Assessment administrators can create and administer metrics and metric templates, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

Note:
Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

Related topics

Update a metric minimum and maximum value to match a template

Create an assessment metric for a category

After you create a category, create metrics you can use to evaluate the assessable records for that category.

Before you begin
Role required: assessment_admin or admin

About this task
When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess.

Procedure

1. Navigate in one of the following ways.

Option	Description
Assessments > **Metric Definition** > **Categories**	Open a category, and locate the **Assessment Metrics** related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.
Assessments > **Metric Definition** > **Metrics**	

2. Click **New**.
3. On the Assessment Metric form, fill in the fields.
   For a description of the field values, see Assessment Metric form for a category.
4. Save the record.
   When you create a **Choice** or **Likert Scale** question, reopen the Assessment Metric form after you submit it to create a metric definition. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the quesitons. If the questions are mandatory, the recipients are unable to submit their questionnaires.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an assessment metric definition

Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

Before you begin
Role required: assessment_admin or admin

About this task
Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: **Very satisfied**, **Somewhat satisfied**, and **Not at all satisfied**.

Procedure

1. Open the metric record you want to edit.
2. In the **Assessment Metric Definitions** related list, click **New** to create a new metric definition.
3. Fill in the fields:
   - **Display:** Enter the text you want to appear as the answer option.
   - **Value:** Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.
4. Click **Submit**.

Metric templates

Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of **Choice** or **Likert Scale**.

Before you begin
Role required: assessment_admin or admin

About this task
The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the **Value** setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the **Order** field and not the **Value** field.

The **Order** column is hidden in the base system.

Procedure

1. Access the question record.
2. Configure the Assessment Metric Definitions related list to display the **Order** column.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Edit the order number in the list.

Note:
The **Value** setting remain the same for each answer option after reorganization.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This set up provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table.

Create metric types and generate assessable records

Create a metric type, which sets a table and filter conditions that define a set of records to evaluate.

Before you begin

Role required: assessment_admin or admin

About this task

For example, the Vendor Performance application provides the **Vendor** metric type, which defines an assessable record for each source record in the Company [core_company] table that has the **Vendor** field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Click **New**.
3. On the form, fill in the fields.

Metric types form

Field	Description
Name	[Required] Name of the type. It may be practical to give the type a name that indicates which records it defines.
Assessment duration	Amount of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated. The assessment duration sets the **Due date** that appears on assessment instances. Changes made to the duration of an attestation in the GRC Control Test Definition form are updated dynamically in this field. The default duration is 14 days.
Live feed	Check box that determines whether to enable (selected) or disable (cleared) the Live Feed view in scorecards for all assessable records created from this type.
Notify manager if overdue	Check box that determines whether to send (selected) email notifications a user's manager when that user fails to submit an assigned questionnaire on time.
Assessment manager	Manager for this assessment metric type. These users are responsible only for managing the assessment process and not the results. The system notifies the assessment manager when an assessment for this metric type is past due.
Scoring type	Scoring method to use for questions with a data type of attestation. The possible selections are: ○ **Percent**: Attestation score as a weighted percentage of correct answers for scored questions. When you select this scoring type, categories can be scored as **Percent** or **All or nothing**. ○ **All or nothing**: Requires all answers for attestation type questions to be correct, or the score is zero for the entire attestation. When you select this scoring type, all categories are scored automatically as **All or nothing**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Scale factor	[Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor. **Note:** This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor you are satisfied with before you save the metric type.
Pagination setting for Service Portal view	Specify how the user will see pages on the desktop or tablet view in Service Portal. ○ **Category**: Display each category on a separate page. The categories appear in the following order: ▪ Each category appears in sequence on a separate page for the first assessable record ▪ Then each category appears in sequence on a separate page for the next assessable record ▪ and so on ○ **Question**: Display each question on a separate page. Questions appear on separate pages for mobile devices regardless of this setting. Each question appears for each category as described for the **Category** setting. ○ **None**: All items on a single page—no pagination Default: **Category** **Note:** This field appears only when Service Portal is installed.
Roles	Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record as well as to associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrixes. **Note:** Users with these roles do not have access to Assessments modules unless they are also assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to easily grant certain users access to specific assessment data in special cases. For example, the **Vendor** metric type provides access to users with the vendor_manager role so they can view results and compare assessable records when they open scorecards or decision matrixes in the Vendor Performance application.
Signature	[Optional] Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to an assessment. For more information, see Create an assessment signature.
Return URL	Destination address of a web page that is presented to users after they submit an assessment for this metric type. When a return URL is configured, the end note content does not appear.
State	[Read-Only] Status of the assessment: **Draft** or **Published**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Business rule	[Admin only] Business rule the system creates to monitor the specified table. When a new record is added to the table that meets the metric type conditions, the business rule generates a corresponding assessable record. If someone changes the table or conditions of the metric type, the system updates the business rule to reflect the changes. Existing assessable records associated with the metric type are not affected.
Schedule type	Setting that determines which assessment process to use. Select **On demand** or **Scheduled**.
Scheduled job	[Admin only] Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format <type name> Assessment Creation. Administrators can configure a recurring assessment generation schedule for the metric type. This field is visible only when the schedule type is **Scheduled**. **Note:** If you change the schedule type from **Scheduled** to **On demand**, the system deletes the scheduled job. If you change the schedule type back to **Scheduled**, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired.
Evaluation method	[Admin only] Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are: ○ **Assessment**: Default filter value for metric types. Only this evaluation method uses assessable records, conditions, and stakeholders. ○ **Attestation**: For details, see Attestations - Legacy. ○ **Survey**: For details, see Survey definitions.
Scale factor	[Required] Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. **10** is generally a good scale factor. **Note:** This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you are satisfied with before you save the metric type.
Allow retake	Check box that allows users to modify their answers to a completed assessment, quiz, survey, or attestation. After the due date, the system removes the assessment from the user's My Assessments and Surveys page.
Active	Check box that determines whether the metric type is active. When the metric type is inactive (cleared), assessment generation is disabled and users cannot take existing assessments.
Description	Helpful information about this type. Enter a clear description of the type and its purpose.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Introduction	Introductory content to display on assessment questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions. You may need to configure the form to see this field.
End note	Content to display on the screen that appears when someone submits an assessment questionnaire. Consider adding a thank you message, followup instructions, or other applicable information. You may need to configure the form to see this field. End notes are not displayed if a **Return URL** is specified.
Send notifications	Select the check box to send notifications for this assessment, survey, or attestation. You may need to configure the form to see this field.
Condition section	
Table	[Required] Table that contains the records you want to evaluate. The system creates assessable records for records on this table that meet the conditions you specify, if any. The number of matching records appears as a link by the **Condition** field. The link dynamically updates if you change the table selection. Click the link to open the list of matching records in a new tab or window. **Note:** Additional roles are required to view the records on certain tables. If you select a table that you do not have access to, a warning message appears by the **Condition** field where the number of matching records would be. You cannot generate assessable records for tables you do not have sufficient roles for.
Enforce condition	Check box that determines what happens to assessable records when you change the selected table or conditions.
Condition	Condition builder that defines specific records to assess from the selected table. If you do not specify any conditions, the system creates assessable records for all records on the selected table. Click the refresh icon to update the adjacent record count. **Note:** If you change the table or conditions, you must click **Generate Assessable Records** to create new assessable records.
Decision Matrix section	
Filter field	[Required] Field on the selected table that can be used to filter results on decision matrixes and scorecards. For example, if the selected table is **Company** `[core_company]` and you choose **Vendor type** as the filter field: ○ When you view decision matrixes for this type, the decision matrix menu to filter plotted items lists vendor types: **Applications**, **Hardware**, **Services**, and **Software**. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ On scorecards for this type, the Averages view displays ratings by vendor type.
Filter condition	Condition builder that defines which records from the table are available as choices on the filter menu. For example, if the filter field is **Vendor type** and you create the filter condition **[Name] [does not contain] [Hardware]**, only records with vendor types of **Applications**, **Services**, and **Software** are possible choices as decision matrix filters.
Default matrix filter	Record to use as the default filter choice on decision matrixes and scorecards. The selected **Filter field** and **Filter condition** control the available record choices. To see the records, if any, click the refresh icon next to the field. Consider the case that the filter field is **Vendor type** and you select **Applications** as the default matrix filter. The filter choice on decision matrixes for this type is set to **Applications** by default. If you change the value of the **Table** or **Filter condition** field, you must click the refresh icon to view the updated **Default matrix filter** choices. If you do not, the system selects the first available choice from the updated field choices when you save the record.
Related Lists	
Metric Categories	All metric categories associated with the type.
Assessable Records	All assessable records associated with the type. This related list is hidden in the Attestation view of this form.

The **Generate Assessments** button is visible to administrators in certain cases for scheduled assessments. Do not click the button until after completing the prerequisite tasks.

4. When you are satisfied with the type settings, click **Generate Assessable Records** to save the record and create assessable records.
   You must click **Generate Assessable Records** to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. **Generate Assessable Records** is located under **Related Links**.

   Note:
   Clicking **Generate Assessable Records** can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record.

   The page redirects to the list of assessable records created.

- On-demand assessments
- Enforce a condition to delete an assessable record
- Metric types and assessable records
- Configuring the form layout

Delete a metric type

Deleting a metric type entails deleting many related records.

Before you begin

Role required: assessment_admin or admin

About this task

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

Procedure

1. Delete the records associated with the type to delete:
   - Assessment results (metric and category results)
   - Assessment instance (questions and assessment instances, in that order)
   - Assessment groups
2. Delete the type.

   A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.
3. Click **OK** to delete the type and these related records:
   - Scheduled job for assessment generation
   - Business rule for assessable record generation
   - Assessable records
   - Metric categories
   - Category users
   - Stakeholders
   - Metrics
   - Metric definitions
   - Decision matrixes

Related topics

Export an assessment

You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: assessment_admin or admin

Note:
Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

About this task

Note:
The system exports a single XML file that does not contain result data.

The XML file contains a metric type `[asmt_metric_type]` and the following records that are associated with the type:

- Assessable records `[asmt_assessable_record]`
- Metric categories `[asmt_metric_category]`
- Metrics `[asmt_metric]`
- Metric definitions `[asmt_metric_definition]`
- Category users `[asmt_m2m_category_user]`
- Stakeholders `[asmt_m2m_stakeholder]`
- Decision matrixes `[asmt_decision_matrix]`, `[asmt_m2m_xcategory_matrix]`, and `[asmt_m2m_ycategory_matrix]`

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Right-click the record and select **Export Assessment**.
3. Save the XML file.

Related topics

Import an assessment

Metric types and assessable records

Import an assessment

Share assessments between ServiceNow instances by importing a previously exported assessment.

Before you begin

Role required: admin

Note:
Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

Procedure

1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in Import data from XML.

Related topics

Export an assessment

© 2026 ServiceNow, Inc. All rights reserved.

Use update sets for surveys and assessments

Use an update set to capture changes to surveys and assessments.

Before you begin
Role required: admin or survey_admin

Procedure

Create an update set and use it to make changes on a development instance.

Note:
For more information, see System update sets.

When developing surveys and assessments, use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates [asmt_template]
- Assessment metric type [asmt_metric_type]
- Assessment Template Definitions [asmt_template_definition]
- Assessment Metric Definitions [asmt_metric_definition]: survey question answer options
- Schedule [sys_trigger]: scheduled jobs associated with the survey
- Assessment Metric Categories [asmt_metric_category]: survey categories
- Assessment Metrics [asmt_metric]: survey questions
- Assessment Category Users [asmt_m2m_category_user]: survey users
- Trigger Conditions [asmt_condition]

Create an assessment signature

A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Before you begin
Role required: assessment_admin or admin

About this task
You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called **Require authentication for user signature** allows you to require users to provide their user name and password when an assessment asks for a full name signature.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Signatures**.

   All signatures in the system appear in this list.

2. Click **New**.
3. Complete and submit the form using the fields in the table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment signature fields

Field	Description
Name	Descriptive name for this signature
Signature type	Type of signature required. The selections are **Checkbox**, **Full name**, or **Assertion only**. If **Assertion only** is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.
Assertion	Text to present to recipients that requires acknowledgement.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Viewing Assessable Records

Field	Description
Name	[Read-Only] Assessable record name based on the Select a field as the table display value of the source record. The name appears on assessment questionnaires. Source	[Read-Only] Source record the assessable record is linked to. The **Source** reflects the table name and source record display value. For example, if the **Name** field is the display value for the Company table, the assessable record for a company record named **Amazon** has the **Source** value **Company: Amazon**.
Live feed	Check box that, when selected, creates a Live Feed group for the assessable record, which appears on the scorecard. If you clear the check box after a Live Feed group has been created, the system deletes the Live Feed group and all its messages.
Type	[Read-Only] Metric type from which the assessable record was generated.
Decision matrix	Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the **View Matrix** related link on the assessable record's scorecard.
Live feed group	[Read-Only] Live feed group for this assessable record. When you select the **Live feed** check box and save the record, the system populates this field.
Related Links	
View Scorecard	Opens the scorecard for the assessable record.
Related Lists	
Category	All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click **Edit** to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.
Category users	All stakeholders who can take assessment questionnaires about this assessable record. Click **Edit** to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the **Scheduled** schedule type.

Enforce a condition to delete an assessable record

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Before you begin

Role required: assessment_admin or admin

About this task

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

Procedure

1. On the Assessment Metric Type form, select the **Enforce condition** check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click **Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.

   The system does not automatically delete assessable records, even if the **Enforce condition** check box is selected. You must click **Generate Assessable Records** with the check box selected every time you want the system to delete non-matching assessable records.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Before you begin

Role required: assessment_admin or admin

About this task

Note:
If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Procedure

Delete the assessable record:

- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.

Add a metric category and metric in the question bank for assessments

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for assessments. You can add metric categories or metrics from the question bank to an assessment, or from the assessment to a question bank.

Before you begin

Role required: admin or assessment_admin

Procedure

1. Navigate to **All** > **Assessments** > **Question Bank**.
2. Click **New**.
3. In the Metric Category form, fill in the fields.

Metric Category fields

Field	Description
Name	Name of the metric category.
Description	Description of the metric category.
Total metrics	Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Assessment Metric form, fill the fields.
   For more information on assessment metric fields, refer to .
7. Click **Submit**.

Configure metric categories or metrics for an assessment using the question bank

Reuse question categories (metric categories) and questions (metrics) from the **Question Bank** module while creating or updating an assessment.

Before you begin

Role required: admin or assessment_admin

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definitions** > **Types**.
2. Open an assessment definition.
3. **Optional:** To add metric categories to an assessment from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, click **New Category from Bank**.
   The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.

   b. Select the required categories and click **Add Selected**.
   A copy of the metric category and the corresponding metrics is created in the Metric Categories related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** To add metrics to an assessment from the question bank in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, click **New Metric from Bank**.
   The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.

   c. Select the required metrics and click **Add Selected**.
   A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. **Optional:** To add a metric category to the question bank from an assessment in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. Click **Add to Question Bank**.
   A copy of the category is created along with its metrics and metric definitions in the question bank.

6. **Optional:** To add a metric to the question bank from an assessment in Platform, perform the following steps.

   a. In the Metric Categories related list, open a metric category definition.

   b. In the Assessment Metrics related list, open the required metric definition.

   c. Click **Add to Question Bank**.
   The Add to Question Bank dialog box is displayed.

   d. In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
   A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

Copy an assessment

Create a copy of an assessment with at least one category to reduce the effort of creating another assessment with similar data.

Before you begin

Role required: assessment_admin or admin

About this task

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Select an assessment metric type.
3. In the title bar, click **Copy**, or click the menu icon, and select **Copy**.

Create a metric template

Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

Before you begin

Role required: assessment_admin or admin

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Templates**.
2. Click **New**.
3. Fill in the **Name** field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select **Allow Image**.
5. Click **Submit**.
6. Under the **Assessment Template Definitions** related list, click **New**.
   Create a template definition for each answer option you want to appear on an assessment question.
7. Fill in the following fields:
   - **Display:** Enter the text to appear as the answer option.
   - **Value:** Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - **Selected Image**: Click to add the image to use for selected state.
   - **Unselected Image**: Click to add the image to use for unselected state.

   When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

   Tip:
   To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click **Update**.

Create an assessment metric for a category

Create an assessment metric definition

Metric templates

Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric templates are available for metrics that have **Template** as the Data type. The following metric templates are available by default.

Default metric templates

Name	Assessment template definition
Likert 5	Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree
Satisfaction	Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied
Frequency	Never, Seldom, Sometimes, Most of the time, All of the time
Amount	None, Few or little, Average amount, Many, Quite a lot
Size	Very Small, Small, Average, Large, Very Large
Quality	Very Poor, Poor, Average, Good, Very Good
Complexity	Very Complex, Complex, Moderate, Simple, Very Simple

Create an assessment metric definition

Update a metric minimum and maximum value to match a template

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

Before you begin

Role required: assessment_admin or admin

About this task

The system sets the **Min** and **Max** fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Metrics**.
2. Configure the Configure the list layout to show the **Min** and **Max** columns.
3. Run the following list filter condition: `[Template] [is] [<select the template you updated>]`
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.

   If the values do not match, edit the Min and Max directly from the list.

   Note:
   When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Category users and stakeholders

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed.

A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

Note:
Category users and stakeholders are used only for scheduled assessments.

Category users

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted metrics.

Stakeholders

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- Configure the system to create stakeholders automatically.
- Associate multiple category users to multiple assessable records.
- Associate multiple category users to one assessable record.
- Associate one category user to one assessable record.

Note:
Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

Delete a stakeholder for multiple assessable records

Delete a stakeholder for one assessable record

Create a category user

Create category users by associating users in the system to metric categories.

Before you begin
Role required: assessment_admin or admin

About this task
When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor's discount practices.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definitions** > **Categories**.
2. Open a category record.

   Note:
   The category must be associated to a metric type that has the **Schedule type** set to **Scheduled**.

3. In the **Users** related list, click **Edit**.
4. Select the appropriate users for this category.

Create stakeholders automatically

You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the **Create stakeholders** check box on the Metric Category form.

Before you begin
Role required: assessment_admin or admin

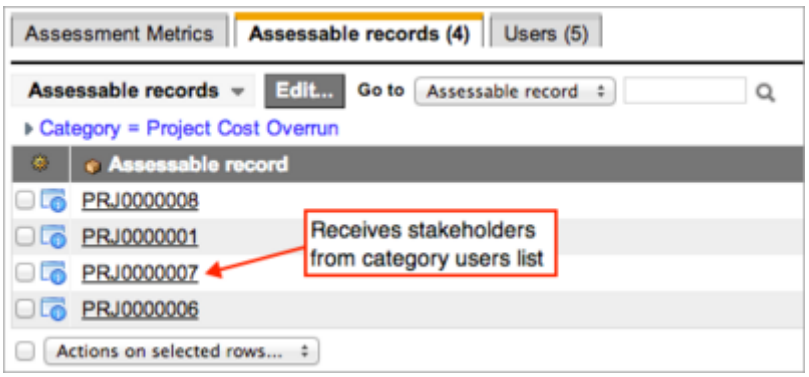
About this task
If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use the **Create stakeholders** check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Categories**.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the **Create stakeholders** check box.
5. Click **Update**.
   All the category users are associated to all the assessable records as stakeholders.
6. In the **Assessable Records** related list, click **Edit**.
7. Using the slushbucket, associate an assessable record to the category.



8. Click **Save**.
   The system makes all category users stakeholders for the new assessable record.

Associate multiple category users to multiple assessable records

The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.

Before you begin

Role required: assessment_admin or admin

About this task

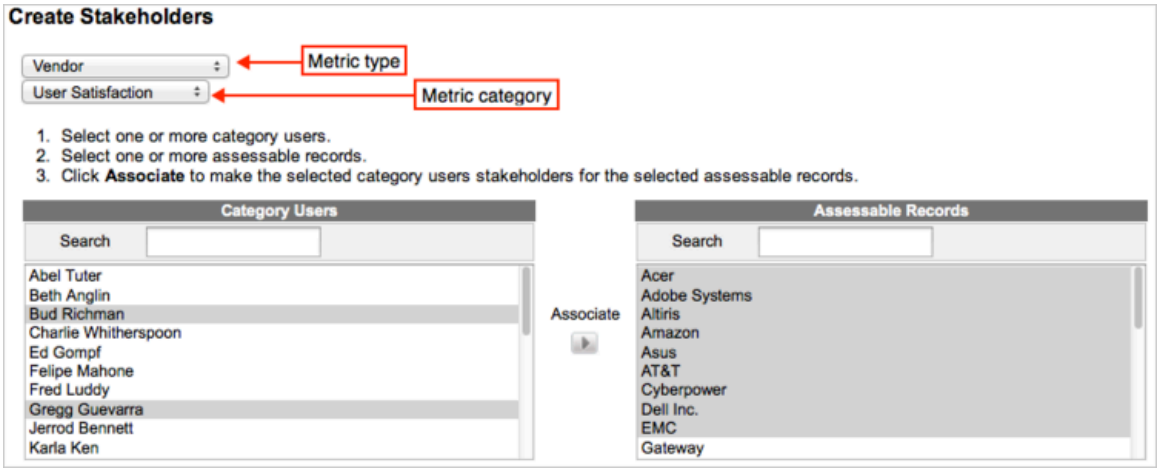
You can select category users from one category at a time.

Note:
You cannot edit or delete stakeholders using the list helper.

Procedure

1. Navigate to **All** > **Assessments** > **Advanced** > **Create Stakeholders**.
   The stakeholder list helper appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select a metric type from the list of available types.

Note:
Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

Note:
Only categories within the selected metric type are available.

The system populates the **Category User** and **Assessable Records** lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the **Category Users** list.
5. Select one or more assessable records from the **Assessable Records** list.
6. Click the **Associate** arrow between the lists to complete the association.
A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Associate one category user to one assessable record

Create a single stakeholder using the list in the Assessment Stakeholders module.

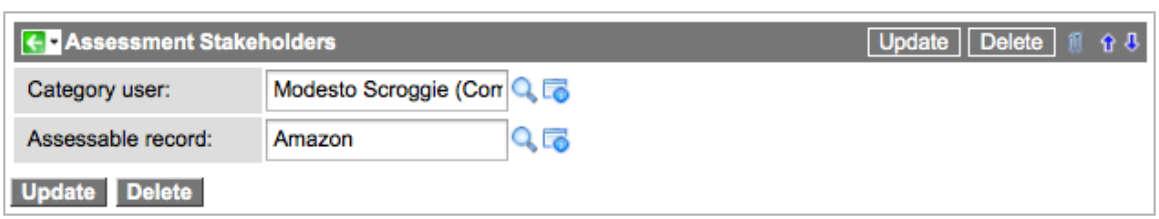
Before you begin
Role required: assessment_admin or admin

About this task
Associate any category user to any assessable record.

Procedure

1. Navigate to **All** > **Assessments** > **Advanced** > **Assessment Stakeholders**.
2. Click **New**.
3. On the Assessment Stakeholders form, fill in these fields:
   - **Category user**: Select a category user.
   - **Assessable record**: Select an assessable record.
4. Click **Submit**.

Result
The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.



Note:
Do not create stakeholders from category users and assessable records of different metric types.

Associate multiple category users to one assessable record

Create many stakeholders for a single assessable record from the Assessable Record form.

Before you begin

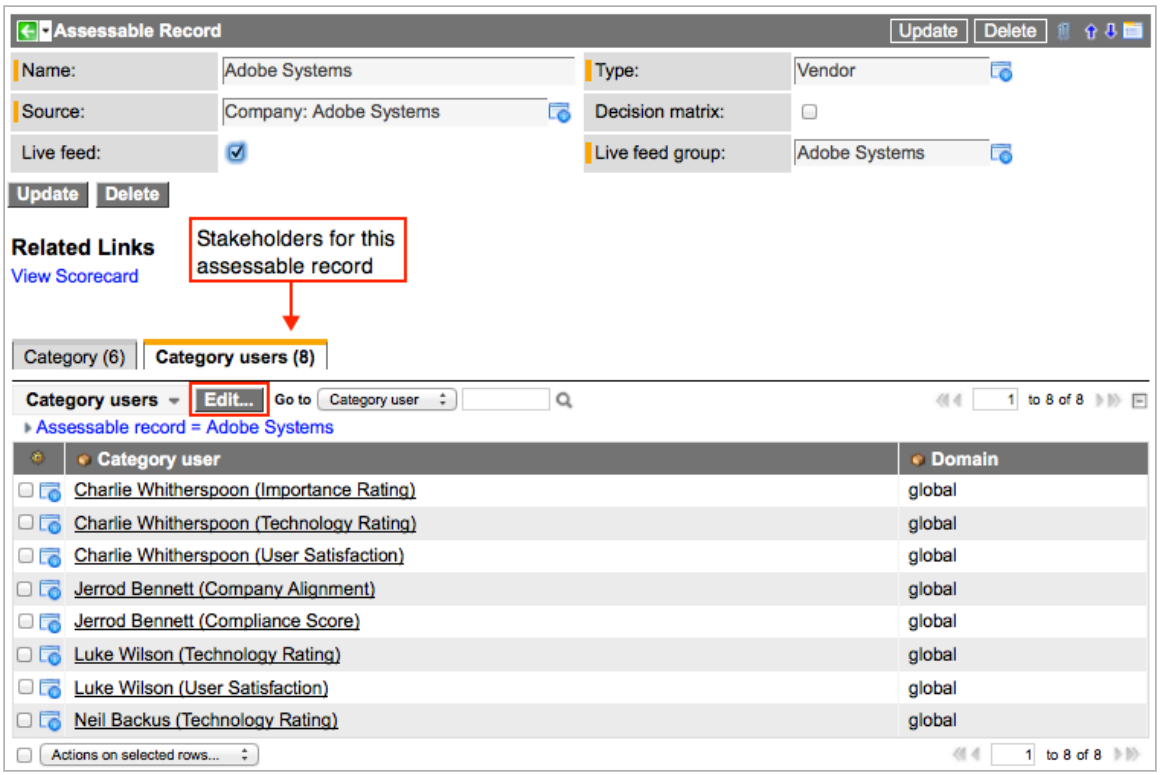
Role required: assessment_admin or admin

About this task

You can also edit or delete stakeholders from the form.

Procedure

1. Navigate to **All** > **Assessments** > **Assessable Records**.
2. Open a record from the list.
3. In the **Category users** related list, click **Edit**.
   These category users are the stakeholders for this assessable record.



4. Add category users to create stakeholders or remove category users to delete stakeholders.
   The system shows only category users for categories associated to the assessable record. For example, if an assessable record is associated only to the Compliance Score and Support Rating categories, User Satisfaction category users will not be listed.

On-demand assessments

On-demand assessments can be generated for metric types with the *Schedule type* field set to *On demand*.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or multiple assessable records.

Related topics

- Assessment generation

Clean up assessment data

Generate an on-demand assessment

Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Before you begin

Role required: assessment_admin or admin

About this task

Select the assessable records to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured stakeholders are not used for on-demand assessments.

Procedure

1. Create a metric type and set the **Schedule type** to **On demand** to allow for testing of your assessment configuration.
2. Generate the assessable records for the metric type you created.
3. Create the metric categories required to evaluate the assessable records selected.
4. Create one or more assessment questions, or metrics, for each category.
5. Publish the assessment.
6. Perform an on-demand assessment to test your categories and metrics.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Related topics

Generate an on-demand assessment for one assessable record

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Before you begin

Role required: assessment_admin or admin

Publish the assessment.

Procedure

1. Navigate to **All** > **Assessments** > **Assessable Records**.
2. Open an assessable record associated to a metric type that has the **On demand** schedule type.
3. To assign the assessment to users configured in the **Assessors** tab of the assessment, and other specified users, perform these steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the Assessment Metric Type form, click **Assign Assessment**.

b. Select a user from the Recent Assessors list or select a different user.

c. Click **OK**.

4. To assign the assessment to users configured in the **Assessors** tab of the assessment, click **Assign to Assessors**.

Result

The system generates an assessment instance assigned to the selected users.

Generate an on-demand assessment for multiple assessable records

When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Before you begin

Role required: assessment_admin or admin
Publish the assessment.

About this task

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Open a metric type that has the **On demand** schedule type.
3. To assign the assessment to users configured in the **Assessors** tab of the assessment, and other specified users, perform these steps.

   a. On the Assessment Metric Type form, click **Assign Assessment**.

   b. Select a user from the Recent Assessors list or select a different user.

   c. Click **OK**.

4. To assign the assessment to users configured in the **Assessors** tab of the assessment, click **Assign to Assessors**.

Result

The system generates an assessment instance assigned to the selected users.

Generate an assessment with the on-demand API

The Assign Assessment buttons call an API to generate on-demand assessments.

Before you begin

Role required: assessment_admin or admin

About this task

Procedure

1. To generate an assessment, call the AssessmentCreation API from any script in the system, such as a business rule or client script.
2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.

Scheduled assessments

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**.

The system generates a unique scheduled job for each metric type with the **Schedule type** field set to **Scheduled**. Each scheduled job generates assessment components for the related metric type. By default, the scheduled job runs when an administrator executes it manually, but administrators can set a schedule to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Stakeholder associated to one of the assessable records
- Metric

Related topics

Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Before you begin

Role required: assessment_admin or admin

Procedure

1. Open the metric type you created for the on-demand assessment and set the **Schedule type** to **Scheduled**.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually.

   Note:
   This procedure must be done by a system administrator.

6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Related topics

Assessments

Schedule types

You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Related topics

Assessments

Set an assessment generation schedule

You can set assessment generation schedules. You must set a schedule for each metric type individually.

Before you begin

Role required: assessment_admin or admin

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Open the appropriate metric type record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the reference icon next to the **Scheduled job** field to open the Schedule Item record.
4. Locate the **Trigger type** field and set a recurring schedule for the scheduled job.

   For example, if you want to generate assessment components each month, select the **Interval** or **Repeat** trigger type and specify a **Repeat** value of 30 days. Alternatively, select **Day in Month** and specify a Run time and Run day of month.

   The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type

Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Before you begin
Role required: assessment_admin or admin

About this task
The **State** field on the Assessment Metric Type form indicates whether the type is published. The default state is **Draft**, which disables the system from generating assessments.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Open a metric type record, and click **Publish**.

   The **Publish** button is available only if the state is **Draft** and there is at least one metric associated with the type.

Note:
A metric type cannot be moved back to the **Draft** state after it has been published.

Generate a scheduled assessment manually

Administrators can generate scheduled assessments manually.

Before you begin
Role required: assessment_admin or admin

About this task
Use this option, for example, if you have set a schedule but want to generate assessments before the next scheduled run date.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Open the appropriate metric type record.
3. Click **Generate Assessments** to trigger the scheduled job immediately.

Note:
Be careful to click **Generate Assessments**, not **Generate Assessable Records**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate a vendor type assessment manually

The Vendor Performance feature provides a direct method of generating assessments for the Vendor metric type.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Vendor Performance** > **Admin** > **Generate Assessments**.
2. Click **Generate Assessments** to execute the scheduled job for the **Vendor** type.

Clean up assessment data

The assessment process generates a considerable amount of data, some of which is not useful after a short time.

Before you begin
Role required: assessment_admin or admin

About this task
The assessment process generates a considerable amount of data, some of which is not useful after a short time. Assessments include a scheduled job called *`Remove Old Assessment Data`* that is available to administrators only. The scheduled job removes these items if they are more than a year old:

- Assessment instance questions
- Assessment instances
- Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs**.
2. Open the **Remove Old Assessment Data** record.
3. On the Schedule Item form, set the **Trigger type** field to run the scheduled job on a recurring schedule.

   It is recommended to set the scheduled job to run on a weekly or monthly basis.
4. **Optional:** Click **Execute Now** to run the scheduled job.

Assessment instances

An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in Scheduled assessments and On-demand assessments, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

Example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recall that there can be multiple stakeholder records associated with one user record. Minh Leclare is a stakeholder for these items related to the **Vendor** metric type:

Assessable records

Assessable record	Category
Amazon	User Satisfaction
Acme	User Satisfaction
Acme	Reliability
Cisco	Reliability

When the system generates a scheduled assessment, Minh is assigned one assessment instance to evaluate Amazon, Acme, and Cisco by answering questions from the categories as a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh's questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment for a specific assessable record, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment for a metric type, the assessment instance contains questions about all that metric type's assessable records and their associated categories.

View an assessment instance

An assessment instance represents one occurrence of a questionnaire assigned to one user.

Before you begin

Role required: survey_admin, assessment_admin, or admin

Procedure

1. Navigate to **All** > **Assessments** > **Assessment Instances**.
   The following sub-modules are available based on the state of the instances:
   - **Ready to take**: Displays assessment instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays assessment instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays assessment instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays assessment instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays assessment instances in all states. By default, these instances are sorted in ascending order by the **Number** field.
2. Open the record from the required sub-module by clicking an assessment instance number.

   By default, the fields in the following table are displayed in the Assessment Instance form for all sub-modules other than **Completed**.

Note:
When you open an instance in the **Completed** sub-module, you are redirected to the User's Response page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Number	Auto-generated record number.
Metric type	Metric type of this assessment.
Assessment group	Assessment group to which this assessment belongs.
Due date	Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type **Assessment duration** field. The system generates email notifications related to the due date. **Note:** By default, the system runs the *Cancel Expired Assessments* script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.
State	State of the assessment.
Domain	Domain associated with the instance.
Assigned to	User this assessment is assigned to. This field becomes read-only when the state is **In progress**, **Complete**, or **Canceled**.
Signature	Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.
Signature result	Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User [sys_user] table or **checked**, indicating that the recipient acknowledged reading the assertion by selecting a check box.

3. Click **Take assessment** to open the questionnaire.
   For more information, see Take an assessment.

   This button is available if all the following conditions are true for the assessment instance:

   - It is **Assigned to** you.
   - The **State** is **Ready to take** or **In progress**.
   - The associated metric type is **Active**.

Enable manager notifications

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

Before you begin

Role required: assessment_admin or admin

About this task

This notification sends emails to assessors' managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

Procedure

1. Navigate to **All** > **Assessments** > **Metric Definition** > **Types**.
2. Open a metric type.
3. Select the **Notify if overdue** check box.

   To disable manager notifications, clear the check box.

4. Save the record.

> **Note:**
> The assessor's user record must have a manager specified in the **Manager** field to use this notification. You might need to configure the form to use this field.

Assessment notifications

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Notify assessment user: This messages notifies you of an assigned an assessment and includes the type, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

  Note:
  If a user has a pending assessment, then the system will not generate another instance of the same assessment.

- Remind assessment user: This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.
- Notify manager assessment is overdue: If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

Note:
By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the **Work in progress** or **Ready to take** states.

View a metric result

Metric results contain values that represent an evaluated record's performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Before you begin

Role required: assessment_admin or admin

About this task

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user's responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

Procedure

1. Navigate to **All** > **Assessments** > **Results** > **Metric Results**.
2. Open the metric result record you want to view.
   All fields on the form except **Updated** and **String value** are read-only.

Metric Result form fields

Field	Description
Assessment group	Assessment group to which the metric result is associated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Metric	Name of the metric to which these metric result values apply.
Data type	Data type of the metric.
Method	method of the metric.
Updated	Date and time the metric result was last updated.
Source	Source record of the assessable record evaluated.
Assigned to	User who completed the assessment questionnaire. This field is blank when the method is **Script**.
Instance	Assessment instance completed by the **Assigned to** user. This field is blank when the method is **Script**.
Actual value	Unscaled value from a user response or script, depending on the method: ○ **Assessment**: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type: ▪ **Checkbox**: The actual value is 0 if the check box is cleared and 1 if it is selected. ▪ **Choice** or **Likert Scale**: The actual value is equal to the Value of the metric definition associated with the chosen answer option. ▪ **Date**, **Date/Time,** or **String**: The actual value is -1 to indicate that these data types do not contribute to category result calculations. ▪ **Template**: The actual value is equal to the **Value** of the template definition associated with the chosen answer option. ▪ **Yes/No**: The actual value is 0 if the response is **No** and 1 if it is **Yes**. ○ **Script**: Value the script placed in the *actual_result* variable. This field is hidden and left blank when the data type is **Duration**.
Duration value	Specific kind of actual value that is only applicable if the data type is **Duration**. The duration value is the value obtained by the script query from the *actual_result* parameter, such as the average duration of outages for a vendor.

Scaled value	Appropriate value from the *scaled_result* variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where *actual_result* is the number of CIs, and *scaled_result* is a representation of the quantity of CIs:
	`if (actual_result < 1)`
	`  scaled_result = 0;`
	`else if (actual_result < 1000)`
	`  scaled_result = 1;`
	`else if (actual_result < 10000)`
	`  scaled_result = 2;`
	`else if (actual_result < 25000)`
	`  scaled_result = 3;`
	`else if (actual_result < 100000)`
	`  scaled_result = 4;`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	``
	else
	 scaled_result = 5;
	``
	If the script detects 315 CIs for the vendor, the *Actual value* is 315 and the *Scaled value* is 1 for this metric result.
	Note:
	Although this field is visible only when the method is **Script**, the system populates the field with the *Actual value* when the method is **Assessment**, as the scaled value is used in the **Normalized value** calculation.

Normalized value	Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric (like the survey responses or the input value—the actual value given by the user). See the example for **Normalized value** in View an assessment category result.
String value	Value that displays the response as it appears on a questionnaire. In some cases this is the same as the *Actual value*, such as when the metric data type is **Percentage**. The string value is **N/A** for unanswered questions of certain data types. For the **Attachment** data type, the names of the attached files are displayed as comma-separated values.

Assessment results

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.

The system calculates metric results first, normalizes the scores, and then calculates category results. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

Note:
Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in scorecards and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

Excluded Responses

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the **Not Applicable** answer option on a questionnaire.
- The user does not answer the question and the data type is not *Checkbox*.
- The question data type is one of the following: *Date*, *Date/Time*, or *String*.
- The metric result **Actual value**, **Scaled value**, and **Normalized value** fields are set to *-1*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Attachments

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the **String value** field on the Metric Result form.

Note:
You cannot add or remove attachments from a metric result.

Assessment Overview dashboard

The Assessment Overview dashboard displays various assessment reports, such as Assessable Records by Type, Total Metrics by Metric Type, and Assessments by State.

The dashboard might not show all these reports. If you want to view a particular report, you can add that report to the dashboard.

Assessment Overview dashboard reports

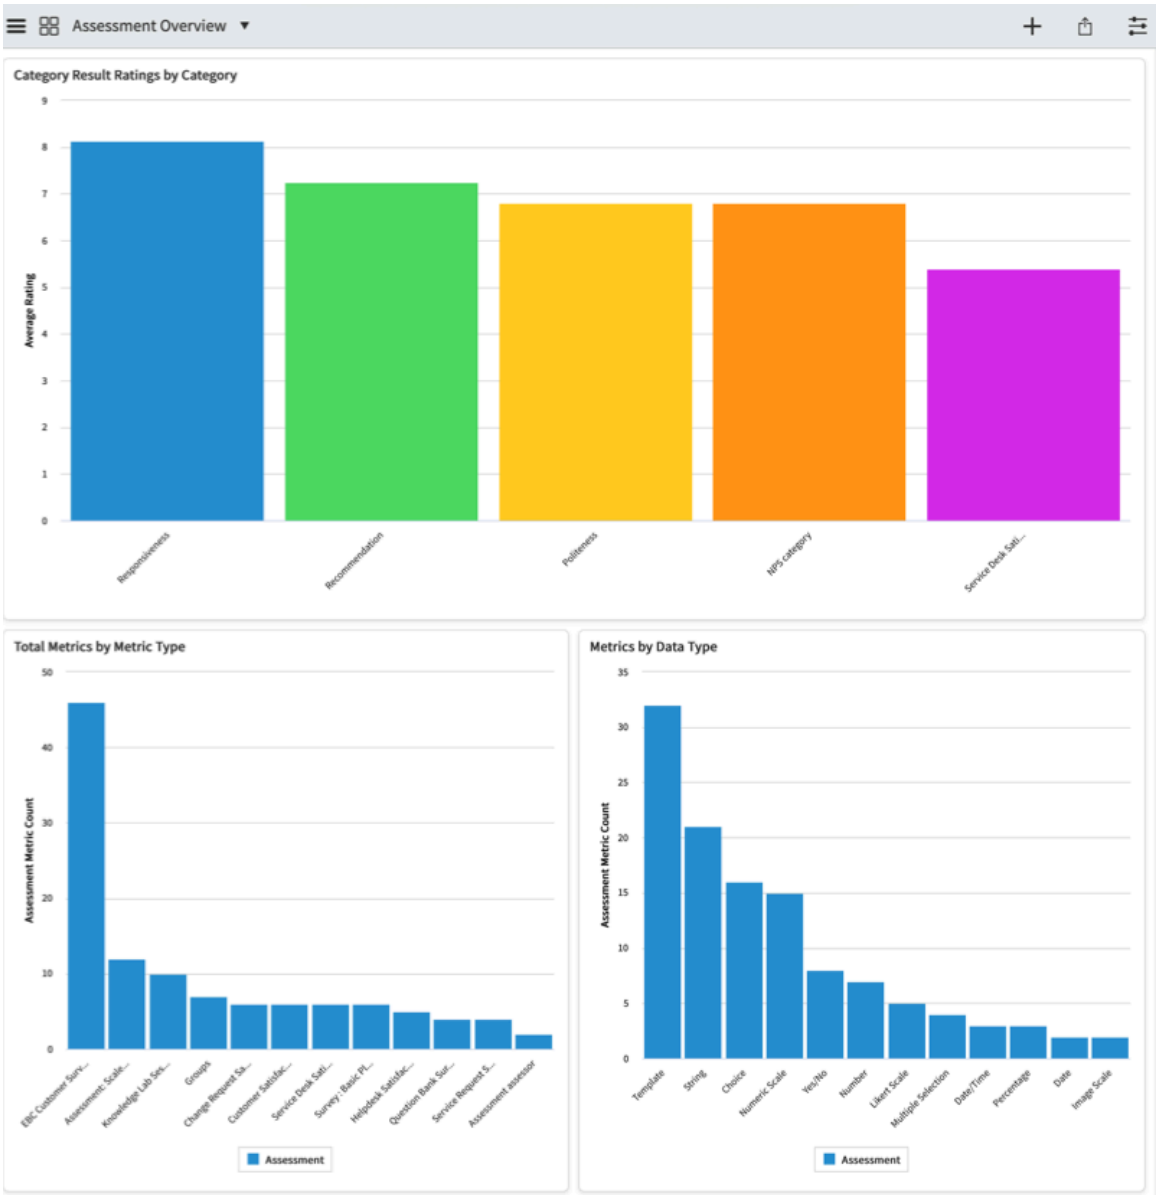
Assessment Overview dashboard



View assessment reports

Use the Assessment Overview dashboard to view your assessment reports.

Before you begin

Role required: assessment_admin or admin

About this task

The dashboard displays reports arranged in widgets. You can add new widgets to the dashboard.

Procedure

1. Navigate to **All** > **Assessments** > **Overview**.
2. Click the elements within the reports to view more information.

   For more information about working with dashboards, see Dashboards.

Assessment results calculation

For every assessment group, there are assessment results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

View a bubble chart for assessments

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Before you begin
Role required: assessment_admin or admin

Procedure

1. Navigate to **All** > **Assessments** > **Admin** > **Bubble Charts**.
2. Click a **Name** to open the bubble chart record.
3. Under **Related Links**, click **View Bubble Chart**.

> **Note:**
> Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See Project Portfolio Suite for more information.

Bubble charts for assessments

A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

Create a bubble chart

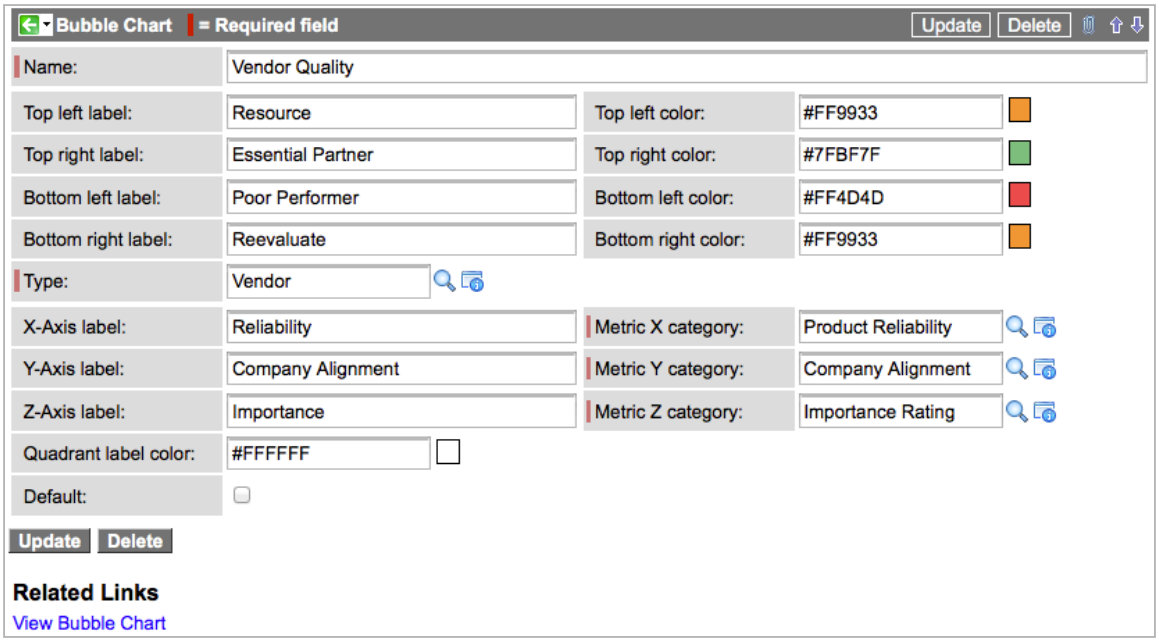
Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to **Assessments** > **Admin** > **Bubble Charts** and create a record (see table for field descriptions).

> **Note:**
> For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bubble Chart form



Bubble Chart form fields

Field	Description
Name	Descriptive name for the bubble chart. **Bubble Chart** is appended to the name when you view the bubble chart.
• Top left label • Top right label • Bottom left label • Bottom right label	Label text for the top left, top right, bottom left, and bottom right quadrants, respectively. Choose labels that help interpret results. For example, a bubble chart that displays vendor assessment results might have the following quadrant labels, where vendors in the top right quadrant have the best scores: • **Top left label**: Resource • **Top right label**: Essential Partner • **Bottom left label**: Poor Performer • **Bottom right label**: Reevaluate
• Top left color • Top right color • Bottom left color • Bottom right color	Border colors for the top left, top right, bottom left, and bottom right quadrants, respectively. Bubbles are the color of the quadrant they are in.
Type	Metric type associated with this bubble chart. Only results for assessable records of the selected metric type are plotted on the bubble chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bubble Chart form fields (continued)

Field	Description
• X-Axis label • Y-Axis label • Z-Axis label	Label text for the X-, Y-, and Z-axis categories of the bubble chart. These labels appear along the X- and Y-axes, if applicable, and in bubble score summary windows. The metric category name is usually a good label. If these fields are left empty, the bubble chart automatically displays the selected category names as the labels.
• Metric X category • Metric Y category • Metric Z category	Metric category each axis represents. Results for the Z-axis category determine the size of each bubble. The Z-axis should generally represent the most important category out of the three.
Quadrant label color	Color of the label text for the quadrant borders.
Default	Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.

Bubble chart components

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

The bubble chart page has these components:

- **Bubble Chart**
  - **X- and Y-axes**: Each axis represents a metric category.
  - **Bubbles**: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.
- **Source record list**: List of all records defined by the **Table** and **Condition** fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.

Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents.

The summary displays the assessable record's average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

Bubble chart score summary

View an assessment scorecard

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Before you begin
Role required: assessment_admin or admin

About this task
Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a **Related Link** on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors.

See Vendor Performance in . Project Portfolio Suite.

Procedure
1. Navigate to **All** > **Assessments** > **Assessable Records**.
2. Open a record.
3. Under **Related Links**, click **View Scorecard**.

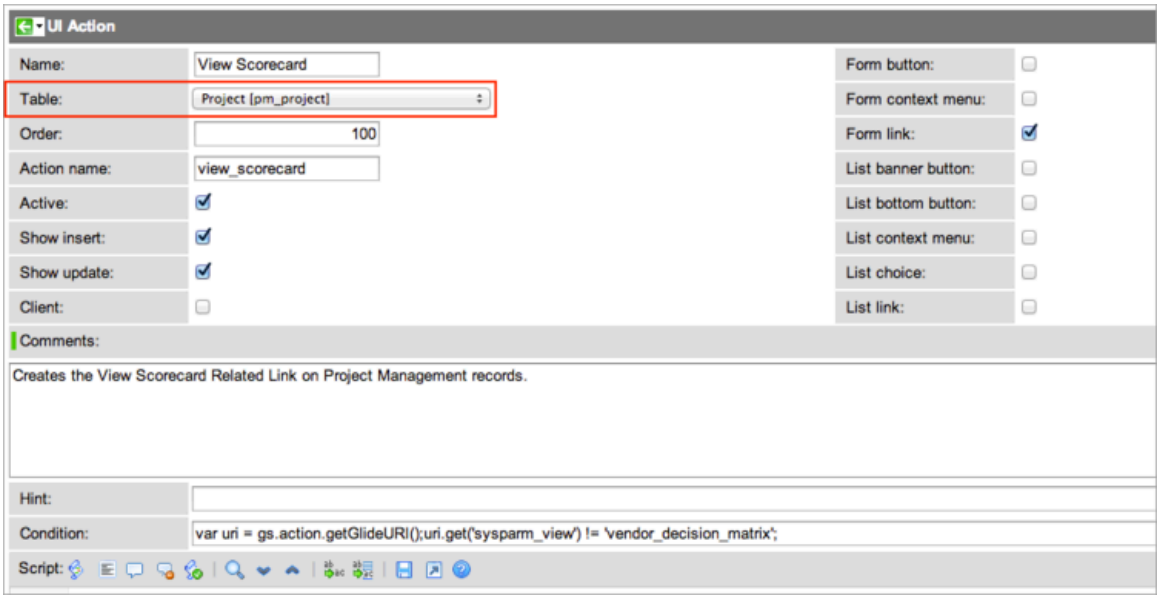
Create a link to a scorecard

Users with the admin role can create UI actions that allow users to view scorecards from tables.

Before you begin
Role required: assessment_admin or admin

Procedure
1. Generate assessable records you want to evaluate.
   For example, you might create a metric type called **Project** to assess project management records.
2. Navigate to **System Definition** > **UI Actions**.
3. Open the View Scorecard record.
4. Right-click the header bar and select **Insert and Stay** from the context menu to create a duplicate record.
5. Change the **Table** name to the table on which you want the UI action to appear.
   For example, you might select Project [pm_project].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Do not edit the **Action name** field or the **Condition** script.
7. Save the record.
8. Navigate to the table on which you created the UI action and open an assessable record.
   a. In this example, navigate to **Project** > **Projects** > **All**.
   b. Open any record in the list.
   c. Click **View Scorecard** under **Related Links** to open the scorecard for that assessable record. The scorecard appears with the title in the form of **<table display name> Scorecard**. For example, a scorecard for an assessable record in the Project `[pm_project]` table is named **Project Scorecard**.

   Note:
   Content does not appear in the scorecard unless the associated assessable record has assessment results or related Live Feed conversations.

9. Insert a new **View Scorecard** UI action record for each table where you want the related link to appear.

Assessment scorecard averages

The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).

Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the **Filter field** field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red**: Ratings are below average in this category. The **Diff** value displays a negative number.
- **Green**: Ratings are above average in this category. The **Diff** value displays a positive number.
- **White**: Ratings are average in this category. The **Diff** value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

© 2026 ServiceNow, Inc. All rights reserved.

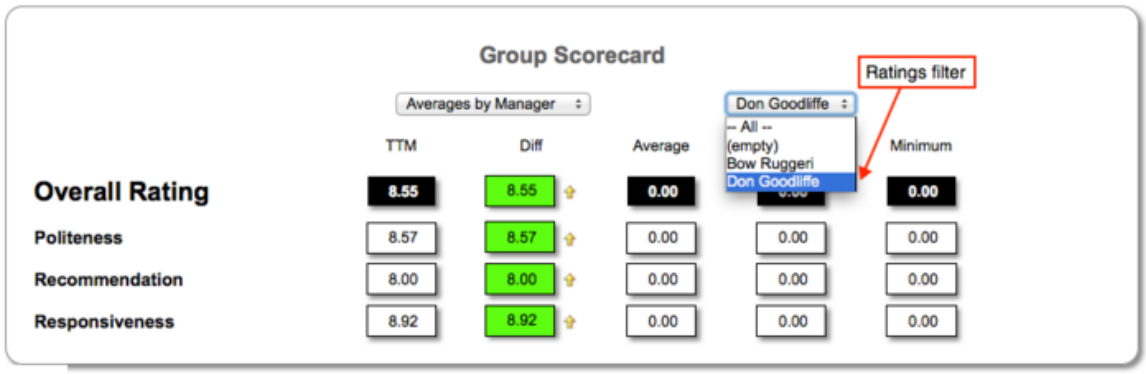
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Group scorecard with ratings filter



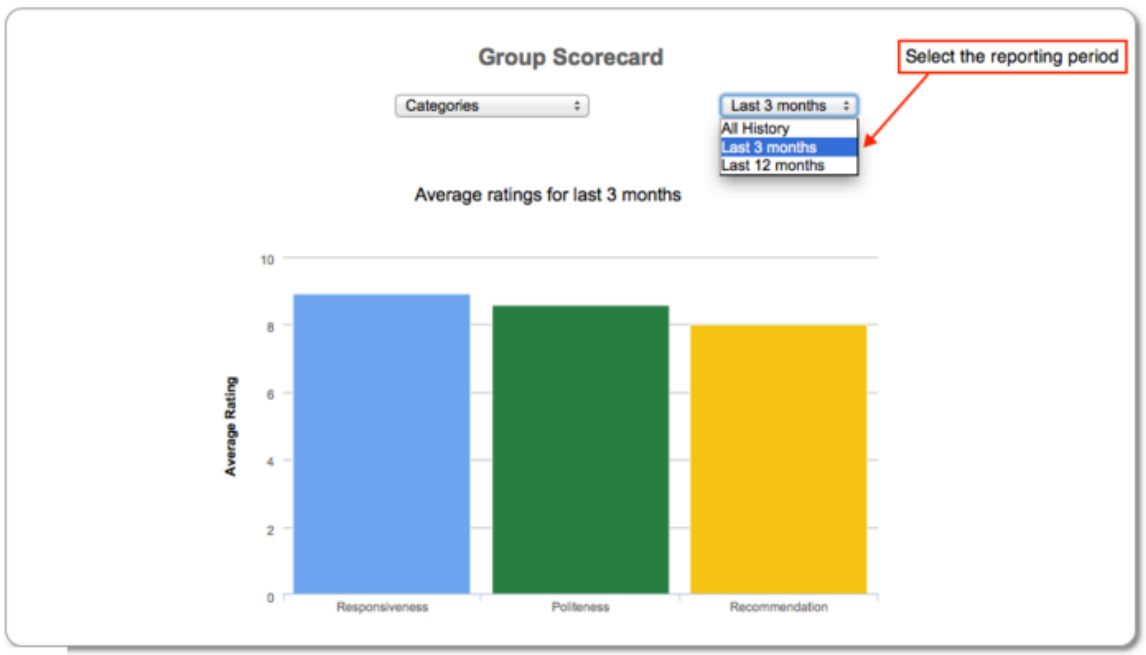
Assessment scorecard categories

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

- All History
- Last 3 Months
- Last 12 Months

Scorecard categories



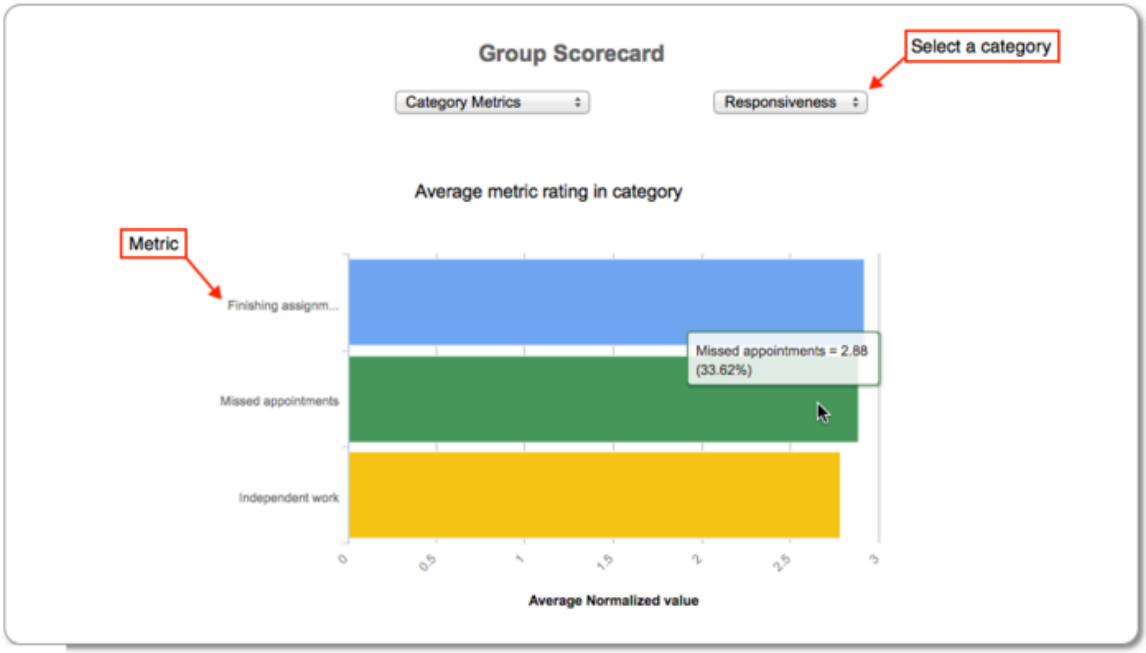
Assessment scorecard category metrics

The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.

Select a metric category from the choice list to display the chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scorecard category metrics



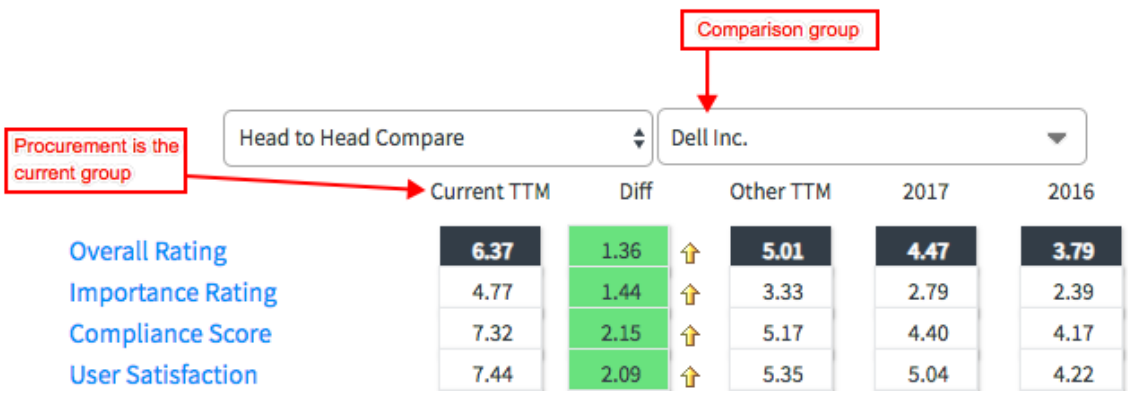
Assessment scorecard head-to-head compare view

The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

Head to head compare

The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.

Scorecard head to head compare



Overall Rating

The Overall Rating is calculated as:

```
(sum of normalized values in category result) / (number of
 assessment groups)
```

In the following example, the calculation is

```
(2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7) / 2 = 8.15
```

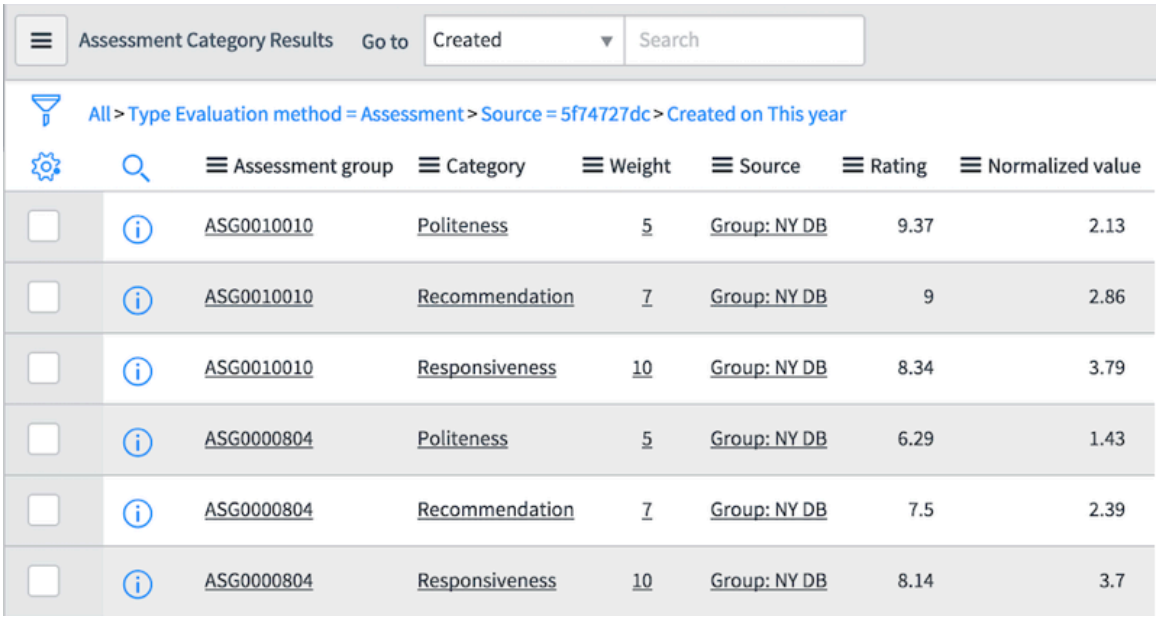
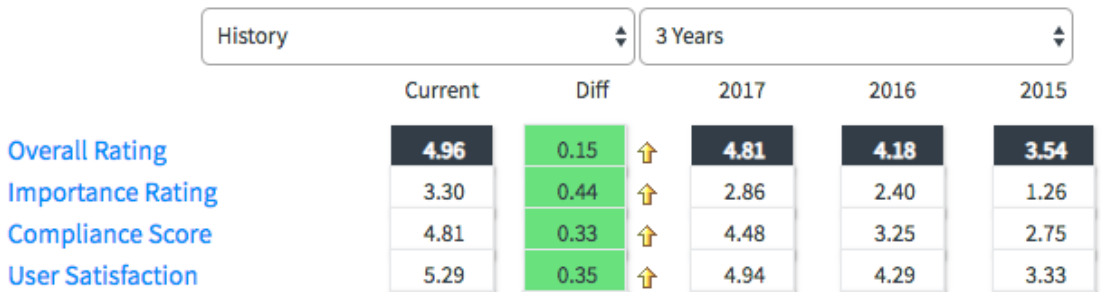
Normalized values



Assessment group	Category	Weight	Source	Rating	Normalized value
ASG0010010	Politeness	5	Group: NY DB	9.37	2.13
ASG0010010	Recommendation	7	Group: NY DB	9	2.86
ASG0010010	Responsiveness	10	Group: NY DB	8.34	3.79
ASG0000804	Politeness	5	Group: NY DB	6.29	1.43
ASG0000804	Recommendation	7	Group: NY DB	7.5	2.39
ASG0000804	Responsiveness	10	Group: NY DB	8.14	3.7

Overall Rating on the group scorecard



Assessment scorecard history

The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current assessment against the previous assessment.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.

Scorecard history - 3 years

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **4 Quarters**: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the **3rd** quarter of 2013, then the previous quarters appear as **2nd** [2013], **1st** [2013], **4th** [2012], and **3rd** [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Scorecard history - 4 quarters

Live feed view of assessable records

The Live Feed view displays Live Feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.

To configure a Live Feed view, an assessment administrator selects the **Live feed** check box on the Assessable Record form. Live feed is available on the scorecard even if there are no category results for the other views.

The Live Feed view provides these viewing options:

- **My Feed**: Displays the user's My Feed preferences.
- **Company**: Displays the user's company feed.
- **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group's conversations.
- **Tags**: Displays all the tags found in Live Feed comments. Click a tag to display the conversations containing that tag.

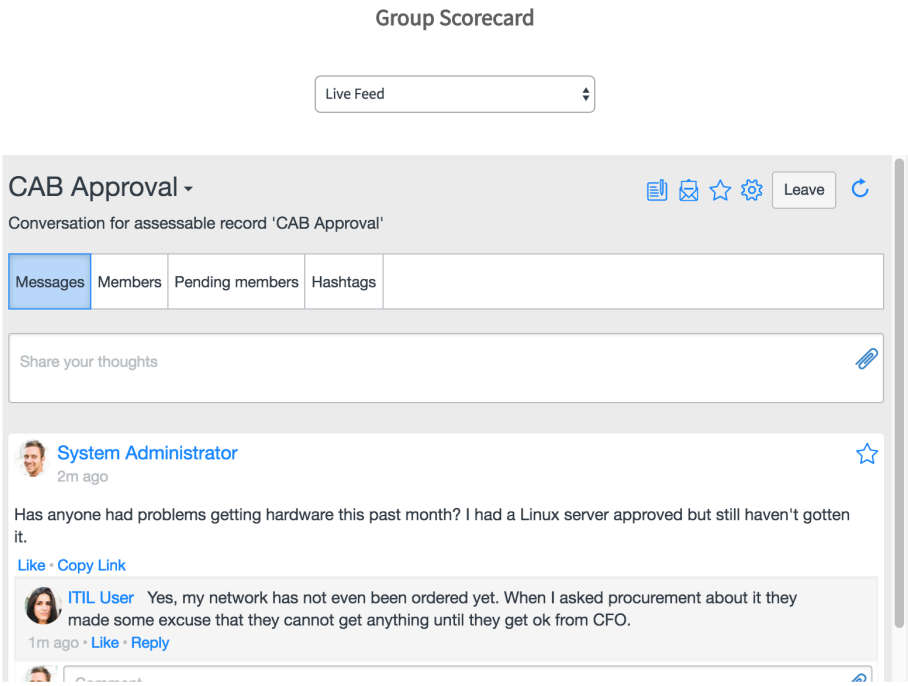
Live Feed group scorecard



Assessment scorecard ratings

The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

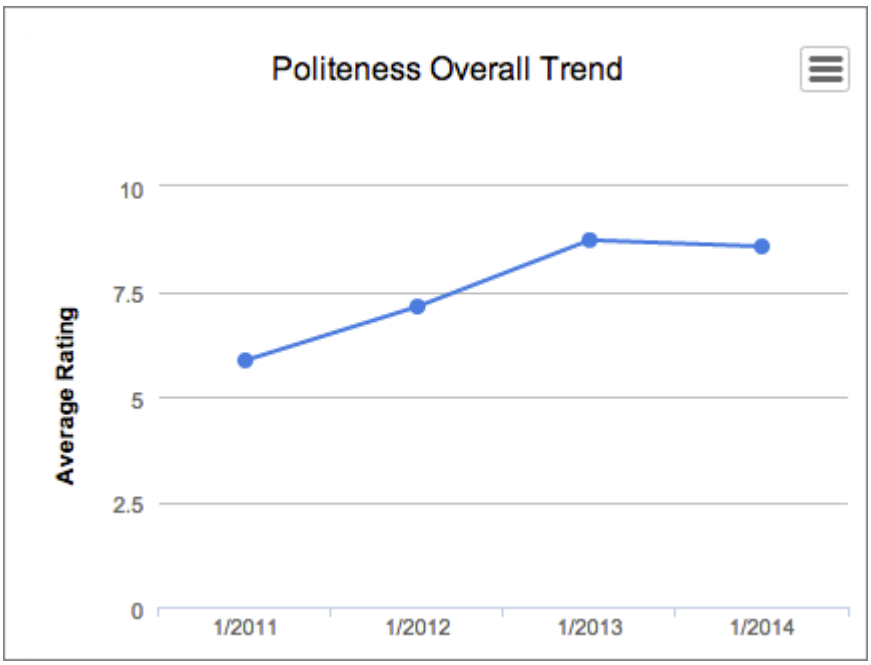
Vendor scorecard trend chart



Create a decision matrix

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Before you begin

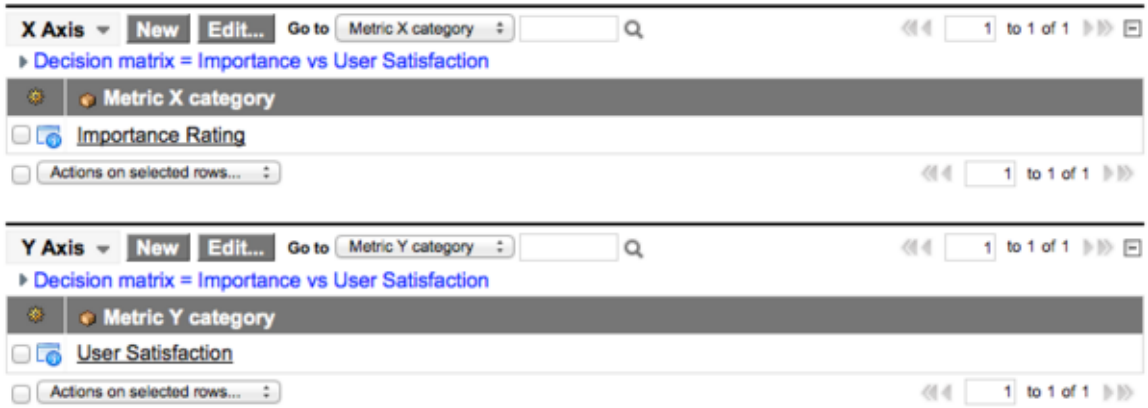
Role required: assessment_admin or admin

Procedure

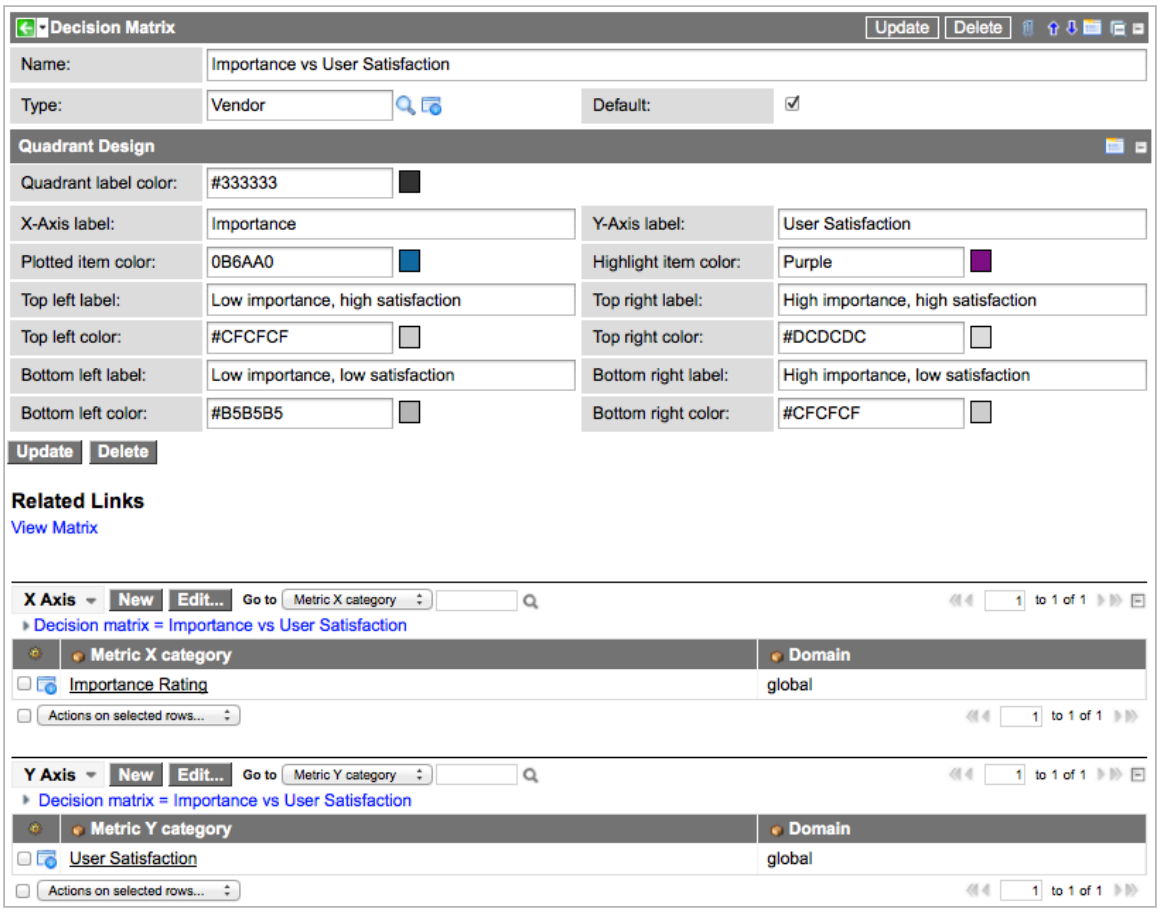
1. Navigate to **All** > **Assessments** > **Admin** > **Decision Matrixes**.
2. Click **New**.
3. Select the metric **Type** to plot results for.
4. Right-click the form header and select **Save**.
   The X Axis and Y Axis related lists appear.
5. Define which metric categories the axes represent.
   Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly. The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Decision matrix axes



6. Fill in the remaining fields on the Decision Matrix form and save the record.



Note:
For color fields, either HTML color names or hexidecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.

Decision Matrix form

Field	Description
Name	Name of the decision matrix, which appears as the title on the decision matrix page. It is recommended to include the axis categories in the name. For example,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	if you selected **Importance Rating** as the X-axis and **User Satisfaction** as the Y-axis, you might name the matrix **Importance vs. User Satisfaction**.
Type	Metric type associated with this decision matrix. Only results for assessable records of the selected metric type are plotted on the decision matrix.
Default	Determines whether or not this is the default decision matrix. The default decision matrix opens when you click **View Matrix** on a scorecard. Select the check box to set the matrix as the default decision matrix. The system prevents you from creating more than one default decision matrix per metric type. If there is already a default decision matrix for the type and you try to save a different matrix with the check box selected, an error message appears. The maximum values for the default decision matrix are controlled by the **Maximum number of items to show for a decision matrix field filter** property *(com.snc.assessment.decision_matrix_filter_max_entries)*, which has a default value of 1000.
Quadrant Design Section	
Quadrant label color	Color of the label text for the quadrants. Each quadrant label displays in the center of the quadrant. You can enter an HTML color name or hex value for this and the other color fields.
X-Axis label	Label text for the X-axis of the decision matrix. It is recommended to include the metric category name in the label text. For example, for an X-axis category of **Importance Rating**, the X-axis label is **Importance**.
Plotted item color	Color used to display plotted items.
Top left label	Label text for the top left quadrant. For an X-axis labeled **Importance** and Y-axis labeled **Support**, you might label the top left quadrant **Low importance, high support**.
Top left color	Fill color for the top left quadrant.
Bottom left label	Label text for the bottom left quadrant.
Bottom left color	Fill color for the bottom left quadrant.
Bottom left label	Label text for the bottom left quadrant.
Bottom left color	Fill color for the bottom left quadrant.
Y-Axis label	Label text for the Y-axis of the decision matrix.
Highlight item color	Color of highlighted plotted items. When you view a decision matrix from an assessable record's scorecard, the assessable record plotted item appears in the highlight color. Specify a highlight color that is different than the **Plotted item color**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Top right label	Label text for the top right quadrant.
Top right color	Fill color for the top right quadrant.
Bottom right label	Label text for the bottom right quadrant.
Bottom right color	Fill color for the bottom right quadrant.
Related Lists	
X Axis	Lists categories that define the X-axis of the decision matrix.
Y Axis	Lists categories that define the Y-axis of the decision matrix.

Decision matrixes

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes.

Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.

Note:
Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the Vendor Management Workspace application.

Decision matrix components

The decision matrix page has these components:

Component	Description
Options	
Filter	Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the **Filter** field and **Filter condition** field settings for each type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component	Description
	Decision matrix components  The maximum values in the filter are controlled by the **Maximum number of items to show for a decision matrix field filter** property *(com.snc.assessment.decision_matrix_filter_max_entries)*, which has a default value of 1000.
Scale	Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.
Decision matrix	
X- and Y-axes	Each axis represents one or more metric categories. If multiple categories are used for an axis, their respectiveweights determine the positioning of the plotted items.
Plotted items	The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record. **Vendor decision matrix** 
Plotted item rating summaries

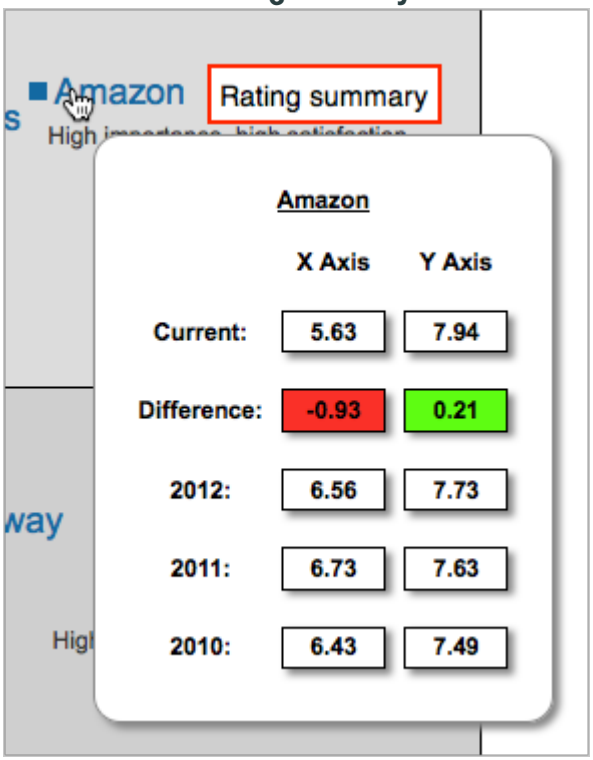
If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record's average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

Decision matrix rating summary



Take an assessment

Take the assessments assigned to you from the assessment and survey queue.

Before you begin

Role required: none

About this task

An assessment card displays the assessment name, state, due date, and associated incident number. Click the card to take the assessment when you're ready.

You must answer every required question, indicated by a red asterisk, before you can submit the assessment as complete. If you start to take an assessment but can't complete it, save your responses and return to it later. When you've answered all the questions and you're happy with the responses, submit the assessment.

Note:
The expired assessments and surveys no longer appear in the **My surveys** widget and the **My Assessments and Surveys list** page.

By default, you can't modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display Modify Assessment at the top of the card. Click the card to modify the assessment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you don't have access to the assessable record for which an assessment is created, the associated record number isn't displayed. You can still take the assessment.

Procedure

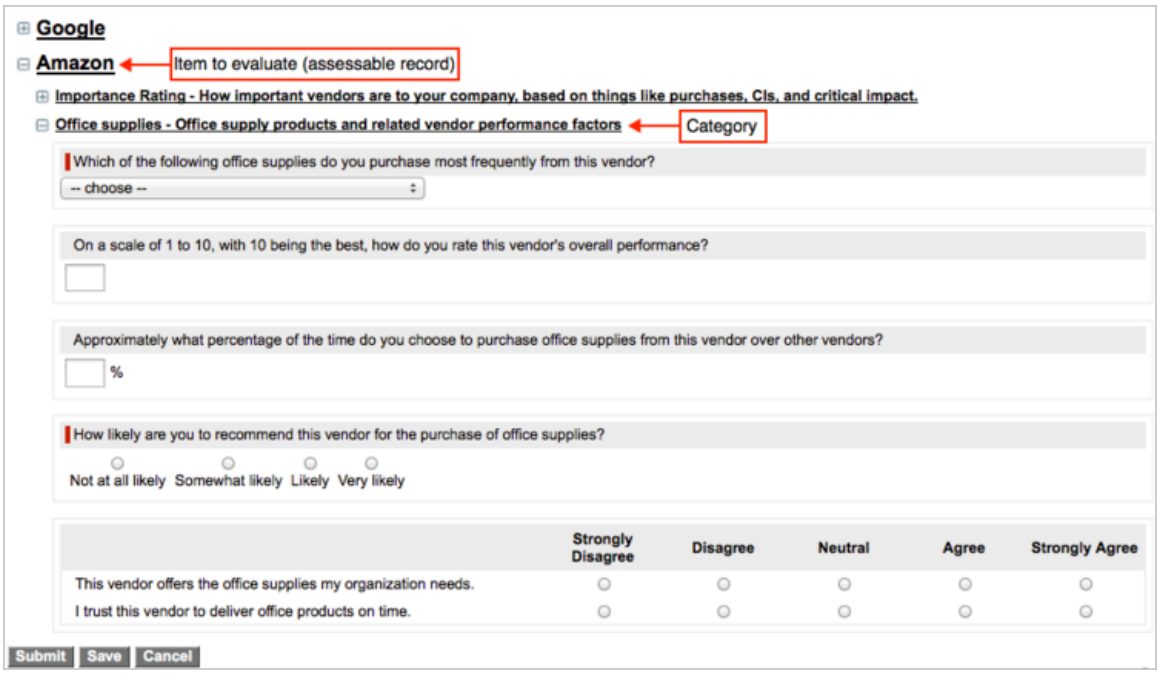
1. Navigate to **All** > **Self-Service** > **My Assessments & Surveys**.

   Note:
   Users with the assessment_admin role can display other users' assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

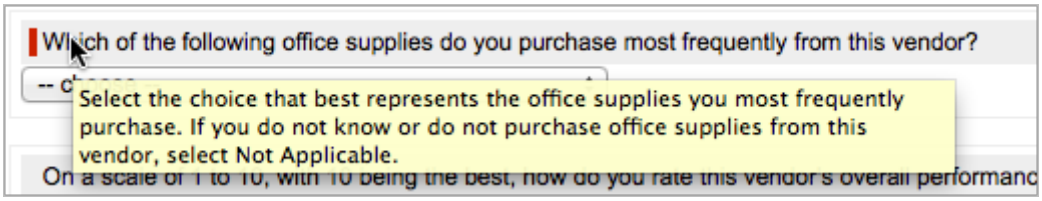
   Note:
   Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click the card to open the questionnaire.
   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear underneath the record, grouped by category. Each category appears as a subsection underneath the record name.
   Click the collapse icon (⊟) or expand icon (⊞) to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.



4. Answer each question to the best of your ability.
   Point to a question for more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you're unsure of how to respond to a question or if a question doesn't apply to a particular record, select **Not Applicable**, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

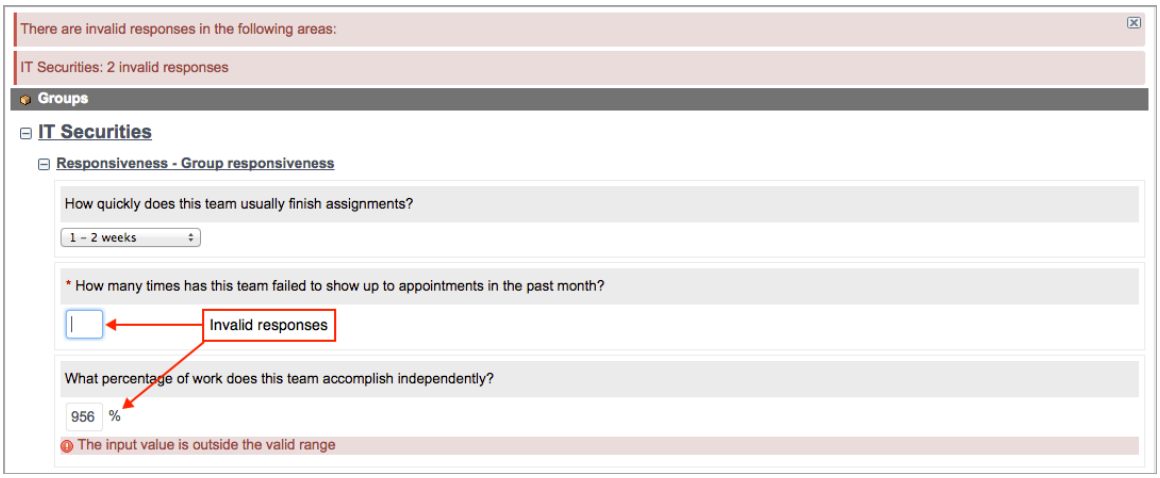
   A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You can't submit your answers to the assessment until you provide the required signature.

6. Save or submit the assessment.

   - **Save**: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   - **Submit**: Submits the completed assessment when you're finished.

7. If prompted, enter your user name and password to verify your full name signature.

   If all the questions are answered with valid values, a `success` message appears. If the system detects an unanswered required question or invalid response, the assessment isn't submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.



8. You can modify your responses to the assessment until its due date.
   To update your answers and resubmit an assessment that permits retakes, click the card to modify it.

Assessments in Service Portal and the Now Mobile app

If you've installed Service Portal, you can use the My Assessments and Surveys widget in Service Portal. Users can view and take assessments in Service Portal. Service Portal also supports assessments for users on mobile devices that have the Now Mobile app installed. The My Assessments and Surveys widget is available by default on the Service Portal home page.

Assessments in Service Portal

To create an intuitive interface for your users, you can set up assessments in Service Portal. Activate Service Portal to view the My Assessments and Surveys widget, which appears on the Service Portal home page.

To learn more about activating Service Portal, see Activate Service Portal.

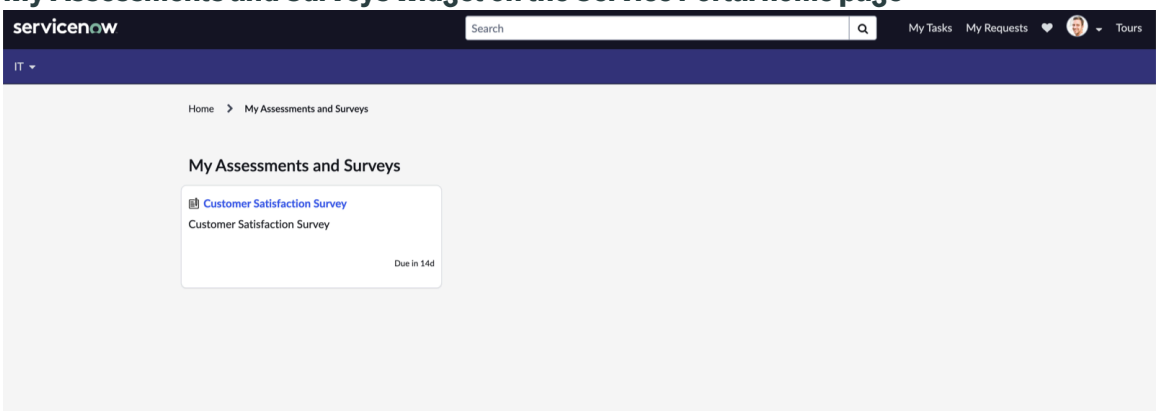
To learn more about configuring a widget, see configure widget instances.

To configure an Assessments and Surveys widget on a Service Portal home page, press the CTRL key, right-click the widget heading, and select **Instance Options**.

Instance options (properties) for the assessments and surveys widget on Service Portal

Property	Description
Max records	Maximum number of assessments to list in the widget on the Service Portal home page. Users can click the **View all** link to view all assessments. Default number of assessments: **5**
Title of the widget	Text that appears in the title bar of the survey widget. Default title: **My Assessments and Surveys**

My Assessments and Surveys widget on the Service Portal home page



Assessments in the Now Mobile app

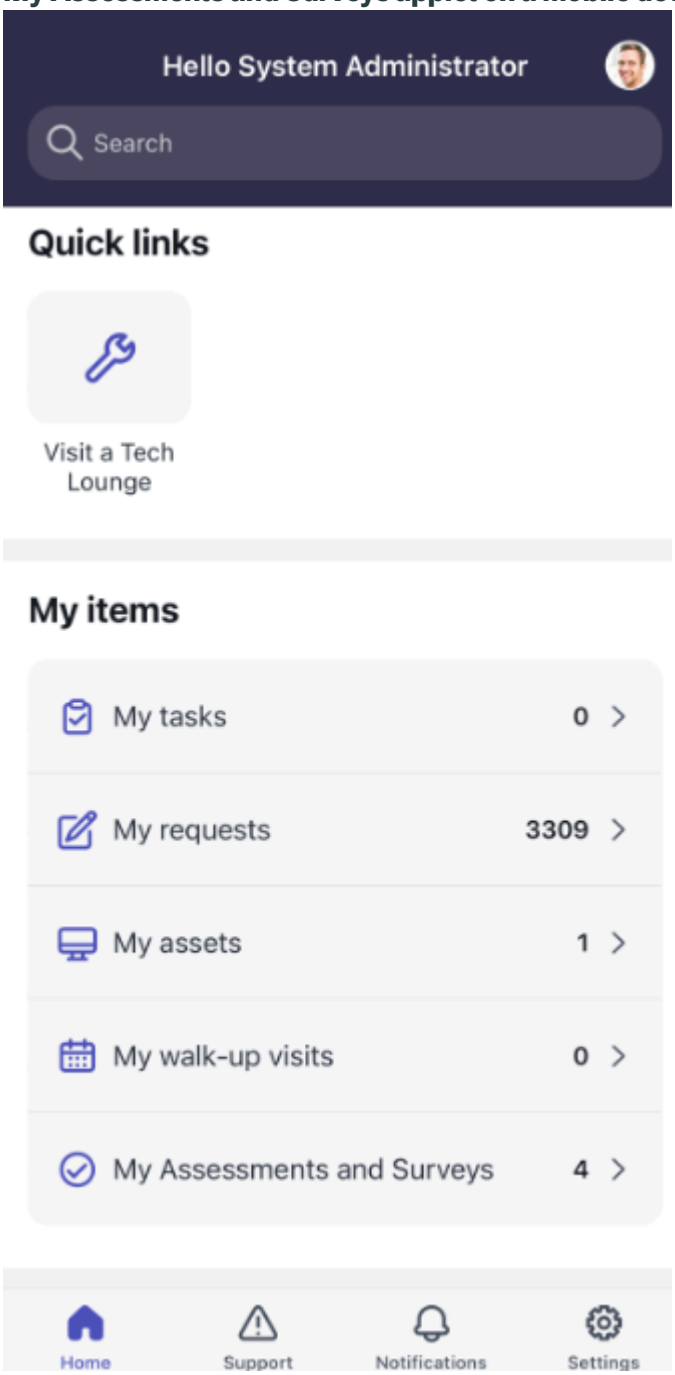
Your users can view and take the assessments on mobile devices using the My Assessments and Surveys applet launcher that is available by default in the Now Mobile app.

When you assign an assessment to a user, an email notification about taking the assessment is sent to the user. If users installed the Now Mobile app, a mobile push notification is also sent on mobile devices. Tapping the notification opens an introduction page for an assessment in the Mobile Employee Service Portal in the Now Mobile app. The page displays a **Get started** link. The

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

introduction page and the **Get started** link are available only if the related settings are enabled. Users can tap the link to view and take the assessment. You can activate push notifications by setting the *glide.sg.universal_links.enabled* system property to **true**.

My Assessments and Surveys applet on a mobile device



Note:
In the Yokohama release, you now see the assessments and surveys assigned in the card view instead of the item view. If you customize the styles of the legacy card item views in older versions of Assessments and Surveys, the card continues to appear in the item view even after you upgrade to Yokohama. You can view the new card view in Yokohama only if no customizations were made to the legacy cards.

When users open an assessment either in Service Portal or the Now Mobile app, the assessment provides the following features:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An assessment page shows breadcrumb navigation on the Service Portal. Users can click the links in the breadcrumb to navigate to previous pages or a home page. For example, clicking the **My Surveys** link in the breadcrumb navigates users to a page, which shows a list of all the assessments.
- When the assessment is in progress, the progress bar, available on each page of the assessment, shows the progress in percentage. The percentage of completion is based on the number of pages in the assessment. For example, suppose that there are three pages in the assessment. The third page shows 66% completion of the assessment. But giving a response to one of the questions on the third page opens a new question on a separate page, which is the fourth page. The fourth page shows the progress of the assessment as 75% completed, which affects overall progress and page indicators. Users can see the pagination - total number of pages - for the entire assessment as well as the current page that the users are on. To hide or show this progress bar, you can use the *sn_portal_surveys.sp_survey.show_progress_bar* property.
- Each user response is saved automatically when users move to the next page in the assessment. If users don't answer the required assessment questions before clicking **Next**, the page shows an error message at the top for all required and unanswered questions. This error message helps users find the exact location of the unanswered and required question. Any question that is not required and is not responded to before clicking **Next** is considered answered. The question is counted as completed.
- When the details of an assessment question contains more than four or five lines of text, the text after these lines disappears. In such cases, users can see the complete details by clicking the **Show more** link. Users can go back to the default behavior by clicking the **Show less** link.
- For a question that has the answer options of **Yes**, **No**, and **Not Applicable**, the **Not Applicable** option appears last in the list of options. The **Not Applicable** option can be configured while creating a question.
- Your users can take assessments for multiple incident records generated. For example, suppose that users have two incident records generated. The user can take an assessment for both the incident records generated using the same assessment instance.
- When the assessment users leave the assessment without submitting it, they can start the assessment later from the same page where they left off in the previous session.

Note:
For mobile users, the pagination is always by question for assessments.

Activate Service Portal

Assessment questionnaires

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.

No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric types and assessable records

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see Assessment administrator tasks.

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This set up provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table.

Delete an assessable record

When you delete an assessable record, the system deletes any stakeholders for the record.

Before you begin

Role required: assessment_admin or admin

About this task

Note:
If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Procedure

Delete the assessable record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To delete a single record, open the record and click **Delete**.
- To delete multiple records, use the Assessable Records list.

Related topics

Metric types and assessable records

View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Before you begin

Role required: assessment_admin or admin

Procedure

1. Navigate to **All** > **Assessments** > **Assessable Records**.
2. Open a record from the list.
   By default, the list displays only assessable records with **Active** metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

Viewing Assessable Records

Field	Description
Name	[Read-Only] Assessable record name based on the Select a field as the table display value of the source record. The name appears on assessment questionnaires. Source	[Read-Only] Source record the assessable record is linked to. The **Source** reflects the table name and source record display value. For example, if the **Name** field is the display value for the Company table, the assessable record for a company record named **Amazon** has the **Source** value **Company: Amazon**.
Live feed	Check box that, when selected, creates a Live Feed group for the assessable record, which appears on the scorecard. If you clear the check box after a Live Feed group has been created, the system deletes the Live Feed group and all its messages.
Type	[Read-Only] Metric type from which the assessable record was generated.
Decision matrix	Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the **View Matrix** related link on the assessable record's scorecard.
Live feed group	[Read-Only] Live feed group for this assessable record. When you select the **Live feed** check box and save the record, the system populates this field.
Related Links

Field	Description
Name	Name of the assessment.
Assessment duration	Allowed duration to complete an assignment after its generation.
Live feed	Checkbox that automatically creates Live Feed groups for newly generated assessable records of this type.
Notify manager if overdue	Checkbox to send a notification to the manager when the assessment becomes overdue.
Scale factor	Scale value for all assessment results.
Pagination setting for Service Portal view	The setting on which the pagination is based for desktop or tablet view in Service Portal. • Category: default • Question: 1 question per page (automatic for mobile) • None: no pagination **Note:** This field is displayed only when Service Portal is installed.
Business rule	Business rule that is automatically created for assessable record generation.
Schedule type	Scheduled or on-demand assessment type.
Scheduled job	Scheduled job the system creates for this assessment definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. • If you change the schedule period and save the survey definition, the system deletes the old scheduled job. • If you selected a recurring schedule period, a new scheduled job is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric form (continued)

Field	Description
	For example, if you change the schedule period from **Daily** to **Weekly** and save the record: • The system deletes the daily scheduled job. • Creates a weekly one set to run a week from the current date. This field is visible to administrators only if the schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**.
Evaluation method	Type of assessment.
Roles	Roles with read access for this metric type.
Active	Check box to enable the distribution of this assessment to recipients.
Owners	Owners of the assessment. You can add a user with the survey_creator, survey_admin, or assessment_admin role.
Description	Description of the assessment.
Conditions	
Table	Table that contains records to assess for this type.
Enforce condition	Checkbox to delete the existing assessable records of this type that do not meet the specified conditions.
Condition	Conditions that the assessable records of this type should meet.
Decision Matrix	
Filter field	Field on the Filter table to identify filter menu choices on decision matrices and scorecard averages for this type.
Filter condition	Conditions to filter results on decision matrices and scorecard averages for this type.
Default matrix filter	Default filter menu choice on decision matrix of this type.
Assessors	
User field	User field from the table specified in the **Conditions** tab. The assessment will be assigned to all users of this user field in the table. When you save the assessment and click **Generate Assessable Records**, an assessable record is created for each unique user of the user field. This is applicable for Scheduled and On-demand assessments. For an on-demand assessment, each assessor assesses all assessable records. For a scheduled assessment, each assessor assesses only the corresponding assessable record.
Related Links	
Generate Assessable Records	Creates assessable records for this metric type.

Assessment Metric form (continued)

Field	Description
Show Benchmarks	Opens the Benchmarks Dashboard that provides visibility into your key performance indicators (KPIs) and trends. **Note:** • This related link is available only for survey_admin, assessment_admin and survey_reader with bm_viewer role. • You must opt in to Benchmarks to view the dashboard. See Enable Benchmarks • This is applicable only for a published survey.
Create Improvement Initiative	Opens the Improvement Initiative window to create an improvement initiative record that helps in improving the performance of the assessment. **Note:** • This related link is available only for the survey_admin and assessment_admin role. A survey_reader can only view the created improvement initiative records. • You should activate the Continual Improvement Management plugin (com.sn_cim).
Related Lists	
Metric Categories	All metric categories for this assessment.
Assessable Records	All assessable records for this assessment.
Improvement Initiatives	Displays improvement initiatives associated with the survey. **Note:** This related list is available only when there is at least one improvement initiative record.

Metric Category form

Description of the field values for the Metric Category form.

Metric Category form

Field	Description
Name	Name of the metric category. The name appears on assessment questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Category form (continued)

Field	Description
Type	[Required] Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.
Create stakeholders	Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.
Table	[Read-Only] Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a **Type** is selected.
Weight	[Required] Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see weight categories and metrics. The default value is 10.
Scoring type	Scoring method for an attestation category. This field appears only when the metric type is an attestation with a **Scoring type** of **Percent**. Use this field to configure different scoring types for specific attestation categories. Possible selections are: • **Percent**: Attestation score as a weighted percentage of correct answers for scored questions. • **All or nothing**: All answers for attestation type questions must be correct or the score is zero for the entire category.
Total metrics	[Read-Only] Number of metrics associated to this category.
Filter	Filter conditions that assessable records must meet to be evaluated using metrics in this category. The filter operates on fields on the selected table. If you specify a filter condition, the system automatically associates matching assessable records to the category when you save the record. If you change the filter conditions, the system removes and creates assessable record associations as needed. The system also deletes stakeholders for assessable records it disassociates. The system does not remove assessable record associations created by users, even if the assessable records do not match the filter conditions. This field is visible only when a **Type** is selected.
Description	Descriptive information about the category that appears on assessment questionnaires.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Metric Category form (continued)

Field	Description
Roles	Only those users with the specified roles can perform the assessment for this category. If no role is specified, then users with any role can perform the assessment for this category. **Note:** If the **Roles** property does not appear on the form, ask your admin to add the property.
Details	Text field containing an HTML editor. Use this field to present important details about this category to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. You may need to configure the form to see this field.
Related Lists	
Assessment Metrics	All metrics associated to this category. There must be at least one metric associated to the category to use any assessments with the category.
Assessable records	All assessable records associated to this category. There must be at least one assessable record associated to the category to use any assessments with the category. This related list is hidden if the **Evaluation method** is **Attestation**. **Note:** Category users are automatically generated based on the user field is specified in the **Assessors** tab of the assessment after publishing the assessment.
Users	All users associated to this category. There must be at least one category user to create scheduled assessments using metrics in this category. If any user field is specified in the **Assessors** tab of the assessment, the corresponding users are automatically generated after publishing the assignment. This related list is available only when the associated metric type has schedule type set to **Scheduled**. Category users are not a part of the on-demand assessment process.

Assessment Metric form for a category

Description of the field values for the Assessment Metric form. Use the fields when you create an assessment metric for a category.

Assessment Metric form

Field	Description
Name	Name of the metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric form (continued)

Field	Description
Category	Metric category that the metric belongs to. The system automatically populates this category if you create a new metric from the Metric Category form. **Note:** You cannot change the category if the **Depends on** field is set or if another metric depends on this metric

Method	Determines how to use the metric.
	• **Assessment** : Non-scripted metric. Make the metric available as a question on an assessment questionnaire. The **Assessment** method is compatible with all data types except **Duration**.
	• **Script**: Scripted metric. Obtain values by writing a custom script. The **Script** method is compatible with the **Duration**, **Number**, and **Percentage** data types.
	• **Default answer from field**: This option appears only if you have selected an **Assessment Metric Type** that contains a table. The **General** tab adds two fields:
	  ○ **Default answer**: Select the default answer for the question. The list comes from the selected table.
	  ○ **Ask question**: Specifies when to ask the question: always or only if the default answer is empty.
	• **Default answer from script**: The **General** tab adds a field:
	Ask question: Specifies when to ask the question: always or only if the script does not contain a default answer. The script is defined on the **Field Type** tab.
	
	Note:
	If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value.

Weight	Numeric value that represents the importance of this metric relative to other metrics in the same category. By default, the weight is 10. For weighting suggestions, see Weight Metrics and Metric Categories. This field is visible and required unless the **Data type** is **Date**, **Date/Time**, or **String**. These data types are not included in results calculations.
Order	Numeric value that determines the order of the metric question on assessment questionnaires, relative to other metric questions in the same category. The metric with the smallest order value appears as the first question in the category section. By default, the order is 100. For more information about questionnaire layout, see Complete Assessment Questionnaires. **Note:** It does not matter which order value you use for metrics with the Script method, as they do not appear on questionnaires.
Active	Check box that determines whether this metric is used to gather assessment results. If a non-scripted metric (Assessment method) is inactive, the question

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric form (continued)

Field	Description
	does not appear on assessment questionnaires generated after the metric becomes inactive. If a scripted metric (Script method) is inactive, the script does not run.
Mandatory	Check box that makes the metric question mandatory (selected) or optional (cleared) on assessment questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which display a red field status indicator. This field is visible only if the **Method** is **Assessment**, the **Depends on** field is empty, and the data type is not **Checkbox**.
Allow not applicable	Check box that determines whether to include a **Not Applicable** answer option for this metric question on assessment questionnaires. Users can select **Not Applicable** if they do not have sufficient information to respond to a question or if a question does not apply to a particular assessable record. User responses of **Not Applicable** are excluded from results calculations. This field is visible only if the **Method** is **Assessment** and certain data types are selected. Additional fields you can add by customizing the form	
Details	Text field containing an HTML editor. Use this field to present important details about this metric to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. General Section	
Question	Text to use as the question on assessment questionnaires. Enter a clear, straightforward question that is easy to answer, such as **How likely are you to recommend this vendor for the purchase of office supplies?** Description	Information about the metric and what it evaluates. If the **Method** is **Assessment**, include details that help users understand how to answer the question. This text appears as a hint when a user points to the question text on the questionnaire.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Metric form (continued)

Field	Description
Depends on	Setting used to make this metric a conditional question. Select an existing metric question from the list, which displays **Checkbox**, **Choice**, **Likert Scale**, **Template**, and **Yes/No** metrics of the same category as this metric. Then, use the **Displayed when** field to set the conditions that display this metric question on questionnaires. The system prevents the creation of recursive dependencies between metrics. For example, if Metric A depends on Metric B, Metric B cannot depend on Metric A. This field is visible only if the Method is Assessment.
Displayed when	Answer options for the selected **Depends on** metric question that, when chosen on questionnaires, display this metric question. This field is visible and required only if the **Depends on** field is set.
Field Type Section	
Data type	[Required] Format of the expected response data. The function of the data type depends on the selected **Method**. If the method is **Assessment**, the data type determines how users answer the corresponding question on questionnaires. If the method is **Script**, the data type determines how the system calculates assessment results. **Note:** If another metric depends on this metric, you cannot change the data type.
Randomize answers	Check box that determines whether to present the answer options for this metric question in a random order. The order of answer options can influence users, which creates biased results. Randomizing answer options can help prevent this bias. This field is visible only if a data type that requires metric definitions is selected. **Note:** Randomizing answer options for certain questions can make those questions confusing for the person answering. In general, only randomize answer options that do not follow a logical order. For example, the following question is confusing when randomization is enabled: Template	Metric template to use for the metric question. A metric template is a set of predefined answer options. This field is visible and required only if the **Data type** is **Template**. **Note:** If another metric depends on this metric, you cannot change the template.

Assessment Metric form (continued)

Field	Description
Dependent plugin	Plugin that contains the tables queried in the script. The system executes the metric script only if the plugin is active. The default available values are **Asset Management**, **CMDB**, **Core**, **Cost Management**, **Procurement**, and **Software Asset Management**. If the **Method** is **Script**, select a plugin. This field is visible only if the **Method** is **Script**. **Note:** An administrator may need to add more Define an option for a choice list of plugins to the field.
Scale definition	Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select **Low** if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select **High** if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is **High**. This field is visible and required unless the **Data type** is **Date**, **Date/Time**, or **String**. The results for these data types are not included in results calculations. **Note:** For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data Types.
Min	Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric. This field is visible and required only if certain data types are selected. If the data type is **Choice** or **Likert Scale**, this field is read-only and is set automatically based on the smallest metric definition **Value**.
Max	Highest numerical value to be used as an answer option or scaled value. This field is visible and required only if certain data types are selected. If the data type is **Choice** or **Likert Scale**, this field is read-only and is set automatically based on the largest metric definition **Value**.
Script	Script that obtains the desired system information. This field is visible and required only if the **Method** is **Script**. **Note:** Script can now only be edited by Assessment Admins. Survey Creators no longer have the ability to edit the script.
Related List	
Assessment Metric Definitions	Lists all metric definitions, which appear as answer options for questions on assessment questionnaires. Click **New** to create a new metric definition.

Create an assessment metric for a category

Trigger Condition form for assessments

Description of the field values for the Trigger Condition form for assessments.

Trigger Condition form

Field	Description
Assessment	[Required] Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the **On demand** schedule type.
Table	[Required] Table to run the trigger condition on. You can select only tables in the current application scope. The table must have a connection to the assessable records for the selected **Assessment**. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the Incident [incident] table. After you select a table, ensure there is at least one option for the **Assessable Record Field**. If there is not, select a different table.
User field	[Required] Field that stores the users you want to send the assessment. You can select any field, on the selected **Table** or on a related table, that references the User [sys_user] table. Use the tree picker to select a field. Repeat Interval	Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.
Active	Check box that determines whether this trigger condition is active (selected).
Business rule	[Admin only] Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trigger Condition form (continued)

Field	Description
Trigger randomly	Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the **Probability (%)** field.
Probability (%)	Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the **Trigger randomly** check box is selected.
Assessable Record Field	[Required] Field on the selected **Table** that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected **Table** are available to select. If there are no **Assessable Record Field** options available, you must select a different **Table**. If the selected **Assessment** evaluates records on the Company `[core_company]` table and the selected **Table** is Incident, the only **Assessable Record Field** options are fields on the Incident table that reference the Company table. For example, **Company** or, if vendor ticketing is enabled, **Vendor**. If you select **Vendor**, the trigger condition sends an assessment about the **Vendor** for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record. **Note:** This field is not available if the selected **Assessment** is a metric type used for surveys. See Survey trigger conditions.
Related Field 1 – Related Field 4	Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected **Table**. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select **Caller** and **Vendor** as related fields. That stores the caller and vendor associated with the incident as **Related record 1** and **Related record 2** in the assessment instance record. To view these fields, configure the Assessment Instance form.
Description	Summary information to identify the trigger condition.
Condition	[Required] Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition [State] [is] [Closed].

Domain separation and Assessments

Domain separation is supported for Assessments. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

User roles

Role title [name]	Description	Contains roles
assessment administrator [assessment_admin]	Can administer the Assessments application. Can access all the modules of the Assessments application. **Note:** The assessment_admin role is contained by the itil_admin role. This role is also contained by the survey_admin role.	None

Script includes

Name	Description
AssessmentUtils	Core code for assessment functionality.
AssessmentUtilsAJAX	AJAX-based code for displaying scorecard data.
MigrateSurveyToAssessment	Code for migrating legacy surveys to assessment surveys.
RatingUtilsAJAX	Reserved for future use.
SurveyUtils	Core code for survey functionality.

Client scripts

Name	Table	Description
Calculate Assessable Record Field choice list	Trigger Condition [asmt_condition]	Limits the Assessable Record Field choices to those choices that are compatible with the selected assessment.
Check survey schedule period	Trigger Condition [asmt_condition]	Checks the selected survey definition's Schedule period. If Schedule period is set to Only Once, this client script displays a warning message that each user can only take the selected survey once.
Clear display_when when depends changed	Assessment Metric [asmt_metric]	Shows the **Display when** field when the **Depends on** field is set. Clears the **Display when** field when the **Depends on** field changes and the options must change.
Conditionally Set Type for Surveys	Group [sys_user_group]	Sets the user group Type to survey if you create a new group from the User Groups module.
Data type -- Hide choices for surveys	Assessment Metric [asmt_metric]	Ensures only Data type options that are valid for surveys are available on the Survey Question form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Description
Data type -- Show/ Hide Not Applicable	Assessment Metric [asmt_metric]	Hides the **Allow not applicable** field and sets its value to **false** if the metric method is Assessment and the data type is **Percentage**, **Checkbox**, **Date**, **Date/Time**, **Number**, or **String**.
Data type defaults to String for surveys	Assessment Metric [asmt_metric]	Sets the default **Data type** field value to **String** on the Survey Question form.
Fetch Min/ Max	Assessment Metric [asmt_metric]	Updates the **Min** and **Max** fields to match the least and greatest metric template definition values if an assessment administrator selects or changes the Template value.
Hide Assessable Record Field	Trigger Condition [asmt_condition]	Hides the **Assessable Record** field unless the evaluation method of the metric type selected in the **Assessment** field is **Assessment**.
Hide Survey Instance Trigger ID if empty	Assessment Instance [asmt_assessment_instance]	Hides the **Trigger ID** field and makes it read-only unless it contains a value.
Hide user lists	Assessable Record [asmt_assessable_record]	Hides the **Category users** related list if the associated metric type schedule type is **On demand**.
Hide user related lists	Metric Category [asmt_metric_category]	Hides the User related list if the associated metric schedule type is **On demand** and the **Evaluation method** isn't **Survey**.
Hide value or String value	Assessment Instance Question [asmt_assessment_instance_question]	Hides the **Value** field and shows the **String value** field if the associated metric data type is **Date**, **Date/Time**, or **String**. Does the opposite if the data type is anything or else.
Live feed deletion warning	Assessable Record [asmt_assessable_record]	Displays a warning message if an assessment administrator clears the **Live feed** check box.
Method -- Show/ Hide Not applicable	Assessment Metric [asmt_metric]	Hides the **Mandatory** and **Allow not applicable** fields and sets both values to **false** if the metric method is Script. Shows the **Mandatory** field if the metric method is Assessment. Shows the **Allow not applicable** field if the method is Assessment, except when the data type is **Percentage**, **Checkbox**, **Date**, **Date/Time**, **Number**, or **String**.

Name	Table	Description
Min/Max Control	Assessment Metric [asmt_metric]	Makes the **Min** and **Max** fields mandatory except when the data type is **Template**.
Min/Max Read-only	Assessment Metric [asmt_metric]	Makes the **Min** and **Max** fields read-only when the data type is **Choice** or **Likert Scale**.
Populate Groups	Assessment Metric Type [asmt_metric_type]	Populates the available values for the **Filter** field with fields from the selected metric type table.
Read only Type	Metric Category [asmt_metric_category]	Makes the **Type** field read-only when it contains a value.
Reload Decision Matrix Filter Columns	Assessment Metric Type [asmt_metric_type]	Populates the available choices for the **Default matrix** filter as appropriate if the **Filter** field value changes.
Reload default filters	Assessment Metric Type [asmt_metric_type]	Populates the available choices for the **Default filter** as appropriate if the **Display all filters** value changes.
Set scale factor	Assessment Metric Type [asmt_metric_type]	Reserved for future use.
Set table field	Metric Category [asmt_metric_category]	Sets the category Table value to that of the metric type.
Show and Hide Scheduled Job	Assessment Metric Type [asmt_metric_type]	Hides the **Scheduled job** field if the Schedule type is **On demand** and shows the **Scheduled job** field if the Schedule type is **Scheduled**.
Show and Hide Scheduled Job Survey View	Assessment Metric Type [asmt_metric_type]	Shows the **Scheduled job** field on the Survey Definition form if the Schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**.
Toggle Metric Definitions (Load)	Assessment Metric [asmt_metric]	Displays the Assessment Metric Definitions related list if the data type is **Choice** or **Likert Scale**.
Toggle Metric Definitions (Update)	Assessment Metric [asmt_metric]	Displays the Assessment Metric Definitions related list if the data type is **Choice** or **Likert Scale**. Sets the **Method** field to the appropriate value if the data type is compatible with one method only.
Update Min And Max	Assessment Metric [asmt_metric]	Sets reasonable default values for the **Min** and **Max** fields, based on the data type.

Name	Table	Description
Default Values		
Validate Probability	Survey Trigger Condition [asmt_condition]	Ensures that the **Probability (%)** value is a whole number between **1** and **100**.
Verify Max	Assessment Metric [asmt_metric]	Verifies that the **Max** value is greater than the **Min** value and greater than or equal to zero if the metric method is Assessment.
Verify Min	Assessment Metric [asmt_metric]	Verifies that the **Min** value is less than the **Max** value and greater than or equal to zero if the metric method is Assessment.
Verify Value	Assessment Metric Definition [asmt_metric_definition]	Verifies that the Value is greater than or equal to zero.
Verify Value	Assessment Template Definition [asmt_template_definition]	Verifies that the Value is greater than or equal to zero.

Business rules

Business rules for Assessments

Name	Table	Description
Assessable domain matches type	Assessable Record [asmt_assessable_record]	Ensures that all new assessable records are in the same domain as the metric type. This is a special requirement of assessment domain separation, that all records must be in the same domain.
Auto stakeholder creation	Assessment Category User [asmt_m2m_category_user]	Assigns new category users as stakeholders automatically for assessable records if the associated category has the **Create stakeholders** option selected.
Auto stakeholder creation	Category Assessable Records [asmt_m2m_category_assessment]	Creates stakeholders from all of a category's category users automatically for new assessable records if: • The **Create stakeholders** option is selected for the metric category. • The same metric category is associated to the new assessable record.

© 2026 ServiceNow, Inc. All rights reserved.

Business rules for Assessments (continued)

Name	Table	Description
Auto stakeholder creation	Metric Category [asmt_metric_category]	Assigns all of a category's category users as stakeholders for each assessable record associated to the category when the **Create stakeholders** option is selected for the category.
Calculate category max weight	Assessment Metric [asmt_metric]	Calculates the sum of all metric weights in a category.
Cancel notification workflow	Assessment Instance [asmt_assessment_instance]	Cancels the workflow that generates assessment email notifications when an assessment instance is deleted or changes the state to **Complete** or **Canceled**.
Category domain matches type	Metric Category [asmt_metric_category]	Ensures that all new categories are in the same domain as the metric type. This is a special requirement of assessment domain separation, that all records must be in the same domain.
Check Live Feed Groups	Assessable Record [asmt_assessable_record]	Selects the **Live feed** option if a Live Feed group is associated with the source record. If the **Live feed** option is selected and no Live Feed group is associated with the source record, this business rule clears the check box.
Check only one default	Bubble Chart [asmt_bubble_chart]	Ensures that there is only one default bubble chart for a metric type.
Check only one default	Decision Matrix [asmt_decision_matrix]	Ensures that there is only one default decision matrix for a metric type.
Create actual results	Assessment Instance [asmt_assessment_instance]	Generates assessment and category results from the user responses if a user completes an assessment.
Create Business Rule on Remote table	Assessment Metric Type [asmt_metric_type]	Generates the following business rules if an assessment administrator creates or updates a metric type: • Business rule called Auto business rule for Assessments, which monitors the Table selected for the metric type. When someone adds a record that meets the metric type

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rules for Assessments (continued)

Name	Table	Description
		conditions, this business rule generates an assessable record. If someone changes the metric type's Table or conditions, the Create Business Rule on Remote table business rule updates the automatic business rule script to reflect the changes. • Business rule called Auto deletion rule for Assessments, which prevents users from deleting a record on the metric type's Table if the record is associated to metric or category results. If the record has no associated results and a user deletes it, this business rule deletes any associated assessable records. The Create Business Rule on Remote table business rule generates automatic business rules only for metric types with Evaluation method set to Assessment.
Create Scheduled Job	Assessment Metric Type [asmt_metric_type]	Assessments: Generates a scheduled job for the creation of assessment components if either of these conditions is met: • Someone creates a new metric type with the schedule type set to **Scheduled**. • The schedule type changes from **On demand** to **Scheduled**. Surveys: Generates a scheduled job for the creation of survey components if the schedule period for a survey definition is set to Daily, Weekly, Monthly, or Yearly.
Create Survey Records	Assessment Metric Type [asmt_metric_type]	Generates various records and populates certain fields on those records when someone creates a new survey definition, which is a metric type with Evaluation method set to Survey. More specifically, this business rule generates a survey category and assessable record,

Business rules for Assessments (continued)

Name	Table	Description
		both associated to the survey definition.
Create UI Action on Remote table	Assessment Metric Type [asmt_metric_type]	Reserved for future use.
decision_matrix_axis	Global [global]	Limits available categories for X- and Y-axes to those that belong to the type if there is a metric type specified on the Decision Matrix form.
Delete Live Feed Group	Assessable Record [asmt_assessable_record]	Deletes the assessable record's Live Feed group, if there is one, when an assessment administrator deletes an assessable record.
delete related users	Category Assessable Records [asmt_m2m_category_assessment]	Deletes any stakeholders for the assessable record and category when an assessment administrator disassociates a category from an assessable record.
Do not allow category to change	Assessment Metric [asmt_metric]	Prevents the **Category** field from being changed if there are any conditional question dependencies related to the current record.
Do not allow datatype to change	Assessment Metric [asmt_metric]	Prevents the **Data type** and **Template** fields from being changed if there are any conditional questions that depend on the current record.
Ensure Types Match	Assessment Metric [asmt_metric]	Sets the type of a metric to the type of the associated category.
Ensure types match	Assessment Stakeholders [asmt_m2m_stakeholder]	Ensures that users can only create a stakeholder from a category user and assessable record of the same type.
Ensure types match	Category Assessable Records [asmt_m2m_category_assessment]	Prevents users from associating categories of one type to an assessable record of a different type.
Evaluate filters	Assessable Record [asmt_assessable_record]	Performs the following after the system generates a new assessable record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Business rules for Assessments (continued)

Name	Table	Description
		• Checks all filter conditions for categories in the type. • Automatically associates the new assessable record to all categories for which it meets the category filter conditions.
Generate assessment trigger condition	Trigger Condition [asmt_condition]	Generates a business rule that the survey or assessment trigger condition uses to send surveys or assessments.
getStakeholders	Global [global]	Ensures that only category users for categories associated with the assessable record are available on the Assessable Record form when users edit the Category users related list.
Link assessable record and category	Metric Category [asmt_metric_category]	Sets these hidden fields as follows for a newly created survey category: • Table: Assessment Metric Type [asmt_metric_type] • Filter: <sys_id of the survey definition the new survey category is associated with>
Live Feed Group	Assessable Record [asmt_assessable_record]	Creates a Live Feed group for the assessable record, if one doesn't exist, when the record is saved with the **Live feed** option selected. If the check box is then cleared and the record saved, this business rule deletes an existing Live Feed group.
Metric domain matches category	Assessment Metric [asmt_metric]	Ensures that all new metrics are in the same domain as the category to which they belong. This rule is a special requirement of assessment domain separation, that all records must be in the same domain.
Notify assessment user	Assessment Instance [asmt_assessment_instance]	Starts a workflow that sends an email notification to the assigned user when an assessment instance changes to the **Ready** state or the user to which it is assigned changes. The workflow

Business rules for Assessments (continued)

Name	Table	Description
		generates other assessment email notifications at later stages.
Prevent recursive dependencies	Assessment Metric [asmt_metric]	Prevents the **Depends on** field from being set in a way that creates a recursive conditional question dependency.
Publish Survey	Assessment Metric Type [asmt_metric_type]	Generates survey instances and assigns them to the associated survey users when the survey definition state changes from **Draft** to **Published**.
Remove auto create Business Rules	Assessment Metric Type [asmt_metric_type]	Deletes the automatically created business rule for a metric type when an assessment administrator deletes that metric type.
Remove auto create UI actions	Assessment Metric Type [asmt_metric_type]	Reserved for future use.
Remove auto created business rule	Survey Trigger Condition [asmt_condition]	Deletes the automatically created business rule when someone deletes the survey trigger condition.
Remove Scheduled Job	Assessment Metric Type [asmt_metric_type]	Assessments: Deletes the scheduled job for a metric type if either of these conditions is met: • Someone deletes the metric type. • Someone changes the schedule type from **Scheduled** to **On demand**. Surveys: Deletes the scheduled job for a survey definition if the schedule period is set to Only Once or No Limit.
Reset Min/Max for metric	Assessment Metric Definition [asmt_metric_definition]	Updates the **Min** and **Max** fields for metrics and survey questions based on the metric definition value.
Set Domain for M2M Cat Assessable Recs	Category Assessable Records [asmt_m2m_category_assessment]	Ensures that assessable records are only associated to categories in the same domain. This rule is a special requirement of assessment domain separation, that all records must be in the same domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rules for Assessments (continued)

Name	Table	Description
Set Domain for M2M Category Users	Assessment Category User [asmt_m2m_category_user]	Ensures that users are only linked to categories in the same domain. This is a special requirement of assessment domain separation, that all records must be in the same domain.
Set Domain for M2M Stakeholders	Assessment Stakeholders [asmt_m2m_stakeholder]	Ensures that assessable records are only linked to category users in the same domain. This is a special requirement of assessment domain separation, that all records must be in the same domain.
Set scratchpad fields	Assessment Metric Type [asmt_metric_type]	Caches field values for use by other scripts that run on the Assessment Metric Type form.
Store view type	Metric Category [asmt_metric_category]	Ensures that the **Type** field only allows users to select metric types used for assessments.
Synchronize category survey users	Assessment Category User [asmt_m2m_category_user]	Ensures that the same users are associated with all of a survey's categories.
Synchronize survey users and stakeholder.	Metric Category [asmt_metric_category]	Adds all users associated with a survey's existing categories to any newly created category for that survey.
Update Category Count	Assessment Metric [asmt_metric]	Updates the value in the **Total metrics** field on the Metric Category form when metrics are added to and deleted from the category.
Update records that match filter	Metric Category [asmt_metric_category]	Automatically performs these tasks when an assessment administrator edits the **Filter** field: • Associates the category to assessable records that meet the filter conditions. • Disassociates the category from assessable records that don't meet the filter conditions. The Assessable records related list reflects these changes when the record is saved.
Update scheduled job on schedule change	Assessment Metric Type [asmt_metric_type]	Updates the survey creation scheduled job to reflect schedule period changes.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rules for Assessments (continued)

Name	Table	Description
Validate mandatory and not applicable	Assessment Metric [asmt_metric]	Sets the **Mandatory** and **Allow not applicable** fields to **false** if the metric method is Script. If the metric data type is Percentage, the business rule sets the **Allow not applicable** field to **false**.
Verify min/max	Assessment Metric [asmt_metric]	Ensures that the Min is greater than or equal to zero and less than the Max. Sets the Min to 0 and the Max to 1 if the data type is **Checkbox** or **Yes/No**.
Verify value	Assessment Template Definition [asmt_template_definition]	Ensures that the metric template definition Value is: • Greater than or equal to zero. • Different from the Value for all other metric template definitions related to the template.
Verify value	Assessment Metric Definition [asmt_metric_definition]	Ensures that users can only enter a metric definition Value greater than or equal to zero. Ensures that the metric definition value is different from the Value for all other metric definitions related to the metric.

Quick start tests for Assessments and Surveys

Validate that Assessments and Surveys still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Assessments and Surveys quick start tests require activating the Automated Test Framework for Survey plugin (com.glide.automated_testing_impl. Survey).

Note:
In the Yokohama release, all the buttons on the assessments or surveys cards have been removed. To run the Automated Test Framework tests successfully, the **Click the Take Survey button** step must be replaced with **Click the Survey card** for all tests that have this step.

Test Suite for Survey

Name	Description	Release version
Survey: Basic Platform Based Test	Create a survey using Platform UI actions.	Madrid
Survey: Platform test for Dynamic Validation	Validate a survey dynamically.	Madrid

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Test Suite for Survey (continued)

Name	Description	Release version
Survey: Clone Action	Clone a survey and validate the records of the original survey and the cloned survey.	New York
Survey: Question Bank Flow	Verify the addition of a question bank to a survey.	New York
Survey: Survey Creator Work Flow	Survey creator can create a survey and assign to the user who can take the survey and submit it.	New York
Assessment: Assign assessment to assessor	Assign an assessment to an assessor and verify that the instance is created for the assessor.	Orlando
Assessment: Create assessment as survey creator	Create an assignment as a survey creator.	Orlando
Assessment: Scale and Template support	Create, publish, and assign the assessment. Then take the assessment.	Rome
Assessment: Basic test flow	Verify the basic flow of an assessment.	Orlando

Quizzes

Quizzes are questionnaires that you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

The difference between assessments, surveys, and quizzes, and when to use each; also provides a quick look at the three stages in the survey process: designing, sharing, and evaluating.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - *Recipients*: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - *Recipient's manager*: The recipient's manager can receive notification when a quiz is overdue.
  - *Quiz manager*: The quiz manager can receive notification of an overdue quiz that is assigned to them.
- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No
- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers *No* to a specific question.

Important terms

The quiz application involves several terms.

Terms used in quiz application

Quizzes	A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.
Categories	A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.
Questions	A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.
Category user	A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.
Templates	A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

Quiz roles

Role Title [Name]	Role Description
assessment administrator [assessment_admin]	Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application. **Note:** The itil_admin role and the survey_admin role contain the assessment_admin role
Administrator [admin]	Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.

Related topics

Assessment metrics

Using Quizzes

You can use quizzes.

Set up and administer quizzes

Set up and administer quizzes.

Before you begin
Role required: assessment_admin or admin

Procedure

1. **Optional:** Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.

   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.

   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.

   You can create unique answers or select preconfigured answers from a template.

What to do next
Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review the results from the submitted quizzes in reports and scorecards.

Data types for quizzes

You need to choose a data type for each quiz question. Various data types helps you collect and analyze different kinds of data.

Available data types

Data type	Description
Attachment	Question with a Manage Attachments icon that allows users to attach one or more files.
Boolean	Question with a check box or a **Yes/No** list for user responses.
Choice	List of predefined options. For more information, see the definition for **Choices** in the Create quiz questions topic. Multiple correct answers are supported.
Date	Date field.
Date/Time	Time and date field.
Number	Number field with predefined minimum and maximum values. The default is 1-10.
Percentage	Percentage field with a prescribed range.
Scale	Predefined Likert scale. Answer options appear as radio buttons. Multiple correct answers are supported.
Image Scale	Predefined set of images. Five emojis similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.
Numeric scale	Selectable number scale. The default is 1-5. Answer options appear as radio buttons. Multiple correct answers are supported.
String	Single or multi-line text field.
Template	Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.
Reference	Choice list of fields from a specified reference table. This data type does not support reference qualifiers.

Activate the quiz designer

Administrators can activate the Quiz Designer plugin.

Before you begin

Role required: assessment_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

View quiz reports

Use the Quiz Overview dashboard to view various reports on data such as Quizzes by State, Questions by Data Type, and Number of Correct Answers.

Before you begin
Role required: assessment_admin or admin

About this task
You can view the Quiz Overview dashboard to refresh the view and add new widgets.

Procedure

1. Navigate to **All** > **Quizzes** > **Overview**.
2. Click the elements within the reports to view more information.

   The Quiz Overview dashboard displays the following reports.

Quiz Overview dashboard reports

Report	Table
Quizzes by State	Assessment Instances [asmt_assessment_instance]
Total Questions by Quiz	Assessment Metrics [asmt_metric]
Questions by Data Type	Assessment Metrics [asmt_metric]
Correct Answers by Assigned User	Metric Results [asmt_metric_result]
Number of Correct Answers	Metric Results [asmt_metric_result]
Incorrect Answers by Assigned User	Metric Results [asmt_metric_result]
Number of Incorrect Answers	Metric Results [asmt_metric_result]

For more information about working with dashboards, see Dashboards.

Quiz designer

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the assessment engine to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see Create quizzes with forms.

Tools on the Quiz Designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to **Quizzes** > **Quiz Designer**.

The designer contains the following elements:

- **Controls** tab
- **Questions** tab
- **Categories** tab
- **Header** bar
- Design canvas

Controls tab

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.

Question controls (continued)

Data type	Description	Scored
	additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.	
String	Single or multiline text field.	N
Template	Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.	Y
Reference	Choice list of fields from a specified reference table. This data type does not support reference qualifiers.	

Questions tab

This tab displays all metrics added to the question bank for quizzes. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.

Categories tab

This tab displays all metric categories added to the question bank for quizzes. All metrics in the question bank are group under the corresponding metric category. Use the **Filter** field to search for categories or questions.

Header Bar

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon ( ) in the in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.
- **Copy Quiz**: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Before you begin

Role required: assessment_admin or admin

About this task

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Procedure

Create a quiz using these procedures.

Create quiz categories

Create quiz categories, which represent a theme for evaluating a specific element of the quiz topic and contain questions pertaining to that theme.

Before you begin

Role required: assessment_admin or admin

About this task

When you create a quiz, the system creates a default category using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

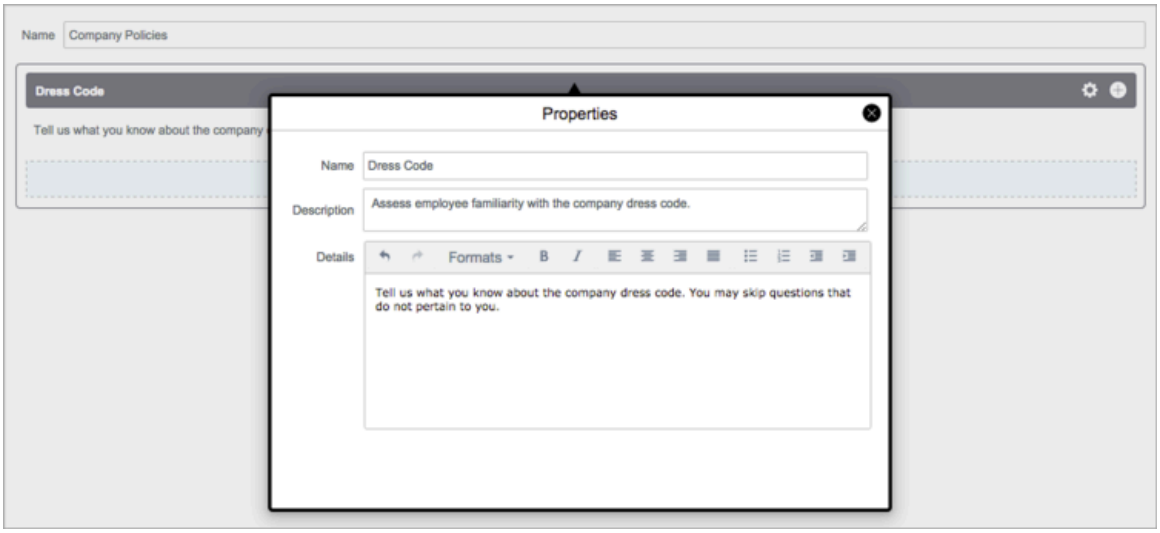
Procedure

1. Navigate either **Quizzes** > **Quiz Designer** or **Quizzes** > **Quizzes** and click **Quiz Designer** in the list header.
2. Enter the name of the quiz in the **Name** field.
   The system uses this name as the name of the quiz and the first category.
3. Configure the category.
   a. Click the gear icon in its title bar.
   b. In the **Properties** dialog box, set or modify the properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can change the name of the category, add a description for it, and enter text in the **Details** field that introduces or explains the category to the recipients. The system updates the category as you type.

c. Click the X icon to close the category properties dialog box and save your settings.



4. **Optional:** Add a new category by clicking the **+** icon in the title bar of an existing category.

Related topics

Create a quiz

Create quiz questions

Create multiple questions for each category. Each question can be associated with only one category.

Before you begin

Role required: assessment_admin or admin

About this task

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

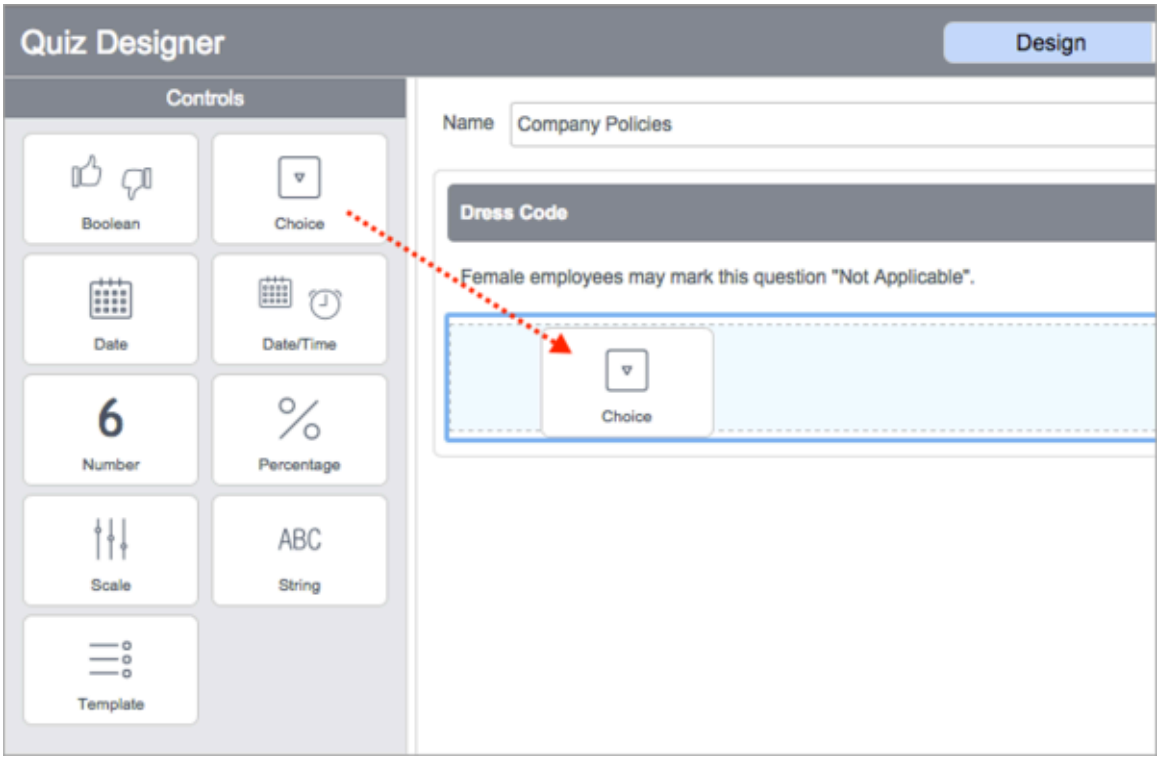
Note:

To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

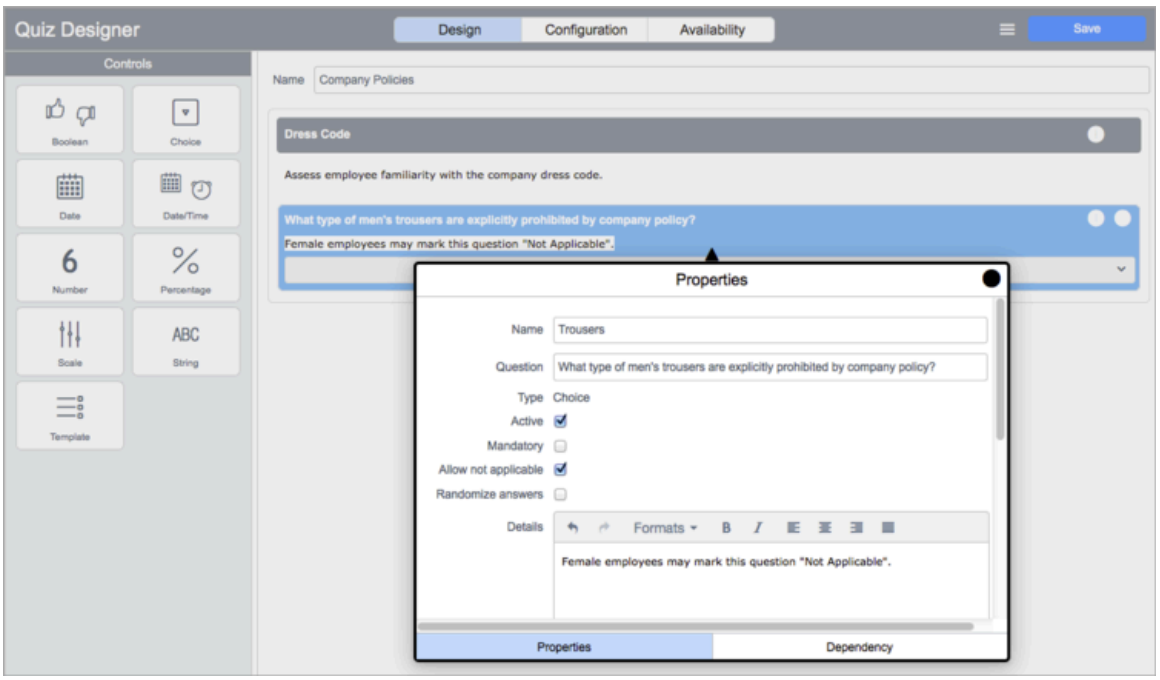
1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.



2. Configure the question.

Note:
To add a question with the same data type as an existing question in the category, select the **+** in the title bar of the existing question.

a. Select in the gear icon in its title bar.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. On the Properties form, fill in the fields.
For a description of the field values, see Question Properties form.

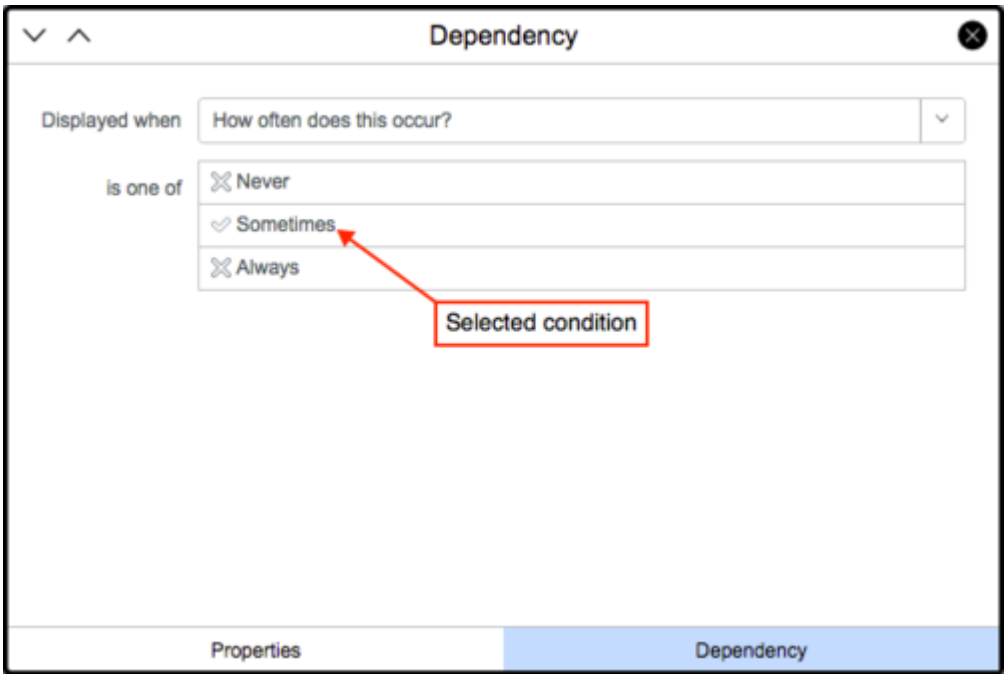
c. Create any special conditions that must be met for a question to appear on the quiz by selecting the **Dependency** tab and filling in the fields.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

d. Select a question in the Displayed when field.
The system selects the appropriate operator and displays the possible answers for the selected question.

e. Select the answers that satisfy the condition.

Selected answers are indicated by a check mark.



f. Select **X** to close the question properties dialog box and save your settings.

3. **Optional:** Drag questions to change their order within a category or move them between categories.
4. **Optional:** Delete a question by selecting the X in its title bar.

Configure a template question

You can configure template questions when designing quizzes.

Before you begin

Role required: assessment_admin or admin

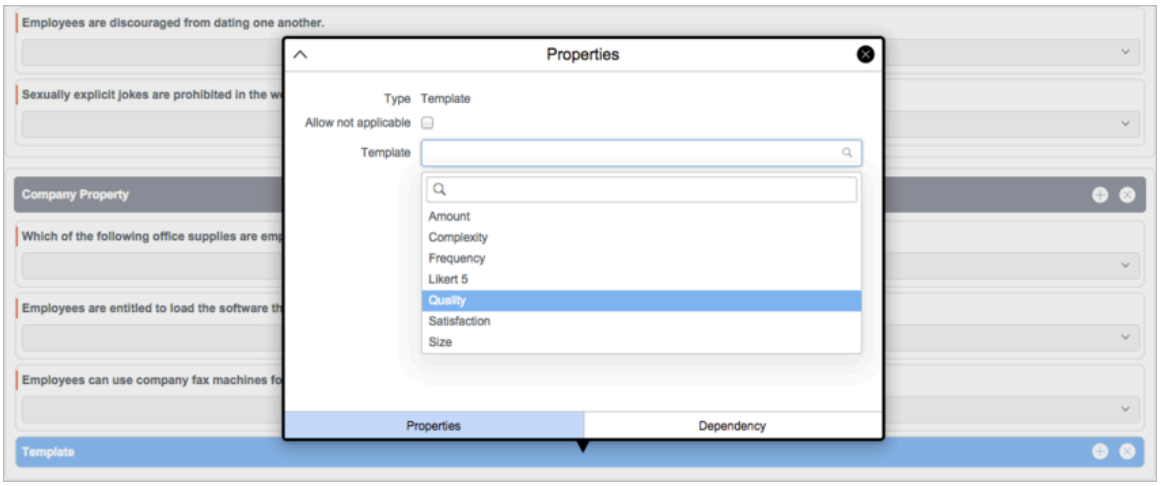
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

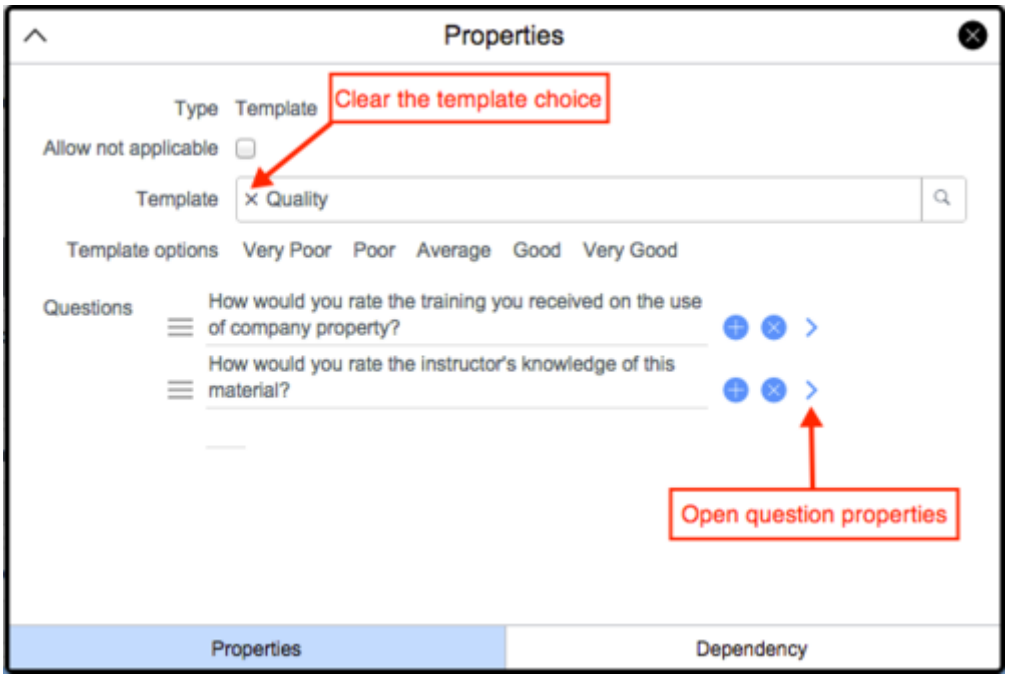
Procedure

1. Drag the **Template** data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.



Question entry fields appear for that template.

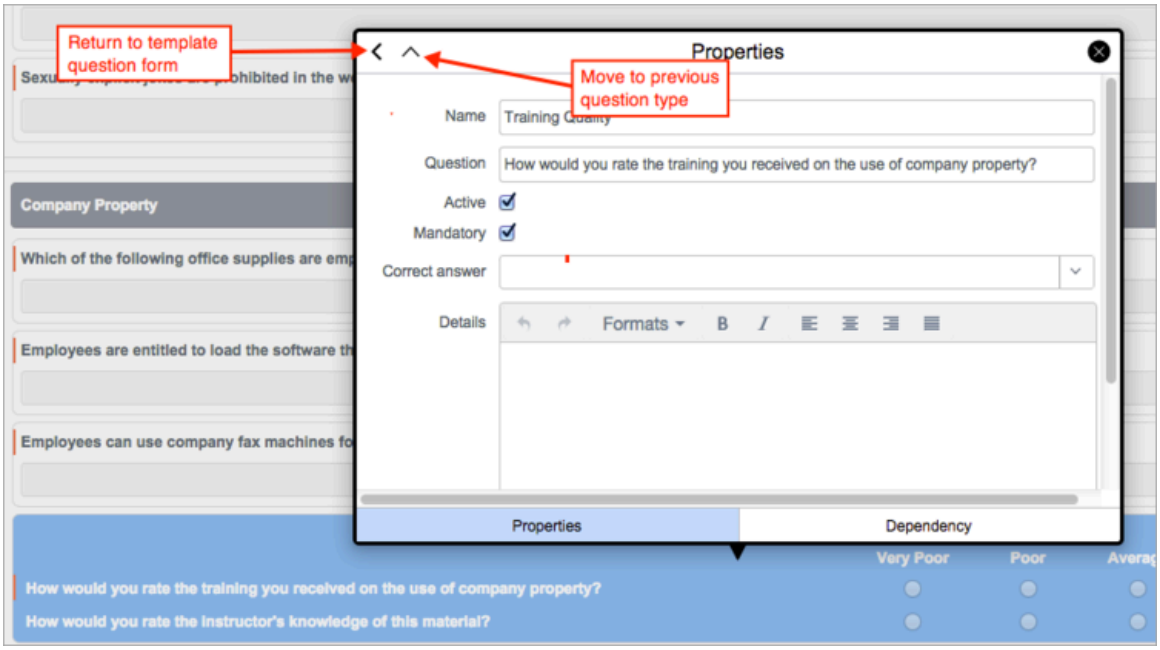
4. Enter one or more questions that are appropriate for the template.



5. Click the arrow to the right of a question to configure its properties.

   You must provide a name for each question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the **X** icon to close the template properties dialog box and save your settings.

Configure a scored question

Only scored questions are considered when calculating category and quiz results.

Before you begin

Role required: assessment_admin or admin

About this task

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

Procedure

1. Navigate to **All** > **Quizzes** > **Quizzes**.
2. Open the quiz containing the questions you want to mark as scored.
3. In the **Metric Categories** related list on the **Assessment Metric Type** form, select the category for the questions you want to mark as scored.
4. In the **Assessment Metrics** related list on the **Metric Category** form, select a question from the list.
5. In the **Question Type** section of the **Assessment Metric** form, select the **Scored** check box.

   This check box is not available if the question's data type is not supported for scoring.
6. Select the **Correct answer** for the question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Multiple correct answers are supported for a few data types. See Data types for quizzes.

7. Click **Update**.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a quiz

You can configure an entire quiz.

Before you begin

Role required: assessment_admin, survey_creator, or admin

About this task

The values you enter and select on this page are applied to the entire quiz.

Procedure

In the quiz designer, click **Configuration** and then fill in the fields as described in the table.

Quiz designer configuration

Field	Description
Active	Check box for enabling the distribution of this quiz to recipients.
Description	Description of this configuration or the quiz to which it is attached.
Introduction	Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.
Owners	Owners of the quiz. You can add a user with the survey_creator, survey_admin, or assessment_admin role.
Signature	[Optional] Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.
Return URL	Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the **End note** content does not appear.
End note	Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a **Return URL** is specified.
Duration	Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.
Manager	Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.
Notify manager if overdue	Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.
Related Links

Field	Description
Show Benchmarks	Opens the Benchmarks Dashboard that provides visibility into your key performance indicators (KPIs) and trends. **Note:** • This related link is available only for survey_admin, assessment_admin and survey_reader with bm_viewer role. • You must opt in to Benchmarks to view the dashboard. See Enable Benchmarks • This is applicable only for a published quiz.

Select a quiz recipient

When the system distributes a quiz, it sends email notifications to the category users and their managers.

Before you begin
Role required: assessment_admin or admin

About this task
A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients' **My Assessments & Surveys** portal. Users can only answer questions in the categories that they are assigned to.

Procedure

To select the recipients for each quiz category, click **Availability** and then fill in the fields as described in the table.

Select recipients

Field	Description
Select category	Category for which the selected users are recipients.
Add users	Users selected as recipients for this category. The choice list shows all users in the system.

Copy a quiz

Create a copy of a quiz with at least one category to reduce the effort of creating another quiz with similar data.

Before you begin
Role required: assessment_admin or admin

About this task
All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

Procedure

1. Navigate to **All** > **Quizzes** > **Quizzes**.
2. Select a quiz.
3. Perform any of the following steps.

Edit a quiz

You can update a quiz after the quiz has been distributed.

Before you begin
Role required: assessment_admin or admin

About this task
You can only edit a quiz that has the same application scope as that of your current session.

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

Procedure

Open the quiz: Group the Service Details form with one of the following options.

   - Average Ratings
   - History

View an assessment category result

Category results contain values that represent an evaluated record's performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based on category and metric weights and from metric result values for the same category.

Before you begin

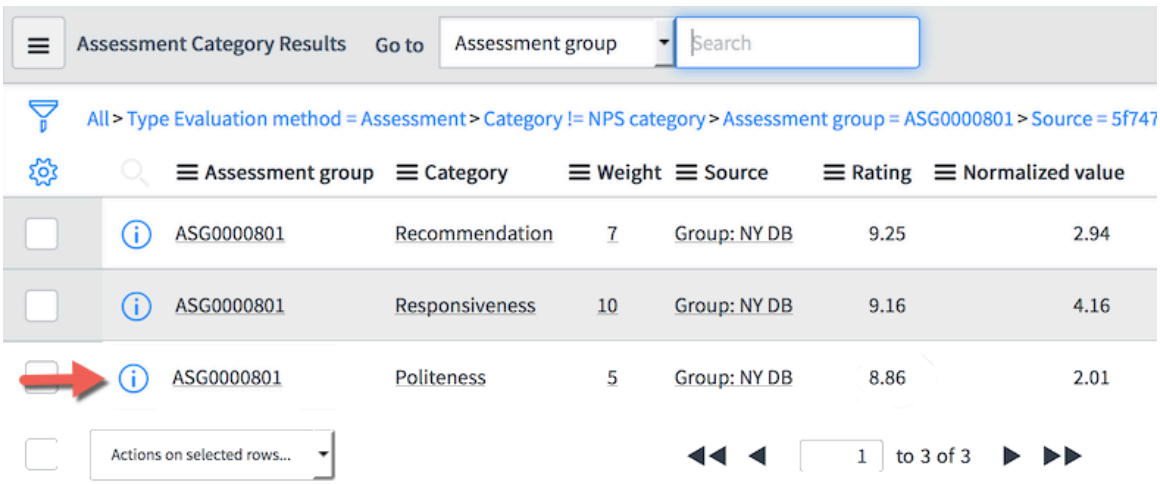
Role required: assessment_admin or admin

About this task

Note:
The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

Procedure

1. Navigate to **All** > **Assessments** > **Results** > **Category Results**.
2. Click the reference icon ( ) next to an assessment group number to open the category result record.

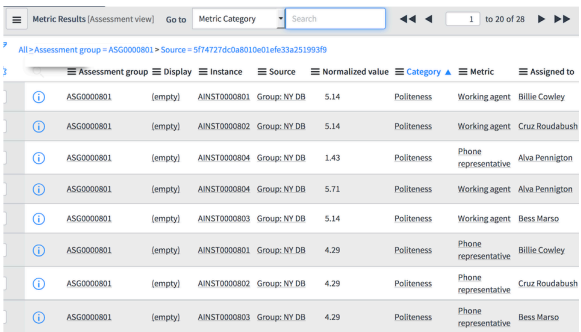


3. View the Assessment Category Result form.
   All fields on the form are read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assessment Category Result form

Field	Description
Category	Name of the metric category that the category result values apply to.

Rating	Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:
	`(Sum of all normalized values that share a particular assessment group, category, and assessable record) / (Number of assessment instances for the assessment group)`
	For example: In the Assessment Category Results table example, the assessment group **ASG0000801** with category **Politeness** from group **NY DB** (the assessable record) has a **Rating** value **8.86**.
	On the associated Metric Results table, you can see that there are **4** instances of this group: **AINST0000801**, **AINST0000802**, **AINST0000803**, and**AINST0000804**.
	The system calculated the rating using
	`(5.14+5.14+1.43+5.71+5.14+4.29+4.29+4.29) / 4 = 8.86`
	 


Assessment group	Assessment group to which the category result is associated. The category result **Rating** and **Normalized value** are calculated from metric results in this assessment group only.
Normalized value	Calculated value that measures the **Rating** relative to the weights of categories used to assess the record evaluated. The normalized value is calculated as follows: Normalized value = Rating x (Associated category weight / Sum of weights of all categories the source record has category results for in this assessment group) Example: A source record has four associated category results in assessment group ASG0000907, one for each of these categories: ○ Importance Rating (weight = 10) ○ Product Reliability (weight = 9) ○ Company Alignment (weight = 9) ○ Compliance Score (weight = 9)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If this source record's category result for Product Reliability has a Rating of 7.81, the normalized value calculation is: 7.81 x [9 / (10+9+9+9)] = 1.9
Weight	Weight of the associated category. You may need to configure the form to see this field.
Source	Record evaluated as the assessment subject. You may need to configure the form to see this field.

Quiz scorecards

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions

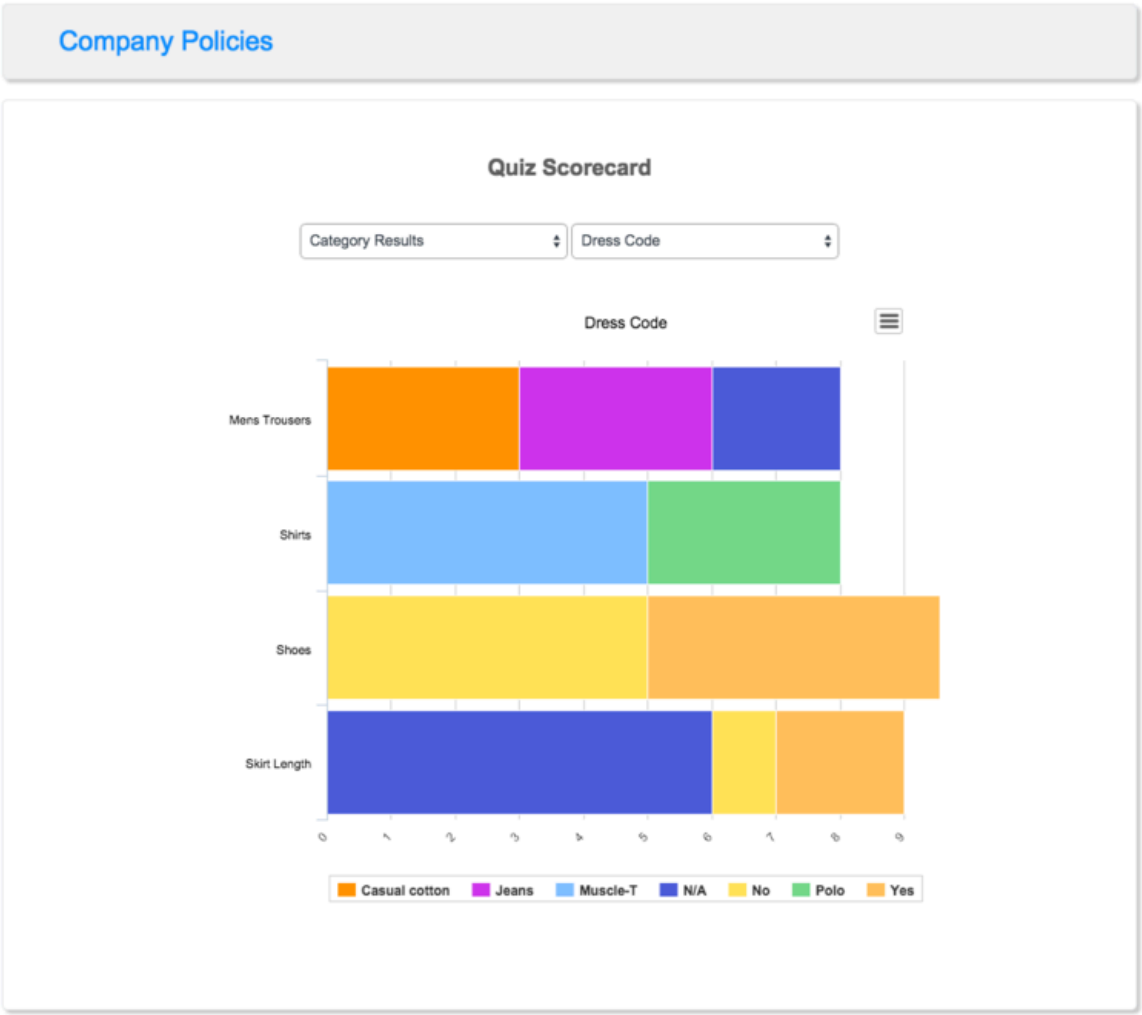
This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note:
The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Quiz designer.

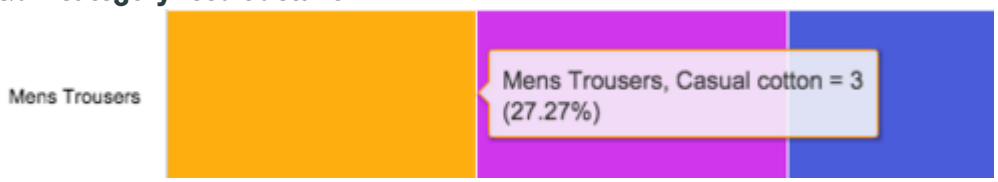
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quiz category results



To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Quiz category result details



Question results

The Question Results view shows the results for all questions in a quiz.

Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart

The pie chart shows question results for these data types:

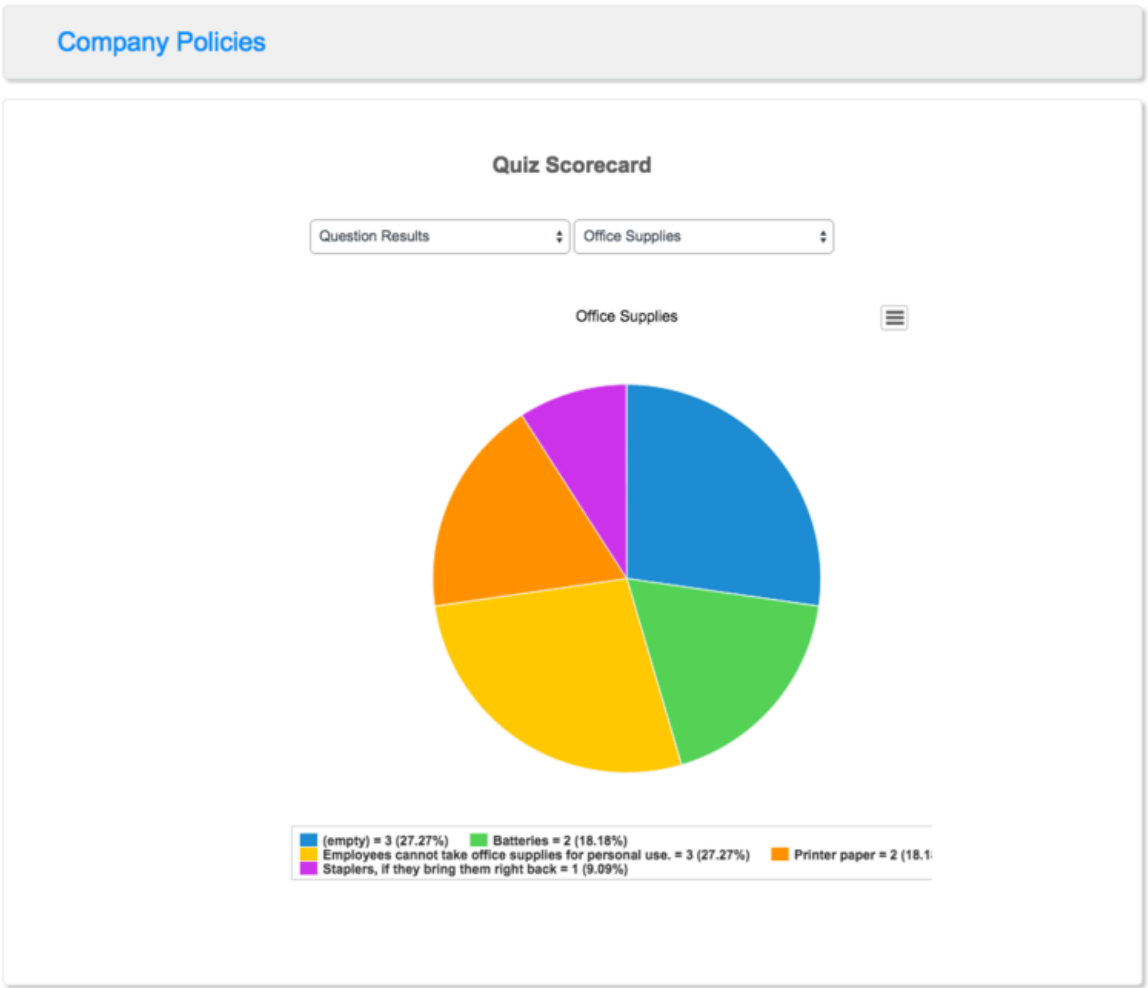
- Checkbox
- Choice

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Likert Scale
- Number
- Template
- Yes/No

Note:
The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Quiz designer

Quiz scorecard question results - pie chart



Bar chart

A bar chart appears when question results use this data type:

Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to **Reports** > **Administration** > **Report Ranges**.

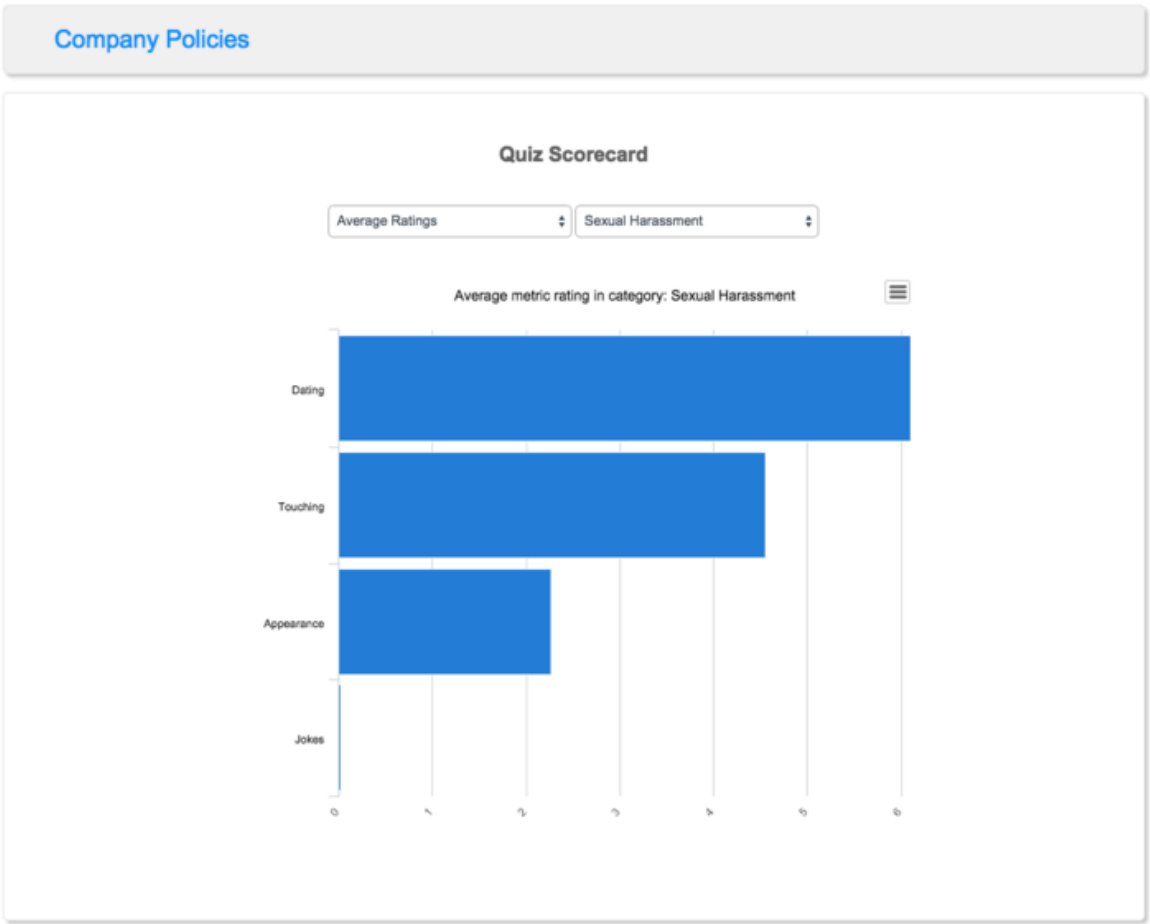
Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

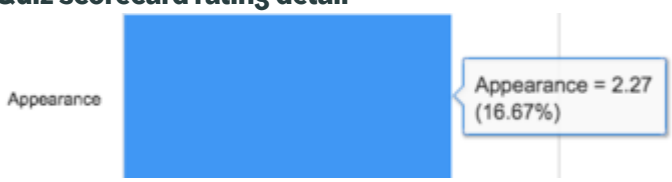
Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions

Average Ratings view



To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

Quiz scorecard rating detail



Scorecard history

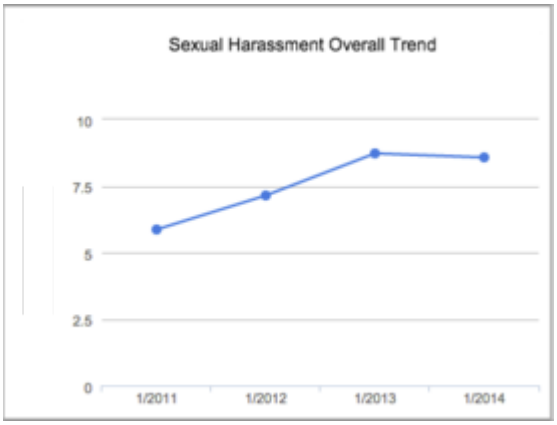
The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters..

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for scored questions questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

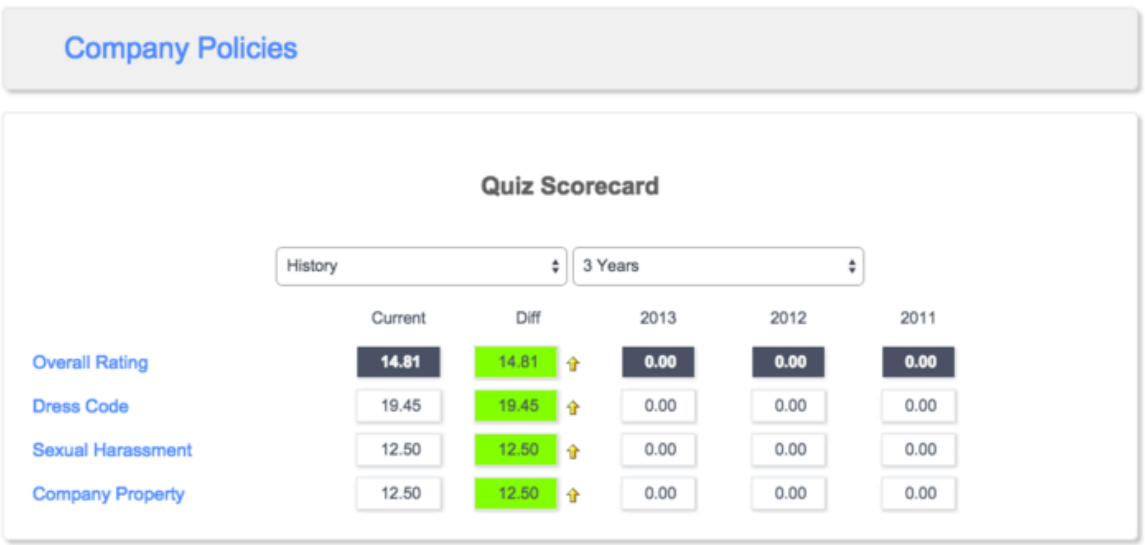
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scorecard trend chart



3 Years: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year's ratings.

Scorecard history - 3 years



4 Quarters: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd [2013], 1st [2013], 4th [2012], and 3rd [2012]. All four of the previous quarters appear, whether or not there was any data for those quarters.

Take a quiz

All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Before you begin

Role required: none

About this task

No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

Procedure

1. Navigate to **All** > **Self-Service** > **My Assessments & Surveys**.
2. Click **Take Quiz** on a quiz card to open the questionnaire.
   If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.
3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable if that choice is available.
4. Click **Save** at any time to save your responses without submitting them.
   You can reopen the quiz from your queue when you are ready to work on it again.
5. When you are ready to submit the completed quiz, read any assertions that require your attention.
6. If present, select the check box to acknowledge the assertion.

   Note:
   If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.

7. Click **Submit**.
8. If prompted, enter your user name and password to verify your signature.
   If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a **Modify Quiz** button after submission. If retakes are not permitted, the card disappears from your queue.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.
10. **Optional:** Edit your answers and resubmit a quiz that permits retakes by clicking **Modify Quiz**. You can modify your responses to the quiz until its due date.

View a quiz instance

View an instance to verify that quiz instances were created, to check the state of a quiz instance, or to reassign a quiz instance. A quiz instance represents one questionnaire assigned to one user.

Before you begin

Role required: admin or assessment_admin

Procedure

1. Navigate to **All** > **Quizzes** > **Quiz Instances**.
   The following submodules are available based on the state of the instances:
   - **Ready to take**: Displays quiz instances that the user can take. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays quiz instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays quiz instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays quiz instances that are canceled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays quiz instances in all states. By default, these instances are sorted in ascending order by the **Number** field.
2. From the required submodule, click a quiz instance.

   By default, the fields listed in the following table are displayed for all submodules other than the **Completed** submodule.

   Note:
   When you select an instance in the **Completed** submodule, you are redirected to the User's Response page.

3. In the form, fill the fields.

Quiz instance form

Field	Description
Number	Automatically generated record number.
Metric type	Metric type of this quiz.
Due Date	Date by which the quiz instance should be completed. The system populates the due date based on the **Assessment duration** of the associated quiz definition, which is set to 14 days by default. The quiz due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	State of the quiz.
Assigned to	User that the quiz instance is assigned to. This field becomes read-only when the state is **In progress**, **Complete**, or **Canceled**.
Domain	Domain associated with the instance.
Related Link	
View User's Response	Shows a read-only version of the survey responses completed by the user.
Related List	
Assessment Instance Questions	All instance question records that store user response values for each question on the quiz questionnaire. The following columns are relevant to quiz: ○ **Category**: Displays the quiz categories the questions belong to. ○ **Metric**: Displays the quiz questions.

Add a metric category and metric in the question bank for quizzes

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for quizzes. You can add metric categories or metrics from the question bank to a quiz, or from the quiz to a question bank.

Before you begin

Role required: admin or assessment_admin

Procedure

1. Navigate to **All** > **Quizzes** > **Question Bank**.
2. Click **New**.
3. In the Metric Category form, fill the fields.

Metric Category fields

Field	Description
Name	Name of the metric category.
Description	Description of the metric category.
Total metrics	Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Assessment Metric form, fill the fields.
7. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Configure metric categories or metrics for a quiz using the question bank

Reuse question categories (metric categories) and questions (metrics) from the **Question Bank** module while creating or updating a quiz.

Before you begin

Role required: admin or assessment_admin

Procedure

1. Navigate to **All** > **Quizzes** > **Quizzes**.
2. Open a quiz definition.
3. **Optional:** To add metric categories to a quiz from the question bank in Platform, perform the following steps.
   a. In the Metric Categories related list, click **New Category from Bank**.
   The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.
   b. Select the required categories and click **Add Selected**.
   A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.
4. **Optional:** To add metrics to a quiz from the question bank in Platform, perform the following steps.
   a. In the Metric Categories related list, open a metric category definition.
   b. In the Assessment Metrics related list, click **New Metric from Bank**.
   The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.
   c. Select the required metrics and click **Add Selected**.
   A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.
5. **Optional:** To add a metric category to the question bank from a quiz in Platform, perform the following steps.
   a. In the Metric Categories related list, open a metric category definition.
   b. Click **Add to Question Bank**.
   A copy of the category is created along with its metrics and metric definitions in the question bank.
6. **Optional:** To add a metric to the question bank from a quiz in Platform, perform the following steps.
   a. In the Metric Categories related list, open a metric category definition.
   b. In the Assessment Metrics related list, open the required metric definition.
   c. Click **Add to Question Bank**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Add to Question Bank dialog box is displayed.

d. In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. **Optional:** To add a metric category or metric to a quiz from the question bank in Quiz Designer, perform the following steps.
   a. Open the quiz in Quiz Designer.
   b. **Optional:** To add a metric category from the question bank, from the **Categories** tab in the left panel, drag the required category banner and drop in the **Design** tab.
   c. **Optional:** To add a metric from the question bank, drag and drop the required metric from the **Questions** tab or the **Categories** tab.

Note:

- When you drag and drop a metric category, all dependencies within the category are also added to the quiz.
- From the **Categories** tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.

Create quizzes with forms

As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.

All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in **quiz views** of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

- Create the quiz.
- Set up the categories.
- Create the questions for the quiz.
- Create the answers for the questions.
- Distribute the quizzes to recipients.

Note:
The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Before you begin

Role required: none

About this task

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the **Quiz view** of the Metric Category table.

Categories have weighting values that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

Procedure

You can create a new category or edit an existing one from the **Metric Categories** related list of a quiz record.

Select a user for a category

Category users are the recipients of the questions for each category.

Before you begin

Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

Procedure

To select users for a category, select the **Users** related list in a category record, and click **Edit**.

Create questions

Create quiz questions. A category can have multiple questions associated with it.

Before you begin

Role required: none

About this task

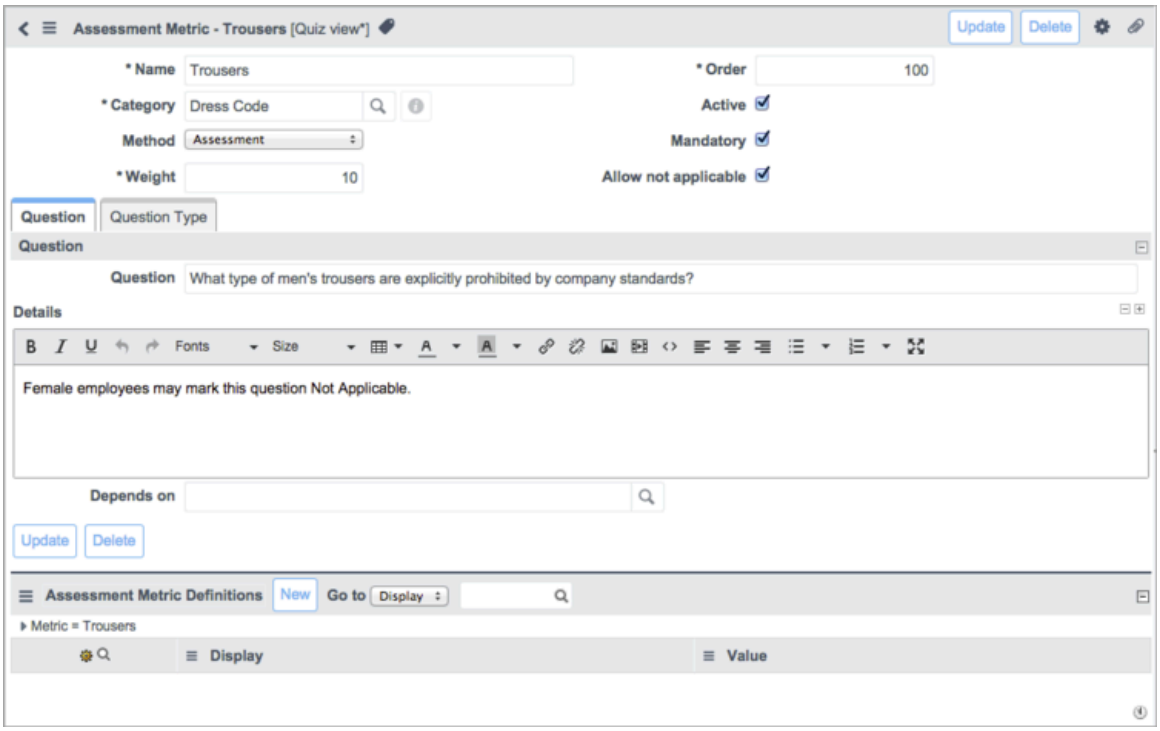
Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

Procedure

1. Open a category record.
2. Create a question record in one of the following ways:
   - By accessing the Assessment Metrics related list and selecting **New**.
   - Navigate to **Quiz Management** > **Questions** and select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Warning:
When you create a **Choice**or **Likert Scale** question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.



On the form, fill in the fields.

Field	Description
Name	[Required] Name of the question.
Category	[Required] Category the question belongs to. The system populates this category if you create a new question from the Metric Category form. **Note:** You cannot change the category if the **Depends on** field is set or if another metric depends on this metric.
Method	Setting that determines how to use the question. ○ **Assessment**: Makes the question available on a quiz distributed to users. The **Assessment** method is compatible with all data types except **Duration**. ○ **Script**: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user's knowledge of a topic. **Note:** If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Weight	Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For weighting suggestions, see weight categories and metrics. This field is available and required unless the **Data type** is **Date**, **Date/Time**, or **String**. These data types are not included in results calculations.
Order	[Required] Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category's section. By default, the order is 100. **Note:** It does not matter which order value you use for metrics with the **Script** method, because they do not appear on questionnaires.
Active	Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive.
Mandatory	Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is available only if the **Method** is **Assessment**, the **Depends**on field is empty, and the **Data type** is not **Checkbox**.
Allow not applicable	Check box for including **Not Applicable** as a possible answer for this question. Users can select **Not Applicable** if they do not have sufficient information to respond to a question. User responses of **Not Applicable** are excluded from results.
Question	
Question	The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.
Details	Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.
Depends on	An existing question that this question is dependent on. You can select **Checkbox**,**Choice**, **Likert Scale**, **Template**, and **Yes/No** questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.
Question Type	
Data type	[Required] Format of the expected response data. See the table of **data types** for details. **Note:** You cannot change the data type if another question depends on this question
Randomize answers	Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the **Data type** is **Choice** or **Likert** Scale. **Note:** Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.
Scale definition	Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select **Low** if lesser numerical values are better. Select **High** if greater numerical values are better. The default value is**High**. This field is available and required unless the **Data type** is **Date**, **Date/Time**, or **String**. The results for these data types are not included in results calculations. When the Scored check box is selected, the scale value is set to **High** and the field is hidden. **Note:** For information about how to set the scale definition for data types that do not require you to set a numerical value, see Data types for assessments.
Min	Lowest numerical value that can be used as an answer option. This field is available and required only if **Data type** is **Number**, **Duration**, or **Percentage**.
Max	Highest numerical value that can be used as an answer option or scaled value. This field is available and required if **Data type** is **Number**, **Duration**, or **Percentage**.
String option	Setting for the appearance of a string field in a question. This field is available when the question type is **String**. The string options are: ○ **Single line**: Single line text field 40 characters in length that allows strings of any length. ○ **String line wide**: Full page width text field that allows a single line entry of any length. ○ **Multiline**: Full page width multiline text field that allows word wrap and returns.
Scored	Check box for using answers in scoring the category results and showing them in the quiz results. Scored questions are available for these data types: ○ Choice ○ Likert Scale ○ Template ○ Checkbox ○ Yes/No Selecting this check box hides the **Scale definition** field and sets the value in that field to **High**.
Correct answer	[Required] Desired answer to a scored question. This field is available when the **Scored** check box is selected. Multiple correct answers are supported for a few data types. See Data types for quizzes.

Create answers for questions

Create answer options for questions with the Choice or Likert Scale data type.

Before you begin

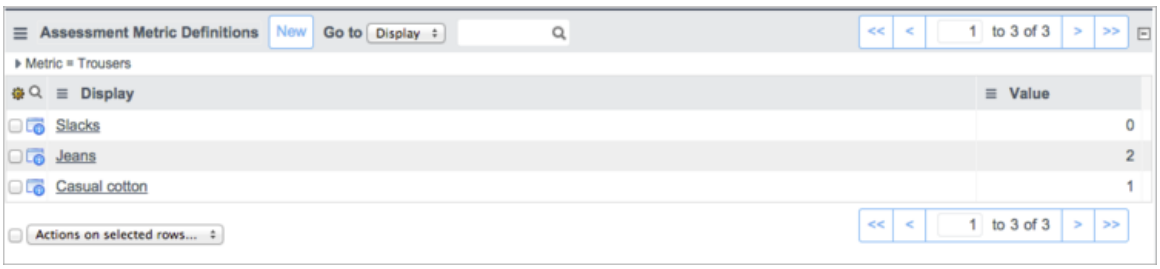
Role required: none

About this task

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question **What type of men's trousers are not permitted by company policy?** might have these three answers configured as metric definitions: **Slacks**, **Jeans**, and **Casual cotton**.

Procedure

1. Open the question record you want to edit.
2. Click **New** in the **Assessment Metric Definitions** related list.



3. Set the order in which the answers appear in the quiz by providing a hierarchical number in the **Value** field.

Distribute a quiz

When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

Before you begin

Role required: none

About this task

You can send the quiz to all the category users configured for the quiz or to a single category user.

Procedure

1. Navigate to **All** > **Quiz Management** > **Quizzes**.
2. Open the quiz record, and click **Publish**.
   The quiz is placed in the Published state, and it is sent to all its category users.
3. **Optional:** Edit the published quiz.
   See Modifying Published Quizzes to learn how various modifications affect the quiz contents.
4. **Optional:** Resend a quiz to either on category user or all category users.
   - Send the quiz to one category user by clicking **Assign Quiz**.
   - Send the quiz to all of its category users by clicking **Send Quizzes**.

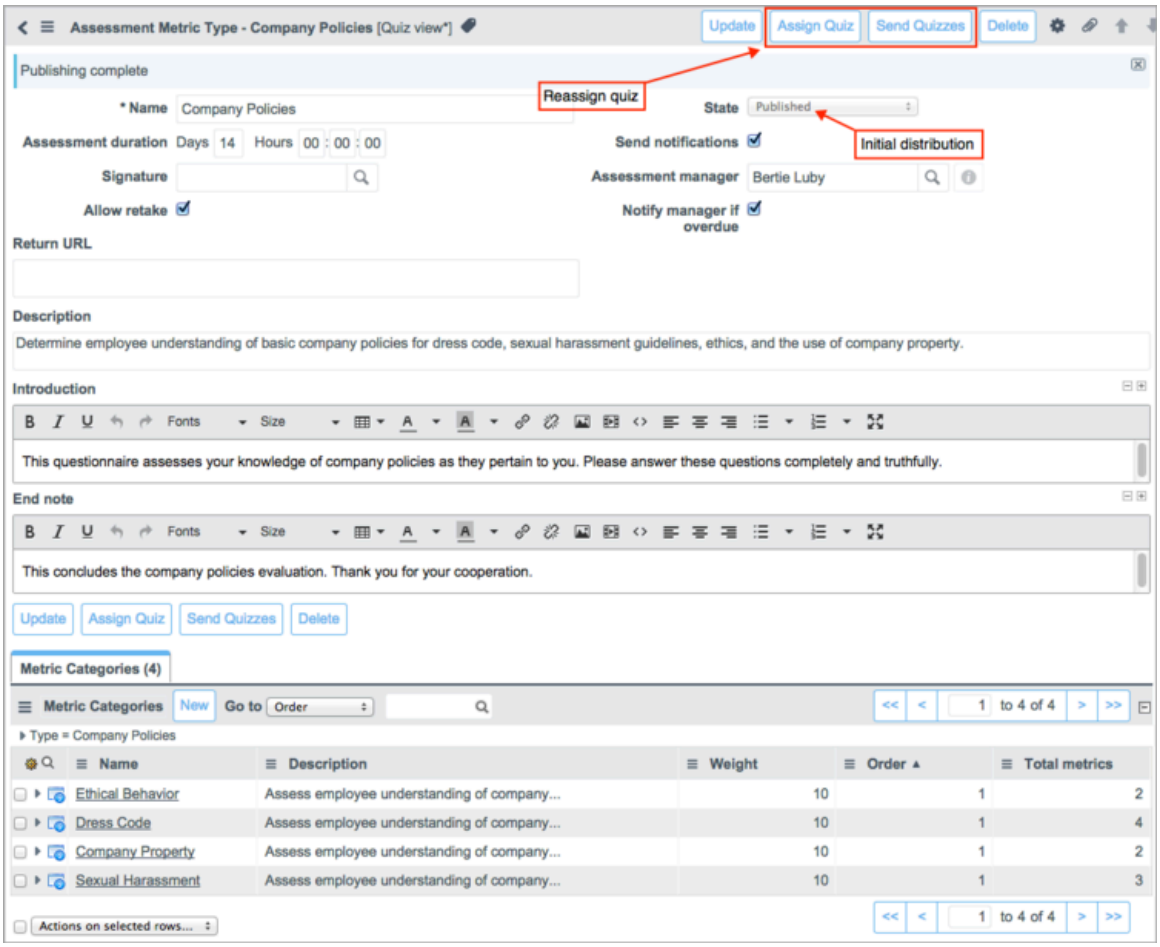
Note:
These buttons are hidden if there are no category users defined for the quiz.



Related topics

Create a quiz

Modify a published quiz

Modify a published quiz

Post changes to existing questions immediately. Make new questions available to users who have not started the quiz.

Before you begin

Role required: none

Procedure

You can edit a quiz even after it has been distributed, with these results:

- Added questions are available only on quizzes that are distributed after this change.
- Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed quizzes in users' queues.

Quizzes reference

Reference topics provide additional information about the forms, fields, and properties you use while working with quizzes.

Quiz scorecards

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results

The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions

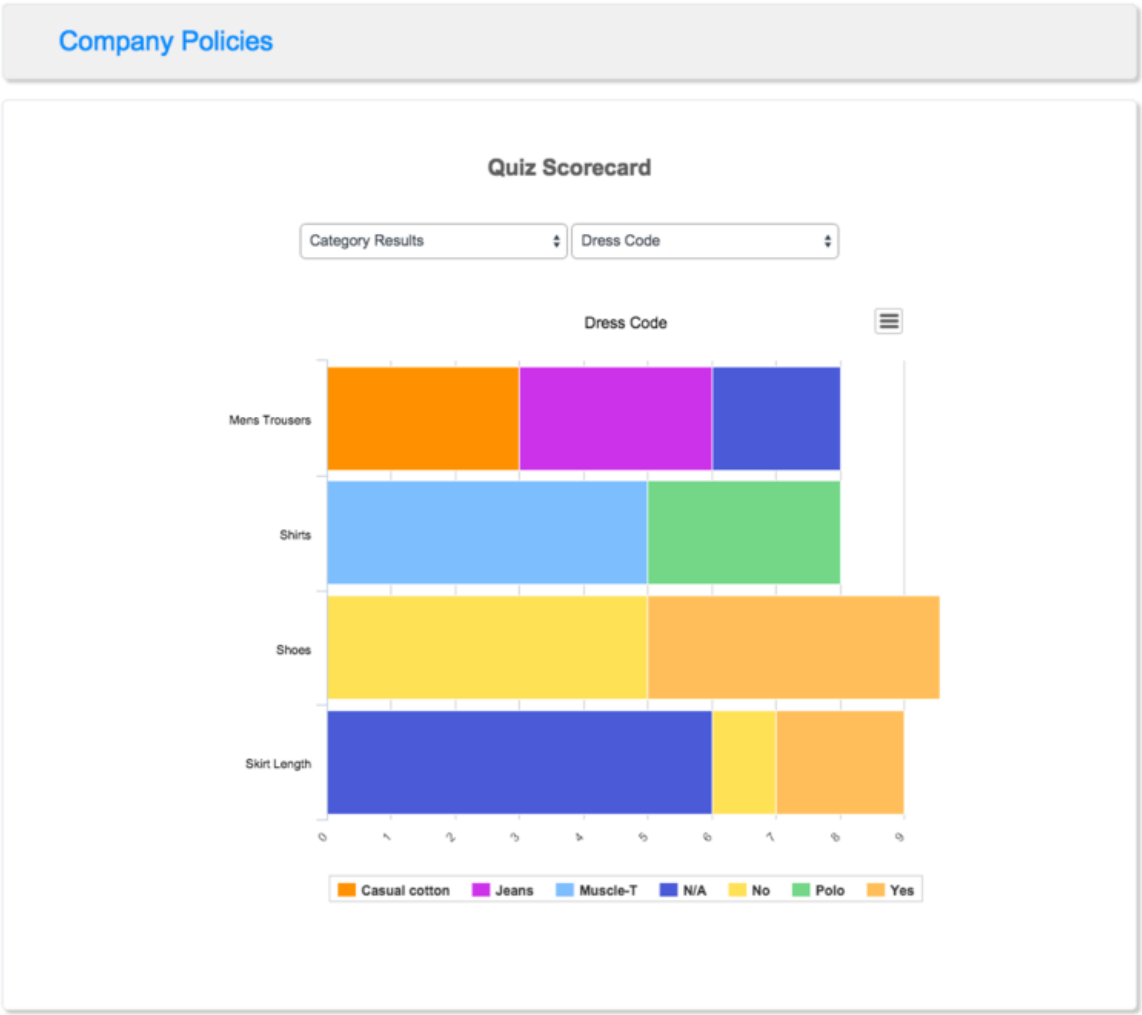
This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note:
The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Quiz designer.

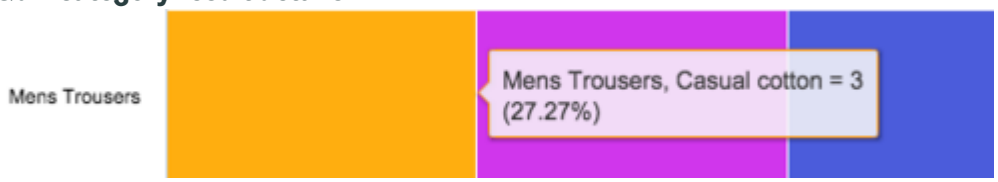
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quiz category results



To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Quiz category result details



Question results

The Question Results view shows the results for all questions in a quiz.

Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart

The pie chart shows question results for these data types:

- Checkbox
- Choice

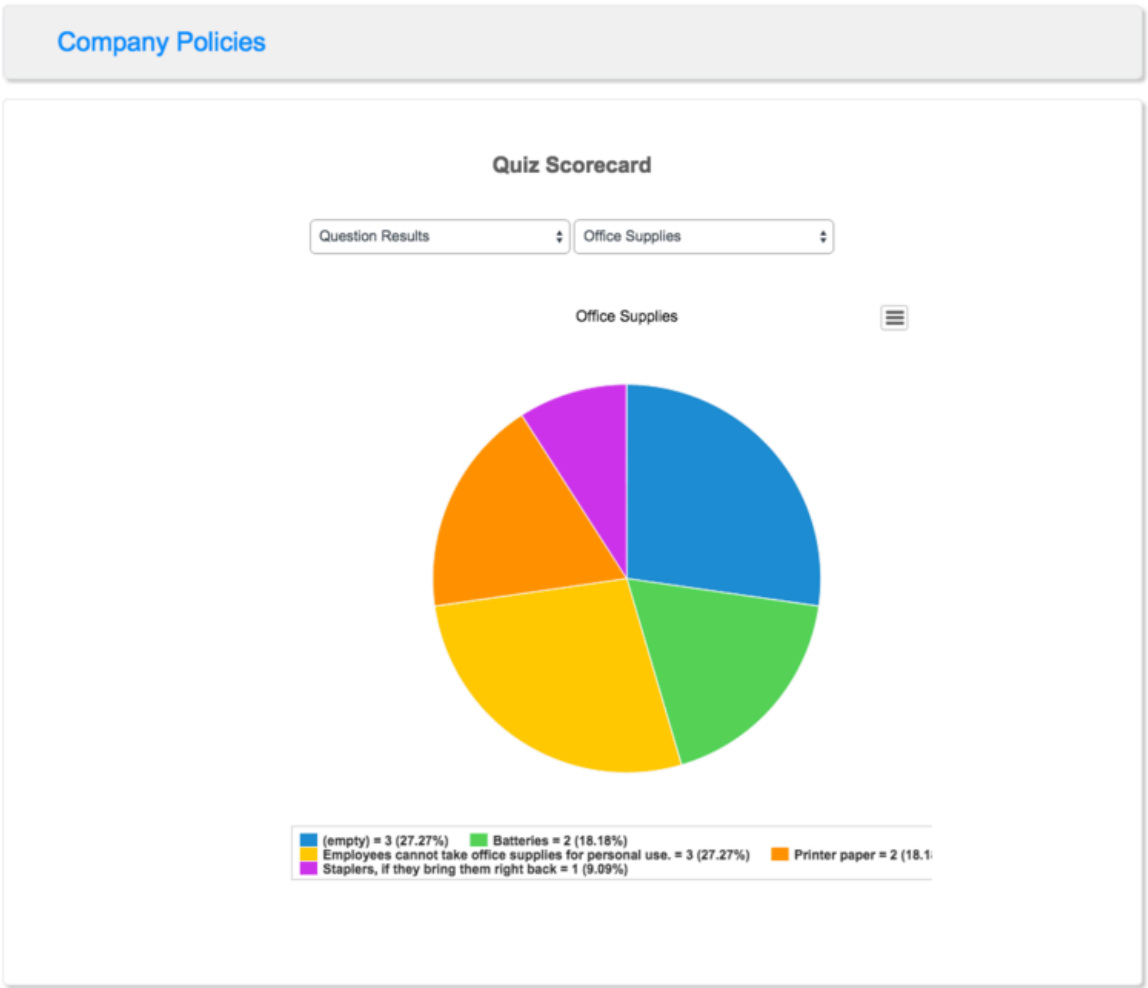
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Likert Scale
- Number
- Template
- Yes/No

Note:
The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Quiz designer

Quiz scorecard question results - pie chart



Bar chart

A bar chart appears when question results use this data type:

Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to **Reports** > **Administration** > **Report Ranges**.

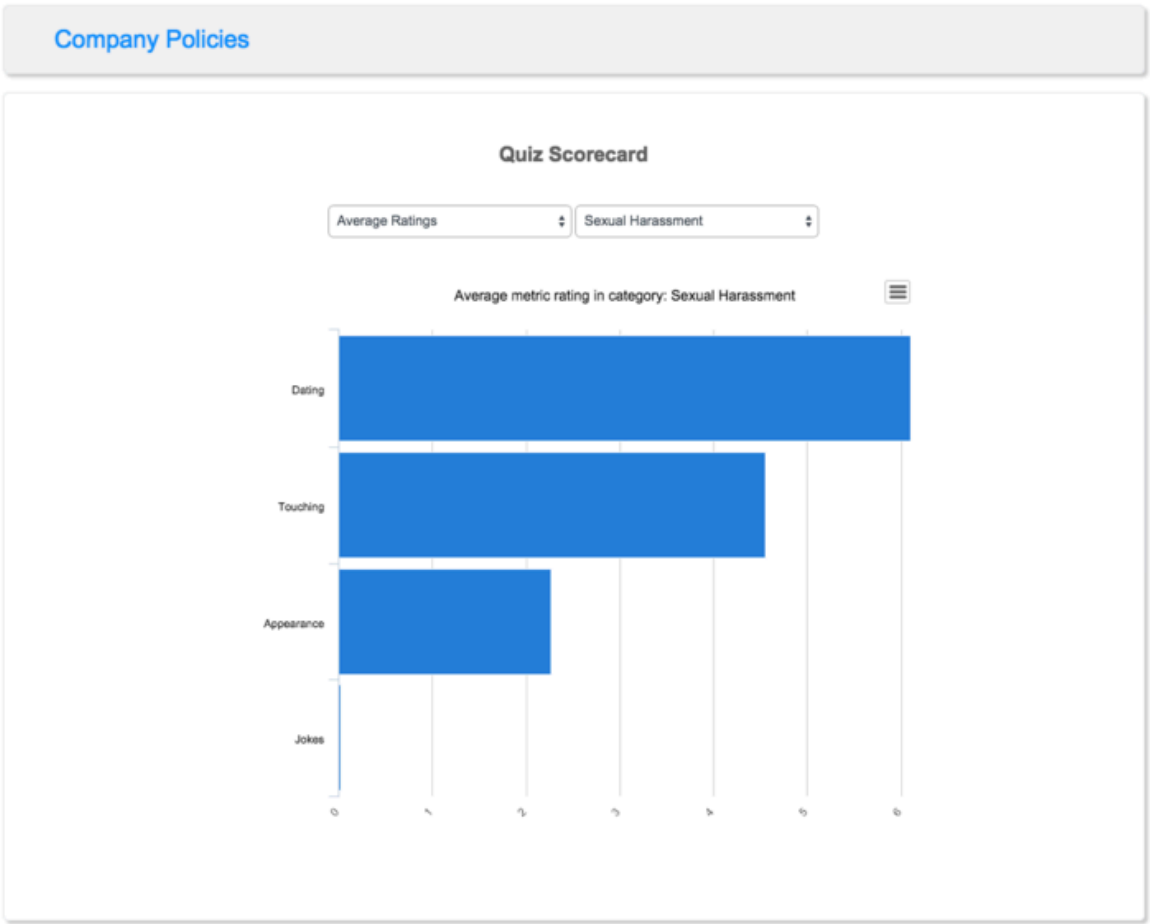
Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

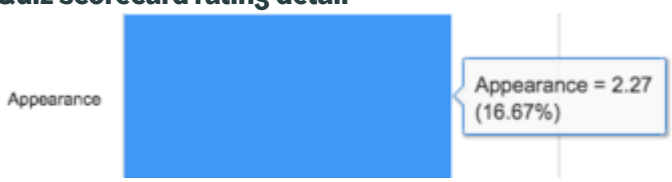
Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions

Average Ratings view



To view the effect of each question's ratings on the entire category's ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question's weighted average.

Quiz scorecard rating detail



Question Properties form

Description of the field values for the Question Properties form.

Question Properties form

Field	Description
Name	[Required] Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question Properties form (continued)

Field	Description
Question	Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.
Type	[Read-only] Data type selected for this question. See the table in Controls for possible data types.
Active	Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.
Boolean option	Whether a check box or a **Yes/No** list appears as the option for the Boolean question.
Mandatory	Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red Introduction_to_Fields#Field_Status_Indicator" --> field status indicator. This field is available when the question does not have a dependency and the question Controls is not **Boolean** with a check box option.
String option	Setting for the appearance of a string field in a question. This field is available when the question type is **String**. The string options are: • **Single line**: Single line text field 40 characters in length that allows strings of any length. • **String line wide**: Full page width text field that allows a single line entry of any length. • **Multiline**: Full page width multi-line text field that allows word wrap and returns.
Min	Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is **Number**, **Percentage**, or **Numeric Scale**.
Max	Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is **Number**, **Percentage**, or **Numeric Scale**.
Allow not applicable	Check box for including **Not Applicable** as an option for this question. Users can select **Not Applicable** if they do not have sufficient information to respond to a question. User responses of **Not Applicable** are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not **Boolean** with a check box option.
Randomize answers	Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.
Details	Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question Properties form (continued)

Field	Description
Correct answer	Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except **Date**, **Date/Time**, and **String**. Multiple correct answers are supported for a few data types. See data types.
Choices	Options for a question with a data type of **Choice** or **Scale**. The system automatically adds text and values that you can edit for each option. Click the **+** icon to add an option, or click the **X** icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.
Dependency	
Displayed when	Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of **Boolean**, **Choice**, **Scale**, or **Template**. Create the condition that must exist for recipients to see the dependent question, using the **is** or **is one of** operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options.

For detailed field information and reporting options, click the link for the chart **Type**. To sort a column in ascending or descending order, click the arrow in the column heading

Quiz reports

Type	Description
Quizzes by State	State of distributed quizzes. This chart displays the percentage of distributed quizzes that are ready to take, in progress, complete, or canceled. • **Type**: Pie Chart • **Table**: Assessment Instance [asmt_assessment_instance]
Total Questions by Quiz	Total number of questions for all categories in each quiz.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quiz reports (continued)

Type	Description
	• **Type**: Bar Chart • **Table**: Assessment Metric [asmt_metric]
Questions by Data Type	Total number of questions in all quizzes by data type. • **Type**: Bar Chart • **Table**: Assessment Metric [asmt_metric]
Correct Answers by Assigned User	Total number of scored questions answered correctly by each assigned user. • **Type**: Bar Chart • **Table**: Metric Results [asmt_metric_result]
Number of Correct Answers	Total number of correct answers for each scored question. • **Type**: Bar Chart • **Table**: Metric Results [asmt_metric_result]
Incorrect Answers by Assigned User	Total number of scored questions answered incorrectly by each assigned user. • **Type**: Bar Chart • **Table**: Metric Results [asmt_metric_result]
Number of Incorrect Answers	Total number of incorrect answers for each scored question. • **Type**: Bar Chart • **Table**: Metric Results [asmt_metric_result]

Classic approvals

Classic approvals are a legacy process to require authorization on tasks before the work is done. In earlier releases, you could create approval records to define approval tasks and associate users or groups to approve or reject them.

Administrators can define classic approval logic by navigating to **All** > **System Policy** > **Rules** > **Approvals**.

Important:
Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

Administrators can see all approval requests by navigating to **All** > **Self-Service** > **My Approvals** and removing the list filter.

An approval record consists of these fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval record components

Field	Input value
Approver	A reference to the user who is responsible for approving the related record.
State	Choices are: • Not Yet Requested (This state indicates that you are not yet asking your approvers to approve this request. Until you set the status to **Requested** they will receive no email notifications about the request.) • Requested • Approved • Rejected
Approving	A document_id reference field to the record being approved, on any table.
Comments	A journal field for storing comments regarding the approval.
Approval Summarizer	A Create a formatter and add it to a form that displays key fields relevant to the approval from the referenced document. This summarizer will not display if there is no record referenced.

Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications.

Important:
Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.

Approval engine options

Option	Description
Approval Rules	A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to **System Policy** > **Approvals**.
Process Guides	A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.
Turn off Engines	Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table. **Note:** Not turning off the approval engines might have a performance or behavioral impact on your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

Before you begin

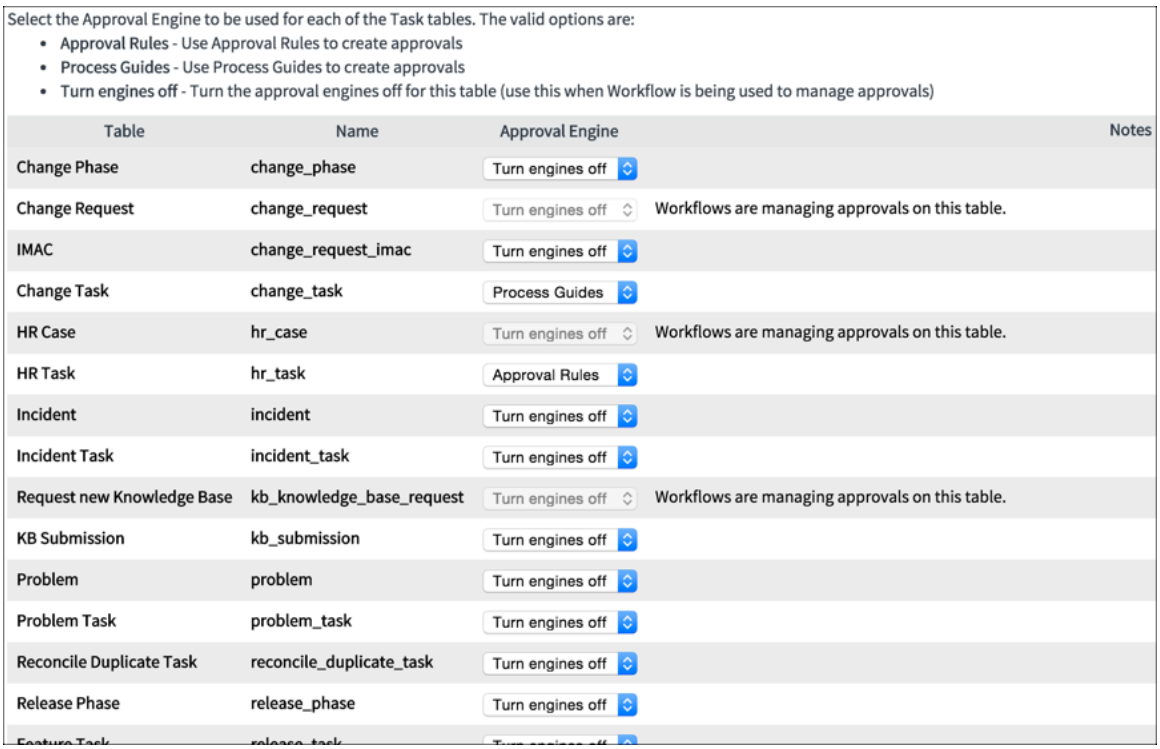
Role required: none

> **Important:**
> Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

Procedure

1. Navigate to **All** > **System Properties** > **Approval Engines**.

   The following page appears with the **Approval Engine** option for each Task table in the system. If the **Approval Engine** option is greyed out and shows **Turn engines off**, read the **Notes** in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.



Select the Approval Engine to be used for each of the Task tables. The valid options are:

- Approval Rules - Use Approval Rules to create approvals
- Process Guides - Use Process Guides to create approvals
- Turn engines off - Turn the approval engines off for this table (use this when Workflow is being used to manage approvals)

Table	Name	Approval Engine	Notes
Change Phase	change_phase	Turn engines off	
Change Request	change_request	Turn engines off	Workflows are managing approvals on this table.
IMAC	change_request_imac	Turn engines off	
Change Task	change_task	Process Guides	
HR Case	hr_case	Turn engines off	Workflows are managing approvals on this table.
HR Task	hr_task	Approval Rules	
Incident	incident	Turn engines off	
Incident Task	incident_task	Turn engines off	
Request new Knowledge Base	kb_knowledge_base_request	Turn engines off	Workflows are managing approvals on this table.
KB Submission	kb_submission	Turn engines off	
Problem	problem	Turn engines off	
Problem Task	problem_task	Turn engines off	
Reconcile Duplicate Task	reconcile_duplicate_task	Turn engines off	
Release Phase	release_phase	Turn engines off	

2. Select the approval engine option for each Task table from the choice list.
3. Click **Save**.
   These preferences are saved as system properties that are named *glide.approval_engine.<table_name>*.

Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization's budget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

The service catalog can use these classes of approvals:

- Gating approvals: Must occur before a request can be initiated. For example, allow a manager to reject an employee's request for a company car. To learn more about gating approvals, see Gating approvals.
- Process approvals: Take place within an execution plan process that has been initiated. For example, allow the security group to reject a request for access to SSN even though the employee's manager approved it. To learn more about process approvals, see Process approvals.

Note:
To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules

Approval rules can automatically set the approval state to something other than *Not yet requested*. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to **Requested**.

Important:
Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

Prerequisites

Role required: admin

Approval rules have two new fields:

- **Run rule before**: If true, the approval rule runs before the record is inserted/updated.
- **Set State**: If this rule applies, then the task record's approval state is automatically set to this value.

Note:
The **Set State** field only behaves as expected if the **Run rule before** check box is enabled.

- In the example below, this rule automatically sets the state of the task to *Approved* thereby auto-approving the task.

Approval Rules fields

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Gating approvals

A gating approval acts as a gate through which a request must pass before it can start.

Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

Gating approvals

Title	Description
Approval rules	Can apply to the service catalog as well as any other task table.
Item-based approvals	Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.

Related topics

Set up a gating approval via an approval rule

Set up a gating approval based on the item being ordered

Set up a gating approval via an approval rule

You canset up a gating approval via an approval rule.

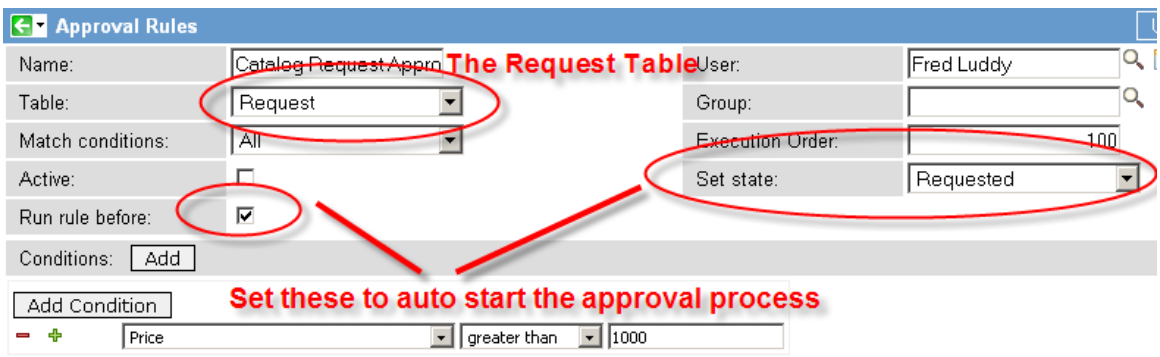
Before you begin

Role required: admin

Important:
Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

Procedure

1. From the left navigation pane, select **System Policy** > **Approval Rules**.
2. Click **New**.



Approval rules

Field	Description
Name	Name of this rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Task table to which this rule applies. For most service catalog approvals, select **Request**. **Note:** The list shows only tables and database views that are Application scope as the approval rule.
Active	Indicator of whether the rule is active (defaults to true).
Run Rule Before	Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.
User	User who must approve this request (can be empty).
Group	Group that must approve this request (can be empty).
Set State	Value of the approval field on the task in after this rule runs. In most cases, select **Requested**.
Condition	Condition under which the rule applies.
Script	An optional server script to programmatically specify who the approver should be. For example, for the one-line script `current.requested_for.manager`, ServiceNow checks the requested_for reference field on the current record. It then locates the manager field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.

Notes and limitations:

a. You can have as many rules as you want on a given table. If more than one rule applies, you will get more than one approver.

b. You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.

c. By default all requests start out in a **Not yet requested** approval state. Approval notifications will not go out until the request's approval state is set to **Requested**. You can do that manually, or you can do it in script, but the easiest way to do it is to use the **Set State** field to automatically set the request to **Requested**.

Set up a gating approval based on the item being ordered

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.

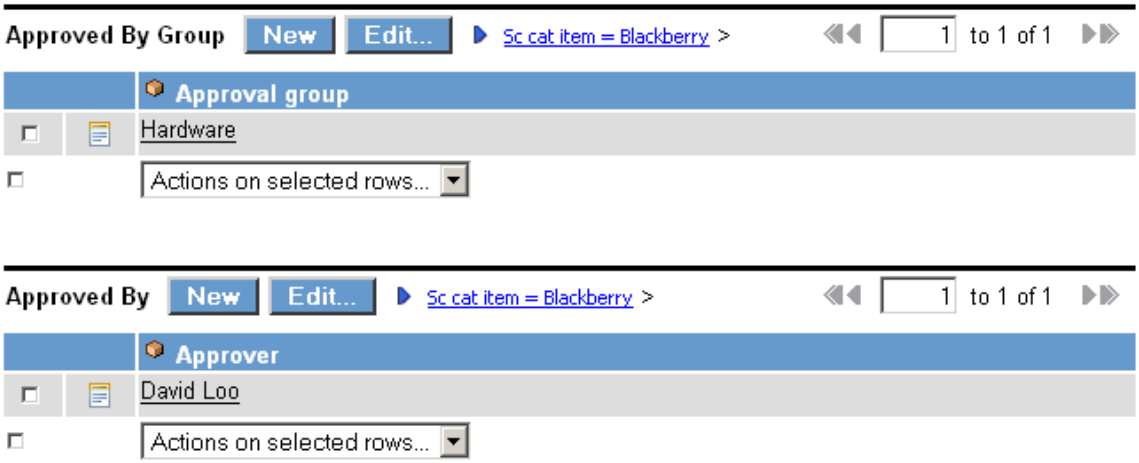
In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. We can, for example, specify that all Blackberrys need to be approved by David Loo.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- **Approved By Group**: A list of groups that have to approve requests for this item
- **Approved By**: A list of users who have to approve requests for this item

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approve list



In the example above, this request must be approved by all members of the Hardware group and by David Loo.

Notes and limitations:

1. As with approval rules, you are protected against duplicate entries. Thus if a person is a member of the hardware group, as well as being a standalone approver, the person will only get one approval request.
2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

Process approvals

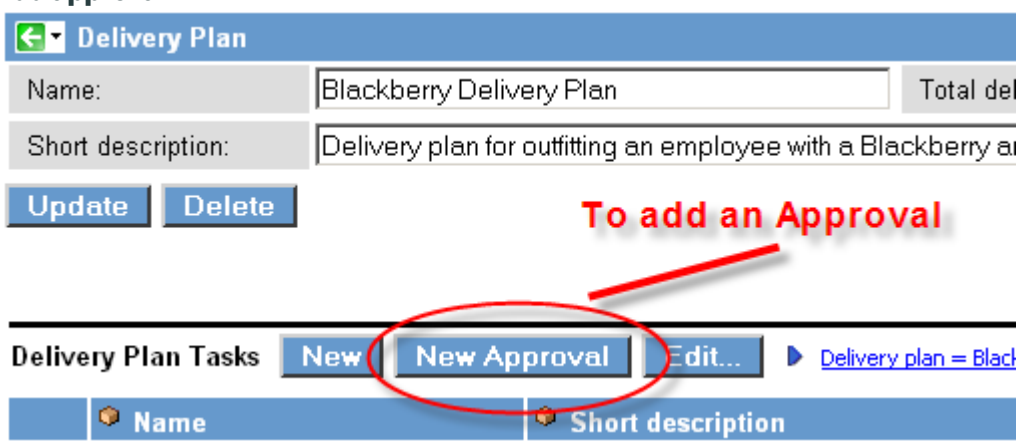
Once a request has passed its gating approvals, any relevant execution plans are initiated.

> **Important:**
> Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select **Service Catalog** > **Execution Plans**, and then select the plan to which to add an approval step. Then click the **New Approval** button.

Add approval



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

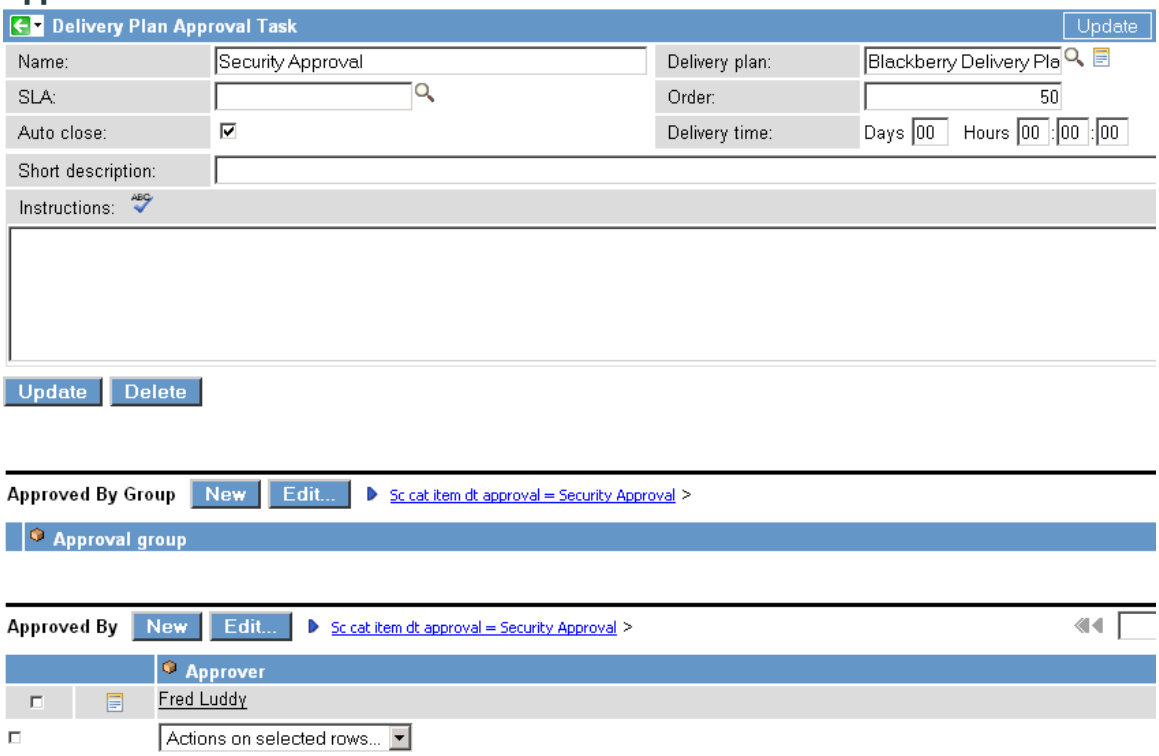
The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right click the title bar and select **Save**. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete

Approval task



In the example above, this security approval task must be approved by Fred Luddy.

Note:
When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn't necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

Approve with a process guide

Process guides work similarly to approval rules in that their execution is controlled via a condition.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people

You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:

1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to a execution task.

Procedure

1. From the left navigation pane, select **System Policy** > **Process Guides**.
2. Create a new guide.
3. Set the table to **Catalog task**.
4. Fill in a condition under which this guide should attach.

   Example #1: Apply to all "Capacity Review" tasks.

   Example #2: Apply to all "Capacity Review" tasks where there requester is in Atlanta.

   Process guide tips and tricks:

   a. All catalog tasks are generated when a request is first submitted, but tasks which aren't active yet have a state of "pending". So if you do not want to send out approval requests until a task has actually started, add "state=open" as part of your condition.

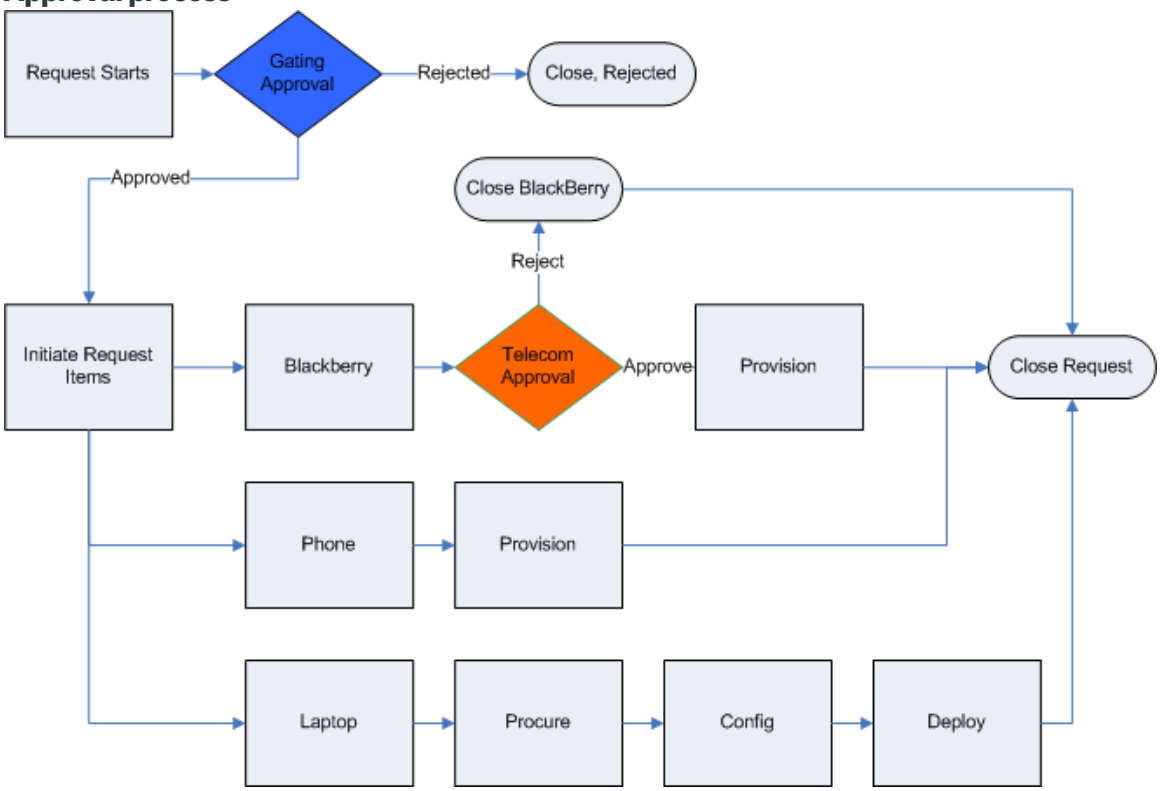
   b. There is a "Default" process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

Schematic of a hypothetical approval process

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval process



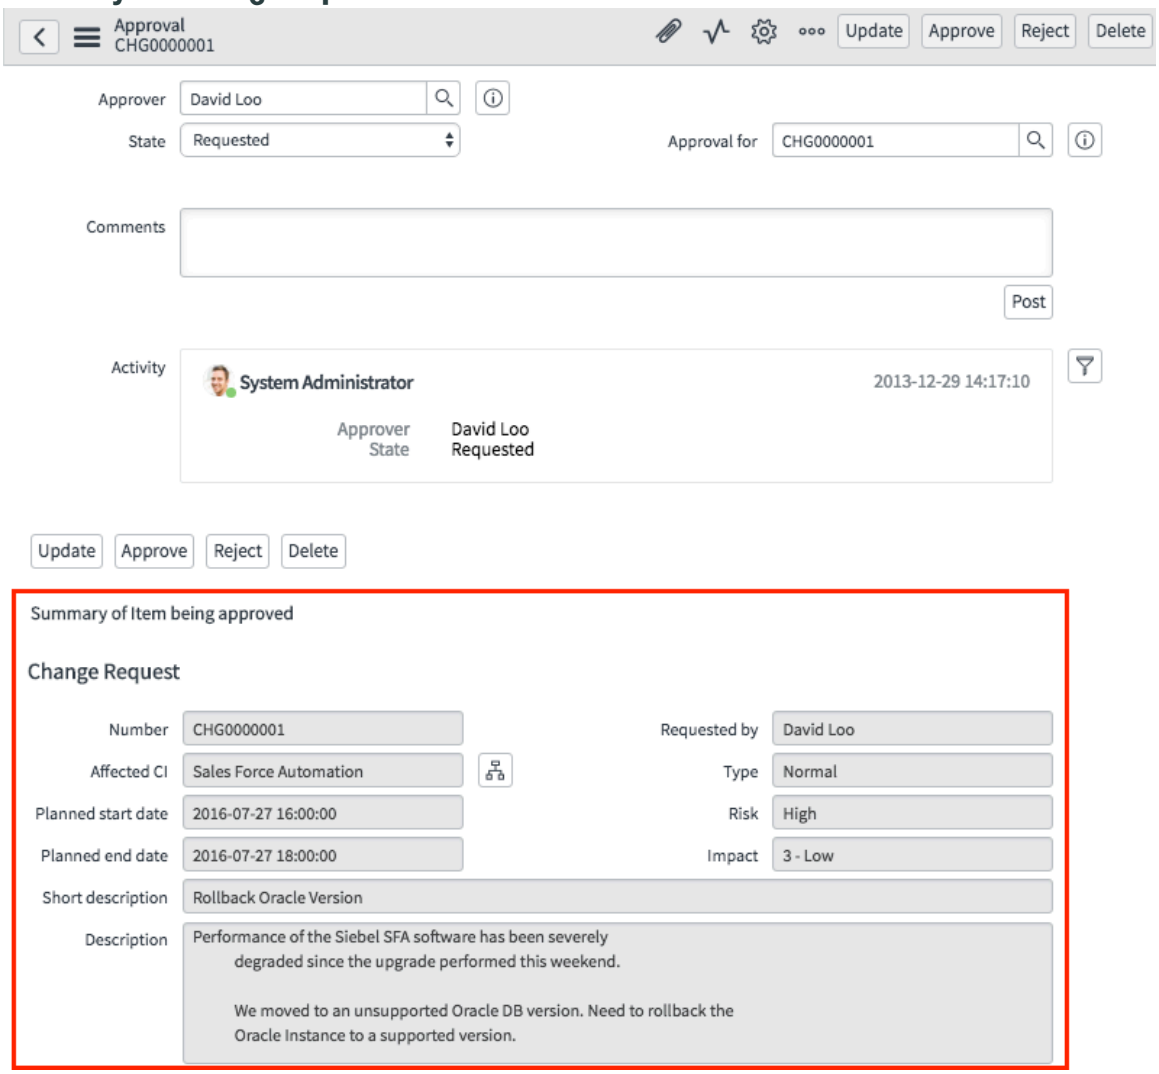
Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form.

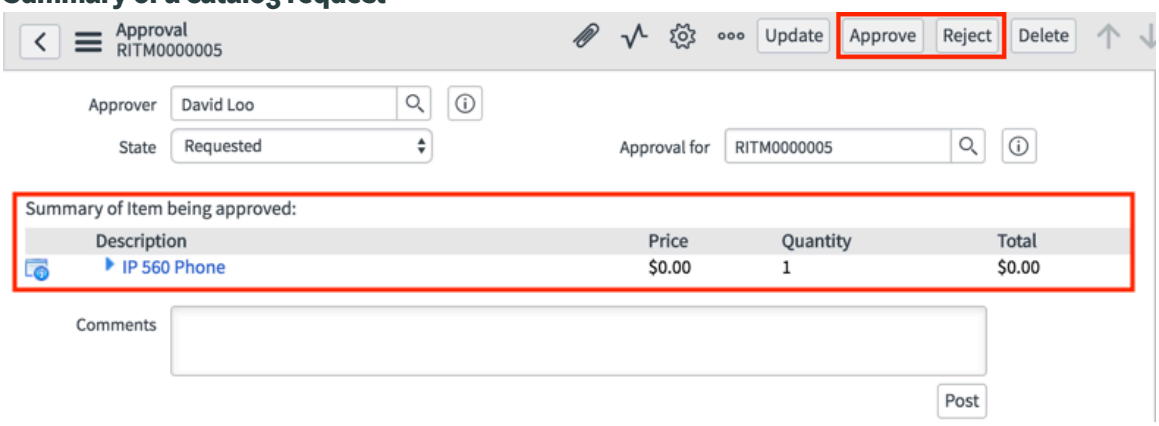
The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary of a change request



Summary of a catalog request



The **Reject** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When the overall request is approved, you must ensure this **Reject** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

Related topics

Using formatters

Summarizers

Approval summarizers are stored in the Macro [sys_ui_macro] table.

From the left navigation pane, select **System UI** > **UI Macros**. Summarizers use a naming convention of approval_summarizer_ + '<table_name> (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

Change an approval summarizer

You can modify existing approval summaries to include additional information.

Before you begin
Role required: none

About this task
These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click **Update**.

Create a new custom approval summarizer

After you add a new table that has approvals to an instance, you can add a custom activity formatter by creating a new UI macro and then add it to the appropriate form.

Before you begin
Role required: admin

About this task
approval_summarizer can only be used on approval forms in the global scope.

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**
2. Click **New**.
3. Give the macro a name that follows the summarizer naming convention: `approval_summarizer_<tablename>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Complete the rest of the form and click **Submit**.
5. Create a formatter and add it to a form and add it to the appropriate form.
   To learn more about activity formatters, see Activity formatter.

Approval with e-signature

Approve or reject an approval record by re-entering your login credentials. See the history of an approval from its activity stream or its audit history.

Support for Title 21 Code of Federal Regulations (CFR) Part 11

The Approval with e-signature plug-in is validated for Title 21 CFR Part 11 electronic signature requirements. This plug-in is required for compliance to 21 CFR Part 11.

Each time someone approves a record, the system stores this information.

- The printed name of the signer
- The date and time when the signature was made
- The meaning of the signature (approval or rejection)

This information is stored as part of the activity stream and audit history of the record.

Approval tables

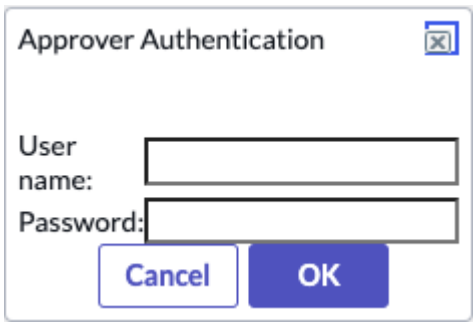
By default, Approval with e-signature supports these tables.

- Change Request [change_request]
- Standard Change Proposal [std_change_proposal]

When you add an approval table, any approval for the table needs an e-signature authorization. See Select an approval table to add or remove a table from supporting Approval with e-signature.

Approver Authentication dialog

Approvers must enter their user credentials to change the approval state. If the credentials fail, then the approval remains unchanged. The system checks the user credentials against local user records or an active single sign-on integration.

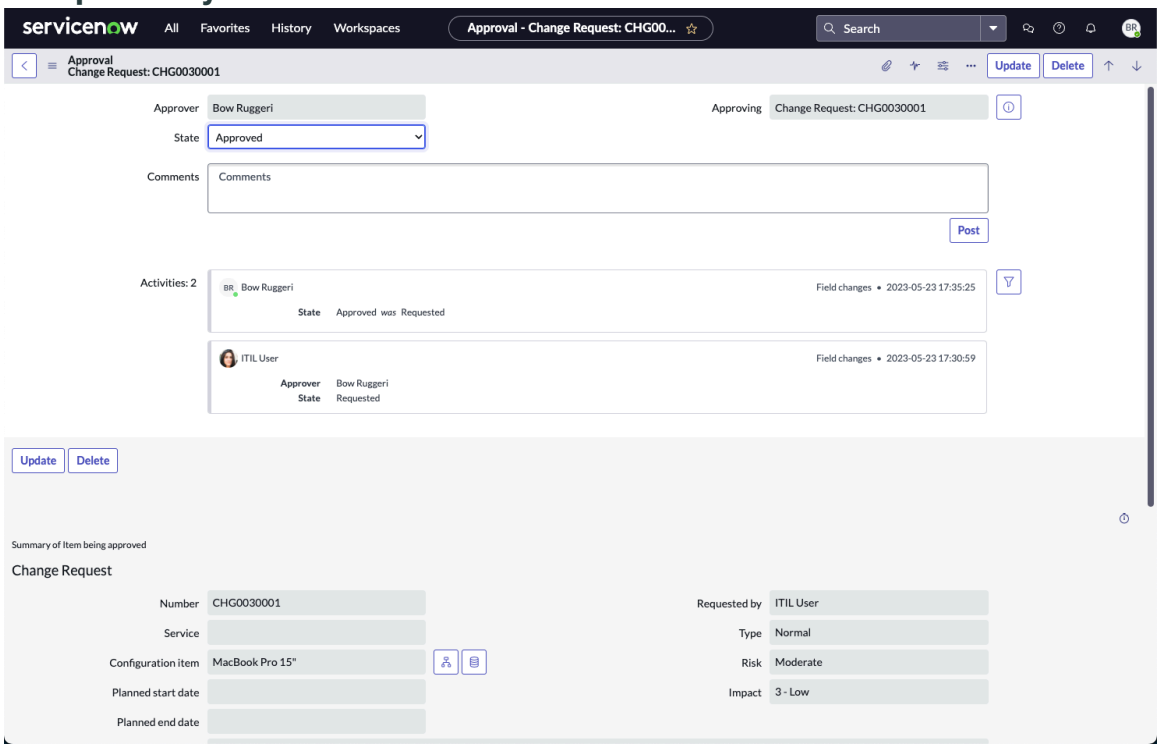


Approval History

Each Approval [sysapprover_approver] record has an activity stream that tracks changes to it. Approvals made by e-signature are stored as field changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example activity stream



Available approval options

The Change Request [change_request] table provides these approval options.

List options

The Change Request table provides context menu options to approve or reject records. When someone selects either the Approve or Reject context menu option, the system displays the Approver Authentication confirmation dialog.

UI actions

The Change Request form provides UI actions to approve or reject a record. When someone selects either the Approve or Reject UI action, the system displays the Approver Authentication confirmation dialog.

Change record state

The Change Request table provides a State field to approve or reject a record. When someone selects either the Approved or Rejected state, the system displays the Approver Authentication confirmation dialog.

User credential sources

Approval with e-signature supports these types of user credential sources.

- A set of local User [sys_user] records.
- A remote identity provider service accessed by the Multi-Provider Single Sign-On (SSO) integration.

User credentials must be set up before enabling Approvals with e-signature. See Creating users to create local User records.

See Multi-Provider Single sign-on (SSO) to create an integration to a Security Assertion Markup Language (SAML) 2.0 identity provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Approval with e-Signature plugin

The Approval with e-Signature plugin (com.glide.e_signature_approvals) allows users to approve requests by re-entering their login credentials.

Before you begin

Role required: admin

Note:
You must install the Code Signing Signatures (`com.glide.code_signing.signatures`) to install the E-signature plugin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

De-activate e-signatures

Use this procedure to de-activate e-signatures.

Although plugins cannot be removed, e-signatures can be disabled.

1. Navigate to **System Definition** > **E-Signature Registry**.
2. Set **Enabled** to **False** on any tables where e-signatures are no longer required.

Select an approval table

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which an approval exists.

Before you begin

Role required: admin

About this task

E-signature approvals can also be enabled on a table-by-table basis.

Procedure

1. Navigate to **All** > **System Definition** > **e-Signature Registry**.
2. Select **New**.
3. In **Table name**, use the drop-down list to select a specific table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table Descriptions

Field	Input Value
Table	Table that requires e-signatures for approvals.
Enabled	Option to require e-signature for approvals. Clear this option to remove the e-signature requirement.

4. Select **Submit**.

Set up an approval from a local database

Enable users to authorize e-signature approvals using local database credentials.

Before you begin
Role required: none

Procedure

1. Activate the **Approval with e-signatures** plugin.
2. Create user records for approval users.

Use Multi-Provider SSO to set up an SSO approval for a SAML 2.0 authentication

An SSO approval with e-signature requires configuration on the SAML IdP and the ServiceNow instance.

Before you begin
Role required: admin

About this task
The SAML IdP must support and honor the forceAuthn attribute in SAML assertion requests. E-signature doesn't function without this IdP setting. Set up an approval with e-signature using credentials from a SAML 2.0 authentication.

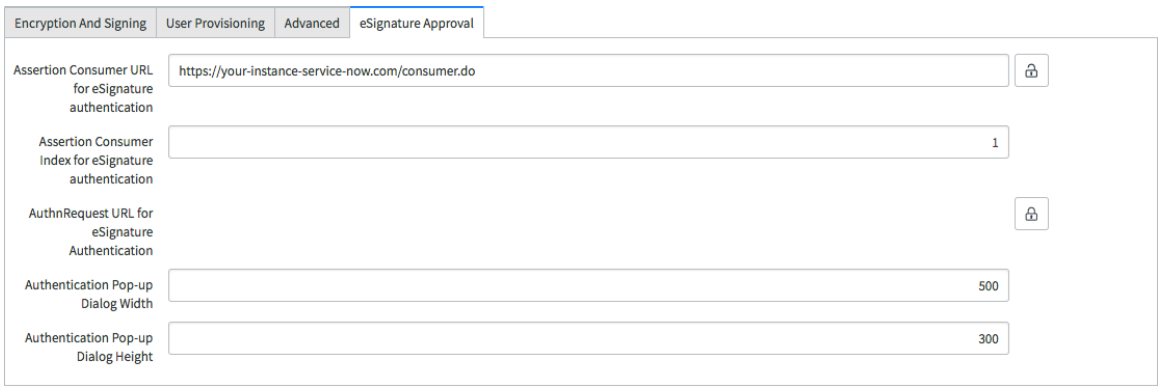
Procedure

1. Activate or upgrade to SAML 2.0 with the Activate Multi-Provider SSO plugin.
2. Activate the Approval with E-Signature plugin.
3. Navigate to **Multi-Provider SSO** > **Identity Providers** and verify your 2.0 SAML IdP configuration Advanced tab shows the **Force AuthnRequest** attribute checked.
   Your SAML 2.0 IdP must support the **Force AuthnRequest** attribute, or e-signature isn't supported.
4. On the eSignature Approval tab, enter the following e-signature SAML properties.

Option	Description
Assertion Consumer URL for eSignature authentication	This property defaults to the appropriate URL. To configure this property, select the lock icon to make this field editable. After edits, select the icon to lock the field.
Assertion Consumer Index for eSignature authentication	If your Service Provider has more than one URL set for the AssertionConsumerURL, you

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	can set the index to use for eSignature, start ing with index 1 or more.
AuthnRequest URL for eSignature Authenti cation	You can enter the URL that points to the SAML 2.0 IdP AuthnRequest URL for eSigna ture authentication. If the URL is the same as the Assertion Consumer URL, you can leave this setting empty.
Authentication pop-up Dialog Width	When a user approves a request using eSig nature, a dialog opens and a user can enter credentials. This setting controls the width of that dialog box. The default is 500.
Authentication pop-up Dialog Height	When a user approves a request using eSig nature, a dialog opens and a user can enter credentials. This setting controls the height of that dialog box. The default is 300.



5. Select the **Generate Metadata** button underneath the tabs to regenerate the service provider metadata.
6. Copy the service provider metadata, and update it on the SAML IdP.

Installed with approval with e-signature

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see E-signature SAML properties
- Client Script - Authenticate Approver
- Script Include - User

- Script Include - UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two out-of-the-box Approve UI Actions on the `sysapproval_approver` table.

Approval status

The approval status of a change request is determined by looking at the current status of all the approvers.

If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an "one of" approval where only one person of a group of approvers needs to approve, consider using Workflows .

Related topics

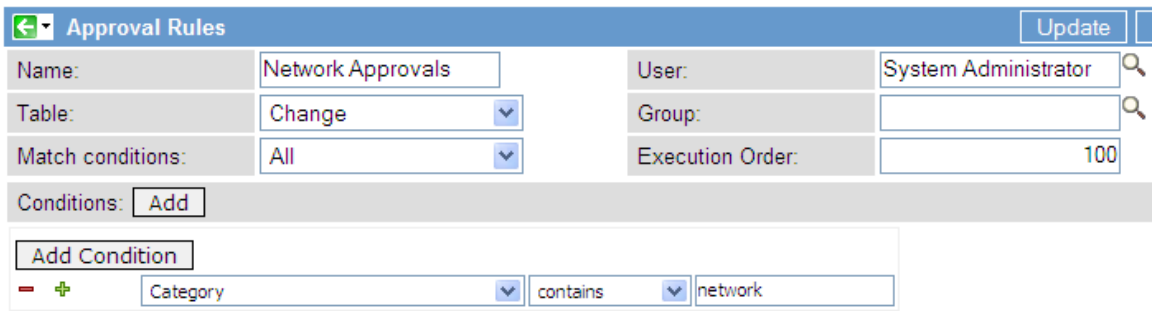
Classic approvals

Generate an approval using approval rules

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.

In the sample below, a change opened in the category **network** is assigned to the System Administrator:

Approval Rules



When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

Related topics

Classic approvals

Generate approvals using the approvers related list

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the **Edit** button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to **Not Yet Requested**. When the status of the approver changes to **Requested**, the approver is sent an email requesting approval action.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Classic approvals

Generate approvals using Workflow flows

Workflow Studio flows are a powerful and flexible method of generating approvals. Use workflow flows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a Workflow Studio flow generates an approval record, the system populates the **Flow** field on the approval record with a reference to the flow and the Ask for Approval action. Do not use this field when creating business logic. For more information, see .

Note:
Conflicts can arise when the approval process for a table is managed by both the Workflow Studio engine and the approval engine. In general, if there is a Workflow Studio flow that manages the approval process for a table, the approval engine should be turned off for that table.

Related topics

Classic approvals

Multiple approvers

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".

Related topics

Classic approvals

Receive notifications

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.

Approval notifications will be sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using **System Definition** > **Business Rules** and **System Policy**.

Note for Blackberry users: In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements `state:approved` or `state:rejected` within the body of the email before sending it to force the automatic approval/rejection functionality.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

Embed an approval request within the Outlook email client

Embed an interactive approval request for service catalog requests in the email notification sent to a user. The user can accept or reject the approval request from the email client.

Before you begin

Role required: admin
The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.

Note:

- The Outlook Actionable Messages (OAM) feature is not supported in all Microsoft mail products and versions. To verify whether your version of Outlook supports OAM, refer to the Microsoft documentation.
- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as **Organization**. Specify the provider ID value in the *sn_ms_oam.outlookactionable.originator* property.
- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may not be rendered as adaptive cards.
- You cannot customize the default actionable message templates.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. For the approval notification that requires user approval, in the **What it will contain** tab, add the following script in the **Message** field in addition to the existing information, or to the **Message** field in the configured email template if applicable.

   ```
   ${mail_script:include_approval_actionable}
   ```

   For example, for the Catalog Approval Request and Approval Request notifications, you can include the script in `request.itil.approve.role` and `change.itil.approve.role` email templates.

   This script includes the Outlook actionable message in the email notification sent to the user for approvals.
3. Click **Update**.

Dynamic approval forms

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

Important:
Classic approval rules have been replaced by the Workflow Studio Ask for Approval action. Use Workflow Studio to create workflow-driven approval logic that is easier to maintain and provides better reporting information.

For example, if you're looking at a Change Management approval request, you will see details from the relevant change request. For a Service Catalog approval request, you will get details of the request.

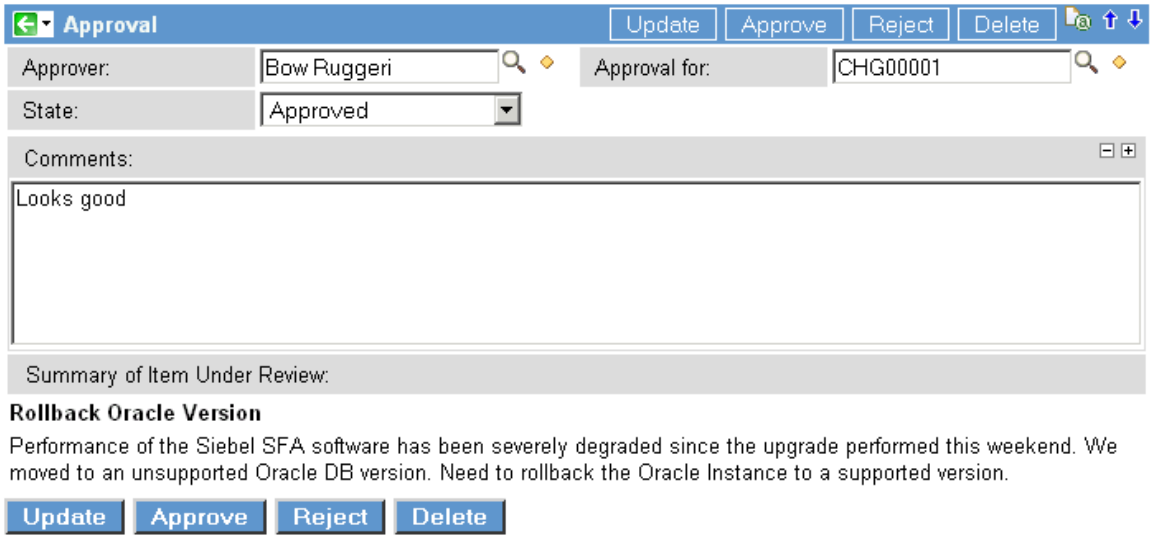
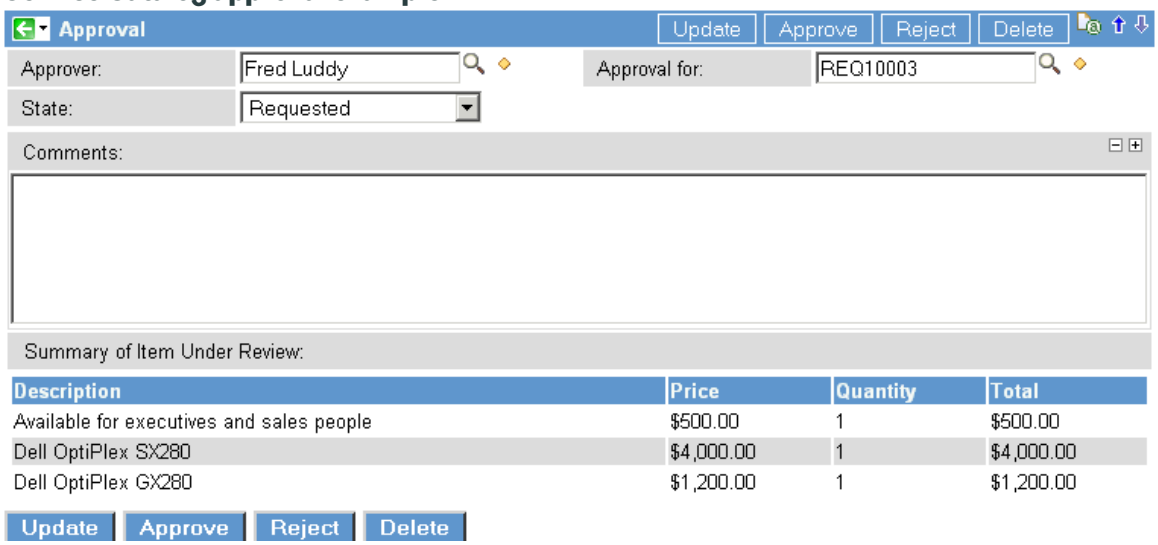
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change request approval example



Service Catalog approval example



Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

Note:
Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. Before business rules: Scripts configured to execute before the database operation with an order less than 1000.
2. Before engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Escalation engine

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data policy engine
- Field normalization engine
- Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
- Execution plan engine (for task tables)
- Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
- Data lookup engine inserts or updates
- Workflow engine (for default workflows)

3. Before business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The data base operation (insert, update, delete).
5. After business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. After engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Workflow engine (for deferred workflows)
   - Trigger engine (for all Workflow Studio flows)
7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. After business rules (Only active records). Scripts configured to execute after the database operation with an order greater than or equal to 1000.

Note:
Like After business rules, Async business rules execute their logic after a database operation occurs. Unlike After business rules, Async business rules execute asynchronously, running in the background simultaneously with other processes. Async business rules run after the user submits the form and after the scheduler runs the scheduled job created from the business rule. The system creates a scheduled job from the business rule after the user submits the form but before any action is taken on the record in the database.

State flows

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task [task] table and configure the system to perform work during transitions to specific states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An example of a state transition is when the **State** field in an incident changes from **Active** to **Awaiting User Info**. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see State flow customization.

Installed with state flows

Several types of components are installed with state flows.

Tables installed with state flows

Tables are added with state flows.

Table	Description
State Flow [sf_state_flow]	Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.
Work Order Flow [sf_work_order]	Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.
Work Task Flow [sf_work_task]	Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.

Business rules installed with state flows

Business rules are added with state flows.

Business rule	Table	Description
Assert Field Uniqueness in State Flow	State Flow [sf_state_flow]	Ensures that business rules and UI actions are not accidentally copied to new state flows.
Check Client Script	State Flow [sf_state_flow]	Adds a client script to new records.
Check Event Rule	State Flow [sf_state_flow]	Adds or deletes event rules, as the event field is updated.
Check Work Notes Rule	State Flow [sf_state_flow]	Adds or deletes work note rules, as the work notes for a state flow are updated.
Create Business Rule	State Flow [sf_state_flow]	Automatically creates a business rule when automatic conditions or script are present.
Create script for Field controls	State Flow [sf_state_flow]	Create scripts for field controls, when they are in use.
Create UI Action	State Flow [sf_state_flow]	Automatically creates a UI action when manual conditions or script are filled in.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Delete Related Elements	State Flow [sf_state_flow]	When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.
Remove script for Field controls	State Flow [sf_state_flow]	If all field controls are disabled, see if any of the client scripts should be removed.
State Change	State Flow [sf_state_flow]	Get the correct state choice value when the state is changed.
Update dependent records	State Flow [sf_state_flow]	When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.

Script includes installed with state flows

Script includes are added with state flows.

Script includes for state flows

Script include	Description
StateFlow	Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts.
StateFlowAJAX	Allows access to state flow functionality from client scripts.

Use state flows

You can create custom state flows for any table that uses states.

Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending Email and SMS notifications.

Administrators can configure state flows to:

- Limit the choice list for the **State** field to contain only those states that are valid for the flow.
- Define the behavior and visibility of specific fields on a task form when state transitions occur and for certain end states.
- Configure events that are triggered when a task changes states.
- Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dictionary overrides for state flows

A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.

1. In a state flow record, select an **Ending state**.

   This is the override value which becomes the starting state for all new records in the table named.

2. Click **Create Default Value**.

   The system populates the *Dictionary override* field with a value of *state*, which is the field in the task table affected by the override. The *Dictionary override* field is read-only. After the override is created, the system hides the **Create Default Value** button on all subsequent state flow forms for that table.

Events triggered on state changes

You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.

Field controls

You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the *Problem* field to be visible when an incident moves to the *Awaiting Problem* state. If the incident state changes to *Awaiting User Info*, you hide the *Problem* field and make the *Caller* field mandatory.

When creating field controls, configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This configuration ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record's *State* field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

Note:
State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects, as needed, to enforce field properties in state flows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field Controls

Type	Name	Description
Business rule	State Flow Notes for <table name>	Enforces mandatory fields for the table on which that field behavior is defined.
Client script (onLoad)	<table name> state flow	Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.
Client script (onChange)	<table name> change state flow	Sets updated mandatory, read-only, and visible properties when a record is changed.

Rebuild state flows

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to **State Flows** > **Admin** > **Rebuild State Flows**. This module runs a script that compares the numerical value of each item in the **State** field choice list until it finds a match in the imported state flow record.

State flow cleanup

Work notes

Use state flows

Create a state flow

Create a state flow

Creating State Flows.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **State Flows** > **State Flows** and click **New**.
2. Fill in the fields, as appropriate.

   The system enforces the field controls with the same client script that filters the choice list for the *State* field.

Creating state flows

Field	Description
Number	Automatically generated record number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	[Required] Table on which the state flow record runs. Only tables that extend the Task `[task]` table are available in the list.
Starting state	Name of the state at the beginning of the transition. The selections in this field are filtered by the possible states for the table selected.
Ending state	Name of the state at the end of the transition. The selections in this field are filtered by the possible states for the table selected.
Client script	Client script to run for this transition. The client script controls the available states you can select by limiting the contents of the *State* choice list to valid states. This client script also controls specific field behavior configured for state changes in the Field Controls section of the form.
Event	Name of an existing event to trigger when this transition occurs. See evernts triggered on state changes for more information.
Name	Name of this record. Make sure the name is descriptive of the state transition or the processing that the record is performing. This name does not have to be unique.
Roles	Not used for any processing.
Active	Enables or disables this state flow record.
Class	Defines the state flow class for this record. The system selects the appropriate class from these options: ○ *State Flow*: Records created for state flows in all task-based tables except those in work management. ○ *Work Order Flow*: Records created for state flows in the Work Order `[wm_order]` table. This class is available when work management is activated. ○ *Work Task Flow*: Records created for state flows in the Work Order Task `[wm_task]` table. This class is available when work management is activated.
Dictionary override	Sets the starting value for the *State* field on all new records for the table named in the state flow record. See dictionary overrides for configuration procedures.
Work notes	Noteworthy comments about this state flow transition. For details about how these notes are used, see Work Notes.
Comment	Details about the customized record.
Manual (Runs scripts from a UI action that require the user to click a button or related link.)	
Manual condition string	Conditions for enabling a UI action that cannot be defined with the condition builder. For example, you can use this string to define UI actions for mobile devices. This condition has an [and] relationship with the condition in the *Manual condition* field.
Manual condition	Conditions for enabling a UI action that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the *Manual condition string* field.
Manual script	Script that defines what the UI action does when the conditions are true. This script runs when the user clicks a button or a related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
UI action	[Read Only] Name of the button that the system creates to enable this transition. The system creates the label using the same name as the state flow record that created it.
Automatic (Runs a business rule automatically when a task record is changed and updated.)	
Automatic condition string	Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an [and] relationship with the condition in the *Automatic condition* field.
Automatic condition	Conditions for running the business rule that can be defined for fields in the target table. This condition has an [and] relationship with the condition in the *Automatic condition string* field.
Automatic script	Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.
Business rule	Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the *Automatic condition* must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.
Field Controls (Determines field properties when a record transitions between states or reaches a specific end state.)	
Mandatory fields	Makes the selected fields required when this transition occurs, or when the end state is the current state.
Read only fields	Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.
Visible fields	Displays the selected fields when this transition occurs, or when the end state is the current state.
Not mandatory	Makes the selected fields optional when this transition occurs, or when the end state is the current state.
Not read only	Makes the selected fields editable when this transition occurs, or when the end state is the current state.
Not visible	Hides the selected fields when this transition occurs, or when the end state is the current state.

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.
   - *Manual*: Click **Create UI Action** to create a button on the task form that enables users to execute the transition manually. The system uses the value in the *Name* field as the label for the UI action. The UI action executes the script in the *Manual Script* field when the conditions are true. For example, a manual transition can create an **Activate** button when an incident is in the *New* state that enables a user to mark the incident as active.
   - *Automatic*: Click **Create Business Rule** to create the business rule. The business rule executes the script in the *Automatic Script* field when the conditions are true. For example, a business rule created by the system can set an incident state to *Assigned* when the *Assigned to* field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see Business rules.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Click **Create Client Script** to create the script that limits the values offered in a task record's *State* field to valid states for that transition.
5. Configure the fields in the *Field Controls* section to control how specific fields display when a task record changes states.

Related topics

Use state flows

State flow cleanup

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

State Flow Cleanup

Element	Deleted When
UI action Business rule Dictionary override	The state flow that created it is deleted.
Business rule that processes events triggered by a state flow	All state flows for the table specified that have events configured are deleted.
Client script (onLoad)	All state flows for the table are deleted.
Client script (onChange)	All state flows with field controls are deleted.
Work notes business rule	All state flows with field controls or work notes are deleted

Related topics

Use state flows

Create a state flow

Work notes

Work notes are an important part of the state flow process and are used to communicate information about state transitions.

The state flow adds these work notes to the *Work notes* field of any task making this transition.

These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

Domain separation and State Flows

Domain separation is unsupported in State Flows. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Overview

Domain separation provides complete data isolation for domain-specific users.

Related topics

- Domain separation for service providers

Geolocation

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent's position each time that agent updates a task record. When the system updates an agent's location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.

- Location tracking
- Activate geolocation

Activate geolocation

An administrator can activate the Geolocation plugin.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Geolocation plugin (com.snc.geolocation) using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics

Geolocation

Installed with geolocation

Several component types are installed with Geolocation.

The Geolocation plugin adds a field called Geolocation tracked to the User `[sys_user]` table. This field allows the system to track individual users by their geographical coordinates.

Business rules installed with geolocation

Business rules are added with activation of Geolocation.

Name	Table	Description
GeoLocation Data updated	User [sys_user]	Populates the **Latitude** and **Longitude** fields on the Geolocation History [geo_history] table when the **Latitude** and **Longitude** fields are updated on the User [sys_user] table.

Related topics

Installed with geolocation

Client scripts installed with geolocation

Client scripts are added with activation of Geolocation.

Name	Table	Description
Update Geolocation on Task	Task [task]	Populates the **Latitude** and **Longitude** fields on a user record with GPS coordinates when that user loads any record on the Task table or a table that extends Task. This occurs only when geolocation tracking is enabled for the user.

Related topics

The Google Maps plugin provides additional map properties that are used to implement and control specific geolocation features. You must have a private key for Google Maps API for Business to take advantage of the properties listed here.

Properties

Name	Description
glide.geolocation.allow.toll.roads	Allow toll roads to be used. Allows the system to use toll roads when auto-routing or optimizing task routes for agents. • **Type**: True/false • **Default value**: True
glide.geolocation.default.start.time	Default start time for all agents when no schedule is set. This value sets the start time for a day other than the current day, when no scheduled task exists or is continued from the previous day. This property uses a 24 hour clock. • **Type**: String • **Default value**: 08:00
glide.geolocation.evening.rush.hours	Evening rush hour span, formatted as 14:30-16:00. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.morning.rush.hours and work.management.rush.travel.buffer properties and uses a 24 hour clock. • **Type**: String • **Default value**: 0
glide.geolocation.history.cleanup	Number of days to keep history data. ServiceNow keeps agent geolocation history records for the number of days specified by this value. • **Type**: Integer • **Default value**: 30
glide.geolocation.morning.rush.hours	Morning rush hour span, formatted as 06:30-08:00. This property uses a 24 hour clock. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.evening.rush.hours and work.management.rush.travel.buffer properties. • **Type**: String • **Default value**: 0

Properties (continued)

Name	Description
glide.geolocation.proximity	Minimum distance an agent must move to be considered in a new location (in meters). This setting establishes a geolocation perimeter that prevents ServiceNow from creating unnecessary history records when an agent has multiple tasks in the same vicinity. An example of this might be when an agent has several tasks in one building. The system assumes that all task activity within the specified radius is part of a single record and does not create additional records when the agent moves from task to task around the building. • **Type**: Integer • **Default value**: 500 For an explanation of how location tracking works, using both the frequency and criteria properties, see the section How location tracking works, at the end of the table. **Note:** The iOS version of the app updates geolocation only when the mobile device detects a significant location change, which is determined by the your device's operating system. When the operating system updates its location, your app updates with that location change. Distance and time property values are not honored for the iOS version of ServiceNow apps.
glide.geolocation.proximity.location	Maximum distance an agent can be from a specific location and still be placed at that location (in meters). This setting defines the maximum distance that an agent can be from a specified location and still be placed at that location by the system. • **Type**: Integer • **Default value**: 200 For an explanation of how location tracking works, using both the frequency and criteria properties, see the section How location tracking works, at the end of the table.
glide.geolocation.rush.travel.buffer	Percentage to add to all rush hour travel times. The system uses this percentage to calculate schedules when auto-routing an agent. Use this property when both morning and evening rush hour times are defined. An example of a valid time buffer percentage is 15. • **Type**: Integer • **Default value**: 0

Properties (continued)

Name	Description
glide.geolocation.tracking.frequency	Sets the length of the recurring interval, in seconds, that the system waits between attempts to capture a user's geographic coordinates. The system updates geographic coordinates only for users who have geolocation tracking enabled. The property *glide.geolocation.tracking.frequency* defines how long the system waits before updating an agent's location, regardless of task activity or travel. This prevents the ServiceNow AI Platform from creating unnecessary history records if an agent in one location views a task multiple times. • **Type**: Integer • **Default value**: 60 For an explanation of how location tracking works, using both the frequency and criteria properties, see the section How location tracking works, at the end of the table. **iOS variations** The iOS version of the app uses both proximity and frequency settings when updating geolocation. • Proximity: A new location is only saved if its distance to the previous location exceeds the configured threshold (in meters). This leverages the native iOS distanceFilter functionality. • Frequency: A new location is only saved if its timestamp is later than the previous known location's timestamp by the configured interval (in minutes). In iOS, frequency is recorded as the minimum interval to track location updates. **Android variation** The Android version of the app updates geolocation data at 1 minute intervals. The app collects a user's location using the interval set in this property, but that data is still uploaded to your instance every 1 minute. This interval at which data is sent to the server (every minute) is not configurable.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties (continued)

Name	Description

	Note: Default proximity and frequency values differ based on the tracking type:
	• Manual tracking
	  ○ Frequency: 1 minute
	  ○ Proximity: 100 meters
	• Action-based tracking
	  ○ Frequency: 5 minutes
	  ○ Proximity: 500 meters

glide.geolocation.travel.buffer	Percentage to add to all travel times. An example of a valid percentage value is 15. • **Type**: Integer • **Default value**: 0
glide.geolocation.work.spacing	Amount of time (in minutes) to add between the end of a task and the travel start of the next. An example of a valid time value is 10. • **Type**: Integer • **Default value**: 0

How location tracking works

The location service captures new coordinates based on the configured tracking frequency and stores them in a local table. A separate service then sends all stored coordinates from the local table and send them to the server.

To determine whether to record a new location update, the system uses both frequency and proximity criteria. When the frequency interval is reached, the location service attempts to capture a new coordinate and automatically compares it with the previous location coordinate. If the difference is less than the configured proximity threshold, the coordinate is discarded and the service checks again after the specified frequency interval.

For example, if the frequency is set to 5 minutes and the proximity threshold is 50 meters, the service attempts to capture a coordinate every 5 minutes. However, if the new coordinate is within 50 meters of the previous one, it is discarded.

Script includes installed with geolocation

Script includes are added with activation of Geolocation.

Name	Description
GeolocationAJAX	Utilities the system uses when making geolocation AJAX calls.
GeolocationUtils	Core utilities for geolocation functionality.

Installed with geolocation

Geolocation Google key

Geolocation functions in the ServiceNow AI Platform® require a Google Maps API for Business license, or a Google Maps Javascript API Key, to enable use of Google Maps.

The auto-routing or auto-dispatch functions in Field Service Management require this license or Javascript API Key to calculate precise travel time estimates. Without these values, precise driving times cannot be calculated, and it uses rough estimates or fixed times instead.

In **System Properties** > **Google Maps**, enable the Geolocation feature using the appropriate entries from a Google Maps API for Business license, or a Google Maps Javascript API Key. To learn more, see Set up Google Maps API

Geolocation

Geolocation history

The Geolocation History [geo_history] table contains the history of each tracked user's location over time.

To view geolocation history, navigate to **Geolocation** > **Geolocation History**. The record list shows time stamped location data for all users configured for geolocation tracking.

The following system properties, located in **Geolocation** > **Administration** > **Geolocation Properties**, control the data that appears in this table.

- Minimum distance an agent must move to be considered in a new location (in meters): Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.

  Note:
  A user's geo_history will not be logged if the user remained at approximately the same location, even if this property is set to 0.

- Maximum distance an agent can be from a specific location and still be placed at that location (in meters): Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
- Number of days to keep history data: Time period for which the system retains history data.
- Minimum amount of time between updating the user's location (in seconds): Time period the system waits before updating a user's location, regardless of how often the user accesses tasks.

Location tracking

Geolocation adds the **Geolocation tracked** field to the User form. In the default view of a user record, select the **Geolocation tracked** check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user's geographic coordinates whenever the user opens, or loads, a record from the Task [task] table or from a table that extends Task. After this initial update, the system continues to update the user's geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the length of this interval, navigate to **Geolocation** > **Administration** > **Geolocation Properties** and

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

change the setting for the property that regulates the update interval for the user's location. The default setting for this property is **300** seconds (5 minutes).

Note:

- The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the **Geolocation tracked** check box selected may be prompted by their browsers to share or withhold their location.
- A user's geo_history will not be logged if the user remained at approximately the same location, even if the Minimum distance an agent must move to be considered in a new location (in meters) property is set to 0.

Service Catalog overview

You can set up one or more service catalogs and provide self-service opportunities. Organize your catalog offerings by using the ability to publish multiple catalogs targeted to specific audiences.

Catalog Builder overview

The Catalog Builder experience enables you to delegate the creation and maintenance of catalog items.

You can create or edit a catalog item (catalog item or record producer) using a visual and guided experience along with specified restrictions.

You can also create a template that can be used to create catalog items. While creating the template, you can specify values or restrictions for items created using the template, for example, restrictions to catalogs, categories, variable types, and portal settings.

From the home page of the Catalog Builder, you can do the following:

- Create a catalog item
- Create a catalog item template
- View the available catalog items
- View the available catalog item templates
- View catalog items that are recently updated
- View the configured content that describes the catalog building process in your organization.

Related topics

Catalog Builder

Types of catalog items

Service Catalog offers a few types of catalog items.

The basic Service Catalog item types include:

- Record producers: giving alternative ways of adding information such as Incidents via the service catalog.
- Order guides: to group multiple catalog items in one request.
- Content Items: catalog items which provide information instead of goods or services.
- Standard catalog items

Record Producer

A record producer is a specific type of catalog item that allows end users to create task-based records, such as incident records, from the service catalog.

Use record producers to provide a better end-user experience instead of using the regular task-based form for creating records. The look and feel of a record producer is similar to that of a catalog item. But the record producer generates a task record such as incident, instead of a requested item.

You can create a record producer for tables and database views that are in the same scope as the record producer. You can also create a record producer for tables that allow create access from applications in other scopes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define a record producer in the service catalog or from the table record.

Note:

- Use a record producer to create task-based records only.
- To ensure that standard service catalog processes are followed, such as initiating workflows as expected, do not create requested item records from record producers. Instead, create requested item using catalog items.
- If the record producer script aborts the record generation, no record is generated in the Item Produced Record [sc_item_produced_record] table.

  Note:
  Do not call the update, setAbortAction method, or set the sys_class_name on current record to avoid unexpected behavior.

Create a record producer

You can create a record producer for tables and database views that are in the same scope as the record producer. Also for tables that allow create access from applications in other scopes.

Before you begin
Role required: catalog_admin or admin

About this task
An overview of record producers in the Service Catalog: what they are, and how to create them and define variables and templates for them.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Record Producers**.
2. Click **New** or select the record producer to edit.
3. Complete the Record Producer form.

   For more information about the fields and their descriptions on the Record Producer form, see Record Producer form.
4. To add attachments such as information and instruction documentation to the catalog item, see Add an attachment .
5. Click **Submit**.

   After you submit the form, the **Variables**, **Variable Sets**, **Categories**, and **Catalogs** related lists become available.
6. Open the record again to define variables for the record producer.

Create record producers from tables

You can create Service Catalog record producers directly from a table record.

Before you begin
Role required: admin

About this task
To create a record producer from a table record:

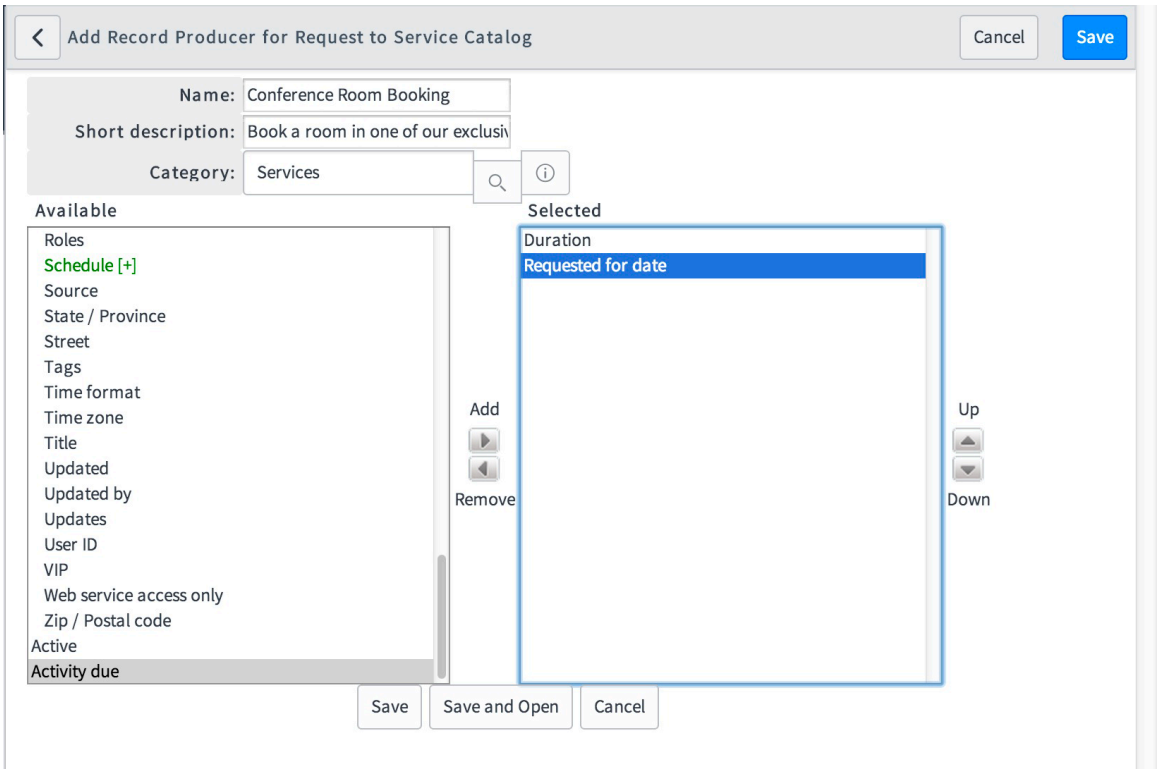
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Tables** and open the table record.

   Note:
   When using a workflow with a Record producer, set the condition to Run the workflow.

2. Under **Related Links**, click **Add to Service Catalog**.
3. Complete the **Name**, **Short Description**, and **Category** fields as you would for service catalog items.
4. Use the list to select the fields and the order in which you want them to appear.
5. To use container variables, select **|- container start -|** and **|- container end -|**.



6. Click **Save and Open** to open the record producer and define additional options. Alternatively, click **Save** to return to the table record.
   - A record producer is created with these values:
     - **Table name**: table record opened in step 1
     - **Name**, **Short Description**, and **Category**: information entered in step 3
   - A variable is created for each of the selected fields with these values:
     - **Name**: Column name of the field
     - **Type**: Variable type that corresponds to the field type
     - **Order**: Position selected in the slushbucket (for example, 100 for the first field and 200 for the second field)
     - **Question**: Column label of the field
   - If the field type is **Choice**, a corresponding question choice is created for each field choice.
   - The new record producer is added to the **Record Producers** related list on the table record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Populate record producer data and redirect users

You can enter data for all records created by the record producer, and redirect an end user to a particular page after the record producer is submitted.

To enter data with a record producer, use any combination of the following methods:

- Create a variable on the record producer with the same name as the field in the target record. For example, a variable named caller_id on a **Create a New Incident** record producer populates the `caller_id` field on the new incident record. Use a variable type that corresponds to the field type.
- Define a template to assign a static field value for all records created by the record producer.
- Define a script that uses any variable or server-side objects and functions to assign values.
  - Use `current.*FIELD_NAME*` to reference fields on the record being created.
  - Use `producer.*VARIABLE_NAME*` to reference values entered by the end user.
  - Use RP.getParameterValue to return specified parameter values passed on the URL. The RP stands for Render Properties, not Record Producer.

Redirect after submitting a record producer

To redirect an end user to a particular page after the record producer is submitted, define the redirect link in the **Script** field using any of the following:

- `producer.redirect`: Enables the redirect behavior within the Platform UI.
- `producer.portal_redirect`: Enables the redirect behavior within Service Portal.

For example, the following code redirects users to their homepage after the record producer is submitted:

- Within the Platform UI:

```
producer.redirect="home.do";
```

- Within Service Portal:

```
producer.portal_redirect = "sp?id=sc_home"
```

The following code gives the id of the record producer:

```
RP.getParameterValue('sysparm_id')
```

Order guides

Order guide submits a single service catalog request that generates several items.

For example, a New Employee Hire order guide can contain several items that new employees commonly need, such as business cards, computer, and cell phone. After selecting this order guide, the customer can then provide information about the new employee, including location and job title. The order guide then submits an order for catalog items like business cards, based on the details provided.

Order guides determine which catalog items to order by evaluating order guide rule conditions. Information the customer enters within the order guide can be passed as cascading variables to the ordered items, allowing common information to be reused across multiple items.

Administrators and catalog administrators can create order guides for the service catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order guides can be run automatically, generating a set of ordered items without needing to manually submit a service catalog request. For example, an onboarding workflow for a new employee can automatically run an order guide to order items for that employee. Order guides can also be configured to order the items of an order guide in a logical sequence. For example, you can configure your order guide to run the request for a new laptop before running the request for a new email.

Use the **Script** field in an order guide to add or remove catalog items to or from the order guide. Add catalog items to the order guide form by configuring the form layout.

- To add a catalog item that is not added to the order guide via a rule base, write the following code in the script field:

```
guide.add("<sys_id_of_cat_item>")
```

- To remove a catalog item that is added to the order guide via a rule base, write the following code in the script field:

```
guide.remove("<sys_id_of_cat_item>")
```

Create an order guide

You can create an order guide with a two-step or three-step ordering process.

Before you begin

Role required: catalog_admin or admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Order Guides**.
2. Click **New**.
3. Fill in the fields as appropriate.

   For more information about the fields and their descriptions on the Order guide form, see Order guide form.
4. Right-click the form header and click **Save**.
5. In the Rule base related list, define the rules that determine which items are included in an order.

   For more information, see Create a rule.
6. **Optional:** Configure the sequence in which the items in a rule base of an order guide must be fulfilled by selecting the **Generate sequence** button.

   (Optional) For more information, see Configure a sequence to fulfill items in order guides.
7. **Optional:** In the *Variables* related list, define any variables required.

Configure a sequence to fulfill items in order guides

Configure a sequence in Playbooks to fulfill items in order guides. Once you define a sequence, you don't have to manually check whether required items have been fulfilled before fulfilling their dependent items.

Before you begin

The Order Guide Sequential Fulfillment (com.glideapp.servicecatalog.order_guide_sequencing) plugin must be installed. Navigate to **System Plugin** and search for this plugin. The plugin form allows you to activate or repair the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The order guide must contain at least one item in the rule base.

Role required: admin or both catalog_admin and playbook.admin

About this task

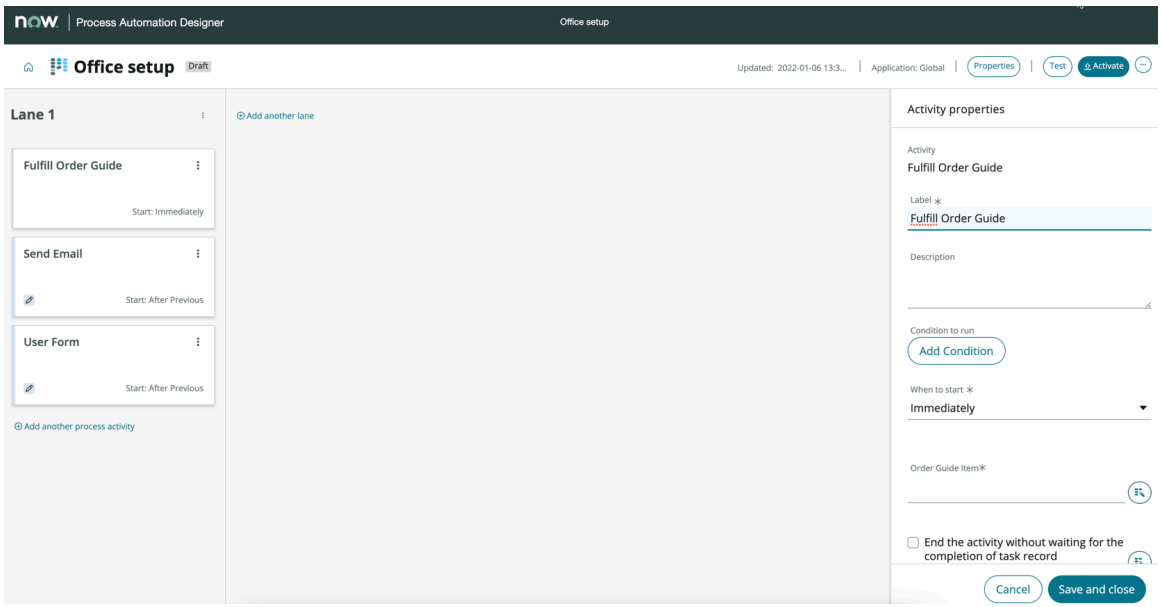
A sequence can be defined for an order guide so that all the items in the order guide do not move to the in-progress state immediately after order guide fulfillment is started. You can configure when an item must be fulfilled. The requested items will remain in the pending state until the time order guide fulfillment reaches the point where the requested item must be fulfilled. Any record generated through record producers will only be generated when order guide fulfillment reaches the point where the record is processed.

Sequence generated for order guides with only record producers as rule base items will not be considered.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Order Guides**.
2. Select the order guide for which you want to create a sequence in which the items must be fulfilled.
3. On the form, select the **Generate sequence** button in the top-right corner.
4. Enter a name for the sequencing process in the **Process name** field.
5. Select **Generate**.
   The Playbooks page is displayed on a new tab and items are added to **Lane 1** according to their sequence in the rule base.

   You can change the default name of the first lane, Lane 1, by selecting **Lane actions > Configure lane** and modifying the name.



6. In the lane, select an activity card for the item you want to configure.
7. Configure the activity's properties.

Activity properties

Field	Description
Label	Name of the rule base in the sequence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description of the activity.
When to start	Determines whether the activity must be run immediately, with the previous activity, or after the previous activity.
Order Guide Item	Item in the order guide for which the activity must be run.
End the activity without waiting for the completion of task record	Option to end the activity before completion of the task record. For example, you can select this option for an incident activity when you want to end the activity before the incident is closed so that the next activity can be started.

8. **Optional:** Add a condition for an activity that is configured to run after the previous activity by selecting **Add Condition**.
   The outputs (Generated Task Record, Record Id, Table) of the previous activity are available as options on which you can apply a condition. The Generated Task Record output is only available for catalog items and record producers whose target table is an extension of the Task table.
9. **Optional:** View the configured properties of the activity by selecting **View all properties**.
10. **Optional:** Add new items to the lane by selecting **Add another process activity** and then select an activity in the **Add activity** dialog box.

    (Optional) If an order guide contains more than 20 rule base items, only the first 20 items are added to the first lane. You can manually add the remaining ones to the sequence by selecting the **Fulfill Order Guide** activity in the **Add activity** dialog box. Items added via order guide script also needs to be added manually.

11. Select **Save and close**.

    Note:
    If the same activity is added multiple times in a sequencing process, the activity runs only once when it occurs for the first time in the sequence.

12. **Optional:** Create a lane to group similar catalog items by selecting **Add another lane**.
13. **Optional:** Change the sequence of the activities by dragging the activity cards within or between the lanes.
14. **Optional:** Determine when the lane will run by selecting an option from the **When to start** drop-down menu.
15. **Optional:** View the properties of the configured sequence by selecting the **Properties** button in the top-right corner.
16. Publish the sequencing process by selecting **Activate**.

    Watch this six-minute video to understand how to configure a sequence to fulfill items in order guides. Configure a sequence to fulfill items in order guides

Request an order guide

Once created, order guides present the customer with a three-step ordering process by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. *Describe Needs*: Enter information as prompted. Order guide rules evaluate this information to determine which catalog items to order.
2. *Choose Options*: Select configuration options for the ordered items and provide any additional information needed, including attachments.
3. *Check Out*: Review and edit item information, then click **Submit Order** to place the request. If the requested item was ordered as part of an order guide, the **Order Guide** field on the Requested Item form shows the order guide name.

> **Note:**
> The *Check Out* step can be omitted from an order guide to provide a quicker two-step process. To omit this third step, select the **Two step** check box when creating the order guide.

Review an order guide example

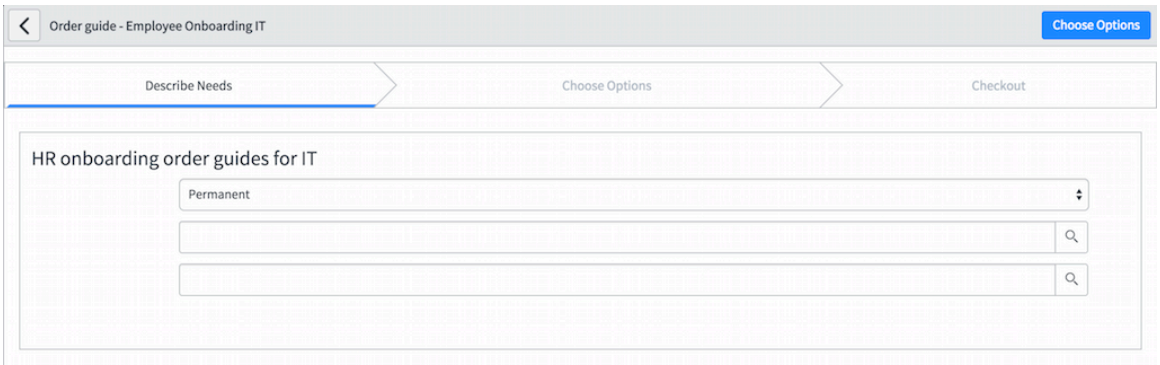
Consider a scenario where you have a New Employee Hire order guide that provides services and items as part of the onboarding process.

Before you begin
Role required: admin

About this task

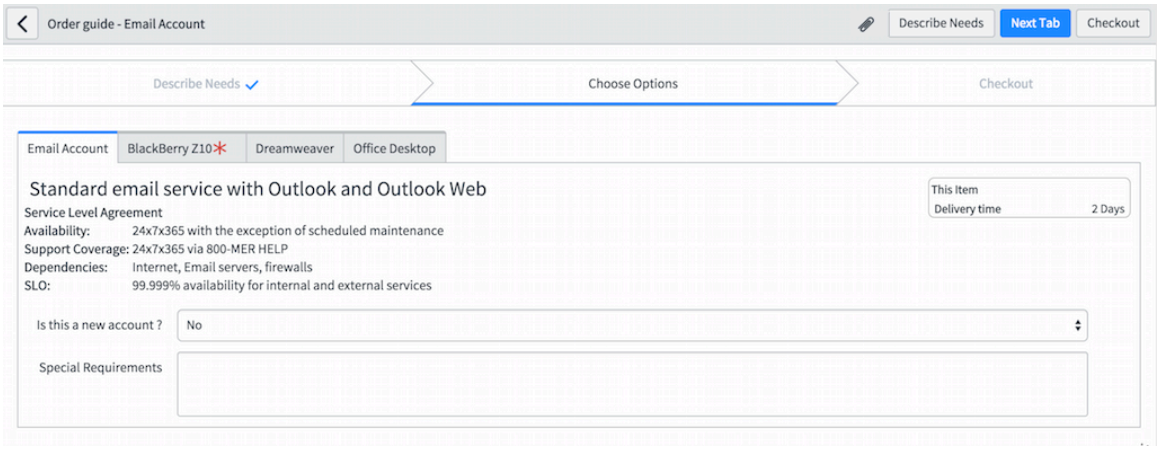
Procedure

1. *Describe Needs*: The order guide prompts the end user for information.



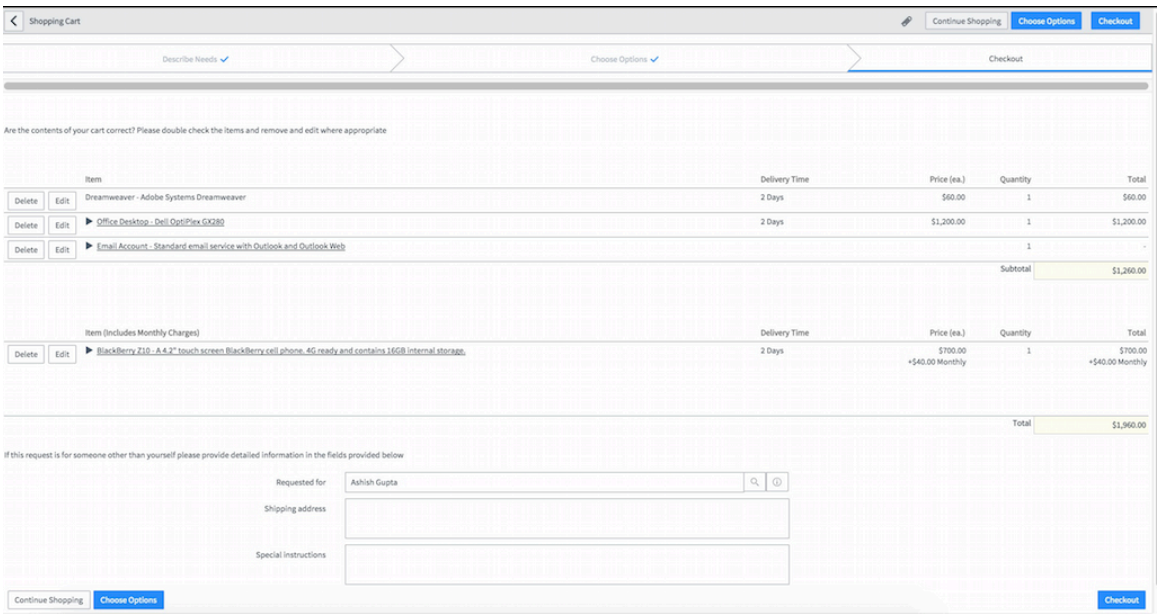
2. *Choose Options*: The order guide uses the information entered and predefined rules to generate options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The end user selects configuration options for the ordered items, and provides any additional information needed.

3. *Check Out*: The end-user reviews and edits item information, then click **Submit Order** to place the request.



Create an order guide rule to add a catalog item

You can add a catalog item to an order guide using specific rules.

Before you begin

Role required: admin

About this task

Order guide rules define conditions that must be met for a specific item to be included in an order. For example, a New Employee Hire order guide rule can state that if the new employee job title is CTO or Director, and the department is IT, then add an executive desktop item to the order.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Order Guides**.
2. Open an order guide.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Rule base** related list, click **New**.
4. On the form, fill in the fields.

Rule guide

Field	Description
Guide	The order guide to which the created rules are applied.
At this position	Tab positions are numbered in order from left to right, with the lowest number appearing at the left of the screen.
Application	Name of the application that is being used.
If this condition is true	Conditions that must be true for this rule to apply. Create conditions using the condition builder . Conditions can be evaluated against *Keywords*, *Requested By*, *Requested For*, or any variables defined for that order guide.
Include this item	Item to include in the order if all conditions defined in *If this condition is true* are matched. **Note:** You can also include record producers in the order guide.
Ignore Mandatory Evaluation	Option to allow customers to proceed without completing mandatory fields for the Describe Needs and Choose Options screens. The mandatory status of a field is determined by the variable defining that field. If mandatory fields are not enforced, then relevant information is not passed on to the ordered items. For example, in a New Employee Hire order guide, if the address is not provided then this information is not included in business cards ordered.
Use cart layout	Option to use the cart layout that has been configured.
Show quantity	Option to display the ordered quantity of a catalog item in the Choose Options section when a customer requests for an order guide through the Service Portal or Now Mobile app. **Note:** If the **Hide Quantity** portal setting is selected while creating or editing a catalog item, the ordered quantity is displayed in the Summary section but not in the Choose Options section.
Quantity	Option to select the default quantity of a catalog item for the order guide. When quantity is shown, this value can be modified during checkout.

5. Click **Submit**.

Create an order guide variable

You can create variables within an order guide.

To create or edit order guide variables, open an order guide, then select an entry from the **Variables** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service catalog variables within order guides define the questions and potential answers presented to the customer while ordering. This information is used by order guide rules. Variables can also be cascaded, which passes the variable values along to individual ordered items.

Pricing is not supported for an order guide variable, even when you define the pricing for the variable though a variable set, and associate the variable set to the order guide.

Create an item variable assignment

Create an item variable assignment that enables the catalog admin set up a default value mechanism in the order guide context so that the user can focus only on required values.

Before you begin

Role required: admin

About this task

For example, you can set the default storage of an iPhone to 64 GB for Sales, and to 16 kB for Development. This setting is configured in the new hire order guide by using mutually exclusive rules and setting the storage variable accordingly for Sales and Development.

The value for an item variable is determined in the following order:

1. Item variable assignment
2. Cascading value (if no item variable assignment exists)
3. Default value defined in the variable definition (if no cascading value or item variable assignment exists)

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Order Guides**.
2. Open an order guide.
3. Open a rule.
4. In the **Item Variable Assignments** related list, click **New**.
5. On the form, fill in the fields.

Item Variable Assignment form

Field	Description
Item Variable	Name of the Item variable. Select an item variable from the list or create one.
Active	Check box to make the record active.
Assignment Type	Name of the assignment type. Select either Order Guide Variable or Value. When Order Guide Variable is selected, the **Order Guide Variable** field is enabled.
Order Guide Variable	Name of the order guide variable. Select an order guide variable from the list or create one. (This field is only visible if **Assignment Type** is Order Guide Variable.)

6. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Set an item variable value to match an order guide variable value, or an order guide default value, using an item variable assignment.

Cascade an order guide variable

Cascading enables values entered for variables in the initial order form to be passed to the equivalent variables in the ordered catalog items.

Cascading allows values entered for variables in the initial order form to be passed to the equivalent variables in the ordered catalog items. For example, a variable on the initial order form prompts the customer to enter a delivery location value. If you enable cascading, the value for this variable then populates delivery location fields on each of the ordered items.

To enable cascading, select the **Cascade variables** check box when creating the order guide. Then, create variables on the catalog items that match the names of the corresponding variables in the order guide. When a customer places an order, the variables on the ordered items inherit the values of the identically named variables in the order guide.

Use a variable set

You can use a variable set with an order guide.

Before you begin
Role required: admin

About this task
Cascading variables require that the same variable be on both the order guide and the ordered items. It can be useful to define each variable once in a variable set, then assign the variable set to both the order guide and the individual catalog item. This approach avoids duplication and ensures that the variable is the same in both locations.

To use a variable set with an order guide:

Procedure

1. Create the variable set.
2. In the Variable Set form, create each variable.
3. Add the variable set to the order guide and to each catalog item involved.

> **Note:**
> The individual variables in a variable set do not appear in the Order guide or Catalog Item forms. To view the variables in a variable set, open the variable set record.

Hide cascaded variables

You can hide the duplicated variables on the **Choose Options** screens to keep your screen clean.

When cascading variables, you can hide the duplicated variables on the Choose Options screens, making these screens simpler.

To hide duplicate variables on all screens after the initial Describe Needs screen in the Service Catalog Platform UI, run an *onLoad catalog client* script.

```
function onLoad(){
  var item = g_form.getControl("current_item");
  var guide = g_form.getControl("sysparm_guide");

  if (item == null && guide == null )
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  return;

  if(item != null && guide != null && item.value == guide.value)
    return;
  g_form.setDisplay('YOUR_VARIABLE_NAME',false);
}
```

To hide duplicate variables on all screens after the initial Describe Needs screen in Service Portal, use the *isOrderGuide()* method.

```
if(g_service_catalog.isOrderGuide())
  g_form.setDisplay('variable_name', false);
```

Avoid enforcement of a mandatory field

You can avoid enforcing a mandatory field within tabs.

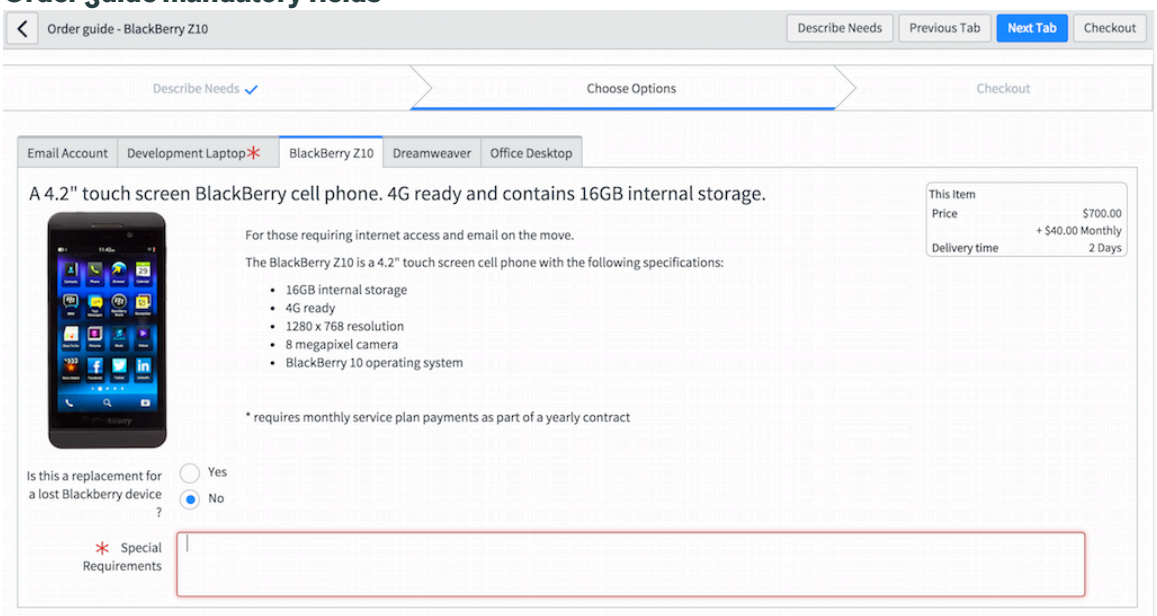
Before you begin

Role required: admin

About this task

By default, mandatory fields must be filled in before switching tabs in the **Choose Options** section of order guides.

Order guide mandatory fields



In this example, if the customer attempts to select another tab without filling in the *Street Address* field, a warning prompt appears. The customer cannot switch tabs without entering this information.

To avoid this enforcement in all order guides:

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties**.
2. Locate the property *Validate mandatory fields when switching tabs in 'Choose Options' section of Order Guides* (`glide.sc.guide.tab.validate`).
3. Clear the *Yes* check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you make this change, mandatory fields are still mandatory, but the customer can switch between tabs before filling in the mandatory fields. Enforcement is then checked when the customer chooses to proceed to the next step.

To avoid enforcement of mandatory fields altogether, use the *Ignore Mandatory Evaluation* check box within the relevant order guide rule.

Run order guides automatically

You can run an order guide automatically from within a workflow or a server script, passing parameters to that order guide to define variable values.

Automatically generate a set of ordered items as part of a wider process, without needing to manually submit a service catalog request and reenter existing information.

For example, you can run an order guide to fulfill HR onboarding requests, passing parameters such as the new employee's position and department. The order guide then generates a set of requested items such as laptop and email account, based on those parameters.

Service Catalog API

Define a content item

A content item is a service catalog item that provides information instead of goods or services.

Before you begin

Role required: admin

About this task

Content items can reference knowledge articles, static blocks of text, or external web-based content.

To define content items:

Procedure

1. Navigate to **All** > **Service Catalog > Catalog Definition > Content Items**.
2. Click **New**.
3. Fill in the form to define the item.

Content Item form

Field	Description
Name, Category, Icon, Roles, Active,	As for standard catalog items.
Content type	The type of information to display when a user selects the item. ○ **KB Article**: a ServiceNow knowledge article available to users with the specified roles. ○ **Catalog Content**: a static block of text, formatted with HTML. ○ **External Content**: documents or web pages stored outside the base system instance.
Target	Location where the content appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Within Catalog**: displays the content within the catalog iframe window (which may not render some external websites properly). ○ **New Window/Tab**: displays the content in a new browser window or tab. Choose this option if the content does not display properly within the catalog.
URL	The full URL (including the prefix http:// or https://) for external content to display when a user selects the item. This field is available only if the **Content type** is **External Content**. **Note:** Since base system instances are accessed via HTTPS, links to HTTP sites could result in a mixed mode content error or warning, depending on browser security settings.
KB article	The knowledge article to display when a user selects the item. This field is available only if the **Content type** is **KB Article**.
Short description, Description, Picture	As for standard catalog items. These fields are only available if the **Content type** is **Catalog Content**.
Meta	Comma-separated list of tags used to search for the content item. See Configure keyword search for catalog items.
Hide on Service Portal	If selected, the content item is not available on Service Portal.

4. Click **Submit**.

Configure a default width for service catalog variables

Configure the default width for variables on a catalog item page to specify what percentage of the screen size that it can span.

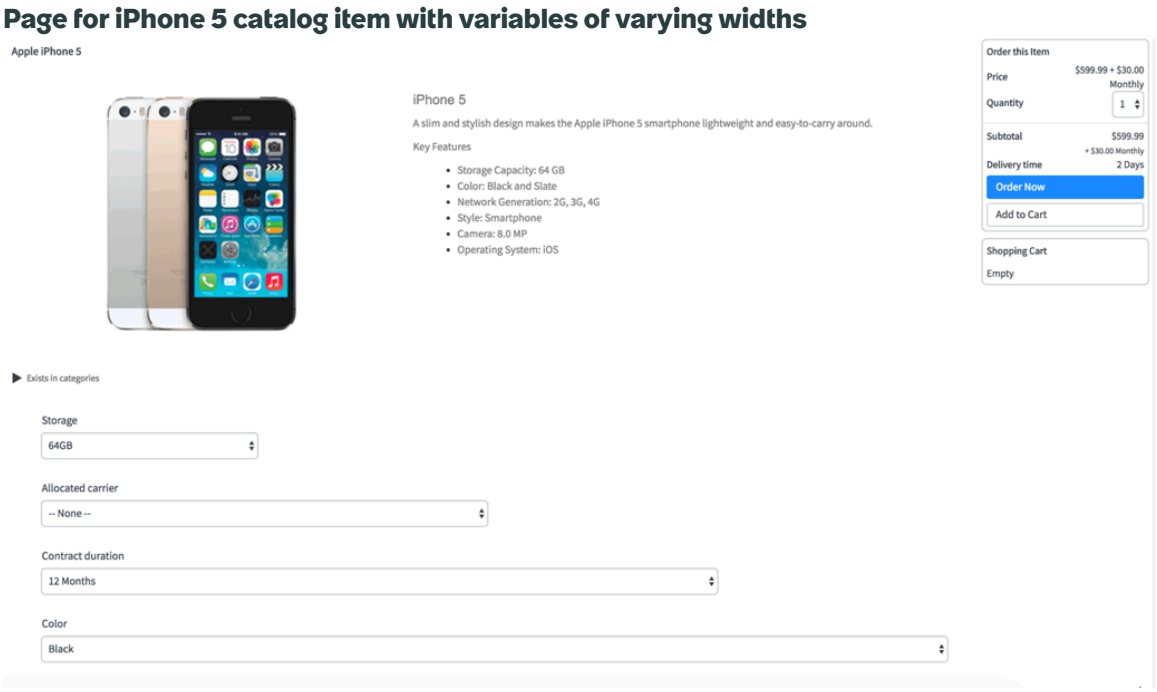
Before you begin

Role required: admin

About this task

The following figure shows how the variables for the different Apple iPhone 5 options are set to different widths.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A default width size cannot be set or does not apply to the following variables:

- The break, container end, container split, container start, and label variables.
- Any variable placed in a container with two-column layout.
- A variable set with a two-column layout.
- Any variable that is created with a custom width set in the **Variable width** field on the Variable form. For details, see Create a service catalog variable. The custom width for the variable overrides the default width set for the variable type.

Note:
Custom variable widths are not supported in either Mobile or Service Portal.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Variables** > **Variable Default Size**.
2. For each variable type, select a default width.

Option	Description
25%	Configures the variable to span 25% of the available screen size.
50%	Configures the variable to span 50% of the available screen size. By default, some vari ables require a minimum of 50% width.
75%	Configures the variable to span 75% of the available screen size.
100%	Configures the variable to span 100% of the available screen size.

3. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define a regular expression for a variable

Define a regular expression (regex) to validate a variable value.

Before you begin

Role required: catalog_admin or admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Variables** > **Variable Validation Regex**.
2. Click **New**.
3. On the form, fill the fields.

Field	Description
Name	Name of the regular expression.
Validation message	Message that appears when the validation fails.
Active	Specifies if the regex is active.
Regular Expression	Sequence of characters that define the format of the variable value. For example: ○ Invalid Regex: /((((ftp|http|https):\/\/)|(www\.))([-\w\.\/#$\?=+@&%_:;]+)/i ○ Valid Regex: ((((ftp\|http\|https):\/\/)\|(www\.))([-\w\.\/#$\?=+@&%_:;]+) **Note:** ○ Ensure that the regex does not cause catastrophic backtracking. ○ You should not use embedded flag expressions. ○ Use the **Regex Flag** list for the ignore case.
Regex Flag	Character set that is considered while validating the regular expression. ○ None: No regex flags are applied. ○ Case Insensitive: Enables case insensitive matching. Case insensitive matching assumes that only characters in the US-ASCII charset are being matched. Unicode-aware case-insensitive matching can be enabled by selecting **Both** as the regex flag. ○ Unicode Case: (Reserved for future use) Same behavior as **None**. ○ Both: Case insensitive matching is done in a manner consistent with the Unicode Standard.

4. Click **Submit**.

Create a service catalog variable

Pass variables between tasks

Pass variables from one step of the fulfillment process to another.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
Variables can be processed by any workflow or execution plan that is associated with the requested items.

Note:
To pass a variable between tasks, select the **Global** check box when you create a Service Catalog variable.

For example, consider the following tasks within the fulfillment process for a New PC catalog item.

Procedure
1. Procure a PC.
2. Install corporate standard software.
3. Set up email account.
4. Deliver and set up PC for requester.
   Step 4 may require a piece of information from step 3 (the email account credentials for setting up email on the PC). If steps 3 and 4 are executed by different fulfillment groups, you can use variables to make this information visible in the tasks for steps 3 and 4. You can then pass the information between groups so that the second group can access the email account credentials.

Create or edit a catalog item

Define individual catalog items using Service Catalog. You can create, edit, and copy catalog items.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**.
2. Click **New**.
3. On the Catalog Item form, fill in the fields.

   For more information about the fields and their descriptions on the Catalog Item form, see Catalog Item form.
4. Click **Submit**.

What to do next
- Assign the item to additional catalogs and categories, if required.
- Define variables for the item, if applicable.
- To add attachments such as information and instruction documentation to the catalog item, see Add an attachment.

Read related topics:

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a service catalog variable
- Apply user criteria to items
- Set a recurring price

Edit a catalog item

Catalog administrators can edit an item from the service catalog listing. Catalog managers and catalog editors can also edit an item if they are assigned to the item.

Before you begin
Role required: admin

About this task
To edit a catalog item from the service catalog listing:

Procedure

Right-click the header and select one of the following options:

- **Configure Variables**: Add or remove variables from an item.
- **New Variable**: Create a new variable for the item.
- **Configure Item**: Edit the item definition.
- **Configure Client Scripts**: Edit the catalog client scripts for the item.
- **Configure UI Policies**: Edit the catalog UI policies for the item.

Copy a catalog item

Copy an item to create a full duplicate of the item, including the item details, attachments, variables, client scripts, and approvals.

Before you begin
Role required: admin

About this task
Copying can be more useful than using the Insert function because the function only copies the item details.

Procedure

1. Open a catalog item form.
2. Use the **Copy** button to create a new copy of a catalog item, named **Copy of [item name]**.

Note:

- If you copy an active catalog item, the copy is also active. Consider deactivating the copy by clearing the **Active** check box until your changes are complete.
- When you specify a table in the **Relationship tables which should be part of the Copy Item Action. Table names should be comma separated** property in the **Service Catalog** > **Catalog Administration** > **Properties** page, the table records that have a reference to a catalog item are also copied. It is applicable only when you copy the catalog item using the **Copy** UI action. Table names should be comma-separated without any spaces.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accessibility checker in the toolbar

Accessibility checker in the toolbar enables you to identify and resolve accessibility related issues while creating a catalog item in Service Catalog.

Before you begin
Role required: admin

Confirm that the following properties contain the correct values for accessibility checker:

Property	Value
glide.ui.html.editor.toolbar	a11ycheck
glide.ui.html.editor.enabled_plugins	a11ychecker

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**.
2. Select **New**.

   Note:
   If you want to check the accessibility of the content for an existing catalog item, select the catalog item form the list.

3. Select the Item Details tab.
4. In the **Description** field, select the accessibility checker icon in the toolbar.
5. View accessibility-related issues in the **Accessibility Checker** window along with suggestions for resolution of each issue.
6. Select **Repair** to implement the suggestion, or **Ignore**.

   If there are no accessibility issues in the article, then the **Accessibility Checker** window displays a success message:

   No accessibility issues detected

Add a catalog item

Service catalog enables you to add a catalog item to multiple catalogs and categories.

Before you begin
Role required: admin

About this task
A catalog item may be available in more than one catalog and category. For example, a laptop carrying case can be available from both Laptops and Cases and Accessories categories. Within an item:

- The Catalogs related list defines the catalogs where the item is available.
- The Categories related list defines the categories where the item is available.

Procedure

To assign an item to another category or catalog, enter the new details in the appropriate related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The values in these lists override the values of the **Catalogs** and **Category** fields in the catalog item form. If you change values for either related list, these changes automatically update the values in those fields.

Share catalog items across catalogs

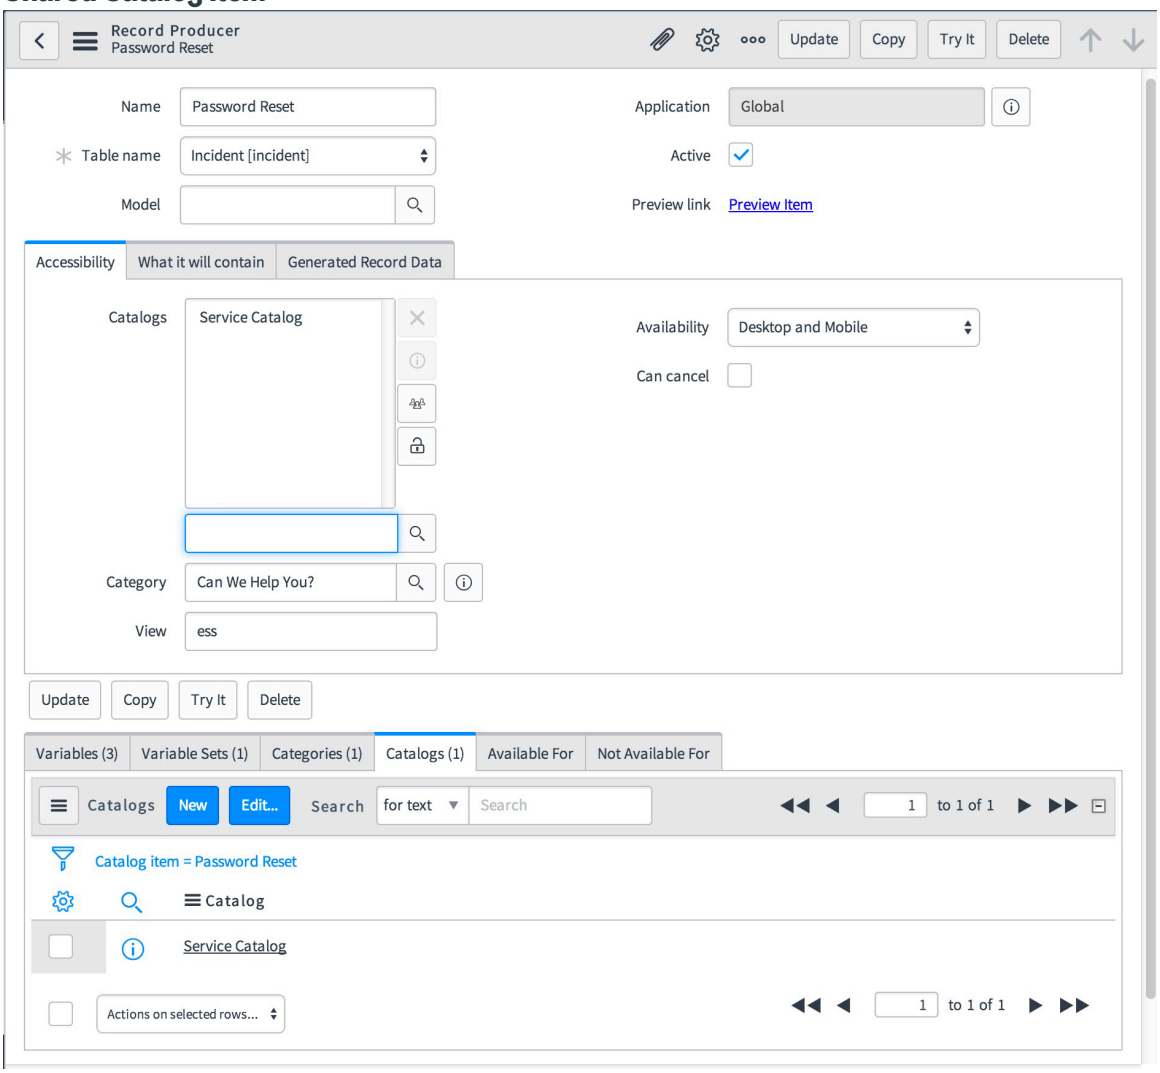
You can share a catalog item, enabling users to order that item from different catalogs. For example, you can share a Password Reset item across catalogs serving different teams.

Before you begin
Role required: admin

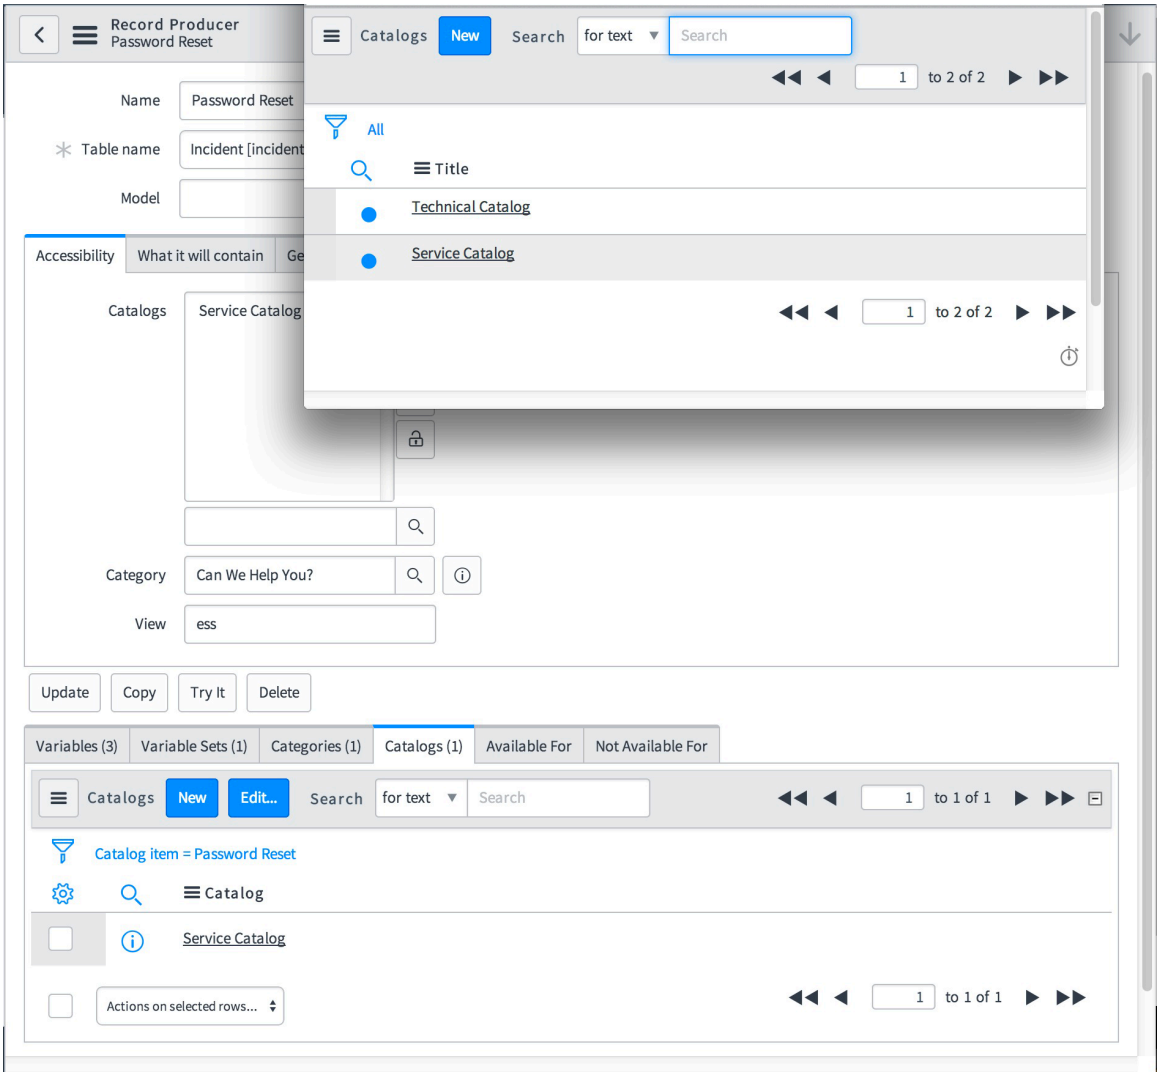
About this task
To share a catalog item across several catalogs:

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**
2. Open the item to share.
3. Select the additional catalogs for that item in the **Catalogs** field.

Shared Catalog Item



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Update**.

   The shared item then appears in the Catalog Items related list for each catalog selected.

Service Catalog customization

Service Catalog enables you to customize the catalog in various ways.

No updates are supported on the following internal service catalog tables, either directly or through business rules.

- Options [sc_item_option]
- Variable Ownership [sc_item_option_mtom]
- Question Answer [question_answer]
- Item Produced Record [sc_item_produced_record]
- Multi Row Question Answer [sc_multi_row_question_answer]

Cart layout

Service catalog enables catalog administrators to configure the layout and functionality of the service catalog cart used in your organization to place requests for catalog items.

You cannot check out a cart item that is no longer available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can perform the following:

- Remove components. For example, hide prices throughout the cart if your catalog does not use pricing.
- Change labels. For example, change the **Order now** button label to **Request Item** in the shopping cart.
- Change the order of elements. For example, change the order of the columns on the order status screen.
- Configure, hide, or create functionality. For example, add a **Requested For** reference field to the shopping cart.

Configure the cart layout

Configure cart layout records to define functionality for widgets or screens in the shopping cart.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
2. Select a widget or screen.
   - Cart widgets: Item Ordering Widget, Shopping Cart Widget, or Item Ordering Widget (Order Guide)
   - Preview screens: Cart Preview Screen, Cart Preview Screen (Two Step), Cart Preview Screen (Wish List), or Cart Preview Screen (Classic Mobile)
   - Order status screens: Order Status Screen or Order, Status Screen (Classic Mobile)
3. Update the **Title** field to change the title that appears on the widget.
4. Leave the default **Target** value.
   Do not change this value because it identifies the cart element being defined.
5. Update the other sections of the cart layout record, as required.
   The availability of these sections varies for each widget and screen record.
   - In the **Components** section, select the components to display, such as delivery times, item descriptions, and prices.
   - In the **Columns** section, select which columns to display, such as the item description column, delivery time column, or price column.
   - In the **Buttons** section, select the buttons to display, such as **Add to Cart**, **Edit Cart**, and **Delete Item**.
   - In the **Button Labels** section, enter new labels to replace the default button labels.

     A new label is used on all screens that the button appears on. For example, the **Continue Shopping** button is used on several screens, so changing its label affects all those screens.
6. If required, configure the widget and column macros.
7. Save the record, and then test the results of your configuration by ordering items from your service catalog.

   Some settings and properties in your instance can override or affect your cart layout.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cart layout considerations

When you enable cart layouts, service catalog properties are impacted. Consider the possible outcomes and alter the settings or properties to achieve the cart layout and functionality you require.

Some of these properties are impacted when you use cart layouts. For example, with the order status screen, the **When to show prices and sub-totals on the Service Catalog Cart** (glide.sc.price.display) property overrides cart layout settings for displaying prices.

Table title

Property	Impact
Allow ESS users the option to cancel their requests from the checkout screen. [glide.sc.checkout.cancel]	Overridden when the **Cancel Request** check box in cart layout settings is selected. If this check box is selected, the **Cancel** button is displayed even if the property is set to **No**.
Enable cloning requests during checkout. [glide.sc.allow.checkout.clone]	Not used (deprecated) if cart layouts are enabled. Replaced by the **Clone Checkout**check box in cart layout settings. The **Clone Checkout** check box is cleared by default for new instances. For upgraded instances, the check box is set to the existing value of the glide.sc.allow.checkout.clone property.
List of roles (comma-separated) that can use the quantity selector in the shopping cart [glide.sc.allow.quantity]	Overrides any relevant cart layout settings.
Show the request item number for each line item on the checkout screen (default false). [glide.sc.checkout.request.number]	Not used (deprecated) if cart layouts are enabled. Replaced by the **Request Item Number column** check box in cart layout settings.
Show the 'Back to Catalog' button on the two-step checkout screen. [glide.sc.checkout.twostep.back]	Not used (deprecated) if cart layouts are enabled. Replaced by the **Back to Catalog** check box in cart layout settings.
When to show prices and subtotals on the Service Catalog Cart. [glide.sc.price.display]	Overrides any relevant cart layout settings.

Configure widget and column macros

Configure macros that define functionality for elements within each widget or screen.

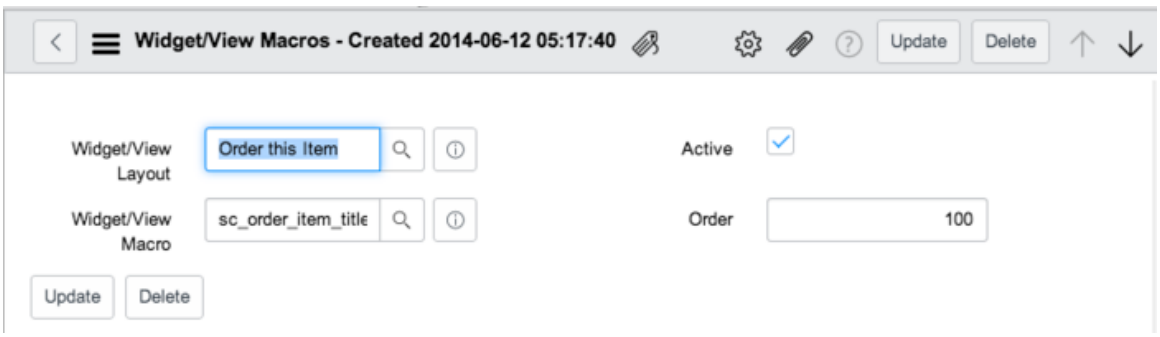
Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Some widgets or screens also have column macros that define the horizontal layout and configuration of shopping cart contents.

You can configure these macros to alter the display order of elements, or hide elements, within the widget or screen. You can also create new macros to implement any extra requirements.

Procedure
1. Navigate to **All** > **Widget Macros** > **Column Macros** related list.
2. Click the order number entry of a macro to edit its display order, or to activate or deactivate it.



3. Click **Update**.
4. Click the **Widget / View Macro** entry of a macro to view its functionality settings.
   You cannot edit functionality settings for default macros, but these settings can be a useful reference for creating your own widget macros.

Create macros for cart layout

Create macros for cart layout records using Jelly scripts to define customized behavior and display within a widget or screen.

Before you begin
Role required: admin

About this task
Macros that you create do not affect upgrades because customized widget functionality is isolated from general cart behavior.

Procedure
1. Open the relevant cart layout record.
2. Navigate to **Widget Macros** or **Column Macro**related list.
3. Click **New**.
4. Enter details for the macro.

Macro form

Field	Description
Name	The name for the new macro.
Active	A check box to indicate whether the macro is displayed or not.
Description	A summary of how the macro is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	A check box to indicate whether the macro is displayed or not.
XML	The Jelly script to apply for your macro.

5. Save the macro record.

Example:
This example demonstrates the script to add a **Requested for reference** field as a widget macro to a cart layout record.

```
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide"
 xmlns:j2="null" xmlns:g2="null">
    <j:set var="ref" value="sc_cart" />
    <j:set var="jvar_ref"
 value="${jvar_cart.getRequestedFor()}" />
    <j:set var="jvar_ref_display"
 value="${jvar_cart.getRequestedForDisplayName()}" />
    <tr>
        <td colspan="3">
            ${gs.getMessage('Requested for')}:
        </td>
    </tr>
    <tr>
        <td colspan="3" style="padding: 4px;">
            <g:catalog_requested_for />
        </td>
    </tr>
</j:jelly>
```

Configure cart layout for specific items

Set fields in the Catalog Item form to configure the cart layout for specific items.

Before you begin
Role required: admin

About this task
Overrides any general cart layout settings. For example, you can hide the price of an item by setting the **Omit price in cart** field to **true** for that item.

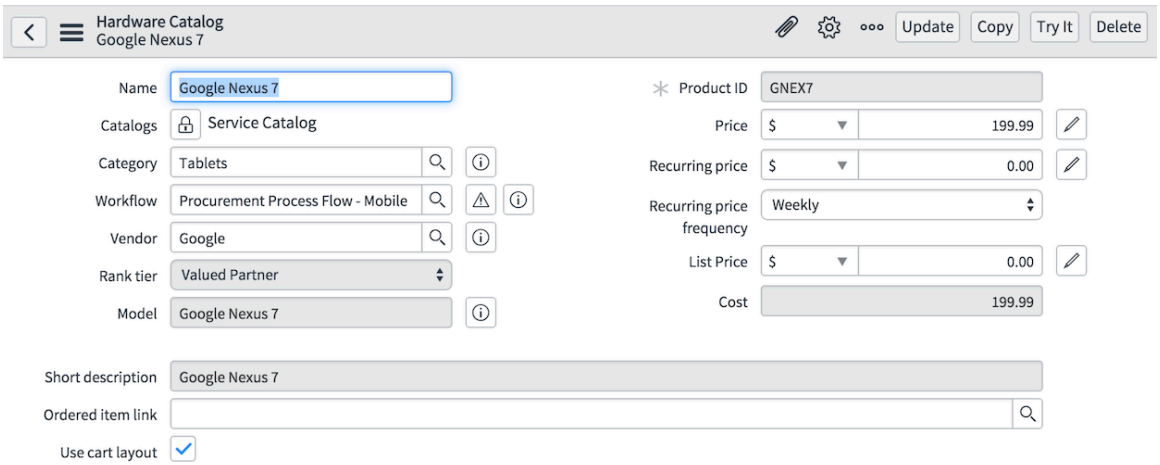
Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**.
2. Select the catalog item.
3. Configure the form to add both **Use cart layout** and any of the following item configuration fields you require:
   - Omit price in cart
   - No cart
   - No order
   - No order now

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- No proceed checkout
- No quantity

4. Clear the **Use cart layout** check box to display the configuration fields for that item.
5. Set the item configuration field values as required.



6. Click **Update**.

Override cart layouts for items

Service catalog enables you to use additional methods to configure cart behavior or layouts, which override cart layout record settings.

For example, your cart layout record settings can hide item prices, but you might decide to display the price of the **Sales Laptop**. In that case, you would set the relevant configuration values on that catalog item. Be aware of the impact of these additional methods, to ensure that your cart behaves in the way you want.

Note:

If you are migrating to cart layouts, you can have defined additional settings and properties that impact your cart layout settings.

Configure Service Catalog cart widgets

You can configure widgets for the shopping cart, catalog items, and order guides.

Before you begin
Role required: admin

About this task
Overview of configurable options in the Service Catalog on the Service Portal and explains how to perform those configurations.

Configure order guide widgets

You can customize the widget that provides details of the current catalog item on an order guide or wizard.

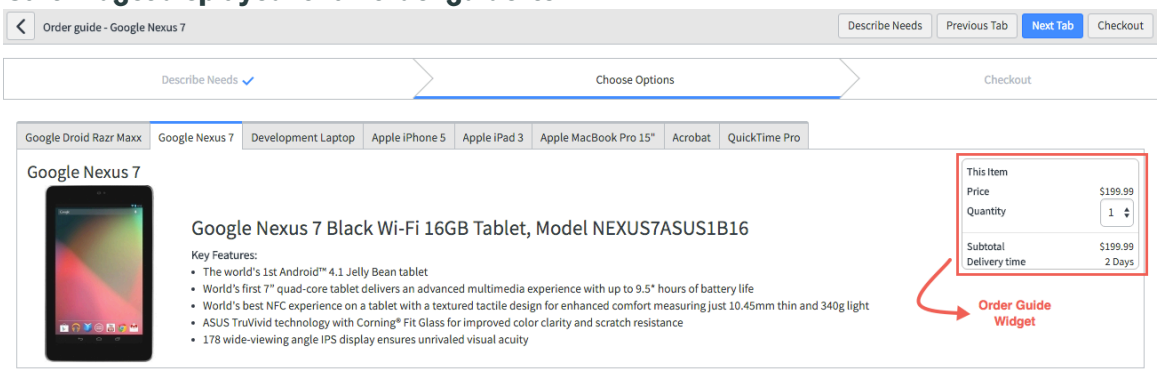
Before you begin
Role required: admin, catalog_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Order guide cart widget is visible when an order guide item is ordered.

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
2. Open the **Item Ordering Widget (Order Guide)** record.
3. You can add/remove components and rename widget title.
4. Click **Update**.

Cart widget displayed for an order guide item



Note:
By default, order guides use a two-step process, and catalog items use a one-step checkout process. If you configure the checkout process, keep in mind that order guides and catalog items provide different cart experiences if they use different checkout processes.

Configure catalog item widgets

You can customize widgets that appear for catalog items.

Before you begin
Role required: admin, catalog_admin

About this task
Both shopping cart and item ordering widgets are visible on the standard catalog page and any ESS catalog page. The shopping cart widget is also available in additional locations, such as the catalog homepage.

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
   a. Open the **Item Ordering Widget** record to modify the widget for ordering item.
   b. Open the **Shopping Cart Widget** record to modify the widget for shopping cart.
2. You can add/remove components, buttons, rename widget title and button labels.

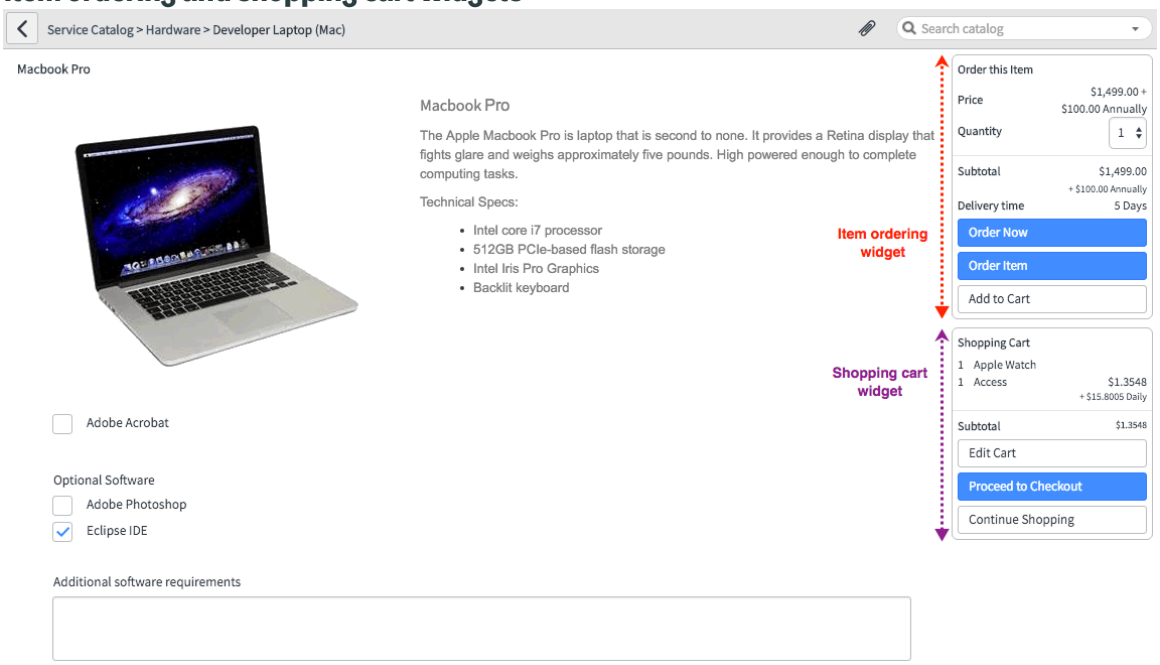
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Update**.

Item ordering and shopping cart widgets



Configure Service Catalog preview screens

You can configure shopping cart preview screens for the one-step and two-step carts, for the wish list, and for the Classic Mobile app.

Configure the wish list screen

Using Service Catalog, customize the cart preview screen for wish list items.

Before you begin

Role required: admin, catalog_admin

About this task

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
2. Open the **Cart Preview Screen (Wish List)** record.
3. You can add/remove components, columns, buttons, and rename labels.
   For more information, see Configure cart layout.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

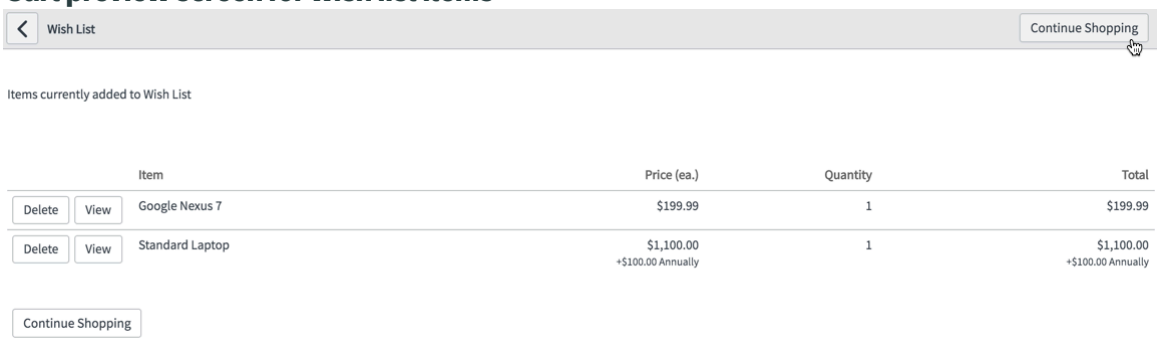
4. Click **Update**.

Cart preview screen for wish list items



Configure Classic Mobile shopping cart screen

Using Service Catalog, customize the shopping cart screen that is displayed on mobile devices.

Before you begin

Important:

Mobile Classic Is Deprecated!

The App Has Been Removed From The Stores And Can No Longer Be Activated. We Are Not Offering Enhancements, Bug Fixes, Or Support For The App. See ServiceNow Classic Mobile App Deprecation Effective September 15, 2022.

Role required: admin, catalog_admin

About this task

The shopping cart on Classic Mobile devices always uses a two-step checkout process. You cannot modify widget macros or button labels on Classic Mobile devices.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
2. Open the **Cart Preview Screen (Classic Mobile)** record.
3. You can add/remove components and buttons.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Update**.

Shopping cart screen on Classic Mobile

Configure a one-step shopping cart screen

Using Service Catalog, customize the shopping cart display screen for a one-step checkout process.

Before you begin

Role required: admin, catalog_admin

About this task

One-step checkout is the default checkout process for catalog items.

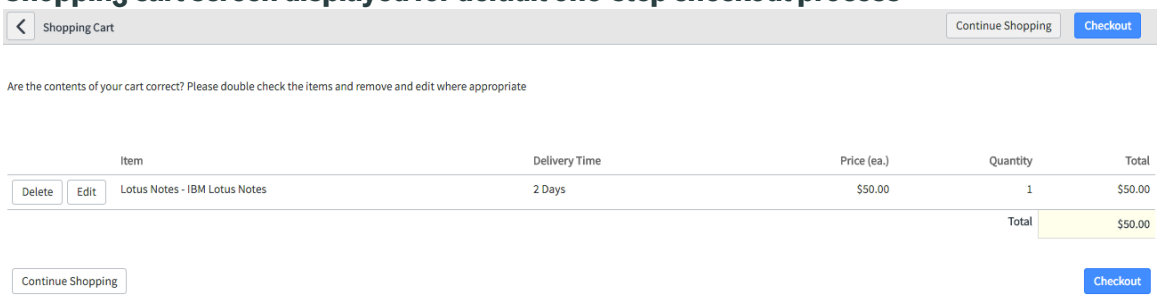
Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
2. Open the **Cart Preview Screen** record.
3. You can add/remove components, columns, buttons, and rename title and button labels. See Configure cart layout.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Update**.

Shopping cart screen displayed for default one-step checkout process



Configure a two-step shopping cart screen

Using Service Catalog, customize the shopping cart display screen for a two-step checkout process.

Before you begin

Role required: admin, catalog_admin

About this task

Changes made to the two-step record are visible only if the two-step checkout process is enabled in properties. By default, catalog items use a one-step checkout process.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**.
2. Open the **Cart Preview Screen (Two Step)** record.
3. You can add/remove components, columns, buttons, and rename title and button labels. For more information, see Configure cart layout.

   In the **Components** tab, both **Shipping Location** and **Shipping Address** are not supported simultaneously. Deselect the selected component to select the other component.

   If you enable **Shipping Address** in the **Components** tab, the editable **Shipping address** field is displayed in the cart preview screen. If you enable **Shipping Location** in the **Components** tab, the editable **Shipping location** field and a read-only **Shipping address** field are displayed in the cart preview screen.

4. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Update**.

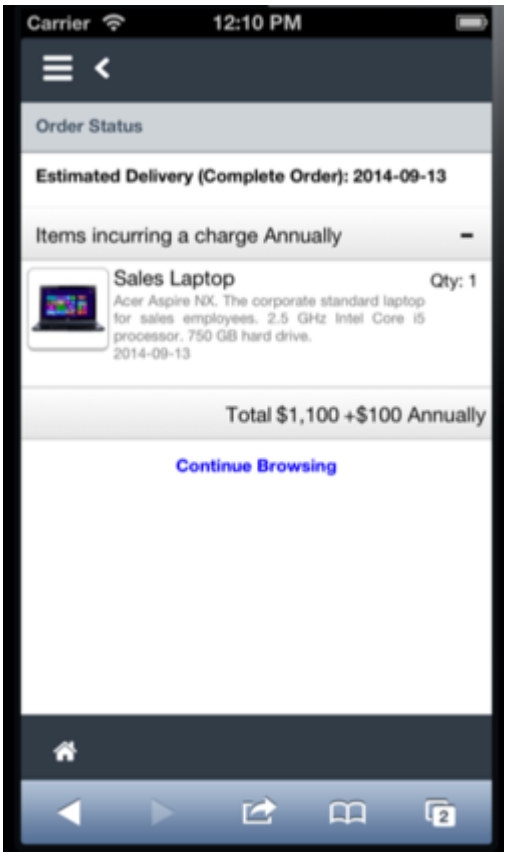
Order status screen on Classic Mobile



Migrating to cart layouts

Service catalog enables you to configure cart layouts to add, remove, or change elements of the service catalog shopping cart. Before you migrate your system to use cart layouts, familiarize yourself with existing configurations for catalog content and decide whether to discard or retain these configurations.

This feature is enabled by default in new instances and the default cart layout settings are implemented. For upgrades, an upgrade script checks to see if your current cart macros are customized. Only a user with an admin role can migrate cart layouts.

- If cart macros are not customized, cart layout configuration is enabled by default.
- If cart macros are customized, cart layout configuration is disabled. Migrate your system to use this feature.

Cart configuration settings

Check your current configurations for:

- UI macros defining custom shopping carts that have been linked to items.
- Service catalog properties impacted by cart layouts.
- Item-specific settings that can override cart layout record settings.

Item-specific settings

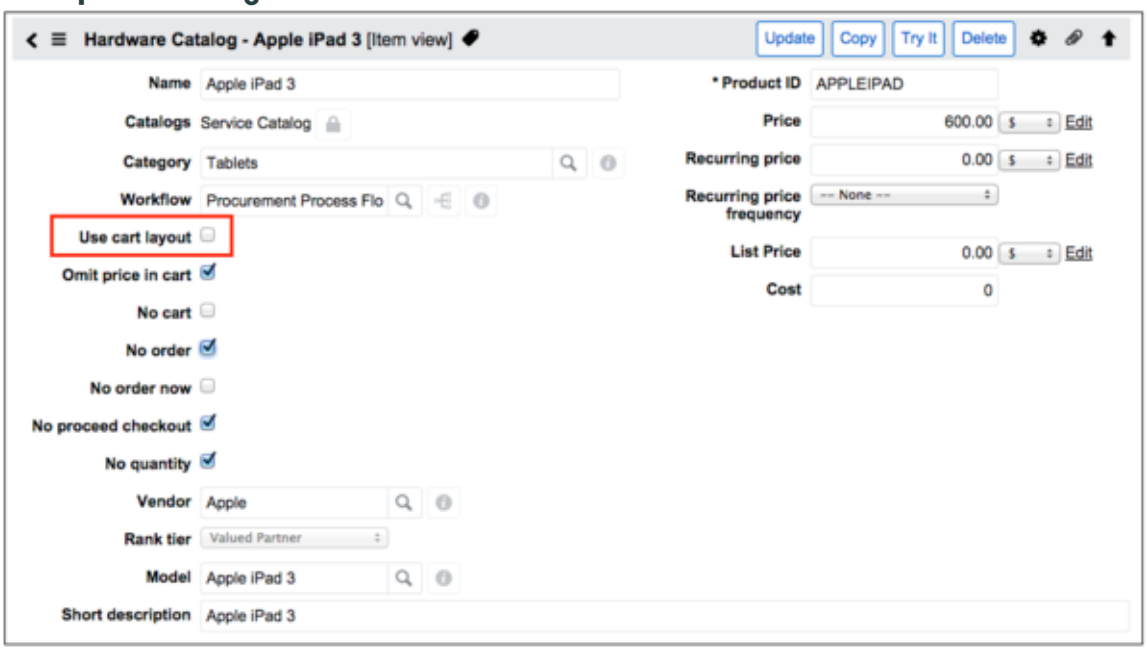
Some catalog items can have cart layout settings that are specific to them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, these items can show prices even though the general cart layout record settings hide prices.

To retain item-specific settings, clear the **Use cart layout** check box in the catalog item form.

Item-specific settings



Note:
You can configure the form to display the **Use cart layout** check box.

Migrate customizations and enable cart layouts

Move customization to cart layout widgets, and then enable cart layouts.

Before you begin
Role required: admin

About this task
When you customize a few UI macros, you should migrate the customizations to cart layout widgets before you enable cart layouts.
Following are the UI macros whose customizations need migration before you enable cart layouts:

- sc_catalog_homepage_cart
- sc_catalog_requested_for
- catalog_item
- catalog_cart_default
- sc_cart_main

In addition, if you have customized the com.glideapp.servicecatalog_category_view UI page, or the Catalog Cart dynamic content, you must migrate these customizations before you enable cart layouts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Save copies of the customizations for later reference.
2. Revert the customizations to restore the customized macros or other content to their standard state.
3. Remove the record for the customization from the Customer Update [sys_update_xml] table.
4. Run the following script in Background Scripts to set the property and set the correct state for all the items in the catalog:

```
var cm = new
 CartLayoutMigration();cm.configureLayoutProperty();cm.setLayou
tFalse();cm.setEmptyLayout();
```

5. Reimplement any cart layout customizations that you want to maintain in the upgraded instance by configuring widget macros.
6. To enable cart layouts, set the service catalog system property *glide.sc.use_cart_layouts* to **Yes**.

Legacy flexible checkout and delivery forms

ServiceNow includes several options that provide administrators some control over content in service catalog template-driven forms.

Some service catalog forms, such as the checkout form, are generated from templates, instead of being data-driven like other forms in the system, such as the Incident form.

Template-driven forms provide enhanced look-and-feel over standard data-driven forms, but they provide more limited control over the form content.

Note:

It is recommended that you use cart layout records to configure cart layouts. Using cart layout records lets you configure the service catalog cart without writing and maintaining scripts.

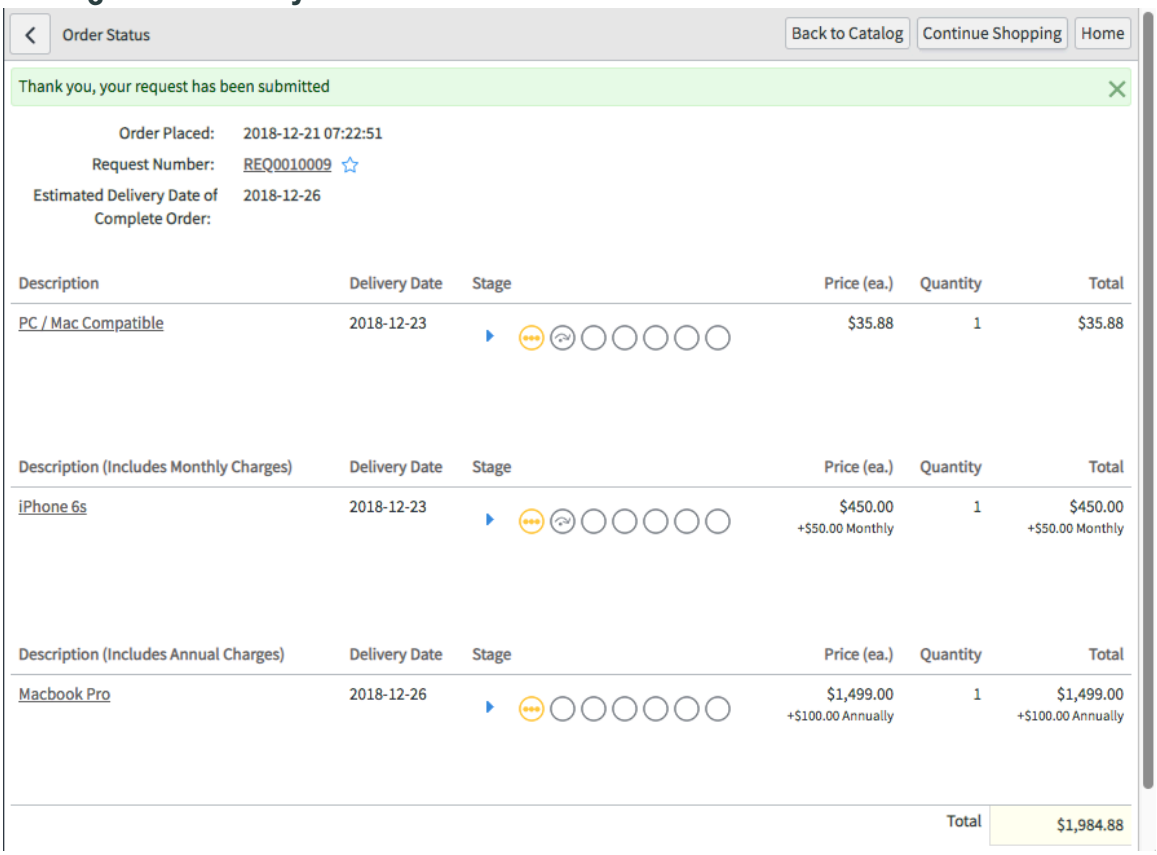
Modifications in the delivery screen

In the final checkout step, a summary screen provides a list of all items and services ordered.

Warning:
Modifying the Order Status or Summary screen requires advanced scripting and a knowledge of Jelly. Also, the upgrade process skips updates to the summary screen after a customization. With these constraints in mind, you can modify the summary screen by editing the *com.glideapp.servicecatalog_checkout_view* UI page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog order summary status



Requester search results

After you enable the two-step checkout process, the *Requested for* field appears on the Request form.

The *Requested for* field references the User `[sys_user]` table and has an auto-complete feature. Two service catalog properties (**Service Catalog** > **Catalog Administration** > **Properties**) enable an administrator to add columns to the search results for this field and to order the list by one of the columns.

Service catalog properties

Property	Description
Additional columns for the "request for" Service Catalog widget. (glide.sc.request_for.columns)	Choose fields from the User `[sys_user]` table. Must be semicolon separated.
Ordering of matches for the "request for" Service Catalog widget. (glide.sc.request_for.order_by)	Choose fields from the User `[sys_user]` table.

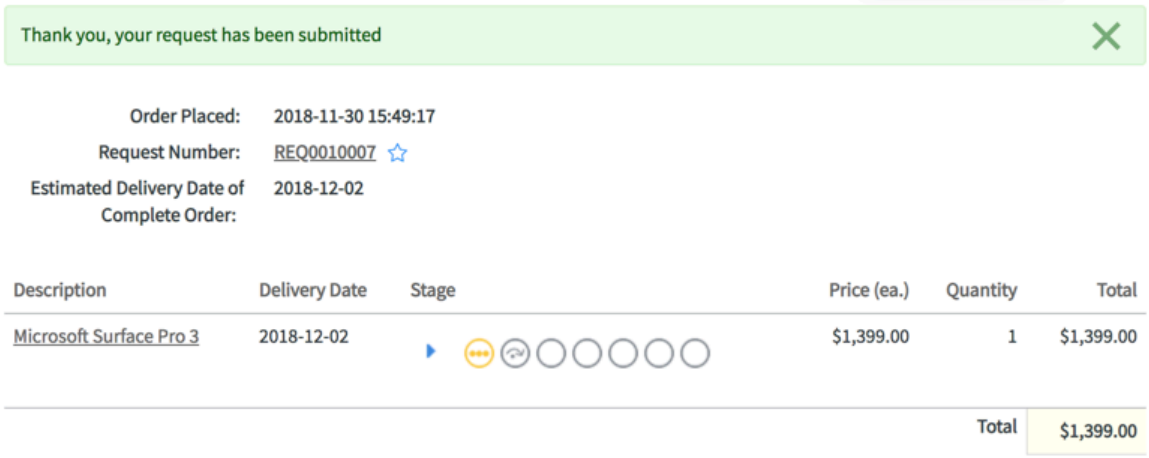
Modifications in the checkout form

You can modify the checkout form to use an alternate description field or to add request item number for each line.

By default, the checkout forms list the **Description**, **Delivery Date**, **Stage**, **Price**, **Quantity,** and **Total** columns. An example of default checkout form is shown:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Checkout default



Add the request item number on checkout form

Add the request item number to display this number as an extra column on the checkout form. By default, the request item number is not displayed in the list.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties**.
2. Locate the property: **Show the request item number for each line item on the checkout screen (default false)**.
3. Select the **Yes** check box to add the number column to the checkout form.

Checkout number

Use an alternate description field on the checkout form

Use an alternate description field to describe your category item in the checkout form. By default, the **short_description** column of the catalog item appears as the item description.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Policy** > **Properties**.
2. Locate the property **Field name to use for the description column of the checkout form. If blank, the default (short_description) is used**.
3. Enter the name of the alternative field (a column in the Catalog Item `[sc_cat_item]` table) and save it.
   For example, if you've selected **name**:

Checkout name

Summary

Your request number is **REQ10005**, which you can use to refer to this request in future interactions with the service desk.

You may also bookmark the following link to get back to Request REQ10005.

Note that clicking on the bookmark link (above) will simply take you back to this screen.

Description	Delivery Date	Stage	Price (ea.)	Qty	Total
Blackberry	2007-04-08		$500.00	1	$500.00
				Total:	**$500.00**

Delivery Information

Estimated Delivery Date of Complete Order: **2007-04-08**

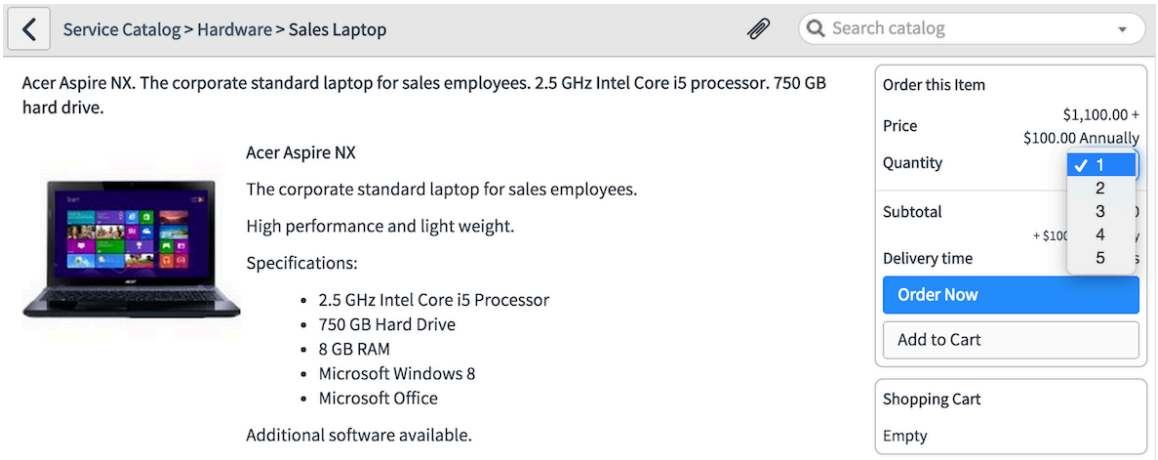
Define item quantity choices

In the Service Catalog, the default quantity choices are 1–10. You can configure the quantity selector with additional choices. This configuration is also applicable in Service Portal.

Before you begin

Role required: admin

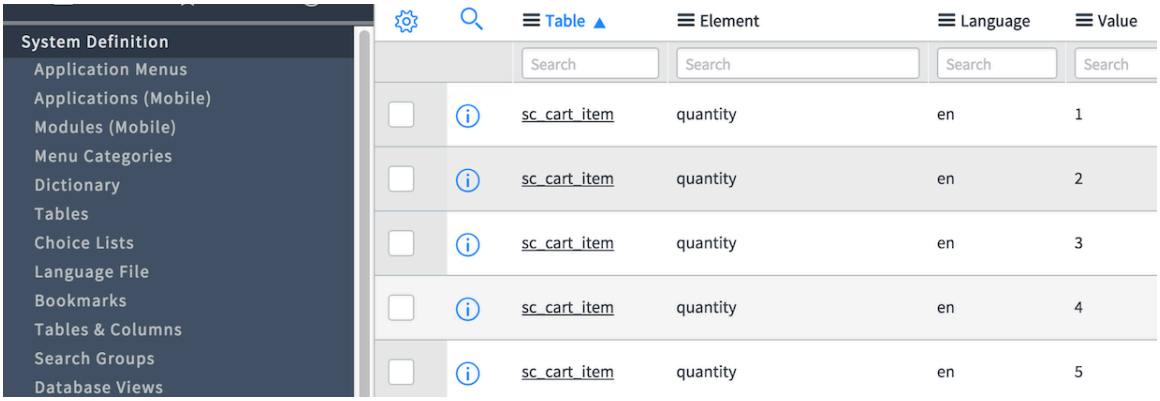
About this task



Procedure

1. Navigate to **All** > **System Definition** > **Choice Lists**.
2. Search for the table **sc_cart_item** and the element **quantity**.
   The existing quantity choices appear.
3. Add quantity choices, modeling them after the existing ones.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To reduce the quantities available for catalog items, delete the relevant quantity records. For example, to reduce the quantity range to 1-3, delete the records for 4 and 5.

To restrict the roles allowed to change quantities, edit the **List of roles (comma-separated) that can use the quantity selector in the shopping cart** (*glide.sc.allow.quantity*) service catalog property. For example, you can limit this ability to the admin and catalog_admin roles.

Related topics

Service Catalog administration

Remove item restrictions

Service Catalog enables you to remove or apply restrictions on all order guides, record producers, and wizard launchers.

Before you begin

Role required: admin

About this task

Catalog administrators can use Service Catalog properties to configure the behavior and usage of a catalog item.

By default, all order guides, record producers, and wizard launchers have these restrictions:

- They cannot be added to a requested item
- They do not provide a **Try It** action
- They are not added to the cart as items

To remove these restrictions or apply these restrictions to other types of items:

Procedure

Modify the comma-separated lists of tables in the following properties:

- **List of class names for catalog items that cannot be added to an existing request**(*glide.sc.item.cannot_add_to_request*): restricts the items that can be added to a requested item, after an end user places a request. For example, to restrict content items from being added to an existing request, add sc_cat_item_content to the list for this property.
- **List of class names for catalog items that do not use the default "Try It" UI Action**(*glide.sc.item.cannot_try_it*): restricts the items which allow you to click **Try**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

It on the item form to preview how it appears in the service catalog. Items with such restrictions do not display **Try It** on the form.

- **List of class names for catalog items that do not generate a normal cart item**(*glide.sc.item.not_normal_cart_item*): restricts which item types are added to the cart by default.

Using variables for price setup

You can define a price for every service catalog item. The price or recurring price of a catalog item can be modified with variables, increasing the base price for that item.

This pricing is useful if you want the price or recurring price dynamically calculated based on how a user completes the ordering form. For example, the cost of an item can be increased based on options the user selects, such as extra memory in a PC.

The following variable types can be configured to modify the total cost of an item:

- Check box
- Multiple choice
- Reference
- List collector
- Select box
- Lookup select box

Check box

A check box variable helps to set the price or recurring price of the item being ordered.

You can Create a check box variable and set the price of the item. Use the **Price if checked** or **Recurring price if checked** field to specify the price or recurring price difference for that variable when the option is selected.

Under the **Type Specifications** tab, you can specify the price in different currency types. Also, you can configure the price in the following pricing models:

- Calculated
- Fixed
- Multiple

For information on the pricing models, see Price fields .

Multiple choice

For a multiple choice variable, there are two options for pricing.

- Specify the price difference in the **Price** field on the question choices.
- Specify the recurring price difference in the **Recurring Price** field on the question choices.

Note:
Select boxes operate the same as multiple choice variables but are displayed as select boxes.

Reference

A reference variable includes a **Pricing implications** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If this field is selected and there is a **price**, **u_price**, **recurring_price**, or **u_recurring_price** field on the referenced table, the value of that field is used to modify the cost of the item being ordered when a reference value is selected.

For example, suppose that computers in Phoenix cost $100 more than the ordering price, and computers in Boise cost $100 less than the ordering price.

1. Set up a reference variable to the Location [cmn_location] table.
2. Put a **u_price** field on the Location table.
3. Set that field to `100` for the Phoenix location.
4. Set that field to `-100` for the Boise location.

When ordering a computer, if **Phoenix** is selected as the location for this variable, the ordering price is increased by $100. If **Boise** is selected, the ordering price is decreased by $100.

Note:
List collectors operate the same as a reference variable, but use the **List table** field to specify the table being referenced. Since it is a list collector variable, multiple selections can be made that all modify the ordering price or recurring price.

Lookup select box

A lookup select box variable is more powerful than a reference variable.

Specify the following when creating a lookup select box variable:

- **Lookup from table**: the table from which values are queried.
- **Lookup value field**: the field on the lookup table whose value is used as the value of the variable (typically sys_id).
- **Lookup label field(s)**: a comma-separated list of fields on the lookup table whose values are used to display the selections in the select box. For example,**manufacturer,name** for the Software [cmdb_ci_spkg] table would display selections as:
  - Microsoft | Excel
  - Adobe | Photoshop Elements
- **Lookup price field**: the field whose value is used to modify the price of the item being ordered.
- **Lookup recurring price field**: the field whose value is used to modify the recurring price of the item being ordered.

Set a recurring price

A catalog item can have a recurring price in addition to an initial price.

Before you begin

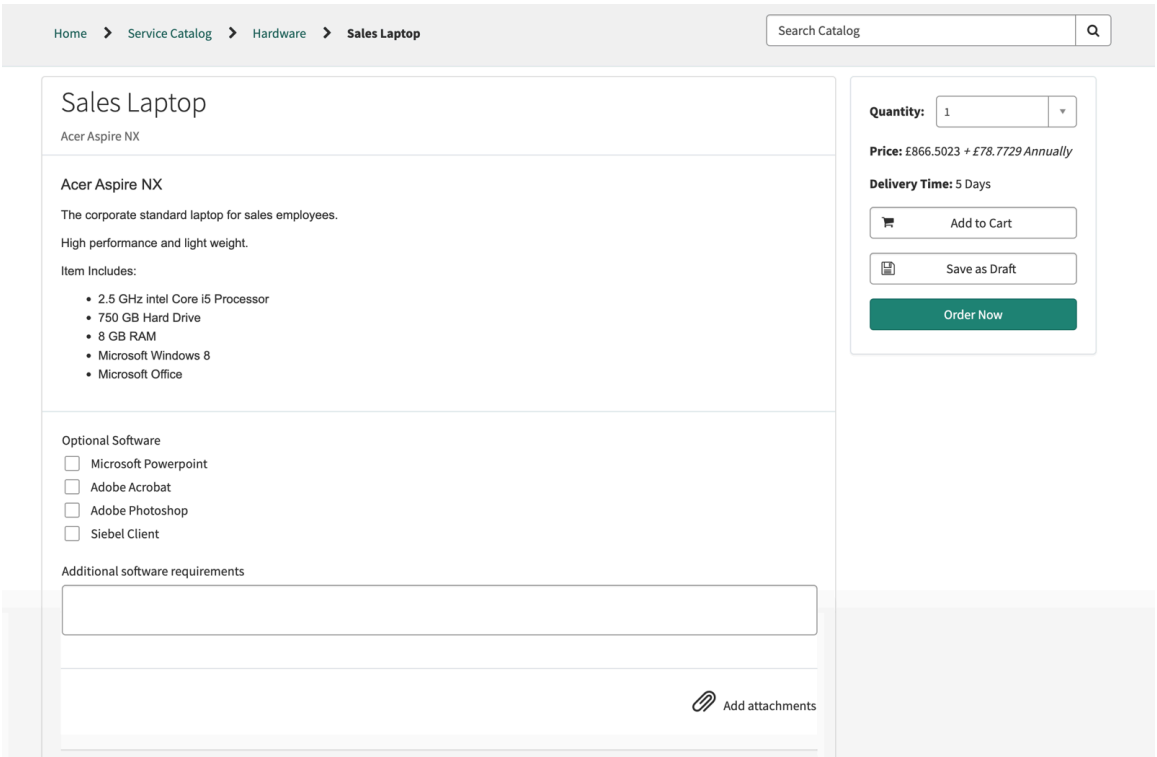
Role required: admin

About this task

The price and the recurring frequency are set on the catalog item record. After the price and frequency are set, the recurring price appears in the catalog, catalog search results, catalog page for the item, shopping cart, and order summary screen.

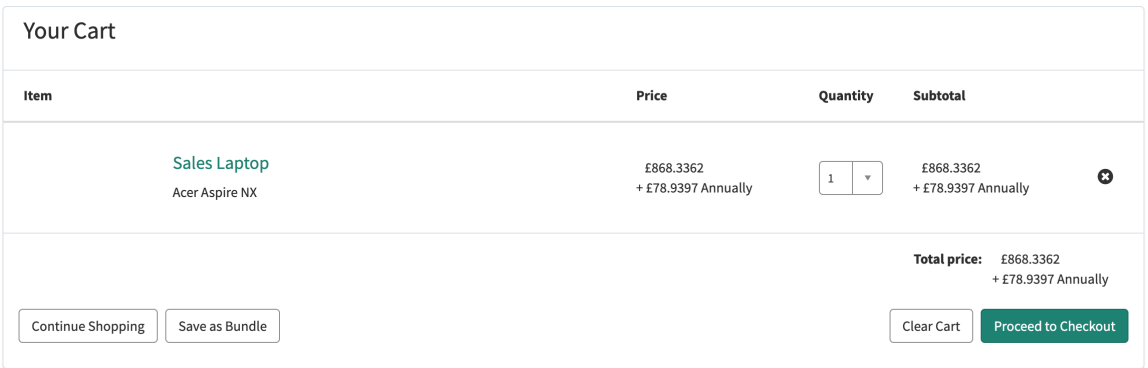
For example, a subscription to a mobile phone contract could cost $500.00, with a $30.00 monthly recurring price.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



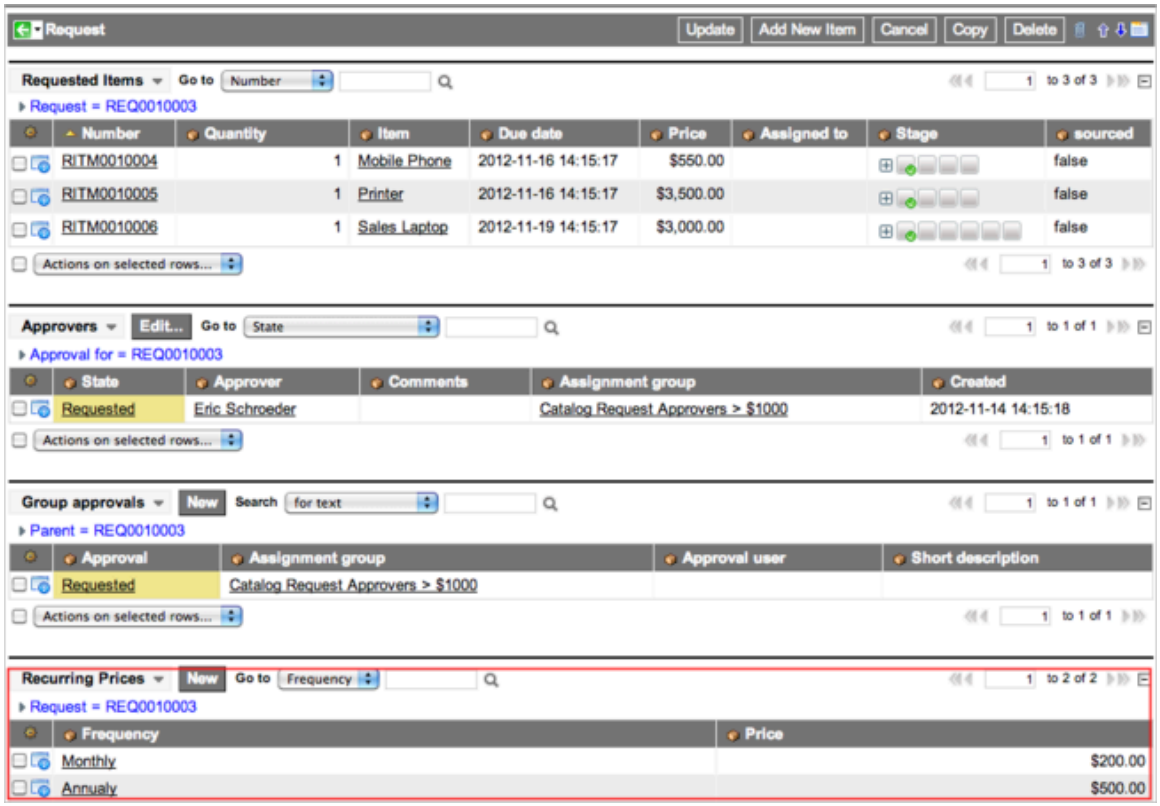
If multiple items with the same recurring price frequency are placed in the shopping cart, they are grouped. The grouping makes it easier to view how much items cost for each frequency (for example, weekly, monthly, and annually). If the shopping cart contains items with and without recurring costs, they are grouped separately.

If multiple items with the same recurring price frequency are placed in the shopping cart, they are grouped. The grouping makes it easier to view how much items cost for each frequency (for example, weekly, monthly, and annually). If the shopping cart contains items with and without recurring costs, they are grouped separately.



On a request record, recurring prices are grouped by frequency and shown in the **Recurring Prices** related list. In the example below, two items each have a monthly recurring cost of $100.00 and their prices are grouped as a single record of $200.00 monthly. Another item with an annual recurring cost of $500.00 is listed as a separate record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If a request record contains multiple items with the same recurring frequency, click the arrow next to the corresponding recurring prices record to view details.

Extend the pricing model

The pricing model is useful if you want the price or recurring price to be dynamically calculated based on how a user completes the ordering form. You can extend the pricing model of a catalog item by editing the item price or the recurring price.

Before you begin

Role required: admin

Procedure

1. From the left navigation pane, select **System Definition** > **Script Includes**.
2. Edit the CatalogPriceCalculator script to customize the item price and the CatalogRecurringPriceCalculator script to customize the recurring price.

Hiding prices in the service catalog

Administrators can configure options to hide catalog item prices in the service catalog for listings of specific items, for specific types of items, or for all items.

Item prices can appear in the following locations:

- A catalog item listing in the **Order This Item** panel.
- Catalog item listings in categories and subcategories.
- The **Shopping Cart** panel.
- The Edit Cart, Order Confirmation, and Order Status pages.

Hide prices globally

Configure service catalog properties to hide prices globally.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To view and edit service catalog properties, navigate to **Service Catalog** > **Catalog Administration** > **Properties**.

Hiding prices by item types

By default, prices do not appear for order guides, record producers, and wizard launchers.

You can change which catalog item types show prices using the **List of class names for catalog items that do not show the price in listings** property (*glide.sc.item.cannot_show_price*). Provide a comma-separated list of table names for item types that you want to hide prices for.

For example, to hide prices for standard catalog items, add **sc_cat_item** to the list.

You can also remove an existing entry to display prices for that item type. For example, to display prices for order guides, remove the order guide entry **sc_cat_item_guide** from the list.

Hiding prices for all items

By default, zero-priced items have prices hidden in listings and carts.

You can configure this behavior to always hide or show prices, using the **When to show prices and sub-totals on the Service Catalog Cart** property (*glide.sc.price.display*).

Set this property to **Always show prices** to display prices for all items on all service catalog screens, or to **Never show prices** to hide prices for all items on all service catalog screens.

Hide prices for specific items

You can hide prices for specific items to match your organizational requirements.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**.
2. Open the relevant item definition.
3. Select the **Omit Price on Cart** check box.

   The price does not appear in the catalog listing or when the item is added to the cart. The price is listed as "-" on the edit cart, order confirmation, and order status screens.

Clone requests

Clone a request to create up to ten copies (clones) of the same Service Catalog request, for different users, without having to enter the same information multiple times. For example, you can request a new piece of equipment for several specified people, generating multiple individual requests quickly from a single initial request.

Before you begin

Role required: admin or catalog_admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Cart Layouts**
2. Under the **Target type: Browser Screen** section, select **Order Status Screen**.
3. In the **Components** tab, select the **Clone Checkout** check box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Navigate to **Service Catalog** > **Catalog Administration** > **Properties**.
5. In the **Cart** category, perform the following:
   - Enable the **Enable cloning requests during checkout** property.
   - For the **List of roles (comma-separated) that can use bulk ordering functionality** property, enter the roles for which you want to enable bulk request capability for all users with these roles, or leave the field blank to enable the capability for all users.
6. Click **Save**.

Related topics

Clone a request

Request a catalog item from Service Portal

Request an order guide from Service Portal

Delegated request experience

Create scripts

Service Catalog enables you to use certain scripts.

Some functions are available, specifically for Service Catalog:

- Client-side scripting allows catalog designers to use the same functionality available on other forms.
- The Service Catalog Script API makes catalog ordering easier from inside business rules.
- Scriptable Assignment of Execution Plans allows selection of an execution plan at the time of ordering, based on scripted conditions.

Create a custom cart

Administrators with a knowledge of Jelly can customize the look and feel of service catalog carts, either globally or for specific catalog items, using the UI macro capability.

Before you begin

Role required: admin

About this task

Note:
You can configure cart layouts without scripting.

Procedure

1. Navigate to **All** > **System UI** > **UI Macros**.
2. Click **New** to create a new macro.
3. Fill in the details and write the script to define your custom cart.

   Note:
   Designing a custom cart requires knowledge of the Jelly expression language. For reference purposes, the default cart script appears in the list as `catalog_cart_default`.

4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
After creating a custom card, you can reuse it and link it to catalog items.

Link a cart to an item

Link the default cart or a custom cart to an item so the requester sees the pertinent information.

Before you begin
Role required: catalog_admin or admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Items**.
2. Open an item to test the new cart.
3. In the **Cart** field, select the cart to use.
   You can configure the form layout to add this field to the form.
4. Save the changed form.

Service catalog home page configuration

The home page for a service catalog provides the primary front end for ordering items within that catalog. You can configure various elements of the pages within the Service Catalog.

Important:

The functionality found in homepages, arranging information from your instance to tell a story about your data, is found in dashboards on new instances. On upgraded instances with Next Experience enabled, users can view existing homepages if they have a direct URL, but they can't create or edit them. Responsive dashboards and Analytics Center dashboards take over homepage functionality.

Use the Homepage deprecation help tool to convert the homepages on your instance to responsive dashboards.

For more information, see:

- Dashboards in the Analytics Center.
- Working with responsive dashboards.

Administrators and catalog administrators can design a home page in any of the following ways.

- Customizing the catalog home page.
- Adding, removing, and arranging categories.
- Enabling content types.
- Using catalog properties to provide additional control over behavior and appearance.
- Using renderers to define the appearance of categories.

Note:
End users can access the catalog through the customizable user home page, or with content management pages that use content blocks for categories.

Configure search and navigation

You can use service catalog properties to configure search and navigation within the service catalog homepage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to **Service Catalog** > **Catalog Administration** > **Properties** to view service catalog properties.

Restrict search access

Each catalog homepage provides a search bar to help locate items not displayed on the homepage. By default, any user who can access the catalog homepage can search using this search bar.

To restrict access to this search function by role, use the **List of roles (comma-separated) that can search the service catalog** property (*glide.sc.can_search*).

For example, to only allow logged-in users to access search, set this field to blank. To remove the search function for all users, set this field to **None**.

Note:
Search results only show items that the logged-in user can access.

Hide search results from inactive categories

By default, search results are returned from all categories, including inactive categories.

To avoid returning results from inactive categories, set the **Service catalog searches return items in inactive categories** property (*glide.sc.search.disabled_cats*) to **No**. For example, when designing a new category, you can avoid users seeing search results from this category until you are ready to make it active.

Note:
Security constraints can also make a category or catalog item inaccessible.

Restrict search by item type

By default, a search field does not appear when viewing order guides, record producers, and wizard launchers.

To define which catalog item types do not show the search field, list these types in the **List of class names for catalog items that do not have the search field displayed** (*glide.sc.item.cannot_show_search*) property.

For example, to enable searching when viewing record producers, remove `sc_cat_item_producer` from this list.

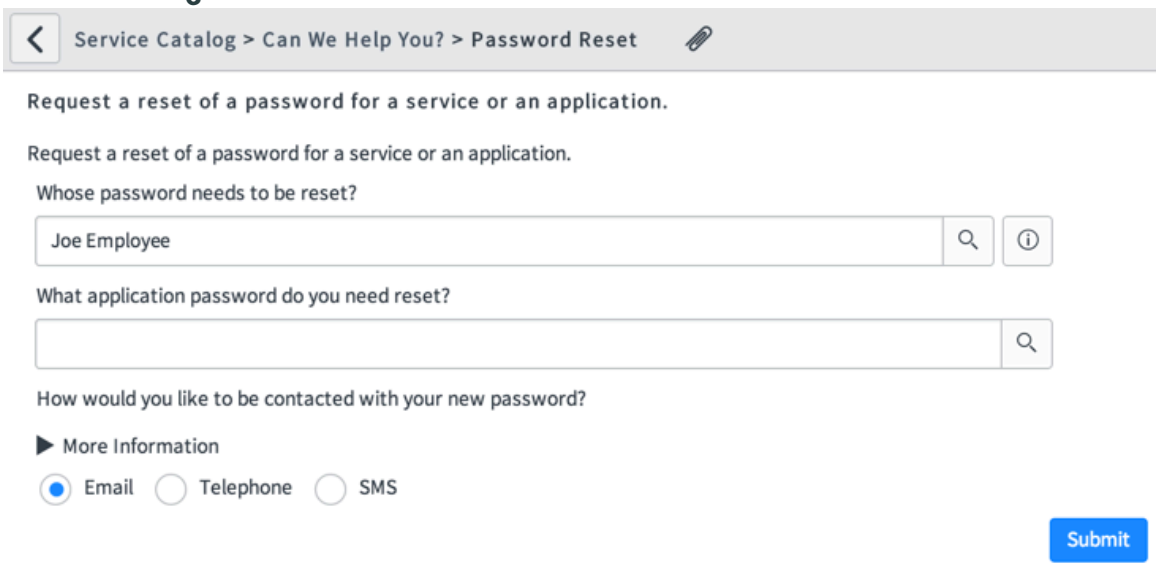
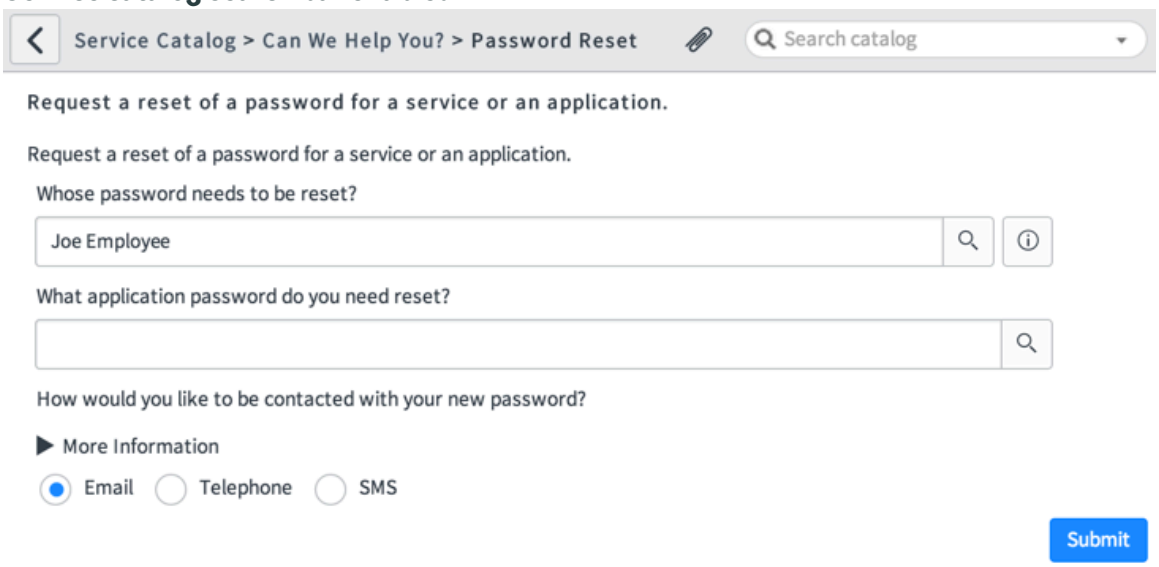
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service catalog search bar removed



Service catalog search bar enabled



Enable breadcrumb links

By default, breadcrumbs appear without links when using content management pages as service catalog homepages.

To display these breadcrumbs with links, set the **Use links for breadcrumbs rendered in Service Catalog pages accessed via a CMS site** property (*glide.sc.use_breadcrumb_links.cms*) to **Yes**. This setting provides greater navigational control for end users.

Disable search suggestions

By default, service catalog searches display "Did you mean?" suggestions if a search does not return any results and an alternate spelling or similar recent search does.

To disable these suggestions, set the **Specify whether search suggestions should be enabled** property (*glide.sc.search.suggestions*) to **No**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refine search results

Use properties to refine search results in Service Catalog.

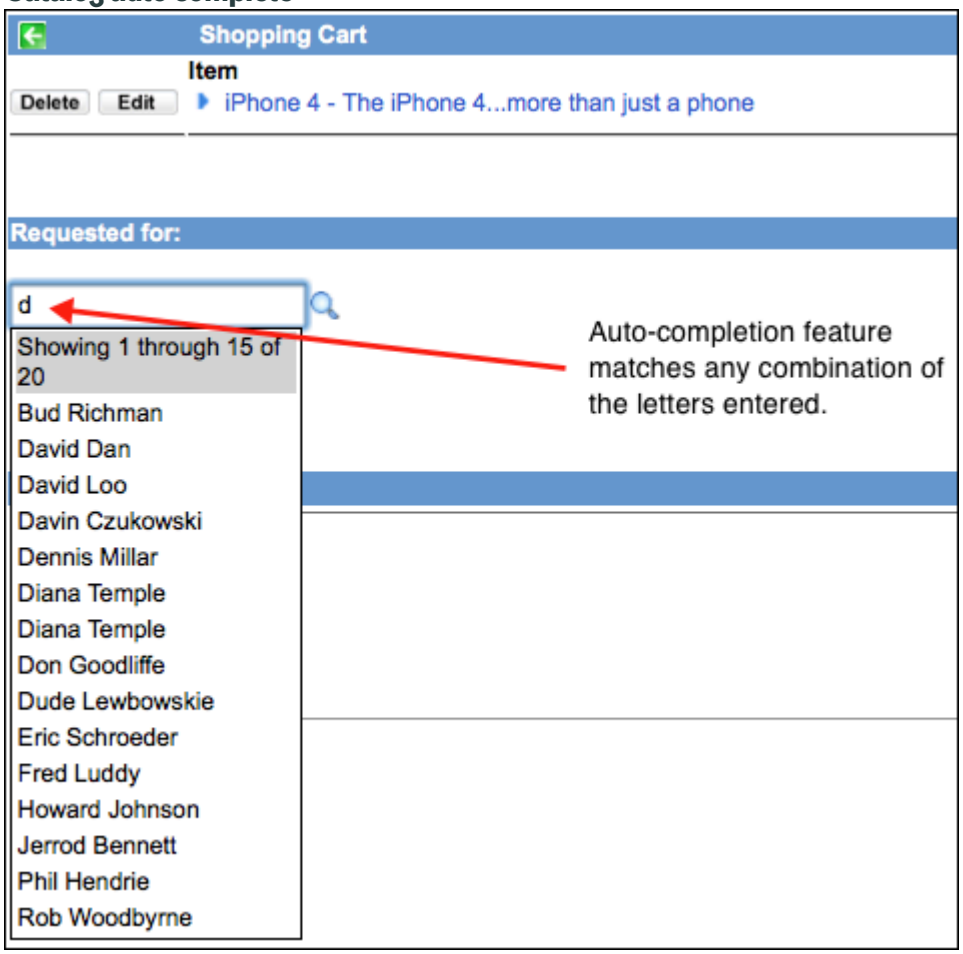
Before you begin

Role required: admin

About this task

The auto-completion feature returns values that contain an exact match to the letter combination entered.

Catalog auto complete

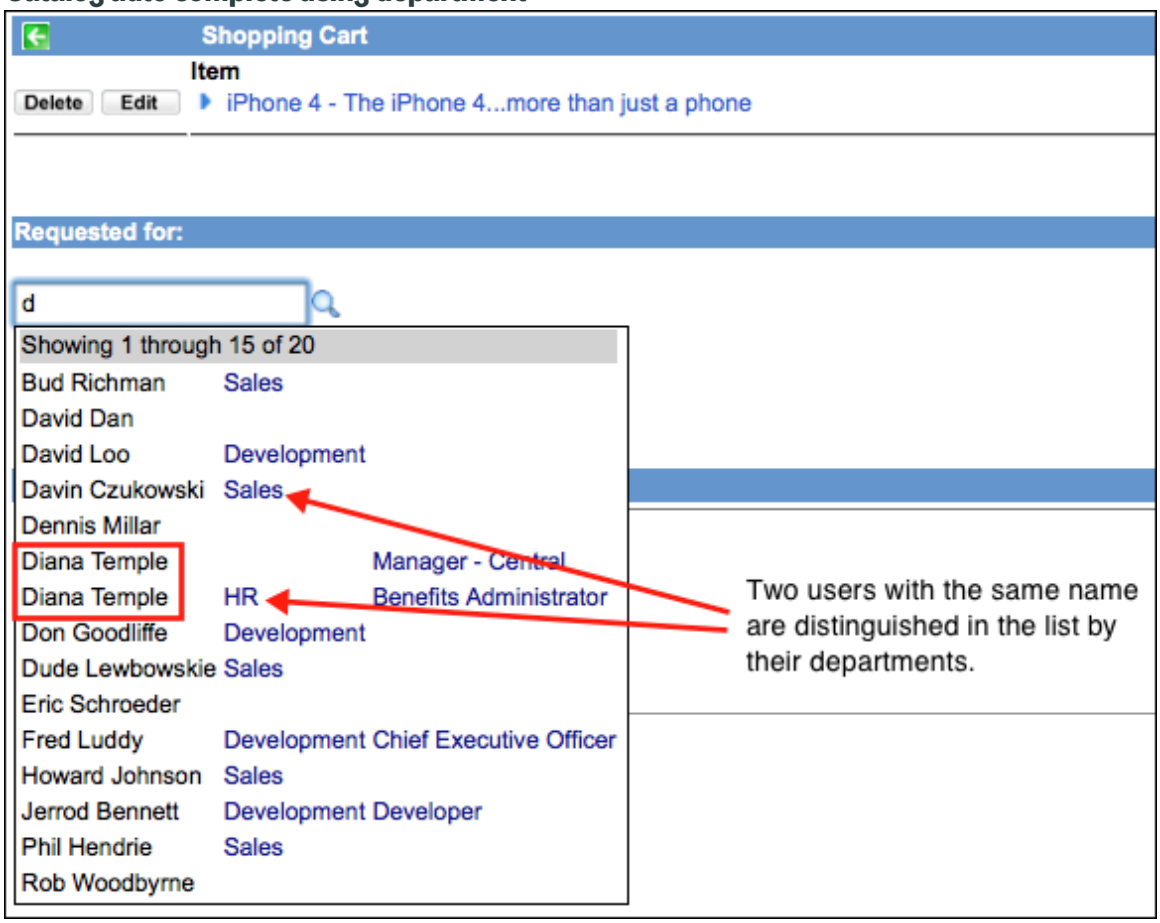


Administrators can use the **Additional columns for the "request for" Service Catalog widget** (*glide.sc.request_for.columns*) property to add columns to this list, to further refine the search results, and help determine which user to select when two users have the same name.

In this example, the property is set to display two additional columns, **Department** and **Title**:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog auto complete using department

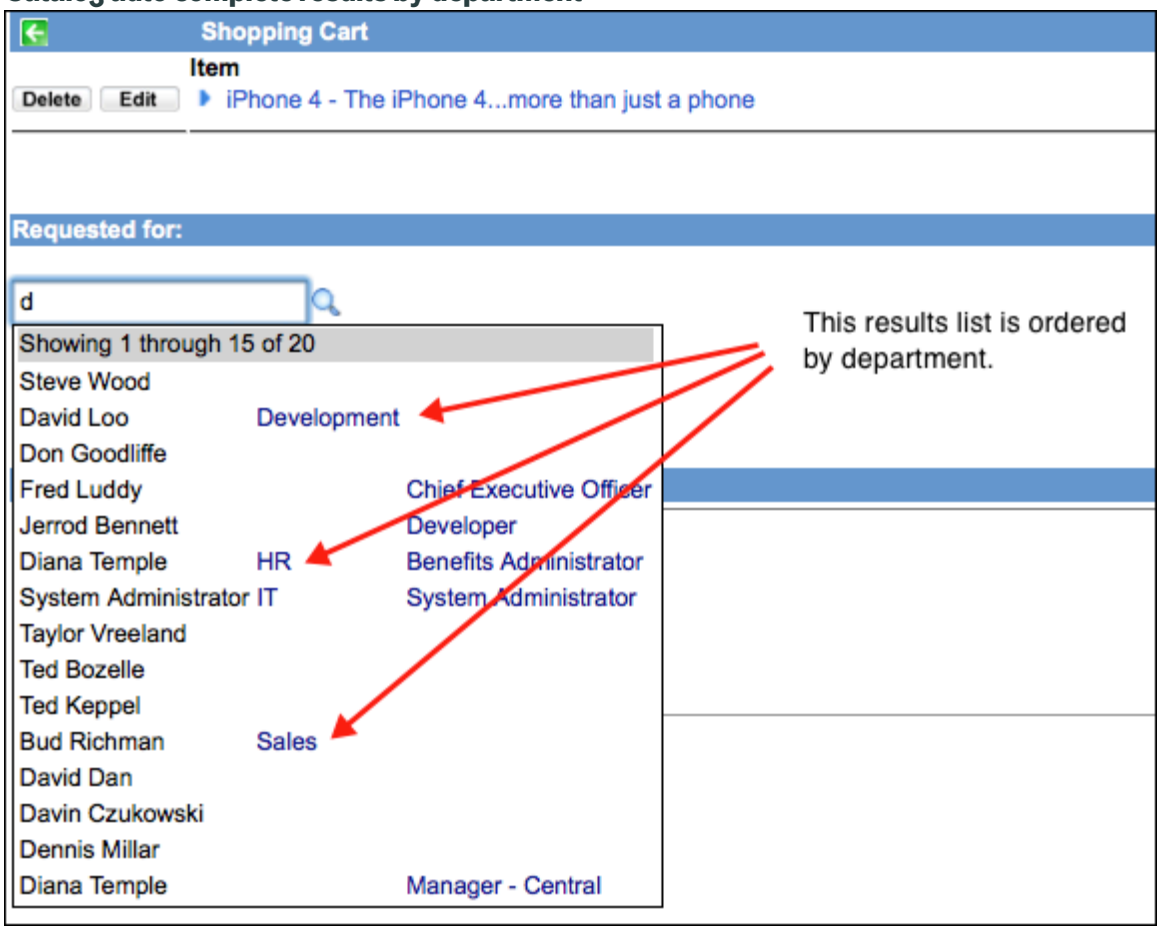


Administrators can use the **Ordering of matches for the "request for" Service Catalog widget**. (*`glide.sc.request_for.order_by`*) property to configure the columns to sort by one of the values.

In this example, the is set to sort the results list by **department**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog auto complete results by department



Auto-completion also applies to the **Request for** field, which can be added to the service catalog homepage.

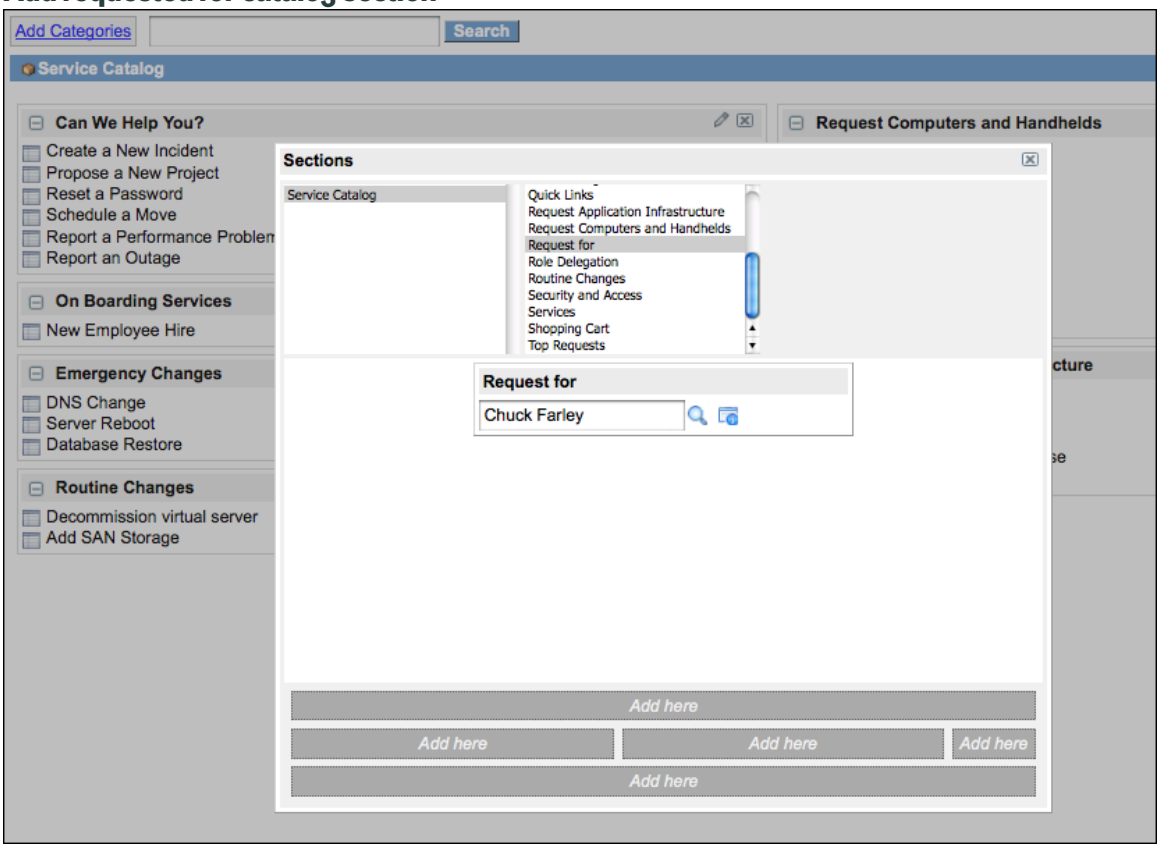
Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog**.
2. Click **Add Categories**.
3. Select **Request for**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Place the category on the page.

Add requested for catalog section



Configure keyword search for catalog items

When you search for a catalog item by a keyword in Service Catalog, the search results are displayed by considering a few fields of the catalog table.

Before you begin

Role required: admin

About this task

If the keyword doesn't have exact matches, its closest matches are displayed as **Did you mean** suggestions. This search functionality is also applicable in Service Portal.

The search results are sorted in the following order based on the frequency of the keyword:

- Catalog items whose **Name** field contains the keyword (top).
- Catalog items whose **Meta** field contains the keyword.

> **Note:**
> The **Meta** field is used for the Zing search, and if AI search is enabled, the field is used for the keyword search as well. If the **Meta** field is empty, the Zing search uses other sources, such as short descriptions and names.

- Catalog items whose **Description** or **Short description** field contains the keyword.
- Categories whose **Name** or **Description** field contains the keyword.
- Catalogs whose **Name** or **Description** field contains the key term, or the catalog items whose **Class** field contains the keyword (bottom).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If your organization has multiple service catalogs, a search returns a result only from the catalog being viewed.
- Search results return an item only when the item is active, has a valid catalog and category association, and you're authorized to view the item.

Procedure

1. Complete the following steps to regenerate a text index for the sys_metadata table.
   a. Navigate to **System Definition** > **Text Indexes**.
   b. Open the text index for the Application File [sys_metadata] table.
   c. Select the **Regenerate Text Index** related link and select **OK**.
   The system schedules the table for the text indexing.
2. Complete the following steps to enable the **Did you mean** suggestions.
   a. Navigate to **System Properties** > **Text Search**.
   b. Under the **Did You Mean Properties** section, enable the **Suggest alternate search spellings for knowledge, catalog or global search** property.

Configure AI-based catalog search experience

Improve employee engagement with an AI-based catalog search experience in Service Portal and Now Mobile. Intelligent query features enable users to quickly and easily find the answers they need.

Before you begin

Role required: admin

About this task

You can configure AI-based catalog search experience in portals and Now Mobile. Following are the default search application configurations for Service Portal and Now Mobile:

- Service Portal Default Search Application. For information about AI Search in Service Portal, see AI Search in Service Portal.
- NowMobile App Search Configurations. For information about AI Search in Now Mobile, see AI Search in mobile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each of these search application configurations have an associated search profile based on which the search results are filtered and displayed.

Note:
If the AI Search is enabled for Now Mobile, the **Experience for items not available in NOW Mobile** (*glide.sc.mobile.unsupported_discover*) property is not applicable. For information on Now Mobile properties, see Service Catalog properties.

Following are a few limitations for AI-based catalog search experience:

- The facets in Service Portal always show the primary category of the catalog item (even if the user does not have access to the primary category and the accessible path to the item is via another category that the item is associated with).
- If the user does not have read permissions for the category record and its fields, the search results cards in Now Mobile do not show the category of the item.

Procedure

1. Navigate to **All** > **AI Search** > **Search Experience** > **Search Applications**.
2. To edit the searchable catalogs in a portal or Now Mobile, perform the following steps.

   Note:
   Items are searched for only in the catalogs configured in the search source, irrespective of the catalogs associated with the portal. For information on associating a catalog with a portal, see Configure a catalog in Service Portal.

   a. In the Search Application Configurations list, select the search application configuration associated with the portal.
   For example, **Service Portal Default Search Application** for Service Portal.

   b. On the Search Application Configuration form, open the search profile.
   For example, **Service Portal Default Search Profile** specified for Service Portal.

      Note:
      To avoid conflicts with future upgrades, it is recommended that you create a search profile instead of using the search profile available in the base system.

   c. From the Search Sources related list, select a search source.
   For example, **Service Portal Catalogs**.

   d. In the **Conditions** field, add catalogs where you want the items to be searched for.

Configure preview

Configure the number of items that have the **Preview** section expanded to display item details. You can also change the default number (5) of items and categories that display, and hide the **Exists in categories** information.

Before you begin

Role required: admin

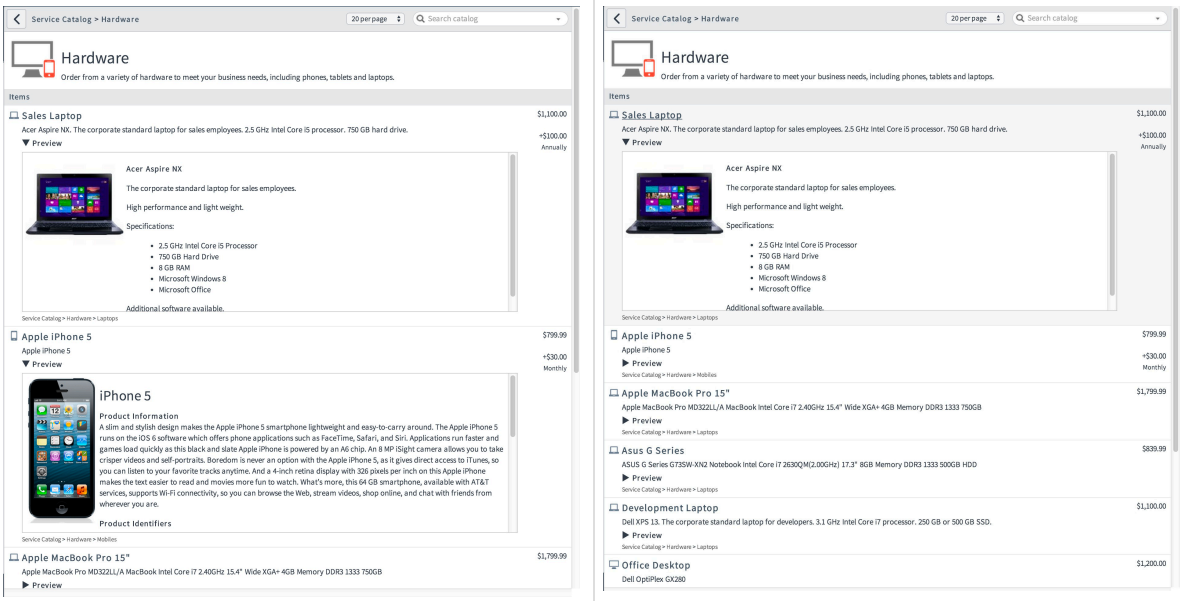
About this task

By default, if not showing item details using pop-ups, the first two items listed in the category display have the **Preview** section expanded to display item details.

To change the number of items with this information expanded, set the **Number of Catalog Items to expand in browsing and search when not using pop-up icons to view details** (glide.sc.auto_expand) property to the number required.

Expanding to 2 items	Expanding to 1 item

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

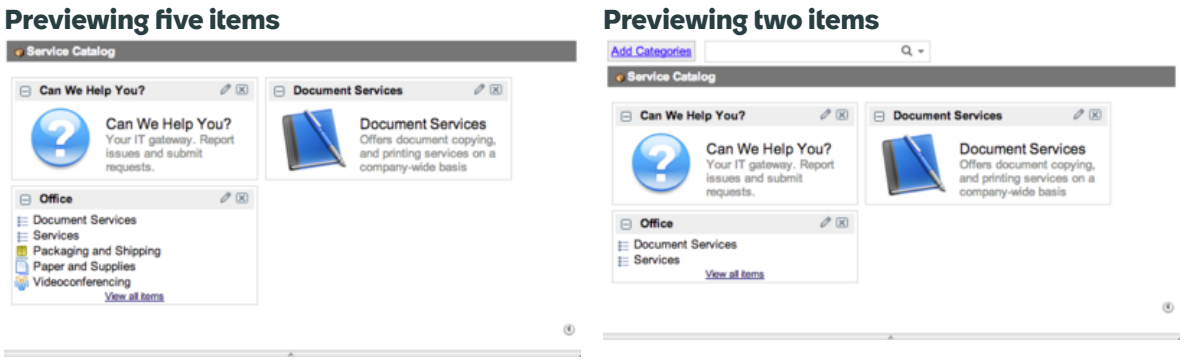


Set number of items and categories to preview

By default, up to five items or categories appear in each category on the homepage.

About this task

To change this number, set the *Number of Catalog Items/Categories to preview in a section* (glide.sc.max_items) property to the required value.



Hide the existing categories in the categories display

By default, catalog items that are in several categories show **Exists in categories** information that shows other categories that the items are available in. You can hide this information.

Before you begin

Role required: admin

Procedure

Set the **Show the additional categories section when viewing a catalog item** (glide.sc.show_additional.cats) property to **No**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

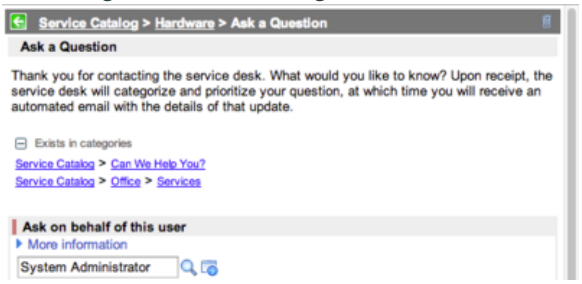
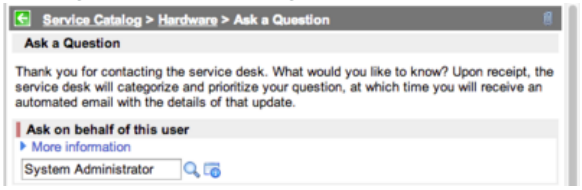
Showing additional categories



Hiding additional categories



Create a renderer

Create or modify renderers using UI macros to provide the rendering instructions. Renderers define a specific look and feel for a catalog or category.

Before you begin

Role required: catalog_admin or admin

About this task

Use renderers to specify the following formats:

- How catalogs appear on the multi-catalog homepage.
- How categories appear on a catalog homepage.

For example, you can create a renderer showing the category homepage image, the description, and the first two catalog items in a category.

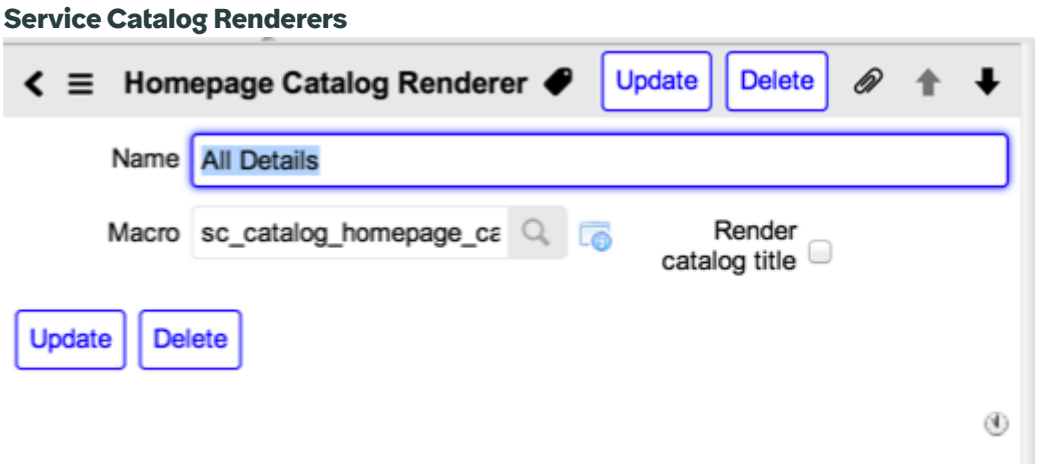
Procedure

1. **Optional:** Create a UI macro to define specific rendering instructions.
2. Navigate to **Service Catalog** > **Catalog Definition** > **Renderers**.
3. Click **New**.
4. Select to create a catalog or category renderer.
5. Enter the renderer details.

Renderer Details

Field	Description
Name	A name for the renderer.
Macro	The UI Macro to use.
Render catalog title	Appears for catalogs renderers. A check box to display the catalog title bar on the multi-catalog homepage.
Render title	Appears for category renderers. A check box to display the category title bar on the catalog homepage. **Note:** The **admin** and **catalog_admin** roles can view the **Render title** even when the check box is not selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Submit**.

> **Note:**
> To modify a default catalog or category renderer, follow a similar process, by selecting one of the default renderers listed.

This new renderer is added to the list of available choices when applying a renderer.

Select a renderer for a catalog

Select a renderer and apply them to a catalog to change its appearance.

Before you begin

Role required: catalog_admin or admin

About this task

The following default catalog renderer schemes are available:

- **All Details**: shows desktop image, title, and categories.
- **Image Only**: shows desktop image only.
- **Title and Image**: shows title and desktop image.
- **Title Only**: shows title only.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalogs**.
2. Click the add content icon (+) on the upper right.
3. Select a catalog in the middle panel of the pop-up window.

© 2026 ServiceNow, Inc. All rights reserved.

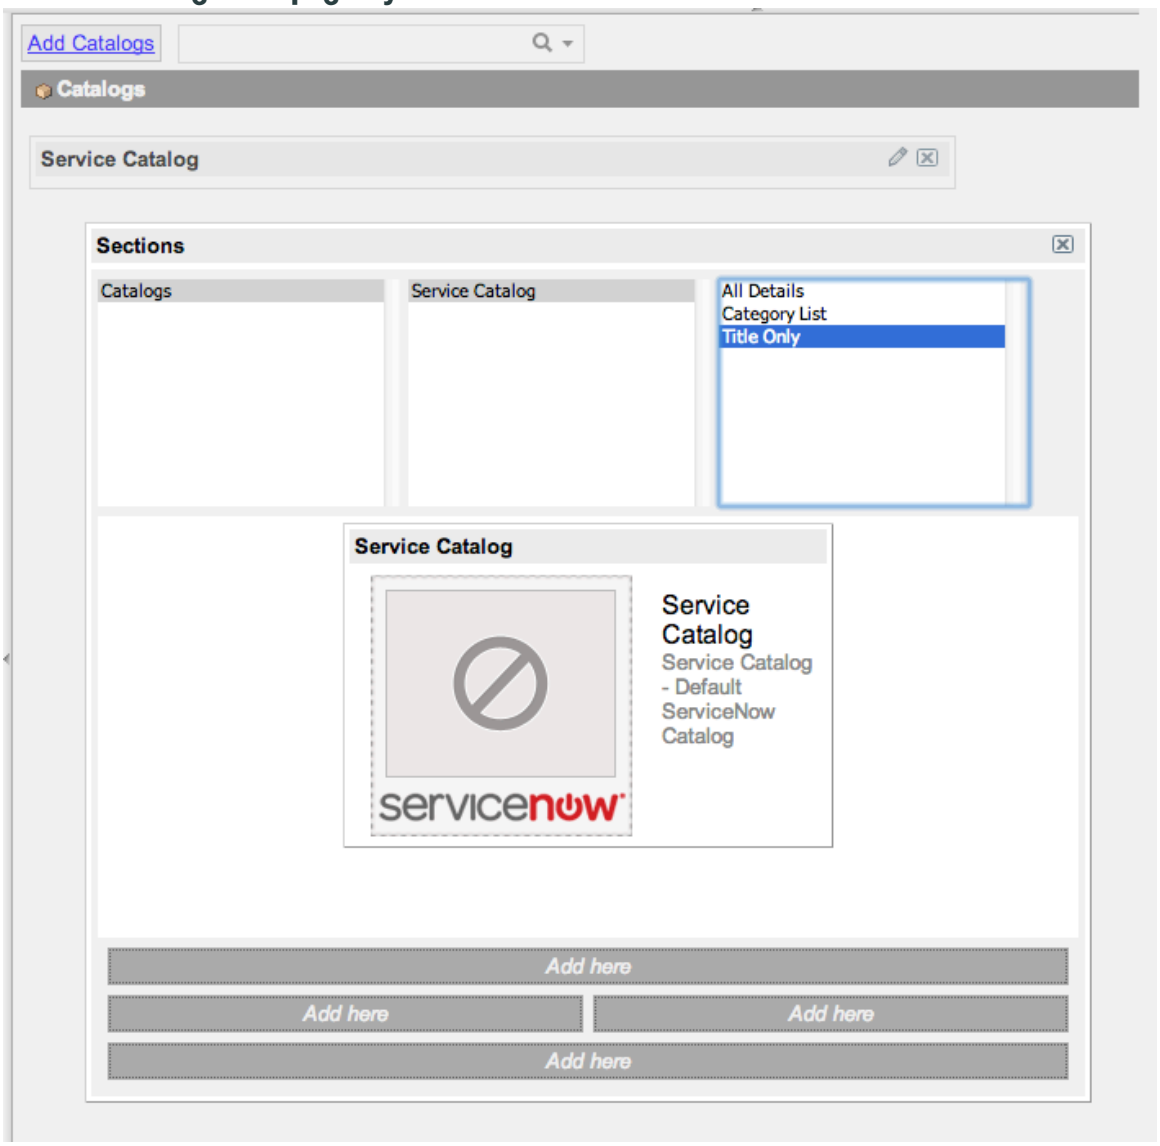
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog home page layout



4. Select a renderer from the list displayed in the right-hand panel, for example **Title Only**.
5. Click **Close** to save the catalog with the renderer settings you defined.

Select a renderer for a category

Select a renderer scheme for your categories.

Before you begin

Role required: catalog_admin or admin

About this task

The following default category renderer schemes are available:

- **Category Items**: shows desktop image, title, and description.
- **Category Items No Title**: shows desktop Image and description.
- **Category Details**: shows the subcategories and items in that category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog**.
2. Click the add content icon (+) on the upper right.
3. Select a category in the middle panel of the pop-up window.
4. Select a renderer from the list displayed in the right-hand panel, for example **Category Items**.
5. Click the close icon (x) to save the catalog with the selected renderer.

Customize a catalog homepage

Customize a catalog homepage to provide end users with access to catalogs from one homepage.

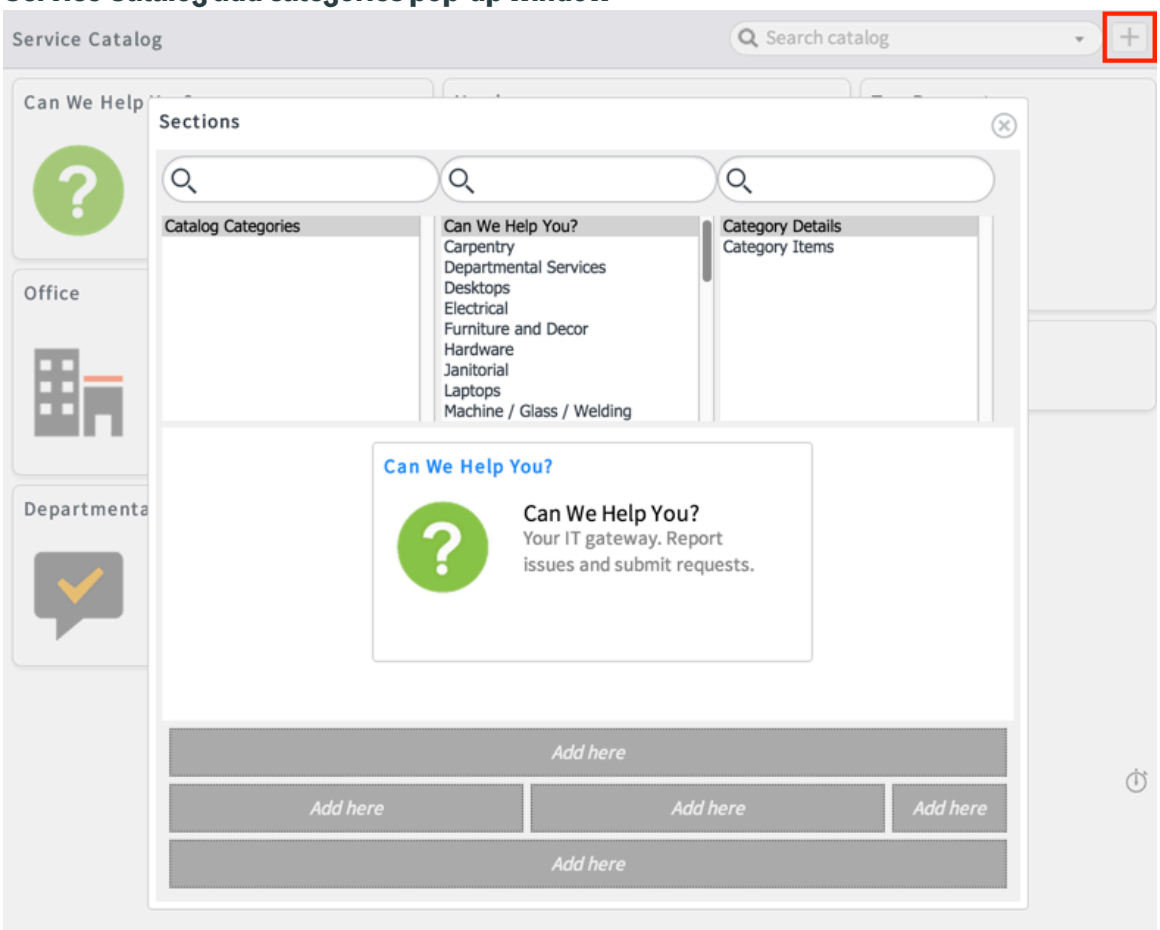
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog**.
2. Click the add content icon (+) at the top of the page to add a category.
3. Select a category in the middle panel of the pop-up window that appears.

Service Catalog add categories pop-up window



4. Click **Add here** in the location where the category appears on the homepage.
5. **Optional:** Repeat steps 3–4 to add more categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Close the pop-up window.
7. **Optional:** To change a category location, drag it to the appropriate place.
8. **Optional:** To remove a category, click the (**X**) icon on the top right of the category header.
9. **Optional:** Add a shopping cart on the page.

Display subcategories in a panel

By default, subcategories are displayed in a panel at the bottom of the category page. You can change a system property to list subcategories at the top.

Before you begin
Role required: admin

Procedure

Use the **In category view display subcategories in a panel** property (*glide.sc.use_sub_cat_section*).

Name of form	
When set to **Yes**, the subcategories appear in a panel at the bottom.	When set to No, the subcategories appear as a list at the top.
Set to Yes 	**Set to No** 
Customize the multi-catalog homepage

Customize the multi-catalog homepage to provide end users with access to multiple catalogs from one homepage.

Before you begin
Role required: admin

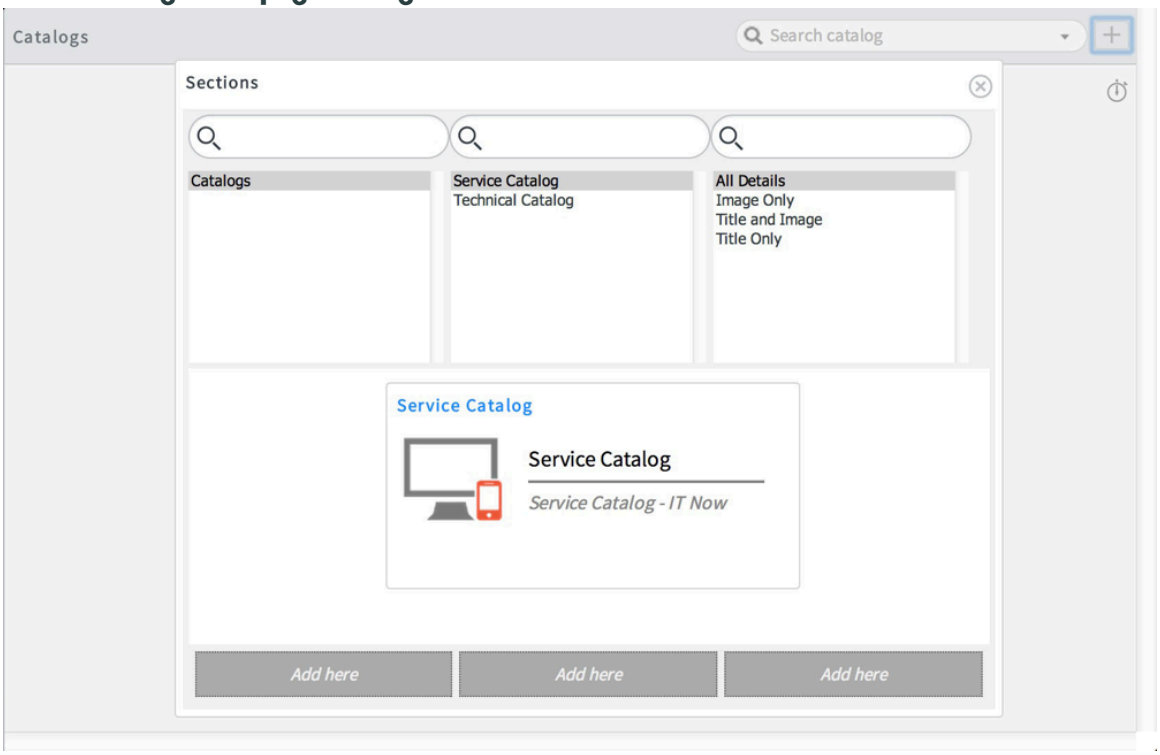
About this task
This task is similar to customizing the homepage for an individual catalog. In this task, you are adding catalogs, not catalog categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalogs**.
2. Select **Add Catalogs** at the top of the page to add catalogs to this page.
3. Select a catalog in the middle panel of the pop-up window.

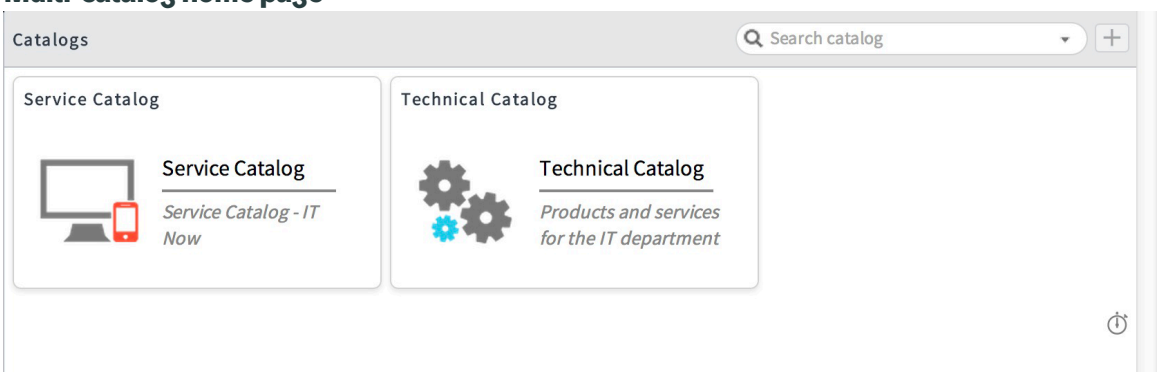
Multi-catalog home page arrangement



Note:
Only administrators can see catalogs that do not contain active categories or items.

4. **Optional:** Select a renderer from the right-hand panel, for example **Title Only**.
5. Click **Add here** in the location where the catalog appears on the homepage.
6. **Optional:** Repeat steps 3–5 to add more catalogs.
7. Close the pop-up window to save the changes.

Multi-catalog home page



You can modify the arrangement of catalogs within the homepage:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To change a catalog location, drag it to the appropriate place.
- To remove a catalog, click the X in the catalog title bar.
- To edit details for a catalog, click the pencil icon in the catalog title bar.

The catalogs appear on the homepage.

Show item details in sections or pop-ups

By default, a service catalog category displays the first two items with the preview section expanded to show item details. You can change the number of items that are previewed, or change the preview to appear in a pop-up window.

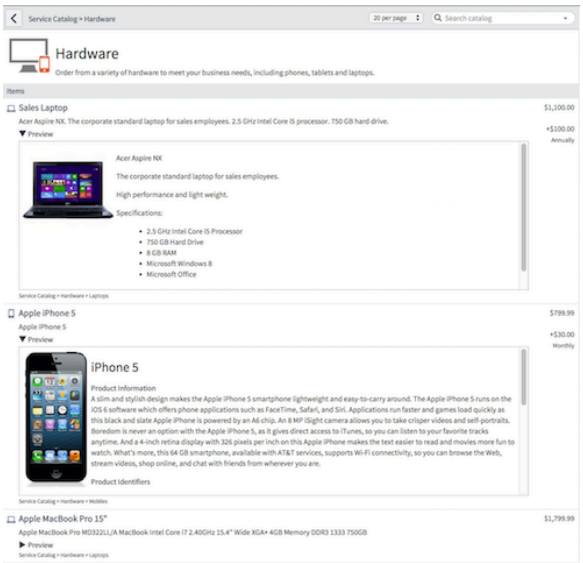
Before you begin

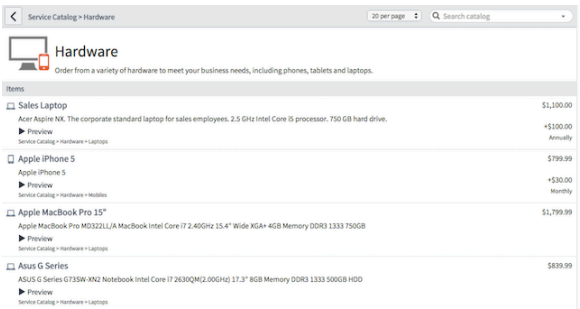
Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties**.
2. To change the number of items previewed, set the **Number of Catalog Items to expand in browsing and search when not using pop-up icons to view details** (*glide.sc.auto_expand*) property to the desired number.

   Example

Expanded to 2 items.	Expanded to 1 item.
2 items	**1 item**
	




3. To use the preview icon, set the **When browsing a category use the pop-up icon to show item details** (*glide.sc.cat_view_use_popup_for_details*) property to **Yes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When set to **No**, the item details appear when you click **Preview**.	When set to **Yes**, the item details appear as a pop-up when the cursor hovers over the item icon.
Set to No  	**Set to Yes** 
Configure Classic Mobile devices

When you configure Service Catalog on a Classic Mobile device, you can define the layout and presentation of catalogs. You can then perform actions such as ordering products and services, submit incidents and problems using record producers.

Before you begin

Important:

Mobile Classic Is Deprecated!

The App Has Been Removed From The Stores And Can No Longer Be Activated. We Are Not Offering Enhancements, Bug Fixes, Or Support For The App. See ServiceNow Classic Mobile App Deprecation Effective September 15, 2022.

Role required: admin

About this task

Users can access the service catalog on Classic Mobile devices to:

- View and order products and services.
- Submit incidents and problems using record producers.

Note:
Users cannot access order guides, wizards, or content items from Classic Mobile devices.

Administrators and catalog administrators can configure the layout, presentation, and other aspects of the service catalog for Classic Mobile devices.

Including:

- Defining rendering options for Classic Mobile categories.
- Defining rendering options for Classic Mobile catalog items.

Accessing the Service Catalogon Mobile Devices

To access the service catalog, navigate to **Self-Service** > **Catalog**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

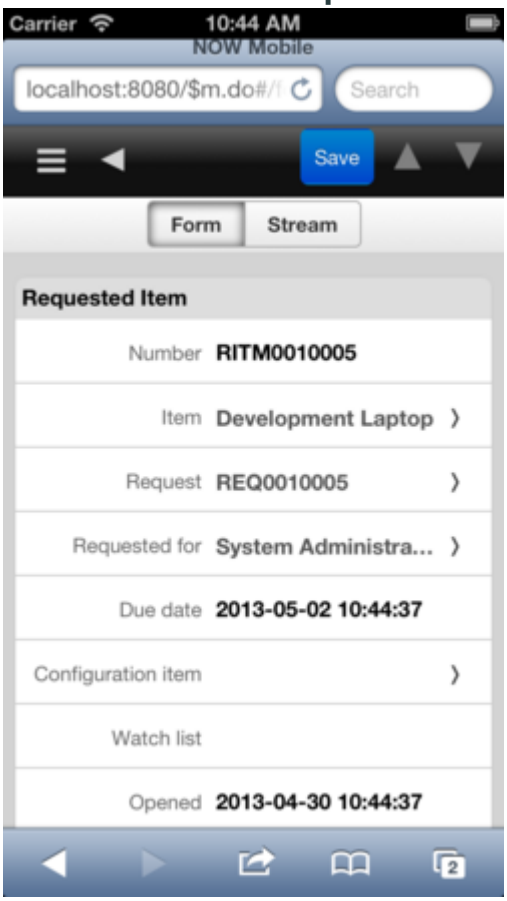
Classic Mobile Order Requested Item Details



7. Tap the back arrow to return to the confirmation message.
8. Tap **Continue Browsing** to return to the service catalog.

   After the request is submitted, ServiceNow follows request fulfillment processes to fulfill the ordered item.

Define the mobile layout

You can configure the Classic Mobile layout for categories within a service catalog.

Before you begin

Role required: admin

About this task

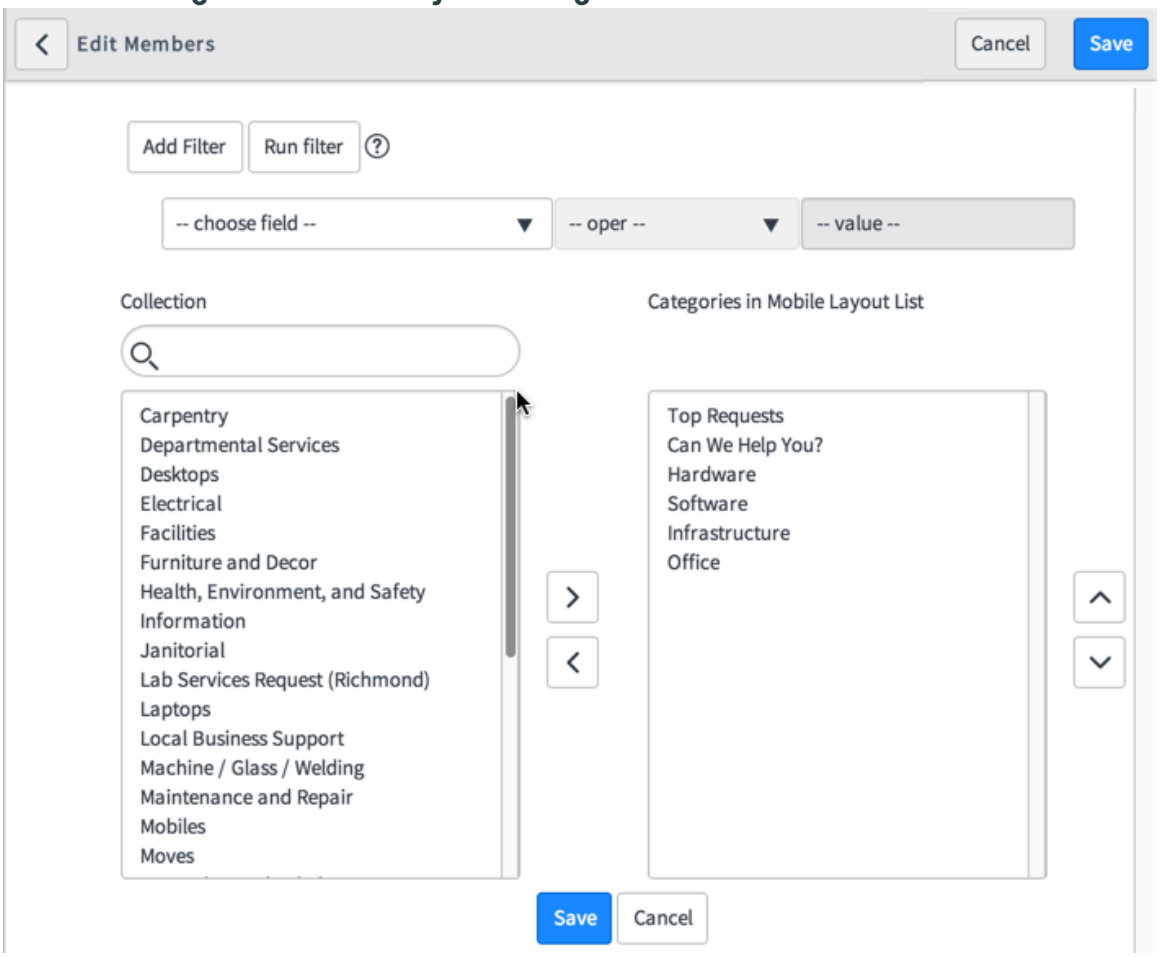
By default, service catalog categories appear on mobile devices in the same order as on desktop devices.

Procedure

1. Navigate to **All** > **Service Catalog** > **Classic Mobile Admin** > **Classic Mobile Layout** to display a list of service catalogs.
2. Click the lookup icon for the service catalog you want to configure.
   The mobile layout displays details for the catalog.
3. Click **Edit** to select which categories appear on mobile devices, and in which order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog Classic Mobile layout catalogs



4. Add, remove, or reorder the selected mobile categories, and then click **Save**.

> **Note:**
> To return the display to the default desktop layout settings for the portal page associated with that catalog, click the **Replace categories with desktop layout** related link.

Limit description sizes in the Classic Mobile UI

By default, item descriptions in the smartphone interface are truncated to a maximum of two lines.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties**.
2. Set the **Limit descriptions in category and item listings to two rows in the Mobile UI** property (glide.sc.mobile.limit.description) to **No**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If set to **Yes**, descriptions are limited to two lines	If set to **No**, the full descriptions are given
Set to Yes 	**Set to No** 
Using the content management system with the service catalog

Use the content management system (CMS) to create a custom interface for the service catalog.

> **Important:**
> Use Service Portal for new development instead of CMS. Service Portal is an alternative to CMS with a refined user experience, and is active by default in the base system. For more information, see Service Portal and Content Management and Service Portal.

Manage catalogs in CMS sites

When your organization uses the content management system (CMS) as well as Service Catalog, you can select which catalogs are supported within the CMS sites.

Before you begin

Role required: catalog_admin or admin

About this task

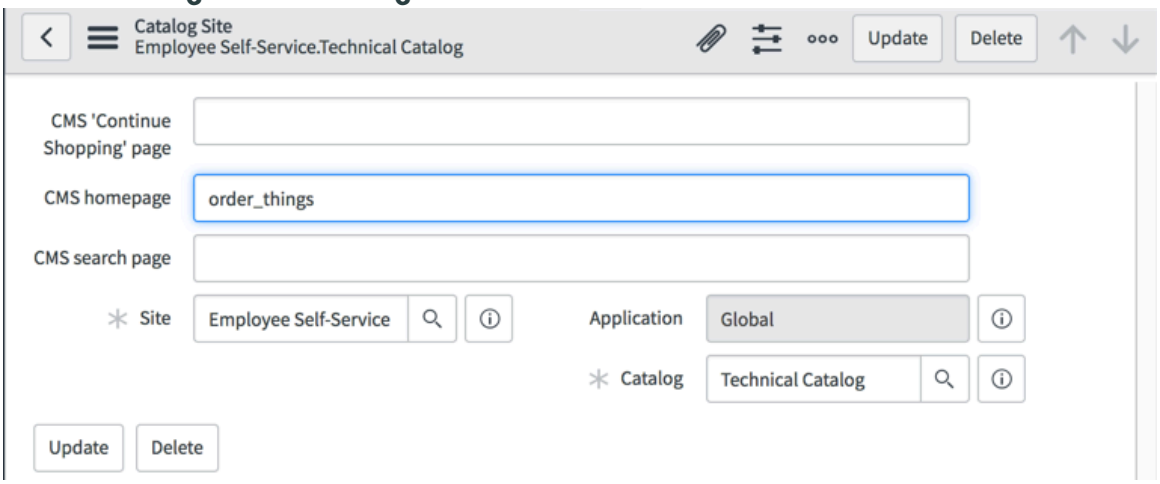
Associating catalogs with sites ensures that users can always access an appropriate catalog.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Catalogs** and open the catalog to associate with a site.
2. In the Sites related list, click **Edit**, select the site to associate with the catalog, and then click **Save**.
3. Click the reference icon beside the site name, and then click **Open Record**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service catalog details - catalog sites details



4. Enter values in the fields, as appropriate.

Field	Description
CMS homepage	The homepage for this site.
CMS search page	The location of the search page for the site.
CMS 'Continue Shopping' page	The location to direct end users to when they click the **Continue Shopping** button in that CMS site. This field is designed to reference a content page URL suffix.

5. Click **Update**.

Set up catalog portal pages

The Catalog Portal Page `[sc_catalog_view_mtom]` table links catalogs to CMS portal pages and defines the default catalog to portal page combination used by URLs.

For example, the default portal page for the service catalog is the catalog_default page.

Catalog portal page records appear in the *Catalog Portal Pages* related list on the Catalog form. The Catalog Portal Page table generates two values in a URL: **sysparm_catalog_view** and **sysparam_catalog**. Use the Catalog Portal Page form to enter a custom link, if required.

Resolve missing catalog portal pages

If a catalog record is not associated to a catalog portal page record, ServiceNow attempts to present a view based on a set prefix of: **catalog_<catalog name>**.

For example, if the default service catalog has no catalog portal page record, the system sets **sysparm_view** to **catalog_Service_Catalog**. With this setting, when you navigate to **Self-Service** > **Service Catalog**, you view a new and apparently blank **catalog_Service_Catalog** portal page, instead of the existing and populated **catalog_default** portal page.

To correct, go to the *Sites* related list on the Catalog form and add a new catalog portal page record manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, for the default service catalog, add a record with the following values:

- *Catalog*: Service Catalog
- *Portal Page*: Catalog (catalog_default)
- *Default*: true

Manage catalog portal pages

Using Service Catalog, you can create and manage multiple portal pages for a catalog.

Before you begin

Role required: admin

About this task

A catalog portal page provides a homepage for a specific catalog. You can use portal pages to create different catalog views for different user groups. Each portal page accesses the same catalog content and presents that content in different ways.

Catalog portal page details include the owner, title, and view to use for that page.

Procedure

1. The Catalog Portal Pages related list shows portal pages available for that catalog. Each catalog has a default page, created automatically when the catalog is created.
2. Select an appropriate action:
   - Click **New** to create a new portal page.
   - Click **Edit** to select another portal page for the catalog.
   - Select a portal page to view and edit details for that page.

Service Catalog for managers and end users

Every user with a login can view and order items from the Service Catalog from departments within your organization. These catalog items can include goods, services, and information.

Anything that can be ordered individually can be ordered as a catalog item. Anything that only exists as a part of a larger whole cannot be a catalog item. For example, a laptop can be a catalog item, but a high-resolution display for a laptop cannot.

After placing an order, its progress can be tracked by the requester. Fulfillment groups complete a predefined series of tasks in a fulfillment process that includes required approvals.

Managers can review record history and run reports to improve the service catalog process. For example, the manager can see most commonly ordered items, or those that are on backorder.

Service Catalog home page

The home page for a service catalog lists the goods and services available to order from that catalog.

Catalog items are grouped into categories, which can also contain one or more subcategories. By default, the first 10 items in a category appear under the category name on the service catalog home page.

To access the default service catalog home page, navigate to **Self-Service** > **Service Catalog**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

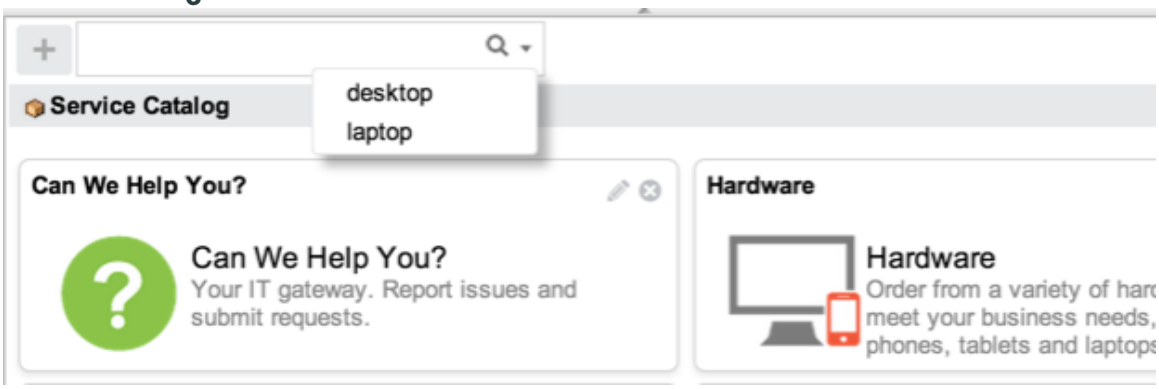
Searching a service catalog

If your organization has multiple service catalogs, you can search for the required catalogs using the **Search** field. The search results list items in active categories along with their short description.

Note:
If your organization has multiple service catalogs, searches return results only from the currently viewed catalog.

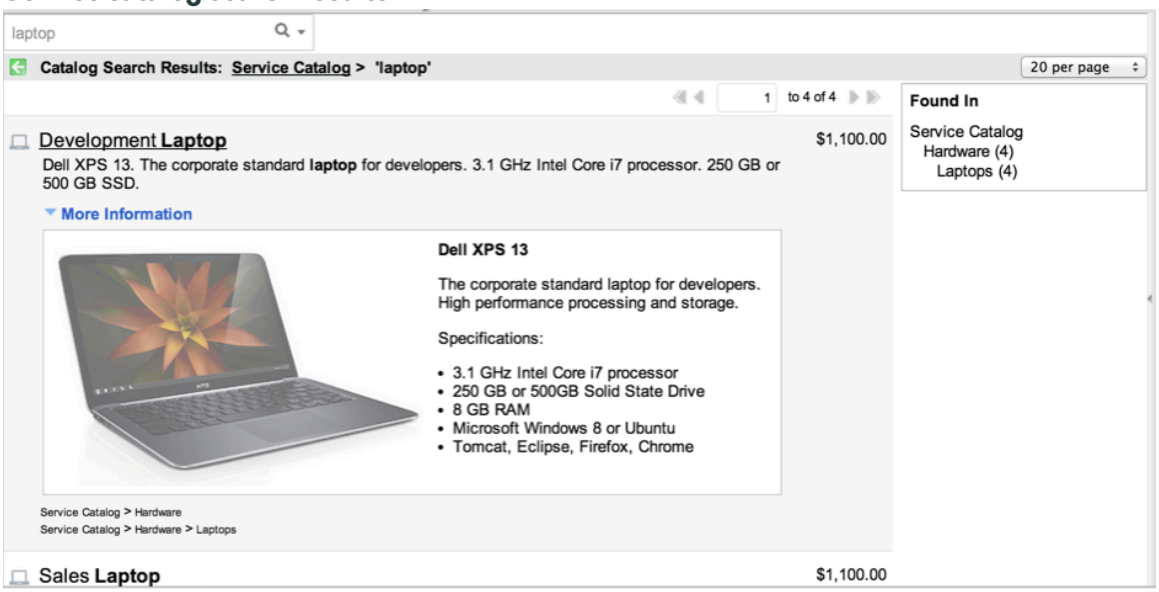
To find a specific item in a catalog, use the **Search** field. Click the down arrow to see a list of previous searches. Catalog search is available on catalog and category pages.

Service catalog search field



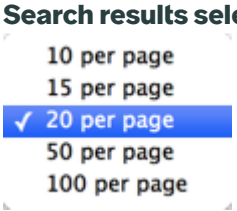
Search results list items in active categories along with their short description. Use the breadcrumbs in the header bar or below the short description to quickly navigate to a different page. The **Found In** list shows the categories related to the search results in hierarchical format.

Service catalog search results



You can control the number of results shown on one page with the search results selection list.

Search results selection list



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the catalog listing, click a link in the breadcrumbs at the top of the screen to quickly navigate back one or more levels in the hierarchy.

To remove the search term from the breadcrumbs, click the **x** next to the term.

If a search returns multiple results, obtain details about a specific catalog item by clicking **Preview**.

Note:
The system performs the type-ahead search based on keywords only.

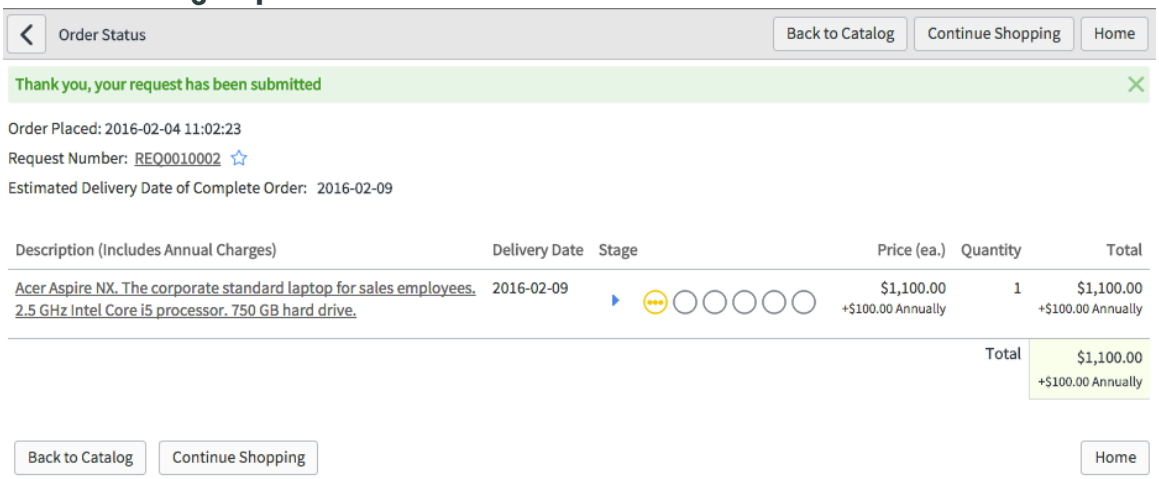
Service Catalog for managers and end users

Service Catalog request screens

To place a request from a service catalog, navigate to the catalog home page and select the item to order.

When an item is ordered, the base system generates a request to track the order and displays a summary that includes the order status in the **Stage** column:

Service Catalog Request Status



Each individual catalog item in a request creates a discrete request item. For example, a request for 2 PCs, 1 chair, and 1 desk would produce four request items on a single request.

Shopping cart screens

The shopping cart screen displays previews of the cart immediately before an order is placed.

You can configure the layout for either the one-step or two-step catalog checkout process.

Order status screens

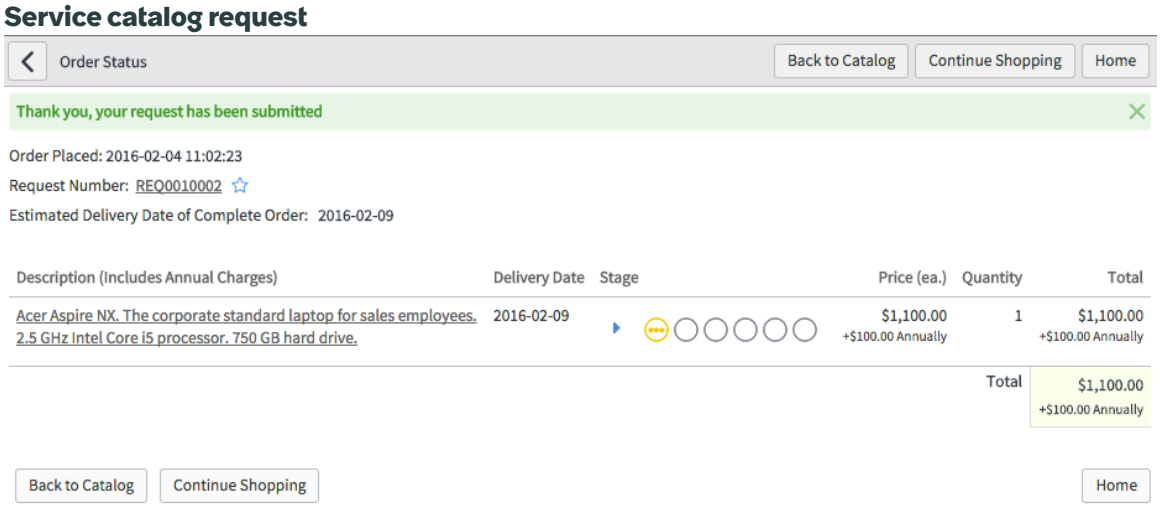
The order status screen is the final summary screen a user sees in the service catalog after placing an order successfully.

Request generation for a Service Catalog item

When a customer orders something from the catalog, a request is generated to track the order.

The user specified in the **Opened By** field of a Requested Item (sc_req_item) record has read access to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Each individual catalog item that is part of a request creates a discrete request item with the request.

For example, a request for 2 PCs, 1 Chair, and 1 Desk would produce:

- Request REQ0000001 -- 4 Things
  - Requested item RITM0000001 -- 2 X PC
  - Requested item RITM0000002 -- 1 X Chair
  - Requested item RITM0000003 -- 1 X Desk

After a service catalog request is submitted, a fulfiller may determine that the item is not in stock. The full filler can select the **Backordered** check box, and enter comments about when the item may be back in stock. The backorder status can be used in reports and dashboards.

If a service catalog request is canceled, all associated purchase orders and transfer orders that have not been received are canceled.

Service Catalog home page

Clone a request

You can clone a request for up to 10 users on the notification list.

Before you begin

Your admin must enable cloning of requests before you can clone a request. For more information, see Clone requests.

Role required: admin

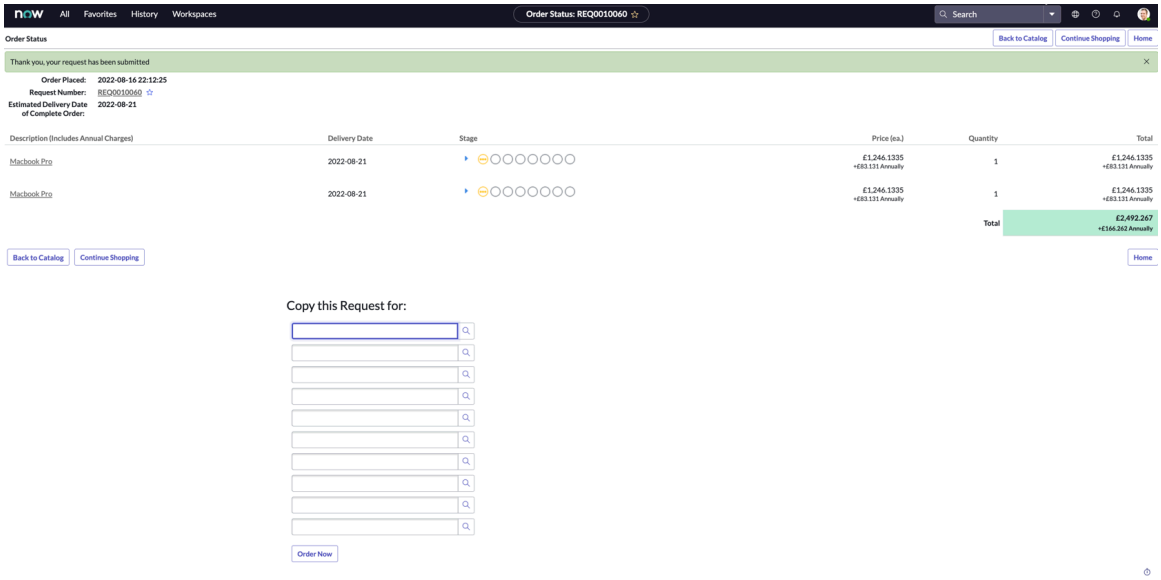
About this task

When you clone a request that contains a multi-row variable set, the information that is specified in the multi-row variable set is available in all cloned requests. All UI policies and client scripts on the multi-row variable set are also cloned.

Procedure

1. Create a Service Catalog request.
2. On the checkout page, enter the users for whom to copy the request, up to a maximum of 10, in the **Copy this Request for:** reference fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Click **Order Now**.

View catalog item audit history

You can view the audit history of changes to items you requested. For example, you can view changes to variable values to find out who made the changes. Fulfillers and administrators can view history for any requested item.

Before you begin

Role required: admin (history list or calendar), itil (calendar only)

Procedure

1. Complete one of the following actions for the history to view.

Option	Description
View history for your requested items	Navigate to **Self-Service** > **Requested Items** and open the item you requested.
View history for any requested item	Navigate to **Service Catalog** > **Open Records** > **Items** and open the requested item to view.

2. Open the form context menu and select **History** > **Calendar**, or **History** > **List** (with permission).
   The history calendar shows you the days where the record was changed, who made the change, and when. The history list displays each change in a list view. History records of variables are prefixed with "VARIABLE:."
3. Click the day number to get a view of the changes for that day, or click the week number to get the week view.

Saving catalog items to a wish list

You can save catalog items to your wish list and visit them later to complete the ordering process.

For example, you need a laptop with specific software installed on it. Add the laptop to your wish list, then visit it when you have the complete software configuration list. Data you enter is saved when you add items to your wish list.

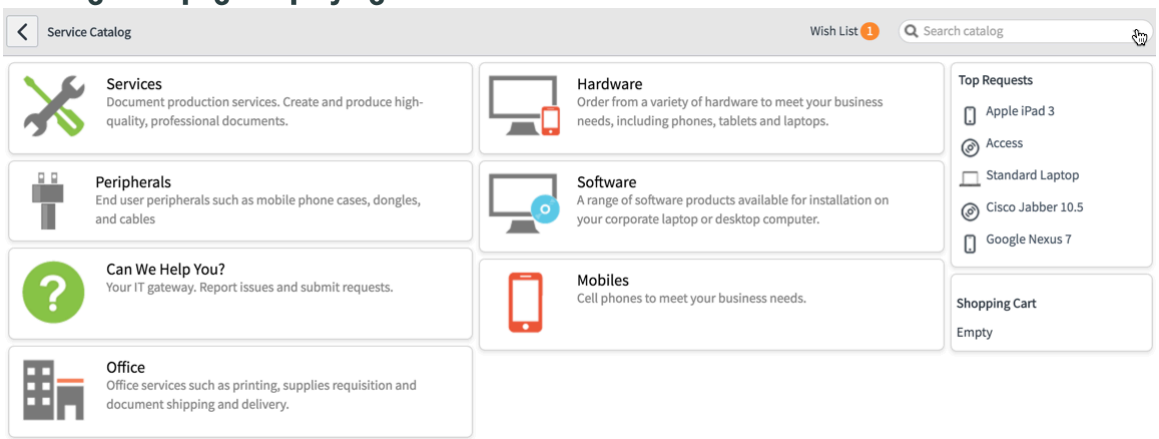
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users with catalog_admin or admin role can enable/disable the wish list feature and configure the wish list cart for end users. By default, the wish list is always disabled for a catalog.

To enable the wish list feature for catalog end users, select the check box for **Enable Wish List** in the catalog record.

The wish list feature does not function if the property `glide.ui.doctype` is set to `false`.

Catalog homepage displaying wish list feature

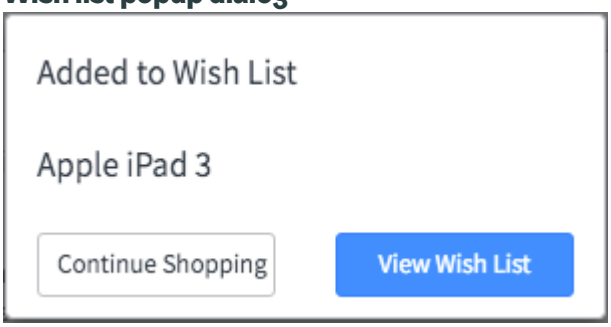


Note:
When the wish list feature is disabled for a catalog, any items in its wish list are deleted. The items in the wish list are retained only if the item is associated with another wish list-enabled catalog.

Working with wish lists

To save an item to your wish list, click **Add to Wish List** on the catalog item page. A pop-up dialog informs you that the item is added to your wish list. Duplicate entries of an item are not added to your wish list. If you try to add an item that is already in your wish list, the latest entry of that item gets updated in the wish list.

Wish list popup dialog



To access your wish list of catalog items, click **View Wish List** on the popup dialog. You can also click the link to wish list items on the header. The wish list cart allows you to update or delete wish list items.

To update a wish list item, go to wish list cart and click **View** for the item. Change the information, and then click **Update** to save the changes. To proceed with ordering the item, click **Add to Cart**. The item is removed from your wish list and added to the shopping cart for final checkout.

Service Catalog items

The overall catalog is made up of a collection of discrete catalog items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The basic Service Catalog item types include:

- Standard catalog items
- Record producers: Provide alternative ways to add information such as `Incidents via the service catalog`.
- Order guides: Enable grouping multiple catalog items in one request.
- Content Items: These are the catalog items which provide information instead of goods or services.

Standard catalog item

A catalog item can be a good or service. If something can be ordered by itself, it is a catalog item. If something only makes sense as part of a greater whole, it is part of an item, rather than an item in and of itself. For example, a new Dell server is a catalog item, as is a new Executive Desk.

Use a catalog item to publish a service to your users. Add a service description, images, and a workflow to determine the approval and fulfillment processes for the catalog items.

Use the variables to present and gather information from the users. Catalog UI Policies and Catalog Client Scripts can also be added to control the item behavior based on user input.

Specify related items and articles for a catalog item

Specify related items and articles for a catalog item to provide alternatives and additional information. These items and articles are displayed in the catalog item page in Service Portal and Now Mobile.

Before you begin

Role required: admin, catalog_admin, or catalog_editor

About this task

You cannot specify related items and articles for an order guide.
You cannot specify these types of items as related items for a catalog item.

- Wizard Launcher
- Content Item
- Standard Change Template
- Any item in Admin Home catalog

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. Select the required catalog item.
3. To specify a related article, perform these steps.
   a. In the Related Articles related list, click **Edit**.
   b. On the Edit Members form, move the required articles from the **Collection** column to the **Related Articles List** column.
   c. Click the up or down icon to arrange articles in the required order and click **Save**.
4. To specify a related catalog item, perform these steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Related Catalog Items related list, click **Edit**.

b. On the Edit Members form, move the required items from the **Collection** column to the **Related Catalog Items List** column.

c. Click the up or down icon to arrange items in the required order and click **Save**.

Note:
In Service Portal, use the instance options to configure the number of articles and items shown in the **Related Articles** and **Related Items** section. See Configure related catalog item widget instance options or Configure knowledge related articles widget instance options.

Related topics

Map related articles

Add an ordered item link to an item

Use ordered item links to provide a link on the ordered item screen that provides more information about an item.

Before you begin
Role required: Catalog administrator

About this task
After you order the catalog item, you can click the link to see relevant information about the item ordered, for example, for standard delivery terms and conditions. The URL text and link can be defined once and reused across multiple items.

Links are rendered with an added parameter providing the sys_id of the requested item. For example, if the link is mylink.com, it is rendered as mylink.com?req_item=abcde12345. This added parameter can be useful for virtual provisioning situations.

Note:
Ordered item links cannot be configured for Classic Mobile devices.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Ordered Item Links**.
2. Click **New**.
3. Enter a **Name** for the ordered item link.
4. Enter **Link text** to display as the link.
   For example, `Click here to see more information about the iPhone`.
5. Enter the exact **Link URL**.
   For example, http://www.mylink.com.
6. Select the **Target**.
   You can choose to open the link in a new window or tab, or within the catalog. If Within Catalog is chosen, the link must be within the same site. An HTTP site cannot be called from within HTTPS.
7. Click **Submit**.
8. Navigate to **Service Catalog** > **Catalog Definition** > **Maintain Items**.
9. Click an item **Name**.
10. In the **Ordered Item Link** field, click the reference lookup icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Click an ordered item link **Name**.
12. Click **Update**.

Create a Service Catalog client script

You can create client scripts to customize the catalog.

Before you begin

Role required: admin

About this task

Use catalog client scripts to control the behavior of the catalog items when presented to your users. Catalog client scripts can be applied to a catalog item or a variable set. These scripts run on the browser instead of the server, allowing you to better control the information that the user submits.

The priority order for g_form APIs is:

1. Mandatory (highest)
2. ReadOnly/Display

If a variable is set to mandatory and doesn't have a value, readonly or hide doesn't work on that variable. If a variable is hidden or readonly, and then set to mandatory, the variable field becomes visible or editable.

This priority order is also applicable for variable sets and containers. If a variable set or container has a mandatory variable without any value, then the container or variable set can't be hidden.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Catalog Client Scripts**.
   A list of current custom catalog client scripts appears.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for the catalog client script.
Applies to	Item type this client script applies to: ○ **A Catalog Item**: enables the Catalog item field. ○ **A Variable Set**: enables the Variable set field.
Active	Check box to enable the client script. Clear the check box to disable the script.
UI Type	Whether to apply this field to desktop, Classic Mobile, or both.
Script	Enter the client script to run on the service catalog item.
Type	Select when the script runs, such as **onLoad** or **onSubmit**.
Catalog item or Variable set	Select a catalog item or variable set from the list. The field name and options available depend on the selection in the **Applies to** field.
Applies on a Catalog Item view	Check box to apply the catalog client script to catalog items displayed within the order screen on the service catalog. Available in the requester view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies on Requested Items	Check box to apply the catalog client script on a Requested Item form, after the item is requested. Available in the fulfiller view. See VEditor.
Applies on Catalog Tasks	Check box to apply the catalog client script when a Catalog Task form for the item is being displayed. Available in the fulfiller view. See VEditor.
Applies on the Target Record	Check box to support the catalog client script on a record created for task-extended tables via record producers. See Default variable editor.

4. Select **Submit**.

Translation of Service Catalog items

You can translate Service Catalog items into multiple languages using the ServiceNow® Localization Framework.

Localization Framework standardizes and enhances the translation process of artifacts such as Service Catalog items through configurable workflows. For more information, see the Localization Framework topic. You can translate Service Catalog items by activating the Localization Framework Installer plugin (com.glide.localization_framework.installer). For information about the plugin activation, see the Activation of Localization Framework topic.

You can request translation for a single or multiple items from a catalog item list. For more information, see Request translations for Service Catalog items

Note:

- When you translate a catalog item from a form or list, the corresponding variables, variable sets, catalog client scripts and catalog UI polices associated with the catalog item also get translated.
- You can create catalog items only in the primary language. If you change the language and edit a catalog item using catalog builder, the corresponding content of the catalog item does not get translated.

You can monitor the overall localization health of the Service Catalog items from the Localization Insights dashboard. The dashboard provides the localization health of the system with reports that are generated from the localization insights records as per the scheduled jobs.

Watch this six-minute video to learn more about the process of localizing catalog items.

Localization framework overview

Monitoring aggregated catalog item data

Monitor aggregated catalog item data like fulfillment automation coverage, translation coverage, and conversational coverage using the Service Catalog Overview dashboard.

Aggregated catalog item data graphs

You can access the aggregated catalog item data graphs in the Service Catalog Overview dashboard by navigating to **All > Service Catalog > Service Catalog Overview** if you have the catalog_admin role.

The Catalog item translation coverage graph is displayed only if you have enabled the Localization framework. For more information, see Localization Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog Overview dashboard

Graph	Description
Catalog request channel analytics - last 12 months	Vertical bar graph representing the count of catalog requests made through different channels such as Virtual Agent, Service Portal, Mobile in the last 12 months.
Catalog item best practice deviations	Pie-chart representing the Item Diagnostic Results report scores for catalog items, which indicate the health of items. A higher score means that an item has more deviations from best practices. For example, duplicate variables for a catalog item will represent a higher score. Each score is represented by a different color.
Catalog item VA render type	Horizontal bar graph representing the individual count of the way catalog items are rendered in Virtual Agent. It specifies whether an item is rendered as a pop-up, window, or conversation in Virtual Agent.
Catalog item fulfillment automation coverage	Vertical bar graph representing the count of fulfillment automation coverage of catalog items. It specifies whether items are fully automated, semi-automated, manual, unspecified, or empty.
Catalog item translation coverage	Vertical bar graph representing the count of the translation status of catalog items. It specifies whether items are completely translated, partially translated, not translated, or in-progress.

Configuring Service Catalog

Service Catalog enables users with the Catalog Administrators role (catalog_admin) to set up the service catalog.

Configuration overview

Set up one or more service catalogs and provides self-service opportunities. You can organize your catalog offerings by using the ability to publish multiple catalogs targeted to specific audiences.

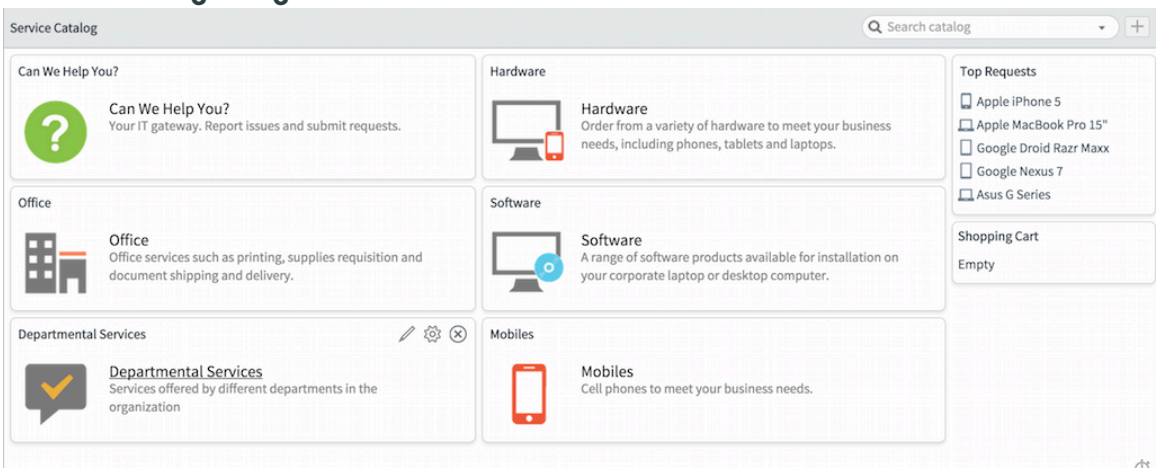
Service catalog categories

Categories organize service catalog items into logical groups. Administrators and catalog administrators can create and configure categories, defining their characteristics and adding content such as catalog items to them.

Categories can have a parent-child relationship, for example, **IT** and **Laptops**. A child category is a subcategory of its parent category. Each catalog item, order guide, record producer, content item, and subcategory appears as a single item within the category. A catalog item can exist in multiple categories, giving you the flexibility to offer the same service from multiple places within your catalog.

Introduces creating categories in a ServiceNow Service Catalog.

Service Catalog Categories



Certain system properties control the following Service Catalog category configuration.

- How categories are displayed to users. For example, are subcategories displayed in a panel or as a list in the category view.
- What content types and search and navigation elements are available on the homepage. For example, searching the service catalog can be enabled or disabled for all users.
- How catalog items, item class names and item categories appear to users. For example, what number of catalog items or categories are previewed in a section.

Catalog managers and catalog editors can also configure categories, but only categories to which they are assigned.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If there are no active items in a category's hierarchy, that category does not appear in the catalog, and cannot be added to the catalog.
- Users with the admin or catalog_admin roles can view categories only if there is an active item in the category and **Availability** is set to either **Desktop** or **Both**.
- Configure the *glide.sc.category.canview.override* property to change the roles for this behaviour.

Create a category

Administrators and catalog administrators can create or edit a category.

Before you begin

Role required: admin

About this task

To create or edit a category:

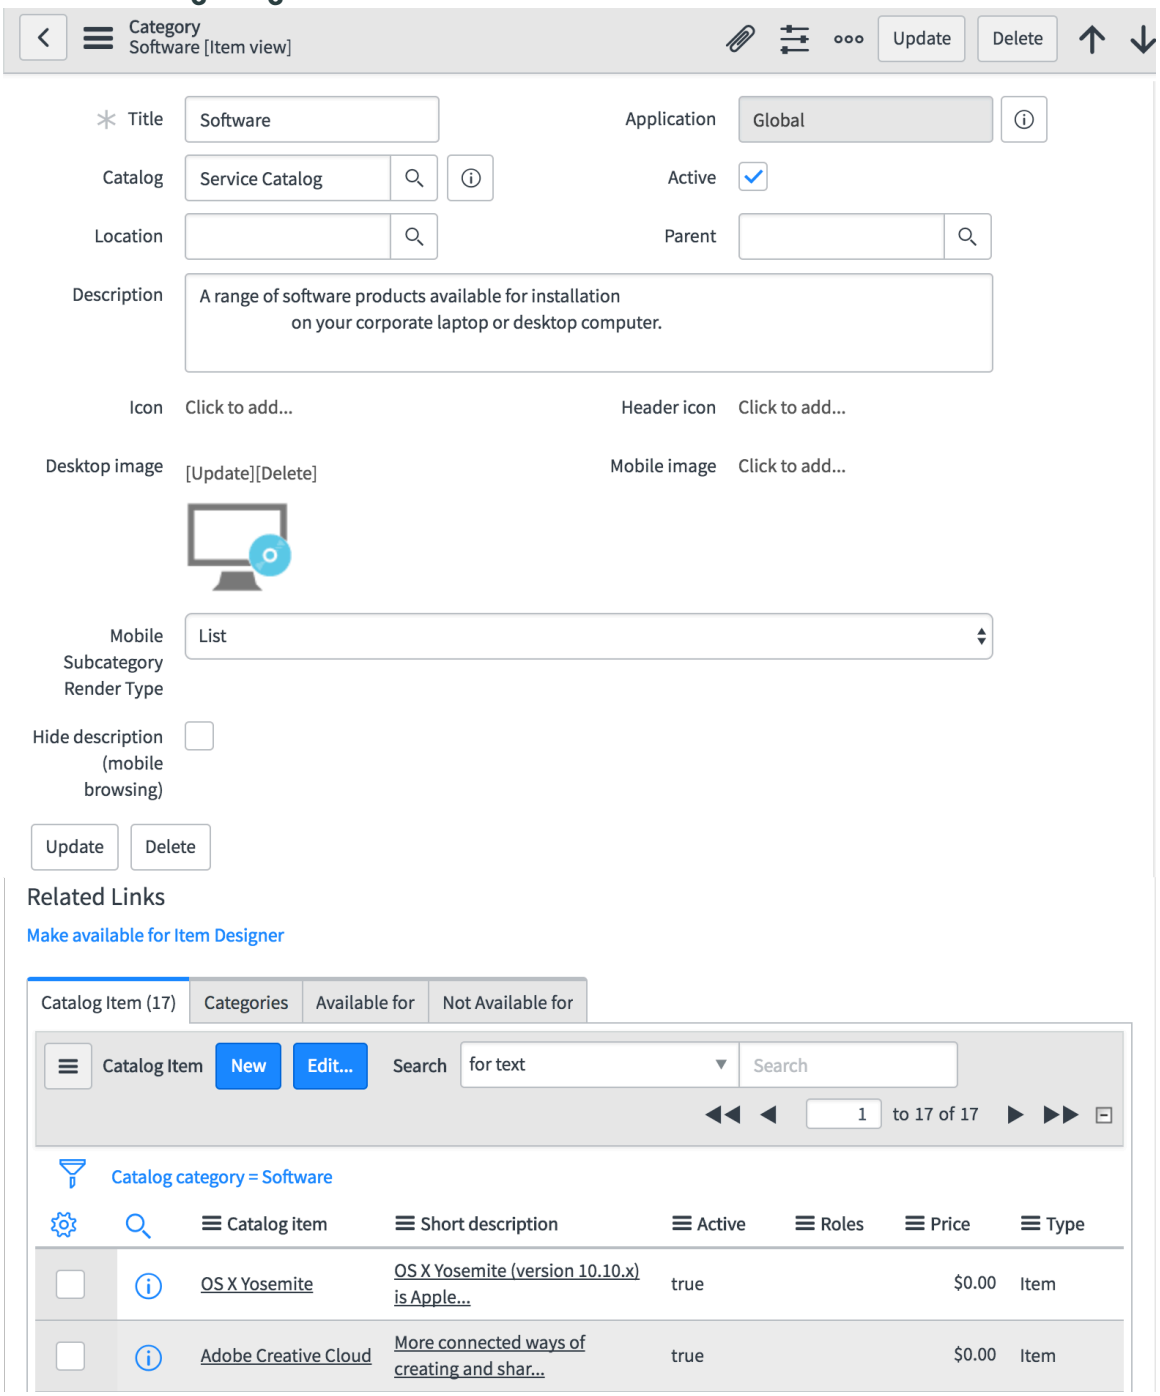
Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Categories**.
   A list of existing categories appears. If the **Parent** field is blank, the category does not have a parent category.
2. Click **New** or select the category to edit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The visibility of a category is controlled by user criteria. See Apply user criteria to items and categories.

Service Catalog categories



3. Fill in the fields on the form, as appropriate.

Service Catalog category form

Field	Description
Title	Descriptive name for the category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Application	The application scope in which the category is applicable.
Catalog	The catalog this category belongs to.
Active	Check box to indicate that the category is available to add to the service catalog homepage.
Location	Any location information relevant for the category.
Parent	Any parent category for which this category is a subcategory.
Description	Information about the category. The description appears when the category is collapsed on the service catalog homepage. The description also appears in the **Related Categories** list when a user clicks the parent category title.
Icon	The small icon displayed beside the category name, when the category is listed as a subcategory.
Header icon	The icon displayed beside the category header, when the category is a top-level category.
Desktop image	A larger image to display with the category on the Service Catalog homepage. This image is visible only if the relevant renderer defines it to be used (the default renderer does not display this field).
Classic Mobile image	A picture to use on Classic Mobile devices for this category. If a mobile image is not selected, the **Desktop image** appears if the **Classic Mobile Subcategory Render Type** is set to **Cards**.
Classic Mobile Subcategory Render Type	The rendering option to control how subcategories are displayed. Select **List** for a single-column list, or **Cards** for a multi-column display.
Hide description (classic mobile browsing)	Option for displaying the description at the top of the list on Classic Mobile devices.

Configure dynamic categories

Dynamic categories let you organize and display commonly requested items and knowledge articles. Dynamic categories appear on the right side of the service catalog homepage by default.

Before you begin

Role required: admin

About this task

Use dynamic categories to provide users with an access option that automatically adjusts to changing request trends.

To configure dynamic catalog categories:

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Dynamic Categories**.
2. Select **New** or open an existing dynamic category.
3. Fill in the fields on the **Dynamic category** form, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Dynamic category** form contains many of the same fields as the Category form. Additional fields are:

Name of form

Field	Description
Type	The kind of items to display. Can be **Requested items** or **KB Articles**
Search how long?	For catalog items only, the period during which to search for the most common requests. For example, enter 7 00:00:00 to display the most commonly requested items in the previous seven days.
Number of Entries	The number of items to display in the dynamic category.

4. Use this example of a step with additional info.
   The results displayed are limited to those items or knowledge articles available in the currently viewed catalog.

Service catalog setup

Service Catalog enables users with the Catalog Administrators role (catalog_admin) to set up the service catalog.

Service Catalog enables you to set up one or more service catalogs and provides self-service opportunities. You can organize your catalog offerings by using the ability to publish multiple catalogs targeted to specific audiences.

An overview of ServiceNow service catalog administration.

Set up a service catalog

To set up a Service Catalog, plan the way your organization defines and maintains Service Catalog items, and how it fulfills them.

Before you begin

Role required: admin

About this task

Administrators and catalog administrators, users with the catalog_admin role, can use the Service Catalog application to define service catalog content and layout. Catalog managers, users with the catalog_manager role, can define and manage a single service catalog. Catalog editors, users with the catalog_editor role, can manage a single service catalog.

Administrators and catalog administrators can define and manage multiple service catalogs. A catalog manager can define and manage a single catalog. One or more catalog editors can manage a single catalog.

Follow these steps to plan for your service catalog:

Procedure

1. Assign roles to the users working with the service catalog.
2. Define content to provide in the service catalog:

Catalog items	The goods and services available within the catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Categories	The groups of items displayed on the catalog home page
Variables	The options available for tailoring a catalog item to meet specific needs.

3. Customize the service catalog homepage to meet your requirements such as defining a Classic Mobile layout.
4. Define the request fulfillment processes your organization uses to deliver ordered catalog items.
5. **Optional:** Create a navigation module for the new catalog.
6. **Optional:** Add the catalog to the multi-catalogs home page.

What to do next

Administrators and catalog administrators can further extend the service catalog to provide more powerful features, using specialized catalog items, configuration options, and scripting functions. For example, administrators can customize the checkout process used when ordering catalog items.

Service Catalog terms and roles

Set up Platform URLs for catalog modules

You can direct users to a specific catalog via a URL to a module in that particular catalog.

Before you begin

Role required: admin

About this task

When you create a module for your catalog page, you can direct users to a specific catalog and view from this module via a URL.

Procedure

In the **Link Type** section, select **URL (from Arguments)**, then in the **Arguments** field, enter a URL of the form `catalog_home.do?sysparm_catalog=id of sc_catalog record&sysparm_catalog_view=view name of sys_portal_page`.

For example, `catalog_home.do?sysparm_catalog=742ce428d7211100f2d224837e61036d&sysparm_catalog_view=catalog`

Note:
If you make the default catalog inactive, then deactivate the **Catalog** module otherwise users can continue to access the inactive catalog using that module.

If a URL has a valid *sysparm_catalog* parameter, but an invalid or missing *sysparm_catalog_view* parameter, the view with the default value from the corresponding Catalog Portal Page record is used.

If a URL has a valid *sysparm_catalog_view* parameter, but an invalid or missing *sysparm_catalog* parameter, the corresponding Catalog Portal Page record is used to set the catalog.

Note:
To ensure peak performance, define both parameters correctly.

© 2026 ServiceNow, Inc. All rights reserved.

Multiple service catalogs setup

Multiple service catalogs enable your organization to offer different sets of services to different teams within the organization, such as IT services, human resources, and facilities management.

Administrators and catalog administrators can define and manage multiple service catalogs. End users can access multiple catalogs from a single homepage, can search across all catalogs, or can search directly within each catalog.

Enabling access for catalogs

You can enable read access to the catalogs by applying the rule **read ACL** on Catalog (sc_catalog) table. See Access Control Rules for more information.

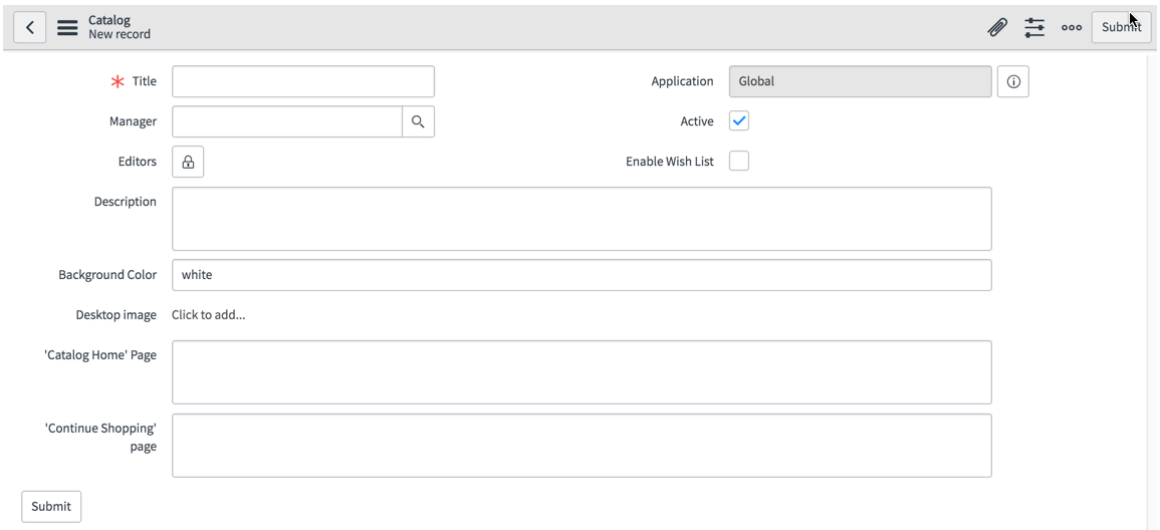
Create a catalog

Using Service Catalog, you can create a catalog and define items and categories within the catalog.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Catalogs**.
2. Select **New**.



3. Enter the new catalog details (see table).
4. Right-click the form header and select **Save**.
5. Define catalog items and categories to include in the catalog.
6. **Optional:** Define additional portal pages for the catalog.
7. **Optional:** Manage sites if you are using a CMS system.

Field	Description
Title	Descriptive name for the catalog.
Application	The application scope for this catalog. For information on the application scope, see Application scope .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Manager	Name of the catalog manager assigned to this catalog. (Optional) The manager is able to edit and update the catalog, as well as the categories and catalog items within the catalog. The manager can assign editors and also a different manager for the catalog, if desired. Only one manager can be assigned to a catalog and must have the catalog manager role or catalog_admin role assigned.
Active	Select the check box to make the catalog available to end users.
Editors	Name of the catalog editor. (Optional) The editor is able to edit and update the catalog, as well as categories and catalog items within the catalog. The editor can assign other editors, but cannot change the manager. Multiple editors can be assigned to a catalog. Each user must have the catalog editor role assigned.
Enable Wish List	Select the check box to enable the wish list feature for the catalog.
Description	Information about the catalog, displayed on the multi-catalog homepage.
Background Color	The background color used for the catalog on the multi-catalog homepage.
Desktop image	The larger image to display with the catalog on the multi-catalog homepage. This image is only shown if image display is included in the renderer selected, such as the default **Title and Image** renderer.
'Catalog Home' page	The location to direct service catalog users to when they click the **Catalog Home** button. This field is designed to reference a content page url suffix.
'Continue Shopping' page	The location to direct service catalog users to when they click the **Continue Shopping** button. This field is designed to reference a content page url suffix.

What to do next
To add a module in the navigator for the new catalog, see Create a module.

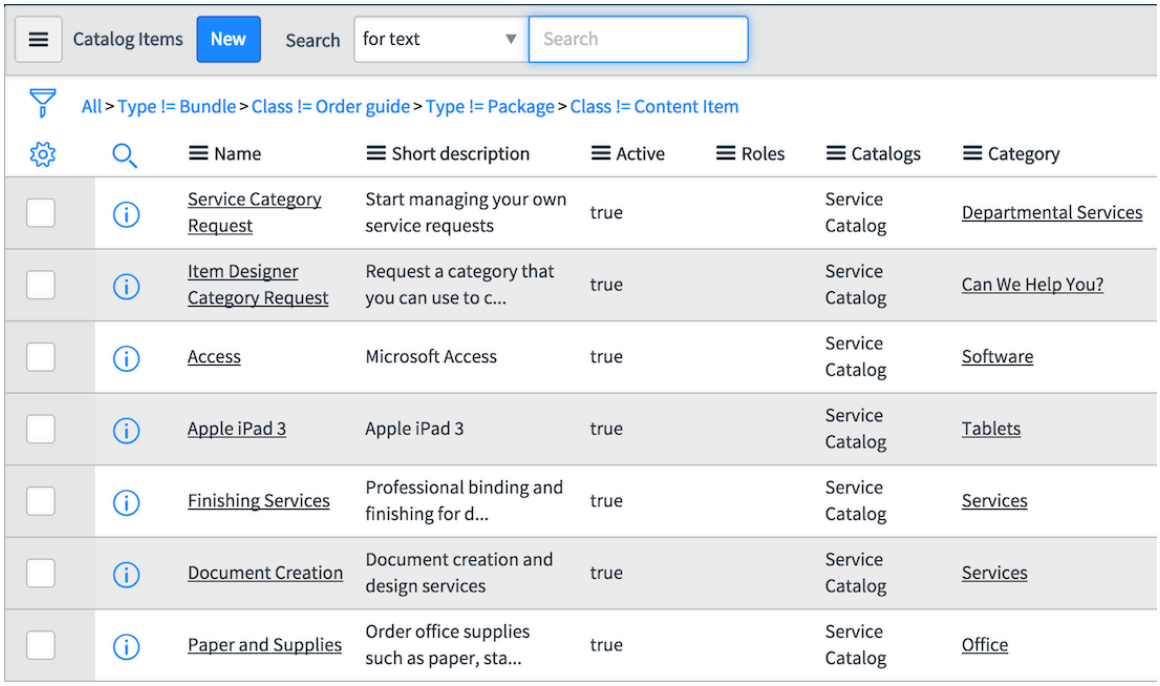
Manage items in a catalog

Using Service Catalog, you can view and manage items within a catalog.

Before you begin
Role required: admin

About this task
Use the **Catalog Items** related list on the Catalog form to view and manage the items available in the catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To define a new catalog item for the catalog, click **New** and enter the details for the item.

Manage catalog portal pages

Using Service Catalog, you can create and manage multiple portal pages for a catalog.

Before you begin

Role required: admin

About this task

A catalog portal page provides a homepage for a specific catalog. You can use portal pages to create different catalog views for different user groups. Each portal page accesses the same catalog content and presents that content in different ways.

Catalog portal page details include the owner, title, and view to use for that page.

Procedure

1. The Catalog Portal Pages related list shows portal pages available for that catalog. Each catalog has a default page, created automatically when the catalog is created.
2. Select an appropriate action:
   - Click **New** to create a new portal page.
   - Click **Edit** to select another portal page for the catalog.
   - Select a portal page to view and edit details for that page.

Tables provided with multiple service catalogs

Administrators and catalog administrators must consider these points before they upgrade to multiple service catalogs.

Before upgrading, be aware of changes made to the underlying Service Catalog data model. These changes are made to implement multiple catalogs and do not affect a standard upgrade. However, if you have made customizations, such as changes to the data model, the changes can impact the instance.

The following tables are provided with multiple service catalogs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables provided with multiple service catalogs

Table [name]	Description
Catalog Site [sc_catalog_site]	Associates catalogs to sites.
Catalog Portal Page [sc_catalog_view_mtom]	Links catalogs to CMS portal pages. Defines the default catalog to portal page combination used by default links.
Catalog Items Catalog [sc_cat_item_catalog]	Stores the catalogs an item is available in.
Catalog Item Category [sc_cat_item_category]	Stores the categories an item is available in.

Catalog site records

Catalog site records appear in the **Sites** related list on the Catalog form.

The Catalog Site [sc_catalog_site] table associates catalogs with CMS web sites.

Several service catalog system properties are used to specify values for different sites used by different catalogs.

Catalog site records properties

Property	Catalog site field [name]
glide.sc.home.cms_page	CMS homepage [cms_home]
glide.sc.search.cms_page	CMS search page [cms_search]
glide.sc.continue.shopping.target	CMS 'Continue Shopping' page [cms_continue_shopping]

Service Catalog scoping

Scoping support is available to define the limits of entities in Service Catalog.

- A catalog can have categories from different scopes.
- A category can only be in the same scope as its parent category.
- You can associate a catalog item with categories of a different scope.
- Catalog items can contain variable sets from a different scope.
- Variables can only be in the same scope as the catalog item or variable set.
- Catalog UI policies can only be in the same scope as the catalog item or variable set.
- Catalog client scripts can only be in the same scope as the catalog item or variable set.
- Catalog data lookup can only be in the same scope as the catalog item or variable set.
- The rule base of an order guide can have items from different scopes.
- The scope of the record producer and the target table should be the same.

Scriptable service catalog variables

You can use scripting to reference any request item variable from a table in scoped and non-scoped environment.

An example of a variable reference follows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
current.variables.<variable_name>
```

Where current refers to the current record, and *<variable_name>* is the name of your variable.

Note:
In order to reference a variable from JavaScript, it must have a name.

When a variable is part of a variable set, you can reference it as current.variables.<variable_name> or current.variables.<variable_set_name>.<variable_name>.

Variable set is also a first-class citizen in Service Catalog. Like variables, a variable set has read, write, and create roles. If roles are provided for a variable set, the roles are applicable for the variables within the set. Roles of an individual variable are overridden by the roles of the variable set.

Print a variable

```
var original = current.variables.original_number;
gs.print(original);
```

Set a variable

```
current.variables.name = "Auto-Generated:" +
 current.variables.asset_tag;
```

Create an inventory item with fields set from variables

```
doCreation();

function doCreation ( ) {
var create = current.variables.create_item;
if (create == 'true') { // we want to create an asset
  var computer = new GlideRecord('cmdb_ci_computer');
  computer.initialize();
  computer.asset_tag = current.variables.asset_tag;
  computer.serial_number = current.variables.serial_number;
  computer.name = current.variables.name;
  computer.manufacturer = current.variables.company;
  computer.insert(); } }
```

Get GlideElementVariable of variables and variable sets associated with a GlideRecord

```
now_GR.variables
```

Get the name value pair of variables associated with a GlideRecord

```
now_GR.variables.getVariableValue();
```

Get a list of GlideElementVariable for variables within a task record

```
now_GR.variables.getElements();
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get a list of GlideElementVariable for variables (including multi-row variable set) within a task record

```
now_GR.variables.getElements(true);
```

Note:
The *getElements()* method returns all the variables present on the given task record except for the formatter variables like label, break, container end, container split, and so on.

APIs for GlideElementVariable

- *now_GR.variables.<var_name>.isMultiRow()*: Get whether the GlideElementVariable is a multi-row variable set or a variable.
- *now_GR.variables.<var_name>.getQuestion()*: Get the Question object for a variable. Applicable only for a variable (*isMultiRow()* is false) and not for a multi-row variable set.
- *now_GR.variables.<var_name>.getLabel()*: Get the label of the GlideElementVariable. For a variable, the label of the variable is returned. For multi-row variable set, the title of the variable set is returned.
- *now_GR.variables.<var_name>.canRead()*: Get whether the user can view a variable or multi-row variable set.
- *now_GR.variables.<var_name>.canWrite()*: Get whether the user can edit a variable or multi-row variable set.
- *now_GR.variables.<var_name>.getDecryptedValue()*: Get the decrypted value for a masked variable. Applicable only for a masked variable.
- *now_GR.variables.<var_name>.getRows()*: Get the list of row objects for a multi-row variable set. Applicable only for a multi-row variable set (*isMultiRow()* is true).
- *now_GR.variables.<var_name>.getRowCount()*: Get the number of rows for multi-row variable set. Applicable only for a multi-row variable set (*isMultiRow()* is true).

Example to access variables of GlideRecord for the Task table

```
var now_GR = new GlideRecord('sc_req_item');
if (now_GR.get('635a1f5387320300e0ef0cf888cb0b73')) {
    var variables = now_GR.variables.getElements();
    for (var i=0;i<variables.length;i++) {
        var question = variables[i].getQuestion();
        gs.log(question.getLabel() + ":" + question.getValue())
    }
}
```

Example to access a multi-row variable set of GlideRecord for the Task table

```
var now_GR = new GlideRecord('sc_req_item');
now_GR.get('02c38dcd87013300e0ef0cf888cb0bb2');

var vars = now_GR.variables.getElements(true);

for (var i=0; i<vars.length; i++) {
    var now_V = vars[i];
    if (now_V.isMultiRow()) {
        var rows = now_V.getRows();
        for (var j=0; j<now_V.getRowCount(); j++) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            var row = rows[j];
            var cells = row.getCells();
            for (var k=0; k<cells.length; k++) {
                var cell = cells[k];
                gs.info(cell.getLabel() + ":" +
 cell.getCellDisplayValue())
            }
        }
    }
}
```

Multi-row variable set

Multi-row variable set

Operation	Usage
Table operations	
Return JSON array value as String	`now_GR.variables.table_var`
Set value of a multi-row variable set	`now_GR.variables.table_var = <val>` **Note:** An array of ordered (key, value) pairs is also applicable as input.
Get value of column, var1, of a multi-row variable set	`now_GR.variables.table_var.var1`
Set value of a variable set, var1	`now_GR.variables.table_var.var1 = <val>` **Note:** An array of ordered (key, value) pairs is also applicable as input.
Row operations	
Get the current row count	`now_GR.variables.table_var.getRowCount()`
Returns the row specified by the variable "i" - getRow(<int> i)	`var row = now_GR.variables.table_var.getRow(<int> i);`
Get the cell value for a question column mapped to <var_name>	`row.<var_name>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Multi-row variable set (continued)

Operation	Usage
Set the cell value for a question column mapped to <var_name>	`row.setCellValue('<var_name>', value)`
Set the cell value for a question column mapped to <var_name>	`row.<var_name> = value`
Add an empty row at the end of the table and return a scriptable object	`var row = now_GR.variables.table_var.addRow()`
Delete a row	`row.deleteRow()`

Notes and limitations

- //Single column of table_Var
- now_GR.variables.table_var.var1
- now_GR.variables.table_var.var1 = <val>

1. You can only set a variable in a before business rule. Variables set in an after rule are not written to the database.
2. There is nothing in place to prevent namespace collision with variables. Creating two variables named computer_speed would result in only one of them showing up; the second one would overwrite the first one.
3. Date/time variables use the same time zone formatting and storage rules as all other dates in the system. They are stored internally in GMT, but translated into the user's local time zone and format for display.

Define filters for My Requests

Define request filters to filter incidents, requests, or tasks under the **Self-Service** > **My Requests** module in ServiceNow AI Platform, the **My Requests** widget in Service Portal, and the My Requests applet in the Now® Mobile app.

Before you begin

Role required: catalog_admin or admin

Since the My Request Filter [request_filter] table has been reparented to the Filter [sys_filter] table, a few fields from the My Request Filter table have been migrated to fields in the Filter table. The **Short Description** field from the My Request Filter table has been migrated to the **Title** field in the Filter table. The **Table Name** field from the My Request Filter table has been migrated to the **Table** field in the Filter table.

Note:
If the My Request Filter form is modified, the form still displays the **Short Description** and **Table Name** fields that are no longer valid. Delete these invalid fields from the form and add the **Title** and **Table** fields to the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Service Catalog** > **Catalog Administration** > **My Request Filter**.
2. On the form, fill the fields.

My Request Filter form

Field	Description
Title	Name of the filter.
Table	Table on which the filter condition is applied.
Application	Application scope of the filter.
Active	If set to true, the filter is active.
Applies to	Interface for which the filter is applicable. Possible values: ○ Desktop ○ Service Portal ○ Desktop/Service Portal ○ Mobile
Filter	Conditions to filter requests.
Portal Settings	
This section is displayed when the **Applies to** field is set to **Service Portal** or **All**.	
Portal page	Portal page that opens when you click the request.
Primary field to display	Primary information displayed for the request.
Secondary fields to display	Secondary information displayed for the request. **Note:** ○ Add a maximum of three secondary fields. ○ Do not add an image field. ○ If the Request [sc_request] table is selected, secondary field is not configured. If the request contains only one item, the Requested Item name is displayed. Else, it contains the requested item count.

3. Click **Submit**.

Delegated request experience

You can request a catalog item on behalf of another user or multiple users using the Requested For variable.

Delegated request experience comprises of the following entities:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Requested For variable for a catalog item
- Requested For field on a requested item (RITM)

Note:
The form views, list views, and email notifications are not updated to reflect the Requested For field on a RITM.

Configuration options

The following configuration options are available:

- Specify who you want to submit the request for using the Requested For variable. You can also map the Requested For variable to a field on the table for record producers.
- If required, configure the **Requested For** field on the RITM form. This field automatically stores the value of the Requested For variable.
- Allow delegated requests for a catalog item using its **Access Type** field, where you can specify if a request can be submitted for a user who does not have access to the catalog item.
- Submit a single request for an item on behalf of multiple users in Service Portal

Important:
If two-step checkout is enabled, the delegated request experience is not supported.

Request Management

After you submit a catalog item request, the Requested For variable value is copied to the **Requested For** field of the RITM. In case this field is not available on the RITM form, you should configure it.

Note:
After you submit a catalog item, the **Requested For** field value is not automatically updated when the Requested For variable is modified, and vice versa.

In Service Portal,

- If RITMs have different Requested For users, the following information is displayed in the order status page.
  - The **Requested For** column to display the RITM's Requested For user.
  - When the user viewing the Order Status page is not the user who submitted the request, the **Requestor** information to display the request's Requested For user. This is also applicable in Now Mobile, when the user viewing the RITM is not the user who requested it.
- If the RITM's Requested For user is different from the request's (REQ) Requested For user, My Requests menu displays the RITM records to the user who the RITM is being requested for. If the RITM Requested for is the same as the REQ requested for user, My Requests menu displays REQs.
- When you create a bundle from the cart by adding a catalog item with a Requested For variable, the item preserves the variable value. When you later add it to the cart to request for another user, you should edit the Requested For variable value as required.

Request experience for a record producer

After you submit a record producer, the Requested For variable value is copied to the target record's field based on the **Map To Field** configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request experience for an order guide

This experience is supported in an order guide only if the following conditions are met:

- Order guide has a Requested For variable
- All items in the order guide have a Requested For variable

A catalog item is included in an order guide based on the Requested For user's access to a catalog item.

- When the user has no access to the catalog item and its **Access Type** is set as `Restricted`, that item is not included in the order guide.
- When the user has no access to the catalog item and its **Access Type** is set as `Delegated`, that item is included in the order guide.

The Requested For variable value from the **Describe Needs** section is always cascaded to the Requested For variable of catalog items in rule bases.

- The cascading of the Requested For variable value depends just on the variable type, but not the variable name.
- The Requested For variable value is cascaded even when the **Cascade Variables** check box is not selected for the order guide.
- The Requested For variables in the included catalog item cannot be edited.

Submitting a catalog item request for multiple users

To support submitting a request for multiple users, you can configure the Requested For variable of a catalog item.

1. From the **Type Specifications** tab, select the **Enable also request for** check box.
2. Specify the roles in the **Roles to use also request for** field that can submit a catalog item request for multiple users. If no role is specified, anyone who has access to the catalog item can submit the request.

After you configure the Requested For variable of a catalog item, the **Also request for** field is displayed for that item in Service Portal. After you specify multiple users in this field, you can:

- Add the item to the cart
  - Separate cart items are created for each user specified in the **Also request for** field.
  - The Requested For variable of each cart item is populated with the corresponding user.
- Submit the request
  - A single request is created and assigned to the current logged-in user requesting the item
  - Separate RITMs are created, one for each user specified in the **Enable also request for** field and the Requested For variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- This experience is available in Service Portal.
- This experience is not available in Now Mobile and Workspace.
- This experience is not available for a record producer and order guide.
- The **Also request for** field is not displayed in the wish list and cart.
- Catalog client scripts, catalog UI policies, and g_form() APIs are not applicable for the **Also request for** field.
- The **Also request for** field is displayed only if the Requested For variable is editable. For example, the field is not displayed if the requesting user has no write permissions for the Requested For variable, or if the variable is made read-only via catalog client scripts.
- You can add up to a maximum of 50 users in the **Also request for** field.
- If any of the users does not have access to a catalog item with **Access Level** set as **Restricted**, then the item cannot be added to cart.

Request cloning

When you clone a request:

- The Requested For value for the cloned request is updated with the user for whom the request is being cloned.
- The Requested For value for cloned RITMs (with or without a Requested For variable) is updated with the user for whom the request is being cloned for the following entities:
  - RITM Requested For user
  - Requested For variable value

For information about cloning requests, see Clone requests.

Important:

- You can clone a request only when all RITMs are requested for the same user.
- You cannot clone a request for a user who does not have access (based on **Access Type**) to any item in the request.
- Variable dependencies on the Requested For variable are not considered when a request is cloned.

Cart behavior

Using the Requested For variable, you can add multiple catalog items to the cart for different users and submit the cart as one request. When you submit a request for a cart with multiple items, a single request is created with separate RITMs, one for each catalog item. In this case, the **Requested for** field of each RITM inherits the corresponding Requested For variable value.

When you add multiple items to the cart for different users and submit the request, a single request is created with a separate RITM for each catalog item with the corresponding Requested For user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cart submission scenarios

Scenario	Cart behavior
All items in the cart have a Requested For variable and are requested for the same user	• Requested For value of the RITM is the Requested For variable value. • Requested For value of the request is the Requested For variable value.
All items in the cart have a Requested For variable and are requested for different users	• Requested For value of the RITM is the Requested For variable value. • Requested For value of the request is the logged-in user or the default Requested For user specified in the cart.
No items in the cart have a Requested For variable	• Requested For value of the RITM is the default Requested For user specified in the cart. • Requested For value of the request is the logged-in user or the default Requested For user specified in the cart.

Few items in the cart have a Requested for Variable while others do not	• Requested For value of the RITM is one of the following:
	  ○ If a Requested For variable exists, it is the variable value.
	  ○ If no Requested For variable value exists, it is the logged-in user or the default Requested For user specified in the cart
	• Requested For value of the request is the logged-in user or the default Requested For user specified in the cart.

Passing parameters for the Requested For variable

You can use parameters in ServiceNow AI Platform and Service Portal to specify the default Requested For variable value for a catalog item.

- In Platform, pass a user's sys_id as the *sysparm_requested_for* value in the URL.
- In Service Portal, specify the *requested_for_id* and *requested_for_display* parameters in widget instance options.

  For example, navigate to a catalog item widget, press Ctrl+click to select **Instance in Page Editor**, and specify the following parameters in the **Additional options, JSON format** field.

```
"requested_for_id": "a8f98bb0eb32010045e1a5115206fe3a
"requested_for_display": "Abraham Lincoln"
```

Note:
The Requested For value is set after the catalog form is loaded.

Types of service catalog variables

Configure the default behavior to request items for other users

Define the default behavior when no roles are specified in the *glide.sc.req_for.roles* property.

Before you begin

Role required: admin

About this task

The *glide.sc.req_for.roles* property specifies the list of roles who can request items for other users. When no roles are specified, then the default behavior is defined by the *glide.sc.req_for.roles.default* property. For information about the *glide.sc.req_for.roles* property, see Service Catalog properties.

Following are the possible values for the *glide.sc.req_for.roles.default* property.

- When the property is set to `allow`, then any user can request items for other users.
- When the property is set to `deny`, then no user can request items for other users.

The value of the *glide.sc.req_for.roles.default* property is considered as `allow` in any of the following scenarios and any user can request an item for other users:

- The *glide.sc.req_for.roles.default* property is not defined.
- The value of the *glide.sc.req_for.roles.default* property is empty, `allow`, or any string other than `deny`.

A user with the admin role can request an item for other users. In this case, values of both the properties, glide.sc.req_for.roles and glide.sc.req_for.roles.default, are not considered.

For zBoot customers, the *glide.sc.req_for.roles.default* property is available in the base system with the default value as `deny`. Upgrade customers can add and modify the property if required.

Procedure

1. Navigate to sys_properties.list.
2. Select the *glide.sc.req_for.roles.default* property.
3. On the System Property form, in the **Value** field, specify the value.
4. Click **Update**.

Service Catalog request fulfillment

When a user orders a catalog item, a request is created that follows a fulfillment process. A fulfillment process defines the steps to request approval, assign fulfillment tasks, and fulfill requests. Workflow Studio flows, workflows, or execution plans are used to define fulfillment processes.

Preparing to fulfill catalog item requests involves the following activities.

- Set up fulfillment groups to assign to tasks.
- Define the fulfillment processes using Workflow Studio flows, workflows, or execution plans.
- Assign the fulfillment process to catalog items.

Using Workflow Studio flows

The Workflow Studio application enables process owners to automate work, such as approvals, tasks, and notifications, without having to code. Build multi-step flows from reusable components. For more information, see Exploring Workflow Studio.

Using workflows

Workflows provide greater flexibility than execution plans, which are linear. Workflows allow for different paths to the end of the process. For example, an approver can reject a request, ending the process. If the request is approved, the process continues through fulfillment to the end of the process.

Use the Workflow Editor to define fulfillment workflows. The Workflow Editor offers the following features.

- Edit workflows graphically.
- Modify activities and conditions.
- Define transitions between workflow activities.
- Summarize workflow progress through stages.
- Validate workflows to identify potential problems.
- Publish workflows for other users.

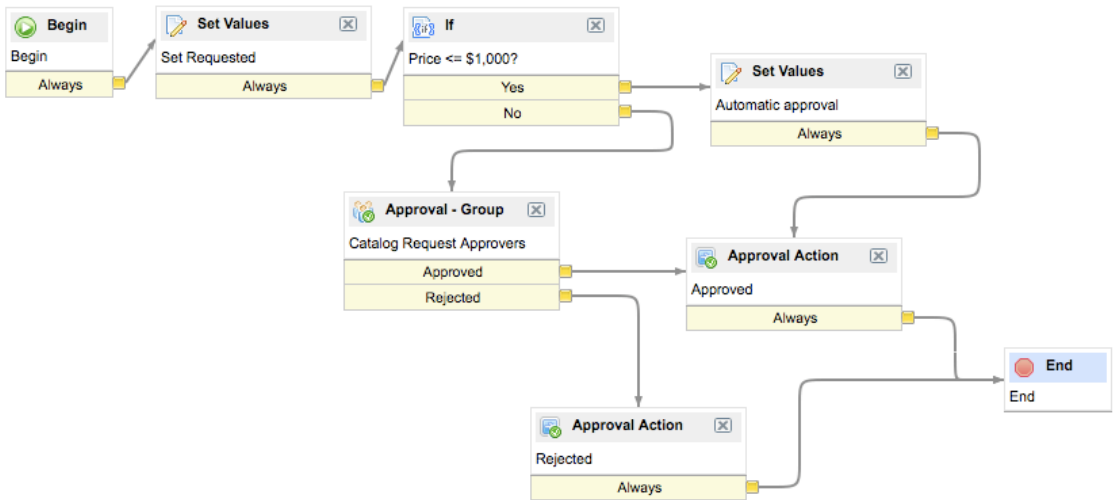
Service catalog workflows

Two service catalog workflows are provided in the base system. Use the Graphical Workflow Editor to modify the default workflows or to create additional service catalog workflows. Service catalog workflows support domain separation.

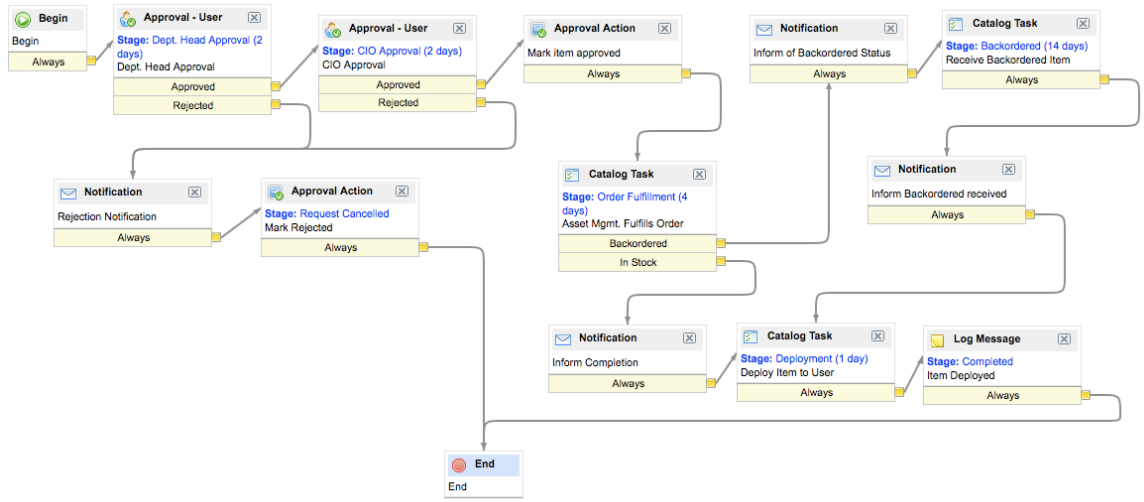
Default service catalog workflows

- **Service Catalog Request**: a simple workflow that fulfills a simple order.
- **Service Catalog Item Request**: a more complex workflow that fulfills a more complex order.

Service Catalog Request workflow



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Defining service catalog workflows

Creating a workflow involves the following processes:

- Create a workflow to process the catalog item.
- Define the workflow activities to process the catalog item.
- Publish the catalog item workflow.
- Create or edit a catalog item to call the catalog item workflow

Note:
If your catalog workflow requires catalog tasks to access catalog variables, create the catalog tasks from a parent workflow. A catalog workflow cannot access catalog variables from catalog tasks created by a subflow.

Deleting catalog workflow records

Workflow stage fields for service catalog workflows display when a user deletes a record required by the workflow. If a user deletes a catalog item and that catalog item has active request workflows running, the workflow stage field displays **Catalog item removed**. Similarly, deleting the associated workflow context causes the stage field to display **Workflow context removed**.

Associating items with the domain-specific workflow

When using service catalog workflows with domain separation, ensure your catalog items use the domain-specific workflow. If you create a domain-specific version of a workflow, existing catalog items continue to use the original workflow. To configure the catalog item to use the domain-specific workflow, select the new workflow in the **Workflow** field on the catalog item record.

Create a catalog workflow

Create service catalog workflows when the default workflows are not appropriate for a fulfillment process.

Before you begin
Role required: workflow_creator, workflow_admin, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

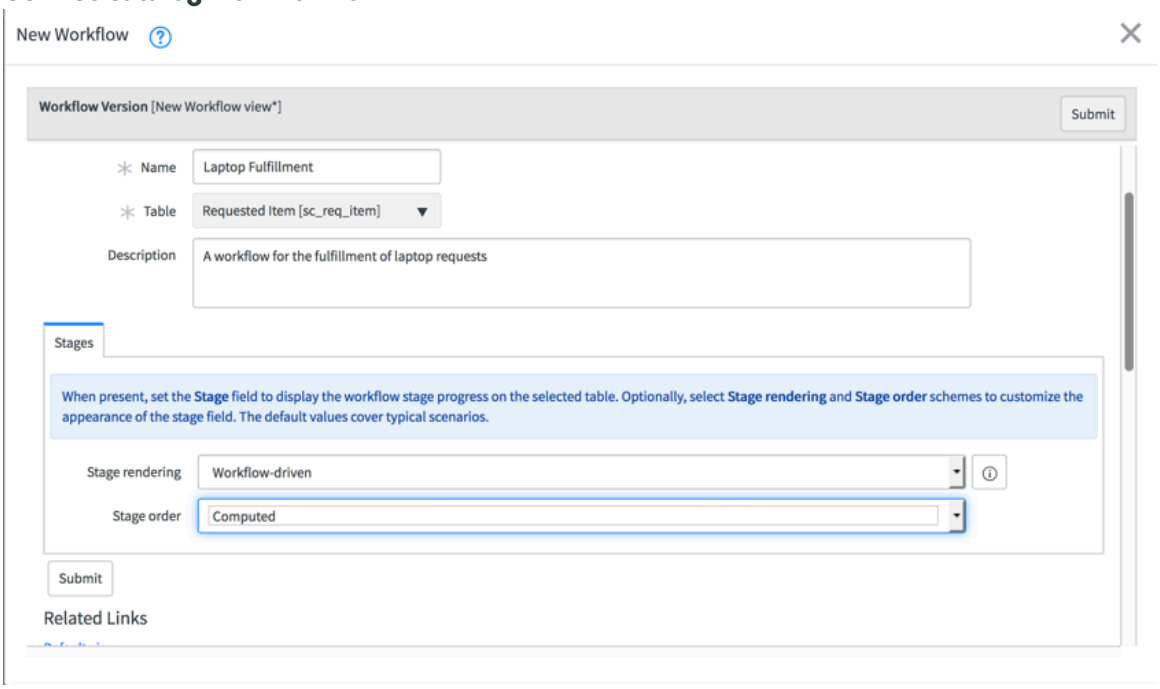
About this task

This example describes the procedure to set up fulfillment for a laptop request.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**
2. Click **New Workflow**.

Service catalog workflow form



3. Complete the form with the following information.

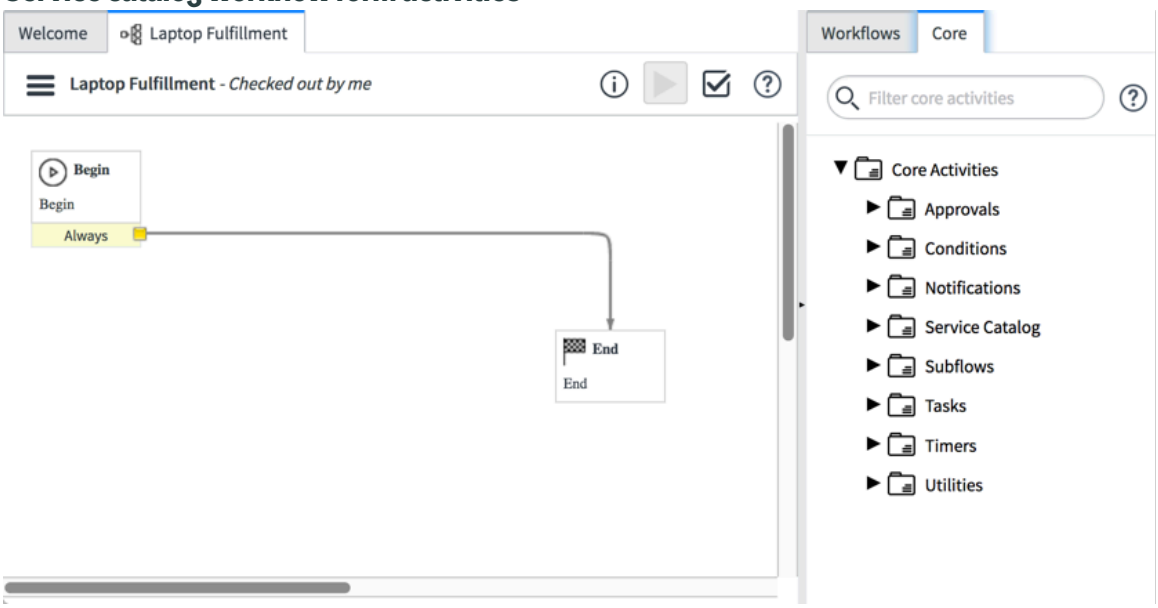
Field	Input value
Name	`Laptop Fulfillment`
Table	**Requested Item [sc_req_item]** Consider the following information: ○ Workflows on the Service Catalog Requested Item [sc_req_item] table fulfill the request of a single catalog item. Each requested item triggers its own fulfillment workflow when the item is ordered. Use the Requested Item table to add workflows for requested items. **Note:** To enable approval-type workflows to operate smoothly, make sure that the appropriate users have the correct role to access necessary tables in all domains. ○ Use caution when using *`before query`* business rules, as they can restrict access to the requested item record. ○ Workflows on the Request [sc_request] table always run when a service catalog request is submitted, regardless of what item was ordered. These

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input value
	workflows control the entire request process, which can involve delivering several requested items. Therefore, Request table workflows are not assigned to a specific item from the maintain item form. If you do use the Request table for service catalog requests, add conditions to the workflow to ensure it runs when the correct item is requested.
Expected time	**Days** 7, **Hours** 00 : 00 : 00. Workflows cannot calculate the end time because not all the activities within the workflow have defined times. Therefore, the **Expected time** on the workflow becomes the **Delivery Time** on the catalog request. **Note:** When both **Expected time** and **Schedule** are filled in, the catalog delivery time is then calculated based on the combination of both. For example, if you put 2 days as **Expected time**, it is calculated as 48 hours. If you then add a schedule that defines a work day as 8 hours, the delivery time becomes 48 / 8 = 6 days. If your schedule excludes weekends, the calculation also add 2 days for the weekend, making the delivery time 8 days.
Schedule	**8–5 weekdays**.
Timezone	**US/Pacific**. The timezone that the schedule applies to.
Description	`A workflow for the fulfillment of laptop requests.`

4. Click **Submit**.

Service catalog workflow form activities



What to do next

After initiating a workflow, add workflow activities to it. Workflow activities are listed on the **Core** tab in the right pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add an activity to a catalog workflow

You can add activities to a workflow to perform tasks such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

Before you begin

Role required: workflow_creator, workflow_admin, or admin

About this task

After creating the workflow to add a laptop fulfillment process, add the activities.

Procedure

1. Complete the following steps to add an activity that requests manager approval.

   a. In the **Core** pane, expand **Approvals** and drag the activity **Approval - User** onto the arrow between **Begin** and **End**.
   This activity generates an approval from the manager of the person requesting the laptop.

   b. Complete the form with the following information.

   - **Name**: `Manager Approval`
   - **Stage**: **Waiting for Approval**
   - **User**: Click the lock icon in the Approvers section, and then click the select fields icon. Expand **Requested** > **Requested For**, and then select **Manager**.

   c. Click **Submit**.

2. Complete the following steps to add an action for when the approver rejects the request.

   a. Expand **Utilities** in the **Core** pane and drag the activity **Set Values** to the space below the approval.

   b. Complete the form with the following information.

   - **Name**: `Rejected`
   - **Stage**: **Completed**
   - **Values** condition builder: **[Approval] [Rejected]**

   c. Click **Submit**.

   d. Drag from the yellow box beside **Rejected** on the **Approval - User** activity to the new **Set Values** activity.

   e. Drag again from the yellow box beside **Always** on the **Set Values** activity to **End**.
   This activity marks the request as rejected if the manager rejects the request and then ends the workflow

3. Complete the following steps to add an action for when the approver approves the request.

   a. Drag the activity **Set Values** onto the arrow between **Approval - User** and **End**.

   b. Complete the form with the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Name**: `Approved`
- **Stage**: **Fulfillment**
- **Values** condition builder: **[Approval] [Approved]**

This activity marks the request as approved once a manager approves it.

c. Click **Submit**.

4. Expand **Tasks** and drag the activity **Create Task** onto the arrow between **Approval - User** and **End**, add the following information, and click **Submit**.
   - **Name**: `Laptop Procurement`
   - **Stage**: **Fulfillment**
   - **Task Type**: **Catalog Task [sc_task]**
   - **Priority**: **3 - Moderate**
   - **Fulfillment group**: **Procurement**
   - **Short description**: `Procure a Laptop`

   This task tells Procurement to procure a laptop for the user.
5. Expand **Notifcations** and drag the activity **Notification** onto the arrow between **Laptop Procurement** and **End**, add the following information, and click **Submit**.
   - **Name**: `Procurement`
   - **Stage**: **Fulfillment**
   - **To**: Click the lock icon in the Addressee(s) section, and then click the select fields icon. Expand **Requested** and select **Requested For**.
   - **Subject**: `Your laptop has been procured.`

   This activity marks the request as approved if a manager approves it.
6. Drag the activity **Create Task** onto the arrow between **Procurement** and **End**, and then fill in the form.

Option	Description
Name	Set Up Laptop
Stage	Fulfillment
Task Type	Catalog Task
Priority	3 - Moderate
Fulfillment Group	Hardware
Short Description	Set up laptop.

   This task tells Hardware to configure the laptop and prepare it for use.
7. Drag the activity **Create Task** onto the arrow between **Set Up Laptop** and **End**, add the following information, and click **Submit**.
   - **Name**: `Pickup Laptop`
   - **Stage**: **Delivery**
   - **Task Type**: **Catalog Task [sc_task]**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Priority**: **3 - Moderate**
- **Assigned to**: Leave the field blank, as the script in the **Advanced** field assigns this task to the requester.
- **Short description**: `Pick up laptop.`
- **Advanced**: Select the check box and set the **Advanced Script** value to:
  `task.assigned_to=current.requested_for;`

  This task informs the requester to come pick up the laptop.

8. Drag the activity **Log Message** onto the arrow between **Pick Up Laptop** and **End**, add the following information, and click **Submit**.
   - **Name**: `Delivered`
   - **Stage**: **Completed**
   - **Message**: `The laptop delivery workflow is complete.`

     Leaves a message in the log to record the successful completion of the workflow.

Publish a catalog workflow

Publish the catalog workflow to make it available for use in the system.

Before you begin

Role required: workflow_creator, workflow_admin, workflow_publisher, or admin

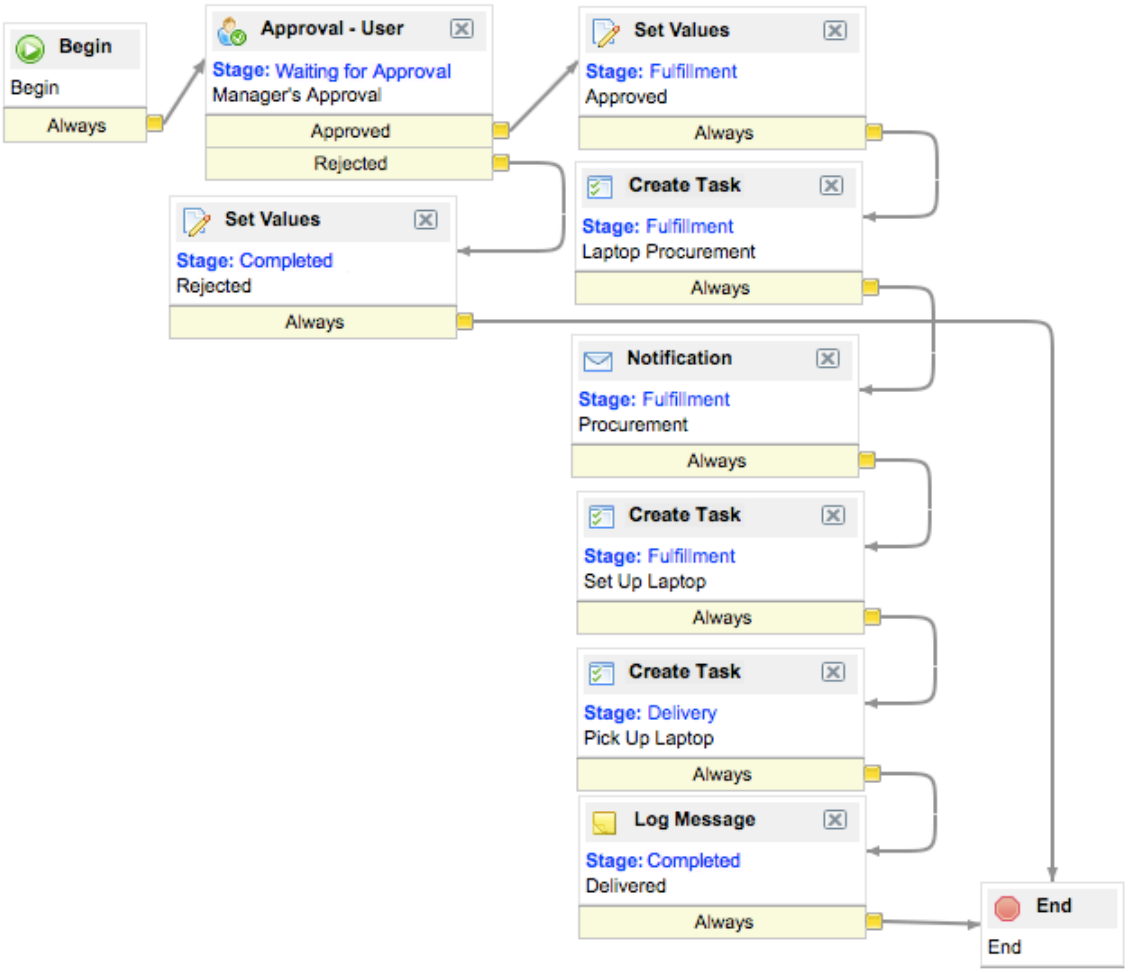
About this task

After adding activities to your workflow, publish it to make it available for use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the workflow actions menu on the left beside the workflow name.
2. Click **Publish** to publish the workflow.



Execution Plans

An execution plan describes how a catalog item is procured, configured, and installed.

Execution plans enable you to describe simple, linear processes. Each execution plan contains one or more tasks. For example, an organization could create an execution plan for delivering a corporate standard PC that contains these tasks:

1. Procure the PC from a supplier.
2. Configure the PC according to requester specifications.
3. Deliver the PC to the requester.

An execution plan is not specific to any one catalog item. There could be many different models of PC that a user can order, all using the same execution plan. It is not necessary to create a new execution plan for each individual catalog item in a mature service catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Execution plans are not as powerful or flexible as workflows, and cannot be designed using a graphical editor. Execution plans are useful in some circumstances, for example, if you want to build your processes programmatically or through imports. ServiceNow recommends using workflows for request fulfillment processes.

Create an execution plan

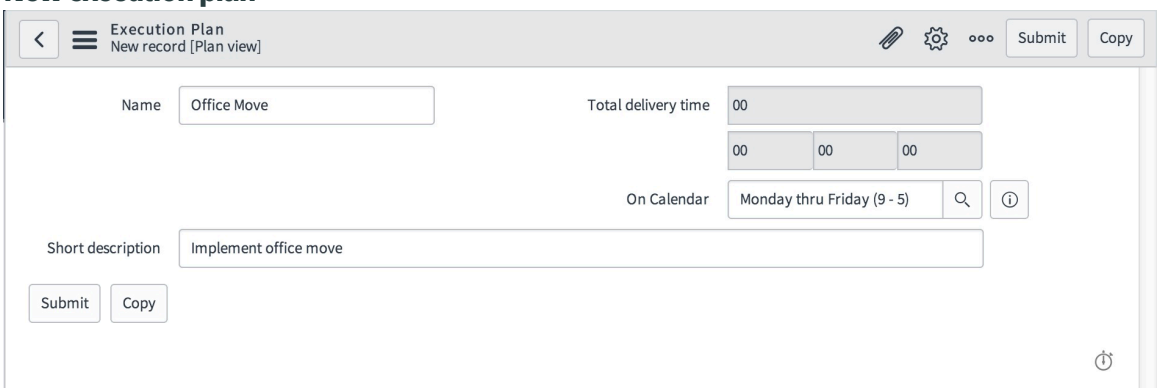
Administrators and catalog administrators can create and manage execution plans and the associated variable tasks.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Execution Plans**.
2. Click **New**.

New execution plan



3. Enter a *Name* and *Short description* for the execution plan.
4. Specify delivery information in the *Total delivery time* and *On Calendar* fields.
5. Click **Submit**.

Add catalog item variables to a task

You can add variables of a catalog item to a task to specify information about the requested catalog item.

Before you begin
Role required: admin

About this task
For example, when a user requests a laptop, the fulfillment group can need to know what screen size and how much memory to order.

Each catalog item can contain one or more variables for gathering information from the user who requests the item. Assuming that the relevant catalog items have been associated to the execution plan, you can associate these variables to the specific created tasks that need the information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Execution Plans**.
2. Open an execution plan.
3. In the *Execution Plan Tasks* related list, open a task.
   Ensure that the form shows the Plan view. If not, right-click the header bar and select **View** > **Plan**.
4. Go to the *Available Variables* related list and click **Edit**.
5. Use the slushbucket to select the variables that are appropriate for the task.

   Consider all the types of catalog items that could use this execution plan, and select all the variables that can be assigned to them.
6. Click **Save** to associate these variables to the execution plan task, making them accessible.

Execution plan tasks

An execution plan contains one or more execution plan tasks, such as for obtaining approval. Execution plan tasks are assigned to a fulfillment group.

Each task represents work to be completed by a specific group as part of the overall request fulfillment process.

Administrators create templates for tasks as part of defining an execution plan. The catalog tasks themselves are then created when the relevant item is requested, based on these task templates.

Set up an execution plan approval task

Approval tasks are specific types of tasks within execution plans.

Before you begin

Role required: admin

About this task

If an approval task is rejected, the execution plan can roll back to a previous task, but the approval record does not roll back.

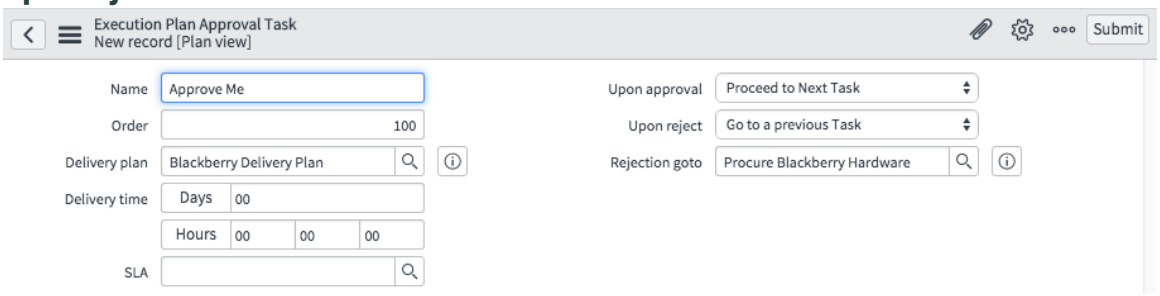
To set up an approval task including a rollback action:

Procedure

1. Navigate to **All** > **Service Catalog** > **Execution Plans**.
2. Select an execution plan.
3. From the Execution Plan Tasks related list, select **New Approval** to create the approval task.
4. Fill in the fields for that approval task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upon Reject



5. Use the *Upon reject* field to define the action to take if the task is rejected:
   - *Cancel all future Tasks*: [default] cancels all future tasks in the execution plan and also cancels the parent request item.
   - *Go to a previous Task*: displays the *Rejection goto* field where you can select which task this execution plan rolls back to.
6. **Save** the task, then scroll down to the *Approved By* list and select one or more approvers for the tasks.

   You can also use an Approval script to select approvers.
7. Select **Update** to add the task to the execution plan.

   This example shows how the process works in practice, using a request to order a Blackberry phone.

   First, the request is ordered:

Rollback 1

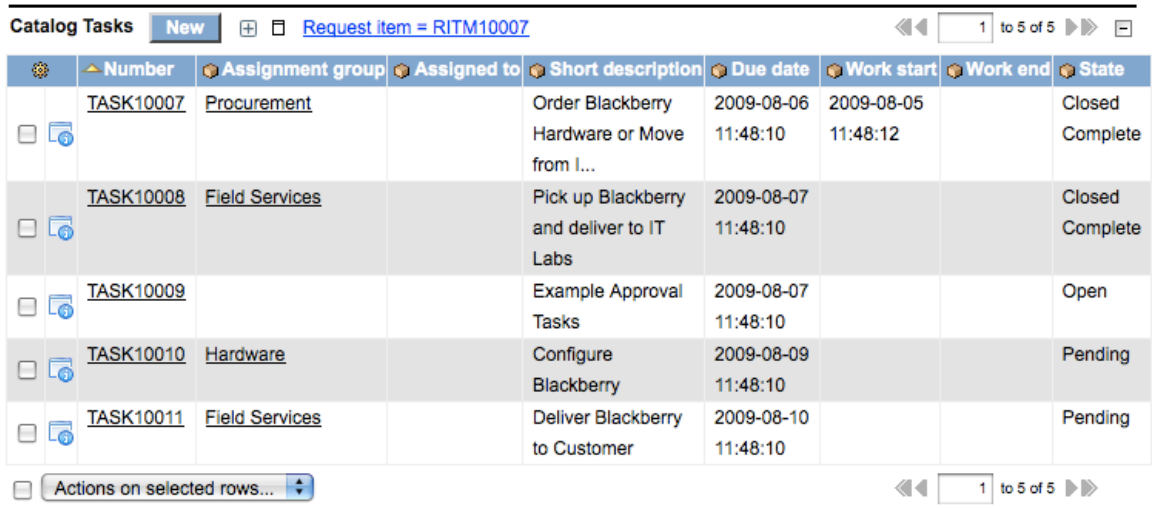
Catalog Tasks | New | Request item = RITM10007 | 1 to 5 of 5

Number	Assignment group	Assigned to	Short description	Due date	Work start	Work end	State
TASK10007	Procurement		Order Blackberry Hardware or Move from I...	2009-08-06 11:48:10	2009-08-05 11:48:12		Open
TASK10008	Field Services		Pick up Blackberry and deliver to IT Labs	2009-08-07 11:48:10			Pending
TASK10009			Example Approval Tasks	2009-08-07 11:48:10			Pending
TASK10010	Hardware		Configure Blackberry	2009-08-09 11:48:10			Pending
TASK10011	Field Services		Deliver Blackberry to Customer	2009-08-10 11:48:10			Pending

   Next, complete the first two steps, which leads to the approval task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rollback 2



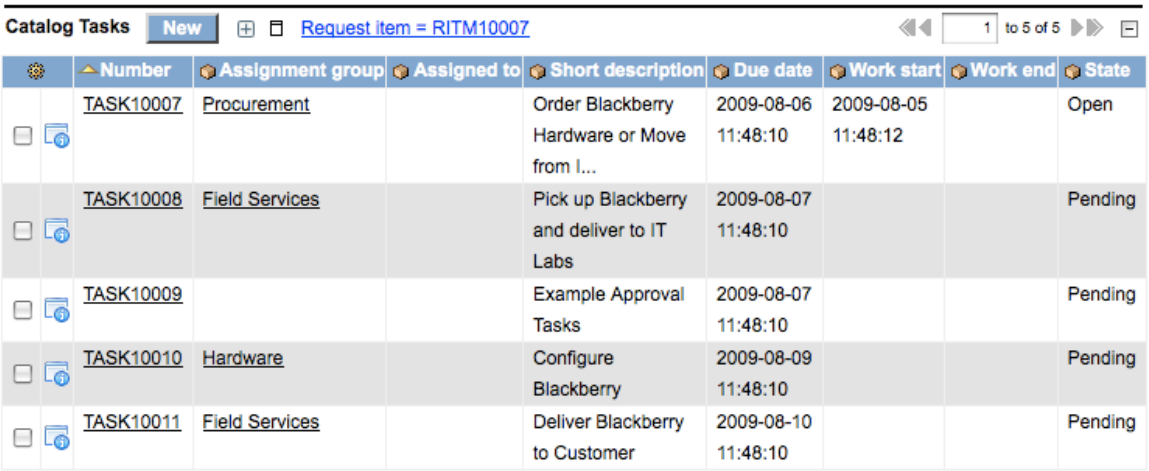
Catalog Tasks | New | Request item = RITM10007 | 1 to 5 of 5

Number	Assignment group	Assigned to	Short description	Due date	Work start	Work end	State
TASK10007	Procurement		Order Blackberry Hardware or Move from I...	2009-08-06 11:48:10	2009-08-05 11:48:12		Closed Complete
TASK10008	Field Services		Pick up Blackberry and deliver to IT Labs	2009-08-07 11:48:10			Closed Complete
TASK10009			Example Approval Tasks	2009-08-07 11:48:10			Open
TASK10010	Hardware		Configure Blackberry	2009-08-09 11:48:10			Pending
TASK10011	Field Services		Deliver Blackberry to Customer	2009-08-10 11:48:10			Pending

Actions on selected rows... | 1 to 5 of 5

Reject the request to roll back the execution plan to a previous task, and reset any intermediate tasks to pending:

Rollback 3



Catalog Tasks | New | Request item = RITM10007 | 1 to 5 of 5

Number	Assignment group	Assigned to	Short description	Due date	Work start	Work end	State
TASK10007	Procurement		Order Blackberry Hardware or Move from I...	2009-08-06 11:48:10	2009-08-05 11:48:12		Open
TASK10008	Field Services		Pick up Blackberry and deliver to IT Labs	2009-08-07 11:48:10			Pending
TASK10009			Example Approval Tasks	2009-08-07 11:48:10			Pending
TASK10010	Hardware		Configure Blackberry	2009-08-09 11:48:10			Pending
TASK10011	Field Services		Deliver Blackberry to Customer	2009-08-10 11:48:10			Pending

After a plan has been rolled back, ServiceNow adds to the rolled-back task a note indicating that it was rolled back and why.

Note:
Rolling back reverts all intermediate tasks within the execution plan. Other plans within the same request are not rolled back, however.

Set up a fulfillment group

Fulfillment groups perform the tasks related to fulfilling an order.

Before you begin
Role required: admin

About this task
This group setting can include approving an order based on characteristics such as content and price, or any direct action required to complete the order. For example, loading software or installing hardware. Any existing user group (in **User Administration** > **Groups**) can be assigned fulfillment tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To create a group specifically for order fulfillment:

Procedure

1. Navigate to **Service Catalog** > **Catalog Policy** > **Fulfillment Groups**.
2. Click **New**.
3. Fill in the Group form as described under creating groups.
   These groups have the type *catalog* and are assigned the catalog and itil roles, but are otherwise normal groups.

Delivery information for tasks

When managing execution plans, catalog administrators can specify the delivery information to provide an estimated date of delivery based on the execution plan.

Use the **Total delivery time** field to specify an estimated delivery time for each task in your execution plan. This estimate is calculated based on the combined total of times for the tasks in that execution plan.

By default, time estimates do not use a "working days" calendar system, but are based on simple elapsed time. For example, for a 5-day execution plan, if you submit the request on a Friday, the delivery date is Wednesday of the following week. This estimate means five elapsed days later, even if your organization does not work on weekends.

Setting the calendar to Monday through Friday (9-5) defines each day as being eight hours long, but the task delivery time day is 24 hours. If you create a task that takes one day (24 hours), the plan calculates the task as needing three work days (which are eight hours each) for the total delivery time. Similarly, if a task takes two days (48 hours), the plan calculates eight days of total delivery time. This total breaks down as six work days of eight hours each and, because six days are longer than the five-day work week, two weekend days. When assigning delivery times, keep this calculation process in mind.

Use the *On Calendar* field to specify a calendar system to apply to the execution plan, to help estimate more accurate delivery times.

If using this calendar system for estimated delivery time, ensure that estimates are expressed in working hours and days. For example, a task which is supposed to take one day on a 9-5 calendar is assumed to take 24 working hours. This process takes three working days.

Note:
This calendar system is used to help provide delivery estimates only, and is not linked to any SLAs you have set on execution tasks.

Skipped tasks

If a task is skipped, the request fulfillment process moves on to the next task.

If the last task in an execution plan is skipped, the process is finished and the appropriate request item is closed as complete. Skipped tasks have their state set to **Closed Skipped** and display as gray boxes on a requested items list.

Creating execution plan tasks

An execution plan contains one or more task templates. Each task template defines work that can be completed by a specific fulfillment group.

Execution plans are associated with catalog items. When the relevant catalog item is requested, these task templates are used to generate tasks. That is, tasks to be performed as part of the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

request fulfillment process for that requested item. Each generated task within that requested item is assigned a catalog task number.

Example

The execution plan for an executive desktop computer catalog item could define the following task templates in the execution plan:

- Obtain managerial approval
- Order hardware
- Install standard corporate applications
- Deliver computer to requester

When this catalog item is ordered, the following request, requested item, and tasks are then created:

Request REQ0002 -- 1 PC

Requested Item ITEM0004 -- 1 X executive desktop

- Catalog Task0001 -- Obtain managerial approval
- Catalog Task0002 -- Order hardware
- Catalog Task0003 -- Install standard corporate application
- Catalog Task0004 -- Deliver computer to requester

Define task templates

Each execution plan contains one or more task templates that define actions that must be taken to fulfill a request.

Before you begin

Role required: admin

About this task

After creating the execution plan, define these task templates.

When the relevant catalog item is ordered, request tasks are generated for that requested item, based on this information.

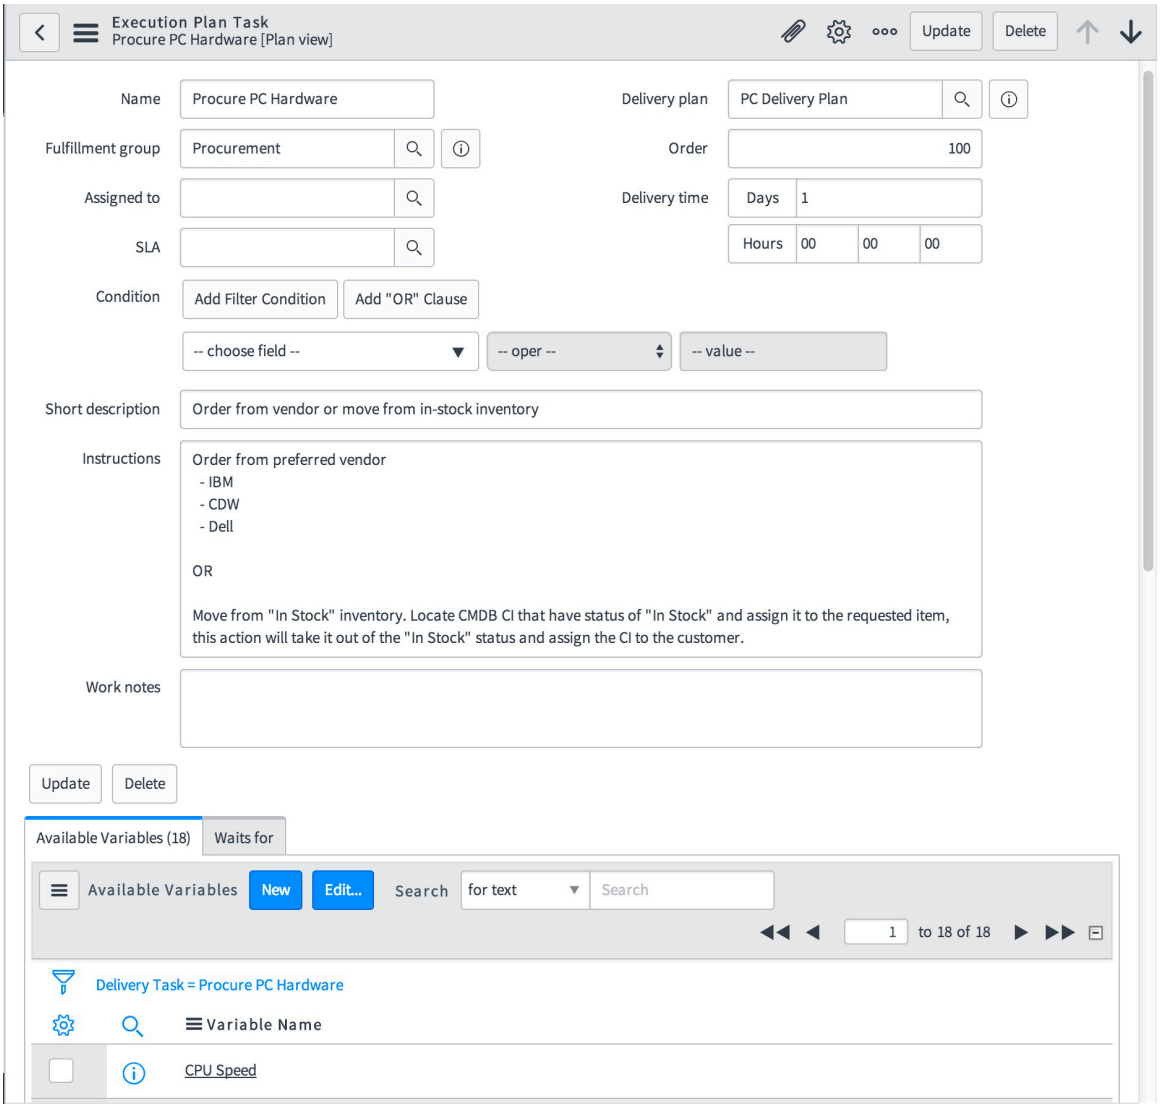
To define an execution plan task template:

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Policy** > **Execution Plans**.
2. Open an execution plan.
3. In the **Execution Plan Tasks** related list, click **New**.
4. Fill in the fields on the Execution Plan Task form (see table).
5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cat DP Task1



Defining Task Templates

Field	Description
Name	Name of the task. This name becomes the created task name.
Fulfillment group	The group that performs the task. Whenever a user requests a catalog item associated with this execution plan, the task is automatically assigned to the fulfillment group. Leave blank if automatic assignment to a group is not required.
Assigned to	The individual who performs the task. Leave blank if automatic assignment to a user is not required.
SLA	The service level agreement that applies to catalog items associated with this execution plan. **Note:** This field is normally left blank, as the functionality was superseded by the service level management functionality.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Delivery plan	The parent execution plan for this task.
Order	A number representing the task sequence in the execution plan. It is good practice to "leave gaps" between order numbers (for example, 100, 200, 300). That way you can insert new tasks without changing the order number of existing tasks. (If the order for several execution plan tasks is the same, each of these tasks starts at the same time.)
Delivery time	Amount of time the task is expected to take. This value becomes a component of the overall time to complete the execution plan.
Condition	Condition under which the task is performed (if the condition is not met, the task is skipped).
Short description	Brief description of the task activity. This information populates the created task short description field.
Instructions	Details of the activities to be performed for the task. This information populates the created task description field.
Work notes	A journal field for entering comments about the task template. Note: this information is separate from the created task work notes field.

Conditions to run execution plan tasks

Administrators and catalog administrators can define conditions under which a particular execution plan task runs, or is skipped, when the relevant item is requested.

For example, an execution plan can contain the following tasks:

1. Order hardware
2. Receive hardware
3. Configure hardware
4. Deliver hardware

If the hardware requested is already on-site, it does not need to be ordered. The first task in the list can be skipped.

Note:
Skipped task records are still created, but are marked as skipped, and are not processed within the execution plan.

Conditional Tasks

To make an execution plan task conditional, defining the conditions under which the task runs.

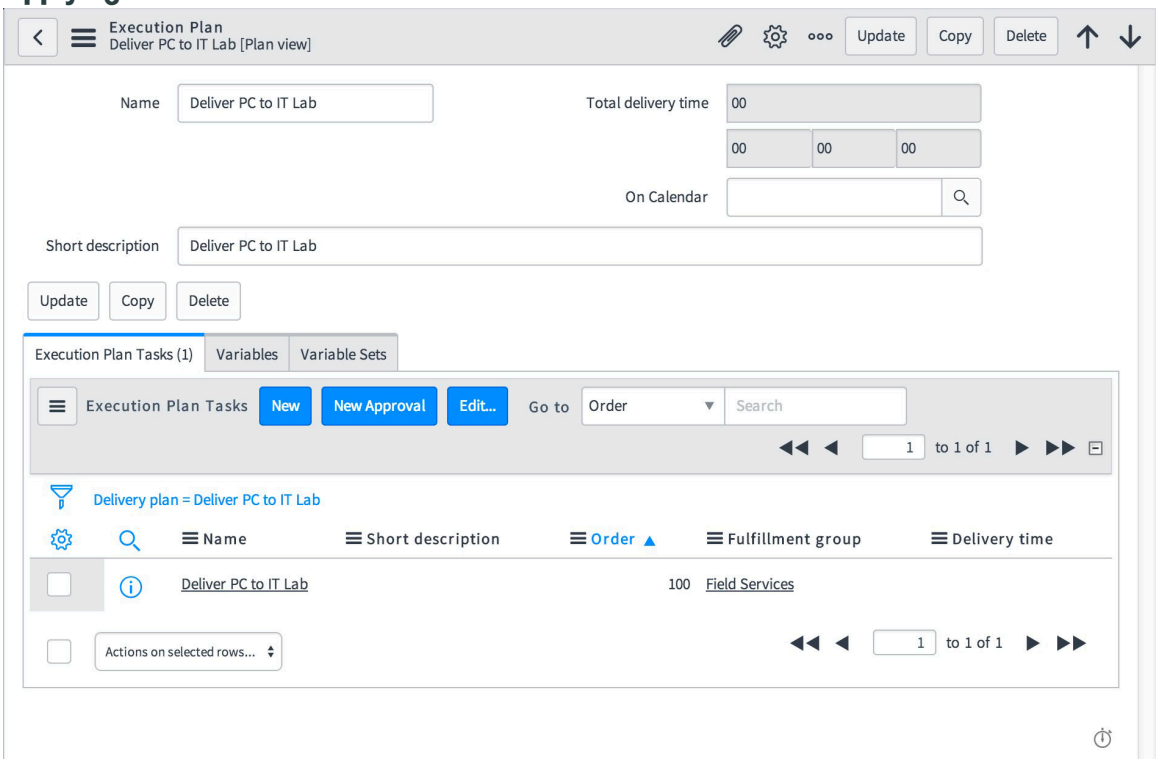
1. Navigate to **Service Catalog** > **Execution Plans**.
2. Open an execution plan, and then open a task within that plan.
3. Use the **condition** field to select the condition under which the task runs.

If no conditions are set, the task runs every time a user orders an item associated with this execution plan.

Here is an example of conditional task for an IT lab based in Atlanta:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applying Conditions to Execution Plan Tasks



In this example, the **Deliver to IT Labs** step does not run if the request itself is in Atlanta. There is no need to deliver something to the IT lab if it is already there.

Condition scripts to run tasks

Administrators can use a condition script in addition to or instead of any condition to determine whether a task runs.

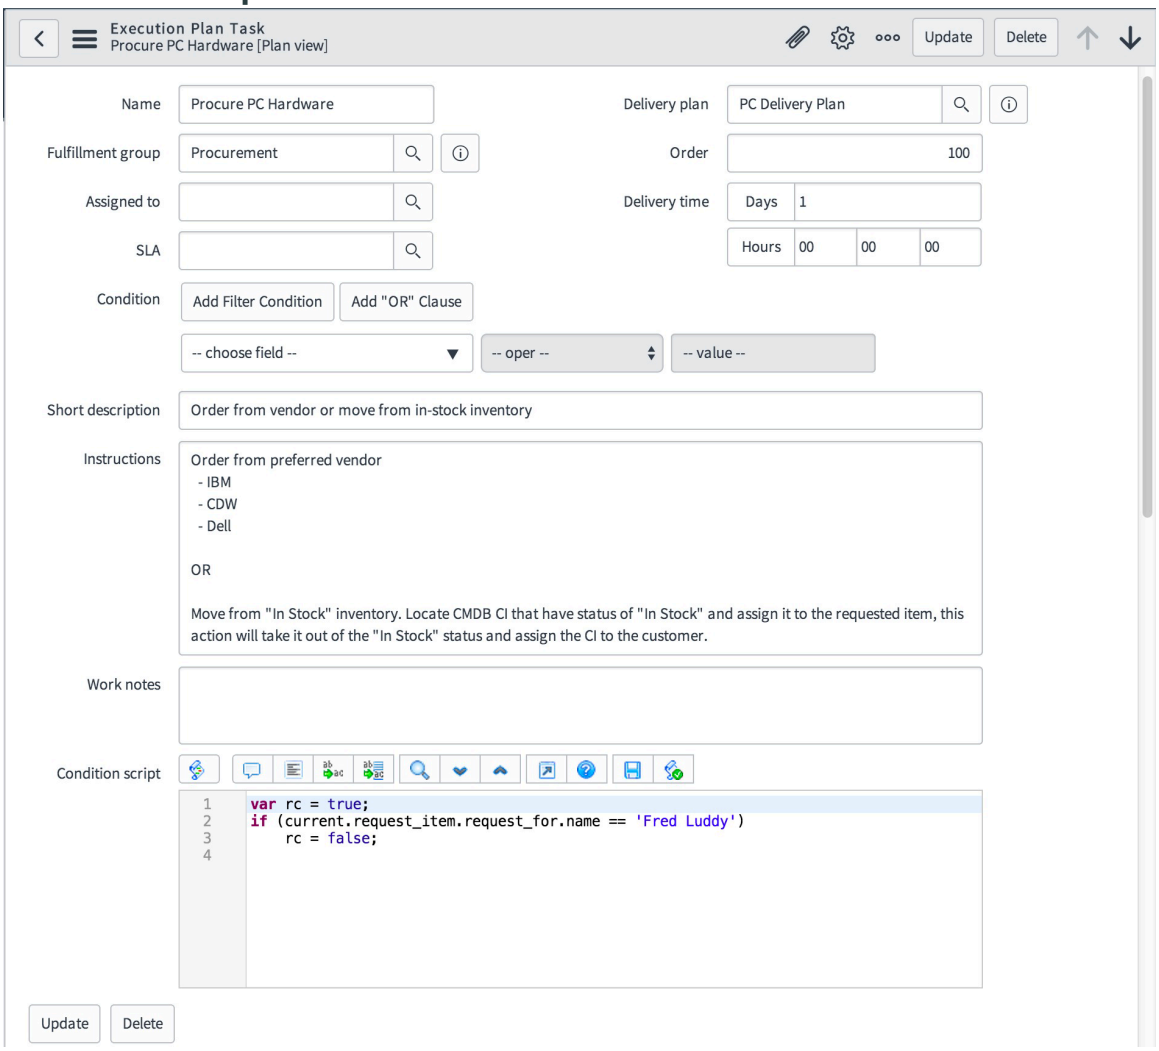
> **Note:**
> If you are using both a condition (via the condition field) and a condition script, both must be true before the task runs.

To use a script, you must configure the Execution Plan Task form to add the "Condition script" field. If the script returns true, the task runs. If the script returns false, the task does not run.

Ensure that you add the variable used in the script to the execution plan task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use Condition Scripts



Service catalog execution plans

Service catalog enables you to associate execution plans with catalog items.

Once you have created the execution plan record, you can associate it with catalog items, create task templates, and associate any catalog item variables to tasks, if required.

You can also:

- Apply conditions to tasks
- Create approval tasks, enabling you to step back to a previous step if the approver rejects the request.

Associate execution plan with items

After you submit the execution plan record, you select a catalog item to use the execution plan.

Before you begin

Role required: admin

About this task

This association can be done later, but doing it at this stage enables you to access relevant catalog item variables in the execution plan.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**.
2. Select a catalog item.
3. In the *Execution Plan* field, select the new execution plan.
4. Click **Update**.

Service Catalog checkout models

The service catalog defaults to one-step checkout model, but also allows two-step checkout. Administrators and users with the catalog_admin role can enable and configure the two-step checkout model and control how the delivery address is populated.

The service catalog defaults to a one-step checkout model. When a user clicks **Proceed to checkout** or **Order now**, items in the shopping cart are ordered and the order summary or status screen appears. The one-step checkout model runs in the following order:

Press Checkout > **Order Summary**

The service catalog also supports a two-step checkout model. Under this model, when a user clicks **Proceed to checkout** or **Order now**, an order confirmation screen appears. You can edit the order, choose a delivery location, or upload an attachment before submitting the order. The two-step checkout model runs in the following order:

Press Checkout Order > **Confirmation Screen** > **Submit Order** > **Order Summary**.

Access check for a catalog item is performed during its checkout. This check is also applicable in scripts and APIs.

Enable the two-step checkout process

You can enable the two-step checkout to specify a recipient, delivery address, and special instructions for an order.

Before you begin

Role required: admin

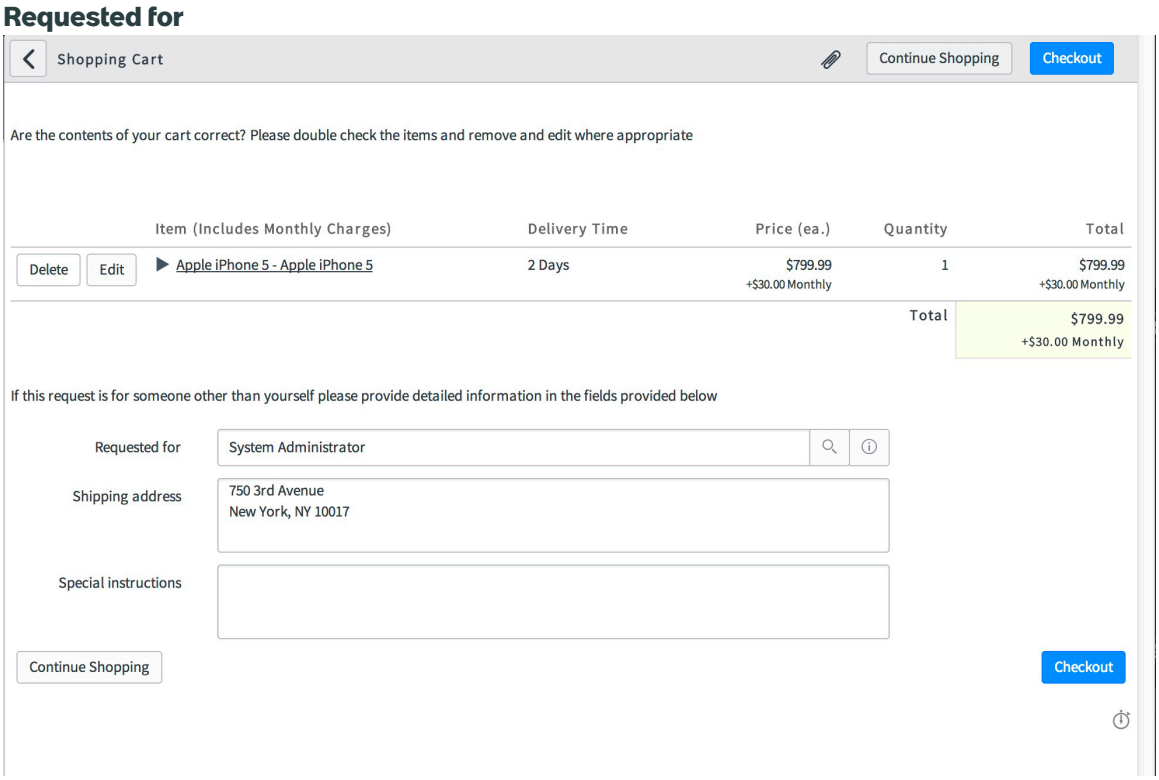
Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties**.
2. Locate the property *Use the two step catalog checkout model (default false)*.
3. Select the **Yes** check box to enable the two-step process.
4. Locate the property *Show the 'Back to Catalog' button on the two step checkout screen*.
5. Select the **Yes** check box to provide a button that navigates back to the catalog from the order confirmation screen (default).
   Clear the check box to hide the button.

Specify requester location

Administrators can control how the delivery address is populated. By default the delivery address is defined by the client script called set location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When the two-step checkout process is enabled, the `set location` script retrieves the address of the user and enters formatted details in the *Deliver to* field.

Create a catalog request from another flow

You can create a catalog request to join the Service Catalog flow from a different flow. For example, from an incident flow, you can create a request, and associate the request with the incident. It helps you in tracking the requests associated with an incident and vice versa.

Before you begin

Role required: itil

- To associate a request with any parent table record, the corresponding mapping configuration should be available in the **Catalog Administration** > **Request Parent Mapping** submodule.
- To associate a record producer request with the parent table record, retrieve the *`sysparm_parent_sys_id`* and *`sysparm_parent_table`* parameters from the URL using the RP.getParameterValue() method in the **Script** field of the record producer.

Note:
If you set the **Use the sc_layout driven cart macros (default true)** (*`glide.sc.use_cart_layouts`*) property to **false** and create a request from a parent table record, the request is not associated with the parent table record.

Procedure

1. Navigate to the required table and select a parent record.
2. Click the additional actions menu icon and select **Create Request**.
   The Catalogs home page is displayed with all active catalogs that you can access.

Note:
If there is only one active catalog, then that catalog page is displayed with available categories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the required catalog and navigate through its categories and items.
4. Check out the required catalog item, order guide, or record producer.
   For information on checkout models, see .
   For a catalog item or order guide, a request is created and displayed under the **Requests** tab of the parent table record. For a record producer, the corresponding task is created and displayed under the **Problems** tab of the parent table record, for example, an incident.

   Note:

   - The associated incident is specified in the annotation message throughout the request process.
   - Both for the one-step and two-step checkout, the caller of the incident is automatically set as the **Requested For** user for the request. If the two-step checkout is enabled, the fulfiller can change the **Requested For**.

     Note:
     For delegated request experience, the caller of the incident is populated in the Requested For variable. For information on delegated request experience, see Delegated request experience.

   - You cannot add items to the wish list, or save a record producer in this flow.

Configure a parent mapping for a request

You can configure a mapping that specifies the association between the parent record and the request record.

Before you begin

Role required: admin or catalog_admin

Procedure

1. Navigate to **All** > **Catalog Administration** > **Request Parent Mapping**.

   Note:
   The Incident request configuration that creates a mapping between the incident table and the request table is available by default.

2. Click **New** and specify the field information.

Request Parent mapping fields

Field	Description
Name	Name of the mapping configuration for a request.
Parent table	Table from which the request is created.
Request Parent	Request table field that specifies the association with the parent table.
Parent requestor	User reference field on the parent table that is specified as the requestor of the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: For delegated request experience, the user from the parent table record is populated in the Requested For variable. For information on delegated request experience, see Delegated request experience.

3. Click **Submit**.

State closure in the request fulfillment execution plan

The state closure in the request fulfillment process of a catalog item depends on the status of the associated catalog tasks, request items, and the request. It is applicable only for execution flows.

State closure dependency between a catalog task and RITM

- If all catalog tasks are closed as **Closed Complete**, the RITM is closed as **Closed Complete**.
- If there is at least one catalog task closed as **Closed Incomplete**, the RITM is closed as **Closed Incomplete**.
- If all catalog tasks are closed as **Closed Skipped**, the RITM is closed as **Closed Skipped**.

State closure dependency between a RITM and request

- If all RITMs are closed as **Closed Complete**, the request is closed as **Closed Complete**.
- If there is at least one RITM closed as **Closed Incomplete**, the request is closed as **Closed Incomplete**.
- If all RITMs are closed as **Closed Skipped**, the request is closed as **Closed Skipped**.

View request notifications

View request notifications that are sent during specific events in a catalog request life cycle. These notifications are sent to various recipients including the Employee Center and ITIL users.

Before you begin

Role required: admin

About this task

Use the email notification layout and template that is shipped with the Employee Experience Foundation (com.snc.sn_ex_emp_fd) plugin to deliver notifications that are consistent and built with industries best practices layout. Applying the layout to email notifications elevates the look and feel, and also helps to deliver branded notifications. For more information, see Use email notification layout.

Procedure

1. Navigate to **All > System Notification > Email > Notifications**.
2. View the notifications related to request by filtering the **Table** field by **sc_request**and **sc_req_item**.
3. Click the notification name to view the details.

Note:
To receive these notifications, the end user must enable notifications. For more information, see Subscription-based notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog security

Service Catalog enables you to set the security for catalog with user criteria.

Set security for items and categories

An administrator can control access to content in the service catalog by creating and applying user criteria records.

Catalog managers and catalog editors can apply existing user criteria for items and categories to which they are assigned. Catalog managers and catalog editors cannot create or edit user criteria directly.

You can create user criteria records that define conditions for user information and then apply these criteria records to catalog items and categories. In this way you can control access to these items and categories.

For example, create a **USA Sales** user criteria record matching users who are both in the sales team and based in the USA. Then apply this record to the **USA IT Hardware** catalog category, so only users matching the record can access that category.

The feature is active by default in new Fuji instances and upgraded instances that do not use entitlement-based access controls. If you upgrade an instance that uses entitlements, you can migrate to user criteria to take advantage of the improved control, flexibility, and reuse.

Access controls allow you to:

- Manage access to multiple items and categories in one user criteria record. For example, create a single **UK Employees** user criteria record and apply it to multiple items and categories that are available to employees in the UK.
- Allow access if one condition matches, or if all conditions match. For example, define that only users who are both in a specific location and who belong to a specific department can have access.
- Use **Available For** and **Not Available For** lists to allow or prohibit access to users matching the conditions in a criteria record. For example, specify that a US-based catalog category is available for the users located in the USA but is not available for users belonging to the Sales department (whether in the US or not).
- Extend matching to create conditions matching additional fields in the User [sys_user] table, without having to use a script. For example, you can add a condition to match items against the **Cost center** field in user records.

Important:
After making user criteria additions or changes, you may need to log out and log back in to clear the prior configuration.

Related topics

Debug user criteria of a catalog item

Create a user criteria record in Service Catalog

Create a user criteria record to define conditions that are evaluated against user records.

Before you begin

Role required: admin, catalog_admin

About this task

You can apply several user criteria records to a single catalog item or category. In this situation, users match only one of these criteria records to have access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **User Criteria** and create a record.
2. Fill in the fields on the form, as appropriate.

User criteria fields

Field	Description
Name	The name of the criteria record.
Users	The individual user records to match.
Groups	The group records to match.
Roles	The roles to match. **Note:** ○ The evaluation of a role is cached in the session, so any change in the role requires you to logout and login, similar to roles in ACL (Access Control List). ○ User Criteria is not applicable for elevated privilege roles.
Advanced	A check box to display or hide the **Script** field.
Script	A script to define any additional criteria, and return **true** or **false**. This field is available only if **Advanced** is selected. **Note:** ○ The script is evaluated in the scope that the user criteria is created in. ○ The evaluation of the script is cached in the session, so any change in the evaluation requires you to logout and login, similar to roles in ACL. ○ Do not use `gs.getUser()` or other session APIs since they cause conflict when used in diagnostic tools. Use the pre-defined `user_id` variable available in the script to get the user id of the user being used to evaluate the script. ○ Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance. ○ Because answer is a pre-reserved keyword, do not use a function with its name as answer, that is, answer().
Active	A check box to activate or deactivate this criteria record.
Companies	The companies to match.
Locations	The locations to match.
Departments	The departments to match.
Match All	A check box to determine whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access. By default, this check box is cleared so that any condition met provides a match.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example, consider a user criteria record for the following: ○ Locations A or B ○ Company C or D With **Match All** selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C. With **Match All** cleared, users meeting any of these conditions are matched. For example, a user with a location B. **Note:** If you select **Match All**, ensure that you do not create contradictory conditions which can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.

Implementing user criteria

When creating user criteria for your system, consider the following recommendations.

- Design Criteria for Reuse:

  Ensure that you design user criteria for maximum reuse. Create user criteria records with common sets of conditions matching your organization requirements. Allow them to be shared across as many items and categories as possible, rather than creating multiple similar criteria records for individual items and categories.

- Naming conventions: Give each user criteria record a meaningful name, to help you determine the function for that record. For example,
  - Users in company Cloud Dimensions AND in Madrid
  - Users in company Cloud Dimensions OR in Madrid
  - Users belonging to the Group Development, IT, or Sales
  - Users with role itil, asset_manager, or catalog_admin
- Test user criteria on a development or test instance, and then transfer the records from the user criteria tables and catalog records to your production instance using update sets.

Apply user criteria to items and categories

Apply a user criteria record to items and categories, either from the item or category form or from the user criteria form.

Before you begin

Role required: admin

About this task

The user criteria restriction applies only within Service Catalog for the specific item that it's applied for. However, the user criteria restriction isn't applied outside the Service Catalog where the user has access to the item via the table.

To apply criteria directly to an item or category, use the Available For or Not Available For related lists in the Item or Category form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Changes to the user's profile, such as location or department, apply immediately for standard user criteria. The catalog item visibility is updated without needing a new session. However, for the scripted user criteria, a session relaunch is needed for the changes to take effect.
- The user criteria restrictions of a category don't automatically apply to the catalog items within the category. If necessary, you should apply the user criteria restrictions to the individual catalog items.

To apply criteria directly from the User Criteria form, add items to the Available For Catalog Items and Not Available For Catalog Items related lists, and add categories to the Available For Categories and Not Available For Categories related lists. You can configure the User Criteria form to add these lists.

Note:

The **Not Available For** settings override **Available For** settings. A user on the **Not Available For** list for an item can't access that item, even if that user is also on the **Available For** list for that item.

Apply user criteria to items

Apply user criteria to an item to define which users can and cannot access that item.

Before you begin

Role required: admin

About this task

You can apply user criteria to all types of catalog item, including order guides, content items, and record producers.

Note:

The user criteria restriction applies only within Service Catalog for the specific item it is applied for. However, the user criteria restriction is not applied outside the Service Catalog where the user has access to the item via the table.

Procedure

1. In an item record, navigate to the Available For or Not Available For related lists.
2. Click **Edit** to add an existing user criteria record, or click **New** to create a new one.
3. Save the record to associate the user criteria record with the item.

Note:

The **Not Available For** settings override **Available For** settings. A user on the **Not Available For** list for an item cannot access that item, even if that user is also on the **Available For** list for that item.

Apply user criteria to categories

Apply user criteria to a category to define which users can and cannot access a category.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In a category record, navigate to the Available For or Not Available For related lists.
2. Click **Edit** to add an existing user criteria record, or click **New** to create a new one.
3. Save the record to associate the user criteria record with the category.

Note:

- The **Not Available For** settings override **Available For** settings. A user on the **Not Available For** list for a category cannot access that category, even if that user is also on the **Available For** list for that category.
- The user criteria restrictions of a category do not automatically apply to the catalog items within the category. If required, you should apply the user criteria restrictions to the individual catalog items.

Extend user criteria

Extend the user criteria table when the available user criteria fields are not sufficient. User criteria references various user fields (fields from the User [sys_user] table), such as department, company, and groups. You can extend user criteria with a custom field to include any other user reference field (field from the User [sys_user] table) of interest.

Before you begin

Role required: admin

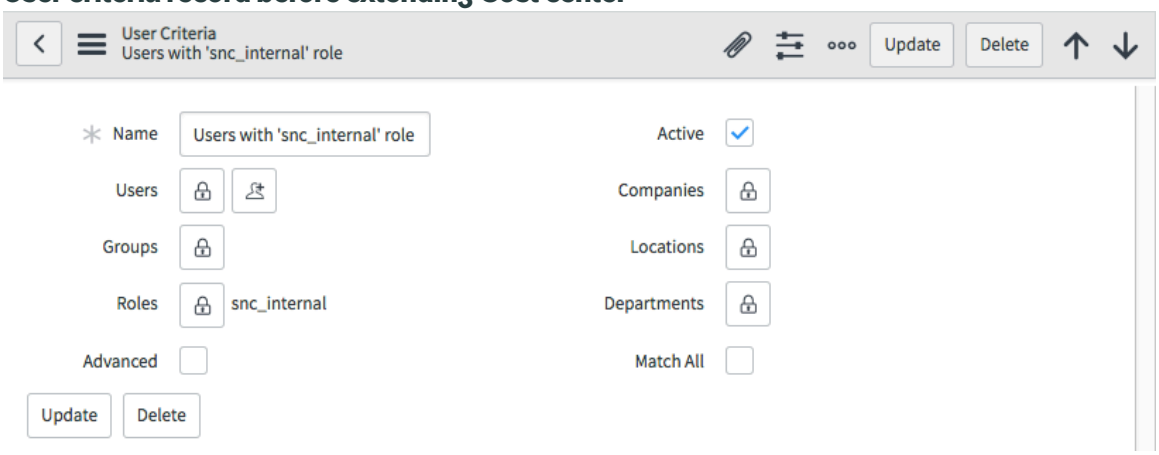
About this task

For example, you can extend user criteria to include the user's cost center, and then restrict certain catalog items only to members of that cost center.
Meet the following rules to extend the user criteria table.

- The field to add must be a reference field in the user record.
- The field added to the user criteria table must be **List** type.
- The fields must have matching names. For example, **cost_center** [sys_user] and **u_cost_center** ("u" prefix is added to custom fields in a table) are considered to be matching.

This example demonstrates how to extend the current user criteria record to include **Cost center** as an option.

User criteria record before extending Cost center



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

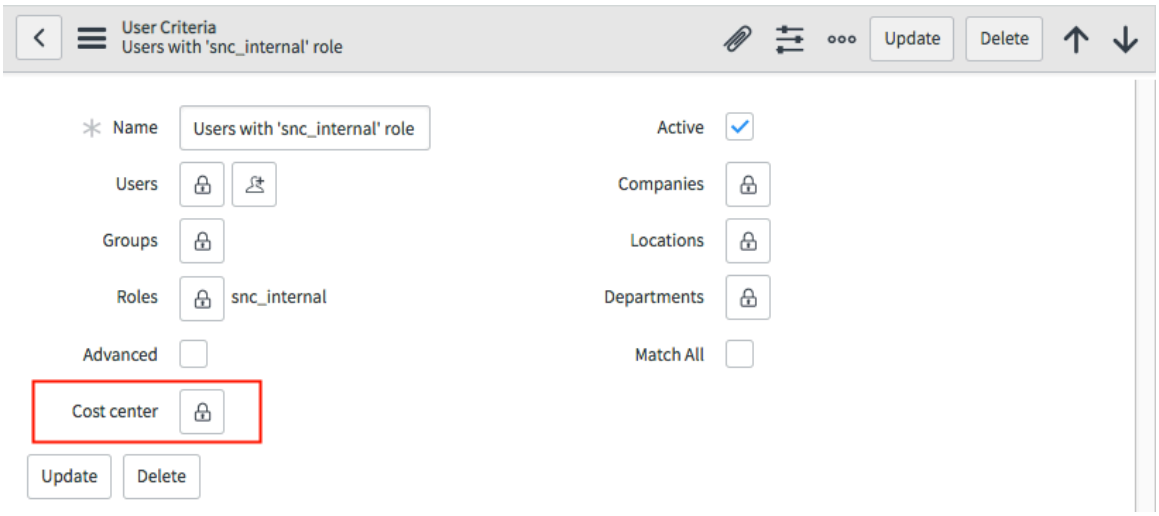
Procedure

1. Navigate to **All** > **System Definition** > **Tables**.
2. Open the **User Criteria** record.
3. In the **Table Columns** related list, click **New**.
4. Set the type to **List**, and then enter `Cost center` as the column label.
   The **Column name** field populates with **u_cost_center**.
5. In the Reference Specification form section, select **Cost Center** for the reference field.
6. Add any conditions or additional information to the dictionary entry as desired.
7. Click **Submit**.
8. Navigate to **Service Catalog > Catalog Definition > User Criteria**.
9. Select or create a user criteria record, and see that you can now use the new field.

What to do next

Test the user criteria record by navigating to **Service Catalog** > **Catalog Definition** > **User Criteria**, and opening any record. Verify that the extended field is available.

User criteria with cost center



You can extend the User [sys_user] table if there are fields in other tables that you want considered in user criteria. After extending the User table, follow the steps in this procedure to extend it to user criteria.

User criteria migration

Service catalog user criteria records provide access control for service catalog items and categories.

You can migrate your access controls to use user criteria. The user criteria feature is automatically enabled for new instances. If you upgrade your instance, a script runs to determine current access control usage.

- If your instance does not use entitlement-based access controls, the user criteria feature is automatically enabled.
- If your instance does use entitlements, the user criteria feature is not enabled. If you want to use user criteria, use the procedure described on this page to migrate your access controls from entitlements to user criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrate to user criteria to provide more reuse, control, and flexibility compared to entitlements.

For example, you can use a single criteria record to make multiple catalog items available to only users who meet all these requirements:

- Are located in EMEA or APAC
- Belong to ACER
- Are in the Training department

Migrate to Service Catalog user criteria

Service Catalog enables you to maintain the required access controls to your service catalog while migrating from entitlements to user criteria.

Before you begin

Role required: admin

About this task

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties** and verify that the user criteria feature is not already enabled on your system.
   - If the property **Use "User Criteria" to define access to catalog items and categories** (*glide.sc.use_user_criteria*) is set to **true**, you can skip the following steps. The user criteria feature is automatically enabled because entitlements were not used in your old system.
   - If this property is set to **false**, continue with the following steps. The user criteria feature has not been enabled yet on your system.
2. To preview the user criteria feature, set the service catalog property **Enable both "User Criteria" and "Entitlement" related lists for catalog items and categories when migrating from entitlements** (*glide.sc.user_criteria_migration*) to **true**.
   This option lets you compare user criteria records and entitlements before you fully switch to user criteria.
3. Inspect your service catalog items and categories to identify access control sets that you can configure user criteria records for.
   Review your current entitlements and record your current design for access controls. Focus on identifying patterns where multiple items have the same combination of location, group, and so on. Each combination is a possible access control set.
4. Create a user criteria record for each access control set that you identified from your inspection of the service catalog.
   You have a step with a list, note, and image.
5. Apply these user criteria records to the items and categories identified, replacing the equivalent entitlements.
6. Enable user criteria on your system by setting the service catalog property **Use "User Criteria" to define access to catalog items and categories** (*glide.sc.use_user_criteria*) to **true**.
   When this property is set to **true**, any remaining entitlements are no longer used.

> **Note:**
> Scripts in user criteria cannot reference the category or catalog item as **current** as entitlement scripts do. For scripts in user criteria, use the **user_id** available for the user currently being evaluated against the category or catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

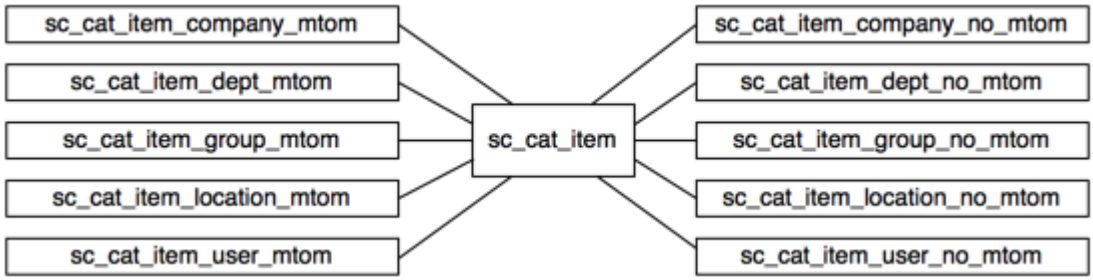
Data structure differences

There are significant data structure differences between entitlements and user criteria, which you must be aware of while migrating.

Using entitlements, the following tables are loaded into memory and evaluated before rendering.

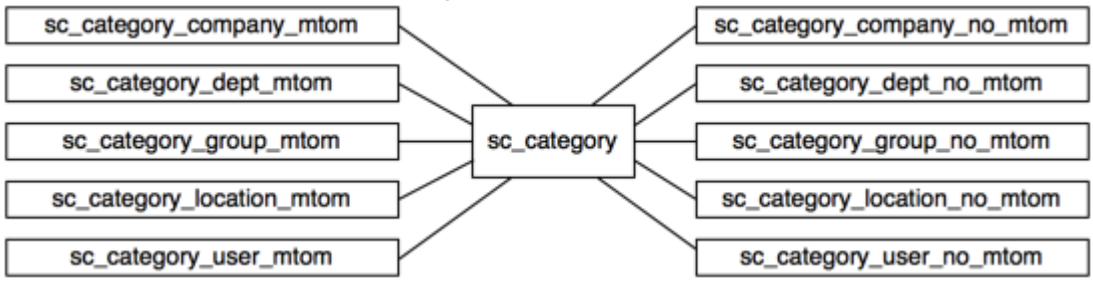
For catalog items:

Entitlements Data Structure - Catalog Items



For categories:

Entitlements Data Structure - Categories



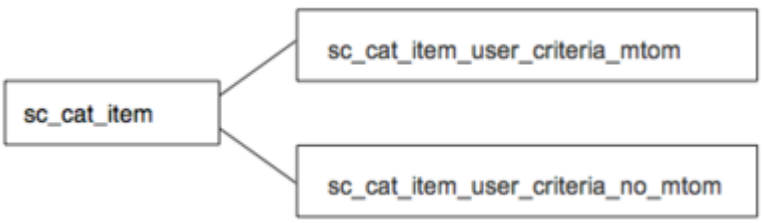
The user criteria architecture collects all user attributes in the User Criteria [user_criteria] table.

User criteria records can link to items and categories, as follows.

For catalog items:

- Catalog Item Available for [sc_cat_item_user_criteria_mtom]
- Catalog Item Not Available for [sc_cat_item_user_criteria_no_mtom]

User Criteria Data Structure - Catalog Items

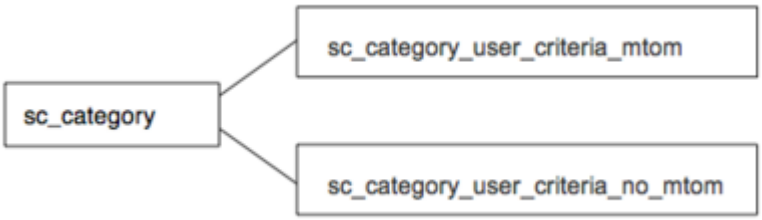


For categories:

- Category Available for [sc_category_user_criteria_mtom]
- Category Not Available for [sc_category_user_criteria_no_mtom]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User Criteria Data Structure - Categories



Legacy service catalog access controls

Service catalog supports several ways to control access to a catalog item or category. These controls are also known as catalog entitlements.

Instead of access controls, use user criteria that is the supported security model for catalog item and category. For information about user criteria, see Apply user criteria to items and categories.

A service catalog item with no specific access controls is available to all users. If access controls are specified, only users who meet all conditions have access.

The following entitlements are available:

- Role
- Custom script
- Company, Department, Group, User, or Location

Access controls are checked in the following order: roles, then scripts, then Company, Department, Group, User, or Location.

Note:
The functionality described here is superseded by access controls using user criteria. Migrate to user criteria for a more flexible and reusable way to define access controls.

Service Catalog administration

Service Catalog enables an administrator to configure the service catalog.

Before you begin
Role required: admin

About this task

Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items** or **Service Catalog** > **Maintain Categories**.
2. Open an item or category, and then configure the related lists in the form to add **Available for Department and Available for Company**.
3. Click **Update** to save the form layout.
4. Open the item or category you wish to secure and add companies and departments to related lists.

   The item or category is available only for the companies and departments listed. If no companies or departments are listed, then the item or category is available to all companies or departments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Restrict access

Service Catalog enables an administrator to grant or deny access to a service catalog item or category by company, department, group, user, or location.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items** or **Service Catalog** > **Maintain Categories**.
2. Open the relevant catalog item or category.
3. Configure the form to add the appropriate **Available** or **Not available** lists.

4. Add the companies, departments, groups, users, or locations to the appropriate list.
5. Click **Update**.

Restrict access by role

By default, individual catalog items and categories do not have access restrictions.

Before you begin

Role required: admin

About this task

Administrators can grant or deny access to a service catalog item or category based on role.

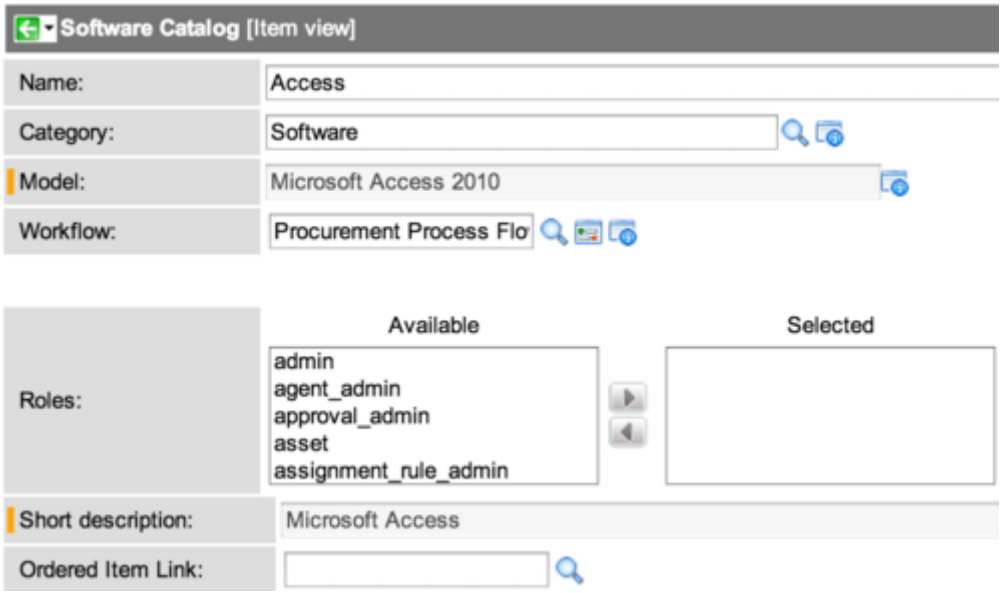
Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items** or **Service Catalog** > **Maintain Categories**.
2. Open the relevant catalog item or category.
3. Add the required roles to the **Roles** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can, if needed, Configure the form or change to **Default View** to see the **Roles** field.

Roles Granted



Restrict access by a script

Service Catalog enables you to control access to a service catalog item or category with a custom script.

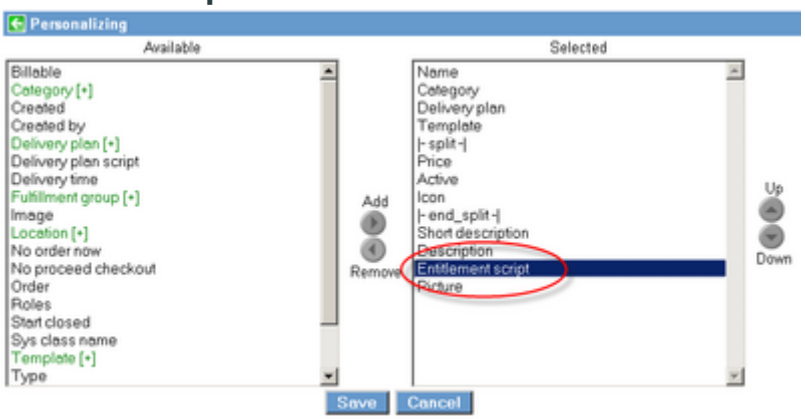
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items** or **Service Catalog** > **Maintain Categories**.
2. Open the relevant catalog item or category.
3. Configure the form to add the **Entitlement Script** field.

Entitlement Script



4. In the **Entitlement Script** field, enter the access control script.

   Sample Scripts:

   The following example script grants access to a catalog item named French Blackberry to users with a language of Fr (French):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
gs.log ( 'Running Entitlement script for French Blackberry' ) ;

 if (gs. getUser ( ). getLanguage ( ) == 'fr' )
    answer = true ; else
    answer = false ;

answer ;
```

The following example script could be used to distinguish between two categories of users (one with full access and one with restricted access) on the catalog of services:

```
var userid  = gs. getUserID ( ) ; var now_GR  = new GlideRecord
 ( 'sys_user' ) ;
now_GR. get ( 'sys_id' , userid ) ;

 if (now_GR. source )
    answer = true ; else
    answer = false ;

answer ;
```

Overriding Entitlement Scripts by Role

a. Navigate to **Service Catalog** > **Properties**.

b. Enter the roles for which to override the entitlement script (grant access) in the property List of roles (comma-separated) that can override normal entitlement checking inside the catalog. An itil role of "itil" means that the itil role can order any catalog item, even one protected by entitlement restrictions.

Service Catalog and CSDM

The Service Catalog lets you create other catalogs (such as the Request Catalog and the Product Catalog) that provide self-service opportunities in the channel you want to use, such as the self-service portal, the mobile app, or the Virtual Agent.

The goal of this product view is to help you to understand how Service Catalog key entities work with the core CSDM framework.

Related topics

Applying CSDM guidelines to your product — product views

Service Catalog and CSDM tables

Service Catalog manages and uses CSDM tables. Several ServiceNow products benefit from and add value to Service Catalog.

CSDM tables managed by the Service Catalog

The Service Catalog primarily manages business services in the Sell/Consume domain. Technical Services are also viewed from the Operate domain of Event Management.

The Service Catalog manages the Catalog Item table [sc_cat_item]. The Catalog Item table creates requests in Request Management. The requests usually have an automated, semi-automated, or business workflow for fulfilling the request, which can consist of approvals and tasks. When part of Service Portfolio Management, the CIs are associated with service offerings. When you link a catalog item, you can track request activity for all catalog items associated with a service offering. An offering can have multiple catalog items.

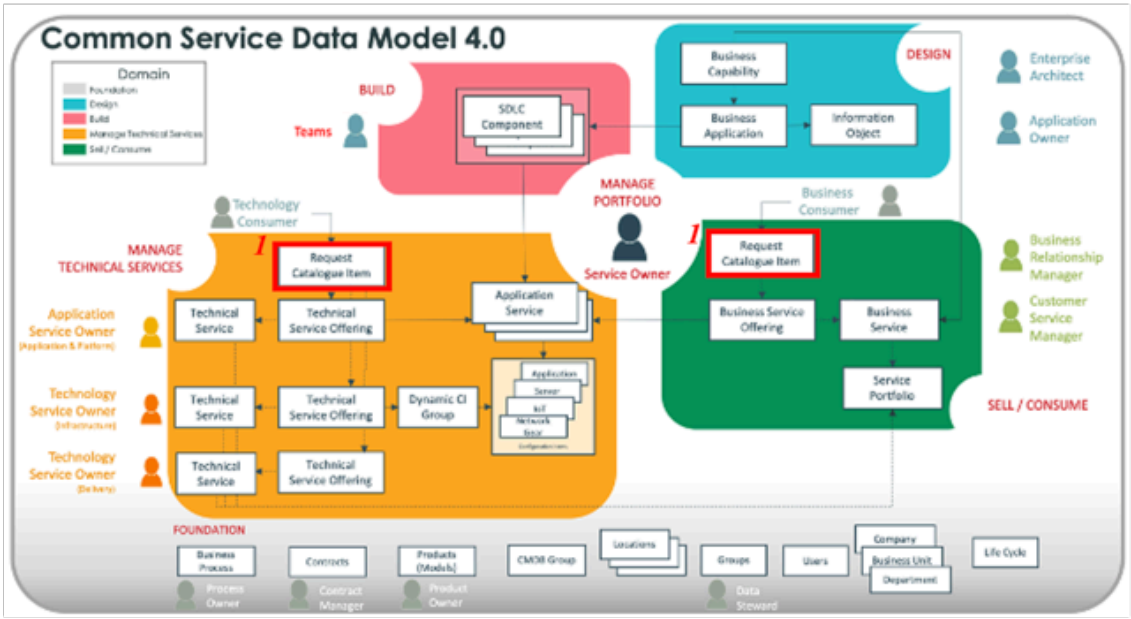
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The CIs can include:

- PC Hardware Item (pc_hardware_cat_item): Submits hardware asset requests included in Asset Management workflows.
- PC Software Item (pc_software_cat_item): Submits software asset requests included in Asset Management workflows.
- Record Producer (sc_cat_item_producer): Submits requests or generates records other than Request Management tables for services that aren't serviced by Request Management (for example, HR Cases, Facilities Requests, or Legal Requests).

CSDM tables managed by the Service Catalog



CSDM tables used by the Service Catalog

1. Configuration Item tables [cmdb_ci*]
2. Service Offering table [sc_cat_item_subscribe]
3. Application Service table [cmdb_ci_service_discovered]
4. Product Model tables [cmdb_model]

Note:
The following legacy CMDB relationships that once provided access to catalog items are no longer supported. To provide access, use the new relationships listed in the table.

Relationship tables

CMDB table	Catalog item relationship table	New relationship to use instead
User (sys_user)	sc_cat_item_user_mtom, sc_cat_item_user_no_mtom	User criteria
Group (sys_user_group)	sc_cat_item_group_mtom, sc_cat_item_group_no_mtom	User criteria
Department (cmn_department)	sc_cat_item_dept_mtom, sc_cat_item_dept_no_mtom	User criteria

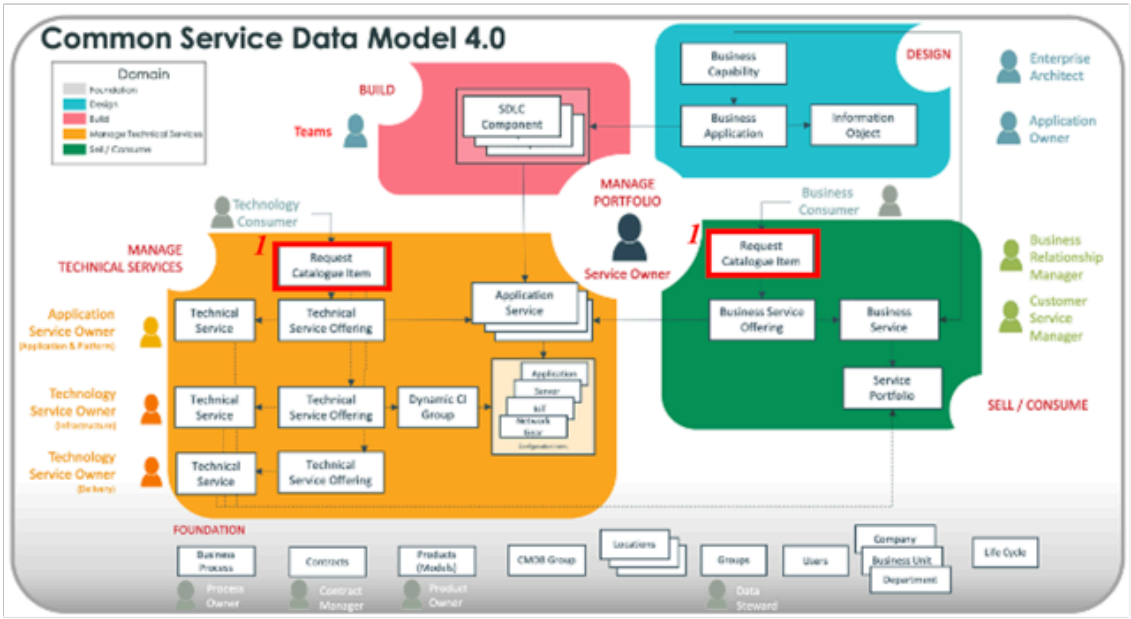
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB table	Catalog item relationship table	New relationship to use instead
Location (smn_location)	sc_cat_item_location_mtom, sc_cat_item_location_no_mtom	User criteria
Company (core_company)	sc_cat_item_company_mtom, sc_cat_item_company_no_mtom	User criteria

CSDM tables used by the Service Catalog



Products that benefit from the Service Catalog

Service Portfolio Management (Service Portfolio Management)

Ties catalog items to service offerings. Lets service owners create and maintain catalog items more easily, and gives more visibility into the service offerings.

Hardware Asset Management and Software Asset Management

Self-service catalog lets you order an asset and track service delivery.

Human Resources (HR)

Exposes the creator (Record Producer) of HR cases and displays the Record Producer in the relevant self-service catalogs (for example, Portal, Mobile, and Virtual Agent).

Customer Service Management (CSM)

Exposes the creator (Record Producer) of customer service cases and displays the Record Producer in the relevant self-service catalogs (for example, Self-service Portal, Mobile, and Virtual Agent).

Service Catalog use case

You can create customized catalogs where you can request items such as a specific service or product. With this use case, CSDM provides Service Catalog connection to the service offerings and services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog use case

Catalogs contain catalog items and are the starting points for accessing available services. Request Catalogs and Product Catalogs are two of the customized catalogs you can create from the Service Catalog. For details, see Service Catalog.

- A Request Catalog is a list of business and technical products, services, service commitment options, and offerings that you can order.
- A Product Catalog is a set of information about individual models. A model is a specific version or configuration of an asset. Asset managers use the Product Catalog as a centralized repository for model information.

Key features of the Service Catalog use case

Digital Portfolio Management (DPM) uses the CSDM framework to navigate the Service Portfolio. You can then use the Service Portfolio to locate the services and their related service offerings, catalog items, dependents, dependencies, metric roll-ups, costs and initiatives. The associated metrics are aggregated using the CSDM framework with the related tables.

Catalog items

A catalog item is an item or a service that you can request from the catalog. A service can contain multiple catalog items. Catalog items are listed on the catalog portal and are available to the users who need them (either through subscription or job responsibility). Each catalog item is linked to one service offering.

The Catalog Item form includes the following tabs.

- Item Details: Description of the catalog item.
- Process Engine: The defined process used to fulfill the catalog Item request.
- Picture: Picture used to represent the catalog item when it appears in the catalog.
- Pricing: Pricing details for the catalog item.
- Portal Settings: Provides specific settings on how you interact with the catalog item in the catalog portal.

Product Catalog use case

Use the Product Catalog to specify information about a product model. Product models are specific versions or configurations of an asset. Asset managers use the Product Catalog as a centralized repository for model information.

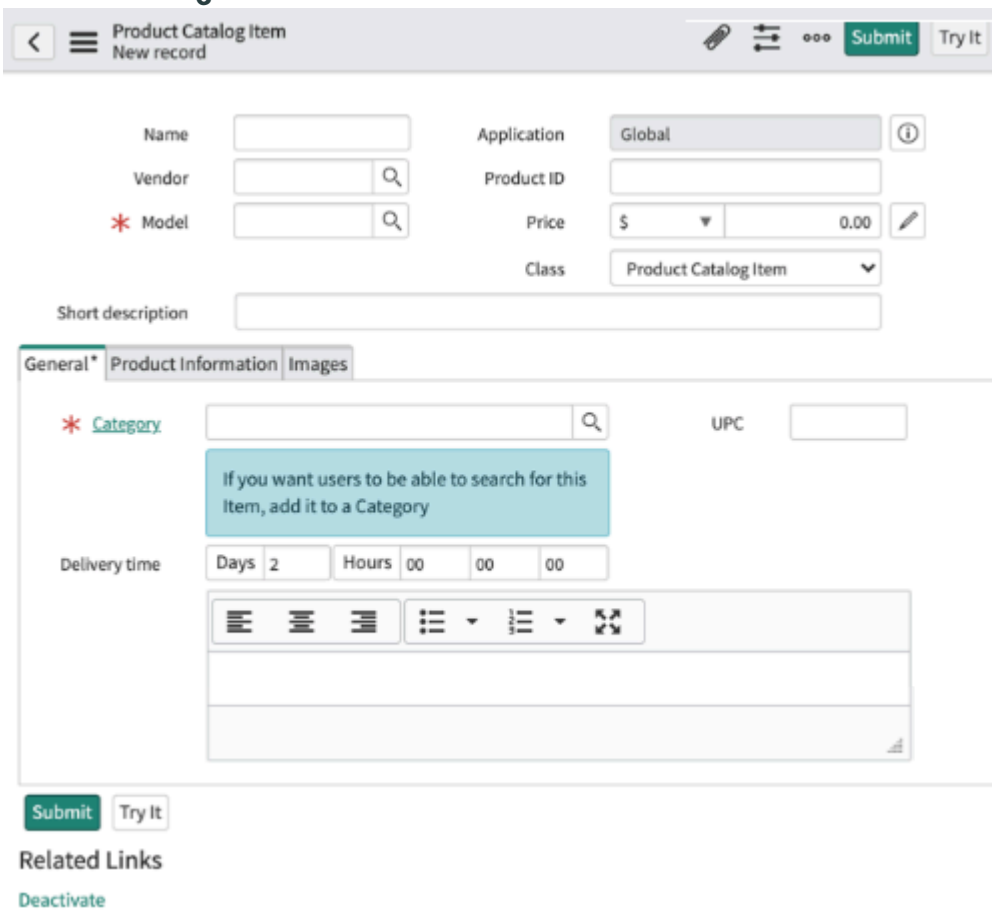
A detailed and well-maintained Product Catalog can coordinate with the Service Catalog, asset, procurement, request, contract, and vendor information. Models published to the Product Catalog are automatically published to the Service Catalog. The Service Catalog includes information about goods (models) and services. If the model is available from multiple vendors, a model can be listed more than once. Models are included with Asset Management.

Key features of the Product Catalog use case

This use case lets you include hardware and software product information as items in the Product Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Product Catalog items



Results of Product Catalog use case

The CSDM framework ensures that product models are available in the catalog and that there are processes defined to consume the models.

Service Catalog considerations

Consider these points while implementing the CSDM framework.

- The Product Catalog builds on the Service Catalog. Product catalogs specify the product models that are available for use. Product-specific attributes are captured in each catalog item. You can create product catalogs for each type of products in your portfolio.
- You can create catalog types that reflect the types of offered products and services.

Creating a Service Catalog Wizard

Service Catalog wizards help you to create wizard like, multi-step experiences.

Before you begin

Service Catalog wizards are especially useful when the input required is huge and complex since the wizard offers a step-by-step experience for the requester and also provides a side panel to provide contextual help. A visa application is a good example where Service Catalog wizards could be used as the data needs to be presented in steps such as Personal details, Education details, and so on.

Pre-requisites for creating Service Catalog wizards:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ensure that you have either a composite record producer, or a record producer set up. For more information, see Create a record producer.
- The **Save options** field must have the value **Save in destination** in the composite record producer or record producer to enable the wizard to create records.
- The **Allow edit** option should be selected on the composite record producer or record producer form so that records are editable in the wizard.

Role required: wizard_admin, or admin

About this task

The Service Catalog Wizard is available as a component in UI Builder (UIB). You can use it to create guided experiences backed by composite record producers or record producers. You can create multi-step wizard experiences using Service Catalog Wizard.

Service Catalog Wizards are used in these modes:

- **Normal** mode: To create records in the table configured in the record producer, or the composite record producer associated with the wizard.
- **Template** mode: To create a template where admins can predefine some data and provide guardrails to fine-tune and personalize the creation of records.

Procedure

1. Navigate to **Service Catalog Wizards** > **Maintain Wizards**, and click **New** to create a new wizard.
2. On the form, fill in the fields.

Service Catalog Wizard form

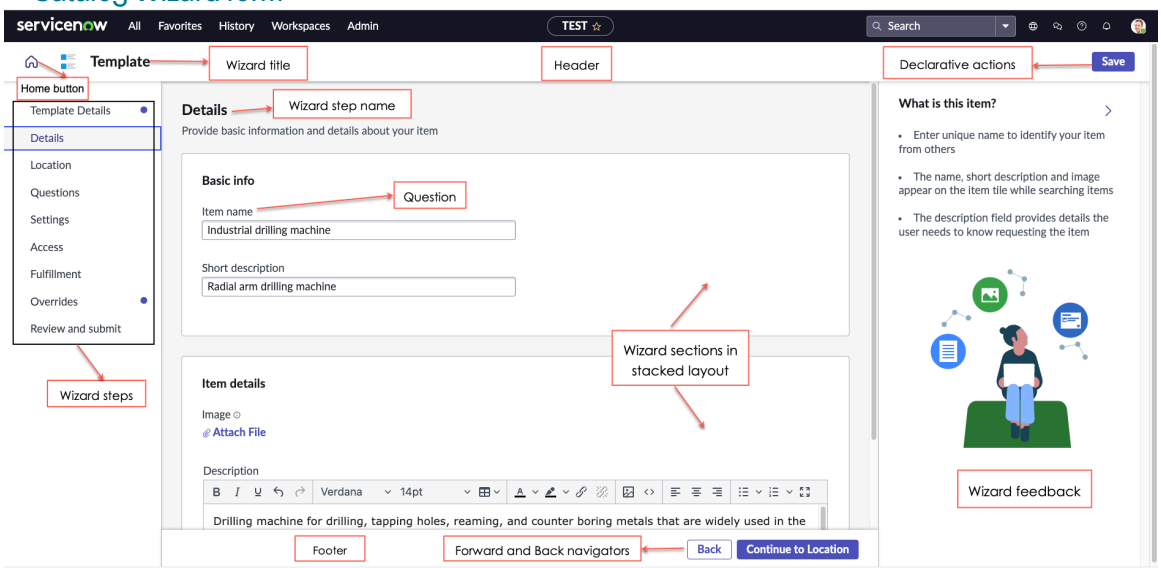
Field	Description
Name	Name of the wizard.
Type	The wizard uses a composite record producer, or record producer.
Producer	Reference of the composite record producer, or record producer.
Has feedback panel	Option to specify if the wizard has a feedback panel.
Layout[Stacked/Tabbed]	The rendering of wizard steps can be either stacked or tabbed layout mode.
Title	Title of the wizard. **Note:** The title can also dynamically refer to the composite record producer, or record producer variables using ${variable} syntax.
Enable Save	Auto-save the wizard on each step change.
Show review step	The Review and submit step is displayed to summarize the wizard steps, and field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Show Submit on last step	If **true**, the **Submit** button is displayed in the last step.
Review step label	Label of the Review and submit step.

For more information on fields, steps, sections, or questions on Service Catalog wizard, see the following:

- Add a step, section, or question to a catalog item wizard
- Catalog Wizard form

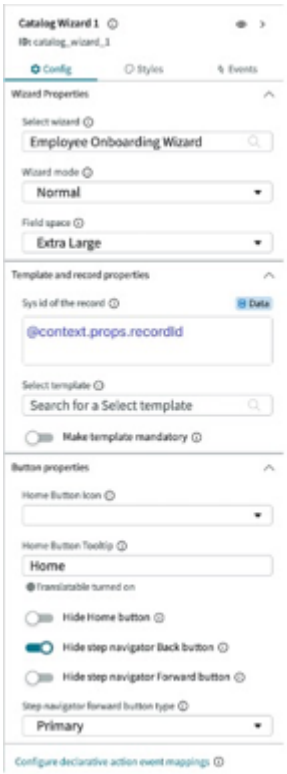


After you set up the field values, the resulting wizard with the steps, layout, labels, and other elements appear as follows:

Elements of a Service Catalog Wizard

3. Set up the Catalog Wizard component properties using the UI Builder (UIB) components, for more information see Customize UI Builder pages using components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



a. **Select Wizard**: Select the wizard that you're creating the experience for (you can choose the wizard you created in the previous step).

b. **Wizard mode**: Select the mode for this experience.

c. **Field space**: Specify the spacing that should appear between fields in the wizard. The possible values are **Small**, **Medium**, **Large**, and **Extra Large**.

d. **Sys_id of the record**: In Normal mode, the sys_id of the record being edited or created by the wizard. In Template mode, the sys_id of the template that is being edited.

e. **Select template**: Select the template that must be applied to the wizard. The **Select Template** option is applicable only in Normal mode.

f. **Make template mandatory**: If **true**, providing a template is mandatory for creating records, and is applicable only in Normal mode.

g. **Home button icon**: Select an icon that appears in place of the Home button icon.

h. **Hide home button**: If **true**, the **Home** button is hidden in the wizard.

i. **Hide step navigator Back button**: If **true**, hides the **Back** button in the footer of the wizard.

j. **Hide step navigator Forward button**: If **true**, hides the **Forward** or **Continue** button in the footer of the wizard.

k. **Step navigator forward button type**: Specify the button type for the **Forward** button in the wizard footer. The possible values are **Primary** or **Secondary**.

For more information, see Next Experience Components in the developer documentation site.

Create declarative actions for Service Catalog Wizards

Create and configure declarative actions to enable administrators to configure buttons (wizard actions) in Service Catalog Wizards.

Before you begin

There are two types of declarative actions for catalog wizards:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- UXF Client Action: Create declarative actions and map an action to a UIB page level event handler. Use this if you need to handle events at the UIB level such as opening a dialog box, or opening another catalog wizard, and so on.
- Client Script: Use a client script that executes on a button click. Use this if you need to manipulate g_form fields of the composite record producer that are linked to the catalog wizard.

The Catalog Wizard model is the declarative action model for catalog wizard which has the model fields that define the properties of the wizard. Use these fields to define what the payload can contain (for UXF Client Action type), or define conditions for button display on the wizard. Every wizard must use the Catalog Wizard model to create declarative actions.

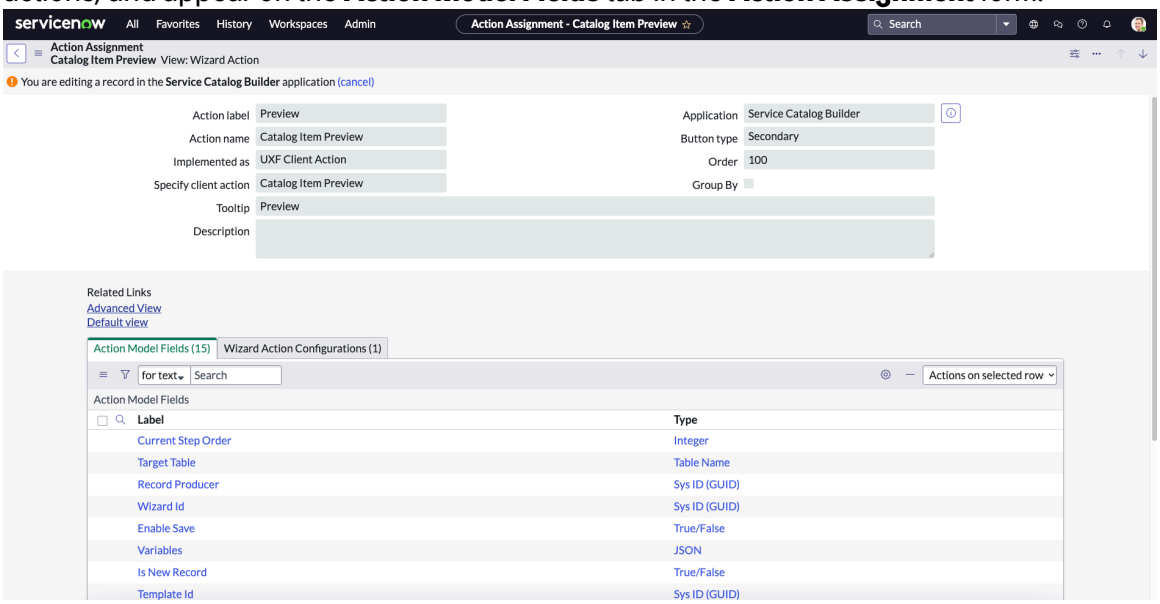
Role required: wizard_admin, admin

Procedure

1. Navigate to **Service Catalog Wizards > Catalog Wizard Declarative Actions**.

> **Important:**
> Use this navigation path only to create declarative actions. This path sets the fields correctly when the declarative action form is loaded.

2. Click **New** to create a new declarative action.
3. Specify Catalog Wizard **Action Model Fields** to create payloads.
   The action model fields are available by default for catalog wizard declarative actions, and appear on the **Action Model Fields** tab in the **Action Assignment** form.



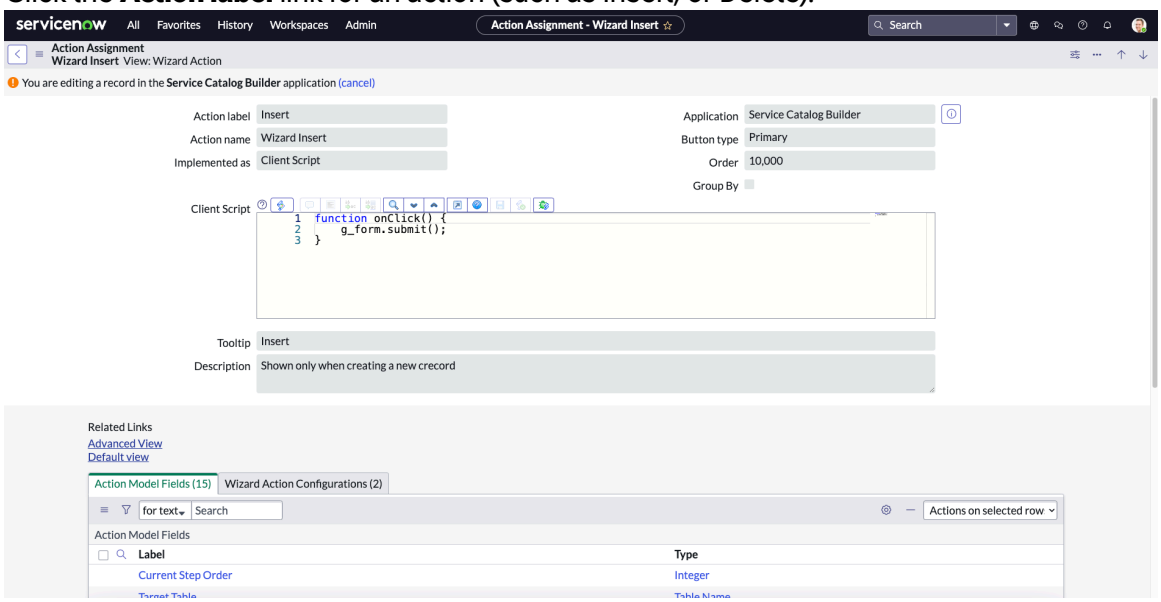
Action Model Fields tab

Field	Description
Current Step Order	Order of the current selected step.
Target Table	Target table of the record producer or composite record producer used by the wizard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Record Producer	Sys_id of the record producer or composite record producer used by the wizard.
Wizard Id	Sys_id of the wizard.
Enable Save	Value of the **Enable Save** field on the wizard record.
Variables	Object containing name and value for composite record producer variables associated with the wizard.
Is New Record	The value is **True** when creating a new record using the wizard.
Template Id	Sys_id of the template applied on the wizard.
Has Review Step	The value of the **Has Review Step** field on wizard record.
Is Last Step	Indicates if it's the last step of the wizard. The last step is not dependent on order, and could change dynamically based on client scripting or UI policies of the wizard.
Form Dirty	The value is **True** if the wizard has unsaved changes.
Submitting	The value is **True** if a submission of the wizard is in progress.
Mode	Mode in which the wizard is operating (Template or Normal mode).
Target Record Data	Not Applicable (this field is no used).
Record Id	Sys_id of the record being created or edited by the wizard.

4. Click the **Action label** link for an action (such as Insert, or Delete).



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action Assignment form

Field	Description
Action label	Display label for the button on the wizard.
Action name	Identifier for the action.
Implemented as	UXF Client Action or Client Script for wizard declarative actions.
Specify client action	The payload definition if **Implemented as** is the UXF Client Action.
Client Script	If the **Implemented as** field value is Client Script, this value must be specified. **Important:** You can only use the variables on the CRP that are linked to the wizard.
Tooltip	Tooltip for the button.
Button type	Possible values are **Primary** or **Secondary**.
Order	Sequence that the button appears in.
Group By	Option that must be selected if the button is part of a group.
Group	The group the button belongs to, for the **Group By** option. Grouped buttons are displayed as a split button in the wizard.
Scripted client conditions	The conditions to be evaluated during button display. For example: `mode=='template'&&variables.var=='xxxx'`. **Note:** This field does not appear on the form by default.

5. Click **Submit** to create the Wizard action.
6. Navigate to **Service Catalog Wizards** > **Catalog Wizard Actions Configurations** and click **New**.
   Create a Wizard Action Configuration record so you can use the declarative action in a wizard. Enter the following fields in the form.

Wizard Action Configuration record

Field	Description
Name	Identifier of the wizard action configuration record.
Declarative action	Select a declarative action that was created using the Catalog Wizard model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies to	The wizard mode in which this action should appear. The values are **Normal mode**, **Template mode**, or **All** (both modes).
Global	This action configuration applies to all wizards, regardless of whether it's mapped to a particular wizard or not. **Note:** The global actions **Save** and **Submit** are available by default.
Overflow	The button is displayed as part of overflow menu.
Force Save	Saves the wizard if any field values have been updated in the wizard before triggering the action.
Label override	Enter a label to override the label specified in the declarative action.
Button type override	The button type specified by the declarative action is overridden.

7. Navigate to **Catalog Wizard** > **Maintain Wizards**.

   To display a declarative action as a button on the wizard, map the Wizard Action Configuration with the Catalog Wizard.

   Open the wizard that you want to add the declarative action to. Use the related list **Wizard Actions Configurations** to create a mapping record between the wizard and the wizard action configuration.

   a. Click **New** to create a new configuration directly.

   b. Click **Edit** to attach an existing configuration to create a mapping record between the wizard and the configuration. The mapping record also has a toggle to hide a specific action.

   c. Toggle the **Hide action** field to True to hide a specific action.

   Tip: Buttons with global configurations are available on the wizard by default. To hide a global action in a wizard, map the global configuration to the wizard and set the **Hide Action** to true.

   For more information on Catalog Wizards, see Creating a Service Catalog Wizard.

8. Use the **Configure declarative actions event mappings** action on the **Config** tab of UI Builder. Configure declarative actions event mappings is applicable only to UXF Client Action type of declarative action. Create a page level event handler, then map the declarative action to the page level event handler and specify the payload. For more information on binding events to declarative actions in UI Builder, see Bind an event to a declarative action.

Integrating Service Catalog

You can integrate Service Catalog with other applications, such as Service Portal and Employee Center.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate Service Catalog

- Submit requests for service and product offerings using catalog items from the Employee Center.
- Configure an improved version of catalog. Customize Service Portal where your customers can request catalog items such as service and product offerings.
- Use a mobile and track request and approval flows of Service Catalog.
- Configure a catalog item or record producer to create a universal request when a request is submitted.
- Design a topic conversation in Virtual Agent by including reusable topic blocks to perform request submission tasks.

Service Catalog in Employee Center portal

Employees can submit requests for service and product offerings using catalog items from the Employee Center portal.

ServiceNow® Employee Center provides a single and unified portal experience for employees to find information and request services across various departments, including HR, IT, Legal, Workplace, and Procurement. Using the Content Taxonomy framework, you can modify the default IT taxonomy to include your catalog items as content in the topics or child topics.

To enable Service Catalog on the Employee Center portal, ensure you've the following ServiceNow applications and plugins installed:

- Employee Center plugin (sn_ex_sp)
- Employee Experience Taxonomy plugin (sn_ect)

IT taxonomy on Employee Center

The base system taxonomy—Employee—is installed when you install the Employee Experience Taxonomy plugin. To provide catalog items, the following IT taxonomy structure is available by default under the IT taxonomy:

1. **Hardware**
2. **Software**
3. **Network**
4. **Browse IT**

Associate a catalog item with a taxonomy topic in Employee Center

Associate your existing and new catalog items, knowledge base articles, and quick links to the appropriate taxonomy topics so that the catalog items are available in the Employee Center as content in the topics or child topics.

Before you begin

Role required: admin

About this task

You must associate your catalog items that you want to display in the Employee Center with a taxonomy topic.

By default, Employee Center application ships employee-centric taxonomy and taxonomy topics for IT, HR, Workplace, Legal, and Procurement. You can use the default IT taxonomy to associate your catalog items or you can clone a taxonomy to make your own additions or modifications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to the default topic structure that matches your requirements. To clone a taxonomy, refer to the steps mentioned in the Clone taxonomy for employee content topic.

You can associate your existing or new catalog items with a taxonomy topic directly from the Content Taxonomy also. To associate your existing or new catalog items with a taxonomy topic, refer to the steps mentioned in the Associate connected content to a topic topic.

For more information about Unified taxonomy, see Unified taxonomy for Employee Center.

To associate a catalog item from the Service Catalog:

Procedure

1. Navigate to **All** > *Service Catalog* > **Catalog Definition** > **Maintain Items**.
2. Select the item that you want to associate with a taxonomy topic.
3. In the Assigned Topics related list, click **Add**.
4. Select the base taxonomy from the **Taxonomy** list.
5. Select the appropriate topic, for example **IT**.
6. Select the appropriate child topic from the topic list.
   For example, to add a laptop, select **Hardware**, and then **Computers**.
7. Click **OK**.

Result
The catalog item is associated with the selected taxonomy topic and appears on the Employee Center.

Enable Shopping Cart and Add to Wish List options in Employee Center

Modify the Main Menu configuration of the Employee Center to provide the Shopping Cart and Add to Wish List options while requesting catalog items.

Before you begin
Enable the wish list feature for catalog. For information about enabling the wish list, see Saving catalog items to a wish list.

Role required: admin

About this task
The Shopping Cart and Add to Wish List menu options that are available by default on the Service Portal are not available in the Employee Center. You must enable these options in the Employee Center to allow employees to add catalog items to the Shopping Cart and Wish List.

If these features are not required, then consider disabling these options in Service Catalog for a seamless experience in the Employee Center. To enable or disable the shopping cart option in Service Catalog follow the first three steps mentioned in the Enable the Shopping Cart Widget topic and for information on enabling or disabling the Wish list option in Service Catalog, see Saving catalog items to a wish list topic.

Procedure

1. Navigate to **All** > **Service Portal** > **Portals**.
2. Search for and select **Employee Center**.
3. If you are prompted with the message `To edit this record click here`, then click **here**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open the **Main menu** by clicking the preview this record icon (ⓘ).
5. Change the values for **enable_cart** and **enable_wishlist** to **True**.

```
{
 "enable_cart":{
  "displayValue":"true",
  "value":true
 },
 "auto_update_cart":{
  "displayValue":"true",
  "value":true
 },
 "exclude_search_on_homepage":{
  "displayValue":"true",
  "value":true
 },
 "enable_wishlist":{
  "displayValue":"true",
"value":true
```

6. Click **Update**.

Result

The Shopping Cart and Add to Wish List options appear on the Employee Center.

Add an item to the wish list in Employee Center

Add catalog items or record producers to the wish list to review them when required.

Before you begin

Role required: requester

Procedure

1. Navigate to **All** > **Employee Center** > **IT**.
2. Select a topic to view the catalog items and then select catalog item or record producer from the Catalog.
3. Click the Add to Wish List icon ( ) in the Ordering widget.

> **Note:**
>
> When you edit an item that is added to the wish list, the Update Wish List icon ( ) is displayed in the corresponding Ordering widget.

4. Click **View Wish List** from the confirmation message or the **Wish List** menu option on the main navigation bar.
   The wish list details page is displayed.
5. If required, perform any of these actions.

Option	Description
Remove Item	To remove an item from the wish list, click the Remove Item icon ( ).
Clear Wish List	To clear the wish list, click **Clear Wish List**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
View the Catalog	To navigate to the Service Catalog landing page, click **View the Catalog**.

6. To navigate to any wish list item page, click the image or name of the item in the wish list details page.

   Note:
   This does not open a new instance of the item, but the instance that is in the wish list, where you can edit the details.

Add a catalog item to the shopping cart in Employee Center

Add a catalog item or order guide to the shopping cart to store at one place and checkout.

Before you begin

Role required: requester

Procedure

1. Navigate to **All** > **Employee Center** > **IT**.
2. Select a topic to view the catalog items and then select catalog item or record producer from the Catalog.
3. Click **Add to Cart** in the Ordering widget.

   Note:
   - You can add the same item to the cart multiple times. Every time you add an item to the cart, a new instance of the item is created.
   - The cart information is automatically updated.

4. Click **View Cart** from the confirmation message or the **Cart** option on the main navigation bar. The cart details page is displayed.
5. To navigate to any cart item page, click the image or name of an item in the cart details page.

   Note:
   This step doesn't open a new instance of the item, but the instance that is in the cart, where you can edit the details.

6. **Optional:** If necessary, edit the quantity of items.
7. **Optional:** To remove an item from the cart, click the Remove Item icon ( ).
8. **Optional:** To make changes to this item, select it, and then select **Save as Draft**.

   (Optional) The item is removed from the cart. You can access the saved drafts from the My Request widget in the **Drafts** tab.

9. To navigate to the Service Catalog landing page, click **Continue Shopping**.
10. **Optional:** To clear all the items from your cart, click **Clear Cart**.
11. **Optional:** To create a bundle from the cart:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **Save as Bundle**.

b. In the Create New Bundle window, specify the **Bundle Name** and select the items that you want to include.

c. Click **Save**.

Note:
When you create a bundle from the cart, which includes an order guide, the association of the items to the order guide is lost.

12. **Optional:** To add a saved bundle to the cart, open the bundle from the **My Saved Bundles** section and click **Add to Cart**.
13. **Optional:** To replace the cart items with a saved bundle, open the bundle from the **My Saved Bundles** section and click **Replace Cart**.
14. Click **Proceed to Checkout**.
The Order Confirmation window is displayed.
15. **Optional:** Specify the **Delivery Information** and **Special instructions**.
16. **Optional:** To add one or more attachments for the cart, click the add attachment icon ( ).

    (Optional) You can browse and choose the files, drag the files, or copy and paste them in the Add attachments window.
17. Click **Checkout**.

    The corresponding request is displayed in the My Requests page with the request number, estimated delivery date for the entire order, price, and the order status of individual ordered items.

Related topics

Save a draft of a catalog item

Request a catalog item from Employee Center

Use the SC Catalog Item widget in Employee Center to request a catalog item.

Before you begin
Role required: requester

Procedure

1. Navigate to **All** > **Employee Center** > **IT**.
2. Select a topic to view the catalog items and then select catalog item or record producer from the Catalog.
3. Enter the required information in the catalog item form.
4. Enter the number of items in the **Quantity** field.
5. If required, perform any of these actions.

Option	Description
Add attachments	To add one or more attachments to the cata log item, click the add attachments icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	You can browse and choose the files, drag the files, or copy and paste them in the Add at tachments window.
Add to Cart	To add the catalog item to the shopping cart, click **Add to Cart**.
Add to Wish List	To add the catalog item to the wish list, click the Add to Wish List icon ( ).

6. Click **Order Now**.
   The Order Confirmation window is displayed.
7. From the **Request for** list, select the user for whom you are requesting.

   Note:
   By default, the user who is logged in is selected in this list.

8. If required, specify the **Delivery Information** and **Special instructions**.
9. Click **Checkout**.
   The corresponding request is displayed in the My Requests page with the request number, estimated delivery date for the order, price, and the order status.

Request an order guide from Employee Center

Request multiple catalog items together as an order guide from the Employee Center for a specific purpose.

Before you begin
Role required: requester

About this task
An order guide submits a single service catalog request that contains several catalog items so that you don't have to request each item manually. For more information, see Order guides.

For example, a New Employee Hire order guide can contain several items that new employees commonly need, such as business cards, computer, and cell phone. After selecting this order guide, the customer can then provide information about the new employee, including location and job title. The order guide then submits an order for catalog items like business cards, based on the details provided.

Procedure

1. Navigate to **All** > **Employee Center** > **IT**.
2. Select an order guide from the Catalog.
3. In the **Describe Needs** section, enter the required information and click **Next**.

   Note:
   The **Next** button is disabled until you fill all mandatory fields on the form.

4. In the **Choose Options** section, enter the requirements for catalog items and click **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If a catalog item has fields that need user inputs, **Options** is displayed on the accordion.
- If the fields are mandatory, a red asterisk is displayed beside **Options**.

a. To expand or collapse the catalog item information, click the accordion.

b. To include or exclude the catalog item from the order guide request, set the toggle switch to off on the accordion.

Note:
When the item is excluded from the order guide request, the item is not editable and the corresponding mandatory field restrictions are ignored.

c. To add an attachment for the catalog item, click the Add attachments icon ( ) and select the required attachment.

d. Click **Previous** to navigate to the **Describe Needs** section.

5. In the **Summary** section, review the order guide summary.
6. **Optional:** To add the order guide to the shopping cart, click **Add to Cart**.

Note:
When you add an order guide to the cart, you can only edit the order guide instance in the cart.

7. **Optional:** To go to the **Choose Options** section and edit the order guide items, click **Edit Options**.
8. Click **Order Now**.
   The Order Confirmation window is displayed.
9. From the **Request for** list, select the user for whom you are requesting.

Note:
By default, the user who is logged in is selected in this list.

10. **Optional:** If required, specify the **Delivery Information** and **Special instructions**.
11. **Optional:** To add one or more attachments for the cart, click the add attachment icon ( ).

    (Optional) You can browse and choose the files, drag the files, or copy and paste them in the Add attachments window.

12. Click **Checkout**.
    The corresponding request is displayed in the My Requests page with the request number, estimated delivery date for the entire order, price, and the order status of individual ordered items.

Save a draft of a catalog item

Save a draft of a catalog item while requesting it on the Employee Center, Service Portal, and Now Mobile.

Before you begin

Role required: requester

About this task

If enabled, save the draft if you don't want to discard the form and edit it later. For example, this procedure explains how you can save a draft in Employee Center.

For information about enabling **Save as Draft**, see Catalog Item form.

Procedure

1. Navigate to **All** > **Employee Center** > **IT**.
2. Select the item that you want to request and start filling the form.
3. If you want more information to fill the form and want to save it, select **Save as Draft**.

   Your draft is saved. You can access the saved drafts from the My Request widget in the **Drafts** tab.

   If you open a new but the same item to request, and the draft of the item is already saved, you get a message stating that the draft of this item exists. If you want to save the draft of this new item as well, you must give a unique name to this item in the **Save as draft** field, and select **Save**.

   The **Drafts** tab shows all the draft items related to the same item name.
4. Open a draft item that you want to edit, and if you still don't want to submit it, select **Update draft** or if you want to submit it, select **Submit**.

Service Catalog in Service Portal

Use Service Portal to configure an improved version of Catalog. You can customize Service Portal where your customers can request catalog items such as service and product offerings. You can use the Service Catalog widgets to build a catalog for your portal.

Note:
If you're an existing customer using Service Portal we recommend that you migrate to the Employee Center for a better experience. For more information on Employee Center, see Employee Center

The Catalog landing page provides an interface from where you can access the catalog items, requests, approvals, popular items, recent items, and saved bundles. This page is available by default for zBoot users.

Note:
Upgrade users need to activate the Service Portal - Service Catalog v2 plugin (com.glideapp.servicecatalog.portal).

Overview of configurable options in the Service Catalog on the Service Portal and explains how to perform those configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can access the Catalog landing page in Service Portal using the **Catalog** option from the main menu header of Service Portal.

The landing page has:

- A search bar to search within all configured catalogs in Service Portal. When you search for a specific item, the search results page displays results based on the configured catalogs and categories.

  Only the items associated with a catalog and category are searchable. The primary category of the item is displayed under the **Category** filter. The catalog where the primary category is defined for the item is displayed under the **Catalog** filter.

- The **Browse by Categories** option to navigate to the list of categories in Service Catalog and the items within. Click this option to navigate to the categories landing page.
- The Requests and Approvals widget to display the list of requests and approvals associated with the user. The list is based on the configurations available in the **My Request Filter** module in Platform. For information about the **My Request Filter** module, see Define filters for My Requests.
- The My Saved Bundles widget to display the saved bundles associated with the user. You can remove a bundle, or open a bundle to add or replace the cart with the items in the bundle.
- The My Recent Items widget to display catalog items, record producers, or order guides that are most recently viewed or requested by the user. An instance option on the widget allows you to display either the viewed or requested items. This widget is not displayed when it has no data.
- The Popular Items widget to display the most popular catalog items ordered across the organization by other users. These items are displayed based on the **Top Requests** dynamic category. This widget is not displayed when there is no data.

Note:

- In the order status page of a request, stage renderer displays the current stage in a collapsed view. You can expand this view for all stages.
- These pages have dynamic titles to display the name of the selected entity.
  - Catalog Item [sc_cat_item]
  - Catalog Categories [sc_category]
  - Order Guide [sc_cat_item_guide]

Content Management and Service Portal

Access Service Catalog categories in Service Portal

Access Service Catalog categories to access the catalog items within.

Before you begin

Role required: requester

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Home**.
   The Service Portal homepage is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click any of the following:
   - The **Request Something** link from the Service Portal landing page.
   - The **Catalog** option from the main menu header of Service Portal and then the **Browse by Categories** option.

   The popular items from all categories are displayed.
3. In the **Catalogs** section, select the required catalog from the list.
   For information on how you can configure a catalog, see Configure a catalog in Service Portal.

   Note:
   - The **Catalogs** section is available only when you have multiple catalogs and have access to items of multiple catalogs.
   - The list contains all catalogs configured for Service Portal.

   The following information is displayed:
   - Categories of the selected catalog in the **Categories** section.
   - Popular items of the selected catalog.
4. In the **Categories** section, click the required category.
   The category details and the items within are displayed.

   Note:
   - You can click the category count or anywhere in the row to view the category details.
   - For a category with a long name, additional text is displayed as ellipses. Point to the category name to view the additional text.
5. To change the display of category items, click the card view icon ( ) or the grid view icon ( ).

   Note:
   When you access a catalog item from the Catalog landing page or type ahead search results, the breadcrumb of the item displays the path based on the primary category configured on that item. When you access the item from a specific category, the breadcrumb of the item displays the path based on that category.

SC Categories widget

Add an item to the wish list in Service Portal

Add catalog items or record producers to the wish list to review them when required.

Before you begin
Role required: requester

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Home**.
   The Service Portal homepage is displayed.
2. Select a catalog item or record producer from Service Catalog.
3. Click the Add to Wish List icon ( ) in the Ordering widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

When you edit an item that is added to the wish list, the Update Wish List icon ( ) is displayed in the corresponding Ordering widget.

4. Click **View Wish List** from the confirmation message or the **Wish List** menu option on the main navigation bar.
   The wish list details page is displayed.
5. If required, perform any of these actions.

Option	Description
Remove Item	To remove an item from the wish list, click the Remove Item icon ( ).
Clear Wish List	To clear the wish list, click **Clear Wish List**.
View the Catalog	To navigate to the Service Catalog landing page, click **View the Catalog**.

6. To navigate to any wish list item page, click the image or name of the item in the wish list details page.

Note:

This does not open a new instance of the item, but the instance that is in the wish list, where you can edit the details.

SC Wish List Cart widget

Add a catalog item to the shopping cart

Add a catalog item or order guide to the shopping cart to store at one place and checkout.

Before you begin

Role required: requester

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Home**.
   The Service Portal homepage is displayed.
2. Select a catalog item or order guide from Service Catalog.
3. Click the Add to Cart icon ( ) in the Ordering widget.

Note:

- You can add the same item to the cart multiple times. Every time you add an item to the cart, a new instance of the item is created.
- The cart information is automatically updated in all open tabs or windows.

4. Click **View Cart** from the confirmation message or the **Cart** menu option on the main navigation bar.
   The cart details page is displayed.
5. To navigate to any cart item page, click the image or name of an item in the cart details page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This step does not open a new instance of the item, but the instance that is in the cart, where you can edit the details.

6. If required, edit the quantity of items.
7. To remove an item from the cart, click the Remove Item icon ( ).
8. To navigate to the Service Catalog landing page, click **Continue Shopping**.
9. To clear the cart, click **Clear Cart**.
10. To create a bundle from the cart:
    a. Click **Save as Bundle**.
    b. In the Create New Bundle window, specify the **Bundle Name** and select the items that you want to include.
    c. Click **Save**.

Note:
When you create a bundle from the cart, which includes an order guide, the association of the items to the order guide is lost.

11. To add a saved bundle to the cart, open the bundle from the **My Saved Bundles** section and click **Add to Cart**.
12. To replace the cart items with a saved bundle, open the bundle from the **My Saved Bundles** section and click **Replace Cart**.
13. Click **Proceed to Checkout**.
    The Order Confirmation window is displayed.
14. From the **Request for** list, select the user for whom you are requesting.

Note:

- By default, the user who is logged in is selected in this list.
- The User [sys_user] table columns specified in the **Additional columns for the "request for" Service Catalog widget. Choose fields in the sys_user table. Must be semicolon separated** (*glide.sc.request_for.columns*) Service Catalog property are displayed in the **Request for** list and you can search for a user by the specified columns.
- You can provide additional widget options to control the **Request for** default value. For example:

```
"requested_for_id": {
"value": "62826bf03710200044e0bfc8bcbe5df1"
},
"requested_for_display": {
"value": "Abel Tuter"
}
```

15. If required, specify the **Delivery Information** and **Special instructions**.
16. To add one or more attachments for the cart, click the add attachments icon ( ).

    You can browse and choose the files, drag the files, or copy and paste them in the Add attachments window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

17. Click **Checkout**.

    The corresponding request is displayed in the Order Status page with the request number, estimated delivery date for the entire order, price, and the order status of individual ordered items.

    Note:

    - Use the instance options on the Order Status page to display the pre-defined columns.
    - You can display either the RITM number or the name of the catalog item. By default, the name of the catalog item is displayed.

SC Shopping Cart widget

Request a catalog item from Service Portal

Use the SC Catalog Item widget in Service Portal to request a catalog item.

Before you begin
Role required: requester

Select the **Allow Cloning** instance option on the Order Status page to display the **Additional Actions** section after placing the request.

For information about the SC Catalog Item widget, see SC Catalog Item widget

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Home**.
   The Service Portal homepage is displayed.
2. Select a catalog item or record producer from Service Catalog.
3. Enter the required information in the catalog item form.
4. Enter the number of items in the **Quantity** field.
5. If required, perform any of these actions.

Option	Description
Add attachments	To add attachments to the catalog item, click the add attachments icon ( ). You can browse and choose the files, drag the files, or copy and paste them in the Add attachments window.
Add to Cart	To add the catalog item to the shopping cart, click the Add to Cart icon ( ).
Add to Wish List	To add the catalog item to the wish list, click the Add to Wish List icon ( ).

6. Click **Order Now**.
   The Order Confirmation window is displayed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For a record producer, you can edit the label of the **Submit** button by using the widget instance options.

For example, if you want to change the label to **Request**, press Ctrl+click on the catalog item widget, select **Instance in Page Editor**, and specify the following parameters in the **Additional options, JSON format** field.

```
"record_producer_label":{
   "value" : "Request"
  }
```

7. From the **Request for** list, select the user for whom you are requesting.

Note:
- By default, the user who is logged in is selected in this list.
- The User [sys_user] table columns specified in the **Additional columns for the "request for" Service Catalog widget. Choose fields in the sys_user table. Must be semicolon separated** (*glide.sc.request_for.columns*) Service Catalog property are displayed in the **Request for** list and you can search for a user by the specified columns.
- You can provide additional widget options to control the **Request for** default value. For example:

```
"requested_for_id": {
"value": "62826bf03710200044e0bfc8bcbe5df1"
},
"requested_for_display": {
"value": "Abel Tuter"
}
```

8. If required, specify the **Delivery Information** and **Special instructions**.
9. Click **Checkout**.
The corresponding request is displayed in the Order Status page with the request number, estimated delivery date for the order, price, and the order status.

Note:
- Use the instance options on the Order Status page to display the pre-defined columns.
- You can display either the RITM number or the name of the catalog item. By default, the name of the catalog item is displayed.
- When a service catalog item is ordered from an existing record, a link is added between the order item request and the parent record.

10. **Optional:** To clone a request for other users, perform the following steps.

    a. In the **Additional Actions** section, from the **Also request for** list, select the required users and click **Submit**.

    b. In the Cloning Requests window, click **Ok**.

© 2026 ServiceNow, Inc. All rights reserved.

Service Catalog in mobile

You can use a mobile and track request and approval flows of Service Catalog.

Fulfiller experience in Mobile Agent

Approve catalog requests, requested items, or change requests from anywhere using the ITSM ServiceNow Agent application.

As an ITSM agent or technician, you can use the mobile app when connected online to accomplish the following:

- Accept or reject the pending approval requests.
- View the completed approval requests.

Note:

- The request experience is not available in this mobile app.
- On-load catalog UI policies (non-scripted) are supported for variables in record views, for example, requested item and incident.
  - Only the visibility condition is considered.
  - A variable with no value is not displayed.
  - These policies are also applicable for container variables and a group of check boxes.
  - Since the multi-row variable set is displayed with a message that it is not viewable, these policies can be used to display or hide that message.

Watch this three-minute video to learn how to manage approval requests in the mobile app. This video covers: Accessing the Approvals mobile app and viewing and approving or rejecting requests.

Activation information

This mobile application runs on the ServiceNow® mobile platform. You should activate the ITSM Mobile Experience (com.sn_itsm_mobile) plugin that enables the ITSM mobile application.

Get started with the mobile app for Approvals

Access the My Approvals application instance on your mobile app to manage approval requests using your mobile device.

Before you begin
Role required: business_stakeholder or approver_user

About this task
Download the ServiceNow® mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the mobile app and tap the plus icon ( ).
2. Add a ServiceNow instance. For more information on adding the instance, refer to Add a ServiceNow instance.
3. Tap **My Approvals** to start managing your requests.

Related topics

Agent mobile app

Manage a catalog request approval

Manage your assigned catalog request or requested item by approving or rejecting it from anywhere using your mobile device.

Before you begin

Role required: business_stakeholder or approver_user

Procedure

1. Tap **My Approvals** on your mobile app.
2. To approve or reject a pending approval request, perform the following steps.

   a. Tap the Pending Approvals applet.
   All approvals in the Requested state are displayed.

   b. Swipe a request and tap **Approve** or **Reject**.

   Note:
   You should specify the reason while rejecting a request.

   c. **Optional:** To view the details of a pending approval request, tap it.

   Note:
   To approve or reject a request, tap the menu icon ( ) and tap **Approve** or **Reject**.

3. To view a completed approval request, perform the following steps.

   a. Tap the Completed Approvals applet.
   All approval requests that are either accepted or rejected are displayed.

   b. To view the details of the request, tap it.

Request experience in Now Mobile

You can enable users to request for an item or service, and track or approve requests on mobile using the Now® Mobile app.

Activation of Now Mobile for Service Catalog

If you have the admin role, activate the ServiceNow Mobile Request Native Application Screens and Applet Launcher plugin (com.glide.mobile-employee). See Now Mobile app. This plugin enables the Service Catalog functionality by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Me tab

When you log into Now Mobile, the following functionality related to Service Catalog is available:

- **My To-Dos**: Displays approval records of requests and requested items assigned or delegated to the user.
- **My Requests**: Displays requests based on the filters defined for mobile in the **My Requests Filter**. By default, the Incident Mobile and Service Catalog Request Mobile filters are available. For information about configuring filters, see Define filters for My Requests and Configure My Requests.

Note:
It is recommended to include only open requests.

Services tab

You can submit or track requests.

- **Recent Services**: Displays the items and services (10 items and services in the last 12 months) that were requested recently by the logged-in user.
- **Popular Services**: Displays the most requested items and services (10 items and services in the last 12 months) that are visible to the user. Displays the 10 recent items and services in the last 12 months.
- **Browse Services**: Displays the categories of items and services that you can browse through and order.

Note:

- If a category contains both items and sub-categories, the items specific to the category are displayed under **Others**.
- The category listings do not display the catalog information for users who do not have the roles that have permissions to read the records in the sc_category table. For such users, an ACL can be added to provide read permission for the Title field of the sc_catalog table.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You cannot request these item types in the mobile app.
  - Content items
  - Wizard
  - Standard change template
- All items hidden in Service Portal are also hidden in the mobile app.
- In the RITM and record view, these variable types are not supported.
  - HTML
  - Custom
  - Custom with Label
  - UI Page
- In the RITM and request view, a multi-row variable set is not supported. A message is displayed in this view that this variable set is not viewable.
- On-load catalog UI policies (non-scripted) are supported for variables in record views, for example, requested item and incident.
  - Only the visibility condition is considered.
  - A variable with no value is not displayed.
  - These policies are also applicable for container variables and a group of check boxes.
  - Since the multi-row variable set is displayed with a message that it is not viewable, these policies can be used to display or hide that message.

From Now Mobile, you can also perform the following tasks:

- Browse catalog items using the catalog hierarchy in addition to the category hierarchy. For information about its configuration, see Browse catalog items using the catalog hierarchy.
- Change the label of the **Submit** button for a record producer. For information on editing the button label, see Edit the label of Submit button for a record producer.
- Use the mobile camera to scan bar codes for identifying a variable value of a catalog item. This is only applicable by using the *barcode* attribute for the Single Line Text variable. For information about this variable attribute, see Service Catalog variable attributes.

Quick actions

You can provide easy access to a catalog item by creating a quick action. For information on creating a quick action in Now Mobile, see Create a quick action.

Siri shortcuts

iOS users can use Siri shortcuts to open the following pages in the mobile app.

- Browse items and services.
- Open my requests

See Siri shortcuts.

Now Mobile properties

You can define the following behavior for various catalog entities by configuring the Now Mobile properties. For information about configuring these properties, see Configure Now Mobile properties.

- Sort categories by the **Order** field.
- Define the availability of a catalog item in one of the following ways:
  - Include the catalog item with **Availability** set to `Desktop only` in Now Mobile.
  - Specify catalog item types to exclude in Now Mobile.
- Define the non-availability behavior of a catalog item by making it discoverable but not viewable, or not available at all.
- Specify colors for buttons to match your mobile theme.

Mobile plugins and upgrades

Configure catalogs

Enable your users to view and request their associated items in the Now Mobile app. If no catalogs are selected, users can view and request items from all catalogs in the system. By default, the app uses Service Catalog.

Before you begin

Role required: admin

About this task

Demonstrates configuring service catalogs, knowledge bases, and My Requests in the Now Mobile App.

Procedure

1. Navigate to **All** > **Now Mobile App** > **Catalogs**.
2. **Optional:** In the portal catalogs [m2m_sp_portal_catalog] table, add a catalog in addition to the base system catalog, or change the catalog that is associated with the base system record:

   a. Click **New** or open the base system record.

   b. On the form, fill in the fields.

Portal catalogs form

Field	Description
Portal	Portal that you select. Select **Employee Center**.
Catalog	Catalog that you would like to associate with the app.
Order	Number that indicates the order that the configurations should run. If there are multiple configurations on a portal, the system runs the configurations from the lowest to the highest order that you selected.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Your users can view and request items from all added catalogs.

Browse catalog items using the catalog hierarchy

In addition to the category hierarchy, browse catalog items using the catalog hierarchy for proper context.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Mobile** > **Now Mobile app** > **Applet Launchers**.
2. Select the **Services** applet launcher.
3. Replace the **Browse Services** applet launcher section with the **Browse Catalog** applet launcher section.
   a. On the Applet launcher form, navigate to the **Body** section.
   b. Under the **Section** column, click **Browse Services**.
   c. On the Item Section form, set **Destination screen** as `Browse Catalog`.
   d. Click **Update**.
   After the **Browse Catalog** applet launcher section is enabled, the catalog appears as the first level of browsing and then the categories.

Submit and track a request

Submit a request for an item or service and track the progress of your request with the Now Mobile app.

Before you begin
Role required: none

Procedure

1. In the navigation bar, tap **Services**.
2. Browse items and services, or search for an item.
3. Tap the item or service that you would like to request.

   Note:
   If configured by your administrator, the related items and articles area provides alternatives and additional information.

4. Select **ORDER NOW**.
5. On the form, fill in the fields.

Field	Description
Request for	Change this field if ordering the item for someone else.
Delivery Information	Confirm the shipping address for the item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Special instructions (Optional)	Add any special instructions for the item.

6. Tap **CHECKOUT**.
   The app displays a confirmation that your request is submitted.
7. To return to the list of items, tap **Close**.
8. In the navigation bar, tap **For Me**.
9. To view all your requests, tap **My Requests**.
10. To view the status of your request, tap the item that you ordered.

    a. To view information about the request, use the **Details** tab.

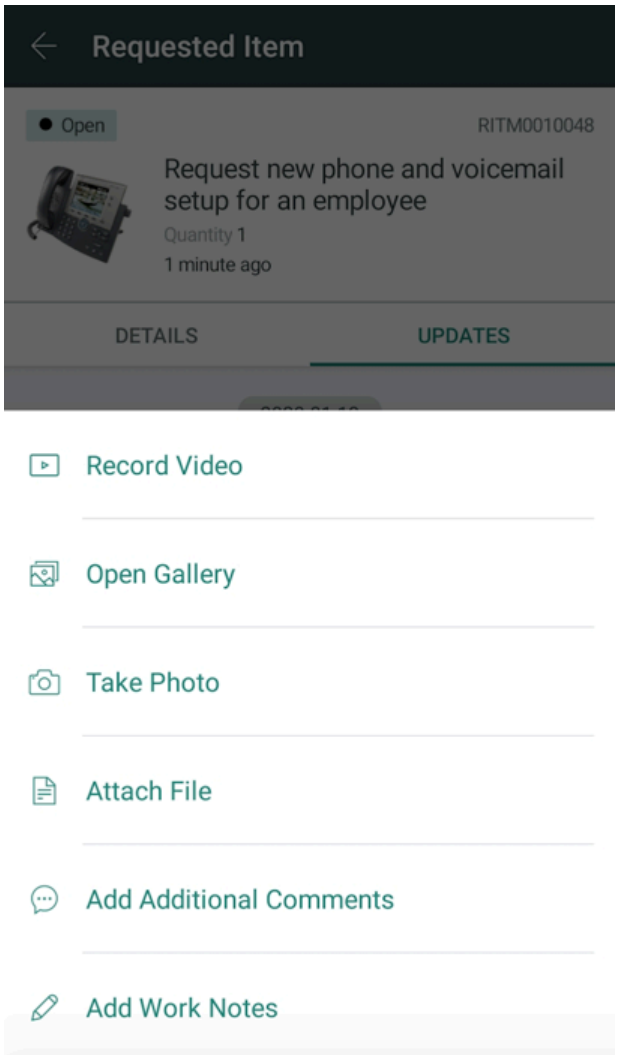
    Note:
    You can add comments for an open incident.

    b. To view field changes and comments about your request, use the **Updates** tab.

    c. Tap + to add comments and work notes, or to attach a file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you add comments for a resolved incident, you can reopen it.



Create a quick action in your mobile applications

Provide easy access to an important item by creating a quick action. For example, you can create a quick action that opens a Service Catalog item.

Before you begin

Role required: admin

Procedure

1. Create a function for the quick action.

   a. Navigate to **System Mobile** > **Functions**.
   The Function [sys_sg_button] table opens.

   b. Click **New**.

   c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Button fields form

Field	Description
Name	Name of the function record.
Description	Description to enable other users to easily understand the purpose of the function.
Type	Type of quick action that you want to create. To create a quick action that opens a Service Catalog item, select **URL**. For more information about function types, see Configure a smart button.
Context	Whether the function applies at the record or table level. ▪ Record: Action only applies at the record level. For example, updating a field. ▪ Global: Action that only applies at the table level. For example, creating or deleting a record. For this example, select **Global**.
Link Label	Label for the link. This value does not display in the user interface.
Link URL	Relative URL for the item that you want to open when the user clicks the function. For example, to open a Service Catalog item in the Now Mobile portal, enter `/mesp?id=sc_cat_item&sys_id=060f3afa3731300054b6a3549dbe5d3e`. This field only displays if the **Type** field is **URL**.
Relative URL	Option that is selected to determine whether the URL is relative. For this example, choose **Selected**. This field only displays if the **Type** field is **URL**.
Condition	
Table	Table on which the condition runs.
Condition	Condition that should be met for the action to be successful. For a catalog item, enter `var item = new sn_sc.CatItem('3f1dd0320a0a0b99000a53f7604a2ef9'); answer = item.canView() && item.isVisibleServicePortal();` to display the quick action only when the end user has permissions to view the item.
Roles	Roles that you want to user to have to view the quick action.

2. Add an instance of the function that you created to the page.

   a. In the native UI, navigate to **Now Mobile App** > **Applet Launchers**.

   b. Open the applet launcher record that you would like to add the quick action to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select the **Body** tab.

d. Insert a new row in the Quick Actions Menu Maps related list.
If you're not able to insert a row, make sure that you're in the **ServiceNow Now Mobile App Screens and Applet Launcher** application scope.

e. Click the magnifying glass to look up an item
The Function Instances [sys_sg_button_instance] table opens.

f. Click **New**.

g. On the form, fill in the fields.

Function instance form

Field	Description
Name	Name of the function instance.
Description	Description to enable other users to easily understand the purpose of the function instance.
Parent	Page on which you are adding the quick action. For example, select **Applet Launcher: Homepage** to add the quick action to the home page. Select a value in the **Parent table** field first.
Application	Application scope.
Parent table	Table that contains the record type where the button appears. For this example, select **applet Launcher [sys_sg_applet_launcher]** to add the quick action to an applet launcher page.
Function	Function record that you created earlier.
Label	Label to help the user understand what the quick action opens. For example, `Report an outage`.
Location	Location where the button appears in the UI. For this example, select **Quick Action**.
Icon	Icon to display next to the label. For more details on mobile icons, see Mobile icons. **Note:** Not all listed icons work with quick actions. To see a list of compatible icons, filter your list where the **Icons** field contains `now-mobile-icons-buttons`. **Note:** The **Icons** field is not on the icon list by default. To add the **Icon** field to your list, right-click the list header and select **Configure** > **List Layout**. Then, add the *Icon* field to the selected list. You should see the icon field on your reference field list.
Order	Number that indicates the order that the functions are listed. If there are multiple instances in the same location, the app displays them from the lowest to the highest.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

h. Click **Submit**.

i. Save the applet launcher record.

Result

Your users can open the quick action by selecting the icon on the applet launcher page.

Enable notifications in Now Mobile

Allow push notifications on your mobile device when there is an update for a request.

Before you begin

Role required: admin

Procedure

1. Tap **Notifications** in the navigation bar.
2. Tap the **Enable notifications** radio button.
   You will receive a notification in any of the following scenarios.
   - Request Completed (one RITM)
   - Request Completed (multiple RITM)
   - Request not Processed
   - Approval Record Assigned - RITM
   - Approval Record Assigned - Request
   - Request Rejected
   - Agent adds comment to Requested Item

Enable the cart in Now Mobile

Allow a requester to add or edit items in the cart. By default, the cart is disabled in Now Mobile.

Before you begin

Role required: admin

Procedure

1. Navigate to sys_properties.list.
2. For the *glide.sc.cart.enabled* property, specify **Value** as `true`.
3. Click **Update**.
   The Cart icon is displayed at the top of the app and the **Add to Cart** button is enabled for items.

Edit the label of Submit button for a record producer

For a record producer submission experience that you can relate to, edit the label of the **Submit** button.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Portal** > **Widgets**.
2. Select the SC Catalog Item (widget-sc-cat-item-v2) widget.
3. From the Instances related list, preview and open the instance for the ServiceNow NowMobile App – Catalog Screens and Applet Launcher application.
4. In the **Additional options, JSON format** field, specify the *record_producer_label* parameter.

   For example, if you want to change the label to **Request**, press Ctrl+click on the catalog item widget, select **Instance in Page Editor**, and specify the following parameters in the **Additional options, JSON format** field.

```
"record_producer_label":{
   "value" : "Request"
  }
```

5. Click **Update**.

Configure Now Mobile properties

Define the behavior of various catalog entities in Now Mobile.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Properties**.
2. On the Service Catalog Configuration form, select the **Mobile** section.
3. Configure the required properties.

Now Mobile properties

Property	Description
Catalog category sort option in Now Mobile (*glide.sc.mobile.category.order_by*)	Sort option for categories in Now Mobile. ○ Title: Categories are sorted by their title. By d sorted alphabetically by their title. ○ Order: Categories are sorted by their order.
Include 'Desktop only' Items in Now Mobile (*glide.sc.mobile.include_desktop_only_items*)	Option to include the catalog item with **Availab** `only` in Now Mobile.
Catalog item classes not available in Now Mobile (comma separated list) (*glide.sc.mobile.item_class_not_supported*)	Catalog item types to exclude in Now Mobile. F `sc_cat_item_content, sc_cat_iten`
Experience for items not available in Now Mobile (*glide.sc.mobile.unsupported_discover*)	Option to define the non-availability behavior Possible options: ○ Discoverable-show message that item is not Item is discoverable in the search and brows viewable. ○ Not discoverable-do not show in search and Item is neither discoverable in the search an viewable.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The following properties are interdependent.

- Include 'Desktop only' Items in NOW Mobile
- Catalog item classes not available in NOW Mobile (comma separated list)
- Experience for items not available in NOW Mobile

Dependency between the Include 'Desktop only' Items in NOW Mobile property and Experience for items not available in NOW Mobile property

Availability value of the catalog item	Include 'Desktop only' Items in NOW Mobile (true)	Include 'Desktop only' Items in NOW Mobile (false) Desktop only
Desktop only	Viewable in search and browse experience	○ If set as discoverable using the *`Experience for items not available in NOW Mobile`* property, viewable in search and browse experience, but not available when you click the item. ○ If set as not discoverable, not viewable in search and browse experience
Desktop and Classic Mobile	Always viewable in search and browse experience	Always viewable in search and browse experience
Classic Mobile only	Not viewable in search and browse experience	Not viewable in search and browse experience

Dependency between the Experience for items not available in NOW Mobile property and Items excluded using the Catalog item classes not available in NOW Mobile (comma separated list) property

Experience for items not available in NOW Mobile property value	Items excluded using the Catalog item classes not available in NOW Mobile (comma separated list) property
Discoverable-show message that item is not viewable in the mobile	Item types are viewable in search and browse experience, but not available when you click them.
Not discoverable-do not show in search and browse experience)	Item types do not appear in search and browse experiences

4. Click **Save**.

Service Catalog configuration for Universal Request

You can configure a catalog item or record producer to create a universal request when a request is submitted. The associated requested item (for catalog item) or task-based record (for record producer) becomes the primary ticket for that universal request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Create or edit a catalog item

Create a record producer

Configure a catalog item or record producer to create a universal request

Configure all catalog items or record producers to create a universal request

Reduce the implementation time by configuring all catalog items or all record producers at a time for universal request creation.

Before you begin

Role required: admin

About this task

For catalog items, RITM should be registered as a service in Universal Request.

For record producers, the target table should be registered as a service in Universal Request.

For information about service configurations, see Service Configuration form.

Procedure

1. Navigate to sys_properties.list.
2. Click **New**.
3. To configure all catalog items to create a universal request:

   a. On the form, fill in the fields.

   System Property form

Field	Description
Name	Unique identifier of the property. Specify *sn_uni_req.enable_ur_all_cat_items*.
Type	Type of the property. Specify **boolean**.
Value	Option to specify if all catalog items can be configured at a time to create a universal request. Possible values are **true** or **false**.

   b. Click **Submit**.

4. To configure all record producers to create a universal request:

   a. On the form, fill in the fields.

   System Property form

Field	Description
Name	Unique identifier of the property. Specify *sn_uni_req.enable_ur_all_rec_prod_items*.
Type	Type of the property. Specify **boolean**.

Field	Description
Value	Option to specify if all record producers can be configured at a time to create a universal request. Possible values are **true** or **false**.

b. Click **Submit**.

Service Catalog Reference

Reference topics provide additional information about the lists and forms.

Service Catalog terms and roles

The Service Catalog application uses these roles to manage different aspects of the application.

Service Catalog terms

Execution Plans

Define how something gets delivered. For example, a PDA could go through procurement / activation / and installation of the desktop software.

Execution Plan Tasks

Plan Tasks represent a step in the Execution Plan, are associated with a Fulfillment Group, and have an approximate duration.

Fulfillment Groups

Fulfillment Groups work execution tasks. For example, one group can activate a cell phone while a different group installs the desktop software.

Tickets

Tickets represent work done by Fulfillment Groups as part of an Execution Plan.

Administrator [admin]

Can manage all aspects of the Service Catalog application, including scripting functions such as creating UI macros or business rules.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Catalog administrator [catalog_admin]

Can manage the Service Catalog application, including catalogs, categories, and items, but not including scripting functions available to administrators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog properties

The Service Catalog application contains properties used to configure various settings in the application.

To configure Service Catalog system properties, navigate to **Service Catalog** > **Catalog Administration** > **Properties**. The properties are categorized into the following sections.

- **Homepage**: Configure settings for the Service Catalog homepage, and control the behavior of the categories and the items displayed on the homepage.
- **Catalog Items**: Configure settings for catalog items and record producers.
- **Order Guides** > **General**: Configure settings for the order guide.
- **Order Guides** > **Scriptable Order Guides**: Configure settings for scriptable order guides.
- **Cart**: Control the behavior of the shopping cart and checkout screens.
- **Request Fulfillment**: Configure settings for request fulfillment processes.
- **Search**: Configure search settings for the Service Catalog homepage.
- **Security**: Configure security settings for the Service Catalog.
- **Pricing**: Configure settings for the pricing engine and pricing display.
- **Portal**: Configure settings for catalog portal widgets.
- **Virtual Agent**: Configure settings for request submission in Virtual Agent.

  This section is visible only when you activate the Service Management Virtual Agent Topic Blocks
  plugin (com.glideapp.cs.sm_topic_blocks)
  .

- **Mobile**: Configure settings for Now Mobile.
- **Other**: Additional settings for the Service Catalog.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog adds the following script includes.

Script include	Description
DemoSCCreateItem	Demonstrates the use of service catalog scoped API.

Domain separation and Service Catalog

Domain separation is supported in Service Catalog. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Activation information

You should activate the Service Catalog - Domain Separation plugin (com.glideapp.servicecatalog.domain_separation) to enable domain separation for Service Catalog. For information on how you can request for the plugin activation, see Request for domain separation in Service Catalog.

This plugin should only be activated if there is a need for the following scenarios:

- Isolate items to requesters in a specific domain.
- Make items unavailable for request in any other domain irrespective of the domain hierarchy.

If Service Catalog has already been domain separated as a custom solution, activating this plugin may override the existing behavior to enforce the plugin-specific isolation.

How domain separation works in Service Catalog

Service providers supporting multiple customers in a single ServiceNow instance can ensure data privacy across domains using domain separation. Service providers can ensure that items created or published in a specific domain can only be requested by users in that domain without adding additional user criteria to the individual catalog items.

In Service Catalog, catalog items (catalog items, record producers, content items, and order guides) are domain-separated as data. Catalogs, categories, and variables are not domain-separated, and belong to the global domain. Also, items that need to be shared across multiple domains must be published in the global domain and restricted by user criteria.

Domain separation in Service Catalog is applicable to all requester views in the ServiceNow AI Platform, Service Portal, Agent Workspace, mobile application, as well as to all API calls requesting for items.

Domain-separated tables

The **Domain** (sys_domain) and **Domain Path** (sys_domain_path) columns are added to the following tables that are domain-separated:

- sc_cat_item
- sc_item_option
- sc_multi_row_question_answer
- question_answer

Effective domain for a user

For users with visibility to a single domain, the effective domain is the user's domain. For users with visibility to multiple domains, the effective domain is the domain selected in the domain picker.

Visibility of catalog items - Item creation and maintenance

A catalog item can be created or published in any domain in the hierarchy. For information on creating a catalog item, see Create or edit a catalog item.The item is created in the effective domain of the user. For information on enabling the domain picker, see Enable domain selection menus in Core UI. Once the item is created in a specific domain, all future edits to the item are done in that domain itself.

If a catalog item is published using Item Designer, the domain of the item is the domain selected in the domain picker while publishing the item. Once the item is published, it can only be modified and re-published in the domain it was originally published in.

Catalog items are domain separated as data. Only for maintenance and administration, the visibility of the catalog items follows the data domain hierarchy rules. For information on domain separation hierarchies, see Domain separation hierarchies.

User criteria associated with a catalog item must be visible in the domain of the catalog item. If not visible, catalog item is considered to be not associated with that user criteria.

Visibility of catalog items - Item request flow

The catalog item created in a specific domain is available in the browse, search, and request experience only in that domain and not available in the peer domains, child domains, and parent domains irrespective of the hierarchy and visibility of the domains. So, requesters can only request for items in their domain as well as in the global domain.

For users with access to multiple domains (for example, IT fulfiller), the items are available for request based on the domain selected in the domain picker. To view or request an item of a specific domain, the user should switch to that domain. For information on enabling the domain picker, see Enable domain selection menus in Core UI.

When a requester submits a request using an order guide which has items from multiple domains, only the items in the effective domain and the global domain are ordered.

The target records such as requests, requested items, or records created by record producers are created in the effective domain.

Request fulfilment flow and reporting for a domain-separated catalog item

The target records such as requests, requested items, or records created by record producers can be accessed by a fulfiller who has visibility to the domain that the record has been

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

generated in. For information on visibility in domain hierarchies, see Visibility domains and Contains domains. Even when the fulfiller modifies the requested item from a domain other than the requested item's domain, the modifications are recorded in the target record's domain. Since the target records are separated as data, the reports retrieve data based on the effective domain of the user requesting the report.

Request flow by a fulfiller from a different domain

When a fulfiller creates a request from a parent record such as an incident in Agent Workspace or in ServiceNow AI Platform, the fulfiller can only request for an item from the parent record's domain or from the global domain. Also, the corresponding target records are created in the parent record's domain.

Note:
Items from multiple domains cannot be added to the cart.

Catalog client scripts and catalog UI policies

Since the catalog client scripts and catalog UI policies are domain-separated as processes, scripts and policies in the parent domain can be overridden in the child domains. However, these scripts and policies are applicable based on the domain of the catalog item or the domain of the target record.

For example, consider that A is the parent domain and B is its child domain. A catalog item in domain B is associated with a catalog client script defined in domain A. If this catalog client script is overridden in the child domain B, the overridden script in domain B is applicable while fulfilling the requested item in domain B. Even when a fulfiller from the parent domain A fulfills the requested item in the child domain B, the overridden script in domain B is applicable.

Note:
It is recommended to not override catalog client scripts and catalog UI policies.

Catalog builder

An item can only be edited in the domain that it has been created. Catalog UI policies and actions added in catalog builder are created in the same domain as that of the item.

Domain separation for service providers

Request for domain separation in Service Catalog

Enable domain separation in Service Catalog by requesting for the activation of the Service Catalog - Domain Separation plugin (com.glideapp.servicecatalog.domain_separation).

Before you begin

Role required: admin

About this task

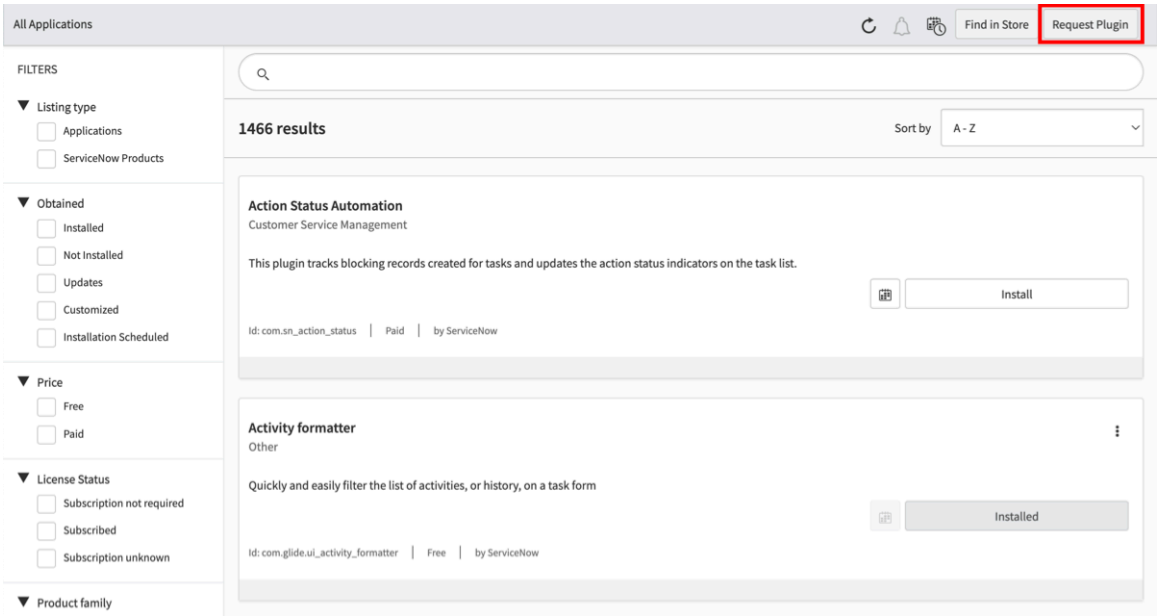
There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **Automation Store** > **Service Catalog** > **Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Select **Request plugin** to open the **Activate Plugin** form on Now Support.



3. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

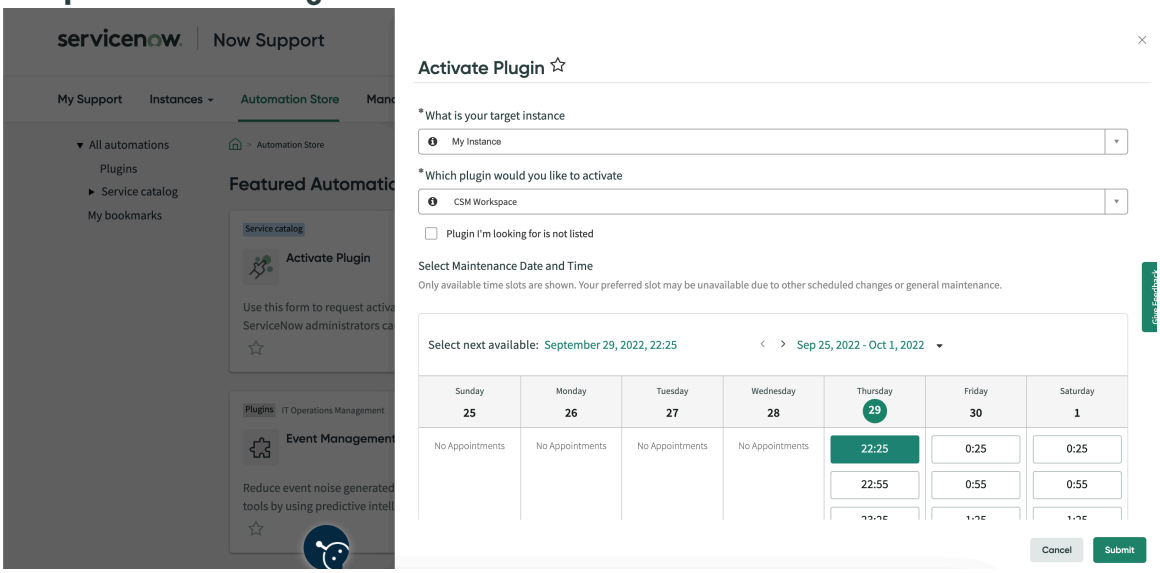
Field	Description
What is your target instance	Select the instance that you want to activate the plugin on.
Which plugin would you like to activate	Select the name of the plugin to activate. **Note:** If the system doesn't list the plugin you want or if you're activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	Select the date and time to activate the plugin.

Example

For example, see the following form to activate the Event Management plugin on an instance named SNC Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Completed Activate Plugin form



4. Select **Submit**.
   After the maintenance window, the system installs the plugin on your instance. To confirm the installation, go to the Installed tab in the Application Manager.

Sample ATF tests for Service Catalog in Service Portal

Validate the continued functionality of Service Catalog after any configuration change such as an upgrade or after developing an application. All test suites and tests should pass on a default implementation. To validate a custom implementation, copy the automated tests and configure them for your customizations.

Service Catalog sample tests require activating the Service Catalog - ATF Tests plugin (com.glideapp.servicecatalog.atf.test) along with the demo data. To run these tests using a suite, follow the procedure described in Run an automated test suite by selecting the **Service Catalog - ATF Tests** test suite. These sample tests are dependent on the demo data items.

Service Catalog Tests test suite

Test	Description
Ordering an item with a multi-row variable set (SP)	Validate ordering an item in Service Portal that needs data from a multi-row variable set
Ordering catalog items using an Order Guide (SP)	Validate ordering an item from an order guide in Service Portal
Request a catalog item (SP)	Validate requesting a catalog in item in Service Portal
Search for items, add to cart and checkout (SP)	Validate using the cart in Service Portal
Submitting requests using a Record Producer (SP)	Validate using a record producer in Service Portal
Viewing and editing catalog item variables in the Catalog Task page	Validate catalog item variables from a catalog task
Viewing and editing catalog item variables in the Requested Item page	Validate catalog item variables from a requested item

Service Catalog Tests test suite (continued)

Test	Description
Add comment on catalog item(s) request created by user	Add comments on a ticket page for a requested item or incident
Approving requests on different catalog item ordered from end-users	Approving a request for catalog items
Catalog item(s) ordering from multiple catalogs	Order catalog items from multiple catalogs
Filter for recent records from My Request filter	Filter for recent open and closed records from the **My Requests** menu
Ordering catalog item(s) from saved bundle	Order catalog items from a saved bundle
Validate contents of 'My Recent Items'	Validate contents of the My Recent Items widget
Validating Regex for Variables	Validate variables using a regular expression
Validate Requested For variable flow for Cart Checkout	Validate the Requested For variable flows for cart checkout
Validate Requested For variable flow for Order Guide	Validate the Requested For variable flows for an order guide
Validate Requested For variable flow with Catalog Item access	Validate the Requested For variable flows based on the catalog item access

Variables to collect data for record producer fields

Use variables to collect data for record producer fields.

You can use the following variable types to collect data for the corresponding record producer fields.

Variables for record producer fields

Field type	Recommended variable type
True/False	Yes/No
Reference	Reference
Date or Due Date	Date
Date/Time	Date/Time
Choice or any field with an associated choice list	Select Box
Email address	Email
URL	URL
HTML	HTML
List or UI Action List	List Collector
String with length greater than 256	Multi-Line Text
String, Integer, Decimal, Floating Point Number	Single-Line Text
File Attachment	Attachment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables for record producer fields (continued)

Field type	Recommended variable type
All other field types	Multi-Line Text

Note:

- If the record producer variable is mapped to an encrypted field of another table, then this variable value is not stored in Question Answer [question_answer] table. So, it is also not available in the variable editor of the target record.
- If the record producer variable is masked and encrypted, and also mapped to an encrypted field of another table:
  - The variable value is not stored in Question Answer [question_answer] table.
  - The decrypted value of the variable is copied to the encrypted field of the target record.

Values Returned

When you construct a record producer, be aware of the return value.

Most of these field types return a string. However, there are some exceptions. For example, a **Reference** value returns the `sys_id` of the target object, and a **List** value returns a comma-separated list of `sys_ids`.

Example 1: For a **List** value, return an array which can be iterated to retrieve the individual values submitted by your user:

```
var sys_id_string  = producer.glide_list_field;
var sys_id_list = sys_id_string.split(',');
```

Example 2: For a **Date** or **Date/Time** value, return a date which GlideDate can evaluate.

```
var glideDateTime  = new GlideDateTime(producer.date_field);
```

Service catalog variables

Service catalog variables capture and pass on information about choices a customer makes when ordering a catalog item. Variables help define the structure of a catalog item form that is displayed to the customer.

For example, you can define a variable called **Memory** to provide users with memory options at an extra cost for a PC catalog item. An Apple iPhone catalog item can use a variable called **Color** that allows customers to select the color when they order the phone from the catalog. You can define some variables to affect an item price, depending on the choices made.

Service Catalog provides several types of variables, which are also referred to as questions. Variables can be stored, accessed from multiple places, and passed between tasks in a process when fulfilling a request. They can be displayed on the Requested Item and Catalog Task forms after an item has been ordered.

You can define service catalog variables with the catalog_admin role.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of service catalog variables

Variables allow you to specify questions for a catalog item. Several types of service catalog variables are provided. Some variable types accept variable attributes.

See the following sections for more details on each variable type. For details on creating a variable, see Create a service catalog variable. You can also provide help text for any service catalog variable. For information on defining help information, see Define help information for a service catalog variable.

Support in various channels

Service Catalog variables are supported in various channels. For information on their availability, see Variable support in various channels.

Attachment

When submitting a catalog item request, this variable lets you upload an attachment for a question of the item.

After you upload the attachment, you can also download, update, and delete it. Even when fulfilling the request, you can download, update, and delete the attachment in a requested item or catalog task. You can specify restrictions for file size and extensions using the *max_file_size* and *allowed_extensions* variable attributes. For information on these variable attributes, see Service Catalog variable attributes.

Important:

- You should specify only an integer value for the following:
  - The `max_file_size` variable attribute
  - The *glide.sc.variable.attachment.default_max_size* system property (catalog-level). The default value is 20.
- If the `max_file_size` variable attribute is not specified, the *glide.sc.variable.attachment.default_max_size* system property value is considered as the upper limit for the attachment file size.
- Irrespective of the file size allowed in the variable, the attachment file size cannot exceed the size specified in *com.glide.attachment.max_size* system property, which is applicable for attachments across ServiceNow AI Platform.
- The *g_form.setValue()* API is supported in catalog client scripts.

Note:
When you edit an attachment, the existing attachment is removed and a new attachment is uploaded.

When you upload an attachment to this variable, an entry is created in the Attachment [sys_attachment] table. The variable is not updated until you submit the item request, add it to the cart, or save the record while editing it (in fulfiller flows). If you delete or update the attachment before submitting the corresponding catalog item, the entry in the Attachment [sys_attachment] table is cleared.

The attachment uploaded for this variable is copied in the following scenarios:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In an order guide, when the variable is cascaded to a catalog item in the rule base

> **Important:**
> The individual variable attributes are not honored for the catalog items in the rule base. For example, let us consider that a variable in the **Describe Needs** section allows a .pdf attachment and the variable of a catalog item in the rule base allows a .txt attachment. When you upload an attachment of .pdf type for a variable in the **Describe Needs** section, it is initially cascaded to the variable in the catalog item as well and the variable attributes specified in the catalog item are not honored. However, if you delete this initially cascaded attachment from an individual item and try to upload a new attachment, then the individual variable attributes of the catalog item are honored.

- In a record producer, when the variable is mapped to a task table field. This variable can be mapped only to the File Attachment field type of a task table.

> **Important:**
> After an attachment is copied, the changes to the individual attachments are independent. For example, any change to an attachment in the order guide does not impact the same attachment cascaded to the catalog item in the rule base.

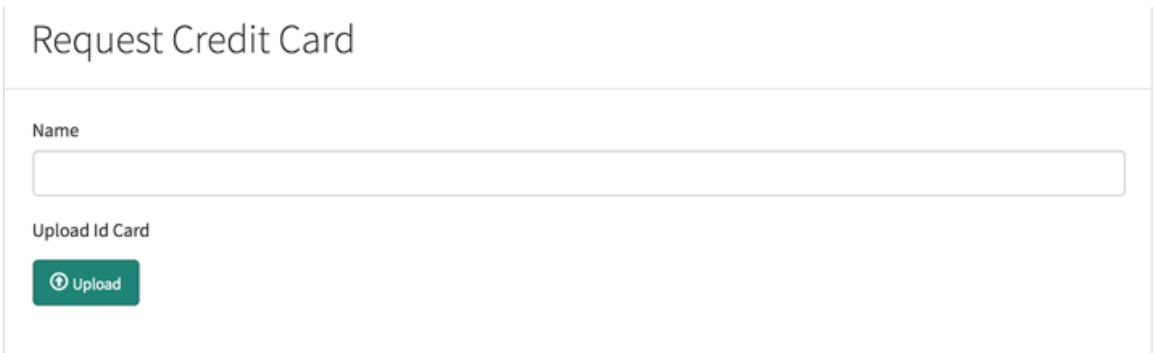
> **Warning:**
> Since the attachments are copied, a larger size can lead to performance issues.

If the system-wide anti-virus check is enabled, the anti-virus check is performed on the attachment when you:

- Submit a request for the corresponding catalog item
- Add the catalog item to the cart or wish list

> **Note:**
>
> - This variable is not supported in a multi-row variable set.
> - This variable is supported in flows and workflows.
> - This variable is available in condition builder
> - For this variable, item variable assignment is not supported in order guide.

Attachment variable

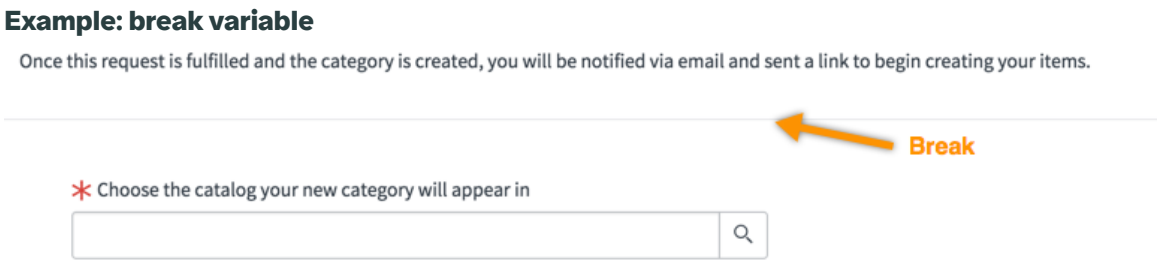


Break

The break variable displays a horizontal line across the form.

This line is a formatting element that does not collect data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Check box

The check box variable lets you enable and disable options by selecting and clearing it.

To make a check box mandatory, select the **Selection Required** option when you create the variable. For example, use this option to require users to select the **I agree** check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.

A group of check box variables is created when you create consecutive check box variables. These check box variables are sorted by their order within the group. If you want to define a custom label for the group of check boxes, create a label variable at the start of the consecutive check box variables. The label is then considered a part of this group and acts a label of the group. If there is no custom label, check boxes are grouped under an **Options** label by the application.

In a group of check box variables:

- If any check box variable in the group is mandatory, the entire group becomes mandatory irrespective of the visibility of the mandatory check box variable. An asterisk (*) is then displayed next to the group label and you must select at least one of these check boxes.
- Hiding the label hides the entire group.
- If all other check box variables of a mandatory check box group are hidden and not selected, the following scenarios are applicable:
  - The group remains mandatory as long as there is one check box in the group that is visible and not selected.
  - The last check box of this group cannot be hidden if it is not selected.

In Service Portal, to make a group of check box variables mandatory, set at least one of the check box variables as mandatory. While defining the label for a group of check boxes, setting a label mandatory does not make the group of check box variables mandatory.

In catalog builder, the following scenarios are applicable:

- If there are two consecutive check boxes, then a virtual container is created for a group of check boxes. Only check box variable types can be added inside the group
- Even if a check box variable is added immediately after a group of check boxes, it is automatically added to the group.

Under the **Type Specifications** tab, you can specify the price in different currency types. Also, you can configure the price in the following pricing models:

- Calculated
- Fixed
- Multiple

For information on the pricing models, see Price fields .

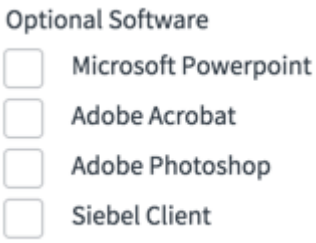
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: check box variable



Container start, container split, and container end

The container start, container split, and container end variables define a layout for a container that can hold more variables.

Use the container start and container end variables to define the start and end points of a container layout. The container end must be used along with the container start to close a container.

A container layout can be split into two or three columns using the container split variable. By default, the split is calculated at the 50% mark.

A container is similar to a variable set. Unlike a variable set, containers can be used anywhere, including inside a variable set. Containers can also be nested inside each other.

For more help with selecting the appropriate container type, see the Determining if you are using the correct container variable [KB0539982] article in the HI Knowledge Base.

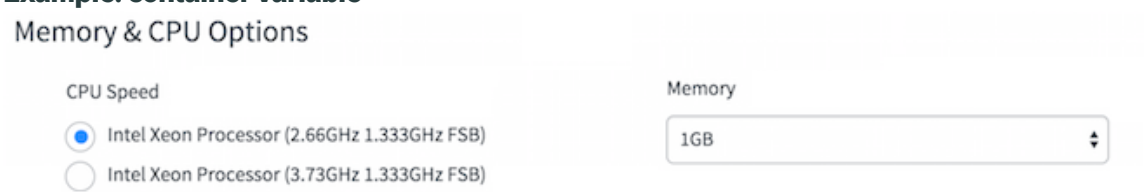
Note:

- The container variables are not yet supported on mobile devices.
- Container start, container split, and container end variables are supported in Service Portal. However, if the settings are done on the top-level container, a maximum of two-column layouts can be achieved.
- Variable sets are also considered as containers. So, a container start variable with a two-column layout under a variable set is not supported in Service Portal.

To reproduce the container shown in the following figure, enter the following settings when creating a container start variable:

- Select a **Layout** with *2 Columns Wide, alternating sides*.
- Select the **Display title** check box to use a collapsible title bar.

Example: container variable



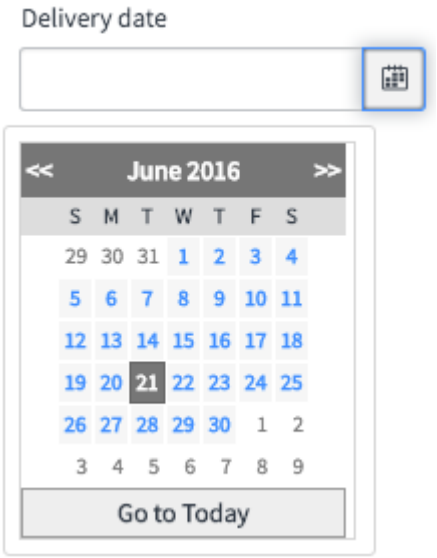
Date, Date and time, and Duration

The date variable creates a widget with a field and calendar to select a date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Date

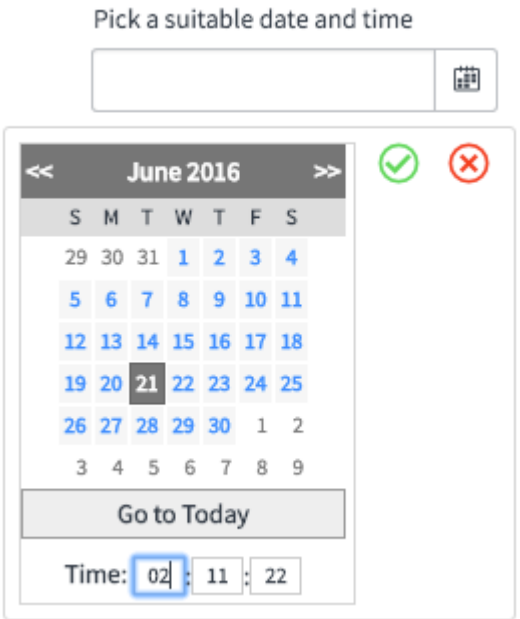
Example: date variable



Date and time

The date and time variable creates a widget with a calendar and fields to select a date and time. The time value is stored in Greenwich Mean Time (GMT) and displayed in your time zone.

Example: date and time variable



Duration

Use the duration variable to specify the duration for which a catalog item is available.

For attributes supported by this variable, see variable attributes.

Note:
Enter the duration in the DD HH:MM:SS format when setting the default value of the variable, and specifying in the g_form.getValue() and g_form.setValue() functions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: duration variable

Email

The email variable creates a widget to enter and select an email address.

The variable accepts only valid email expressions containing @ and domain information.

Example: email variable

HTML

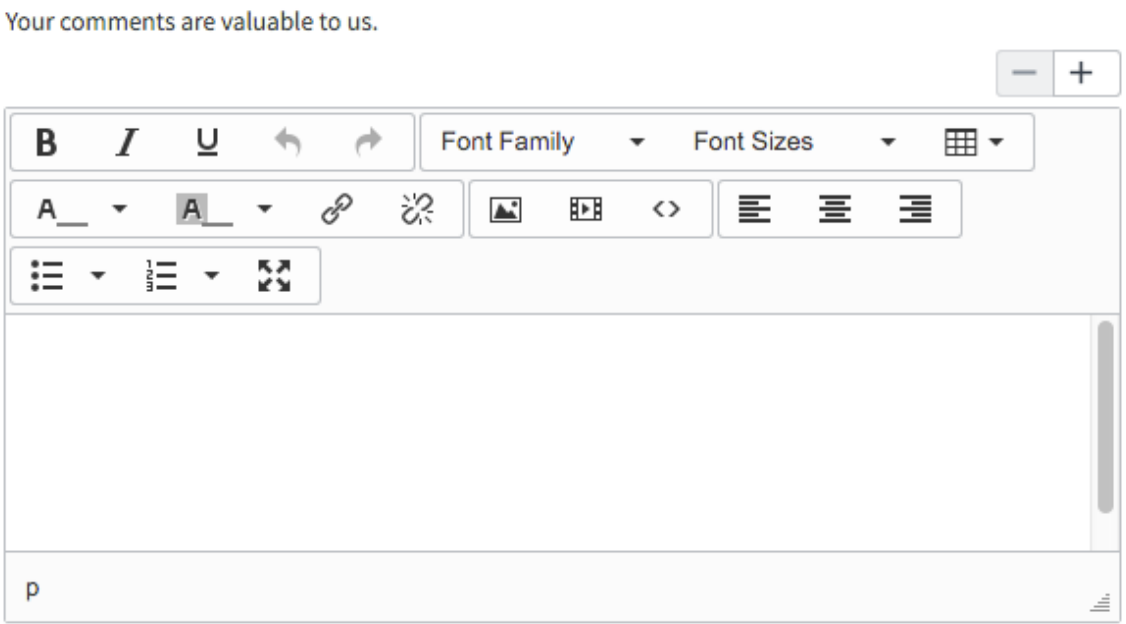
The HTML variable lets you provide content with advanced formatting, including images, for a catalog item.

Use the variable to create fields for user input. You can also use the variable for reusable content when put into a variable set, such as terms and conditions.

The variable is available in two modes: edit and read-only. In edit mode, a toolbar is available, and links do not work. In read-only mode, the toolbar is disabled, and links work. To switch between modes, use entitlements or create a UI policy to set the HTML field to read-only mode.

Note:
HTML variables are not supported for display on the shopping cart summary or approval summary screens.

Example: HTML variable



IP Address

Use the IP address variable to specify the IPv4 and IPv6 data for a catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Under the **Validation Scripts** submodule, a validation script type associated with this variable is available.

Note:
When you set the default value for the **IP Address** variable, or specify its value in the g_form.getValue() and g_form.setValue() functions, the delimiter is (.).

Example: IP address variable

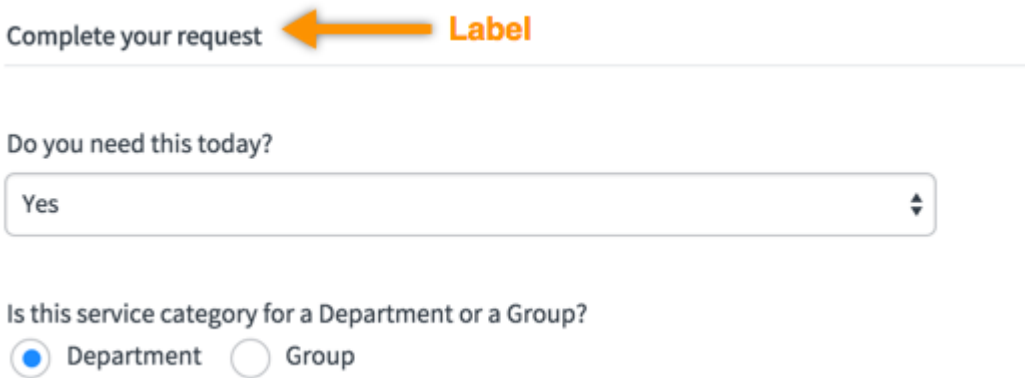
Label

The label variable displays a label across the form. Labels are formatting elements. No data is collected.

You can use labels to arrange questions into sections. You can also use labels for questions with multiple options. For example, label check boxes for the different options for a question.

You cannot set a Label variable as mandatory. However, you can make mandatory, a group of check box variables preceded by a Label variable.

Example: label variable



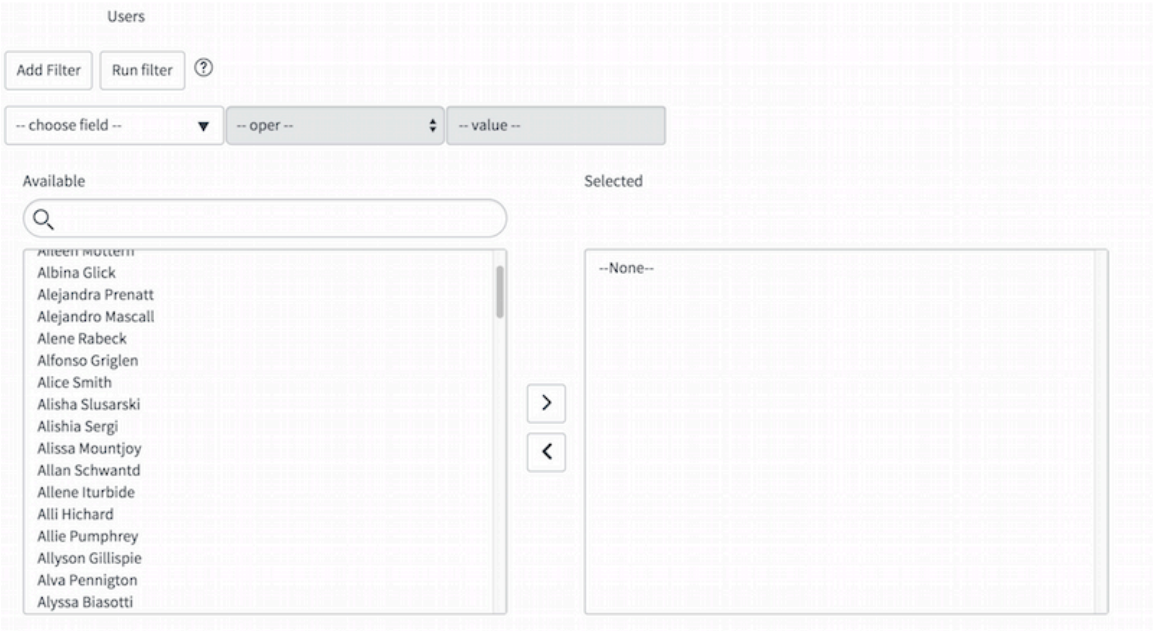
List collector

The list collector variable creates an interface that lets you select and add multiple records from a table.

For attributes supported by this variable, see variable attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: list collector variable



Note:

- The Reference Qualifier and glide_list attribute applies to releases from Helsinki onward only. The attribute does not apply to Geneva.
- You can set a value for this variable using the `g_form.setValue()` function in a catalog client script.
- When the glide_list attribute is not true, you can only set the value that is visible in the **Available** list using the `g_form.setValue()` function. This functionality is not applicable when the `setValue()` function is called onLoad.
- Table with large data causes performance issues when loading the page. Use reference qualifiers to reduce data or use the glide_list attribute.
- The values in the referenced table do not appear if the user is not logged in.
- The list collector displays a maximum of 100 items in a list. After moving items to the **Selected** list, you can click **Run Filter** to refresh the **Available** list. This action will add more available items to the list, to a maximum of 100 items.

Lookup multiple choice

The lookup multiple choice variable creates radio buttons using data from a table. Its functionality is similar to the lookup select box variable, which creates a choice list from queried data.

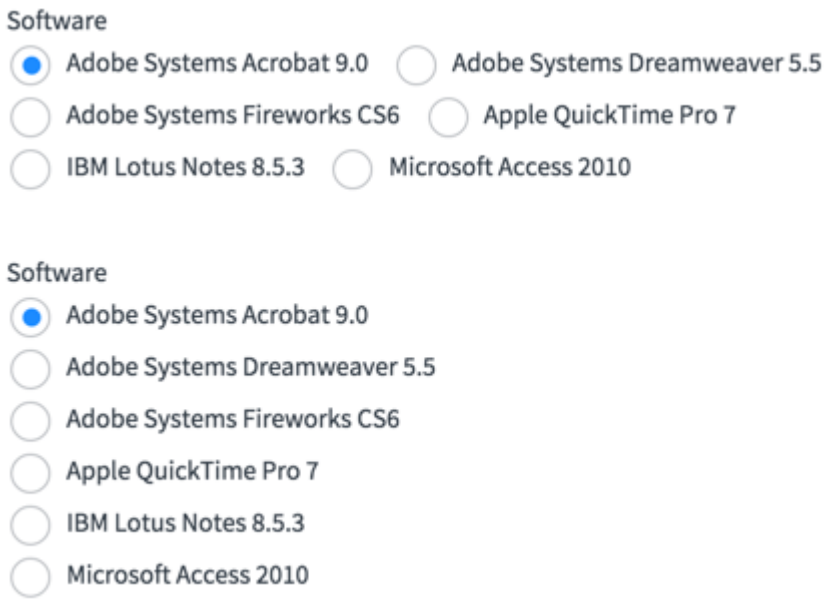
For attributes supported by this variable, see variable attributes.

Note:

- Table with large data causes performance issues when loading the page. Use reference qualifiers to reduce data or use the reference type variable.
- You cannot add more than 10,000 choices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: lookup multiple choice variable



Lookup select box

The lookup select box variable creates a choice list using data queried from a table. Its functionality is similar to the lookup multiple choice variable, which creates radio buttons from queried data.

For attributes supported by this variable, see variable attributes.

To create the lookup select box, enter the following values when creating the variable:

- **Lookup from table**: `Incident [incident]`
- **Lookup value field**: `Sys ID`
- **Lookup label field**: `number, category, priority`
- **Reference qual**: `caller_id=javascript:gs.getUserID()^active=true`

Note:

- Table with large data causes performance issues when loading the page. Use reference qualifiers to reduce data or use the reference type variable.
- You cannot add more than 10,000 choices.

Custom and Custom with label

The custom variable inserts a UI macro into the catalog item. Custom with label variable inserts a UI macro with a label.

Custom

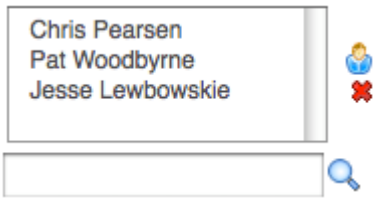
This variable inserts a UI macro into the catalog item.

UI macros in the service catalog do not support the following glide_list functions: clickthrough, slushbucket editing, and email field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use phase one Jelly only for any UI macros added as variables. Phase two Jelly within the macro is not processed and appears on the page as standard content.
- This variable is not yet supported on Classic Mobile devices.
- This variable is supported in Service Portal through widgets. Create a widget with the same functionality as that of a macro and link the widget with the variable.

Example: Custom variable

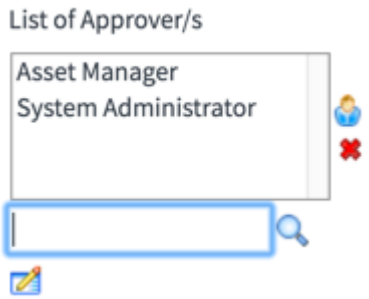


Custom with label

This variable inserts a UI macro with a label.

- This variable is not yet supported on Classic Mobile devices.
- This variable is supported in Service Portal through widgets. Create a widget with the same functionality as that of a macro with label, and link it with the variable.

Example: Custom with label variable



Masked

The masked variable inserts a field that masks the text entered.

Each character entered is displayed as an asterisk (*). Use this variable to ask users for sensitive or confidential data such as passwords.

By selecting the **Use encryption** check box, you can configure the variable to encrypt its value using various encryption algorithms before storing in the database. These values can only be decrypted by using now_GR.variables.var_name.getDecryptedValue() on RITM, Catalog Task, or any task extension record created using a record producer.

Note:
By default, the **Use encryption** field is set to true to ensure secure storage of information.

On the variable editor, you can also decrypt and encrypt the values of a masked variable using the **Show** and **Hide** buttons. These buttons are not available for a fulfiller (itil) without the catalog_view_masked role. You can only view the value that you specified while requesting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actions on an encrypted variable

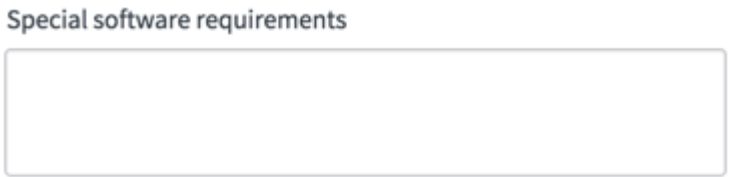
Action	Roles		
	Requester	Fulfiller with the catalog_view_masked role	Fulfiller without the catalog_view_masked role
View or hide the encrypted value on catalog forms	Yes	Not applicable	Not applicable
Edit the encrypted value on catalog forms	Yes	Not applicable	Not applicable
View or hide the encrypted value on the variable editor	Yes	Yes	No
Edit the encrypted value on the variable editor	Yes **Note:** If the masked variable is read-only on the variable editor, the variable value is not editable	Yes **Note:** If the masked variable is read-only on the variable editor, the variable value is not editable	No

Example: masked variable

Multi-line text

The multi-line text variable creates a field that lets you enter multiple lines of text.

Example: multi-line text variable

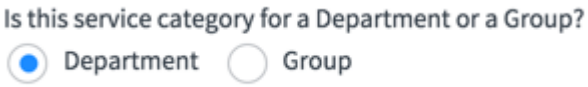


Multiple choice

The multiple choice variable creates radio buttons for question choices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: multiple choice variable



Numeric scale

The numeric scale variable creates a set of radio buttons for a range of options, like a Likert scale.

Example: numeric scale variable

Reference

A reference variable references a record in another table. For example, a variable named point_of_contact references the User [sys_user] table.

For attributes supported by this variable, see variable attributes.

Keep the following information in mind when you create a reference variable:

- Reference variables use the auto-complete feature . To ensure that users have enough information to make the selection, configure the reference lookup list .
- Reference variables store the sys_id of the selected record (like reference fields). To use the display value in a script, use the same methods as for a reference field.

```
current.variables.<variable name>.getDisplayValue()
```

Example: reference variable

Requested for

Before submitting a catalog item request, this variable helps you specify who this request can be submitted for.

Requested For

You should specify this information while answering catalog item questions.

Important:

- You can only specify users from the User [sys_user] table.
- If you don't specify the default value for this variable, the current logged-in user requesting the item is considered as the default Requested For variable value.
- You can submit the request for a user based on access to a catalog item. The **Access Type** field of the catalog item can be used to specify if a request can be submitted for a user who does not have access to the catalog item.
- For this variable, item variable assignment is not supported in the rule base of an order guide. If the order guide contains the Requested For variable, the value would be cascaded to the equivalent variable of items in the rule base as read-only.

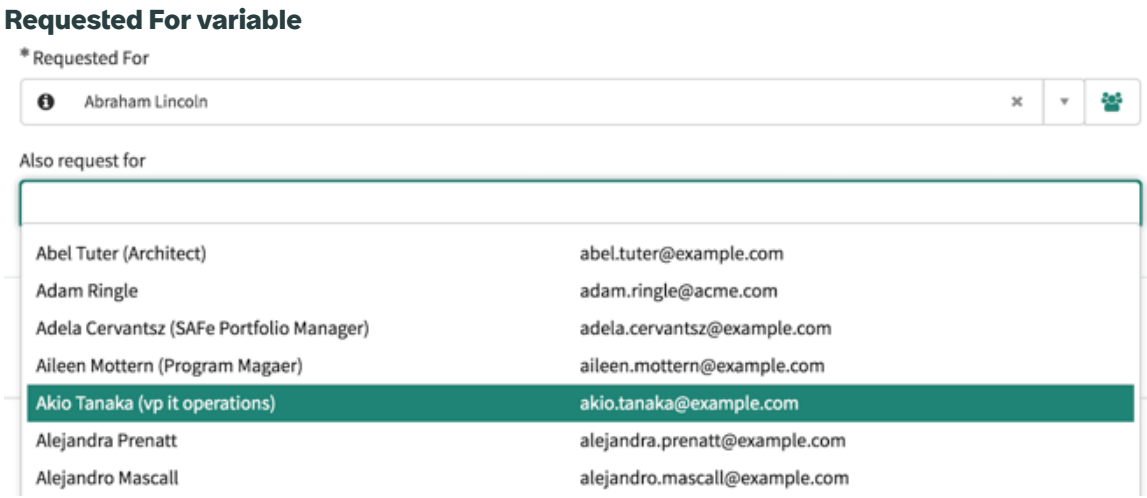
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the **Enable also request for** field of the Requested For variable, you can request a catalog item for different users under one request.

For information about delegated request experience, see Delegated request experience.

Important:

- You can add this variable to a catalog item or variable set. However, when submitting the request, a catalog item can have only one Requested For variable.
- You can add only one Requested For variable for a variable set.
- This variable is not supported in a multi-row variable set.
- After the request is submitted, this variable value is visible in the variable editor and variable summarizer.



Rich Text Label

This variable displays a formatted label on a catalog item form.

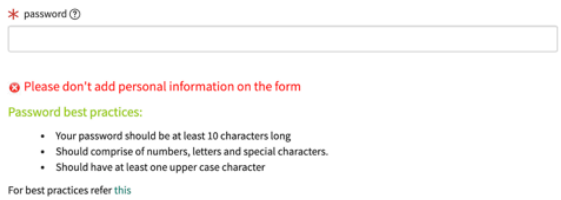
In the TinyMCE rich text editor, you can format the label and add images or links. This variable supports the HTML tags.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You can make this variable visible using catalog client scripts and catalog UI policies.
- You cannot cascade this variable in an order guide.
- You cannot set this variable as mandatory.
- In the Automated Test Framework, this variable is only supported in the Variable State Validation step to check the visibility.
- This variable is not supported in the following:
  - Variable summarizer
  - Multi-row variable set
  - Condition builders and reports
- You cannot specify the following for this variable:
  - Help text and instructions
  - Tool tip
  - Permissions
  - Variable width
  - Example text
- The `g_form.setValue()`, `g_form.setReadOnly()`, and `g_form.setMandatory()` APIs are not supported in catalog client scripts. Only the `g_form.setVisible()` API is supported.

Rich Text Label variable

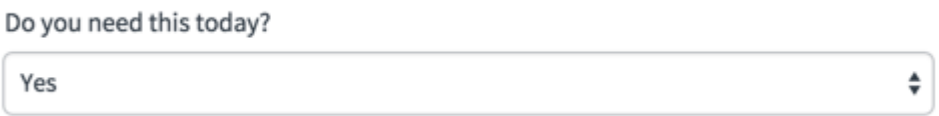


Select box

The select box variable creates a list from predefined question choices.

For attributes supported by this variable, see variable attributes.

Example: select box variable



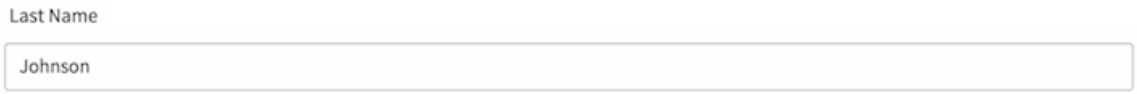
Single-line text

The single-line text variable creates a field to enter a single line of text.

For attributes supported by this variable, see variable attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example :single-line text variable



UI page

The UI page variable inserts a UI page into the catalog item.

- Use phase one Jelly only for any UI macros added as variables. Phase two Jelly within the macro is not processed and appears on the page as standard content.
- This variable is not yet supported on Classic Mobile devices and in Service Portal.

URL

The URL variable creates a widget for users to enter URLs.

URLs are validated for the following protocols: HTTP, HTTPS, FTP.

Note:
This variable is not editable on Now Mobile.

Example: URL variable

Wide single-line text

The wide single-line text variable creates a field that spans the form, letting users enter longer lines of text.

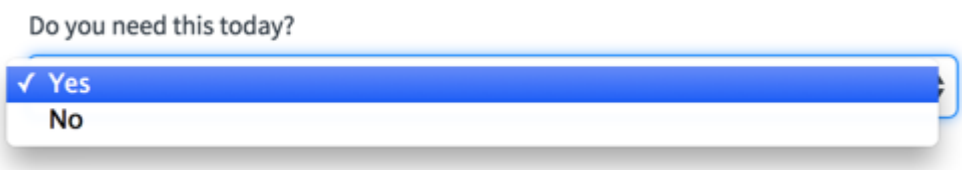
For attributes supported by this variable, see variable attributes.

Example: wide single-line text variable

Yes/No

The Yes or No variable creates a choice list with **Yes** and **No** as options.

Example: Yes or No variable



Variable support in various channels

Service Catalog variables are supported in various channels.

Create a service catalog variable

Create service catalogs variables to gather information from users ordering a catalog item, for example, to ask users which options they want for the item.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. Select the catalog item that you want to create a variable for.
3. In the **Variables** related list, click **New**.
4. Select the variable type.
   Only the applicable fields for the variable type are then displayed.
5. In the form, fill the fields.

Variable form

Field	Description
Application	Read-only field that indicates which applications can use this variable.
Map to field	Maps the variable to a specific field on the table for the record producer. This field appears if the variable belongs to a record producer.
Type	The variable type that you want to create. For more information, see Types of service catalog variables.
Catalog item	Catalog item using the variable.
Order	Order that the variable is placed on the page for the catalog item. The variables are organized from top to bottom from least to greatest order value. For example, a variable with an order value of 1 is placed above other variables with higher-order values.
Active	Check box to make the variable available for use
Mandatory	Check box to make the variable mandatory as part of the ordering process. **Note:** This behavior is applicable only on page load, and can be changed via client APIs.
Read only	Option to make a variable read only or editable.
Hidden	Option to hide a variable.
Unique	Option to disallow duplicate values for this variable within a multi-row variable set. **Note:** ○ This field appears only for a variable created in a multi-row variable set. ○ This behavior is applicable only in ServiceNow AI Platform, Service Portal, and variable editor in Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Selection Required	Check box to require users to select the check box variable. For example, use this option to require users to select an **I agree** check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.
Global	If selected, the variable is available for all catalog tasks within service catalog workflows or execution plans by default. If deselected, the variable must be associated with individual catalog tasks.
Field	Field that the variable maps to. This field appears if the variable belongs to a record producer.
Record producer table	Table that the record producer creates a record in. This field appears if the variable belongs to a record producer.
Question	
Question	Question to ask users ordering the catalog item.
Name	A name to identify the question. **Note:** If this field is empty, its value is auto-populated based on the **Question** field for all variable types except break, container split, and container end.
Tooltip	Tooltip text to display when users point to the variable. Enter a brief note to describe the purpose of the 'Question'.
Example text	Hint that is displayed in the question field before a user enters a value. Applicable for the following variables: ○ IP Address ○ Email ○ URL ○ Single Line Text ○ Wide Single Line Text ○ Multi Line Text ○ Date ○ Date/Time
Rich Text	Formatted label to be displayed on a catalog item form. Applicable for the Rich Text Label variable.
Annotation	
Show help	If selected, displays the help text and instructions for the variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ It is not available for break and check box variables. ○ Help text and instructions are not available for a variable set.
Always Expanded	If selected, the **Help text** and **Instructions** field value are expanded by default when the catalog item page loads. This check box appears only when the **Show help** check box is selected. **Note:** ○ This field is also applicable in Service Portal. ○ This field is not applicable in the variable editor in Workspace and Catalog Item UIB component. ○ If the **Expand help for all questions** check box is selected at the catalog item level, then the **Always Expanded** field setting at the variable level is overridden. ○ If the **Expand help for all questions** check box is deselected at the catalog item level, then the **Always Expanded** field setting at the variable level is applicable.
Help tag	If the **Always Expanded** check box is deselected, click the value specified in this field to display the **Help text** and **Instructions** field values. This field is not applicable in the variable editor in Workspace and Catalog Item UIB component.
Help text	Help information for a service catalog variable. This field is applicable in ServiceNow AI Platform, Service Portal, and variable editor in Workspace, and Catalog Item UIB component. However, in Workspace and Catalog Item UIB component, you can view either help text or instructions. If both instructions and help text are available, you can view only the instructions. This field is not applicable for Break, CheckBox, Container End, Container Split, Macro, and UI Page variables. In Workspace and Catalog Item UIB component, this field is additionally not applicable for a Masked variable.
Instructions	Information that requires rich text formatting or adding images to support help information. This field is applicable in ServiceNow AI Platform, Service Portal, and variable editor in Workspace, and Catalog Item UIB component. However, in Workspace and Catalog Item UIB component, you can view either help text or instructions. If both instructions and help text are available, you can view only the instructions. In Workspace and Catalog Item UIB component, this field is additionally not applicable for a Masked variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: For HTML tables, use sizes that are within the width of the variable.
Type Specifications (The fields in this section vary for each variable type)	
Variable Width	Width for the variable on the catalog item page, to specify what percentage of the screen size that it can span. For details, see Configure a default width for service catalog variables. This field appears for all variable types except for break, container end, container start, container split, container layout, and label variables.
Enable also request for	Option to allow a catalog item request to be submitted for multiple users. After you select this option, the **Also request for** field is displayed along with Requested For variable in a catalog item. ○ This functionality is only applicable in Service Portal. ○ This field is applicable only for the Requested For variable. For information about delegated request experience, see Delegated request experience.
Roles to use also request for	Option to specify the roles that can submit a catalog item request for multiple users. ○ This functionality is only applicable in Service Portal. ○ This field is applicable only for the Requested For variable. ○ This field appears only when the **Enable also request for** check box is selected. **Note:** If no role is specified, anyone who has access to the catalog item can submit the request. For information about delegated request experience, see Delegated request experience.
Choice direction	The direction in which the choice list is arranged. ○ **Across**: Arranges choices horizontally. ○ **Down**: Arranges choices vertically. This field appears for lookup multiple choice variables. **Note:** The selected direction is also applicable in Service Portal.
Choice field	Table field to populate options for the variable. If no choices are defined for a field, then the variable loads field-related distinct values from the table. This field appears for select box variables.
Choice table	Table with values to populate in the **Choice field**. This field appears for select box variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Do not select the first choice	Check box to leave all options for the variable cleared on the catalog item page. If this check box is selected, the first choice for the variable selected by default. This field appears for multiple choice and numeric scale variables.
Dynamic ref qual	Dynamic qualifier. Select a dynamic filter to run a query against the reference field. This field appears for reference variables when **Use reference qualifier** is set to **Dynamic**.
Include none	Check box to include the **None** option in a list of choices. This field appears for lookup multiple choice, lookup select box, multiple choice, and select box variables.
Layout	Layout for a container, whether one or two columns. This field appears for container start variables.
List table	Table with the values for the list collector. The table should have a display column specified. This field appears for list collector variables.
Lookup from table	Table from which values are obtained for users to select. The values from this table are populated in the **Lookup value field**. This field appears for lookup multiple choice and lookup select box variables.
Lookup value field	Field in the lookup table that populates options for the variable. This field appears for lookup multiple choice and lookup select box variables.
Lookup label field(s)	Comma-separated list of fields in the lookup table whose values are used to display options. This field appears for lookup multiple choice and lookup select box variables.
Lookup price field	Field in the lookup table whose value is used to modify the price of the item being ordered. This field appears for lookup multiple choice and lookup select box variables.
Lookup recurring price field	Field in the lookup table whose value is used to modify the recurring price of the item being ordered. This field appears for lookup multiple choice and lookup select box variables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Macro	UI macro to insert into the catalog item. This field appears for macro, macro with label, and UI page variables.
Summary macro	Applicable only for Marco, and Macro with Label type variables.
Widget	Applicable only for Marco, and Macro with Label type variables.
Price if checked	Price of the item. This field appears for check box variables.
Recurring price if checked	Price that increments for the item, when the user requests more than one order of the item. This field appears for check box variables. For more information about prices and recurring prices, see Using variables for price setup.
Reference	Reference table for the variable. The table should have a display column specified. This field appears for reference variables.
Reference qual	Qualifiers to restrict data that is available in the field. Supports reference qualifiers and advance qualifiers. For more information, see Reference qualifiers. Returns all matching results (no maximum). **Note:** For security reasons, the use of scripts in the **Reference qual** field is restricted to system administrators through the **Allow javascript in Default Value** business rule. This field appears for list collector, lookup multiple choice, lookup select box, reference and Requested For variables. It appears for reference variables when **Use reference qualifier** is set to **Dynamic**.
Reference qualifier condition	Options to build conditions. This field appears for reference variables when **Use reference qualifier** is set to **Simple**.
Scale max	Highest value on the scale of available options for the variable. This field appears for numeric scale variables.
Scale min	Lowest value on the scale of available options for the variable. This field appears for numeric scale variables.
Unique values only	Check box to require a unique value for the field. When this check box is selected, two records cannot have the same value for that field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears for lookup multiple choice, lookup select box, and select box variables.
Use confirmation	Check box to prompt users to reenter data to verify their entries. This field appears for masked variables.
Use encryption	Check box to store the answer in encrypted format in the database. If not encrypted, the answer is stored in plain text format. Encryption uses Triple DES with system encryption. This field appears for masked variables.
Use reference qualifier	Type of qualifier to use. This field appears for reference variables.
Validation Regex	Regular expression that validates the variable value. This field is displayed only for Single Line Text and Wide Single Line Text variable types. To define regular expressions, see Define a regular expression for a variable. **Note:** ○ This field is also applicable in Service Portal. ○ The max_length attribute value is valid even when the validation regex is set. ○ You cannot add a catalog item with regex validation errors to the wishlist.
Variable attributes	Attributes that define the behavior and restrictions for a variable. For information on variable attributes, see Service catalog variable attribute.
Topic block	Specify the topic block similar to configured UI macros or widgets used in the custom or custom with label variables to replicate the same behavior in a Virtual Agent conversation. **Note:** This field is available only for the "Custom" and "Custom with Label" variable types.
Default Value	
Default value	Default value for the variable.
Permission If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role. For example, if no role is specified for the **Write roles** field, all users who can access the catalog item can edit the variable value in the variable editor. A user with a role that does not match any of the following roles cannot set variable values even through scripting.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
These roles are not available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables.	
Read roles	Roles that can view the variable before or after requesting the catalog item or record producer. Only a user with the roles specified in this field can view the variable.
Write roles	Roles that can edit the variable in the variable editor after requesting the catalog item or record producer. If a user does not have the roles specified in this field, the variable is read-only in the variable editor.
Create roles	Roles that can create values for the variable before requesting the catalog item or record producer. If a user does not have the specified role, the variable is read-only before requesting the catalog item or record producer.
Availability	
Visible Elsewhere	If selected, the variable is visible in the item form before ordering the item, in VEditor after ordering the item, and in the cart view of the item.
Visible on Bundles	If selected, the variable is visible when the item is added to a bundle.
Visible on Guides	If selected, the variable is visible when it is added to an order guide, or when it is added to a catalog item that is included in the order guide. **Note:** If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides.
Visible on Summaries	If selected, the variable is visible on any variable summarizer of the catalog item. In Service Portal, the variable is visible in the RITM ticket page and the Approval page. In Now Mobile, the variable is visible in the RITM and the Approval records.
Remove from Conversational Interfaces	If the catalog item has a variable that's making the item non-conversational, for example, a variable about pricing, then select the check box so that the catalog item becomes conversational. **Note:** This option doesn't apply to the a multi-row variable set (MRVS).

6. Click **Submit**.

Define help information for a service catalog variable

Enter help information for a variable to help users determine what info they must provide for a service catalog variable.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

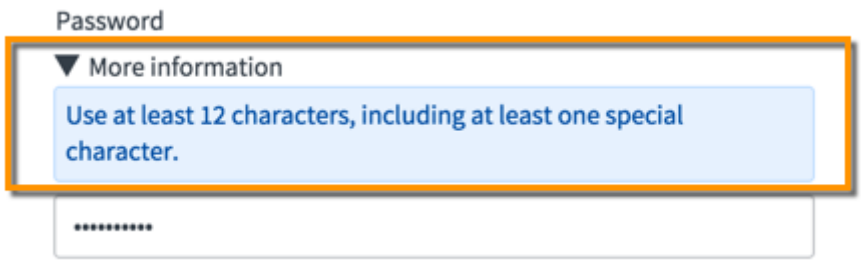
Demonstrates these options to provide help text for service catalog item variables: tooltips, help text, instructions (HTML help text), and example text.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and click the catalog item with the variable that you want to provide help for.
2. In the **Variables** related list, click the variable.
3. In the **Annotation** section of the Variable form, select the **Show help** check box.
   The **Help tag**, **Help text**, and **Instructions** fields appear.
4. In the **Help tag** field, enter the short descriptive text that appears between the question and the responses.
   For example, **Click here for help** or **Preview**.
5. In the **Help text** field, enter the help text that displays for users who clicks the **Help tag** on the page for the catalog item.

Note:
The **Help** and **Help text** fields do not support HTML tags.

Example of help information



Service Catalog variable attributes

There are a few Service Catalog variables support specific attributes to define the behavior and restrictions for variables.

In the Catalog variable form, under the **Type Specifications** tab, you can specify the variable attributes in the **Variable attributes** field.

Note:

- You can enter multiple attributes for a variable type by separating each with a comma.
- You can enter multiple values for an attribute by separating each with a semicolon.
- If you don't see the **Variable attributes** field, enable the **Show attributes when Type is One of Certain Values** UI policy.
- Pre-selected values are not cleared automatically when the dependent variable value changes when using an attribute or reference qualifier. Create a client script to clear the values based on your needs and the needs of your customer.

Variable attributes

allowed_extensions

Specifies a list of allowed file types. For example, `allowed_extensions=txt;pdf`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applicable variables: Attachment

barcode

Specifies if the barcode can be scanned using the mobile camera for identifying a variable value of a catalog item. For example, `barcode=true`.

Applicable variables: Single Line Text

max_file_size

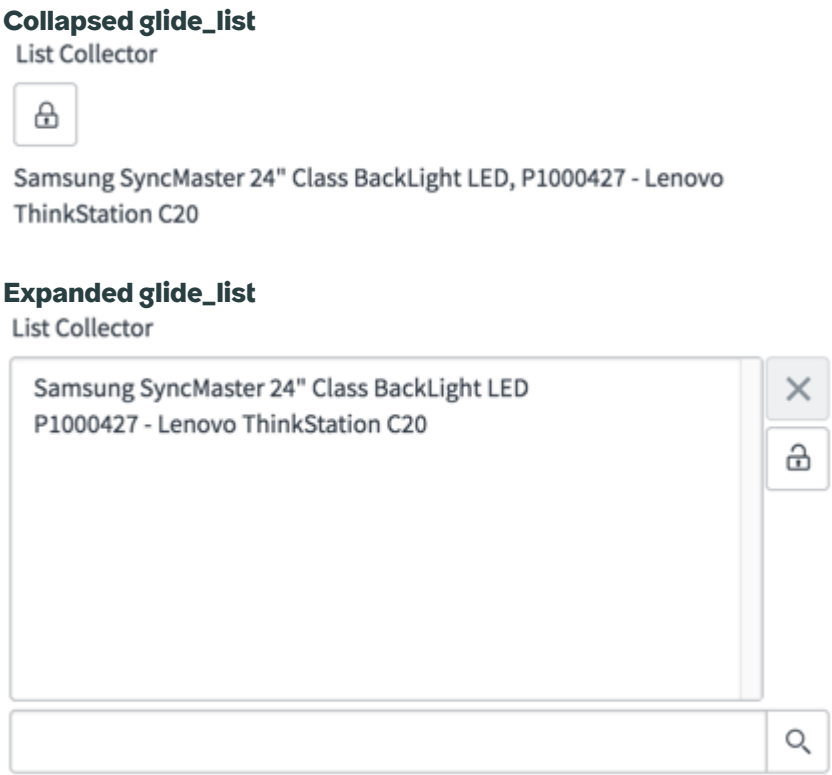
Specifies the maximum file size in MB. For example, `max_file_size=2`.

Applicable variables: Attachment

glide_list

Changes the list collector interface from slushbucket to glide list.

Applicable variables: List collector



is_searchable_choice

If set to **true**, enables you to search for and select the required value for the variable. For example, `is_searchable_choice=true`.

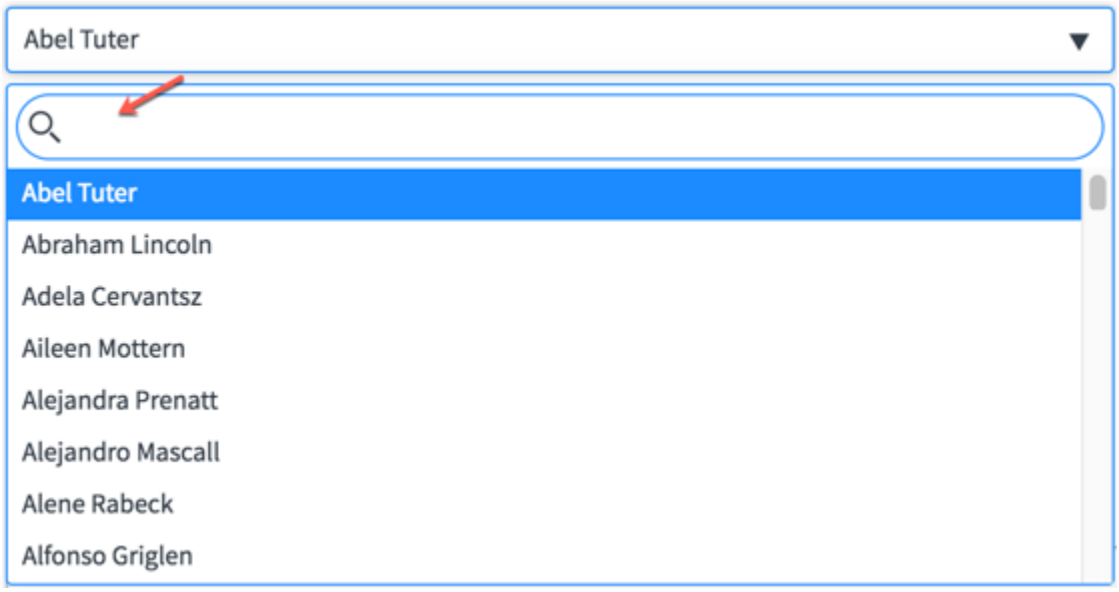
Note:

- For Lookup select box, a default value is available at the page load itself.
- This attribute is not applicable in Service Portal.

Applicable variables: Lookup select box, Select box

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

is_searchable_choice



max_length

Sets the maximum number of characters allowed in the field. By default, the field accepts long strings of text, several thousand characters. Set the *max_length* attribute as appropriate for the information that the variable is collecting. For example, to allow for entry of an address, set `max_length=200`, or other appropriate length.

Applicable variables: Single-line text, Wide single-line text

max_unit

Sets the maximum unit of time for the duration. Possible values are `max_unit=days`,`max_unit=hours`,`max_unit=minutes`, and `max_unit=seconds`.

For example, if `max_unit=minutes`, the duration is displayed in minutes and seconds. In this case, a duration of 2 days 3 hours 5 minutes 15 seconds is displayed as 3065 minutes 15 seconds.

Applicable variables: Duration

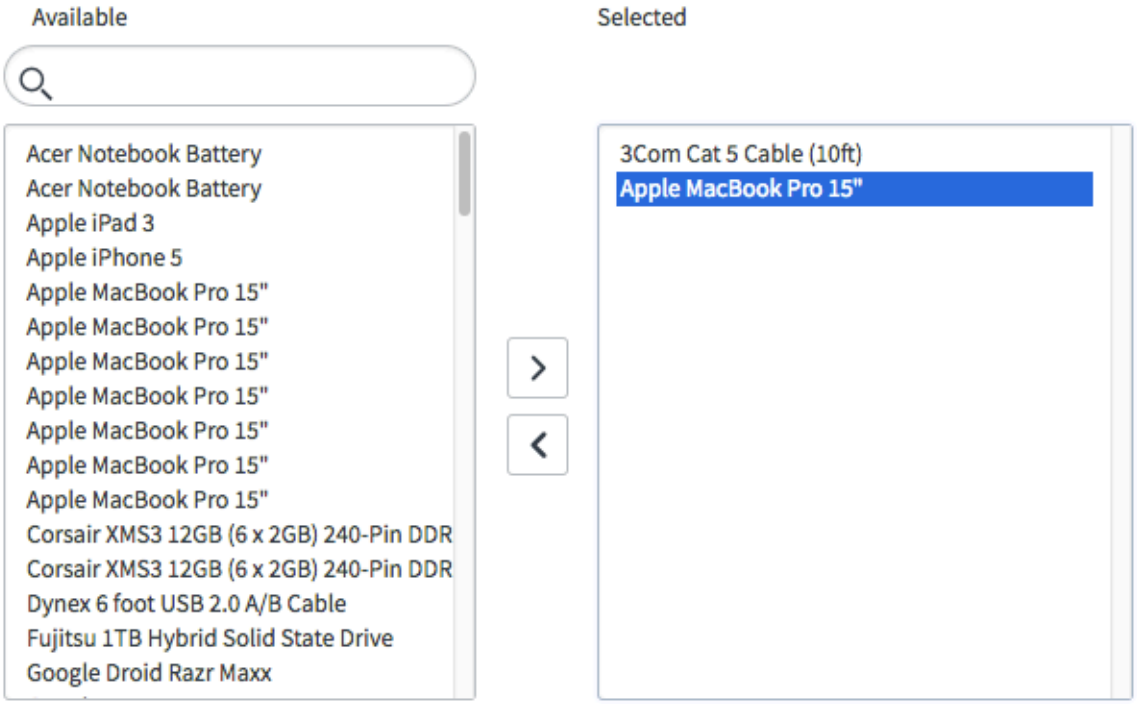
no_filter

Hides the filter fields that appear above a list collector.

Applicable variables: List collector

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

no_filter



ref_ac_columns

Specifies the columns with display values that appear in an auto-completion list in addition to the name. Separate column names with a semicolon. For example, `ref_ac_columns=user_name;email;sys_created_on` allows auto-complete to match text from the user_name, email, and sys_created_on columns.

Applicable variables: Reference, Requested For.

ref_ac_order_by

Specifies the column that is used to sort the auto-completion list. For example, `ref_ac_order_by=name` sorts the auto-completion choices alphabetically by name.

Applicable variables: Reference

ref_auto_completer

Specifies the name of a JavaScript class (client-side) that creates the list for auto-completion choices. Valid class values include:

- **AJAXReferenceCompleter**: Displays matching auto-complete choices as a drop-down list. The list only displays the display value column of the reference table. If there is no other auto-completion class specified, reference fields automatically use this class.
- **AJAXTableCompleter**: Displays matching auto-complete choices as rows in a table. The table displays the display value column of the reference table and any columns listed in the ref_ac_columns attribute.
- **AJAXReferenceChoice**: Displays matching auto-complete choices as a drop-down list. The list only displays the display value column of the reference table. The list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applicable variables: Reference

ref_qual_elements

A list of fields to be sent back to the server to get an updated reference.

Applicable variables: Lookup multiple choice, Lookup select box, List Collector.

Important:
Attribute behavior is specific to the service catalog desktop.

Define a question choice for a variable

Define a question choice for a variable with service catalog.

Before you begin
Role required: admin

About this task
Some variable types present the user with a list of choices. For example, a multiple choice variable that asks how much memory you want in a computer requires you to define the available choices, such as 1 GB and 2 GB.

Procedure

1. Open the variable definition.
2. In the **Question Choices** related list, click **New**.
3. Enter the question choice details in **Question Choice** form and click **Submit** to save the record.
   - **Price** and **Recurring price**: variables can affect the item price and recurring price (if used).
   - **Order**: the number defining the order in which the price appears when displayed.
   - **Question**: the actual question being asked for that variable.
   - **Text**: the choice presented to the user.
   - **Value**: the value stored in the database.
   - **Inactive**: Option to make a question choice inactive.
4. Repeat the steps for each available choice to define the full set of choices for that variable.

Note:
When you modify variable choices that are attached to a catalog item, the existing requested items (RITMs) are also affected. For example, if you add a variable choice for the catalog item, the value of that choice is also considered in the existing RITMs. If you delete a variable choice that is selected for a RITM, the value of that choice still persists in the RITM.

Service catalog data lookup

The Data Lookup and Record Matching Support for Service Catalog plugin offers similar features to the general Data Lookup and Record Matching Support plugin.

Use the plugin for service catalog to perform data lookups for variables. This lookup can be on service catalog item screens, on requested items, and on catalog tasks as a user fills out the values contained in variables.

Service Catalog data lookup roles

Service Catalog enables specific roles to participate in the process of creating and using Service Catalog data lookups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog data lookup roles

Role	Description
catalog_lookup_admin	Similar to data_lookup_admin. Can create, update, and delete catalog data lookup definitions, matcher variable definitions, and setter variable definitions.
catalog_lookup_manager	Can read catalog data lookup definitions, matcher variable definitions, and setter variable definitions. The role can be granted to anyone using catalog data lookups so they can see the definitions for which they are creating rules. As required, grant create, read, write, or delete access to the individual data lookup rules tables created to delegate maintenance.

Create a catalog lookup definition

Create a catalog data lookup definition record.

Before you begin

Role required: admin or catalog_admin

About this task

Note:
The *Run on Insert* and *Run on Update* options are not supported for catalog data lookups. Other options operate the same as for normal data lookup.

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Data Lookup Definitions**.
2. Click **New**.
3. Select **Catalog Data Lookup Rule**.
4. Enter a *Name*.
5. In *Applies to*, select catalog item or variable set.
6. In *Catalog item/Variable set*, select a specific item or set.
7. Select a **Matcher Table**.
8. Select other options, as required.
9. Right-click the form header and click **Save**.
10. From the *Catalog Matcher Variable Definitions* related list, click **New**.
11. Fill in the fields, as appropriate.

Catalog data lookup definitions fields

Field	Description
Name	Enter a unique name to identify the definition record.
Applies to	Select what the data lookup rule applies to: a catalog item or a variable set.
Catalog item/ Variable Set	Select the catalog item or variable set to which the data lookup rule applies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Matcher Table	Any table within the current scope containing the lookup values. **Note:** The list shows only tables and database views that are in the same scope as the catalog data lookup definition.
Active	Select this check box to run this catalog data lookup rule. Clear the check box to ignore this catalog data lookup rule.
Run on form change	Select this check box to automatically look up values whenever a user changes a variable value on a catalog item or form. This option is the only supported method for catalog data lookup rules. **Note:** This option does not include changes automatically made by other data lookup rules, such as the priority lookup rules.

12. Click **Submit**.
13. From the *Catalog Setter Variable Definitions* related list, click **New**.
14. Fill in the fields as appropriate.

Setter variable definition fields

Field	Description
Data Lookup	Displays the name of the parent data lookup definitions record.
Source variable field	Select the variable from the source item or variable set that the data lookup updates.
Matcher table field	Select the field from the matcher table that provides the new value for the update.
Always replace	Select this check box to replace any existing value with a value from the data lookup. Clear this check box to ignore the update if the field has an existing value.

15. Click **Submit**.
16. Click **Update**.

Add a data lookup value

The columns of a data lookup table contain both matcher and setter field data. Each data lookup is a query that searches for a row containing values that match the matcher fields.

Before you begin
Role required: catalog_lookup_admin

About this task
The data lookup then returns the value listed in the setter fields.

For example, you can define the matching settings for bronze, silver, and gold offerings as described previously.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the navigation filter, enter the name of the new custom lookup table.
2. Configure the list and create appropriate fields for the lookup table.
3. From the table list, click **New** and enter appropriate matcher and setter field values.
   For example:

Service Catalog lookup 1

Server Offering Lookups | New | Go to Order | 1 to 3 of 3

All

Order	Offering	Disk Space	Memory	Active
100	Gold	1000	32	true
100	Bronze	250	16	true
100	Silver	500	16	true

Actions on selected rows... | 1 to 3 of 3

> **Note:**
> Each row in a data lookup table must be unique.

Custom data lookup

You can create a custom table to store lookup data.

The custom table must extend the Data Lookup Matcher Rules [dl_matcher] table.

For example, you can create a Server Offering Lookups table. It stores information about matcher offerings (bronze, silver, and gold) and associated setter values (memory and disk space) for each matcher offering.

Create a custom data lookup

Creating a catalog data lookup is similar to creating a normal, custom data lookup except when creating the catalog data lookup definition record.

1. Create a custom data lookup table. It must extend the Data Lookup Matcher Rules `[dl_matcher]` table.
2. Add data lookup values to the data lookup table.
3. Create a catalog data lookup definition record.
4. (Optional) Create a data lookup module.

Troubleshooting

If the custom data lookup definition rules are not behaving as expected, check for certain conditions.

If the custom data lookup definition rules are not behaving as expected, check for the following conditions:

- Ensure that the matcher variable is not read-only. Since users cannot change read-only variables, there cannot be an on form change event for read-only variables.
- Ensure that the data in the matcher table is correct.
- If the lookup requires an exact match, verify that there is a matcher table row for each possible combination (including blank values). The lookup fails if it cannot find a matching value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the variable is an option or check box, it always has a value, so you must select **Always replace**.
- Verify that you have not created a recursive rule, such as:

  If Variable A = 1, then Variable B =2. If Variable B = 2, then Variable A = 2.

Audit service catalog variables

Audit the variables so that the audit history records all changes to the named variables.

Before you begin
Role required: admin

About this task
Auditing is enabled by default for service catalog variables.

These changes are displayed in:

- The requested item history for all variables associated with the item.
- The catalog task history for all variables that are used by the task.

This auditing allows service catalog administrators to view a full history of changes to variables that can affect the parent record, including their creation.

Note:
Unnamed variables are not audited.

Procedure

1. Navigate to **All** > **System Properties** > **Service Catalog**.
2. Locate the line **Audit changes to Service Catalog Variables**.
3. Select the **Yes** check box to enable auditing.

Service Catalog variable editors

Variable editor displays variable values in fulfiller forms. A requester, while requesting the item, specifies these variable values in the catalog item questions.

Types of variable editors based on the catalog item type:

- For a catalog item, the VEditor (`com.glideapp.servicecatalog.VEditor`) displays the values of questions in the requested item and catalog task forms.
- For a record producer, the default variable editor (`com.glideapp.questionset.DefaultQuestionEditor`) displays the values of questions for records generated from a record producer for task-extended tables.

Warning:
The variable editor depends on the **Variables** column of the Task [task] table. By default, this column is inactive, and you should not make it active.

VEditor

The VEditor is applicable only for the requests created from catalog items.

In ServiceNow AI Platform, this editor is a formatter added on the requested item (RITM) form (Default View) and the catalog task form (Default View).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The VEditor is applicable only for RITMs and catalog tasks. It cannot be used for any other tables. To support catalog UI policies or catalog client scripts on the VEditor for the RITM and catalog task form, select the **Applies on Requested Items** and **Applies on Catalog Tasks** check boxes for the catalog UI policy or the catalog client script.

Note:
The values in the VEditor are displayed from the Options [sc_item_option] table. This is an internal table and you should not add any business rules to this table.

To make the VEditor read-only in ServiceNow AI Platform, activate the onLoad client script, *`Variable Editor Readonly`*, for the following tables:

- Requested Item [sc_req_item]
- Catalog Task [sc_task]

Note:
You can make the *`Variable Editor Readonly`* scripts conditional, by adding conditions to them.

VEditor

Default variable editor

The default variable editor is applicable only for record producers. This editor is a formatter added on records that are generated by a record producer for task-extended tables. This editor displays the values of questions specified in the record producer.

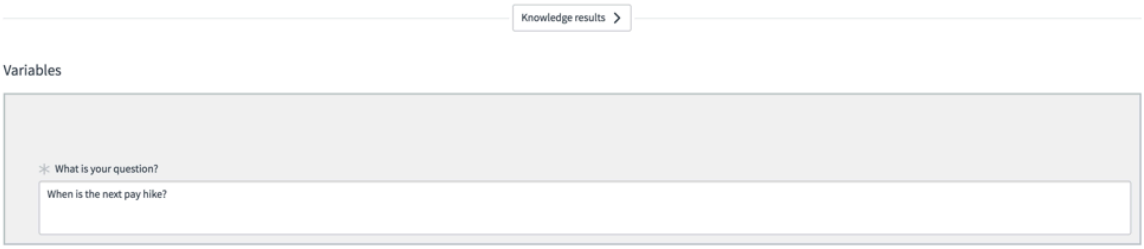
By default, this editor is applicable for the Incident and Change tables. For other tables, you can configure this editor.

Catalog UI policies, catalog client scripts, catalog data lookups, reference qualifiers, and dependent reference fields are supported on the default variable editor only for task-extended tables. To support a catalog UI policy or a catalog client script on this editor, select the **Applies on the Target Record** check box for the catalog UI policy or the catalog client script.

Note:
The values in the default variable editor are displayed in the Question Answer [question_answer] table. This is an internal table and you should not add any business rules to this table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default variable editor



Variable editor in Agent Workspace

In Agent Workspace, the following scenarios are possible:

- If the variable editor formatter is available in the Workspace view of the form, the variable editor is automatically added to the **Variables** section in the Agent Workspace UI.
- If the variable editor formatter is added inside a section in the Workspace view of the form, that section does not display the variable editor in the Agent Workspace UI.

The following variable types are not displayed in the variable editor.

- Macro
- Macro With Label
- UI Pages

The following variables are displayed as a select box in the variable editor:

- Multiple Choice
- Numeric Scale
- Lookup Multiple Choice

Variable editor in Service Portal

In the Service Portal UI, the variable editor is available for forms with the variable editor formatter.

Note:
Since Service Portal is only for requester use cases, it is recommended to use the Agent Workspace UI for the variable editor.

Making a variable editor read-only

The following options are available to make a variable editor read only, depending on application.

Service Catalog variable editors in the core UI

The `GlideForm` setVariablesReadOnly() method is supported for ServiceNow AI Platform and Agent Workspace forms to make the variable editor read-only. This method is intended for requested item, target record, and catalog tasks.

Note:
This method is not applicable in Service Portal and is not recommended for catalog forms.

Service Portal variable editors

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To make the VEditor read-only in Service Portal, navigate to **Service Portal** > **Portals**, select **Service Portal**, and specify the following code in the **Quick start config** field.

```
"readonly_variable_editor": "true"
```

Note:
The UI Page, Macro, and Macro with Label variables are rendered even when the variable editor is read-only.

Configure the default variable editor for a task-extended table

After you configure the default variable editor for a task-extended table, you can view and edit the values of questions specified by the requester in the record producer. Applicable only for records generated by a record producer.

Before you begin

Role required: admin

Procedure

1. Create a formatter for the task-extended table.
   a. Navigate to **System UI** > **Formatters**.
   b. Click **New**.
   c. On the form, fill the fields.

Field	Description
Name	The name of the formatter that is displayed in the form of the task-extended table.
Formatter	The file name of the formatter. In this case, specify `com_glideapp_questionset_default_question_editor`.
Table	The table that uses the formatter.
Active	Specifies if the formatter is active.
Type	The type of the formatter. In this case, specify `Formatter`.

UI formatter

   d. Click **Submit**.

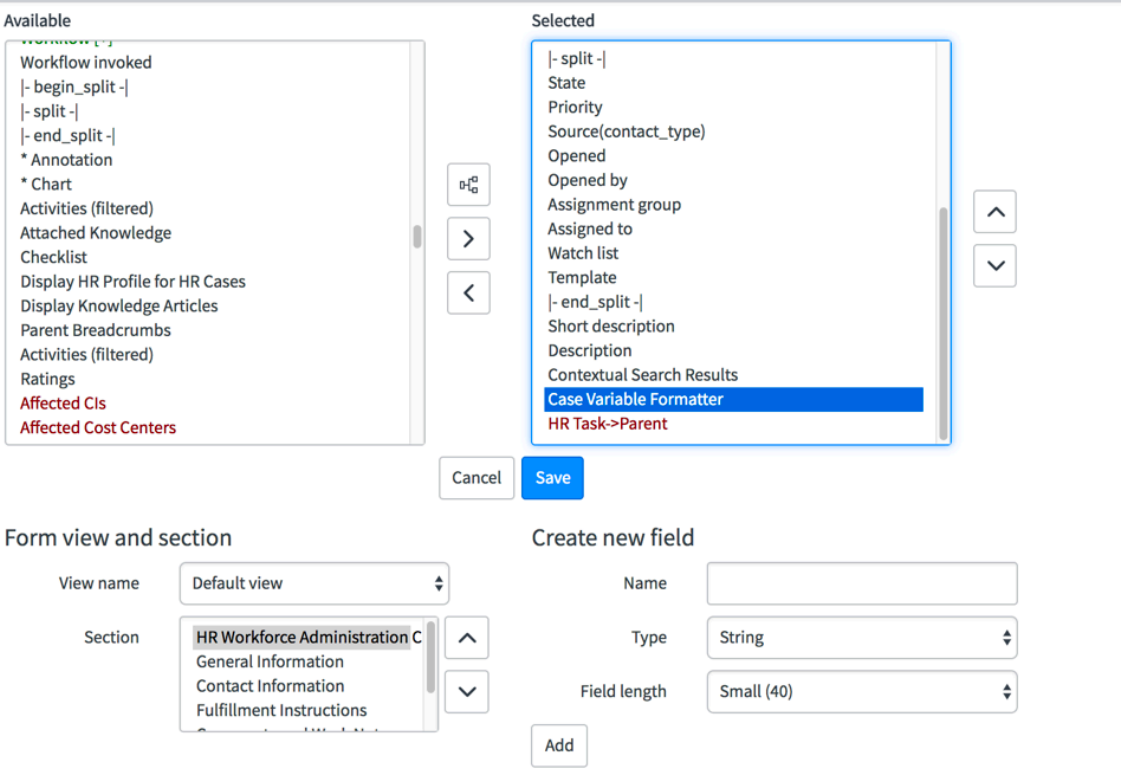
2. Add the formatter to the form of the task-extended table.
   The formatter is displayed on the form according to your selections.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the **Additional Actions** menu on the form, select **Configure** > **Form Layout**.

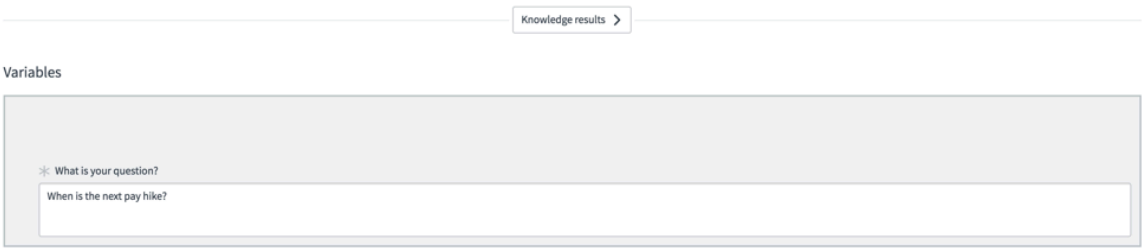
b. Use the list to select the display order for the formatter field.

Add a formatter to a form



c. Click **Save**.
The default variable editor is available on the form.

Default variable editor



Service catalog variable sets

Administrators and catalog administrators often define multiple catalog items that use the same group of service catalog variables. Catalog managers and catalog editors can attach a variable set for items to which they are assigned. However, catalog managers and catalog editors cannot create a variable set.

For example, a catalog administrator defines 10 catalog items for types of servers. The request process for all these items asks the same five questions, using the same variables.

Associating these variables individually per catalog item is repetitive, time-consuming, and error-prone. Also, to make a single change to multiple catalog items involves manually changing each

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

item. For example, to add a variable to 10 catalog items, you would need to manually associate the variable with each item.

Variable sets allow you to create a collection of variables that can be reused across multiple catalog items and order guides. Using variable sets saves time because you do not have to create the same variables individually for many catalog items. Also, when variables should be modified, you can modify the variable set and the changes are reflected across all the catalog items that are associated with the variable set.

Variable sets also allow you to define catalog client scripts and UI policies that are applicable to the variables in the set.

Note:
Variables in a set use the same rules as other variables to determine when the variables in a set appear on a task. For example, variables must either be global or be attached directly to an item.

A catalog administrator can provide read, write, and update roles to access a variable set. When you access variables of a variable set, a validation is first done at the variable set level, and then at the variable level. If the access is blocked at the variable set level, then the access settings on the variable are over-ridden. If the access is allowed at the variable set level, then access at the variable level is verified.

Note:
Both single-row and multi-row variable sets are supported in ServiceNow AI Platform, Service Portal, Now Mobile, and in the Variable editor in Agent Workspace.

Single-row variable set

Use a single-row variable set to capture data from variables that are grouped together, while submitting a catalog item request for a single entity.

Multi-row variable set

Use a multi-row variable set (MRVS) to capture variable data in a grid layout while submitting a catalog item request for a group of entities. For example, for HR during the reorganization of employees, a single record producer should be able to capture the relevant information such as the department and manager for a group of employees. Also, when you request a catalog item to order virtual machines and servers, configuration options should be captured as a single request. In this case, a requester can define multiple hardware units as rows and their configuration options as columns of an MRVS.

You cannot include the following variable types in an MRVS:

- Attachment
- Break
- Container End
- Container Start
- Container Split
- HTML
- Label
- Macro
- Macro with label

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Rich Text Label
- UI Page

Note:

- You can configure an MRVS variable to disallow duplicate values. For information about the **Unique** field, see Create a service catalog variable.
- You can hide a variable in the MRVS so that it does not appear when the dialog box is open.
- The **Map to field** functionality is not supported for variables used in an MRVS.
- Only the glide list interface is supported for the List Collector variable.
- Cascading functionality for variables in an order guide is not supported in an MRVS.
- An MRVS is not displayed when added within a container.
- You cannot add variables with read roles in an MRVS.
- When you clone a request that contains an MRVS, the information that is specified in the MRVS is available in all cloned requests. All UI policies and client scripts on the MRVS are also cloned.
- Set a limit to the number of rows that you can add to an MRVS by using the *max_rows* attribute in the **Variable Set attributes** field.
- In the RITM and request view in Now Mobile, an MRVS is not supported. A message is displayed in this view that this variable set is not viewable.
- An MRVS is supported in the variable summarizer only in Service Portal.
- You can include an MRVS in the GetCatalogVariables and CreateCatalogTask actions using Workflow Studio.
- You can iterate through individual rows and access variables using the For Each flow logic.
- You can include MRVS while creating a catalog task using a workflow.

An MRVS form changes dynamically based on the data in the catalog item form that includes the following:

- Other rows of that MRVS
- Other variables outside of that MRVS on the catalog item form.

For information about accessing data in a multi-row variable set (MRVS) when a dialog box is open, see g_service_catalog - Client.

You can define catalog client scripts, catalog UI policies, and catalog data lookups for an MRVS. Visibility is honored just on the MRVS form and not in the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- `onSubmit` catalog client scripts are not supported for an MRVS.
- Catalog UI policies and catalog client scripts defined at the item level are not applicable for variables in an MRVS. Only those catalog UI policies and catalog client scripts defined within the MRVS are applicable for variables in the MRVS.
- Scripts that are not included in an MRVS cannot affect variables inside the MRVS. Similarly, the scripts included in the MRVS cannot affect the variables that are not included in the MRVS.
- Variables that are not included in an MRVS cannot be used in dependent reference qualifiers for variables in the MRVS. Similarly, the variables included in the MRVS cannot be used in dependent reference qualifiers for variables that are not in the MRVS. For a reference qualifier, the current row is the one that is being edited.

You cannot set **Global** as `True` for any variable that belongs to an MRVS. So, an MRVS is not available in catalog tasks.

If the variables included in the MRVS have price implications for a catalog item, the price of the catalog item reflects the corresponding changes when a row is added, edited, or removed from this variable set.

Note:
When you disable the `glide.sc.use_cart_layouts` property, the Order Item Widget does not reflect the price changes of the item from the MRVS. However, when you add this item to the cart, these price changes are reflected.

You cannot select variables of an MRVS when defining the following for a catalog item:

- UI policy conditions
- Unsupported ATF step configurations. You can only validate if an MRVS is visible, mandatory, or read only.
- Reporting

Create a variable set and add it to an item

Create a set of variables and add them to multiple catalog items and order guides for reuse.

Before you begin

Role required: catalog_admin, admin, catalog_editor, or catalog_manager

About this task

- Variable sets within a catalog item cannot have the same internal name.
- Within a catalog item, the name of a variable cannot be the same as the title or internal name of a variable set.
- Any catalog client script or catalog UI policy script should refer to the internal name of a variable set instead of its name or title.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Variables** > **Variable Sets**.
2. Click **New**.
   The Variable Set Creation page is displayed.
3. Select any of the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter details.

Field	Description
Title	Title of a variable set. Appears if the **Display title** check box is selected.
Internal name	Variable set name for internal use. For example, to access the variable set for the front-end (through the *g_form* API) and server side scripting.
Order	Order number for the variable set.
Type	Type of the variable set. Possible choices are: ○ Single Row ○ Multi Row
Application	Applications that can use this variable set.
Display title	If selected, adds a title and an expandable header to the right of the variable set. **Note:** When a user requests the item, all check box variables are grouped under a default title of **Options**. To use a custom title, insert a variable of type **Label**, with an **Order** value that puts it directly above the check box variables.
Variable Set attributes	Attributes for configuring a multi-row variable set. Use the *max_rows* attribute to set a limit to the number of rows that you can add to a multi-row variable set. For example, specify `max_rows=1` as the field value.
Layout	The layout display. Set to **1 Column Wide** or **2 Columns Wide, alternating sides** or **2 Columns Wide, one side, then the other**.
Description	Description of variable set.

5. Right-click and select **Save**.
6. Create the variables to use in that set.
   a. In the Variables related list, click **New**.
   b. Follow the steps for creating variables.

   Note:
   For a multi-row variable set:
   - The included variables are displayed as columns of a table.
   - The column order is the order of variables defined in the variable set.

7. To create an associated catalog data lookup rule, perform the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Catalog Data Lookup Definitions related list, click **New**.

b. On the Catalog Data Lookup Definitions form, fill the fields.
For information on creating a data lookup rule, see Create a catalog lookup definition.

8. Click **Submit**.

Add a variable set to a catalog item or order guide

Service Catalog enables you to add a variable set to one or more catalog items or order guides.

Before you begin
Role required: catalog_admin, admin, catalog_editor, or catalog_manager

Procedure

1. Open a catalog item or an order guide.

2. In the **Variable Sets** related list, click **Edit**.

   You can configure the form to add the **Variable Sets** related list.

3. Select and add a variable set.

   Note:
   If the **Cascade Variables** check box is selected for an order guide, multi-row variable set data should be cascaded to the included items.

4. Click **Save**.
5. Click **Try**.

   Note:
   For a multi-row variable set:

   - The associated variables are displayed as columns of a table on a catalog item or record producer. Each row corresponds to a set of data for all variables in the variable set.
   - The column order is the order of variables defined in the variable set.

6. **Optional:** Edit a multi-row variable set.

   a. To add a row, click **Add** within the variable set, specify the variable information in the **Add Row** window, and click **Add**.

      Note:

      - A maximum of 50 rows can be added.
      - Unless default values are provided for variables or On Load scripts are used to pre-populate data, you should add variable data for each row.

   b. To edit a row, click the edit row icon in the **Actions** column, specify the variable information in the Edit Row window, and click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you add or edit an existing row, all catalog UI policies and client scripts associated with the multi-row variable set should be honored.

c. To remove a row, click the remove row icon ✕ in the **Actions** column and click **Remove** in the confirmation window.

d. To remove all rows of the table, Click **Remove All** within the variable set and click **Remove** in the confirmation window.

Variable set layout

Variable sets can have one of many layouts. You can define the order of the variables for each item.

- **1 column wide**: Variables appear in a single vertical column, ordered from top to bottom. This column is a simple way to display information, but can result in empty space to the right of questions. This order is the default layout.
- **2 columns wide, alternating sides**: Variables are laid out in two columns with variables placed alternately in the left and right columns.
- **2 columns wide, one side, then the other**: The first half of the variable set is laid out sequentially in the left column and the second half is laid out sequentially in the right column.

Note:
Variables with several possible choices defined, such as multiple choice variables, are considered a single entity in layouts. All choices are displayed as a single, contiguous unit.

Variable set order

A variable set is a discrete unit with an order number by default. All variables within the set are included wherever the set is included.

For example, if you set the following order for some example variables and a variable set:

- Variable A (100)
- Variable B (200)
- Variable C (300)
- Variable Set 1 (250) - containing three variables (VS1, VS2, VS3) with incremental order values (150, 250, 350)

The variables are displayed in this order:

- Variable A (100)
- Variable B (200)
- Variable Set 1 (250): Variable VS1 (150)
- Variable Set 1 (250): Variable VS2 (250)
- Variable Set 1 (250): Variable VS3 (350)
- Variable C (300)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional layout options

For additional layout options, you can also add container variables to a variable set.

For example, create the following variables and orders:

Order of variables

Variable	Order
Alfa	100
Bravo	200
Charlie	300
Delta	400
Echo	500
Foxtrot	600

Order of variables in a layout

1 Column Wide	2 Columns Wide, alternating sides	2 Columns Wide, 1 side, then the other
Alfa	Alfa Bravo	Alfa Delta
Bravo	Charlie Delta	Bravo Echo
Charlie	Echo Foxtrot	Charlie Foxtrot
Delta		
Echo		
Foxtrot		

Set an item-specific order

You can set the order value on a per item basis.

Before you begin
Role required: admin

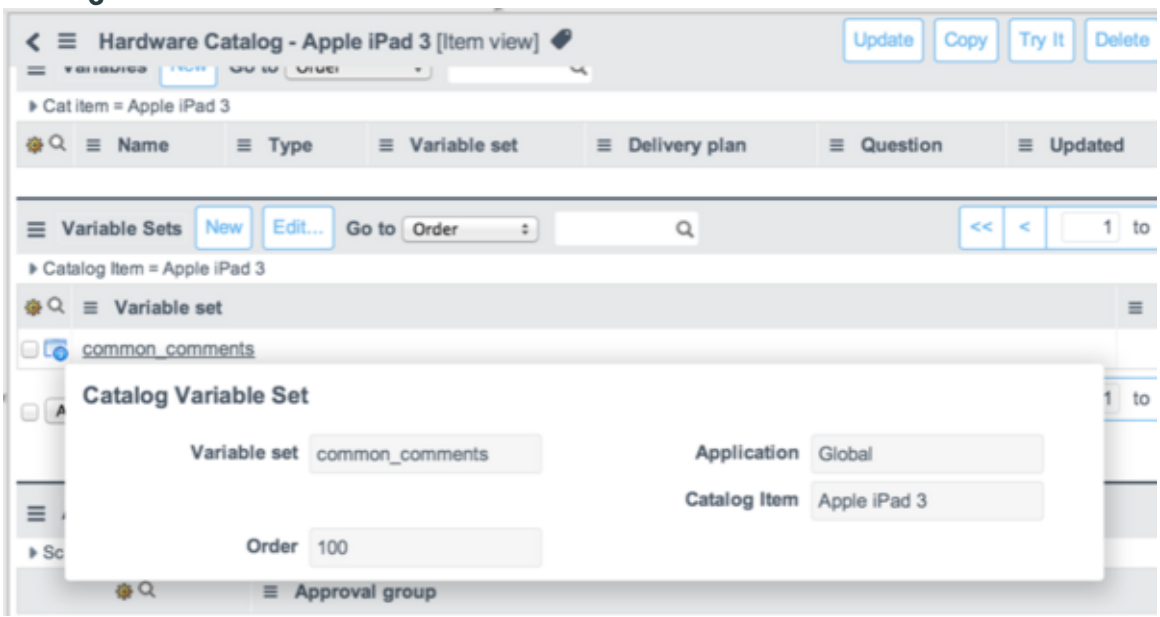
About this task
When a variable set is used by more than one catalog item, you can define item-specific ordering to provide more flexibility in the layout. You do this using the catalog variable set record associated with the item.
Use the **Order** field in this catalog variable set record to set this order value on a per-item basis, overriding the default value defined in the variable set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

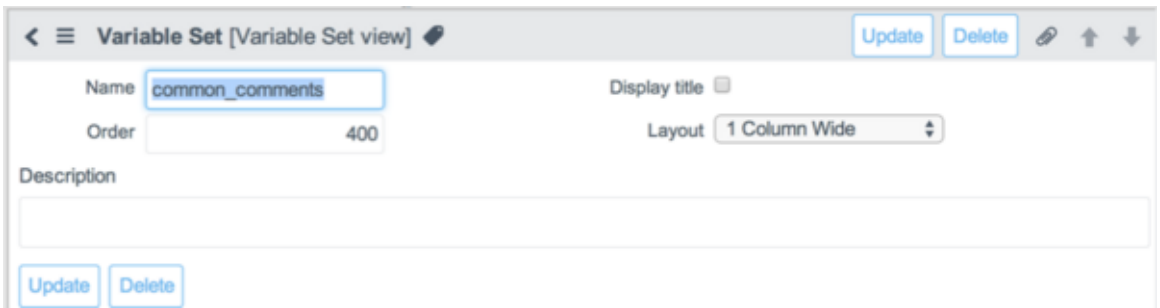
1. Navigate to **All** > **Service Catalog** > **Catalog Definition** > **Maintain Items**.
2. Open the catalog item to edit.
3. Navigate to the Variable Sets related list.
4. Click the reference icon for the variable set.

Catalog variable set



5. Set the order value as required.
   The catalog variable set order is specific to the link between the item and the variable set. It overrides the default order defined on the variable set itself.

Variable set order



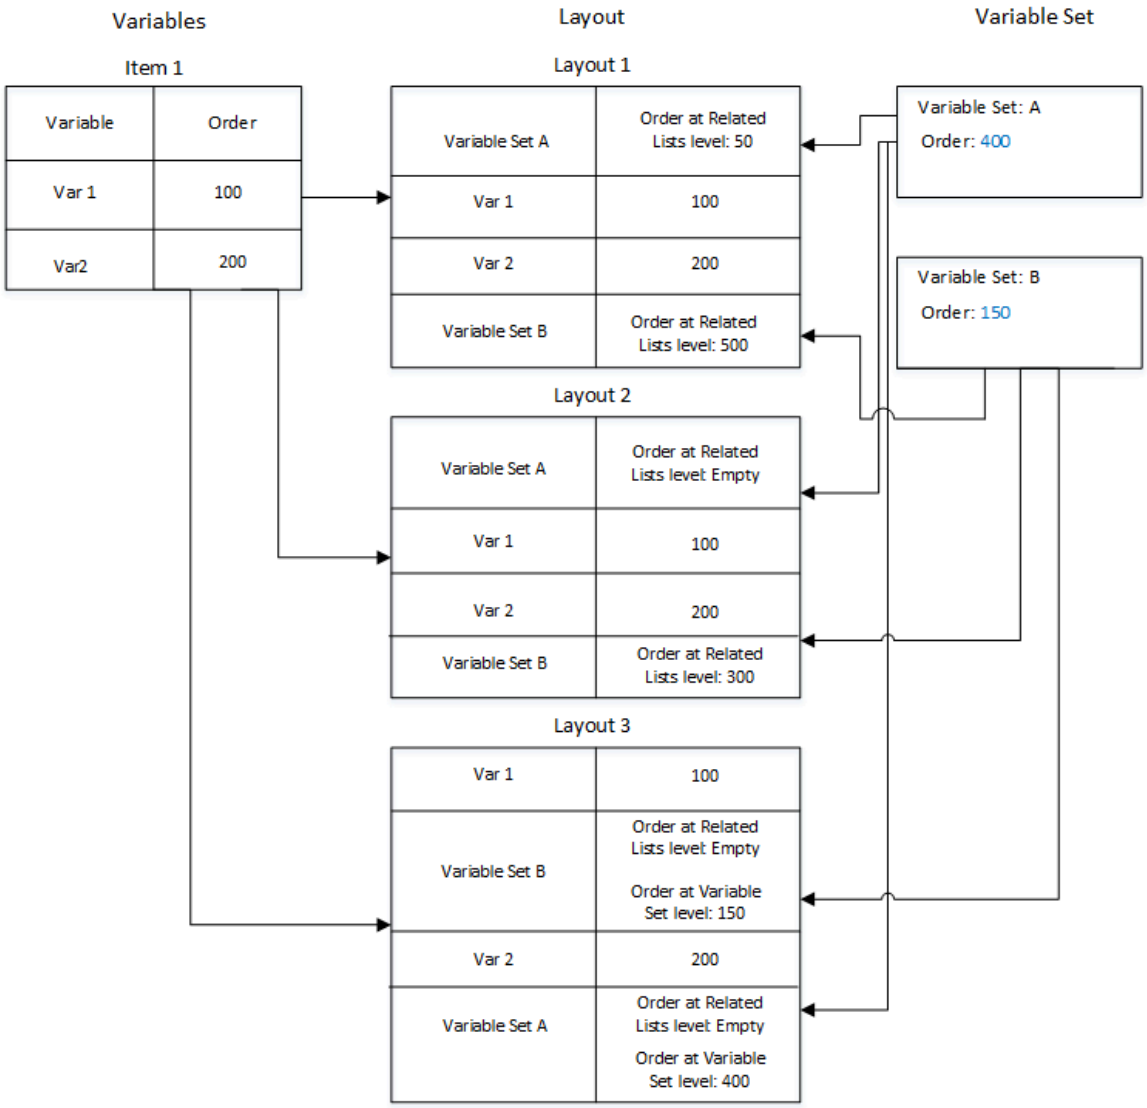
Examples of variable set orders

The following example demonstrates the layout of variables when variable sets and item variables are associated with an item under different scenarios.

The order for display of the variables and variable sets is specified using the Information icon in the Related Lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order of variables and variable sets



- In Layout 1, order values are specified for both Variable Set A and Variable Set B at the Related Lists level and those order values always takes precedence. Hence, the layout is organized based on the order value specified for the variable sets at the Related Lists level.
- In Layout 2, an order value is not specified for Variable Set A whereas an order value is specified for Variable Set B at the Related Lists level. In this case, the empty value for Variable Set A is considered as zero. Hence, the layout is organized based on the order value of 0 for Variable Set A and 300 for Variable Set B.
- In Layout 3, order values are not specified for both Variable Set A and Variable Set B at the Related Lists level. In this case, the order values specified within the variable sets are considered. Hence, the layout is organized based on the order value of 400 for Variable Set A and 150 for Variable Set B.

Service Catalog parameters

You can use the Service Catalog parameters to identify the parent mapping configuration for a request, and join the service catalog flow from any other flow. For example, from an incident flow, you can create a request, and associate the request with the incident.

These parameters are passed in the application URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog parameters

Name	Description
sysparm_parent_sys_id	sys_id of the source record that is passed to the target record generated from it. Format is *sysparm_parent_sys_id*= <sys_id of the parent>. For example, sysparm_parent_sys_id=85071a1347c12200e0ef563dbb9a71c1.
sysparm_parent_table	Name of the parent table from which the catalog request is created. Format is *sysparm_parent_table*=<name of the parent table>. For example, sysparm_parent_table=incident.
sysparm_view	Type of the catalog view. Format is *sysparm_view*=<name of the catalog view>. For example, sysparm_view=catalog_default. **Note:** This is only applicable in Platform.
sysparm_processing_hint	Specifies a processing hint. Format is *sysparm_processing_hint*=setfield:request.parent=<incident sys_ For example, sysparm_processing_hint=setfield:request.parent=85071a1347c12200e0ef563dbb9 **Note:** If specified, this parameter overrides the configuration in the **Request Parent Mapping** sub-module.

Catalog Wizard form

Description of the fields for the Catalog Wizard Step, Catalog Wizard Section, Variable, and Catalog Wizard Question forms in Service Catalog wizards.

Catalog Wizard Step

Field	Description
Name	Unique name of the step.
Wizard	Wizard for which you are creating the step.
Hide on template	Option to hide the step in the catalog item template.
Custom step	Option to configure the step as a custom step.
Short description	Brief description of the step.
Feedback	Option to associate a feedback record with the step in the catalog item builder wizard or record producer builder wizard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Wizard Step (continued)

Field	Description
Template feedback	Option to associate a feedback text with a step in the catalog item template.
Order	Order where the step is placed in Catalog Builder.
Macroponent	Reusable seismic building blocks in the Next Experience UI Framework that can be used to create a custom step. This field appears only when the **Custom step** check box is selected. For more information, see https://developer.servicenow.com/dev.do#!/reference/now-experience/sandiego/ui-framework/getting-started/introduction

Catalog Wizard Section

Field	Description
Name	Unique name of the section.
Style	Display style of the section.
Order	Order in which the section appears inside a step.
Wizard step	Step with which the section is associated.
Short description	Brief description of the section.
Width	Width of the section in Catalog Builder.

Variable

Field	Description
Map to field	Maps the question to a specific field on the Catalog Item (sc_cat_item) table or Record Producer (sc_cat_item_producer) table.
Type	The variable type that you want to create.
Catalog item	Catalog item associated with the question.
Active	Option to make the variable available for use.
Mandatory	Option to make the variable mandatory as part of the ordering process.
Hidden	Option to hide the variable.
Read-only	Option to make the variable read only or editable.
Question	Question to ask catalog item creators in Catalog Builder.
Name	Name to identify the question.
Tooltip	Tooltip text to display when catalog item creators point to the variable in Catalog Builder. You can enter a brief note to describe the purpose of the question.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable (continued)

Field	Description
Example Text	Hint that is displayed in the **Question** field before a catalog item creator enters a value. Applicable for the following variables: • IP Address • Email • URL • Single Line Text • Wide Single Line Text • Multi Line Text • Date • Date/Time

Catalog Wizard Question

Field	Description
Wizard section	Section with which the question must be associated with.
Map to set	Option to map the question to a question set. The **Set** field is enabled only when this option is selected.
Order	Order in which the question must appear inside a section.
Question	Option to associate a question to the section. **Note:** You can create a new variable to associate to a question or select an existing one. For information on creating a new variable, see Add a step, section, or question to a catalog item wizard.
Set	Option to associate a question set to the section if you have selected the **Map to set** option.

For information about adding a step, section, or question to a catalog item wizard, see Add a step, section, or question to a catalog item wizard.

Record Producer form

Description of the fields on the Record Producer form.

© 2026 ServiceNow, Inc. All rights reserved.

Record Producers in the Service Catalog

Field	Description
Name	The descriptive name for the record producer. **Note:** The list shows only tables and database views that meet the scope protections for field styles.
Table name	The table in which the record producer creates records.
Active	A check box for making the record producer active. Only active record producers are available to users if they meet the role criteria.
Preview Link	A link that opens a preview of the item.
Post insert script	Script that operates on the submitted record, after the record is inserted in the associated table. **Note:** Post insert script overrides the target record values and record producer template values.
Accessibility	
Catalogs	The service catalog this record producer belongs to.
Category	The service catalog category this record producer belongs to. When users perform catalog searches, only items that are assigned to a category appear in search results.
View	The CMS view in which the item is visible.
Roles	The roles required to use the record producer.
Availability	The interface the record producer is available from: **Desktop and Classic Mobile**, **Desktop Only**, or **Classic Mobile Only**.
Can cancel	A check box for displaying a **Cancel** button on the record producer. Users can click **Cancel** to cancel the record producer and return to the last-viewed screen
What it will contain	
Short description	A short summary of the record producer.
Description	The full description of the record producer. You can embed videos, images, links to internal knowledge base (KB) articles, and links to external sources of information and instruction documentation. The description appears under a **More information** link on the record producer to give users any additional information they need.
Meta	Comma-separated list of tags used to search for the record producer. See Configure keyword search for catalog items.
Hide on Service Portal	If selected, the record producer is not available on Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record Producers in the Service Catalog (continued)

Field	Description
Redirect To	Specifies the redirect behavior of the record producer after its generation. Possible values are: • **Generated Task record**: Redirects to the task record created using the record producer. • **Catalog Homepage**: Redirects to the service catalog where the order for the record producer is placed. The default value is based on the **Specifies the default behavior of record producer after record generation** property in the **Service Catalog** > **Catalog Administration** > **Properties** page.
Script	Scripts that are run to dynamically assign values to specific fields on the created record.
Icon	The small icon that appears on the list of service catalog items. Click the **Click to add** link and upload the photo.
Picture	The picture that appears at the top of the record producer form on the desktop view. Click the **Click to add** link and upload the photo.
Classic Mobile picture	The small picture that appears on the list of service catalog items. Click the **Click to add** link and upload the photo. This field is available when you select the **Classic Mobile** for the **Classic Mobile picture type**.
Classic Mobile picture type	The picture that the mobile interface uses on the list of service catalog items. Select one of the following: • Desktop: Uses the icon specified in the **Icon** field. Selecting this option hides the **Classic Mobile picture** field. • Classic Mobile: Uses the icon specified in the **Classic Mobile picture** field. • None: Does not use any picture on the mobile view. Selecting this option hides the **Classic Mobile picture** field.
Generated Record Data	
Template	Static assignments for fields on the created record.
Portal Settings	
Hide Attachment	If selected, the **Add attachments** button is not displayed for the record producer. **Note:** • Applicable for a catalog item and record producer. • An order guide inherits this setting from the included catalog item.
Hide 'Save as Draft'	If selected, the **Save as Draft** button isn't displayed for the record producer on the portals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record Producers in the Service Catalog (continued)

Field	Description
	You can let requesters save a draft of a record producer while requesting it on the portals such as Employee Center and Service Portal, and Now Mobile app. The requesters can access the saved drafts from the My Request widget in the **Drafts** tab on the portals and edit the drafts.
Mandatory Attachment	If selected, adding an attachment is mandatory for the record producer. **Note:** Applicable for a catalog item and record producer.
Universal Request Config	
This section is available only when the Universal Request plugin (com.snc.universal_request) is activated. For information about this configuration, see Service Catalog configuration for Universal Request.	
UR certified/ enabled item	Option to specify that a universal request should also be created along with a task-based record. In the universal request, a reference is created to the associated task-based record, which becomes the primary task of the universal request.
Requires Additional Review	Option to automatically select the **Needs resolution review** check box on the corresponding universal request. For information about the universal request fields, see Universal Request form. The **Requires Additional Review** field appears only when the **UR certified/ enabled item** check box is selected.

For information about creating record producers, see Create a record producer.

Order guide form

Description of the fields on the Order guide form.

Order guide form

Field	Description
Name	Order guide name that appears in the catalog.
Active	Check box to indicate whether the order guide is active or not.
Category	Category heading under which the order guide appears in the catalog.
Two step	Check box to enable two step ordering instead of the default three-step ordering, omitting the final step. With two step ordering, selecting **Check out** submits the request immediately, then displays the order confirmation screen. This is not applicable for Service Portal.
Icon	A 16x16 pixel image to appear as an icon beside the order guide name in the catalog. If no image is uploaded, the default icon appears beside this order guide. To use your own default icon, upload an image, overwriting the image stored in images/service_catalog/generic_small.gif.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order guide form (continued)

Field	Description
Cascade variables	Check box to select whether the variables used cascade, which passes their values to the ordered items. If this check box is cleared, variable information entered in the order guide is not passed on to ordered items.
Ordered Item Link	Link to more information about an ordered item. Select a predefined link item to appear on the ordered item screen. Customers can click the link to access more information. This is not applicable for Service Portal.
Roles	Roles that users must have to access this order guide.
Short description	Summary of the order guide purpose.
Description	Description that appears on the first page of the order guide. Apply formatting with the HTML editor.
Meta	Comma-separated list of tags used to search for the order guide. See Configure keyword search for catalog items.
Hide on Service Portal	If selected, the order guide is not available on Service Portal.
Picture	[Optional] Image of the item.
Order to cart	Check box allowing users to add order guides to their cart, then continue shopping rather than checking out immediately. This is not applicable for Service Portal. **Note:** This setting only works when the *Two step* check box is also set to true.
Portal Settings	
Use these settings to configure the order guide behavior in Service Portal.	

Request method	Setting that controls the label displayed for the **Order Now** button and the order submission experience.
	
	• **Order**:
	  ○ Button label: **Order Now**
	  ○ Confirmation dialog box: Displayed
	  ○ Delivery information: Editable
	
	Note:
	This is the default setting.
	
	• **Request**:
	  ○ Button label: **Request**
	  ○ Confirmation dialog box: Displayed
	  ○ Delivery information: Not displayed.
	
	This setting can be used in scenarios such as a code access request where the delivery information is pre-determined.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order guide form (continued)

Field	Description

	• **Submit**:
	  ○ Button label: **Submit**
	  ○ Confirmation dialog box: Not displayed
	  ○ Delivery information: Not displayed
	  This setting can be used in scenarios such as reset password request where no further request information is required.

Hide 'Add to Cart'	If selected, the **Add to Cart** button is not displayed for the order guide. If the **Show Add to Cart** instance option of the widget is set to false, then this setting is ignored. This setting is selected by default if the **Request method** is **Request** or **Submit**. For upgrade scenarios, if the **No cart** field is selected in Platform, run the *CatalogPortalSettingsMigration* script include to update this setting to the **Hide 'Add to Cart'** field in the **Portal Settings** tab.
Show Include Toggle	If selected, a toggle is displayed for each catalog item in the **Choose Options** section in Service Portal. You can click this toggle to include or exclude the catalog item from the order guide request. For zBoot customers, this option is selected by default for existing order guides in the demo data and new order guides. For upgrade customers, this option is selected by default only for new order guides.

For information about creating an order guide, see Create an order guide.

Catalog Item form

Description of the fields on the Catalog Item form.

Catalog Item form

Field	Description
Name	Name to appear in the catalog.
Catalogs	Catalogs this item appears in.
Category	Category for the item. Categories can only be selected after the **Catalogs** field is populated. Catalog searches find only items that are assigned to a category in the Service Portal. For Employee Center, catalog searches find only items that are associated with a taxonomy topic. For more information, see Associate a catalog item with a taxonomy topic in Employee Center.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Item form (continued)

Field	Description
Model	Product model to which the item is linked. This field is visible by default only for items created by publishing models. Click the reference icon to view the product model.
Active	Check box to make the item active (available to be ordered). **Note:** Inactive catalog items added to order guides do not appear in the order guide. Use **Visible On Guide**, **Visible elsewhere** to hide the item and show only in the order guide.
Fulfillment automation level	Option to specify the level of fulfillment automation for catalog item requests. The available options are: • Unspecified: Automation level of catalog item is not specified. • Manual: Catalog item is not automated. • Semi-automated: Catalog item is semi-automated. • Fully automated: Catalog item is completely automated.
Access Type	Option to specify if a request can be submitted for a user who does not have access to the catalog item. Possible options are: • Restricted: The request can only be submitted for users who have access to the catalog item. • Delegated: The request can be submitted even for users who do not have access to the catalog item. By default, this field is set to `Restricted`. For information about delegated request experience, see Delegated request experience. **Note:** This functionality is only applicable when the catalog item has a Requested For variable.
Owner	Owner of the catalog item who has edit access to it.
Template	Template using which the item is created.
Preview Link	Click **Preview Item** to preview in a new window how the current item definition would look in the catalog.
Ordered Item Link	Link to preview, as shown on the ordered item screen.
Hide on Service Portal	If selected, the catalog item is not available on Service Portal.
Availability	Devices to display the item: **Desktop and Classic Mobile**, **Desktop Only**, or **Classic Mobile Only**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Item form (continued)

Field	Description
	Note: Unsupported catalog item types are not displayed on Classic Mobile devices, even if **Availability** is set to show an item of this type.
Item Details	
Short Description	Text that appears on the service catalog homepage, search results, and the title bar of the order form.
Description	Full description of the item. This description appears in the catalog when a user selects the item or clicks the associated **Preview** link. You can embed videos, images, links to internal knowledge base (KB) articles, and links to external sources of information and instruction documentation.
Meta	Comma-separated list of tags used to search for the catalog item. Use commas between keywords for better results when searching. The Zing search engine removes common words from search queries that do not produce meaningful results. See Configure keyword search for catalog items.
Process Engine **Note:** You can specify a value for only one of these fields.	
Flow	Flow that defines how the item request is fulfilled.
Workflow	Workflow that defines how the item request is fulfilled.
Execution plan	Execution plan (formerly named delivery plan) that defines how the item request is fulfilled.
Picture	
Icon	Image to appear as an icon beside the item name in the catalog. Upload a 27x27 pixel image. If no image is uploaded, the default icon appears beside this item. To use your own default icon, upload an image. The uploaded image overwrites the default image stored in `images/service_catalog/generic_small.gif`.
Picture	Image of the item.
Classic Mobile	
Classic Mobile Picture Type	Type of picture to display for the item on mobile devices. Set to **Desktop** to use the standard desktop picture, **Classic Mobile** to use a specific image for the mobile device using the **Mobile picture** field, or **None** to not use a picture.
Classic Mobile Picture	Image file for the mobile picture. The field appears if **Classic Mobile picture type** is set to **Classic Mobile**.
Hide Price (classic	Check box to hide the item price on mobile devices. Clear the check box to display the price.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Item form (continued)

Field	Description
mobile listings)	
Pricing	
Price	Price for the item. Select the currency from the choice list.
Recurring Price	Price that occurs repeatedly at a regular interval. For example, a printer maintenance service could have a $100.00 monthly recurring price.
Recurring Price Frequency	Time frame for recurrence, such as **Monthly** or **Annually**, only if the **Recurring Price** field has an entry.
Omit Price in Cart	Check box to hide the item price in the cart and the catalog listing.
Portal Settings	
Use these settings to configure the catalog item behavior in Service Portal.	
Request method	Setting that controls the label displayed for the **Order Now** button and the order submission experience. • **Order**: ◦ Button label: **Order Now** ◦ Confirmation dialog box: Displayed ◦ Delivery information: Editable **Note:** This is the default setting. • **Request**: ◦ Button label: **Request** ◦ Confirmation dialog box: Displayed ◦ Delivery information: Not displayed. This setting can be used in scenarios such as a code access request where the delivery information is pre-determined. • **Submit**: ◦ Button label: **Submit** ◦ Confirmation dialog box: Not displayed ◦ Delivery information: Not displayed This setting can be used in scenarios such as reset password request where no further request information is required.
Hide 'Add to Cart'	If selected, the **Add to Cart** button is not displayed for the item. If the **Show Add to Cart** instance option of the widget is set to false, then this setting is ignored. This setting is selected by default if the **Request method** is **Request** or **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Item form (continued)

Field	Description
	For upgrade scenarios, if the **No cart** field is selected in Platform, run the *CatalogPortalSettingsMigration* script include to update this setting to the **Hide 'Add to Cart'** field in the **Portal Settings** tab. **Note:** Applicable for a catalog item and order guide.
Hide 'Save as draft'	If selected, the **Save as Draft** button isn't displayed for the item on the portals. You can let requesters save a draft of a catalog item while requesting it on the portals such as Employee Center and Service Portal, and Now Mobile app. The requesters can access the saved drafts from the My Request widget in the **Drafts** tab on the portals and edit the drafts.
Hide Quantity	If selected, the **Quantity** list is not displayed for the catalog item. This is selected by default if the **Request method** is **Request** or **Submit**. For upgrade customers, if the **No quantity** field is selected in Platform, run the *CatalogPortalSettingsMigration* migration script to update this setting to the **Hide Quantity** field in the **Portal Settings** tab. **Note:** • Applicable for a catalog item. • An order guide inherits this setting from the included catalog item.
Hide Delivery time	If selected, the **Delivery Time** field is not displayed for the catalog item. This is selected by default if the **Request method** is **Submit**. **Note:** • Applicable for a catalog item. • An order guide inherits this setting from the included catalog item.
Hide 'Add to Wish List'	If selected, the **Add to wish list** button is not displayed for the catalog item. If the wish list is disabled for the catalog item or the portal widget instance option is set to false, then this setting is overridden for the item. **Note:** Applicable for a catalog item and record producer.
Hide Attachment	If selected, the **Add attachments** button is not displayed for the catalog item. **Note:** • Applicable for a catalog item and record producer. • An order guide inherits this setting from the included catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Item form (continued)

Field	Description
Mandatory Attachment	If selected, adding an attachment is mandatory for the catalog item. **Note:** Applicable for a catalog item and record producer.
Universal Request Config	
This section is available only when the Universal Request plugin (com.snc.universal_request) is activated. For information about this configuration, see Service Catalog configuration for Universal Request.	
UR certified/ enabled item	Option to specify that a universal request should also be created along with a requested item. In the universal request, a reference is created to the associated requested item, which becomes the primary task of the universal request.
Requires Additional Review	Option to automatically select the **Needs resolution review** check box on the corresponding universal request. For information about the universal request fields, see Universal Request form. The **Requires Additional Review** field appears only when the **UR certified/ enabled item** check box is selected.
Fields that can be added by configuring the form	
Expand help for all questions	Check box to expand and display help information for all questions on loading the page. **Note:** • This field is also applicable in Service Portal. • If the **Expand help for all questions** check box is selected at the catalog item level, then the **Always Expanded** field setting at the variable level is overridden. • If the **Expand help for all questions** check box is deselected at the catalog item level, then the **Always Expanded** field setting at the variable level is applicable.
Template	Template to populate the generated record with predefined values. The field is available for **Record Producer** items only.
No Quantity	Check box to hide the quantity selector for the item.
No Cart	Check box to hide the shopping cart for the item.
No search	Check box to prevent this item from being listed in search results and also in the Service Catalog widget on the Service Portal. If this is selected: • In Service Portal, you can neither browse nor search for the item. • In Platform, you can browse to find the item.

Catalog Item form (continued)

Field	Description
Order	Controls the ordering of items in category lists.
Domain	Domain in which the catalog item is created. Applicable when the domain separation is enabled in Service Catalog. For information about domain separation, see Domain separation and Service Catalog.
Domain Path	Series of three-character codes separated by a slash (/) delimiter to identify a domain. This path string is unique in the domain hierarchy. Applicable when the domain separation is enabled in Service Catalog.
Related Links	
Item Diagnostic	Generates a diagnostic report and score to identify possible issues within the Service Catalog data and configuration.
Edit checked out item in advanced view	Allows you to edit the catalog item in the advanced view. To add a catalog client script to a checked out item in the Draft state, you can click this related link and add the catalog client script using the Catalog Client Scripts related list. **Note:** This option is available only after you click **Edit in Catalog Builder** to edit an item in catalog builder.
Related Lists	
Variables	Variables for the item to provide options for ordering the item.
Variable Sets	Variable Set linked to the item. Link an existing variable set to the item to provide multiple options for ordering the item.
Approved By Group	Groups that must approve requests for this item.
Approved By	Users who must approve requests for this item.
Categories	Additional categories associated with this item.
Catalogs	Additional catalogs associated with this item.
Catalog Data Lookup Definitions	Catalog data lookup rules associated with the catalog item. For information on creating a data lookup rule, see Create a catalog lookup definition.
Catalog UI Policies	Catalog UI policies associated with this item.
Catalog Client Scripts	Catalog client scripts associated with this item.
Related Items	Related items for a catalog item to provide alternatives. These items are displayed in the catalog item page in Service Portal and Now Mobile.
Related Articles	Related articles for a catalog item to provide additional information. These articles are displayed in the catalog item page in Service Portal and Now Mobile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog Item form (continued)

Field	Description
Service Fulfillment Steps	Associated service fulfillment steps.
Assigned Topics	Associate a catalog item to a taxonomy and topic. For information about how to add an item to a taxonomy, see Associate a catalog item with a taxonomy topic in Employee Center. **Note:** This field becomes available when you activate the Employee Experience Taxonomy plugin (sn_ect).

For information about creating or editing a catalog item, see Create or edit a catalog item.

Debugging Service Catalog

Debug user criteria of catalog items, UI customizations for Service Catalog pages, actions on catalog item variables, performance diagnostics of a catalog item, and so on.

Debug actions on catalog item variables

Analyze the client-side actions affecting the state and values of all variables. You can also get insights into the performance of each script working on the variables.

Before you begin

Role required: admin, catalog_admin, catalog_manager, or catalog_editor.

Note:
You can perform this task with the catalog_manager or catalog_editor role only if you are assigned as the manager or editor of the catalog.

About this task

The variable action logger displays the chronology of actions that happen on all variables of a catalog item before it is submitted. These actions can happen due to catalog client scripts, catalog UI policies, or catalog data lookups. This client-side logger does not store any data in the database. Also, the information displayed is applicable only while you work on the catalog form. Features available for debugging Service Catalog issues including UI macro customization debugging; variable action logger; variable watcher; item diagnostic report

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Enable Variable Action Logger**. The UI Page Customization Diagnostics logger is enabled.

   Note:
   Perform this step before you run the logger.

2. Navigate to **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
3. In the Catalog Items list, select an item that you want to log .
4. On the Catalog Item form, click **Try it**.
5. On the catalog page for the item, right-click the header and select **Show Variable Action Logger**.

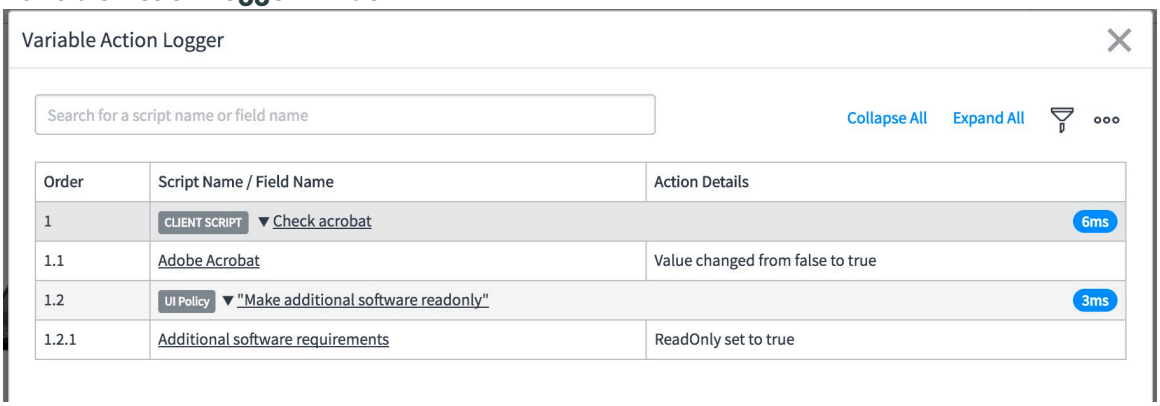
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The variable logs are grouped by catalog UI policies, catalog client scripts, and data lookups.

The following information is displayed in the Variable Action Logger window:

- Order in which scripts and actions are executed. When a new action is triggered from an existing action, the order of the new action is tracked at a sublevel under the order of the existing action. For example, the order of a new action triggered from step 1.2 is 1.2.1.
- Source of the action taken on a variable and the variable name.
- Details of the action taken on the variable.

Variable Action Logger window



6. Review the results of the variable action logger.

Option	Description
Search	To search for a variable or script, use the **Search** field.
Collapse All	To collapse variable logs within a group, click **Collapse All**.
Expand All	To expand variable logs within a group, click **Expand All**.
Filter	To filter variable logs, click the Filter icon ( ) and select the required options.
Clear Logs	To clear variable logs, click the Actions icon ( ) and select **Clear Logs**.
Export to CSV	To export the variable logs to a .csv file, click the Actions icon ( ) and select **Export to CSV**.
Print Logs	To print variable logs, click the Actions icon ( ) and select **Print Logs**.

Debug user criteria of a catalog item

Debug whether a user can access a catalog item based on the matched user criteria and fix any issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: catalog_manager, catalog_admin, or admin

About this task
You can only debug access issues based on user criteria, but not based on access control list rules (ACLs). For information about user criteria, see Set security for items and categories.

For any scripted user criteria that uses a session api such as `gs.getUserID()`, the session of the logged-in user is used. Edit the behavior of the scripted user criteria using the pre-defined `user_id` variable in the **Script** field of a user criteria. For information about the Script field, see Create a user criteria record in Service Catalog.

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **User Criteria Diagnostics**.
   The User Criteria Diagnostics form is displayed.
2. In the **Select user** field, select the user whose access you want to debug.
3. In the **Select catalog item** field, select the required catalog item.
4. Click **Diagnose**.

   - The item hierarchy is displayed along with an indication of the user's access to each node (catalog, category, or catalog item) based on the user criteria associated with the node.

Note:

- If the item is available in multiple catalogs or nested categories, the corresponding catalogs and categories are displayed as nodes in a tree format.
- If the user matches multiple user criteria associated with the node, then the user can access the node only if the following conditions are met:
  - The user matches at least one of the user criteria in the **Available For** list.
  - The user does not match any user criteria in the **Not Available For** list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- All user criteria defined for the item is displayed. For each user criteria, the following information is available:

  User Match

  is displayed if the selected user matches the user criteria.

  Association

  Association of the node with the user criteria, that is, **Available for** or **Not Available for**.

  User Criteria

  Name of the user criteria.

5. To verify if the user can view a node of the hierarchy, click the node.
   User criteria defined at the node is displayed. For example, when you click a node representing a category, the user criteria defined for the category is displayed.
6. To edit the configuration of a user criteria, click its name under the **User Criteria** column.

Debug UI customizations for a Service Catalog page

Perform the health check of a Service Catalog page. The UI Page Customization Diagnostics window displays the UI macros applicable for the Service Catalog page and their corresponding states. For issues on a Service Catalog page due to customized UI macros, you can identify the source of broken functionality.

Before you begin

Role required: admin or catalog_admin.
Watch this seven-minute video to learn more about UI customization debugging, variable action logger, variable watcher, and the Item Diagnostic report. Features available for debugging Service Catalog issues including UI macro customization debugging; variable action logger; variable watcher; item diagnostic report

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Debug UI Customization**.
   The UI Page Customization Diagnostics window is enabled.
2. Navigate to a Service Catalog page that you want to debug.
3. Review the information in the UI Page Customization Diagnostics window at the bottom of the page.

   To maximize the UI Page Customization Diagnostics window, click . The following information is displayed:

   - Name of the current Service Catalog page.
   - State of the Service Catalog page.
   - All UI macros applicable for the Service Catalog page.
   - State of each UI macro. For details on possible states, click the Help icon ( ).
   - Number of occurrences of each UI macro in the Service Catalog page.

Possible states for a UI macro and a Service Catalog page

State	Color indicator	Description
Unchanged	Green	Created by ServiceNow and one of the following scenarios is applicable: ○ It has never been customized by the customer. ○ It has been customized by the customer and then reverted to the latest ServiceNow upgrade.
Skipped	Red	Created by ServiceNow and then customized by the customer, and hence skipped the latest ServiceNow upgrade. The customer should resolve a skipped update and set a resolution status after an upgrade.
Customized	Orange	Created by ServiceNow, and then customized by the customer after the latest ServiceNow upgrade. The customer can revert a customization to implement the latest ServiceNow upgrade.
New	Blue	Created by the customer. The top element of the UI macro should have the following attribute: `data-sn-macro-sys-id="${jvar_macro_sys_id}"` **Note:** The top element can be a div, span, or table.

Note:

- When you click the Service Catalog page name or the UI macro name, the corresponding UI page or the macro page is displayed.
- When you point to a macro in the UI Page Customization Diagnostics window, the corresponding UI elements are displayed with a pink border.
- The state-based color indication is applicable only for UI macros that have a visible UI.

Debug performance diagnostics of a catalog item

Analyze the impact of the variable setup in a catalog item on its runtime performance, and identify any issues. You can review the processing time of the catalog item and its variables based on the triggered SQL queries.

Before you begin

Role required: admin or catalog_admin

About this task

The variable SQL debugger is not applicable for the following variables:

- Container Start
- Container End
- Container Split
- Break

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enable the variable SQL debugger by navigating to **Service Catalog** > **Catalog Variables** > **Enable Variable SQL Debugger**.

   Note:
   - The variable SQL debugger is applicable for catalog items and record producers.
   - After you enable the variable SQL debugger, if you disable the display of the troubleshooting information on a catalog page by navigating to **System Diagnostics** > **Session Debug** > **Disable All**, the variable SQL debugger is still active.
   - To disable the variable SQL debugger, navigate to **Service Catalog** > **Catalog Variables** > **Disable Variable SQL Debugger**.

2. Navigate to **Service Catalog** > **Catalog Definitions** > **Maintain Items**, select a catalog item that you want to debug, and click **Try It**.

3. Click the more options icon (⋮) and select **Show Variable SQL Debugger**.
   The following information is displayed in the Variable SQL Debugger window:
   - Number of variables included in the catalog item.
   - Number of SQL queries triggered for the catalog item.
   - Time taken to process and load the catalog item page.
   - Time taken to run all SQL queries of the catalog item.

   Variable SQL debugger fields

Field	Description
Variable	Catalog item variable for which the performance diagnostics are displayed.
Processing Time	Time taken to process and load the variable.
SQL Count	Number of SQL queries triggered for the variable.
SQL Time	Time taken to run SQL queries for the variable.
SQLs	Details of the SQL queries triggered for the variable.

4. To sort by any field, click the field name.

   Note:
   - By default, variables are sorted in descending order by their processing time.
   - Variables within a single-row or multi-row variable set are displayed in hierarchical order.

5. To view the configuration of a variable, click the variable name.
6. To view a detailed summary of all SQL queries triggered for a variable, click **View Details** in the **SQLs** field of the variable.
7. To change the sort order, Use the **Sort By** list.

   Note:
   By default, triggered SQLs are sorted in descending order by their execution order.

Debug a Service Catalog variable

Monitor changes in the state and the value of a Service Catalog variable due to catalog client scripts, catalog UI policies, and catalog data lookups. You can diagnose and resolve issues related to such changes, and track client-side scripting errors on this tab.

Before you begin

Role required: admin or catalog_admin Features available for debugging Service Catalog issues including UI macro customization debugging; variable action logger; variable watcher; item diagnostic report

Procedure

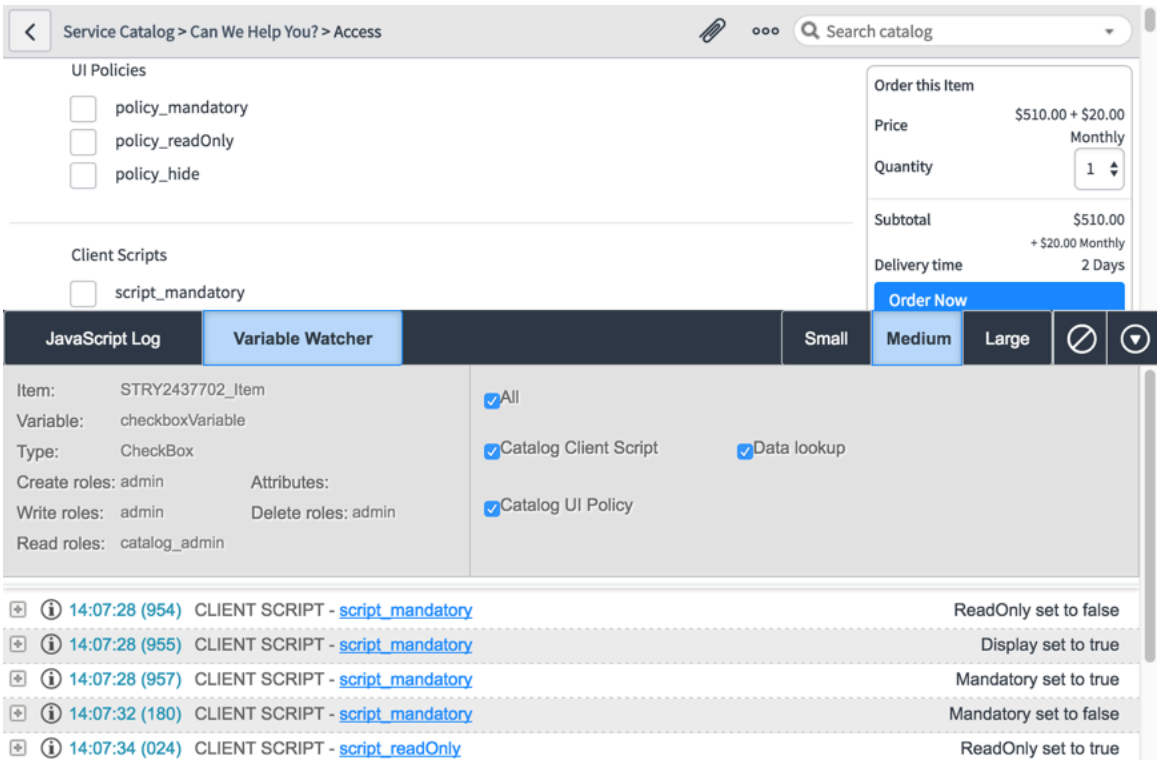
1. Enable the JavaScript log and field watcher..
   a. In the banner, click the settings icon ( ).
   b. In the System Settings window, click the **Developer** tab.
   c. Enable the **JavaScript Log and Field Watcher** option.
   The **JavaScript Log** and **Field Watcher** tabs are displayed in a pane at the bottom of the page. For information about JavaScript logs and fields watcher, see JavaScript log and Field Watcher .
   d. Close the System Settings window.
2. Navigate to **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
3. In the Catalog Items list, select a catalog item to debug its variables, and click **Try it**.
4. On the form, right-click a variable field label and select **Watch Variable**.
   The debug icon ( ) is displayed next to the variable, and the **Field Watcher** tab in the bottom pane is replaced with the **Variable Watcher** tab.
5. Edit the fields on the **Variable Watcher** tab.

Field	Description
Item	Current catalog item.
Variable	Variable that is being watched.
Type	Type of the variable.
Create roles	User type that can create values for the variable.
Write roles	User type that can edit values for the variable.
Read roles	User type that can read values for the variable.
Reference	Reference table for the variable. Applicable for reference variables.
Reference Qual	Qualifiers to restrict data that is available in the field. Applicable for list collector, lookup multiple choice, lookup select box, and reference variables.
Attributes	Attributes of the variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Delete roles	User type that can delete values for the variable.
All	If selected, displays the action log of the variable due to catalog client scripts, data lookups, and catalog UI policies.
Catalog Client Script	If selected, displays the action log of the variable due to catalog client scripts.
Data lookup	If selected, displays the action log of the variable due to data lookups.
Catalog UI Policy	If selected, displays the action log of the variable due to catalog UI policies.

Variable Watcher tab



6. To watch another variable, right-click that variable and select **Watch Variable**.

Note:
You can watch only one variable at a time.

7. To stop watching a variable, right-click the variable and select **Unwatch Variable**.
8. To clear the logs, click the Clear log icon ( ).
9. To resize the pane, click **Small**, **Medium**, or **Large**.
10. To close the pane, click the Close icon ( ).

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

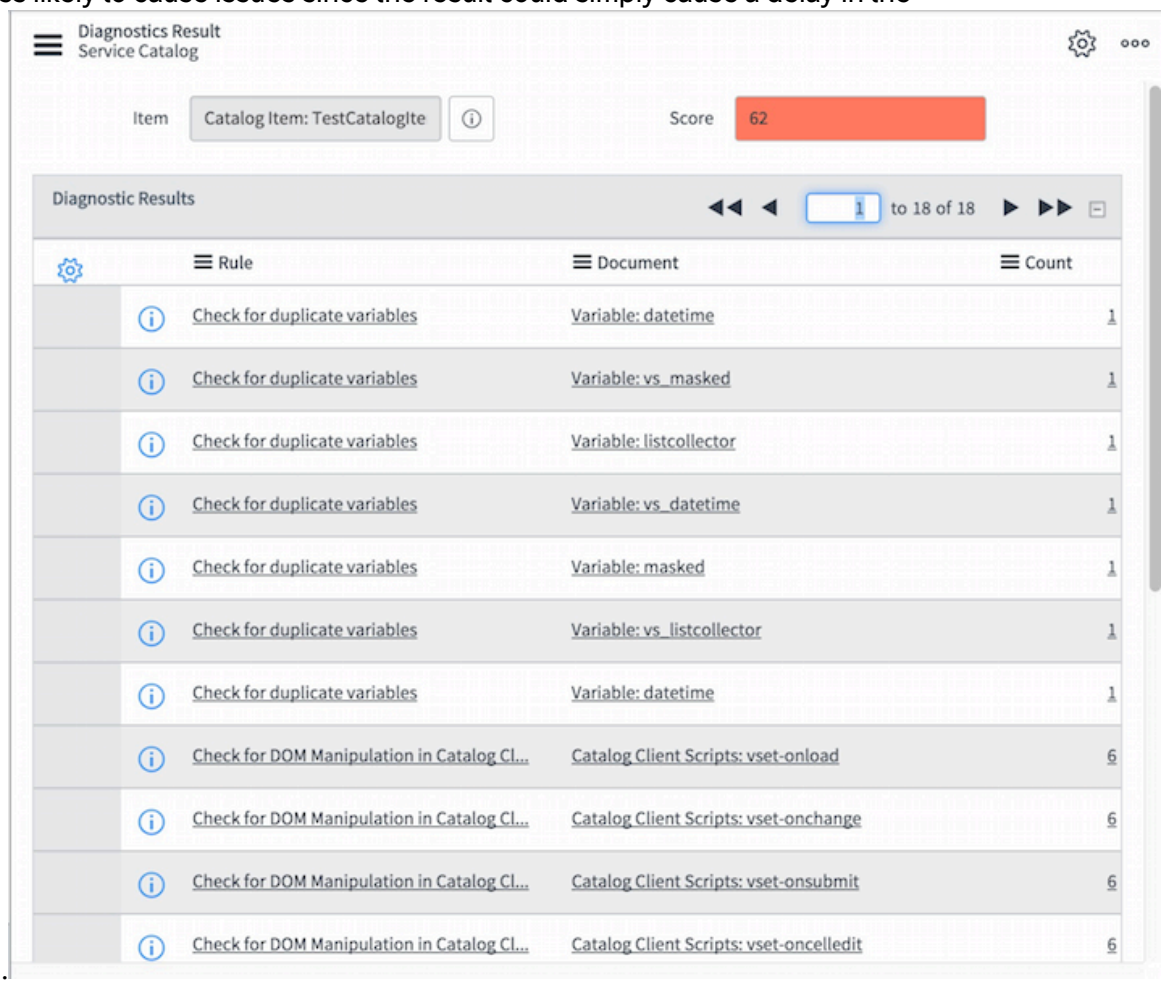
Item diagnostic report

For a catalog item data and configuration, you can identify possible violations from the ServiceNow recommended practices.

The item diagnostic report includes a score that measures the health of the item, and a list of diagnostic result entries. These entries consist of a rule, a document (record that violates the rule), and a count (the number of violations in the record).

Correct violations for best performance and to maintain expected behavior.

The lower the score, the better (0 is ideal). A higher score means that an item has more violations from the ServiceNow recommended practices. Each rule has a different weight and level of importance. For example, a violation of duplicate variables is more likely to result in user issues. An AJAX usage violation is less likely to cause issues since the result could simply cause a delay in the UI.



Default diagnostic rules

These diagnostic rules are designed as per ServiceNow recommended practices.

Default diagnostic rules

Rule	Description
checkUserCriteriaUsage	Identifies if the item is using entitlements instead of user criteria

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default diagnostic rules (continued)

Rule	Description
checkBalancedContainers	Checks if the Container Start and Container End variables are balanced.
checkDuplicateVariables	Identifies variables with the same name associated to a catalog item (or an associated variable set).
checkDOMManipulation	Identifies any DOM violation in catalog client scripts. The DOM is not guaranteed to be the same between releases and can affect catalog client scripts during upgrades. Therefore, it is not recommended for customers to do any kind of DOM manipulation. You can view detailed information for each client script by clicking the information icon.
checkLookupVariableRowCount	Checks if the Lookup variable is run on tables with many records as it can lead to slower load times.
checkAJAX	Identifies all AJAX calls in catalog client scripts because, although AJAX calls in catalog client scripts are allowed, they must be asynchronous. All AJAX calls are listed because even asynchronous calls can cause some delay. You can view detailed information for each client script by clicking the information icon.
checkSelectBoxUnique	Identifies Select Box type variables that have the attribute enabled to show only unique entries in the select box.
checkOrderGuideRuleBaseCount	Checks for high number of active rule bases in an order guide as higher number of rule bases can lead to slower load times
checkFormatterVariablesUsage	Checks if the item has the following variable types: • Macro • Macro with label • UI Page For information on the variable availability across various channels, see Variable support in various channels.

Run the Item Diagnostic Results report

Identify the catalog items that are not designed per ServiceNow recommended practices to run your catalog efficiently.

Before you begin

Role required: admin or catalog_admin

About this task

This report runs every weekend on all catalog items of all types.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Request Reports**.
2. Select the [Catalog] Item Diagnostics Results report.
   A report is displayed with all active catalog items with a non-zero score. These catalog items are grouped by score and each score has a different color.
3. Click the score to diagnose the associated catalog items.

   Note:

   - Any item with a score greater than zero indicates a recommended practice rule violation.
   - The higher the score, the more is the catalog item deviating from ServiceNow recommended practices.

4. Click the score of the required catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Diagnostic results are displayed for the catalog item with violated rules. For information on default diagnostic rules per ServiceNow recommended practices, see Item diagnostic report.

5. To understand details of each violated rule, click the **Count** value for that rule.

Service catalog UI policy

UI policies can be used to define custom process flows for tasks.

Catalog UI policies control the behavior of catalog item forms when presented to your users. Catalog UI policies can be applied to a catalog item or a variable set.

UI policies are useful when applied to service catalog items. Keep the following points in mind when creating service catalog UI policies:

- A catalog UI policy applies to either a specific catalog item or any item that uses a specific variable set.
- A catalog UI policy can only contain and reference variables that are defined for the catalog item or variable set.
- Like UI policy conditions, the variables in a service catalog UI policy condition must be visible (even if hidden by UI policy or read-only) on the form for the condition to be tested. Also, ensure that the variables have names. For more information, see Create a catalog client script.
- Limited UI policy functionality applies to following variables:
  - The Mandatory and Read Only policy do not apply to the following variable types: Break, Container Split, Container End, UI Macro, UI Macro with Label, Label, UI Page.
  - The Set visible policy does not apply to the following variable types: Break, Container Split, Container End.
- Service catalog UI policies are applied to variables and variable sets of catalog items ordered in the service catalog. Policies can also be applied when the variables are present in a Requested Item or Catalog Task form.

  Note:
  The **Clear the variable value** UI policy action is not applicable on variable sets and containers.

- Catalog UI policy actions can be applied on a variable set. The actions on a variable set are applied on all variables within the variable set. If different catalog UI policy actions are applied on a variable or a variable set, the action with the lowest order is considered.
- The priority order for UI actions types is:

  1. Mandatory (highest)
  2. ReadOnly/Display

  If a variable is set to mandatory and does not have value, readonly or hide do not work on that variable. If a variable is hidden or readonly, and then set to mandatory, the variable field becomes visible or editable.

  This priority order is also applicable for variable sets and containers. If a variable set or container has a mandatory variable without any value, then the container or variable set cannot be hidden.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Catalog UI policies are supported for catalog items viewed in a service catalog wizard.

Note:
The UI policy for catalog items always takes precedence over UI policy for variable sets. You can change this behavior by editing the *glide.sc.ui_policy.variable_set_run_first* property.

Create a UI policy for catalog items

You can apply UI policies for catalog items ordered in the service catalog.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Administration** > **Catalog UI Policies**.
2. Select **New**.
3. In the **Applies to** field, select **A Catalog Item**.
4. Fill in the remaining fields.

Field	Description
Applies to	Select the type of item this UI policy applies to: ○ **A Catalog Item**: enables the **Catalog item** field. ○ **A Variable Set**: enables the **Variable set** field.
Catalog Item or Variable Set	Select the catalog item or a variable set this UI policy applies to. The field name and options available depend on the **Applies to**selection.
Short description	Enter a brief description (example, Out-of-state move).
Active	Select the check box to enable the UI policy. Clear the check box to disable it.
When to Apply	
Catalog Conditions	Create conditions for the UI policy using catalog item variables. The policy is applied if the conditions evaluate to be true. For example, a catalog item of **Schedule a Move** may have a condition of **move_from > is > San Diego**. The UI policy is applied when an employee schedules a move from San Diego to any other company location. **Note:** The label of a variable associated with a variable set reflects the variable set name. The format is *variable_set_name » variable_name*.
Applies on a Catalog Item view	Select the check box to apply the UI policy to catalog items within the order screen. Available in the requester view.
Applies on Catalog Tasks	Select the check box to apply the UI policy on a Catalog Task form. Available in the fulfiller view. See VEditor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Applies on Requested Items	Select the check box to apply the UI policy on a Requested Item form. Available in the fulfiller view. See VEditor.
Applies on the Target Record	Select the check box to support the catalog UI policy on a record created for task-extended tables via record producers. See Default variable editor.
On load	Select the check box to apply the UI policy when the form is loaded. Clear the check box to apply the policy only when the form is changed.
Reverse if false	Select the check box to reverse the UI policy if the **Catalog Conditions** statement evaluates to false.
Script	
Run scripts	Select the check box to use the **Execute if true** and **Execute if false** scripting fields. Scripts are necessary to apply a UI policy other than **Read Only**, **Mandatory**, or **Visible**. For example, you must create a script to apply a UI policy to a specific role.
Other fields	
Order	Enter the sequence in which this UI policy is evaluated if more than one matching UI policy exists. The order is evaluated from the lowest value to the highest value.
Global	This field isn't used for the service catalog.
Inherit	This field isn't used for the service catalog.
Catalog UI Policy Actions	
Variable name	Select the variable or variable set that belongs to the catalog item. When you apply catalog UI policy actions on a variable set, the actions are applied on all variables within the variable set. If different catalog UI policy actions are applied on a variable or a variable set, the action with the lowest order is considered. **Note:** ○ The set value UI policy action isn't applicable for the attachment and masked variables. Use the **Clear the variable value** option to clear the value for the attachment and masked variables. ○ For multi-row variable set, you can apply a UI policy action on the complete variable set but not on individual variables inside it. ○ The label of variables associated with a variable set reflects the variable set name. The format is *variable_set_name » variable_name*.
Order	Sequence in which the UI policy action is evaluated. The order is evaluated from the lowest value to the highest value. This is also applicable in Service Portal.
Mandatory	Choice list for specifying how the UI policy affects the mandatory state of the field. Choices are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Leave alone ○ True ○ False
Visible	Choice list for specifying how the UI policy affects the visible state of the field. Choices are: ○ Leave alone ○ True ○ False
Read Only	Choice list for specifying how the UI policy affects the read-only state of the field. Choices are: ○ Leave alone ○ True ○ False
Value action	Choice list for specifying whether to set a value for the question, clear the value, or set nothing for the question. Here are the choices. ○ Leave alone ○ Set value: Option to set a value for the question in the catalog item. ○ Clear value: Option to clear the variable value.
Value	Enter a value for the question. This field appears only when you select **Set value** from the Value action list.
Field message type	Select any of the message types that you want to show for the question. ○ Info ○ Warning ○ Error **Note:** If you don't want any message, select **None**.
Field message	Enter a message that you want to show for the question when a specified condition is met. This field appears only when you select a value from the Field message type list.

5. Select **Submit**.

Note:
Configure the variable form to display all fields.

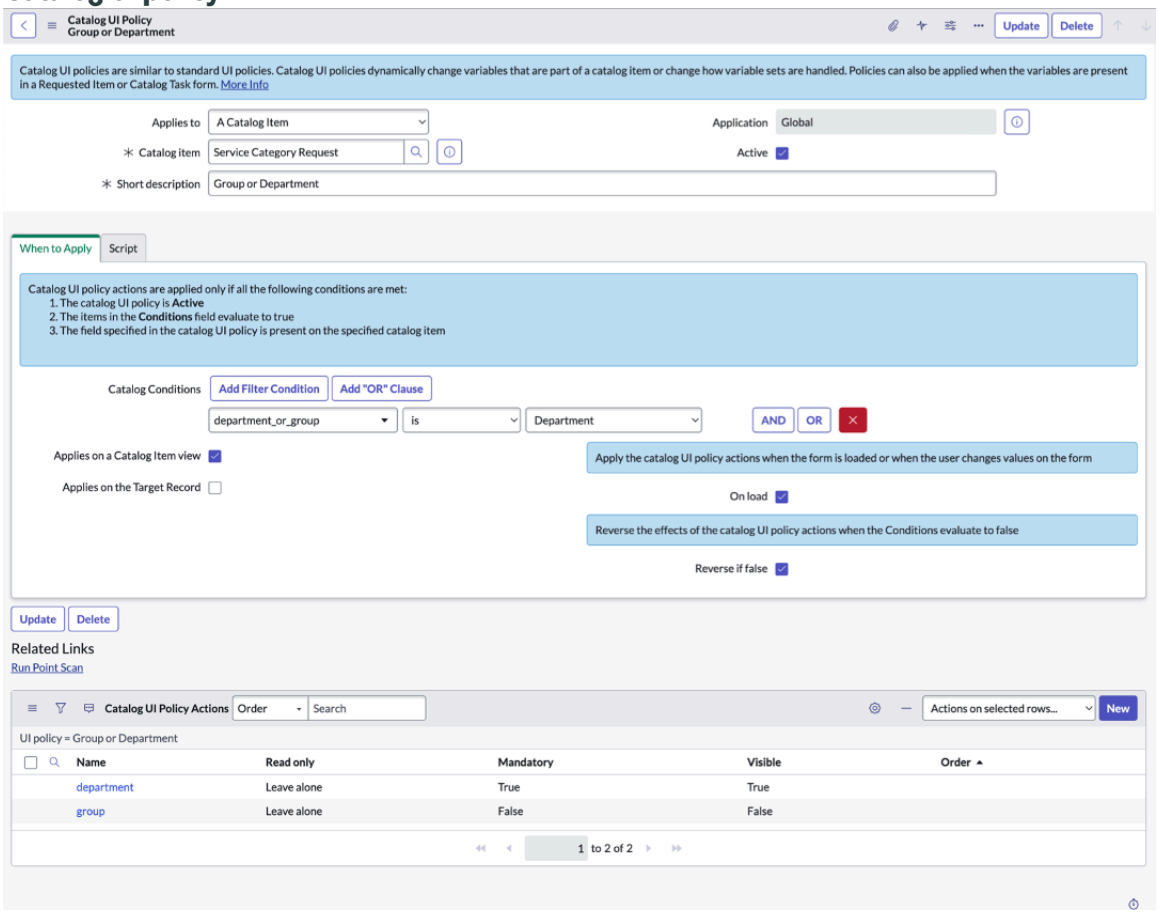
Service Catalog UI policy examples

The following is an example of how Service Catalog UI policies work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following UI policy makes it mandatory for any department to specify the name of the department if **Department** is selected for the question **Department or group?**.

Catalog UI policy



Catalog Builder

You can create or edit a catalog item (catalog item or record producer) using a visual and guided experience along with specified restrictions. The Catalog Builder experience enables you to delegate the creation and maintenance of the catalog.

You can also create a template that can be used to create catalog items. While creating the template, you can specify values or restrictions for items created using the template, for example, restrictions to catalogs, categories, variable types, and portal settings.

From the home page of the Catalog Builder, you can do the following:

- Create a catalog item
- Create a catalog item template
- View the available catalog items
- View the available catalog item templates
- View catalog items that are recently updated
- View the configured content that describes the catalog building process in your organization.

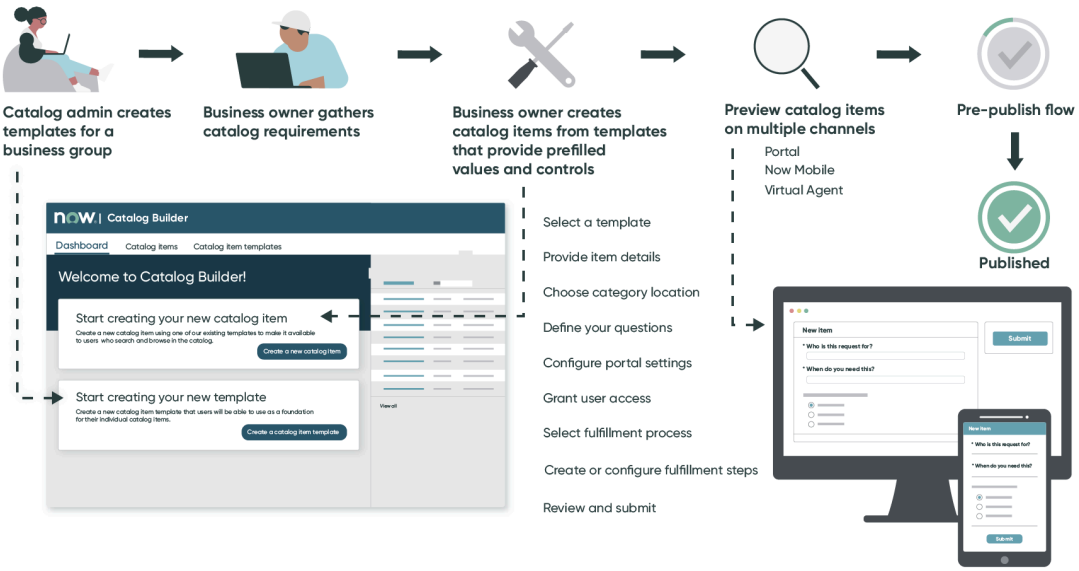
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How does the Catalog Builder work

Catalog administrator creates templates for a business or service group. The business owner or service owner gathers catalog requirements and creates catalog items from these templates. All advanced capabilities are added by the catalog administrators or developers.

Catalog Builder overview

Catalog item creation process



Catalog item states

A catalog item goes through various states during the item creation and maintenance process.

Catalog item states

State	Description
Draft	A catalog item is in the Draft state in one of these scenarios: • A new item is being created in Catalog Builder. • An existing published item has been checked out for editing in Catalog Builder. When the item is being edited, Catalog Builder checks out the item and creates a copy of the item and its associated records(variables, UI policies, client scripts). The item copy is in the Draft state. The published item remains in the Published state and the **Checked out** field is set to **True**. Once the editing is done and the item is submitted, the edits to the draft item are merged with the associated published item and the draft item is deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog item states (continued)

State	Description
	Note: • You can only edit a draft item but not a published item that has been checked out. • A draft item is always inactive and does not show up in the search or browse experience. • You cannot modify the **Active** flag of a draft item. • Any changes to the draft item are not available until it is submitted.
Publishing	A catalog item is in this transient state for a while just after its submission and before its state changes to Published. You cannot check out an item in the Publishing state.
Published	When a new item is submitted, the item finally moves to the Published state. This state indicates that it is the item version being used by the application and available in the catalog. When you edit a published item, it is checked out in Catalog Builder and the item's draft copy is created.

Limitations

Catalog Builder is designed to support the most common and simple use cases so that it can easily be used by business users, while the complex functionality can be added to the item in ServiceNow AI Platform by catalog administrators.

When creating a record producer in a specific scope, you can select tables in that scope and tables in other scope if the objects from the other application scope are given read and create access for selecting a record submission table. For more information on making a table accessible to other applications, see Table design and runtime settings.

Catalog Builder does not allow creation and editing of the following entities, but they can be set in ServiceNow AI Platform either for a draft item or a published item that has not been checked out.

- Catalog item
  - Meta tags
  - Execution plans. If an item is assigned an execution plan, the process engine cannot be changed in the Catalog Builder.
  - Price settings
- Variable settings
  - Tool tips
  - Advanced and dynamic reference qualifiers. If a variable has advanced or dynamic reference qualifiers, then the reference qualifier cannot be edited in the Catalog Builder.
  - Attributes
  - Permissions
  - Availability

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Lookup label field (defaults to lookup value field)
- Lookup price fields
- Unique values only
- Always expanded help
- Help text
- Advanced reference qualifiers

- Question types. The following questions are supported in Catalog Builder, and they are grouped into types and subtypes. For the unsupported question types, you can view the questions but not edit them:
  - Text
    - Single-line. This is the Single-line text variable type in ServiceNow AI Platform.
    - Multi-line. This is the Multi-line text variable type in ServiceNow AI Platform.
    - Rich text. This is the HTML variable type in ServiceNow AI Platform
  - Option
    - Check box. This is the Check box variable type in ServiceNow AI Platform.
    - Yes/No. This is the Yes/No variable type in ServiceNow AI Platform.
  - Choice
    - Dropdown (fixed values). This is the Select Box variable type in ServiceNow AI Platform.
    - Dropdown (values from a table). This is the Lookup Select Box variable type in ServiceNow AI Platform.
    - Record reference. This is the Reference variable type in ServiceNow AI Platform.
    - Radio. This is the Multiple Choice variable type in ServiceNow AI Platform.
    - Multi-select. This is the List Collector variable type in ServiceNow AI Platform.
  - Date/Time
    - Date. This is the Date variable type in ServiceNow AI Platform.
    - Date &Time. This is the Date and time variable type in ServiceNow AI Platform.
  - Display label
    - Plain text. This is the Label variable type in ServiceNow AI Platform.
    - Rich text. This is the Rich Text Label variable type in ServiceNow AI Platform
- Catalog UI policy
  - **On Load** field (defaults to true)
  - **Script** field. When a catalog UI policy has a script, it does not show up in the question's behavior settings list in the Catalog Builder.
  - **Reverse if false** field. By default, it is set to true.
  - Multiple actions. When a catalog UI policy has multiple actions, it does not show up in the question's behavior settings list in the Catalog Builder.
- For a catalog item, the questions cannot be viewed and edited in the Catalog Builder in the following scenarios:
  - It has more than two levels of containers.
  - It has a two-column question set or two-column container within a container.

© 2026 ServiceNow, Inc. All rights reserved.

- Catalog client scripts
- Data lookup rules

Related topics

Set up a service catalog

Setting up the Catalog Builder

Set up the catalog item building process.

Before you begin
Role required: admin

Procedure

1. To direct users from the Catalog Builder homepage to your organization-specific catalog building process documentation, perform the following steps.

   a. Navigate to sys_properties.list.

   b. Select the *glide.sc.builder.content_url property*.

   c. On the System Property form, in the **Value** field, specify the URL for the documentation of your choice.

      You can include both absolute and relative URLs. Following are the examples:

      - Absolute URL: https://www.youtube.com
      - Relative URL: sp?id=kb_article&sysparm_article=KBXXXXXX

   d. Click **Update**.

2. **Optional:** To preview a catalog item in a specific portal, perform the following steps.

   a. Navigate to sys_properties.list.

   b. Select the *glide.sc.builder.preview_portal_id*.

   c. On the System Property form, in the **Value** field, specify the portal name.

      (Optional) The default value is `swp`.

   d. Click **Update**.

3. Create or duplicate catalog item templates.

   For information on creating a template, see Creating or editing catalog item template.

4. **Optional:** To allow users with access to a catalog item template to edit all items created using that template, perform the following steps.

   a. Navigate to sys_properties.list.

   b. Select the *glide.sc.builder.template_access*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. On the System Property form, in the **Value** field, set the value to `true`.

(Optional) The default value is `false`.

d. Click **Update**.

5. **Optional:** Define and configure a pre-publish subflow that is triggered after submitting the catalog item in Catalog Builder.

(Optional) This subflow is run after the catalog item has been submitted but before it gets published. For example, an approval flow after submitting the edited catalog item in Catalog Builder.

a. Create a pre-publish subflow by specifying the following input and output parameters.

(Optional) You can also copy the Template: Catalog Builder - Item review subflow and then define your subflow. For information about subflows, see Subflows.

Template: Catalog Builder - Item review subflow input parameters

Parameter	Type	Description
catalog_item	String	sys_id of the draft version of the catalog item.

Template: Catalog Builder - Item review subflow output parameters

Parameter	Type	Description
state	String	State of the pre-publish subflow. Possible values are: ▪ completed: Publishing process is triggered for the item in the **In review** state. ▪ failed: Reverts the state of the item from **In review** to **Draft**. **Note:** The **completed** and **failed** values are case sensitive and must be selected the same way.

For information about subflow field types, see Field types.

b. Create the *glide.sc.builder.item_review_flow* property.

i. Navigate to sys_properties.list.

ii. Click **New**.

iii. On the form, fill in the fields.

System Property form

Field	Description
Name	Unique identifier of the property. Specify *glide.sc.builder.item_review_flow*.
Type	Type of the property. Specify **string**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Value	sys_id of the review subflow.

iv. Click **Submit**.

6. **Optional:** To modify the content in feedback panels for Catalog Builder steps, perform the following steps.
   a. Navigate to sc_wizard_feedback.list.
   b. From the list of catalog wizard feedbacks, select the feedback panel content that you want to edit.
   c. On the Catalog Wizard Feedback form, in the **Content** field, edit the content.
   d. Click **Update**.
7. **Optional:** To determine which users can view and edit catalog items, specify a value in the *glide.sc.builder.item_filter_mode* property.
   a. Navigate to sys_properties.list.
   b. Select the *glide.sc.builder.item_filter_mode* property.
   c. On the System Property form, in the **Value** field, specify one of the following values:
      - **default**: All the catalog items for which the user has read access will be displayed. When set to **default**, the user cannot edit a catalog item unless the user has write access for that item.
      - **catalog_editor**: All the items where the user is the catalog editor or catalog manager are displayed and can be edited.
      - **owner_only**: All the items for which the user is the owner are displayed and can be edited.

      Note:
      If the user has the catalog_admin role, the user can view and edit all catalog items irrespective of what is selected in the property.

Configure a step-based service fulfillment flow

Define service fulfillment steps while creating a catalog item in Catalog Builder.

Before you begin

Role required: admin, catalog_builder_editor, or catalog_admin

About this task

In the base system, the Step-based request fulfillment flow is available. It includes the Service Fulfillment Steps base flow subflow that runs all steps defined in the service fulfillment flow. Following are the input and output parameters of the subflow.

Service Fulfillment Steps base flow input parameters

Parameter	Type	Description
task	Reference	RITM record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Fulfillment Steps base flow output parameters

Parameter	Type	Description
state	String	State of the subflow. Possible values are: • completed: All steps are complete. • failed: At least one step failed because of invalid configurations such as missing subflow or step configurations.

For information about subflow field types, see Field types.

If your organization has processes to be run before or after the service fulfillment steps, create a flow and ensure that it is configured as a step-based service fulfillment flow.

Procedure

1. Create a Workflow Studio flow (With the trigger type as Service Catalog).
   Ensure that the Service Fulfillment Steps base flow subflow is called from this flow.

   For information about creating a flow with Service Catalog trigger type, see Create a flow with a Service Catalog trigger.

2. Register the flow as service fulfillment flow.

   a. Navigate to **Service Catalog** > **Catalog Administration** > **Service Fulfillment Steps Registry**.

   b. Click **New**.

   c. On the form, fill in the fields.

   Service Fulfillment Flow Registry form

Field	Description
Service Fulfillment Flow Registry	Workflow Studio flow for which you want to enable service fulfillment steps.
Application	Application scope in which the flow is supported for service fulfillment.
Active	Option to enable the service fulfillment support for the flow.

   d. Click **Submit**.

Create a service fulfillment step type

Expand the coverage of service fulfillment use cases beyond those supported by step types in base system. Using a service fulfillment step type, catalog item owners can define multiple steps that are part of the request fulfilment process.

Before you begin

Role required: admin

About this task

The following step types are available in the base system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Task
- Custom approval
- Manager approval

Procedure

1. Set up a data store to store information needed for running the step. This information is provided by a catalog item owner while defining the request fulfillment process. Do one of the following.

2. Create a record producer to store the values provided by the catalog item owner to the data store (base table or extended table) of that step. For information about creating a record producer, see Create a record producer.

   Note:

   - The Service Fulfillment Steps - Properties set variable set is automatically added to the record producer and it should not be removed from the record producer.
   - All additional columns defined in the extended table should have corresponding variables mapped in the record producer.
   - Configure the Record Producer form to display the **Allow edit** option and **Save Options** field. Also, select the **Allow edit** option and set the value of the **Save Options** field to **Save in Destination**.
   - Ensure that the record producer is not restricted for the users with catalog_builder_editor role.

3. Create a subflow to perform a sequence of actions by copying the Template: Service Fulfillment Steps subflow and then defining your subflow. For information about subflows, see Subflows.

   Template: Service Fulfillment Steps subflow input parameters

Parameter	Type	Description
requested_item	Reference	RITM record
service_fulfillment_step_data	Reference	Step data record. Update the state to one of the following values before ending the subflow: ○ canceled ○ failed ○ completed
service_fulfillment_step	Reference	Step defined on a catalog item. It must refer to a table in which the record producer defined in the step configuration inserts a record. Do not update the step record.

   For information about subflow field types, see Field types.

4. Create a step configuration to define the behavior and display of a service fulfillment step type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Service Catalog** > **Catalog Administration** > **Service Fulfillment Step Configurations**.

b. Click **New**.

c. On the form, fill in the fields.

Service Fulfillment Step Configuration form

Field	Description
Name	Name of the step configuration.
Application	Application scope in which the step configuration is supported.
Active	Option to enable the service fulfillment support for the flow.
Order	Order of the step configuration. Based on the order of step configurations, the corresponding service fulfillment step types are displayed in the list in the **Steps** region of the **Fulfillment** step. The step type corresponding to the step configuration with the least order is displayed beside the list and step types for all other step configurations are included in the list based on their order. **Order of service fulfillment step types** Hide	Hides the step type corresponding to this step configuration in the list in the **Steps** region of the **Fulfillment** step. No impact on existing steps.
Short description	Description of the step configuration.
Producer	Record producer that creates an instance of the step type in the step's data store.
Service fulfillment subflow	Subflow triggered during the request fulfillment process.
Dynamic title	Text that should be displayed for the corresponding service fulfillment step in the **Steps** region of the **Fulfillment** step. If you don't provide any value, the step configuration name is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	To display dynamic text, you can include the field name from the step's data store (base table or the extended table) where the associated record producer creates a record. For example, in the base system, the **Dynamic title** field for the Custom approval step configuration contains the following value:`Approval from ${approval_title}` Here, *`approval_title`* is the field from the Service Fulfillment Approval Step [sc_service_fulfillment_approval_step] table where the associated record producer, Add custom approval, creates a record.

d. Click **Submit**.

Add a step, section, or question to a catalog item wizard

Add a step, section, or question to a catalog item wizard so catalog item editors can enter custom details while creating catalog items.

Before you begin
Role required: catalog_admin

About this task
This video shows you how to add a step, section, or question to a catalog item wizard. This video demonstrates how to add a step, section, or question to a catalog item wizard.

Procedure

1. Navigate to **All** > **Service Catalog Wizards** > **Maintain Wizards**.
2. Indicate the wizard you want to modify by selecting either **Create catalog item** or **Create record producer**.
3. Add steps, sections, or questions to the Catalog Builder wizard.

   For more information about the fields and their descriptions of the Catalog Wizard form, see Catalog Wizard form.

Creating or editing catalog item template

Pre-specify values or provide restrictions for attributes such as catalogs, categories, variable types, and portal settings, which are applicable during the catalog item creation or editing process. You can create a template for a catalog item or record producer.

Before you begin
Role required: admin or catalog_admin

Create a catalog item template in catalog builder

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Dashboard** tab and select **Create a catalog item template**.
3. Select any of the following options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Standard** for a catalog item.
- **Record Producer** for a record producer

4. In the wizard, specify the information for each step.

Catalog item template creation wizard

Step	Description
Template Details	○ Basic info: Contains the template name, short description, and an option to use the template scope for creating records. If you select the **Use template scope for creating records** check box, the record producers or catalog items created using this template would be created in the scope of the template. ○ Template Available for: Specifies the user criteria for users who can use the template. Users matching the criteria must have the catalog_builder_editor role. **Note:** You can add up to a maximum of 50 user criteria.
Details	○ Basic info: Suggestions for the item name and short description. ○ Item details: Suggestions for the description of the item.
Destination	Destination table in which a record producer creates records. **Note:** This step is available for a record producer template.
Location	Catalogs, categories, and topics that the item can be associated with. Configure catalogs and categories to make the catalog item discoverable on the Service Portal. In the Topics card, select the taxonomy and its associated topics for a catalog item to make the catalog item discoverable on the Employee Center. **Note:** You can add up to a maximum of 50 catalogs or categories.
Questions	Question sets (variable sets) that should be included in the item. You can also restrict question types that can be used for items using the template by selecting the define owner permissions icon ( ).
Settings	Settings to configure the catalog item behavior in portals, such as Employee Center and Service Portal. Determine whether to display the following buttons or options on the portals: ○ Add to cart ○ Save as draft ○ Quantity selector ○ Delivery time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Description
	○ Attachment ○ Make the attachment mandatory For example, if you don't want to display the **Save as draft** button on the portal for the catalog item, select the **Hide 'Save as draft'** option.
Access	User criteria to specify users for whom the item is available or not available.
Fulfilment	Flow or workflow that you want to associate with the item using this template.
Overrides	Restrictions that apply while creating the catalog item. ○ Can Edit: Only the attributes specified here can be edited. ○ Must specify: Editable attributes that should be answered. The following attributes must be made mandatory: ▪ Item name ▪ Record submission table ○ Restricted selections: For the attributes that enable selection of multiple values (for example, catalogs, categories, Available For, Not Available For), the user creating the item can only select or deselect the options from within the values specified in the template.
Review and submit	Review the template information and submit it.

Note:
For each step, you can review the information in the feedback panel to know more about that step.

5. Select **Submit**.
6. To edit the catalog item template, select the **Catalog item templates** tab, select the required template, and perform any of these actions.

   a. To edit the item, make the necessary changes, and select **Save**.

   Note:
   - The changes to the template don't automatically apply to existing items.
   - While editing an existing catalog item, the new values in the template aren't automatically updated in the item but the new restrictions apply. For example, if a new category is added to the template, that category isn't automatically added to the catalog item. However, the restrictions to the categories apply.
   - When question sets are added to the template, they don't have any impact on the existing catalog items using the template.

   b. To duplicate the catalog item template, select **Duplicate**.

   Note:
   You can't delete a catalog item template in the catalog builder, but it can be deleted in ServiceNow AI Platform. After a template is deleted, it's disassociated from all catalog items using the template and the restrictions no longer apply to those items.

Create a catalog item using a template

Make an item available in service catalog for catalog item requests.

Before you begin

Role required: catalog_builder_editor, catalog_admin, or admin

About this task

You must create a catalog item using one of the available catalog item templates.

Demonstrates how business owners can create catalog items in Catalog Builder.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Dashboard** tab and click **Create a new catalog item**.
3. Review the steps involved in the creation process and click **Continue**.
4. Select a template from the list and click **Use this item template**.

Note:

- After you select the template, the preview of this template is available.
- You can only view templates assigned to you.
- Based on the template configuration, during the item creation or editing, few attributes have pre-specified values, are not editable, have limited options to select, and are mandatory.
- When selecting a record submission table for record producers, you can only select tables in that scope.

5. Based on how each step is defined in the template, specify the required information.

Catalog builder steps

Step	Description
Details	○ Basic info: Item name and short description. ○ Item details: Description of the item.
Destination	Destination table in which a record producer creates records. **Note:** This step is available when using a record producer template.
Location	Catalogs, categories, and topics that the item can belong to. You can only view the catalogs, categories, and topics specified in the template. Configure catalogs and categories to make the catalog item discoverable on the Service Portal. In the Topics card, select taxonomy and its associated topics for a catalog item to make the catalog item discoverable on the Employee Center.
Questions	Question sets (variable sets) or questions for the item. By default, the question sets included in the template are added and cannot be removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Description
	Available question types are restricted to those specified in the template. From the **Insert new question** list, you can include additional question sets, questions, deactivated questions, single-column container, two-column container, and line break. For information on creating a question and supported question types, see Create a question for a catalog item in Catalog Builder. You can also add dynamic form behavior for a question. For information on adding dynamic form behavior, see Edit a question in Catalog Builder. **Note:** ○ The questions within a question set cannot be edited. The question sets can be reordered by dragging and dropping them. ○ Question sets specified in the template cannot be removed, while the ones added by the user can be removed. ○ Removal of question sets simply removes the association with the item and does not delete the question set. ○ A single-column question set can be added to a single-column or a two-column container. Two-column question set cannot be added to a container. ○ The questions for a catalog item are available as options on which a condition can be applied for a step when you create service fulfillment steps for that catalog item.
Settings	Settings to configure the catalog item behavior in portals, such as Employee Center and Service Portal based on the request method. For example, you can determine whether to display buttons or options for adding attachments, making them mandatory, or saving the draft of the items while requesting them.
Access	User criteria to specify users for whom the item is available or not available. **Note:** You can add up to a maximum of 50 user criteria.
Fulfilment	Flow or workflow that you want to associate with this item. It defines how this catalog item can be fulfilled. When a catalog item is associated with a Workflow Studio flow that supports service fulfillment steps, the catalog item owner creating the item can configure steps within the flow. By default, the Step based request fulfillment flow is available in the base system. For information about defining service fulfillment steps, see Define a service fulfillment step. For information about Workflow Studio flows, see Flows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Description
Review and submit	Review the item and submit it.

Note:
A dot beside the step name indicates it has a mandatory field.

6. To save your changes in each step, click **Save**.
   All edits to the item attributes are automatically saved when you navigate to the next step.
7. To preview a catalog item in Portal, Now Mobile, or a Virtual Agent conversation, click **Preview**.

   Note:
   When you preview an item, you can interact with it but not submit it.

   a. To preview the item in Portal, select **Portal** for the **View within** field.

      Note:
      Portal preview is based on portal URL configured for the catalog builder.

   b. To view an item representation in Now Mobile, select **Now Mobile** for the **View within** field.

   c. To preview a catalog item in a Virtual Agent conversation, select **Virtual Agent** for the **View within** field.

      The Service Management Virtual Agent Topic Blocks plugin (com.glideapp.cs.sm_topic_blocks) and one of these plugins must be installed.

      - Glide Virtual Agent (com.glide.cs.chatbot)
      - Glide Virtual Agent Lite (com.glide.cs.chatbot.lite)

      A Virtual Agent conversation whose sys_id is specified in the *glide.sc.builder.va_preview_topic_id* property is opened. By default, the property has the sys_id of the base system Catalog builder preview topic. For information about this topic, see Catalog builder preview topic conversation. If the base system topic is used, the following scenarios are possible:

      - If the item is supported in the conversation mode, you can preview the item in the Virtual Agent conversation by answering the questions but cannot submit a request for the item. For information about when a catalog item is supported in the conversation mode, Service Catalog topic blocks in Virtual Agent powered by NLU.
      - If the item is not supported in the conversation mode, a link is provided for the portal preview of the item.
      - When the required plugins are not installed, an illustration displaying a sample conversational experience for the catalog item submission appears.

   d. To open the preview in a new tab, click **Open preview in a new tab**.

      Note:
      When you make any changes to the item and save it, the preview is dynamically refreshed in the opened tab.

8. To delete an unpublished draft item, click **Delete**.

   Note:
   You cannot delete a published item but can make it inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Click **Submit**.

> **Note:**
> Until you submit the item, it is in the Draft state and is not available in the catalog.

Define a service fulfillment step

Define how a catalog item request should be fulfilled by creating simple service fulfillment steps.

Before you begin

Role required: catalog_builder_editor or catalog_admin or admin

About this task

To configure fulfillment steps while creating a catalog item, associate it with a Workflow Studio flow that supports service fulfillment steps.

Fulfillment process can contain multiple steps. These steps can run sequentially or can be grouped to run in parallel.

The following video demonstrates how business owners can define the fulfillment process of catalog items using service fulfillment steps.

Demonstrates how business owners can define the fulfillment process of catalog items using service fulfillment steps.

Procedure

1. In the **Fulfillment** step of creating a catalog item, for the **Selected flow** field, select a flow that supports service fulfillment steps.
2. In the **Steps** region, perform one of the following:

   a. To create a task, click **Add task**.

      i. On the form, fill in the fields.

Task form

Field	Description
Task	
Short description	Brief description of the task. It appears in the **Steps** region.
Description	Detailed description of the task.
Assignment group	User group that the task should be assigned to.
Assigned to	User for which the task is assigned.
Priority	Priority of the task.
When to run	
Sequence	Sequence of this step relative to the previous step. Possible options are: ▪ With previous step: This step is grouped with the previous step or group. All grouped steps run simultaneously. ▪ After previous step: This step is placed after the previous step

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is not editable if it is the first step.
Condition	Condition that defines whether the step must run. The options on which a condition can be applied are the questions that are available on the catalog item for which you're creating the service fulfillment steps. For information on questions, see the Create a catalog item using a template topic.

ii. Click **Add**.

b. To create a custom approval and define who can approve the step, perform the following:

i. From the list beside **Add task**, click **Custom approval**.

ii. On the form, fill in the fields.

Custom approval form

Field	Description
Custom approval	
Users	Users that can approve this step.
Groups	User groups that can approve this step.
Approval type	Type of the required approval. ▪ All approve: The step is approved only when all assigned users and user groups approve. ▪ Anyone approves: The step is approved when any of the assigned users or any user from the assigned user groups approve.
When to run	
Sequence	Sequence of this step relative to the previous step. Possible options are: ▪ With previous step: This step is grouped with the previous step or group. All grouped steps run simultaneously. ▪ After previous step: This step is placed after the previous step **Note:** This field is not editable if it is the first step.
Condition	Condition that defines whether the step must run. The options on which a condition can be applied are the questions that are available on the catalog item for which you're creating the service fulfillment steps. For information on questions, see the Create a catalog item using a template topic.

iii. Click **Add**.

c. To create a manager approval and define who can approve this step, perform the following:

i. From the list beside **Add task**, click **Manager approval**.

ii. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.

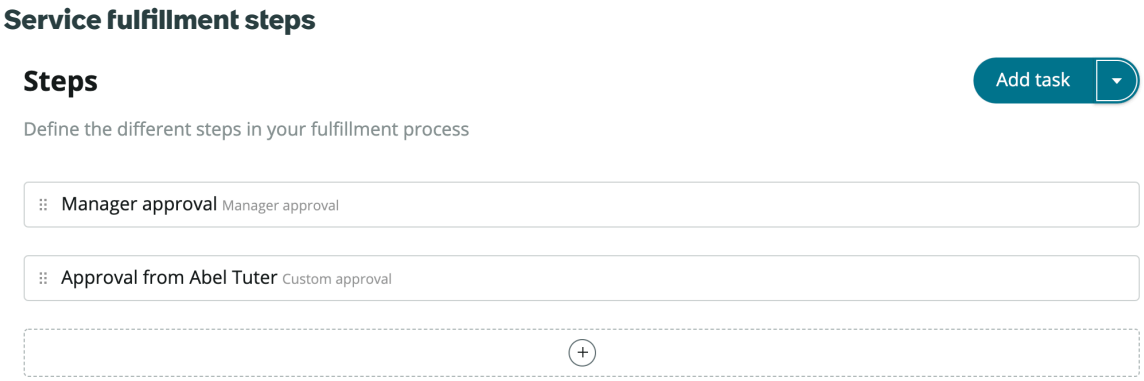
Manager approval form

Field	Description
When to run	
Sequence	Sequence of this step relative to the previous step. Possible options are: ▪ With previous step: This step is grouped with the previous step or group. All grouped steps run simultaneously. ▪ After previous step: This step is placed after the previous step **Note:** This field is not editable if it is the first step.
Condition	Condition that defines whether the step must run. The options on which a condition can be applied are the questions that are available on the catalog item for which you're creating the service fulfillment steps. For information on questions, see the Create a catalog item using a template topic.

iii. Click **Add**.

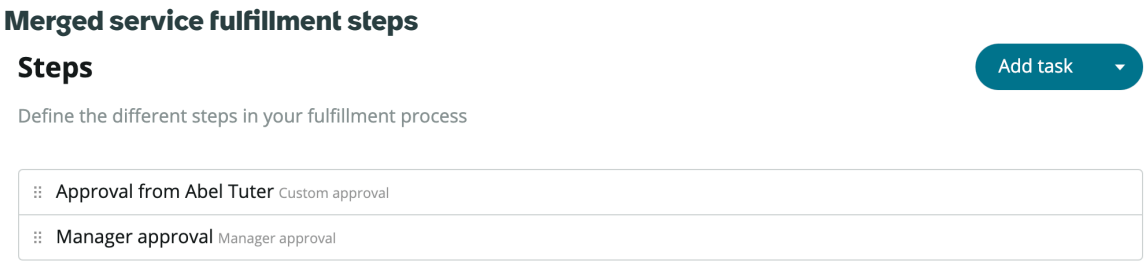


3. In the **Estimated time to deliver** region, for the **Days** field, specify the time by which the RITM should be fulfilled.

   The due date is calculated based on when the service fulfillment flow is triggered.

4. **Optional:** To edit a step, click the edit icon ( ).
5. **Optional:** To delete a step, click the delete icon ( ).
6. **Optional:** To rearrange steps, drag the steps.
7. **Optional:** To group steps together, perform one of the following tasks.
   - Drag a step and drop it on another step or group of steps.
   - To group this step with the previous step or group, click the merge icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. **Optional:** To separate a step from a group of steps, perform one of the following tasks.
   - Click the separate icon ( ). The step is placed after the group.
   - Drag a step out of the group and drop it at a location of your choice.

Catalog builder preview topic conversation

From the catalog builder, a user can preview a catalog item in a Virtual Agent conversation.

This conversation uses the Request Catalog Item topic block. For information on this topic block, see Service Catalog topic blocks in Virtual Agent powered by NLU.

The Service Management Virtual Agent Topic Blocks plugin (com.glideapp.cs.sm_topic_blocks) and one of these plugins should be installed.

- Glide Virtual Agent (com.glide.cs.chatbot)
- Glide Virtual Agent Lite (com.glide.cs.chatbot.lite)

In catalog builder, when the user selects the required item and navigates to preview it, the following scenarios are possible:

- If the item is supported in the conversation mode, you can preview the item in the Virtual Agent conversation by answering the questions but cannot submit a request for the item. For information about when a catalog item is supported in the conversation mode, see Service Catalog topic blocks in Virtual Agent powered by NLU.
- If the item is not supported in the conversation mode, a link is provided for the portal preview of the item.
- When the required plugins are not installed, an illustration displaying a sample conversational experience for the catalog item submission appears.

Create a question for a catalog item in Catalog Builder

Specify a question that the requester should answer before submitting the catalog item.

Before you begin

Role required: catalog_builder_editor, catalog_admin, or admin

About this task

If allowed in the template by the template owner (catalog_admin) while configuring the template, the following question types can be used in the item creation process in the catalog builder. These question types are grouped into types and subtypes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Text
  - Single-line. Single-line text variable type in ServiceNow AI Platform.
  - Multi-line. Multi-line text variable type in ServiceNow AI Platform.
  - Rich text. HTML variable type in ServiceNow AI Platform.
- Option
  - Check box. Check box variable type in ServiceNow AI Platform.
  - Yes/No. Yes/No variable type in ServiceNow AI Platform.
- Choice
  - Drop down (fixed values). Select Box variable type in ServiceNow AI Platform.
  - Drop down (values from a table). Lookup Select Box variable type in ServiceNow AI Platform.
  - Record reference. Reference variable type in ServiceNow AI Platform.
  - Radio. Multiple Choice variable type in ServiceNow AI Platform.
  - Multi-select. List Collector variable type in ServiceNow AI Platform.
  - Requested for
- Date/Time
  - Date. Date variable type in ServiceNow AI Platform.
  - Date &Time. Date and time variable type in ServiceNow AI Platform.
  - Duration
- Display label
  - Plain text. Label variable type in ServiceNow AI Platform.
  - Rich text. Rich Text Label variable type in ServiceNow AI Platform.
- Attachment

For detailed information about these question types, see Types of service catalog variables.

Procedure

1. Navigate to **Catalog Builder** > **Create a new catalog item** > **Question** and click **Insert new question**.
2. On the Create question form, specify the required details.

Note:

- The fields on the form vary based on the question type and subtype.
- While you configure each question, its preview is available.
- The question preview doesn't show interactions for the following questions types until the question is saved and then edited.
  - Record reference
  - Multi-select
  - Drop down (values from a table)
- The question preview doesn't show annotations.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Specify the details on the **Question** tab.

Question tab

Field	Description
Type	
Question type	Group under which the question type is categorized.
Question subtype	Subtype of the question. Only the question types allowed in the template are available.
Details	
Map to field	Maps the question to a specific field on the table for the record producer.
Question label	Question for a requester while ordering the catalog item. For the Rich text question subtype, you can specify a formatted label to be displayed on a catalog item form.
Name	Internal name to identify the question. The name should not contain spaces or special characters. Only the underscore character is allowed.
Mandatory	Option to specify if the question is mandatory.
Hidden	Option to specify if the question is hidden.
Read-only	Option to specify if the question is read-only.
Conversational label	Option to specify the text that you want to ask in the conversation for the question of your catalog item.

b. Specify the details on the **Annotation** tab.

This tab is available for the following question subtypes:

- Single-line
- Multi-line
- Rich text
- Yes/No
- Drop down (fixed values)
- Drop down (values from a table)
- Record reference
- Radio
- Date
- Date &Time
- Multi-select

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Annotation tab

Field	Description
Instructions	
Show instructions	Option to specify if instructions should be displayed for the question.
Instructions label	Instruction for the requester while ordering the catalog item.
Instructions	Detailed instruction content.

c. Specify the details on the **Additional Details** tab.

This tab is available for the following question subtypes:

- Single-line
- Drop down (values from a table)
- Record reference
- Multi-select

Additional Details tab

Field	Description
Validation	
Available for the Single-line question type	
Text validation	Option to validate the specified text value based on the regular expression validations that have been set up in the system.
Source	
Available for the Dropdown (values from a table), Record reference, and Multi-select question subtypes	
Table	Table from which the choices are retrieved.
Field	Field that should be displayed as a choice. This field is not available for the Record reference and Multi-select subtypes.
Filter conditions	Conditions to filter the choices.

d. Specify the details on the **Choices** tab.

This tab is available for the following question subtypes:

- Drop down (fixed values)
- Drop down (values from a table)
- Yes/No
- Radio

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Choices tab

Field	Description
Settings	
Include none choice	Option to include **None** as a choice for the question.
Choice direction	Direction in which the choices should be displayed. Possible options are **Down** and **Across**. This option is available only for the Radio question subtype.
Do not select first choice	Option to ignore the first choice. This option is available only for the Radio question subtype.
Available Choices	
Available for the Drop down (fixed values) and Radio question subtypes. You can add a name-value pair for each choice.	
Display name	Label for a choice.
Value	Value of the choice.

e. Specify the details in the **Default Value** tab.

The default value specified here is pre-selected as the answer for the question when a requester opens the catalog item form for the item. This tab is available for the following question subtypes:

- Single-line
- Multi-line
- Yes/No
- Radio
- Date
- Date &Time
- Multi-select

f. Specify the question details on the **Auto-populate** tab.

For more information about configuring auto-populate value, see Configure an auto-populate value for a question in Catalog Builder.

3. Click **Insert Question** to add the question to the item.

Note:

- If there are two consecutive check boxes, then a virtual container is created for a group of check boxes. Only check box variable types can then be added inside that group.
- Even if a check box variable is added immediately after a group of check boxes, it's automatically added to the group.

Configure an auto-populate value for a question in Catalog Builder

Configure the value of a question to populate automatically whenever the value of another question of the reference type changes.

Before you begin

Role required: catalog_builder_editor, catalog_admin, or admin

About this task

In a catalog item, for example, you can set up the value of the “Name of the manager” question to auto-populate whenever the value of the “Select the requester” question changes.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Catalog items** tab.
3. Select a catalog item and navigate to the **Questions** tab.
4. Select **Insert new question**.
5. On the **Questions** tab, do the following:
   a. In the **Question type** field, select **Choice**.
   b. In the **Question subtype** field, select **Record reference**.
   c. In the **Question label** field, enter `Name of the manager`.
   d. **Optional:** Select the **Read-only** option.
6. On the **Additional details** tab, in the Source table field, search for and select `User (sys_user)`.
7. On the **Auto-populate** tab, do the following:
   a. In the **Select the question this depends on** field, select the reference question that this question depends on.

      For example, select **Select the requester**.

      The list displays all the Reference and Requested For question types that belong to the current catalog item and the associated single-row variable sets.

   b. To select the field that contains the value that you want to set, select the Select the lookup field icon ( ).

      The list shows all the values in the sys_user table.

   c. From the list, select **Manager**.

      Note:
      To search any value, enter what you're looking for, for example, `manager` or dot-walk to get the required value.

      For more information about dot-walking, see Dot-walking to data in related tables.
8. Select **Insert question**.

Edit a question in Catalog Builder

Edit an existing question if you want to improve it by adding dynamic form behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: catalog_builder_editor, catalog_admin, or admin

About this task
Set values for the fields and condition-based field messages. Make the question mandatory, visible, or read-only based on your requirements. You can also deactivate the question.

You can't edit the questions that belong to single-row and multi-row variable sets.

- If the question is used in a published catalog item, you can't delete it but you can mark it as inactive. You can include such questions again in the catalog item by using the **Insert De-activated questions** option.
- Removing a new question that has never been published deletes the question.
- You can't remove questions of types that aren't allowed in the template or supported in the Catalog Builder.

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Catalog items** tab.
3. Select a catalog item and navigate to the **Questions** tab.
4. Deactivate a question.
   a. Point to the question and select the deactivate icon (⊗).
   b. In the dialog box, select **Deactivate**.
5. Edit a question.
   a. Point to the question and select the edit icon (⚙).
   b. Make the required changes and select **Save**.
6. Add dynamic form behavior to a question.
   a. Point to the question and select the UI policies icon (0) for defining dynamic behavior.
   b. In the Dynamic behavior dialog box, select **Define new behavior**.
   c. On the **Actions** tab, fill in the required information.

Actions tab

Field	Description
Outcome	
Specify the behavior of this question when the trigger conditions are met	
Make the question mandatory	Specifies how the dynamic behavior setting affects the mandatory state of the field. Available options: ▪ No action ▪ Yes ▪ No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Make the question visible	Specifies how the dynamic behavior setting affects the visible state of the field. Available options: ▪ No action ▪ Yes ▪ No
Make the question read-only	Specifies how the dynamic behavior setting affects the read-only state of the field. Available options: ▪ No action ▪ Yes ▪ No
Value	
Specify the value that should be set for this question when the condition is met.	
Do this action	Select any of the actions that you want to set for this question. ▪ No action. ▪ Clear value: Option to clear the question value. ▪ Set value: Option to set a value for the question.
Set this value to the question	Option to set a value for the question. For example, if you have a question related to storage with the question type **Choice**, and you set the available choices of storage as 1 TB, 256 GB, and 512 GB, then this field shows these values. You can select any one of these values for the question. This field appears only when you select **Set value** from the Do this action list.
Field message	
Specify the type and message that should be shown under this question when the condition is met.	
Set this field message type	Select any of these field message types. ▪ Info ▪ Warning ▪ Error **Note:** If you don't want a message, select **None**.
Set this message under the field	Option to set a message that you want to show when the condition is met.

d. On the **Conditions** tab, add conditions that trigger the action on this question.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. On the **Settings** tab, fill in the required information.

Settings tab

Field	Description
Applicability	
Scenarios where this dynamic behavior applies	
Applies when the item is being requested	Option to specify if the dynamic behavior applies when the item is being requested.
Applies while viewing the catalog tasks after the request is submitted	Option to specify if the dynamic behavior applies while viewing the catalog tasks after the request is submitted.
Applies while viewing the requested item record after the request is submitted	Option to specify if the dynamic behavior applies while viewing the submitted record.

f. Select **Add behavior**.

Note:
When dynamic behavior is added, a catalog UI policy and action is created and a short description is automatically generated.

Edit a catalog item in Catalog Builder

Make changes to an existing catalog item if you have permissions to edit the item.

Before you begin

- You can edit a catalog item if you are a catalog admin.
- If you have the catalog_builder_editor role and you are the owner of the catalog item, you can edit it. If the template access property, *glide.sc.builder.template_access*, is set to **true** (which is **false** by default), any user with the catalog_builder_editor role with access to the template used for creating the catalog item can edit the item.
- Role required: catalog_builder_editor, catalog_admin, or admin

About this task

When you edit a published item in the catalog builder, the system creates a draft copy of the item and its associated records such as variables, UI policies, and client scripts. The draft version is inactive until published. The published item remains in the published state and the **Checked out** field is set to **True**.

After you edit the item and submit it, the following scenarios are possible:

When a pre-publish subflow isn't configured

- The edits to the draft version are merged with the associated published item.
- The draft item and the associated records are deleted.
- The **Checked out** field of the published item is set to **False**.

When a pre-publish subflow is configured

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The state of the draft item is changed to **In review**.
- If the *state* variable of the subflow output returns **Completed**:
  - The state of the draft item is changed to **Reviewed** and edits made to the draft version are merged with the associated published item.
  - The state of the published item changes to **Publishing**, then to **Published**, and the **Checked out** field of the published item is set to **False**. The state change from **Publishing** to **Published** may not happen instantaneously.
  - The reviewed draft item and the associated records are deleted.
- If the *state* variable of the subflow output returns **Failed**, the state of the draft item is reverted to **Draft**, and the item is ready for editing.

For information about configuring a review subflow, see Setting up the Catalog Builder.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Catalog items** tab.

   Note:
   In the catalog item list view of the catalog builder, you can view items based on the value set in the *glide.sc.builder.item_filter_mode* property.

3. Select the item that you want to edit and select **Edit**.

   Note:
   - To edit an item in the **In review** state, you must cancel the review. After you cancel the review, the state of the item is reverted to **Draft**.
   - To view the conversational details of the catalog item, select **View conversational details**.

   To edit an item in the **In review** state, you must cancel the review. After you cancel the review, the state of the item is reverted to **Draft**.

4. Make the required changes and select **Save**.

   For information on editing a question and catalog item fields, see Edit a question in Catalog Builder and Create a catalog item using a template.

5. To make an item inactive, clear the **Item is active** check box in the **Basic info** section of the **Details** step.
6. To publish the modified item, navigate to the **Review and submit** step and select **Submit**.

Add advanced capabilities to a catalog item

Add advanced capabilities, such as catalog client scripts, data lookup rules, and advanced reference qualifiers to a catalog item.

Before you begin

Role required: catalog_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Add advanced capabilities to a catalog item using any of these methods.
   - Using the **Edit in advanced view** button.
     a. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
     b. Select the **Catalog items** tab.
     c. Select the catalog item for which you want to add advanced capabilities or features.
     d. Select **Edit in advanced view**.

     Note:
     If you have the catalog item wizard open, and you want to edit it in advanced view, select the more actions icon ( ) on the wizard, and select **Edit in advanced view**.

   - Using the **Edit checked out item in advanced view** related link.
     a. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.

     Note:
     - The checked out item icon ( ) for the checked out item beside a catalog item indicates that it's the published version of the item that has been checked out for editing in the catalog builder.
     - A draft item icon ( ) for the draft item mark beside the item indicates that it's the draft version of the item that can be directly edited in ServiceNow AI Platform.

     b. Open the published item that you want to edit.
     c. Select the **Edit checked out item in advanced view** related link.

     Note:
     - When a published item is checked out for editing, you can't edit the published version of the item in ServiceNow AI Platform, unless you cancel the checkout in ServiceNow AI Platform. Canceling the checkout cancels all changes made after the item was checked out.
     - To edit an item in the **In review** state, you must cancel the review. After you cancel the review, the state of the item is reverted to **Draft**.

2. Make the required changes and select **Update**.
3. To edit the same item in the catalog builder, select **Edit in Catalog Builder**.
   If the item has not already been checked out, this step checks out the item.

Discard a catalog item

Discard a catalog item that’s in the Draft state in Catalog Builder.

Before you begin

Role required: catalog_builder_editor, catalog_admin, or admin

About this task

If you no longer want a draft item, you can discard it in Catalog Builder. When you discard a draft item that doesn’t have a published item associated with it, that draft item is deleted. If a draft item has a published item associated with it, the draft item is deleted while the published

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

item remains intact. The data of the catalog item is reverted to the state that it was in before you started editing it.

Procedure

1. Navigate to **All** > *Service Catalog* > **Catalog Builder**.
2. Select the **Catalog items** tab.
3. Select the catalog item that you want to discard.

   Note:
   You can discard only those catalog items that are in the **Draft** state. After you select any draft item, the **Discard draft** button becomes active.

4. Select **Discard draft**.

   Note:
   If a catalog item wizard is already open for editing, and you want to discard it, select the more actions icon (...) on the wizard, and select **Discard draft**.

Transfer catalog items using update sets

Transfer catalog items published through Catalog Builder from one instance to another easily by using update sets automatically created for the catalog item. For example, you can transfer catalog items created by a business user from a non-production to production instance.

Before you begin

You can access update sets for a catalog item only if it is created or modified in Catalog Builder.

For information on creating a catalog item in Catalog Builder, see Create a catalog item using a template.

For information on editing a catalog item in Catalog Builder, see Edit a catalog item in Catalog Builder.

Role required: catalog_admin, catalog_builder_editor

Procedure

1. Access an update set for a catalog item by navigating to **All > System Update Sets > Local Update Sets**.
2. Search for the update set by the name, `CB_<Template Name>_<Catalog Item Name>_<Date and Time Stamp>`.

   Note:
   If a catalog item contains related records such as Variables, Variable Sets, Available For, or Not Available For in a scope other than the current item scope, then such items are transferred in a batch where the related record update set's parent field is set as the update set of the parent catalog item. For more information, see Update set batching.

3. Transfer the completed update sets from the source instance to the target instance. For more information, see Update set transfers.

Localization Framework integration with Catalog Builder

The **Translation Status** tab in the Catalog items tab on the Catalog Builder dashboard enables you to view the translation status of catalog items, and translate catalog items on the fly using manual or machine translation methods.

Ensure that the following plugins are installed before you start using Localization Framework in Catalog Builder:

1. Localization Framework Installer plugin for Service Catalog: The plugin enables the Localization Framework capabilities in Service Catalog and Catalog Builder.
2. Dynamic Translation plugin: Enables on-the-fly machine translation capabilities.

Translate catalog items information using one of the following modes:

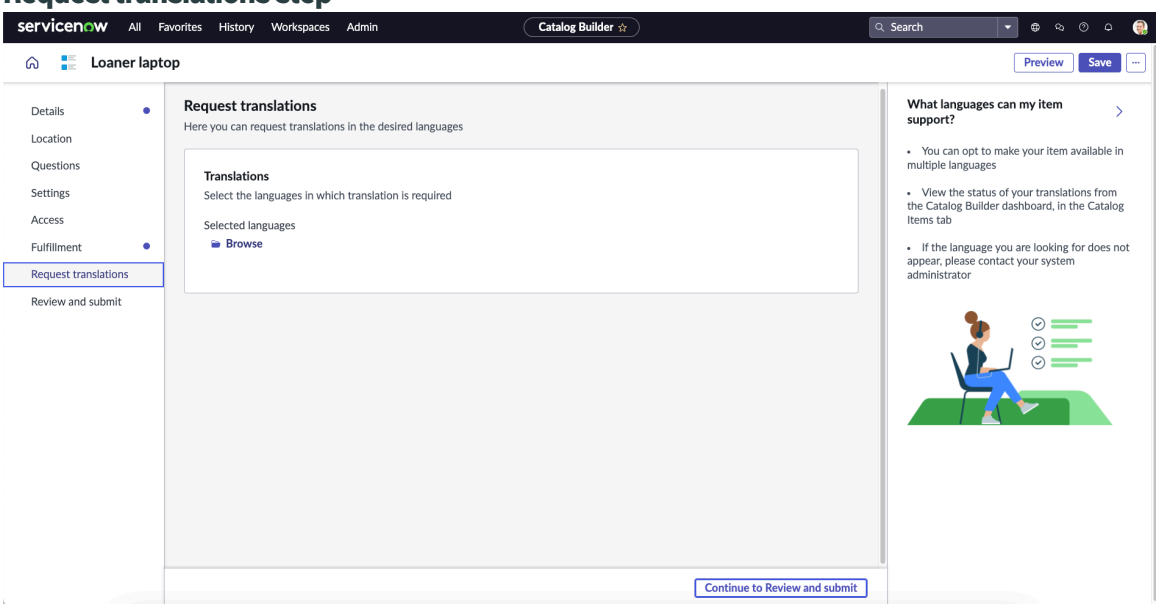
- Request Translation mode
- Self-translation (ad hoc) mode

Request translation mode for new catalog items

Set the glide.sc.catalog_builder.localization.enable_request_translation_mode property to **True**, to enable the Request translations mode.

When you create a new item, the **Request translations** step appears in the wizard steps region. Click **Browse** to view and select the languages you want to translate the catalog item information to.

Request translations step



For more information, see Request translations for Service Catalog items.

Request translation mode for existing items

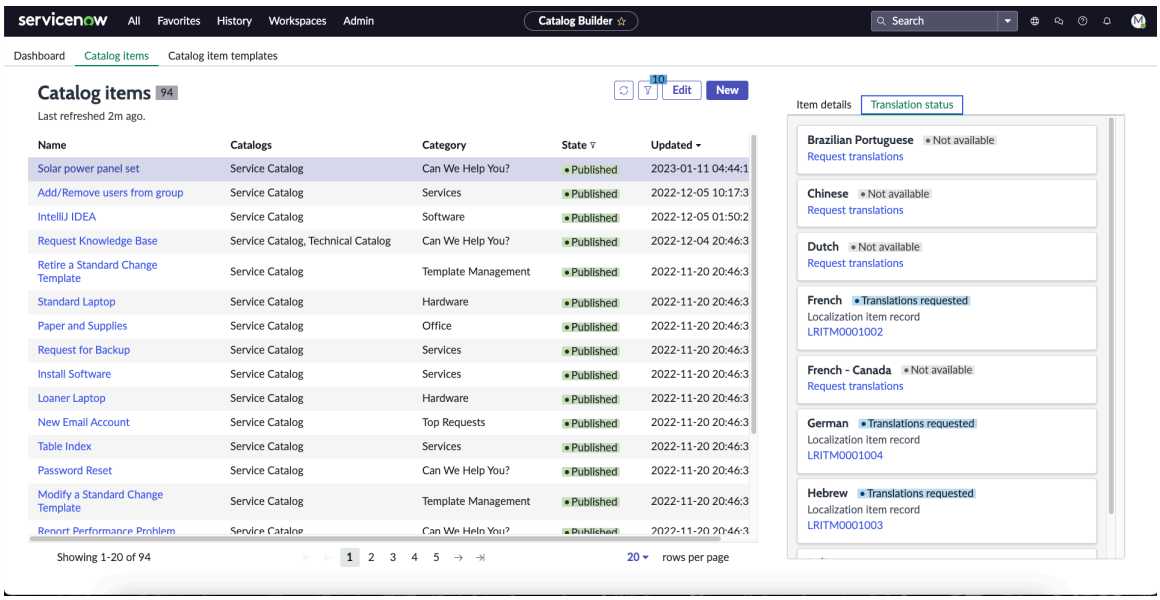
Set the glide.sc.catalog_builder.localization.enable_request_translation_mode property to **True**, to enable the Request translations mode is enabled.

On the **Catalog Items** tab, click the existing item that you want translated, then click the **Translation status** tab on the right pane (next to the **Item details** tab). You would see the list of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

languages configured in the system along with the state of that language for the catalog item and a **Request translations** link to request for a translation.

Translation status tab



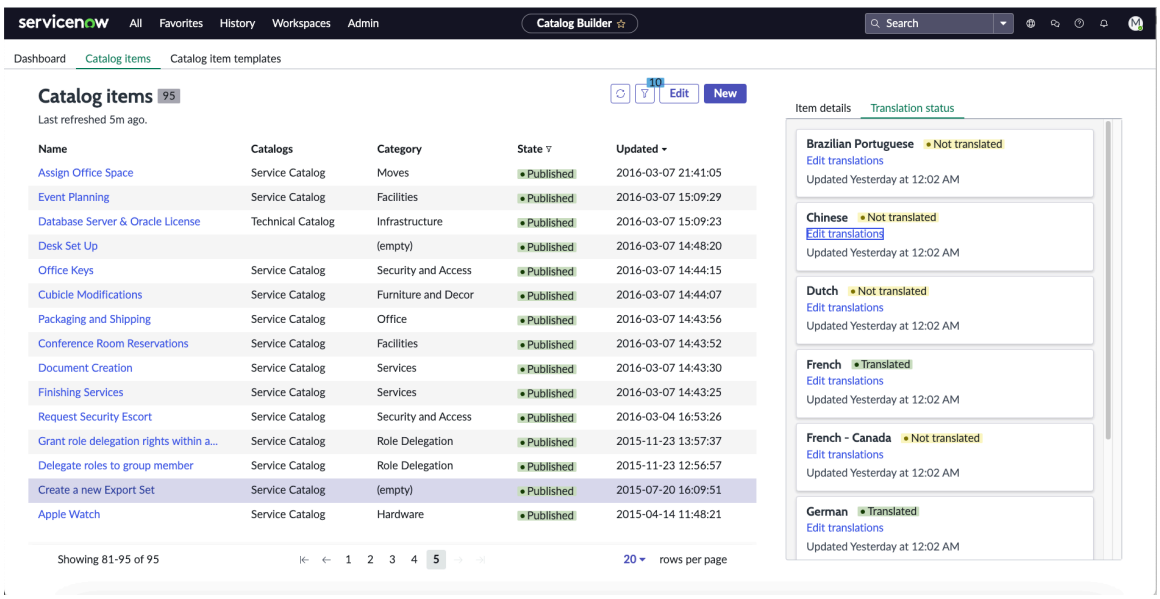
Click the **Request translations** link below the language you want the translations for. A dialog appears prompting you to confirm the translation request. When you confirm the translation request on the **Translation status** tab, a localization task gets generated and its corresponding Localization item record ("LRITMXXXXXXX") shows up in place of the **Request translations** link. The state for that specific language changes to **Translations requested**.

When the localization task completes in Localization Framework, the **Request translations** link comes back which you can use to request for translations again. The state changes to **Translated**, **Partially translated**, or **Not translated** on the **Translation status** tab, depending on whether the translations occur for all fields, some fields, or no fields in the table.

For more information, see Request translations for Service Catalog items.

Self-translation (ad hoc) mode

Translation status tab with self-translation mode



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

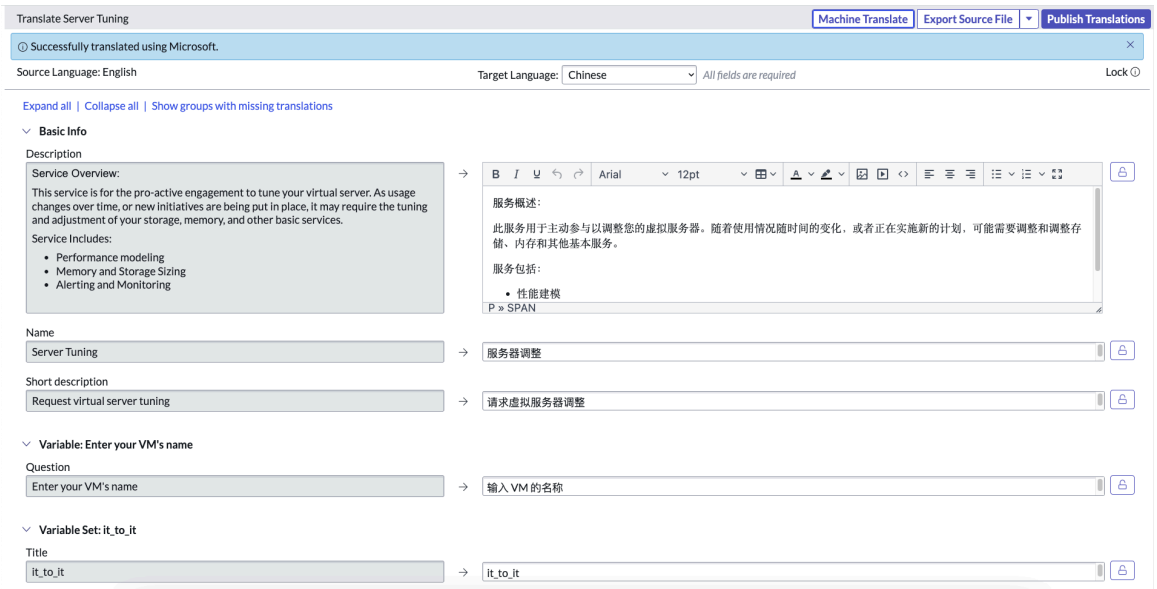
Set the glide.sc.catalog_builder.localization.enable_request_translation_mode property to **False** to enable self-translation mode. The default value for this property is **False**.

In the **Catalog Items** tab, click the existing item you want translated, then click the **Translation status** tab on the right pane (next to the **Item Details** tab). The list of languages configured in the system is displayed, along with the state of that language for the catalog item and an **Edit translations** link to edit the translation.

Click the **Edit translations** link to open another tab that contains two comparison UI regions: The left region is the source language, and the right region is the target or translated language. You can compare the language translation side by side in the page, and make changes if required.

For more information, see Request ad hoc translation for Service Catalog items.

Self-translation



Translation States

Translation states for both modes

State	Mode	Description
Not available	Request translation and Self-translation	If the Localization Framework Insights record is not available, the translation state displayed by the system is **Not Available**, and the state appears near the language name.
Not translated	Request translation and Self-translation	If there are no translations in the system for that specific catalog item for that language, the state **Not Translated** appears near the language name.
Translations requested	Request translation	If there is an active LRTIM associated with a language for the item, the state

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Furthermore, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

Exploring Now Assist in Catalog Builder

Learn how the Now Assist in Catalog Builder application helps you to create catalog items by simply describing them. Now Assist generates catalog items with more detailed descriptions and question labels.

Now Assist in Catalog Builder overview

In Catalog Builder, you can describe the catalog item you want, and Now Assist generates the catalog item for you.

The application uses the Catalog item generation skill to create catalog items.

Note:
You must be assigned the catalog_builder_editor role to create the items using Now Assist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now Assist in Catalog Builder benefits

Benefit	Feature	Roles
• Catalog items of your choice: Describe your item, and it's generated for you by Now Assist. • Tailored catalog items: Provide specific details, and Now Assist tailors catalog items to your needs. It's customizable, so you can verify every item fits the specifications you need. • Professional descriptions: Get descriptions and question labels automatically. Now Assist crafts compelling narratives, enhancing your catalog's professionalism.	Create catalog items using Now Assist	catalog_builder_editor

Note:

Now Assist generates only the entities that Catalog Builder supports. The limitations of Catalog Builder apply to Now Assist in Catalog Builder as well. For more information about the limitations of Catalog Builder, see Limitations of Catalog Builder.

Install Now Assist in Catalog Builder

Install the Now Assist for Creator application from the ServiceNow® Store to get Now Assist in Catalog Builder.

Before you begin

- Review the Now Assist for Creator application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility. Now Assist for Creator installs the Now Assist for catalog generation application (com.snc.text2catalog).
- Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Now Assist in Catalog Builder is a capability within the Now Assist for Creator application and to start using this capability, you must to first install the application.

Procedure

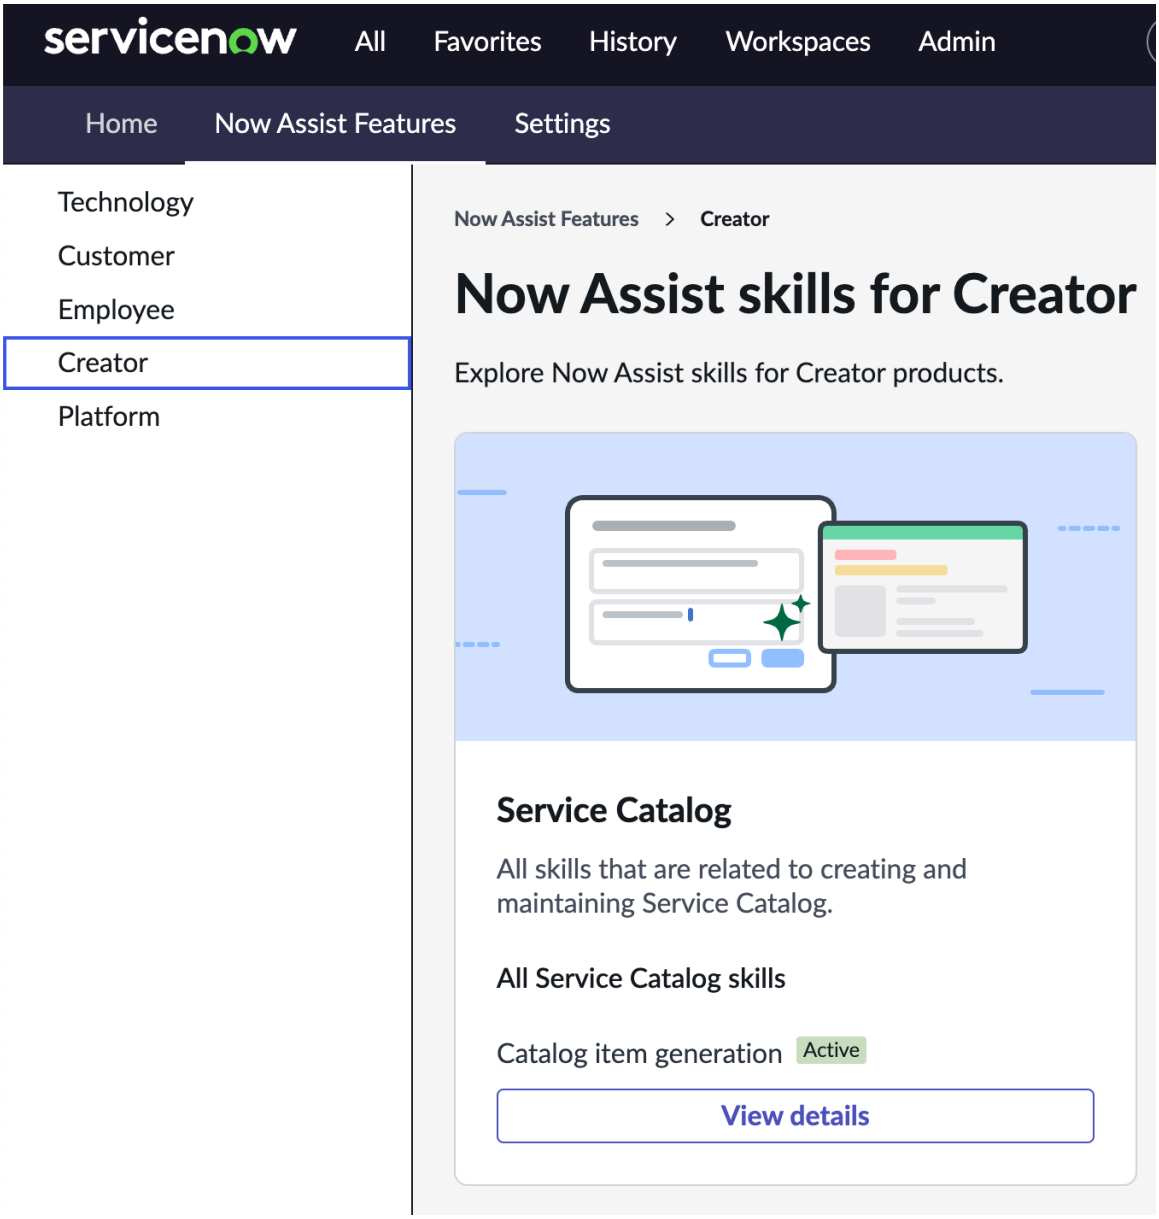
1. From the Now Assist for Creator application page on the ServiceNow Store, select **Request App**.
2. After approval has been granted, on your instance, navigate to **All** > **System Applications** > **All Available Applications** > **All**.
3. Using the search bar, search for the Now Assist for Creator application (sn_now_creator).
4. Select **Install**.
5. Verify that Now Assist for Creator is installed:

   a. Navigate to **All** > *Now Assist Admin* > **Features**.

   b. In the workflow list, select **Creator**.

   c. On the Service Catalog card, verify that the Catalog item generation skill is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
If the skill isn't active, select **View details**. Then on the Service Catalog page, turn on the Catalog item generation skill.

For more information about Now Assist Admin, see Now Assist.

What to do next
Grant the catalog_builder_editor roles to enable users to create catalog items using Now Assist.

Creating a catalog item using Now Assist

Create a catalog item by using Now Assist and make the item available in Service Catalog for catalog item requests. You can also define dynamic behavior for your catalog item and apply auto-populate settings.

Before you begin
Role required: catalog_builder_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Dashboard** tab and select **Create a new catalog item**.
3. Review the steps involved in the creation process and select **Continue**.
4. Select a template from the list and select **Use this item template**.
5. In the Now Assist step, describe the catalog item you want.

   For more information about describing your catalog item, see How to describe a catalog item.
6. **Optional:** Select **Try an example** to view sample prompts for creating catalog items using Now Assist.

   Note:
   Select **Try an example** again to view more samples. You can edit the text in the sample and describe the item according to your requirements.
7. Select **Generate with** *Now Assist*.
   Now Assist generates content for the Details and Questions steps of the catalog item.
8. Verify the content in the Details and Questions steps before you submit the item.

   Note:
   The AI sparkle (✦) icon displayed for these steps and their fields denotes that the content in the fields is AI-generated. If you change the content, the sparkle is removed.

Related topics

How to describe a catalog item

Catalog item generation reference

Reference topics provide additional information about configuration properties, roles, and more.

How to describe a catalog item

Now Assist uses the description that you write to generate a catalog item for you. If you're using Now Assist for creating a catalog item, use these points to describe your catalog item.

- Provide the necessary details of the catalog item that you want to build. For example, you can start with entering the following text:

  ```
  Create a travel visa request form.
  ```
- If you want, you can add details of one or more questions that you want to include in the catalog item. For accurate results, describe all aspects of the question, including type, properties such as mandatory, choices, and default value.
- Specify the exact table name for reference questions.
- For a record producer, provide the exact field name to which you want to map the question.

  For example, you can write the following text:

  ```
  Create a travel visa request form

  It must include a drop down menu offering three travel types:
  Internal, External, and Customer visit (with Customer visit as
  the default option). Add mandatory fields for the travel start
  ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
date, country of birth, and country traveling to (these must
be reference fields from the core_country table). Include an
optional field for trip duration and a section prompting the
user to provide a business justification.
```

Defining dynamic behavior

You can add dynamic behavior by specifying actions and conditions in the Now Assist prompt. While generating the item, Now Assist creates dynamic behavior for the catalog item based on the text input.

Let's see an example. Specify the text in the prompt as "`Create a catalog item for a standard mobile; color (Black, Space Grey, Silver); storage (512 GB and 256 GB) If color is Black or Silver, then set the storage to 256 GB and make it read only.`" Generate the item. For the storage question, Now Assist creates a dynamic behavior that sets the field to 256 GB and makes it not editable if Black or Silver is specified as the color.

Configuring auto-populate

Using Now Assist, you can configure the value of a question to populate automatically whenever the value of another question of the reference type changes. For more information about auto-populate, see Configure an auto-populate value for a question in Catalog Builder.

```
Create a catalog item requesting for replacement of access card
with the following questions: - Who is it for?: (The question
type should be "Requested for") - Manager: (Reference type on
the sys_user table. This field should auto-populate based on
the value of the Requested for question.) - Upload your profile
picture: (Attachment, mandatory)
```

After generating the catalog item, you can verify the **Auto-populate** tab. It's configured based on your text input.

Catalog Conversational Coverage

ServiceNow® Catalog Conversational Coverage provides a dashboard to view a high-level overview of the conversational and non-conversational catalog items.

You can view this information in the Conversational catalog overview dashboard. The dashboard displays a graphical representation of various reports, such as the number of conversational and non-conversational catalog items, reasons that make the items non-conversational, and popular request channels. It also shows a list of the catalog items, their conversational status, and other details.

Note:
You can access the conversational catalog dashboard only if you've installed the Now Assist in Conversational Catalog Request app. Conversational catalog dashboard can't be installed separately as it's bundled with Now Assist in Conversational Catalog Request.

Drilling down the catalog items, you can view the details, for example, whether they're conversational or non-conversational and why the items are non-conversational. Explore the potential suggestions for non-conversational items that might help you make items conversational.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have any of the following roles, you can view the dashboard:

- Catalog administrator [catalog_admin]
- Catalog manager [catalog_manager]
- Catalog editor [catalog_editor]

To access and view the dashboard, you must install and activate the Catalog Conversational Experience plugin (sn_catalog_con_cov). You can find the plugin in the ServiceNow® Store.

Note:
If you've installed Now Assist for conversation request submission plugin, you get the Catalog Conversational Experience plugin (sn_catalog_con_cov) by default.

The **Update catalog items conversational status** scheduled job pulls conversational data of catalog items. This scheduled job updates the reasons for the catalog items. The scheduled job runs once in three days automatically. But to get the latest data when you need, run this job manually.

Conversational catalog overview dashboard

The dashboard shows the information that you need in graphs and a table.

You can view the data of only those catalog items you have edit access to.

Note:
You can access the conversational catalog dashboard only if you've installed the Now Assist in Conversational Catalog Request app. Conversational catalog dashboard can't be installed separately as it's bundled with Now Assist in Conversational Catalog Request.

In the graphical representation of reports, you can view the following information:

Graphical representation of reports	Description
Conversational and non-conversational item count	The number of catalog items that are conversational and non-conversational.
Reasons that make items non-conversational	Reasons for catalog items to be non-conversational. For example, having unsupported questions or scripted UI policies make the item non-conversational.
Popular request channels - last 6 months	The channel distribution of catalog item requests that have been submitted in the last six months.

The Catalog items section shows the following information:

Column name	Description
Catalog item	Name of the catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column name	Description
	You can select the name to open the catalog item details page.
Conversational status	Conversational or non-conversational status of the catalog item.
VA render type	Type of catalog item rendering. Based on the configuration of the catalog item, the render type is determined to be conversation, window, or popup.
Number of reasons	The number of the reasons that are causing the item to be non-conversational. You can select the name of the non-conversational catalog item to view the reasons.
Number of requests	Number of requests that corresponds to the requests submitted in the last six months.
State	The status of the catalog item.
Owner	Name of the owner of the catalog item.
Updated	Date and time when the catalog item was last edited.

Catalog item conversational details page overview

View the details page for your catalog item. If your item is non-conversational, view why your catalog item isn't conversational and review the suggestions to know what you can do to make the item conversational.

You can view this page only if you have any of the following roles:

- Catalog administrator [catalog_admin]
- Catalog manager [catalog_manager]
- Catalog editor [catalog_editor]
- Catalog builder editor [catalog_builder_editor]

Note:
The catalog manager, catalog editor, and catalog builder editor can view the details page only if they have edit access to the catalog item.

The page displays the following information related to conversational or non-conversational catalog items:

- Name of the catalog item
- Conversational status and render type
- Date and time when the catalog item was last updated
- The **Reasons and suggestions** and **Item details** tabs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Reasons and suggestions** tab shows one or more reasons for the item being non-conversational and suggestions that might make the item conversational. If there's more than one reason, you can select each reason to view the suggestions for that particular reason.

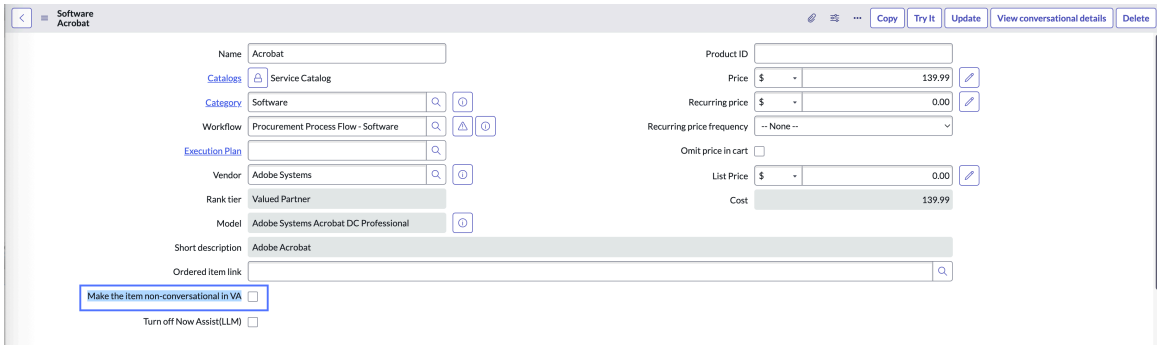
The **Item details** tab shows the details, such as a short description, description, and image of the item if available.

After going over the reasons and suggestions for the non-conversational items, select **Edit in advanced view** if you want to make changes. The catalog item opens in the ServiceNow AI Platform for editing.

Note:

- Only the catalog admin, catalog manager, and catalog editor can view the **Edit in advanced view** button.
- If you're viewing a catalog item that's in the checked out state, you view its data that corresponds to the published version of the item. Any changes to the draft of the catalog item won't be reflected here until it's published.

By default, all catalog items are conversational. To make the catalog item non-conversational, select the **Make the item non-conversational in VA** check box.



Important:

Select the **Turn off Now Assist (LLM)** check box if you don't want the data of the catalog item (and user responses) to be sent to the LLM for security reasons, in case the catalog item contains sensitive data. Selecting this option ensures that this item will invoke the NLU topic block if it's compatible, otherwise, it will show up either as a pop-up or as a link depending on the item's configuration. Restrictions on the NLU topic block are stricter than the LLM topic block and therefore a conversational item in the LLM topic block (as shown in the Conversational Catalog Overview dashboard) may not be conversational in the NLU topic block.

View the conversational catalog overview dashboard using Catalog Builder

Use Catalog Builder to view the dashboard that shows the catalog items that are conversational or non-conversational. Understand why catalog items aren't conversational, and explore the potential suggestions that might help make the items conversational.

Before you begin

Verify that you've installed the Catalog Conversational Experience plugin (sn_catalog_con_cov).

Role required: catalog_admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Builder**.
2. Select the **Dashboard** tab.
3. In the Conversational Coverage in VA section, select **View conversational coverage**.

   The Conversational catalog overview dashboard opens. To view the conversational details page for a specific catalog item, on the dashboard, select the catalog item name. The details page opens.

   Note:
   You can also open a catalog item details page to view its conversational details. To do so, select the **Catalog items** tab, select an item that you want to view the details for, and select **View conversational details**.

View the conversational catalog overview dashboard using the ServiceNow AI Platform

Use the ServiceNow AI Platform to view the dashboard that shows the catalog items that are conversational or non-conversational. Understand why catalog items aren't conversational, and explore the potential suggestions that might help make the items conversational.

Before you begin

Verify that you've installed the Catalog Conversational Experience plugin (sn_catalog_con_cov).

Role required: catalog_admin, catalog_manager, and catalog_editor

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items**.
2. On the Catalog Items list page, select **Conversational Overview**.

Service Catalog topic blocks in Virtual Agent powered by NLU

You can design a topic conversation in the Virtual Agent powered by Natural Language Understanding (NLU) by including reusable topic blocks to perform request submission tasks.

Search Catalog Item

You can use this topic block to search for a catalog item based on the search criteria. If there are multiple search results, you can select one from a carousel view.

Input parameters

Parameter	Description
query_term	Keyword to search for a catalog item. For information on configuring keyword search for a catalog item, see Configure keyword search for catalog items.
catalogs	Comma-separated list of catalogs where a catalog item should be searched for.
result_limit	Number of search results that should be displayed. By default, this number is set to 5.

Output parameters

Parameter	Description
catalog_item_id	If a catalog item is selected, sys_id of the item is returned. If no catalog item is selected, that is, **None of these** option is selected, -1 is returned.
item_type	sys_class_name of the catalog item that the user selected.
is_conversational	Specifies if the catalog item can be requested in the conversation mode in Virtual Agent.

Request Catalog Item

You can use this topic block to request for a catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input parameters

Parameter	Description
catalog_item_id	sys_id of the catalog item that should be requested.
execute_contextual_search	Option to specify if the contextual search should be run for a record producer based on its configuration. For information on defining contextual search for a record producer, see Define contextual search for record producer.
confirm_catalog_item	Option to specify whether the user must confirm the catalog item before continuing with the next step. If this is set to `false`, user can answer the catalog items questions by skipping the confirmation.
show_end_state_card	Option to display the end state card information about the generated record to the user.

Output parameters

Parameter	Description
record_id	sys_id of the record that is generated after the item submission. If the catalog item is not supported in the conversation mode or if the user does not have access to the item, -1 is returned.
record_table	Name of the table in which the record is generated.
variables	Questions related to the catalog item.

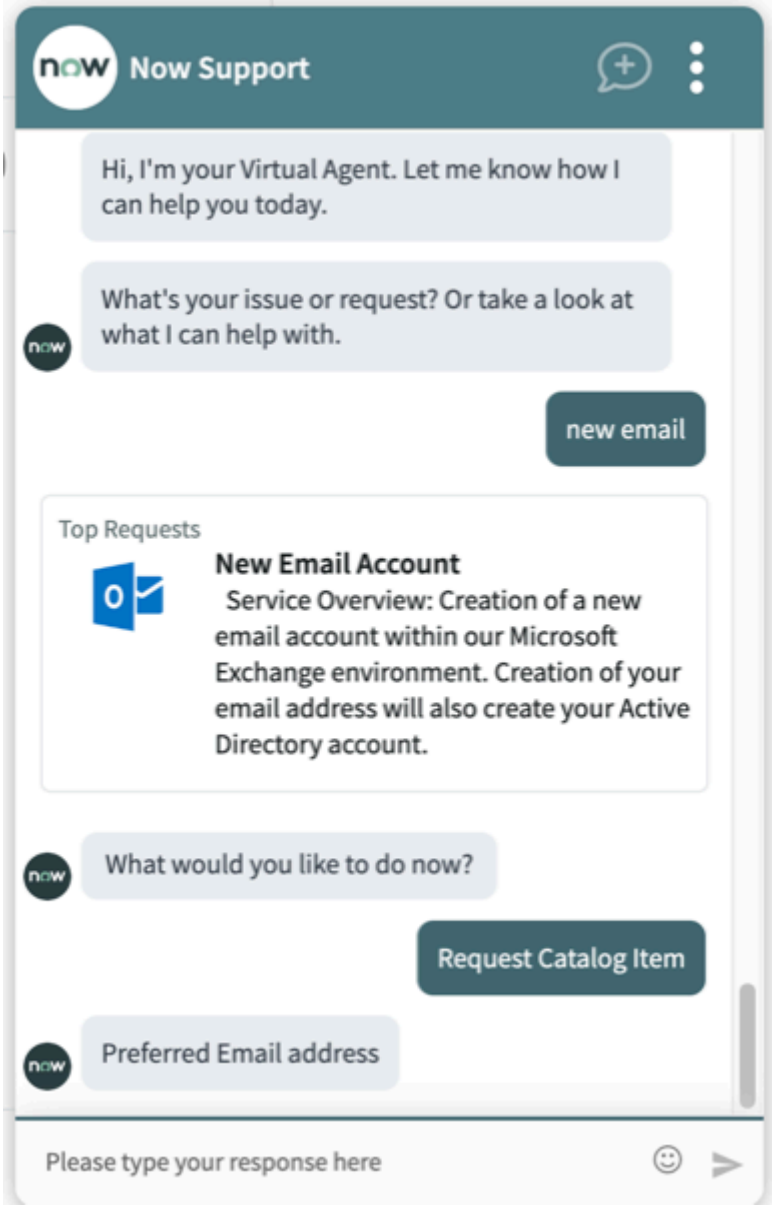
Virtual Agent render types

A catalog item can be rendered in Virtual Agent as a conversation, window, pop-up, or inline.

Catalog item request using a conversation render type

A user can submit a request in the conversation mode (by answering the questions in line).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following conditions must be met when a user requests a catalog item in the conversation mode in Virtual Agent powered by NLU.

- A catalog item cannot have more than the number of questions specified in the *glide.sc.conversational.request.question.limit* property. By default, this number is set to 10. For more information about this property, see Service Catalog properties.
- A catalog item can have non-scripted catalog UI policies. These UI policies should be defined such that variables are affected sequentially, that is, only a variable with the lower order affects a variable with the higher order.
- A catalog item cannot have catalog client scripts that are defined for Now Mobile or Service Portal.
- Only the following variables are supported:
  - Attachment
  - Check box (A group of check box variables isn't supported)
  - Date
  - Date/Time

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Email
  - IP Address
  - Label
  - Lookup Multiple Choice (without pricing implications and advanced reference qualifier)
  - Lookup Select Box (without pricing implications and advanced reference qualifier)
  - Multiple Choice (without pricing implications)
  - Multi Line Text
  - Numeric Scale (without pricing implications)
  - Reference (without pricing implications and advanced reference qualifier)

    Note:
    Reference type variables that correspond to a table that has more than 7000 records are not supported. The upper limit for the number of records can be specified in the *glide.sc.va.reference_question_choices.limit* property. By default, it is set to 7000.

  - Requested For (without pricing implications and advanced reference qualifier)
  - Rich Text Label
  - Select Box (without pricing implications)
  - Single Line Text
  - URL
  - Wide Single Line Text
  - Yes / No
  - Container variables
- The following variable attributes are supported:
  - ref_ac_order_by
  - allowed_extensions
  - max_file_size

  Note:
  All the other variable attributes are ignored in Virtual Agent.

- A catalog item can have a single-row variable set but not a multi-row variable set.
- If a catalog item has a default value configured for a question, the default value is displayed in Virtual Agent, which enables the user to proceed with the default value without having to select it manually. The user can also choose a different value other than the default value.
- If a catalog item has a data lookup configured for a question, the setter value is displayed in Virtual Agent, which enables the user to proceed with the setter value or choose a different value. A catalog item with data lookup is not supported as a conversational item when the setter question precedes the matcher question.
- User cannot skip the following type of questions for a catalog item:
  - Lookup Multiple Choice
  - Select Box
  - Lookup Select Box

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Yes/No
- Numeric Scale (If **Do not select first choice** configuration is not selected)
- Multiple Choice (If **Do not select first choice** configuration is not selected, or **Include none choice** configuration is selected)

- If the user is using Virtual Agent in a different supported collaboration tool like Microsoft Teams:
  - Searching for a value using the search icon in choice type of fields is not supported.

Choice type fields in Microsoft Teams

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

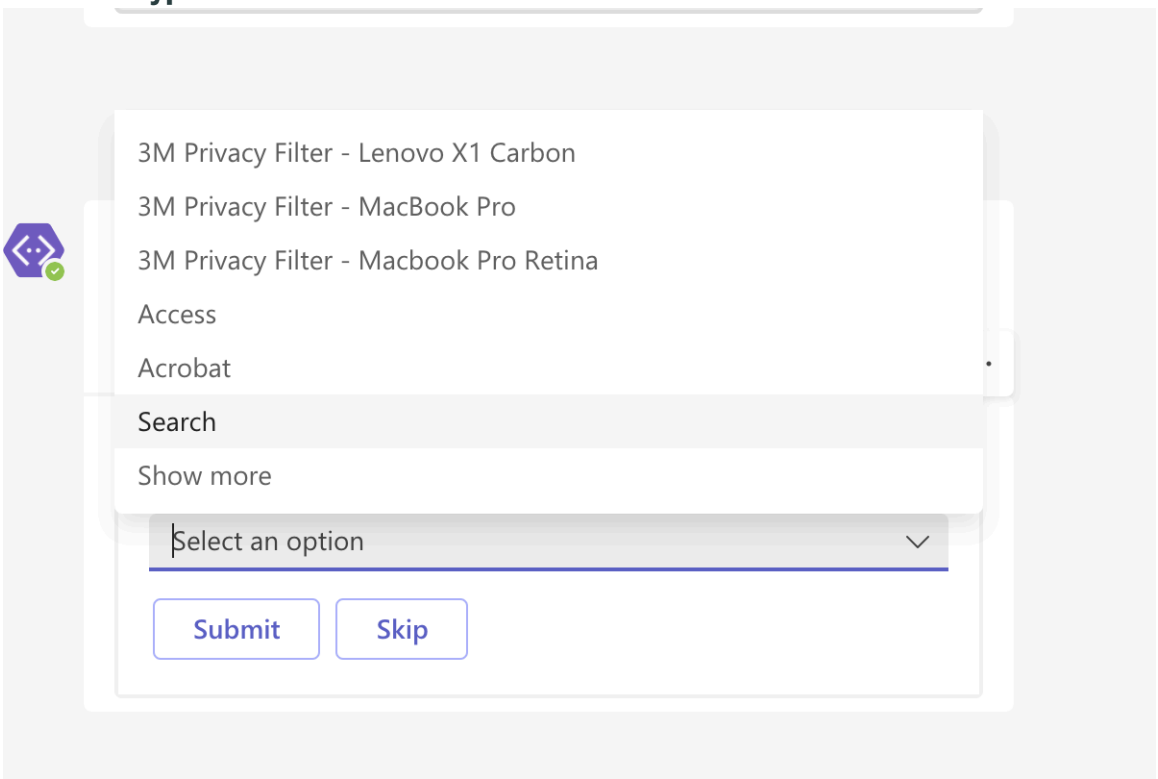
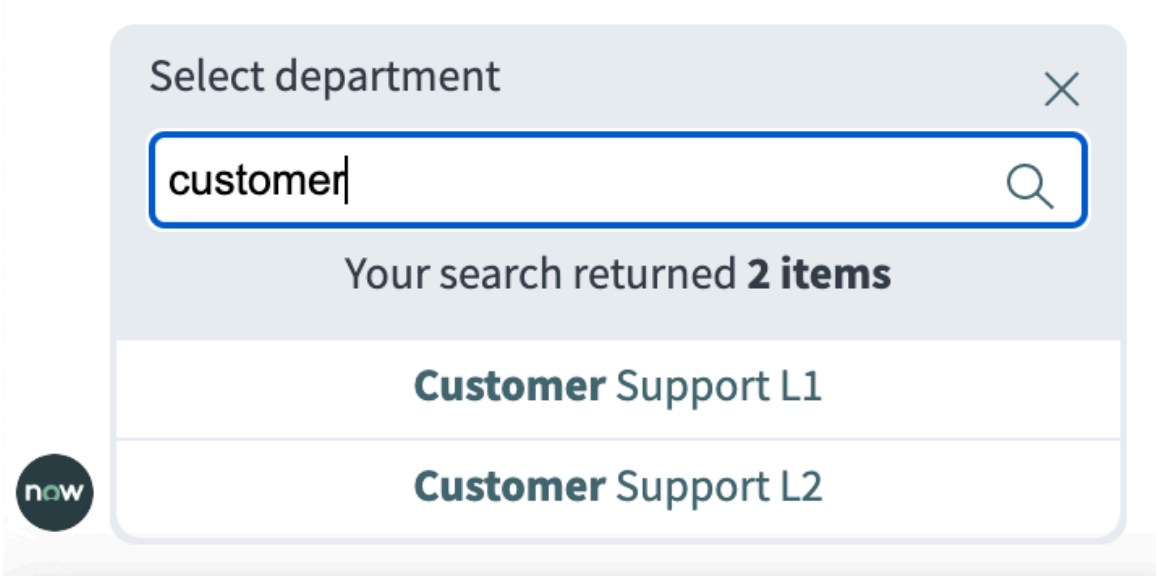
Reference type fields in Microsoft Teams



Reference type field in Virtual Agent



If the catalog item is non-conversational, the request form can appear as any of these render types:

- Inline
- Pop-up
- Window

The conditions determine whether the catalog item form for the non-conversational catalog item will appear as inline, pop-up, or window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Based on the number of questions, a *glide.sc.va.inline_render.question.limit* property determines whether the catalog item form appears as inline or pop-up. By default, the property's value is 20.

The catalog item form appears as	Conditions
Inline	• The catalog item doesn't contain custom or UI page variables. • If the catalog item contains 20 or fewer questions, the item form appears as inline. The default value of the *glide.sc.va.inline_render.question.limit* property is 20. • The catalog item doesn't contain multi-row variable set (MRVS).
Pop-up	• The catalog item doesn't contain custom or UI page variables. • If the catalog item contains more than 20 questions, the item form appears as a pop-up. The default value of the *glide.sc.va.inline_render.question.limit* property is 20.
Window	• The catalog item contains custom or UI page variables. • The *glide.sc.va.render_type.legacy* property is set to true.

Catalog item request using an inline render type

Catalog item requesters can submit a catalog item by filling the form inline in the Virtual Agent powered by NLU. While requesting a catalog item that's marked with inline render type, the requester can fill the item and its options within the Virtual Agent conversation.

For example, a requester can fill a form inline in the Virtual Agent conversation and submit the item.

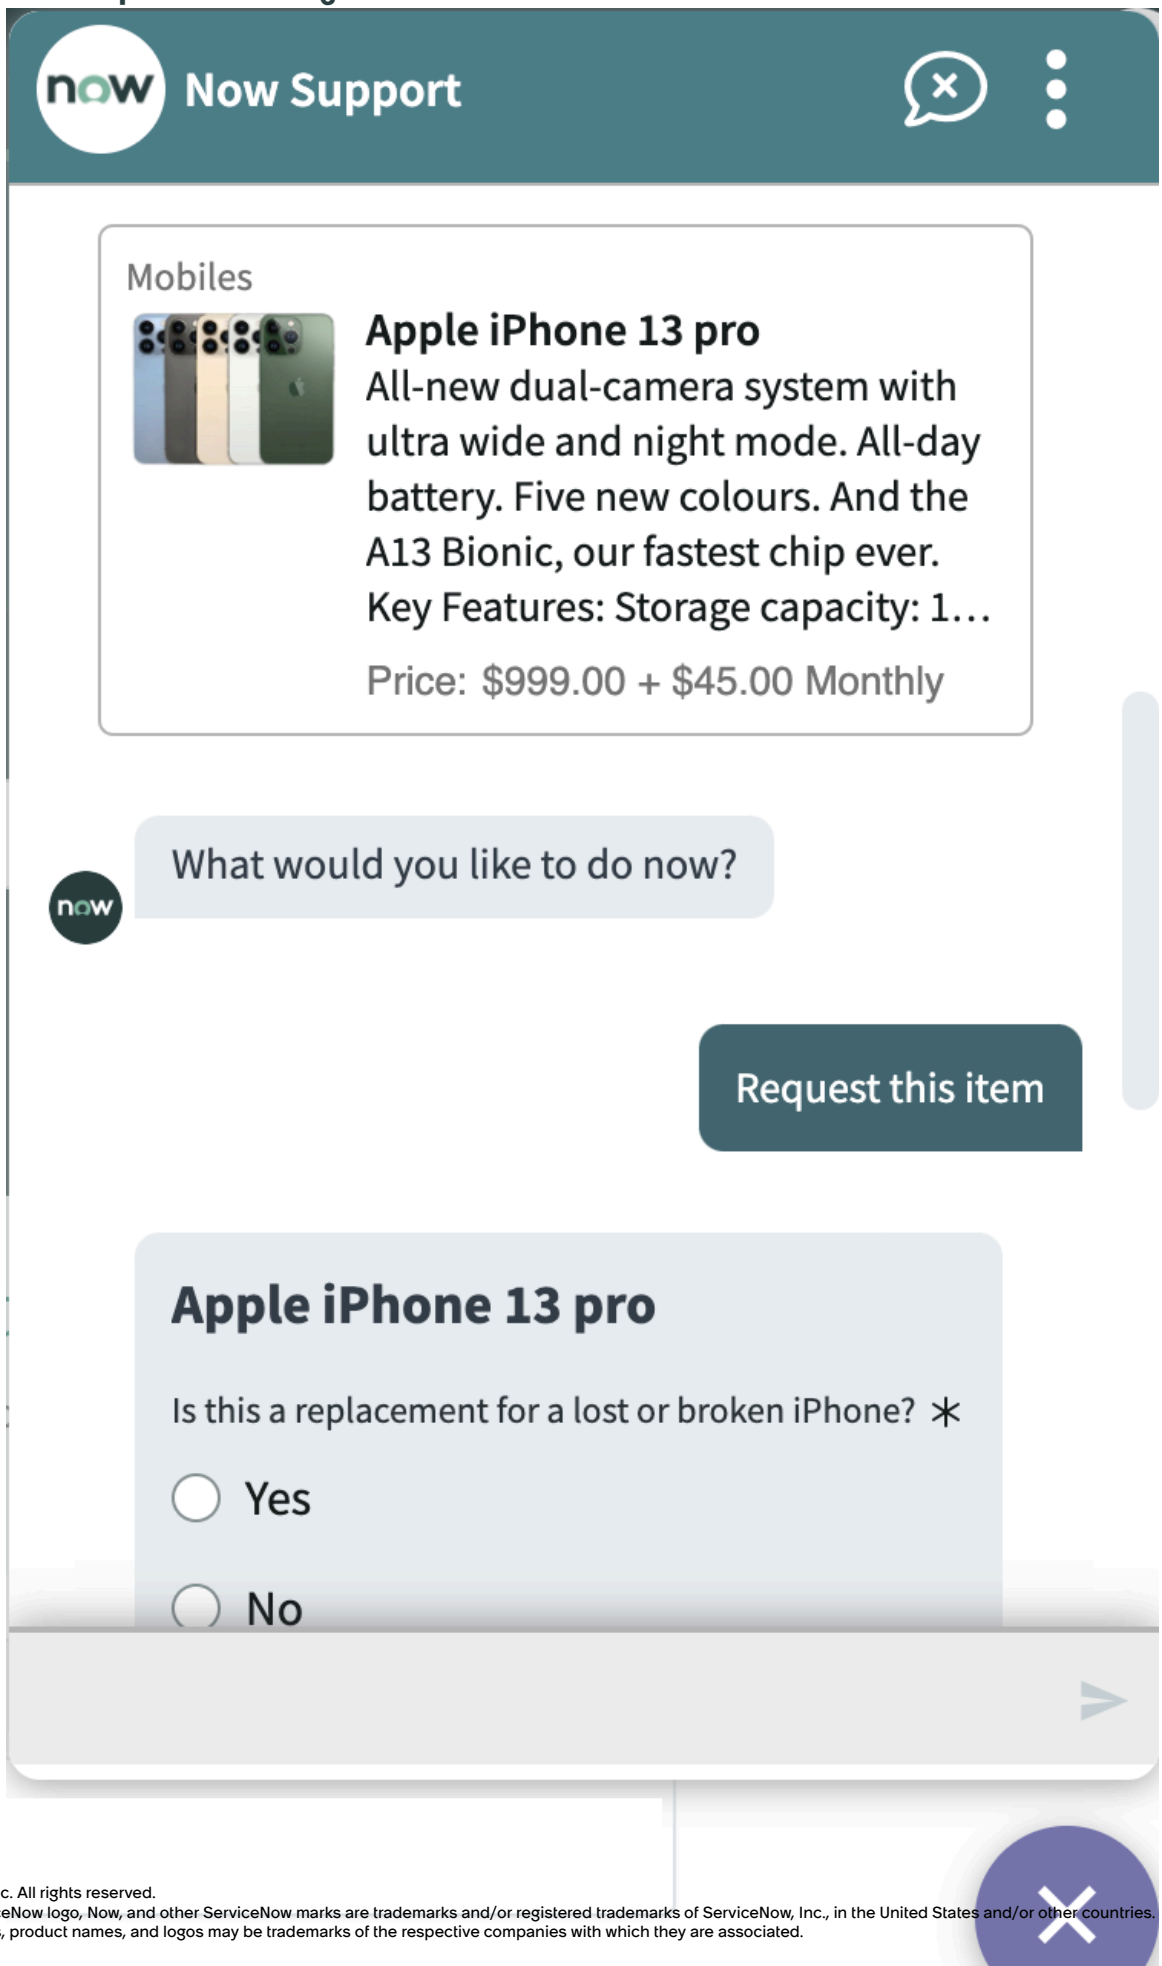
Inline request of a catalog item



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Catalog item request using a pop-up render type

A user can submit a catalog item request as a pop-up for items, which are not conversational. In a pop-up, Virtual Agent provides a link for the user to submit the request in a pop-up without navigating to a new tab. A non-conversational catalog item can be rendered as a pop-up only if it does not have any Custom, Custom with label, or UI Page variables.

Note:
If you do not want to render your Virtual Agent conversation as a pop-up, set the *glide.sc.va.render_type.legacy* property to true, which renders all non-conversational catalog items in the configured portal in a new tab.

Apple iPhone 13

Request for Apple iPhone 13

All-new dual-camera system with ultra wide and night mode. All-day battery. Six new colours. And the A13 Bionic, our fastest chip ever.

No

Monthly data allowance *

-- None --

Catalog item request using a window render type

A user can submit a catalog item request in a window. In a window, Virtual Agent provides a link for the user to submit the request in the Service Portal defined in the *sn_itsm_va.com.snc.itsm.virtualagent.portal_url* property. A non-conversational item is rendered as a window if it has a Custom, Custom with label, or UI Page variable.

A catalog item is rendered as a window if it is of the following types:

- Content Item
- Order Guide
- Wizard Launcher
- Standard Change Template

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Submit a request topic conversation

Users can submit a request in a Virtual Agent conversation.

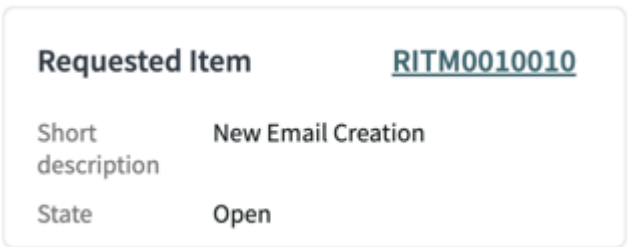
The Submit a request topic conversation uses the following topic blocks:

- Search Catalog Item
- Request Catalog Item

Using the Submit a request topic conversation, users can submit a request by choosing from all available options. For example, when a user is requesting an item, the Virtual Agent prompts the user to enter a search keyword. After the user enters the keyword, the Virtual Agent responds with available choices in a carousel view.

When the user selects the required item, the following scenarios are possible:

- A user can submit a request in the conversation mode (by answering the questions in line). After the request submission, a requested item card is displayed with the request number as a link to the request page.



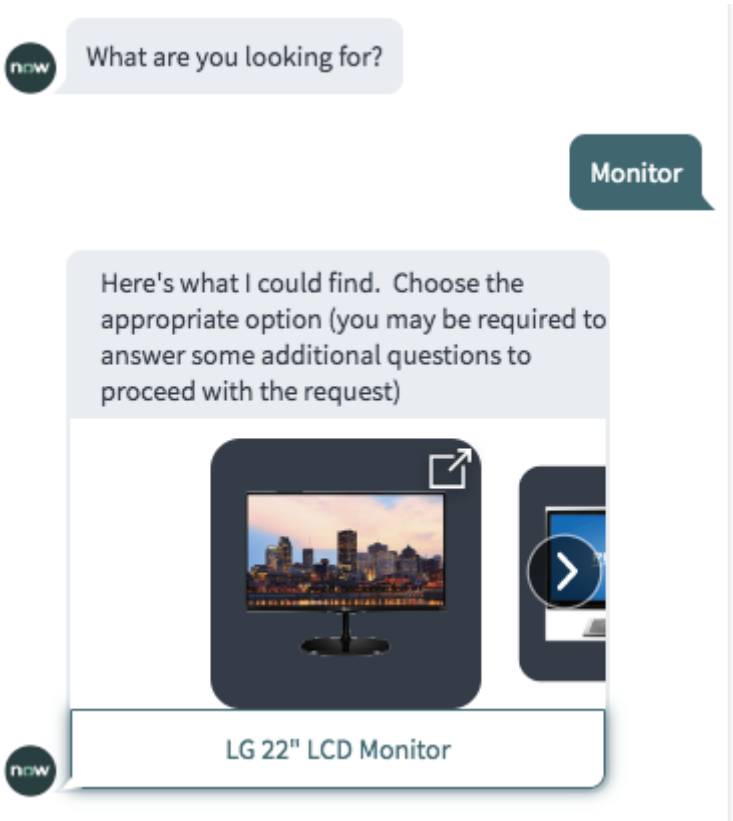
Note:
In Now® Mobile, the URL opens the native screen.

- A user can submit a request in a popup or a window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In case of a popup, Virtual Agent provides a link for the user to submit the request in a popup without navigating to a new tab. A non-conversational catalog item can be rendered as a popup only if it does not have any Custom, Custom with label, or UI Page variables. For more information, see Service Catalog topic blocks in Virtual Agent.
- In case of a window, Virtual Agent provides a link for the user to submit the request in the Service Portal defined in the *sn_itsm_va.com.snc.itsm.virtualagent.portal_url* property. A non-conversational item will be rendered as a window it has a Custom, Custom with label, or UI Page variable. For more information, see Service Catalog topic blocks in Virtual Agent.

Note:
Now Mobile opens the item in Mobile Employee Service Portal (mesp).



Related topics

Service Catalog topic blocks in Virtual Agent powered by NLU

Service Catalog topic blocks in Virtual Agent powered by Now LLM

You can design a topic conversation in Virtual Agent powered Now LLM by including reusable topic blocks to perform request submission tasks.

Request catalog item (Now LLM)

You can use this topic block to request for a catalog item through a conversational and streamlined experience based on generative AI. For information about configuring Now Assist in conversational catalog request, see Configure Now Assist in Conversational Catalog Request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input parameters

Parameter	Description
catalog_item_id	sys_id of the catalog item that should be requested.
context_json	Context of the conversation in JSON format.
execute_contextual_search	Option to specify if the contextual search should be run for a record producer based on its configuration. For information on defining contextual search for a record producer, see Define contextual search for record producer.
confirm_catalog_item	Option to specify whether the user must confirm the catalog item before continuing with the next step. If this is set to `false`, user can answer the catalog items questions by skipping the confirmation.
show_end_state_card	Option to display the end state card information about the generated record to the user.

Output parameters

Parameter	Description
record_id	sys_id of the record that is generated after the item submission. If the catalog item is not supported in the conversation mode or if the user does not have access to the item, -1 is returned.
record_table	Name of the table in which the record is generated.
status	Status of the request. Possible options are success or error.
variables	Questions related to the catalog item.
message	Message that gives additional information in case of any failure.
used_LLM	Option that indicates if Now LLM was used while requesting the item, that is, if slot filling was done for questions defined in a catalog item using generative AI.

Virtual Agent render types

A catalog item can be rendered in Virtual Agent as a conversation, window, or pop-up.

Catalog item request using a conversation render type

A user can submit a request in the conversation mode (by answering the questions in line).

- A catalog item can have catalog client scripts. But when a catalog item has catalog client scripts containing unsupported methods or functions, the catalog item becomes non-conversational.
- The variables containing pricing implications aren't supported.
- You can specify the upper limit for the number of records of reference type variables corresponding to a table in the *sn_now_assist_cr.llm.reference_question_choices.limit* property. By default, the limit is 2000000. If you specify the value more than 2000000, then it might impact the response time.
- The UI page variable type is ignored in Virtual Agent like the UI page is ignored in Service Portal. For more information, see Types of service catalog variables.
- To support the custom variables, users must associate topic blocks with the custom variables to represent them in the conversational interfaces. If the users don't associate topic blocks, the catalog item containing the custom variables, becomes non-conversational.
- If you know that a variable makes a catalog item non-conversational, you can remove such variable from the conversational interfaces by selecting **Remove from Conversational Interfaces** option. Find the option in the Availability tab of the question form in ServiceNow AI Platform.

- The field messages aren't shown to the requester in the following scenarios:
  - If the field message appears for the question that's already answered.
  - If the question is not shown to the requester because the question is read-only, hidden, or already auto-filled.
- The following variable attributes are supported:
  - ref_ac_order_by
  - allowed_extensions
  - max_file_size

  Note:
  All the other variable attributes are ignored in Virtual Agent.

- A catalog item can have a single-row variable set but not a multi-row variable set.
- If a catalog item has a default value configured for a question, the default value is displayed in Virtual Agent, which enables the user to proceed with the default value without having to select it manually. The user can also choose a different value other than the default value.
- User can't skip the following type of questions for a catalog item:
  - Lookup Multiple Choice
  - Select Box

Exploring Hermes Messaging Service

Learn about the Hermes Messaging Service and how it helps you manage the flow of data between your Kafka environment and your instance.

Hermes Messaging Service overview

Apache Kafka is an open-source data streaming platform that provides a single integration point for exchanging data across business systems in your organization. The Hermes Messaging Service enables you to integrate your Apache Kafka environment with your ServiceNow® instance to exchange data with these business systems.

The Hermes Messaging Service is a multi-tenant, multi-cluster, data transport, and queuing service built on Apache Kafka that enables your instance to produce and consume large volumes of Kafka events.

- Simplify and standardize asynchronous data transport between your Kafka environment and your ServiceNow instance.
- Publish and process Kafka events at scale. Publish events to your Kafka environment from your ServiceNow instance and consume Kafka events from your external systems at a high volume with low latency.
- Effectively process spikes and bursts in message volume to minimize performance impacts on your instance.
- Manage the health and performance of message delivery using Hermes diagnostic tools.

Components

Hermes uses the following components.

Event

A record of something that happened, such as the creation of a log entry. Kafka uses events to transmit data between systems in near real time. An event includes a key and a value.

Topic

A logical group of events. In Kafka, these events are transmitted as messages. Topics are used to group related events together. Events in a topic are organized using partitions.

Partition

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A topic is divided into partitions to support scalability and parallel processing. Each event is assigned to a partition based on its key. Events with the same key are always written to the same partition in order of arrival.

Namespace

A logical grouping of topics. You can organize topics by namespace to indicate which Kafka cluster they come from. In a domain-separated instance, you can create a namespace for each domain to control access to specific topics.

Hermes Kafka cluster

A Kafka cluster hosted in a ServiceNow data center. Hermes uses Kafka clusters to manage the delivery of messages between producers and consumers.

Producer

A system or component that creates and sends events to a topic in the Hermes Kafka cluster. The producer sets the event key, which determines the partition where the event is stored.

Consumer

A system or component that reads events from one or more topic partitions. Consumers process events in the order they appear within each partition. Consumers can read from multiple partitions simultaneously.

Hermes Messaging Service users

Users

User	Description
Hermes administrator	The Hermes admin defines namespaces for each Kafka cluster or domain and creates topic records in the instance or through the command-line interface (CLI). The Hermes admin monitors topics and views the payload of a message in a Hermes topic using the Hermes Messaging Service topic inspector.

Hermes Messaging Service workflow

1. In a domain-separated instance, the Hermes admin creates namespace records for different domains.
2. The Hermes admin creates topic records in the instance or through the CLI.
3. The Hermes admin updates or rescans topic records as needed in the instance.
4. The Hermes admin monitors topics and views message payloads using the Hermes Messaging Service topic inspector.

Benefits

Different integration points and applications in the ServiceNow platform can use the Hermes Messaging Service to publish and ingest events.

The Hermes Messaging Service is a ServiceNow AI Platform capability that is available as part of Stream Connect, Log Export Service (LES), and Instance Data Replication (IDR).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefit	Application	Users
Export data from your ServiceNow instance to an external application using the Hermes Messaging Service with Workflow Studio.	Flow Designer	Administrator
Export log data securely from your instance to your external data lake for reporting, auditing, or regulatory purposes by using the Hermes Messaging Service with the Log Export Service.	Exploring Log Export Service (LES)	Administrator
Trigger flows from incoming Kafka events and trigger outgoing messages to your Kafka environment using the Hermes Messaging Service with Stream Connect.	Using Stream Connect for Apache Kafka	Administrator
Improve the performance and processing efficiency of Instance Data Replication (IDR) by upgrading replication sets that you created prior to the Utah release to use the Hermes Messaging Service.	Instance Data Replication	Administrator

Limitations

- Maximum message size: 2 MB
- Maximum message size per second: 2 MB (produced or consumed)
- Number of topics: 30 topics per instance
- Maximum number of partitions: 32 partitions per topic
- Retention policy: 36 hours
- Supported compression types for producing messages to Hermes: GZIP, LZ4, and NONE.

What to explore next

To learn more about configuring and using the Hermes Messaging Service, see:

- Configuring Hermes Messaging Service
- Exchanging data using Hermes
- Managing namespaces and topics in Hermes
- Administering Hermes Messaging Service
- Hermes Messaging Service reference

Exchanging data using Hermes

Produce and consume Kafka messages in your ServiceNow instance using the Hermes Messaging Service.

There are several methods for exchanging data between your ServiceNow instance and your Kafka environment using the Hermes Messaging Service. In all cases, data is produced from one entity and consumed by another.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

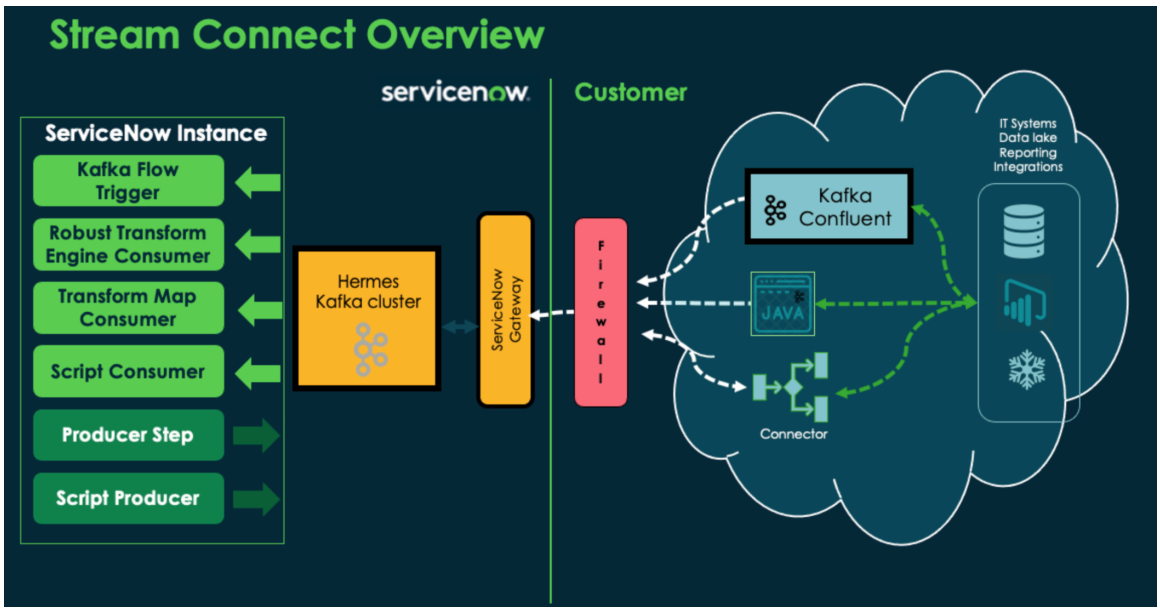
Using Stream Connect

With Stream Connect, you can produce messages from your ServiceNow instance using a Producer step from a flow action or the Producer API, and then consume the messages in your external application.

You can also produce messages from an external application and then consume the messages in your ServiceNow instance via any of the following methods:

- Kafka flow trigger
- ETL consumer
- Transform map consumer
- Script consumer

Stream Connect overview



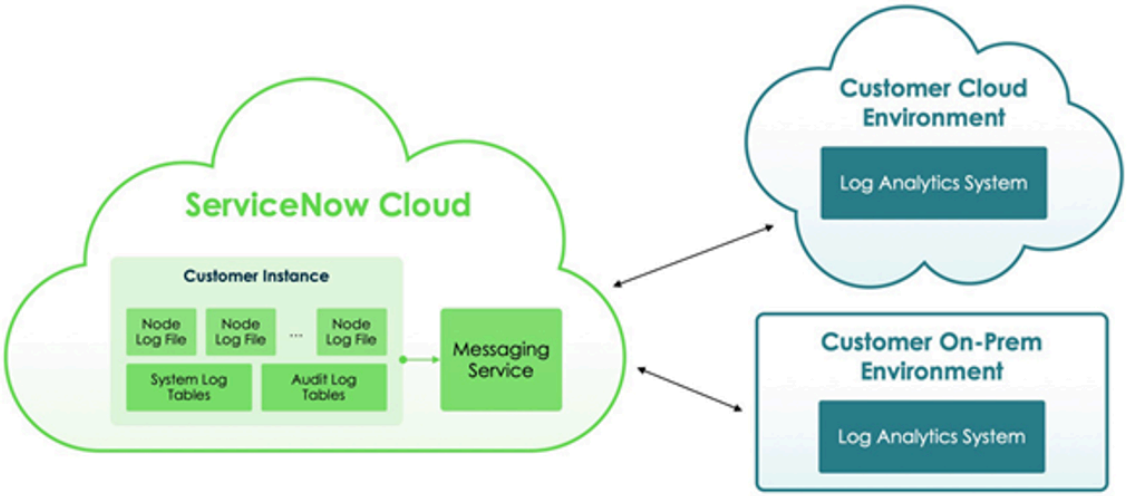
For details, see Stream Connect for Apache Kafka.

Using Log Export Service

With the Log Export Service, you can produce logs from your ServiceNow instance, and then consume the logs in your external application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Log Export Service architecture

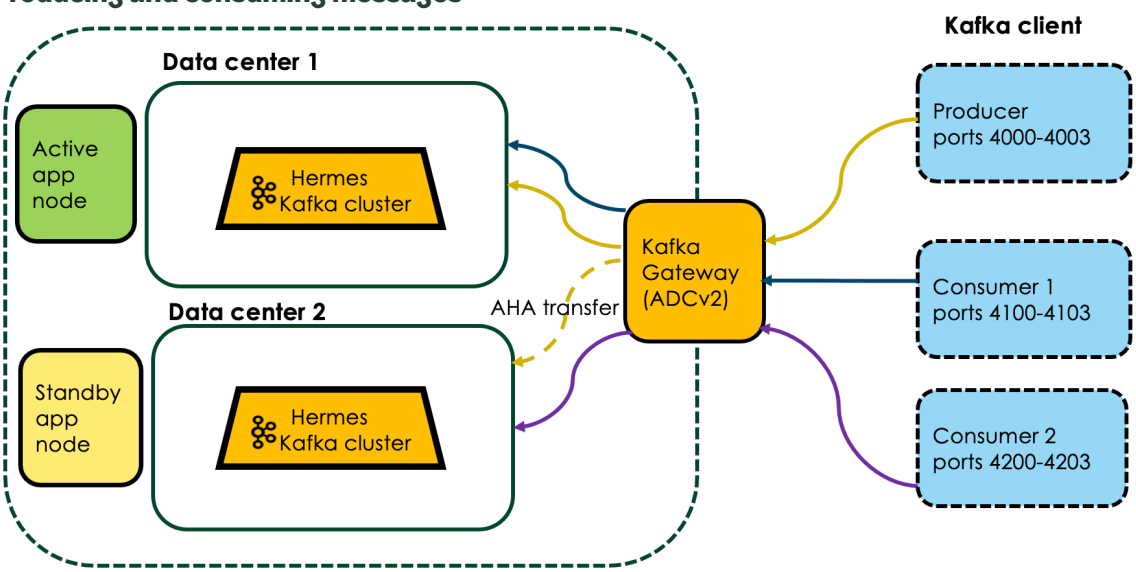


For details on producing and consuming logs for Log Export Service, see Exploring Log Export Service (LES).

Using a Kafka client

With the Kafka standard protocol, you can exchange messages with any application that produces messages. For example, you can produce messages from a Java application using the standard Kafka protocol and then consume them in your ServiceNow instance and vice versa.

Producing and consuming messages



For details on exchanging data using a Kafka client, see Producing and consuming messages from a Kafka client.

Advanced High Availability transfer with Hermes

Learn how messages are produced and consumed in Hermes during normal operation, Advanced High Availability (AHA) transfer, and failover scenarios.

ServiceNow production instances operate in geographically separate data centers. Each data center is paired with another data center to provide redundancy with failover support. One data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

center is designated as the active side and the other as standby. For example, your instance might be configured in the DC1 and DC2 data centers, with DC1 as the active side.

With the activation of StreamConnect, LES, or IDR, a new Hermes Kafka cluster is provisioned in both data centers. To ensure high availability and provide failover support, Hermes uses a pair of active/active Kafka clusters, one in each data center.

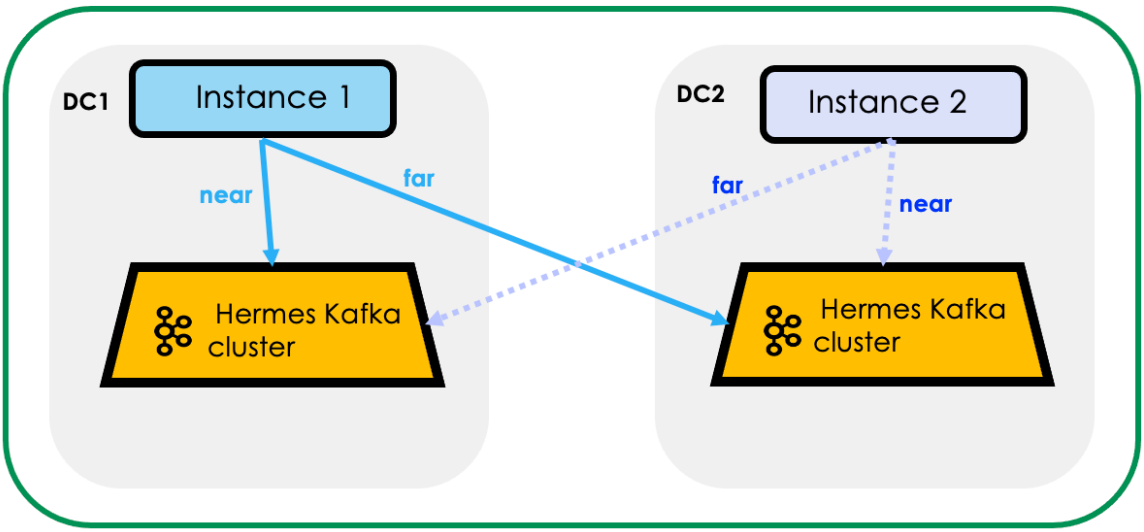
Near cluster

The Hermes Kafka cluster located in the same data center as the instance is the near cluster.

Far cluster

The cluster running in the other data center is the far cluster. The opposite is true for the other instance. Its near cluster is in its data center, and its far cluster is running in the other data center.

Near and far Hermes Kafka clusters



Normal operation

Under normal operating conditions, messages are produced by the instance or an external client to the near Hermes cluster. For example, if your instance is running in the DC1 datacenter, messages are produced to the near Hermes cluster in DC1. Messages sent from an external client are produced to the cluster using a port in the 400x range as defined in the producer bootstrap URL.

When a topic is created in Hermes, its created in both clusters. Two consumer processes are used for consuming messages from both clusters, but only a single consumer is actively consuming under normal circumstances. Each consumer must use distinct bootstrap URLs, one in the 410x range and the other in the 420x range.

Failover process

Under the following circumstances, the cluster where messages are produced can change.

Instance Advanced High Availability (AHA) Transfer

When an instance undergoes an AHA transfer, the standby instance becomes active, and the previously active instance becomes standby. In this scenario, the instance switches to using the Hermes cluster on the newly-active side.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, if the instance is running in DC1 and DC2 datacenters with DC1 as the current active side, and an AHA transfer occurs, the instance switches to using the Hermes cluster in DC2.

Hermes failover

The instance actively monitors the health of the Hermes cluster. If it detects any issues with the cluster, it enters failover mode. In this case, until the instance detects that the near Hermes cluster has recovered, it uses the Hermes cluster near the standby instance.

For example, if the instance is running in DC1 and DC2 datacenters with DC1 as the active side, it uses the Hermes cluster in DC1. If it detects an issue with the Hermes cluster in DC1, it enters Hermes failover mode and starts producing messages to the DC2 cluster until the DC1 cluster is healthy again. After recovery, it resumes using the Hermes cluster in DC1.

When failover occurs, if consumers are lagging, both consumers can potentially consume messages until one of the consumers finishes processing. For example, if the current active side is DC1, the consumer consuming from DC1 is actively processing messages. If a problem occurs in the DC1 cluster resulting in failover to the DC2 cluster, the consumer consuming from the DC2 cluster starts processing messages. If the consumer consuming from the DC1 cluster was lagging, both consumers continue to consume messages until the DC1 consumer catches up.

Maintaining order

If maintaining message order is required, it's the responsibility of the consumer application to manage this. Note that the global ordering of messages is dependent on how the topic in Kafka is defined.

Configuring Hermes Messaging Service

Learn how the Hermes Messaging Service is activated. Set up a secure connection to the Hermes Messaging Service.

Configuration overview

The Hermes Messaging Service is a ServiceNow AI Platform capability that is available as part of Stream Connect, Log Export Service (LES), and Instance Data Replication (IDR).

To successfully set up and configure Stream Connect or Log Export Service, you must complete the steps in Set up a secure connection to the Hermes Messaging Service.

Hermes Messaging Service activation

The Hermes Messaging Service is enabled when the Glide Hermes Message Queue plugin (com.glide.hermes) is activated.

This plugin isn't activated directly. Instead, the plugin is activated by any of the following actions:

- Activation of the ServiceNow Stream Connect Installer (com.glide.hub.stream_connect.installer) plugin
- Installation of the Log Export Service application
- Activation of the IDR plugin (com.glide.idr) in Utah or higher
- Activation of the IDR plugin (com.glide.idr), and then a subsequent upgrade to Utah or higher

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Stream Connect requires an Workflow Data Fabric subscription and a Stream Connect subscription. For more information, see https://www.servicenow.com/products/automation-engine.html.

Set up a secure connection to the Hermes Messaging Service

Secure your Kafka topics by generating a ServiceNow® instance-signed certificate.

Before you begin

Setting up the Hermes Messaging Service requires coordination with your network administrator and with your Kafka administrator. Work with your network administrator to obtain required security certificates and open the required ports. Work with your Kafka administrator to ensure that your Kafka environment is configured correctly and that your applications can connect to the Hermes Messaging Service using the standard Kafka protocol.

Make sure the following setup is in place:

- The Hermes Messaging Service is activated. See Hermes Messaging Service activation.
- The Key Management Framework plugin (com.glide.kmf.global) is activated.
- The Certificates [sys_kmf_certificate] table contains a ServiceNow instance root CA certificate.
- The instance isn't configured with a Custom URL. Custom URLs are not supported with the Instance PKI Certificate Generator.

Role required: hermes_admin, sn_kmf.cryptographic_manager, or admin

For details on assigning KMF roles, see Roles installed with Key Management Framework.

Procedure

1. Navigate to **All** > **Certificate Generator** > **Instance PKI Certificate Generator**.
2. **Optional:** Control access to topics by configuring Access Control Lists (ACLs) at the namespace or topic-level.
   The bearer of the certificate is granted read or read/write access to the topics in the namespace or the existing topic that you selected.
3. Set up security for the Hermes Messaging Service.
   a. Navigate back to the Instance PKI Certificate Generator page.
   b. Enter a keystore password in the **Certificate Password** field.
   c. Select **Generate**.
   The system generates an instance-signed certificate in the Certificates [sys_kmf_certificate] table, creates a keystore, and creates a truststore.

   If Restricted Caller Access isn't allowed for the IPKI Certificate Generator, a cross scope access error appears. Contact Customer Service and Support for assistance with allowing Restricted Caller Access. To resolve this issue, Customer Service and Support can reference source_scope=76f9d51369115083f4ea77aab1677cc0 in the Restricted Caller Access Privileges [sys_restricted_caller_access] table.
4. Save a copy of the keystore by selecting **Download Keystore**.
5. Save a copy of the truststore by selecting **Download Truststore**.
6. Copy the keystore and truststore files to each producer and consumer client that will connect to the Hermes Messaging Service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You can now create a secure connection to the Hermes Messaging Service.

Note:
You must use the keystore that you generated using the Instance PKI Certificate Generator to connect to Hermes. Custom-generated keystores that aren't created according to the ServiceNow documentation aren't supported.

What to do next
- Review the guidance in Exchanging data using Hermes.
- Prepare your Apache Kafka client environment
- Configure the SSL connection to Hermes in the producer and consumer properties files using the truststore and keystore files that you generated. For more information, refer to the following topics:
  - Create a test topic in Hermes using the Kafka client
  - Produce test messages to a Hermes topic using the Kafka client
  - Consume test messages from a Hermes topic using the Kafka client

Revoke a Hermes certificate

Revoke a ServiceNow® instance-signed certificate so that it can't be used in secure connections to the Hermes Messaging Service.

Before you begin
Role required: hermes_admin or sn_kmf.cryptographic_manager

Procedure
1. Navigate to **All** > **Certificate Generator** > **Instance PKI Certificate Generator**.
2. Select **Manage Certificates**.
3. In the **Hermes IPKI Certificates** dialog box, select one or more certificates that you want to revoke.
4. Select **Revoke**.
5. Select a reason for the revocation and then select **OK**.

Result
The certificates are revoked and can no longer be used in secure connections to Hermes. You can view the revocation date and the reason it was revoked in the Certificates [sys_kmf_certificate] table.

Producing and consuming messages from a Kafka client

Learn how to produce and consume messages to Hermes from a Kafka client.

To begin exchanging messages from a Kafka client, start by creating a topic in the Hermes Kafka cluster. After you successfully create the topic, you must create a total of three processes to communicate with Hermes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- One process is required to produce messages to Hermes.
- Two processes are required to consume messages from Hermes. Two processes are required because Hermes uses a pair of Kafka clusters for failover purposes. If one cluster goes down, data is produced to the other Hermes Kafka cluster.

> **Important:**
> You must configure two distinct consumer bootstrap addresses, one for each consumer client.

One consumer process uses ports in the 410x range and the other uses ports in the 420x range. This means you must define two distinct clients, one for each port range. Within each client configuration, you can define consumer group IDs.

Required port ranges

Work with your network administrator to ensure that the following port ranges are open before you begin exchanging messages using Hermes:

- Producer: 4000-4050
- Consumer1: 4100-4150
- Consumer2: 4200-4250

To confirm that the ports are accessible through the firewall, run the following command:

```
openssl s_client -connect <instance_name>.service-now.com:<port>
 -servername <instance_name>.service-now.com
```

- Change the service-now.com domain if your instance uses a different domain name.
- Complete the test using ports from each of the three port ranges. For example: test 4000-4003, 4100-4103, and 4200-4203.

If the command fails internally but succeeds from a client outside the network, consult your network administrator to gain access through the network firewall.

Bootstrap addresses

Use the following port mappings to connect producers and consumers to the Kafka cluster bootstrap addresses. All Application Delivery Controllers used by Hermes follow this same convention.

> **Important:**
> The following Hermes bootstrap address examples use ports 4000-4003, 4100-4103, and 4200-4203. However, you must open the following port ranges to ensure connectivity as additional clusters are added to the Hermes Messaging Service.
>
> - Producer: 4000-4050
> - Consumer1: 4100-4150
> - Consumer2: 4200-4250

Producer clients use ports ranging from 4000 to 4050. For example:

```
Producers
 = "<instance_name>.service-now.com:4000,<instance_name>.service-now.com:4001,<inst
ance_name>.service-now.com:4002,<instance_name>.service-now.com:4003"
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Because Hermes uses a pair of Kafka clusters, you must configure two consumer clients with separate consumer bootstrap addresses.

Important:
You must configure two distinct consumer bootstrap addresses, one for each consumer client.

- The first consumer client uses ports ranging from 4100 to 4150. For example:

```
Consumer A
 = "<instance_name>.service-now.com:4100,<instance_name>.service-now.com:4101,<instance_name>.service-now.com:4102,<instance_name>.service-now.com:4103"
```

- The second consumer client uses ports ranging from 4200 to 4250. For example:

```
Consumer B
 = "<instance_name>.service-now.com:4200,<instance_name>.service-now.com:4201,<instance_name>.service-now.com:4202,<instance_name>.service-now.com:4203"
```

When you configure producer and consumer properties for your own Kafka client, use this string pattern.

Using the command-line interface (CLI)

When using the `list` command to view a list of topics, a list of current topics are returned from one or both clusters. Topics might be returned from only one cluster, depending on when the last synchronization occurred. Topics created for failover purposes are differentiated by a three-letter cluster identification prefix.

When accessing the Hermes clusters using the CLI, internal topics appear in addition to any topics you've created. For details, see KB1705399.

You can't delete a topic from both Kafka clusters using a single command in the command-line interface (CLI). However, you can delete the topic from both clusters by deleting the topic record in your instance. See Delete a topic in Hermes.

Prepare your Apache Kafka client environment

Install the Apache Kafka binaries on your Unix or Windows client machine.

Before you begin

Confirm that you have Java 11.0 or higher installed by running the following command:

```
java --version
```

Role required: admin

Procedure

1. Download and install Apache Kafka.

a. Download the Apache Kafka binaries.
Ensure that you download the binaries, not the source code, from the Apache Kafka website.

b. Unzip the Apache Kafka package.
For example:

```
tar -zxvf kafka_2.13-3.2.0.tgz
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Navigate to the parent directory where you extracted the Apache Kafka package.
   - For example, on Unix:
     ```
     cd /home/user/Software
     ```
   - For example, on Windows:
     ```
     cd C:\Software
     ```
3. Simplify the Apache Kafka directory name by renaming it to `kafka`.
   - For example, on Unix:
     ```
     mv kafka_2.13-3.2.0 kafka
     ```
   - For example, on Windows:
     ```
     rename kafka_2.13-3.2.0 kafka
     ```

Result
The Apache Kafka client is installed in a simplified directory on your local machine.

What to do next
Create a test topic in Hermes using the Kafka client

Create a test topic in Hermes using the Kafka client

Create a topic for sending and receiving test messages in the Hermes Kafka cluster.

Before you begin
- Secure your Kafka topics by generating a ServiceNow® instance-signed certificate and keystore. You must provide truststore and keystore details when you configure a producer to create a topic in Hermes. See Set up a secure connection to the Hermes Messaging Service.
- Download and install Apache Kafka. See Prepare your Apache Kafka client environment.

Role required: admin

About this task
The full Hermes Kafka topic name is composed of the following elements:

```
snc.<instance_name>.<namespace>.<app_id>.<topic_name>
```

where:

- `<instance_name>` is the name of your instance
- `<namespace>` is the namespace of the domain your Kafka topic belongs to (optional)
- `<app_id>` is your application ID

  The topic you create belongs to this application. Specify either of the following:

  - `sn_logstoanalytics` for Log Export Service topics
  - `sn_streamconnect` for Stream Connect topics
- `<topic_name>` is the unique name for your topic

Note:
The full topic name is case-sensitive and limited to 200 characters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the `config` directory where you extracted Kafka.
   - For example, on Unix:

     ```
     cd /home/user/Software/kafka/config
     ```

   - For example, on Windows:

     ```
     cd C:\Software\kafka\config
     ```

2. Configure a producer.

   a. Open the `producer.properties` file.

   b. Configure the following SSL properties:

   ```
   security.protocol=SSL

   ssl.truststore.password=<truststore password>

   ssl.truststore.location=<path to truststore.p12>

   ssl.truststore.type=PKCS12

   ssl.keystore.password=<keystore password>

   ssl.keystore.location=<path to keystore.p12>

   ssl.keystore.type=PKCS12

   ssl.key.password=<keystore password>
   ```

   Replace the following placeholder variables:

   - `<truststore password>` with your truststore password
   - `<path to truststore.p12>` with the path to your truststore file
   - `<keystore password>` with your keystore password
   - `<path to keystore.p12>` with the path to your keystore file

   c. Save your changes in plain text.

3. Navigate to your Kafka directory.
4. Create a test topic by running the following command:
   - Unix:

     ```
     ./bin/kafka-topics.sh --create --topic
      snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
      --command-config ./config/producer.properties
      --bootstrap-server
      <instance_name>.service-now.com:4000,<instance_name>.service
     -now.com:4001,<instance_name>.service-now.com:4002,<instance_
     name>.service-now.com:4003
     ```

   - Windows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
bin\windows\kafka-topics.bat --create --topic
 snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
 --command-config config\producer.properties
 --bootstrap-server
 <instance_name>.service-now.com:4000,<instance_name>.service
-now.com:4001,<instance_name>.service-now.com:4002,<instance_
name>.service-now.com:4003
```

Replace the following placeholder variables:

- `<instance_name>` with your instance name (case-sensitive)
- `<namespace>` with the namespace of the domain your Kafka topic belongs to (optional)
- `<app_id>` with the application ID (case-sensitive)
- `<topic_name>` with the unique topic name you want to use (case-sensitive)

Result

A test topic is created in the Hermes Kafka cluster.

What to do next

Produce test messages to a Hermes topic using the Kafka client

Produce test messages to a Hermes topic using the Kafka client

Produce test messages to a Hermes topic by configuring a producer client.

Before you begin

- Secure your Kafka topics by generating a ServiceNow® instance-signed certificate and keystore. You must provide truststore and keystore details when you configure the Hermes producer. See Set up a secure connection to the Hermes Messaging Service.
- Download and install Apache Kafka. See Prepare your Apache Kafka client environment.
- Create a test topic to store the test messages that you produce. For details, see Create a test topic in Hermes using the Kafka client.

Role required: admin

About this task

The following steps describe how to configure a producer client and send test messages to the Hermes Kafka cluster. Refer to these steps when you're ready to produce messages to Hermes for business or production purposes.

Procedure

1. Navigate to the `config` directory where you extracted Kafka.
   - For example, on Unix:

     ```
     cd /home/user/Software/kafka/config
     ```

   - For example, on Windows:

     ```
     cd C:\Software\kafka\config
     ```

2. Configure a producer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the `producer.properties` file.

b. Configure the following SSL properties:

```
security.protocol=SSL

ssl.truststore.password=<truststore password>

ssl.truststore.location=<path to truststore.p12>

ssl.truststore.type=PKCS12

ssl.keystore.password=<keystore password>

ssl.keystore.location=<path to keystore.p12>

ssl.keystore.type=PKCS12

ssl.key.password=<keystore password>
```

Replace the following placeholder variables:

- `<truststore password>` with your truststore password
- `<path to truststore.p12>` with the path to your truststore file
- `<keystore password>` with your keystore password
- `<path to keystore.p12>` with the path to your keystore file

c. Save your changes in plain text.

3. Produce a test topic.

a. Navigate to the Kafka directory.

b. Run the following command:
Unix:

```
./bin/kafka-console-producer.sh --topic
 snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
 --producer.config ./config/producer.properties
 --bootstrap-server
 <instance_name>.service-now.com:4000,<instance_name>.service
-now.com:4001,<instance_name>.service-now.com:4002,<instance_
name>.service-now.com:4003
```

Windows:

```
bin\windows\kafka-console-producer.bat --topic
 snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
 --producer.config config\producer.properties
 --bootstrap-server
 <instance_name>.service-now.com:4000,<instance_name>.service
-now.com:4001,<instance_name>.service-now.com:4002,<instance_
name>.service-now.com:4003
```

Replace the following placeholder variables:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `<instance_name>` with your instance name
- `<namespace>` with the namespace of the domain your Kafka topic belongs to (optional)
- `<app_id>` with the application ID
- `<topic_name>` with a unique test topic name

Note:
Each part of the topic name is case-sensitive.

c. Send test messages to the test topic.
For example:

```
test1
test2
test3
```

Result
Test messages are produced to the test topic in the Hermes Kafka cluster.

What to do next
Consume test messages from a Hermes topic using the Kafka client

Consume test messages from a Hermes topic using the Kafka client

Consume test messages from a Hermes topic by configuring two consumer clients.

Before you begin

- Secure your Kafka topics by generating a ServiceNow® instance-signed certificate and keystore. You must provide truststore and keystore details when you configure the Hermes consumers. See Set up a secure connection to the Hermes Messaging Service.
- Download and install Apache Kafka. See Prepare your Apache Kafka client environment.
- Create a topic and produce test messages in the Hermes Kafka cluster before you can consume messages. For details, see Create a test topic in Hermes using the Kafka client and Produce test messages to a Hermes topic using the Kafka client.

Role required: admin

About this task
The following steps describe how to configure two consumer clients and receive test messages from the Hermes Kafka cluster. Because Hermes uses a pair of Kafka clusters, you must configure two consumer clients with separate consumer bootstrap addresses. This ensures messages are consumed from both clusters without dropping any messages.

Important:
You must configure two distinct consumer bootstrap addresses, one for each consumer client.

Refer to these steps when you are ready to consume messages from Hermes for business or production purposes.

Procedure

1. Navigate to the `config` directory where you extracted Kafka.

- For example, on Unix:

```
cd /home/user/Software/kafka/config
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For example, on Windows:

```
cd C:\Software\kafka\config
```

2. Configure the consumers.

   a. Open the `consumer.properties` file.

   b. Configure the following SSL properties:

```
security.protocol=SSL

ssl.truststore.password=<truststore password>

ssl.truststore.location=<path to truststore.p12>

ssl.truststore.type=PKCS12

ssl.keystore.password=<keystore password>

ssl.keystore.location=<path to keystore.p12>

ssl.keystore.type=PKCS12

ssl.key.password=<keystore password>
```

   Replace the following placeholder variables:

   - `<truststore password>` with your truststore password
   - `<path to truststore.p12>` with the path to your truststore file
   - `<keystore password>` with your keystore password
   - `<path to keystore.p12>` with the path to your keystore file

   c. Save your changes in plain text.

3. Consume a message using each consumer.

   a. Run the following command for the first consumer client:
   Unix:

```
./bin/kafka-console-consumer.sh
 --consumer.config ./config/consumer.properties --topic
 snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
 --group snc.<instance_name>.<consumer_group_id>
 --from-beginning --bootstrap-server
 <instance_name>.service-now.com:4100,<instance_name>.service
-now.com:4101,<instance_name>.service-now.com:4102,<instance_
name>.service-now.com:4103
```

   Windows:

```
bin\windows\kafka-console-consumer.bat
 --consumer.config config\consumer.properties --topic
 snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
 --group snc.<instance_name>.<consumer_group_id>
 --from-beginning --bootstrap-server
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 <instance_name>.service-now.com:4100,<instance_name>.service
-now.com:4101,<instance_name>.service-now.com:4102,<instance_
name>.service-now.com:4103
```

Replace the following placeholder variables:

- `<instance_name>` with your instance name
- `<namespace>` with the namespace of the domain your Kafka topic belongs to (optional)
- `<app_id>` with the application ID
- `<topic_name>` with a test topic name
- `<consumer_group_id>` with a label of your choice for the group that the consumer belongs to

Note:
Each part of the topic name is case-sensitive.

b. Open a new terminal window.

c. Navigate to the Kafka directory.

d. Run the following command for the second consumer client:
Unix:

```
./bin/kafka-console-consumer.sh
 --consumer.config ./config/consumer.properties
 --topic snc.<instance_name>.<namespace>.<topic_name>
 --group snc.<instance_name>.<consumer_group_id>
 --from-beginning --bootstrap-server
 <instance_name>.service-now.com:4200,<instance_name>.service
-now.com:4201,<instance_name>.service-now.com:4202,<instance_
name>.service-now.com:4203
```

Windows:

```
bin\windows\kafka-console-consumer.bat
 --consumer.config config\consumer.properties
 --topic snc.<instance_name>.<namespace>.<topic_name>
 --group snc.<instance_name>.<consumer_group_id>
 --from-beginning --bootstrap-server
 <instance_name>.service-now.com:4200,<instance_name>.service
-now.com:4201,<instance_name>.service-now.com:4202,<instance_
name>.service-now.com:4203
```

Replace the following placeholder variables:

- `<instance_name>` with your instance name
- `<namespace>` with the namespace of the domain your Kafka topic belongs to (optional)
- `<topic_name>` with a test topic name
- `<consumer_group_id>` with a label of your choice for the group that the consumer belongs to

Note:
Each part of the topic name is case-sensitive.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
Test messages are consumed from the Hermes Kafka cluster.

Managing namespaces and topics in Hermes

Organize and manage namespaces and topics in the Hermes Kafka cluster using the Hermes Messaging Service.

Managing namespaces in Hermes

Group Kafka topics together for simplified topic management and access control specification using namespaces.

In ServiceNow, all Kafka topics link to a namespace. You can use namespaces to organize topics in logical ways. For example, you can group topics together based on their Kafka cluster. You can also use namespaces to configure which domains can access which topics on a domain-separated instance. You assign topics to ServiceNow domains using the topic's namespace.

Namespace records

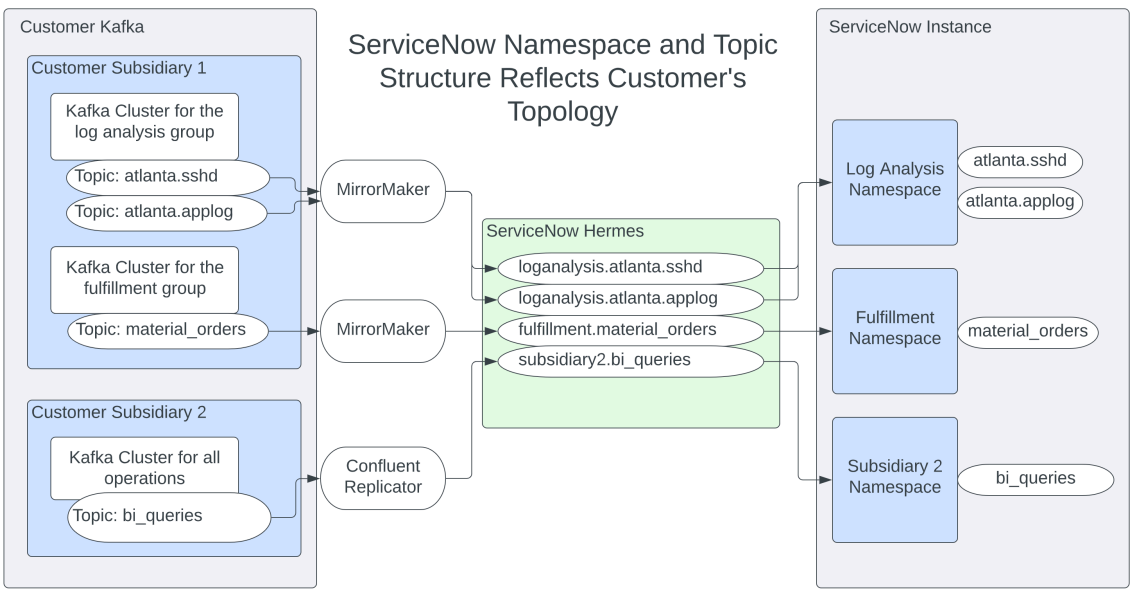
Namespace records are stored in the Kafka Namespaces [sys_kafka_namespace] table. This table shows a list of namespace records with each namespace's related topic prefix. An administrator with the kafka_namespace_admin role creates namespace records in the Kafka Namespaces [sys_kafka_namespace] table.

Namespaces and topic prefixes

A topic is assigned to a namespace based on the topic name's prefix. A scheduled job regularly checks Hermes for new topics. When it finds one, it creates a ServiceNow topic record for the topic and links the topic to a namespace. The prefix assigned to the topic is the basis for its namespace assignment in ServiceNow.

This image shows an example of using the Kafka cluster name prefix to organize topics into different namespaces in ServiceNow.

Kafka prefixes and topic namespaces



In this example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. An instance administrator with the kafka_namespace_admin role creates namespace records for the Log Analysis group, the Fulfillment group, and another subsidiary in the ServiceNow instance.
2. The instance administrator works with the Kafka administrator to replicate topics to Hermes using the Kafka cluster name as the namespace prefix.
3. The Kafka cluster for the fulfillment group has a topic named `material_orders`. The topic is replicated to Hermes using `fulfillment` as the namespace prefix. A new topic is created in Hermes called `fulfillment.material_orders`.
4. A scheduled job finds the `fulfillment.material_orders` topic in Hermes, creates a topic record, and assigns the record to the Fulfillment namespace to match its prefix.

Prefix matching rules

Topic name prefixes are matched to namespaces according to the following rules.

- The namespace is selected based on the longest matching namespace prefix. If there's a matching namespace, the topic record is assigned to that namespace and that namespace's domain.
- If there isn't a longer namespace prefix that matches, the zero-length prefix of the Default Namespace will match. The topic record is assigned to the Default Namespace in the global domain.
- If the Default Namespace has been deleted or modified, so there’s no matching namespace at all, then no topic record is created.

Namespace design considerations

Plan how want to organize your namespaces and topics before you start creating them. Once you add a topic to a namespace, you can't delete the namespace without deleting the topics that are associated with it.

Have a namespace for each domain on a domain-separated instance

Create one namespace per ServiceNow domain.

Use namespaces to organize topics by domain and Kafka installation

Use namespaces to separate both topics that belong in separate ServiceNow domains and topics from separate Kafka installations.

After you've configured your namespaces, consider deleting or deactivating the Default Namespace

Keeping the Default Namespace could lead to configuration issues, such as a mismatched topic prefix. This mismatch could result in a topic that should have been created in one domain being created in the global domain.

You can enforce tighter constraints on where topics are created by deleting the Default Namespace. For example, if you decide that all topics must have a prefix that matches a namespace, deleting the Default Namespace ensures that topics without a matching prefix aren't created.

For details on using domain separation with namespaces in Hermes, see Hermes Messaging Service domain separation.

Create a namespace in Hermes

Organize your Kafka topics by creating a namespace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: hermes_admin or kafka_namespace_admin

About this task
Use namespaces to organize Kafka topics in logical ways. For example:

- Create namespace records for each Kafka cluster that replicates messages to Hermes.
- Create namespace records for each domain in a domain-separated instance. For more information, see Hermes Messaging Service domain separation.

Procedure
1. Navigate to **All** > **Hermes Messaging Service** > **Namespaces**.
2. Select **New**.
3. On the form, fill in the fields.

Kafka namespace form

Field	Description
Name	Name of the namespace.
Topic Prefix	Prefix assigned to all topics in this namespace. Topics are assigned to namespaces based on the topic prefix. A scheduled job checks for new topics in Hermes. When it finds one, it creates a topic record and links the topic to the namespace. **⚠ Warning:** To avoid conflicts between the app ID and the namespace that could result in unexpected behavior, don't specify a topic prefix beginning with `sn_` when creating a namespace record.
Allowed Application Scopes	List of application scopes that have access to this namespace.

4. Select **Submit**.

Result
A namespace record is created in the Kafka Namespace [sys_kafka_namespace] table. Topics created in or replicated to Hermes are assigned to the namespace based on the topic prefix.

What to do next
- Organize topics yourself by creating one or more topic records and linking them to this namespace. See Create a topic in Hermes.
- Manage access to Kafka topics in the Hermes Kafka cluster by configuring Access Control Lists (ACLs) for this namespace in the certificate generator. See Set up a secure connection to the Hermes Messaging Service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete a namespace in Hermes

Prevent topics from being added to a namespace by deleting the namespace in Hermes.

Before you begin
Role required: hermes_admin or kafka_namespace_admin

About this task
You can't delete a namespace if any active topics belong to it. You must delete or deactivate the topics in a namespace before you can delete the namespace.

Procedure

1. Navigate to **All** > **Hermes Messaging Service** > **Namespaces**.
2. Select a namespace that you want to delete.
3. Select **Delete**.

Result
The namespace record is deleted from the Kafka Namespace [sys_kafka_namespace] table.

Managing topics in Hermes

Manage topic records in your instance and Kafka topics in the Hermes Kafka cluster using the Hermes Messaging Service.

Topic records

Messages are organized and stored in Kafka topics in the Hermes Kafka cluster. Topic records are stored in the Kafka Topics [sys_kafka_topic] table in your instance. This table shows a list of topics records with a reference to each topic's namespace. Each topic record has a field for the topic's name, related namespace, and whether the topic is active.

Values in the Name column of the Kafka Topics [sys_kafka_topic] table aren't inherently unique. For example, topic records might have the same Name value when they belong to different namespaces or exist in different clusters. However, values in the Full Name column are always unique.

A scheduled job runs regularly to synchronize topic records with the topics found in Hermes. This job performs the following functions:

- Creates topic records for any discovered topics, assigning them to the appropriate namespace based on the prefix for the topic name.
- Synchronizes topics created from external sources, such as the Kafka command-line interface (CLI). For example, when a topic is created from an external source on the near cluster, the job runs and creates the topic on the far cluster as well.
- Logs a warning message if a topic can't be matched to any namespace. If a topic can't be matched to any namespace, the topic record isn't created. There's a default, prefix-less namespace called the Default Namespace that matches all topics. The only time a topic doesn't match any namespace is when the Default Namespace has been deleted or modified.
- Marks topics as inactive if no Kafka topic was found for them.

You can monitor and view topics in the Hermes Kafka cluster using the topic inspector. For more information, see Monitoring topics in the Hermes Kafka cluster.

Kafka topics are specific to a particular instance. This means you can't migrate a topic record from the Kafka Topics [sys_kafka_topic] table to another instance using an update set. Instead, you must manually create the topic in the target instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating topics

You can create topics in the Hermes Kafka cluster using either of the following methods:

- Create the topic from your instance. This creates a record the Kafka Topics [sys_kafka_topic] table and creates a Kafka topic in the Hermes Kafka cluster. See Create a topic in Hermes.
- Create the topic externally. For example, create the topic using the Kafka command-line interface (CLI).

> **Note:**
> To avoid syncing issues between the cluster and your instance, include the application ID when creating topics externally. For example, without the application ID, a topic created from the CLI with a name like `snc.instancename.fulfillment.topicname` is created in the default namespace instead of the `fulfillment` namespace. To ensure the topic is created in the `fulfillment` namespace, include the application ID in the name using the format `snc.instancename.fulfillment.app_id.topicname`. Replace `app_id` with the application ID of your choice.

If, for some reason, a topic can't be created in the Hermes Kafka cluster, it won't be created in the Kafka Topics [sys_kafka_topic] table either.

Updating topics

If necessary, you can change the number of partitions in a topic. Note that you can only increase the number of partitions in a topic. For more information, see Update a topic in Hermes.

After it's created, the namespace assigned to a topic record is permanent. If you create a namespace record and want to move existing topics to it, you must delete the topics and recreate them in the Hermes Kafka cluster with the new namespace prefix. If the topics weren't created through the instance, new topic records will be created and assigned to the matching namespace record after a rescan.

Deleting topics

You can delete topics from the Hermes Kafka cluster using either of the following methods:

- Delete the topic directly from the Kafka Topics [sys_kafka_topic] table in your instance. This method automatically deletes the topic from all the Hermes Kafka clusters in one action. See Delete a topic in Hermes
- Delete the topic externally. For example, delete the topic using the Kafka command-line interface (CLI).

> **Important:**
> Deleting the topic externally requires that you delete the topic from both Hermes clusters manually by specifying each set of ports (410x and 420x). If possible, delete the topic through the instance instead.

You can't delete a topic if it has subscriptions in Stream Connect.

Rescanning topics

Rescanning creates topic records for any topics in the Hermes Kafka cluster that don't already have corresponding topic records. For example, if you create topics in Hermes using the CLI, you can rescan to create corresponding topic records in the Kafka Topics [sys_kafka_topic] table immediately instead of waiting for the scheduled job to create them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The rescan occurs automatically every ten minutes.
- Created topic records are assigned to existing namespaces based on prefix matching rules.

Sometimes topic records in your instance don't match what's in Hermes. This situation can happen in the following cases:

- When the ServiceNow Integration Hub Kafka Consumer (com.glide.hub.kafka_consumer) plugin is enabled after there are already topics in Hermes.
- When topic records are deleted accidentally.
- When namespace definitions are changed, and you want to assign existing topics to the new namespaces.

Create a topic in Hermes

Create a topic from within ServiceNow. Creating a topic from your instance adds a topic record to the Kafka Topics [sys_kafka_topic] table and adds a Kafka topic to Hermes.

Before you begin

Role required: kafka_admin

Procedure

1. Navigate to **All** > **Hermes Messaging Service** > **Topics**.
2. Select **New**.
3. On the form, fill in the fields.

Kafka Topic Form

Field	Description
Name	Name of the topic. The string that you enter is combined with the application ID and namespace to create the full Kafka topic name. **Note:** Don't include the `snc.<instance_name>` prefix with the topic name.
Application ID	Application associated with the topic. Default is Stream Connect.
Namespace	Namespace associated with the topic. You can either select a namespace created by the Kafka namespace administrator or select the Default Namespace if separate namespaces aren't configured for your instance. In ServiceNow, all Kafka topics link to a namespace. Namespaces are used to organize topics and, on a domain-separated instance, for domain separation. When

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	a namespace is assigned to a particular domain, all the topics created in that namespace have the same domain.
Partitions	Number of partitions to create for the topic. ○ Minimum value: 1 ○ Maximum value: 32 ○ Default value: 1
Active	Option to activate the topic.

4. Select **Submit**.

Result
The topic appears in both the Kafka Topics [sys_kafka_topic] table and in Hermes. If, for some reason, a topic can't be created in Hermes, it won't be created in the Kafka Topics [sys_kafka_topic] table either.

Update a topic in Hermes

Update a Kafka topic in Hermes by modifying the topic record.

Before you begin
Role required: kafka_admin

Procedure
1. Navigate to **All** > **Hermes Messaging Service** > **Topics**.
2. Select the topic record that you want to update.
3. **Optional:** Change the number of partitions in the topic.
   Note the following restrictions:
   - You can only increase the number of partitions.
   - A topic can have up to 32 partitions.
4. **Optional:** Change the topic's activation status.
5. Select **Update**.

Result
The topic record and the Kafka topic in the Hermes Kafka cluster are updated.

If an error occurs when updating the partition count, you can synchronize the topic's partition count across Hermes Kafka clusters by selecting **Synchronize Partition Count**.

Delete a topic in Hermes

Remove a topic and its messages by deleting it from Hermes. Deleting a topic record deletes it from your instance and from the Hermes Kafka cluster.

Before you begin
Role required: kafka_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Hermes Messaging Service** > **Topics**.
2. Select the topic that you want to delete.
3. Select **Delete**.

Result

The topic record is deleted from the Kafka Topics [sys_kafka_topic] table. The corresponding Kafka topic is deleted from the Hermes Kafka cluster.

Rescan topics in Hermes

Synchronize topic records in your instance with topics in the Hermes Kafka cluster by rescanning.

Before you begin

Role required: kafka_admin

Procedure

1. Navigate to **All** > **Hermes Messaging Service** > **Rescan Topics**.
2. Synchronize topics by selecting **Confirm**.
3. **Optional:** After the rescan finishes, view the script execution history.

Result

Topic records are added to the Kafka Topics [sys_kafka_topic] table for each topic discovered in the Hermes Kafka cluster. The topic refresh date and time that appears in **All** > **Hermes Messaging Service** > **Topics** is updated.

Monitoring topics in the Hermes Kafka cluster

Monitor message processing and view topics in the Hermes Kafka cluster that belong to you using the Hermes Messaging Service topic inspector.

Tracking messages in partitions

You can track messages in the Hermes Kafka cluster by viewing partition information.

- Determine whether your messages are reaching the Hermes Kafka cluster by checking whether the end offset value changes when you produce messages to a topic.
- Determine whether messages have expired by noting the beginning offset value, which increases as messages expire. If you send messages to a topic but the beginning offset is higher than you expect, some of the messages have already expired. Messages expire in the Hermes Kafka cluster after 36 hours.

Tracking consumer progress

You can track the progress of processing messages for each consumer by viewing consumer information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the consumers for each partition in a topic, including the group ID and consumer ID for each consumer.
- Determine which message a consumer is processing by viewing the **Current Offset** column.
- Determine whether the consumer is delayed by checking the **Lag** column. The lag is the difference between the current offset and the end offset that indicates how many messages remain.

Inspecting message details

You can detect problems with consuming messages using the topic inspector. For example, if a message that you produced isn't consumed from the Hermes Kafka cluster, you can validate the payload and message key by inspecting the topic. You can also download the full payload and save it as a file on your local machine.

You can view messages as binary data in base-64 encoding instead of UTF8 strings by adding a system property. See Hermes Messaging Service properties.

View a message in a Hermes topic

View the payload of a message in a Hermes topic using the Hermes Messaging Service topic inspector.

Before you begin

Role required: hermes_admin, kafka_namespace_admin, or admin

Important:
Administrators with the kafka_namespace_admin role can view message data across different domains.

About this task

Note:
Messages expire after 36 hours.

Procedure

1. Navigate to **All** > **Hermes Messaging Service** > **Topic inspector**.
2. Select a cluster set with topics that you want to view in the **Select Service** drop-down list.
3. Select **List Topics**.
   The primary cluster, the secondary cluster, and the number of topics on the instance are listed above the table of topics.
4. **Optional:** View messages from all partitions.
   a. Select a topic row in the table.
   b. **Optional:** Retrieve messages from all clusters or a specific cluster using the **Select Data center** drop-down list.
   c. **Optional:** Retrieve messages received in a specific date range using the **Message start date (UTC)** and **Message end date (UTC)** fields.
   d. **Optional:** Search for a specific message in the partition by entering a keyword or regular expression in the **Message body filter** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The message filter only supports string searches of text data. You can't search for messages with binary payloads.

e. Select **Inspect Topic**.

5. **Optional:** View messages in a specific partition.

a. View the list of partitions by selecting **Load Partition Info**.

b. Select a partition with messages that you want to retrieve in the **Read from Partition** drop-down list.

c. **Optional:** Retrieve messages from all clusters or a specific cluster using the **Select Data center** drop-down list.

d. **Optional:** Retrieve messages received in a specific date range using the **Message start date (UTC)** and **Message end date (UTC)** fields.

e. **Optional:** Search for a specific message in the partition by filtering the **Message body filter** field using a keyword or regular expression.

Note:
The message filter only supports string searches of text data. You can't search for messages with binary payloads.

f. Select **Inspect Topic**.

6. **Optional:** Track message processing for each consumer by selecting **View Consumer Info**.
7. **Optional:** View audit history for a topic by selecting **Audit Info**.
The Hermes Topic Audit Records [hermes_topic_audit_records] table displays an audit trail of topic changes, including the type of operation performed, the originating instance as Principal Name, and the timestamp for each change. Audit history is refreshed every 30 minutes.
8. View the message details and payload.

Note:
To view headers, keys, or messages that are greater than 20 characters, select the **View** link or download the data.

Message details

Field	Description
Offset	The Hermes Kafka cluster's datacenter identifier and the position of the message in the partition.
Partition	Partition of the topic where the message is stored.
Timestamp	Date and time when the message was created.
Headers	Message header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Key	Message key.
Payload	Message body contents. Note the following information about the message payload: ○ The topic inspector automatically replaces some characters with escape characters in message payload text data. ○ The message size that is displayed is the size of the payload as viewed in the topic inspector and not necessarily the size of the message as it exists in the Hermes Kafka cluster.

Administering Hermes Messaging Service

Monitor the Hermes Messaging Service by viewing diagnostics and inspecting topics.

Check the status of and connection to the Hermes Kafka cluster

Check the status of and test the connection to the Hermes Kafka cluster by sending and receiving test messages.

Before you begin

Role required: hermes_admin or admin

Procedure

1. Navigate to **All** > **Hermes Messaging Service** > **Diagnostics**.
   The dashboard loads and Hermes diagnostic tests are run automatically verifying instance public key infrastructure (PKI) configuration, external port status, and Glide Hermes Message Queue plugin (com.glide.hermes) activation.

   If any of the tests fail, contact Customer Service and Support.

2. Monitor the health of the Hermes components over time by viewing the charts in the Hermes Component Tests section.

   a. Track the number of successful and failed diagnostic tests for all Hermes services over the last seven days.
   If a component test fails, determine when the failure started and whether the failure coincides with any recent configuration changes.

   b. View the number of messages successfully sent and received by selecting a cluster set in the **Service** drop-down list and entering a date range.
   Determine whether failures occurred with sending or receiving messages.

3. View the producer and consumer bootstrap addresses that you can use to connect to Hermes in the Setup Information section.
   Use these port mappings to connect producer and consumer clients to the Kafka cluster bootstrap addresses, as described in Exchanging data using Hermes.

   Note:
   When configuring consumer clients, you must configure two clients using ports in separate ranges: one in 4100-4150 and another in 4200-4250.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Verify that the instance can act as an issuer in an x.509 trust hierarchy.
   a. Expand the **Instance PKI** container.
   b. View the configuration status.
   c. View additional instance PKI details on the Key Management Framework Health page by selecting **View more**.
   The instance PKI configuration status is displayed. If the configuration is valid, you can secure connections to Hermes by following the steps in Set up a secure connection to the Hermes Messaging Service. If the configuration is invalid, contact Customer Service and Support.
5. Confirm availability of the external ports used to connect to the Hermes Kafka cluster.
   a. Expand the **Bootstrap Connectivity** container.
   b. Select **Run Test**.

   In the range of ports required for Hermes, the following ports are checked:
   - 4000, 4001, 4002, 4003 producer client ports
   - 4100, 4102, 4102, and 4103 consumer client ports
   - 4200, 4201, 4202, and 4203 consumer client ports

   If the ports aren't open, contact Customer Service and Support.
6. Confirm that the instance is able to send messages to and receive messages from the Hermes Kafka cluster.
   a. Expand the **Instance Connectivity** container.
   b. Select the set of clusters that you want to connect to in the **Hermes Service** drop-down list.
   c. Select **Run Test**.
   Test Message Send and Test Message Receive results are displayed including the elapsed time, datacenter, and bootstrap information for each operation. If the tests fail, contact Customer Service and Support.
7. Verify the timestamp of the most recent message from a topic in the Hermes Kafka cluster.
   a. Expand the **View Topics** container.
   b. Select the set of clusters that you want to connect to in the **Hermes Service** drop-down list.
   c. Select **Get Topic List**.
   d. View the timestamp for an external topic's last known message by selecting the topic name in the **External Topics** column.
   e. View the timestamp for an internal topic's last known message by selecting the topic name in the **Internal Topics** column.
   The message's timestamp is displayed. To view full details for a topic, use the Hermes Topic Inspector. See Monitoring topics in the Hermes Kafka cluster.

Monitoring data usage in Hermes

Monitor data usage in Hermes over time.

Monitor the amount of data that is produced to the Hermes cluster over time in the Hermes Usage Dashboard.

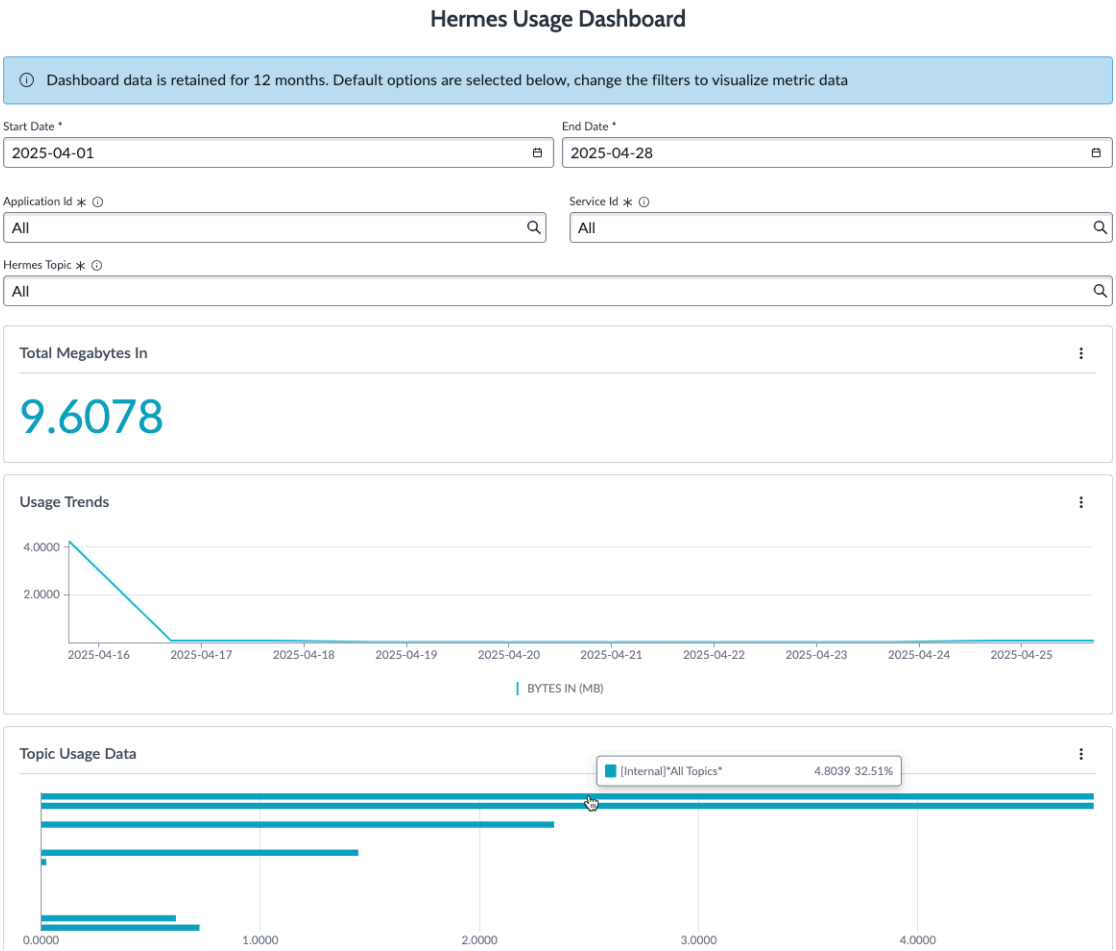
Usage data is calculated by aggregating the size of all messages sent to the cluster. The size for each message is determined by combining the key size, if present, and the actual size of the message sent to the Hermes cluster. For example, if a 100 MB message is sent to the cluster with a 2 MB key size, 102 MB usage is recorded for the message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key benefits

- Monitor Hermes performance with insights into data inflow in megabytes for a specified time period.
- Visualize data usage over time for all topics or a single topic.
- Compare data usage for topics that belong to an application.

Hermes Usage Dashboard



Required roles

Either the hermes_admin or admin role is required to view the Hermes Usage Dashboard.

Accessing the Hermes Usage Dashboard

View usage by navigating to **All** > **Hermes Messaging Service** > **Usage Dashboard**.

Use cases

- Monitor data usage for an application. Determine if usage has increased or decreased over time.
- View data usage for a specific topic. Determine if usage patterns changed by looking for spikes or drops in usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Look for decreased usage over time to determine if your application is producing data that isn't supported by Hermes.
- Compare data usage for topics in a single application or all applications that belong to you.

Reports

Data displayed in the Hermes Metrics Dashboard is collected from the Hermes usage metrics [hermes_usage_metrics] table.

- Metric data is captured hourly, with each collection point reflecting the latest value recorded within that hour.
- Metric data is aggregated and displayed over time. This means the dashboard enables you to view an overall trend rather than precise moment-to-moment traffic.
- Metric data displayed on the dashboard is initially aggregated daily. Depending on the date range you select, the dashboard dynamically adjusts its view. For example, for ranges greater than 60 days, it presents the data in monthly summaries. For ranges less than 60 days, it displays daily summaries.
- Metric data is retained for 12 months.

Title	Type	Source table	Description
Total Megabytes In	Single score	Hermes usage metrics [hermes_usage_metrics] table	View the aggregated total of data produced to Hermes in megabytes.
Usage trends	Trend	Hermes usage metrics [hermes_usage_metrics] table	Monitor data usage in terms of bytes in for selected topics over time.
Topic Usage Data	Bar	Hermes usage metrics [hermes_usage_metrics] table	Compare data usage for each topic over time.

Tracking message usage in Hermes

Message usage through the Hermes Messaging Service is tracked for monitoring and management purposes through the Kafka topic name.

You access the Hermes Messaging Service exclusively through integrations with other applications, such as Stream Connect and Log Export Service.

You can access Kafka topics in your namespace using the following naming convention:

```
snc.<instance_name>.<namespace>.sn_<app_id>.<topic_name>
```

where:

- `snc.<instance_name>` is your namespace prefix
- `<namespace>` is the namespace of the domain your Kafka topic belongs to (optional)
- `sn_<app_id>` is your application ID
- `<topic_name>` is your unique topic name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The full topic name is case-sensitive and limited to 200 characters.

Kafka message usage and licensing impact vary by application. License usage is tracked at the application level.

Cloning with Hermes Messaging Service enabled

To clone your database from one instance to another successfully with Hermes enabled, you must ensure that certain Hermes tables are preserved and excluded. The list of tables in the preserve list should match those in the exclude list and vice versa.

Before you request a clone, verify the Hermes tables in the preserve and exclude lists. For example, make sure the sys_kafka_topic table is in the preserve list to maintain the current Hermes topics in the target instance. If the sys_kafka_topic table is not preserved, it is overwritten when the clone operation occurs.

The following sections assume that Hermes is installed on both the source and target instances before the clone. For example, if Hermes is not installed on the target instance, there are no Hermes tables to preserve.

Important:
If you clone an instance without Hermes installed to an instance with Hermes installed, the Hermes tables in the target instance are removed.

To avoid losing this data, capture the data in the following Hermes tables using an update set:

- hermes_cluster_config
- hermes_topics_state
- hermes_topic_location
- hermes_topics_metrics
- hermes_metrics

You must ensure the hermes_cluster_config and hermes_topic_location tables are preserved to ensure the Hermes Messaging Service is functional.

Hermes tables to preserve

Add the following Hermes tables to the Clone Data Preservers list if they're missing. Remove any Hermes tables that aren't in this list.

- hermes_app_services
- hermes_audit_operational_metadata
- hermes_audit_records
- hermes_client_metrics
- hermes_cluster_config
- hermes_metrics
- hermes_metrics_collection
- hermes_system_status
- hermes_topic_audit_records
- hermes_topic_location

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- hermes_topics_metrics
- hermes_topics_state
- hermes_usage_metrics
- sys_kafka_namespace
- sys_kafka_topic

Hermes tables to exclude

Add the following Hermes tables to the Clone Exclude Tables list if they're missing. Remove any Hermes tables that aren't in this list.

- hermes_app_services
- hermes_audit_operational_metadata
- hermes_audit_records
- hermes_client_metrics
- hermes_cluster_config
- hermes_metrics
- hermes_metrics_collection
- hermes_system_status
- hermes_topic_audit_records
- hermes_topic_location
- hermes_topics_metrics
- hermes_topics_state
- hermes_usage_metrics
- sys_kafka_namespace
- sys_kafka_topic

View Hermes Messaging Service log messages

Review Hermes event details by viewing log messages.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Log** > **All**.
   The Log [syslog] table displays all system log messages.
2. View logs only related to Hermes by adding a filter.

   a. Select the filter icon ( ).

   b. Set a condition with a field, operator, and search string.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example
For example, **[Source] [contains] [Hermes]**.

c. Select **Run**.

Result
The Log [syslog] table displays only the Hermes Messaging Service log messages.

Hermes Messaging Service reference

Reference topics provide details on the Hermes Messaging Service components and the security model.

Hermes Messaging Service components

The Hermes Messaging Service architecture is built on the following components.

Hermes Messaging Service components

Component	Description
Hermes Message Queue	A dedicated multi-tenant message queue in the ServiceNow Hermes Kafka cluster for managing the flow of data to and from the instance. The message queue uses certificate-based authentication that supports bi-directional traffic. The Hermes Message Queue is available to ServiceNow applications via the Hermes Glide API.
Hermes Gateway	Part of the ServiceNow datacenter that enables you to connect to a ServiceNow endpoint to read and write data to the Hermes Message Queue.
Hermes Glide connector	Connector that integrates instance functionality (for example, flows, data export, and data replication) with the Hermes Message Queue via the API.

Hermes Messaging Service security model

The Hermes Messaging Service security model relies on the following capabilities.

Hermes Messaging Service security model

Capability	Description
Namespaces and data isolation	All Kafka topics are namespaced per customer. You can only view topics that belong to you and your topics aren't visible to anyone else.
Authentication and authorization	The Hermes Messaging Service requires certificate-based authentication using mTLS endpoint authentication with trusted identities and authorization based on identity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hermes Messaging Service security model (continued)

Capability	Description
Domain separation	Domain separation is supported with the Hermes Messaging Service. See Hermes Messaging Service domain separation.
High-availability	Failover is provided by multiple Kafka clusters running in separate ServiceNow datacenters.

Hermes Messaging Service properties

These system properties control the behavior of the Hermes Messaging Service.

To set Hermes Messaging Service system properties, navigate to the System Properties [sys_properties] table and add the property.

System properties

Encoding format for message payload in the Hermes Messaging Service topic inspector `glide.hermes.topic.inspector.payload.format`	By default, messages in the **Payload** column are displayed as strings in UTF8. You can display binary data using base-64 encoding by adding this system property and setting the value to binary. • string: display message payload in UTF8 • binary: display message payload in base64
Encoding format for message keys in the Hermes Messaging Service topic inspector `glide.hermes.topic.inspector.key.format`	By default, identifiers in the **Keys** column are displayed as strings in UTF8. You can display binary data using base-64 encoding by adding this system property and setting the value to binary. • string: display keys in UTF8 • binary: display keys in base64

Hermes Messaging Service roles

Hermes Messaging Service is installed with these roles.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Hermes Messaging Service administrator [hermes_admin]

Enables users to access the Hermes Messaging Service Topic Inspector.

Contains Roles

List of roles contained within the role.

None.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Kafka administrator [kafka_admin]

Enables users to manage the integration with Apache Kafka, including topics and settings related to Kafka subscriptions.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Note:
Avoid granting an admin role when more specialized roles are available.

Kafka namespace administrator [kafka_namespace_admin]

Enables users to manage Kafka namespace definitions.

Contains Roles

List of roles contained within the role: kafka_admin.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Stream Connect administrators with the kafka_namespace_admin role can view message data across different domains.

For example, in a Managed Service Provider (MSP) instance with Kafka integrations in multiple domains, managing namespace definitions properly is important to maintain separation between domains, so don't grant this role to administrators within a single domain.

Hermes Messaging Service domain separation

Domain separation is supported for the Hermes Messaging Service. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Overview

On a domain-separated instance, you can use namespaces to configure which domains can access specific topics in the Hermes Kafka cluster. You assign topics to ServiceNow domains using the topic record's namespace.

How domain separation works with the Hermes Messaging Service

On a domain-separated instance, a user with the kafka_namespace_admin role can assign namespaces to specific ServiceNow domains. When the Kafka namespace admin assigns a namespace to a particular domain, all the topics created in that namespace will have the same domain. Users can only see and interact with the topics and namespaces they have access to, based on domain visibility and access control lists (ACLs). Topics created with the Default Namespace are created in the global domain.

Both the Kafka Topics [sys_kafka_topic] table and the Kafka Namespaces [sys_kafka_namespace] table are domain-separated tables. Domain separation rules filter which records are available in each domain. In addition to being domain-separated, these tables can also be protected with ACLs, just like any other table.

All domain support features require the Domain Support - Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin.

Domain separation and the Password Reset application

Password Reset

The Password Reset application enforces strong and secure passwords by enabling end users to reset or change their passwords either by using the self-service process or by requesting the assistance of a service desk agent.

Password Reset application features

Manage enrollment

Automatically enrolls end users or allows manual enrollment.

Verification types

Validates user authenticity with the help various verifications.

Integrated plugins

Resets passwords directly from the Windows application and Microsoft Azure active directory (AD).

Enrollment types

Enables end users to enroll in different password reset programs at their convenience.

Homepages with a dashboard view

Password Reset has a new, modernized look and feel. For more information, see Next Experience UI.

Password Reset processes

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- Self-service process:

  Users reset passwords over the internet using a browser on any supported interface, including mobile devices.

- Service Desk assisted process:

  Users request the assistance of a service desk agent, over the phone or in person. In this process, users don't reset passwords.

For more information, see Configuring Password Reset and Plan your Password Reset processes.

Self-service and Service Desk - assisted processes

In addition to configuring the connections, user groups, and verifications, you can specify one of the following operational methods for the organization:

Self-service process

End users reset passwords using a browser on any supported interface, including mobile devices. They can provide the identifying information and answer questions

© 2026 ServiceNow, Inc. All rights reserved.

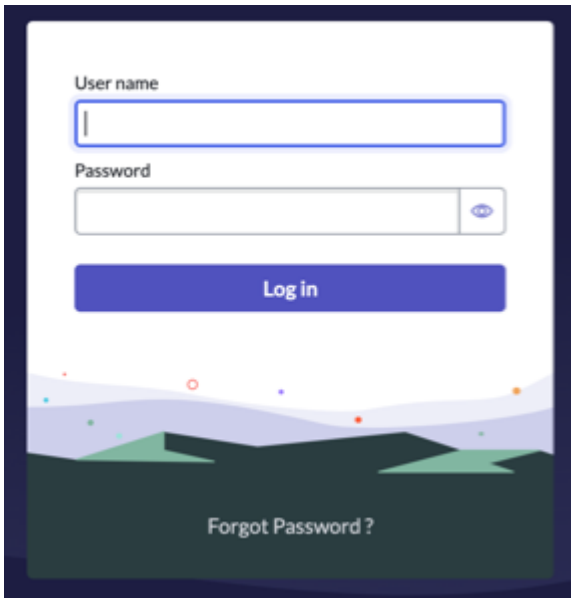
or submit a securely delivered code number. The following example shows the default self-service process Password Reset flow:

1. If a user doesn't remember their password, the user clicks **Forgot Password** on the Login page.



2. The Password Reset application starts. On the Identify page, the user enters their identifying information (generally the user name or email address). The example includes the default CAPTCHA security feature. The user provides identification by entering a user name and CAPTCHA, and clicks **Next**.

> **Note:**
> Users can hear characters displayed in CAPTCHA by clicking the Speak the CAPTCHA icon ( ) displayed in the pop-up window for the Identify step.

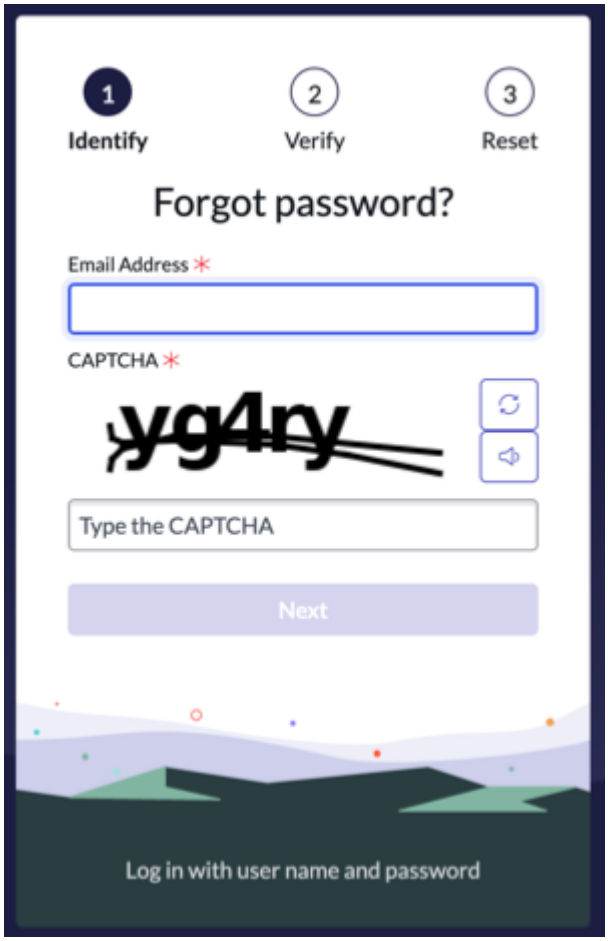
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the **Verify** tab, the user provides personal data associated with their user name. For example, the user can either enter the email address associated with the user profile or answer the security question that an administrator has configured. This information is specified while enrolling in the Password Reset process. The administrator can configure a different verification method. For example, a personal question that only the user can answer.

   Note:
   Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The Reset page tells the user to check email for instructions.
5. The user opens the email and clicks the link in the email to reset the password. The link is valid for a period of time that an administrator specifies by using the **password_reset.request.expiry** property.
6. The Reset Password page guides the user to reset the password.
7. The system checks the credential store to verify the identity and then displays the new password on the Reset page.

Service desk-assisted process

An end user requests the assistance of a Service Desk agent, over the phone or in person. The agent processes the request. Each Service Desk agent has the Password Reset admin Service Desk role. The Reset request form that the agent

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

contains a **Select user** field and a **Select process** field. On the form, the agent can view all processes in the end user's domain.

Next steps

Based on your role, do these steps:

- If you're an administrator, start configuring Password Reset for your users.
- If you're an end user who wants to reset a password, start enrolling to reset your password.

Password Reset for Virtual Agent

Augment an end-user experience with Password Reset for Virtual Agent that handles common support issues, using pre-built conversations.

For more information about the Virtual Agent, see Virtual Agent.

Your end users can perform the following actions through the Virtual Agent conversations:

- Reset a password
- Change a password
- Unlock an account
- Enroll to reset passwords

The end users can reset passwords and unlock accounts even if they aren't logged in. When the users are logged in, they can do all the actions including changing passwords. After changing or resetting a password, the users can't change or reset the password for the next 24 hours.

Password management topics for ITSM Virtual Agent

Password Reset Windows Application

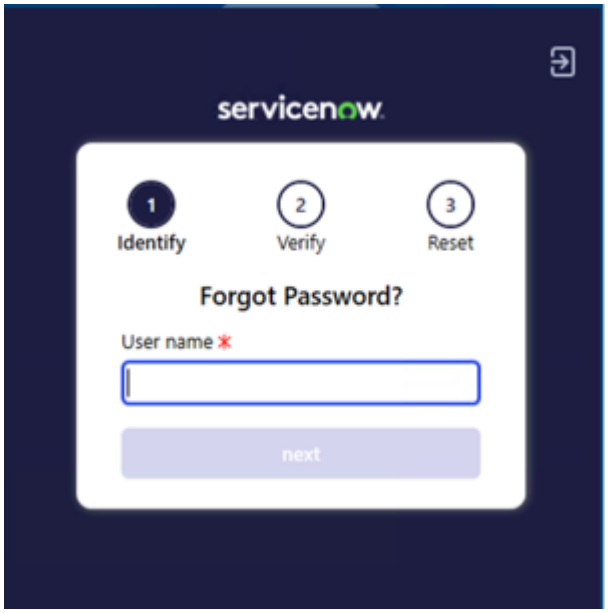
The Password Reset Windows Application enables a user, who forgets the password or is locked out of a Windows computer, to reset the password directly from the Windows login screen.

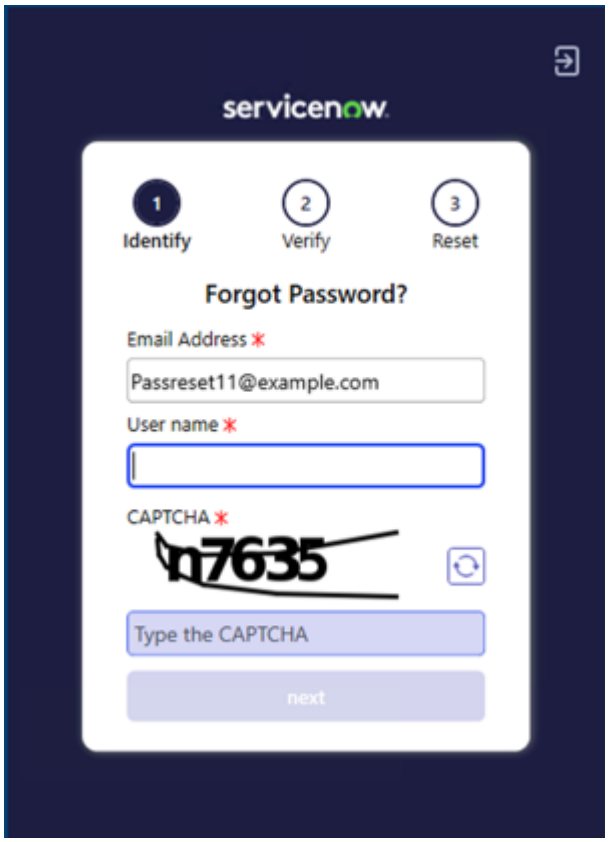
How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (**Forgot Password** as depicted in the examples on various Windows versions) and is then guided through the process of resetting the password.

If your user is using Windows, 8.1, 10, or 11 operating system on the computer, a pop-up window opens after the user clicks the **Forgot Password** link. On the pop-up window, the user enters the user name. For the multi-identification type, the user enters a user name and email address and enters the displayed CAPTCHA if enabled for the process. If the CAPTCHA is incorrect, the user gets an error message.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.





This is an identification step, which takes the user to the verification step after clicking **next** on the pop-up window.

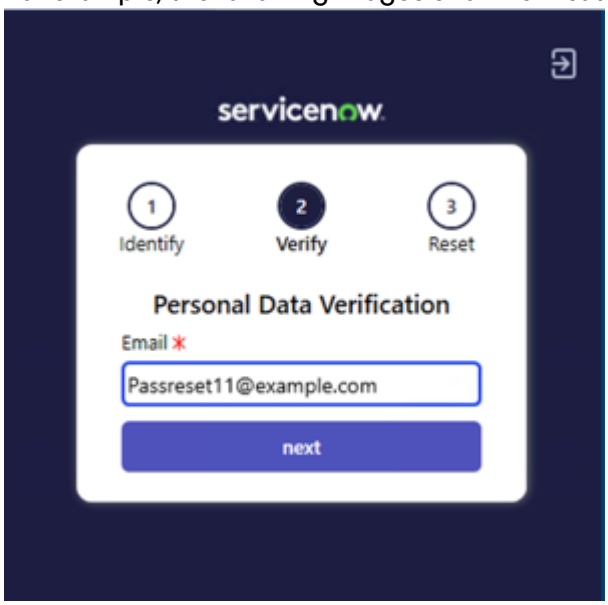
In the Verify step, the users can verify themselves using one of the following configured verification types for security:

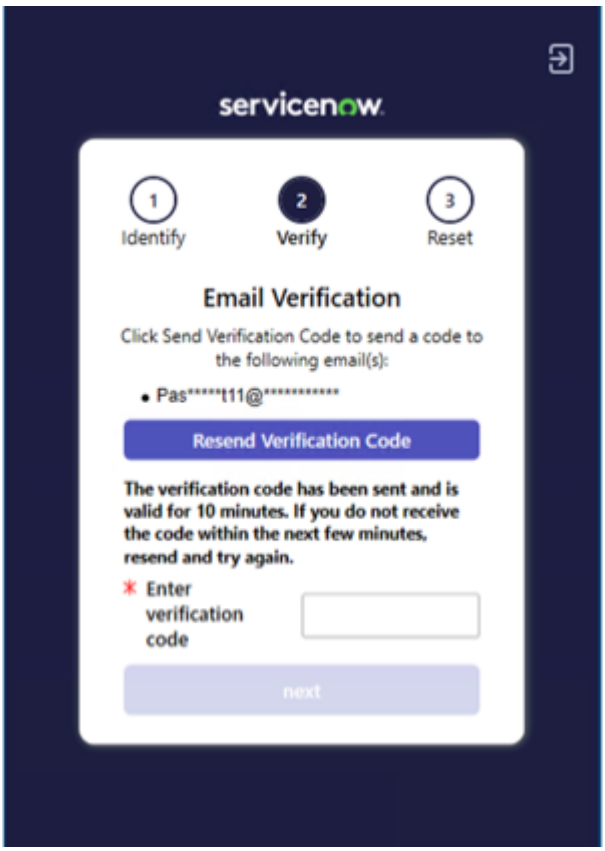
- Personal data: The user enters a user name or email. The personal data verifications compare the user's answers with the available details. For example, the email address entered by the user must match with the available registered email address.
- Authenticator app: The user enters the code generated by an authenticator app.
- Security Questions: The user enters the answers to the security questions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SMS: The user enters the verification code sent to the registered mobile number.
- Email: The user enters the verification code sent to the registered email address.
- Soft PIN: The user enters a soft PIN.

For example, the following images show verification using email.

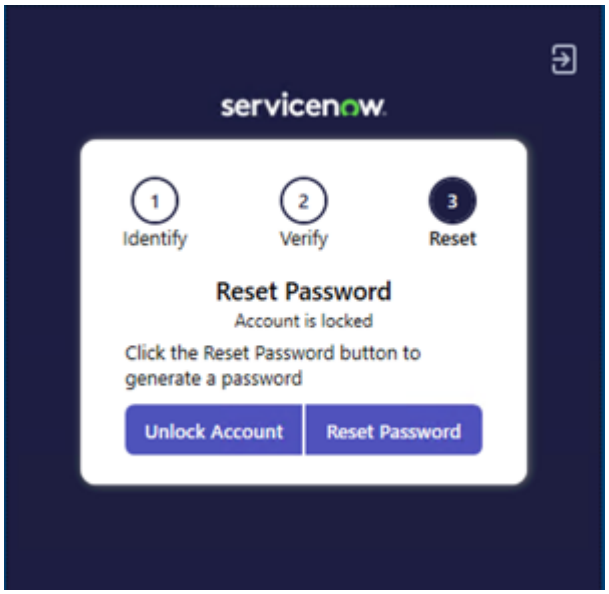




After the successful verification, the users go to the Reset step. Based on the status of the user account and email provided, the reset step contains various types.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the user account isn't locked, the user enters a new password, enters the same password again in the **Retype password** field, and clicks **Reset Password**.
- If the user account is locked, the user gets a message stating the account is locked, and if enabled, the user can view an option to unlock the account, or the user can continue resetting the password. For example, the following image shows both the **Unlock Account** and **Reset Password** buttons.



- After the reset password process is complete, based on the configured type, the user either gets the auto-generated password on the pop-up window or an email containing the instructions to reset the password is sent to the user.

Request to reset the default admin password

You can request a default instance admin password reset via the Service Catalog, which triggers an automated process to securely complete the reset.

Users with the customer_admin or partner_admin roles on Now Support can request to reset the admin account password.

For more information, refer How to request default admin password reset via Now Support Service Catalog.

Setting up Password Reset

The Password Reset application is active by default and includes example verifications. The base system enables connections only to the local ServiceNow instance credential store types.

Requirements

Role required: admin

Note:
The Password Reset application is not available during an upgrade.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Active and available plugins

- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, activate the Password Reset Windows App (Password Reset Orchestration) (com.glideapp.password_reset_desktop) plugin and Microsoft AD for Password Reset store app. No other components are installed. Orchestration is available as a separate subscription. See Request the Password Reset Windows App plugin.
- To enable connections to Microsoft Entra ID Integration for Password Reset, Integrate Microsoft Entra ID Integration with Password Reset and Configure the connection to Microsoft Entra ID Credential Store.

Next steps

Plan and configure the Password Reset processes for your organization. See the Configuring Password Reset.

Set up Microsoft Entra ID for Password Reset

Set up Microsoft Entra ID for Password Reset by activating the plugin and configuring the Microsoft Entra ID instance. The Microsoft Entra ID plugin is activated with the help of this plugin. Microsoft Entra ID for Password Reset is also available in the ServiceNow store.

Related topics

Request the Microsoft Entra ID Integration for Password Reset app

Request the Microsoft Entra ID Integration for Password Reset app

Microsoft Entra ID users can reset passwords with the Microsoft Entra ID Integration for Password Reset app.

Before you begin

Role required: admin

About this task

You can request the plugin from Now Support (HI) or from your instance.

In Now Support, navigate to **Service Catalog Activate Plugin**.

Or you can complete the following procedure.

Procedure

1. In your instance, navigate to **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the request form on Now Support.
3. On Now Support, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

Field	Description
Target Instance	Instance on which to activate the plugin.
Plugin Name	Name of the plugin to activate.
Specify the date and time you would like this plugin to be enabled	The date and time must be at least two business days from the current date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: By default, plugins are activated in two batches each business day: once in the morning and once in the evening, Pacific (U.S.) time. If you need your plugin activated at a specific time, enter a request for this in the Reason/Comments field.
Reason/Comments	Information that would be helpful for ServiceNow personnel who will activate the plugin. For example, if you need the plugin activated on a specific day or time instead of during one of the default activation windows, specify it in the comments.

5. Click **Submit**.
   The Microsoft Entra ID Integration for Password Reset app is activated.

What to do next

Plan, create, and customize the Password Reset process for your organization.

Set up Microsoft Active Directory for Password Reset

Enable connections to Active Directory (AD) by activating the Password Reset Windows App and Microsoft AD for Password Reset available in the ServiceNow Store.

Request the Password Reset Windows App plugin

Request the Password Reset Windows App (Password Reset Orchestration) (com.glideapp.password_reset_desktop) plugin that enables connections to the Active Directory (AD) credential store types. No other components are installed.

Before you begin

Role required: admin

About this task

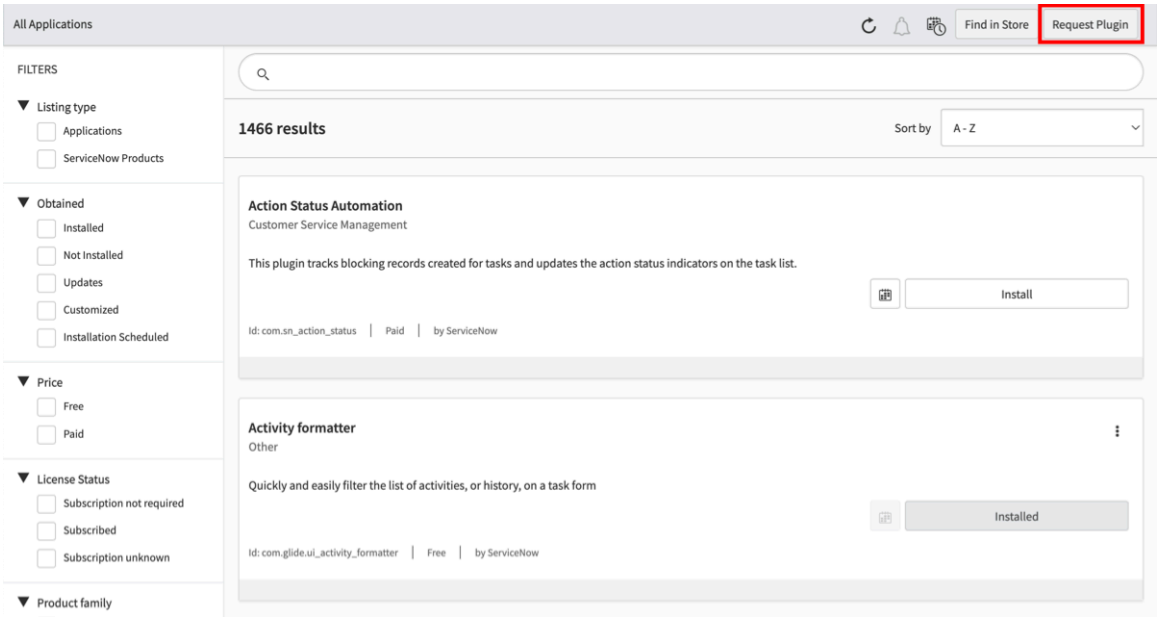
There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **All** > **Service Catalog** > **Activate Plugin** on Now Support. For more information about the list of plugins, see List of Plugins.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

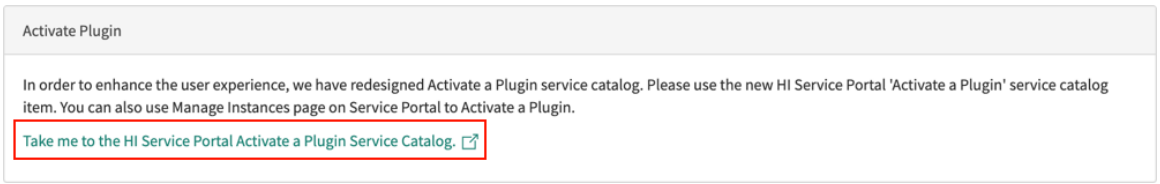
Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the Request form on HI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the form, fill in the fields.

Activate Plugin request form

Field	Description
Target Instance	Instance on which to activate the plugin.
Plugin Name	Name of the plugin to activate.
Specify the date and time you would like this plugin to be enabled	The date and time must be at least two business days from the current time. **Note:** Plugins are activated in two batches, in the morning and in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.
Reason/Comments	Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Windows login screen

By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

Restrictions on the Password Reset Windows Application

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab" in Configure your Password Reset process. .
- The Password strength indicator is not supported. See Configure the connection to a credential store for the Password Reset processes.
- For some verification types, you can use only one verification. Custom verifications are not supported. See Password Reset verifications for details.
- Custom UI macros configured on the **Process** > **Advanced** page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the **Password rule hint** text. Other formatting is not supported (bold, underline, hyperlink, and so on). See Configure the connection to a credential store for the Password Reset processes.

Password Reset Windows Application installation requirements

Activate the Password Reset Windows App (Password Reset Orchestration) (com.glideapp.password_reset_desktop) plugin and activate the Microsoft AD for Password Reset store app to use the Password Reset Windows Application. You must activate the Password Reset Windows App to use the Password Reset Windows Application.

Requirement	Description
Required ServiceNow release	Password Reset Windows Application latest version can be downloaded from store.
Required hardware	• 1 GHz or faster processor • 512 MB of RAM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement	Description
	• 10 MB of available hard disk space (x86) • 10 MB of available hard disk space (x64)
Required software	• Version of Password Reset Windows Application: 4.1 • Microsoft .NET Framework: 4.7.1 and newer • Microsoft Visual C++: Redistributable Visual Studio 2017
Supported operating systems	• Windows 7 • Windows 8.1 • Windows 10 Enterprise • Windows 10 Pro
Supported processor architecture	• X86 • X64
Supported network architecture	• Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured • For Password Reset Windows Application versions that use an SHA certificate, the corporate network must not block the SHA certificate. • To reset an AD password, the client must be on the corporate network.

Set up Password Reset integration with Okta

Enables end users to reset or change their Okta passwords using Password Reset and Okta spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This application requires an Integration Hub or Workflow Data Fabric subscription. For more information, see Legal schedules - Integration Hub overview.

Application version

Password Reset integration with Okta 1.1.2 is the latest version.

Dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Okta spoke v 4.1.3
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the application implementation.

Subflows

The Password Reset integration with Okta application provides these subflows that automate the Password Reset tasks:

Subflow	Description
Password Change	Changes password of the required Okta user.
Password Connection Test	Tests connection to Okta.
Password Lock State	Checks the lock status of the specified user account in Okta.
Password Reset	Resets the password of the specified Okta user.
Password Unlock	Unlocks the required user account in Okta.
Send Email After Change Password	Sends a password change notification email to the user. This subflow is used in the Password Change subflow.

Actions

The Password Reset integration with Okta provides the Get Configuration Variables for Okta Reset Process action to retrieve the user name of the required Okta user and the details of all variables.

Set up the Password Reset integration with Okta

Customize the default credential store records and password reset processes to integrate Password Reset with Okta.

Before you begin

- Request Integration Hub subscription.
- Activate Password Reset
- Activate and set up the Okta spoke.
- Activate Password Reset integration with Okta.
- Role required: admin

Procedure

1. Navigate to **Password Reset** > **Credential Stores**.
2. Open the record for Password Reset integration with Okta.
   For example, **Sample Okta Credential Store**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Customize the default record as per your requirement.
   For more information, see Configure the connection to a credential store for the Password Reset processes.
4. Navigate to **Password Reset** > **Processes**.
5. Customize the default records, **Service-Desk Process for Okta** and **Employee Self-Service Process for Okta** , as per your requirement..

   Note:
   The **User must reset password** check box isn't supported in this integration. That is, you can't enforce users to reset their password upon first login after they reset password using the auto-generated password.

   For more information, see Configure your Password Reset process.

Set up Password Reset integration with Google Directory

Enables end users to reset their Google passwords using Password Reset and Google Directory spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Integration Hub subscription

This application requires an Integration Hub or Workflow Data Fabric subscription. For more information, see Legal schedules - Integration Hub overview.

Application version

Password Reset integration with Google Directory 1.0.3 is the latest version.

Dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- Google Directory spoke v 1.3.1 or higher
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note:
Some of these plugins are licensable features and require appropriate licenses, if used outside the application implementation.

Subflows

The Password Reset integration with Google Directory application provides these subflows that automate the Password Reset tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Password Connection Test	Tests connection to Google Directory.
Password Lock State	Checks the lock status of the specified user account in Google Directory.
Password Reset	Resets the password of the specified Google Directory user.
Password Unlock	Unlocks the required user account in Google Directory.

Actions

The Password Reset integration with Google Directory provides the Get Configuration Variables for Google Directory Reset Process action to retrieve the user name of the required Google Directory user and the details of all variables.

Set up the Password Reset integration with Google Directory

Customize the default credential store records and password reset processes to integrate Password Reset with Google Directory.

Before you begin

- Request Integration Hub subscription.
- Activate Password Reset
- Activate and set up the Google Directory spoke.
- Activate Password Reset integration with Google Directory.
- Role required: admin

Procedure

1. Navigate to **Password Reset** > **Credential Stores**.
2. Open the record for Password Reset integration with Google Directory.
   For example, **Sample Google Directory Credential Store** .
3. Customize the default record as per your requirement.
   For more information, see Configure the connection to a credential store for the Password Reset processes.
4. Navigate to **Password Reset** > **Processes**.
5. Customize the default records, **Sample Service-Desk Process for Google Directory** and **Sample Employee Self-Service Process for Google Directory**, as per your requirement.
   For more information, see Configure your Password Reset process.

> **Note:**
> Google Directory doesn't support password change. Hence, the **Password change** check box on the process records isn't supported in this integration.

Configuring Password Reset

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: Introducing Password Reset (video)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elements of the Password Reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials, like user name and password, are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (generally user name or email address).
- One or more verifications — Methods to verify the identity of the user. Here are some examples of the verifications:
  - Question and answer: Answer a question that only the user knows (based on the **Security Question verification** type).
  - Email: Enter a code number that was emailed to the user.
  - SMS: Enter a code number that was texted to a mobile device.
  - Authenticator app: Enter a code that is displayed on your Authenticator app on a mobile device.

Note:
Password Reset supports the following authenticator apps:

- Google Authenticator
- Microsoft Authenticator
- Cisco Duo

Implementing a Password Reset process

1. Plan your implementation: Consider all applicable organizational guidelines, security policies, and areas of the organization.
2. Set up the elements of the password reset and password change processes according to the plan:
   - Connection to the credential store.
   - User groups that use the password reset process.
   - Identification type to use.
   - Verifications to use.
3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.
4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the **Forgot Password?** link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Users can change their passwords by using a self-service process.

1. The user logs in to the instance and then selects the **All** > **Password Reset** > **Change Password** module or link from the user profile record. The user can also use the Password Change application on mobile devices.

   Note:
   By default, the dark theme doesn't apply to the Change Password form. Users can change the theme to the dark theme. For more information about the dark theme, see Exploring themes in Next Experience.

2. On the Change Password form, the user selects a Password Reset process related to a credential store for which the user wants to change the password.
3. The user enters the old password and the new password.

   Note:

   As the user enters a password, the **New Password** field shows a message indicating whether the characters entered in the field are correct or not. For example, if a user enters a character that doesn't fit the password policy, the **New Password** field shows an error message. The strength bar also shows the strength of the new password that the user has entered.

   The password policy (granular password complexity) helps create a correct, strong password on the Change Password form in the Next Experience and the Core UI.

4. After all the password rules are met, the workflows validate the old password, and then implement the new one.
5. The user types the new password again in the **Retype password** field, and selects **Change Password**.
6. The system notifies the user that the password was changed.

Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Before you begin

Role required: password_reset_admin or admin

Procedure

1. Decide on the password reset process:
   - **Self-service process:** Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the **Public access** property. See Example: The default self-service Password Reset process.
   - **Service desk-assisted process:** Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Decide how groups and roles differ in access and security needs.
   Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.

   Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.

   Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.
3. Decide how to manage credentials.
   Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.
4. Decide how to implement enrollment in the Password Reset program.
   For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.
5. Decide which Password Reset options to offer to users.
   - If your organization uses single sign-on, how will users reset their password if they are unable to log on?
   - What options are available to users working off-site?

Configure your Password Reset process

Calculating the security score for password reset process

The security score of the password reset process is a critical metric for the password reset administrators to assess the strength and configuration of the password reset process.

Password reset calculation

The password reset process score provides a quantitative measure of how well the process is configured to protect against unauthorized access and confirm that only legitimate users can reset their passwords. The score is based on the following categories:

- Identification score (Max: 20 points)
- Verification score (Max: 40 points)
- Configuration score (Max: 20 points)
- Password policy score (Max: 20 points)

Identification score

To increase your identification score, you must enable multiple identification methods. If you're currently using only one method, such as a username, adding another method like an email can increase your score by approximately five points. Additionally, enabling CAPTCHA adds 10 points to your score and help to prevent the bots from exploiting the password reset flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verification score

To achieve a high score, you must use at least two verification methods with medium or high security levels. Each method adds up to 15 points (medium) or 25 points (high).

For the custom verification types, you must assign the security level. By default the custom verification is set as **low**.

Configuration score

To optimize your score, enable either the Email/SMS Password Reset URL or auto-generate passwords. If neither is enabled, the score is set at 10 points. Enabling either of these options fetches 20 points.

Password Policy Score

To maximize your Password Policy Score, enable the Password Policy on the Credential Store if it isn't active. Implement the Enforce History Policy to prevent users from reusing their last five passwords as defined in the *password_history_limit* property. Use a **High** strength password policy and enable the following settings:

Send password reset process security score notification is a weekly job that send reminders to the password admin about the score and recommendations to improve the score. An email notification is sent to the Process Owners of all the active processes if **Enable security score notification** option is selected in Password Reset Process form.

Configure your Password Reset process

To implement the process, you configure credentials, verification methods and settings, and enrollment settings. You also specify to which users the process applies.

Before you begin
Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes.
2. Create the credential store record for user names and passwords that are managed.

   Note:
   For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the installed Password Reset plugin.

   - The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
   - The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self service is intended for password reset only on the local ServiceNow instance and cannot change an AD password. In order to change AD password, you must install the **Microsoft AD spoke for Password Reset**.
   - The Password Reset Windows App (com.glideapp.password_reset_desktop) plugin supports changing the AD password.

3. Define the verifications that the process can use.
4. Configure Password Reset to auto-enroll users or to enable users to enroll for the program. See Configure your Password Reset process to auto-enroll users and Enable users to enroll for Password Reset.

Configuring password reset for external users: External users (users with the snc_external role) cannot manually enroll their devices in the password reset system. Security restrictions prevent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

external users from writing data to the password reset enrollment tables, and the enrollment form is not accessible to external users by default.

To enable password reset for external users, configure an automatic verification that does need manual enrollment such as Personal data verification or Email Code or SMS Code verification. Make sure that their email address or phone number is already stored in their user record.

To configure automatic verification for external users:

1. Navigate to **Password Reset** > **Processes**.
2. Select any of the automatic verifications from the related list of a process record ie Personal data/SMS/Email.
3. Ensure that the SMS/Email are of type Automatic and for that navigate to **Password Reset** > **Extensions** > **Verification types**.
4. Select the **Automatic enrollment** option.
5. Ensure that external users have a valid email address or phone number in their user profile.

Once configured, external users can receive a one-time verification code to their registered email address or phone number to complete the password reset process.

About this task

A Password Reset process consists of the following elements:

- The credential store that contains user login credentials.
- Optionally, the user groups that are authorized to use the Password Reset process.
- The verifications that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password. (Verifications are implemented by script includes.)
- Process strength configuration that helps view the security score of the process. You see the score in digits and colors based on the verification methods you select for the process. If enabled, notifications can be sent for potential configuration improvements to the process. If there are any deviations between the maximum attainable and current scores, an email with an actionable list of recommendations to improve the configuration is sent.

Procedure

1. Navigate to **All** > **Password Reset** > **Processes**.
2. Click **New** and then specify a meaningful **Name** and **Description** for the process.
3. Select the **Credential store** that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the **Password reset** check box, the **Password change** check box, or both check boxes.
5. Specify the **Apply to all users** setting.
   For more information about the fields on the Password Reset Process form, see Password Reset Process form.
6. For Password Reset, configure settings on the **Password Reset Details** tab.
   For information about the settings and fields on the **Password Reset Details** tab, see Description of the fields on the **Password Reset Details** tab.
7. For Password Reset, configure settings of interest on the **Advanced** tab.
   For information about the fields on the **Advanced** tab, see Description of the fields on the **Advanced** tab.
8. For Password Reset, fill in any fields of interest on the **Enrollment Reminder** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Save your changes on the Password Reset Process form.
   The form refreshes, and additional related lists appear.
10. From the **Password Reset Process Verifications** related list, select one or more verifications.
11. **Optional:** From the **Password Reset Process Groups** related list, select the user groups that use the process that you are defining.
    The **Password Reset Process Groups** related list appears only if the **Apply to all users** check box is not selected.
12. Save the record and then select the **Active** check box to enable the Password Reset process that you configured.
    The check box is available only after the record has been saved.
13. Click **Update**.
14. Navigate to **Password Reset** > **Properties** to set the properties that configure the Password Reset experience for end users.

Related topics

Plan your Password Reset processes

Configure the required strength for passwords

Configure password expiration reminder

You can configure the password reset expiration reminder feature to send notifications to change or reset a user's password whenever it is going to expire.

Before you begin

You must enable the *pwd_reset.enable.password_expiration_reminder* property to configure password expiration reminder. By default, this property is turned off.

Role required: admin

About this task

Configure password expiration reminder for any credential stores, such as Microsoft Entra ID.

Note:
Password expiration reminder doesn't support the local ServiceNow credential store.

After configuring password expiration reminder, notifications are sent to users by different channels, such as emails, text messages, or actionable virtual agent notifications. Users get an option to reset or change the password through notifications, such as a link that users can select to reset or change the password.

Procedure

1. Navigate to **All** > **Password Reset** > **Processes**.
2. On the Password Reset Process page, select the process for which you want to configure password expiration.
3. On the form for the selected process, select the **Password Expiration Configuration** tab.
4. Select the **Send expiration reminder** option.
5. On the form, fill in the fields.

   For information about the fields on the Password Expiration Configuration form, see Password Expiration Configuration form.

6. Save the form.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After enabling password expiration reminder for a process, a sync expiration data scheduled job runs after an hour. The scheduled job creates records in the password expiration table for every user entitled for that process. The schedule job creates records for the process for which you configured password expiration and users who belong to this process.

If you find that the data in the password expiration table is not in sync, select **Sync Expiration data** to sync the data. Otherwise, the sync is an automated process.

Note:
After you select **Sync Expiration data**, the scheduled job runs after an hour. The **Sync Expiration data** button appears only for those processes that are active and the processes for which the **Send expiration reminder** option is selected.

Related topics

System properties for password expiration

View scheduled jobs

You can view scheduled jobs for the process that you configured password expiration for. When you configure password expiration for a process, two scheduled jobs are created automatically.

Before you begin
Role required: admin

About this task
One scheduled job creates a record in the password expiration table, which has the prefix as *`Sync password expiration records for pwd_process_`* followed by a sys_id.

Note:
This job runs only once. This scheduled job only creates a record in the password expiration table. It doesn't fetch information about each user's password expiration by calling the external credential store. For example, the values for the **Last Password Reset Date** or **Password Expiration Date** field remain empty. The expiration reminder scheduled job retrieves the dates for all the expiration records with empty dates before sending the expiration notifications.

The second scheduled job runs periodically based on configuration. The scheduled job that has a prefix as *`pwd_expiration_reminder_`* followed by a sys_id does the following two actions:

- Fetches the latest information about the user's password expiration.
- Sends a notification when the user's password is going to expire.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.

   The Scheduled Jobs page shows the scheduled jobs, which are created after you configure the password expiration.

2. Select any of the scheduled jobs with the following prefixes:
   - *`Sync password expiration records for pwd_process_`*
   - *`pwd_expiration_reminder_`*

   These prefixes are followed by the sys_id of the password reset process.

© 2026 ServiceNow, Inc. All rights reserved.

View a password expiration table

You can view a password expiration table and validate whether a record is created in it.

Before you begin

Role required: admin

About this task

This table contains the password expiration information of an individual user in each process that the user is entitled to. The expiration framework uses this table information to send the expiration notification reminders across the credential stores. You can also view details of the record, such as if there are any errors, error logs, or password expiration dates.

Procedure

1. Select **All** and then enter *pwd_expiration.list* in the navigation filter.

   The Password Expirations page shows the table with the generated records.

2. View the various columns that you want to use in the table and validate the information.

Password expiration table

Column Name	Description
Users	Shows the reference to the sys_user table.
Password Reset Process	Shows the reference to the password reset process table. The process that a user belongs to and for which you have configured password expiration.
Last Password Reset Date	Shows the last date when the user reset the password.
Password Expiration Date	Shows the date that indicates when the password is going to expire.
Send Notification	Shows whether password expiration notifications are to be sent or not.
Active	Shows the status of the password expiration record. For example, suppose that a user is no longer associated with the process. In that case, the record shows the value as **false**. It means that the record is inactive and the scheduled process does not fetch the data for that user. The **true** value indicates that the record is active.
Error Count	Shows whether there is any error while getting information about the user password expiration. For example, when getting information about a user's password expiration while calling an external credential store, an error might occur.
Last Refresh Date	Shows the last date when the record was refreshed from an external system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column Name	Description
Last Error Log	Shows the last error log if there is any error while getting information about the user's password expiration.

Note:
The password expiration table stores the password expiration information of different users for different password reset processes because both the tables are data domain separated. The password expiration table is also data domain separated. For more information about domain separation, see Domain separation and the Password Reset application.

Credential stores for Password Reset

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User table [sys_user] or an Active Directory server.

Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.

Credential store types installed with the base system

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to **Password Reset** > **Credential Store Types** to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

Name	Description
Local ServiceNow Instance	Represents the current (local) ServiceNow instance.

Credential store types included in Store apps

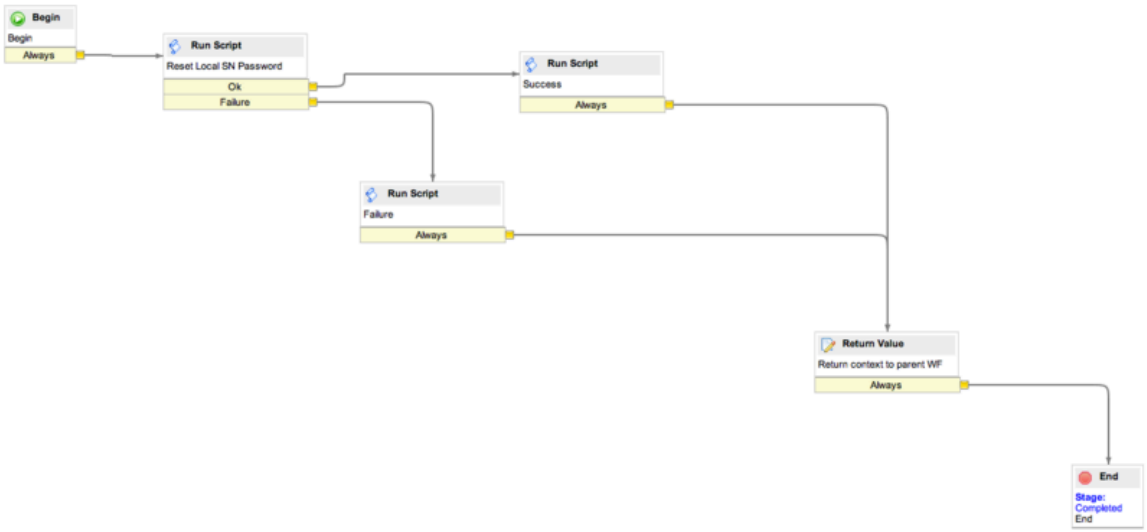
Name	Description
Microsoft AD Credential Store	Represents a Microsoft Active Directory credential store. See Set up Microsoft Active Directory for Password Reset.
Microsoft Entra ID Credential Store	Represents a Microsoft Entra ID credential store.
Okta credential store	Represents an Okta credential store.
Google credential store	Represents a Google Directory credential store.

Connection subflows for credential store types

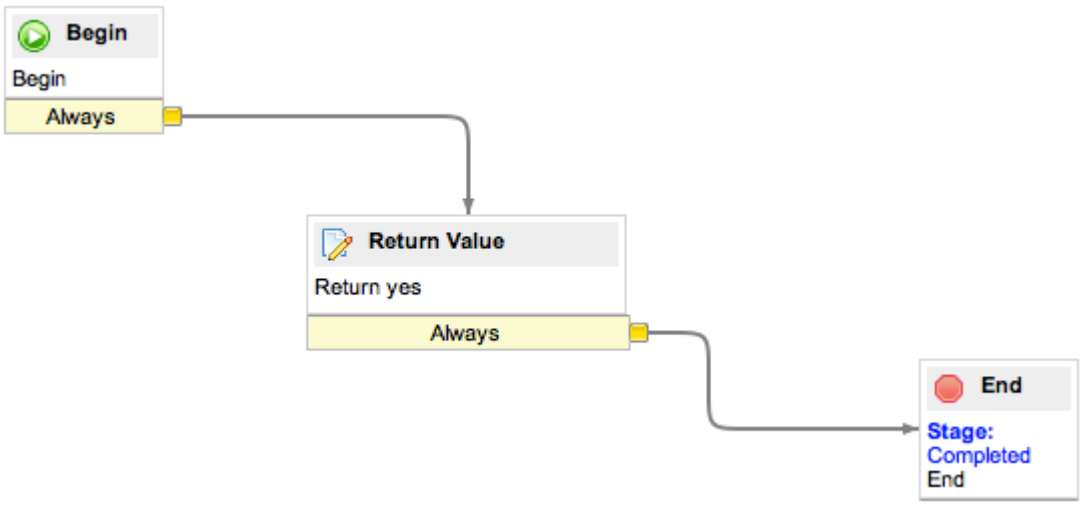
A credential store type workflow requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the **Pwd reset – AD** and **Pwd Reset - Local** subflows as models for your custom connection workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pwd Reset Local sub workflow



Pwd connection test local SN sub workflow



Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset.

Configure the connection to a credential store for the Password Reset processes

You create a Password Reset credential store record to configure access to your credential store server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

Before you begin

Role required: none

About this task

- For an AD credential store, skip this procedure and instead follow the instructions in Integrate Password Reset with your Active Directory service. The Password Reset Windows Application supports only AD credential stores.
- Configuration for multiple connections using a child alias. You can configure a connection credential alias with multiple child connections and map the child connection to a password

reset credential store. The connections are used during the run time in the password reset flows. With this configuration password reset flows can support multiple Active Directory server credentials in Workflow Studio.

Procedure

1. Navigate to **All** > **Password Reset** > **Credential Stores**.
2. Select the following sample credential store.

   Local ServiceNow Instance credential store

3. Enter a unique and meaningful **Name** and **Description**, and then on the Password Reset Credential Store form, fill in the fields.
   For information about the fields on the Password Reset Credential Store form, see Password Reset Credential Store form.
4. Click **Submit**.
5. If you use the Local ServiceNow Instance credential store and you selected the **Enforce history policy** check box, then follow these steps:
   a. Open the Password Reset process that is associated with the credential store: **Password Reset** > **Processes**.
   b. On the **Password Reset Details** tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.
6. Select Enable password policies on your instance
7. Test the connection to the credential store.

- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:

- Read Members
- Read MemberOf

Procedure

1. Install a MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. If using the Workflow and Orchestration add-ons, in the ServiceNow instance, navigate to **Orchestration** > **Credentials**.
4. Click **New**, complete the form with the following values for the AD credential, and then click **Submit**.

Field	Description
Type	Select Windows.
User name	Enter your Active Directory domain user. For example, **domain \admin**.
Password	Enter your Active Directory domain user password.
Applies to	Select the MID Server that you use to access the Active Directory server.

Note:
If you are using Integration Hub, from the Microsoft AD Credential store, click **Microsoft AD Connection Alias** to create a new connection. To learn more, see Set up the Microsoft AD v2 spoke.

What to do next

Create a connection to the credential store as described in Configure the connection to an AD credential store.

Configure the connection to an AD credential store

You can create a Password Reset credential store record to configure access to your Active Directory server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

About this task

The Microsoft AD Spoke for Password Reset add-on installs the AD Credential store type. The Password Reset Windows Application supports only **Microsoft AD Credential Store**.

Procedure

1. Navigate to **All** > **Password Reset** > **Credential Stores** and select **Sample Microsoft AD Credential Store** to use as a template.
2. Enter a unique and meaningful **Name** and **Description** and then fill in the form.

Type	Select **Microsoft AD Credential Store type**. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular type of credential store. Credential stores inherit the functionality of the credential store type.
Auto-generate password	Specify a script include that generates a temporary password for use during the reset process. **Note:** If you select the **Enforce history policy** check box, then you must specify a value for **Auto-generate password** that is compliant with the password policy. There are several options to choose from: ○ An auto-generated password that is compliant with the policy you selected. ○ An auto-generated password that is Crypto-secure. ○ A default auto-generated password.
Enforce history policy	Appears only if you select a **Microsoft AD Credential Store type** or **Local ServiceNow Instance** credential store type. The Microsoft AD Credential Store type supports history check. The **Enforce history policy** option appears only when the **Supports history check** option is selected for the **Microsoft AD Credential Store type**. For information on configuring the setting for credential store types other than AD, see Configure the connection to a credential store for the Password Reset processes. Select the **Enforce history policy** check box to enforce the history policy (password reuse). History policy (password reuse): Active Directory domains can be configured to include a history policy that ensures that users don't reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous 10 passwords when resetting a password. This history policy limit is managed by the password_history_limit verification parameter.
Hostname	Specify the URL or IP address of the credential store.
User account lookup	Specify the script include that maps the user ServiceNow platform ID to the user credential store ID. The default script, *PwdDefaultUserAccountLookup*, returns the user ServiceNow platform user name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password rule hint	Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The **Password rule** script enforces the requirements. **Note:** The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).
Password rule	Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks **Password Reset**. You can use the script to enforce password strength/complexity requirements.
Enable Password Strength	Select the check box to: ○ Display the text box for the **Strength rule** script so you can update the script. ○ Display the graphical **Password Strength** bar to the user while the user changes or resets the password. **Note:** The Password Reset Windows Application does not support Password Strength.
Strength rule	This text box appears only if you select **Enable Password Strength**. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings: ○ Selected for local ServiceNow credential stores ○ Not selected for other credential stores **Note:** ○ To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.  ○ The Password Reset Windows Application does not support Password Strength.

3. Click **Submit**.
4. On the domain controller, set **Password Aging** (*MIN_PASSWORD_AGE*) to zero.
5. To enforce the history policy that is configured for the AD credential store, follow these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open the Password Reset process that is associated with the credential store: **Password Reset** > **Processes**.

b. On the **Password Reset Details** tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.

6. To enforce the maximum number of attempts to reset the password, in the Password Reset Credential Store Parameters related list, set the value of the *max_reset_attempts* parameter to the number of allowed failed attempts.

   The default value of 0 (zero) enables an unlimited number of reset attempts.

   Note:
   The *max_reset_attempts* setting applies only to Password Reset processes that use AD credential stores.

7. Click **Submit**.
8. Set up the Microsoft AD v2 spoke
9. Test the connection to the credential store.

Integrate Password Reset with your Microsoft Entra ID

When the Microsoft Entra ID Integration for Password Reset store app is activated, the Password Reset application can manage passwords of a Microsoft Entra ID application. The application manages passwords by referencing a Microsoft Entra ID user with appropriate roles and password change privileges.

Before you begin

Role required: admin

Procedure

To integrate Password Reset with your Microsoft Entra ID, you must set up the Microsoft Entra ID spoke.
For more information about setting it up, see Set up Microsoft Entra ID spoke.
The Microsoft Entra ID Integration for Password Reset is integrated.

What to do next

Create a connection to the credential store as described in Configure the connection to an AD credential store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the connection to the Microsoft Entra ID Credential Store

Create a Password Reset credential store record to configure access to your Microsoft Entra ID server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see and other settings.

Before you begin

Role required: none

About this task

The Microsoft Entra ID Integration for Password Reset installs the Microsoft Entra ID Credential Store type. The Microsoft Entra ID application supports only the **Microsoft Entra ID Credential Store**.

Procedure

1. Navigate to **All** > **Password Reset** > **Credential Stores** and select **Sample** *Microsoft* **Credential Store** that you can use out of the box or as a template.
2. Enter a unique **Name** and **Description** and then complete the form.

Type	Select **Sample Microsoft Entra ID Credential Store**. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular type of credential store. Credential stores inherit the functionality of the credential store type.
Auto generate password	Specify a script include that generates a temporary password for use during the reset process.
Hostname	Specify the domain name of the Entra ID application in this column.
User account lookup	Specify the script include that maps the user ServiceNow platform ID to the user credential store ID. The default script, *PwdDefaultUserAccountLookup*, returns the user ServiceNow platform user name.
Password rule hint	Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The **Password rule** script enforces the requirements.
Password rule	Specify the client script that validates the new password entered by the user. The script is invoked when the user enters a new password and selects **Password Reset**.
Enable Password Strength	Select the check box to: ○ Display the text box for the **Strength rule** script so you can update the script. ○ Display the graphical **Password Strength** bar to the user while the user changes or resets the password.
Strength rule	This text box appears only if you select **Enable Password Strength**. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Selected for local ServiceNow credential stores
- Not selected for other credential stores

Note:

To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

Enable password policy	Check this option to select either a default password policy or one you created yourself previously.

3. Click **Submit**.
   Password Reset Credential store record to access your Microsoft Entra ID server is configured.

Note:

- The **Enable Password Policy** option was added in the Quebec release. Checking the option displays your password policy choices right from your instance. To learn more, see Enable password policies on your instance.
- Since the Microsoft Entra ID doesn't support the history policy, the **Enforce history policy** option is hidden.

Test the connection to a credential store

You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Password Reset** > **Credential Stores** and then open the credential store record.
2. In the header bar, click **Save and Test Connection**.
   A progress page displays the result of the test.

Delete a connection to a credential store for Password Reset

Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Before you begin

Role required: password_reset_admin or password_reset_credential_manager

Procedure

1. Navigate to **All** > **Password Reset** > **Credential Stores** and then select the check box for the credential store.
2. In the *Actions* choice list, select **Delete**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password Reset verifications

Each verification specifies the method and process for verifying the identity of the user that is requesting a password reset.

Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

Note:
The Password Reset Windows Application doesn't support custom verifications.

Password Reset verifications	
QA verification	Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. Questions are presented in the language that the user requested during login. When a user requests a password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify their identity. **QA verification on the Verify page** 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password Reset verifications (continued)

	For information on the user enrollment experience, see Enroll for the Password Reset program using questions and answers. This verification is based on the **Security Questions** verification type.
Email verification	This verification relies on auto-generated code numbers. You typically implement email verification as a self-service Password Reset model. When a user requests a password reset, the system sends a verification code to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Enroll for the Password Reset program using emailed codes. The Password Reset Windows Application supports email verification. This verification is based on the **Email Code** verification type. By default, a six-digit email verification code is sent to the user through email. The code expires in 10 minutes. Users can attempt to send another code after two minutes. A maximum of 10 email verification codes can be sent to a user in one day.
SMS verification	Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers. When a user requests a password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page. You can use the ServiceNow Notify feature to send the codes. For information on the user enrollment experience, see Enroll for the Password Reset program using SMS codes. This verification is based on the **SMS Code** verification type. When users enroll for email or SMS verification on the Password Reset Enrollment page, they get a code to verify their email address or device. After the users enter the code and select **Verify**, an associated record is automatically created in the Password Reset Enrollment for Verifications [pwd_enrollment] table even before they select **Submit**. By default, a six-digit verification code is sent to the user's mobile device. The code expires in five minutes. Users can attempt to send another SMS verification code to the device after two minutes. A maximum of 10 codes can be sent to a particular device in one day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password Reset verifications (continued)

	Note: While the record is created automatically in the Password Reset Enrollment for Verifications [pwd_enrollment] table for the email or SMS verification, the associated enrollment check script doesn't get processed unless users select **Submit**.
Authenticator verification	Password Reset model that relies on auto-generated code numbers. Users typically implement authenticator verification as a self-service Password Reset model. When a user requests a password reset, the user reads a code from the authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Enroll for the Password Reset program using an authenticator. The Password Reset Windows Application supports Google Authenticator verification. This verification is based on the authenticator verification type.
Personal Data — Confirm Email Address	Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the **Personal Data Confirmation** verification type. **Note:** Users can't configure this verification for the processes with the active public access.
Personal Data — Enter User Name	Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance. This verification is based on the **Personal Data** verification type.
Soft PIN Verification	Implements a self-service Password Reset model that relies on a Soft PIN that's a six-digit number. Users can enroll for the Soft PIN verification for a process and reset the Soft PIN. ServiceNow® Virtual Agent supports the Soft PIN verification method.

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table `[sys_user]`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User experience

For an example of how a user might enroll for Personal data verification, see Enroll for the Password Reset program using questions and answers.

Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

Name	Description
Email Identification	Identifies users by their email addresses.
Username Identification	Identifies users by their user names.

Personal data confirmation verifications

- **Personal data verification:** If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
- **Personal data confirmation verifications** allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the **label** parameter (the text that the end user should see) to *Email* (that is, `label=Email`).
2. Set the **column** parameter (the column in the table that holds the verification data) to *email* (that is, `column=email`).

Note:
You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.

Personal data and personal data confirmation type verifications

Parameter Name	Description
label	Text to display as a label for the field that the user fills in during the password reset request. Data Type: string Default Value: n/a
column	Column of the sys_user table that provides the data that is used to verify the identity of the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter Name	Description
	Data Type: string Default Value: n/a

Create a custom identification type for Password Reset

SMS Code Verification type for Password Reset

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity with the help of any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user then enters the code on the Password Reset Verification page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table.
- Update property settings for the Password Reset application.

Note:
The system allows only one instance of each SMS code parameter.

SMS Code Verification type parameters

Parameter name	Description
expiry	Number of minutes the verification code is valid. **Data Type**: integer (any positive integer) **Default Value**: 5
complexity	Number of digits in the numerical verification code. **Data Type**: integer (any positive integer) **Default Value**: 6
pause_window	Number of minutes before the user can request another SMS code for verification. **Data Type**: integer (any positive integer) **Default Value**: 2
max_per_day	Maximum number of codes sent for verification in one day. **Data Type**: integer (any positive integer) **Default Value**: 10

User experience

For information on how users enroll for SMS verification, see Enroll for the Password Reset program using SMS codes.

Use Notify to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using the ServiceNow Notify application (via the Twilio SMS Messaging system). Notify is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

Before you begin
Role required: admin

About this task
Notify requires a separate contract with Twilio.

Procedure

1. Enroll for a Twilio account and telephone number at https://www.twilio.com/
2. Activate the **Notify** plugin.
3. Associate the Twilio account with Notify.

Result
No other configuration is required. Users who request password change or password reset receive SMS codes through Notify.

Related topics

Activate a plugin

Specify the number of required security questions

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll. You can also specify the number to display when a user is verifying identity while resetting the password.

Before you begin
Role required: password_reset_admin or admin

Procedure

1. Navigate to **All** > **Password Reset** > **Verifications** and then open a verification that uses the **Security Questions Verification Type**.
2. Configure the parameters in the **Password Reset Verification Parameters** related list.

Parameters for Security Questions Verification

Parameter Name	Description
num_enroll	Number of questions that a user must provide answers to while enrolling for the Password Reset process. The value that you specify here overrides the setting of the **Number of security questions required during enrollment** property. See Configuring Password Reset properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter Name	Description
	Data Type: Positive integer that does not exceed the number of questions in the security questions list (**Password Reset** > **Security Questions**). **Default Value**: 5
num_reset	Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity. The questions are selected at random and are presented in random order. The value that you specify here overrides the setting of the **Number of security questions required during the password reset request** property. See Configuring Password Reset properties. **Data Type**: Positive integer that does not exceed the value of the num_enroll parameter **Default Value**: 3

3. Click **Update**.

Add a custom question to the Security Questions verification

Configure your Password Reset process to auto-enroll users

To simplify management, many organizations auto-enroll users in the Password Reset program. Every base-system verification type enables you to specify automatic enrollment for your process.

Before you begin

Role required: password_reset_admin or admin

About this task

To enable automatic enrollment, you configure settings for the verification type that your Password Reset process is based on.

Procedure

1. Navigate to **All** > **Password Reset** > **Extensions** > **Verification Types**.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in Password Reset verifications.
3. On the **Verification Types** page, specify the following settings:

Field	Description
Enrollment check	Script that determines whether a user is enrolled for verification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: For automatic enrollment to work, the **Enrollment check** script must return true. This may require additional setup by the admin to ensure that the preconditions are met. For example, for the **SMS Code** verification type, records must be populated in particular tables. If no script is specified when **Automatic Enrollment** is selected, a default script is provided.
Automatic enrollment	Select the check box to auto-enroll users. **Note:** If **Automatic enrollment** is not selected, then you must provide an enrollment UI macro and enrollment processor script as described in Create a custom Password Reset verification type.

4. Repeat the procedure for all verifications that your Password Reset process uses.

Enable users to enroll for Password Reset

To enable users to enroll for the Password Reset program, you specify a UI macro that takes the user through the enrollment process and a script that processes the enrollment data that the user entered. The base system includes a functioning macro and script.

Before you begin
Role required: password_reset_admin or admin

About this task
To enable users to enroll, you configure settings for the verification type that your Password Reset process is based on.

Procedure
1. Navigate to **All** > **Password Reset** > **Extensions** > **Verification Types**.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in Password Reset verifications.
3. On the **Verification Types** page, specify the following settings:

Field	Description
Automatic enrollment	Clear the check box to disable automatic enrollment.
Enrollment UI	Enrollment UI macro that takes the user through the enrollment process.
Enrollment processor	Enrollment processor script that processes enrollment data.

4. Repeat the procedure for all verifications that your Password Reset process uses.

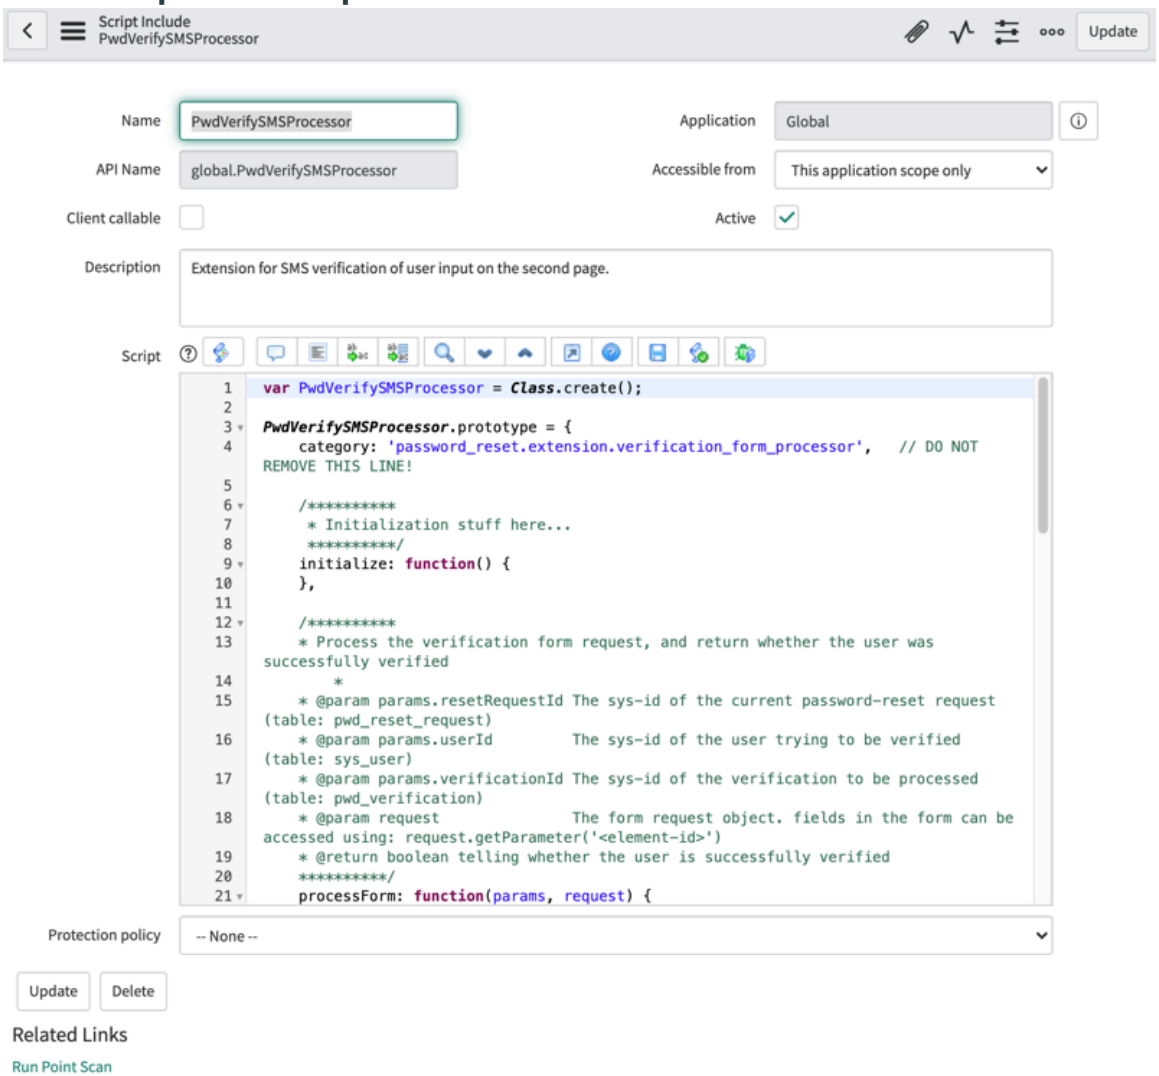
Verification processor script



Configuring Password Reset properties

You can specify properties that configure the Password Reset experience for end users.

Before you begin

Role required: password_reset_admin

About this task

While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is 3 attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between 5 and 7.

Procedure

1. Navigate to **All** > **Password Reset** > **Properties**.
   For information about the Password Reset properties, see Password Reset global properties.
2. Update settings as needed and then click **Save**.

Send email to remind users to enroll for Password Reset

You can automatically send messages that remind users to enrolled in the Password Reset process. You specify the text of the message and can configure the messages to repeat at intervals.

Before you begin

Role required: password_reset_admin

About this task

The default email content is:

- Subject: Reminder: Enroll in the Password Reset program
- Body: Click here to enroll in the Password Reset program.

To customize the email, see Customize the Password Reset enrollment reminder email.

Procedure

1. Navigate to **All** > **Password Reset** > **Processes** and select your process.
2. Click the **Enrollment Reminder** tab, configure the following settings, and then click **Update**.

> **Note:**
> The tab appears only when the **Password reset** check box is selected.

Field	Value
Send reminder	Select the check box to send reminder emails to users (either all users or users in the specified groups, as you configured). Clear the check box to send no reminders.
Sender alias	Enter a non-functional email alias that should appear in both the **To** and **From** fields of the message. For example, `do-not-reply@myCompany.com`. Users will not be able to respond to the alias. The alias is required by the email system to use the **bcc** field for all of the users who receive the message. The intent is that the users should not see the other addressees. Default: do-not-reply@ServiceNow.com
Send, Day, and Time	Specify a schedule of one message each month or one message each week. ○ If you set **Send** to **Monthly**, then enter the day of the month and optionally the time of day when the message should be sent. ○ If you set **Send** to **Weekly**, then enter the day of the week and optionally the time of day when the message should be sent. Default: Weekly message at 00:00 on Monday
Starting	Date and time to send the first message. Click the calendar button to specify the setting. Default: [Now]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Customize the Password Reset enrollment reminder email

The email message that reminds users to enroll for the Password Reset process is based on an email template. To customize the message, you can modify the default template or create a custom template.

Before you begin

Role required: password_reset_admin

About this task

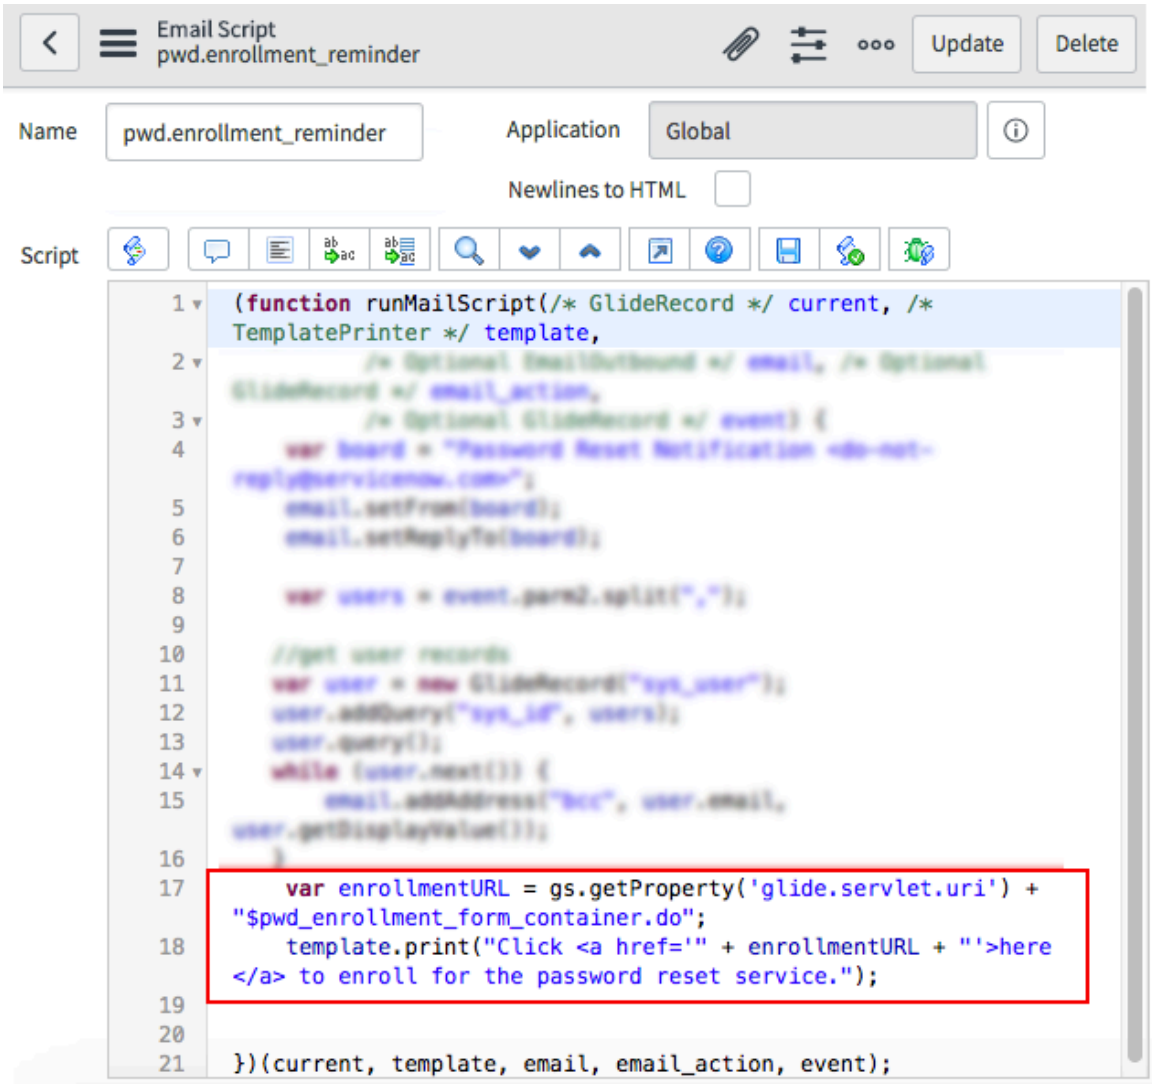
The default email content is:

- Subject: Reminder: Enroll in the Password Reset program
- Body: Click here to enroll in the Password Reset program.

Procedure

1. To modify the email subject text:
   a. Navigate to **System Policy** > **Email** > **Templates**.
   b. Open the *Password reset enrollment reminder* template.
   c. Update the **Subject** field as needed.
   d. In the **Message HTML** text box, you can add code as needed, but do not modify the default text.
2. To modify the email body content:
   a. Navigate to **System Notifications** > **Email** > **Notification Email Scripts**.
   b. Open the *pwd.enrollment_reminder* script.
   c. Modify only the indicated portion of the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. To create a custom email template:
   a. Make a copy of the *`Password reset enrollment reminder`* template and edit as described above.
   b. Navigate to **Password Reset** > **Properties** and enter the template name in the **Email template for enrollment reminder emails** field.

Configure the required strength for passwords

The password that a user defines must meet certain requirements — for example, it must contain at least 12 characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

Before you begin

Role required: password_reset_admin

About this task

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating a password. The default requirements are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral

Note:
In addition to configuring password strength requirements, you can configure several other settings for the credential store, as described in Configure the connection to a credential store for the Password Reset processes.

Procedure

1. Navigate to **All** > **Password Reset** > **Credential Stores**.
2. Select the credential store in the list and then configure the following settings:

Field	Description
Password rule hint	Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The **Password rule** script enforces the requirements. **Note:** The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).
Password rule	Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks **Password Reset**. You can use the script to enforce password strength/complexity requirements.
Enable Password Strength	Select the check box to: ○ Display the text box for the **Strength rule** script so you can update the script. ○ Display the graphical **Password Strength** bar to the user while the user changes or resets the password. **Note:** The Password Reset Windows Application does not support Password Strength.
Strength rule	This text box appears only if you select **Enable Password Strength**. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings: ○ Selected for local ServiceNow credential stores ○ Not selected for other credential stores

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.  ○ The Password Reset Windows Application does not support Password Strength.

3. Click **Submit**.
   You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.
4. Navigate to **Password Reset** > **Credential Stores** and then open the credential store.
5. In the header bar, click **Save and Test Connection**.
   A progress page displays the result of the test.

Specify lockout for failed login attempts

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Before you begin

Role required: admin

Procedure

Navigate to **All** > **System Policy** > **Script Actions** to view or activate the scripts.

Note:
Starting with the Kingston release, following a zBoot, the script actions **SNC User Lockout Check with Auto Unlock** and **SNC User Clear** are activated.

To learn more about properties that affect failed login attempts, see Managing failed login attempts (instance security hardening) in the Instance Security Hardening Settings.

Script action	Description
SNC User Lockout Check with Auto Unlock	• Uses the value of the `glide.user.max_unlock_attempts` property to set the limit for failed login attempts. • Unlocks the user account after the time period that is specified for the `glide.user.unlock_timeout_in_mins` property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script action	Description
SNC User Lockout Check	Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5).
SNC User Clear	Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login.

What to do next

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy** > **Event Logs**.
2. Filter for **login.failed** in the **Name** field. You can view the attempted login name, date, and IP address logged for the attempt.

Configure Google reCAPTCHA for the password reset process

To use the Google reCAPTCHA service, instances that are running on a domain other than `service-now.com` require an API key pair from Google.

Before you begin

Role required: admin

About this task

- The procedure described in this topic is optional for instances that are running on the `service-now.com` domain.
- Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the procedure described in this topic. Instead, set the *password_reset.captcha.google.enabled* system property to **false**. This setting enables the CAPTCHA service that is provided with the base system.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

Procedure

1. Request an API key pair (a site key and a secret) from Google at https://www.google.com/recaptcha.
2. Set the following system properties:

Property	Value
password_reset.captcha.google.enable	Set to `true`. Type: string Default: true
google.captcha.site_key	Set to the site key that Google provided. Type: string

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Value
	Default: A site key that Google provided to ServiceNow
google.captcha.secret	Set to the secret that Google provided. Type: password2 Default: An encrypted secret that Google provided to ServiceNow **Note:** Select reCAPTCHA v2, **I'm not a robot** option. (reCAPTCHA v3 is not currently supported). 
Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

Legacy

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in Password Reset extension script categories.

   Extension scripts are example script includes that enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

2. Follow the configuration steps described in Configure your Password Reset process.
3. Select the new types that you created. You can customize the following components:
   - Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See Create a credential store type for Password Reset.
   - Verification types: Define new types for how users are verified. See Create a custom Password Reset verification type.
   - Identification types: Define new types for how users can identify themselves. See Create a custom identification type for Password Reset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced password reset configuration

You can customize the Password Reset and Password Change applications to meet your organization's needs. See Password Reset and Password Change applications for more information. Also see Configuring Password Reset properties for a list of properties that control several aspects of password reset.

Customize password reset processes and integrate third-party credential services

To customize password reset processes or to integrate them with third-party credential services such as Okta or Microsoft Entra ID, use Integration Hub capabilities. Use Workflow Studio to create or modify actions like user unlock, change password, and get user status. Use Workflow Studio to create or modify subflows that perform the actions.

Before you begin

Role required: admin, password_reset_admin, or password_reset_credential_manager

About this task

- The base system provides actions, subflows, and credential store types for the "Local ServiceNow Instance" identity provider.
- For Microsoft Active Directory, the subflows are available when you activate the Microsoft AD Spoke for Password Reset app.
- To use any other identity provider such as Okta, you must use Integration Hub to create the required actions, subflows, and custom credential store types.
- For Microsoft Entra ID, the subflows are available when you activate the Microsoft Entra ID Integration for Password Reset app.

Procedure

1. Use Workflow Studio to create password reset actions like user unlock, change password, and get user status.
   For more information about Workflow Studio, see Action Designer.
2. Use Workflow Studio to create the following subflows.

   Use the specified names, inputs, and outputs for the subflows. For more information about the subflows, see Subflows.

Subflow name	Input	Input type	Output	Output type
<Provider Name> Password Unlock	Password Reset Request	Record.Password Reset Request	Error Message	String
			Status	Choice
<Provider Name> Password Reset	Password	Password (2 Way Encrypted)	Status	Choice
	Password Reset Request	Record.Password Reset Request	Error Message	String
<Provider Name> Password Change	Password Reset Request	Record.Password Reset Request	Status	Choice
	Current Password	Password (2 Way Encrypted)	Error Message	String

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow name	Input	Input type	Output	Output type
		Note: **Name** under **Advanced options** is `old_password`.		
	New Password	Password (2 Way Encrypted) **Note:** **Name** under **Advanced options** is `new_password`.		
<Provider Name> Password Lock State	Password Reset Request	Record.Password Reset Request	Error Message	String
			Locked	Choice
			Status	Choice
<Provider Name> Password Connection Test	Not Applicable	Not Applicable	Error Message	String
			Status	Choice

3. For third party providers, create a credential store type.
   a. Select the **Use Flow** check box.
   b. Select the password reset subflows that you created for the provider. See Password Reset application for more information.
4. Create password reset credential store.
5. Create a password reset process.
6. Select the credential store type created for the provider.

Result
The password reset mechanism for the required third-party application is set up.

Add a custom question to the Security Questions verification

To enroll for the 'Security Questions' verification, the user selects several questions and supplies confidential answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

Before you begin
Role required: password_reset_admin or admin

About this task
The base system provides a large set of default questions in all supported languages. Questions are presented to each user in the language that the user requested during login. Creating a custom English language question is a one-step process. To create a custom question in a non-English language, you can use either of the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create a custom question in the non-English language.
- Create a custom English language question plus one or more translations of the question into other languages.

Procedure

1. Navigate to **All** > **Password Reset** > **Security Questions**.

   Note:
   Each question in the list is presented to users when they enroll for the Password Reset process. The user selects each question to use by providing a confidential answer to the question.

2. Follow this procedure to create a custom question in a single language.

   Note:
   To enter non-English question text, you must request the language when logging in.

   a. On the Password Reset Questions page, click **New**.

   b. Enter the text in the **Question (Translated field)** field and then click **Submit**.
   The question is added to the list of questions that is presented to users when they enroll. No additional steps are needed and you can skip the remaining steps.

3. Follow this procedure to create a custom question in English and the same question in one or more other languages:

   a. Click **New**, enter English language text in the **Question (Translated field)** field, and then click **Submit**.

   b. Create a record in the *sys_translated* table for the non-English language question.

   Details appear at Translated Name / Field table and Languages table.

Field	Description
Label (translate)	Non-English equivalent of the English text in the **Value** field.
Element	Name of the field in the Password Reset Question [pwd_question] table: `question_translated`
ID	ISO 639.2 code for the language.
Table	Table that you are adding the translated question to: the **Password Reset Question [pwd_question]** table.
Language	Language code for this translated text.
Value	English-language question that you added in the Security Questions table.

   c. Repeat the process for each language that users might request.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a custom header or footer to the user pages for Password Reset

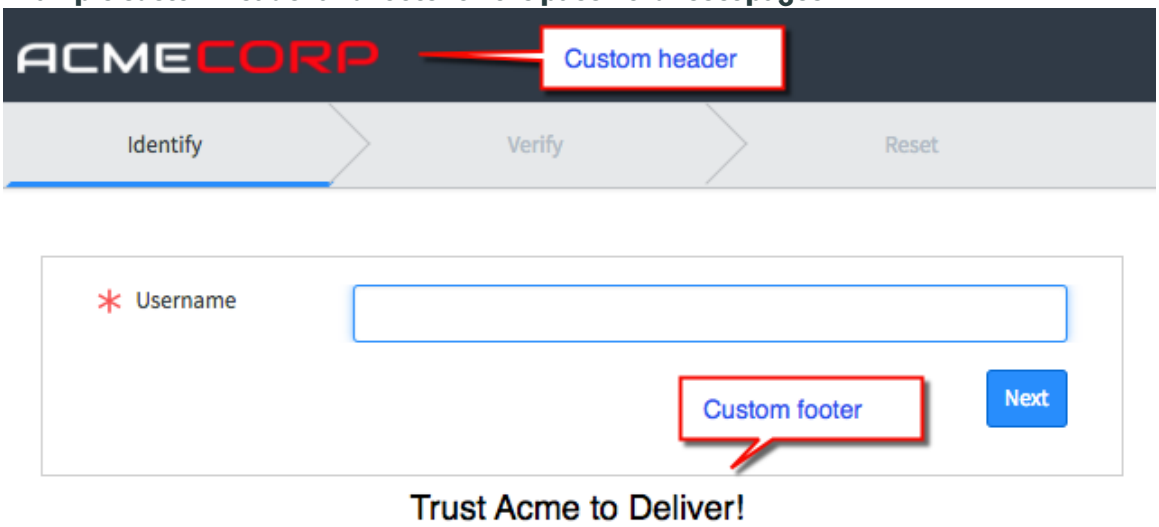
You can specify UI macros that add a header or footer to the pages that end users work in while resetting a password (the Identify, Verify, and Reset pages).

Before you begin

Role required: password_reset_admin

About this task

Example custom header and footer on the password reset pages

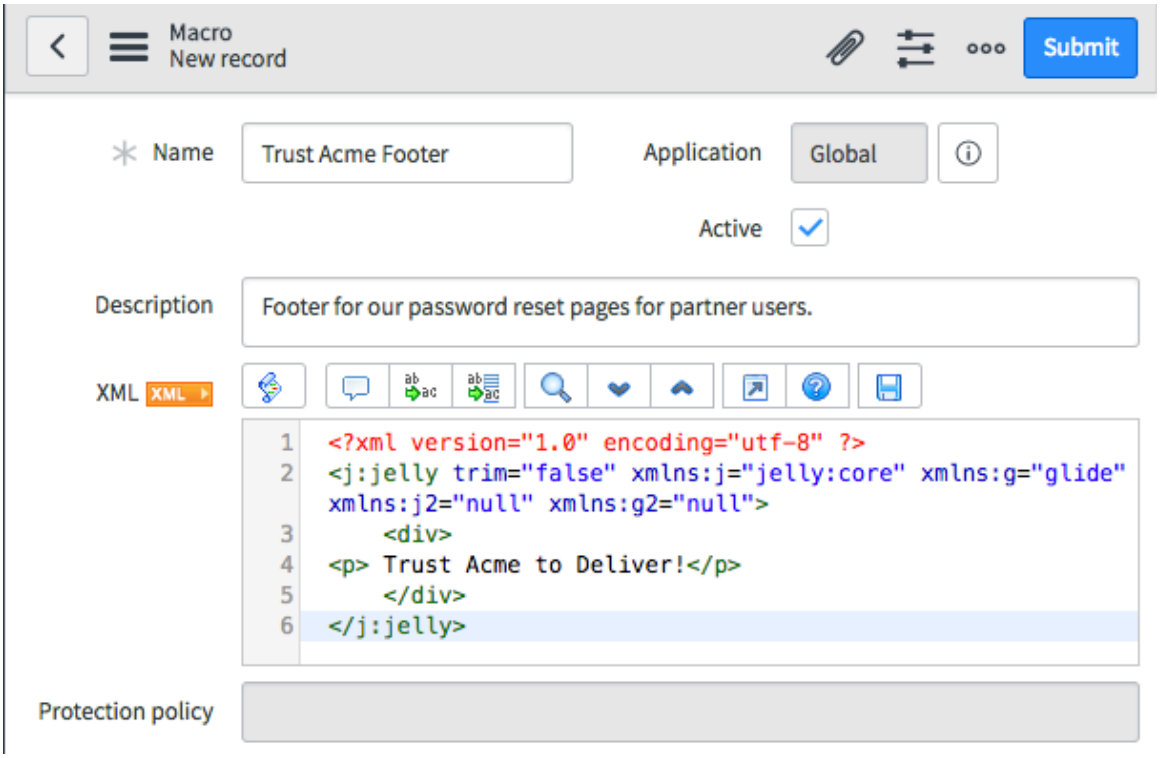


Procedure

1. Configure a UI macro for the header or footer: Navigate to **All** > **System UI** > **UI Macros**, click **New**, and then enter a meaningful **Name** and **Description**.
2. In the **XML** text box, enter the macro text.

   The example macro adds the text "Trust Acme to Deliver!" to the footer of the page that users work in while resetting a password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the **Active** check box and then click **Submit**.
4. Navigate to **Password Reset** > **Processes** and select the process to update.
5. On the **Advanced** tab, click ( ) for the **Header UI macro** or **Footer UI macro** and select the macro that you created.
6. Click **Save**.
7. Verify the appearance of the end-user pages.

Option	Description
If the reset pages are Public Access	On the **Password Reset Details** tab, click the **Public URL**.
If the reset pages are not Public Access	Log in as an end user and request password reset.

Create a Password Reset verification from an existing verification

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Before you begin

Role required: password_reset_admin

About this task

Note:
The Password Reset Windows Application does not support custom verifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Password Reset** > **Verifications** and select a verification.
2. If needed, modify the parameters on the **Password Reset Verification Parameters** tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click **Submit**.

> **Note:**
> Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom Password Reset verification type

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Before you begin

Role required: password_reset_admin or admin
Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop. For more information about verification types in the base system, see Verification types in the base system.

Procedure

1. Navigate to **All** > **Password Reset** > **Extensions** > **Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form. For information about the fields on the Password Reset Verification Type form, see Password Reset Verification Type form.
3. Click **Submit**.

Related topics

- Password Reset script includes

Create a custom Password Reset verification

Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Before you begin

Role required: password_reset_admin

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop. For more information about verification types in the base system, see Verification types in the base system.

Procedure

1. Navigate to **All** > **Password Reset** > **Verifications**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information about the fields on the Password Reset Verification form, see Password Reset Verification form.

3. Click **Submit**.

> **Note:**
> Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom identification type for Password Reset

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Before you begin

Role required: password_reset_admin or admin

About this task

Procedure

1. Navigate to **All** > **Password Reset** > **Extensions** > **Identification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

Identification field label	Text to display as a label for the **Identification** field.
Identification processor	Identification processor script. Choose an existing script or create your own using the Identification form processor category (extension script).

3. Click **Submit**.

Related topics

Create a Password Reset extension script

Configure a credential store type to support third-party password auto-generation

Enable the subflows in credential store type to support third-party password auto-generation.

Before you begin

Role required: password_reset_credential_manager, password_reset_admin, or admin

About this task

Users can easily reset their passwords for the credential stores that don't have REST APIs to reset the password. For example, the password reset subflows support Robotic Process Automation. The Password Reset process can be automated with a Robotic Process Automation robot to reset the password of an application that does not have an API to reset the password.

For more information about Robotic Process Automation, see Robotic Process Automation (RPA) Hub.

Procedure

1. Navigate to **All** > **Password Reset** > **Extensions** > **Credential Store Types**.
2. Open the credential store type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To use password reset subflows in the Integration Hub, leave the **Use Flow** check box selected.
4. In the **Password reset flow** field, enter a required value for the password reset subflow.
5. From the **Password Delivery Mechanism** list, select **Reset flow doesn't accept password as input**.
6. If you want your users to change the password immediately after signing in post password reset, select the **Supports Force Password Change On First Log In** check box.

   Note:
   Ensure that the **User must reset password** check box is selected on the Password Reset Process form of the associated process. But these settings of changing passwords after first sign-in post reset work only if the credential store you are configuring supports the settings.

7. Click **Update** or save the changes.

Asynchronous password reset subflow

When a user requests a password reset, based on the application for which the password reset is requested, the process works either synchronously or asynchronously.

When a user requests a password reset for a credential store for which the REST APIs are available to reset the password, the password is reset immediately. This process is synchronous.

In the asynchronous process, when a user requests a password reset for credential stores that don't provide REST APIs, you can configure such credential stores to reset passwords using an external system, such as Robotic Process Automation.

For more information about Robotic Process Automation, see Robotic Process Automation (RPA) Hub.

When a user requests a password reset, the password doesn't get reset immediately. The user receives a message that shows the request has been submitted, and the request status is displayed as **Pending With External System** on the Password Reset Requests page for that request.

When the process completes, the password is reset. The user receives an appropriate message based on the success or failure of the password reset action from the external system, which resets a password for the user. If the password reset is successful, the user receives an email containing the new password from the external system if the credential store doesn't accept the password.

If a credential store processes a password reset request asynchronously, then to update the corresponding password reset request status from pending to either **Completed With Success** or **Completed With Failure**, the process must use the **Update Password Reset Request** subflow as a callback.

Note:
To open the **Update Password Reset Request Status** subflow, navigate to **All** > **Process Automation** > *Workflow Studio*, and click the **Subflows** tab. Then search for and select the **Update Password Reset Request Status** subflow.

© 2026 ServiceNow, Inc. All rights reserved.

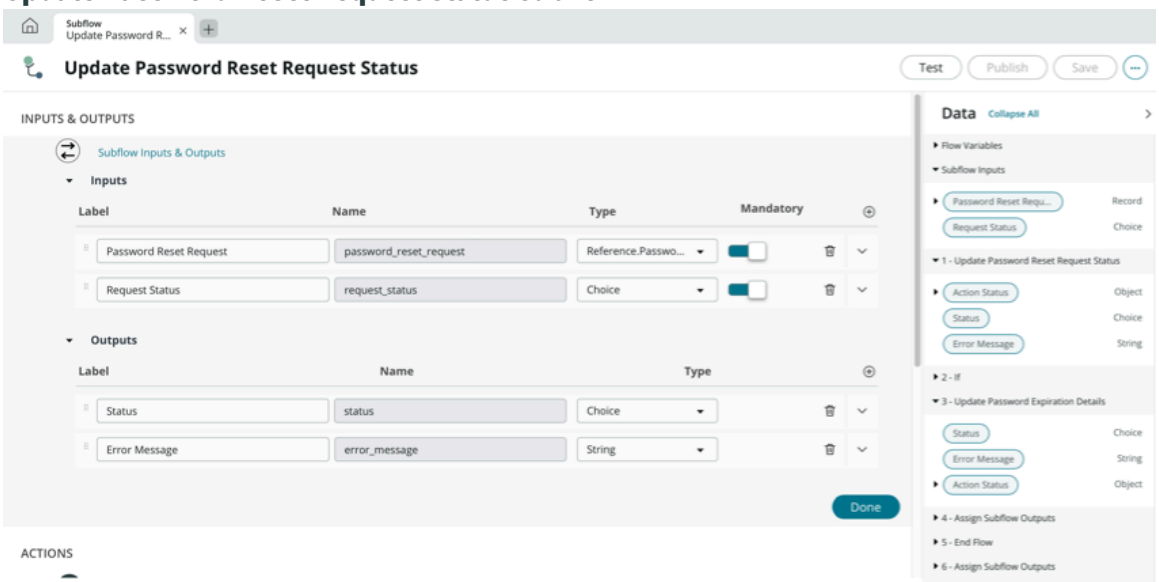
Update Password Reset Request Status subflow input parameters

Input Parameters	Description
Password Reset Request	Glide record of the password reset request.
Request Status	Determines which choices are available as input. For example, **Completed With Success** or **Completed With Failure**.

When this subflow is used, the input parameters are considered in this subflow to set the corresponding password reset status.

Update Password Reset Request Status subflow



Create a credential store type for Password Reset

Create a custom credential store type when the base-system types do not meet your needs.

Before you begin

Role required: password_reset_credential_manager

About this task

You can also configure a credential store type to work independently with the password reset, password change, and unlock password actions.

Procedure

1. Navigate to **All** > **Password Reset** > **Extensions** > **Credential Store Types**.
2. Click **New**.
3. In the **Name** field, enter the name for the credential store type.
4. In the **Description** field, enter the description for the credential store type.
5. To use password reset subflows in Integration Hub, leave the **Use Flow** check box selected.

Note:
See Customize password reset processes and integrate third-party credential services for information on creating provider-specific subflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the **Supports history check** check box to determine whether the credential store supports the history policy capability.

   If selected, only then the password_reser_admin can disable or enable this feature through a credential store record.

7. Select the subflows created for the third-party application.

   Note:
   See Customize password reset processes and integrate third-party credential services for information on creating provider-specific subflows.

Subflow	Description
Base Alias	A connection and credential alias that is used in the subflows of this credential store type. This is the default alias used by the subflows while making an external call. **Note:** If you want to override the default alias, use the child alias property of the credential store.
Password change flow	Changes the password of an authenticated and unlocked user account to the provided new password. Verifies that the new password conforms to the password format and history policies. Displays an error if the user is not authenticated or is locked out. Use the Password Reset flow to unlock a locked user account and require a password change.
Unlock user flow	Defines the process to unlock a user. If a credential store supports the unlock user flow, the **Get user lock state flow** field becomes a required field. But when a credential store doesn't support the unlock user flow, you can still set up the user lock state flow.
Get user lock state flow	Retrieves the lock status of an account specific to the credential store.
Connection test flow	Defines how to test the connection.
Password reset flow	Unlocks the specified user account. Expires the current password and changes the password to the provided new password if it conforms to the password format and history policies. If it doesn't conform, a warning is displayed. **Note:** In the case of an Robotic Process Automation setup, the subflow doesn't reset the password immediately but only pushes the request into the Robotic Process Automation queue and the status is displayed as **Pending**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflow	Description
Password Delivery Mechanism	Sets the mechanism such as whether to accept the password as input or not. For example, in the case of the credential store for which Robotic Process Automation functionality is required, Robotic Process Automation can't accept the password from the Password Reset application for security purposes. So, for Robotic Process Automation subflows, the **Reset flow doesn't accept password as input** value must be selected. That means, while users create a reset password request, they are not asked to enter passwords of their choice. **Note:** This feature is applicable only to the password reset action. If for a credential store, the reset flow doesn't accept a password, which is configured through the password delivery mechanism, then all the fields for password policy and password generation are hidden on the related credential store form. For example, **Enable password policy**, **Password policy**, **Enable Password Strength**, **Strength rule**, and **Auto-generate password**.
Supports Force Password Change On First Log In	When selected, notifies the user to change the password when the user signs in for the first time with the new password that the user receives after the password reset action is completed. **Note:** Based on this setting, the fields on the Password Reset Process form change. For example, when a password reset administrator selects the **Auto-generate password** check box on the Password Reset Process form, the form displays the **User must reset password** field. So, it depends on the password reset administrator whether to prompt users to change their auto-generated password or not even if the **Supports Force Password Change On First Log In** check box is selected.

8. If you want to use workflows, clear the **Use Flow** check box to use the password reset workflows in Orchestration.

Note:

- The workflows have been deprecated. Use the subflows by leaving the **Use Flow** check box selected.
- The workflows are available only if you have upgraded from the previous releases.

Field	Description
Password Reset workflow	Defines the credential store processing. Password Reset workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see Create a workflow. For installed workflows, see Installed with Password Reset.
Connection test workflow	Defines how to test the connection. Connection test workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset.
Get user lock state workflow	Defines how to get the user lock state. Get user lock state workflows are available to use as a model. Provide scripts for each of the activities defined for

Field	Description
	the subflow. For more on how to create a workflow, see Create a workflow. For installed workflows, see Installed with Password Reset.
Unlock user workflow	Defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see Installed with Password Reset.

9. Click **Submit**.

Reset a password or unlock a user account with service desk assistance

Reset a password or unlock a user account by requesting the assistance of a service desk agent.

Before you begin

Watch this video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Note:

- You must clear the **Public access** property to enable the service desk-assisted process. See Configure your Password Reset process.
- You can perform this activity on a mobile device.
- You can change the theme of the service desk page to the dark theme. For more information about the dark theme, see Exploring themes in Next Experience.

Role required: password_reset_admin or password_reset_service_desk

About this task

In a service desk-assisted Password Reset process, only the service desk agents with the password_reset_service_desk role can reset user passwords. Users can't reset passwords.

Procedure

1. Navigate to **All** > **Password Reset** > **Service Desk**.
2. Select a user and the Password Reset process to use.
3. Click **Verify Identity**.
4. On the Verify Identity form, enter the answers provided by the user, and then click **Continue**. If the user's identity is verified, the Reset Password form displays the identity verification and status of the account lock.
5. Perform one of the following actions.
   - If the user isn't locked, the form displays the **Reset password** button. Enter the new password and click **Reset password**.
   - If the user's account is locked, the form displays the **Reset password** and **Unlock account** buttons. You can enter a new password and click **Reset password** to reset the password and unlock the account. If the **Enable account unlock** option is selected for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.
6. To reset the password for a different user, you must first navigate away from the **Service Desk** and then navigate to **Password Reset** > **Service Desk**.

View user requests for password reset

The **Reset Requests** module displays the status of each password reset request from the Password Reset Request table [pwd_reset_request].

Before you begin

Role required: password_reset_admin or password_reset_service_desk

Procedure

Navigate to **All** > **Password Reset** > **Reset Requests**.

Password Reset request fields

Field	Description
User	User whose password is being reset or changed.
Process	Process that implements this password reset request.
Type	Type of Password Reset request: • **Change Password**: Request to change a password. • **Help Desk**: Request opened on behalf of the requesting user by a service desk agent. • **Self Service**: Requesting user opened the reset request.
Action Type	Corrective action performed during the Password Reset request. • **Change Password**: Update the credential store with the new password. • **Reset and Unlock Account**: Generate a new password for the user and unlock the user account. • **Reset Password**: Generate a new password for the user. • **Unlock Account**: Unlock the user account.
Status	Result of the Password Reset request: • **Completed With Failure**: User completed all steps in the Password Reset process, but the password was not reset in the credential store. • **Completed With Success**: User completed all steps in the Password Reset process and the password was reset in the credential store. • **Expired**: User did not complete all steps in the Password Reset process in the time allowed. • **In Progress**: User is working through the steps to reset the password. • **Max Number of Attempts**: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed. • **Verified**: User has completed the identity verification step and is verified. The user can move to the Password Reset step.
Active	Whether the request is open or closed.
Retry	Total number of times the user has attempted to complete a password reset request.

Unblock a Password Reset user

If a user is manually banned or is flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Before you begin

Role required: password_reset_admin or password_reset_service_desk

About this task

Blocking events include:

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked or locked users and the time interval required to generate the log event by setting the *password_reset.activity_monitor.incident_threshold* and *password_reset.activity_monitor.incident_window* properties.

Procedure

1. To view the list of blocked users, navigate to **Password Reset** > **Blocked Users**.
2. To unblock a self-service user:
   a. Navigate to **Password Reset** > **Blocked Users**.
   b. Select a user from the list.
   c. Select **Delete** on the **Actions on selected rows** list.
3. To unblock a user whose password was reset by a service desk agent:
   If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

   In contrast, service desk agents are allowed any number of retries. The *max_attempt_reached* limit does not apply and the **Blocked** status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.

   If the user is not unblocked manually, then the system resets the blocked state only when the *max_attempt_window* time period elapses and the user tries to reset the password using self-service.

   a. After you successfully reset a user password, navigate to **Password Reset** > **Blocked Users**.
   b. Change the **Blocked** setting for the user from true to false.

Integrate Password Reset with a Service Portal widget

You can enable a Password Reset process in a Service Portal page by adding a widget that opens the password reset pages inside the portal.

Before you begin

Role required: admin or sp_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the Service Portal Designer for the portal, create a new page — the page where the user will perform the password reset process.
2. On the **Widget** tab, under Layouts, select the 12-column layout and drop it onto the page.
3. Drop the **Pwd reset** widget into the 12-column layout and then save the page.
   The three tabs of the password reset process appear in the layout.
4. In the **Reset my password** link on the login page for the portal, specify the URL of the new password reset page.
   The URL must include one required parameter and may contain one optional parameter:
   - Required: `sysparm_show_custom_header_footer=false`. This parameter disables the native header and footer feature of the password reset page.
   - `sysparm_redirect_url=<portalName>?id=<pageName>`. This parameter specifies the page to go to after a successful reset — typically the login page for the portal.

   For example, `https://server.acme.com/acme_community?id=password_reset_page&sysparm_show_custom_header_footer=false&sysparm_redirect_url=acme_communityid=communities_login`

Integrate Password Reset with a CMS integration

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

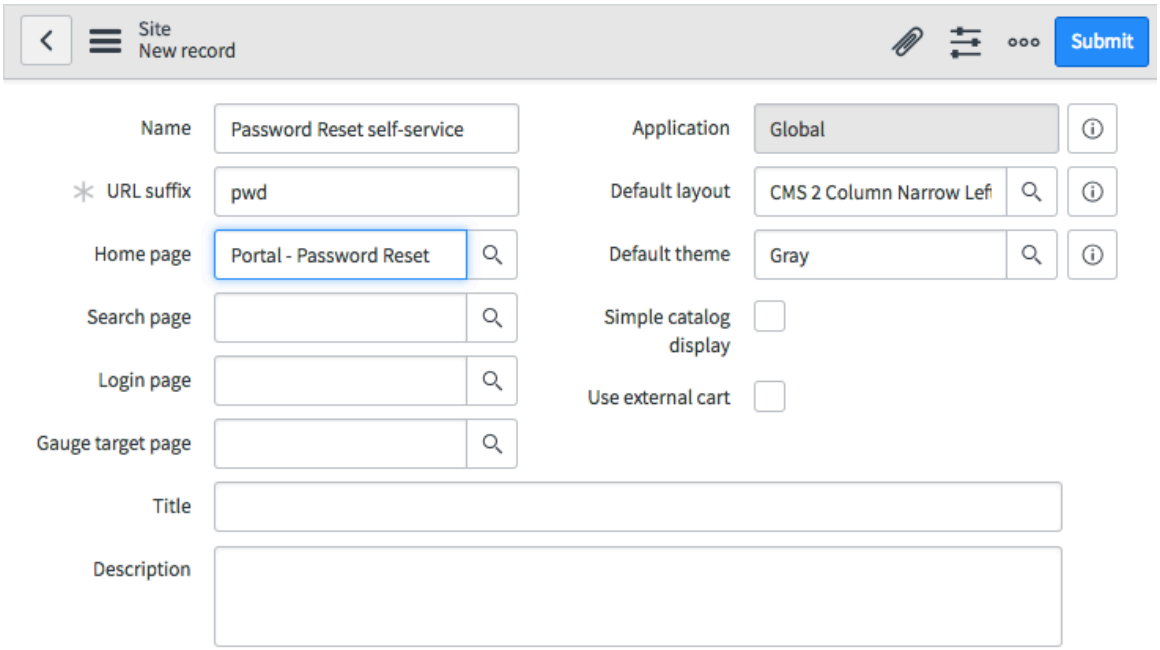
Before you begin
Role required: content_admin

About this task
Each Password Reset process requires a separate CMS page.

Procedure

1. Navigate to **All** > **Content Management** > **Specialty Content** > **iFrames** and create an iFrame record.
2. Go to **Content Management** > **Sites** and create a site that has no login page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Go to **Content Management** > **Pages** and create a password reset page.
4. Enter the name of the site that you created in the **Content site** field (**Password Reset self-service** in the example).
5. Right-click the form header and click **Save**.
6. Click the **Edit Page** related link and then click **Add content**.
7. In the **Content Blocks** section, select the iFrame that you created and add more content as needed.
8. Click **Update**.

Installing and configuring Password Reset Windows Application

Request the Password Reset Windows App (Password Reset Orchestration) (com.glideapp.password_reset_desktop) plugin that enables connections to the Active Directory (AD) credential store types.

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen.

Password Reset Windows Application installation requirements

Activate the Password Reset Windows App (Password Reset Orchestration) (com.glideapp.password_reset_desktop) plugin and activate the Microsoft AD for Password Reset store app to use the Password Reset Windows Application.

Requirement	Description
Required ServiceNow release	Password Reset Windows Application version 5.0 is supported on the San Diego, Tokyo, and Utah releases.
Required hardware	• 1 GHz or faster processor • 512 MB of RAM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement	Description
	• 10 MB of available hard disk space (x86) • 10 MB of available hard disk space (x64)
Required software	• Version of Password Reset Windows Application: 5.0 • Microsoft .NET Framework: 4.7.1 and newer • Microsoft Visual C++: Redistributable Visual Studio 2017
Supported operating systems	• Windows 8.1 • Windows 10 Enterprise • Windows 10 Pro • Windows 11
Supported processor architecture	• X86 • X64
Supported network architecture	• Password Reset Windows Application clients must have direct access to both the internet and the ServiceNow instance where the Password Reset Windows Application is configured • For Password Reset Windows Application versions that use an SHA certificate, the corporate network must not block the SHA certificate. • To reset an AD password, the client must be on the corporate network.

Download the Password Reset Windows Application installer

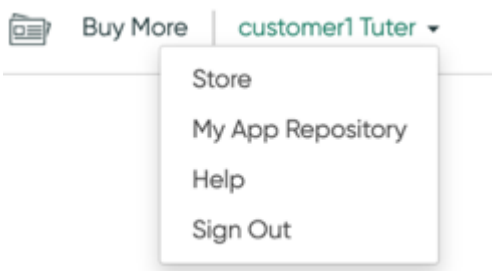
Download the Password Reset Windows Application installer.

Before you begin

Role required: any user

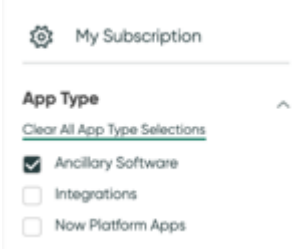
Procedure

1. Log in to the ServiceNow Store Publisher Portal.
2. Click your user menu and select **Store**.

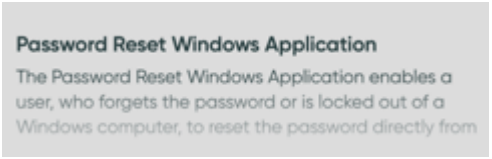


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Set the filter for the **Ancillary Software** app type.



4. Click **Password Reset Windows Application**.
   The application download location appears.



5. Click **Download**.

Install Password Reset Windows Application

Install Password Reset Windows Application using different available methods.

Use an EXE file from the command line

As an alternative to command-line installation, you can use a wizard.

Before you begin

Role required: security_admin elevated privilege
Privilege required: Windows local administrator

Procedure

1. Ensure that the user with the ServiceNow security_admin role configures the security properties.
   For more information about the security properties, see Configure security settings for the Password Reset Windows Application
2. Copy the following command into a text editor as one line with no breaks.

```
PasswordResetWinAppInstall.exe /VERYSILENT /
PasswordResetLinkURL
 https://<YourServerName>/$pwd_reset.do?sysparm_url=default /
PasswordResetLinkName "Forgot password?"
```

3. Add arguments and replace the default parameter values with the correct values for your organization.

Argument	Example	Description
`/Log`	`/Log=c:\temp\PwdResetInstallLog.log`	Optional. To generate a log file, you must first create the directory that the file is written to. In this example, you would create the `c:`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Argument	Example	Description
		`\temp` directory before running the installation.
`/NORESTART`	`/NORESTART`	Optional. Include `/NORESTART` to prompt the user to restart the computer after installation.

Parameter	Default	Description
PasswordResetLinkURL	`https://<YourServerName>/$pwd_reset.do?sysparm_url=default`	URL of the page that users access when resetting a password. Be sure to substitute your ServiceNow server name and the URL suffix for the desired Password Reset process.
PasswordResetLinkName	`"Forgot password?"`	Text to display for the Password Reset link on the Windows login page. Update the text as needed. You must enclose the text in double-quote characters as shown. To ensure that the correct characters are used, do not copy/paste the example text. Instead, type the characters at the command line.
CredentialProviderGUID		Most installations do not need to specify this parameter value. Provide this value only if you use a customized credential provider and can provide a valid credential provider GUID.

4. Navigate to the directory that holds the `PasswordResetWinAppInstall.exe` file.
5. Run the updated command at the command line.
6. After installation and depending on the setting for the `/NORESTART` argument, you might need to restart the computer.
   See Install Password Reset Windows Application using a wizard.

Use an MSI file from the command line

Use the MSI file to install the Password Reset Windows Application on multiple computers over a network. As an alternative to MSI installation, you can also install from the command line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: Windows local administrator

Procedure

1. Ensure that the user with the ServiceNow security_admin role configures the security properties.
   For more information about security properties, see Configure security settings for the Password Reset Windows Application.
2. Copy the following command into a text editor as one line with no breaks.

```
msiexec.exe /i PasswordResetWinAppInstall.msi /quiet
 WRAPPED_ARGUMENTS="/SUPPRESSMSGBOXES /VERYSILENT /NORESTART /
PasswordResetLinkURL
 https://<YourServerName>/$pwd_reset.do?sysparm_url=default /
PasswordResetLinkName ""Forgot password?"""
```

3. Add arguments and replace the default parameter values with the correct values for your organization.

Argument	Example	Description
`/Log`	`/Log=c:\temp\PwdResetInstallLog.log`	Optional. To generate a log file, you must first create the directory that the file is written to. In this example, you would create the `c:\temp` directory before running the installation.
`/NORESTART`	`/NORESTART`	Optional. By default, MSI installations restart the computers. Include `/NORESTART` not to restart the computers after installation. You might want to communicate with end users that they must restart their computer to enable the Password Reset Windows Application.

Parameter	Default value to replace	Description
PasswordResetLinkURL	`https://<YourServerName>/$pwd_reset.do?sysparm_url=default`	URL of the page that users access when resetting a password. Be sure to substitute your ServiceNow server name and the URL suffix for the desired Password Reset process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Default value to replace	Description
PasswordResetLinkName	`""Forgot password?""`	Text to display for the Password Reset link on the Windows login page. You must enclose the text in two double-quote characters as shown. To ensure that the correct characters are used, do not copy/paste the example text. Instead, type the characters at the command line.
Optional: CredentialProviderGUID		Most installations do not need to specify this parameter value. Provide this value only if you use a customized credential provider and can provide a valid credential provider GUID.

4. Navigate to the directory that holds the `PasswordResetWinAppInstall.msi` file.
5. Run the updated command at the command line.
6. After installation and depending on the setting for the `/NORESTART` argument, you might need to restart computers.
   See Install Password Reset Windows Application using a wizard and Install the Password Reset Windows Application using an EXE file from the command line.

Use a wizard

As an alternative to wizard installation, you can run commands directly at the command line.

Before you begin

Role required: Windows local administrator

Procedure

1. Ensure that the user with the ServiceNow security_admin role configures the security properties.
   For more information about the security properties, see Configure security settings for the Password Reset Windows Application.
2. Right-click the `PasswordResetWinAppInstall.exe` installation file that you downloaded and select **Run as administrator**.
3. On the **Configure Password Reset Web page and credential provider** page, configure the following settings and then click **Next**:

Field	Description	Default
URL of the Password Reset page	URL of the page on your ServiceNow instance that users access when resetting a password.	`https://<YourServerName>/$pwd_reset.do?sysparm_url=default`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Default
	Be sure to substitute your ServiceNow server name and the URL suffix for the desired Password Reset process.	
Text to display for the Password Reset link	Text to display for the Password Reset link on the Windows login page. Update the text as needed.	`Forgot password?`
GUID of the credential provider	Most installations do not need to specify this parameter value. Provide this value only if you use a customized credential provider and can provide a valid credential provider GUID.	[Accept the default.]

4. For the remaining pages, perform the following actions:

Page title	Action
License Agreement	Select **I accept the agreement**.
Select Destination Location	Accept the default installation location.
Select Start Menu Folder	Accept the default "ServiceNow".
Ready to Install	Click **Install**.

5. Restart the computer.
   See Use an EXE file from the command line.

Configure security settings for the Password Reset Windows Application

Configuring security settings for the Password Reset Windows Application.

Security settings

- The *glide.security.use_csrf_token* property setting allows the Password Reset Windows Application to retrieve a token for a secure communication with the datacenter instance.
- The *CheckCertificateRevocationList* registry key default setting of **true** causes the Password Reset Windows Application to validate the server certificate before every communication. See Customize the Password Reset Windows Application for details.
- The *ServiceNowCertPublicKey* registry key contains the public key for the app. See Customize the Password Reset Windows Application for details.

Configure the glide.security.use_csrf_token property

To configure the *glide.security.use_csrf_token* property, a security_admin elevated privilege is required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set the *glide.security.use_csrf_token* property to true (Yes). See the topic titled "High Security Settings" in https://servicenow.com/docs.

The Windows local administrator performs the remainder of the installation procedure.

Configure the Password Reset Windows Application to use a proxy server

The Password Reset Windows Application supports the use of a proxy server. There are three options for configuring the proxy server.

Before you begin
Role required: Windows system administrator

Procedure

Use any one of the following configuration options to enable the Password Reset Windows Application to use a proxy server.

Configure an exception policy on your proxy server

You can configure an exception policy on your proxy server to allow unauthenticated access to the *service-now.com* domain.

Before you begin
Role required: Windows system administrator

Procedure

1. On a machine in the network, back up the following registry key: `HKEY_USERS\.DEFAULT\Software\Microsoft\Windows\CurrentVersion\Internet Settings`
2. Download and install the Sysinternals Suite from `https://technet.microsoft.com/en-us/sysinternals/bb842062.aspx`
3. At the command prompt, navigate to the extracted `sysinternals` folder.
4. Run the following command to launch Internet Explorer:
   `psexec -s -i "C:\Program Files\Internet Explorer\iexplore.exe"`
5. On the Internet Explorer **Tools** menu, select **Internet options**.
6. On the **Connections** tab, click **LAN settings**.
7. In the **Proxy server** section, select **Use a proxy server for your LAN** and then fill in the **Address** field using the following format: `<proxy_server>:<port>`
8. Click **OK** to close the **LAN Settings** page and then click **OK** to close **Internet options**.
9. Export the following registry key to all clients that use the Password Reset Windows Application:`HKEY_USERS\.DEFAULT\Software\Microsoft\Windows\CurrentVersion\Internet Settings`

Configure a proxy server using client credentials method

If you cannot configure an exception policy, you must configure all Windows clients that use the Password Reset Windows Application to pass valid credentials to the proxy server.

Before you begin
Role required: Windows system administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If you choose not to use the method described in this topic, there are other methods to configure a proxy server:

- Configure registry keys. See Configure registry keys on your proxy server.
- Configure an exception policy on your proxy server to allow unauthenticated access to the *service-now.com* domain. See Configure an exception policy on your proxy server.

Procedure

1. On a machine in the network, back up the following registry key: `HKEY_USERS\.DEFAULT\Software\Microsoft\Windows\CurrentVersion\Internet Settings`
2. Download and install the Sysinternals Suite from `https://technet.microsoft.com/en-us/sysinternals/bb842062.aspx`
3. At the command prompt, navigate to the extracted `sysinternals` folder.
4. Run the following command to launch Internet Explorer:
   `psexec -s -i "C:\Program Files\Internet Explorer\iexplore.exe"`
5. On the Internet Explorer **Tools** menu, select **Internet options**.
6. On the **Connections** tab, click **LAN settings**.
7. In the **Proxy server** section, select **Use a proxy server for your LAN** and then fill in the **Address** field using the following format: `http://<userID>:<password>@<proxy_server>:<port>`
8. Click **OK** to close the **LAN Settings** page and then click **OK** to close **Internet options**.
9. Export the following registry key to all clients that use the Password Reset Windows Application:`HKEY_USERS\.DEFAULT\Software\Microsoft\Windows\CurrentVersion\Internet Settings`

Configure registry keys on your proxy server

You can configure registry keys to enable the Password Reset Windows Application to use a proxy server.

Before you begin

Role required: Windows system administrator

About this task

If you choose not to use the method described in this topic, there are other methods to configure a proxy server:

- Configure an exception policy on your proxy server to allow unauthenticated access to the *service-now.com* domain. See Configure an exception policy on your proxy server.
- Configure all Windows clients that use the Password Reset Windows Application to pass valid credentials to the proxy server. See Configure a proxy server using client credentials method.

Procedure

1. Open the Registry Editor on your Windows computer.
2. Go to **Computer** > **HKEY_LOCAL_MACHINE** > **SOFTWARE** > **Microsoft** > **Windows** > **CurrentVersion** > **Authentication** > **Credential Providers** > **0780AF60-65C2-4718-942D-E0C56E89EF9B**.
3. Set the following registry keys:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can modify any of the listed string values.

```
"ProxyServer"="<YourProxyName>:<PortNumber>"
"ProxyEnable"="true"
"ProxyUser"="<YourProxyUserName>"
"ProxyPassword"="<YourProxyPassword>"
"ProxyDomainName"="<YourProxyDomainName>"
"ByPassProxyOnLocal"="false"
```

- ProxyServer: Set the proxy server name or IP address with port
- ProxyUser: User name associated with the credentials, in case proxy is enabled with basic authentication
- ProxyPassword: Password for the user name associated with the credentials
- ProxyDomainName: Domain name that verifies the credentials
- ByPassProxyOnLocal: Set to true if you want to bypass a proxy server for local calls.

Configure a proxy server using PAC file (automatic configuration script method)

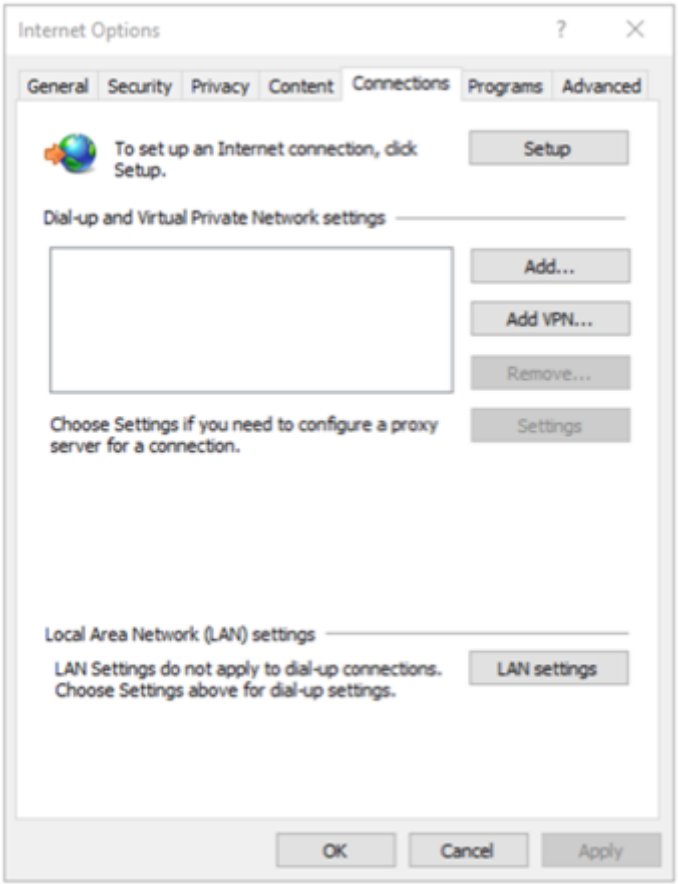
Configure the Proxy Auto-Configuration (PAC) file or Windows proxy auto detection (WPAD) using the Internet Explorer (IE) settings.

Before you begin
Role required: Windows system administrator

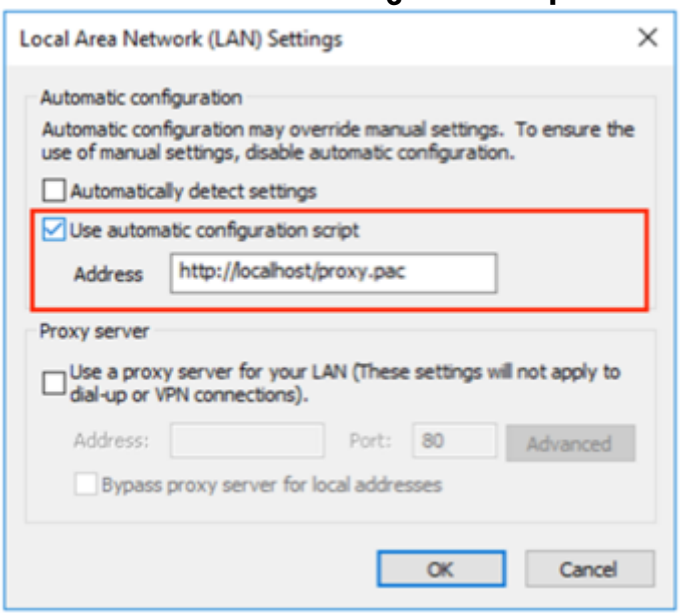
About this task
The Password Reset Windows Application internal classes automatically pick the configuration that is done using **Use automatic configuration script** at the Internet Explorer level. If you configure the proxy at Internet Explorer, level all the changes done at a remote proxy level are applicable in the Password Reset Windows Application as well.

Procedure
1. On the Internet Explorer Tools menu, select **Internet options**.
2. On the **Connections** tab, click **LAN settings**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the **Use automatic configuration script** check box.



4. In the **Address** field, enter the PAC file location on the network.
5. Click **OK**.

PAC file with registry setting

In this proxy configuration, the Proxy Auto-Configuration (PAC) file can be configured in Password Reset Windows Application registry settings.

The name of the registry setting enables the proxy via PAC file is *`UseProxyAutoConfigScript`*. The PAC script location (URL) can be provided in the

UseProxyAutoConfigScript	REG_SZ	true
UserAccountPictureLoc	REG_SZ	C:\Program Files\ServiceNow\bin\tileimage.bmp
VerifyEmbeddedFileSignature	REG_SZ	true
WorkingDir	REG_SZ	C:\Program Files\ServiceNow\bin

Registry setting to configure proxy via PAC

- ProxyEnable – <true>

  Enables the proxy on application level.

- ProxyServer – <PAC file URL>

  Initialize the PAC file location here.

- UseProxyAutoConfigScript – <true>

  If set to true, it indicates that the address provided in the *ProxyServer* registry setting is PAC script.

How it works

The PAC file provided in the *ProxyServer* registry setting is used to get the actual target proxy server address for a URL (In this case, the ServiceNow instance) based on the PAC file script configuration. The PAC file script must return a valid Proxy server address for a provided ServiceNow URL to make the application work.

The target proxy address is cached for a URL in the machine. The caching behavior is applicable for the browsers as well. The ServiceNow® Password Reset Windows Application behaves the same as the Internet Explorer browser. That is, if the URL is accessible via a browser, then it's accessible via the app as well.

Note:
It is not necessary to configure the proxy setting in Internet Explorer as the APP is reading the PAC file script via a registry.

Enable the Password Reset Windows Application to set the display language for the session

When the Password Reset Windows Application starts, the application passes the Windows language code to the instance. The instance then dynamically sets the language for the guest user session.

Before you begin

Role required: admin

Procedure

1. On the Windows computer: Set the **Welcome screen display language** property to the preferred language.
2. On the instance:
   a. Activate the plugin for the preferred language.
   b. Ensure that no record in the [sys_user_preference] table specifies a particular **user.language** for *guest* user.
   You clear the setting for a *guest* user to enable the instance to dynamically set the language during the session.

Integrate McAfee disk encryption with the Password Reset Windows Application

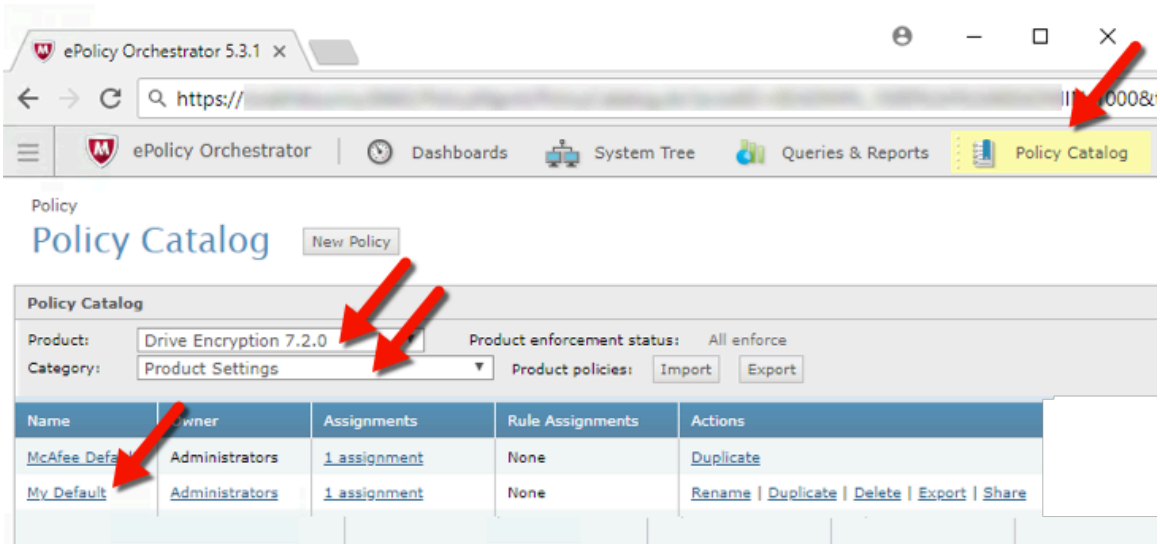
You use ePolicy Orchestrator (ePO) to enable McAfee MDE 7.2 on a Windows desktop computer to support the Password Reset Windows Application.

Before you begin

- Role required: admin
- Required: MDE version 7.2x

Procedure

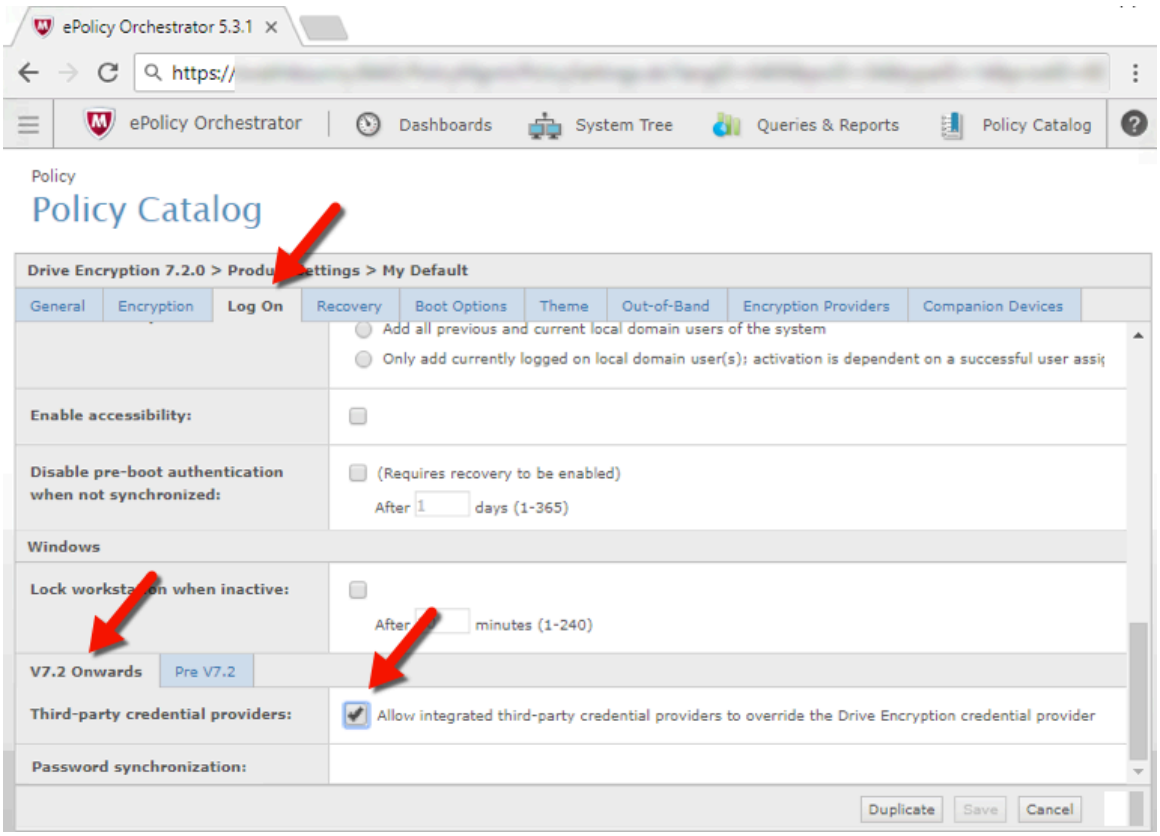
1. Log in to ePO.
2. On the Policy Catalog, select **Product** > **Drive Encryption 7.2.0** and select **Category** > **Product Settings**



3. Click the **Name** of your policy catalog (**My Default** in the example).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the **Log On** tab, select the **V7.2 Onwards** tab and then select the **Allow integrated third-party credential providers ...** check box.



5. Click **Save** and then log out of ePO.
6. On the end-user computer, create the following registry keys (client-side ePO setting):

```
Windows Registry Editor Version 5.00
[HKEY_LOCAL_MACHINE\SOFTWARE\McAfee EndPoint
 Encryption\IntegratedCredentialProviders\{0780AF60-65C2-4718-9
42D-E0C56E89EF9B}]
"Vendor"="ServiceNow, Inc"
"Product"="ServiceNow PasswordReset WinApp"
"Version"="<PasswordReset WinApp version>" (for example,
 "Version"="4.5")
"BuiltAgainst"="<MDE version>" (for example,
 "BuiltAgainst"="7.2.3.28")
```

7. Restart the computer.

Customize the Password Reset Windows Application

You can customize the appearance and other aspects of the application.

Before you begin
Role required: Windows system administrator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the Registry Editor on your Windows computer.
2. Go to **Computer** > **HKEY_LOCAL_MACHINE** > **SOFTWARE** > **Microsoft** > **Windows** > **CurrentVersion** > **Authentication** > **Credential Providers** > **0780AF60-65C2-4718-942D-E0C56E89EF9B**.
3. Modify any of the listed string values:

Note:
Registry keys that begin with the text `"proxy"` enable use of a proxy server. SeeConfigure registry keys on your proxy server.

Registry configuration options

File name	Description	Default string
AppDir	Directory that holds the Password Reset Windows Application application files.	`C:\Program Files\ServiceNow`
AppFormIconFile	Icon that is associated with the Password Reset application.	`C:\Program Files\ServiceNow\bin\ServicenowLogo.png` You can change the icon that's associated with your company. Replace the `ServicenowLogo.png` with your company logo and change the `AppFormIconFile` path in the registry.
AppFormTitle	Displayed name of the application.	Password Reset Windows Application
CheckCertificateRevocationList	By default, before every communication, the Password Reset Windows Application validates that the server certificate has not been revoked by checking the Certificate Revocation List (CRL). If the Password Reset Windows Application is slow to load after a user requests reset, you can choose to skip checking the CRL.	Default: "true" ○ **true**: When a user requests reset, the application first checks the CRL to validate the certificate. The application does not proceed without a valid certificate. ○ **false**: The application starts immediately and does not validate the certificate.
CredentialProviderGUID	GUID of the credential provider that is in use.	”"="{6f45dc1e-5384-457a-bc13-2cd81b0d28ed}”
DebugFlag	Write entries in the ServiceNowPwdReset event log.	”0”

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File name	Description	Default string
PasswordResetLinkName	Text to display for the Password Reset link on the Windows login page.	"Forgot password?"
PasswordResetLinkURL	URL of the Password Reset application on your ServiceNow instance.	https://<YourServerName>/$pwd_reset.do?sysparm_url=default
Proxy	Keys that configure proxy settings	Registry keys that begin with the text `"proxy"` enable use of a proxy server. See Configure registry keys on your proxy server.
ServiceNowCertPublicKey	By default, before every communication, the Password Reset Windows Application validates the server certificate.	Copy the certificate public key from the browser. See the example that follows the table. Paste the whole public key into the registry key text box. You can add multiple public keys in the text box (each on a new line).
ServiceNowServerVersion	Version of your production instance.	"<YourInstanceVersion>" (For example, "Kingston")
ServiceNowWinAppVersion	Version of the Password Reset Windows Application.	"<YourWindowsAppVersion>" (For example, "4.5")
UserAccountPictureLoc	Image that appears on the Login screen.	`%programdata%\Microsoft\User Account Pictures\user.bmp`
WorkingDir	Directory that holds the library files.	`C:\Program Files\ServiceNow\bin`

© 2026 ServiceNow, Inc. All rights reserved.

Limitations of the Password Reset Windows Application

The Password Reset Windows Application has a few limitations.

- The Password Reset Windows Application doesn't support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface.
- The Password strength indicator is not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For some verification types, you can use only one verification. Custom verifications are not supported. For more information, see Password Reset verifications.
- Custom UI macros configured on the **Process** > **Advanced** page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the **Password rule hint** text. Other formatting is not supported (bold, underline, and hyperlink). For more information, see Configure the connection to a credential store for the Password Reset processes.

Uninstall the Password Reset Windows Application

You can run either an EXE or an MSI file to uninstall the application.

Before you begin

Role required: Windows Local Administrator

Procedure

Follow either procedure.

Option	Description
Use an EXE file from the command line	**a.** Navigate to the uninstall directory that you created during installation, for example: `C:\Program Files\ServiceNow\uninstall\` **b.** Double-click the `unins000.exe` file.
Use an MSI file from the command line	**a.** Navigate to the directory that holds the `PasswordResetWinAppInstall.msi` file. **b.** Run the following command at the command line: `msiexec.exe /x PasswordResetWinAppInstall.msi /quiet`

Enrolling in the Password Reset application to reset your password

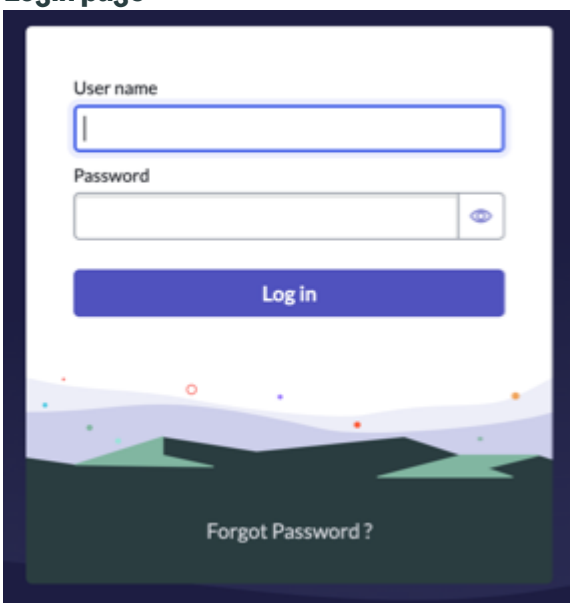
The self-service process is a typical process that you might follow to reset your password. Your experience might differ.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example experience of the self-service process

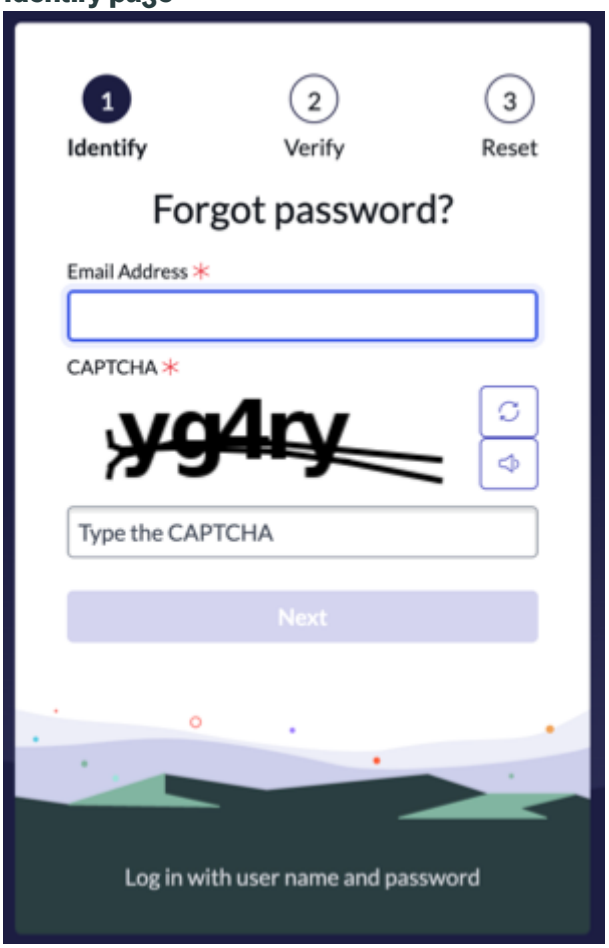
1. On the Login page, click the **Forgot Password** link to start the process.

Login page



2. On the Identify page, enter your identifying information (generally your user name or email address). The example includes the CAPTCHA security feature.

Identify page



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Verify page, verify your identity by providing your verification information. The admin configured the method of verification and can require multiple verifications. In the following example, the admin has configured the Security Questions verification. You must answer questions to prove your identity. (Earlier, while enrolling for the password reset process, you selected these questions and provided secure, private answers.) Other possible verifications require you to enter a code that was sent to a mobile device by SMS text, through the authenticator app, or by email.

Verify page

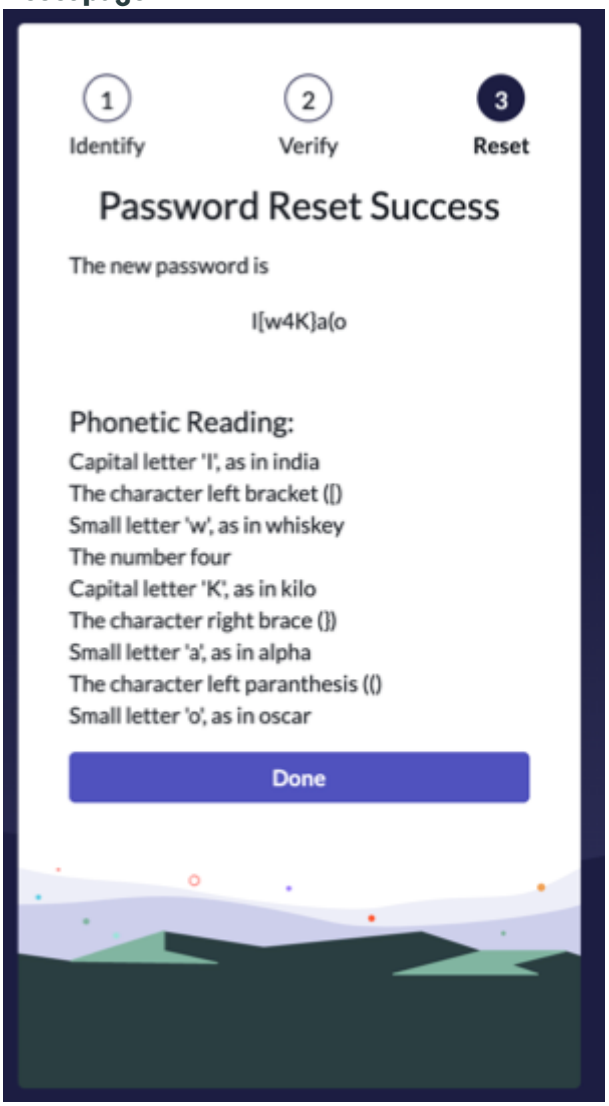
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. The system checks the credential store to verify your identity and then displays the new password on the Reset page.

Reset page



Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer end users the option to enroll for one or more methods of verifying your identity when resetting the password. End users can enroll for most Password Reset programs on a mobile device.

Note:
By default, the dark theme doesn't apply to the Password Reset Enrollment form. Users can change the theme to the dark theme. For more information about the dark theme, see Exploring themes in Next Experience.

End users might enroll for any combination of the following methods:

Verify your identity using an authenticator app

- You enroll on a computer that you normally use to access the instance (you use an authenticator app to reset your password, but can't use an authenticator to enroll for Password Reset Windows Application.). After you've enrolled, you install

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

an authenticator app on one or more devices and then authorize the devices for authenticator verification.

- Later, when you want to reset your password, read the authenticator code on your device and then enter the code on the web page to verify your identity.

Verify your identity using an SMS code (SMS verification)

- To enroll, you authorize a mobile device for SMS verification.
- Later, when you want to reset your password, you get a code on the device and enter the code on the web page to verify your identity.

Verify your identity using an emailed code

- To enroll, you authorize one or more email addresses.
- Later, when you want to reset your password, the system sends a code to the email address. You then enter the code on the web page to verify your identity.

Verify your identity using security questions verification

- To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely.
- Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity.

Enroll for the Password Reset program using an authenticator

Verify your identity while resetting your password by enrolling for the Password Reset program using a third-party authenticator app.

Before you begin

Role required: none

About this task

To verify your identity while resetting your password, you get a code from an authenticator app on your mobile device and then enter the code on the Password Reset web page.

Password Reset supports the following authenticator apps:

- Google Authenticator
- Microsoft Authenticator
- Cisco Duo
- Okta Verify

Procedure

1. Navigate to **All** > **Password Reset** > **Enroll**.
2. Click the **Authenticator App Verification** tab.

   Note:
   If your organization requires you to enroll for the Password Reset Authenticator verification method, the tab is marked with an asterisk (*).

3. Download the authenticator app to your device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open the app and then use the device to scan the QR code on the tab.
5. When the device generates a code, enter the code in the text box, and then click **Pair Device**.
6. Select **Submit**.
7. **Optional:** If the system displays a success message, select **Submit**.
8. **Optional:** If the system displays a failure message, enter the code again, click **Pair Device**, and then select **Submit**.

   When you submit the enrollment, the tab displays the following options:

Option	Description
Generate New QR Code	Enables you to pair a device with a new code. This option is useful if you have a new device. New data replaces the existing secure verification data.
Disable Multi-factor Authentication	Deletes existing secure verification data. The Google Authenticator verification is no longer available.

9. **Optional:** Enroll for an additional identity verification using any of the other methods that your organization offers.
   For more information about enrolling using different methods, see the following topics:
   - Enroll for the Password Reset program using questions and answers
   - Enroll for the Password Reset program using SMS codes
   - Enroll for the Password Reset program using emailed codes

Enroll for the Password Reset program using SMS codes

To verify your identity while resetting your password, you can use a code (the SMS code) that was delivered to your mobile phone or device. You can enroll on a mobile device.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Password Reset** > **Enroll** and then click the **SMS Verification** tab.
   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).
2. To add and verify a device, click **Add Device** and then follow the instructions.

   Note:
   If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed.

3. Provide a meaningful name for each device, and if you want to add multiple devices, then repeat the process.
4. After you verify each device, select the **Authorized** check box for each device that you expect to use to change or reset your password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can deauthorize a device at any time by clearing the **Authorized** check box.

5. Select **Submit**.
6. **Optional:** Enroll for an additional identity verification using any of the other methods that your organization offers.

   (Optional) For more information about enrolling in the Password Reset program, see the following topics:

   - Enroll for the Password Reset program using questions and answers
   - Enroll for the Password Reset program using an authenticator
   - Enroll for the Password Reset program using emailed codes

Enroll for the Password Reset program using emailed codes

To verify your identity while resetting your password, you enter a code that was sent to your email address. You can enroll for this program on a mobile device.

Before you begin
Role required: none

About this task
During this enrollment process, you add the email address, the system sends you a code so you can verify the address, and then you authorize the address to be used for the Password Reset process. By default, the system sends the code to the email address that is associated with your ServiceNow profile. You can send the code to additional email addresses.

Procedure

1. Navigate to **All** > **Password Reset** > **Enroll** and then click the **Email Verification** tab.
   If your organization requires you to enroll for the Email verification method, then the tab is marked with an asterisk (*). Email addresses that were added previously are listed on the tab.
2. Click **Add Email**, enter the email address and a meaningful email name to associate with the address and then click **Add Email**.
   Repeat the process for as many email addresses as you need.
3. On the **Email Verification** tab, for each email that should receive Password Reset codes, click **Verify**.
   The system sends an email message with a code and then displays the **Verify the Email Address** pop-up.
4. On the **Verify the Email Address** pop-up, enter the code and click **Verify**.

   Note:
   If this process fails, click **Send a New Code** to send a different code and try again.

5. After you verify each email address, select the **Authorized** check box for each address that you expect to use to change or reset your password.

   Note:
   To deauthorize an email address so that it does not receive Password Reset codes, clear the **Authorized** check box.

6. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Enroll for an additional identity verification using any of the other methods that your organization offers.
   For more information about enrolling using different methods, see the following topics:
   - Enroll for the Password Reset program using questions and answers
   - Enroll for the Password Reset program using SMS codes
   - Enroll for the Password Reset program using an authenticator

Enroll for the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity. You can enroll on a mobile device.

Before you begin
Role required: none

About this task
The list of questions is presented in the language that you requested while logging in.

Procedure

1. Navigate to **All** > **Password Reset** > **Enroll** and then click the **QA Verification** tab.
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each **Question** field, select a question from the list and then enter the answer in the **Answer** field.
   Repeat the process until the required number of **Question** and **Answer** fields are filled in.
3. Click **Submit**.
4. **Optional:** Enroll for an extra identity verification using any of the other methods that your organization offers.
   For more information about enrolling using different methods, see the following topics:
   - Enroll for the Password Reset program using SMS codes
   - Enroll for the Password Reset program using an authenticator
   - Enroll for the Password Reset program using emailed codes

Enroll for the Password Reset program using Soft PIN

Verify your identity while resetting your password by using a Soft PIN. To use it, you must enroll for the verification using a Soft PIN.

Before you begin
Role required: none

Procedure

1. Navigate to **All** > **Password Reset** > **Enroll**.
2. Select the **Soft PIN Verification** tab.

Note:

If your organization requires you to enroll for the Soft PIN verification, then the tab is marked with an asterisk (*).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Enter the Soft PIN** field, enter a six-digit number of your choice.

   Make sure that you follow these rules while enrolling for the Soft PIN verification.

   - The length of the Soft PIN must be six digits.
   - The soft PIN repetition threshold is two.
   - The soft PIN sequence threshold is two.
   - You can't use your previous five Soft PINs.

   Note:
   Based on the configuration set by your admin, these rules might change.

4. Select **Submit**.
   You're enrolled for the Soft PIN verification.

Reset your password on Windows systems

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

Before you begin
Role required: none

Procedure

1. Start your computer or press **Ctrl**+**Alt**+**Delete** to go to the Windows login screen.
2. Click the **Forgot Password?** link.

   Note:
   Your administrator may configure different text for the link.

3. On the **Identify** page, enter the requested information and then click **Next**.
4. On the **Verify** page, enter the requested information, and then click **Next**.

   Note:
   You might be given the option to choose the method used to verify your identity.

   If your identity is verified, the **Reset** page displays whether you were successfully verified and the state of your account (either locked or unlocked).
5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the **Reset Password** button. Enter and reenter the new password and then click **Reset Password**.
   - If your account is locked, the page displays the **Reset Password** and **Unlock Account** buttons.
     - You can enter a new password and click **Reset password** to reset the password and unlock the account.
     - If your administrator has selected **Enable account unlock** for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

Table name	Description
Password Reset Email Verification Code [pwd_email_code]	Verification codes that were sent to users via email for password reset or email address enrollment.
Password Reset Enrollment for Verification [pwd_enrollment]	Information about user enrollment by verification.
Password Reset Enrollment Snapshot [pwd_enrollment_snapshot]	Snapshot of user enrollment by verification. This table is used for the reporting purpose. The Sync Password Reset Enrollment Snapshot Data Monthly scheduled job runs once a month to generate or sync snapshot data in this table. The data, such as sys_user creation or deletion, verification to process creation or deletion, and so on, is synchronized. Password Reset DB listener is used to create or update the data in this table which is managed by the *`pwd_reset.enable.dbListener`* property with default value as true. If you're an admin and want to manually sync the data in this table related to an active process, select **Sync Enrollment Snapshot Data** on that Password Reset process. You can turn off the data synchronization in this table through the DB listener or the monthly scheduled job by setting the *`pwd_reset.enable.enrollment_snapshot`* property to false. **Note:** Initially, an inactive record is created by the DB listener for a user-verification pair. When the users enrol themselves on the Password Reset Enrolment page, the record becomes active in this table.
Password Reset Extension Type [pwd_extension_type]	Extension types that are available.
Password Reset History [pwd_history]	History of passwords that users reset.
Password Reset Identification Type [pwd_identification_type]	Password Reset identification types that are available.
Password Reset Process	Password Reset processes that are available.

Table name	Description
[pwd_process]	
Password Reset Process Credential Store [pwd_map_proc_to_cred_store]	Credential stores and the associated Password Reset processes that the application is using.
Password Reset Process User Group [pwd_map_proc_to_group]	Groups and the associated Password Reset processes that the application is using.
Password Reset Process Verification [pwd_map_proc_to_verification]	Verifications and the associated Password Reset processes that the application is using.
Password Reset Question [pwd_question]	Questions that the application uses for security question verifications.
Password Reset Request [pwd_reset_request]	Information about Password Reset requests.
Password Reset Request Verification [pwd_map_request_to_verification]	Password reset requests and the associated verification that the application is using.
Password Reset SMS Verification Code [pwd_sms_code]	SMS verification codes that were sent to users for a password reset.
Password Reset User Lockout [pwd_user_lockout]	Users that are locked out of Password Reset.
Password Reset Verification [pwd_verification]	Verifications that are available.
Password Reset Verification Param [pwd_verification_param]	User-created verification parameters.
Password Reset Verification Type [pwd_verification_type]	Password Reset verification types that are available.

Password Reset roles

Note:
Only the user with the following roles can have access to Password Reset tables. The deny unless authenticated ACLs restrict access to the Password Reset tables for any unauthenticated role such as public role user.

For more information, see Deny-Unless ACL.

Role	Description
password reset administrator [password_reset_admin]	Configures and maintains Password Reset and Password Change.
service desk agent [password_reset_service_desk]	Resets passwords on behalf of users, tracks password reset requests, and views logs.
credentials manager [password_reset_credential_manager]	Determines which credential stores are valid for use with Password Reset.

Password Reset business rules

Business rule	Table	Description
Abort if password history limit exceeds	Password Reset Credential Store Parameters [pwd_cred_store_param]	Prevents setting password history limit that exceeds the value of the *password_reset.history.limit* property. You can set a password reset history value in the *password_reset.history.limit* property. This system property checks the history of previous passwords based on the specified value. By default, the value is 10. But you can set it based on your organizational needs. **Note:** Currently, this property is applicable only to the ServiceNow credential store.
Add default parameters QA verification	Password Reset Verification [pwd_verification]	If no parameters for Security Question verifications are specified, generates parameters.
Add default parameters SMS verification	Password Reset Verification [pwd_verification]	If there are no parameters specified, generates SMS code verifications parameters.
Add params personal confirm verification	Password Reset Verification	If there are no parameters specified, generates personal data confirmation verifications parameters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
	[pwd_verification]	
Add params personal verification	Password Reset Verification [pwd_verification]	If there are no parameters specified, generates parameters for personal data verification.
Check unique verifications	Password Reset Process Verification [pwd_map_proc_to_verification]	Prevents a verification from being assigned multiple times to a specific Password Reset process.
Clear parameters for Mock verification	Password Reset Verification [pwd_verification]	Clears parameters for the Mock verification.
Deactivate process with no group	Password Reset Process User Group [pwd_map_proc_to_group]	Deactivates the process if it does not apply to all users or if the groups associated with it are removed.
Deactivate process with no min ver	Password Reset Process Verification [pwd_map_proc_to_verification]	Deactivates the process if the verifications associated with the process are less than the minimum value for the process.
Deactivate process with no verification	Password Reset Process Verification [pwd_map_proc_to_verification]	Deactivates the process if the verifications associated with it are removed.
Delete history passwords if needed	Password Reset Credential Store [pwd_cred_store]	Deletes history passwords if needed.
Enforce password history message	Password Reset Credential Store [pwd_cred_store]	Passes enforce password history related messages to the client side.
Google Auth Enabled Check	Password Reset Process [pwd_process]	Deactivates the process with Google Authenticator verification if the Google authenticator is disabled.
GoogleAuthSysPropertyCheck	Password Reset Process Verification [pwd_map_proc_to_verification]	Deactivates the process with the Google Authenticator verification if the Google authenticator is disabled.
Handle req_enroll validation/ default val	Password Reset Process Verification [pwd_map_proc_to_verification]	Handles requires_enrollment and auto_enroll values for the process.
Insert/update scheduled job for reminder	Password Reset Process [pwd_process]	Inserts/updates the scheduled job for enrollment reminder.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Order must be unique	Password Reset Desktop Access Control [pwd_access_control]	Enforces order to be unique.
Parameter Names Cannot Be Updated	Password Reset Verification Param [pwd_verification_param]	Prevents parameter name changes.
Password Reset Activity Monitor	Password Reset User Lockout [pwd_user_lockout]	Creates an event when the number of users locked out of Password Reset during a specific interval exceeds the threshold value.
Password Reset Validate Auto-generate	Password Reset Process [pwd_process]	Checks that either **Email/SMS password** or **Display password** is selected when the **Auto-generate password** check box is selected.
Personal Data Confirm Param Validation	Password Reset Verification Param [pwd_verification_param]	Checks that a column exists in the sys_user table for the parameter used in a personal data confirmation verification.
Personal Data Param Validation	Password Reset Verification Param [pwd_verification_param]	Checks that a column exists in the sys_user table for the parameter used in a personal data verification.
Prevent against deletion	Password Reset Credential Store [pwd_cred_store]	Checks whether the credential store is part of an active process before allowing deletion.
Prevent against deletion	Password Reset Identification Type [pwd_identification_type]	If an identification type is part of an active process, prevents the identification type from being deleted.
Prevent against deletion	Password Reset Verification [pwd_verification]	If the verification is part of an active process, prevents it from being deleted.
Prevent against deletion when in use	Password Reset Credential Store Types [pwd_cred_store_type]	Prevents deletion when the type is in use.
Prevent against deletion when in use	Password Reset Verification Type [pwd_verification_type]	Prevents deletion when the type is in use.
Queue event if history limit decreases	Password Reset Credential Store Parameters	Queues the pwd.credStore.history.limit.decrease event if history limit decreases.

Business rule	Table	Description
	[pwd_cred_store_param]	
Security Questions Param Validation	Password Reset Verification Param [pwd_verification_param]	Checks for valid parameters in security question verifications.
Send SMS code	Password Reset Device Enrollment Code [pwd_dvc_enrollment_code]	Sends an enrollment code to a device.
Set new record flag	Password Reset Process [pwd_process]	Sets a new record flag for the client to take appropriate action.
Send SMS Verification Code Via Notify	Password Reset SMS Verification Code [pwd_sms_code]	Sends out SMS authentication code via Notify if the Notify plugin is active.
Single credential store per process	Password Reset Process Credential Store [pwd_map_proc_to_cred_store]	Prevents having more than one credential store per process.
SMS Code Param Validation	Password Reset Verification Param [pwd_verification_param]	Checks for valid parameters in SMS code verifications.
Update action based on access conditions	Password Reset Desktop Access Log [pwd_access_log]	Updates the "action" field of this log record based on the access control conditions.
Update proc_to_cred_store	Password Reset Process [pwd_process]	Enforces a one-to-one relation between a Password Reset process and a credential store.
Validate Process	Password Reset Process [pwd_process]	Verifies that a Password Reset process is configured correctly.
Validate Pwd Cred Store Name	Password Reset Credential Store [pwd_cred_store]	Enforces the name to be unique.
Validate Pwd Cred Store Type Name	Password Reset Credential Store Types [pwd_cred_store_type]	Enforces the name to be unique.
Validate Pwd Extension Type Name	Password Reset Extension Type	Enforces the name to be unique.

Business rule	Table	Description
	[pwd_extension_type]	
Validate Pwd Identification Type Name	Password Reset Identification Type [pwd_identification_type]	Enforces the name to be unique and not empty.
Validate Pwd Process Name	Password Reset Process [pwd_process]	Enforces the name to be unique.
Validate Pwd Verification Name	Password Reset Verification [pwd_verification]	Enforces the name to be unique.
Validate Pwd Verification Type Name	Password Reset Verification Type [pwd_verification_type]	Enforces the name to be unique.
Validate Security Question	Password Reset Question [pwd_question]	Validates rules for security questions such as no duplicates or empty questions.
Verify Account Lookup Script	Password Reset Credential Store [pwd_cred_store]	Checks whether the account lookup script has the correctly named function.
VerifyAutoEnroll	Password Reset Verification Type [pwd_verification_type]	Checks whether auto-enroll is selected and ensures that an enrollment check script is provided.

Password Reset UI pages

Name	Description
$pwd_reset	First page of self-service reset process (asks for user ID).
$pwd_reset_serviceDesk	First page of service desk assisted reset process (asks for user ID).
$pwd_verify	Second page of reset process (asks user to verify identity).
$pwd_new	Last page of password change process (asks for new password).
$pwd_success	Page that appears when password is reset successfully.
$pwd_error	Page that appears on error during reset process.
$pwd_confirm	For processes configured to email or SMS password reset URL: After successful verification, this page displays message about sending link to user.
$pwd_change	Page for changing password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
$pwd_change_success	Page that appears when password is changed successfully.
$pwd_change_error	Page that appears on error during password change process.
$pwd_enrollment_form_container	Enrollment page for all verifications.
$pwd_enrollment_success	Page that appears when enrollment is successful.
$pwd_enroll_error	Page that appears when any error happens during enrollment.
$pwd_unlock_success	Page that appears when locked user is successfully unlocked.
$pwd_reset_downloads_ui	Page for downloading Password Reset Windows Application.

Password Reset UI macros

Name	Description
$pwd_csrf_validation	CSRF validation for Password Reset Application. If violation is detected, the page will be redirected to the error page.
$pwd_display_password	Displays a temporary password on the success page if the process is configured to auto-generate.
$pwd_enroll_email_ui and $pwd_verify_email_ui	UI for email enrollment and verification.
$pwd_enroll_google_auth_ui and $pwd_verify_google_auth_ui	UI for Google Authentication enrollment and verification.
$pwd_enroll_questions_ui	UI for question and answer security validation enrollment.
$pwd_enroll_questions_ui_js	JavaScript code that requires server-side data for security question and answer enrollment.
$pwd_enroll_sample_ui	Sample UI macro for enrollment for Mock Verification Type.
$pwd_enroll_sms_ui and $pwd_verify_sms_ui	UI for SMS enrollment and verification.
$pwd_enrollment_form_title	Jelly macro function that prints the title for the enrollment form. A verification ID is mandatory.
$pwd_error_message	UI for displaying error messages.
$pwd_process_flow	UI for indicating current stage.
$pwd_process_footer	JavaScript code to get the footer macro name.
$pwd_reset_stylesheet	JavaScript code to get the default CSS file ID.
$pwd_verify_personal_data_ui and $pwd_verify_personal_data_confirmation_ui	UI for verifying personal data and for confirming personal data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
$pwd_verify_questions_ui	UI for verifying questions.
$pwd_verify_simple_ui	Input section for a simple verification method. This field is a single input field.

UI scripts installed with Password Reset

You can create a UI script and reference the script from a UI macro or UI page by using a `<g:include_script>` Jelly tag. The following example shows how the *$pwd_enroll_questions_ui* UI macro can reference the *$pwd_enroll_questions_ui* script. In the example, *[UI Script Name]+".jsdbx"* is the name of the script:

```
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

Name	Description
$pwd_csrf_common_ui_script	Common UI script for handling a Cross-site Request Forgery (CSRF).
$pwd_enroll_email_ui	JavaScript code for the $pwd_enroll_questions_ui UI macro.
$pwd_enroll_google_auth_ui	JavaScript code for the $pwd_enroll_google_auth_ui UI macro.
$pwd_enroll_questions_ui	JavaScript code for the *$pwd_enroll_questions_ui* UI macro.
$pwd_enroll_sample_ui	Included sample client JavaScript for the *$pwd_enroll_sample_ui* UI macro.
$pwd_enroll_sms_ui	SMS enrollment UI script.
$pwd_enrollment_submit_event	UI script for an enrollment submission event.
$pwd_util	Utilities for password reset UI pages and UI macros.
$pwdWfManager	Helper class to handle workflow activities and post-processing.

Password Reset workflows

The Password Reset plugin adds workflows that you can use as examples to create custom workflows for Password Reset processes.

Workflows that connect to a credential stores

Workflow	Description
Pwd Reset - AD	Connects to an AD server.
Pwd Reset - Local ServiceNow	Current (local) instance.
Pwd Reset - Master	Password Reset primary workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflows that connect to a credential stores (continued)

Workflow	Description
Pwd Reset - Mock Fatal	Example workflow to use in Password Reset testing to simulate a fatal error. No retries.
Pwd Reset - Mock Non Fatal	Example workflow to use in Password Reset testing to simulate a non-fatal error.
Pwd Reset - Mock Success	Example workflow to use in Password Reset testing to simulate a successful completion.
Pwd Reset - Remote ServiceNow	Connects to a remote(SOAP) ServiceNow instance.

Workflows that test the connection to a credential store

Workflow	Description
Pwd Connection Test - AD	Tests connection to an AD server.
Pwd Connection Test - Local SN	Tests connection to local instance.
Pwd Connection Test - Master	Master workflow to test credential store connectivity.
Pwd Connection Test - Mock Failure	Example credential store connection test that simulates a failed connection.
Pwd Connection Test - Mock Success	Example credential store connection test that simulates a successful connection.
Pwd Connection Test - Remote SN	Tests connection to a remote(SOAP) ServiceNow instance.

Workflows that determine the lock state of a user account

Workflow	Description
Pwd Get Lock State - AD	Gets a user account lock state for the AD server.
Pwd Get Lock State - Local SN	Workflow to get a user account lock state for the local instance.
Pwd Get Lock State - Master	Primary workflow to get a user account lock state.
Pwd Get Lock State - Remote SN	Gets a user account lock state for the remote(SOAP) ServiceNow instance.

Workflows that unlock a user account

Workflow	Description
Pwd Unlock Account – AD	Unlocks a user account for a local instance.
Pwd Unlock Account - Local SN	Workflow to unlock a user account for a local instance.
Pwd Unlock Account - Master	Master workflow to unlock a user account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflows that unlock a user account (continued)

Workflow	Description
Pwd Unlock Account – Remote SN	Unlocks a user account for a remote(SOAP) ServiceNow instance.

Workflows that change a password

Workflow	Description
Pwd Change - Master	Password change primary workflow.
Pwd Change – Local ServiceNow	Connects to a local instance to change a password.
Pwd Change – AD	Connects to an AD server to change a password.
Pwd Change – Remote ServiceNow	Connects to a remote(SOAP) ServiceNow instance to change a password.

Password Reset notifications

Name	Fired by event name	Description
Password Reset – Send SMS Code	pwd.send_sms_code.trigger	Sends out SMS authentication code for verification.
[K] Password Reset – Send Email Code	pwd.send_email_code.trigger	Sends out authentication code via Email for verification.
Password Reset - Enrollment Reminder	pwd.enrollment_reminder.trigger	Sends emails to remind users to enroll in the required verifications.
Password Reset - New Password Confirmation	pwd.email.trigger	For the Email/SMS Password process, sends an email or SMS (if configured) that includes the new password.
Password Reset - Send Verify Code	pwd.send_verify_code.trigger	Sends authentication code to users using email or SMS for password reset or enrollment. **Note:** If the Notify plugin is active, SMS code is sent via Twilio instead of ServiceNow Notification.
Password Reset URL	password.reset.url	For the Email/SMS Password Reset URL process: Sends email or SMS (if configured) that includes a link to the password reset URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Fired by event name	Description
		Note: Check the following items if the instance does not send the email notification to the user: • Check the System Event [sys_event] table to see if the email was sent. • Verify that the user is subscribed to the notification. • Verify that the Default Self Service password reset process and password reset properties are configured correctly.

SOAP messages for Password Reset

SOAP Message	Description
Change Password	When the Orchestration Add-on plugin is active, the system can use the SOAP protocol to change passwords on remote credential stores such as a remote ServiceNow instance.
Password Reset Request	When the Orchestration Add-on plugin is active, the system can use the SOAP protocol to reset passwords on remote credential stores such as a remote ServiceNow instance.

REST API

- Name: Pwd Reset
- API ID: pwd_reset
- Base API path: /api/now/pwd_reset

Resources (Version v1)

Name	Resource path	API Version	Description
pwd_init	/api/now/v1/pwd_reset/init	v1	Initial request to establish session, write logs, and fetch UI messages.
pwd_identify	/api/now/v1/pwd_reset/identify	v1	Get identification page components.
pwd_verify	/api/now/v1/pwd_reset/verify	v1	Get verification page components.
pwd_new	/api/now/v1/pwd_reset/reset	v1	Get resetting password page components.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resources (Version v1) (continued)

Name	Resource path	API Version	Description
pwd_success	/api/now/v1/pwd_reset/success	v1	Get success page components.
pwd_failure	/api/now/v1/pwd_reset/failure	v1	Get failure page components.

Resources (Version v2)

Name	Resource path	API Version	Description
pwd_init	/api/now/v2/pwd_reset/init	v2	Initial request to establish session, write logs, and fetch UI messages.
pwd_identify	/api/now/v2/pwd_reset/identify	v2	Get identification page components.
pwd_verify	/api/now/v2/pwd_reset/verify	v2	Get verification page components.
pwd_new	/api/now/v2/pwd_reset/reset	v2	Get reset password page components.
pwd_success	/api/now/v2/pwd_reset/success	v2	Get success page components.
pwd_failure	/api/now/v2/pwd_reset/failure	v2	Get failure page components.

Domain separation and the Password Reset application

Domain separation is supported in the Password Reset application. A password reset process that you define in any domain is isolated from a process that you create in any other domain. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

How domain separation works in Password Reset

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user's domain.
- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain (the identification type record has a domain field). There are uniqueness constraints on identification names within a domain.
- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Password Reset process tables include a *sys_overrides* column on business rules, UI actions, and so on.
- The Password Reset application is built using Orchestration. Orchestration supports "Data only" domain separation — the data security model of separating visibility of data from one domain to another.

Password Change process

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user's domain (or child domain of an end user's domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.

Domain separation for service providers

Password Reset Process form

Description of the fields on the Password Reset Process form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields in the Process Strength Configuration section on the Password Reset Process form

Field	Description
Security score	View the security score in digits. As the security score changes, the color of the field changes. The following are three ranges of the security score: • 0 to 40: The color is red and the security is low. • 40 to 75: The color is orange and the security is medium. • 76 to 100: The color is green and the security is high.
Enable security score notification	Send security score notifications to process owners. If this field is selected, a weekly scheduled job sends emails containing the security score for all the active public processes. **Note:** The email notifications aren't sent for the service-desk processes and the processes for which only Change Password is configured.
Process owner	Designate one or more users as owners for the process you're creating. You can add only the users with the password reset admin role to this field. If you select **Enable security score notification**, the Process owner field becomes a required field.

Note:
The Process Strength Configuration section is displayed only when you select the **Public access** check box in the **Password Reset Details** tab.

Description of the fields on the Password Reset Details tab

Field	Value
Public access	The check box is available only when **Password reset** is selected. • Select the check box to enable a self-service process with public user access to the Password Reset or Password Change form through a URL. • Clear the check box to define a Service desk-assisted process in which only service desk agents can reset a password at the request of a user.
Public URL	The field is available only when **Public access** is selected. URL of the page where users go to reset or change the password. The value from the URL suffix field is appended to the URL when you tab out of the URL suffix field. For the Default self-service Password Reset process, this value must be `/$pwd_reset.do?sysparm_url=ss_default`.
URL suffix	The field is available only when **Public access** is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Description of the fields on the Password Reset Details tab (continued)

Field	Value
	Suffix used to create a unique URL for the Password Reset or Password Change form.
Display CAPTCHA	The check box is available only when **Public access** is selected. Select the check box to display a CAPTCHA on the user identification page. The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. See Configure Google reCAPTCHA for the password reset process. **Note:** The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA. Because on-premises instances do not have access to the internet, the instances cannot use the Google reCAPTCHA service. Set the *password_reset.captcha.google.enabled* system property to **false** for on-premises instances. To use the base system CAPTCHA, change the *password_reset.captcha.google.enabled* system property to false.
Identification type	Method that the user employs to claim identity for the public Password Reset or Password Change process. Any selection overrides the default identification that is associated with the process. The base system includes the Email and Username Identification identification types. You can create a custom identification type (some knowledge of JavaScript is recommended). See Personal data identification types and confirmation type verifications.
Redirect URL	URL to go to after a successfully resetting a password — typically, the URL of the original login page. Enter a complete path, including the protocol (for example, https://myDomain.myURL.com). If the path is under the same domain as the **Public URL**, then start the path with the / character.
Minimum verifications	Number of verifications that a user must successfully submit to reset the password. If the number exceeds the number of required verifications, then the user must submit enough additional optional verifications to meet the number specified for **Minimum verifications**. **Note:** Each user must submit all mandatory verifications regardless of the number specified. By default, during the password reset process, the system presents optional verifications to the user based on the **Order** values for the verifications. If you

Description of the fields on the Password Reset Details tab (continued)

Field	Value
	selected **Allow user to choose from optional verifications**, then the Verification page presents all optional verifications to the user. The user then selects the appropriate number of verifications. In this example, the **Minimum verifications** value is 1. Because no mandatory verifications are configured, the user can choose an optional verification. Also, see **Allow user to choose from optional verifications**.
Allow user to choose from optional verifications	Select the check box to enable a user, on the Verifications page during the process of resetting the password, to select which optional verifications to use. The choice of optional verifications appears only if the **Minimum verifications** setting is greater than the number of mandatory verifications. The number that you specify for **Minimum verifications** determines how many optional verifications that the user is allowed to select. In the example, the **Minimum verifications** setting is **2** and there are no mandatory verifications. The user has selected two optional verifications, so cannot select a third verification. Email/SMS Password Reset URL	Select the check box to enable users to reset the password by clicking a link in an email that the instance sends to them. This is the secured method of resetting a password. If configured, the instance also sends the URL to the users through SMS on mobile devices. By default, the self-service Password Reset processes enable this option. When you select this option, the **Auto-generate password** check box is not available. See Example: The default self-service Password Reset process for an outline of the process that is enabled by default. If you don't select the **Email/SMS Password Reset URL** option and try to save the record, you get a message that suggests you select the verification options to configure with secure verification. You can't set the QA verification as the only verification for this process as the process becomes less secure. You must either enable the **Email/SMS Password Reset URL** option or configure this process with multi-factor authentication. Also, you can't configure the process only with personal data and QA verifications. You must configure any other verification along with these two.

Description of the fields on the Password Reset Details tab (continued)

Field	Value
	If you still don't select the **Email/SMS Password Reset URL** option with a weak security verification configuration, it might allow unauthenticated users to reset any user's password using any user ID or email address.
Enable account unlock	This check box is available only when **Password reset** is selected. Select the check box to allow user accounts on credential stores to be unlocked without resetting the password. **Note:** Not supported by the default self-service Password Reset process.
Unlock user account	Select the check box to unlock user accounts on credential stores after a password reset.
Auto-generate password	Select the check box to auto-generate a new password for the user. When this check box is selected, you must select the **Email/SMS password** or **Display password** check box, or both. This setting is useful for Service Desk assisted processes. This check box is available only when: • The **Password reset** check box is selected. • The **Email/SMS Password Reset URL** check box is cleared. **Note:** If you use the credential store on your local ServiceNow instance or an Active Directory credential store: Clear the check box to enable the **Enforce history policy** option for a credential store. See Configure the connection to a credential store for the Password Reset processes.
User must reset password	This check box is available only when **Auto-generate password** is selected. Select the check box to require users to reset their password immediately after logging in with the auto-generated password. **Note:** Users whose credentials are held in the local ServiceNow instance credential store are prompted to change their password the first time that they log in. Users whose credentials are held in an Active Directory credential store are not prompted to change their passwords in the instance. Such users must change their passwords from a computer on the domain.
Display password	This check box is available only when **Auto-generate password** is selected. Select the check box to display the new password on the screen. In a self-service process, the password appears on the user screen. In a service desk-assisted process, the password appears on the service desk agent screen.
Email/SMS password	This check box is available only when **Auto-generate password** is selected.

Description of the fields on the Password Reset Details tab (continued)

Field	Value
	Select the check box to email or SMS the new password to the user. The setting is useful in both self-service and Service Desk assisted processes. The setting can add a layer of security by requiring that users access their email or SMS to view the password. In a Service Desk assisted process, sending password through email or SMS to users ensures that only the user requesting the password reset can view the password.

Related lists on the Password Reset Details tab

List	Description
Verifications	One or more verifications that the Password Reset process uses. See Password Reset verifications. The Verifications related list is available only after the record has been saved.
Groups	ServiceNow user groups to associate with the Password Reset process. The Groups related list is available only after the record has been saved and if the **Apply to all users** check box is cleared.

Description of the fields on the Advanced tab

Field	Description
Entry UI macro	UI macro that displays a customized message to users when they access the initial Password Reset screen.
Success UI macro	UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.
Failure UI macro	UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.
Post reset script	Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the **Post reset** script category as described in Password Reset extension script categories.
Header UI macro or Footer UI macro	Macros that add a header or footer to customize the appearance of the pages that end users work in while resetting a password (the Identify, Verify, and Reset pages. See Add a custom header or footer to the user pages for Password Reset.

Password Expiration Configuration form

The Password Expiration Configuration form allows you to define how frequently users must update their passwords and receive reminder notifications before expiration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the Password Expiration Configuration form

To access the **Password Expiration Configuration** form, navigate to **All** > **System Properties** > **Password Expiration**.

Password Expiration Configuration form

Field	Description
Days password is valid	The number of days that you want a password to be set as valid. The default value is **90**.
Days prior to start reminders	The number of days required to send notifications before password expiration. For example, if you set it to 5 days, a notification is sent 5 days prior to password expiration. The default value is **10**.
Schedule Frequency	Frequency to send reminders, such as daily or periodically. The default value is **Daily**. If you select **Periodically**, then notifications are sent based on the period, for example, alternate days or once in three days.
Time zone	The time zone to send reminders.
Time	The time when you want reminder notifications to be sent.
Repeat Interval	The days and the time that you want to use to send reminders with a specific interval. For example, when you enter 2 days and time, the notification is sent alternate days on the time you specified. This field appears only when **Periodically** is selected from the **Schedule Frequency** field.
Start time	The time when you want a notification reminder to be started.

System properties for password expiration

You can configure the system properties that support operations in password expiration.

To navigate to the system properties, you can select **All** and then enter *`sys_properties.list`* in the navigation filter.

Properties for password expiration

Property	Description
pwd_reset.enable.password_expiration_reminder	Use this property to enable or turn off a password expiration feature. By default, the value of this property is **false**, which means that password expiration is turned off by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for password expiration (continued)

Property	Description
pwd_reset.enable.dbListener	Use this property to enable or turn off the password reset DB listener (to raise events). The default value is **true**, which means that the property is enabled by default. **Note:** If this property is enabled, the password expiration records are managed automatically while inserting or deleting user data. While importing bulk data, for each sys_user or sys_user_grmember insertion or deletion, password expiration records are inserted or updated for each password reset process that users are entitled to. Even if updating the expiration data is an asynchronous activity, this activity might impact the performance, if the number of users is high. In that case, disable the *pwd_reset.enable.dbListener* property by setting it to **false** so that there is not an event on insertion or deletion of sys_user or sys_user_grmember.
pwd_reset.password_expiration.error_count	Number of maximum attempts (if there is failure) while retrieving the expiration details from the external credential store for a user. The default value is **5**. The expiration record is deactivated if the error count exceeds the value of this property. This property is not available by default. To use the property, you must create it.
pwd_reset.refresh_expiration_data.duration	Duration, in days, to refresh the expiration details for a user whose password never expires. The default value is **30 days**. This property is not available by default. To use the property, you must create it.

Password Reset Credential Store form

Description of the fields on the Password Reset Credential Store form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Type of credential store that you are connecting to. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular kind of credential store. Credential stores inherit the functionality of the credential store type. **Note:** For an AD credential store, skip this procedure and see Integrate Password Reset with your Active Directory service. The Password Reset Windows Application supports only AD credential stores.
Auto generate password	Script include that generates a temporary password for use during the reset process. If you select the **Enforce history policy** check box, then you must specify a value for **Auto-generate password** that is compliant with the password policy.
Enforce history policy	Appears only if you select a credential store **Type** of **AD Credential Store** or **Local ServiceNow Instance**. For information on configuring the setting for an AD credential store, see Configure the connection to an AD credential store. Select the **Enforce history policy** check box to ensure that users do not reuse passwords. For example, you might configure the history policy to not allow the user to reuse any of the previous 10 passwords. Follow this procedure: 1. Select the **Enforce history policy** check box. 2. In the Password Reset Credential Store Parameters related list, create a *password_history_limit* parameter. 3. Set the value of the parameter to the number of previous passwords that cannot be used (maximum **10**). The default value of 0 (zero) enables use of any previous password.
Child Alias	Child aliases are associated with the base alias. After creating a connection and credential alias, you can create a child alias to configure multiple connections for a password reset credential store. When a password reset request is made, the flow checks whether there are child alias connections at the process level. If the child alias is configured at the credential store level, the flow picks the aliases connections and proceeds with the request.
Enable password policy	See Enable password policies on your instance
Password policy	You can use the default policy or define your own.
Hostname	URL or IP address of the credential store.
User account lookup	Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, *PwdDefaultUserAccountLookup*, returns the user ServiceNow platform user name.
Password rule hint	Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The **Password rule** script enforces the requirements.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).

Password rule	Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks **Password Reset**. You can use the script to enforce password strength/ complexity requirements.
Enable Password Strength	Select the check box to: • Display the text box for the **Strength rule** script so you can update the script. • Display the graphical **Password Strength** bar to the user while the user changes or resets the password. **Note:** The Password Reset Windows Application does not support Password Strength.
Strength rule	This text box appears only if you select **Enable Password Strength**. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings: • Selected for local ServiceNow credential stores • Not selected for other credential stores **Note:** • To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field. • The Password Reset Windows Application does not support Password Strength.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Several components in the Self Service Password Reset (`com.snc.password_reset`) plugin and the Password Reset (`com.glideapp.password_reset`) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the **Password Reset** > **Properties** page:

You can add the `glide.pwd_reset.onetime.token.validity` property to the System Properties [sys_properties] table to specify the number of hours that the Password Reset token should be valid. Default: 12.

Note:
The setting for the `glide.pwd_reset.onetime.token.validity` property takes precedence over the setting for `password_reset.request.expiry` when the **Email Password Reset URL** checkbox on the process record is selected.

Properties accessible from the System Properties [sys_properties] table:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the **Forgot password?** button. See the `glide.security.password_reset.uri` property in High Security Settings . Default: */$pwd_reset.do?sysparm_url=ss_default*
- If `glide.security.forgot_password.display.link` is set to **true**, displays the **Forgot Password?** link on the login page.

Verification types in the base system

Use a verification type in the base system as a template to design a custom verification.

Verification types in the base system

Verification type	Description
Personal Data Confirmation	Verifies user identity using data from the User [sys_user] table. The user data is displayed to a service desk agent. The agent verifies the data. Enrollment is not required for this type. Recommended for service desk-assisted processes. **Note:** The Password Reset Windows Application does not support the Personal Data Confirmation Verification type. See Personal data identification types and confirmation type verifications.
Personal Data	Verifies user identity using data from the User [sys_user] table. The user is required to answer questions. Enrollment is not required for this type. **Note:** The Password Reset Windows Application allows you to define and use multiple verifications of the Personal Data type.

Verification types in the base system (continued)

Verification type	Description
	See Personal data identification types and confirmation type verifications.
Email Code	When a user requests password reset, the system sends a verification code to the email address in the user profile or to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset **Verify** page. **Note:** The Password Reset Windows Application allows you to define and use multiple verifications of the Email Code type. See Personal data identification types and confirmation type verifications.
Google Authenticator	While requesting password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset **Verify** page. **Note:** The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type.
Security Questions	Verifies user identity by presenting personal security questions that the user must answer correctly. **Note:** The Password Reset and Password Reset Windows Application support only a single verification of the Security Questions type. See Add a custom question to the Security Questions verification.
SMS Code	When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then enters the code on the Password Reset web page. **Note:** The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type. See SMS Code Verification type for Password Reset.
Mock	Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process. **Note:** The Password Reset Windows Application does not support the Mock verification type.

Field	Description
Enrollment check	Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when **Automatic Enrollment** is selected, a default script is provided.
Automatic enrollment	Select the check box to auto-enroll users. If **Automatic enrollment** is not selected, then you must provide an enrollment UI macro and enrollment processor script. For SMS and email verification, if the **Automatic enrollment** check box is selected and the user's mobile number and email address already appear in the sys_user table record, the user is enrolled for the corresponding verification. If the user's mobile number and email address aren't mentioned in the sys_user table, the user is not enrolled. **Note:** If the **Automatic enrollment** check box isn't selected, then even if the user's mobile number and email address appear in the sys_user table record, the user is not enrolled. The user must enroll manually by using the password reset enrollment process.
Enrollment UI	Enrollment UI macro that provides the UI for the enrollment.
Enrollment processor	Enrollment processor script that processes the enrollment.
Verification UI	Verification UI macro that provides the UI for the verification.
Verification processor	Verification processor script (extension scripts) that processes the verification.

Password Reset Verification form

Description of the fields on the Password Reset Verification form.

Field	Description
Type	Create verifications based on one of the verification types in the base system. Password Reset supports the following types. You can create multiple instances of any type. • Personal Data Confirmation Verification • Personal Data Verification • Security Question Verification • SMS Code Verification The Password Reset Windows Application supports the following types: • Personal Data Verification. You can create only a single instance. • Security Question Verification. You can create multiple instances. • SMS Code Verification. You can create only a single instance.
Order	Position of the verification as it appears on the Enrollment form and Password Reset form.
Password Reset Verification Parameters	Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the value that is specified in the Password Reset properties. The available parameters are described separately for each verification type.

Related topics

Create a custom Password Reset verification

Password Reset script includes

The Password Reset plugin installs script includes that implement password reset processes. To enable you to extend functionality, each base-system script include provides extension points that you can use to invoke "extension scripts" that you customized.

The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

'Enrollment check' script includes

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification being checked (table: [pwd_verification]).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
PwdAlwaysEnrolled	Default check of whether a user is enrolled that always returns true.
PwdMockIsEnrolled	Default check of whether a user is enrolled that always returns true.
PwdQuestionsEnrollmentCheck	Determines whether a user has enrolled for Password Reset using security question verification.
PwdSMSEnrollmentCheck	Determines whether a user has enrolled for Password Reset using SMS verification.

'Identification form processor' script includes

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- `params.processId`: The sys_id of the calling Password Reset process (table: [pwd_process]).
- `param request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`. The supported request parameter is `sysparm_user_id`, the user identifier value entered in the form.

Name	Description
PwdIdentifyViaEmail	Verifies a user's identity by checking the email address.
PwdIdentifyViaUsername	Verifies a user's identity by checking the user name.

'Enrollment form processor' script includes

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.

- `params.userId`: The sys_id of the user trying to enroll (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification used to enroll (table: [pwd_verification]).
- `params.enrollmentId`: The sys_id of this enrollment process.
- `request`: The form request object. Fields in the form can be accessed with `request.getParameter('<element-id>')`.

You should add the following information to the state of the enrollment process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `gs.getSession().putProperty("result.status",status)`: Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)`: An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)`: A custom value associated with the enrollment.

Name	Description
PwdEnrollQuestionsProcessor	Handles questions and answers for verification.
PwdEnrollSampleProcessor	Provides an enrollment processor for sample verification.
PwdEnrollSMSProcessor	Provides an enrollment processor for SMS verification.

'User account lookup' script includes

User account lookup script includes return the credential store account_id for a given user.

The following parameter returns the credential store account_id for a given user.
`params.userId`: The sys_id of the user being checked (table: [sys_user]).

Name	Description
PwdDefaultUserAccountLookup	Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.

'Password generator' script includes

Password generator script includes take the following parameter, and return an auto-generated string password.

`params.credentialStoreId`: The sys_id of the calling Password Reset process (table: [pwd_process]).

Name	Description
PwdDefaultAutoGenPassword	Generates a password from a random word and 4 digits.

'Verification processor' script includes

If the user identity is verified, the verification processor script includes return `true`.

Verification processor script includes take the following parameters:

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- `params.userId`: The sys_id of the user to be verified (table: [sys_user]).
- `params.verificationId`: The sys_id of the verification (table: [pwd_verification]).
- `request`: The form request object. Access the fields in the form with `request.getParameter('<element-id>')`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
PwdVerifyPersonalDataConfirmationProcess	Verifies that the user accepts the answer.
PwdVerifyPersonalDataProcessor	Verifies that the user's answers match the expected data in the system.
PwdVerifyQuestionsProcessor	Provides question and answer verification of user input on the second page of the verification form.
PwdVerifySimpleProcessor	Provides simple verification of user input on the second page of the verification form.
PwdVerifySMSProcessor	Provides SMS verification of user input on the second page of the verification form.

'Post processor' script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- `params.resetRequestId`: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- `params.wfSuccess`: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

Name	Description
PwdPostProcessor	Executes actions after the process completes for success, failure, or both conditions.

Example custom scripts for Password Reset

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.

Perform a user account lookup and process an identification form

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```
// User account lookup
var lookupExtensionSysId =
 getExtensionScriptSysId('SampleUserAccountLookupExtension',
 'user_account_lookup');
var lookupExtension = new
 SNC.PwdExtensionPoint(lookupExtensionSysId);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter() ;
params.userId= 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

//Form processor sample - Identification form processor
var identExtensionSysId =
 getExtensionScriptSysId('SampleIdentificationProcessorExtensio
n', 'identification_form_processor');
var identificationExtension = new
 SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter() ;
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification
 processor
var request = new SNC.PwdExtensionPointParameter() ; // A real
 life case will inject it's own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params,
 request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension
 script
function getExtensionScriptSysId(scriptName, category) {
   var result;
   var now_GR = new GlideRecord('sys_script_include');
   gr.addQuery('name', scriptName);
   gr.addQuery('script', 'CONTAINS', 'category:
 \'password_reset.extension.' + category + '\'');
   gr.query();

   if (gr.next() ) {
     result = gr.getValue('sys_id');
   }
   return result;
}
```

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to **Password Reset** > **Extensions** > **New extension script** and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

```
<?xml version="1.0" encoding="UTF-8"?>

Use the process and processForm extensions

This example shows a script that uses two sample extensions, one *process* extension and one *processForm* extension.

```
// User account lookup
var lookupExtensionSysId =
 getExtensionScriptSysId('SampleUserAccountLookupExtension','use
r_account_lookup');
var lookupExtension =new
 SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params =new SNC.PwdExtensionPointParameter();
params.userId='joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: '+ answer);

//Form processor sample - Identification form processor
var identExtensionSysId =
 getExtensionScriptSysId('SampleIdentificationProcessorExtension
','identification_form_processor');
```

Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

Note:
To use a script include as an extension script, you must set it to **Active** status.

Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, `category: 'password_reset.extension.enrollment_check'`. The ServiceNow platform installs several scripts in each category. A script in the **Enrollment check** category can perform the enrollment check for a verification. Detailed information on each extension script appears in Password Reset extension scripts.

Extension script category	Description
Enrollment check	Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the **Enrollment check** field when you define a verification type (Password Reset Verification Type form).
Enrollment form processor	Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the **Enrollment form processor** field when you define a verification type (Password Reset Verification Type form).
Identification form processor	Defines how a user identification is processed. Scripts of this category are available in the **Identification processor** field when you define a verification type (Password Reset Identification Type form).
Password generator	Defines how to generate a password. Scripts of this category are available in the **Auto generate password** field when you configure a credential store (Password Reset Credential Store Type form).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension script category	Description
Post reset script	Executes at the end of a Password Reset process. Scripts of this category are available in the **Post reset script** field when you configure a process (Password Reset Process form).
User account lookup	Defines how to look up a user account. Scripts of this category are available in the **User account lookup** field when you configure a credential store (Password Reset Credential Store form).
Verification form processor	Defines how a verification form is processed. Scripts of this category are available in the **Verification processor** field when you define a verification type (Password Reset Verification Type form).

Related topics

Password Reset extension scripts

Password Reset extension scripts

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

Password Reset extension script includes

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

Note:
Create extension scripts only from the Password Reset Extension Script form (**Password Reset** > **Extensions** > **New extension script**). Extension scripts are special purpose script includes that are not created in the **System Definition** > **Script Includes** interface. To use a script include as an extension script, you must set it to **Active** status.

'Enrollment Check' script include category

Script include category	Description	Method signature	Input fields	Output fields
Enrollment Check	Checks whether a user is enrolled for a given verification.	process(params)	Parameters: • `params.userId` - The sys_id of the user to check (table: sys_user). • `params.verificationId` - The sys_id of the verification to check (table: pwd_verification).	Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the **Script** field of an extension script named `SampleEnrollmentCheck`:

```
var SampleEnrollmentCheck = Class.create ();
SampleEnrollmentCheck. prototype = {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 category:'password_reset.extension.enrollment_check', // DO
NOT REMOVE THIS LINE!

  /**********
  * Returns boolean telling whether the user is enrolled.
  * This sample returns true if both parameters are supplied,
false otherwise
  *
  * @param params.userId         The sys-id of the user being
checked (table: sys_user)
  * @param params.verificationId The sys-id of the verification
being checked (table: pwd_verification)
  * @return Boolean indicating whether the user is enrolled
into the specified verification
  **********/
 process:function (params) {return (params.userId &&
params.verificationId)? true:false; },

 type:'SampleEnrollmentCheck'};
```

'Enrollment Form Processor' script include category

Script include category	Description	Method signature	Input fields	Output fields
Enrollment Form Processor	Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.	process(params)	Parameters: • *params.resetRequestId* - The sys_id of the current Password Reset request (table: pwd_reset_request). • *params.userId* - The sys_id of the user to be verified (table: sys_user). • *params.verificationId* - The sys_id of the verification to be processed (table: pwd_verification). • *request* - The form request object. Fields in the form can be accessed with request.getParameter('<element-id>'). The following information should be added to the state of the enrollment process: • gs.getSession().putProperty("result.status",status) - Whether the user was successfully enrolled. • gs.getSession().putProperty("result.message",message) - An associated message to be returned to the UI, such as a detailed error message. • gs.getSession().putProperty("result.value",value) - A custom value associated with the enrollment.	Returns: (boolean true, if th user is enrolled in the specifie verificati otherwis false.

This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the **Script** field of an extension script named *SampleEnrollmentProcessor*.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var SampleEnrollmentProcessor = Class.create ();
SampleEnrollmentProcessor.prototype = {
    category:
 'password_reset.extension.enrollment_form_processor', // DO NOT
 REMOVE THIS LINE!

     /**********
    * Process the enrollment form request, and return whether
 the user was successfully enrolled.
    *
    * @param params.userId         The sys_id of the user trying
 to enroll (table: sys_user)
    * @param params.verificationId The sys_id of the
 verification to be enrolled into (table: pwd_verification)
    * @param params.enrollmentId   The sys_id of this enrollment
 process
    * @param request               The form request object.
 Felds in the form can be accessed with
    *
 request.getParameter('<element-id>')
    * @return boolean telling whether the user was successfully
 enrolled
    * The following information should be added to the state of
 the enrollment process
    *     gs.getSession().putProperty("result.status",status) -
 whether the user was successfully enrolled
    *     gs.getSession().putProperty("result.message",message)
 - an associated message to be returned
    *             to the UI. Eg. a detailed error message
    *     gs.getSession().putProperty("result.value",value) -
 custom value associated with the enrollment
    **********/
    processForm:function (params, request) {var verificationId =
 params.verificationId; var sampleInput = request.getParameter
 ('sample_input');

  if (gs.nil (verificationId) || (sampleInput!= 'success'))
 { return false; }

  var now_GR = new GlideRecord ('sys_user');
 now_GR.get (params. userId);
 now_GR.print ('User:' + now_GR.getValue ('user_name') + '
 successfully enrolled'); return true; },
    type: 'SampleEnrollmentProcessor' };
```

'Identification Form Processor' script include category

Script include category	Description	Method signature	Input fields
Identification Form Processor	Processes an identification form request.	processForm(params, request)	Parameters: • *params.processId* - The sys_id of the calling Password Reset process (table: pwd_process). • *request* - The form request object. Fields in the form can be accessed with

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script include category	Description	Method signature	Input fields
			`request.getParameter('<element-id>')`. Use `request.getParameter('sysparm_user_id')` to get the user ID that was entered into the form.

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the **Script** field of an extension script named *`PwdIdentifyViaUsername`*:

```
var PwdIdentifyViaUsername = Class.create ();
PwdIdentifyViaUsername. prototype = {
    category:
 'password_reset.extension.identification_form_processor', // DO
 NOT REMOVE THIS LINE!

    initialize: function () { },

   /**********
   * Process the identification form request, and returns the
 user's sys_id. If user was not identified return null.
   *
   * @param params.processId   The sys_id of the calling Password
Reset process (table: pwd_process)
   * @param request            The form request object. fields
 in the form can be accessed with
   *  request.getParameter('<element-id>')
   *  Supported request parameters: sysparm_user_id - the user
 identifier value entered in the form
   * @return The sys_id of the user that corresponds to the
 requested input;
   *  if no user was found, null should be returned
   **********/
  processForm: function (params, request) {var processId =
 params. processId; var sysparm_user_id = request.getParameter
 ('sysparm_user_id');
     now_GR = new GlideRecord ('sys_user') ;
     now_GR.addQuery ('user_name', sysparm_user_id) ;
     now_GR.query (); if (!now_GR.next ()) {return null; }
 return now_GR.sys_id;},

    type:'PwdIdentifyViaUsername' }
```

'Password Generator' script include category

Script include category	Description	Method signature	Input fields	Output fields
Password Generator	Returns an auto-generated password.	process(params)	Parameters:*`params.processId`* - The sys_id of the calling Password Reset process (table: pwd_process).	Returns: (String) an auto-

Script include category	Description	Method signature	Input fields	Output fields
				generated password.

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the **Script** field of an extension script named *SamplePasswordGenerator*:

```
var SamplePasswordGenerator = Class.create ();
SamplePasswordGenerator. prototype = {
  category: 'password_reset.extension.password_generator', // DO
 NOT REMOVE THIS LINE!

   /**********
   * Returns an auto-generated string password.
   * This sample randomly generates 4 digits to add to the
 password.
   *
   * @param params.credentialStoreId The sys_id of the
 target Password Reset credential store to generate
   *  a password for (table: pwd_cred_store)
   * @return An auto-generated string password
   **********/
  process:function (params) { var basePassword ;

  var now_GR = new GlideRecord ('pwd_cred_store');
 now_GR.addQuery ('name', 'Local ServiceNow Instance');
 now_GR.query (); if (now_GR.next ()) { if
 (params.credentialStoreId = now_GR.getValue ('sys_id'))
   basePassword = "Password"; else
   basePassword = "Dorwssap"; } return this. generateSimple
 (basePassword); },

  generateSimple:function (base) {var pwd = base; var numbers =
 '0123456789'; var length = 4;

     for (var i  = 0 , n  = numbers. length ; i  < length ; i
 ++) {
        pwd += numbers.charAt (Math.floor (Math.random () * n) +
 1); } return pwd;},

  type:'SamplePasswordGenerator'} ;
```

'Post Reset' script include category

Script include category	Description	Method signature	Input fields	Output fields
Post Reset	Performs additional operations after the completion of the	process(params)	Parameters:	Returns: void

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script include category	Description	Method signature	Input fields	Output fields
	Password Reset process.		• *params.resetRequestId* - The sys_id of the calling Password Reset process (table: pwd_process). • *params.wfSuccess* - A flag indicating whether the workflow completed successfully. True if, and only if, successful.	

This example adds failed reset requests to the system log. The code would be contained in the **Script** field for an extension script named *PwdPostProcessor*':

```
var PwdPostProcessor = Class.create ();

PwdPostProcessor. prototype = {
    category: 'password_reset.extension.post_reset_script', //
 DO NOT REMOVE THIS LINE!

    initialize:function () { },

     /**********
     * Execute custom actions after the Password Reset process has
 completed.
    *
    * @param params.resetRequestId The sys_id of the
 current Password Reset request (table: pwd_reset_request)
    * @param params.wfSuccess      A flag indicating if the
 workflow completed sucessfully.
    *  True if (and only if) successful.
    * @return no return value
    **********/
    process: function (params) {if (!params. wfSuccess) {
           now_GS.log ('[PwdPostProcessor.process] failure post
 processing for request [' + params. resetRequestId + ']'); }

         // We could place actions here that we always want
 executed return; },

    type:'PwdPostProcessor' }
```

'User Account Lookup' script include category

Script include category	Description	Method signature	Input fields	Output fields
User Account Lookup	Gets the credential store account ID for a given user.	process(params)	Parameters:*params.userId* - The sys_id of the user being checked (table: sys_user).	Returns: (String) the credential store account ID for the given user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This example gets the credential store account for a user. This code would be contained in the **Script** field of an extension script named *SampleUserAccountLookupExtension*:

```
var SampleUserAccountLookupExtension = Class.create ();
SampleUserAccountLookupExtension. prototype = {
  category:'password_reset.extension.user_account_lookup', // DO
 NOT REMOVE THIS LINE!

   /**********
  * Returns the credential store account id for a given user.
  * This sample echoes the user_id supplied as the credential
 store account id for that user.
  *
  * @param params.userId  The sys_id of the user being checked
 (table: sys_user)
  * @return              The credential store account id
 (string) for a given user
  **********/
  process:function (params) {return params.userId;},

  type:'SampleUserAccountLookupExtension' }
```

'Verification Form Processor' script include category

Script include category	Description	Method signature	Input fields	Output fields
Verification Form Processor	Processes a verification form request and indicates whether the user was verified or not.	processForm(params, request)	Parameters: • *params.resetRequestId* - The sys_id of the current Password Reset request (table: pwd_reset_request). • *params.userId* - The sys_id of the user to be verified (table: sys_user). • *params.verificationId* - The sys_id of the verification to be processed (table: pwd_verification). • *request* - The form request object. Fields in the form can be accessed with request.getParameter('<element-id>').	Returns: (boolean) true, if the user is verified; otherwise, false.

This example shows a verification processor that returns true only if the user sent **ok** in the input field; otherwise, it returns false. The code would be contained in the *Script* field of an extension script named *SampleVerificationFormProcessor*.

```
var SampleVerificationFormProcessor = Class.create ();
SampleVerificationFormProcessor.prototype = {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 category:'password_reset.extension.verification_form_processor'
, // DO NOT REMOVE THIS LINE!

   /**********
   * Process the verification form request, and return whether
 the user was successfully verified.
   * This is a sample verification processor returns true only
 if the user sent "ok" in the input field;
   * otherwise, it returns false.
   *
   * @param params.resetRequestId The sys_id of the
 current Password Reset request (table: pwd_reset_request)
   * @param params.userId         The sys_id of the user trying
 to be verified (table: sys_user)
   * @param params.verificationId The sys_id of the verification
 to be processed (table: pwd_verification)
   * @param request               The form request object.
 Fields in the form can be accessed with
   * request.getParameter('<element-id>')
   * @return Boolean indicating whether the user is successfully
 verified
   **********/
  processForm:function (params, request) {if
 (request.getParameter ("sysparm_simple_input") == "ok") return
 true; else return false; },

  type:'SampleVerificationFormProcessor'};
```

Extension points

Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the **System Definition** > **Script Includes** interface.

Before you begin

Role required: password_reset_admin or admin

Note:
To use a script include as an extension script, you must set it to **Active** status.

Procedure

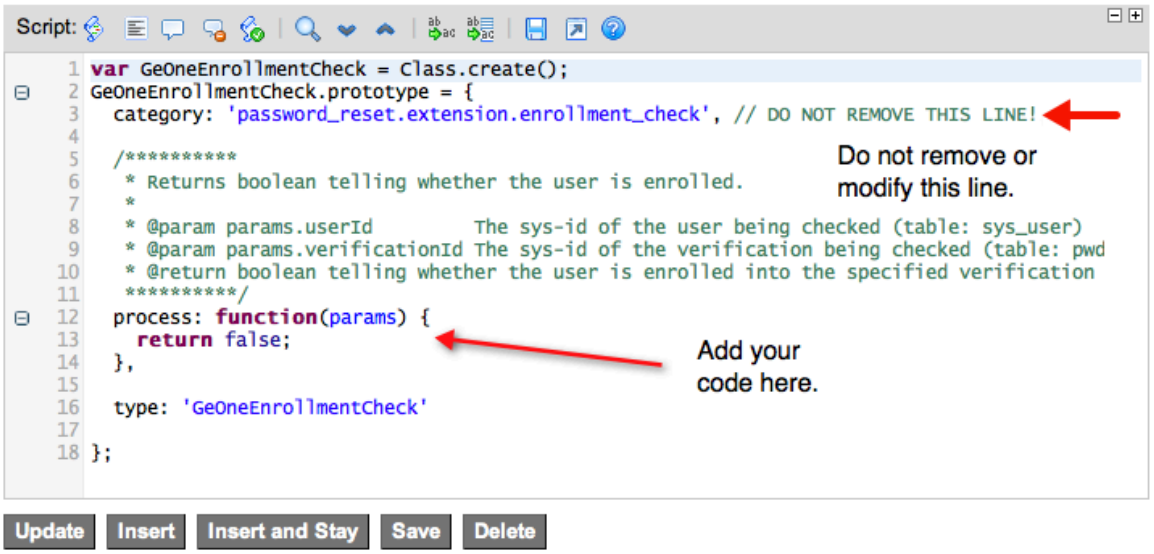
1. Navigate to **Password Reset** > **Extensions** > **New extension script**.
2. Enter a name in the **Extension script name** field.
   Use CamelCase to construct a name without spaces, for example, `PwdEnrollmentCustom`.
3. Select an **Extension script category**.
   - Enrollment check
   - Enrollment form processor
   - Identification form processor
   - Password generator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- User account lookup
- Verification form processor

4. Click **Submit**.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or `processForm` function, depending on the script category.
   You can add additional functions as long as the process or `processForm` function accepts the defined parameters and returns the expected results.

Note:
Do not edit or delete the `Category` declaration.



6. Click **Update**.

Password Reset and Password Change reports and logs

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.

The **Reset Requests**, **Activity Log**, and **Blocked Users** modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

Password Reset Overview module

The **Password Reset** > **Overview** module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password Reset reports

Title	Description
Password Requests (last 7 days)	Number of password reset requests by type during the last 7 days.
Blocked Users (last 7 days)	Number of users blocked over the last 7 days.
Password Reset Request Status (last 7 days)	Status of all password reset requests by process.
Password Reset Request by Action (last 30 days)	Number of password reset requests by action type: **Reset Password**, **Unlock Account**, or **Reset and Unlock**.
Password Reset Top Users (last 30 days)	Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.
Password Reset Failed Verifications (last 7 days)	Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.
Password Reset Enrollment By Verification	Number of users by verification type who enrolled and did not enroll in the password reset program. A large number for users who did not enrolled could indicate a compliance or communication issue within the organization.
Password Change Top Users (last 30 days)	Number of password change requests per user. Many password change requests from a single user could indicate a security issue.

Password Reset activity log

The activity log (**Password Reset** > **Activity Log**) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log [pwd_reset_activity] table.

You must have the password_reset_credential_manager or password_reset_admin role to view the log.

Password Reset event log

The event log is a valuable resource for troubleshooting. On the **Start** menu, click **Programs (or All Programs)** > **Administrative Tools** > **Event Viewer**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the log does not appear, then, on the **Windows Logs** menu, click **Applications** > **Service Logs**.

You must have the admin role to view the log.

To write to the Password Reset event log

Edit the `DebugFlag` registry key entry at: `Computer > HKEY_LOCAL_MACHINE > SOFTWARE > Microsoft > Windows > CurrentVersion > Authentication > Credential Providers > {B6EFF27D-C1C4-481F-B81B-F3547C47D58A}`

By default, the key is set to 0. Set the key to 1 to write log entries to the `ServiceNowPwdReset` event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

Password Reset blocked user notification

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the **Password Reset-Activity Monitor Lockout** notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

Schedule for purging Password Reset data

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge.

Users with the password_reset_credential_manager or password_reset_admin role can follow this procedure to modify the purge interval:

1. On a non-production instance: Navigate to **Automated Test Framework** > **Administration** > **Table Cleanup**.
2. Modify the designated tables.
3. Test all changes on the non-production instance.
4. Modify the tables on your production instance and test.

Alternatively, contact ServiceNow Technical Support to modify the purge interval.

Purge intervals for Password Reset tables

Table name	Purge interval
[pwd_reset_request]	90 days (7,776,000 seconds). Depending on your organizational data monitoring requirements, you could configure the rule to: • Purge successful requests after 90 days • Keep failed requests for 120 days
[pwd_user_lockout]	90 days (7,776,000 seconds).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Purge intervals for Password Reset tables (continued)

Table name	Purge interval
	Depending on your organizational data monitoring requirements, you could configure the rule to: • Purge successful requests after 90 days • Keep failed requests for 120 days
[pwd_reset_activity]	90 days (7,776,000 seconds).
[pwd_activity_monitor]	90 days (7,776,000 seconds).
[pwd_dvc_enrollment_code]	1 day (86,400 seconds).
[pwd_sms_code]	1 day (86,400 seconds).

Actions in Password Reset for Virtual Agent

The actions in the Virtual Agent use plugins.

- Password Reset (com.glideapp.password_reset): This plugin is active by default.
- Password Reset for Virtual Agent (com.snc.password_reset.virtual_agent): You must install this plugin to use Password Reset for Virtual Agent.

For more information about creating your password reset process, see Password Reset.

End users can initiate a password reset conversation with Virtual Agent by entering specific keywords. For example, when a user enters the keyword `Reset`, the Virtual Agent shows the **Reset Password** action. The users can select the action to initiate the password reset.

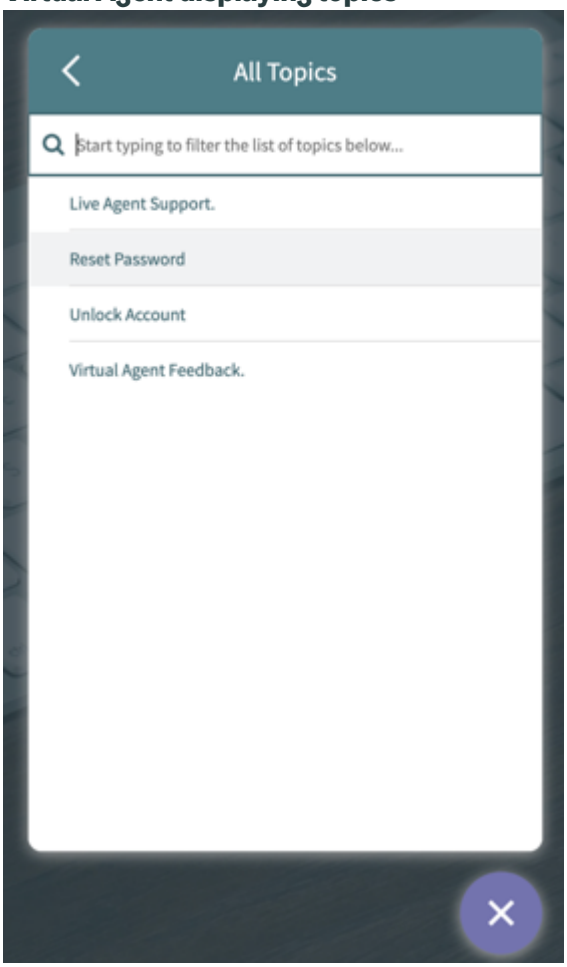
Virtual Agent displaying topics



Enrollment in Password Reset for Virtual Agent

You can let end users enroll for Password Reset verifications using the Virtual Agent. The Virtual Agent includes an enrollment topic and its topic blocks for each verification, such as SMS, email, security question, Soft PIN, or a third-party authenticator app. Users can select any of the topic blocks to enroll for verification.

You can modify the enrollment topic, but you must duplicate the default enrollment topic and then modify the duplicated topic.

Here's the enrollment flow in Virtual Agent:

1. Users select the enrollment topic in Virtual Agent.
2. Users select any one of these verification types:

   Security questions

   - If users aren't enrolled, Virtual Agent displays the questions, and users need to select questions and give answers to them.
   - If users are already enrolled, Virtual Agent shows options to the users to:
     - Change answers to the existing questions
     - Re-enroll

   Soft PIN

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the user isn't enrolled, Virtual Agent displays rules that are followed by a Soft PIN question. Users enter a valid Soft PIN and complete the enrollment.
- If users are already enrolled, they get a message asking whether to update existing Soft PIN enrollment.

  If users select **Yes**, Virtual Agent displays rules that are followed by a Soft PIN question.

  Users must enter a valid Soft PIN to complete the enrollment.

  Note:
  When users change the existing Soft PIN, they must use a new Soft PIN that must differ from the previously existing Soft PIN.

Third-party authenticator app

- If users aren't enrolled, they get a QR code and an alphanumeric code. Users can scan the QR code or enter the alphanumeric code in the authenticator app.
- If users are already enrolled, they get two options:
  - Generate a new QR code and an alphanumeric code
  - Disable multi-factor authentication

  If users select an option to generate a new QR, the new enrollment flow starts. If users select the other option, the multi-factor authentication gets disabled. If the multi-factor authentication is disabled, to re-enroll, users must enable it again.

Password Reset supports the following third-party authenticator apps:

- Google Authenticator
- Microsoft Authenticator
- Cisco Duo

Email and SMS

- If users aren’t enrolled, they can add new mobile devices for SMS verification or can add an email address for email verification.
- If users are already enrolled, they can view the list of enrolled mobile devices for SMS verification, or they can view an email address. For SMS, the users can verify, remove, or authorize mobile devices. For email, the users can verify or authorize the email address.

3. Users complete the enrollment.

Verification options for Password Reset for Virtual Agent conversations

The following verification options are supported in Virtual Agent conversations. Custom verifications are not supported in Virtual Agent.

- Personal data: The user provides specific pieces of personal data.
- Authenticator app: The user enters the generated code from the an authenticator app on a mobile device.
- SMS:The user enters the code received on a mobile phone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Email:The user enters the code received in an email.
- Security question verification: The user enters the answers for the security question.

Soft PIN expiration framework for Password Reset

Virtual Agent supports expiration framework to account for Soft PIN verification during Password reset. As an end-user, you can use the existing Virtual Agent topic to enroll for Soft PIN enrollment to:

- Re-enroll when your Soft PIN has expires.
- Inform you of the number of days from the time you setup a new Soft PIN after which your token expires.
- Reset Soft PIN to account for history policies.
- Configure the topic to ask for password before proceeding to reset your Soft PIN.

Reset password conversation flow for Virtual Agent

1. Virtual Agent sends identity verification information to the end users based on the password reset process configuration.
2. Virtual Agent provides the reset steps if users successfully verify themselves with the given inputs.
3. Virtual Agent displays the password rules.
4. The user enters a new password, adhering to the password rules.
5. Virtual Agent prompts the user to reenter the password if the password does not meet the criteria.
6. Once the password meets the criteria, the Virtual Agent resets the password.
7. Users then log in using the new password.

Password reset flow using interactive voice response (IVR)

A user can reset a password using interactive voice response (IVR). For example, by using a phone call. A user gets the instructions for verification on a phone call. Once the verification is complete, the user receives an auto-generated password or an email containing a URL, which the user can use to reset the password based on the configuration of the process.

After resetting your password, the newly auto-generated password is spoken over IVR. If the Password Reset process is configured with an email or SMS, the password is also sent to the registered email and SMS.

The following verification types are supported over IVR:

- Authenticator app
- SMS
- Email

You can use the *sn_pwdreset_va.supported_channels* system property to enable the IVR or Microsoft Teams or both.

Note:
By default, the minimum character length is 8 characters. The maximum length in the password policy must be modified for a better experience over IVR.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change password conversation flow for Virtual Agent

1. The user initiates the Change Password action. The user selects the password reset process, or if only one process is available, the process is selected automatically.
2. Virtual Agent prompts the password guidelines or rules.
3. The user enters the old password, enters the new password, confirms the new password, and submits the request.
4. Virtual Agent shows the request status whether the password is changed or not.
5. If the password is changed, the users can use the new password to log in.

Unlock account conversation flow for Virtual Agent

When a user account is locked, the user can't log in to the account. But using the Virtual Agent, the user can unlock the account and log in.

1. Virtual Agent sends identity verification information to the end user based on the password reset process configuration.
2. Virtual Agent provides the verification information if the user successfully verifies their identity with the given inputs.
3. Once the user has been identified and verified, the Virtual Agent unlocks the user's account.

Note:
Users can also use the Microsoft Teams channel to unlock accounts and reset passwords.

Notify

Notify provides support for SMS and voice channels on the ServiceNow platform for communicating internally with team members and externally with customers and contractors. The plug-in also provides APIs and workflow activities to achieve the above. Some customers directly make use of the APIs in their products, and others via products like Major Incident Management, On-Call and CTI Softphone.

Exploring Notify

Use and integrate Notify with the third-party service providers as a communication channel to meet with the stakeholders to resolve the incidents.

Notify Twilio Direct driver

The Notify-Twilio integration with the Notify-Twilio Direct driver provides APIs and workflow activities for applications to handle various notification features.

The Notify-Twilio Direct driver provides the following notification features:

- Start and manage a conference
- Send and receive SMS messages
- Send and receive calls

Notify automatically creates a TwiML application in the Twilio account and configures the application to use the instance as an endpoint.

Phone numbers associated with the Twilio account are imported to Notify. To manage phone numbers per instance, set up one Twilio account for each instance and configure all relevant phone numbers for the instance under that account.

Note:
Only one Twilio account (or subaccount) can be configured on a given Notify driver at a time. Both the old and new driver can be used simultaneously because they can be configured with different accounts.

The Notify-Twilio direct driver supports the use of API Keys and API Secret to make outbound REST API calls to Twilio. For more details, see API Key Resource.

To enhance the security, another set of user credentials are added in the system for the credentials in the form of Twilio API keys. The record contains the generated API key and the API secret as the username and password respectively.

Note:
Twilio Direct creates the Standard type API keys.

If the instance is connected to Twilio and you upgrade to Yokohama, the Twilio will not be disconnected from your instance and continues to use the Account SID and Auth key. However, if the administrator disconnects Twilio from the instance and re-connect the Twilio service, the additional record will be created to enhance the security.

Activation Information

For new customers, only the Notify-Twilio Direct driver is available by default. For customers upgrading to the latest version, both the Notify-Twilio Direct and Notify-Twilio drivers are available.

The Notify plugin must be active to access Notify.

Related topics

Configure Notify with Twilio

Notify Zoom connector

The Notify Zoom Connector expands the Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

Compatibility

New York and later.

Key Features

- Start and end Zoom meeting directly from any task record such as incident, or a change or even from the Major incident Workbench.
- Manage a Zoom meeting by adding or removing participants.
- Track and report meeting details such as meeting duration and attendees for further analysis.

System Requirements

- Install and activate the Notify plugin (com.snc.notify) before you install the application.
- Ensure that the system has Zoom spoke, version 1.0.2, for ServiceNow Integration Hub plugin (sn_zoom_spoke) installed and the necessary Integration Hub license to use Zoom for meeting management.

Plugins

- ServiceNow IntegrationHub Installer (com.glide.hub.integrations): Suite of plugins necessary to design integration flows in the Workflow Studio application.
- The Zoom spoke, version 1.0.2 (com.sn.zoom.spoke) for ServiceNow Integration Hub provides actions that allow user to create and manage the conference meetings.

Notify voice and SMS capabilities

Notify provides support for SMS and voice channels for communicating internally with team members and externally with customers and contractors.

Notify provides a way for applications to start and manage a conference, send/receive SMS, send/receive calls and present them with IVR like system.

How Notify processes incoming calls

Notify processes incoming calls using workflow activities.

Any Notify activity that manages incoming phone calls creates a record on the Notify Workflow Activity [notify_wf_activity] table. Each notify_wf_activity record is associated with a single call. These records store JSON data detailing the actions to send to the telephony provider.

Notify processes incoming calls in the following way:

1. A person calls a Notify phone number.
2. Notify launches the incoming call workflow associated with that Notify phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. The workflow reaches a Notify activity and invokes the activity `onExecute()` function.
4. The activity creates a new notify_wf_activity record detailing any actions to take, with a **State** value of execute.
5. Notify sends the specified actions to the telephony provider.
6. The notify_wf_activity record **State** changes to processed.
7. The telephony provider sends a response.
8. Response arguments, such as user input or recording info, are stored as JSON data in the notify_wf_activity **response_args** field.
9. The notify_wf_activity **State** changes to complete.
10. The JSON data from the notify_wf_activity record is copied to the **Last action** field in the Notify call record that triggered the workflow.
11. The workflow invokes the `onUpdate()` function in executing activities.
12. The activity confirms that the associated notify_wf_activity record has completed, and changes the activity state to finished.
13. The workflow transitions to the next activity.

Notify Cisco Webex Connector

Notify Cisco Webex Connector enables you to manage and initiate a Webex meeting directly from an incident.

Key Features

- Start and end Cisco Webex meetings directly from the major incident workbench.
- Manage a Cisco Webex meeting by adding or removing participants.

System Requirements

Install and activate the Notify plugin (com.snc.notify) before you install the application.

Install the ServiceNow IntegrationHub Installer (com.glide.hub.integrations) plugin to design the integration flows in the Workflow Studio application. For more information, see Request IntegrationHub.

Configuring Notify

Configure and use Notify application with the third-party applications in your environment to resolve the incidents.

Activate Notify

You can activate the Notify (com.snc.notify) plugin if you are an administrator. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
Notify activates these related plugins if they are not already active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins for Notify

Plugin	Description
E164 Compliant Phone Number [com.glide.phone_number]	Provides E-164 compliant phone number support.
SMS Preferences [com.snc.sms_pref]	Provides ability to set SMS preferences for receiving messages from different providers.

Note:
If you are upgrading from an earlier version of Notify, the Notify-Twilio driver remains active.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Differences between Notify and Legacy Notify

Describes the differences between the Notify and Legacy Notify applications, including architecture, workflows, Twilio support, and task-initiated conference calls.

Legacy Notify (com.snc.notifynow)	Notify (com.snc.notify)
Is deprecated. Supported only telephony services.	Supports pure conferencing solutions such as Zoom in addition to the Telephony providers like Twilio.
Manage a single number from a Twilio account per instance.	Provides support for multiple numbers per Twilio account, especially cross-geographical scenarios.
Does not include support for customizable workflows for Voice and SMS incoming or outgoing scenarios.	Workflow-driven approach for handling incoming and outgoing Voice and SMS events, making the integration easy to customize.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Notify (com.snc.notifynow)	Notify (com.snc.notify)
Hard-coded join conference SMS and IVR prompts for joining a conference call.	Includes a configurable workflow for handling SMS and Voice IVR prompts.
Support for SMS-based answers.	Notify On Task support for sending SMS and initiating conference calls from any task.

Migrating from Legacy Notify

When migrating to Notify from the Legacy Notify functionality, several changes are made to the instance.

If the Legacy Notify functionality is already enabled, several automatic changes occur when you activate Notify:

- The Legacy Notify menu is removed from the application navigator.
- Two separators are added to the new Notify menu: **Legacy Notify** and **Legacy Notify Admin**. New modules that replace the Legacy Notify modules are added to these sections.

  Note:
  The added modules are not the same modules that were in the Legacy Notify menu. Any customizations made to the Legacy Notify modules are not preserved.

- The notify_admin role allows access to Notify modules.
- The notifynow_admin role allows access to Legacy Notify modules.
- All workflow activities from the Legacy Notify application are moved to the **Legacy Notify** group.

Configure Notify with Twilio

Configure Notify to use the Twilio telephony service.

Before you begin

You must have an SID and authentication token for an active Twilio account (https://www.twilio.com/). You must have a separate contract with Twilio.

You must exclusively use a Twilio account to connect your ServiceNow instance.

Important:
Ensure that each instance on which you configure Notify uses a different Twilio account. Each account specifies a unique account SID, authentication token, telephone numbers, and endpoint. Using the same account across multiple instances may cause your Twilio service configuration to be overwritten.

Account and sub-account are Twilio categorizations, and both act the same for a ServiceNow instance.

Role required: notify_admin

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **Twilio Direct Configuration**.
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the account is not associated with an instance and the connection is successful, a read-only list of E.164 and short code phone numbers associated with this Twilio account appears. This list displays the phone number, supported capabilities such as voice or SMS, the country for each Twilio number, and the Notify number group to which the number belongs.

If the account is already associated with an instance, the system displays an error message. To connect to this account,

- Disconnect the account from the instance.
- Delete the TwiML apps in the Twilio account.

Note:
If you buy or release numbers on the Twilio account, open the configuration page again to refresh the list of numbers. Numbers removed from the Twilio service remain as Notify Number records, but with the **Active** field set to false. Use only active phone numbers for inbound or outbound communication.

What to do next
Phone numbers and short codes are provided by Twilio once the account is successfully connected and are stored on the Notify Phone Numbers [notify_number] table. Assign each number to a number group. Number groups allow you to control which workflows run when using the phone numbers in each number group.

Twilio-Direct callback testing

Make an outgoing call or send an SMS using Twilio and trigger callbacks to ServiceNow to test whether Twilio can reach the instance. You can also view when the last callback test was run, its status, and the test logs.

Before you begin
Role required: admin, notify_admin

Procedure
1. Navigate to **All** > **Notify** > **Administration** > **Twilio Direct Configuration**.
2. Click **Test Callbacks**.
3. Select the SMS option and click **Initiate SMS**.
4. Select the call option and click **Initiate Test Call**.

Note:
The callbacks can be tested only after a connection is established with Twilio.

Advanced configuration for SMS

Use the Twilio co-pilot features to improve SMS delivery with phone number like using multiple numbers to send high-volume messages and content intelligence to automatically format every message without writing custom code. Reach large lists of users with one API request.

Before you begin
Role required: notify_admin

About this task
The Twilio co-pilot features are enabled in your instance once configured. An example of a copilot feature is that you can configure which identity (phone number, shortcode, or alpha sender ID) to use to send a message. You can also spread the messaging traffic over several phone numbers or prioritize an alpha sender ID when sending messages to countries

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

where alpha senders are commonly used. To know more about these features, visit https://www.twilio.com/copilot.

Important:
All the Twilio numbers must be part of the same messaging service for which you have enabled the **Advance SMS Features** feature.

The Twilio Notify bulk SMS feature is used to send SMS in bulk to customers. Use the passthrough `sendBulkSMS` API to reach large number of users across using a single API request. For more information on these features visit https://www.twilio.com/notify

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **Twilio Direct Configuration**.
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.
5. On the **Advance SMS Features** tab, check the **Intelligent SMS Handling** box.

   Note:
   To setup Alpha Sender ID, users need to go to Twilio console.

   When you enable **Intelligent SMS Handling**, the "Messaging Service SID" is used to send the SMS even if a Twilio number is used in Notify.sendSMS API.

6. On the **Advance SMS Features** tab, check the **Twilio Notify Bulk SMS** box.

   Note:
   This feature uses Twilio Notify feature and might have an associated cost. Contact Twilio Support for more details.

Related topics

Using Notify with SMS

Advanced configuration for voice

Configure Answering Machine Detection (AMD) to determine if a human has picked up the call or not.

Before you begin
Role required: notify_admin

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **Twilio Direct Configuration**.
2. On the Twilio Account Properties page, enter your **Account SID**.
3. Enter your **Auth Token**.
4. Click **Connect**.
5. On the **Advance Voice Features** tab, check the **Detect answering machine**box.
6. On the **Advance Voice Features** tab, enter the number of seconds in the **Machine detection timeout** field to set a timeout value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disconnect from a Twilio account

If a Twilio account is already associated with a different system, disconnect the account from the other system before connecting to the current instance.

Before you begin
Role required: notify_admin

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **Twilio Direct Configuration**.
2. On the Twilio Account Properties page, click **Disconnect**.
3. In the Disconnecting Twilio account pop-up window, click **OK**.

   The account is disconnected from the instance. The system clears the **Account SID** and **Auth Token** fields and deactivates the list of associated phone numbers.

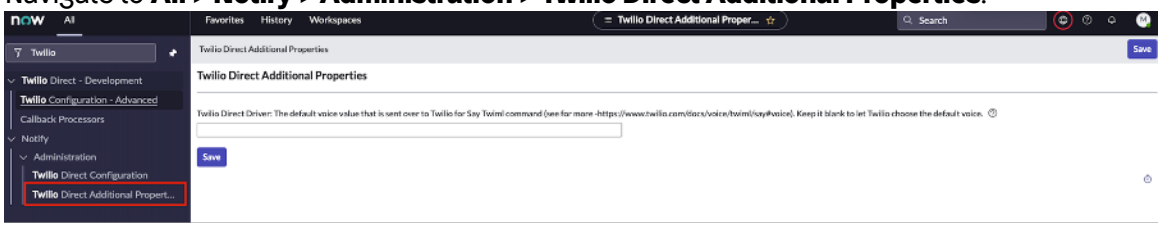
Configure Amazon Polly as default voice tone for text to speech

You can configure Amazon Polly as the default voice by overriding the default voice tone for text to speech.

Before you begin
Role required: notify_admin

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **Twilio Direct Additional Properties**.



2. In the Twilio Direct driver property field, enter the preferred voice tone.

   For example: "`Polly.Joanne`". The ServiceNow® instance passes Polly.Joanne value to the Twilio service and renders the voice in Joanne's tone.

   If you have a new *`San Diego`* or a higher version instance, the voice property will not be defined by default and the voice settings at Twilio will be considered. For more information on Amazon Polly voice, see Twilio Text-to-speech. However, if you are upgrading to *`San Diego`* or a higher release version, the default voice property will be "alice".

   Note:
   If you are defining the property in your ServiceNow® instance, the Twilio voice settings are overridden.

Configure Notify Zoom connector in Notify

Configure Notify to receive the event information from Zoom. An event is usually any action that is related to a meeting.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Notify** > **Zoom** > **Configuration**.
2. Paste the verification token that you recorded on Zoom Event Subscription screen in the **Webhook validation token** field.
3. Save the record.

What to do next

Configure and use Zoom as a conference provider from any of the task records.

Note:
The person creating a conference is the host of the conference and must have their email set in their ServiceNow profile and use the same email for the Zoom account.

You must be signed in to the browser in order to direct to the Zoom client. However, if you are not signed in, you must provide your registration details.

Start a conference call

Set up Notify Zoom connector in Zoom

Use the Notify Zoom connector to expand the Notify communication channel by managing and initiating a Zoom meeting directly from any task record such as an incident or a change.

Before you begin

Role required: admin, Zoom admin

1. Ensure that you have Zoom spoke installed on your instance.
2. Make sure you have the required credentials and connections to Zoom on your instance.
3. Configure the Notify Zoom connector with the same Zoom account with which you created the OAuth app for Zoom spoke.

Procedure

1. On your Zoom OAuth app, navigate to **Feature** > **Add Feature** > **Event Subscription**.
2. Use the toggle button to enable the event subscription feature.
3. In the form that appears, fill in the URL using the following URL format: https://yourinstancename.com/api/sn_notify_zoom/notify_zoom/ZoomEvent
   The URL is used to post information about events in Zoom to your instance.
4. Use the **Add Events** button to list all the events which Zoom is informing Notify about.
5. In the categories that appear, select **Meeting** and select all the meeting-related events from the list and click **Done.**
6. Under **Recording**, select **All Recordings have completed** and **Recording Transcript files have completed** from the list and click **Done**.
7. Click **Save**on the Add feature screen.
   A *`Verification Token`* appears on the Add Feature screen.
8. Record the token by clicking **Copy**.

What to do next

Configure Notify with the verification token from Zoom.

Disable Zoom meeting password

Disable Zoom meeting password so that you can join a Zoom meeting without any meeting password.

Before you begin

Role required: notify_admin or admin

Procedure

1. Navigate to **Notify** > **Zoom** > **Configuration**.
2. Select **Do not set password**.
3. Click **Update**.

Configure a provider in Notify

Configure a conference provider or a phone number to be used as choices for initiating a conference call. For sending SMS, configure preferences for phone numbers.

Before you begin

Role required: notify_admin

About this task

Procedure

1. Navigate to **All** > **Notify** > **Provider Selector**.
2. Click **New**.
3. On the form, fill in the fields.

Provider selector fields

Field	Description
Name	Name of the provider you are adding.
Order	Order in which the provider appears when multiple providers are configured.
Source table	The table to which this provider needs to be added.
Condition	Conditions on the source table based on which provider selectors is applied.
Active	Indicates whether the provider is active.
Catch-all	Selects this provider if no other Provider Selector matches.
Manual selection	Disables the automatic selection of this provider, for example, if in a communication plan you want to use this provider only as a forced communication channel.

4. Click **Submit.**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the Provider Selector Choices section, click **New.**
6. Search for the conference provider or the Notify group that contains the phone numbers for initiating a conference.
   For sending SMS, search for the Notify group that contains the phone numbers.
7. Click **Submit.**

Configure SMS opt-out preferences

Allow recipients to opt out of receiving text messages.

Before you begin

Role required: admin, notify_admin

About this task

According to regulations in the CTIA Short Code Monitoring Handbook, recipients must be allowed to opt out of receiving text messages. The opt-out functionality is applicable only to Notify. When the user sends an SMS message with an opt-out keyword to any Notify number, the user is opted out of receiving messages from only the Notify number to which the message has been sent, not from all Notify numbers on that instance.

Important:
The Advanced opt-out feature is automatically enabled for short code and long code numbers associated with a Messaging Service. For more information, refer Getting Started with Advanced Opt-Out for Messaging Services. As this feature is a duplicate of the Twilio's new Advanced Opt-out feature, you should not activate the feature for numbers that are part of Messaging Service. For long code numbers that are not part of a Messaging service, Twilio handles the opt-out for default stop keywords listed at Twilio support for opt-out keywords.

This feature is disabled by default and holds significance for short-code and long codes that are not part of Messaging Service. To enable this feature, the Notify admin.

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **SMS Preference Configuration**.
2. Click **New** in the SMS Preference Configuration window.
3. Fill in the form fields.

SMS configuration preference fields

Field	Description
Provider	Select the provider for which you are configuring the SMS preferences.
Name	A user-friendly name for the configuration.
Order	Order in which the preference configurations apply. If you have multiple configurations, this field indicates which configuration to consider first.
Default preference	The default preference for the configuration. The two options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Opt-in**: Users by default will receive SMS messages. ○ **Opt-out**: Users by default will not receive SMS messages. They can start receiving SMS messages from a specific Notify number after sending a message with an opt-in keyword like START or BEGIN.
Enable for long code	Option that enables the opt-out feature for long code or toll-free numbers.
Enable for short code	Enables the opt-out feature for short codes only.
Opt-out keywords	Keyword replies that prevent a customer from receiving new messages from the phone number they're responding to. You can configure standard keywords such as STOP, STOPALL, END, CANCEL, QUIT, and UNSUBSCRIBE.
Opt-out confirmation message	Customized confirmation message to send to customers when they opt out of receiving SMS messages.
Opt-in keywords	Customized confirmation responses that enable customers to receive the messages coming from a phone number. You can configure standard keywords such as START, UNSTOP, and YES.
Opt-in confirmation message	A customized confirmation message to send to customers when they opt in to receiving SMS messages.

4. Click **Submit**.

Configure Notify Cisco Webex Connector

Configure the Notify Cisco Webex Connector in your environment to be able to use Cisco Webex application for making conference calls.

Install Notify Cisco Webex Connector

You can install the Notify Cisco Webex Connector application (sn_notify_webex) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Notify Cisco Webex Connector application (sn_notify_webex) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Create a Cisco Webex app

Create an app in Cisco portal to make outbound calls from an incident using Webex.

Before you begin

Role required: Cisco admin

Procedure

1. Log in to Cisco admin portal.
2. Navigate to **Start Building Apps** > **Start Building Apps** > **Create a New App** > **Create an Integration**.
3. On the form, fill the details for the integration app.

   a. **Will this integration use a mobile SDK**: Select **No**.

   b. **Integration name**: Option to provide the name for the Notify with Cisco Webex app.

   c. **Icon**: Option to choose an icon for the app.
   Select upload to select an icon for the Cisco Webex app.

   d. **Description**: A brief description of the app.

   e. **Redirect URI(s)**: URL of your ServiceNow instance.
   The URL should be of the format: "http://<instance_url>/oauth_redirect.do" where <instance_url> is your instance URL.

   f. **Scopes**: Option to select the scopes that are required for conference calls.
   Select **meeting:admin_participants_read**, **meeting:admin_schedule_read**, **meeting:admin_schedule_write**, and **spark:all**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Select **Add Integration**.

The app is successfully created. Save the **Client ID** and **Client Secret** by clicking on the **Copy** button in a notepad.

You must update the **Client ID** and **Client Secret** values in your ServiceNow instance.

Configure OAuth entity for Notify Cisco Webex

Configure the Cisco Webex as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **Cisco Webex Teams spoke**.
3. Update the following values in the application registry.
   - **Client ID**: Paste the client ID generated while creating the Cisco integration app.
   - **Client Secret**: Paste the client secret generated while creating the Cisco integration app.
   - **Redirect URL**: Provide your instance details of your ServiceNow instance. The URL should be of the format "http://<instance_url>/oauth_redirect.do" where <instance_url> is your instance URL.
4. Select **Update**.
5. Select **OAuth Entity Scopes** tab.

   The following scopes are available by default:
   - meeting:admin_participants_read
   - meeting:admin_schedule_read
   - meeting:admin_schedule_write
   - spark:all

Create an OAuth credential record for Notify with Cisco Webex

Create a credential record for the Notify with Cisco Webex account.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

   The system displays this message: `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth 2.0 Credentials form

Field	Description
Name	Name to uniquely identify the record. For example, Cisco Webex Teams Cred.
Active	Option to actively use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Cisco Webex Teams as an OAuth provider. For example, Cisco Webex Teams OAuth Profile.
Applies to	Option to specify if the credential applies to all MID Servers in your network, or to one or more **Specific MID servers**. Specify the MID Servers that should use this credential in the **MID servers** field.
Order	Order to apply this credential. For example, 100.
Credential alias	Credential alias associated with the spoke.

5. Right-click the form header and click **Submit**.
6. Select the **Get OAuth Token** related link.

   You must log in to Cisco Webex account to retrieve the token details.

   Enter the email address of the Cisco account that connects your ServiceNow instance with Cisco Webex portal. This email address should be unique and can't be assigned to any user. Ex: cisco_servicenow@webex.com.

   On successful authentication, a confirmation message is displayed on the header.

Create a connection and credential alias for Notify connector for Cisco Webex Spoke

Create a credential record for the Notify connector for Cisco Webex account. The Notify connector for Cisco Webex Spoke connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select the **CiscoWebexTeams** record.
3. Select **New** under **Connections** tab.
4. On the form, fill these values.

Connection & Credential for Cisco Webex Teams

Field	Description
Name	Name for the HTTPS connection record for Cisco Webex Teams spoke

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credentials	Name of the credential created for Cisco Webex Teams spoke Provide the value created in “Create a OAuth credential record for the Cisco Webex Teams spoke”.
Connection URL	Option to provide the connection URL. Provide the value as https://webexapis.com

5. Right-click the form header and click **Submit**.

Make Notify Cisco Webex Connector as default communication channel

Make Notify Cisco Webex Connector as a default communication channel to initiate a meeting to resolve the major incidents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Notify** > **Provider Selector**.
2. Select **New**.
3. On the form, fill in the fields.

Provider Selector

Field	Description
Name	Name of the provider you are adding. For Example, Notify Cisco Webex.
Order	Order in which this provider appears when multiple providers are configured.
Source table	The table to which Notify Cisco Webex must be added. For Example: incident.
Active	Option for indicating whether Notify Cisco Webex as a provider is active.
Default	Option for making Notify Cisco Webex the default provider if other notify providers like Zoom or Twilio are configured. Enable the default option.

4. Select **Submit**.
5. Select the newly created service provider.
6. In the **Provider Selector Choices** section, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **Webex** as the conference provider.

7. Select **Submit**.

Manage Notify properties

Manage the Notify Webex Connector application properties to configure the meeting capabilities.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Notify** > **Administration** > **Notify Properties**.
2. On the form, fill the fields.

Notify properties

Field	Description
Enable Notify integration for Task table and extensions	Option to enable Notify integration for Task table and extensions. Select the check box.
Enable Notify integration for Incident Communications Management. Entering phone number in 'com.snc.iam.notify_number' property is equivalent to setting this to true.	Option to use Notify Webex Connector for incident and major incident-related records. Select the check box.

3. Select **Save**.

Using Notify

Use the service providers to schedule the conference calls with the stake holders to resolve the incidents.

Using Notify with SMS

Send and receive SMS messages using Notify.

Notify stores inbound and outbound SMS messages in the Notify Messages [notify_message] table.

Notify supports sending concatenated SMS messages. Messages that exceed 160 characters, or 70 unicode characters, are split into multiple messages. This may affect your total telephony cost because each message can incur a cost. Some mobile carriers, such as Sprint, do not support concatenated SMS messages.

To send SMS messages to an individual recipient, use the Notify API `sendSMS` method. This method takes one recipient as an input parameter. You can also use the **send SMS** workflow activity.

To send SMS messages to one or more recipients, use the Notify API `sendBulkSMS` method. This method takes a list as an input parameter and uses one API call to send multiple messages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Include the list of phone numbers in an array in the API call. This method improves performance by streamlining platform checks and Notify number validation.

Note:
When using *SNC.Notify.sendBulkSMS* API, instead of simply iterating over the numbers, all the given numbers are sent for SMS to Twilio in one API call. This happens only when Twilio Direct driver is active and Twilio Notify bulk SMS is enabled for the number in Advanced SMS features.

The Notify-Twilio integration provides programmable SMS outbound message status tracking with Status Callbacks. These callbacks can be helpful to see if a message has been delivered, failed, or ran into some other delivery issues.

SMS Statuses

Every Twilio SMS message request has a status value which describes the current state of the message. Use this information for troubleshooting SMS related incidents/ issues. Here are few descriptions of possible statuses of SMS sent from Notify through Twilio REST API.

Outbound message status progression

Status	Description
queued	The message has been queued by the provider to be sent to the carrier network.
accepted	The message is being processed by the provider before sending it to the carrier network.
sending	The message is being forwarded to the carrier network.
sent	The message has been successfully forwarded to the carrier network.
receiving	The provider has received an incoming message from the carrier network and is processing it.
received	ServiceNow has received the incoming message from the provider.
delivered	The message has been delivered to the target device. **Note:** A provider may not be able to report this status if the upstream carrier does not report this.
undelivered	The message could not be delivered to the target device. **Note:** A provider may not be able to report this status if the upstream carrier does not report this.
failed	The message failed to be forwarded to the carrier network.
unknown	The driver does not support the status

Send an SMS with Zoom meeting invite

Send an SMS with Zoom meeting invite to ensure that the meeting participants or any newly added participant is updated with the meeting details when the meeting host starts the conference or adds a participant to the conference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: notify_view, notify_admin or admin

Note:
You need a telephony provider like Twilio or Nexmo.

Procedure

1. Navigate to **All** > **Notify** > **Zoom** > **Configuration**.
2. In the **Run Workflow on conference change** field, enter `Notify Zoom: Send SMS on Conference Change`.
   The Notify Zoom: Send SMS on Conference Change workflow is available with the demo data of the Notify Zoom Connector plugin (sn_notify_zoom).
3. Click **Update**.

Outbound communication requirements

Outbound communications initiated through Notify, such as phone calls and SMS messages, must satisfy recipient number requirements.

Recipient number requirements

These requirements apply to any number that receives a Notify phone call or message.

- The number must be E.164 compliant.
- The number must be different than the phone number used to initiate the call or message.

These requirements apply to all outbound communication initiated through Notify, such as by using Notify workflow activities or the Notify JavaScript API.

Invalid numbers prevent Notify workflows from running and cause an error to be logged. Set the **glide.notify.debug** property to true to create detailed error logs.

Using Notify for making conference calls

Notify administrators, major incident managers, or communications managers can manage conference calls.

Conference call records are stored on the Notify Conference Calls [notify_conference_call] table. Conference call participant records are stored on the Notify Conference Call Participants [notify_participant] table.

Conference call and participant records are created automatically when starting and connecting to a conference call. Most fields, such as the **Duration** of a call, are set automatically using business rules.

Note:
If a participant attempts to join a conference call using an invalid phone number, the caller is added to the participant list and the phone number is marked with a status of **Invalid**.

Notify administrators, major incident managers, or communications managers can manage conference call participants.

Several conference call workflows are available by default. These workflows can be used for incoming and outgoing calls and incoming SMS messages. Conference call workflows are:

- Notify: (Re)join Conference Call
- Notify: Join Conference Call Via SMS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Notify: (Re)join Conference Call with muting

> **Note:**
> Notify: (Re)join Conference Call with muting is available only with demo data.

The number groups Conference Call Group and Notify On Task Group use these conference call workflows by default.

Start a conference call

Start a conference call from a task or an incident communication plan by inviting one or more users to join a call. The conference will not start until at least two participants join.

Before you begin
Role required: notify_view, incident_communication_manager

About this task
Call participants can include:

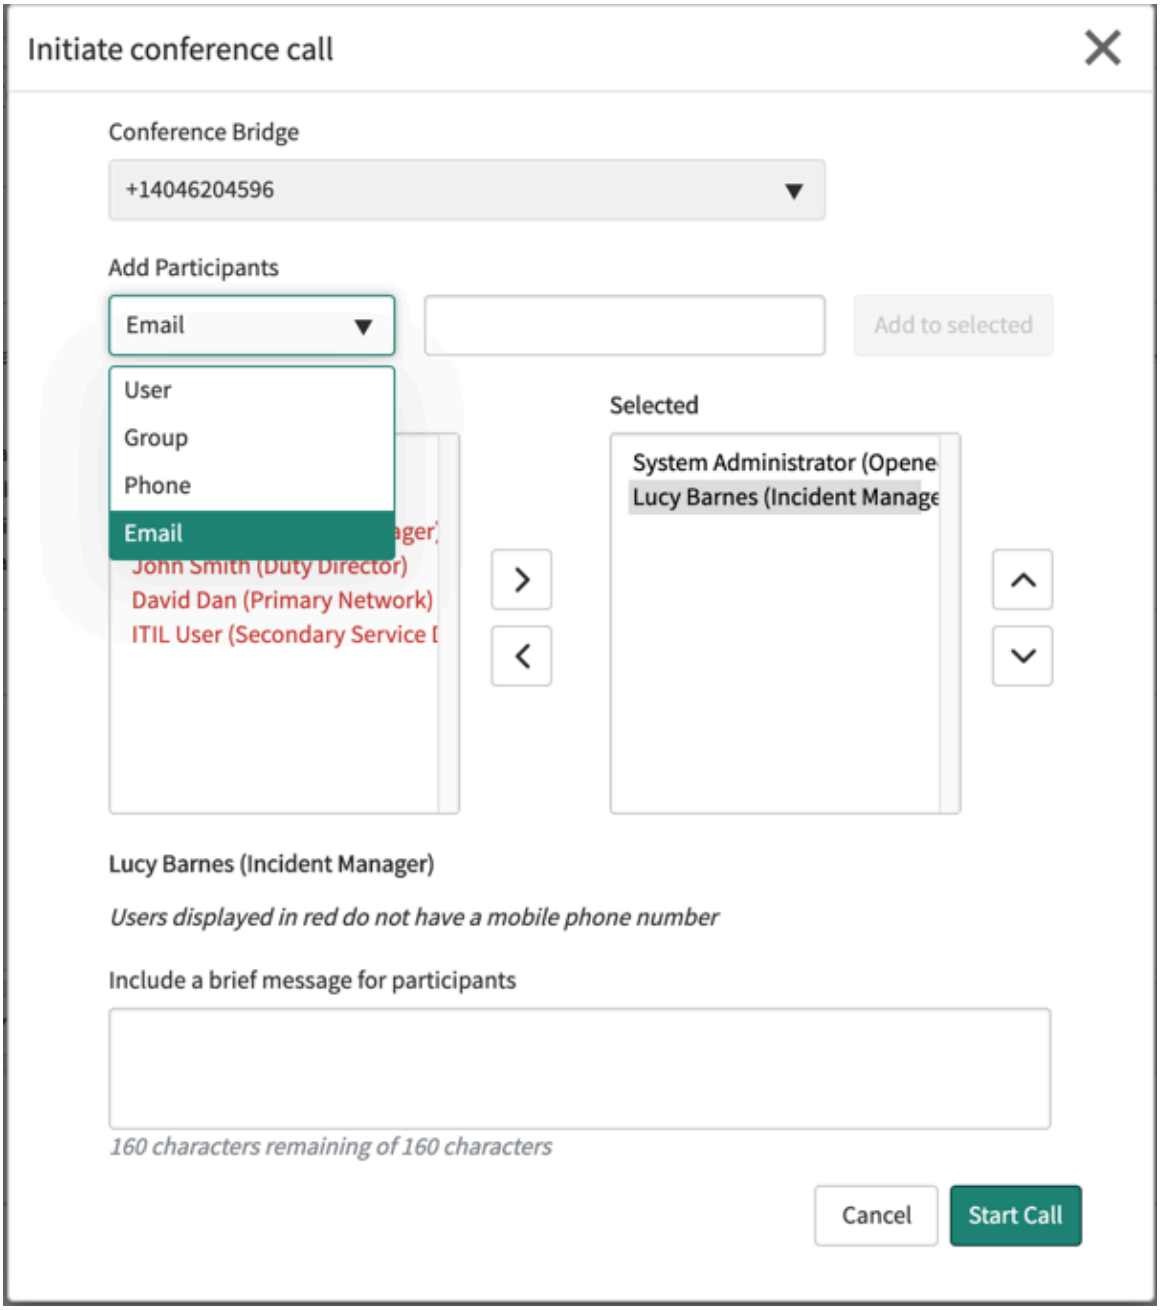
- Users who have been assigned specific responsibilities
- Ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Open**.
2. Open the relevant incident communication plan.
3. Click the **Initiate Conference Call** related link.
4. From the dialog box that appears, choose the **Conference Bridge** that you want to dial from.
5. Select the participants for the conference.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Initiate a conference call



The dialog box displays the Recommended and Selected participants for the conference. All users from the **User Contacts**list in the incident communication plan are in the Recommended section by default. The user who initiates the conference call is added to the selected list of participants.

If a shift exists for the group contacts, the primary and secondary on-call resources are shown in the **Recommended** list.

Calls are placed to the number in the **Mobile** phone field on the user record. If that information is blank, the user cannot be contacted through Notify. The mobile phone number has to be an E.164 compliant phone number. If the phone number is a local number, without the + prefix, the number will be retrieved based on the user's location and, if possible, converted into a valid E.164 number.

6. To select ad-hoc participants,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Click the reference lookup icon, and select the relevant user.	Click **Add to selected**.
Enter the participant's phone number	Click **Add to selected**.

7. After the participant list is finalized, click **Start Call**.
   The conference call starts and a **Conference call initiated** message is displayed at the top of the incident communication plan form. Each user is called and can accept the call to join the conference.
8. Click the **Conference call initiated** message to see details of that conference call.
   When the final participant leaves the conference, the conference call closes.

> **Note:**
> VoIP phone systems, which do not use touch tone phones, may encounter issues with recognizing key presses. To avoid problems, ensure that conference call users use touch tone phones, or configure your VoIP system settings to recognize key presses, as described in your VoIP system documentation.

Add participants to a conference call

Add a participant to a conference call using Notify.

Before you begin

Role required: notify_view, notify_admin, major_incident_manager, or communication_manager

About this task

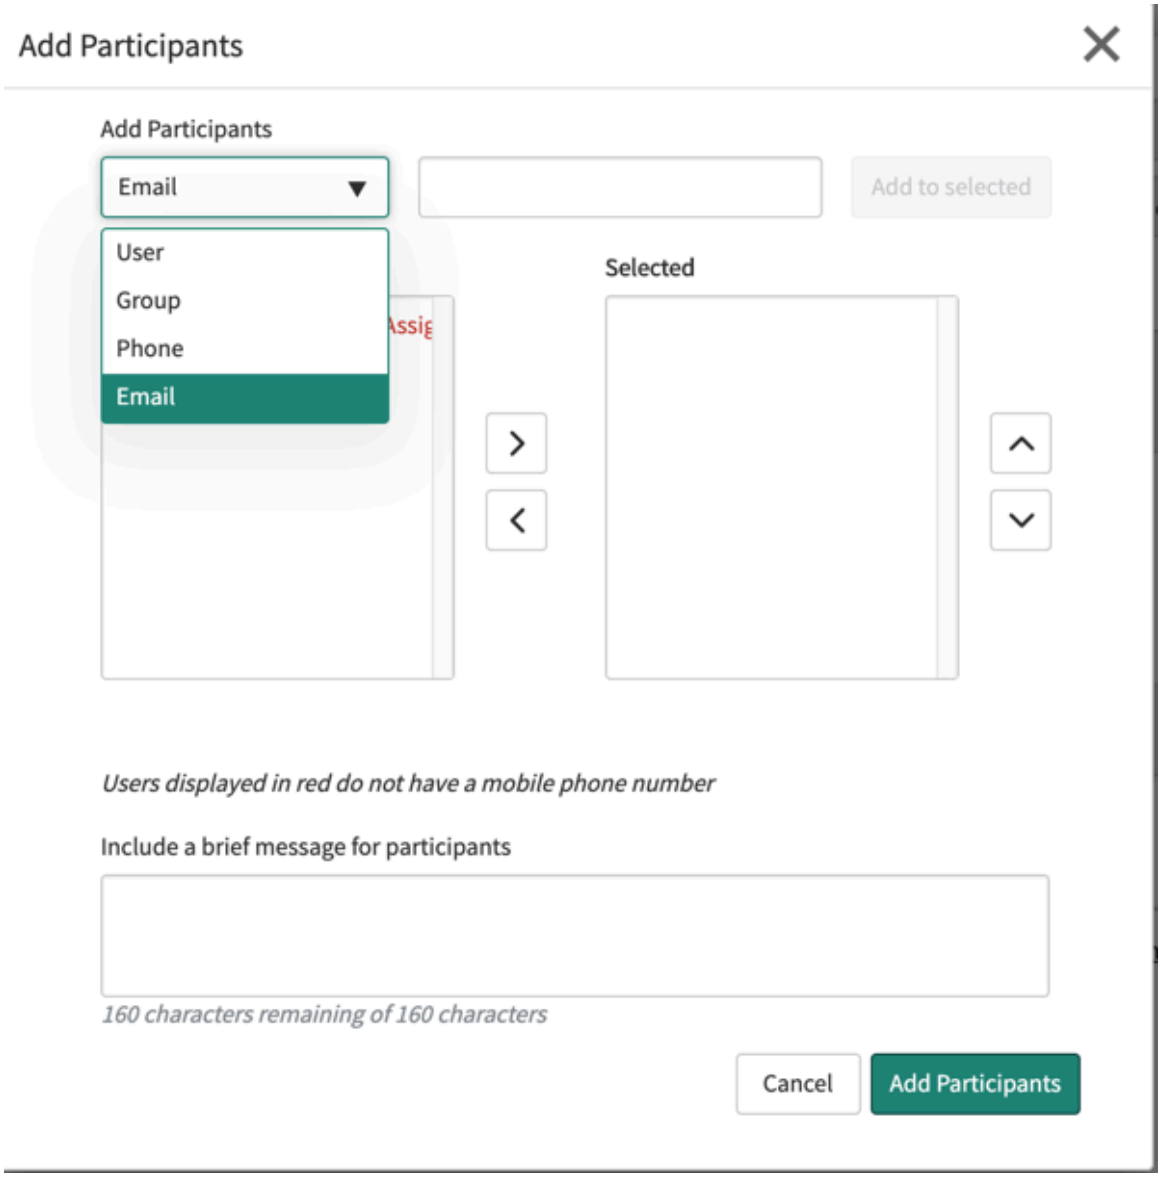
You can add the following participants:

- Users who have been assigned specific responsibilities
- Required ad-hoc user contacts
- Other involved parties who are not recorded as users, such as third-party contacts

Procedure

1. Navigate to **All** > **Notify** > **Conference Calls**.
2. Open the conference call that you want to add a participant to.
3. Click the **Add Participant** related link.
4. In the dialog box that appears, select the participants you want to add to the conference.
   You can add a single participant, a group of participants, or a phone number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. You can send a message for the participant who you want to add in the **Include a brief message for participants** field.
6. Click **Add Participant**.
   The selected user, group, or phone number is added to the selected conference call.

Mute or remove a conference call participant

Mute or unmute all participants

As a communications manager or a conference call host, mute/unmute all the conference participants from the workbench.

Before you begin

Role required: notify_view, notify_admin, major_incident_manager, or communications_manager
Before starting this procedure, ensure there is an active conference call with one or more participants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Major Incident Management** in the application filters.
2. Select the incident that you are trying to resolve.
3. On the incident, click **View Workbench**
4. In the **Conferences** tab, select a conference

Option	Description
Mute All	Click this button to mute all the participants in the conference
Unmute All	Click this button to unmute all the participants in the conference

Mute or remove a conference call participant

As a communications manager, you can mute or kick conference call participants.

Before you begin

Role required: notify_view, notify_admin, major_incident_manager, or communication_manager
Before starting this procedure, ensure there is an active conference call with one or more participants.

Note:
Any participant with the host flag set to active, can mute or kick a participant from a conference call.

Procedure

1. Navigate to **All** > **Notify** > **Conference Calls**.
2. Select a conference call.
3. In the **Notify Conference Call Participants** related list, select a participant.
4. Click **Mute** or **Kick**.

Note:
You can unmute a muted participant. A kicked participant may rejoin the conference call by calling in again.

Send a message to conference call participants

Send a brief message as a text or voice message to the participants of a conference call to set a context to the call.

Before you begin

Role required: notify_view, or major incident manager

About this task

You must configure a telephony provider like Twilio so that you can use one of the Notify numbers to send SMS to the conference call participants.

Procedure

1. Navigate to **All** > **Major Incident Management** > **View Workbench**.
2. In the **Conference** tab, select the type of the call and click **Start Call**.
3. In the **Include a brief message for participants** field, type the message that you want to send to the conference call participants and click **Start Call**.

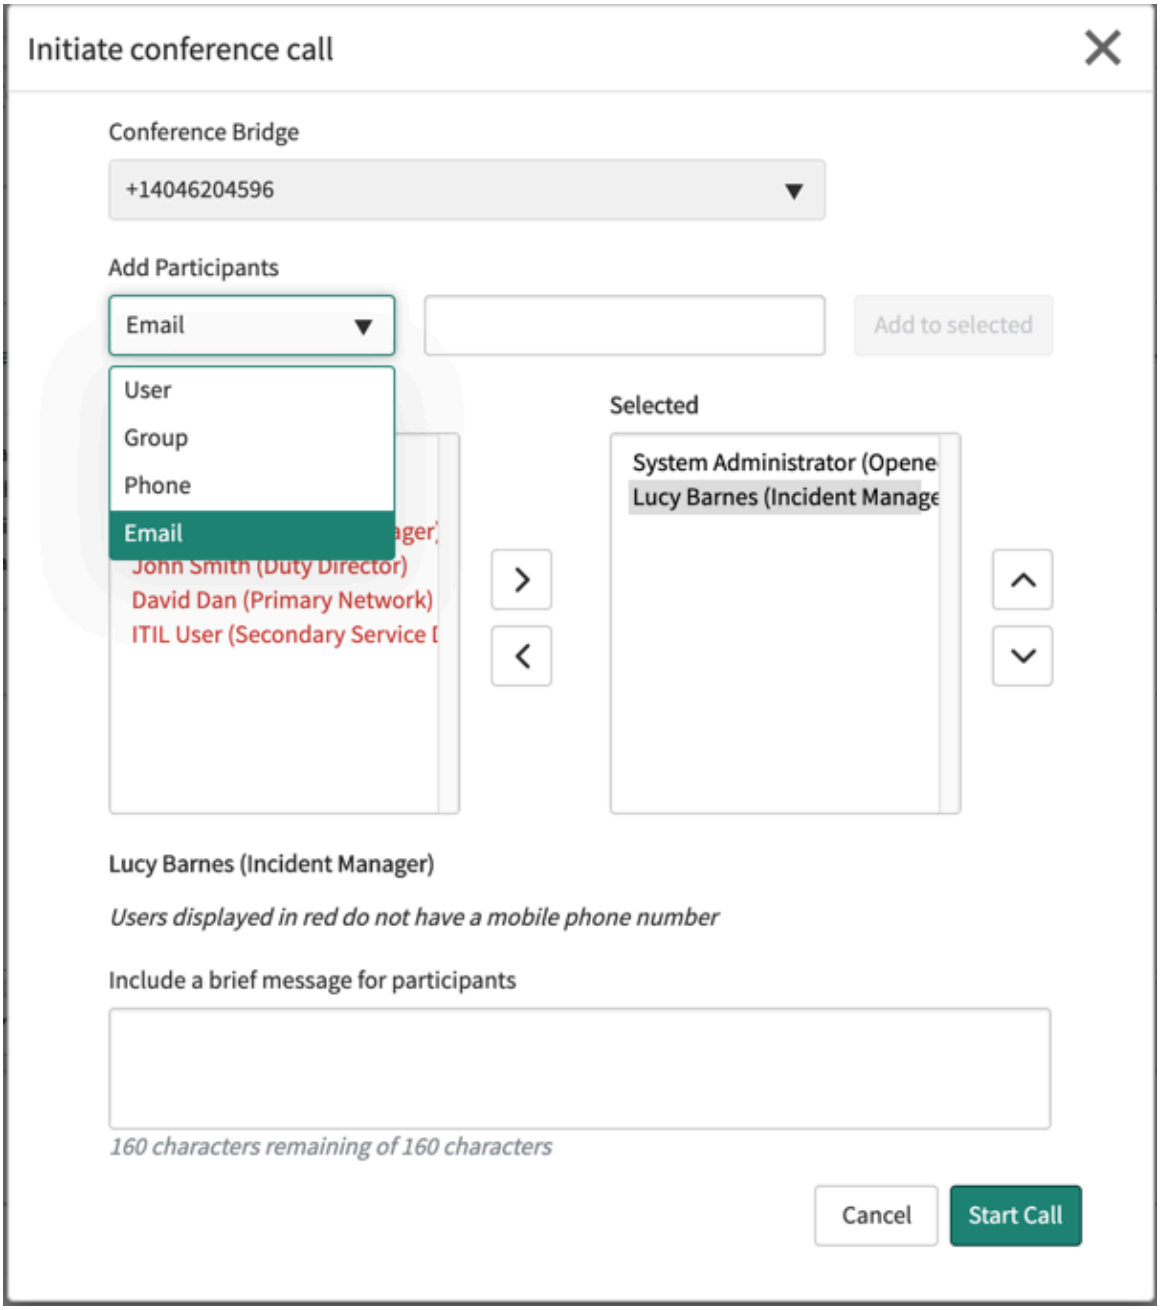
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Initiate a conference call



Note:
Upon clicking **Start Call** the message text entered will be stored as description on the conference call record. If the OOB workflow is not modified, then the workflow takes care of sending this message text as SMS to the user. This is applicable if you have configured a telephony provider.

Viewing conference call information

Conference calls are listed as system activities in the **Activity** section of the Incident Communication Plan form and also are listed in the **Conference Calls** related list.

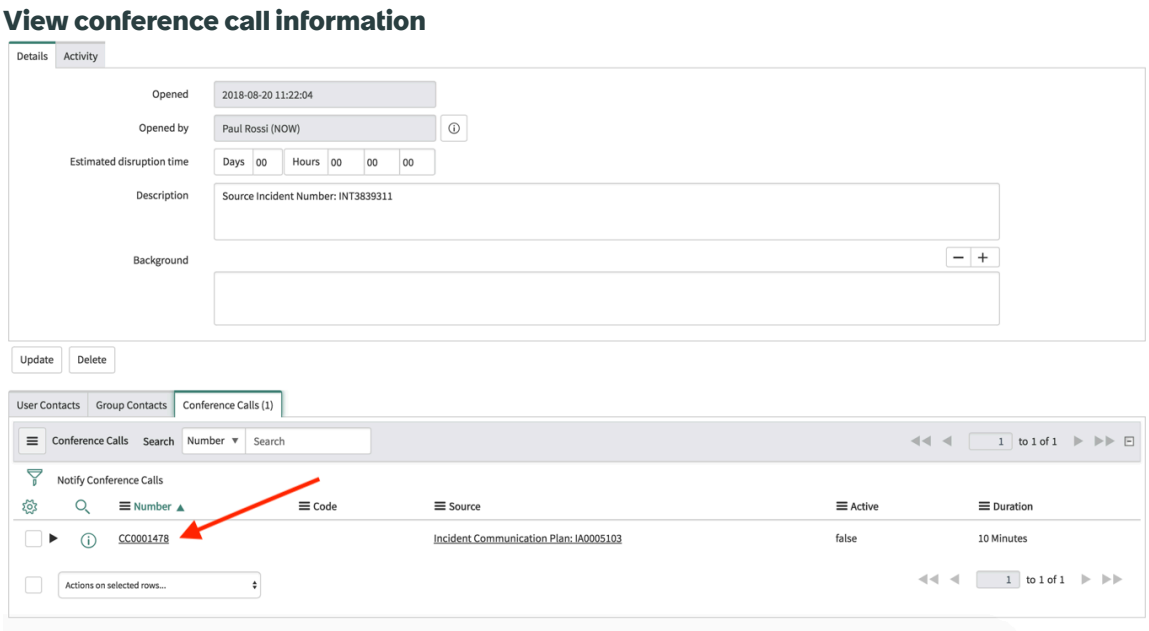
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



List of Notify calls

If you are a Notify administrator, you can view a list of calls and the status of a call made to or from Notify. The call records help in reporting and analytics.

To view a list of calls, navigate to **Notify** > **Calls**.

Call records are generated automatically when a user calls a Notify number or when a user makes an outbound call through Notify. You cannot create call records manually.

Note:
Although you can delete a call record, doing so may result in cascade deletion of related records.

For Notify calls where the source is specified, such as a task number, the source is added to the Notify Calls [notify_call] table in the **Source** column. For Notify conference calls where the source is specified, the source is added to the records for each of the calls in the conference.

Call status	Description
initiated	The number has just been dialed
ringing	The call is currently ringing.
in_progress	The call was answered and is currently in progress.
no_answer	The call was not answered.
completed	The call was answered and has ended normally.
busy	The caller received a busy signal.
failed	The call could not be completed as dialed, most likely because the phone number was non-existent.
invalid	The call could not be connected since input is invalid.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Call status	Description
unknown	The driver does not support the status

Using Notify with tasks

Notify allows you to initiate conference calls and send SMS alerts from task records.

This functionality is available for all tables that extend the Task table, such as incident, problem, or change request. All calls and messages made from tasks are initiated using a single Notify phone number (E.164 or short code). You can configure which phone number is used by setting the property **glide.notify.task.phone_number**.

Start a conference call from a task

Use Notify to start conference calls from a task record.

Before you begin

Role required: notify_view, or itil
Notify must be set up before you can use Notify on task. Ensure there are Notify phone numbers (E.164 or short code) in number groups with phone call workflow.

Use **glide.enable.notify_on_task** property to enable Notify integration for Task table and its extensions. Entering phone number in **glide.notify.task.phone_number** property is equivalent to setting **glide.enable.notify_on_task** to true.

Procedure

1. Navigate to any task record, such as an incident or change request.
2. Click the **Start conference call** related link.
3. Select one or more **Recipients** to participate in the conference call.
4. Click **Start**.
   Any conference call records created from a task are associated with that task. You can view associated conference calls from the task record in the **Conference calls** related list. You may need to configure the form to add the related list.

Manage conference calls on task

Add and manage multiple participants on the conference including self-joining in to the conference call and end the conference call when the discussion is over.

Before you begin

- Role required: notify_view, itil, itil_admin, or admin
- A conference call is already initiated.

About this task

The **Manage Conference Calls** UI action is available for any table that extends the Task [task] table. If at least one conference call is active on a task record, the link appears on the related links section of the form. Out of the tables that extend the task table, the **Manage Conference Calls** UI action is intentionally hidden for Incident Communication Plan [incident_alert] table and Communication Task [comm_task] table. For these two tables, the functionality is already available as **Join conference call** and **End conference call** UI actions.

Procedure

1. Navigate to any task record such as Incident, Problem, or Change Request.
2. Open the record on which the conference all is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the related links, click **Manage Conference Calls**.
4. In the Manage Conferences window, you can perform the following activities:

Options	Description
Join Conference Call	If the logged in user is not already a part of the conference call, the user can join the conference.
Add Participants	Add participants to the conference who can contribute to the discussion.
End Conference Call	End the conference when the discussion is over.

5. **Optional:** In the Manage Conferences window, click the conference call number to know the details of the conference.

Send an SMS alert from a task

Use Notify to send information related to a call through SMS alerts from a task record.

Before you begin

Role required: notify_view, or itil

About this task

Ensure that there are Notify phone numbers (E.164 or short code) in number groups with SMS workflows.

Use **glide.enable.notify_on_task** property to enable Notify integration for Task table and its extensions. Entering phone number in **glide.notify.task.phone_number** property is equivalent to setting **glide.enable.notify_on_task** to true.

Procedure

1. Navigate to any task record such as an incident or a change request.
2. Click the **Send SMS** related link.
3. In the **From** choice list, select the phone number from which you want to send the SMS message.
4. Select and add the participants to whom you want to send the SMS message.
   All users from the **User Contacts** list in the incident communication plan are in the Recommended section by default.

   The dialog box displays the Recommended and Selected participants you selected to send an SMS message.
5. To select ad-hoc participants, choose one of the following actions.

Option	Description
Click the reference lookup icon and select the relevant user	Click **Add to selected**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Enter the participant's phone number	Click **Add to selected**.

6. After the participant list is finalized, type the message you want to send to the participants in the **Message** field and click **Send SMS**.

Result

Any SMS records created from a task are associated with that task. You can view associated SMS messages from the task record in the **SMS Messages** related list. You might need to configure the form to add this related list.

Using Notify with Incident Communications Management

Use Notify with incident communication plan to send SMS messages or start conference calls.

Certain configuration steps are required to use Notify with an incident communication plan.

- Both Notify and Incident Communications Management must be active.
- Notify must be configured and able to initiate and receive phone calls and SMS messages.
- The property **com.snc.iam.notify_number** must be set to an active Notify number with outgoing voice and SMS capability.
- This Notify number must belong to a number group configured with inbound and outbound conference call workflows.

Note:
The Conference Call Group number group is configured with conference call workflows by default.

Join and end a conference call from incident communications management

After a conference call is initiated, join the call to participate in the discussion or end the call when the conference is no longer required.

Before you begin

Role required: notify_view, ia_admin or admin

Procedure

1. Navigate to **Incident Communications Management** > **All**.
2. Open the relevant incident communication plan.
3. Click the **Conference** tab.
4. For the relevant incident communications task, under **Actions**, perform one of the following actions.

Send communication updates for an incident communications plan

Update users on the latest communication on an incident through selected communication channels.

Before you begin

- Role required: notify_view, or admin
- Activate the Notify plugin (com.snc.notify) if you want to send communication through SMS.
- Set at least one communication channel for a communication task as SMS or email.

Procedure

1. Navigate to **Incident Communications Management** > **All**.
2. Open an incident communication plan record.
3. From the Incident Communication Tasks related list, open the incident communication task for which you want to send updates.
4. In the related links, click **Start Updates**.
5. Fill the required information and click **Send**.
   For sending an SMS communication, in the **From** choice list, select a number from which you want to send the communication.
6. Click **Send**.

Incident Communications Management

Using Notify with On-Call Scheduling

When using both Notify and On-Call Scheduling, you can send On-call escalation notifications as SMS messages, in addition to emails.

Configure the following items to use Notify with On-Call Scheduling:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses (via On-Call: Check Assignment Response) that accepts or rejects an on-call assignment and to handle outbound voice calls (via On-Call: Assign by Acknowledgement Voice) to accept or reject assignments.
- You must configure workflows, such as the On-Call: Assign by Acknowledgement to drive escalations via SMS and Voice.

Set up Notify with On-Call Scheduling

You can configure on-call scheduling to use Notify functionality to send SMS alerts and assign users to tasks based on the SMS responses.

Before you begin

Ensure that the Notify and On-Call Scheduling plugins on your instance are activated.

Role required: notify_view, or admin

About this task

Set up Notify with On-Call Scheduling for the first time or migrate from On-Call Scheduling with NotifyNow.

Procedure

1. Navigate to **All** > **Notify** > **Numbers**.
2. Select the phone number you want to use to send and receive on-call scheduling messages.
3. In the **Notify group** field, select the **On-Call Group**.
   The On-Call Group is configured with the on-call workflows: **On-Call: Check Assignment Response**and **On-Call: Assign by Acknowledgement Voice** by default.
4. Navigate to **Workflow** > **Workflow Editor**.
5. Select the **On-Call: Assign by Acknowledgement** workflow.
6. Click the workflow menu icon in the title bar and select **Copy** to copy the **On-Call: Assign by Acknowledgement per rota** workflow.

   Save the copied workflow under a different name than what it is named by default.

   Note:
   You must avoid modifying default workflows and instead choose to copy and then modify the required workflow.

7. Select a **Send SMS** activity.
8. In the **To (script)** field, modify the `getRecipientsAndNumberToSendFrom()` to use the correct value from `getNotifyNumber()` notify number's sys ID.
9. Close the **Workflow Editor**
10. Navigate to **On-Call Scheduling** > **Trigger Rules**.
11. Select a trigger rule that launches an assignment workflow
12. In the **Trigger action** field, select **Workflow**.
13. In the **Trigger workflow** field, select the On-call: Assign by Acknowledgement workflow.
14. Click **Update.**
15. Repeat the previous 3 steps for each assignment trigger rule.
    Each time the conditions for one of these trigger rules is met, the On-call: Assign by Acknowledgement workflow runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow editor title bar

Controlling the on-call communication channel with Notify

Configure On-Call Scheduling with Notify to always use a user's preferred communication channel.

If **Force communication channel** is specified in the **Escalation settings** for rosters, the preferred user device is used: SMS, voice, or email.

For example, if the preferred device is SMS and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The fact that the user could not be reached is logged.

Related topics

Subscription-based notifications

On-Call Assign by Acknowledgement workflow

The **On-Call: Assign by Acknowledgement** workflow is provided with Notify.

The workflow uses data from the escalation settings, including overlapping shifts and custom escalation settings, of shifts and rosters. Depending on these escalation settings, the workflow iterates through the defined escalation chain and sends notifications by SMS, email, or voice to users asking them for incident assignment. The workflow respects time-off as specified in the rosters. People who have time-off are not included in the escalation chain and no notifications are sent to them.

When you install both On-Call Scheduling and Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment. Before you can send notifications, you must define trigger rules. Trigger rules determine the conditions that must be met before a notification is sent and what action must be taken.

Call a user from the WebRTC UI

Make outbound calls and receive a voice call in the browser through the WebRTC interface from On-Call Schedules landing page, Roster and Escalation Details dialog box and on-call calendar.

Before you begin

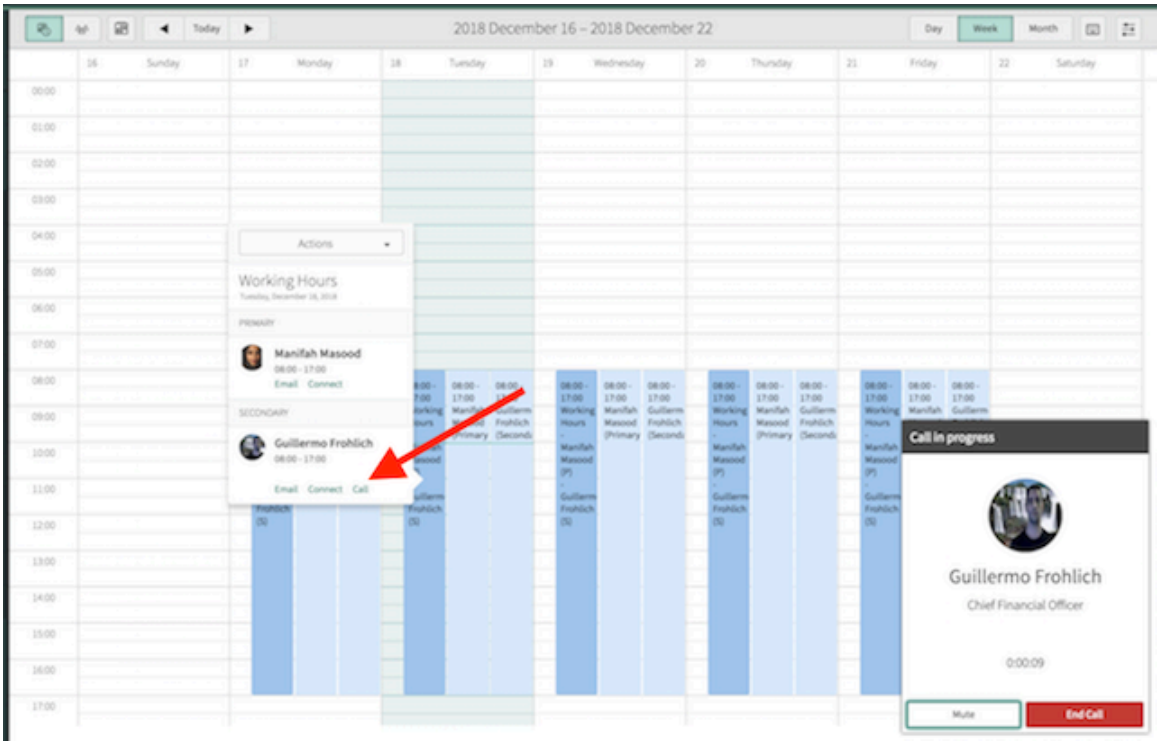
Role required: notify_view, or itil

Procedure

1. Navigate to **All** > **On Call scheduling** > **On Call calendars**.
2. In the calendar that opens, click the name of the user you want to call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Choose **Call** to call the user.



Key differences between on-call scheduling with NotifyNow and with Notify

There are key differences between on-call scheduling with NotifyNow and on-call scheduling with Notify.

Tracking responses to questions

The On call:Assign by Acknowledgement workflow no longer uses the Notify Question tables to track assignment responses. When you install On-Call Scheduling with Notify, the message_number column is added to the Notify Messages [notify_messages] table to track responses to on-call assignment requests. This column indicates if the contacted user accepted or rejected the assignment.

Using the Notify Cisco Webex Connector with a major incident

Initiate a conference call from the major incident workbench by inviting one or more users to join a call.

Notify administrators, major incident managers, or communications managers can manage conference calls.

Create a collaborative communication task from MIM workbench

Create a communication plan or add a new communication task to an existing communication plan to resolve a major incident from the major incident management workbench.

Before you begin

Role required: notify_view, or admin

Procedure

1. Navigate to **All** > **Incident** > **Major Incidents** > **Open**.
2. Open the relevant major incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **View Workbench**.
4. Select **Collaborate** tab.
5. Select **Add** that appears in the **Communication Tasks** section.
6. On the form, fill the fields.

Collaborative Task

Field	Description
Task Short description	Option to provide a short description for the communication task.
Channels	Option to choose the channel for communication. Select **Conference**.
Frequency	Option to select the frequency at which the task must be executed. A task can be executed only once or on specific durations.
Due in (Minutes)	Time span by when the task must be executed after the task initiates.

7. Select **Next**.
8. In the **Manage Recipients** tab, add the users required to be involved in the major incident communication plan.
9. Select **Add**.

Initiate Notify Cisco Webex conference from MIM workbench

Initiate a Webex conference from the MIM workbench to work towards the resolution of the major incident.

Before you begin

Role required: notify_view, or major_incident_manager

Procedure

1. Navigate to **All** > **Incident** > **Major Incidents** > **Open**.
2. Open the relevant major incident.
3. Select **View Workbench**.
4. Select **Collaborate** tab.
5. Select **Initiate** button.
6. On the form, fill the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Initiate task dialog box table

Field	Description
Conference Bridge	Option to select the conference bridge for the meeting. The Conference Bridge will be selected as Webex only Webex is the default provider selector.
Add Participants	Option to add the users and the stakeholders to work towards the resolution of the ticket. ○ **Users**: Enter the name of the user to include in the call. ○ **Group**: Enter the group of users to be included in the call. ○ **Email**: Enter a valid email of the participant to be included in the call. After adding the required stakeholders, click **Add to selected**.
Title	The default title is the ticket number appended with the short description.
Include a brief message for participants	Option to provide an opening message to the user before beginning the interaction.

7. Select **Start**.
8. Select **Open Link** in the dialog box that appears.

   You can also click the link from the workbench to begin the Webex conference call.

Add participants to a conference call

Add a participant to a conference call to participate in the discussion to resolve the major incident.

Before you begin

Role required: notify_admin, major_incident_manager, or communication_manager

Procedure

1. Navigate to **All** > **Incident** > **Major Incidents** > **Open**.
2. Open the relevant major incident.
3. Select **View Workbench**.
4. Select **Collaborate** tab.
5. Select (+) Participants under **Active Participants**.
6. On the form, fill the fields.

Add participants

Field	Description
Add Participants	Option to add the users and the stakeholders to work towards the resolution of the ticket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Users**: Enter the name of the user to include in the call. ○ **Group**: Enter the group of users to be included in the call. ○ **Email**: Enter a valid email of the participant to be included in the call. After adding the required stakeholders, click **Add to selected**.
Title	The default title is the ticket number appended with the short description.
Include a brief message for participants	Option to provide an opening message to the user before beginning the interaction.

7. Select **Add Participants**.

   You can view the participants status in an active conference call.

Join a conference call

You can join an active conference call from an incident to discuss about the resolution of an incident.

Before you begin

Role required: notify_view, notify_admin, major_incident_manager, or communication_manager

Procedure

1. Navigate to **All** > **Incident** > **Major Incidents** > **Open**.
2. Open the relevant major incident.
3. Select **View Workbench**.
4. Select **Collaborate** tab.
5. Select **Join Call**.

Notify reference

View the additional information about Notify application in this section.

Differences between Notify-Twilio and Notify-Twilio Direct

Describes the differences between the Notify-Twilio and Notify-Twilio Direct drivers, including architecture, workflows, Twilio support, and task-initiated conference calls.

Differences between Notify-Twilio and Notify-Twilio Direct

Notify-Twilio (com.snc.notify.twilio)	Notify-Twilio Direct (com.snc.notify.twilio_direct)
This plugin is deprecated. Notify - Twilio Direct Driver now replaces this plugin.	Provides next generation integration with Twilio and Notify.
Uses Java SDK based integration with Twilio.	It is a JavaScript based driver which uses platform provided outbound REST APIs to connect to Twilio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Differences between Notify-Twilio and Notify-Twilio Direct (continued)

Notify-Twilio (com.snc.notify.twilio)	Notify-Twilio Direct (com.snc.notify.twilio_direct)
NA	Adds support for various advanced SMS features such as Co-pilot messaging, Twilio Notify bulk SMS.
NA	Adds support for various functionalities in conference calls such as view the participant who is speaking on the conference call, disable beep when someone enters/exits a conference, advanced call features like machine detection and so on.

Migrate to Notify-Twilio Direct driver

Migrating to Notify-Twilio Direct driver provides next-generation integration with Twilio and Notify.

Before you begin

You must be connected to Twilio using the Notify Twilio driver.

Role required: notify_admin

Procedure

1. Navigate to **Notify** > **Administration** > **Twilio Configuration (Legacy)**.
2. Click **Migrate Now**.
3. Click **Ok** on the confirmation dialog.
   A disconnection of the Twilio driver is initiated and the Account SID and Auth Token are copied to Twilio Direct's configuration page. Twilio Direct is then autoconnected to that account, and you are redirected to the driver's configuration page.

Public URLs

On-premise customers should ensure that the URLs are accessible from the Internet for the Notify-Twilio driver to work correctly.

The Notify-Twilio drivers (both new and old) require that specific URLs on the instance be accessible from the Internet by the Twilio server without authentication. If the instance is within a private network, you need to either port forward or set up a reverse proxy.

For the Notify-Twilio driver, the URLs are:

- /NotifyTwilioCallProcessor.do
- /NotifyTwilioCallStatusProcessor.do
- /NotifyTwilioSMSProcessor.do
- /NotifyTwilioDialStatusProcessor.do
- /NotifyTwilioEventProcessor.do
- /NotifyTwilioDialProcessor.do
- /NotifyTwilioRecordingProcessor.do

For the Notify-Twilio Direct driver, the URLs are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- /api/sn_twilio_direct/twilio_callbacks/process/twiml/{callback_name}
- /api/sn_twilio_direct/twilio_callbacks/process/xml/{callback_name}

Note:
The *glide.notify.endpoint* property needs to be set to an Internet visible name because the instance name inside a private network can be different from the Internet domain.

Components installed with Twilio Direct driver

Several types of components are installed with the Twilio Direct driver for integration with Notify.

Business rules installed with Twilio Direct driver

Twilio installs the following business rules.

Business rule	Table	Description
Account Connected Disconnected Message	[sn_twilio_direct_twilio_config]	Verifies if Twilio is completely configured and displays an info message.
Calculate test duration	[sn_twilio_direct_callback_test]	Sets the duration for Twilio Callback tests.
Machine detection timeout range check	[sn_twilio_direct_twilio_config]	Verifies the timeout values for detecting the answering machine if the **Detect answering machine**is enabled. The valid range of the timeout is 3-120 seconds.
Move credentials	[sn_twilio_direct_twilio_config]	Moves the account credentials to [sn_twilio_direct_basic_auth]
Populate Credentials	[sn_twilio_direct_twilio_config]	Populates the current SID and Auth token from the [sn_twilio_direct_basic_auth] table to display them.
Set outbound calculated fields & auth	[sn_twilio_direct_twilio_config]	Sets the account credentials in the basic auth profile
Set Reset JWT Key	[sn_twilio_direct_basic_auth]	Copies the auth token from [sn_twilio_direct_basic_auth] to signing key password in [jwt_keystore_aliases].
Validate & set inbound calculated fields	[sn_twilio_direct_twilio_config]	Populates the callback_endpoint field based on the inbound rest field value. Displays an error message if the endpoint URLs are not in the correct format.
Validate Fast Bulk SMS option	[sn_twilio_direct_twilio_config]	When **Twilio Notify bulk SMS** is enabled, validates the Twilio messaging and Notify service id.
Validate Intelligent SMS option	[sn_twilio_direct_twilio_config]	When **Intelligent SMS handling** is enabled, validates the Twilio messaging service id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with Twilio Direct driver

The tables installed with Twilio Direct driver are described below.

Tables installed with Twilio Direct driver

Table	Description
[sn_twilio_direct_callback_processor]	Extends the application file. Contains scripts which process callback payloads from Twilio and generate appropriate response XML or TwiML document. **Note:** Use caution when editing, deleting or adding new Callback Processor scripts as they are one of the key core components of the driver.
[sn_twilio_direct_twilio_config]	Extends the application file. Contains configuration option values for the driver.
[sn_twilio_direct_basic_auth]	Extends the basic auth credentials. The Account SID and Auth token are stored in this table.
[sn_twilio_direct_callback_test]	Stores the history of callback test runs.

Numbers and number groups

Number groups allow you to group Notify phone numbers and share workflows across grouped numbers.

Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the **Notify Phone Numbers** related list on the Notify Phone Number Group form.

If the number group workflows have incorrect conditions, a warning appears.

Create a number group

Group Notify phone numbers and share workflows across grouped numbers.

Before you begin

Role required: notify_admin

About this task

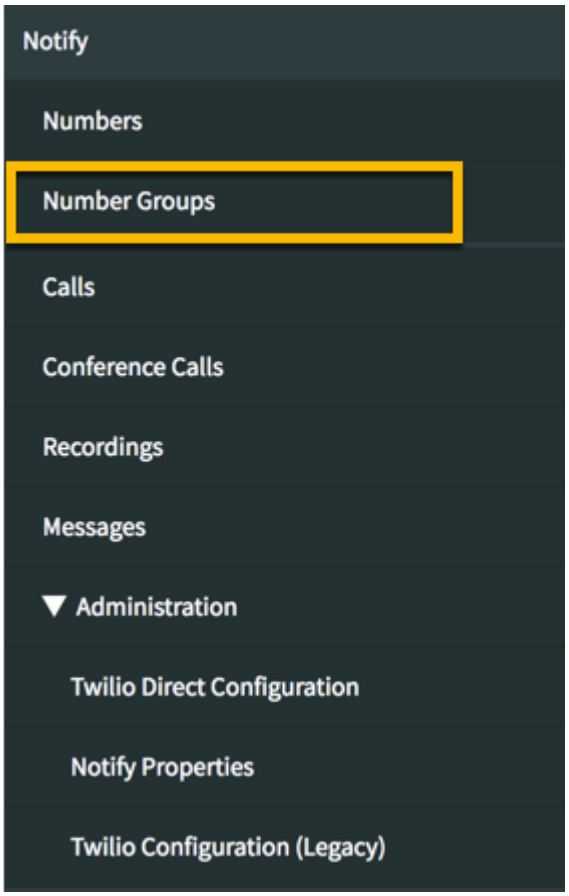
Each phone number within Notify has an associated number group. Numbers within a group use the same workflows for handling incoming and outgoing calls and SMS messages.

Numbers associated with a group appear on the **Notify Phone Numbers** related list on the Notify Phone Number Group form.

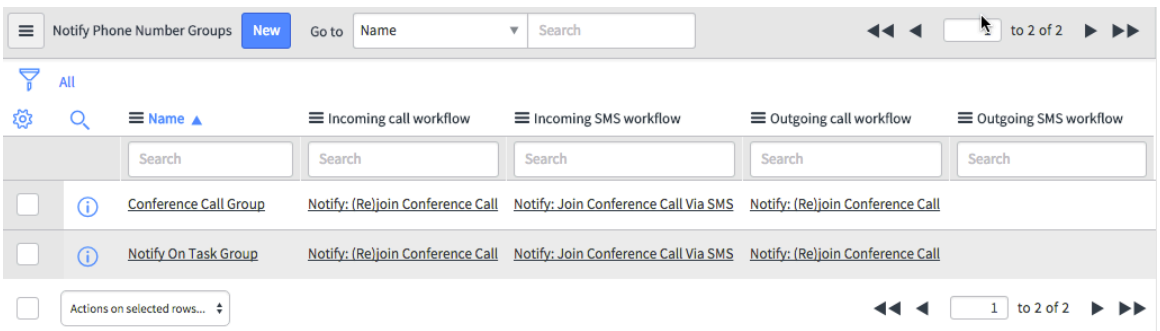
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Notify** > **Number Groups**.



2. Click **New**.
3. Enter a **Name**, and select **Notify: (Re)join Conference Call** for the **Incoming call workflow** field.



Note:
Ensure not to configure a workflow, which sends an outbound SMS itself, resulting in recursive calling of the workflow.

Field	Description
Name	Unique name for the number group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Incoming call workflow	Workflow to run when there is an incoming phone call for this group.
Incoming SMS workflow	Workflow to run when there is an incoming SMS message for this group.
Outgoing call workflow	Workflow to run when there is an outgoing phone call for this group.
Outgoing SMS workflow	Workflow to run when there is an outgoing SMS message for this group. **Note:** The Out of the Box workflow "Notify: Join Conference Call Via SMS" should not be populated for "Outgoing SMS workflow". Populating a workflow that sends an SMS under Outgoing SMS Workflow will trigger the same workflow thus causing recursive loop.

Incoming call workflows must run on the Notify Call [notify_call] table. Incoming and outgoing SMS workflows must run on the Notify Message [notify_message] or Global [global] tables.

Short codes can only be associated with SMS workflow groups. You cannot add an incoming or outgoing call to a short code group.

4. Click **Submit**.

What to do next

Associate a number to a number group

After creating a number group, associate numbers with that group to use the selected workflows.

Note:
Each phone number can only be associated with one number group.

You can create multiple number groups and configure with different Twilio numbers. You can then the associate the number groups with the various workflows based on your requirement.

Associate a number to a number group

Associate a Notify number to a number group to use inbound and outbound workflows.

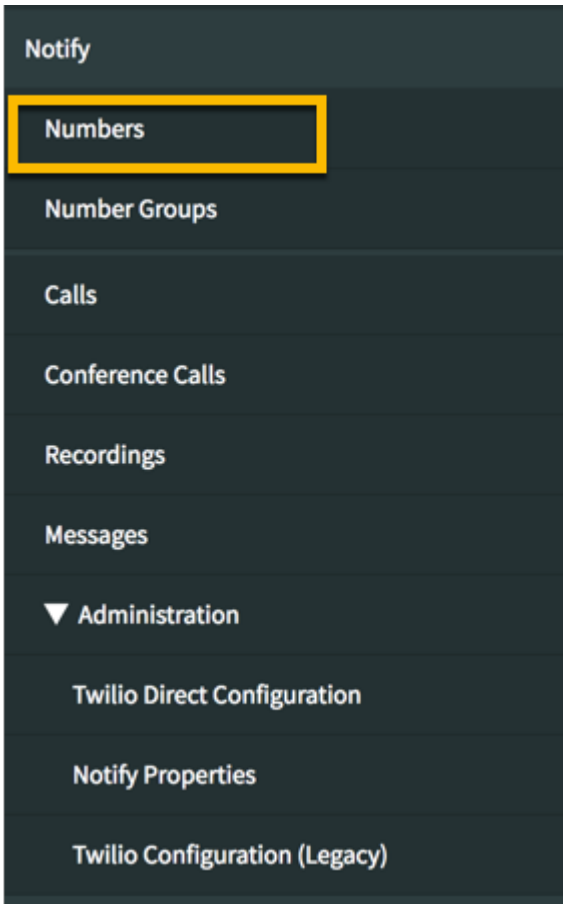
Before you begin

Role required: notify_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Notify** > **Numbers**.



2. Click the listed phone number and assign it to a **Number Group**, as appropriate.

Note:
Each phone number can only be associated with one number group.

Field	Description
Number	Number for the entry.
Phone number	E.164 phone number, if applicable.
Notify group	(Optional) Group to which this number is assigned.
Number owner	Service provider of the number.
Short Code	Short code number, if applicable.
Active	Check box that indicates whether the number is active or not.

3. Click **Update**.

Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All Notify workflows that manage a phone call must run on the notify_call table. Call-related Notify activities can be added only to workflows where the **Table** field value is **Notify Call [notify_call]**.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the *current.is_human* variable, such as with an **If** workflow activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

Note:
Do not add a **Timer** activity between multiple Notify activities that interact with active phone calls.

Important:
When creating a Notify workflow, set the workflow **If condition matches** field to **-- None --**. Notify controls which workflow to run based on the configured number groups.

Related topics

Using variables in Notify workflow activities

Join conference call workflow activity

The **Join Conference Call** activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the **join conference call** activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

Input variables

Input variables determine the initial behavior of the activity.

Input variables

Variable	Description
Record	Select this check box to record the conference call.
Advanced	Select this check box to display advanced configuration options.
Script	Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.

Conditions

The conditions determine which transition comes after this activity. The **join conference call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the confernece_call scratchpad variable is not set.

Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Values read from scratchpad

Scratchpad variable	Description
workflow.scratchpad.conference_call	A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the **join conference call** activity will log an error. When initiating an outgoing call workflow using the Notify API `call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall)` method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.

Enable different attributes available with Join Conference Call activity

System administrators can enable any or all of the below attributes and use them in the Join Conference Call workflow activity.

Attribute	Description
hangupOnStar	When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.
muted	When muted is enabled (set to true), the participant will join the conference in a muted state.
beepOnEnter	When beepOnEnter is enabled (set to true), a notification beep is played when a user joins the conference.
beepOnExit	When beepOnExit is enabled (set to true), a notification beep is played when a user leaves the conference.
enableImmediateInput	When enableImmediateInput is enabled (set to true), it allows input of a single digit immediately after the conference ends for this user and sets that in workflow.scratchpad.confDigits. This option will be ignored if hangupOnStar is false.

To enable any of the above attributes, perform the following steps:

1. Navigate to **Workflow** > **Administration** > **Workflow Versions**.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the **Show Workflow** related link.
4. To modify the workflow, click the WorkFlow Actions icon and click **Checkout**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Open the Join Conference Call workflow activity.
6. Enable the **Advanced** check box to display the **Script** field.
7. Set the **hangupOnStar** attribute to true in the *config* variable in the script. The default setting is false.
8. Click **Update**.
9. Click the WorkFlow Actions icon and click **Publish** to save the changes.

Similarly, you can enable the other attributes.

Call workflow activity

The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

Input variables

Input variables determine the initial behavior of the activity.

Input variables

Variable	Description
Notify Number	The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.
Phone number to call	The E.164-compliant phone number to call.
Advanced	Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the **Phone number to call** and **Notify Number** variables.
Script	Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as {notify_number: 'sys_id', phone_number: '+316...'}

Conditions

The conditions determine which transition comes after this activity. The **call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

Send SMS workflow activity

The **send SMS** workflow activity to send short text messages using Notify to users' phones. This workflow activity can be added to any table.

Notify requirements

To send SMS messages, you must add and configure a provider in Notify. For more information about configuring a provider, see Configure a provider in Notify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Input variables determine the initial behavior of the activity.

Input variables

Variable	Description
From	Select the Notify phone number to use to send the SMS message.
Advanced	Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.
To	Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.
To (groups)	Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.
Message	Enter the message to send. You can add field values from the current record by using the **Select variables** box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.
To (script)	Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format `{notify_number: \'...sys_id...\', users: [...], groups: [...], numbers: [...]}`. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if **Advanced** is selected.

Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

Forward call workflow activity

The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

Input variables

Input variables determine the initial behavior of the activity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Variable	Description
Phone number to call	Enter the phone number to forward the call to.
Timeout (in seconds)	Enter the amount of time to wait for the call to be answered before hanging up.
Record	Select this check box to record the conversation.

Conditions

The conditions determine which transition comes after this activity.The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

Input workflow activity

The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

Input Variables

Variable	Description
Number of digits	Specify the maximum number of digits the caller can enter. A caller can enter fewer digits than the maximum and press the **Finish key** to complete the entry.
Finish key	Specify the key a caller can press on their phone when finished selecting a menu option.
Timeout (in seconds)	Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.
Advanced	Select this check box to use a script to build the phone menu, instead of using the activity conditions.

Script	Define the script to build the phone menu. The script must specify an *answer* variable as a JavaScript object with the following format:
	`answer = {`
	`"1": {`
	`"play": "https://some_url.com/options/one.mp3",`
	`"myCustomData": "some data here"`
	`},`
	`"2": {`
	`"play": "https://some_url.com/options/two.mp3",`
	`"myCustomData": "some other data here"`
	`},`
	`"3": {`
	`"speak": "type 3 to speak to a representative",`
	`"language": "en-US",`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input Variables (continued)

Variable	Description

	``"myCustomData": "some more data here"
	}
	};```
	
	The script may specify either a text-to-speech string and language code using the *speak* attribute or URL of the music to be played using the *play* attribute. You can also add optional attributes to store related information, such as *myCustomData* in the example above.
	
	Note:
	The script object continues to support *say* attribute for backward compatibility.

Conditions

The conditions determine the transition that comes after this activity.

The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format **xx-XX:<Message>**. For example, add **fr-CA:** for Canadian French. Available languages are stored on the Notify Language [notify_language] table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition** value to **parseInt(workflow.scratchpad.digits) == <expected digits>**. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to **parseInt(workflow.scratchpad.digits) == 3**.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

Scratchpad Entries

The activity uses the workflow scratchpad to write persistent values.

Values written to scratchpad

Entry	Description
workflow.scratchpad.digits	The digits entered by the caller, as a string.
workflow.scratchpad.menu<activity name>	The entire *answer* variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is `choices`, you can access values from the menu using ```var previousActivity = "choices"; var choicesMenu = workflow.scratchpad.menu[previousActivity];```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Values written to scratchpad (continued)

Entry	Description

	`var menuItem = choicesMenu[workflow.scratchpad.digits]; // Selects the menu item based on the caller's input.`
	`var selectedValue = menuItem.myCustomData; //get the custom data for the selected menu item.`

Hangup workflow activity

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

Play workflow activity

The **Play** activity plays a sound file on a Notify call.

Input Variables

Input variables determine the initial behavior of the activity.

Input Variables

Variable	Description
URL	Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the **play** activity is skipped.
Loop	Enter the number of times the sound file should play.

Conditions

The conditions determine which transition comes after this activity. The **play** activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types [notify_mime_type] table.

Record workflow activity

The **Record** workflow activity records audio from a user on a Notify call.

Note:
The Record workflow activity records Notify call but not the Notify conference call. To record the Notify conference call, you can set the **Record** activity variable on the Join Conference Call workflow activity.

Input Variables

Input variables determine the initial behavior of the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input Variables

Variable	Description
Max duration (in seconds)	Enter the maximum duration, in seconds, allowed for a recording.
Timeout (in seconds)	Enter the amount of time to wait before ending a recording automatically when the caller is silent.
Finish Key	Specify the key a caller can press on their phone to end the recording.

Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.

The **record** activity adds the *recording* variable to the workflow scratchpad. This variable stores metadata about the recording, such as URI, ID, and duration. You can access the following values from this variable.

Values written to scratchpad

Value	Description
recording.recordingDuration	The duration of the recording, in seconds.
recording.from_number	The caller's phone number, including country code.
recording.notify_number	The Notify phone number used to respond to the call, including country code.
recording.recordingID	The ID used by the telephony provider to identify the recording.
recording.recordingURL	The URL from the telephony provider to access the recording.

Reject workflow

The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

Input variables

Input variables determine the initial behavior of the activity.

Input variables

Variable	Description
reason	Select a reason for rejecting the call, such as **busy**.

Say workflow activity

The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

Input variables

Input variables determine the initial behavior of the activity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Input variables

Variable	Description
Text to say	Specify the text to read.
Language	Select the language and locale to use when reading text.
Advanced	Select this check box to use a script to define the language and message, instead of using the **Text to say** and **Language** values.
Script	Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return {language: 'en-US', text: 'Text to read'}.

Forward to notify client workflow activity

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.

Input variables

Input variables determine the initial behavior of the activity.

Input variables

Variable	Description
User	Select the user to connect the call to.
Advanced	Select this check box to use a script to determine which client to connect to, instead of using the **User** variable.
Script	Define a script that controls which client to connect to. This script should return a GlideRecord for a single User [sys_user] record.
Timeout (in seconds)	Enter the amount of time to wait for the call to be connected before hanging up.
Record	Select this check box to record the call.

Conditions

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

Queue workflow activity

The **Queue** activity places an active Notify call in a queue.

Add the **Queue** activity to a workflow on the Notify Call [notify_call] table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Notify activity event handlers

Notify workflow activities provide JavaScript functions that are invoked automatically when your telephony provider broadcasts certain events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When the telephony provider broadcasts an event related to a Notify call, such as the caller hanging up, the event is processed by the workflow associated with that Notify call. All currently-executing Notify activities in that workflow invoke a JavaScript function associated with that event.

Not all activities that support an event provide a default event handler implementation. You can provide an implementation for those event handlers when creating custom Notify activities.

Related topics

Creating Notify activities

Available Notify activity event handlers

Creating Notify activities

Default Notify workflow generally performs a single action, such as initiating a phone call. You can create custom Notify workflow activities to implement more complex functionality.

Use event handler functions in each Notify activity definition to design your own activity behavior. For example, you can set the activity result if the caller hangs up by using the `onCompleted` function.

```
onCompleted: function() {
activity.result = 'call_ended';
},
```

When creating a new Notify workflow activity, follow these design principles.

- Within `onExecute` event handler function, create a new NotifyAction object. Use this object to create a simple or complex action, then serialize the object to the notify_wf_activity table.
- Within the `onUpdate` event handler function, deserialize the NotifyAction object from the notify_wf_activity table and use this object to perform any other operations.
- Use the other event handler functions and the Notify as needed to implement the desired activity behavior.

NotifyAction - Global

Notify languages

Notify supports multiple languages when using text-to-speech.

For example, when using the **input** or **say** workflow activities, you can specify which language to use when reading the text.

The list of available languages is stored on the Notify Languages [notify_language] table. By default, languages supported by all Notify telephony providers are available. You can add additional languages if they are supported by your specific telephony provider.

Available Notify activity event handlers

When creating Notify workflow activities, you can use event-handler functions to respond to events from a telephony provider.

Not all activities or telephony providers support all events. For example, the **Reject** activity ends the call before the caller connects so the `onNoAnswer` function is never invoked from this activity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When configuring an activity to respond to an event, ensure that your telephony provider supports that event.

The following table describes available event handlers and lists the Notify workflow activities that can invoke each handler.

Event handlers

Handler	Description	Activities
onExecute	Runs when the activity first runs.	All call-related activities
onUpdate	Runs when the call record associated with the workflow is updated.	All call-related activities
onCompleted	Runs when a call ends.	All call-related activities
onRinging	Runs when a call starts ringing.	Forward call, call, join conference call, forward to notify client
onInProgress	Runs when both parties are connected on a call.	Forward call, call, join conference call, forward to notify client
onNoAnswer	Runs when a call is not answered.	Forward call, call, join conference call, forward to notify client
onBusy	Runs when a called number is busy.	Forward call, call, join conference call, forward to notify client
onFailed	Runs when an error occurs.	All call-related activities

Components installed with Notify

Several types of components are installed with the Notify application.

Roles installed with Notify

Notify adds the following roles.

If you have created a new role, then you must add the new role to the corresponding deny ACL list to not allow user to access the Notify tables.

Note:
Only the user with the Notify administrator [notify_admin], and Notify viewer [notify_view] roles can have access to Notify tables. The deny unless authenticated ACLs restrict access to the Notify tables for any unauthenticated role such as public role user.

To learn more about managing subscriptions, see Managing per-user subscriptions in Subscription Management and contact your account representative.

Notify administrator [notify_admin]

Administrator with privileges for Notify 2 functionality.

Contains Roles

List of roles contained within the role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- workflow_admin
- workflow_creator
- workflow_publisher

Groups

List of groups this role is assigned to by default.

None.

Special considerations

Important:
Avoid granting an admin role when more specialized roles are available.

Notify viewer [notify_view]

Assign to users who need to view notify content.

Contains Roles

List of roles contained within the role.

None.

Groups

List of groups this role is assigned to by default.

None.

Special considerations

This role has read-only access to the Notify Conference Calls table [notify_conference_call] and the Notify Conference Call Participants table [notify_participant].

The itil role inherits the notify_view role when the Incident Communications Management and the Notify plugins are activated.

Tables installed with Notify

Notify adds the following tables.

Tables

Table	Description
Notify Conference Calls [notify_conference_call]	A list of conference calls started using Notify
Notify Calls [notify_call]	A list of calls started using Notify
Notify Call Queue [notify_queue]	A list of calls that are in queue

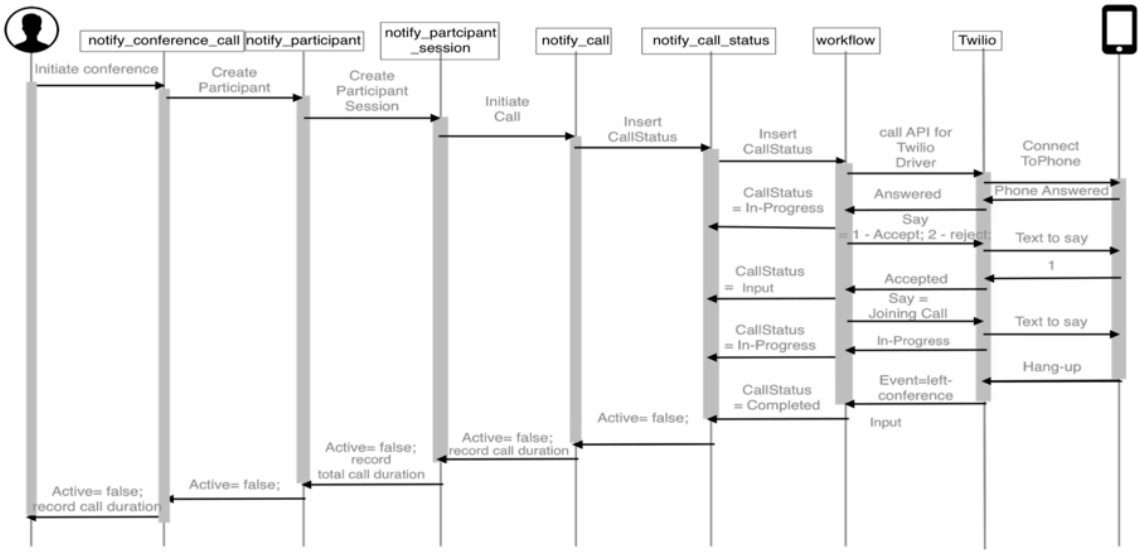
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables (continued)

Table	Description
Notify Call Status [notify_call_status]	List of possible statuses of calls, such as; initiated, ringing, etc.
Notify Client Connected Sessions [notify_client_session]	List of the connected sessions
Notify Conference Call Participants [notify_participant]	List of the participants in a conference call
Notify Conference Call Participant Sessions [notify_participant_session]	List of the associations of a call record and Notify participant record
Notify Messages [notify_message]	List of messages sent from/to Notify
Notify Phone Numbers [notify_number]	List of phone numbers used by Notify to make calls and send messages
Notify Phone Number Groups [notify_group]	List of phone number groups used by Notify to make calls and send messages
Notify Languages [notify_language]	List of the languages that Notify supports when using text-to-speech workflow activities.
Notify Recordings [notify_recording]	List of conference call recordings
Notify Workflow Activity [notify_wf_activity]	List of Notify workflow activities
Notify Audio MIME Types [notify_mime_type]	List of audio file formats
Temporary Serialized Notify Action Cache [notify_action]	List of serialized Notify actions waiting to be processed
Notify SMS Template [notify_sms_template]	Contains the templates which are used while sending a Notify SMS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notify call sequence



Properties installed with Notify

Notify adds the following properties.

Properties for Notify

Property	Description
sn_twilio_driver.max_conference_participants	Twilio maximum limit for number of participants in the conference call.
com.snc.iam.notify_number	The Notify number to use for conference calls. **Note:** This number must have a group configured with conference call workflows.
glide.notify.sms.max_characters	Maximum number of characters allowed to send SMS messages.
glide.enable.notify_on_task	Use this property to enable Notify integration for Task table and its extensions. Entering phone number in 'glide.notify.task.phone_number' property is equivalent to setting this to true.
glide.notify.endpoint	If the instance is accessible on public internet using some other name, which can happen if the instance is within a private network and is accessible via a reverse proxy from outside. In that case the public name needs to be provided here. e.g. https://some_public_domain.com
glide.notify.sms.save_confirmation_in_db	Check **Yes**if you want track the confirmation of opt-in/out requests SMS. The confirmations are saved in notify_message table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Notify (continued)

Property	Description
com.snc.iam.enable_notify	Use this property to enable Notify integration for Incident Communications Management. Entering phone number in 'com.snc.iam.notify_number' property is equivalent to setting this to true.
com.snc.iam.notify_number	The Notify number to use for conference calls. Note that this number needs to have a group configured with conference call workflows.
com.snc.on_call_rotation.notify_webrtc_number	Specify a valid Notify number with voice capability. This will enable On-Call integration with Notify which allows On-Call users to directly call people on rosters from the browser.
sn_major_inc_mgmt.notify_webrtc_number	Specify a valid Notify Number with voice capability. This will enable a specific Major Incident Management integration with Notify which allows Workbench users to directly call people from the browser.

Business rules installed with Notify

Notify adds the following business rules.

Business rule	Table	Description
No Call Workflows for Shortcodes	[notify_group]	Checks and displays an error if the call is being triggered by a short code.
Update Participant Duration	[notify_participant]	Updates participant duration when it becomes inactive.
Check if Notify call exists and active	[notify_participant_session]	Checks if Notify call has valid reference record and updates it if the call is inactive currently.
Update Last Active On	[notify_participant]	Sets the last active before insertion/update of Notify participant.
Show info msg about selection in choice	[notify_group_selector_choice]	Displays a message if either Notify group or conference provider is not selected.
Validate values in the choice	[notify_group_selector_choice]	Checks if either of Notify group or conference provider is filled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Set scratchpad values	[notify_group_selector_choice]	Checks if conference provider is available by iterating through service provider list.
Show message for empty choices	[notify_group_selector]	Displays an info message if there are no choices for the provider selector.
Clear fields when Manual Selection is set	[notify_group_selector]	Clears out some fields when manual selection is set in Notify group selector table.
Update Participant Duration	[notify_participant_session]	Calculates the duration of participant on conference call.
Update session muted state	[notify_participant]	Sets the value of mute and expelled to true once the conference call participant becomes inactive.
Update conference call	[notify_participant]	Sets the state of conference call based on the participant leaving or joining the call.
Validate Order field value	[notify_group_selector]	Validates order field value to be unique amongst all provider selectors.
Restrict Workflows For only Voice Nums	[notify_number]	Restricts association of voice only capable number with number group having inbound/ outbound SMS workflows.
Restrict Workflows For only SMS Numbers	[notify_number]	Restricts association of SMS only capable number with number group having inbound/ outbound voice workflows.
Validations on default record	[notify_group_selector]	Validates that source table and order field are mandatory in case of default set to false and both fields empty in case of default set to true.
Clearing fields when Default is true	[notify_group_selector]	Clears out some fields when default is set to true.
No Default selector set	[notify_group_selector]	Ensures one active provider selector is set as default.
Check active default selector is unique	[notify_group_selector]	Ensures only one provider selector is set as default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Process SMS preferences for incoming SMS	[notify_message]	When an SMS preference configuration defined for a particular telephony provider, then apply it for every incoming SMS.
Check default notify group is unique	[notify_group]	Validates that not more than one group is set as default Notify group.
Trigger conference end	[notify_conference_call]	When a conference call ends, triggers the notify.conference.end event
Update Call Active State	[notify_call_status]	Updates the status of the call in notify_call_status with the status received from Twilio.
Update Conference Call Active State	[notify_participant	Updates the active flag in notify_participant table. Also calculates the duration when the call is ended by a participant.
Update Participant Active State	[notify_participant_session]	Updates the active flag for the participant (notify_participant), and calculates the total time on the call upon disconnecting from the call.
Update Participant Session Active State	[notify_call]	Synchronizes the state of the call between notify_call and notify_participant_session. Upon disconnecting from the call, updates notify_participant_session with the duration of the call.
Warn for incorrectly configured workflow	[notify_group]	Checks notify_group table and displays an error if the a workflow is not configured correctly

Manage people and work capabilities

Use these applications to help streamline communications, manage work assignments and interactions, and assess employee skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced Work Assignment

Handle team assignments, route workflow, and provide user assistance.

Skills Management

Assess skills in individuals and teams.

Omnichannel Callback

Connect users and agents with callback service options.

E-signature

Manage signatures for documents or knowledge articles on any device.

Interaction Management

Centralize all communications on the platform for improved service call handling.

Password Reset

Provide secured password reset, user verification options, and more.

ServiceNow Voice

Manage third-party call systems and improve the service call experience for users and agents.

Advanced Work Assignment (AWA)

Maintain and improve your business workflow on the ServiceNow AI Platform. Advanced Work Assignment has options to assign tasks to teams and individual personnel based on availability and demand, as well as their skill levels. Give users the best service possible, with service messaging and role management handled on-the-fly for each task or assignment.

Skills Management

Track the skills that your teams use and need the most, associate skills with groups or individuals, and improve your training and hiring all with this module. Skills Management helps you manage data on various defined proficiencies or sets thereof. Create efficient skill assessments and associate them with teams or single personnel for improved task assignment, find and address knowledge gaps in your organization, and tailor your hiring and training plans.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Omnichannel Callback

Expand your service contact opportunities with Omnichannel Callback. This module lets agents contact users back when they make calls for help or service requests during high-activity periods. Display or announce callback options in other apps on the ServiceNow AI Platform, configure callback options to route users to live or virtual agents, and more.

E-signature

Handle electronic signatures and acknowledgments with E-signature. Use desktop or mobile interfaces to sign documents and knowledge base articles. Tailor roles related to handling signing, and give users the option to provide typed or drawn signatures, credentials, or acknowledgments.

Interaction Management

Handle all your service interactions in one place with this highly flexible, extensible system. Calls, chats, and other contacts are routed and queued through a centralized location with the Interaction Management System (IMS), enabling every product to use the same framework for communication.

ServiceNow Voice

Keep your service call system working efficiently with Voice. This module integrates easily with third-party phone systems, and reduces navigation through multiple networks for more efficient call center interactions. Added metrics and analytics let managers review call data all in one place.

Advanced Work Assignment

Advanced Work Assignment (AWA) automatically assigns work items to your agents, based on their availability, capacity, and optionally, skills. AWA pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define.

Get started

Explore	Configure	Use
Learn about Advanced Work Assignment (AWA) concepts and features.	Install Advanced Work Assignment (AWA) and activate relevant plugins. Set up AWA to automatically assign work items to qualified agents using defined work item queues, routing conditions, and assignment criteria.	Use Advanced Work Assignment (AWA) to compose SMS conversations, check work items and AWA events, and enable logging.

Exploring Advanced Work Assignment

Use Advanced Work Assignment (AWA) to automatically assign work items to your agents, based on their availability, capacity, and optionally, skills. AWA pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Agents see their assignments in their Agent Workspace inbox.

Overview of how AWA works

Customers use different channels to request service, for example, chats, cases, or incidents. Requests from customers create task or interaction records that store information about these objects, called work items. AWA automatically routes work items to queues that focus on certain types of support using criteria (such as priority or customer status) that you provide.

Queues can be defined based on need or type, for example product or critical cases. You also identify the agent groups responsible for work in the queue. AWA then applies assignment rules that you set and uses agent availability, capacity, skills (if defined), and shifts (if defined) to assign work to the most qualified agent.

Note:
Starting with the Quebec release, legacy Agent Workspace is no longer deployed, enhanced, or supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Workflow

See the following diagram to learn more about the Advanced Work Assignment process flow.

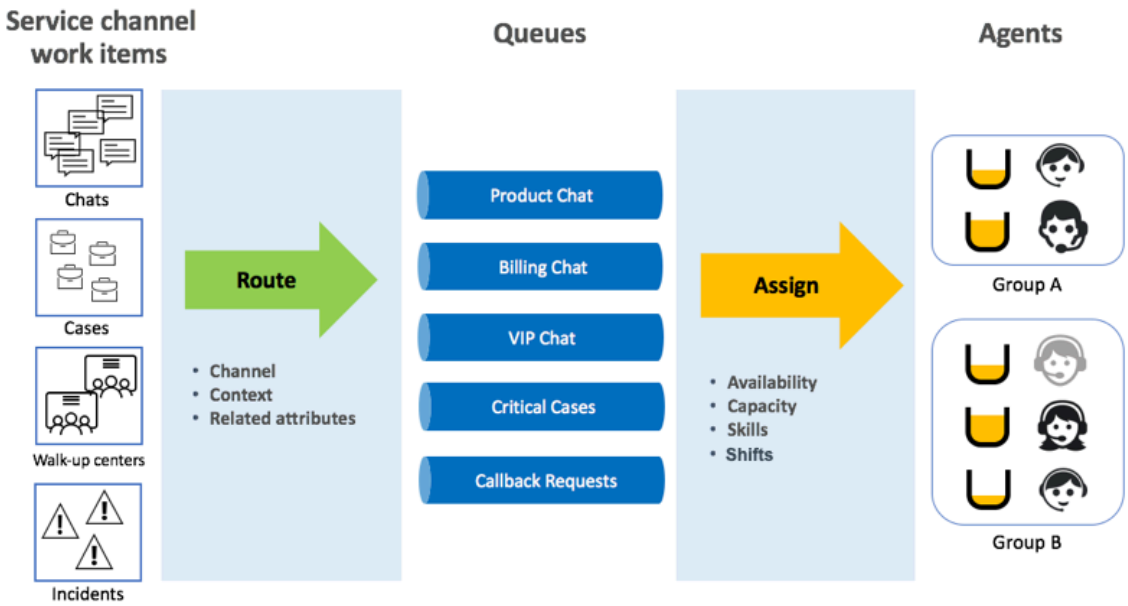
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Navigate to **Advanced Work Assignment** > **Home** to start exploring AWA features.

Benefits

Advanced Work Assignment provides the following benefits.

Benefit	Feature	User
By automating the assignment of work tasks, AWA eliminates manual efforts involved in distributing workloads. Work items are conveniently pushed to the agent's inbox, so that the agent can focus on doing the work, rather than looking for work.	Work assignments	awa_admin or admin
AWA helps organizations make the best use of available resources by matching the right skills and expertise with specific tasks. This leads to reduced idle time and better allocation of talent across the organization.	Configure agent assignment rules	awa_admin or admin
AWA ensures a fair and balanced distribution of work tasks among resources. It takes into consideration factors like workload, capacity, and availability to avoid overloading certain individuals while underutilizing others.	Agent Inbox controls	awa_admin or admin

Advanced Work Assignment components

Service channels

A means of providing customer service. AWA offers base system channels for chats, cases, incidents, and walk-up centers. For each channel, you can set attributes such as agent capacity and utilization conditions to control the work handled in the channel.

Work items

A single piece of work handled by an agent from start to completion. For example, one chat or one case is an object that is routed and assigned to agents.

Work item queues

A queue stores a specific type of work item for a service channel. AWA admins can create queues that focus on certain types of support within the channel, such as VIP customers or critical cases. AWA routes work items to queues based on specific conditions or requirements that you define, such as customer status, or region. Groups assigned to each queue handle the incoming work items. After work items are placed in a queue, AWA can then assign items to available agents based on assignment rules and agent availability and capacity.

Assignment groups

Agents belong to specific groups organized by the type of work assigned to them. You provide details about an assignment group including the name and description, manager, and group email. You can also set up roles, groups and group members, queues, and agent capacity overrides for agents in an assignment group.

Assignment rule

Criteria that determines how work items are pushed to the appropriate agent within a qualified assignment group.

Agent capacity

The maximum number of work items on a particular service channel that an agent may actively work on at one time. If you want to set a maximum capacity for an agent across all service channels, define the maximum universal capacity for that agent. For information on configuring the maximum universal capacity, see Configure an agent's maximum universal capacity. Messaging Interactions in an On Hold state aren’t calculated as part of an agent's capacity.

Agent availability

States that indicate agent presence and whether the agent is available for work or is busy or offline. AWA uses the agent availability state to determine if an agent is able to receive work.

Inbox layout

A configuration tied to a service channel that defines which fields of a record representing a work item are shown in agent inboxes. A layout defines what the agent sees in Agent Workspace.

Reassigning messaging conversations

If you want messaging conversations to be automatically reassigned if the current Assigned To agent on the conversation isn’t available, set the *`glide.messaging.reassign.enabled`* system property to `true`. The system property only affects messaging conversations and the Assigned To agent is considered not available if the AWA Inbox status isn’t set to "Available."

Configuring Advanced Work Assignment

Quickly install the required and popular plugins through the plugin page after selecting any **Get [plugin]** button on the Advanced Work Assignment home page. Plan and configure Advanced Work Assignment (AWA).

Before you begin

The AWA home page appears after you have installed and updated the Omni-Experience Standard Feature Set to the latest version through the ServiceNow Store.

Role required: admin

About this task

After installing the Advanced Work Assignment plugin and any relevant org-specific plugins, the following list outlines the basic planning and configuration steps that you must determine for AWA:

- Determine what to route – Configure the base service channels to be used.
- Determine where to route – Define the work item queues and the routing rules, execution order, work item sort order, and strategy.
- Determine how to assign work items – Define the assignment rules that determine the work items pushed to agents.
- Determine what the agent sees – Set the inbox card layouts and presence (availability) states that agents use in their Agent Workspace inbox.

Procedure

1. Navigate to **Advanced Work Assignment** > **Home**, and then select the **Get Advanced Work Assignment plugin** button from the First, install a required plugin section.

   Note:
   Only users with the sys_admin role can install a plugin from the Advanced Work Assignment home page. For example, if a user with the awa_admin role tried to install the Advanced Work Assignment plugin, they're prompted to contact their administrator for installation. After the Advanced Work Assignment plugin is installed, all AWA home page options are available in the application navigator for users with the admin and awa_admin roles.

   The All Applications page opens in a new window or tab.
2. In the All Applications page, select **Install** and complete the installation prompts.
   The AWA home page experience refreshes and the Get targeted routing capabilities section appears.
3. **Optional:** Install org-specific AWA plugins through the **Get plugin** button for ServiceNow® IT Service Management (ITSM), ServiceNow® Customer Service Management, and/or ServiceNow® HR Service Delivery (HRSD) plugins.
   The AWA home page experience refreshes and the Get the most popular plugins section appears.
4. **Optional:** Install popular plugins, such as Agent Chat, Walk-up Experience, and/or Performance Analytics, to boost your AWA experience.
5. In the Essential settings section, select **Set up service channels** to configure the service channels that you activated.
   a. Create or change an inbox layout.
   b. Override agent capacity, as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Essential settings section, select **Set up queues** to create work item queues for your service channels.
   a. Set the sort order for work items in the queue.
7. In the Essential settings section, select **Set up assignment rules** to configure the work assignment rules used to push work to the appropriate agents.
8. **Optional:** In the Additional settings section, consider configuring the following parameters to improve your AWA functionality.
   a. Select **Set up presence states** to configure availability states states that agents use to indicate whether they can receive work or are offline or away.
   b. Select **Set up reject reasons** to define the reject reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox.
   c. Select **Set up universal capacity** to configure your team's maximum universal capacity to prevent an agent from being assigned too many work items.
   d. Select **Set up groups** to create groups of user sets who share a common purpose.
9. **Optional:** In the Advanced settings section, consider configuring the following parameters to improve your AWA functionality.

   Note:
   Advanced settings cards appear conditionally after installing their respective plugin.

   a. Select **Set up Agent Affinity** to create or change the Agent Affinity rules that route work items in Advanced Work Assignment.
   b. Select **Set up Shift-based Assignment** to assign work items to agents based on shifts.

Advanced Work Assignment home page

Explore, implement, and maintain ServiceNow® Advanced Work Assignment using a home-page experience. Discover AWA, install relevant plugins, and configure settings for AWA through the Advanced Work Assignment home page available to admins.

Advanced Work Assignment home page advantages

The Advanced Work Assignment home page makes it easy for you to get started and work toward achieving positive outcomes with your implementation. The Advanced Work Assignment home is ideal for first-time users who have never installed or configured Advanced Work Assignment (AWA), to experienced users looking to expand capabilities and maintain existing implementations.

AWA home provides the following features:

- Cards that guide you through the order of essential settings, like creating service channels, configuring queues, and adding assignment rules. Cards that redirect you to additional and advanced settings, such as configuring presence states, setting up reject reasons, determining universal capacity, setting up agent affinity, and establishing shift-based assignments.
- Lists of installed and available plugins.
- Quickly install plugins through the plugin page. The plugin page appears in either a new window or tab after selecting any **Get [plugin]** button. The plugin page opened dialog box appears on the home page, where you can select **Not Now** to continue with your current home page experience or **Done** to refresh the home page after your plugin's installation.
- Access to helpful resources and videos to help you learn more about configuring and managing AWA.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to **Advanced Work Assignment** > **Home** to start exploring AWA features.

Important:
The AWA home page appears after you have installed and updated the Omni-Experience Standard Feature Set to the latest version through the ServiceNow Store. Existing customers don't need to install it from the store. However, subsequent updates are available there. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Planning, installing, and exploring AWA

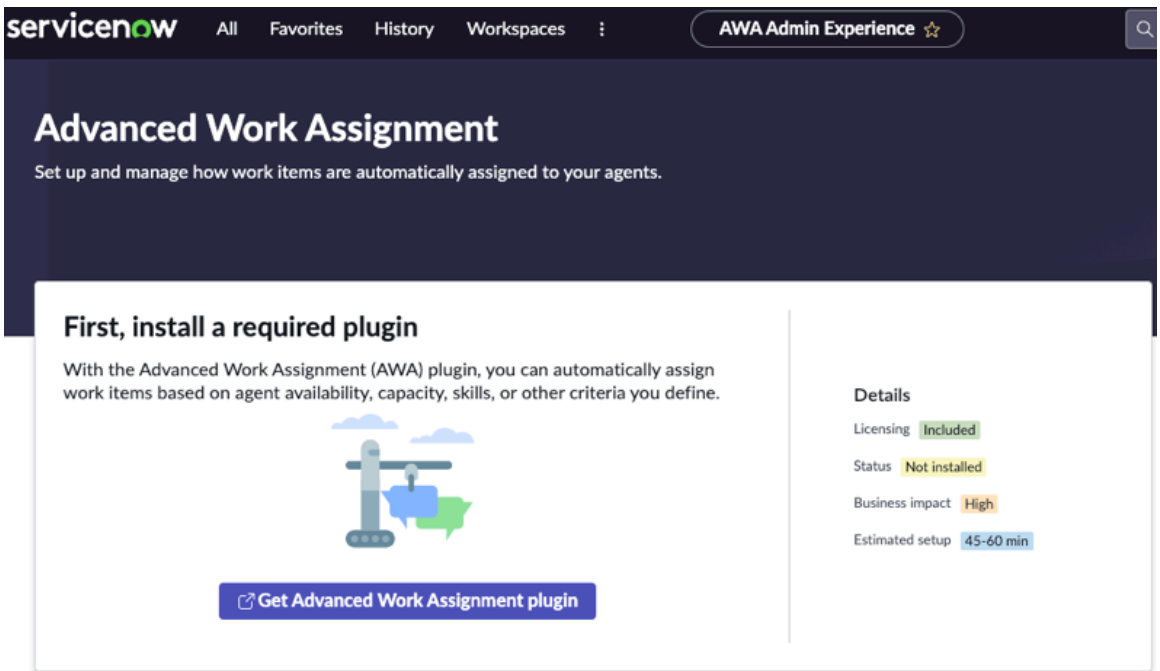
If you've never installed AWA, the Advanced Work Assignment home page prompts you to do so first. Before implementing AWA, take some time to reflect on a few important questions in the Think through these questions with your team Think through these questions with your team list. These questions are meant to help you envision the AWA experience that you need and want for your business. Expand the available questions to explore more thoughtful considerations, such as what queues would work best for your team and what skills does your team have.

The layout of the home page may vary, depending on which features you've installed and configured.

First, install the required plugin

Install the Advanced Work Assignment plugin to begin. Select **Get Advanced Work Assignment plugin** to install it.

Note:
Only users with the sys_admin role can install a plugin from the Advanced Work Assignment home page. For example, if a user with the awa_admin role tried to install the Advanced Work Assignment plugin, they're prompted to contact their administrator for installation. After the Advanced Work Assignment plugin is installed, all AWA home page options are available in the application navigator for users with the admin and awa_admin roles.



Get targeted routing capabilities

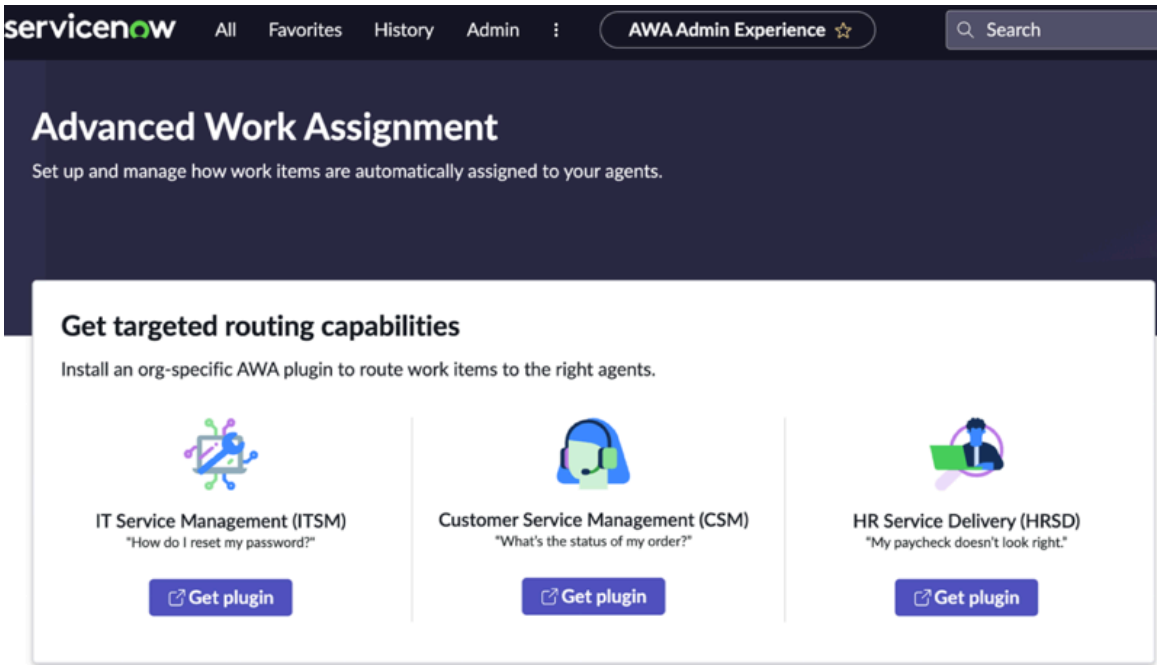
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate org-specific AWA plugins through the **Get plugin** button to route work items to the right agents for ServiceNow® IT Service Management (ITSM), ServiceNow® Customer Service Management, and ServiceNow® HR Service Delivery (HRSD) plugins. These plugins enable org-specific service channels in AWA including configured data and demo data.



Get the most popular plugins

After installing any of the targeted routing capabilities plugins, install these popular plugins to boost your AWA experience.

- Agent Chat: The Agent Chat plugin enables the Chat service channel in AWA and chat monitoring in Agent Workspace.
- Walk-up Experience: The Walk-up Experience plugin activates the walk-up contact service channel for pre-built technology lounges.
- Performance Analytics: The Performance Analytics plugin activates the Performance Analytics Content Pack for AWA.

Watch and learn

Watch the embedded AWA implementation guide for more information about installing and implementing AWA directly from the right side of the home page.

Helpful Resources

Explore the helpful AWA resources such as release notes, product documentation, and ServiceNow Community forums and content directly from the right side of the home page. These resources give you information to understand the configuration process and the benefits of setting up AWA features.

Installed Plugins

View a list of installed plugins. Admin role users can select a plugin's link to have that application's plugins page appear in a separate window or tab.

Available Plugins

View a list of available plugins that help save time setting up AWA. Admin role users can select a plugin's link to have that application's plugins page or ServiceNow Store site appear in a separate window or tab. Awa_admin role users can view a store app's plugin page to learn about the plugin, but only admin role users can install plugins.

Configuring essential AWA settings

Follow the order of the guided configuration setup to establish your AWA settings in the most logical order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Essential settings cards

Card	Feature	Description
	Create Service Channels	Give customer support by automatically routing incoming work to agents through service channels. Service channels assign a specific type and scope of work to agents.
	Configure work item queues	Determine routing conditions and destinations for queues.
	Add assignment rules	Establish assignment criteria to agents who either have gone the longest without being assigned a work item, have the most work availability, or have the needed skills.

Configuring additional and advanced AWA settings

The additional card settings expand your organization's ability to maximize productivity with AWA.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

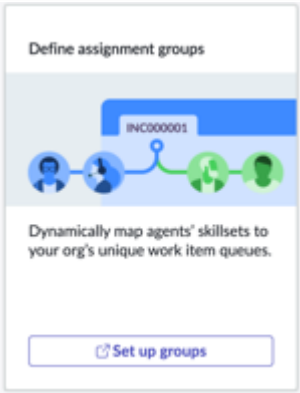
Additional settings cards

Card	Feature	Description
	Customize presence states	Configure availability states that agents use to indicate whether they can receive work or are offline or away.
	Configure reasons for rejections	Define the reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox.
	Determine agent capacity	Configure your team's maximum universal capacity to prevent an agent from being assigned too many work items. If the agent's maximum universal capacity has been reached, additional work items aren't assigned to the agent.
Select **See More** to view this card.	Define assignment groups	Create groups of user sets who share a common purpose.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional settings cards (continued)

Card	Feature	Description
		



Advanced settings cards appear conditionally after installing their respective plugin.

Advanced settings cards

Card	Feature	Description
	Set up Agent Affinity	Install the Agent Affinity plugin for this card to conditionally appear. Create or change the Agent Affinity rules that route work items in Advanced Work Assignment.
	Set up shift-based assignment	Install either one or both of the following plugins for this card to conditionally appear: • Workforce Optimization for Customer Service • Workforce Optimization for ITSM Assign work items to agents based on shifts.

Get started with Advanced Work Assignment

To implement Advanced Work Assignment, complete these initial configuration and setup steps.

Before you begin

Role required: awa_admin and admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home**.
2. Select **Get Advanced Work Assignment plugin** to install the Advanced Work Assignment plugin for your instance.
   The All Applications page opens in a new window or tab.
3. In the All Applications page, select **Install** and complete the installation prompts.
4. Go back to the Advanced Work Assignment (AWA) home page, and then select **Done** on the Plugin page opened dialog box.
   The AWA home page experience refreshes and the Get targeted routing capabilities section appears.
5. Select **Get plugin** to activate org-specific IT Service Management (ITSM), Customer Service Management, and HR Service Delivery (HRSD) plugins.
   The All Applications page opens in a new window or tab.
6. In the All Applications page, select **Install** and complete the installation prompts.
7. Go back to the Advanced Work Assignment (AWA) home page, and then select **Done** on the Plugin page opened dialog box.
   The AWA home page experience refreshes and the Get the most popular plugins section appears.
8. **Optional:** Install additional plugins through various ways.
   - Select **Get plugin** to install popular plugins.
   - Select the plugin name from the Available Plugins sections.

   The All Applications page opens in a new window or tab.
9. **Optional:** In the All Applications page, select **Install** and complete the installation prompts.
10. **Optional:** Go back to the Advanced Work Assignment (AWA) home page, and then select **Done** on the Plugin page opened dialog box.

    (Optional) The plugin page opened dialog box only appears when you install plugins from the Get the most popular plugins section.

    The AWA home page experience refreshes and either the Get the most popular plugins section refreshes with the installed plugin or the plugin appears under the Installed Plugins section.
11. In the Essential settings section, select **Set up service channels** to configure the service channels that you activated.
    a. Create or change an inbox layout.
    b. Override agent capacity, as needed.
12. In the Essential settings section, select **Set up queues** to create work item queues for your service channels.
    Set the sort order for work items in the queue.
13. In the Essential settings section, select **Set up assignment rules** to configure the work assignment rules used to push work to the appropriate agents.
14. **Optional:** In the Additional settings section, consider configuring the following parameters to improve your AWA functionality.
    a. Select **Set up presence states** to configure availability states that agents use to indicate whether they can receive work or are offline or away.
    b. Select **Set up reject reasons** to define the reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Set up universal capacity** to configure your team's maximum universal capacity to prevent an agent from being assigned too many work items.

d. Select **Set up groups** to create groups of user sets who share a common purpose.

15. **Optional:** In the Advanced settings section, consider configuring the following parameters to improve your AWA functionality.

> **Note:**
> Advanced settings cards appear conditionally after installing their respective plugin.

a. Select **Set up Agent Affinity** to create or change the Agent Affinity rules that route work items in Advanced Work Assignment.

b. Select **Set up Shift-based Assignment** to assign work items to agents based on shifts.

Activate Advanced Work Assignment

You can activate the Advanced Work Assignment plugin (com.glide.awa) if you have the admin role.

Before you begin
Role required: admin

About this task
Advanced Work Assignment activates the Skills Management plugin (com.snc.skills_management) to implement user and group skills.

Plugins for Skills Management

Plugin	Description
Skills Management [com.snc.skills_management]	Implements user and user group skills. Based on the same principles of roles management, which uses inheritance between user groups.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home**.
2. Select **Get Advanced Work Assignment plugin** to install the Advanced Work Assignment plugin for your instance.
   The All Applications page opens in a new window or tab. If you don't see the **Get Advanced Work Assignment plugin** button, you either don't have the permissions to install the plugin, or the plugin has already been installed.
3. In the All Applications page, select **Install** and complete the installation prompts.
4. In the Advanced Work Assignment (AWA) Home experience's Plugin page opened dialog box, select **Done**.
   The AWA Home experience refreshes, the Get targeted routing capabilities section appears, and AWA is installed.

What to do next
Activate the targeted routing capabilities plugins and other popular AWA plugins to enable the appropriate service channels and the Platform Analytics Solutions for Advanced Work Assignment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate related plugins for Advanced Work Assignment

After activating the Advanced Work Assignment plugin, activate related AWA plugins to enable other base system service channels and the Performance Analytics Solutions dashboard for AWA.

You must have the admin role to activate these additional plugins for AWA.

Targeted routing capabilities plugins

Install the following plugins from the AWA Home experience's Get targeted routing capabilities section or the Available Plugins section. If you'd rather search for each plugin individually, see Activate a plugin.

Plugin	Description
Advanced Work Assignment for Incidents [com.snc.incident.awa]	Enables the Incident service channel in AWA. Includes a default configuration to support AWA for incidents.
Advanced Work Assignment for CSM [com.sn_csm.awa]	Enables the Case service channel in AWA. Includes configuration data supporting routing, queuing, and assignment of CSM cases.
Advanced Work Assignment for HRSD [com.sn_hr_awa]	Enables base system configuration data supporting routing, queuing, and assignment of HRSM cases, chats, and calls to agents.

Popular plugins

Install the following plugins from the AWA Home experience's Get the most popular plugins section or the Available Plugins section. If you'd rather search for each plugin individually, see Activate a plugin.

Plugin	Description
Agent Chat [com.glide.interaction.awa]	Enables the Chat service channel in AWA and chat messaging in Agent Workspace. Includes default configuration data for chats, including demo data.
Walk-up Experience [com.snc.walkup]	Activates the walk-up contact service channel for prebuilt tech lounges. Enables an IT organization to support online and off-site checkin.
Performance Analytics Content Pack – Advanced Work Assignment [com.snc.pa.awa]	Activates the Performance Analytics Content Pack for AWA. Provides base system KPIs.

Move from Connect Support to Advanced Work Assignment and Agent Chat

Move from ServiceNow® Connect Support to Agent Chat (live chat), which is the messaging system that agents use in Agent Workspace to interact with customers. Moving from Connect Support also involves using Advanced Work Assignment (AWA) to create the chat queues for routing chat work items to agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Important:

As of Utah, Connect Support is deprecated. For similar capabilities, please move to Advanced Work Assignment and Agent Chat.

About this task

Moving to modern applications such as Advanced Work Assignment and Agent Chat offers features and benefits that are not available in Connect Support. These new capabilities include:

- Automatic assignment of chats and work items to agents based on criteria that you define, such as agent availability, capacity, skills, Agent Affinity, and variable work item sizing.
- Automatic queue overflow handling
- Chat timeout reassignment
- Native Chat surveys
- Supervisor features, such as Agent Whisper, that enable managers to join ongoing public customer chats with agents or send private messages to agents.
- Agent features, such as workspace inbox controls for viewing, accepting, or rejecting incoming chats.

If you are currently using Connect Support APIs, see AWA Routing API for information on AWA APIs.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home**.
2. Activate the Advanced Work Assignment and Agent Chat plugins if they are not currently active.
3. If needed, review your existing Connect Support chat queues and determine whether you want to create a similar set of queues for the Chat service channel in AWA.

   Note:
   You cannot use your Connect Support chat queues in AWA. Chat queues for Connect Support are stored in the Chat Queue [chat_queue] table. Chat queues for AWA are stored in the AWA Queue [awa_queue] table.

4. In the AWA Home page, configure the Chat service channel, create the associated chat queues, and establish agent work assignments.
5. In Agent Chat settings, access the Chat Setup form to specify Agent Workspace as the fulfiller interface for live chat and enable other live chat features.
6. Activate the chat client on your end user Service Portal.

Trouble?

Troubleshooting suggestions include these common problems and solutions:

Problem: While using AWA, the chat remains in routing and is not offered to an available agent.

Solution: This problem may happen if AWA attempts to route the chat to a Connect Support queue. In this case, the interaction remains assigned to the Virtual Agent user and no

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

awa_work_item record is created. A common cause of this problem is the Chat Setup entry for the chat's application still being set to **Connect**.

Problem: When trying to route to a live agent, the requester is incorrectly told that no live agents are available.

Solution: This problem may be caused by one of these situations:

- Queue conditions that depend on checking interaction fields or context were created on the interaction too late for routing.
- Chat service channel is not associated with the Available presence state. A common cause of this problem is deactivating and reactivating the Chat channel.

Debugging suggestions include these questions to consider:

Here are a few questions to ask and places to look if agents are not receiving chats:

- Does an awa_work_item record exist for the interaction? If it does not, is the **Assigned to** field for the interaction empty or is it set to Virtual Agent? If the **Assigned to** field is set to Virtual Agent, it is probably trying to use Connect Support.
- In the Chat setup, are the fulfillers set appropriately for each application?
- In the interaction_json_blob referenced by the **interaction.context_document** field, is the *`Liveagent_application`* variable set to the expected value?

Install Conversational SMS service channel

You can install the Conversational SMS service channel application (sn_awa_sms_int) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- The Conversational Messaging plugin (com.glide.messaging.awa) must be installed.

  For more information on activating plugins, see Activate a plugin.

Role required: admin

About this task

Note:
The Conversational SMS service channel is automatically installed with an application that implements an SMS provider, such as the Conversational SMS Integration with Twilio (sn_va_sms_twilio) application. For more information, see Install Conversational SMS Integration with Twilio.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home**.
2. In the Available Plugins section, select **Conversational SMS**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you cannot find the application, you may have to request it from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. Select **Install**, and then in the Install dialog box, select **Install**.

What to do next
Set up the Conversational SMS service channel

Activate Agent Affinity

You can activate the Agent Affinity plugin (com.glide.awa.agent_affinity) if you have the admin role.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home**.
2. In the Available Plugins section, select **Agent Affinity**.

Note:
If the plugin doesn't appear in the Available Plugins section, try searching for the plugin using the search bar. You can search for the plugin by its name or ID. If you can't find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install/Update All**, and then in the Install dialog box, select **Install**.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

Activate Conversational Messaging

You can activate the Conversational Messaging plugin (com.glide.messaging.awa) if you have the admin role.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home**.
2. In the Available Plugins section, select **Conversational Messaging**.

Note:
If the plugin doesn't appear in the Available Plugins section, try searching for the plugin using the search bar. You can search for the plugin by its name or ID. If you can't find a plugin, you might have to request it from ServiceNow personnel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Install/Update All**, and then in the Install dialog box, select **Install**.

> **Note:**
> When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

Service channels

Provide customer support by automatically routing incoming work to agents through service channels.

A service channel is a means of assigning a specific type and scope of work to agents. You can configure base system service channels to set the context and attributes that define work handled in the channel, or create your own custom service channel.

Advanced Work Assignment provides several service channels from which work items originate. These channels are:

Service channel	Description	Plugin
Case	Routes and assigns customer service cases.	Included with Customer Service
Chat	Routes and assigns chat interactions.	Included with the Agent Chat plugin (com.glide.interaction.awa).
Chat - Asynchronous	Routes long-running conversations that use multiple service channels.	Included with the Conversational Messaging plugin (com.glide.messaging.awa).
Facebook Messenger	Routes requests from the Facebook Messenger chat conversations.	Included with the Conversational Integration with Facebook Messenger store application.
Incident	Routes and assigns incidents.	Included with the Advanced Work Assignment for incidents plugin (com.snc.incident.awa).
Line	Routes requests from LINE chat conversations.	Included with the Conversational Integration with LINE store application.
SMS	Routes long-running SMS conversations and	Included with the Install Conversational SMS service channel application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service channel	Description	Plugin
	conversations that use multiple service channels.	
Walk-up	Routes requests from walk-up contact channels.	Included with the Walk-up Experience plugin (com.snc.walkup).
WhatsApp	Routes requests from the WhatsApp chat conversations.	Included with the Conversational Integration with WhatsApp (powered by Twilio) store application.

You can also set up a custom service channel to address work that is not supported in the base system channels. For more information, see Set up a custom service channel.

For each service channel, you set attributes such as:

- Agent capacity: Amount of work that can be handled by the agents supporting the channel.
- Filters: Conditions that filter the type of work handled in the channel.
- Utilization: Conditions that determine when work items are generated.

For each service channel, you also:

- Create the agent inbox card layout used in Agent Workspace.
- Set capacity overrides for specific agents.
- Review and modify associated work item queues. For the Chat service channel, you can create queues using the **Queues** related list.

Service channel capacity and utilization

In Advanced Work Assignment, capacity is the number of work items automatically assigned to agents supporting a service channel. Utilization is the condition that identifies the work item states supported in the channel.

Agents have an assigned capacity for each service channel. This capacity is based on the default capacity set for the channel. The agent capacity for one service channel (for example, chat) does not interfere with the capacity on other service channels (for example, case or incident). Admins can set the **Default capacity** for a channel on the Service Channel form. This setting applies to all agents supporting the channel.

Managers can override the default capacity for:

- Individual agents, by using the **Agent Capacity Override** related list on the Service Channel form.
- Groups of agents, by using the **Agent Capacity Override** related list on the Group form.

If an agent already has a capacity override, setting the override again updates the existing capacity for that agent. Override capacity is stored in the Agent Capacity (awa_agent_capacity) table.

Create or configure a service channel

Create or configure a service channel that is used in Advanced Work Assignment (AWA).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: awa_admin or admin

About this task
You can specify additional conditions to filter the work items that are handled in the channel, change the agent capacity (workload) for the channel, set the inbox layouts that your agents use in Workspace, and view associated work item queues.

If you activate the corresponding plugins or install the corresponding store applications, AWA provides base system channels for these services:

- Cases plugin (com.snc_csm.awa)
- Chats plugin (com.glide.interaction.awa)
- Chats - Asynchronous plugin (com.glide.interaction.awa)
- Conversational Integration with Facebook Messenger application (sn_va_fb_messenger)
- Incidents plugin (com.snc.incident.awa)
- Conversational Integration with LINE application (sn_va_line)
- Walk-up interactions plugin (com.snc.walkup)
- Conversational Integration with WhatsApp (powered by Twilio) application (sn_va_whatsapp_twi)

For each channel, you can change certain default settings, such as the default capacity (workload) for agents. You can also use the related lists to review associated queues, define the associated inbox layouts (work item cards) that are displayed in Workspace, and override the agent capacity value.

You can also create a service channel record from the Service Channel module, but you must create a queue, assignment rule, and eligible assignment pool to route work through the service channel. For more information, see Set up a custom service channel.

Procedure
1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Choose a situation.
   - To create a service channel, select **New**.
   - To update a service channel, select the service channel record that you want to update.
3. On the form, fill in the fields.

Service Channel form

Field	Definition
Name	Name of the selected base system service channel to be configured: ○ Chat ○ Chat - Asynchronous

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	○ Case ○ Facebook Messenger ○ Incident ○ Line ○ Walk-up ○ WhatsApp
Inbox order	Order in which channel items appear in the agent inbox.
Application	Name of the application. ○ Chat: Global ○ Chat - Asynchronous: Global ○ Case: Advanced Work Assignment for CSM ○ Facebook Messenger: Conversational Integration with Facebook Messenger ○ Incident: Advanced Work Assignment for Incidents ○ Line: Conversational Integration with LINE ○ Walk-up: Walk-up Experience ○ WhatsApp: Conversational Integration with WhatsApp (powered by Twilio)
Active	Option for activating the service channel. When you select this option, the associated queues for the service channel can start accepting work items.
Short description	Brief description of the service channel: ○ Chat: Live Agent Chat Interactions ○ Chat - Asynchronous: Asynchronous Live Agent Chat Interactions ○ Case: Cases for Agents ○ Facebook Messenger: Live Agent Facebook Messenger Interactions ○ Incident: Incidents for Agents ○ Line: Live Agent LINE Interactions ○ Walk-up: Walk-up interactions for agents to work on ○ WhatsApp: Live Agent WhatsApp Interactions
Table	Table that stores the service channel records.
Advanced condition	If enabled, the advanced conditions that apply to the channel. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	○ Chat: **[Type] [is] [Chat]** ○ Chat - Asynchronous: **[Subtype] [is] [mweb]**, **[Type] [is] [Messaging]** ○ Facebook Messenger: **[Subtype] [is] [Facebook Messenger]** ○ Line: **[Subtype] [is] [Line]** ○ Walk-up: **[Type] [is] [Walk-up]** ○ WhatsApp: **[Subtype] [is] [WhatsApp]**
Assign to field	Field that references the user assigned to the item. In both Case and Interaction (and most other tables), this field is the **Assigned to** (assigned_to) field.
Assignment group field	Field that references the assignment group assigned to the item. In most tables, this field is the **Assignment group** field.
Type	Indicator of whether a communication service channel is handled as a synchronous or asynchronous conversation channel. This field appears when you select **Interaction** in the **Table** field. ○ Chat ○ Phone ○ Messaging ○ Other
Log level	Amount of information recorded when AWA events are logged. ○ None: No information is logged. ○ Basic: Only basic information is logged. ○ Verbose: Detailed information, including record details and event details, is logged. This field appears if **Enable logging** is enabled.
Inbox Alert Audio	Audible alert that sounds when a new item arrives in your inbox for this service channel. If you don't specify an audio file, the default audio file sounds.
Message Alert Audio	Audible alert that sounds when a new message arrives in your conversation for this service channel. If you don't specify an audio file, the default audio file sounds.
Capacity and Utilization	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Default work item size	Amount of an agent's capacity that is used when this work item is assigned. The default is 1.
Default capacity	Number of items automatically assigned to agents (pending overrides). ○ Case: The default is 2. ○ Chat: The default is 4. ○ Chat: Asynchronous: The default is 4. ○ Facebook Messenger: The default is 4. ○ Incident: The default is 2. ○ Line: The default is 4. ○ Walk-up: The default is 1. ○ WhatsApp: The default is 4.
Utilization condition	Condition that determines what constitutes an active item that counts toward agent workload/capacity. For example, the record state is New, Open, or Awaiting Info. ○ For chat: The state is not Closed Complete or Closed Abandoned ○ For Chat - Asynchronous: The state is Closed Complete or Closed Abandoned ○ For case: The state is New or Open ○ For Facebook Messenger: The state is New or Work in Progress ○ For incident: The state is New, In Progress, or On Hold ○ For Line: The state is New or Work in Progress ○ For walk-up: The state is not On Hold, Closed Complete, or Closed Abandoned ○ For WhatsApp: The state is New or Work in Progress
Logging	
Enable logging	Option to record information in the syslog_awa table when AWA events are logged. Specify the level of detail to be recorded in the **Log level** field on this screen.
Stop logging at	Date and time that logging should stop. This field appears if **Enable logging** is enabled.

4. Select **Submit** or **Update**.
   The channel is added to or updated in the Service Channels [awa_service_channel] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Override the agent capacity for selected agents or groups.
- Create or modify an inbox layout for the service channel.
- Configure agent assignment rules for the channel.
- Define agent pools eligible for assignment.
- Create or modify a work item queue for the channel.
- Create or modify a work item size override for the channel.

Conversational SMS service channel

Using the Conversational SMS service channel app on the ServiceNow Store, workspace agents can provide support for long-running SMS conversations and conversations that use multiple service channels.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Overview

Requesters can initiate support conversations through SMS. Since these support conversations can be long-running, workspace agents need the ability to track ongoing conversations while also addressing requesters on other service channels. With the Conversational SMS service channel store app, workspace agents can initiate or continue SMS conversations and also accept SMS work items from the Workspace Inbox. Requesters in SMS conversations see a limited subset of system messages. This minimizes the number of system messages in case the conversation is long-running.

Messaging profiles

Messaging profiles provide a way to match an incoming phone number to a requester:

If	Then
New SMS is received from a requester who is associated to a phone number on the User [sys_user] table but has no messaging profile match	• A messaging profile record is generated to match the number to the User table. • An interaction record is associated to the matching User table.
New message received from a requester who does not have a phone number match in the User table but does have messaging profile match	• An interaction record is associated to the matching messaging profile user. • The User table record is not associated to the phone number. The agent can manually verify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If	Then
New message received from a requester who does not have a phone number match in the User table or messaging profiles	• An interaction record is associated to the guest user (Virtual agent or live agent can manually verify). • A messaging profile record is generated for the phone number but not associated to a user.
New SMS from a requester that conflicts with an existing User table or messaging profile	• An interaction is associated with the messaging profile/user currently associated with the number. • Virtual agent or live agent can verify the user and reassociate the interaction/profile with the correct user.

Messaging actions

Messaging actions provide a way to trigger actions based on messaging activity on a conversation.

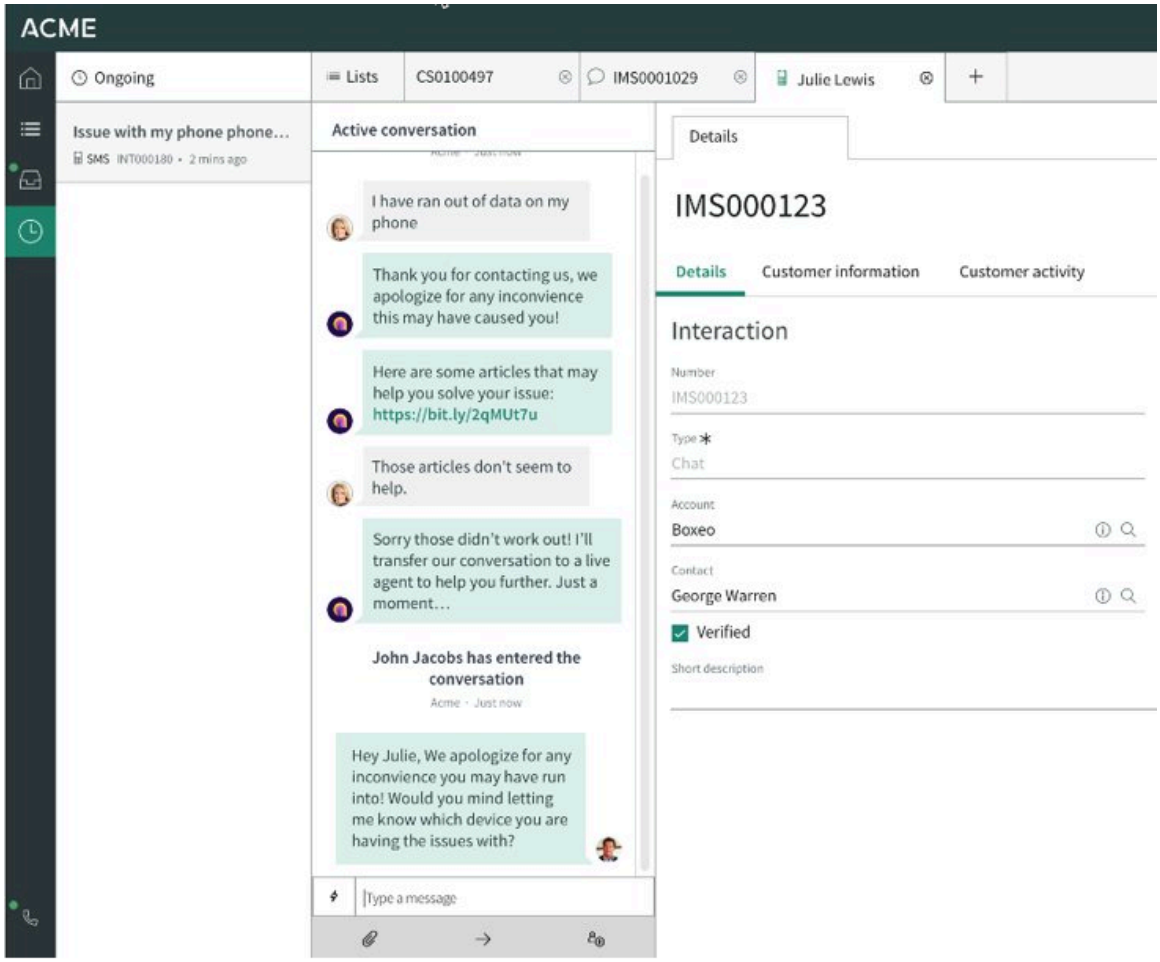
Messaging action parameters	Description
Event **1.** Requester message without agent response **2.** Agent message without requester response	Sending of a message from a requester or agent starts a timer that can trigger an action
Duration	Time set to trigger an action based on the Event parameter being set
Filter conditions	Condition needed on the Interaction record for a messaging action to be triggered (for example, State is "On Hold")
Action	Possible actions include: • Prompt agent – Sent Workspace notification to agent • Prompt requester – Sent system message in messaging conversation to requester • Reassign – Remove assigned agent from interaction • Set state – Set Interaction state to desired state

Ongoing conversations

The Agent Inbox displays new SMS messages and agents can locate currently assigned SMS conversations in the **Ongoing** tab. The tab indicator and record highlight indicate when an SMS

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

conversation has a new message. Unlike chat conversations, SMS conversations can be long-running. Completed SMS conversations do not display in the **Ongoing** tab.



Requester initiated SMS conversations

When a requester initiates a support conversation, a virtual agent or a live agent addresses the conversation. Like other service channels, Advanced Work Assignment handles the routing of SMS conversations to live agents. This is how requester-initiated SMS conversations are handled:

If	Then
There is no active SMS interaction	• Create a new SMS interaction • Assign the interaction to a virtual agent or a live agent
There is an active interaction involving a live agent	• Inject the message into an existing conversation • Continue with agent in current conversation • Track using the same interaction record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If	Then
There is an active interaction involving a virtual agent	• Inject the message into existing conversation • Continue with existing virtual agent topic • Track using the same interaction record

An active SMS interaction represents an ongoing conversation between a requester's phone number and a company's phone number.

Agent initiated SMS conversations

To initiate an SMS conversation with a requester, agents can select a provider number for an outbound service or manually enter a provider number. If there is a current ongoing SMS conversation, it automatically appears. When an agent initiates an SMS conversation:

If	Then
There is no active SMS interaction	• Create a new SMS interaction • Assign interaction to agent
There is an active interaction involving an agent	• Inject the message into existing conversation • Add agent to live group profile • No reassignment
There is an active interaction involving VA	• Close existing interaction • Create a new interaction and assign to agent
There is an active interaction involving a different contact/consumer/user	• Close existing interaction • Create a new channel user profile and deactivate the existing channel user profile • Create a new interaction and assign to agent

An active SMS interaction represents an ongoing conversation between a requester’s phone number and a company’s phone number.

Set up the Conversational SMS service channel

Configure the Conversational SMS service channel store app.

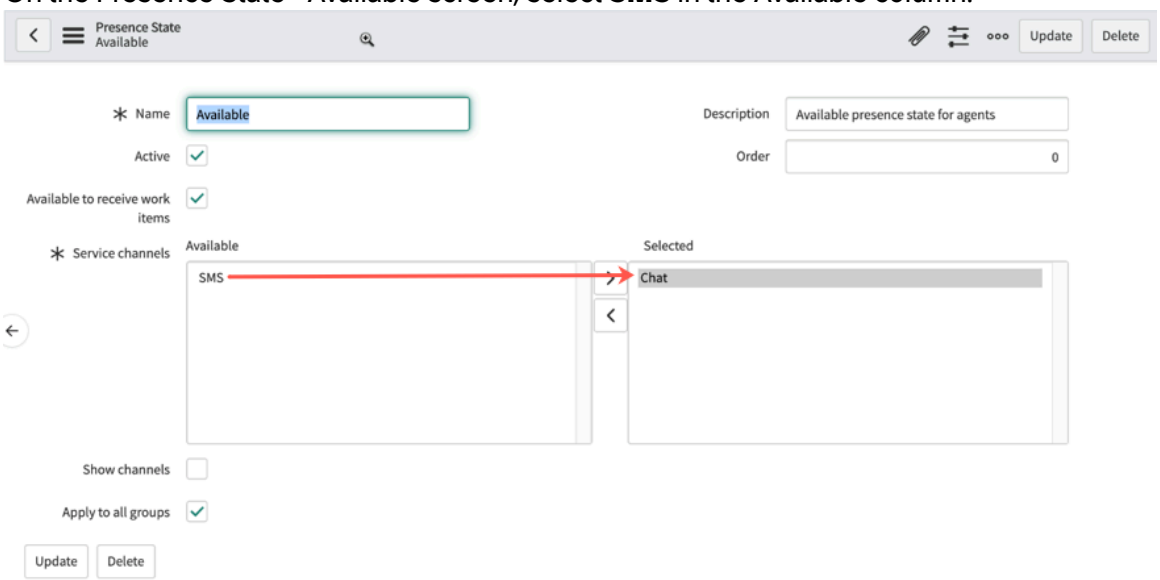
Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the service channel settings through one of the following navigation paths.
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select the SMS service channel.
3. On the Service Channel - SMS screen, select the **Active** check box to activate the service channel.
4. Because the SMS group has no users by default, manually add users to the SMS group.
5. Navigate to **All** > **Advanced Work Assignment** > **Home**.
6. In the Additional settings section, select **Set up presence states**.
7. In the Name column, click **Available**.
8. On the Presence State - Available screen, select **SMS** in the Available column.



9. Select the right-pointing arrow to move SMS from the Available column to the Selected column.
10. Select **Update**.

Set up a custom service channel

Set up a custom service channel to expand the type and scope of work that is routed automatically to your agents.

Before you begin

- Select the table that you want to use to route work to agents automatically. Only Task [task] and Interaction [interaction] tables are supported.
- Ensure that the form layout for the selected table is configured for the workspace view. Record types without a workspace view appear as read-only in Agent Workspace. For more information, see Set up forms in legacy workspace.
- If you want to open a record in AWA for a table that extends another table that has a service channel defined, ensure that the workspace view for that table has already been defined.
- Assign the awa_agent and workspace_agent roles to whichever agents are receiving work items in Agent Workspace from your custom service channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: awa_admin or admin

About this task

You can create a service channel record from the Service Channel module, but you must create a work item queue, assignment rule, and eligible assignment pool to route work through the service channel. You also must configure the custom service channel to make it available in an agent's inbox in Agent Workspace.

Procedure

1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select **New**.
3. Complete the service channel fields, and then select **Submit**.
   For more information, see Create or configure a service channel.
4. Create an assignment rule.
   For more information, see Configure agent assignment rules.
5. Create a work item queue for your service channel.

   For more information, see Create a work item queue.
6. On the form for the work item queue that you created, go to the **Assignment Eligibility** related link and create an eligible assignment pool.

   Make sure to associate your assignment rule to the eligible assignment pool.

   For more information, see Define agent pools eligible for assignment.
7. Make your service channel available in Agent Workspace.
   a. Navigate to **All** > **Advanced Work Assignment** > **Home**.
   b. In the Additional settings section, select **Set up presence states**, and then open **Available**.
   c. On the form, move your custom service channel to the **Selected** list.
   d. Select **Active** option (if not already selected).
   e. Select **Update**.
8. **Optional:** Create or change the inbox card layout to show the most important information from a work item.
   For more information, see Create or change an inbox layout.

Result

Your custom service channel routes work to agents. In Agent Workspace, the service channel appears as an available service channel in the agent inbox.

Tutorial: Set up a custom service channel for change requests

Learn how to configure Advanced Work Assignment to automatically assign change requests to agents. Use this tutorial as a guideline to help you understand how service channel records, queues, and assignment rules work together to create a custom service channel.

In this tutorial, you learn how to set up a custom channel that:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Assigns new change requests to whichever Change Management agent has the most capacity
- Populates the assignee's agent inbox in Agent Workspace with change requests from the queue
- Displays the change request number, short description, and type on the inbox card
- Enables the agent to accept or reject change requests

For information on setting up custom service channels, see Set up a custom service channel.

Before you begin:

- Ensure that the form layout for the Change Request table is configured for the workspace view; otherwise, work items from the Change Request service channel appear as read-only in Agent Workspace. For more information, see Set up forms in legacy workspace.
- Assign the awa_agent and workspace_agent roles to the Change Management group so that members can open work items in Agent Workspace.

Create a service channel to route requests

Create a service channel in Advanced Work Assignment so that you can route change requests to agents.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select **New**.
3. On the form, fill in the fields.
   - Name: Change Request
   - Inbox Order: 100
   - Table: Change Request [change_request]
   - Active: Selected
   - Utilization condition: [Active] [is] [true]
4. Select **Submit**.

Create an assignment rule for change requests

Create an assignment rule in Advanced Work Assignment that assigns change requests to agents who are available to do the tasks.

Before you begin

Role required: awa_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the assignment rules settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up assignment rules**.
   - **All** > **Advanced Work Assignment** > **Assignment Rules**.
2. Select **New**.
3. On the form, fill in the fields.
   - Name: Change Request Assignment Rule
   - Assign by: Most Capacity
   - Allow agents to reject: Selected
4. Select **Submit**.

Create a queue to route new change requests

Create a work item queue in Advanced Work Assignment that routes new change requests through the service channel that handles change requests.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select **New**.
3. On the form, fill in the fields.
   - Name: Change Management
   - Service channel: Change Request
   - Condition mode: Simple
   - Work item routing condition: [State] [is] [New]
4. From the form context menu, select **Save**.

Create an assignment pool of agents

Create an eligible assignment pool in Advanced Work Assignment that receives overflow work items, just in case you need more help from other agents to handle change requests.

Before you begin

Role required: awa_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Open the Change Management queue.
3. On the form, go to the **Assignment Eligibility** related list and select **New**.
4. On the form, fill in the fields.
   - Agent assignment rule: Change Request Assignment Rule
   - Groups: Change Management
5. Select **Submit**.

Make your service channel available in Agent Workspace

Make your service channel available in Agent Workspace so that agents can receive change requests in their inbox.

Before you begin
Role required: awa_admin or admin

Procedure

1. Navigate to the presence states settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Additional settings section, select **Set up presence states**.
   - **All** > **Advanced Work Assignment** > **Presence States**.
2. Open **Available**.
3. On the form, move **Change Request** to the **Selected** list.
4. Select **Active** (if not already selected).
5. Select **Update**.

Customize how change requests appear in an agent inbox

Customize how change requests appear in an agent inbox so that agents receive enough information to decide whether to accept or reject the work item.

Before you begin
Role required: awa_admin or admin

Procedure

1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select the **Change Request** service channel record.

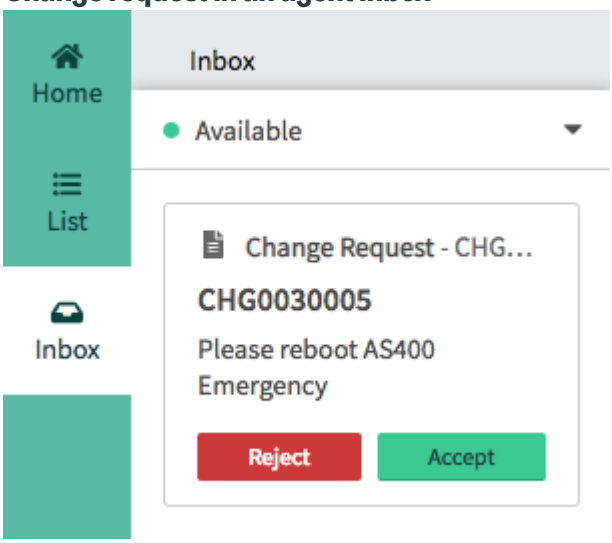
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Change Request service channel form, go to the **Inbox Layouts** related list and open **Default Change Request layout**.
4. On the form, fill in the fields.
   - Field 1: Number
   - Field 2: Short description
   - Field 3: Type
5. Click **Update**.

Result

When you create a change request, the item is routed through the Change Request service channel and assigned to the agent in the Change Management assignment group who is available to receive the change request. When the assignee checks their agent inbox, the change request appears with the option for the agent to either reject or accept the work item.

Change request in an agent inbox



Inbox layout

The inbox layout determines the information shown on work item cards displayed in an agent's inbox.

The AWA admin (awa_admin) can configure layouts that represent items in an agent inbox. The configuration allows agents to see the most important attributes by service channel work items. The fields specified on the inbox layout determine the information displayed for a work item.

Each base system service channel provides preconfigured inbox layouts for work items. The AWA admin can view and edit these layouts and also create new layouts.

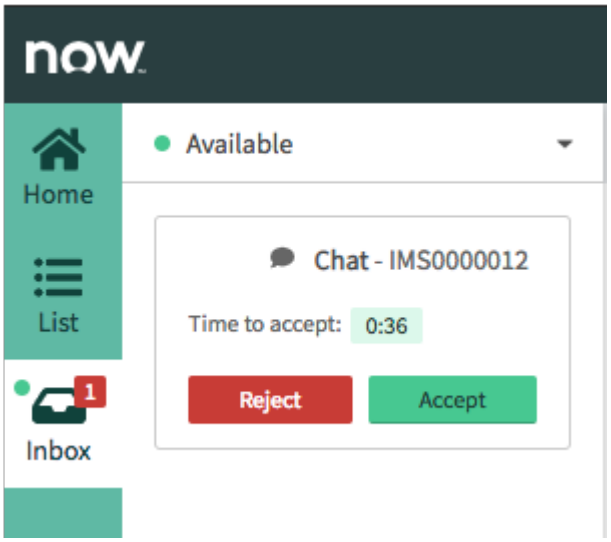
Up to five fields can be shown in the card layout.

- Fields can be added from the table that the service channel points to.
- Fields are dot-walkable.
- The first field added to the layout becomes the title field on the card.

Layout example

For chats that do not have either a contact or consumer, the layout includes only the chat subject. You control the display of the **Time to accept** count (timer) and the **Reject** button through the agent assignment rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



See Create or change an inbox layout for more information on accessing and modifying an inbox layout.

Create or change an inbox layout

Create or change the card layout for inbox items for a given service channel. Card layouts are displayed in the agent inbox view of Agent Workspace.

Before you begin

Role required: awa_admin or admin. Users with the awa_manager or agent role can review inbox layouts.

About this task

Cards represent work items in an agent's inbox in Agent Workspace. Each channel has a default layout for these cards, which can display up to five fields from the related table record. Use the Inbox Layout form to change a default layout, such as the name, short description, and the specific fields displayed on the card, for example channel and contact or consumer name. You can also specify certain conditions that determine when the card layout is used.

Procedure

1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select the service channel to be updated.
3. In the Service Channel form, select the **Inbox Layouts** related link.
   - To create a layout, select **New**.
   - To change a layout, select the layout to be updated.
4. On the form, fill in the fields.

Field	Definition
Name	The name of the inbox layout.
Service channel	The name of the selected service channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Short description	The description of the inbox layout.
Order	The order in which the layouts appear in the agent inbox.
Condition	A condition that determines when this layout is used. Use the condition builder to specify a condition that must evaluate to true to apply the layout.
Card layout	Example card layout.
Field 1	The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select **None** to remove an existing field.
Field 2	The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select **None** to remove an existing field.
Field 3	The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select **None** to remove it.
Field 4	The field from the table for the channel, for example the Interaction [interaction] table for the chat service channel. Select the field or select **None** to remove it.
Field 5	The field from the table for the channel. For example, the Interaction [interaction] table for the Chat service channel. Select the field or select **None** to remove it.

5. Select **Submit** for a new layout or **Update** to modify a layout.
   The layout is added to or updated in the Inbox Layout [awa_inbox_layout] table.

What to do next
As needed:

- Override the agent capacity value for selected agents or groups.
- Create or change a work item queue for the channel.

Override agent capacity for selected agents

Change the default number of work items that an agent can handle for a service channel.

Before you begin
Role required: awa_admin or admin

About this task
To change the capacity for selected agents, use the **Agent Capacity Override** related list for the service channel. To change the capacity for one or more members of a selected group, use the **Agent Capacity Override** related list for the group (**Advanced Work Assignment** > **Groups**).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select the service channel.
3. In the **Agent Capacity Override** related list, select **New**.
4. On the form, fill in the fields.

Field	Definition
Service Channel	Name of the selected channel.
Override Capacity	Number of work items that the selected agents can handle.
Users	Agents to which this override applies. Move the agent names from the **Available** list to the **Selected** list. You can use the filter to identify conditions that restrict the list of agents. **Note:** The filter shows only users or groups that have AWA roles (awa_agent, awa_manager, awa_admin, admin).

5. Select **Submit**.
   The selected agents and their associated capacity values are listed in the Agent Capacities table.

What to do next

If you're configuring a service channel, you can create or change an inbox layout for the channel.

Create or change a work item size override

Create a work item size override if you want Agent Affinity to calculate an agent's workload using a work item size other than the default.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to the service channel settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up service channels**.
   - **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select the service channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, select the **Work Item Size Override** list.
   - To create an override, select **New**.
   - To change an existing override, select the override that you want to update.
4. On the form, fill in the fields.

Change work item size form

Field	Definition
Name	Name of the override.
Service Channel	Service channel that is assigned to the override.
Override Size	Size to use instead of the default.
Order	Order in which Advanced Work Assignment considers this size override.
Condition mode	Type of condition for routing work items using this size override: ○ Simple: Specify a routine condition using the condition builder. ○ Advanced: Specify a JavaScript scripted condition.
Conditions	Condition that applies to the override work item sizes. This field appears when you select **Simple** in the **Condition mode** field.
Script	JavaScript condition statement that specifies the override work item size. The condition must evaluate to true. This field appears when you select **Advanced** in the **Condition mode** field.

5. Select **Submit** to create the override or **Update** to change the override.

Work items

View Advanced Work Assignment work items using the Work Items menu options.

Work items are a single piece of work handled by an agent from start to finish. For example, one chat or one case is an object that is routed and assigned to agents. Only users with awa_manager privileges can access the Management menu options.

Work item queues

In Advanced Work Assignment, queues store a specific type of work item for a service channel.

AWA administrators can create or modify queues based on customer need. As part of creating or modifying a queue, the awa_admin identifies some information about the queue, including the service channel to which the queue belongs and which agent groups handle the incoming work items.

The awa_admin can select a schedule that defines when the queue is available and identify a time limit within which an agent should accept a work item in the queue. If the selected service channel is **Chat**, the awa_admin creates the chat messages that are displayed to users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Routing conditions identify the work items that are routed to a queue. Create routing conditions in one of two ways:

- Simple: use a condition builder to select routing conditions. The fields available for selection are based on the selected service channel.
- Advanced: use a JavaScript script to identify routing conditions.

The awa_admin can also create a queue without routing conditions so that work items are not routed to that queue automatically. Customers can manually assign work items to the queue or assign work items using assignment tools such as matching rules or Workflow Studio.

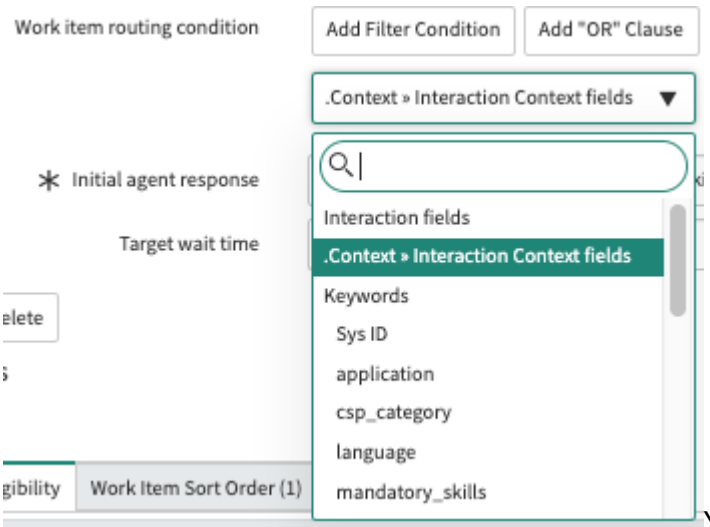
When a case in a queue is assigned manually, the case is removed from the queue. The state of the work item is set to **Canceled** and the cancellation reason is set to **Manually assigned**.

Note:
New work items may not be assigned if they are routed to queues containing more than 10,000 work items in the queued state.

Configure routing rules that use chat context variables

You can specify queue routing rules that use chat context variables in the condition builder. For details on creating chat context variables, see Configure context variables for storing chat-related information. These variables can store contextual information that can be used in routing conditions to control where chat work items are routed.

For example, you can define chat context variables to store user responses from pre-chat surveys that you create. If you store these responses in chat context variables, such as a user's department or a product name, you can specify the context variables in queue routing conditions to direct where the live chat is routed. When you specify a routing condition using the condition builder, you can dot walk to the Context fields. In the fields menu, select **Show Related Fields** and open the fields menu again to select **Context → Interaction Context fields**.



You can then select from the available chat context variables in the condition builder. For example, choosing **csp_category** becomes **Context.csp_category**.

Assign pools of agents eligible to work on a queue

Assign one or more agent groups to a queue using the **Eligibility Assignment** related list. These groups are eligible to receive work items from the queue, which allows work to get prioritized to eligible agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select an agent assignment rule and any eligibility time constraints for each group. The eligibility time constraints are used to determine when the next pool of agents is eligible for assignment. For example, you can assign one group to handle work items immediately and a second group to handle the overflow from the first group after work items sit in the queue for a specified amount of time.

Note:
If no groups are assigned to a queue, work items can be routed to the queue but Advanced Work Assignment does not assign them.

Create a sort order for a queue

Use the Work Item Sort Order related list to create one or more sort conditions for work items in a queue. For each sort condition, specify a field from the selected service channel table and the direction to sort, either ascending or descending. Items in the queue are sorted and assigned to agents based on these conditions.

Create a work item queue

Define or change a queue so that you can determine which work items are routed automatically to agents through a given service channel.

Before you begin
Role required: awa_admin or admin

About this task
Depending on the service channel, additional configuration options are available. For example, in the chat channel you define the standard messages displayed during a chat session with a user.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Choose a situation.
   - To create a queue, select **New**.
   - To change a queue, select the queue record to be updated.
3. On the form, fill in the fields.

Field	Definition
Name	Name of the queue. A default queue may be available for the service channel you activated through the plugins related to AWA.
Number	Base number for the table. For more information, see Record numbering.
Service channel	Channel to which the queue belongs. For the chat channel, define the standard messages displayed to chat users in the Chat Messages section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Active	Option indicating whether the queue is enabled.
Application	Type of scoped application.
Schedule	Support schedule that defines when the queue is available.
Order	During routing, the order in which AWA considers the routing condition for this work item queue, in comparison to other queues.
Short description	Brief explanation of the queue.
Routing Condition	
Define condition here	Option that indicates a routing condition is to be applied to the queue. If checked, define the **Condition mode** and **Work item routing condition**.
Condition mode	Type of condition for routing work items in the queue. ○ Simple: Specify a routing condition using the condition builder. ○ Advanced: Specify a JavaScript scripted condition.
Work item routing condition	Condition that applies to routing work items to this queue. Use the condition builder to select routing conditions. The fields available for selection are based on the selected service channel. For the chat service channel, you can specify chat context variables in the condition builder by dot-walking to related context fields. For example, if you defined chat context variables that store pre-chat routing information, you can dot-walk to those chat context variables in the condition builder. You can use the variables in routing conditions to specify where chats are routed.
Script	JavaScript condition statement that specifies the work items to be routed to the queue. The condition must evaluate to true. This field appears only when **Advanced** is selected from Condition mode.
Initial agent response	Message that users see when an agent accepts a chat. For example: `Thank you for contacting support. I am looking into your question now and will be with you shortly.`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Max wait time message	Message that users see when a chat ends because the Max Wait Time has elapsed. This field is required if the **Max Wait Time** is greater than 0.
Target wait time	Estimated time (Days or Hours, minutes, seconds) allotted for an agent to accept an item in the queue.
Max Wait Time	Maximum amount of time that all available agents have to accept or reject a chat request. After time runs out, the requester receives the value in either the **Max wait time message** field or the **No Agents Available Message** field defined in Agent Chat settings. **Note:** The **Max Wait Time** field is available after you associate the queue to the chat service channel.

4. Select **Submit** for a new queue or **Update** to change the queue.
   The queue is added to or updated in the Queues [awa_queue_list] table.

What to do next

- Define the **Assignment Eligibility**.
- Optionally, define the **Work Item Sort Order**.
- Optionally, define the **Queue Triggers**.
- Optionally, define the **Set Agent Affinity rules**.

Define agent pools eligible for assignment

Specify pools of agents eligible to receive overflow work assignments for a queue. An eligible assignment pool can consist of one or more groups of agents available to work on items in the queue. This feature enables Advanced Work Assignment to find a qualified agent from a wider pool of agents.

Before you begin

Role required: admin

About this task

Use the **Assignment Eligibility** related link to expand the pool of agents eligible to work on items in the queue when other agents are busy or unavailable. For each agent pool, select the assignment rule that determines the assignment eligibility. If you don't define an eligible assignment pool for a queue, work items are routed to the queue but AWA doesn't assign them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select the queue.
3. To create an assignment pool, go to the **Assignment Eligibility** related link.
   - To create a new eligible assignment pool, select **New**.
   - To change the assignment eligibility for a pool of agents, select the pool to be updated.
4. On the form, fill in the fields.

Field	Definition
Agent assignment rule	The name of the rule that determines how work items are to be assigned. Select an assignment rule from the list.
Eligible at	The length of time in seconds before AWA considers the next set of agents for assignment.
Groups	The set of groups eligible for assignment. ○ Click the lock icon to unlock it and select the agent groups in the eligible assignment pool. ○ Click the lock icon to lock it.

5. Select **Submit** to create the eligible or **Update** if modifying an eligible assignment pool. The Queues [awa_queues] table is updated with the eligible assignment pool.

Set work item sort order

Specify the order in which work items in a queue are sorted.

Before you begin

Role required: awa_admin or admin

About this task

The **Work Item Sort Order** field only determines the order that AWA assigns the work item and doesn't affect the order of work items in the agent's inbox card. Work items in the inbox card are displayed based on the time that they arrive. The **Work Item Sort Order** field assigns a set of pending work items to agents designed by the defined work item sort order. For example, if two work items are pending when an agent becomes available, the **Work Item Sort Order** decides which work item is assigned first to an agent via AWA.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select the queue.
3. Select the **Work Item Sort Order** related list and select **New**.
4. In the Work Item Sort Order form, select:
   - **Field**: The field to be used for the sort. The fields are from the table for the associated channel. For example, the fields available for the chat service channel are from the Interaction table.
   - **Sort Direction**: The order in which work items are sorted. Select either Ascending (smallest to largest or oldest to newest) or Descending (largest to smallest or newest to oldest).
   - **Order**: The value of the **Order** value relative to other items in the queue.
5. Select **Submit**.

Create and manage queue triggers

Create and manage queue triggers to set off multiple actions during customer wait times for a particular queue.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select the queue.
3. Select the Queue Triggers related list.
   - To create a queue trigger, select **New**.
   - To change a queue trigger, select the queue trigger record to be updated.
4. On the form, fill in the fields.

Queue Trigger form

Field	Description
Queue	Work items that belong to a service channel.
Message	Message that users see because the **Trigger Time** has elapsed. If the **Trigger Type** field value is **Max Wait**, this field becomes read-only and displays the value entered in the Queue form's **Max wait**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	time message field. When the **Max wait time message** appears to users, they're prompted to select a Virtual Agent topic and if they select a topic, they don't return to the live agent's queue.
Trigger Type	Type of configurable trigger: **Wait** or **Max Wait**. The **Wait** trigger defines the actions that happen when users are waiting in the queue and the **Max Wait Time** hasn't been met. The **Max Wait** trigger defines the actions that happen when users are waiting in the queue and the **Max Wait Time** is met.
Trigger Time	Time (days or hours, minutes, seconds) allotted for the **Trigger Type**. If the **Trigger Type** field value is **Max Wait**, this field becomes read-only and displays the value entered in the Queue form's **Max Wait Time** field.
Flow	Name of the flow or subflow. **Note:** Workflow Studio subflows must have a string input parameter named `conversation_id` for AWA queue triggers to detect the appropriate subflow. Ensure that the subflow you want to use has a string input parameter named `conversation_id` through the **Execution** tab in Workflow Studio.
Virtual Agent topic	Name of the existing Virtual Agent topic that appears to the users when the max wait time is met.

5. Select **Submit** for a new queue or **Update** to change the queue.
   The queue triggers are added to or updated in the Queue Triggers related list.

External routing overview

External Routing involves routing to external queue based on the service channel and queue conditions, and then the assignment is completed by the third-party system.

Process flow

This is how the work items are processed when using external routing:

1. Work items are routed to the queue in a queued state but are unassigned. Work items expire if the Max timeout is set.
2. External solution looks for work items in queued state by the Work Item Table API.
3. External solution looks for agent availability vi the AWA Agent API before assigning to agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. The external solution uses the AWA Assignment API to assign the work items to the agent.
5. The agent sees an inbox card.

When Advanced Work Assignment is configured to use external routing:

- Queues do not allow to have Assignment Eligibility Groups defined.
- Work items remain in the queue with a "queued" status until the external system assigns the work item or the queue maximum wait time elapses.
- Related lists do not display at the bottom of the Queues screen.

These APIs are required for external routing:

- AWA Assignment API to support the external routing system to assign work items. For information on AWA Assignment API, see AWA Assignment API .
- Work item table API (awa_work_item) to look up the queued work items waiting for assignment. For information on table API, see Table API .
- AWA Agent API if the external solution requires validation of agent availability within Workspace before assignment. For more information on the AWA Agent API, see AWA Agent API .

Functionality of AWA components

When external routing is enabled, the AWA components provide these capabilities:

Agent

- Components utilized
  - Agent availability
  - Accept button
  - Agent capacity in use (Service channel capacity) increases but is not utilized against the max capacity of service channel
  - Agent universal capacity in use increases but is not utilized against the max universal capacity
- Components not utilized
  - Reject button with rejection reasons: The Reject button is used when configured in the manual assignment API. If the reject button is enabled (allowed_to_decline=**true** parameter in assignment API request), then the rejection reasons are supported.
  - Max agent capacity
  - Max universal capacity

Service channel

- Components utilized
  - Channel advanced condition
  - Inbox layouts
  - Queue order
- Components not utilized
  - Assign to and assignment group fields

    These fields are used to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

        - Determine if a document should qualify for routing.
        - Determine which field to update once the work item is successfully assigned to an agent.
    - Capacity and utilization features
    - Agent capacity overrides
    - Work item override

Queue

- Components utilized
    - Max wait time will expire work items if set on queue
    - Work item routing conditions
    - Queue order
- Components not utilized
    - Queue agents' presence checks: Agent's presence is checked during the assignment API request processing.
    - Work items remain in the queue with a status of "queued" until the external system routes the work item
    - Queue schedules
    - The following related lists are hidden on the queue since they are not utilized:
        - Assignment eligibility and rules
        - Work item sort order
        - Agent Affinity
        - Agent assignments
        - Group queue priorities
        - Work items

Functionality of External routing in AWA

External routing enables AWA to integrate with third-party contact-center-as-a-service (CCaaS) providers. When the external provider has made an assignment decision, the work item gets assigned utilizing the existing AWA Assignment API.

External Routing can

- Send events to keep providers informed about the work item and agent status.
- Enhance the assignment API to handle provider-initiated work items.
- Track and offer contact center work items, while outsourcing agent selection to the contact center.

When Advanced Work Assignment is configured for external routing:

- AWA provides additional parameters for an Inbox experience.
- AWA provides additional logging and performance improvements.
- The Inbox card is presented to the Agent with both the Reject and Accept buttons when Auto-accept is false.
- The Inbox card shows the Time-out value to Agent. If auto-assign is true, this field is ignored, when the Time-out value of the Work Item is greater than 0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The presence state of the agent switches to the specified presence state. If auto-assign is true OR no timeout is passed in, this field is ignored.
- The work item is immediately assigned to Accept, when the Auto-assign value is true.
- The auto-assigned work item is either displayed as an Inbox card, or both Inbox card and workspace tab. If the auto-assign value is false, this field is ignored.

Create a connection Alias for third-party provider

Create a connection Alias for your third-party provider to enable external routing on your instance.

Before you begin

Role required: admin

- Plugins to be installed:
  - Advanced Work Assignment plugin (com.glide.awa)
  - External Routing Support plugin (com.glide.awa-external)

    Note:
    Load the demo data while installing the plugin.

- Role required: admin

Procedure

1. On your ServiceNow instance, navigate to **Connection and Credential Aliases** and select the **ServiceNow_Basic** record.
2. Create a connection from the **Connections** tab.
   - Set up Credentials for the Connection record.

     Note:
     For the local setup, select the Basic Auth Credentials.

     - In the Credentials record, provide the **Name**, **User name**, and **Password**.
     - Select **Submit** and select that credential.
     - For the Connection URL, give an active URL (of any third-party provider) for local set up.
   - Select **Save**.

Create a custom flow action

Create a custom flow action in Workflow Studio for enabling external routing.

Before you begin

Role required: admin

Procedure

1. On your ServiceNow instance, navigate to **All** > **Flow Designer** > **Actions**.
2. From the Actions list, open **AWA Post External Routing Events – Demo**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Copy action** from the More Actions menu , copy the contents of the **AWA Post External Routing Events – Demo** action and provide a name to it.
4. Select **Publish**.

Create a subflow

Create a subflow for the Workflow Studio for enabling external routing.

Before you begin
Role required: admin

Procedure

1. On your ServiceNow instance, navigate to **All** > **Flow Designer** > **Subflows**.
2. From the Actions list, select **Template - AWA Send Event**.
3. Select **Copy subflow** from the More Actions menu , copy the contents of the **Template - AWA Send Event** subflow and provide a name to it.
4. Configure the action that you created in Create a custom flow action.
   a. Select the Add an Action, Flow Logic, or Subflow.
   b. Select the action that you created and in the Actions form, fill in the fields.

Action form

Field	Description
Action	The custom action that you created. For more information, see Create a custom flow action.
Payload	Input the variables for the action.
Connection Alias [Connection & Credential Aliases	The HTTP(s) Connection that you created. For more information, see Create a connection Alias for third-party provider.
Resource Path	The endpoint URL of the third-party CAAS provider.

   c. Select **Done**.
5. Select **Publish**.

Create a payload for external third-party providers

Create a payload for external third-party providers to send your work items to the external queue.

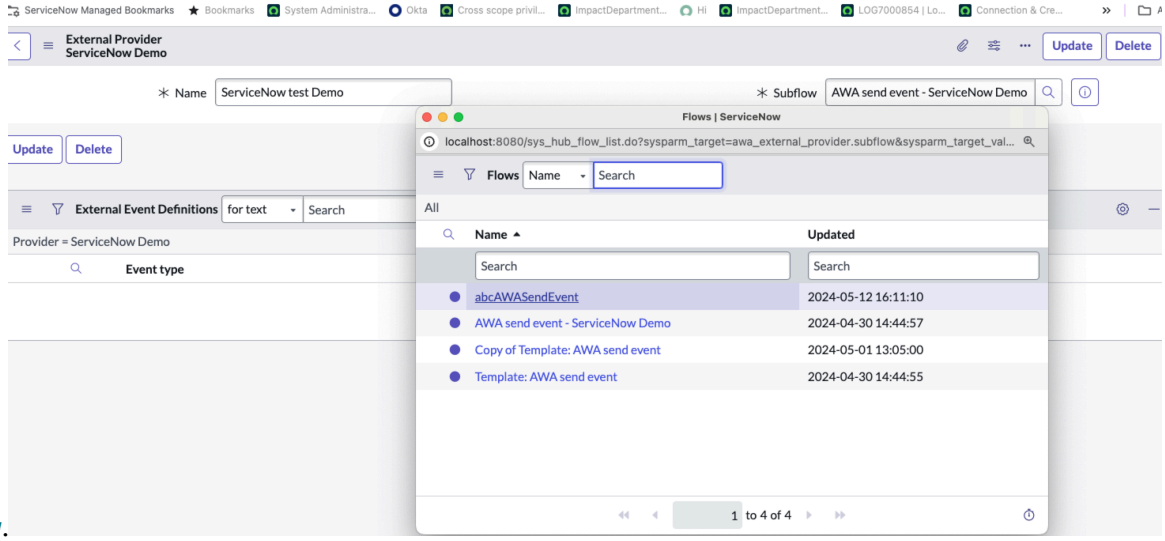
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

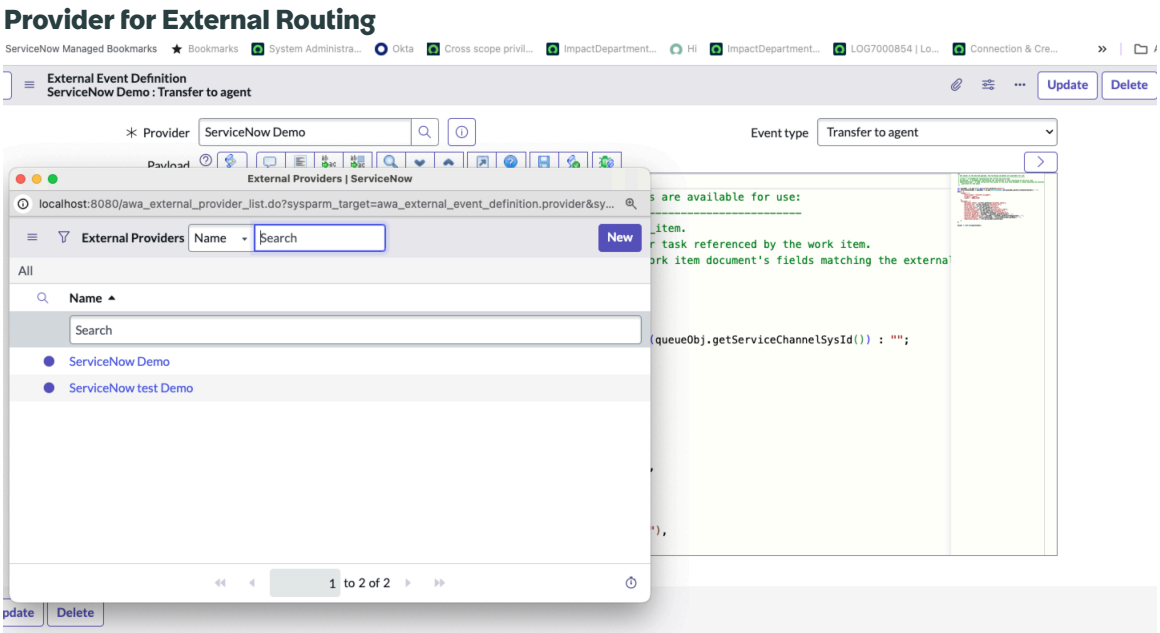
Role required: admin

Procedure

1. On your ServiceNow instance, navigate to **All** > **Advanced Work Assignment** > **Queues**.
2. Create a queue enabling External Routing.
   For more information about creating a queue with external routing, see Enable external routing for queues.
3. Open the provider record, select the subflow that you created, and select **Save**.
   For more information about creating a subflow, see Create a subflow.



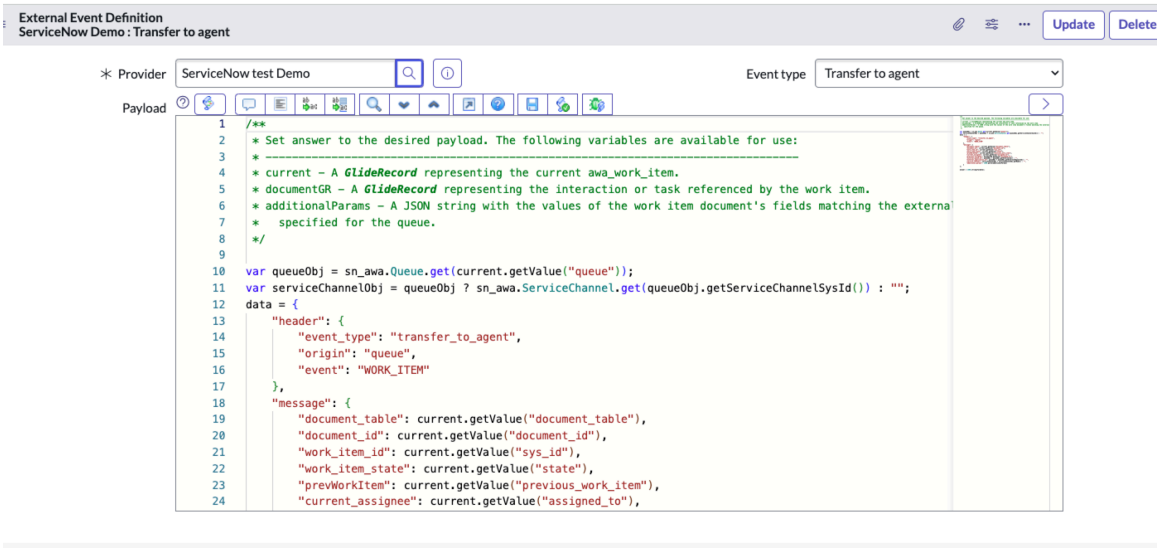
4. In the External Event definition section, create a definition form or modify the existing demo data records by changing the provider name you created.



The payload script in the External event definition [awa_external_event_definition] table has the event type and payload information that you send to the third-party providers. Therefore, it is required for you to change all the events' provider to the provider you created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Payload for External Routing



In the payload script:

- `current` refers to the work item glideRecord associated with the queue. You can access all the workitem records from the glideRecord current.
- `queueObj` is the glideRecord for the existing awa_queue record.
- `additionalParams` refers to the parameters from the document table.

Note:
Before saving the script, verify that you have the required data.

5. Select **Update**.

Link Subflow and Payload to External Queues

Link the subflow and the payload to your external queue to complete external routing.

Before you begin
Role required: admin

Procedure

1. On your ServiceNow instance, navigate to **All** > **Advanced Work Assignment** > **Queues** and select your Queue.
2. On your Queue form, check the **External** field checkbox.
3. In the External third-party provider section, select the provider you chose while creating the payload.
   For more information, see Create a payload for external third-party providers

   If you need any additional information, add it in the `additionalParams` of the payload script, and select the added params from the **Document Fields to include** slush bucket.
4. From the FDIH Dashboard, select **Test**.
   While you want to test your flow action, ensure that you select the HTTP(s) Connection you configured previously, the Resource Path URL for the third-party external provider, and provide the sample payload.
5. In the script to run the FD, provide the necessary Work Item ID and the interaction sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Verify that you have the third-party external provider URL in the outbound HTTP logs after testing.
   Open the third-party external CCaaS provider and verify the transaction logs for the endpoint.

What to do next

You can perform a quick setup test using the demo data by connecting to your external provider. For more information, see Define external routing test implementation.

Enable external routing for queues

Configure Advanced Work Assignment to route work items in the queue using external routing.

Before you begin

Verify that you have reviewed the functionality of external routing and configured the necessary APIs. For more information, see External routing overview.

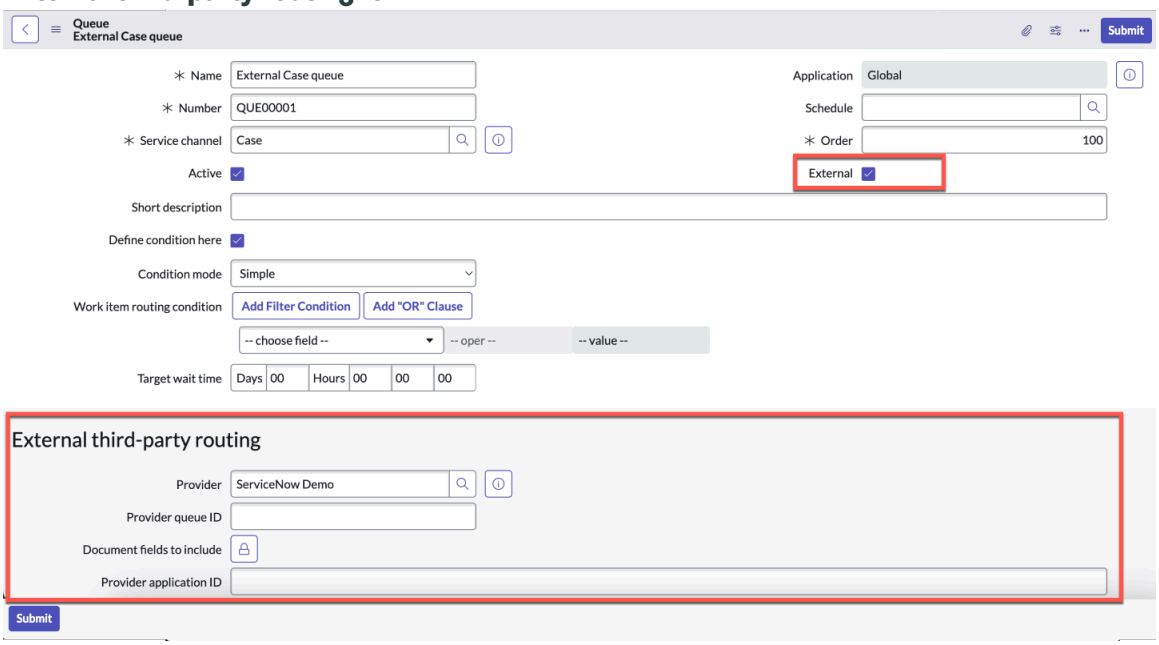
Role required: awa_external_user

> **Note:**
> With the installation of the External Routing Support plugin (com.glide.awa-external), the awa_external_user role is available by default.

About this task

From Xanadu release, you can add the **External** field to the AWA queue form view. The **External** field is not available by default, but it is available with the installation of the External Routing Support plugin (com.glide.awa-external) in Xanadu release. The **External** field can be added to the queue UI form only when the plugin is installed in your instance.

External third-party routing form



The installation of the External Routing Support plugin (com.glide.awa-external), adds demo data for the following:

- An AWA External Provider (awa_external_provider).
- A sys_alias representing an endpoint for the external provider API.
- A set of awa_external_event_definition records demonstration reasonable payloads for each event type.

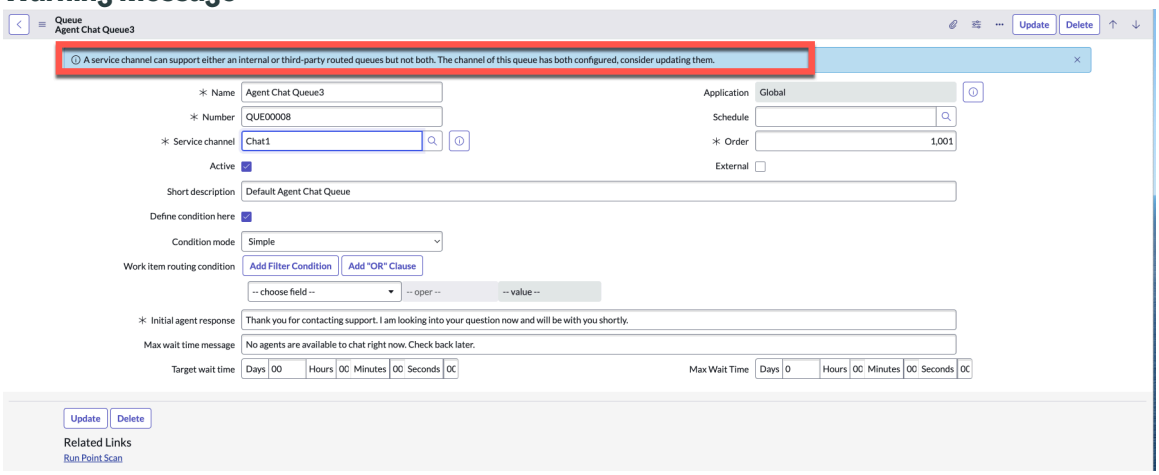
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If the customer modifies the default AWA Queue form view, the **External** field is not added to the form even if the external routing plugin is installed as the installation does not override the customer configurations and it must be manually added to the form.
- Installing AWA without this plugin still enables AWA and Agent Chat to function normally, and does not result in any errors or warning logs due to code attempting to access tables or fields that do not exist.

If External (with external partner) and internal AWA queues are mixed up with the respective service channel in an External Partner outbound payload-defined configuration, then a warning message is displayed.

Warning Message



Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select **New** for an External Routing Queue form.
3. Check the **External** check box to use external routing.

   ### Note:

   - If the **External** field doesn't appear, select the update personalized list icon ( ) and add the **External** field to the screen.
   - If you don't want to use external routing, clear the **External** check box.
4. On the form, fill in the fields.

External third-party routing

Field	Description
Provider	The third-party provider for external routing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: By default, ServiceNow provides the ServiceNow Demo provider, but you can select a provider of choice.
Provider Queue ID	Queue ID of the external third-party provider.
Document fields to include	Fields of the document that the service channel is on. The work item fields that can be sent out to the external third-party. You can select the required fields.
Provider application ID	Unique application or integration identifier, which is used by the third-party routing system to make requests if necessary.

5. Select **Submit**.

Configure External Routing events and payload

Configure Advanced Work Assignment with external routing using AWA External Service API for CCaaS and third-party providers to enable them to submit events.

Before you begin

Role required: admin

About this task

When AWA Queue is configured for external routing, it enables for setting up a REST endpoint corresponding to the CCaaS entry point for routing, which:

- Makes the schema changes needed to associate with an AWA External queue with the CCaaS REST endpoint.
- Provides the following fields to provide the payload for the REST call:
  - Case (sn_customerservice_case)
  - Task (sn_customerservice_case)
  - Interaction (interaction)

Configuring AWA with external routing enables you to consolidate the routing of ServiceNow channels (such as Chat, Cases, or Incidents) and the CCaaS channels. The AWA External Service API involved in the configuration plays a key role:

- Detects the Work Item (created or transferred)
- Uses the External AWA Service API pushEvent (EVENT_TYPE) function to pass the Work Item.
- Generates the request payload and constructs the flow object using the The ExternalAWAServiceAPI.
- Pushes the events to the external system using the Subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

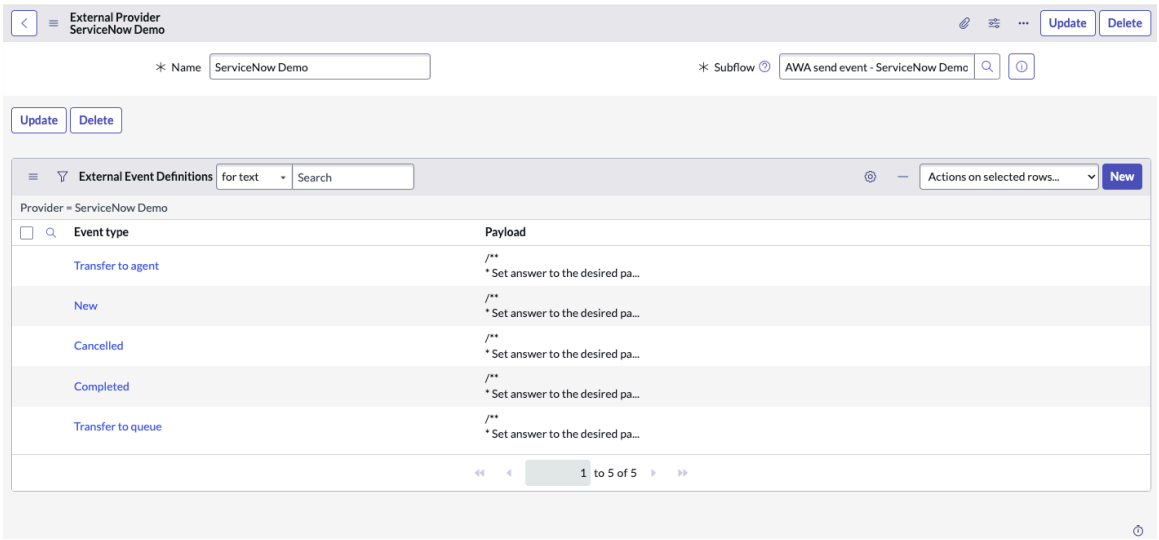
     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select an existing External Routing Queue item or create one.
3. Select the **External** check box to create an external routing Work Item.

   Note:
   If you selected an existing AQA Queue item, verify that external routing is enabled with the **External** field checked.

4. In the External third-party routing section of the queue form, select the Preview this record icon and select **Open record**.

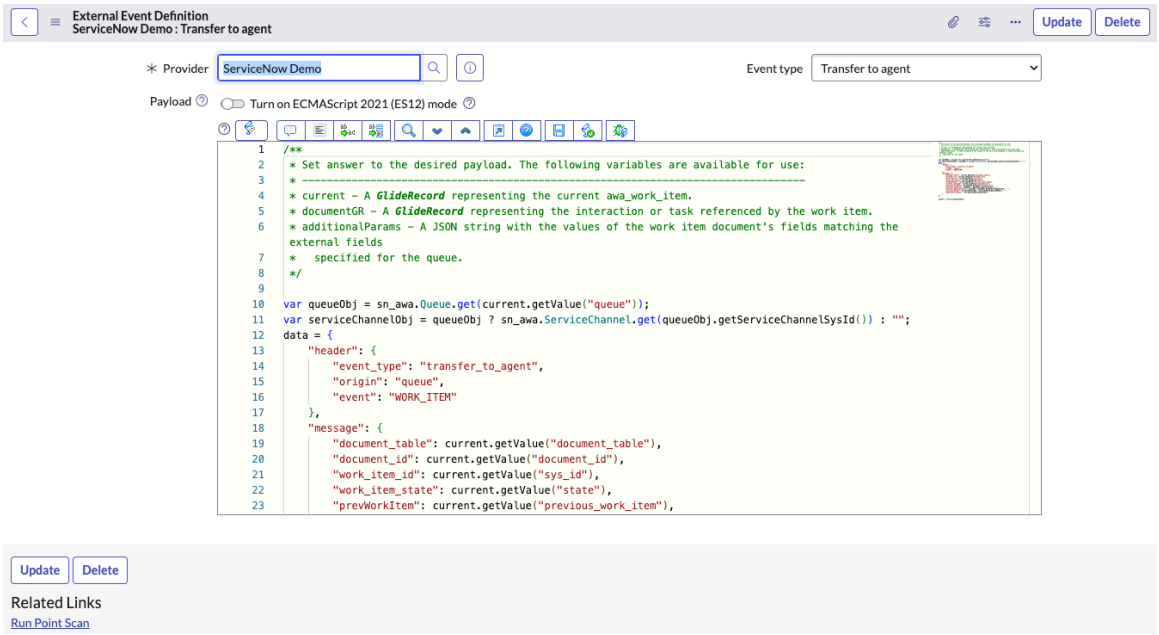
   Note:
   You are notified to save the Queue record for any changes you made upon navigating. Select **Update** for an existing queue or select **Submit** for a new queue.

5. Select the **Subflow** from the list of flows available to send events to the selected provider.



6. Select the required External Event Definitions for the provider.
   The selected External Event Definitions are associated with the provider to define the external events that must be handled by the provider. You can either select from the existing event definitions or create one.
7. Select an external event definition to see the **Event type** and **Payload** that it contains.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
Ensure that you do not add any info message or error message after answer block. Answer should be always return string, if answer is in try block, you can add info/error messages in catch block.

Use the following items that are available by default, to construct the payload contents you want on the external system:

- `current` = Represents the AWA Work item record
- `docuemntGR` = Represents the interaction or task referenced by the Work Item.
- `additionalParams` = Contains objects with the values of the Work Item document's fields.
- payload script = Contains scriptable APIs.

8. Select **Update**.
   The Agent chat queue is configured to the external routing queue.

Result

After the configuration, all the incoming chats are routed to the external queue and you can see the list of work items sent to the external queue in the Work Items [awa_work_items] table. You can find the recorded event logs of the subflows associated with the provider in the Flow engine contexts [sys_flow_context] table.

To view the execution details of the event payload, open an event record from the Flow engine contexts [sys_flow_context] table and select **Open in Operations View**. You will see the AWA Post External Routing Events flow with the payload.

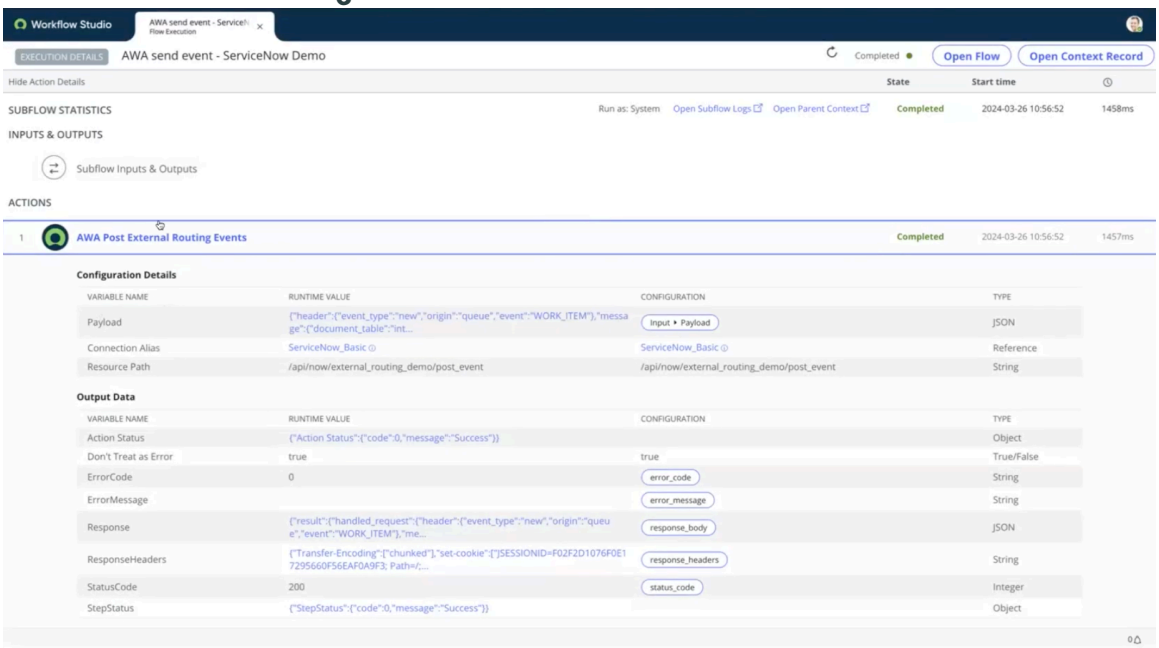
AWA Post External Routing Events



Define external routing test implementation

Define the External Routing Test Tools plugin [com.glide.awa.external.test_tools] with a simplified external-routing-provider sample Automated Test Framework (ATF) by using the demo data that is available with the plugin installation.

To run the ExternalRoutingConfigurationTestTool, verify that you have:

- Loaded the demo data for AWA, awa.external, and awa.external.test_tools.
- Filled up the credentials in the **AutomationUser** in the sys_auth_profile_basic table.
- Created the HTTP(s) Connection in sys_alias, ServiceNow_Basic record.

You must open the ExternalRoutingConfigurationTestTool record and click Run Test to complete the actions of the External Routing test.

Functions of the External Routing Test Tools plugin (com.glide.awa.external.test_tools)

When the External Routing Test Tools plugin (com.glide.awa.external.test_tools) is run, it validates if:

- The Connection record is created in the HTTP(S) Connection [http_connection].
- The Credentials are provided in the HTTP(S) Connection [http_connection].
- The AWA_Queue record is updated successfully with the following values:
  - **External** = **true**
  - **Provider** = **ServiceNow Demo**
- A record is successfully created in the Interaction [interaction] table with the following values:
  - **Short description** = **Created from ATF test automation**
  - **State** = **New**
  - **Type** = **Chat**
- The record is automatically created in the Work Item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Server-Side Validation Script is run by passing the Work Item ID to the Workflow Studio and calling to the external third-party CCaaS provider.
- The sys_flow_context ID is retrieved from the sys_flow_context execution.
- The retrieved sys_flow_context ID provides the payload response.
- The payload response belongs to the Work Item that you have created.
- The Server-Side Validation Script is run to verify if the response is successful and then the payload is sent to the Manual Assignment REST API.
- The authorization for credentials is configured in the Basic Auth Configuration [sys_auth_profile_basic] table.
- An Agent is available in the User [sys_user] table to ascend the payload.
- The Server-Side Validation Script is run to confirm that the Agent is available in the correct Service Channel.
- The Manual Assignment REST API is called when the Agent is available.
- The response status is successful and the response payload contains `Manual Assignment successfully requested`.
- The AWA Work Item is successfully assigned to the Agent and is not in the queue state.

Note:
If the test fails at any step, the detailed information about where the configuration failed is provided to the user along with the solution to fix it.

Tutorial: Route interactions by context

Learn how you can configure Advanced Work Assignment to route conversations to agents according to the context of the conversation.

Activate the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin.

A basic understanding of context variables is required. For more information on context variables, see Virtual Agent scripts.

The **What can we help you with?** record producer is available by default with the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin. In the record producer, chat requesters can specify one of three issue categories that they need help with:

- Product
- Billing
- Order

Whichever category they select passes a value through the *liveagent_csp_category* context variable. Learn how to create queues that route conversations to agents according to the values passed through this context variable.

Create a queue for product issues

Create a queue for the Chat service channel that routes product issues.

Before you begin

Role required: awa_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select **New**.
3. Enter the following information in the fields listed:
   - Name: Product Support
   - Service channel: Chat
   - Condition mode: Advanced
4. In the **Script** field, enter this script:

```
(function executeCondition(/* glide record */ current) {
 var contextTable = current.getValue('context_table');
 var interactionBlobRecord = new GlideRecord(contextTable);
 interactionBlobRecord.addQuery('sys_id',current.getValue('cont
ext_document'));
 interactionBlobRecord.query();

 if(interactionBlobRecord.next()){
  var jsonBlob =
 JSON.parse(interactionBlobRecord.getValue('value'));
  if(jsonBlob.liveagent_csp_category == 'product')
   return true;
 }
 return false;
})(current);
```

5. Click **Submit**.

Create a queue for billing issues

Create a queue for the Chat service channel that routes billing issues.

Before you begin

Role required: awa_admin or admin

Procedure

1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
   - Name: Billing Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the **Script** field, enter this script:

```
(function executeCondition(/* glide record */ current) {
 var contextTable = current.getValue('context_table');
 var interactionBlobRecord = new GlideRecord(contextTable);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 interactionBlobRecord.addQuery('sys_id',current.getValue('cont
ext_document'));
 interactionBlobRecord.query();

 if(interactionBlobRecord.next()){
  var jsonBlob =
 JSON.parse(interactionBlobRecord.getValue('value'));
  if(jsonBlob.liveagent_csp_category == 'billing')
   return true;
 }
 return false;
})(current);
```

4. Click **Submit**.

Create a queue for order issues

Create a queue for the Chat service channel that routes order issues.

Before you begin

Role required: awa_admin or admin

Procedure

1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
   - Name: Order Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the **Script** field, enter this script:

```
(function executeCondition(/* glide record */ current) {
 var contextTable = current.getValue('context_table');
 var interactionBlobRecord = new GlideRecord(contextTable);
 interactionBlobRecord.addQuery('sys_id',current.getValue('cont
ext_document'));
 interactionBlobRecord.query();

 if(interactionBlobRecord.next()){
  var jsonBlob =
 JSON.parse(interactionBlobRecord.getValue('value'));
  if(jsonBlob.liveagent_csp_category == 'order')
   return true;
 }
 return false;
})(current);
```

4. Click **Submit**.

Work assignments

After routing work items to the appropriate queues and corresponding agent groups, Advanced Work Assignment (AWA) pushes work to the most qualified agent using the assignment criteria that you specify. Assignment criteria revolve around the type of assignment rule (most capacity or last assigned) and whether skills are defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administrators can choose to push work items to agents based on one of these assignment rules:

- Most capacity: This option pushes work to agents that have the most capacity (availability for work) for a given channel. For example, suppose that two available agents, Agent 1 and Agent 2 have different capacities. Agent 1 has capacity for three chats, but Agent 2 has capacity for two chats and is currently working on one chat. AWA assigns the next work item to Agent 1 with the most capacity.
- Last assigned: This option pushes work to the agent who has gone the longest without a work assignment in the service channel. If more than one agent has the same spare capacity in a service channel, AWA creates and assigns the next work item to the agent who has gone the longest without work in the service channel.

In addition to selecting the assignment rule, AWA admins can also determine whether:

- Agents can reject work items.
- Agents automatically accept chat interactions.
- A timer is used to set a timeout period (the length of time that an agent has to reject or accept a work item).
- Agent skills are to be considered during assignment.

Assignment process

When an agent is available, AWA:

- Checks the queue priority and gets an item from the queue with the highest priority. AWA also reviews items that have timed out or have been rejected by agents.
- Identifies the eligible assignment pool. The eligibility assignment pool widens the group of agents who are eligible to work on an item.
- Determines the available agents based on their presence state, the assignment rule selected (most capacity or last assigned), and also skills, if defined. Agents have spare capacity when they decline, transfer, or complete a work item. For example, after an agent transfers a chat, the agent has additional capacity.
- Pushes the item to the inbox of the most qualified agent (the timer begins).
- Accepts work items automatically when **Enable auto-assign work items** is selected. Agents are unable to manually **Accept** or **Reject** work items.

Skill-based work assignment

In AWA, you can enable skill-based assignment and if needed, evaluate skill levels and make skill assignment mandatory (required). The basic process for setting up skills involves the following steps:

1. Identify agents that have specific skills (for example, a foreign language or expertise in a certain area such as network routers), and then assign the skills to those agents using the Skills Management feature.
2. Make the agents members of the assignment groups for the work item queues involving those skills.
3. Create an assignment rule in AWA that enables skill handling for the specific skills.

   If you chose to select the **Evaluate skill level** option while creating the assignment rule, AWA also reviews agents' skill levels prior to assigning the work item to the most qualified agent. If multiple agents have the same number of matching skills, agents with more skills at the sufficient skill level are prioritized over agents with fewer skills at the sufficient level. For

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

example, a chat comes through listing three skills at a high skill level. Agent A and Agent B both have the three skills. Agent A has three skills with the following skill levels: two high and one low. Agent B has three skills with the following skill levels: one high and two low. In this example, Agent A would be the first assignee of the work item because they have more skills with the sufficient skill level than Agent B. Agent B would only be assigned this work item if Agent A rejected the work.

AWA also prioritizes the number of matching skills over the number of skills with the sufficient skill level. For example, a chat comes through listing two skills and their sufficient skill levels: Both the English skill and the Databases skill are associated with an advanced skill level. Agent 1 has both skills but only at the beginner skill level. Agent 2 has only the English skill at the sufficient advanced skill level but doesn't have the Databases skill. In this example, the chat is routed to Agent 1 because this agent has both skills even though they aren't at the sufficient skill level.

If you also chose to select the **Enforce mandatory skills** option while creating the assignment rule, AWA only assigns the work item to agents that have the mandatory skills at the sufficient skill level. For example, a work item with two high-level associated mandatory skills and one optional skill is ready for assignment. Agent C has all three skills but only one of the mandatory skills at the sufficient high skill level. Agent D has only the two mandatory skills, but both skills are at the sufficient high skill level. In this example, Agent D would be the only applicable work item assignee because they are the only agent with both mandatory skills at a high enough level.

4. Create the work item queue with a routing condition that includes the specific skill, and include the appropriate group in the eligible assignment pool.
5. Create a scripted business rule that includes the skill in the table associated with the relevant service channel (for example, the Case table).

During work assignment, AWA routes and assigns work items to the Agent Workspace inbox of the most qualified agent based on the agents skills and if applicable, skill level and mandatory skill settings.

Configure agent assignment rules

Set the Advanced Work Assignment criteria for assigning work items to agents. Choose the assignment rule that considers the agent with the most capacity or the agent who has gone the longest without work. Establish the settings for the auto-assign handling, reject handling, and skill handling related lists.

Before you begin

- A basic understanding of the Skills Management feature is recommended.
- If you want agent skills to be considered when work is routed to the appropriate agents, define the skills for your agents or groups. When you enable the skill handling options on the Assignment Rules form, AWA assigns the users in groups with the appropriate skills to corresponding work items.
- You can use rules to identify skills and assign them to work items. For more information on defining and assigning skills for work items, see Routing work items to agents based on skills.

Role required: awa_admin or admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the assignment rules settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up assignment rules**.
   - **All** > **Advanced Work Assignment** > **Assignment Rules**.
2. Choose a situation.
   - To create a rule, select **New**.
   - To change a rule, select the rule to be updated.
3. On the Assignment Rule form, fill in the fields.
   For a description of the field values, see Assignment Rule form.
4. Select **Submit** for a new rule or **Update** if you're changing the rule.
   The assignment rule is added to or updated in the Assignment Rules [awa_assignment_rule] table.

Tutorial: Automatically assign work to agents by skill

Learn how you can configure Advanced Work Assignment to automatically route cases to agents who speak German. Use this tutorial as a guideline to help you understand how you can route work items to agents according to their designated skills.

Before you begin:

- Activate the Skills Management (com.snc.skills_management) plugin.
- A basic understanding of the Skills Management feature is required.
- To have skills automatically assigned to cases, consider activating the Skill Determination (com.snc.skill_determination) plugin.
- Create a group of users who work in customer support.
- Assign the awa_agent and workspace_agent roles to the customer support group.

Advanced Work Assignment (AWA) Tutorial: Automatically assign work to agents by skill
Watch this video for a visual representation of the following tutorial example.

Create a skill

Create a "German" skill.

Before you begin
Role required: skill_admin or admin

Procedure

1. Navigate to **All** > **Skills** > **All Skills**, and then click **New**.
2. Enter the following information in the fields listed:
   - **Name**: `German`
   - **Active**: Selected
3. Select **Submit**.

Create an assignment rule that auto assigns agents' work

Create an assignment rule that routes cases according to skills.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to the assignment rules settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up assignment rules**.
   - **All** > **Advanced Work Assignment** > **Assignment Rules**.
2. Select **New**.
3. Enter the following information in the fields listed:
   - **Name**: `Case Assignment Rule with Skills`
   - **Assign by**: `Most Capacity`
   - **Enable auto-assign work items**: Selected

     Note:
     Selecting this option automatically accepts chat interactions on behalf of agents. The **Display options** field appears and you can select either **Inbox card** or **Inbox card and workspace tab**.
   - **Enable skills**: Selected
   - **Evaluate skill level**: Cleared
   - **Enforce mandatory skills**: Selected
4. Select **Submit**.

Create a queue

Create a queue where you can route work to agents who have the German skill.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select **New**.
3. Enter the following information in the fields listed:
   - **Name**: `German Case Queue`
   - **Service channel**: `Case`
4. Select **Submit**.

Define assignment eligibility

Define who is eligible to receive cases from the German Cases queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select the German Cases queue.
3. On the form, go to the Assignment Eligibility related link and select **New**.
4. In the **Agent assignment rule** field, select **Case Assignment Rule with Skills**.
5. In the **Groups** field, select your customer support group.
6. Select **Submit**.

Enable skill determination

Activate the skill determination business rule to tag skills for your work items.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to **All** > **System Definitions** > **Business Rules**.
2. Select the **Skill determination for cases** record.
3. On the form, select the **Active** field.
4. Select **Update**.

Define a skill determination rule

Create a skill determination rule to tag the German skill to incoming cases from German speakers.

Before you begin
Role required: awa_admin or admin

Procedure
1. Navigate to **All** > **Skills** > **Skill Determination Rules**, and then select **New**.
2. Enter the following information in the fields listed:
   - **Name**: `Skill determination for German cases`
   - **Active**: `true`
   - **Source table**: **Case [sn_customerservice_case]**
   - **Condition**: **Opened by.language is German**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Search for the `Show related fields` option when defining the conditions to get the Opened by.language option.

- **Skills**: German

3. Select **Submit**.

Result
Cases that need German speakers are routed to users in Customer Service and Support who have the German skill.

Using Agent Affinity

Agent Affinity is an Advanced Work Assignment feature that lets you assign work items by an agent's work history, related task, or account team affinity.

Advanced Work Assignment assigns work items to agents by their availability, capacity, and skills. You can use Agent Affinity to customize this AWA assignment process and identify the agent best suited for the work item. Agent Affinity ensures that the same agent is assigned to a similar work item instead of orienting a new agent every time.

Note:
Agent Affinity rules do not override assignment eligibility or constraints that are specified on AWA assignment rules.

The types of affinities are:

Historical

Identifies the best agent based on the agent's history of serving the same customer.

Related task

Identifies the best agent based on the agent's past assignments of related tasks.

Account team

Identifies the best agent based on the agent's responsibility or role in the account team.

Note:
Account team affinity is available only to Customer Service Management customers.

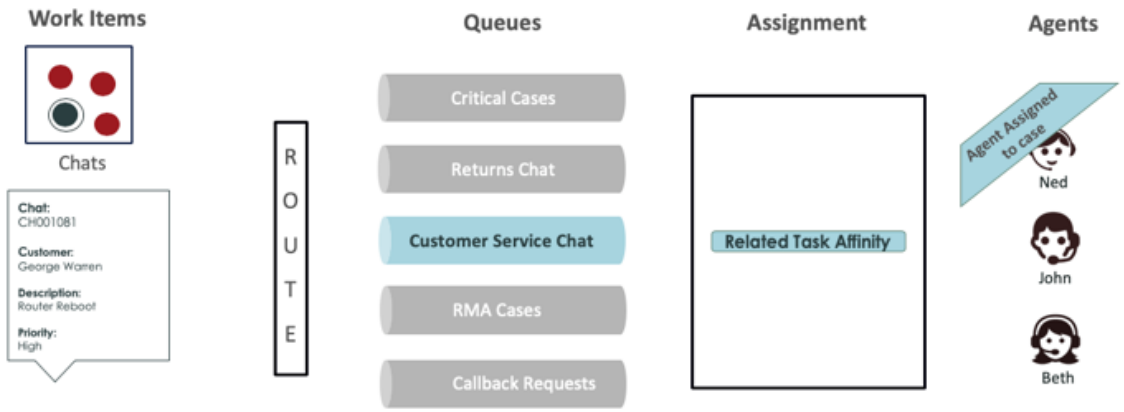
Affinity rules are associated with AWA queues. Up to three rules can be associated with each queue. The affinity order determines how the assignment engine ranks the agents. The agent with the higher order affinity rule is considered as the best agent first.

The following example shows how AWA uses Agent Affinity to determine the best agent for a work item. In this example, AWA is configured to use all three affinities in this order: related task affinity, account team affinity, and historical affinity. George Warren, who is a customer at the Boxeo company, has a router problem. George previously contacted support to report an issue. That case was assigned to agent Ned. The primary support agent for Boxeo is agent John. Within the past seven days, another agent, agent Beth, addressed a chat with Boxeo.

The next time George initiates a customer service chat from the case page, the case is automatically added as a related task to the chat interaction. Agent Affinity uses the related task affinity to look for an agent who has fulfilled past assignments for a related task. Because agent Ned was assigned to a related task on the record, AWA assigns the work item to agent Ned if available with capacity.

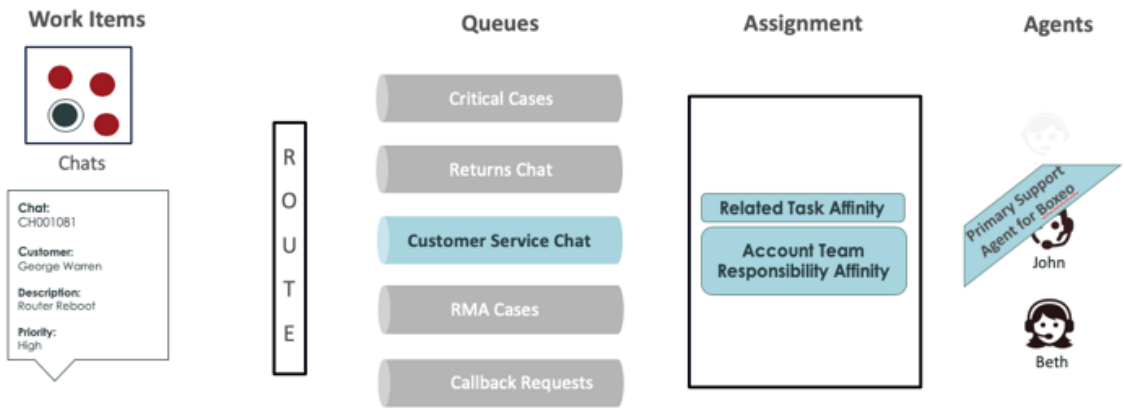
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of related task affinity



If agent Ned is unavailable or doesn't have the capacity, AWA uses the account team affinity. AWA looks for another agent based on an agent's responsibility or role in the account team. Because agent John is the primary support agent for the Boxeo company, AWA assigns the work item to Agent John if available with capacity.

Example of account team affinity



If agent John is not available, AWA uses the historical affinity and looks for an agent that has recently interacted with the company. This information is stored on the Agent Affinity screen. Because agent Beth addressed a chat with Boxeo within the past seven days, AWA assigns the work item to agent Beth if available with capacity.

Example of historical affinity

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Agent Affinity rules

Create or change the Agent Affinity rules that route work items in Advanced Work Assignment.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to the agent affinity settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Advanced settings section, select **Set up Agent Affinity**.
   - **All** > **Advanced Work Assignment** > **Agent Affinity Rules**.
2. Choose a situation.
   - To create an affinity rule, select **New**.
   - To update an existing affinity rule, select the affinity rule.
3. On the form, fill in the fields.

Field	Definition
Name	Name of the affinity rule.
Service channel	Service channel that the rule applies to.
Application	Name of the application.
Affinity based on	Type of affinity. Only affinity types corresponding to your selection appear. ○ History ○ Related Tasks ○ Account Team Responsibility
Agent's affinity to	Account level or contact level. This field appears when you select **History** in the **Affinity based on** field.
Number of days	Past number of days during which the agent has worked with the customer. The maximum number of days is 30. This field appears when you select **History** in the **Affinity based on** field.
Responsibility	Agent who is part of the account team. This field appears when you select **Account Team Responsibility** in the **Affinity based on** field.

4. Click **Submit** for a new affinity rule or **Update** to modify an existing affinity rule.

Set Agent Affinity rules

Specify the Agent Affinity rules to determine the order in which work items in a queue are sorted.

Before you begin

Role required: awa_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the queue settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Essential settings section, select **Set up queues**.
   - **All** > **Advanced Work Assignment** > **Queues**.
2. Select the queue.
3. Select the Agent Affinity related list.
   - To create a Agent Affinity rule mapping, select **New**.
   - To change an existing Agent Affinity rule mapping, select the mapping to be updated.
4. On the form, fill in the fields.

Agent Affinity Rule Mapping form

Field	Definition
Agent Affinity Rule	Agent Affinity rule to be used for the sort.
Order	Value of this rule relative to the other rules in the queue. Rules are ordered from lowest to highest so a rule with an order of 100 is considered before a rule with an order of 200.

5. Select **Submit**.
   You can specify a maximum of three Agent Affinity rules per queue.

Deactivate Agent Affinity

Deactivate Agent Affinity if you do not want Agent Affinity to assign work assignments to agents.

Before you begin

Role required: awa_admin or admin

Procedure

1. In the navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. In the **Search** field, enter `glide.awa.agent_affinity.enabled`.
3. Click **glide.awa.agent_affinity.enabled**.
4. On the system property screen, change **Value** from **true** to **false** and click **Update**.
   Agent Affinity is now deactivated.

Agent Inbox controls

Control certain elements of the agent experience in Agent Workspace. Define the agent presence (availability) states and the work item rejection reasons used by agents to decline work assignments in their Agent Workspace inbox.

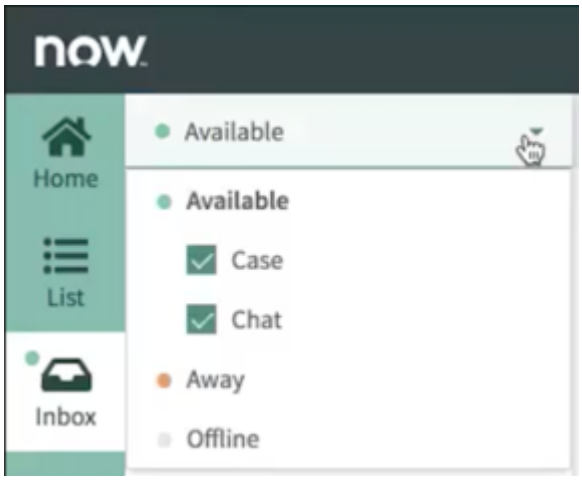
Agent presence states

Agent availability in Agent Workspace Inbox



AWA admins can define the presence states that agents choose in their inbox to indicate their availability. The default states are

- Available: Solid green bubble indicates that the agent is available to receive work.
- Away: Solid yellow bubble indicates that the agent is not available to receive work.
- Offline: Solid grey bubble indicates that the agent is not available to receive work.

AWA developers with the awa_integration_user role can also use JavaScript or REST APIs to get or set agent presence and agent channel availability. For more information, see

- Agent Presence API (REST APIs)
- Agent - Global (JavaScript APIs)

Agent rejection controls

AWA admins can give agents the option to reject work assignments and specify the reason for rejecting it. The **Reject** button displays on work assignment cards. When an agent rejects an assignment, a pop-up window enables the agent to select a reason for declining the work item.

Configure agent presence states

Create or modify the availability states that agents use to indicate whether they can receive work or are offline or away. Agents set these states in their Workspace Inbox.

Before you begin

Role required: awa_admin or admin. Users with the awa_manager and awa_agent roles can review the presence states.

About this task

The default presence states are Available, Away, and Offline. For the Available state, be sure to enable it (using the Active check box) so that AWA can route work to agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to the presence states settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Additional settings section, select **Set up presence states**.
   - **All** > **Advanced Work Assignment** > **Presence States**.
2. Choose a situation.
   - To create a presence state, select **New**.
   - To update a presence state, select the presence record you want to update.
3. On the form, fill in the fields.

Field	Definition
Name	Name of the presence state, for example: Out of office. The default presence states are Available, Away, or Offline.
Active	Enables this presence state for agents. **Note:** For the default Available state, be sure to enable this **Active** check box so that work items are routed to available agents. If the **Active** state is not enabled, AWA does not route work items to agents.
Available to receive work items	Indicates that agents can handle work items in this presence state. If the presence state is Away or Offline, this box is not selected.
Service channels	Service channels that can use this presence state. To select a service channel, move the channel name from the **Available** list to the **Selected** list.
Description	Brief description of the state.
Order	Order in which this state is displayed in the agent inbox.
Show channels	Enables you to restrict the service channels in which agents can update their presence using this state. When you select this field, the **Restrict agent update** field is displayed.
Disable agent inactivity check	If this check box is selected, the agent's presence will not be automatically set to "offline" based on inactivity and it must be manually set by the AWA Agent API. You may need to configure the form to add this field.
Restrict agent updates	Service channels in which agents cannot use this state to update their presence. Select

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	the lock icon and select the appropriate channels. When you complete your selections, select the lock icon to lock the field. You may need to configure the form to add this field.
Apply to all groups	Indicates all groups can use this presence state. To specify only certain groups that can use this presence state, unselect this check box to display the **Apply to groups** list. You may need to configure the form to add this field.
Apply to groups	Selected groups that can use this presence state. To select a group, move the group name from the **Available** list to the **Selected** list. You may need to configure the form to add this field.

4. Select **Submit** for a new presence state or **Update** if modifying an existing presence state. The presence state is added to or updated in the Presence States [awa_presence_state] table. The presence state is also listed in the Availability section of the Agent Workspace Inbox for the agents belonging to the groups and channels that use this state.

Configure reasons for rejecting work items

Define the reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox. A reject reason can apply to all service channels or a single channel that you specify.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to the reject reasons settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Additional settings section, select **Set up reject reasons**.
   - **All** > **Advanced Work Assignment** > **Reject Reasons**.
2. Choose a situation.
   - To create a rejection reason, select **New**.
   - To update an existing rejection reason, select the reason record.
3. On the form, fill in the fields.

Field	Definition
Reason	Name of the reason for rejecting work items.
Agent selectable	Indicates that the reject reason is selectable by agents in their Agent Workspace Inbox.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Order	Order in which the reject reasons are listed in the agent inbox.
Apply to all service channels	Indicates that the reject reason applies to all service channels. To make the reason available to a single channel, unselect this check box and in the **Service channel** field, select the appropriate channel.
Service channel	Service channel that the rule applies to. This field is displayed when **Apply to all service channels** isn't enabled.
Reassignable	Indicates if the work item can be reassigned to the agent who rejected it.

4. Select **Submit** for a new reason, or if changing an existing reason, select **Update**.
   The rejection reason is added to or updated in the Reject Reasons [awa_reject_reason] table.

Configure reassignable settings

Configure whether an agent who rejected a work item is eligible to be offered the same work item.

Before you begin

Role required: admin

Procedure

1. Navigate to the reject reasons settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Additional settings section, select **Set up reject reasons**.
   - **All** > **Advanced Work Assignment** > **Reject Reasons**.
2. Select the reason record that you want to change.
3. On the form, configure the **Reassignable** field:
   - If you want to have an agent who rejected a work item be eligible to be offered the same work item, select the **Reassignable** field.
   - If you don't want to have an agent who rejected a work item be eligible to be offered the same work item, unselect the **Reassignable** field.

Advanced Work Assignment Inbox Sentiment display

Surface the sentiment in AWA Inbox for agents to get the visibility of requester sentiment (if available) during live agent handoff or agent transfer for all channels.

With Advanced Work Assignment sentiment, you can:

- Display the sentiment (negative or positive) in Advanced Work Assignment inbox card for interactions during live agent handoff and agent transfer.
- Admin configuration to enable or disable sentiment per service channel.

© 2026 ServiceNow, Inc. All rights reserved.

Wrap up overview

When agents close an interaction, the wrap up feature enables them to enter closing details and wrap up codes for future reference.

To configure the wrap up feature, follow these steps:

- Wrap up configuration
- Wrap up codes
- Wrap up segments

Wrap up configuration

Set up the wrap up configuration.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Interaction** > **Wrap Up Configuration**.
   The Interaction Wrap Up Configurations screen appears.
2. If this is the first time you are setting up the wrap up configuration
   a. Select **Wrap Up for Chat Interactions**.
   b. On the Wrap Up for Chat Interactions screen, select **Active**.
   c. Select **Update** or configure other options on the screen.
3. Do one of the following:
   - To edit an existing record, select the name of the record.
   - To create a new record, select **New**.
4. Fill in the fields:

Field	Description
Name	Name of the wrap up configuration.
Application	
Table	
Active	Indicates whether wrap up is enabled.
Order	Value of this configuration relative to the other configurations.
Conditions	Set the conditions that define the class of interactions that use this configuration.

5. In the Duration tab, configure the wrap up duration settings:
   - Enforce wrap up duration - if selected, the agent will have a limited length of time (defined in the **Duration in seconds** field) to enter wrap up information.
   - Show duration to agent - this field appears only if you selected **Enforce wrap up duration** and indicates whether the wrap up duration displays on the screen for the agent.
   - Duration in seconds - this field appears only if you selected **Enforce wrap up duration** and defines the length of time (in seconds) that the agent has to wrap up the interaction.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Codes tab, configure the wrap up codes:
   - Enable wrap-up codes - if selected, the agent can enter pre-defined wrap up codes when they close an interaction.
   - Default wrap-up code - this field appears only if you selected **Enforce wrap up codes** and indicates the default wrap up code.
   - Allowed wrap-up codes - this field appears only if you selected **Enforce wrap up codes** and lists all of the wrap up codes that an agent can use.
7. Select **Update** if you are updating an existing configuration or **Submit** if you are creating a new configuration.

Wrap up codes

Define the wrap up codes.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Interaction** > **Wrap Up Codes**.
   The Interaction Wrap Up Codes screen appears.
2. Do one of the following:
   - To edit an existing code, select the name of the code.
   - To create a new code, select **New**.
3. Fill in the fields:

Field	Description
Code	Name of the wrap up code.
Application	
Active	Indicates whether wrap up code is enabled.
Description	Description of the wrap up code.

4. Select **Update** if you are updating an existing code or **Submit** if you are creating a new code.

Wrap up segments

Define the wrap up segments.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Interaction** > **Wrap Up segments**.
   The Interaction Wrap Up Segments screen appears.
2. Do one of the following:
   - To edit an existing segment, select the name of the segment.
   - To create a new segment, select **New**.
3. Fill in the fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

Awaiting confirmation	
Confirmed on	

4. Select **Update** if you are updating an existing segment or **Submit** if you are creating a new segment.

Management

Configure Advanced Work Assignment properties using the Management menu options.

Only users with awa_manager privileges can access the Management menu options.

Configure an agent's maximum universal capacity

Prevent an agent from being assigned too many work items by configuring the agent's maximum universal capacity. If the agent's maximum universal capacity has been reached, additional work items won't be assigned to the agent.

Before you begin

Role required: admin

Procedure

1. Navigate to the universal capacity settings through one of the following navigation paths:
   - **All** > **Advanced Work Assignment** > **Home**.

     In the Additional settings section, select **Set up universal capacity**.
   - **All** > **Advanced Work Assignment** > **Universal Capacity**.
2. Choose a situation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create a new maximum universal capacity for an agent, select **New**:

Field	Definition
Max Universal Capacity	Maximum capacity for an agent across all service channels. If an agent's current capacity equals the maximum universal capacity, additional work items won't be assigned to the agent.
Users	The max universal capacity is assigned to the users (agents) in the Selected list. Select agents in the Available list and then select the right-pointing arrow to add them to the Selected list. To filter the agents in the Available list, create a filter by selecting **Add Filter** or run an existing filter by selecting **Run Filter**.

- To update an existing maximum universal capacity for an agent, select the maximum universal capacity to update:

Field	Definition
Max Universal Capacity	Maximum capacity for an agent across all service channels. If an agent's current capacity equals the maximum universal capacity, additional work items won't be assigned to the agent.
Universal Capacity In Use	Current workload for an agent across all service channels.
Agent	Name of the agent.

3. Select **Submit** for a new universal capacity or **Update** for an existing universal capacity.

Create or change groups for Advanced Work Assignment queues

Create or manage groups that have associated Advanced Work Assignment queues.

Before you begin

Role required: awa_manager or admin

About this task

Groups are sets of users who share a common purpose. By creating these groups, information that is displayed in AWA is limited to only users that are in AWA groups. The assignment group can be configured so that work items are assigned using the group queue priority. Each round of assignment can include multiple passes through the work items, each with an increasingly inclusive set of groups. This process ensures that agents in each group are offered items according to their group's queue priority order.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Home** > **Management** > **Groups**
2. Choose a situation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create a group, select **New**
- To change a group, select the group you want to update.

3. On the Group screen, fill in the fields.

Field	Description
Name	Name of the group.
Manager	Group manager or lead.
Group email	Group email distribution list or the email address of the point of contact, such as the group manager.
Parent	Other group of which this group is a member. If a group has a parent, the child group inherits the roles of the parent group. The members of the child group aren't members of the parent group. For example, if an incident is assigned to the parent group and you select the Assigned to look up icon, only the members in the parent group are available. The members of the child group aren't available.
Description	Helpful information about the group.

4. Select **Submit**.
5. If you want to configure the queue priority order for the group, follow these steps:
   a. Select the group name on the list.
   b. Select the Queues related list at the bottom of the screen.
   c. Double-click in the order number field that you want to change.
   d. On the pop-up Order dialog, enter the new order number.
   e. Select the green check mark to save the change.

AWA post work item subflow

Configure the base system AWA post work item subflow by defining the input in Workflow Studio.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > *Workflow Studio*.
2. On the Workflow Studio screen, select **Subflows**.
3. In the Name column, enter `Template: AWA post work item`.

   This searches for the Template: AWA post work item.

4. Select **Template: AWA post work item**.
5. In the subflow header, select the more actions icon ( ) and then **Copy subflow.**
6. On the Create a copy of this subflow dialog, enter a unique and descriptive name for the copied subflow in the **New subflow name** field.
7. Select **Copy**.
   The new subflow is created and displays as a tab in the subflow designer editor.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. You can customize the subflow by doing one of the following:
   - Integrate with a third-party system by adding an action with a spoke from the Integration Hub (for more information, see Spokes)
   - Use a REST action step and call the external endpoint (for more information, see REST step).
   - Call a REST message in the subflow itself (for more information, see Outbound REST Web Service).

AWA group queue priorities

Use the group queue priority feature to set a queue or work item preference for a given group of agents. For a given group or agent with limited capacity, this feature controls which queues should be preferred if matching work items are found in both.

For each group defined across the eligibility pools for a given queue, a corresponding group queue priority record will automatically be created for that group and queue combination, with the order set to a default of 100.

Example

The admin has configured two AWA queues: chat queue and P1 chat queue.

- Chat queue has one eligibility pool with two groups: Spanish agent group and English agent group.
- P1 chat queue has one eligibility pool with one group: English agent group.

The admin creates three group queue priority records, each with the default order of 100:

Group	Queue	Order
Spanish agent group	Chat queue	100
English agent group	Chat queue	100
English agent group	P1 chat queue	100

Since both group queue priority records for the English agent groups have the same order of 100, work items across both queues are equally considered during assignment.

If the admin then changes the order of one of the group queue priority records to 200:

Group	Queue	Order
Spanish agent group	Chat queue	100
English agent group	Chat queue	200
English agent group	P1 chat queue	100

The English agent group now has a group queue priority hierarchy of two levels:

1. Level 1: Work items in the P1 chat queue
2. Level 2: Work items in the chat queue

With the above hierarchy, agents in the English agent group will prefer work items in the P1 chat queue over the chat queue. The assignment engine will try to assign all work items under the P1

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

chat queue to the English agent group, before trying to assign any work items under chat queue to that same group (assuming some agents still have free capacity).

Group queue priority processing: tiers

AWA uses tiers as a series of assignment rounds. In each round, AWA expands the pool of eligible agents based on group queue priority tiers. Each tier represents a set of groups at the same level and indicates how those groups prioritize a queue relative to other queues they qualify for.

Group	Queue	Order
Spanish agent group	Chat queue	100
English agent group	Chat queue	200
English agent group	P1 chat queue	100

For the above group queue priority configuration, the tiers are organized as follows:

1. Tier 1:
   a. Consider English agent group for P1 chat queue
   b. Consider Spanish agent group for chat queue
2. Tier 2: Consider English agent group for chat queue

The ordering within each tier is negligible since all work items across queues in the same tier are equally considered.

The above tier ordering translates into the following rounds of assignment:

1. Assignment run #1
   a. Assign work items in P1 chat queue, with agents from English agent group
   b. Assign work items in chat queue, with agents from Spanish agent group
2. Assignment run #2: Assign work items in chat queue, with agents from English agent group

Side effect of tier organization

A side effect of the tier setup is that the Spanish agent group may receive more work items under the chat queue, since they will be considered earlier during the first run of assignment. Since agents from English agent group may have been assigned work items in the P1 chat queue in the first assignment run, they will have less capacity to handle work items assigned in the second assignment run. Both factors influence the likelihood of groups in later tiers in receiving work items.

These side effects are important as this implies that the group queue priority setup hierarchy across different groups could also affect the distribution of work items within a queue.

Consider a more complex scenario where three groups are all eligible for three different queues, with the following group queue priority setup:

Group	Queue	Order
1	A	10
1	B	20

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Group	Queue	Order
1	C	30
2	A	300
2	B	100
2	C	200
3	A	2
3	B	3
3	C	1

The assignment process is organized into three tiers, since the maximum hierarchy across all three groups is three levels. There will be three runs of assignment:

1. Assignment Run #1
   a. Queue A, with agents from group 1
   b. Queue B, with agents from group 2
   c. Queue C, with agents from group 3
2. Assignment Run #2
   a. Queue A, with agents from group 3
   b. Queue B, with agents from group 1
   c. Queue C, with agents from group 2
3. Assignment Run #3
   a. Queue A, with agents from group 2
   b. Queue B, with agents from group 3
   c. Queue C, with agents from group 1

If each group has one agent having capacity 2, where agent 1 is in group 1, agent 2 is in group 2, and agent 3 is in group 3, then assignments are made in the following manner:

Scenario	Outcome
2 work items in each queue	• Agent 1 gets two items from Queue A • Agent 2 gets two items from Queue B • Agent 3 gets two items from Queue C
3 items in Queue A and 3 items in Queue B	• Agent 1 gets two items from Queue A • Agent 2 gets two items from Queue B • Agent 3 gets the last item from Queue A • Agent 1 gets the last item from Queue B

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario	Outcome
6 items only in Queue C	• Agent 3 gets the first two items from Queue C • Agent 2 gets the next two items from Queue C • Agent 1 gets the last two items from Queue C

Configure messaging actions

Create or modify messaging actions that are performed when an event occurs. These actions apply only to messaging.

Before you begin

Activate the Conversational Messaging plugin (com.glide.messaging.awa). For information on activating this plugin, see Activate Messaging Actions.

Role required: admin

About this task

- For the Requester Message without Agent Response event, the default length of time that elapses before an agent is sent a reminder is 30 minutes.
- For the Agent Message without Requester Response event, the default length of time that elapses before the conversation is set to the Closed Abandoned state is 2 days.

  If you're using both Virtual Agent and Live Agent, the system closes an abandoned live conversation based on the lowest timeout value for closing conversations. Be aware that other conversation timeout behavior can affect idle live chat timeouts, regardless of the **Duration** and **Action** that you specify. For details, see Closing Virtual Agent and Agent Chat conversations.

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Messaging** > **Actions**.
   - To create a new messaging action, click **New**.
   - To update an existing messaging action, click the messaging action.
2. On the form, fill in the fields.

Messaging Action form

Field	Definition
Name	Name of the messaging action.
Event	Event that starts the timer: ○ Requester Message without Agent Response - message from a requester that has not been responded to by an agent. ○ Agent Message without Requester Response - message from an agent that has not been responded to by a requester.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Duration	Length of time that elapses after the event before the action runs.
Active	Option to track the timers and perform actions.
Filter Conditions	Condition the timer is evaluated for.
Action	Action to perform after the duration of time has elapsed: ○ Prompt Agent - prompt the agent using a Workspace notification. ○ Prompt Requester - display system message with prompt to requester. ○ Reassign - clear the **Assigned to** field of the interaction so that it can be rerouted to another agent. ○ Set State - set the interaction to the given state.
Prompt	Message displayed to requester. This field appears when you select **Prompt Agent** in the **Action** field.
State	State of the interaction. This field appears when you select **State** in the **Action** field.

3. Click **Submit** for a new messaging action or **Update** to modify an existing messaging action.

Enable logging for Advanced Work Assignment

Enable logging to monitor AWA routing and assignment.

Before you begin

Role required: maint

Procedure

1. In the navigation filter, enter `sys_logger_configuration.list`.
2. On the Logger Configurations screen, select **New**.
3. On the New record screen, fill out the fields:

Field	Description
Logger Name	Name of logger that this configuration applies to. This should be set to `com.snc.awa`.
Application	This field defaults to `Global` and cannot be changed.
Active	Option to activate logging.
Additive	Option to use the new logging in addition to any existing logging. This should be set to `false`.
Level	Type of errors that should be logged:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ FATAL - errors that cause the service to shut down (status 0). ○ ERROR - non-fatal service error messages. ○ WARN - warning messages indicating potential issues. ○ INFO - informational messages representing service actions. ○ DEBUG - detailed service operation messages which help troubleshoot issues. ○ TRACE - very detailed service operation messages which help troubleshoot issues. ○ ALL - all errors should be logged. This should be set to `INFO`.
Filters	Enter any filters and their values that you want applied to the results.
Destination	Where the format log is sent. This should be set to `Database`.
Layout	Layout format that should be applied to the logs.

4. Select `Submit`.
   Logging for the AWA assignment engine is enabled in the syslog table.
5. To view the system log, navigate to **System Logs** > **System Log** > **All**.

Using Advanced Work Assignment

The following sections detail how awa_manager or awa_agent roles can use Advanced Work Assignment (AWA) to complete various tasks such as checking an agent's presence and capacity, checking unassigned work items, and creating SMS conversations.

Check for an agent's presence and capacity

View a list of agents in Advanced Work Assignment, their presence status, and capacity for each of the agent's service channels to see which agent can handle a case. This list is filtered across different teams, channels in teams, and channels dashboards.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Management** > **Agent Presence & Capacity**.
2. In the list, check which agent is available to handle a case:

AWA Agent Presence and Capacities form

Field	Definition
Agent	Name of the agent.
Current presence state	Presence state that is currently assigned to the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Updated	Date and time that this agent was last updated.
Channel	Service channel that is assigned to the agent.
Capacity in use	Current workload of agent.
Capacity	Maximum capacity that the agent can handle.

Check unassigned interactions

View a list of unassigned interactions in Advanced Work Assignment from chat and phone that are currently waiting in the queue and are not assigned to any agents. You can use this list to debug, implement advanced work assignments, or determine why certain work items are not being assigned.

Before you begin

Role required: awa_manager or admin

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Management** > **Unassigned interactions**.
2. In the list, check the unassigned interactions:

Field	Description
Number	Interaction number.
Type	How the interaction began (for example, chat, phone, or walk-up).
Created	Date that the interaction was created.
Opened for	Name of the user starting the interaction.
Account	Name of the company that is associated with the interaction.
Assigned to	User that is assigned to the interaction.
State	Status of the interaction.
Queue	Queue that is assigned to the interaction.
Offered on	Date that the interaction was first offered to an agent.
Rejected	Interaction that was rejected by the agent.
Timed Out	Interaction that has exceeded the timeout specified in assignment rule.
Exceeded Queue Target Wait Time	Interaction that has waited longer than the target wait time of the queue.

Check unassigned task work items

View a list of unassigned task work items in Advanced Work Assignment, such as cases and incidents, that are currently waiting in the queue and are not assigned to any agents. You can use this list to debug, implement advanced work assignments, or determine why certain work items are unassigned.

Before you begin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Management** > **Unassigned Task Work Items**.
   - To create a task, click **New**.
   - To modify an existing task, select the task to be updated.
2. On the form, fill in the fields.

Work Item form

Field	Description
Active	Whether the task is still being worked on or is complete.
Display Name	Task name.
Offered on	Date that the task was first offered to an agent.
State	List that shows the status of the task: ○ Accepted ○ Cancelled ○ Pending Accept ○ Queued
Assignment rule	Rule that assigns cases that meet the matching rule criteria to a customer service agent.
Exceeded Queue Target Wait Time	Task that has waited longer than the target wait time of the queue.
Rejected	Task that was rejected by the agent.
Timed Out	Task that has exceeded the timeout specified in the assignment rule.
Assigned to	User that is assigned to the task.
Document ID	Document ID that is assigned to the task.
Previous Work Item	Reference to a previous work item for the same Document ID.
State changed on	Date that the task state was most recently changed.
Cancelled reason	Reason that the task was canceled: ○ Disqualified from service channel ○ Manually assigned ○ Time out ○ Transfer was cancelled or rejected
Is Dismissed	Whether the task has been dismissed.
Work Item Size	Amount of an agent's capacity that is used if this task is assigned.
Wait time	Length of time the task has waited in the queue before being assigned.
Assignment group	Group that is assigned to the task.
Document table	Document table that is assigned to the task.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Queue	Queue that is assigned to the task.

3. Click **Submit** to create the task or **Update** to modify the task.

Check work items and AWA events

View a list of work items and AWA events.

Before you begin

Role required: awa_admin or admin

Procedure

1. Navigate to **Advanced Work Assignment** > **Work Item** > **All**.
   A list of the work items appears.
2. Select the preview button ( ) for the work item you want to view.
3. On the Work Item dialog box, select **Open Record**.

Work Item form

Field	Definition
Exceeded Queue Target Wait Time	Indicator that the interaction has waited longer than the target wait time of the queue.
Queue	Queue assigned to the task.
Assigned to	User assigned to the task.
Document ID	Document ID assigned to the task.
State	Status of the task: ○ Accepted ○ Canceled ○ Pending Accept ○ Queued
Active	Indicator of whether the task is still being worked on (active) or is complete.
Canceled reason	Reason the task was canceled: ○ Disqualified from service channel ○ Manually assigned ○ Time out ○ Transfer was canceled or rejected **Note:** Work items may be canceled if all agents remain at full capacity for the entire interaction.
Is Dismissed	Indicator of whether the task was dismissed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Rejected	Task that was rejected by the agent.
Timed Out	Task that has exceeded the timeout specified in the assignment rule.
Assignment group	Group assigned to the task.
Document table	Document table assigned to the task.
Previous Work Item	Reference to a previous work item for the same Document ID.
State changed on	Date that the task state was most recently changed.
Allocated by	User who assigned the work item.
Display Name	Task name.
Offered on	Date the task was first offered to an agent.
Work Item Size	Amount of an agent's capacity used when this task is assigned to the agent.
Wait time	Length of time the task waited in the queue before being assigned.
Assignment rule	Rule that assigns cases that meet the matching rule criteria to a customer service agent.
Offer Count	Number of times the work item was offered to agents.

4. Scroll to the bottom of the Work Item form to view the list of the AWA Events.
5. Select the preview button for the AWA event you want to view.
6. On the AWA Event dialog box, select **Open Record**.

AWA Event form

Field	Definition
Caused By	User who triggered the AWA event.
Record ID	Interaction record ID.
Type	Type of AWA event: ○ Assignment ○ Manual Assignment ○ Routing ○ Acceptance ○ Rejection ○ Cancellation
Name	Name of the corresponding interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Channel	Service channel used for the AWA event.
Record table	Table name of document being logged.
Record Details	Details of the work item record.
Timestamp	Date and time the AWA event occurred.
Event Details	Details about the AWA event: ○ Routing event - details of the queue that was selected. ○ Assignment event - details about which agent was selected and which eligibility pools were considered. These details include a listing of all candidate agents that were considered from each pool and a summary of which agents were filtered from consideration. ○ Rejection events - details about the user who rejected the item and the reason. ○ Manual assignments - details about the manager making the assignment, the previous and new agents, and the previous work item (if there is one). ○ Cancellation events - no additional details.
Summary	Event summary.

The AWA Event form appears.

Agent initiated SMS conversation

Customer Service Management supports additional messaging channel such as SMS which tracks interactions between the agent and customer.

Requirements

At least one provider configuration for messaging type channel must be available to view the **Compose SMS** option in the agent interaction screen. For more information about provider sys_cs_provider_application.list, see Create a channel identifier.

Phone number validation

REST endpoint `/api/now/initiate_message/validate_phone_number` is used to validate if the phone number is in the E.164 format. If the number of a known consumer is not in the E.164 format, the system converts it to the E.164 format based on for example, the location of the consumer. If the location is not found, it will by default convert the number to an E.164 format. For more information about E.164 formats and validation, see Phone number field type.

Customer profile validation

REST endpoint `/api/now/initiate_message/validate_profile` is used to validate the channel user profile. When you send an SMS in reply to an interaction of type phone, the message is sent to a consumer originally associated with the interaction. If the same phone number is associated to a different consumer, and you send an SMS, you will get a message that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the phone number is currently associated to another consumer and sending the new message will associate the phone number to the current user.

A phone number is associated to consumer A and an interaction has occurred after which the phone number was disconnected for consumer A. There is a new interaction with consumer B and you select the same phone number that was associated with consumer A. A message appears that the phone number is currently associated to consumer A, and sending a new message will associate consumer A's phone number to consumer B who is the current user.

Agent initiated SMS conversations

To initiate an SMS conversation with a requester, agents can select a provider number for an outbound service or manually enter a provider number. If there is a current ongoing SMS conversation, it automatically appears. When an agent initiates an SMS conversation:

If	Then
There is no active SMS interaction	• Create a new SMS interaction • Assign interaction to agent
There is an active interaction involving an agent	• Inject the message into existing conversation • Add agent to live group profile • No reassignment
There is an active interaction involving VA	• Close existing interaction • Create a new interaction and assign to agent
There is an active interaction involving a different contact/consumer/user	• Close existing interaction • Create a new channel user profile and deactivate the existing channel user profile • Create a new interaction and assign to agent

Customize the behaviour of send from and to numbers

The AgentInitiatedConversationUtil extension point is added to implement a customers' logic to change the default behaviour of the **Send from** and **Send to** fields. For more information, see Associating user profiles on messaging interactions. For this store application, AgentInitiatedMessagingUtilExtPointImpl extension point is configured for fetching the from and to numbers.

Compose an SMS conversation

An agent can compose an SMS to interact with a customer for resolving various issues. If the interaction is not messaging type, you see the **Compose SMS** option.

Before you begin
Role required: agent_workspace_user
A provider is configured for SMS messaging type channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

As an agent, you can compose and send an SMS to an ongoing interaction which is not messaging type.

Procedure

1. Click **Compose SMS**.
   The Send via SMS screen is displayed.
2. Select a phone number from the **Send from:** drop-down list.
   - If there is only one provider phone number this field is pre-populated with the number.
   - If there are multiple provider profiles available for SMS channels, you can choose from the drop-down list.
3. Select a phone number from the **Send to:** drop-down list.
   - The phone numbers are pre-populated from the consumer or contact records.
   - If both are not populated, the system looks for the number from the opened for record in the sys_user table.
   - If there is already a channel user profile associated with a consumer or contact, the phone number is pre-populated.

   a. Choose **Other** and select a phone number in the drop-down list.

   Note:
   All phone numbers must be in the E.164 format. For more information, about phone number and channel user profile validation, see Phone number validation.

   If there is already an ongoing SMS type of interaction with the same or different consumer, you can view the interaction card in the same screen. The interaction card for the consumer number you have selected contains interaction number, message type, last updated time, consumer, and assigned to information.
4. Enter your message in the **Message** field.
5. Click **Attach file**, browse, select the file and attach.

   Note:
   You can attach only image files to the message. For more information about the REST API for uploading attachments, see Attachment - POST /now/attachment/upload.
6. Click **Send**.
   For more information, see Agent initiated SMS conversations.

Analytics & Reporting Solutions

The following sections review advanced analytics and Platform Analytics Solutions. Advanced analytics equips you to view cards that represent the Advanced Work Assignment dashboards that you can access.

Using Advanced analytics to access AWA dashboards

Advanced analytics enable you to view cards that represent the Advanced Work Assignment dashboards that you have access to. You can also see a dashboard picker, which lets you view the cards for all the dashboards in a group. You can then search and choose a dashboard from a list.

Navigate to **Advanced Work Assignment** > **Management** > **Advanced Analytics**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The advanced analytics for the dashboards lets you see the dashboards in one of these categories: by default, the Recent category is selected when you visit the advanced analytics for the dashboards.

- **Recent** shows up to nine dashboards that you have visited recently. The most recent are shown first.
- **Owned by me** shows the dashboards that you have created and those dashboards to which you have been assigned ownership.
- **Shared with me** shows the dashboards which have been shared with you as a user, or member of a group or role.
- **All** shows all the dashboards that you have access to.

Note:
The category that you choose limits the dashboard groups and individual dashboards that you see when you choose from the Groups list and the **Dashboard Picker** field. If no dashboards in the incident group have been shared with you, and you select Incident from the Groups list, then the overview displays a note that no dashboards match your search.

All tabs except for the Recent tab are sorted in ascending order by:

1. Dashboard group — Order

   The owner of the dashboard can specify an order number in the dashboard group's form. This field is optional.

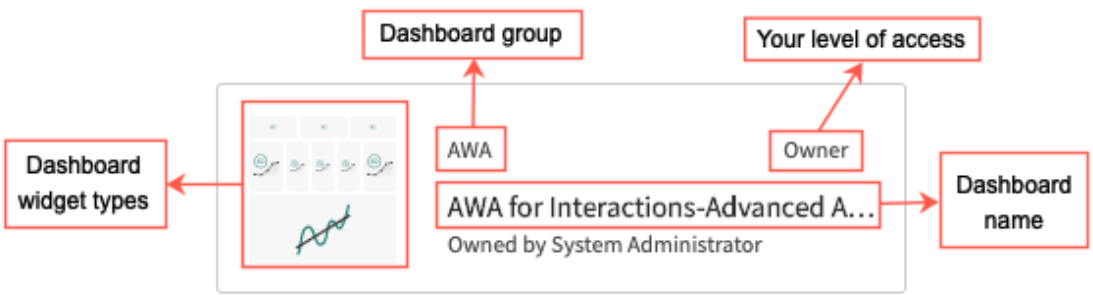
2. Dashboard group — Name
3. Dashboard — Order

   The owner of the dashboard can specify an order number in the dashboard's form. This field is optional.

4. Dashboard — Name

Using Advanced Analytics tiles

Tiles on Advanced Analytics show thumbnails of the widgets on the dashboard, the dashboard group, your level of access on the dashboard, the name of the dashboard, and the owner of the dashboard. Dashboard access levels are Owner, Editor, and Viewer. For more information, see Share a responsive dashboard.

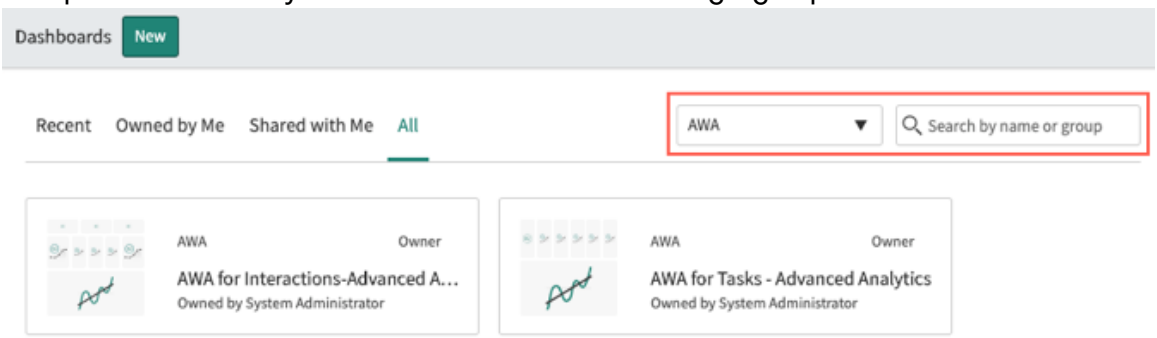


Note:
If you can't view a dashboard widget, you will see a message that prompts you to contact the administrator. You may not be able to view a dashboard widget because of wrong configuration settings, access restrictions, or because there is no data to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the Advanced Analytics Groups list

The advanced analytics screen defaults to showing only the dashboards related to AWA. You can see other dashboards by changing the Groups list to show only those dashboards in another single group.



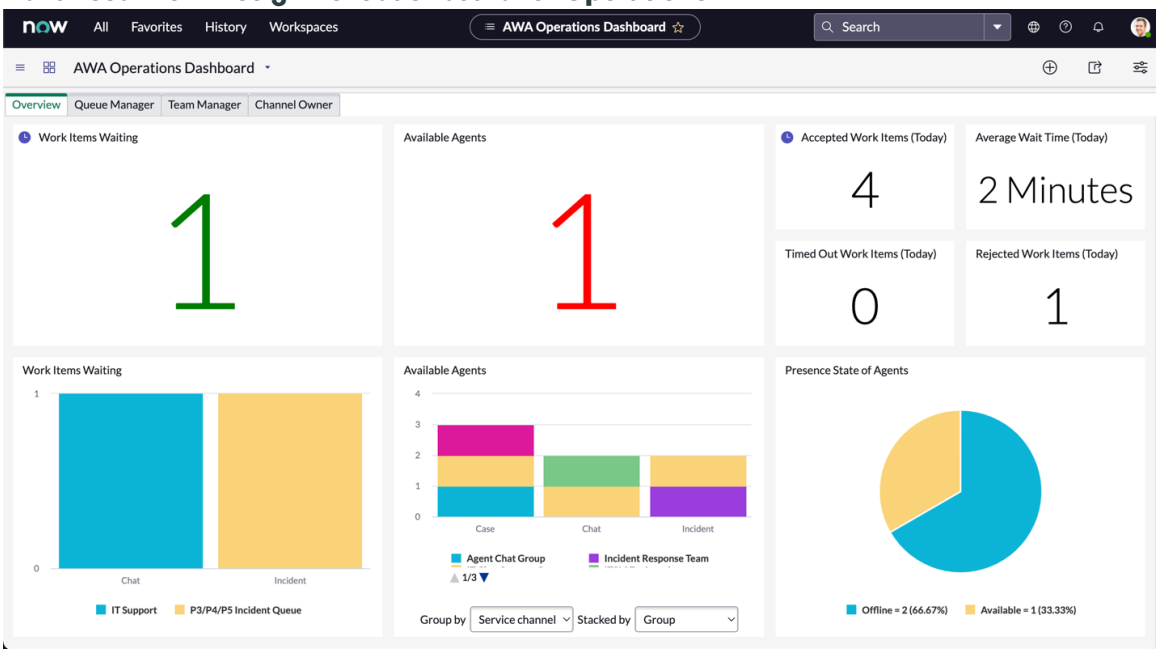
Click **New** to Create or configure a responsive dashboard.

Operations dashboard

Enable managers to monitor work items across all service channels so that their agents can better support customer needs.

This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see Platform Analytics Solutions for Advanced Work Assignment.

Advanced Work Assignment dashboard for Operations



End users and roles

End user and goal	Required role
AWA administrator: Configures Advanced Work Assignment to best fit the business needs of customer service.	awa_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End user and goal	Required role
AWA manager: Identifies the areas of concern for routing and assignment of work items across service channels.	awa_manager
Agent manager: Manages agents or agent groups. The agent manager wants to know what agents are working on to make sure that customer needs are being met.	sn_customerservice_manager
Performance Analytics administrator: Ensures that business managers are making the best use of Performance Analytics solutions.	pa_admin or pa_viewer

Use case

This dashboard provides support managers with an overview of incoming work items and the availability of agents to handle them. Managers can monitor these daily trends to determine if adjustments should be made to the routing criteria, agent capacity values, and other settings that determine how work is pushed to agents.

Indicators

Indicator	Description
New Work Items	Total number of interaction work items that were created today. The goal for this indicator is to minimize the number of interaction work items that agents receive.
Accepted Work Items	Percentage of interaction work items that agents have accepted.
Exceeding Target Work Items	Percentage of interaction work items that have exceeded the target wait time.
Rejected Work Items	Percentage of interaction work items that agents have rejected.
Timed Out Work Items	Percentage of interaction work items that timed out.
Weekly Trends	Number of work items in each of the following states for the past week: • New • Exceeding Target • Abandoned • Rejected • Timed Out

Breakdowns

To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Channel
- Queue
- Assignment Group

For more information on analyzing data with breakdowns, see Using breakdowns on dashboards.

Reports

Title	Type	Description
Accepted Work Items - Last Hour	Single Score	Number of interaction work items that agents have accepted in the past hour.
Abandoned Work Items - Last Hour	Single Score	Number of interaction work items that agents have abandoned in the past hour.
Average Wait Time - Last Hour	Single Score	Average amount of time that customers have spent waiting for an agent response in the past hour.

Platform Analytics Solutions for Advanced Work Assignment

This Platform Analytics Solution contains preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Enabling Platform Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

Note:
Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

For unlimited access to all features of this Platform Analytics Solution, purchase a Performance Analytics subscription. For more information, see Activating your Performance Analytics subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To enable a solution for Advanced Work Assignment, an admin navigates to **System Definitions** > **Plugins** and activates the Performance Analytics - Content Pack - Advanced Work Assignment plugin.

Title	Type	Description
Agent Presence & Capacity		• Agent • Current presence state • Updated • Channel • Capacity in use • Applied Max Capacity • Universal Capacity In Use • Max Universal Capacity
Average Handling Time - Last 24 Hours	Single Score	Average time of the interactions handling duration in the last 24 hours.
Agent Average Response Time - Last 24 Hours	Single Score	Average agent response time in the last 24 hours.

Migrating Advanced Work Assignment Dashboards

Migrating the Advanced Work Assignment CoreUI dashboards to Next Experience increases the product adoption of key platform capabilities to drive customer benefit.

The new Advanced Work Assignment users see the Next Experience dashboards by default.

The existing users will not see their custom changes on the new dashboards by default when they upgrade. The CoreUI dashboards of the existing users will not be deleted or deprecated. To see the custom changes on the CoreUI dashboard in the new Next Experience dashboard, they must migrate their CoreUI customized dashboards to Next Experience while upgrading from the Washington DC release to the Xanadu release.

AWA Next Experience dashboards

All the AWA Core UI dashboards have been migrated to Next Experience.

Advanced Work Assignment reference

The following sections detail the installed components and properties for Advanced Work Assignment (AWA), along with domain separation and performance statistics information.

Assignment Rule form

When creating or changing an Advanced Work Assignment assignment rule, the Assignment Rule form contains the following fields.

Assignment Rule form

Field	Definition
Name	Name of the assignment rule.
Application	Name of the application to which this assignment rule belongs. The default application is **Global**.
Short description	Brief description of the assignment rule.
Assign by	Type of assignment. Select one of the following values: • **Last Assigned**: Routes a work item to the agent who has gone the longest without being assigned work. • **Most Capacity**: Routes a work item to the agent who has the greatest availability for handling the work.
Auto-assign handling	Work items are automatically accepted without agents having to select **Accept** or **Reject**. • **Enable auto-assign work items**: Select this option to have work items automatically accepted on behalf of agents. Agents are unable to manually **Accept** or **Reject** work items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment Rule form (continued)

Field	Definition

	• **Display options**: Select one of the following values:
	  ○ Select **Inbox card** to accept the chat interactions and add them to the agent inbox. Agents can open the accepted interaction from the inbox.
	  ○ Select **Inbox card and workspace tab** to accept chat interactions and open a tab for each accepted interaction.

Rejection handling	Work items are rejected and handled.
	• Allow agents to reject: Enable agents to reject work items in their inbox.
	• Reassign on timeout: Enable reassignment of work items not accepted or rejected by agents within the specified timeout period:
	  ○ Timeout value (Days and Hours, Minutes, Seconds): Length of time allowed for an agent to accept or reject a work item before the assignment times out (ends) and is reassigned to another agent.
	  ○ Timeout presence state: Agent availability state after the timeout occurs: Available, Away, or Offline.
	
	This tab isn't available when auto-assign handling is activated.

Skill handling	Skill-based work assignments. • **Enable skills**: Route work items to agents with the appropriate skills. When selected, the **Evaluate skill level** and **Enforce mandatory skills** check boxes appear cleared. • **Evaluate skill level**: Route work items to the most qualified agents based on their skill level. • **Enforce mandatory skills**: Route work items to agents with required skills.
Shift handling	Work items are assigned to agents based on shifts.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment Rule form (continued)

Field	Definition
	• Enable-shift based assignment: Assign work items to agents based on time available in their shifts. • Add time constraints: Add the time required to complete work items in shifts and whether agents should be continuously available for the required time period. This field appears only when the **Enable shift-based assignment** option is selected. • Agent criteria: Select an agent based on the time left in the agent's shift. This field appears only when the **Enable shift-based assignment** option is selected. Available options: ○ Least time left in shift: Assign a work item to an agent from a group of available agents based on the least amount of time available in their shifts. ○ Most time left in shift: Assign a work item to an agent from a group of available agents based on the maximum time available in their shifts. • Time required: Time required to complete a work item. • Available continuously for the required time: Assign work items to agents who are continuously available for the required time period without any breaks in a shift. Agents who don’t have the minimum time required

Assignment Rule form (continued)

Field	Definition
	in their shifts aren't considered for work item assignments. **Note:** The **Shift handling** field is available only if the Advanced Work Assignment plugin (com.glide.awa) is activated and the Workforce Optimization for Customer Service plugin (com.snc.wfo.csm) or the Workforce Optimization for ITSM plugin (com.snc.wfo_itsm) plugin, or both, is activated. As a manager, you must have planned schedules for agents to assign them shifts. For more information, seeScheduling in Workforce Optimization for Customer Service and Scheduling in Workforce Optimization for ITSM. This field appears only when the **Add time constraints** option is selected.

Domain separation and Advanced Work Assignment

Domain separation is supported in the Advanced Work Assignment feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview

Advanced Work Assignment enables the automatic assignment of work items to qualified agents using work item queues defined for specific service channels. Managed Service Providers can create domain-specific queues by specifying a particular domain as a queue routing condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in Advanced Work Assignment

When an instance has a domain hierarchy where users and groups belong to different domains, you may need to restrict the visibility of work items to certain agents in a domain. You may also need to ensure that work items are routed to agents in the proper domain. AWA admins can configure service channels and associated work item queues to:

Route work by domains

To push work items to agents in domains where only certain tasks or interactions are visible to them, use a routing condition that routes those items to the appropriate queues. For example:

- To restrict a queue to only items that match exactly to a particular domain X, specify this condition: **[Domain] [is] [X]**
- To route all work items in domain X and its child domains to a queue, use the **Domain Path** field and specify a condition such as: **[Domain Path] [starts with] [!!!/!!#/]**

Assign work to agents in the appropriate domain

To assign work items to agents in the appropriate domain, ensure that the assignment groups specified in the queue Eligibility Assignment pools have agents that belong to the domains where they can see the work items routed to the queue.

If a mismatch occurs, and agents in an eligible assignment group cannot see a work item in a queue, AWA may temporarily assign an item to an agent. However, before the item is moved to the agent's inbox, AWA automatically rejects the assignment with the reason **No access**. AWA reassigns the work item to a different agent who might have access. If none of the available agents can see the work item, the item could be rejected multiple times.

> **Warning:**
> The item can get stuck in the queue until the AWA admin corrects the eligible assignment configuration.

Components installed with Advanced Work Assignment

Several types of components are installed with activation of the Advanced Work Assignment plugin, including tables, user roles, and scheduled jobs.

> **Note:**
> The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

AWA adds the following roles for users who configure, manage, and receive work assignments.

Role title [name]	Description	Contains roles
Advanced Work Assignment administrator	Admin role for the AWA feature. Configures and manages AWA.	awa_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[awa_admin]		
Advanced Work Assignment developer [awa_integration_user]	Developer role for the AWA feature. Uses the AWA integration APIs.	None
Advanced Work Assignment agent [awa_agent]	Agent role for the AWA feature. Handles customer interactions and manages workload across multiple service channels.	None
Advanced Work Assignment manager [awa_manager]	Manager role for the AWA feature. Monitors performance of agents across all service channels.	None

Scheduled jobs installed

Scheduled job	Description
AWA WorkItem TimeOut Job	
AWA Cleanup Job	

Tables installed

Table	Description
AWA Agent Capacity [awa_agent_capacity]	Stores capacity override records for agents on individual channels.
AWA Agent Channel Availability [awa_agent_channel_availability]	Store the records that determine the agents available in the channel.
AWA Agent Presence [awa_agent_presence]	Stores the records that define the agent availability state.
AWA Agent Presence History [awa_agent_presence_history]	Stores records on agent presence state changes.
AWA Assignment Rule [awa_assignment_rule]	Stores the assignment rule records used to determine the work items pushed to agents.
AWA Eligibility Pool [awa_eligibility_pool]	Stores the records that define grouping of agents eligible to receive work items in the queue when the items have been rejected by agents or agents are unavailable.
AWA Group Queue Priority	Stores the priority values for queues assigned to groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[awa_group_queue_priority]	
AWA Inbox Layout [awa_inbox_layout]	Defines the fields that appear on a work item card in the Agent Workspace inbox.
AWA Offer Details [awa_offer_details]	Stores whether a work item was assigned using Agent Affinity and how the assignment was completed.
AWA Presence State [awa_presence_state]	Defines presence states.
AWA Queue [awa_queue]	Stores the work item queue records.
AWA Queue Item Sorting [awa_queue_item_sorting]	Defines which fields in a work item for a queue you can sort on.
AWA Reject Reason [awa_reject_reason]	Stores the records that define the reasons that agents use to decline work items assigned to them.
AWA Service Channel [awa_service_channel]	Defines the communication channel for which work items may be queued.
AWA Work Item [awa_work_item]	Stores items of work, for example, chats, cases, or incidents, that are routed from service channels to queues and then to agents.
AWA Work Item Rejection [awa_work_item_rejection]	Stores the rejection history records for each work item.

Properties installed

Property	Description
glide.awa.enabled	Enables the auto assignment of work items for Advanced Work Assignment. • **Type**: true | false • **Default value**: true • **Location**: System Property [sys_properties] table
com.snc.awa.cache.enabled	Enables the Advanced Work Assignment cache.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type**: true | false • **Default value**: true • **Location**: System Property [sys_properties] table

Properties for Advanced Work Assignment

The Advanced Work Assignment Properties page provides configuration options for AWA.

If you have the admin role, you can create or change these properties by navigating to **System Properties** > **All Properties**.

Properties for AWA

Property	Description
AWA Routing Look-Back Time `com.glide.awa.routinglookback`	AWA defaults to routing work items created within the last 10 minutes. If a work item is created after 10 minutes has passed, it isn't considered for AWA routing. For work items that are created outside of the default 10-minute window, create this system property to expand the AWA routing look-back time: • **Name**: `com.glide.awa.routinglookback` • **Type**: **Integer** • **Value**: Number of seconds For example, set the property **Value** to 86400 (24 hours) to cover a full shift for any missed work items. • **Description**: `Number of seconds AWA looks back for routing once the work items are eligible for AWA.` **Note:** This property affects all service channels in the system.
Disable Query business rules `glide.awa.query_br_disable`	If the property is enabled, AWA disables before query business rules during its execution. For example, if enabled, an instance can have a custom before-query business rule on the interaction table without affecting how AWA routes or assigns interactions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for AWA (continued)

Property	Description
	• **Type**: true | false • Default value: true • Location: **System Properties** > **All Properties**
Bypass *AWA* Queue Max Wait Time *glide.awa.bypass_max_wait_time.enabled*	This property overrides the queue's max wait time value with the assignment rule's timeout value to help prevent work items from disappearing prematurely in an agent's inbox.
Enable/disable execution of subflows *glide.awa.enable_routing_subflow*	Enables/disables the execution of subflows defined on the AWA queues when work items are routed. • **Type**: true | false • Default value: false

For information on adding a system property, see Add a system property.

Advanced Work Assignment monitoring page

Administrators (admin or awa_admin) can monitor Advanced Work Assignment activity by reviewing information on the Advanced Work Assignment Stats page.

The Advanced Work Assignment Stats page displays AWA performance statistics. Administrators can access the Advanced Work Assignment Stats page by entering `<instance_url>/awa_stats.do` where instance_url is the base of the ServiceNow URL.

Note:
The mean, median, max, and min statistics are representative of the particular node you are viewing.

Total Agent Summary

Field	Description
Agent Status	Overview of agent status for all assigned agents

Channel Summaries

Work Items

Field	Description
Number Queued	Number of work items currently queued
Number Pending Acceptance	Number of work items currently pending acceptance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work Items (continued)

Field	Description
Number of Duplicates	Number of duplicate work items (meaning same document id, usually from transfers)
Number Rejected	Number of work items rejected
Current Number Meeting Channel Condition	Number of work items with the channel condition met
Current Number Meeting Utilization Condition	Number of work items with the current utilization condition met
Current Number Meeting Channel & Utilization Condition	Number of work items meeting both channel and utilization condition
Total Work Item Count	Total number of work items for the given channel

Query Performance

Field	Description
Max Query Response Time	Maximum amount of time for the response of querying all the active and unassigned work items of a given channel
Min Query Response Time	Minimum amount of time for the response of querying all the active and unassigned work items of a given channel
Mean Query Response Time	Mean amount of time for the response of querying all the active and unassigned work items of a given channel
Median Query Response Time	Median amount of time for the response of querying all the active and unassigned work items of a given channel
Total Query Count	Total number of times the query for inactive/unassigned work items has been made for the given channel

Record Watchers

Field	Description
Record Watcher Entries Present	True if the required record watchers for the channel exist (channel eligibility responder, work item responder, workload responder).
Number of Entries Triggered	Number of times onEntry has been called on this node for the given record watcher
Number of Exits Triggered	Number of times onExit has been called on this node for the given record watcher
Number of Changes Triggered	Number of times onChange has been called on this node for the given record watcher

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Queues

Field	Description
Total Number of Queues	Total number of active queues for a given channel
Number of Queues in Schedule	Number of queues for a given channel that are currently in schedule
Number of Queues Out of Schedule	Number of queues for a given service channel that are currently out of schedule
Number of Inactive Queues	Number of queues that are not marked as active

Agents

Field	Description
Agent status overview for the given channel	Number of agents with this status

Channel Breakdown

Queues

Field	Description
In Schedule	True if the queue is in schedule, false otherwise
Agents Available	True if the given queue has agents available, false otherwise
Number of Agents Available	Number of agents marked as available for the given queue
Number of Work Items Queued	Number of work items queued for the given queue
Number of Work Items Pending Acceptance	Number of work items pending acceptance for the given queue
Max Routing Time for Work Items	Maximum routing time of creating a work item for a given record and assigning it to the queue
Min Routing Time for Work Items	Minimum routing time of creating a work item for a given record and assigning it to the queue
Mean Routing Time for Work Items	Mean routing time of creating a work item for a given record and assigning it to the queue
Median Routing Time for Work Items	Median routing time of creating a work item for a given record and assigning it to the queue
Total Routing Count of Work Items	Total number of work items routed to the queue from created records

Exploring Skills Management

Use Skills Management to associate skills with individual users or groups and assign them to tasks or projects. You can also assess the skills needed for your organization, identify gaps, and implement effective plans for hiring or training of your teams.

Important:
Using the Skills Management application, you can create skills and skill categories manually, and also assign them manually to users. Skills Foundation uses Artificial Intelligence (AI) to help your organization leverage skills data for talent management and employee development. When you activate the Skills Foundation plugin (com.sn_skills_int), it also activates the Skills Management plugin (com.snc.skills_management). For information on Skills Foundation, see Skills Foundation.

Skills can contain other skills. For example, if you define network as a skill, you can add router as the skill it contains. A user assigned to a parent skill grants access to a child skill. Once a skill is assigned to a group, all members of the group inherit that skill and any others contained within it. Skills management works similar to ServiceNow platform Create a role.

Using this application, you can:

- Manage skills for agents and your employees from a central location.
- Use a standard way to identify skills for your organization and keep them up to date.
- Group skills into categories and define skill levels to track the expertise of your resources at a granular level.
- Reduce task or project reassignments by assigning tasks to agents and projects to teams that have the right skills to work on those items.
- Identify skill gaps and resolve them by implementing effective plans for coaching and training of resources.
- Manage the effectiveness of your team by evaluating the skills your team has and determining the skills you need for on your projects.

Integration with ServiceNow® applications

A skill is an ability to do something that comes from training, experience, and practice. As a system administrator, you can define skills for your organization and assign it to users and groups from a central location. As an application manager, you can assign users to tasks based on these skills. For example, if you are an IT manager, you can use the Skills Management application to define skills and assign them to users and groups, which facilitates the routing of incidents to agents with relevant skills.

Group skills into categories and define skill levels to standardize skill implementation across your organization.

Use skills from the centralized location in the following applications:

- IT service management - As an IT manager, reduce your time and costs while resolving incidents by assigning work items to the right agent. Assess the skill gaps that agents have in your team and coach or train agents based on those needs. Identify and define a standard way to keep skill categories and levels consistent within your team.
- Customer service management - As a customer service manager, identify agent skills and automatically route tasks to agents who have the required skill to work on those tasks. Manage your team's effectiveness by understanding what type of skills your employees need to get hired or get trained to take on other roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Field service management - As a field service or customer service manager, use rules to identify skills and skill levels that agents require to resolve work items such as cases, work order tasks, and agent interactions. Automate skill assignment to reduce a manager's work load. Automatically assign tasks to agents using Field Service dynamic scheduling.
- Human resources management - As an HR manager, identify the types of skills your organization needs and make hiring decisions based on those needs. Manage your team's effectiveness by understanding what type of skills your employees need to get hired or get trained to take on other roles.
- Project portfolio management - As a project and portfolio manager, standardize how you categorize skills, define skill level types, and add skill levels for your team. Set up skills for your team in a central location and make them available within your team. Prevent project reassignments by assigning projects to the team members who have the right skills to work on them.

Roles used in Skills Management

Role	Description
Skill administrator [skill_admin]	• Inherits the skill manager [skill_manager] and skill user [skill_user] roles. • Can perform create, read, update, and delete (CRUD) operations on skills, skill levels, skill level types, skill categories, and sub categories.
Skill manager [skill_manager]	• Inherits the skill user [skill_user] role. • Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories. • Can assign skills to users and groups.
Skill user [skill_user]	Can perform read operations on skills, skill levels, and skill level types.

Activating Skills Management

The Skills Management application is activated when you enable the Skills Management (com.snc.skills_management) plugin.

Configuring Skills Management

Create Skills, identify the Skill Level Type the skill belongs to, and associate Skill Levels for each level type to define a structured skills architecture for your organization.

For example, you can add French as a skill, Language as the skill level type, and Familiar, Proficient, and Expert as the skill levels.

Identify all the skills you currently have and would require across your organization to start implementing skills in your organization. For example, if you are in Customer Service, you might have agents who have Java as a technical skill and you might need agents who have experience in network administration. If you are in Human Resources, you may have employees who have coaching as a skill and you might need employees who can get new hires on board.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate each skill that you have identified with a Skill Level Type. Example, you could associate Java with Programming as the skill level type and Coaching with Leadership as the skill level type.

Define skill levels for each skill level type that you have identified. Example, for the Java skill you can define Novice, Intermediate, Advanced, and Expert as the skill levels.

Define the skill taxonomy

Organize related skills into categories and subcategories so that you can manage skills and create reports quickly and efficiently.

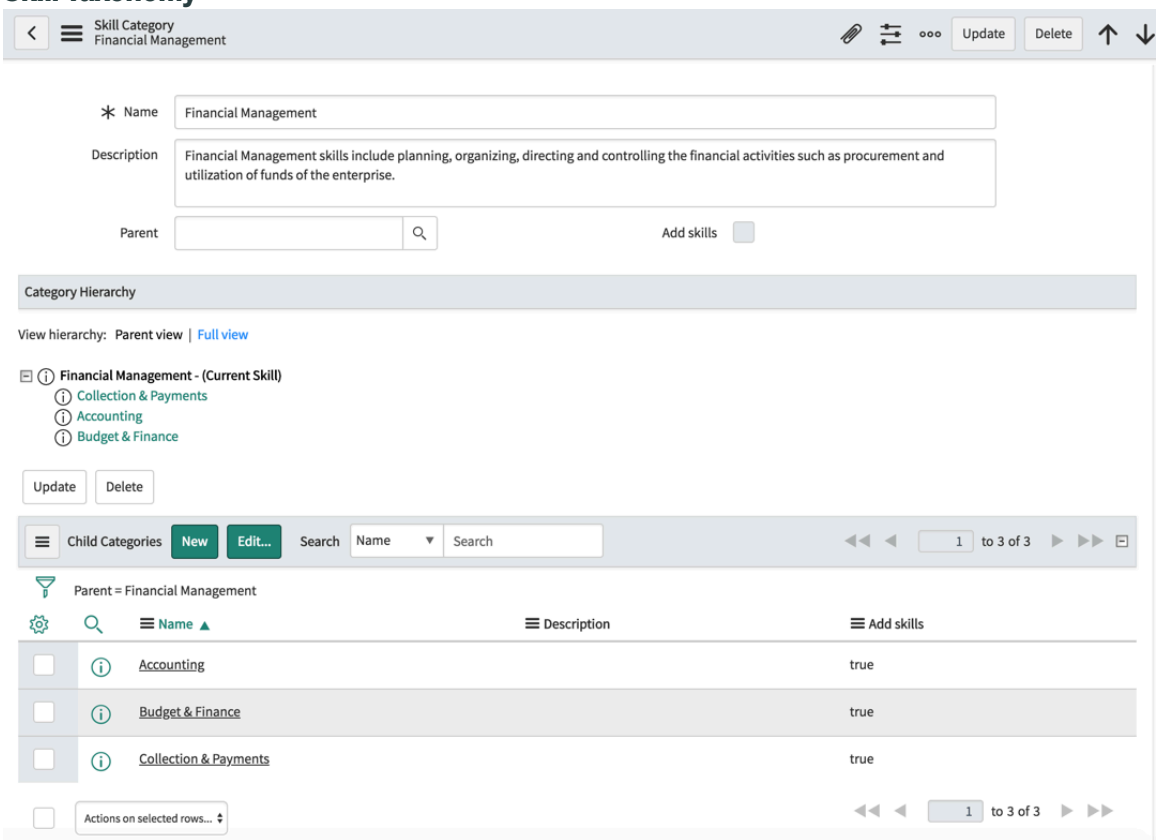
Before you begin

Role required: skill_admin

About this task

A skill category can contain parent and child categories that together create a category hierarchy. You can add skills to the lowest category in the hierarchy.
You can build your skill taxonomy from scratch or use the sample data provided with your application.

Skill Taxonomy



Procedure

1. Navigate to **All** > **Skills** > **Skill Taxonomy**.
2. In the **Skills Categories** list, click **New**.
3. In the **Name** field, enter a unique name for the category.
4. **Optional:** In the **Parent** field, select a parent category.
5. Right-click the form header and click **Save**.
   The category is added to the **Category Hierarchy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Add sub-categories or skills.

7. Click **Submit**.

Create skill categories using sample data

Onboard your team quickly using the skill taxonomy framework provided with your application.

Before you begin

Role required: skill_admin

About this task

The sample data provides 150 records that you can use to get started building your skill taxonomy.

Procedure

1. Activate the Skills Library Data for Skills Management (com.snc.skills_management.seed_data) plugin.
2. Navigate to **Skills** > **Skill Taxonomy**.
3. In the **Skill Categories** list, review each category and set the **Add skills** field to **true** for all skill categories you want to add to your application.

Define a skill level type

Define skill levels (for example, beginner, intermediate, advanced) for different skill level types (for example, a language or an IT certification) so you can associate skill levels to users and define skill levels and types required for tasks.

Before you begin

Role required: skill_admin or admin

Procedure

1. Identify skill level types.

   You can group skills that belong to the same category into a skill level type. For example, you could use language as the skill level type if Japanese and French are defined as skills. Take an inventory of every type of skill your organization needs.

2. Add skill level types, define skill levels, and associate them with a skill level type.
   After you add a skill level type, you can define different levels for that type of skill. For example, if you add language as a type of skill, you can associate familiar, proficient, and expert as skill levels. When you select French, for example, as a skill for a user, you will be able to define the user's skill level for French as either familiar, proficient, or expert.

   a. Navigate to **Skills** > **Skill Level Types**.

   b. Click **New**.

   c. Enter a name and description for the skill level type, and then right-click the form and click **Save**.

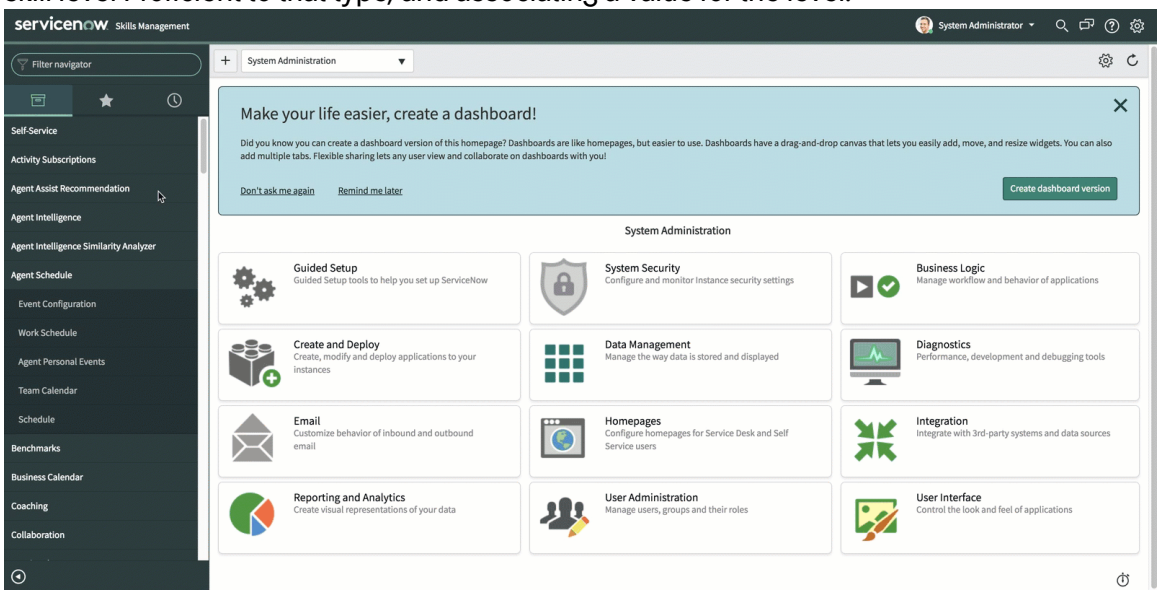
   d. Associate skill levels with this skill type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, skill level types are associated with the **Default** skill level and have a value of 1. You can change the name and value for this default skill level. The value is used to measure skill gaps. For example, if you give a value of 10 for a skill level defined as proficient and a value of 25 for a skill level defined as expert, when you create a skill report to measure gaps, you will see a value of 15 as a measure for the skill gap.

3. Click **Submit**.

Example:
This example shows a system administrator creating the skill level type Language, adding the skill level Proficient to that type, and associating a value for the level.



Add a skill

Create skills to specify the competencies of your users and associate them with users, and configuration items.

Before you begin
Role required: skill_admin or admin

Procedure

1. Identify skills.

   Take an inventory of all skills you currently have and would need across your organization. For example, if you are using Customer Service, you may have agents who have Java as a technical skill and you may need agents who have experience in network administration. If you are using Human Resources, you may have employees who have coaching as a skill and you may need employees who can get new hires on board.

2. Add skills.

   You can associate each skill with other skills, users, or configuration items. You can assign users to tasks or projects, or identify employees with specific skills using these associations.

   a. Navigate to **Skills** > **All Skills**.

   b. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Enter a name and description for the skill and then right-click the form and click **Save**.

d. If you want to associate subskills with the skill, click the **Contains Skills** tab and create a new skill or add an existing skill as a subskill.
The subskill is automatically inherited by the user or group that contains the associated skill.

e. Specify skills for users by clicking the **Users** tab and creating a new user for the skill or adding existing users.

f. Associate the skill with configuration items by clicking the **Model** tab and adding one or more configuration items.

3. Click **Update**.

Using Skills Management

Use the Skills Management dashboard to analyze trends in assessing skill gaps in your organization and plan for coaching or training of your employees based on needs. Identify users and teams who have the right skills to work on tasks and projects.

The Skills Management dashboard provides comprehensive reports on skill competencies of users, the tasks that require those skills, and skill gaps you can address to fulfill your organizational needs.

You can access the dashboard by navigating to **Skills** > **Dashboard**.

Overview and Skill Matrix tab

Title	Type	Description
Skills in Category	Bar chart	View the total number of skills in the selected category.
List of user skills	List of skills with total count of users for each skill	View number of users available for each skill.

Assigning and Managing skills

Manage skill assignment efficiently by assigning skills to users and analyze the skill coverage of your teams.

Note:
The **Manage skills** page uses the Next Experience user interface. For more information on Next Experience, see Next Experience UI.

You can analyze your teams' skills based on a department. For example, if you select Finance as the department, the page displays all skills that contain Finance skill. When you select a department, the page displays all users from that department. You can also display all users and their skills based on the groups you manage.

If you want to add your own custom group types, your administrator can configure Skills Management extension points to add them.

The skill matrix displays the skill coverage and skill proficiency of all users within a team. If a skill hasn't been added to the user, the skill matrix displays an **Add** button. You can select this button, add the skill, and associate a skill proficiency for the user. If a skill doesn't have the proficiency defined, it displays the skill as acquired. For information on adding skills, see Assign skill proficiency levels for skills.

For each team, the skill coverage bar displays the number of users that have that skill and the number of users in each proficiency. If the skill proficiency isn't defined, it displays the number of users with or without the skill.

You can select the filter icon and narrow down the display of the skill matrix using the Users, Skills, and Location filters.

Assign skill proficiency levels for skills

Add a skill and assign skill levels to users to facilitate the automatic assignment of skill-based tasks to agents.

Before you begin

Role required: skill_manager or skill_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Only skill administrators can create or edit skills. Skill managers can assign skills to users.

Procedure
1. Navigate to **All** > **Skills** > **Manage IT Skills**.
2. Assign a skill level to a user or add a skill along with the skill level.

Assign skills to tasks
Add skills and the level required for each skill to tasks. Identify whether the skill is mandatory to perform the task.

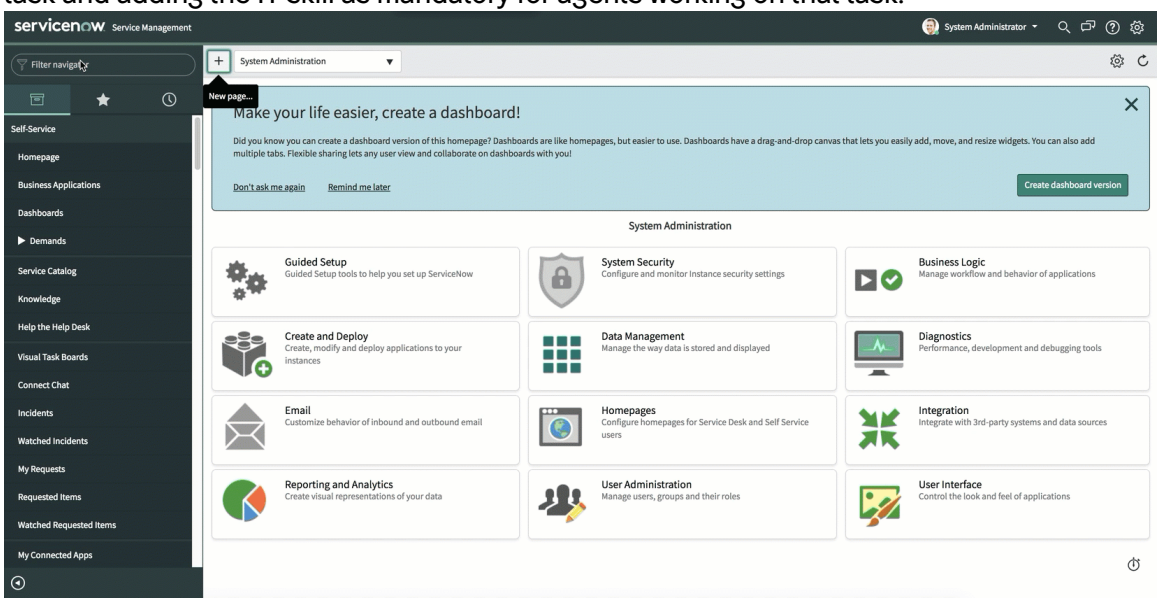
Before you begin
Role required: admin

Procedure
1. Navigate to incident, problem, change request, or any task record to which you want to associate skills.
2. In the related list, select the **Tasks Skills** tab.

> **Note:**
> You must configure the related list and add **Task Skill->Task** to the **Selected** column to display this tab.

3. In the Task Skills table, do the following:
   a. In the **Skill** field, click the lookup icon and select a skill.
   b. In the **Skill level** field, select a level for the selected skill.
   c. In the **Mandatory** field, select **true** if the skill is mandatory for the selected task.
4. Click **Submit**.

Example:
The image below shows an administrator configuring skills for an incident task and adding the IT skill as mandatory for agents working on that task.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Routing work items to agents based on skills

Use rules to automatically route work items to agents.

You can route work to agents based on their skills using Skill Determination Rules and Advanced work assignments. For more information on routing agents to work items, see Advanced work assignments

Learn how Skill Determination works

Use Skill Determination to add skills to incoming work items so that agents with those skills can work on it.

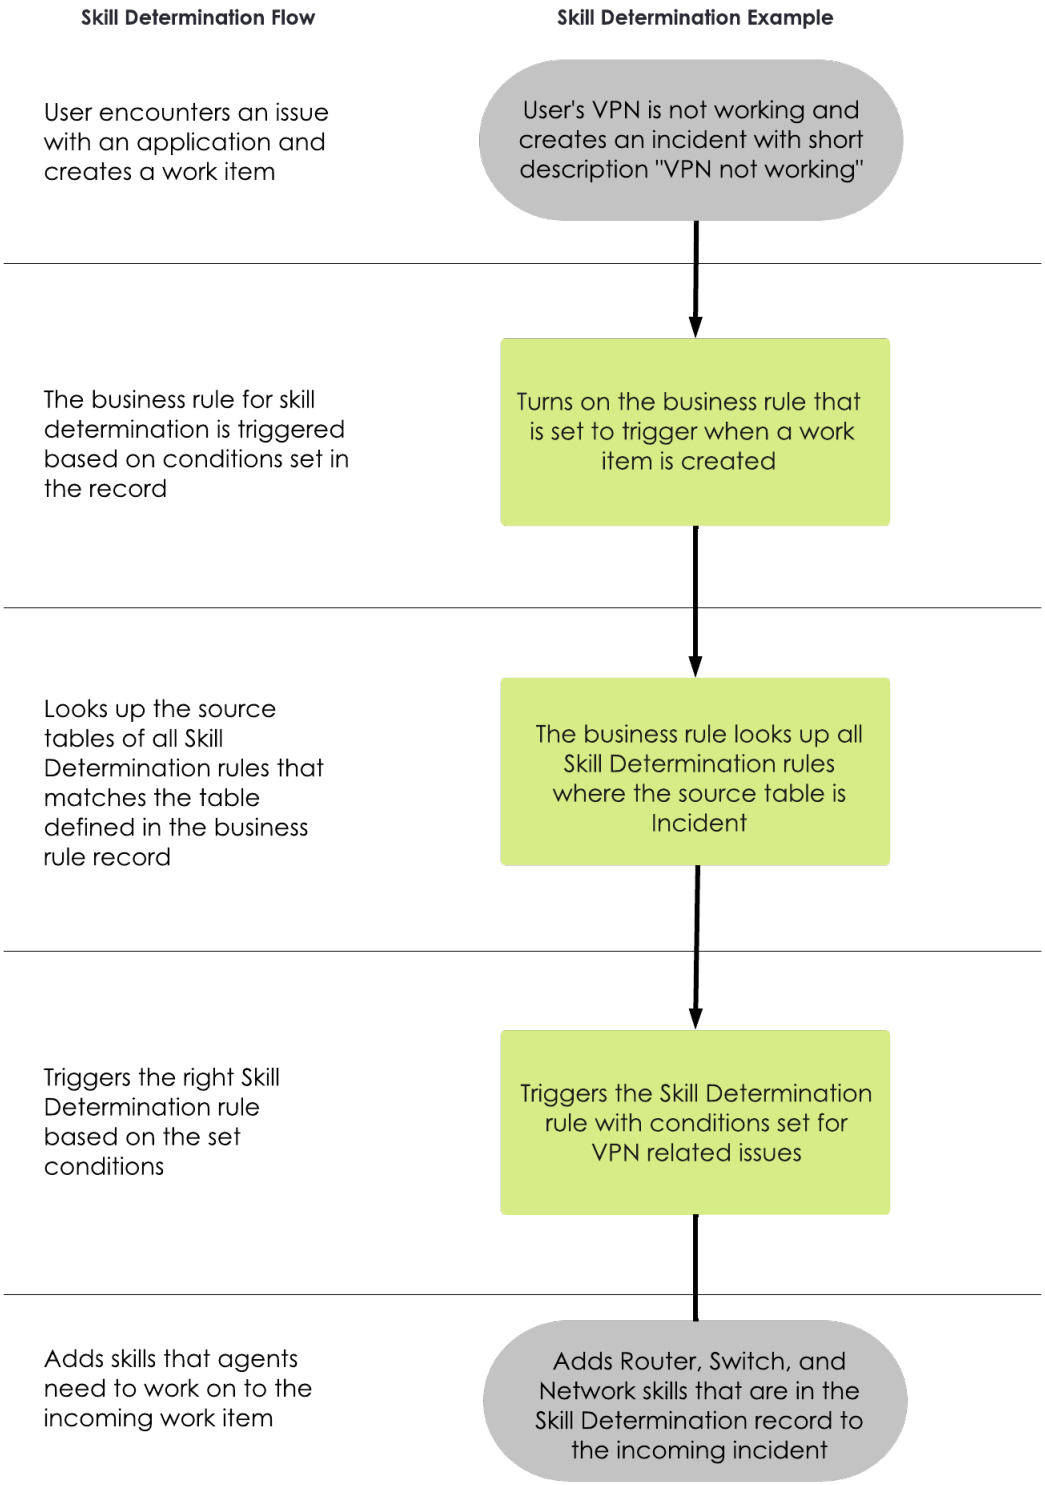
Skill Determination uses two rules:

- Skill Determination rule—set what skills you want to add to incoming work items.
- Business rule for Skill determination—set criteria for when a business rule must execute.

  When executed, it runs on the source table defined in the Skill Determination rule, triggers the corresponding Skill Determination rule, and adds the skills that are in the Skill Determination rule record to the incoming work item.

The flow chart shows a visual representation of the Skill Determination flow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Step	Skill Determination Flow
1.	A user has an issue with their VPN connection and has created an incident with the short description 'VPN not working'. The incident needs agents with **Router, Switch,** and **Network** skills to work on the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Step	Skill Determination Flow
2.	A business rule has been created on the incident table that's set to trigger when an incident is created.
3.	The business rule looks up all Skill Determination rules where the incident table is set as the source table. The business rule then triggers the Skill Determination rule that has one of the conditions set as the **[Short description] [contains] [VPN]**. The Skill Determination rule has the skills **Router, Switch,** and **Network** skills in the Skills related list. When triggered, these skills are added to the incident with the short description 'VPN not working'.

Add a business rule for skill determination

Set up or enable business rules for agents to manage cases, chat interactions, or work order tasks. These business rules trigger Skill Determination rules, ensuring that the required skills are assigned to relevant work items so agents are properly equipped to handle these responsibilities efficiently.

Before you begin

Role required: admin

Enable the Skill Determination [com.snc.skill_determination] plugin.

Procedure

1. Navigate to **All** > **System Definition** > **Business Rules**.

   Note:
   If you want to use the skill determination rules available by default, make sure the **Active** field for that rule is set to **true**. For example, if you want to use the *`Skill determination for interaction`* business rule, make sure that the rule is active.

2. Select **New**.
3. Add details for the business rule.

Field	Description
Name	Descriptive name for the business rule.
Table	Select the table on which you want to run this business rule for skill determination.
Advanced	**a.** Enable the **Advanced** check box. **b.** Select the **Advanced** tab. **c.** In the **Script** field, enter the following code: `(function executeRule(current, previous /*null when async*/ ) { var skillUtils = new sn_skill_rule.SkillDeterminationUtils(); var skills = skillUtils.determineWorkItemSkills(current);`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	``` skillUtils.assignSkillsToWorkItem(skills, current); })(current, previous); ```

Note:
This script uses the SkillDeterminationUtils utility to identify which skills are needed for the current work item (such as an incident or task) and then assigns those skills to it automatically. This helps ensure that the work item has the correct skill requirements based on its details.

d. In the **When to run** tab, set when you want the business rule to execute. For more information, see Create a business rule.

4. Select **Submit**.

Create Skill Determination rules to assign skills to work items

Create Skill Determination rules to identify skills required by agents to work on work items and automatically associate them to those work items.

Before you begin
Role required: skill_admin or admin

About this task
You can automatically add a skill to a case based on the product associated with the case if you enable the Product to Skill mapping table (Skill Required for Model Maintenance [cmn_m2m_skill_model]).

A skill determination rule is created for every new skill required for a work item.

- If a skill is no longer required for a work item, deactivate or remove the rule applied for the work item.
- If two rules have the same skill associated with one work item and one rule evaluates the skill as mandatory and the other rule evaluates it as optional, then the rule that evaluates the skill as mandatory is always used.

The table describes the types of Skill Determination rules you could create.

Skill Determination Rule Types

Rule Type	Description
Simple	Adds skills to work items based on a set of conditions used to evaluate the source table.
Lookup	Adds skills to work items based on selections from two different tables connected using one or more reference fields.
Advanced	Adds skills to work items using a script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Skills** > **Skill Determination Rules**.
2. Click **New**.
3. In the **Name** field, enter a name for the rule.
4. Select the **Active** check box to enable the rule to assign skills to work items.
5. From the **Source table** drop-down menu, select the work item source table for this rule.
6. Using the condition builder, select the conditions to evaluate the work item.
7. Create the rule.
8. Click **Submit**.

Qualify and rank users based on skills and skill levels

Rank users so that you can select the right users based on skills needed to complete tasks. Qualify users to work on tasks such as case, work order task, or chat interaction based on the number of skills and skill levels required to work on those tasks.

Before you begin

Role required: skill_admin

About this task

Use the UserSkillAnalyzer API to analyze the skills and skill levels of users and the UserSkillRanking API to rank and assign them to tasks. For example, when you use the Field Service Management application to assign agents to tasks, you can analyze and rank them based on their skills and skill levels using these APIs and use dynamic scheduling to assign them to tasks.

Note:
You must add the Matching Skill Level Gap for Dynamic Scheduling criterion to the task filter to rank agents assessed based on skill gaps. For more information on adding this criterion, see Create a task filter.

Procedure

1. Analyze the skills and skill levels users have to complete work items using the UserSkillAnalyzer API.

   The API performs the following verification to check if users are qualified to be assigned to the work items:

   a. If the user has all mandatory skills required to complete the work item, but does not have the skill level, the agent is not qualified to work on the task if the skill level is mandatory to work on the task.

   b. If the user does not have all mandatory skills required to complete the task, the agent is not qualified to work on the task.

   c. If the user has all skills and the skill levels required to complete the task, the agent is qualified to work on the task.

   d. If the user has all skills required, but not mandatory to complete the task, the agent is qualified to work on the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the user is qualified to work on the task, the API performs the following verification to analyze gaps in skill level and the total number of skills the users have to execute tasks based on the skill requirements for the work item:

a. Verifies if a work item requires a skill that does not have a level type defined.

b. Verifies if a work item requires a skill that has a level type defined but does not have the skill level defined.

c. Verifies if a work item requires a skill that has the skill level defined, but the agent does not have the skill level defined. If the skill level is mandatory to complete the task, the user who does not have those skill levels will not be assigned to those tasks.

d. Verifies whether a user has all skill levels that are mandatory, but not optional, to perform a task.

2. Rank users qualified to complete work items using UserSkillRanking API.
The API retrieves a list of qualified users based on matching and mandatory skills and skill levels.

Translate text in Skills Management

Translate skills and descriptions when you add new skills in Skills Management.

Before you begin

Role required: skill_admin

Activate the relevant translation plugins. For more information, see Localization Framework.

About this task

Translate skill names and the description using the following fields that support the translated text data type in the Skill [cmn_skill] table:

- **Display Skill Name**

  Auto-populates the corresponding value in the **Name** field.

- **Description**

Procedure

1. Add a skill.
2. For the newly added skills, load the translation to the Translated text [sys_translated.text] table.
3. Set the session language based on the language plugin that you've installed.

> **Note:**
> Every time you add new skills, you must load the translation to the Translated text table and set the session language.

The text in the **Display Skill Name** and **Description** fields are translated.

For more information on translating custom content, see Translating custom content.

Domain separation and Skills Management

Domain separation is supported in the Skills Management app, and configured to apply to all features of the application. Separation of data is configured along with separation of logic and process.

Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Skills Management

Domain separation is supported in Skill Management with no explicit setup or configuration requirements. Skills, skill categories, skills levels can be created in separate domains, including the global domain. When domain separation is implemented, people with skill app roles can view skill information only in the domain assigned. **Domain** and **Domain Path** columns are available for all Skill tables provided with the base system. The **Domain** column contains the name of the domain to which the event or alert belongs, and the **Domain Path** column contains the unique domain identifier.

Table name	Description
sys_user_has_skill	User skill information
cmn_skill	Main skill table
cmn_skill_category	Define skill categories
cmn_skill_level_type	Define skill level type
cmn_skill_level	Define skill level
sys_group_has_skill	Group skills
cmn_skill_contains	Define skills contained within skills
task_m2m_skill	Task skill information

Note:
If the domain column is not shown, click the **Update Personalized List** icon and add the required column. You can also add the domain path column, if desired.

Use cases:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A Skill Manager that belongs to the Acme domain creates a skill and wants to view and associate it to user in the Acme domain. A user must belong to the Acme domain, its parent domain, or the global domain to view the skill record.
- A Skill Manager that belongs to a parent domain tries to view a skill in a child domain. The user of a parent domain can view a skill record of the parent as well as all child domains of that parent.
- A Skill Manager that belongs to a parent domain wants to create/associate a skill on behalf of another user in the Acme domain. A user must belong to the same domain as the user for which the skill record is created.
- A Skill Manager wants to associate a record for an integrated application in the Acme domain. A user must belong to the domain of the integrated application from which a record is associated.
- A Skill Manager has access to multiple domains but wants to update a record with content within a specific domain. The domain specified for the current record drives the functionality of that record and reference fields.
