field of the **Activity** section.
11. Select **Save**.
12. To generate a PDF, select **Generate PDF**.
    If you have edit access to the crisis event, you can save a copy of the event in PDF format to your local hard drive.

Note:
By default, the PDF is generated and attached after the event is closed.

13. Select the refresh icon ( ) to display the updated state of the asset or plan, and the actual time taken to recover the asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
To request an approval, see Request an approval and approve the event.



Request an approval and approve the event

Approve the exercise in BCM UIB Workspace.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure
1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises** > **Pending**.
2. Select an event for which you are an approver.
3. Verify that all activated plans are closed; close the open plans before submitting the event for an approval.

Note:
Submitting a functional exercise or actual event for approval when an activated plan is still in the **Open** state results in an error message: `All activated plans must be closed before submitting the event for an approval.`

4. Select **Submit for approval**.

Note:
If an approval record is created for the exercise, the **Approve** or **Reject** actions are not displayed on the form. For a user to view the **Approve** or **Reject** actions, these conditions must be fulfilled:

- The user should have the sn_recovery.event_manager role.
- The exercise should be in the **Pending approval** state.
- The exercise should not have any approval records created.

5. Select **Closed Complete**.
   You can update the state of the event to **Closed Complete**.

View recovery tasks from Self-Service

View the recovery tasks that are assigned to you or the recovery task team to recover assets from a crisis event or exercise. Your BCM program manager assigns the tasks to you and you can view them from the self-service application menu.

Before you begin
Role required: sn_bcm.recovery_team_member

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Self-Service** > **My Recovery Tasks**.
2. View the list of the event tasks that are assigned to you, the assigned group that you are part of, or a recovery team that you belong to and the state of the event is not in the **Pending** state. You can view the name and description of the recovery task.
3. Select the link to the **Task ID** of an event task that you want to update.
   You can update the **Actual start** and **Actual end** details.
4. Sort the **Event Type** column to list the crisis-related tasks at the top.
5. View the **Event Task type** column to understand whether it is planned or an ad-hoc event.
6. To add any notes to the event task activity, select the **Activity** section on the **Details** tab and add the information in the **Work notes** field.
7. To update the task to an **In progress** state, select **Work in Progress**.
8. To close the task, select either **Close Incomplete** or **Close Complete**.
9. To update the record, select **Update**.

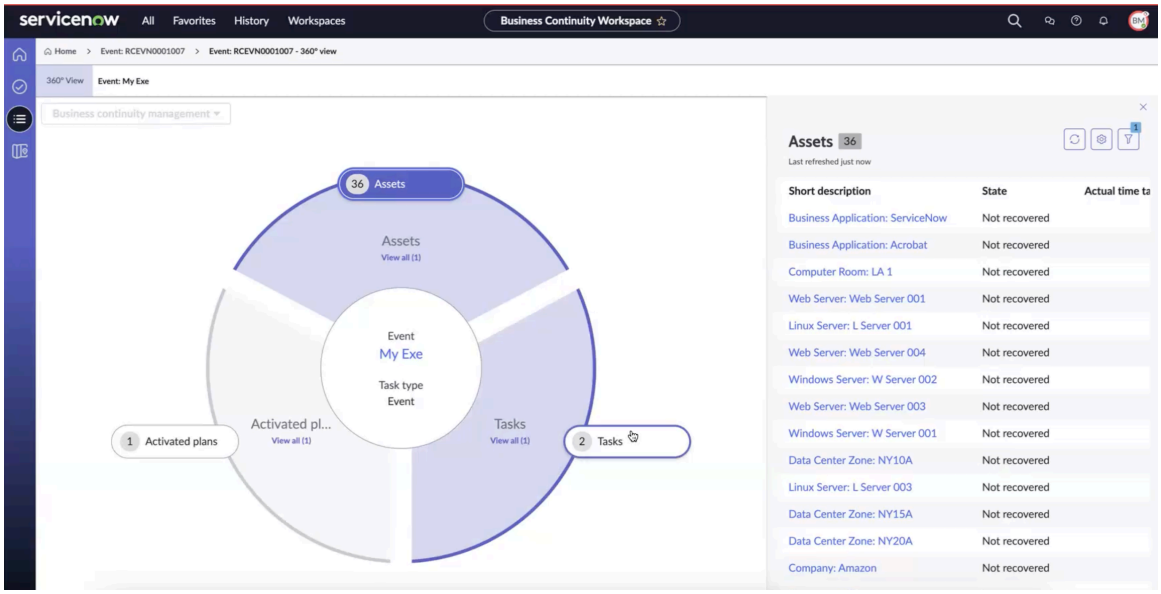
View 360° relationships for exercises and crises

Visualize the 360° relationships for an exercise or a crisis event and the associated entities in BCM UIB Workspace. You can access the 360° view at any time while creating an exercise and a crisis event.

Before you begin

Role required: sn_bia.bia_admin, sn_bcm.program_manager, sn_bcm.planner

About this task



The configurations for the 360° view are stored in **360° View Configurations** > **Configure 360° Views**. If you have the BCM administrator role, you can configure the relationships for the records in **360° View Configurations** > **Relationship Registries**.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercise**.
2. Select a record from the list.
   The exercise event record is displayed. The same procedure applies for a crisis event.
3. Select **360° view** in the event record.

   The 360° view for the selected event is displayed as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The 360° view for the selected event shows these details:

- **Activated plans**: Activated plans that are associated with the assets.
- **Assets**: Assets that are impacted due to the event.
- **Tasks**: Tasks that are associated with the event.

When you select the **Assets** capsule in the 360° view, the details of the assets for the event are displayed in the **Assets** panel on the right as shown in the example.

4. Select the event or list view in the breadcrumb navigation to open the original event record.

Generate event reports in PDF or Microsoft Word

Generate the PDF or Microsoft Word copy of an exercise or a crisis event in the BCM Configurable Workspace and save it for a future reference.

Before you begin

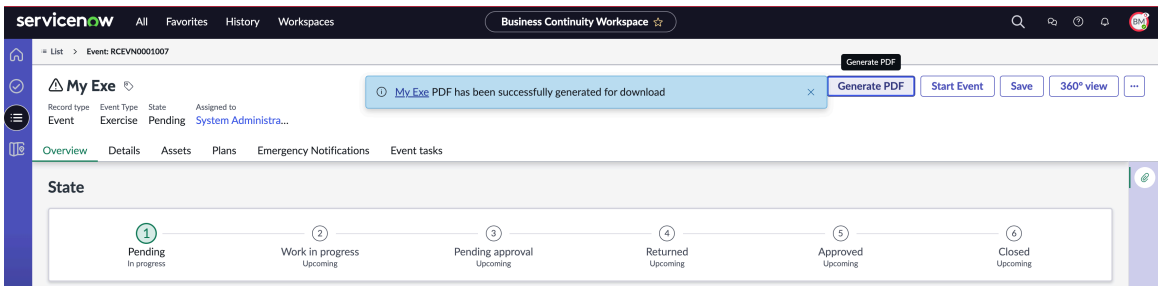
Role required: sn_bcm.planner, sn_bcm.program_manager

About this task

To format the PDF for your business needs, see Format PDF templates for BIAs, BCPs, and events.

Beginning with the Xanadu release, the content in PDFs of Business Impact Analyses, Plans, and Events is improved by implementing a new layout:

- Arrange the various event tasks in a table format.
- Include details of the asset owner and the description from the Business Impact Analysis.
- Display a table that outlines the dependencies of the plan assets.
- Mark the date of the PDF creation on the front page.



Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises**.
2. Select any event record that is in the **Review** or next state from the list view.
   You can use the same process of generating the PDF for a crisis event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Generate PDF** in the form.

   The example shows the message that is displayed on the screen: `<Name of the exercise event> PDF has been successfully generated for download.`

4. To download the PDF, select the link in the message.

   The example shows that the PDF of the exercise has been downloaded locally.

5. Save the PDF on your system.
   You can save the PDF for a future reference.
6. To format the Events PDF template, follow the instructions in Format PDF templates for BIAs, BCPs, and events.
7. To create the event report in Microsoft Word, select **Generate MS Word**.

   Generate a report of the event or crisis record in Microsoft Word format. The Microsoft Word copy of the BIA record is successfully generated that you can download.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on generating reports in Microsoft Word format using Document designer, see Generating reports using Document designer.

8. To print the report, open the saved PDF or Microsoft Word copy and select **Print**.

Structured workflows for crisis events

Perform the structured workflows to manage a crisis event in Business Continuity Workspace (also known as BCM Configurable Workspace).

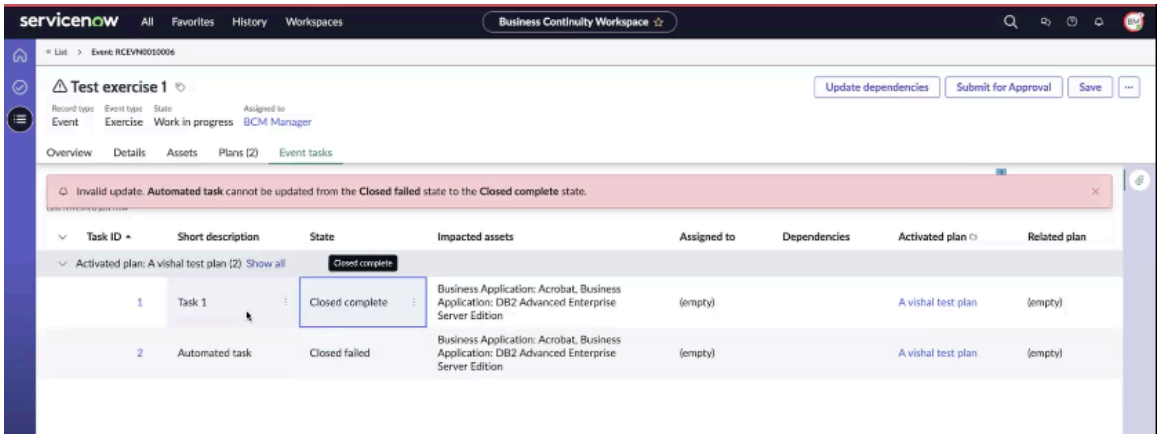
Typically, the BCM program manager performs the following tasks to respond to a crisis event:

- Create a crisis event. For more information, see Start a crisis event.
- Add an asset and plan to the crisis event. For more information, see Track impacted assets and add related plans.
- Add an event task to the crisis event. For more information, see Add a task to the crisis event.
- Submit the event task for the exercise event. For more information, see Request an approval and approve the crisis event.

Additional information on Crisis events

- For information on the **Crisis events** tab in the Home page, see Home page view.
- For information on the threats, feeds, and alerts in the Crisis map interface, see Crisis map interface.
- For information on the administrative tasks in the Crisis map interface, see Setup for Crisis map.
- For information on the crisis events, see Crisis events.

Bulk editing of tasks from the Event tasks related list



Starting with version 6.1.x of the Business Continuity Management application, users who have editing access to the event record can now perform bulk edits on tasks directly from the Event tasks related list. This feature is beneficial for users who manage multiple event tasks simultaneously.

In the recovery tasks list, users with the necessary edit permissions can modify the following fields simultaneously:

- **State**
- **Assigned to**
- **Actual start**
- **Actual end**
- **Assigned group**

Once an event is initiated, these users can also modify the state of an event task either from the list view or the form view. The process for updating the state of an event task from the list view is demonstrated in the following example. If a state transition is not allowed, an error message is displayed to indicate that the update is invalid.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table details the permitted state transitions for an event task.

Permitted state transitions for an event task

Transition from state	Pending state	Open state	Work In Progress state	Closed Complete state	Closed Incomplete state	Closed Skipped state	Closed Failed state
Pending	No	Yes	No	No	No	Yes	No
Open	No	No	Yes	No	No	Yes	No
Work In Progress	No	Yes	No	Yes	Yes	Yes	Yes
Closed Complete	No	Yes	No	No	No	No	No
Closed Incomplete	No	Yes	No	No	No	No	No
Closed Skipped	No	Yes	No	No	No	No	No
Closed failed	No	Yes	No	No	No	No	No

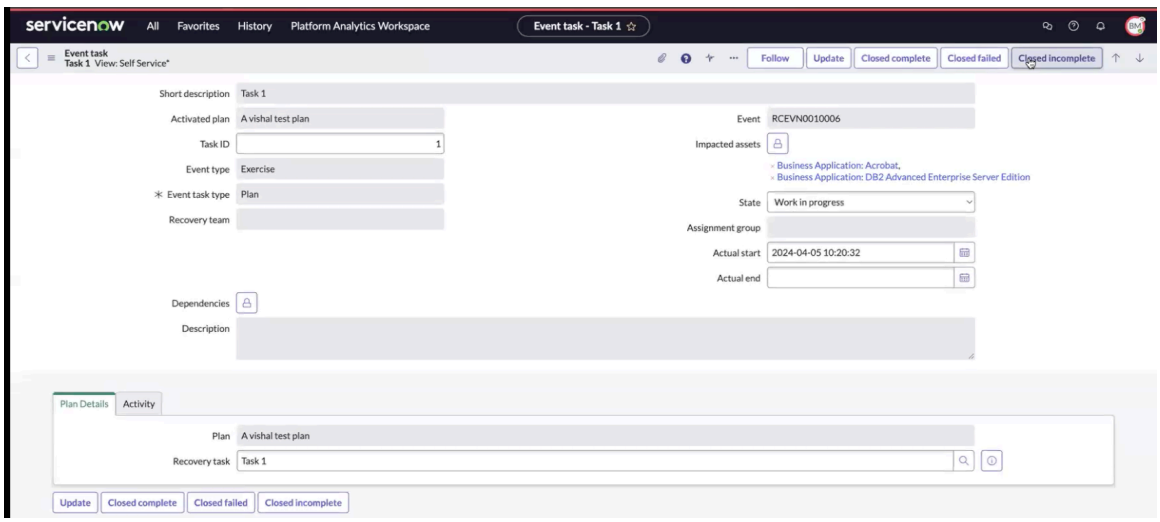
Note:
All changes to state transitions and updates to the start or end dates are listed in the Task activity log.

Consider the following key details about the state transitions of an event task.

1. The event task can only be opened from the **Closed complete** state.
2. Once the event task moves to the **Open** state, users of the event task can edit it further.
3. The task can then be moved from the **Open** state to the **Closed Skipped** state.
4. Only users with access to the event can reopen the event task. While recovery task members can change the status of the event task, they cannot reopen it.

The following table summarizes the UI actions available for an event task and their corresponding states:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



UI actions and the associated states of the event tasks

UI action	State of the event task	Notes
Trigger	**Pending**	This condition is applicable only when an event has been started.
Skip task	**Pending**, **Open**, **Work in progress**	-
Work in progress	**Open**	-
Closed complete	**Work in progress**	-
Closed incomplete	**Work in progress**	-
Closed failed	**Work in progress**	-
Re-trigger as a manual task	**Closed**	-
Re-trigger automation	**Work in progress**, **Closed**	This condition is applicable for an automated task only.

If a task is mistakenly closed, users of the event task can reopen it to make the required edits, ensuring the recovery process remains accurate and complete.

Updating the event task as a recovery task member

Generally, recovery task members update the status of event tasks. Although they do not have access to the event page or workspace, they can navigate to **My Recovery Tasks** in the instance to access the recovery task. By modifying the UI action, they can change the status of the event task, as demonstrated in the example.

For instance, when members of the recovery task mark the task as Closed complete, all fields on the form become locked. This implies that while members of the recovery task cannot modify the fields, they are still able to add activity notes. Only users who have access to the event task can edit the fields on the form.

For information on importing the automated task in an event, see Import automated tasks and start an event.

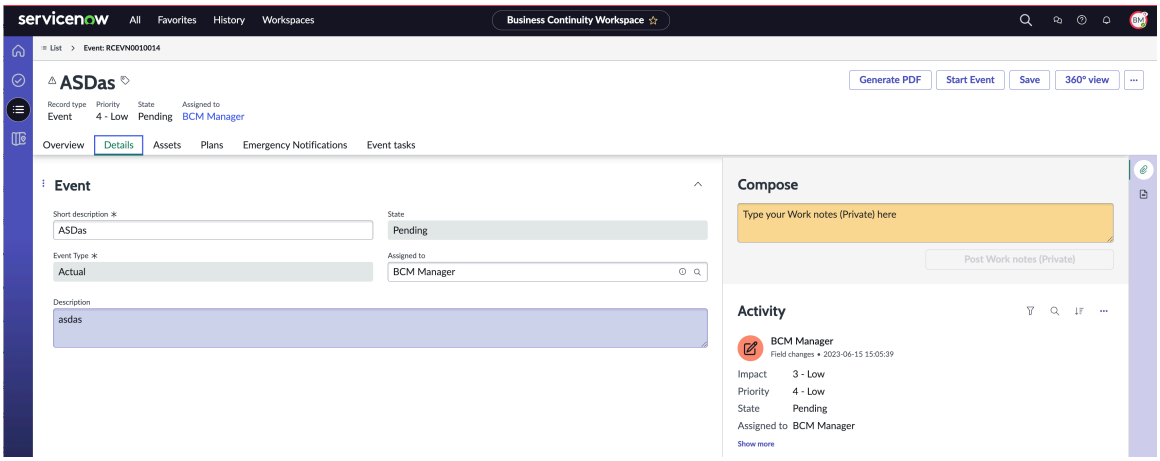
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start a crisis event

Report a crisis event in the BCM Configurable Workspace. A crisis event is any significant disruption that threatens business operations. The BCM Configurable Workspace enables you to create crisis records, classify severity levels, set priorities, assign response teams, and document initial actions.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager



Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **crisis events** > **Pending** and select **New**.
   The **Create New Event** form is displayed.
3. In the **Details** tab of the **Create New Event** form, fill in the required fields.

   Note:
   For a crisis event, the event type is **Actual**.

   For more information on the fields, see Create Crisis Event form.

   A crisis event is created in the **Pending** state as shown in the example.

   The state and details of the crisis event are displayed in the tabs:

   - **Overview**: You can view the current state and overall state progression of the crisis event.
   - **Details**: You can view details on the crisis event such as its short description, state, event type, assignee, and so on.
   - **Assets**: You can select the impacted item type or the primary elements that you want to recover for an asset type.
   - **Plans**: You can add an ad-hoc plan for the selected asset to the crisis event.
   - **Emergency Notifications**: You can create a notification for the crisis event with the Everbridge integration.
   - **Event tasks**: You can add an ad-hoc task to the crisis event.
4. To perform more actions on the crisis event, select **More actions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Save**.
   The crisis event is saved in the **Pending** state and it is displayed in the Crisis events list view of the record.

Create Crisis Event form

Use the Create Crisis Event form in BCM UIB Workspace to add details about a crisis event.

Create Crisis Event form

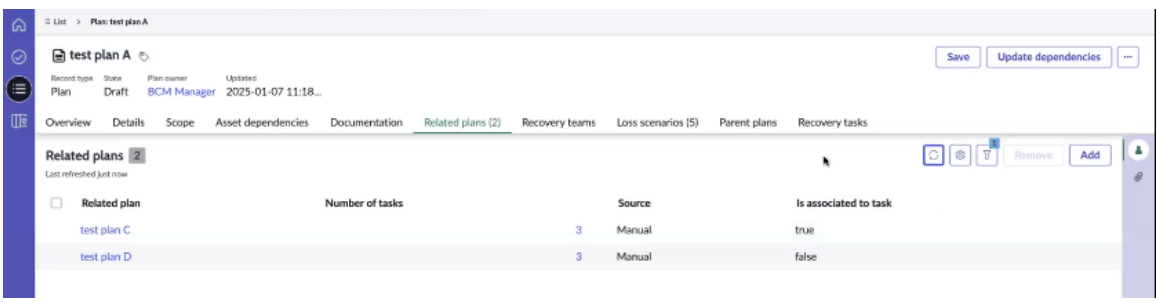
For description of the field values, see the table.

Create Crisis Event form

Field	Description
Details tab	
Short description	Brief description about the crisis event.
State	State of the event. Defaults to the **Pending** state.
Event type	Type of the event. For a crisis event, the event type is **Actual**.
Assigned to	User or users from the Assignment group. If the **Assignment group** field is empty, then select any user.
Description	Description of the event.

Using nested plans

Configure a system property to control activated plan levels in an event. The system automatically creates nested plans within an event, reducing the manual effort of adding plans and improving system performance. You can also add dependencies between multiple activated plans by updating the **Dependencies** field in the event tasks.



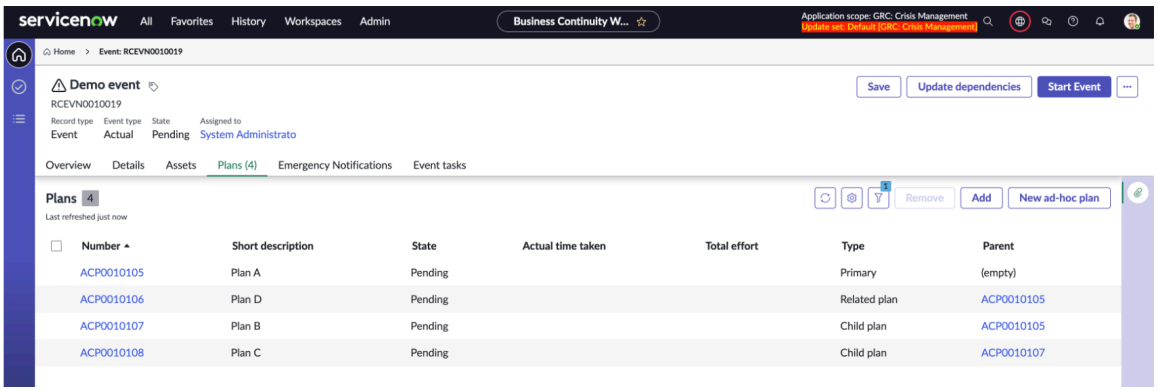
Changes in the plans and events

Beginning with the Yokohama release, new changes in the plans and events focus on the planning phase and the creation of related plans.

Associating related plans with recovery tasks

You can now associate related plans with recovery tasks, helping you identify and manage plan triggers during recovery.

A new field, **Is associated to task**, has been added to the Related Plans table. If a related plan is associated with a recovery task, the field is set to True. If it is not associated, the field is set to False.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When a related plan listed in the **Related plans** tab is associated with a recovery task, it is created as a child plan in the event. If not associated with any task, it is created as a related plan but not as a child plan.

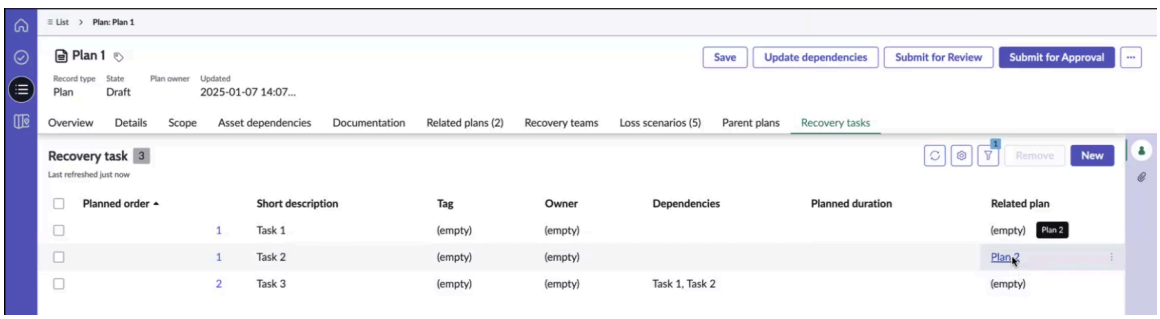
Adding a plan to the event

When a plan is added to an event, its related plans and their entire hierarchy are included. Plans manually added to an event are called primary activated plans. Plans without task associations are called related plans. Plans associated with recovery tasks are called child plans.

Using a hierarchy of the plans

Previously, only the primary plan and its directly related plans were included in an event. With the Yokohama release, you can set the *sn_recovery.max_activated_plan_levels* property to control the depth of activated plans in events, up to 10 levels.

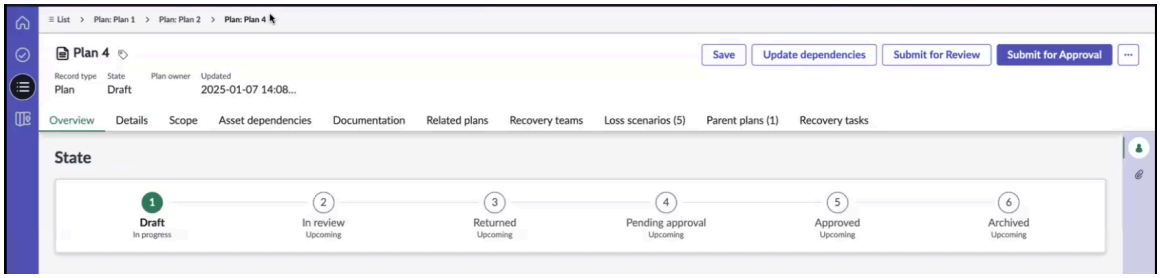
Resetting the property for activated plan levels



You can customize the *sn_recovery.max_activated_plan_levels* property as shown in the following examples to control the levels of activated plans that are created in an event.

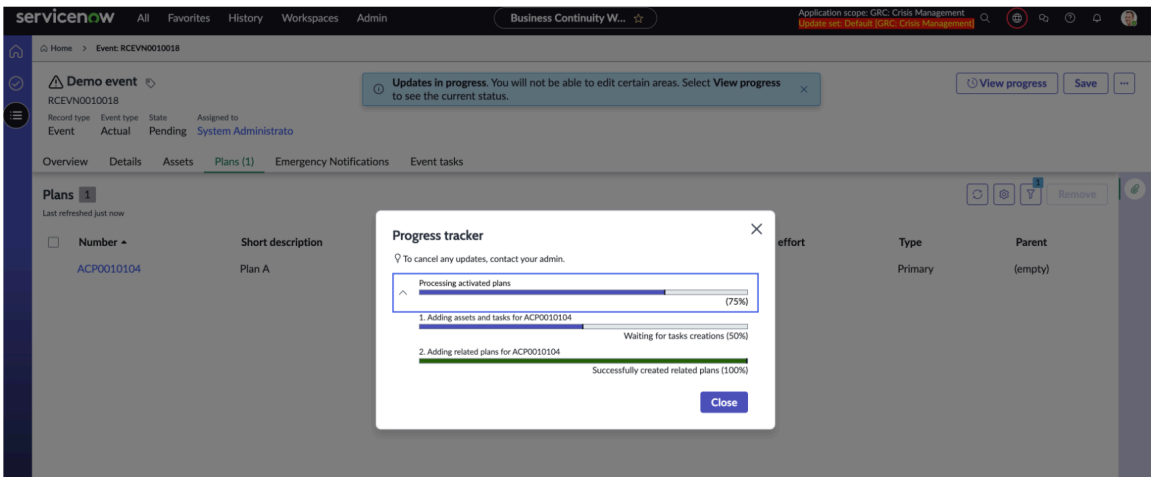
- Set the property to 1 to create only the plans added manually.
- Set the property to 2 to create only the primary plan and its first-level related plans.

Sample use case for a multi-level plan



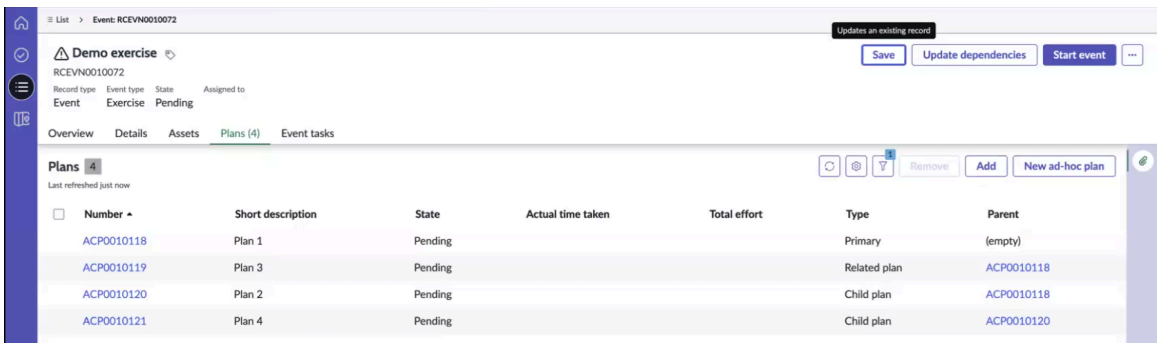
You can add a multi-level hierarchical plan to an event. Consider the following use case where the system property is configured and a few related plans have recovery tasks associated with them. An event is created where the related plans are added to the event.

The primary plan, Plan 1, has Plan 2 and Plan 3 as related plans. Plan 1 includes three recovery tasks: Task 1, Task 2, and Task 3. Task 2 has Plan 2 as a related plan.



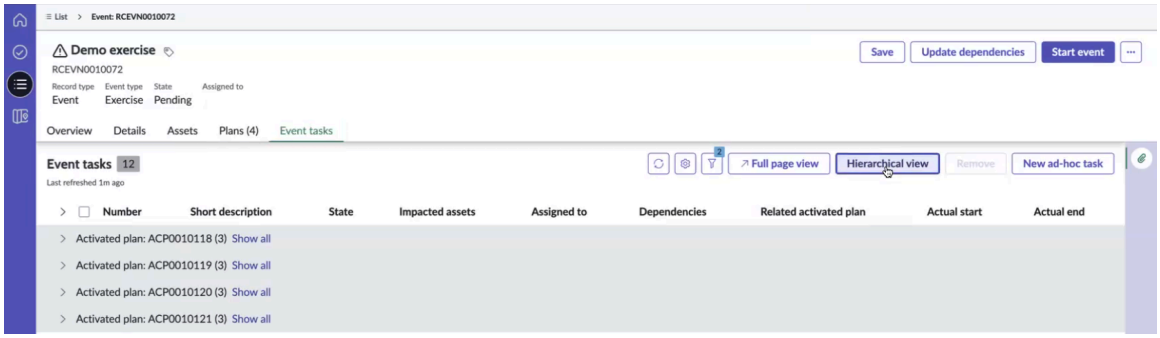
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Similarly, Plan 2 has three recovery tasks: Task 1, Task 2, Task 3. Plan 1 triggers Plan 2, and Plan 2 triggers Plan 4 as shown in the example.



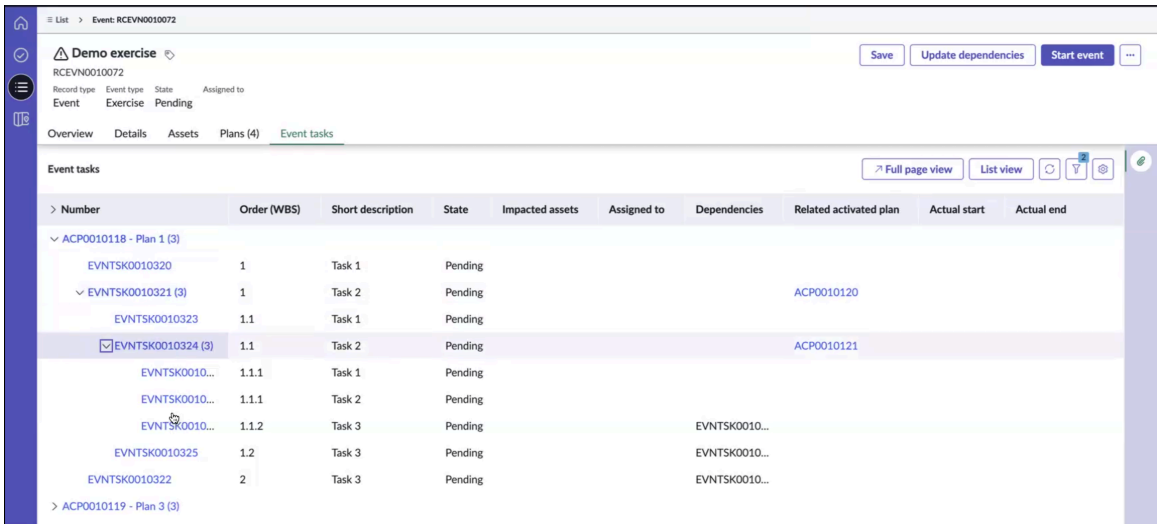
Previously, when a primary plan like Plan 1 was included in an event, only the first level of related plans, such as Plan 2 and Plan 3, were added. Deeper levels, like Plan 4, were not included. With the nested plan functionality, plans up to 10 levels deep, including Plan 4, can be added to the hierarchy.

When you create an event and add Plan 1, its related plans, assets, and tasks are automatically included. Selecting the **View progress** button opens the Progress tracker window, showing the progress and status of adding plans, assets, tasks, and related plans, and the steps and status of the background process.



Once all processes are completed, a message prompts you to refresh the page to see the latest updates. You can close the message and then view the created plans and event tasks.

As shown in the example, Plan 1 is the primary plan. Plan 3 is marked as a related plan of Plan 1 because it is not associated with any recovery task. Plan 2 and Plan 4 are child plans because they are associated with recovery tasks.



Event tasks: Event tasks are shown in the list view by default. Switch to the hierarchical view to display the hierarchy, with primary and related plans at the top level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example illustrates the hierarchy of event tasks and plans, with the primary plan (ACP0010118) and related plan (ACP0010119) at the top level.

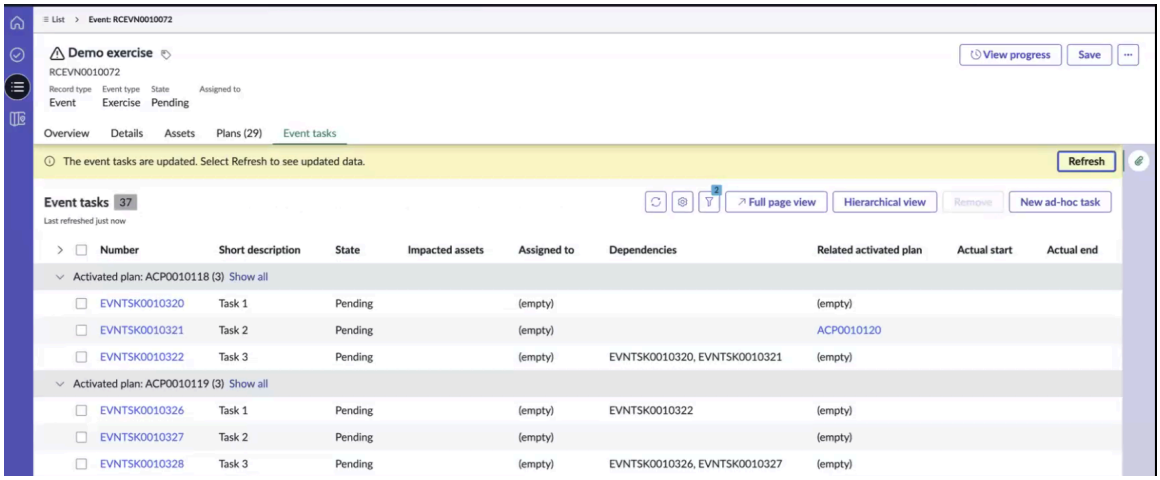
- Plan 1 (ACP0010118) has three event tasks. The second event task (EVNTSK0010321) triggers Plan 2 (ACP0010120), and another event task (EVNTSK0010324) triggers Plan 4.
- Plan 3 (ACP0010119) has no related activated plan.
- Two child plans (ACP0010120 and ACP0010121) are shown at child levels.

Navigating between the list view, hierarchical view, and full page view

While working on event tasks, you can navigate between the list view, hierarchical view, and full page view.

List view

Arranges event tasks in a list format, making it easy to read and quickly understand the hierarchy. It helps you to scan and find specific information without sifting through lengthy text.



Hierarchical view

Visualizes plan dependencies and the order of event tasks. By default, the system shows only primary and related plans in the list view. Switch to the hierarchical view to see the full plan hierarchy.

Note:
You can edit event task and plan information in the list view, but the hierarchical view is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

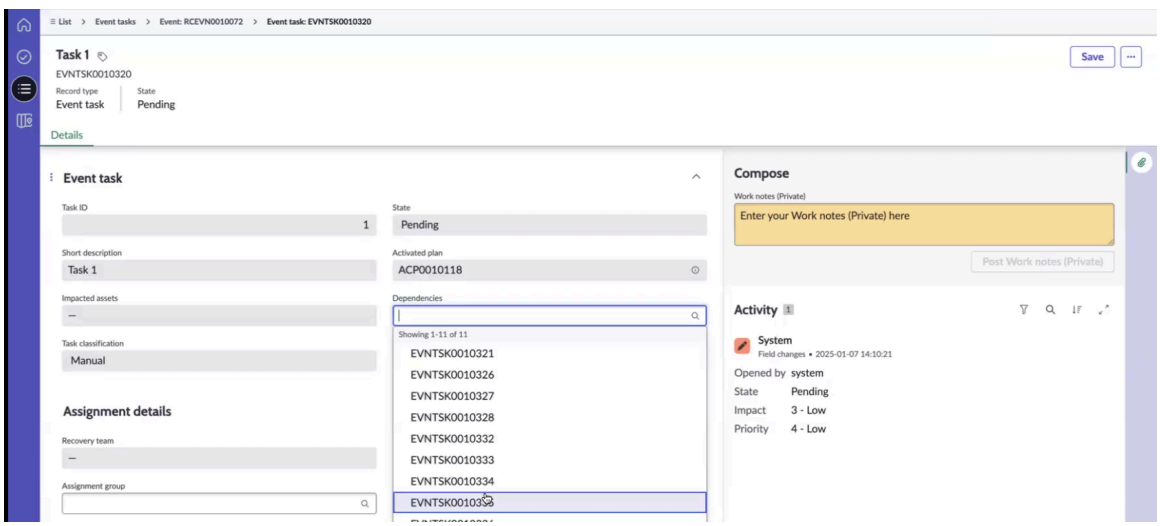
The Work-breakdown structure (WBS) arranges tasks based on their dependencies. For an activated plan, the WBS order is calculated considering both event task and plan dependencies.

Full page view

Allows you to see more tasks at once, providing a comprehensive overview of the plan hierarchy and tasks. You can switch between the list, hierarchical, or full-page views.

To return to the original record, select the **Back to record** button.

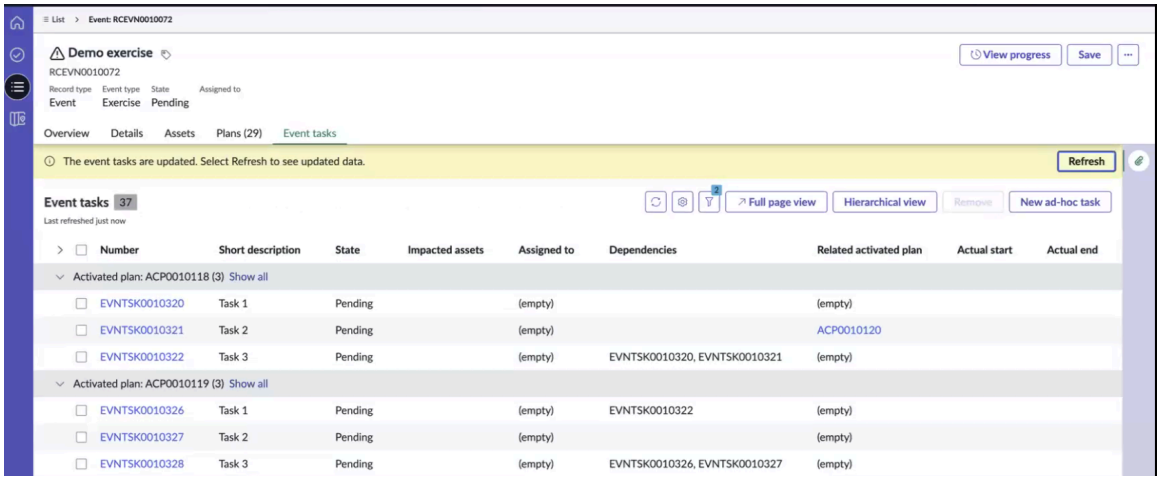
Records per level



UI navigation

By default, only 10 plans are shown at the first level. If there are more, select the **Show more** button to display additional records. For example, if there are 100 plans, only 10 are shown initially, and selecting **Show more** loads the next set.

Configuring cross-plan dependencies



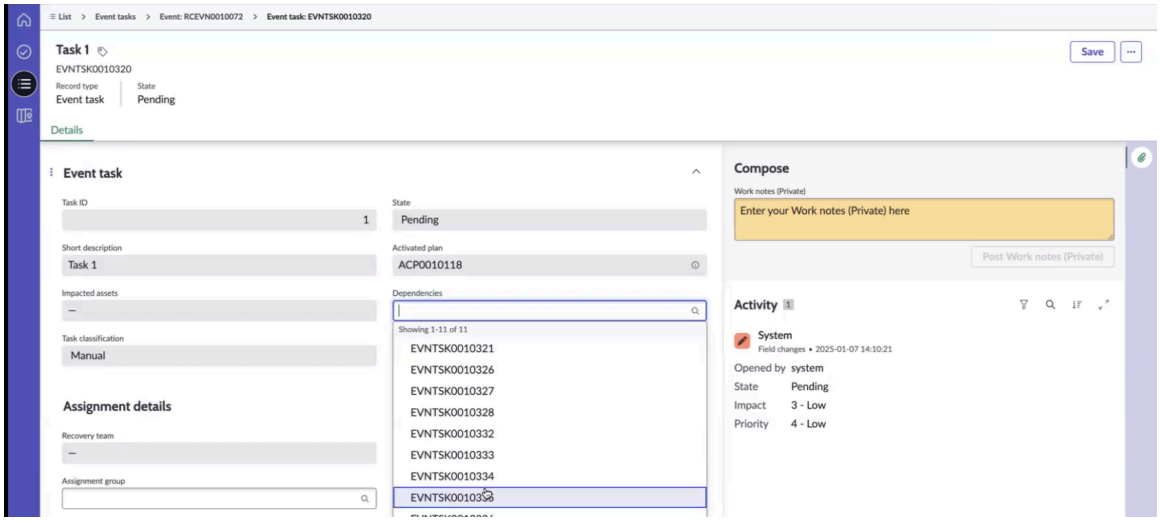
You can configure cross-plan dependencies by updating the **Dependencies** field as shown in the example.

Note:
You can only add dependencies between first-level activated plans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example shows an activated plan (ACP0010119) that depends on another activated plan (ACP0010118). Similarly, an event task (EVNTSK0010326) can start only after its dependent task (EVNTSK0010322) is completed.

Note:
An event task from a primary or related plan can be associated as a dependency with an event task from the same or another primary or related plan. An event task from a child plan can only be associated as a dependency within the same child plan.

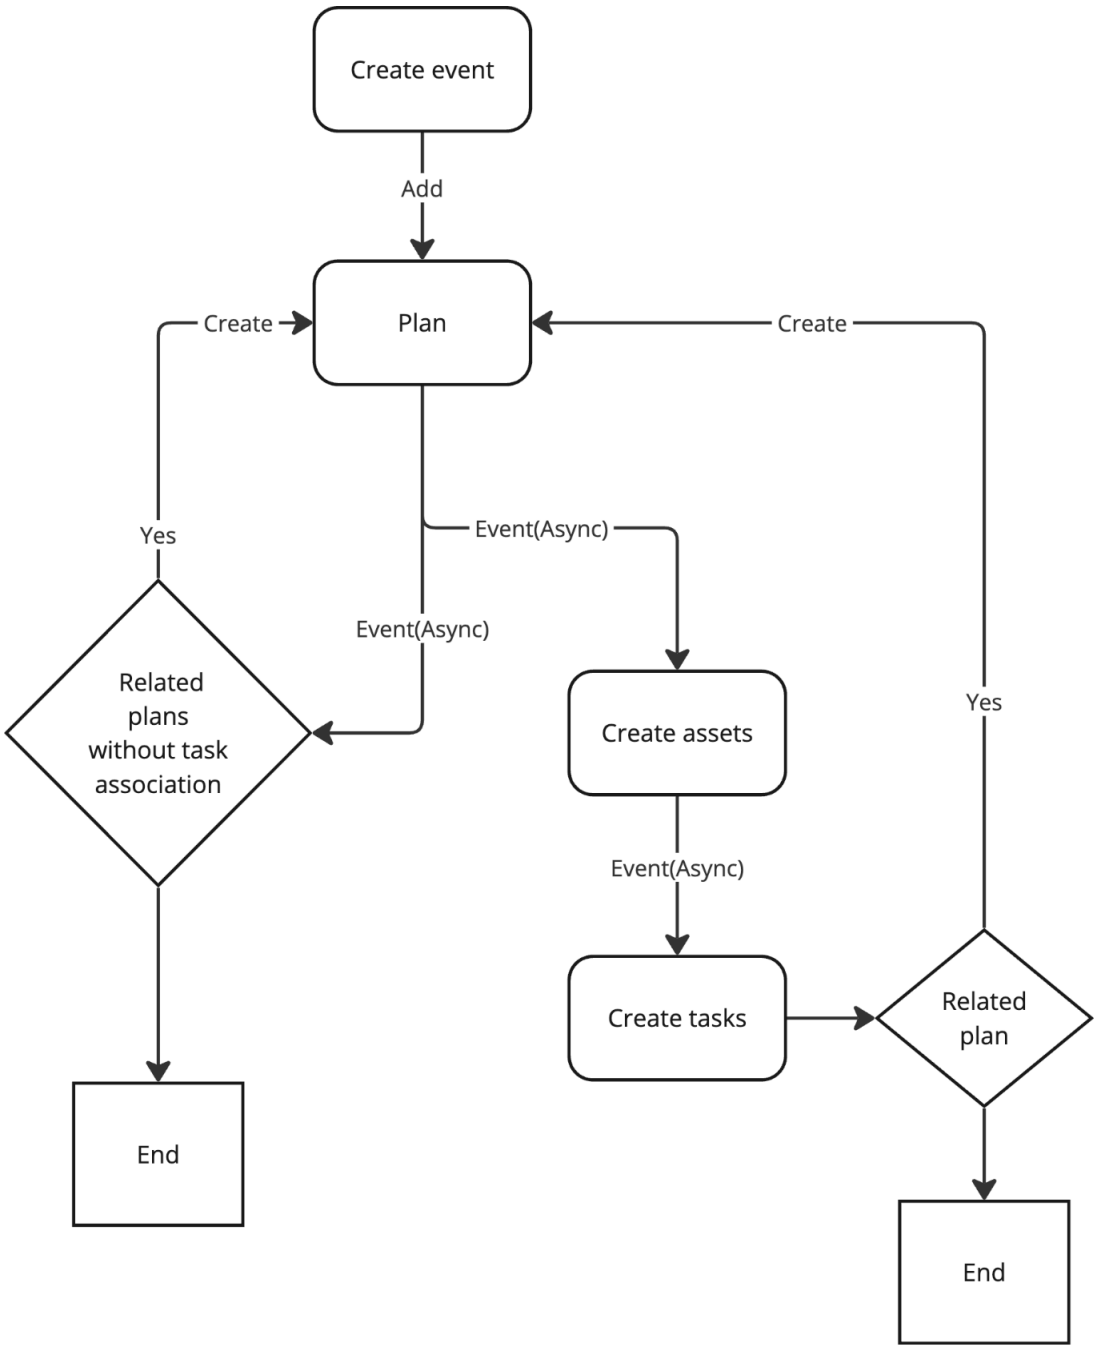


Whenever any event task is updated, as shown in the example, a message indicates that the event tasks have been updated. Selecting **Refresh** loads the updated data.

You can add task dependencies in primary and related plans, but not in child plans. For an event task in a child plan, dependencies can only be selected from the same child plan. For example, in Plan 4, task 3 (EVNTSK0010331) depends on tasks (EVNTSK0010329 and EVNTSK0010330) within the same child plan.

When adding task dependencies in primary and related plans, only tasks from other primary or related plans are available for selection in the **Dependencies** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Configuring the property to refresh the event task order

Whenever task dependencies are updated, the event task order is updated. If more than 500 event tasks are affected, the order is calculated asynchronously. The *sn_recovery.sync_task_order_calculation_limit* property sets the limit for asynchronous calculation to 500 tasks by default. When the task count exceeds this limit and dependencies are updated, the task order calculation becomes asynchronous, and a **Refresh tasks order** button appears in the event, event task, and activated plan. Selecting this button manually refreshes the event task order.

Process of creating a nested plan

Previously, related plans were created only for primary activated plans. Starting with the Yokohama release, related activated plans can be created from an event task for all activated plan types. An example of creating a nested plan is shown in the following diagram.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The steps to create a nested plan are as follows.

1. Create an event.
2. Add a plan to the event. An activated plan is created with the plan type set as primary.
3. An event is triggered to create related plans. If the plan has related plans without any task associations and the plan level is less than the default value defined in the property, an activated plan is created with the type set as related plan.
4. An event is created to generate one or more event assets.
5. After the assets are created, an event is triggered to create event tasks.
6. If the event task has a related plan and its level is less than the level defined in the property, an activated plan is created with the type set as child plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Track impacted assets and add related plans

Track the impacted assets and add a related plan during a crisis event. You can monitor the assets and plans for the crisis event in BCM UIB Workspace. You can then recover your assets in the planning stage.

Before you begin
Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Crisis events** > **Pending** and select the crisis event in the list.
3. Select the **Assets** tab and select **Add**.

   You can add an asset that you want to recover during the crisis. The primary elements of the asset are listed as **Asset types**. The primary elements belong to the element definition type that is identified in the plan template. When you add an asset to the event, its associated dependencies are pulled into the event. The dependencies are displayed in the **Asset types** panel.

   Note:
   When you select **Add** for an application, all the dependencies that you had identified in the business impact analysis of that application are also added to the exercise.

4. In the Applications list, select the application and navigate to the **Plans** tab.
   When you add a plan to the crisis event, the related plans, assets, and event tasks that are associated with the plan also get pulled into the event.
5. Select **Add all plans related to asset**.
   If you have any plans related to the selected application in the instance, they are added to the exercise event.
6. Select **Save**.
   The crisis event is saved in the **Pending** state.

Add a task to the crisis event

Add a task to the crisis event in BCM UIB Workspace. You can then monitor and complete the required actions to respond to the crisis event.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager

About this task
Users with an edit access to the event record can edit the fields in the recovery tasks list simultaneously:

- **State**
- **Assigned to**
- **Actual start**
- **Actual end**
- **Assigned group**

For more information, see Structured workflows for crisis events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Crisis events** > **Pending** and select the crisis event in the list.
3. Select the **Event tasks** tab.

   Note:
   For the crisis events, the event type is **Actual**.

   When you add or update the plan to the crisis event, the related plans, assets, and event tasks that are associated with the plan also get pulled into the event.
4. To add an ad-hoc task to the event, select **New ad-hoc task**.

   Note:
   An ad-hoc task is added to the crisis event so that you can take corrective actions for the crisis event. When you add an ad-hoc task to the crisis event that is in the **Work in progress** state and if the activated plan is in the **Work in progress** state, the tasks will be in the **Open** state. If the activated plan is the **Pending** state, the task will be in the **Pending** state.

   For more information on the fields in the New Event Task form, see Create New Event Task form.

   Note:
   You cannot create an ad-hoc task for the activated plans that are in **Closed Complete** or **Closed Incomplete** state.

5. To start the crisis event, select **Start Event**.
   After you start the event, the event state is updated to **Work in Progress**.

   Note:
   If the event task has a circular dependency, you have to trigger the tasks manually for this event.

6. Select the first task and select **Trigger**.
7. Complete all the activated plans of the event tasks for the crisis event and select **Submit for Approval**.
8. To generate a PDF, select **Generate PDF**.
   If you have edit access to the crisis event, you can save a copy of the event in PDF format to your local hard drive.

   Note:
   By default, the PDF is generated and attached after the event is closed.

9. Navigate to the **Results** section on the **Details** tab and update the **Actual start** and **Actual end** dates for the event task.
10. Update the assignment fields, if necessary.
11. Enter any event task-related information in the **Work notes** field of the **Activity** section.
12. Select **Save**.
13. Select the refresh icon ( ) to display the updated state of the asset or plan, and the actual time taken to recover the asset.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Import automated tasks and start an event

Import the automated task from the business continuity plan in an actual event. Utilizing automated tasks during an actual event enhances efficiency and reduces response time for users.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **crisis events** > **Pending** and select **New**.
   The **Create New Event** form is displayed.
3. In the **Details** tab of the **Create New Event** form, fill in the required fields.

   Note:
   For a crisis event, the event type is **Actual**.

   For more information on the fields, see Create Crisis Event form.
4. Navigate to the Planning list in the Workspace view and select the plan associated with the event.

   When you select the plan, the associated tasks are pulled into the event. The tasks are displayed on the **Event tasks** tab. When the tasks displayed on the **Event tasks** tab have a dependency between them, they are executed in a sequential order.
5. Select **Start event**.

   Upon initiating an event, the event tasks that do not have any dependency between them are executed. When a task is completed, the subsequent tasks that depend on it are executed. For example, when a task transitions to the **Closed incomplete** or **Closed failed** state, you have the option to select the task and review its activity details. If an error message is displayed on the screen, you can examine it to identify the issue and take appropriate corrective measures. For instance, if the error message indicates that the code variable must be a positive value, you can update the code variable accordingly.

   If the task transitions to the **Closed failed** state, then its dependent tasks are not triggered. In the event that a task is in the **Closed incomplete** or **Closed failed** state, an email notification is sent to the backup assignee, informing them that the automated flow has encountered an error and manual intervention is necessary from the backup assignee.
6. Select **Re-trigger automation**.
   The automated flow is triggered for execution once more.
7. If the automated flow fails again, select **Re-trigger as a manual task**.
   The task transitions to the **Open** state.

   a. Update the event task and select **Work in progress**.

   b. Select **Closed complete**.
   You have the option to manually update the event task. Once you mark the task as **Closed complete**, the subsequent event task is automatically triggered. If the next task is a manual task, its assigned user can proceed to complete the workflow for the event task.
8. Select **Save**.
   The event task is then saved within the instance.

Creating action items in crisis events

Starting with BCM release 9.0.x, crisis managers can create action tasks for recovery members or teams anytime during a crisis event or exercise, as long as the event remains open. Crisis managers can create these tasks on the fly without mapping them to event assets or recovery plans. These action tasks are also not included in the event recovery timeline.

Action items in real-time

Action items can be used to assign tasks in real-time. For example, a crisis manager can assign an action item to verify that there are no injuries at a specific office location after an exercise or they can request someone to review the business continuity plan before proceeding to the next steps.

You can also use action items to conduct assessments during a crisis event. For example, in the event of a fire, you can assign an action item to assess the situation, determining the severity, and identify affected employees and buildings. You can perform an assessment and assign an action item.

Fields and states associated with Action items

The Action items tab contains the following details related to the ad-hoc tasks:

- Actual start date
- Actual end date
- Total time taken
- Event (Reference)
- Short description
- Description
- Due date
- Task numbers
- Type
- Task
- Assessment

The following workflow (states) is associated with action items.

States associated with action items

State	Description
Open	First state of the action item.
Work in progress	State of the action item when its work begins. When an action item moves to the **Work in progress** state, the system auto-captures its start time.
Skipped	Assigned state of the action item when it is not relevant. When an action item is skipped and considered not relevant, its time fields are removed, resulting in a total time of 0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

States associated with action items (continued)

State	Description
Closed (complete, incomplete)	Final state of the action item task. When an action item has been completed, the system auto-captures its end time.

BCM managers or planners can update the action items and can reopen the ad-hoc tasks associated with them.

You can assign the action item tasks to the groups or team members by using the following fields:

- **Assignment group**
- **Assigned to**
- **Additional assignee list**

Comparison between event tasks and action items

The action items are distinct from the event tasks in crises and events. The following table outlines the differences between event tasks and action items.

Comparison between event tasks and action item tasks

Fields/Criteria	Event task	Action items
Details	• Short description • Description • Task numbers • Dependencies • Activated plan • Impacted assets • Task ID	• Short description • Description • Task numbers • Type
Assignment	• Assignment group • Assigned to • Recovery team • Additional assignee list	• Assignment group • Assigned to • Additional assignee list
Access	• Plan owner, Program manager can create/ update/delete action items. • Event recovery members can read/update action items that they are assigned to.	• Plan owner, Program manager can create/ update/delete action items. • Event recovery members can read/update action items that they are assigned to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Comparison between event tasks and action item tasks (continued)

Fields/Criteria	Event task	Action items
Workflow	Pending -> Open -> Work in progress -> Skipped -> Closed (complete, incomplete, failed)	Open -> Work in progress -> Skipped -> Closed (complete, incomplete)
Dependencies	Yes	No
Automation	Yes	No
Orders	Yes, order is auto-calculated based on dependencies.	No, order is not calculated for the action item tasks.
Time calculation	Yes, the event tasks time is rolled up to activated plans, and impacted assets.	No, the event tasks time is not rolled up for the action item tasks.

Roles associated with action items

The following roles are associated with action items.

Roles associated with action item tasks

Role	Description
Plan owner	Can create, read, update, and delete action items when the plan owner is the event owner.
Program managers	Can create, read, update, and delete action items for all events.
Viewers	Can read all action items.
Recovery event/Plan owner	Can read and update all action items that they are assigned to.

Create task and assessment-type action items

Use integration of crisis events and Smart Assessment for creating necessary action items related to the crisis event. The action items can be of task and assessment type.

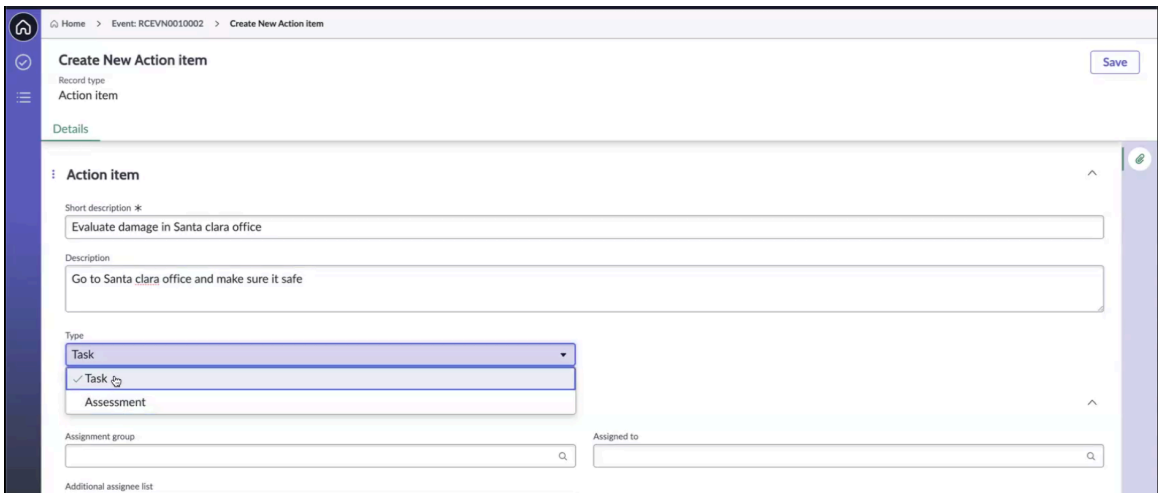
Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

About this task

Verify that you have created Smart Assessment templates for integrating crisis events with the Smart Assessment Engine.

Procedure



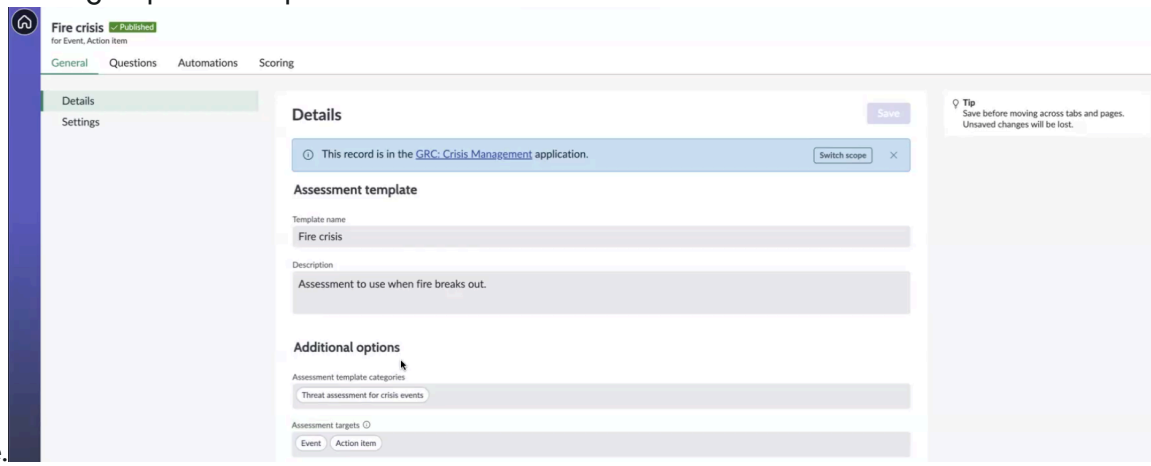
1. In the List view, navigate to **Crisis events** > **Pending** and select the crisis event in the list.
2. Report the crisis event either from the home page or from the events page by creating an event.
   a. Add the description of the event.
   b. Assign it to a user by updating the **Assigned to** field.
   c. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An event is created in the application. You can create action items related to the event by updating the **Action items** tab, even before the event starts.

3. In the **Action items** tab of the event, select **New**.

   The Create New Action item form is displayed.



4. On the form, fill in the fields.
   For descriptions of all these fields, see Create New Action item form for crisis events.
   a. Add the description and short description of the action item.
   b. Select the type of action task by selecting **Task** or **Assessment**.
   c. Add an assignment group or a team member and an additional assignee list.
   d. Assign a due date in the Timeline section.
   e. Select **Save**.
   The Action item record is created in the **Open** state and the action item is displayed in the **Action items** tab of the event.
5. To skip the action item if it is not needed, select **Skip task**.
6. To work on the action item as a task, select **Task** in the **Type** field.
   a. To work on the action item task, select **Work in progress**.
   The state of the action item is updated to **Work in progress**. The actual start date and time for the action item task is recorded and displayed in the Actual start column of the **Action items** tab.
   b. To complete the action item task, select **Closed complete** in the action item record.
   The state of the action item is updated to **Closed complete**. The actual end date and time taken for the action item task is auto-captured and displayed in the Actual end date and Actual time taken columns of the **Action items** tab.
7. To mark the action task as an assessment, select its type as **Assessment** in **Type** field in the Create New Action item form.
   a. Select the assessment template in the **Assessment template** field.

      When you select the action task as an assessment, the **Assessment template** field is displayed in the form. The application uses Smart Assessment to perform the assessment. Ensure that BCM administrators have already created the necessary templates in the Assessment Workspace beforehand using the Smart Assessment Engine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To make the desired Smart Assessment templates visible in the drop-down in the action item form in the Business Continuity Workspace, verify that following steps are completed in the Assessment Workspace.

i. Select the necessary template, such as the Fire crisis template shown in the example, in the Details section.

ii. Choose the **Threat assessment for crisis events** category in the **Assessment template categories** field. If you choose a different category, the desired template will not be shown in the Business Continuity Workspace.

iii. Choose **Event** and **Action item** as the targets in the **Assessment targets** field.

iv. To read the assessment, specify the reader role, such as the core viewer (sn_bcm.core_viewer) as the minimum role, in the **Assessment reader role** field of the Settings section. Usually, the core viewer (sn_bcm.core_viewer) role is specified as it is shared across all the roles.

v. Publish the assessment template.
Only when these conditions are met, the template is available for selection in the drop-down of the action item form.

For information on setting up Smart Assessment templates, see Create an assessment template.

b. Add an assignment group or a team member and additional assignee list, select the timeline, and save the record.

c. To continue working on the action item assessment, select **Work in progress**.

d. To view responses to the assessment as another user, select **View response**.

e. To respond to the assessment as the assignee, select **Take assessment**.

f. Respond to all the questions and select **Submit**.

g. Confirm that you have reviewed the answers and select **Submit** again in the modal.
Your response is submitted and a confirmation is displayed on the screen.

h. To complete the action item assessment, select **Closed complete**.
The state of the action item assessment is updated to **Closed complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To re-trigger the action task, select **Re-trigger**.
9. To save the action task, select **Save**.
   This step completes the workflow of the action item record.

Create New Action item form for crisis events

Use the Create New Action item form in the BCM Configurable Workspace to add action items about a crisis event.

Create New Action item form

For a description of the field values, see the table.

Create New Action item form

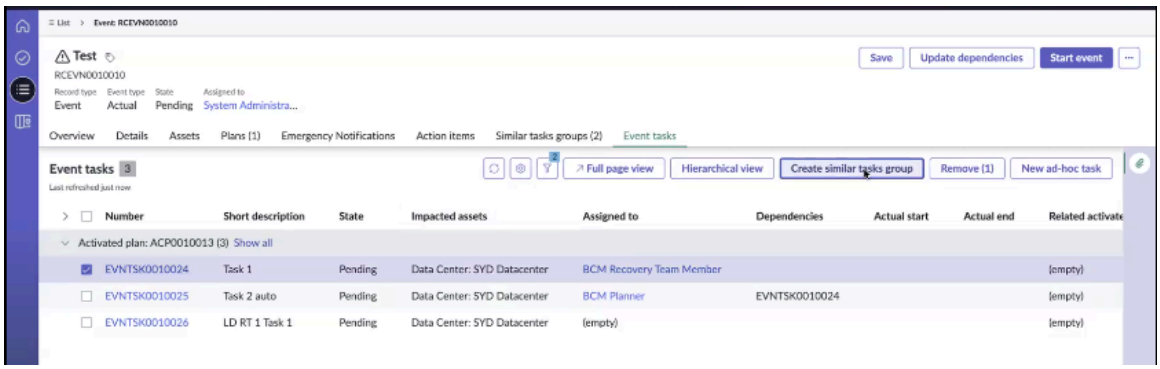
Field	Description
Details tab	
Number	Auto-assigned number for the action item record, for example, EVNITM0010020.
Short description	Short description of the action item.
Description	Detailed description of the action item.
State	Auto-assigned state of the action item record.
Type	Type of the action item to choose from. Available options are: • **Task** • **Assessment**
Assessment template	Template based on the Smart Assessment Engine.
Assignment details	
Assignment group	Assignment group that the action item is assigned to.
Additional assignee list	Additional assignee list for the action item.
Assigned to	User that the action item is assigned to.
Timeline	
Actual start	Actual start date and time for the action item.
Actual time taken	Actual time taken for the action item in days, hours, minutes, and seconds.
Actual end	Actual end date and time for the action item.
Due date	Due date for the action item.

Create a similar tasks group in a crisis

Identify and group similar or duplicate tasks related to a crisis event using the **Similar tasks groups** tab. Grouping similar tasks helps you to optimize event task management and minimize redundant work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager



About this task
You can create a similar tasks group and add tasks to it only in the **Draft** state of the event.

For information on identifying and grouping duplicate event tasks, see Grouping similar event tasks in events.

For information on the state changes for event tasks in similar tasks groups, see State changes for event tasks in groups.

Procedure
1. Navigate to **Workspaces** > **Business Continuity Workspace** > **Exercises** > **Pending** and select the event from the list.
2. To create a similar event tasks group, use one of these options.

   - Choose similar event tasks in the **Event tasks** tab and select the **Create similar tasks group** UI action.

     a. In the Create similar tasks group, add a name for the group and select **Create**.

     b. Verify that the group is created and shows up in the Similar tasks groups list.

   - Add event tasks from the **Similar tasks groups** tab by completing these steps:

     a. Select **New** in the **Similar tasks groups** tab and select **Save**.

     b. From the **Event tasks** tab in the group, select **Add**, choose applicable tasks from the tasks list, and select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applicable event tasks are added to the Similar tasks group.

Note:
When you select **Add** in the **Event tasks** tab, the modal displays only applicable event tasks, helping to prevent cyclic dependencies.

To add events tasks with dependencies to the Similar tasks group, a cyclic dependency validation check is performed by the system. An event task and its dependent event task cannot be added to the same similar task group. For example, if you add task 4 into an event task group and task 5 is dependent on task 4, then task 5 cannot be added into the same group as task 4 as shown in the example.

When an event starts, the system identifies the first executed event task as the original task. Other similar tasks are marked as duplicate tasks in the group.

Note:
The **Original task** field in the Similar tasks group is automatically assigned when the event task begins execution and cannot be edited manually at any point.

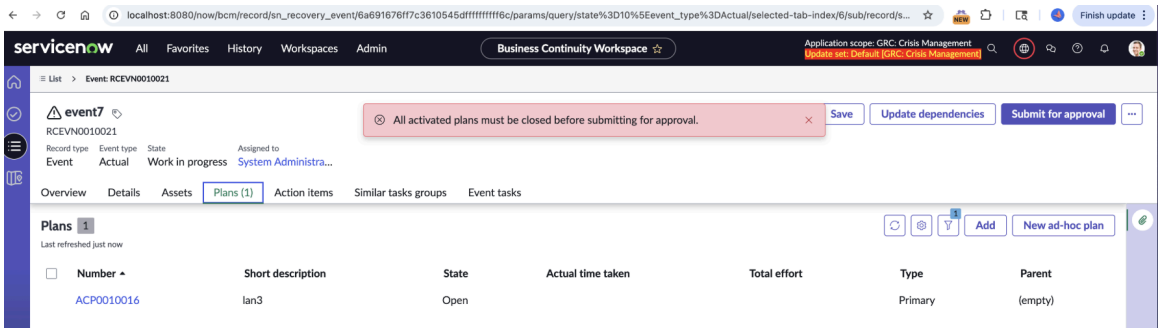
When an event starts, a task with dependencies remains in the **Pending** state until its dependencies are resolved. Once the dependencies, such as EVNTSK0010008 in the example, are closed, the task moves to the **On hold** state.

3. To remove an event task from the group, select **Unlink** in the Similar tasks group record.
   The event task is removed from the Similar tasks group.
4. To delete the event task, select **Remove**.
   The event task is deleted from the event.

Request an approval and approve the crisis event

Approve the crisis event in BCM UIB Workspace.

Before you begin



Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. In the List view, navigate to **Crisis events** > **Pending** and select the crisis event in the list.
3. Log in as the approver of the event and select the Event in the List view.
4. Verify that all activated plans are closed; close the open plans before submitting the event for an approval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Submitting an exercise or actual event for approval when an activated plan is still in the **Open** state results in an error message: `All activated plans must be closed before submitting the event for an approval.`

5. Select **Submit for approval**.
6. Select **Approve**.
7. Select **Save**.
8. Select **Closed Complete**.
   You can update the state of the event to **Closed Complete**.
9. Select **Closed Incomplete**.
   You can update the state of the event to **Closed Incomplete**.

Structured workflows for Crisis map

You can use the Crisis map interface in BCM Configurable Workspace to receive alerts on possible threats for the business operations of your organization. You can then manage the alerts by initiating response workflows.

Typically, the BCM program manager performs the following tasks to manage the alerts from the Crisis map interface:

- Manage the alerts in Crisis map. For more information, see Manage alerts from the map interface.
- Set controls in Crisis map to customize the alerts. For more information, see Set controls to customize the alerts.
- View resource layer clustering in Crisis map. For more information, see Select resource layer clustering.
- Monitor the assets within the impacted area in Crisis map. For more information, see Monitor assets within the impacted areas.
- Initiate response workflows for crisis management. For more information, see Initiate the response actions.

Additional information on Crisis map

- For information on the Crisis map view in BCM Configurable Workspace, see Crisis map view.
- For information on the threats, feeds, and alerts in Crisis map, see Crisis map interface.
- For information on the administrative tasks in Crisis map, see Setup for Crisis map.

Adopting UIB page for improved performance

Beginning with the Xanadu release, the Crisis map application is now built with a UI Builder (UIB) page. Previously, the single-use component limited the ability to customize the user interface

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(UI), add filters, or modify the design in the Crisis map. By adopting the UIB page, you can gain full control over the implementation, enabling you to extend support for your specific use cases.

Limitations of a single-use component used in prior releases

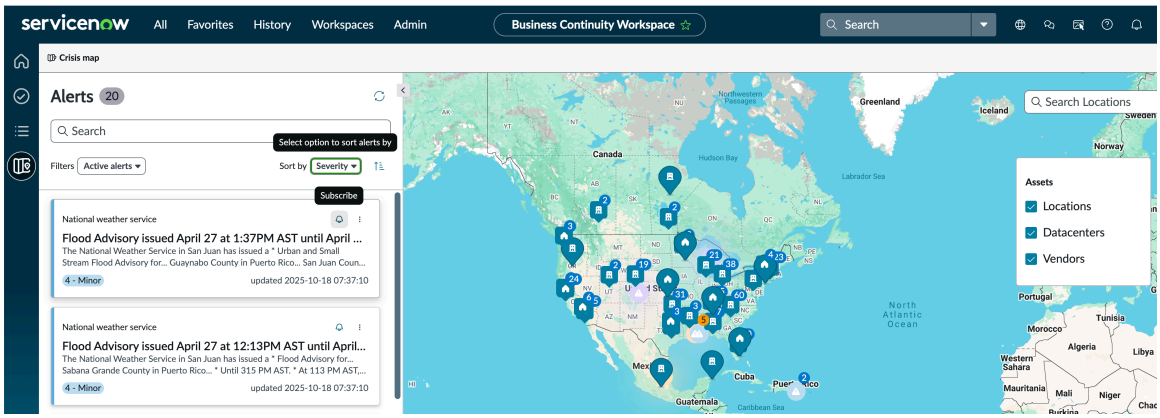
The single-use component in the Crisis map application had several limitations.

- Lack of configuration flexibility: The component was not open for configuration, limiting options to customize the user interface (UI).
- Limited customization options: It restricted the ability to change the design of elements such as cards, add different filters or sorting options, or update other features on the page.
- Restricted tailoring: It limited the ability to tailor the application to meet specific needs.

Benefits of adopting the UIB page

Adopting the UIB page in the Crisis map application offers the following benefits.

Configuration flexibility



The UIB page provides full control over the implementation, and enables you to extend it for your own use case. It also helps you to minimize development efforts and offers more configuration options. You can filter alerts based on their state (active or inactive), severity level, location (regions), and source. This setup enables you to fine-tune details, perform searches, and edit actions on the alerts, making it easier to locate both alerts and assets on the map. Additionally, you can set secondary values for the alerts in the Details card.

Accessibility

The FAM Map [sn-fam-map] component used earlier for the map was outdated and no longer supported new updates or defect fixes. It also had various accessibility issues. Replace the FAM Map [sn-fam-map] component with the Geomap component addresses these accessibility issues and enables for the implementation of new features, as the old component has been deprecated.

Actions on the alerts

The Crisis map application now includes enhanced functionality such as listing alerts, sorting by severity, and displaying resources such as locations, vendors, datacenters, as shown in the illustration.

Actions on the alerts: You can perform the following actions on the alerts in the map:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the **Sort by** option to sort the alerts by their **Severity**, **Created**, and **Updated** options.

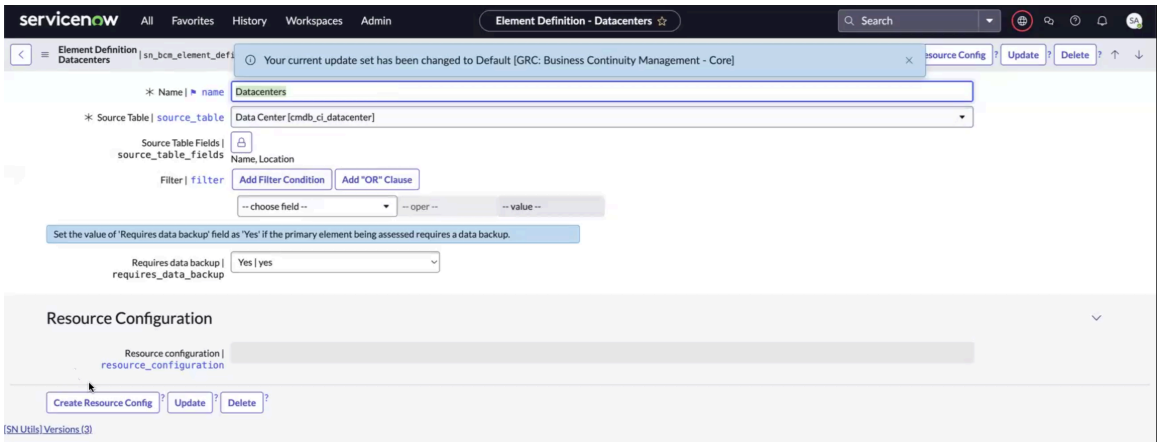
  You can also use the sorting icon to sort the alerts in an ascending or descending order.

- Select the icon to subscribe to an alert. A subscription notification, such as `Alert subscribed: Drought is ongoing in Madagascar` is displayed on the screen.

- Select the icon to open or dismiss an alert. Actions related to an alert are recorded and displayed in the Activity panel of the alert record.

Additional filters for the alerts

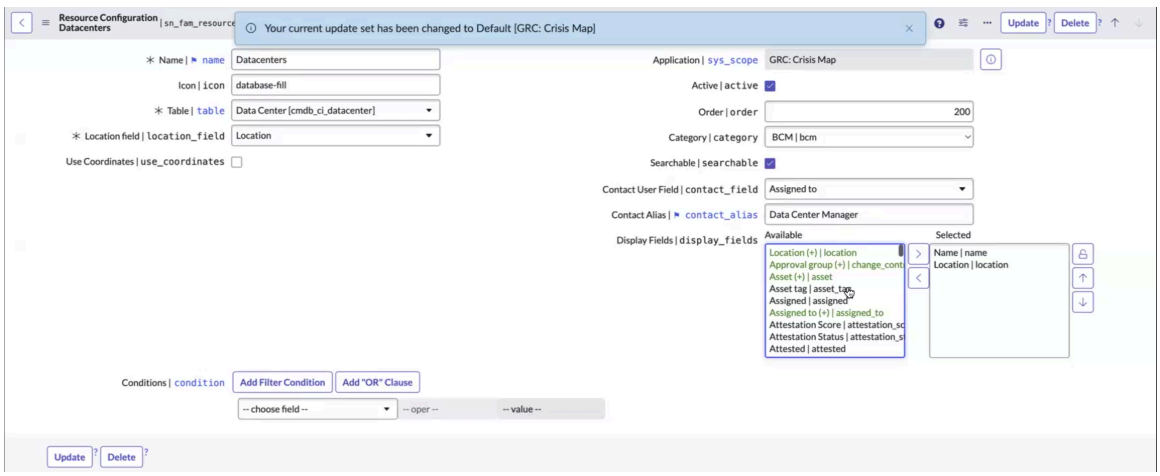
Additional filters on the map, such as region and severity, enhance alert visibility. Previously, you could only filter between active and dismissed alerts. Now, you have more options to filter the alerts as shown in the example.



1. Alert states: Filter alerts by their states such as Active alerts or Dismissed alerts.
2. Alert regions: Filter alerts by region, for example, Americas or both Americas and EMEA.
3. Alert severities: Filter alerts by severity, for example, red or both red and yellow.
4. Search functionality: Filter alerts by searching multiple fields.
   - Source: Searching for the source such as GDAC shows all alerts from the GDAC feed.
   - Alert name: Search for specific alert names, for example, Madagascar Star.
   - Severity: Search alerts by their severity level such as Extreme, Severe, Moderate, Minor, or Unknown alerts.
   - Description: Search an alert by its specific description or by using a phrase from the description. For example, searching for Level of strength shows you alerts that include this phrase in their description.

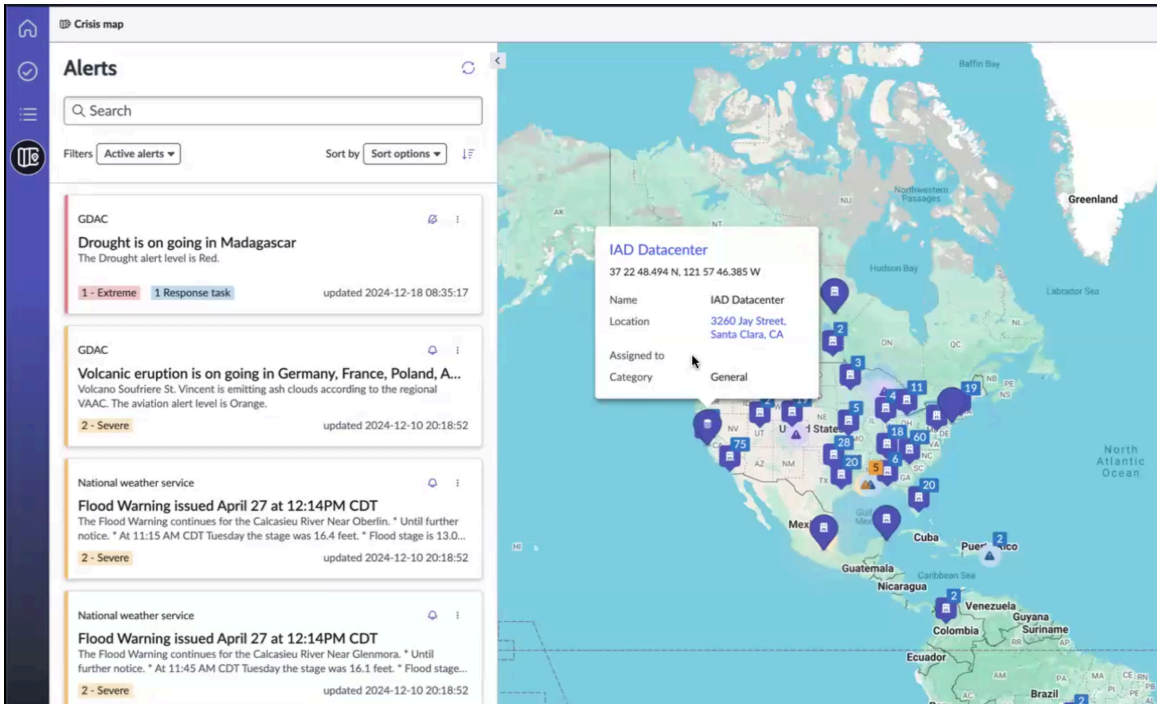
These new filters and search options provide more flexibility and control over the alerts that are displayed on the page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resource configuration

Custom icons and fields: The resources on the map such as Locations or vendors are defined in the BCM element definition table, with options to specify icons, tables, and location fields. You can update the element definition record to add a resource as shown in the example, which adds the Datacenters resource to the map.



Only active resources within the BCM category are displayed. You can also configure which fields are displayed when a resource, such as the name, location, and additional information, is selected.

The **Display Fields** in the resource configuration are used to customize the information shown on the map. You can add fields such as **Assigned to** and **Category** to show the person assigned to the data center and the categories. You can also remove fields that are no longer needed. Additionally, you can add filter conditions to show only the records that match your specific criteria. For example, setting a filter for a specific name displays only the data centers that match that name as shown in the example.

This condition helps you to view relevant fields and analyze a focused view of the data in the map.

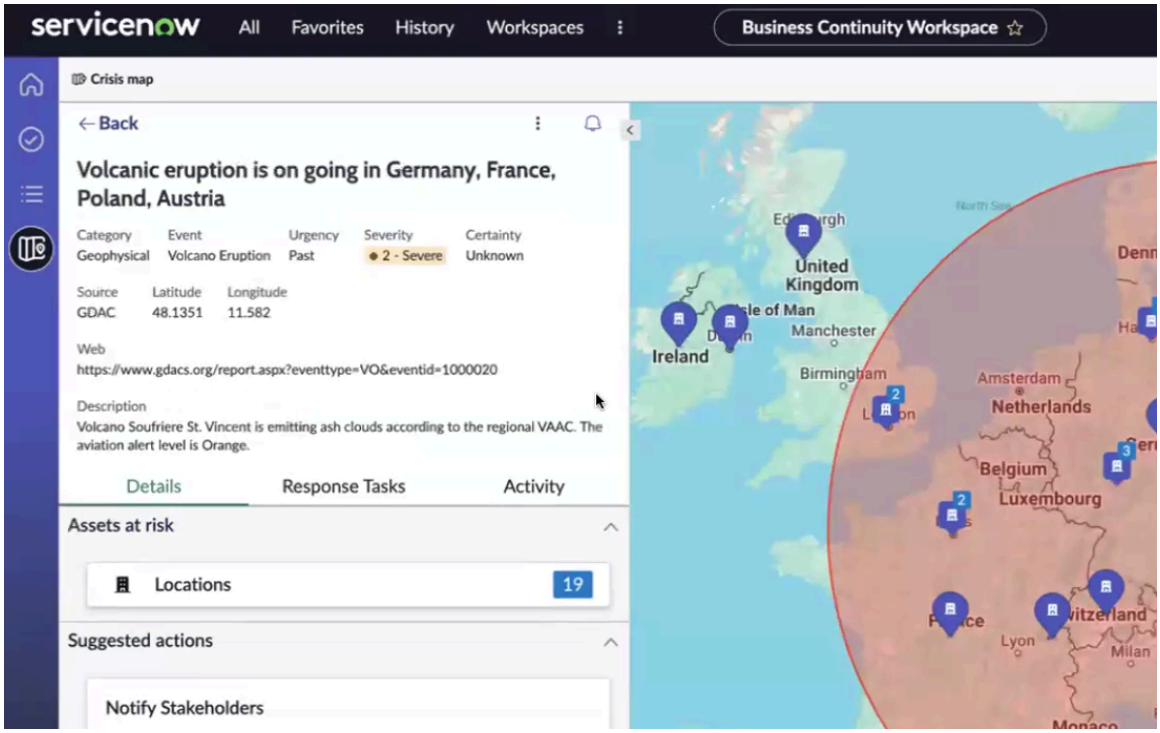
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with BCM release 9.0.x, the Crisis map application has been enhanced. You can now display more than 10,000 resources on the map. Similarly, the application handles more than 1,000 alerts without any performance issues.

For information on creating a Resource configuration in Crisis map, see Configure Resource Configuration records.

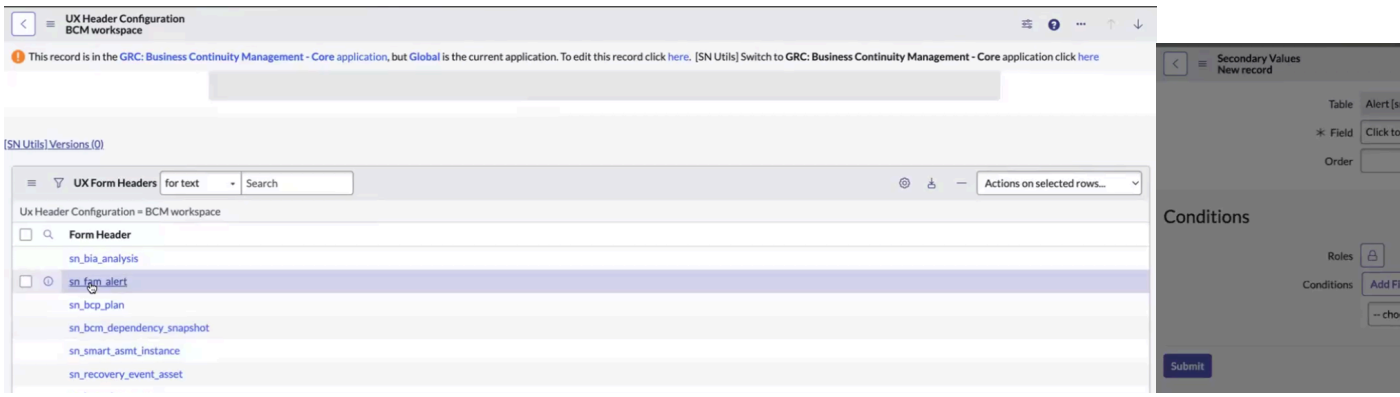
Alert details page

When you select an alert, the map zooms into a smaller area centered on the latitude and longitude of the alert, providing a focused view of the specific location.



In the alert details, additional information on the alert is listed.

1. Alert name
2. Secondary values, similar to those in the Workspace.



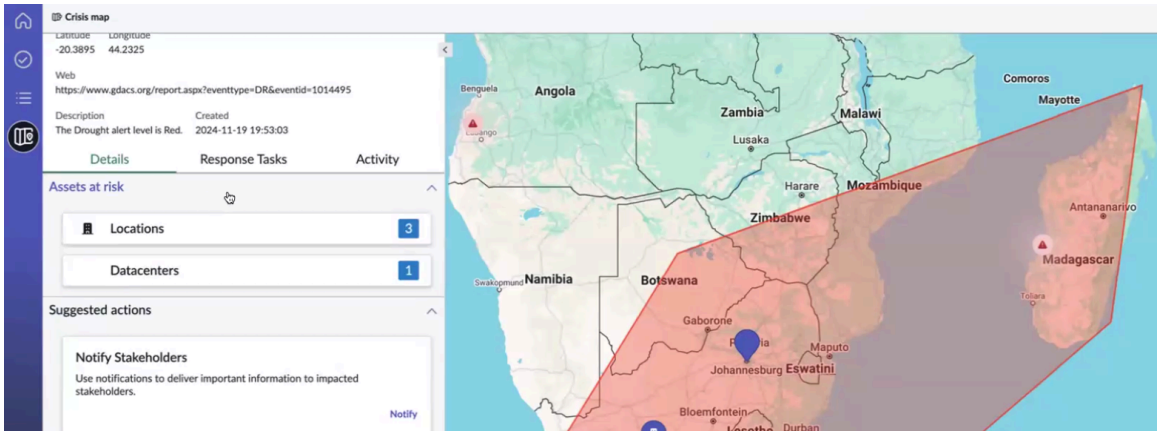
Starting with BCM release 9.0.x, pagination has been added for alerts, which improves readability for the users.

These secondary values are now configurable. Previously, they were fixed, but you can now customize them to better suit your needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure these secondary values by navigating to **UX Header Configuration** > **BCM Workspace** > **UX Form Headers (sn_fam_alert)**. You can select the alert that you want to modify and choose which secondary values you want to display or remove as shown in the sample configuration.

For information on the form headers, see Set up a form header in Configurable Workspace.



Zoom and focus: Selecting on an alert zooms the map to a smaller area centered on the alert's location.

Configurable secondary values: The alert details page now includes configurable secondary values, such as urgency, severity, category, enabling you to add more fields to the display. The secondary values are applied to all the alerts in the list.

The Assets at Risk section is displayed on the **Details** tab of an alert. The **Response Tasks** tab shows secondary values such as the Response task number, Title, State, Assigned to, Created.

The Assets at Risk section as shown in the example provides an overview of all assets associated with an alert. You can view the at-risk assets by selecting each element definition, to monitor which assets are at risk for a specific alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The suggested actions for an alert are displayed in the Alert panel. These actions include steps like notifying stakeholders (with a feature to send emails), creating response tasks, and clearing crisis events. Custom alert actions can also be implemented using scripts.

Custom alert actions

You can add custom alert actions by searching for them in the Alert Actions section. Two base system alert actions are provided, which include a model for user input. For custom alert actions, you can implement your own scripts, but currently, these scripts run without any input or custom model.

For example, if you select the **Test Script** action, it runs a script without any input. You can check the log to confirm that the script has been executed. The log shows a message indicating that the test script alert action has run.

You can add custom scripts for alert actions, and the system supports both base system and custom actions. This migration promotes better configuration, accessibility, and future support for the Crisis map application for the users. For information on alert actions, see Configure alert actions.

Enhanced user experience and accessibility

Various accessibility issues in previous Crisis map releases have been resolved with the implementation of the Geomap [sn_geo_map] component, which has replaced the FAM Map [sn-fam-map] component and the user experience has been enhanced.

Manage alerts from the map interface

Manage alerts from the Crisis map interface to identify threats and their geo-locations relative to your assets. You can open alerts for details, dismiss them when resolved, adjust the impacted area boundaries, or undo recent changes.

Before you begin

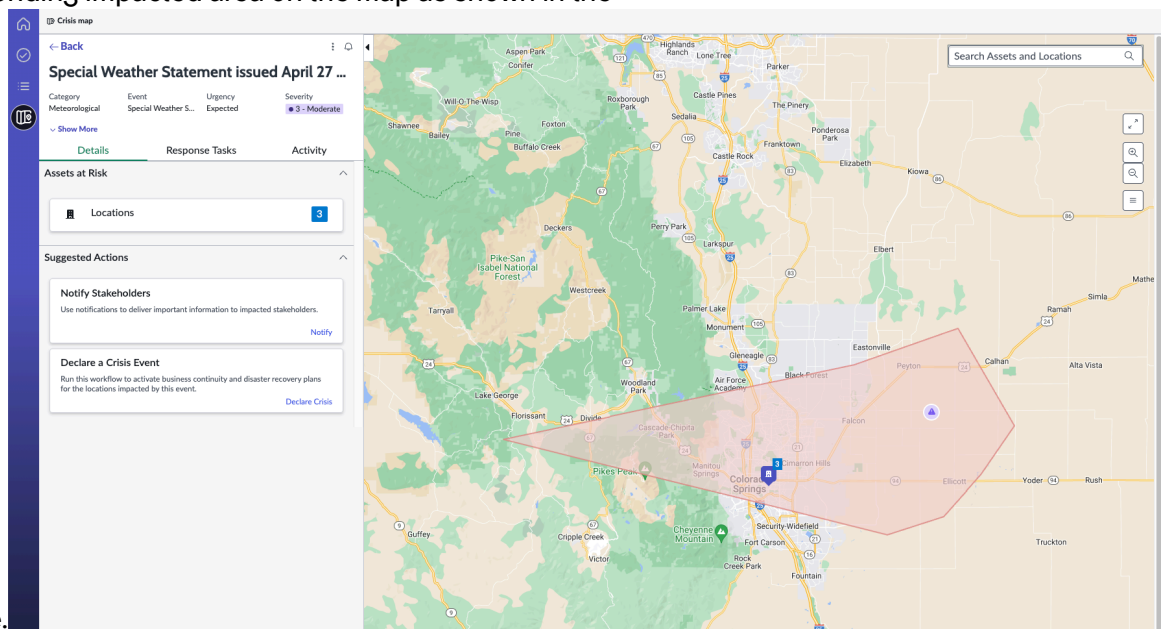
Role required: sn_bcm.admin or sn_bcm.program_manager

About this task

The Crisis map interface has been optimized to handle over 10,000 resources and more than 1,000 alerts without performance issues.

Procedure

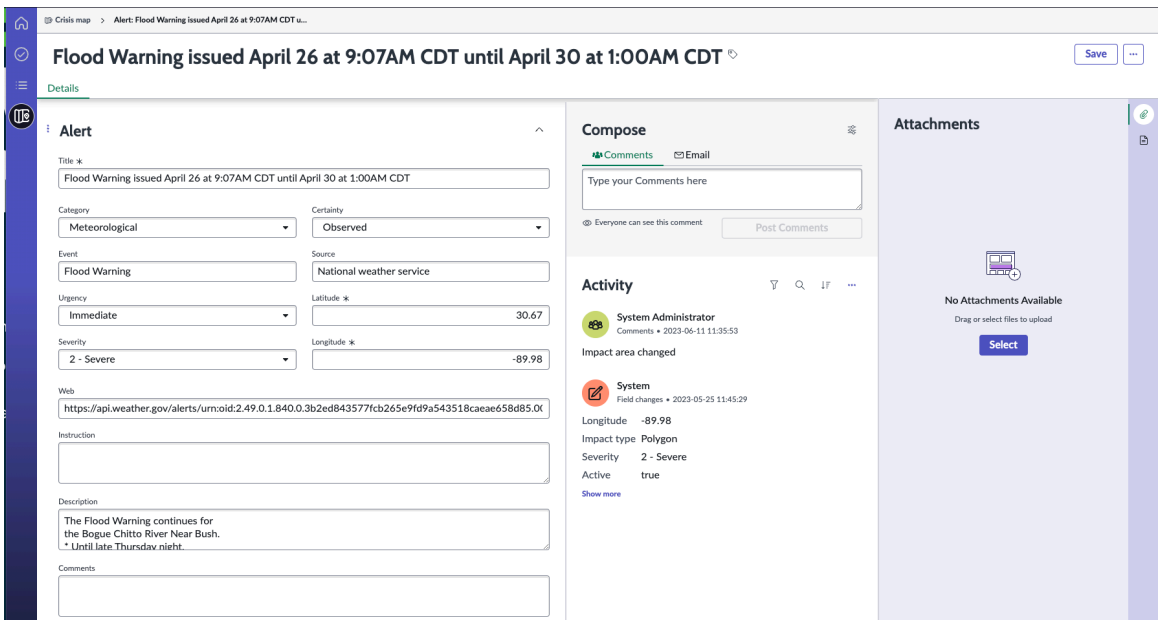
1. Navigate to **Workspaces** > **Business Continuity Workspace** and select the **Crisis map** icon in the list view.
2. Select an alert record.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with BCM release 9.0.x and later, pagination has been added for alerts, which improves readability for the users.

This action opens the alert record in the **Alerts** panel. You can view the details of the record in the header of the record.



In the **Details** tab, you can view the assets at risk in the **Assets at Risk** section. You can view the suggested actions such as **Notify Stakeholders** or **Declare a Crisis Event** in the **Suggested Actions** section.

You can open the detailed view of an alert and view its corresponding impacted area on the map as shown in the example.

3. Open the alert details in the form view by selecting the **Open Alert** option in the **Alert menu** icon (⋮).

This action opens the record on a separate **Details** tab as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. View the response tasks associated with the alert in the **Response Tasks** tab.
5. Monitor the activity on the alert and add your comments in the **Compose** section of the **Activity** tab.
6. Sort the alerts with the **Sort by** option.
   You can sort the alerts by their **Severity**, **Created**, and **Updated** options. You can also use the sorting icon to sort the alerts in an ascending or descending order.
7. Subscribe to an alert using the icon.
   When an alert or its source feed item is updated, you receive the workspace notification, such as `Alert subscribed: Drought is ongoing in Madagascar`, which is displayed on the screen.
8. Open an alert with the **Open alert** option in the icon.
   The alert form is displayed. If you want to edit the alert, you can make necessary changes and select **Save**.
9. Dismiss an alert using the **Dismiss alert** option in the icon.

   If the alert doesn't pose a threat currently to your employee locations, datacenters, core companies, or any of your business establishments, you can dismiss the alert. If you know that the alert wouldn't hamper your business operations, you can dismiss it in the list view as well as in its detailed view.

   When you dismiss an alert in the list view, it's removed from the list. When you dismiss an alert from the detailed view, it's removed and you return to the list view to review the remaining alerts. In both cases, you can see a confirmation message about the dismissal of the alert.

   A message is displayed on the screen that the alert is dismissed.
10. Edit an impacted area using the **Alert menu** icon.

    a. Select the **Edit Impact Area** option.

    b. In the Edit Impacted Area pop over that opens on the map, select either **Custom Shape** or **Custom Radius** depending on the shape of the impacted area.
       - Select **Custom Shape** if the impacted area is polygonal shape.
       - Select **Custom Radius** if the impacted area is a circle.

    c. Select and drag the vertex on the boundary of the impacted area to include the asset location.

    d. Select **Save**.

    e. To revert the impacted area, select the **More options** icon and select **Revert impacted area**.

Set controls to customize the alerts

Set controls in the Crisis map interface in BCM UIB Workspace. You can then customize the alerts for assets, locations, and so on.

Before you begin

Role required: sn_bcm.admin or sn_bcm.program_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace**.
2. Select **Crisis map** in the list view.

   The Workspace view is divided into two sections: the alerts list and the map view.

3. Select the **Search assets and locations** search field in the map view and enter the location or datacenter that is impacted by an alert.

   When you search for a location, the results display a combined list of your company records (showing their display values and icons) along with Google map pin icons. If you aren't sure of both the employee locations or datacenters, then use the Layers control.

4. Change the zoom level of the map and view specific areas with the **zoom-in** and **zoom-out** control buttons.
5. Select and display the assets on the map using the **Layers** icon.

   The assets such as **Locations**, **Web Servers**, **Datacenters**, or **Vendors** are displayed on the map as shown in the example.

6. Clear the map of all the search results with the **Reset** icon.

Select resource layer clustering

Select resource layer clustering in the Crisis map within the BCM Configurable Workspace to view assets or resources on the map.

Before you begin

Role required: sn_bcm.admin or sn_bcm.program_manager

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** and select **Crisis map** in the list view.
2. Select the **Layers** icon.

   The layers on the map appear just as pins on a Google map and are configurable. All the layer details like the asset locations, assets, datacenters, and core companies are displayed on the map by their configured icons.

   Use the layers control to view only the selected or all assets that can be toggled on and off on the map. As a crisis manager, you can review active alerts and focus on individual assets that require immediate attention.

3. Display a selective resource or asset on the map by selecting the check box of that asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The icons of the selected asset are displayed on the map. Layer icons are displayed within black borders, whereas alert icons are within a white circle.

4. Select the **Asset** icon on the map to view its details.

   For example, when you select a datacenter icon without a count indicator, a popover displays the information configured in the Resource Configuration table [sn_fam_resource_config].

   If you configure the **Power** and **Power consumption** fields from the datacenter table [cmdb_co_datacenter] as display fields in the Resource Configuration form, the popover shows the datacenter's power consumption details and location coordinates.

5. Select the **Asset** icon with a number next to it.

   The map zooms in to show all the assets that match with the count in that cluster. You can further select each asset within the cluster and drill down to any asset to view its details on the popover.

   You can view only one popover at a time. When you select another node, the popover disappears.

6. Select the **Reset** icon in the map to clear the search results on the map.

Monitor assets within the impacted areas

Monitor at-risk assets in the Crisis map within the BCM Configurable Workspace when alert threats appear near your business locations. This functionality enables you to protect resources in impacted areas and help prevent significant losses to your organization.

Before you begin

Role required: sn_bcm.admin or sn_bcm.program_manager

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** and select **Crisis map** in the list view.
2. Select an alert record to open the alert in its detailed view.

   You can see various details of the alert on the form header.

   - Alert title
   - Category
   - Urgency (Immediate or expected in the future)
   - Severity in terms of loss
   - Certainty as to how likely it can strike
   - Source of the alert feed
   - Coordinates of the impacted area
   - Source or website from where the feed alert was received
   - Description

3. Expand the **Assets at risk** section to view all the listed assets that are at risk.
   The **Assets at risk** lists locations, datacenters, and core companies that lie within the impacted area of the alert. It also displays the count as to how many of these assets are impacted. You can view the impacted area on the map and take any of the suggested actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The boundary of the impacted area for the alert on the map is marked in mauve color. You can view the assets that are at risk within this impacted area on the map. If one of your location, datacenter, or a core company is impacted by the alert, you can edit the impacted zone to include the asset.

4. Save or bookmark the URL of the alert to open the detailed view of the alert directly anytime.
5. Select an asset card like a location or datacenter in the **Assets at risk** section.
   The list view of the records opens up in a new tab.
6. View asset details by selecting the record link in the **Name** column.
   You can view the complete details of the asset including its latitude and longitude.

Initiate the response actions

Initiate the response workflows for your recovery teams in BCM UIB Workspace. You can then notify the stakeholders and help them respond to the threat and take the necessary actions.

Before you begin

Role required: sn_bcm.admin or sn_bcm.program_manager

Procedure

1. Navigate to **Workspaces** > **Business Continuity Workspace** and select **Crisis map** in the list view.
2. Select an alert record.

   While viewing the alerts and their severity, you can initiate appropriate actions and trigger Crisis Management workflows for the respective stakeholders to respond and act on the crisis. The **Suggested Actions** section lists various responses that you can initiate.

   Notify Stakeholders

   Notify important stakeholders of the assets that are at risk because of the alert.

   Declare a Crisis Event

   Start an event to activate the recovery tasks to recover the assets with a recovery team.

3. Notify stakeholders of the impending crisis by email using the **Notify** button in the 'Notify Stakeholders' card.
   In the modal window that opens, identify the concerned person or persons and communicate the information to them. It's a two-step process, where you identify the audience and draft an email to send it to them.

   a. Select an audience from the list in the Notify Stakeholders pop-up.
      You can select an additional audience from the list whom you think must be notified too.

   b. Select **Next**.

   c. Verify the alert details as described in step 2 of the process and draft an appropriate email in the **Email Body** field.

   d. Select the **Send Notification** button.
      You get a message that the action is executed.

4. Activate a business continuity or disaster recovery plan for impacted locations by selecting **Declare Crisis** in the 'Declare a Crisis Event' card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter a brief description of the crisis event in the Declare a Crisis Event form that opens and select **Next**.

b. Select the assets at risk that are within the radius of the threat alert.

c. Select the **Start Crisis Event** button.

When you trigger these actions, separate scripts run to trigger the alert notify action and the declaration of the crisis event. A message appears to confirm that your actions are executed. You can navigate to the **Response Tasks** tab to view the action and recovery event details.

All the assets at risk are copied over to the Event Assets table [sn_recovery_event_asset] that is related to the event [sn_recovery_event].

What to do next

1. If it's a recovery event, select anywhere on the **Response Tasks** card to take you to the event details.
2. In the **Details** tab of the event, update the details if necessary.
3. Select the **Start Event** button. The event for the crisis is then activated. All the associated plans for this recovery event and the tasks associated with it are set into action. The Crisis Management workflow begins to recover the impacted assets. For more information, see Crisis events.

   All the assets at risk are copied over to the Event Assets table [sn_recovery_event_asset] that is related to the event [sn_recovery_event].

Sending notifications with Everbridge

You can send an emergency notification with Everbridge in BCM Configurable Workspace and inform the stakeholders about a crisis event.

Typically, the BCM program manager sends out the emergency notifications to the stakeholders. For more information on creating an emergency notification, see Create emergency notifications.

Additional information on Everbridge

- For information on the emergency notifications in Everbridge, see Emergency notifications in Everbridge.
- For information on the setup tasks for Everbridge, see Setup for Everbridge notifications.

Status of emergency notifications

When you send an emergency notification for a crisis event with Everbridge, it creates a corresponding incident along with a notification. You can track the notification delivery and monitor its status in the Business Continuity Workspace until it's successfully delivered to the contacts from Everbridge.

Status flow for an emergency notification

The status flow for an emergency notification lists different states of an emergency notification in Everbridge. The short description of the event in the Business Continuity Workspace is created as an incident with a notification in Everbridge.

Notification state

The emergency notification that is created and sent from the ServiceNow Business Continuity Management Workspace is tracked in the **Notification state** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication status

The emergency notification that is received in Everbridge and the different stages to which it moves until it's delivered are tracked in the **Communication status** field.

Emergency notification workflow status

Notification state	Communication status
Draft: The draft of the notification is stored in Business Continuity Workspace.	**None**
Attempting to send: The notification is being sent from Business Continuity Workspace.	**None**
Error: An error occurs in creating the notification in Everbridge.	**None**
In Progress: The notification is successfully created in Everbridge.	**Active**: A notification is created and is active. An incident and a notification for the incident are created. The notification remains active for the duration set in Everbridge.
Stopped	**Stopped**: Notification is stopped from being sent.
Sent	**Sent**: After the set duration has elapsed, the state moves to Sent.
Completed: The notification is sent.	**Completed**: The state moves to Completed.

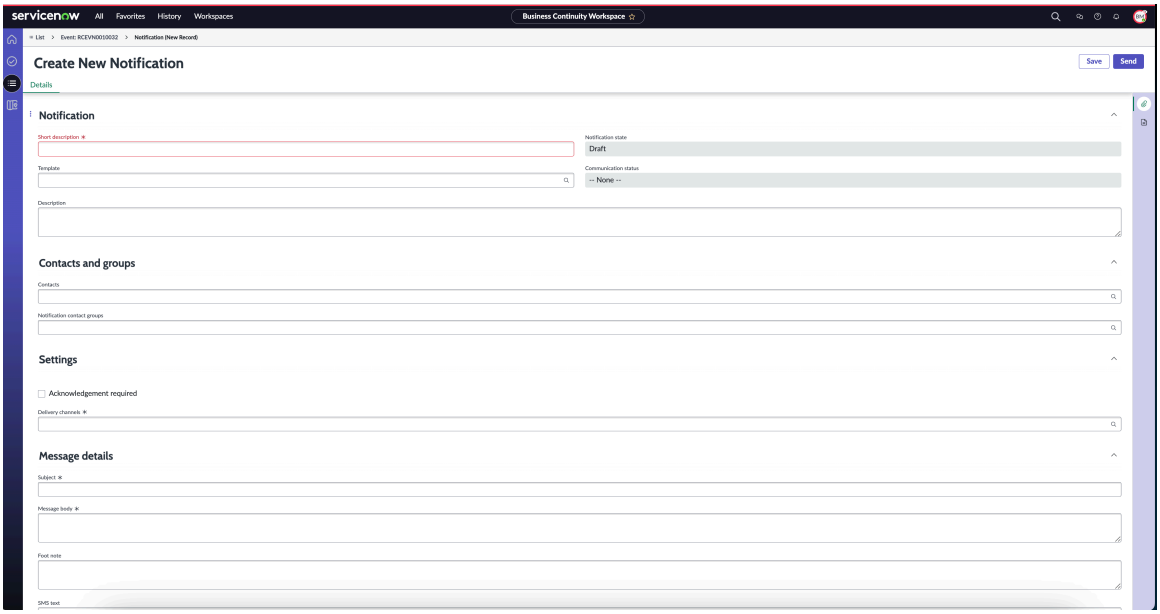
Create emergency notifications

Create an emergency notification in BCM UIB Workspace. You can then use Everbridge to notify the stakeholders.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager, or sn_bcm.admin

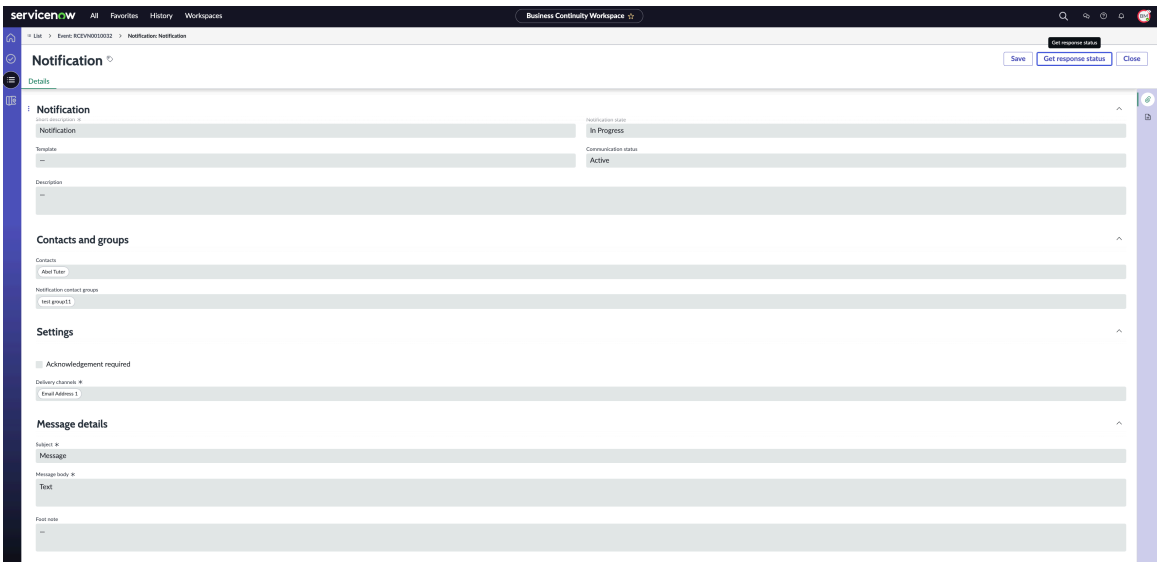
Procedure



1. Navigate to **Workspaces** > **Business Continuity Workspace** and select **Crisis events** in the list view.
2. Select the record in the **Pending** state.

> **Note:**
> If the **Exercise Method** is **Functional**, then you can create an emergency notification for an exercise event.

3. Open the event record link from the **Number** column.
4. Select the **Emergency Notifications** tab and choose **New**.



The New Notification form is shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. On the form, fill in the fields.
   For more information on the fields in the form, see Create New Notification form.
6. To save the notification and send it later, select **Save**.
7. Select **Send**.

   It creates a notification in Everbridge as shown in the example.

   When you create and send a notification for a crisis event in Business Continuity Workspace, a corresponding incident is created along with a notification in Everbridge.

8. Refresh the page and verify that the notification was sent without any errors.
   If the notification isn't sent due to an error, the Notification state moves to **Error**.
9. Select **Get response status** to retrieve the notification status from Everbridge for contacts in the **Communication status** field.

   Before you submit an event for approval, all the notifications that are **In Progress** must be closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the link to the emergency notification record in the Number column to delete a notification that is in **Draft** or **Error** state.

> **Note:**
> You can't delete a notification that is in the **Attempting to send**, **In Progress**, or **Completed** state.

b. Select **Delete** in the **More** actions icon.

10. Select **Save**.

> **Note:**
> Now that the event is closed and the corresponding incident in Everbridge is also closed, you can't create any more notifications for this event.

Create New Notification form

Use the Create New Notification form in BCM UIB Workspace to add details about an emergency notification.

Create New Notification form

Field	Description
Short description	Title of the emergency notification.
Template	Preconfigured template that has the subject of the mail and the delivery channels for the contacts.
Notification state	State of the notification in the ServiceNow workspace.
Communication status	State of the notification in Everbridge.
Description	Description of the notification.
Contacts and Groups	
Contacts	Persons to whom the notification is sent. Contacts that are successfully synced with Everbridge are listed.
Notification contact groups	Groups of contact to whom the notification is sent. Successfully synced contact groups are listed.
Settings	
Acknowledgement required	Option for requiring acknowledgement from contacts for received notifications.
Delivery channels	Communication channels that are used for sending the notification.
Message Details	
Subject	Title of the notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Notification form (continued)

Field	Description
Message body	Introductory text message for the notification. If a template is selected, then the message details are auto-populated from the template.
Foot note	Closing message for the notification.
SMS text	Text message sent through short message service (SMS).

Using BCM Classic Workspace

This section provides information on managing the business continuity tasks in Business Continuity Management classic Workspace.

Support for BCM Classic Workspace

Starting with the Vancouver release, the BCM Configurable Workspace provides the latest user experience. Using the BCM Configurable Workspace will ensure a smooth transition post Xanadu release.

The BCM Classic Workspace is an obsolete user interface that will not be compatible with the new features and enhancements introduced with the Xanadu release. If you continue to use the BCM Classic Workspace after the upgrade, you may encounter issues and errors that will not be supported by ServiceNow®.

To avoid any disruptions, transitioning to the BCM Configurable Workspace before or immediately following the Xanadu release will offer the latest functionality and the best user experience.

For information on managing your business continuity tasks in BCM Configurable Workspace, see Managing BCM workflow tasks.

Customizing the Business Continuity Management classic Workspace

You can set up the basic settings and features in the Business Continuity Management classic Workspace for your specific requirements.

For information on how to configure commonly used custom components in BCM classic Workspace, see the KB1442692 article.

Note:
You must log in to Now Support to view the Knowledge Base articles.

Migrating reports and custom changes to BCM UIB Workspace

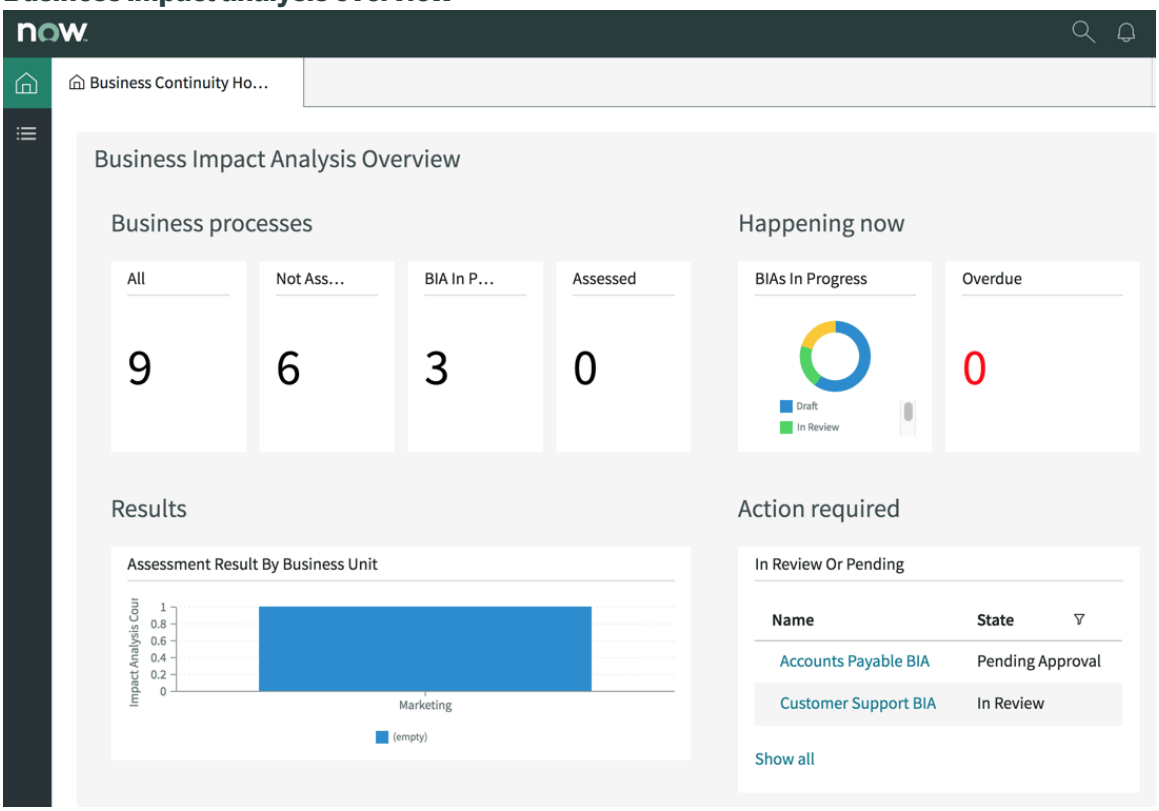
If you are an existing customer of the Business Continuity Management application and you have customized UI actions, you must migrate those actions to BCM UIB Workspace.

The UI actions that were shipped with the Business Continuity Management application have been migrated to the BCM UIB Workspace as part of the Business Continuity Management application software.

If you have customized few UI actions for your specific requirements, you must migrate them manually to the Business Continuity Management UI Builder Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on how to migrate reports and custom changes to BCM UIB Workspace, see the KB1444397 article.



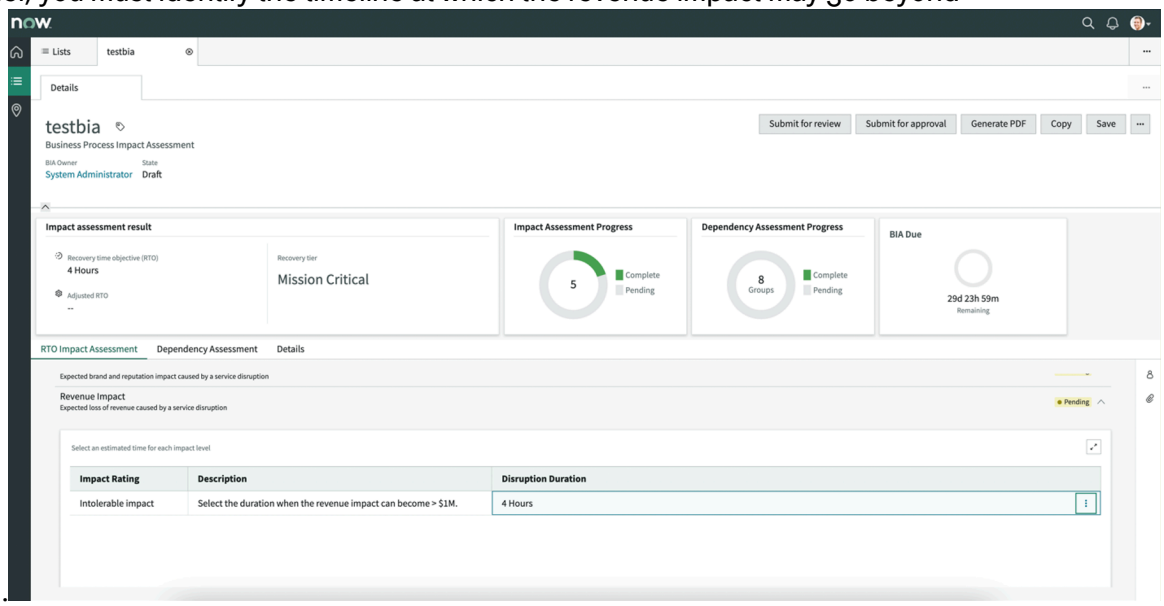
Structured workflows for Business Impact Analysis

Business impact analysis helps you to predict the consequences of a disruption on a business process or business function.

A business process is a set of tasks done by a business organization to deliver a business service or product to customers. When a business process in disrupted, the impact to the organization can be huge in terms of revenue and reputation. Business impact analysis (BIA) is performed to identify and prioritize critical processes, quantify or qualify the impacts, and identify recovery dependencies. Ideally, business impact analysis on critical processes must be performed annually.

The assessment of a business critical process disruption helps you to estimate the consequential impact on your business revenue, legal issues, workforce disruption, or business reputation. It also enables you to identify the dependencies of your business process on business applications, technology, or vendors that might be affected. This analysis gathers the information needed to develop recovery strategies.

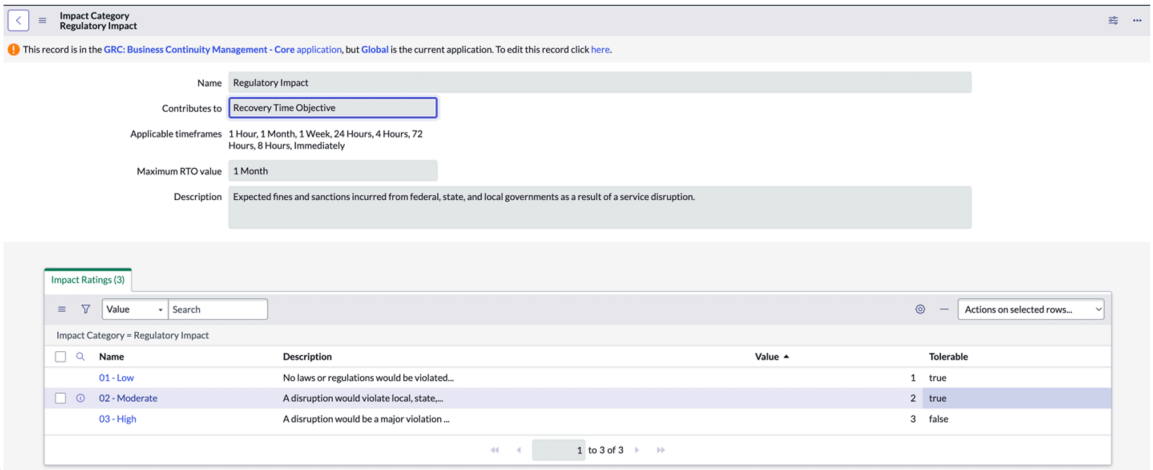
Business impact analysis overview



Impact ratings for your business impact analysis

The Business Continuity Management (BCM) administrator of your organization defines the impact ratings for your business impact analysis (BIA) and decides if the impact is tolerable for your business process. For more information on the impact ratings, see Configure an impact rating to assess an impact category. According to the configuration set up by the BCM administrator, the questions are displayed in the **RTO Impact Assessment** tab.

Consider the following example where the BCM administrator has configured an intolerable impact rating for the Revenue impact category. The BCM administrator has defined what qualifies to be an intolerable impact. As a BIA

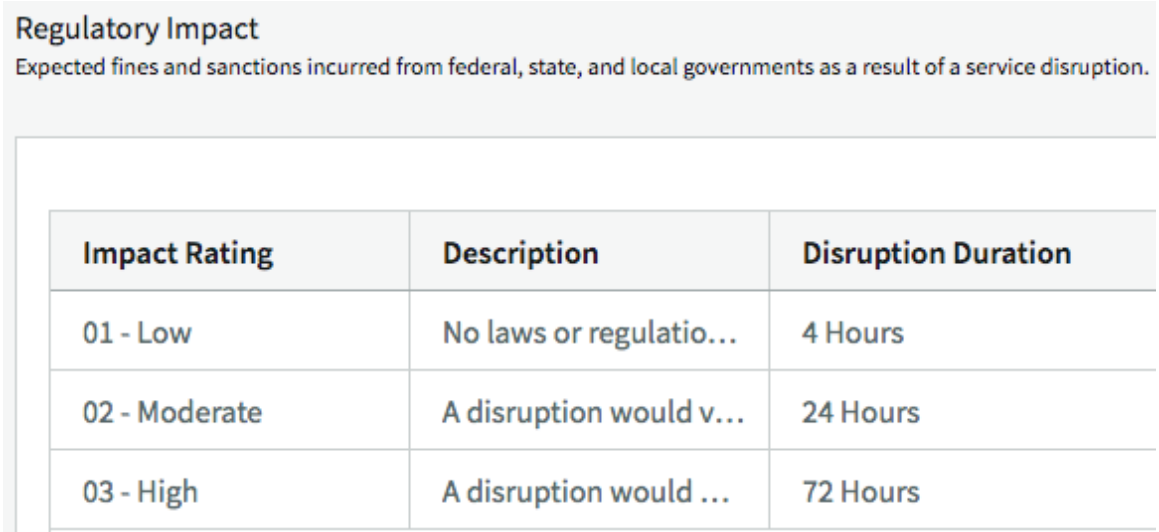


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

owner, you must identify the timeline at which the revenue impact may go beyond $1M.

Multiple impact ratings for an impact category

If your BCM administrator has configured the assessment questionnaire to include multiple impact ratings for an impact category, the impact category ratings are displayed in the Impact Category view as shown in the following example.



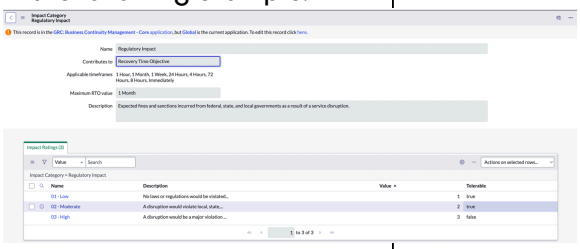
The BCM administrator can specify a threshold of non-tolerance for the impact ratings, per impact category. The disruption duration for the first non-tolerable impact category is selected for the recovery time objective (RTO). The impact ratings have the following specified values:

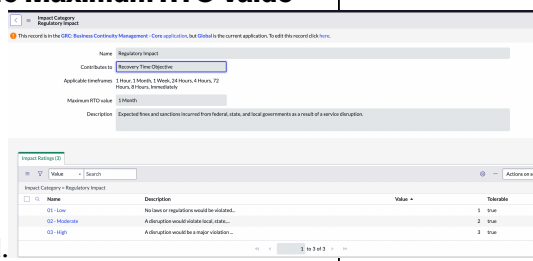
- Low = 1
- Moderate = 2
- High = 3

See the following example for the sample RTO calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example to show the calculation of impact category





Sample RTO calculation

Scenario	Non-tolerable impact	Description
Scenario 1	In the Impact Ratings table, the **Tolerable** field is set to **false**.	If the administrator has specified that Low regulatory impact is non-tolerable, its corresponding disruption duration is set as the recovery time objective (RTO). In this example, the disruption duration for the **01 - Low** impact rating is set to 4 hours. Therefore, the recovery time objective (RTO) for the impact category is above 4 hours. Even if the moderate impact disruption duration is shorter, the calculation will select the value from the first alphanumerically sorted impact rating that has the **Tolerable** field set to **false**.
Scenario 2	In the Impact Ratings table, the **Tolerable** field is set to **false**.	If the administrator has specified that Moderate regulatory impact is non-tolerable, its corresponding disruption duration is set as the recovery time objective (RTO). In this example, the disruption duration for **02 - Moderate** impact is set to 24 hours. Therefore, the recovery time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample RTO calculation (continued)

Scenario	Non-tolerable impact	Description
		objective (RTO) for the impact category is above 24 hours.
Scenario 3	In the Impact Ratings table, the **Tolerable** field is set to **false**.	If the administrator has specified that High regulatory impact is non-tolerable, its corresponding disruption duration is set as the recovery time objective (RTO) as shown in the following example.  In the tabular example, the disruption duration for **03 - High** impact is set to 72 hours. Therefore, the recovery time objective for the impact category is above 72 hours.
Scenario 4	The **Tolerable** field for the Low, Moderate, and High impact ratings is set to **true**.	If the administrator has set all the impact ratings as tolerable, the value specified in the **Maximum RTO value** field in the template is selected as the recovery time objective (RTO). In the following example, the administrator has set all the impact ratings as tolerable. Therefore, the recovery time objective (RTO) is one month as per the value specified in the **Maximum RTO value** field. 

Calculation of category score from impact analysis questions for an impact category that contributes to Recovery Point Objective (RPO)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the impact category contributes to **RPO**, then evaluate each impact analysis question in that RPO category based on the value of your data like business critical, operation critical, business essential, or operation essential. The maximum value among all the questions of that RPO is considered as the Category Score of that Impact Category and stored in the Impact Category Results table [sn_bia_category_result].

Calculation of overall impact assessment result for a BIA

When you update the **Disruption Duration** of an impact category, the RTO of the BIA is automatically updated. The RTO of the BIA is set as the lowest tolerable downtime from each impact category.

For example, consider a BIA having four impact categories – Legal, Reputation, Workforce, and Regulatory. When you update the disruption duration value of the legal impact category, then the RTO value of the BIA is recalculated based on the lowest tolerable disruption duration from each impact category. The Recovery Tier varies from organization to organization and is set based on the recalculated RTO value.

RTO value	Recovery Tier
Immediate	Mission Critical
1 Hour	Mission Critical
4 Hours	Mission Critical
8 Hours	Business Critical
24 Hours	Business Critical
72 Hours	Essential
1 Week	Essential
2 Weeks	Non-Essential
1 Month	Non-Essential

Create a business impact analysis

Create a business impact analysis (BIA) to get the necessary information for a plan. Use the BIA to identify the recovery time objective for an item and prioritize assets that have most and least critical dependencies. Use the information to establish their recovery strategies during the planning phase.

Before you begin

Role required: sn_bcm.program_manager or sn_bcm.planner

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click **Start a BIA** in the **Actions** section.
3. On the form, fill in the fields.

Start a BIA form

Field	Description
Name	Name of the business impact analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Describe the BIA within 255 characters length.
Template	Template that you can use as a model to create the BIA. The template BIA has the primary elements (applications, business processes, and locations), impact categories, and the dependent assets identified for the type of assessment.
Applies to table	Table that stores the template's primary element data.
Applies to	Business process, business application, or any other asset that is assessed in the BIA.
Business Unit	Business unit that uses the business process and for which the BIA is assessed.
Department	Department which uses the business process.
BIA Owner	Person who owns and is responsible for completing the BIA. BCM lead can review the BIA.

4. Click **Submit**.

   A BIA is created in **In Draft** state.

   State transitions for a BIA:

   In Draft

   It is the state where your BIA is under edit. Add RTO, RPO, and dependency assessments. Either you can submit the BIA for review, in which case confirm that a BCM Lead is assigned to the BIA. Or, as a BIA owner you can submit the BIA for approval.

   In Review

   Review the BIA and submit it for approval. In this state, the BCM admin can modify the BIA owner and BCM lead.

   Pending Approval

   When you click **Submit for Approval**, the BIA is set to **Pending Approval** state. The approval configurations, approval levels, and approval rules are evaluated against the BIA to determine the approvers. If there are no approval records in the requested state for the BIA, then as a BCM program manager you can either **Reject** or **Approve**. You must add RTO, RPO, and dependency assessments before you submit for approval. In pending approval state, the BIA is read only and the RTO, RPO, and dependency assessment details cannot be modified. The state of the plan and its related tables becomes read only.

   Returned

   BIA is editable. BCM admin can change the BIA owner in this state. When the BIA is rejected, it is set to **Returned** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approved

When a BIA is in an approved state, it becomes read only and the RTO, RPO, and dependency assessment details cannot be modified. Your only option to change the status is to move it to **Archived** state.

Archived

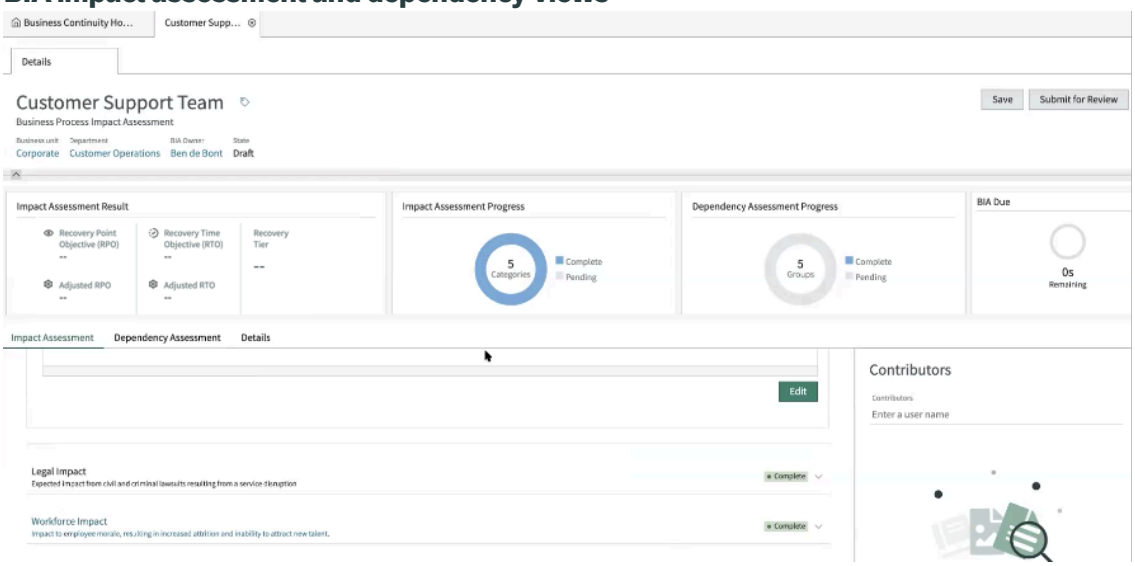
When the BIA is archived, it becomes read only. All the underlying tables like impact dependency groups, impact category results, and dependencies from where the BIA retrieves data to populate in the impact assessment and dependency assessment tabs become read only. You can no longer edit the information in these tabs. In this state, you can also generate a PDF of the BIA.

Note:
A scheduled job runs weekly to move the BIAs that have expired to **Archived** state.

Assess impact categories and dependencies of a process

Assess the different components of a business impact analysis (BIA). First by assessing and determining the impact categories of a business process. Second, by identifying any underlying dependencies that the business process requires across different dependency types.

Before you begin



Role required: sn_bcm.program_manager or sn_bcm.planner

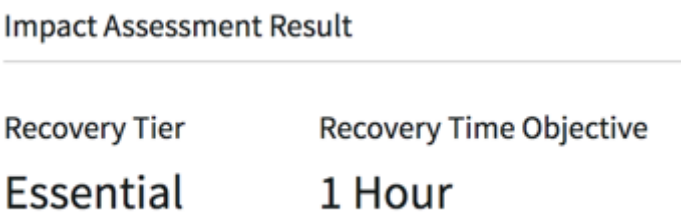
Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
   By default the records in the **In Draft** state of the Business Impact Analysis list opens.
3. To create a business impact analysis (BIA) record, click **New**.
4. To update an existing BIA, click the link to the record in the **Name** column.

   You can view different cards that give the information on the impact assessment result, its progress, and the dependencies of the business process on business application, hardware, software, or vendors.

BIA impact assessment and dependency views

Impact Assessment Result



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This card provides the assessment results of the recovery tier level and the recovery time objective for the item that is assessed.

- **Recovery Point Objective** (RPO): Metric that evaluates the data loss during the business disruption duration that can exceed the tolerance level. RPO results appear in the Impact Assessment Result card only when the primary element assessed in the BIA requires data backup. Otherwise the card shows only the Recovery Time Objective (RTO) and recovery tier results.
- **Recovery Time Objective**: Metric that calculates how quickly the business must recover an element or an item after a disruption. RTO is measured in terms of how long your business can survive following a disaster before operations are restored to normalcy. If the RTO is four hours and the item recovered is beyond four hours, then your business could suffer quite some loss.
- **Recovery Tier**: Organizations differ in defining recovery tiers depending on the item and the time by which it should be recovered on the state of a crisis. A recovery time objective of **Immediately**, **1 hour**, or **4 hours** is impending and falls within the **Mission Critical** recovery tier level. On the other hand, an RTO of two weeks to one month can be graded as a **Non-Essential** recovery tier, which may not incur considerable loss to the business.

Note:
You can configure the mapping of recovery tiers to RTOs as per your requirement.

Impact assessment result

Impact Assessment Progress

This component indicates the categories of impact that you have assessed and completed in relation to the categories that are assessment pending. As you complete the assessment for each category of impact, you can see the progress of the **Impact Assessment Progress** ribbon component. The color-coded ribbon component prompts you to complete the assessment for the pending impact categories.

Impact assessment progress component

Dependent Assessment Progress

Identifies the dependency of the business process on different asset classes or types for its functioning. The assessment identifies the relationship between the business process and the business application, software, workplaces, or vendors. Or, the asset types that the process uses. The progress of the dependency assessment pie chart advances as you complete assessing the business applications, software or hardware, and vendors that the business process depends on.

Dependency assessment progress pie chart

BIA SLA

The business impact analysis also requires a specific time by which the assessment of a business process must be completed. By default, the SLA timer is set to 30 days and it marks the time since the BIA is drafted, which is **In Draft** state, until the time it is complete, which is **Approved** state.

5. To assess the different types of business impact categories on the business process, click the **RTO Impact Assessment** tab.
   All impact categories are configurable. A business process draws a set of impact categories, by default, from the template that you have used for the business impact analysis. For more information, see: Review an impact category and assess its downtime.
6. To answer questions on the data value of the asset in terms of its impact on the business and its data change frequency, click **RPO Impact Assessment** tab.
   For more information, see Assess RPO impact of technology assets on the business.
7. To review the dependency groups and identify the items within each group that your business process depends on, click the **Dependency Assessment** tab.

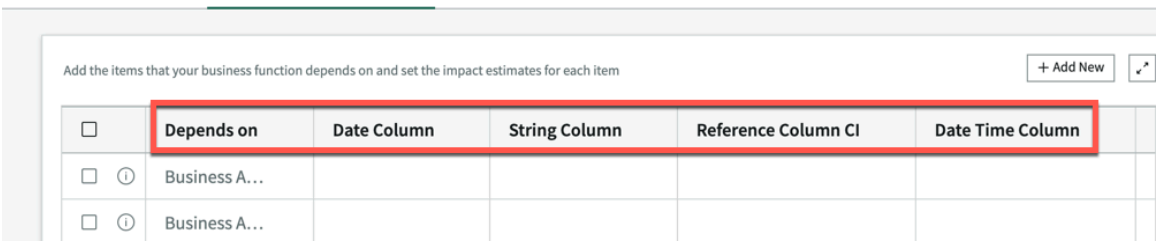
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can prioritize your business continuity and recovery plans based on the criticality of the assets that your business process utilizes. For more information, see: Identify dependent items to prioritize recovery plans.

Order of impact categories

The order in which the impact categories appear in the **RTO Impact Assessment**, **RPO Impact Assessment**, and **Dependency Assessment** tabs depend on the order in which the impact categories are created in the template that is used in the BIA.

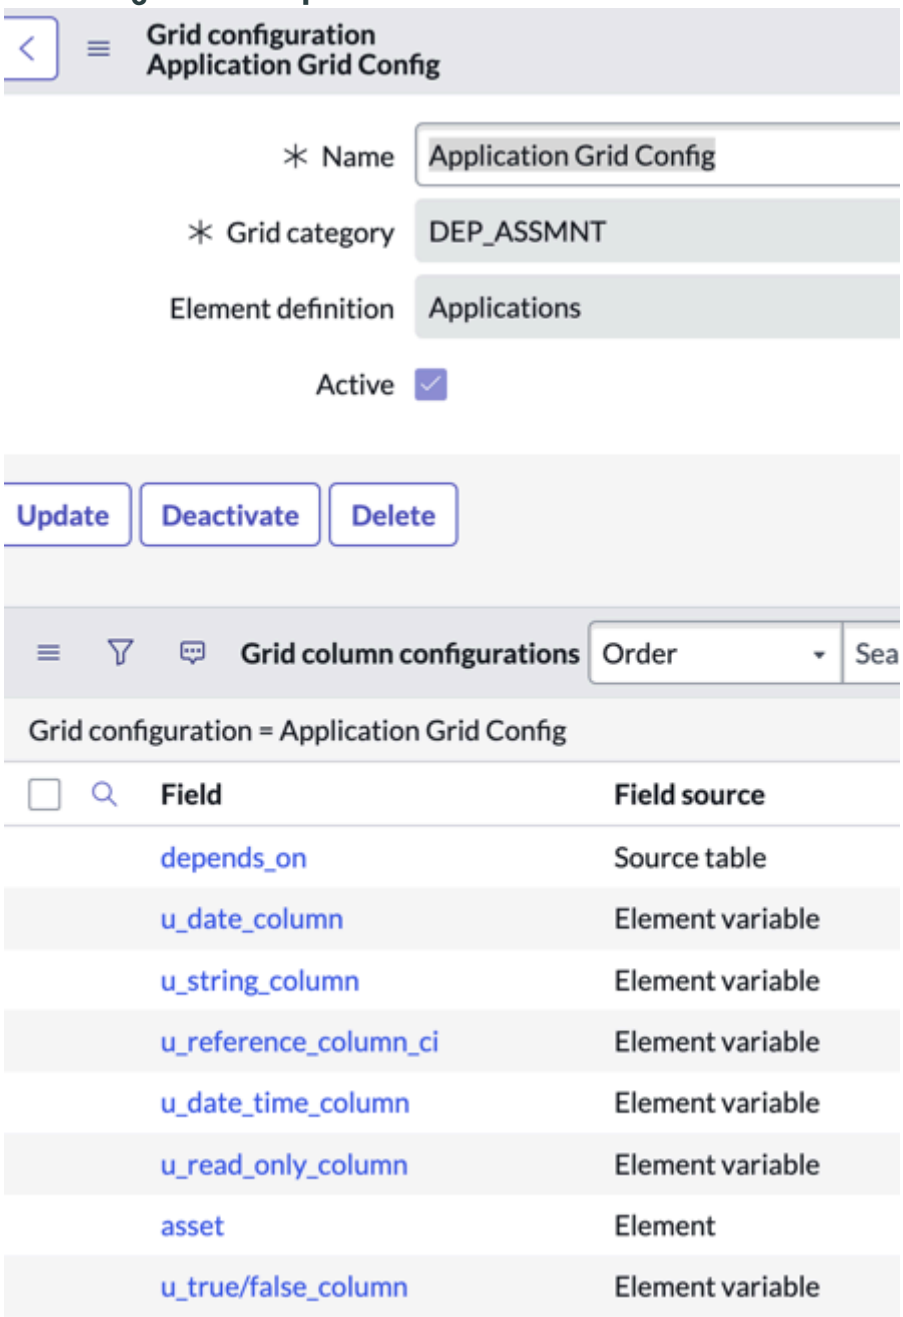
The order of impact rating in the RTO impact assessment grid and the order of the questions in the RPO impact assessment grid are defined by the impact rating scale and the impact analysis questions in the BIA, respectively.



However, any user who can access the BIA can change the order of the RPO impact grid, RTO impact categories, and dependency groups.

Columns in dependency group grid

If you had set up column configurations for an element of a dependency group and enabled your grid configuration as active, then you can view those columns in the dependency grid for the corresponding dependency group in which element definition matches with the grid configuration element definition.



Otherwise, you can view the grid that is rendered based on the configured view; that is either IT asset or non-IT asset view based on the required data backup value of the dependency group.

Grid columns for dependency assessment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Grid configuration setup

For ad hoc reporting of variables created for dependency: Add the columns in Dependency report source [sn_bia_dependency_report_source] table to match the variables that you defined in Element variable where the **Enable reporting** option is set to **true**. A scheduled job that runs weekly:

- retrieves the
  - dependencies (sn_bia_dependency), where the impact analysis is in approved state, updated in the last seven days, and has not expired, and the
  - corresponding element
- and updates the data in the reporting table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

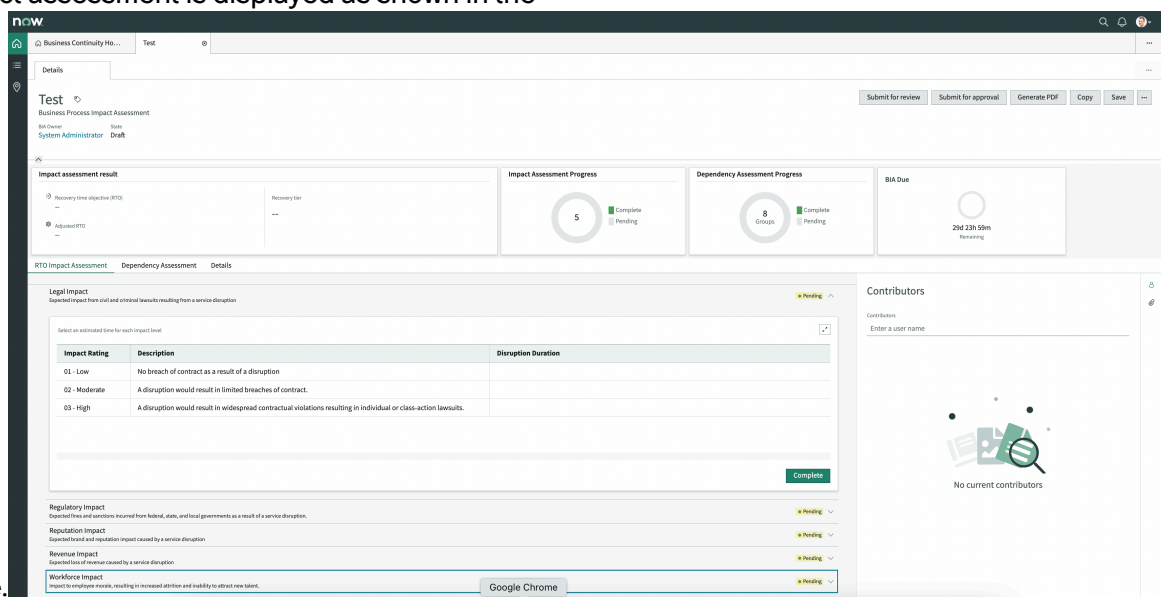
To display the columns that you require you must set up the element variable and grid configuration. For more information, see, Grid configuration for column display.

8. To change the order of appearance of the impact categories in RTO, RPO, and dependency groups in dependency assessment, navigate to **Business Continuity** > **Business Impact Analysis** > **Impact Category Results**.
   a. Click the impact analysis record.
   b. To change the order of the impact categories for RTO and RPO, click the Impact Category Results related list and change the order in the **Order** column.
   c. To change the order of dependency groups, click the Impact Dependency Groups related list and change the order.

Review an impact category and assess its recovery time

Review the impact categories and define the timeframe during which the organization would experience the downtime of its business processes. Analyze the downtime or disruption duration, which helps to determine the recovery time objective for the asset that is assessed.

Before you begin



Role required: sn_bcm.planner, sn_bcm.program_manager

About this task

BCM administrators configure the impact categories that are relevant to your business. For more information on configuring an impact category in the classic BCM workspace, see Configure an impact rating to assess an impact category and Structured workflows for Business Impact Analysis.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Select the lists icon ( ).
3. In the **Name** column, select the link to the BIA record that is in the **In Draft** state.
   An impact assessment is displayed as shown in the example.

4. To update a business impact category with its recovery time, select the **RTO Impact Assessment** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The state of the impact category changes to **Pending** and the grid is editable.

5. Double-click the **Disruption Duration** cell for each Impact rating.

   Disruption duration is an estimated duration of the disruption that is based on your responses to the assessment questions and your subject matter expertise. If you're the BIA owner, you have to select the right disruption duration based on your responses to the assessment questions and your subject matter expertise. The disruption duration is used for calculating the recovery time objective (RTO).

6. Select the duration from the list that pops up depending on the criticality of the impact.

   The system prompts you to complete entering the disruption duration for all impact ratings of an impact category.

   The list of values displays only those durations that are configured as applicable timeframes for the recovery time objective (RTO) type impact category.

7. Select the **Disruption Duration** cell of the next Impact Rating to enter its value and save similarly.
8. Select the **Complete** button after you've assessed the duration for all impact ratings of an impact category.
   The state changes to **Complete** and is closed for editing unless you select the **Edit** button again.

Assess RPO impact of technology assets on the business

Use the RPO impact assessment tab to enter asset information. The information can be critical from the objective of its recovery, the data value of the asset, and the frequency at which the data changes in the asset.

Before you begin

Role required: sn_bcm.program_manager or sn_bcm.planner

About this task

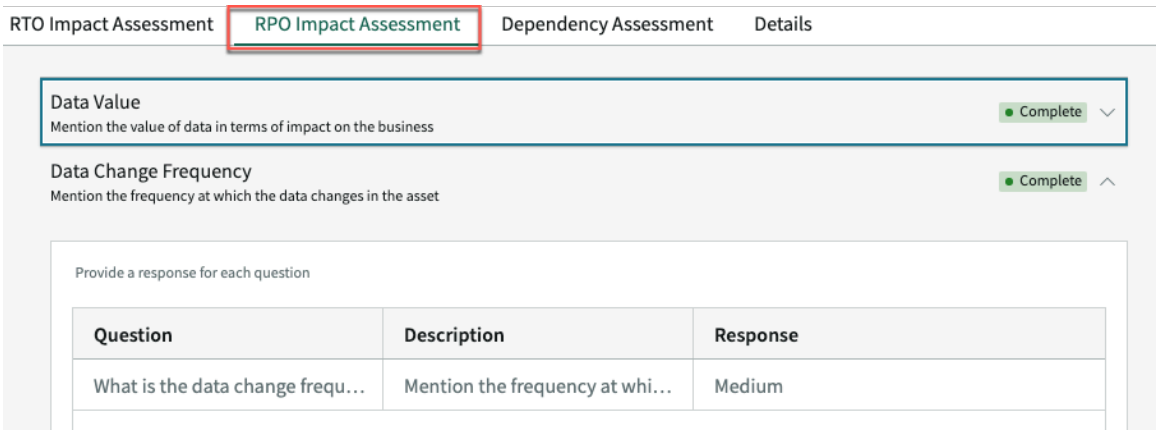
Not all elements require data backup, however technology assets like IT hardware and software require data backup due to the critical information content.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
   By default the records in the **In Draft** state of the Business Impact Analysis list opens.
3. To create a business impact analysis (BIA) record, click **New**.
4. To update an existing BIA, click the link to the record in the **Name** column.
5. To assess a BIA of its recovery point objective, click the **RPO Impact Assessment** tab.
   The **RPO Impact Assessment** tab appears only if you, as a BCM administrator, had set the **Requires data backup** field as **Yes** in the Configure element definitions for Business Continuity Management.
6. Enter the data value of the asset in terms of its RPO impact on the business in the **Response** cell of the Data Value grid.
7. Click **Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To mention the frequency at which the data changes in the asset, enter your response to the questions in the Data Change Frequency grid.
9. Click **Complete** after you answer all the RPO related questions.



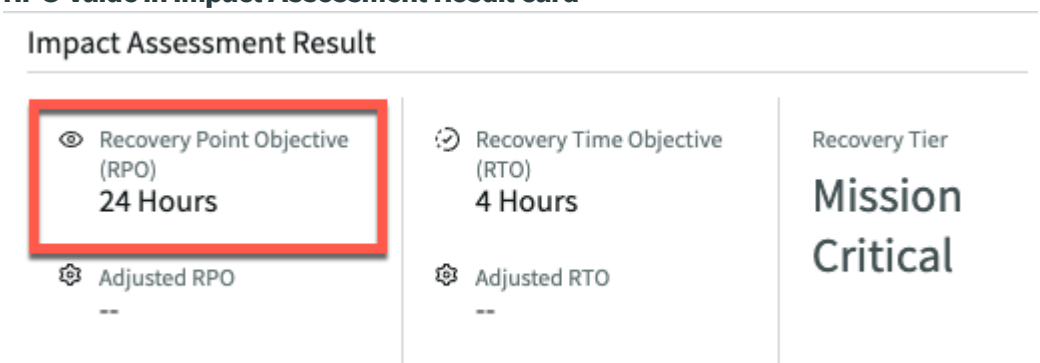
Result

Calculation of **Recovery Point Objective (RPO)** for **Impact Assessment Result**

If the impact category contributes to RPO, then the RPO calculation is as follows:

RPO depends on the rating or the response that you give for each question in the impact category of RPO Impact Assessment.

RPO assessment result



Based on your response that you have selected for each Impact analysis question of an impact category, the system calculates the RPO.

For example, if two questions have a Medium (value is 20) response and one question has High (value is 30) as response, then the system considers the response whose value is maximum. Hence, in this case the impact rating is considered as High and the value is 30.

The impact rating has an integer value preconfigured in the Impact Rating table [sn_bcm_impact_rating]. This value is updated as the **Category score** for the corresponding impact category in the Impact Category Results table [sn_bia_category_result]. The system picks up the maximum category score across all impact categories. This score falls within a range of lower and upper threshold values. The threshold range within which the maximum score falls corresponds to a timeframe, which is stamped as **Recovery Point Objective (RPO)** in the **Impact Assessment Result** card of the BIA.

RPO value in Impact Assessment Result card

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The mapping results of the threshold score and the timeframe are stored in the Score timeframe mapping table [sn_bia_score_timeframe_mapping].

Identify critical dependencies to prioritize recovery plans

Use the **Dependency Assessment** tab to identify items or assets that belong to a definite object type or a dependency group.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

About this task

Add a description of use and a timeframe to recover the item and provide data backup for the item. Assessing dependencies for a group helps you to know the underlying dependent items or assets of your business process. This assessment helps to prioritize critical dependencies that require recovery strategies to be established during the planning phase.

The BIA template that you use to create a business impact analysis has dependency groups associated to it. When you do an assessment, the dependency groups are automatically populated in the BIA. You can view them as Applications, Hardware, Software, Vendors, Workplaces, and others, each in its own container depending on how many of these groups are associated to the template. Each of them is a dependency group and you can add or remove items that belong to each group within its container.

Note:
You can add or remove dependent items only if you are a user with appropriate access.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon).
3. Click the link to the record in the **Name** column in the **In Draft** state.
4. To review a group and identify the items within each group, click the **Dependency Assessment** tab.
   You can click the container to know the group and the items that belong to the group. For example, if the group is Application, you can select an item related to the business process that is assessed like Enterprise Resource Planning or Customer Relationship Management.
5. To add an item to a dependency group, click the **Add New** button of that container.
   - If it is the Application, Hardware, or Software dependency group that uses class extensions to populate configuration items and discover technologies or software, see Add dependencies based on CI relationships in CMDB.
   - If it is Vendors or Locations group, add assets accordingly. You can add multiple items in the modal form. The grid in the container becomes editable and you can enter data in each cell for an item.

   The state of the dependency group changes to **Pending**.

   a. Select an item from the list in the **Depends on** cell.

   b. Double-click the **Description of Use** cell and enter the function or role of the item.

   c. Select the time period in the **Required Recovery Timeframe** cell by which the item is to be recovered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Required Data Backup** cell, select the time period by which a data backup for the asset can be provided.
While configuring an element in the Element Definition form, you can set the **Requires data backup** field as **Yes**. However, at the time when a BIA is created, the application copies the required data backup information from the element definition over to the dependency group of the BIA. If at this point, the required data backup is true for the dependency group, then the **Required Data Backup** column appears in the grid.

6. To expand the dependency grid to full screen and edit the grid values, click the full screen icon ( ).
You can use the collapse screen icon ( ) to collapse the grid back to the normal screen size.
7. To update a group with dependent items, click the **Edit** button.
The state of the dependency group changes to **Pending**.
8. To remove a previously identified dependency item, select the item in the check box and click the **Remove** button.
When you click **Remove**, the record is deleted from the Dependency table [sn_bia_dependency].
9. Click **Complete** to complete the assessment of a group.
Confirm that you have entered data in all the cells for the items before clicking complete. Otherwise, the system prompts you to fill in the incomplete cells. The container closes, the state is set to **Complete**, and you are directed to the next container. You cannot edit it unless you click the **Edit** button again.
10. Click **Save** to save the BIA and its dependency details.
11. Click **Submit for Review** to submit the BIA for a BCM program manager's review.
12. Click **Add Dependencies** to add dependent CIs collectively for all the dependency sections of the BIA.
If the dependency groups depend on configuration items (CIs) in CMDB, then those CIs are linked as dependent items for the corresponding group in each section.

Note:
Dependency mapping of the dependency groups to their CIs is tracked up to five levels. Items within these five layers are added as dependent items to those Dependency Assessments that are only defined in the BIA template. For example, if Applications, Hardware, and Software are defined as Dependency Assessments in the Business Process BIA template, then only those CIs mapped up to five levels of the Dependency Assessments are added.

To select and add CI as dependent item to each dependency group individually, see Add dependencies based on CI relationships in CMDB.

The filter condition in the Element definition is used to add specific configuration items (CIs) via the pop-up. The **Update dependencies** UI action also considers the element definition's filter and retrieves the related CIs of the configuration item listed in the **Applies to** field of the BIA. These relationships are retrieved from the CI Relationships table.

Add dependencies based on CI relationships in CMDB

Add an item by referencing its CI relationship to drill down to the item that is related directly to the dependency group. You can map the item's relationship with the dependency group while assessing the business impact analysis of an asset that is at risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager

About this task
If it is an Application, Hardware, or Software dependency group that uses class extensions to populate configuration items and discover technologies or software, you can add items by filtering records based on the item's relationship with the BIA dependency group. Or, you can add items to the group by simply selecting items from all the records.

For example, your business function, Accounts Receivable, may depend on the business application, Acrobat, to complete a business process. Therefore, the relationship is captured as Depends on::Used by. The Accounts Receivable business function depends on the Acrobat application item, and the Acrobat application is used by Accounts Receivable. Similarly, your business function may depend on other dependency groups like software technology or hardware to accomplish a business process.

Procedure
1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ().
3. Click the link to the record in the **Name** column in the **In Draft** state.
4. To review a group and identify the items within each group, click the **Dependency Assessment** tab.
5. To add an item to a dependency group, click the **Add New** button of that container.
6. To filter items from all the records, click the **From all records** button.
   a. Click **Next**.
   b. Select items from the Add items pop-up.
   c. Click **Add**.
7. To filter an item based on its relationship with the dependency group, click **Based on CMDB dependencies (Level 1)**.
   a. Click **Next**.
   b. Select items based on the relationship.
   c. Click **Next**.
   d. Select the item.
   e. Click **Add**.
   The dependency group grid lists items that depend on the BIA. If you add an item from all the records, then the **Relationship source** is **BCM**. If it is based on CMDB dependencies, then it is **CMDB**.

> **Note:**
> If you select an item **Based on CMDB dependencies (Level 1)**, only those items that are directly related or in the level 1 of dependency based on the relationship types identified in CMDB are listed in the Add items pop-up. On the other hand, if you select **From all records**, then all items from the respective table, irrespective of its relationship in CMDB, are displayed and are tracked up to a maximum of five levels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To view the details of the dependent item, click .
   The dependency details of the item that your business function depends on opens in a new tab. You can update the required recovery timeframe, required data backup, and the description of its use in the business function, and save the details.

View business impact analysis details

Use the **Details** tab to view the general information of the business impact analysis. You can also adjust the recovery time objective and recovery point objective results of the primary element as per your requirement.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click the link to the record in the **Name** column in the **In Draft** state.
4. To view the details of the business impact analysis, click the **Details** tab.

General Information

View the general details of an assessment for the Business Impact Analysis such as the name of the BIA, its description, and the business unit and department that it pertains to. You can also view the template that you have used to create the BIA.

Results

You can track the results at the asset level. Hence, the primary scope is to recover the primary element or the asset. Defining recovery requirements depends on the type of disaster and the time by which each asset must be recovered.

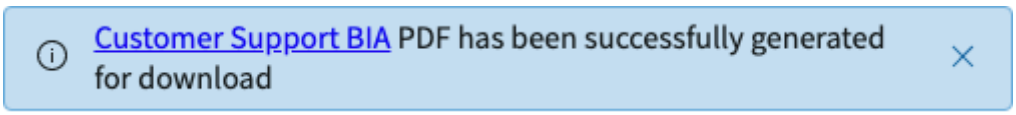
- **Recovery tier**: The level of criticality at which the primary element is in terms of its recovery.
- **Recovery time objective** (RTO): The maximum time by which the business should recover the primary element or asset after the business disruption.
- **Adjusted RTO**: If you want to adjust the calculated RTO, then edit this field to add your value.
- **Reason for adjusted RTO**: Enter the reason for adjusting the RTO value.
- **Recovery point objective** (RPO): Point in time at which the primary element must be restored following a disaster. It also indicates the maximum amount of data loss that a business can sustain during a disruptive event.
- **Adjusted RPO**: Edit this field to enter your RPO for the primary element.

  Note:
  Recovery point objective and **Adjusted RPO** fields appear only if the primary element requires data backup and is flagged as **Yes** in the Element Definition form.

- **Reason for adjusted RPO**: This field appears when you enter a value in the **Adjusted RPO** field. Enter the reason for adjusting the RPO value.
- **Confidentiality**, **Integrity**, and **Availability**: If the primary element includes critical data, then add Confidentiality, Integrity, and Availability (CIA) details. CIA details are basic security goals that the BIA must be compliant with.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Non-compliance to these standards may lead not only to huge business and productivity loss but also credibility loss.



Note:
The **Confidentiality**, **Integrity**, and **Availability** fields appear only if you have already set the **Include CIA** field as **Yes** in the Configure a business impact analysis template that you have used.

If you have not adjusted the RTO and RPO values, you can still view the system-calculated RTO and RPO values in their respective fields.

Activity

Additional comments about the BIA.

5. Click **Save**.
6. Click the **Generate PDF** button to generate the BIA in a PDF format.
   A message appears that the PDF has been generated.

Click the link in the message to download the PDF.

- If you have view-only access to the BIA, the option to generate a PDF helps you to download the document to your local hard drive.
- You can download the BIA before its **Approval** state.
- By default, the PDF is generated and attached after the BIA is approved.

7. To move a BIA from **Approved** to **Draft** state, click the **Edit** button.
8. To create a copy of the BIA, click **Copy** button.
   If you have the permission to read and create a BIA, then you can also copy the BIA.

   a. Enter the name of the new BIA in the Copy impact analysis pop-up.
   The copy action creates an exact replica of the BIA with the name that you enter in the Copy impact analysis pop-up. It also copies all its dependencies and dependency groups on to the new BIA.

   b. Click **Confirm**.

   - The new BIA that is copied from the original BIA has all the RTO, RPO impact, dependency assessment structural details similar to the original BIA.
   - However, the impact category details for each of these assessments are editable for you to assess the dependency details exclusively for the copied BIA.
   - If the impact categories of the RTO and RPO impact assessments in the original BIA are in the **Complete** state, then the impact categories in the copied BIA are in the **Complete** state.
   - Therefore, you must assess and enter the disruption duration, response, and required recovery timeframe relevant to the copied BIA.
   - You can assess the details in the **Results** section. The RTO and RPO values are recalculated after you complete the assessments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Activities and Work notes are not copied to the new BIA. Enter this information relevant to the new BIA.
- Any attachments attached to the original BIA in any format are copied to the new BIA. However, the PDF generated for the original BIA using the **Generate PDF** button will not be copied over to the new BIA as the assessment data pertain to the original BIA. Since you have the flexibility to modify the assessment details in the copied BIA and generate a PDF, copying the PDF generated for the original BIA has no relevance.

Note:
You can delete a BIA and its related tables in the **Draft** state. The BCM planner and program manager can delete a BIA that is in the **In Review** and **Returned** states whereas, a BCM admin can delete a BIA irrespective of its state.

View approval state flows for a business impact analysis

View the approval state transitions sent at each level of the approval process, and the details of the approvers as you direct the business impact analysis through multiple levels of approvals.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager, sn_bcm.viewer

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
   You can view approval records for a business impact analysis (BIA) that is any state except **Draft** and **In Review** states.
3. Click the link to the business impact analysis record in the **Name** column.
4. To view the approval details of the BIA, click the Approvals related list.
   If there are no approval records in the requested state for the BIA, then you can either **Reject** or **Approve** the BIA.

   Note:
   If you are a BCM Program Manager, then you can see the **Approve** and **Reject** buttons.

5. Click the link to the approval record in the **Name** column.
   You can view the name of the approval, approval level, its current state, and the details of approvers such as users and groups.
6. To view the approval history of the impact analysis, click the **Details** tab.

   a. Click the Approval History related item.
   You can view the complete approval history of the approvers and the details as to when it was created.

   State transitions for multiple levels of BIA approvals:

   Not Yet Requested

   State where an approval is not yet sent to the approvers at a respective level.

   Requested

   Approvals are sent to the approvers of that level. Correspondingly, the state of all successive levels of approvals turns to Not Yet Requested.

   Approved

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

One or more approvers have approved the BIA at the respective level. Correspondingly, the state of the succeeding level of approval moves to Requested.

Rejected

One or more approvers have rejected the BIA at a particular level. Even if one approver rejects the BIA, then it moves to **Rejected** state. Correspondingly, the state of all succeeding levels of approvals moves to No Longer Required.

No Longer Required

If the approvers at a level have approved or rejected the BIA, then the state moves to No Longer Required for all succeeding levels of approvals.

Update dependency details of a BIA in Self Service

Use contributor role to update the disruption duration of the impact category result, RPO Impact analysis responses, state of the impact dependency group, and the work notes in the Activity related item.

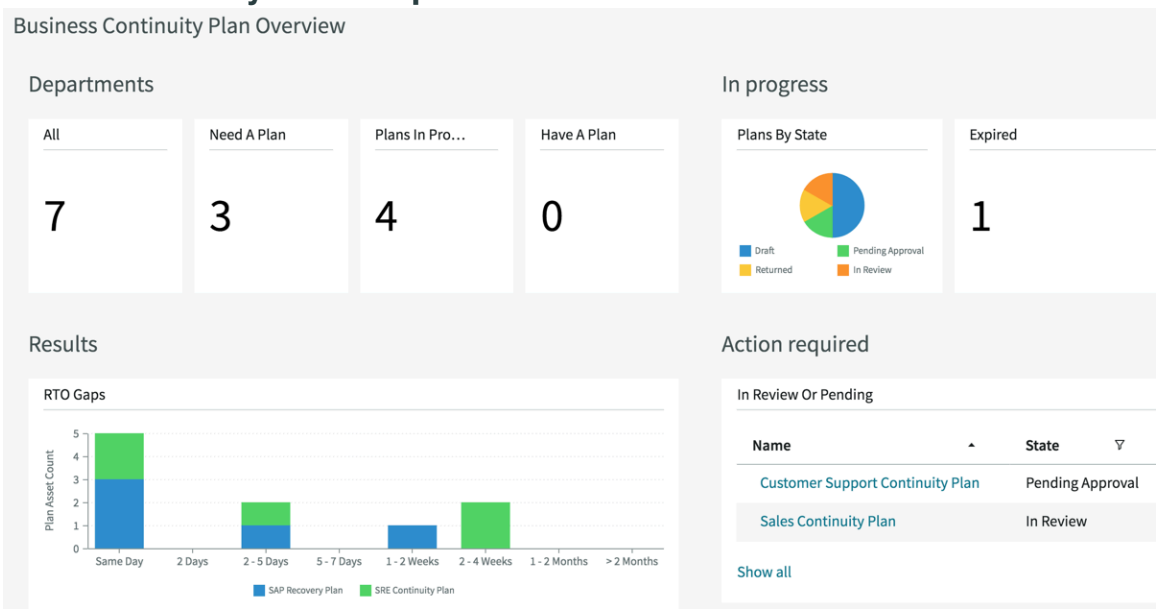
Before you begin

Role required: sn_bcm.contributor

If you are a BCM contributor and is part of the Contributors list, then you can update the dependency details of a business impact analysis (BIA).

Procedure

1. Navigate to **All** > **Self-Service** > **My Impact Analysis**.
2. View the list of business impact analysis assigned to you and the BIAs that you can contribute to.
3. Click a impact analysis record.
4. Click the Impact Category Results related list.
5. Select any RTO impact assessment record to update its disruption duration details.
6. To update the impact analysis response, click the RPO impact category record.
7. To update the state of the impact dependency group, click the Impact Dependency Group related list.
   You can also add, update, and delete dependencies under the dependency group.
8. To add work notes to the BIA, click the **Activity** tab.
9. Click **Update** after your changes.

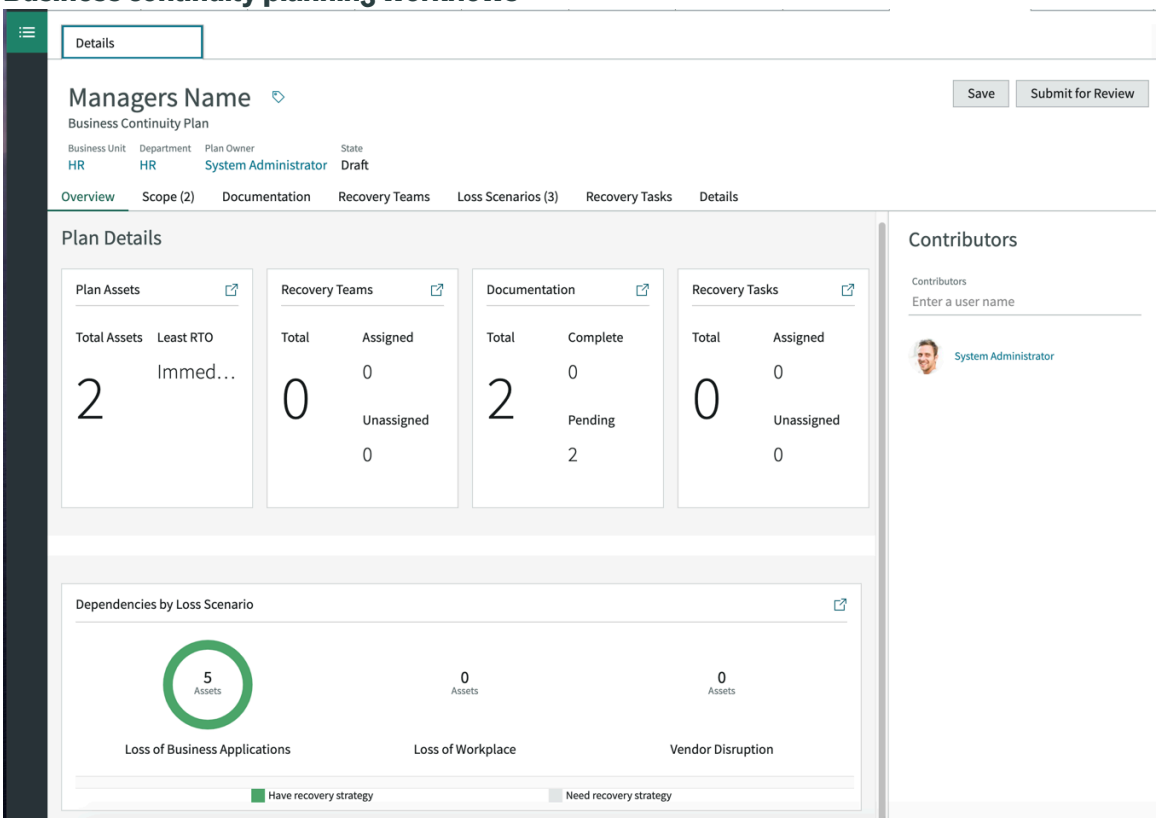


Structured workflows for Business Continuity Planning

Business Continuity Planning (BCP) helps you enact and mitigate risk at the time of an event by addressing action items such as plan assets, activities, recovery teams, documentation, policies, and procedures.

BCP consolidates all the data needed for managing business continuity and disaster recovery plans in ServiceNow AI Platform®. It organizes a catalog of enterprise data into a single system of records. Instead of creating records, you can simply select the required data. Creating plans then becomes simple and effortless by taking advantage of the existing information and arranging it in a logical association of data for recovery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Business Continuity Plan workspace overview

The program manager, planner, and viewer get a custom workspace to work on, which presents them with the current status of plan-related activities. The workspace is a secure portal to open the plans that are available for access to the user with a particular role.

You can build your plan within a single user interface with the ability to open a plan tab to complete a task. You can move on to the next plan task to add, delete, or update the details of the plan.

Business continuity planning workflows

With comprehensive action plans in place for different possible disruptive scenarios, and a dedicated team with responsibility to act quickly at the time of a loss scenario, your organization is equipped to face a crisis or any adverse situation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a business continuity plan from a plan template

As a program manager you can create a plan for the respective business units that can be used in times of business disruption. You can use a specific plan template for each plan type to streamline the process of a plan creation.

Before you begin

Role required: sn_bcm.program_manager, sn_bcm.planner

About this task

You can create a plan using a pre-configured plan template that suits your requirement. Using the plan template gives you a standard plan layout automatically adding document sections, loss scenarios, and identifying primary elements that are to be recovered. Plan templates help you to focus on the plan content, its tasks, and the effective implementation of the plan.

Creating a plan helps an organization to identify processes, locations, and assets that must be recovered as a priority when there is a disruption. Selecting a plan type helps to identify the elements for recovery and the time by which it should be done.

As a BCM program manager you can create a plan by clicking the **New** button. When you select a template for the plan, all the related information in the template is copied over to the plan after you submit.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. To create a plan from the Business Continuity Home page, click **Create a Plan**.
3. To view the list of existing plans in different states and to create a plan record, click the lists icon ( ).
   a. Click **In Draft** state in the Planning list.
   b. Click **New**.
4. Enter plan details in the Create Plan modal form.
5. Enter a name for the plan and select a plan template.

   Describe the plan name within 255 characters following a naming convention exclusively for your business teams.

   The details of the referenced template are copied over to the plan. Select the business unit, department, and the plan owner applicable to the plan.
6. Click **Submit**.

   The plan that you created opens up in the record view. This view displays the details of the plan under the headers **Business Unit**, **Department**, **Plan Owner**, and **State**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

The tabs that are available in the Plan view depends on the value that you have selected in the **Plan authoring type** field of the Configure a business continuity plan template that is used in this plan.

Plan authoring type values

When you create a plan using a template, the plan documentations associated to the plan template are copied over to the documentation section of the plan that you created.

7. Review the plan details in the **Overview** tab.
8. Click the **Details** tab to update the plan details.
9. To save the plan and update its details later, click **Save**.
10. To save and submit it for review, click **Submit for Review**.

Note:
You can submit the plan for review only when it is **In Draft** stage.

When you submit the plan for review, the plan moves to **In Review** state.

As a plan owner, you can add details to the plan and move it across different states to get it approved finally.

Note:
The **State** field is read only. It indicates the status of the plan. Hence, your action on the plan in the UI takes it through to its approved state.

In Draft

It is the state when your plan is under edit. Add documentation sections to the plan, identify recovery teams and set up recovery tasks for the owners, and submit the plan for review.

To submit for review, confirm that a BCM Lead is assigned to the plan. Otherwise, you can submit the plan for approval.

After the plan owner submits the plan for review, the state changes to **In Review**. The state of the plan changes to **Submit for Approval** for the plan owner.

In Review

The plan owner can review, edit, and submit the plan for approval.

Pending Approval

When you click **Submit for Approval**, the plan is set to **Pending Approval** state. The approval configurations, approval levels, and approval rules are evaluated against the plan to determine the approvers. If there are no approval records in the requested state for the plan, then as a BCM program manager you can either **Reject** or **Approve** the plan. The state of the plan and its related tables is read only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Returned

When the plan is rejected, the state is set to **Returned** state.

Approved

When the plan is approved, it moves to **Approved** state.

The plan and all its related tabs are read only. Your only option to change the status at this state is to move it to **Archived** state.

Archived

When you archive the plan, it becomes read only. All underlying tables from where the plan retrieves its data to populate in the plan assets, related asset dependencies, recovery strategy, documentation, recovery teams, loss scenarios, and recovery tasks tabs become read only. You cannot edit the information in these tabs anymore.

Note:
A scheduled job runs weekly to move the plans that have expired to **Archived** state.

11. To export the plan to different locations and make it available for people to execute the plan in a crisis situation, click **Generate PDF**.

Note:
You can generate a PDF if you are a plan contributor (sn_bcp.plan_contributor) or plan manager (sn_bcp.plan_manager).

You can generate a PDF of the plan in all states except **Approved** and **Archived** states. If the plan is approved, then by default a PDF is generated and attached to the plan.

The plan is exported in its entirety with its summary, recovery teams, loss scenarios, recovery tasks, and an appendix table listing the contact number of every member who is part of the recovery team.

View plan details in scorecards

Use the **Overview** tab to gain a quick understanding of how robust your business continuity and emergency plans are. This tab gives an overview of the scores of important plan elements, each as a scorecard.

Before you begin
Role required: sn_bcm.program_manager, sn_bcm.planner

About this task
Your emergency action plan must be customized to your workplace and include information about all potential sources of emergencies. The plan must be comprehensive with details of:

- the assets that have to be recovered
- the teams that are responsible for the recovery of each type of asset
- a designated group to which the plan is assigned
- an owner identified to the assignment group
- documentation detailing how the plan must be executed

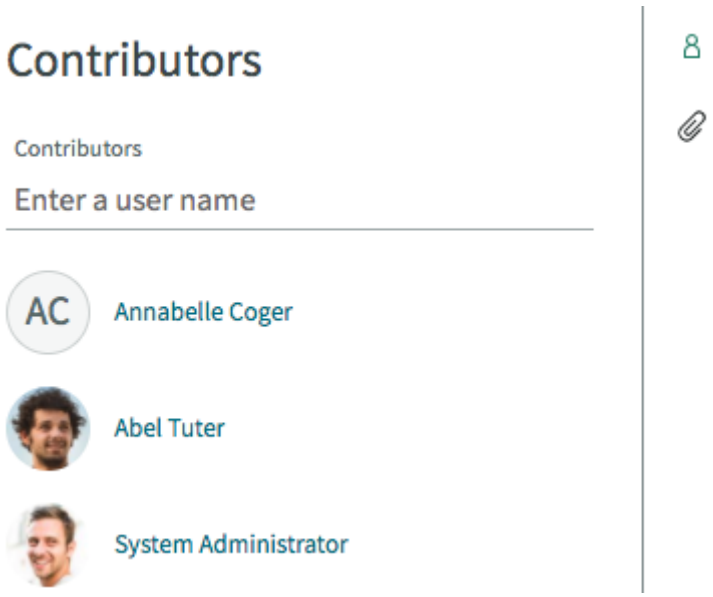
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
   In the **Overview** tab, you can see the scorecards that are graphical representations of the progress of the plan for making it complete towards its goal.

   The different scorecards that are available to view in the **Overview** tab depends on the value that has been selected in the **Plan authoring type** field of the Configure a business continuity plan template used in this plan.

   Note:
   If your plan is in **Approved** state, then you can view the **Plan Usage and Results** section. However, you can view all the details of a plan in the **Plan Details** section irrespective of the plan being in any state. For more information, see Plan overview scorecards for plan usage details.

5. To complete the documentation sections that are in **Pending** state, identify teams and individuals for the unassigned recovery teams, or assign groups to carry out specific plan activities, click go to section icon ( ) in the respective scorecard widget to add the required information and set the plan to complete.
6. To add contributors to the plan, click the **Contributors** field to select the users.

Contributors card in the Overview tab

   To make a business continuity plan complete and robust, you need inputs from people who can assist and contribute information on the plan. These contributors can also be users to whom you can assign specific tasks. You can add as many contributors as the plan requires.

7. To remove a contributor from the plan if no longer required, click the **Remove** button next to the name of the contributor.

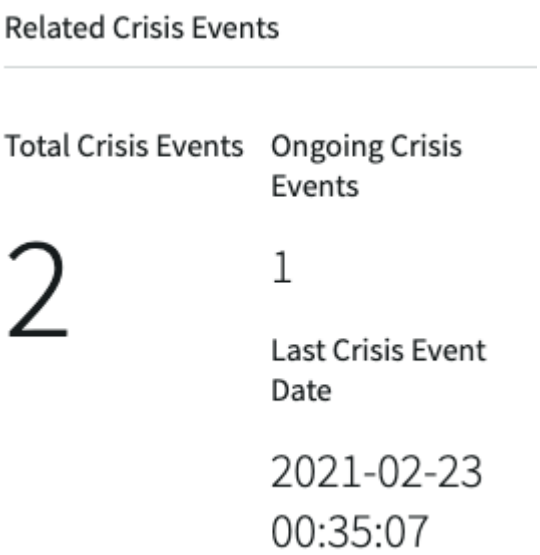
Plan overview scorecards for plan usage details

The **Overview** tab gives you the details of the plan and the exercise and actual events that use the plan. It also indicates how successful the plan was in recovering the assets in a loss scenario.



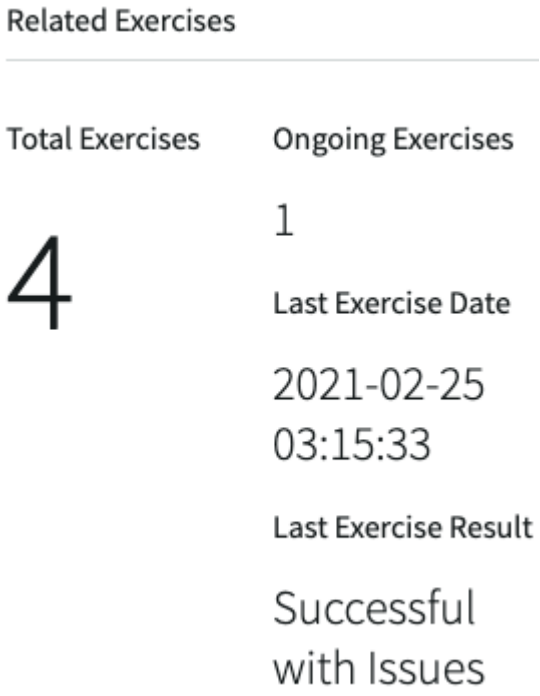
Plan usage and results

The Plan Usage and Results section shows the details of the crisis and exercise events that use the current plan that you are viewing.

Related Crisis Events

- Total Crisis Events: The total number of crisis events that use the current plan.
- Ongoing Crisis Events: The number of crisis events that are currently in progress.
- Last Crisis Event Date: The actual end date and time of the last crisis event that happened.

Related crisis events



Related Exercises

- Total Exercises: The total number of exercises that use the current plan.
- Ongoing Exercises: The number of exercise events that are currently in progress.
- Last Exercise Date: The actual end date and time of the last completed exercise event.
- Last Exercise Result: Indicates whether the last completed exercise event was successful or not.

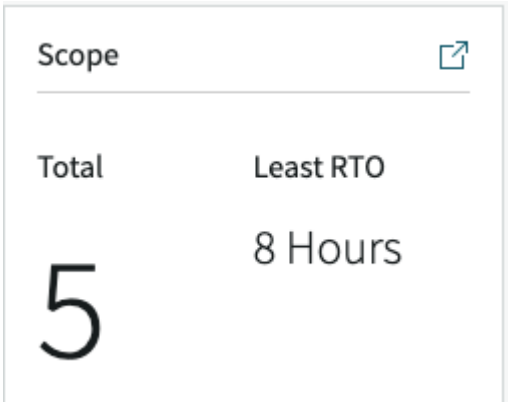
Related exercises

Exercise Results

The color-coded donut indicates the number of completed exercise events that were successful, unsuccessful, and successful with issues.

Exercise results



Plan details

Scope

Displays all the assets identified in the plan as **Total**. Out of all the RPO and RTO that a primary element supports, the minimum value of RPO and RTO is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

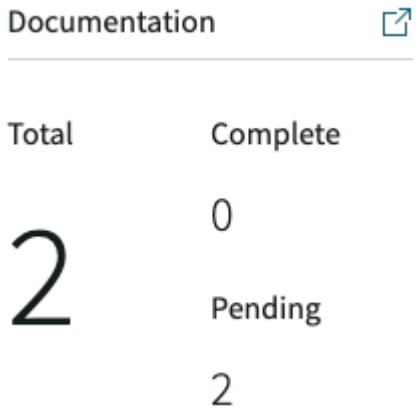
Plan assets scorecard

Recovery Teams

The scorecard helps you to identify teams and individuals with clear guidelines of responsibilities to act at the time of a crisis.

The assigned score indicates that a recovery role of a plan has been assigned to a group or a user. The unassigned score indicates that the recovery role is not assigned to any group or user.

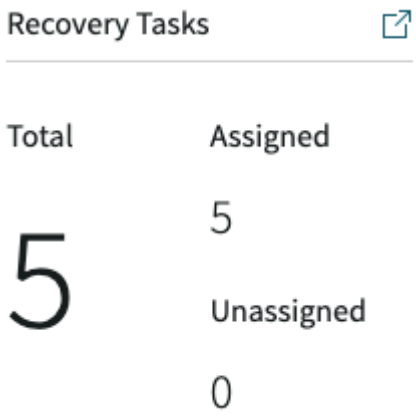
Recovery teams scorecard



Documentation

Displays the total number of documentation sections that are attached to the plan. The breakdown shows the status of the documentation sections that are updated according to the plan and in **Complete** state. The **Pending** state indicates the documentation sections that are still under edit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

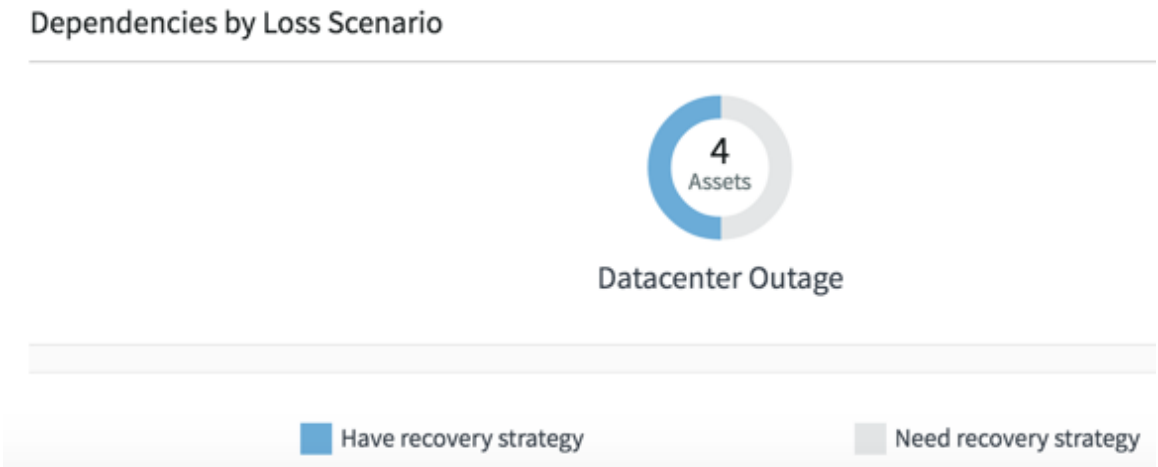


Documentation scorecard

Recovery Tasks

The recovery tasks scorecard indicates a group and an owner for the group, identified to carry out the activities of the plan during the recovery process.

Recovery Tasks scorecard



Out of the total number of activities identified for the plan, the assigned score indicates the number of activities for which groups have been assigned. Unassigned score indicates plan activities for which groups have not been assigned.

Dependencies by Loss scenario

The donut chart shows the assets covered by a strategy, and uses colors to indicate whether the asset has a strategy or not. A loss scenario plan must have at least one strategy for an asset. However, you can also have a single strategy covering multiple assets.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependencies by loss scenarios

Add an asset to the scope of a business continuity plan

Use the **Scope** tab to add an asset to the scope of the plan. If the business impact analysis (BIA) application is installed, you can view the primary elements defined in the plan template, its recovery time objective (RTO) and recovery point objective (RPO) details, and the business impact analysis.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Scope** tab.
   If the plan is created from a plan template, you can view the primary elements defined in the plan template.
6. To add new scope to the plan, click **Add**.
7. On the Add Items modal, select the plan asset.
8. Click **Add**.
   Assets that are displayed in the Add Items modal belong to the element definition type identified in the **Primary element recovered** field of the plan template.

   If an asset has an approved BIA attached to it while adding the plan asset, then the approved BIA is automatically added in the **BIA** column of the asset.

   If the BIA is attached to the plan scope, then you cannot edit the RTO and RPO as they are values populated from the BIA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If the BIA application is installed, then **RTO** and **RPO** fields are visible and non-editable. **BIA** field is visible and editable. You can attach a BIA by clicking the link BIA icon ( ).
- If BIA is not installed, then **RTO** and **RPO** fields are visible and editable.
- If an approved BIA is attached to the plan, then **RTO**, **RPO**, and **BIA** fields are populated with values and they are read only and non-editable.

9. To update a plan asset or to link a BIA to it, click the asset in the **Name** column.

   a. Click the link BIA icon ( ).
   If there is an approved BIA for the asset, then the BIA is automatically attached to the asset when you click the link. If you have adjusted the RTO and RPO values based on the criticality of an asset, then the Adjusted RTO and Adjusted RPO values take precedence over the system-calculated RTO and RPO values. The adjusted RTO and RPO values are displayed in the **Recovery Time Objective** and **Recovery Point Objective** fields when you click .

   b. Click **Save**.

10. To remove an asset from the plan list, select the item and click **Remove**.

Add related assets and related plans

Identify related assets and their referred plans to recover the assets in your planning stage. Reuse the configuration item relationship data that flow from CMDB to business impact analysis (BIA) during dependency assessment to identify the assets in your plan.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task

With this feature enhancement, the relationship data of the configuration items in CMDB flow in to the business impact analysis (BIA) when you Add dependencies based on CI relationships in CMDB. If you have done the BIA, then the related assets data flow to the planning phase. In the planning phase, you can identify these BIA-dependent items as related assets. Additionally, if you have done the BIA and if your related assets has a plan, then you also have the capability to add the plan existing for the related assets as related plans in the planning phase, and as sub-plans in the execution phase of the event recovery process.

Therefore, instead of identifying new assets and creating plans to recover the assets you can use the BIA-dependent items that are added as configuration items from CMDB based on their CI relationship and reuse these items as related assets in the planning stage.

This feature gives you the ability to:

- Identify the related assets based on dependencies established in the CMDB and BIA during planning.
- Create a main plan and set a task that refers to another related plan.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Related Assets** tab to view the assets that are pulled from the BIA to the plan.
   If you have added a business process or a location as an item in the **Scope** tab, and if the scoped item is related to the BIA, then all the related assets of the BIA are lined in to the **Related Assets** tab of the plan. In other words, the CMDB configuration item added as a dependency in BIA is pulled into the plan as related assets. The source of these related assets is displayed as BIA.

   When you create a plan, you also select a primary element that the plan covers. Based on the scope that you selected in the business continuity plan or the primary element of the plan, the application adds the related assets and related plans during the planning phase. These items could be business processes, critical business applications, data centers, or resources working from a location. All these dependencies if stored in the BIA are copied over to the plan in the **Related Assets** tab in addition to other dependencies that are added while creating the BIA.

   Related assets tab

> **Note:**
> Unless you do the business impact analysis, the related items of the configured item data will not flow to the plan, although you have the option to manually add the related assets and related plans in the planning phase.

6. To add an asset manually, click the **Add** button.
   a. Select a type of the impacted item in the Add Items pop-up.
   b. Click **Next** and select the items that belong to the impacted item type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Click **Add**.

> **Note:**
> If the item did not come from the BIA but added during the planning phase, then the source of the impacted item that you added is **Manual**.

7. To remove a related asset, select the related asset and click **Remove**.
8. Click the **Related Plans** tab to view the plans that are related to the items in the **Related Assets** tab.
   After the assets are copied over to the plan, if there are plans attached to any of the related assets, then these plans are automatically pulled and listed in the **Related Plans** tab. Assets in the plan are those that are to be recovered by the plan during the event.

   When the related plans are pulled into the planning phase, you can also create the recovery tasks. As a planner you can set a sequence to the execution of the recovery tasks of the main plan and its dependent sub-plans.

   If you have not done the BIA or scoped the plan to a BIA, you can manually add plans at this stage.
9. To add a plan manually, click the **Add** button.

   a. Select a plan in the Add pop-up.

   b. Click **Add**.

Related plan tab

> **Note:**
> The source of the related plan that you added is **Manual**, as the plan did not come from the BIA but added during the planning phase.

10. To remove a related plan, select the related plan and click **Remove**.

What to do next

You can refer one of the related plans in a recovery task of the main plan and sequence the order of execution in the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create and manage plan documentation sections

Use the documentation section to document the recovery capabilities of the plan.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task

Document all additional information such as the goals, objectives, and scope that are required in the context of your plan as separate sections within the document.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Documentation** related list of the plan.
   You can view each section of the documentation in a separate text box. The documentation sections that are part of the plan template, which you used to create the plan, default to this plan. You can create new sections to the documentation and edit existing sections as well.
6. To edit a documentation section, click the edit icon ( ).
   Use this icon to edit the title as well as the text in the description of the documentation section.
7. To edit the text in a section, click the **Edit** button in the text box.
8. To undo all your updates and revert to the original text of the documentation section, click **Reset to template** and click **Reset** to confirm your action.

   Note:
   Reset to template button is enabled only when the document section is in Pending state and not in Complete state.

   When you reset, both the title and description along with the text in the documentation section are reset to the title, description, and documentation content in the plan template.

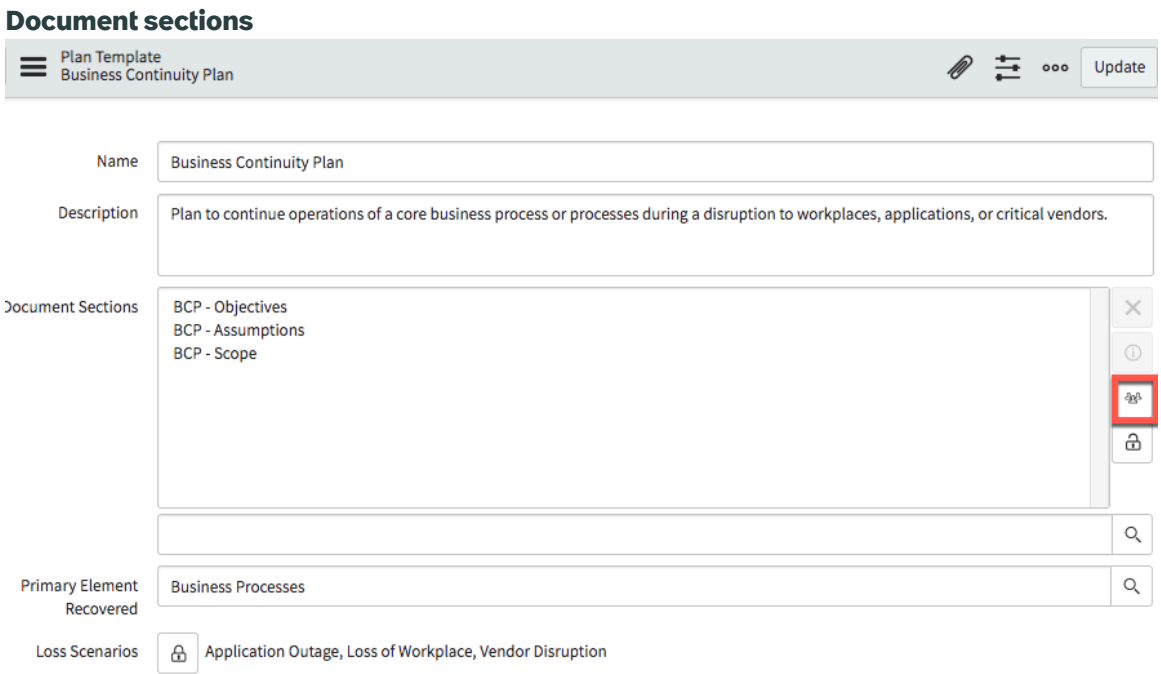
9. To delete a documentation section, click the delete icon ( ).
   This action deletes the documentation section.
10. To create a section in the documentation tab, click **New section**.
    a. In the New section pop-up, enter a title and a description for the section.
    b. Click **Create**.
    c. Click the **Edit** button to enter the contents in the text box for the section.
11. To save the updates and continue to edit the content, click **Save**.
12. To save and exit the edit mode, click **Complete**.
    After you click **Complete**, both the and icons are disabled. To enable the icons, click the **Edit** button in the documentation section text box.
13. To view the subsequent section and scroll through all the sections, collapse the section after you complete editing.

Change section order at the plan level

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can change the order in which the sections appear in the **Documentation** related list to help the user review the sections in a logical sequence. However, you must set the order preference for the sections by entering an integer value in the **Order** field of the Plan Documentation form for each documentation section in the plan. This customization overrides the order preference set at the plan template level.

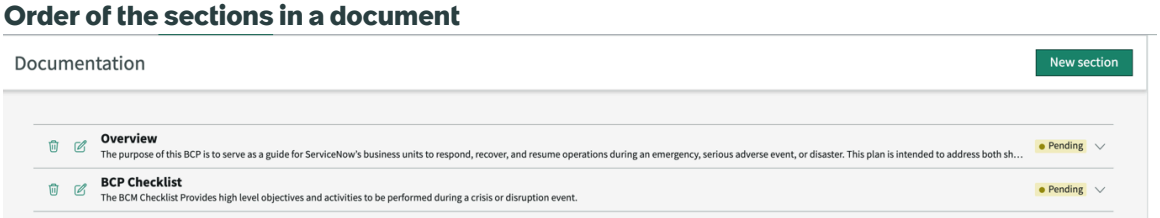
Change section order at the plan template level



You can define the order of document sections in the Plan template as well. This order is applied to all the plans that use the template. However, only a BCM administrator can change the order of the sections in the Plan Template form, when the template is created.

a. To rearrange the section order, navigate to **Business Continuity** > **Plan Configuration** > **Plan Templates**

b. Click the plan template in the **Name** link.



c. Click unlock document sections icon ( )

d. Click the add/remove multiple icon ( ) and move the items in a preferred order in the **Document Sections** field.

e. Click **Update**.

As a program manager, planner, viewer, or BCM administrator, you can only view the rearranged order of the sections in the workspace when your plan uses that template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assign roles and responsibilities to recovery teams

Identify individuals and groups and assign them to the recovery team so that they are aware of their roles and the responsibilities of the role to act in a crisis situation.

Before you begin
Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task
Business continuity planning workspace guides you step by step to complete your plan by creating a recovery team, defining roles and responsibilities for users, assigning the users and groups appropriately to the recovery team, and directing the team to execute the plan.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Recovery Teams** tab of the plan.
6. To create a recovery team and assign users and groups to the team, click **New**.
   You can create a recovery team by entering a name and description or update an existing one. Select one or more users and groups from the respective lists. The description for the recovery team also indicates the responsibilities of the users and groups who are assigned to the recovery team. You can also create a recovery team and leave the user and group assignment for later.
7. Click **Submit**.

Identify loss scenarios and align them to the plan

When you create a continuity plan or a recovery plan for a department or a business unit, it is necessary to identify and align loss scenarios to the plan.

Before you begin
Role required: sn_bcm.program_manager

About this task
As a plan owner identification of loss scenarios helps you to be prepared for any sudden disruptive event and continue with business functions as usual.

When you create a plan using a plan template, the loss scenarios that are identified in the plan template automatically get associated to the plan that you created. Your plan has a basic set of loss scenarios attached to it. You can then add additional loss scenarios to the plan as per your requirement.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Loss Scenarios** tab of the plan that opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use this tab to plan for every disruptive scenario that you can predict, and to manage response and recovery in such a situation.

6. Click **Add** to add additional loss scenarios to the plan.
7. Select the scenario names from the Add Loss Scenarios modal form.
8. Click **Add**.

   The loss scenario is associated to the plan. The Plan Loss Scenario table [sn_bcp_plan_loss_scenario] stores the relationship between the plan and the loss scenario.
9. To add related asset dependencies to the loss scenario of the plan, click the link to the loss scenario record in the **Name** column.
10. Click **Add** in the Related Asset Dependencies related list to add dependent items.

    a. To filter items from all the records of the underlying element definition, click the **From all records** button.
    If the loss scenario is loss of business applications, then all impacted applications are filtered and listed.

    b. Click **Next**.

    c. Select items from the Add items pop-up.

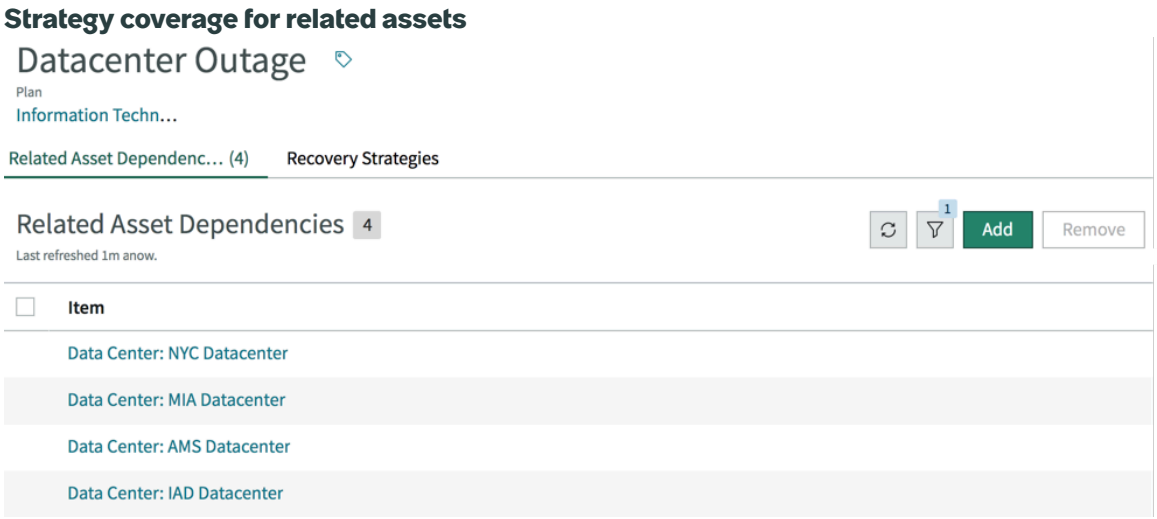
    d. Click **Add**.

    a. To filter items that depend on the plan scope, which is attached to the BIA, click **Based on plan scope**.
    b. Select the plan scope from the list.
    c. Click **Next**.
    d. Select the dependencies of the selected plan scope item attached to the BIA.
    e. Click **Add**.

Establish recovery strategies for asset dependencies

Use the **Loss Scenarios** tab to add asset dependencies and identify recovery strategies to deal with various loss scenarios. A plan, complete with recovery strategies for the identified loss scenarios, helps to address gaps that exist.

Before you begin



Role required: sn_bcm.program_manager or sn_bcm.planner

About this task

As a program manager, you can check if there are recovery strategies for various loss scenarios of the plans owned by the planners. Such assessments enable you to be prepared for those scenarios.

When you see the details of a loss scenario associated to a plan, you can also view the assets that are attached to the plan, and the recovery strategies for each of these assets. For example, NYC datacenter can be a related asset for a datacenter outage loss scenario of a customer support plan. You can create a recovery strategy by estimating the time to implement the strategy to get the NYC datacenter up and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click the **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Loss Scenarios** tab of the plan.
6. Click the link to the loss scenario record in the **Name** column.
7. To add a related asset to the existing list of assets that can be impacted and dependent on the plan loss scenario, click the **Related Asset Dependencies** tab.
   For more information, see Identify loss scenarios and align them to a business continuity plan.
8. To remove an asset from the plan, select the item and click **Remove**.

   Note:
   You can add or remove an asset, dependent on the plan, only if you are a program manager or owner of the plan.

9. To establish a strategy and recover a critical asset, click the **Recovery Strategies** tab.
   a. Click the **New** button.
   b. Enter a name and description for the recovery strategy and determine the implementation details to recover the asset.
   c. Click **Save**.
10. To add a recovery task to the recovery strategy of a plan's loss scenario, click the **Recovery Tasks** tab.

    You can create a recovery task at the recovery strategy level and also at the plan level. See: Create, update, and group recovery tasks.

Create, update, and group recovery tasks

Create tasks in a plan to recover your business from various disaster situations. Prioritize the tasks by determining the critical assets that have to be recovered and estimate the time by which the task must be completed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

About this task
Assign the task to a group, identifying an owner, to execute the processes and procedures of a recovery. The task has details of the item to be recovered and the time by which it should be accomplished.

Procedure
1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ().
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Recovery Tasks** tab of the plan.
   The **Recovery Tasks** tab displays all the data in editable lists. You can prioritize the tasks by sorting, grouping, and filtering each column of data the way you want.
6. To create a recovery task, click **New**.

   a. On the form, fill in the fields.

Create Recovery Task form

Field	Description
Task ID	Number assigned to each task. Indicates the position of the task with respect to other tasks in the grid. Enables you to view the tasks in a particular sequence especially in a printed PDF.
Scope	Asset that the task recovers. If field is empty, the task recovers asset at the plan level. Otherwise, it recovers the recovery task scope.
Recovery team	Team to which the recovery task is assigned.
Assignment group	Group to which the task is assigned.
Refer a different plan	Option to indicate that the recovery task is not an individual task, but refers to a separate plan with its own set of tasks. If the check box is clear then the recovery task is executed normally as per the task ID sequence at the time of exercise.
Select plan	Plan from the list in the **Related Plans** tab. If the task has a referred related plan within, then the tasks of the referred plan are executed before the execution continues sequentially with the rest of the recovery tasks in the main plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Field appears only if the **Refer a different plan** check box is enabled.
Assignment group	Group to which the task is assigned.
Dependencies	Tasks dependent on the asset and plan, ruling out cyclic dependency.
Documentation	Details about the execution of the plan.
Recovery strategy	Objective to recover an asset identified in a plan.
Completion deadline	Time by which the recovery task must be completed.
Configuration item	Item or asset that is recovered in this task.
Description	Brief note about the recovery task.

Note:
You can create a recovery task at the recovery strategy level and also at the plan level.

b. Click **Create**.

Recovery task grid

All recovery tasks that you have created for the plan appear in a grid. You can group the recovery tasks based on the fields in the recovery task table. Grouping helps you to group the recovery tasks the way you want, focus, and manage the task groups.

Note:
To group by a field, you must set up the group criteria value as a BCM admin by selecting the **Group recovery tasks** option and a value in the **Group by** field of the plan template before creating the plan.

Dependencies

The dependencies column displays recovery tasks that match the asset scope level and the plan level. However, If it is at scope level, then it displays recovery tasks that match the scope level and also tasks that do not have a scope.

If it is at the Plan level, then the recovery tasks that match only at the plan level are displayed. Considering that the plan level recovery task does not have any scope.

If there is a cyclic dependency between tasks, then those recovery tasks are not displayed in the **Dependencies** column.

Task group

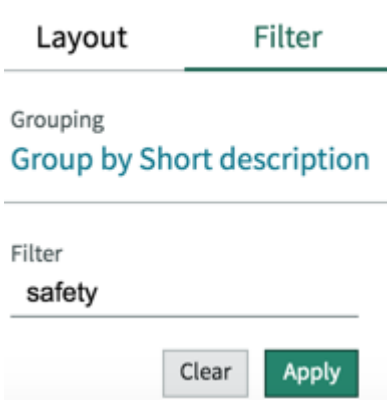
Groups the tasks based on the **Group by** field in the plan template.

7. To edit the data in a cell, double-click and click again in the cell.

8. To apply grouping and filter, click the vertical ellipsis icon.

Sort

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can sort the data at each column level. The first click in the column header sorts the data of the column in ascending order ( ). The next click makes the sort descending ( ). Another click removes the sort.

Filter

Apply column filter to filter data that have simple text. For example, you can filter tasks with short descriptions that talk about safety.

Use the simple number filter to filter time critical data. For example, you can apply the filter to the **Completion deadline** column to filter the tasks that have to be completed within an hour of a business disruption.

Group and filter tasks

9. To remove the filter, click the **Clear** button.
10. To delete one or more recovery tasks, select the record or records and click the **Remove** button.

View the general details of a business continuity plan

Use the **Details** tab of the plan to view the general information about the template that is used for the plan, its type, and other details.

Before you begin

Role required: sn_bcm.admin, sn_bcm.program_manager, or sn_bcm.planner

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **In Draft** state in the Planning list.
4. Click the link to the plan record in the **Name** column.
5. Click the **Details** tab of the business continuity plan (BCP).
   This tab gives you a summary of the plan details. You can edit the information if required.
6. Click **Save** after updating the plan details.
7. To generate a PDF and download a copy of the BCP to your local hard drive, click **Generate PDF**.
   A message appears with a downloadable link to the BCP PDF.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
After the plan is approved, the PDF is generated and attached to the plan.

8. To move a plan from **Approved** to **Draft** state, select the **Edit** button.
9. To create a copy of the plan, click the **Copy** button.
   If you have the permission to edit a BIA, then you can also copy the BIA. A BCM planner and program manager can delete a plan and its related table records when the plan is in Draft, In Review, and Returned states. BCM admin can delete a plan irrespective of its state.

   a. Enter the name of the new plan in the Copy plan pop-up.

   b. Click **Confirm**.

   - The copy action creates an exact replica of the plan with the name that you enter in the Copy plan pop-up. The copied plan is moved to **Draft** state.
   - The action copies the plan assets, plan documentation sections, recovery teams, loss scenarios, its related asset dependencies and recovery strategies, and recovery tasks of the original plan to the copied plan.
   - The documentation sections of the copied plan are in **Pending** state. Edit each section, if required, and move it to **Complete** state.
   - Dependencies are populated when the plan is copied.

View approval state flows for a business plan

View the approval state transitions sent at each level of the approval process, and the details of the approvers as you direct the business plan through multiple levels of approvals.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager, sn_bcm.viewer

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
   You can view approval records for a business plan that is any state except **Draft** and **In Review** states.
3. Click the link to the business plan record in the **Name** column.
4. To view the approval details of the plan, click the Approvals related list.
   If there are no approval records in requested state for the plan, then you can either **Reject** or **Approve** the plan.
5. Click the link to the approval record in the **Name** column.
   You can view the name of the approval, approval level, its current state, and the details of approvers such as users and groups.
6. To view the approval history of the plan, click the **Details** tab.

   a. Click the Approval History related list.
   You can view the complete approval history with details of the approvers and the date and time of its creation.

   State transitions for multiple levels of plan approvals:

   Not Yet Requested

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State where an approval is not yet sent to the approvers at a respective level.

Requested

Approvals are sent to the approvers of that level. Correspondingly, the state of all successive levels of approvals turns to Not Yet Requested.

Approved

One or more approvers have approved the plan at the respective level. Correspondingly, the state of the succeeding level of approval moves to Requested.

Rejected

One or more approvers have rejected the plan at a particular level. Correspondingly, the state of all succeeding levels of approvals moves to No Longer Required.

No Longer Required

If the approvers at a level have rejected the plan, then the state moves to No Longer Required for all succeeding levels of approvals.

Structured workflows for Exercise and Crisis Management

Business Continuity is an ongoing set of activities aimed at reducing the risk of an organization and improving its ability to respond to and recover from disruptions. To this effect, recovery and exercise management helps in continuous testing and improving of your continuity plans, and minimize business disruptions when a crisis strikes.

The objectives of Recovery and Exercise Management are:

Plan Exercising Recovery Management

- Provide continuous testing and improving of continuity plans.
- Improve effectiveness and usability of plans during simulated and actual crisis events.

Crisis Management

- Minimize unavailability of critical business functions and processes across the organization.
- Minimize financial, reputation, legal, and regulatory impacts during a crisis event.

Start an exercise event

Create an exercise event to test your business continuity and recovery plans on a planned date and monitor the completion of the event tasks.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the **Start an Exercise** link in the **Actions** section of the workspace.
3. On the modal form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Exercise form

Field	Description
Short description	Name of the exercise event.
Assigned to	Auto-populates the name of the user who created the exercise event. As a BCM program manager you can update the field.
Exercise Method	Method to implement the event. The methods can be Simulation, Tabletop, or Walkthrough. ○ Simulation: An environment that simulates an actual disaster with necessary equipment, supplies, and personnel. ○ Tabletop: An exercise done in a room with a team analyzing over the plan, looking for gaps. ○ Walkthrough: Each member of the team walks through a component of the plan in detail to identify weaknesses. ○ Functional: Option to include ad hoc tasks that are not part of a plan.
Planned Start	Planned start date of the exercise event.
Description	Detailed description of the exercise event.

4. Click **Submit**.
   The exercise event is created and is in **Pending** state.

Start a crisis event

Unlike an exercise event, a crisis event strikes suddenly. Your business must be equipped to face the challenge and must be able to recover the critical business functions quickly to save you from business loss.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

About this task

You may not have a plan ready for a crisis as it strikes suddenly without prior notice. However, you can have an event ready and add tasks to the crisis event depending on the requirement.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the **Start a Crisis Event** link in the **Actions** section.
3. On the modal form, fill in the fields.

Report Crisis Event form

Field	Description
Short description	Name of the crisis event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assigned to	Auto-populates the name of the user who created the crisis event. As a BCM program manager you can update the field.
Description	Detailed description of the crisis event.

4. Click **Submit**.
   The crisis event is created and is in **Pending** state.

Review event details and start an exercise event

Review the details of an event in the **Details** tab, start an event to test your business continuity or recovery plan, and monitor completion of the event.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ().
3. Click the **Pending** state in the Exercises list.
4. Click the link to the event record in the **Number** column.
5. Review the exercise event details in the **Details** tab and update if required.

Details for an exercise event

Field	Description
Event	
Short description	Brief description about the event.
Event Type	Auto-populates the event type
State	Current status of the event.
Assigned to	Event coordinator to manage and complete the event.
Description	Detailed description of the event.
Planning	
Planned Start	Planned start date of the event.
Plan Approvers	Approvers of the event exercise.
Result Approvers	Person who approves the result of the plan.
Scope	
Exercise Method	Method to implement the event. Autopopulates the exercise method previously selected.
Goals	Goals to achieve from the exercise event.
Objectives	Objective of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Results	
Actual start	Actual start date of the exercise.
Actual end	Date on which the exercise was completed.
Closed on	Date on which the exercise event was closed. The field appears when the event is moved to closed state.
Result	Outcome of the exercise.
Result Summary	Summary of the exercise event.
Recommended Improvements	Recommendations on how to improve the exercise event.
Activity	
Work notes	Additional information about the exercise event.

Note:
You cannot view the **Results** section in **Pending** state. However, you can view the section in all other states.

6. Click **Save**.
   The event is in **Pending** state.
7. Click **Start event** for the exercise after you have updated the details.
   When you start an exercise, the **State** field moves to **Work in Progress** state. As a result approver, you can update the actual start and end dates of the exercise if the exercise was not conducted on the planned date. Update the outcome or the result of the exercise. The result can be Successful, Successful with Issues, or Unsuccessful. Enter the result summary and recommended improvements that can be followed for future exercises.
8. If all the activated plans of the event tasks for the exercise event are completed, click the **Submit for Approval** button.

   You must enter the **Actual start** and **Actual end** dates before submitting the exercise event for approval. Update the details in the **Results** section. Save the form after you make the changes and before submitting it for approval.

   Pending Approval

   When you click **Submit for Approval**, the event is set to **Pending Approval** state. In this state, you can only update the **Work notes** field.

   If there are any approval rules configured for the event, then approvals are generated and sent to the approvers. If there are no approval records in the requested state for the event, then you can either **Reject** or **Approve** the event.

   You can view the approval details in the Approvals related list with its name, level of approval, and the state of the approval.

   Select the Approval History related list to view the approval state, name of the approver, event number, the date on which the approval was requested, and comments if any.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you are a BCM Program Manager, then you can see the **Approve** and **Reject** buttons.

Returned

When the event is rejected, the state is set to **Returned** state. It can be moved to **Submit for Approval**, **Closed Complete** or **Closed Incomplete** states. Since this is related to an event, only certain sections like description, results, and work notes can be updated in the form.

When the event is in **Returned** state, you can edit the state of the event asset.

From the **Returned** state onwards, you can only add comments and attachments to the event task.

Closed Complete and Closed Incomplete

You can set the event state to either **Closed Complete** or **Closed Incomplete** by clicking the **Close Event** button.

Approved

When the event is approved, the state is set to **Approved** state. You can set the event state to either **Closed Complete** or **Closed Incomplete**.

9. To generate a PDF, click **Generate PDF** button and download the PDF.
If you have edit access to the exercise event, you can save a copy of the event in PDF format to your local hard drive.

Note:
By default, the PDF is generated and attached after the event is closed.

Manage a crisis event

Review and update the details of a crisis event in the **Details** tab. Get the event ready for a crisis that may strike and disrupt your business.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ().
3. Click **Pending** state in the Crisis Events list.
4. Click the link to the event record in the **Number** column.
5. Review the crisis event details and update if required.

Details for a crisis event

Field	Description
Event	
Short description	Name or description of the event.
Event Type	Autopopulates the event type

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	Current status of the event.
Assigned to	Event coordinator who manages the crisis.
Description	Detailed description of the event.
Additional Information	
Actual start	Actual start date of the crisis event.
Actual end	Date on which the crisis event ended.
Closed on	Date on which the event was closed. The field appears when the event is moved to closed state.
Activity	
Work notes	Additional information about the crisis event.
Compose	
Work notes (Private)	Additional information about the crisis event.

6. Click the **Browse** button to add any document as an attachment.
7. Click **Save**.
   The event is in **Pending** state.
8. To start the crisis event, click **Start Event** button.
   After you start the event, it moves to **Work in Progress** state.
9. If all the activated plans of the event tasks for the crisis event are completed, click **Submit for Approval** button.

   You must enter the **Actual end** date and save the form before submitting the event for approval.

   Pending Approval

   When you click **Submit for Approval**, the event is set to **Pending Approval** state. In this state, you can only update the **Work notes** field.

   If there are any approval rules configured for the event, then approvals are generated and sent to the approvers. If there are no approval records in the requested state for the event, then you can either **Reject** or **Approve** the event.

   You can view the approval details in the Approvals related list with its name, level of approval, and the state of the approval.

   Select the Approval History related list to view the approval state, name of the approver, event number, the date on which the approval was requested, and comments if any.

   Note:
   If you are a BCM Program Manager, then you can see the **Approve** and **Reject** buttons.

   Returned

   When the event is rejected, the state is set to **Returned** state. It can be moved to **Submit for Approval**, **Closed Complete** or **Closed Incomplete** states. Since this is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

related to an event only certain sections like description, results, and work notes can be updated in the form.

When the event is in **Returned** state, you can edit the state of the event asset.

From the **Returned** state onwards, you can only add comments and attachments to the event task.

Closed Complete and Closed Incomplete

When the event is approved, the only option available is to close the event. You can set the event state to either **Closed Complete** or **Closed Incomplete** by clicking the **Close Event** button.

Approved

When the event is approved, the state is set to **Approved** state. You can set the event state to either **Closed Complete** or **Closed Incomplete**.

10. To generate a PDF, click **Generate PDF** button and download the PDF.
If you have edit access to the crisis event, you can save a copy of the event in PDF format to your local hard drive.

Note:
By default, the PDF is generated and attached after the event is closed.

View event details and monitor event task completion

View the event details and add impacted items to start an event.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. To update an active exercise or crisis event from the Home page of the Business continuity workspace, click the link to the event record in the **Event** column of the **My exercises** section.
3. To update the event from the lists view of the workspace, click the lists icon ( ).
4. If the record is an exercise event and is in pending state, Click **Pending** link in the Exercises list.
5. Click the link to the event record in the **Number** column.
6. Review the event details in the **Details** tab.

   You can view and update all the details of an event. However, you cannot edit the event type.

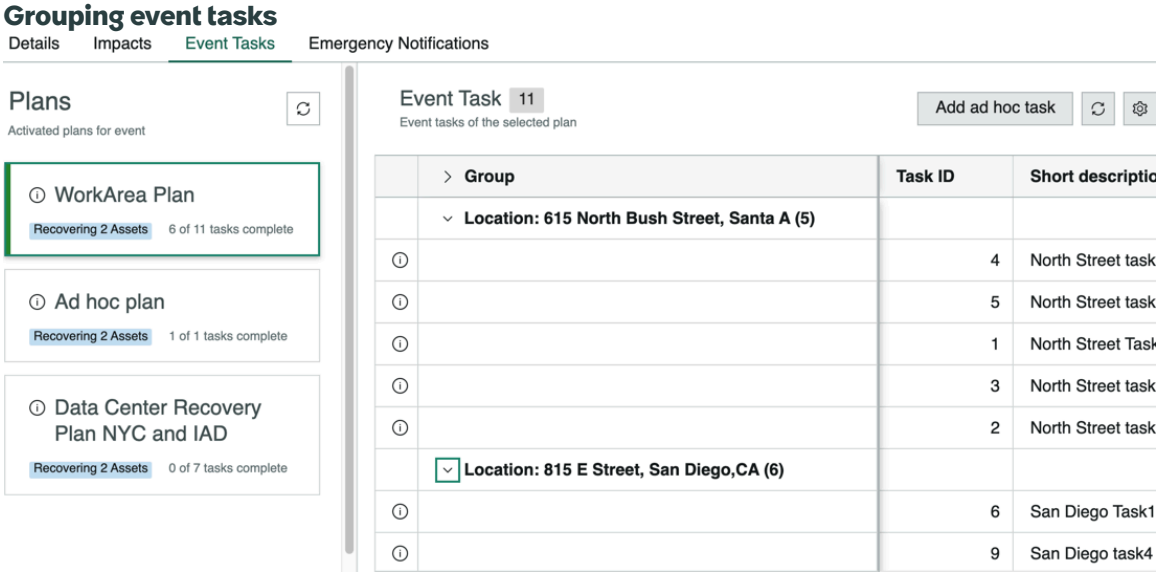
   A crisis manager should be able to report a crisis event with the information provided in the details tab. For more information, see Manage a crisis event.

7. Click the **Impacts** tab to add impacted items.
   To add a list of impacted items and activated plans to the event, see Add impacted assets and plans to an event.
8. Click **Event Tasks** tab.
   This tab appears for all crisis events but exercises that are of **Functional** type events only.

   The Plans section, which appears as a side panel, displays all the activated plans that are added to the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a plan is activated, all the recovery tasks where the scope is empty and tasks where the scope match with the impacted asset of the plan that is activated are added as event tasks for that activated plan.



Each activated plan is an interactive card that shows you the number of assets that are in the process of being recovered and the number of event tasks that are completed for that activated plan. When you add an activated plan to the event task, all the recovery tasks of the plan are added as event tasks to the event.

You can also create a task for the event that is not covered in any of the existing plans for the event as an ad hoc task.

a. Click an activated plan card to view the associated event tasks.
The selected activated plan card is highlighted in green and displays all the event tasks for that plan in a grid on the right pane.

If the plan is pre-grouped, then the event task is also pre-grouped. Use the first column of the grid, which is the task Group column, to view the pre-grouped event tasks.

Grouping event tasks

Note:
If the activated plan refers to a different plan to recover a related asset, then all those related plans are listed below the main activated plan as **Related plans** in the left pane.

For more information on the planning and execution of a recovery event, see Data flow, planning, execution, and recovery of related plan assets in event.

b. To add an ad hoc task to the event, click the **Add ad hoc task** button.

Create New Event Task form

Field	Description
Short description	Brief note about the event task.
Task ID	Defaults to the next number of existing event tasks for the plan.
Assignment group	Group to which the event task is assigned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assigned to	User or users from the Assignment group. If **Assignment group** field is empty, then select any user.
Additional assignee list	Additional users.
Impacted assets	Assets that are impacted for the event task.
State	Defaults to **Pending** state.
Dependencies	For tasks copied from plan level, dependencies are copied from plan recovery task. Dependencies cannot be added for ad hoc tasks.
Description	Information about the event task.
Activity	
Work notes	Information about the event task shared internally.

c. Click **Save**.

> **Note:**
> You cannot create an ad hoc task for activated plans that are in **Closed Complete** or **Closed Incomplete** state.

d. To update an existing event task, click the ⓘ of the task in the grid.

e. Update the **Actual start** and **Actual end** dates for the event task.

f. Update the assignment fields, if required.

g. Enter any event task related information in the **Work notes** field of the **Activity** section.

h. Click **Save**.

Calculation of actual duration and total effort to recover an event asset:

Actual duration to recover an event asset is calculated by `Actual end - Actual start of an event asset`

- the actual start of an event asset is the minimum start time of the event task executed for the event asset that is, event task that has the event asset as impacted asset. And the minimum start time of the activated plan without a task.
- the actual end of an event asset is the maximum end time of the event task executed for the event asset that is, event task that has the event asset as impacted asset. And the maximum end time of the activated plan without a task.

Total effort of an event asset is calculated by rolling up the actual time taken by all the event tasks that are executed for the event asset that is, the impacted asset in event task that contains the event asset. And the total effort of all activated plans associated with the asset without a task.

Actual duration of an event task

The difference in time between the actual start and actual end time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actual duration of an activated plan with a task

The difference between the actual start and actual end of the activated plan, where

- the actual start of an activated plan is the minimum start time of the event task for that plan
- the actual end of an activated plan is the maximum end time of the event task for the plan

Actual duration of an activated plan without a task

The difference between the actual start and actual end of the activated plan.

Total effort of an activated plan with a task

Sum of the actual durations of all event tasks that belong to the plan.

Total effort of an activated plan without a task

The difference between the actual start and actual end of the activated plan.

State transitions of an event task:

Open

When an event is started, its event tasks that do not have a dependent recovery task move to the **Open** state.

Pending

The event tasks that are dependent on other recovery tasks are in **Pending** state when the event is started. After the dependent tasks are closed, the parent event task moves to **Open** state.

Skip Task

This button is available only if you have logged in as a BCM program manager. **Skip** button appears when the task is in **Pending** or **Open** state and the event must be in Work in Progress state. Clicking **Skip Task** moves the task to **Closed Skipped** state. The actual start and actual end time at this state are blank.

Trigger

This button is available only if you have logged in as a BCM program manager. The task is in **Pending** state. Clicking **Trigger** moves the task to **Open** state irrespective of its dependencies.

Work In Progress

The task is in **Open** state. Clicking **Work In Progress** button moves the task to **Work in Progress** state. You can update the actual start time of the task in the **Actual start** field in this state. If you do not update the actual start, the current date and time is recorded as the actual start time. The next available options are **Closed Complete** or **Closed Incomplete** state.

Closed Complete

The task is closed and complete. Actual end time of the task is recorded in the **Actual end** field. If you do not update the actual end, the current date and time is recorded as the actual end time.

Closed Incomplete

Actual end time of the task is recorded in the **Actual end** field. If you do not update the actual end, the current date and time is recorded as the actual end time. Update necessary information in the **Work notes** field and save the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add impacted assets and plans to an event

Quantify the performance of your continuity and recovery plans through event-based testing. Measure success by tracking the completion of tasks associated with each plan.

Before you begin

Role required: sn_bcm.planner, sn_bcm.program_manager

About this task

A good business continuity plan is a result of thoughtful assessment of business impact analysis and the risks involved in a disruptive situation. However, the plan becomes viable only after it is tested in an event.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. To update an active exercise or crisis event from the Home page of the Business continuity workspace, click the link to the event record in the **Event** column of the **My exercises** section.
3. To update the event from the lists view of the workspace, click the lists icon ( ).
4. If the record is an exercise event and is in pending state, Click **Pending** link in the Exercises list.
5. Click the link to the event record in the **Number** column.
6. Click the **Impacts** tab to view the list of impacted items.
   You can add assets, activated plans for the recovery of the assets, and an ad hoc plan for an event asset.
7. Click the **Impacts** tab to view the list of impacted items.

   Impacts grid displays impacted assets and activated plans. You can:

   - add the assets that are impacted and the plans that are related to the assets
   - view the plans related to the assets under the respective assets in the grid
   - add an ad hoc plan that does not have a plan reference
   - view the details of asset recovery and the activated plan by clicking the information icon ( )

   For information on the logic behind the calculation of recovery task entities, see Calculation of actual duration and total effort to recover an event asset.

   If the impacted assets are CMDB CI data that came into the BIA automatically based on CMDB dependencies and when these assets are scoped in the plan, then at the time of recovery of the asset, the related assets and the related plans are automatically pulled into the exercise event as impacted assets and activated plans in the **Impacts** tab.

   For more information on the planning and execution of a recovery event, see Data flow, planning, execution, and recovery of related plan assets in event.
8. Click the **Add assets** button to recover assets in the event.

   a. Select the impacted item type or the primary element to recover in the Add Assets pop-up.

   b. Click **Next**.

   c. Select the impacted items or assets in the Add Assets pop-up.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click **Save**.
The grid displays the assets in the **Short description** column. As these assets are added to the event, they are now event assets. The grid also displays the state of assets whether they are recovered or not, and the actual time taken for recovery.

9. Click **Add plans** button.
The assets can be part of an approved plan or without a plan.

Use the grouped button to add as many plans as you need to an event. However, you can add only one ad hoc plan to the event. **Add ad hoc plan** button appears when an ad hoc plan is created for an event. This ad hoc plan is the one that appears in the Ad hoc plan pop-up when you select assets.

Add ad hoc plan button is shown after an adhoc plan is created for an event. The same is mapped to the selected assets in the ad hoc plan modal.

- To select a plan that the impacted asset is part of, select **Show plan for impacted assets**.
  a. Select the asset that is impacted in the **Select Impacted Asset** field.
  b. Click **Next**.
  c. Select the plans for the impacted asset in the Select Plans to Add pop-up.

  This action creates the activated plan if it does not already exist and then maps the impacted asset with the activated plan in the Impacted Asset to Activated Plan [sn_recovery_impacted_asset_to_activated_plan] table.

- To display all plans and select assets from the plans, select **Show all plans**.
  a. Click **Next**.
  b. Select plans from the list in the Select Plans to Add modal.
  c. Click **Next**.
  d. Select impacted assets for the selected plans from the Choose Assets of Selected Plans modal.

  This action adds impacted assets, activated plans, and maps the impacted assets with the activated plans in the Impacted Asset to Activated Plan [sn_recovery_impacted_asset_to_activated_plan] table.

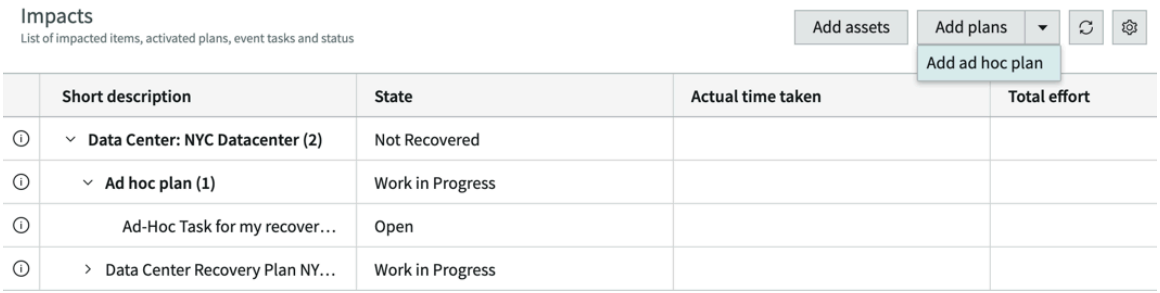
  As the plan is being activated for the event that is active, the plans or the assets cannot be removed once the event is **In Progress** state.

  e. Click **Confirm** to proceed with the activation of the selected plans. This message pops up for the events that are **In Progress** state.

Note:
The impacted items or event assets, the activated plans, and their status are displayed in the grid.

10. Click the **Add ad hoc plan** button.
After you add assets to the event, you can click the **Add ad hoc plan** button to add an ad hoc plan for the selected assets of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



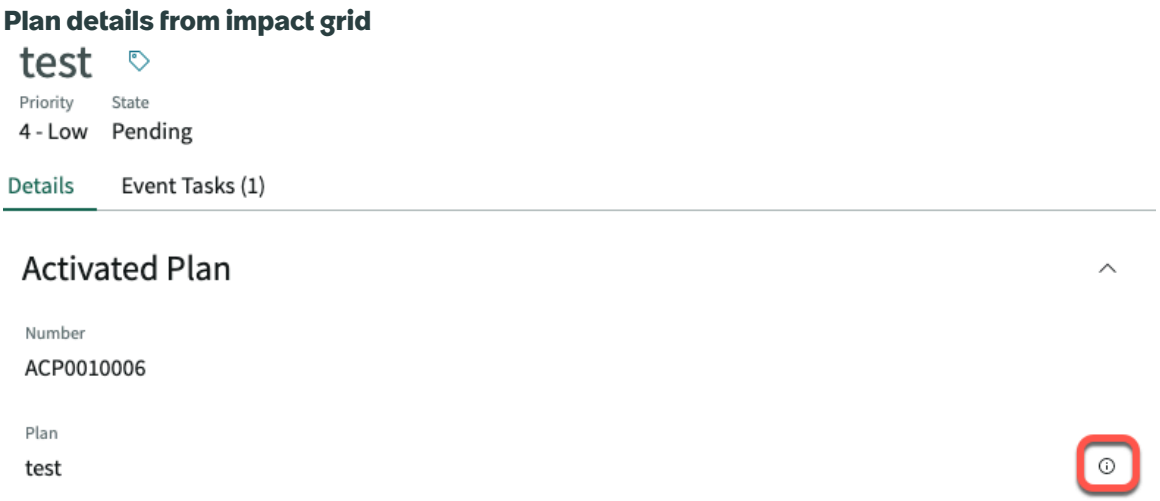
Note:
This action adds an ad hoc plan if it does not already exist for the event. After an ad hoc plan is added to the event, subsequently whenever you click the add ad hoc plan button, all the impacted assets that you select are added to this existing ad hoc plan.

There can be only one ad hoc plan per event.

- You can delete the impact of an event that is its assets, activated plans, and tasks until the event begins or is in **Pending** state.
- If the exercise or the crisis event is in **Work in Progress** state, then you cannot delete the associated impacts.
- You cannot add event assets, activated plans, or event tasks when the event is in **Closed Complete** or **Closed Incomplete** states.

You can view the selected assets and plans in a hierarchy on the grid in the **Short description** column.

Impacts grid



11. To update the impact details, click ⓘ of the respective record to launch the event asset and activated plan in the form view.

    a. To view the plan details of an activated plan, click ⓘ for the respective plan record in the impact grid.
    You can view the activated plan number, the plan name, its short description, state of the plan, priority, and description details.

    b. Click the **Open Record** link next to the plan name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The action opens the plan in a separate tab, where you can view its complete details.

Editable details in an Impacted Asset

In the impacted asset details, you can only edit the **State** of the asset if it has been recovered or not, and the **Actual time taken** to recover the asset. However, the rest of the impacted asset details are view only.

Editable details in an Activated Plan

You can edit the state of the plan, its priority, and description. However, you cannot edit the activated plan number or its short description.

Editable details in an impacted Event Task

You can only edit the **Assignment group**, **Assigned to**, and **Additional assignee list** fields. The rest of the fields are read only.

12. Click **Save**.
13. Click the refresh icon ( ) to display the updated state of the asset or plan, and the actual time taken to recover the asset.

Data flow, planning, and execution in an event

When the configuration item data is available on the ServiceNow AI Platform the same items can be used to assess dependencies in business impact analysis (BIA). The dependencies from the BIA can then be used in the planning and events. The configuration items (CIs) can be added manually to the plans and events as well.

You can also add new plans with assets to be recovered in a sequence.

The advantages of automatic data flow are:

- You can reuse the configuration item (CI) data that is created in CMDB in BIA, and from the BIA the dependencies are used in the plans and events.
- You have the capability to branch off to a related referred plan within the task of the main plan before executing the rest of the tasks in the main plan, especially when the referred plans are managed by planners of other departments or teams to recover their respective assets.
- The flow of execution is sequenced as per the Task ID and no event task is skipped in between.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic data flow from CMDB to BIA and BIA to plans

When a record in created in ServiceNow AI Platform as a configuration item in CMDB, the record with all its related items are available for you to leverage as assets to assess dependencies in BIA.

CMDB

Data is created as a CI and the record is stored in CMDB. In CMDB, this CI is related to other items by a relationship either that depends on or used by the other related items. For example, if it's a Data Center NYC, then it can depend on SAP on-premise application and other web servers, business processes, locations, and others.

BIA

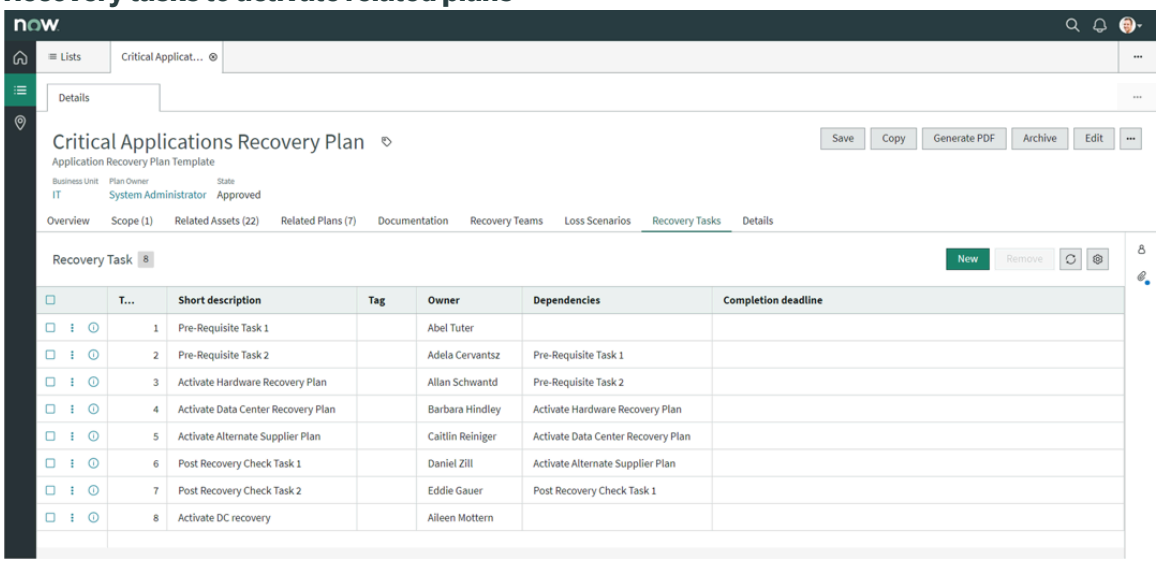
When you assess a BIA based on CMDB dependencies, the CMDB CI and its related items are automatically available as items for assessment in BIA. You can add these dependencies and the source of these items are tracked as CMDB. Therefore, the data created in CMDB is available as dependencies in BIA. In addition, you can also manually create other dependencies in BIA. For example, the Data Center NYC and its dependent SAP on-premise application are available in BIA to be added as dependencies. In addition, you can also add dependencies manually such as a Facility: New York.

Plan

When you are in the planning stage, if you have scoped the BIA-dependent item and added it as the scope, then the dependencies of the scoped item are available as Related Assets. Also, the plans existing for these assets are available as Related Plans. In addition, you can add new plans also. For example, a plan is created for Data Center: NYC, along with which the related plans of the related assets such as SAP on-premise application and Facility: New York (created in BIA) also move in to the planning phase automatically. In addition to the items that came from the BIA, you can also add new assets manually to the plan.

In the **Recovery Tasks** tab of a plan, you can also refer to a different plan and select the plan from the list of related plans.

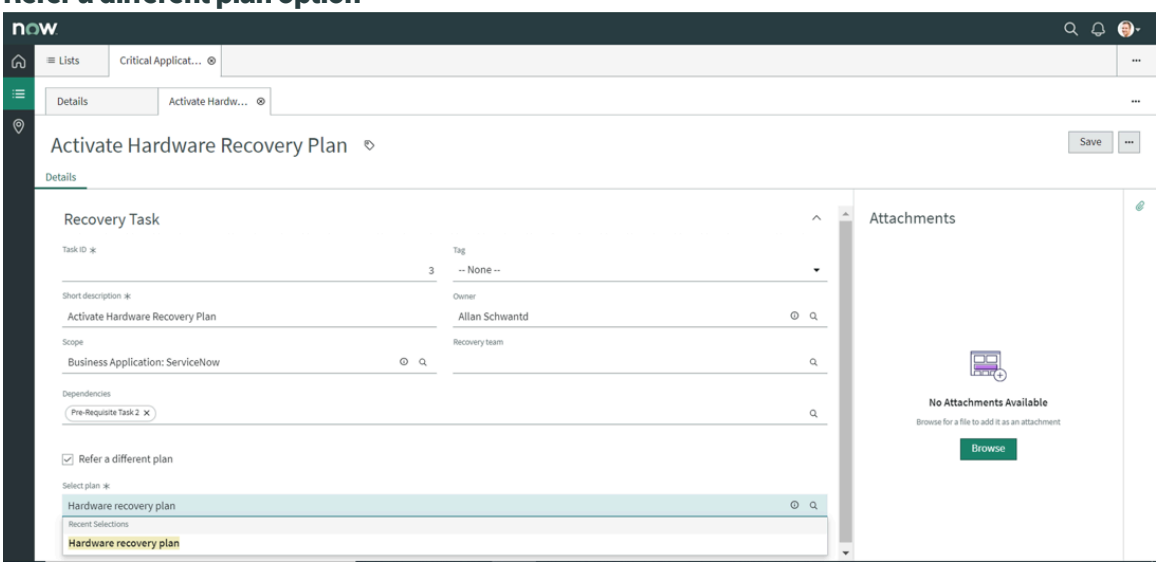
Exercise



In the event, the impacted assets and the activated plans are pulled into the **Impacts** tab automatically based on the dependencies in the BIA. Along with the primary scope of exercise and related impacts, you can also add assets and plans manually, which are all pulled into the exercise for recovery.

Planning phase

In this planning phase, as a planner you can identify the related assets, add the related plans, and set a sequence and dependencies for execution of recovery.

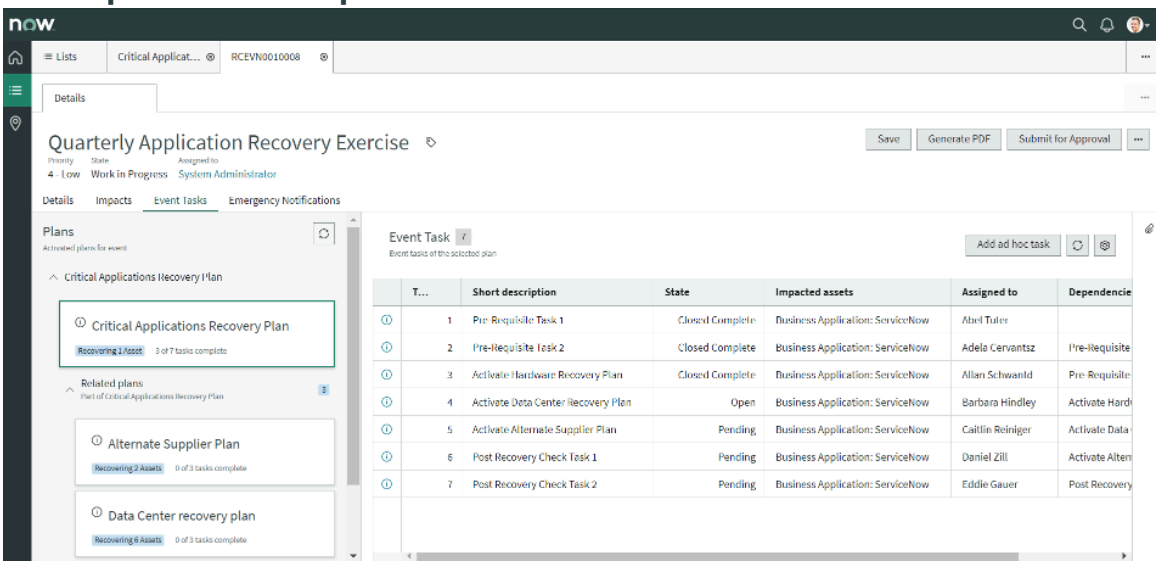


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recovery tasks to activate related plans

If you must recover assets in Data center A before recovering assets in Data center B, then you can refer to a different plan that follows the recovery process of Data Center A. In this case, use the **Refer a different plan** option in the **Recovery Tasks** tab of the main plan, and select the relevant plan from the related plans to recover Data center A. The referred plan has its own set of tasks that the application executes when it comes to this particular task. You can also set a sequence for the execution of the referred plan within the event tasks of the main plan.

Refer a different plan option



Tracking and execution phase

In the tracking and execution phase, you can activate relevant plans during an event recovery. When you add an impacted asset in the **Impacts** tab of an exercise, then all the related assets and related plans are pulled in. Similarly, if you add a plan, then all its sub-plans are also added.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related plan execution sequence

Navigate to the **Event Tasks** tab to track the execution of the event tasks of the selected main plan. When you click the **Start Event** button for an event, the tasks are triggered for execution. When you select the main activated plan in the **Plans** section of the left pane, you can view all the event tasks of the selected plan listed on the right pane as event tasks. In the **Plans** section on the left, below the main plan are the **Related plans**. The event tasks of the main plan are executed in the order of Task ID sequentially but when a particular task in the sequence has a referred or a related plan, then the application branches off to that plan and executes all the tasks listed in that plan thereof and completes the sequence before coming back to the original main plan from where it branched off to complete the rest of the tasks in the sequence. Therefore, there's a main list of recovery tasks under a main plan, within which there are sub-plans with their own set of recovery sub-tasks. The application executes all the tasks sequentially within the referred plan before it continues to execute the rest of the recovery tasks sequentially in the main plan.

Note:

For a primary main plan, if there are related referred plans within, then the application executes only the referred sub-plan but does not execute any other related plan that the sub-plan might have. The hierarchy of execution stops with the first level only if there are sub-plans.

View your recovery tasks from Self-service

View the tasks assigned to you or a recovery task team that you are a part of to recover assets from a crisis or exercise (Functional type) event. Your BCM Program Manager assigns the tasks to you and you can view them any time you want from the self-service application menu.

Before you begin

Role required: sn_bcm.recovery_team_member

Procedure

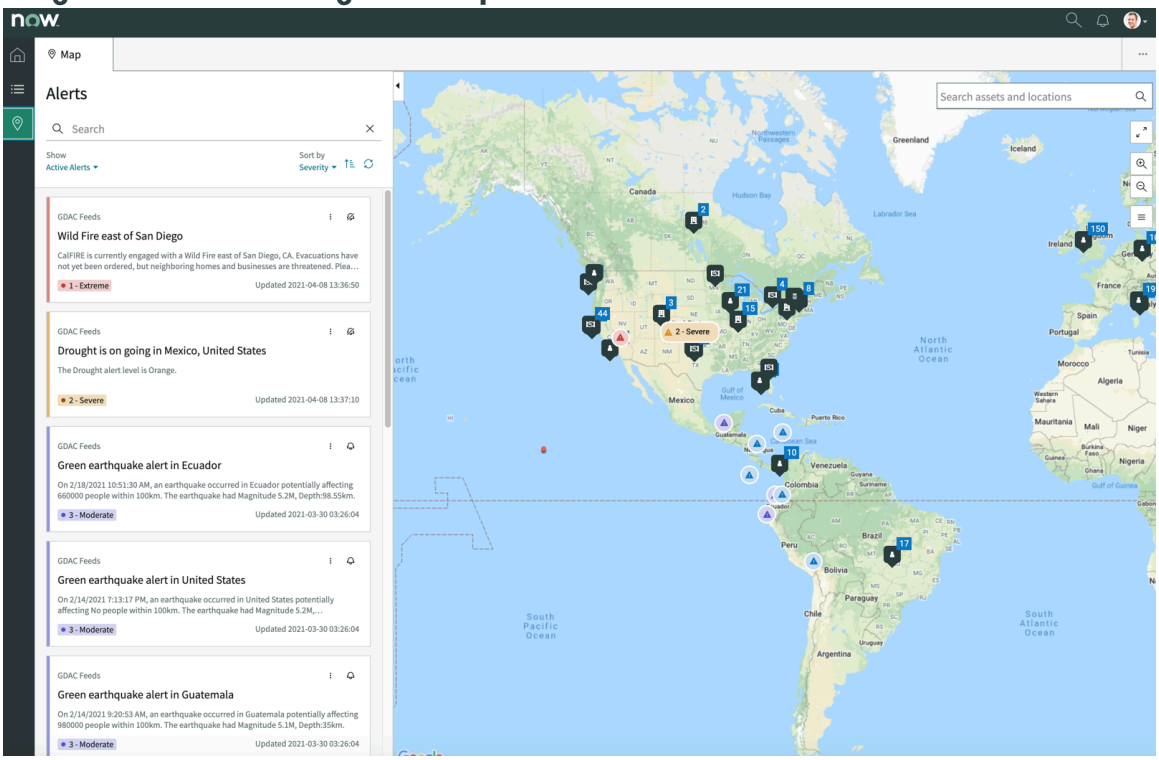
1. Navigate to **Self-Service** > **My Recovery Tasks**.
2. View the list of event tasks assigned to you, the assigned group that you are part of, or a recovery team that you belong to.
3. Sort the **Event Type** column to list the crisis-related tasks at the top.
4. View the **Event Task type** column to understand whether it is planned or an ad hoc event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click the link to the **Task ID** of an event task that you want to update.
   You can update the **Actual start** and **Actual end** details.
6. To add any notes to the event task activity, click the Activity related list and add the information in the **Work notes** field.
7. To update the task to in progress **State** field, click the **Work in Progress** button.
8. To close the task, click either **Close Complete** or **Close Incomplete** button.
   For more information, see State transitions of an event task.
9. Click **Update** after your changes.

Crisis Management map

You can integrate the crisis management application with the Crisis Management map to receive alerts as the alert feeds on possible threats in continuing the business operations of your organization.



A threat feed is the data intelligence information of a potential or current threat that can pose a danger to an organization and stop its business routine or disable its business processes. Threat feeds can include but not limited to:

- Severe weather or tornado
- Hurricane
- Earthquake
- Wildfire or red flag warnings
- Flood
- Civil unrest or riots
- War or military conflict

As a BCM administrator, you can enable or disable threat feed integrations provided by the base system. You can also configure additional threat feeds in to the Crisis Management application. The integration and configurations that you set up alert the crisis manager of the threats and aid to take appropriate action on time.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration of Crisis Management map

Setting up the crisis map

Before you integrate the crisis management map with the geographical locations of your assets, there are certain configurations that you must do to display the active alerts in the crisis map.

Understanding feed, alert, and event

Feed

A feed is news content updated frequently and provided on a world-wide website. You can subscribe to a news feed by manually entering the web address or URL of the feed channel in the **Web** field of the Feed form.

Alert

An alert is a notification that reports an incident happened at a particular place and time. First, an incident or an event reportedly happens. Then, the alert triggers a notification that reports or notifies the incident to the concerned people to take an action.

Event

Based on the severity of the alerts, you can take actions by just notifying the stakeholders of the incident that happened or declare a crisis event. An event can become a crisis event if it disrupts the business operations. In such a case, you can run the Crisis Management workflow to activate the business continuity and disaster recovery plans for the locations impacted by the event.

Setup steps to integrate crisis map

You require the following steps of configurations for the threat and alert feeds to show up in the crisis map visualization.

- To search locations on the crisis map, set up the system property.
- To manage your threat feed subscriptions sourced internally and externally, configure scheduled data imports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To plot your organization's assets or resources on the crisis map, configure the resources.
- To specify the conditions under which a feed should bubble up as an alert on the crisis map, configure alert rules.
- Finally, to act on a critical alert from the crisis map dashboard, configure an alert action.

Configure search for places in crisis map

Set the system property to manage searching places on the crisis map.

Before you begin

Role required: Administrator

About this task

To enable crisis map functionality in the GRC: Crisis Map application, you must set up Google maps. For more information, see Set up Google Maps API.

Note:
Prior to enabling the Crisis Map feature, confirm that you have purchased and set up Google Maps API.

Procedure

1. To open the System Properties table [sys_properties], enter sys_properties.list in the left pane of the application navigation filter.
2. Search for sn_bcm_map.use_google_places_lib in the **Name** column.
3. To search places in the Google map, set the value to **True** in the **Value** column for the sn_bcm_map.use_google_places_lib system property.

Configure scheduled data imports for crisis map

Manage your subscriptions to threat feeds from internal or external sources by configuring scheduled data imports.

Before you begin

Role required: System administrator

You must set up the Google maps for enabling the crisis map functionality. For more information, see Set up Google Maps API.

About this task

Threat feeds provide a situational awareness of potential or current threats to an organization's security. Threat alerts can be weather alerts, pandemic alerts, geopolitical situations, or internal events like security incidents and system outages.

Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Scheduled Imports**.
   Following two scheduled data imports exist within the base system.

Name	Data source
GDAC Feed Source	GDAC Feeds
Weather.gov Severe Alerts Scheduled Import	Weather Gov Alerts

2. To add a new scheduled data import, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Scheduled Data Import form

Field	Description
Name	Name of the scheduled import. Normally the source is the name.
Data source	Internal or external source of the threat and alert data used for import.
Run as	User who has the permission to import the threat alerts.
Active	Option for enabling the alert as active.
Application	Read-only field. The field helps distinguish items relevant to the crisis map.
Run	Frequency at which the data is imported.
Conditional	Option to indicate if a conditional script is required for the threat alert import.
Concurrent Import	Option for allowing concurrent imports.
Execute pre-import script	Option for enabling the execution of a pre-import script.
Execute post-import script	Option for enabling the execution of a post-import script.

4. Click **Submit**.

Configure a resource for crisis map

Configure resources to plot the organization's assets on the crisis map. The assets can be locations, employees, data centers, suppliers, and others. Configuring resources is also required as an input to set up alert rules.

Before you begin

Role required: System administrator

Set up the Google maps for enabling the crisis map functionality. For more information, see Set up Google Maps API.

Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Resource Configurations**.
2. To add a new scheduled data import, click **New**.
3. On the form, fill in the fields.

Resource Configuration form

Field	Description
Name	Name of the resource configuration used in the map visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Icon	Image representing a resource item on the map.
Table	Table for resources to plot on the map.
Location field	Location column of the table used as location on the map.
Use Coordinates	Option for enabling coordinates to plot the resources on the geo-map.
Application	Read-only field. The field helps distinguish items relevant to the crisis map.
Active	Option to indicate that the resource configuration is active.
Category	Value is BCM application. Helps to identify the BCM-related resources when multiple applications use the component.
Searchable	Option to indicate if the resource is searchable in the map visualization.
Contact User Field	Contact for communication for the resource in focus.
Contact Alias	Contacts for identification.
Display Fields	Fields selected for display as the contacts.
Conditions	Conditions for filtering records from the table.

4. Click **Submit**.

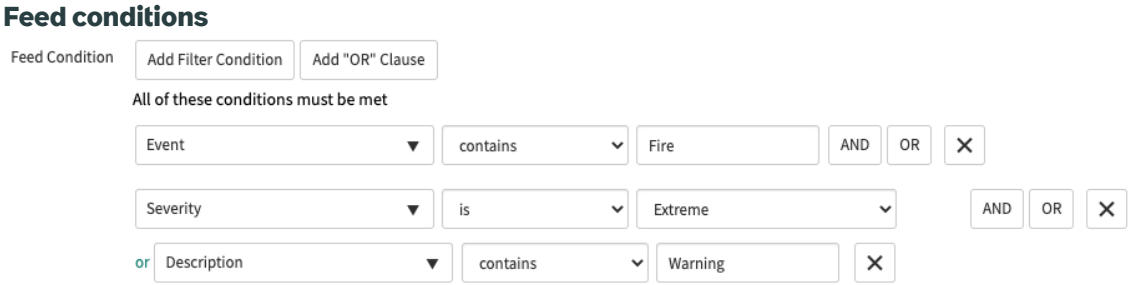
Configure alert rules to display alerts in crisis map

Set alert rules to specify conditions under which a feed has to be bubbled up and displayed in the dashboard as an alert. You can also specify the conditions under which an alert is no longer valid and dismiss it from the dashboard.

Before you begin

Role required: Administrator

About this task



Configure an alert to notify the crisis manager of an impending danger, potential harm, or risk that can cause business disruption. Set up filter conditions to notify events or feeds that can happen within a boundary from the location of your assets.

Configuring an alert rule: Define simple conditions to evaluate an alert rule and determine the feed items that generate an alert. These alerts are displayed on the Crisis Management map.

Feed condition filters

Use these filter conditions to set your rules for a feed alert. Setting filter conditions help you to filter those alerts that are critical to your business locations from the thousands of feeds that come from the feed resources you have subscribed. Business locations can be corporate offices, employee locations, data centers, suppliers, and others.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced condition script filters

Use the advanced rules option to set a filter rule with a condition script. For example, you can set a condition based on the proximity of the crisis to your asset locations. You can also make the rule active.

Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Alert Rules**.
2. Click **New**.
3. On the form, fill in the fields.

Alert Rule form

Field	Description
Name	Name of the alert rule.
Active	Option to set the rule active.
Application	Read-only field. The field helps distinguish items relevant to the crisis map.
Order	Display order of the alert rule. By default it is 100.
Description	Details about the alert.
Create Condition	
If Resource Impacted	Option for enabling an alert rule if a resource is impacted.
Advanced	Option for enabling advanced filter rules with a condition script for the alert rule.
Optimize Impact Area	Option to indicate if the map area is to be optimized. Select the check box for optimal performance.
Feed Condition	Conditions to filter alerts based on the set rule.
Advanced Condition Script	This field appears if the **Advanced** option is selected. Enter a script to filter feeds based on a criteria, for example, active alerts.
Dismiss Condition	
When Feed Deleted	Option to indicate that the alert must be dismissed from the dashboard, if the feed is deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
When Resources Not Impacted	Option to indicate that the alert must be dismissed from the dashboard, if there are no resources impacted.

4. Click **Submit**.

Configure an alert action

The alert actions are the follow-up actions that you can perform from the crisis map dashboard.

Before you begin

Role required: System administrator

Procedure

1. Navigate to **Threat and Alert Data Feeds** > **Administration** > **Alert Actions**.
   These actions are available within the base system.

Name	Description
Notify	Used to send email notifications to stakeholders and the asset managers that are within the impact radius.
Declare Crisis	Used to declare a combination of alert and critical assets as a crisis event.

2. To add a new alert action, click **New**.
3. On the form, fill in the fields.

Alert Action form

Field	Description
Title	Title of the alert action.
Description	Detailed description of the alert action.
Name	Name of the action in the crisis map dashboard.
Action name	Unique name for the alert action.
Run once	Option to indicate the execution of the action one or more times from the dashboard.
Type	Type of action to be executed. It can be a task, script, or flow.
Task type	Task type used for the action.
Application	Read-only field. The field is used as a flag to filter the items relevant to crisis management from a common list of actions.
Active	Option to indicate that the alert action is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Display order to be followed on the dashboard.
Run automatically	Option for enabling the action to be executed automatically based on a condition.
Roles	User roles who can execute the task successfully.
Display Fields	Fields to be displayed in the response actions after the actions are executed.
Condition	Conditions to execute the actions.
Task script	Task script to be executed when the user clicks the action control on the dashboard.

4. Click **Submit**.

View and manage alerts in the crisis map interface

Business Continuity Management integrates with the Crisis Map to provide you the capability of identifying a threat and its geolocation from your asset locations.

Before you begin

It not only helps you to identify a threat as a business crisis but also notify your stakeholders and declare it as a crisis event if it has the potency to disrupt your business.

Note:
Activate the Business Crisis Management Map (sn-crisis-map) application for the crisis map feature.

Role required: BCM admin or BCM Program Manager

About this task

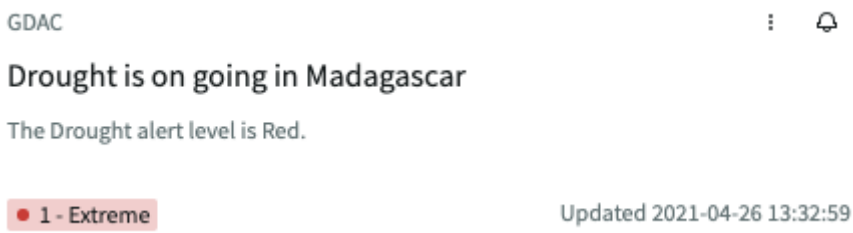
Use the crisis map to manage feeds, prioritize alerts based on their severity, and create events. Thereafter, you can run the Crisis Management workflow and activate the business continuity and recovery plans for the locations impacted by the event.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the map icon ( ).

   The alerts section is on the left of the workspace and the map view is on the right.

Alert control feature	Description
Search Alerts	Key word to search and filter alerts from the list.
Select active or dismissed alerts	List to select either active or dismissed alerts. When an alert is dismissed, it becomes inactive.
Select column to sort by	List to select and display alerts based on their severity, created, or updated date.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert control feature	Description
Change sort order ( )	Sorting order of the alerts, either in ascending or descending order.
Refresh Alerts ( )	Option to refresh the alert list and the map components after an update.

Threat alerts, based on severity or in any sorting order that you have set, are displayed in a list view. As you point to an alert in the list of alerts, you can view additional details about the impact of the threat.

Each alert record in the list has these details:

Alert record in the alert list

Title

Name of the alert.

Description

Brief note about the impact of the alert.

Severity

Intensity of the threat impact. It can be extreme, severe, moderate, minor, or unknown.

Updated details

The alert's last updated date and timestamp.

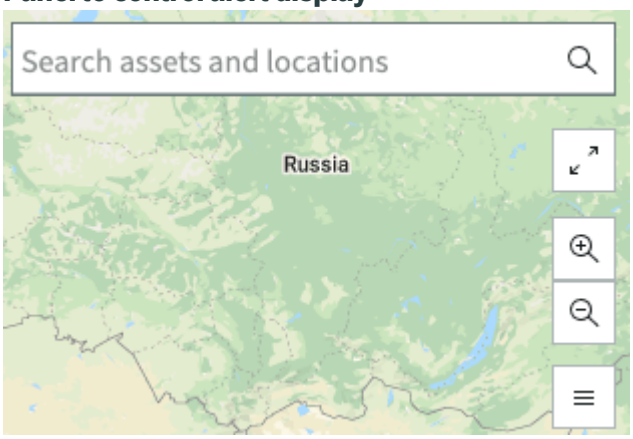
3. Click an alert record to open the alert in its detailed view and view its corresponding impacted area on the map.
4. To go back to the list view of alerts, click the **Back** button.
5. To open the alert details in the form view, click the **Open Alert** option in the alert menu icon ( ).
   This action opens the record in a separate **Details** tab.
6. To go back to the alert list, click the **Map** tab.
7. If the alert does not pose a threat currently to your employee locations, datacenters, core companies, or any of your business establishments, click the **Dismiss Alert** option in the alert menu.
   If you know that the alert would not hamper your business operations, you can dismiss it in the list view as well as in its detailed view. When you dismiss an alert in the list view, it is removed from the list. If you dismiss an alert from the detailed view, the alert is removed and brings you back to the list view so that you can review the other alerts in the list. In both cases, you can see a confirmation message about the dismissal of the alert.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. To subscribe to the alert notifications, click the subscribe icon ( ).
   You receive an email and workspace notifications every time the alert or its source feed item is updated.

Set controls to customize alerts on the map dynamically

Use a set of controls on the crisis map to display the alerts that are critical to your asset locations.



Before you begin

Role required: BCM admin or BCM Program Manager

About this task

You can customize the crisis map to display the layers that you would like to see on the map. Use the controls to view locations, employee locations, or core companies.

Panel to control alert display

The search bar helps you to search the assets and locations. A set of zoom controls helps you to zoom in and zoom out to focus on the area that has the information shown in that layer. The layers help you to get additional details on the map. Use the reset button to clear your control settings.

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the map icon ( ).

   The alerts section is on the left of the workspace and the map view is on the right.
3. Click the **Search assets and locations** field and enter a location or a datacenter that is impacted by an alert.
   When you search for a location, a mixed list of your company results with the display value of the records along with their icons, and the Google map pin icons appears.

   If you are not sure of both the employee locations or datacenters, then use the Layers control.
4. To change the zoom level of the map and view specific areas, use the zoom control buttons, zoom-in ( ) and zoom-out ( ).
5. To select and display the assets such as asset locations, datacenters, or core companies on the map, click the layers icon ( ).
6. To clear the map of all the search results, click the reset icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View resource layer clustering

View your assets or resources on the map.

Before you begin

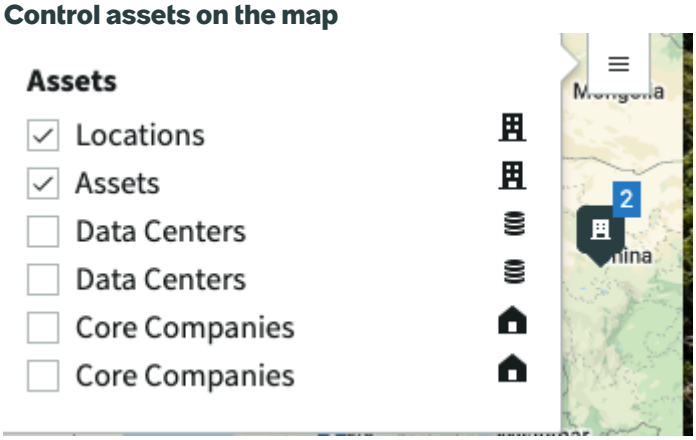
Role required: BCM admin or BCM Program Manager

About this task

The layers that you see in the map like the assets, datacenters, and core companies are the resources that you have configured. Each of these layers fetches data from the respective resource tables. The assets, datacenters, and core companies resources retrieve data from the location, datacenter, and company tables, respectively.

Asset locations that are nearby to each other are clustered and a cumulative count of the assets is displayed next to the asset icon.

Procedure



1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the map icon ( ).
3. Click the layers icon ( ).

   The layers on the map appear just as pins on a Google map and are configurable. All the layer details like the asset locations, assets, datacenters, and core companies are displayed on the map by their configured icons.

   Use the layers control to view only the selected or all assets that can be toggled on and off on the map. As a crisis manager, when viewing the active alerts you can make an informed decision by concentrating on a single asset that can be critical at that moment from the rest.

4. To display a selective resource or asset on the map, select the check box of that asset.

   Control assets on the map

   The icons of the selected asset are displayed on the map. Layer icons are displayed within black borders, whereas alert icons are within a white circle.

5. Click an asset icon on the map to view its details.

   For example, if you click a datacenter icon ( ) that has no number or a count next to it, a pop over appears with the display information that you have configured in the Resource Configuration table [sn_fam_resource_config].

   If you have configured **Power** and **Power consumption** fields of the datacenter table [cmdb_co_datacenter] as the display fields in the Resource Configuration form, then the power

consumption details of that datacenter are displayed on the pop over along with its location coordinates.

6. Click an asset icon with a number next to it.

   The map zooms in to show all the assets that match with the count in that cluster. You can further click each asset within the cluster and drill down to any asset to view its details on the pop over.

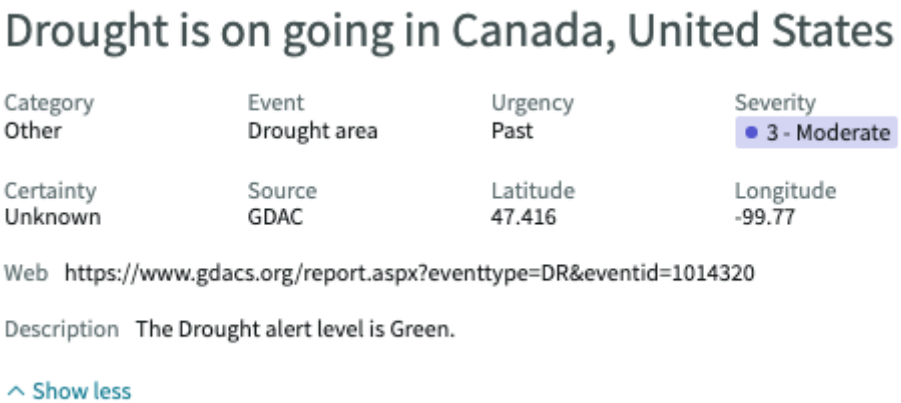
   You can view only one pop over at a time. The pop over disappears on clicking another node.

7. Click the reset icon ( ) to clear the search results on the map.

View assets at risk within the impacted area

View the list of resources that are at stake because of an alert threat that is near your business locations. Take actions to protect your resources and prevent major loss.

Before you begin



Role required: BCM admin or BCM Program Manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the map icon ( ).
3. Click an alert record to open the alert in its detailed view.

   You can see various details of the alert on the form header.

Assets at risk form header

   - The title of the alert
   - The category of the alert
   - Urgency of the alert whether it is going to strike immediately or expected in future
   - Its severity in terms of loss
   - Its certainty as to how likely it can strike
   - Source of the alert feed
   - The coordinates of the impacted area
   - The source or the website from where the feed alert was received
   - Its description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Expand **Assets at Risk** section to view all the listed assets that are at risk.
   The **Assets at Risk** lists locations, datacenters, and core companies that lie within the impacted area of the alert. It also displays the count as to how many of these assets are impacted. You can view the impacted area on the map and take any of the suggested actions.

   The boundary of the alert's impacted area on the map is marked in mauve color. You can view the assets that are at risk within this impacted area on the map. If one of your location, datacenter, or a core company is impacted by the alert, you can edit the impacted zone to include the asset.

5. To edit an impacted area, click the alert menu icon (⋮).

   a. Click the **Edit Impact Area** option.

   b. In the Edit Impacted Area pop over that opens on the map, select either Custom Shape or Custom Radius depending on the shape of the impacted area.
      - Custom Shape: Select Custom Shape if the impacted area is polygonal shape.
      - Custom Radius: If the impacted area is a circle.

   c. Click and drag the vertex on the boundary of the impacted area to include the asset location.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit impacted area

d. Click **Save**.

6. Save or bookmark the URL of the alert to open the detailed view of the alert directly anytime.
7. Click an asset card like a location or datacenter in the **Assets at Risk** section.
   The list view of the records opens up in a new tab.
8. To view the details of the asset, click the link to the record in the **Name** column.
   You can view the complete details of the asset including its latitude and longitude.

Notify stakeholders and initiate response workflows

Notify the stakeholders and initiate multiple workflows for the recovery teams across your organization and help them respond to the threat and take necessary actions.

Before you begin

Role required: BCM admin or BCM Program Manager

Procedure

1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the map icon ( ).
3. Click an alert record.

   As a crisis manager, while viewing the alerts and their severity, you can initiate appropriate actions and trigger Crisis Management workflows for the respective stakeholders to respond

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

and act on the crisis. The **Suggested Actions** section lists various responses that you can initiate.

Notify Stakeholders

Notify important stakeholders of the assets that are at risk because of the alert.

Declare a Crisis Event

Start an event to activate the recovery tasks to recover the assets with a recovery team.

4. To notify a stakeholder of the impending crisis by an email, click the **Notify** button in the Notify Stakeholders card.
   In the modal window that opens, identify the concerned person or persons and communicate the information to them. It is a two-step process, where you identify the audience and draft an email to send it to them.

   a. Select an audience from the list in the Notify Stakeholders pop-up.
      You can select an additional audience from the list whom you think must be notified too.

   b. Click **Next**.

   c. In the Step 2 of the process, verify the alert details and draft an email appropriately in the **Email Body** field.

   d. Click the **Send Notification** button.
      You get a message that the action is executed.

5. To activate a business continuity or disaster recovery plan for the locations that are impacted, click **Declare Crisis** in the Declare a Crisis Event card.

   a. Enter a brief description of the crisis event in the Declare a Crisis Event modal window that opens.

   b. Click **Next**.

   c. Select the assets at risk that are within the radius of the threat alert.

   d. Click **Start Crisis Event** button.

   When you trigger these actions, separate scripts run to trigger the alert notify action and the declaration of the crisis event. A message appears to confirm that your actions are executed. You can navigate to the **Response Tasks** tab to view the action and recovery event details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All the assets at risk are copied over to the Event Assets table [sn_recovery_event_asset] related to the event [sn_recovery_event].

What to do next

1. If it is a recovery event, click anywhere on the Response Tasks card to take you to the event details.
2. In the **Details** tab of the event, update the details if required.
3. Click the **Start Event** button. The event for the crisis is then activated. All the associated plans for this recovery event and the tasks associated with it are set into action. The Crisis Management workflow begins to recover the impacted assets. For more information, see Manage a crisis event.

   All the assets at risk are copied over to the Event Assets table [sn_recovery_event_asset] related to the event [sn_recovery_event].

Integrating Crisis Management with Everbridge

You can integrate Crisis Management in Business Continuity Management application with Everbridge notifications system. Everbridge system enables you to send emergency notification to individuals or group of people alerting them of an impending emergency. It provides a one-way notification and two-way communication through properly established delivery channels.

Crisis Management in Business Continuity Management application uses Everbridge to direct certain crisis response activities. This integration helps to send notifications about critical events to stakeholders and coordinates responses from them in an effective two-way delivery channel.

To send a notification, you need correct contacts, groups, and delivery channels. Delivery channels are created and stored in Everbridge and you have to import those delivery channels for your particular organization ID. These delivery channels are used for sending notifications and contact creation.

Setup steps for emergency notification

Setting up the Emergency Notification feature requires you, as a BCM admin, to configure certain pre-requisite data. The setup steps help you to establish a consistent connection with Everbridge and a successful notification delivery workflow on the Everbridge side.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following configurations are required to be set up for different users to use the Crisis Management workspace for sending an emergency notification and monitoring the notification workflow:

- To create a connection and authenticate your credentials with Everbridge, see Create connection and authenticate credential with Everbridge.
- To get the delivery details of the contacts from Everbridge and use them to send notification, see Import delivery channels from Everbridge.
- To get the details about the type of contacts from Everbridge, see Import record types from Everbridge.
- To pre-configure a notification template to send an email or SMS to your contacts, see Define a template for emergency notification.
- To create contacts for sending the notification, see Create contacts for emergency notifications.
- To set up rules in filtering the contacts from the user table, see Create contact import rules.
- To create a group of contacts, see Create a notification contact group.

Here is a flow diagram that shows how the different setup steps are connected for the integration:

Emergency notification setup flow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create connection and authenticate credential with Everbridge

As a first step, establish a connection and authenticate your login credentials with an Everbridge instance to send out a notification using a delivery channel. This connection not only helps you to send but also receive communications.

Before you begin

Role required: BCM admin (sn_bcm.admin)

Procedure

1. Navigate to **Business Continuity** > **Everbridge Notification Configuration** > **Connection & Credential Alias**.
2. Click the **Create New Connection & Credential** related link.
3. On the form, fill in the fields.

Create Connection and Credential form

Field	Description
Connection Name	Name of the connection. Enter Everbridge Connection.
Connection URL	Everbridge API base address.
Organization ID	Organization ID of Everbridge. **Note:** You can get the organization ID from the Everbridge instance.
Incident Template ID	Unique ID of Everbridge incident template. **Note:** You can get the ID from the Everbridge instance.
Credential Name	Name of Everbridge credential.
Username	User name of API user in Everbridge.
Password	Password to validate and establish connection.

4. Click **Create**.

Import delivery channels from Everbridge

After setting up the connection and credentials with Everbridge, you must import the delivery channels from Everbridge. Sending notifications is made easier through these delivery channels.

Before you begin

Role required: BCM admin (sn_bcm.admin)

About this task

Finding out how to reach or connect with your stakeholders at the time of crisis may have many challenges. Your notifications may not reach them as they may no longer use those delivery

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

methods through which you are trying. Having imported delivery channels to reach your contacts and selected groups make your notification service much more certain and manageable.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Notification Configuration** > **Delivery Channels**.
2. Click **Import**.
   All delivery channels are imported from Everbridge successfully. You get a message of confirmation if successful, otherwise an error message.

Import record types from Everbridge

Import the record types for your organization ID from Everbridge and use them to create contacts.

Before you begin
Role required: BCM admin (sn_bcm.admin)

About this task
Record types are information stored in Everbridge which are required to create contacts.

Procedure

1. Navigate to **Business Continuity** > **Everbridge notification Configuration** > **Record Types**.
2. Click **Import**.
   Record types for your organization ID with the category are imported from Everbridge. If successfully imported you get a message of confirmation, otherwise an error message.

Define a template for emergency notification

Create a template with pre-defined information that you can use to send notification quickly to your users in an emergency.

Before you begin
Role required: BCM admin (sn_bcm.admin)

About this task
For example, you can define a template drafting an email information for a particular emergency crisis that might strike a business location or facility specifically.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Notification Configuration** > **Notification Templates**.
2. Click **New**.
3. On the form, fill in the fields.

Notification Template form

Field	Description
Name	Name of the notification template.
Description	Short note about the purpose of the template.
Delivery channels	Communication channels used for sending the notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Subject	Title of the notification.
Message body	Introductory text message for the notification.
Foot note	Closing message for the notification.
SMS text	Message sent through SMS.

4. Click **Submit**.

Create contacts for emergency notifications

Use the ServiceNow users list to create contacts manually and synchronize the contacts with Everbridge to send emergency notifications.

Before you begin

Role required: BCM admin (sn_bcm.admin)

About this task

After creating the contact from the user list, you can update the contacts and synchronize them with Everbridge.

Delivery channels are imported from Everbridge to the delivery channels table. Using the imported delivery channels, you can manually create contact delivery details or the system administrator can do an easy import.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Contact Configuration** > **Contacts**.
2. Click **New**.
3. On the form, fill in the fields.

Contact form

Field	Description
Source	○ If you created the contact manually from the users list, then it is Manual. ○ If you had used the sync rule to create contact, then it is Sync rule.
Last sync on	Auto-populates the date on which the contact was last synchronized with Everbridge.
Contact ID	Unique ID of the contact.
Sync status	Defaults to **New** when the contact is created. The status can also be: ○ **Success**: When the contact is successfully synced with Everbridge. ○ **Error**: If there is an error in syncing. ○ **Updated**: If the contact or the delivery details were modified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
User	User reference from the Users table [sys_user].
External contact ID	Contact ID in Everbridge.
Sync error	Error in syncing the contact with Everbridge.

You can delete a contact that you created manually from the User table. However, the contact must be in **New** state. If the referenced user record is deleted, then a scheduled job that runs weekly deletes the contact from the Contacts table.

4. Click **Submit**.
5. To create delivery details for the contact you created, click **New** in the **Delivery details** related list.
   a. Select the Delivery channel from the list that you imported.
   b. Enter a value.
   If the delivery channel is email, then enter an email ID.
   c. Enter the order of preference in which the delivery channels are prioritized to send notifications.
   d. Click **Submit**.
6. To import contacts using a sync rule, you must first create a contact import rule.
7. To import contacts based on contact sync rules, click **Import users** button.
   Refresh the form page to get the imported list of users.

   Import users action reads the Users table [sys_user] based on the contact sync rules and creates a record in the Contacts table.
8. To synchronize your list of contacts with that of Everbridge, click the **Sync with Everbridge** button.
   After the contacts are synchronized with Everbridge, the status of the sync action is recorded in the **Sync status** field. The unique ID of the contacts that are synced successfully in Everbridge are recorded as the **External contact ID** of the Contacts table.

Create contact import rules

Create a contact import rule to apply on the User table and filter out users as contacts for emergency notifications.

Before you begin

Role required: BCM admin (sn_bcm.admin)

About this task

The contact import rule is applied on the default table that is the User table [sys_user]. The unique user reference that is the sys_id of the user table and the unique contact ID of the Contacts table that is synced with Everbridge are mapped.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Business Continuity** > **Everbridge Contact Configuration** > **Contact Import Rules**.
2. Click **New**.
3. On the form, fill in the fields.

Contact Import Rules form

Field	Description
Name	Name of the import rule.
Table	Defaults to the User table [sys_user]
Filter condition	Condition applied on the User table to filter records.
Record type	Default category of the record type.
User mapping	Unique user reference from the Users table.
Contact ID mapping	Unique ID of each contact used to sync with Everbridge.

4. Click **Submit**.

Create a notification contact group

Create a notification contact group using the ServiceNow AI Platform groups. Use the group members as contacts for emergency notification. Synchronize the group members as contacts with Everbridge and track the non-synchronized members as exceptions.

Before you begin

Role required: BCM admin (sn_bcm.admin)

Procedure

1. Navigate to **Business Continuity** > **Everbridge Contact Configuration** > **Notification Contact Groups**.
2. Click **New**.
3. On the form, fill in the fields.

Notification Contact Group form

Field	Description
Group	Reference to the User Group table.
Sync status	Defaults to **New** when the group is created. ○ **Success**: The contact group is successfully synchronized with Everbridge. ○ **Error**: If there is an error in syncing. ○ **Updated**: If the contact group is modified.
Last sync on	Auto-populates the date on which the group was last synchronized with Everbridge.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Submit**.
5. To synchronize the group with the groups in Everbridge, click **Sync Groups to Everbridge**. Refresh the page to get the synchronized status of the group.

   If a group did not synchronize with Everbridge, then you get an error message.
6. To view the names of the group members that did not synchronize with Everbridge, click **Group User Exceptions** related list.

Example:
There are five members in a group, out of which four members are already synced with Everbridge and existing as contacts. When you synchronize the group, a group is created in Everbridge with the four synced group members. However, the unsynchronized single member is logged as an exception displaying a message as to why the syncing failed.

You can synchronize this particular contact first and then the group with Everbridge.

Create an emergency notification and monitor its workflow

Use the **Emergency notification** tab in the event workspace to create a notification for a crisis event or an exercise event where the exercise method is Functional.

Before you begin
Role required: sn_bcm.planner, sn_bcm.program_manager, or sn_bcm.admin

About this task
Send an event notification from the workspace that triggers a complete workflow of activities from the **Draft** to **Complete** state in Everbridge, where all the activities can be monitored from the workspace.

When you send an emergency notification from the workspace, the action creates an incident and a notification for the incident in Everbridge to be sent to the right contacts and groups.

Procedure
1. Navigate to **Business Continuity** > **Business Continuity Workspace**.
2. Click the lists icon ( ).
3. Click **Pending** state in the Crisis Events list.

   Note:
   If the **Exercise Method** is **Functional**, then you can create an emergency notification for an exercise event.
4. Click the link to the event record in the **Number** column.
5. Click the **Emergency Notifications** related list.
6. Click **New**.
   New Notification form opens in a separate tab.
7. On the form, fill in the fields.

Create New Notification form

Field	Description
Short description	Title of the emergency notification

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Template	Pre-configured template that has the subject of the mail and the delivery channels for the contacts.
Notification state	State of notification in the ServiceNow workspace.
Communication status	State of notification in Everbridge.
Description	Description of the notification.
Contacts and Groups	
Contacts	Persons to whom the notification is sent. Contacts that are successfully synced with Everbridge are listed.
Notification contact groups	Groups of contact to whom the notification is sent. Successfully synced contact groups are listed.
Settings	
Acknowledgement required	Option if an acknowledgement is required from the contact for the notification received.
Delivery channels	Communication channels used for sending the notification.
Message Details	
Subject	Title of the notification.
Message body	Introductory text message for the notification. If a template is selected, then the message details are auto-populated from the template.
Foot note	Closing message for the notification.
SMS text	Message sent through SMS.

The notification that you create is in **Draft** stage.

8. To save the notification and send it later, click **Save**.
9. To delete the notification that is in **Draft** stage, click **Delete**.
10. Click **Send**.

    The send action creates a notification in Everbridge.

    When you create and send a notification for a crisis event in the workspace, a corresponding incident is created along with a notification in Everbridge.

11. To know if there are any errors in sending the notification, refresh the page.
    If there is an error in sending, the **Notification state** moves to **Error**.
12. To get the state from Everbridge for the notification sent to the contacts in the **Communication status** field, click the **Get response status** button.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Summary** section displays the list of contacts and groups to whom the notification was sent and their responses. It also displays the number of contacts who could not be reached, the number of contacts who acknowledged the notification, and the number of pending acknowledgements. This information is retrieved from Everbridge and displayed on your workspace.

Summary of the notification sent to contacts

Sent to

Number of contacts to whom the notification was sent.

Unreachable

Number of contacts to whom notification was not sent.

Acknowledged

Number of contacts who acknowledged the receipt of notification.

Pending acknowledgement

Number of contacts who did not acknowledge the receipt of notification.

Late acknowledgement

Number of contacts who confirmed the receipt of notification after the notification duration had elapsed.

If there are many contacts to whom the notification could not be delivered, then create another notification for the same crisis event. This time, you can send to a team of managers, as the previous notification did not reach many contacts.

Before you submit an event for approval, all the notifications that are In Progress must be closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To delete a notification that is in **Draft** or **Error** state, click the link to the emergency notification record in the **Number** column.

> **Note:**
> You cannot delete a notification that is in **Attempting to send**, **In Progress** or **Completed** state.

b. Click **Delete** in the more actions icon ( ).

> **Note:**
> Now that the event is closed and the corresponding incident in Everbridge is also closed, you cannot create any more notifications for this event.

Workflow status of the emergency notification

The table lists the different states to which the emergency notification proceeds in the Everbridge side. You can track the notification delivery and monitor its status in the workspace until it is successfully delivered to the contacts from the Everbridge side.

Status flow of emergency notification

An emergency notification that you create for a crisis event, when sent to Everbridge creates a corresponding incident along with a notification. The short description of the event in the workspace is created as an incident with a notification in Everbridge.

Notification state

The emergency notification that is created and sent from ServiceNow Business Continuity Management workspace is tracked in the **Notification state** field.

Communication status

The emergency notification that is received in Everbridge and the different stages to which it moves until it is delivered are tracked in the **Communication status** field.

Emergency notification workflow status

Notification state	Communication status
Draft: Draft is stored in the workspace.	
Attempting to send: Notification is being sent from the workspace.	
Error: Error in creating the notification in Everbridge.	
In Progress: Notification is successfully created in Everbridge.	**Active**: A notification is created and is active. An incident and a notification for the incident are created. The notification remains active for the duration set in Everbridge.
	Sent: After the set duration has elapsed, the state moves to Sent.
Completed: The notification is sent.	
	Stopped: Notification is stopped from being sent.

Approval [sn_grc_appr_approval]	Stores information of the approvers for each approval level.	Business Continuity Management – Approver Configurator
Approval [sn_bia_approval]	Stores information of the BIA approvers for each approval level.	Business Continuity Management – Impact Analysis
Approval [sn_bcp_approval]	Stores information of the BCP approvers for each approval level.	Business Continuity Management – Planning

Properties installed

For properties installed with the Business Continuity Management application, see Properties installed with BCM.

Script includes in Business Continuity Management

When you download the Business Continuity Management application, several scripts includes are added to your instance.

Script includes updated for the Xanadu release

Script includes updated for the Xanadu release

Script-includes	Description
ActivePlanCandidateFilter	Contains the utility functions that are used in the BCP active plan filter.
AssessmentTemplateBIAFieldsUtilBase	Functions used in creating AssessmentTemplateBIAFields record from selected assessment templates.
AssessmentTemplateBIAFieldsUtil	Script include to override BIA creation functions in AssessmentTemplateBIAFieldsUtilBase.
BCPConstants	Contains the utility functions that are used in the BCP constants.
BCPDataVisualizationUtilsBase	Contains the utility functions that are used in the BCP data visualization.
BCPDependencySnapshotUpdateStrategyBase	Contains the API for updating the dependencies in plans.
BCPDocumentationRecordAPIBase	Contains the utility functions that are used in the BCP documentation record API base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes updated for the Xanadu release (continued)

Script-includes	Description
BCPDocumentationRecordAPI	Contains the utility functions that are used in the BCP documentation record APIs.
BCPRecordUI	Contains the utility functions that are used in the BCP record UI pages.
BCPRecordUIBase	Contains the utility functions that are used in the BCP record UI base.
BCPRecordAPI	Contains the utility functions that are used in the BCP record API.
BCPTemplateUtilsBase	Contains the utility functions that are used in the BCP template utilities base.
BIAAjaxProcessor	Helper class to handle Ajax requests from client scripts. Implementing methods:1. To determine visibility of "Include CIA" field on BIA Template form.2. To set "Applies to table" field with source table name of primary element assessed.
BIARecordAPIBase	An API built to interact with BIA records. The goal of this API is to hide the implementation details about BIA records, and provide the consumers with a structured API to retrieve and update data for BIA records.
BIAAssessmentUIBase	Utility class to support Business Impact Analysis Assessment UI pages.
BIAUtil	Script to handle insert and updates on BIA table, including validationsSetting depends on table field based on dependency group element definition.
BIASmartAssessmentBase	Utility class to support all Smart Assessment functionality.
BIASmartAssessment	Script include to override Smart Assessment related functions in BIASmartAssessmentBase
BIAConstants	Generic class for BIA constants
BIACopyUtilBase	Utility to copy existing BIA and generate a new BIA in draft state.
BIARecordCreationUtilBase	Functions used in creating BIAs from templates
BIAFilterUtilBase	Script which contains functions to provide reference qualifiers on BIA tables.
BIADependencySnapshotUpdateStrategyBase	Contains the API for updating the dependencies in the BIAs.
DependencySnapshotUpdateStrategyBase	Contains the API for the Update dependencies action and scheduled job.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes updated for the Xanadu release (continued)

Script-includes	Description
EventDependencyUpdateStrategyBase	Contains the API for updating the dependencies in the events.
PlanRestAPIResourceUtil	Contains the utility functions that are used in the BCP Plan Rest API resource utility.
PlanRestAPIResourceUtil	Contains the utility functions that are used in the BCP plan Rest API resource utility.
PopulateBIAForPlanAsset	Contains the utility functions that are used to populate the BIA for the plan and asset.
PlanCopyUtilBase	Contains the utility functions that are used in the BCP plan copy utility base.
PlanUtil	Contains the utility functions that are used in the BCP plan utility.
PlanCommonUtils	Contains the utility functions that are used in the plan common utility.
RecoveryTasksUtil	Contains the utility functions that are used in the BCP recovery tasks utility.

Scripts used for Nested events

Scripts used

Name	Description
EventTaskGanttUIBase	Utility class to support event task hierarchical view.
EventTaskGanttUI	Script include to override event task hierarchical view functions in EventTaskGanttUIBase.
EventSandboxCallableUtilsBase	Utility class containing sandbox callable functions.
EventSandboxCallableUtils	Script include to override event related functions in EventSandboxCallableUtilsBase.
EventRecordProgressTrackerBase	Utility class to support progress tracker functionality for event.
EventRecordProgressTracker	Script include to override progress tracker related functions in EventRecordProgressTrackerBase.
BCMRecoveryConstants	Generic class for recovery constants.
EventRecordAPIBase	An API to interact with event record.
EventTaskUtil	Utility class for event tasks.
ActivatedPlanRecordAPIBase	An API to interact with activated plan record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Relationships Framework

The Data Relationships Framework application (sn_grc_rel_config) supports the BCM application with the underlying framework to fetch the dependencies in the BIAs, plans, and events from different sources such as CMDB, BIA, and BCP. Beginning with the Xanadu release, the Data Relationships Framework (sn_grc_rel_config) application is installed with the BCM application by default.

Framework for fetching the dependencies

The Data Relationships Framework (sn_grc_rel_config) stores the configurations for how a main object type can relate to other object types. It enables the users to configure the source (main node) for the dependency updates, configure its relationship with the child nodes, and fetch the dependencies for the selected object.

A scheduled job scans the object configuration data at regular intervals and checks if any dependencies have been updated. If any changes are observed in the dependencies, the scheduled job fetches the dependencies of the selected object from one of the configured sources such as BIA, BCP, or CMDB.

Benefits of the Data Relationships Framework

The Data Relationships Framework provides the following benefits for the BCM application users:

- Provides a single API to fetch the dependencies from different sources.
- Supports the configuration of the main node (source) and maintains its relationships with its child nodes such as assets, risks, and so on.
- Enables the users to control the performance by selecting different sources.

Roles associated with the Data Relationships Framework

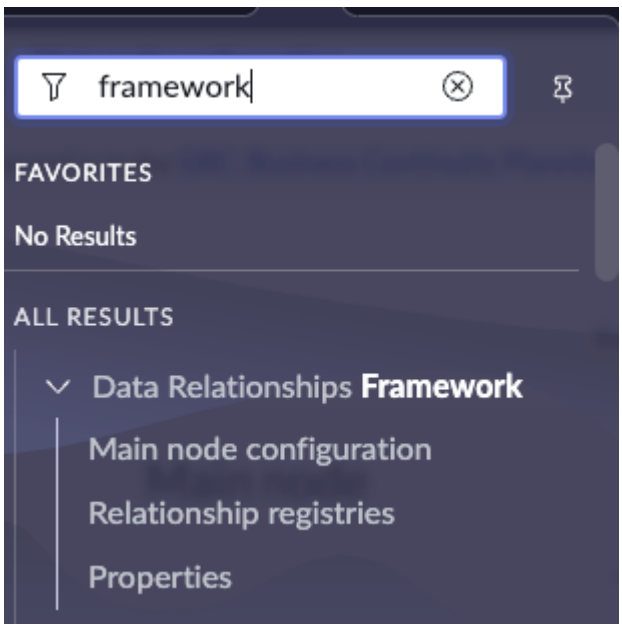
The following roles are associated with the Data Relationships Framework application.

Roles associated with the Data Relationships Framework

Roles	Description
Data Relationships Framework administrator [sn_grc_rel_config.admin]	Configures the relationship of the object types such as the relationship of the main node to the child nodes.
Data Relationships Framework reader [sn_grc_rel_config.reader]	Views the data for the object types as defined in the Data Relationships Framework. **Note:** All BCM application users have the Data Relationships Framework reader role.

Tables for the framework

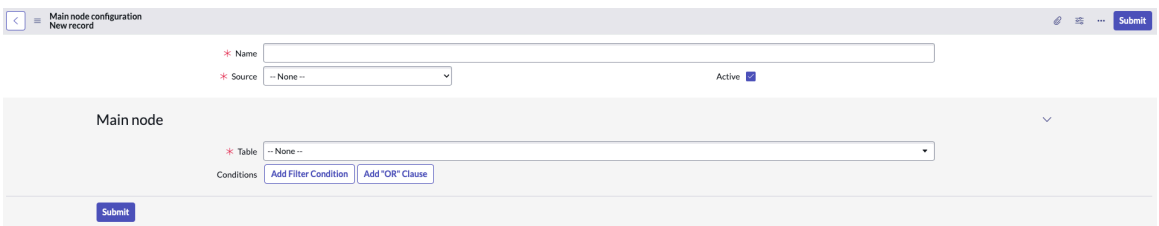
To support the Data Relationships Framework, the following new tables have been added and existing tables have been revised.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

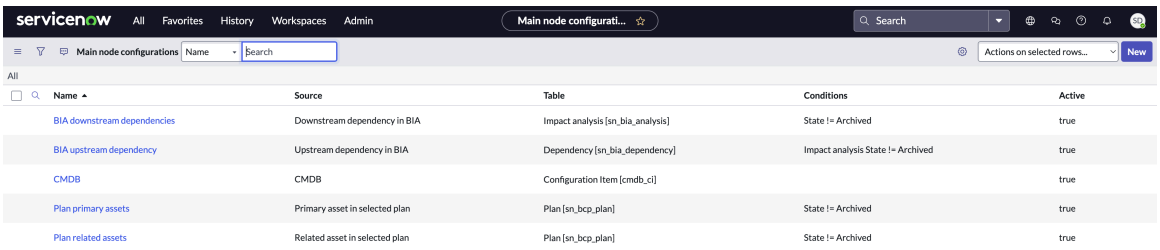
Tables used for the Data Relationships Framework

New and existing tables	Table	Description
New table	Main node configuration [sn_grc_rel_config_main_node_config]	Table to store the configuration of the main node from where the dependencies are fetched.
New table	Node relationship configuration [sn_grc_rel_config_node_rel_config]	Table to store the configuration that determines the dependencies of the main node and child nodes. It also maintains a reference to the main node configuration.
Existing table	Relationship registries [sn_data_registry_relationship]	Table to determine the relationship of an object with other objects.



Modules for configuring the relationships

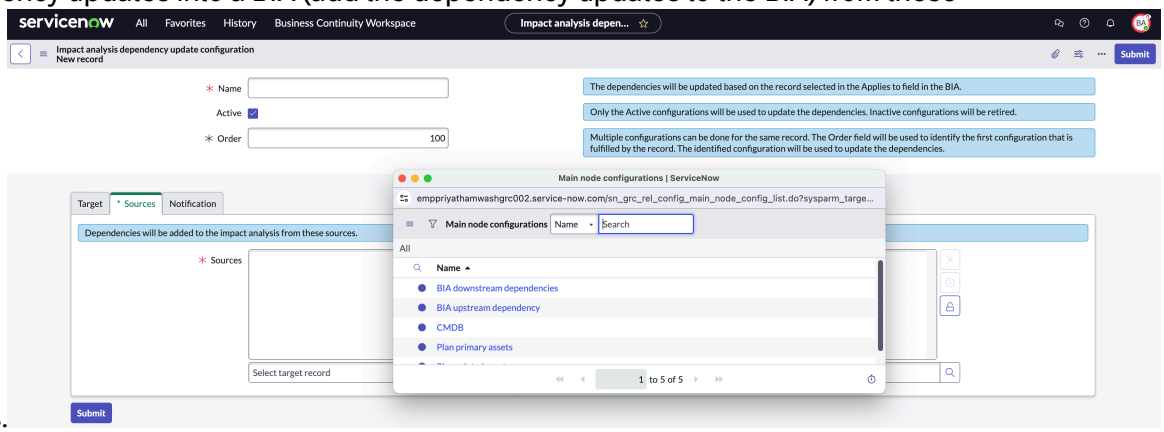
The BCM application users can navigate to **Data Relationship Framework** in the application navigator and access its modules for configuring the relationships.



The Data Relationships Framework application consists of the following modules:

1. Main node configuration: Configure the details of the main node such as its name, source, table name, filer conditions, and so on as shown in the following examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

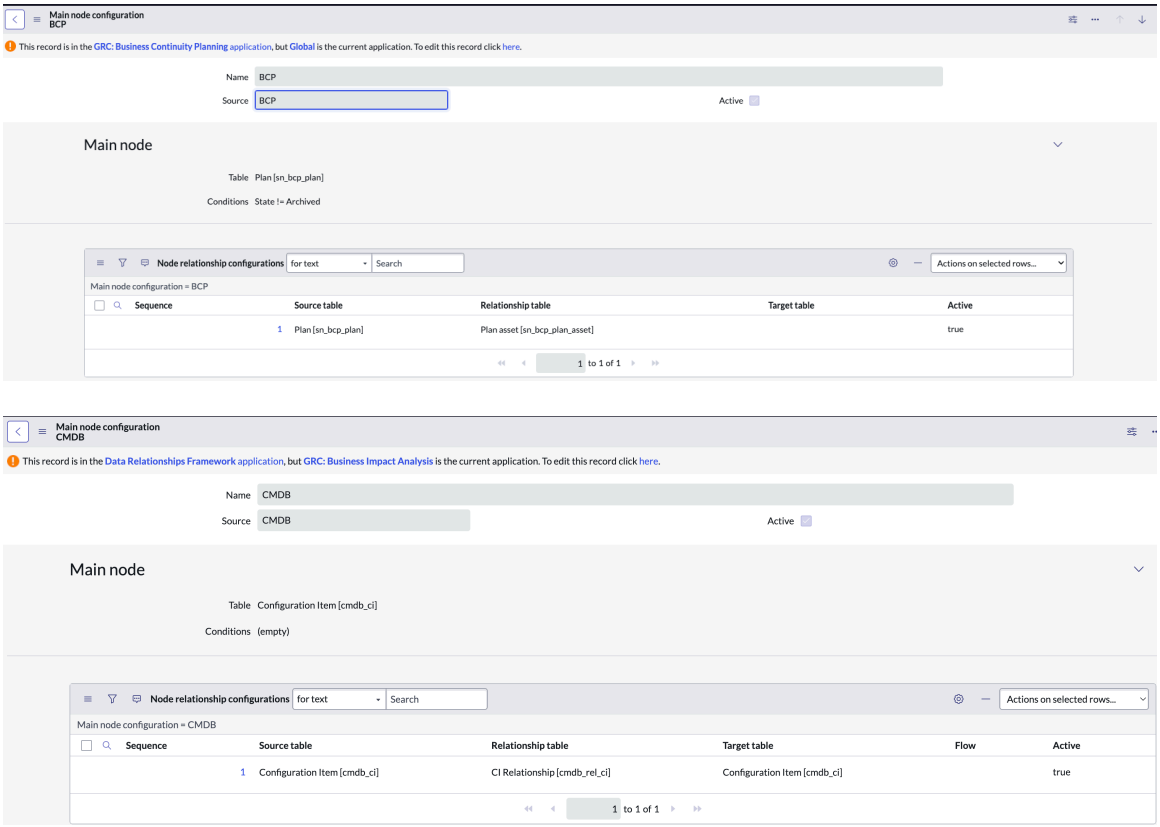


The following main node configurations are provided as sources with the base system as shown in the following example:

- BIA upstream dependency
- BIA downstream dependencies
- CMDB
- Plan primary assets
- Plan related assets

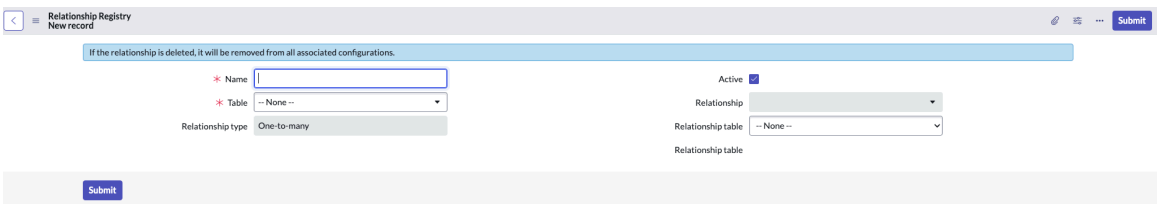
The BCM administrators use the main node configuration to perform the following tasks:

- Configure the Impact analysis dependency update configuration module and fetch the dependency updates into a BIA (add the dependency updates to the BIA) from these sources.



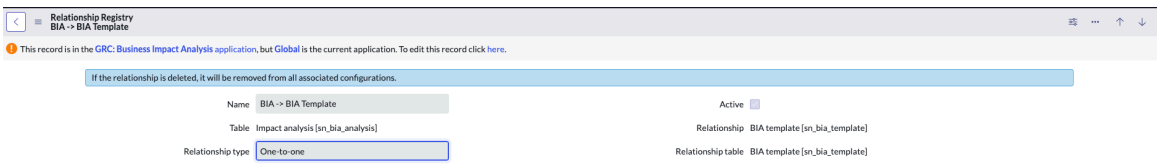
- Configure the Planning dependency update configuration module and fetch the planning dependency updates into a plan (add the updated related assets to the plan) from these sources.
- Configure the Event dependency source configuration module and configure the sources for the event dependency updates (add the updated impacted assets to a recovery event).

Note:
All the information on how data should be pulled is stored in the Main node configuration, which is attached to the records. This configuration determines the order in which the data is pulled. To reduce the amount of data pulled and how it is pulled, you need to configure the conditions in both the Main node configuration and the records. This ensures that only the necessary data is retrieved.



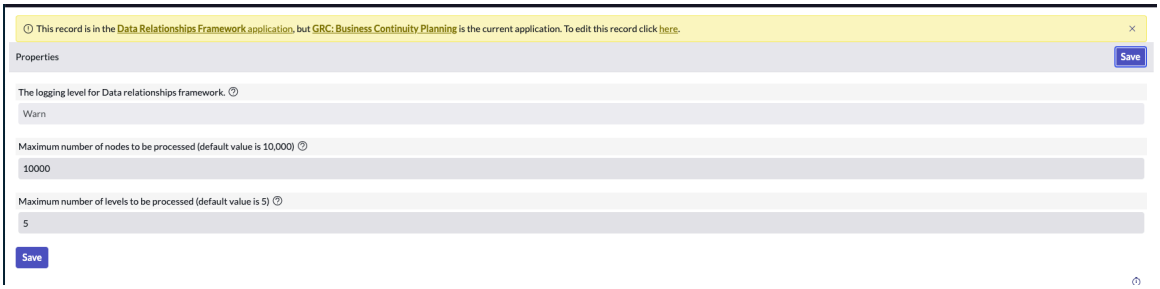
The main node configuration records for plans and CMDB are shown in the following examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information on creating a main node configuration record, see Create a main node configuration record.

2. Relationship registries: Configure the relationship registries for the main node. Relationship registries are part of the 360-degree configuration in GRC where a user can define how one object has a related object. The configuration details of a relationship registry record such as its name, table, relationship type, relationship table, and so on are shown in the form.

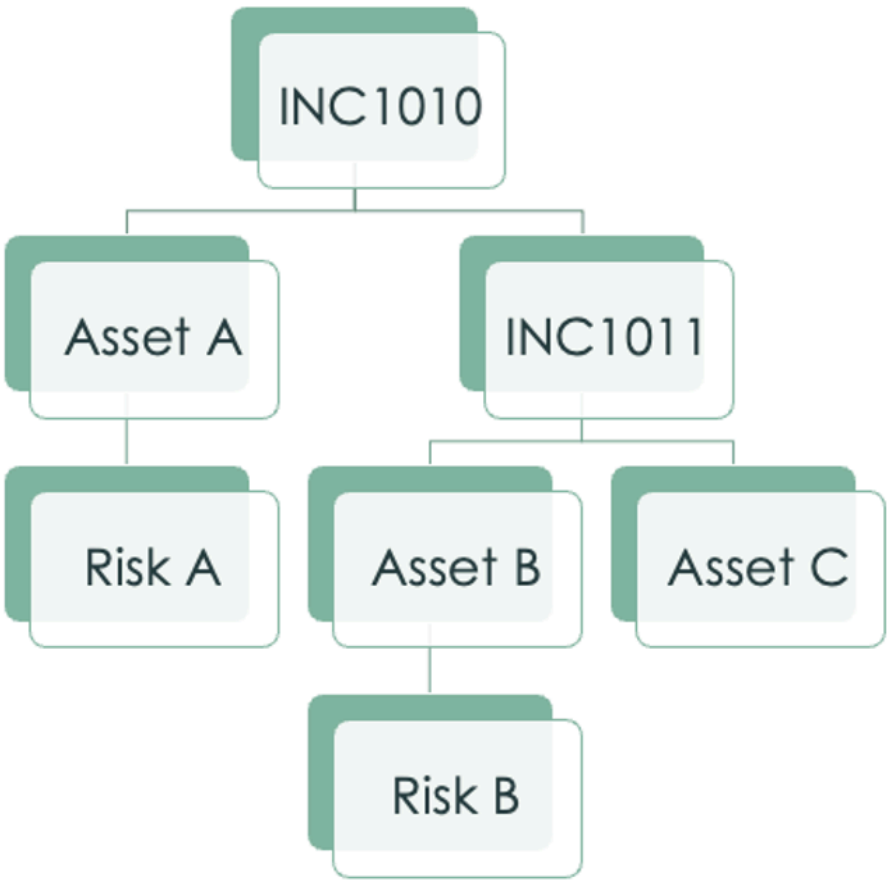


A sample relationship registry record for a BIA and BIA template is shown in the following example.

For information on creating a relationship registry record, see Create a relationship registry record.

3. Properties: Configure the properties of the Data Relationships Framework as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information on configuring the properties, see Configure the properties for the Data Relationships Framework.

Use cases for the Data Relationships Framework

The Data Relationships Framework is used to configure the node and asset relationships such as mapping a main node to its child node or mapping an asset to a risk.

Consider the following use case that shows the main node configuration and its relationships.

In this example, INC1010 is the main node where the source is an Incident. INC1010 has two child nodes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Asset A: The affected configuration item for Asset A is Risk A.
2. INC1011: The affected configuration items (CIs) for INC1011 are Asset B and Asset C. For Asset B, the affected configuration item is Risk B.

With the underlying Data Relationships Framework, the following relationships are configured:

- Main nodes:
  - INC1010 -> Asset A
  - INC1010 -> INC1011
- Node relationships:
  - Asset A -> Risk A
  - INC1011 -> Asset B
  - INC1011 -> Asset C
  - Asset B -> Risk B
- Input nodes:
  - Source = Incident
  - Record = INC1010
  - Max Levels = 5
  - Max Nodes = 1000
- Output nodes:
  - INC1010
  - Asset A
  - INC1011
  - Risk A
  - Asset B
  - Asset C
  - Risk B
- Edges:
  - INC1010 -> Asset A
  - INC1010 -> INC1011
  - Asset A -> Risk A
  - INC1011 -> Asset B
  - INC1011 -> Asset C
  - Asset B -> Risk B

Limitations of using the Data Relationships Framework

The Data Relationships Framework has the following limitations:

- The data fetched for an object cannot be reused for another purpose.
- The sources provided in the framework must be used for fetching the dependency updates into an object. It is not possible to configure your own sources for fetching the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the administrative setup for the configuration records, see Dependency Configuration records.

Create a main node configuration record

Create a main node configuration record to configure the source for fetching the dependencies. You can configure the details of the main node such as its name, source, table name, filer conditions, and so on.

Before you begin

Role required: sn_grc_rel_config.admin

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration**.
2. Select **New**.
3. On the form, fill in the fields.
   For information on the fields in the form, see Main node configuration new record form.
4. Select **Submit**.
   The main node configuration record is displayed in the Main node configurations list.

Main node configuration new record form

Use the Main node configuration new record form to create a main node configuration record in the Data Relationships Framework.

Main node configuration new record form

Main node configuration new record form

Field	Description
Name	Name of the main node configuration record. For example, BCP.
Source	Source for the main node configuration record. Available options are: • **BIA upstream dependency** • **BIA downstream dependencies** • **CMDB** • **Plan primary assets** • **Plan related assets**
Active	Option to indicate that the record is active.
Table	Table used to set up the relationship. For example, Plan [sn_bcp_plan].
Condition	Filter condition used to set up the relationship for the configuration record. For example, you can set the condition as `"Status in source" "is" "Valid"`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a relationship registry record

Create a relationship registry record to set up relationship between the record and object defined in the table. You can configure the details of the main node such as its name, source, table name, filer conditions, and so on.

Before you begin

Role required: sn_grc_rel_config.admin

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Relationship registries**.
2. Select **New**.
3. On the form, fill in the fields.
   For information on the fields in the form, see Relationship registry new record form.
4. Select **Submit**.
   The relationship registry record is displayed in the Relationship Registries list.

Relationship registry new record form

Use the Relationship registry record form to create a relationship registry record.

Relationship registry new record form

Relationship registry new record form

Field	Description
Name	Name of the relationship registry record. For example, BIA analysis –> Issue.
Table	Table used to set up the relationship registry record. For example, Impact analysis [sn_bia_analysis].
Relationship type	Relationship type for the relationship registry record. Available options are: • **One-to-one**: One record has a relationship to one record in another table. • **One-to-many**: One record has a relationship to one or more records in another table. • **Many-to-many**: One or more records have a relationship to one or more records in another table. • **Scripted relationship**: Use scripts to define the relationship between the tables.
Active	Option to indicate that the relationship registry record is active.
Relationship	Table used to set up the relationship with the object that is defined in the **Table** field. For example, Issue [sn_grc_issue].
Relationship table	Read-only field. The table selected in the **Relationship** field is displayed as a

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationship registry new record form (continued)

Field	Description
	relationship table by default. For example, Issue [sn_grc_issue].

Configure the properties for the Data Relationships Framework

Configure the properties for the Data Relationships Framework application.

Before you begin

Role required: sn_grc_rel_config.admin

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Properties**.
2. Update the properties in the form.
   For information on the properties in the form, see Data Relationships Framework properties form.
3. Select **Save**.

Data Relationships Framework properties form

Use the Data Relationships Framework properties form to configure the relationship properties for Data Relationships Framework APIs.

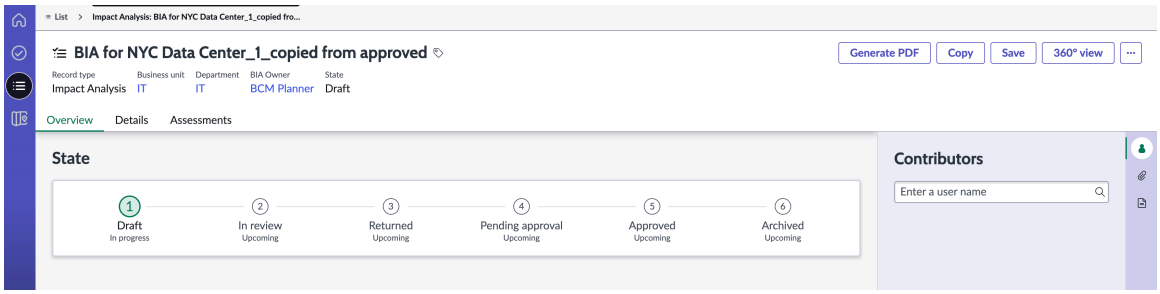
Data Relationships Framework properties form

Data Relationships Framework properties form

Field	Description
The logging level for Data Relationships Framework	Logging level for the Data Relationships Framework. Available options are: • **Debug** • **Info** • **Warn** • **Error** The default value is Warn.
Maximum number of nodes to be processed	Maximum number of nodes to be processed when the Data Relationships Framework API is called. The default value is 10,000. For example, when the API is called, it displays the results for a maximum 10,000 nodes.
Maximum number of levels to be processed	Maximum number of levels to be processed when the Data Relationships Framework API is called.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Relationships Framework properties form (continued)



Field	Description
	The default value is 5. For example, when the API is called, it processes maximum 5 levels of the relationships and does not go deeper than 5 levels.

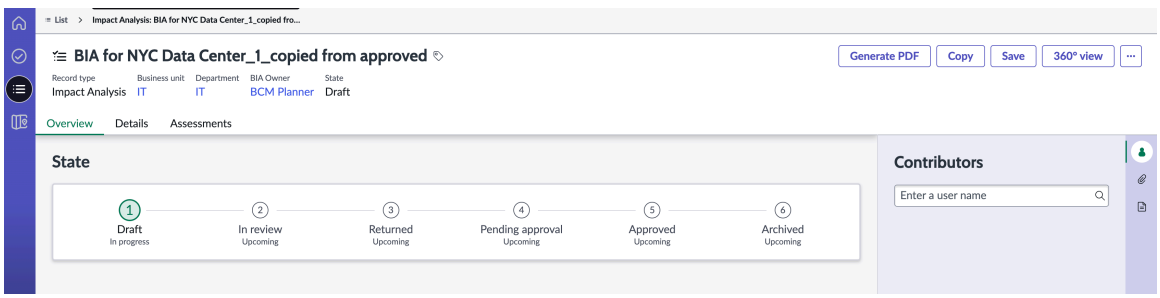
GRC record page template for BCM records

Beginning with the Xanadu release, the GRC records use the common GRC record page template. You can leverage the new variant of record pages to streamline page creation, simplify maintenance, and minimize the cost of page ownership.

With standard record page migration, you can configure consistent styling and a uniform look for all BCM records. You can also configure the header of the record to display additional information such as priority, due date, issue source, issue type, and so on.

A record in the BCM application with the GRC record template is shown in the following example.

Note:
If you are upgrading to the version 17.x apps, you can also revert to the previous record page.



Stepper component in the Overview tab of the records

The stepper component on the **Overview** tab shows the progression of the states for the record.

Stepper component in the Overview tab of the records

The stepper component on the **Overview** tab shows the progression of the states for the record.

The numerical value of the current state of the record is highlighted in the stepper component for reference as shown in the following example.

A typical record moves through the following progression of the states:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Draft**
- **In review**
- **Returned**
- **Pending approval**
- **Approved**
- **Archived**

If a record requires further updates and it is rejected by the approver of the record, it is set to the **Returned** state by the application software. When the record owner updates the details of the record, it follows the approval workflow again.

Compliance Case Management

Report, investigate, analyze, and resolve a compliance case or raise a compliance request by using the ServiceNow® GRC: Compliance Case Management application.

The Compliance Case Management application helps you to report, investigate, and resolve compliance cases, such as complaints and breaches. The Compliance Case Management application provides a highly configurable workflow that is based on a compliance case or request.

Explore	Configure	Use

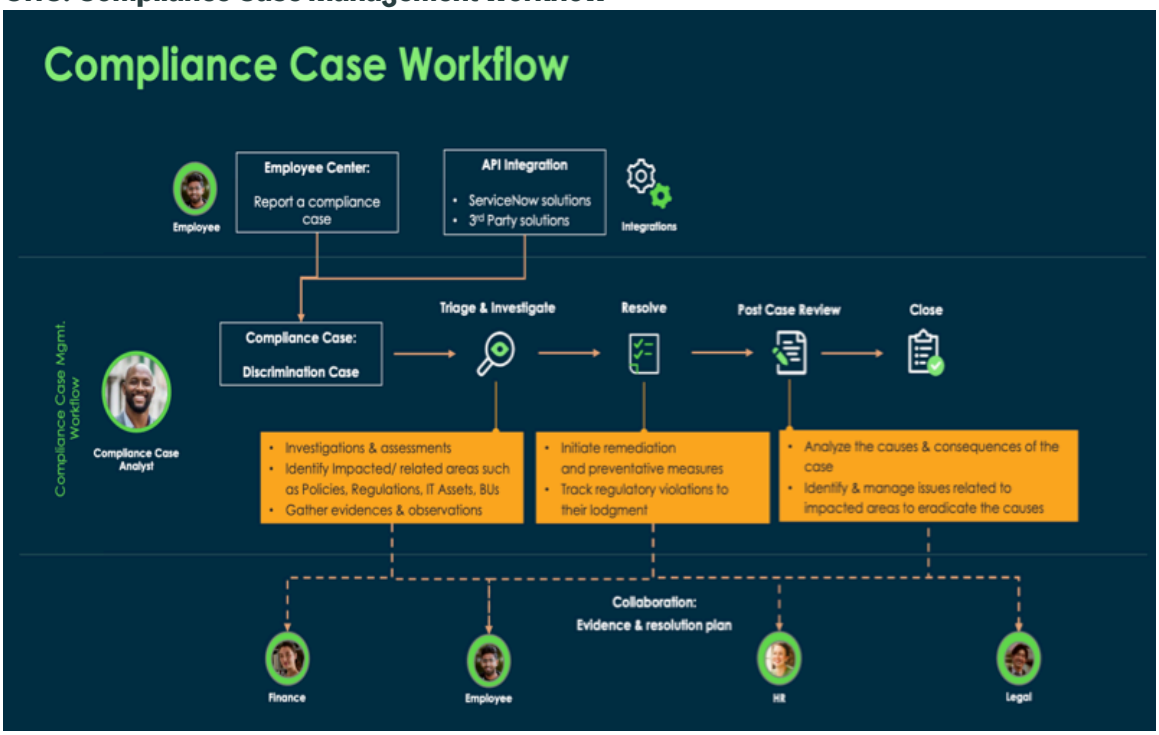
Exploring Compliance Case Management

Learn how you can use the GRC: Compliance Case Management application to report, investigate, analyze, and resolve a compliance case, or raise a compliance request for your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits of Compliance Case Management

The Compliance Case Management application offers the following benefits for your organization:



- Reporting, investigating, and resolving compliance cases or events, such as requests, complaints, and breaches.
- Raise a compliance request, such as policy modifications, clarifications, and inquiries.
- Recording the regulations that were violated by the event impact, with the event lodgement date.
- Collaborate effortlessly with multiple teams to investigate and manage compliance cases and requests.
- Providing a highly configurable workflow that is based on a compliance case or request.
- Gain a comprehensive risk view to tie policy violations or control failures to risks.
- Share data and communicate across functional groups.
- Analyze cases and perform investigations and assessments –including collaborating with various teams and creating and assigning case tasks.

Compliance case workflow

The workflow in the Compliance Case Management application is a process that enables you to report and manage cases that need the compliance team's attention.

The following diagram shows the workflow of the GRC: Compliance Case Management application.

GRC: Compliance Case Management workflow

The different stages of the workflow are described as follows:

- Report a compliance case
- Triage the compliance case

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Investigate and evaluate the compliance case
- Resolve the compliance case
- Post case review and closure

Report a compliance case

A business user or a compliance team can report a compliance violation in the Employee Center application. Compliance case team can report cases in the Compliance Workspace application. For more information, see Reporting a compliance case in GRC: Compliance Case Management.

Triage the compliance case

After a compliance case is reported, the compliance team triages the case from a validity standpoint. The team then assigns a case analyst to work on the case.

Investigate and evaluate the compliance case

The compliance case analyst collaborates with multiple teams to investigate, gather evidence, and capture the details and responses about the case. Then, the case analyst creates the case tasks to initiate an investigation and assessment of a reported case and assigns them to a case task owner.

The case task owner adds the requested details and submits them to the case analyst for review. Based on the investigation and assessment responses, the case analyst performs the following tasks:

- Add the areas that are impacted by a compliance case. For example, the impacted areas or records that could be impacted are the entities, controls, locations, or users that are affected by the compliance case. For more information, see Add an impacted area to a compliance case.
- Add the areas that are related to the compliance case. For example, the related areas include the policies, citations, control objectives, or risk events. For more information, see Add a related area to a compliance case.
- Add the compliance regulations that might be impacted by the compliance case. For more information, see Add compliance regulations to a compliance case.
- Add the causes and consequences of this compliance case such as the root cause for the reported compliance case or event and its consequences to the organization. For more information, see Add a cause and consequence to a compliance case.

Resolve the compliance case

After all the analysis for the reported case is completed, the case analyst initiates the remediation actions and preventive measures to resolve the case. The case analyst also tracks the reportable regulatory violations to ensure their lodgement to the regulators.

Post case review and closure

The case analyst analyzes the causes and consequences of the case. Then, the case analyst conducts a root-cause analysis to remove the cause of the case. The case analyst can review the case to identify and manage the issues that are related to the impacted areas. For more information, see Add or create an issue for a compliance case. Finally, the compliance analyst works closely with the various teams to review and close the compliance case.

Compliance request workflow

Use the request workflow in the Compliance Case Management application to raise and manage compliance requests within an organization. By using this workflow, your compliance requests are addressed effectively and efficiently by your compliance team.

The following diagram shows the workflow of a compliance request in the GRC: Compliance Case Management application.

GRC: Compliance Case Management workflow

The different stages of a compliance request are described as follows:

- Raise a compliance request
- Triage the compliance request
- Working on a compliance request
- Awaiting request approval
- Cancel a compliance request
- Close a compliance request

Raise a compliance request

A business user or a compliance team can raise a compliance request in the Employee Center application. Compliance case team can raise requests in the Compliance Workspace application. For more information, see Raising a compliance request in GRC: Compliance Case Management.

Triage the compliance request

After a compliance request is raised, the compliance team assigns a request analyst to work on the case. The request analyst then triages the case from a validity standpoint. By conducting this evaluation, the request analyst ensures that only the valid and relevant requests proceed further in the compliance process. After the request analyst verifies the request as valid, the request moves to the In progress state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Working on a compliance request

In the In progress stage, the request analyst determines all the requirements for the raised request. The request analyst verifies the eligibility of the request and identifies any supporting documents, such as the policies, controls, citations, and control objectives that are related to the request. The case analyst can approve or reject the compliance request. If necessary, the analyst can seek approvals from the various stakeholders.

Awaiting request approval

After the request has been reviewed, it reaches this stage where a decision is made regarding its approval or rejection. This stage involves evaluating the raised request. If the request meets the necessary criteria, it's approved. Otherwise, it may be rejected with the justifications provided to the requester. Requests can be sent for approval to multiple users and can be approved or rejected by any one of them. The **Any Approvers** option enables the request to be closed as soon as it receives an approval or rejection from any of the assigned approvers. For more information, see Create an approval workflow.

Cancel a compliance request

In this stage, a request may need to be canceled if it isn't a compliance request. A request can be canceled with the justifications provided to the requester. A request can be canceled at any stage, including Triage, In Progress, and Awaiting Approval states.

Close a compliance request

After a compliance request is fully processed and approved or rejected, it enters the Closed stage. This stage indicates that all the necessary actions that are related to the request have been taken. The request is considered resolved, and no further actions are required.

Compliance Case Management landing page

See an overview of all your compliance case-related information on your GRC: Compliance Case Management landing page. You can also create the cases, requests, and issues from this GRC: Compliance Case Management landing page.

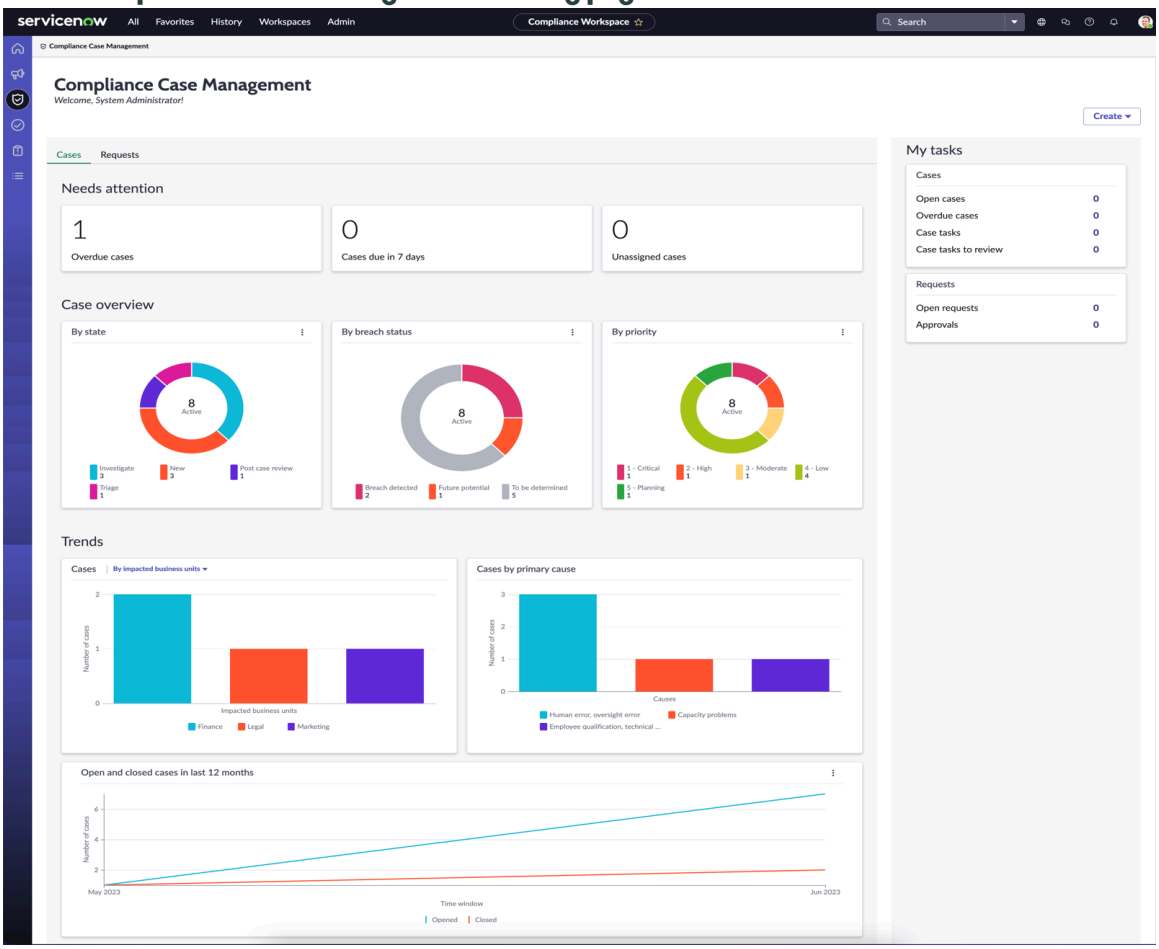
Roles required: sn-compliance-case-manager or sn-compliance-case-analyst

Overview of compliance case management landing page

You can launch the compliance case management landing page by using the launcher ( ) icon.

The GRC: Compliance Case Management landing page consists of the following sections:

- Cases
- Requests
- My tasks



Cases section

The Cases section includes the cards that offer information on compliance cases. You can see the cases that require attention, an overview, trends, and monitoring information.

The following example shows the cards that are available for the cases on the GRC: Compliance Case Management landing page.

© 2026 ServiceNow, Inc. All rights reserved.

Cases section (continued)

Card	Description
Case overview	Graphical representation of all the active cases by their state, breach status, and priority: **By state** Shows the number of active cases by the workflow states that they're in. For example, as a compliance case manager, you can view the number of active cases that are under the investigation state. **By breach status** Shows the number of active cases only when a breach is detected, a chance of a breach is in the future, or the breach status is determined yet. **By priority** Shows the number of active cases by the priority that is defined at the case level. There are drill-down capabilities. When you click the individual sector you are navigated to a list view to get more rich and contextual information.
Trends	Trends about your cases: • Reported cases by the affected business units and geographical locations. • Cases by Syb-type. • Number of reported cases for each primary cause. • Number of open and closed cases in the last 365 days.
Tracking	Items to track: • Number of open issues for a compliance case • Number of overdue issues • Number of issues due in the next seven days There are drill-down capabilities. When you click the individual sector you are navigated

Card	Description
	Requests that aren't assigned yet. There are drill-down capabilities. When you click the individual sector you are navigated to a list view to get more rich and contextual information.
Request overview	Graphical representation of all the active requests by their state, priority, and business units: **By state** Shows the number of active requests by the workflow states that they're in. For example, as a compliance case manager, you can view the number of active cases that are under the in progress state. **By priority** Shows the number of active requests by the priority that is defined at the request level. **By business units** Shows the number of active requests categorized by the business units. There are drill-down capabilities. When you click the individual sector you are navigated to a list view to get more rich and contextual information.
Trends	Number of compliance requests that are open, approved, rejected, and canceled in the last 12 months, and requests by sub-types. There are drill-down capabilities. When you click the individual sector you are navigated to a list view to get more rich and contextual information.

My tasks section

My tasks section consists of the individual sections for cases and requests.

In the Cases section, you can access all the cases and tasks that are assigned to you:

Open cases

All the cases that are assigned to you.

Overdue cases

Any overdue cases that are assigned to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case tasks

All the case tasks that are assigned to you to work on.

Case tasks to review

Pending case tasks that you need to review. For example, let's say that as a case analyst, you've created a case task and assigned it to a case task owner to work on it. The case task owner completed the case task and submitted it to you for review. Now, you need to review and complete these case tasks.

In the Requests section, you can access all the requests that are assigned to you:

Open requests

All the requests that are assigned to you.

Approvals

All the requests that are awaiting your approval.

Smart assessments in Compliance Case Management

Use the Smart Assessment Engine to perform smart assessments on compliance case action tasks.

Using the abilities of the Smart Assessment Engine, you can empower the compliance case teams to initiate compliance case assessments. These assessments assist compliance case analysts in identifying the impacted and related areas during a compliance case investigation. They also help determine whether the employees in your organization adhere to the required regulations. The analyst can then collect observations and evidence from the stakeholders and arrive at a resolution. The Smart Assessment Engine provides numerous benefits some of which are listed as follows:

- Automate repetitive tasks
- Configure the assessment templates
- View progress indicators and automatically save responses
- Identify the assessment responders
- Define the due date for responding to the assessment

In the Assessment Workspace, you can view the templates available for Compliance Case Management. You must ensure that the assessment template category is set to Compliance Case Management and the assessment targets are set to **Action task** and **Compliance case**. Only the assessment templates that are published are available for performing the assessments. The ability to tailor templates designed for various types of assessments, for example, financial breach assessments, empowers compliance teams to conduct more focused and targeted analysis of the breaches.

For more information about Smart Assessment Engine, refer to Exploring Smart Assessment Engine.

Pre-requisites to enable smart assessment in Compliance Case Management

Smart assessment scoped applications

The base system ships the GRC smart assessment template to the users when the Compliance Case Management plugin is installed. However, the following scoped applications are required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Smart Assessment core (sn_smart_asmt)
2. Smart assessment Migration tools (sn_smart_asmt_mig). For more information, see Migrate a legacy metric type to an assessment template
3. Smart Assessment Connected (sn_smart_asmt_conn)
4. Smart Assessment Designer (sn_smart_asmt_desg). For more information, see Using the template designer

Enable smart assessments system property

The administrator sets the *sn_grc_case_mgmt.enable_smart_assessments* system property to **true** for the compliance case manager to assess the action tasks using the smart assessment method.

Migrate the template

Create a new template in Smart Assessment Engine. For more information, see Creating an assessment template from legacy assessment metric types.

To get started with smart assessments, the compliance case administrator (sn_comp_case.compliance_case_admin), configures the assessment questionnaire. When an action task moves from the **Draft** state to the **Assigned** state, the assessment is sent. Based on the assessment results, appropriate remediation measures are identified and implemented. To learn more about how to configure a questionnaire in the Exploring Smart Assessment Engine, refer to Configuring Smart Assessment Engine. To learn how to perform smart assessment on action tasks, refer to Perform smart assessment on action tasks.

Related topics

Perform smart assessment on action tasks

Using the compliance case overview related list

The compliance case overview related list shows the details about a case. For example, you can see the description, state, schedule and milestones, case tasks, and issues that are related to a case in the GRC: Compliance Case Management application.

The Compliance Case Management overview related list includes the following sections:

- Description
- State
- Case schedules and milestones
- Case tasks overview
- Tracking
- Attachments

Description section

The Description section includes the detailed information that you can fill in when you're creating a compliance case. For example, you can add the purpose, action being taken, time line, applicable rules and regulations, and any relevant evidence or documents. By using this section, you can understand the context of the case and take the necessary steps to resolve it.

State section

The State section includes the workflow states of a compliance case. For example in this section, you see various stages of the compliance case, such as New, Triage, Investigate, Resolve, Post

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

case review, and Close. These states determine the status of the case. A compliance case administrator can configure these states in the GRC: Compliance Case Management application. For more information, see Create a state model to define the workflow states and transitions.

Case schedules and milestones section

The Case schedules and milestones section includes the details on all the milestones or events during the case life cycle in a time-line range. In this section, you can see an outline of the key events, such as the date when the case was reported, occurred, discovered, or closed. You can also filter the events to view the following options on the time-line range after you select the **Show events** option:

Case creation date

Date when the case was created.

Date of discovery

Date when the case was discovered.

Date of occurrence

Date when the case occurred.

Milestone

Dates related to the investigation remediation milestones.

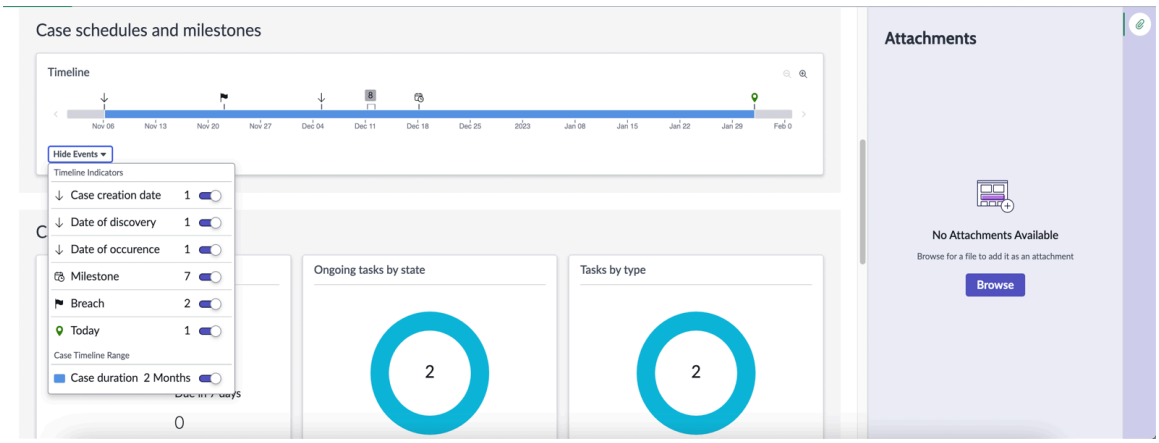
Breach

Dates related to the breach analysis.

Today

Current date on the time line.

Case closure



Date when the case was closed or met the case closure service level agreement (SLA).

Case duration

Date when the case was created to the last milestone date.

The following example shows the options available after you select the **Show events** option.

Case schedules milestones

Note:
The options that are displayed after you select the **Show events** option are limited to the events and milestones that are available for the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case tasks overview section

The case task overview section includes the following subsections:

Tasks

Total number of case tasks, any overdue case tasks, and case tasks that are due in seven days.

Ongoing tasks by state

Number of active case tasks by the states.

Tasks by type

Number of active case tasks by the case type.

Tracking section

The Tracking section displays the following information:

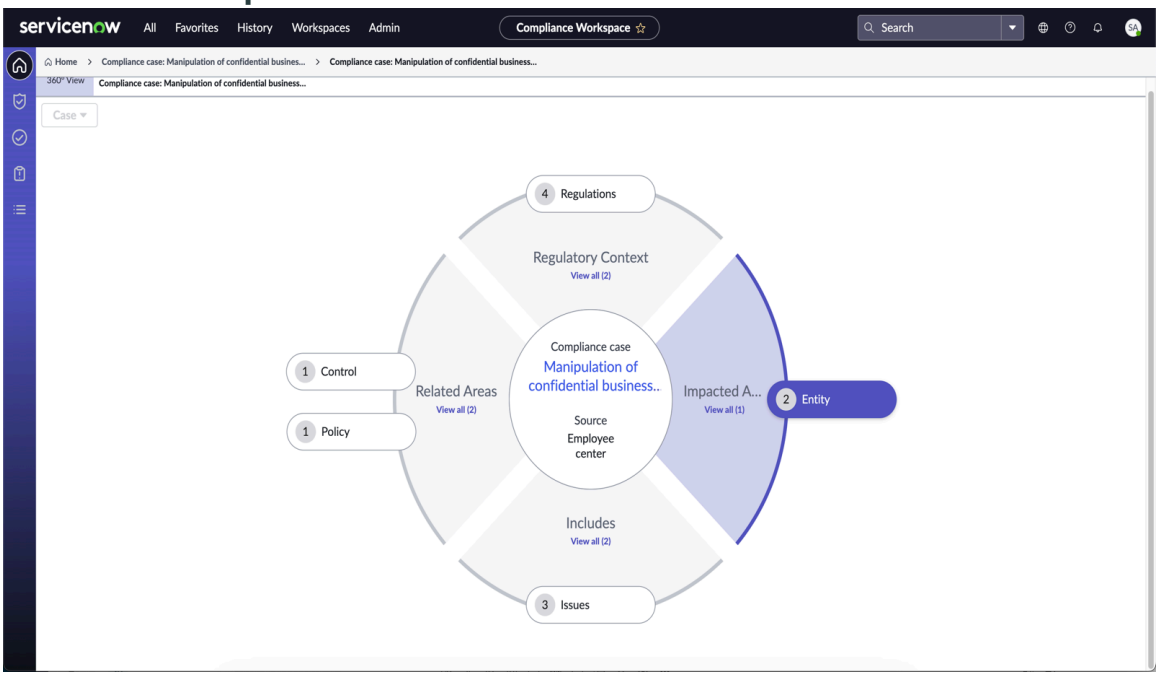
- Number of open issues for a compliance case
- Number of overdue issues
- Number of issues due in the next seven days

Attachments section

The Attachment section enables you to upload a file as an attachment to a case. In this section you can find all the attachments that have been added.

360° Relationship Visualization of a compliance case

Use the 360° compliance case view to explore the relationship between your compliance case and all its associated records in a distinctive visualization. To use this feature, you must integrate Compliance Case Management with the 360° Relationship Visualization application.



360° view of a compliance case

When you launch the 360° view from a compliance case record, you can visualize the relationships between the selected record and all its associated records. This visualization provides valuable insights into how these objects interact and relate to each other within the compliance case. You can take actions on the displayed records. For example, you can dive deeper to explore more information or create records.

The following example shows the 360° view of a compliance case:

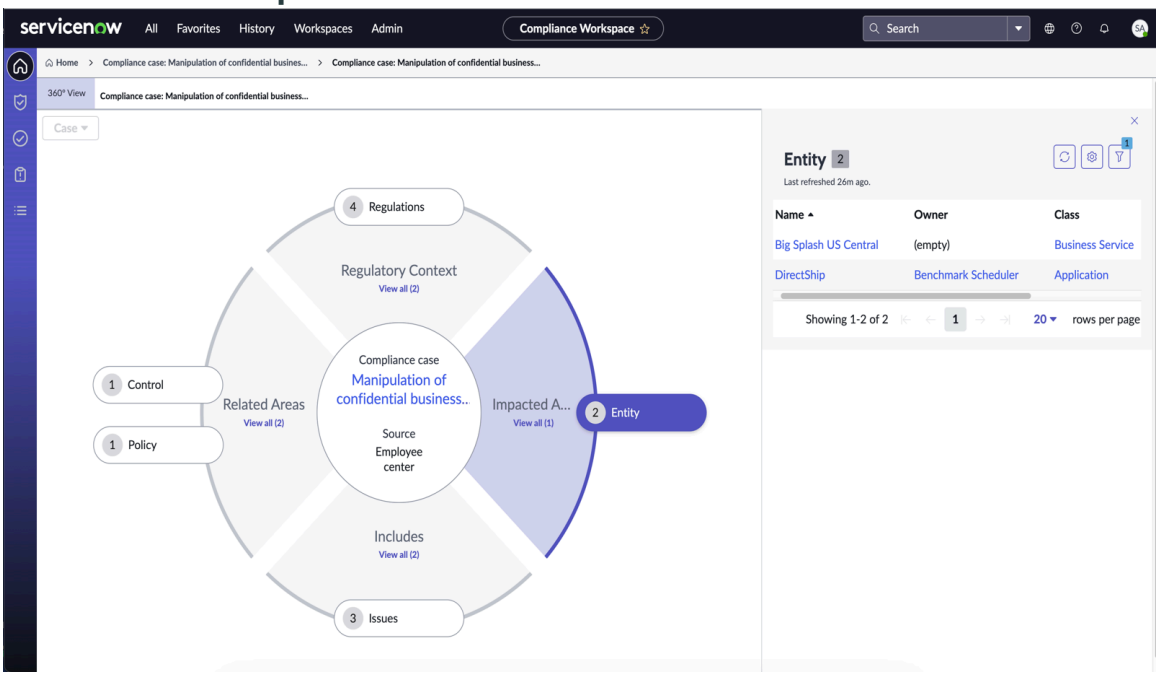
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

360° view of a compliance case

To explore the 360° view and to learn how to launch the view, see Exploring the 360° view.

To learn more about the users who could use 360° Relationship Visualization, their roles, and responsibilities, see 360° Relationship Visualization.

360° view of compliance inventories integrated with compliance case



The 360° view of a compliance case record offers a comprehensive and detailed perspective on the various records that are associated with the case. The associated objects are entities, citations, regulations, case tasks, issues, controls, and policies. For example, when you select the Entity option, it enables you to explore the list of entities that are related to the compliance case. You can also view the source from where the compliance case has been raised.

The 360° view enables you to access information about the source from which the compliance case has been raised.

The following example shows the entities linked to a compliance case:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entities linked to compliance case

Configuring Compliance Case Management

You can configure the Compliance Case Management application to report, investigate, analyze, and resolve a compliance case or requests.

Follow the order of the tasks here to configure the GRC: Compliance Case Management application. These tasks help you to manage the compliance cases and requests effectively.

Download Compliance Case Management

Before you run the Compliance Case Management application in your instance, you must download it from the ServiceNow Store.

Before you begin

Role required: admin

About this task

The ServiceNow Store application enables you to download the core products and applications. A product contains one or more applications that are licensed as a group. For example, the GRC application is a product.

Procedure

1. In the ServiceNow Store application, you must ensure that you have entitlements, or licenses, to the application and its dependent applications.

   Note:
   This process applies only to the applications that are downloaded to the production instances. If you're downloading the applications to your non-production or development instances, it isn't necessary to get entitlements. Proceed to Activate a ServiceNow Store application.

2. Activate the application and run it on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Compliance Case Management

You can install the GRC: Compliance Case Management application (sn_comp_case) if you have the admin role.The application includes the demo data and related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

Role required: admin

Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

About this task

The following items are installed with Compliance Case Management:

- Plugins
- Store applications
- Roles
- Scheduled jobs
- Tables

For more information, see Tables installed with Compliance Case Management and Roles installed with Compliance Case Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Compliance Case Management application (sn_comp_case) by using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Create a case type

Create a case type in the GRC: Compliance Case Management application to categorize the compliance cases by the type of occurrence. For example, you can create a case type, such as a financial case, code of conduct, or HR case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_compliance_case_admin

About this task
You can set up a case type to categorize the compliance cases by the type of occurrence. After you define the case type, the compliance analyst and compliance manager can select the case type on the case form. A case type is mapped with a state model that specifies the workflow states and transition conditions for the compliance case. To define the workflow states and transitions, see Create a state model to define the workflow states and transitions.

Procedure
1. Navigate to **All** > **Compliance Case Management** > **Case types**.
2. Select **New**.
3. On the form, fill in the fields.

   For a description of the field values on the case type form, see Case Type form.
4. Open the form context menu and select **Save**.
   The Case subtypes related list appears.
5. On the Case subtypes related list, select **New** to define a case subtype.
6. On the form, fill in the fields.

Case Subtype form

Field	Description
Label	Label to be displayed for the case subtype.
Name	Name of the case subtype. For example, Conflict of interest.
Parent	Parent case type. This field is automatically set to the parent case type.
Active	Option to select the case subtype as active or inactive.
Description	Description of the purpose of the case subtype. This description is for the administrator to understand the case subtype.

7. Select **Submit**.
8. **Optional:** To create a view rule instead of using the default one, see Create a view rule.
9. **Optional:** To create an assignment rule instead of using the default one, see Create an assignment rule.

Case Type form

Use the Case Type form in the Compliance Case Management application to categorize the compliance cases by their type.

See the following table for a description of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case Type form

Field	Description
Label	Label to be displayed for the case type.
Name	Name of the case type. For example, Code of conduct.
Case category	Category of the case type. This field is automatically set to **Compliance case [sn_comp_case_compliance_case]**.
Active	Option to select the case type as active or inactive.
Description	Description about this case type. This description is for the administrator to understand the case subtype.
State Model	
State Model	Workflow states for the case type. For more information, see Create a state model to define the workflow states and transitions.
Assessment Configuration	
Assessment templates	Assessment template for the case type. For more information, see Create an assessment template.
Template Configuration	
Document templates	Template to generate Portable Document Format (PDF) reports for compliance cases associated with this case type.

Create a view rule

Define the view rules for the workspace and default view in the GRC: Compliance Case Management application. By defining the rules, you can control how the compliance case or request form appears.

Before you begin

Role required: sn_compliance_case_admin

Procedure

1. Navigate to **All** > **Compliance Case Management** > **Case types**.
2. Open a case type from the list.
3. On the case type form, select **View Rules**.
4. Select **New**.
5. On the form, fill in the fields.
   For a description of the field values on the View Rule form, see View Rule form.
6. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View Rule form

Use the View Rule form to define the workspace and default view rules in the GRC: Compliance Case Management application.

See the following table for a description of the field values.

View Rule form

Field	Description
Name	Name to identify the rule.
Table	Table that this view rule applies to. This field is automatically set to **Compliance case [sn_comp_case_compliance_case]**.
View	View option that you're creating a rule for: • **Default view**: Define the form view on the Classic environment. • **Workspace**: Define the form view on Workspace.
Experience Restricted	Option to enable this view rule to one or multiple workspaces.
Application	Name of the application that this view rule applies to. This field is automatically set to **GRC: Compliance Case Management**.
Execution Order	Order in which this view rule executes.
Active	Option to enable the view rule.
Conditions	
Roles	Roles that this view rule applies to.
Conditions	Condition builder to set conditions for the view rule.
Form Settings	
Hide details & UI actions	Option to hide the **Details** tab in the related list.
Hide Journal Input Fields	Option to disable the journal fields on the Workspace forms.
Hide section navigation	Option to disable the jump-to section navigation on the Workspace forms.
Disable section collapsing	Option to disable the default form section collapse.
Form Tabs	
Default Tab Order	Option to select the default tab order on the Workspace form.
Tab Order	Option to define the tab order on the Workspace form. This field appears only when you deselect the **Default Tab Order** option.
Default Tab Focus	Item that should be in focus when you open a record in the table that is specified in this rule.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an assignment rule

Create an assignment rule and apply it to a compliance case type or request type by using the Compliance Case Management application. By using an assignment rule, you can determine the appropriate person or group to handle a compliance case.

Before you begin

Role required: sn_compliance_case_admin

About this task

You can create an assignment rule to assign the case or request to a user or group by the pre-defined conditions.

Procedure

1. To define assignment rule for a case type, navigate to **All** > **Compliance Case Management** > **Case types**.
2. To define assignment rule for a request type, navigate to **All** > **Compliance Case Management** > **Request types**.
3. Open a case or request type from the list.
4. On the case type or request type form, select **Assignment Rules**.
5. Select **New**.
6. On the form, fill in the fields.
   For a description of the field values on the Assignment Rule form, see Assignment Rule form.
7. Select **Submit**.

Assignment Rule form

Use the Assignment Rule form to define the case assignment rules in the Compliance Case Management application.

See the following table for a description of the field values.

Assignment Rule form

Field	Description
Name	Name of the assignment rule.
Application	Name of the application that this assignment rule applies to. This field is automatically set to **GRC: Compliance Case Management**.
Active	Option to enable the assignment rule.
Applies to	
Table	Table that this assignment rule applies to. This field is automatically set to **Compliance case [sn_comp_case_compliance_case]**.
Conditions	Condition builder to set conditions for the assignment rule.
Assign to	
User	User that the case or request is assigned to.
Group	Group that the case or request is assigned to.
Script	
Script	Script to define the advanced assignment rule.

Create a request type

Create a request type in the GRC: Compliance Case Management application to categorize and manage the compliance requests. After you create a request type, the compliance analysts and managers can select the required request type on the request form.

Before you begin

Role required: sn_compliance_case_admin

Procedure

1. Navigate to **All** > **Compliance Case Management** > **Request types**.
2. Select **New**.
3. On the form, fill in the fields.

   For a description of the field values on the request type form, see Request type form.
4. Open the form context menu and select **Save**.
   The Subtypes related list appears.
5. On the Subtypes related list, select **New** to define a request subtype.
6. On the form, fill in the fields.

Subtype form

Field	Description
Label	Label to be displayed for the subtype.
Name	Name of the subtype. For example, Policy update.
Parent	Parent request type. This field is automatically set to the parent request type.
Active	Option to select the subtype as active or inactive.
Case category	Category of the subtype. This field is automatically set to **Compliance case [sn_comp_case_compliance_request]**.
Description	Description of the purpose of the subtype. This description is for the administrator to understand the request subtype.

7. Select **Submit**.
8. **Optional:** To create a view rule instead of using the default rule, see Create a view rule.
9. **Optional:** To create an assignment rule instead of using the default rule, see Create an assignment rule.

Request type form

Use the Request Type form in the Compliance Case Management application to categorize the compliance requests by their type.

The following table lists the descriptions of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request Type form

Field	Description
Label	Label to be displayed for the request type.
Name	Name of the request type. For example, Policy update/enquiry.
Category	Category of the request type. This field is automatically set to **Compliance case [sn_comp_case_compliance_request]**.
Active	Option to select the request type as active or inactive.
Description	Description about this request type. This description is for the administrator to understand the request type.
State Model	
State Model	Workflow states for the request type. For more information, see Create a state model to define the workflow states and transitions.
Template Configuration	
Document templates	Template to generate Portable Document Format (PDF) reports for compliance requests associated with this request type.

Create a state model to define the workflow states and transitions

Create a state model to define the workflow states and transition conditions for compliance case types and request types.

Before you begin

Role required: sn_compliance_case_admin

About this task

A state model is a list of states that describe the workflow of a record. With a state model, you can define the state transitions for a specific case or request type. The case type or request type follows the workflow states and transition conditions that are defined in the state model.

Procedure

1. Navigate to **All** > **Compliance Case Management** > **State Models**.
2. Select **New**.
3. On the form, fill in the fields.

   For a description of the field values on the GRC State Model form, see GRC State Model form.
4. Select **Submit**.

GRC State Model form

Use the GRC State Model form to define the workflow states and transition conditions in the Compliance Case Management application.

See the following table for a description of the field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC State Model form

Field	Description
Name	Name of the state model. For example, Breach case.
Application	Name of the application that this state model applies to. This field is automatically set to **GRC: Compliance Case Management**.
Active	Option to select the state model as active or inactive.
Table name	List of applications the State model has to be applied for the business configuration. This field is automatically set to **Compliance case [sn_comp_case_compliance_case]**.
State model	Field to hold the state model value in a table that this state model applies to. It is dependent on Table name and displays a list of corresponding state model values.
State field	Field to hold the state value in a table that this state model applies to. It is dependent on Table name. This field is automatically set to **State**. You can change the value to match your configuration.
Manage Attachments	Select this icon and choose the required files to attach.

Create a workflow state for a compliance case or request

Create a workflow state for a compliance case or request to define the life cycle of the case or request using the Compliance Case Management application. GRC State Model is to configure the states and the state transitions that are created as part of the table.

Before you begin

Role required: sn_compliance_case_admin

About this task

To create new states for the compliance case, the admin must create a new state in the State field of the compliance case table.

Procedure

1. Navigate to **All** > **Compliance Case Management** > **State Models**.
2. Open the state model that you want to add the workflow to.
3. Select **New** from the GRC workflow states related list.
4. Fill in the fields on the form.

   For a description of the field values on the Workflow state form, see Workflow State form.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow State form

Use the Workflow State form to define the workflow states in the GRC: Compliance Case Management application.

See the following table for a description of the field values.

Workflow State form

Field	Description
State	Select an applicable state. Name of the workflow state for compliance case: • **New** • **Triage** • **Investigate** • **Resolve** • **Post case review** • **Close** • **Canceled** Name of the workflow state for compliance request: • **New** • **Triage** • **In progress** • **Canceled** • **Awaiting approval** • **Approved** • **Rejected** • **Closed**
Application	Name of the application that this view rule applies to. This field is automatically set to **GRC: Compliance Case Management**. You cannot update it.
Model	State model that uses this workflow state. This field is automatically set to the state model name. You cannot update it.
Display type	Display type option of the workflow state: • **As node**: Option to select as a parent state. • **As sub-level**: Option to select as a sub-state of the parent state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow State form (continued)

Field	Description
Is optional	Option to select the state as optional. This field appears only when **As node** is selected from **Display type**.
Stepper label	Label to be displayed on the stepper component for the state. This field appears only when **As sub-level** is selected from **Display type**. The label is updated on the Overview page and not on the State section.
Parent model state	Parent state for the sub-level state. This field appears only when **As sub-level** is selected from **Display type**.

Define the model state transitions for a compliance case or request

Define the transition conditions to control how a compliance case traverses through the different workflow states by using the GRC: Compliance Case Management application.

Before you begin

Role required: sn_compliance_case_admin

About this task

The state transitions are a list of conditions for entering or exiting each state that is defined for a table. In the State Transitions table, use the condition builder to build a list of required conditions for entering or exiting each state.

Procedure

1. Navigate to **All** > **Compliance Case Management** > **State Models**.
2. Open the state model that you want to define the model state transition for.
3. To define the model state transition, select the required workflow state.
4. On the Model State Transitions context menu, select **New**.
5. Select the state that you want to move to from the selected state.
6. **Optional:** To enable the automatic transition of the workflow state, select the **Automatic transition** option.
7. Open the form context menu and select **Save**.
   The GRC model state transition conditions related list appears.
8. On the GRC model state transition conditions context menu, select **New**.
9. On the form, fill in the fields.

   For a description of the field values on the GRC model state transition form, see GRC Model State Transition Condition form.
10. Select **Submit**.

GRC Model State Transition Condition form

Use the GRC Model State Transition Condition form to define the transition conditions to control how a compliance case or request traverses through the different workflow states by using the GRC: Compliance Case Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

See the following table for a description of the field values.

GRC Model State Transition Condition

Field	Description
Name	Name of the condition.
State transition	Transition of states. This field is automatically set to the model state transition value.
Application	Name of the application that this condition applies to. This field is automatically set to **GRC: Compliance Case Management**.
Active	Option to enable the model state transition condition.
Description	Description of this state transition. For example, in the **Description** field for the New state, you could enter `New state can move only to Analyze state`.
Error message	Error message to be displayed when the conditions aren't met.
Requires	Transition conditions: • **Task has been through Approval**: Condition passes if the related task has an approval that is either accepted or rejected. • **Task is Approved**: Condition passes when the task is approved. • **Task is Rejected**: Condition passes when the task is rejected. • **Transition Condition**: Conditions for this state transition. • **Transition Script**: Advanced conditions for this state transition.
Condition	Conditions to be defined for this state transition. This field appears only when **Transition Condition** is selected from **Requires**.
Script	Script to be defined for this state transition. This field appears only when **Transition Script** is selected from **Requires**.

Create an assessment template

Create an assessment template to request responses from the assessor or reviewer. You can create this template by using the assessment metric type form in the GRC: Compliance Case Management application.

Before you begin

Role required: sn_compliance_case_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can create a questionnaire template instead of using the default template to assess your compliance cases. After you set up the assessment template, it's available in the case task section for that case type.

Procedure

1. Navigate to **All** > **Compliance Case Management** > **Assessment Templates**.
2. Select **New**.
3. On the form, fill in the fields.
   For a description of the field values on the Assessment Metric Type form, see Assessment Metric Type form.
4. Select **Submit**.

Assessment Metric Type form

Use the Assessment Metric Type form to create an assessment questionnaire template by using the GRC: Compliance Case Management application.

See the following table for a description of the field values.

Assessment Metric Type form

Field	Description
Name	Name of the assessment template.
Assessment duration	Length of time allowed for completing the assessment from the time that the assessment is generated.
Table	Table that contains the records. This field is automatically set to **GRC core case [sn_grc_case_mgmt_core_case]**.
State	State of the assessment. This field is automatically set to **Draft**.
Roles	Roles who can view the results and access records that are associated with this template.
Description	Purpose of the assessment template and the reason for its creation.
Introduction	Guidance text for business users who respond to the assessment.

Using Compliance Case Management

Report compliance cases and manage the lifecycle of a case by using the GRC: Compliance Case Management application.

Next Experience Discuss and Chat Collaboration

On a compliance case, select **Discuss** from other options. Collaborate with virtual agents by using **Next Experience Chat Collaboration** and Discuss.

- Using Next Experience Chat and Discuss streamline communication and enhance collaboration among distributed risk and compliance teams working on compliance cases/requests.
- Fill out preliminary information and context for the discussion. Identify subject matter experts to help and collaborate within the discussion. Managers can access multiple discussions at once using the docked windows feature.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Identify subject matter experts to help and collaborate with the discussion.
- Managers can access multiple discussions at once using the docked windows feature.

Reporting a compliance case in GRC: Compliance Case Management

You can report a compliance case or an event that needs the attention of the compliance team by using the GRC: Compliance Case Management application.

As a business user, you can report a case by using one the following options:

- Report a compliance case from the Employee Center
- Create a compliance case in the Compliance Workspace

Report a compliance case from the Employee Center

Report any violation of the organization's policies or guidelines by using the Employee Center application. By reporting a case, you reduce and avert the adverse regulatory actions that could impact the company's financials, reputation, and growth.

Before you begin

Role required: sn_grc_emp_user.grc_employee or sn_comp_case.compliance_case_business_user

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. On the Employee Center landing page, select the **Risk & Compliance** tab.
3. In the Browse Risk & Compliance section, select **Report a compliance case**.
4. On the form, fill in the fields.

   For a description of the field values on the Report a compliance case form, see Report a Compliance Case form.

5. **Optional:** On the Report a compliance case form, select **Add attachments** to attach supporting material or evidence.
6. Select **Submit**.

Report a Compliance Case form

Use the Report a Compliance Case form in the Employee Center to report a compliance case.

See the following table for a description of the field values.

Report a Compliance Case form

Field	Description
Name	Name of the case. For example, Verdict of a lawsuit leaked.
Description	Brief description of the case.
Case type	Type of the reported case. This field is automatically set to **Compliance case**.
Case sub-type	Subtype of the reported case. For example, Data theft/Loss.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report a Compliance Case form (continued)

Field	Description
Date of occurrence	Date when the case occurred. For example, the case may have occurred on 18-02-2024.
Date of discovery	Date when the case was discovered. For example, the case may have occurred on 18-02-2024, but is discovered by you on 12-03-2024.
Case origin	
Impacted business unit	Business unit that is impacted by the reported case or event.
Impacted department	Department that is affected by the case. For example, Customer support.
Location of occurrence	Location of the case occurrence. For example, the location is Japan.
Sub-location of occurrence	Sub-location of the case occurrence. For example, the sub-location is Tokyo.
Add attachments	
Add attachments	Choose a reference file or copy and paste clipboard files

Create a compliance case in the Compliance Workspace

Report any violation of the organization's policies or guidelines by using the Compliance Case Management application. By reporting a case, you reduce and avert the adverse regulatory actions that could impact the company's financials, reputation, and growth.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst and sn_compliance_ws.corporate_compliance_manager

About this task

Your users can report a case to the compliance teams through phone calls or emails. The compliance teams can then create these cases in the Compliance Workspace and attach the relevant details to the case.

Procedure

1. Navigate to **All** > **Compliance Workspace**.
2. Select the Compliance case management icon ( ).
3. From the options available in **Create**, select **Case**.
4. On the form, fill in the fields.
   For a description of the field values on the Create a Compliance Case form, see Compliance Case form.
5. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Compliance Case form

Use the Create Compliance Case form in the GRC: Compliance Case Management application to report a compliance case.

See the following table for a description of the field values.

Create Compliance Case form

Field	Description
Number	Number of the case. This field is automatically set to a case number.
Name	Name of the case. For example, Verdict of a lawsuit leaked.
Type	Type of the case. This field is automatically set to **Compliance case**.
Sub-type	Sub-type of the case. For example, Fraud and Embezzlement.
State	Workflow state of the case. This field is automatically set to **New**.
Priority	Priority of the case: • **1 - Critical** • **2- High** • **3 - Moderate** • **4 - Low** • **5 - Planning**
Requester	Person who reported the case.
Requested on behalf of	Name of the person you created the case for.
Primary entity	Entity that is affected by the case. This field is automatically set to the entity that is identified in the Impacted areas related list.
Entity owner	User who is the owner of the entity. This field is automatically set based on the entity that is selected in the Impacted areas related list.
Description	Brief description of the case.
Assignment	
Assignment group	Group that is assigned to the case. **Note:** The assignment group is preconfigured to the case type during the configuration setup.
Watch list	User who must be informed about the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Compliance Case form (continued)

Field	Description
Case analyst	Analyst who can analyze and work on the case. The case analyst is a part of the assignment group.
Accountable executive	Executive who is accountable for the case.
Primary origin	
Location	Location where the case occurred. For example, Japan.
Sub-location	Sub-location of the case occurrence. For example, the sub location is Tokyo.
Impacted business unit	Business unit that is affected by the reported cases or events. For example, Finance.
Impacted department	Department that is affected by the case. For example, Customer support.
Source	Source from which the case is reported: • **Manual**: When the case is created from the compliance workspace, the field displays the source as **Manual**. • **Employee Center**: When the case is reported from the Employee Center, the field displays the source as **Employee Center**.
Source record	Source record of the source object from where the case is created. For example, if the case is reported from risk events, then this field displays the name of the risk event from which the case is reported.
Additional source	Mode of how the case is reported when the case is created manually. This field is available only when **Manual** is selected from the **Source** field and the record is saved. The choices are as follows: • **Email**: When you create the case from the information that you received in an email. • **Phone**: When you create the case from the information that you received in a phone call.
Schedule	
Date of occurrence	Date when the case occurred. For example, the case may have occurred on 18-02-2024.
Date of discovery	Date when the case was discovered. For example, the case may have occurred on 18-02-2024, but was discovered on 12-03-2024.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Compliance Case form (continued)

Field	Description
Case creation date	Date when the case was created. This field is automatically set to the current date and time.
Case closure SLA	Expected date of the case closure. This date is automatically calculated based on the case creation date.
Investigation planned start	Planned start date to investigate the case.
Investigation planned end	Planned end date to investigate the case.
Investigation actual start	Actual start date of the case investigation.
Investigation actual end	Actual end date of the case investigation.
Remediation planned start	Planned start date to remediate the case.
Remediation planned end	Planned end date of the case remediation.
Remediation actual start	Actual start date of the case remediation.
Remediation actual end	Actual end date of the case remediation.
Breach analysis	
Breach status	Status to indicate if a breach has occurred or not: • **To be determined**: When the breach isn't determined yet. • **Breach detected**: When the breach is confirmed. • **Future potential**: When the breach hasn't occurred but may occur in the future. • **Not a breach**: When no breach is detected.
Reporting status	Status of the case being reported to the regulators. This field is automatically set based on the reporting status of the regulations that are associated with the case. If a case has many regulations and even if one regulation is identified as **reportable**, then the reporting status of the case is set to reportable. The default value of this field is **To be determined**.
Breach start	Date that the breach started. This field only appears when **Breach detected** or **Future potential** is selected from **Breach status**.
Breach end	Date that the breach ended. This field only appears when **Breach detected** or **Future potential** is selected from **Breach status**.
Breach significance identified	Date when the user identifies that the breach is significant. This field only appears when **Breach detected** or **Future potential** is selected from **Breach status**.

Create Compliance Case form (continued)

Field	Description
Root cause analysis	
Primary cause	Primary cause of the case reported. This field is automatically set to the primary cause that is selected in the Cause and consequences related list.
Consequences	Consequences from the primary cause of the case reported. For example, damage to physical assets.
Overall observations	Observations made regarding the case.
Remediation taken	Option to indicate if the remediation measures have been taken to address the case: • **Yes** • **No**
Overall preventive measures	Preventive measures taken to re-mediate the case.
Activity	
Work notes (Private)	Notes or information about the case.
Additional comments (Customer visible)	Additional information about the case that you want to share with the customers.
Save	Save the details of the compliance case.

Raising a compliance request in GRC: Compliance Case Management

You can raise a compliance request to the compliance team by using the GRC: Compliance Case Management application. For example, you can submit a compliance request to seek advice or guidance on the organization's policies and guidelines.

You can raise a compliance request by using one of the following options:

- Raise a compliance request from the Employee Center
- Create a compliance request in the Compliance Workspace

Raise a compliance request from the Employee Center

Raise a compliance request regarding organization's policies, inquiries, and guidelines by using the Employee Center application. By seeking guidance, clarification, or approval, you contribute to maintaining a culture of compliance within your organization.

Before you begin

Role required: sn_grc_emp_user.grc_employee or sn_comp_case.compliance_case_business_user

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. On the Employee Center landing page, select the **Risk & Compliance** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Browse Risk & Compliance section, select **Report a Compliance Request**.
4. On the form, fill in the fields.

   For a description of the field values on the Report a Compliance Request form, see Raise a Compliance Request form.

5. **Optional:** On the Report a compliance request form, select **Add attachments** to attach supporting material or evidence.
6. Select **Submit**.

Raise a Compliance Request form

Use the Raise a Compliance Request form in the Employee Center to raise a compliance request.

The following table lists the descriptions of the field values.

Report a Compliance Request form

Field	Description
Name	Name of the request. For example, a request for the Policy Update - Annual medical examination is mandatory for all permanent employees.
Description	Brief description of the request.
Request type	Type of the request.
Priority	Priority of the request: • **1 - Critical** • **2- High** • **3 - Moderate** • **4 - Low** • **5 - Planning**
Requested by	Name of the person who raised the request.
Requested on behalf of	Name of the person that you created the request for.
Business Unit	Business unit that is affected by the request. For example, Legal.
Location	Location where the request was raised. For example, Japan.

Create a compliance request in the Compliance Workspace

Raise a compliance request regarding organization's policies, inquiries, and guidelines by using the Compliance Case Management application. By seeking guidance, clarification, or approval, you contribute to maintaining a culture of compliance within the organization.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst and sn_compliance_ws.corporate_compliance_manager

© 2026 ServiceNow, Inc. All rights reserved.

Procedure

1. Navigate to **All** > **Compliance Workspace**.
2. Select the Compliance case management icon ( ).
3. On the Compliance Case Management landing page, select **Create**.
4. From the options available in the Create list, select **Request**.
5. On the form, fill in the fields.
   For a description of the field values on the Create a Compliance Case form, see Compliance request form.
6. Select **Save**.

Compliance request form

Use the Create new compliance request form in the GRC: Compliance Case Management application to raise a compliance request.

The following table lists the descriptions of the field values.

Create new compliance request form

Field	Description
Number	Number of the request. This field is automatically set to a request number.
Name	Name of the request. For example, a request for the Policy Update - Annual medical examination is mandatory for all permanent employees.
Description	Brief description of the request.
Type	Type to classify the nature of the compliance request.
State	Workflow state of the request. This field is automatically set to **New**.
Priority	Priority of the request: • **None** • **1 - Critical** • **2- High** • **3 - Moderate** • **4 - Low** • **5 - Planning**
Requested by	Name of the person who raised the request.
Requested on behalf of	Name of the person that you created the request for.
Assignment	
Assignment group	Group that is assigned to the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new compliance request form (continued)

Field	Description
	Note: The assignment group is preconfigured to the request type during the configuration setup.
Approvers	Person who should approve the request.
Assigned to	Person who is assigned to this request.
Watch list	User who must be informed about the request.
Primary origin	
Business unit	Business unit that is affected by the request. For example, Legal.
Location	Location where the request was raised. For example, Japan.
Schedule	
Created	Date when the request was raised. This field is automatically set to the current date and time.
Approved on	Date when the request was approved.
Activity	
Work notes (Private)	Notes or information about the request.
Additional comments (Customer visible)	Additional information about the request that you want to share with your customers.
Save	Save the details of the compliance case.

Compliance case task workflow

You can collaborate with multiple teams to investigate, perform an impact assessment, and gather the evidence to capture the details and responses for review in the GRC: Compliance Case Management application.

After a compliance case is reported, the compliance analyst can create case tasks and assign those tasks to the various case task owners. The case task owners can then work on the tasks and submit them for the case analyst to review. There are three types of case tasks:

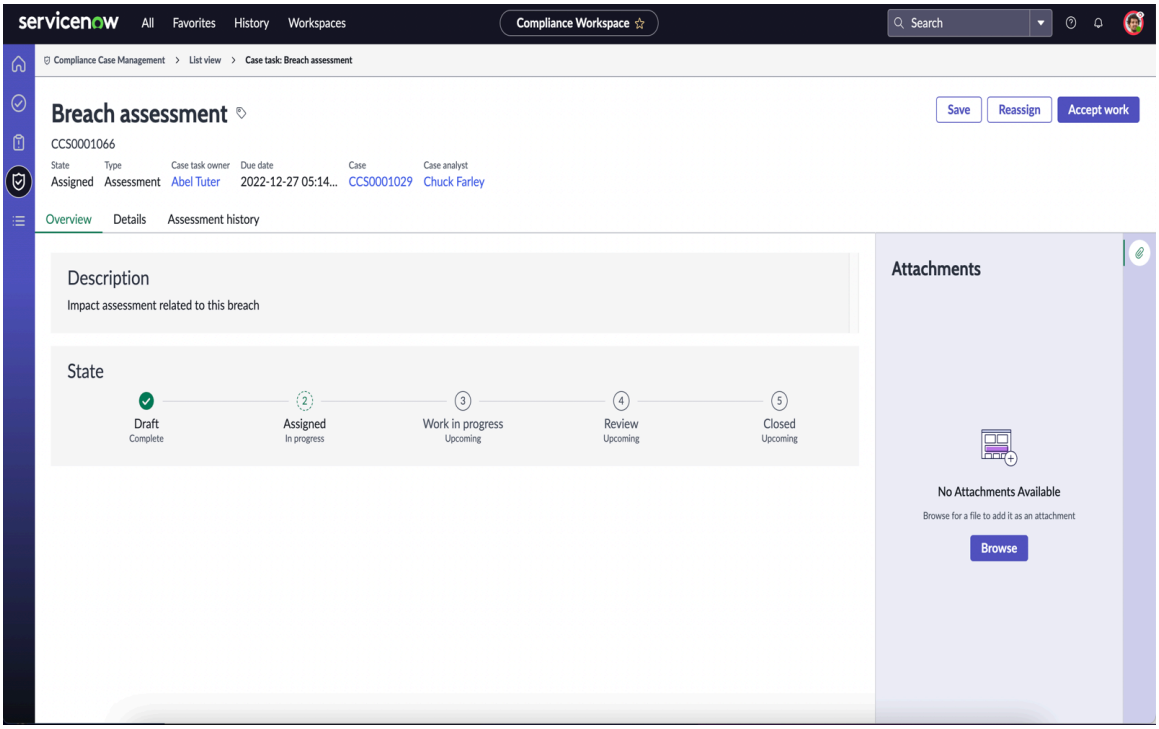
Assessment

An Assessment case task requires the case task owner to take an assessment and provide responses. A case task of this type can only be reassigned.

Investigation

An Investigation case task requires the case task owner to provide observations.

Others



An Others case task also requires the case task owner to provide observations.

After the case task owners work on a task, they submit the task for the case analyst to review.

The following example displays the life cycle of a case task.

© 2026 ServiceNow, Inc. All rights reserved.

Case task workflow

Create a case task

Create a case task to investigate, gather evidence, and perform an assessment so that you can analyze and assess a reported case in the GRC: Compliance Case Management application. Each case can have multiple case tasks that you can assign to different owners across multiple teams.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

About this task

After a case is reported to the compliance team, a compliance case analyst can create case tasks and assign the tasks to the relevant task owners. This way, the compliance case analyst can collaborate with various teams to investigate, assess, and capture observations that are related to the case.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list icon.
3. In the List section, select **All Cases**.
4. Open the case that you want to create a case task for.
5. Select the Case task related list.
6. Select **New**.
7. On the form, fill in the fields.

   For a description of the field values on the Case Task form, see Case task form.
8. Select **Save**.
9. To assign the task to the case task owner, select **Assign task**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** In the confirmation dialog box, provide your notes.
11. In the confirmation dialog box, select **Move to assigned**.
    The state of the record changes to **Assigned** and the case task is assigned to the case task owner.
12. **Optional:** To reassign the case task to another user before the case task is accepted by the case task owner that is specified by you, select **Reassign**.

    Note:
    You can only reassign the Assessment type of case tasks.

    a. In the **Assignment group** field, select the relevant group.
    b. In the **Case task owner** field, select a new owner.
    c. In the Reassign case task dialog box, select **Reassign**.

Case task form

Use the Case Task form in the GRC: Compliance Case Management application to create a case task for a reported compliance case.

See the following table for a description of the field values.

Case task form

Field	Description
Number	Number of the case task. This field is automatically set.
State	Workflow state of the case task. This field is automatically set to **Draft**.
Title	Name of the task that is being created for the case. For example, Investigation for wrongly charged late payment fees.
Type	Type of task: • **Assessment**: Collect the responses from the users about the case. **Note:** Only case tasks with the Assessment case task type can be reassigned to a different task owner if required. • **Investigation**: Create a case task to perform any investigation for the case reported. For example, you may want to determine the cause of wrongly charged late payment fees. • **Others**: Any other type of task that you configure.
Priority	Priority of the case task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Case task form (continued)

Field	Description
Assessment template	Assessment template available to assess the case recorded. This field appears only when **Assessment** is selected from **Type**. **Note:** Each case type can be mapped to specific assessment templates during the configuration. Only the templates that are mapped to the case are available for selection. For example, if the case type is **Financial fraud**, then the assessment templates that are specific to the financial fraud type are available for selection. You can't select the same assessment template if an open assessment with the selected assessment template is already being worked on.
Description	Brief description of the case task. This description is useful for the user who works on the case task.
Assignment	
Assignment group	Group that works on the case task. Any user who belongs to the selected group can work on the case task if a case task owner isn't specified.
Case task owner	Person who owns the case task. The user selected in this field must be a member from the assignment group.
Watch list	Users who must be informed about the case.
Schedule	
Due date	Date within which the case task must be completed. **Note:** The due date must be before the date specified in the **Case closure SLA** field on the case form.
Accepted date	Date when the case is accepted.
Created	Date when the case is created and assigned to the case task owner.
Task closure date	Date when the task is closed.
Summary	

© 2026 ServiceNow, Inc. All rights reserved.

Case task form (continued)

Field	Description
Observations	Observations that you make about the case while you're working on the case task.
Activity	
Additional comments	Additional information about the case task.

Work on a case task

Accept the case task, provide the details requested by the case analyst, and submit the case task for a review in the GRC: Compliance Case Management application. When a case task is assigned to an assignment group, any user from the assignment group can accept and work on the task.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

About this task

If a case task is the Assessment type, the case task owner must take an assessment to determine the losses that were incurred from a case. In this case, the task owner can accept the work and then take the assessment. If the case task is the Investigation type or Others type, the case task owner can accept the task, provide observations, and submit the case for review to the case analyst.

Procedure

1. Navigate to **Self Service** > **Employee Center**.
2. Access your task from the My Tasks module.
3. Open the task that is assigned to you from **Action Tasks**.
4. In the Open section, select **Accept work**.
5. In the confirmation dialog box, select **Accept work**.
6. Depending on your case task type, select one of the following options.

What to do next

1. Add the areas that are impacted by a compliance case. For example, the impacted areas or objects that could be impacted are the entities, controls, locations, or users that are affected by the compliance case. For more information, see Add an impacted area to a compliance case.
2. Add the areas that are related to the compliance case. For example, the related areas include the policies, citations, control objectives, or risk events. For more information, see Add a related area to a compliance case.
3. Add the causes and consequences of this compliance case. For example, you can add the root cause for the reported compliance case or event and its consequences on the organization. For more information, see Add a cause and consequence to a compliance case.
4. Add the compliance regulations that might be impacted to the compliance case. For more information, see Add compliance regulations to a compliance case.
5. Add or create an issue related to a compliance case. For more information, see Add or create an issue for a compliance case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reassign an Assessment type case task

Reassign an Assessment type case task to another user in the GRC: Compliance Case Management application. For example, a case analyst or a case task owner can reassign a compliance case task to another case task owner if a case task is wrongly assigned or isn't accepted by the case task owner.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst

About this task
As a case analyst, after a task is assigned to a case task owner, you can reassign the task to another user.

As a case task owner, you can also accept the task, start working on it, and then reassign the partially completed task to another user. When you reassign a partially completed case task to another user, the data that you provide also gets copied and is available to the new case task owner. The newly assigned task owner can modify the case task based on that owner's requirements.

Note:
You can only reassign the case tasks that have the **Type** field set to **Assessment**.

Procedure
1. Navigate to **Self Service** > **Employee Center**.
2. Access your task from the My tasks module.
3. Open the task that you want to work on.
4. In the Open section, select **Reassign**.
   The Reassign case task dialog box appears.
5. In the **Assignment group** field, select the assignment group.
6. In the **Case task owner** field, select the owner.
7. In the Reassign case task dialog box, select **Reassign**.

Review and close a case task

Review and close a case task after a case task owner provides responses and observations for the case in the GRC: Compliance Case Management application.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst

Procedure
1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. In the Tasks module, open the task to review.
3. Review the case task and then select one of the following options.

Add an impacted area to a compliance case

Add an impacted area or object that is affected by the compliance case or event in the GRC: Compliance Case Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst

About this task
You can specify the impacted areas or objects, such as the entities, controls, companies, and users that are affected by the compliance case.

Procedure
1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list icon.
3. From the list, select **All Cases**.
4. Open the case that you want to add an impacted area in.
5. Select the Impacted areas related list.
6. Select **Add**.
7. Select the impacted area type from the drop-down list.
   This value is not configurable.
   Records related to the selected record type are available for your selection.
8. Select the records from the available list.
   Modifying the **Select type** field clears the current selection.
9. Select **Add**.
10. Select **Save**.

Add a related area to a compliance case

Add an area that is related to the compliance case or event that is reported in the GRC: Compliance Case Management application.

Before you begin
Role required: sn_compliance_ws.corporate_compliance_analyst

About this task
You can specify the related areas for a compliance case or reported event. Related areas include the policies, citations, control objectives, control, and risk events.

Procedure
1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list icon.
3. From the list, select **All Cases**.
4. Open the case that you want to add a related area to.
5. Select the Related areas related list.
6. Select **Add**.
7. Select the related area type.
   Records related to the selected record type are available for your selection.
8. Select the records from the available list.
   Modifying the **Select type** field clears the current selection.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Select **Add**.
10. Select **Save**.

Add a cause and consequence to a compliance case

Define the root cause for the reported compliance case or event and its consequences on the organization by using the GRC: Compliance Case Management application.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

About this task

You can add multiple causes to a compliance case or event and define a primary cause. Any compliance case can have only one primary cause. You can also add a cause that is suspected but not confirmed. The Compliance Case Management application enables you to add the consequences based on the reported case and any action or remediation plan that is in place.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list  icon.
3. From the list, select **All Cases**.
4. Open the case that you want to add a cause and consequence to.
5. Select **New**.
6. On the form, fill in the fields.
   For a description of the field values on the Cause and Consequence form, see Cause and Consequence form.
7. Select **Save**.

Cause and Consequence form

Use the Cause and Consequence form to define the cause and consequence that a case has on your organization in the GRC: Compliance Case Management application.

See the following table for a description of the field values.

Cause and Consequence form

Field	Description
Cause	Cause for the case or event.
Cause status	Status of the cause: • **Suspected**: When the cause isn't confirmed. • **Confirmed**: When the cause is confirmed.
Primary cause	Option to select the cause as the primary cause.
Cause description	Brief description of the cause.
Consequences and actions	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cause and Consequence form (continued)

Field	Description
Consequences	Consequences of the case or event. You can select multiple consequences for a reported case.
Actions taken	Any action or measures taken to address the case.
Summary	
Observations	Record overall observations, if any.

Add compliance regulations to a compliance case

Add the regulations that are or can be impacted by the reported compliance case. In the ServiceNow platform, regulations are captured as authority documents. Adding the regulations to the case enables you to identify which regulations are breached or violated and prevents your organization from getting penalties or fines for this case.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

About this task

As a case analyst, you can choose and add the regulations that are related to the reported case. By default, all the regulations in the system are displayed. After you add the regulations, you must analyze which regulations have been violated and set their reporting status. The reporting status helps you to determine if the regulation must be reported or not.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list  icon.
3. From the list, select **All Cases**.
4. Open the case that you want to add a regulation to.
5. Select the Regulations related list and do the following actions:
   a. Select **Add**.
   b. Select the regulations to add.
   c. Select **Add**.
6. To set the reporting status of a regulation, select and open the regulation.
7. On the form, fill in the fields.

Regulation form

Field	Description
Case	Case that you're adding the regulation to. This field is automatically set to the case name.
Reporting status	Status to determine if the regulation must be reported immediately, in the future, or doesn't

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	need to be reported at all. The options are as follows: ○ **To be determined**: When you're not sure if the violation must be reported. ○ **Reportable**: When the violation must be reported. ○ **Non-reportable**: When the violation doesn't need to be reported. ○ **Potentially reportable**: When the violation can be reported in the future based on the case investigation.
Authority document	Authority document that forms the regulation.
Lodgement date	Date that the regulation is reported to the regulators.
Description	Brief description of the regulation violation based on your analysis.

8. Select **Save**.

Add or create an issue for a compliance case

Identify and add an issue that is related to the impacted areas of a reported compliance case. You can also create an issue from the GRC: Compliance Case Management landing page.

Before you begin

Role required: sn_compliance_ws.corporate_compliance_analyst

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list  icon.
3. From the list, select **All Cases**.
4. Open the case that you want to add an issue to and then select one of the following options.

5. Select **Save**.

Create an Issue form

Use the Create an Issue form in GRC: Compliance Case Management to add an issue to a compliance case, report findings or observations or compliance deficiencies, or matters that require immediate attention from the respective owners.

For a description of the field values, see the following table.

Create an Issue form

Field	Description
Issue	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an Issue form (continued)

Field	Description
Number	Number of the issue. This field is automatically filled in.
Name	Name of the issue.
Issue source	Source of the issue, such as Compliance Case analysis. This field is automatically filled in.
Issue type	Issue Type is a way of classifying the nature of issue being reported. This field is automatically filled with one of the following options based on how the issue was created: • Control design effectiveness failure • Control operative effectiveness failure • Control doesn't meet requirement • Control doesn't exist • Non-compliance to a regulation • Non-compliance to a policy • Improvement or suggestion to an existing policy • Recommendation for a new policy • Process optimization or improvement • Observation • Data breach • Fraud • Misstatement • Training • Documentation
Classification	Classification of the issue. This field is automatically filled in with one of the following options: • Audit • Compliance • Operational Resilience • Risk • Vendor
Location	Location of the issue.
State	State of the issue: • **New** • **Analyze** • **Respond** • **Review**

© 2026 ServiceNow, Inc. All rights reserved.

Create an Issue form (continued)

Field	Description
	• **Closed Complete** • **Closed Incomplete**
Substate	Substate of the issue is the sub-type of the issue. This field is automatically filled in.
Priority	Priority of the issue: • **Critical** • **High** • **Moderate** • **Low** • **Planning**
Issue rating	Rating of the issue: • **Very High** • **High** • **Moderate** • **Low** • **Very Low**
Description	Approver of the issue.
Assignment	
Assignment group	Assignment group for the issue. For example, Compliance team or Ethics/ Compliance team.
Assigned to	User that the issue is assigned to.
Issue manager group	User assigned to work on the recorded issue: • **Compliance Managers** • **IT Risk Managers** • **Risk Managers**
Issue manager	Manager that the issue is assigned to.
Watchlist	Users who are on the watchlist for the issue.
Schedule	
Due date	Date when the issue is due.
Confirmed date	Confirmation date for the issue. This field is automatically filled in based on the auto-calculation of future dates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an Issue form (continued)

Field	Description
Planned start date	Planned start date for the issue.
Planned end date	Planned end date for the issue.
Duration	Duration for the issue in days, hours, minutes, and seconds.
Created	Date on which the issue is created. This field is automatically filled in based on the current system date.
Closed	Date on which the issue is closed.
Actual start date	Actual start date for the issue.
Actual end date	Actual end date for the issue.
Actual duration	Actual duration for the issue in days, hours, minutes, and seconds.
Issue grouping	
Parent issue	Parent issue associated with this issue.
Issue group rule	Group rule for the issue. This field is auto-populated.
Action plan	
Recommendation	Recommendation for the issue.
Action plan	Action plan for the issue.
Activity	
Work notes	Work notes for the issue.
Additional comments	Additional comments for the issue.
Settings	
Functional domain	Functional domain for the issue.

Other actions

Apart from the from fields, there are a few actions that you can perform on a Compliance Case record.

- Attachment- select this icon in the side-bar to add any related attachments to the Compliance Case record.
- Compose email- compose an email.
- Discard draft- discard a draft version of the email.
- Send email- send the email with all the details in it.
- Create new email- Create a new email.
- View drafts - view the existing drafts in the system.
- Save- save the details of the compliance case.
- 360 view- view the compliance case in a 360 view with all the relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Export PDF- export the compliance case as a PDF.
- Delete- delete the compliance case.

Export a report to PDF

Create Portable Document Format (PDF) reports for compliance cases or requests using predefined or customized templates in the GRC: Compliance Case Management application. This feature enables the stakeholders who may not have access to the application can still access the data.

Before you begin

Role required: sn_comp_case.compliance_case_analyst

About this task

You can export compliance data to PDF reports for easy sharing with audit teams, partners, or internal committees, eliminating the requirement for application access. A compliance administrator can select a predefined template or create a customized document template to generate reports. For more information, see Configure a PDF document template.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list icon.
3. To generate a compliance case report, select **All cases**.
4. To generate a compliance request report, select **All requests**.
5. Open the compliance case or compliance request that you want to export as a PDF report.
6. Select the More actions icon.
7. Select **Export PDF**.
   The **Export PDF** button appears only when a document template is specified in the record type.
8. Select the template to generate a PDF report.
9. Select **Export**.
   A PDF report is generated and is available in the Attachments section of the record to download.
10. To download a local copy of the PDF report, select the More actions icon on the PDF report, and select **Download**.

Compose an email in GRC: Compliance Case Management

Compose and send an email for compliance cases and requests by using the GRC: Compliance Case Management application. This feature helps you to communicate with different stakeholders within or outside your organization.

Before you begin

Role required: sn_grc_case_mgmt.grc_case_analyst

About this task

You can compose and send emails regarding your cases and requests to multiple stakeholders. For example, you can consult the legal team for any obligatory opinions and suggestions on the recorded compliance case. You can manage the emails from the case or request record page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Policy and Compliance** > **Compliance Workspace**.
2. Select the list  icon.
3. To compose an email, use the following options.

4. Select the More actions icon.
5. Select **Compose Email**.
6. On the form, fill in the fields.

Email Draft form

Field	Description
To	Email ID of the recipient. You can add multiple email IDs separated by commas in this field to send email to more than one recipient.
Subject	Brief summary or title of your email.
Email message	Body of your message that includes any information, requests, or details you want to convey to the recipient. You can format the text, add attachments, and include links in this section. **Note:** You can send emails to both ServiceNow users and external stakeholders who don't have access to the ServiceNow instance. You must provide the basic record details in the subject line or body of the email to make them aware of the record that you're referring to.

7. **Optional:** To add attachments, select **Attach File**.
8. Select **Send Email**.

Configure due dates

Set up a pre-defined rule to automate due date calculations. Rules are designed to run and becomes effective when a new record is reported into the application.

Before you begin
Role required: admin

About this task
Apply rule-based conditions on a combination of agency, regulation or jurisdiction to manage timelines for due date auto-calculation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Compliance Case Management** > **Due Date Configurations** > **New**.
2. Enter a **Name** for the rule configuration.
3. Select a **Regulatory agency** from the lookup list.
4. Select a **Jurisdiction** from the lookup list.
5. Select a **Regulation** from the lookup list.
   Selecting all of **Regulatory agency**, **Jurisdiction**, and **Regulation** is not mandatory. You can select any one of them.
6. Define **Conditions**.
7. Select **Applies to**.
   The Applies to field refers to a record type for which the agency profile is applicable for. Currently, only Compliance case is applicable in the current release.
8. Set **Criteria** by selecting the required filter conditions and the logical operator.
9. Select **Submit**.
   The pre-defined rule to automate due date calculations is saved. This pre-defined rule gets applied to all the compliance cases created from now on.

Perform smart assessment on action tasks

Use the **Tasks** page on the Employee Center for a consolidated view of all your tasks, including all assessments, enabling you to access and complete them efficiently.

Before you begin

Ensure the following:

- the *sn_grc_case_mgmt.enable_smart_assessments* system property is enabled.
- the assessment templates are configured and published.

Role required: sn_comp_case.compliance_case_business_user

About this task

When a compliance case action task moves from **Draft** to **Assigned** state, an assessment is initiated. When you perform a smart assessment on an action task that is of type **Assessment**, and the smart assessment property is enabled, the assessments appear on the unified **Tasks** landing page. The tasks that appear on the **Tasks** page are unique to the logged-in user and therefore can help the user complete all tasks assigned to them. If you're not the rightful responder of the assessment, you can reassign the assessment to the correct responder. On the assessment landing page, you have various features such as the option to collaborate with the stakeholders using the **Discuss** feature. If you pause responding to an assessment, you can get back to it using the **Resume** action without losing your responses.

Procedure

1. Navigate to **All** > **Employee Center** > **GRC Tasks** > **My to-dos** > **Open** > **My pending tasks** > **Action tasks**.
2. Select the action task that you want to assess.
3. Select **Start**.
4. Respond to the questionnaire.
   You can view detailed guidance for each question on the side of the screen. The guidance helps you in responding to the questions.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the success dialog box, select **OK**.
7. After you submit the assessment, to view the assessment, select **View**.

Result
After the assessment is submitted, the state of the assessment gets updated to **Review** and the status of the assessment is set to **Completed**. A compliance case analyst reviews the assessment and updates the state of the assessment to **Closed Complete**.

Compliance Case Management reference

Reference topics provide additional information such as the tables and roles that are installed with the GRC: Compliance Case Management application.

Tables installed with Compliance Case Management

Tables are added with the activation of the GRC: Compliance Case Management application.

See the following table for a description of the tables that were added with the GRC: Compliance Case Management application.

Tables installed

Table	Description
GRC case [sn_grc_case_mgmt_case]	Stores all the compliance case details.
Case classification [sn_grc_case_mgmt_case_classification]	Stores the compliance case classifications.
Case task [sn_grc_case_mgmt_case_task]	Stores all the case tasks that were created for the compliance case.
Case type [sn_grc_case_mgmt_case_type]	Stores the case type and case subtype details.
Cause [sn_grc_case_mgmt_cause]	Stores the causes that were added to the library and mapped to the case.
Cause and consequence [sn_grc_case_mgmt_cause_consequence]	Stores the causes and consequences that were mapped to the case.
Consequence [sn_grc_case_mgmt_consequence]	Stores the consequences that were added to the library and mapped to the case.

Tables installed (continued)

Table	Description
GRC core case [sn_grc_case_mgmt_core_case]	Stores the core functionality details of the case.
Impacted area [sn_grc_case_mgmt_impacted_area]	Stores the impacted areas that were mapped to the case.
Case task to assessment instance [sn_grc_case_mgmt_m2m_case_task_asmt_instance]	Stores the assessment details on the case tasks of the type assessment.
Issue to case [sn_grc_case_mgmt_m2m_issue_case]	Stores the issues that were mapped to the case.
Regulation [sn_grc_case_mgmt_regulation]	Stores the regulations that were mapped to the case.
Regulated area [sn_grc_case_mgmt_related_area]	Stores the related areas that were mapped to the case.
Compliance case [sn_comp_case_compliance_case]	Stores the compliance case records.

Roles installed with Compliance Case Management

The GRC: Compliance Case Management installs the essential role to perform respective day-to-day operational tasks towards managing compliance cases for the enterprise to perform their respective tasks.

Roles and their descriptions

Role title [name]	Description	Contains roles
Compliance Case Business User [sn_comp_case.compliance_case_business_user]	The compliance case business user can perform the following tasks: • Create compliance cases and requests from the Employee Center • Work on the case tasks.	sn_grc_case_mgmt.grc_case_business_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	.	
Compliance Case Analyst [sn_comp_case.compliance_case_analyst]	Compliance case analyst can review the case. The compliance case analyst can perform the following tasks: • Review the key stakeholders, impacted areas, related areas, causes and consequences, regulations, and issues that are assigned to the case analyst. • Review any unassigned cases.	• sn_grc_case_mgmt.grc_case_analyst • sn_comp_case.compliance_case_business_user
Compliance Case Manager [sn_comp_case.compliance_case_manager]	Compliance case manager can review and work on the created cases. The compliance case manager can perform the following tasks: • Review the key stakeholders, impacted areas, related areas, causes and consequences, regulations, and issues that are assigned to the case analyst. • Review all cases.	• sn_comp_case.compliance_case_analyst • sn_grc_case_mgmt.grc_case_manager
Compliance Case Admin [sn_comp_case.compliance_case_admin]	Compliance case administrators can configure the Compliance Case Management application. They can perform the following tasks: • Create a case type. • Create a state model and transitions. • Create an assessment template. • Delete cases. • Review the key stakeholders, impacted areas, related areas, causes and consequences,	• sn_grc_case_mgmt.grc_case_admin • sn_comp_case.compliance_case_manager **Note:** If you use the Smart Assessment Engine for assessments of action tasks, then the following roles are granted to the Compliance case admin. • sn_risk_advanced.ara_assessor • sn_smart_asmt.assessment_admin • sn_grc.business_user

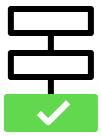
Continuous Authorization and Monitoring

Continuous Authorization and Monitoring (CAM) employs the seven steps defined by the NIST Risk Management Framework (RMF) to allow you to make better-informed decisions about your security posture.



https://player.vimeo.com/video/1001739779?h=ff3de57991&badge=0&autopause=0&app_id=58479

The video gives you an overview of the seven steps of the Risk Management Framework mandated by the US government for federal agencies that help companies to identify and eliminate risks to their infrastructure.

Get started

Explore	Configure	RMF Step 1 - Prepare
		
The CAM application applies a standardized approach to automating NIST's Risk Management Framework (RMF).	Follow the steps in the checklist to download CAM from the ServiceNow Store and get it ready for operation.	In the Prepare step, you set up authorization boundaries, control overlays, and information types, as well as create the actual authorization package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

RMF step 2 - Categorize  In the Categorize step, you define the criticality or sensitivity of your information system according to potential worst-case scenarios.	RMF step 3 - Select controls  When the impact levels for the package have been approved, it is time to select baseline controls.	RMF step 4 - Implement controls  After you have selected controls for implementation and performed any of the possible actions on them, you can implement the controls.
RMF steps 5, 6, and 7  After you have implemented controls, you can assess internal and external controls, generate Plans of Action and Milestones (POA&M), and manage change requests and vulnerable items.	Implementing controls and assessment objectives  NIST 800-53A – assessment objectives are included in the base system with the CAM application. The assessment objectives are mapped to revision 5 control objectives.	Monitoring and managing  The CAM Workspace is a centralized hub where you can continuously monitor and manage compliance with the NIST Risk Management Framework to ensure adherence to your security policies and guidelines.
Reference  Reference topics provide the detailed descriptions of tables, properties, forms, and roles that are installed with the CAM application.		

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Exploring CAM

Learn about the CAM benefits and workflows for users.

CAM overview

The CAM application applies a standardized approach to automating NIST's Risk Management Framework (RMF).

CAM users

CAM roles that are required for particular tasks are listed in CAM user roles.

Roles and Responsibilities tab

Role	Responsibilities
System owner	The individual responsible for procuring, developing, integrating, modifying, operating, and maintaining an information system.
Authorizing Official (AO)	The individual responsible for accepting an information system into an operational environment at a known risk level. Typically, this person is at the CISO or deputy CISO level.
Authorizing Official Designated Representatives (AODR)	One or more AODRs.
Security Control Assessors (SCA)	The individuals responsible for conducting a thorough assessment of the controls of an information system.
Information System Security Managers (ISSM)	The individuals responsible for conducting information system security management activities as designated by the ISSO.
Information System Security Officers (ISSO)	The individuals responsible for ensuring that the appropriate operational security posture is maintained for an information system.
Information owners	The individuals responsible for statutory, management, and operational authority.
System users	The users responsible for performing the actual work on the system.

RMF workflow supported by CAM

RMF was mandated by the U.S. Federal government to provide the necessary resiliency to support the economic and national security interests of the United States. CAM employs the seven steps defined by the RMF to allow you to make better-informed decisions about your security posture.

RMF consists of the seven steps illustrated here.

RMF security life cycle

What to explore next

To learn more about configuring and using CAM, see:

- Configuring CAM
- RMF step 0 - Prepare the authorization package
- RMF step 1 - Categorize the authorization package

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- RMF step 2 - Select controls for an authorization package
- RMF step 3 - Implement controls
- RMF steps 4, 5, and 6 - Assess, authorize, and monitor
- Implementing controls and assessment objectives in CAM
- Continuous authorization and monitoring tasks in the CAM Workspace
- CAM reference

Configuring CAM

Follow the steps in the checklist to download CAM from the ServiceNow Store and get it ready for operation.

Configuration overview

1. Setup checklist for Continuous Authorization and Monitoring

   The checklist includes the tasks that you must complete to prepare the base system.

2. Download Continuous Authorization and Monitoring

   You download CAM from the ServiceNow Store.

3. Assign Continuous Authorization and Monitoring roles to users and groups

   Assign roles to users and groups to prepare to use the CAM application.

Setup checklist for Continuous Authorization and Monitoring

The checklist includes the tasks that you must complete to prepare the base system.

Before you begin

Role required: admin, sn_irm_cont_auth.admin

Procedure

Create and print a PDF of the checklist topic and check off tasks as you complete them.

To generate a PDF, select the **Save As PDF** icon ( ) at the top of this topic and select **Selected topic**.

Set up checklist for CAM

Item	Description
☐	As a user with the System Administrator role, verify that you have the GRC core applications installed on a ServiceNow AI Platform instance. **Note:** The GRC applications and the ServiceNow AI Platform instance must be from the same family release. **a.** To verify that the GRC: GRC Profile application is installed on your instance, navigate to **Plugins** and search for GRC `Profile`. **b.** If the GRC Profile core application is not installed, select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Description
	c. Also install the following applications as needed: ○ GRC: Policy and Compliance Management ○ GRC: Risk Management ○ GRC: Audit Management **d.** After the applications have been installed, install the Continuous Authorization and Monitoring core application. If any application is not visible in your instance, you can download it from the ServiceNow Store. For more information about getting entitlement, downloading, and installing the GRC core applications, see GRC and the ServiceNow Store.
☐	As a user with the CAM Administrator role, assigned users with the required roles as described in Assign Continuous Authorization and Monitoring roles to users and groups.

Result
Congratulations! You have successfully set up the CAM base system. Many of the elements included in the base system can be customized for your particular business needs. Refer to the links in the checklist for more information.

Download Continuous Authorization and Monitoring

You download CAM from the ServiceNow Store.

Before you begin
Role required: admin

Procedure

Follow the instructions in Download a GRC application from the ServiceNow Store for the first time.

Related topics

List of plugins

Assign Continuous Authorization and Monitoring roles to users and groups

Assign roles to users and groups to prepare to use the CAM application.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Select the name of a user.
3. Select the **Roles** tab and then select **Edit**.
4. Move the roles that you want to assign to the user from the Collection side to the Roles List, then select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles are describe in CAM user roles.

5. Repeat the process for each user or group.

Note:
If the Employee Operator plugin is installed, then each of these roles (such as Authorization Official, Executive Reader, and Reader) is classified as a lite role.

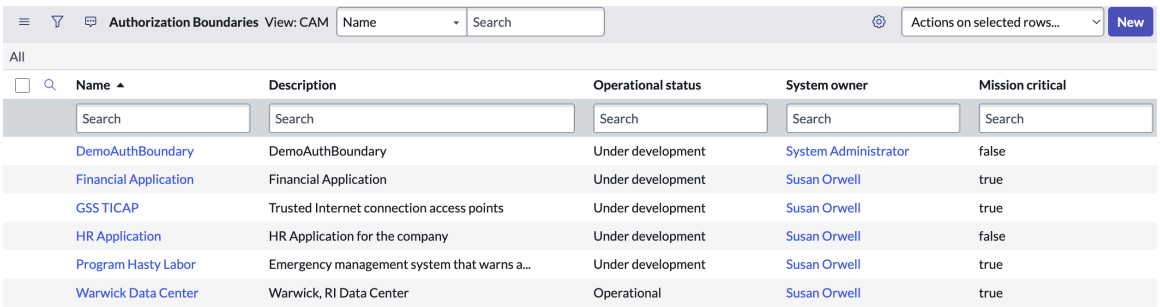
RMF step 0 - Prepare the authorization package

In the Prepare step, you set up authorization boundaries, control overlays, and information types, as well as create the actual authorization package.

Your actions in the Prepare step

- Define the authorization boundary
- Create an authorization package

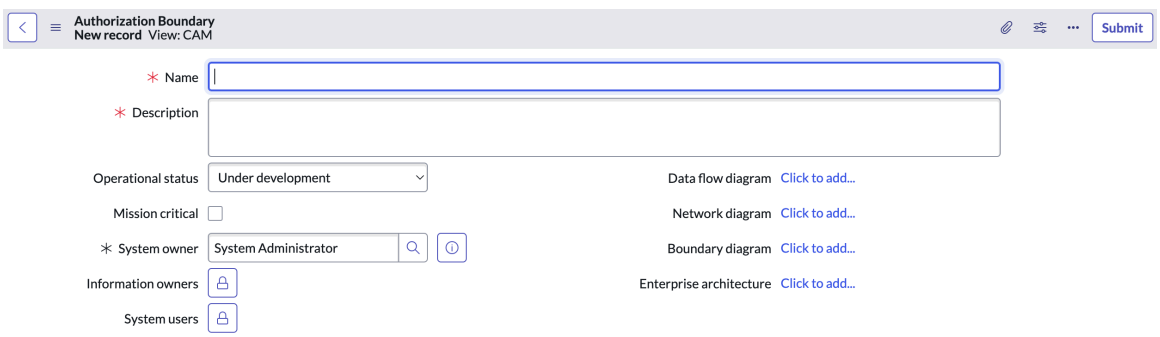
Define the authorization boundary



An authorization boundary defines the scope of a particular system that can be continuously managed and monitored using the CAM application.

Before you begin

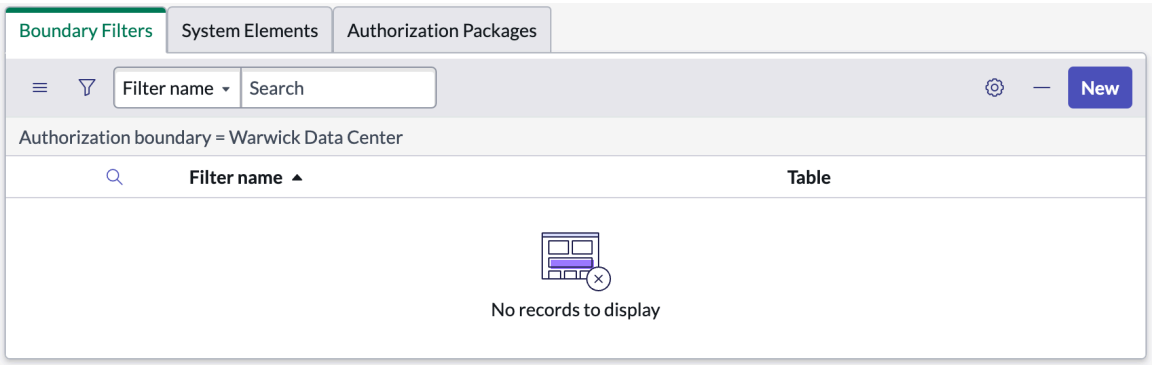
Role required: sn_irm_cont_auth.system_owner or sn_irm_cont_auth.admin



Procedure

1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Authorization Boundaries**.

2. Select **New** and then fill in the form.



The settings are described in Fields on the Authorization Boundary form.

3. Save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the tabs that appear to identify which systems and parts of systems you own and should go through the authorization process.

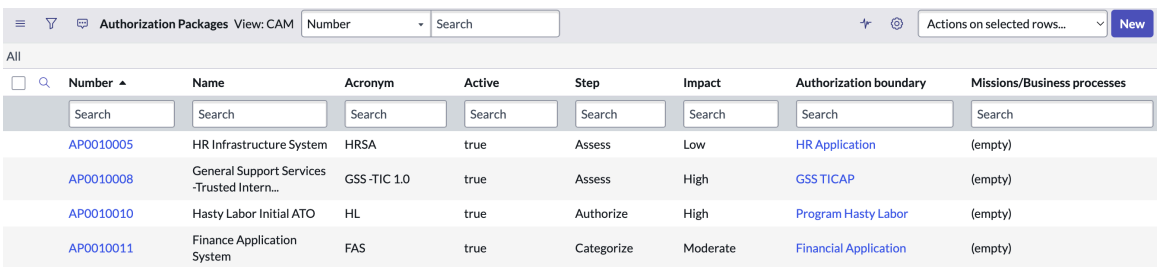
4. You can use the **Boundary Filters** tab to create filters for identifying all of your system elements.
   After running the filters, the results appear in the **System Elements** tab.
5. If elements appear that should not be included in the authorization process, you can select them, and select **Delete** from the **Actions on selected rows** list at the bottom of the screen.
6. You can select **Add** to include additional assets or systems to the list of system elements in the authorization boundary.

What to do next

This completes the procedure for defining the authorization boundary. The next step is to create the authorization package that will be processed through approvals. You can initiate the process by clicking the **Authorization Packages** tab or via the navigation pane. For details, see Create an authorization package.

Create an authorization package

After you have defined the authorization boundaries for the assets or systems to send through the Authorization to Operate process, you must create an authorization package for that purpose. The package is processed through the seven steps mandated by the RMF.

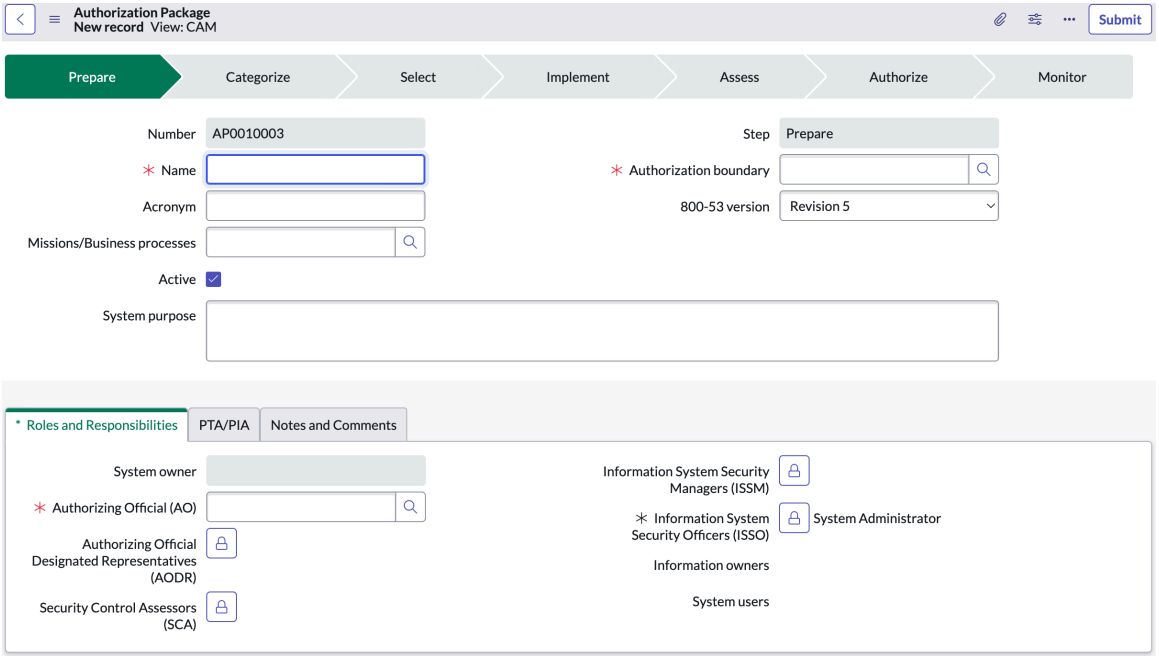


Before you begin

Role required: sn_irm_cont_auth.system_owner or sn_irm_cont_auth.admin

Note:
The roles are required for accessing the authorization package only after it has transitioned beyond the Prepare state.

Procedure

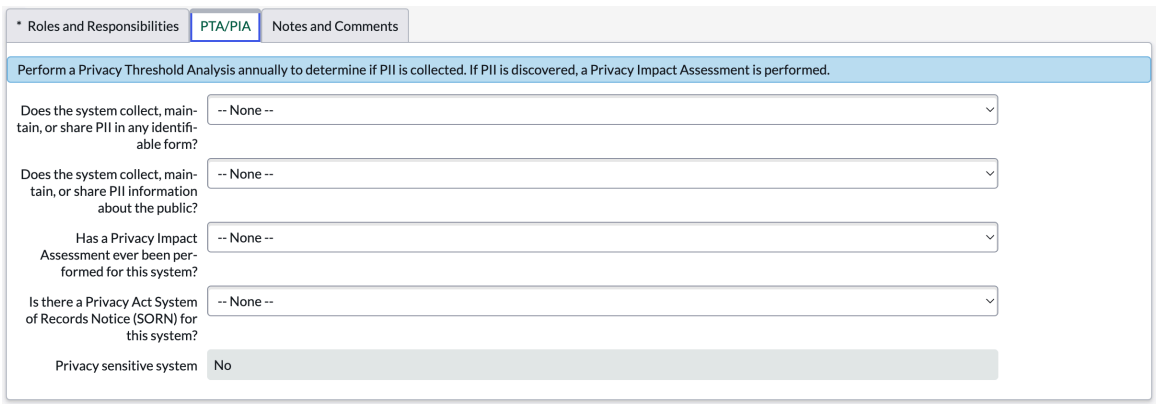


1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Authorization Packages**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **New** and then fill in the form.

   The settings are described in Fields on the Authorization Package form.



3. Select the **Roles and Responsibilities** tab and specify the responsibilities of various stakeholders during the review and approval process.

   The settings are described in Fields on the Roles and Responsibilities tab.

4. Select the **PTA/PIA** tab and perform the Privacy Threshold Analysis by answering the questions.

   The PTA identifies whether various types of the Personal Identifiable Information (PII) exist in the systems being authorized.

5. If you answered **No** to all of the questions, you are not required to take a Privacy Impact Analysis and can select **Submit**.
6. If you answered **Yes** to any of the questions, you must take a Privacy Impact Analysis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Assessment respondents field, select the lock icon and select the users you want to take the assessment.

b. When you have selected the respondents, select the lock icon again.

c. Select **Submit**.
The assessment request notification is sent to the selected respondents.

d. When the PIA has been completed, the assessment responses appear in a related list in the Authorization Package form.

7. Select the **Notes and Comments** tab to add any customer-facing notes to the package.
8. Select **Categorize** to transition the package to the next step

RMF step 1 - Categorize the authorization package

In the Categorize step, you define the criticality or sensitivity of your information system according to potential worst-case scenarios. This involves selecting NIST information types for the package and using the information types to define the impact levels for the package.

Before you begin

Role required to use **Categorize**:

- sn_irm_cont_auth.system_owner
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.info_system_sec_officer

Role required to write to an authorization package:

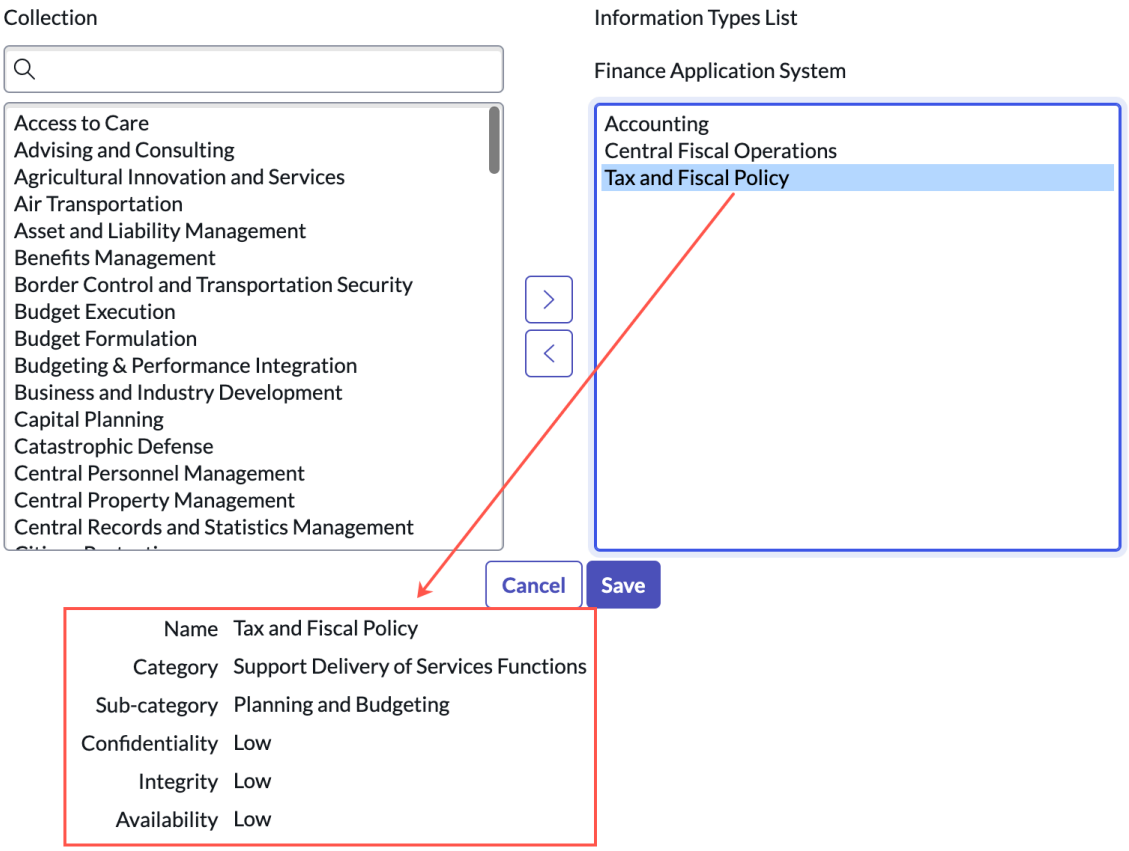
- sn_irm_cont_auth.admin
- sn_irm_cont_auth.system_owner
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.info_system_sec_officer

Role required to select information types:

- sn_irm_cont_auth.admin
- sn_irm_cont_auth.system_owner

Role required to write to overridden fields on the Package form: sn_irm_cont_auth.system_owner

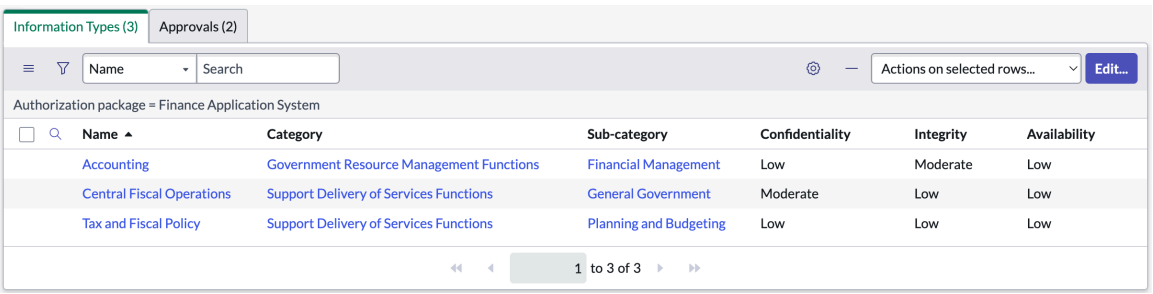
About this task



When you clicked **Categorize** on the Authorization Package form, an **Impact** field, an **Impact** tab, and an **Information Types** related list appeared on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

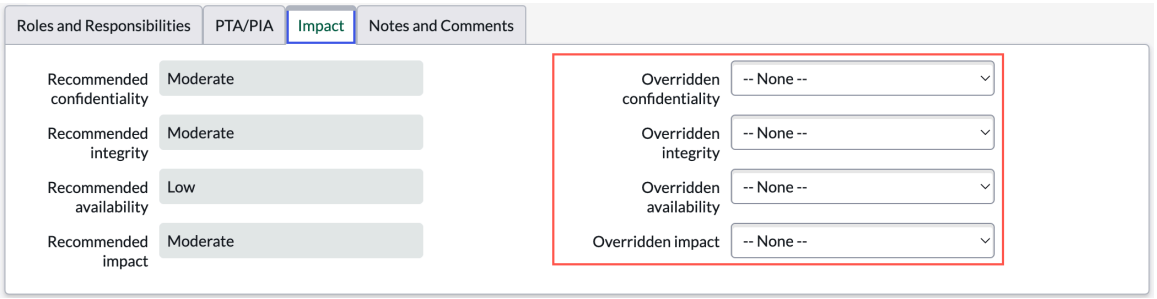


1. In the Information Types related list, select **Edit**.

> **Note:**
> As you select the information types, guidance about the selected information type appears, including name, categories, and the Confidentiality, Integrity, and Availability (CIA) ratings for the information type.

2. Multi-select the information types you want to select for this authorization package and move them to the Information Type List box.
3. When you have completed your selections, select **Save**.

   The Information Types related list now contains the guidance information for the information types you selected.



4. Select the **Impact** tab and review the recommended impacts for the information types you selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The impacts displayed in the **Recommended** fields reflect the worst-case scenario of the information types you selected. For example, if you selected an information type with High CIA levels, the **Recommended** fields under the **Impact** tab would all show **High** levels of risk. The CIA levels are used to calculate the overall impact of the information types you selected, which is now displayed in the **Impact** field.

5. You can override any of the impact levels by modifying the **Overridden** fields and providing a justification.

   As you provide overrides, the **Impact** field is updated accordingly based on the update CIA levels.

Important:
It is vital that the **Impact** field accurately reflects the impact of the data you are authorizing. All processes downstream from this point relies on that impact level. According to NIST guidelines, the number of controls you must implement depends on the Impact, as follows:

- High risk = 343 controls
- Moderate risk = 262 controls
- Low risk = 125 controls

6. After you have defined the impact, select **Request Approval**.
   An approval request is sent to the Authorizing Official, who will access My Approvals from the navigation pane and review the information in the package. When approval is received, the package transitions to the **Select** state.

RMF step 2 - Select controls for an authorization package

When the impact levels for the package have been approved, it is time to select baseline controls.

Before you begin

Role required: To write to the sn_im_cont_baseline_control_objective table: sn_irm_cont_auth.system_owner, sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.admin

To access **Mark as not Applicable**: sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.info_system_sec_manager, sn_irm_cont_auth.admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Continuous Authorization and Monitoring

GRC: Continuous Authorization and Monitoring quick start tests require activating the Continuous Authorization and Monitoring plugin (com.sn_compliance) and loading the demo data.

GRC: Continuous Authorization and Monitoring Quick Start Tests test suite

Test	Description	Release version
GRC: System Owner create and validate responsibilities and roles for an AB and AP	System Owner creates and validates responsibilities and roles for an Authorization Boundary and Authorization Package. Information Owners and System User are pre-populated when selecting the Authorization Boundary.	Quebec (compatible with Paris and Orlando)
GRC: System Owner validate App Modules visibility	Verifies that the system owner persona is able to view the Continuous Authorization & Monitoring application menu and the following modules under that menu: • All Authorization Boundaries • All Authorization Packages • Information Type Library • Control Overlays • Control Objectives • Controls • All Engagements	Quebec (compatible with Paris and Orlando)
GRC: System Owner Request First approval & My approvals module	System Owner requests an approval.	Quebec (compatible with Paris and Orlando)
SO: Create and validate responsibilities and roles for an AB and AP	Verifies if a system owner can create an Authorization Boundary by completing the fields on the Authorization Boundary form. Also verify if the same SO can create an Authorization Package from the form view.	Quebec (compatible with Paris and Orlando)

To learn more about Continuous Authorization and Monitoring, see Continuous Authorization and Monitoring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When approval was received on the Authorization Package form, a **Control overlays** field and a series of **Controls** related lists appeared on the form.

Procedure

1. Select the **Baseline Controls** related list.
   The list shows the baseline controls for the calculated impact level of the package. The number of controls to be implemented (as defined by NIST) depends on the Impact level (High, Moderate, and Low).
2. You can perform the following actions on the list of controls.

Actions on baseline controls

Action	Description
Add controls to the list	Select **Add**, select the controls you want to add, and then select **Create Baseline Controls**. **Note:** When adding control objectives, you cannot select multiple control objectives with the same reference ID to add to the baseline controls. You cannot add a control objective if its reference ID already exists in the baseline controls list.
Add controls using a control overlay	Select a control overlay from the **Control overlays** field. **Note:** Privacy overlays and other types of control overlays might be mandated by government agencies, but you can create them to add a specified number of controls to your list.
Identify certain controls as being non-applicable	Select the controls, select **Select**, enter a justification, and then select **Confirm**. The controls you marked this way are removed from the **Baseline Controls** list to the **Not Applicable Controls** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
	Note: ○ You cannot move control objectives with the same reference ID from the baseline controls list to the not applicable controls. ○ You cannot move control objectives with the same reference ID from baseline controls to not applicable controls, or from not applicable controls to baseline controls. ○ When you select two control objectives with the same reference ID from the Not Applicable Controls list, the Return to Baseline Control action is disabled.
Inherit controls from common controls	You can create common controls to which other, subordinate controls can be assigned so they can inherit risk guidance from them. For example, if you have a control that handles an entire facility, you can identify related controls that will inherit protection and compliance from the common control. To create a common control, select the control, select **Create Common Control**, select **OK** to confirm. For information on allowing a control to inherit from a common control, see Inherit from a common control.

3. Select **Request Approval**.

   An approval request is sent to the authorizing official, who will access My Approvals from the navigation pane and review the information in the package. When approval is received, the package transitions to the **Implement** state.

   To send the package back to the Categorize state, select **Back to previous step**. All baseline controls are removed and the package must receive approval to advance again to the Select state.

Set up baseline controls to generate controls and implement requirements

Use the baseline controls to inherit a control, mark a control as common, or create a hybrid control. Create a hybrid control to inherit requirements partially from common controls and the remaining requirements are created for the control that was generated from the baseline control.

Before you begin

Role required: sn_irm_cont_auth.system_owner, sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.info_system_sec_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Hybrid controls not only give you the ability to inherit partial requirements from common controls but also gives you the flexibility to make the best use of the common control requirements while self-implementing the remaining requirements for that control.

In CAM there are two ways to inherit controls from the control objectives sourced from NIST 800-53-r5:

Inherit from provider

The control is inherited directly and completely. For example, if the common provider, Building A, provides a control objective that is fire prevention, and this control objective has about three different requirements, namely fire alarm, smoke detection, and sprinkling, then the control is directly inherited by identifying it as common control.

Note:
A control associated with one authorization package can be a common provider to another authorization package if the control is marked as a Common control provider in its Authorization package, and that particular package must be in Monitor state. Only then it's called as a common control.

Hybrid inheritance

The control is partially inherited. Only one or a few of the control's requirements are inherited in this case. Considering the preceding example, hybrid inheritance is enabled in the following combinations:

- One of the requirement such as fire alarm can be inherited from Building A, and the other two requirements can be self-implemented.
- One of the requirements such as fire alarm can be inherited from Building A, and another requirement such as smoke detection can be inherited from Building B. The rest of which can be self-implemented.
- All requirements are inherited. This inheritance is not a partial inheritance because at least one of the requirements must be inherited and one must be self-implemented. Therefore this inheritance can't be termed as hybrid inheritance.

Note:
The role and responsibility of the authorization package must be assigned to an Authorization official (AO) who must review and approve the authorization package when it moves from one state to another. The Information System Security Officer (ISSO) is required to mark a common control, create a hybrid control, or to identify a control as not applicable as these control objectives are sourced by NIST. After the Authorization official (AO) provides the approval, the authorization package moves to the Implement state.

Procedure

1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Authorization Packages**.
2. Select an authorization package record that is in a **Select** state and has the Baseline controls added.
   In the **Select** state, all the baseline controls are added and you can identify the role of each baseline control. You can inherit a control, mark a control as common, or create a hybrid control.
3. To assign baseline controls from a common control provider as common controls, select the control objectives in the Baseline Controls tab that you want to assign as common controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Mark as Common** and then select **OK** in the Confirmation popup.

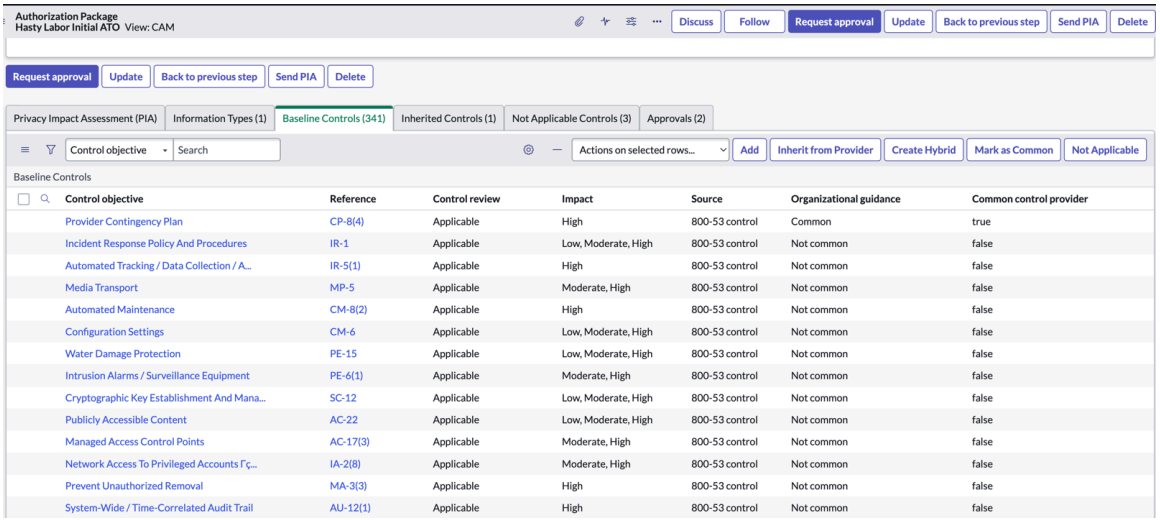
b. Select **Request approval** to request approval.
After approval, the authorization package moves to Implement state. Before moving to the Implement state, the **Creates controls automatically** option in the control objective form must be true for all the baseline controls and hybrid controls. Otherwise, an error message pops up with the list of control objectives prompting you to make the **Creates controls automatically** option as true.

c. Select the control objectives link in the message and enable the **Creates controls automatically** option for all the control objectives in the respective control objective form.

After the authorization package is approved, the controls are created in the Controls tab. You can then move the authorization package to the Assess state. In this state, the Security Control Assessor (SCA) is required as an engagement lead, where the engagement is created to test the controls. After this state, the authorization package is moved to the Authorize state.

For an authorization package to be available as a common control provider for other authorization packages, it must be in the Monitor state. After the authorization package is moved to the Monitor state and the Common control provider flag is set as true for a few of the baseline controls, the controls that were generated for those baseline controls become common control providers for other authorization packages.

4. To inherit the requirements from a common control of a particular common control provider or create a hybrid control, select only one control objective in the Baseline Controls tab.



a. Select **Create Hybrid**.
The Create hybrid control popup lists the entities in groups. Grouping by entity helps when there are more requirement numbers added to the reference number of a control objective. You can inherit requirements partially from some of the common control providers, and self implement the rest of the requirements. If you select all control requirements from all the categories of providers for inheritance without a single self implemented requirement, then the requirements are not partially inherited but becomes full inheritance of all requirements, which is not allowed. At least one self-implemented requirement is required to create a hybrid control.

b. Select the requirements from the entity groupings, leaving one or more requirements for self implementation for that control.

c. Select **Add**.
The Hybrid Controls related list appears with the selected baseline controls. A baseline control is an m2m of a control objective and an authorization package.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI actions on baseline controls

d. Select the Display/hide hierarchical lists ( ) icon to see the inherited requirements.
All the other requirements that are not listed here are self implemented.

> **Note:**
> Only common control providers with control requirements can be used to create hybrid controls.

5. To inherit controls from a common provider, select a control objective from the Baseline Controls related list.

a. Select **Inherit from Provider** and then select the Common control list in the Inherit from Common Control popup.

b. Select the controls that you want to inherit from and then select **Confirm**.
The entities of the controls that you select become the common provider. For each of these authorization packages, there is an Inherited Controls related list. The **Inherited from** field in this related list gives you the information as to which control is the common control provider.

> **Note:**
> To inherit from a provider, which is a direct inheritance, there might not be any requirement for the control.

6. To mark a particular baseline control as not applicable so that it is out of the work flow and not allow controls to be generated, select a baseline control

a. Select **Not Applicable**.

b. Enter a note to justify your action in the **Justification** field and then select **Confirm**.
This action changes the status of the selected baseline control to **Not implemented**.

In the **Select** state, you did the setup for the type of controls to be generated. After the setup is complete, you can approve the authorization package.

7. Select **Request approval**.
The authorization package then moves to the **Implement** state. In this state, based on the setup, controls are created.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

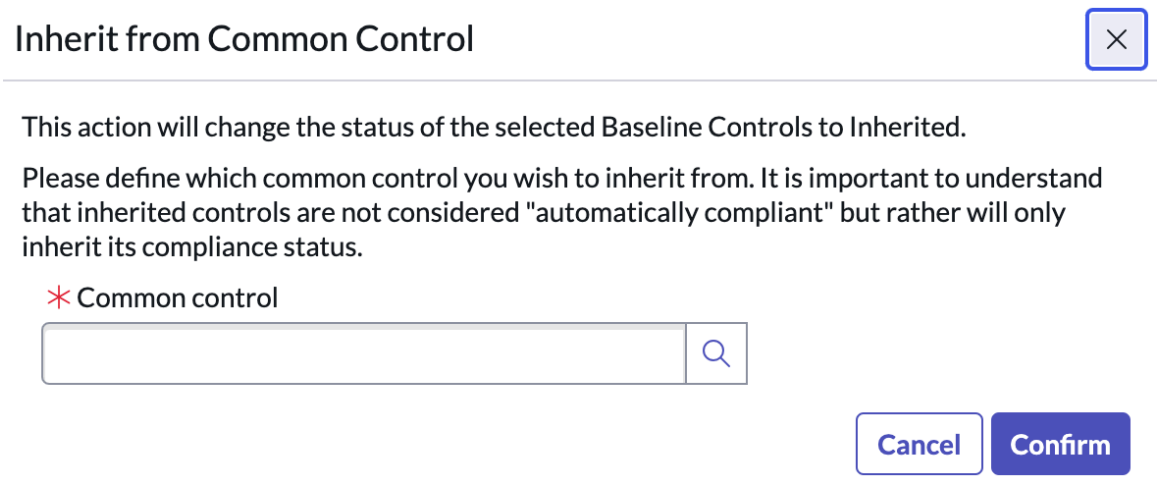
Inherit from a common control

After you have created a common control, you can identify other controls that can inherit protection and compliance from that common control.

Before you begin

Role required: sn_irm_cont_auth.system owner, sn_irm_cont_auth.info_system_sec_officer, or sn_irm_cont_auth.admin

About this task

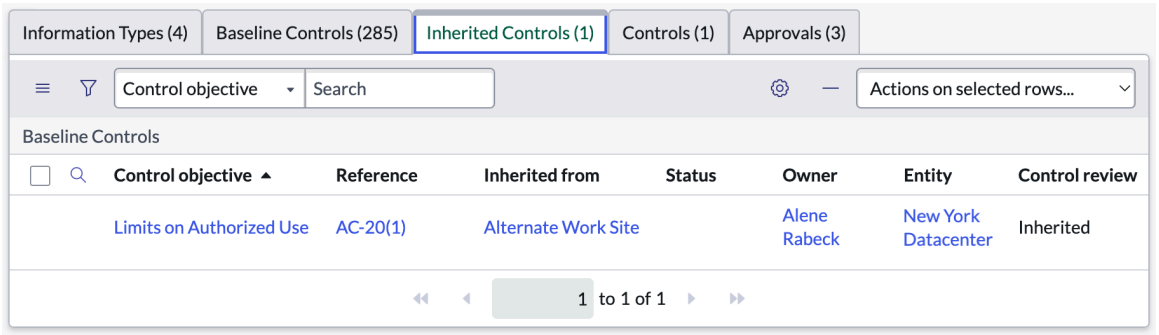


Consider this scenario. You and I are system owners. You own hundreds of servers and I own the facility in which they are installed. Based on the impact level of your authorization package, NIST recommends that you implement a given number of controls to protect your servers. However, you do not possess the means to implement two of them:

- Fire protection
- Visitor access control

You are aware that the facility has a fire suppression system, fire alarms, and smoke detectors. You also know that the facility has doors protected by a badge system. So you decide to inherit the protection in those controls from me, as well as the compliance. As long as I am compliant in terms of those controls, you are also compliant.

Procedure



1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Authorization Packages**.
2. Open an authorization package in the Select state.
3. Select a control that you want to inherit from a common control.
4. Select **Inherit from Common Control**.

5. Select the common control you want to inherit protections from and select **Confirm**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

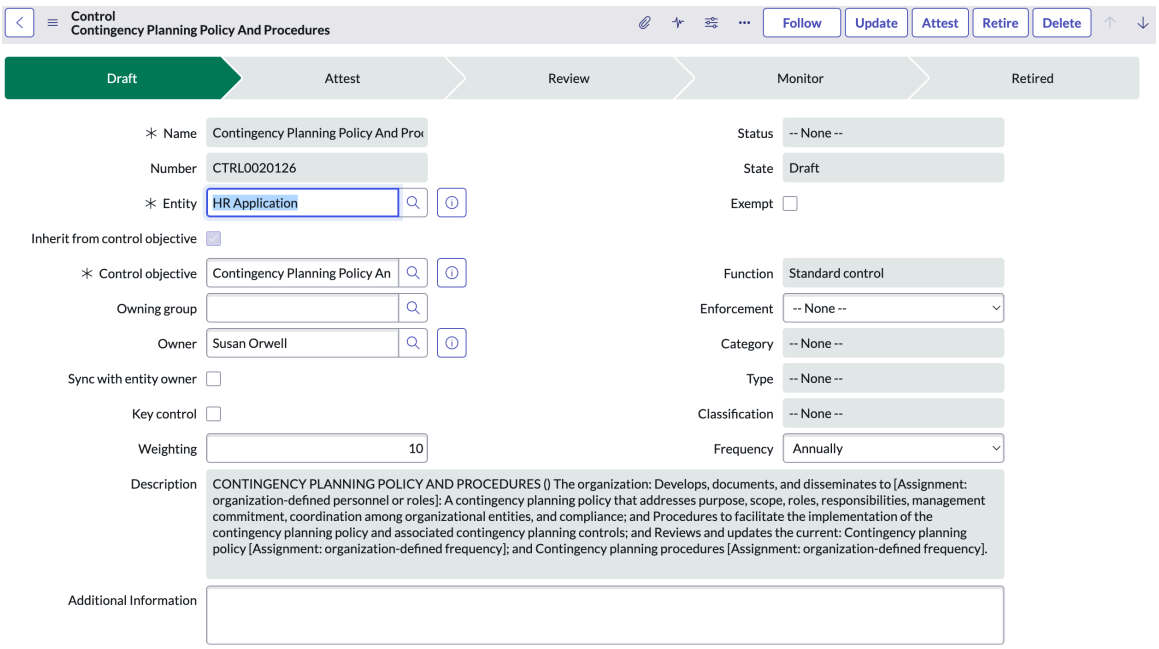
The Inherited Controls related list now shows the control objective and the common control from which it is inheriting protection and compliance.

RMF step 3 - Implement controls

After you have selected controls for implementation and performed any of the possible actions on them, you can implement the controls.

Before you begin

Role required: sn_irm_cont_auth.information_type, sn_irm_cont_auth.information_owner, or sn_irm_cont_auth.admin



About this task

When approval was received on the Authorization Package form, a **Percentage of controls implemented** field and a **Controls** related list appeared on the form.

The **Controls** related list contains all of the controls created from the control objectives within the selected authorization boundary.

Procedure

1. From the list of controls, select the control number (with a CTRL prefix) to open the control.

2. The implementation process performed by your system owner and other technical or security personnel employs the control management workflow inherent in the base GRC system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details, see the following:

- Manage controls
- Manage control attestations
- Manage control indicators

3. The **Percentage of controls implemented** field keeps track of your progress while you implement the controls.
4. After you have completed the implementation process for all controls, select **Assess** to transition the package to the **Assess** state.

   To send the package back to the **Select** state, select **Back to previous step**. All active controls will be retired and the package must get approval to advance again to the **Implement** state.

RMF steps 4, 5, and 6 - Assess, authorize, and monitor

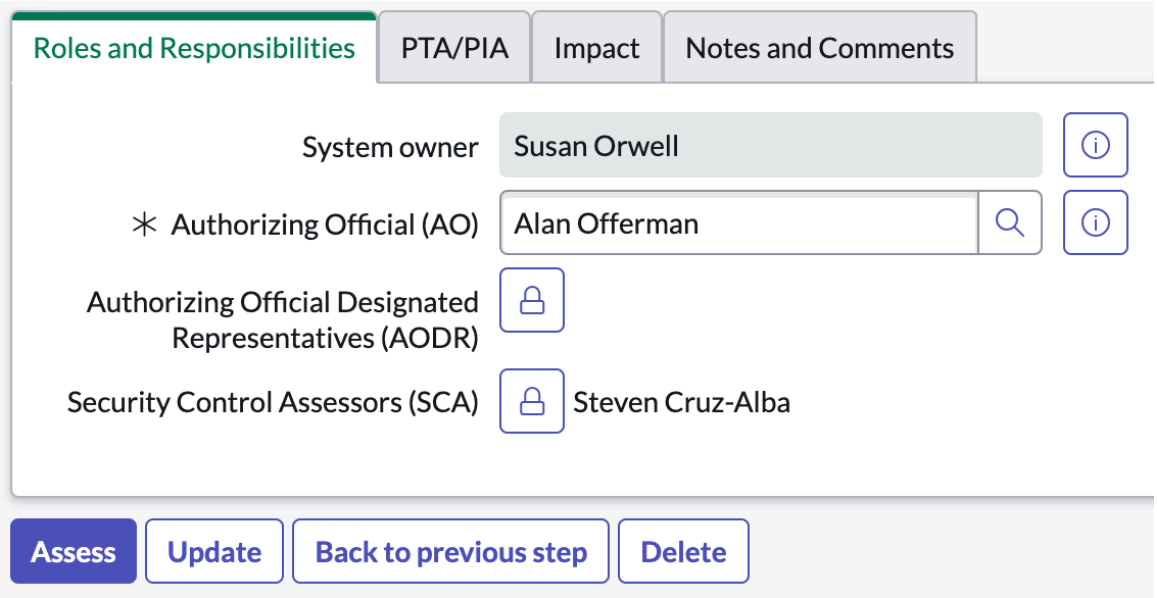
After you have implemented controls, you can assess internal and external controls, generate Plans of Action and Milestones (POA&M), and manage change requests and vulnerable items.

Before you begin

Role required:

- sn_irm_cont_auth.system_owner
- sn_irm_cont_auth.info_system_sec_officer
- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.admin

About this task

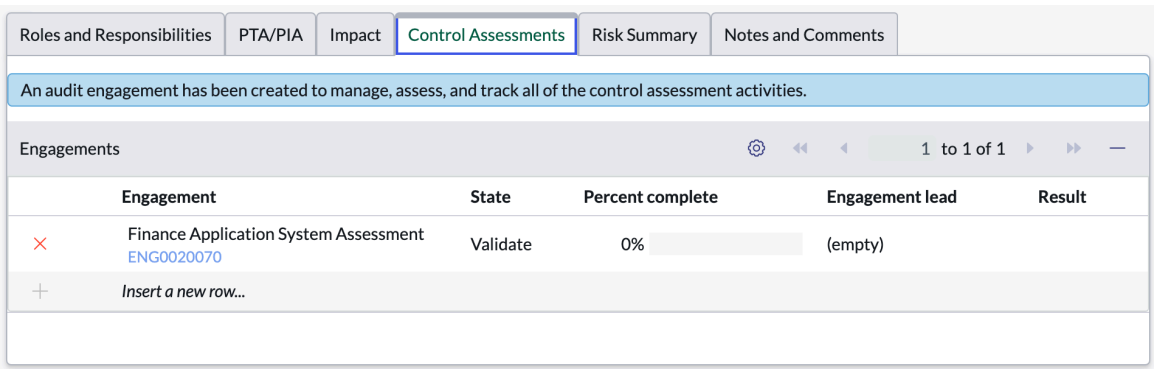


The Assess process is generally performed by a user other than the system owner or the personnel who implemented the controls.
The Assess state adds **Control Assessments** and **Risk Summary** related lists, as well as **POA&M**, **Change Requests**, **Security Incidents**, and **Vulnerable Items** tabs to the Authorization Package form.

Note:
CAM performance may slow when a high volume of Change Request, Incident records, or both is related to a single authorization package. If you experience long transaction response times, consider performing the procedures detailed in KB0861865.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

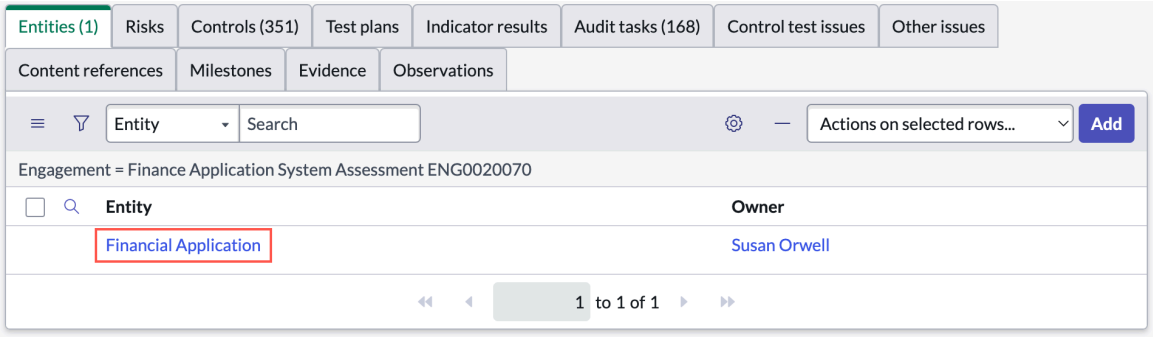


1. For an authorization package in the Implement state, select **Assess**.

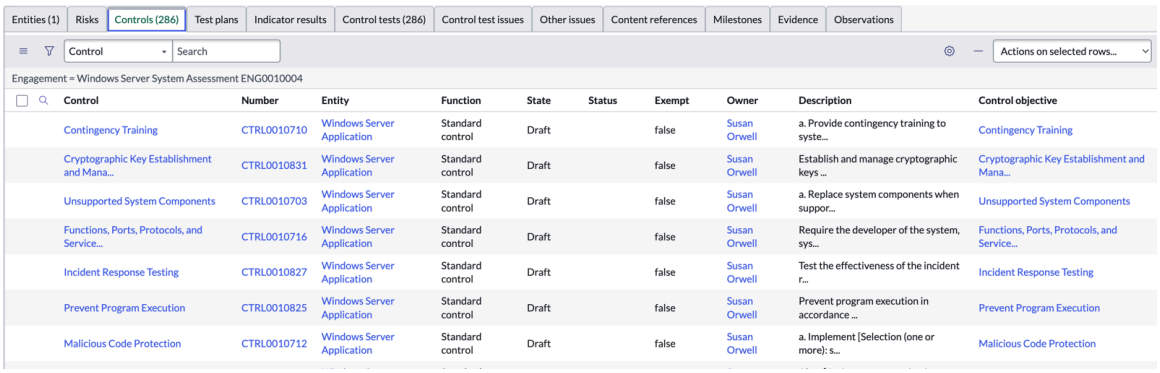
Note:
An Audit Engagement is automatically created.

To send the package back to the Implement state, select **Back to previous step**. The state of the engagement becomes Closed Incomplete. On selecting **Assess**, an engagement is created.

2. Select the **Control Assessments** related list to view the Audit engagement.



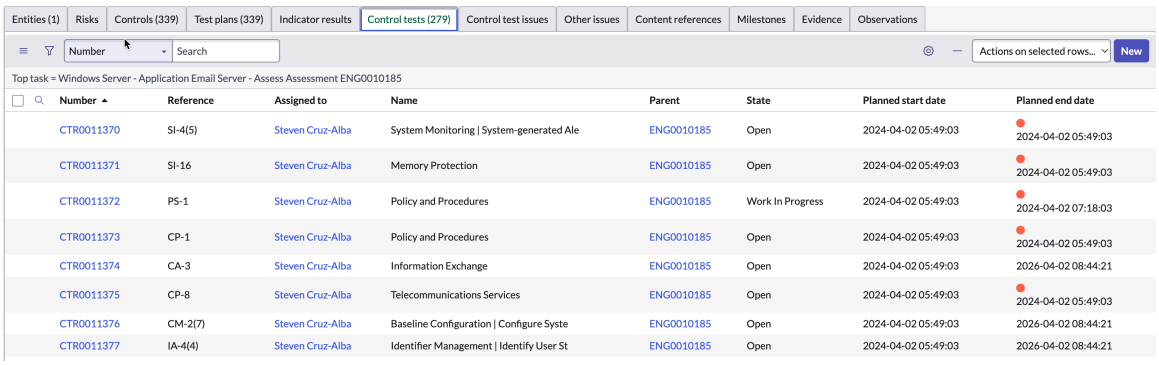
Note:
The Audit Engagement is automatically assigned to the SCA.



3. Select the engagement number to open it.

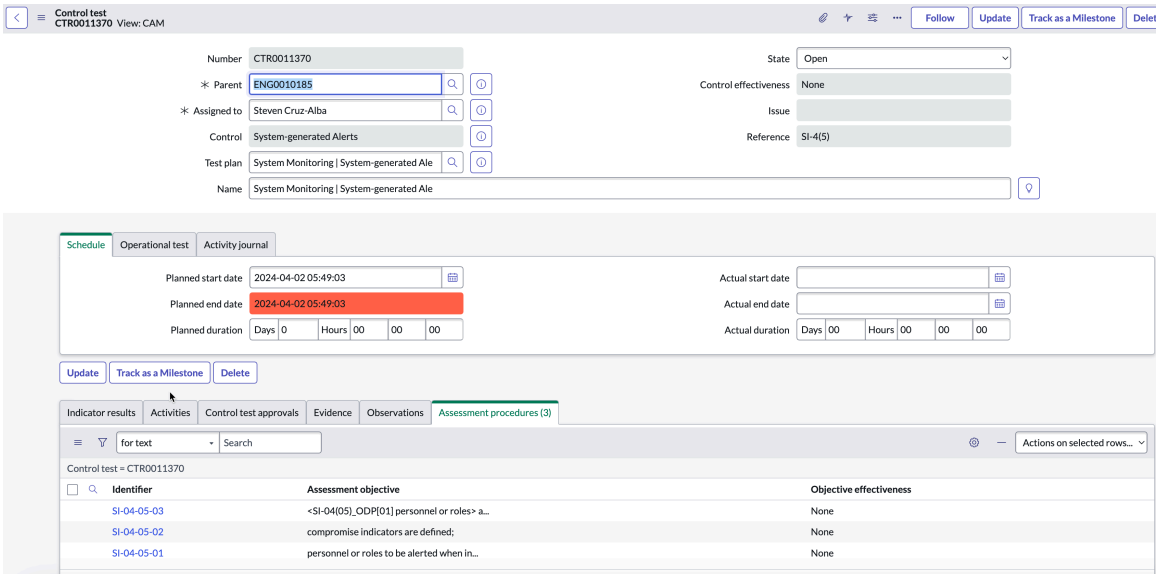
Notice that the **Entities** tab is displaying the authorization boundary for the package.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the **Controls** tab to view all the controls that your team implemented.

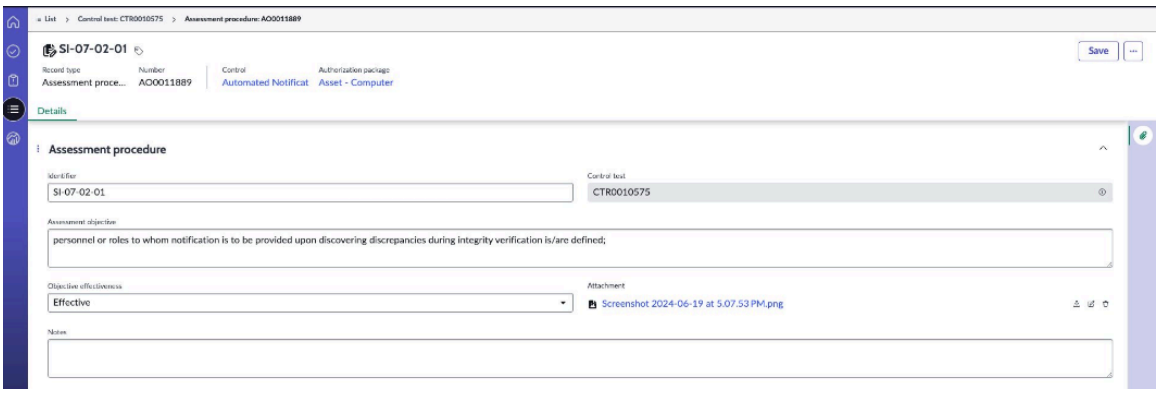
5. Select the **Test plans** tab.
   Test plans are automatically created for the control. For more information on test plans, see Generate assessment procedure plans for a test plan.
6. Select the **Control tests** tab to view the tasks for assessing the controls.



> **Note:**
> The **Audit tasks** tab in the Default view is renamed as **Control tests** tab in the CAM view. The names of the related list labels vary and are specific to the Default view or CAM view.
> You can change the view by selecting the Additional actions icon (☰).

For more information on test plans, see Determine control effectiveness of a control test.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. Select a control test.

b. From the **Assessment procedures** list, select a record.

c. Select the **Attach File** link to attach an evidence document as a proof of the test.

d. Select the **Notes** field to enter additional assessment details.

7. In the Default view, select an audit task and perform the Design Test and Operation Test to judge the control's effectiveness.

For details on this process, see Manage engagements.

> **Note:**
> Any issues that arise during the Assess phase appear in the **POA&M** tab. Additionally, any open Change Requests or Vulnerable Items targeting the system elements in the package appear under those tabs.

8. The system owner must review and document any POA&M issues, change requests, and vulnerable items that potentially threaten your systems.

9. When the review is complete, select **Authorize**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In the Monitor state, continuous monitoring is achievable if you have indicators. If not, you can manually review the controls. For more information, see Manage control indicators.

You can select **Generate Report(s)** to generate a FedRAMP System Security Plan (SSP) document for the authorization package in PDF format.

The package transitions to the **Authorize** state. When you're satisfied that all is in order, select **Request Approval**. An approval request is sent to the Authorizing Official, who will access **My Approvals** from the navigation pane and review the information in the package. When the approval is received, the package transitions to the **Monitor** state.

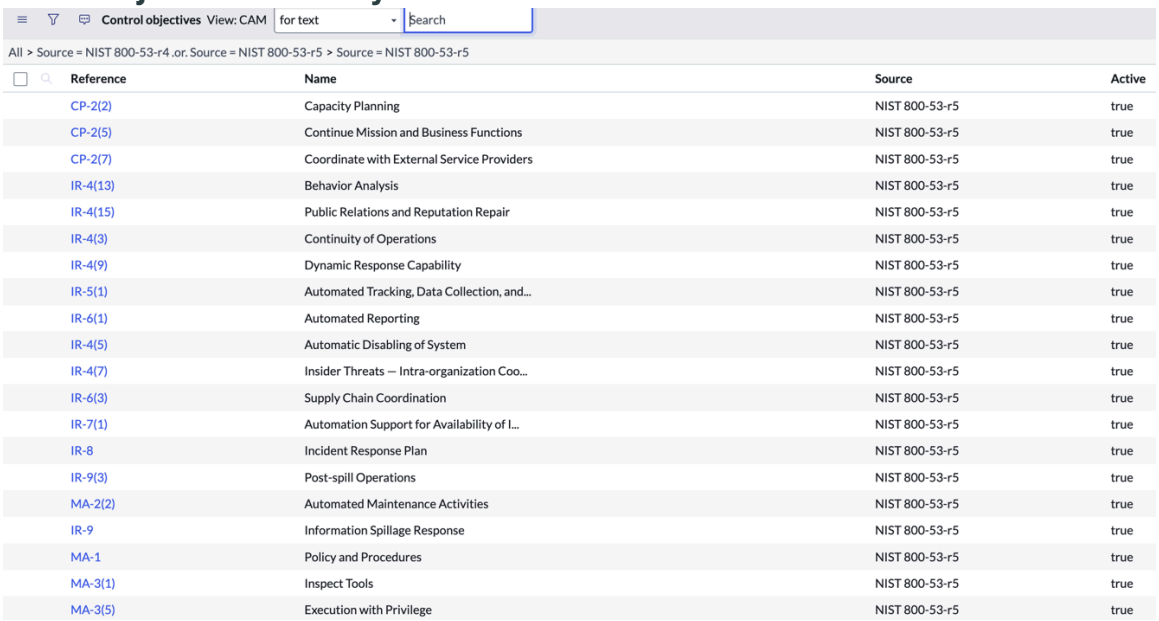
Implementing controls and assessment objectives in CAM

NIST 800-53A – assessment objectives are included in the base system with the CAM application. The assessment objectives are mapped to revision 5 control objectives.

Note:

- NIST SP 800-53 is the Security and Privacy Controls for Federal Information Systems and Organizations.
- NIST SP 800-53A is the Guide for Assessing the Security controls in Federal Information systems and organizations: Building Effective Security Assessment Plans.

Each test template has assessment procedure templates and is imported by the ServiceNow base system to CAM users for control objectives sourced by NIST 800-53 revision 5. Each assessment procedure template has an identifier and assessment objective. The assessment objective determines how controls are tested.



A new CAM view is available for control test in which design effectiveness is removed and there is only operating effectiveness, which is named as Operational test.

In CAM, a control is tested at a more granular level with multiple assessment procedures. The control test measures the effectiveness of a control. The effectiveness of a control test is measured through its operating effectiveness and assessment procedure effectiveness, based on which the control effectiveness of the control test is determined. A control test failure indicates the failure of the assessment objective as well.

New control test criteria such as Examine, Interview, and Test are available during control testing. These fields are read-only, however you can update these descriptions at the test template and test plan levels. A set of assessment procedures is available as a related list while control testing. Assessment procedures are at the objective level, and can be marked as not applicable in addition to being effective, ineffective, and none.

Generate assessment procedure plans for a test plan

Use the test plan that is automatically generated for a control, which is in an assess state, to view and determine if the control is assessed in accordance with the assessment procedure plan.

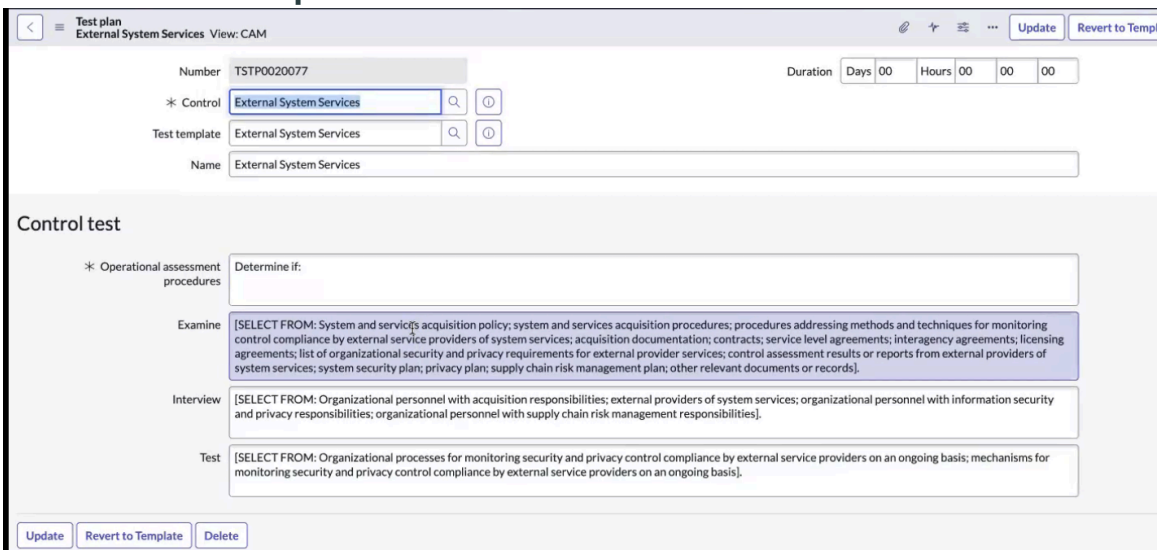
Before you begin

Role required: sn_irm_cont_auth.system_owner, sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.authorization_official, sn_irm_cont_auth.info_system_sec_manager, sn_irm_cont_auth.admin

About this task

Assessment procedure plans are generated for the test plan of a control based on the control objective. Each control objective has a particular test template, and assessment procedure templates are created for this test template. Test plans are generated from the test template of a control objective. Assessment procedure plans are generated from the assessment procedure template.

Procedure



1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Controls**.
2. Select the control that has been assessed for which the test plans are created.
3. Select the Test plans related list and select the test plan link in the **Number** column.
   In the Test plan form that opens, you can view the test plan details such as the name of the test template from which this test plan is generated and the name of the control that is to be assessed based on this test plan.

   The base system includes test templates for NIST 800-53 revision 5 controls. Test plans are automatically created from these test templates. Whenever the authorization package moves from the Implement state to the Assess state, the control tests are created from the test plans that are generated from the test templates.

   The Control test section includes **Operational assessment procedures**, **Examine**, **Interview**, and **Test** field descriptions. The Examine, Interview, and Test descriptions are drawn from the NIST guideline and are added to the Test template form. You can update the field descriptions in the Test plan form.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control test tab of test plan

4. To update the descriptions, select the field, update the text, and then select **Update**.
5. To revert to the original control test descriptions in the associated test template, select **Revert to Template**.
6. Select **OK** in the Confirmation popup to confirm your decision.
7. To open the Assessment procedure plan and view the assessment objective, select the link in the **Identifier** column of the Assessment procedure plans section.
   In the Assessment procedure plan form, you can view the identifier of the assessment procedure plan, the name of the test plan, and the assessment objective. An assessment objective is the guideline as to how to assess the control. If necessary, update the objective.

Assessment procedure plans

8. To view the control tests that are generated to assess the control, navigate to the Controls tests related list of the Engagement form.
   See RMF steps 4, 5, and 6 - Assess, authorize, and monitor.

© 2026 ServiceNow, Inc. All rights reserved.

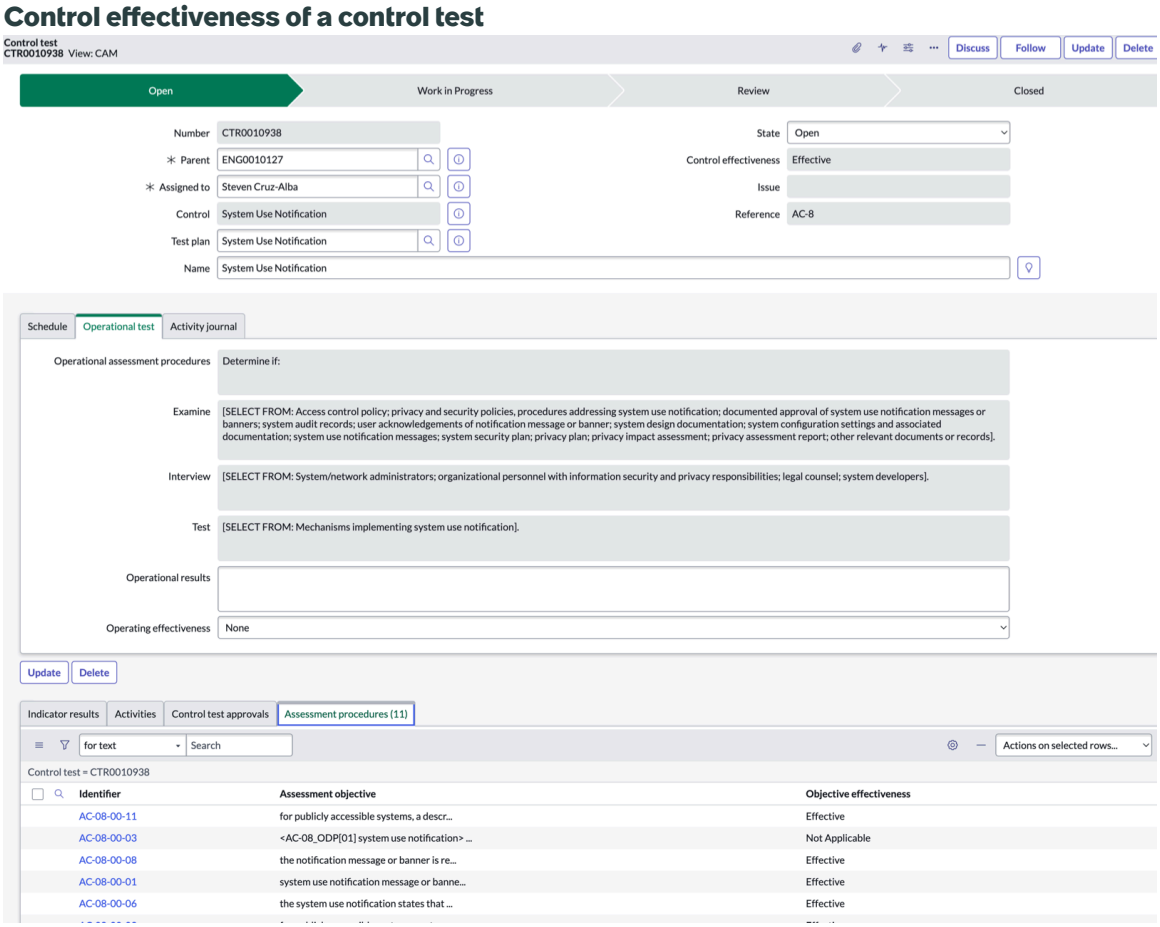
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Determine control effectiveness of a control test

Apply the objective effectiveness of the assessment procedures and the operating effectiveness of the control test to determine the control effectiveness of the control test. An assessment procedure is applied to check the control test at a granular level.

Before you begin

Role required: sn_irm_cont_auth.system_owner, sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.authorization_official, sn_irm_cont_auth.info_system_sec_manager, sn_irm_cont_auth.admin



Procedure

1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Engagements**.
2. Select the engagement.
3. Select the **Control tests** tab and select a control test link in the **Number** column.
4. In the Control test form that opens, you can view the effectiveness of the control in the **Control effectiveness** field.
5. Select the **Operational test** tab to view the operating effectiveness of the control test.

   Note:
   The **Examine**, **Interview**, and **Test** fields are pre-populated from the NIST control objectives, and aren't editable at the control test level. If you must edit any of these descriptions, you can do so in the test plan form. See Generate assessment procedure plans for a test plan.

6. Select the Assessment procedures related list to view the objective effectiveness of all the assessment procedures.
   The number of assessment procedures generated is exactly equal to the number of assessment procedure plans that were generated from the test plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The values of the operating effectiveness of a control test are:

- None
- Ineffective
- Effective

The values of the objective effectiveness of an assessment objective are:

- None: Indicates that the assessment procedure hasn't been analyzed or assessed yet.
- Effective
- Ineffective
- Not Applicable: Indicates that the assessment procedure isn't valid or not required for this control test check.

The Control effectiveness of the control test is determined by:

Operating effectiveness	Objective effectiveness	Control effectiveness
Effective/Ineffective/None	Any one is Ineffective	Ineffective
Effective	Not applicable/None/ Effective	Effective
Ineffective	Not applicable/None/ Effective/Ineffective	Ineffective
Ineffective	Ineffective	Ineffective

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operating effectiveness	Objective effectiveness	Control effectiveness
None/Effective	Effective	Effective
None	One is Effective and another Ineffective	Ineffective
None	One is None and another is Not applicable	None

As long as the control test is in the Open or Work in Progress state, it does not matter if the objective effectiveness of the Assessment procedures is None. However, you cannot move the control test to the Review state until you mark every assessment objective as either Effective, Ineffective, or Not Applicable. An error message pops up to indicate that you must check the assessment objective and move it out of the None state, so as to move the control test to the Review or Closed Complete state.

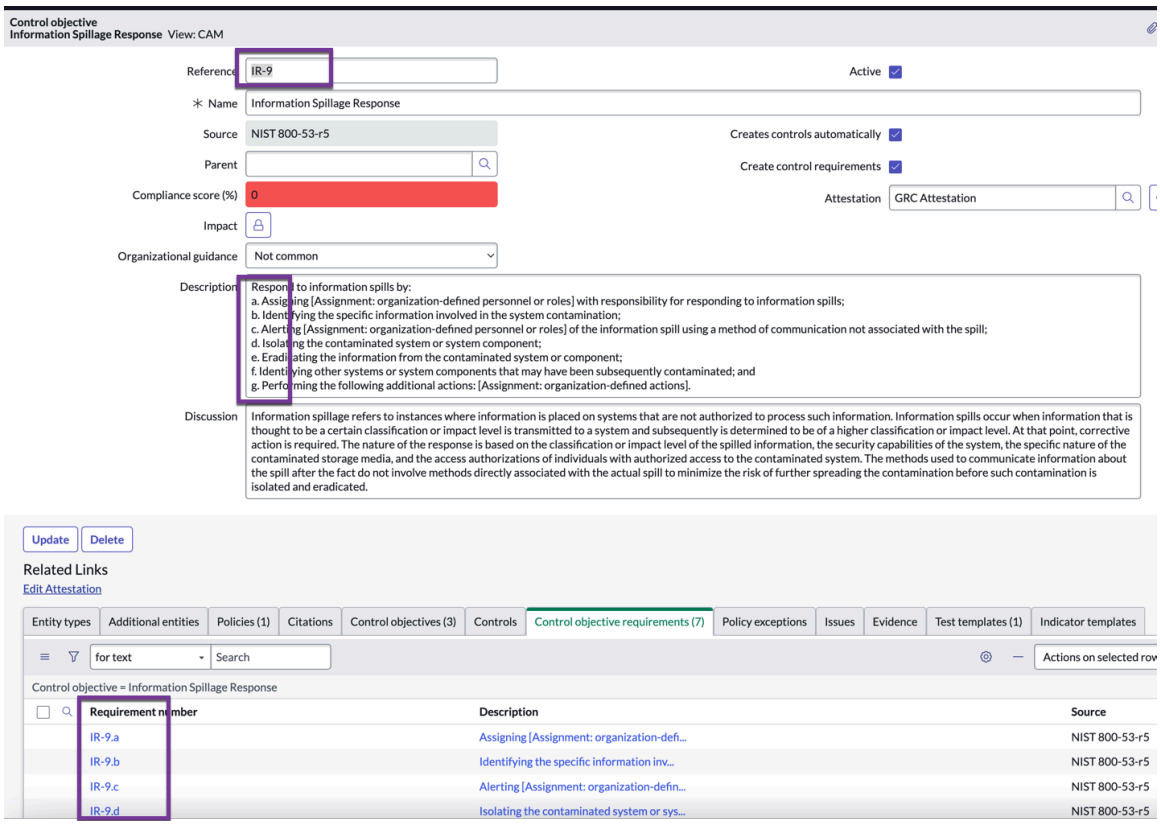
7. Select the link in the Identifier column of the Assessment procedures related list to view the Assessment procedure form.
   All fields in the form are read only except the **Objective effectiveness** field, which you can edit if the control test is either in Open or Work in Progress state. The **Objective effectiveness** field is read only in the Review state, or in any closed states such as Closed Complete, Closed Incomplete, and Closed Skipped.
8. If you update the objective effectiveness value of the assessment procedure, select **Update** to save your changes.

Defining a control's requirements at the level of control objective

You can break down a control at a more granular level as requirements when you generate the control at the control objective level.

Defining control requirements helps:

- Security Control Assessor (SCA): To assess each requirement of the control individually if there are different aspects to the control testing.
- Authorization official (AO), Information System Security Officer (ISSO) and Information System Security Manager (ISSM): To understand the requirement that failed, which lead to the non-compliance of the control, instead of evaluating the failure of the control as a whole.
- Attestation respondent identified for a control: To respond at the control requirements level, which is at a more granular level, rather than the control level.



As a CAM user you can break down the controls to control requirements, manage the requirements more efficiently, attest them individually, and have the package authorized. You can also define the requirements and create them at the control objective level when controls are generated.

Creating NIST content from control objective description as control requirements

The ServiceNow base system ships the control requirements generated from the NIST 800-53 revision 5 control objectives to CAM users. The **Description** field of the Control objective form lists the requirements broken down as sub-points with sub-numbers. The Reference of the control objective is clubbed with each sub-number or the clause in the **Description** field and referenced as a **Requirement number** in the Control objective requirement. For example, if the Control objective reference is IR-9, and the description of the control objective starts with a sub-number (a.), then the two are clubbed together to generate the first control objective requirement

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

as IR-9.a, with further sub-numbers added to it if available. Therefore, if there are about seven sub-descriptions, then seven control requirements are generated.

Control requirement details in the CAM view of Control objective and Control forms

The CAM view of the Control form has fields that have been added to capture the control requirement details.

To accommodate the control requirement details in the CAM view of a Control objective form a Control objective requirements related list is added.

> **Note:**
> The views of the Control objective form and Control form in the CAM view are almost the same as the Control objective and Control forms used in Policy and Compliance Management. However, some fields have been removed and some added in the forms to capture the control requirement details.

CAM view of a Control objective form

CAM view of the Control objective form

Field	Description
Reference	Unique numerical identifier or the content reference number.
Family	Control objectives grouped into a family.
Active	Option to activate a control objective.
Family ID	Unique identification for a family of control objectives.
Name	Name of the control objective.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CAM view of the Control objective form (continued)

Field	Description
Source	Source of the control objective, which is NIST 800-53 revision 5 for which the test templates are provided.
Parent	Control objective that is not a child of the current control objective. This relationship is to avoid cyclic parent – child relationship.
Compliance Score (%)	Compliance score percentage calculated for this control objective and its color code: • 80 and higher in green • 80 to 50 in yellow • below 50 in red
Creates controls automatically	Option to indicate that controls are automatically created when an entity is associated from the Additional entities related list by selecting **Add relationship** and the entity.
Create control requirements	Option to generate control requirements automatically for the control objective. **Note:** If there are no control objective requirements, then there won't be any control requirements either.
Attestation	Reference to the metric type. **GRC Attestation** is chosen by default. **Note:** If the user changes the control attestation, the related control objective attestation type is changed also.
Impact	Potential impact to business functions because of loss of confidentiality, integrity, or availability of target and data.
Organizational guidance	Security control definitions from NIST, which when designated as common control definitions by organizations, are inheritable by one or more organizational targets.
Description	Description of the control objective.
Supplemental guidance	If it is control objective sourced by NIST 800-53 revision 4, then a direction for the control objective implementation.
Discussion	If it's a control objective sourced by NIST 800-53 revision 5, then content-related information that is sourced by NIST.

Control objectives are just guidelines and aren't specific to an entity or any object. You can link one control objective with any control objective requirement, and one control objective requirement with any number of control objectives, as the relationship between the control objective and the control objective requirement is many-to-many.

Control objective requirements related list

Field	Description
Requirement number	Requirement number of the control objective.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control objective requirements related list (continued)

Field	Description
Active	Option to make the requirement active.
Description	Detailed description about the requirement for the control objective.

In the Control objective requirements related list, you can select **New** to create a requirement for the control objective if necessary, based on which requirements are generated. Or, select **Edit** to add an existing control objective requirement to the control objective.

Note:

- If the control objective is in the Inactive state, you cannot create or add control objective requirements. Therefore, **New** and **Edit** are not available.
- If the control objective requirement is inactive, you cannot add a control objective to the control objective requirement.

CAM view of the Control form

CAM view of Control form

Field	Description
Reference	Unique identifier.
Name	Name of the control.
Number	Unique identification number of the control.
Entity	Related entity. **Note:** If you change the state of the entity to Active from Retired state, then the manually created control on the entity also moves to the Draft state.
Control objective	Related control objective.
Owner	User who owns the policy. **Note:** The owner is always added as a respondent. The control owner that you select belongs to the owning group.
Status	Control status. Possible choices are: • **Compliant** • **Non-compliant** • **Not applicable**
State	Control state. Possible choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CAM view of Control form (continued)

Field	Description
	• **Draft**: When the control is created from a control objective, controls are in this state. In this state, all compliance users can modify the control. Only available when creating a one-off control. One-off controls are possible but not recommended. • **Attest**: When you select **Attest** and take attestations, the control moves to this state. **Note:** When a control is set back to draft, the attestation is canceled. • **Review**: Controls are automatically moved to review from the attestation phase. • **Monitor**: In this state, all compliance managers can move the control from review to monitor. • **Retired**: Compliance managers or administrators can move a control from Monitor to Retired. **Note:** When a control is retired: ○ Associated indicators don't run ○ Associated attestations are canceled ○ Changes to associated control objectives don't update the control
Authorization package	The authorization package that the control is associated with or originating from.
Frequency	List of options: • Event Driven • Daily • Weekly • Monthly • Quarterly • Semi-Annually • Annually Attestation is sent based on the value selected for the control or control requirement. **Note:** For information on the difference between the **Frequency** field for a control and the **Attestation Frequency** field in an entity, see KB0694607.
Weighting	Value used when calculating control score effectiveness.
Owning group	Group that owns the policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CAM view of Control form (continued)

Field	Description
Control allocation	Type of control that is created: either system-specific or hybrid.
Description	Description of the control.
Discussion	Content-related information from NIST 800-53 revision 5.
Supplemental guidance	If it's a control sourced by NIST 800-53 revision 4, then a direction for the control implementation.
Implementation statement	An explanation on how the control will be implemented. This information is required if the control is created from an authorization package and in the Draft state.
Attestation	
Take attestation at requirement level	Option to send attestations at the control requirement level and not at the control level.
Attestation	Select from a list of options. • Other attestation types can be configured. • If this field is populated, then the **Attestation Respondents** value is required, and the owner is made the respondent. **Note:** If the user changes the attestation type in the control objective, all related controls are also changed.
Attestation respondents	• Users assigned to the attestation of this control. • Only a user with the sn_grc.user role can be added as a respondent. **Note:** When both the **Attestation** and **Attestation respondents** fields are set, attestations are created when you select **Attest**.
Activity Journal	
Additional comments	Public information about the control.
Activities	Message logs of control state change.

Control requirements related list

Field	Description
Number	Control requirement's unique number.
Requirement number	Reference number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Control requirements related list (continued)

Field	Description
Control	Control to which the control requirement is associated.
Status	Status of the control requirement.
State	Requirement state.
Frequency	Control frequency.
Description	Description of the control requirement.
Attestation	
Attestation	Attestation metric type.
Attestation respondents	Users who attest the control requirement.
Activity Journal	
Additional comments	Information about the control requirement. When the control objective requirement is dissociated, that is removed or deleted, the control requirement becomes manual. This information is logged in this field.
Activities	Message logs of control requirement's state change.

Modify control requirement's implementation status at the control level

Approve the authorization package when it is in the Select step to create controls. After approval, the authorization package moves to the Implement step and the controls are generated. You can still modify the control requirement implementation status at the control level.

Before you begin

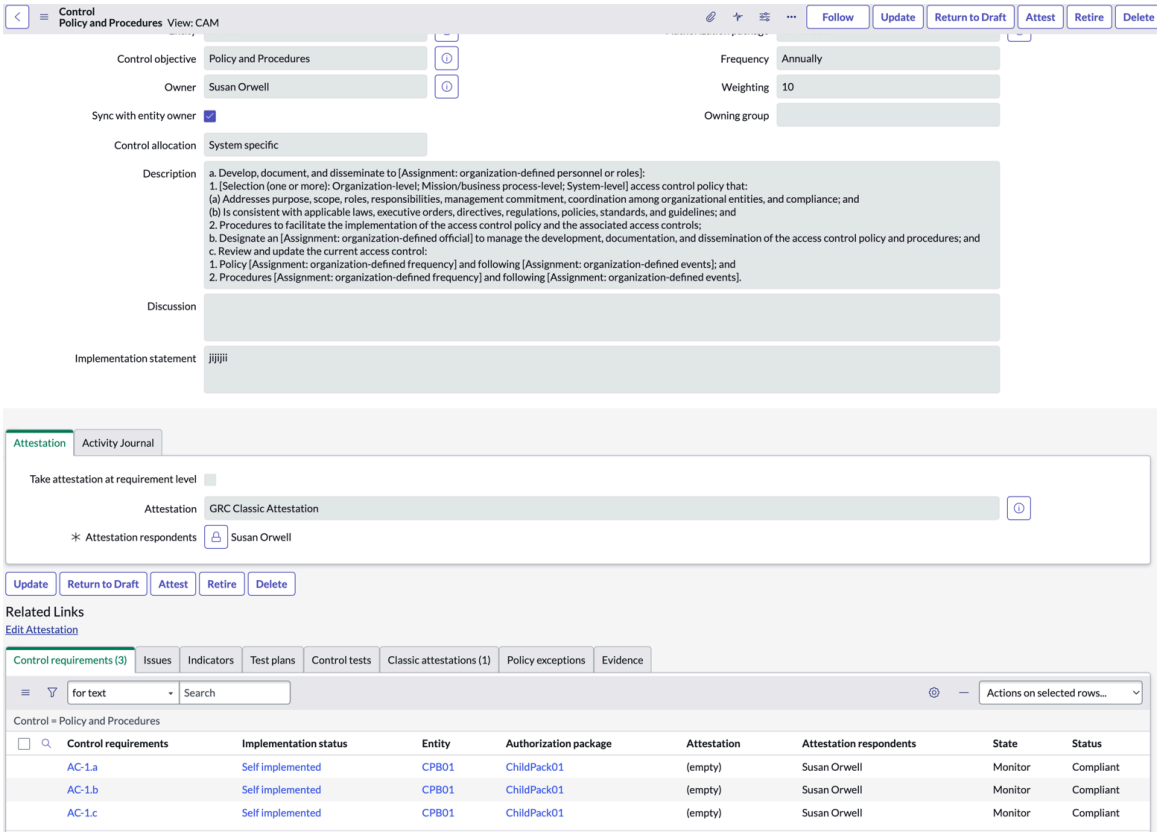
Role required: sn_irm_cont_auth.system_owner

About this task

Controls are generated for all the baseline controls that have the value as **Applicable** or **Hybrid** in the **Control review** field of the Baseline control tab. Additionally, the type of control that is generated is determined by the **Control allocation** field in the Control form, which can be either **System specific** or **Hybrid**.

- Controls are created for all controls coming directly from baseline controls that are system specific and marked as Applicable.
- Controls are created for hybrid controls, which will have requirements based on the hybrid setup.
- Controls are not created for inherited controls.

All the controls are generated in the **Implement** state, however you can still update the setup at the control level in this state.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Continuous Authorization & Monitoring** > **All Authorization Packages**.
2. Select the authorization package that is in the Implement state, for which you want to modify the control setup.
3. Select the Controls related list.
   The number of controls generated is displayed in the Controls related list.

```
Number of Controls = Baseline Controls + Hybrid Controls
```

4. Select the control to modify its setup.

5. To change the provider for a particular requirement, select the control requirement in the Control requirements related list.

   a. Select **Change Provider**.

   b. Select the **Common control** list field in the Inherit from Common Control popup.
      The filter query lists only those providers that you have not already selected for you to choose from.

   c. Select **Confirm**.

   On selecting confirm, the query filter removes the current provider from the authorization package of the Control requirements list. You can also select the Activity Journal related list to see the message that the provider has been changed, logged in the **Activities** field.

   You can only change the provider for the requirement using **Change Provider**. However, this action does not make the requirement automatically compliant by changing the provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
You must not make a selection that changes the value in the **Control allocation** field of the Control form when you do this setup change. If it is a hybrid control and if this requirement is the only one that has the **Implementation status** as **Self implemented**, and by changing the provider to another control that has the control allocation value as **System specific** where the **Implementation status** of all its requirements are **Inherited**, then the control allocation is no longer hybrid as all its requirements are inherited.

For a hybrid control at least one requirement should be inherited and at least one should be Self implemented.

- All the requirements are Self implemented for a system specific control.
- At least one requirement must be Self implemented and the rest can be inherited for a hybrid control. If it is inherited, then the control requirements are inherited from a provider, which comes from the Baseline Controls related list.

6. To change the implementation status of the control requirements to self implemented, select those control requirements in the Control requirements related list.

   a. Select **Convert to Self implemented**.

   b. Select **Yes** in the Confirmation popup.
   Your control requirement selections can also include those requirements that are already in self implemented status. However, after this operation, only those requirements that were in Inherited status are converted to Self implemented.

   By this UI action, the existing m2m relationship between the control provider and the control is deleted. Thereafter, a new m2m relationship is created with the new selection. A message describing the change is also logged in the **Activities** field of the Activity Journal tab of the Control form.

7. To convert a control requirement from self implemented to inherited status, select the requirement in the Control requirements related list.

   a. Select **Convert to Inherited**.

   b. Select the **Common control** list field in the Inherit from Common Control popup.
   You can select from all the providers that are available to inherit that control requirement. After this UI action, the previous self implemented control requirement is deleted, and the new requirement that you selected is inherited from the provider. Simultaneously, the set up is also changed at the authorization package level in the Hybrid Controls related list, where the requirement selections of that baseline control reflect your change.

   If this is the only requirement that is in self implemented status for the hybrid control, then you cannot convert it to inherited.

8. To see the list of control requirements for a hybrid control, select the Display/hide hierarchical lists ( ) icon that gives you a hierarchy view.
   You can use in the Hybrid Controls related list as well. Additionally, you can also do the above three actions – Convert to Self implemented, Convert to Inherited, and Change Provider – from the Controls related list.

   From the Implement state you can move back to the Select state. When you do so, all the controls that were active and created in the Implement state will be deleted or retired. When you are in Select state, you can modify the setup for all the hybrid controls and generate controls once again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. To revert a hybrid control as a baseline control, select the control in the Hybrid Controls related list.

   a. Select **Return to Baseline Control** and then select **OK** in the Confirmation popup.
   This action deletes the previous Requirement selections for the hybrid control. It also updates the baseline control's **Control review** field from **Hybrid** to **Applicable**. You can set up the steps for this baseline control and select **Create Hybrid**. You can view the current control requirements available for this control. Four setup changes are possible for a hybrid control to return to being a baseline control:

   - It must be a system specific control while moving back to Select state, and you can mark this as inherited.
   - Convert from hybrid to inherited.
   - Move the control back to baseline, mark it as common, and make it a common provider.
   - Convert the control to not applicable so that it is out of the work flow and controls will not be generated for this.

   You can also revert an inherited control as a baseline control by selecting **Return to Baseline Control** in the Inherited Controls related list. In this case, the baseline control's **Control review** field is updated from **Inherited** to **Applicable**.

Impact of associated compliance objects on control requirements

Control objective requirements are created for a control objective. The control requirements are generated for all the controls that are associated with a control objective. However, a control or a control requirement can become non-compliant because of an attestation failure or issue creation at either of the two levels.

Associating an issue to a control requirement and its impact on control status

An issue can be created for a control requirement through an attestation. You can enable the **Take attestation at requirement level** option to send out the attestations for all the control requirements instead of sending an attestation for the control at the control level. The **Take attestation at requirement level** option is in the Attestation related list of the Control form.

If the attestation fails, then an issue is created. The issue created because of an attestation failure has the **Issue source** field tagged as **Requirement Attestation Failure**.

You can view the control requirement reference in the **Control/Risk** field of the Details related list in the Issue form.

You can close the issue by providing a response and saving it in the Issue form. Your response can be either **Remediate** or **Accept**.

- If you select Remediate and set the state of the issue to Closed Complete, then the control requirement becomes compliant, provided there is no other open issue on the control requirement.
- If you select Accept, then you imply that the issue still exists and that you accept it. In this case, even if you close the issue with no other open issues, the status of the control requirement is still non-compliant.

Therefore, to make the control requirement status compliant you must set your response to Remediate and not Accept.

Whenever the control requirement becomes non-compliant, the control also becomes non-compliant. When the status of the control requirement becomes compliant, there are two more criteria to be checked at the control level:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There should be no open issue on the control.
- Not even one control requirement of the control must be non-compliant.

If these two conditions are satisfied, then the status of the control becomes compliant. Otherwise, the status of the control remains non-compliant despite the control requirements status being compliant.

- If the control and control requirements are in Draft or Attest state, then you can pass the attestation to make the control and control requirement compliant.
- If the control and control requirements are in the Review or Monitor state, you can move the state **Back to attest** and pass the attestation to make the control and control requirements compliant.
- If the control requirement is in Monitor or Retired state, then you cannot create an issue for the control requirement.

Impact of indicator test and control test on the control requirement status

A control requirement can become non-compliant because of an issue that is created as a result of an attestation failure on this control requirement. If there is no open issue on the control or even if you close the issue that existed, the control requirement remains non-compliant. Although the indicator task **Result** is **Passed**, the control remains non-compliant because one of the control requirements of the control is non-compliant. You must explicitly make the control requirement of the control as compliant, and then when the indicator test is passed, then the control becomes compliant.

The same is the case for a control test also.

Changes in control state and its impact on control requirements

Draft

All control requirements are generated when the control is in Draft state.

When the control moves to Draft state, the associated control requirements also move to Draft state.

Attest

When the control moves to Attest state from any other state, then all the control requirements of the control also move to Attest state irrespective of the **Take attestation at requirement level** option.

> **Note:**
> When you select **Attest**, you have the option to take a single attestation at the control level or take multiple attestations at the control requirements level, which is guided by the **Take attestation at requirement level** option.

Review

For control-level attestation, when the **Take attestation at requirement level** option is not selected, after attestation is complete the control moves to Review state. Simultaneously all associated control requirements of the control move to Review state.

For control requirement level attestation, when the **Take attestation at requirement level** option is selected, then the attestation is sent to all the Attestation respondents of all the control requirements individually. When the attestation is completed, irrespective of the attestation outcome as Pass or Fail at the control

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

requirement level, the control requirement moves to Review state. If the attestation passes, the status of the control requirement becomes compliant, and if it fails, the control requirement becomes non-compliant. After the attestation is completed for all the control requirements and when they all are in Review state, then the control moves to the Review state.

Monitor

When the control moves to Monitor state, the associated control requirements also move to Monitor state.

Control requirements remain in the Monitor state as long as the control remains Active and hasn't moved back to Draft or Attest state.

Retired

When the control is Retired, the control requirements move to Retired state.

Deleting a control removes or deletes all the control requirements associated with the control.

For more information on attestation flow scenarios, see the Attestation workflow for Control and Control requirements [KB0555561] article in the Now Support Knowledge Base.

Impact of inherited requirements on the life cycle of a control

1. If one of the control requirements becomes non-compliant, then the corresponding control is also non-compliant.
2. If one of the inherited control requirements becomes non-compliant, then the control is also non-compliant.
3. If an attestation for a control fails, an issue is created, and the control becomes non-compliant.
4. If an attestation for a control requirement fails, an issue is created, and the control requirement becomes non-compliant. So, the associated control also becomes non-compliant.
5. If one of the inherited control requirements of a hybrid control retires in such a condition, an automated issue is created. The reason for issue creation is reflected in the **Issue source** field of the Issue form as **Provider Control Retired**. An appropriate message is also logged in the Activity related list of the Issue form. To resolve the issue, you can either change the common control provider or convert the control requirement to self implemented.
6. If the control is in Draft state and one of its requirements is retired, then you cannot move the control from Draft to Attest state.

Note:
For more information, see the Operational changes and their impact on the process flow of control and its requirements [KB1587264] article in the Now Support Knowledge Base.

Control requirement generation and upgrade steps

The **Creates controls automatically** and **Create control requirements** options in the control objective form and the state of the authorization package are important to create control requirements.

Control requirement generation logic

If you enable the **Creates controls automatically** and **Create control requirements** options in the control objective form, then the item generation flow is triggered automatically to create controls and control requirements, respectively. Depending on the state of the control, the generated control requirements' state changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the **Create control requirements** option is selected when the authorization package moves from the **Select** to the **Implement** state, the controls are generated. At the same time, control requirements for the control objective requirements are also generated. Control requirements would be generated only if the control objective requirements are present and if the flag is true. If the control objective requirements are present but the flag is false, then the control requirements would not be generated.

If while creating the control objective, the flag was set as false and the requirements weren't generated, you can still generate the control requirements by selecting the flag and saving the control objective record, provided the controls associated with this particular control objective have control objective requirements, and the controls are Active and in the Draft state. If the controls are in any state other than Draft, then control requirements would not be generated. However, if, for example, the control was in the Monitor state and is moved back to Draft state, then control requirements would be generated provided the **Create control requirements** option is selected.

New control objective requirements added

The same is the case when you add control objective requirements to a control objective using **New** or **Edit** in the Control objective requirements related list.

Update

If you update the description of a control objective requirement, then the description of the corresponding control requirement is updated provided the control is in the Draft state. If the control is in any other state, then the description is updated when the control moves back to Draft state.

Delete

If a few of the control objective requirements of a control objective are removed, then correspondingly the control requirements of the control cannot be removed, instead they are marked as a Manual requirement. This condition is true for controls in any state. Later, if the control moves to Draft state, then you can remove the manual tag from these requirements. On the other hand, if a new control is created after some of the control objective requirements are removed, then the new control does not have the requirements that were removed but only the existing number.

If the authorization package moves from the Implement to Select state, then all the associated controls of CAM are retired, and correspondingly all the requirements associated with them are also retired. All these actions are handled by item generation.

Required upgrade steps

The following actions happen when you upgrade to the Xanadu release:

1. The **Authorization package** field and **Control allocation** field in the Control form are newly added. The values in these fields are populated for existing CAM controls.
2. For all NIST 800-53-revision 5 control objectives, the **Create control requirements** option is set to **True** by default in the Control objective form.
3. The control requirements are created for all the existing controls, from NIST 800-53-revision 5 control objectives, which are in the Draft state.

Continuous authorization and monitoring tasks in the CAM Workspace

The CAM Workspace is a centralized hub where you can continuously monitor and manage compliance with the NIST Risk Management Framework to ensure adherence to your security policies and guidelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview of continuous authorization and monitoring

- Monitoring and managing security from the CAM Workspace Home page

  The CAM Workspace is a centralized hub where you can continuously monitor and manage compliance of users and systems with the NIST Risk Management Framework to ensure adherence to your security policies and guidelines.

- View the dashboards to monitor and manage your NIST security posture

  Access the CAM Overview, AO Overview, and SCA Overview dashboards from the CAM Workspace to monitor and analyze data and view CAM reports.

- Monitor and manage CAM tasks

  Use the Tasks page to address the approvals, control attestations, and all other items that are assigned to you and to your group.

- Managing POA&Ms issues

  In CAM application, all issues related to an authorization package are called as Plan of Actions and Milestones (POA&Ms). The issues can be package issues, or control issues, engagement issues, or control test issues that are related to the package.

- View reports on authorization boundary elements

  Use the Authorization Boundary page to define the parameters of security measure for your organization.

- View package details in CAM Workspace

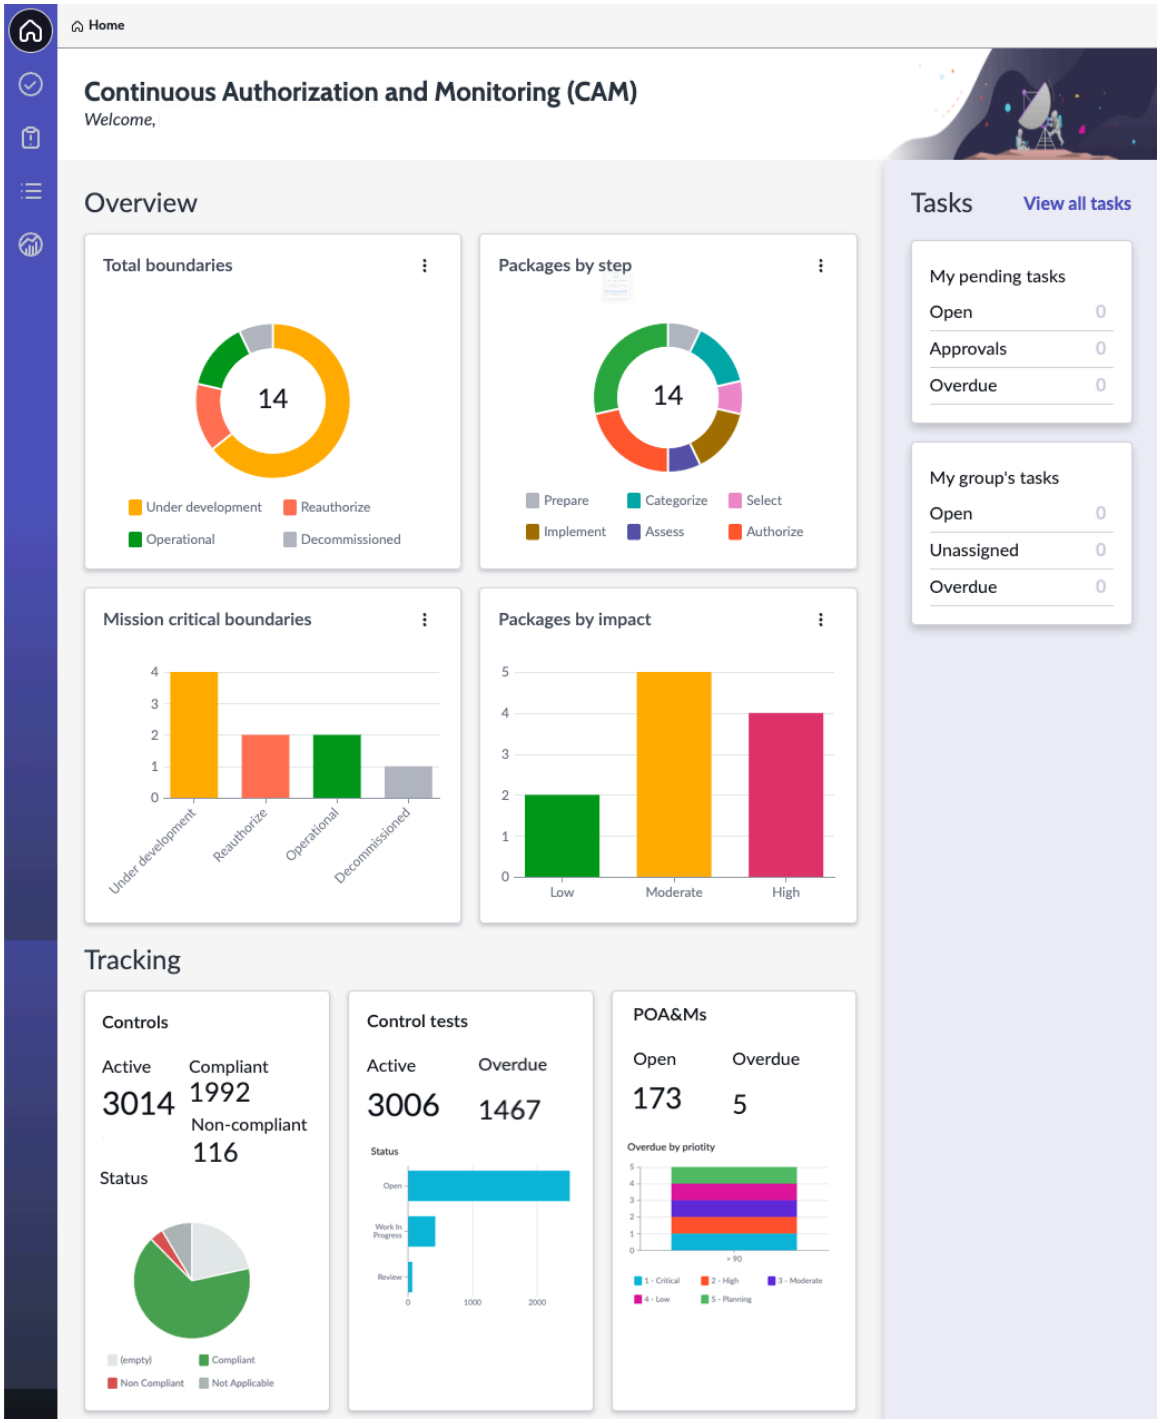
  Use the authorization package overview page to view documents and evidence that help you to assess your organization's security posture.

- ATO artifacts for an authorization package

  Generate Authority to Operate (ATO) artifacts such as System Security Plan (SSP), Security Assessment Report (SAR), Plan of Actions and Milestones (POA&Ms), Security Assessment Plan (SAP), Authority to Operate (ATO Letter), and Executive Summary from an authorization package in Microsoft Word format.

- Exporting Catalog, Profile, and SSP in OSCAL format

  CAM supports the Open Security Controls Assessment Language (OSCAL) used by the National Institute of Standards and Technology (NIST) that provides control-related information in standardised machine readable formats. Currently, CAM supports Catalog, Profile, and SSP models.



Monitoring and managing security from the CAM Workspace Home page

The CAM Workspace is a centralized hub where you can continuously monitor and manage compliance of users and systems with the NIST Risk Management Framework to ensure adherence to your security policies and guidelines.

Accessing the Home page

Navigate to **All** > **CAM Workspace**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview section

Authorization boundaries define the scope of a particular system that can be continuously managed and monitored using the CAM application.

Total boundaries

The donut chart displays the relative proportion of total boundaries present in your organization based on operational status.

Packages by step

The bar chart displays the count of packages in each NFT step. However, there's only one package that is active for the selected boundary.

Mission critical boundaries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The bar chart displays the count of mission-critical boundaries by operational status.

Packages by impact

Active packages are characterized as low, medium, or high impact and in NFT states such as Select, Implement, Assess, Authorize, and Monitor.

Aging of Packages

Track the ageing of the package at different steps, showing you for how many days the authorization package stayed in each step. If the package moves back to a previous step, the widget will clear the number of days recorded for the subsequent steps. Only the days spent in the current step and the previous step are displayed.

Tracking section

Tracks the active controls, control tests, and plan of action and milestones (POA&Ms) as separate widgets to give an overall status of these CAM objects.

Controls report

Total count of active, compliant, non-compliant controls. The pie chart displays the status proportionally.

Control tests report

Total count of active and overdue control tests and count of control tests in the Open, Work in Progress, and Review statuses. For these CAM control tests, the parent is an engagement and the engagement is associated with the authorization package.

POA&Ms report

Counts of open and overdue POA&Ms and the stacked horizontal chart depicts their priority status. POA&Ms are issues related to an authorization package, or control, engagement, control test of the package.

Tasks section

Displays your and your group's pending tasks. Select **View all tasks** to open the Tasks landing page as described in Monitor and manage CAM tasks.

CAM roles that are required for particular tasks are listed in CAM user roles.

Required roles

- Authorization Official (sn_irm_cont_auth.authorization_official), to approve and update authorization packages.
- CAM admin (sn_irm_cont_auth.admin), to perform all system admin tasks in CAM.
- Executive Reader (sn_irm_cont_auth.executive_read), to read CAM Workspace.
- Information Owner (sn_irm_cont_auth.information_owner), to update information types of an authorization package.
- Information System Security Manager (sn_irm_cont_auth.info_system_sec_manager), to conduct information system security management activities.
- Information System Security Officer (sn_irm_cont_auth.info_system_sec_officer), to verify that the appropriate operational security posture is maintained for an information system.
- Reader (sn_irm_cont_auth.reader), to read CAM Workspace.
- Scheduler (sn_irm_cont_auth.scheduler), to run all scheduled jobs for the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Security Control Assessor (sn_irm_cont_auth.sec_control_assessor), to conduct a thorough assessment of the management, operational, and technical security controls of an information system.
- System Owner (sn_irm_cont_auth.system_owner), to procure, develop, integrate, modify, operate, and maintain an information system.
- System User (sn_irm_cont_auth.system_user), to update authorization boundaries, set boundary filter, elements, milestones, and acceptance tasks.

Access the Home page of the CAM Workspace

To access the Home page, navigate to **All** > **CAM Workspace**.

View the dashboards to monitor and manage your NIST security posture

Access the CAM Overview, AO Overview, and SCA Overview dashboards from the CAM Workspace to monitor and analyze data and view CAM reports.

Before you begin

Role required: sn_irm_cont_auth.admin, sn_irm_cont_auth.authorization_official, sn_irm_cont_auth.info_system_sec_manager, sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.sec_control_assessor, sn_irm_cont_auth.system_owner

About this task

Procedure

1. Navigate to **All** > **CAM Workspace** and then select the dashboard icon ().
   The dashboard appropriate for your user role opens.
2. Select the change dashboard list icon () to select the dashboard to view.

   CAM Overview dashboard

   The CAM Overview dashboard provides multiple tabs with reports on critical aspects of your CAM security posture.

   Users with the CAM Administrator [sn_irm_cont_auth.admin] role can view the dashboard.

   See CAM Overview dashboard.

   AO Overview dashboard

   The Authorization Packages tab on the AO Overview dashboard provides central visibility into the state of all packages. The reports on the Baseline Controls tab provide a general overview of the baseline controls in your system.

   The reports on the Baseline Controls tab on the AO Overview dashboard provide a general overview of the baseline controls in your system.

   Users with the Authorization Official [sn_irm_cont_auth.authorization_official] role can view the dashboard.

   See AO Overview dashboard.

   SCA Overview dashboard

   The SCA Overview dashboard enables you to view and manage control assessments as they occur.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

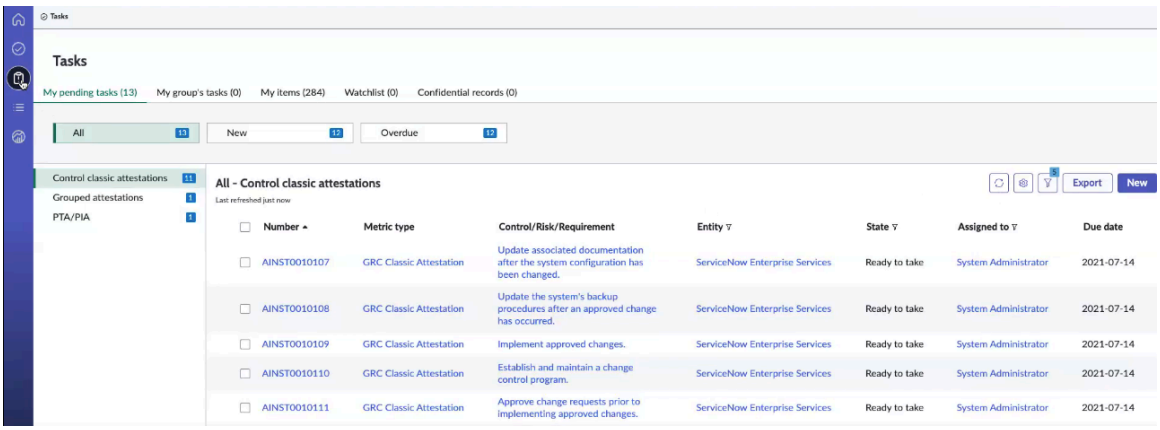
Users with the CAM Administrator (sn_irm_cont_auth.admin) or Security Control Assessor (sn_irm_cont_auth.sec_control_assessor) role can view the dashboard.

See SCA Overview dashboard.

Monitor and manage CAM tasks

Use the Tasks page to address the approvals, control attestations, and all other items that are assigned to you and to your group.

Before you begin



Role required:

- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.information_owner
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.info_system_sec_officer
- sn_irm_cont_auth.sec_control_assessor
- sn_irm_cont_auth.system_owner
- sn_irm_cont_auth.scheduler
- sn_irm_cont_auth.system_user
- sn_irm_cont_auth.admin
- sn_irm_cont_auth.reader
- sn_irm_cont_auth.executive_read

Procedure

1. Navigate to **All** > **CAM Workspace** and then select the tasks icon ( ).
2. Navigate to the appropriate tab.

Note:
When a user or user group doesn't have pending or associated tasks, the `All your tasks are done` message appears for the tab.

My pending tasks

Monitor the pending tasks assigned to you. The **All** tab under the **My pending tasks** tab on the Tasks Page Configuration module displays the list of control

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

classic attestations, grouped attestations, Privacy Threshold Analysis (PTA) or Privacy Impact Assessment (PIA), and others. If the tasks are relevant to you, then they're populated under the **My pending tasks** section in the workspace UI.

If you don't have any assigned tasks, then no data is displayed under the My pending tasks tab. Only open and active tasks assigned to you're listed under the My pending tasks tab.

My group's tasks

Monitor the tasks assigned to the user groups that you belong to. The **My group's tasks** page displays the pending tasks assigned to the user groups that you belong to. When there are no pending tasks for the user group, a message displays that All tasks are completed. Select the group from the list for which you want to filter the tasks.

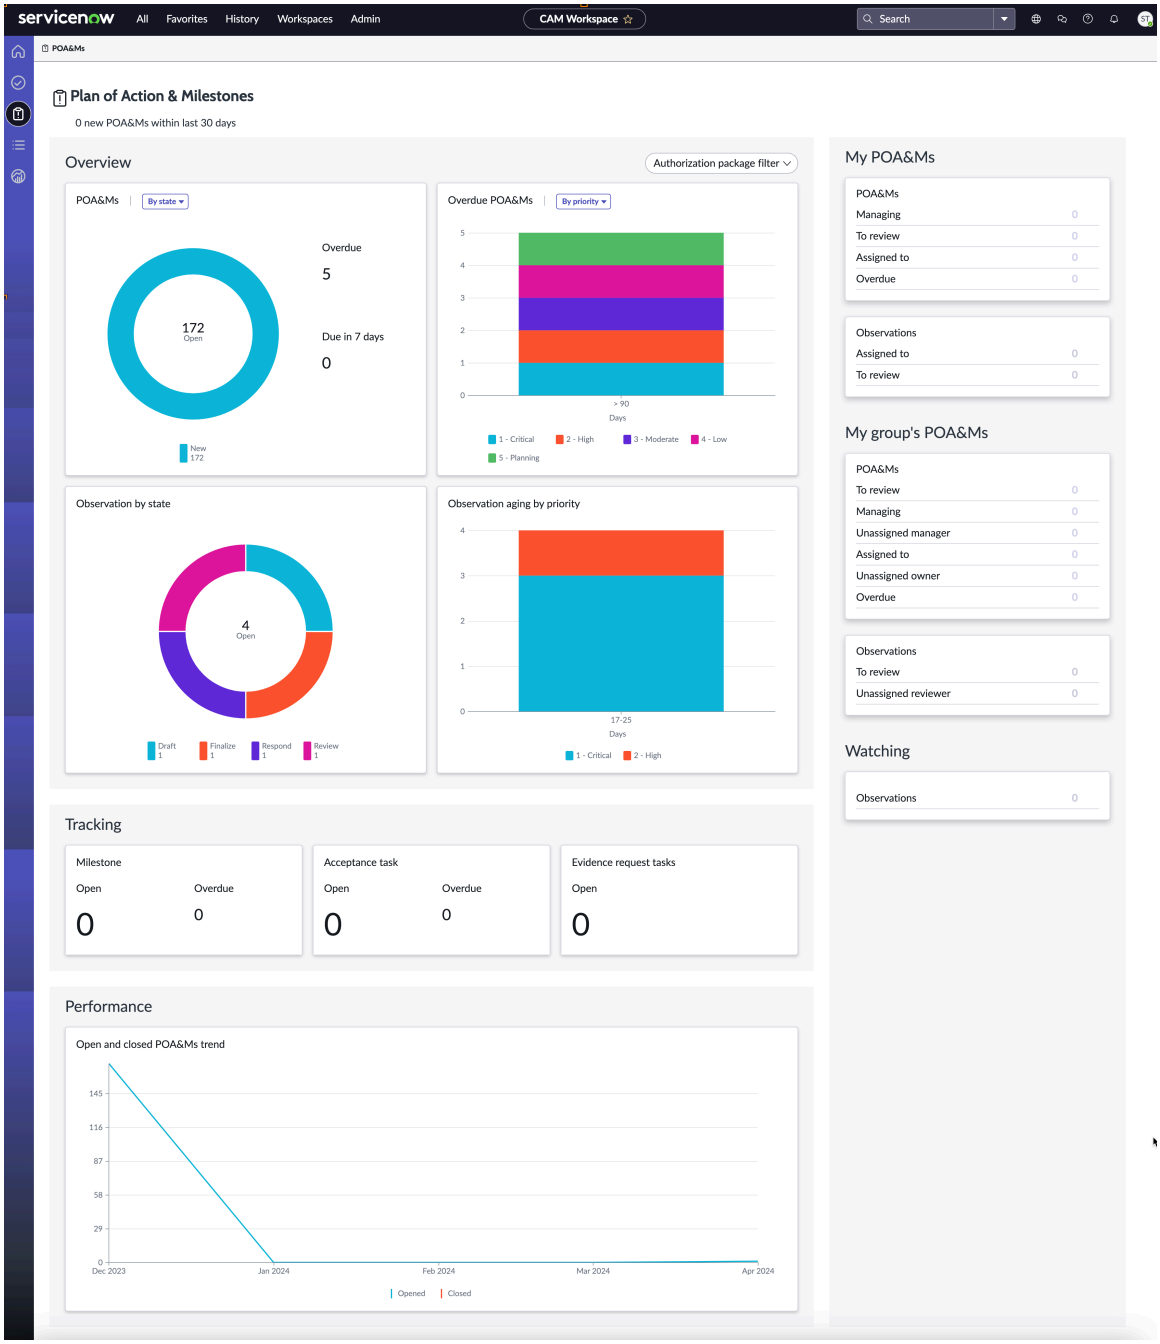
My items

Monitor the tasks assigned to you and the issues reported by you such as issues, policy exceptions, remediation tasks, and others. The **My items** tab displays the list of items that are either created by you or opened by you. For example, if you're a system user then this tab lists the authorization packages and issues.

Watchlist

Monitor the tasks for which you are in the watchlist. The **My watchlist** tab configuration displays the list of tasks for which you are in the watchlist.

Confidential records



Mark sensitive records as confidential and ensure that the appropriate people have access to these records. The **Confidential records** tab configuration displays the confidential records for the selected table.

Managing POA&Ms issues

In CAM application, all issues related to an authorization package are called as Plan of Actions and Milestones (POA&Ms). The issues can be package issues, or control issues, engagement issues, or control test issues that are related to the package.

In the POA&Ms page you can view all the authorization package issues in different states that belong to the CAM application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The authorization package filter, exclusive to the POA&Ms page, filters all the POA&Ms associated with the selected packages.

Note:
The Issue to Authorization Package [sn_irm_cont_auth_m2m_issue_auth_pack] table stores the data related to POA&Ms associated with with authorization packages.

Overview

POA&Ms: The donut charts display the total number of POA&Ms, by default grouped by state. However, POA&Ms can also be grouped by priority, POA&Ms type, and rating. The visualization displays only the active POA&Ms. You can apply the filter to visualize the data however you want.

Overdue POA&Ms: The stacked bar charts display the overdue POA&Ms grouped by due date and stacked by priority. The stacking can also be updated to POA&Ms rating.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Observation by state: The donut chart displays POA&Ms in different states.

Observations aging by priority: The stacked bar displays POA&Ms by priority.

Performance

Displays the open and closed POA&Ms trend.

My POA&Ms

Monitor the POA&Ms assigned to you, which are in different states.

My group's POA&Ms

Monitor the POA&Ms assigned to the user groups that you belong to.

Required roles

All users who can access the CAM Workspace can also access the POA&Ms landing page. For a complete list of CAM Workspace users, see List of users who can access CAM Workspace.

Access the POA&Ms landing page

To access the POA&Ms page, navigate to **All** > **CAM Workspace** and select the POA&Ms icon ().

View reports on authorization boundary elements

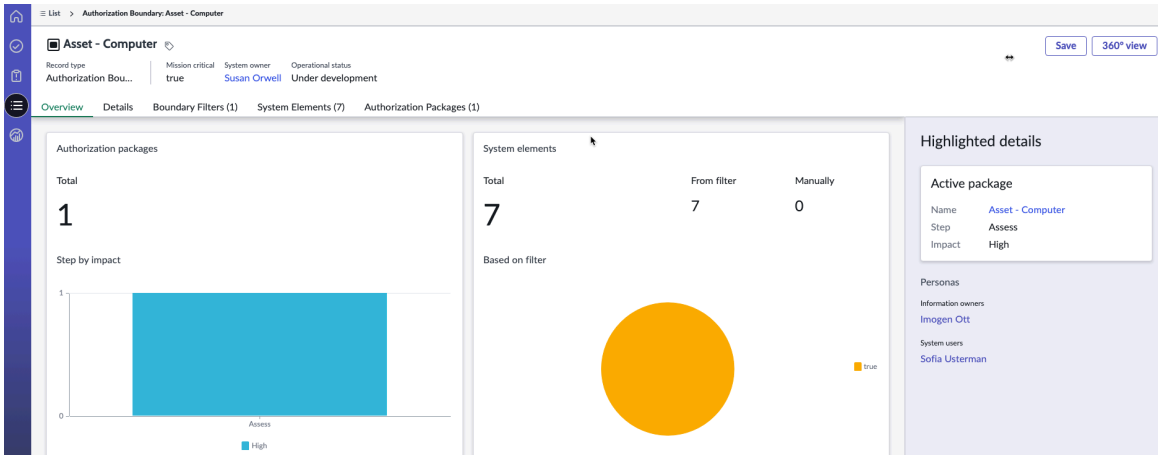
Use the authorization boundary overview page to define the parameters of a security measure for an organization.

Before you begin

Role required:

- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.information_owner
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.info_system_sec_officer
- sn_irm_cont_auth.sec_control_assessor
- sn_irm_cont_auth.system_owner
- sn_irm_cont_auth.scheduler
- sn_irm_cont_auth.system_user
- sn_irm_cont_auth.admin
- sn_irm_cont_auth.executive_read

About this task



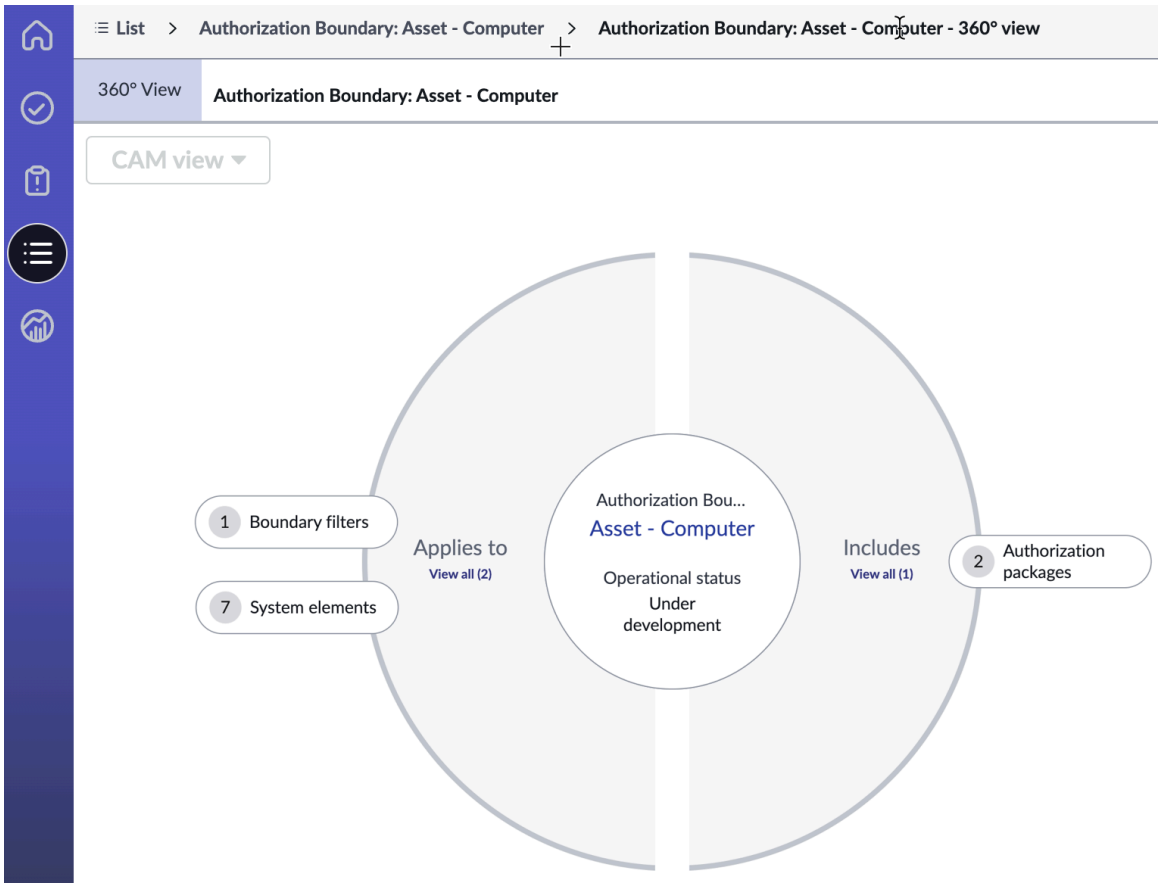
For example, your organization might have many data centers. You can define a parameter within a boundary, for example `Application servers in San Diego data center`. Setting this boundary and parameter enables you to monitor the objects within the boundary and set the scope.

Procedure

1. Navigate to **All** > **CAM Workspace** and then select the lists icon ().
2. From the Authorization boundaries in the RMF list on the left pane, select an authorization boundary record on the right pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The boundary overview page displays all the authorization packages that are available within the boundary. However, when you select the sidebar, it displays an active package.



3. Select the sidebar icon ( ).
   The Highlighted details section displays:
   - The name of the active package, its state, and impact. If there's an active package already existing for the boundary, you can't create another package for the boundary.
   - The link to the package, if selected, helps you to navigate to the associated, active authorization package.
   - The users who are directly responsible and have a key role to play in updating the authorization boundary.
4. To create another package, select the Authorization Packages related list and deactivate the existing package by selecting false in the **Active** column of the package.
   This action deactivates the current package, and you can then create a package by selecting **New**. A boundary having only one active package behavior is guided by NIST 800-53 revision 5.

   Within this authorization boundary, you can set the boundary filters, such as asset tags as computers. With this set filter condition, all the elements that fulfill the filter condition get added as system elements.
5. To view the relationship between the selected authorization boundary and all its associated objects in a distinct visualization, select **360° view**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

360° view is added in the Overview pages of Authorization Boundary, Authorization Package, Control, Control objective, Control overlays, Control test, Test template, Test plan, Engagements, and in the Details pages of Indicator, Indicator Template, and POA&Ms.

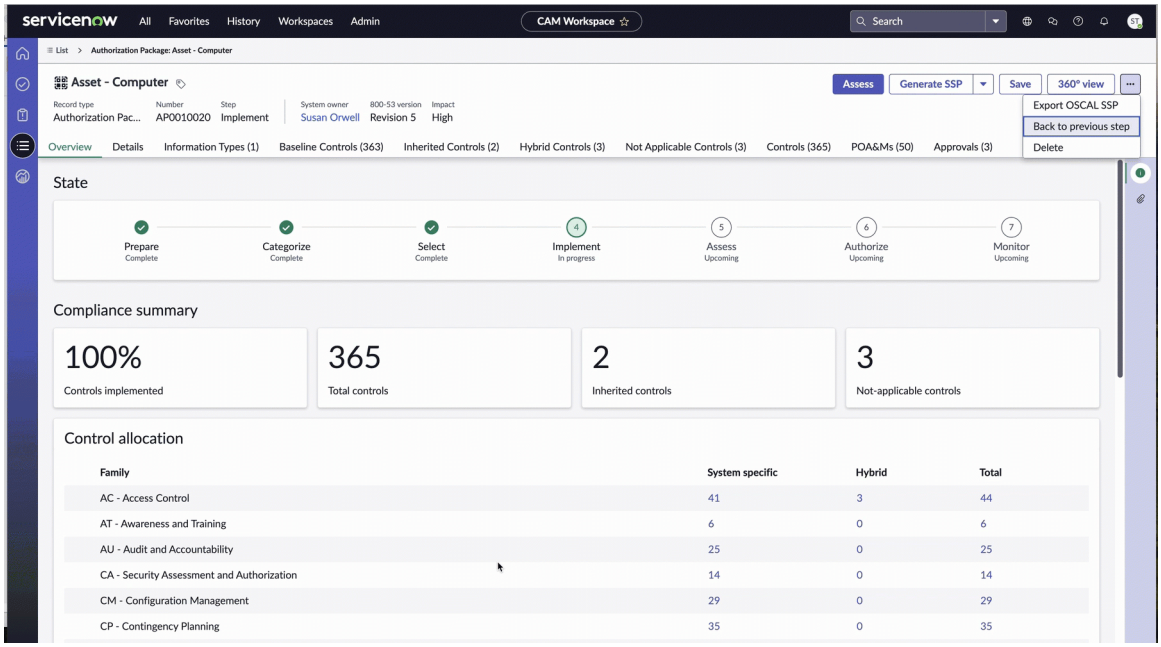
What to do next

Select the name of the Active package in the side bar to navigate to the Authorization Package overview page.

View package details in CAM Workspace

Use the authorization package overview page to view documents and evidence that help you to assess your organization's security posture.

Before you begin



Role required:

- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.information_owner
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.info_system_sec_officer
- sn_irm_cont_auth.sec_control_assessor
- sn_irm_cont_auth.system_owner
- sn_irm_cont_auth.scheduler
- sn_irm_cont_auth.system_user
- sn_irm_cont_auth.admin
- sn_irm_cont_auth.executive_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **CAM Workspace**.
2. To navigate to the Lists page, select the lists icon ( ).
3. From the Authorization packages in the RMF list on the left pane, select an authorization package record on the right pane.
   The stepper component displays the current state of the package, and the roadmap to reach the Monitor state.

Compliance summary

Displays the total number of controls contained in this package. Breakup counts of inherited control and not applicable controls of the package are also displayed. The **Controls implemented** contain the percentage of controls in the Monitor state.

Note:

- You cannot move control objectives with the same reference ID from the baseline controls list to the not applicable controls.
- When you select two control objectives with the same reference ID from the **Not Applicable Controls** list, the **Return to Baseline Control** action is disabled.
- You cannot move control objectives with the same reference ID from baseline controls to not applicable controls, or from not applicable controls to baseline controls.

Control allocation

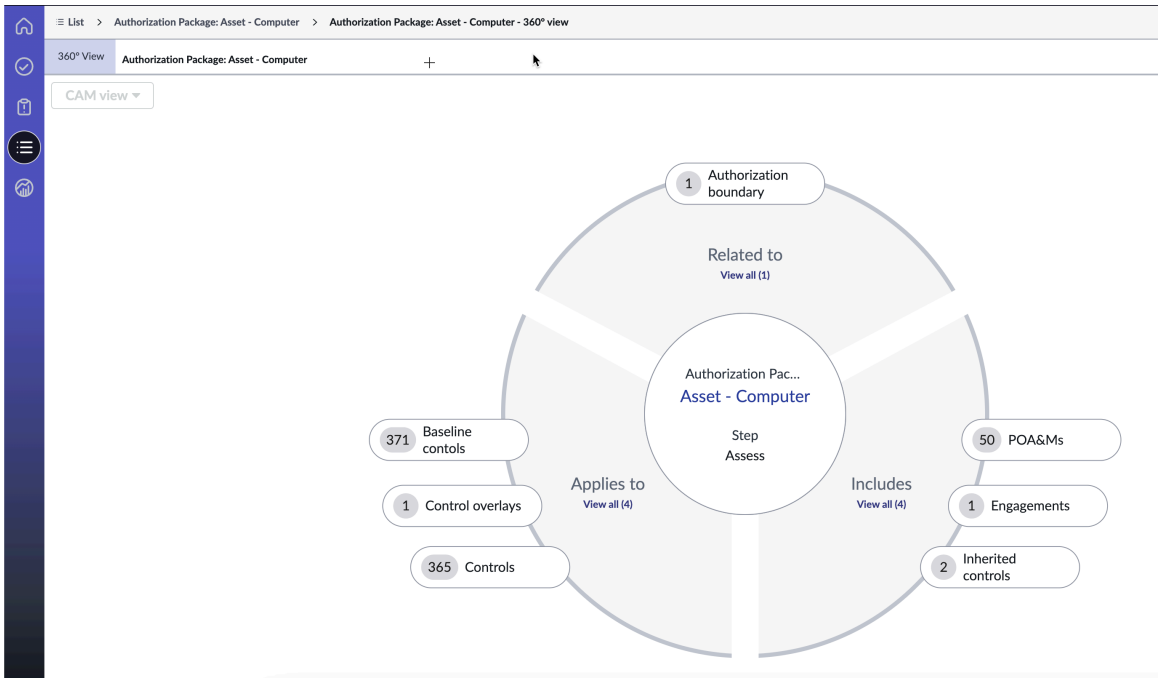
Controls grouped by family and categorized as system specific and hybrid.

Overview

Displays the total count of Controls, Control tests, and POA&Ms and their status.

Details

More granular details of controls in control requirement widget, control tests details in assessment procedures widget.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the **Details** tab when the authorization package moves to the **Authorize** step you can view the following details:

- **Next Authorization Date**: This date is generated when the Authorization Package is moved to the Authorize step. The next authorization date will be set to three years from the date the package is moved to this step.
- **Next Engagement Date**: The next engagement date is prepopulated based on the number of days defined on the **System Properties** page. For more information, see Continuous Authorization and Monitoring system properties.

  On this date, a new engagement is created with controls, test plans carried over from previous engagements, and newly associated control tests and assessment procedures.

4. Select the sidebar icon ( ).
   The Highlighted details section displays:
   - The privacy sensitive system status of the package.
   - The link to the boundary, if selected, helps you to navigate to the authorization boundary to which this package is associated.
   - The **Impact** card shows the confidentiality, integrity, and availability status of the package, based on which the **Impact** of the package is determined.
   - The users who have a key role to play in updating the authorization package are also listed.
5. To view the relationship between the selected authorization package and all its associated objects in a distinct visualization, select **360° view**.
   360° view is added in the Overview pages of Authorization Boundary, Authorization Package, Control, Control objective, Control overlays, Control test, Test template, Test plan, Engagements, and in the Details pages of Indicator, Indicator Template, and POA&Ms.

6. Select **Generate SSP** to generate a System Security Plan (SSP).
   You can also generate ATO artifact reports such as Security Assessment Report (SAR) and Plan of Actions and Milestones (POA&Ms) by selecting the more actions icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on CAM ATO artifacts, see ATO artifacts for an authorization package.

7. To generate OSCAL SSP, select the **Export OSCAL SSP** option from the more actions icon ( ).
   For more information, see Exporting Catalog, Profile, and SSP in OSCAL format and Export data in OSCAL format.
8. To move to the previous step of the authorization package and to update any details, select the **Back to previous step** option from the more actions icon ( ).
   All actions that are done when you moved to the current state are reversed if you opt the **Back to previous step** action. For example, if the package is in Implement state, then when it moves back to Select state all the existing controls that are generated are retired. In the Select state, you can revisit the baseline controls and take necessary actions if required. However, this operation can only be done by a Continuous Authorization and Monitoring administrator (sn_irm_cont_auth.admin).
9. To view the controls related to the authorization package, select the **Controls** related list.

   a. Select a control from the list.
      In the Continuous Authorization and Monitoring application, you can view the control's allocation category in the header of the control's Overview page. **Control allocation** is either System specific or Hybrid.

   b. Select the sidebar icon ( ) to view the NIST reference details.

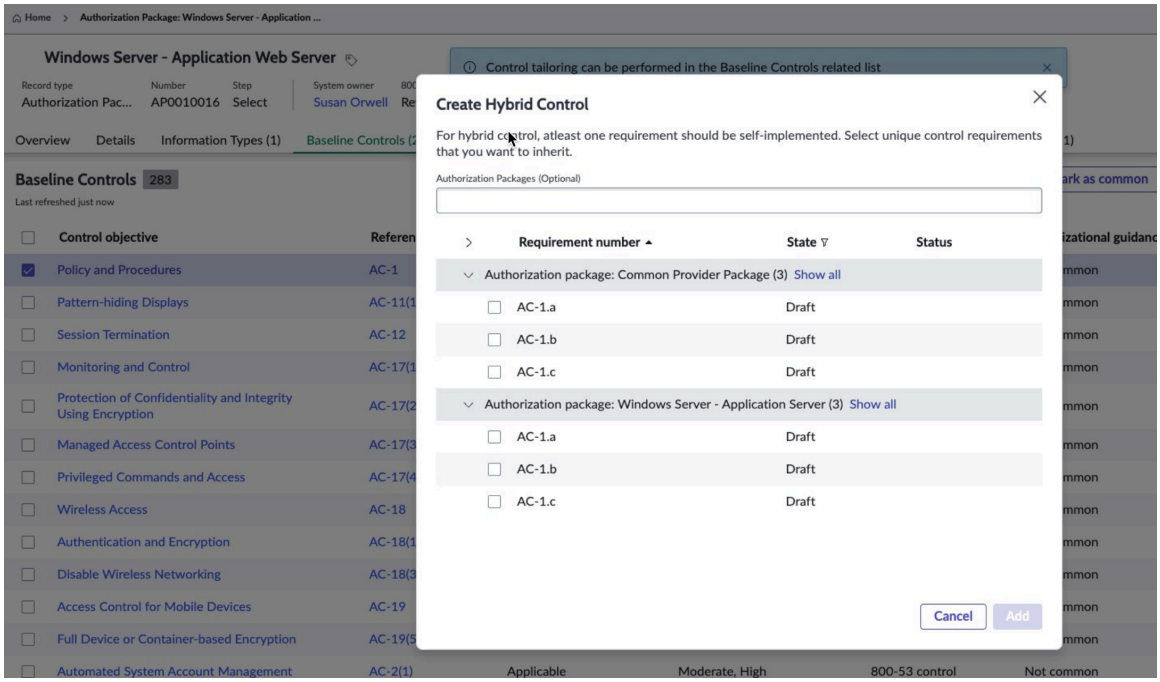
   c. Select the **Details** related list.
      The family to which the control objective of the control belongs can be known by the **Family** and **Family ID** fields. These fields are read only in the Control form.

      The **Control allocation** list in the authorization package overview page displays the controls grouped by their families segregated into system specific and hybrid.

10. Select **Add**, select the controls you want to add, and then select **Add** to add the selected control objectives to the baseline controls.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When adding control objectives, you cannot select multiple control objectives with the same reference ID to add to the baseline controls. You cannot add a control objective if its reference ID already exists in the baseline controls list.



11. To inherit the requirements for a baseline control, select only one control objective in the **Baseline Controls** tab.
    You must have one self implemented requirement and the remaining requirements can be inherited from common control providers.

    The package must be in the Select state. Only common control providers with control requirements can be used to create hybrid controls.

    a. Select **Create Hybrid**.
       The Create Hybrid Control pop-up lists the packages in groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Enter a package in the **Authorization Package (Optional)** field.
You can enter all the packages that you require, from which you can select the requirements.

c. Select the requirements from the package groupings, leaving one or more requirements for self implementation for that control.
You're creating a hybrid control, for which the requirement is inherited from the package that you selected.

d. Select **Add**.

12. To navigate to the associated control objective, select the link to the control objective in the sidebar.
The Reference for the control objective, sourced by NIST, is captured as **Source ID** in the header of the control objective.

The controls are grouped as a **Family**, and abbreviated with an ID that is defined as **Family ID**. These fields are editable and help you to identify the group to which the control belongs and are used in the Control allocation section for reporting purpose. The content for Family and Family ID is updated based on NIST 800-53. For more information, see Control requirement details in the CAM view of Control objective and Control forms.

a. Select the Related control objectives related list.
All control objectives that have an impact in the implementation of the package but belong to different families are grouped as Related control objectives. These control objectives are sourced by NIST. All related controls in a package based on the mapped control objectives are linked as Related control objectives.

Related controls related list contains controls from the related control objective with the same entity.

b. To add related control objectives, select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the control objectives and select **Add**.
The list shows those control objectives that aren't already added to the related control objectives list of the package.

ATO artifacts for an authorization package

Generate Authority to Operate (ATO) artifacts such as System Security Plan (SSP), Security Assessment Report (SAR), Plan of Actions and Milestones (POA&Ms), Security Assessment Plan (SAP), Authority to Operate (ATO Letter), and Executive Summary from an authorization package in Microsoft Word format. Generating ATO artifacts as Microsoft Word format enhances ease of editing, collaboration, and compliance, confirming professional and portable documents.

ATO artifacts are documents and evidence produced while authorizing a system that supports the compliance of a package with the security standards.

SSP, SAR, POA&Ms, SAP, ATO Letter, and Executive Summary are reports that you can generate for an authorization package. It gives you a consolidated, detailed report about the effectiveness of the system security.

SSP

A document that provides an overview of security requirements for an information system. It describes how a system adheres to the security requirements or how it plans to meet the requirements.

SAR

A structured document that provides the assessment results and recommended guidelines of an assessor in remediating the vulnerabilities found in the security controls.

POA&Ms

A document that gives details as to how to accomplish the elements of the plan, milestones to achieve the tasks, and time line to complete the milestones.

SAP

A document which outlines evaluating and testing security controls and safeguards according to NIST SP 800-37 and organizational policies.

ATO Letter

A document that's based on compliance with security frameworks and a comprehensive risk assessment.

Executive Summary

A document that outlines the comprehensive security assessment of the package, verifying with federal security requirements and relevant authorization frameworks.

Note:
You can generate SSP, SAR, POA&Ms, SAP, ATO Letter, and Executive Summary reports in Microsoft Word where you can update the content in CAM Workspace. Whereas in classic UI, you can generate the SSP report in PDF format using **Generate Report(s)** in the Authorization package form.

To configure the predefined CAM Microsoft Word template, you must navigate to **All** > *Continuous Authorization and Monitoring* > **Administration** and set up the following administrative steps:

- Configuring ATO artifacts report templates using the Document Designer with Word add-in
- Components installed with Continuous Authorization and Monitoring

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate ATO artifacts

From the Authorization package overview record page, generate Authority to Operate (ATO) artifacts in Microsoft Word format. This action enables you to download your ATO artifacts from CAM.

Before you begin

Role required:

- sn_irm_cont_auth.admin
- sn_irm_cont_auth.authorization_official
- sn_irm_cont_auth.info_system_sec_manager
- sn_irm_cont_auth.info_system_sec_officer
- sn_irm_cont_auth.system_owner

Important:

- Set up the ServiceNow Document designer for Word plugin before you create a Microsoft Word template and generate the ATO artifacts reports.

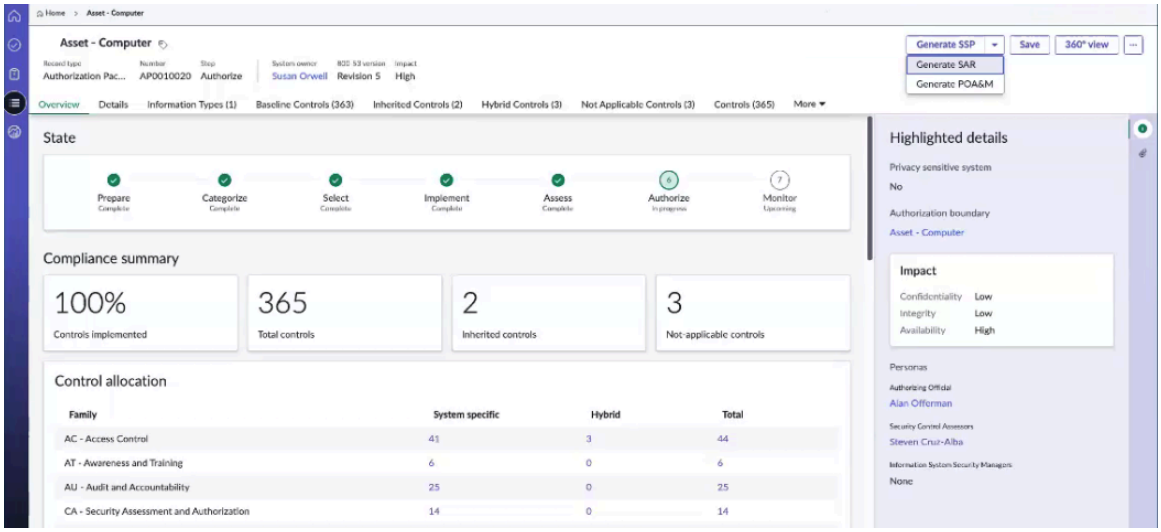
  For more information, see Install the ServiceNow Document Designer add-in.

- Verify using which report type you want to generate the respective ATO artifacts.

  For more information, see Continuous Authorization and Monitoring system properties.

Procedure

1. Navigate to **All** > **CAM Workspace**.
2. To navigate to the Lists page, select the lists icon ( ).
3. From the Authorization packages in the RMF list, select an authorization package record for which you want to generate the reports.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
To generate ATO artifacts, the reports must be in the following state:

State	ATO artifacts
Implement, Assess, Authorize, or Monitor	○ SSP ○ POA&M **Note:** ○ The repetition property "com.snc.word_doc_api.max_repetitions" in the Document designer plugin must be set to 200 to generate an SSP report successfully. For more information, see Reference information for Document designer. ○ For authorization packages with medium or high data limits, increase the number of records to 200 in the template configuration to generate the SSP report successfully. For more information, see Create content configurations for CAM.
Assess, Authorize, or Monitor	○ SAP ○ SAR
Authorize or Monitor	○ ATO Letter ○ Executive Summary

4. To generate an SSP report for the package, select **Generate SSP**.
5. To generate the following report, select the drop-down action icon ( ):
   - To generate an SAR report for the package, select **Generate SAR**.
   - To generate an POA&M report for the package, select **Generate POA&M**.
   - To generate an SAP report for the package, select **Generate SAP**.
   - To generate an ATO letter report for the package, select **Generate ATO Letter**.
   - To generate an Executive Summary report for the package, select **Generate Executive Summary**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Proceed**.
   After the Microsoft Word file is generated, a banner message states that the report has been generated successfully.

   Note:
   When generating a report from an HTML template, the screen remains displayed after you select **Proceed** until the report is fully generated.

   When generating a report from a Word template, the **Proceed** screen disappears, and the report generation takes place in the background.

7. Close the message and select the attachment in the sidebar.
   The Microsoft Word document is also attached to the **Authorization** section of the package in the **Details** related list. You can also select the download icon next to the report to download the file.

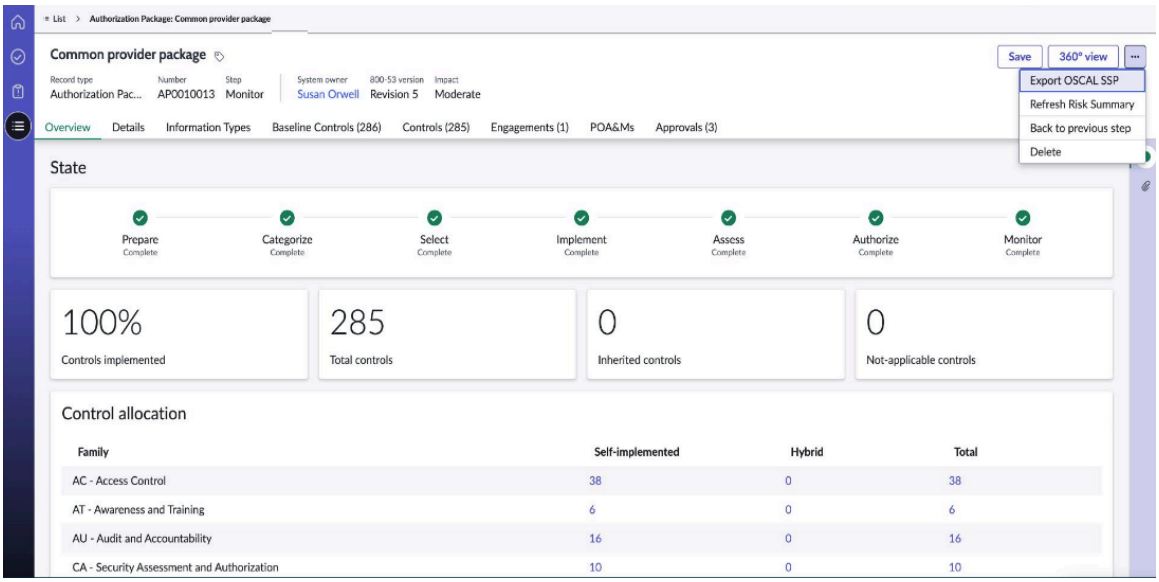
8. Select the more actions icon (...) next to the file with a *.docx* extension and select the **Download** option.
   The downloaded file opens in a Microsoft Word format with all the details. The report is also attached in the **Activity** section of the package with the timestamp and the user who generated it.

   To use the functionality of Generate ATO artifacts for an authorization package using the HTML template, see the Configurations Required to Enable Report Generation for Authorization Package in CAM Workspace [KB1649486] article in the Now Support knowledge base.

Exporting Catalog, Profile, and SSP in OSCAL format

CAM supports the Open Security Controls Assessment Language (OSCAL) used by the National Institute of Standards and Technology (NIST) that provides control-related information in standardised machine readable formats. CAM supports Catalog, Profile, and SSP models.

Exporting SSP in CAM



With CAM, you can generate Catalog, Profile, System Security Plan (SSP) models and export the following:

Catalog

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

According to NIST, the catalog model provides a structured, machine-readable representation of a catalog of controls. Therefore, as part of the catalog model, using CAM you can export the following control-related information:

- Control objectives: These are mapped to controls. The **Reference** field in a control objective maps to the NIST control. The requirements of a control objective map to the statements of the NIST's control. Therefore, each part of the **Description** field in a control objective align with the sub-part of the NIST's control. The child control objectives of each control objective are mapped to the control field. Related control objectives of the control objective are mapped to the links field.
- Control objective requirements: Statements or control requirements that are further broken down from a control objective's description.
- Test templates: Tests done on controls. Each control has at least one test template, which has one assessment objective.
- Assessment Procedures: These are assessment objectives of a test template or the tests done on controls.

Overlay catalog

Overlay controls: These are policies that consist of control objectives and are not part of NIST but can be in an authorization package. Therefore, these are exported as a separate file.

Profile

According to NIST, the profile model provides a structured, machine-readable representation of a baseline. The profile model also represents a baseline of selected controls from one or more control catalogs.

Baseline controls: Small set of control objectives that are auto-populated based on the impact. Impact is decided based on the Information Type of an authorization package.

- Include-controls: These are baseline controls, which are part of the authorization package.
- Exclude-controls: These are baseline controls that have been marked as Not Applicable.

Profile consists of both Catalog and Overlay Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System Security Plan (SSP)

According to NIST, OSCAL SSP model enables a system owner to express the system implementation of an information system within the context of a specific baseline or OSCAL profile. Or, it represents a description of the control implementation of an information system.

- Authorization boundary: An authorization boundary defines the scope of a particular system that can be continuously managed and monitored using the CAM application.
- Authorization package: Created for the purpose of processing the assets or systems through the seven steps mandated by the RMF. For more information, see NIST RMF process overview.
- Information type: Information type defines the impact level of the package, which is based on the criticality of the information system defined in the Categorize step.
- Control: When control objectives move to Implementation state, they become controls.
- Control requirement: When control objectives move to Implementation state, they become controls. Correspondingly, the control objective requirements convert to control requirement.
- Inherited Control: Controls that are entirely inherited from parent authorization package. Then, it means that all the control requirements of each such control are also inherited completely.
- Hybrid Control: These are partially inherited from the parent authorization package.

Source tables to fetch data for the models

Source table	JSON property
Catalog	
Control objective	controls
Control Objective to Control objective requirement	statements parts
Test template to Assessment procedure	assessment objective parts
Control Objective	guidance
Test Template	Assessment-method (Examine)
Test Template	Assessment-method (Interview)

Export data in OSCAL format

From the Authorization package overview record page, generate zip files and export the record's mapped content details in OSCAL format. This action enables you to export your authorization package from CAM.

Before you begin

Role required: sn_irm_cont_auth.authorization_official, sn_irm_cont_auth.info_system_sec_manager, sn_irm_cont_auth.info_system_sec_officer, sn_irm_cont_auth.system_owner

Procedure

1. Navigate to **All** > **CAM Workspace**.
2. In the CAM Workspace, select the List icon ( ).
3. Select Authorization packages from the **RMF** list.
4. From the list view, select the authorization package record for which to generate SSP files.

   Note:
   The authorization package must be in Implement state to generate OSCAL SSP.

5. Select the more actions icon ( ) and then select the **Export OSCAL SSP** option from the list. A message appears stating that the OSCAL report is being processed and that the file will be exported. A zip is generated which contains JSON files along with some diagrams.

   Note:
   If you do not have the Integration Hub Pro entitlement that is not included in the CAM Workspace, then follow the steps in the Generate OSCAL Models without zip [KB1651422] article in the Now Support Knowledge Base to generate the OSCAL models.

6. Refresh the page and select the attachment icon ( ) in the sidebar.
7. Select the action icon ( ) in the oscal-ssp.zip and then select the **Download** option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Right-click the zip file and select **Open** to extract the file contents from the oscal-ssp.zip. You can view the catalog.json, overlay-catalog.json, profile.json, ssp.json files. Additionally, if the authorization package has any diagrams that are mapped to it, then they are also available in the contents of the zip. The diagrams can be a catalog dataflow diagram, network architecture diagram, or an authorization boundary diagram, available as png files in the zip.

> **Note:**
> To customize the OSCAL support solution, see the OSCAL Model customization support [KB1650397] article in the Now Support Knowledge Base.

OSCAL namespace

To include CAM specific information, custom properties with a unique namespace are used to add impact and tailor the content as needed.

Field	Description
impact	Captures control objective impact.
justification	Justification for making baseline control not applicable. Present only when a baseline control is made not applicable.
source	Source of baseline control objective.
impact-change-justification	If recommended impact is changed. This property will contain the justification for change.
category	Category of Information type.
sub_category	Subcategory of information type.
pii-in-identifiable-form	PII information pii-in-identifiable-form.
pii-information-about-public	PII information pii-information-about-public.
privacy-impact-assessment	PII information privacy-impact-assessment.
system-of-records-notice	PII information system-of-records-notice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
privacy-sensitive-system	PII information privacy-sensitive-system.

CAM reference

Reference topics provide the detailed descriptions of tables, properties, forms, and roles that are installed with the CAM application.

CAM user roles

Assign users and groups with roles to prepare them to user the CAM application.

Role permissions and responsibilities

Role title [name]	Description
Authorization Official (sn_irm_cont_auth.authorization_official)	Responsible for accepting an information system into an operational environment at a known risk level. The Authorization Official is entitled to approve and update authorization packages. The role and contains: • sn_irm_cont_auth.reader
Continuous Authorization and Monitoring administrator (sn_irm_cont_auth.admin)	Responsible for all system administration duties in the CAM application. The role contains: • sn_audit.manager • sn_compliance.admin • sn_doc.admin • sn_irm_cont_auth.reader • sn_irm_cont_auth.scheduler
Executive Reader (sn_irm_cont_auth.executive_read)	Read-only access to all modules of the CAM application. The role contains: sn_irm_cont_auth.reader. Users with this role can access CAM Workspace.
Information Owner (sn_irm_cont_auth.information_owner)	Responsible for statutory, management, or operational authority and the establishment of policies and procedures governing its generation, collection, processing, dissemination, and disposal. The user can also update information types of an authorization package. The role contains:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description
	• sn_audit.user • sn_irm_cont_auth.reader
Information System Security Manager (sn_irm_cont_auth.info_system_sec_manager)	Responsible for conducting information system security management activities. They develop and maintain the system-level cybersecurity program. Can update the authorization package. The role contains: • sn_compliance.user • sn_irm_cont_auth.reader
Information System Security Officer (sn_irm_cont_auth.info_system_sec_officer)	Responsible for ensuring that the appropriate operational security posture is maintained for an information system. Can update the authorization package. The role contains: • sn_compliance.user • sn_irm_cont_auth.reader
Reader (sn_irm_cont_auth.reader)	Read-only role. Users with this role can access CAM Workspace. The role contains: • sn_audit.reader • sn_grc_workspace.task_reader • sn_grc_workspace.user • sn_compliance.reader • sn_incident_read • sn_change_read • sn_vul.read_all • sn_si.read
Scheduler (sn_irm_cont_auth.scheduler)	Responsible for running all scheduled jobs for the application. This role is for a technical user. The role contains: sn_irm_cont_auth..system_owner.
Security Control Assessor (sn_irm_cont_auth.sec_control_assessor)	Responsible for conducting a thorough assessment of the management, operational, and technical security controls of an information system. The role contains: • sn_audit.manager • sn_compliance.user • sn_irm_cont_auth.reader

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description
System Owner (sn_irm_cont_auth.system_owner)	Responsible for procuring, developing, integrating, modifying, operating, and maintaining an information system. The role contains: • sn_audit.user • sn_compliance.user • sn_irm_cont_auth.reader
System User (sn_irm_cont_auth.system_user)	Responsible for performing actual work in the system. They can update authorization boundaries, filter, elements, milestones, and acceptance tasks. The role contains: • sn_audit.user • sn_irm_cont_auth.reader • business user

Analytics and Reporting Solutions for CAM

Platform Analytics Solutions contain prepackaged Performance Analytics and Reporting content for use with ServiceNow AI Platform products. The solutions help you to track and analyze CAM performance analytics dashboard reports.

CAM Analytics dashboards

Required roles

The following roles and tasks are associated with this solution:

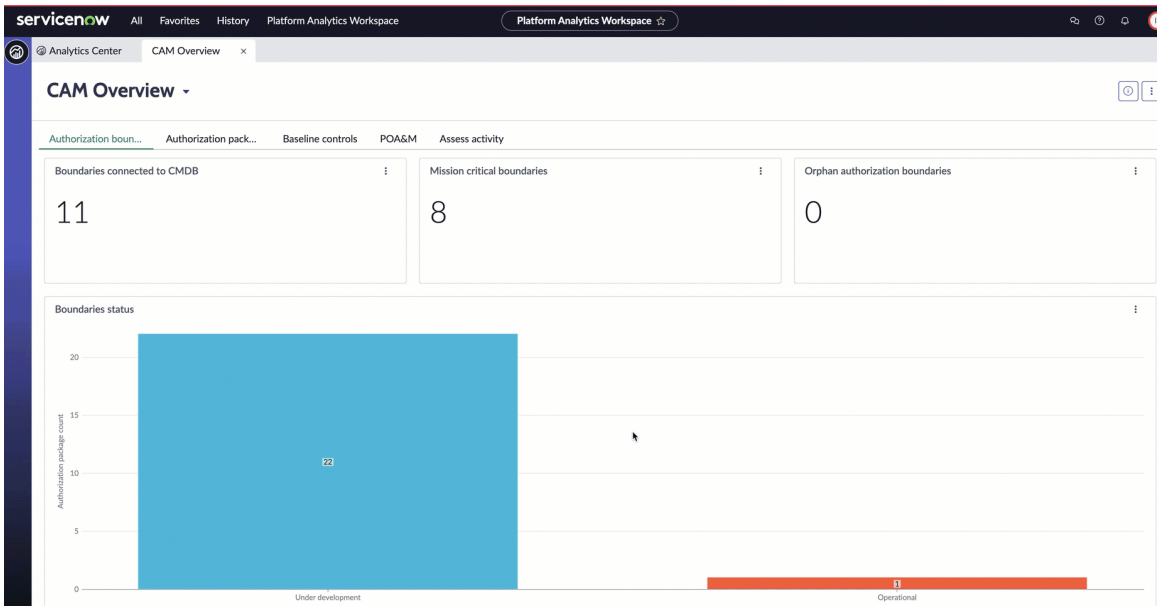
- CAM Administrator (sn_irm_cont_auth.admin): View the reports in the CAM Overview dashboard.
- Authorization Official (sn_irm_cont_auth.authorization_official): View the reports in the AO Overview dashboard.
- Security Control Assessor (sn_irm_cont_auth.sec_control_assessor): View the SCA Overview dashboard.
- Executive Reader (sn_irm_cont_auth.executive_read): View the reports in all the CAM dashboards.
- System Owner (sn_irm_cont_auth.system_owner): Access all the dashboards.
- Information System Security Manager (sn_irm_cont_auth.info_system_sec_manager): Access all the dashboards.
- Information System Security Officer (sn_irm_cont_auth.info_system_sec_officer): Access all the dashboards.

CAM Overview dashboard

The CAM Overview dashboard provides multiple tabs with reports on critical aspects of your CAM security posture.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessing the dashboard



Users with the CAM Administrator [sn_irm_cont_auth.admin] or Executive Reader (sn_irm_cont_auth.executive_read) role can view the tabs on the CAM Overview dashboard.

Users with the following roles can access the dashboard:

- CAM Administrator (sn_irm_cont_auth.admin)
- Executive Reader (sn_irm_cont_auth.executive_read)
- System Owner (sn_irm_cont_auth.system_owner)
- Information System Security Manager (sn_irm_cont_auth.info_system_sec_manager)
- Information System Security Officer (sn_irm_cont_auth.info_system_sec_officer)

To open the dashboard, navigate to **All** > **Continuous Authorization & Monitoring** > **Analytics Dashboards** > **CAM Overview**.

Tabs on the dashboard

Title	Type	Source table	Description
Authorization boundary tab			
Boundaries connected to CMDB	Single Score	System elements [sn_irm_cont_auth_boundary_element]	The number of authorization boundaries defined to work with your CMDB.
Mission critical boundaries	Single Score		The number of authorization boundaries defined as being mission critical. For more information, see Define the authorization boundary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Source table	Description
Orphan authorization boundaries	Single Score		The number of authorization boundaries not related to an authorization package.
Boundaries status	Bar chart		The number of authorization boundaries in each state.
Authorization packages tab			
Packages with overridden impact	Single Score		The number of authorization packages with an impact that have been overridden. For more information, see RMF step 1 - Categorize the authorization package.
Packages pending approval	Single Score		The number of authorization packages for which approval has been requested, but that haven't yet received approval.
Packages by impact	Bar chart		The number of authorization packages categorized by impact levels.
Packages by step	Bar chart		The number of authorization packages categorized by steps (for example, Monitor, Access, Select, and so on).
Baseline controls tab			
Packages with inherited controls	Single Score		The number of authorization packages that contain baseline controls inherited from a common control.
Packages with common controls	Single Score		The number of authorization packages for which common controls were created and implemented.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Title	Type	Source table	Description
Packages with unimplemented controls	Single Score		The number of authorization packages for which common controls were created, but haven't yet been implemented.
POA&M tab			
Pending POA&Ms	Single Score		The number of Plans of Action and Milestones (POA&M) that are pending authorization.
POA&Ms with milestones	Single Score		The number of POA&Ms that contain milestones.
POA&Ms with acceptance tasks	Single Score		The number of POA&Ms that contain acceptance tasks.
Overdue POA&Ms	Single Score		The number of POA&Ms that have overdue milestones or acceptance tasks.
POA&Ms by state	Bar chart		The number of POA&Ms categorized by state.
Packages with POA&Ms	Bar chart		The number of authorization packages that contain POA&Ms.
POA&Ms by priority	Bar chart		The number of POA&Ms categorized by priority.
POA&Ms by response	Bar chart		The number of POA&Ms categorized by responses.
Assess activity tab			
Inadequate engagements	Single Score		The number of engagements closed with an inadequate result.
Satisfactory engagements	Single Score		The number of engagements closed with a satisfactory result.
Adequate engagements	Single Score		The number of engagements closed

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

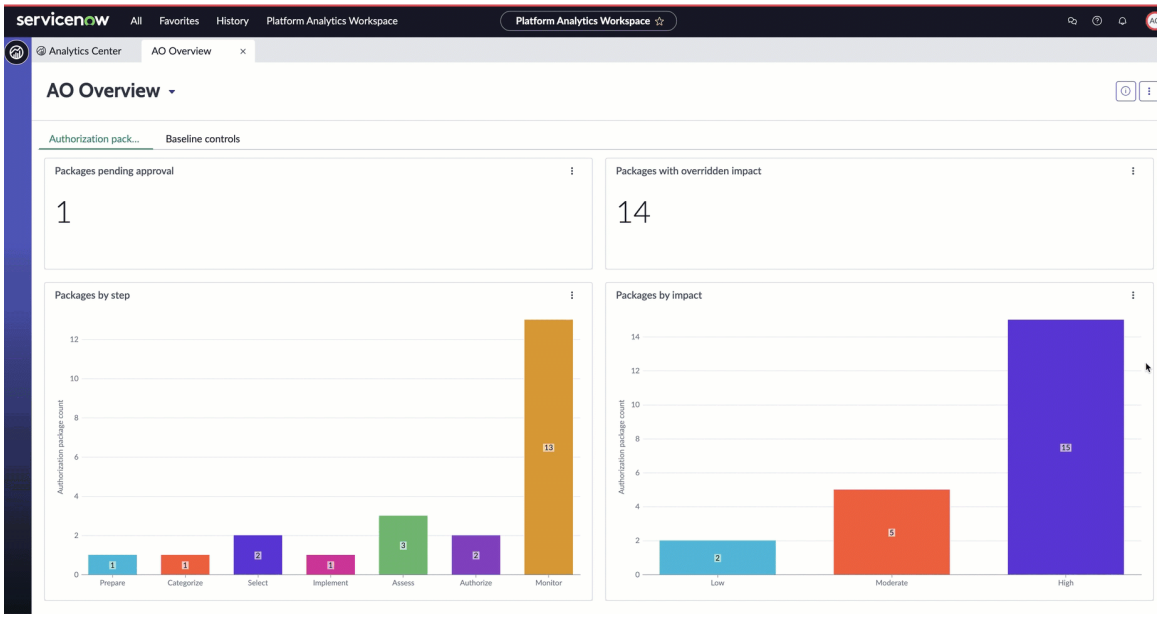
Title	Type	Source table	Description
			with an adequate result.
Controls by engagement	Bar chart		The number of controls categorized by engagements.
Audit task breakdown	Bar chart		Audit tasks grouped or stacked, or both, by task type, assigned user, top task, or state.
POA&M breakdown	Bar chart		POA&Ms grouped or stacked, or both, by engagement, state, or response.
Control test results	Donut chart		The number of completed control tests, broken down by overall control effectiveness rating.
Engagement results	Bar chart		An overall count of audit engagements conducted for each entity. The chart is stacked to display the overall audit results for each entity.
Overdue audit tasks	List		List of open audit tasks that have exceeded the planned end date.

AO Overview dashboard

Users with the Authorization Official [sn_irm_cont_auth.authorization_official] role can view the reports in the AO Overview module.

Important:
Starting with version 18.1.2 of CAM users on Vancouver or Washington DC can view the AO Overview dashboard in the Next Experience UI Framework.

For more information on navigation steps and dashboard appearance, see Analytics and Reporting Solutions for CAM.



Accessing the dashboard

Users with the following roles can access the dashboard:

- CAM Administrator (sn_irm_cont_auth.admin)
- Executive Reader (sn_irm_cont_auth.executive_read)
- Authorizing Official (sn_irm_cont_auth.authorization_official)

To open the dashboard, navigate to **All** > **Continuous Authorization & Monitoring** > **Analytics Dashboards** > **AO Overview**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AO Overview - Authorization Packages tab

The Authorization Packages tab on the AO Overview dashboard provides central visibility into the state of all packages. The reports on the Baseline Controls tab provide a general overview of the baseline controls in your system.

Reports on the Authorization Packages tab

Report	Description
Packages Pending Approval	The number of authorization packages for which approval has been requested, but that haven't yet received approval.
Packages with Overridden Impact	The number of authorization packages with an impact that have been overridden. For more information, see RMF step 1 - Categorize the authorization package.
Packages by Step	The number of authorization packages categorized by steps (for example, Monitor, Access, Select, and so forth).
Packages by Impact	The number of authorization packages categorized by impact levels.
Pending Approvals	A list of all packages pending approval.

AO Overview - Baseline Controls tab

The reports on the Baseline Controls tab on the AO Overview dashboard provide a general overview of the baseline controls in your system.

Reports on the Baseline Controls tab

Report	Description
Packages with Unimplemented Controls	The number of authorization packages for which common controls were created, but haven't yet been implemented.

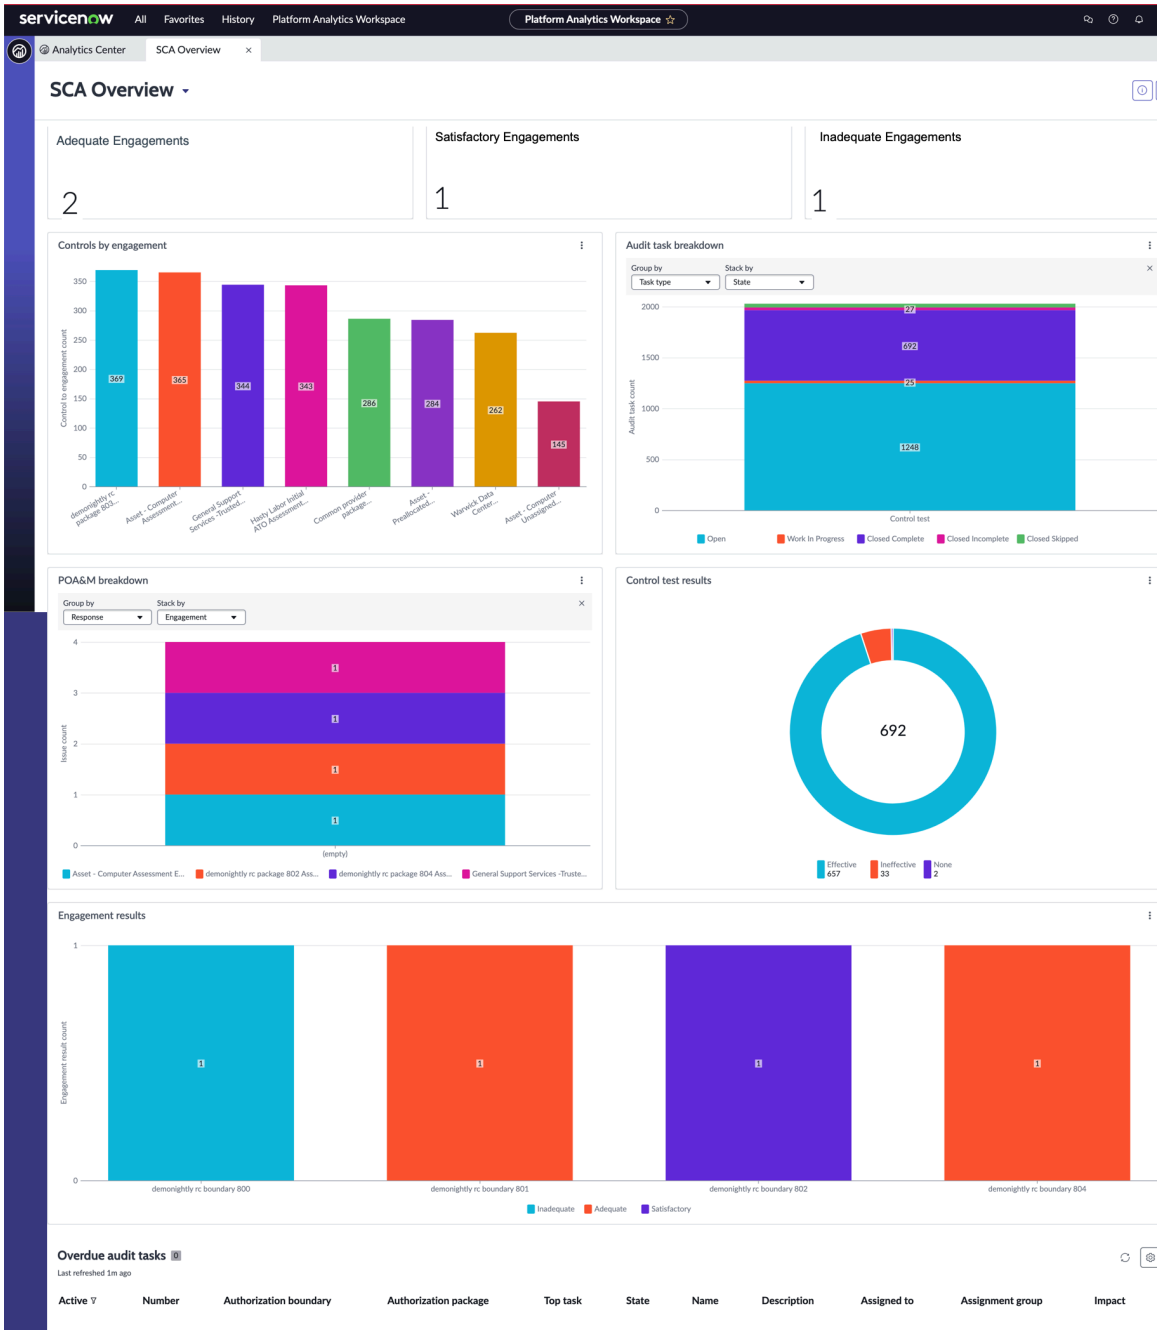
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reports on the Baseline Controls tab (continued)

Report	Description
Packages with Inherited Controls	The number of authorization packages that contain baseline controls inherited from a common control.
Packages with Common Controls	The number of authorization packages for which common controls were created and implemented.
Compliance Score Percentage	Compliance score percentages for policies grouped by name or number.

SCA Overview dashboard

The SCA Overview dashboard enables you to view and manage control assessments as they occur.



Accessing the dashboard

Users with the following roles can access the dashboard:

- CAM Administrator (sn_irm_cont_auth.admin)
- Executive Reader (sn_irm_cont_auth.executive_read),
- Security Control Assessor (sn_irm_cont_auth.sec_control_assessor)

To open the dashboard, navigate to **All** > **Continuous Authorization & Monitoring** > **Analytics Dashboards** > **SCA Overview**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reports on the SCA Overview dashboard (continued)

Report	Description
Audit Task Breakdown	Audit tasks grouped or stacked, or both, by task type, assigned user, top task, or state.
POA&M Breakdown	POA&Ms grouped or stacked, or both, by engagement, state, or response.
Control Test Results	The number of completed control tests, broken down by overall control effectiveness rating.
Engagement Results	An overall count of audit engagements conducted for each entity. The chart is stacked to display the overall audit results for each entity.
Overdue Audit Tasks	List of open audit tasks that have exceeded the planned end date.

Fields on the Authorization Boundary form

An authorization boundary defines the scope of a particular system that can be continuously managed and monitored using the CAM application.

Authorization Boundary form

Field	Description
Name	A unique and descriptive name for this boundary.
Description	A description for this boundary.
Operational status	The operational status: • Under development • Reauthorize • Operational • Decommissioned
Mission critical	Option to set the boundary as mission-critical.
System owner	The individual responsible for procuring, developing, integrating, modifying, operating, and maintaining an information system.
Information owners	The individuals responsible for statutory, management, and operational authority.
System users	The users responsible for performing the actual work on the system.
Diagrams	If needed, or if you do not have a Configuration Management Database (CMDB), add data flow, network, and boundary diagrams.

Fields on the Authorization Package form

After you have defined the authorization boundaries for the assets or systems to send through the Authorization to Operate process, you must create an authorization package for that purpose. The package is processed through the seven steps mandated by the RMF.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authorization Package form

Field	Description
Number	Auto-generated authorization package number.
Name	A name for the package.
Acronym	If needed, an acronym for identifying the package.
Missions/ Business processes	The appropriate business process for this authorization package. Business processes are defined on the ServiceNow AI Platform; for example, at **Policy & Compliance** > **Scoping** > **Business Processes**.
Active	Activate the authorization package.
Step	The RMF step currently assigned to the package.
Authorization boundary	The authorization boundary for this package.
System purpose	The purpose behind this authorization package.

Fields on the Roles and Responsibilities tab

On the **Roles and Responsibilities** tab, you specify the responsibilities of various stakeholders during the review and approval process.

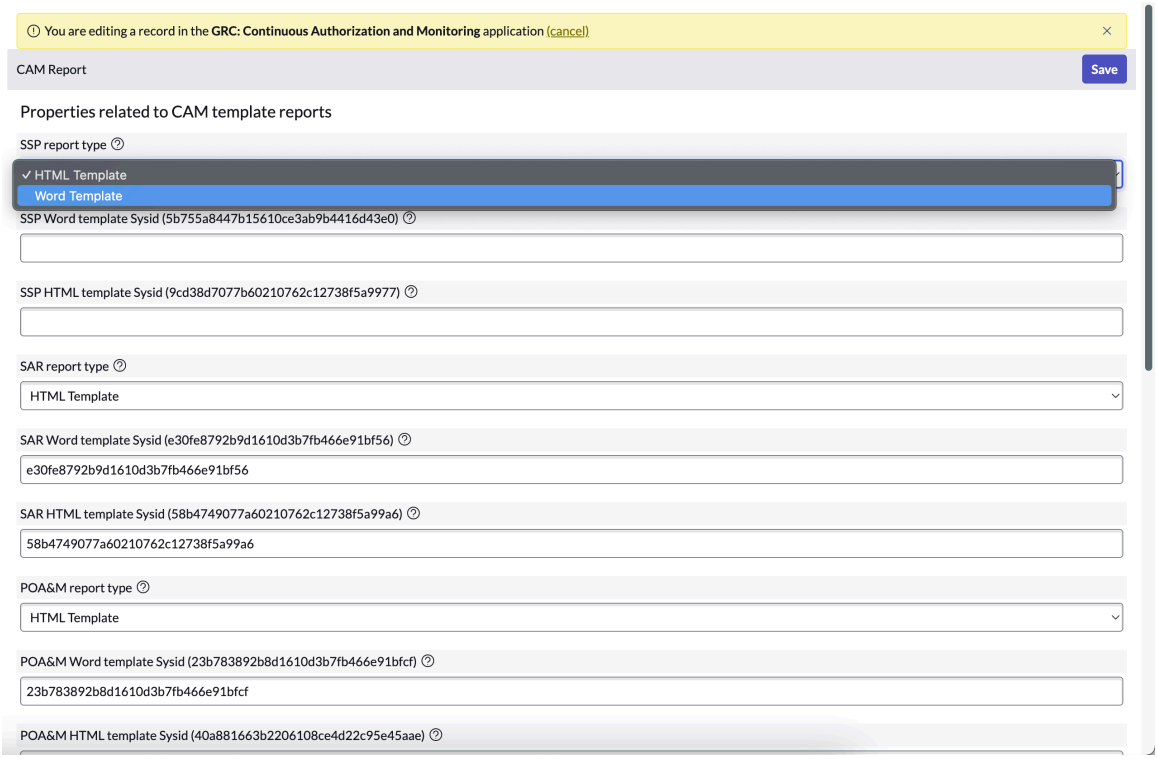
CAM roles that are required for particular tasks are listed in CAM user roles.

Roles and Responsibilities tab

Role	Responsibilities
System owner	The individual responsible for procuring, developing, integrating, modifying, operating, and maintaining an information system.
Authorizing Official (AO)	The individual responsible for accepting an information system into an operational environment at a known risk level. Typically, this person is at the CISO or deputy CISO level.
Authorizing Official Designated Representatives (AODR)	One or more AODRs.
Security Control Assessors (SCA)	The individuals responsible for conducting a thorough assessment of the controls of an information system.
Information System Security Managers (ISSM)	The individuals responsible for conducting information system security management activities as designated by the ISSO.
Information System Security Officers (ISSO)	The individuals responsible for ensuring that the appropriate operational security posture is maintained for an information system.
Information owners	The individuals responsible for statutory, management, and operational authority.
System users	The users responsible for performing the actual work on the system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components installed with Continuous Authorization and Monitoring



Activating the GRC: CAM plugin adds or modifies several tables, user roles, and other components.

Continuous Authorization and Monitoring system properties

Default properties are set with activation of CAM plug-in.

To configure the CAM report properties, navigate to **All** > *Continuous Authorization and Monitoring* > **Administration** > **Report Properties**.

Enter the days in the **Auto generate engagement** field to automatically create the next engagement in the authorization package. The days entered in the **Auto Generate Engagement** field in System Properties are subtracted from the next authorization date to determine the next engagement date, which is recorded in the authorization package. For more information, see View package details in CAM Workspace.

Name	Description	Options	Default Value

Configuring ATO artifacts report templates using the Document Designer with Word add-in

Configure the ATO artifacts report templates using the ServiceNow Document Designer with Word add-in.

Perform the following steps to successfully configure the ServiceNow Document Designer with Word add-in and create your ATO artifacts report templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install the ServiceNow Document Designer add-in

Install ServiceNow Document Designer add-in to your Microsoft Word document. This add-in is required to create audit and CAM report templates.

Before you begin

Ensure that the following plugins are activated:

- sn_grc_doc_design
- sn_outlook_addin

Role required: sys_admin

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In Manifests**.
2. From the Office Manifests list, select **ServiceNow Document Designer**.
3. Select **Download Manifest**.
4. To enable the add-in, contact your Microsoft 365 account manager who can use the manifest file you downloaded in step 3.

What to do next

For detailed instructions on how to deploy the manifest file, see the Deploy add-ins in the Microsoft 365 admin center [KB1307378] article in the Now Support Knowledge Base.

To configure the HTTP response headers for add-in for Microsoft Word in the browser, see the Response header resolution [KB1434453] article in the Now Support Knowledge Base.

Create content configurations for CAM

Define the data that you want to view or fetch, whether it's a list of records or an aggregation when creating an ATO artifacts. For example, specify if you want to see a list of closed POA&M or the list of system elements. A maximum of 200 records can be fetched from any table.

Before you begin

Role required: sn_grc_doc_design.admin and sn_irm_cont_auth.admin

Procedure

1. Navigate to **All** > *Continuous Authorization and Monitoring* > **Administration** > **Template configuration**.
2. Open the template for which you want to create content configurations.
3. On the Content configurations related list, select **New**.
4. On the form, fill in the fields.

Content configuration form

Field	Description
Name	Name of the content configuration. For example, `List of remediation tasks`.
Template configuration	Template configuration for which you're defining the content configuration. This field is automatically set based on the configuration you selected in step 2.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target table	Table from which data must be fetched.
Data relationship	Data relationship for which you want to create content configurations. Only the data relationships that you have previously created are available for selection.

5. Build the Filter criteria and the Aggregation criteria as required.
6. To specify table or data that you want to insert in the content block as a table, select the **Content block criteria** tab.
   a. In the **Parent block configuration** field, select the required content configuration.
   b. Select **Submit**.
7. In the Data columns related list, specify the columns you want on the report from the table that you have selected.
   You can either specify the standard columns available or you can write a custom script for the column.
8. Specify the order of the columns as they must appear on the ATO artifact report template.
9. Select **Update**.

Word template form

The table gives a description of the field values for the Word template form.

Word template form

Field	Description
Name	Unique name of the Word template for the table that is selected in the Table field.
Category	Classification or group to which the Word template belongs. For example, Audit for audit-related Word template. To create a Word template category, see Word template category form.
Table	Record table for which the Word template is being created.
Document	Word template that was created based on content configuration. **Note:** The document must be a docx file only. If you attach a document that is in any other format, then an error message appears.
State	State of the Word template record defaults to Draft.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Word template form (continued)

Field	Description
	• Draft: Defaults to Draft state when you open the record. • Published: When the Word template record is published. You can't update the record in the published state. • Edit: State in which the record details can be updated. **Note:** The Word template record in Edit state can't be used for report generation. The record isn't available to select in the Generate report pop-up. See Generate a report for an engagement in a classic report template.
Active	Option to activate the record.
Word document generation configurations	
Cloud enabled	Option to manage the generated report either as a sys_attachment in the engagement record or as a cloud document. You can access the document in the cloud either from the Microsoft SharePoint or Google Drive site based on your cloud upload configuration. For more information, see Manage your documents and work papers with Audit Management as cloud files.
Post processing action	Option to update the generated Word template report with fields from the Report section of the Engagement record. Options are: • **Populate audit word template and report fields**: If you choose Word report-based template, the fields from the Report section of the Engagement record populate in the Word report. **Note:** This option is available only if Audit Management application is installed. • **None**: Report is generated as a sys attachment or a cloud file. However, no post

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Word template form (continued)

Field	Description
	processing action happens to add or update any report-based fields of the engagement record to the Word report that is generated.

Word template category form

The table gives a description of the field values for the Word template category form. Template categories enable you to categorize similar reports and filter them accordingly. For example, Audit is a category.

Word template category form

Field	Description
Name	Unique name for the Word template category.
Active	Option to make the record active.

Model Risk Management

The ServiceNow® Model Risk Management application enables you to identify, assess, validate, and address risks associated with a model throughout their life cycle.

Exploring Model Risk Management

Learn how you can use the Model Risk Management application to identify, assess, and mitigate risks related to the quantitative models.

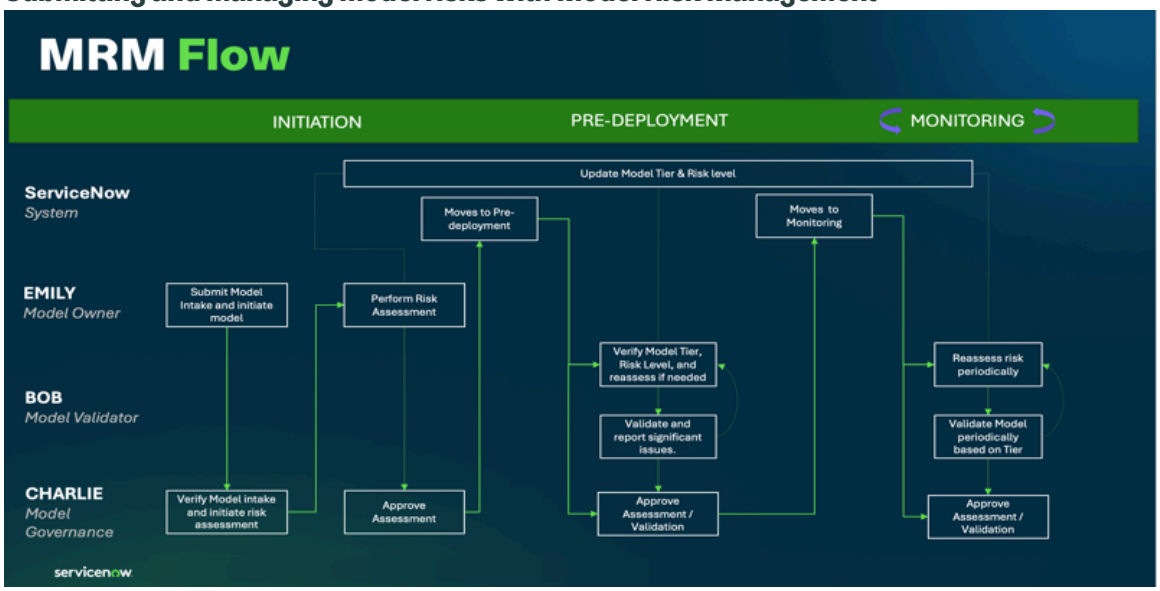
Model Risk Management overview

The Model Risk Management (MRM) application provides a unified solution to help organizations proactively manage the risks associated with the use of models. It offers a structured approach to identify, assess, validate, and address model risks throughout the model life cycle. This approach reduces operational and compliance risks caused by inconsistent or inadequate model oversight.

For example, a financial institution uses a Value at Risk (VaR) model to estimate potential trading losses. Without proper validation, the model can underestimate risk, leading to poor capital allocation. By using the MRM application, the bank can validate the model regularly, document assumptions, track issues, and confirm it meets regulatory standards. This reduces risk and supports better decision-making.

Model Risk Management users

Users



User	Description
Model Owner	Oversees the model life cycle and monitors its performance.
Model Developer	Designs and builds models aligned with business requirements.
Model Validator	Performs independent validation to confirm model accuracy, reliability, and robustness.
Model Governance	Reviews models for risk and compliance and approves models based on governance standards.
Executive Management	Provides strategic oversight and makes high-level decisions informed by model risk insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model Risk Management workflow

The following section describes the steps from the submission of a model risk in the Employee Center to the assessment and monitoring of the risks associated with that model.

Submitting and managing model risks with Model Risk Management

1. An employee can use the Employee Center and submit a new model request.
2. A new model record is automatically created in the model inventory and can be assessed in the Model Risk Workspace.
3. The Model Governance team reviews the submitted model, fills in the required details such as stakeholders, and then creates relevant assessments.
4. The Model Owner performs the risk assessment on the model and submits it to the Model Governance team for review. The assessment task is then sent for approval to the defined approvers configured in the Approver Configurator.
5. The Model Governance team reviews and approves the assessment. The model then moves to the Pre-deployment stage.
6. The Model Governance team creates and assigns the validation task to the validator.
7. The model validator validates the model, collects required documents, reports any issues, and decides if the model is fit for use.
8. The validation task is then sent for approval to the defined approvers configured in the Approver Configurator.
9. The model then moves to the Monitor stage.
10. The Model is periodically assessed and validated to confirm regulatory compliance and effective risk management.

Model Risk Management benefits

Model Risk Management benefits

Feature	Benefit	Users
Model Inventory	Provides a single, reliable source of truth for all models, enabling faster oversight and informed decision-making.	• Model Governance • Model Owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model Risk Management benefits (continued)

Feature	Benefit	Users
		• Model Validator • Model Risk Owner • Model Risk Coordinator
Model Risk Life-cycle	Manages the full model life-cycle by tracking models from initiation to monitoring through defined governance stages, confirming consistent governance and lowering operational and compliance risk.	• Model Governance • Model Owner • Model Validator • Model Risk Initiator • Model Risk Coordinator
Model Risk Assessment	Helps quickly identify and prioritize high-risk models so resources focus where they matter most. To perform a model risk assessment and evaluate the risks associated with a quantitative model, refer to Perform model risk assessment.	• Model Owner • Model Validator
Model Validation	Builds confidence in model reliability through independent checks that reduce errors and regulatory concerns. To perform model validation, refer to Perform model validation.	Model Validator
Model Documentation	Makes it easy to maintain clear, audit-ready documentation that streamlines reviews and improves transparency. To link documents from your repository to a model record, refer to Link existing documents to a model record.	• Model Governance • Model Validator • Model Risk Coordinator
Model Issue & Remediation	Enables timely detection and resolution of model issues, minimizing business disruption and confirming continuous compliance. To report an issue, refer to Create an issue for model.	• Model Governance • Model Validator • Model Risk Coordinator

What to explore next

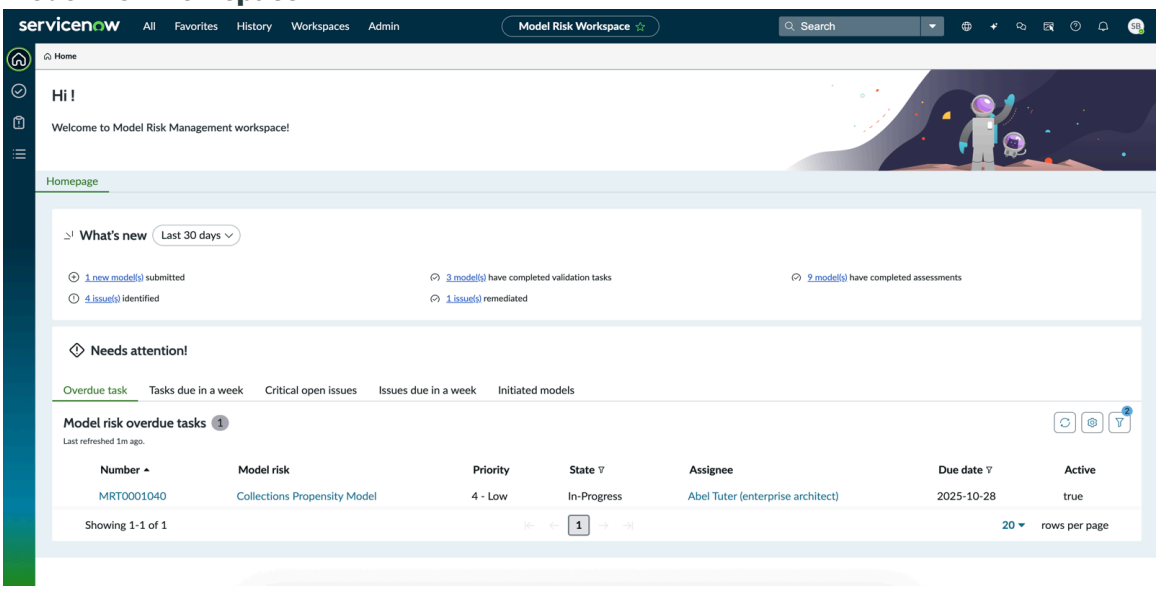
Model Risk Workspace

The Model Risk Workspace enables the model risk governance team and model validators to view the action items that require their immediate attention.



The Model Risk Workspace gives model risk governance teams and model validators a centralized environment to monitor, track, and act on model-related tasks and issues. It organizes key information into easily accessible tabs, helping you prioritize your work and take timely risk management actions.

It displays overdue items, upcoming deadlines, critical issues, new initiated models, and the status of models throughout their life cycle. The workspace enables teams to make informed decisions quickly and reduces the need to navigate multiple pages or reports.

You can access the Model Risk Workspace by navigating to **All** > **Model Risk Workspace**.

The Homepage of the Model Risk Workspace contains the following information:

Model Risk Workspace

Tab	Description
What's new	The What's new section shows information based on the selected time period of 30, 60, and 90 days.
Needs attention	
Overdue task	Lists model risk tasks that have passed their due date and require immediate action.
Tasks due in a week	Lists model risk tasks with deadlines within the next seven days, enabling you to plan ahead.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tab	Description
Critical open issues	Shows unresolved high-severity issues related to the model risk that may significantly impact compliance or operations.
Issues due in a week	Shows issues that must be resolved within the next seven days, enabling you to plan ahead.
Initiated models	Lists models that have been created but haven't yet progressed to later life cycle stages such as assessment or validation.

Configuring Model Risk Management

Plan and configure the implementation of the Model Risk Management application. You can follow the steps listed in this topic.

Configuration overview

1. Install Model Risk Management

   Install the Model Risk Management application (sn_model_risk_mgmt) with the admin role. The application installs related ServiceNow® Store applications and plugins if they aren't already installed.

2. Configure scoring logic for model risk assessments

   Configure the scoring logic for Smart Assessment templates that you use to assess the model risks.

Install Model Risk Management

Install the Model Risk Management application (sn_model_risk_mgmt). The application installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Model Risk Management application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Check your entitlements to determine whether you have access to Model Risk Management.

Role required: sn_model_risk_mgmt.admin

About this task

The following items are installed with Model Risk Management:

- Plugins
- Store applications
- Roles
- Tables
- Properties

For more information, see Model Risk Management reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Model Risk Management application (sn_model_risk_mgmt) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you're displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Configure Model Workflow Settings

Configure the conditions and frequency for scheduling assessment and validation tasks to maintain a structured and timely approach to model risk management.

Before you begin

Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.admin

About this task

This task explains how to configure the frequency for assessment and validation tasks, and define filter conditions. You can schedule assessment and validation tasks for a model risk in the Monitor stage. Based on the configuration, tasks are automatically created for model risks that match the defined conditions in the workflow settings.

Note:
Models with customized frequencies at the model risk record level aren't affected.

To manually schedule assessment and validation tasks from the model risk record, refer to Schedule assessment and validation tasks.

Procedure

1. If you're a Model Risk Management admin [sn_model_risk_mgmt.admin], navigate to **All** > **Model Risk Configuration** > **Model Workflow Settings**, and continue from step 3.
2. Users with sn_model_risk_mgmt.model_governance role, navigate to **All** > **Model Risk Workspace** and do the following:
   a. Select the list  icon.
   b. From the list, navigate to **Model risk configurations** > **Model workflow settings**.
   c. Continue from step 3.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **New**.
4. On the Create New Model Workflow Settings form, fill in the fields.

Create New Model Workflow Settings

Field	Description
Name	Unique name of the model workflow settings.
Table	Table that the workflow setting applies to. This field is automatically set to **Model Risk**.
Priority	Priority level for this workflow setting. If multiple workflow settings match the same conditions, the system uses the one with the highest priority.
Active	Option to activate the workflow setting. When active, the defined scheduling rules and frequencies are applied to the filtered models.
Filter condition	Conditions that determine which model records the workflow applies to. Select **Set conditions** to choose filter criteria. For more information, refer to Condition builder.

5. Select **Save**.
6. To update task schedules, go to the **Frequency settings** tab.
7. Define the task frequency for Model risk assessment and Model validation task types.
8. On the Frequency form, fill in the fields.

Frequency form

Field	Description
Frequency	Option to define how often the assessments and validations should occur.
Duration (days)	Number of days within which the assessment or validation must be completed after it's scheduled.
Repeat every	Interval value for how often the task repeats. For example, enter 2 to repeat every 2 units of the selected period. You can select the unit value in the **Period** field. This field appears only when **Custom** is selected from **Frequency** field.
Period	Time unit for the custom interval. The options are as follows: ○ **Days** ○ **Weeks** ○ **Months** ○ **Years** This field appears only when **Custom** is selected from **Frequency** field.

Note:
Updating the frequency applies the change to all filtered models, except those where the frequency is modified at the model level.

9. Select **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Model Risk Management

Use the Model Risk Management to identify, assess, and mitigate risks related to the quantitative models.

Request a new model

Request a new model in the Employee Center to initiate the model intake process and capture all required details for review and approval.

Before you begin

Role required: sn_model_risk_mgmt.model_owner or sn_grc_emp_user.grc_employee

Any employee [sn_grc_emp_user.grc_employee] can request a model, when the Employee User application is installed.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. On the Employee Center landing page, select **Risk and compliance**.
3. Select the **New Model Intake** card.
4. On the form, fill in the fields.

   For a description of the field values on the New Model Intake form, see New Model Intake form.

5. Select **Submit**.
   A new model record is created and submitted to the Model Governance team to review.

New Model Intake form

Use the New Model Intake form to request a new model by providing details such as the purpose, owner, model complexity, and expected outputs.

See the following table for a description of the field values.

New Model Intake form

Field	Description
What is the name of the model?	Unique name of the model that reflects its purpose and functionality. For example, `VaR-Cashflow Forecasting Model`.
Can you provide a brief description of the model's functionality?	Brief summary explaining what the model does and how it functions. For example, `This model calculates market risk exposure using pricing models, value at risk, and projected cash flows based on market data inputs.`
What is the purpose of this model?	Specific business objective or problem the model is designed to address.
Who is the model owner?	Individual accountable for the model’s oversight and performance.
Who is the model developer?	Individual responsible for designing and building the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New Model Intake form (continued)

Field	Description
What type of model is this?	Classification of the model, such as statistical, machine learning, or rule-based. The options are as follows: • Statistical Model • AI Model
Is this model sourced from a third-party provider?	Option to indicate whether the model has been obtained from an external vendor or service provider.
What category does the model fall under?	Internal classification based on the model's use case. The options are as follows: • **Retail**: Models designed for individual customer products or services, such as personal loans, credit cards, or consumer risk assessment. • **Corporate**: Models used for business or institutional clients, typically involving larger exposures or complex financial products.
What data will be used as inputs for this model?	Details about the data sources or datasets the model uses.
What is the expected output of the model?	Result or prediction generated by the model based on input data. For example, Value at Risk (VaR) or projected cash flows.
What is the anticipated level of model complexity?	Estimated level of model complexity. The options are as follows: • Simple • Moderate • Complex

Note:
The fields shown in the intake form are sample basic fields. You can configure additional fields and update choice values as needed to meet your specific requirements.

Initiate a model risk assessment

Initiate a model risk assessment by verifying the details, assigning stakeholders, and create an assessment using the Model Risk Management application.

Before you begin

Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.risk_coordinator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **Initiation**.
4. Select the model.
5. On the Details card, review and modify the field values copied from the model intake form.

Details card

Field	Description
Name	Unique name of the model that reflects its purpose and functionality. The field value is auto-populated from the model intake form entry. You can edit the name as required.
Description	Brief summary explaining what the model does and how it functions. The field value is auto-populated from the model intake form entry. You can edit the description as required.
Purpose	Specific business objective or problem that the model is designed to address. The field value is auto-populated from the model intake form entry. You can edit the purpose as required.
Active	Option to indicate whether the model is in use.
Model classification	Identification of whether the item qualifies as a model or not. The options are as follows: ○ Model: Meets the criteria to be treated as a model. ○ Non Model: Doesn't meet the criteria for classification as a model.
Model type	Classification of the model, such as statistical, machine learning, or rule-based. The options are as follows: ○ Statistical Model ○ AI Model
Third party model	Option to indicate whether the model has been obtained from an external vendor or service provider.
Model category	Internal classification based on the model's use case. The options are as follows: ○ **Retail**: Models designed for individual customer products or services, such as personal loans, credit cards, or consumer risk assessment. ○ **Corporate**: Models used for business or institutional clients, typically involving larger exposures or complex financial products.
Model complexity	Estimated level of model complexity. The options are as follows: ○ Simple ○ Moderate ○ Complex
Input data	Details about the data sources or datasets the model uses.
Output data	The result or prediction generated by the model based on input data. For example, Value at Risk (VaR) or projected cash flows.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

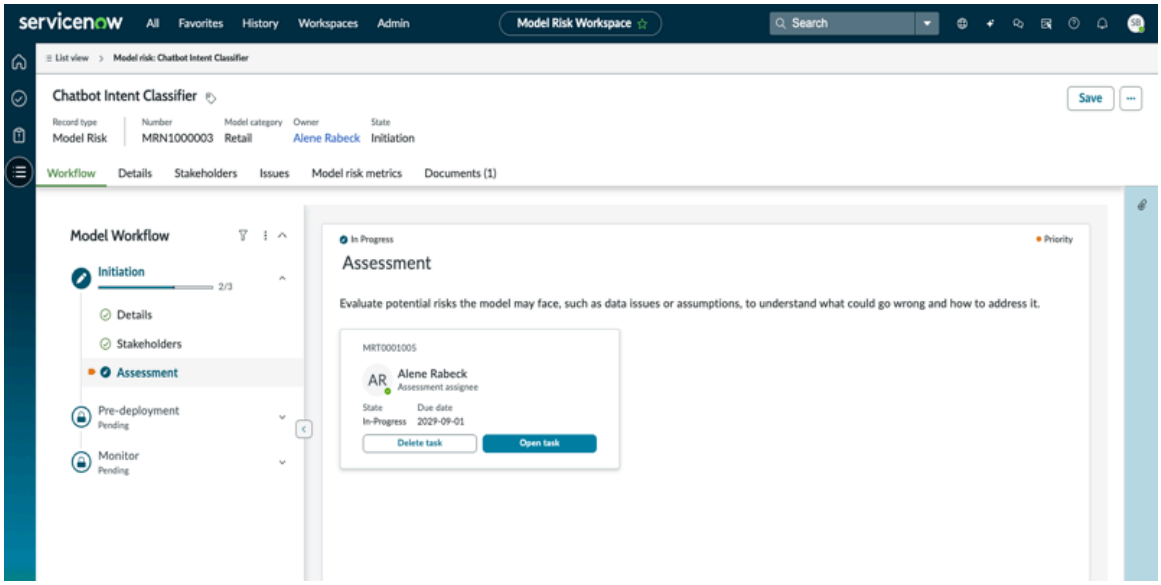
Field	Description
Attachments	Option to attach any supporting files or documents.

6. **Optional:** To save the information entered in Details card, select the **Save** button next to the **Mark as complete** button.
7. Select **Mark as complete**.
   The Stakeholders stage in the Model Workflow playbook opens.
8. Select **Edit** to define the Persona, Group, and Users.

   Note:
   The **Users** field is auto-populated with the model owner and model developer defined in the model intake form. A user with the Model Risk Governance or Model Risk Coordinator roles can edit stakeholders at any point in the workflow.

9. Select **Mark as complete** to move to the Assessment stage.

   Note:
   If you update the model owner in the stakeholder list, the model record continues to display the name of the user who submitted the model request as Owner. However, all ongoing activities are assigned to the new model owner selected in the stakeholder list.



10. Select **Create assessment**.
11. On the Model Risk Assessment dialog, fill in the fields.

Model Risk Assessment

Field	Description
Assessment template	Predefined template that outlines the structure, questions, and scoring logic for the assessment. This field is auto-populated with the default assessment template.
Assessment assignee	Individual assigned to complete the assessment task. This field is auto-populated with the model owner name.
Due date	Date by which the assessment task must be completed.

12. Select **Create**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A model risk task is created and assigned to the model owner.

What to do next

Perform model risk assessment

Perform model risk assessment

Perform the model risk assessment initiated by the Model Governance team to identify and assess the risks related to a quantitative model using the Model Risk Management application.

Before you begin

Role required: sn_model_risk_mgmt.model_owner or sn_model_risk_mgmt.model_validator

Note:
To perform the model risk assessment from the GRC task page, you must assign either the business_user or business_user_lite role to sn_model_risk_mgmt.model_owner.

Procedure

1. Navigate to **All** > **Self-Service** > **Employee Center**.
2. Under My active items, select **GRC tasks**.
3. Select the model risk assessment from the My to-dos card.
4. Respond to all the factors or questions listed in the Materiality Assessment.
5. Respond to all the factors or questions listed in the Risk Assessment.
6. Select **Submit**.
   After you submit your responses, you are no longer able to modify them.

Result

The model risk task is submitted for approval. If no approvers are configured, the model directly moves to the Pre-deployment state.

Create a validation task

Create a validation task by selecting a predefined validation template, assigning a validator, and setting a due date. This task defines the validation scope and responsibilities, preparing the model for formal validation and deployment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.risk_coordinator

About this task
You can create a validation task for a model when it is in the Pre-deployment or Monitor stage.

Procedure
1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. Select the model for which you want to create a validation task.
4. In the Pre-deployment state, select **Create task**.
5. On the Model Validation dialog, fill in the fields.

Model Validation

Field	Description
Validation checklist template	Predefined template that outlines the structure, questions, and scoring logic for the assessment. This field is auto-populated with the default assessment template.
Validation assignee	Individual assigned to complete the validation task. This field is auto-populated with the assignee name selected as a validator in the stakeholder list. You can select only those users who are specified as stakeholders.
Due date	Date by which the validation task must be completed.

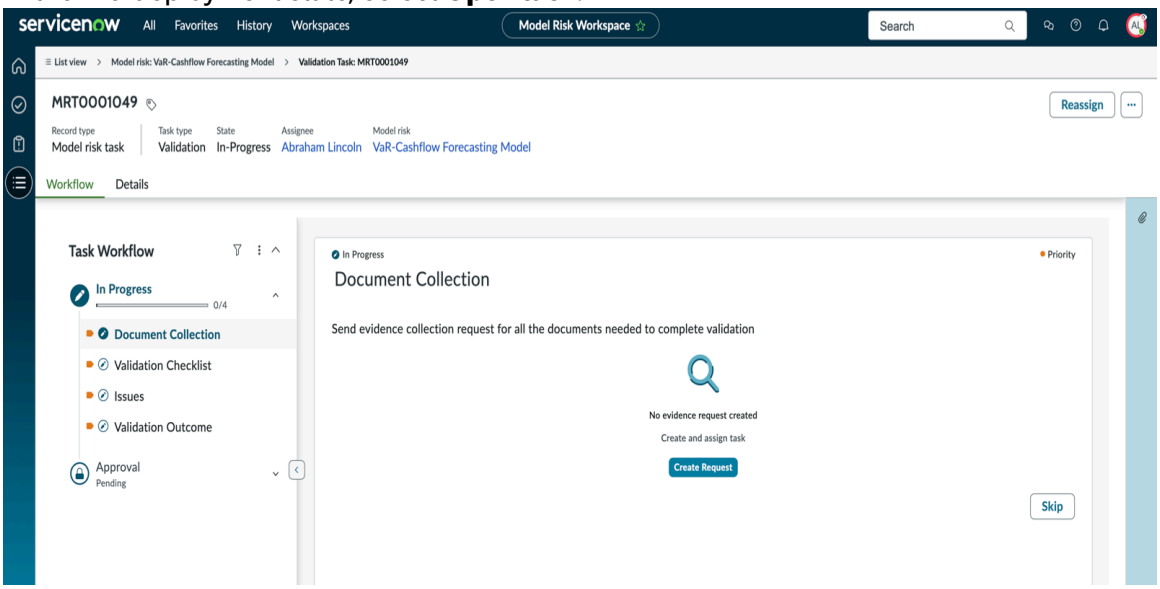
What to do next
Perform model validation

Perform model validation

Perform model validation to assess and validate the model, collect required documents, report any issues, and determine if the model is fit for use. This process confirms that the model meets required standards and is ready for deployment.

Before you begin
Role required: sn_model_risk_mgmt.model_validator

About this task
A model risk validation task contains the following stages:



- Document collection
- Validation checklist
- Issues
- Validation outcome

You can perform the listed activities in any sequence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To perform model validation from the GRC tasks page, navigate to **All** > **Self-Service** > **Employee Center** and do the following:
   a. Under My active items, select **GRC tasks**.
   b. Select the model validation from the My to-dos card.
2. To perform model validation from the Model Risk Workspace, navigate to **All** > **Model Risk Workspace** and do the following:
   a. Select the list icon .
   b. From the list, navigate to **Models** > **Pre-deployment**.
   c. Select the model for which you want to perform validation.
3. In the Pre-deployment state, select **Open task**.

The model risk validation task workflow opens.

4. To send an evidence collection request, select **Create Request**.
   For more information, see Request evidence for model.
5. In the Validation Checklist stage, select **Open** to perform the validation.
6. Respond to all the factors or questions listed in the validation task.
7. Select **Submit**.
   After you submit your responses, you're no longer able to modify them.
8. **Optional:** In the Issues stage, add new or existing issues with the model.
   When you add new or existing issues, they are associated with the model risk and the model risk task.
9. In the Validation Outcome stage, select the outcome whether the model is fit to use or not and send it for approval.

> **Note:**
> All activities must be completed before sending the task for approval.

Result

The model validation task is submitted for approval. If no approvers are configured, the task is marked as completed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Request evidence for model

Request evidence for model

Send evidence collection request for all the required documents to complete the model validation. Evidence request helps validators to electronically request the information that they need from the model owner to perform model validation.

Before you begin
Role required: sn_model_risk_mgmt.model_validator

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **Pre-deployment**.
4. Select the model for which you want to request evidence.
5. To send an evidence collection request, select **Create Request**.
6. On the form, fill in the fields.

   For a description of the field values on the Evidence request form, see Request evidence form.
7. Select **Request**.

Request evidence form

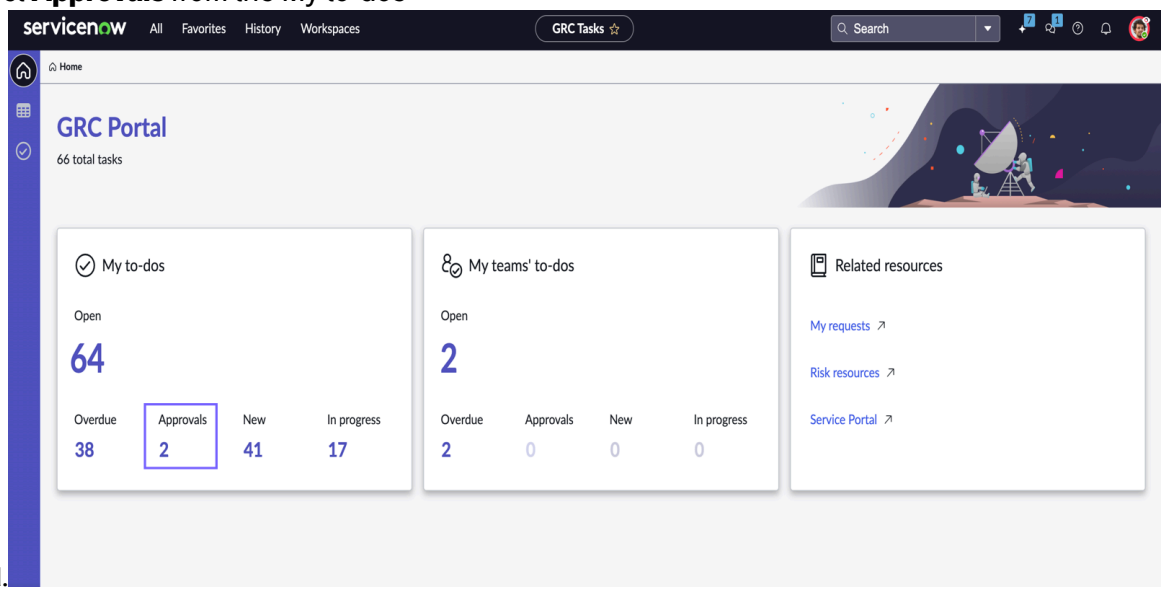
Use this form to electronically request the information needed from the model owner to perform model validation.

See the following table for a description of the field values.

Document request form

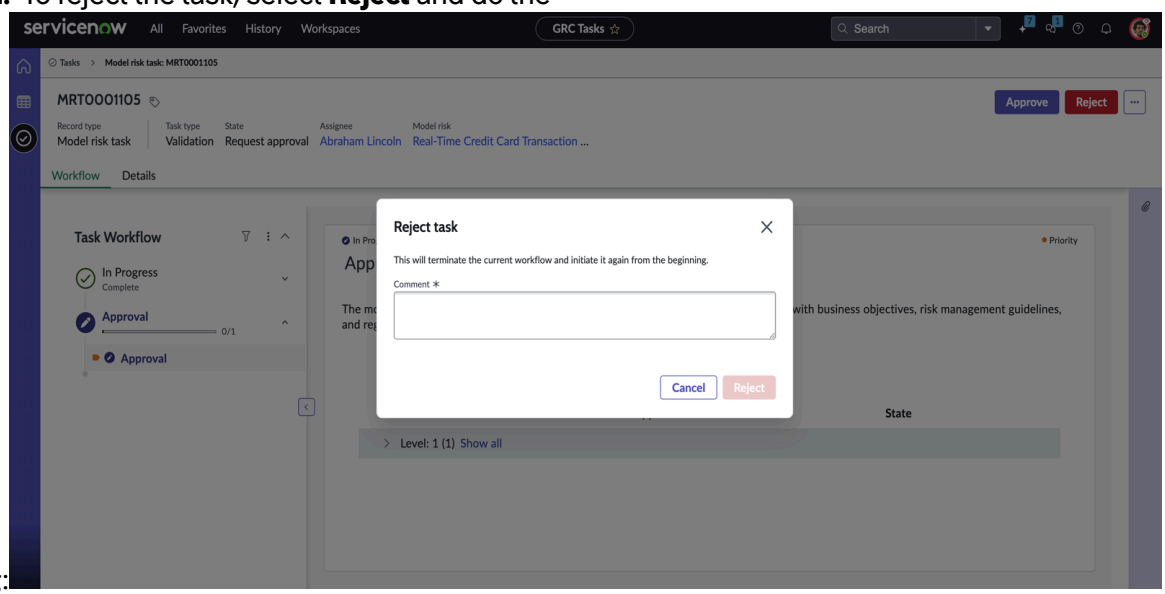
Field	Description
Name	Unique name of the evidence request.
Due date	Expected date of evidence submission.
Assignment group	Group assigned to provide evidence.
Assigned to	User responsible for providing the evidence.
Evidence collection instructions	Instructions for providing evidence. For example, list of supporting documents, files, and so on.

Approve or reject model assessment and validation tasks



Approve or reject the model assessment and validation tasks either from the Employee Center or Model Risk Workspace.

Before you begin
Role required: sn_model_risk_mgmt.task_approver



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To approve or reject model assessment and validation tasks from the GRC tasks page, navigate to **All** > **Self-Service** > **Employee Center** and do the following:
   a. Under My active items, select **GRC tasks**.
   b. Select **Approvals** from the My to-dos card.

   c. To approve or reject model assessment tasks, select **Model assessment tasks** and open the task.
   d. To approve or reject model validation tasks, select **Model validation tasks** and open the task.
2. To approve or reject model assessment and validation tasks from the Model Risk Workspace, navigate to **All** > **Model Risk Workspace** and do the following:
   a. Select the tasks icon .
   b. To approve or reject model assessment tasks, select **MRM Assessments** and open the task.
   c. To approve or reject model validation tasks, select **MRM Validations** and open the task.
3. Select **Approve**.
4. **Optional:** To reject the task, select **Reject** and do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Provide rejection comments.

b. Select **Reject**.
This action terminates the current workflow and initiates it again from the beginning.

Create an issue for model

Add or create model issues and their remediation actions. Capture validation findings or performance problems and follow them through to resolution.

Before you begin

Role required: sn_model_risk_mgmt.model_risk_coordinator, sn_model_risk_mgmt.model_governance

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **All**.
4. Select the model and navigate to the **Issues** tab.
5. Select **New**.
6. On the form, fill in the fields.

   For a description of the field values on the Create an issue form, see Create an issue form.
7. Select **Save**.

Create an issue form

Use the Create an issue form to capture validation findings or performance problems for a model.

See the following table for a description of the field values.

Create an issue

Field	Description
Name	Unique name for the issue. For example, `Model accuracy deviation`.
Description	Detailed information about the issue, including the context, observed behavior, and any relevant details.
Recommendation	Suggested action or solution to address the issue.
Priority	Importance level of the issue to help determine the order in which it should be resolved.
Assigned to	Individual responsible for resolving the issue.
Issue source	Origin or source from which the issue was identified. This field is automatically set to **Model Risk**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create assessment in the Pre-deployment stage

Create a model risk assessment by verifying the details, assigning stakeholders, and create an assessment using the Model Risk Management application in the Pre-deployment stage.

Before you begin

Role required: Role required: sn_model_risk_mgmt.model_governance

The Model Risk Coordinator [sn_model_risk_mgmt.risk_coordinator] can also create assessments when they are designated as a stakeholder.

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **Pre-deployment**.
4. Select the model for which you want to create an assessment task.
5. In the Pre-deployment state, select **Create assessment**.
6. On the Model risk task dialog, fill in the fields.

Model risk task

Field	Description
Assessment template	Predefined template that outlines the structure, questions, and scoring logic for the assessment. This field is auto-populated with the default assessment template with category as Model Risk.
Assessment assignee	Individual assigned to complete the assessment task. This field is auto-populated with the model owner's name. You can select only those users who are specified as stakeholders.
Due date	Date by which the assessment task must be completed.

7. Select **Create**.

What to do next

Perform model risk assessment

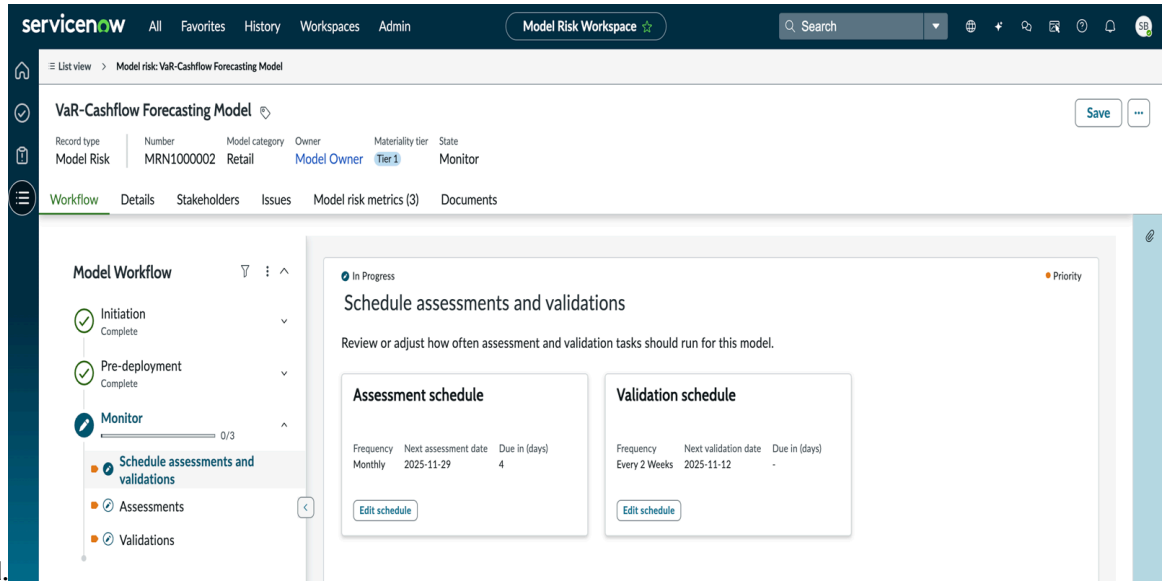
Schedule assessment and validation tasks

Schedule assessment and validation tasks for model risks in the Monitor stage to ensure regulatory compliance and effective risk management.

Before you begin

Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.risk_coordinator

About this task



You can schedule assessment and validation tasks for a model risk in the Monitor stage. You can also configure the conditions and frequency for these tasks in the model workflow settings. Based on the configuration, the assessment and validation tasks are created automatically. For more information, refer to Configure Model Workflow Settings.

This task guides you on how to schedule assessment and validation tasks manually from the model risk record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **Monitor**.
4. Select the model record to schedule assessment and validation tasks.
5. Select **Edit schedule** on the Assessment schedule or Validation schedule card.

6. On the Edit assessment schedule dialog, fill in the fields.

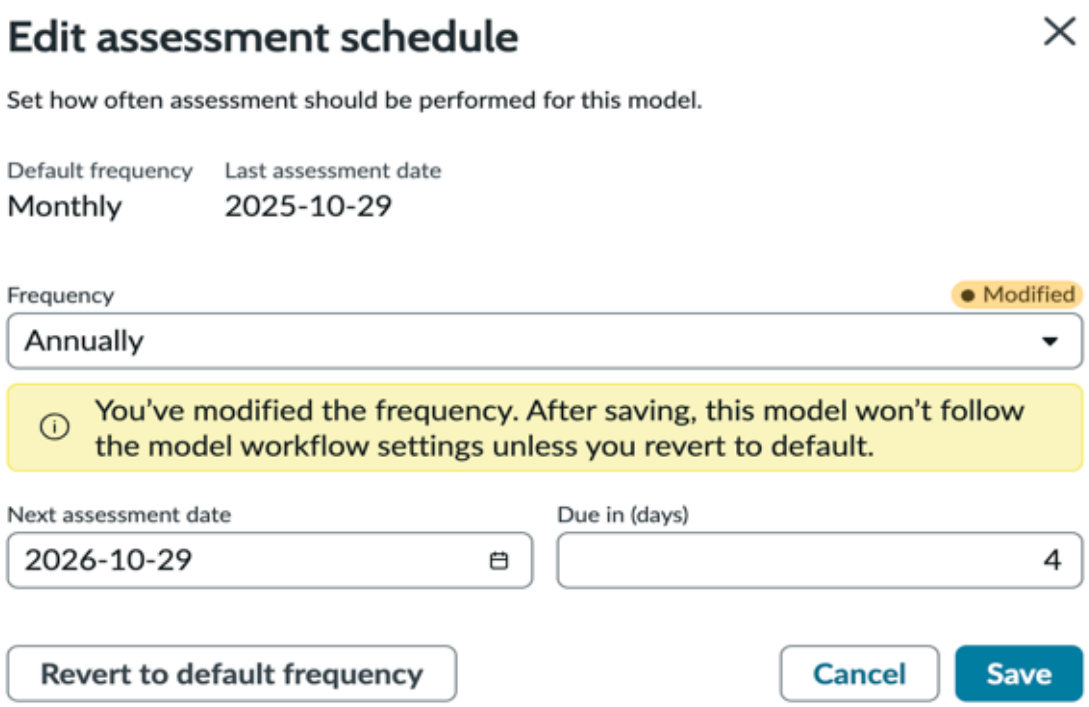
Edit assessment schedule

Field	Description
Default frequency	Default assessment frequency defined in the model workflow settings. This field is auto-populated.
Last assessment date	Date when the last assessment was performed for the model. This field is auto-populated.
Frequency	How often assessments should be performed. The options are as follows: ○ **Daily**: Creates an assessment every day. ○ **Weekly**: Creates an assessment once every week. ○ **Monthly**: Creates an assessment once every month. ○ **Quarterly**: Creates an assessment once every three months. ○ **Semi-annually**: Creates an assessment once every six months. ○ **Annually**: Creates an assessment once every year. ○ **Custom**: Enables you to define your own interval and period for scheduling assessments. ○ **None**: Disables automatic scheduling for assessments. This field is auto-populated with the frequency defined in the Model workflow settings, if available. You can modify the value, and a Modified tag appears after the change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Next assessment date	Date on which the next assessment is scheduled to start. This field is auto-populated based on the last assessment date and the defined frequency. **Note:** If assessment tasks are skipped, you must manually define the next assessment date.
Due in (days)	Number of days within which the assessment task must be completed after it starts.
Repeat every	Interval value for how often the assessment repeats. For example, enter 2 to repeat every 2 units of the selected period. You can select the unit value in the **Period** field. This field appears only when **Custom** is selected from **Frequency** field.
Period	Time unit for the custom interval. The options are as follows: ○ **Days** ○ **Weeks** ○ **Months** ○ **Years** This field appears only when **Custom** is selected from **Frequency** field.

7. On the Edit assessment schedule dialog, fill in the fields.



Edit validation schedule

Field	Description
Default frequency	Default validation frequency defined in the model workflow settings. This field is auto-populated.
Last validation date	Date when the last validation was performed for the model. This field is auto-populated.
Frequency	How often assessments should be performed. The options are as follows: ○ **Daily**: Creates a validation task every day. ○ **Weekly**: Creates a validation task once every week. ○ **Monthly**: Creates a validation task once every month. ○ **Quarterly**: Creates a validation task once every three months. ○ **Semi-annually**: Creates a validation task once every six months. ○ **Annually**: Creates a validation task once every year. ○ **Custom**: Enables you to define your own interval and period for scheduling validation task. ○ **None**: Disables automatic scheduling for validation task. This field is auto-populated with the frequency defined in the Model workflow settings, if available. You can modify the value, and a Modified tag appears after the change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Next validation date	Date on which the next validation task is scheduled to start. This field is auto-populated based on the last validation date and the defined frequency. **Note:** If validation tasks are skipped, you must manually define the next validation date.
Due in (days)	Number of days within which the validation task must be completed after it starts.
Repeat every	Interval value for how often the validation task repeats. For example, enter 2 to repeat every 2 units of the selected period. You can select the unit value in the **Period** field. This field appears only when **Custom** is selected from **Frequency** field.
Period	Time unit for the custom interval. The options are as follows: ○ **Days** ○ **Weeks** ○ **Months** ○ **Years** This field appears only when **Custom** is selected from **Frequency** field.

8. **Optional:** To use the frequency defined in the Model workflow settings, select **Revert to default frequency**.

Reassign model assessments and validations

Reassign an model risk assessment or validation to another assignee from the stakeholder list of the model risk record when the task is in the In-progress state. It ensures that the task continues without delay if the original assignee is unavailable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.risk_coordinator

Model validators [sn_model_risk_mgmt.model_validator] can also reassign tasks, but only those tasks that are assigned to them.

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. Navigate to the right location based on the type of task.
   a. To reassign an assessment task, navigate to **Assessment tasks** > **In-progress**.
   b. To reassign a validation task, navigate to **Validation tasks** > **In-progress**.
4. Select the task that you want to reassign.
5. Select **Reassign**.
6. In the Reassign model task dialog, enter the assignee name and reason for reassignment. You can view only those users in the **Assignee** field who are included in the stakeholder list of the model record.
7. Select **Reassign model task**.

Copy assessment responses

Enable the option to copy responses from the most recent completed assessment into new assessments. Respondents can review and edit the pre-filled responses before submission to save time and ensure consistency.

Before you begin

Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.risk_coordinator

About this task

This task guides you on how to enable or disable the option to copy responses from previous assessment tasks for a model risk. Model risk governance and model risk coordinators can modify this field at any stage of the model risk life-cycle. When enabled, responses from the most recent completed assessment are copied into new assessment tasks.

Note:
You can copy responses only from assessment tasks, not from validation tasks.

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **All**.
4. Select the model and go to the **Details** tab.
5. In the Pre-fill assessment responses, select **Copy responses from previous assessment**. When enabled, new assessments copy responses from the most recently completed assessment, if available. Respondent can edit the pre-filled responses before submitting.

Override model ratings

Override the risk rating and materiality tier of a model manually at any stages of its life-cycle. This helps maintain data accuracy, transparency, and governance when business context or expert judgment requires adjustments to system-calculated values.

Before you begin

Role required: sn_model_risk_mgmt.model_governance or sn_model_risk_mgmt.risk_coordinator

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **All**.
4. Select the model and go to the **Details** tab.
5. In the Risk & materiality section, select the override icon  on the **Risk rating** field.
6. On the Override risk rating dialog, fill in the fields.

Override risk rating

Field	Description
Computed risk rating	The system-calculated risk rating. This field is automatically set to the computed value.
New risk rating	Risk rating you want to apply, reflecting business context or expert judgment.
Reason for override	Context to justify the manual override of the system-calculated risk rating.
Revert to computed	Option to revert to the system-calculated risk rating.

7. In the Risk & materiality section, select the override icon  on the **Materiality tier** field.
8. On the Override materiality tier dialog, fill in the fields.

Override materiality tier

Field	Description
Computed materiality tier	The system-calculated materiality tier. This field is automatically set to the computed value.
New materiality tier	Materiality tier you want to apply, reflecting business context or expert judgment.
Reason for override	Context to justify the manual override of the system-calculated materiality tier.
Revert to computed	Option to revert to the system-calculated materiality tier.

9. Select **Save**.

Link existing documents to a model record

Link documents from your repository to a model record. This feature helps you manage all model-related documents in one place, ensuring version control, audit readiness, and traceability.

Before you begin

Role required: sn_model_risk_mgmt.executive_reader, sn_model_risk_mgmt.model_validator, sn_model_risk_mgmt.model_risk_coordinator, sn_model_risk_mgmt.model_governance

Users on the Xanadu and Yokohama releases must install the Document Management plugin manually. Users upgrading from an earlier release to Zurich must also install it manually. For new installations, the plugin is installed automatically.

Procedure

1. Navigate to **All** > **Model Risk Workspace**.
2. Select the list icon .
3. From the list, navigate to **Models** > **All**.
4. Select the model and navigate to the **Documents** tab.
5. Select **Link Documents**.
6. Select the document that you want to link.
7. Select **OK**.

Result

The document is linked in the model risk record.

Document Services

Model Risk Management reference

Reference topics provide additional information such as default notifications, roles, and tables that are installed with the Model Risk Management application.

Default Model Risk Management email notifications

Default Model Risk Management notifications inform users about important events and status changes throughout the Model Risk Management workflow.

Default Model Risk Management notifications keep stakeholders informed about key events and status changes throughout the Model Risk Management life cycle. These notifications typically cover updates such as model creation, assignment changes, assessment or validation progress, approval requirements, and status transitions. They ensure that users receive consistent and reliable communication without requiring initial configuration.

Default email notification configurations for Model Risk Management

Use the default notification configurations to notify users about specific activities in Model Risk Management. Notification configurations enable administrators to specify:

- When to send the notification
- Who receives the notification
- What content is in the notification

To access these configurations, navigate to **All** > **System Notification** > **Email** > **Notifications**.

Model Risk Management notifications

Notification configurations	Event	Recipients
Assessment task submitted	An assessment task is submitted for approval.	Approver
Validation task approval and completion	A validation task is approved and marked as Completed.	Assigned validator
Assessment task approval and completion	An assessment task is approved and marked as Completed.	Assessment assignee
Assessment task smart asmt cancelled	An assessment task is canceled.	Assessment assignee
Validation task assignment	A validation task is submitted and is ready for validation.	Assigned validator
Validation checklist reopened	A validation task is reopened.	Assigned validator
Assessment task reopened	An assessment task is reopened.	Assessment assignee
Assessment task assignment	An assessment task is assigned to an assessor for assessment.	Assessment assignee
Validation checklist cancelled	A validation task is canceled.	Assigned validator
Notify model owner for new model	A model is created.	Model owner
New model submission	A model is submitted for review.	Model Risk Governance team

Roles installed with Model Risk Management

The Model Risk Management application installs the essential roles to perform respective day-to-day operational tasks for managing models.

Roles and their descriptions

Role title [name]	Description	Contains roles
MRM Admin [sn_model_risk_mgmt.admin]	The MRM (Model Risk Management) admin can perform the following tasks: • Configure approval configurations for Model Risk Management. • Create Model Risk Management scoring configurations.	• sn_grc_appr.admin • sn_model_risk_mgmt.model_risk_reader • sn_smart_asmt.template_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	• Create or modify assessment templates that belong to Model Risk Management category from the Model Risk Workspace.	
Model Risk Governance [sn_model_risk_mgmt.model_governance]	User with Model Risk Governance role can perform the following tasks: • Configure approval configurations for Model Risk Management. • Access the Model Risk Workspace. • Perform end to end workflow tasks for all the submitted models. • Create or modify assessment templates that belong to Model Risk Management category from the Model Risk Workspace.	• sn_model_risk_mgmt.model_risk_create • sn_smart_asmt.template_manager • sn_grc_advanced.evidence_admin • sn_grc_appr.admin • sn_grc.reader • sn_grc.business_user • sn_model_risk_mgmt.model_risk_delete
Model Risk Coordinator [sn_model_risk_mgmt.risk_coordinator]	Model Risk Coordinator can perform the following tasks: • Access the Model Risk Workspace. • Access model intakes and tasks, and perform actions as needed where the user is assigned as a stakeholder. • Perform and modify model risk and model risk tasks where the user is assigned as a stakeholder.	• sn_grc.business_user • sn_grc_advanced.evidence_admin • sn_model_risk_mgmt.model_risk_reader • sn_grc.reader
Model Validator [sn_model_risk_mgmt.model_validator]	Model validator can perform the following tasks: • Access the Model Risk Workspace. • Perform a smart assessment of models that are assigned to them from the Model Risk Workspace and GRC task page.	• sn_grc.business_user • sn_grc_advanced.evidence_admin • sn_smart_asmt.actor • sn_model_risk_mgmt.model_risk_reader • sn_grc.reader

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	• View the model risks where the user is assigned as a stakeholder. • Perform and modify model risk tasks where the user is assigned as a stakeholder.	
Model Executive Reader [sn_model_risk_mgmt.executive_reader]	Model Executive Reader can perform the following tasks: • Access the Model Risk Workspace. • View all the information available in the Model Risk Workspace such as model intakes, tasks, issues.	• sn_model_risk_mgmt.model_risk_reader • sn_grc_advanced.evidence_reader • sn_grc.reader • sn_grc_appr.approver
Model Task Approver [sn_model_risk_mgmt.task_approver]	Model Task Approver can perform the following tasks: • View model risks and model risk tasks for which they're the designated approver. • Approve the model risk tasks assigned to them.	• sn_grc_appr.approver • sn_grc.reader • sn_model_risk_mgmt.task_read
Model Owner [sn_model_risk_mgmt.model_owner]	Model Owner can perform the following tasks: • Request new models from the Employee Center or Service Portal. • Perform a smart assessment from the GRC task page when either the business_user or business_user_lite role is assigned.	• sn_grc_advanced.evidence_responder • sn_smart_asmt.actor
Model Risk Initiator [sn_model_risk_mgmt.model_initiator]	Model Risk Initiator can request new models from the Employee Center or Service Portal.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles and their descriptions (continued)

Role title [name]	Description	Contains roles
	Note: Model Risk initiators can only request a new model but cannot perform assessments. They must define a model owner when raising the model request.	

For more information, see the Employee Center.

Tables installed with Model Risk Management

Tables are added with the activation of the Model Risk Management application.

See the following table for a description of the tables.

Tables installed

Table	Description
Model Risk [sn_model_risk_mgmt_model_risk]	Captures model intakes submitted via the Employee Center, serving as a central repository for all submitted model requests.
Model Risk task [sn_model_risk_mgmt_model_risk_task]	Captures model risk tasks created for the model risks in the model risk workflow.
Model risk task approval [sn_model_risk_mgmt_model_risk_task_approval]	Captures the approval status of all approval records generated for model risk tasks through approval configurations.
Issue to Model Risk [sn_model_risk_mgmt_m2m_issue_model_risk]	Stores the many-to-many (M2M) mapping between all issues attached to the model risk.
Issue to Model Risk task [sn_model_risk_mgmt_m2m_issue_model_risk_task]	Stores the M2M mapping between all issues attached to the model risk task.
Model Risk configuration [sn_model_risk_mgmt_model_risk_configuration]	Stores the model risk assessment scoring configuration created for Smart Assessment templates in the Model Risk Management category.
Model Risk Config to SAE section	Stores the M2M mapping between all the Smart Assessment sections added for use in the model risk configuration scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed (continued)

Table	Description
[sn_model_risk_mgmt_m2m_model_scoring_section]	
Model Risk Config To SAE Question [sn_model_risk_mgmt_m2m_model_scoring_question]	Stores the M2M mapping between all the Smart Assessment questions added for use in the model risk configuration scripts.
Model risk score [sn_model_risk_mgmt_model_risk_score]	Stores the scores calculated by the execution of model risk scoring configurations whenever a Smart Assessment is submitted and the assessment task is completed.

Operational Resilience

Operational Resilience is the ability of an organization to respond to the adverse operational events by anticipating, preventing, recovering from, and adapting to such events.

Operational Resilience overview

In today's changing business landscape, an organization may face various operational risks at unanticipated times. Every function of your business plays an important role in maintaining and promoting operational resilience. For example, the Risk team must have the right governance in place to identify and respond to operational risks. The IT team must identify and address the existing and potential threats.

The ServiceNow® GRC: Operational Resilience application empowers your organization to continue to provide your business services in the face of adverse operational events, such as pandemic, extreme weather, or hacking. With Operational Resilience, you can monitor and report data from multiple places and recover from the potential disruptions quickly, with a minimal impact on your customers.

Exploring Operational Resilience

The Operational Resilience application provides a complete view of your operational resilience status including business service details, entities, and the status of your core business areas.

Operational Resilience overview

The Operational Resilience application helps your organization to achieve a uniform vision and build resilience across different business functions. By using the Operational Resilience application on one platform, various teams can monitor the health of their services in one place.

The Operational Resilience application helps different departments to build their operational resilience effectively:

- IT departments can automate their processes and track the availability and functioning of the failover systems of their applications.
- HR departments can have clear visibility on the market trends, resource pools, and retention risks.
- Facilities departments can focus on implementing the major improvements that help you to manage your day-to-day business operations with low maintenance.
- Security departments can address the physical vulnerabilities and cyberthreats efficiently.
- Finance teams can manage the contractual issues, supply chain risks, and overall finances effectively.
- Risk teams can analyze their potential risks and mitigate their service impact on the business operations.

Operational Resilience and Business Continuity Management

Operational Resilience defines the steps that an organization must proactively take to prevent any operational disruptions. Business Continuity Management implements an approach wherein it builds a plan to respond quickly to a disruption that may impact your entire organization.

Operational Resilience is about proactively monitoring the resilience statistics and ensuring that the service delivery happens at any cost. Business Continuity Management is about analyzing the business disruptions, preparing a disaster recovery plan, and responding to a crisis event at the business process level.

As stated earlier, Operational Resilience provides a clear understanding of your company's operational resilience statistics on the dashboard. It includes the statistics for Business Continuity Management, Risks, Controls, Service statistics, and so on. On the other hand, Business Continuity Management operates at the business process level.

Roles installed with BCM Pro and IRM Pro licenses

Users, managers, and administrators with an Operational Resilience IRM Pro license can now access the associated reports, charts, and data. Similarly, those with an Operational Resilience BCM Pro license can also access their respective reports, charts, and data.

For more information on the updated roles, see Roles installed with Operational Resilience.

Operational Resilience workflow

The Operational Resilience application provides a continuous four-stage workflow that helps your resilience managers and administrators to achieve your organization’s safety and well-being. You can prepare for and cope with the adverse events by anticipating, preventing, recovering from, and adapting to such events. The stages of operational resilience are shown in the following example.

To build resilience for your organization, analyze each stage in the resilience life cycle:

1. Anticipate: When disastrous events happen, it is not always obvious which services, people, and processes are critical. Organizational silos, poor data, and different tools can impede your understanding of risks and cross-business dependencies. A lack of prioritization and planning can mean imprecise decision making.

   To overcome these challenges, the Operational Resilience application helps you to perform a what-if scenario analysis to better plan for best, worst, and expected outcomes. The application helps you to prepare for what you must protect and identify the areas to prioritize, according to your business and risk context.

2. Prevent: Most operational procedures are designed for efficiency rather than for risk and compliance. Businesses often over-rely on the manual corrective controls, rather than the automated preventative controls. Early warning of risks or adverse events can be thwarted by manual processes and fragmented data. Such practices can cripple your response to disastrous events.

   The Operational Resilience application can guide you through establishing sufficient controls that reduce the likelihood of potential problems in time to mitigate them effectively. With risk and compliance activities incorporated into your daily work, operations run smoothly with fewer efforts. Intelligent processes and policies help you unlock new efficiencies. Continuous monitoring triggers an immediate and targeted incident response.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Respond/Recover: Many businesses are organized in such a way that they are unable to respond to adverse events quickly or safely. Communication internally, or with vendors and suppliers is poor. Split-second decisions can worsen the situation, especially when information is incomplete or outdated.

   Continuity plans that are created using the Operational Resilience application can help you prevent an out-of-control escalation of an incident. A pre-approved and tested recovery plan prepares you to respond to the situations effectively, reduces the risks, and improves the recovery time.

4. Adapt: Operational resilience means you can quickly and easily bounce back from disasters. However, when these events occur, they are not often seen as learning opportunities. But they are. If you look at them in that way, you have a chance to improve your protective measures and respond effectively to the next event. Learning from these events and adapting can lead to minimized impacts and speedier recovery.

   Adverse events, such as fire, extreme weather, pandemics, or data breaches, offer lessons about what could work better. The Operational Resilience application can help you collect data, assess results, and feed conclusions back to your teams. Visibility to the past provides business leaders with a vision of better operational performance in the future.

Operational Resilience benefits

The Operational Resilience application provides the following benefits:

Benefits	Features	Users
Analyze the importance and impact tolerance of a business service.	Performing Importance and impact tolerance assessment	Operational Resilience managers and users
Perform a scenario analysis in Operational Resilience workspace.	Conducting a scenario analysis	Operational Resilience managers and users
Self-attest the business services in Operational Resilience workspace.	Certifying services using self-attestation	Operational Resilience managers and users
Add an issue, change request, incident, and outage in Operational Resilience workspace.	Creating or adding an issue	Operational Resilience managers and users
Add or remove an operational vulnerability in Operational Resilience workspace.	Managing Operational vulnerability	Operational Resilience managers and users

Coral theme

Coral is now the default theme for Business Continuity Workspace. This theme provides a fresh look and feel, featuring brand-neutral illustrations to enhance your user experience. A dark theme option is available for web and mobile experiences.

Key dependencies for Operational Resilience

Before you install the Operational Resilience application, you must install the required GRC applications in your instance.

The following example shows the Operational Resilience hierarchy, required GRC applications, and optional GRC applications that you can add to the reporting dashboard.

Operational Resilience application hierarchy

Required and optional plugins for Operational Resilience

The Operational Resilience application (com.sn_grc_oper_res) is available from the ServiceNow Store. The following plugins are required (hard dependencies) for Operational Resilience.

1. GRC: Common Workspace Elements (com.sn_grc_workspace)
2. GRC: Profiles (com.sn_grc)
3. GRC: Core Case Management (com.sn_grc_case_mgmt)
4. Data Relationships Framework (com.sn_app_grc_relationship_config)
5. Data registry (com.sn_app_grc_data_registry)
6. GRC: Risk Shared Common Components (com.irm-shared-common-components)
7. Document Templates (com.snc.app-document-templates)

The following plugins are optional (soft dependencies) for Operational Resilience.

1. GRC: Policy and Compliance Management (com.sn_compliance)
2. Advanced Risk (com.sn_risk_advanced)
3. GRC: Risk Management (com.sn_risk)
4. GRC: Business Continuity Planning (com.snc.bcm.app_bcm_planning)
5. GRC: Business Impact Analysis (com.snc.bcm.app_bcm_bia)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. GRC: Crisis Management (com.snc.bcm.app_bcm_exercise)
7. Vulnerability Response (com.snc.vulnerability)

Depending on the applications installed in your instance, you can view the reports on the Operational Resilience reporting dashboard.

Common Service Data Model for Operational Resilience

Starting with Release 20.1.x, the Operational Resilience application supports the latest Common Service Data Model (CSDM). CSDM is the data framework that administrators use when configuring ServiceNow® products and applications. It ensures that configuration items (CIs) and their relationships are properly defined and stored in the relevant Configuration Management Database (CMDB) tables.

About Common Service Data Model (CSDM)

The Common Service Data Model (CSDM) offers a robust framework for defining and managing services and business services related data in Operational Resilience reporting. Implementing this model helps organizations achieve the following objectives.

- Define and manage services, business services, and interfaces.
- Identify and manage risks, controls, and incidents.
- Develop and maintain business continuity plans.
- Support operational resilience and control environment management.
- Enable informed decision-making and service optimization.

This data model ensures that services are of high quality and align with the overall business goals.

Benefits of CSDM

The CSDM offers several key benefits for organizations.

1. Improved service management: By defining and managing services, business services, and interfaces, organizations can ensure efficient and effective service/business service delivery.
2. Enhanced Operational Resilience: The CSDM model enhances organizational resilience by identifying and managing risks, controls, and incidents, which enables a quick response and recovery from disruptions.
3. Informed decision-making: By providing a comprehensive view of business services, risks, and controls, the CSDM model facilitates informed decision-making and service optimization.

These benefits help organizations achieve their strategic objectives, enhance customer satisfaction, and maintain a competitive edge in a dynamic business environment.

About the Common Service Data Model

The Common Service Data Model is the standard data model for all products that use the Configuration Management Database (CMDB).

ServiceNow AI Platform® products, applications, and features are CSDM compliant, meaning they all have identical access to the underlying CSDM data model. This shared access greatly enhances the capabilities of your applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional information about the CSDM can be found in the CSDM in a nutshell and Community Forum.

For the playlist of all the videos, see Playlist of all CSDM videos.

Highlights of CSDM for Operational Resilience

The previously integrated data model did not support service offerings and application services. The latest CSDM model now includes support for both service offerings and application services.

Staging tables and pillars

The Operational Resilience application uses the Entity Hierarchy table, [sn_grc_m2m_profile_profile], to save hierarchical relationships. For example, if a record has `upstream_profile` as a business service (BS) and `downstream_profile` as a service offering (SO), it indicates that the business service (BS) directly connects to the service offering (SO) in the CSDM data model.

The Service Process pillar is the parent table for all staging tables in Operational Resilience. Other staging tables inherit the profile field from it.

References for business services (BS), service offerings (SO), business processes (BP), and application services (AS) are added to the [sn_oper_res_profile] table.

For more information on the tables that are relevant to the CSDM data model, see Tables relevant to CSDM. For information on the pillars, see Pillars overview tab.

CSDM data workflow and business model views

The CSDM model offers a framework for evaluating and enhancing an organization's reporting and resilience environment, applicable to various business model views. ServiceNow® products are CSDM aware, and their Configuration Management Database (CMDB) data is organized according to CSDM guidelines, leveraging this structure for improved functionality.

CSDM data workflow

Integrating CSDM data workflow with Operational Resilience uses data from various sources to support the assessment and improvement of the control environment. Here's a high-level overview of the data workflow.

Data collection

Gather data from various sources, including:

- Risk management systems (for example, risk registers, risk assessments)
- Incident management systems (for example, incident reports, root cause analysis)
- Business continuity management (BCM) systems (for example, business impact analysis, recovery plans)
- Compliance and regulatory data (for example, audit reports, regulatory requirements)
- Operational data (for example, key performance indicators (KPIs), metrics)

Data integration

Integrate data from various sources into a centralized repository or data warehouse, using techniques such as:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data mapping and transformation
- Data normalization and standardization
- Data quality checks and validation

Data analysis

Analyze the integrated data to perform the tasks:

- Identify operational resilience risks and control deficiencies
- Assess the effectiveness of controls and processes
- Evaluate the impact of disruptions on business operations
- Identify trends and patterns in operational resilience data

CSDM integration

Use the analyzed data to support CSDM processes:

- Risk assessment and control objective definition
- Control activity identification and documentation
- Control evaluation and testing
- Remediation and corrective action planning

Reporting and visualization

Provide reporting and visualization capabilities to perform following tasks:

- Communicate operational resilience and CSDM insights to stakeholders
- Support decision-making and prioritization of actions
- Monitor progress and track key performance indicators (KPIs)

By following the data workflow, organizations can perform the following tasks.

- Integrate operational resilience and CSDM data to support a comprehensive control environment assessment
- Identify and mitigate operational resilience risks
- Improve the effectiveness of controls and processes
- Enhance business continuity and resilience
- Support informed decision-making and prioritization of actions

This data-driven approach enables organizations to proactively manage operational resilience and ensure a robust control environment that supports their overall objectives.

Business model views

CSDM provides a framework that can be applied to various business model views, as shown in the following examples.

1. Process view: Assess and improve the control environment for specific business processes, such as financial reporting, procurement, or customer onboarding.
2. Functional view: Evaluate the control environment for specific functional areas, like finance, HR, or IT.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Entity view: Assess the control environment for individual entities or subsidiaries within a larger organization.
4. Cross-functional view: Evaluate the control environment for cross-functional processes, such as risk management, compliance, or internal audit.
5. Enterprise view: Assess the control environment across the entire organization to ensure a consistent and effective control framework.

In each of these views, the CSDM model can help organizations perform the following tasks.

- Identify and assess risks
- Define and document control objectives and activities
- Evaluate control effectiveness
- Foster a culture of continuous improvement

By applying the CSDM model to different business model views, organizations can benefit from the following activities:

- Identify and mitigate risks at various levels
- Improve process efficiency and effectiveness
- Enhance compliance and regulatory adherence
- Ensure a consistent control environment across the organization

This flexible approach, along with the use of Main node configurations, enables organizations to customize their CSDM implementation to meet their specific business needs, ensuring a robust and effective control environment.

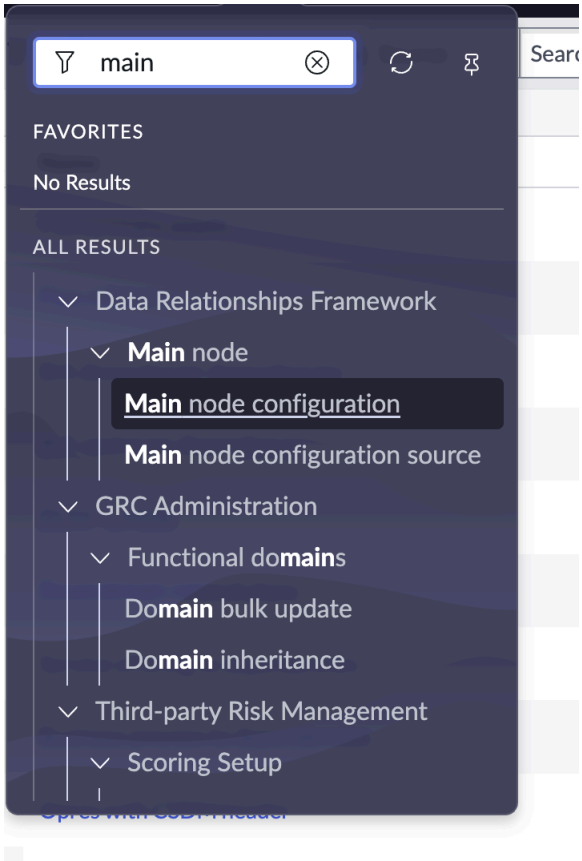
For information on setting up the Main node configurations, see Main node configurations: A component of the Data Relationships Framework.

For information on gathering Operational Resilience data aligned with the CSDM model, see Gathering data aligned with the CSDM setup and Landing page and dashboard views.

Main node configurations: A component of the Data Relationships Framework

Starting with Release 20.1.x, the Main node configurations, supported by the Data Relationships Framework, are available with Operational Resilience to define dependency roll-up chains. Operational Resilience administrators configure the entity types and pillars, generate the entities, and then establish relationships between different CSDM objects. After this setup is complete, data from the CMDB is fetched into Operational Resilience, displaying rolled-up dependencies in the Workspace view.

Data Relationships Framework



The Data Relationships Framework (sn_grc_rel_config) application provides the underlying framework to retrieve data from the CMDB. The Main node configurations in Operational Resilience support different business views in the CSDM model. The relationships defined in the Main node configuration align with the relationships specified in the CSDM model.

Setting up the Main node configurations

The Operational Resilience administrators set up the Main node configurations via the Main node configuration module listed in the **General administration** menu of the Core UI.

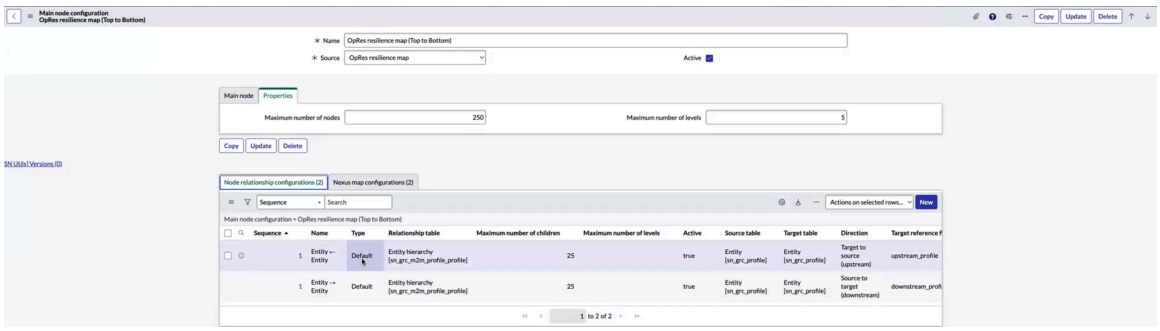
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on configuring the Main node configurations, see Configure the Main node configurations.

Administrators can also configure the sources of the Main node configurations by accessing the Main node configuration source module. For information on configuring the Main node configuration source, see Main node configuration source.

Changes in the Main node configurations in Operational Resilience, version 21.1.x

Beginning with Operational Resilience, version 21.1.x, the following changes are introduced in the Main node configurations.



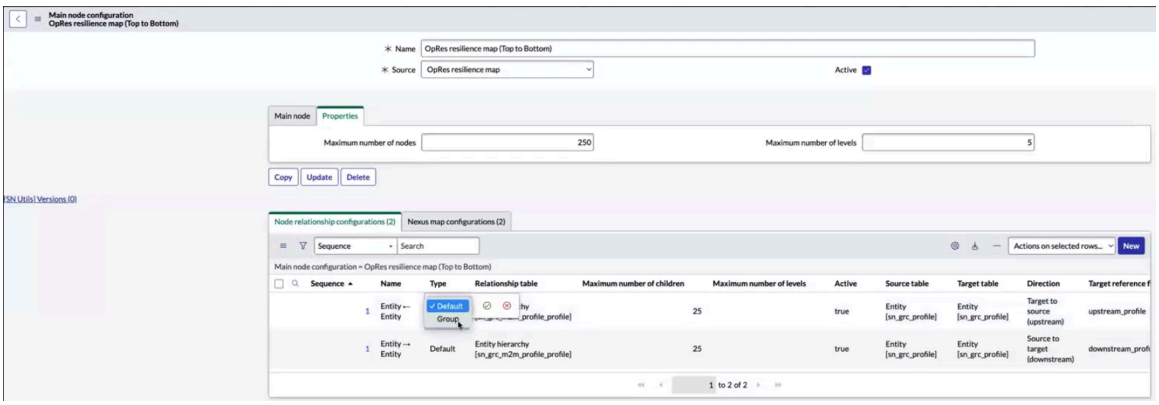
1. Properties tab in the UI: A **Properties** tab has been introduced in the UI of the Main node configurations. For more information, see the "Properties tab introduced in the Main node configurations UI" section.
2. Node relationship configurations related list: The existing Node relationship configurations related list has been enhanced. For more information, see the "Node relationship configurations related list" section.
3. Nexus map configurations related list: Define the UI configuration for the selected main node by configuring the Nexus map configuration settings. You can configure the node and edge settings as defined in the following sections:
   - Node configurations
   - Node status configurations
   - Edge configurations
   - Edge status configurations

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties tab introduced in the Main node configurations UI

Two new properties have been introduced to control the display settings for node maps:

- Maximum number of nodes: Determines the total number of nodes that are displayed in the node map.
- Maximum number of levels: Specifies the maximum number of hierarchical levels to be shown, from top to bottom.



These properties enable you to have more customized and controlled visualization of complex node maps, enhancing the overall user experience.

Changes in the Node relationship configurations related list

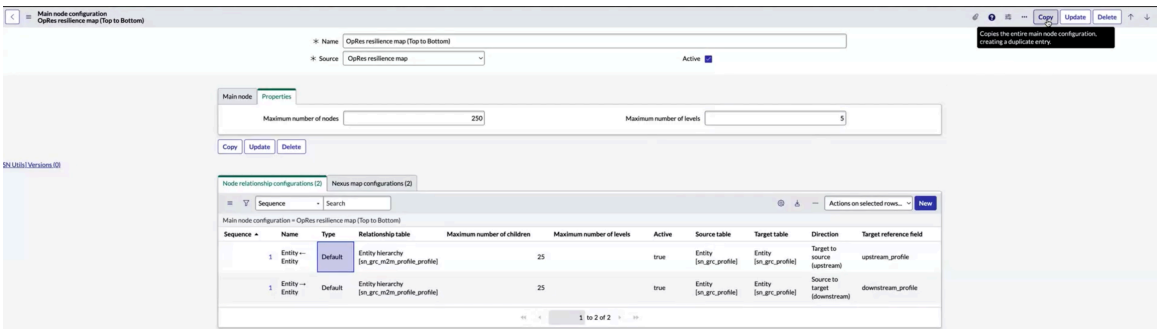
The existing Node relationship configurations related list has been updated and includes the following changes:

- Type column: The Type column has been added, offering two distinct options for displaying node relationship information:
  - Default type: As shown in the earlier illustration, the "Default type" column displays the hierarchy from top to bottom. It's the default option.
  - Group type: Aggregates data at a specific node, providing a more focused view.

  This enhancement enables for more flexible and meaningful visualization of node data.

- Maximum number of nodes and Maximum number of levels: You can set the maximum number of nodes and levels for the map (as shown in the **Properties** tab). Similarly, you can also control the maximum number of children shown at the specific node relation and maximum number of levels shown at a specific node. The *`Maximum number of levels`* property is enabled only when the source table and target table in the Main node configuration are the same; if they're different, this property is disabled.

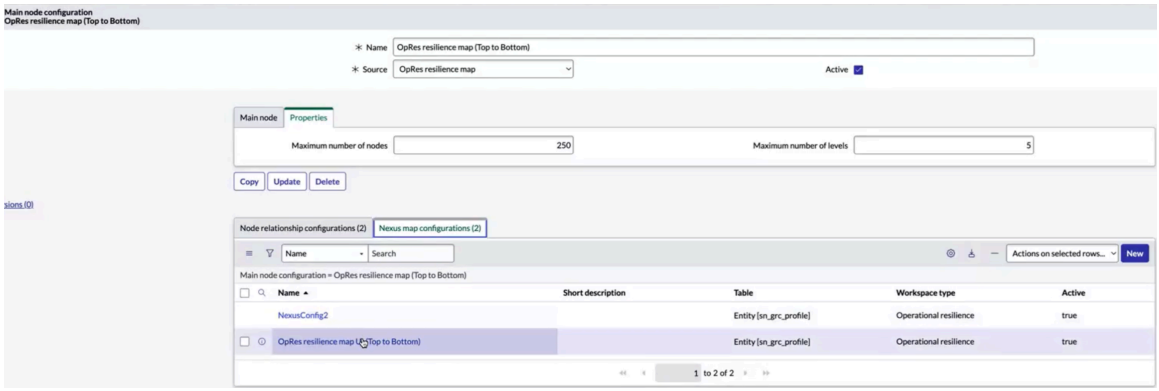
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



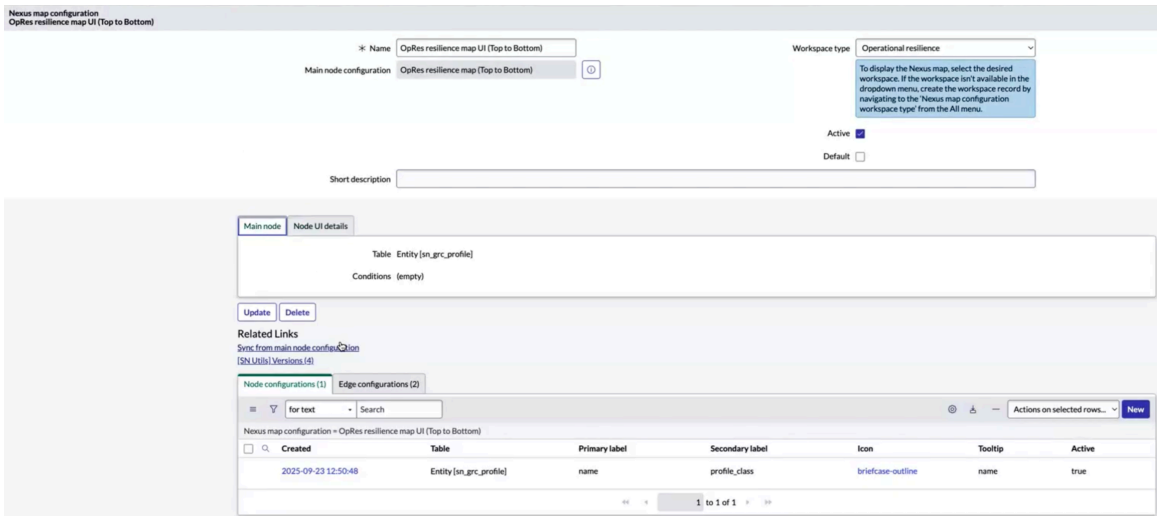
- Maximum number of children: You can control maximum number of children to be displayed at the specific node relation. The minimum value for this field is 2.

- Direction: Another field added to the relationship configuration is "Direction," which specifies the direction of the relationship between the source and target tables. The direction can be set to either "Target to source" or "Source to target." When set to "Target to source," selecting a specific node displays all its upstream nodes, showing the relationships leading to that node. When set to "Source to target," selecting a specific node displays all its downstream nodes.

The "Direction" column helps you to visualize and understand the relationships between nodes.



- Copy functionality at the Main node: The main node configuration now includes a **Copy** UI action. When this functionality is used, the selected main node configuration is copied and then you're required to set up the Nexus configuration for the copied main node.



Nexus map configurations related list

The Nexus map configurations related list has been introduced in the UI. Configuring the Nexus map configuration for the selected main node helps you to define its UI configuration, determining how the selected node would be displayed in the Nexus map. This setting includes settings for colors, icons, edge configuration, and other visual elements. A single main node configuration can have multiple Nexus configurations, enabling for different data views for the same structure. This flexibility is achieved through configuration at the Nexus map level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select the Nexus map configuration from the related list and view or update its configuration details. The Nexus map configuration for "OpRes resilience map UI" is shown in the example.

For every selected main node configuration, you must choose the workspace type where you want to apply this configuration. The available workspace type includes the Operation Resilience Workspace.

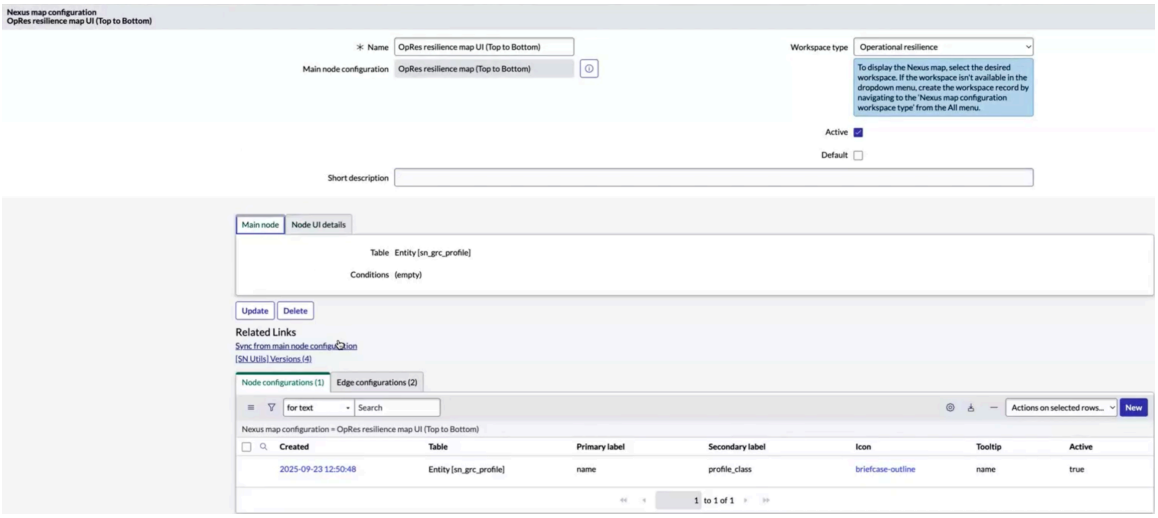
Note:
To display the Nexus map, choose the desired workspace from the available options. If the required workspace isn't listed, you can create a workspace record by accessing the **Nexus map configuration workspace type** from the **All** menu.

The **Main node** tab displays the name of the Main node table along with its associated conditions. The **Node UI details** tab shows the Node UI type, which is set to "Node map default node" by default.

To synchronize changes made at the Main node level, such as adding or modifying relationships, into the Nexus map configuration, use the **Sync from main node configuration** UI action. This action helps you to maintain synchronization between the Main node and Nexus map configuration.

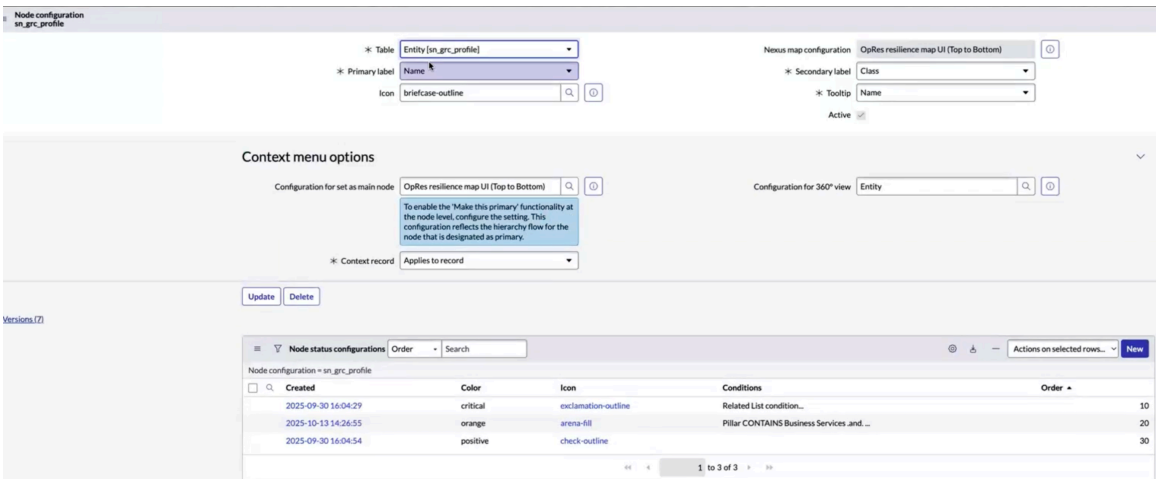
The Nexus map configuration is also referred to as the Main Node UI configuration.

Within the Nexus map configuration, you can customize two key aspects:



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Node configuration: This setting involves configuring the UI settings for nodes, including their appearance.
- Edge configuration: This configuration involves customizing the edges between nodes, including their type (dashed or solid), color, and other conditional settings.



These configurations enable you to tailor the visualization of your Nexus map according to your requirements.

Node configurations

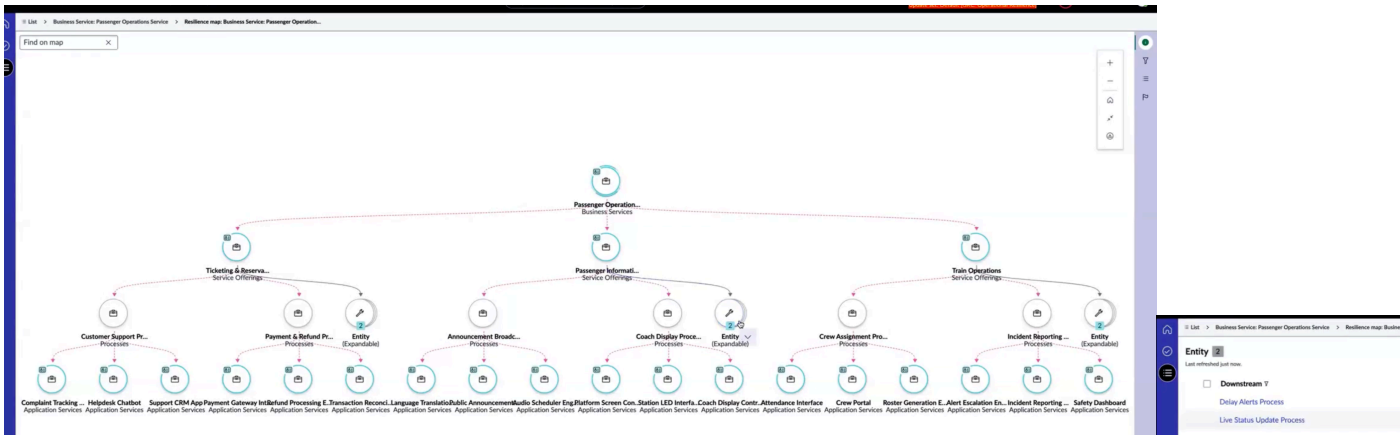
The Node configurations related list helps you to configure the UI settings for the selected node. Then the selected node is displayed in the Nexus map according to the UI settings. The following example shows the node configuration settings for the "Opres resilience map UI (Top to bottom)" Nexus map configuration.

Node configuration settings: Selecting the Node configuration related list shows the node configuration settings defined for the selected node. The example shows the node configuration settings defined for the "Entity [sn_grc_profile]" table.

You can update the following UI parameters for the node:

- Primary label: Update the primary label to be displayed for the node, for example, Name.
- Icon: Update the icon to be used for the node in the main node UI, for example, briefcase-outline.
- Secondary label: Update the secondary label to be displayed for the node, for example, class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



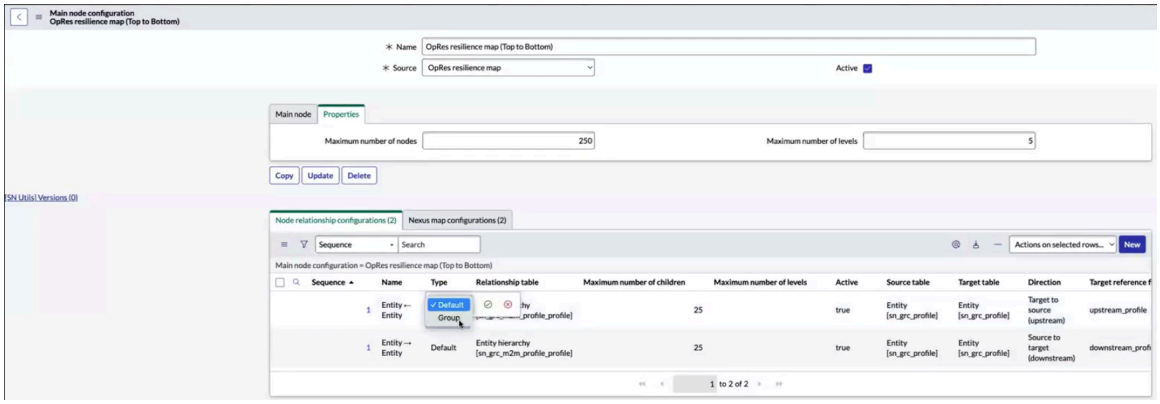
- Tooltip: Update the tooltip to be displayed when hovering over the node, for example, Name.

- **Configuration for set as main node** field (Setting a node as the Main Node): To enable the **Make this primary** functionality for a node (To make a node as a primary node), you must configure the *`Configuration for set as main node`* setting. This configuration reflects the hierarchy flow for the node that is designated as primary. To set a specific node as the Main node (primary node) at any point, select the Nexus map configuration in the *`Configuration for set as main node`* field. For example, when viewing node relationships from primary node A to node B and node C, the node chain such as "A ->B ->C" is displayed. You can select node B as the Main node (primary node) and then the display shows node A as the upstream node and node C as the downstream node.

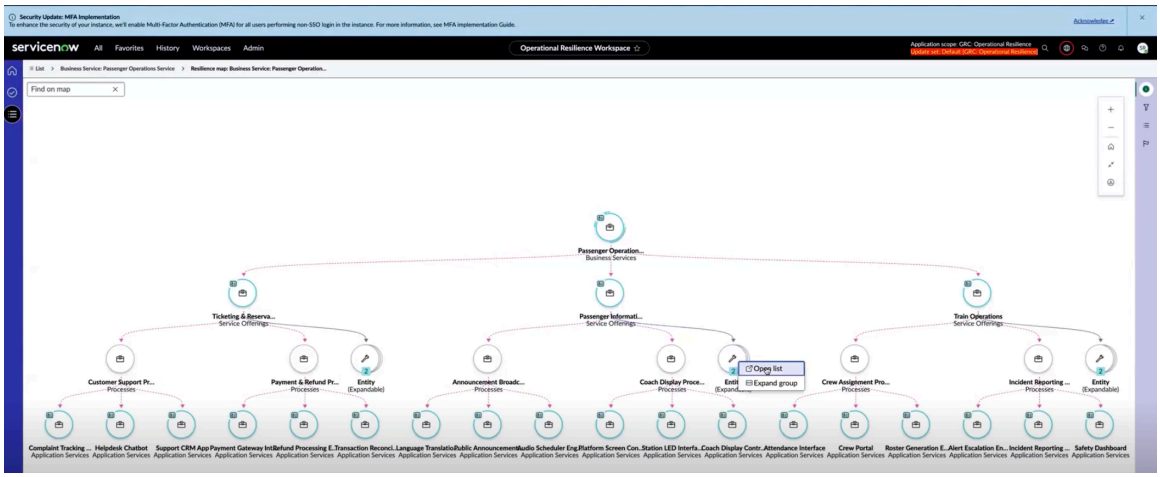
  Configuration for 360° view field: You can configure this setting to determine the configuration to be used when viewing a 360° view, for example, **Entity**.

  Context record: You can define the context record for the selected entity, for example, **Applies to record**.

Node map grouping and expansion: The node map displays grouped nodes, such as first node, second node, and third group as expandable. Right-selecting on the grouped node provides the options to either expand the node or view the open list, which lists the number of nodes grouped at that point.



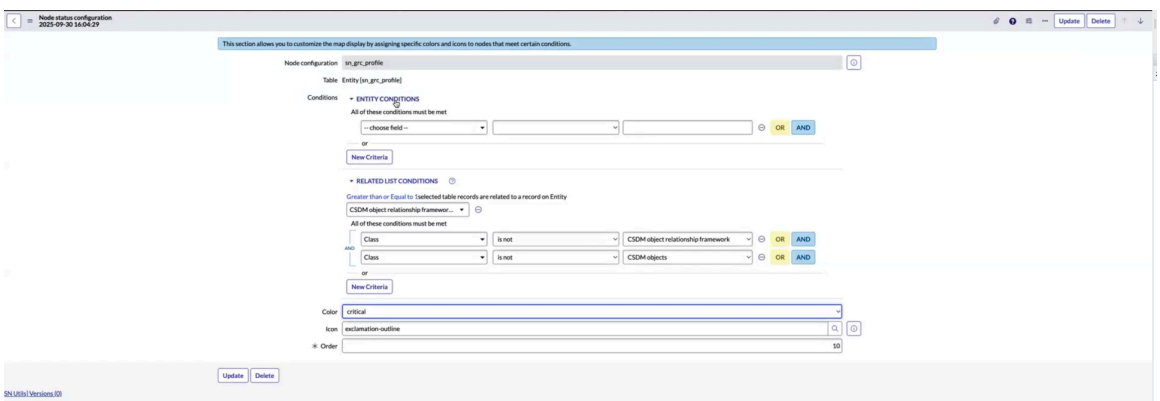
Expansion functionality: The node expansion feature enables you to view additional nodes, such as the "passenger information" level shown in the example. The expansion of the nodes is updated dynamically based on the number of levels available, enabling a more detailed and controlled exploration of the node map. By using the expand and open list options, you can efficiently navigate the map and better understand the relationships between nodes.



Node map aggregation feature: The node map includes an aggregation feature that enables you to group nodes at a specific level. To use this feature, you can change the main node

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

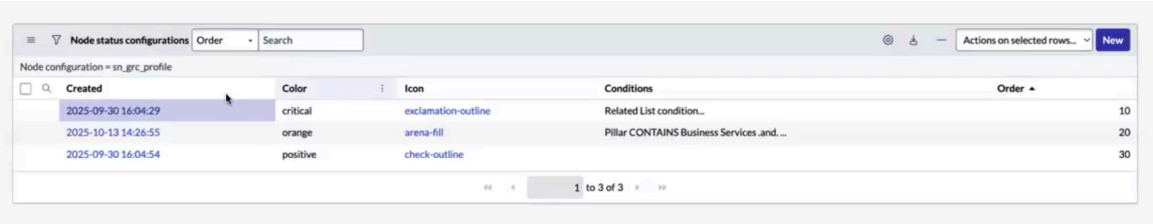
configuration type from **Default** to **Group** as shown in the example. This action aggregates the nodes at the selected level, providing a more consolidated view.



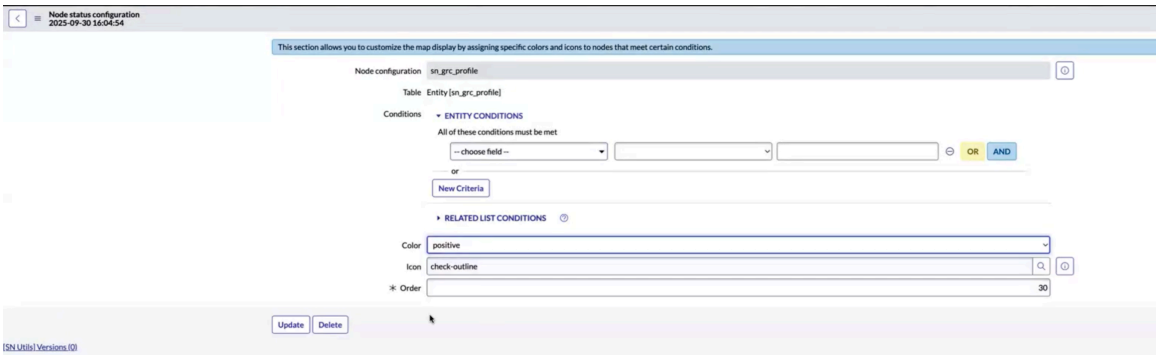
When loading a map with a grouped configuration, nodes are initially displayed in a grouped state. Right-selecting on an aggregated node provides the **Open list** option, which displays the entities aggregated at that point.

This feature simplifies complex node maps, allowing you to focus on specific areas of interest and enhancing overall usability. By using the Group feature, you can more easily analyze and understand the relationships between nodes.

Node status configurations



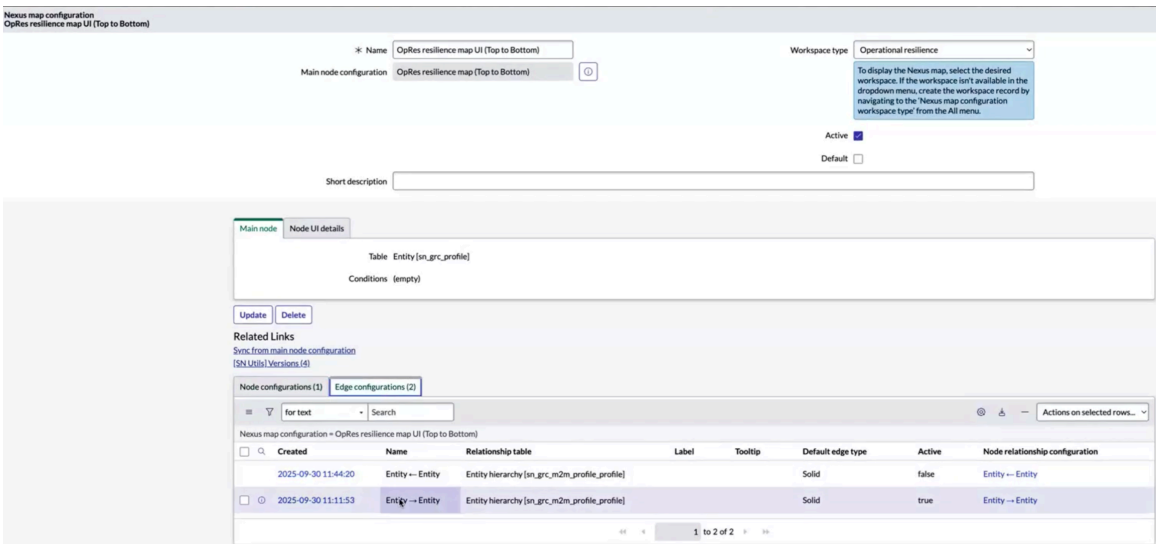
The Node status configurations related list helps you to define conditions for a table and its related lists for the selected node. The example shows entity conditions since the Entity [sn_grc_profile] table is being used. These conditions can be set using fields from the node table or related lists. For example, when the conditions defined in the "Related list conditions" panel are met, that specific node is marked with the "Critical" color and the "Exclamation-outline" icon.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this way, when the defined conditions are met, the node status configuration is updated accordingly.

You can define multiple filter conditions as shown in the Conditions column.

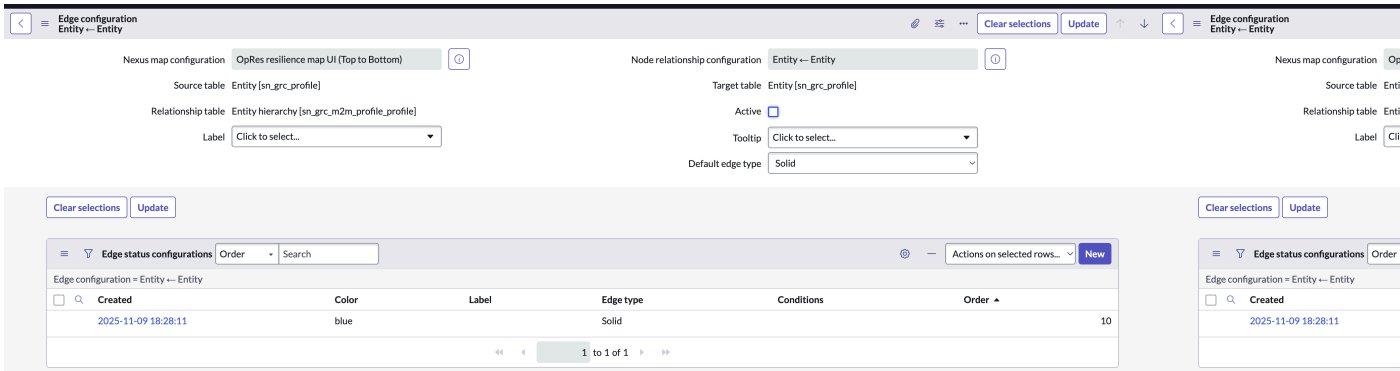


Default node status configuration: When a condition isn't defined for the node status configuration, it's the default node status configuration.

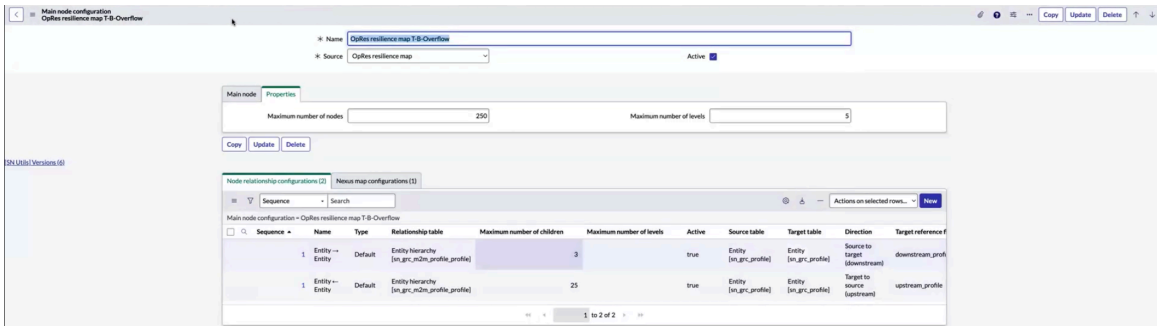
By configuring these settings, you can customize the display and behavior of nodes in the Nexus map to suit your needs.

Edge configurations

Edge configurations can be set up similarly to node configurations. For a given relationship between entities (for example, upstream or downstream), you can define two edge configurations.



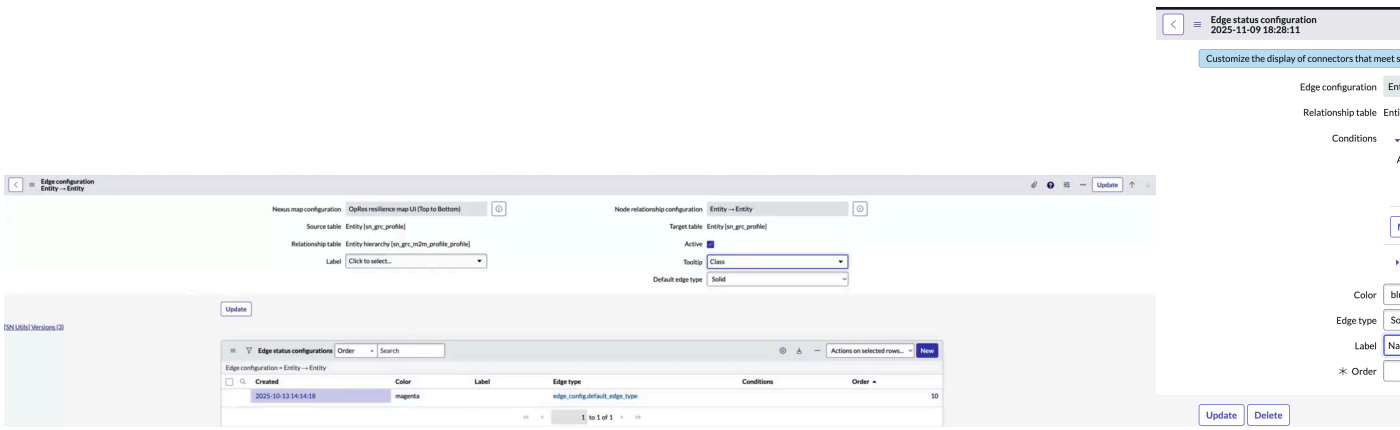
Edge settings: You can customize the following edge settings:



- Label: The label to be displayed on the edge.
- Tooltip: The tooltip to be shown when hovering over the edge.
- Edge type: The type of edge to be displayed (for example, solid or dashed).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Edge configurations related list and Edge configuration record are displayed in the following examples.

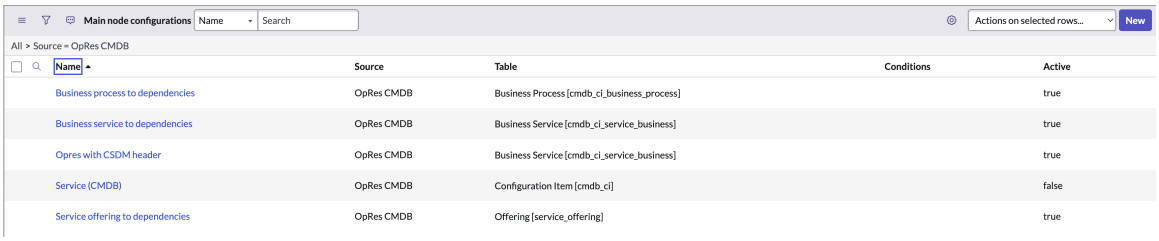


The following example shows the maximum number of children from Source to target direction as 3.

As a result, for every node, the maximum number of children shown is 3.

Edge status configurations

Edge status configurations can be defined based on specific conditions. You can set the edge color, type, and other properties based on these conditions. For example, you can set an edge to display in magenta by default, or change its type to dashed or solid based on a specific condition. By configuring these edge settings, you can create a more informative and visually appealing Nexus map. The edge configuration settings complement the node configuration settings, enabling for a comprehensive visualization of the relationships between entities.



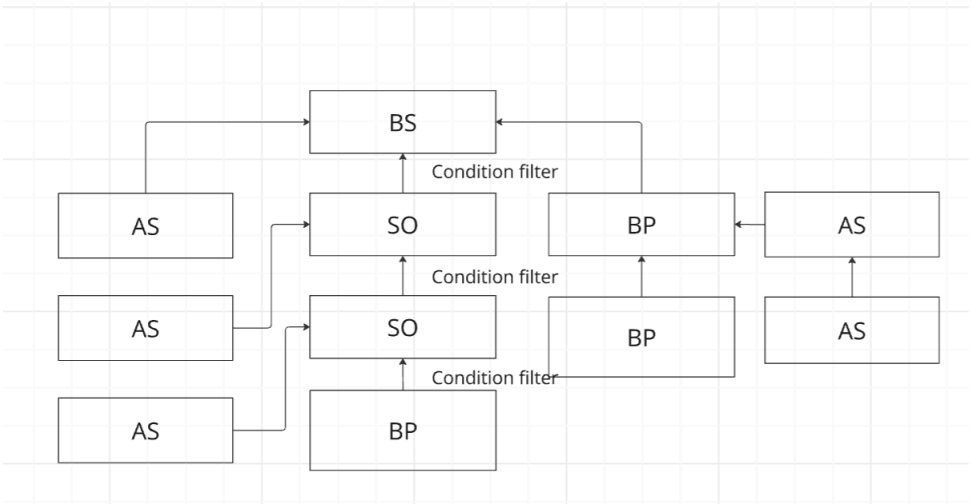
Main node configurations included with the base version

The Main node configurations are included with the Operational Resilience base version. The following Main node configurations, with the source being the "OpRes CMDB", are shipped with the base version:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Opres with CSDM header
- Business process to dependencies
- Business service to dependencies
- Service offering to dependencies
- Service (CMDB)

Note:
You can fully customize the Main node configurations and for each configuration, you can configure the node relationships and Nexus map configurations from the Node relationship and Nexus map configuration related lists. For more information on how to configure the node relationships and Nexus map configurations, see Configure the Node relationship configurations.



1. Opres with CSDM header configuration for business services: The Opres with CSDM header configuration defines the relationships for a business service and is primarily used by new customers.

   This configuration sets up the direct and indirect relationships between the following objects:

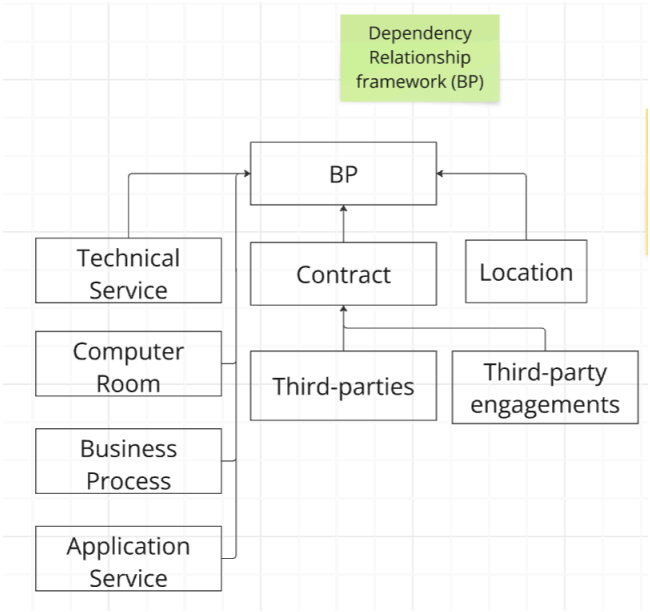
   a. Application services
   b. Business processes
   c. Business services
   d. Service offerings

   The following diagram illustrates the structure of the Opres with CSDM header configuration, available as a base version in Operational Resilience. A business service can have relationships configured with one or more application services, service offerings, and business processes. When entities are generated and scheduled jobs are executed, dependencies are fetched and rolled up to the parent business service. The configuration supports multiple levels of dependencies, as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the Opres with CSDM header configuration, see Opres with CSDM header Main node configuration.

2. Service (CMDB) configuration for services: The Service (CMDB) configuration defines the relationships for a service and is primarily used by existing customers. It supports only one level of dependency, such as a parent service having a child service, a process, or a dependency. A child service can have a process and a dependency (such as Dep2 or Dep4 as shown in the example) and a process can have a dependency (such as Dep3 as shown in the sample hierarchy).



For more information on the Service (CMDB) configuration, see Service (CMDB) Main node configuration.

3. Dependency configurations:

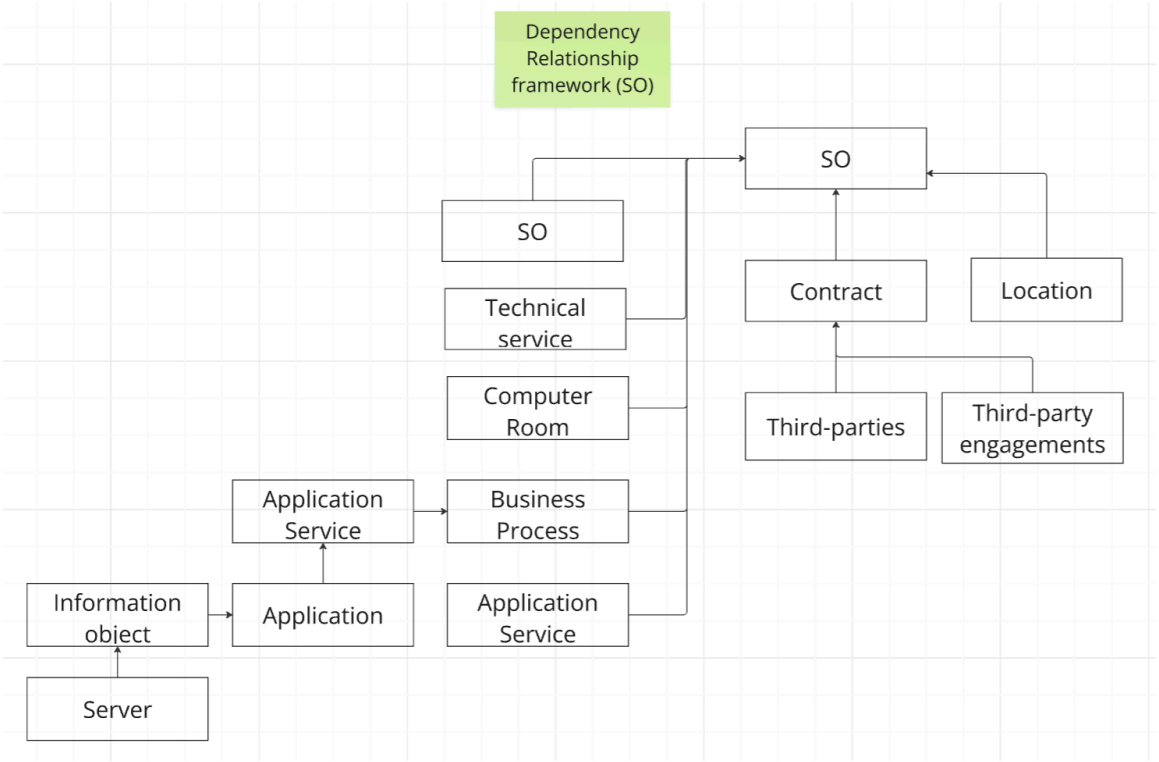
   The Dependency configurations define the relationships for dependencies that are related to business services, business processes, and service offerings.

   a. Business process to dependencies: The Business process to dependencies configuration defines the relationships from a business process to its dependencies. The following diagram shows the dependency relationship framework for a business process, available as a base version in Operational Resilience. A business process can have relationships with application services, other business processes, technical services, contracts, third parties, and more. When entities are generated and scheduled jobs are executed, dependencies are fetched and rolled up to the parent business process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

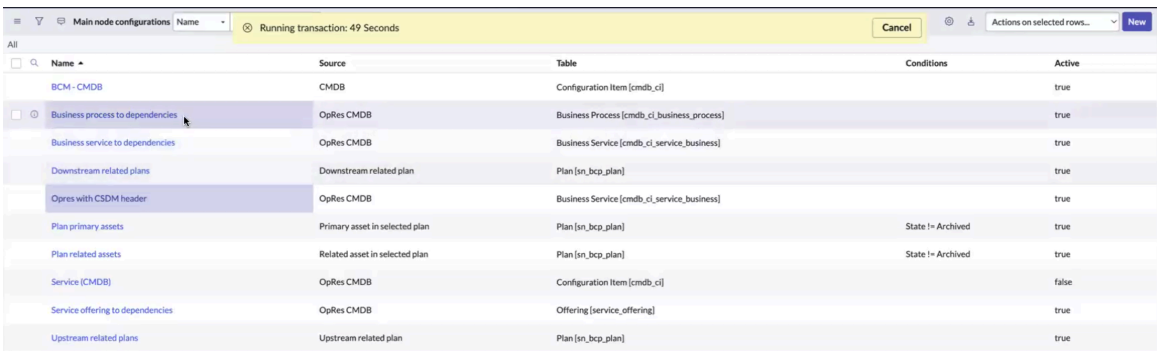
For more information on the Business process to dependencies configuration, see Business process to dependencies Main node configuration.

b. Business service to dependencies: The Business service to dependencies configuration defines the relationships from a business service to its dependencies. The following diagram illustrates the dependency relationship framework for a business service, available as a base version in Operational Resilience. A business service can have relationships with locations, contracts, third-parties, third-party engagements and more. When the entities are generated and scheduled jobs are executed, dependencies are fetched and rolled up to the parent business service.



For more information on the Business service to dependencies configuration, see Business service to dependencies Main node configuration.

c. Service offering to dependencies: The Service offering to dependencies configuration defines the relationships from a service offering to its dependencies. The following diagram shows the dependency relationship framework for the service offerings, available as a base version in Operational Resilience. A service offering can have relationships with application services, other business processes, technical services, contracts, third parties, and more.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When entities are generated and scheduled jobs are executed, dependencies are fetched and rolled up to the parent service offering.

For more information on the Service offering to dependencies configuration, see Service offering to dependencies Main node configuration.

4. BCM dependency configurations: When the Business Continuity Management application is installed in an instance, BCM related dependencies are fetched into the Operational Resilience application. The Main node configurations related to BCM, such as BCM-CMDB, Downstream related plan, Plan primary assets, Plan related assets, and Upstream related plans, are shown in the example.

Name	Source	Table	Conditions	Active
BCM - CMDB	CMDB	Configuration Item [cmdb_ci]		true
Business process to dependencies	OpRes CMDB	Business Process [cmdb_ci_business_process]		true
Business service to dependencies	OpRes CMDB	Business Service [cmdb_ci_service_business]		true
Downstream related plans	Downstream related plan	Plan [sn_bcp_plan]		true
Opres with CSDM header	OpRes CMDB	Business Service [cmdb_ci_service_business]		true
Plan primary assets	Primary asset in selected plan	Plan [sn_bcp_plan]	State != Archived	true
Plan related assets	Related asset in selected plan	Plan [sn_bcp_plan]	State != Archived	true
Service (CMDB)	OpRes CMDB	Configuration Item [cmdb_ci]		false
Service offering to dependencies	OpRes CMDB	Offering [service_offering]		true
Upstream related plans	Upstream related plan	Plan [sn_bcp_plan]		true

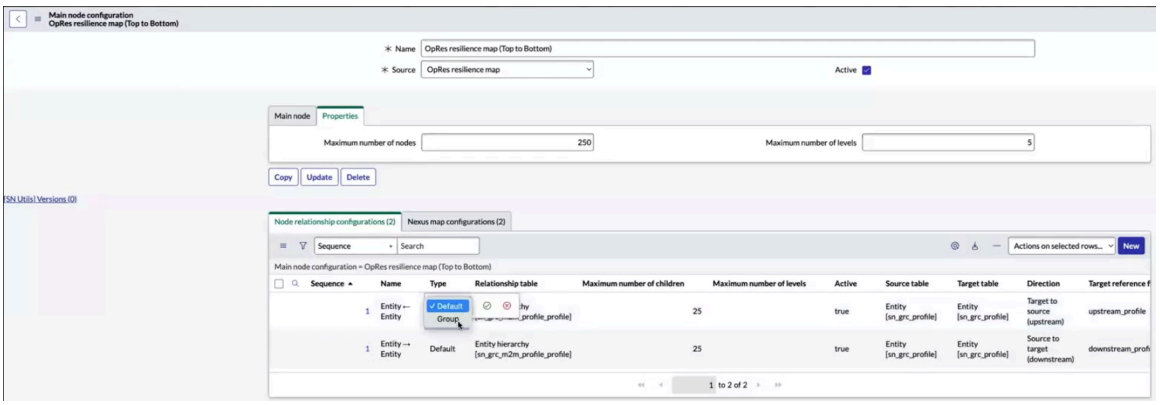
For more information on the BCM dependency configurations, see BCM dependencies related Main node configurations.

For information on gathering data aligned with the latest CSDM model, see Gathering data aligned with the CSDM setup.

After setting up the Main node configurations, you must verify that the entities are generated in Operational Resilience. Only when the entities are generated in Operational Resilience and the relationships are created in the Main node configurations, CMDB data can be brought into Operational Resilience for reporting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node relationship configurations



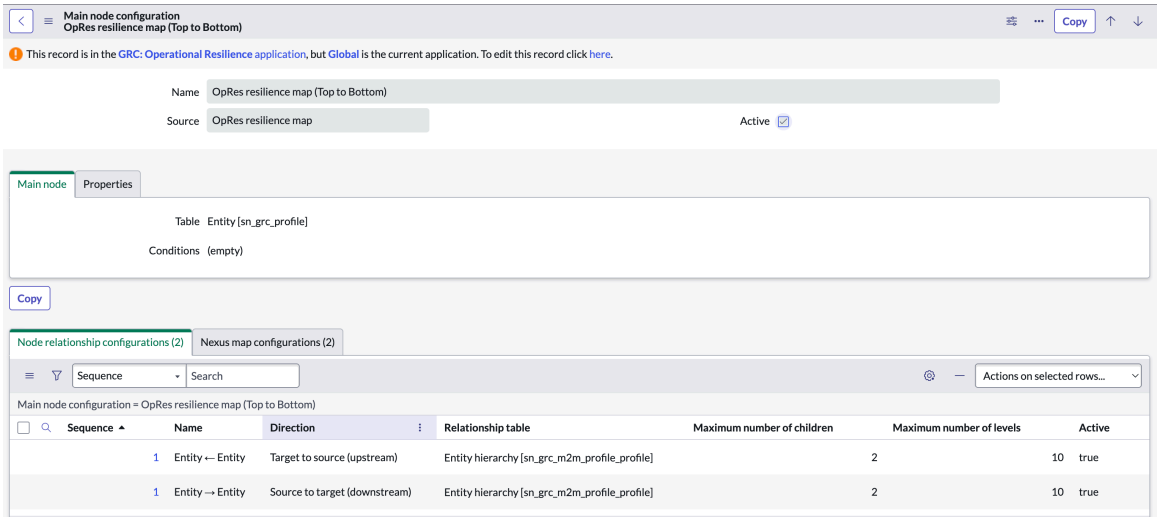
Node relationship configurations are used to set up relationships between the records and objects defined in the table. You can configure the details of the main node such as its name, source, table name, filer conditions, and so on.

For details on the updates in the Node relationship configurations introduced in Operational Resilience, version 21.1.x, refer to the "Node relationship configurations related list" in Main node configurations: A component of the Data Relationships Framework.

Node relationship configurations related list

The existing Node relationship configurations related list has been updated and includes the following changes:

- Type column: The Type column has been added, offering two distinct options for displaying node relationship information:
  - Default type: As shown in the earlier illustration, the "Default type" column displays the hierarchy from top to bottom. It's the default option.
  - Group type: Aggregates data at a specific node, providing a more focused view.



This enhancement enables for more flexible and meaningful visualization of node data.

- Maximum number of nodes and Maximum number of levels: You can set the maximum number of nodes and levels for the map (as shown in the **Properties** tab). Similarly, you can also control the maximum number of children shown at the specific node relation and maximum number of levels shown at a specific node. The *`Maximum number of levels`* property is enabled only when the source table and target table in the Main node configuration are the same; if they're different, this property is disabled.

- Direction: Another field added to the relationship configuration is "Direction," which specifies the direction of the relationship between the source and target tables. The direction can be set to either "Target to source" or "Source to target." When set to "Target to source," selecting a specific node displays all its upstream nodes, showing the relationships leading to that node. When set to "Source to target," selecting a specific node displays all its downstream nodes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This enhancement provides more flexibility in visualizing and understanding the relationships between nodes.

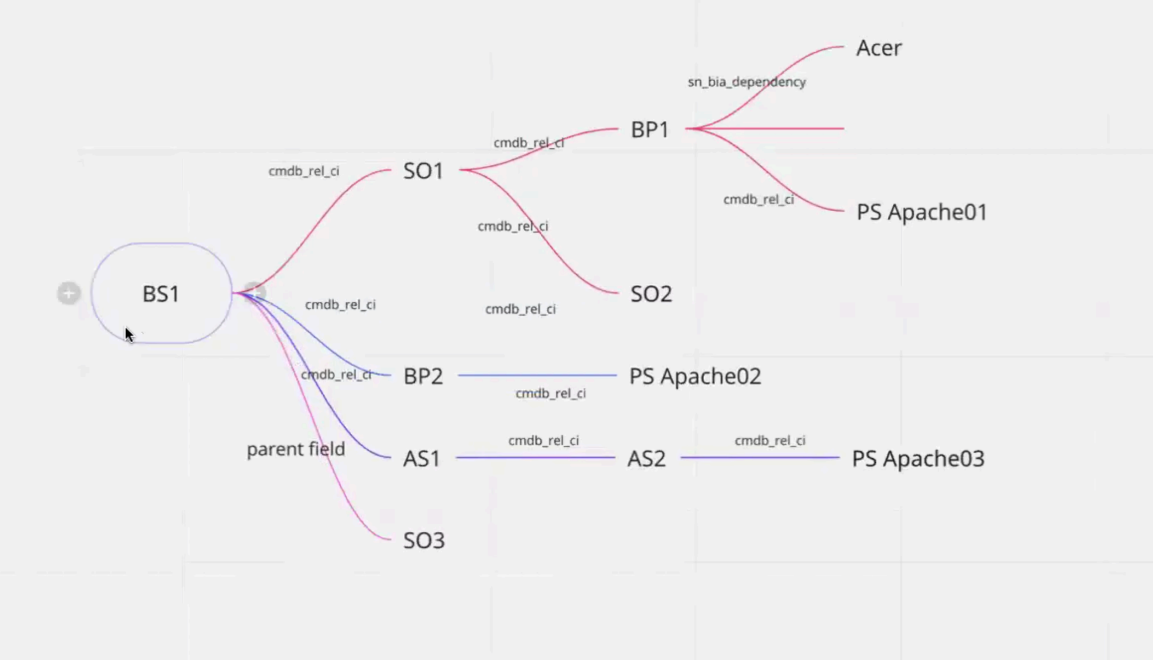
- Copy functionality at the Main node: The main node configuration now includes a **Copy** UI action. When this functionality is used, the selected main node configuration is copied and then you're required to set up the Nexus configuration for the copied main node.

For information on configuring the Node relationship configurations, see Configure the Node relationship configurations.

For information on setting up relationships between different objects, see Relationships between CSDM objects.

Relationships between CSDM objects

You can configure relationships between various CSDM objects such as business services, service offerings, business processes, and application services by using the Main node configurations. The [sn_grc_m2m_profile_profile table] serves as the source table for establishing these relationships.



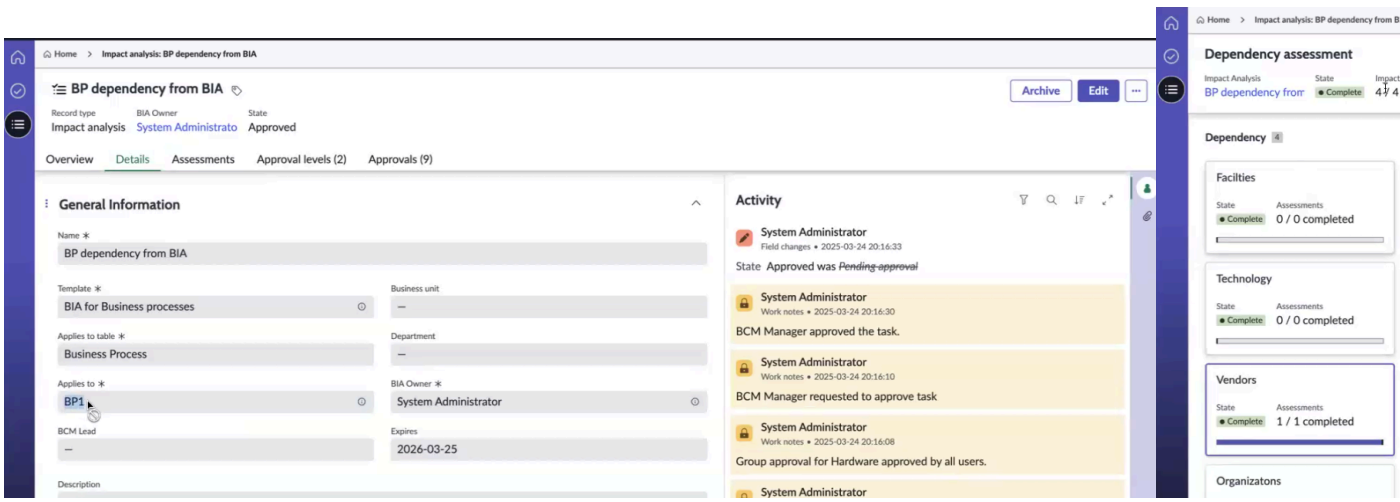
Establishing relationships between different objects

To illustrate the relationships between different CSDM objects, consider the following example of a business service (BS1).

The business service (BS1) includes the following objects as shown in the example.

- Service offering (SO1)
- Business process (BP2)
- Application service (AS1)
- Service offering (SO3)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

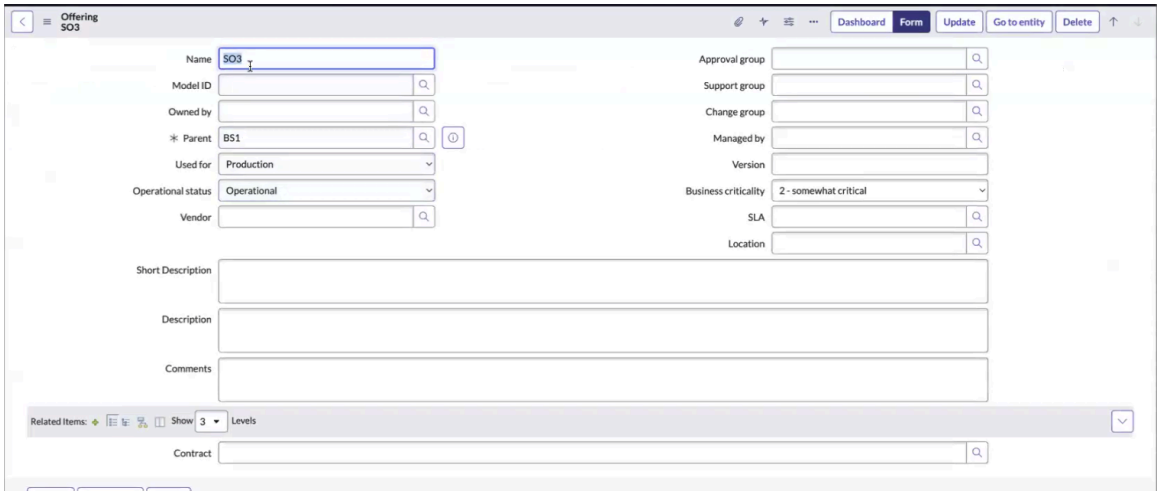


The Service offering (SO1) is related to the Business process (BP1) and Service offering (SO2). BP1 has the following dependencies:

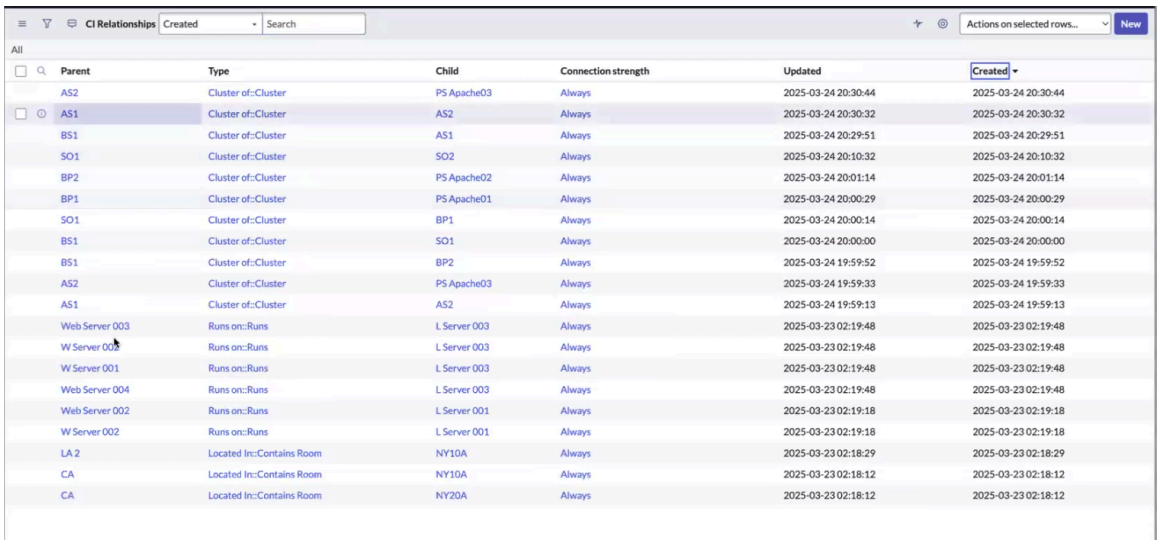
- Acer
- PS Apache01

BP2 has a dependency on PS Apache02. AS1 has a dependency on AS2 and AS2 has a dependency on PS Apache03.

Note:
When you set up the Main node configurations, you must ensure that the entities are set up in Operational Resilience. Only when these entities exist, relationships can be established between the CSDM objects and then data is brought into Operational Resilience for reporting.



The **Applies to** field in a business impact analysis (BIA) shows the object that has the dependency. The example shows that the business process (BP1) has Acer as a dependency.



The dependency is also brought from the **Parent** field into Operational Resilience for the service offerings and application services. For example, the parent for service offering (SO3) is business

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

service (BS1). Therefore, when the scheduled job is executed, it fetches SO3 as a configured relationship for business service (BS1).

All the CMDB relationships, as shown in the example, are maintained in the CI relationships [cmdb_rel_ci] table.

To bring these relationships into Operational Resilience, you must use the Main node configurations. For more information, see Configure the Main node configurations.

You can establish the following relationships between objects such as business services, service offerings, and business processes.

Establishing relationships

Entity	Relationships
Business services	• Service offering for a business service: BS -> SO1, SO2 • Business process for a business service • Application service for a business service • Dependencies for a business service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Establishing relationships (continued)

Entity	Relationships
Service offerings	• Business process for a service offering • Application service for a service offering • Dependencies for a service offering
Business processes	• Application service for a business process • Dependencies for a business process

The same relationship can be applied and used on multiple forms. For example, the business process relationship can be used on both Business service and Service offering forms.

For information on the Main node configurations, see Main node configurations: A component of the Data Relationships Framework.

Nexus map configurations

Beginning with Operational Resilience, version 21.1.x, the Nexus map configuration has been introduced. To display a main node in the Operational Resilience Workspace, you must configure the Nexus map. The Node Map configuration UI allows you to visualize related data hierarchically, track issues, and identify areas needing attention for effective resolution or health monitoring.

Limitations observed before using Nexus map configurations

Before implementing Node map configurations with Operational Resilience, version 21.1.x, visualizing dependencies across multiple stages of the Common Service Data Model (CSDM) in various Workspace views was challenging. The data hierarchies, as shown in the following example model, are complex and multidimensional, making it difficult to understand relationships between different data entities:

- Business Service → Business Service Offering → Business Process → Application → Dependencies
- Entity → Policy → Control Objective → Control → Control Indicator

List views alone are insufficient for effectively depicting complex relationships, often requiring manual navigation through multiple related lists and records to understand upstream or downstream impacts. Node map configurations offer a more efficient solution, enabling you to visualize these complex relationships easily.

Benefits of Nexus map configurations

The Node map configurations, which are part of Data Relationships Framework by default, enable you to define relationships between records and visualize them on a node map. This visualization makes it easier to understand upstream and downstream relationships.

The Node map configuration feature offers the following benefits:

- It enables any consuming application to define relationships between records and visualize related data hierarchically on a node map.
- It facilitates issue tracking and identification of areas requiring attention for troubleshooting purposes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dependencies for Nexus map configurations

The Node map configurations have the following hard dependencies:

- Data registry for defining data relationships (sn_data_registry)
- Record Related Items Connected (sn_rec_relatedItem)

The Node map configuration has the following optional dependencies:

- Providing 360° Relationship Visualization for rendering 360° view and related items
- Using GRC: Common Workspace Elements for navigating to 360° view and related items

Record visibility based on user access

Access to records is determined by the read access control lists (ACLs) associated with those records. You can only view records that you have access to. Nodes and their underlying children that you don't have access to, aren't displayed in the map.

This functionality verifies that sensitive information is protected and you can only see data that you're authorized to access.

For details on Nexus map configurations, including Node and Edge configurations, refer to the "Nexus map configurations related list" in Main node configurations: A component of the Data Relationships Framework.

Node and edge configurations and property setting from the UI

To access the Node map configuration from the Operational Resilience Workspace, BCM administrators must set up the Main node configurations. Once the Main node configuration table is set up, it enables you to create configurations for entities such as services, business services, offerings, business processes, and application services. You can update the properties, node, and edge configuration details.

Main node configuration properties tab in the UI

The main node configuration comprises several key properties:

- Maximum number of nodes and levels
- An order field that auto-increments by 10 (You can update the order field manually.)
- A direction property defining relationships between configuration items and entities

You can update these property settings from the UI directly. For more information on setting up the Main node configurations in your instance, see Configure the Main node configurations.

Nexus map configuration related list in the Main node configuration

As of Operational Resilience, version 21.1.x, the Nexus map configuration related list is available within the Main node configuration. This enhancement enables you to create multiple configurations for a single main node. You can designate a default configuration for a main node, which is used when loading the node map. The Nexus map configuration consists of two distinct aspects: node configuration and edge configuration.

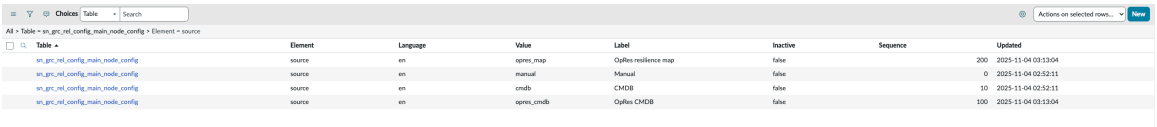
Node and edge configurations

The node configuration defines the visual representation of nodes, including their icon, tooltip, primary label, and secondary label. In contrast, the edge configuration determines the appearance of the connections between nodes, such as line type, color, label, and tooltip.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

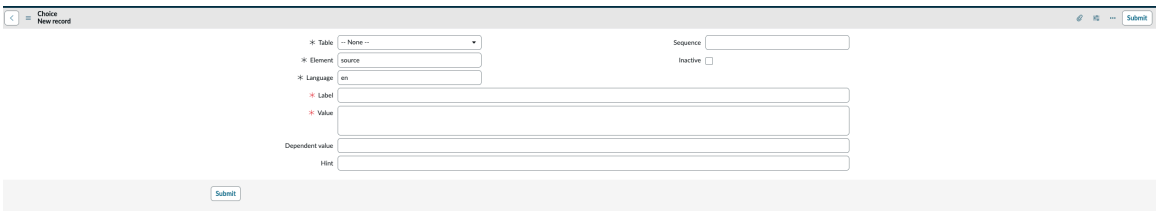
To access the entity hierarchy graphically, select the **Resilience Map** button on an entity's **Overview** tab in the Operational Resilience Workspace list view. The node map illustrates the entity hierarchy based on upstream and downstream relationships.

User roles and UI display



The Nexus map feature is accessible to multiple user roles, although its configuration settings are read-only. The configuration for Nexus Map is managed through the Main node configuration, with related lists for the node relationship and edge configurations. You can customize properties such as maximum number of nodes, maximum number of children, and edge properties. Based on your configuration settings, the resulting node map is displayed in the UI.

Main node configuration source



You can set up the source for the Main node configurations.

You can select the Main node configuration table and set up the element type as source. You can also add the label for the source such as CMDB, OpRes CMDB and then set up the Value, Sequence, Active flag, and so on.

In the Main node configuration source list view, you can review the available source configurations as shown in the example.

You can create a Main node configuration source configuration as shown in the example.

Configuring Operational Resilience

Configure the Operational Resilience application to identify risks, failed controls, monitor services and processes, and ensure a complete resilience of your organization.

Operational Resilience configuration overview

A typical configuration of the Operational Resilience application consists of the following steps:

1. Download the Operational Resilience application in your instance. For instructions, see Install Operational Resilience application.
2. Pillar configuration: Configure the pillars in Operational Resilience. You can also add new pillars or modify the existing pillars, but it is suggested to retain the pillars that come with the base system. For information, see Configure the pillars.
3. Entity type and entity filter configuration: Activate the entity types and entity filters. For information, see Configure entity types and entity filters.
4. Main node configurations: Update the main node configurations that are available with the base system or add more main node configurations. For information, see Configure the Main node configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Properties: Configure the properties to suit your business needs. For information, see Configure Operational Resilience properties.
6. Dashboard customization: Customize the dashboard by adding or removing reports as needed to suit your requirements.

Sample Main node configurations

For creating new Main node configurations in the Operational Resilience application, refer to the following end-to-end examples:

- Create a Services to dependencies sample Main node configuration.
- Create an Application service to dependencies sample Main node configuration.
- To configure an end-to-end workflow for a business service and fetch its CSDM dependencies and red flags data to Operational Resilience, see Sample end-to-end workflow for business services.
- To configure an end-to-end workflow for a service and fetch its CSDM dependencies and red flags data to Operational Resilience, see Sample end-to-end workflow for services.

For other general administrative setup tasks, see Completing general administrative tasks.

Install Operational Resilience application

Install the GRC: Operational Resilience application from the ServiceNow Store and run it in your instance.

Before you begin

Role required: admin

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the GRC: Operational Resilience (App id: sn_oper_res) application using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find an application, you may have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. Select **Install**.
   The application dependencies are installed by default.
4. If demo data is available and you want to load it, select **Load demo data**.

   Some applications include demo data, which are sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you do not select the **Load demo data** check box for a store application during installation, demo data is not available to install from the **Application Manager** later. For information on how to install or reinstall demo data after the initial installation, see the Workaround to install demo data if application is already installed [KB0722909] article in the HI Knowledge Base.

5. Select **Install**.

Related topics

List of plugins

Assign Operational Resilience roles to your users

Assign the appropriate roles to the users of the Operational Resilience application.

Before you begin
Role required: sn_oper_res.admin

About this task
To use the Operational Resilience application successfully, you must assign relevant roles to your users.

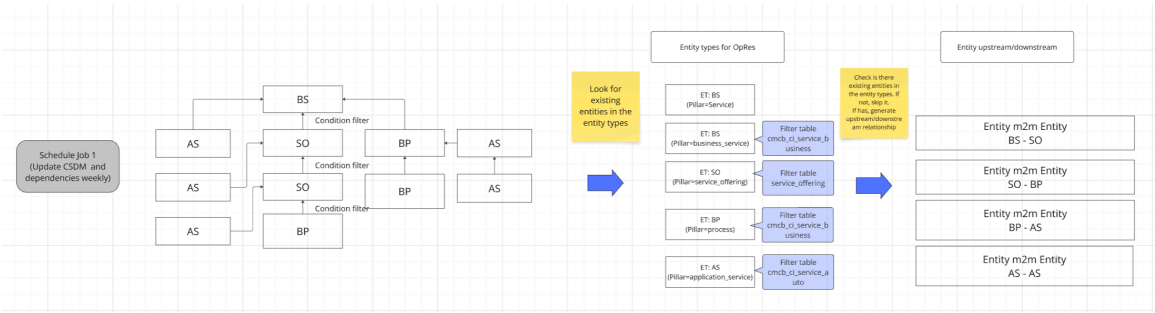
Procedure
1. Navigate to **All** > **User Administration** > **Users**.
2. Click the name of a user.
3. Click the **Roles** tab.
4. Click **Edit**.
5. Move the roles that you want to assign to the user from the Collection side to the Roles List and click **Save**.
6. Repeat these steps for each of your users.
   For more information on the roles, see Roles installed with Operational Resilience.

Set up pillars, entity types, and generate entities

Create entity types and pillars from the Operational Resilience Workspace and generate the entities based on the setup in the Operational Resilience application.

Before you begin
Role required: sn_oper_res.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



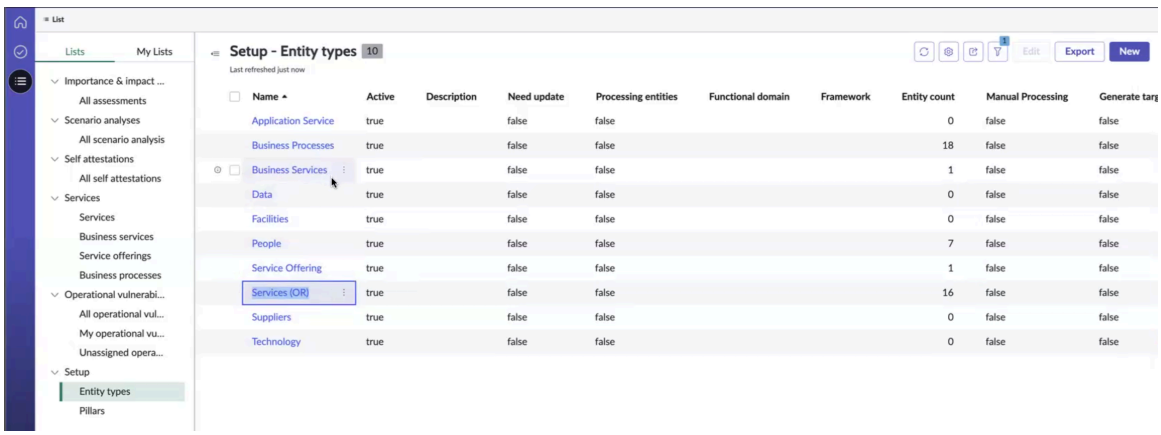
About this task

Note:
As an Operational Resilience administrator, you must perform the following tasks:

1. Activate the necessary entity types.
2. Activate the necessary entity filters.
3. Create new or update the existing pillars and entity types.
4. Generate entities based on the setup.

Operational Resilience managers can create or update the entity types, but they cannot delete the entity types. The entities can be manually added to the entity types or Operational Resilience managers can use the entity filters to create entities automatically. The entities are required for the relationships to be created when running the scheduled job.

If the#CMDB relationship changes, and there are entities on both sides of the CMDB relationship, the entity relationship is created on the#Operational Resilience side. However, if an entity relationship is created or deleted, these changes are not reflected in the#CMDB.



Note:
If the relationship changes in the CMDB, it creates the relationship into an entity hierarchy, but it does delete the old relationship in the entity hierarchy. You may have to delete the old relationship manually in the entity hierarchy.

Procedure

1. Navigate to **Operational Resilience Workspace** > **Entity types | Pillars** module.

   The entity types are displayed in the list view.

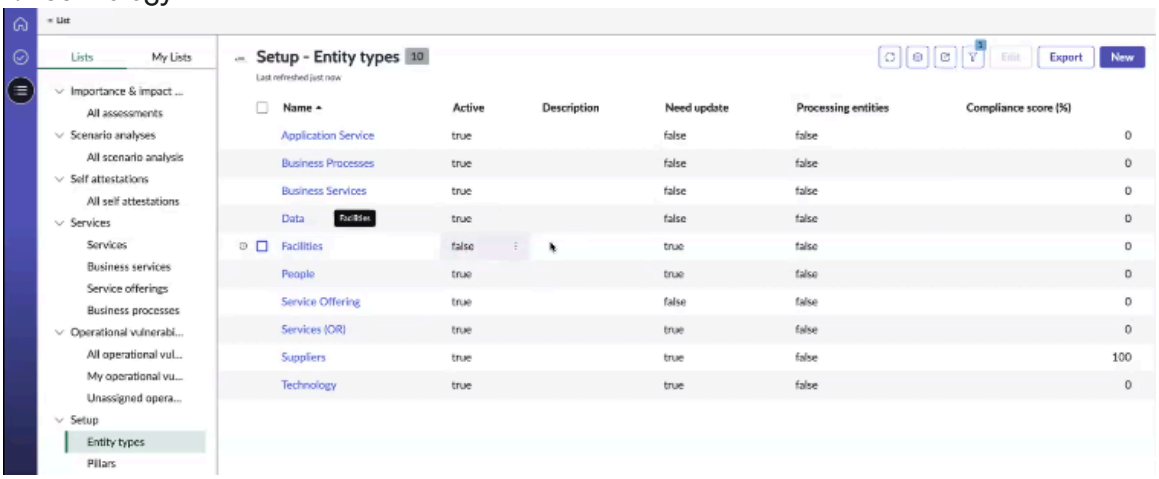
   For services, use the Services (OR) entity type. For business services, use the Business Services entity type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

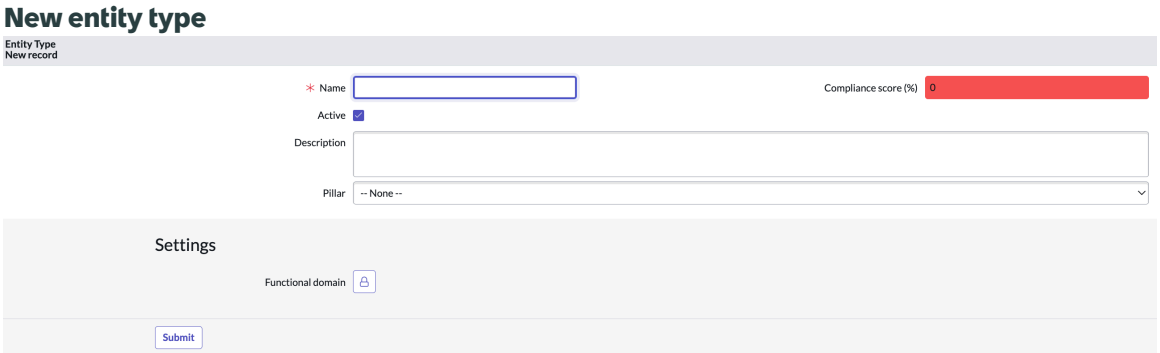
The Services (OR), Business Services, and Business Processes entity types are associated with the main CSDM pillars, which are used by the Opres with the CSDM header configuration. Therefore, you must not change the Services (OR), Business Services, and Business Processes entity types. You can only add, update, or delete the following entity types.

a. Application services



b. Data

c. Facilities

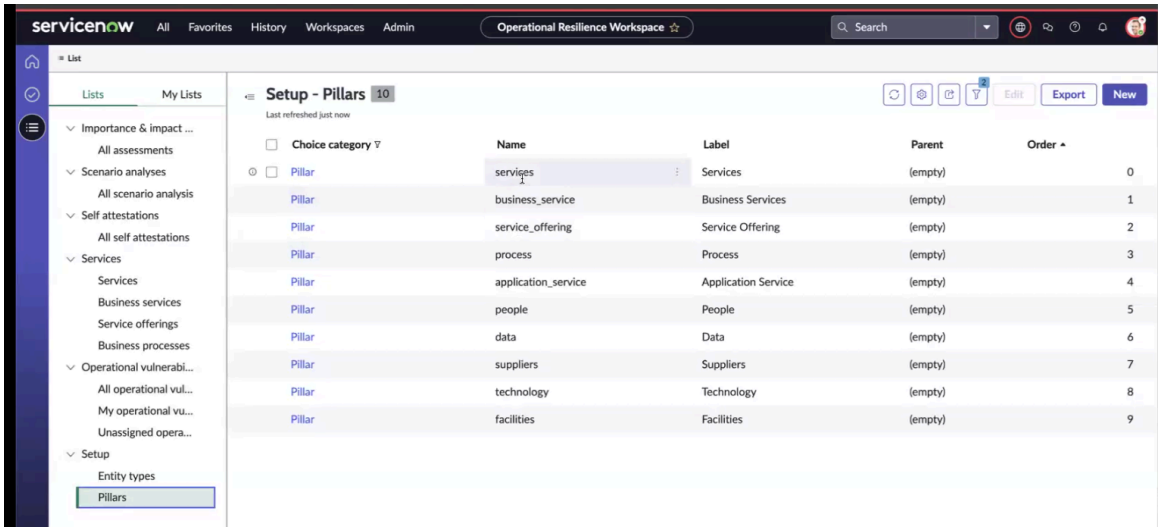


d. People

e. Suppliers

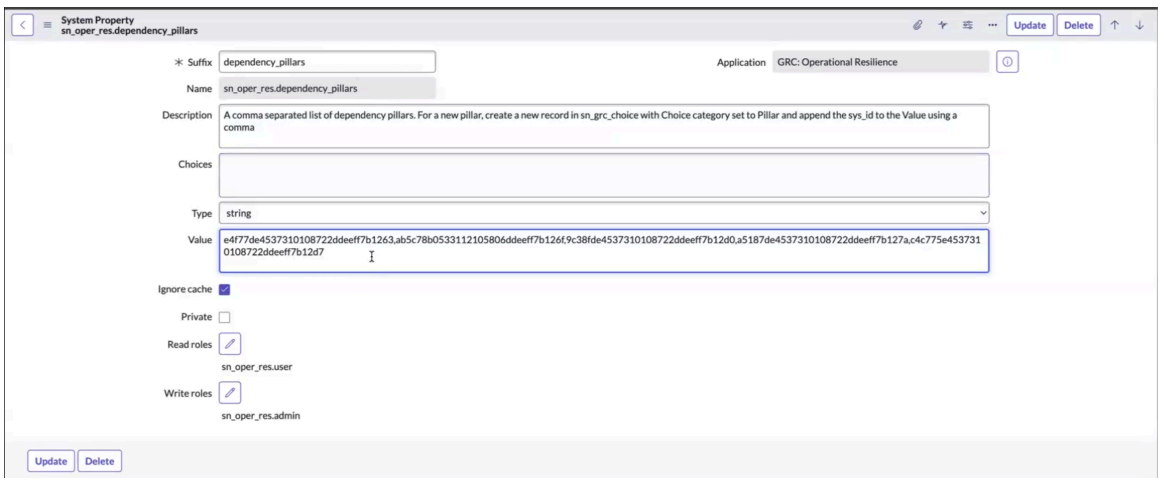
f. Technology

2. To create an entity type, select **New** in the Entity types view.
3. To create an entity type, return to the Entity Types screen, and select **New**.



For information on the fields, see Entity Type New record form.

4. To create a pillar from the Operational Resilience application, select **New** in the Pillars view.

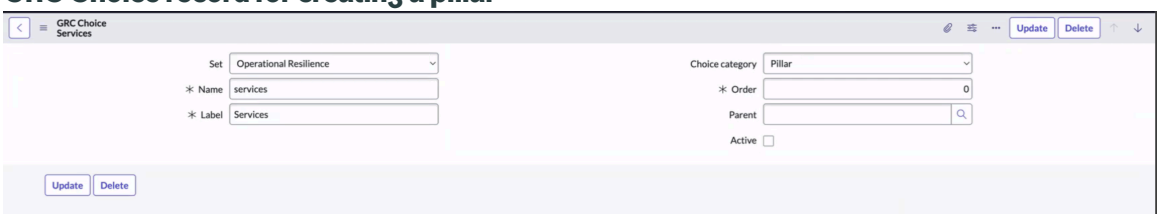


Note:

The main CSDM pillars (used by Opres with the CSDM header in the Main node configuration) and the supplementary pillars are shown in the following example. The main CSDM pillars are Services, Business Services, Service Offering, and Process. The supporting pillars are Application Service, People, Data, Suppliers, Technology, and Facilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you delete an existing pillar and add a pillar, you must update the pillars property manually in the **Value** field.



5. To create a pillar, select **New**.

   The GRC Choice record is shown in the example.

   For information on the fields, see GRC Choices form.

   GRC Choice record for creating a pillar

Note:
You can create entity types and pillars, then generate entities from either the Workspace view or the Core UI (UI16) view. Once the entity types, pillars, and entities are set up, complete the remaining required administrative tasks as outlined in Completing general administrative tasks, and then proceed to set up the Main node configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

To complete the remaining required administrative tasks, refer to the other sections in Completing general administrative tasks.

For information on setting up the Main node configurations, see Main node configurations: A component of the Data Relationships Framework.

Configure the pillars

Configure the pillar using the Core UI (UI16) view in the Operational Resilience application. You can then define the core areas relevant to your business entity.

Before you begin

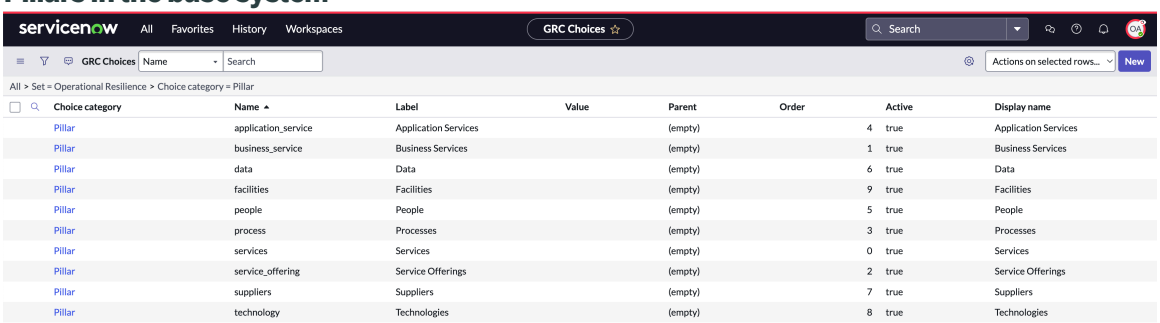
Role required: sn_oper_res.admin

About this task

Note:
If you have set up the entity types and pillars from the Workspace view in the earlier step (Set up pillars, entity types, and generate entities), you can ignore this step and proceed to Main node configurations: A component of the Data Relationships Framework.

The Operational Resilience base system includes the pre-defined pillars such as Technology, Facilities, People, Services, Processes, and Suppliers. You can create a pillar or use the pre-defined pillar for your business requirement.

The following pillars are now added in the tables: Application Service, Service Offering, Business Services, and Data.



For the pillars to function, entity types are used to create the necessary entities.

Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Pillars**.

   The following example shows the pillars in the base system. For each of the pillars, a default entity type is included in the base system. For example, the Technology pillar has the Technology entity type pre-selected.

   Pillars in the base system

Choice category	Name	Label	Value	Parent	Order	Active	Display name
Pillar	application_service	Application Services		(empty)	4	true	Application Services
Pillar	business_service	Business Services		(empty)	1	true	Business Services
Pillar	data	Data		(empty)	6	true	Data
Pillar	facilities	Facilities		(empty)	9	true	Facilities
Pillar	people	People		(empty)	5	true	People
Pillar	process	Processes		(empty)	3	true	Processes
Pillar	services	Services		(empty)	0	true	Services
Pillar	service_offering	Service Offerings		(empty)	2	true	Service Offerings
Pillar	suppliers	Suppliers		(empty)	7	true	Suppliers
Pillar	technology	Technologies		(empty)	8	true	Technologies

   Beginning with Release 20.0.x, the following entity types have been added in the tables:

   - Application Service
   - Service Offering
   - Business Services
   - Data

2. To create a pillar, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GRC Choice record for creating a pillar

Beginning with Release 21.x.x, the [sn_grc_choice] table includes an **Active** field. The pillars are shipped in an inactive state by default. You must activate the pillars from the list view before activating the entity types, as the entity types depend on the pillars. Activation of entity types can only occur after pillar activation.

3. On the form, fill in the fields.
   For a description of the field values, see GRC Choices form.
4. Select **Submit**.

GRC Choices form

Use the GRC Choices form to set up a pillar to define the core areas for your business entity.

GRC Choices form

For a description of the field values, see the following table.

GRC Choices form

Field	Description
Set	View that is set to Operational Resilience.
Name	Name that the pillar belongs to such as Process, Suppliers, Technology, Facilities, People, Services, and Processes.
Label	Label for the pillar that is displayed in the UI.
Active	Field to activate the pillars. The pillars are shipped in an inactive state by default. You must activate the pillars from the list view before activating the entity types, as the entity types depend on the pillars. Activation of entity types can only occur after pillar activation.
Choice category	Category that is set to **Pillar** by default.
Value	Value of the pillar.
Order	Order for the pillar.
Parent	Parent entity that is associated with the selected pillar.

Configure entity types and entity filters

Configure the entity type and entity filter using the Core UI (UI16) view in the Operational Resilience application. IT enables you to define the relevant data for your business entity.

Before you begin
Role required: sn_oper_res.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:
If you have set up the entity types and pillars from the Workspace view in the earlier step (Set up pillars, entity types, and generate entities), you can ignore this step and proceed to Main node configurations: A component of the Data Relationships Framework.

An entity in Governance, Risk, and Compliance can be a person, a process, a department, an application, or an object. An entity type in Governance, Risk, and Compliance is a group of the entities that have similar attributes.

The entity type form in the Operational Resilience application is pre-configured with an entity filter that defines the data for an entity.

You can use the pre-defined entity types that are provided with the base system or you can create an entity type depending on your business requirement. You can operate Operational Resilience by using these entity types as shipped, edit them as needed, or create entity types.

To create an entity from an existing record, select the **Add to OpRes reporting** UI action, which adds the entity record to the entity type.

Note:
As an Operational Resilience administrator, you must perform the following tasks:

1. Activate the necessary entity types.
2. Activate the necessary entity filters.
3. Create new or update the existing pillars and entity types.
4. Generate entities based on the setup.

The Operational Resilience managers cannot create the entity types, but they can update the entity types.

Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Entity Types**.
   Beginning with Release 20.1.x, the following entity types have been added in the tables:
   - Application Service
   - Service Offering
   - Business Services
   - Data
2. Select the **Name** of an entity type record and view its details.

   In entity types, a combination of entity filters is used for selecting the entities into the entity types. By default, all entity types and entity filters are inactive in the application. You can activate the entity types and entity filters based on your needs.

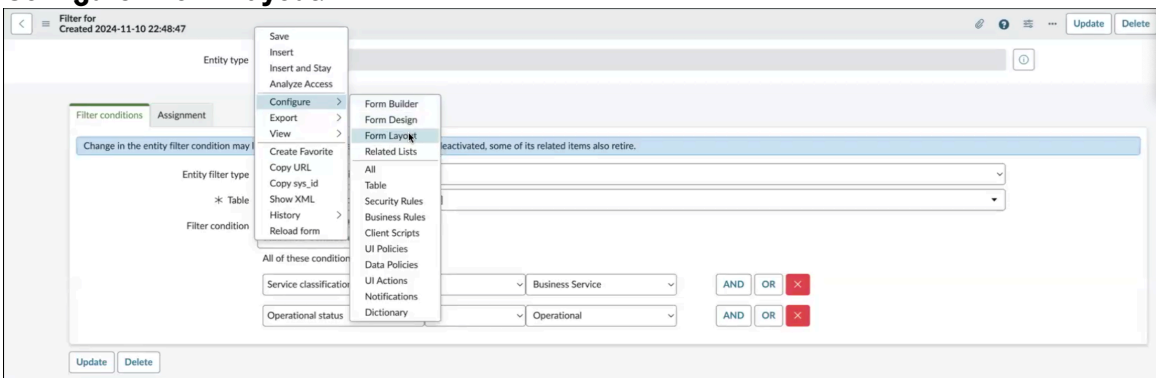
   Note:
   The default entity types are used to pull data into the pillars of the application.

3. To update the filter condition, select the Entity Filters related list and select **Build your own conditions**.

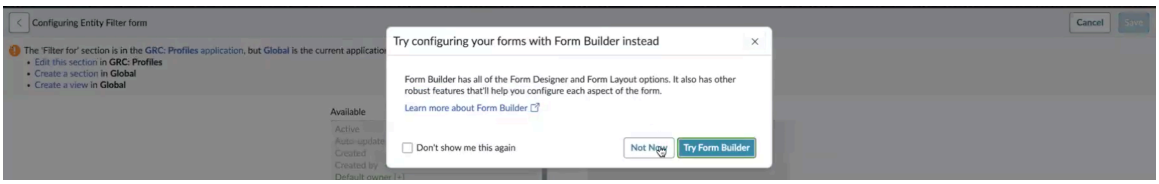
   The Entity Filters related list and the **Build your own conditions** option are shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The entity filter is used to define the table from which data is pulled into each entity type for display in the Operational Resilience application. The filter condition requires that the service classification field is set to "business service and operation," and the operational status of the service is "operational." These conditions determine whether an entity type can have any entity records.

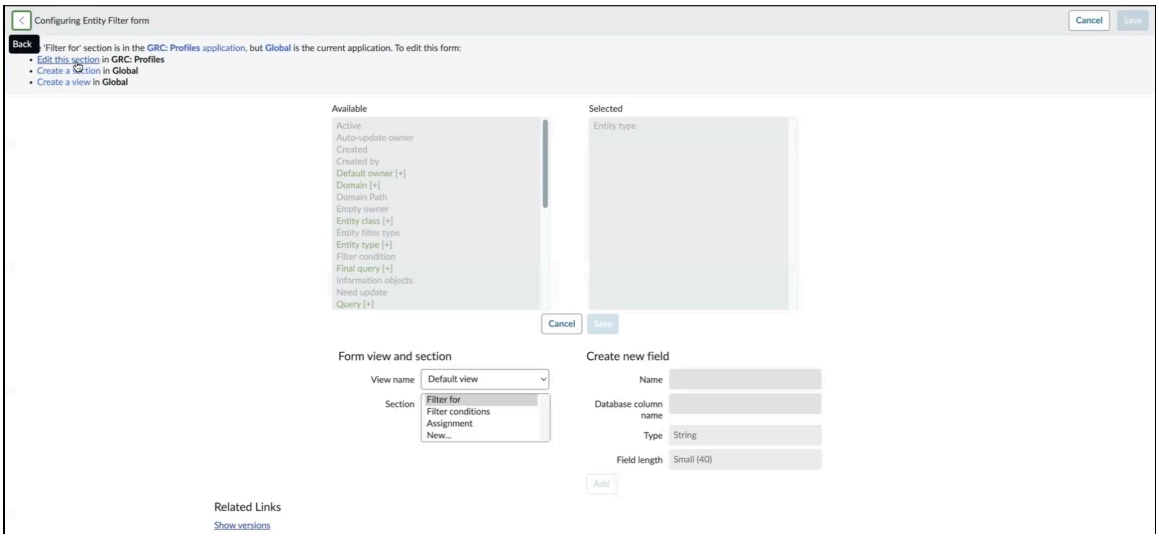


4. To use a predefined query instead of building your own conditions, choose the **Select from predefined queries** option in the **Entity filter type** field and select **Save**.



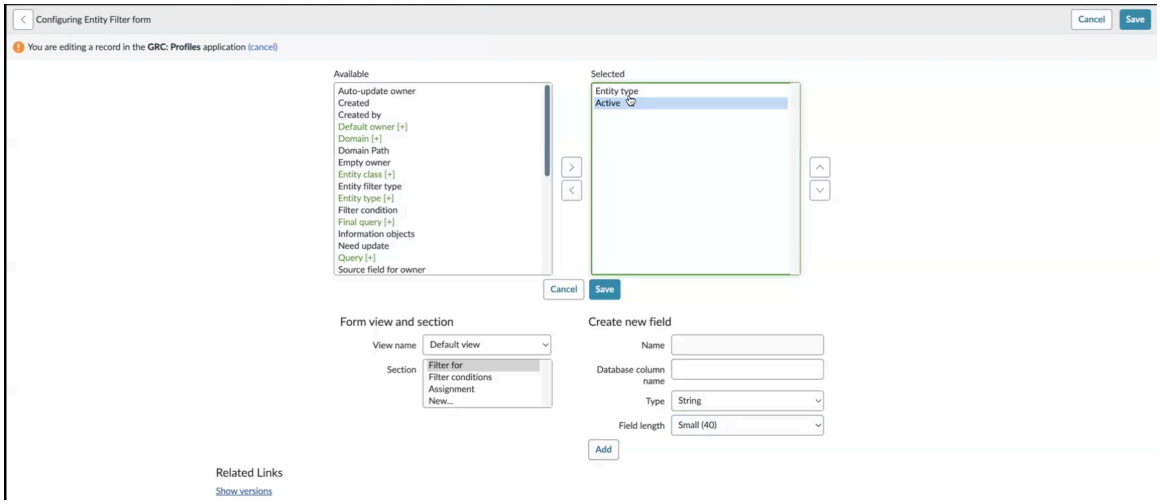
5. Check the Entity filter related list in the form for Business Service and Application Service Entity types.
   You can verify that the selected filters are applied to the entities.
6. To create an entity type, return to the Entity Types screen, and select **New**.
7. On the form, fill in the fields.
   For a description of the field values, see Entity Type New record form.
8. Select **Submit**.
   The newly defined entity type is listed in the Entity Types screen.
9. To activate entity filters directly from the entity filters page, complete the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

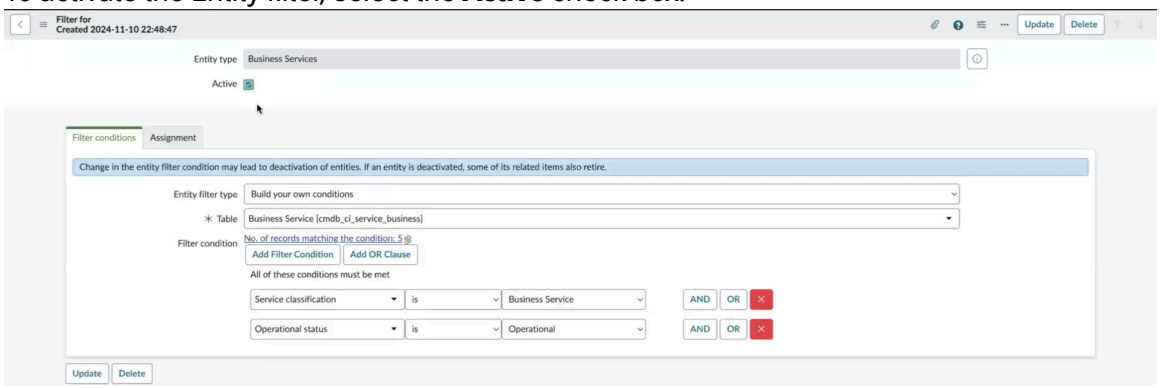


a. Select and hold (or right-click) on the page header in the Entity Filter record and select **Configure > Form Layout**.

If you see the option to try the Form Builder, you can select **Not now**.



You can select **Edit this section** in the "Configuring Entity Filter" form so that the picker list is displayed.



b. From the "Available" selection list on the left, select **Active** and use the right arrow to shift it to the "Selected" list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Save**.
On the Entity Filter page, a check box with the Active label is displayed.

d. To activate the Entity filter, select the **Active** check box.

Once this change is made for one entity filter, all the other records within the Entity filters list have the Active option set to **True** by default.

What to do next

Set up the main node configurations so that Configuration Management Database (CMDB) data can be fetched into Operational Resilience for reporting. For more information, see Main node configurations: A component of the Data Relationships Framework.

Entity Type New record form

Use the Entity Type New record form to create an entity type depending on your business requirement.

Entity Type New record form

For a description of the field values, see the following table.

Entity Type New record form

Field	Description
Name	Name of the entity type such as Business Processes, Services, or Facilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity Type New record form (continued)

Field	Description
Compliance Score Percentage	Compliance score percentage for the entity type as defined in the Policy and Compliance Management application. Auto-populated field.
Active	Option to mark the entity type as active.
Description	Description for the entity type.
Pillar	Category that is used to organize your risk data and that an entity type is assigned to. The available options are as follows: • **Services** • **Process** • **Suppliers** • **Technology** • **Facilities** • **People**
Settings	
Functional domain	Functional domain for the entity, for example, IT and risk compliance.

Configure the Main node configurations

Create the Main node configuration record to fetch data into Operational Resilience for reporting. Main node configurations are available with the base system. You can use the existing Main node configurations or create new Main node configurations for your business needs.

Before you begin

Role required: sn_oper_res.admin

About this task

Main node configurations define how your source data is linked, for example, how one table is related to another table.
You can define the relationships in the following ways:

Direct

It can be via a direct reference field in either of the table or it can be via an m2m table
.

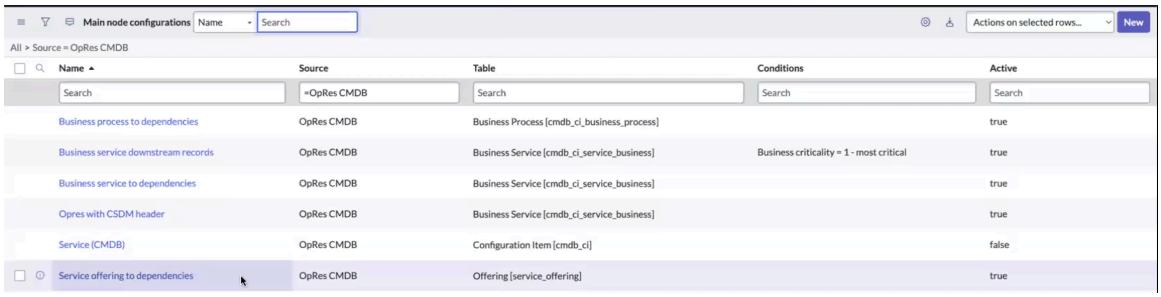
Indirect

If the tables are not directly related, you can use scripts to define their relationship. The script option gives you more flexibility. However, for most of the use cases, the direct option serves the purpose.

Before creating the Main node configuration record, ensure that you have completed the following prerequisites:

1. You can create a new Main node configuration with the sn_oper_res.admin role only.
2. You have completed the configuration set up instructions listed on the Configuring Operational Resilience page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. The Data Relationships Framework (sn_grc_rel_config) application is installed in your instance by default.
4. The entities are generated in Operational Resilience. Only when the entities are generated and the relationships are created in the Main node configurations, CMDB data can be brought into Operational Resilience for reporting.
5. All Main node configurations with the source as **OpRes CMDB** run in parallel.
6. To enable reporting, ensure that entities are generated and relationships are established in Main node configurations. Data can only be brought in for reporting after these steps are completed.

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Main node configurations**.

   Note:
   In order for the Main node configuration to be picked up by the scheduled job, its source should be **OpRes CMDB** and its status should be **True** (**Active**).

   The base version of Operational Resilience includes the following Main node configurations.

   You can update an existing Main node configuration or set up a brand new configuration in your instance.

2. To create a new Main configuration record, select **New**.

   The Main node configuration form is displayed.

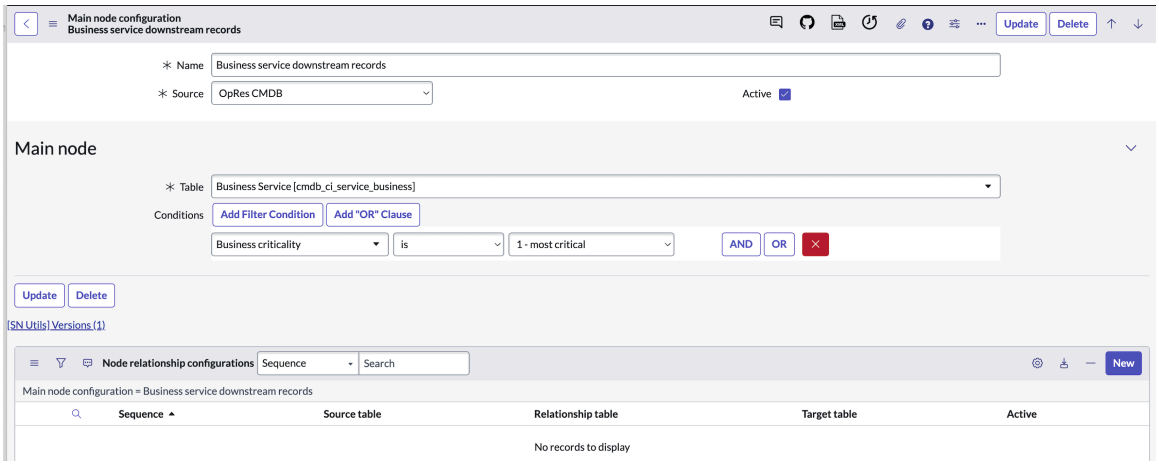
3. On the form, fill in the fields.
   For descriptions of all the fields in the form, see Main node configuration form.

   a. Add the name for the configuration.

   b. To use it in the Operational Resilience scheduled job, select the source as **OpRes CMDB** and set the status to **True**.

   c. Select the table from where you want the hierarchy to start, for example, Service.

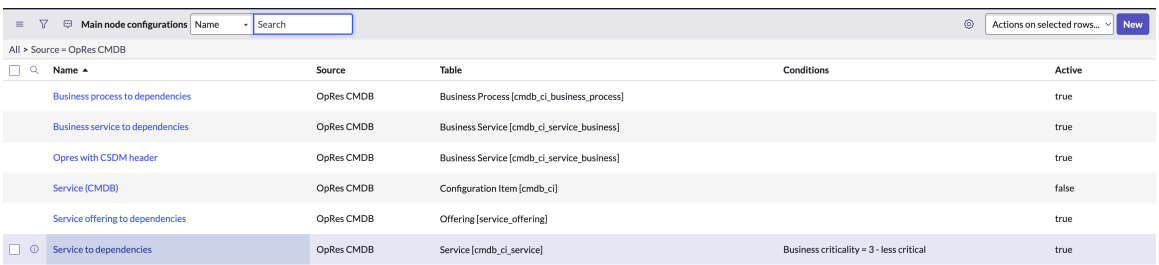
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tables are the starting point of the entire tree structure that is received as an output. The Main node configuration starts with a table, such as [cmdb_ci_service], to generate a tree structure. It scans the table to create a hierarchy for each record. If you do not want to scan the entire table, and if you have specific business requirements, you can apply filter conditions ensuring that only relevant records are scanned.

d. Add conditions to filter the records for which this main node definition is created.

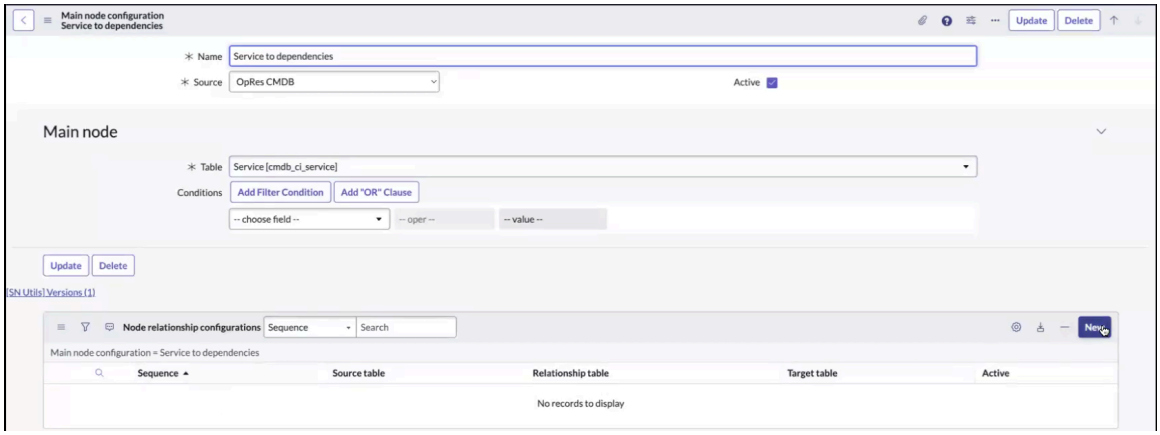
The following example shows the filter condition for the "Service to dependency" configuration.



The following example shows the Business service downstream records configuration.

e. Select **Submit**.

The Main node configuration is created and displayed in the Main node configurations list.



Based on your Main node configuration settings, data for business services, services, offerings, application services, business processes is brought from CMDB into Operational Resilience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Specify how the source table is connected to the target table in the Node relationship configurations.

For details, see Configure the Node relationship configurations.

Main node configuration form

Use the Main node configuration form to create a Main node configuration record in the Data Relationships Framework.

Main node configuration new record form

Main node configuration new record form

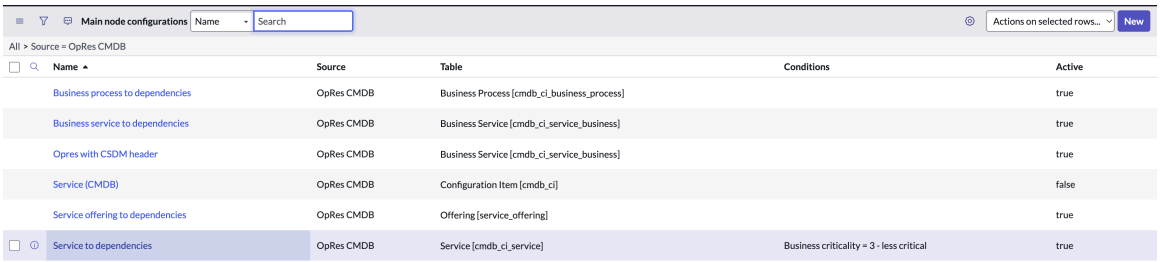
Field	Description
Name	Name of the Main node configuration record. For example, Service to dependencies.
Source	Source for the Main node configuration record. By default, it is OpRes CMDB.
Active	Option to indicate that the record is active. The value is **True** or **False**.
Main node	
Table	Table that is used to set up the relationship, for example, Configuration Item [cmdb_ci].
Conditions	Filter conditions used to set up the relationship for the configuration record. If you want a specific object from a table, you can set up the filter conditions accordingly.
Properties	
Maximum number of nodes	Maximum number of nodes that can be displayed in the map.
Maximum number of levels	Maximum number of levels that are set to be displayed in the map.

Configure the Node relationship configurations

Create a Node relationship configuration record to establish relationships between nodes. Update the node relationships including source table, both Configuration Items (CI) and non-CI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

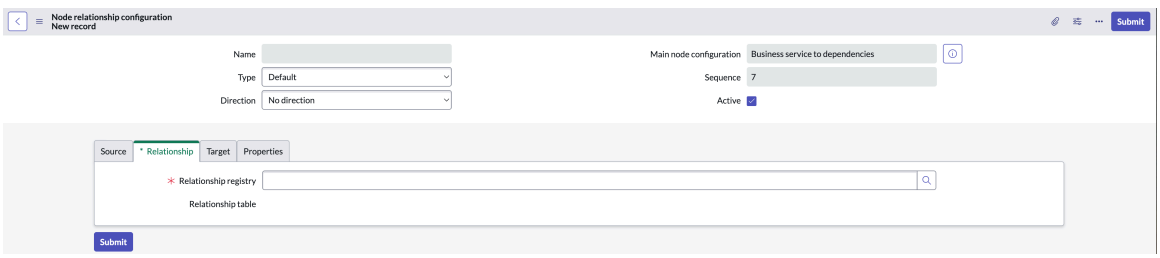
relationships. The Node relationship configurations define the connections between the source table and other tables (target tables), specifying how they are related.



Before you begin

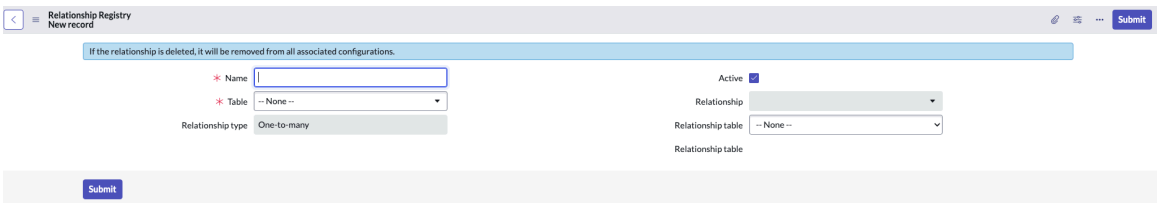
Role required: sn_oper_res.admin

Procedure



1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration**.
2. Open the desired Main node configuration from the list.

   The following example shows the Main node configurations available in the instance.



3. To add a Node relationship configuration, select **New** in the Node relationship configurations related list.

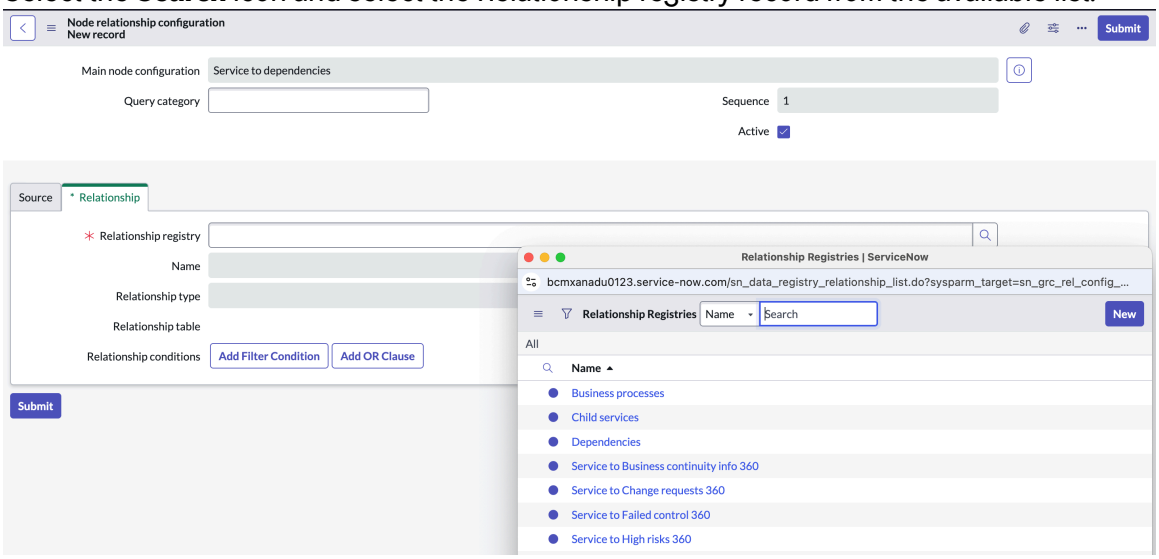
   The Node relationship configuration form is displayed.

   For description of the fields in the Node relationship configuration form, see Node relationship configuration form.

   You can set up these relationship registries by creating a Relationship Registry record in the Relationship Registries module. The Relationship Registry new record form is shown in the example.

   For the description of the fields in the Relationship registry form, see Relationship registry record form.

4. Select the table of your choice in the **Source table** field in the **Source** tab.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the system auto-selects the table listed in the Main configuration record, the Service [cmdb_ci_service] table in this example. You can choose the auto-suggested table or a different table as per your requirements.

5. Select the relationship registry record in the **Relationship registry** field in the **Relationship** tab. The relationship registry record defines how the Source table links to another table.

   a. Select the **Search** icon and select the Relationship registry record from the available list.

   Selecting the search icon shows the out-of-the-box Relationship registries that have Service as the source table. You can select a Relationship registry from the list.

   b. To select a new registry record instead of choosing a record from the out-of-the-box list, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create a new registry record if the out-of-the-box options do not meet your needs.

c. Add a meaningful name for the new Relationship registry record.
You can add a proper name to avoid confusion because there might be other registries with the same name.

d. Select the relationship table in the **Table** field.
The table should be the same as the Source table from the previous screen. This table name may be different from the table that you have defined in the Main node configuration record.

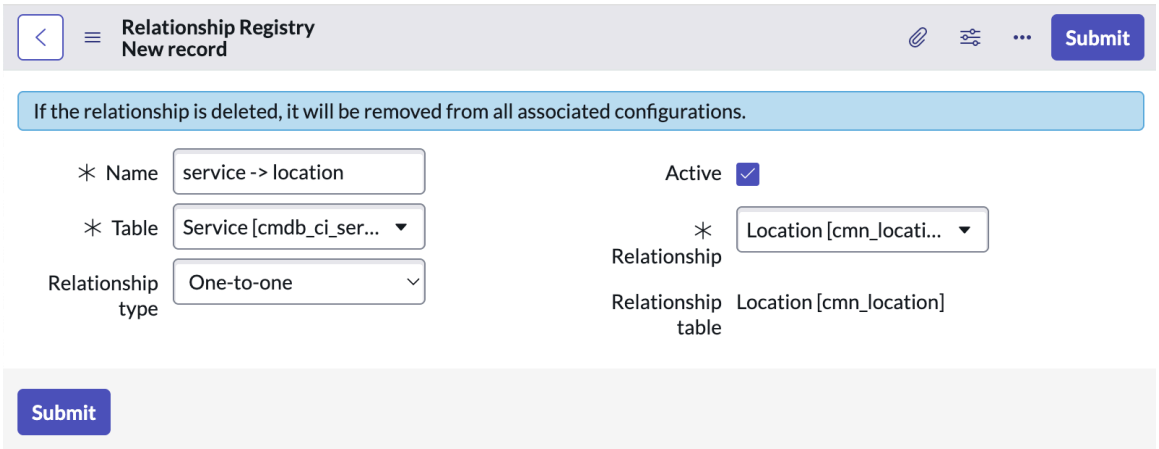
e. Select the relationship type for the table in the **Relationship type** field.

Once the table is selected, the following options are displayed in the drop-down.

i. One-to-one

ii. One-to-many

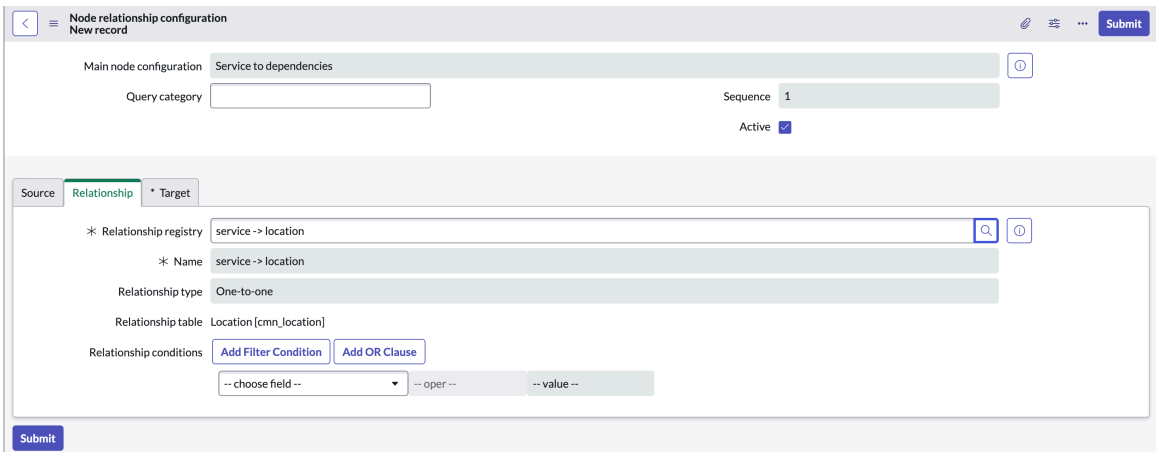
iii. Many-to-many



iv. Scripted relationship
Based on the selected drop-down value, a different list of tables is displayed in the **Relationship** field.

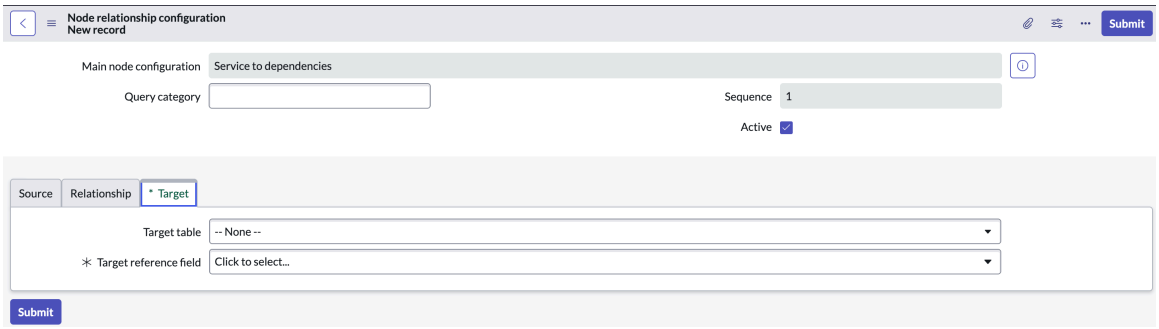
f. Select the relationship table in the **Relationship table** field.

For One-to-one relationship type, the **Relationship** field shows the list of tables that are used as reference fields in the Source table.



The table name is populated in the **Relationship** field.

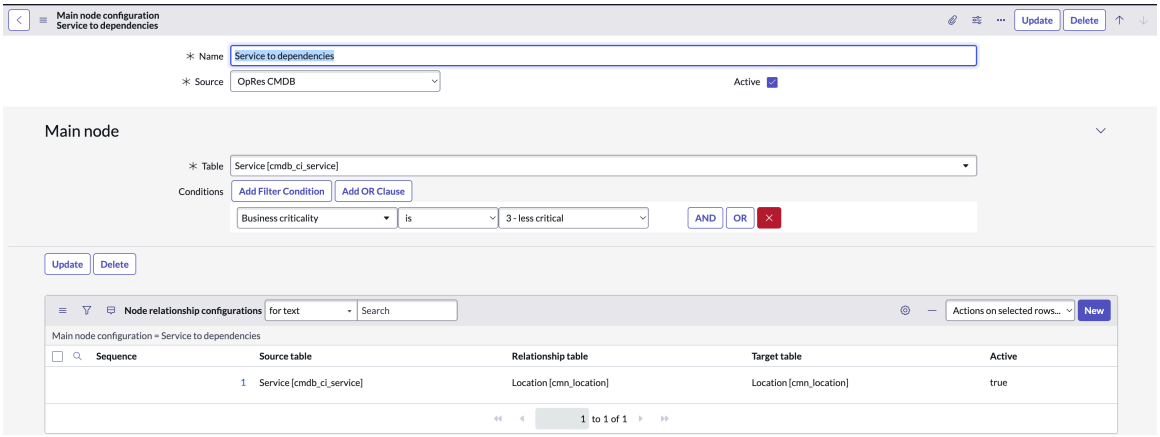
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



g. Select **Submit**.

You have configured the Source table and Relationship registry.

To select the target table, configure the Target section in the Node relationship configuration record in the next step.



6. Configure the **Target** tab.
All the relationship options are explained in this step.

7. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Node relationship configuration for the Main configuration record is now updated. The example shows the Node relationship configuration for the **Service to Dependencies** Main configuration record.

Node relationship configuration form

Use the Node relationship configuration form to configure the node relationships. You can also view these settings in the Nexus map.

Node relationship configuration new record form

Node relationship configuration new record form

Field	Description
Name	Unique name for the Node relationship configuration.
Type	Type column has been added, offering two distinct options for displaying node relationship information: • Default type: As shown in the earlier illustration, the "Default type" column displays the hierarchy from top to bottom. It's the default option. • Group type: Aggregates data at a specific node, providing a more focused view.
Direction	Direction of the relationship between the source and target tables
Main node configuration	Main node configuration for which the Node relationship is configured. This field is auto-selected.
Sequence	Sequence of the Node relationship configuration. This field is auto-selected.
Active	Option to mark the Node relationship configuration as active.
Source	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node relationship configuration new record form (continued)

Field	Description
Source table	Source table used for the Node relationship configuration.
Relationship	
Relationship registry	Table used to set up the relationship registry. **Note:** When you select the table in the **Relationship registry** field, the **Name**, **Relationship type**, **Relationship table**, **Relationship condition** fields are displayed.
Name	Name of the Relationship registry table. This field is auto-selected.
Relationship type	Relationship type for the Relationship registry table. This field is auto-selected.
Relationship table	Relationship table or the target table associated with the Relationship registry table. This field is auto-displayed.
Relationship conditions	Relationship conditions that you can set up for the Node relationship configuration.
Target	
Target reference field	Target reference field for the Node relationship configuration. For example, Sys ID.
Target table	Relationship table or the target table associated with the Relationship registry table.
Sort by	Parameter used to sort the target table, for example, Actual end date or Assigned to.
Target conditions	Conditions that you can set up for the target table used in the Node relationship configuration.
Properties	
Maximum number of nodes	Maximum number of nodes that can be displayed in the map.
Maximum number of levels	Maximum number of levels that are set to be displayed in the map.
Query category	Query category that can be used for the Node relationship configuration.

Relationship registry record form

Use the Relationship registry record form to create a relationship registry between objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Relationship registry new record form

Relationship registry new record form

Field	Description
Name	Name of the relationship registry record. For example, BIA analysis –> Issue.
Table	Table used to set up the relationship registry record. For example, Impact analysis [sn_bia_analysis].
Relationship type	Relationship type for the relationship registry record. Available options are: • **One-to-one**: One record has a relationship to one record in another table. • **One-to-many**: One record has a relationship to one or more records in another table. • **Many-to-many**: One or more records have a relationship to one or more records in another table. • **Scripted relationship**: Use scripts to define the relationship between the tables.
Active	Option to indicate that the relationship registry record is active.
Relationship	Table used to set up the relationship with the object that is defined in the **Table** field. For example, Issue [sn_grc_issue].
Relationship table	Read-only field. The table selected in the **Relationship** field is displayed as a relationship table by default. For example, Issue [sn_grc_issue].
Related field	List of fields that should be set as target or output of the relationship.

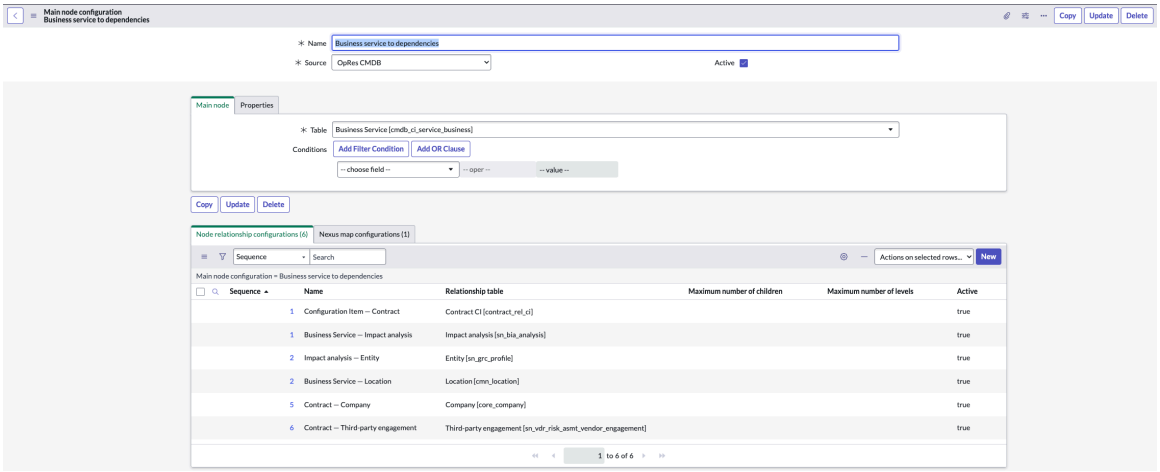
Configure the Nexus map configurations

Configure the appearance of the Nexus map (Resilience map) for a specific main node by defining its UI settings. It involves defining visual elements such as colors, icons, and edge configurations. By configuring the settings at the Nexus map level, you can associate a single main node with multiple Nexus configurations, enabling flexible loading of settings for different entities.

Before you begin

Role required: sn_oper_res.admin

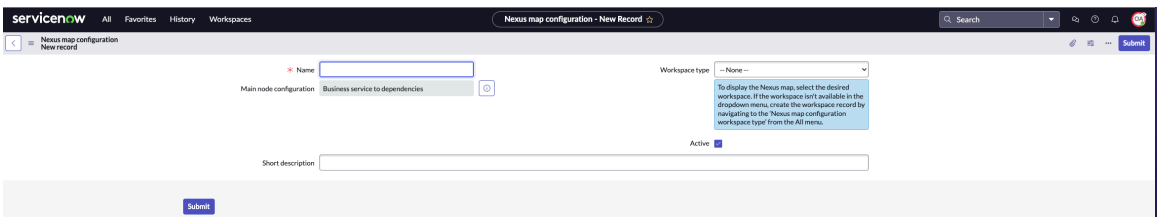
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



About this task

Note:
When you create the Nexus map configuration, the system automatically creates the nodes list and edges list from the Main node configuration, prompting you to configure the node and edge visualization. If you have already created a configuration for a specific node type in another Nexus map configuration, it is pre-populated with the most recently created configuration.

Procedure



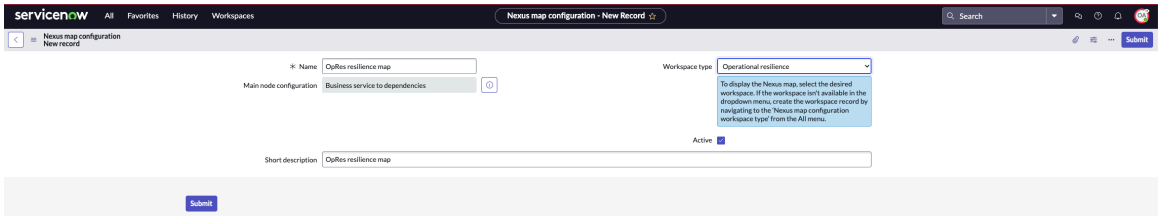
1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration**.
2. Open the desired Main node configuration from the list.

   The following example shows the Main node configurations available in the instance.

3. In the Nexus map configurations related list, select **New**.

   The Nexus map configuration new record is displayed as shown in the example.

   For more information on the fields, see Nexus map configuration form.



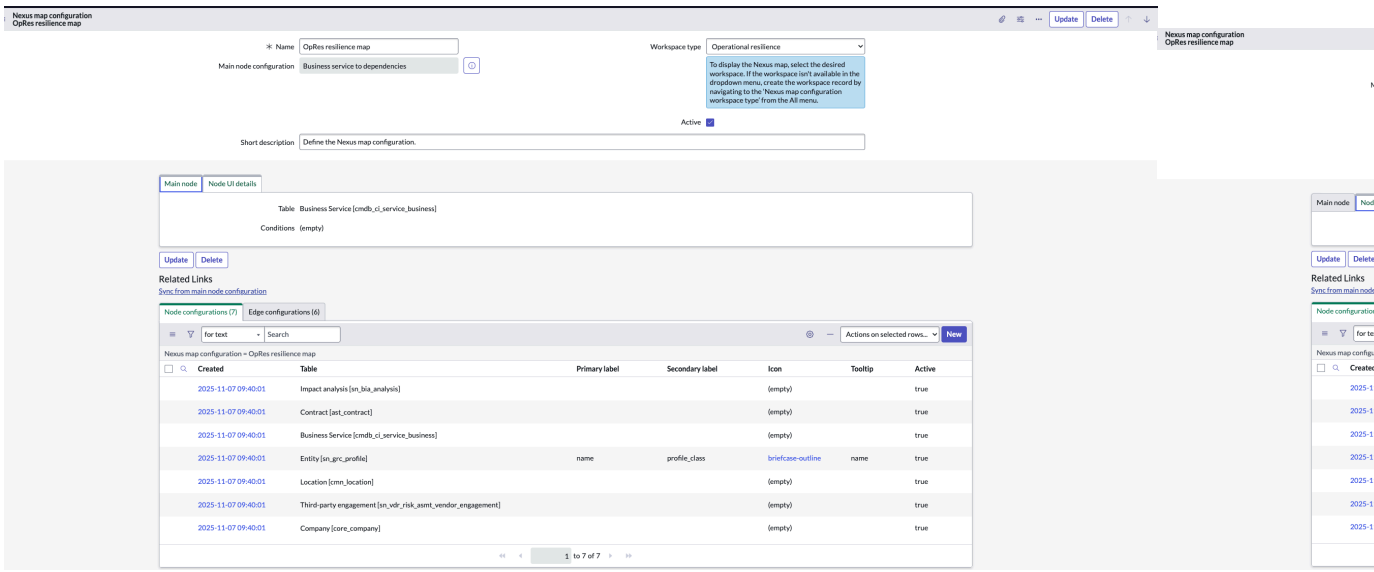
4. Enter a unique name for the Nexus map configuration in the **Name** field.
   The Main node configuration record for which the Nexus map configuration is being configured is displayed by default in the **Main node configuration** field.
5. Select the desired Workspace in the **Workspace type** field.

   Note:
   If the desired Workspace isn't available in the field, you can create a workspace record by accessing the "Nexus map configuration workspace type" module through the **All** menu.

6. Add a short description for the Nexus map configuration in the **Short description** field.
7. To mark the Nexus map configuration as active, select the **Active** option field.

   A sample record is shown for reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. To submit the details of the Nexus map configuration, select **Submit**.

   The Nexus map configuration record is displayed in the Nexus map configurations related list as shown in the example.

   Opening the record shows the details of the Nexus map configuration as shown in the following examples.

   The **Main node** tab displays the name of the Main node table along with its associated conditions. The **Node UI details** tab shows the Node UI type, which is set to "Node map default node" by default.

   After creating the Nexus map configuration, if any changes are made at the Main node level, such as adding or modifying relationships, you can synchronize those changes into the Nexus map configuration by using the **Sync from main node configuration** UI action.

   The Node configurations and Edge configurations related lists for the selected Nexus map configuration, as shown in the examples, are displayed in the record.

What to do next

To configure the node settings for the Nexus map, see Configure the Node configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To configure the edge settings for the Nexus map, see Configure the Edge configurations.

Nexus map configuration form

Use the Nexus map configuration form to define the UI configuration for the selected Main node configuration. It also helps you to define the node and edge configurations, determining how the Nexus map is displayed.

Nexus map configuration new record form

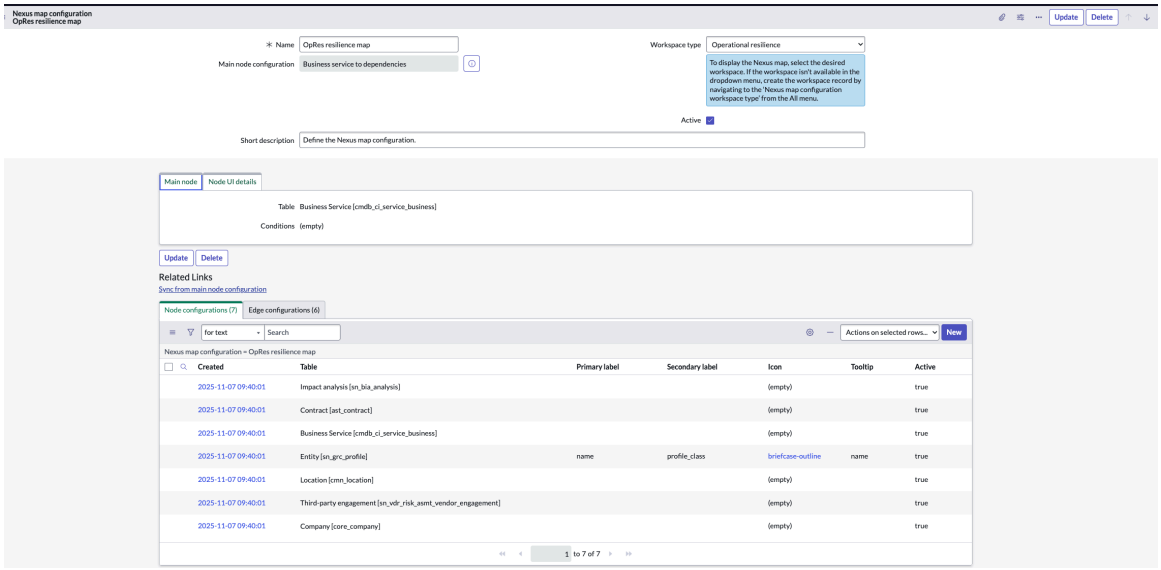
Nexus map configuration new record form

Field	Description
Name	Unique name for the Nexus map configuration. For example, OpRes resilience map.
Workspace type	Desired Workspace for setting up the Nexus map. If the desired Workspace isn't available in the field, you can create a workspace record by accessing the "Nexus map configuration workspace type" module through the **All** menu.
Main node configuration	Main node configuration record displayed by default for which the Nexus map configuration is being configured.
Active	Option to indicate that the Nexus map configuration is active.
Short description	Short description of the Nexus map configuration.

Configure the Node configurations

Configure the settings for the selected node. It helps you to determine the UI display in the Nexus map. You can select the table associated with the node and configure the primary label, icon, secondary label, tooltip, and so on for the node.

Before you begin



Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration** and open the desired Main node configuration from the list view.
2. Open the Nexus map configuration record from the Nexus map configurations related list.

   The following example shows the Nexus map configuration record with the Node configurations related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Node configurations related list, select **New**.

   The Node configuration new record is displayed as shown in the example.

   For more information on the fields, see Node configuration form.

4. Select the table in the **Table** field.
   The Nexus map configuration record for which the Node configuration is being configured is displayed by default in the **Nexus map configuration** field.
5. Select the primary and secondary labels for the node in the **Primary label** and **Secondary label** fields.
6. Select the icon and tooltip for the node in the **Icon** and **Tooltip** fields.
7. To mark the Node configuration as active, select the **Active** option field.
8. To enable the 'Make this primary' functionality at the node level, configure the setting by selecting the Nexus map configuration in the **Configuration for set as main node** field.
   This configuration reflects the hierarchy flow for the node that is designated as primary.
9. Select the 360° view type in the **Configuration for 360° view** field.
10. Select the Context record in the **Context record** field.

    A sample record with the details filled in is shown for reference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. To clear the selections for the context record, primary label, secondary label, tooltip, select **Clear selections**.
12. To submit the details of the Node configuration, select **Submit**.

    The Node configuration record is displayed in the Nexus map configurations related list.

What to do next

To customize the map display such as assigning specific colors and icons to nodes that meet certain conditions, configure the Node status configuration. For more information, see Configure the Node status configurations.

Node configuration form

Use the Node configuration form to configure the settings such as the primary label, icon, secondary label, tooltip for the selected node.

Node configuration new record form

Node configuration new record form

Field	Description
Table	Table associated with the node configuration.
Nexus map configuration	Nexus map configuration record displayed by default for which the Node configuration is being configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node configuration new record form (continued)

Field	Description
Primary label	Primary label to be displayed for the node, for example, Name.
Secondary label	Secondary label to be displayed for the node, for example, class.
Icon	Icon to be used for the node in the main node UI, for example, briefcase-outline.
Tooltip	Tooltip to be displayed when hovering over the node, for example, Name.
Context menu options	
Configuration for set as main node	Nexus map configuration required to enable the "Make this primary" functionality at the node level. This configuration reflects the hierarchy flow for the node that is designated as primary.
Configuration for 360° view	360° configuration to open the 360 view of the record when you right-select on that particular node.
Context record	Context record to show or consider for the side panel and other context areas when you select that particular node.

Configure the Node status configurations

Configure the Node status conditions and parameters for the selected node configuration table. You can then customize the map display by assigning specific colors and icons to the nodes that meet certain conditions.

Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration** and open the desired Main node configuration from the list.
2. Open the desired Nexus map configuration record from the Nexus map configurations related list.
3. Open the desired Node configuration record from the Node configurations related list.
4. In the Node status configurations related list, select **New**.

   You can customize the map display such as assigning specific colors and icons to nodes that meet certain conditions by configuring the Node status configuration record.

   For more information on the fields, see Node status configuration form.

   The Node status configuration record is displayed in which the **Node configuration** and **Table** are auto-populated.
5. Add the conditions that must be satisfied for the node status configuration in the **Conditions** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the color for the node status in the **Color** field.
7. Select the icon for the node status in the **Icon** field.
   The order for the node status is auto-selected.

   A sample configuration is shown in the example.

8. To submit the details of the Node status configuration, select **Submit**.
   The Node status configuration record is displayed in the Node status configurations related list.

Node status configuration form

Use the Node status configuration form to configure the Node status conditions and parameters for the selected node configuration table.

Node status configuration new record form

Node status configuration new record form

Field	Description
Node configuration	Node configuration record for which the Node status configuration is being configured.
Table	Table associated with the node configuration for which the conditions and parameters are updated. For example, Entity [sn_grc_profile].
Conditions	Entity and related list conditions. Once the conditions are satisfied, the node status is updated and reflected in the Nexus map.
Color	Color to be displayed for the node status once the conditions are satisfied, for example, Critical or Magenta.
Icon	Icon to be used for the node in the main node UI, for example, exclamation-outline.
Order	Order assigned to the Node status configuration. This field is auto-assigned. The system selects the configuration to use when a node satisfies the condition and has the least order.
Context menu options	
Configuration for set as main node	Nexus map configuration required to enable the "Make this primary" functionality at the

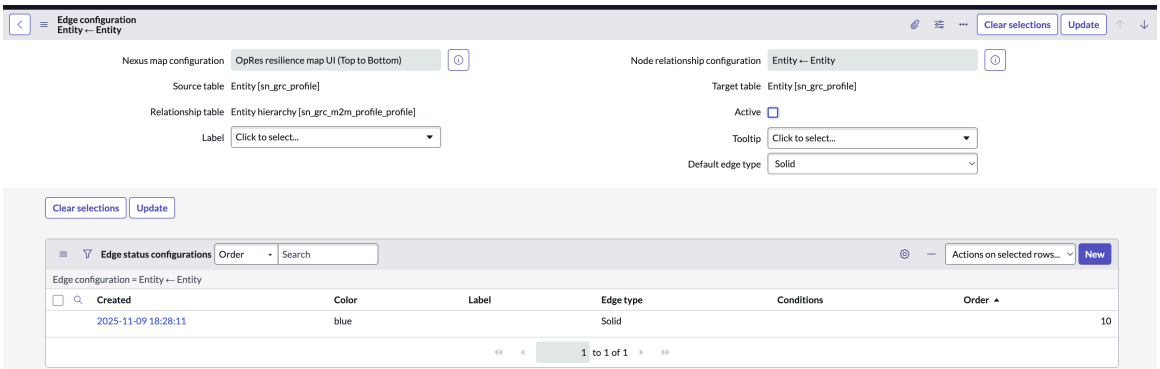
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Node status configuration new record form (continued)

Field	Description
	node level. This configuration reflects the hierarchy flow for the node that is designated as primary.
Configuration for 360° view	360° view type that is selected for the Nexus map configuration.
Context record	Context record for the table selected. This field is auto-filled. for example, for the Entity [sn_grc_profile] table, the "Applies to record" value is auto-filled for this field.

Configure the Edge configurations

Configure the Edge configurations settings for the selected Nexus map configuration. You can then configure the label, tooltip, default edge type for the edge of the selected node.



Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration** and open the desired Main node configuration from the list view.
2. Open the Nexus map configuration record from the Nexus map configurations related list.
3. In the Edge configurations related list, select **New**.

   For more information on the fields, see Edge configuration form.

   The Nexus map configuration, Node relationship configuration, Source table, Target table, and Relationship table fields are auto-populated in the Edge configuration record.
4. To mark the Edge configuration as active, select the **Active** option field.
5. Select the label for the edge in the **Label** field.
6. Select the tooltip for the edge in the **Tooltip** fields.
7. Select the default edge type in the **Default edge type** fields.
8. To clear the selections for the label and tooltip, select **Clear selections**.
9. To submit the details of the Edge configuration, select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge configuration form

Use the Edge configuration form to configure the Edge configurations settings such as the label, tooltip, default edge type for the edge of the selected node.

Edge configuration new record form

Edge configuration new record form

Field	Description
Nexus map configuration	Nexus map configuration record for which the edge is being configured. For example, OpRes resilience map UI (Bottom to Top).
Node relationship configuration	Node relationship configuration for which the edge is being configured. For example, Entity ← Entity.
Source table	Source table for which the edge is being configured. For example, Entity [sn_grc_profile].
Target table	Target table for which the edge is being configured. For example, Entity [sn_grc_profile].
Relationship table	Relationship table for the source and target tables. For example, Entity hierarchy [sn_grc_m2m_profile_profile]
Active	Option to mark the Edge configuration as active.
Label	Label to be displayed for the edge configuration once the conditions are satisfied, for example, Class.
Tooltip	Tooltip to be used for the edge configuration, for example, Domain created by.
Default edge type	Default edge type for the edge configuration, for example, Solid.

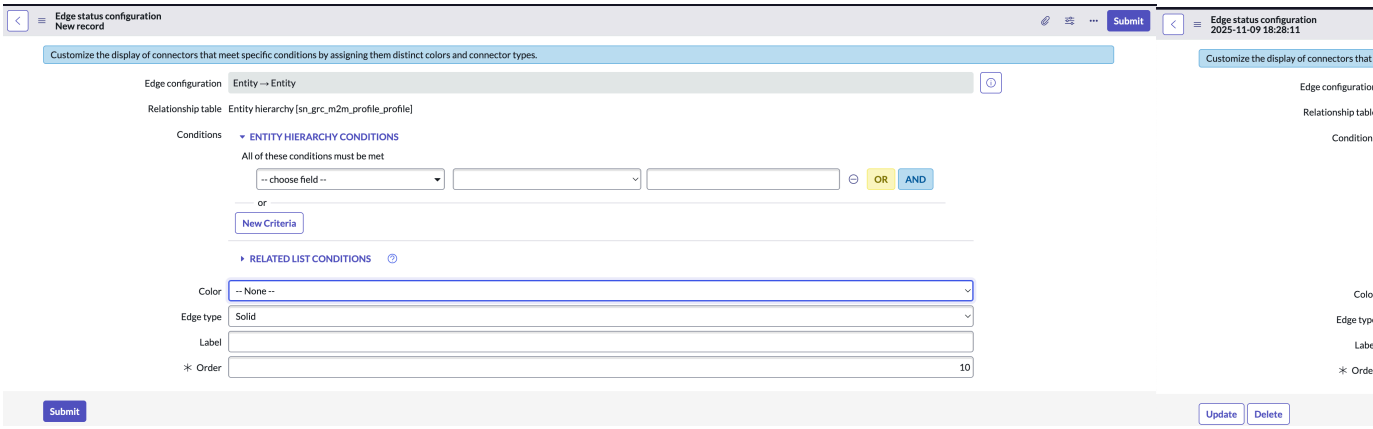
Configure the Edge status configurations

Configure the Edge status configurations for the selected Nexus map configuration. You can customize the display of connectors that meet specific conditions by assigning them distinct colors and connector types.

Before you begin

Role required: sn_oper_res.admin

Procedure



1. Navigate to **All** > **Data Relationships Framework** > **Main node configuration** and open the desired Main node configuration from the list.
2. Open the desired Nexus map configuration record from the Nexus map configurations related list.
3. Open the Edge configuration record from the Edge configurations related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the Edge configuration record, the details of the edge are auto-selected.

4. In the Edge status configurations related list, select **New**.

   You can customize the map display such as assigning specific colors and icons to nodes that meet certain conditions by configuring the Node status configuration record.

   For more information on the fields, see Edge status configuration form.

   The Edge status configuration record is displayed in which the **Edge configuration** and **Relationship table** are auto-populated.

5. Add the conditions that must be satisfied for the node status configuration in the **Conditions** field.
6. Select the color for the node status in the **Color** field.
7. Select the Edge type for the node status in the **Edge type** field.
   The order for the node status is auto-selected.
8. Select the label for the edge status in the **Label** field.
9. To submit the details of the Edge status configuration, select **Submit**.
   The Edge status configuration record is displayed in the Edge status configurations related list.

Edge status configuration form

Use the Edge configuration form to configure the Edge status settings for the selected Nexus map configuration. You can customize the display of connectors that meet specific conditions by assigning them distinct colors and connector types.

Edge status configuration new record form

Field	Description
Edge configuration	Edge configuration to be defined between two specific entities.
Relationship table	Relationship table for the source and target tables. For example, Entity hierarchy [sn_grc_m2m_profile_profile]
Conditions	Entity and related list conditions. Once the conditions are satisfied, the edge status is updated and reflected in the Nexus map.
Color	Color to be displayed for the edge status once the conditions are satisfied, for example, Critical or Magenta.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edge status configuration new record form (continued)

Field	Description
Edge type	Edge type to be defined for the node, for example, Solid.
Label	Label to be defined for the node, for example, Primary.
Order	Order assigned to the Edge status configuration. This field is auto-assigned. The system selects the configuration to use when an edge satisfies the condition and has the least order.

Configure Operational Resilience properties

Configure main properties of the Operational Resilience so that you can set up and fetch data into the application for reporting purposes.

Before you begin

Role required: sn_oper_res.admin

About this task

Configurations and customizations: When you update an application property, it's considered a configuration. If a function change needs modifications to the code in#Operational Resilience, like the script include, it's classified as a customization.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Filter the properties for GRC: Operational Resilience application.
   The properties for GRC: Operational Resilience application are displayed. For a list of the properties, see Properties installed with Operational Resilience.
3. Update the values of Dependency pillars in the *sn_oper_res.dependency_pillars* property by adding the sys_ids of the pillars to the **Value** field.
   You can add the sys_ids separated by commas such as e4f77de4537310108722ddeeff7b1263,ab5c78b0533112105806ddeeff7b126f,9c38fde4537310108722ddeeff7b1
   Refer to the following pillars and their corresponding sys_ids:
   - Application Service: e4f77de4537310108722ddeeff7b1263
   - People: ab5c78b0533112105806ddeeff7b126f
   - Data: 9c38fde4537310108722ddeeff7b12d0
   - Suppliers: a5187de4537310108722ddeeff7b127a
   - Technology: c4c775e4537310108722ddeeff7b12d7
   - Facilities: 2fad3034533112105806ddeeff7b123f
4. Update the *sn_oper_res.max_top* property.
   This property is used for the 'Top vulnerabilities to be fixed' section on the Home page. If the property value is set to 5, records are generated for the top 5 vulnerabilities which have most impacted entities, and they are displayed in the "Top vulnerabilities to be fixed' report on the Home page.
5. Configure the *sn_oper_res.top_class_name* property to designate any class as the top class in the dashboard.

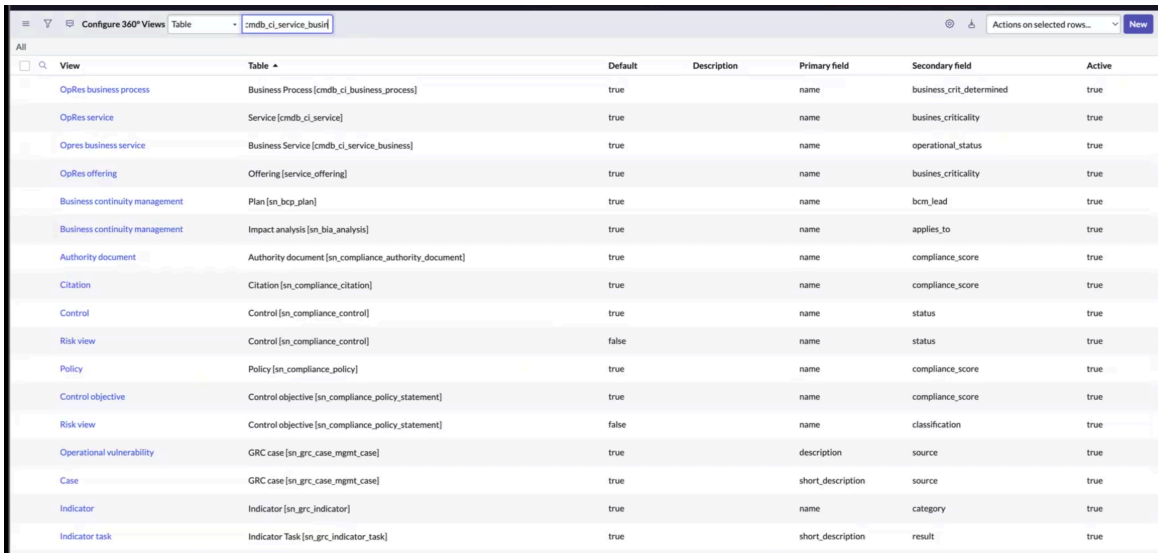
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting with Operational Resilience Release 21.0.x, this property is updated so that any node, such as business service, business process, or application service, can be the top node. This property is applicable only for the dashboards and not for the Workspace forms. For information on configuring the property, see Using the flexible data model.

6. Select **Update**.
   The updated properties are saved.

Configure 360° views for services and processes

Configure 360° views for the services, business services, business processes, and application services. You can select the table for which you want to update the sector configurations, relationship registries, and their positions on the 360° view.



Before you begin

Role required: sn_oper_res.admin

Procedure

1. Navigate to **All** > **360° View Configurations** > **Configure 360° Views** > .
2. Select the table for which you want to configure 360° View.

   You can select the table from the list view as shown in the example.

View	Table	Default	Description	Primary field	Secondary field	Active
OpRes business process	Business Process [cmdb_ci_business_process]	true		name	business_crit_determined	true
OpRes service	Service [cmdb_ci_service]	true		name	busines_criticality	true
Opres business service	Business Service [cmdb_ci_service_business]	true		name	operational_status	true
OpRes offering	Offering [service_offering]	true		name	busines_criticality	true
Business continuity management	Plan [sn_bcp_plan]	true		name	bcm_lead	true
Business continuity management	Impact analysis [sn_bia_analysis]	true		name	applies_to	true
Authority document	Authority document [sn_compliance_authority_document]	true		name	compliance_score	true
Citation	Citation [sn_compliance_citation]	true		name	compliance_score	true
Control	Control [sn_compliance_control]	true		name	status	true
Risk view	Control [sn_compliance_control]	false		name	status	true
Policy	Policy [sn_compliance_policy]	true		name	compliance_score	true
Control objective	Control objective [sn_compliance_policy_statement]	true		name	compliance_score	true
Risk view	Control objective [sn_compliance_policy_statement]	false		name	classification	true
Operational vulnerability	GRC case [sn_grc_case_mgmt_case]	true		description	source	true
Case	GRC case [sn_grc_case_mgmt_case]	true		short_description	source	true
Indicator	Indicator [sn_grc_indicator]	true		name	category	true
Indicator task	Indicator Task [sn_grc_indicator_task]	true		short_description	result	true

   The Configure 360° Views form for the selected table is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Update the section configuration for the top, bottom, left, and right positions as desired in the **Sector configuration** field.
4. To update the relationship configurations, choose **Select Relationships** in the Relationships Registries related list.
5. Select **Update**.
   The selected relationships are saved in the application.
6. Navigate to the specific form in the Operational Resilience Workspace.
7. Select the **360° View** UI action.

   You can navigate to the 360° view for the selected table.

8. Verify the positions of the relationships on the form.

   The 360° view shows the context information of the opened service, business service, service offering, and business process. When you select the node, it shows more information on the selected node in the right side panel. You can verify the placements and positions of the relationships on the form as shown in the example.

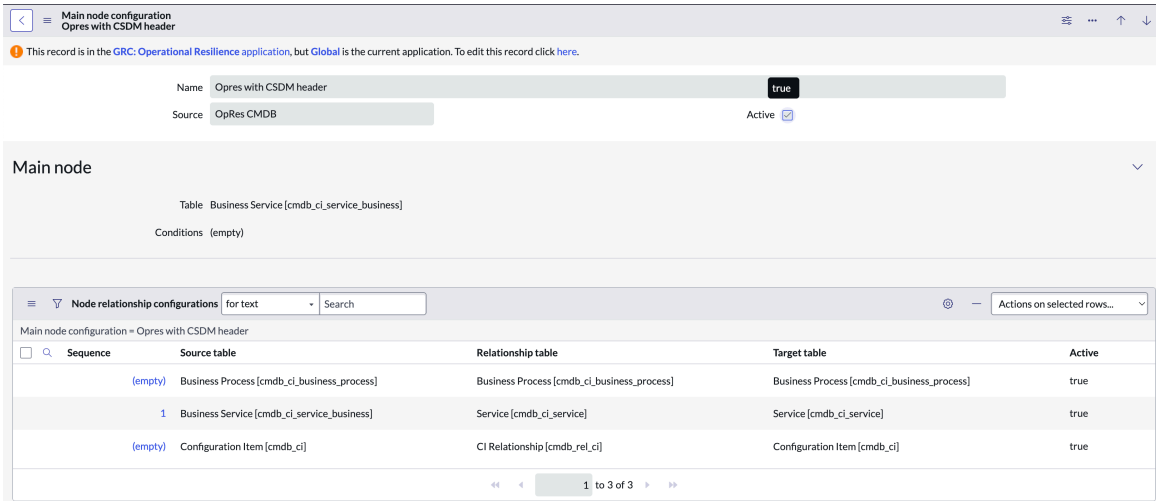
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on 360° views, see Exploring the 360° view.

Opres with CSDM header Main node configuration

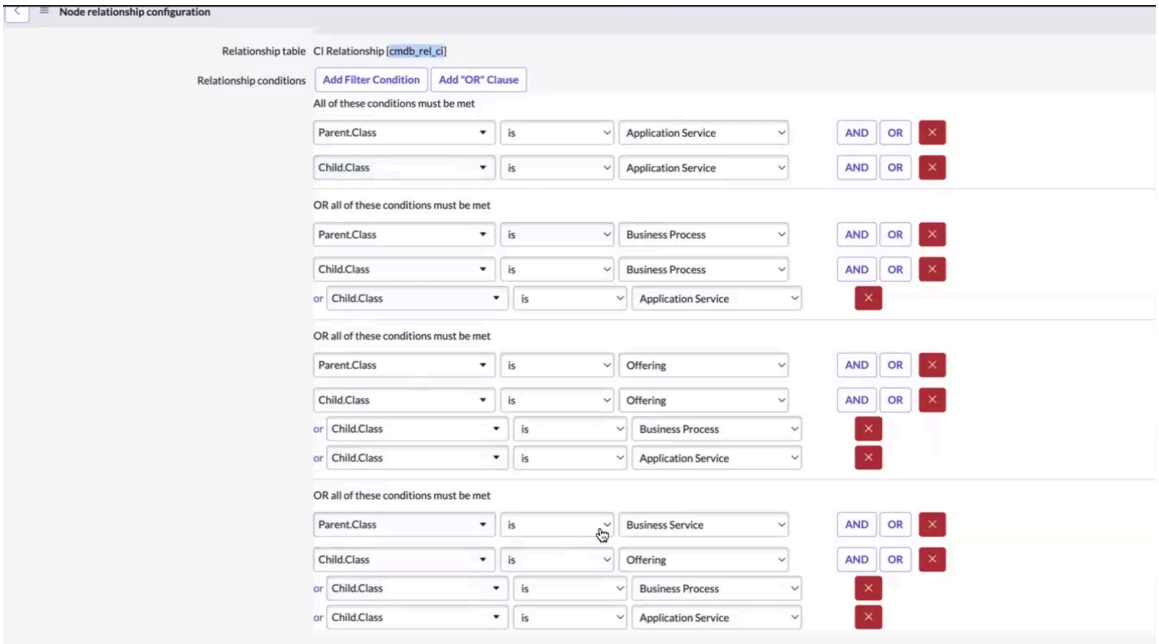
The Opres with CSDM header Main node configuration, used by new customers, fetches CMDB objects such as business services, business processes, service offerings, and application services into Operational Resilience. Existing customers typically use the Service (CMDB) Main node configuration. Administrators or UI Builder administrators can display or hide the **Services overview** or **Business services overview** tab from the Workspace view based on organizational needs.

For Opres with CSDM header configuration, Operational Resilience administrators set up the records in the following required tables:



- Business Service [cmdb_ci_service_business]
- Service Offering [service_offering]
- Business Process [cmdb_ci_business_process]
- Application Service [cmdb_ci_service_auto]

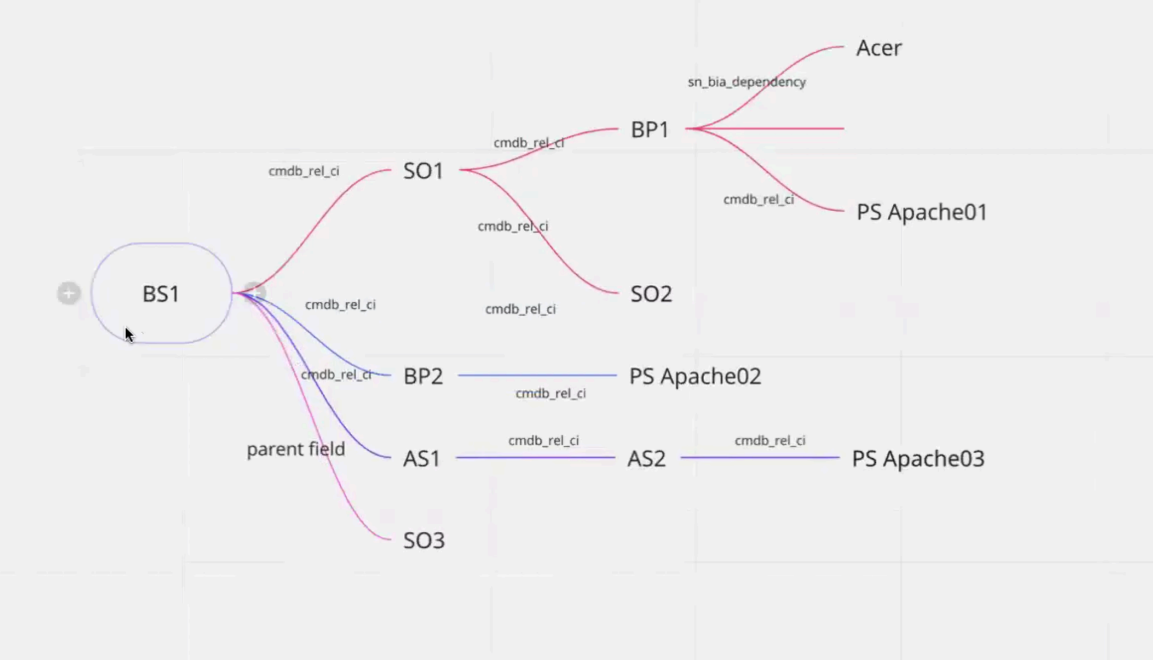
After setting up the records in the required tables, Operational Resilience administrators define the hierarchy levels and add relationships for the records. For example, you can set up a hierarchy from business service to service offering, from service offering to business process, and from business process to application service.



Node relationship configurations

You can configure the node relationships such as the sequence, source table, relationship table, target table, and active flag in the Opres with CSDM header Main node configuration as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



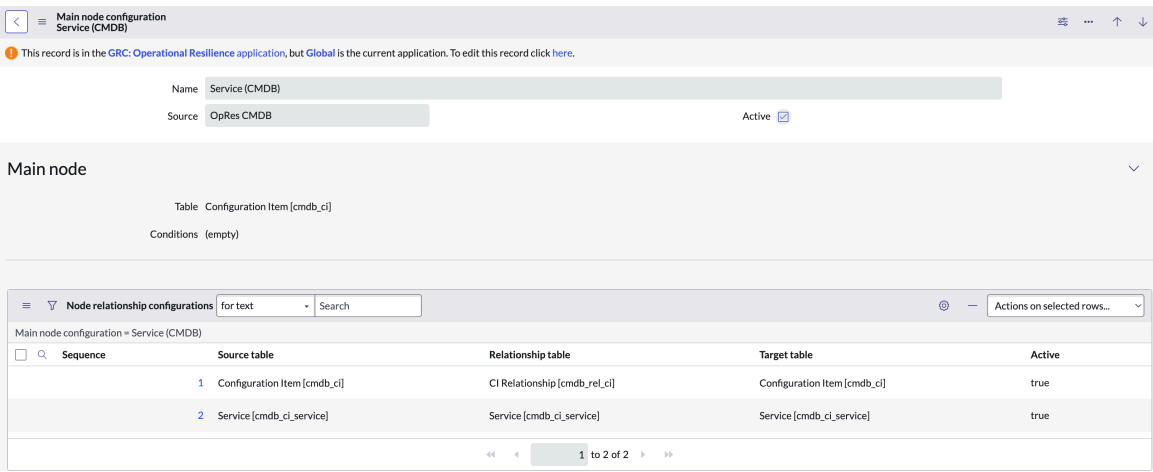
The following illustration shows the node relationship configurations for Opres with CSDM header Main node configuration, provided as the base version. For each relationship [cmdb_rel_ci] table, you can set up combined relationship configurations. For example, for a business service as the parent class, you can configure its relationship to a service offering, then to a business process, and to an application service.

The relationship of the CMDB objects is shown in the illustration. The data shown in the illustration exists in the CMDB tables. Main node relationships are configured to inform Operational Resilience about the type of data that should be imported into the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on updating the node relationship configurations, see Configure the Node relationship configurations

.



Service (CMDB) Main node configuration

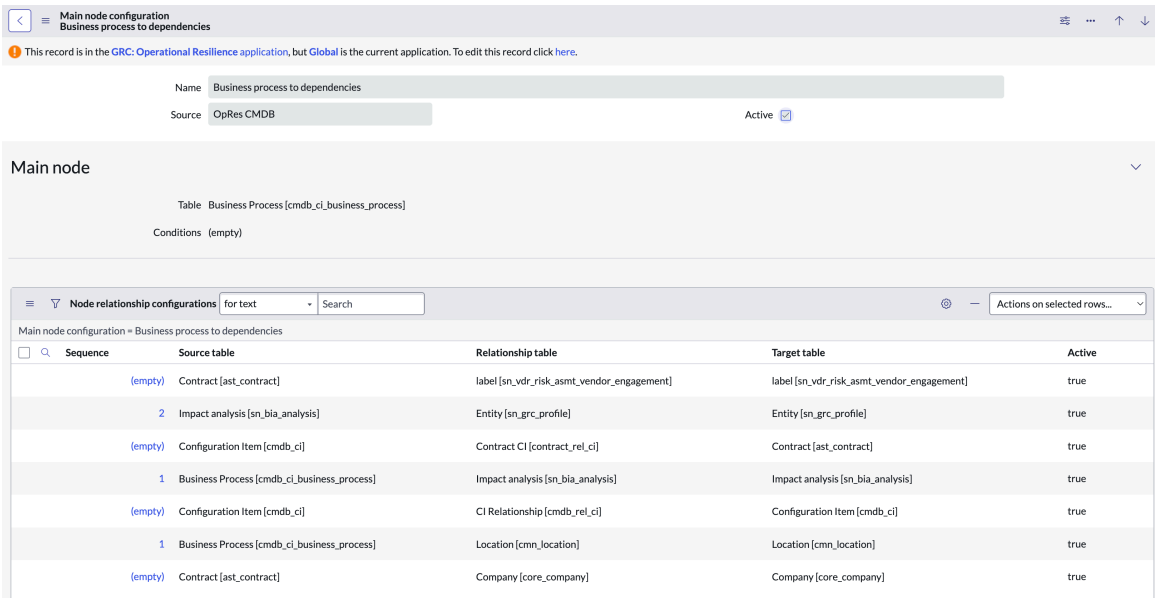
The Service (CMDB) Main node configuration defines the relationships for the services. Existing customers typically use the Service (CMDB) Main node configuration, while new customers use the Opres with CSDM header Main node configuration. Administrators can display or hide the Services overview or Business services overview based on organizational needs.

For the Service (CMDB) Main node configuration, the source typically used is OpRes CMDB and the table used is Configuration Item [cmdb_ci].

Node relationship configurations

You can configure the node relationships such as the sequence, source table, relationship table, target table, and active flag in the Service (CMDB) Main node configuration as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Business process to dependencies Main node configuration

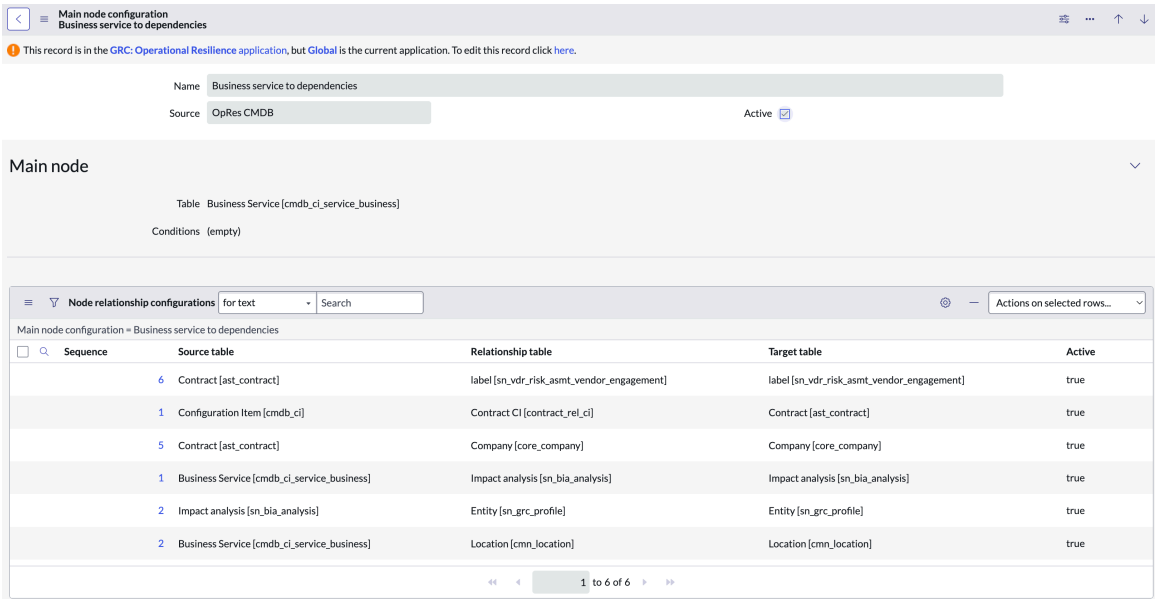
The Business process to dependencies Main node configuration defines the relationships from a Business process to its dependencies.

For the Business process to dependencies Main node configuration, the source is OpRes CMDB and the table is Business Process [cmdb_ci_business_process].

Node relationship configurations

You can configure the node relationships such as the sequence, source table, relationship table, target table, and active flag in the Business process to dependencies Main node configuration as shown in the example.

Business service to dependencies Main node configuration



The Business service to dependencies Main node configuration defines the relationships from a Business service to its dependencies.

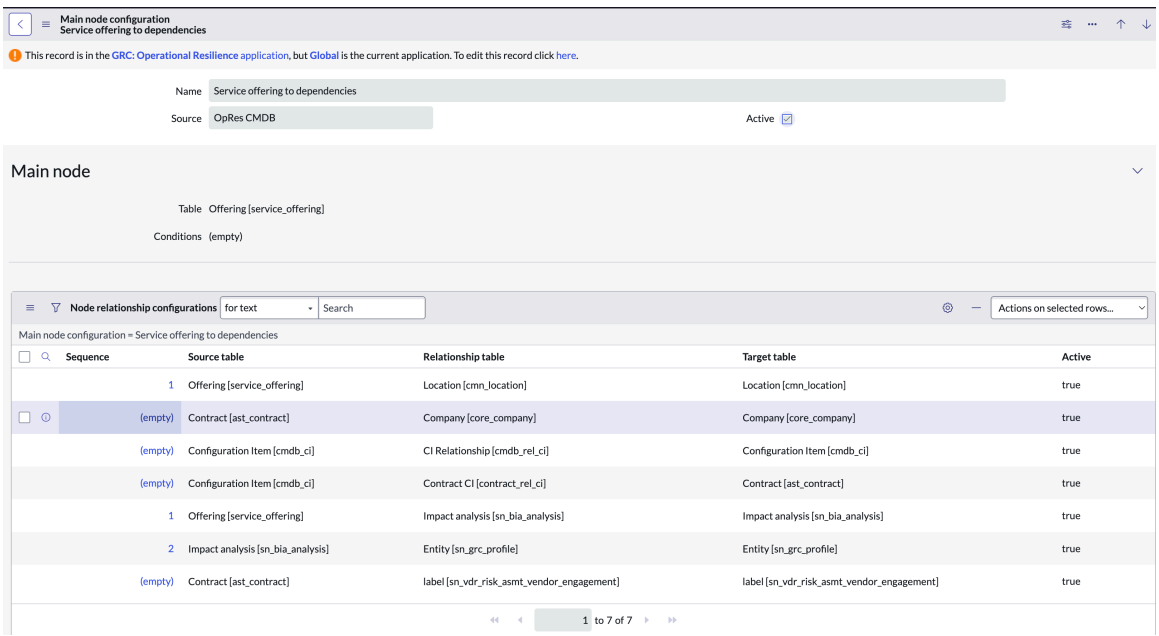
For the Business service to dependencies Main node configuration, the source is OpRes CMDB and the table is Business Service [cmdb_ci_service_business].

Node relationship configurations

You can configure the node relationships such as the sequence, source table, relationship table, target table, and active flag in the Business service to dependencies Main node configuration as shown in the example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

TPRM integration: As shown in the node relationship configuration of the Business Service to Dependencies, if you have the TPRM application installed, you can establish relationships between a business service and a contract, and from a contract to a company or an engagement.



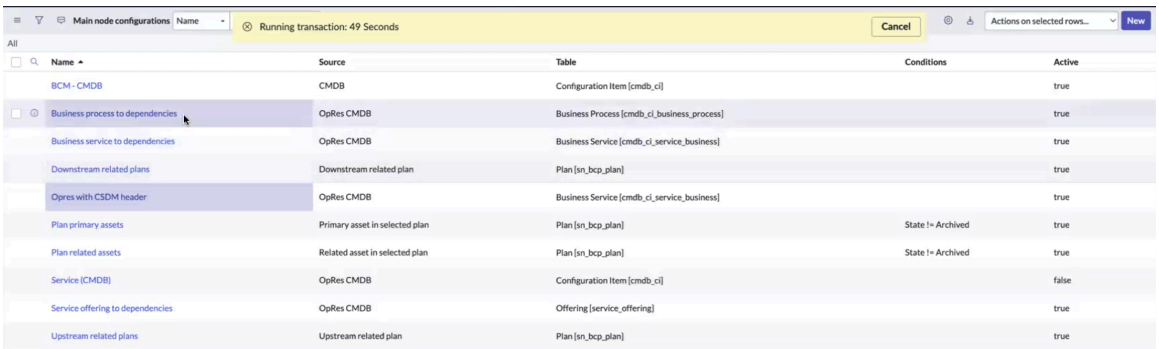
Service offering to dependencies Main node configuration

The Service offering to dependencies Main node configuration defines the relationships from a Service offering to its dependencies.

For the Service offering to dependencies Main node configuration, the source is OpRes CMDB and the table is Offering [service_offering].

Node relationship configurations

You can configure the node relationships such as the sequence, source table, relationship table, target table, and active flag in the Service offering to dependencies Main node configuration as shown in the example.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

BCM dependencies related Main node configurations

When the Business Continuity Management application is installed in an instance, BCM dependencies are fetched into the Operational Resilience application.

When the Business Continuity Management application is installed in an instance, BCM dependencies are fetched into the Operational Resilience application as shown in the example.

- BCM - CMDB
- Downstream related plans
- Plan primary assets
- Plan related assets
- Upstream related plans

Name	Source	Table	Conditions	Active
BCM - CMDB	CMDB	Configuration Item [cmdb_ci]		true
Business process to dependencies	OpRes CMDB	Business Process [cmdb_ci_business_process]		true
Business service to dependencies	OpRes CMDB	Business Service [cmdb_ci_service_business]		true
Downstream related plans	Downstream related plan	Plan [sn_bcp_plan]		true
Opres with CSDM header	OpRes CMDB	Business Service [cmdb_ci_service_business]		true
Plan primary assets	Primary asset in selected plan	Plan [sn_bcp_plan]	State != Archived	true
Plan related assets	Related asset in selected plan	Plan [sn_bcp_plan]	State != Archived	true
Service (CMDB)	OpRes CMDB	Configuration Item [cmdb_ci]		false
Service offering to dependencies	OpRes CMDB	Offering [service_offering]		true
Upstream related plans	Upstream related plan	Plan [sn_bcp_plan]		true

Sample Services to dependencies configuration

Create a Services to dependencies sample Main node configuration record for linking services to dependencies.

Before you begin

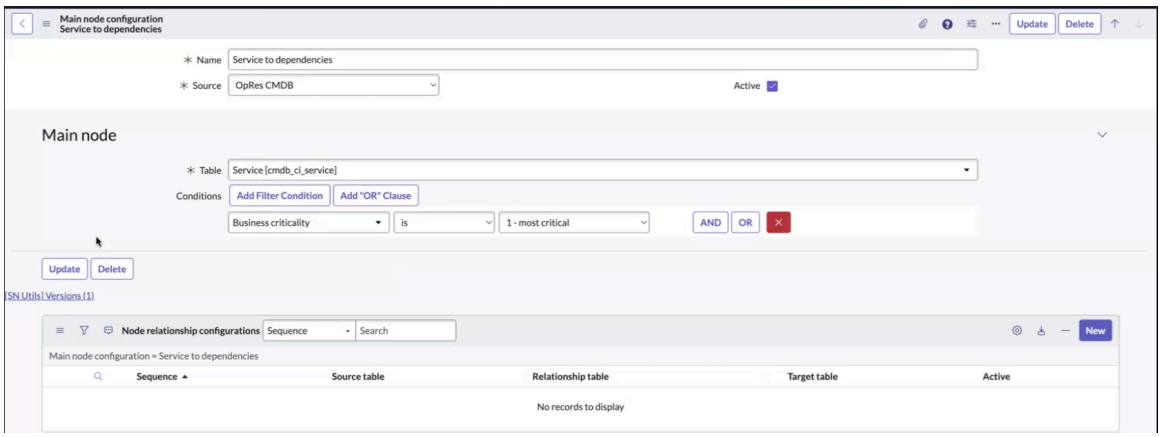
Role required: sn_oper_res.admin

About this task

For the configuration sequence and instructions in Operational Resilience, see Configuring Operational Resilience.

For instructions on creating the Main node configuration records, see Configure the Main node configurations.

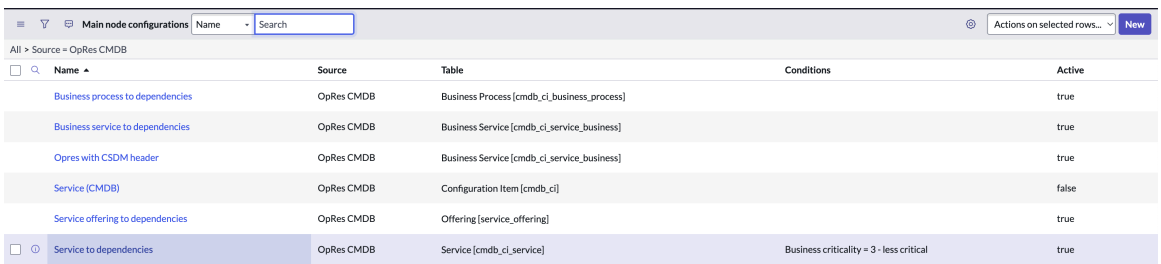
Procedure



1. Download the Operational Resilience application in your instance.
   For instructions on downloading the Operational Resilience application, see Install Operational Resilience application.
2. Ensure that you have set up the pillars, entity types, entity filters and entities are generated.
   Refer to the configuration instructions on the Configuring Operational Resilience page.
3. Ensure that you have the Data Relationships Framework application, which is available by default, is available in your instance.
   Ensure that you have completed other pre-requisites listed in the Configure the Main node configurations.
4. Navigate to **All** > **Data Relationships Framework** > **Main node configurations**.

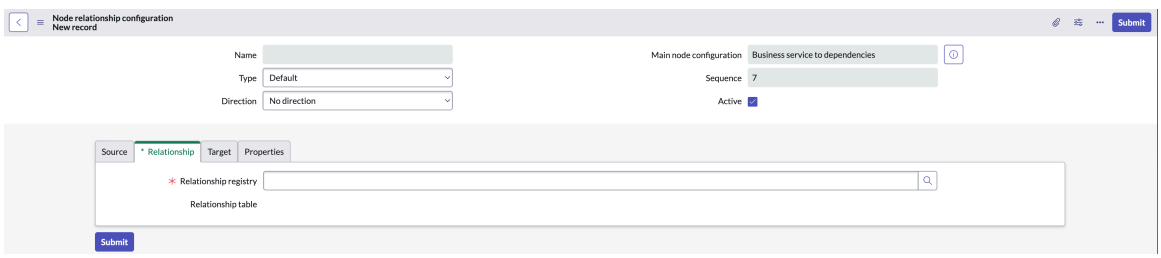
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In order for the Main node configuration to be picked up by the scheduled job, its source should be **OpRes CMDB** and its status should be **True** (**Active**).



5. To create a new Main configuration record, select **New**.
   For descriptions of all the fields in the form, see Main node configuration form.
6. Add the name for the configuration as **Service to Dependencies**.
7. To use it in the Operational Resilience scheduled job, select the source as **OpRes CMDB** and set the status to **True**.
8. Select the table from where you want the hierarchy to start, for example, Service.
9. Add conditions to filter the records for which this main node definition is created.

   The following example shows the filter condition for the **Service to Dependencies** configuration.



10. Select **Submit**.

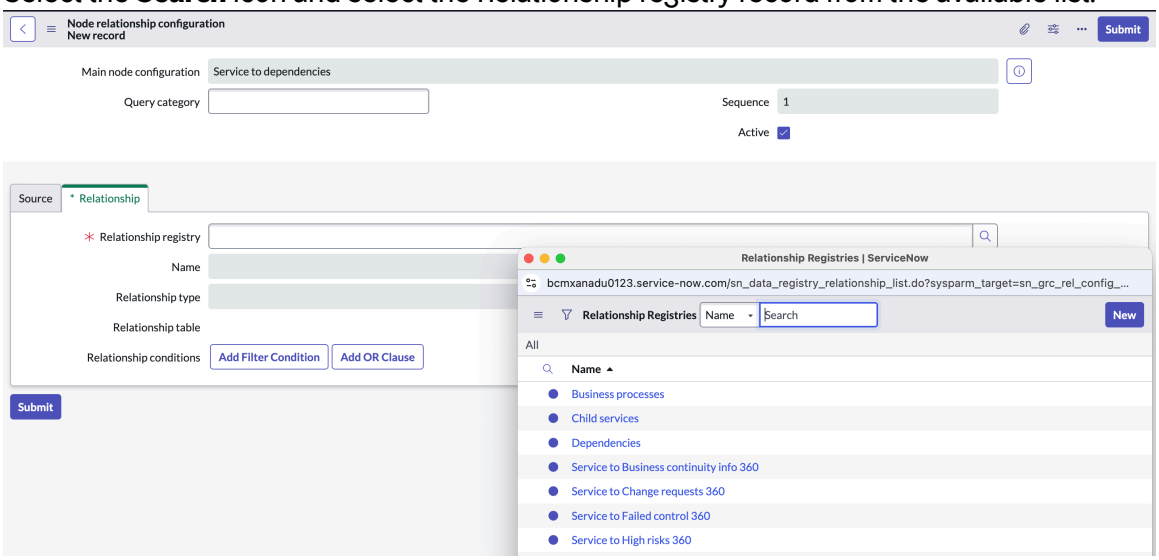
    The **Service to Dependencies** Main node configuration is created and displayed in the Main node configurations list.

11. To define the node relationships, open the **Service to Dependencies** Main node configuration record and select **New** in the Node relationship configurations.

    The Node relationship configuration new record is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For description of the fields, see Relationship registry record form.



12. Select the table of your choice in the **Source table** field in the **Source** tab.

By default, the system auto-selects the table listed in the Main configuration record, the Service [cmdb_ci_service] table in this example. You can choose the auto-suggested table or a different table as per your requirements.

13. Select the relationship registry record in the **Relationship registry** field in the **Relationship** tab. The relationship registry record defines how the Source table links to another table.

    a. Select the **Search** icon and select the Relationship registry record from the available list.

    Selecting the search icon shows the out-of-the-box Relationship registries that have Service as the source table. You can select a Relationship registry from the list.

    b. To select a new registry record instead of choosing a record from the out-of-the-box list, select **New**.

    You can create a new registry record if the out-of-the-box options do not meet your needs.

    c. Add a meaningful name for the new Relationship registry record.
    You can add a proper name to avoid confusion because there might be other registries with the same name.

    d. Select the relationship table in the **Table** field.
    The table should be the same as the Source table from the previous screen. This table name may be different from the table that you have defined in the Main node configuration record.

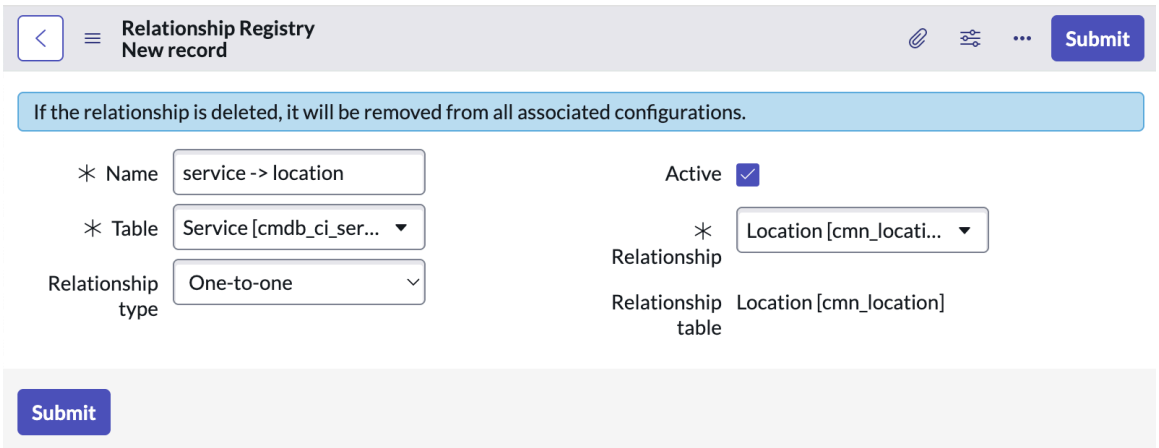
    e. Select the relationship type for the table in the **Relationship type** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once the table is selected, the following options are displayed in the drop-down.

i. **One-to-one**

ii. **One-to-many**

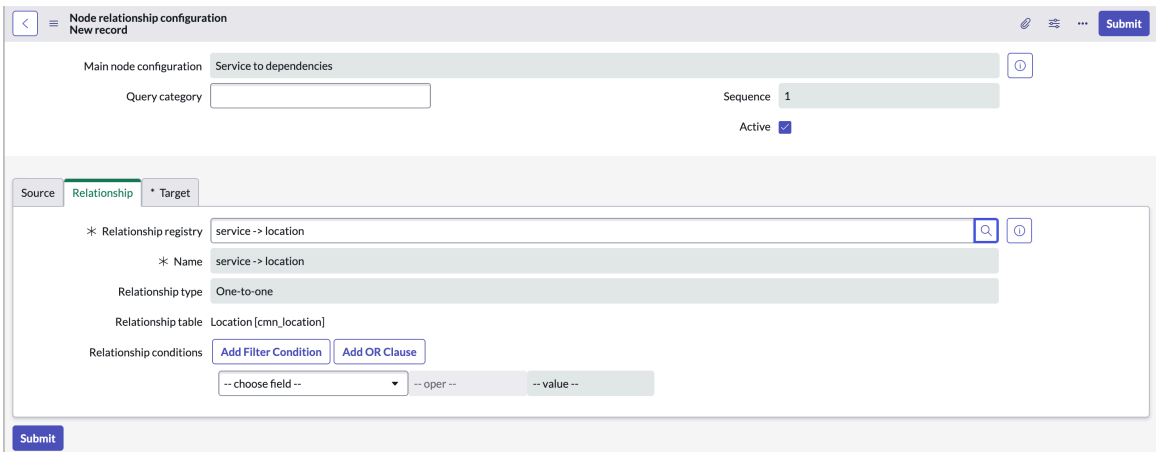


iii. **Many-to-many**

iv. **Scripted relationship**

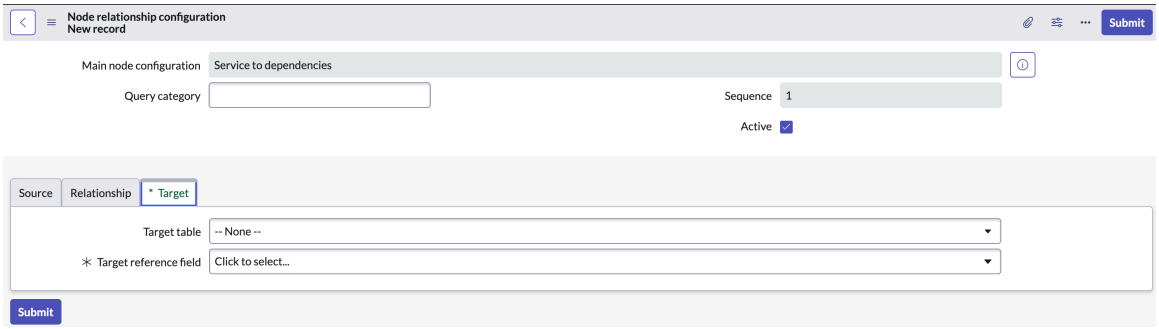
Based on the selected drop-down value, a different list of tables is displayed in the **Relationship** field. The **One-to-one** option is considered in this example.

f. Select the relationship table in the **Relationship table** field.



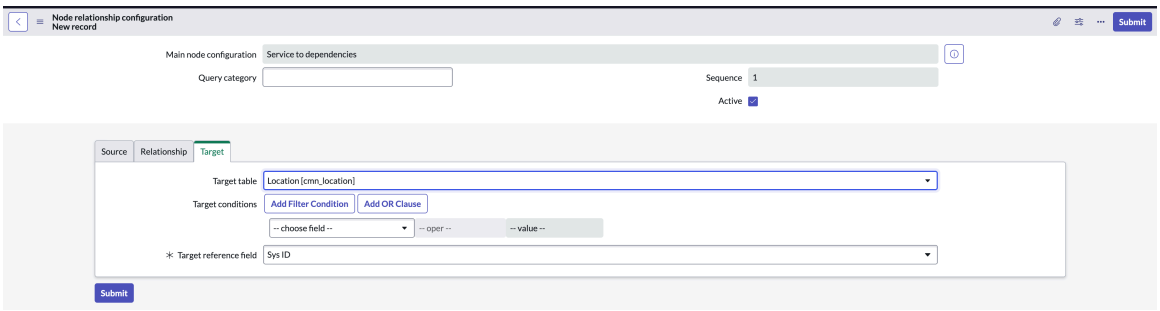
For One-to-one relationship type, the **Relationship** field shows the list of tables that are used as reference fields in the Source table.

After you select the relationship table, the table name is populated in the **Relationship** field.



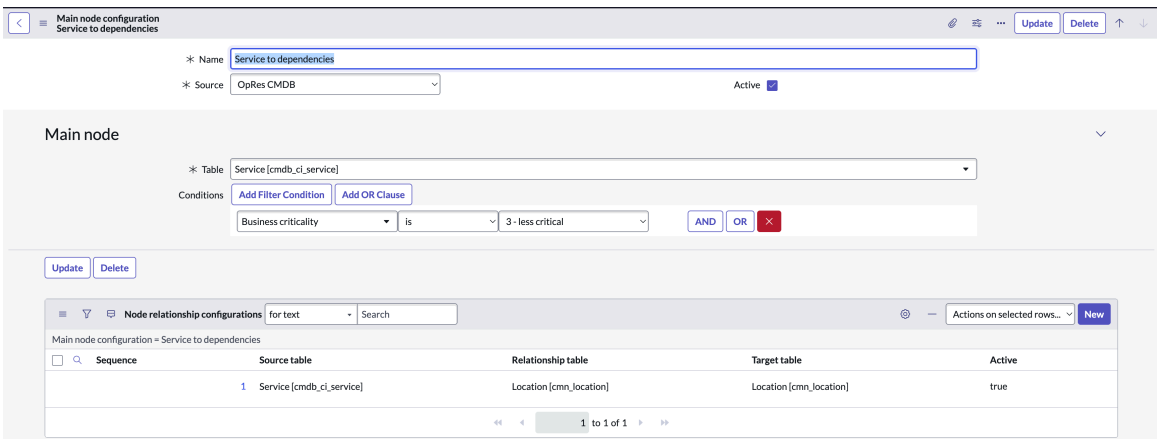
g. Select **Submit**.

You have configured the Source table and Relationship registry.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure the Target section in the Node relationship configuration record in the next step.



14. For non-m2m tables, in the **Target** tab, select **Sys ID** as the **Target reference field** and choose the Relationship table as the **Target table**.

    The Target table and Target reference field are shown in the example.

15. Select **Submit**.

    The Node relationship configuration for the **Service to Dependencies** Main configuration record is now updated.

Sample Application service to dependencies configuration

Create an Application service to dependencies sample Main node configuration record for linking an application service to the dependencies.

Before you begin

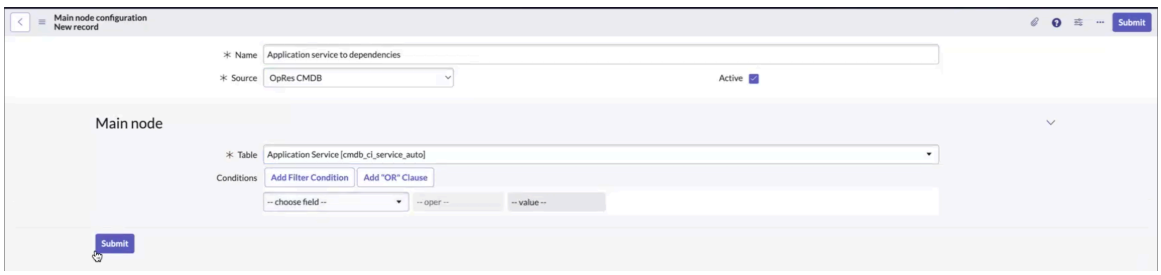
Role required: sn_oper_res.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

For the configuration sequence and instructions in Operational Resilience, see Configuring Operational Resilience.

For instructions on creating the Main node configuration records, see Configure the Main node configurations.



Procedure

1. Download the Operational Resilience application in your instance.
   For instructions on downloading the Operational Resilience application, see Install Operational Resilience application.
2. Ensure that you have set up the pillars, entity types, entity filters and entities are generated.
   Refer to the configuration instructions on the Configuring Operational Resilience page.
3. Ensure that you have the Data Relationships Framework application, which is available by default, is available in your instance.
   Ensure that you have completed other pre-requisites listed in the Configure the Main node configurations.
4. Navigate to **All** > **Data Relationships Framework** > **Main node configurations**.

   Note:
   In order for the Main node configuration to be picked up by the scheduled job, its source should be **OpRes CMDB** and its status should be **True** (**Active**).

5. To create a new Main configuration record, select **New**.
   For descriptions of all the fields in the form, see Main node configuration form.
6. Add the name for the configuration as **Application service to dependencies**.
7. To use it in the Operational Resilience scheduled job, select the source as **OpRes CMDB** and set the status to **True**.
8. Select the table from where you want the hierarchy to start, for example, Application Service [cmdb_ci_service_auto].
9. Add conditions to filter the records for which this main node configuration is created.
   This is an optional step.

   The **Application service to dependencies** Main node configuration is shown in the example.

10. Select **Submit**.

    The **Application service to dependencies** Main node configuration is created and displayed in the Main node configurations list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. To define the node relationships for the **Application service to dependencies** Main node configuration, open the record from the list and select **New** in the Node relationship configurations.

    The Node relationship configuration new record is displayed.

    For the description of the fields, see Relationship registry record form.

12. Select the table of your choice in the **Source table** field in the **Source** tab.

    By default, the system auto-selects the table listed in the Main configuration record, for example, Application Service [cmdb_ci_service_auto]. You can choose the auto-suggested table or a different table as per your requirements.

13. Select the relationship registry record in the **Relationship registry** field in the **Relationship** tab. The relationship registry record defines how the Source table links to another table.

    a. Select the **Search** icon and select the Relationship registry record from the available list.

       Selecting the search icon shows the out-of-the-box Relationship registries that have Service as the source table. You can select a Relationship registry from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also create a new registry record if the out-of-the-box options do not meet your needs.

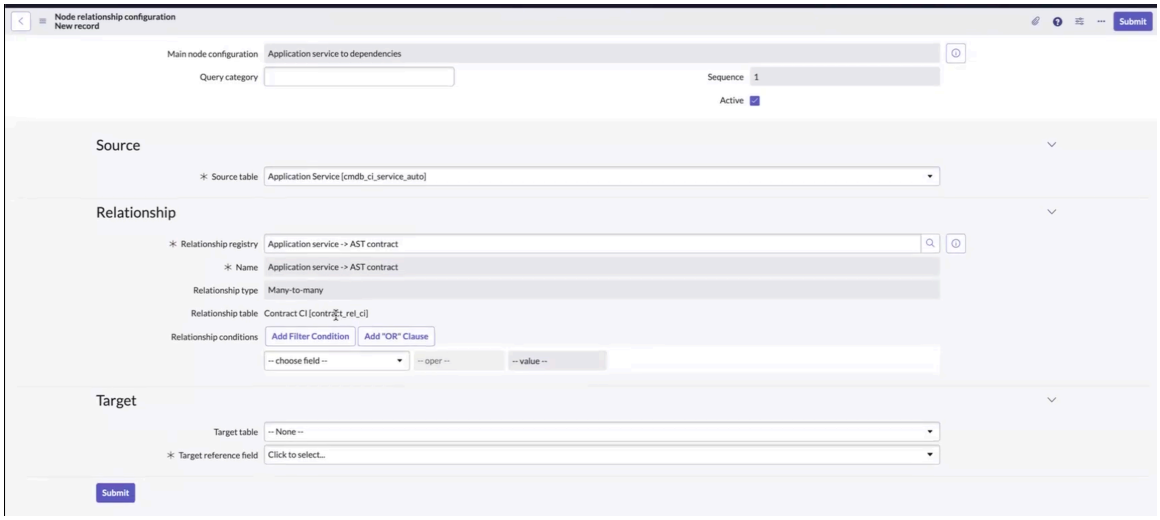
b. Add a meaningful name for the new Relationship registry record.
You can add a proper name to avoid confusion because there might be other registries with the same name.

c. Select the relationship table in the **Table** field.
The table should be the same as the Source table from the previous screen. This table name may be different from the table that you have defined in the Main node configuration record.

d. Select the relationship type for the table in the **Relationship type** field.

Once the table is selected, the following options are displayed in the drop-down.

i. One-to-one

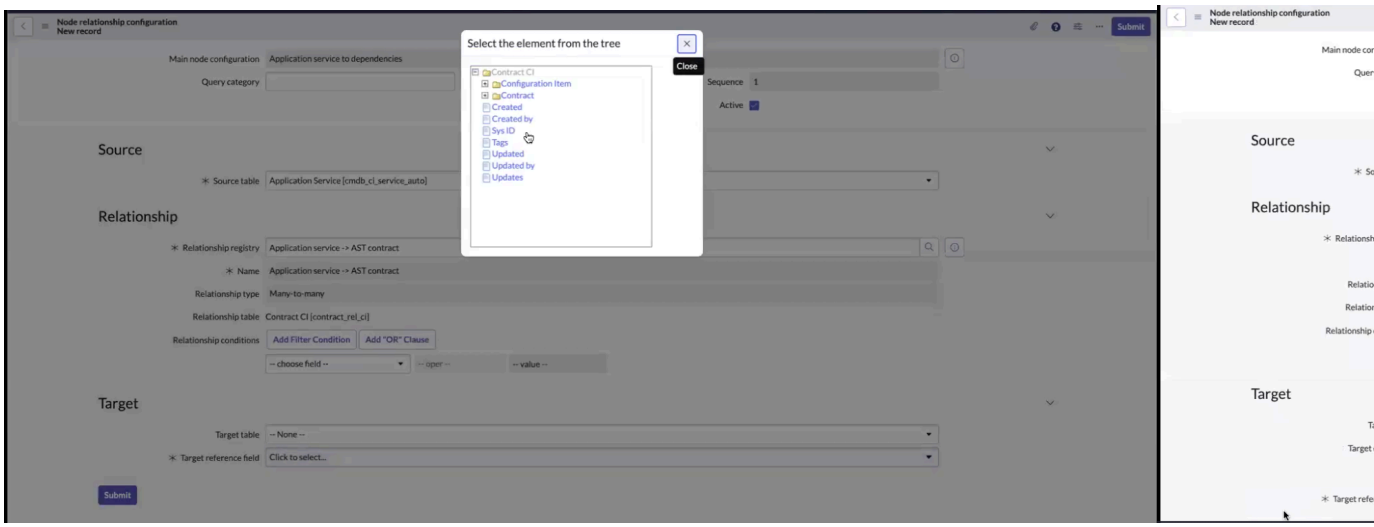


ii. One-to-many

iii. Many-to-many

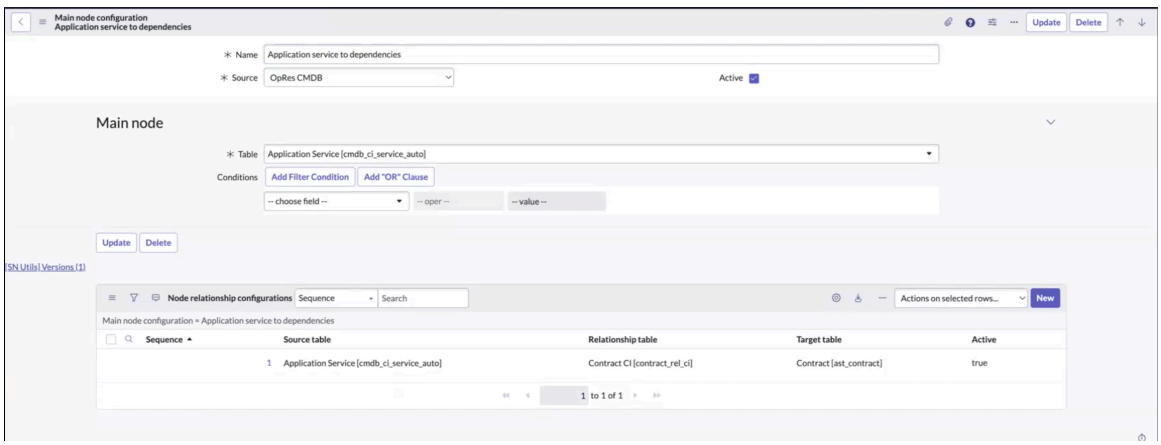
iv. Scripted relationship
Based on the selected drop-down value, a different list of tables is displayed in the **Relationship** field. The **One-to-one** option is shown in this example.

e. Select the relationship table in the **Relationship table** field.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you select the relationship table, the table name is populated in the **Relationship** field.



14. Select the **Target table** in the **Target** tab.

The Target table and Target reference field are shown in the example.

15. Select **Submit**.

The Node relationship configuration for the **Application service to dependencies** Main configuration record is now updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

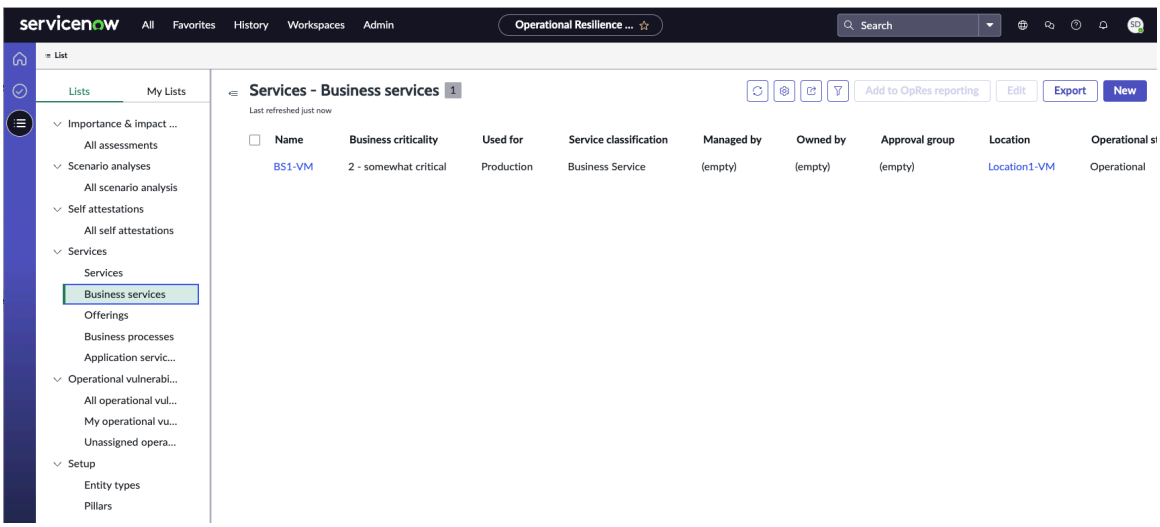
Sample end-to-end workflow for business services

Configure an end-to-end workflow for the business service to fetch the CSDM dependencies and red flags data to Operational Resilience. You must ensure that entities are generated and associated with pillars, and that the Main node configurations are set up before fetching the required data.

Before you begin

Role required: sn_oper_res.manager

About this task



For the configuration sequence and instructions in Operational Resilience, see Configuring Operational Resilience.

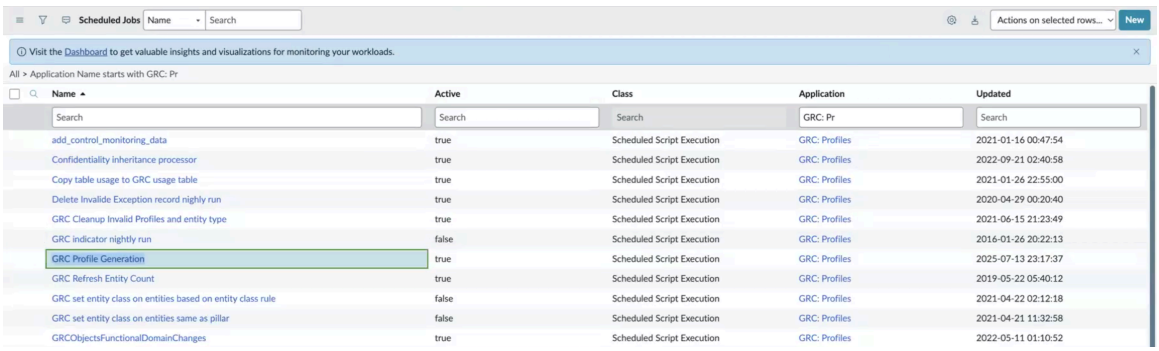
For instructions on creating the Main node configuration records, see Configure the Main node configurations.

Procedure

1. Download the Operational Resilience application in your instance.
   For instructions on downloading the Operational Resilience application, see Install Operational Resilience application.
2. Ensure that you have set up the pillars, entity types, entity filters and entities are generated.
   Refer to the configuration instructions on the Configuring Operational Resilience page.
3. Navigate to **Operational Resilience Workspace** > **List** > **Business service** and select the business service.

   You can select a business service, for example, BS1-VM as shown in the illustration.

4. To add the business service to Operational Resilience reporting, select the service from the list and select **Add to OpRes reporting**.
   The selected service is added to Operational Resilience reporting.
5. Verify that the entity is created for the business service, it is listed in the Business Services entity type on the Entity types page, and it is set to active on that page.

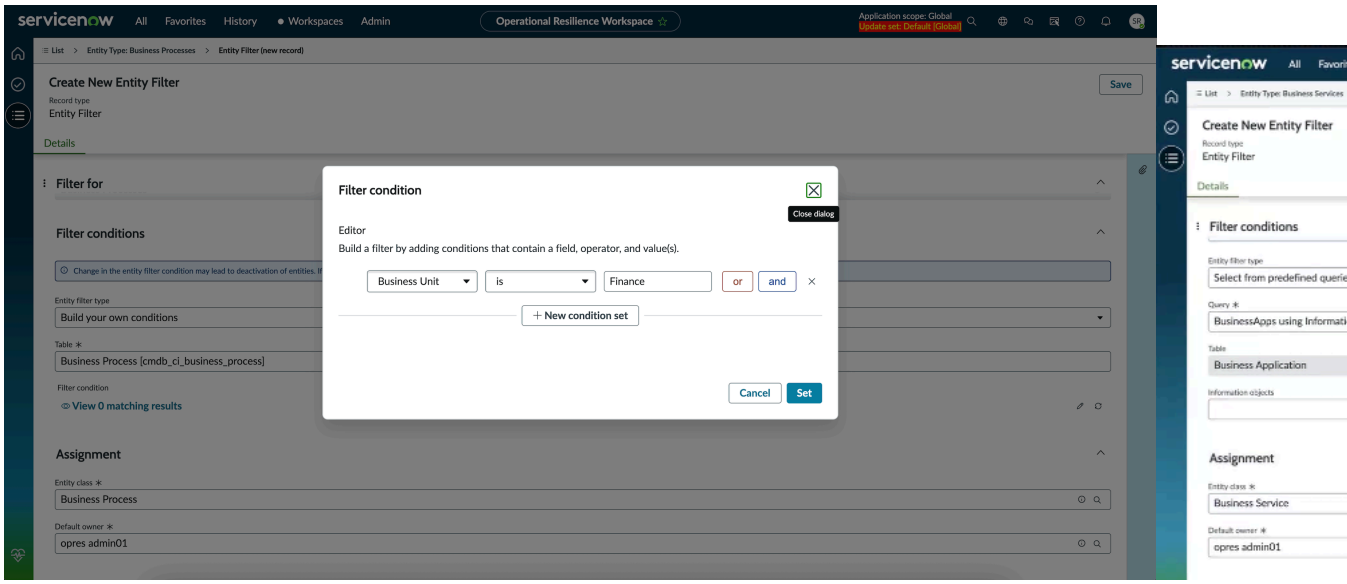


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can verify that the value of the Active column for the Business Services is set to **True**. Verify that the entity is listed in the **Entities** tab and it is marked as Active in the **Details** tab.

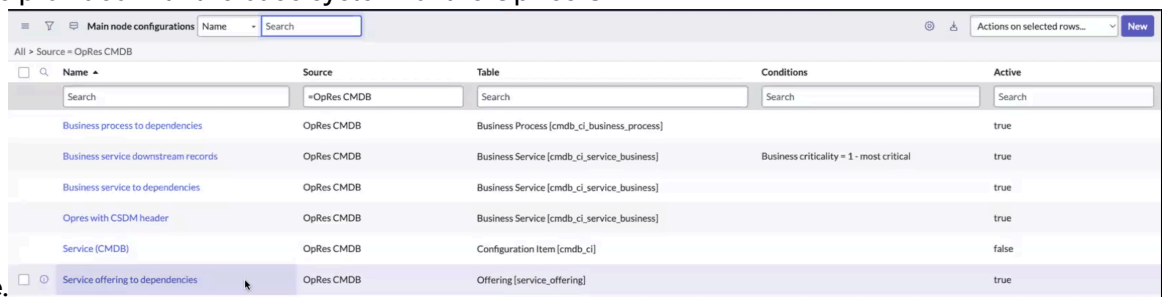
Note:
The following example illustrates how to use entity filters to generate entities. However, for actual entity creation, you should run the *GRC Profile Generation* scheduled job rather than using entity filters.

For reference, the *GRC Profile Generation* job details are shown.



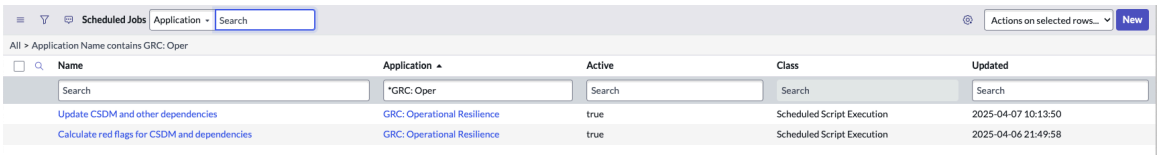
a. In the **Entity Filters** tab, verify the filter condition for the business service that you want to include and fetch it in Operational Resilience.

b. Use either **Build your own conditions** or **Select from predefined queries** option in the **Entity filter type** field and select **Save**.



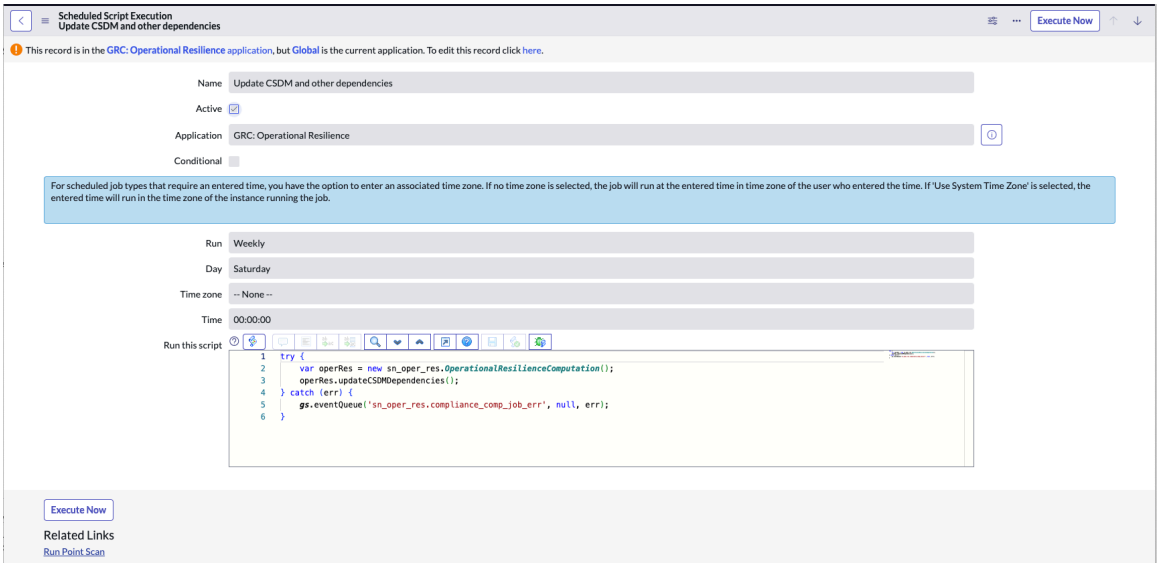
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can build your own conditions or use predefined queries as shown in the examples.



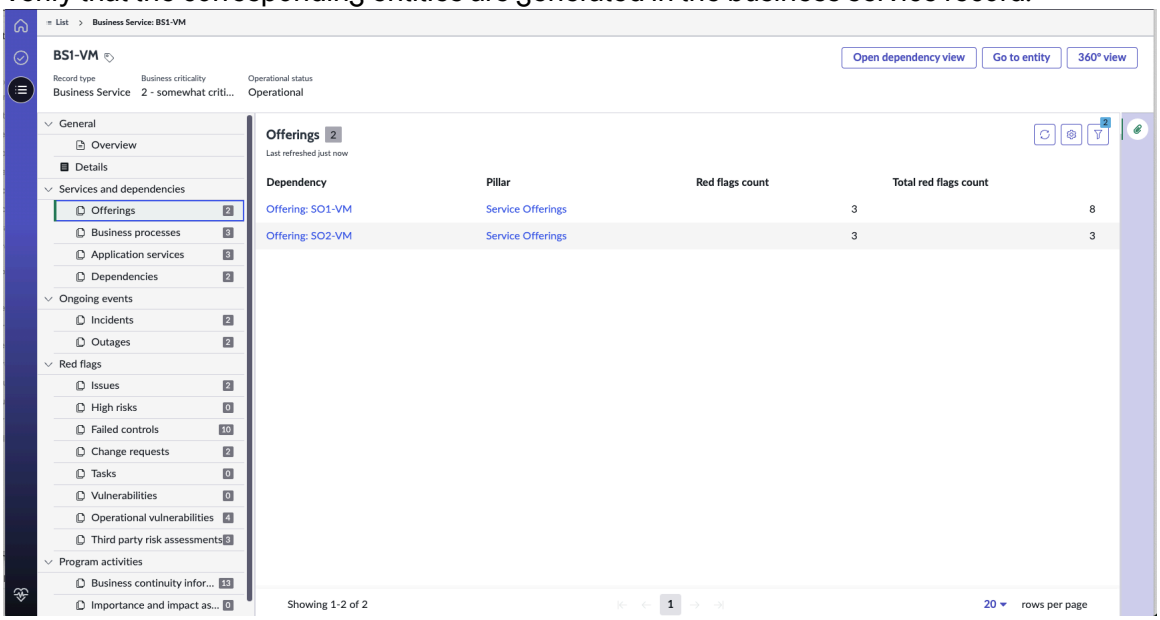
Once the filter condition or query is used, the entities are generated for the selected business service.

6. Navigate to **All** > **Data Relationships Framework** > **Main node configurations** and select the Main node configuration.
   The following example shows the Main node configurations that are provided with the base system for the OpRes CMDB source.



7. To fetch all these relationships into the entity hierarchies in Operational Resilience, execute the *`Update CSDM and other dependencies`* scheduled job.

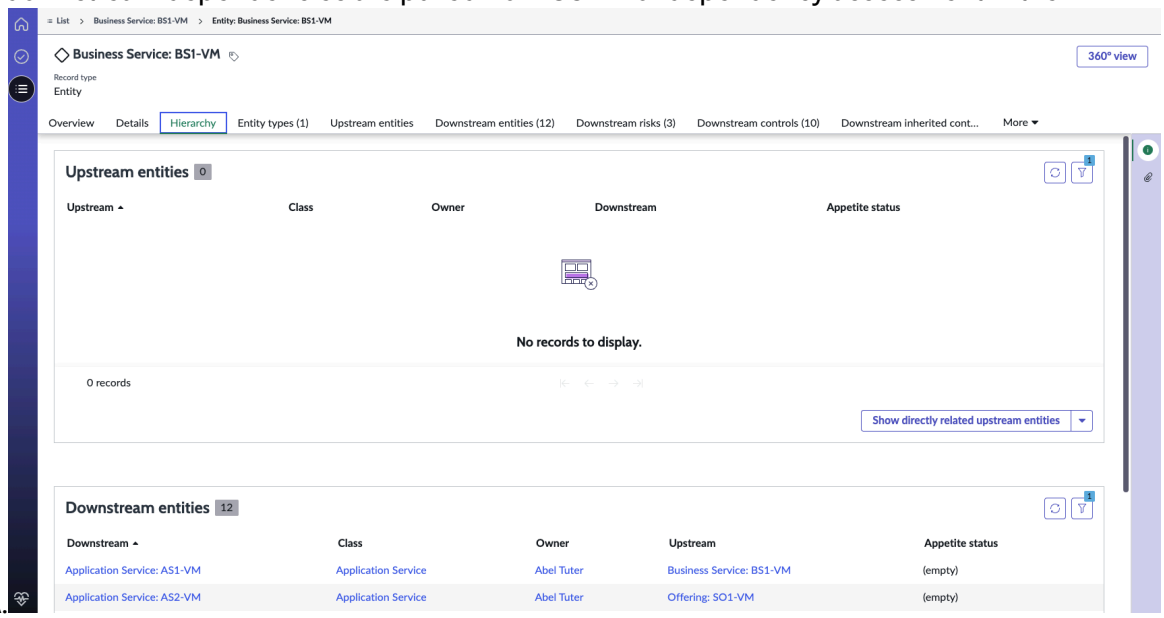
   The following illustration shows all scheduled jobs.



The `UpdateCSDMDependencies` function in the *`Update CSDM and other dependencies`* scheduled job fetches all dependencies of the business service into an entity hierarchy, as part of the Opres with CSDM header Main node configuration.

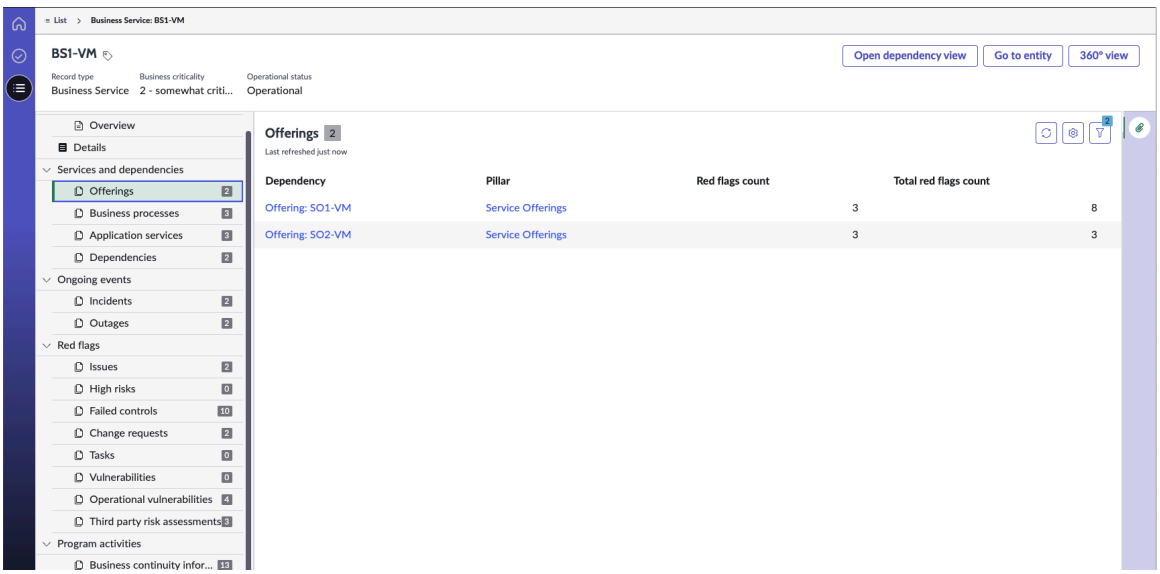
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the scheduled job is executed, it creates an entity hierarchy for preconfigured relationships in the Main node configurations.



8. Verify that the corresponding entities are generated in the business service record.

9. In the business service record, select **Go to entities** and select the **Hierarchy** tab to view how the entities are inherited from each other.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Based on the node relationship configurations set up in each Main node configuration, the downstream dependencies are pulled from CSDM or dependency assessment in the BIA.

10. To calculate the red flags, execute the *`Calculate red flags for CSDM and dependencies`* scheduled job.

    When the *`Calculate red flags for CSDM and dependencies`* scheduled job is triggered, it cleans up all the staging records and then it starts calculating the red flags.

    The red flags data, including issues, high risks, failed controls, change requests, tasks, incidents, and outages, are listed for each dependency and also in the separate Red flags tabs in the business service record.

11. To view dependencies of the business service from the CMDB, select the **Open dependency view** option in the business service record.

    The dependency view shows how the relationships of the selected business service are configured in the CMDB.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. To access a comprehensive overview of the business service record, select the **360° view** option.

    The 360° view of the business service record is displayed.

Sample end-to-end workflow for services

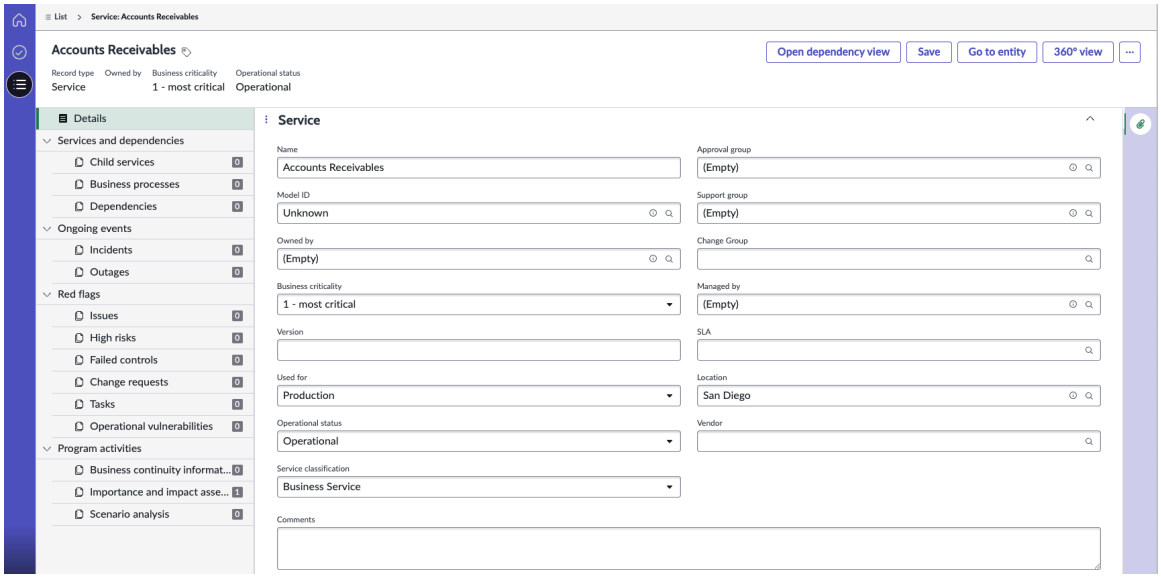
Configure an end-to-end workflow for the service to fetch the CSDM dependencies and red flags data to Operational Resilience. You must ensure that entities are generated and associated with pillars, and that the Main node configurations are set up before fetching the required data.

Before you begin

Role required: sn_oper_res.manager

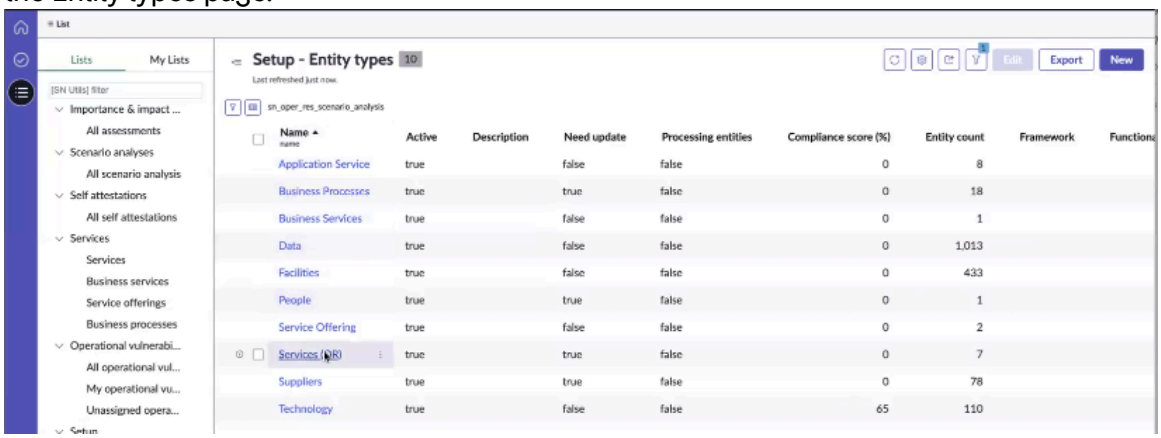
About this task

For the configuration sequence and instructions in Operational Resilience, see Configuring Operational Resilience.



For instructions on creating the Main node configuration records, see Configure the Main node configurations.

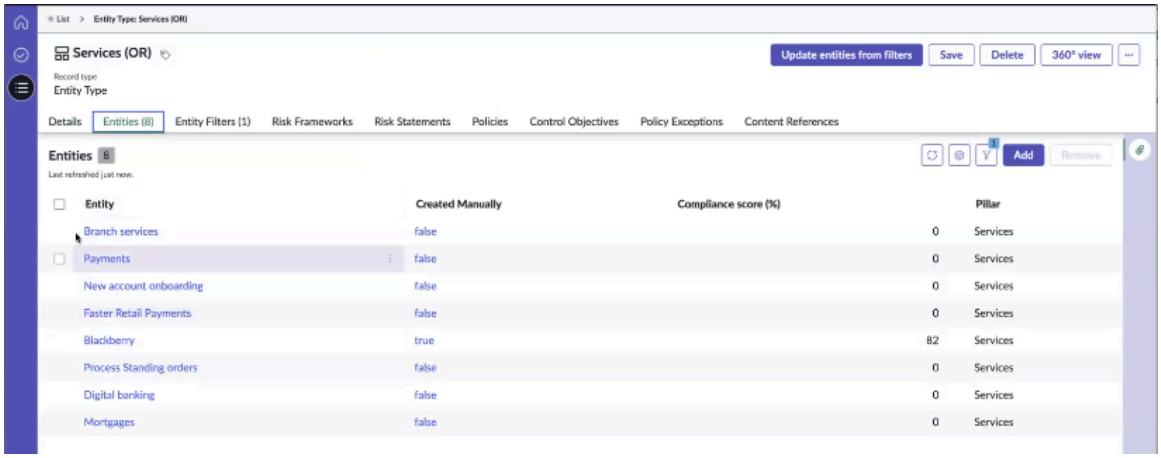
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Download the Operational Resilience application in your instance.
   For instructions on downloading the Operational Resilience application, see Install Operational Resilience application.
2. Ensure that you have set up the pillars, entity types, entity filters and entities are generated. Refer to the configuration instructions on the Configuring Operational Resilience page.
3. Navigate to **Operational Resilience Workspace** > **List** > **Service** and select the service.

   You can select a service record as shown in the illustration.



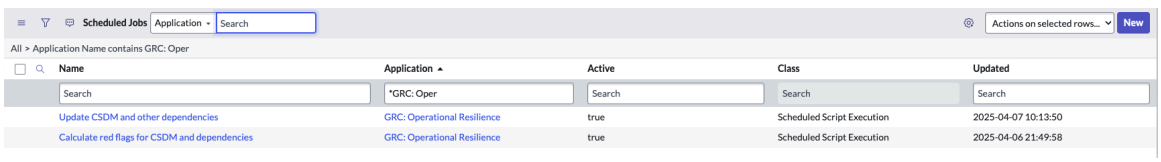
4. To add the service to Operational Resilience reporting, select the service from the list and select **Add to OpRes reporting**.
   The selected service is added to Operational Resilience reporting.
5. Verify that the entity is created for the service and it is listed in the Services (OR) entity type in the Entity types page.

   Verify that the entity is listed in the **Entities** tab and it is marked as Active in the **Details** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The following example illustrates how to use entity filters to generate entities. However, for actual entity creation, you should run the *GRC Profile Generation* scheduled job rather than using entity filters.

For reference, the *GRC Profile Generation* job details are shown.



a. In the **Entity Filters** tab, verify the filter condition for the service that you want to include and fetch it in Operational Resilience.

b. Use either **Build your own conditions** or **Select from predefined queries** option in the Entity filter type and select **Save**.
Entities are generated for the selected service.

6. Navigate to **All** > **Data Relationships Framework** > **Main node configurations** and select the Main node configuration.
7. To fetch all these relationships into the entity hierarchies in Operational Resilience, execute the *Update CSDM and other dependencies* scheduled job.

   The following illustration shows all scheduled jobs and their set schedules.

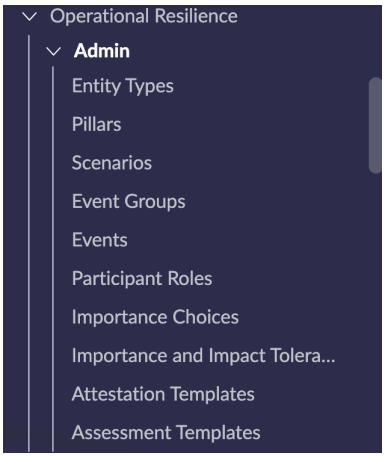
The `UpdateCSDMDependencies` function in the *Update CSDM and other dependencies* scheduled job fetches all dependencies of the business service into an entity hierarchy, as part of the Opres with CSDM header Main node configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the scheduled job is executed, it creates an entity hierarchy for preconfigured relationships in the Main node configurations.

8. To calculate the red flags, execute the *Calculate red flags for CSDM and dependencies* scheduled job.
   Red flags, including issues, high risks, failed controls, change requests, tasks, incidents, and outages, are updated in the business service record.
9. Verify that the corresponding entities are generated in the service record.
10. In the service record, select **Go to entities** and select the **Hierarchy** tab to view how the entities are inherited from each other.

    Based on the node relationship configurations set up in each Main node configuration, the downstream dependencies are pulled from the CSDM or dependency assessment in the BIA.
11. To view the dependencies of the service, select the **Open dependency view** option.
12. To access a comprehensive overview of the service record, select the **360° view** option.



Completing general administrative tasks

A user with the sn_oper_res.admin role can perform the setup tasks in the Operational Resilience application.

Admin module in the classic Operational Resilience view

If you have the sn_oper_res.admin role, you can configure the Admin module and set up the administrative tasks in the Operational Resilience Workspace as shown in the following example:

Admin module in the classic view

A user with the sn_oper_res.admin role can set up the following entities by using the Admin module:

- Entity Types

> **Note:**
> Installing the Operational Resilience application inserts seed data to the Entity type [sn_grc_profile_type] table. Both entity types and entity filters are installed as inactive. When you activate them, it could lead to generation of thousands of entity records.

- Pillars
- Scenarios

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Groups
- Events
- Participant Roles
- Important Choices
- Importance and Impact Tolerance Rating Scale
- Attestation Templates
- Assessment Templates

Note:
When you log in to the application as a user with the sn_oper_res.admin role, you can view the Admin module.

Operational Resilience administrators can create pillars and can also modify the reports on the dashboard.

Note:
Though you can modify the entity types, their filters, and pillars as a user with the sn_oper_res.admin role, you must exercise proper caution while modifying them.

Administrative setup tasks

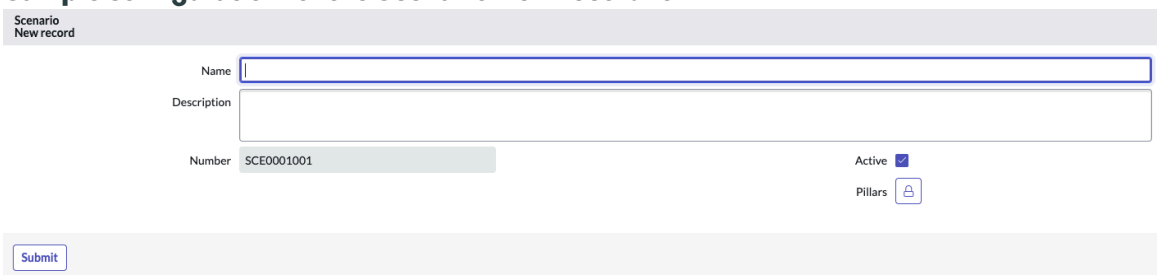
As a user with the sn_oper_res.admin role, you can complete the following general setup tasks:

- Create a scenario that represents a risk. For more information, see Create a scenario and link it to an event.
- Classify an event by associating it with an event group. For more information, see Create an event group for the scenario.
- Create an event that you can associate with a scenario. For more information, see Create an event for the scenario.
- Add a participant role for your scenario analysis. For more information, see Add a participant role for the scenario analysis.
- Update the assessment rating by using the Important choices module. For more information, see Update the Important choices module.
- Update the importance and impact rating scale. For more information, see Set up the Importance and Impact Tolerance Rating Scale.
- Create an attestation template. For more information, see Create and edit the attestation template.

Create a scenario and link it to an event

Create a scenario in the Operational Resilience application so that you can associate it with an event and assess its impact on your business services.

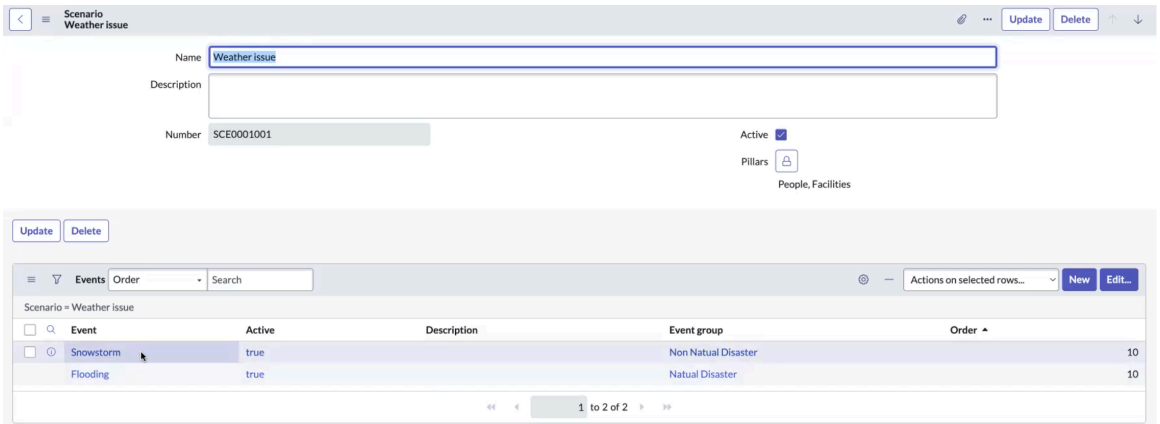
Before you begin
Role required: sn_oper_res.admin



About this task
A scenario helps you to determine the risks that are applicable to your business. If you have the sn_oper_res.admin role, you can create a scenario in the Operational Resilience application. You can use a scenario to test how an event can impact your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure



1. Navigate to **All** > **Operational Resilience** > **Admin** > **Scenarios**.
2. Click **New**.
   The sample configuration for the Scenario New record form is shown in the following example.

Sample configuration for the Scenario New record form

3. On the form, fill in the fields.
   For the description of the field values, see Scenario New record form.
4. Click **Submit**.
   You have associated an event with a scenario. The Events related list displays the associated events as shown in the following example.

Events that are associated with a scenario

The order for the event is tied to the scenario and it is auto-filled by default in the related list.

Scenario New record form

Use the Scenario New record form to create a scenario and test how an event that is associated with a scenario can impact your organization.

Scenario New record form

For a description of the field values, see the following table.

Scenario New record form

Field	Description
Name	Name of the scenario.
Description	Description of the scenario.
Number	Number of the scenario record. This field is auto-filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario New record form (continued)

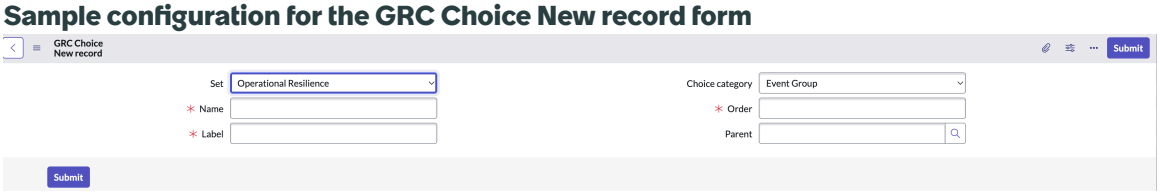
Field	Description
Active	Option to mark the scenario as active.
Pillars	List of pillars that you can associate with the scenario. The following pillars are provided with the Operational Resilience base system: • Facilities • People • Process • Suppliers • Technology
Related list (Displayed after a scenario is added)	
Events	Events that are related to a scenario. The related list displays the name of the event, its active status, description, associated event group, and its order that is related to the scenario. The order for the event is tied to the scenario and it is auto-filled by default in the related list. **Note:** You can add a new event or edit an existing event that is related to a scenario.

Create an event group for the scenario

Create an event group in the Operational Resilience application so that you can categorize the events that are defined in a scenario.

Before you begin

Role required: sn_oper_res.admin



About this task

Classify the events of a similar type into an event group for your scenario. For example, you can classify a natural event, such as flooding, into the Weather event group. Similarly, you can classify a power outage under the Energy Issues event group.

Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Event Groups**.
2. Click **New**.
3. In the **Name** field, enter the name for the event group.
4. In the **Label** field, enter the label for the event group.
   The configuration of a sample event group is shown in the following example.

Sample configuration for the GRC Choice New record form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Order** field, enter the order for the event group and click **Submit**.
   For more information on the fields in the Event group form, see GRC Choice New record form.

GRC Choice New record form

Use the GRC Choice New record form to classify your events and organize them into event groups.

GRC Choice New record form

For a description of the field values, see the following table.

GRC Choice New record form

Field	Description
Set	View that is set to Operational Resilience by default.
Name	Name of the event group. For example, Weather or Energy Issues.
Label	Label for the event group that appears in the UI.
Choice category	Category that is set to **Event group** by default.
Order	Order of the event group.
Parent	Parent category that you associate with an event group.

Create an event for the scenario

Create an event in the Operational Resilience application so that you can associate it with a scenario and assess its impact on your services.

Before you begin

Role required: sn_oper_res.admin

About this task

If you have the sn_oper_res.admin role, you can create an event in the Operational Resilience application. An event can be something like flooding or a power outage. You can classify the events that are of a similar type under an event group.

Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Events**.
2. Click **New**.
3. In the **Name** field, enter the name for the event.
4. In the **Description** field, enter the description for the event.
5. In the **Event group** field, select an event group.

   For a description of the field values in the form, see Event New record form.

   Note:
   You can add an event to many scenarios, but you can add an event to a scenario only once.

6. Click **Submit**.
   You can classify an event under an event group as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample configuration for the Event New record form

As shown in the example, the scenarios for an event can be associated with different pillars.

Event New record form

Use the Event New record form to create an event that you can associate with a scenario and assess its impact on your services.

Event New record form

For a description of the field values, see the following table.

Event New record form

Field	Description
Name	Name of the event. For example, Flooding or Earthquake.
Description	Description of the event.
Event group	Event group that you associate with the event. For example, Weather Issues.
Active	Option to mark the event as active.

Add a participant role for the scenario analysis

Add a participant role for your scenario analysis in the Operational Resilience application so that you can collect the observations and recommendations of the participants by their roles and functions.

Before you begin

Role required: sn_oper_res.admin

About this task

Depending on the scenario analysis type, such as a scenario analysis for critical services, you can add the participants from the associated business functions and assign various roles. For example, you can add HR, Legal, Finance, or Procurement roles to your participants.

Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Participant Roles** and click **New**.
2. In the **Set** field, select **Operational Resilience**.
3. In the **Name** field, enter the name for the participant role.
4. In the **Label** field, enter a label for the participant role.
5. In the **Choice category** field, select **Role**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **Value** field, enter the value of the choice for the participant role.
7. In the **Order** field, enter an order for the participant role.
   This field displays the order of the participant role in the GRC Choice table.
8. In the **Parent** lookup list options, select a parent service.
   See the sample configuration for a participant role as shown in the following example.

Sample configuration for the GRC Choice New record form

9. Click **Submit**.

Result

In the Participant Roles module in the application UI, the participant role is listed in the Roles list view.

GRC Choice New record form

Use the GRC Choice New record form to add a role for the participants of your scenario analysis.

GRC Choice New record form for the role

For a description of the field values, see the following table.

GRC Choice New record form

Field	Description
Set	View that is set to Operational Resilience by default.
Name	Name of the role. For example, Facilities or Finance.
Label	Label for the role that appears in the UI.
Choice category	Category that is set to **Role** by default.
Value	Integer value that you set for the role.
Order	Order of the role. This field displays the order of the participant role in the GRC Choice table.
Parent	Parent category that you associate with the role.

Update the Important choices module

Update the rating of the assessment in the Operational Resilience application so that you can update the criticality and the order of the assessment for your business services.

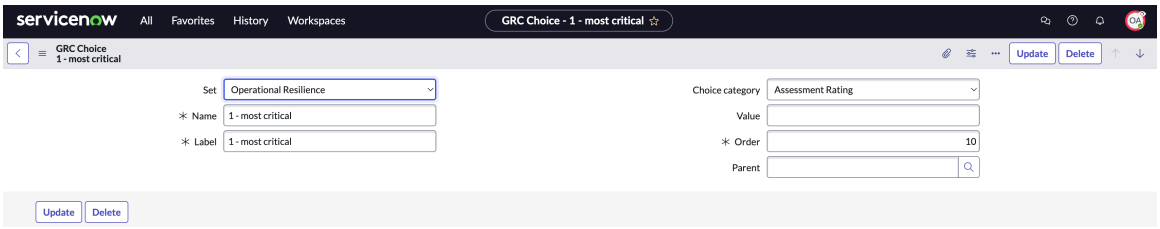
Before you begin

Role required: sn_oper_res.admin

About this task

You can update the criticality and the order of the assessment rating by using the Important choices module. This task is optional.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Important Choices**.
   You see the default assessment rating that is shown in the following example.

Default assessment rating

   A sample assessment rating is shown in the following example.

2. Click **New**.
3. On the form, fill in the fields and select **Submit**.
   For a description of the field values on the GRC Choices form, see GRC Choices form.

GRC Choices form

Use the GRC Choices form to set up the rating of the assessment by updating its criticality and the order of the choice in the Important choices module.

GRC Choices form

For a description of the field values, see the following table.

GRC Choices form

Field	Description
Set	View that is set to Operational Resilience.
Name	Name of the assessment rating. For example, **1- Most Critical**.
Label	Label of the assessment rating. For example, **1- Most Critical**.
Choice category	Choice category. It is set to **Assessment Rating** by default.
Order	Field used for sorting the order of the assessment rating. Based on the Importance and Impact Assessment score, the application selects the corresponding rating. 
Parent	Parent setting that is associated with the assessment rating. For example, the **Technology** pillar can be associated with the assessment rating.
Active	Indicates whether the configuration record is currently active and available for selection in the GRC Choice table.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up the Importance and Impact Tolerance Rating Scale

Set up the Importance and Impact Tolerance Rating Scale in the Operational Resilience application so that you can define new parameters for your business services.

Before you begin

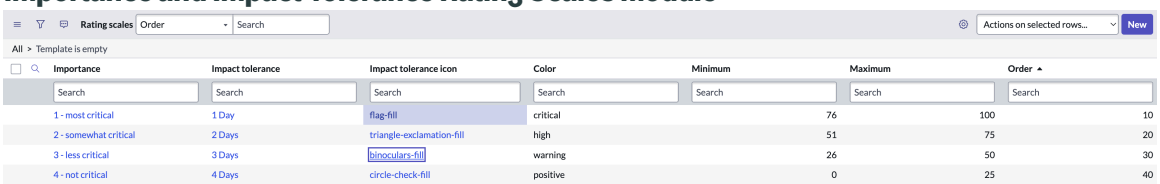
Role required: sn_oper_res.admin

About this task

Define new parameters such as importance, impact tolerance, impact tolerance icon and its color, minimum and maximum tolerance value, and the tolerance order for your business service. When the options in the sn_grc_choice table are set as *choice_category=opres_asmt_rating* and *set=operational_resilience*, the Operational Resilience application delivers the following default importance rating scales. This task is optional.

Default importance rating scales

Importance	Impact tolerance	Impact tolerance icon	Minimum-maximum score	Order
1—Most critical	1 Day	flag-fill	76—100	10
2— Somewhat critical	2 Days	triangle-exclamation-fill	51—75	20
3—Less critical	3 Days	binoculars-fill	26—50	30
4—Not critical	4 Days	circle-check-fill	0—25	40



When a new questionnaire template is created, the application clones the default rating scale to it.

A user with the sn_oper_res.admin role can change the rating scale for the individual templates.

Procedure

1. Navigate to **All** > **Operational Resilience** > **Admin** > **Importance and Impact Tolerance Rating Scale**.
   You see the default importance and impact tolerance rating scales as shown in the following example.

Importance and Impact Tolerance Rating Scales module

2. Click **New**.
   You can define new parameters such as the importance, impact tolerance, impact tolerance icon and its color, minimum and maximum tolerance value, and the tolerance order for your business service.
3. On the form, fill in the fields and click **Submit**.
   For a description of the field values on the Rating Scale New Record form, see Rating Scale New Record form.

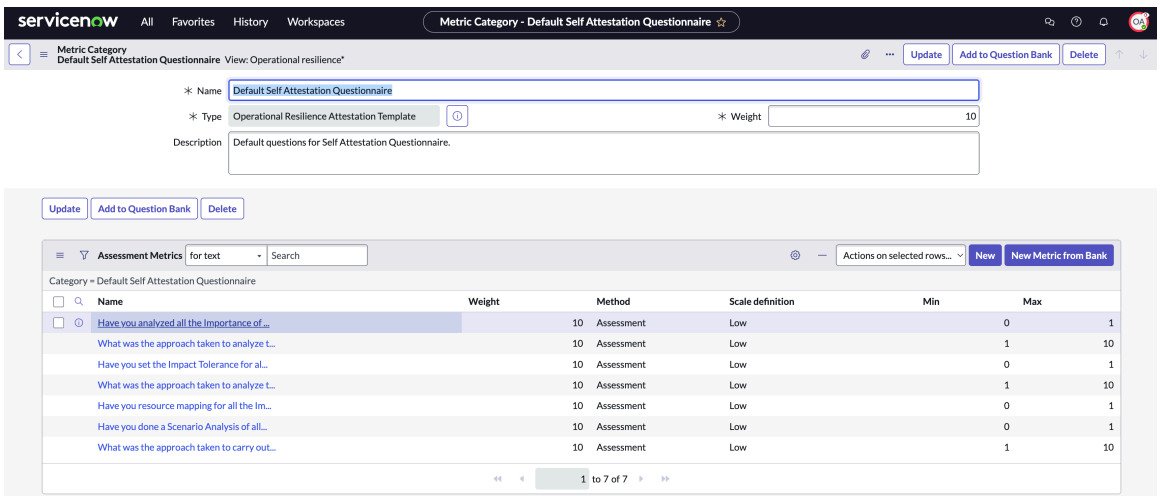
Rating Scale New Record form (continued)

Field	Description
Impact tolerance	Impact tolerance duration in days as per the defined importance of the service.
Impact tolerance icon	Impact tolerance icon for the selected tolerance rating.

Create and edit the attestation template

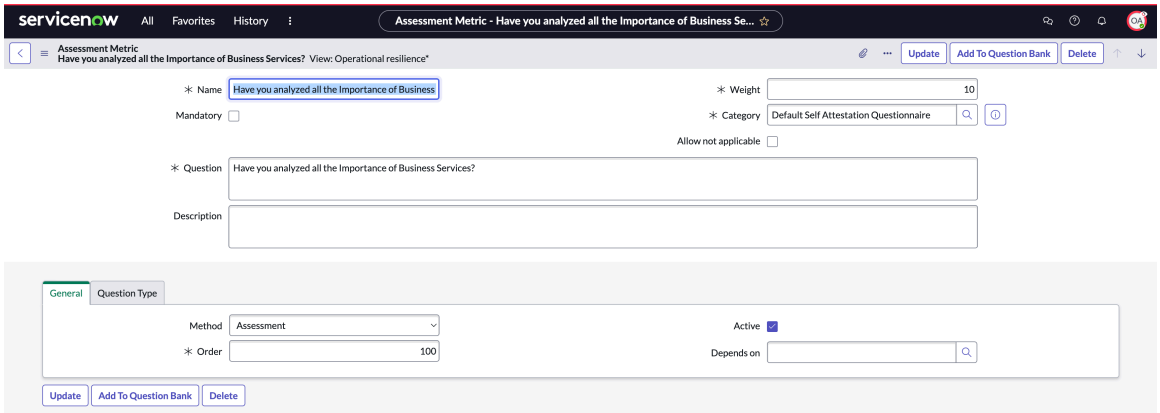
Create a customized attestation template in the Operational Resilience application that suits your business needs. By customizing an attestation template, you can add your own questions for your self-attestation. You can also edit an existing attestation template for your own business needs.



Before you begin

Role required: sn_oper_res.admin

About this task



The Operational Resilience application provides you with an attestation template as part of the base system. Creating an attestation template is optional.

If you have the sn_oper_res.admin role, you can also edit an existing attestation template for your own business needs. You can select and update the questions in the attestation template as shown in the following example.

You can update the questions according to your business requirements as shown in the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Assessment Workspace** to access the Assessment Workspace landing page.
2. Select **New template** and then fill in the Template details in the Create assessment template form.

   a. Enter the name of the template in the **Template name** field in the Details section of the **General** tab.
   You can add the name for the self-attestation template, for example, the self attestation assessment template.

   b. Add details about the template in the **Description** field.

   c. Select **Self attestation assessment** as the purpose from the Assessment templates list. Ensure that you select the correct purpose, as it is crucial for the self-attestation process.

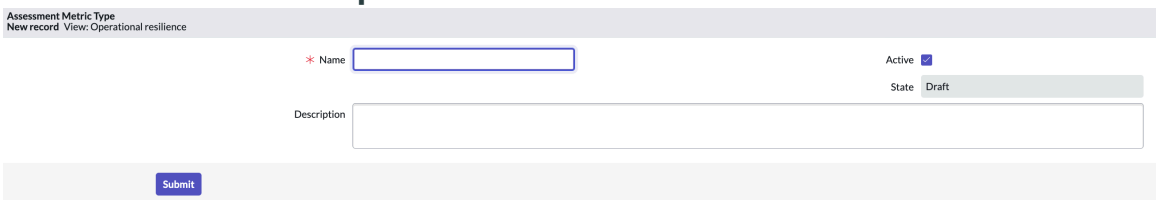
   d. Select the assessment target as **Self attestation**.

   e. Select **Create**.

   f. In the Settings section, add the duration of the assessment in the number of days, assign Assessment reader role such as sn_oper_res.user, and select **Save**.

   g. Add questions and set up automation in the **Questions** and **Automation** tabs respectively. For more information, see Add instructions and questions to an assessment template and Automate response.

   h. To publish the template, select **Publish**.



3. To update the legacy template, complete the following steps.

   a. Navigate to **All** > **Operational Resilience** > **Admin** > **Attestation Templates**.
